Desktop: Events, select Define an event, double-click an event, double-click an event function, click More> Speakers, and click Print

While the event is open, use the Room Setup report to view function-level speaker data (evaluation criteria, scores, and comments recorded).

Using Hotel Room Reports

The three hotel room reports together provide a comprehensive packet to give to hotel personnel. They itemize the room assignments, the room sharing requested, and the changes that occurred throughout the event registration. These reports are:

- Hotel Room Bookings/Availability
- Hotel Room Change Roster
- Hotel Room Roster

The Hotel Room Roster has an option for including phone numbers, which adds the telephone number of the person with whom to confirm the reservation.

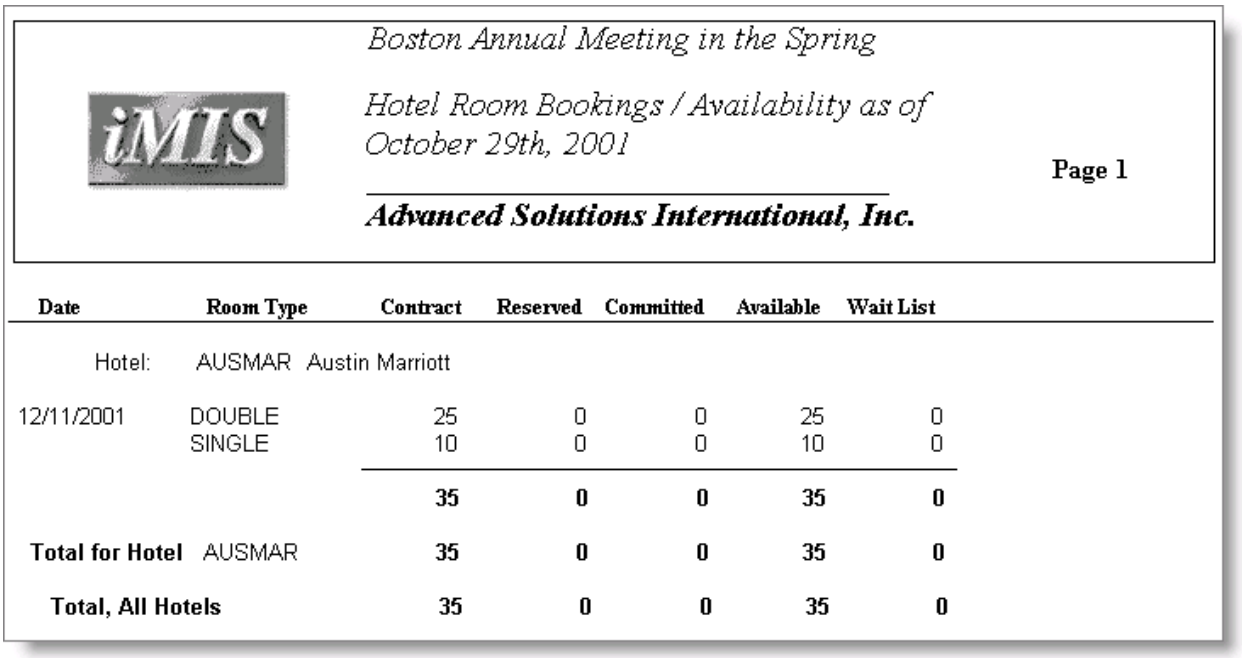
To report on sharing of multiple rooms

If a primary room holder registers multiple rooms and then shares these rooms, each room appears as a separate event function with the appropriate pricing, and all people sharing with the primary room holder appear under both functions in the report.

Therefore, individuals can appear twice in the Hotel Room Roster report and be shown as sharing both of these functions. The primary room holder is responsible for allocating those rooms within hotel regulations.

Hotel Room Bookings/Availability report

This report shows the number of rooms contracted for the event, and the number of rooms that are currently shown as reserved, committed, available, or on a wait list.



Boston Annual Meeting in the Spring

Hotel Room Bookings / Availability as of October 29th, 2001

Admin Console: Continuum > Events and Orders Reports > Event reports > Hotel > Hotel Room Bookings / Availability

Desktop: Events > Generate reports > Hotel > Hotel Room Bookings/Availability

Hotel Room Roster report

If you have entered Arrival and Departure dates for all individuals, you can generate the Hotel Room Roster report to get a complete breakdown of who is sharing a room at any one time. Notice that the arrival and departure dates are mandatory only if registering for a room.

iMIS does not warn or control how many people share a room because every hotel has its own rules and capabilities to accommodate this. Instead, generate a Hotel Room Roster report, which allows a hotel auditor to see who is sharing a room and when. As the report indicates, pricing is not split between sharing registrants; billing for the room goes to the primary registrant.

Desktop: Events > Generate reports > Hotel > Hotel Room Roster

Hotel Room Change Roster report

The Hotel Room Change Roster report records housing cancellations. This report sorts registrations by their Added, Changed, or Dropped status.

If a couple is in the Dropped section, you also see them in the Added section, because they had to register for a room to be able to cancel that room. They will also be listed in the Changed section if they had a change before they dropped.

Warehouse Availability Analysis report

The Warehouse Availability Analysis report generates a list of order line items for back-ordered products. Separated by products on backorder, each line item lists specific order information including order number, order date, order priority, and product quantity. The product quantity information lists the number of products Ordered, Shipped, Backordered, and Fillable. If you are using multiple warehouses, the report also lists a product's availability at each warehouse.

If a product's default warehouse does not have sufficient inventory in stock, you can run the report to view a product's availability at other warehouses. If another warehouse has available inventory, you can edit an order to ship a product from a warehouse with sufficient inventory.

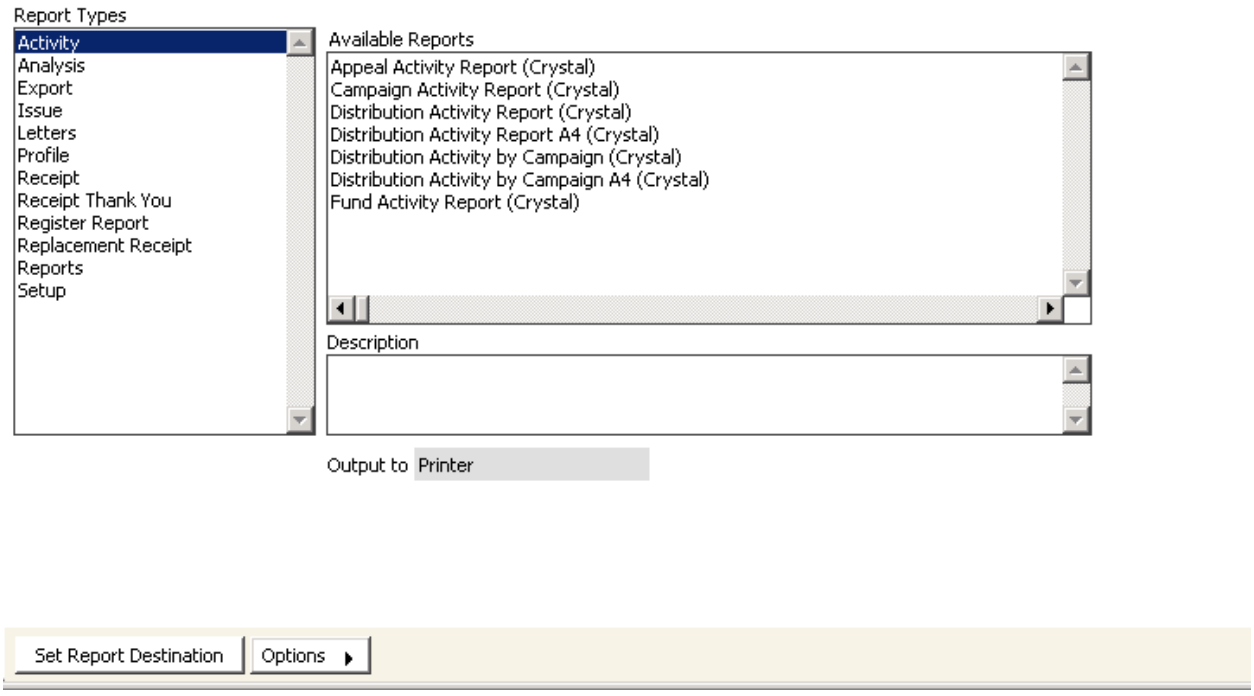
Fundraising Reports

Fundraising Reports

Fundraising reports window



Admin Console: Continuum > Fundraising reports
Desktop: Fundraising > Generate reports

Report Types

The reports and outputs available through the iMIS Customer Management, Events, and Fundraising modules are generated from information gathered during customer entry, registration entry, gift entry, order entry, and planning processes. The following standard reports are available:

- Activity – Generates a list of activities for individuals.
- Badges – Prints groups of badges using a variety of formats for both continuous-fed and laser printers. (Events only)

- Certificates – Formats and produces continuing education, appreciation, and customer certificates at the event, function, or committee level. (Customer Management and Events)
- Confirmations – Prints confirmation letters or postcards for event registrations. Each printing run consists of the new registrants entered since the last printing run. (Events only)
- Export – Exports a variety of field and file data.
- Hotel – Prints hotel booking/availability, rosters, and transfer information. (Events only)
- Invoices – Prints invoices for event registrations and orders. (Events and Orders only)
- Issue – Prints reminders for donors who have made pledges or who have committed to new gifts on a certain date. (Fundraising only)
- Labels – Prints groups of labels using a variety of sizes and layouts. (Customer Management and Events)
- Letters – Selects letter formats for printing mass mailings for event registrations and other customer activities. (Customer Management, Events, and Fundraising)
- Meetings – Generates event reports from a group of indexes that list the events and related functions. (Events only)
- Order Status – Generates a variety of detailed summary reports on open orders.
- Planning – Generates room setup and general planning reports. (Events only)
- Product – Prints product and product inventory reports.
- Product Transactions – Generates reports on both posted and unposted product inventory transactions.
- Profiles – Prints customer profile information.
- Receipt – Prints receipts. (Fundraising only)
- Receipt Thank You – Prints thank you letters. (Fundraising only)

- Register Report – Prints detailed and summarized reports of receipts printed. (Fundraising only)
- Replacement Receipt – Prints replacement receipts. (Fundraising only)
- Reports – Prints detailed and summarized reports and analyses. (Fundraising only)
- Rosters – Generates a variety of detailed rosters that list registrants or committee members for events or functions.
- Statistics – Generates statistical analysis of data including event registrations and customer participation. (Customer Management only)
- Status – Prints summary reports that recap registration and cancellation counts and fees. (Events only)
- Tickets – Prints personalized tickets for functions. Each printing consists of new registrants entered since the last printing run. (Events only)
- Transaction Lists – Generates accounting audit trail details and recaps reports that list activities based on the transactions generated through AR/Cash, Billing, and Events.

Generating Letters from the Fundraising Overview Tab

To streamline fundraising processes, you can generate thank-you letters directly from the Overview tab of Fundraising, while the donor's record is open.

To generate a Fundraising letter

To generate a letter, the donor record opened must display a valid gift transaction. To access this feature, you must have Word Integration installed on the iMIS system.

1. From Fundraising > Enter and edit gifts, open the gift record for the contact for whom you are generating a letter.

   Note: To generate a letter, the record opened must display a valid gift transaction.

2. Click Letter at the bottom. The Fundraising Standard Letters window opens.
3. Choose the letter you want you use from the Fundraising Standard Letters window.

Note: If you are creating a new letter or editing an existing letter, see To create a new letter or To edit an existing letter.

4. Click Merge.
5. Choose one or both of the following options: Create Activity Records with Merge and/or Create EMAIL Activities Records with Merge.
6. Click Continue.
7. A dialog box prompts: The System has X Activities to insert. Do you wish to write these activities? Click Yes or No. Microsoft Word opens and displays the Template.
8. To create the merged output, select Merge to New Document from the Word toolbar.
9. To print the letter, select File > Print.
10. Select File > Save As to save the letter to a folder on your computer.

To create a new letter

1. Click New. The New Standard Letter window opens.
2. Complete the Report Title and Report File fields.
3. Click OK. Microsoft Word opens.
4. Create the letter by selecting merge fields and entering text.
5. When you finish, click the Save icon or select File> Save.
6. To save the letter to another location outside of iMIS, select File> Save As and save a copy in another location.
7. Close Microsoft Word.

To edit an existing letter

1. Select the title of the letter you wish to edit and click OK.
2. Once the letter opens in Microsoft Word, edit it.
3. When you finish, select File> Save.

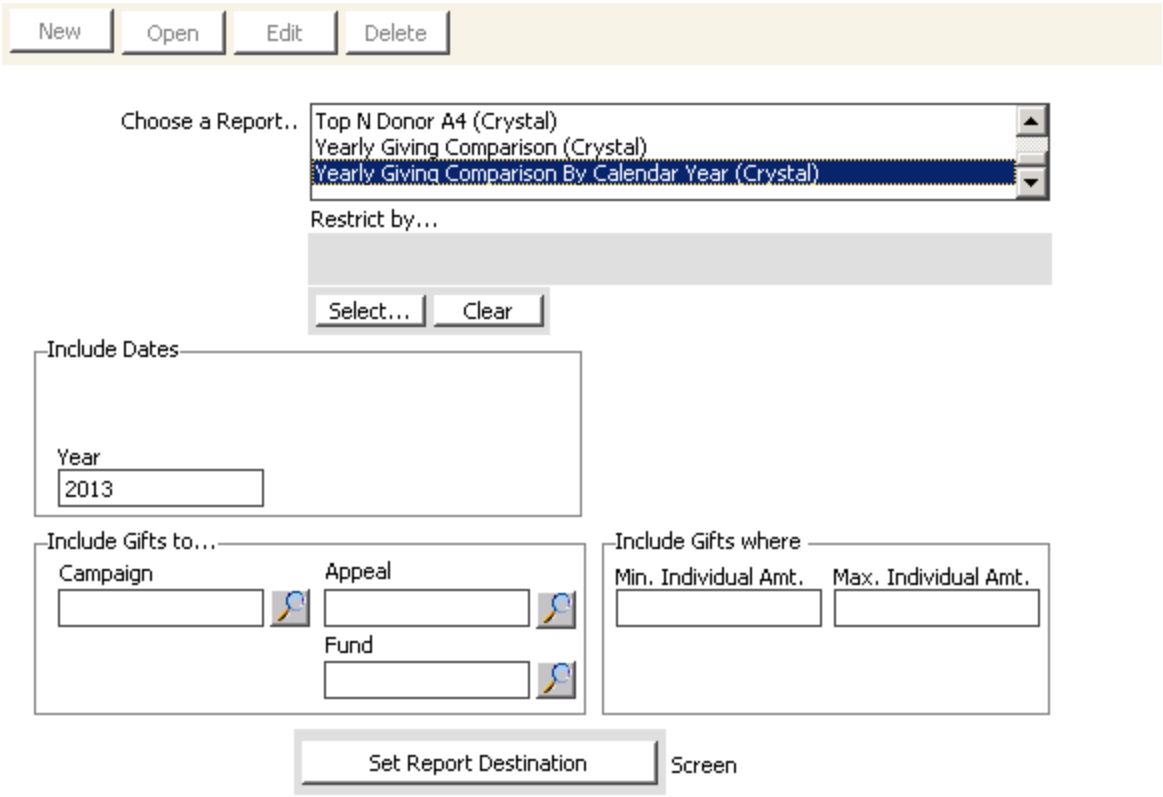
4. If you also want to save the letter to another location outside of iMIS, you can select File> Save As and save a copy in another location.
5. Close Microsoft Word.

Executive Reports in Fundraising

The Generate executive reports window is an abbreviated version of the Fundraising Generate reports window. The Generate executive reports window allows you to generate several of the detail and summary reports that are available in the Fundraising Generate reports window. The Generate executive reports window is just that – a window designed to allow the fundraising executive to view or print detail or summary reports of gifts, pledges, and donor clubs, and to view or print comparisons between current and previous time periods – all without having to go to the Generate reports window.

The Generate executive reports window has some limitations. You cannot rename reports in the Generate executive reports window, nor can you export, issue, or run letters reports as you can in the Generate reports window.

Executive reports window



Admin Console: Continuum > Fundraising Reports > Executive reports
Desktop: Fundraising > Generate executive reports

Choose a Report

This area contains a scrolling list of all reports available from the Generate executive reports window. For each available report displayed in this area, you can select either a detail or summary report by enabling either the Detail or Summary option.

- Pledge – Select this report to generate either a detail or summary report of all pledges entered. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Donor Club and Meeting. The report lists the amounts pledged and paid as well as balances remaining. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.

- Giving – Select this report to generate either a detail or summary report of all gifts and pledge/installment payments. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Donor Club and Meeting. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.
- Prev/Curr Period – Select this report to generate a detail or summary list of gifts given per user-selected sort, comparing these amounts between two defined time periods. These reports show the difference in amounts and the percentage of change, with single gifts and pledges broken down by fund. To run the Prev/Curr Period report, you must enter values in the Comparison to Previous Period From and Thru date fields.
- Donor Club – The Donor Club Detail (lndscape) report allows you to generate a list of all individuals who have attained a donor club, subtotaled by individual donor clubs with a total of all donor clubs achieved. The report displays the date the donor club was achieved and the Solicitor, Donor, List As, Fund, Campaign, and Appeal associated with each donor club. Subtotal the report by sorting on any of the options in the Sort and Summarize by area except Meeting and Donor Club. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date. The solicitor is determined by the solicitor specified in the Solicitor field on the Donor Data tab on the Manage customers window (from Customers, select Manage customers, open a customer record, and select the Donor Data tab) rather than the solicitor specified in the Solicitor field on the Enter and edit gifts window (from Fundraising, select Enter and edit gifts).
- The Donor Club Summary report lists only the fund, campaign, and appeal codes for each specified donor club. The solicitor is determined by the solicitor specified in the Solicitor field on the Donor Data tab on the Manage customers window rather than the solicitor specified in the Solicitor field on the Enter and edit gifts window. Selecting the Summary option allows you to generate a list of all donor clubs achieved. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Meeting and Donor Club. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.

Sort & Summarize by

Select from the following options to sort and summarize your report:

- Date – Subtotal your report by sorting by date or date range. The date cannot be selected for Prev/Curr Period reports.
- Fund – Subtotal your report by sorting on Fund. This sorting option is available for all applicable reports.
- Campaign – Subtotal your report by sorting on Campaign. This sorting option is available for all applicable reports.
- Appeal – Subtotal your report by sorting on Appeal. This sorting option is available for all applicable reports.
- Member Number – Subtotal your report by sorting on the donor's customer ID. This sorting option is available for all applicable reports.
- Solicitor – Subtotal your report by sorting on solicitor. This sorting option is available for all applicable reports. In all reports except for the Donor Club reports, the solicitor entered in the Solicitor field on the Enter and edit gifts window restricts each report. The Donor Club reports search on the solicitor entered in the Solicitor field on the Donor Data tab on the Manage customers window.
- Donor Club – Subtotal your report by sorting on donor club. This sorting option works only for Donor Club Detail and Donor Club Summary reports.
- Meeting – Subtotals report by sorting on events. This sorting option is available only for Donor Club reports.

Restrict by

There are several options in this area of the window for restricting report output.

Member – Enter the customer ID for the report, or click the lookup icon to select an ID.

Select – (optional) Lets you open the Member/Contact Selections window to select customer type options for setting your report parameters. All is the default. You can select from one of the following options:

- All (all customer types)
- Members
- Non Members
- Specific Types
- All (all company and individual customers)
- Company Only
- Individual Only

Note: If you select the Specific Types field, a blank field displays where you can enter one or more customer types (to enter multiple customer types, enter a comma (but no space) between customer types).

Clear – Lets you clear the values entered on the Member/Contact Selections window.

Solicitor

(optional) Enter the customer ID of the solicitor associated with the report, or click the lookup icon to select an ID.

Gifts To

Enter an Appeal, Campaign, and Fund for your report in these fields. You can click the lookup icon to select an appeal, campaign, or fund code. For all reports except Donor Club reports, the Appeal, Campaign, and Fund are determined by the information that was entered in the Appeal, Campaign, and Fund fields on the Enter and edit gifts window (from Fundraising, select Enter and edit gifts).

Date

Enter the beginning date for the reporting period. The system searches on the actual transaction date for all reports except for Prev/Curr Period reports.

Thru

Enter the report ending date.

Comparison to Previous Period

The following fields and options are used in conjunction with the Prev/Curr Period reports:

- From – Enter the beginning date of the previous comparison period.
- Thru – Enter the ending date of the previous comparison period.
- All – Enable to print all records for the specified time period. This is the default value.
- Lapsed – Enable to print a record with subtotals that have previous amounts and zero current period amounts.
- Decreased by – Enable to print records with a specified subtotal where the percentage change is equal to (=) or less than (<) the percentage specified in the Percent field.
- New – Enable to print only records with subtotals in the current period and zero amounts in previous time periods.
- Increased by – Enable to print only records with a specified subtotal where the percentage change is equal to (=) or greater than (>) the percentage specified in the Percent field.
- Percent – Enter the percentage for a Decreased by or Increased by comparison.

Detail

Enable to specify a detail report.

Summary

Enable to specify a summary report.

Set Report Destination

Opens the Set report destination window to set the report output destination. The initial default output device is Printer. You can change the default output device and save this setting (select File> Report Destination, select the desired default output device, and click Save) so that the desired default output device is selected each time you start iMIS.

Note: Set the report destination to Screen to avoid the unnecessary printing of reports.

Note: To print the report, from the Report Destination window select the Printer option rather than printing the report from the screen. The printed reports will not align exactly as they appear on the screen if you print them from the screen; printing from the Printer option will prevent this problem.

To generate reports in the Generate executive reports window

1. From Executive reports, click New.
2. From Choose a Report, select a report.
3. Select the search options for the report. The options available vary based on the report selected.
4. Click Run.

To upgrade a cloned Fundraising Profile Crystal report

If you cloned a Fundraising Profile Crystal report for use in a previous iMIS release, make sure you add the date range parameters to the cloned report description, or the report will not print from the Fundraising History window or any location in iMIS. (The standard Fundraising Profile Crystal report specification file is updated automatically when you upgrade to iMIS 10.5. You need to manually update this type of report specification file only if you created a clone and saved it with a customized name or location.)

To add date range parameters manually to a cloned Fundraising Profile Crystal report specification file, use the following steps.

1. Select Utilities > Report Specs.
2. In the Report Specifications window, select the cloned Fundraising Profile Crystal report from the list, then click Parameters.

3. In the Detail Report Parameters window, click Edit, then click Crystal Params.
4. In the Crystal Parameters window, add the new parameters:

- BeginDate

  Select Insert. In Parameter Name, enter BeginDate. In Variable Name (or String), enter RV.BeginDate.

- EndDate

  Select Insert. In Parameter Name, enter EndDate. In Variable Name (or String), enter RV.EndDate.

5. Click OK in the Crystal Parameters window.
6. Click Save in the Detail Report Parameters window.
7. Close the Detail Report Parameters and the Report Specifications windows.

Fundraising Receipts

Receipt Reports

The Fundraising module offers several receipting reports. All of these reports are Crystal reports, which can be customized.

Receipt (Conforms to the Canadian tax publication IT-110R3 Interpretation Bulletin for Gifts and Official Donation Receipts)	Sample Auto Receipt	Generates a receipt that includes the following fields: Registration Number, Receipt Number, Issued Date, Amount, and Original Receipt Number
Receipt Thank You	Sample Thank You	Sample receipting thank you letter that includes receipt amount and breakdown of gifts received
Register Report	Sample Register Report 1	Sample register report that includes a detail report of receipts printed

Register Report	Sample Register Report 2	Sample register report that includes a summary of receipts printed
Replacement Receipt (Conforms to the Canadian tax publication IT-110R3 Interpretation Bulletin for Gifts and Official Donation Receipts)	Duplicate Receipt	Generates a duplicate receipt that includes the following fields: Registration Number, Receipt Number, Issued Date, Amount, and Original Receipt Number

Assigning Receipting Intervals to Customer Records

One of the benefits of the Fundraising receipting function is the ability to assign receipting intervals to donors. For example, if you set the receipting interval to annual, the donor receives one receipt per year.

Other donors may have a monthly donation schedule and receive a receipt every 30 days. By enabling a receipting interval option, the donor's receipts are filtered out from the rest of the auto-generated receipts until the desired receipting interval has passed.

The Last Receipt Date field on the Donor Data tab of the Manage customers window is updated when a receipt is issued. The last date that a receipt was printed for the donor is displayed on the Donor Data tab.

Receipts are printed when the interval preference is greater than or equal to the difference between the current receipts issued date (system date) and the donor's Last Receipt Date. For example, a donor's receipt interval is set to Monthly and the donor makes a new gift (with payment) within 30 days after their last receipt was printed. If an auto-receipt run is initiated on the 31st day after the last receipt was printed, a receipt prints for the gift. However, a receipt does not print if a receipt run is initiated within 30 days after the donor's last receipt was printed.

Receipting intervals for customers are selected in the customer's Donor Data tab on the Manage customers window. See Adding Fundraising Information to a Customer Record.

Generating Receipts

Gift receipts are not generated until you run the auto-receipting batch query report. You can also generate receipts if batch control is not enabled. You cannot edit a gift after a receipt has been issued for the gift because an accounting record has been generated. With the Fundraising module, you can print receipts, thank you letters, and register reports in one linear process or you can print each separately.

Note: If you use multiple entities, batch control should be enabled.

Printing receipts uses the same batch logic that is used in AR/Cash and Billing. A batch is used to select and group receipts. It also can be used as part of the selection criteria for other receipting reports. You can select an AR/Cash batch that has been used to record payments, or you can use a receipt batch created for receipting purposes only.

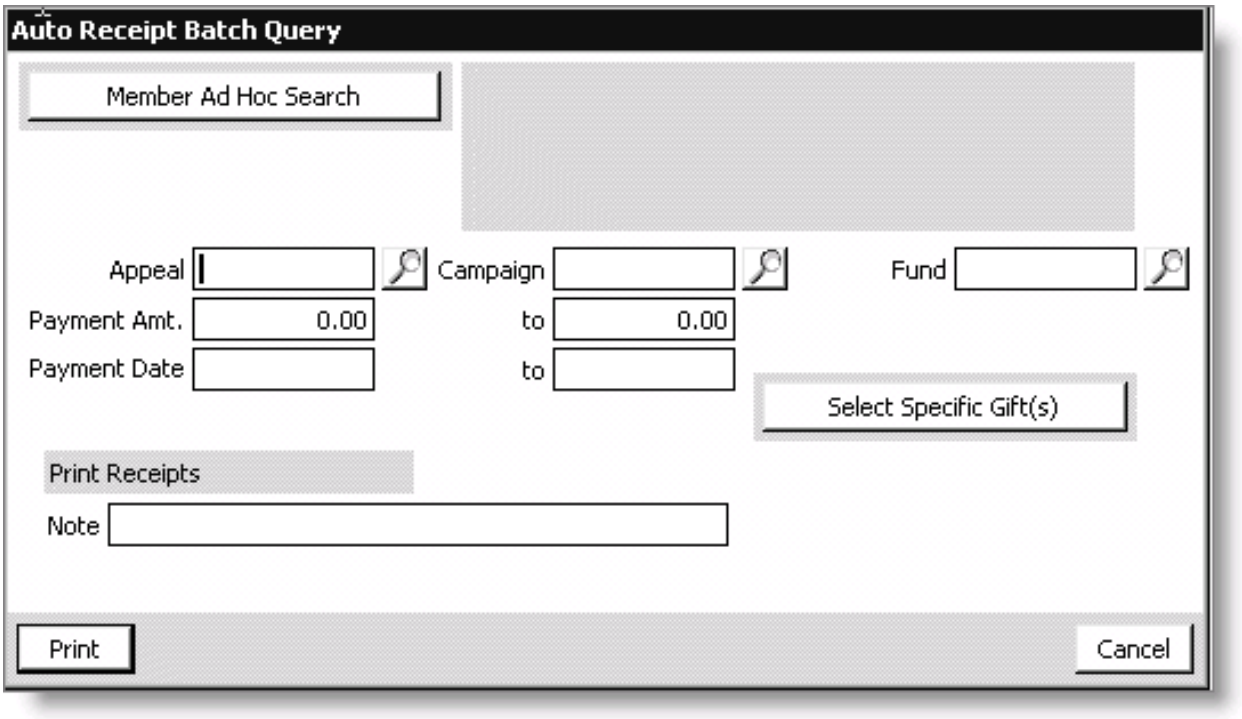
Note: If you use a mixed batch (one that contains receipts and payments) and post the batch, you cannot open the batch to print thank you letters or register reports unless you change the batch's status to open. However, you can enter the closed batch name or number as selection criteria for thank you letters, register reports, or replacement receipts.

Auto Receipt Selection Criteria

You can select from several methods for printing receipts:

- Set a Receipting Interval at the donor level.
- Use selection criteria from the Auto Receipt Batch Query window.
- Conduct an ad hoc search from the Select Search Instructions window.
- Use selection criteria from the Select Specific Gift(s) window.
- You can generate receipts from the Auto Receipt Batch Query window.

Auto Receipt Batch Query window



Admin Console: Continuum > Fundraising reports > Receipt > Sample Auto Receipt (Crystal)
Desktop: Fundraising > Generate reports > Receipt from the Report Types list > Sample Auto Receipt (Crystal)

Member Ad Hoc Search

(optional) Enables you to display the Select Search Instructions window for options to conduct an ad hoc search.

Appeal

(optional) Enter the appeal to be included in the search criteria for the auto receipt report.

Campaign

(optional) Enter the campaign to be included in the search criteria for the auto receipt report.

Fund

(optional) Enter the fund to be included in the search criteria for the auto receipt report.

Payment Amt

(optional) Enter the minimum payment amount for the payment amount range criteria for issuing the receipts.

to

(optional) Enter the maximum payment amount for the payment amount range criteria for issuing the receipts.

Payment Date

(optional) Enter the beginning payment date range criteria for issuing the receipts.

to

(optional) Enter the ending payment date range criteria for issuing the receipts.

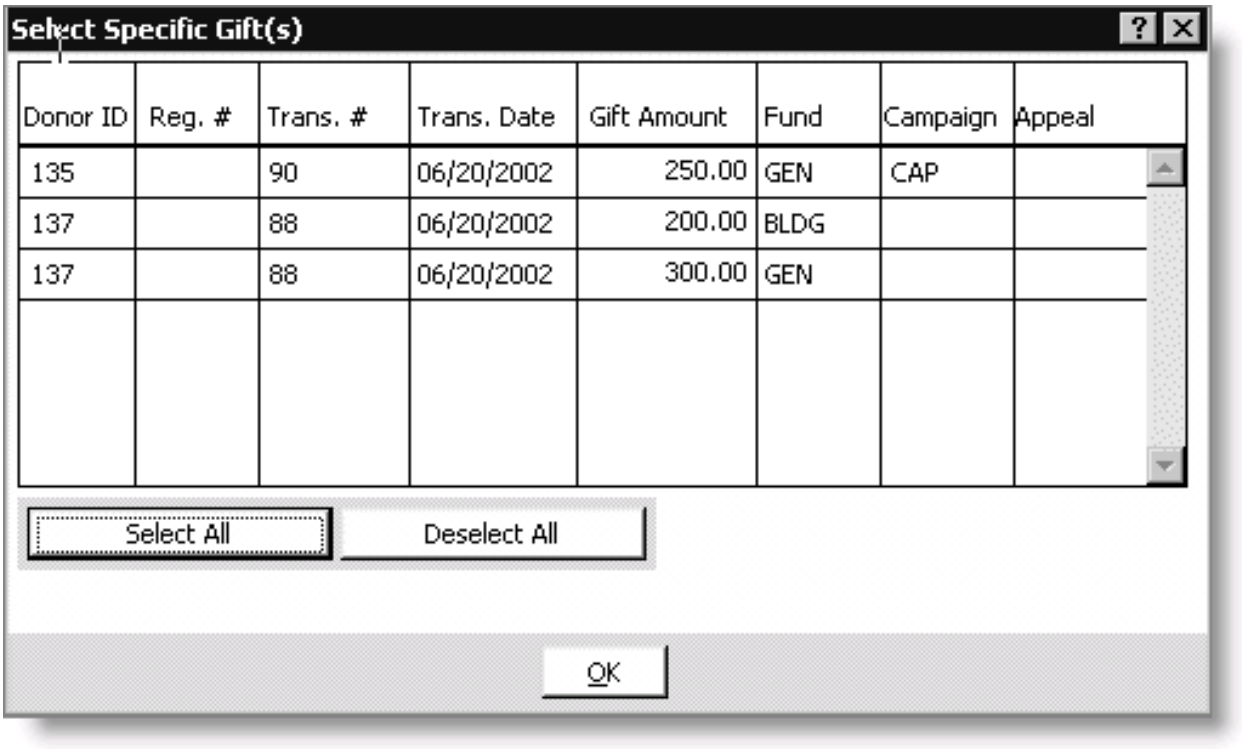
Select Specific Gift(s)

(required) Enables you to display the Select Specific Gift(s) window to select from a list of gifts. You cannot print receipts unless you click this button and select at least one gift in the Select Specific Gift(s) window.

Note

Enter additional information to be printed on the receipt.

Select Specific Gift(s) window



Use the Select Specific Gift(s) window to select specific gifts for donation receipts after the search criteria have been entered on the Auto Receipt Batch Query window. You may also use the Select Specific Gift(s) window as the sole selection of gifts for donation receipts.

Donor ID

Displays the customer ID number of the donor associated with the gift.

Reg #

Displays the registration number of the fund or organization associated with the gift.

Trans #

Displays the transaction number associated with the gift.

Trans Date

Displays the date of the transaction associated with the gift.

Gift Amount

Displays the amount of the gift.

Fund

Displays the fund associated with the gift.

Campaign

Displays the campaign associated with the gift.

Appeal

Displays the appeal associated with the gift.

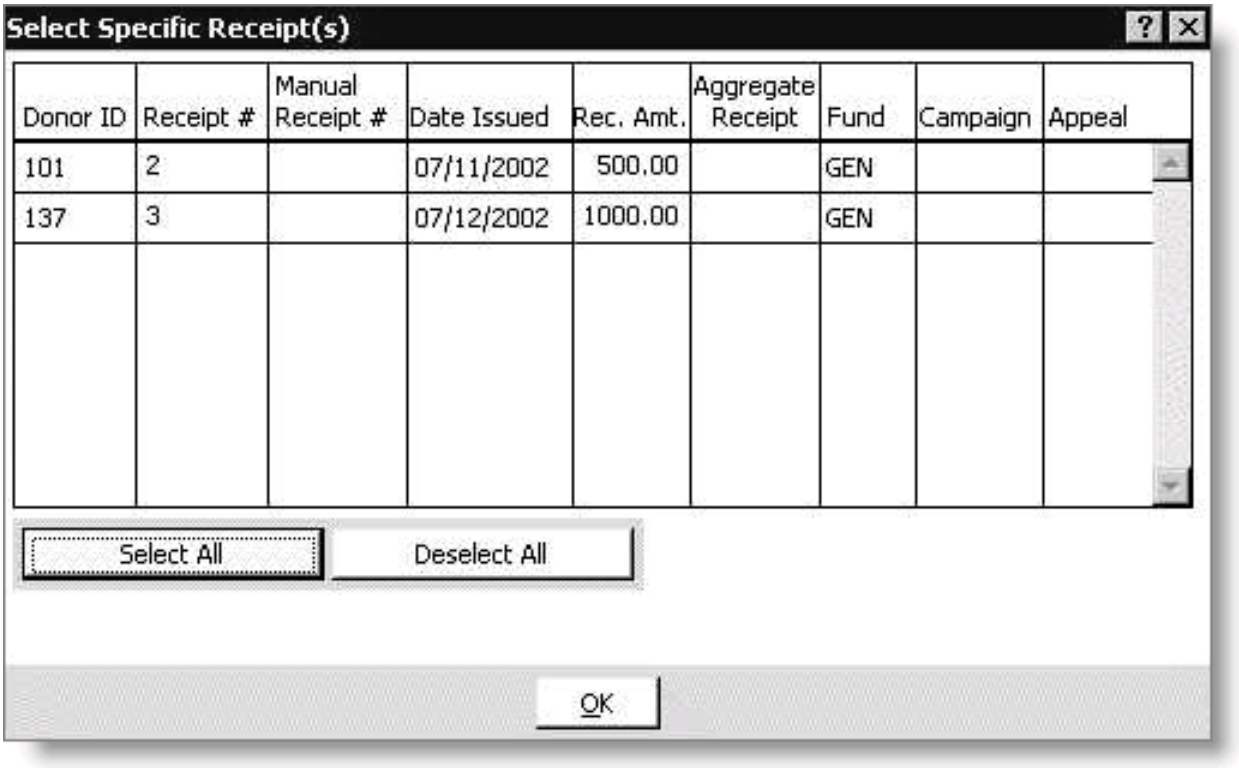
Select All

Enables you to select all the gifts in the window.

Deselect All

Enables you to deselect all selected gifts in the window.

Select Specific Receipt(s) window



Admin Console: Continuum > Fundraising Reports > Receipt Thank You > Sample Thank You (Crystal)
Desktop: Generate reports > Receipt Thank You from the Report Types list > Sample Thank You (Crystal)

Use the Select Specific Receipts(s) window to select specific receipts for thank you receipts after the search criteria have been entered on the Auto Receipt Batch Query window. You may also use the Select Specific Receipts(s) window as the sole selection of receipts for thank you receipts.

Donor ID

Displays the customer ID number of the donor associated with the receipt.

Receipt #

Displays the automatically generated receipt number.

Manual Receipt #

Displays the manual receipt number.

Date Issued

Displays the date the receipt was issued.

Rec Amt

Displays the receipt amount.

Aggregate Receipt

Displays Yes if the receipt is an aggregate receipt.

Fund

Displays the fund associated with the receipt.

Campaign

Displays the campaign associated with the receipt.

Appeal

Displays the appeal associated with the receipt.

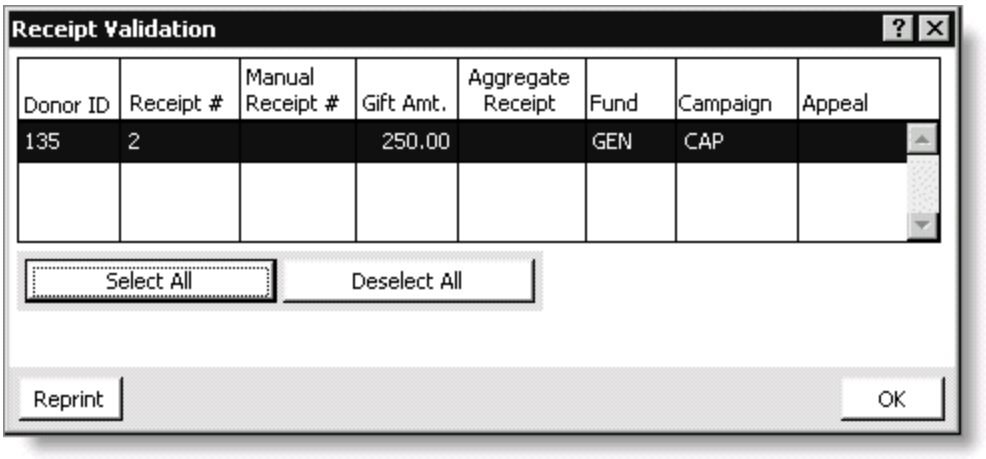
Select All

Enables you to select all the gifts in the window.

Deselect All

Enables you to deselect all selected gifts in the window.

Receipt Validation window



Admin Console: Continuum > Fundraising Reports > Receipt > Sample Auto Receipt (Crystal)
Desktop: Fundraising > Generate reports > Receipt > Sample Auto Receipt (Crystal)

After you print receipts, you can either validate or reprint the receipts. All receipt numbers in the current batch that have been printed are listed in the Receipt Validation window.

Donor ID

Lists donors by ID number.

Receipt #

Lists receipt numbers for recently printed receipts.

Manual Receipt #

Lists manual receipt numbers for recently issued receipts.

Gift Amt

Lists gift amounts for the recently issued receipts.

Aggregate Receipt

Displays Yes if the receipt is an aggregate receipt.

Fund

Displays the fund associated with the printed receipt(s).

Campaign

Displays the campaign associated with the printed receipt(s).

Appeal

Displays the appeal associated with the printed receipt(s).

Select All

Enables you to select all the receipts in the window.

Deselect All

Enables you to deselect all the receipts in the window.

Reprint

Enables you to reprint all selected receipts in the window.

Note: When you click the OK button, you are prompted to print a thank you letter report and a register report. Before you click OK, verify that the receipts printed correctly. After you click OK, the receipts cannot be reprinted. However, the original receipts can be canceled and you can issue replacement receipts with new receipt numbers.

To generate auto receipts

When issuing receipts, you are prompted to issue thank you letters and register reports during the process. You can issue these additional reports at this time or to postpone printing them.

1. From Fundraising, select Generate reports to display the Generate reports window.

2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Auto Receipt Batch Query window opens.
6. Enter the search parameters for finding the receipts.
7. Click Select Specific Gift(s). The Select Specific Gift(s) window opens.

- If you did not enter specific search criteria in the Auto Receipt Batch Query window and only clicked Select Specific Receipt(s), a confirmation message is shown before the list of receipts is built. Click Yes to proceed.

  The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a thank you receipt was printed or not.

8. Select the gifts for which to generate receipts, or click Select All to select all of the gifts.
9. Click OK to return to the Auto Batch Receipt Query window.
10. (optional) Add a note of up to 30 characters in the Note field. This information is printed on all receipts generated in this batch.
11. Click Print.
12. Click OK to print the receipts.
13. (optional) To reprint the receipt, click Reprint.
14. Click OK after you have checked the receipts and verified that they have printed correctly. A message asks if you want to print the thank you letter now.

    To print the thank you letter:

- Click Yes.
- Click OK.

- The Fundraising Reports window opens.
- Select the Sample Thank You (Crystal) report.
- Click OK.

  A message asks if you want to print the Register Report.

15. To print the Register Report, click Yes.
16. Click OK. The Fundraising Reports window opens.
17. Select the Register Report to print and click OK.

    To print a thank you letter after auto receipting

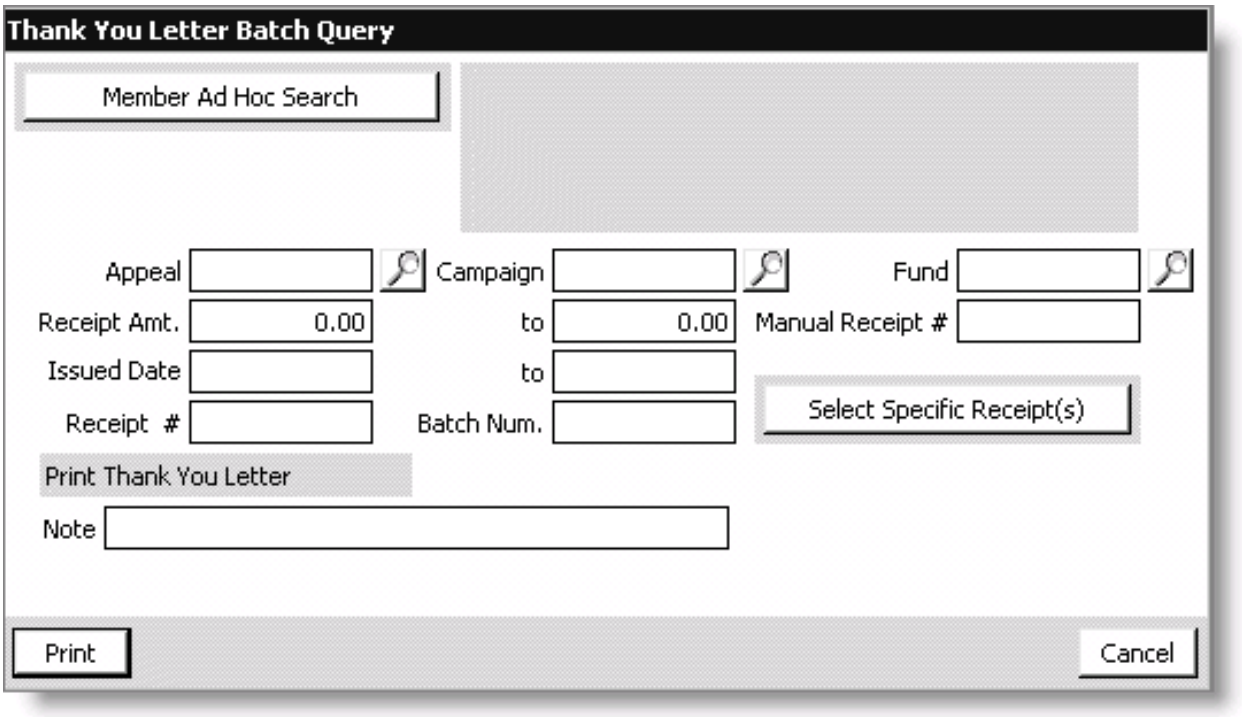
1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt Thank You from the list of Report Types.
3. Select Sample Thank You (Crystal) from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Thank You Letter Batch Query window opens.
6. Enter the search parameters.
7. Click Select Specific Receipt(s).

   - If you did not enter specific search criteria in the Thank You Letter Batch Query window and only clicked Select Specific Receipt(s), a confirmation message is displayed before the list of receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a thank you receipt was printed or not.

8. Select the receipts to be generated, or click Select All to select all of the receipts.
9. Click OK to return to the Thank You Letter Batch Query window.
10. (optional) Add a note of up to 30 characters in the Note field. This information displays on

all receipts generated in this batch.

11. Click Print to generate the report and close the Thank You Letter Batch Query window.



Thank You Letter Batch Query window

To print a Register Report after auto receipting

1. From Fundraising, select Generate reports to open the Generate reports window.
2. Select Register Report from the list of Report Types.
3. Select one of the register reports from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Batch Receipt Query window opens.
6. Enter the search parameters.
7. Click Select Specific Receipt(s).

- If you did not enter specific search criteria in the Batch Receipt Query window and only selected Select Specific Receipt(s), a confirmation message displays before the list of

receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a register report was printed or not.

8. Select the receipts to be generated, or click Select All to select all of the receipts.
9. Click OK to return to the Batch Receipt Query window.
10. (optional) Add a note of up to 30 characters in the Note field. This information displays on all receipts generated in this batch.
11. Click Print to generate the report and close the Batch Receipt Query window.

Trans.#	Date	Appeal	Campaign	Fund	Amount
90	6/20/2002		CAP	GEN	250.00

Grand Total $250.00

Sample Register Report

Generating Receipts Using Special Search Criteria

You can conduct specific searches using a wide range of options when generating donation receipts and receipt reports. For example, you can narrow your search to a specific appeal, campaign, or fund, or you can specify a date or amount range. In addition, you can conduct ad hoc searches on the Name table, the Name_FR table, or both.

To generate receipts using a date and amount range

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
4. Click Run. The Auto Receipt Batch Query window opens.

5. Enter the Campaign.
6. Enter the Fund.
7. Enter an amount range in the Payment Amt and to fields.
8. Enter a date range in the Payment Date and to fields.
9. Click Select Specific Gift(s) and select records for which receipts will be issued.
10. Click OK to return to the Auto Receipt Batch Query window.
11. Click Print to run the report.

To generate receipts using an ad hoc search

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
4. Click Run. The Auto Receipt Batch Query window opens.
5. Click Member Ad Hoc Search. The Select Search Instructions window opens.
6. Click New. The Search Instructions window opens.
7. Enter the name of the search in the Search Name field.
8. Select a Mode.
9. Select a Comparison File from the drop-down list.
10. Select a Comparison Field from the drop-down list.
11. Select a comparison operator from the list of comparison options.
12. Enter the desired value in the Comparison Value data entry area.
13. Click Save to save the search instructions and return to the Select Search Instructions window.

14. Click OK to return to the Auto Receipt Batch Query window. The search parameters display to the right of the Member Ad Hoc Search button.
15. Click Select Specific Gift(s). The Select Specific Gift(s) window opens.
16. Select the receipt to be generated, or click Select All to select all of the receipts.
17. Click OK.
18. Click Print to generate the report.

Generating Replacement Receipts

You can generate replacement receipts with the receipting function. Replacement receipts are issued to replace previously issued receipts. To provide an audit trail, the original receipt number is canceled and a new replacement receipt number is issued. Only receipts that have not been canceled can be selected to print replacements. When the receipt is selected, the original receipt number is canceled and the next available auto-generated receipt number is assigned.

Note: When printing replacement receipts, if you do not enter information in the Note field on the Replacement Receipt Batch Query window, the receipt prints the note from the original receipt. For example, if the original note was January 99 receipts and a replacement receipt is issued in July, the note on the receipt will still read January 99 receipts if you do not enter a new note in the Note field. If a new entry is made in the Note field, this entry overrides the original note text.

To generate replacement receipts

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Replacement Receipt from the list of Report Types.
3. Select Sample Replacement Receipt (Crystal) from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Replacement Receipt Batch Query window opens. This window is similar to the Auto Receipt Batch Query window in that it also allows you to specify search

criteria to generate receipts.

6. (optional) Enter the search criteria.
7. Click Select Specific Receipt(s) to display the Select Specific Receipts window.

- If you did not enter selection criteria on the Replacement Receipt Batch Query window and only clicked Select Specific Receipt(s), a confirmation message displays before the list of receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a register report was printed or not.

8. Select the receipts for which to generate replacements, or click Select All to select all of the receipts.
9. Click OK to return to the Replacement Receipt Batch Query window.
10. Click Print to generate the replacement receipts. You are prompted to change the printer settings if necessary.

- To change the printer selection, select the destination from File> Report Destination.

11. Click OK.

- A message is printed on the receipt indicating that it is a replacement receipt. The original receipt number is also printed on the receipt. The Receipt Validation window opens after the receipt prints.

12. Click OK. A message displays asking if you want to print a thank you letter for this receipt.
13. Click Yes to print the letter, or No to skip printing the letter. After you print the thank you letter or click No, a second message displays asking if you want to print a register report for this receipt.
14. Click Yes to print the register report, or No to skip printing the register report.

Generating Aggregate Receipts

The receipting feature allows you to generate aggregate receipts. An aggregate receipt can be a single receipt for multiple payments or for one payment split among multiple

funds.

An aggregate receipt prints under the following conditions:

- A donor made multiple payments to one fund (one registration number)
- A donor made one payment distributed to multiple funds that meet the specified selection criteria, but the funds have the same registration number
- A donor made a payment to a fund that does not have a registration number (receipts for payments to funds without registration numbers are aggregate receipts by default)

To generate an aggregate receipt

1. From Fundraising, select Enter and edit gifts to display the Overview tab on the Enter and edit gifts window.
2. Enter a gift. See To enter a single gift or single pledge for information on entering a single gift.
3. Click New and enter a second gift using the same donor ID, but to a different fund, and click Save.
4. From Fundraising, select Generate reports to display the Generate reports window.
5. Select Receipt from the list of Report Types.
6. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
7. Click Run to display the Auto Receipt Batch Query window.
8. Click Select Specific Gift(s) to display the Select Specific Gifts window. Select the two gifts you just entered.
9. Click OK to return to the Auto Receipt Batch Query window.
10. Click Print.
11. Click OK when the system prompts you to change printers.

- In this example, a single receipt was issued for both gifts. The gift amount of $500 displays in the Gift Amt. field in the Receipt Validation window. This is the total of the two

gifts. Yes displays in the Receipt Validation window to indicate that this is an aggregate receipt. Because this is an aggregate receipt, only one receipt number displays.

12. Click OK. A message displays asking if you want to print a thank you letter for this receipt.
13. Click Yes to print the letter, or No to skip printing the letter. After you print the thank you letter or click No, a second message displays asking if you want to print a register report for this receipt.
14. Click Yes to print the register report, or No to skip printing the register report.

Manual Receipting

Although the Fundraising module provides a robust auto-receipting feature, you can use the user-generated manual receipting function when necessary. Because manual receipting and auto receipting are mutually exclusive, if you enter a manual receipt for a gift, a receipt is not auto-generated for the gift. Manual receipts are never printed; they are stored with the gift. Manual receipt numbers cannot be entered for single pledges or installment pledges. If you select a Gift Type of Single Pledge or Installment, the Receipt Number field and the Do not Print Receipt option are disabled on the Enter and edit gifts window.

To issue manual receipts

1. From Fundraising, select Enter and edit gifts to display the Overview tab on the Enter and edit gifts window.
2. Enter a gift.
3. Enter a manual receipt number in the Receipt Number field.
4. Click Save.

Note: When you enter a receipt number, the Do not Print Receipt option is automatically selected and cannot be cleared. You cannot edit a gift associated with a manual receipt after the gift has been saved.

Sample Fundraising Reports

Fundraising reports are used to generate detail and summary reports on many aspects of fundraising.

Donor Club Summary as of July 23rd, 2002

Page 1

Sorted by Date

Advanced Solutions International, Inc.

Date	Donor Clubs Awarded	Donor Clubs	Donor Club Title
08/29/2000	1	BRICK	Brick Donor Club
07/15/2002	2	AMBASSADOR	Ambassador Donor Club
Total Donor Clubs Awarded	3	Awards listed	

Admin Console: Continuum > Fundraising reports > Reports, select report from Available Reports

Desktop: Fundraising > Generate reports > Reports, select a report from the Available Reports

Appeal Activity Report (Crystal)

The Appeal Activity Report is a detailed listing of all of the Donation (Gifts and Pledges) Activities, listed by Appeal for a given period of time. Run this report from:

Admin Console: Continuum > Fundraising Reports > Fundraising reports > Activity

Desktop: Fundraising > Generate Reports > Activity

Notes

- Donations include Gifts and Pledges, including unpaid pledges.
- The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.
- In this report, Donations include Fundraising, Events, and Dues donations.

- Split donations will be displayed on two or more shaded lines.
- If the donor is a company, company name is displayed. If the donor is a person, Full Name is displayed.

Appeal Activity Report

Donor Id	Donor Name	Member Type	Donation Date	Campaign	Fund	Type	Net Donation	Payments	Balance
000021									
10145	Bill Bretschneider	D	10/29/2003	AC03	AF	G	2,500.00	5,000.00	-2,500.00

Split donations are shown on consecutive shaded lines

Appeal Performance Analysis (Crystal)

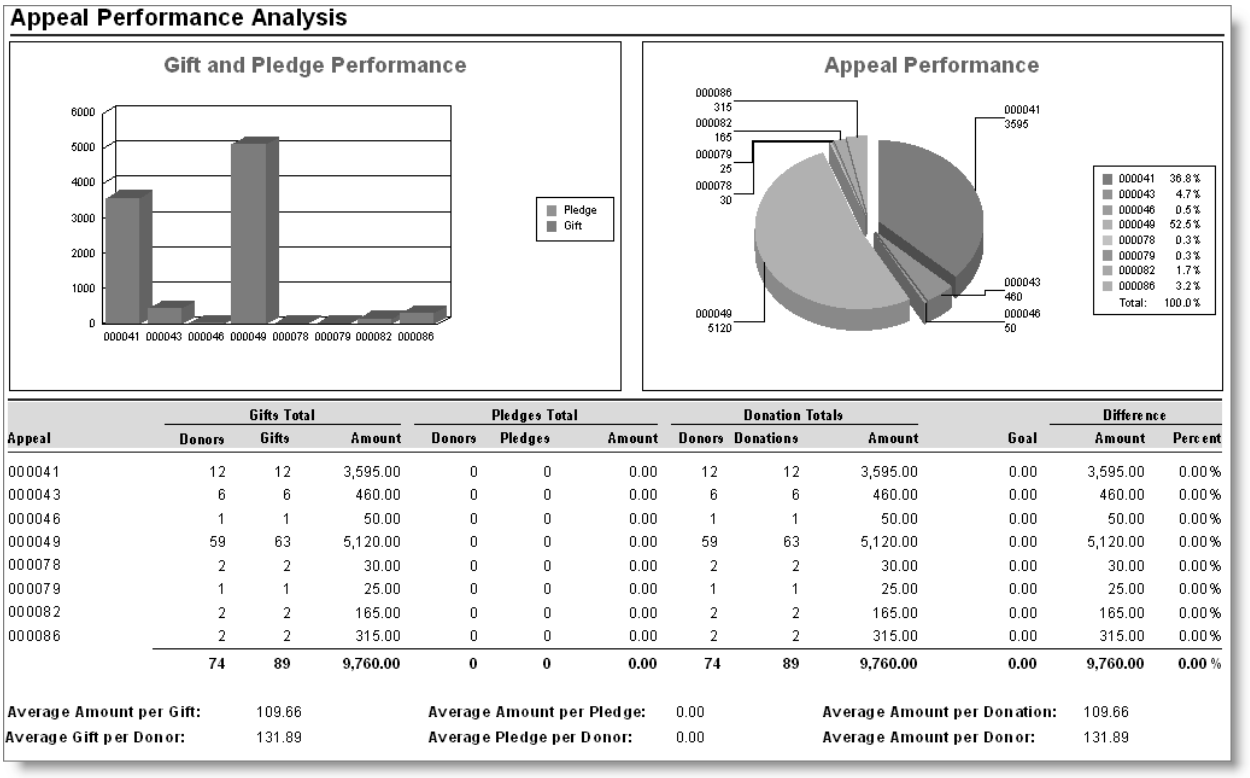
The Appeal Performance Analysis is a comprehensive summary of appeal results and statistics. The report provides a snapshot of each appeal. It lists the total number and total amount of gifts, pledges, and donations; the number of donors; the appeal goal and the amount and percentage difference between the goal and the actual proceeds. Run this report from:

Admin Console: Continuum > Fundraising Reports > Executive reports
Desktop: Fundraising > Generate Reports > Analysis or Fundraising > Executive Window

Note: In this report, Donations include Fundraising, Events, and Dues donations.

The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

This report cannot be filtered for Distribution. Adding Report Spec parameters for Distribution will produce an error.



Appeal	Gifts Total Donors	Gifts	Amount	Pledges Total Donors	Pledges	Amount	Donation Totals Donors	Donations	Amount	Goal	Difference Amount	Percent

Appeal Performance Analysis report

Appeal Expense report

You can enter these search criteria when printing an Appeal Expense report (Fundraising > Generate reports > Reports > Appeal Expense):

- Appeal code
- Campaign code
- Fund code
- Date range
- Amount range

The system searches for the expense items with exact match on Appeal, Campaign, or Fund if any of these fields are populated.

Date searches

Date searches work with these conditions:

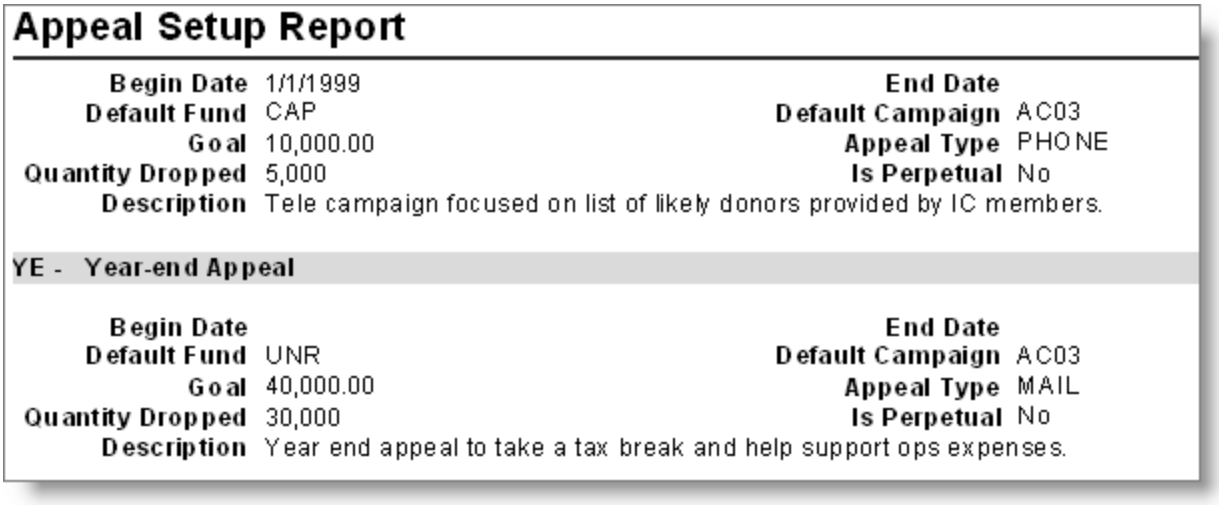
- If only the minimum date is populated, the system searches for any expense items that are equal to or greater than the minimum date.
- If only maximum date is populated, the system searches for any expense items that are equal to or less than the maximum date.
- If both minimum and maximum date are populated, the system finds the expense items that are greater than or equal to minimum date but less than or equal to maximum date.

The rules applied to the amount range are the same as for the date range.

Appeal Setup Report (Crystal)

The Appeal Setup Report lists each Fundraising Appeal and its current configuration in iMIS. Run this report from:

Admin Console: Continuum > Fundraising Reports > Fundraising reports > Setup
Desktop: Fundraising > Generate Reports > Setup



Appeal Setup Report

Solicitor Performance Analysis

Solicitor Profile (Crystal)

The Solicitor Profile report shows solicitor performance summaries by Gift and Pledge, by Campaign, by Fiscal Year, and by Distribution and also lists donation information for Donors associated with the solicitor. The report can be run for one solicitor or for all solicitors.

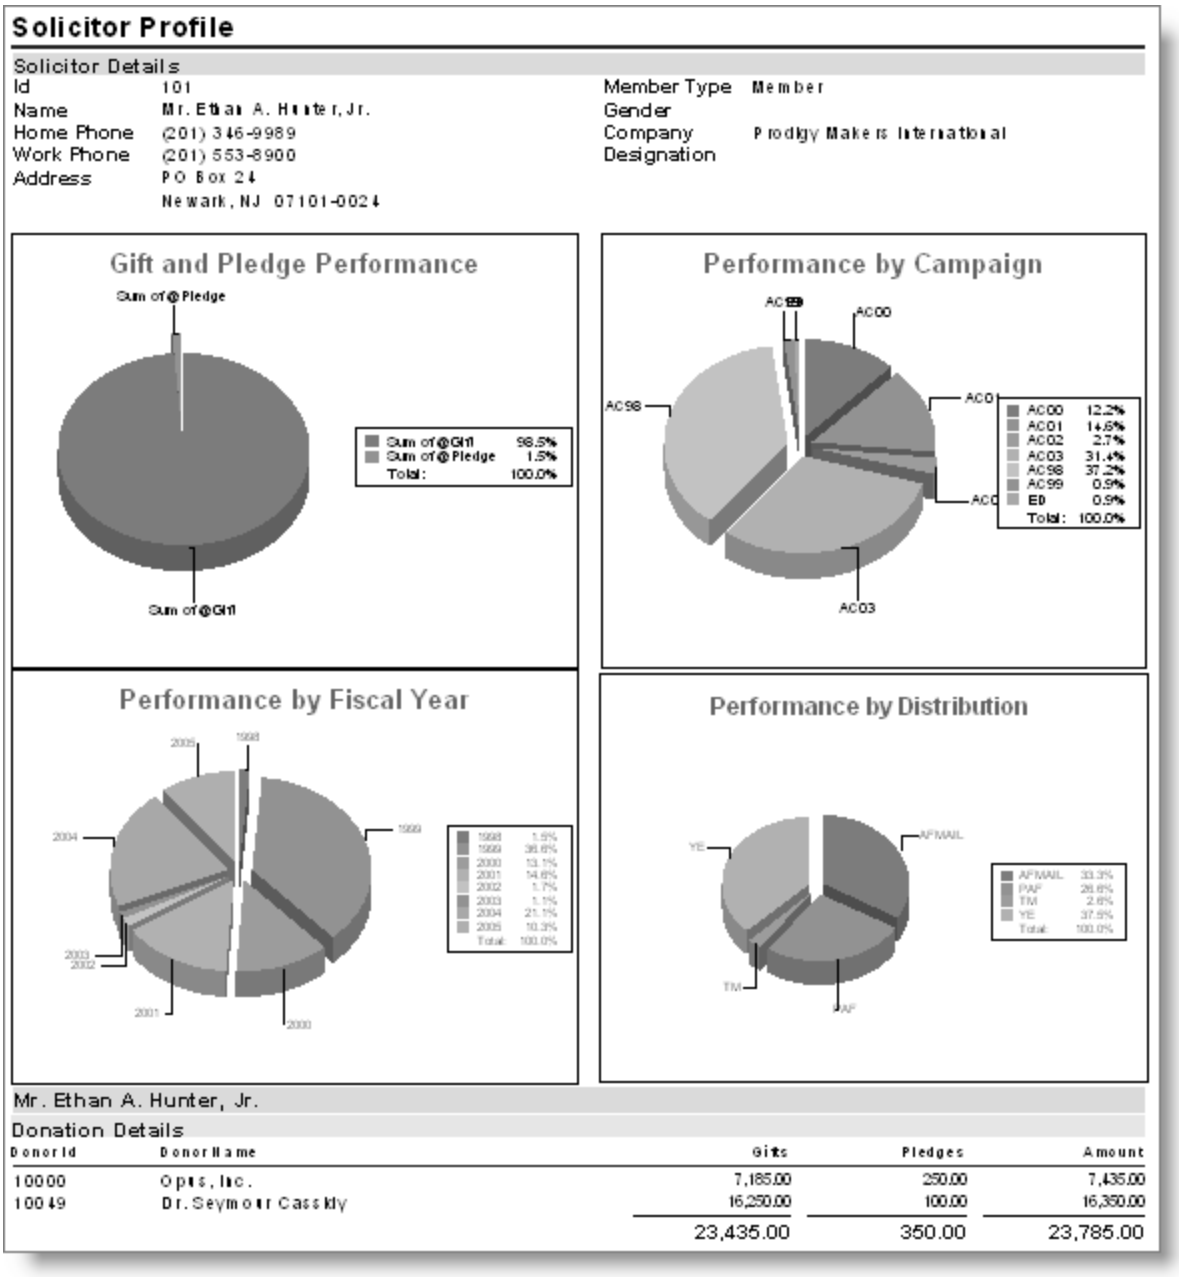
Admin Console: Continuum > Fundraising Reports > Fundraising reports > Reports
Admin Console: Continuum > Fundraising Reports > Executive reports
Desktop: Fundraising > Generate Reports > Reports, Fundraising > Executive Window

Note: In this report, Donations include Fundraising, Events, and Dues donations.

Donations include Gifts and Pledges, including unpaid pledges.

The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

This report cannot be filtered for Distribution. Adding Report Spec parameters for Distribution will produce an error.



Solicitor Profile

SYBUNT Report (Crystal)

The SYBUNT (some year but unfortunately not this year) report lists past collected funds (either gifts or payments) for all Donors who have contributed in two or more calendar years before the current year but who have not contributed this year or last year.

Note: To see which donors have donated last year but not this year, run the LYBUNT report.

Run this report from:

Admin Console: Continuum > Fundraising Reports > Fundraising reports > Reports
Admin Console: Continuum > Fundraising Reports > Executive reports
Desktop: Fundraising > Generate Reports > Reports, Fundraising > Executive Window

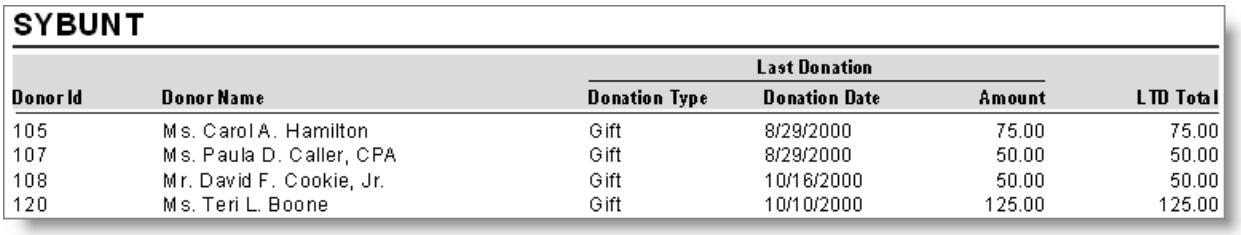
Note:

In this report, Donations include Fundraising, Events, and Dues donations.

This report includes Gifts and Pledge Payments. It does not include pledge income that has not been collected.

The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

This report includes Gifts and Pledge Payments. It does not include pledge income that has not been collected.



SYBUNT

		Last Donation			
Donor Id	Donor Name	Donation Type	Donation Date	Amount	LTD Total
105	Ms. Carol A. Hamilton	Gift	8/29/2000	75.00	75.00
107	Ms. Paula D. Caller, CPA	Gift	8/29/2000	50.00	50.00
108	Mr. David F. Cookie, Jr.	Gift	10/16/2000	50.00	50.00
120	Ms. Teri L. Boone	Gift	10/10/2000	125.00	125.00

Some Year but Unfortunately Not This Year (SYBUNT)

Yearly Giving Comparison by Calendar Year report

The Yearly Giving Comparison by Calendar Year report compares and summarizes the number and amounts of gifts and pledges from new and established donors for a specified year and the preceding four years. Run this report from:

Admin Console: Continuum > Fundraising Reports > Analysis
Desktop: Fundraising > Analysis

Note: To view fiscal year data, run the Yearly Giving Comparison report.

Yearly Giving Comparison by Calendar Year

Reporting performance for large Fundraising data sets

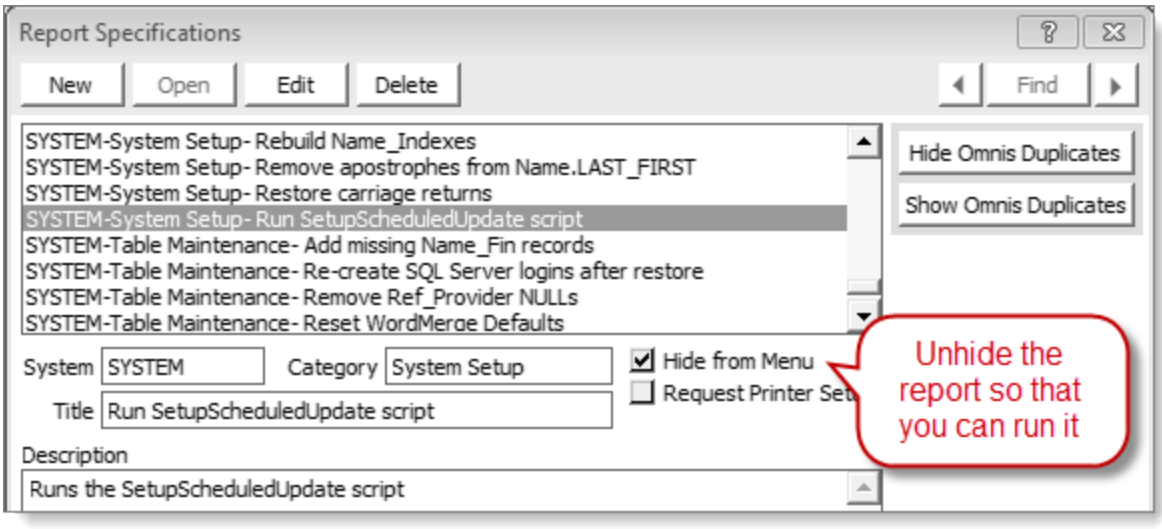
If you have a large amount of Fundraising data, you can enhance the performance of your Fundraising reports by periodically updating the Fundraising report summary tables. These tables act as a cache of pre-calculated data, so that when a report runs, only the data collected since the last time you updated the summary files must be combined, filtered, and calculated.

Note: Do not use these tables to create customizations. Instead, use the views that support Fundraising. These views are optimized each time you run the update procedure.

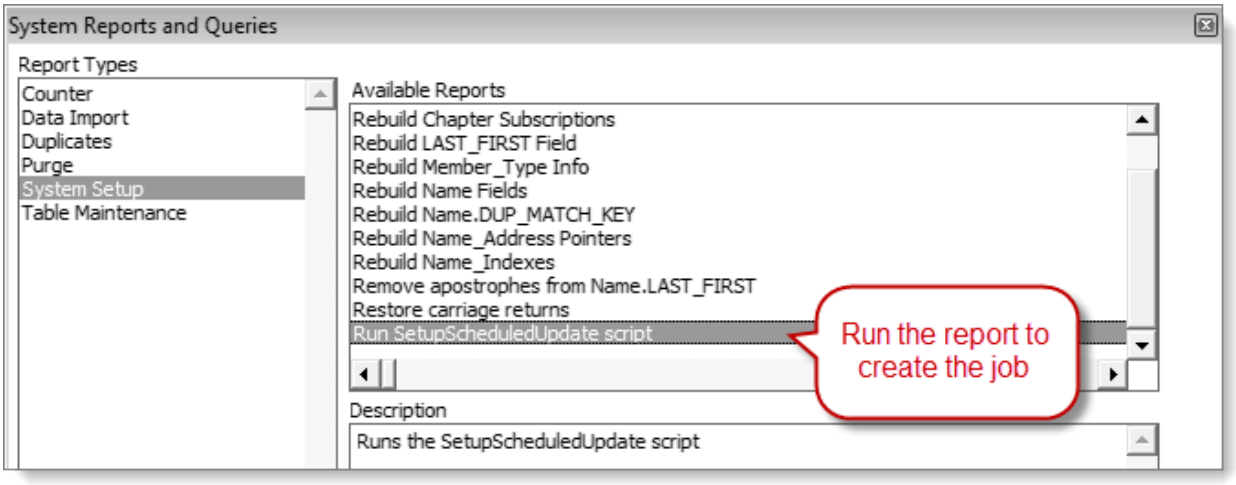
To create the job that updates FR report data

To create the job that updates these fundraising tables, unhide and then run a special report within Desktop. Once the job exists, you can run the update manually as needed.

1. From the Desktop menu, select Utilities > Report Specs.
1. Select the item titled SYSTEM-System Setup-Run SetupScheduledUpdate script.
2. Select Edit, uncheck Hide from Menu, and Save.



3. To run the script, select Utilities > Reports and Queries.
4. From Report Types, select System Setup.
5. From Available Reports, select Run SetupScheduledUpdate script.
6. Click Run.



To automate the job that updates FR report data

In SQL Server Agent, configure the update job to run automatically.

1. Enable the job titled ASI Update Fundraising Views.
2. As needed, change the job's scheduled run time, which defaults to 2:00 AM daily.

Tip: Avoid running updates during hours when iMIS usage is heavy to avoid affecting performance.

3. After you enable the ASI Update Fundraising Views job, configure SQL Server Agent to start whenever the operating system restarts.

Hands-on exercise: Generate reports

1. From Fundraising, select Generate reports to open the Generate reports window.
2. Export a report in Microsoft Word for all gifts made during August 2009:

- Report Types: Export
- Available Reports: All Gifts to Microsoft Word

1. Click Run to display the Select Date Range window.
2. Enter 08/01/2009 in the Begin Date field.
3. Enter 08/31/2009 in the End Date field.
4. Click OK to display the Set print file name window.
5. Browse to the desired folder for the file.
6. Enter August 2009 in the File name: field.
7. Click Save.

3. Issue a reminder for installments due during August 2009:

- Report Types: Issue
- Available Reports: Reminder for Installments Due

1. Click Run to display the Select Date Range window.
2. Enter 08/01/2009 in the Begin Date field.
3. Enter 08/31/2009 in the End Date field.

4. Click OK. The Set report destination window opens.
5. Select Screen and click OK.

4. Generate a summary of all gifts made during August 2009, sorted by campaign:

- Report Types: Reports
- Available Reports: Giving Summary

1. Click Run to display the Reports window.
2. Enter ANNUAL in the Campaign field.
3. Enter 08/01/2009 in the Date field.
4. Enter 08/31/2009 in the Thru field.
5. Click Run.

5. Generate a detailed list of all pledges made to the General (GEN) fund from August 1, 2009 through November 1, 2009, sorted by customer ID:

- Report Types: Reports
- Available Reports: Pledge Summary

1. Click Run to display the Reports window.
2. Select Member Number from the Sort & Summarize by scrolling list.
3. Delete ANNUAL from the Campaign field (if still displayed from the last report run).
4. Enter GEN in the Fund field.
5. Enter 08/01/2009 in the Date field.
6. Enter 11/01/2009 in the Thru field.
7. Click Run.

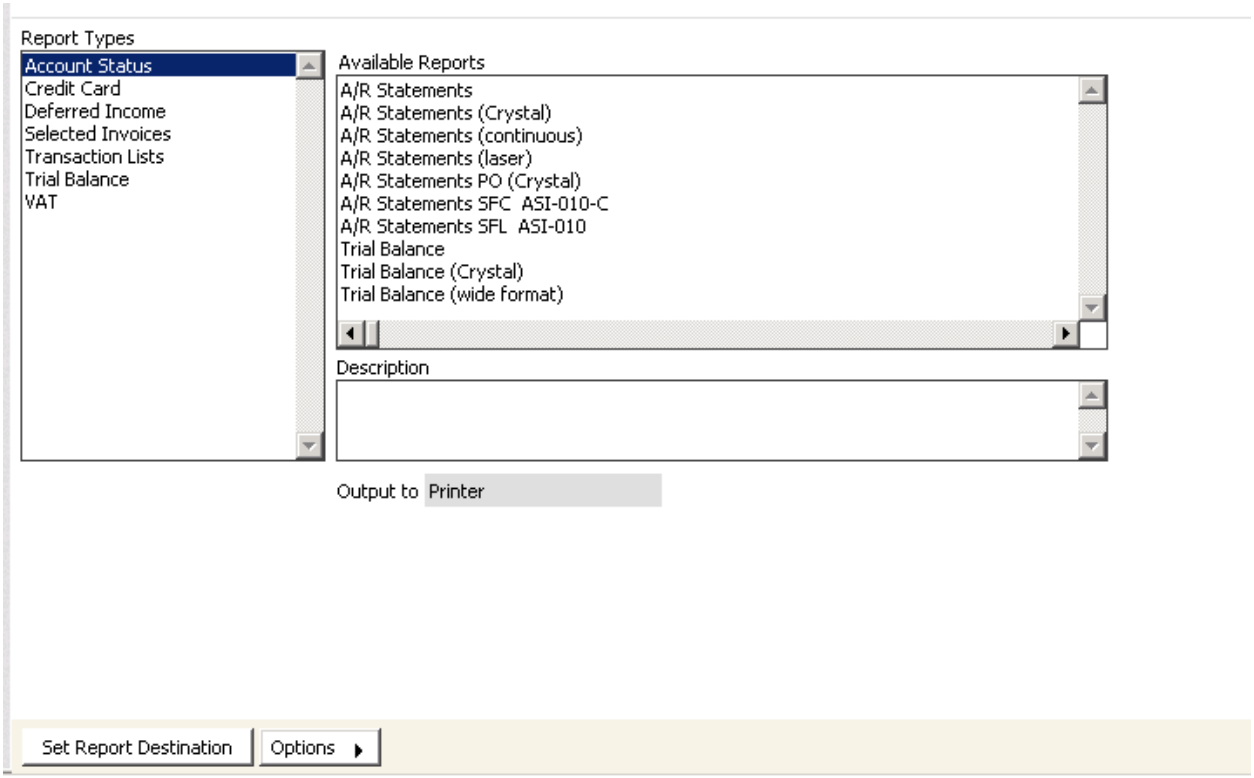
Hands-on exercise: Generate reports from the Generate executive reports window

1. From Fundraising, select Generate executive reports to open the Generate executive reports window.
2. Click New.
3. Select Pledge from the Choose a Report.. scrolling list.
4. In the Comparison to Previous Period area, enter 08/01/2009 in the From field and 11/01/2009 in the Thru field.
5. Click Run.

Commerce and Customer Service Reports

Accounting Reports

Accounting reports window



Admin Console: Continuum > Commerce and Customer Service Reports > Accounting reports
Desktop: AR/Cash > Generate reports

The following reports are the most frequently used in Accounting, and are often used on a daily basis:

- On-screen account inquires
- Accounting Transaction reports
- Accounting Transaction journal
- Accounting Statements reports
- Trial Balance reports
- Deferred Income reports
- Selected Invoices reports
- Credit/Debit Card Authorization reports

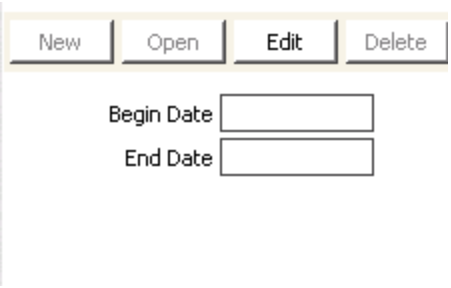
To view on-screen account inquiries

Perhaps the most important inquiry tool you will use is located in the customer's record. For example, if a customer asks for instant information on the status of an account item, you can immediately open screens that show overall and detailed data on open items.

1. From Accounting reports, find a customer's record.
2. The name and address data for the selected customer displays on the Manage customers window.
3. Select the AR/Cash tab.
4. Double-click on a line item to display the transaction details on the Transaction Ledger window.
5. Click OK.

6. Click Print Trial Balance on the AR/Cash tab. The system automatically generates a Trial Balance report for the specified customer ID.

Print transaction journal window



Admin Console: Accounting > Processes > Print transaction journal
Desktop: AR/Cash > Print Transaction Journal

The Print Transaction Journal window includes the following fields:

Begin Date

Enter the beginning date for the AR transactions to be printed.

End Date

Enter the ending date for the AR transactions to be printed.

Print button

Click to print the AR transactions for the specified date range.

After specifying a date range and clicking Print, the Transaction Recap, Debit Memo Journal, Revenue-Sales Journal, and Payments Journal reports are printed.

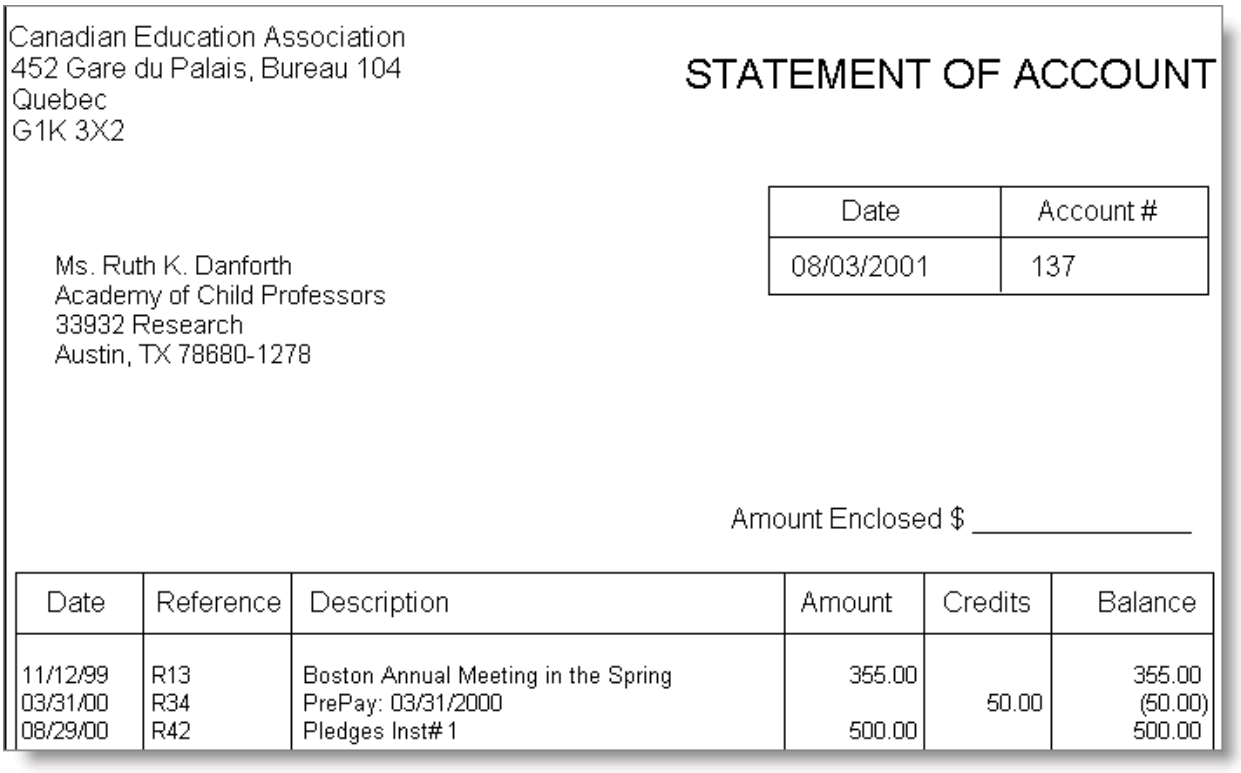
Sample Accounting Reports

Account Status - AR Statements report

The AR Statements report produces a Statement of Account for any customer that has an outstanding balance. The search features on the A/R Statements dialog window determine the range of information printed on the report.

The statements print on plain paper designed for laser printers. The statements list all open items in the body and provide an aged summary at the bottom of the report.

Depending on the age of an open account, you have the option of a pre-configured message at the bottom of the report that lines up with text entered on the AR/Cash Set up module window (from AR/Cash, select Set up module). The AR Statements reports are primarily used for sending reminders out to customers who are overdue in paying one or more invoices.



Canadian Education Association

Admin Console: Continuum > Commerce and Customer Service Reports > Accounting reports > A/R Statements (Crystal)

Desktop: AR/Cash > Generate reports > Account Status > A/R Statements (Crystal)

Account Status - Selected Invoices report

Invoice reports are frequently used to verify the accuracy of a billing run and to see which customers or subscribers have not paid.

The invoice printing process prints the invoice and generates the related accounting transactions to record the sales. Because orders cannot be modified after they are invoiced, the printing process represents the final step in the order processing cycle.

Selected Invoices
as of May 31st, 2002

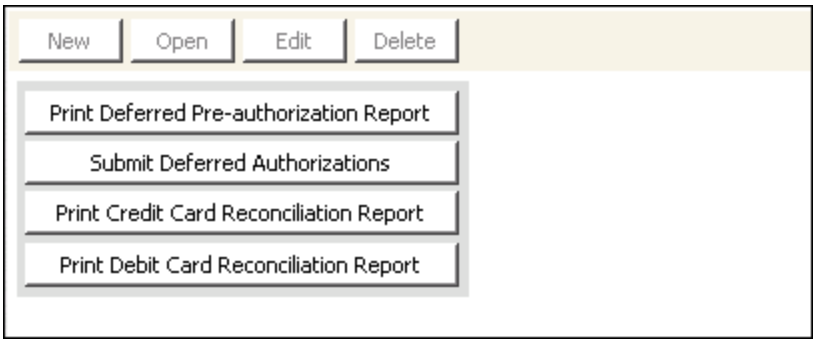
Credit card reports

Credit card authorization window

Note: If you have not set up credit card cash accounts in the AR/Cash module, the Credit card reporting menu item is disabled.



The following report options display on the Credit card authorization window:

- Print Deferred Pre-authorization Report – Prints a report of deferred credit/debit card transactions. The report parameters include Date Range and Org Code.
- Submit Deferred Authorizations – Sends transactions flagged for deferred authorization. All flagged transactions are submitted immediately. This applies only to deferred credit/debit card authorizations.
- Print Credit Card Reconciliation Report – Prints a credit card reconciliation report.
- Print Debit Card Reconciliation Report – Prints a European debit card reconciliation report.

  Note: If you have not set up European debit card cash accounts in the AR/Cash module, the Print Debit Card Reconciliation Report button is not available.

Credit Card Authorization Audit report

This report prints a list of all credit card transactions that were authorized within the given date range and/or Org Code. You can use this report to compare with the results of queries you receive from your gateway provider. Run this report from:

Admin Console: Continuum > Commerce and Customer Service Reports > Accounting reports > Credit Card > Credit Card Authorization Audit (Crystal)
Desktop: AR > Generate Reports > Credit Card > Credit Card Authorization Audit (Crystal)

Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Debit Card Post Authorization Report

Debit Reconciliation - Debit Card Reconciliation report

The Debit Card Reconciliation report shows a list of all European debit card transactions for the selected time frame, sorted by batch and transaction number. Run this report from:

Admin Console: Continuum > Commerce and Customer Service Reports > Credit card reports > Print Debit Card Reconciliation Report

Desktop: AR/Cash > Credit Card Reporting > Credit Card Reports > Print Debit Card Reconciliation Report

Troubleshooting

- The Print Debit Card Reconciliation Report button is only available if you have defined a credit card authorization gateway and a cash account for debit cards.
- To return results, you need to select a batch with at least one debit card transaction. Otherwise, the report is empty.

  Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Debit Card Reconciliation report

Deferred income reports

Several summary and detail level reports let you review the status of deferred income. Go to AR/Cash > Generate reports > Deferred Income:

- Deferred Income Analysis/Spread
- Deferred Income Audit Trail (Crystal)

- Deferred Income Detail (Crystal)
- Deferred Income Matrix Summary (Crystal)

  Provides a projection of how the current balances in deferred income will be recognized in each future period. This is an important management report.

  Deferred Income Audit Trail (Crystal)

  Provides a report on the income that was recognized, as well as the deferred income balance that remains at the end of the reporting period. This report is designed to run for a specific monthly period (any month for which the GL interface has already been run). The report is designed as an audit trail report to simulate the income that was recognized, as well as the deferred income balances that remain at the end of the reporting period.

  Note: This report is generated using the specified End Date. Only transactions equal to or less than the report's End Date are included. It is important to always enter the last day of the month.

  This report is based on deferred income transactions for which the deferral/recognition timeframe is still in effect as of the beginning of the month being reported on (residual income is yet to be recognized either during the report month and/or in a future month).

  This report simulates the process that iMIS uses to generate the deferral to income transfer entries with one exception. It depicts the income recognition at the individual detail transaction level, as opposed to the matrix summary level that iMIS uses to generate the actual entries. As a result, the reported income amounts will most likely be different from the actual amounts by small rounding differences. Nonetheless, the report should give a close approximation of the actual transfer amounts per month as well as the residual balance at the end.

  This report is structured as follows:

- The report is based on all transactions dated on or before the reporting end date that have been posted to the deferred income matrix.

- The transactions are grouped, sorted, and subtotaled by the four key deferral matrix elements (deferral account, income account, begin date, and term).
- For identification and cross reference, the Trans #, Trans Date, Bill To ID, Bill To Name, and Product code are listed.
- The transaction amount is listed and subtotaled at the matrix summary level. This subtotal should agree with the original amount on the Deferred Income Matrix Summary report as of the end date of the report (the sign is shown as positive instead of the normal credit balance for easier use of the report).
- For each detail line, the monthly transfer column will show the portion of the income that should have been transferred during the reporting month. In most cases, if the begin date is equal to or less than the reporting period, this will be the transaction amount divided by the term, with appropriate rounding. In some cases, the amount may be more if the transaction date falls within the reporting date and the deferral begin date was within an earlier period. In this case, iMIS works in a catch-up mode on income that needs to be recognized by the reporting date. If the reporting period is the last period within the deferral term, the amount may be smaller or larger to account for any cumulative rounding differential. The transfer amount is summarized at the matrix level and is also subtotaled for each income account. The actual transfer amount can be compared to the total income from transfer for the reporting period.

  Note: If the actual transfer amount differs substantially from the report amount, this may be due to timing issues where the income for certain transactions was not recognized because a future month's GL interface was processed before the affected transactions were processed through an interface cycle.
- The Months Remaining in the deferral term beyond the reporting month is shown for each transaction.
- The deferred income Amount Remaining is shown at the individual transaction level, matrix summary level, and the Total amount by the deferred GL account. It can be compared to the GL balance and/or the Deferred Income Matrix Summary report as of the end of the

reporting month. Again, due to the detail basis of the report, this balance will only be an approximation, which may be off by a rounding difference.

Deferred Income Detail (Crystal)

Provides a report of transactions to be posted to deferred income. Transactions are sorted by deferred income account, regular income account, beginning date, and term. This report should be printed prior to running the GL interface procedure. Verify the accuracy of the data and make modifications as needed before running the GL interface.

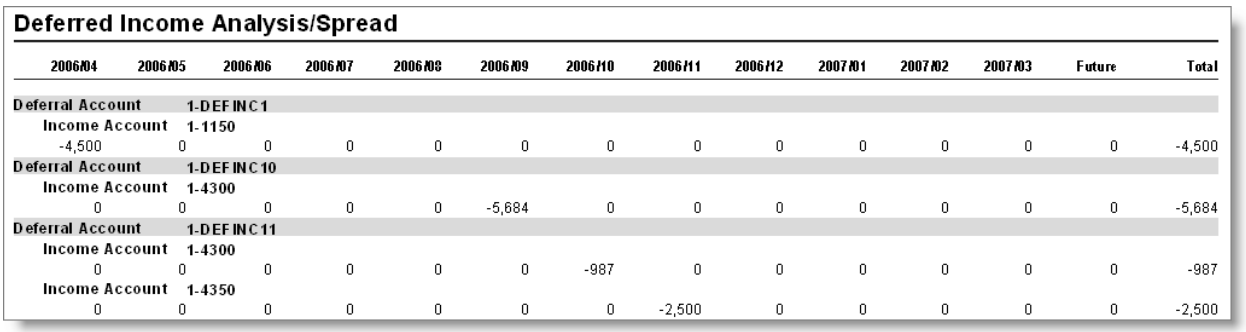
Deferred Income Matrix Summary (Crystal)

Provides a current status of the deferred income matrix table and shows the totals that were originally posted to deferred income, how much has been recognized to date, and the amount that remains to be recognized in future months. This report should be printed after each GL interface. The remaining amounts should tie to the deferred income balances in the General Ledger. Save this report and use it as a backup for deferred income transfer entries.

Deferred Income - Deferred Income Analysis/Spread report (Crystal)

The Deferred Income Analysis/Spread report (Crystal) provides a projection, sorted by deferral account, of how the current balances in deferred income will be recognized over the next twelve months. It also summarizes all amounts projected beyond one year in the Future column, and shows the total of all deferred amounts in the Total column.

Note: The total deferred amount equals Original Amount - Amount Transferred - Amount already realized.



Deferred Income Analysis/Spread

MenuTransJournal - AR/Cash Transactions report

The AR/Cash Transactions report runs the following reports:

- Credit Memo Journal – This report groups together adjusting transactions that typically reduce or reverse income, such as credit memo transactions entered in AR/Cash, Billing (from adjusting accrual dues invoices), Fundraising, and Order Entry (from invoicing Credit Memo type orders).
- Debit Memo Journal – This report groups together adjusting transactions that typically increase income, such as debit memo/adjustment transactions entered in AR/Cash, Billing (from adjusting accrual dues invoices), Fundraising, and Order Entry (from invoicing debit memo type orders).
- Payments Journal – This report focuses primarily on cash receipt transactions, such as those entered in the (AR/Cash) Enter and edit cash receipts, (Billing) Enter and edit payments, (Fundraising) Process payments, and (Service Central) Enter and edit payments windows.
- Refund Journal – This reported provides information on transactions generated as a result of refunds issued from AR/Cash (from AR/Cash, select Process month-end procedures, click Credit Invoices, select one or more credit invoices, and click Issue Refunds).

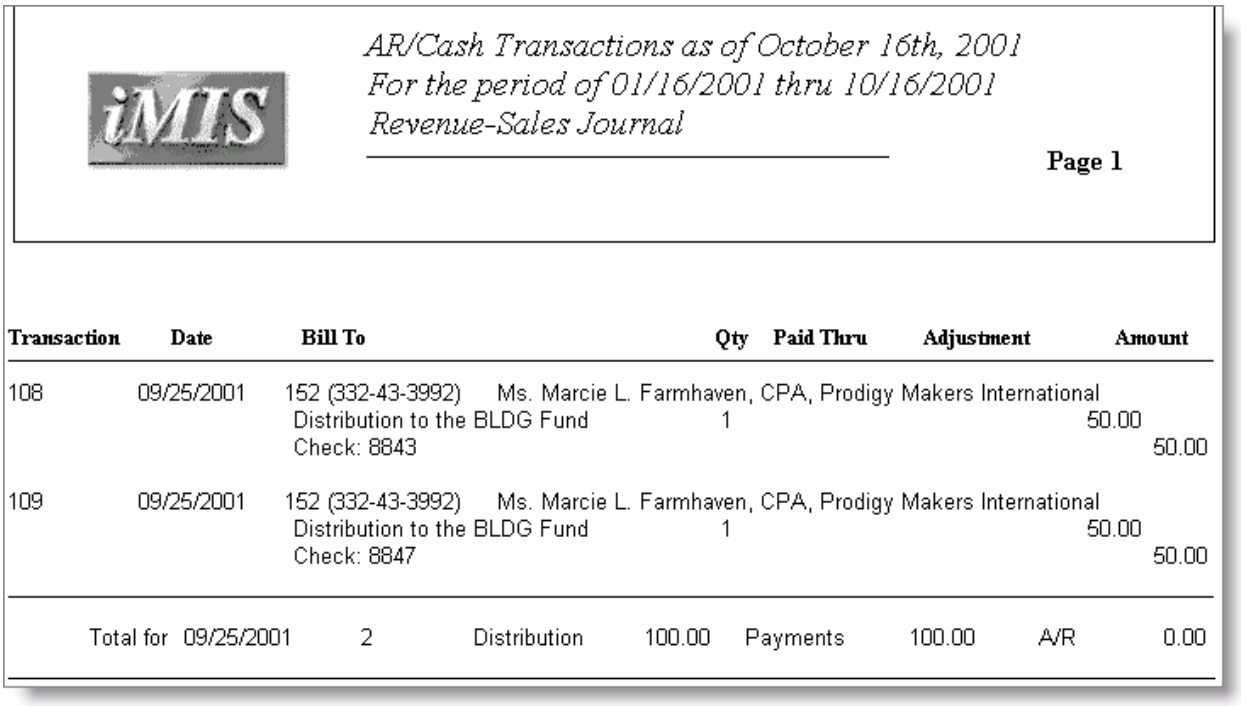
- Revenue-Sales Journal – This report provides a detailed audit trail of all AR/Cash transactions entered through AR/Cash.
- Transaction Recap – This report provides an accounting summary showing the net effect of the transactions.

  These documents do not include transactions generated through other modules, such as Events.

  Note: If you have batch control enabled (from AR/Cash, select Set up module, and click Batch Control) print your transaction journal from the Manage batches window (from AR/Cash, select Manage batches). You can also select batch-specific printing options on the Manage batches window.

  The detail journal separates transactions by type. Transactions entered on the Enter and edit sales transactions window (from AR/Cash, select Enter and edit transactions> Sales transactions) print with summary totals followed by a page break before printing transactions entered on the Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions> Cash receipts).

  Note: Remember to select the output destination (printer, screen, file, and so on) before you generate this journal.



AR/Cash Transactions as of October 16th, 2001
For the period of 01/16/2001 thru 10/16/2001

The Transaction Journal - Transaction Recap

Note: The AR Cash Transactions (Crystal) report prints as two different pages on the same report. Use the scroll feature on the Print window to view Transaction Recap.

Reconciliation - Credit Card Reconciliation report

The Credit Card Reconciliation report shows a list of all credit card transactions for the selected batch, sorted by BT ID and Org code. Run this report from:

Admin Console: Continuum > Commerce and Customer Service Reports > Credit card reports > Print Credit Card Reconciliation Report
Desktop: AR/Cash > Credit Card Reporting > Credit Card Reports > Print Credit Card Reconciliation Report.

Troubleshooting

- The Print Credit Card Reconciliation Report button is only available if you have defined a credit card authorization gateway and a cash account for credit cards.
- To return results, you need to select a batch with at least one credit card transaction. Otherwise, the report is empty.

  Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Batch Distribution Summaries report

Trial Balance - Trial Balance report

The Trial Balance report lists customer accounts with an open balance, and provides contact name, company name, telephone number, a line for each open item, a summary aging for each account, and a total.

The Trial Balance report is used as a collection report to locate and call overdue customers and is also a month-end accounting report used to balance the iMIS AR subsidiary ledger against the general ledger AR control account.

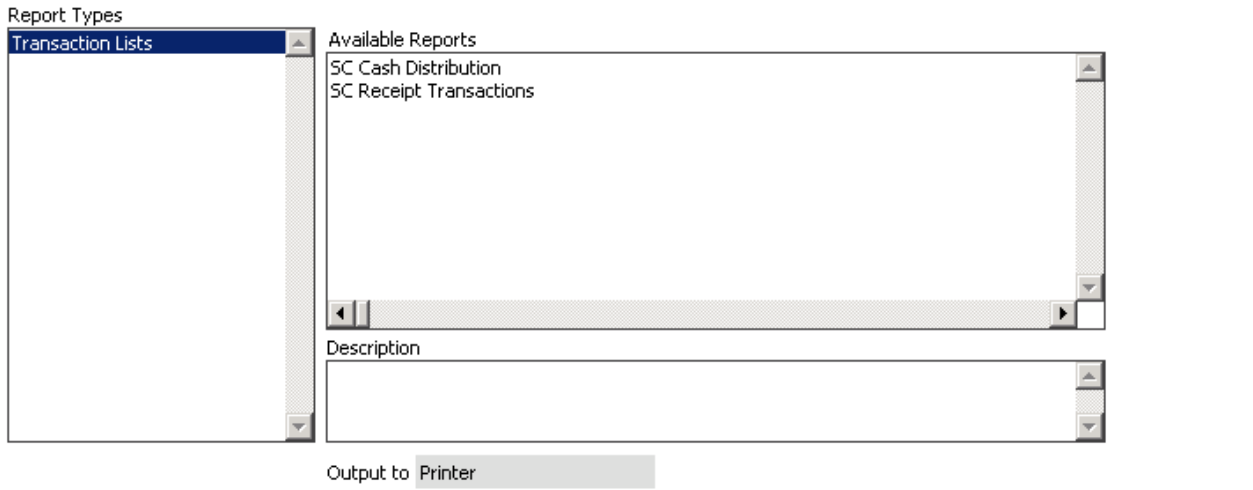
Desktop: AR/Cash > Account Status > Trial Balance (Crystal)

Reports for Customer Service

Customer service reports window



Admin Console: Continuum > Commerce and Customer Service Reports > Customer service reports
Desktop: Service Central > Generate reports

You can generate two reports through Customer service reports by utilizing Service Central: SC Cash Distribution and SC Receipt.

Transaction. The SC Cash Distribution report is a monthly transaction detail report, sorted by income and account number. The SC Receipt Transaction report is a daily receipts detail report showing all payment details, including a recap by income account.

Printing Service Central Reports

You can print Service Central reports in the same manner as other iMIS modules.

To print Service Central reports

1. From Customer service reports, select a report.

2. Click the Set Report Destination button and select where you want the view the output.
3. Click Run. The Date Range window opens.
4. Enter a Begin Date and End Date for the report.

   Note: Enter a date range that is not greater than 30 days. If you enter a date range that exceeds 30 days.
5. Click OK to run the report.

Receipt Transaction - Payments Journal

Transaction Summary by Batch

The Transaction Summary by Batch report shows all service (charge) and payment transactions for the current batch. This report is available only if Batch Control is enabled.

Run this report from Service Central > Generate Reports > Transaction by Batch > Transaction Summary by Batch.

Transaction Summary by Date

The Transaction Summary by Date report shows all service (charge) and payment transactions for the current day. This report is available only if Batch Control is not enabled.

Run this report from Service Central > Generate Reports > Transaction by Batch > Transaction Summary by Batch.

Continuum Reporting

Document System

The Document System is the web-based document management system for your entire iMIS system, providing unified management, versioning, and security of your organizational content assets. It lets you view and maintain the full range of definition objects for iMIS:

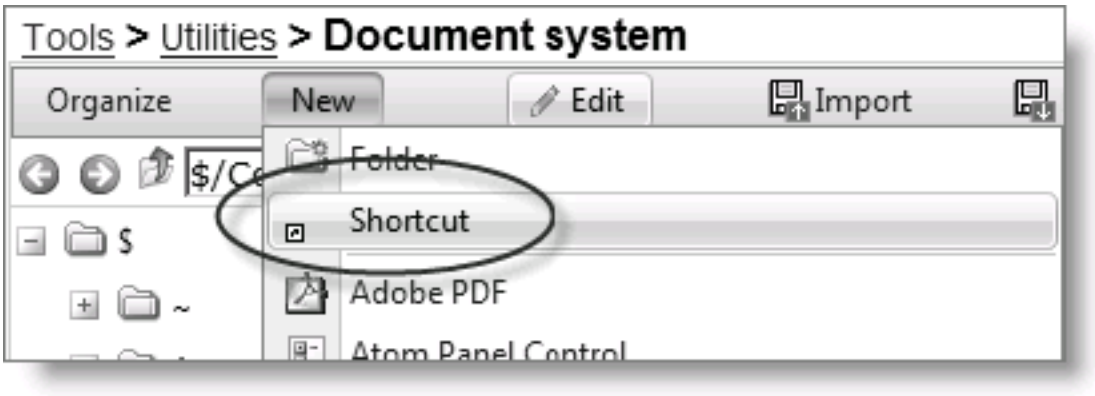
- Business objects, used by Business Object Designer (BOD)
- Queries, used by Intelligent Query Architect (IQA)
- Workflow definitions
- Reports
- HTML files and Microsoft Word files, used for mail merge output

Filtered views

When you use Tools > Document System, you see every type of object (document), but when you see the Document Browser throughout the rest of iMIS, the view is filtered to show you only what you need for that situation. For example, when working with IQA, the Document Browser only shows you queries. In the same way, toolbar commands such as New are filtered so that, when you are working in Business Object Designer, you can create only business objects.

Shortcuts

In the Document System, you can move and copy objects and folders to other folders. Beyond this, you can also create a virtual link (alias) in one folder that points to another object or folder, which keeps you from duplicating objects or folders that you want to share in different contexts.



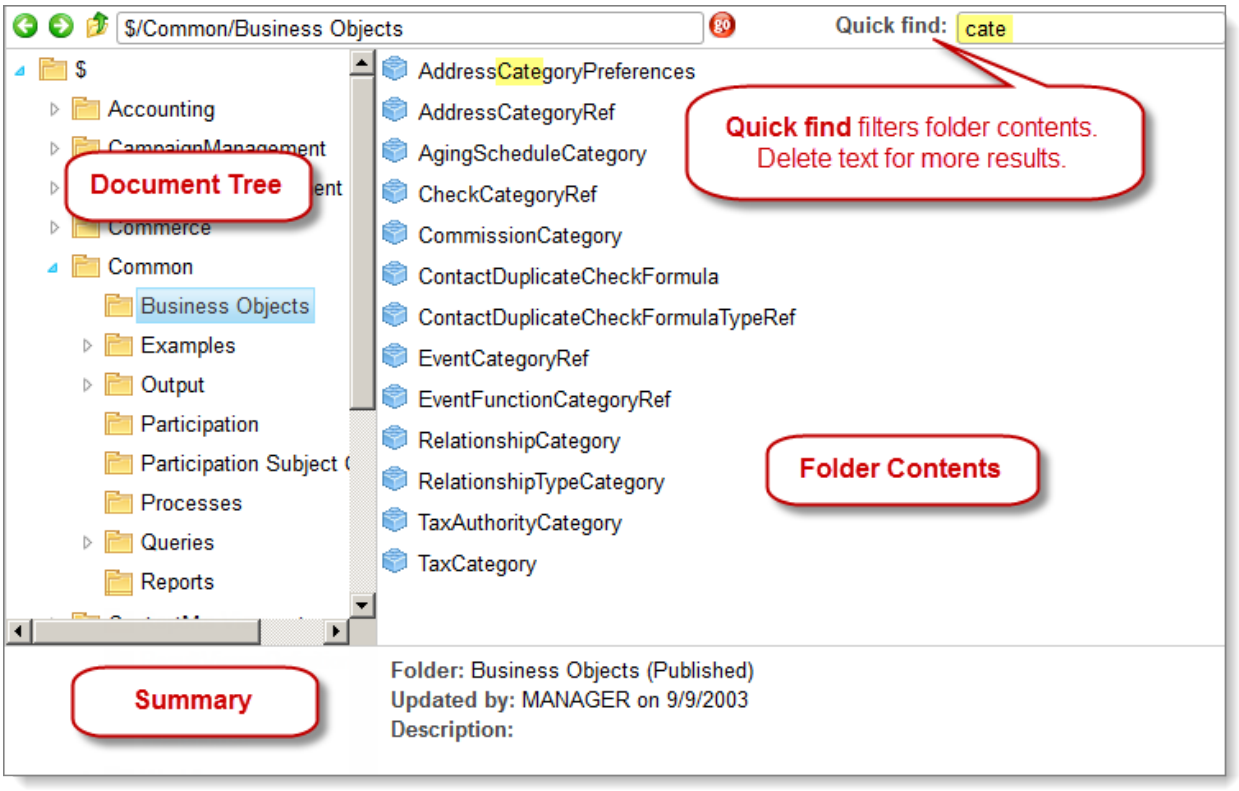
Security access

iMIS users that belong to the SysAdmin security role can see and maintain all definition objects that exist in the Document System. Users who do not belong to the SysAdmin role see a more limited set of definition objects that is determined by the security privileges that are set on each object or on each folder that contains objects.

For example, you can limit the visibility of an entire folder and its definition objects to a specific user-defined security role such as Fundraising Users. Alternatively, you could define that same folder to be visible to Everyone, but limit a few definition objects in that folder to be visible only to Fundraising Users.

Document Browser

Selecting Tools > Document System opens the Document System, which has a toolbar at the top and the three-pane Document Browser below it:



The Document Browser also appears throughout iMIS for locating relevant objects, which it does by filtering the view so that you only see folders and objects that are appropriate for your current task. The Document Browser always appears with these three panes:

1. Document tree (left pane): displays all folders that are relevant to the context in which the Document System is displayed.
2. Folder contents (right pane): displays the contents of the folder that is selected in the document tree area. Folder contents can comprise definition objects, subfolders, or links to items that are located in a different folder.

   Tip: The Quick find box dynamically filters the folder contents, to help you to find items quickly when there are large numbers in the folder. Delete text to see more results. In Desktop, press F12 to apply the filtering.
3. Summary (bottom pane): summarizes the basic properties of the item that is selected in the folder contents area. To show or hide the summary area, select Organize > Display Summary.

Managing document folders

The document tree area of the Document System lists the folders available in the current view of the Document System. The folders that are visible depend on the roles and groups assigned to your user record as well as by what feature of iMIS you are using. The full extent of the folders available in the Document System can be seen only by SysAdmins.

Multiple hierarchies, different roots

There are several Document System hierarchies, each used for different areas of iMIS:

- $/ – Business Object Designer (BOD) has its own hierarchy of business objects. The root is represented by a $ character.
- @/ – Content folders and content records exist in their own hierarchy. The root is represented by a @ character.
- ~/ – Sitemaps each exist as their own hierarchy. The roots are represented by ~ characters.
- $/– All other definition objects exist in the main Document System hierarchy, portions of which are also exposed in other features of iMIS. The root is represented by a $ character.

Tasks that you can perform

- Click an item to select it for use with a toolbar command and to display a read-only summary of its basic properties in the summary area.
- Double-click a folder to open the folder and display its contents.

Toolbar behavior when folders are selected

When a folder in the document tree area is selected, the toolbar commands behave as follows:

- Organize > Refresh refreshes the document tree.
- Organize > Cut, Organize > Copy, and Organize > Paste enable you to copy or move entire folders, including all of their descendants. The cut or copied folder and all of its descendants are placed inside the folder that is selected when you use the Organize > Paste command.
- Organize > Select All selects all contents within the selected folder.
- Organize > Delete moves the selected folder and all of its descendants to the Recycle Bin.
- Organize > Properties shows a read-only summary of the selected folder's basic properties.
- Organize > Display Summary shows or hides the summary panel for the object selected.
- New displays a drop-down list from which you can choose a new folder or definition object type to create in the selected folder. When you select an object type, a properties window appears in which you can define the object. The object types shown in the drop-down list are determined by the properties of the selected folder, which you can examine by using the Edit toolbar command.
- Edit opens a window that enables you to edit the definition of the selected folder.
- Import imports an external XML file (created by the Export command on a different iMIS database) into objects in the Document System. (You cannot use Export and Import to make copies of objects within the same iMIS database.)

  The Upload button reads the XML file contents and displays a list of the definition objects that were exported to the XML file. You can select which of the objects to import, and whether to overwrite objects with the same database GUID in the destination folder or to create new copies of the objects. You can also opt to import the objects to the folder from which they were originally exported, or to override that default destination with the selected folder.

For versioned document types, if a newer version of the object exists in the Document System, then the newer version is not overwritten during the import. Instead, the imported object is added as an archived version of the object. To replace the newer version of the object with the imported object, select Versions from the toolbar, choose the correct version, and click Revert.

- Export exports all selected folders and definition objects into a single XML file, which can later be used to import those objects into the same folder or a different folder in a different iMIS database. (You cannot use Export and Import to make copies of objects within the same iMIS database. To make copies, use Organize > Copy and Organize > Paste.)
- Versions displays a list of the existing versions of the folder, from which you can:
- Export a specific version to an XML file.
- Purge a specific version from the version list, removing all traces of that version from the system.
- Copy a specific version to a new folder with a different name.
- Create an new version based on any existing version by selecting the version, clicking Revert (which creates a new working version), and then publish the working version. If you make no changes to the working version you are effectively reverting to the state of the selected version, although technically it becomes a more recent version in the list of versions.
- Run cannot be used in this context. You must use this command from the folder contents area.
- Publish transforms all working versions of the descendant definition objects in the selected folder into published versions of those objects. Only the most recent published version (of a versionable object) is actively used by the system. You must select the Publish children as well? checkbox when publishing a folder.

To manage folders and objects in the Recycle Bin

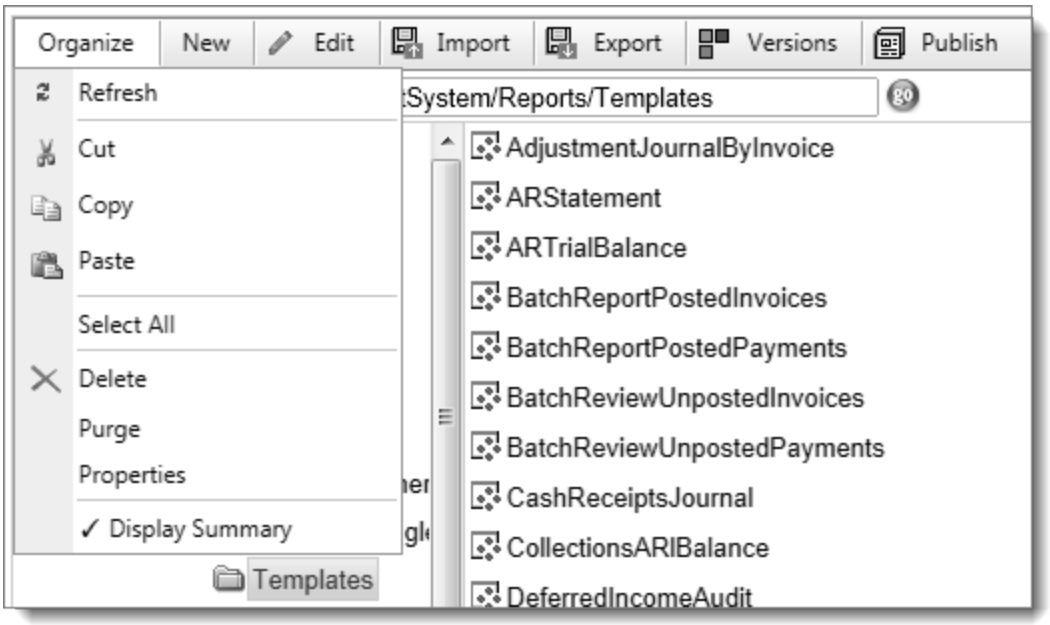
Folders and definition objects that have been deleted are moved to the Recycle Bin at the bottom of the Document System hierarchy.

- To permanently delete individual folders and definition objects that you do not think you'll ever need again, select an object listed in the recycle bin and from the toolbar choose Organize > Purge. To permanently delete the entire contents of the recycle bin, select the Recycle Bin itself and from the toolbar choose Organize > Empty the Recycle Bin.
- To restore a deleted definition object, select it and from the toolbar choose Versions. In the version history that appears, click the Recycled version at the top of the list and click Revert. The definition object is moved to its original parent folder in the hierarchy, and its status changes to Working. You must then re-publish the definition object to make it active again.

  Note: If the definition object's original parent folder no longer exists, the restored object is placed in the root folder of the Document System hierarchy. You must move it out of the root into another folder before you'll be able to publish the object.

Managing folder contents

The folder contents area of the Document System lists the definition objects, subfolders, and links that are stored in the folder selected in the document tree area.



Example of the folder contents area of the Document System

Tasks that you can perform

- Click an item to select it for use with a toolbar command and to display a read-only summary of its basic properties in the summary area.
- Select multiple items for use with a toolbar command or right-click command by holding down Shift or Ctrl while clicking each item. The last object you select is the one whose properties are displayed in the summary area.
- Double-click a definition object to perform one of the following actions (depends on the type of object):
- Open a properties window that enables you to edit the definition of the object.
- Open the Document Utility.
- Double-click a folder to open the folder and display its contents.

Toolbar behavior when items are selected

When an item in the folder contents area is selected, the toolbar commands behave as follows:

- Organize > Refresh refreshes the document tree.
- Organize > Cut, Organize > Copy, and Organize > Paste enable you to copy or move the selected definition objects. The cut or copied objects are placed inside the folder that is selected when you use the Organize > Paste command.
- Organize > Select All selects all contents within the folder.
- Organize > Delete moves the selected objects to the Recycle Bin.
- Organize > Properties shows a read-only summary of the selected object's basic properties.
- Organize > Display Summary shows or hides the summary panel for the object selected.

- New displays a drop-down list from which you can choose a new folder or definition object type to create. When you select an object type, a properties window appears in which you can define the object. The object types shown in the drop-down list are determined by the properties of the folder in which you are working. You can examine these folder properties by selecting the folder in the document tree area, then choosing the Edit toolbar command.
- Edit opens a window that enables you to edit the definition of the selected folder, object, or of the object to which a selected link points.
- Import imports an external XML file (created by the Export command on a different iMIS database) into objects in the Document System. (You cannot use Export and Import to make copies of objects within the same iMIS database.)

  The Upload button reads the XML file contents and displays a list of the definition objects that were exported to the XML file. You can select which of the objects to import, and whether to overwrite objects with the same database GUID in the destination folder or to create new copies of the objects. You can also opt to import the objects to the folder from which they were originally exported, or to override that default destination with the current folder.
- Export exports all selected folders and definition objects into a single XML file, which you can use later to import those objects into the same folder or a different folder in a different iMIS database. (You cannot use Export and Import to make copies of objects within the same iMIS database; to make copies, use Organize > Copy and Organize > Paste.)
- Versions displays a list of the existing versions of a versionable object, from which you can:
- Export a specific version to an XML file.
- Purge a specific version from the version list, removing all traces of that version from the system.
- Copy a specific version to a new definition object with a different name.

- Create a new version based on any existing version by selecting the version, clicking Revert (which creates a new working version), and then publish the working version. If you make no changes to the working version, you are effectively reverting to the state of the selected version, although technically it becomes a more recent version in the list of versions.
- Run executes a selected query, report, or other object types that are designed to be run. If the selected object is a .PDF, .DOC, or .XLS file, this command opens the file in its assigned editor.
- Preview displays a fully rendered view of the selected navigation item, content record, or other CM object types that are designed to be previewed.
- Publish transforms a working version of an object into a published version. Only the most recent published version (of a versionable object) is used actively by the system.

Virtual linking among folders

Many Document System folders in iMIS contain a default virtual link to the Common > Shared Documents folder, which is the central location for definition objects that are available without restriction to all staff users. These virtual links enable users who are given only limited access to the Document System functionality to easily navigate back to the top of the Shared Documents sub-tree.

Caution! These default virtual links to the Shared Documents folder can be deleted by any user that belongs to the SysAdmin role.

There are also some hard-coded virtual links within the Document System, which exposes specific folders in various locations throughout the iMIS interface.

CampaignManagement > DefaultSystem > Reports View	Marketing > Campaign Management > Generate Reports
Common > Output	Marketing > View Output
Common > Shared Docu-	Marketing > Campaign Management > select a source

ments	code > Source Lists tab > from Select Type drop-down list, choose Query
	Marketing > Segmentation > select a segment job > Definition tab > in Universe field click Shortcut to queries
	Marketing > Segmentation > select a segment job > Segments tab > select a segment > in Population field click Shortcut to queries
	Tools > Document system > New Object > Project Process Outputs > Definition tab > in Query field click ...

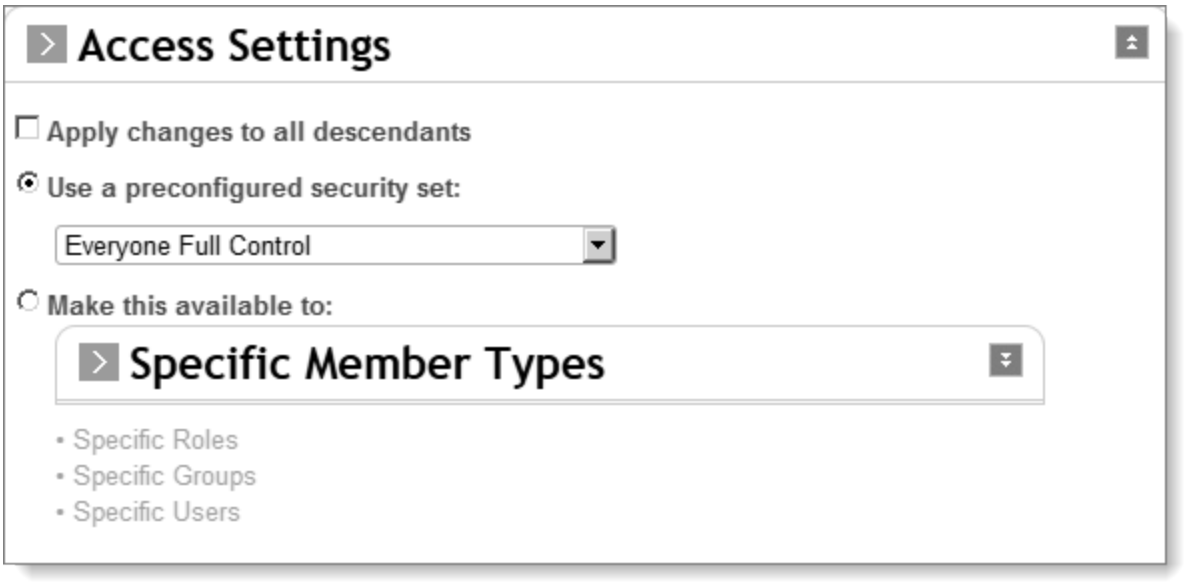
OpportunityManagement > DefaultSystem > ReportsView	Process Mgr > Generate Reports

OrderManagement > DefaultSystem > Queries > Advanced > Order	Home page (Desktop view) > Advanced Queries > Orders > Advanced Queries
RFMAnalysis > DefaultSystem > ReportsView	Marketing > RFM Analytics > Generate Reports
RFMAnalysis > DefaultSystem > Process Engines	Marketing > RFM Analytics
RFMAnalysis > DefaultSystem > Process Engines > User Queries	Marketing > RFM Analytics > edit an RFM definition object > Definition tab > in Population Query or Transaction Query fields click Shortcut to queries
SegmentManagement > DefaultSystem > ReportsView	Marketing > Segmentation > Generate Reports

Using Access Settings

Access Settings give you a consistent way to apply security (grant permissions) to folders and objects throughout iMIS: entire websites, individual navigation items, content records, queries, business objects, and the wide array of objects that you can define, import, and store in the Document System.



Access Settings are immensely flexible: they let you tie an object's permissions to iMIS security roles, security groups, specific users, member types, or your organization's staff (licensed iMIS users).

Tip: You can meet most of your needs using the preconfigured security sets that ship with iMIS, so become familiar with those.

- Apply changes to all descendants – (Document System folder objects) Changes to this section, when saved, flow automatically to all descendant definition objects. When cleared, changes to this section apply only to the current definition object.
- Use a preconfigured security set - Specifies a preconfigured security configuration to use for this definition object, which is the default and preferred way to set permissions for definition objects. You can see the specific permissions that make up the security set in the Make this available to area.

  Tip: If a preconfigured security set is close to what you need, select it and then select Make this available to, so that the permissions granted by the security set are copied for you to work from.
- Make this available to - Lists the roles, groups, users, member types, or authorization levels that may define or view rendered output from this object. If none of the pre-

configured security configurations meets your needs, you can set custom permissions here.

The SysAdmin, Content Administrator, and Everyone roles are default system-defined security roles that are assigned to every definition object. The SysAdmin role is assigned in the definition of an iMIS user record, but the Content Administrator role is automatically assigned to every iMIS user who is a member of a content authority group (CAG) that is designated as a Master Admin CAG.

The permissions that can be assigned to each entry in the list are:

- Full Control - Enables all of the following permissions.
- Read - Enables users to see this object both in definition windows and as rendered output in websites, but they cannot change the object's definition.
- Add - Enables users to create new objects, or to paste or import an object into the Document System.
- Edit - Enables users to edit this object's definition, but not to delete the object.
- Delete - Enables users to delete this object.
- Select - Enables users to assign a tag to content folders and content records.

Custom security groups (use sparingly)

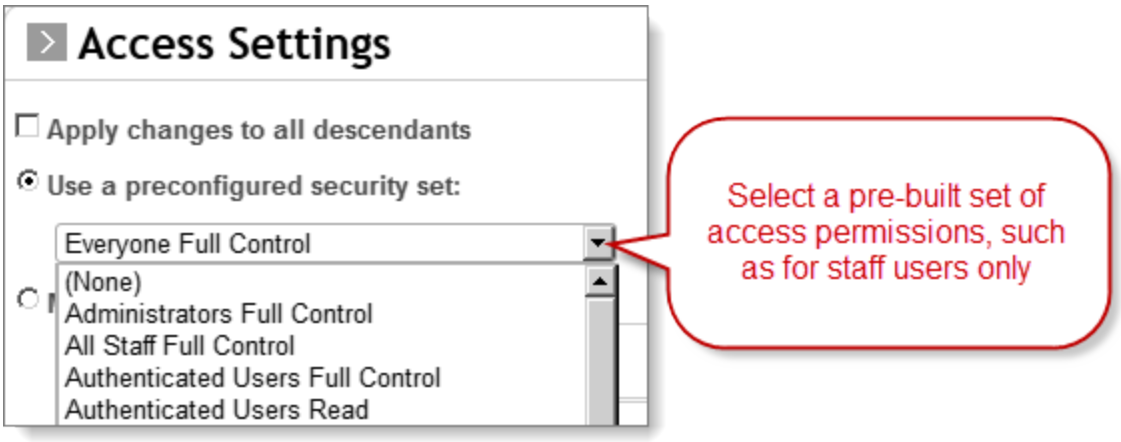
You can add/remove specific Roles, Groups, and Users and assign them each a specific set of permissions. Making this type of change to the security for an object results in a new unique AccessKey for the specified Access List permissions.

You can create a custom security group by tweaking a predefined group or building your own from scratch (using the Make available to radio button). While a custom security group offers great flexibility, it jeopardizes performance, because it adds several rows per object. If the security tables get too large (given that they are joined on every query), your system can slow significantly.

Caution! To minimize performance impacts, avoid using custom security groups where their effect multiplies: folders, Navigation items, and all children the same (unless you are using shared security, or it is mission-critical).

Preconfigured security sets

Throughout iMIS, whenever you configure Access Settings, you see a drop-down list of available security settings that you can apply to individual folders and objects. These security sets offer you easier control and faster iMIS performance than defining custom ones.



These are the key security sets you should use, from most permissive to least:

- Everyone * – no restrictions, including the public (if they can access this level/context).
- Authenticated Users * – restricts access to users who are signed in (both staff and public members).
- * Staff * – restricts access to users by licensing: Full Staff Full Control limits to Full users, Casual Staff Full Control limits to Casual users, and All Staff Full Control limits to Full and Casual users.
- Administrators * – restricts access to users with the SysAdmin role.

Tip: If you do not have the feature named in the security set (such as Certification), do not use the set.

iMIS ships with these pre-built security sets to cut down on the customization you need, for objects that should be neither unsecured (Share) nor locked for you alone (Private). Each security set contains a predefined Access List and permissions (Full Control, Read, Add, Delete, Edit) that are constant for all objects that use it. A Select permission is also available for tagged objects.

When you choose a set, the Current Access List below it updates to show the settings it includes. Look at those details to decide if the selected security set has the permissions you need.

Feature-specific default security

Most feature-specific security sets have three levels (Admin, Manager, User), each of which allows access for any level above it. For example, "Certification Users" grants access for Managers and Admins as well. Note that you can define your own access settings based on User-level security: Roles and Groups.

For example, applying Segmentation Job Default Access security means that

- users in the "SegAdmin" group get control privileges
- users in the "SegMgr" group get Read+Add+Edit+Delete privileges
- users in the "SegUser" group get Read-only privileges
- users in the "SysAdmin" role get control privileges

Setting access for folders and objects

iMIS SysAdmins have Full Control access to all folders and objects in the Document System, so they can also define security privileges for every folder and object.

Caution

- New folders have unrestricted access: When a new folder is created, the Everyone role is granted Full Control by default.

- Folder permissions are not the same as per-object permissions: you can set Control/Read/Add/Edit/Delete privileges individually for most definition object types in the Security page of its properties window, independent of the folder.
- IQA folders are special: Certain folders within the Document System are exposed through the IQA task list item in Customers, Events, Billing, Fundraising, and Orders. These folders and all sub-folders that they contain behave differently when viewed from the IQA task list item:
- You can create only queries in these folders even if the folder is defined to allow any type of definition object. Only members of the SysAdmin role who edit these folders from Tools > Document System can create the other types of allowable objects.
- If any user modifies the folder definition to disallow the creation of Query objects, the folder and all of its contents become invisible from within an IQA task list item. Only members of the SysAdmin role who are viewing the entire Document System via Tools > Document System are subsequently able to see the folder.

To define security access for a folder

1. In the Document System, select a folder and click the Edit toolbar command.
2. In the Only allow certain types of objects in the folder? area, specify the objects to be allowed in the folder.

   Multi-select object types from the list by holding Shift or Ctrl while clicking items in the list.
3. For the Access Settings, select Private or else select Use a preconfigured security set and select a set from the list, if any apply.
4. If you need custom access settings, enable Make this available to and complete the panel.

- For Specific Roles, select the checkbox for each system-defined role that should have access to the folder. For each role, you can click the Edit icon next to the role name to define the specific privileges for that role.

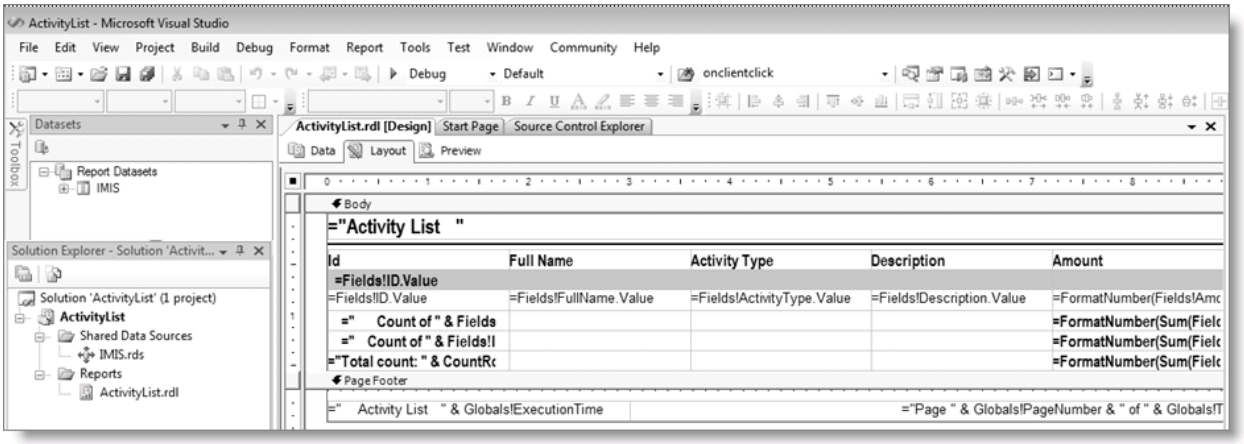
- For Specific Groups and Specific Users areas, add the groups and users that should have access to this folder, and click the Edit icon next to each entry to define the specific privileges for that entry.

5. At the bottom of the folder security definition window, click Save to commit the changes.

Quick facts: SSRS reports

iMIS natively supports SQL Server Reporting Services (SSRS) for both static and dynamic reporting capability with SQL Server databases. Reporting Services includes everything you need to create, distribute, and manage reports.

Important: iMIS supports Crystal Reports, but all new iMIS reports use SSRS.



What do I need to license or buy?

Nothing! iMIS installs the SSRS Report Viewer control for ASP.NET applications that comes with Microsoft Visual Studio. iMIS uses the Report Viewer control, which offers a document map, jump-to-page, zoom, and search. iMIS enables the control's built-in report navigation (pagination), parent report support, and export functionality, including Excel (XLS) and PDF formats.

- Microsoft freely distributes the Report Viewer control
- You can edit the XML-based report format in any text editor

- Visual report designers, Report Builder and Business Intelligence Development Studio, are free for download

  How do I run reports in iMIS?

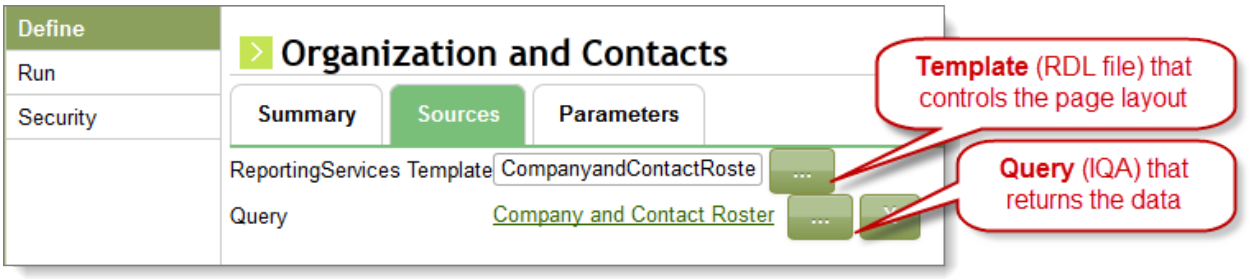
- Generate a default SSRS report on the fly using the Report command in IQA.
- Browse to a content record that has an SSRS Report iPart configured on it.
- Open a navigation item that lists all of the reports in a given folder, and select one.
- Run SSRS reports directly from the Document System.

  Where to find samples: In the Document System, go to $\Samples\ReportingServices to access example SSRS reports (each of which has a query, a template, and a run-time report).

Creating SSRS reports

To use SSRS reports natively in iMIS, you work with three associated objects:

1. Query – provides the data needed for the report.
2. Template (Reporting Services Template, the .RDL file) – provides the formatting to display the results, such as a matrix or pie chart. IQA uses a default template that you can generate from any query, either to save in the Document System or to export as an RDL, for editing and reimport.
3. Report (the runtime report, an iMIS output process) – binds the query and the template, sets the name, parameters, and security, and makes the report usable from an iPart or list of reports.



You can generate a default table-based SSRS report just by using the Report command in IQA. These you can export so that you can craft production-quality page layouts or add charting and graphing.

Can't I just use IQA?

Yes, take advantage of queries and special iParts to filter and present iMIS data to your users. See Displaying query results in iParts for the growing number of query-based iParts available.

But some situations require the full power of Reporting Services. You might, for example, need

- a different type of chart or graph than is available
- to change the chart from listing counts to showing percentages
- to add special header/footer and page layout for production quality
- to output the records in list format, one per page

How hard is adding a report?

Faster than you can brew a cup of tea, you can publish a new report in iMIS. Suppose that you need a new report, and you want this report added to your site, for easy access. Without using report editors at all, you can achieve this in a few steps:

1. Create and save your query.
2. Click Report to generate the default report.

   Tip: If you want to adjust any layout defaults, you can do so in SystemConfig table settings.
3. Click Save Report Definition to iMIS. Select the name and location you want and click Save, which creates the template and report file, already bound to your query.
4. Add access to your new report by adding an SSRS Report iPart (Utility folder) to an appropriate content record. Enable Excel and PDF exporting as needed.

   Tip: Most reports display best on content records that use single-column layouts.

What is the easiest way to change a report?

Suppose that you already added a default report to your site, but you now need to add a pie chart. The essential process is this:

1. Download the RDL template: edit the query, click Report, click Save Report Definition to Workstation, and Save it.
2. Edit it in your report writer.

- Tutorial: Adding a Pie Chart to a Report
- How to: Display Data Point Labels Outside a Pie Chart

3. Upload it to iMIS as a new template: in the Document Browser, select New > Reporting Services Template, and browse to your RDL file.
4. Update the report runtime to use it: edit the report file, and browse to your new template.

Using iMIS to generate SSRS reports

You can take advantage of the dynamic reporting feature of IQA to generate many of the reports you need, without using any report editors:

1. In the Document System, browse to your query and choose Edit.
2. Click Report to generate a report that is dynamically formatted using the settings you control through SystemConfig parameters.
3. Under Options, select Save Report Definition to iMIS.
4. Browse to the save location you specified and edit the outputs as needed:

- Reporting Services Template: , which exports as [QueryName].rdl
- Reporting Services Report: , which exports as [Query Name] and binds template to query

  For example, you might edit the report's Parameters tab to hide the report's parameters at run-time or to preset values (such as to make this report display Texas locations only).

5. Create a content record with an SSRS iPart to display your new report:

- In Content Designer > Manage content, open an appropriate folder to house your new report.
- From the toolbar, select New > Website content.
- For add new content, open the Utility folder and select the SSRS Report iPart.
- Configure the iPart to point to the report ( ) you just created.

6. Deploy the content into the site through a new navigation item, tagging, or other method.

Creating reports in SQL Server tools

1. Install the free report writing tool that works with your version of SQL Server:

- Microsoft SQL Server 2008 R2 Report Builder 3.0
- Microsoft SQL Server 2005 Express Edition Toolkit, which installs SQL Server Business Intelligence Development Studio (BIDS)

2. Reuse or copy reports created in other editions. When you publish a report created in an earlier version of Reporting Services, it upgrades to the newer format.
3. Create reports using any Reporting Service features: drill-through reports, sub-reports, and parameterized reports that include charts, tables, matrices, and lists.
4. Publish to a report server. To make a published report available to users, use Report Manager to create role assignments that grant access to it.

Adding custom SSRS reports and subreports

If you have designed your own RDL source files, you can upload them into iMIS templates, create reports (which link templates to queries), and display those reports with SSRS iParts.

Note: In Reporting Services, subreports are stored as separate RDL files that the main report references. Therefore, you need to upload them into iMIS separately.

To add an SSRS report to iMIS

1. Import your template (RDL) into iMIS as a Reporting Services Template:

- In the Document System, open the \Reports\Templates folder for the target module.
- From the toolbar, select New > Reporting Services Template.
- Browse to the source RDL file on your file system.

2. Create a report that will bind a query to this template as a Reporting Services Report:

- In the Document System, open the \Reports folder for the target module.
- From the toolbar, select New > Reporting Services Report. This object is a process engine.
- On the Sources tab, specify which Reporting Services Template and IQA query to use.
- On the Parameters tab, choose whether to show the report's parameters at run-time and whether to preset their values (such as to make this report display Texas locations only).

3. Create a content record with an SSRS iPart to display your new report:

- In Content Designer > Manage content, open an appropriate folder to house your new report.
- From the toolbar, select New > Website content.
- For add new content, open the Utility folder and select the SSRS Report iPart.
- Configure the iPart to point to the report ( ) you just created.

4. Deploy the new content into the site through a navigation item, tagging, or other method.

To add SSRS subreports to iMIS

Creating a report that has subreports is the same process, except that you also import the subreport RDL files into the same folder as the main (parent) RDL file.

1. Import your template (RDL) into iMIS as a Reporting Services Template:
2. In the same folder, also create templates for each subreport RDL used by the main report. iMIS can run the subreports specified in the main report only if they are in the same folder.

3. Create a report that will bind a query to this template as a Reporting Services Report:
4. Create a content record with an SSRS iPart to display the main report:
5. Deploy the content into the site through a new navigation item, tagging, or other method.

Direct URL calls to run one-off reports

Content Management also supports direct calls to its reports from your web page code, so that you can create one-off reports you may need. This sample code for a Print Detail button on the Batch details page shows the process:

1. Call a content item (@/iMIS/Accounting/BatchDetailReport).
2. Pass it a parameter (Batch Number) as a URL parameter.

```
protected void PrintDetailClick(object sender, EventArgs e)
{
   Guid documentKey = DocumentSystem.DocumentKeyByPath("@/iMIS/Accounting/BatchDetailReport");

   Document d = DocumentController.Document(documentKey);

   Business.ContentManagement.Content content = Business.ContentManagement.Content.GetFromDocument(d);

   string url = string.Format(CultureInfo.InvariantCulture, "{0}?&Batch Number={1}", content.GetNavigateUrl(), Batch.BatchNumber);

   Response.Redirect(url);
}
```

Customizing SSRS reports

Changing the default layout for SSRS reports

Your iMIS database stores configuration parameters that control the layout and design of reports generated through Reporting Service (SSRS). These parameters in the SystemConfig table control the look and feel of SSRS reports being created system-wide.

For example, if you have international customers, a helpful change might be to configure the reports for A4 format (21.0 x 29.7 cm).

Tip: Like Word templates, these configuration settings control new reports only; layout changes do not propagate to existing reports. Therefore, test and perfect your settings before creating new SSRS reports, to minimize rework later.

To change SSRS layout parameters

3. Use your favorite SQL query tool to access the SystemConfig table in iMIS.
4. Change the values as needed.

   Tip: For valid color names and samples, search the web for aspnet named colors.
5. Restart IIS (or reboot the server) to clear the cache and apply the changes.

SSRS layout parameters

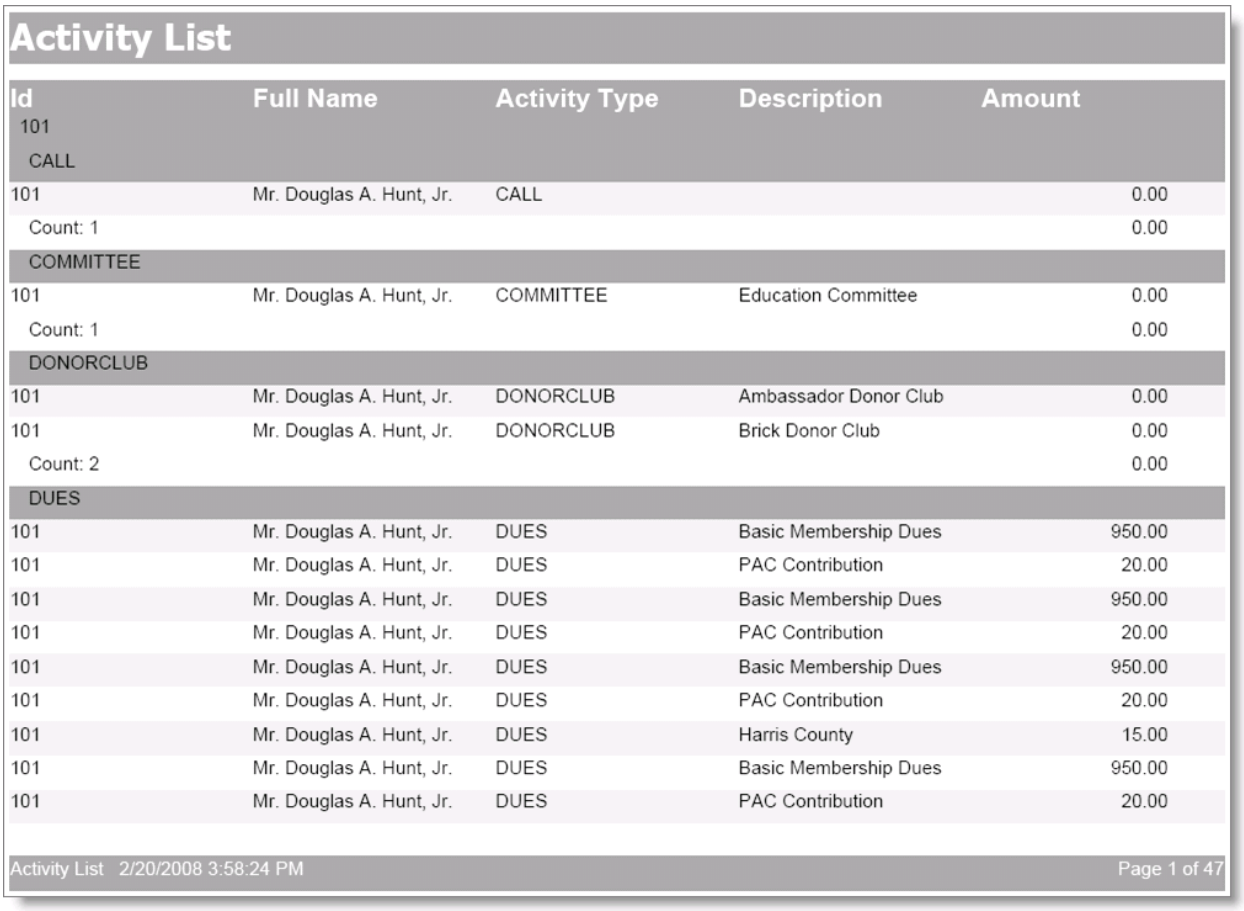
You can generate the table below using this query:

```
select ParameterName, ParameterValue, Description
from SystemConfig where ParameterName like 'SSRS%'
order by ParameterName
```

.BodyReportItemsHeight	0.2	Body report items height (units only, no UOM) used when generating SSRS reports
.BottomMargin	0.5	Bottom margin (units only, no UOM)

		used when generating SSRS reports
.DetailFont	Arial	Detail font for generated SSRS reports
.EnableGreenBar	false	Turns on alternating background color in rows of generated SSRS reports
.FieldHeaderBackgroundColor	White	Named color used when generating SSRS reports
.FieldHeaderForegroundColor	Black	Named color used when generating SSRS reports
.FooterHeight	0.3	Footer height (units only, no UOM) used when generating SSRS reports
.GreenBarBackgroundColor	LightSteelBlue	Named background color used when EnableGreenBar is true for generated SSRS reports
.GroupHeaderBackgroundColor	LightSteelBlue	Named color used when generating SSRS reports
.GroupHeaderForegroundColor	Black	Named color used when generating SSRS reports
.HeaderFont	Arial Narrow	Header font for generated SSRS reports
.HeaderHeight	0.25	Header height (units only, no UOM) used when generating SSRS reports
.LandscapeTotalWidth	11	Total page width (units only, no UOM) for landscape orientation paper used when generating SSRS reports
.Language	en-US	Default language used when generating SSRS reports
.LeftMargin	0.5	Left margin (units only, no UOM) used when generating SSRS reports
.PageFooterBackgroundColor	White	Named color used when generating

		SSRS reports
.PageFooterForegroundColor	Black	Named color used when generating SSRS reports
.PageHeaderBackgroundColor	White	Named color used when generating SSRS reports
.PageHeaderForegroundColor	Black	Named color used when generating SSRS reports
.PortraitTotalWidth	8.5	Total page width (units only, no UOM) for portrait orientation paper used when generating SSRS reports
.RightMargin	0.5	Right margin (units only, no UOM) used when generating SSRS reports
.SeparatorLineColor	DarkBlue	Color of the separator line for generated SSRS reports
.TableCellWidth	1.8	Width for table cells (units only, no UOM) used when generating SSRS reports
.TopMargin	0.5	Top margin (units only, no UOM) used when generating SSRS reports
.UnitOfMeasure	in	Unit of measure used when generating SSRS reports



Activity List

Id	Full Name	Activity Type	Description	Amount
101				
CALL				
101	Mr. Douglas A. Hunt, Jr.	CALL		0.00

Getting report layouts from iMIS

The SSRS template file format is Report Definition Language, which uses an .RDL extension. These are much like Crystal .RPT files, but they are defined in XML. Because they are XML, you can edit .RDL files in any text editor; however, you need free tools available for your version of SQL Server to design the report visually and to preview your report layouts with data.

To generate RDL files from IQA

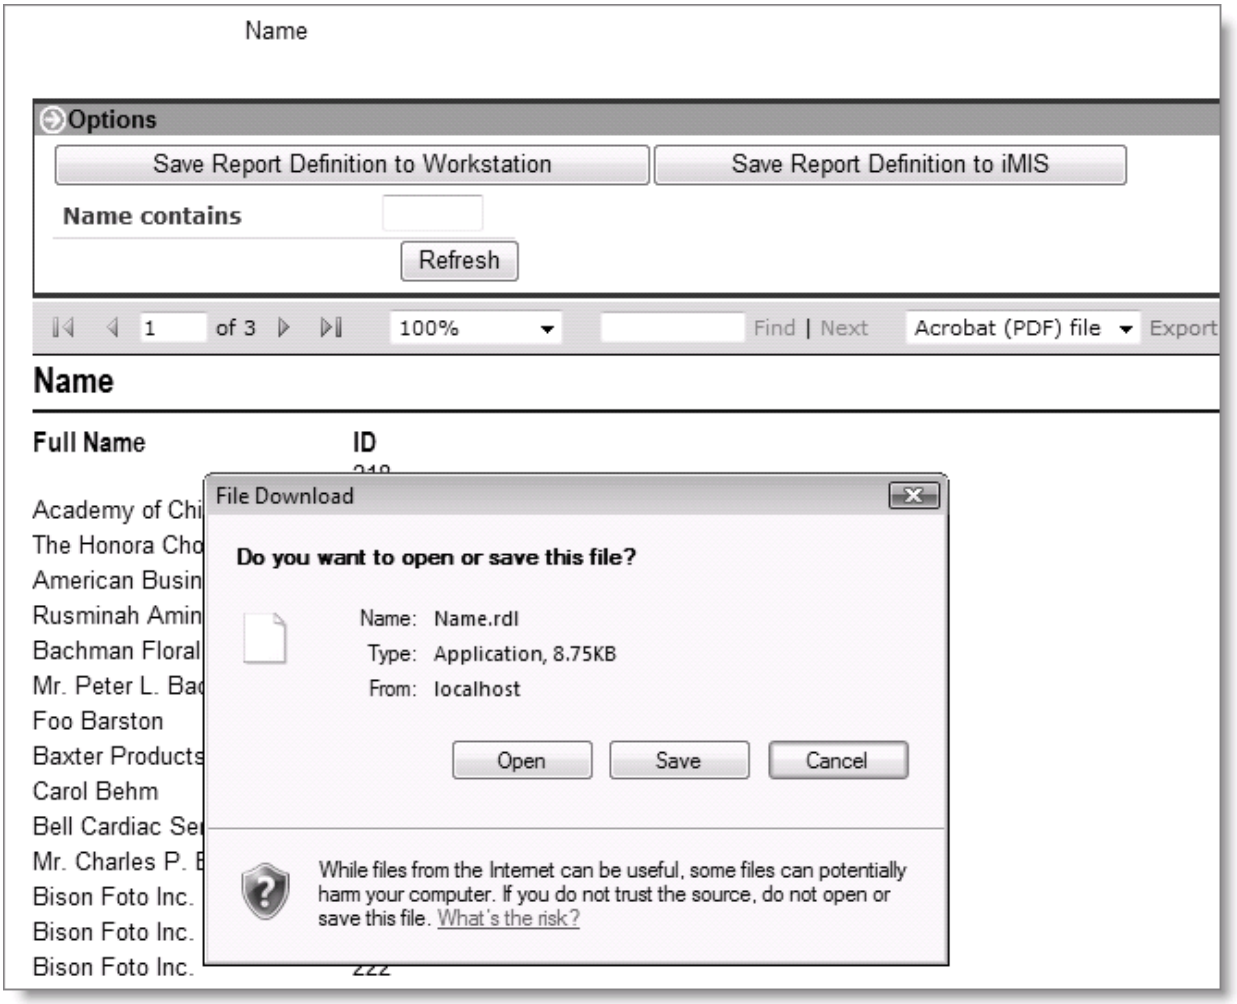
1. From the query definition, click Report.

   iMIS generates the report in memory; nothing is saved to database or disk yet.

2. If the query results need adjustment, click Define, make your changes, and click Report.
3. When the results are good, save the report to a permanent format:

- Save Report Definition to iMIS copies the report to the Document System, for future availability in iMIS.
- Save Report Definition to Workstation copies the report to your file system, for editing outside of iMIS:

  When prompted, choose Open to launch the file in the application is associated with the .RDL extension, or choose Save to copy the file to the locally.



To retrieve an .RDL from the Document System

1. Locate the .RDL template within the Document System.

Tip: Be sure you're selecting the template, not the output process!

2. Select the Run icon.
3. When prompted, select Open.

   Tip: You can choose Save rather than Open, but be aware that BIDS will copy the file into its project location when you add it to a project, regardless. However, be sure to re-import your edited version, not the original!

4. Edit the file, and save it to your file system.
5. Import the edited file into the Document System, either as an updated version or as a new template.

Setting up SQL Server tools to edit iMIS reports

You can customize Reporting Services reports using free SQL Server tools:

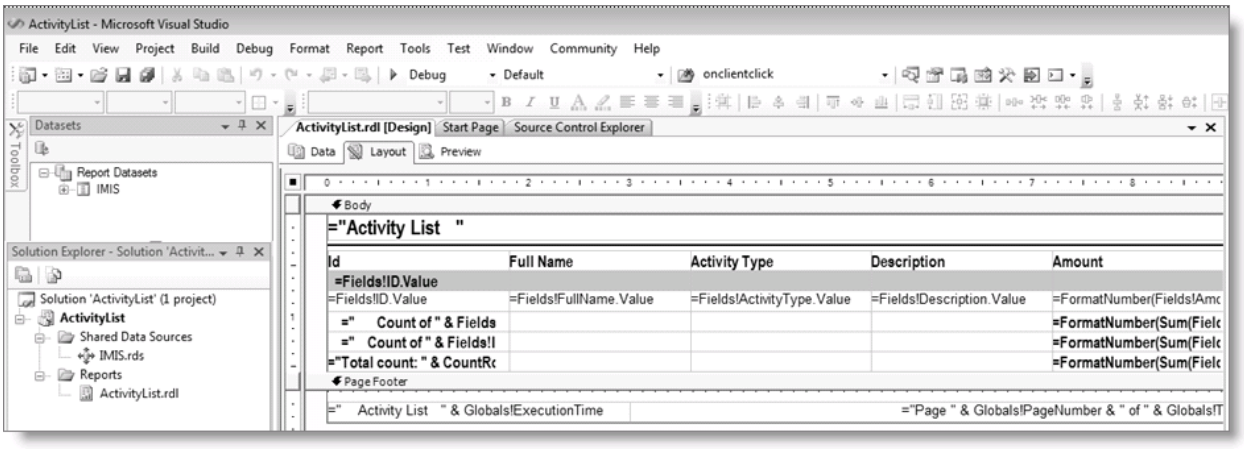
- Microsoft SQL Server 2008 R2 Report Builder 3.0
- SQL Server Business Intelligence Development Studio (BIDS) installs with the SQL Server 2005 Express Edition Toolkit.

To prepare your environment

1. Uninstall any beta or Community Technology Preview (CTP) versions of SQL Server Management Studio Express.
2. Verify you have administrative rights and ample free space on the machine where you will be working with reports: 600 MB for the toolkit.
3. Install Microsoft .NET Framework 4.0.
4. Install your version of Microsoft SQL Server Express Edition.
5. Install your report tool using the links above.

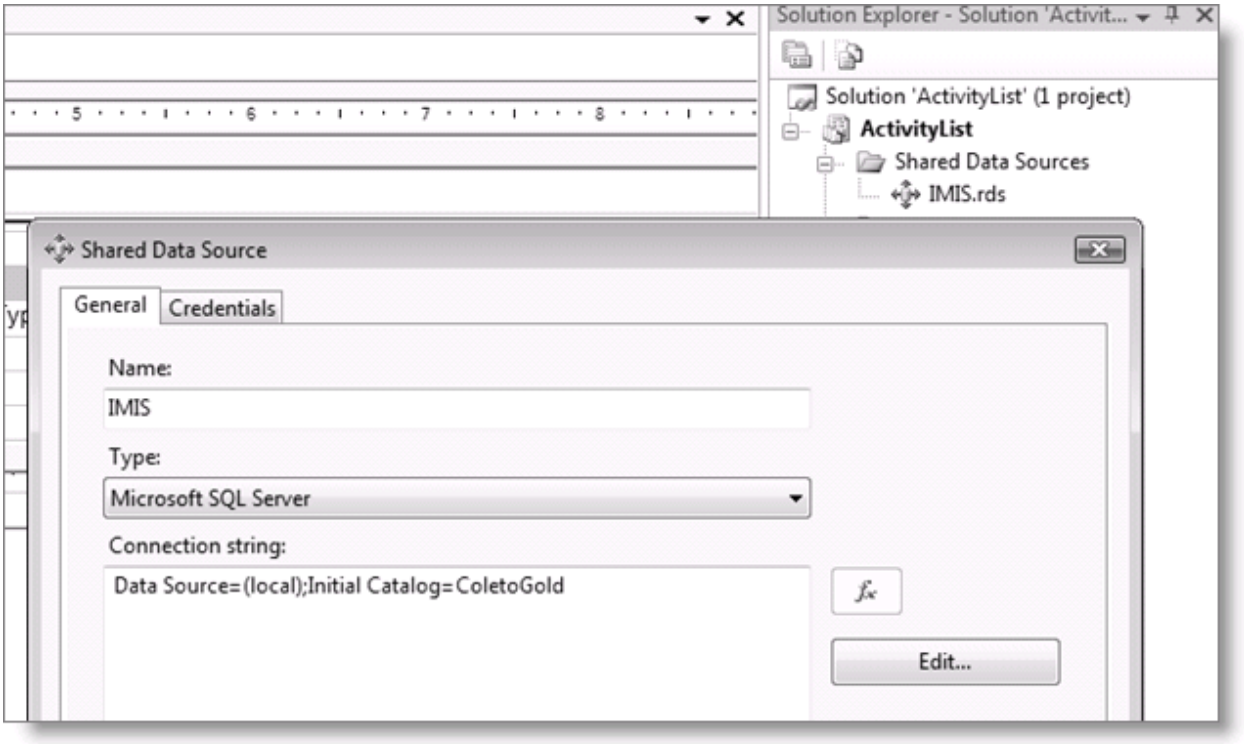
To work with an .RDL in BIDS

1. Create a new Report Server project (File > New > Project > Report Server Project).



2. For the project, create a new Shared Data Source.

- Name it IMIS.
- Use Edit... to specify your server and database.
- Select the Credentials tab to specify your SQL Server login.

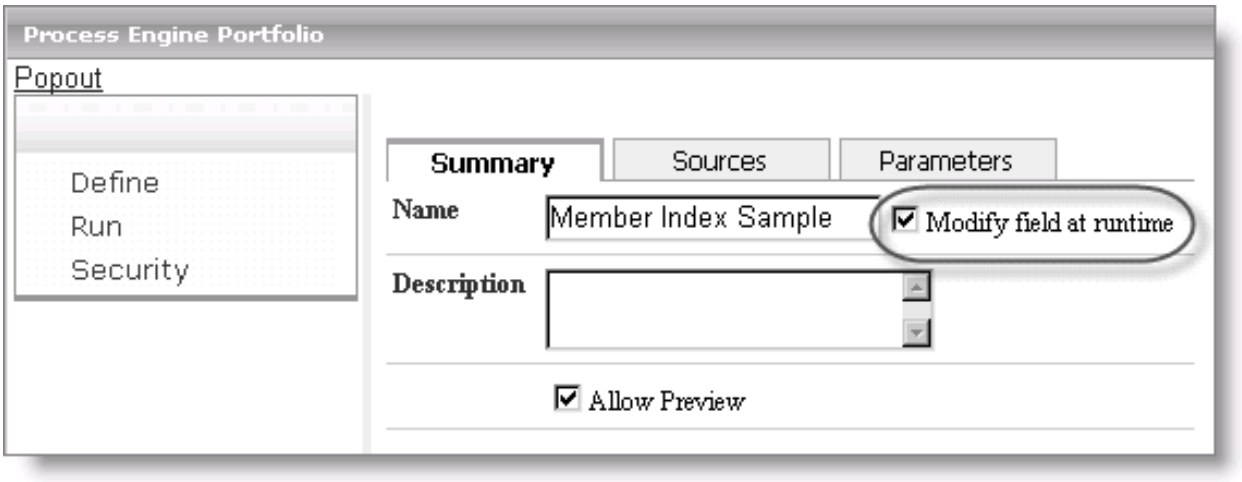


3. In the Solution Explorer, right-click Reports, Add / Existing Item, and browse to the .RDL file downloaded from IQA.

4. Edit the report definition, and select Save.
5. Import the report back into the Document System, or use it in a separate SQL Server Reporting Services server environment, as needed.

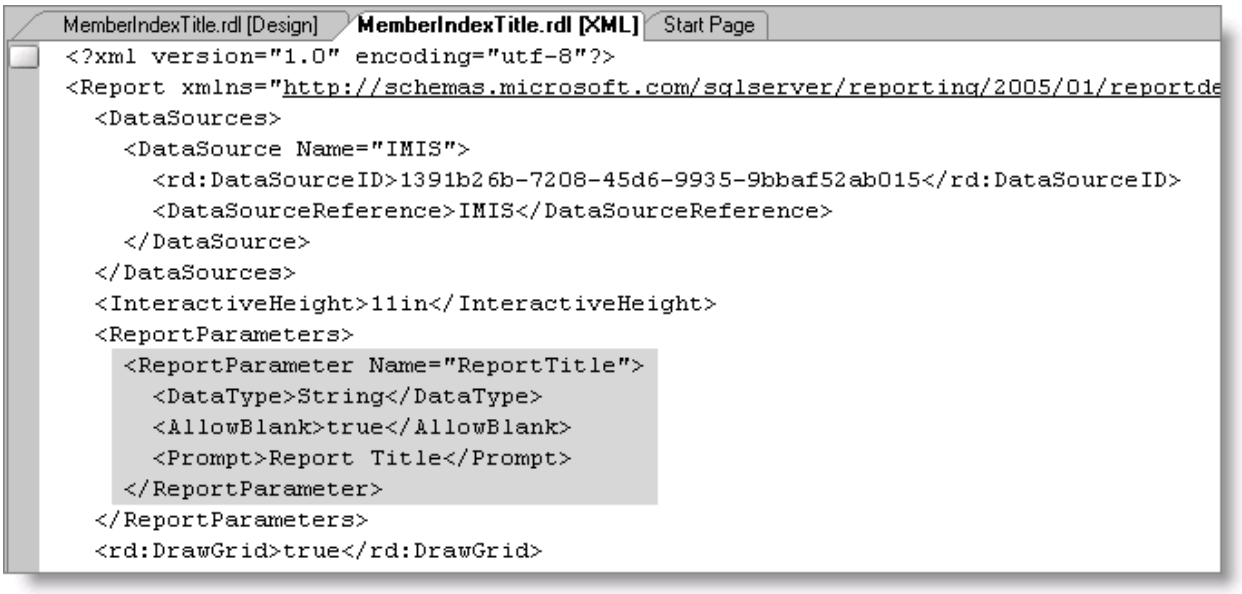
Making report titles editable at runtime

IQA adds a parameter to its SRSS reports to let users modify the report title at run-time, so that the title that displays on the report is changed just for that run. To prevent users from changing report titles at run-time, you just disable the Modify field at runtime check-box on the reports you save.



The availability of the Modify field at runtime option is controlled by report parameters in the .RDL.

If you create any RDL files outside of iMIS, you can give them this functionality by adding the ReportTitle parameter on the XML tab:



The "ReportTitle" parameter controls how users can affect the report's title, if at all.

Code for the ReportTitle parameter

<ReportParameters>

<ReportParameter Name="ReportTitle">

<DataType>String</DataType>

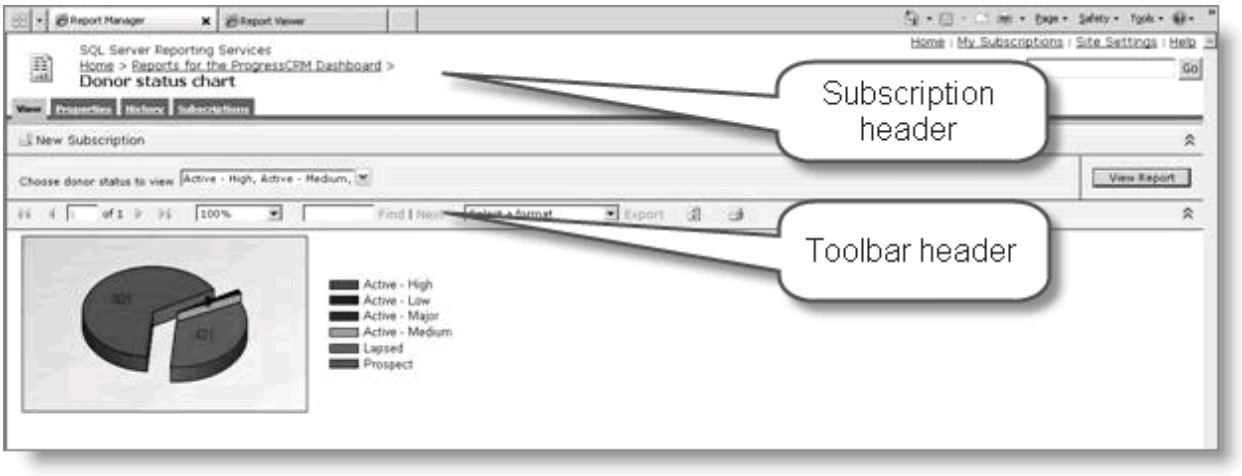
<AllowBlank>true</AllowBlank>

<Prompt>Report Title</Prompt>

</ReportParameter></ReportParameters>

Customizing headers in SSRS reports

By default, Reporting Services reports output with two headers. When these headers are not useful or take up too much space in the page design, you can control it by changing the URL through which the report is run.



SSRS reports include two headers, Subscription and Toolbar.

To suppress the Subscription header

When you publish a report, Report Manager generates a URL that includes the Subscription header:

http://-
loc-
alhost/Re-
ports/Pages/Re-
port.as-
px?ItemPath=%2fReports+for+the+ProgressCRM+Dashboard%2fDonor+status+chart

To run the report without the Subscription header, call a different command, formed like this:

http://-
loc-
alhost/re-
portserver-
?%2fRe-
ports+-
for+the+ProgressCRM+Dashboard%2fDonor+status+chart&rs:Command=Render

To suppress the Toolbar header

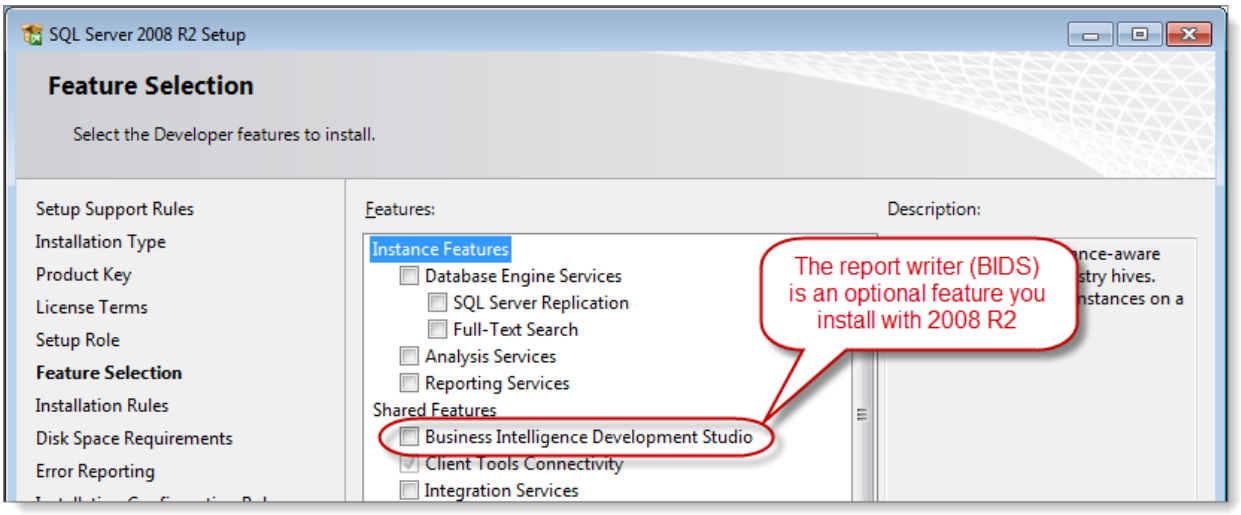
To run the report with the Toolbar header, which includes parameter and export options, add &rc:Toolbar=false to the end:

http://-
loc-
alhost/re-
portserver-
?%2fRe-
ports+-
for+the+Pro-
gressCRM+Dashboard%2fDonor+status+chart&rs:Command=Render&rc:Toolbar=false

Tutorial: Customizing a report template

This demonstration walks you through the entire process of creating a reporting project, getting a report template from iMIS, editing it to add a pie chart, and getting the template back into iMIS.

1. If needed, install the Business Intelligence Development Studio (BIDS) feature.



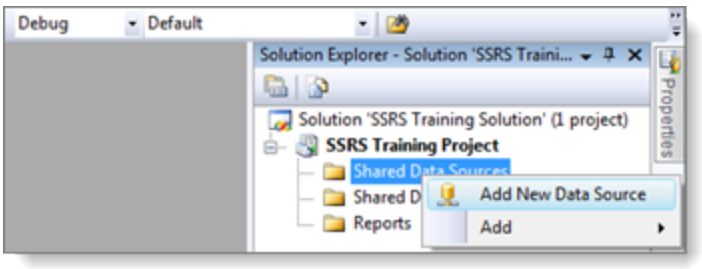
2. Open your report writer and create a new solution.

- Open BIDS: go to All Programs > Microsoft SQL Server 2008 R2 > SQL Server Business Intelligence Development Studio.

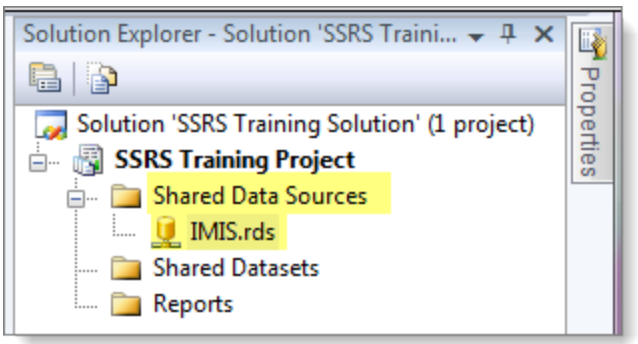
- Select File > New > Project.
- Select Report Server Project.
- (Project name) Name: SSRS Training Project
- (Default location) Location: C:\...\Visual Studio 2008\Projects
- Solution Name: SSRS Training Solution
- Click OK.

3. Add Shared Data Source called iMIS.

- Right-click the Shared Data Sources folder inside the SSRS Training Project within the Solution Explorer and select Add New Data Source.



- Name the Data Source IMIS so that it will work with the RDL that you will export from iMIS.
- Click Edit and add the connection information for your local database.
- Select Test Connection to verify that it works.
- Note the new connection within the Shared Data Sources folder.



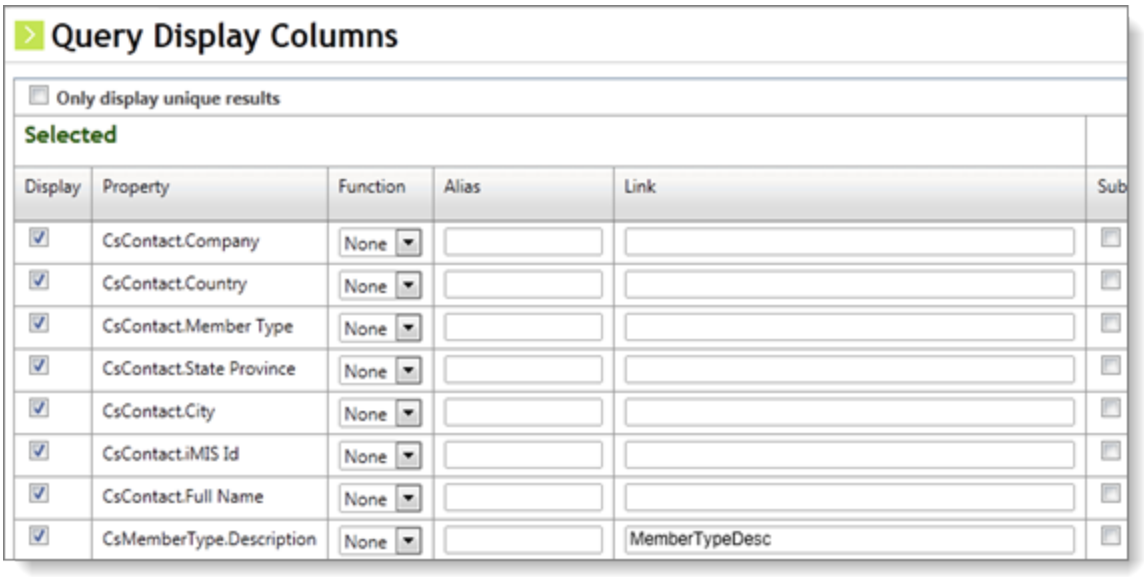
4. Create a data source and default report template (RDL) using IQA.

- Select Manage > Intelligent Query Architect.
- Browse to $/Samples/ReportingServices.
- Create a new IQA that grabs the data you need for your report.

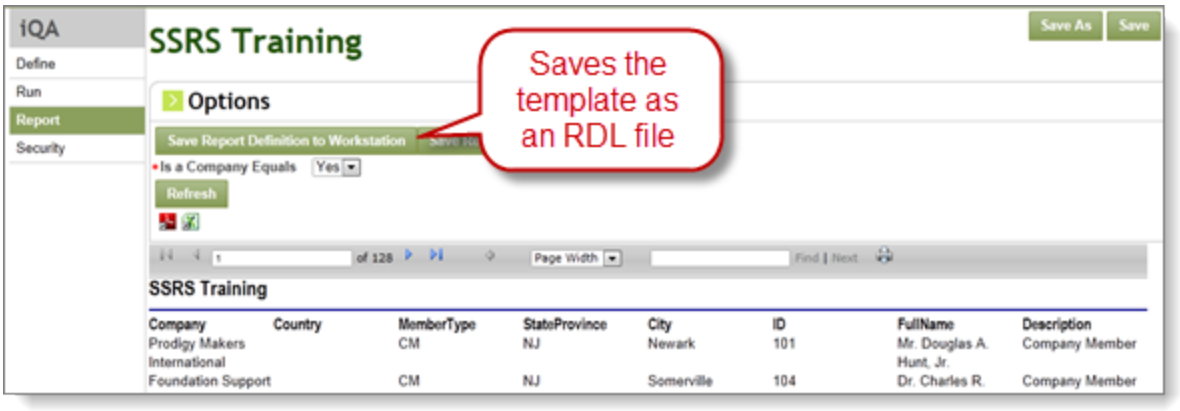
  Sources: CsContact and CsMemberType business objects

  Filters: CsContact.Is a Company

  Display: Defaults & CsMemberType.Description



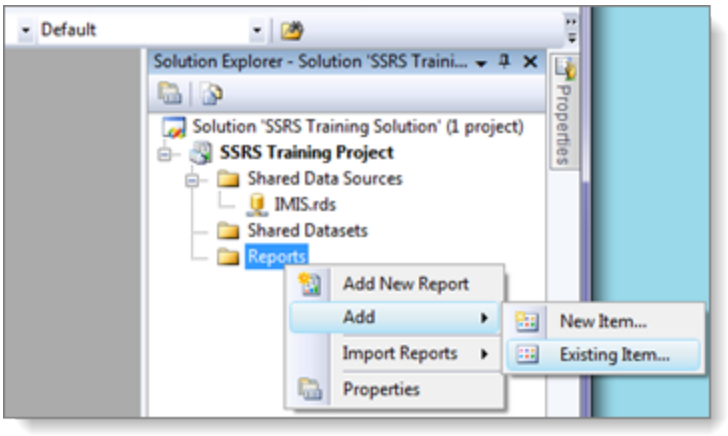
- Go to the Report tab and click Save Report Definition to Workstation to export the default RDL file to your workstation.



- Save the RDL to your project folder.

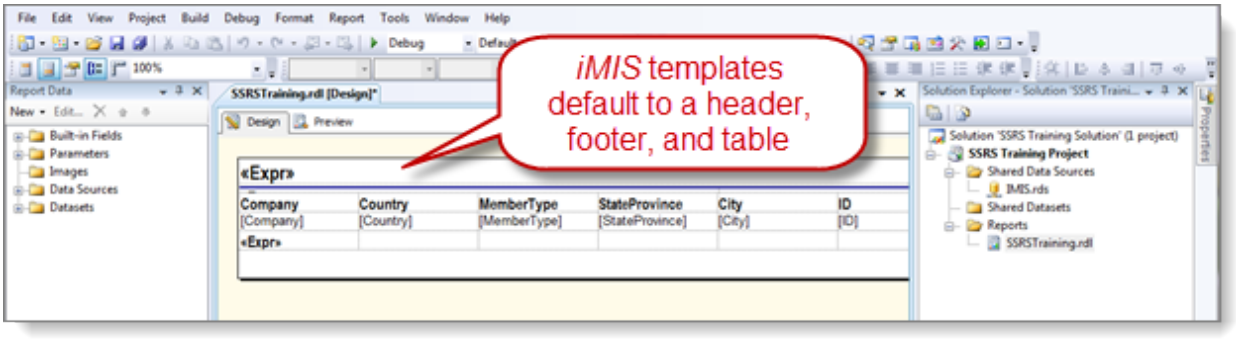
5. Add the exported template to your reporting project.

- Go back to BIDS and add the RDL to the Reports folder within the SSRS Training Project.
- Right-click Reports and select Add, Existing Item.



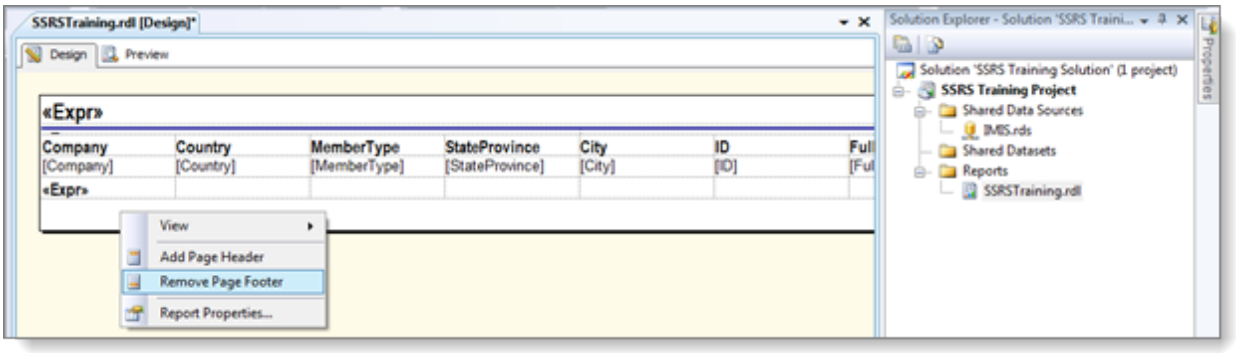
- Find the RDL you exported from IQA (note that name defaults to the name of the query).
- Double-click on the name of the report to open it for editing. You'll see the default template that IQA uses for all IQA report definitions which includes a header, a table to dis-

play the results set, and a footer.

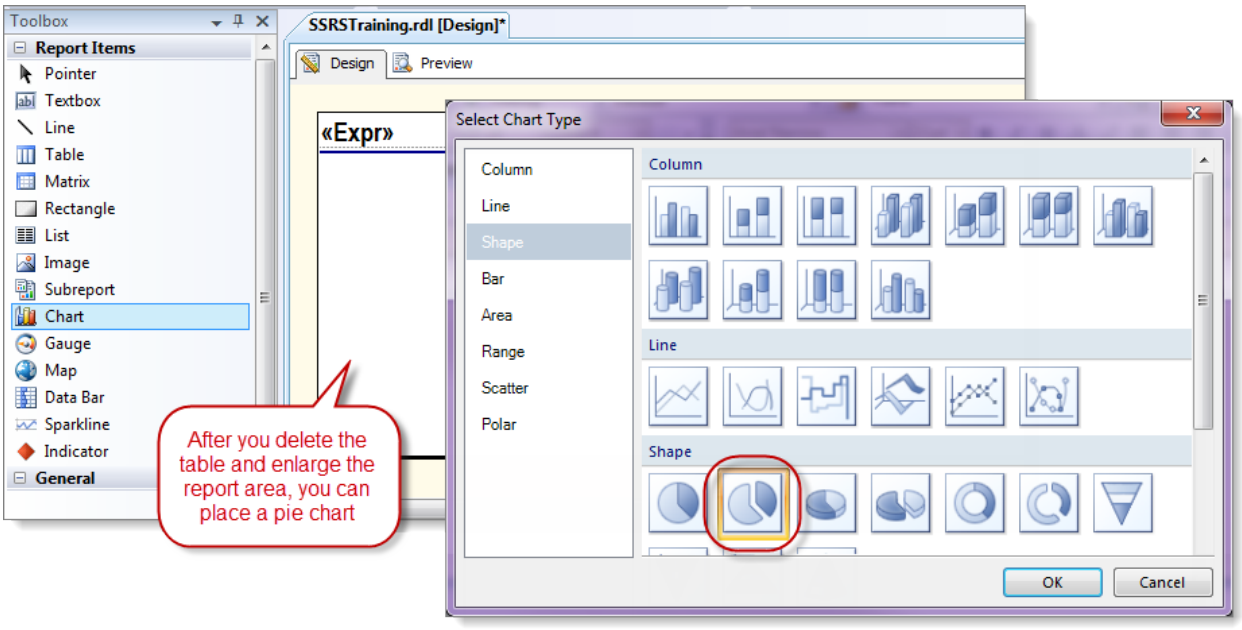


6. Change the report template into a pie chart that shows the percentage of members within a given member type.

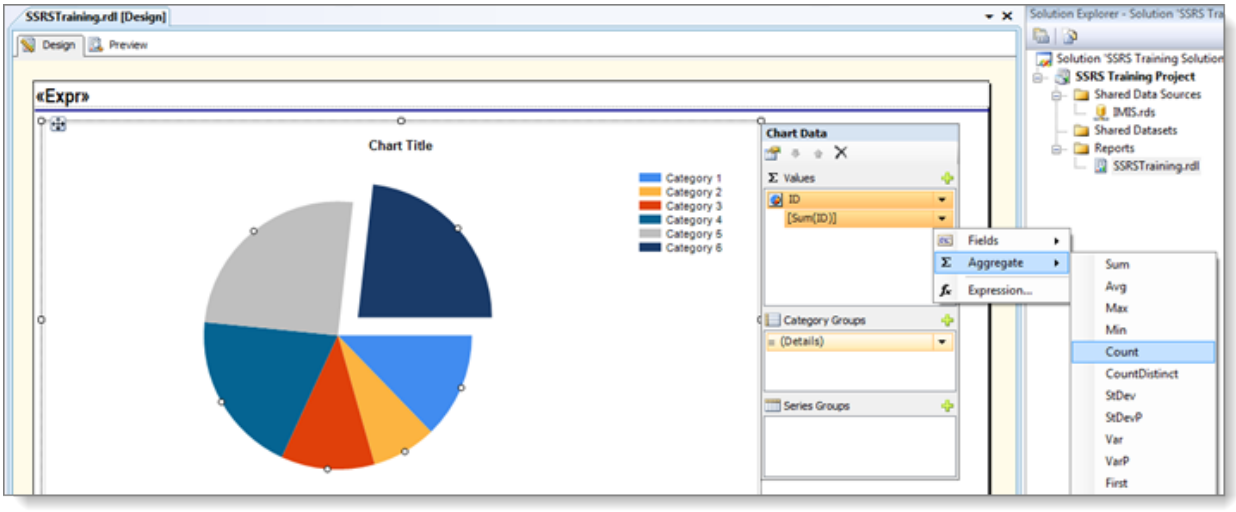
- Right-click on the footer and select Remove Page Footer.



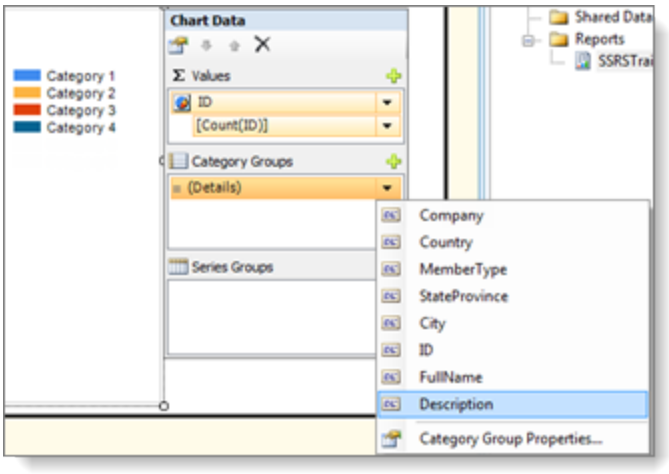
- Select the table, click the top left corner, and press the Delete button on your keyboard.
- Drag the bottom of the report to give yourself more room to add the chart.
- From the toolbox, drag and drop the Chart report item onto the body of the report.
- The Select Chart Type window opens.
- Select the exploded pie chart and click OK and expand the pie chart to fill in the area as needed.



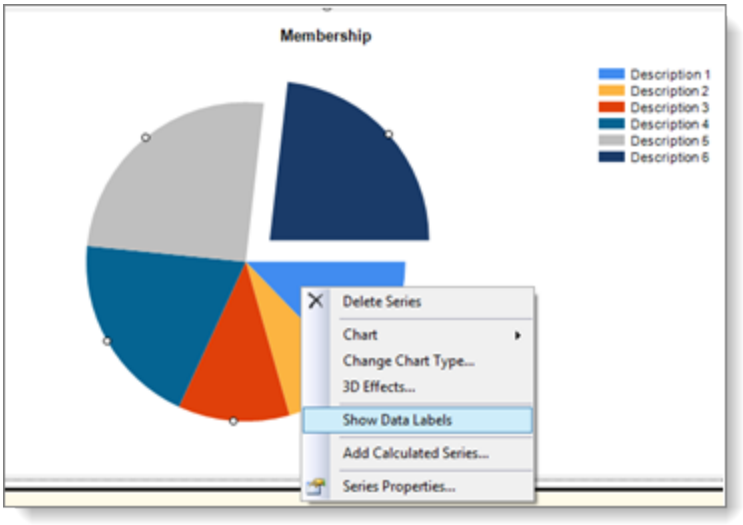
- Right-click on the chart itself to show its properties, which open in the Chart Data pane to the right of the chart.
- In the Value section, select ID.
- Change the Aggregate type from Sum to Count.



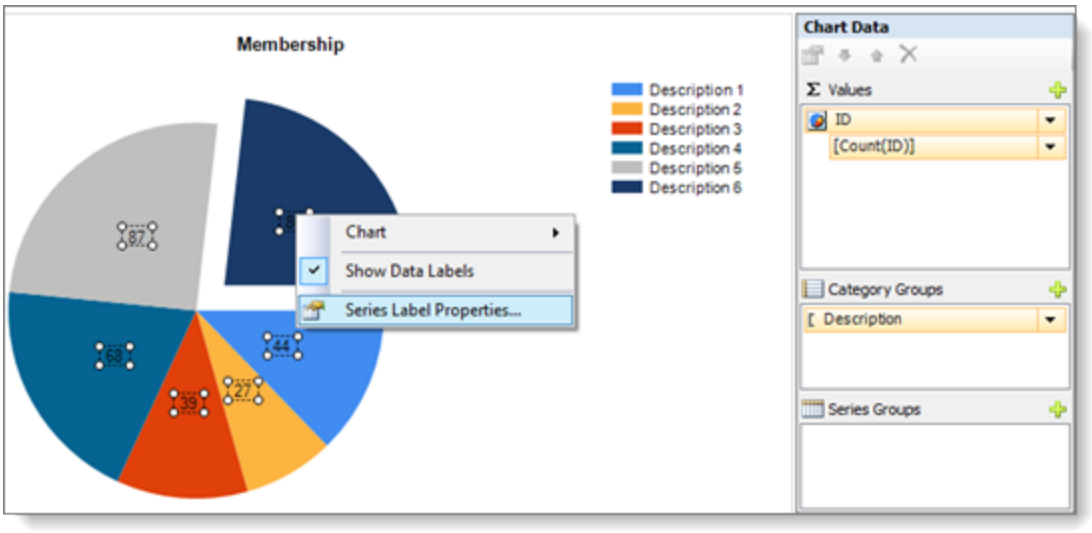
- In the Category Groups section, select Description (which is the Member Type Description).



- Change the title of the report by clicking the area that says Chart Title and typing.
- Add labels that show the counts-per-member type by right-clicking on the chart and selecting Show Data Labels.



- Click Preview to see the new report (there is a default parameter for the report title – click the View Report button on the top right to preview the report).
- Change the chart to show percentages instead of counts.
- Right-click on any of the labels in Design mode.
- Select Series Label Properties.



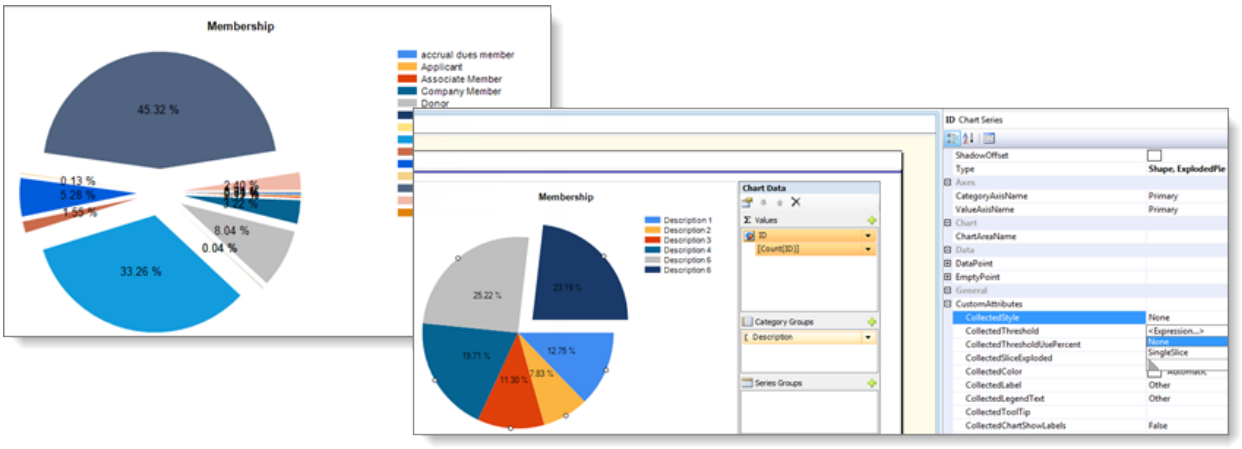
- Add #PERCENT to the Label data field so that the labels show the percent instead of the count.
- When prompted, This property will not have effect unless UseValueAsLabel is set to False. Do you want to set the UseValueAsLabel to False?, click Yes.
- Click OK.

7. Combine all member types that have less than 5% into one pie slice called Other.

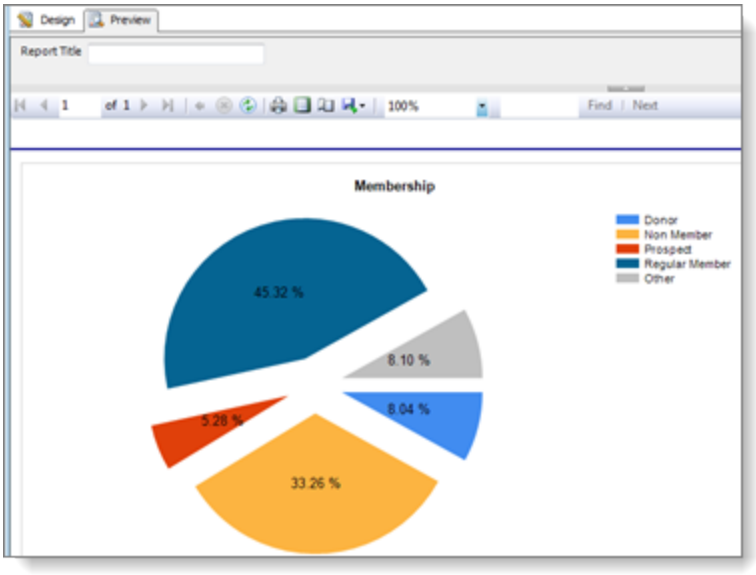
- Go back to the Design view by clicking the Design tab.
- If you do not see the chart properties, select View > Properties Window.
- Click a pie slice to select the chart area (you will see the Chart Data pane at right).
- On the Properties menu to combine all of the less than 5% member types:
- Find the General sub menu, double-click the CustomAttributes section, and find and set two properties:

  CollectedStyle = SingleSlice

  CollectedThreshhold = 5

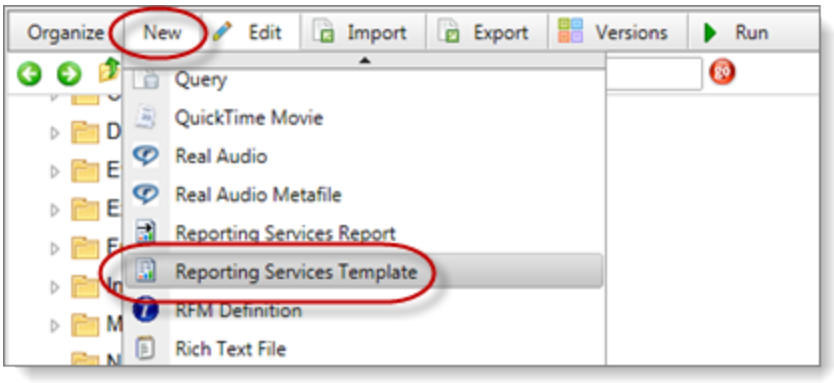


8. Preview, adjust as needed, and Save.

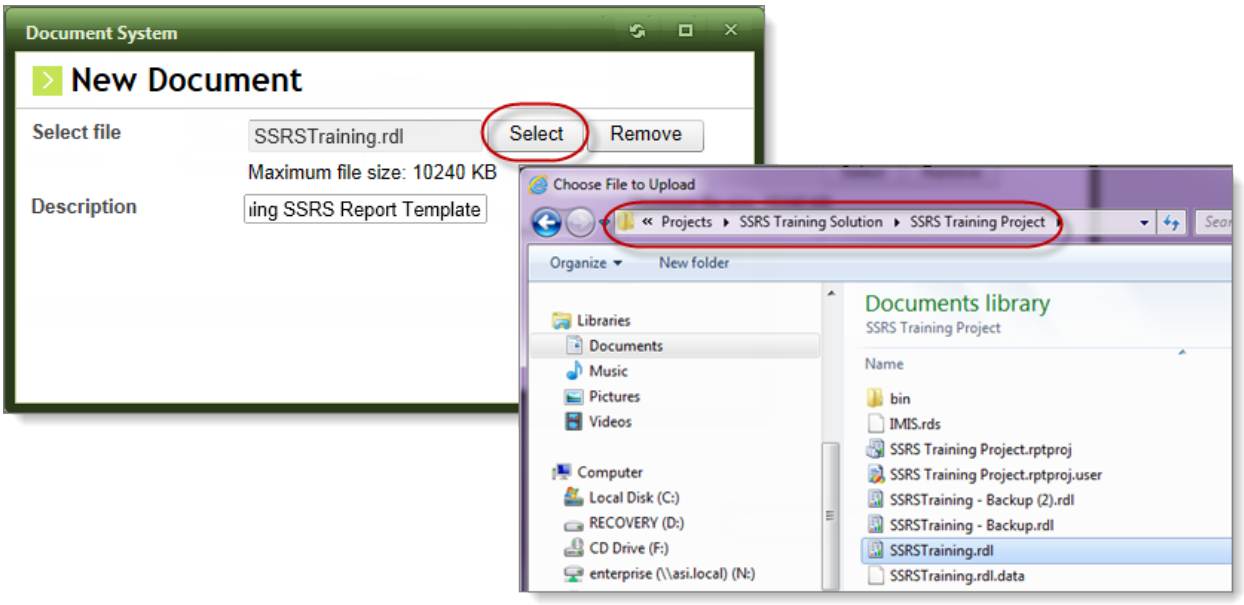


9. Add your template to your report in iMIS.

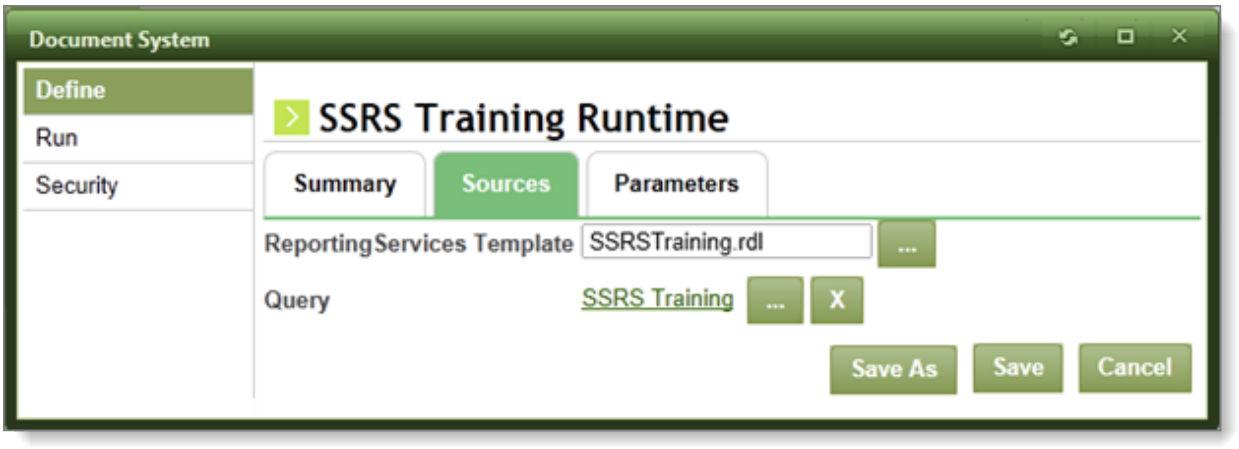
- On your Member site, open the Document System: select Manage > Document System.
- Browse to the location of the original template : $/Samples/ReportingServices.
- Bring your template into iMIS as a new object: select New > Reporting Services Template.



- Upload your RDL file: Click Select and browse to the file that you turned into a chart template: ..\Visual Studio 2008\Projects\SSRS Training Solution\SSRS Training Project.

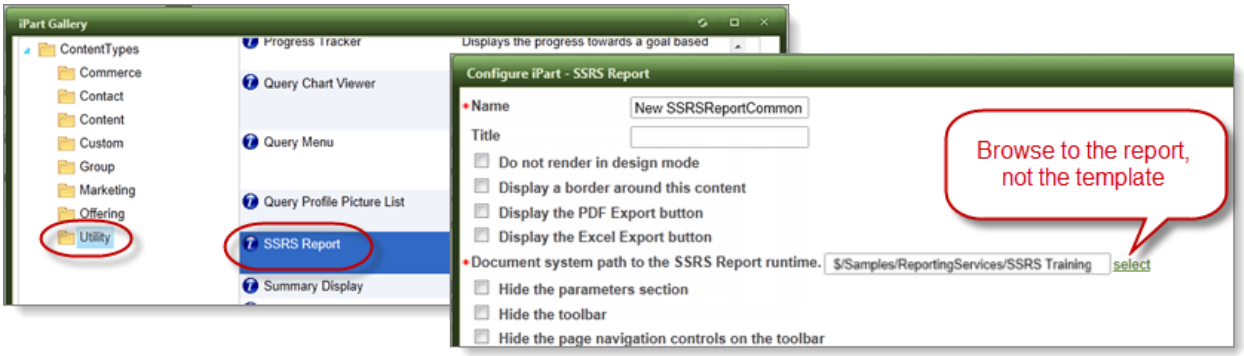


- Create a report runtime to use your template with your query: select New > Reporting Services Report.
- On the Sources tab, use the browse buttons to select your template and your query.



- Click Run to preview the report.
- When you Save the new report, verify the folder to which you are saving: $/Samples/ReportingServices.

10. Publish your report using the SSRS Report iPart.
    - Edit a new or existing content record.
    - Select add content and select the SSRS Report, in the Utility gallery.



- Select Hide the toolbar, since pagination isn't needed.
- Save & Publish, and view your report.

Creating content with iParts

iParts are the foundation of your iMIS sites that you build with RiSE. This section helps you to understand and master the critical iParts that present attractive and dynamic content to your users.

What are iParts?

An iPart is an iMIS-specific web part that represents a building block of features that you can place on a content record with other building blocks to create new pages of features. Multiple iParts can be combined and displayed in a content record as you prefer.

Default iParts appear throughout iMIS. You can modify them for your needs and you can reuse iParts throughout the system. For example, an iPart displaying a roster for a Membership Group can follow the same user behavior patterns as an iPart for a roster in Events.

Where can I find and use iParts?

To create a new web page containing one or more iParts

1. From RiSE > Content designer > Manage content, create a content record.
2. Click add content and select the desired iPart from the Content Gallery.
3. Enter the applicable information and select the desired options.
4. Click OK.
5. Click Preview to see how the content will be displayed to users.
6. Click Save and then Publish.
7. From RiSE > Site designer > Manage sitemaps, create new website navigation.

   Note: If no owner is specified for the content block, the default organization displays as the owner.
8. Click Publish.

To add an iPart to an existing webpage

All iMIS sample sites come pre-filled

1. From RiSE > Content Designer > Manage Content, select the site you'd like to add the iPart to.
2. Select the Content area in which you would like to place the new iPart.

   For example, if you would like to add a new iPart to the home page, select Home from the content area list.
3. Click Edit.
4. Determine where you would like to place your new iPart, and click add content.
5. The Content Gallery window will pop up. Navigate to the folder that contains your desired iPart.
6. Select the desired iPart and click OK.
7. Configure the iPart by entering applicable information and select the desired options.
8. Click OK.
9. Click Preview to see how the content will be displayed to users.
10. Click Save and then Publish.

To set up a user content area

User content areas are created by using iParts which can be configured to allow a user to post content on the web. Examples of this user-generated content include forums, message boards, or blogs.

1. From RiSE > Content designer > Manage content, create a content record.
2. Select the Content Block iPart from the Content Gallery.
3. Enter the applicable information and select the desired options. See the help file for details.
4. Click OK.

5. Add additional content to page, if desired.
6. Click Save.
7. Click Publish.
8. From RiSE > Site designer > Manage sitemaps, create a navigation.
9. Click Publish. The page displays as configured with an area dedicated to user content entry directly on the page.

Configuring iParts

iPart configuration allows you to:

- Define how the iPart will behave
- Control how much access you want end users to have
- Hide configuration details from end users; two instances of the same iPart with different configurations can appear as two different controls to the end user
- Examples:
- Allow users to edit on a staff-facing site, but display the data in read-only mode on a public-facing site
- Use multiple instances of an iPart on one page to access different sets of data

Run-time versus design-time

iParts have two different views:

- Design-time view: What you see in a content record when you add an iPart and configure it.
- Run-time view: What your end-user sees when viewing the iPart within your website. This may differ from what you see in the Design-time view, because some iParts have a different behavior after you publish the content.

Specifying commit sequence

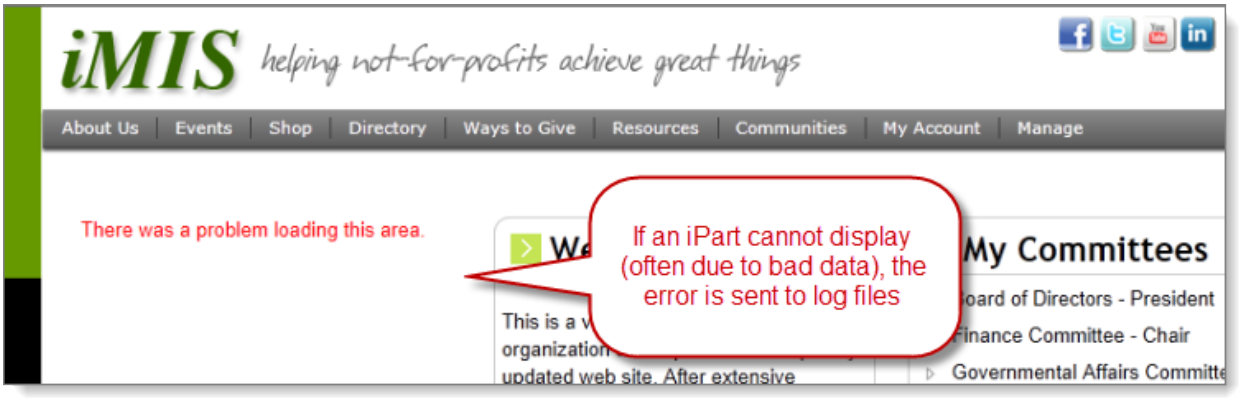
If you place more than one iPart on a page, you might need to specify the order in which actions occur on that page. The commit sequence function allows you to explicitly define the execution order of multiple iParts in a content record.

You can define a commit sequence value for the processing order of each iPart relative to the other iParts in the same content record. The commit sequence value must be zero or greater. iParts with a value of zero (the default) are processed after any other iParts with a non-zero commit sequence value that are in the same content record.

Setting a commit sequence is only required in a few scenarios and is noted in an iPart's configuration help if needed.

Troubleshooting iPart errors

Occasionally, an iPart may fail. However, it will fail gracefully in place, without disabling the whole page. Typically, a "problem loading" error results from some kind of bad data. By default, iMIS hides the error details:



The settings controlling this error logging reside in the <log4net> section of your site's web.config file. The default settings enable error logging in the Windows Event log and comprehensive logging in the ASI log file, which captures both errors and warnings. This log file, Asi.WebRoot.log, is in the folder above your website root.

Contact your hosting administrator if you need access to information in these logs.

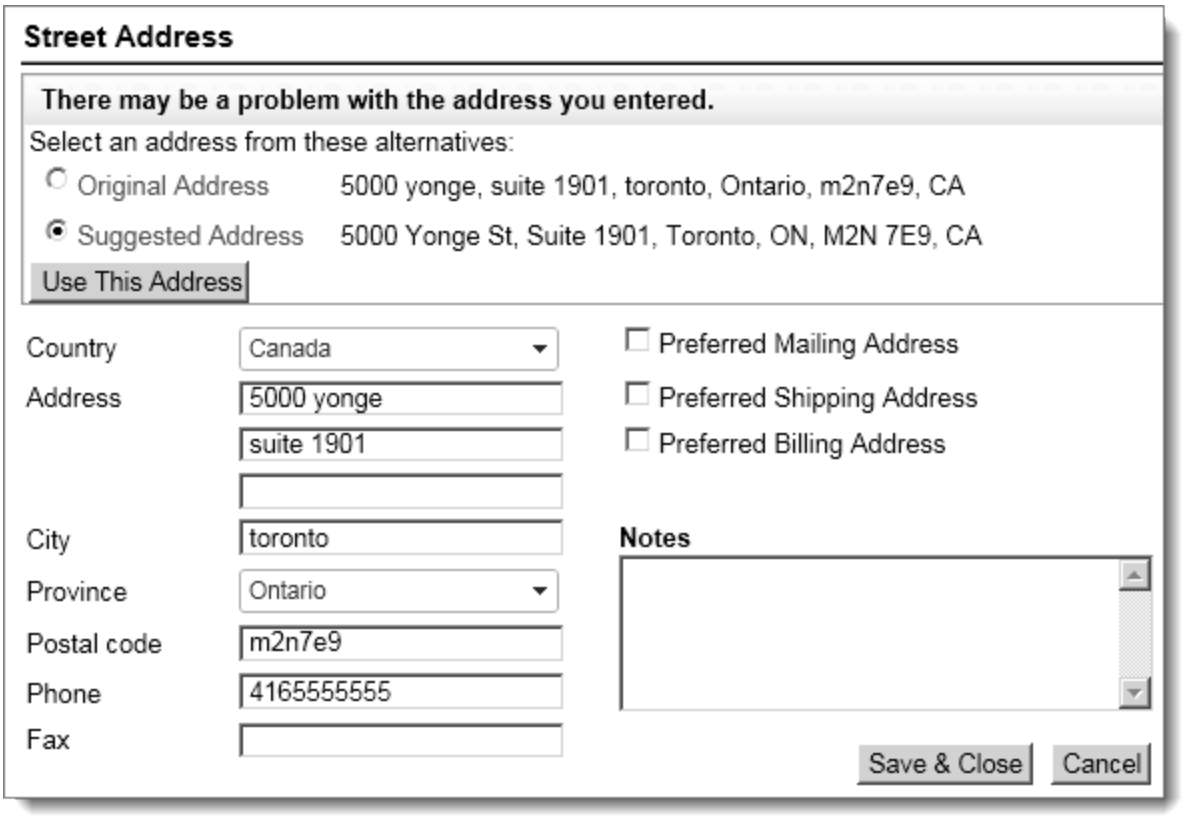
Security for iParts

Most security is defined at the content record level within iMIS. You can choose that different iParts display for different users. For example, an unauthorized user might see the description of a Special Interest Group, but a signed-in member might see the roster for the group and a staff person might have the privilege to add, edit, or delete the group.

Address verification for iParts

iMIS SOA can perform real-time address verification using web services hosted by ASI. There are several benefits to this:

- Running this verification through the ASI web service frees you from having to install and maintain these data files locally.
- Offloading verification to this service keeps it from adding to the processing load of your page.
- The services of different address providers can co-exist, making it possible to verify addresses across multiple countries.
- The service can support future verification of collections of addresses as well as single ones.
- Postal addresses entered in the Contact Account Creator and Contact Address Editor iParts automatically upload to this service that verifies and standardizes the address. Users can then either accept the suggested address or keep the original as it was entered.



The countries supported by this service are subject to change. Contact your AiSP to obtain an up-to-date list.

Passing URL Parameters

Many iParts allow you to change the content they display based on the value of a URL parameter. This gives you the freedom to create a single content record. This record can be reused and the display can be changed based on a value sent in a link to the page. For example, instead of creating a new content record for every event, you can reuse a single content record that displays different event information based on the EventKey value in the URL.

Parameter values are passed to iParts from a several types of sources:

- Search result links
- IQA query links
- Navigation items

- Relative links
- Absolute links

For any iPart that allows URL parameters to be passed, see the configuration help file for detailed instructions.

Tip: If multiple values are sent to a page for a single URL parameter, the first parameter value wins. For example, if the URL pointing to the Event Display iPart is http://my-org/Events/Event_Display.aspx?EventKey=SPR12&EventKey=FALL12, only the SPR12 event displays.

Note: URL parameters set by navigation items cannot be manually overridden in the URL. A user cannot change the parameter value in the URL to display different content.

iPart Examples

iParts can be used in a variety of ways, and in many different combinations to meet your organization's needs. This section contains examples of commonly used iParts and provides guidance in maximizing their benefits.

Displaying query results in iParts

The iParts described in this section use IQA queries to drive the data displayed to users. Each iPart provides a unique way to display the data.

Query Chart Viewer iPart

The Query Chart Viewer displays query results in a chart, which can be set to a range of sizes, skins, and chart types.

Designing queries for Query Chart Viewer

The Query Chart Viewer can render any existing query, but you will get the best results by following these guidelines on how to design queries specifically for use with this iPart:

- Queries: The queries you create for the iPart should be structured so that the results are appropriate for charting. For example, if you want the chart to display the total sales per salesperson, then the source query should be written using the Sum function in IQA.

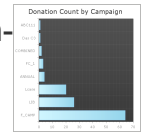
- Query Display Columns: Each property you select on the Display tab in IQA is available in the iPart's configuration page as a Data column display option. Note, however, that you can only select two properties to be displayed in the iPart.
- Aliases: In your source query, enter an Alias for the Display properties you plan to show in the iPart. Relying on the default labels may not be sufficient, especially when your query uses multiple joined sources or custom SQL expressions. If the query does not display as you expect, using an Alias often resolves the issue.
- Sorting: You can sort the query results displayed in your chart in ascending or descending order. To sort your results, edit your source query and, from the Sorting tab, add the property to be sorted.
- Labels: The labels on your chart's x-axis may overlap if there are too many data points or if the labels are too long. You may be able to improve the display through a few methods. In the iPart, you can expand the width of the chart or change the label angle. In the query, you can try to reduce the number of data points.
- Dates: For dates to display correctly, you must cast them as float data types with an offset of 2. You can do this in IQA from the Custom SQL Expression section of the (Display tab). For example, if you want to display the OrderDate property in your chart, add the following expression: CAST(OrderDate AS FLOAT) + 2. Then, when you select this property from the Data column list in your iPart, set the Data column format to a date format.
- Integers: If integers display incorrectly in your chart, cast the column to a data type of INT in the Custom SQL Expression section of IQA's Display tab. For example: CAST (OrderCount AS INT).

Chart Types

You can display the following types of charts in the Query Chart Viewer iPart.

Chart Type	Example
Area - Displays data in an area filled with color to illustrate trends. For example, create an area chart that shows a member's giving history over time. Note: You can only display one area of data in the iMIS Area chart.	

Bar - Horizontal - Displays sets of data with horizontal rectangular bars for comparison. For example, create a horizontal bar chart that shows the number of donations received by each of your fundraising campaigns.



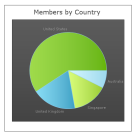
Bar - Vertical - Displays sets of data with vertical rectangular bars for comparison. For example, create a vertical bar chart that shows the distribution of your members across states.

Bubble - Displays data as a series of bubbles. For example, create a bubble chart to show the total number of function registrations for an upcoming conference.

Note: You cannot assign a size value to the bubbles in the iMIS Bubble chart.

Line - Displays data as a series of data points connected by a line to illustrate trends. For example, create a line chart that shows a member's giving history over time.

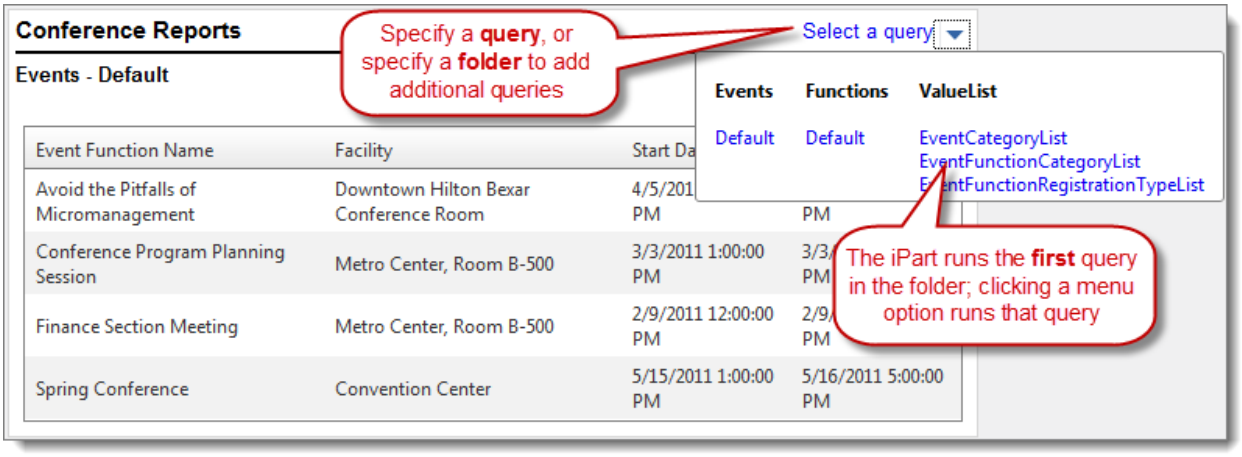
Pie - Displays data in a circular chart divided into sections to illustrate proportion. For example, create a pie chart that shows the proportions of your members by country.



Query Menu iPart

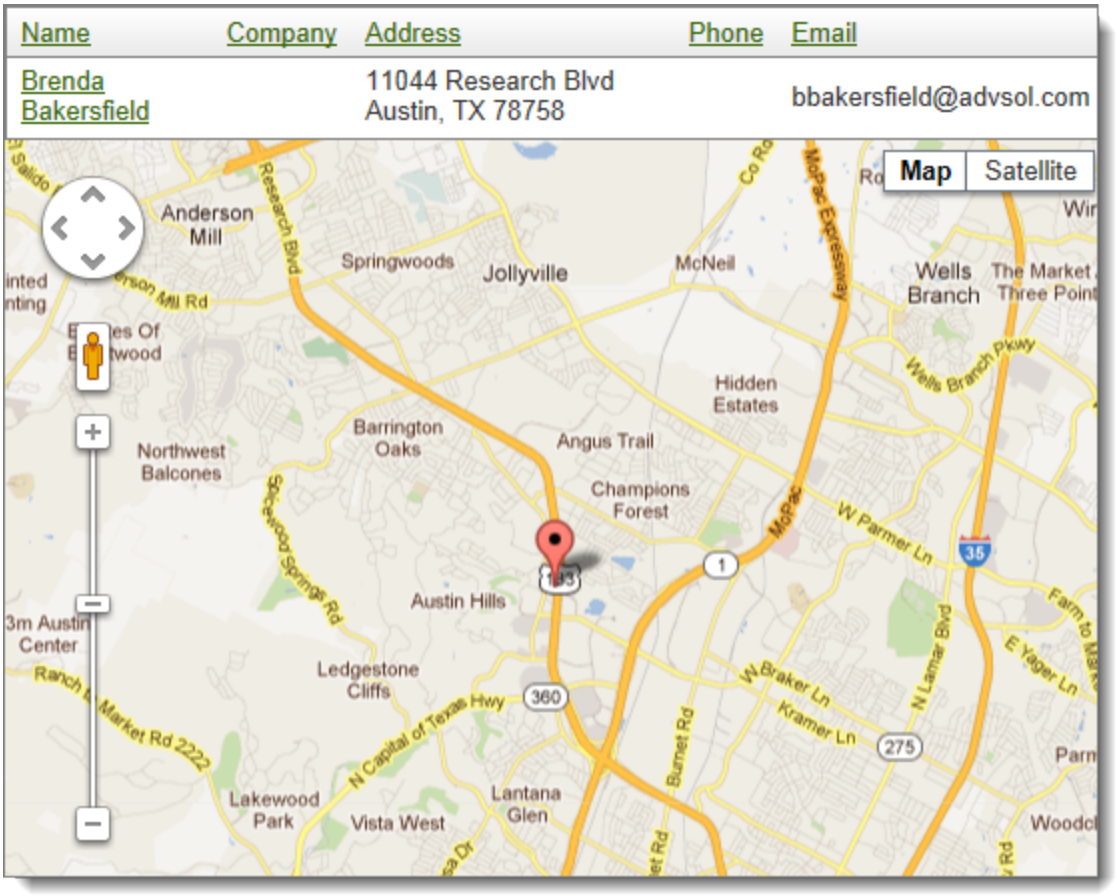
The Query Menu iPart lets you merge query results into your site for tremendous utility. You can set the iPart to display a query, set with whatever title, parameters, columns, labels, and sorting you need, and you can enable exports, which adds icons for sending the data to Word, Excel, PDF, and CSV.

You can also organize helpful queries into a folder and point the iPart to that folder. When the page loads, the iPart displays the first query at the top of that folder, and it presents a drop-down menu of additional queries available, organizing them by subfolders, if any. When the user clicks on a query from the menu, the iPart immediately runs that query and displays the results.



If the query selected contains an address property, you can configure the iPart to automatically map the query results when an address is available. Only one address property per query can be mapped. When this option is enabled, the iPart looks for the following

address properties in this order and maps the first one it finds: FullAddress, Address, FullAddressText, AddressText, Address Text, and Full Address Text.



Related Items iPart

With the Related Items iPart, you can display a list of profile or product pictures based on the results of an IQA query. For example, you can write a query to display the profile pictures of everyone who has registered for an event, made a donation, or ordered a particular product, or to display products in the same category. You can configure the list to display horizontally or vertically, to display a name for the item, and to choose the size of the image. You also have the option to make the profile picture a live link that opens a URL of your choosing, such as the member profile page.

Guidelines for working with the Related Items iPart

- The pictures displayed in the iPart are based on iMIS product or contact IDs. When creating the query for this iPart in IQA, you must select a property that returns an iMIS product or contact ID on the (Display tab). Give this property an Alias of key_Id (the Alias is case sensitive).
- To define the image to display for each record, include a column in your query that specifies the image file name for that record. Give this property an Alias of Image.
- To display a name for each record, include a column in your query for the name of the item or contact. Give this property an Alias of Name.
- When you add Display columns to the query in IQA, they become available within the iPart as Filter columns to filter on.
- You can dynamically filter the query results displayed in the iPart based on the value of another iPart's URL parameter. For example, you can set up your donation page to display the profile pictures of people that have donated to a particular cause (called a distribution in iMIS). The Donation Creator iPart uses the URL parameter itemid to determine which distribution the donation should go towards. If you add your iPart to the same content record as the Donation Creator, then you can set up the Related Items iPart to look at the value of itemid to determine which profile pictures to display. You just have to make sure that your query includes the CsActivity.Product Code property, so that you can select it as a Filter column on the iPart's configuration page. Once selected, enter itemid for the Filter on URL parameter, so that the iPart knows to filter the results based on that URL parameter's value.

  Example: Display other products in the same category

  In this example, the Related Items iPart is set up to display clickable images for other products in the same category as a particular product. This example uses content installed for the sample Member site.

  Go to Content Designer > Manage Content:

1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > RelatedItems. Select RelatedProducts.
4. Filter Options dropdown, select ProductCategory. ProductClassKey.
5. Filter on URL parameter, type in Category.Class.
6. For the Items link to (URL or shortcut), type in ItemDetail?iProductCode={key_Id}&Category={ProductCategory}.ItemDetail?iProductID={key_Id}&Class={ProductClassKey}. This uses the ItemDetail shortcut to link each item in the list to the product page. The particular item's product ID and category are specified in URL parameters so that the correct product and related products are displayed in the resulting product page.
7. Click Save & Publish to complete the content record.

Example: Display other users who have purchased a product

In this example, the Related Items iPart is set up to display clickable profile pictures of other users who have bought a particular product. This example uses content installed for the sample Member site.

Go to Content Designer > Manage Content:

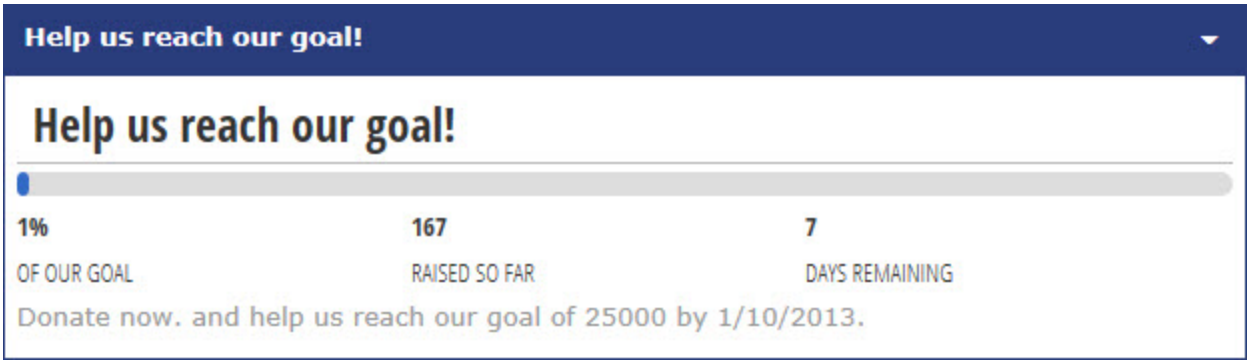
1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Content Types > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > QueryProfilePictureList. Select Orders.
4. Filter column dropdown, select ProductCode.
5. Filter on URL parameter, type in iProductCode. iProductID.
6. For the Items link to (URL or shortcut), type in MBR/Party.aspx. This redirector web page looks for an ID in the URL parameter and then checks the ID's party type and the user's permissions to determine which content record to display. The user's ID is appended to any URL specified in this field.
7. Click Save & Publish to complete the content record.

Progress Tracker iPart

With the Progress Tracker iPart, you can visually display progress towards a goal based on the results of an IQA query. For example, connect this iPart to a fundraising query, so that your members can easily track the progress of a fundraising effort towards a specific goal. Or connect it to an events query, so that you can see at a glance how many people have registered for an event.



To set up the Progress Tracker

1. Create a query for the Progress Tracker.

   Note: For sample queries that will work with this iPart, see $/Samples/ProgressTracker/ in IQA.

The Progress Tracker uses three pieces of information supplied by an IQA query: a goal amount, the sum total of what you are tracking, and the end date (which is optional). When you build your query for this iPart, it must contain specific aliases. In IQA, create a new query and choose the business object you want to query on. Make sure you are in Advanced Mode, then from the Display tab, choose properties to assign the following aliases to:

- Goal_Amount: Indicates which property is the goal amount. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST(25000 AS INT) as a property to set the goal amount to 25,000.
- Sum_Total: Indicates which property is the amount to be summed. The percentage displayed in the Progress Tracker is based on this amount compared to the goal. It can be a monetary amount or any other number, such as the number of event registrations.

  Tip: From the Function dropdown list for this property, select Sum, so that only one row is sent to the iPart. This is not required, but it will improve performance.
- End_Date: Indicates which property specifies the end date. This alias is only required if you want to display an end date in the iPart. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST('2012-12-25' AS DATE) as a property to set the end date to 25 December, 2012.

2. Add the iPart to a content record and configure it.

   Go to RiSE > Content designer > Manage content:

1. Do one of the following:

- Select a Content Folder and click Edit.
- Select New > Website Content.

2. Click add content.
3. Go to ContentTypes > Utility.
4. Select Progress Tracker.
5. Click OK.

6. Enter the iPart CSS class to style the Progress Tracker. Two styles have been pre-defined that you can use in the iPart: ProgressTracker and ProgressTracker2. You can edit these classes to change the look and feel, or you can create your own style for the Progress Tracker.
7. Select a Source query.
8. (optional) Select a data column by which you want to filter. You can use this feature to dynamically update your Progress Tracker, based on the value passed to it in the URL. If you choose to filter on a data column, then also enter the name of the URL parameter, which the iPart uses to identify the value to filter on. For example, to limit the results of an event query to a specific event, you can select the EventCode property and give the URL parameter a name such as EventCode. The progress displayed will then reflect only the event code which is included in the URL as EventCode=[EventCodeValue].
9. (optional) Enter any messages you want to appear in the iPart. The variables below can be used in the descriptions. For example, "Help us reach our goal of {0} new members by {2}!"
   - {0} displays the goal total
   - {1} displays the current sum total or count
   - {2} displays the end date in a long format
   - {3} displays the end date in a short format
10. Select the Caption Options. In addition to the progress bar, you can also display the values as text. If any of the Caption Options are unavailable after selecting a query, this indicates that the required aliases have not been defined in the query.
11. Select the Progress bar location. The bar can be displayed above or below the captions.

    Note: You can also use this iPart to display only a countdown (days remaining to a certain date). In configuration, only select the caption option Display days remaining, then for the Progress bar location, select (None).
12. Click OK.

SSRS Report iPart

The SSRS Report iPart lets you display the results of any IQA query on any page where you place it. The SSRS iPart uses the version 10.0 ReportViewer, which supports IE8 natively and, in IE8, adds a Print button on its toolbar. You can add the SSRS iPart to any content page using CM: open the Utility folder and choose the content type SSRS Report.

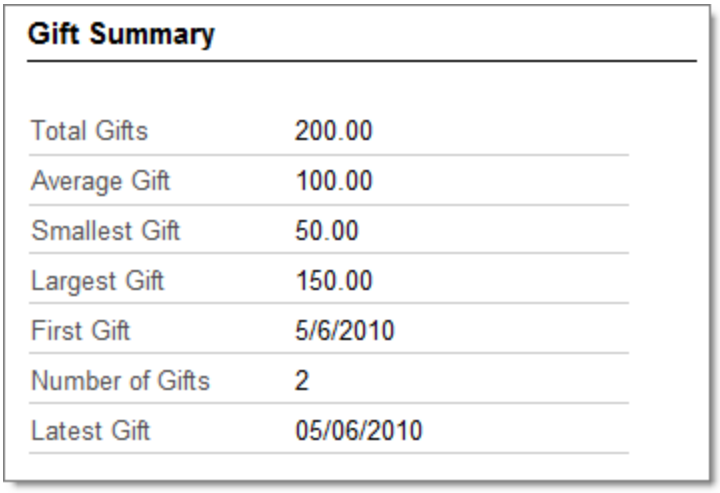
The iPart lets you customize whether to display the export buttons for PDF and Excel versions of the report. You can change the default design (layout, colors, fonts) of your reports by editing the SSRS parameters in the SystemConfig table.

How it works: The process engine specified by the iPart loads a report template (.RDL file) from the document system and creates a report data source (a DataTable) based on an IQA query's SQL source; the report viewer then combines the template and query to generate the report's output. When you configure the iPart, you specify the Document system path to the SSRS Report runtime, which must be a link to an SSRS Process Engine. Click the select link next to the textbox, then browse to your reports (such as $/Samples/ReportingServices), and pick one of the runtime entries.

Tip: Identify a process engine (run-time report) by the arrow on its icon!

Summary Display iPart

The Summary Display iPart displays a single row of query results in a form view.



Gift Summary

Total Gifts	200.00
Average Gift	100.00
Smallest Gift	50.00
Largest Gift	150.00
First Gift	5/6/2010
Number of Gifts	2
Latest Gift	05/06/2010

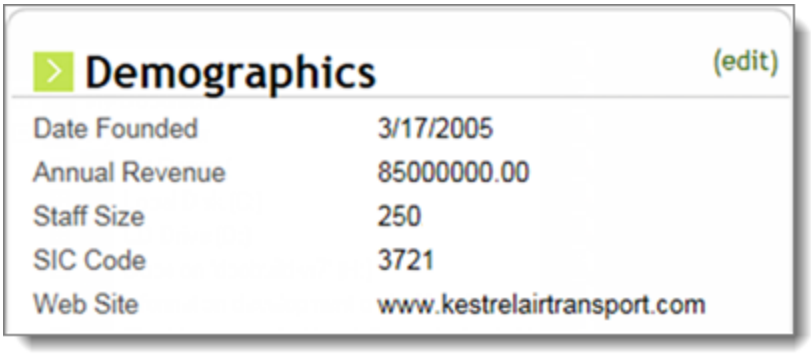
Guidelines for queries displayed in the Summary Display iPart

When creating a query that you want to display in the Summary Display iPart, keep the following guidelines in mind:

- This iPart only displays a single row of query results.
- If you connect the iPart to a query that returns more than one row of results, only the first row is displayed.
- Tip: You can dynamically filter your query results by the currently logged in user, a selected contact, or a date. See Adding dynamic filters to queries for more information.

Panels and custom data

Panels are custom displays of iMIS data that you are able to name, build, arrange in grids, and add to your site. Using panels, your users can browse, edit, add, and delete their data, as you specify:



Panels display within Panel iParts, which allows your users view and edit custom data on the broadest range of browser and platform types that iMIS supports. You can manage your custom data directly and conveniently from the web pages where you place these iParts:

- Panel Editor (which creates panels and shows one panel) --
- Panel Collection Editor (which combines existing panels into tabbed displays)

You can configure the iParts to let your users add and edit that data directly from their browser page. You can import your existing user-defined tables (from iMIS Customizer) directly from the Panel Editor iPart configuration. In addition, your Activity table data is

automatically available as a source, so that you can use and extend that data. Panel sources can include existing user-defined tables (defined in the UD_Table table) and user-defined sources (listed in the ObjectMetaData table).

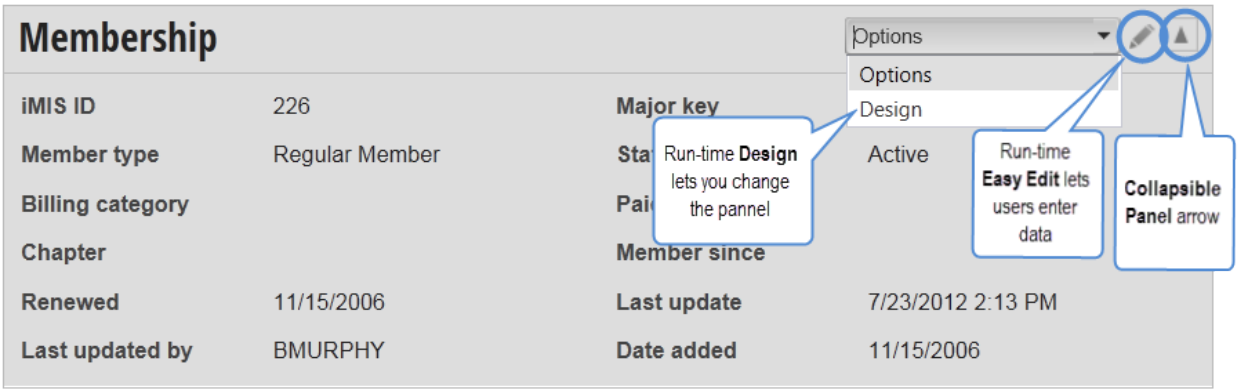
Tip: Panels are shared: when you update one panel, it updates within every iPart that uses it.

Creating custom panels of data

In a few clicks from your browser, you can have a new panel that displays the data you want, labeled and made editable as you need.

1. Enable Easy Edit by clicking on the button at the top right hand corner of the screen.
2. Once Easy Edit has been enabled, you will find and click the icon at the bottom left corner; this is the Content Designer.
3. From the Content Designer, click add content > ContentTypes > Content > Panel Editor
4. Select (New Panel) from the Panel drop-down menu.
5. Drag in and arrange your desired data, then Save & Publish.

   Once you have placed a panel iPart into a content record and published it, you can then edit the panel directly: As a system administrator, you see a run-time Design command, which lets you make quick changes to the panel, changes that save and publish for you automatically. For extensive panel work, such as to change the type of data it shows, use Easy Edit to access all of the content design features.



Best practices for panel layout

Here are key layout features to help you design the best use of screen real estate on the page:

- Multiple columns: Click + or – icons next to the panel layout to add/remove columns in your panel. For best display results, place multi-column panels into single-column content records.
- Hide in Summary View: Check this box on certain properties to trim the initial display of the iPart to the read-only information that is most useful. Only when users open the full window for viewing or adding/editing (as you configured it) do they see the additional information.
- Read-only: Check this box to provide information in read-only form while still allowing users to edit other information on the panel.

  Tip: To prevent editing of all of the properties, simply disable Allow users to edit on the iPart Configuration, rather than in the Panel definition.
- Collapsible panel: In order to maximize utility and minimize scrolling on the page, users are able to click on the arrow to expand and collapse iParts.

  Tip: Be sure to add an optional Title to any iPart that you make collapsible, so that title bar text guides your users as to what information they will access by clicking Show.

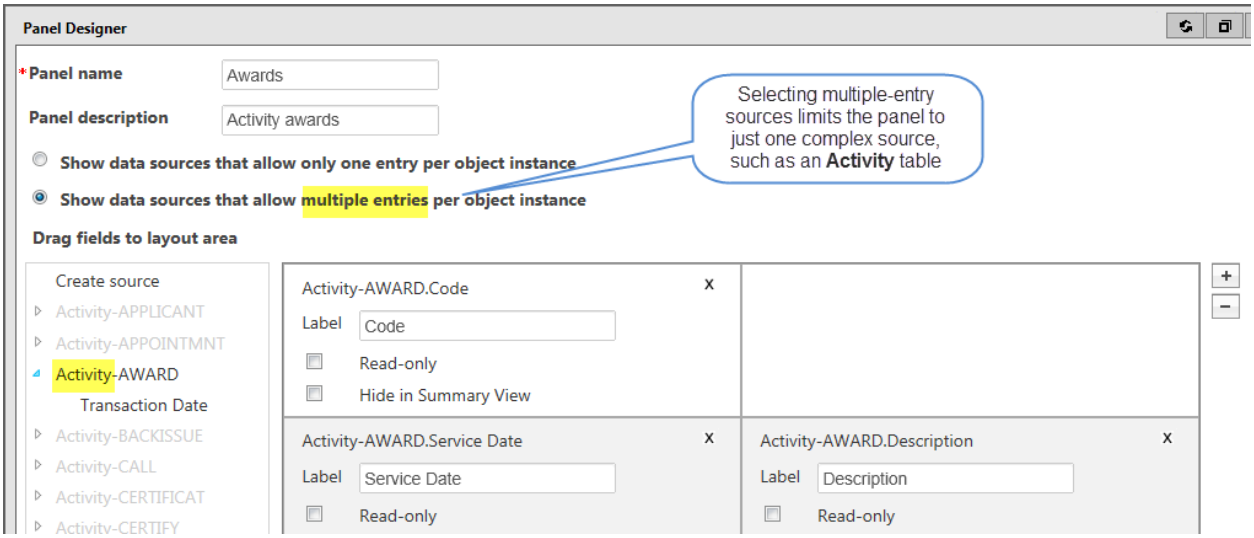
  Panels for Activity data

  Most organizations need to show activity information on their websites. All of the Activity data in your iMIS database appears as complex (multi-entry) sources when you use Panels.

  Suppose you created new award types in the general lookup table called AWARDS and want to add them to a page for dynamic editing. In a few clicks, you can have exactly that:

1. Enable surf-to-edit.
2. Click add content.
3. Go to ContentTypes > Panel Editor.

4. Click OK.
5. In the Panel list, select (New panel).
6. Select Show data sources that allow multiple entries per object instance.
7. Drag in your new data sources.
8. Click Save & Close.
9. Select Allow users to edit.
10. Click OK.
11. Click Save & Publish.



All of your Activity data appears as available sources when you select multiple entries for the type of data source.

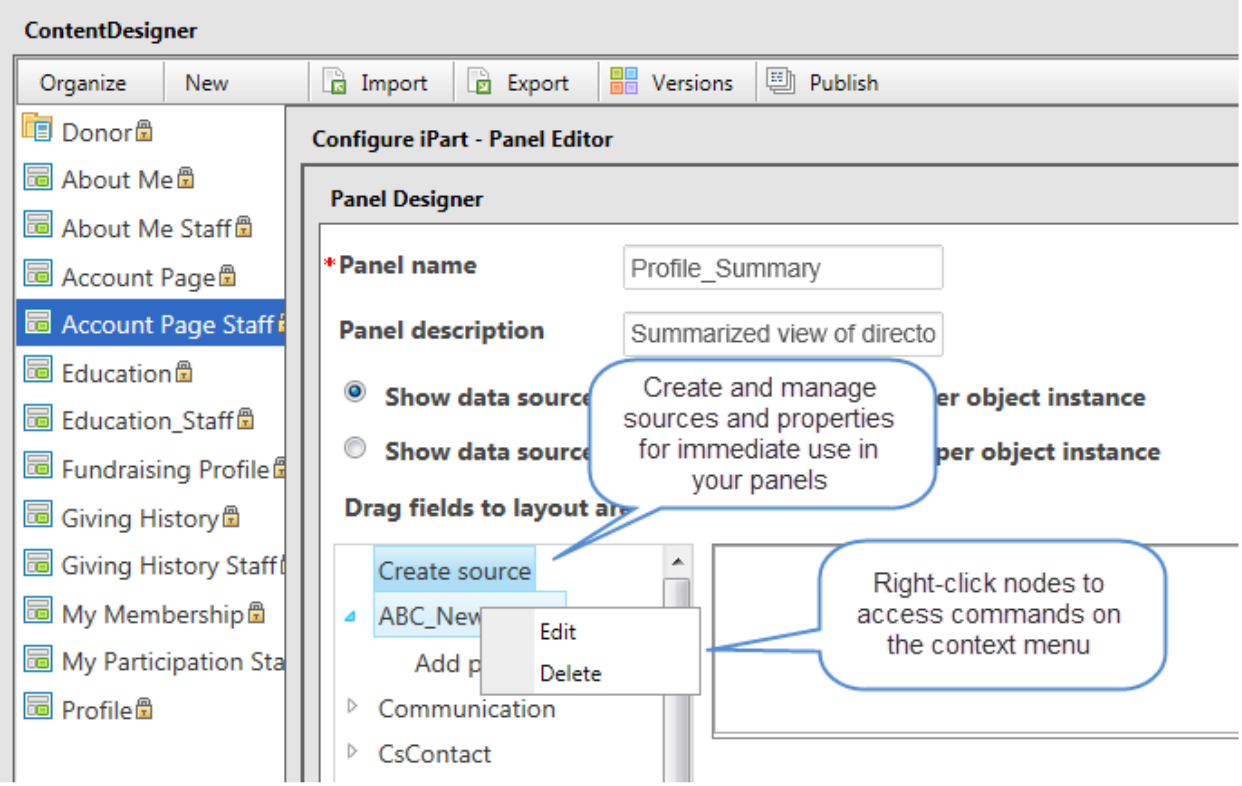
Tip: If you want to combine data from different sources, be sure to show simple sources (the first radio button option). Only one complex table can display in a panel, so the others are grayed out as long as any one of them has properties placed in the panel.

Defining your own data with Panel Designer

With the Panel Designer, you can not only craft reusable panels that combine fields from many tables, but you can also define new data structures (business objects and

properties) to manage information for your organization. Without special tools or knowledge of the iMIS schema, you can add data sources on the fly, right from your browser. When you save the panel, you have saved your newly created data sources as iMIS business objects.

Tip: You can see your new data source show up as a business object in Business Object Designer, but it will be read-only: continue to edit and manage these special sources in Panel Designer itself.



Access the Panel Designer by editing or creating a panel in a Panel Editor iPart.

To create a new panel source and properties

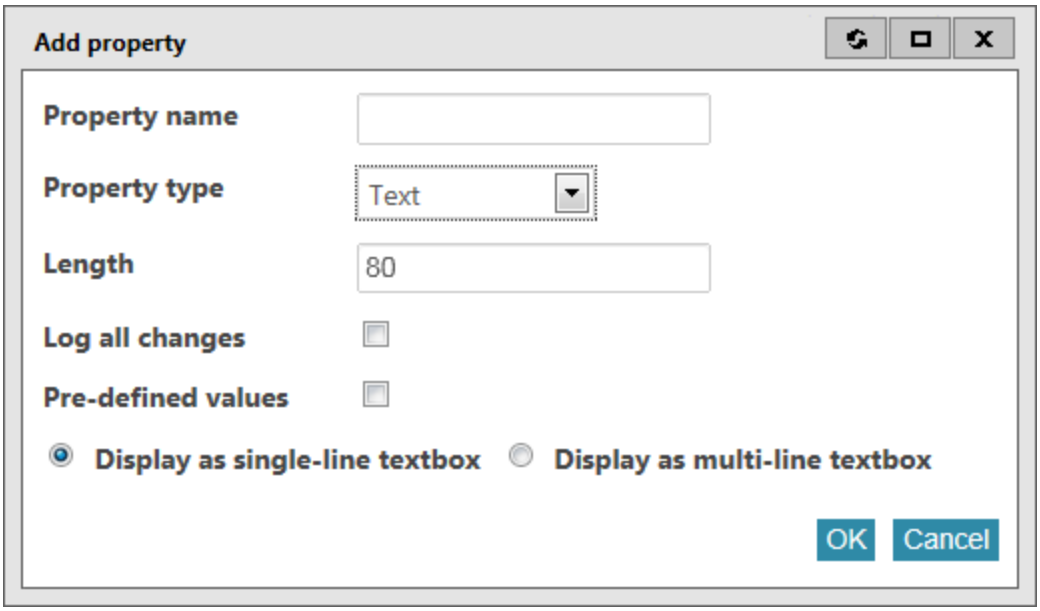
To create your own data source with properties, you work within Panel Designer. Each new source you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

1. Select New > Website Content.
2. Click add content.
3. Go to ContentTypes > Content.
4. Select Panel Editor.
5. Click OK.
6. From the Panel drop-down list, select (New panel).
7. At the top of the source tree, select Create Source.
8. Choose a Name for each new Source that meets these criteria and click OK:

- Starts with a letter
- Contains only letters, numbers, and underscores
- Is unique across iMIS, not matching any existing iMIS data or SQL Reserved Words

  Tip: Use an organizational prefix (such as ABC_*) so that your sources are unique, sort together in the tree view, and are easy to identify as ones that you created.

9. Select Add Property for the new source added.



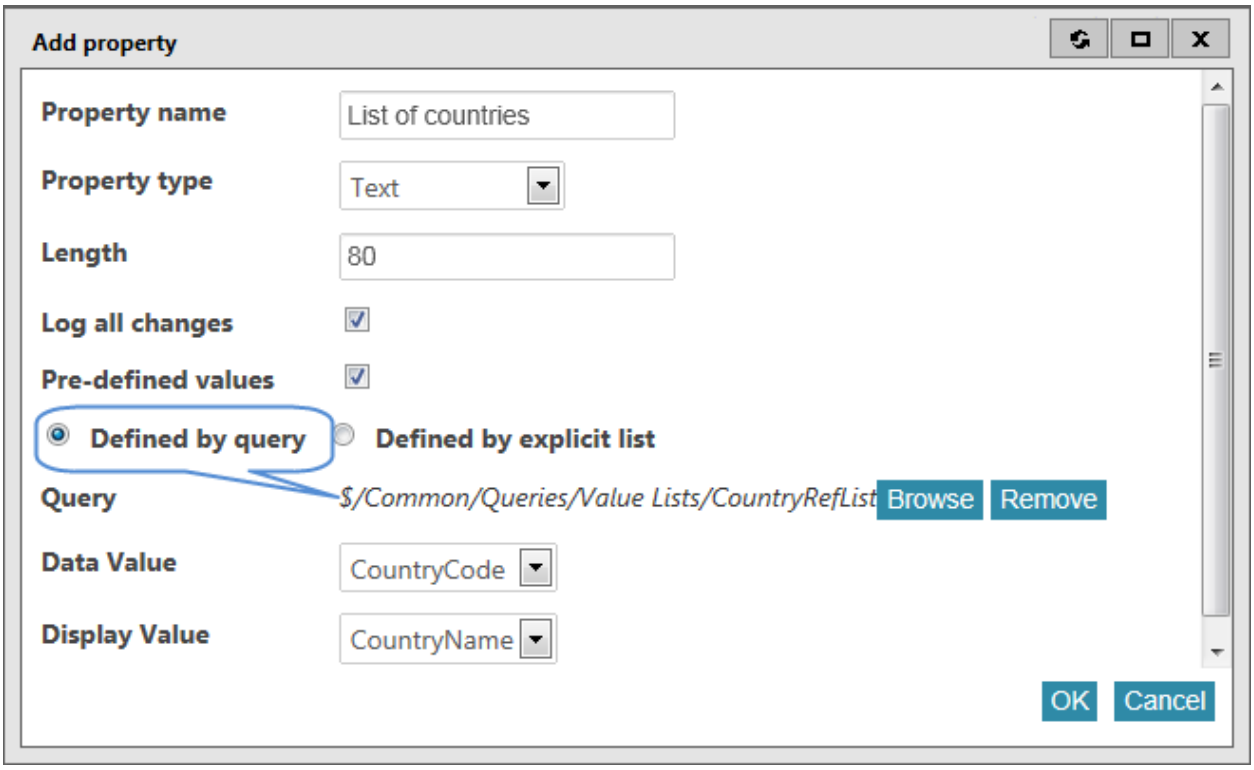
10. Enter a Property Name.
    - Starts with a letter
    - Contains only letters, numbers, and underscores
    - Is unique within its Source
11. Choose a property type that best fits your purpose, within these valid ranges:
    - Currency: 19 total digits (precision), with 4 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Date, Date and Time, Time: January 1st, 1753, through December 31st, 9999
    - Decimal: 28 total digits (precision), with 12 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Email: Creates a mailto link, which launches the user's default mail application when selected.
    - Integer: -2,147,483,648 to 2,147,483,647 (±2 billion)
    - Text: By default, the Text Property type allows:
    - Free-form entry up to 400 characters (defaults to 80). You can select to display the text-box as a single line or multi-line textbox.
    - Pre-defined values from a query or explicit list that display as a drop-down list at runtime:
    - Query – For example, you may want to use a query that returns a list of countries.
    - Explicit List – For example, you can add a list of colors the user can select as their favor-ite.
    - URL: Creates a live hyperlink, which launches a new instance of the browser to open the link when selected.
    - Yes/No: Boolean

12. Enable the Log all changes if you want to track any data change made to the property you are adding.

    Hint: Add the Change History Display iPart to a content record if you want to display data changes made in the Name and Name_Fin tables as well business objects.

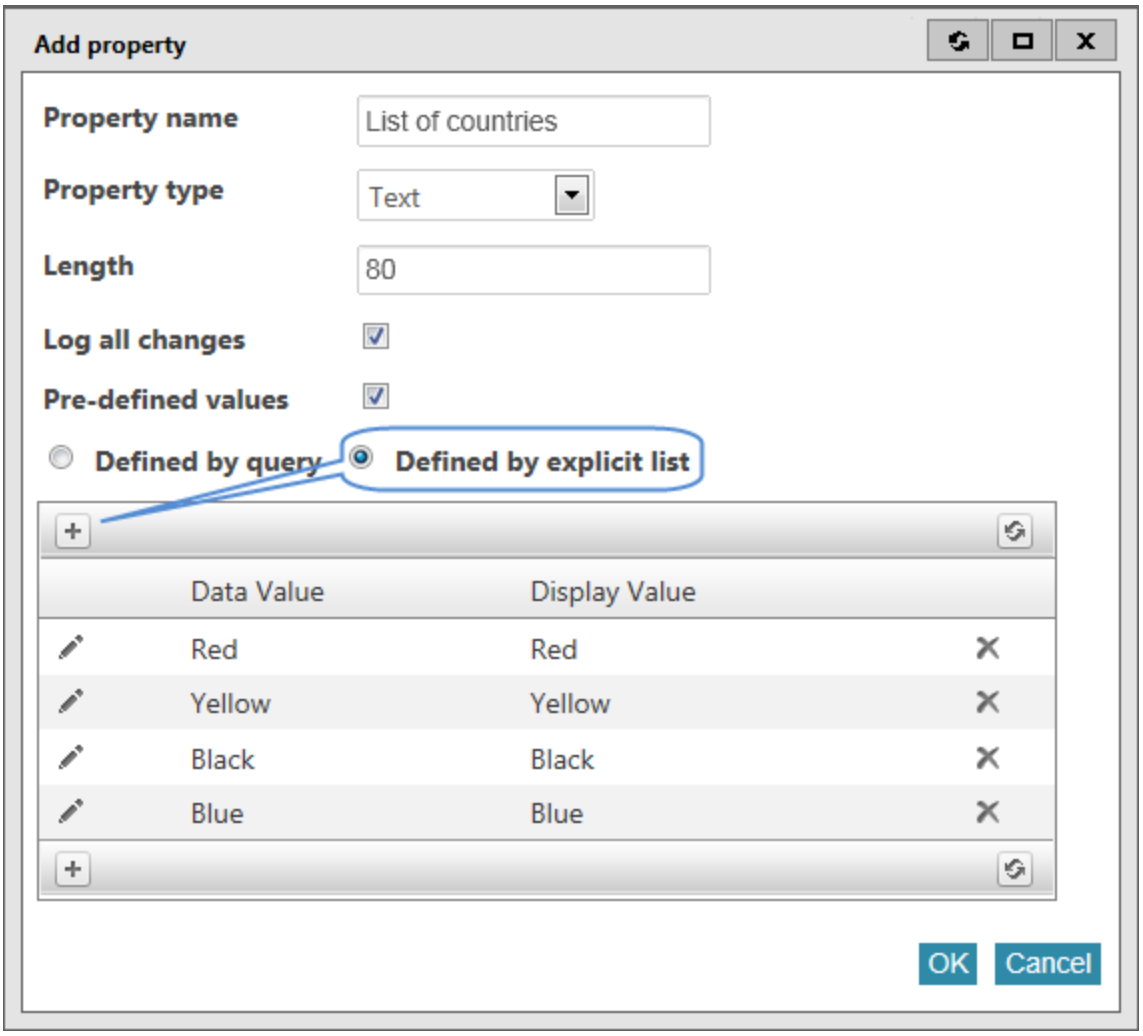
13. (Text Property type only) The Pre-defined values option allows you to present a list from which the user can select.

- The Query option provides validation-type properties based on the query results. For example, instead of typing out a list of countries, you could select a query that displays country values.
- Enable the Pre-defined values checkbox and select the Defined by query option.
- Click Browse, select a query, and click OK.
- Two additional fields display, Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel. For example, the country code may not be as clear as the country name.
- Select the fields from the drop-down list in the Data Value and Display Value fields.
- Click OK.



- The Explicit List option allows you to create a list to display on the panel. For example, you may want a user to select their favorite color.
- Enable the Pre-defined values checkbox and select the Defined by explicit option. A table grid displays.
- Click + to add a data row. The data row contains two icons: Insert and Cancel, and two fields: Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel.
- Enter the appropriate values in the Data Value and Display Value fields.
- Click the checkmark located to the left of the data row.
- Click + to add additional data rows.

- Click OK.



14. Drag the field(s) to the layout area.
15. Save the panel to save the source and properties. Once you save a property, you cannot rename it. Note that the sources will alphabetize properly on reopening.

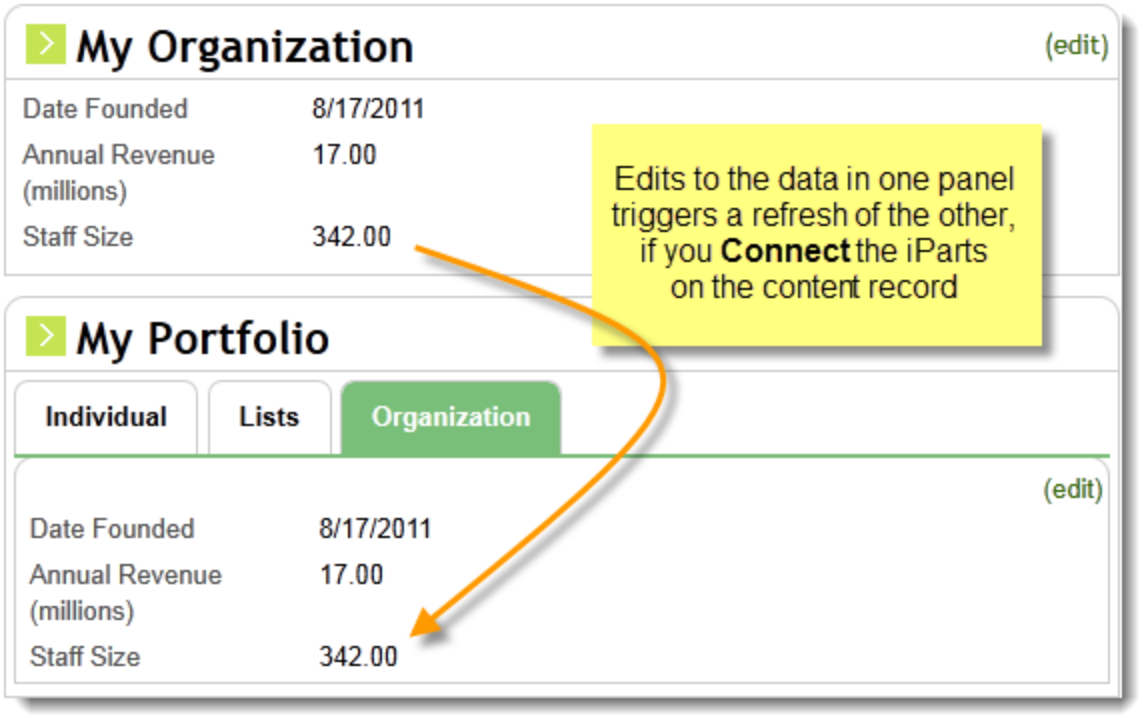
    Each new property you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object property is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

    Tip: Do not save until you create all of the properties. This way, you can view them as a set of properties and improve your naming convention before it is finalized.

16. Save and close the Panel Designer window.
17. Save & Publish the content record.

Connecting iParts to refresh panels

When you combine panel-displaying iParts on the same content record, data might appear out of sync after the user edits it, if both panels display the same property. You can solve this refresh problem through the iPart's Connect feature, which you enable separately from Configure.



Note: Check an iPart's Configuration Help topic to find out if it supports any connection options. An iPart has no connection support (neither consumer nor provider) unless its author added it.

To connect panels for dynamic updating

1. Edit a content record and add two user-editable iParts that display panels (Panel Editor, Panel Collection Editor).
2. Set up the first connection:

- From the first iPart's title-bar menu, select Connect.

  The Connect box that opens shows you any current connections and lets you disconnect them.

- Select Create a new connection.

  The Connect box that pops up prompts you to create one of four connection types.

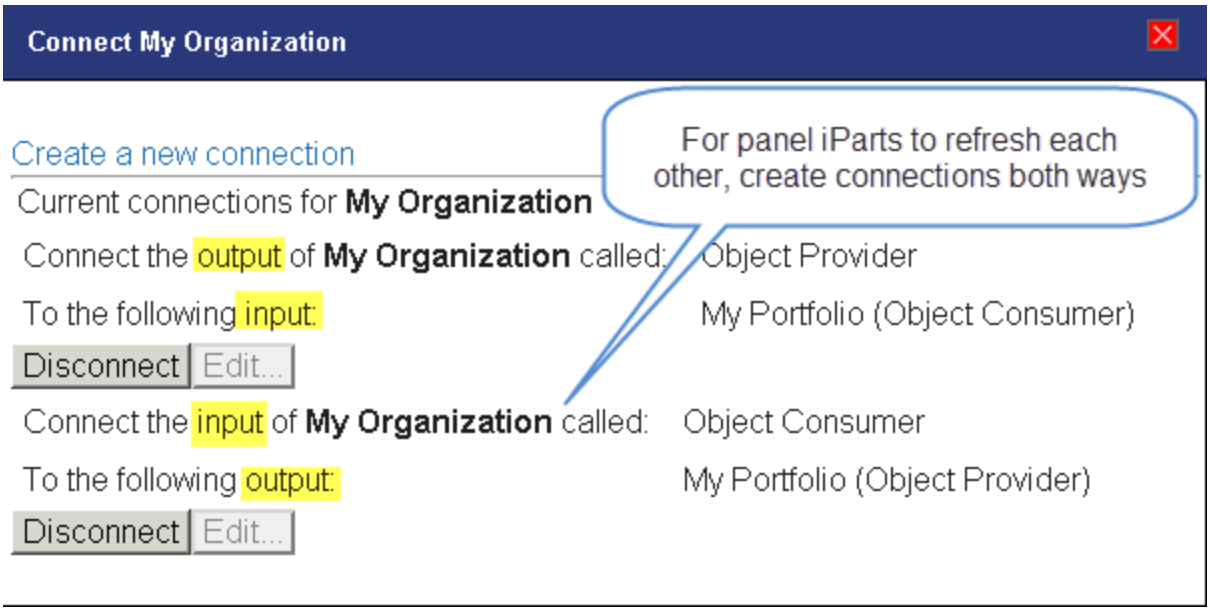
  Tip: Do not be misled by the language of connection. The Consumer is the actor that triggers a refresh on another iPart, and the Provider provides a pointer to itself to the Consumer.

- From the Object Consumer drop list, select the panel iPart you want to refresh.
- Select Connect.

3. Set up the second connection:

- From the second iPart's title-bar menu, select Connect, and select Create a new connection.
- From the Object Consumer drop list, select the first iPart.
- Select Connect.

  You should see a pair of connections, for mutual refreshing.



4. Save and Publish the content record.

Adding existing business objects to panels

Panel Designer lets you create new data sources on the fly, access any user-defined tables, and make full use of the Activity table. It can also display your existing business objects, if they meet these requirements and configuration settings:

Referencing existing business objects

Panel Designer can display existing business objects that have a ContactKey or ID property. When ContactKey or ID is the primary key, Panel Designer treats it as a single-instance table; otherwise, it assumes it to be multi-instance.

Panel Designer cannot display your business objects until you add them to the ObjectMetaData table. While attached to the iMIS database in SQL Server Management Studio, run this SQL statement:

INSERT INTO [dbo].[ObjectMetaData] (ObjectName, RelatedToEntity, IsUserDefined, IsMultiInstance)

VALUES ('MyObject', 'Party', 0, 0)

- Replace MyObject with the name of the business object, table, or view that is related to Party.
- Change the last value to 1 if it is multi-instance.

Settings for Business Object Designer (BOD)

1. In Business Object Designer, edit your object and open the BOD (Properties tab) > (Display tab).
2. To make a property available to your panels, enable its Available to UI? option.

   Tip: To see your BOD changes immediately, restart IIS.
3. To enable multiple selection for a property, select Check box(es) under Display Control so that you can enable the Allow multiple selection? option.
4. To enable HTML editing, select HTML Editor under Display Control. Be sure to use the property in a single-column panel to provide the control adequate width.

   Troubleshooting

   If you get an error when creating a new data instance at runtime (either single- or multi-instance), check that your business object does not have a 'Read-only' constraint set on the ContactKey or ID property's Definition tab.

Connecting picture iParts to Facebook

You can set up the Contact Mini Profile and Contact Profile Picture iParts to prompt people to use their Facebook profile picture in iMIS, instead of uploading a picture. To use this feature, you must do the following:

- Contact your Hosting Administrator to enable Enable the Facebook feature in the web.config file
- Create a Facebook app so that your website can connect to Facebook
- Enable the iPart configuration option to Prompt for Facebook connection

When enabled, signed in users are prompted to connect to Facebook when they edit their profile picture and wherever their profile picture is displayed.

To create your Facebook application and use it in iMIS

1. Contact your Hosting Administrator to request that they do the following: Edit your web-site's web.config file, located by default in C:\Program Files\ASI\imis\net. Find the EnableFacebookApi property, and change the value to true.
2. Create your Facebook application.

- Log in to the Facebook Developers site.
- Click +Create New App.
- Enter an appropriate App Display Name and App Namespace for your organization. Only the App Display Name will be visible to users.
- Click Continue and complete your App creation.
- On the Basic info page for your App, enter the Site URL for your iMIS application.
- Take note of the App ID Facebook has created for you.

3. Contact your Hosting Administrator to request that they do the following: Add your Face-book App information to the required iMIS JavaScript.

- Edit your iMIS Facebook.js file using a text editor. By default it is located in C:\Program Files\ASI\imis\Net\AsiCommon\Scripts\SocialMedia.
- Find the appId value and update it with the ID issued to you by Facebook.

To load the Facebook API

1. Edit your website's master page. By default it is located in C:\Program Files\ASI\im-is\Net\App_Themes.
2. Add the following html within the <body></body> tags of your master page:

To enable the Facebook connection in iParts

Configure each instance of the Contact Mini Profile and Contact Profile Picture iParts used in your website to enable the options Allow picture change and removal and Prompt for Facebook connection.

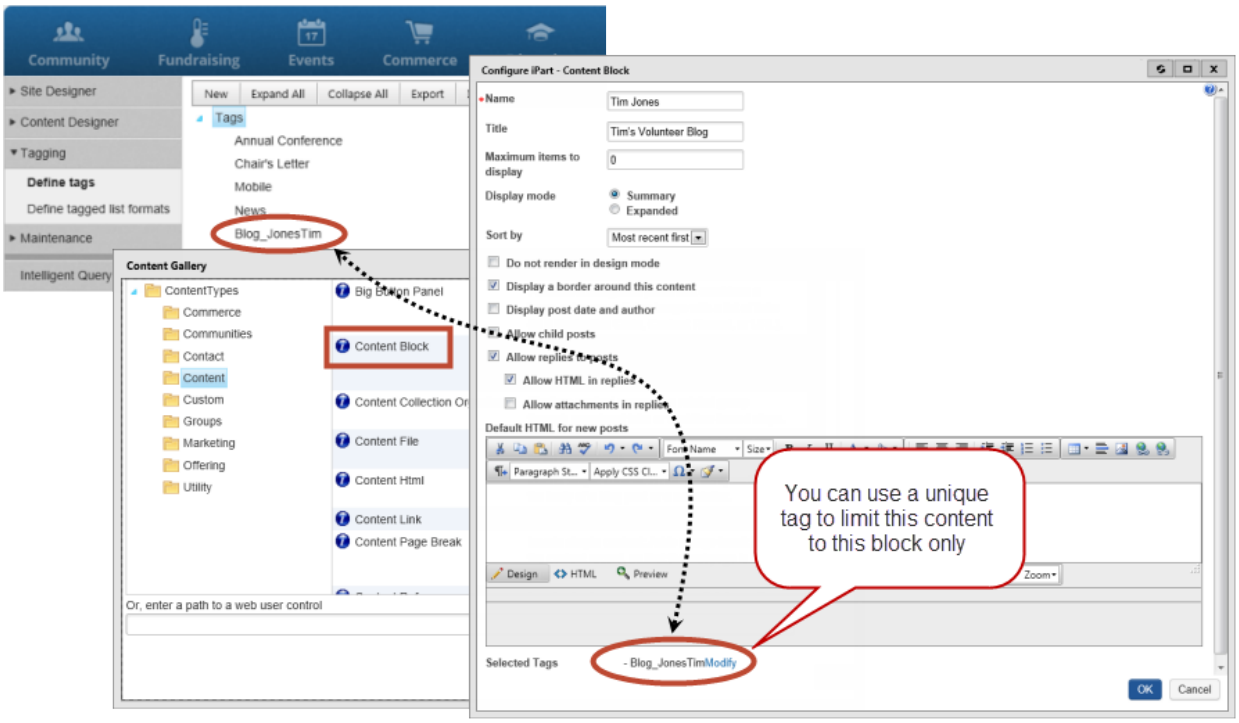
Note: When the Facebook feature is disabled in the web.config file, the Facebook options do not appear in the Contact Mini Profile or Contact Profile Picture iParts.

Using the Content Block iPart

With the Content Block iPart, you can empower authorized users to create and edit content directly on a page, without using Surf-to-Edit or accessing Tools. Through iPart configuration, you can allow users to insert HTML content, add attachments, create child pages, and submit replies. At its simplest, a content block can be HTML that is read-only unless the user has permissions to see the edit command. At its most complex, a block can act as a message board with multiple posts, child posts, and replies. You can limit the number of posts to a set number, or you can leave it at the default (zero), which lets it grow indefinitely.

Tagging to filter content

To control what content appears in a Content Block, you create tags specific to ContentBlock Items and apply those tags to specific instances of the iPart. For example, if you want to create a new blog for Tim Jones, you could create a ContentBlock tag such as blog-JonesT, place a new Content Block iPart on a content record, and configure the iPart to display the tag blog-JonesT. Now the content that Tim authors in this blog will be unique to his+ blog, if you do not apply this tag anywhere else:



Content created with anything other than a Content Block iPart will not be displayed, even if it has the same tag. For example, a content record containing HTML tagged with News will not show up in a Content Block that is also using the News tag.

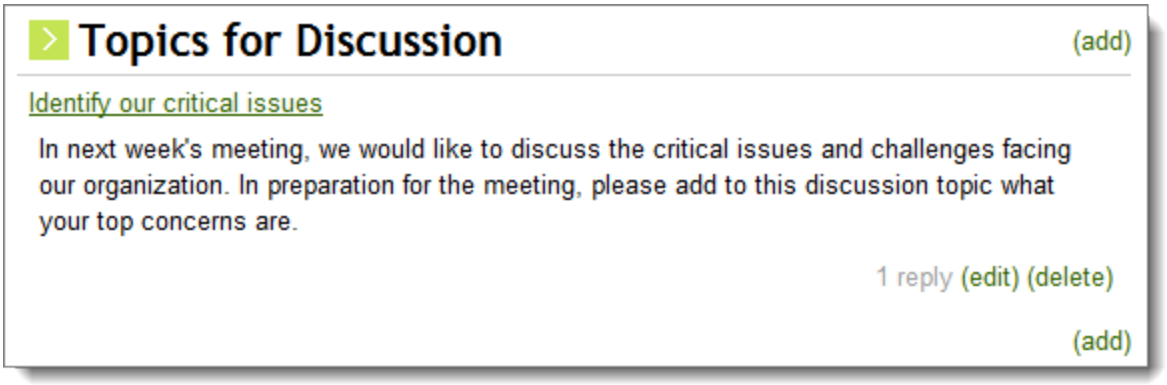
Best practice: Plan for and create the tags you want to use before configuring your Content Block iParts. Content can seem to disappear if you change the tags assigned to a content block already in use, because it no longer matches the tag set currently configured.

Creating a message board

Only users with the Content Editor permission may create posts and children, but any authenticated users can reply to a post and edit or delete their own replies. Any authenticated user may create posts and children, reply to a post and edit or delete their own replies.

To use the Content Block as a message board with multiple posts, child posts, and replies, make use of the following configuration options:

- Maximum items to display - Choose the maximum number of posts that will be displayed; 0 indicates an unlimited number of posts.
- Display mode - Expanded display mode will display replies and child posts in-line, while Summary mode only shows replies and child posts when the post is opened.
- Allow child posts - Allow Content Editors to add a child post to existing content. Allow any authenticated user to add a child post to existing content.
- Allow replies to posts - Allow authenticated users to reply to posts; you may indicate whether to allow HTML and/or attachments in the replies.



Content Block iPart set up as a discussion board

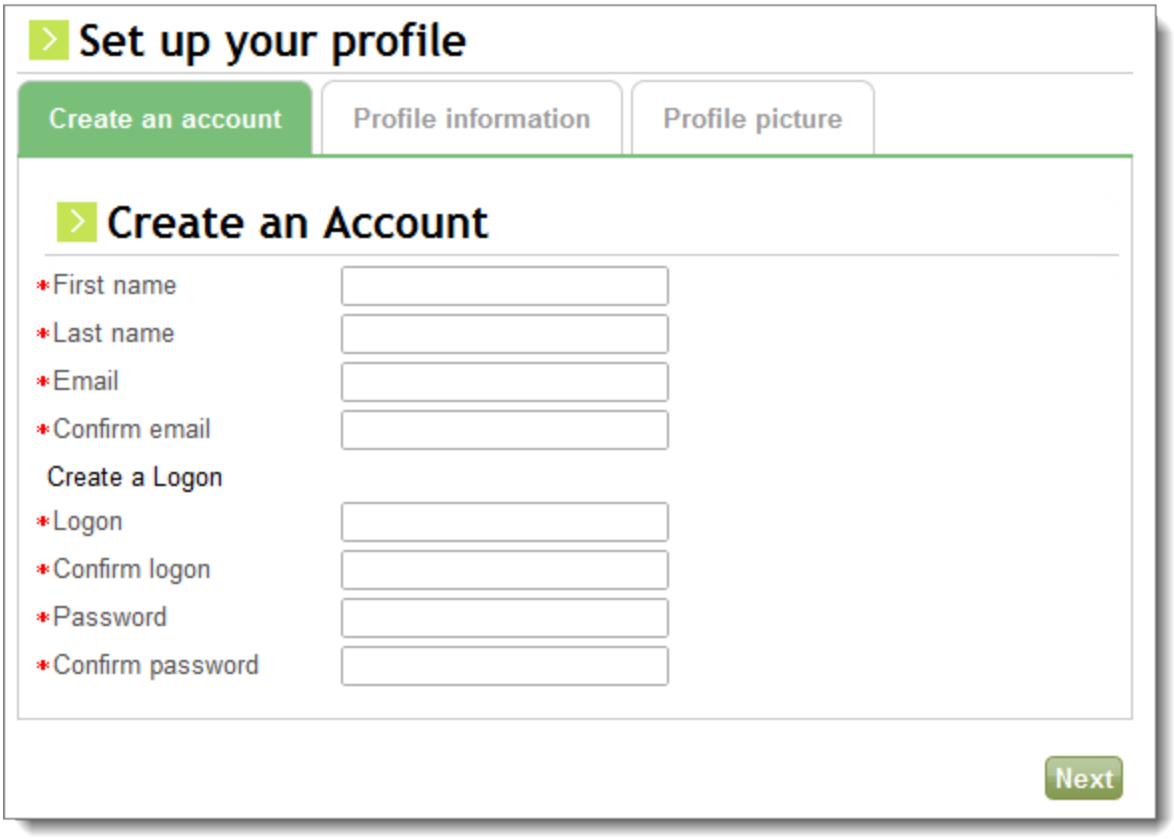
Using the Content Collection Organizer

Use the Content Collection Organizer to create a collection of pages and assign names to the tabs or headers for each page. In the simplest example, those pages are displayed,

the user can access tabs in any order desired, and information is saved independently on each page. The following screenshot shows an example with tabs across the top, configured to display different content pages.

Using the Content Collection Organizer as a Wizard

You can configure the Content Collection Organizer to function as a wizard, which will guide the user through multiple steps. When enabled, Next and Previous buttons display, allowing users to navigate between the steps, as shown below. The user can navigate to any previous tab, but forward only to the next tab in the workflow sequence. The user can also navigate with the browser's Forward and Back buttons, but the data does not commit until the user clicks Next.



Each page in the workflow is validated when the user clicks the Next button. Each iPart's page.Validate method is processed in the order the iParts appear on the page. The order of calls is:

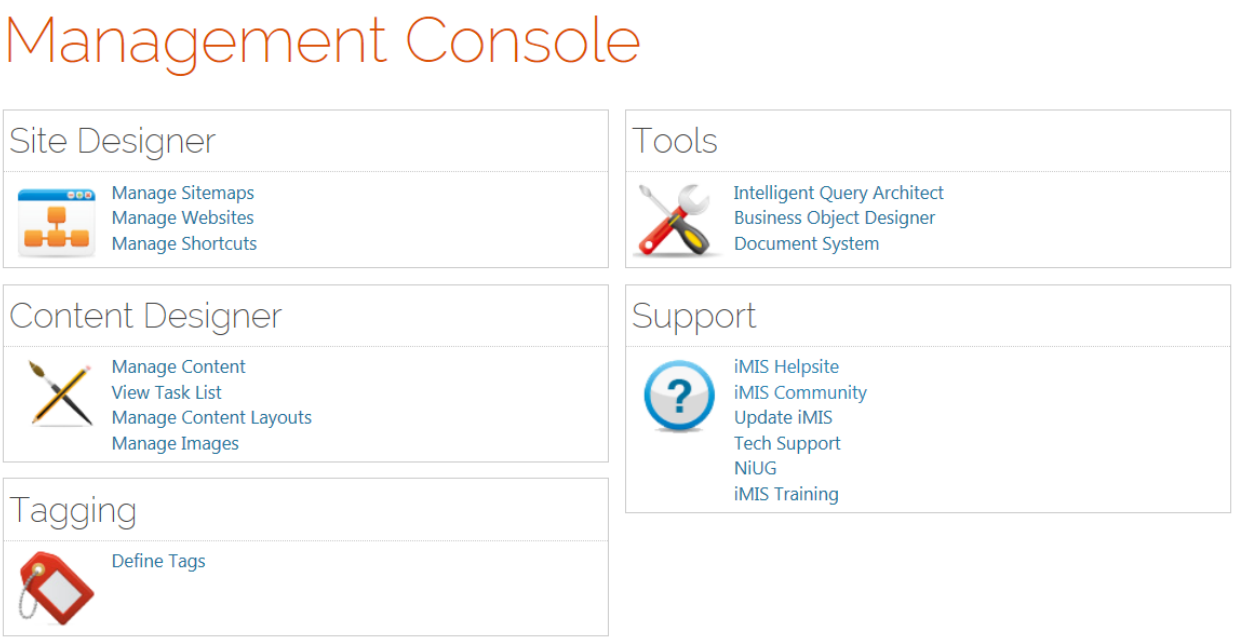
- Validation
- If Validation passes, then PreCommit
- If PreCommit passes, then Commit

If any of the calls fail (the data on a page is incomplete or incorrect), then an error message displays and the user cannot move to the next step until it is corrected.

Using the Big Button Panel iPart

With the Big Button Panel iPart, you can display a navigation panel that combines a larger, category-defining image with a list of links, as shown in the screenshot below. You

can also use this iPart to create links that make it easy for staff to perform routine tasks for contacts such as running reports, registering for events, and ordering on their behalf.



Example: Working On Behalf Of contacts and running reports using the Big Button Panel

In this example, we will set up the Big Button Panel on the account page, so that staff can select a contact from the Directory, then quickly run a report, register for an event, make a donation, or order a product for that contact.

1. Edit the account page that displays after a staff user selects a contact from your directory. In the Member site, it is the Account Page Staff content record.
2. Add the Big Button Panel (add content > ContentTypes > Content > Big Button Panel) iPart to the content record and configure it with the following settings:

- Mode: Actions
- Add an action link to run a report:
- Link Text: Print Info
- Link Target: Enter a link to a page that contains the SSRS Report iPart that displays a report such as $/Samples/ReportingServices/MemberProfileQuery_Report.

Note: The SSRS Report iPart must be configured to Hide the parameters section and to enable the option to Inspect query string for parameters. Do not enable the option to Inspect Session for parameters. For more information about SSRS reports, see Creating SSRS reports.

- URL Parameter: ContactKey=@SelectedUser
- Add an action link for event registrations:
- Link Text: Register for an event

  Note: Customize this text for the event you want to register the contact for. For example, Register for the Spring Conference.
- Link Target: Enter a link to the event page
- URL Parameter: EventKey=XYZ (replace XYZ with an event code) EventKey=XYZ (replace XYZ with an event key)
- Use On Behalf Of: Enable
- Add an action link for donations:
- Link Text: Make a donation
- Link Target: Enter a link to your donation page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable
- Add an action link for the shop:
- Link Text: Purchase a product
- Link Target: Enter a link to your Shop page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable

3. Save and Publish the account page.

Using the Group List Editor iPart

The Group List Editor provides a flexible tool for you to display and manage lists of groups, sub-groups, relationships, and/or memberships. You can configure it to serve several different purposes.

Display an organization's roster

A common use for the Group List Editor is to display a list of contacts that belong to an organization.

For example, add the iPart to an organization's profile page, so that the iPart displays memberships for the selected organization. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the roster
- Clicking on a contact opens their profile page: Enable to link contact names directly to their profile page
- Provide option to view and edit membership details: If you want users to have easy access to both the account pages and the Group Member Detail window, also enable this option. Users can click an icon to switch between these options.
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups owned by the parent ID and their members
- Choose the group types to include: Organization
- Automatically create a group if one does not exist: Enable if you have allowed editing (this allows the creation of new rosters)
- Group owner type: Party
- Group type to auto-create: Company
- Choose the group types to include: Ensure that Company is selected

Display a contact's memberships

Another common use for the Group List Editor is to display a list of a contact's memberships in groups such as committees and chapters.

For example, add the iPart to a contact's profile page, so that the iPart displays memberships for the selected contact. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the contact's memberships
- Clicking on a contact opens their profile page: Not applicable
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups that the parent ID is a member of
- Choose the group types to include: Select the group types you want to display, such as Chapters and/or Sections

Relationships in the Group List Editor

You can easily create a link between two contacts using the Group List Editor iPart. The relationships you define show up on the record of both contacts, and you can specify roles for one or both of the contacts. For example, if you edit Jean Smith's record to indicate that she knows Russell Smith, then that relationship will also appear in Russell Smith's record. Alternately, if you edit Jean's record to indicate that Russell is her child, you can also specify that her role is the parent of Russell. Then Russell's record will reflect that Jean is his parent.

There is no limit to the number of relationships you can create or the types of relationships you can create. We have provided a few relationship types out-of-the-box, but you can add additional ones if needed.

Only users with System Administrator or Staff privileges can create relationships between contacts, but any user can view a list of relationships.

Note: To use this relationship feature, you must have the RELATION license.

The following sections walk you through how to create relationship types and how to set up the Group List Editor to display relationships.

Creating relationship types groups and roles

Edit the Customer setup table for Relationship types, adding the relationships that you want to have available in the Group List Editor. For each relationship type you add, you can also define a Reciprocal relationship, which the Group List Editor automatically populates as a set (such as for Parent and Child).

To display and edit relationships in the Group List Editor, you must define a Relationship Group and Roles (relationship types) associated with that group. A sample relationship group type named Connections has been provided. You can create your own group type from Setup > Groups > Types. If you create your own group type, the only requirement is that you select the Relationship Group checkbox, so that the Group List Editor can properly display relationships.

To create Roles used in relationship groups

1. Decide which relationships you want to be able to define for users. For example, Parent-Child, Husband-Wife, etc.
2. Create Roles for each relationship type.

- From Setup > Groups > Roles, click add.
- Enter the Name of the Role and a Description of the role.
- Select the Active checkbox.
- (optional) Select a default Reciprocal Role for this role. For example, if you are creating a Parent role, you may consider selecting Child as the default Reciprocal Role, so that it is automatically selected when someone defines a Parent relationship. If the Reciprocal Role you want to add is not in the list, create it first, then add it to this role.
- Save and repeat for each relationship role you want to define.

3. Edit your relationships group (for example, the group Connections) to add the roles you have defined.

To set up the Group List Editor to display relationships

1. Add the Group List Editor iPart to a content record on which you want to display a list of a contact's relationships. For example, add it to an account page. The iPart displays a list of relationships for the currently selected contact. The selected contact is determined by either a contact ID passed to the page via a URL parameter (from the Directory, for example), the contact selected in the On Behalf Of control, or the currently signed in user.

   Note: For help adding iParts, please see Creating Custom Panels of Data.

2. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit relationships
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Both of the above
- Automatically create a group if one does not exist: Enable
- Group owner type: Party Choose the group types to include: Select Relationships
- Group type to auto-create: Select a relationship group, like Connections
- Choose the group types to include: Ensure that Connections is already selected.

  Note: Only the relationship group type selected to auto-create may be edited. For this reason, if Allow editing is selected, we recommend including only the one relationship group type in this instance of the iPart.

3. Save and Publish the content record.

Using the Content HTML iPart

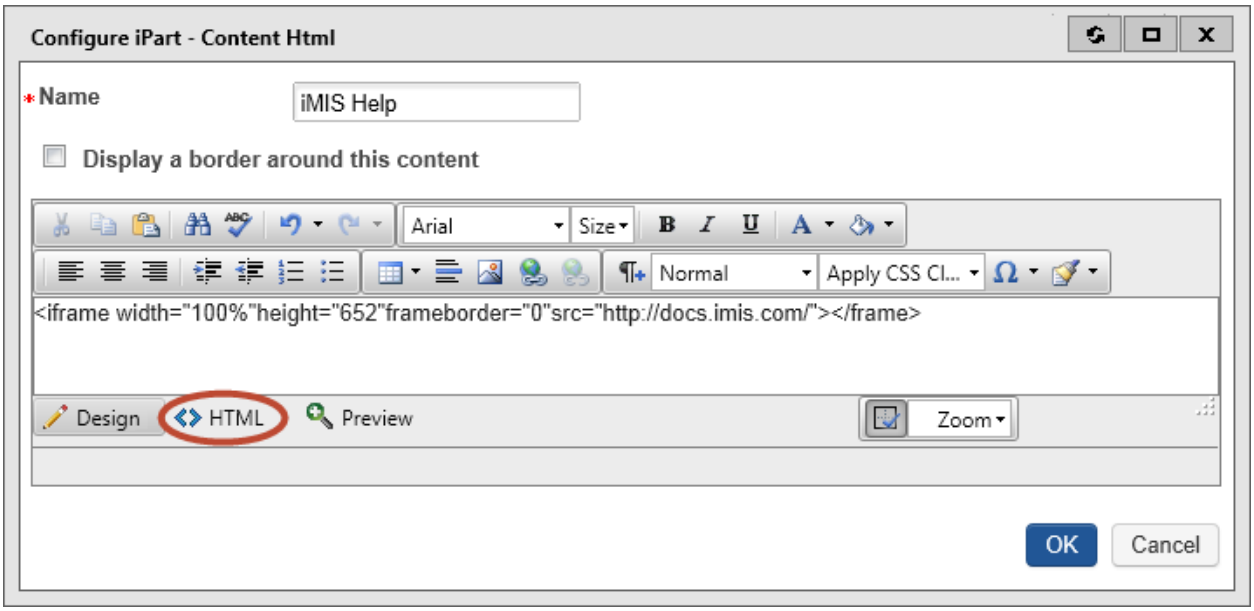
Using the Content HTML iPart, you can add simple content to your website, anywhere you want. In addition to the WYSIWYG functionality, you can switch to HTML mode to insert JavaScript to embed other sites, display web widgets, and use variables to create relative paths.

Embedding external sites

To embed any external page into an iMIS site, you can use an <iframe> like this:

1. Go to Content designer, Manage content and create a new content record.
2. Select add content and place a single Content Html iPart on it (from the ContentTypes folder).
3. Show the source by clicking the <> HTML tab and type in an iframe tag, such as this:

   <iframe width="100%" height="652" frameborder="0" src-c="http://docs.imis.com/"></iframe>
4. Go to Tools > Site designer > Manage sitemaps and create a new navigation item that points to the new content record.
5. If appropriate, restrict the navigation item's Access Settings, such as to Authenticated User Full Control.



Displaying web widgets

You can install and display JavaScript-based web widgets (plugins, gadgets) in your WCM-generated websites using the Content HTML iPart. A web widget is a small pro-

gram that your users can execute within a web page and that can provide a wide range of functionality.

For example, Google Gadgets offers thousands of free web widgets including mini applications, games, news feeds, maps, and a wide range of other types of content. Many other websites also provide free widgets that can access data from their site. For example, Twitter provides widgets that let you display Twitter updates on your website. LinkedIn provides plugins that display information such as company profiles, member profiles, and links to share on LinkedIn. You just have to search the web to see what you can find that meets your needs.

Warning: Only embed widgets from authors whom you trust. Malicious code may damage your computer or violate your privacy.

To add a JavaScript-based web widget to a webpage

Go to Content Management > Content designer > Manage content:

1. Create a new content record or edit an existing one.
2. Click add content to find and select the Content Html iPart.

   The Configure iPart window opens.
3. Click < > HTML to switch to HTML mode.
4. Copy the JavaScript embed code for the widget you want to add and paste it into the HTML area.
5. Click OK, then Save and Publish your content record.

   The widget is displayed when that content record is rendered on a webpage.

Creating relative paths using variables

The Content HTML iPart does not support the use of the ~/ (tilde slash) shortcut, often used to automatically build the correct paths when a control is rendered in different domains. However, several variables are available in this iPart that allow you to enter

paths for links and resources that are automatically resolved to various folders in your website. The variable names are case-sensitive.

Note: Images do not render in Design mode because the variable is not transformed until the content record is published.

- [Website] – Resolves to the root of the website and contains the website name. Example: [Website]Home.aspx.
- [~] and [Root] - Both variables resolve to the root of the website. Example: [~]Home.aspx resolves to http://mydomain/Home.aspx.
- [Theme] - Resolves to the website's theme folder. Example: [Theme]images/image.png. This variable can be used to access theme resources such as images and CSS.
- [iMIS] - Resolves to the iMIS directory of the website. Example: [iMIS]ContactManagement/CreateAccount.aspx
- [Common] - Resolves to the AsiCommon directory of the website. Example: [Common]Controls/Shared/FormsAuthentication/Login.aspx

On Behalf Of: Customer service mode

Your iPart-based site is not just for self-service: On Behalf Of gives your staff a customer service mode, to complete website commerce on behalf of your customers. When requests for event registrations, product orders, and even membership renewal payments come in by phone, fax, or email, On Behalf Of lets you conduct a secure session during which you can add items to a customer's cart and complete the transaction for them, all without signing out of your own session.

Separate carts, for privacy

To avoid confusion and to protect your customers' privacy as to which items they may have added to their own carts, On Behalf Of sessions create and save carts that are completely separate from those your customers see. For added security, items yet to be purchased are saved in these carts, but not any cardholder information that may have been entered.

For example, if you added a registration to a member's cart but do not submit it, then she will not see the registration in her cart the next time she signs in; however, when you return to registering her on her behalf, you see her cart restored to the state it was in when you left it. Once you complete a purchase on her behalf, both she and you can see the order through her account page.

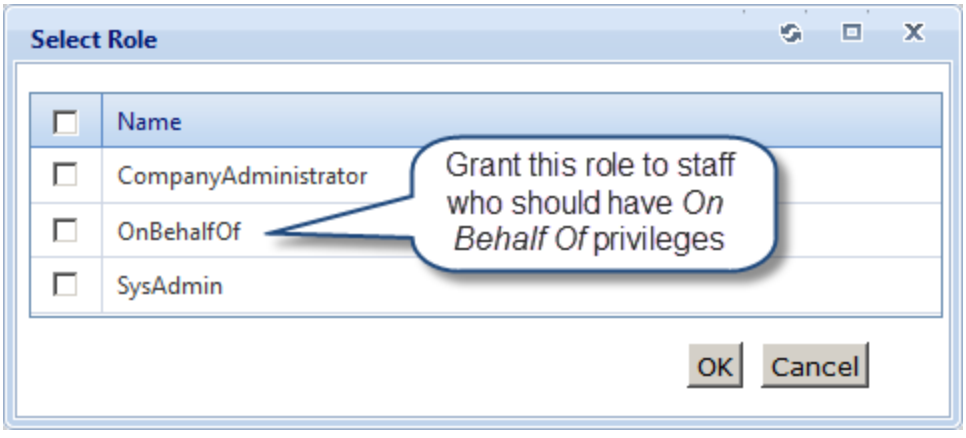
Tip: You can use the audit trails to track which logged-in user performed each action that affected an On Behalf Of transaction.

Who can act On Behalf Of?

To protect the security of contact data, users must be added to the security role SysAdmin or OnBehalfOf to perform actions on behalf of another contact (individual or organization). It is easy to give a staff member On Behalf Of privileges.

Go to System Setup > Security administration > Users:

Find and select a user, and in User Information click add role.



Changing and ending On Behalf Of

When you act on behalf of someone else, all of your commerce-related actions pertain to the target contact until you end the session in one of these ways:

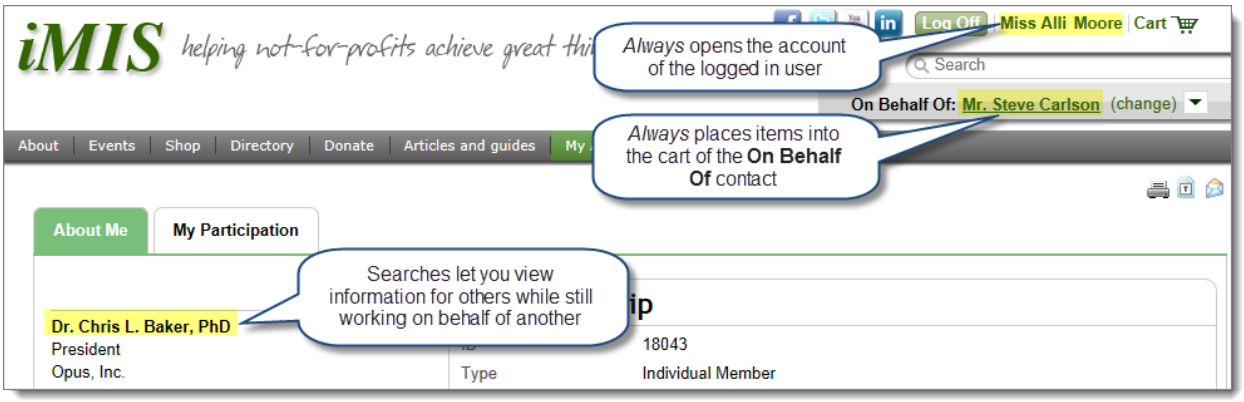
- Select a new target contact: click (change) next to the target contact.
- Clear the selected contact: click the down arrow next to the target contact and select Clear.
- Close the browser.
- Sign out of iMIS.

Whose contact information do iParts show?

Acting on behalf of another contact controls the current cart, but it does not keep you from getting to information for other contacts. An iPart determines whose cart and information to show and update based on this logic:

- If the link's URL specifies an ID (such as for search results), it shows information for that contact.
- If not, it shows information for your On Behalf Of contact, if appropriate. (For example, the Query Menu iPart runs queries regardless of the target contact.)
- Without On Behalf Of, it shows information for you, the logged-in user.
- If no one is signed in, it shows limited information.

For example, you could be working on behalf of one contact when you need to use the Directory to look up an address for another. You can drill down on information from those searches with no effect on your on-behalf-of contact: the iParts pass the queried contact's ID on the URL to show you the information you need. Only when you take actions that add items to the cart is On Behalf Of enforced.



Tip: What never changes is the contact name link in the top navigation: it always shows information for you (the logged-in user).

Creating dynamic content with iParts

iParts are the foundation of your iMIS sites that you build with RiSE. This section helps you to understand and master iParts that present attractive and dynamic content to your users.

What are iParts?

An iPart is an iMIS-specific web part that represents a building block of features that you can place on a content record with other building blocks to create new pages of features. Multiple iParts can be combined and displayed in a content record as you prefer.

Default iParts appear throughout iMIS. You can modify them for your needs and you can reuse iParts throughout the system. For example, an iPart displaying a roster for a Membership Group can follow the same user behavior patterns as an iPart for a roster in Events.

Where can I find and use iParts?

To create a new web page containing one or more iParts

Go to RiSE > Content designer > Manage content:

1. Create a content record.
2. Click add content and select the desired iPart from the Content Gallery.
3. Enter the applicable information and select the desired options.
4. Click OK.
5. Click Preview to see how the content will be displayed to users.
6. Click Save and then Publish.
7. From RiSE > Site designer > Manage sitemaps, create new website navigation.

Note: If no owner is specified for the content block, the default organization displays as the owner.

8. Click Publish.

To add an iPart to an existing webpage

All iMIS sample sites come pre-filled:

Go to RiSE > Content designer > Manage content:

1. Select the site you'd like to add the iPart to.
2. Select the Content area in which you would like to place the new iPart.

   For example, if you would like to add a new iPart to the home page, select Home from the content area list.
3. Click Edit.
4. Determine where you would like to place your new iPart, and click add content.
5. The Content Gallery window will pop up. Navigate to the folder that contains your desired iPart.
6. Select the desired iPart and click OK.
7. Configure the iPart by entering applicable information and select the desired options.
8. Click OK.
9. Click Preview to see how the content will be displayed to users.
10. Click Save and then Publish.

To set up a user content area

User content areas are created by using iParts which can be configured to allow a user to post content on the web. Examples of this user-generated content include forums, message boards, or blogs.

Go to RiSE > Content designer > Manage content:

1. Create a content record.
2. Select the Content Block iPart from the Content Gallery.
3. Enter the applicable information and select the desired options. See the help file for details.
4. Click OK.
5. Add additional content to page, if desired.
6. Click Save.
7. Click Publish.

   Go to RiSE > Site designer > Manage sitemaps:

8. Create a navigation.
9. Click Publish. The page displays as configured with an area dedicated to user content entry directly on the page.

Configuring iParts

iPart configuration allows you to:

- Define how the iPart will behave
- Control how much access you want end users to have
- Hide configuration details from end users; two instances of the same iPart with different configurations can appear as two different controls to the end user
- Examples:
- Allow users to edit on a staff-facing site, but display the data in read-only mode on a public-facing site
- Use multiple instances of an iPart on one page to access different sets of data

  Run-time versus design-time

  iParts have two different views:

- Design-time view: What you see in a content record when you add an iPart and configure it.
- Run-time view: What your end-user sees when viewing the iPart within your website. This may differ from what you see in the Design-time view, because some iParts have a different behavior after you publish the content.

Specifying commit sequence

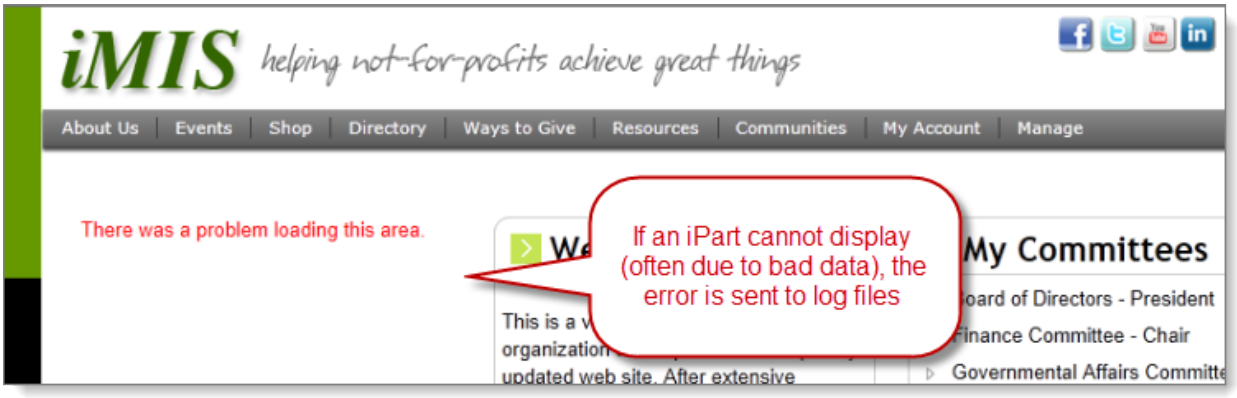
If you place more than one iPart on a page, you might need to specify the order in which actions occur on that page. The commit sequence function allows you to explicitly define the execution order of multiple iParts in a content record.

You can define a commit sequence value for the processing order of each iPart relative to the other iParts in the same content record. The commit sequence value must be zero or greater. iParts with a value of zero (the default) are processed after any other iParts with a non-zero commit sequence value that are in the same content record.

Setting a commit sequence is only required in a few scenarios and is noted in an iPart's configuration help if needed.

Troubleshooting iPart errors

Occasionally, an iPart may fail. However, it will fail gracefully in place, without disabling the whole page. Typically, a "problem loading" error results from some kind of bad data. By default, iMIS hides the error details:



The settings controlling this error logging reside in the <log4net> section of your site's web.config file. The default settings enable error logging in the Windows Event log and comprehensive logging in the ASI log file, which captures both errors and warnings. This log file, Asi.WebRoot.log, is in the folder above your website root.

Contact your hosting administrator if you need access to information in these logs.

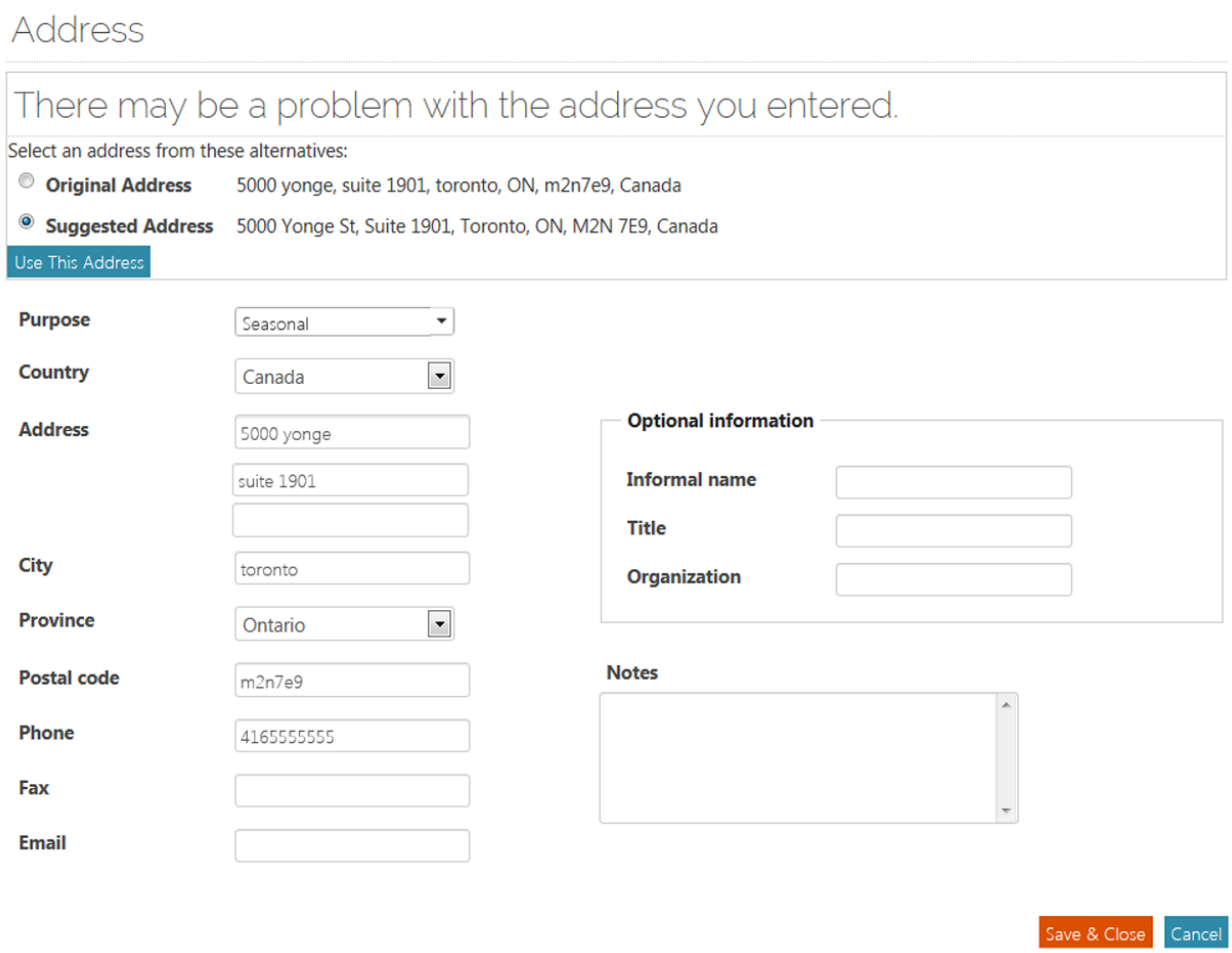
Security for iParts

Most security is defined at the content record level within iMIS. You can choose that different iParts display for different users. For example, an unauthorized user might see the description of a Special Interest Group, but a signed-in member might see the roster for the group and a staff person might have the privilege to add, edit, or delete the group.

Address verification for iParts

iMIS SOA can perform real-time address verification using web services hosted by ASI. There are several benefits to this:

- Running this verification through the ASI web service frees you from having to install and maintain these data files locally.
- Offloading verification to this service keeps it from adding to the processing load of your page.
- The services of different address providers can co-exist, making it possible to verify addresses across multiple countries.
- The service can support future verification of collections of addresses as well as single ones.
- Postal addresses entered in the Contact Account Creator and Contact Address Editor iParts automatically upload to this service that verifies and standardizes the address. Users can then either accept the suggested address or keep the original as it was entered.



The countries supported by this service are subject to change. Contact your AiSP to obtain an up-to-date list.

Passing URL Parameters

Many iParts allow you to change the content they display based on the value of a URL parameter. This gives you the freedom to create a single content record. This record can be reused and the display can be changed based on a value sent in a link to the page. For example, instead of creating a new content record for every event, you can reuse a single content record that displays different event information based on the EventKey value in the URL.

Parameter values are passed to iParts from a several types of sources:

- Search result links
- IQA query links
- Navigation items
- Relative links
- Absolute links

For any iPart that allows URL parameters to be passed, see the configuration help file for detailed instructions.

Tip: If multiple values are sent to a page for a single URL parameter, the first parameter value wins. For example, if the URL pointing to the Event Display iPart is http://my-org/Events/Event_Display.aspx?EventKey=SPR12&EventKey=FALL12, only the SPR12 event displays.

Note: URL parameters set by navigation items cannot be manually overridden in the URL. A user cannot change the parameter value in the URL to display different content.

iPart Examples

iParts can be used in a variety of ways, and in many different combinations to meet your organization's needs. This section contains examples of commonly used iParts and provides guidance in maximizing their benefits.

Displaying query results in iParts

The iParts described in this section use IQA queries to drive the data displayed to users. Each iPart provides a unique way to display the data.

Query Chart Viewer iPart

The Query Chart Viewer displays query results in a chart, which can be set to a range of sizes, skins, and chart types.

Designing queries for Query Chart Viewer

The Query Chart Viewer can render any existing query, but you will get the best results by following these guidelines on how to design queries specifically for use with this iPart:

- Queries: The queries you create for the iPart should be structured so that the results are appropriate for charting. For example, if you want the chart to display the total sales per salesperson, then the source query should be written using the Sum function in IQA.
- Query Display Columns: Each property you select on the Display tab in IQA is available in the iPart's configuration page as a Data column display option. Note, however, that you can only select two properties to be displayed in the iPart.
- Aliases: In your source query, enter an Alias for the Display properties you plan to show in the iPart. Relying on the default labels may not be sufficient, especially when your query uses multiple joined sources or custom SQL expressions. If the query does not display as you expect, using an Alias often resolves the issue.
- Sorting: You can sort the query results displayed in your chart in ascending or descending order. To sort your results, edit your source query and, from the Sorting tab, add the property to be sorted.
- Labels: The labels on your chart's x-axis may overlap if there are too many data points or if the labels are too long. You may be able to improve the display through a few methods. In the iPart, you can expand the width of the chart or change the label angle. In the query, you can try to reduce the number of data points.
- Dates: For dates to display correctly, you must cast them as float data types with an offset of 2. You can do this in IQA from the Custom SQL Expression section of the (Display tab). For example, if you want to display the OrderDate property in your chart, add the following expression: CAST(OrderDate AS FLOAT) + 2. Then, when you select this property from the Data column list in your iPart, set the Data column format to a date format.
- Integers: If integers display incorrectly in your chart, cast the column to a data type of INT in the Custom SQL Expression section of IQA's Display tab. For example: CAST (OrderCount AS INT).

Chart Types

You can display the following types of charts in the Query Chart Viewer iPart.

Chart Type	Example
Area – Displays data in an area filled with color to illustrate trends. For example, create an area chart that shows a member's giving history over time. Note: You can only display one area of data in the iMIS Area chart.	
Bar - Horizontal – Displays sets of data with horizontal rectangular bars for comparison. For example, create a horizontal bar chart that shows the number of donations received by each of your fundraising campaigns.	Bar - Vertical – Displays sets of data with vertical rectangular bars for comparison. For example, create a vertical bar chart that shows the distribution of your members across states.	
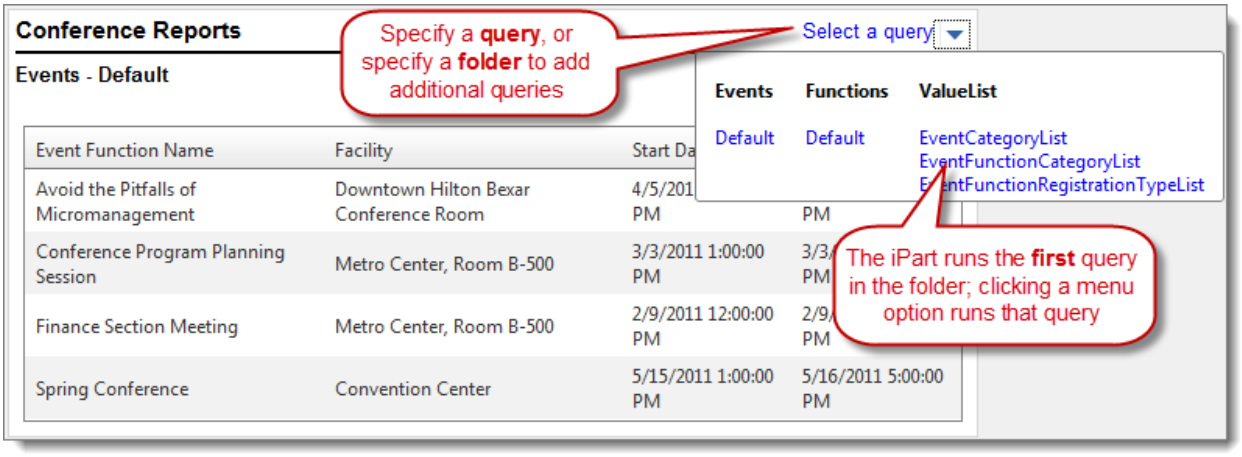
Bubble – Displays data as a series of bubbles. For example, create a bubble chart to show the total number of function registrations for an upcoming conference. Note: You cannot assign a size value to the bubbles in the iMIS Bubble chart.	
Line – Displays data as a series of data points connected by a line to illustrate trends. For example, create a line chart that shows a member's giving history over time.	
Pie – Displays data in a circular chart divided into sections to illustrate proportion. For example, create a pie chart that shows the proportions of your members by country.	
Query Menu iPart

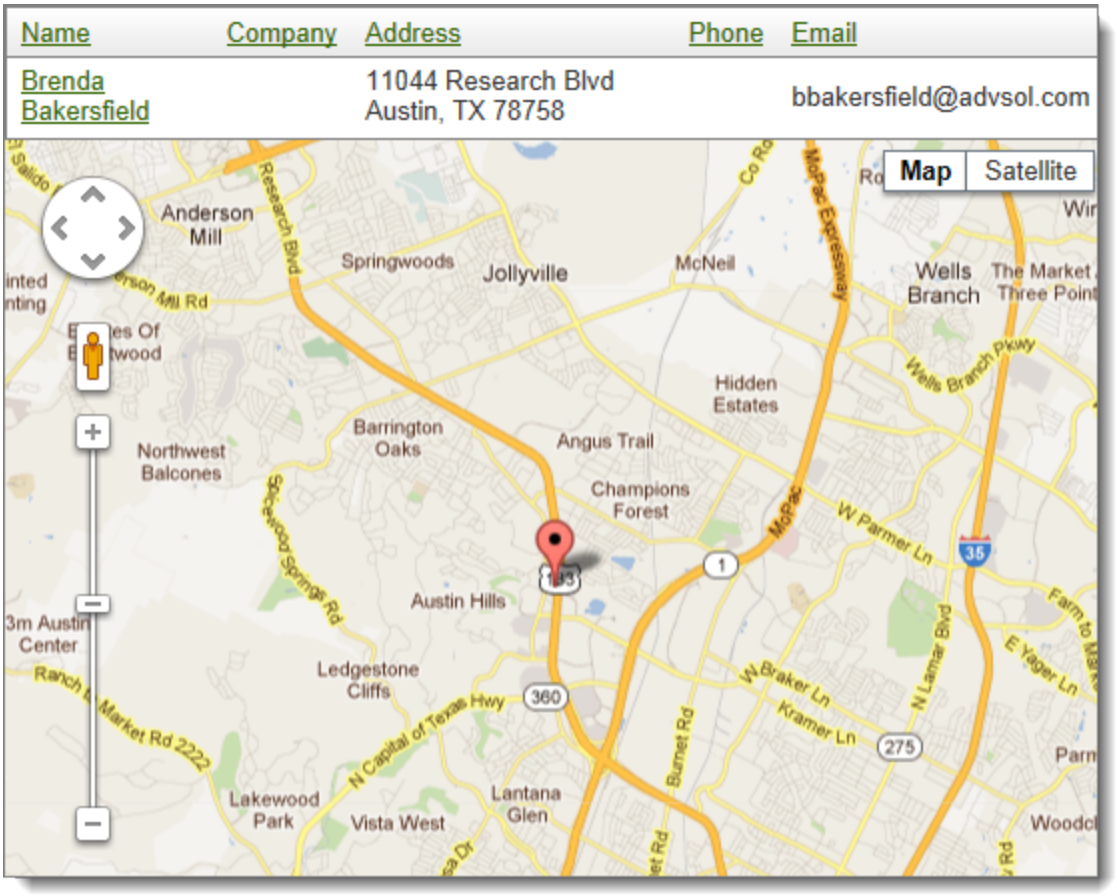
The Query Menu iPart lets you merge query results into your site for tremendous utility. You can set the iPart to display a query, set with whatever title, parameters, columns, labels, and sorting you need, and you can enable exports, which adds icons for sending the data to Word, Excel, PDF, and CSV.

You can also organize helpful queries into a folder and point the iPart to that folder. When the page loads, the iPart displays the first query at the top of that folder, and it presents a drop-down menu of additional queries available, organizing them by subfolders, if any. When the user clicks on a query from the menu, the iPart immediately runs that query and displays the results.



If the query selected contains an address property, you can configure the iPart to automatically map the query results when an address is available. Only one address property per query can be mapped. When this option is enabled, the iPart looks for the following

address properties in this order and maps the first one it finds: FullAddress, Address, FullAddressText, AddressText, Address Text, and Full Address Text.



Related Items iPart

With the Related Items iPart, you can display a list of profile or product pictures based on the results of an IQA query. For example, you can write a query to display the profile pictures of everyone who has registered for an event, made a donation, or ordered a particular product, or to display products in the same category. You can configure the list to display horizontally or vertically, to display a name for the item, and to choose the size of the image. You also have the option to make the profile picture a live link that opens a URL of your choosing, such as the member profile page.

Guidelines for working with the Related Items iPart

- The pictures displayed in the iPart are based on iMIS product or contact IDs. When creating the query for this iPart in IQA, you must select a property that returns an iMIS product or contact ID on the (Display tab). Give this property an Alias of key_Id (the Alias is case sensitive).
- To define the image to display for each record, include a column in your query that specifies the image file name for that record. Give this property an Alias of Image.
- To display a name for each record, include a column in your query for the name of the item or contact. Give this property an Alias of Name.
- When you add Display columns to the query in IQA, they become available within the iPart as Filter columns to filter on.
- You can dynamically filter the query results displayed in the iPart based on the value of another iPart's URL parameter. For example, you can set up your donation page to display the profile pictures of people that have donated to a particular cause (called a distribution in iMIS). The Donation Creator iPart uses the URL parameter itemid to determine which distribution the donation should go towards. If you add your iPart to the same content record as the Donation Creator, then you can set up the Related Items iPart to look at the value of itemid to determine which profile pictures to display. You just have to make sure that your query includes the CsActivity.Product Code property, so that you can select it as a Filter column on the iPart's configuration page. Once selected, enter itemid for the Filter on URL parameter, so that the iPart knows to filter the results based on that URL parameter's value.

  Example: Display other products in the same category

  In this example, the Related Items iPart is set up to display clickable images for other products in the same category as a particular product. This example uses content installed for the sample Member site.

  Go to Content Designer > Manage Content:

1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > RelatedItems. Select RelatedProducts.
4. Filter Options dropdown, select ProductCategory. ProductClassKey.
5. Filter on URL parameter, type in Category.Class.
6. For the Items link to (URL or shortcut), type in ItemDetail?iProductCode={key_Id}&Category={ProductCategory}.ItemDetail?iProductID={key_Id}&Class={ProductClassKey}. This uses the ItemDetail shortcut to link each item in the list to the product page. The particular item's product ID and category are specified in URL parameters so that the correct product and related products are displayed in the resulting product page.
7. Click Save & Publish to complete the content record.

Example: Display other users who have purchased a product

In this example, the Related Items iPart is set up to display clickable profile pictures of other users who have bought a particular product. This example uses content installed for the sample Member site.

Go to Content Designer > Manage Content:

1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Content Types > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > QueryProfilePictureList. Select Orders.
4. Filter column dropdown, select ProductCode.
5. Filter on URL parameter, type in iProductCode. iProductID.
6. For the Items link to (URL or shortcut), type in MBR/Party.aspx. This redirector web page looks for an ID in the URL parameter and then checks the ID's party type and the user's permissions to determine which content record to display. The user's ID is appended to any URL specified in this field.
7. Click Save & Publish to complete the content record.

Progress Tracker iPart

With the Progress Tracker iPart, you can visually display progress towards a goal based on the results of an IQA query. For example, connect this iPart to a fundraising query, so that your members can easily track the progress of a fundraising effort towards a specific goal. Or connect it to an events query, so that you can see at a glance how many people have registered for an event.

To set up the Progress Tracker

1. Create a query for the Progress Tracker.

   Note: For sample queries that will work with this iPart, see $/Samples/ProgressTracker/ in IQA.

The Progress Tracker uses three pieces of information supplied by an IQA query: a goal amount, the sum total of what you are tracking, and the end date (which is optional). When you build your query for this iPart, it must contain specific aliases. In IQA, create a new query and choose the business object you want to query on. Make sure you are in Advanced Mode, then from the Display tab, choose properties to assign the following aliases to:

- Goal_Amount: Indicates which property is the goal amount. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST(25000 AS INT) as a property to set the goal amount to 25,000.
- Sum_Total: Indicates which property is the amount to be summed. The percentage displayed in the Progress Tracker is based on this amount compared to the goal. It can be a monetary amount or any other number, such as the number of event registrations.

  Tip: From the Function dropdown list for this property, select Sum, so that only one row is sent to the iPart. This is not required, but it will improve performance.
- End_Date: Indicates which property specifies the end date. This alias is only required if you want to display an end date in the iPart. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST('2012-12-25' AS DATE) as a property to set the end date to 25 December, 2012.

2. Add the iPart to a content record and configure it.

   Go to RiSE > Content designer > Manage content:

1. Do one of the following:

- Select a Content Folder and click Edit.
- Select New > Website Content.

2. Click add content.
3. Go to ContentTypes > Utility.
4. Select Progress Tracker.
5. Click OK.

6. Enter the iPart CSS class to style the Progress Tracker. Two styles have been pre-defined that you can use in the iPart: ProgressTracker and ProgressTracker2. You can edit these classes to change the look and feel, or you can create your own style for the Progress Tracker.
7. Select a Source query.
8. (optional) Select a data column by which you want to filter. You can use this feature to dynamically update your Progress Tracker, based on the value passed to it in the URL. If you choose to filter on a data column, then also enter the name of the URL parameter, which the iPart uses to identify the value to filter on. For example, to limit the results of an event query to a specific event, you can select the EventCode property and give the URL parameter a name such as EventCode. The progress displayed will then reflect only the event code which is included in the URL as EventCode=[EventCodeValue].
9. (optional) Enter any messages you want to appear in the iPart. The variables below can be used in the descriptions. For example, "Help us reach our goal of {0} new members by {2}!"
   - {0} displays the goal total
   - {1} displays the current sum total or count
   - {2} displays the end date in a long format
   - {3} displays the end date in a short format
10. Select the Caption Options. In addition to the progress bar, you can also display the values as text. If any of the Caption Options are unavailable after selecting a query, this indicates that the required aliases have not been defined in the query.
11. Select the Progress bar location. The bar can be displayed above or below the captions.

    Note: You can also use this iPart to display only a countdown (days remaining to a certain date). In configuration, only select the caption option Display days remaining, then for the Progress bar location, select (None).
12. Click OK.

SSRS Report iPart

The SSRS Report iPart lets you display the results of any IQA query on any page where you place it. The SSRS iPart uses the version 10.0 ReportViewer, which supports IE8 natively and, in IE8, adds a Print button on its toolbar. You can add the SSRS iPart to any content page using CM: open the Utility folder and choose the content type SSRS Report.

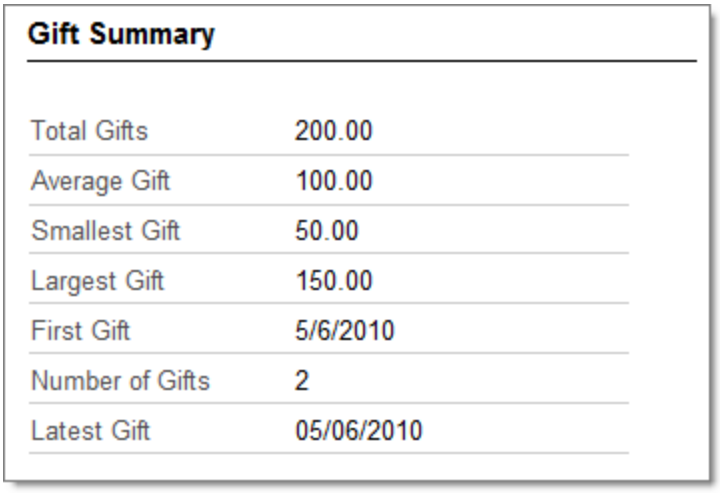
The iPart lets you customize whether to display the export buttons for PDF and Excel versions of the report. You can change the default design (layout, colors, fonts) of your reports by editing the SSRS parameters in the SystemConfig table.

How it works: The process engine specified by the iPart loads a report template (.RDL file) from the document system and creates a report data source (a DataTable) based on an IQA query's SQL source; the report viewer then combines the template and query to generate the report's output. When you configure the iPart, you specify the Document system path to the SSRS Report runtime, which must be a link to an SSRS Process Engine. Click the select link next to the textbox, then browse to your reports (such as $/Samples/ReportingServices), and pick one of the runtime entries.

Tip: Identify a process engine (run-time report) by the arrow on its icon!

Summary Display iPart

The Summary Display iPart displays a single row of query results in a form view.



Gift Summary

Total Gifts	200.00
Average Gift	100.00
Smallest Gift	50.00
Largest Gift	150.00
First Gift	5/6/2010
Number of Gifts	2
Latest Gift	05/06/2010

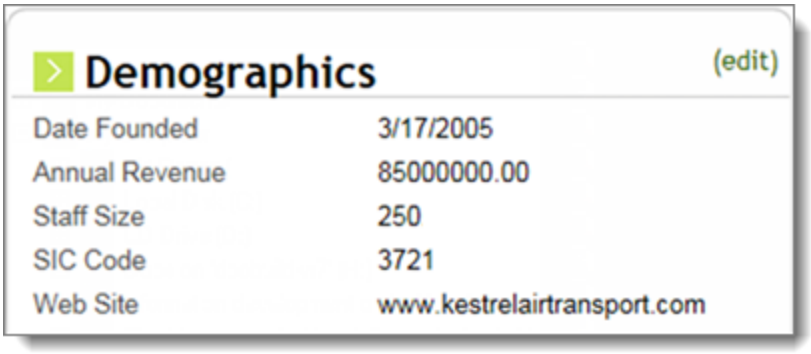
Guidelines for queries displayed in the Summary Display iPart

When creating a query that you want to display in the Summary Display iPart, keep the following guidelines in mind:

- This iPart only displays a single row of query results.
- If you connect the iPart to a query that returns more than one row of results, only the first row is displayed.
- Tip: You can dynamically filter your query results by the currently logged in user, a selected contact, or a date. See Adding dynamic filters to queries for more information.

Panels and custom data

Panels are custom displays of iMIS data that you are able to name, build, arrange in grids, and add to your site. Using panels, your users can browse, edit, add, and delete their data, as you specify:



Panels display within Panel iParts, which allows your users view and edit custom data on the broadest range of browser and platform types that iMIS supports. You can manage your custom data directly and conveniently from the web pages where you place these iParts:

- Panel Editor (which creates panels and shows one panel) --
- Panel Collection Editor (which combines existing panels into tabbed displays)

You can configure the iParts to let your users add and edit that data directly from their browser page. You can import your existing user-defined tables (from iMIS Customizer) directly from the Panel Editor iPart configuration. In addition, your Activity table data is

automatically available as a source, so that you can use and extend that data. Panel sources can include existing user-defined tables (defined in the UD_Table table) and user-defined sources (listed in the ObjectMetaData table).

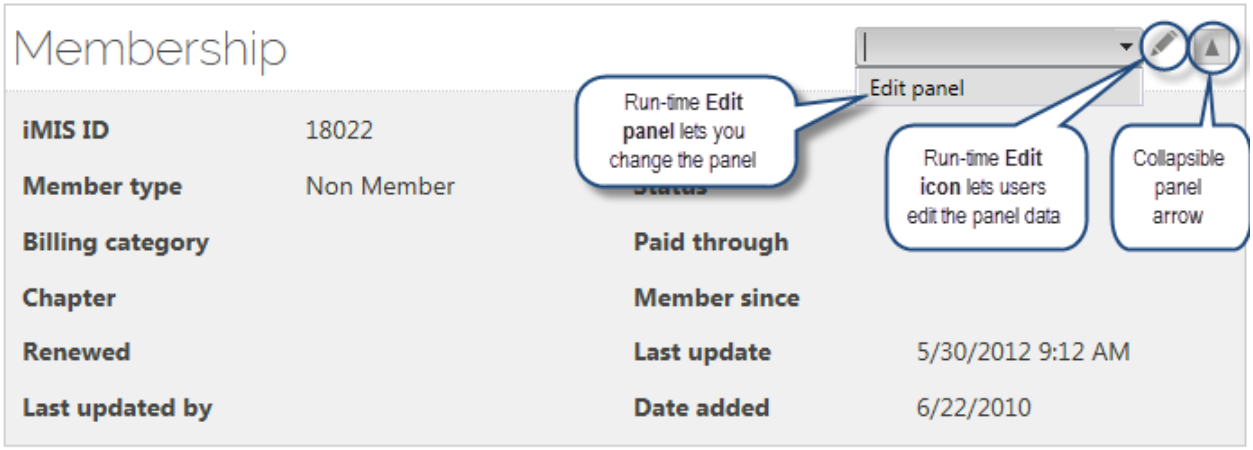
Tip: Panels are shared: when you update one panel, it updates within every iPart that uses it.

Creating custom panels of data

In a few clicks from your browser, you can have a new panel that displays the data you want, labeled and made editable as you need.

1. Enable Easy Edit by clicking on the button at the top right hand corner of the screen.
2. Once Easy Edit has been enabled, you will find and click the icon at the bottom left corner; this is the Content Designer.
3. From the Content Designer, click add content > ContentTypes > Content > Panel Editor
4. Select (New Panel) from the Panel drop-down menu.
5. Drag in and arrange your desired data, then Save & Publish.

   Once you have placed a panel iPart into a content record and published it, you can then edit the panel directly: As a system administrator, you see a run-time Edit panel command, which lets you make quick changes to the panel, changes that save and publish for you automatically. For extensive panel work, such as to change the type of data it shows, use Easy Edit to access all of the content design features.



Best practices for panel layout

Here are key layout features to help you design the best use of screen real estate on the page:

- Multiple columns: Click + or – icons next to the panel layout to add/remove columns in your panel. For best display results, place multi-column panels into single-column content records.
- Hide in Summary View: Check this box on certain properties to trim the initial display of the iPart to the read-only information that is most useful. Only when users open the full window for viewing or adding/editing (as you configured it) do they see the additional information.
- Read-only: Check this box to provide information in read-only form while still allowing users to edit other information on the panel.

  Tip: To prevent editing of all of the properties, simply disable Allow users to edit on the iPart Configuration, rather than in the Panel definition.
- Collapsible panel: In order to maximize utility and minimize scrolling on the page, users are able to click on the arrow to expand and collapse iParts.

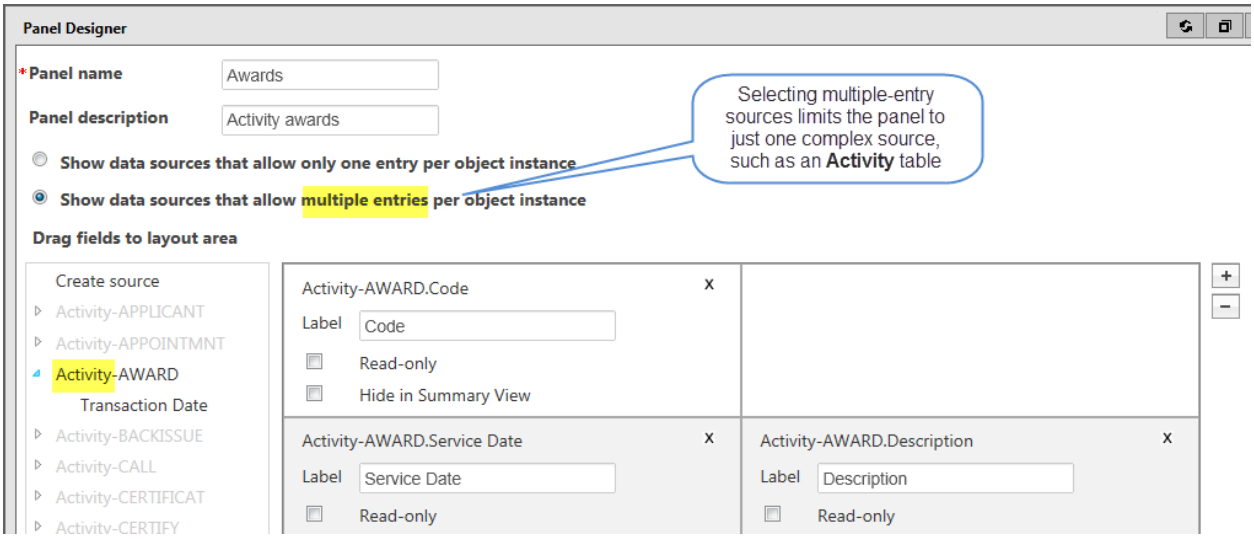
  Tip: Be sure to add an optional Title to any iPart that you make collapsible, so that title bar text guides your users as to what information they will access by clicking Show.

Panels for Activity data

Most organizations need to show activity information on their websites. All of the Activity data in your iMIS database appears as complex (multi-entry) sources when you use Panels.

Suppose you created new award types in the general lookup table called AWARDS and want to add them to a page for dynamic editing. In a few clicks, you can have exactly that:

1. Enable Easy edit.
2. Click add content.
3. Go to ContentTypes > Panel Editor.
4. Click OK.
5. In the Panel list, select (New panel).
6. Select Show data sources that allow multiple entries per object instance.
7. Drag in your new data sources.
8. Click Save & Close.
9. Select Allow users to edit.
10. Click OK.
11. Click Save & Publish.



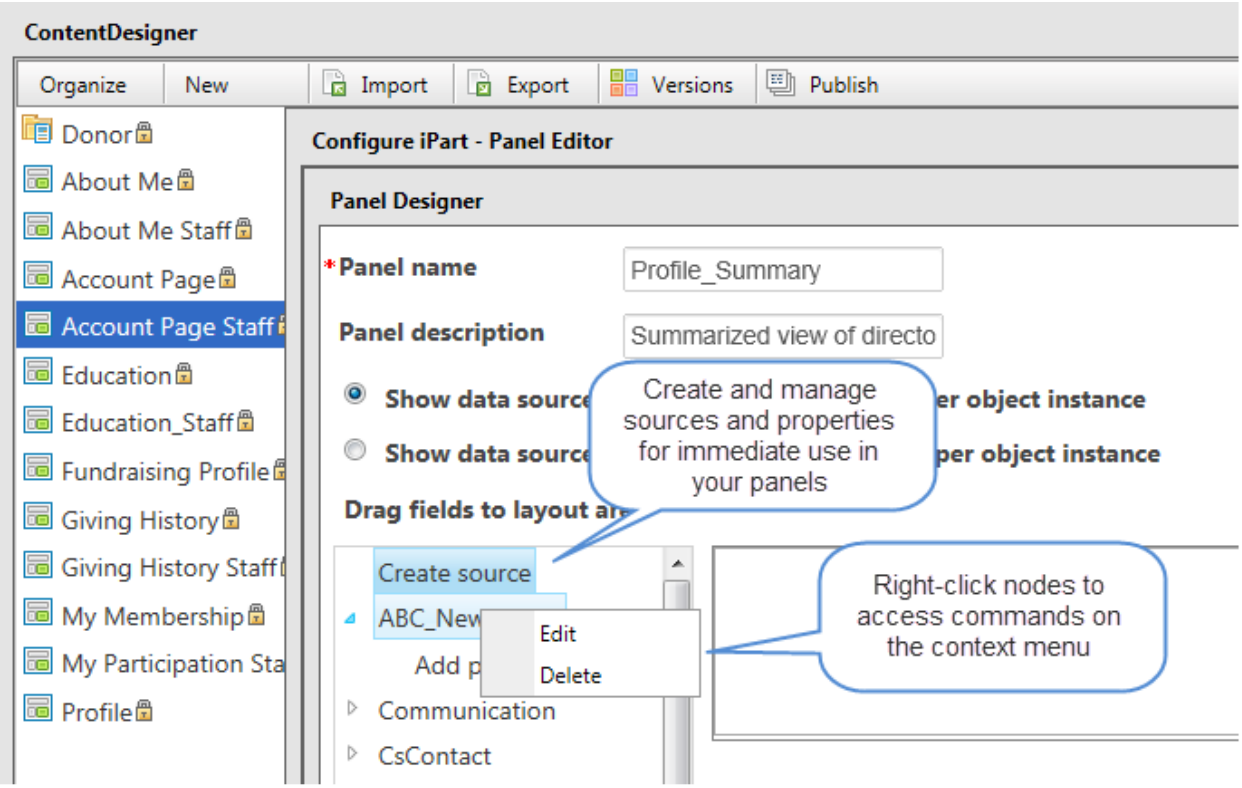
All of your Activity data appears as available sources when you select multiple entries for the type of data source.

Tip: If you want to combine data from different sources, be sure to show simple sources (the first radio button option). Only one complex table can display in a panel, so the others are grayed out as long as any one of them has properties placed in the panel.

Defining your own data with Panel Designer

With the Panel Designer, you can not only craft reusable panels that combine fields from many tables, but you can also define new data structures (business objects and properties) to manage information for your organization. Without special tools or knowledge of the iMIS schema, you can add data sources on the fly, right from your browser. When you save the panel, you have saved your newly created data sources as iMIS business objects.

Tip: You can see your new data source show up as a business object in Business Object Designer, but it will be read-only: continue to edit and manage these special sources in Panel Designer itself.



Access the Panel Designer by editing or creating a panel in a Panel Editor iPart.

To create a new panel source and properties

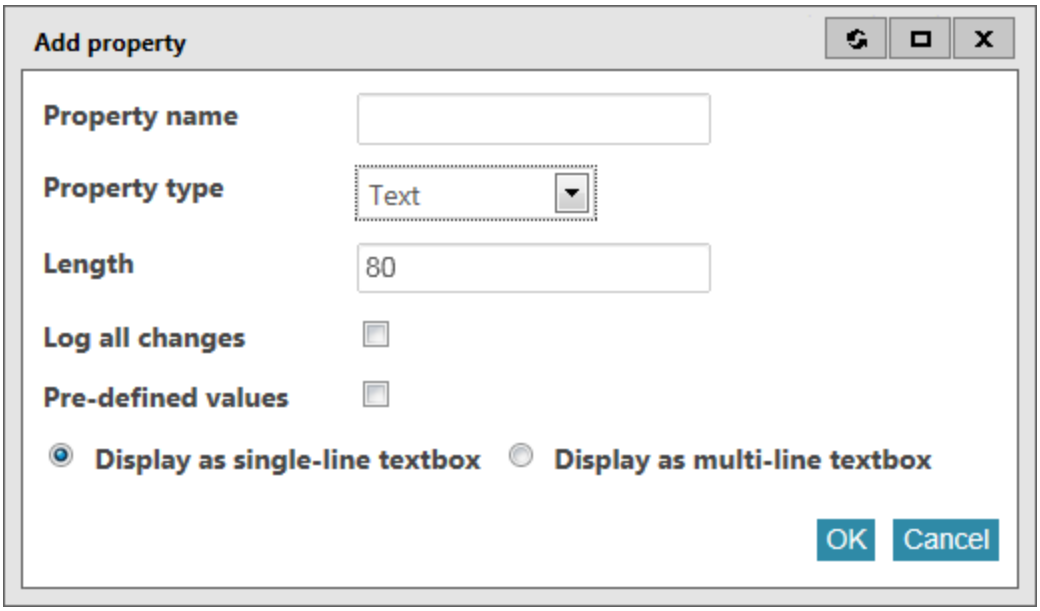
To create your own data source with properties, you work within Panel Designer. Each new source you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

1. Select New > Website Content.
2. Click add content.
3. Go to ContentTypes > Content.
4. Select Panel Editor.
5. Click OK.
6. From the Panel drop-down list, select (New panel).
7. At the top of the source tree, select Create Source.
8. Choose a Name for each new Source that meets these criteria and click OK:

- Starts with a letter
- Contains only letters, numbers, and underscores
- Is unique across iMIS, not matching any existing iMIS data or SQL Reserved Words

  Tip: Use an organizational prefix (such as ABC_*) so that your sources are unique, sort together in the tree view, and are easy to identify as ones that you created.

9. Select Add Property for the new source added.



10. Enter a Property Name.
    - Starts with a letter
    - Contains only letters, numbers, and underscores
    - Is unique within its Source
11. Choose a property type that best fits your purpose, within these valid ranges:
    - Currency: 19 total digits (precision), with 4 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Date, Date and Time, Time: January 1st, 1753, through December 31st, 9999
    - Decimal: 28 total digits (precision), with 12 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Email: Creates a mailto link, which launches the user's default mail application when selected.
    - Integer: -2,147,483,648 to 2,147,483,647 (±2 billion)
    - Text: By default, the Text Property type allows:

- Free-form entry up to 400 characters (defaults to 80). You can select to display the text-box as a single line or multi-line textbox.
- Pre-defined values from a query or explicit list that display as a drop-down list at runtime:
- Query – For example, you may want to use a query that returns a list of countries.
- Explicit List – For example, you can add a list of colors the user can select as their favor-ite.
- URL: Creates a live hyperlink, which launches a new instance of the browser to open the link when selected.
- Yes/No: Boolean

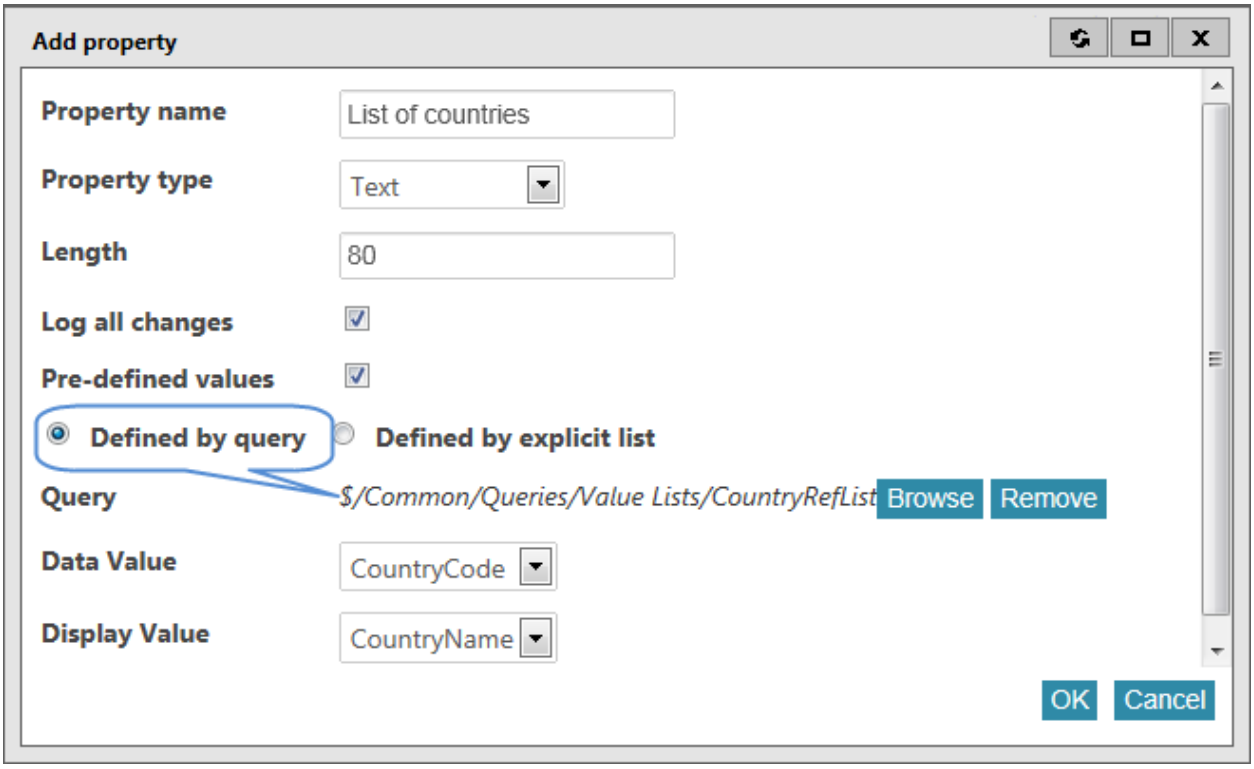
12. Enable the Log all changes if you want to track any data change made to the property you are adding.

    Hint: Add the Change History Display iPart to a content record if you want to display data changes made in the Name and Name_Fin tables as well business objects.

13. (Text Property type only) The Pre-defined values option allows you to present a list from which the user can select.

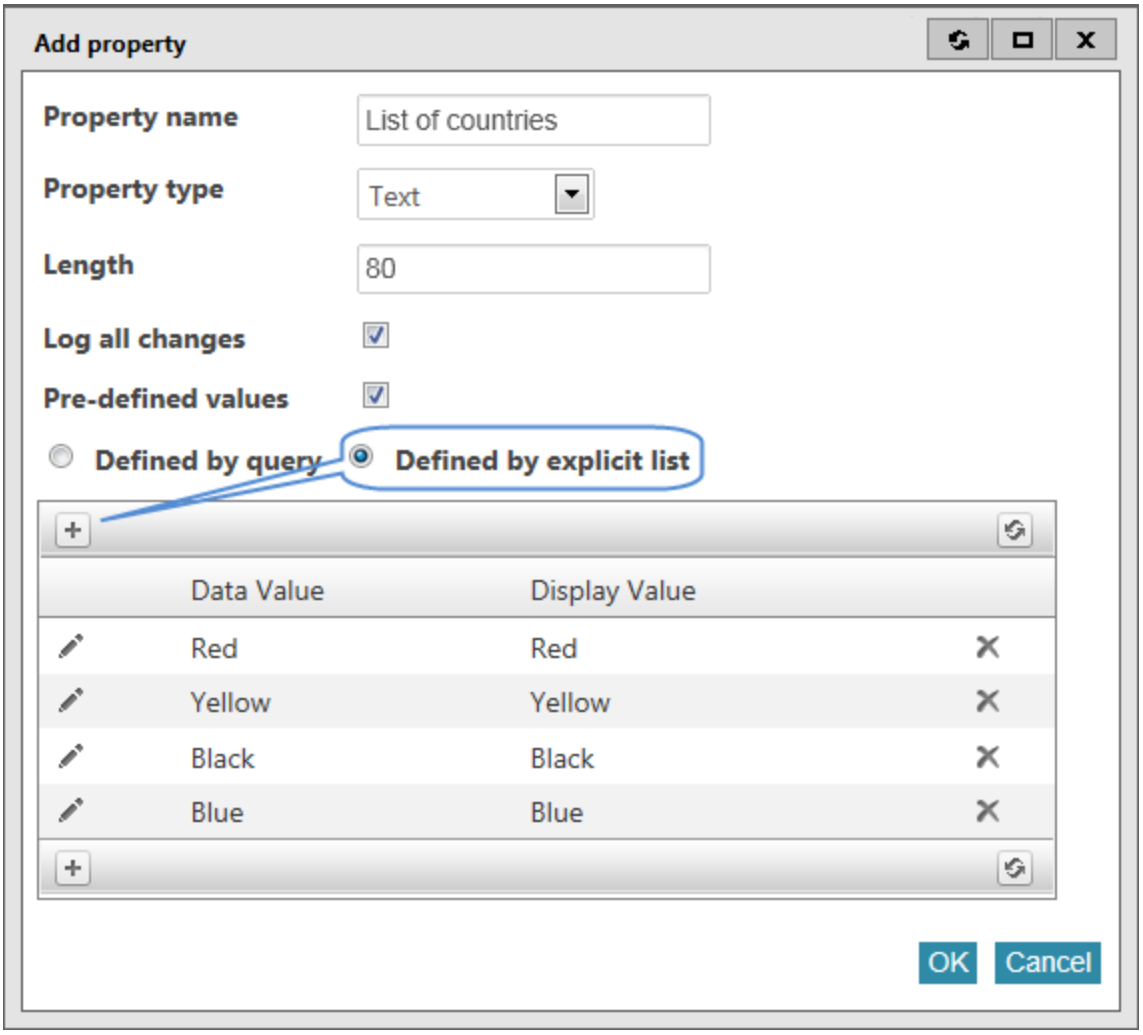
    - The Query option provides validation-type properties based on the query results. For example, instead of typing out a list of countries, you could select a query that displays country values.
    - Enable the Pre-defined values checkbox and select the Defined by query option.
    - Click Browse, select a query, and click OK.
    - Two additional fields display, Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel. For example, the country code may not be as clear as the country name.

- Select the fields from the drop-down list in the Data Value and Display Value fields.
- Click OK.



- The Explicit List option allows you to create a list to display on the panel. For example, you may want a user to select their favorite color.
- Enable the Pre-defined values checkbox and select the Defined by explicit option. A table grid displays.
- Click + to add a data row. The data row contains two icons: Insert and Cancel, and two fields: Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel.
- Enter the appropriate values in the Data Value and Display Value fields.
- Click the checkmark located to the left of the data row.

- Click + to add additional data rows.
- Click OK.



14. Drag the field(s) to the layout area.
15. Save the panel to save the source and properties. Once you save a property, you cannot rename it. Note that the sources will alphabetize properly on reopening.

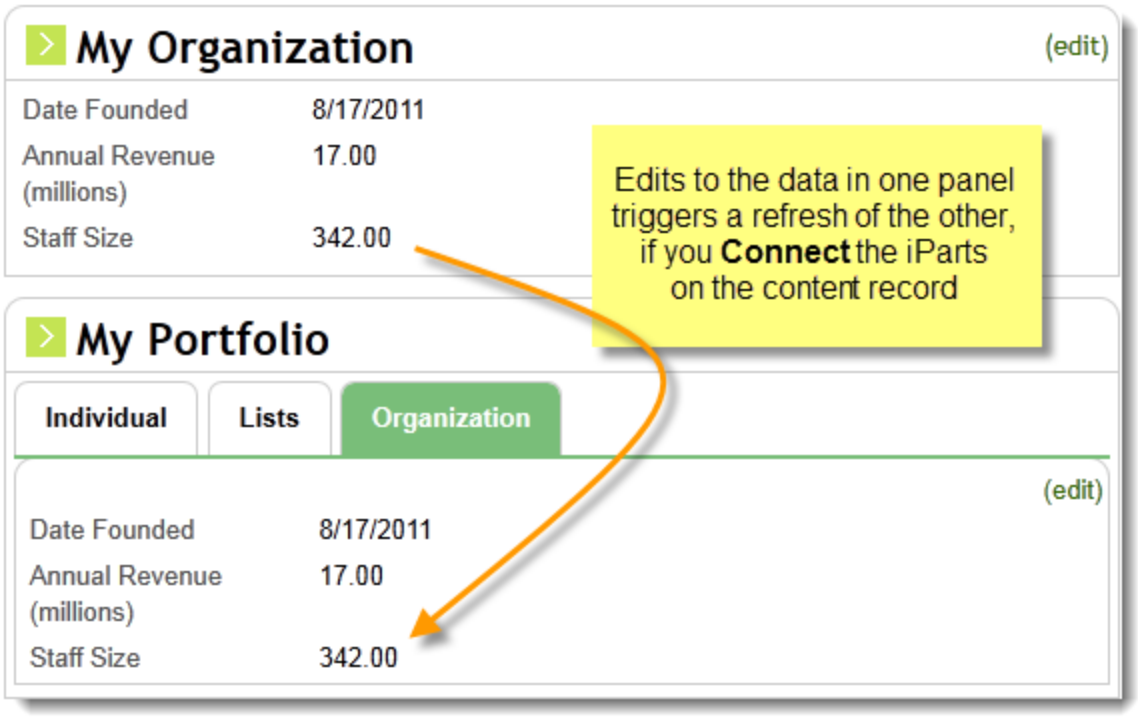
    Each new property you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object property is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

Tip: Do not save until you create all of the properties. This way, you can view them as a set of properties and improve your naming convention before it is finalized.

16. Save and close the Panel Designer window.
17. Save & Publish the content record.

Connecting iParts to refresh panels

When you combine panel-displaying iParts on the same content record, data might appear out of sync after the user edits it, if both panels display the same property. You can solve this refresh problem through the iPart's Connect feature, which you enable separately from Configure.



Note: Check an iPart's Configuration Help topic to find out if it supports any connection options. An iPart has no connection support (neither consumer nor provider) unless its author added it.

To connect panels for dynamic updating

1. Edit a content record and add two user-editable iParts that display panels (Panel Editor, Panel Collection Editor).
2. Set up the first connection:

- From the first iPart's title-bar menu, select Connect.

  The Connect box that opens shows you any current connections and lets you disconnect them.

- Select Create a new connection.

  The Connect box that pops up prompts you to create one of four connection types.

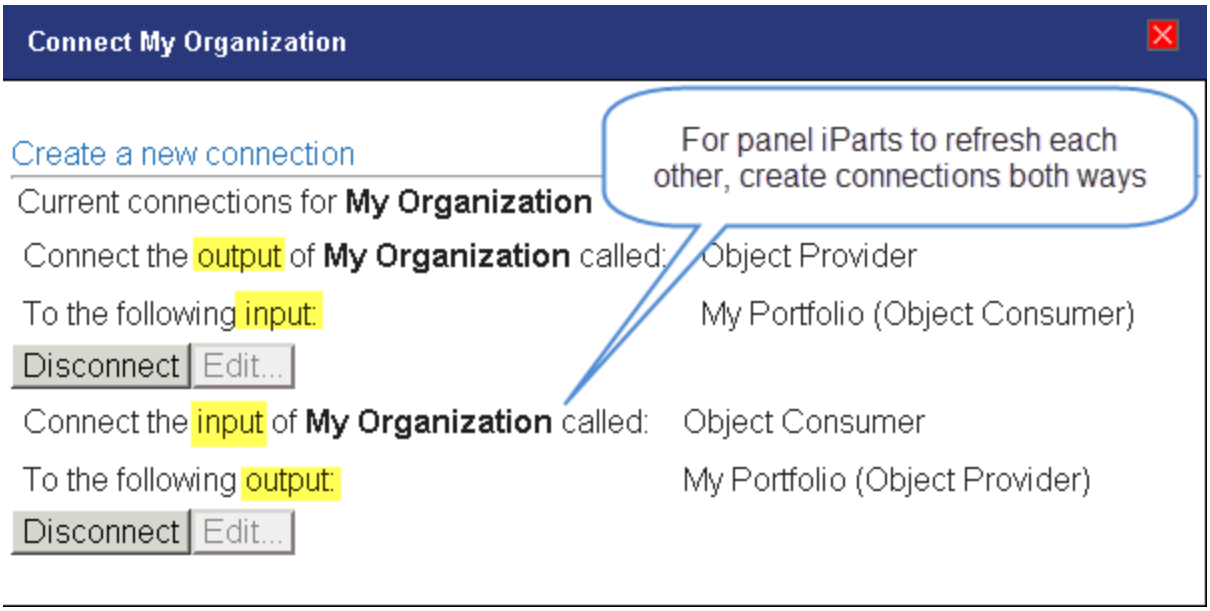
  Tip: Do not be misled by the language of connection. The Consumer is the actor that triggers a refresh on another iPart, and the Provider provides a pointer to itself to the Consumer.

- From the Object Consumer drop list, select the panel iPart you want to refresh.
- Select Connect.

3. Set up the second connection:

- From the second iPart's title-bar menu, select Connect, and select Create a new connection.
- From the Object Consumer drop list, select the first iPart.
- Select Connect.

  You should see a pair of connections, for mutual refreshing.



4. Save and Publish the content record.

Adding existing business objects to panels

Panel Designer lets you create new data sources on the fly, access any user-defined tables, and make full use of the Activity table. It can also display your existing business objects, if they meet these requirements and configuration settings:

Referencing existing business objects

Panel Designer can display existing business objects that have a ContactKey or ID property. When ContactKey or ID is the primary key, Panel Designer treats it as a single-instance table; otherwise, it assumes it to be multi-instance.

Panel Designer cannot display your business objects until you add them to the ObjectMetaData table. While attached to the iMIS database in SQL Server Management Studio, run this SQL statement:

INSERT INTO [dbo].[ObjectMetaData] (ObjectName, RelatedToEntity, IsUserDefined, IsMultiInstance)

VALUES ('MyObject', 'Party', 0, 0)

- Replace MyObject with the name of the business object, table, or view that is related to Party.
- Change the last value to 1 if it is multi-instance.

Settings for Business Object Designer (BOD)

1. In Business Object Designer, edit your object and open the BOD (Properties tab) > (Display tab).
2. To make a property available to your panels, enable its Available to UI? option.

   Tip: To see your BOD changes immediately, restart IIS.
3. To enable multiple selection for a property, select Check box(es) under Display Control so that you can enable the Allow multiple selection? option.
4. To enable HTML editing, select HTML Editor under Display Control. Be sure to use the property in a single-column panel to provide the control adequate width.

   Troubleshooting

   If you get an error when creating a new data instance at runtime (either single- or multi-instance), check that your business object does not have a 'Read-only' constraint set on the ContactKey or ID property's Definition tab.

Connecting picture iParts to Facebook

You can set up the Contact Mini Profile and Contact Profile Picture iParts to prompt people to use their Facebook profile picture in iMIS, instead of uploading a picture. To use this feature, you must do the following:

- Contact your Hosting Administrator to enable Enable the Facebook feature in the web.config file
- Create a Facebook app so that your website can connect to Facebook
- Enable the iPart configuration option to Prompt for Facebook connection

When enabled, signed in users are prompted to connect to Facebook when they edit their profile picture and wherever their profile picture is displayed.

To create your Facebook application and use it in iMIS

1. Contact your Hosting Administrator to request that they do the following: Edit your web-site's web.config file, located by default in C:\Program Files\ASI\imis\net. Find the EnableFacebookApi property, and change the value to true.
2. Create your Facebook application.

- Log in to the Facebook Developers site.
- Click +Create New App.
- Enter an appropriate App Display Name and App Namespace for your organization. Only the App Display Name will be visible to users.
- Click Continue and complete your App creation.
- On the Basic info page for your App, enter the Site URL for your iMIS application.
- Take note of the App ID Facebook has created for you.

3. Contact your Hosting Administrator to request that they do the following: Add your Face-book App information to the required iMIS JavaScript.

- Edit your iMIS Facebook.js file using a text editor. By default it is located in C:\Program Files\ASI\imis\Net\AsiCommon\Scripts\SocialMedia.
- Find the appId value and update it with the ID issued to you by Facebook.

To load the Facebook API

1. Edit your website's master page. By default it is located in C:\Program Files\ASI\im-is\Net\App_Themes.
2. Add the following html within the <body></body> tags of your master page:

To enable the Facebook connection in iParts

Configure each instance of the Contact Mini Profile and Contact Profile Picture iParts used in your website to enable the options Allow picture change and removal and Prompt for Facebook connection.

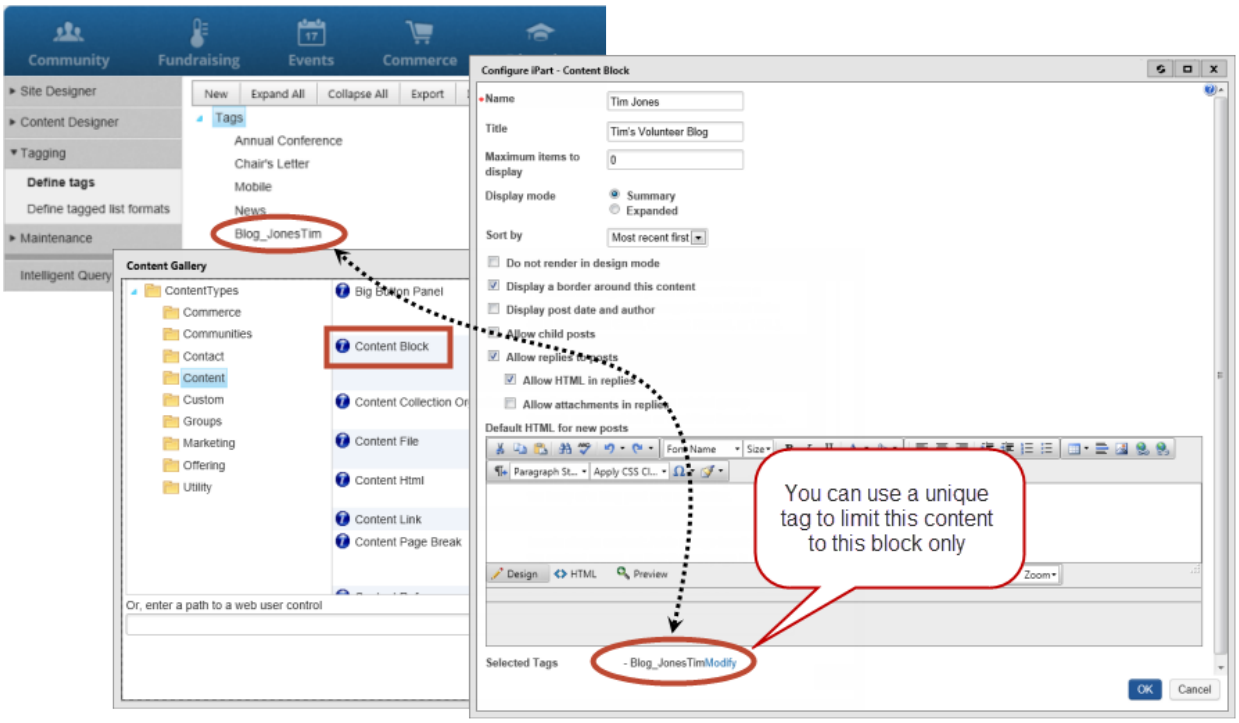
Note: When the Facebook feature is disabled in the web.config file, the Facebook options do not appear in the Contact Mini Profile or Contact Profile Picture iParts.

Using the Content Block iPart

With the Content Block iPart, you can empower authorized users to create and edit content directly on a page, without using Easy edit or accessing Tools. Through iPart configuration, you can allow users to insert HTML content, add attachments, create child pages, and submit replies. At its simplest, a content block can be HTML that is read-only unless the user has permissions to see the edit command. At its most complex, a block can act as a message board with multiple posts, child posts, and replies. You can limit the number of posts to a set number, or you can leave it at the default (zero), which lets it grow indefinitely.

Tagging to filter content

To control what content appears in a Content Block, you create tags specific to ContentBlock Items and apply those tags to specific instances of the iPart. For example, if you want to create a new blog for Tim Jones, you could create a ContentBlock tag such as blog-JonesT, place a new Content Block iPart on a content record, and configure the iPart to display the tag blog-JonesT. Now the content that Tim authors in this blog will be unique to his+ blog, if you do not apply this tag anywhere else:



Content created with anything other than a Content Block iPart will not be displayed, even if it has the same tag. For example, a content record containing HTML tagged with News will not show up in a Content Block that is also using the News tag.

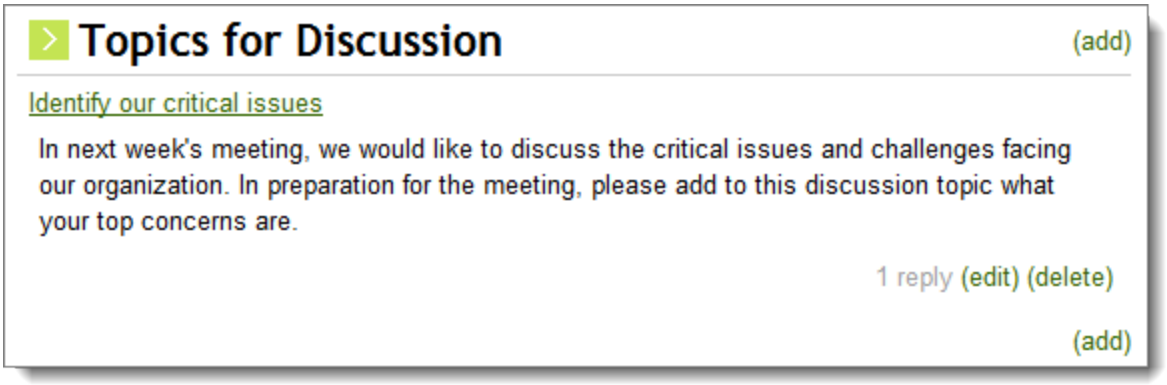
Best practice: Plan for and create the tags you want to use before configuring your Content Block iParts. Content can seem to disappear if you change the tags assigned to a content block already in use, because it no longer matches the tag set currently configured.

Creating a message board

Only users with the Content Editor permission may create posts and children, but any authenticated users can reply to a post and edit or delete their own replies. Any authenticated user may create posts and children, reply to a post and edit or delete their own replies.

To use the Content Block as a message board with multiple posts, child posts, and replies, make use of the following configuration options:

- Maximum items to display – Choose the maximum number of posts that will be displayed; 0 indicates an unlimited number of posts.
- Display mode – Expanded display mode will display replies and child posts in-line, while Summary mode only shows replies and child posts when the post is opened.
- Allow child posts – Allow Content Editors to add a child post to existing content. Allow any authenticated user to add a child post to existing content.
- Allow replies to posts – Allow authenticated users to reply to posts; you may indicate whether to allow HTML and/or attachments in the replies.



Content Block iPart set up as a discussion board

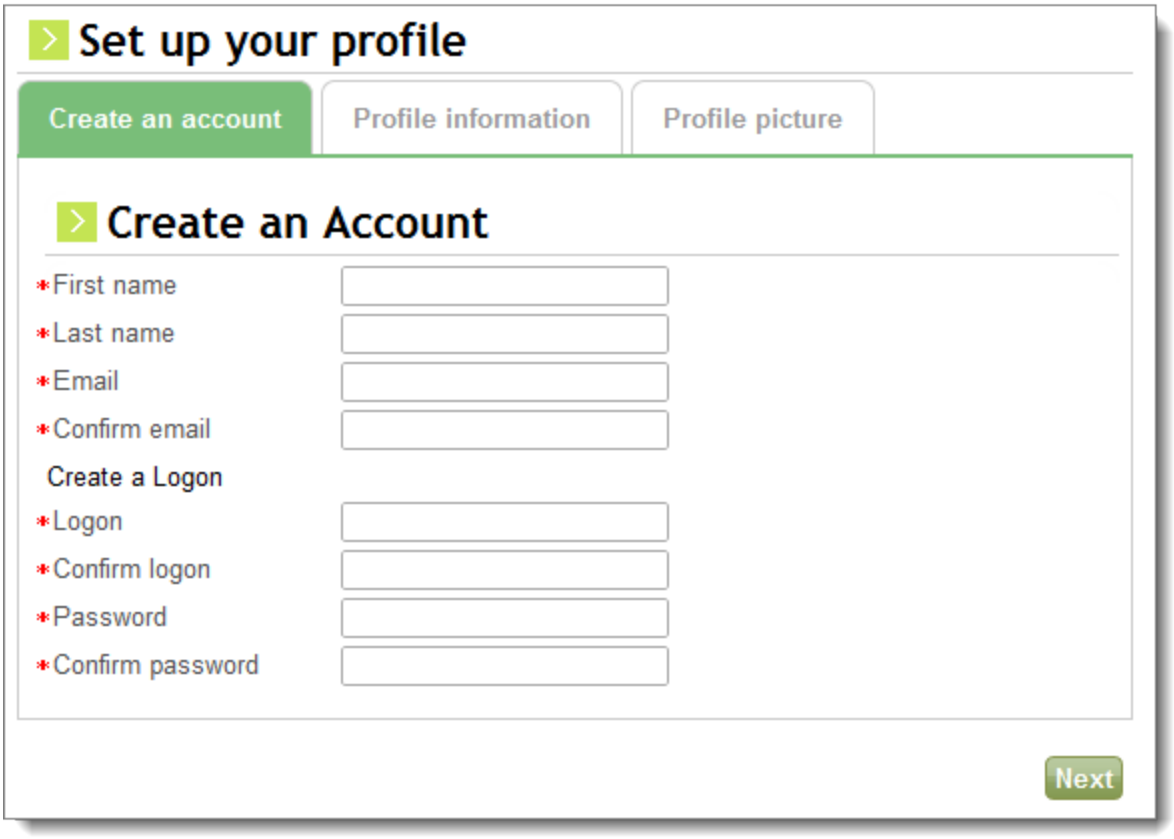
Using the Content Collection Organizer

Use the Content Collection Organizer to create a collection of pages and assign names to the tabs or headers for each page. In the simplest example, those pages are displayed,

the user can access tabs in any order desired, and information is saved independently on each page. The following screenshot shows an example with tabs across the top, configured to display different content pages.

Using the Content Collection Organizer as a Wizard

You can configure the Content Collection Organizer to function as a wizard, which will guide the user through multiple steps. When enabled, Next and Previous buttons display, allowing users to navigate between the steps, as shown below. The user can navigate to any previous tab, but forward only to the next tab in the workflow sequence. The user can also navigate with the browser's Forward and Back buttons, but the data does not commit until the user clicks Next.



Each page in the workflow is validated when the user clicks the Next button. Each iPart's page.Validate method is processed in the order the iParts appear on the page. The order of calls is:

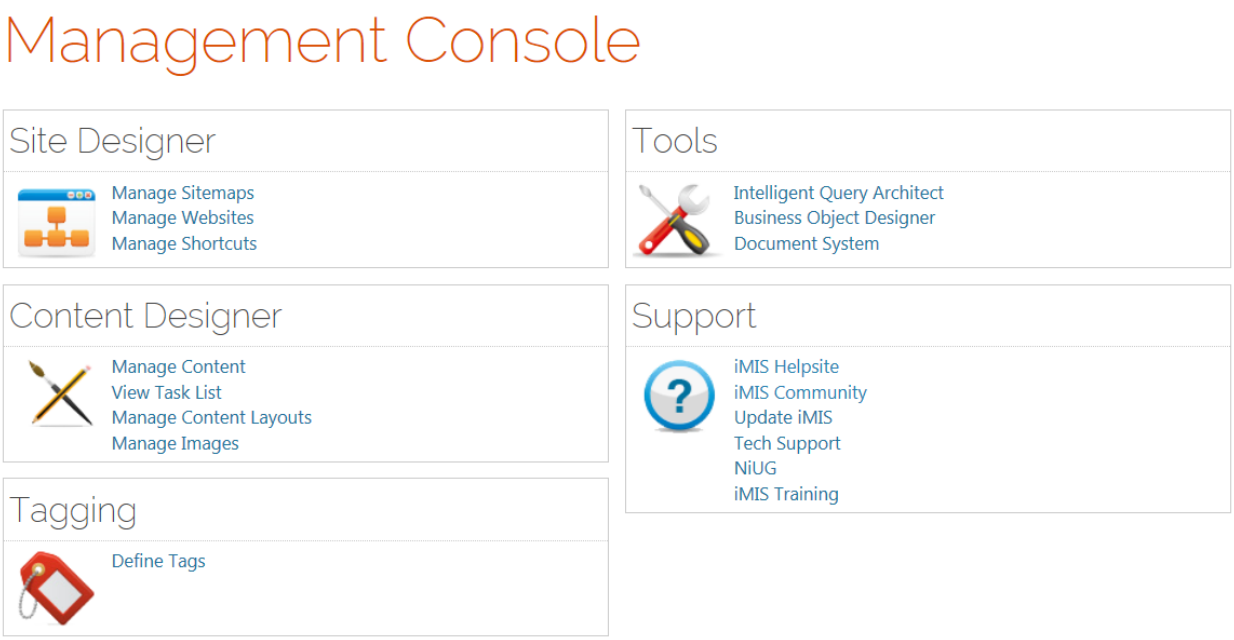
- Validation
- If Validation passes, then PreCommit
- If PreCommit passes, then Commit

If any of the calls fail (the data on a page is incomplete or incorrect), then an error message displays and the user cannot move to the next step until it is corrected.

Using the Big Button Panel iPart

With the Big Button Panel iPart, you can display a navigation panel that combines a larger, category-defining image with a list of links, as shown in the screenshot below. You

can also use this iPart to create links that make it easy for staff to perform routine tasks for contacts such as running reports, registering for events, and ordering on their behalf.



Example: Working On Behalf Of contacts and running reports using the Big Button Panel

In this example, we will set up the Big Button Panel on the account page, so that staff can select a contact from the Directory, then quickly run a report, register for an event, make a donation, or order a product for that contact.

1. Edit the account page that displays after a staff user selects a contact from your directory. In the Member site, it is the Account Page Staff content record.
2. Add the Big Button Panel (add content > ContentTypes > Content > Big Button Panel) iPart to the content record and configure it with the following settings:

- Mode: Actions
- Add an action link to run a report:
- Link Text: Print Info
- Link Target: Enter a link to a page that contains the SSRS Report iPart that displays a report such as $/Samples/ReportingServices/MemberProfileQuery_Report.

Note: The SSRS Report iPart must be configured to Hide the parameters section and to enable the option to Inspect query string for parameters. Do not enable the option to Inspect Session for parameters. For more information about SSRS reports, see Creating SSRS reports.

- URL Parameter: ContactKey=@SelectedUser
- Add an action link for event registrations:
- Link Text: Register for an event

  Note: Customize this text for the event you want to register the contact for. For example, Register for the Spring Conference.
- Link Target: Enter a link to the event page
- URL Parameter: EventKey=XYZ (replace XYZ with an event code) EventKey=XYZ (replace XYZ with an event key)
- Use On Behalf Of: Enable
- Add an action link for donations:
- Link Text: Make a donation
- Link Target: Enter a link to your donation page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable
- Add an action link for the shop:
- Link Text: Purchase a product
- Link Target: Enter a link to your Shop page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable

3. Save and Publish the account page.

Using the Group List Editor iPart

The Group List Editor provides a flexible tool for you to display and manage lists of groups, sub-groups, relationships, and/or memberships. You can configure it to serve several different purposes.

Display an organization's roster

A common use for the Group List Editor is to display a list of contacts that belong to an organization.

For example, add the iPart to an organization's profile page, so that the iPart displays memberships for the selected organization. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the roster
- Clicking on a contact opens their profile page: Enable to link contact names directly to their profile page
- Provide option to view and edit membership details: If you want users to have easy access to both the account pages and the Group Member Detail window, also enable this option. Users can click an icon to switch between these options.
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups owned by the parent ID and their members
- Choose the group types to include: Organization
- Automatically create a group if one does not exist: Enable if you have allowed editing (this allows the creation of new rosters)
- Group owner type: Party
- Group type to auto-create: Company
- Choose the group types to include: Ensure that Company is selected

Display a contact's memberships

Another common use for the Group List Editor is to display a list of a contact's memberships in groups such as committees and chapters.

For example, add the iPart to a contact's profile page, so that the iPart displays memberships for the selected contact. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the contact's memberships
- Clicking on a contact opens their profile page: Not applicable
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups that the parent ID is a member of
- Choose the group types to include: Select the group types you want to display, such as Chapters and/or Sections

Relationships in the Group List Editor

You can easily create a link between two contacts using the Group List Editor iPart. The relationships you define show up on the record of both contacts, and you can specify roles for one or both of the contacts. For example, if you edit Jean Smith's record to indicate that she knows Russell Smith, then that relationship will also appear in Russell Smith's record. Alternately, if you edit Jean's record to indicate that Russell is her child, you can also specify that her role is the parent of Russell. Then Russell's record will reflect that Jean is his parent.

There is no limit to the number of relationships you can create or the types of relationships you can create. We have provided a few relationship types out-of-the-box, but you can add additional ones if needed.

Only users with System Administrator or Staff privileges can create relationships between contacts, but any user can view a list of relationships.

Note: To use this relationship feature, you must have the RELATION license.

The following sections walk you through how to create relationship types and how to set up the Group List Editor to display relationships.

Creating relationship types groups and roles

Edit the Customer setup table for Relationship types, adding the relationships that you want to have available in the Group List Editor. For each relationship type you add, you can also define a Reciprocal relationship, which the Group List Editor automatically populates as a set (such as for Parent and Child).

To display and edit relationships in the Group List Editor, you must define a Relationship Group and Roles (relationship types) associated with that group. A sample relationship group type named Connections has been provided. You can create your own group type from Setup > Groups > Types. If you create your own group type, the only requirement is that you select the Relationship Group checkbox, so that the Group List Editor can properly display relationships.

To create Roles used in relationship groups

1. Decide which relationships you want to be able to define for users. For example, Parent-Child, Husband-Wife, etc.
2. Create Roles for each relationship type.

- From Setup > Groups > Roles, click add.
- Enter the Name of the Role and a Description of the role.
- Select the Active checkbox.
- (optional) Select a default Reciprocal Role for this role. For example, if you are creating a Parent role, you may consider selecting Child as the default Reciprocal Role, so that it is automatically selected when someone defines a Parent relationship. If the Reciprocal Role you want to add is not in the list, create it first, then add it to this role.
- Save and repeat for each relationship role you want to define.

3. Edit your relationships group (for example, the group Connections) to add the roles you have defined.

To set up the Group List Editor to display relationships

1. Add the Group List Editor iPart to a content record on which you want to display a list of a contact's relationships. For example, add it to an account page. The iPart displays a list of relationships for the currently selected contact. The selected contact is determined by either a contact ID passed to the page via a URL parameter (from the Directory, for example), the contact selected in the On Behalf Of control, or the currently signed in user.
2. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit relationships
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Both of the above
- Automatically create a group if one does not exist: Enable
- Group owner type: Party Choose the group types to include: Select Relationships
- Group type to auto-create: Select a relationship group, like Connections
- Choose the group types to include: Ensure that Connections is already selected.

  Note: Only the relationship group type selected to auto-create may be edited. For this reason, if Allow editing is selected, we recommend including only the one relationship group type in this instance of the iPart.

3. Save and Publish the content record.

Using the Content HTML iPart

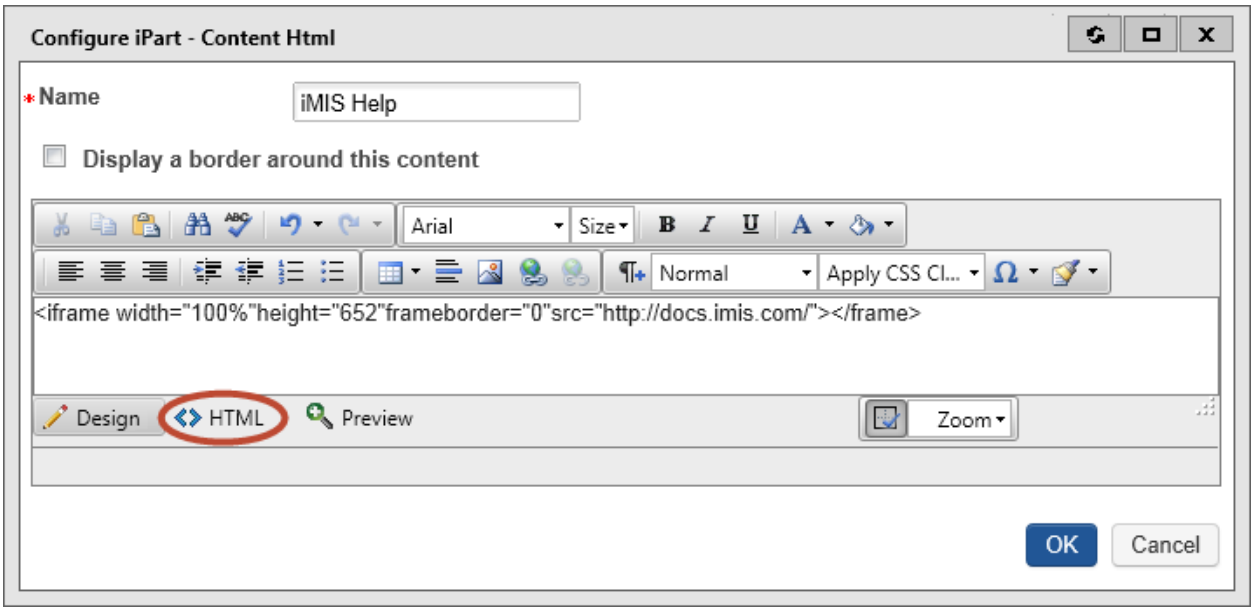
Using the Content HTML iPart, you can add simple content to your website, anywhere you want. In addition to the WYSIWYG functionality, you can switch to HTML mode to insert JavaScript to embed other sites, display web widgets, and use variables to create relative paths.

Embedding external sites

To embed any external page into an iMIS site, you can use an <iframe> like this:

1. Go to Content designer, Manage content and create a new content record.
2. Select add content and place a single Content Html iPart on it (from the ContentTypes folder).
3. Show the source by clicking the <> HTML tab and type in an iframe tag, such as this:

   <iframe width="100%" height="652" frameborder="0" src-c="http://docs.imis.com/"></iframe>
4. Go to Tools > Site designer > Manage sitemaps and create a new navigation item that points to the new content record.
5. If appropriate, restrict the navigation item's Access Settings, such as to Authenticated User Full Control.



Displaying web widgets

You can install and display JavaScript-based web widgets (plugins, gadgets) in your WCM-generated websites using the Content HTML iPart. A web widget is a small program that your users can execute within a web page and that can provide a wide range of functionality.

For example, Google Gadgets offers thousands of free web widgets including mini applications, games, news feeds, maps, and a wide range of other types of content. Many other websites also provide free widgets that can access data from their site. For example, Twitter provides widgets that let you display Twitter updates on your website. LinkedIn provides plugins that display information such as company profiles, member profiles, and links to share on LinkedIn. You just have to search the web to see what you can find that meets your needs.

Warning: Only embed widgets from authors whom you trust. Malicious code may damage your computer or violate your privacy.

To add a JavaScript-based web widget to a webpage

Go to Content Management > Content designer > Manage content:

1. Create a new content record or edit an existing one.
2. Click add content to find and select the Content Html iPart. The Configure iPart window opens.
3. Click < > HTML to switch to HTML mode.
4. Copy the JavaScript embed code for the widget you want to add and paste it into the HTML area.
5. Click OK, then Save and Publish your content record. The widget is displayed when that content record is rendered on a webpage.

Creating relative paths using variables

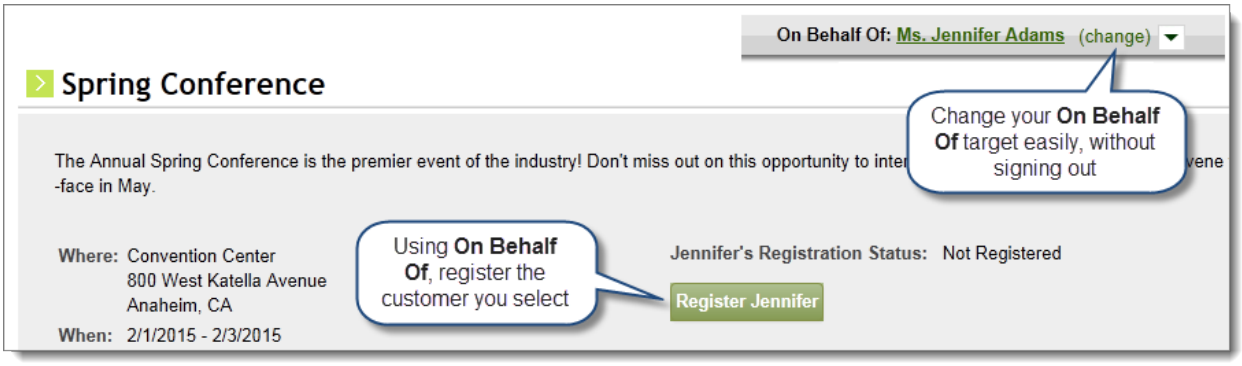
The Content HTML iPart does not support the use of the ~/ (tilde slash) shortcut, often used to automatically build the correct paths when a control is rendered in different domains. However, several variables are available in this iPart that allow you to enter paths for links and resources that are automatically resolved to various folders in your website. The variable names are case-sensitive.

Note: Images do not render in Design mode because the variable is not transformed until the content record is published.

- [Website] – Resolves to the root of the website and contains the website name. Example: [Website]Home.aspx.
- [~] and [Root] – Both variables resolve to the root of the website. Example: [~]Home.aspx resolves to http://mydomain/Home.aspx.
- [Theme] – Resolves to the website's theme folder. Example: [Theme]images/image.png. This variable can be used to access theme resources such as images and CSS.
- [iMIS] – Resolves to the iMIS directory of the website. Example: [iMIS]ContactManagement/CreateAccount.aspx
- [Common] – Resolves to the AsiCommon directory of the website. Example: [Common]Controls/Shared/FormsAuthentication/Login.aspx

On Behalf Of: Customer service mode

Your iPart-based site is not just for self-service: On Behalf Of gives your staff a customer service mode, to complete website commerce on behalf of your customers. When requests for event registrations, product orders, and even membership renewal payments come in by phone, fax, or email, On Behalf Of lets you conduct a secure session during which you can add items to a customer's cart and complete the transaction for them, all without signing out of your own session.



Separate carts, for privacy

To avoid confusion and to protect your customers' privacy as to which items they may have added to their own carts, On Behalf Of sessions create and save carts that are

completely separate from those your customers see. For added security, items yet to be purchased are saved in these carts, but not any cardholder information that may have been entered.

For example, if you added a registration to a member's cart but do not submit it, then she will not see the registration in her cart the next time she signs in; however, when you return to registering her on her behalf, you see her cart restored to the state it was in when you left it. Once you complete a purchase on her behalf, both she and you can see the order through her account page.

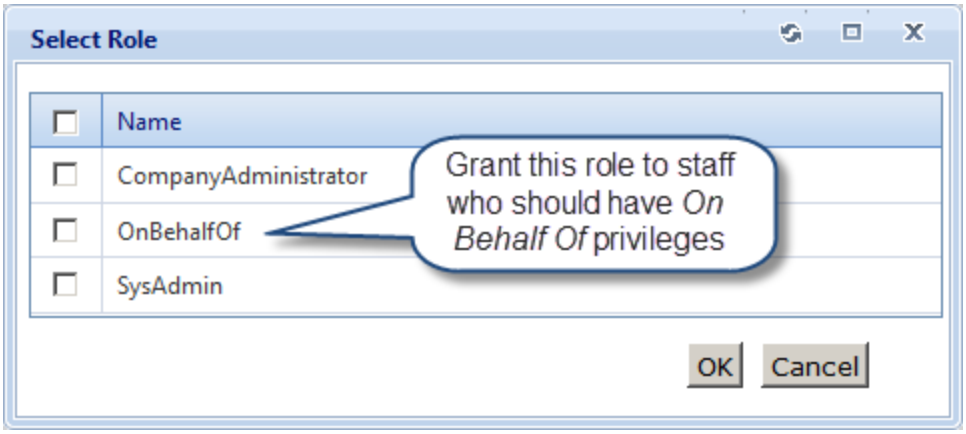
Tip: You can use the audit trails to track which logged-in user performed each action that affected an On Behalf Of transaction.

Who can act On Behalf Of?

To protect the security of contact data, users must be added to the security role SysAdmin or OnBehalfOf to perform actions on behalf of another contact (individual or organization). It is easy to give a staff member On Behalf Of privileges.

Go to System Setup > Security administration > Users:

Find and select a user, and in User Information click add role.



Changing and ending On Behalf Of

When you act on behalf of someone else, all of your commerce-related actions pertain to the target contact until you end the session in one of these ways:

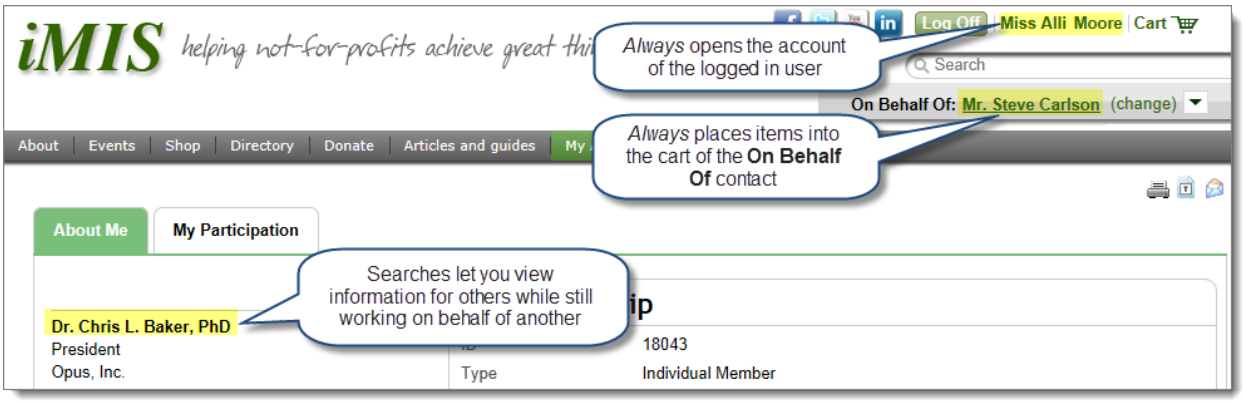
- Select a new target contact: click (change) next to the target contact.
- Clear the selected contact: click the down arrow next to the target contact and select Clear.
- Close the browser.
- Sign out of iMIS.

Whose contact information do iParts show?

Acting on behalf of another contact controls the current cart, but it does not keep you from getting to information for other contacts. An iPart determines whose cart and information to show and update based on this logic:

- If the link's URL specifies an ID (such as for search results), it shows information for that contact.
- If not, it shows information for your On Behalf Of contact, if appropriate. For example, the Query Menu iPart runs queries regardless of the target contact.
- Without On Behalf Of, it shows information for you, the logged-in user.
- If no one is signed in, it shows limited information.

For example, you could be working on behalf of one contact when you need to use the Directory to look up an address for another. You can drill down on information from those searches with no effect on your on-behalf-of contact: the iParts pass the queried contact's ID on the URL to show you the information you need. Only when you take actions that add items to the cart is On Behalf Of enforced.



Tip: What never changes is the contact name link in the top navigation: it always shows information for you (the logged-in user).

Creating websites

Creating a website is simple with iMIS! You can simply make a copy of one of the sample sites installed with iMIS and select a look and feel template and theme that is the best match for the look that you want for your new site.

Creating a site

To create a public-facing website that makes full use of iParts and SOA, it is easiest to copy an existing sample site, such as Member, and change it to meet your needs.

When you copy a website, iMIS duplicates the site navigation and content records for the new site.

Go to RiSE > Site Designer > Manage websites:

1. Select a website from the list of websites and review the following fields before you proceed:

- (Properties tab) Make sure the folder selected for the Website-specific parent content folder field contains the content unique to this website. Only the content in this site-specific folder will be copied. Any content shared with another website should be placed in a separate, shared folder.
- (Look and Feel tab) The Folder containing template content is normally a sub-folder of the parent folder. If the template content (footer area, header logo, and so forth) is stored in a different folder, select that folder instead.

2. Copy a website:

1. Select Organize > Copy.
2. Select the folder where you want to paste the new website.
3. Select Organize > Paste.
4. Enter the Name of the new website, for example, MemberCopy. Do not use special characters or punctuation.

Note: During the copy process, Content Codes are cleared from content records because this code must be unique for each content record. A warning message displays a list of the content records where the Content Code was cleared. See the log files for details.

3. Copy an out-of-the-box Master Page and Theme to be unique to your new website.

   Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme. Creating a copy of a theme also ensures that you do not compromise your ability to fall back to a working original. Follow these steps to copy a theme, which is far easier than creating one from scratch.

1. Select your new website.
2. (Look and Feel tab) Select the master page and theme that you want for your new site.
3. Locate the theme folder (such as \Aspen), which defaults to C:\Program Files\ASI\iMIS\Net\App_Themes.
4. Copy, paste, and rename \Aspen to your new site name (\ABC).
5. Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages
6. Copy, paste, and rename Forest.master to your new site name (MemberCopy.master).
4. Edit your site to use your new theme files.

- Select Site Designer > Manage Websites and highlight your site (ABC).
- Edit the site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save.

5. Click the expand icon in the Status area, and enable the Is this website active option.
6. Publish the website. Select the website and click Publish.
7. Publish the new website's content:

Go to RiSE > Content Designer > Manage content:

Note: When creating a copy of a sample website, the copied website's content will not be included in search results until the content has been published and the Default Website (for search) has been selected for the copied website's content folder.

1. Select the copied website's content folder.
2. Click Edit.
3. For the Default Website (for search) field, click select.
4. Select the website for which you want searches to always include the content records within this content folder.
5. Click Save and then close the window.
6. Publish the website's content folders. Select the content folder of the copied website.
7. Select Publish. As each folder and content record publishes, the status will change from Publish Pending to Published.
8. If the website is hosted on a separate web server, publish the Core Content folder. See Installing WCM on web servers for more information on hosting a site on a separate web server.

Go to Content Designer > Manage content:

1. Select the Core Content folder.
2. Select Publish menu and choose the Publish All Items option. As each folder and content record publishes, the status will change from PublishPending to Published.

8. After all content folders are published, log off and close the browser.

Note: If the website you copied contains URL shortcuts, be sure to review those shortcuts in your new website to determine if you need to create fresh shortcuts. For example, when you select the iMIS logo in the Member site, the page redirects to the shared Member Home content record. When you make a copy of the Member site and you select the iMIS logo from the new site, you will be redirected to the same shared Member Home

content record. To resolve this, create a fresh shortcut that will point to your new Member Home.

Deleting a website

A website administrator can delete a website and the content records associated with the website. However, you should proceed with caution, as a deleted website cannot be retrieved. Ensure the website is not a production site.

Go to RiSE > Site Designer > Manage websites:

1. Select the website you want to delete (such as MemberCopy).
2. Select Organize > Delete. A warning message is displayed.
3. Click OK. A results window is displayed.
4. Click Close.
5. Select Recycle Bin.
6. Select Organize > Empty the Recycle Bin. A warning message is displayed.
7. Click OK. A results window is displayed.
8. Click Close.

Go to RiSE > Content Designer > Manage content:

9. Select the content folder of the copied website.
10. Select Organize > Delete. A warning message is displayed.
11. Click OK. A results window is displayed.
12. Click Close.
13. Select Recycle Bin.
14. Select Organize > Empty the Recycle Bin. A warning message is displayed.
15. Click OK. A results window is displayed.
16. Click Close.

Implementing a mobile site

The Member Mobile sample site is optimal for mobile devices like smart phones and tablets, featuring accessible content and a sitemap for members needing information on the go. The master page Sapling places key information at the top of the screen and works with the Aspen Mobile and Austin Mobile themes; featured styles are sized appropriately for smaller screens.

If you want to provide a mobile site for your members, we recommend that you start with a copy of the Member Mobile sample site, and then apply your changes. When you make a copy of the site, iMIS creates a copy of the website, content, and sitemap.

Note: Before the following required steps, you must complete your copy of the mobile site.

To implement a mobile site, do the following:

Go to RiSE > Site Designer > Manage sitemaps:

1. Choose your copy of the Member Mobile site.
2. Edit the Full Site navigation item to add your main site's URL to the Content or URL to Link to.
3. Go to RiSE > Content Designer > Manage content, then select the content folder created for your copy of the mobile site.
4. From the ContentAreas folder, edit the following content records:

- Social Networking Images: Configure the Social Networking instance of the Content Html iPart, and from the <>HTML tab, update the href's to link to your social media accounts or remove any links you do not want to appear.
- Header Logo: Configure the Header Logo Span instance of the Content Html iPart and update the logo to your organization's logo.
- Footer Copyright: Configure the Footer Copyright instance of the Content Html iPart, and update the content and link for your organization.

Tips and reminders

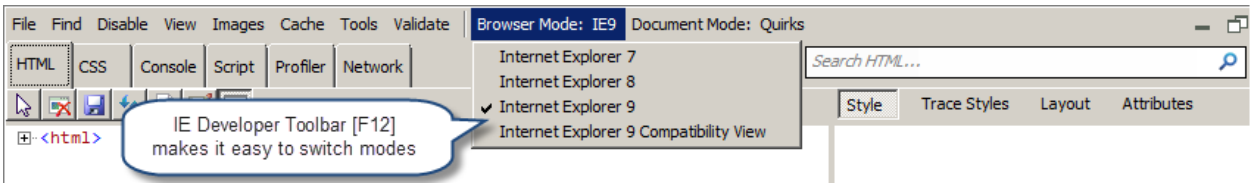
- Trim content – For easier reading on small screens, and to decrease page load time, keep content simple.
- Automatic redirect – Consider adding some JavaScript to redirect users automatically to the mobile site when they try to access your full site on mobile devices.
- Add favicon – Update the favicon used for your mobile site, apple-touch-icon, located by default in C:\Program Files\ASI\iMIS\Net.
- Easy edit limits – When you access the mobile site, Easy edit is only available when you access the website from a browser with a width larger than 700 pixels.

Modifying site themes

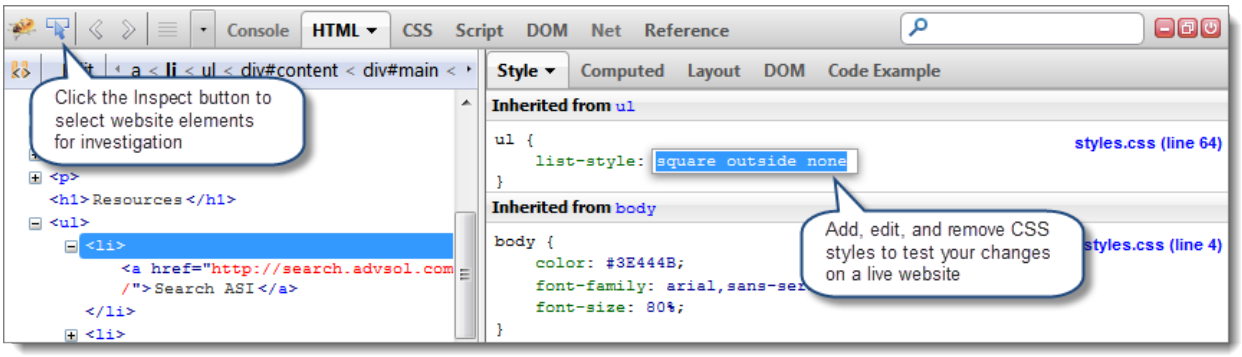
Several themes have been created for the sample sites. You can modify these themes to help identify and personalize your organization's website.

Best practices for theme development

- Caution: Never change the core style sheets 00-Reset.css and 10-UltraWave.css. All derivative themes inherit from these files, and any changes you make to them are lost on upgrade. Instead, override the base styles in your 99-[theme].css.
- Before modifying a theme, find the best one: apply all of the themes to the default Member site in turn, and decide which theme is closest to the final look and layout that you want.
- Always work from your copy of the theme, so that you can begin again.
- Make changes only to websites that you create. When a sample site is updated with each release, the iMIS Upgrader overwrites any changes you made to it.
- Take advantage of browser-based developer tools to test and troubleshoot changes before committing them to your style sheets:
- Internet Explorer and Chrome: Press F12 to toggle the Developer Toolbar.



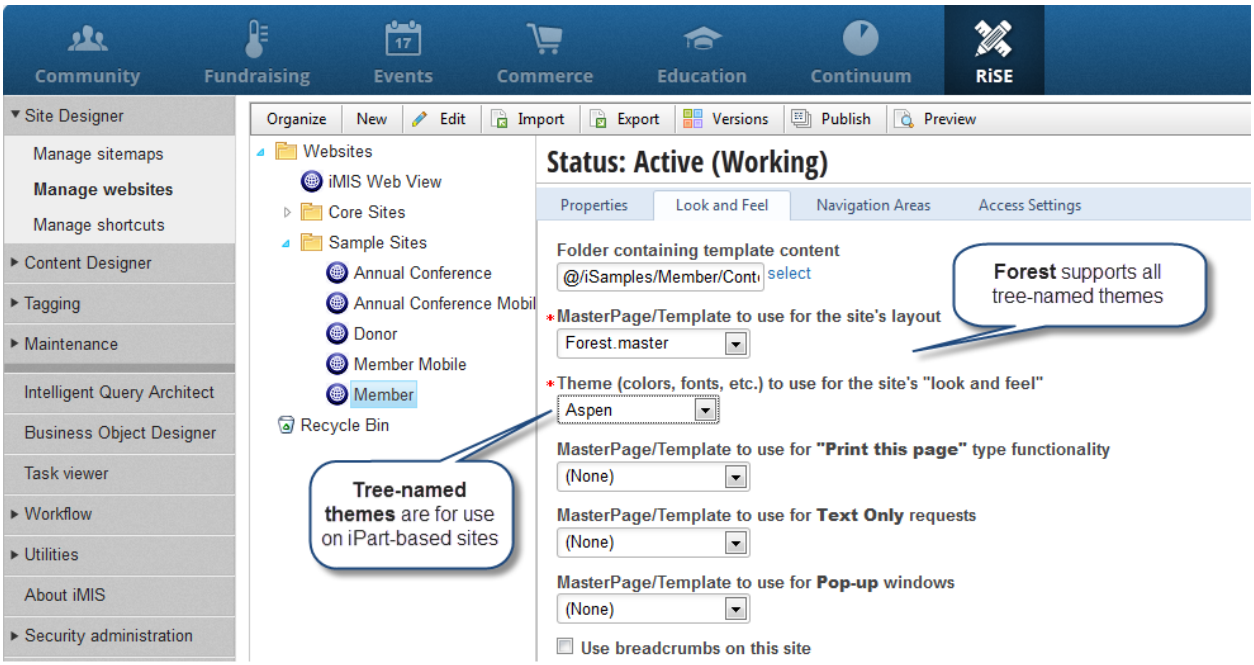
- FireFox: Install the Firebug add-on to see a wealth of information about the structure of the website and the styles it is using. Turn on the element inspector and click a piece of content to see the styling that it is implementing:



Sample themes and master pages

You can change the look and feel of the sample sites by selecting different combinations of a Master Page and its matching Theme. If you want to modify a particular design for your website, make sure you create a copy of the master page and theme before making any changes.

Note: iMIS themes give you a head start on developing your website. To provide you an idea of how things could look, we have used numerous pictures, illustrations, and images that we purchased under a limited license for ASI's use. The icons can be used on your website, but if you reuse any of the other images, you will need to buy a license. We acquire the majority of our images from iStockPhoto and most are available in the range of $15-$50; much less than the cost and labor of creating them on your own. If you have any questions, please contact us.



Example: Selecting a theme created for the Forest master page

Important: If possible, avoid customization to master pages. If you do need to make changes, make the changes in a copy of the master page. Any customizations performed to the out-of-the-box master pages will be overwritten after an upgrade.

The following designs are available out-of-the-box for iMIS sample sites.

City.master

The set of city-named themes support RiSE sites and can be used interchangeably with the City master page.

Available theme:

Austin

Forest.master

The set of tree-named themes support RiSE sites and can be used interchangeably with the Forest master page.

Upcoming weekend study sessions
By Ms. Carly Kowalski on March 6, 2013
All About Certification Discussion
We have had many members ask if we will be sponsoring weekend study sessions for the upcoming certification exams. I'm pleased to let you know that we will be doing this again this year! Each regional chapter will set the dates and location of their own sessions and will include a light dinner and refreshments as well as any necessary study materials. Please let us know if you would like to be a part of the study sessions in your area!

Questions about our finances
By Charlotte Richards on February 28, 2013
Chapter Finances Blog
At some of our past chapter meetings members have asked me to include more information on our financial status. We receive these reports every month:
1. The balance sheet gives an overview snapshot of our bottom line.
2. The profit and loss statement gives us a look at where we are relative to our budget according to each account.
Please let me know if you would like additional information.

UltraWave and Universal Design

The Sample site themes and master pages build upon a new underlying template called UltraWave. UltraWave incorporates structure and styling for Universal Design. Universal Design seeks to make web content "barrier-free," making sites accessible to all challenged users. Challenged users include not only the millions of physically or cognitively impaired, but also seniors, non-native speakers, and those in other countries and cultures (localization).

Universal Design has benefits beyond helping websites meet the myriad of web accessibility standards: it also aids in breaking technology and human barriers. Universal Design is the foundation for transforming pages and content into outputs and displays your members may need, including print presentation, net book usage, and even cell phone applications.

Important: UltraWave themes support RiSE sites, which are an alternative to Public view. They do not support existing Public views.

Features of the template include:

- Developed toward W3C standards to help meet accessibility requirements
- Fluid-width template dynamically reflows content to fit your user's browser window
- Clean, minimal design uses neutral shades and layout
- Offers a streamlined set of stylesheets and skins
- Easily customized with logos, fonts, and colors
- Designed to be easily rebranded by your organization

Copying a website theme

Themes control the layout, font, and colors of your iMIS sites. The sample sites come with a set of special themes, designed for RiSE sites.

Creating a copy of a theme also ensures that you do not compromise your ability to fall back to an original that works. Follow these steps to copy a theme, which is far easier than creating one from scratch.

Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme, as outlined below.

1. Copy an out-of-the-box theme and master page to be unique to your new site.

- Locate the theme folder (such as \Aspen), which defaults to C:\Program Files\ASI\iMIS\Net\App_Themes.
- Copy, paste, and rename \Aspen to your new site name (\ABC).
- Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages.
- Copy, paste, and rename Forest.master to your new site name (ABC.master).

Go to RiSE > Site Designer > Manage websites:

2. Edit your site to use your new theme files.

- Highlight your site (ABC).
- Edit the Site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save and Publish.

3. Edit your theme files as needed to tailor the design.

Changing theme headers

The first elements to change on your website are the highly visible elements that public visitors see and use in the header: logo, social networking links, welcome banner, and the favicon.

Logo

The header logo is contained in a content record: @\[theme]\ContentAreas\Header Logo. To add your own logo, edit this content record, remove the contents in the HTML iPart, and replace with your own logo.

Note: Alternatively, you can change the logo in the CSS. The logo is set in 99-[theme].css by the selector #masterHeaderImage. Change the background image and the dimensions to match your own logo.

Social networking links

The links to the social networking sites in the top (auxiliary) navigation are also defined in a content record: @\[theme]\ContentAreas\Social Networking Images.

To change the links to navigate to your own social networking pages, edit the content record and change the links on the icons.

In the HTML editor, replace the href on each <a> tag with the appropriate URL. For example:

Favicon

The favicon is the little icon that displays next to the website in your bookmarks and on the browser tab in modern browsers. Changing it to your organizations' icon is simple: create an icon sized either 32x32 or 64x64 pixels and name it Favicon.ico. Then overwrite the original file:

C:\Program Files\ASI\iMIS\Net\Favicon.ico

Update the copyright statement

The copyright statement is contained in a content record within your copied site's ContentAreas folder: Footer Copyright. Edit the Footer Copyright instance of the Content Html iPart on that page to update the copyright.

Changing theme colors

The next step in customizing your theme is to change to colors that support your branding & style. You will make these changes in both CSS and in images.

CSS colors

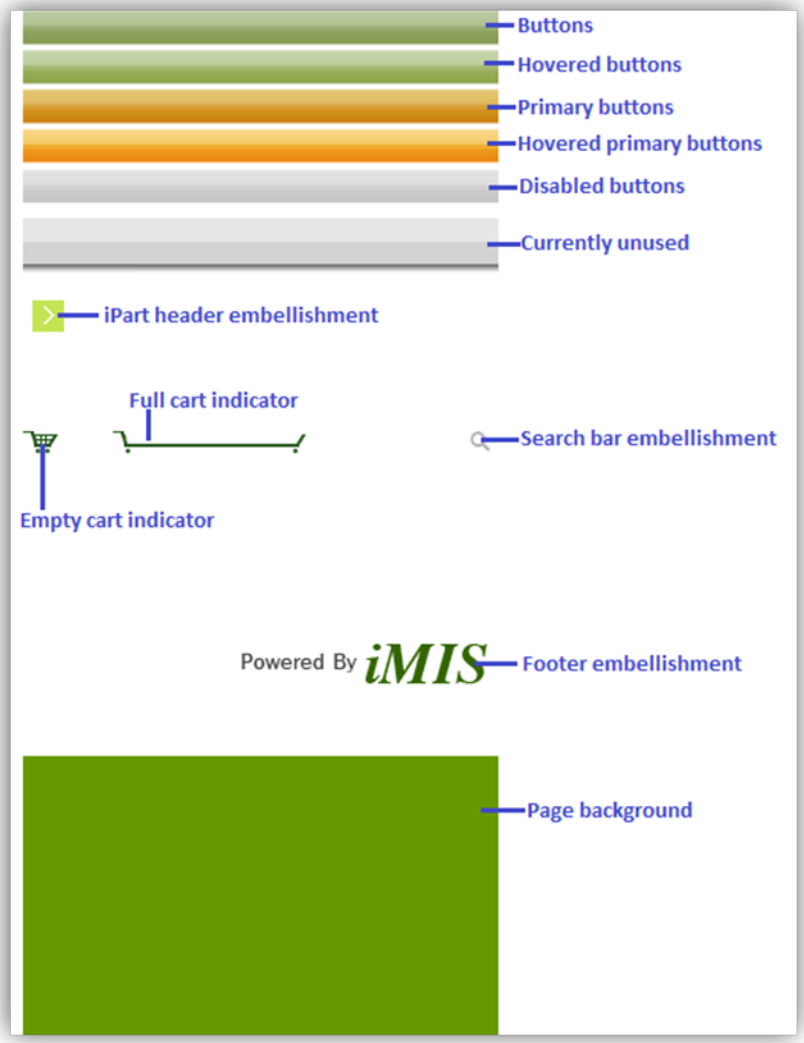
All theme-specific color and styling is located in 99-[theme].css. To find all color references that you might want to change, search the CSS file for these strings:

- color
- border
- background

We also recommend using your browser development tools to help you identify which styles you need to update for your color changes.

Sprite colors

A few of the theme's use sprites to control some of the site colors. A sprite is a single image that combines several commonly used images into one file. CSS then defines which part of the image displays for various purposes. Because your server only has to load a single image instead of several, using sprites reduces load time for your website. To improve performance, the new sample sites use sprites when possible. The image below shows a sprite used in the theme Aspen, and labels where each image is used:



You can either edit the sprite we have provided (which is easier), or create your own.

- When editing the provided sprite, keep all elements in their original pixel coordinates, so that you do not have to edit the related CSS.
- The .png version of the sprite is located in images/[theme]_sprite.png. You can edit this image in your favorite image editor, but we do not recommend editing in MS Paint, as you will lose the background transparency.
- Your theme's \Resource folder also includes a .psd source file of each sprite. You can edit the .psd with Photoshop or GIMP, a free image editor that can edit and save images in .psd and web-safe formats.

- If you edit the .psd, save your new image as a .png, and place it in the images folder of your theme.

  For greater design control, you also have the option of creating your own sprite. If you choose that option, you may also need to update your theme CSS for the new coordinates of the sprite. To help you with this process, we recommend the following resources:

- CSS Sprites: What They Are, Why They're Cool, and How To Use Them
- Sprite Cow calculates the pixel positions of the various images inside your sprite.
- CSS Sprite Generator lets you upload a zip file of images and get back a sprite file with the corresponding CSS.

Changing theme home pages

The Member site uses a pair of home pages: one that appears to guests (unauthenticated view) and another that appears to those who have signed in (authenticated view). You can change one or both of them, or drop one entirely and have one home page appear to all.

Do the following to change the unauthenticated home page:

Go to RiSE > Content Designer > Manage content:

Note: To have your own home page behave like the default one (switch to the authenticated home page when the user signs in), you need to add the code-bearing HTML iPart that does so.

1. Create a new content record for your unauthenticated home page.
2. Copy the AuthScript code to your new home page:

- Edit the unauthenticated home page content record @\iSamples\Member\Home.
- Locate the HTML iPart named AuthScript.
- Select Move To and select your unauthenticated home page.

- Now edit your unauthenticated home page and move the AuthScript iPart to the top of the content record.
- Save and Publish your home page.

3. Make your site's home page link to your new home page.

- Go to Site Designer > Manage sitemaps.
- Select your website.
- Edit the default navigation item (flagged with ★) and select your new home page for Content or URL to Link to.
- Save and Publish your sitemap.

Do the following to change the authenticated page:

Go to RiSE > Content Designer > Manage content:

Note: To have your own authenticated home page appear as soon as the user signs in, you need to edit the code-bearing HTML iPart that calls it.

1. Edit your unauthenticated home page content record.
2. Locate the HTML iPart named AuthScript.
3. Select Configure and switch the editor's view from Design to HTML, to view the code.
4. Edit the path to be the published path of your new authenticated home page:

path = "~/Mbr/Home/[theme]/MemberHome.aspx";

Do the following to use only one home page.

You can drop to a single home page either by:

- Removing the script that opens the authenticated home page:
- Go to Content Designer > Manage content and Edit the unauthenticated home page @\[site]\Home and delete the HTML iPart named AuthScript.
- Substituting your own page entirely:

- Go to Site Designer > Manage sitemaps and set your desired content record to be the default home page of your website.

Changing Telerik skins

Several iParts throughout the product use Rad Controls developed by Telerik. These controls require a few steps to style, and Telerik resources can help you get started:

- Telerik Control Guide – an overview of Telerik controls, including available skins.
- Telerik Visual Style Builder – generates CSS and some images for skinning Telerik controls.

Every [theme].skin file lists all of the Telerik skins that it uses to style controls. If a control does not explicitly define a theme, then it uses the Default Telerik skin.

Rad Window control

This control is the pop-up window that we see in many iParts. Its skin is set by two lines in Aspen.skin:

<asiweb:Window runat="server" Skin="Forest" />

<asiweb:WindowManager runat="server" Skin="Forest" />

Forest is a skin designed by Telerik and is available on most Telerik controls, along with a handful of other Skins. You can preview available Telerik skins for this control.

Tip: Telerik skins are easy to switch out and virtually maintenance-free. However, they are difficult to customize, so avoid this route unless you can use the skins as-is.

Rad Tab Strip

This control is used by the Content Collection Organizer (CCO) iPart, the Contact Address Editor iPart, and most other places where you see a tab strip. This line defines the skin:

<telerik:RadTabStrip runat="server" Skin="Aspen" EnableEmbeddedSkins="false" />

The definition for this look and feel is near the bottom of the 99-[theme].css, under the heading RadTools Styles.

Rad Menu control

This control displays the primary navigation area. There is wrapper for this control called PageNavR, so this line defines the skin:

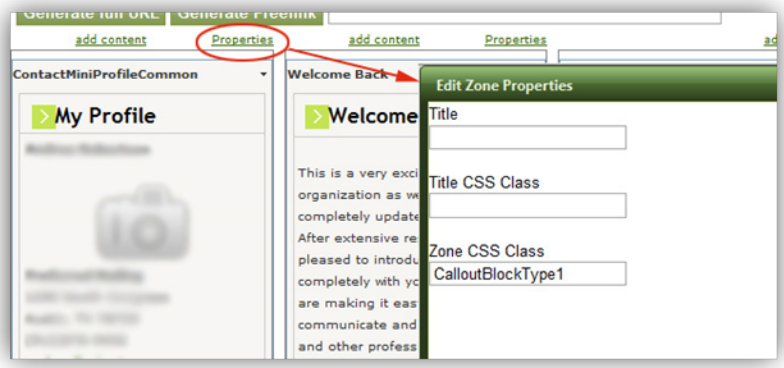
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" … />

The styling for the Rad Menu is located in Menu.[theme].css, and the image sprite is under [theme]\Menu\rmSprite.png. The easiest way to customize this control is to use Telerik's Visual Style Builder. (Tip: This tool works best in Internet Explorer.)

Changing zone properties

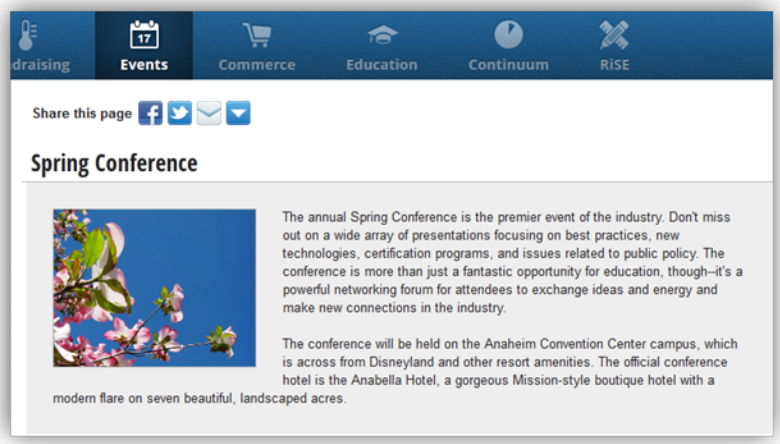
Zone properties make it easy to apply unique styling to specific iParts, for emphasis and contrast.

To apply a style to an iPart's zone property, edit the content record, click Properties, and enter the name of the class in Zone CSS Class:

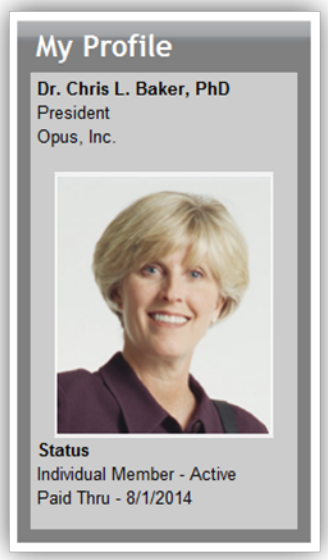


You can add more if needed, but all tree-name themes contain the following three zone style classes:

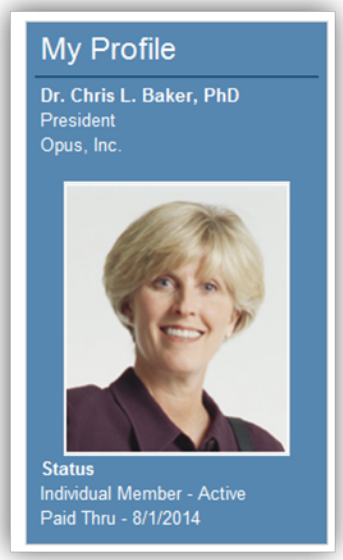
- TitleBarNoBorder – simply removes the bottom border from iPart headers
- CCOGrayBg – applies a gray background to content appearing in CCO tabs



- CalloutBlockType1 – accentuates an iPart whose border is enabled



Aspen:



Birch:

Creating a new theme

Instead of editing a copy of Aspen or Birch, you can also start from scratch when designing your own theme. However, you must include the 00-Reset.css and10-UltraWave.css in your new theme. To do so, begin your new style sheet with these lines:

```
/*##########################################*/
/*     Import UltraWave StyleSheets      */
/*##########################################*/
```

@import url("../UltraWave/00-Reset.css");

@import url("../UltraWave/10-UltraWave.css");

Resources for CSS

- w3schools.com – a great resource for CSS and HTML information and examples.
- CSS3 Generator – a tool to help generate CSS for rounded corners, box shadows, background gradients, and opacity. (Note: CSS3 is not fully supported in all browsers.)

Designing site navigation

Displaying left navigation

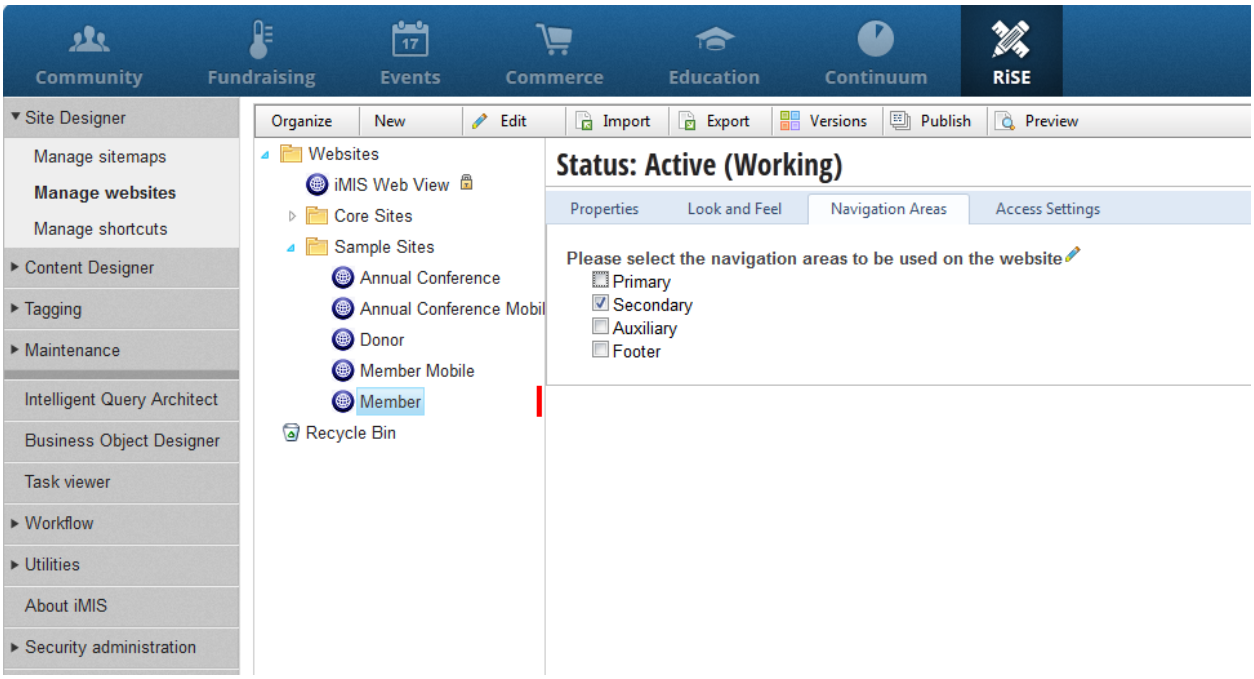
You can display website left navigation in a hierarchical format with a few changes to your theme's master page and skin file.

Do the following to implement left navigation:

Go to RiSE > Site Designer > Manage websites:

1. Define how many levels of navigation to display.

- Select the website.
- Select the Navigation Areas tab and select the Secondary navigation area.
- Save and publish your changes.



2. Edit the website theme's master page.

- Using your preferred text editor, find and open the website theme's master page. Master pages, by default, are located in C:\Program Files\ASI\iMIS\Net\Templates\MasterPages.
- Register the control by adding the following line to the top of the master page, just below the other registered controls:

  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>
- Add the following scripts to the <script language="C#" runat="server"> section:

  protected override SiteMapNode GetStartingNode()

  {

  return Secondary.GetStartingNode();

  }

  protected override SiteMapNode GetCurrentNode()

  {

```
    return Secondary.GetCurrentNode();
}
```

- Find the masterSideBarPanel div. It should look like this:

```
<div id="masterSideBarPanel" class="yui-b">
    <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server">
      </asp:ContentPlaceHolder>
</div>
```

- Update the masterSideBarPanel div so that it contains the following:

```
<div id="masterSideBarPanel" class="yui-b">

     <asp:Panel ID="SubNavPanel" runat="server" >
         <asp:ContentPlaceHolder ID="PageSubNavigationPlaceHolder" runat="server">
         <asp:Panel id="SubNavHead" runat="server" class="SubNavigationHead">
         <asp:Literal ID="SubNavPanelTitle" runat="server" />
         </asp:Panel>
         <asp:Panel id="SubNavBody" runat="server" class="SubNavigationBody">
         <asi:SubNavigation id="Secondary" runat="server" NavigationPaneCode="2"
           StartingNodeOffset="1" StartFromCurrentNode="true"
           StartingNodeOffsetAutoSet="true" SelectDefaultNode="false" />
          </asp:Panel>
          </asp:ContentPlaceHolder>
        <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server" />
    </asp:Panel>
```

```
</div>
```

- Find the masterWrapper div, and add the yui-t2 class to it:

```
<div id="masterWrapper" class="yui-t2">
```

- To improve JavaScript performance for websites using hierarchical sub-navigation, find the following script:

```
<script type="text/javascript">
    // if there is something in the side bar this converts the layout to 2 columns
    if ($('masterSideBarPanel').children.length != 0) {
      $('masterWrapper').setAttribute("class", "yui-t2 HasSubNav");
    }
</script>
```

- Update that script to the following:

```
<script type="text/javascript">
    // if there is something in the side bar this converts the layout to 2 columns
    if ($('masterSideBarPanel').children.length === 0) {
      $('masterWrapper').removeAttribute("class");
    }
</script>
```

3. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.

- Register the control by adding the following line to the top of the skin file, just below the other registered controls:

  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>

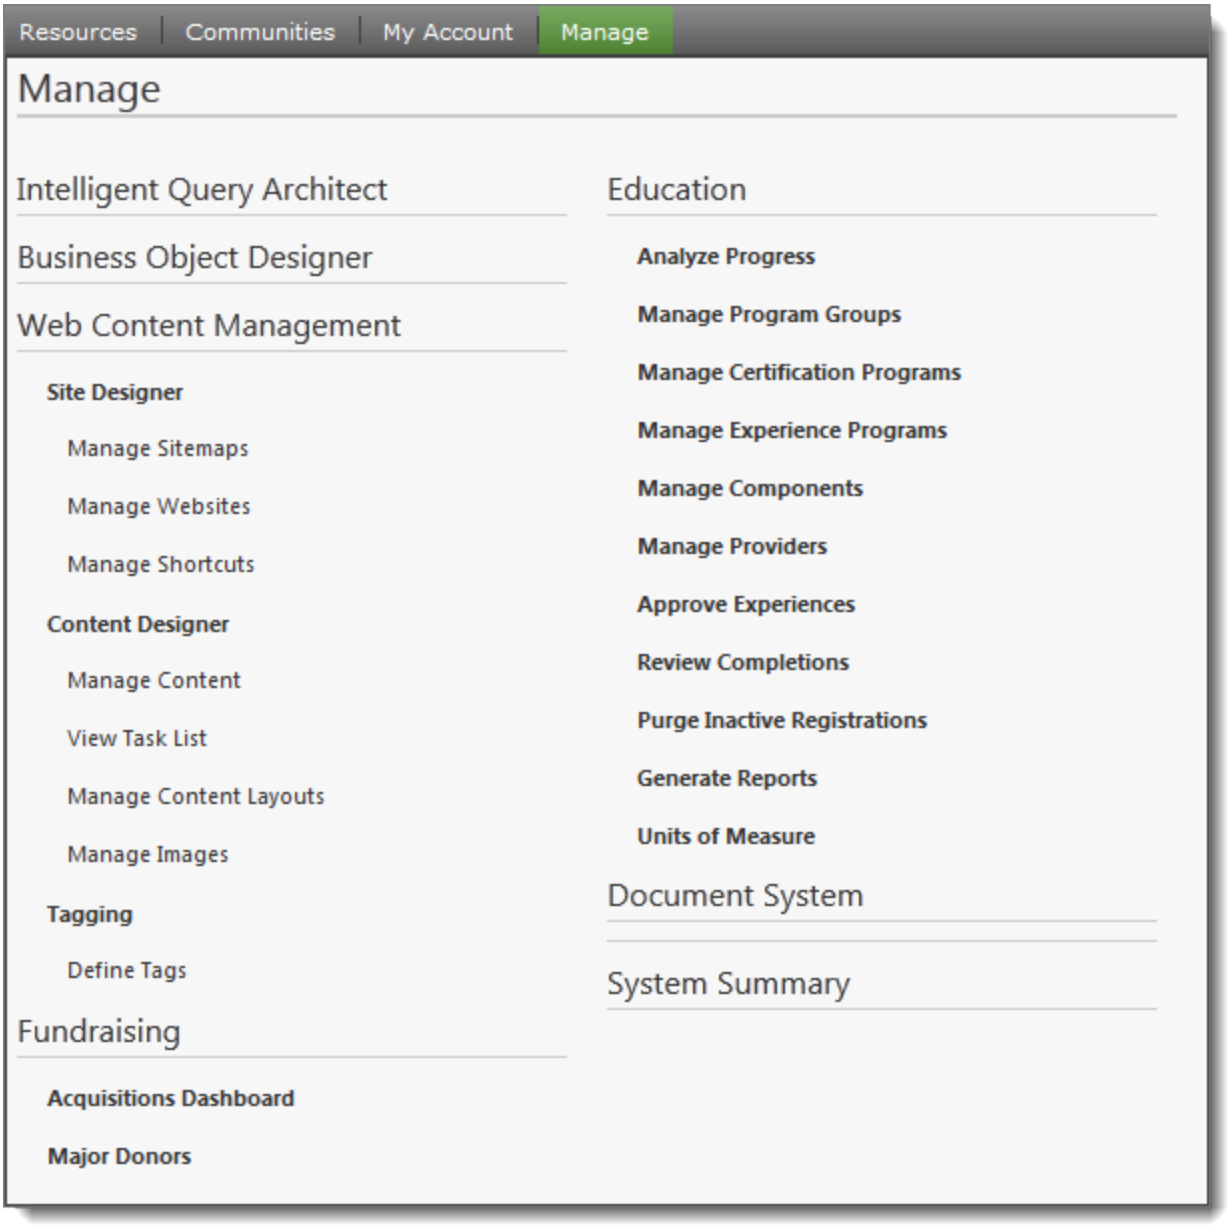
- Just below the section registering controls, add the following line:

  <asi:SubNavigation runat="server" Skin="Aspen" EnableEmbeddedSkins="false" SingleExpandPath="true" ShowLineImages="false" />

- (optional) If you are familiar with skin controls, you can configure how the SubNavigation control behaves using the following properties:
- string NavTreeSkinId – A unique ID for the skin if needed. The default is RadTreeView.
- bool SingleExpandPath – Gets or sets a value indicating if only the current branch of the tree is expanded. The SingleExpandPath property, when set to True, automatically collapses nodes that are not on the path of the currently expanded node. Use the SingleExpandPath property when you need to conserve screen space and make navigating nodes easier.
- public bool ShowLineImages – Gets or sets a value indicating if the tree node line images display or not.
- string Width – Gets or sets width of the control. Specify in pixels (px) or percentage (%) e.g. 500px, 90%.
- bool EnableEmbeddedSkins – Gets or sets a value indicating if the built in skins should be used on the navigation tree.
- int MaxDataBindDepth – Gets or sets the maximum number of levels to bind to the navigation tree.
- bool WrapNodeText – Gets or sets the option to wrap text if it is wider than the trees allowed width.
- bool ExpandAllNodes – Gets or sets the option to expand all of the nodes when the navigation tree renders.

Displaying mega drop-downs

You can display mega drop-downs from your primary navigation with a few changes to your theme's skin file and menu CSS. Mega drop-downs display navigation items within large panels, grouped by level, which reduces scrolling and improves the usability of site navigation.



To implement mega drop-downs

1. Ensure that all navigation items in the sitemap have a value for Content or URL to Link to. Otherwise, the navigation hierarchy may not render properly.
2. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableMegaDropDownMenu="true"

- (optional) If you are familiar with skin controls, you can configure how the mega drop-down behaves by altering the following properties:
- EnableMegaDropDownMenu – Enables the mega drop down.
- MegaDropDownMenuShowStartingNode – Displays the parent navigation node as the first item in the mega drop down. Enter true or false.
- MegaDropDownMenuLevelSettingLevel – Defines the navigation level at which the number of columns set for MegaDropDownMenuRepeatColumns starts to take effect. For example, if you set MegaDropDownMenuRepeatColumns="3" and set MegaDropDownMenuLevelSettingLevel="2", then the mega dropdown displays three columns for the second and higher navigation levels, and the first level only has one column.
- MegaDropDownMenuRepeatColumns – Defines the number of columns used to display the navigation.
- MegaDropDownTooltipLocation – This option only applies to tooltips defined for top level navigation items in the primary navigation. When defined, it specifies the location of the tooltip text if a tooltip is defined for that navigation item. Enter either Menu (displays the tooltip directly beneath the top level navigation item) or Append (displays to the right of the navigation text within the dropdown). If you do not define this property, navigation tooltips are not displayed in the dropdown.

3. Edit the theme's menu CSS to tailor the display of the mega drop-down for the theme's look and feel.

- Using your preferred text editor, find and open the website theme's menu CSS file (for example Menu.Aspen.css). Menu CSS files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the MegaDropDownMenu Styling section and edit the styles as needed:

```
/* ############################ */
/*  MegaDropDownMenu Styling  */
/* ############################ */

.RadMenu .rmGroup .MegaDropDownMenuOuter .rmText {
   padding: 0;
   margin: 0;
   width: 600px !important;
}

div.MegaDropDownMenu
{
   background-color: #f8f7f7;
   padding-left: 5px !important;
   padding-right: 5px !important;
}

.MegaDropDownMenuToolTip
```

```
{
   padding: 5px;
}
```

Using image sprites for navigation items

A sprite is a collection of images combined into a single image. Using CSS, you can shift the image around to display only parts of it. The advantage of using sprites is that they reduce the number of server requests to load images (only one is loaded), leading to improved performance.

One way to use sprites in iMIS is for rollover effects on navigation items.

To implement image sprites for navigation items

1. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableImageSprites="true"

  When enabled, a new class named rmLeftImage is added to root level links in PageNavR.

2. Create the sprite file.

- Using an image editor like Adobe Photoshop, or a free alternative like GIMP, create your sprite by adding the images you want to a single image, like the following:

- Save the sprite to the website theme's image folder.

3. Edit the theme's 99-[theme].css file to define the classes to control the sprite.

- Use a tool like SpriteCow to determine the position values of the images in the sprite.
- Using your preferred text editor, find and open the website theme's 99-[theme].css file, located by default in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Add styles for the sprite. For example:

```
.RadMenu a.rmRootLink.CartLink .rmLeftImage
{
   Background-image: url(images/cartsprite.png);
   Background-repeat: no-repeat;
   Background-position: -1px -1px;
   Width: 48px;
   Height: 36px;
}
.RadMenu a.rmRootLink.CartLink:hover .rmLeftImage, .RadMenu a.rmRootLink.CartLink.rmExapnded .rmLeftImage, .RadMenu a.rmRootLink.CartLink.rmFocused .rmLeftImage
{
   Background-position: -1px -39px;
}
```

The first group of selectors sets the resting position for the image sprite. The second group of selectors defines the hover state and shifts the image when the link is rolled over.

Go to RiSE > Site Designer > Mange websites:

4. Apply the sprite class to the appropriate navigation items.

- Edit the navigation item for which you want to apply the sprite hover effect (for example, the Shop).
- For the CSS Class property, enter the sprite class (for example, CartLink).
- Save and Publish the navigation items.

Styling your website's primary navigation

If you customize your website with a new look and feel, you will want to restyle the primary navigation to match the rest of the site. To customize the look of the navigation, you must be using iMIS 15.2 or later along with an UltraWave-derivative theme such as Aspen, Austin, or Birch. In iMIS, the primary navigation bar is built with Telerik RadControls; providing powerful tools for creating dynamic menu systems.

You can change your navigation menu's style by:

- Choosing an out-of-the-box skin provided by Telerik
- Customizing the font or color of an existing Telerik skin using Telerik's Visual Style Builder
- Styling your menu with CSS instead of using the Telerik tools

What is PageNavR?

PageNavR is a control that iMIS uses to display a website's primary navigation. The navigation bar automatically populates with each top-level navigation item, and each sub-item displays in a drop-down list that can expand to multiple levels. PageNavR wraps around a Telerik RadMenu control, so all PageNavR styles are controlled by Telerik's base styles.

What is a .skin file?

Skin files allow you to override default control behaviors in a theme-dependent way. If you set a property for a control in one theme's skin file, it will not affect how the control displays in other theme's skin files.

Take a look at this section of the Aspen.skin file in App_Themes/Aspen:

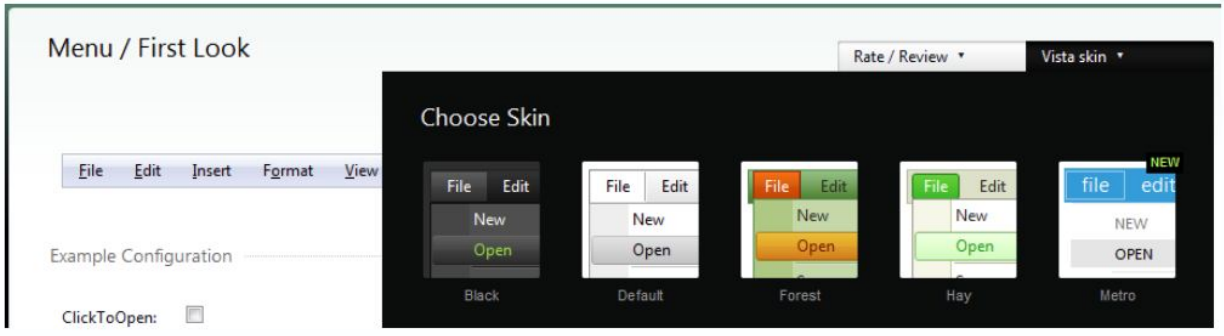
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" EnableRootItemScroll="false" Flow="Horizontal" DefaultGroupSettings_Flow-w="Vertical" DefaultGroupSettings_OffsetX="0" Width="100%"/>

These are just a few of the PageNavR properties available for the control in the skin file. The two properties which affect the navigation bar's style are "Skin" and "EnableEmbeddedSkins."

The "EnableEmbeddedSkins" property determines whether Telerik embedded skins should be loaded as the default. If you are creating your own custom skin, you MUST set this property to "false."

To style the navigation using a skin provided by Telerik

1. Choose an existing Telerik skin to style the navigation menu at [Telerik RadMenu Demo: First Look](#).



2. Change the "Skin" property of the PageNavR control in the theme's skin file to the name of the skin you selected.

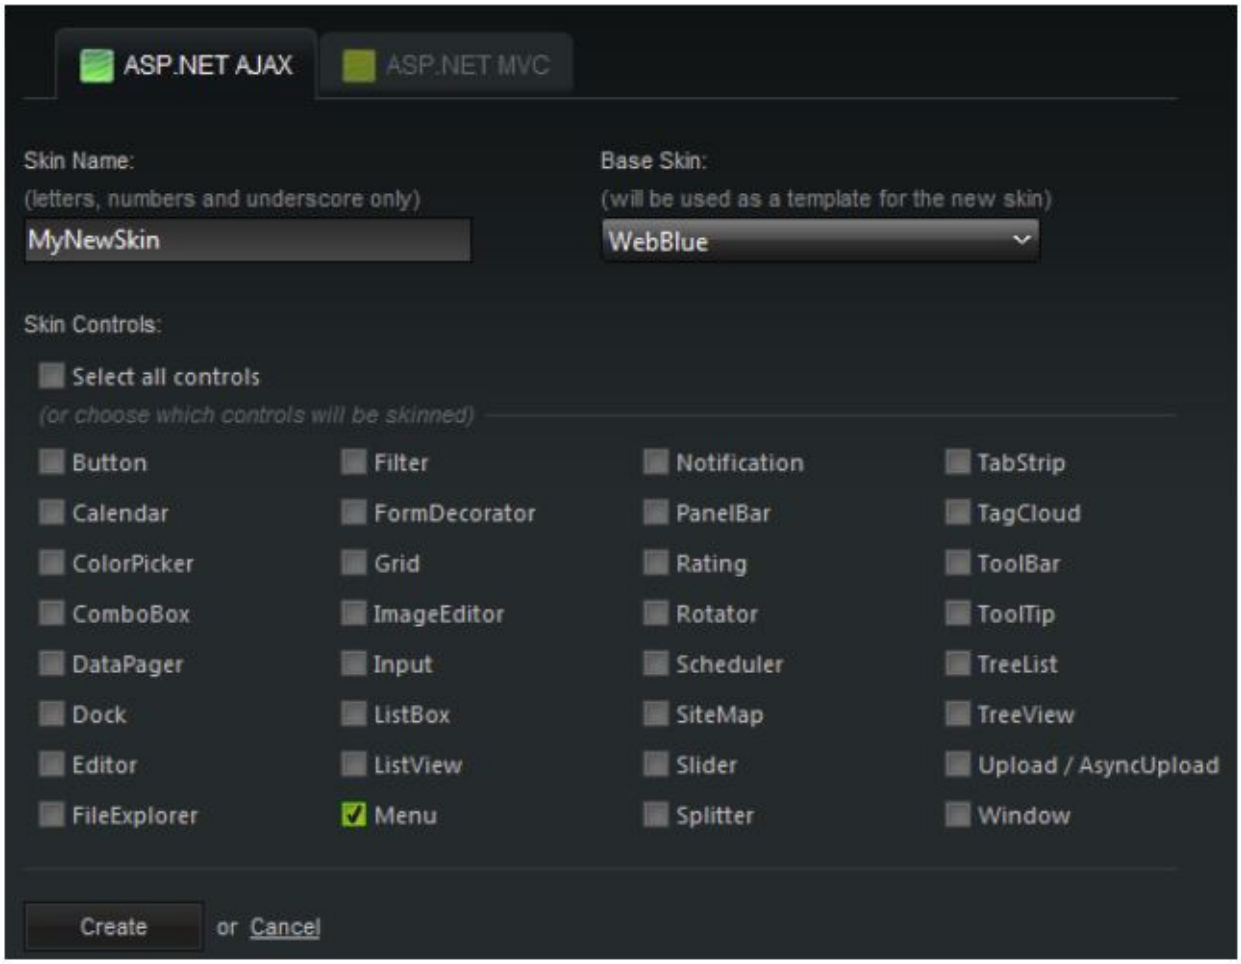
3. Change the “ EnableEmbeddedSkins=" property of the PageNavR control to “true." The navigation bar’s styling will change to that of the Telerik skin you selected.

For more information, see MSDN's guide to ASP.NET Themes and Skins.

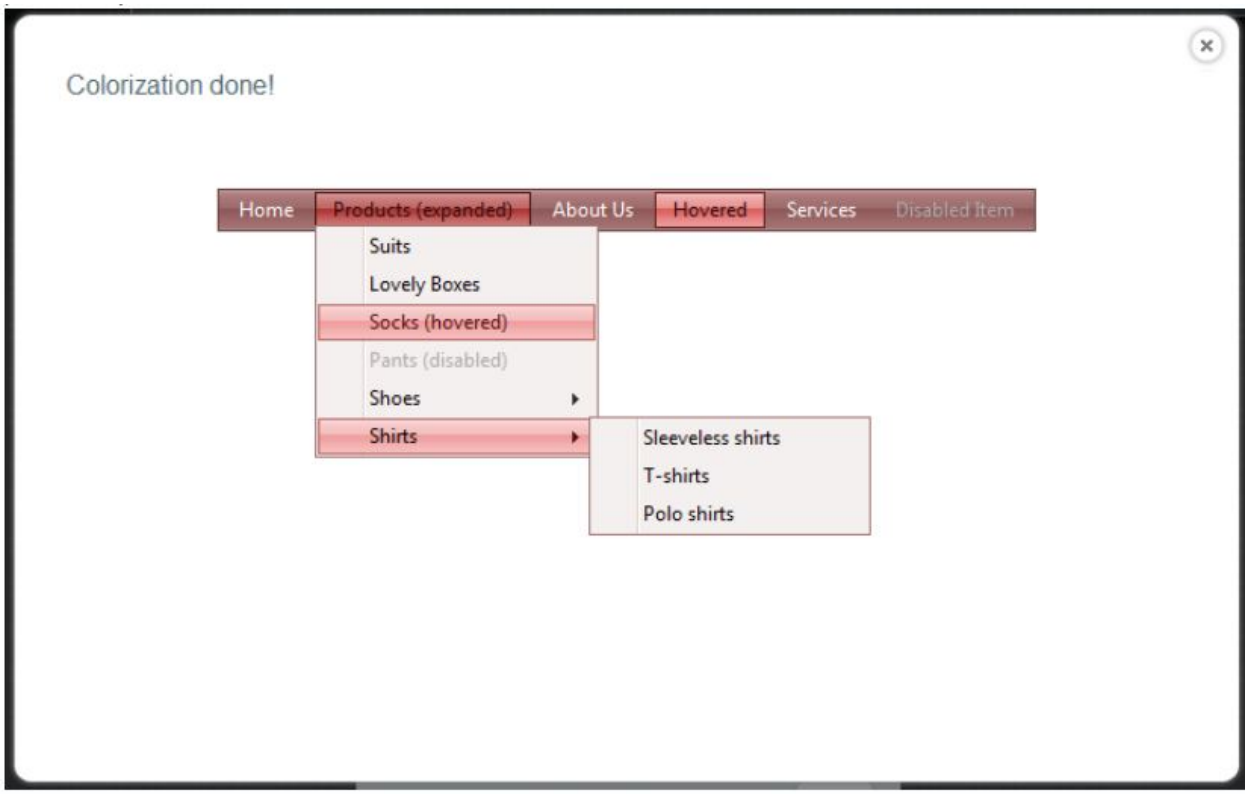
To style the navigation by customizing an existing Telerik skin using Visual Style Builder

If you want to customize the colors or font for a particular Telerik skin, you can use Telerik's Visual Style Builder:

1. Open the Telerik Visual Style Builder and select New Skin. (Note: The Visual Style Builder is in beta. For best results, use Internet Explorer as it is not fully functional in any other browser.)
2. Name your new skin, select your base skin, and check the Menu checkbox.
3. Click Create. Visual Style Builder will open on the Colorize tab.



4. Select your preferred color for the menu. You can fine-tune the hue and saturation of the color on the Shift colors tab in the color window that is open.
5. Click Save to see a preview of your new skin. If you are satisfied with the outcome, you can now download the generated images and CSS and skip to step 9.

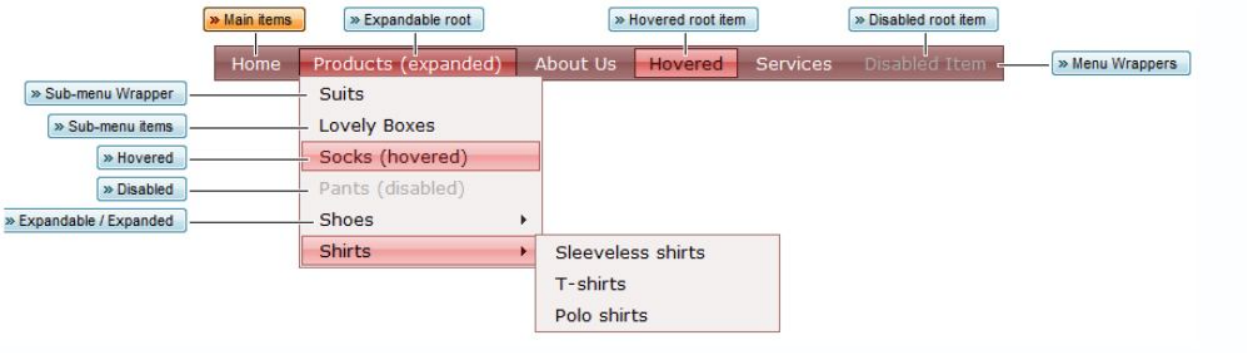


6. For additional customizing, click the Fine-tune tab of the Style Builder itself in the top left.

   Tip: The fine-tune functionality can be unpredictable. Save frequently so that if you don't like the way a change turns out, you can click "load last save" to undo it.

7. Begin with any universal changes you would like to make, such as changing the font on the navigation nodes. Click the Main items bubble to make changes to the font on the main navigation node.

   Each time you make a change the example dynamically responds. Each of the blue bubbles opens a different set of configuration options.



8. When you are finished, click Save and then Download to get the necessary code and images.
9. Copy the unzipped files to your theme's folder. Open the .skin file and set “EnableEmbed-dedSkins” to “false” and “Skin” to the name of your new skin.

   For more information and a video tutorial, see Telerik's Visual Style Builder Overview.

   To style the navigation using CSS

   If you do not like the Telerik provided skins, you can create, with the aid of your browser’s developer tool, your own image-free styling using CSS. If you choose to work by hand, you may find it helpful to start with a working skin, and adjusting to suit your needs.

1. Rename all of the base-level selectors in your working skin file to RadMenu_[Your theme name] .
2. Use your browser’s developer tools to help you figure out how to modify the CSS to get the desired result.
3. In your theme's skin file set “EnableEmbeddedSkins” to "false" and “Skin” to the name of your skin.

Controlling sitemap behavior

This section explains sitemap behavior, including:

content records, iParts, and shortcuts used for searching.

- How to modify the [OverrideLinkText] and [CartItemCount] dynamic navigation items
- Profile pages linked from the Member site's Directory, which uses an ASPX web page to redirect users to a navigation item based on a set of criteria

How search works with navigation

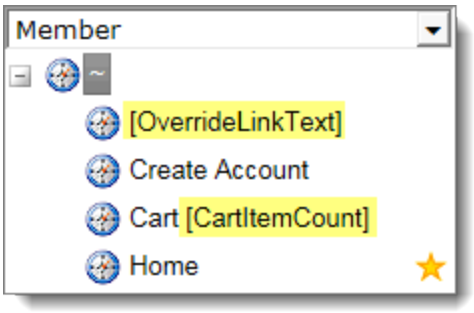
Three elements make search work in the sample sites:

- The search content records: The sample sites use search content records that are dynamically populated with an initial search result set based on a URL parameter value. These content records contain the Common Search iPart and are located within @/iCore folders.
- The pages that display the initial search results: The Shop and Events navigation items are linked to the Search content records. These navigation items have a unique value for the InitialArea URL parameter, which defines the result set generated when the pages are first displayed (i.e. products or events).
- The page displayed when a user clicks a result: The page displayed when a user clicks a search result link are based on the shortcuts defined from Site Designer > Manage shortcuts. The following shortcuts display search result links in the sample sites:

- ItemDetail –The ItemDetail shortcut displays the Item_Detail content record, which uses the Product Display iPart to display the item selected.
- GiftDetail – The GiftDetail shortcut displays the Gift_Detail content record, which uses the Donation Creator iPart to display donation pages selected from search results.
- EventDetail – The EventDetail shortcut displays the Event_Display content record, which uses the Event Display and Event Program Display iParts to display event pages selected from search results.

Modifying dynamic nav items

The default sitemaps include variables that dynamically generate the text displayed for two navigation items. [OverrideLinkText] displays the Full Name of the logged in user by default. [CartItemCount] displays the number of items a user has added to the Cart.



If you want to add new navigation items that use these variables, or if you want to modify the existing ones, keep the following guidelines in mind:

- Navigation areas and master pages – The variables only work in the Auxiliary and Footer navigation areas of websites using one of the Sample Site master pages (or copies of these files) or 1700.master. To specify a navigation area, edit a navigation item and in the Options section, select Auxiliary, Footer, or both from the Show in the following navigation areas options.
- [OverrideLinkText] – You can use this variable on its own or with other text. For example, if you only enter the variable, then only the logged in user's name is displayeds as a link. However, if you enter [OverrideLinkText]'s Profile, and Bob Smith logs in, then Bob Smith's Profile is displayed as a link.

- [CartItemCount] – You can use this variable on its own or with other text, but we recommend that you only use it with other text. Otherwise, when no items are in the cart, nothing is displayed for this navigation item.

  To change the data displayed for [OverrideLinkText]

  The variable [OverrideLinkText] can display any property of the NetContact business object. You can change the property displayed by editing the ContactDetail property in your copy of one of the Sample Site themes, or in 1700.master.

  For example, instead of displaying the Full Name of the logged in user, you may want to display only their First Name. To make this change, edit the ContactDetail property to replace all instances of FullName with FirstName. The result should look like this:

```
public string ContactDetail
  {
    get
    {
      if (ViewState["ContactDetail"] != null)
        return (string)ViewState["ContactDetail"];
      _contact = Asi.Business.Contact.ContactController.Contact(Asi.AppContext.CurrentIdentity.UserKey,
                                                  Asi.AppContext.CurrentContext.
                                                    StatefulBusinessContainer);
      return _contact.FirstName != "GUEST" ? _contact.FirstName : String.Empty;
    }
    set { ViewState["ContactDetail"] = value; }
  }
```

Account and profile pages in the Directory

When users select a result after searching the Member site's Directory, or when they navigate to the account pages, the content record that displays depends on the user's permissions. The rules that determine where a user is redirected are defined in the Party.aspx file, located by default in C:\Program Files\ASI\iMIS\Net.

You can modify the information displayed on the account and profile pages by editing the content records described below from Content Designer > Manage content.

Note: In the Member Mobile site, only simple profile pages are shown for member and organization accounts to restrict the amount of information displayed on small screens.

Page description	Users directed to the page	Content record: @/iCore/Contacts/*	Shortcut
Detailed page for staff to manage member accounts	System Administrators Staff with an authorization level of 1 or higher in Customers	ContactLayouts/Account_Page_Staff	FullAccount
Detailed page for member to manage own account	Contacts selecting their own record	ContactLayouts/AccountPage	MyAccount
Detailed Organization account page	System Administrators Staff Organizations selecting their own record	OrganizationLayouts/Account_Page	OrganizationAccount

Simple (non-editable) Contact profile page	Users who do not have permission to edit the account	ContactLayouts/Profile	Profile
Simple (non-editable) Organization profile page	Users who do not have permission to edit the account	OrganizationLayouts/Organization_Profile	Organization

Tracking your site with Google Analytics

Google Analytics tracks and collects important data on how visitors interact with a website. Google Analytics provides reports on the data collected allowing you to assess whether your website is meeting its goals. This tracking is accomplished by adding a Google Analytics script to the website. A new parameter was added to the Manage websites window if you want to use Google Analytics to track data on an iMIS website.

Do the following to track your site with Google analytics:

1. Create a Google Analytics account: google.com/analytics
   - Configure the account.
   - Google Analytics will provide the code for you to paste in the Manage websites window.
2. Add the script to your iMIS website.

   Go to RiSE > Site Designer > Manage websites:
   - Select the website to which you want to add a Google Analytics script.
   - (Properties tab) Expand the Advanced section and paste the entire script, including the tags, in the Google Analytics script field.
   - Click Save.
   - Publish the website.
3. Visit your Google Analytics account to review the data collected.

Synchronizing content on multiple servers

If you have more than one server hosting the same website, take steps to synchronize all servers that host the website. The following are issues to address:

- Theme files: If you modify the website's CSS or master page, or if you apply a different theme, copy the changed files to all other servers.
- Uploaded images: Copy your folder for uploaded images to all other servers, either by direct FTP or by file copy.

  Tip: This is not necessary for ContentFile iPart attached files, which are automatically copied to remote servers when published.
- Hard-coded image paths: If you use different virtual directories on any of your servers, you need to put a variable in any hard-coded image paths to make them publish correctly on all servers. When including images in a Content Html iPart, modify the default Image URL and replace the server name and virtual directory with [Root]. For example, if the Image URL is .../iMIS/images/mypic.jpg, change it to [Root]/images/mypic.jpg.

  Note: When you edit the Content Html iPart, the image appears as a missing-image red X, but it displays correctly when published.
- Navigation area properties: If you modify navigation area properties (using the Easy edit link in the Navigation Areas section of the Website Edit screen) you might need to reset the server's worker process to get it to pick up the changes.
- Publishing servers: When publishing content, iMIS will not consider the content successfully published until all relevant publishing servers have finished publishing it without error. That means that if one of the publishing services corresponding to any of the publishing servers listed in RiSE > Maintenance > Publishing servers is stopped or otherwise inactive, content records will remain in the PublishPending state until the publishing service is started or the entry in Publishing servers is removed and the content is republished.

Improving performance for remote servers

The Easy edit feature of your iMIS content management website might be sluggish on some of your external web servers due to latency in communicating with the iMIS database. For example, it is common for your public-facing web servers to be hosted at a different data center than your iMIS database. You can improve performance by setting up a mirror of the website on your iMIS application server, then directing your frequent Easy edit users to the appserver's URL for the website instead of using the public URL.

Note: If your Easy edit users are working at computers that are outside your organization's firewall, they will need VPN access (or access through a terminal server, for example) to connect to the appserver-hosted version of the website.

Changes to the website's content records and navigation items that are made on any server that hosts the website are automatically picked up by every other server when you publish the changes. However, images that are uploaded during Easy edit sessions must be manually copied to all other servers. Additionally, changes that your web admins make to the site's CSS, master page, and other aspects of the site's template on one server must also be manually copied to all other servers.

Improving Easy edit performance

The following procedure assumes that you already have an external iMIS content management website on which your Easy edit users are experiencing slow performance. You will be changing the website's definition to also host the website on your application server, then advising your Easy edit users to use the new appserver-hosted website for their Easy edit sessions:

1. Modify the website's definition to specify that it be hosted by your iMIS application server as well:

   Go to RiSE > Site Designer > Manage websites:

1. Select the website you want to modify.
2. Click Edit.

3. In the URL(s) pointing to the IIS website root field, enter a comma-delimited list of URLs that point to the root of the iMIS application on your iMIS appserver and to the root of the iMIS content management application that you installed on each external web server. For example, if you already had two external web servers defined for this website, the list should look similar to the following when you have added the URL that points to your iMIS appserver: http://www.my-
   pub-
   lic-
   domain1.or-
   g/wcm/,http://www.mypublicdomain2.org/wcm/,http://www.myiMISappserver.com/iMIS/
4. If using SSL, add the secure addresses to the Secure URL(s) pointing to the IIS website root field in the same order as above.

   Important: Restart IIS whenever you change the Secure URL(s) pointing to the IIS website root setting. Note that localhost is not a valid Secure URL.
5. Click Save to save your changes.
6. Click Cancel.
7. From the toolbar, click Publish.
8. Select Publish children as well? to publish all of the website's navigation items to the new instance of this website on the iMIS application server.
9. Click OK. Note that the website's content records will not be visible on this new instance until a later step. It may take up to 15 minutes for the public and internal sites to reflect the updated navigation.
10. Click Close.
2. Modify the definition of all content folders used by this website to also publish their content records to the new instance of this website on the iMIS application server. This will usually be only the website's root content folder (the one with the same name as the website itself), but your organization might also have some additional content folders that are

used for content shared among several different websites. For each of these content folders, do the following:

1. Go to RiSE > Content Designer > Manage content.
2. Select the content folder you want to configure.
3. Click Edit.
4. From the Publish on Servers dropdown list:

- If the current value is Inherit, do not change the value.
- If the value is Custom, then leave all currently selected checkboxes and also select the checkbox for the publishing server code used by your iMIS application server.

5. Click Save to save your changes.
6. Click Cancel.
7. From the toolbar, select Publish.
8. Select Publish All Items to include all of the folder's content records.
9. Click OK.
10. Click Close. Repeat the steps for each content folder used by the website.

3. Make sure the website's template files exist on the public iMIS content management server, the appserver, and the internal iMIS content management server, if applicable. If the files are missing from any of the servers, manually copy the files to the corresponding locations.
4. Visit your public iMIS content management website and the appserver's website to verify that your changes are successful.
5. Advise your frequent Easy edit users to visit the URL for the iMIS appserver-hosted instance of the website and avoid using the public-facing URLs.

Complying with the EU's Electronic Privacy Directive

To comply with the EU Directive on Privacy and Electronic Communications, iMIS has added support for your organization to display a pop-up notification informing visitors that cookies are used on your site. This popup also includes a link to a longer sample privacy policy we have provided. You can find more information about this law on the ICO website.

Setting up cookie notifications requires that you edit your master page, review (and modify as needed) the privacy policy provided, and add a JavaScript file to iMIS.

To display cookie notification popups

1. Edit the master page of your website (by default located in C:\Program Files\ASI\iMIS\Net\Templates\MasterPages) to add the following items:

- Just under the , add the following divs:

Note: You can edit this content to change the look and feel of the popup to match the design of your site.

```
<div id="EUCookieMessage" style="display: none;">

        <div id="EUCookiewarningBack" style='z-index:999; position:absolute; width:100%;height:100%;background: rgb(0, 0, 0) transparent;background: rgba(0, 0, 0, 0.6);filter:progid:DXImageTransform.Microsoft.gradient(startColorstr=#99000000, endColorstr=#99000000);-ms-filter: \"progid:DXImageTransform.Microsoft.gradient (startColorstr=#99000000, endColorstr=#99000000)\"'>

        <div id="EUCookiewarning" style-='margin:19%;padding:10px;width:62%;height:20%;background:white;color:black'>

        <span id="EUCookiewarningtext"></span>

        <a href="#" class="close-notify">Continue</a>
```

```
</div>
</div>
</div>
```

- At the bottom of the master page, just before the line <!-- Facebook API is loaded into here -->, add the following JavaScript reference:

```
<script type="text/javascript" src="AsiCommon/Scripts/EUCookieWarning.js"></script>
```

2. Review the sample privacy policy provided as a content record in iSamples/Member/Privacy_Policy, and update as needed for your organization.
3. Create a JavaScript file named EUCookieWarning.js containing the code below, and add it to the Scripts folder (by default located in C:\Program Files\ASI\iMIS\Net\AsiCommon\Scripts).

   Note: The displayNotification function in this file contains the content of the popup notification displayed to users the first time they visit a page in your website. Be sure to update the privacy policy link in this message to point to the content record you want to display for this purpose. You can also edit the rest of the content for the needs of your organization.

```
function getCookie(c_name)
{
var i,x,y,ARRcookies=document.cookie.split(";");
for (i=0;i<ARRcookies.length;i++)
 {
 x=ARRcookies[i].substr(0,ARRcookies[i].indexOf("="));
 y=ARRcookies[i].substr(ARRcookies[i].indexOf("=")+1);
```

```
  x=x.replace(/^\s+|\s+$/g,"");
  if (x==c_name)
    {
    return unescape(y);
    }
  }
}

function displayNotification()
{
if (typeof jQuery('#EUCookieMessage' != 'undefined'))
{
      jQuery('#EUCookieMessage').fadeIn("slow");
      if (typeof jQuery('##EUCookiewarning #EUCookiewarningtext' != 'undefined'))
      {
            jQuery("#EUCookiewarning #EUCookiewarningtext").append("In order for this site to work correctly we need to store a small file - called a cookie - on your computer.<br/>");
            jQuery("#EUCookiewarning #EUCookiewarningtext").append("<br/>");
            jQuery("#EUCookiewarning #EUCookiewarningtext").append("We use cookies to store information to make your visit to this site richer and to personalize information according<br/>");
```

{

var exdate=new Date();

exdate.setDate(exdate.getDate() + exdays);

var c_value=escape(value) + ((exdays==null) ? "" : "; expires="+exdate.toUTCString());
```

```
document.cookie=c_name + "=" + c_value;
}

function checkCookie()
{
var cookieName="IMISEUCookieConfirm";
var cookieChk=getCookie(cookieName);
if ( typeof cookieChk === "undefined")
 {
 displayNotification();
 }
}

checkCookie();
```

Website concepts

The terms described in this section explain the basic concepts of iMIS content management.

Concept: master pages and themes

The look and feel of an iMIS content management website comprises the general page layout, colors, graphics, and fonts used for all rendered pages in the website. This look and feel is defined by the design's master page and theme. Master pages and themes are basic elements of ASP.NET websites, and detailed information about developing and customizing master pages and themes can be found in Microsoft developer resources for ASP.NET development such as the Microsoft Developer Network.

- If you want to customize one of the out-of-the-box themes, we recommend that you start with a copy, so that your changes are preserved when you upgrade.
- If you prefer to use your own hand-built master pages and themes, you must first place them in the appropriate MasterPages and App_Themes folders beneath the IIS website root that you plan to associate with this iMIS content management website. This ensures that the master pages and themes are available for selection when defining the properties of the website. You must also ensure that the master pages meet all requirements for compatibility with iMIS content management.

  The master page is an ASP.NET file that specifies the general page layout of all pages in the website. Do not confuse this with the content layout used for the main content area of each page. The master page defines everything that appears on a rendered page, and where they appear, except for two things:

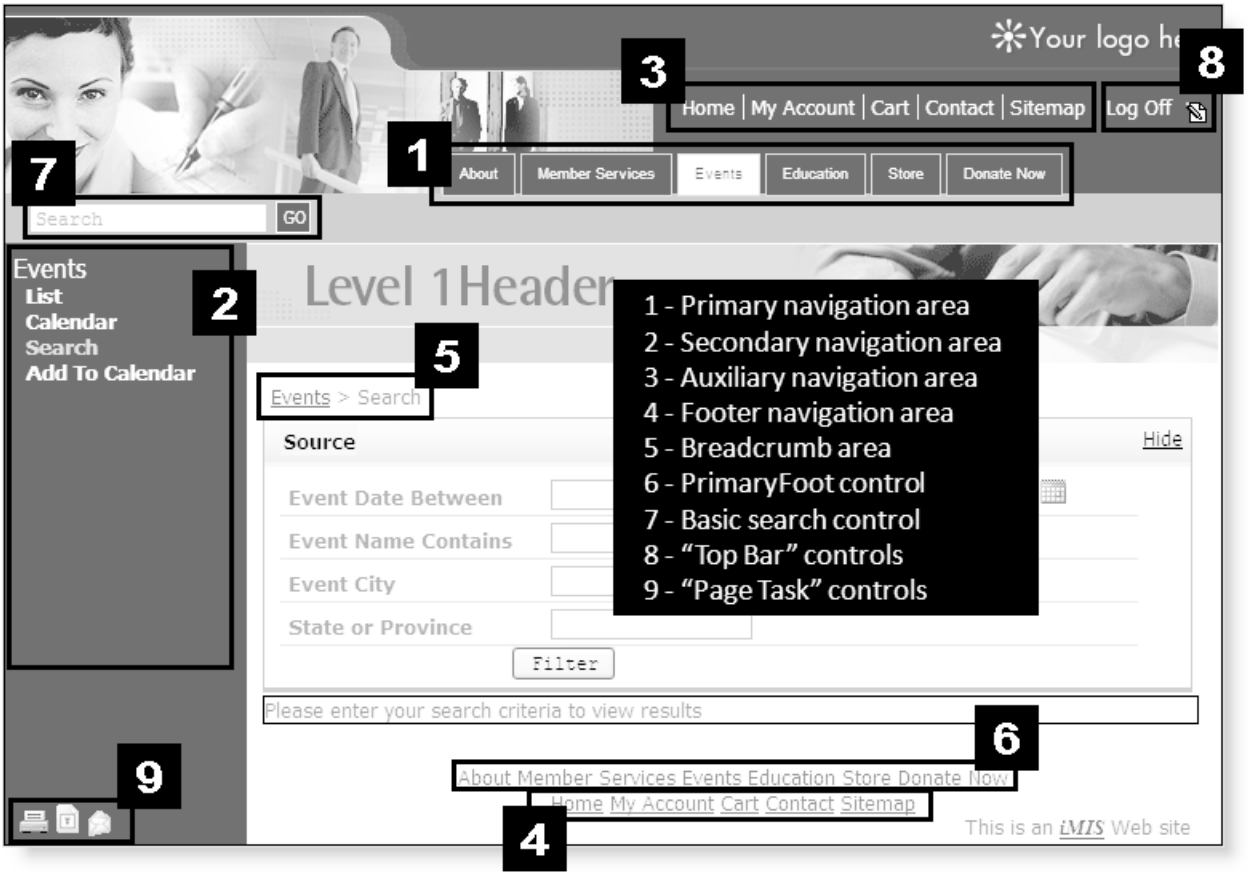
- The rendered content visible in the Main Content Area of each page is controlled by the navigation item for that page. The master page defines only where this content area appears on the website pages, and the content area's exact dimensions.
- The navigation items in the website's sitemap define the actual navigation link text and breadcrumb text shown in the navigation areas. The master page defines only the location, appearance, and behavior of the available navigation areas for the website. Which of the available navigation areas are actually used for the website is defined in the properties of the website itself, and each navigation item specifies the exact navigation areas in which it is displayed.

  The theme is a collection of files that specify exactly which colors, graphics, and fonts are used in all rendered website pages, giving them a consistent appearance. The theme comprises all the cascading style sheets used by the master page and available for use in a content layout's iPart zones and iParts, as well as all the graphics used by the master page, as opposed to graphics used in content records. Some themes might also include ASP.NET skin files, which define property settings for ASP.NET Web server controls.

Concept: navigation areas and breadcrumb areas

Navigation areas are special ASI-developed controls used in master pages that create automated lists of navigation links. All ASI-developed master pages are designed to support the four default navigation areas and the breadcrumb area shown in the following diagram, but you can define up to 30 navigation areas in the system and add the corresponding elements to support those navigation areas to any master page.

The breadcrumb area appears automatically on every site, but you must specify exactly which navigation areas to enable globally for use by the navigation items in the website's sitemap. The four default navigation areas provided with iMIS content management are shown in the following diagram:



When a navigation area is globally enabled in the definition for an iMIS content management website, a checkbox representing that navigation area becomes available for selection when you are defining navigation items in the sitemap for the website. Whether

a particular navigation item actually appears in one of the enabled navigation areas of the website is determined by the specific navigation area checkboxes you select for that navigation item when you are defining it.

All master pages fully support the breadcrumb area and all four of the default navigation areas. However, if you modify the definition of any of the default navigation areas in iMIS content management, you might need to revise the master pages to support the changes that you have made.

To integrate your own hand-built master pages with iMIS content management, if you plan to use the breadcrumb area and navigation areas available to iMIS content management websites, you must ensure that you add the appropriate elements to your master page to support them. Similarly, if you define additional navigation areas in iMIS content management, you must modify your master pages to support these additional navigation areas.

Note: The controls that display the Logon/Logoff link and the icon that toggles Easy edit mode, both of which appear by default at the right of the Auxiliary navigation area, are not a part of the Auxiliary navigation area, so they are unaffected if you remove or move the location of this navigation area.

Concept: publishing iMIS content

When you create or change an existing iMIS content management website, navigation item, content folder, content record, or any other iMIS content management definition object in the Document System and click Save, nothing happens except that iMIS stores a Working version of that object in the iMIS database. It is only when you click Publish that iMIS actually implements the new version of the definition object, replacing the previous Published version of the object with this new Working version and then marking it with a status of Published to indicate that it is now the current active version.

When you publish the various types of iMIS content management definition objects, different things happen depending on what type of object is published.

Note: The following descriptions generally apply to the publishing option Publish Working Items Only. If you select either of the other publishing options, then objects in any state are published.

- Websites – No downstream processes happen other than iMIS content management creates a corresponding sitemap if it is an entirely new website, so that you have a structure into which you can add navigation items. If you have developed your own custom master pages and themes, the people in your organization who perform website administration should have already placed the necessary files on the servers that will host the website.
- Navigation items – When a browser first requests a website URL from the iMIS application server or an external web server that has been prepared to host iMIS content management websites, the iMIS content management code on that server examines the Published sitemap object in the iMIS database and then builds a corresponding in-memory representation of the sitemap's navigation structure. A timer process then rechecks the iMIS database every five minutes by default to determine whether a newer version of the sitemap object has been published, and, if so, the iMIS content management code on that server rebuilds its in-memory sitemap structure for that website.

  Note: You can change this default five-minute polling interval if desired, but be aware that each polling process consumes a small amount of system resources so there is a performance tradeoff in specifying a more frequent polling interval. To change the polling interval, edit the value of the Sitemap.CachePeriod key (expressed in minutes) in the <SystemParams> declaration in the web.config file for the iMIS application (IIS application \iMIS).
- Content folders – No downstream processes happen other than iMIS checks the status of all descendant content records and sub folders and if iMIS finds any that are currently in a Working state, iMIS automatically publishes them as well. This enables you to spend several days working on a major change to your website content that encompasses many content records, and then publish all those changes in one action by publishing a content folder high enough in the folder hierarchy to cover all the content records that are in a Working state.

Changes made to the Access Settings of a content folder that are applied to all descendants are saved to the Published descendant content records without the need to republish each record. Security checks to determine whether the rendered version of a content record should be served to the requesting browser are performed by examining the current Access Setting values of the Published content record object in the iMIS database.

- Content records – iMIS checks the value of the Publish on Servers field in the parent content folder to determine which publishing servers should handle the publishing of the content record. iMIS then creates a separate publishing request in the iMIS database for each associated publishing server. Meanwhile, every five minutes by default, the publishing services (AsiPublishing15) installed on every server that hosts iMIS content management websites are polling the iMIS database to determine whether there are any new publishing requests designated for their corresponding publishing server.

  If so, the publishing service examines the Published content record object in the iMIS database and then renders a corresponding .aspx file and places that file in the appropriate location in the server's local file system so that IIS can serve that page to browsers that request the content record's corresponding navigation item link.

  Note: You can change this default five-minute polling interval if desired, but be aware that each polling process consumes a small amount of system resources so there is a performance tradeoff in specifying a more frequent polling interval. To change the polling interval, edit the definition for the corresponding publishing server and specify the desired polling interval in the Frequency field.

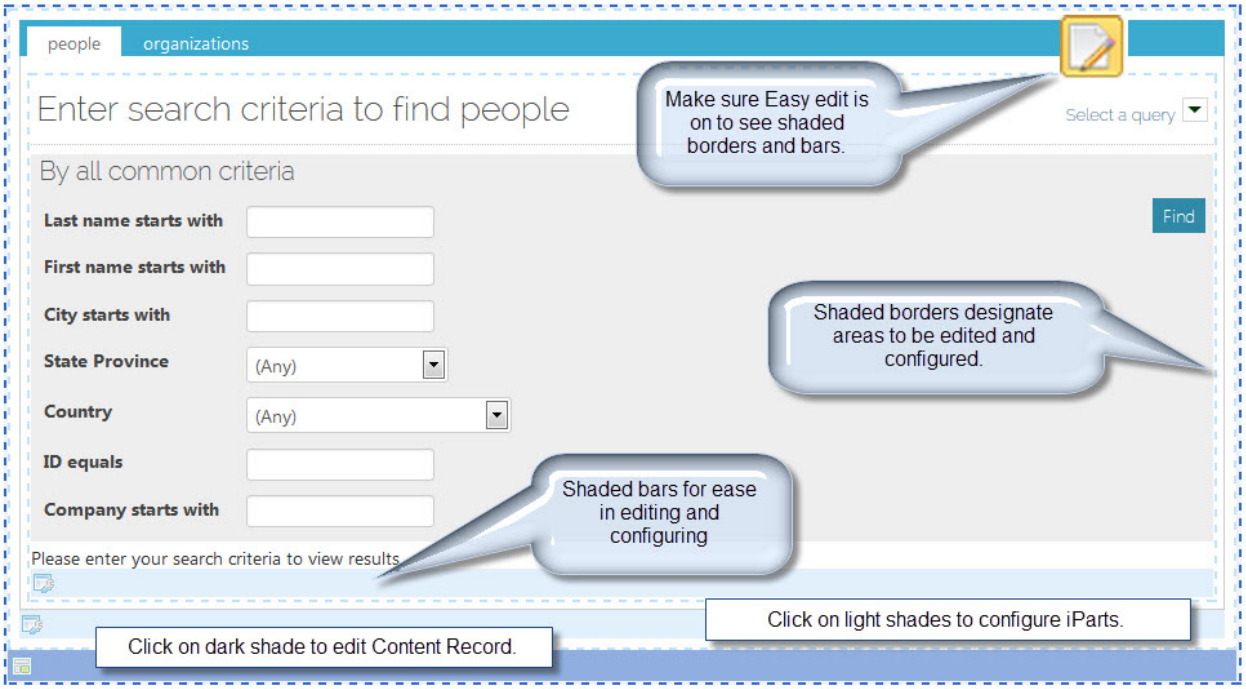
  Note: The iMIS content management configuration field CM.PublishingMaxNumOfAttempts (located in Set up content management > Content designer configuration) determines how many times each publishing service will attempt to process a system publishing request before it flags the request as failed. This prevents overconsumption of system resources if there is a connection issue or other issue that is preventing the publishing service from successfully processing the request.

- Content layouts – No downstream processes happen. When you define a content record, iMIS populates the list of available Page Layouts by examining all the Published versions of content layout objects in the iMIS database.
- Content types – No downstream processes happen. When you define a content record, iMIS examines the Published content type objects in the iMIS database to determine how to display the corresponding iPart when added to the content record.
- Tagged list formats – No downstream processes happen. When you add a ContentTaggedList iPart to a content record, iMIS populates the list of available List Formats by examining all the Published tagged list format objects in the iMIS database.

Concept: Easy edit

The Easy edit feature enables you to browse, or surf, to update your content records in their rendered form. You can quickly open a web page's underlying content record (or even a specific iPart within the content record) for editing. When you have saved your changes, you can continue surfing the website and making further content revisions as needed.

Full, Casual and Public users of iMIS can use the Easy edit feature, provided they are members of at least one content authority group (CAG) and they have been granted the necessary Document System permissions on content records. This is the only way that Casual and Public users can define iMIS content management content.



Concept: user-defined fields (UDFs)

User-defined fields (UDFs) in iMIS content management are created differently, and serve a very different purpose, than user-defined fields in iMIS contact records:

- The UDFs found in iMIS contact records enable you to collect custom information about a contact. These contact UDFs are not available for use in iMIS content management.
- The UDFs found in iMIS content management are primarily useful as a way to capture additional properties of the content in content records, and to provide a controlled list of search criteria for use in iMIS content management only. These iMIS content management UDFs can be used in three ways:
- As a value added to the keywords <META> element in the rendered page for the content record, which enables searches performed through the iMIS content management search engine (but not by typical external web-based search engines) to locate the content record by searching for this value. This behavior is controlled by the Use in Search? property of an iMIS content management UDF.
- As a search filter in AdvancedSearch iParts, applied to the initial result set based on the tags and keywords specified in the search.

- As both filtering criteria and sorting criteria in ContentTaggedList iParts. A date-oriented UDF can be used to filter the initial result set based on the chosen tags, and a different UDF of any type can be used to sort the the final result set.

  Every UDF defined in iMIS content management is added as a new custom property to every content record, and can be displayed in a wide variety of formats, from a simple text field to a drop-down list, to a calendar control, to a set of radio buttons, and so on. In the advanced search panel rendered from an AdvancedSearch iPart, the user-defined field appears exactly the same way that it does in content records. This enables iMIS content management website users to specify UDF values for advanced searches in the same manner that the UDF values are chosen when authoring content. For example, a date-oriented UDF will have a calendar control that makes it easy to select a date.

Concept: websites and web server interaction with iMIS

An iMIS content management website is slightly different from a Microsoft Internet Information Services (IIS) website. While the rendered output of an iMIS content management website provides a total website experience for visitors to the site, a single iMIS content management website can actually be hosted on multiple web servers even though you are only maintaining a single website in your iMIS content management environment. Within the internal structure of IIS, an iMIS content management website is usually maintained as a subset of the iMIS application, but you can configure IIS to host iMIS content management websites as individual IIS applications or even as individual IIS websites.

The following diagram illustrates the connection points between multiple IIS web servers that host iMIS content management websites, the iMIS database, and users.

Creating your own websites

This section guides you in developing, implementing, and maintaining your websites.

Working with RiSE Sites

Because new and improved iParts and features are added to iMIS with every update, iMIS installs sample sites and a demo database that, together, fully demonstrate the more complex enhancements. These sample sites and data will remain synchronized with the ever-evolving state of iMIS, and will showcase new iParts, functionality, and UI improvements as they become available.

Using sample sites

iMIS installs with sample sites, such as Member and Member Mobile. The Member site shows how to build a RiSE site for your members and how to combine related iParts for features such as Commerce and Events. The Member Mobile site shows how to build a site optimized for mobile devices, such as smart phones and tablets.

It is easy to create your own customized website by using and copying a sample site. For detailed instructions on this process, see the topic Creating a site.

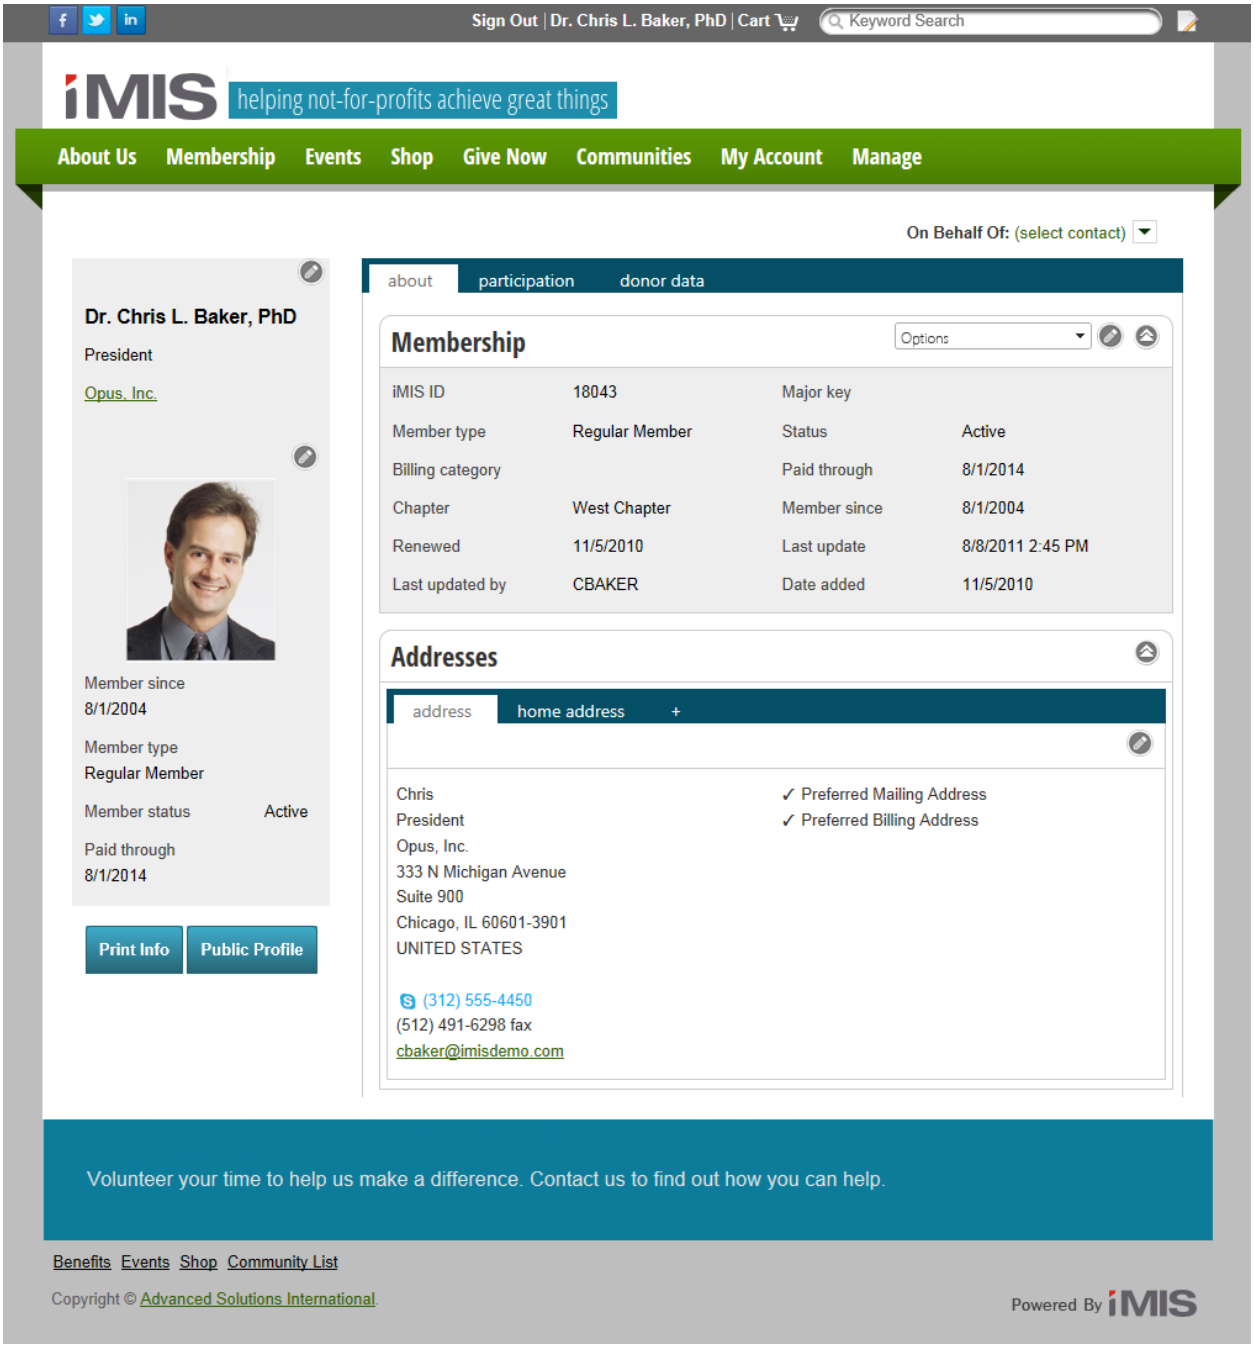
Note: By default, the starter sample sites are marked as Inactive. If you want to use a sample site, copy the site and enable the Is this website active option (RiSE > Manage websites > click the expand icon in the Status area).

By browsing to your Member site (http://yourvirtualroot/mbr), and to your Member Mobile site (http://yourvirtualroot/mobile), you can see how the iParts and pages present your current users and content. For example, if you have events currently defined and set to Show on web, you will see them populated on the Events page.

Tip: Upgrades overwrite the Member and Member Mobile sites, but you can add new content records and navigation items to the site for your own testing purposes. Upgrades will preserve your test objects.

Member site

The Member site offers a rich self-service experience for your members and prospects. This site enables you to choose from a variety of visual themes, change navigation in just a few clicks, and add any number of query-driven iParts to present dynamic information to your site visitors.



Member Mobile site

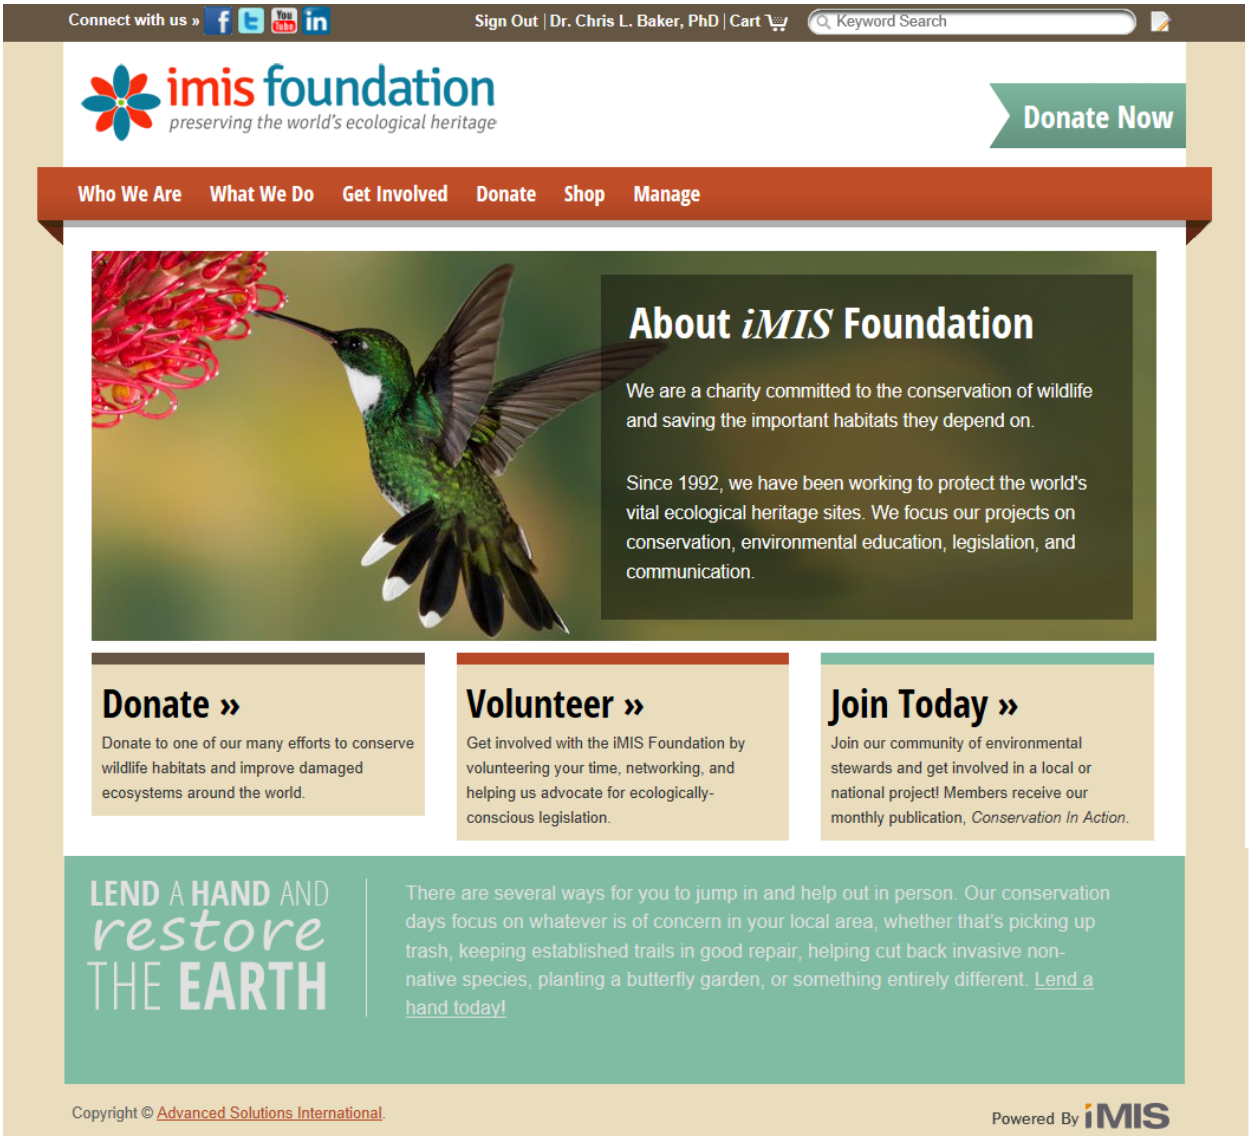
The Member Mobile site renders a version of the Member site that is optimized behaviorally and formatted for use on smart phones and tablets. This site is accessible by your members and by your staff who are working off-site or on the run.

Upcoming Spring Conference

Don't miss out on this year's annual spring conference! The program includes plenty of networking opportunities, workshops to sharpen your skills and sessions to keep you up-to-date with the latest technological advances.
To register for this and other upcoming events click on the events link below.

Donor site

The Donor site offers a rich and highly customizable experience for fundraisers conducting charitable campaigns and product sales with the public.



Annual Conference site

The Annual Conference site offers a "micro site" experience to support your critical projects, such as an organization's annual conference. By shaping the site with unique content and structure, you can maximize the impact of the project without affecting your main

site or micro sites from different years. At the same time, iMIS seamlessly integrates content between your various sites.

Annual Conference Mobile site

The Annual Conference Mobile site renders a version of the Annual Conference that is optimized behaviorally and formatted for use on smart phones and tablets for both by your members and staff who are attending events. Attendees gain quick access to their personalized programs, activities, and event feeds – and can instantly look up directory profiles of those attending with them.

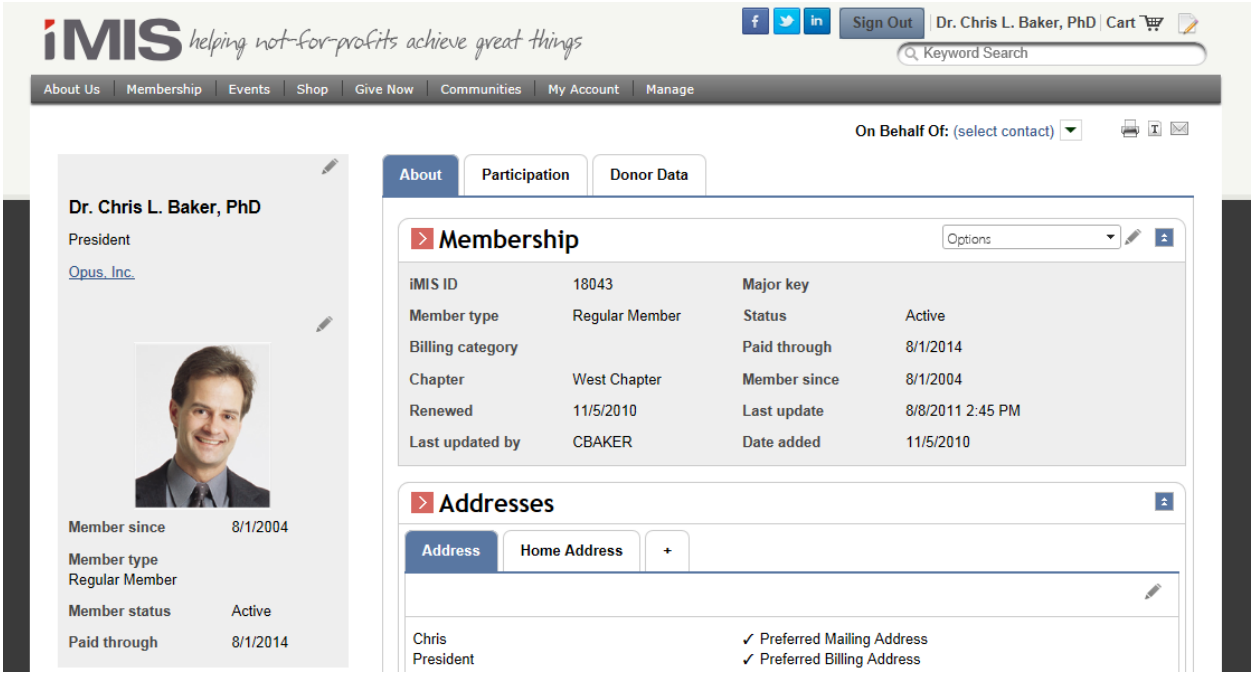
To use the DemoDB with the sample sites

To see the sample sites in action with sample data, you can connect to the demonstration database (DemoDB). This database includes a set of users and content sufficient to experience how the iParts work together.

1. Point your instance of iMIS to the DemoDB, which installs with iMIS.
2. Browse to the sample sites for this instance.
3. Sign in as Chris Baker: cbaker/cbaker.

   This user has full privileges to the system, so you can exercise all aspects of content lay-out, iPart configuration, and use.



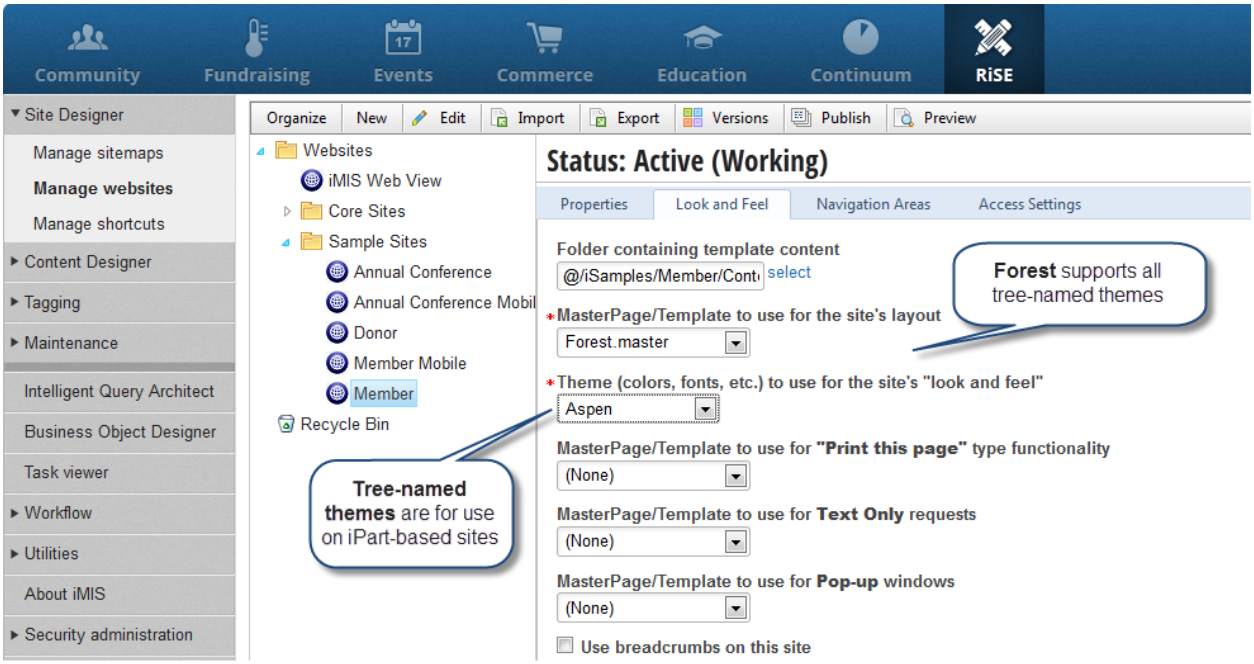
4. Change the password for this user if you want to prevent unauthorized access to your demo site.
5. When you are ready to start making changes to the site you must make a copy. This helps you to avoid losing your changes when you upgrade iMIS. For more information on this strategy, see Creating a site. Items affected by upgrades span the demo data and the site itself:

- Site definition and navigation items
- Content records, including iPart configuration, arrangement, and connection
- User records and demo data (products, events, subscriptions)

Sample themes and master pages

You can change the look and feel of the sample sites by selecting different combinations of a Master Page and its matching Theme. If you want to modify a particular design for your website, make sure you create a copy of the master page and theme before making any changes. See Creating a site for more information.

Note: iMIS themes give you a head start on developing your website. To provide you an idea of how things could look, we have used numerous pictures, illustrations, and images that we purchased under a limited license for ASI's use. The icons can be used on your website, but if you reuse any of the other images, you will need to buy a license. We acquire the majority of our images from iStockPhoto and most are available in the range of $15-$50; much less than the cost and labor of creating them on your own. If you have any questions, please contact us.



Example: Selecting a theme created for the Forest master page

Important: If possible, avoid customization to master pages. If you do need to make changes, make the changes in a copy of the master page. Any customizations performed to the out-of-the-box master pages will be overwritten after an upgrade.

The following designs are available out-of-the-box for iMIS sample sites.

City.master

The set of city-named themes support RiSE sites and can be used interchangeably with the City master page.

Creating a site

To create a public-facing website that makes full use of iParts and SOA, it is easiest to copy an existing sample site, such as Member, and change it to meet your needs.

When you copy a website, iMIS duplicates the site navigation and content records for the new site.

Do the following to copy a sample site.

Go to RiSE > Site Designer > Manage websites:

1. Select a website from the list of websites.

- (Properties tab) Make sure the Folder selected for the Website-specific parent content folder field contains the content unique to this website. Only the content in this site-specific folder will be copied. Any content shared with another website should be placed in a separate, shared folder.
- (Look and Feel tab) The Folder containing template content is normally a sub-folder of the parent folder. If the template content (footer area, header logo, etc) is stored in a different folder, be sure to select that folder instead.

2. Select Organize > Copy
3. Select the folder where you want to paste the new website.
4. Select Organize > Paste.
5. Enter the Name of the new website. Do not use special characters or punctuation.

   Note: During Copy, Content Codes clear from content records because this code must be unique for each content record. A warning displays a list of content records where the Content Code was cleared. See log files for details.

6. Copy an out-of-the-box Master Page and Theme to be unique to your new website.

   Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme. Creating a copy of a theme also

ensures that you do not compromise your ability to fall back to a working original. Follow these steps to copy a theme, which is far easier than creating one from scratch.

- (Look and Feel tab) Select the Master page and theme that is the best match for the look that you want for your new site.
- Locate the theme folder (such as \Aspen), which defaults to C:\Program Files\ASI\iMIS\Net\App_Themes.
- Copy, paste, and rename \Aspen to your new site name (\ABC).
- Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages
- Copy, paste, and rename Forest.master to your new site name (ABC.master).

7. Edit your site to use your new theme files.

- Select Site Designer > Manage Websites and highlight your site (ABC).
- Edit the site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save.

8. Click the expand icon in the Status area, and enable the Is this website active option.
9. Publish the website:

- Select the newly copied website and select Publish.
- Publish the website's content folders:
- Go to Content Designer > Manage content.
- Select the content folder of the copied website.
- Select Publish. As each folder and content record publishes, the status will change from PublishPending to Published.

- If the website is hosted on a separate web server, publish the Core Content folder. See Installing WCM on web servers for more information on hosting a site on a separate web server.
- Go to Content Designer > Manage content.
- Select the Core Content folder.
- Select Publish menu and choose the Publish All Items option. As each folder and content record publishes, the status will change from PublishPending to Published.

10. After all content folders are published, log off and close the browser.

    Note: If the website you copied contains URL shortcuts, be sure to review those shortcuts in your new website to determine if you need to create fresh shortcuts. For example, when you select the iMIS logo in the Member site, the page redirects to the shared Member Home content record. When you make a copy of the Member site and you select the iMIS logo from the new site, you will be redirected to the same shared Member Home content record. To resolve this, create a fresh shortcut that will point to your new Member Home.

Implementing a mobile site

The Member Mobile sample site is optimal for mobile devices like smart phones and tablets, featuring accessible content and a sitemap for members needing information on the go. The master page Sapling places key information at the top of the screen and works with the Aspen Mobile and Austin Mobile themes; featured styles are sized appropriately for smaller screens.

If you want to provide a mobile site for your members, we recommend that you start with a copy of the Member Mobile sample site, and then apply your changes. When you make a copy of the site, iMIS creates a copy of the website, content, and sitemap.

Note: Before the following required steps, you must complete your copy of the mobile site. See Copying a website.

To implement a mobile site, do the following:

Go to RiSE > Site Designer > Manage sitemaps:

1. Choose your copy of the Member Mobile site.
2. Edit the Full Site navigation item to add your main site's URL to the Content or URL to Link to.
3. Go to RiSE > Content Designer > Manage content, then select the content folder created for your copy of the mobile site.
4. From the ContentAreas folder, edit the following content records:

- Social Networking Images: Configure the Social Networking instance of the Content Html iPart, and from the <>HTML tab, update the href's to link to your social media accounts or remove any links you do not want to appear.
- Header Logo: Configure the Header Logo Span instance of the Content Html iPart and update the logo to your organization's logo.
- Footer Copyright: Configure the Footer Copyright instance of the Content Html iPart, and update the content and link for your organization.

Tips and reminders

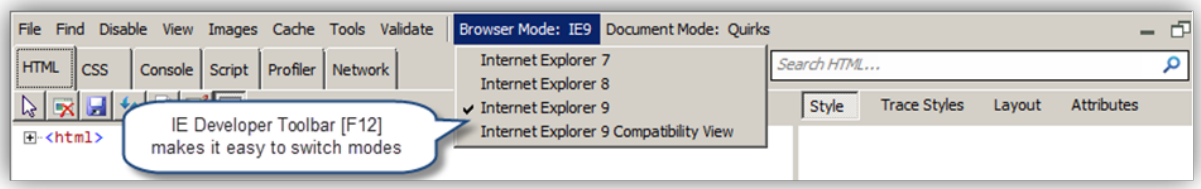
- Trim content – For easier reading on small screens, and to decrease page load time, keep content simple.
- Automatic redirect – Consider adding some JavaScript to redirect users automatically to the mobile site when they try to access your full site on mobile devices.
- Add favicon – Update the favicon used for your mobile site, apple-touch-icon, located by default in C:\Program Files\ASI\iMIS\Net.
- Surf-to-Edit limits – When you access the mobile site, Surf-to-Edit is only available when you access the website from a browser with a width larger than 700 pixels.

Modifying site themes

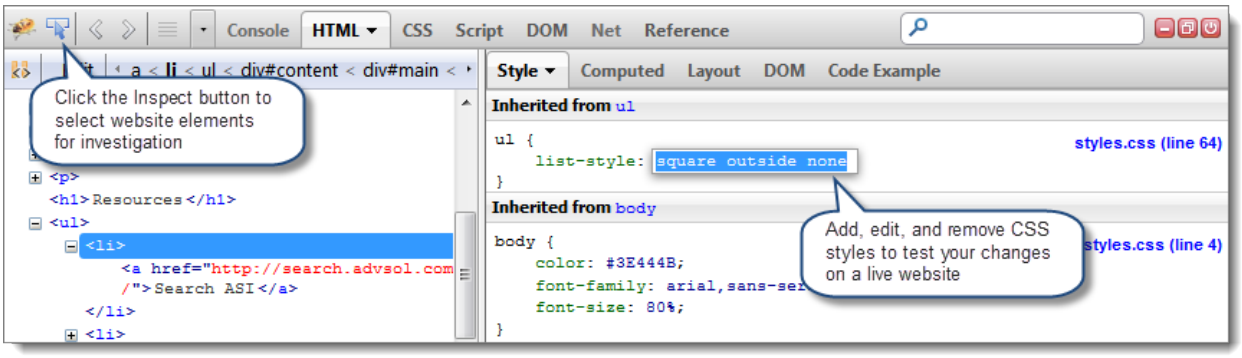
Several themes have been created for the sample sites. You can modify these themes to help identify and personalize your organization's website.

Best practices for theme development

- Caution: Never change the core style sheets 00-Reset.css and 10-UltraWave.css. All derivative themes inherit from these files, and any changes you make to them are lost on upgrade. Instead, override the base styles in your 99-[theme].css.
- Before modifying a theme, find the best one: apply all of the themes to the default Member site in turn, and decide which theme is closest to the final look and layout that you want.
- Always work from your copy of the theme, so that you can begin again. See Copying a website theme.
- Make changes only to websites that you create. When a sample site is updated with each release, the iMIS Upgrader overwrites any changes you made to it.
- Take advantage of browser-based developer tools to test and troubleshoot changes before committing them to your style sheets:
- Internet Explorer and Chrome: Press F12 to toggle the Developer Toolbar.



- FireFox: Install the Firebug add-on to see a wealth of information about the structure of the website and the styles it is using. Turn on the element inspector and click a piece of content to see the styling that it is implementing:



UltraWave and Universal Design

The Sample site themes and master pages build upon a new underlying template called UltraWave. UltraWave incorporates structure and styling for Universal Design. Universal Design seeks to make web content "barrier-free," making sites accessible to all challenged users. Challenged users include not only the millions of physically or cognitively impaired, but also seniors, non-native speakers, and those in other countries and cultures (localization).

Universal Design has benefits beyond helping websites meet the myriad of web accessibility standards: it also aids in breaking technology and human barriers. Universal Design is the foundation for transforming pages and content into outputs and displays your members may need, including print presentation, net book usage, and even cell phone applications.

Important: UltraWave themes support RiSE sites, which are an alternative to Public view. They do not support existing Public views.

Features of the template include:

- Developed toward W3C standards to help meet accessibility requirements
- Fluid-width template dynamically reflows content to fit your user's browser window
- Clean, minimal design uses neutral shades and layout
- Offers a streamlined set of stylesheets and skins

- Easily customized with logos, fonts, and colors
- Designed to be easily rebranded by your organization

Copying a website theme

Themes control the layout, font, and colors of your iMIS sites. The sample sites come with a set of special themes, designed for RiSE sites. See Sample site themes and master pages for a list of available themes.

Creating a copy of a theme also ensures that you do not compromise your ability to fall back to an original that works. Follow these steps to copy a theme, which is far easier than creating one from scratch.

Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme, as outlined below.

1. Copy an out-of-the-box theme and master page to be unique to your new site.

- Locate the theme folder (such as \Aspen), which defaults to C:\Program Files\ASI\iMIS\Net\App_Themes.
- Copy, paste, and rename \Aspen to your new site name (\ABC).
- Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages.
- Copy, paste, and rename Forest.master to your new site name (ABC.master).

Go to RiSE > Site Designer > Manage websites:

2. Edit your site to use your new theme files.

- Highlight your site (ABC).
- Edit the Site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save and Publish.

3. Edit your theme files as needed to tailor the design.

Changing theme headers

The first elements to change on your website are the highly visible elements that public visitors see and use in the header: logo, social networking links, welcome banner, and the favicon.

Logo

The header logo is contained in a content record: @\[theme]\ContentAreas\Header Logo. To add your own logo, edit this content record, remove the contents in the HTML iPart, and replace with your own logo.

Note: Alternatively, you can change the logo in the CSS. The logo is set in 99-[theme].css by the selector #masterHeaderImage. Change the background image and the dimensions to match your own logo.

Social networking links

The links to the social networking sites in the top (auxiliary) navigation are also defined in a content record: @\[theme]\ContentAreas\Social Networking Images.

To change the links to navigate to your own social networking pages, edit the content record and change the links on the icons.

In the HTML editor, replace the href on each <a> tag with the appropriate URL. For example:

Favicon

The favicon is the little icon that displays next to the website in your bookmarks and on the browser tab in modern browsers. Changing it to your organizations' icon is simple: create an icon sized either 32x32 or 64x64 pixels and name it Favicon.ico. Then overwrite the original file:

C:\Program Files\ASI\iMIS\Net\Favicon.ico

Update the copyright statement

The copyright statement is contained in a content record within your copied site's ContentAreas folder: Footer Copyright. Edit the Footer Copyright instance of the Content Html iPart on that page to update the copyright.

Changing theme colors

The next step in customizing your theme is to change to colors that support your branding & style. You will make these changes in both CSS and in images.

CSS colors

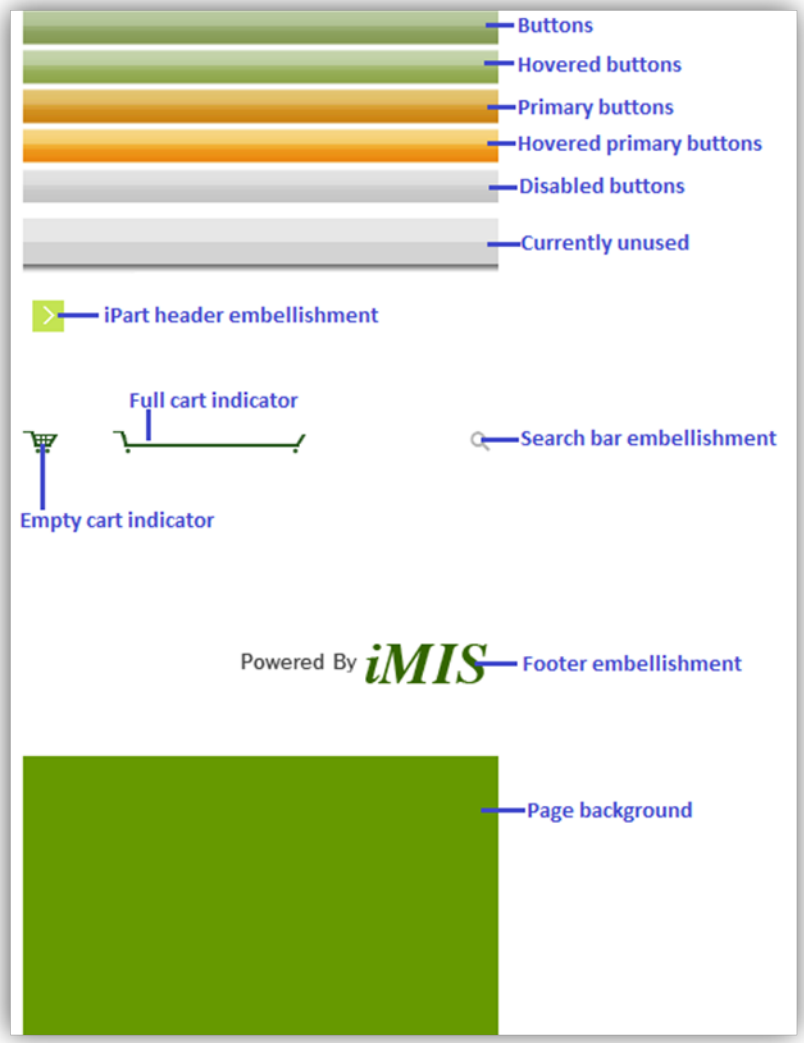
All theme-specific color and styling is located in 99-[theme].css. To find all color references that you might want to change, search the CSS file for these strings:

- color
- border
- background

We also recommend using your browser development tools to help you identify which styles you need to update for your color changes.

Sprite colors

A few of the theme's use sprites to control some of the site colors. A sprite is a single image that combines several commonly used images into one file. CSS then defines which part of the image displays for various purposes. Because your server only has to load a single image instead of several, using sprites reduces load time for your website. To improve performance, the new sample sites use sprites when possible. The image below shows a sprite used in the theme Aspen, and labels where each image is used:



You can either edit the sprite we have provided (which is easier), or create your own.

- When editing the provided sprite, keep all elements in their original pixel coordinates, so that you do not have to edit the related CSS.
- The .png version of the sprite is located in images/[theme]_sprite.png. You can edit this image in your favorite image editor, but we do not recommend editing in MS Paint, as you will lose the background transparency.
- Your theme's \Resource folder also includes a .psd source file of each sprite. You can edit the .psd with Photoshop or GIMP, a free image editor that can edit and save images in .psd and web-safe formats.

- If you edit the .psd, save your new image as a .png, and place it in the images folder of your theme.

  For greater design control, you also have the option of creating your own sprite. If you choose that option, you may also need to update your theme CSS for the new coordinates of the sprite. To help you with this process, we recommend the following resources:

- CSS Sprites: What They Are, Why They're Cool, and How To Use Them
- Sprite Cow calculates the pixel positions of the various images inside your sprite.
- CSS Sprite Generator lets you upload a zip file of images and get back a sprite file with the corresponding CSS.

Changing theme home pages

The Member site uses a pair of home pages: one that appears to guests (unauthenticated view) and another that appears to those who have signed in (authenticated view). You can change one or both of them, or drop one entirely and have one home page appear to all.

Do the following to change the unauthenticated home page:

Go to RiSE > Content Designer > Manage content:

Note: To have your own home page behave like the default one (switch to the authenticated home page when the user signs in), you need to add the code-bearing HTML iPart that does so.

1. Create a new content record for your unauthenticated home page.
2. Copy the AuthScript code to your new home page:

- Edit the unauthenticated home page content record @\iSamples\Member\Home.
- Locate the HTML iPart named AuthScript.
- Select Move To and select your unauthenticated home page.

- Now edit your unauthenticated home page and move the AuthScript iPart to the top of the content record.
- Save and Publish your home page.

3. Make your site's home page link to your new home page.

- Go to Site Designer > Manage sitemaps.
- Select your website.
- Edit the default navigation item (flagged with ★) and select your new home page for Content or URL to Link to.
- Save and Publish your sitemap.

Do the following to change the authenticated page:

Go to RiSE > Content Designer > Manage content:

Note: To have your own authenticated home page appear as soon as the user signs in, you need to edit the code-bearing HTML iPart that calls it.

1. Edit your unauthenticated home page content record.
2. Locate the HTML iPart named AuthScript.
3. Select Configure and switch the editor's view from Design to HTML, to view the code.
4. Edit the path to be the published path of your new authenticated home page:

path = "~/Mbr/Home/[theme]/MemberHome.aspx";

Do the following to use only one home page.

You can drop to a single home page either by:

- Removing the script that opens the authenticated home page:
- Go to Content Designer > Manage content and Edit the unauthenticated home page @\[site]\Home and delete the HTML iPart named AuthScript.
- Substituting your own page entirely:

- Go to Site Designer > Manage sitemaps and set your desired content record to be the default home page of your website.

Changing Telerik skins

Several iParts throughout the product use Rad Controls developed by Telerik. These controls require a few steps to style, and Telerik resources can help you get started:

- Telerik Control Guide – an overview of Telerik controls, including available skins.
- Telerik Visual Style Builder – generates CSS and some images for skinning Telerik controls.

Every [theme].skin file lists all of the Telerik skins that it uses to style controls. If a control does not explicitly define a theme, then it uses the Default Telerik skin.

Rad Window control

This control is the pop-up window that we see in many iParts. Its skin is set by two lines in Aspen.skin:

<asiweb:Window runat="server" Skin="Forest" />

<asiweb:WindowManager runat="server" Skin="Forest" />

Forest is a skin designed by Telerik and is available on most Telerik controls, along with a handful of other Skins. You can preview available Telerik skins for this control.

Tip: Telerik skins are easy to switch out and virtually maintenance-free. However, they are difficult to customize, so avoid this route unless you can use the skins as-is.

Rad Tab Strip

This control is used by the Content Collection Organizer (CCO) iPart, the Contact Address Editor iPart, and most other places where you see a tab strip. This line defines the skin:

<telerik:RadTabStrip runat="server" Skin="Aspen" EnableEmbeddedSkins="false" />

The definition for this look and feel is near the bottom of the 99-[theme].css, under the heading RadTools Styles.

Rad Menu control

This control displays the primary navigation area. There is wrapper for this control called PageNavR, so this line defines the skin:

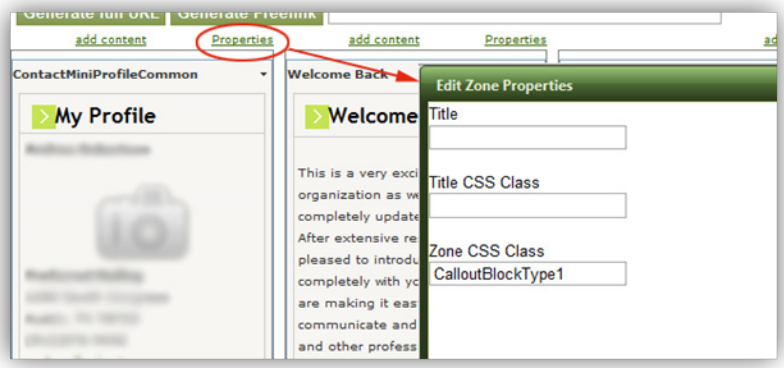
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" … />

The styling for the Rad Menu is located in Menu.[theme].css, and the image sprite is under [theme]\Menu\rmSprite.png. The easiest way to customize this control is to use Telerik's Visual Style Builder. (Tip: This tool works best in Internet Explorer.)

Changing zone properties

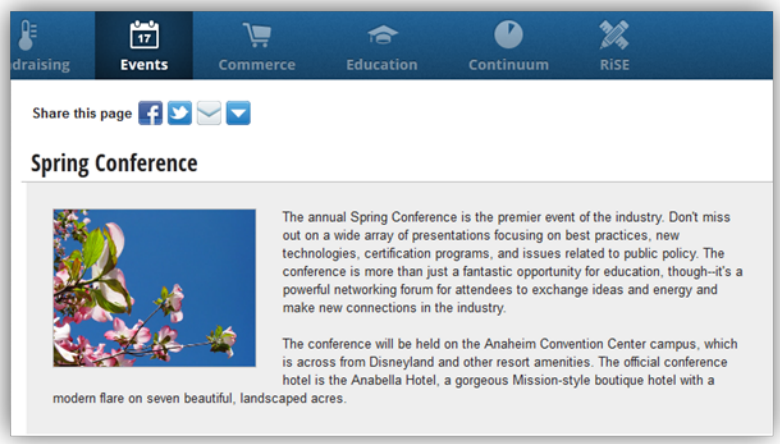
Zone properties make it easy to apply unique styling to specific iParts, for emphasis and contrast.

To apply a style to an iPart's zone property, edit the content record, click Properties, and enter the name of the class in Zone CSS Class:

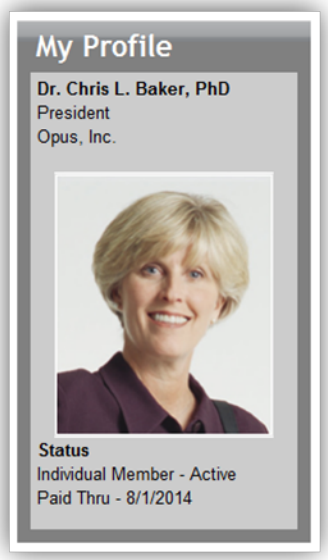


You can add more if needed, but all tree-name themes contain the following three zone style classes:

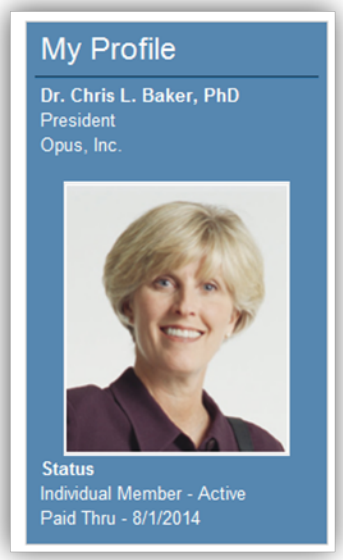
- TitleBarNoBorder – simply removes the bottom border from iPart headers
- CCOGrayBg – applies a gray background to content appearing in CCO tabs



- CalloutBlockType1 – accentuates an iPart whose border is enabled



Aspen:



Birch:

Creating a new theme

Instead of editing a copy of Aspen or Birch, you can also start from scratch when designing your own theme. However, you must include the 00-Reset.css and10-UltraWave.css in your new theme. To do so, begin your new style sheet with these lines:

```
/*##########################################*/
/*     Import UltraWave StyleSheets      */
/*##########################################*/
```

@import url("../UltraWave/00-Reset.css");

@import url("../UltraWave/10-UltraWave.css");

Resources for CSS

- w3schools.com – a great resource for CSS and HTML information and examples.
- CSS3 Generator – a tool to help generate CSS for rounded corners, box shadows, background gradients, and opacity. (Note: CSS3 is not fully supported in all browsers.)

Designing site navigation

Displaying left navigation

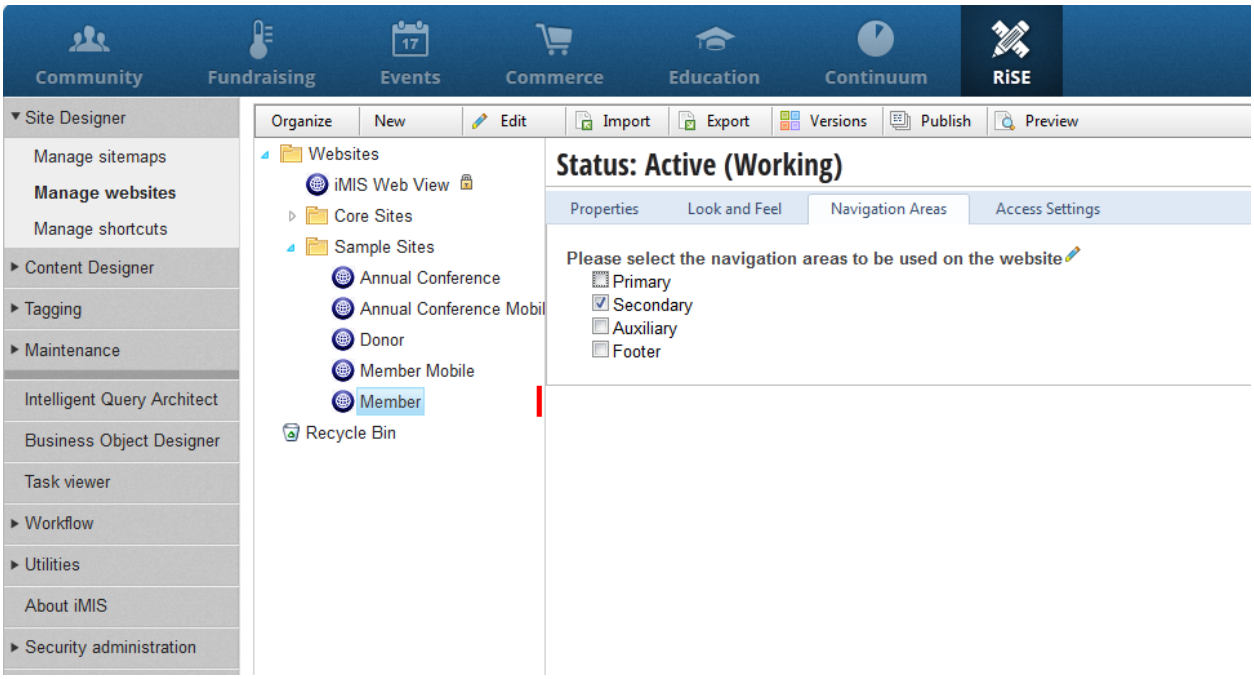
You can display website left navigation in a hierarchical format with a few changes to your theme's master page and skin file.

Do the following to implement left navigation:

Go to RiSE > Site Designer > Manage websites:

1. Define how many levels of navigation to display.

- Select the website.
- Select the Navigation Areas tab and select the Secondary navigation area.
- Save and publish your changes.



2. Edit the website theme's master page.

- Using your preferred text editor, find and open the website theme's master page. Master pages, by default, are located in C:\Program Files\ASI\iMIS\Net\Templates\MasterPages.
- Register the control by adding the following line to the top of the master page, just below the other registered controls:

  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>
- Add the following scripts to the <script language="C#" runat="server"> section:

  protected override SiteMapNode GetStartingNode()

  {

  return Secondary.GetStartingNode();

  }

  protected override SiteMapNode GetCurrentNode()

  {

```
    return Secondary.GetCurrentNode();
}
```

- Find the masterSideBarPanel div. It should look like this:

```
<div id="masterSideBarPanel" class="yui-b">
    <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server">
      </asp:ContentPlaceHolder>
</div>
```

- Update the masterSideBarPanel div so that it contains the following:

```
<div id="masterSideBarPanel" class="yui-b">

     <asp:Panel ID="SubNavPanel" runat="server" >
         <asp:ContentPlaceHolder ID="PageSubNavigationPlaceHolder" runat="server">
         <asp:Panel id="SubNavHead" runat="server" class="SubNavigationHead">
         <asp:Literal ID="SubNavPanelTitle" runat="server" />
         </asp:Panel>
         <asp:Panel id="SubNavBody" runat="server" class="SubNavigationBody">
         <asi:SubNavigation id="Secondary" runat="server" NavigationPaneCode="2"
           StartingNodeOffset="1" StartFromCurrentNode="true"
           StartingNodeOffsetAutoSet="true" SelectDefaultNode="false" />
          </asp:Panel>
          </asp:ContentPlaceHolder>
        <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server" />
    </asp:Panel>
```

```
</div>
```

- Find the masterWrapper div, and add the yui-t2 class to it:

```
<div id="masterWrapper" class="yui-t2">
```

- To improve JavaScript performance for websites using hierarchical sub-navigation, find the following script:

```
<script type="text/javascript">
    // if there is something in the side bar this converts the layout to 2 columns
    if ($('masterSideBarPanel').children.length != 0) {
      $('masterWrapper').setAttribute("class", "yui-t2 HasSubNav");
    }
</script>
```

- Update that script to the following:

```
<script type="text/javascript">
    // if there is something in the side bar this converts the layout to 2 columns
    if ($('masterSideBarPanel').children.length === 0) {
      $('masterWrapper').removeAttribute("class");
    }
</script>
```

3. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.

- Register the control by adding the following line to the top of the skin file, just below the other registered controls:

  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>

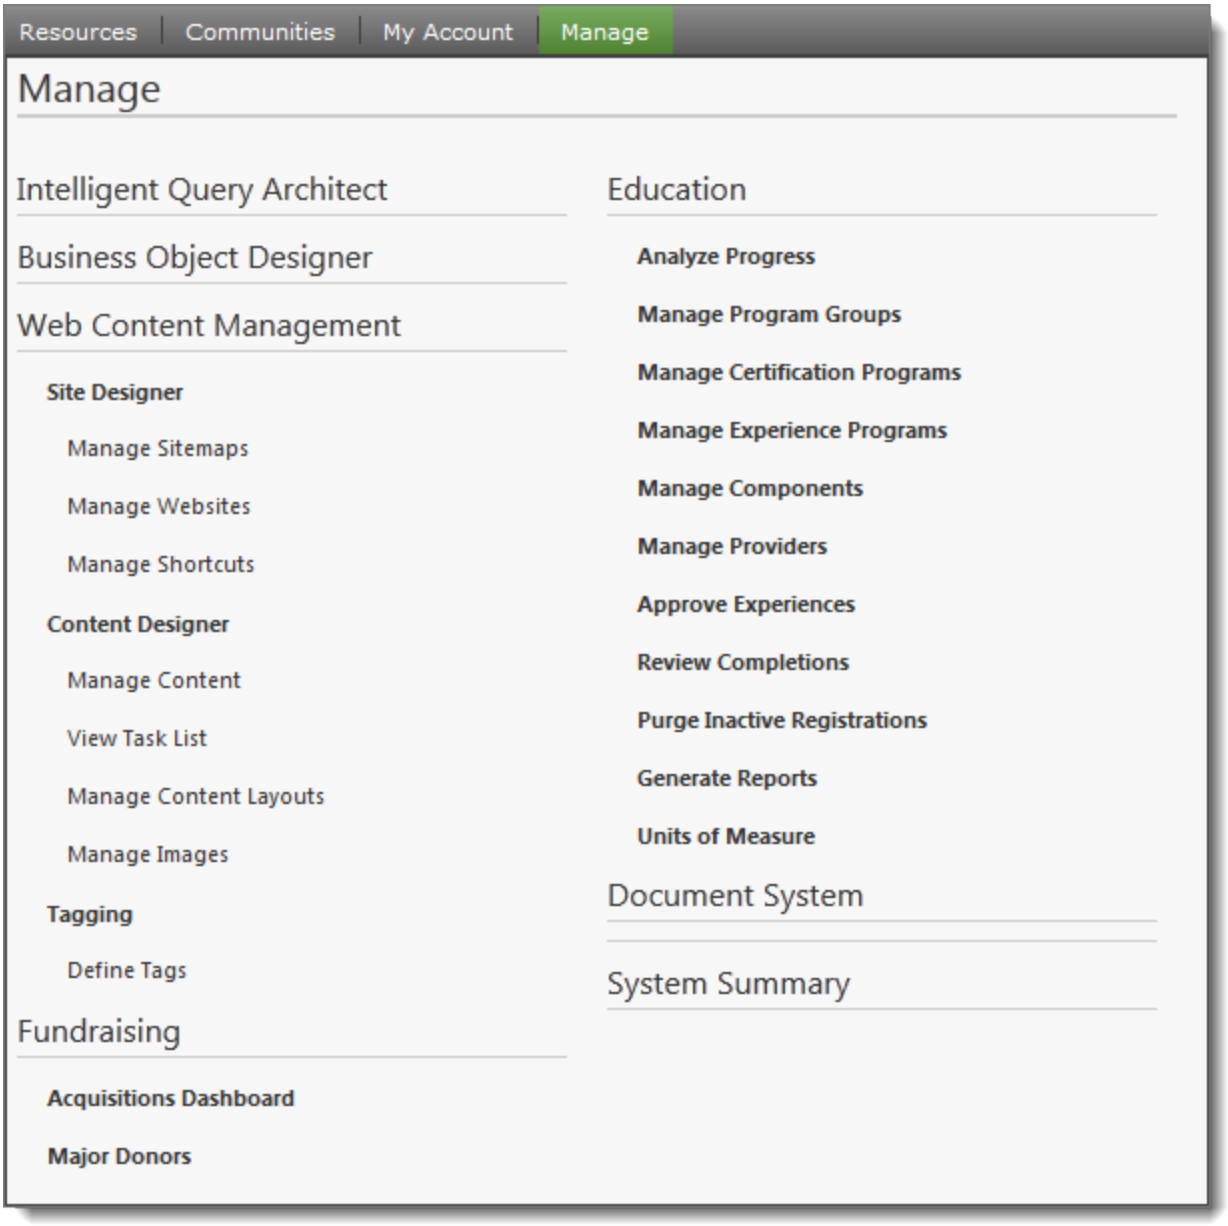
- Just below the section registering controls, add the following line:

  <asi:SubNavigation runat="server" Skin="Aspen" EnableEmbeddedSkins="false" SingleExpandPath="true" ShowLineImages="false" />

- (optional) If you are familiar with skin controls, you can configure how the SubNavigation control behaves using the following properties:
- string NavTreeSkinId – A unique ID for the skin if needed. The default is RadTreeView.
- bool SingleExpandPath – Gets or sets a value indicating if only the current branch of the tree is expanded. The SingleExpandPath property, when set to True, automatically collapses nodes that are not on the path of the currently expanded node. Use the SingleExpandPath property when you need to conserve screen space and make navigating nodes easier.
- public bool ShowLineImages – Gets or sets a value indicating if the tree node line images display or not.
- string Width – Gets or sets width of the control. Specify in pixels (px) or percentage (%) e.g. 500px, 90%.
- bool EnableEmbeddedSkins – Gets or sets a value indicating if the built in skins should be used on the navigation tree.
- int MaxDataBindDepth – Gets or sets the maximum number of levels to bind to the navigation tree.
- bool WrapNodeText – Gets or sets the option to wrap text if it is wider than the trees allowed width.
- bool ExpandAllNodes – Gets or sets the option to expand all of the nodes when the navigation tree renders.

Displaying mega drop-downs

You can display mega drop-downs from your primary navigation with a few changes to your theme's skin file and menu CSS. Mega drop-downs display navigation items within large panels, grouped by level, which reduces scrolling and improves the usability of site navigation.



To implement mega drop-downs

1. Ensure that all navigation items in the sitemap have a value for Content or URL to Link to. Otherwise, the navigation hierarchy may not render properly.
2. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableMegaDropDownMenu="true"

- (optional) If you are familiar with skin controls, you can configure how the mega drop-down behaves by altering the following properties:
- EnableMegaDropDownMenu – Enables the mega drop down.
- MegaDropDownMenuShowStartingNode – Displays the parent navigation node as the first item in the mega drop down. Enter true or false.
- MegaDropDownMenuLevelSettingLevel – Defines the navigation level at which the number of columns set for MegaDropDownMenuRepeatColumns starts to take effect. For example, if you set MegaDropDownMenuRepeatColumns="3" and set MegaDropDownMenuLevelSettingLevel="2", then the mega dropdown displays three columns for the second and higher navigation levels, and the first level only has one column.
- MegaDropDownMenuRepeatColumns – Defines the number of columns used to display the navigation.
- MegaDropDownTooltipLocation – This option only applies to tooltips defined for top level navigation items in the primary navigation. When defined, it specifies the location of the tooltip text if a tooltip is defined for that navigation item. Enter either Menu (displays the tooltip directly beneath the top level navigation item) or Append (displays to the right of the navigation text within the dropdown). If you do not define this property, navigation tooltips are not displayed in the dropdown.

3. Edit the theme's menu CSS to tailor the display of the mega drop-down for the theme's look and feel.

- Using your preferred text editor, find and open the website theme's menu CSS file (for example Menu.Aspen.css). Menu CSS files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the MegaDropDownMenu Styling section and edit the styles as needed:

```
/* ############################ */
/*  MegaDropDownMenu Styling  */
/* ############################ */

.RadMenu .rmGroup .MegaDropDownMenuOuter .rmText {
   padding: 0;
   margin: 0;
   width: 600px !important;
}

div.MegaDropDownMenu
{
   background-color: #f8f7f7;
   padding-left: 5px !important;
   padding-right: 5px !important;
}

.MegaDropDownMenuToolTip
```

```
{
   padding: 5px;
}
```

Using image sprites for navigation items

A sprite is a collection of images combined into a single image. Using CSS, you can shift the image around to display only parts of it. The advantage of using sprites is that they reduce the number of server requests to load images (only one is loaded), leading to improved performance.

One way to use sprites in iMIS is for rollover effects on navigation items.

To implement image sprites for navigation items

1. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableImageSprites="true"

  When enabled, a new class named rmLeftImage is added to root level links in PageNavR.

2. Create the sprite file.

- Using an image editor like Adobe Photoshop, or a free alternative like GIMP, create your sprite by adding the images you want to a single image, like the following:

- Save the sprite to the website theme's image folder.

3. Edit the theme's 99-[theme].css file to define the classes to control the sprite.

- Use a tool like SpriteCow to determine the position values of the images in the sprite.
- Using your preferred text editor, find and open the website theme's 99-[theme].css file, located by default in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Add styles for the sprite. For example:

```
.RadMenu a.rmRootLink.CartLink .rmLeftImage
{
   Background-image: url(images/cartsprite.png);
   Background-repeat: no-repeat;
   Background-position: -1px -1px;
   Width: 48px;
   Height: 36px;
}
.RadMenu a.rmRootLink.CartLink:hover .rmLeftImage, .RadMenu a.rmRootLink.CartLink.rmExapnded .rmLeftImage, .RadMenu a.rmRootLink.CartLink.rmFocused .rmLeftImage
{
   Background-position: -1px -39px;
}
```

The first group of selectors sets the resting position for the image sprite. The second group of selectors defines the hover state and shifts the image when the link is rolled over.

Go to RiSE > Site Designer > Mange websites:

4. Apply the sprite class to the appropriate navigation items.

- Edit the navigation item for which you want to apply the sprite hover effect (for example, the Shop).
- For the CSS Class property, enter the sprite class (for example, CartLink).
- Save and Publish the navigation items.

Styling your website's primary navigation

If you customize your website with a new look and feel, you will want to restyle the primary navigation to match the rest of the site. To customize the look of the navigation, you must be using iMIS 15.2 or later along with an UltraWave-derivative theme such as Aspen, Austin, or Birch. In iMIS, the primary navigation bar is built with Telerik RadControls; providing powerful tools for creating dynamic menu systems.

You can change your navigation menu's style by:

- Choosing an out-of-the-box skin provided by Telerik
- Customizing the font or color of an existing Telerik skin using Telerik's Visual Style Builder
- Styling your menu with CSS instead of using the Telerik tools

What is PageNavR?

PageNavR is a control that iMIS uses to display a website's primary navigation. The navigation bar automatically populates with each top-level navigation item, and each sub-item displays in a drop-down list that can expand to multiple levels. PageNavR wraps around a Telerik RadMenu control, so all PageNavR styles are controlled by Telerik's base styles.

What is a .skin file?

Skin files allow you to override default control behaviors in a theme-dependent way. If you set a property for a control in one theme's skin file, it will not affect how the control displays in other theme's skin files.

Take a look at this section of the Aspen.skin file in App_Themes/Aspen:

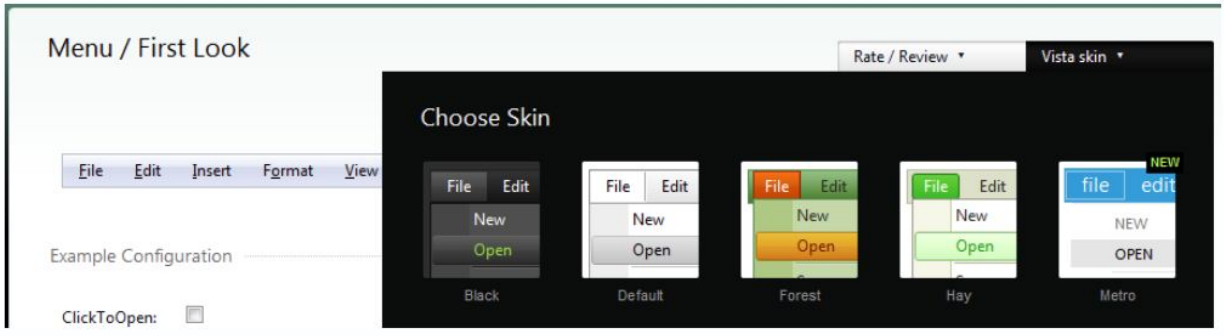
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" EnableRootItemScroll="false" Flow="Horizontal" DefaultGroupSettings_Flow-w="Vertical" DefaultGroupSettings_OffsetX="0" Width="100%"/>

These are just a few of the PageNavR properties available for the control in the skin file. The two properties which affect the navigation bar's style are "Skin" and "EnableEmbeddedSkins."

The "EnableEmbeddedSkins" property determines whether Telerik embedded skins should be loaded as the default. If you are creating your own custom skin, you MUST set this property to "false."

To style the navigation using a skin provided by Telerik

1. Choose an existing Telerik skin to style the navigation menu at [Telerik RadMenu Demo: First Look](#).



2. Change the "Skin" property of the PageNavR control in the theme's skin file to the name of the skin you selected.

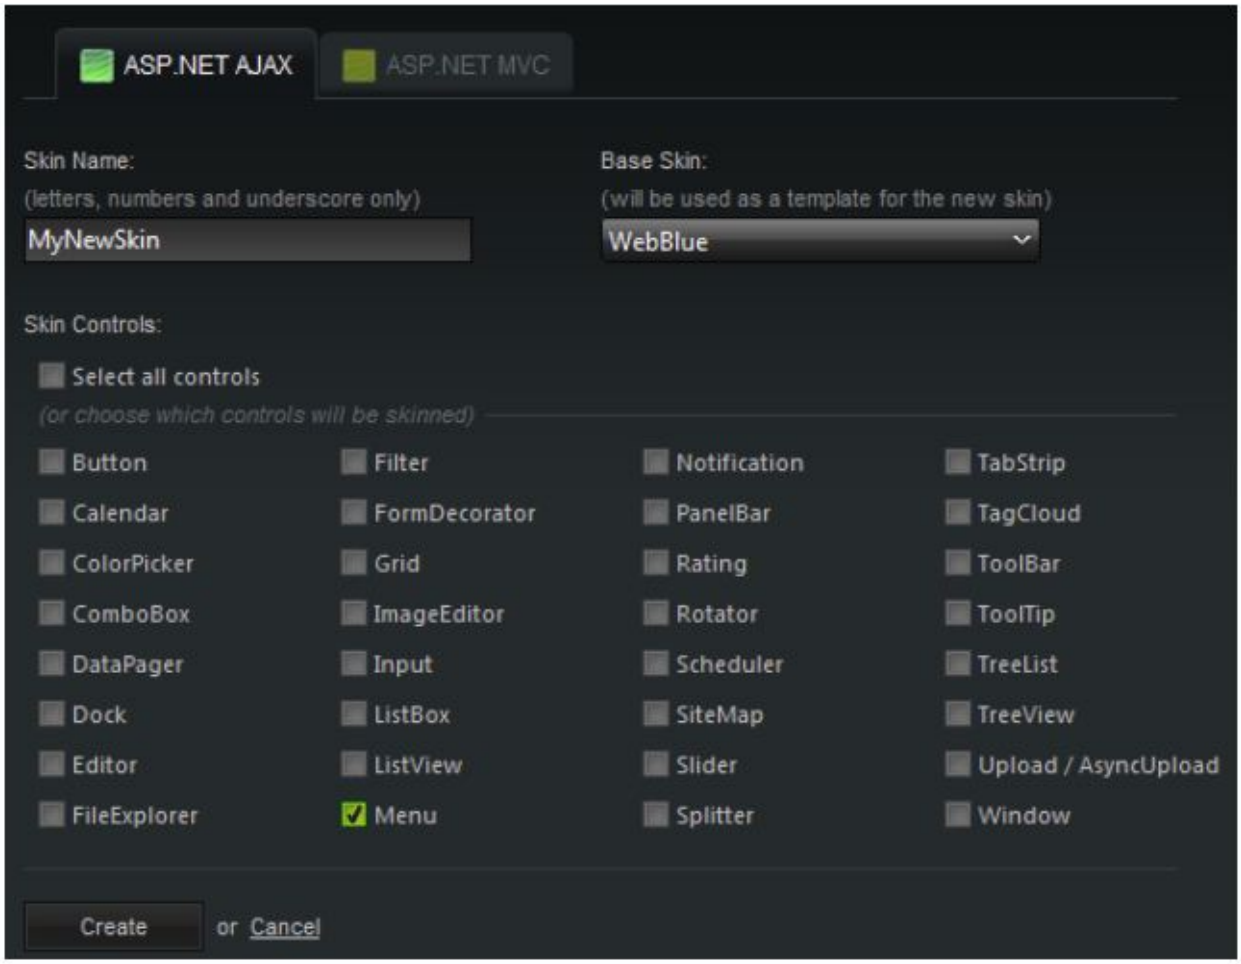
3. Change the “ EnableEmbeddedSkins=" property of the PageNavR control to “true." The navigation bar’s styling will change to that of the Telerik skin you selected.

For more information, see MSDN's guide to ASP.NET Themes and Skins.

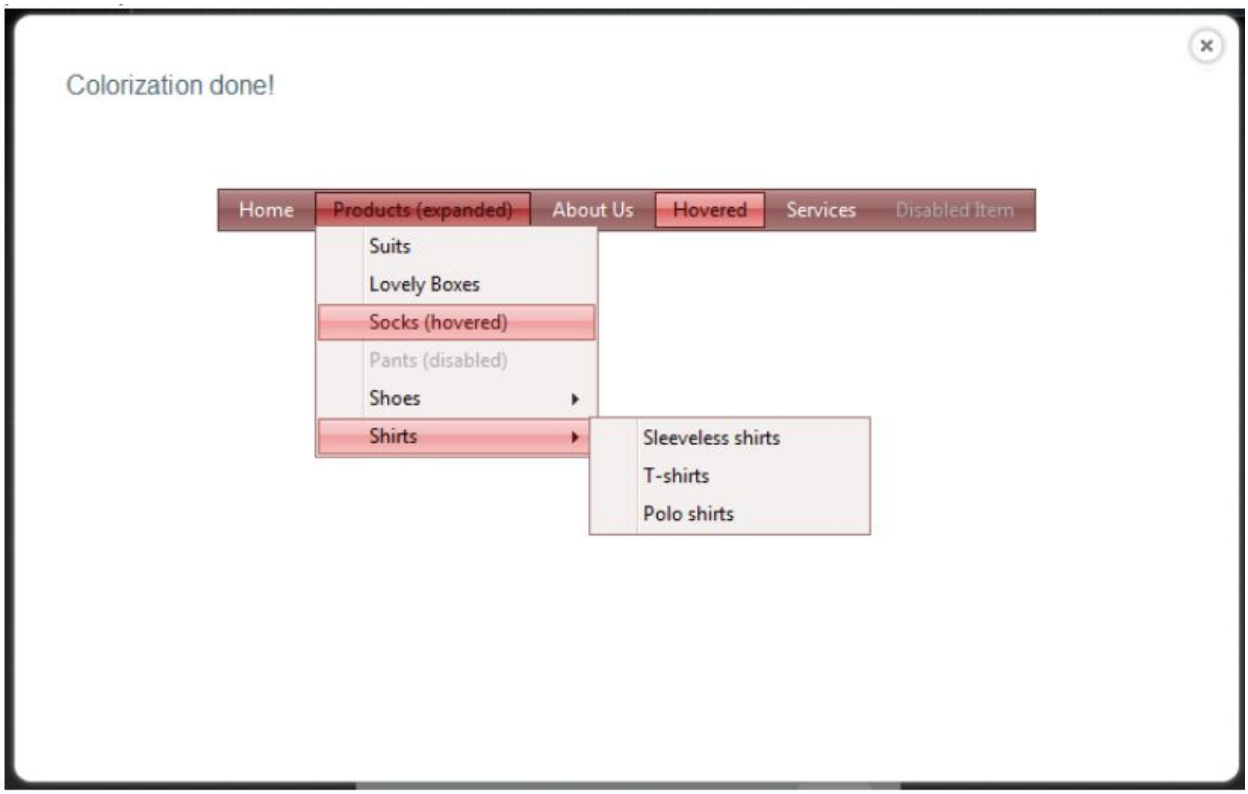
To style the navigation by customizing an existing Telerik skin using Visual Style Builder

If you want to customize the colors or font for a particular Telerik skin, you can use Telerik's Visual Style Builder:

1. Open the Telerik Visual Style Builder and select New Skin. (Note: The Visual Style Builder is in beta. For best results, use Internet Explorer as it is not fully functional in any other browser.)
2. Name your new skin, select your base skin, and check the Menu checkbox.
3. Click Create. Visual Style Builder will open on the Colorize tab.



4. Select your preferred color for the menu. You can fine-tune the hue and saturation of the color on the Shift colors tab in the color window that is open.
5. Click Save to see a preview of your new skin. If you are satisfied with the outcome, you can now download the generated images and CSS and skip to step 9.

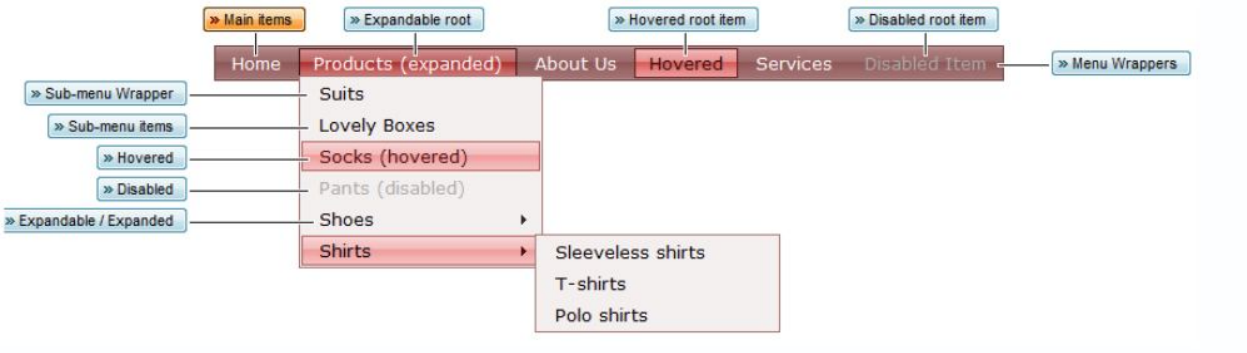


6. For additional customizing, click the Fine-tune tab of the Style Builder itself in the top left.

   Tip: The fine-tune functionality can be unpredictable. Save frequently so that if you don't like the way a change turns out, you can click "load last save" to undo it.

7. Begin with any universal changes you would like to make, such as changing the font on the navigation nodes. Click the Main items bubble to make changes to the font on the main navigation node.

   Each time you make a change the example dynamically responds. Each of the blue bubbles opens a different set of configuration options.



8. When you are finished, click Save and then Download to get the necessary code and images.
9. Copy the unzipped files to your theme's folder. Open the .skin file and set “EnableEmbed-dedSkins” to “false” and “Skin” to the name of your new skin.

   For more information and a video tutorial, see Telerik's Visual Style Builder Overview.

   To style the navigation using CSS

   If you do not like the Telerik provided skins, you can create, with the aid of your browser’s developer tool, your own image-free styling using CSS. If you choose to work by hand, you may find it helpful to start with a working skin, and adjusting to suit your needs.

1. Rename all of the base-level selectors in your working skin file to RadMenu_[Your theme name] .
2. Use your browser’s developer tools to help you figure out how to modify the CSS to get the desired result.
3. In your theme's skin file set “EnableEmbeddedSkins” to "false" and “Skin” to the name of your skin.

Controlling sitemap behavior

This section explains sitemap behavior, including:

content records, iParts, and shortcuts used for searching.

- How to modify the [OverrideLinkText] and [CartItemCount] dynamic navigation items
- Profile pages linked from the Member site's Directory, which uses an ASPX web page to redirect users to a navigation item based on a set of criteria

How search works with navigation

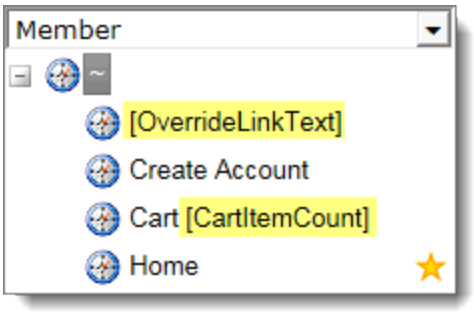
Three elements make search work in the sample sites:

- The search content records: The sample sites use search content records that are dynamically populated with an initial search result set based on a URL parameter value. These content records contain the Common Search iPart and are located within @/iCore folders.
- The pages that display the initial search results: The Shop and Events navigation items are linked to the Search content records. These navigation items have a unique value for the InitialArea URL parameter, which defines the result set generated when the pages are first displayed (i.e. products or events).
- The page displayed when a user clicks a result: The page displayed when a user clicks a search result link are based on the shortcuts defined from Site Designer > Manage shortcuts. The following shortcuts display search result links in the sample sites:

- ItemDetail –The ItemDetail shortcut displays the Item_Detail content record, which uses the Product Display iPart to display the item selected.
- GiftDetail – The GiftDetail shortcut displays the Gift_Detail content record, which uses the Donation Creator iPart to display donation pages selected from search results.
- EventDetail – The EventDetail shortcut displays the Event_Display content record, which uses the Event Display and Event Program Display iParts to display event pages selected from search results.

Modifying dynamic nav items

The default sitemaps include variables that dynamically generate the text displayed for two navigation items. [OverrideLinkText] displays the Full Name of the logged in user by default. [CartItemCount] displays the number of items a user has added to the Cart.



If you want to add new navigation items that use these variables, or if you want to modify the existing ones, keep the following guidelines in mind:

- Navigation areas and master pages – The variables only work in the Auxiliary and Footer navigation areas of websites using one of the Sample Site master pages (or copies of these files) or 1700.master. To specify a navigation area, edit a navigation item and in the Options section, select Auxiliary, Footer, or both from the Show in the following navigation areas options.
- [OverrideLinkText] – You can use this variable on its own or with other text. For example, if you only enter the variable, then only the logged in user's name is displayeds as a link. However, if you enter [OverrideLinkText]'s Profile, and Bob Smith logs in, then Bob Smith's Profile is displayed as a link.

- [CartItemCount] – You can use this variable on its own or with other text, but we recommend that you only use it with other text. Otherwise, when no items are in the cart, nothing is displayed for this navigation item.

  To change the data displayed for [OverrideLinkText]

  The variable [OverrideLinkText] can display any property of the NetContact business object. You can change the property displayed by editing the ContactDetail property in your copy of one of the Sample Site themes, or in 1700.master.

  For example, instead of displaying the Full Name of the logged in user, you may want to display only their First Name. To make this change, edit the ContactDetail property to replace all instances of FullName with FirstName. The result should look like this:

```
public string ContactDetail
  {
    get
    {
      if (ViewState["ContactDetail"] != null)
        return (string)ViewState["ContactDetail"];
      _contact = Asi.Business.Contact.ContactController.Contact(Asi.AppContext.CurrentIdentity.UserKey,
                                                  Asi.AppContext.CurrentContext.
                                                    StatefulBusinessContainer);
      return _contact.FirstName != "GUEST" ? _contact.FirstName : String.Empty;
    }
    set { ViewState["ContactDetail"] = value; }
  }
```

Account and profile pages in the Directory

When users select a result after searching the Member site's Directory, or when they navigate to the account pages, the content record that displays depends on the user's permissions. The rules that determine where a user is redirected are defined in the Party.aspx file, located by default in C:\Program Files\ASI\iMIS\Net.

You can modify the information displayed on the account and profile pages by editing the content records described below from Content Designer > Manage content.

Note: In the Member Mobile site, only simple profile pages are shown for member and organization accounts to restrict the amount of information displayed on small screens.

Page description	Users directed to the page	Content record: @/iCore/Contacts/*	Shortcut
Detailed page for staff to manage member accounts	System Administrators Staff with an authorization level of 1 or higher in Customers	ContactLayouts/Account_Page_Staff	FullAccount
Detailed page for member to manage own account	Contacts selecting their own record	ContactLayouts/AccountPage	MyAccount
Detailed Organization account page	System Administrators Staff Organizations selecting their own record	OrganizationLayouts/Account_Page	OrganizationAccount

Simple (non-editable) Contact profile page	Users who do not have permission to edit the account	ContactLayouts/Profile	Profile
Simple (non-editable) Organization profile page	Users who do not have permission to edit the account	OrganizationLayouts/Organization_Profile	Organization

Complying with the EU's Electronic Privacy Directive

To comply with the EU Directive on Privacy and Electronic Communications, iMIS has added support for your organization to display a pop-up notification informing visitors that cookies are used on your site. This popup also includes a link to a longer sample privacy policy we have provided. You can find more information about this law on the ICO website.

Setting up cookie notifications requires that you edit your master page, review (and modify as needed) the privacy policy provided, and add a JavaScript file to iMIS.

To display cookie notification popups

1. Edit the master page of your website (by default located in C:\Program Files\ASI\iMIS\Net\Templates\MasterPages) to add the following items:

- Just under the , add the following divs:

Note: You can edit this content to change the look and feel of the popup to match the design of your site.

```
<div id="EUCookiewarningBack" style='z-index:999; position:absolute; width:100%;height:100%;background: rgb(0, 0, 0) transparent;background: rgba(0, 0, 0, 0.6);filter:progid:DXImageTransform.Microsoft.gradient(startColorstr=#99000000, endColorstr=#99000000);-ms-filter: \"progid:DXImageTransform.Microsoft.gradient (startColorstr=#99000000, endColorstr=#99000000)\"'>

<div id="EUCookiewarning" style-='margin:19%;padding:10px;width:62%;height:20%;background:white;color:black'>

<span id="EUCookiewarningtext"></span>

<a href="#" class="close-notify">Continue</a>

</div>

</div>

</div>
```

- At the bottom of the master page, just before the line <!-- Facebook API is loaded into here -->, add the following JavaScript reference:

```
<script type="text/javascript" src="AsiCommon/Scripts/EUCookieWarning.js"></script>
```

2. Review the sample privacy policy provided as a content record in iSamples/Member/Privacy_Policy, and update as needed for your organization.
3. Create a JavaScript file named EUCookieWarning.js containing the code below, and add it to the Scripts folder (by default located in C:\Program Files\ASI\iMIS\Net\AsiCommon\Scripts).

   Note: The displayNotification function in this file contains the content of the popup notification displayed to users the first time they visit a page in your website. Be sure to update the privacy policy link in this message to point to the content record you want to display for this purpose. You can also edit the rest of the content for the needs of your organization.

```
function getCookie(c_name)
{
var i,x,y,ARRcookies=document.cookie.split(";");
for (i=0;i<ARRcookies.length;i++)
 {
 x=ARRcookies[i].substr(0,ARRcookies[i].indexOf("="));
 y=ARRcookies[i].substr(ARRcookies[i].indexOf("=")+1);
 x=x.replace(/^\s+|\s+$/g,"");

Creating your websites

Creating a website is simple with iMIS! You can simply make a copy of one of the sample sites installed with iMIS and select a look and feel template and theme that is the best match for the look that you want for your new site.

Working with iMIS Sites

Because new and improved iParts and features are added to iMIS with every update, iMIS installs sample sites and a demo database that, together, fully demonstrate the more complex enhancements. These sample sites and data will remain synchronized with the ever-evolving state of iMIS, and will showcase new iParts, functionality, and UI improvements as they become available.

Using sample sites

iMIS installs with sample sites, such as Member and Member Mobile. The Member site shows how to build a RiSE site for your members and how to combine related iParts for features such as Commerce and Events. The Member Mobile site shows how to build a site optimized for mobile devices, such as smart phones and tablets.

It is easy to create your own customized website by using and copying a sample site. For detailed instructions on this process, see the topic Creating a site.

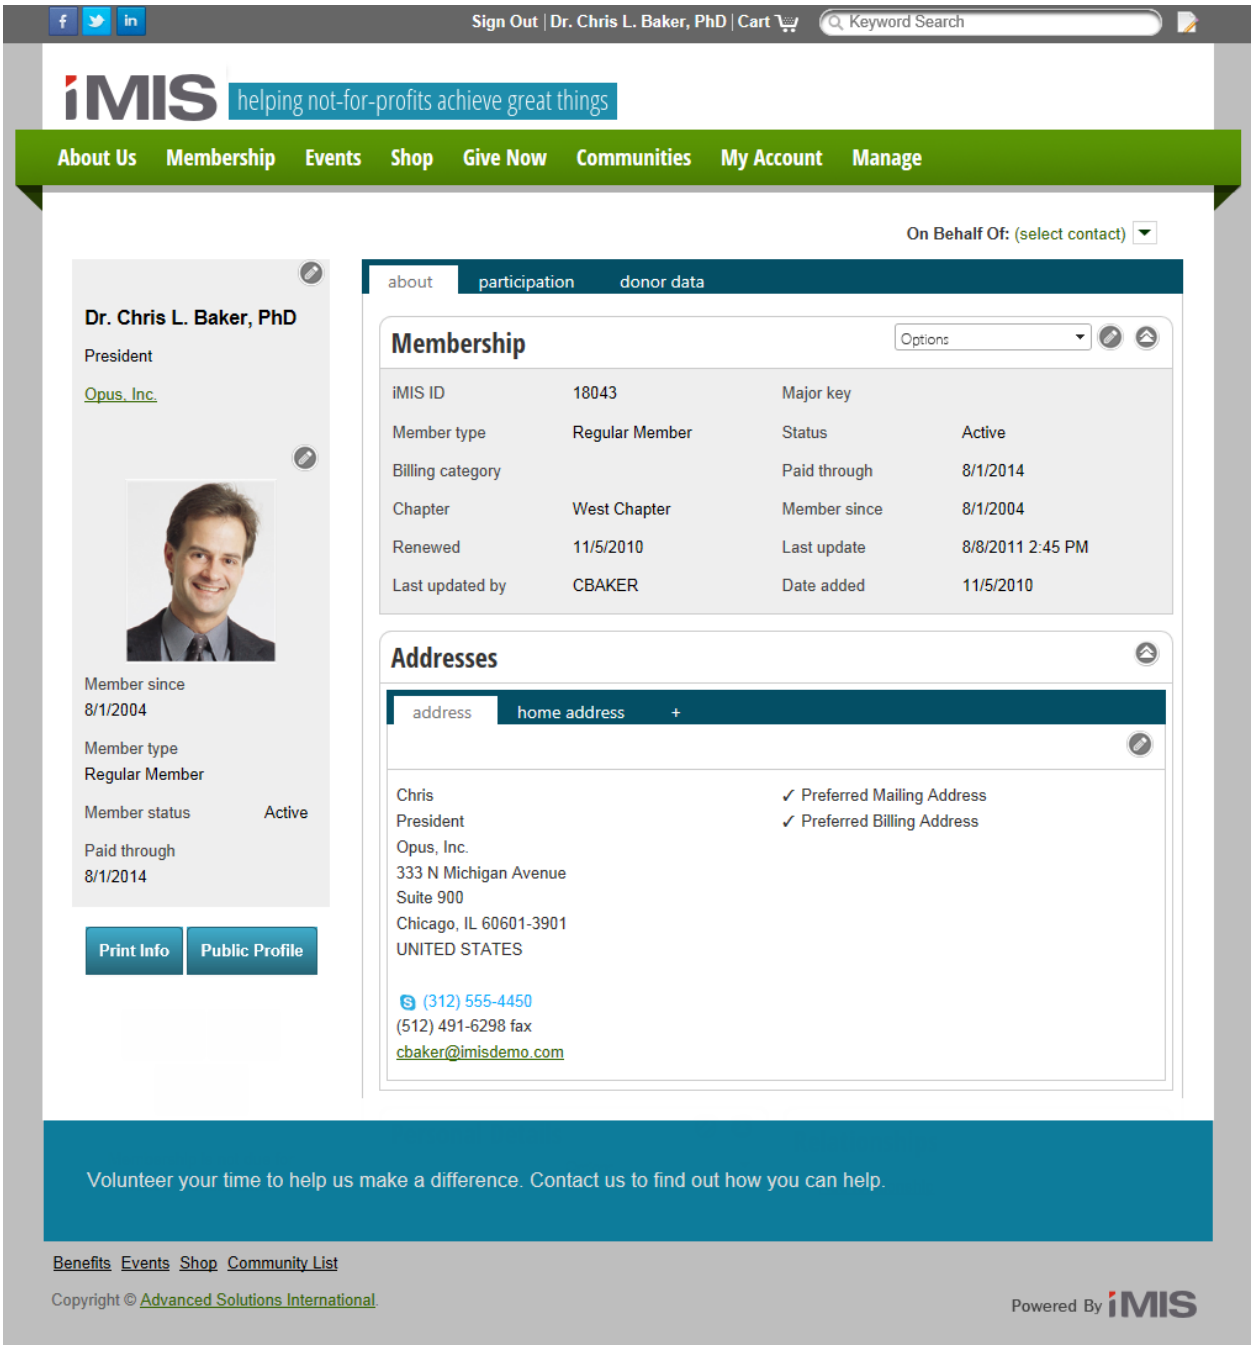
Note: By default, the starter sample sites are marked as Inactive. If you want to use a sample site, copy the site and enable the Is this website active option (RiSE > Manage websites > click the expand icon in the Status area).

By browsing to your Member site (http://yourvirtualroot/mbr), and to your Member Mobile site (http://yourvirtualroot/mobile), you can see how the iParts and pages present your current users and content. For example, if you have events currently defined and set to Show on web, you will see them populated on the Events page.

Tip: Upgrades overwrite the Member and Member Mobile sites, but you can add new content records and navigation items to the site for your own testing purposes. Upgrades will preserve your test objects.

Member site

The Member site offers a rich self-service experience for your members and prospects. This site enables you to choose from a variety of visual themes, change navigation in just a few clicks, and add any number of query-driven iParts to present dynamic information to your site visitors.



Member Mobile site

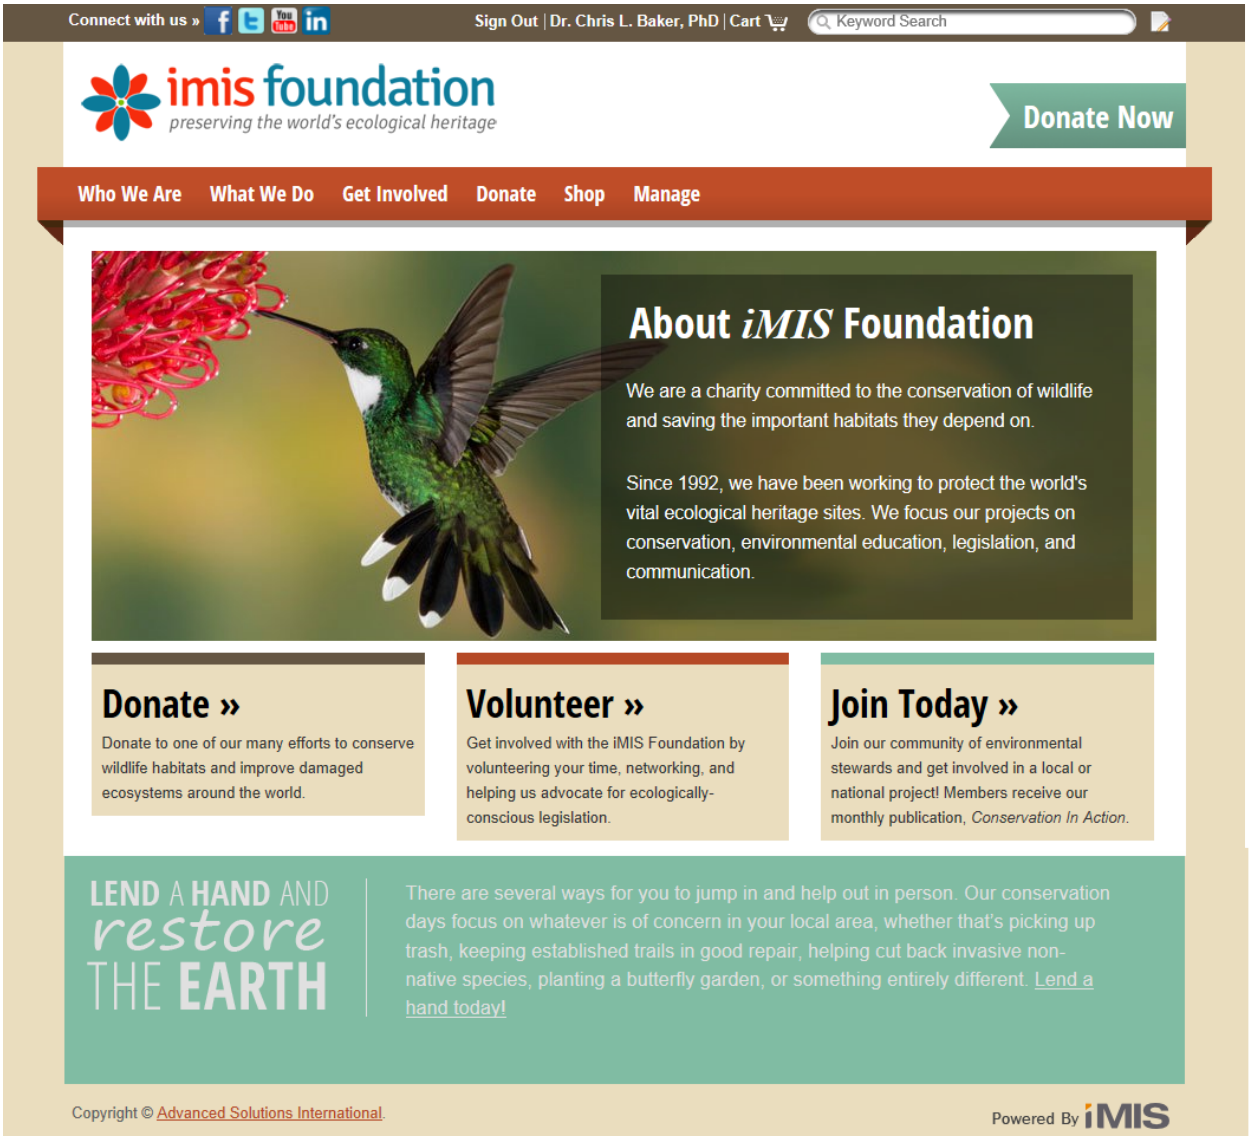
The Member Mobile site renders a version of the Member site that is optimized behaviorally and formatted for use on smart phones and tablets. This site is accessible by your members and by your staff who are working off-site or on the run.

Upcoming Spring Conference

Don't miss out on this year's annual spring conference! The program includes plenty of networking opportunities, workshops to sharpen your skills and sessions to keep you up-to-date with the latest technological advances.
To register for this and other upcoming events click on the events link below.

Donor site

The Donor site offers a rich and highly customizable experience for fundraisers conducting charitable campaigns and product sales with the public.



Annual Conference site

The Annual Conference site offers a "micro site" experience to support your critical projects, such as an organization's annual conference. By shaping the site with unique content and structure, you can maximize the impact of the project without affecting your main

site or micro sites from different years. At the same time, iMIS seamlessly integrates content between your various sites.

Annual Conference Mobile site

The Annual Conference Mobile site renders a version of the Annual Conference that is optimized behaviorally and formatted for use on smart phones and tablets for both by your members and staff who are attending events. Attendees gain quick access to their personalized programs, activities, and event feeds – and can instantly look up directory profiles of those attending with them.

Staff site

The Staff site offers your staff members an easy, cloud-based, convenient way to manage all of your organization's business from the web. Staff can complete transactions and updates for your contacts, and help them renew, register, or purchase. This site also allows staff users to run reports, create and manage events, and utilize the robust RiSE tools. Using the powerful security features of iMIS, you can finely control which areas and content that each staff member can access.

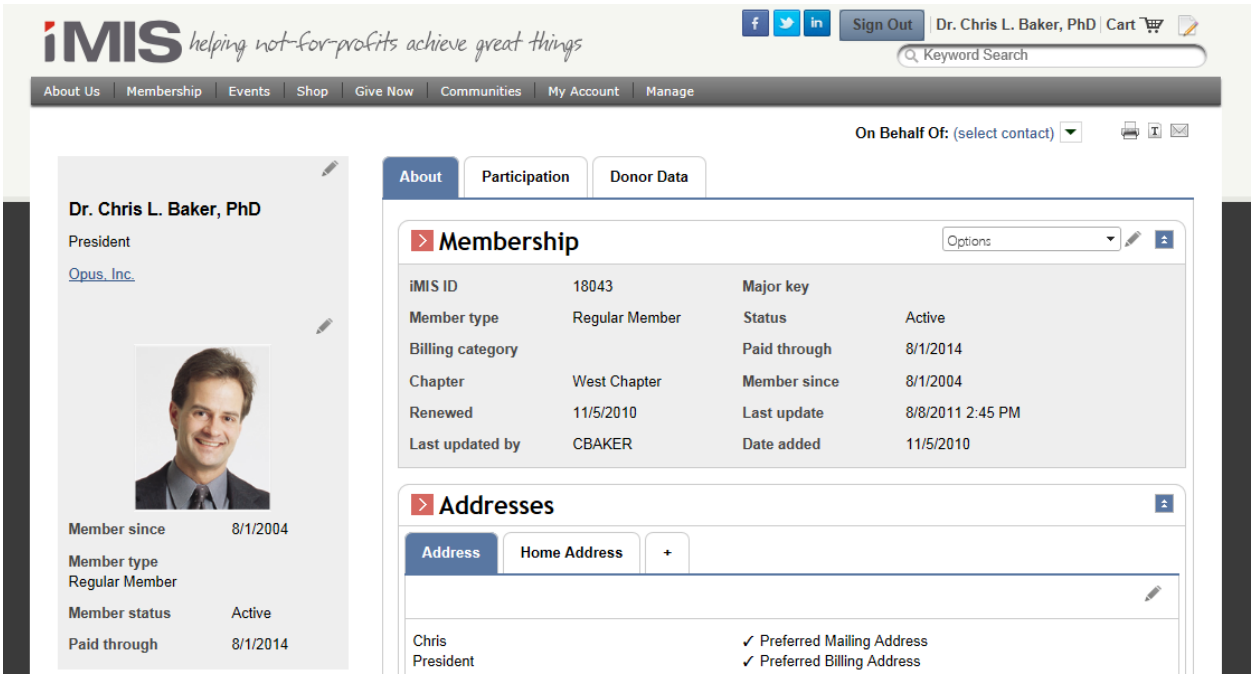
To use the DemoDB with the sample sites

To see the sample sites in action with sample data, you can connect to the demonstration database (DemoDB). This database includes a set of users and content sufficient to experience how the iParts work together.

1. Point your instance of iMIS to the DemoDB, which installs with iMIS.
2. Browse to the sample sites for this instance.

3. Sign in as Chris Baker: cbaker/cbaker.

   This user has full privileges to the system, so you can exercise all aspects of content lay-out, iPart configuration, and use.



4. Change the password for this user if you want to prevent unauthorized access to your demo site.
5. When you are ready to start making changes to the site you must make a copy. This helps you to avoid losing your changes when you upgrade iMIS. For more information on this strategy, see Creating a site. Items affected by upgrades span the demo data and the site itself:

- Site definition and navigation items
- Content records, including iPart configuration, arrangement, and connection
- User records and demo data (products, events, subscriptions)

Creating a site

To create a public-facing website that makes full use of iParts and SOA, it is easiest to copy an existing sample site, such as Member, and change it to meet your needs.

When you copy a website, iMIS duplicates the site navigation and content records for the new site.

Go to RiSE > Site Designer > Manage websites:

1. Select a website from the list of websites and review the following fields before you proceed:

- (Properties tab) Make sure the folder selected for the Website-specific parent content folder field contains the content unique to this website. Only the content in this site-specific folder will be copied. Any content shared with another website should be placed in a separate, shared folder.
- (Look and Feel tab) The Folder containing template content is normally a sub-folder of the parent folder. If the template content (footer area, header logo, and so forth) is stored in a different folder, select that folder instead.

2. Copy a website:

1. Select Organize > Copy.
2. Select the folder where you want to paste the new website.
3. Select Organize > Paste.
4. Enter the Name of the new website, for example, MemberCopy. Do not use special characters or punctuation.

   Note: During the copy process, Content Codes are cleared from content records because this code must be unique for each content record. A warning message displays a list of the content records where the Content Code was cleared. See the log files for details.

3. Copy an out-of-the-box Master Page and Theme to be unique to your new website.

   Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme. Creating a copy of a theme also ensures that you do not compromise your ability to fall back to a working original. Follow these steps to copy a theme, which is far easier than creating one from scratch.

1. Select your new website.
2. (Look and Feel tab) Select the master page and theme|topic=Sample site themes and master pages that you want for your new site.
3. Locate the theme folder (such as \Aspen), which defaults to C:\Program Files\ASI\iMIS\Net\App_Themes.
4. Copy, paste, and rename \Aspen to your new site name (\ABC).
5. Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages
6. Copy, paste, and rename Forest.master to your new site name (MemberCopy.master).
4. Edit your site to use your new theme files.

- Select Site Designer > Manage Websites and highlight your site (ABC).
- Edit the site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save.

5. Click the expand icon in the Status area, and enable the Is this website active option.
6. Publish the website:

- Select the newly copied website and select Publish.
- Publish the website's content folders:
- Go to Content Designer > Manage content.
- Select the content folder of the copied website.
- Select Publish. As each folder and content record publishes, the status will change from PublishPending to Published.

- If the website is hosted on a separate web server, publish the Core Content folder. See Installing WCM on web servers for more information on hosting a site on a separate web server.
- Go to Content Designer > Manage content.
- Select the Core Content folder.
- Select Publish menu and choose the Publish All Items option. As each folder and content record publishes, the status will change from PublishPending to Published.

7. After all content folders are published, log off and close the browser.

   Note: If the website you copied contains URL shortcuts, be sure to review those shortcuts in your new website to determine if you need to create fresh shortcuts. For example, when you select the iMIS logo in the Member site, the page redirects to the shared Member Home content record. When you make a copy of the Member site and you select the iMIS logo from the new site, you will be redirected to the same shared Member Home content record. To resolve this, create a fresh shortcut that will point to your new Member Home.

Deleting a website

A website administrator can delete a website and the content records associated with the website. However, you should proceed with caution, as a deleted website cannot be retrieved. Ensure the website is not a production site.

Go to RiSE > Site Designer > Manage websites:

1. Select the website you want to delete (such as MemberCopy).
2. Select Organize > Delete. A warning message is displayed.
3. Click OK. A results window is displayed.
4. Click Close.
5. Select Recycle Bin.
6. Select Organize > Empty the Recycle Bin. A warning message is displayed.

7. Click OK. A results window is displayed.
8. Click Close.
9. Go to RiSE > Content Designer > Manage content.
10. Select the content folder of the copied website.
11. Select Organize > Delete. A warning message is displayed.
12. Click OK. A results window is displayed.
13. Click Close.
14. Select Recycle Bin.
15. Select Organize > Empty the Recycle Bin. A warning message is displayed.
16. Click OK. A results window is displayed.
17. Click Close.

Implementing a mobile site

The Member Mobile sample site is optimal for mobile devices like smart phones and tablets, featuring accessible content and a sitemap for members needing information on the go. The master page Sapling places key information at the top of the screen and works with the Aspen Mobile and Austin Mobile themes; featured styles are sized appropriately for smaller screens.

If you want to provide a mobile site for your members, we recommend that you start with a copy of the Member Mobile sample site, and then apply your changes. When you make a copy of the site, iMIS creates a copy of the website, content, and sitemap.

Note: Before the following required steps, you must complete your copy of the mobile site. See Copying a website.

To implement a mobile site, do the following:

Go to RiSE > Site Designer > Manage sitemaps:

1. Choose your copy of the Member Mobile site.
2. Edit the Full Site navigation item to add your main site's URL to the Content or URL to Link to.
3. Go to RiSE > Content Designer > Manage content, then select the content folder created for your copy of the mobile site.
4. From the ContentAreas folder, edit the following content records:

- Social Networking Images: Configure the Social Networking instance of the Content Html iPart, and from the <>HTML tab, update the href's to link to your social media accounts or remove any links you do not want to appear.
- Header Logo: Configure the Header Logo Span instance of the Content Html iPart and update the logo to your organization's logo.
- Footer Copyright: Configure the Footer Copyright instance of the Content Html iPart, and update the content and link for your organization.

Tips and reminders

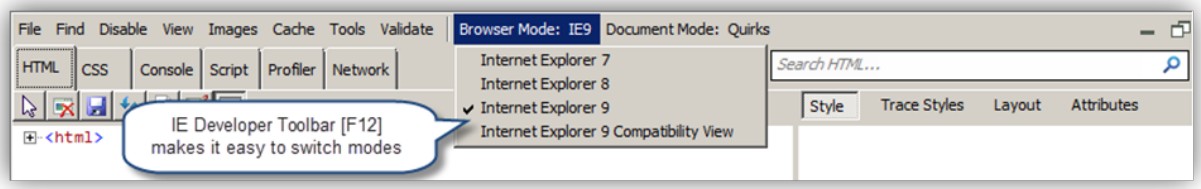
- Trim content – For easier reading on small screens, and to decrease page load time, keep content simple.
- Automatic redirect – Consider adding some JavaScript to redirect users automatically to the mobile site when they try to access your full site on mobile devices.
- Add favicon – Update the favicon used for your mobile site, apple-touch-icon, located by default in C:\Program Files\ASI\iMIS\Net.
- Surf-to-Edit limits – When you access the mobile site, Surf-to-Edit is only available when you access the website from a browser with a width larger than 700 pixels.

Modifying site themes

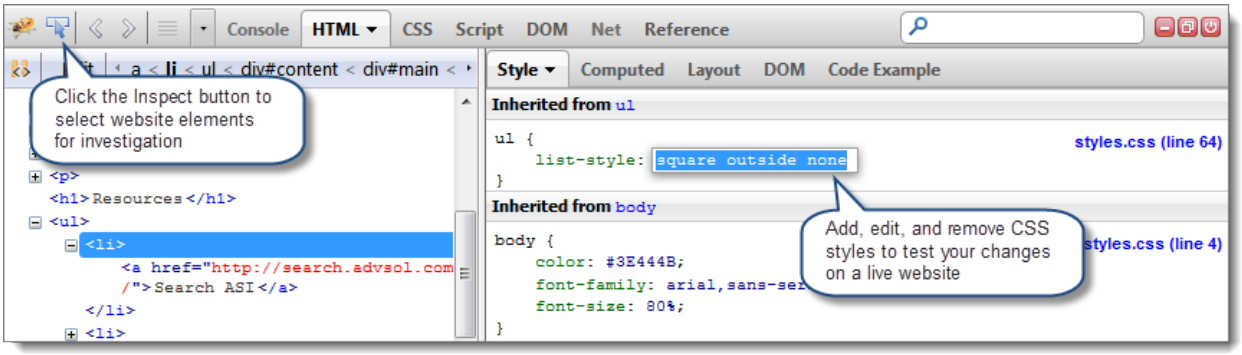
Several themes have been created for the sample sites. You can modify these themes to help identify and personalize your organization's website.

Best practices for theme development

- Caution: Never change the core style sheets 00-Reset.css and 10-UltraWave.css. All derivative themes inherit from these files, and any changes you make to them are lost on upgrade. Instead, override the base styles in your 99-[theme].css.
- Before modifying a theme, find the best one: apply all of the themes to the default Member site in turn, and decide which theme is closest to the final look and layout that you want.
- Always work from your copy of the theme, so that you can begin again. See Copying a website theme.
- Make changes only to websites that you create. When a sample site is updated with each release, the iMIS Upgrader overwrites any changes you made to it.
- Take advantage of browser-based developer tools to test and troubleshoot changes before committing them to your style sheets:
- Internet Explorer and Chrome: Press F12 to toggle the Developer Toolbar.



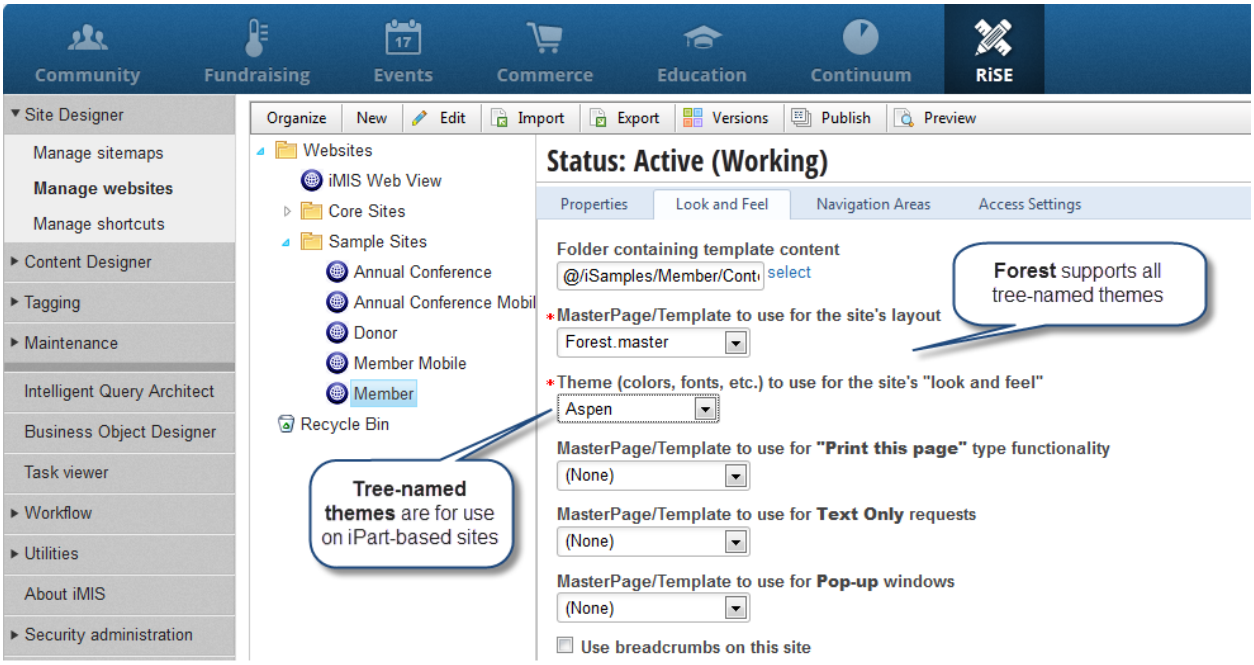
- FireFox: Install the Firebug add-on to see a wealth of information about the structure of the website and the styles it is using. Turn on the element inspector and click a piece of content to see the styling that it is implementing:



Sample themes and master pages

You can change the look and feel of the sample sites by selecting different combinations of a Master Page and its matching Theme. If you want to modify a particular design for your website, make sure you create a copy of the master page and theme before making any changes. See Creating a site for more information.

Note: iMIS themes give you a head start on developing your website. To provide you an idea of how things could look, we have used numerous pictures, illustrations, and images that we purchased under a limited license for ASI's use. The icons can be used on your website, but if you reuse any of the other images, you will need to buy a license. We acquire the majority of our images from iStockPhoto and most are available in the range of $15-$50; much less than the cost and labor of creating them on your own. If you have any questions, please contact us.



Example: Selecting a theme created for the Forest master page

Important: If possible, avoid customization to master pages. If you do need to make changes, make the changes in a copy of the master page. Any customizations performed to the out-of-the-box master pages will be overwritten after an upgrade.

The following designs are available out-of-the-box for iMIS sample sites.

City.master

UltraWave and Universal Design

The Sample site themes and master pages build upon a new underlying template called UltraWave. UltraWave incorporates structure and styling for Universal Design. Universal Design seeks to make web content "barrier-free," making sites accessible to all challenged users. Challenged users include not only the millions of physically or cognitively impaired, but also seniors, non-native speakers, and those in other countries and cultures (localization).

Universal Design has benefits beyond helping websites meet the myriad of web accessibility standards: it also aids in breaking technology and human barriers. Universal Design is the foundation for transforming pages and content into outputs and displays your members may need, including print presentation, net book usage, and even cell phone applications.

Important: UltraWave themes support RiSE sites, which are an alternative to Public view. They do not support existing Public views.

Features of the template include:

- Developed toward W3C standards to help meet accessibility requirements
- Fluid-width template dynamically reflows content to fit your user's browser window
- Clean, minimal design uses neutral shades and layout
- Offers a streamlined set of stylesheets and skins
- Easily customized with logos, fonts, and colors
- Designed to be easily rebranded by your organization

Copying a website theme

Themes control the layout, font, and colors of your iMIS sites. The sample sites come with a set of special themes, designed for RiSE sites. See Sample site themes and master pages for a list of available themes.

Creating a copy of a theme also ensures that you do not compromise your ability to fall back to an original that works. Follow these steps to copy a theme, which is far easier than creating one from scratch.

Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme, as outlined below.

1. Copy an out-of-the-box theme and master page to be unique to your new site.

- Locate the theme folder (such as \Aspen), which defaults to C:\Program Files\ASI\iMIS\Net\App_Themes.
- Copy, paste, and rename \Aspen to your new site name (\ABC).
- Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages.
- Copy, paste, and rename Forest.master to your new site name (ABC.master).

Go to RiSE > Site Designer > Manage websites:

2. Edit your site to use your new theme files.

- Highlight your site (ABC).
- Edit the Site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save and Publish.

3. Edit your theme files as needed to tailor the design.

Changing theme headers

The first elements to change on your website are the highly visible elements that public visitors see and use in the header: logo, social networking links, welcome banner, and the favicon.

Logo

The header logo is contained in a content record: @\[theme]\ContentAreas\Header Logo. To add your own logo, edit this content record, remove the contents in the HTML iPart, and replace with your own logo.

Note: Alternatively, you can change the logo in the CSS. The logo is set in 99-[theme].css by the selector #masterHeaderImage. Change the background image and the dimensions to match your own logo.

Social networking links

The links to the social networking sites in the top (auxiliary) navigation are also defined in a content record: @\[theme]\ContentAreas\Social Networking Images.

To change the links to navigate to your own social networking pages, edit the content record and change the links on the icons.

In the HTML editor, replace the href on each <a> tag with the appropriate URL. For example:

Favicon

The favicon is the little icon that displays next to the website in your bookmarks and on the browser tab in modern browsers. Changing it to your organizations' icon is simple: create an icon sized either 32x32 or 64x64 pixels and name it Favicon.ico. Then overwrite the original file:

C:\Program Files\ASI\iMIS\Net\Favicon.ico

Update the copyright statement

The copyright statement is contained in a content record within your copied site's ContentAreas folder: Footer Copyright. Edit the Footer Copyright instance of the Content Html iPart on that page to update the copyright.

Changing theme colors

The next step in customizing your theme is to change to colors that support your branding & style. You will make these changes in both CSS and in images.

CSS colors

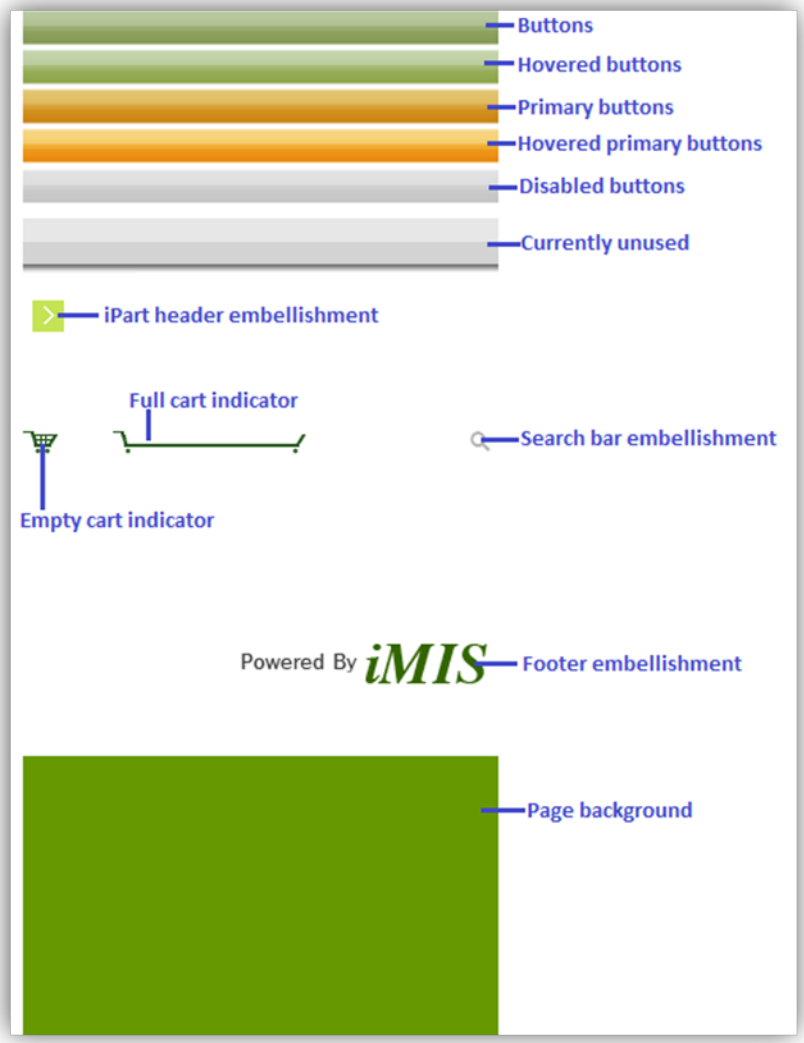
All theme-specific color and styling is located in 99-[theme].css. To find all color references that you might want to change, search the CSS file for these strings:

- color
- border
- background

We also recommend using your browser development tools to help you identify which styles you need to update for your color changes.

Sprite colors

A few of the theme's use sprites to control some of the site colors. A sprite is a single image that combines several commonly used images into one file. CSS then defines which part of the image displays for various purposes. Because your server only has to load a single image instead of several, using sprites reduces load time for your website. To improve performance, the new sample sites use sprites when possible. The image below shows a sprite used in the theme Aspen, and labels where each image is used:



You can either edit the sprite we have provided (which is easier), or create your own.

- When editing the provided sprite, keep all elements in their original pixel coordinates, so that you do not have to edit the related CSS.
- The .png version of the sprite is located in images/[theme]_sprite.png. You can edit this image in your favorite image editor, but we do not recommend editing in MS Paint, as you will lose the background transparency.
- Your theme's \Resource folder also includes a .psd source file of each sprite. You can edit the .psd with Photoshop or GIMP, a free image editor that can edit and save images in .psd and web-safe formats.

- If you edit the .psd, save your new image as a .png, and place it in the images folder of your theme.

  For greater design control, you also have the option of creating your own sprite. If you choose that option, you may also need to update your theme CSS for the new coordinates of the sprite. To help you with this process, we recommend the following resources:

- CSS Sprites: What They Are, Why They're Cool, and How To Use Them
- Sprite Cow calculates the pixel positions of the various images inside your sprite.
- CSS Sprite Generator lets you upload a zip file of images and get back a sprite file with the corresponding CSS.

Changing theme home pages

The Member site uses a pair of home pages: one that appears to guests (unauthenticated view) and another that appears to those who have signed in (authenticated view). You can change one or both of them, or drop one entirely and have one home page appear to all.

Do the following to change the unauthenticated home page:

Go to RiSE > Content Designer > Manage content:

Note: To have your own home page behave like the default one (switch to the authenticated home page when the user signs in), you need to add the code-bearing HTML iPart that does so.

1. Create a new content record for your unauthenticated home page.
2. Copy the AuthScript code to your new home page:

- Edit the unauthenticated home page content record @\iSamples\Member\Home.
- Locate the HTML iPart named AuthScript.
- Select Move To and select your unauthenticated home page.

- Now edit your unauthenticated home page and move the AuthScript iPart to the top of the content record.
- Save and Publish your home page.

3. Make your site's home page link to your new home page.

- Go to Site Designer > Manage sitemaps.
- Select your website.
- Edit the default navigation item (flagged with ★) and select your new home page for Content or URL to Link to.
- Save and Publish your sitemap.

Do the following to change the authenticated page:

Go to RiSE > Content Designer > Manage content:

Note: To have your own authenticated home page appear as soon as the user signs in, you need to edit the code-bearing HTML iPart that calls it.

1. Edit your unauthenticated home page content record.
2. Locate the HTML iPart named AuthScript.
3. Select Configure and switch the editor's view from Design to HTML, to view the code.
4. Edit the path to be the published path of your new authenticated home page:

path = "~/Mbr/Home/[theme]/MemberHome.aspx";

Do the following to use only one home page.

You can drop to a single home page either by:

- Removing the script that opens the authenticated home page:
- Go to Content Designer > Manage content and Edit the unauthenticated home page @\[site]\Home and delete the HTML iPart named AuthScript.
- Substituting your own page entirely:

- Go to Site Designer > Manage sitemaps and set your desired content record to be the default home page of your website.

Changing Telerik skins

Several iParts throughout the product use Rad Controls developed by Telerik. These controls require a few steps to style, and Telerik resources can help you get started:

- Telerik Control Guide – an overview of Telerik controls, including available skins.
- Telerik Visual Style Builder – generates CSS and some images for skinning Telerik controls.

Every [theme].skin file lists all of the Telerik skins that it uses to style controls. If a control does not explicitly define a theme, then it uses the Default Telerik skin.

Rad Window control

This control is the pop-up window that we see in many iParts. Its skin is set by two lines in Aspen.skin:

<asiweb:Window runat="server" Skin="Forest" />

<asiweb:WindowManager runat="server" Skin="Forest" />

Forest is a skin designed by Telerik and is available on most Telerik controls, along with a handful of other Skins. You can preview available Telerik skins for this control.

Tip: Telerik skins are easy to switch out and virtually maintenance-free. However, they are difficult to customize, so avoid this route unless you can use the skins as-is.

Rad Tab Strip

This control is used by the Content Collection Organizer (CCO) iPart, the Contact Address Editor iPart, and most other places where you see a tab strip. This line defines the skin:

<telerik:RadTabStrip runat="server" Skin="Aspen" EnableEmbeddedSkins="false" />

The definition for this look and feel is near the bottom of the 99-[theme].css, under the heading RadTools Styles.

Rad Menu control

This control displays the primary navigation area. There is wrapper for this control called PageNavR, so this line defines the skin:

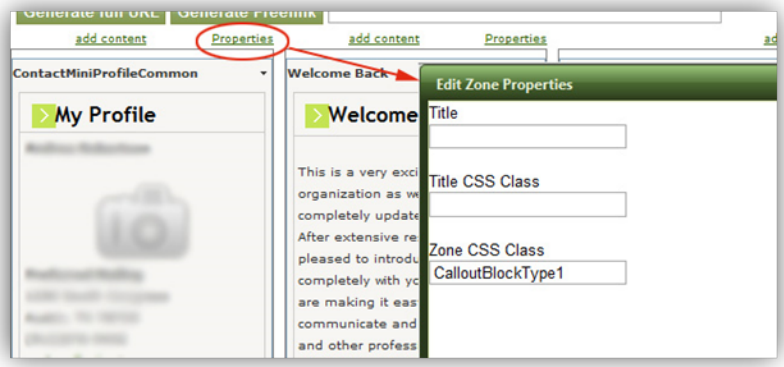
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" … />

The styling for the Rad Menu is located in Menu.[theme].css, and the image sprite is under [theme]\Menu\rmSprite.png. The easiest way to customize this control is to use Telerik's Visual Style Builder. (Tip: This tool works best in Internet Explorer.)

Changing zone properties

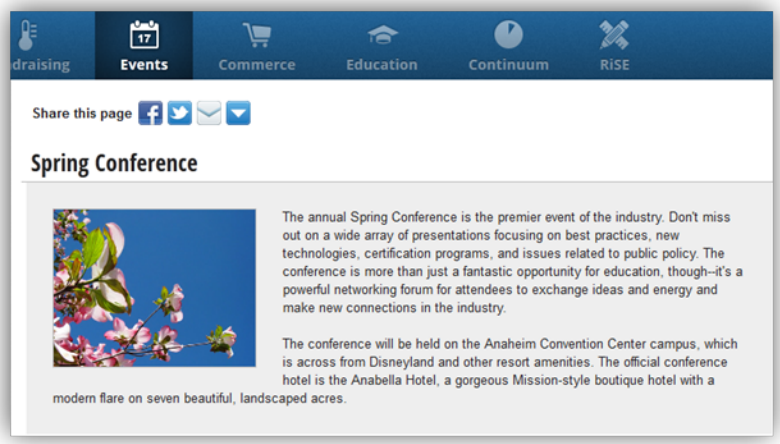
Zone properties make it easy to apply unique styling to specific iParts, for emphasis and contrast.

To apply a style to an iPart's zone property, edit the content record, click Properties, and enter the name of the class in Zone CSS Class:

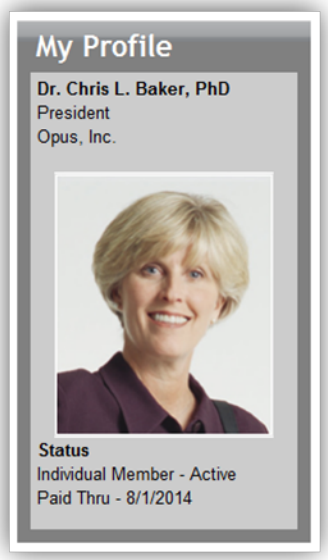


You can add more if needed, but all tree-name themes contain the following three zone style classes:

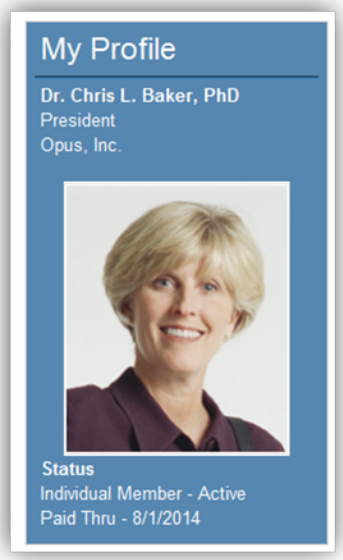
- TitleBarNoBorder – simply removes the bottom border from iPart headers
- CCOGrayBg – applies a gray background to content appearing in CCO tabs



- CalloutBlockType1 – accentuates an iPart whose border is enabled



Aspen:



Birch:

Creating a new theme

Instead of editing a copy of Aspen or Birch, you can also start from scratch when designing your own theme. However, you must include the 00-Reset.css and10-UltraWave.css in your new theme. To do so, begin your new style sheet with these lines:

```
/*##########################################*/
/*     Import UltraWave StyleSheets      */
/*##########################################*/
```

@import url("../UltraWave/00-Reset.css");

@import url("../UltraWave/10-UltraWave.css");

Resources for CSS

- w3schools.com – a great resource for CSS and HTML information and examples.
- CSS3 Generator – a tool to help generate CSS for rounded corners, box shadows, background gradients, and opacity. (Note: CSS3 is not fully supported in all browsers.)

Designing site navigation

Displaying left navigation

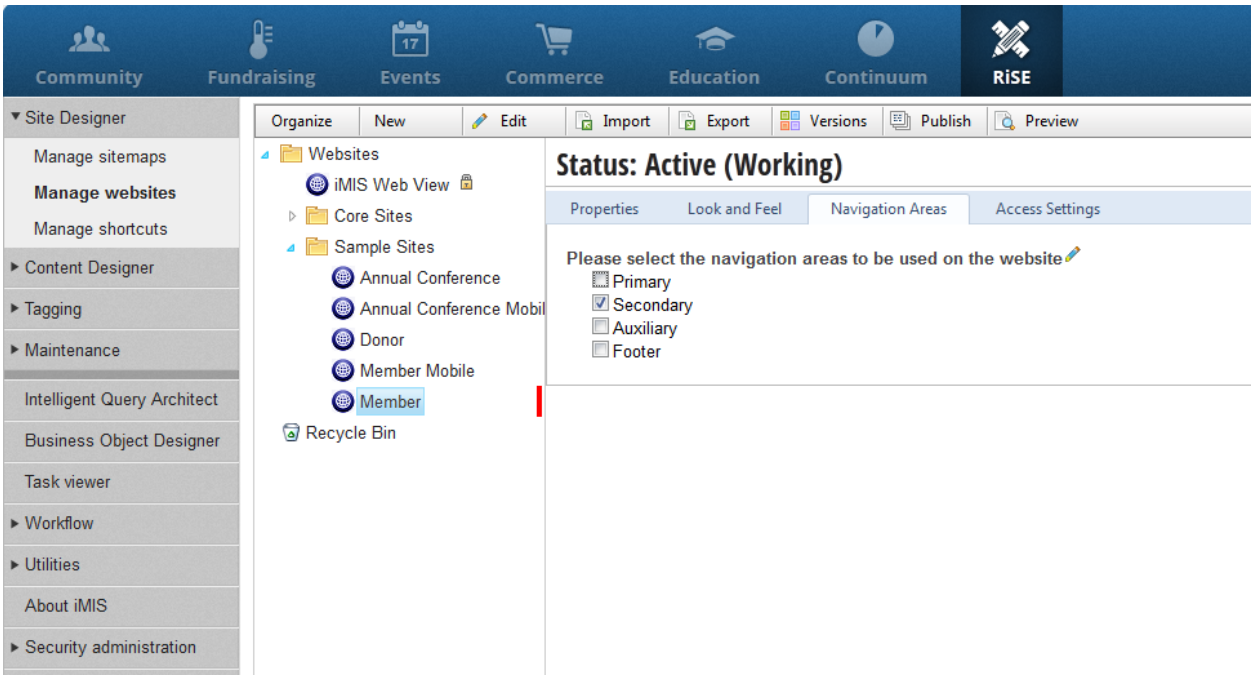
You can display website left navigation in a hierarchical format with a few changes to your theme's master page and skin file.

Do the following to implement left navigation:

Go to RiSE > Site Designer > Manage websites:

1. Define how many levels of navigation to display.

- Select the website.
- Select the Navigation Areas tab and select the Secondary navigation area.
- Save and publish your changes.



2. Edit the website theme's master page.

- Using your preferred text editor, find and open the website theme's master page. Master pages, by default, are located in C:\Program Files\ASI\iMIS\Net\Templates\MasterPages.
- Register the control by adding the following line to the top of the master page, just below the other registered controls:

  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>
- Add the following scripts to the <script language="C#" runat="server"> section:

  protected override SiteMapNode GetStartingNode()

  {

  return Secondary.GetStartingNode();

  }

  protected override SiteMapNode GetCurrentNode()

  {

```
    return Secondary.GetCurrentNode();
}
```

- Find the masterSideBarPanel div. It should look like this:

```
<div id="masterSideBarPanel" class="yui-b">
    <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server">
      </asp:ContentPlaceHolder>
</div>
```

- Update the masterSideBarPanel div so that it contains the following:

```
<div id="masterSideBarPanel" class="yui-b">

     <asp:Panel ID="SubNavPanel" runat="server" >
         <asp:ContentPlaceHolder ID="PageSubNavigationPlaceHolder" runat="server">
         <asp:Panel id="SubNavHead" runat="server" class="SubNavigationHead">
         <asp:Literal ID="SubNavPanelTitle" runat="server" />
         </asp:Panel>
         <asp:Panel id="SubNavBody" runat="server" class="SubNavigationBody">
         <asi:SubNavigation id="Secondary" runat="server" NavigationPaneCode="2"
           StartingNodeOffset="1" StartFromCurrentNode="true"
           StartingNodeOffsetAutoSet="true" SelectDefaultNode="false" />
          </asp:Panel>
          </asp:ContentPlaceHolder>
        <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server" />
    </asp:Panel>
```

```
</div>
```

- Find the masterWrapper div, and add the yui-t2 class to it:

```
<div id="masterWrapper" class="yui-t2">
```

- To improve JavaScript performance for websites using hierarchical sub-navigation, find the following script:

```
<script type="text/javascript">
    // if there is something in the side bar this converts the layout to 2 columns
    if ($('masterSideBarPanel').children.length != 0) {
      $('masterWrapper').setAttribute("class", "yui-t2 HasSubNav");
    }
</script>
```

- Update that script to the following:

```
<script type="text/javascript">
    // if there is something in the side bar this converts the layout to 2 columns
    if ($('masterSideBarPanel').children.length === 0) {
      $('masterWrapper').removeAttribute("class");
    }
</script>
```

3. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.

- Register the control by adding the following line to the top of the skin file, just below the other registered controls:

  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>

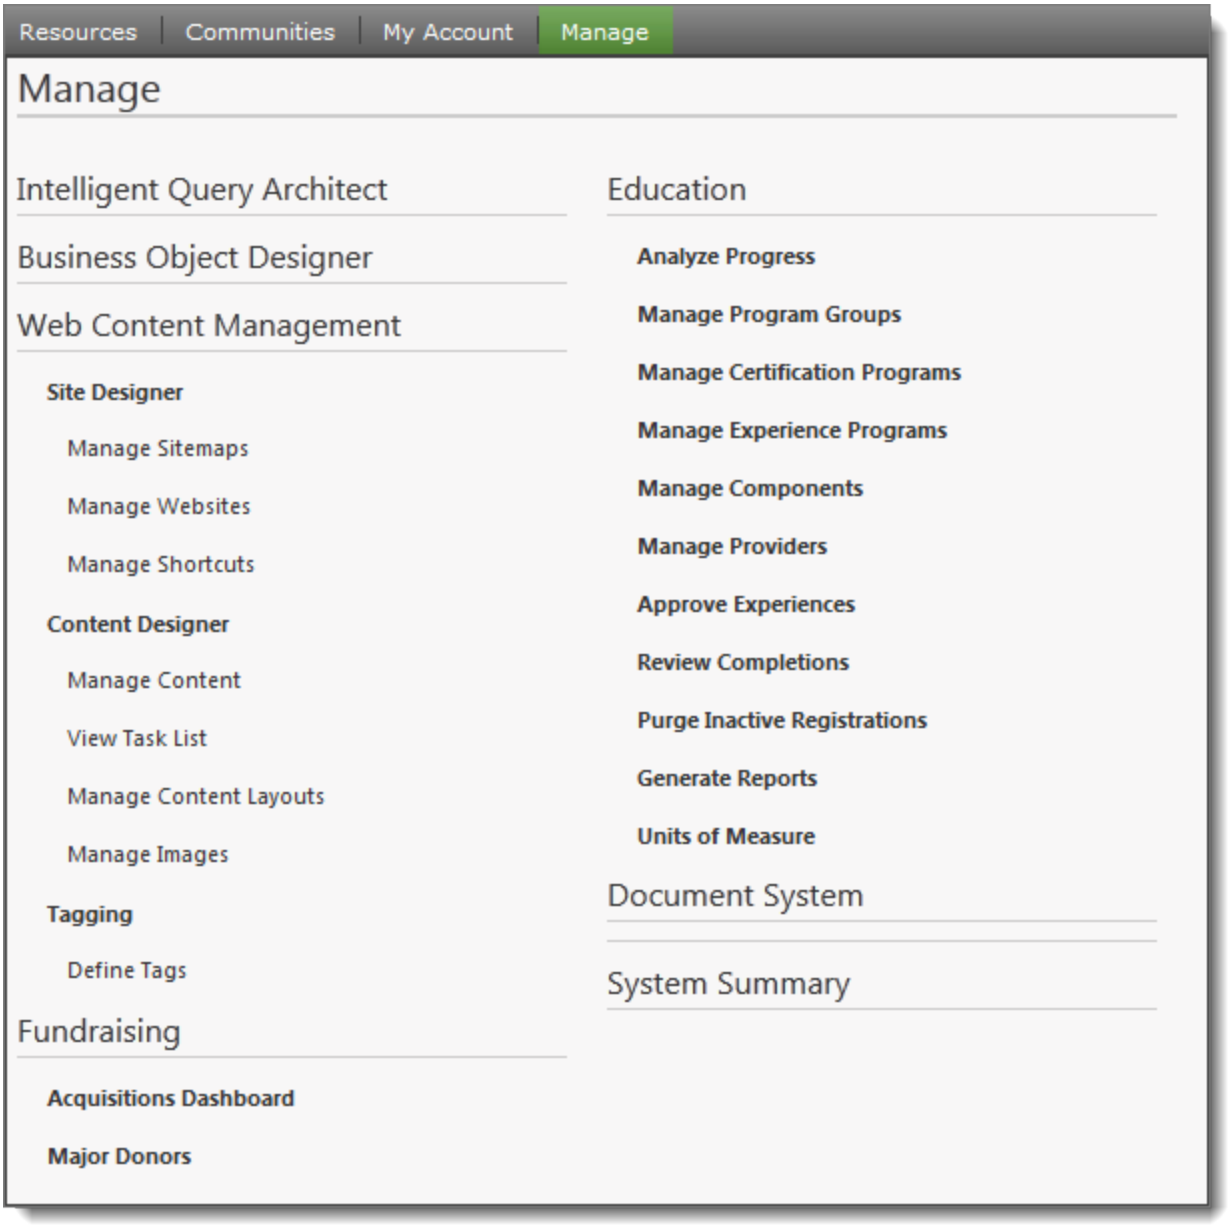
- Just below the section registering controls, add the following line:

  <asi:SubNavigation runat="server" Skin="Aspen" EnableEmbeddedSkins="false" SingleExpandPath="true" ShowLineImages="false" />

- (optional) If you are familiar with skin controls, you can configure how the SubNavigation control behaves using the following properties:
- string NavTreeSkinId – A unique ID for the skin if needed. The default is RadTreeView.
- bool SingleExpandPath – Gets or sets a value indicating if only the current branch of the tree is expanded. The SingleExpandPath property, when set to True, automatically collapses nodes that are not on the path of the currently expanded node. Use the SingleExpandPath property when you need to conserve screen space and make navigating nodes easier.
- public bool ShowLineImages – Gets or sets a value indicating if the tree node line images display or not.
- string Width – Gets or sets width of the control. Specify in pixels (px) or percentage (%) e.g. 500px, 90%.
- bool EnableEmbeddedSkins – Gets or sets a value indicating if the built in skins should be used on the navigation tree.
- int MaxDataBindDepth – Gets or sets the maximum number of levels to bind to the navigation tree.
- bool WrapNodeText – Gets or sets the option to wrap text if it is wider than the trees allowed width.
- bool ExpandAllNodes – Gets or sets the option to expand all of the nodes when the navigation tree renders.

Displaying mega drop-downs

You can display mega drop-downs from your primary navigation with a few changes to your theme's skin file and menu CSS. Mega drop-downs display navigation items within large panels, grouped by level, which reduces scrolling and improves the usability of site navigation.



To implement mega drop-downs

1. Ensure that all navigation items in the sitemap have a value for Content or URL to Link to. Otherwise, the navigation hierarchy may not render properly.
2. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableMegaDropDownMenu="true"

- (optional) If you are familiar with skin controls, you can configure how the mega drop-down behaves by altering the following properties:
- EnableMegaDropDownMenu – Enables the mega drop down.
- MegaDropDownMenuShowStartingNode – Displays the parent navigation node as the first item in the mega drop down. Enter true or false.
- MegaDropDownMenuLevelSettingLevel – Defines the navigation level at which the number of columns set for MegaDropDownMenuRepeatColumns starts to take effect. For example, if you set MegaDropDownMenuRepeatColumns="3" and set MegaDropDownMenuLevelSettingLevel="2", then the mega dropdown displays three columns for the second and higher navigation levels, and the first level only has one column.
- MegaDropDownMenuRepeatColumns – Defines the number of columns used to display the navigation.
- MegaDropDownTooltipLocation – This option only applies to tooltips defined for top level navigation items in the primary navigation. When defined, it specifies the location of the tooltip text if a tooltip is defined for that navigation item. Enter either Menu (displays the tooltip directly beneath the top level navigation item) or Append (displays to the right of the navigation text within the dropdown). If you do not define this property, navigation tooltips are not displayed in the dropdown.

3. Edit the theme's menu CSS to tailor the display of the mega drop-down for the theme's look and feel.

- Using your preferred text editor, find and open the website theme's menu CSS file (for example Menu.Aspen.css). Menu CSS files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the MegaDropDownMenu Styling section and edit the styles as needed:

```
/* ############################ */
/*  MegaDropDownMenu Styling  */
/* ############################ */

.RadMenu .rmGroup .MegaDropDownMenuOuter .rmText {
   padding: 0;
   margin: 0;
   width: 600px !important;
}

div.MegaDropDownMenu
{
   background-color: #f8f7f7;
   padding-left: 5px !important;
   padding-right: 5px !important;
}

.MegaDropDownMenuToolTip
```

```
{
   padding: 5px;
}
```

Using image sprites for navigation items

A sprite is a collection of images combined into a single image. Using CSS, you can shift the image around to display only parts of it. The advantage of using sprites is that they reduce the number of server requests to load images (only one is loaded), leading to improved performance.

One way to use sprites in iMIS is for rollover effects on navigation items.

To implement image sprites for navigation items

1. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableImageSprites="true"

  When enabled, a new class named rmLeftImage is added to root level links in PageNavR.

2. Create the sprite file.

- Using an image editor like Adobe Photoshop, or a free alternative like GIMP, create your sprite by adding the images you want to a single image, like the following:

- Save the sprite to the website theme's image folder.

3. Edit the theme's 99-[theme].css file to define the classes to control the sprite.

- Use a tool like SpriteCow to determine the position values of the images in the sprite.
- Using your preferred text editor, find and open the website theme's 99-[theme].css file, located by default in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Add styles for the sprite. For example:

```
.RadMenu a.rmRootLink.CartLink .rmLeftImage
{
   Background-image: url(images/cartsprite.png);
   Background-repeat: no-repeat;
   Background-position: -1px -1px;
   Width: 48px;
   Height: 36px;
}
.RadMenu a.rmRootLink.CartLink:hover .rmLeftImage, .RadMenu a.rmRootLink.CartLink.rmExapnded .rmLeftImage, .RadMenu a.rmRootLink.CartLink.rmFocused .rmLeftImage
{
   Background-position: -1px -39px;
}
```

The first group of selectors sets the resting position for the image sprite. The second group of selectors defines the hover state and shifts the image when the link is rolled over.

Go to RiSE > Site Designer > Mange websites:

4. Apply the sprite class to the appropriate navigation items.

- Edit the navigation item for which you want to apply the sprite hover effect (for example, the Shop).
- For the CSS Class property, enter the sprite class (for example, CartLink).
- Save and Publish the navigation items.

Styling your website's primary navigation

From http://www.imiscommunity.com/styling_your_website_s_primary_navigation

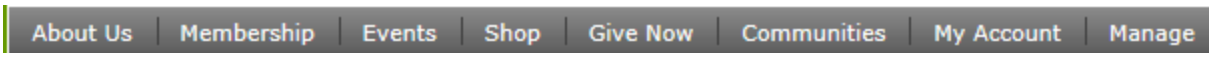
If you customize your website with a new look and feel, you will want to restyle the primary navigation to match the rest of the site. To customize the look of the navigation, you must be using iMIS 15.2 or later along with an UltraWave-derivative theme such as Aspen, Austin, or Birch. In iMIS, the primary navigation bar is built with Telerik RadControls; providing powerful tools for creating dynamic menu systems.

You can change your navigation menu's style by:

- Choosing an out-of-the-box skin provided by Telerik
- Customizing the font or color of an existing Telerik skin using Telerik's Visual Style Builder
- Styling your menu with CSS instead of using the Telerik tools

What is PageNavR?

PageNavR is a control that iMIS uses to display a website's primary navigation. The navigation bar automatically populates with each top-level navigation item, and each sub-item displays in a drop-down list that can expand to multiple levels. PageNavR wraps around a Telerik RadMenu control, so all PageNavR styles are controlled by Telerik's base styles.



What is a .skin file?

Skin files allow you to override default control behaviors in a theme-dependent way. If you set a property for a control in one theme's skin file, it will not affect how the control displays in other theme's skin files.

Take a look at this section of the Aspen.skin file in App_Themes/Aspen:

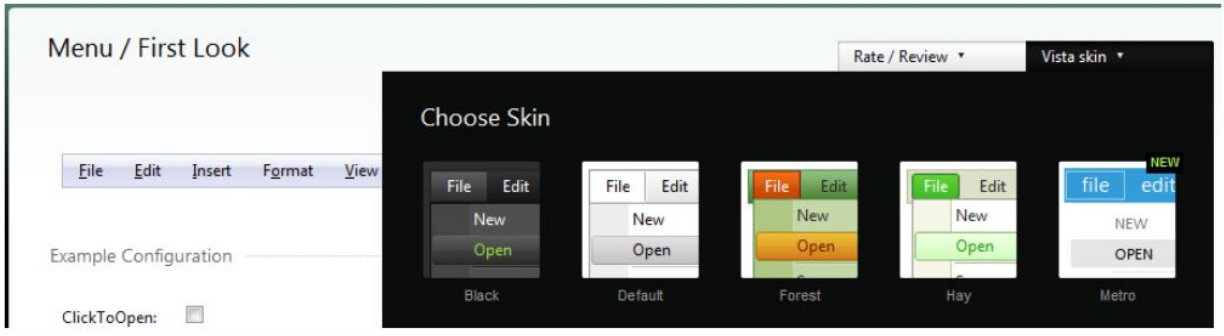
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" EnableRootItemScroll="false" Flow="Horizontal" DefaultGroupSettings_Flow-w="Vertical" DefaultGroupSettings_OffsetX="0" Width="100%"/>

These are just a few of the PageNavR properties available for the control in the skin file. The two properties which affect the navigation bar's style are "Skin" and "EnableEmbeddedSkins."

The "EnableEmbeddedSkins" property determines whether Telerik embedded skins should be loaded as the default. If you are creating your own custom skin, you MUST set this property to "false."

To style the navigation using a skin provided by Telerik

1. Choose an existing Telerik skin to style the navigation menu at [Telerik RadMenu Demo: First Look](#).



2. Change the "Skin" property of the PageNavR control in the theme's skin file to the name of the skin you selected.

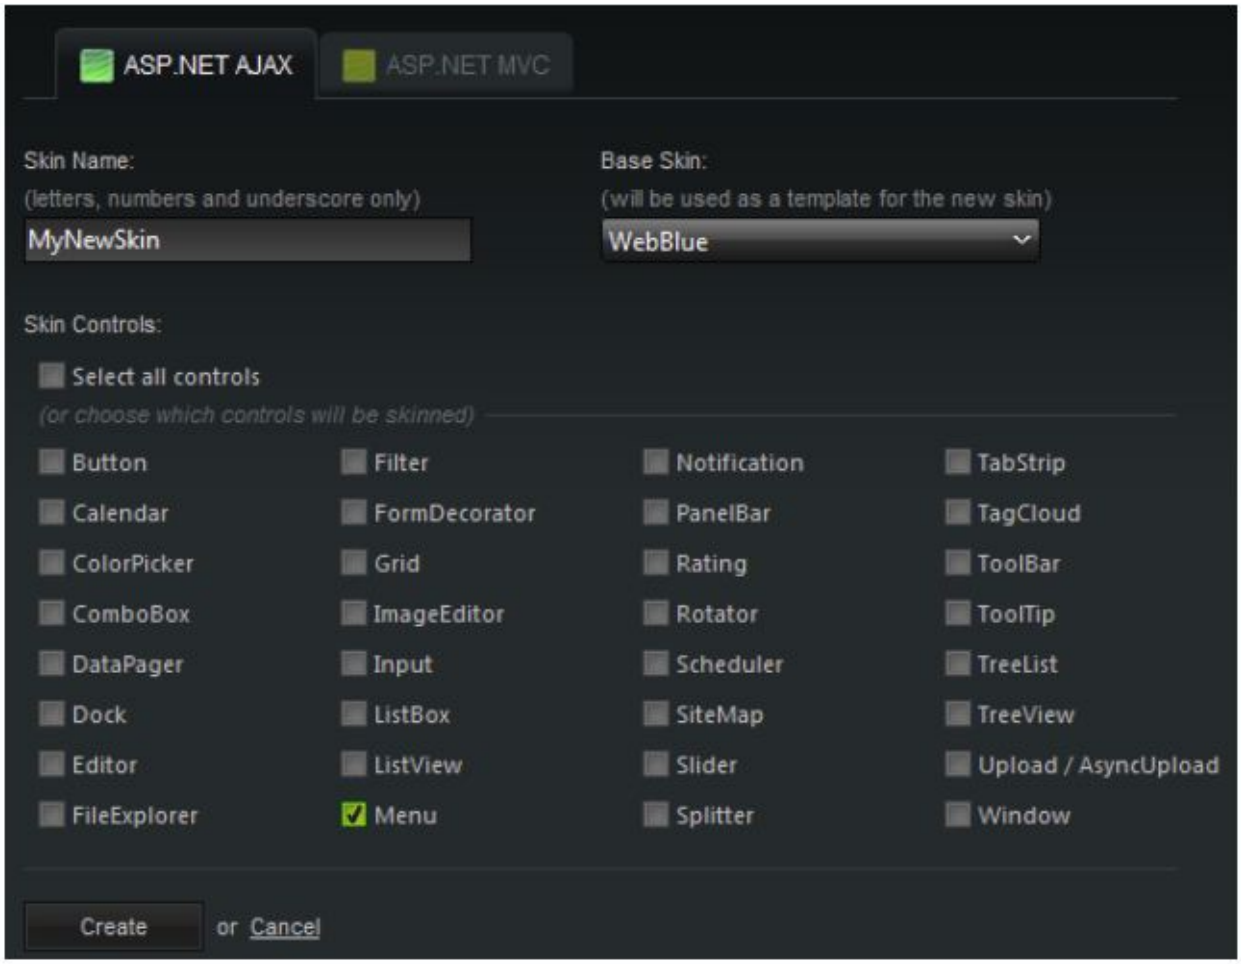
3. Change the “ EnableEmbeddedSkins=" property of the PageNavR control to “true." The navigation bar’s styling will change to that of the Telerik skin you selected.

For more information, see MSDN's guide to ASP.NET Themes and Skins.

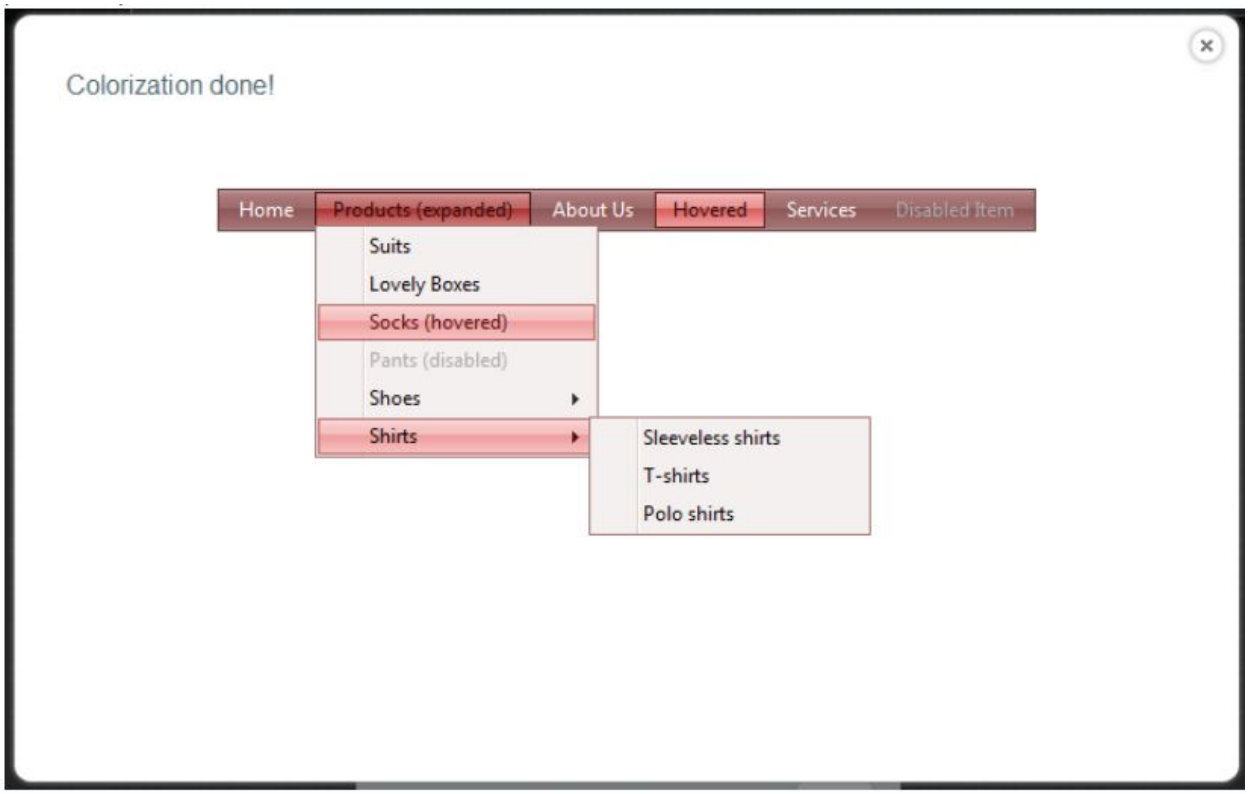
To style the navigation by customizing an existing Telerik skin using Visual Style Builder

If you want to customize the colors or font for a particular Telerik skin, you can use Telerik's Visual Style Builder:

1. Open the Telerik Visual Style Builder and select New Skin. (Note: The Visual Style Builder is in beta. For best results, use Internet Explorer as it is not fully functional in any other browser.)
2. Name your new skin, select your base skin, and check the Menu checkbox.
3. Click Create. Visual Style Builder will open on the Colorize tab.



4. Select your preferred color for the menu. You can fine-tune the hue and saturation of the color on the Shift colors tab in the color window that is open.
5. Click Save to see a preview of your new skin. If you are satisfied with the outcome, you can now download the generated images and CSS and skip to step 9.

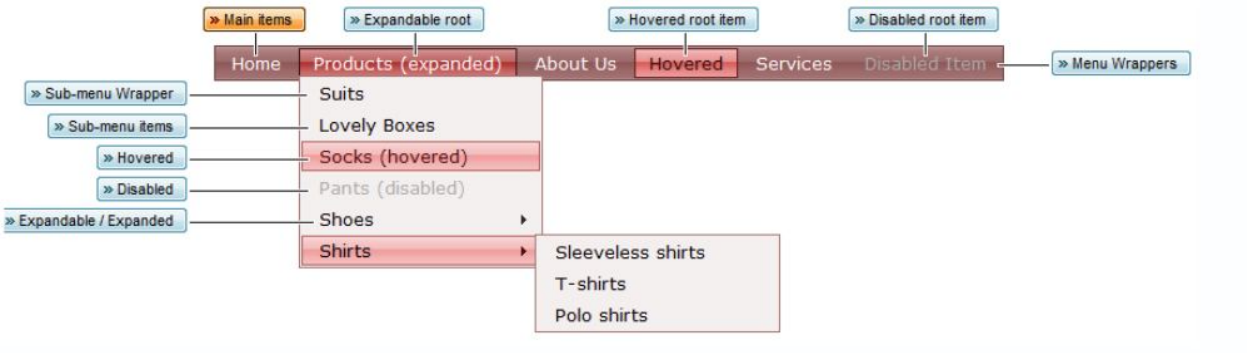


6. For additional customizing, click the Fine-tune tab of the Style Builder itself in the top left.

   Tip: The fine-tune functionality can be unpredictable. Save frequently so that if you don't like the way a change turns out, you can click "load last save" to undo it.

7. Begin with any universal changes you would like to make, such as changing the font on the navigation nodes. Click the Main items bubble to make changes to the font on the main navigation node.

   Each time you make a change the example dynamically responds. Each of the blue bubbles opens a different set of configuration options.



8. When you are finished, click Save and then Download to get the necessary code and images.
9. Copy the unzipped files to your theme's folder. Open the .skin file and set “EnableEmbed-dedSkins” to “false” and “Skin” to the name of your new skin.

   For more information and a video tutorial, see Telerik's Visual Style Builder Overview.

   To style the navigation using CSS

   If you do not like the Telerik provided skins, you can create, with the aid of your browser’s developer tool, your own image-free styling using CSS. If you choose to work by hand, you may find it helpful to start with a working skin, and adjusting to suit your needs.

1. Rename all of the base-level selectors in your working skin file to RadMenu_[Your theme name] .
2. Use your browser’s developer tools to help you figure out how to modify the CSS to get the desired result.
3. In your theme's skin file set “EnableEmbeddedSkins” to "false" and “Skin” to the name of your skin.

Controlling sitemap behavior

This section explains sitemap behavior, including:

content records, iParts, and shortcuts used for searching.

- How to modify the [OverrideLinkText] and [CartItemCount] dynamic navigation items
- Profile pages linked from the Member site's Directory, which uses an ASPX web page to redirect users to a navigation item based on a set of criteria

How search works with navigation

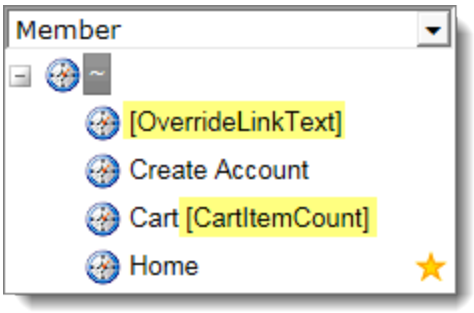
Three elements make search work in the sample sites:

- The search content records: The sample sites use search content records that are dynamically populated with an initial search result set based on a URL parameter value. These content records contain the Common Search|topic=Search (Common Search) iPart and are located within @/iCore folders.
- The pages that display the initial search results: The Shop and Events navigation items are linked to the Search content records. These navigation items have a unique value for the InitialArea URL parameter, which defines the result set generated when the pages are first displayed (i.e. products or events).
- The page displayed when a user clicks a result: The page displayed when a user clicks a search result link are based on the shortcuts defined from Site Designer > Manage shortcuts. The following shortcuts display search result links in the sample sites:

- ItemDetail –The ItemDetail shortcut displays the Item_Detail content record, which uses the Product Display iPart to display the item selected.
- GiftDetail – The GiftDetail shortcut displays the Gift_Detail content record, which uses the Donation Creator iPart to display donation pages selected from search results.
- EventDetail – The EventDetail shortcut displays the Event_Display content record, which uses the Event Display and Event Program Display iParts to display event pages selected from search results.

Modifying dynamic nav items

The default sitemaps include variables that dynamically generate the text displayed for two navigation items. [OverrideLinkText] displays the Full Name of the logged in user by default. [CartItemCount] displays the number of items a user has added to the Cart.



If you want to add new navigation items that use these variables, or if you want to modify the existing ones, keep the following guidelines in mind:

- Navigation areas and master pages – The variables only work in the Auxiliary and Footer navigation areas of websites using one of the Sample Site master pages (or copies of these files) or 1700.master. To specify a navigation area, edit a navigation item and in the Options section, select Auxiliary, Footer, or both from the Show in the following navigation areas options.
- [OverrideLinkText] – You can use this variable on its own or with other text. For example, if you only enter the variable, then only the logged in user's name is displayeds as a link. However, if you enter [OverrideLinkText]'s Profile, and Bob Smith logs in, then Bob Smith's Profile is displayed as a link.

- [CartItemCount] – You can use this variable on its own or with other text, but we recommend that you only use it with other text. Otherwise, when no items are in the cart, nothing is displayed for this navigation item.

  To change the data displayed for [OverrideLinkText]

  The variable [OverrideLinkText] can display any property of the NetContact business object. You can change the property displayed by editing the ContactDetail property in your copy of one of the Sample Site themes, or in 1700.master.

  For example, instead of displaying the Full Name of the logged in user, you may want to display only their First Name. To make this change, edit the ContactDetail property to replace all instances of FullName with FirstName. The result should look like this:

```
public string ContactDetail
  {
    get
    {
      if (ViewState["ContactDetail"] != null)
        return (string)ViewState["ContactDetail"];
      _contact = Asi.Business.Contact.ContactController.Contact(Asi.AppContext.CurrentIdentity.UserKey,
                                                  Asi.AppContext.CurrentContext.
                                                    StatefulBusinessContainer);
      return _contact.FirstName != "GUEST" ? _contact.FirstName : String.Empty;
    }
    set { ViewState["ContactDetail"] = value; }
  }
```

Account and profile pages in the Directory

When users select a result after searching the Member site's Directory, or when they navigate to the account pages, the content record that displays depends on the user's permissions. The rules that determine where a user is redirected are defined in the Party.aspx file, located by default in C:\Program Files\ASI\iMIS\Net.

You can modify the information displayed on the account and profile pages by editing the content records described below from Content Designer > Manage content.

Note: In the Member Mobile site, only simple profile pages are shown for member and organization accounts to restrict the amount of information displayed on small screens.

Page description	Users directed to the page	Content record: @/iCore/Contacts/*	Shortcut
Detailed page for staff to manage member accounts	System Administrators Staff with an authorization level of 1 or higher in Customers	ContactLayouts/Account_Page_Staff	FullAccount
Detailed page for member to manage own account	Contacts selecting their own record	ContactLayouts/AccountPage	MyAccount
Detailed Organization account page	System Administrators Staff Organizations selecting their own record	OrganizationLayouts/Account_Page	OrganizationAccount

Simple (non-editable) Contact profile page	Users who do not have permission to edit the account	ContactLayouts/Profile	Profile
Simple (non-editable) Organization profile page	Users who do not have permission to edit the account	OrganizationLayouts/Organization_Profile	Organization

Tracking your site with Google Analytics

Google Analytics tracks and collects important data on how visitors interact with a website. Google Analytics provides reports on the data collected allowing you to assess whether your website is meeting its goals. This tracking is accomplished by adding a Google Analytics script to the website. A new parameter was added to the Manage websites window if you want to use Google Analytics to track data on an iMIS website.

Do the following to track your site with Google analytics:

1. Create a Google Analytics account: google.com/analytics
   - Configure the account.
   - Google Analytics will provide the code for you to paste in the Manage websites window.
2. Add the script to your iMIS website.

   Go to RiSE > Site Designer > Manage websites:
   - Select the website to which you want to add a Google Analytics script.
   - (Properties tab) Expand the Advanced section and paste the entire script, including the tags, in the Google Analytics script field.
   - Click Save.
   - Publish the website.
3. Visit your Google Analytics account to review the data collected.

Synchronizing content on multiple servers

If you have more than one server hosting the same website, take steps to synchronize all servers that host the website. The following are issues to address:

- Theme files: If you modify the website's CSS or master page, or if you apply a different theme, copy the changed files to all other servers.
- Uploaded images: Copy your folder for uploaded images to all other servers, either by direct FTP or by file copy.

  Tip: This is not necessary for ContentFile iPart attached files, which are automatically copied to remote servers when published.
- Hard-coded image paths: If you use different virtual directories on any of your servers, you need to put a variable in any hard-coded image paths to make them publish correctly on all servers. When including images in a Content Html iPart, modify the default Image URL and replace the server name and virtual directory with [Root]. For example, if the Image URL is .../iMIS/images/mypic.jpg, change it to [Root]/images/mypic.jpg.

  Note: When you edit the Content Html iPart, the image appears as a missing-image red X, but it displays correctly when published.
- Navigation area properties: If you modify navigation area properties (using the Surf-to-Edit link in the Navigation Areas section of the Website Edit screen) you might need to reset the server's worker process to get it to pick up the changes.
- Publishing servers: When publishing content, iMIS will not consider the content successfully published until all relevant publishing servers have finished publishing it without error. That means that if one of the publishing services corresponding to any of the publishing servers listed in RiSE > Maintenance > Publishing servers is stopped or otherwise inactive, content records will remain in the PublishPending state until the publishing service is started or the entry in Publishing servers is removed and the content is republished.

Improving performance for remote servers

The Surf-to-Edit feature of your iMIS content management website might be sluggish on some of your external web servers due to latency in communicating with the iMIS database. For example, it is common for your public-facing web servers to be hosted at a different data center than your iMIS database. You can improve performance by setting up a mirror of the website on your iMIS application server, then directing your frequent Surf-to-Edit users to the appserver's URL for the website instead of using the public URL.

Note: If your Surf-to-Edit users are working at computers that are outside your organization's firewall, they will need VPN access (or access through a terminal server, for example) to connect to the appserver-hosted version of the website.

Changes to the website's content records and navigation items that are made on any server that hosts the website are automatically picked up by every other server when you publish the changes. However, images that are uploaded during a Surf-to-Edit session must be manually copied to all other servers. Additionally, changes that your web admins make to the site's CSS, master page, and other aspects of the site's template on one server must also be manually copied to all other servers.

Improving Surf-to-Edit performance

The following procedure assumes that you already have an external iMIS content management website on which your Surf-to-Edit users are experiencing slow performance. You will be changing the website's definition to also host the website on your application server, then advising your Surf-to-Edit users to use the new appserver-hosted website for their Surf-to-Edit sessions:

4. Modify the website's definition to specify that it be hosted by your iMIS application server as well:

   Go to RiSE > Site Designer > Manage websites:

1. Select the website you want to modify.
2. Click Edit.

3. In the URL(s) pointing to the IIS website root field, enter a comma-delimited list of URLs that point to the root of the iMIS application on your iMIS appserver and to the root of the iMIS content management application that you installed on each external web server. For example, if you already had two external web servers defined for this website, the list should look similar to the following when you have added the URL that points to your iMIS appserver: http://www.my-
   pub-
   lic-
   domain1.or-
   g/wcm/,http://www.mypublicdomain2.org/wcm/,http://www.myiMISappserver.com/iMIS/
4. If using SSL, add the secure addresses to the Secure URL(s) pointing to the IIS website root field in the same order as above.

   Important: Restart IIS whenever you change the Secure URL(s) pointing to the IIS website root setting. Note that localhost is not a valid Secure URL.
5. Click Save to save your changes.
6. Click Cancel.
7. From the toolbar, click Publish.
8. Select Publish children as well? to publish all of the website's navigation items to the new instance of this website on the iMIS application server.
9. Click OK. Note that the website's content records will not be visible on this new instance until a later step. It may take up to 15 minutes for the public and internal sites to reflect the updated navigation.
10. Click Close.
5. Modify the definition of all content folders used by this website to also publish their content records to the new instance of this website on the iMIS application server. This will usually be only the website's root content folder (the one with the same name as the website itself), but your organization might also have some additional content folders that are

used for content shared among several different websites. For each of these content folders, do the following:

1. Go to RiSE > Content Designer > Manage content.
2. Select the content folder you want to configure.
3. Click Edit.
4. From the Publish on Servers dropdown list:

- If the current value is Inherit, do not change the value.
- If the value is Custom, then leave all currently selected checkboxes and also select the checkbox for the publishing server code used by your iMIS application server.

5. Click Save to save your changes.
6. Click Cancel.
7. From the toolbar, select Publish.
8. Select Publish All Items to include all of the folder's content records.
9. Click OK.
10. Click Close. Repeat the steps for each content folder used by the website.
6. Make sure the website's template files exist on the public iMIS content management server, the appserver, and the internal iMIS content management server, if applicable. If the files are missing from any of the servers, manually copy the files to the corresponding locations.
7. Visit your public iMIS content management website and the appserver's website to verify that your changes are successful.
8. Advise your frequent Surf-to-Edit users to visit the URL for the iMIS appserver-hosted instance of the website and avoid using the public-facing URLs.

Complying with the EU's Electronic Privacy Directive

To comply with the EU Directive on Privacy and Electronic Communications, iMIS has added support for your organization to display a pop-up notification informing visitors that cookies are used on your site. This popup also includes a link to a longer sample privacy policy we have provided. You can find more information about this law on the ICO web-site.

Setting up cookie notifications requires that you edit your master page, review (and modify as needed) the privacy policy provided, and add a JavaScript file to iMIS.

To display cookie notification popups

1. Edit the master page of your website (by default located in C:\Program Files\ASI\iMIS\Net\Templates\MasterPages) to add the following items:

- Just under the , add the following divs:

Note: You can edit this content to change the look and feel of the popup to match the design of your site.

```
<div id="EUCookieMessage" style="display: none;">
        <div id="EUCookiewarningBack" style='z-index:999; position:absolute; width:100%;height:100%;background: rgb(0, 0, 0) transparent;background: rgba(0, 0, 0, 0.6);filter:progid:DXImageTransform.Microsoft.gradient(startColorstr=#99000000, endColorstr=#99000000);-ms-filter: \"progid:DXImageTransform.Microsoft.gradient (startColorstr=#99000000, endColorstr=#99000000)\"'>
        <div id="EUCookiewarning" style-='margin:19%;padding:10px;width:62%;height:20%;background:white;color:black'>
        <span id="EUCookiewarningtext"></span>
        <a href="#" class="close-notify">Continue</a>
        </div>
```

```
</div>

</div>
```

- At the bottom of the master page, just before the line <!-- Facebook API is loaded into here -->, add the following JavaScript reference:

```
<script type="text/javascript" src="AsiCommon/Scripts/EUCookieWarning.js"></script>
```

2. Review the sample privacy policy provided as a content record in iSamples/Member/Privacy_Policy, and update as needed for your organization.
3. Create a JavaScript file named EUCookieWarning.js containing the code below, and add it to the Scripts folder (by default located in C:\Program Files\ASI\iMIS\Net\AsiCommon\Scripts).

   Note: The displayNotification function in this file contains the content of the popup notification displayed to users the first time they visit a page in your website. Be sure to update the privacy policy link in this message to point to the content record you want to display for this purpose. You can also edit the rest of the content for the needs of your organization.

```
function getCookie(c_name)

{

var i,x,y,ARRcookies=document.cookie.split(";");

for (i=0;i<ARRcookies.length;i++)

 {

 x=ARRcookies[i].substr(0,ARRcookies[i].indexOf("="));

 y=ARRcookies[i].substr(ARRcookies[i].indexOf("=")+1);

 x=x.replace(/^\s+|\s+$/g,"");
```

```
  if (x==c_name)
    {
    return unescape(y);
    }
  }
}

function displayNotification()
{
if (typeof jQuery('#EUCookieMessage' != 'undefined'))

```

Website doncepts

The terms described in this section explain the basic concepts of iMIS content management.

Concept: master pages and themes

The look and feel of an iMIS content management website comprises the general page layout, colors, graphics, and fonts used for all rendered pages in the website. This look and feel is defined by the design's master page and theme. Master pages and themes are basic elements of ASP.NET websites, and detailed information about developing and customizing master pages and themes can be found in Microsoft developer resources for ASP.NET development such as the Microsoft Developer Network.

- If you want to customize one of the out-of-the-box themes, we recommend that you start with a copy, so that your changes are preserved when you upgrade. See Copying a website theme for more information.

- If you prefer to use your own hand-built master pages and themes, you must first place them in the appropriate MasterPages and App_Themes folders beneath the IIS website root that you plan to associate with this iMIS content management website. This ensures that the master pages and themes are available for selection when defining the properties of the website. You must also ensure that the master pages meet all requirements for compatibility with iMIS content management.

  The master page is an ASP.NET file that specifies the general page layout of all pages in the website. Do not confuse this with the content layout used for the main content area of each page. The master page defines everything that appears on a rendered page, and where they appear, except for two things:

- The rendered content visible in the Main Content Area of each page is controlled by the navigation item for that page. The master page defines only where this content area appears on the website pages, and the content area's exact dimensions.
- The navigation items in the website's sitemap define the actual navigation link text and breadcrumb text shown in the navigation areas. The master page defines only the location, appearance, and behavior of the available navigation areas for the website. Which of the available navigation areas are actually used for the website is defined in the properties of the website itself, and each navigation item specifies the exact navigation areas in which it is displayed.

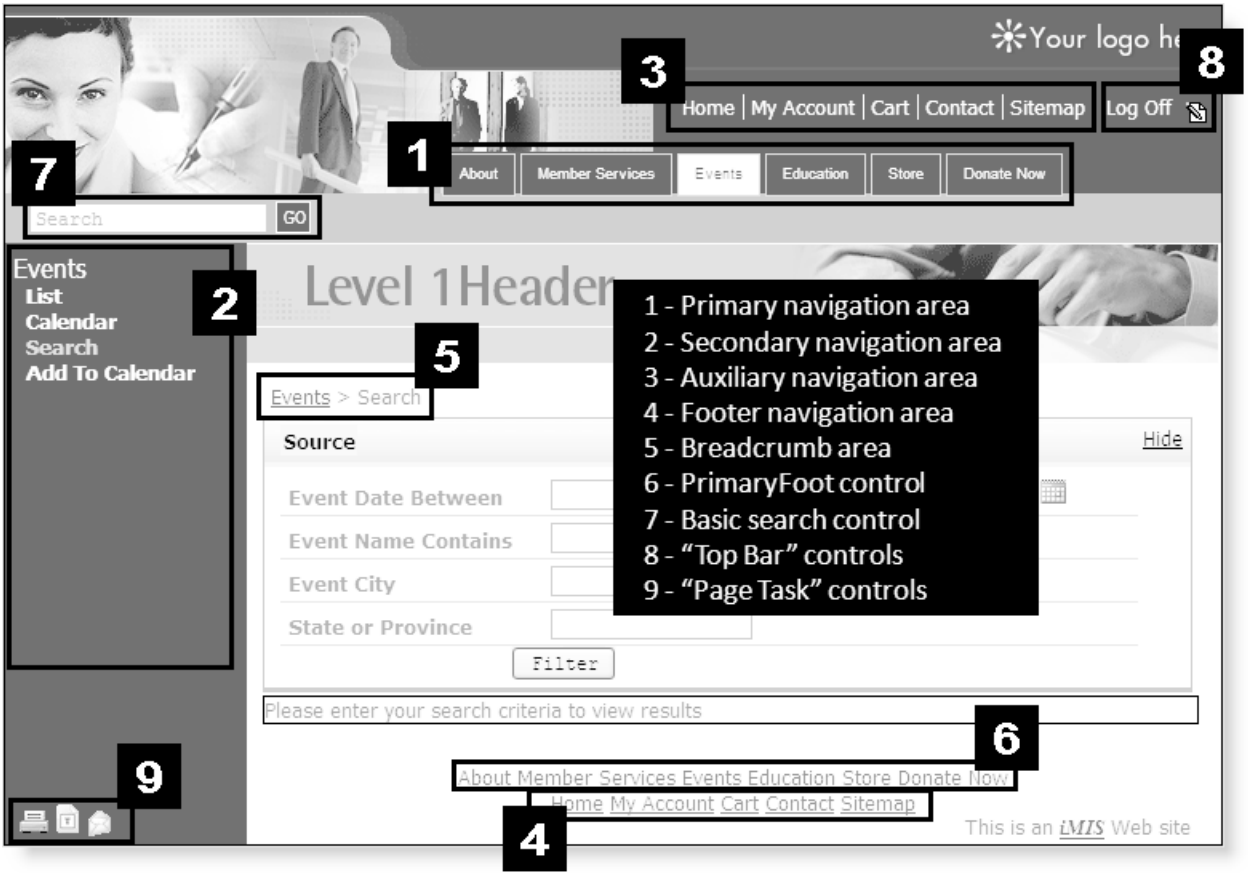
  The theme is a collection of files that specify exactly which colors, graphics, and fonts are used in all rendered website pages, giving them a consistent appearance. The theme comprises all the cascading style sheets used by the master page and available for use in a content layout's iPart zones and iParts, as well as all the graphics used by the master page, as opposed to graphics used in content records. Some themes might also include ASP.NET skin files, which define property settings for ASP.NET Web server controls.

Concept: navigation areas and breadcrumb areas

Navigation areas are special ASI-developed controls used in master pages that create automated lists of navigation links. All ASI-developed master pages are designed to support the four default navigation areas and the breadcrumb area shown in the following

diagram, but you can define up to 30 navigation areas in the system and add the corresponding elements to support those navigation areas to any master page.

The breadcrumb area appears automatically on every site, but you must specify exactly which navigation areas to enable globally for use by the navigation items in the website's sitemap. The four default navigation areas provided with iMIS content management are shown in the following diagram:



When a navigation area is globally enabled in the definition for an iMIS content management website, a checkbox representing that navigation area becomes available for selection when you are defining navigation items in the sitemap for the website. Whether a particular navigation item actually appears in one of the enabled navigation areas of the website is determined by the specific navigation area checkboxes you select for that navigation item when you are defining it.

All master pages fully support the breadcrumb area and all four of the default navigation areas. However, if you modify the definition of any of the default navigation areas in iMIS content management, you might need to revise the master pages to support the changes that you have made.

To integrate your own hand-built master pages with iMIS content management, if you plan to use the breadcrumb area and navigation areas available to iMIS content management websites, you must ensure that you add the appropriate elements to your master page to support them. Similarly, if you define additional navigation areas in iMIS content management, you must modify your master pages to support these additional navigation areas.

Note: The controls that display the Logon/Logoff link and the icon that toggles Surf-to-Edit mode, both of which appear by default at the right of the Auxiliary navigation area, are not a part of the Auxiliary navigation area, so they are unaffected if you remove or move the location of this navigation area.

Concept: publishing iMIS content

When you create or change an existing iMIS content management website, navigation item, content folder, content record, or any other iMIS content management definition object in the Document System and click Save, nothing happens except that iMIS stores a Working version of that object in the iMIS database. It is only when you click Publish that iMIS actually implements the new version of the definition object, replacing the previous Published version of the object with this new Working version and then marking it with a status of Published to indicate that it is now the current active version.

When you publish the various types of iMIS content management definition objects, different things happen depending on what type of object is published.

Note: The following descriptions generally apply to the publishing option Publish Working Items Only. If you select either of the other publishing options, then objects in any state are published.

- Websites – No downstream processes happen other than iMIS content management creates a corresponding sitemap if it is an entirely new website, so that you have a structure

into which you can add navigation items. If you have developed your own custom master pages and themes, the people in your organization who perform website administration should have already placed the necessary files on the servers that will host the website.

- Navigation items – When a browser first requests a website URL from the iMIS application server or an external web server that has been prepared to host iMIS content management websites, the iMIS content management code on that server examines the Published sitemap object in the iMIS database and then builds a corresponding in-memory representation of the sitemap's navigation structure. A timer process then rechecks the iMIS database every five minutes by default to determine whether a newer version of the sitemap object has been published, and, if so, the iMIS content management code on that server rebuilds its in-memory sitemap structure for that website.

  Note: You can change this default five-minute polling interval if desired, but be aware that each polling process consumes a small amount of system resources so there is a performance tradeoff in specifying a more frequent polling interval. To change the polling interval, edit the value of the Sitemap.CachePeriod key (expressed in minutes) in the <SystemParams> declaration in the web.config file for the iMIS application (IIS application \iMIS).

- Content folders – No downstream processes happen other than iMIS checks the status of all descendant content records and sub folders and if iMIS finds any that are currently in a Working state, iMIS automatically publishes them as well. This enables you to spend several days working on a major change to your website content that encompasses many content records, and then publish all those changes in one action by publishing a content folder high enough in the folder hierarchy to cover all the content records that are in a Working state.

  Changes made to the Access Settings of a content folder that are applied to all descendants are saved to the Published descendant content records without the need to republish each record. Security checks to determine whether the rendered version of a content record should be served to the requesting browser are performed by examining the current Access Setting values of the Published content record object in the iMIS database.

- Content records – iMIS checks the value of the Publish on Servers field in the parent content folder to determine which publishing servers should handle the publishing of the content record. iMIS then creates a separate publishing request in the iMIS database for each associated publishing server. Meanwhile, every five minutes by default, the publishing services (AsiPublishing15) installed on every server that hosts iMIS content management websites are polling the iMIS database to determine whether there are any new publishing requests designated for their corresponding publishing server.

  If so, the publishing service examines the Published content record object in the iMIS database and then renders a corresponding .aspx file and places that file in the appropriate location in the server's local file system so that IIS can serve that page to browsers that request the content record's corresponding navigation item link.

  Note: You can change this default five-minute polling interval if desired, but be aware that each polling process consumes a small amount of system resources so there is a performance tradeoff in specifying a more frequent polling interval. To change the polling interval, edit the definition for the corresponding publishing server and specify the desired polling interval in the Frequency field.

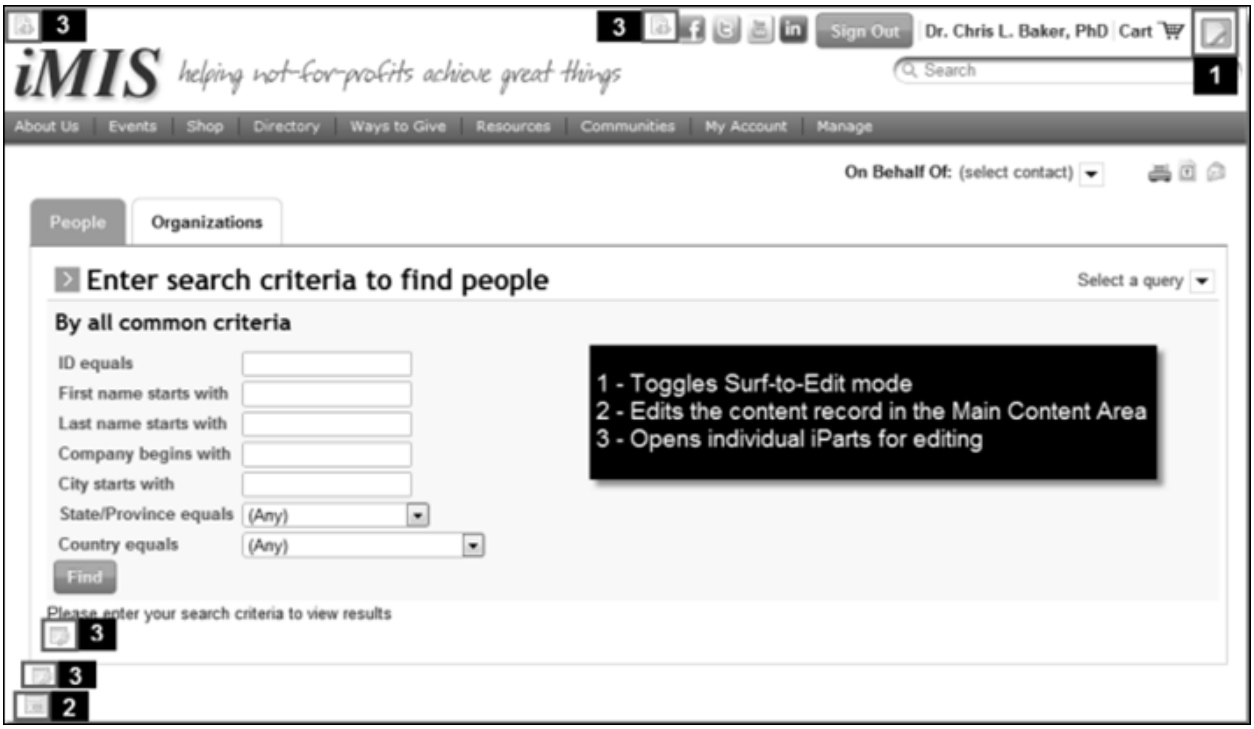
  Note: The iMIS content management configuration field CM.PublishingMaxNumOfAttempts (located in Set up content management > Content designer configuration) determines how many times each publishing service will attempt to process a system publishing request before it flags the request as failed. This prevents overconsumption of system resources if there is a connection issue or other issue that is preventing the publishing service from successfully processing the request.
- Content layouts – No downstream processes happen. When you define a content record, iMIS populates the list of available Page Layouts by examining all the Published versions of content layout objects in the iMIS database.
- Content types – No downstream processes happen. When you define a content record, iMIS examines the Published content type objects in the iMIS database to determine how to display the corresponding iPart when added to the content record.

- Tagged list formats – No downstream processes happen. When you add a ContentTaggedList iPart to a content record, iMIS populates the list of available List Formats by examining all the Published tagged list format objects in the iMIS database.

Concept: Surf-to-Edit

The Surf-to-Edit feature enables you to browse, or surf, to update your content records in their rendered form. You can quickly open a web page's underlying content record (or even a specific iPart within the content record) for editing. When you have saved your changes, you can continue surfing the website and making further content revisions as needed.

Full, Casual and Public users of iMIS can use the Surf-to-Edit feature, provided they are members of at least one content authority group (CAG) and they have been granted the necessary Document System permissions on content records. This is the only way that Casual and Public users can define iMIS content management content.



Concept: user-defined fields (UDFs)

User-defined fields (UDFs) in iMIS content management are created differently, and serve a very different purpose, than user-defined fields in iMIS contact records:

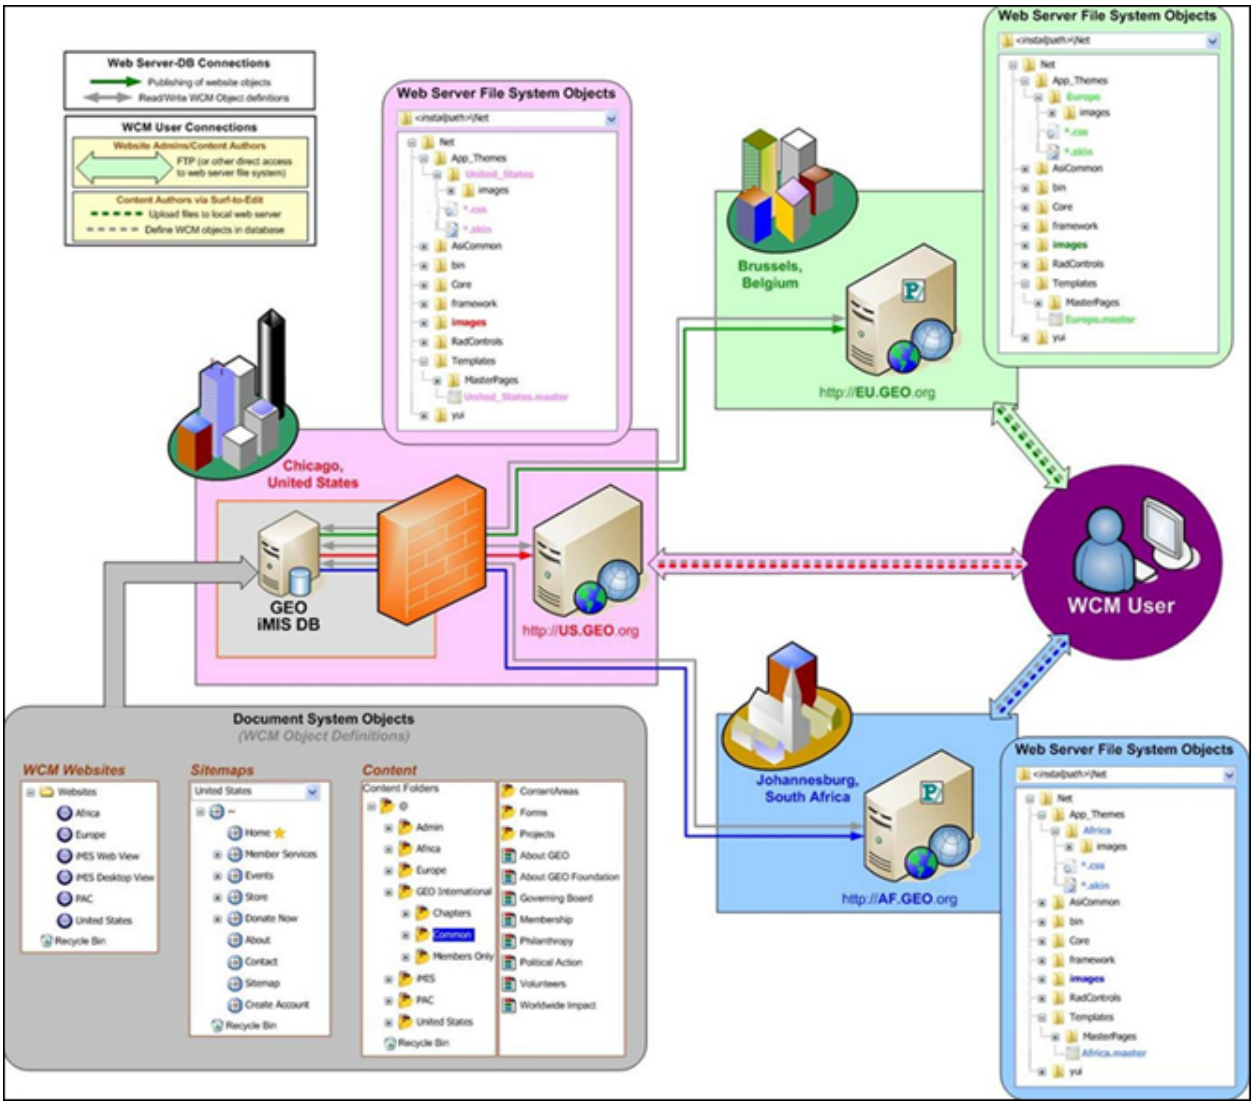
- The UDFs found in iMIS contact records enable you to collect custom information about a contact. These contact UDFs are not available for use in iMIS content management.
- The UDFs found in iMIS content management are primarily useful as a way to capture additional properties of the content in content records, and to provide a controlled list of search criteria for use in iMIS content management only. These iMIS content management UDFs can be used in three ways:
- As a value added to the keywords <META> element in the rendered page for the content record, which enables searches performed through the iMIS content management search engine (but not by typical external web-based search engines) to locate the content record by searching for this value. This behavior is controlled by the Use in Search? property of an iMIS content management UDF.
- As a search filter in AdvancedSearch iParts, applied to the initial result set based on the tags and keywords specified in the search.
- As both filtering criteria and sorting criteria in ContentTaggedList iParts. A date-oriented UDF can be used to filter the initial result set based on the chosen tags, and a different UDF of any type can be used to sort the the final result set.

  Every UDF defined in iMIS content management is added as a new custom property to every content record, and can be displayed in a wide variety of formats, from a simple text field to a drop-down list, to a calendar control, to a set of radio buttons, and so on. In the advanced search panel rendered from an AdvancedSearch iPart, the user-defined field appears exactly the same way that it does in content records. This enables iMIS content management website users to specify UDF values for advanced searches in the same manner that the UDF values are chosen when authoring content. For example, a date-oriented UDF will have a calendar control that makes it easy to select a date.

Concept: websites and web server interaction with iMIS

An iMIS content management website is slightly different from a Microsoft Internet Information Services (IIS) website. While the rendered output of an iMIS content management website provides a total website experience for visitors to the site, a single iMIS content management website can actually be hosted on multiple web servers even though you are only maintaining a single website in your iMIS content management environment. Within the internal structure of IIS, an iMIS content management website is usually maintained as a subset of the iMIS application, but you can configure IIS to host iMIS content management websites as individual IIS applications or even as individual IIS websites.

The following diagram illustrates the connection points between multiple IIS web servers that host iMIS content management websites, the iMIS database, and users.



Web Server-DB Connections

Customer Administration

Committee Management

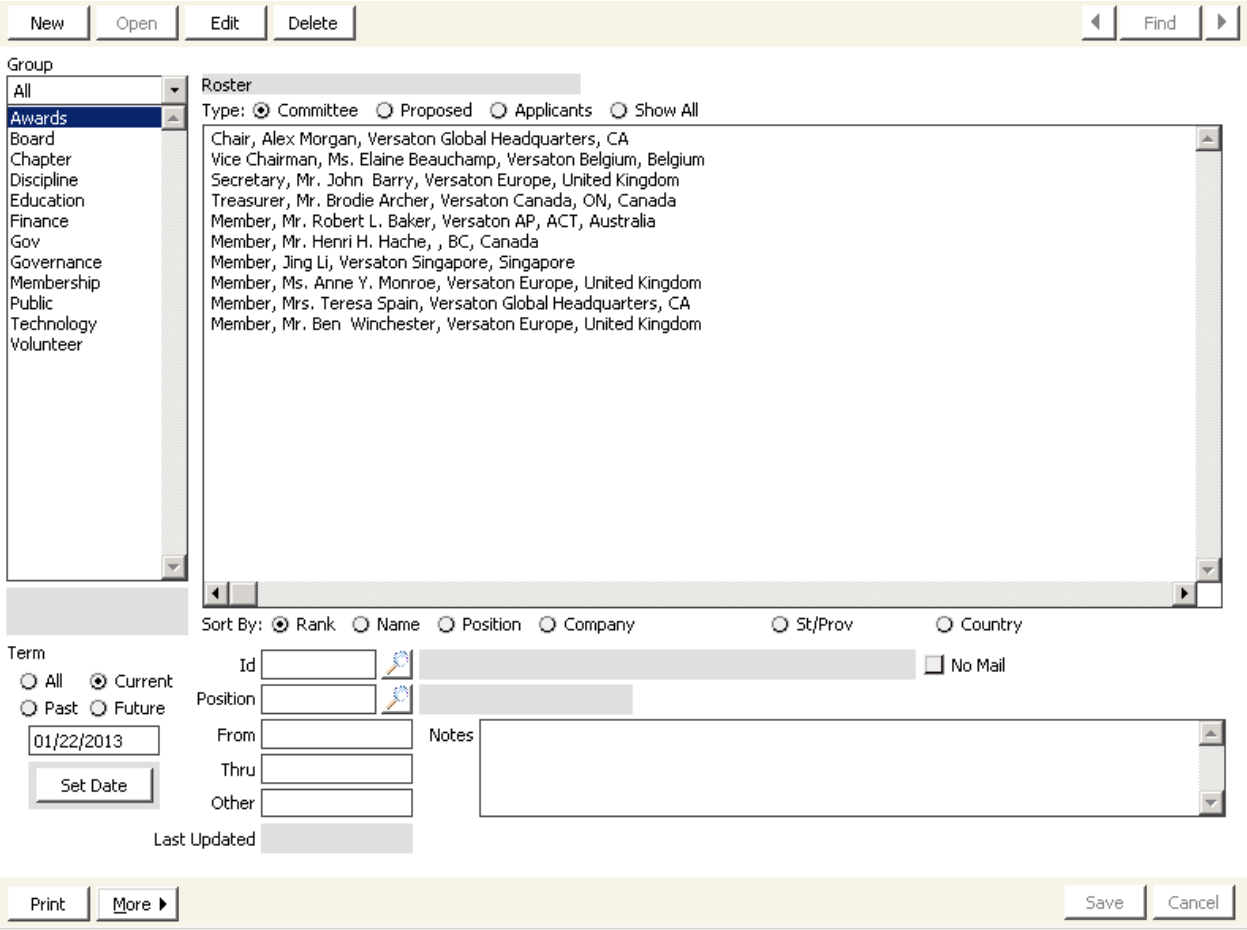
The Committee subsystem of iMIS Customer Management tracks committee members, their respective terms, and the positions they have held. The Manage committees window gives you full access to all committee data maintenance, inquiry, and reporting functions, enabling you to do the following:

- View committee rosters of past, current, and future members
- Maintain a list of members and their positions and terms
- Maintain a list of committee applicants and proposed members
- Create and store minutes on any committee meeting or activity
- Print a detailed roster of past, current, and future committee members and applicants
- Print personalized letters to any committee grouping
- Print labels for any committee list
- Maintain the tables of committee codes and positions

Managing committees

The Manage committees window enables you to assign customers to a committee, edit their assignments, delete assignees, and report this information to other committee members. This window also enables you to enter and track applicants and proposed committee members in advance of actual appointments being made.

Manage committees window



Admin Console: Home > Membership and Dues > Manage committees

Desktop: Customers > Manage committees

Filter by Co ID

The Filter by Co ID option is visible only if enabled during system setup. Although rarely used, this feature enables you to link a committee to the ID of a company record. For example, if you have set up a committee named Awards, and a company has 25 branches and each branch has an Awards committee, you normally would need to create 25 separate Awards committees with each having a slightly different name. Instead, you create 25 company name records that represent your branches.

With Filter by Co ID enabled, you can open the Awards committee and set the filter to work with only one of the 25 branches. A Find window will open so you can locate the company ID to filter by.

Group

The Group field is a drop-down list that enables you to view either all committees or committees that have been assigned to a specific group.

Committees

The Committees field displays the current list of the committee codes that have been defined in the Committee Codes window.

Type

Designates one of the following display filters:

- Committee - All committee members are displayed.
- Proposed - Proposed committee members are displayed.
- Applicants - Committee applicants are displayed.
- Show All - Committee members, proposed members, and applicants are displayed.

Roster

The Roster field displays the currently selected committee's member list (affected by Type and Term choices).

Sort By

Designates one of the following sort orders:

- Rank - Sorts members by the rank assigned to their positions in the Committee Positions window.
- Name - Sorts members alphabetically by last name.
- Position - Sorts members alphabetically by position title.
- Company - Sorts members alphabetically by company name.

- St/Prov - Sorts by the member's Name.STATE_PROVINCE, then Name.LAST_FIRST, both in alphabetic ascending order (A-Z, a-z).

  Note: The State/Province radio button will be labeled according to the value set up in Customer Setup – Address and Notes > State/Province.

- Country - Sorts by the member's Name.COUNTRY, then Name.STATE_PROVINCE, then Name.LAST_FIRST, all three in alphabetic ascending order (A-Z, a-z).

  Term

  Designates on of the following term filters:

- All - Displays all members who have served, are serving, or will be serving on the committee.
- Current - Displays only those members who are currently serving on the committee.
- Past - Displays only those members whose terms have concluded.
- Future - Displays only those members whose terms begin in the future.

  Set Date

  Activates the date field by which member terms are evaluated (date defaults to the current system date).

  ID

  Designates the ID of the currently selected or added member.

  No Mail

  Exempts the committee member from committee-specific label runs.

  Position

  Designates the position the member holds in the selected committee.

  From

  (required) Designates the start of the member's committee term.

Thru

Designates the end of the committee member's term. It defaults to the specified Default Duration (usually 12 months) after the From date.

Other

Designates a user-defined value corresponding to the type or category of educational credit awarded the member, if applicable. The value specified is displayed in the bottom of the member's Activity Detail window if your administrator has defined a prompt for the CEU Type field for the COMMITTEE activity type.

Last Updated

(read only) Shows the last date the record was updated.

Preference

Indicates an order of preference expressed by applicants for more than one committee position. For example, if an applicant wants to be President of a committee but has a second choice of Vice President, create two committee records for the applicant. The first record would have a position of President and a preference of 1. The second record would have a position of Treasurer and a preference of 2. This field is only displayed when Proposed or Applicants is enabled.

Notes

Specifies notes about the individual.

Print

Opens the Committee Reports window from which you can print committee reports.

More

Opens a menu of maintenance choices:

- Minutes - Opens the Minutes window where you can maintain minutes for the active committee. Minutes are accessed by the date that they were stored. You can open the minutes for any meeting and view or transfer them to a letter, report, or other area for

printing. You can open an existing minute's entry to work from or to insert a new set of minutes. Each entry consists of the date and the text of the minutes. All standard data maintenance procedures apply.

- Committee Codes - Opens the Committee Codes window where you can add, edit, and delete committee codes.
- Committee Positions - Opens the Committee Positions window where you add, edit, delete, and assign the rank for committee positions.
- Move to Committee - Assigns the currently selected individual to the currently selected committee as a member.
- Move to Proposed - Assigns the currently selected individual to the currently selected committee as a proposed member.
- Move to Applicant - Assigns the currently selected individual to the currently selected committee as an applicant.
- Check Paid Thru - Checks the currently selected individual's name and linked chapter or area with that chapter's paid thru date. If the selected individual is not linked to any chapter or area, iMIS displays a prompt to notify you.

To assign a member to a committee

To add a member to a committee, you need the following information:

- Customer ID
- Code for the position in which the member will serve
- Date range for the appointed term

1. From Manage committees window, select the committee code that you want the member to be associated with from the Committees field.
2. Select the appropriate type by enabling one of the following options:

- Committee
- Proposed

- Applicants
- Show All

  For example, if you want to add applicants instead of actual committee members, enable the Applicants option before entering the applicant. Otherwise, iMIS assumes you want to enter an appointee.

3. Click New. Your insertion point moves to the ID field.
4. Enter the customer ID of the appointee, or click the lookup icon to select an available value.
5. (optional) Enable the No Mail option to exclude the given appointee from committee-specific label runs.
6. Enter the appointee's position code in the Position field or click the lookup icon to select an available value.
7. Enter the start date of the appointee's committee term in the From field.
8. Enter the ending date of the appointee's committee term. If the default committee duration has been defined by your administrator, you can keep or override this value.
9. Enter any additional information you want to record for the appointee in the Notes field.
10. Click Save.

    To edit a committee appointment

    In the Manage committees window, you can edit any information on a particular appointee except:

- The committee to which the member record is assigned
- The ID associated with the record

  If either the committee or the customer ID is wrong, delete the existing record and insert a new record containing the correct information.

1. From Customers, select Manage committees to open the Manage committees window.

2. Select the committee code from the list in the Committees field (including any necessary filtering selections). Make sure you include a term selection that includes the member's record.
3. Highlight the customer record in the list of committee appointees.
4. Click Edit.
5. Make any necessary changes.
6. Click Save.

To delete an appointee from a committee

1. From Manage committees window, select the committee code from the list in the Committees field. Make sure you include a term selection that includes the customer's record.
2. Highlight the customer record in the list of committee appointees.
3. Click Delete. A system message prompts you to verify the deletion of the selected record.
4. Click Yes.

To change a committee appointment type

After preliminary or final appointment selections have been made, you can change the appointee's status as necessary.

1. From Manage committees window, select the committee code from the list in the Committees field (including any necessary filtering selections). Make sure you include a term selection that includes the customer's record.
2. Highlight the customer record in the list of committee appointees.
3. Select More on the Manage committees window to display a menu of maintenance choices.
4. Select one of the following options:

- Move to Committee to change the member to a permanent appointee
- Move to Proposed to change the member to a proposed appointee

- Move to Applicant to reassign a member to an applicant

  A warning message box is displayed.

5. Click Yes.

   To insert committee minutes

1. From Manage committees window, select the committee code from the list in the Committees field.
2. Click More, and select Minutes to open the Minutes window.
3. Click New.

   Note: The cursor moves to the Date field and automatically populates it with the current date.

4. Enter the date for which you want the minutes to be recorded in the Date field.
5. Enter the minutes of the committee meeting in the Minutes field.
6. Click Save.

   Note: Recorded minutes are listed by date in the Minutes List field of the Minutes window.

   To print committee minutes

1. From Manage committees window, select the committee code from the list in the Committees field.
2. Click More, and select Minutes to open the Minutes window.
3. Select the minutes to be printed from the Minutes List field.
4. Click Print.

Chapter Management

The Chapters subsystem of iMIS Customer Management enables you to track chapter memberships. From the Manage chapters rosters window you have full access to all

chapter data maintenance, inquiry, and reporting functions. This access enables you to do the following:

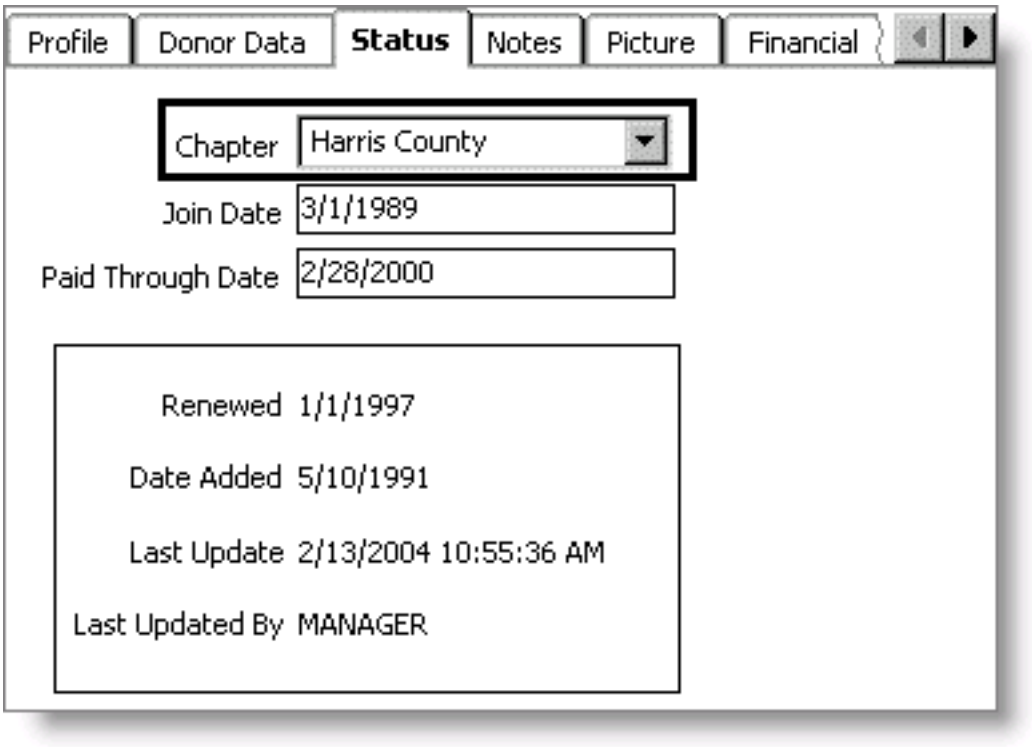
- Activate and view chapter rosters of current, past, or future enrollees
- Maintain a list of enrollees and their terms
- Print a detailed roster of current, future, or past chapter enrollees
- Maintain the tables of chapter codes

The reporting support for Chapter Management includes a full set of rosters and labels, as well as comprehensive statistical reports that reflect member additions and cancellations, movement from chapter to chapter, and other changes in status.

The Manage chapters rosters task list item displays on the Customers task list when iMIS is licensed for CHAPTERS.

Managing chapter members

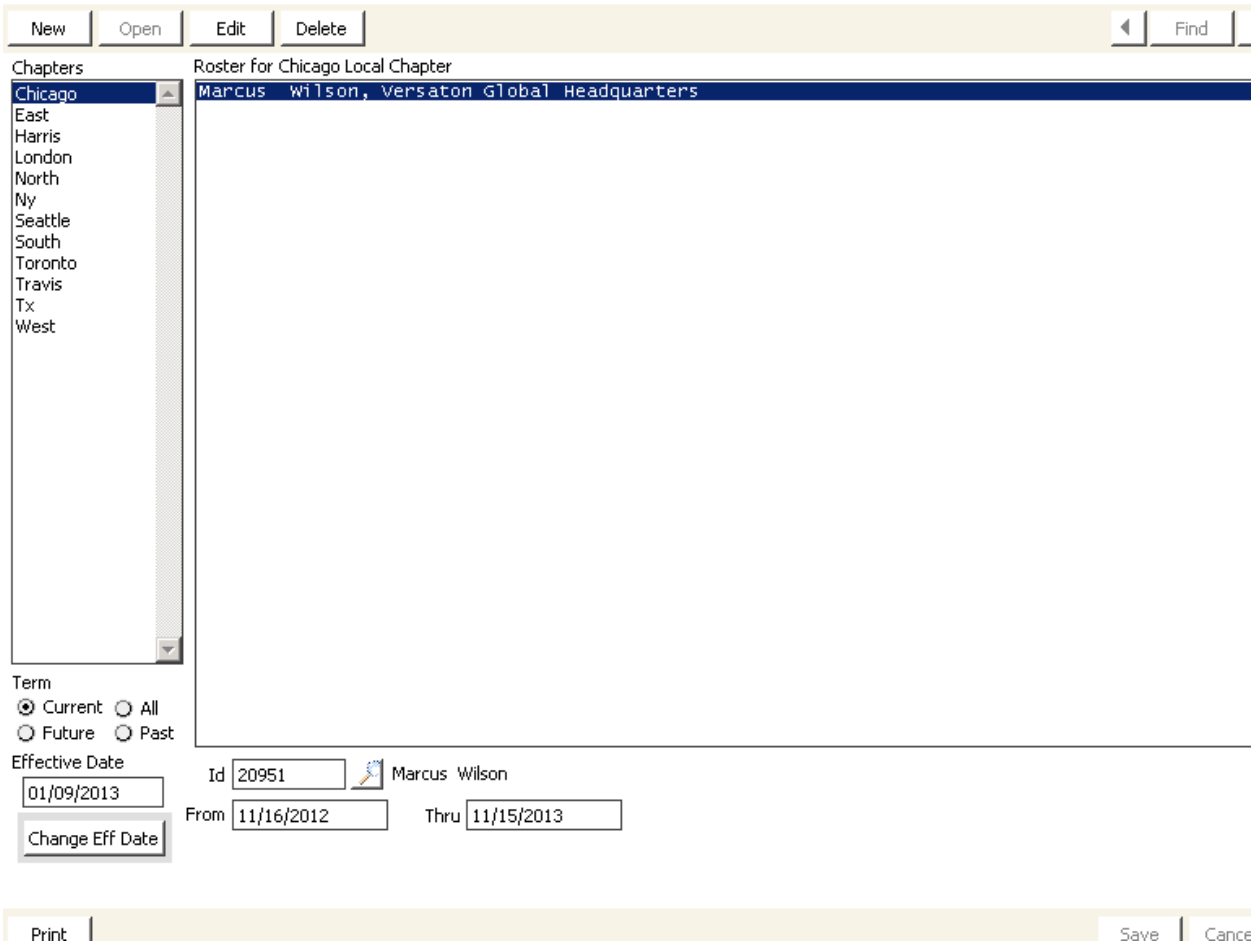
When a customer belongs to only one chapter, you only need to select the appropriate chapter code in the appropriate field on the Status tab on Customers > Manage customers. The label that displays on the Status tab depends on the value you entered in the Chapter Prompt field on the Customer Setup - Basic Options window.



From Customers, select Manage customers, enter/edit a customer record, and select the Status tab

iMIS also supports situations in which you need to enroll customers in multiple chapters, or perform chapter maintenance.

Manage chapters window



Admin Console: Home > Membership and Dues > Manage chapters

Desktop: Customers > Manage chapter rosters

Chapters

Lists the chapters.

Roster for

Displays the members enrolled in the selected chapter for the selected term.

Term

- Current - Enable to display only those members who have terms that include the date displayed in the Effective Date field. The From date must be on or before this date and the

Thru date must be on or after this date.

- All - Enable to display in the roster, all members who have served, are serving, or will be a member of the chapter.
- Future - Enable to display only those members whose term beings in the future (the From date is after the Effective Date).
- Past - Enable to display only those members whose terms have expired (the Thru date is before the Effective Date).

Effective Date

Displays the date upon which the radio button selections are based. Defaults to the current system date.

Change Eff Date

Enables edit of the Effective Date field.

Id

Specifies the member's ID number, or click the lookup icon to select an ID. When you enter the ID, the member's full name displays to the right of the field.

From

Specifies the start date of the term.

Thru

Specifies the end date of the term.

Print

Opens the Chapter Reports window where you can export chapter membership data as well as print rosters and a month-end report based on chapter enrollments, statistical reports, and labels.

To assign a member to a chapter

To add a member to a chapter, you need their customer ID and the code for the chapter to which you are adding the member. Before you can enter lists of chapter enrollees, you must define chapter codes on the Manage chapters window.

1. From Manage chapters window, select the chapter from the Chapters scrolling list to which you want to add the member.
2. Click New.
3. Enter the member's Id, or click the lookup icon to select an ID.
4. Select the appropriate enrollment Term.
5. (optional) Enter the From and Thru dates of the enrollment period.

   Note: When you enter the From date and press Tab, iMIS automatically populates the Thru field with a date one full year from the From date. You can override this value.
6. Click Save.

To edit a chapter enrollment

In the Manage chapter rosters window you can edit any information on a particular enrollee except the chapter to which the member is assigned, and the ID associated with the record.

1. From Manage chapters window, select the chapter from the Chapters list and a term selection that includes the record.
2. Select the record from the roster.
3. Click Edit.
4. Make your changes.
5. Click Save.

To delete a chapter enrollment

1. From Manage chapters window, select the chapter from the Chapters scrolling list and a term selection that includes the record.

2. Select the record from the roster.
3. Click Delete. A message displays prompting you to confirm the deletion.
4. Click Yes.

Acquisition Management

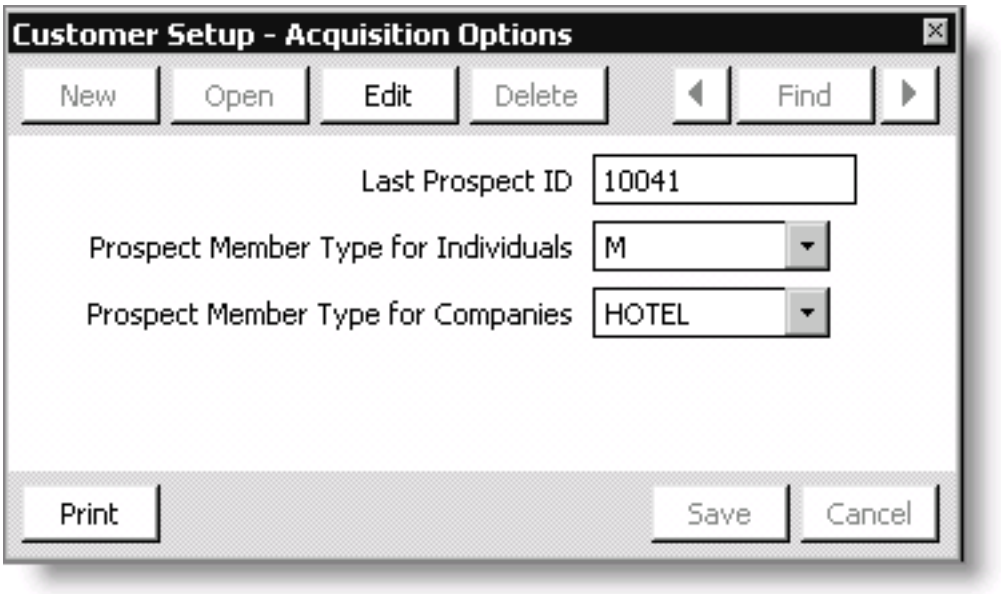
The Acquisition Management feature allows you to import prospects and search an external prospect table from the iMIS global name lookup. For example, if you obtain a list of names and addresses of prospective clients, you can import the data into iMIS and create a mass mail merge to solicit funds from the prospects. Once you locate a prospect record, you can convert the record to a customer record.

Note: Note: You must be licensed for Acquisition Management.

Setting acquisition options

On the Customer Setup - Acquisition Options window you can specify the member type to associate with individual and company prospect records you import into iMIS.

Customer Setup - Acquisition Options window



From Customers, select Set up module > General, click Basic Options, and click Acquisition Options

The Customer Setup - Acquisition Options window includes the following fields and options:

Edit

Used to specify the acquisition options.

Last Prospect ID

(Display-only) The last prospect ID that was assigned

Prospect Member Type for Individuals

Use this drop-down list to select the member type to use when converting individual prospects from the drop-down list.

> **Note:** Note: When you import prospect records into iMIS, the system determines a record is an individual record if the import file contains a value for FirstName, LastName, or FullName.

Prospect Member Type for Companies

Use this drop-down list to select the member type to use when converting company prospects from the drop-down list.

> **Note:** Note: When you import prospect records into iMIS, the system determines a record is a company record if the import file does not contain a value for FirstName, LastName, or FullName.

Print

Used to generate and send a system settings report to your report destination.

To set Acquisition options

1. From Customers, select Set up module > General.

2. Click Basic Options to open the Customer Setup - Basic Options window.
3. Click Acquisition Options.
4. Click Edit on the Customer Setup - Acquisition Options window.
5. Select the Prospect Member Type for Individuals from the drop-down list.
6. Select the Prospect Member Type for Companies from the drop-down list.
7. Click Save.
8. Restart iMIS for your changes to take effect.

Importing prospect records

MC: Medina: Update for Table Analysis removal.

You can import prospect records from a tab-delimited file into iMIS. The prospect import file must contain data matching the following columns. Column values can be blank. However, if the FirstName, LastName, and Organization columns are all blank, the record is deleted during the import process.

- Prefix
- FirstName
- MiddleName
- LastName
- Suffix
- FullName
- Title
- Organization
- Address1
- Address2
- Address3

- City
- State/Province
- PostalCode
- Country
- HomePhone
- WorkPhone
- Fax
- E-mail

> **Note:** Note: The Prospect table cannot be truncated with the iMIS DB Maintenance utility. You must manually truncate the Prospect table.

> **Note:** Note: The column names in the iMIS Prospect table are mixed case. Column names in standard iMIS tables are uppercase.

SQL Server Tools required to import prospect records

When importing a prospect file, iMIS uses the SQL Server utilities osql and bcp. These utilities require that your computer have access to the SQL Server Tools. It is not common for every iMIS client computer to have the SQL Server Tools installed, so to perform this procedure successfully, you might need your system administrator to ensure the following conditions in your environment:

- A computer with SQL Server Tools has the folder with osql.exe (or sqlcmd.exe) and bcp.exe set for file sharing (this is typically the BINN folder, such as C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\Binn).
- An entry that points to that shared folder containing osql.exe (or sqlcmd.exe) and bcp.exe is added to your client computer's PATH variable.

For example, assume your organization has one computer with SQL Server Tools installed in the default location. Your system administrator would need to share the BINN folder on that computer and would need to add a UNC entry similar to the following to your client computer's PATH variable:

\\computerName\sharedPathToSqlServerTools;

Where computerName is the name of a computer in your organization that has the SQL Server Tools installed, and sharedPathToSqlServerTools is the shared file path to the folder that contains the osql.exe (or sqlcmd.exe) and bcp.exe files.

To import a prospect file

1. Select Utilities > Reports and Queries.
2. Select Data Import from the Report Types list.
3. Select Import data into the Prospect table from the Available Reports list.
4. Click Run. A confirmation message displays.
5. Click Yes. The Select import file window displays.
6. Select the prospect import file.
7. Click Open. The Prospect Import - Set Values window opens.
8. (required) Enter the Prefix for Imported IDs. This value must be 1-5 alpha characters. For example, PROSP. (This value displays as part of the ID field in Customers > Manage customers.)
9. (required) Enter the Imported List Code. (This value displays in the Member Type field in Customers > Manage customers.)
10. Click Save. A DOS window displays a confirmation message.
11. Press any key to continue. The file is imported.
12. Press any key again when the file has imported successfully.

Finding and converting prospect records

Finding prospect records is similar to finding customer records. The only difference is you must enable the Include acquisitions in search option on the Search window. Once you find a prospect record, you have the option to convert it to an iMIS customer record.

Customer records in iMIS sort by last name and then first name if there is a last name. Otherwise, records sort by company. When you include prospect in your search and the system finds duplicate names, the iMIS record displays first in the list.

To find a prospect record

1. From Customers, select Manage customers.
2. Open the Search window:

- Click Find; or
- Press Ctrl+F

Note: You can press Ctrl+F to open the Search window (perform a Find) only when the Manage customers window is not in edit mode and you are not in a single-instance, user-defined tab.

3. Select the search criteria from the drop-down list, for example, Name.
4. Enter the search value in the Begins with field, for example, c.
5. Enable the Include acquisitions in search option to include acquisitions from the Prospect table in the search.

   Note: The Include acquisitions in search option is retained on a per-user basis.
6. Click Go. The Results tab is updated.

To convert a prospect record to a Name record

Once you find a prospect record, you have the option to convert the record to a customer record. When a prospect record does not already have an iMIS ID assigned, the data in the prospect record is automatically imported into the Name table and all associated

tables in the same manner as when a new customer record is entered. If the prospect record already has an iMIS ID assigned, the existing Name record associated with the prospect is used. If a prospect record is converted to a customer record during an iMIS operation (for example, when entering a gift or order) and the operation is cancelled, the new customer Name record is retained. Once a prospect record is converted to a customer Name record, the process cannot be reversed.

> **Note:** Note: You must have a Customers authorization level of 3 or higher to convert a prospect record to a customer Name record.

> **Note:** Note: When a prospect record is converted to a customer Name record, the ID number is automatically assigned regardless of the setting of the Auto Assign Member Numbers option on the Customer Setup - Basic Options window.

Duplicate checking for a prospect functions in the same manner as duplicate checking for customers. When you select a prospect record for conversion, a window displays if a duplicate record exists. You can perform the conversion or cancel it.

After you import a prospect record into iMIS, the prospect record is flagged with the associated iMIS ID and cannot be accessed by a Find operation unless an ID search on the prospect ID is performed.

1. From Customers, select Manage customers.
2. Open the Search window:

- Click Find; or
- Press Ctrl+F

3. Select your search criteria.
4. Enable the Include acquisitions in search option and click Go.
5. Double-click a prospect record to convert. The record loads in the Manage customers window in Edit mode.

6. Make any necessary changes to the record.
7. Click Save.

Relationship Management

iMIS Relationships offers you a way to manage relationships that exist between your contact records. It enables you to connect your contact records by connecting individuals to individuals, individuals to companies, companies to individuals, and companies to companies. It works as an extension of iMIS Customer Management, and its thorough integration with Customer Management makes maneuvering through related records clear and efficient.

> **Note:** Note: The Relationships tab displays on the Manage customers window when iMIS is licensed for Relationships.

Relationships features

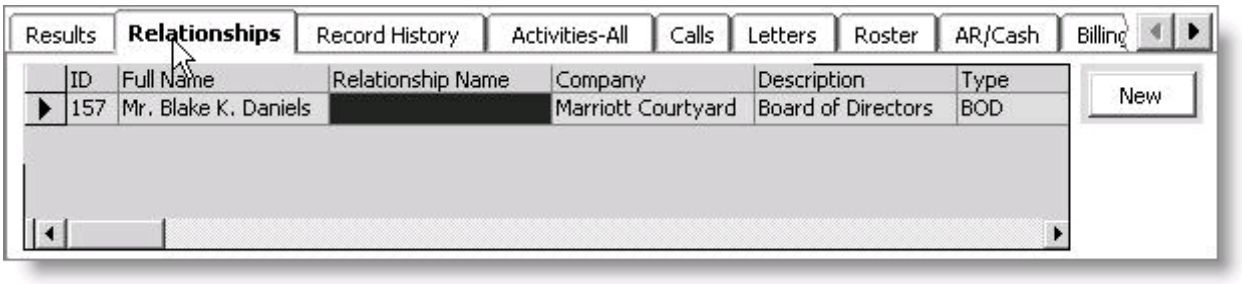
Relationships enables you to accomplish the following tasks:

- Easily manage and view multiple relationships for individual contacts or company contacts
- Place time limits on relationships
- Use relationship codes to specify roles within an organization (for example, President)
- Use relationship codes in contact notifications (for example, one code would specific family members, another code would identify co-workers, etc.)
- Record specific details about related contacts

Managing relationships activity records

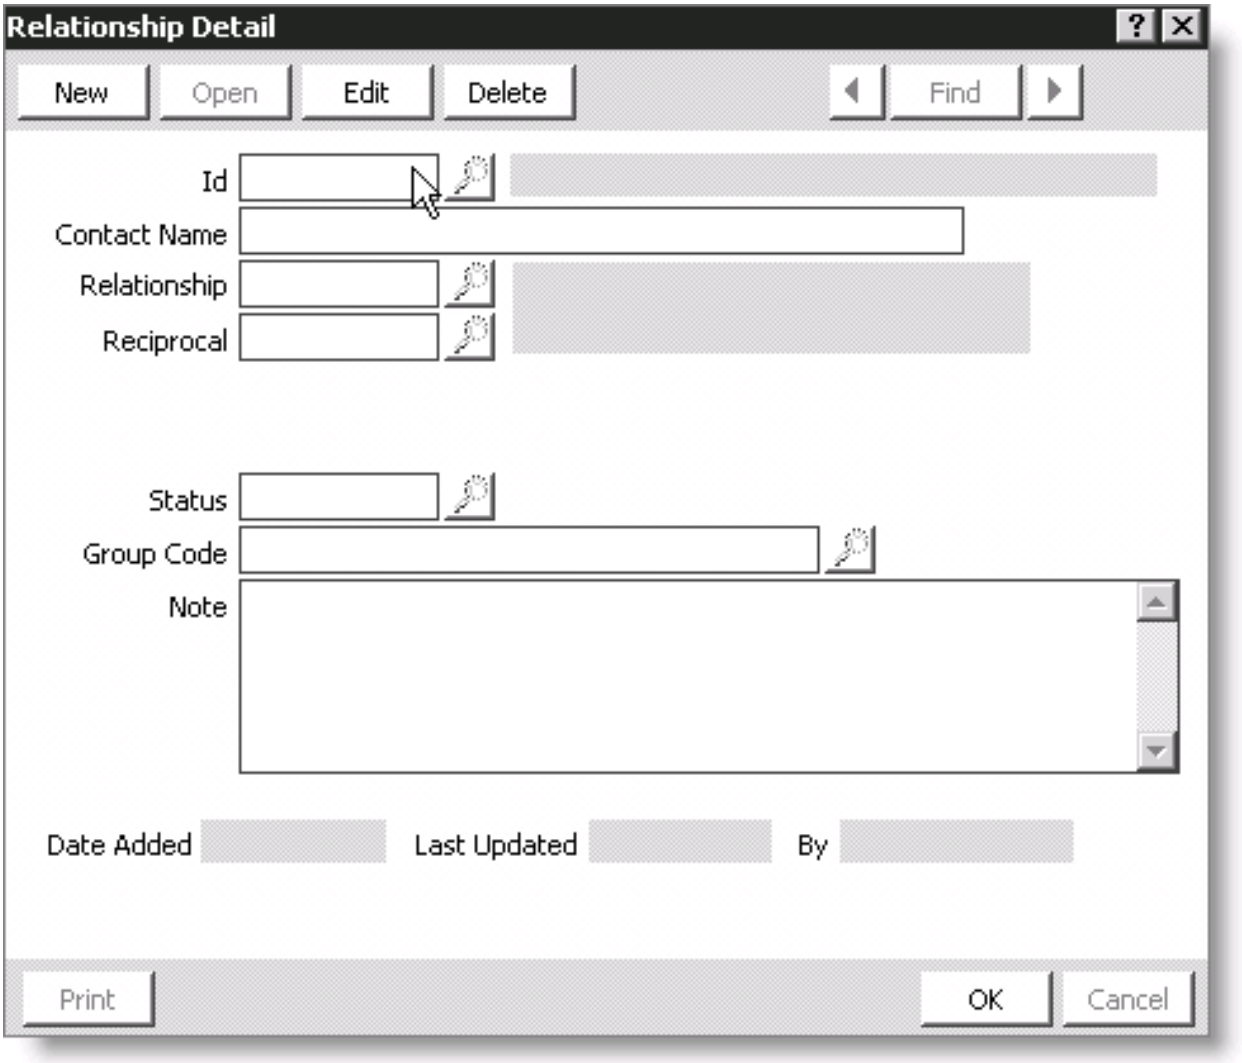
The Relationships tab in the Activity/History area of Customers > Manage customers contains the relationship log for contact records.

Manage customers window - Relationships tab



From Customers, select Manage customers, find customer record, and select Relationships tab

Relationship Detail window



Relationship detail window

Id

Specifies the ID of the contact, or click the lookup icon to search for the contact's ID.

Contact Name

Specifies the name of the contact when the ID is not in the contact database.

Relationship

Specifies the relationship code for the contact, or click the lookup icon to select the relationship code from a list.

Reciprocal

If the relationship code you entered in the Relationship field has a reciprocal relationship with another type, the code for that reciprocal relationship type automatically displays in this field.

Status

Specifies the status of the contact (Active, Marked for deletion, or Suspended), or click the lookup icon to select a value.

Group Code

Specifies a code for the group type (ROLE or DONOR), or click the lookup icon to select a group type.

Note

Specifies any notes you want to keep about the contact.

Date Added

This is a display-only field that shows when a relationship was added.

Last Updated

This is a display-only field that shows when a relationship was updated.

By

This is a display-only field that displays the ID of the person who entered the update to the relationship information.

To add a relationship to a customer record

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. On the Relationships tab, click New. The Relationship Detail window opens.
5. On the Relationship Detail window, click New.
6. In the Id field, enter a contact ID, or click the lookup icon to select the contact's ID.

   Note: If you're adding a relationship with a contact that does not exist in the customer database, leave the ID field blank and enter the contact's name in the Contact Name field.
7. In the Relationship field, enter the relationship code, or click the lookup icon to select the appropriate code. If the relationship code you entered has a reciprocal relationship with another relationship type, the Reciprocal field auto-populates.
8. (optional) Enter a Title, or click the lookup icon to select a value.

   Note: The Title and Functional Title fields only display when the relationship type entered has the Use Title option enabled in the Relationship types window.
9. (optional) Enter a Functional Title, or click the lookup icon to select a value.
10. (optional) Enter a Status, or click the lookup icon to select a value.

    Note: Status codes are limited to 5 characters.
11. (optional) Enter the From and Thru dates.

    Note: The From and Thru date fields only display when the relationship type entered has the Use Dates option enabled in the Relationship types window.

12. (optional)Enter a Group Code, or click the lookup icon to select a value. (For more information on using Group Codes to display relationships on the Role tab, see the Managing Role Activities section of this chapter.)
13. (optional) Enter any additional information in the Note field.
14. Click Save.

To view an existing relationship

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. Double-click on the relationship you want to view to open the Relationship Detail window for that relationship.

To edit an existing relationship

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. Double-click on the relationship you want to edit to open the Relationship Detail window for that relationship.
5. On the Relationship Detail window, click Edit.
6. Make the desired edits. At least two fields must contain information: the Relationship field and either the Id or the Contact Name field.
7. Click Save.

To delete an existing relationship

You can delete relationship records that display on the Relationships tab, provided your administrator has assigned you the appropriate authorization level.

1. Select Customers.

2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. Double-click on the relationship you want to delete to open the Relationship Detail window for that relationship.
5. On the Relationship Detail window, click Delete. A message displays asking you to confirm the deletion.
6. Click Yes to have the record deleted from the tab and the database or click No to cancel the deletion.

> **Note:** Note: You can also delete a record by pressing the Delete key on the keyboard.

Managing role activities

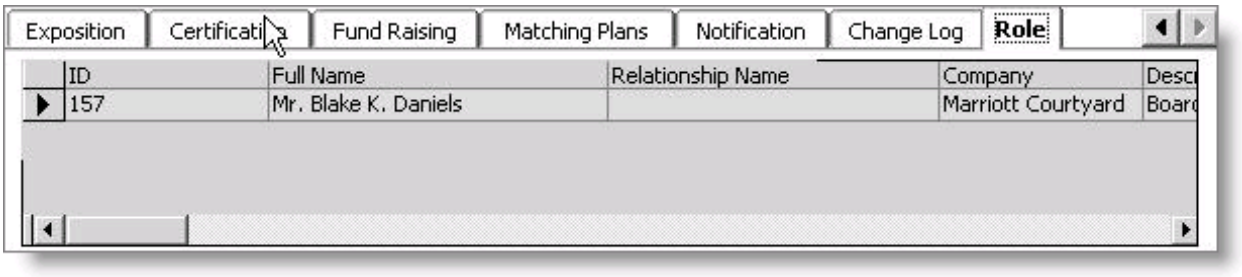
The Role tab is an option available to users licensed for Relationships. The Role tab enables you to see a subset of a contact's relationships, based on relationship type. This is helpful if you have a contact with a large number of relationships, and you want easier access to just a few specific types of relationships for that contact.

> **Note:** Note: All relationships on the Role tab will also appear on the Relationships tab.

The Role tab will display only when the following requirements are met:

- You are licensed for Relationships.
- Your administrator has defined the ROLE code in the GROUP_CODE General Lookup/Validation table.

Manage customers window - Role tab



From Customers, select Manage customers, find customer record, and select Role tab

In order for relationships to appear on the Role tab, they must have the code ROLE entered in the Group Code field on the Relationship Detail window.

To view the Role tab

1. Open a customer's record in the Manage customers window.
2. Select the Role tab. The relationships that have been assigned the ROLE group code display in the tab area.

   Note: If you do not see the Role tab, right-click in the History Tabs section of the page, select Edit Tab Preferences, and make sure that Role is in the Visible History Tabs box.

To display an existing relationship on the Role tab

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab to display the contact's relationships.
4. Double-click on the relationship you want to edit to open the Relationship Detail window for that relationship.
5. Click Edit.
6. Enter ROLE in the Group Code field.
7. Click Save.

To add a relationship that will display on the Role tab

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. Click New on the Relationships tab to open the Relationship Detail window.
5. Click New on the Relationship Detail window.
6. In the Id field, enter a contact ID, or click the lookup icon to select the contact's ID.

   Note: If you're adding a relationship with a contact that does not exist in the customer database, leave the ID field blank and enter the contact's name in the Contact Name field.
7. In the Relationship field, enter the relationship code, or click the lookup icon to select the appropriate code. If the relationship code you entered has a reciprocal relationship with another relationship type, the Reciprocal field auto-populates.
8. (optional) Enter a Title, or click the lookup icon to select a value.

   Note: The Title and Functional Title fields only display when the relationship type entered has the Use Title option enabled in the Relationship types window.
9. (optional) Enter a Functional Title, or click the lookup icon to select a value.
10. (optional) Enter a Status, or click the lookup icon to select a value.

    Note: Status codes are limited to 5 characters.
11. (optional) Enter the From and Thru dates.

    Note: The From and Thru date fields only display when the relationship type entered has the Use Dates option enabled in the Relationship types window.
12. (required) Enter ROLE in the Group Code field, or click the lookup icon and select Role from the list.
13. (optional) Enter any additional information in the Note field.
14. Click Save.

Customers: Set up tables

To derive the most benefit from the iMIS Customer Management system, you need to customize it to meet the unique requirements of your organization. A large part of the iMIS Customer system is customized through its system tables, which support customer data entry and processing. Once built, these tables supply pertinent information to iMIS about your organization's processing requirements. These tables fill the following important roles:

- Data validation - Most of the tables verify specific data elements during data entry. For all fields or data elements for which a supporting table exists, iMIS performs a look-up and refuses any codes not found in the table.
- Clarification - Most tables provide full descriptions of the codes to which they correspond, which display on windows and print on reports.
- Processing controls - Some tables have characteristics that guide or alter iMIS's processing, let you activate features under a certain set of circumstances, or help you establish data organization and hierarchy.
- Typing shortcuts - To keep keystrokes to a minimum, some tables enable expansion that replaces codes with expanded text.

iMIS's tables are powerful and important elements of your customized system. Building these table entries in line with your processing needs is an important prerequisite to beginning live operations with customer data.

iMIS table layout

The Name family of tables holds information about customers, prospects, subscribers, and any other individuals or companies for whom you want to keep information. These tables are as follows:

- Name
- Name_Address
- Name_Fin

- Name_Demo
- Name_Indexes
- Name_Note
- Name_Picture
- Name_Log
- Activity
- Lookup and Validation Tables
- Customizer (such as Demographics)

  Name

  For each name record in the Name table, there is always a corresponding record in the Name_Address and Name_Fin tables. The Name table consists of the following:

- Primary Name (individual or company)
- Category and Status
- Standard Addresses (first three)

  Name_Address

  The Name_Address file contains an unlimited number of addresses for each record in the Name file.

  Name_Fin

  The Name_Fin file contains financial and other associated data on your customers. ID is the primary key that references back to the Name table.

  Name_Demo

  The Name_Demo file contains user-defined fields, check box fields, and list string fields. You can customize these fields with your association's demographic data.

  Name_Indexes

This file is automatically populated by iMIS and contains index information based on user-definable indexes that were created during Customer module setup.

Name_Note

The Name_Note file contains optional note fields specified for a customer.

Name_Picture

The Name_Picture file contains bit map images of customers.

Name_Log

The Name_Log file stores a log of the changes made to the database and who made the change. You have the ability to customize the information you want to store.

Activity

The Activity file contains historical records for various modules in iMIS:

- Committee Management
- Billing
- Fundraising
- Events
- Order Processing

Items that are included in this file are customer history information such as event attendance, billing payments, products ordered, and user-defined items such as a call log.

Lookup and validation tables

During system setup, your System Administrator must set up a number of small tables to provide lookup choices and validation (see "General lookup/validation tables") during data entry for coded fields such as committees, chapters, and customer types.

Customizer tables

The iMIS Customizer lets you create many user-defined fields, windows, and tables during module setup. The user-defined windows make it easy to store and access demographics and other customizable data. To access the Customizer, from Customers, select Set up module > General, and click Additional Windows.

Building tables guidelines

While the number and types of data elements or fields that compose a table entry vary from table to table, they all contain two similar definition fields, the code and a longer description. The code is usually an all upper-case abbreviation that represents or corresponds to the longer table entry description. For example, in the table of states, the standard 2-character abbreviation (TX) is the code, and the state name (Texas) is the description.

The code is a critical field and is:

- The primary access key for the table entry through which the table entry is stored and retrieved
- A validation check against input to the field it supports

In most fields, iMIS only lets you enter or select a code that exists in a table entry definition. In a field referencing the STATE_PROVINCE table, for example, iMIS would reject the code “TT” as not being a valid table entry.

In assigning codes, follow these guidelines:

- Assign meaningful codes that best represent the description.
- Make the codes long enough to be unique in the table but keep them as short as possible.
- Do not use spaces, apostrophes ('), quotation marks (“), or special characters other than underscores.

Using international address formatting

International address formatting enables you to format and store up to 256 different address layouts. These address layouts can be formatted to reflect the address layouts that are used by different countries, and they can be used in iMIS reports.

International address formatting in iMIS reports

International address formatting requires reports in all modules to use the FULL_ADDRESS, Name.FULL_ADDRESS, Name_Address.FULL_ADDRESS, Orders.FULL_ADDRESS, or Order_Badge.FULL_ADDRESS fields rather than a concatenation of the individual address fields.

These fields are calculated based upon the address format associated with the Country name in the Name Address record. Whenever FULL_ADDRESS is calculated, it is built based upon the appropriate address format.

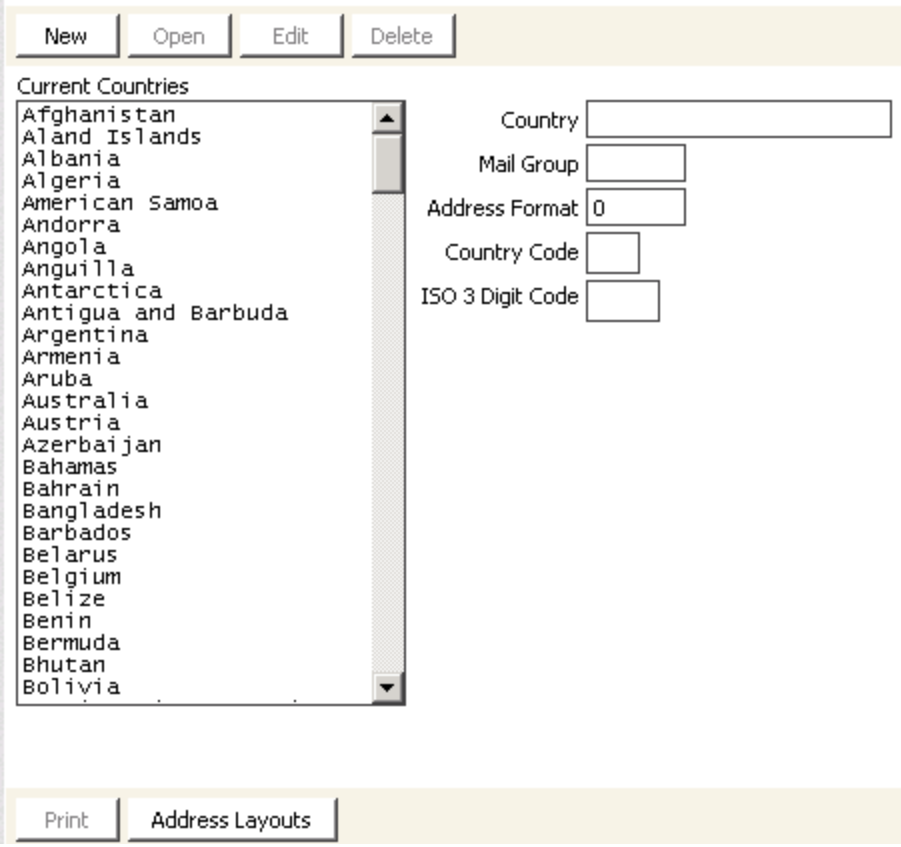
If international address formatting is set up, these FULL_ADDRESS fields are calculated based upon the address format associated with the Country name on the Name Address record. When a new record is inserted into the database, a new ASI stored procedure called sp_asi_AddressUpdate calculates all FULL_ADDRESS values based upon the country specific address formats.

To update the FULL_ADDRESS fields for existing records in the database, you will need to execute the 'Run AddressUpdate' script (select Utilities > Reports and Queries > Table Maintenance). This script calls the ASI AddressUpdate stored procedure that recalculates the FULL_ADDRESS fields based upon the appropriate address format.

If you have to run the 'Rebuild Name_Address Pointers' script for any reason, please note that you will also need to run the 'Run AddressUpdate' script in order to rebuild FULL_ADDRESS based upon the international address formats.

Set up country names window

The Set up country names window is used to add country records to the Country_Names table. The records entered in the Country_Names table then are linked with the appropriate address formats that are stored in the Country_Addr_Layouts table.



Admin Console: Configure > Membership > Set up tables > Set up country names

Desktop: Customers > Set up tables > Country names

Current Countries

Lists the current countries.

Country

(required) Enter the country name in this field (Country_Names.COUNTRY).

Mail Group

This field is reserved for future use (Country_Names.MAIL_GROUP).

Note: Note: The Mail Group field is used in the Advanced Subscriptions module for reporting purposes. You do not need to enter anything in the Mail Group field if you do not intend to separate by mail group in the Advanced Subscriptions module.

Address Format

Displays the Address Format assigned to the country (Country_Names.ADDRESS_FORMAT).

Country Code

Designates the two letter code that stands for this country.

ISO 3 Digit Code

Designates the ISO 3 digit code that stands for this country.

Address Layouts

Opens the Country Address Layouts window to view the address format that is assigned to the country.

The Country table is a combination validation/expansion table for the Country field used for customer addresses. You need to specify values, either abbreviations for expansion and/or for full country names, for all the countries in which your customers may maintain a residence, a mailing address, or a billing address.

Address layouts

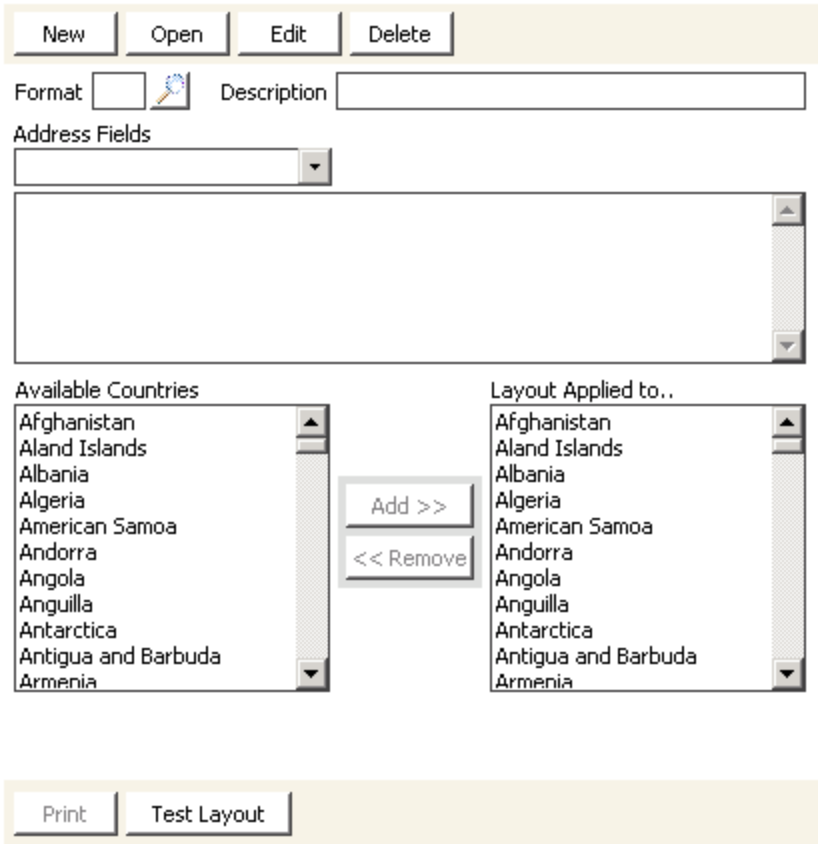
iMIS ships with the following address formats predefined for specific countries. For example, format 12 is applied to Bulgaria, format 13 is applied to Japan, and format 14 is applied to Korea. We recommend that you review these formats to be sure that they fit your business needs. If necessary, you can modify the formats (for example, change the format that applies to a country). For countries that have not had address formats applied to them, you will need to format address layouts and apply them to the countries.

0	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[C][S]STATE_PROVINCE[S][S]ZIP[N][U]COUNTRY
3	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[N][U]ZIP[N][U]COUNTRY
4	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N]

	[U]ZIP[S][U]CITY[N][U]COUNTRY
5	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[N]STATE_PROVINCE[N][U]COUNTRY
6	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[S]STATE_PROVINCE[N][U]COUNTRY
7	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[S][U]ZIP[N][U]COUNTRY
8	CITY[N]ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] ZIP[N]STATE_PROVINCE[N][U]COUNTRY
9	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] CITY[N]ZIP[S][U]COUNTRY
10	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] ZIP[S]CITY[N]STATE_PROVINCE[S]COUNTRY
11	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[N][U]COUNTRY
12	COUNTRY[N]STATE_PROVINCE[N]ZIP[S]CITY[N] ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N]
13	COUNTRY[N]ZIP[S]STATE_PROVINCE[S]CITY[N] ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N]
14	COUNTRY[N]ZIP[N]STATE_PROVINCE[S]CITY[S] ADDRESS_1[S]ADDRESS_2[N]ADDRESS_3[N]

Set up country address layouts window

The Set up country address layouts window is used to enter format codes, to modify existing format codes, to format address layouts, and to apply formatted addresses to specific countries defined in the Country_Names table. This address format information is stored in the Country_Addr_Layouts table.



Admin Console: Configure > Membership > Set up tables > Set up country address lay-outs

Desktop: Customers > Set up tables > Country address layouts

Format

This field contains an address format code that will be auto-assigned to an address format (Country_Addr_Layouts.ADDRESS_FORMAT).

Description

Specifies a description for the address format (Country_Addr_Layouts.DESCRIPTION).

Address Fields

Use this drop-down list to select the fields that you want to use in the address format.

Use the area located below the Address Fields field to format the address layout (Country_Addr_Layouts.ADDRESS_LAYOUT). The formatted address layout combines the component fields of the address with four formatting codes:

- [U] - Uppercase. Enter [U] before a component field to make the data in the field all uppercase. For example, [U]CITY would generate all capital letters for a city such as NEW YORK or LONDON.
- [N] - New line. Enter [N] after a component field to insert a carriage return. For example, ADDRESS_1[N] would generate a carriage return and place the next component field on a different line in the address.
- [S] - Space. Enter [S] after a component field to insert a space between component fields. For example, [U]STATE_PROVINCES[S][U]ZIP would display as TEXAS 75208 when generated in an address.
- [C] - Comma. Enter [C] after a component field to insert a comma between component fields. For example, CITY[C][S][U]STATE[S][U]ZIP would display as Dallas, TEXAS 75208 when generated in an address.

Available Countries

Lists the countries that have not had address formats applied to them.

> **Note:** Note: Countries must be entered on the Country names window before they will be available for address formatting.

Add

Used to move selected countries from the Available Countries list to the Format Applied to list. This action is part of the process of applying an address format to a country.

Remove

Used to move selected countries from the Format Applied to list to the Available Countries list. This action is part of the process of removing an address format from a country.

Layout Applied to

Lists the countries for which address formatting has been applied.

Test Layout

Opens the Address Layout Tester window that is used to verify that an address is formatted correctly.

To enter an address format

1. From Country address layouts window, click New. The Format field automatically populates with the next succeeding format code. For example, if the last format code created was 15, then format code 16 will be entered automatically in the Format field.
2. Enter a Description for the country address format.
3. Arrange the component fields in the area located below the Address Fields field to suit the desired address layout. For example, if you want the country name to display on the first line in the address layout, press Enter before ADDRESS_1[N] to move it to the second line, highlight COUNTRY and press Ctrl+X, then press Ctrl+V.
4. Enter the formatting codes in the Address Layouts field to format the address.
5. Click Save.

To apply an address format to a country

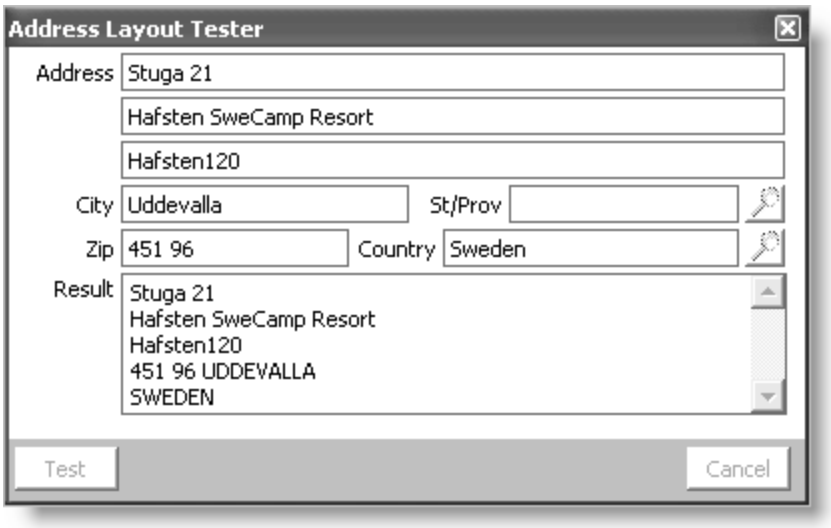
Make sure the country that you want to apply an address format to has been added to the Country_Names table.

1. From Country address layouts window, click Find.
2. Click the lookup icon in the Format field to choose the format code for the address format that you want to modify.
3. Click OK. The address format assigned to that code opens in the window. The countries for which no address formatting has been applied display in the Available Countries drop-down list.
4. Click Edit.

5. Select the country (or countries) from the Available Countries list for which you want to apply address formatting.
6. Click Add to move the selected country from the Available Countries list to the Layout Applied to list.
7. Click Save to apply the address format to the country.
8. (optional) Select Test Layout to verify that the formatted address layout produces the desired result.

Address Layout Tester window

The Address Layout Tester window is used to test and verify that a formatted address layout produces the desired result.



From Customers, select Set up tables > Country address layouts, and select Test Layout

Address

Specifies an address to test a formatted address layout.

City

Specifies a city to test a formatted address layout.

St/Prov

Specifies a state/province to test a formatted address layout.

Zip

Specifies a zip code to test a formatted address layout.

Country

Specifies a country name to test a formatted address layout.

> **Note:** Note: The address format that applies to a given layout is based upon the value entered in the Country field, so be sure to enter a value in this field. If the incorrect value is entered in this field, the test will not function correctly.

Result

Displays the results of the formatted address layout using the values entered in the above fields.

Test

Used to display the test results in the Result field.

To test an address format

1. From Customers, select Set up tables > Country address layouts to open the Country address layouts window.
2. Click Find.
3. Click the lookup icon in the Format field to choose the format code for the address format that you want to test.
4. Click OK to open the address format on the Country address layouts window.
5. Click Test Layout to open the Address Layout Tester window.
6. Enter an address in the first Address field.
7. (optional) Enter an address in the second Address field.
8. Enter a City.
9. Enter a state or province in the St/Prov field.

10. Enter a Zip code.
11. (required) Enter a Country that has had the selected address format applied to it.

    Note: The address format that applies to a given layout is based upon the value entered in the Country field, so be sure to enter a value in this field. If the incorrect value is entered in this field, the test will not function correctly.
12. Click Test to view the results of the formatted address in the Result field.

    To view the address format applied to a country

1. From Customers, select Set up tables > Country names to open the Country names window.
2. Select the country from the Current Countries field. The code for the address layout applied to the country displays in the Address Format field.

   Note: If an address format has not been applied to a country, the Address Format will reflect a zero (0) for the format code.
3. Click Address Layouts to open the Country Address Layouts window and view the address layout.

   To remove address formatting from a country

1. From Customers, select Set up tables > Country names to open the Country names window.
2. Select the country from the Current Countries field. The code for the address format applied to the country displays in the Address Format field.
3. Click Address Layouts to open the Country Address Layouts window.
4. Click Edit.
5. Select the country from the Layout Applied to list for which you want to remove address formatting.

6. Click Remove to move the selected country from the Layout Applied to list to the Available Countries list and remove the address formatting.
7. Click Save.

To edit an address format

1. From Customers, select Set up tables > Country address layouts to open the Country address layouts window.
2. Click Find.
3. Click the lookup icon in the Format field to choose the format code for the address format that you want to edit.
4. Click OK.
5. Click Edit and make the change.
6. Click Save.

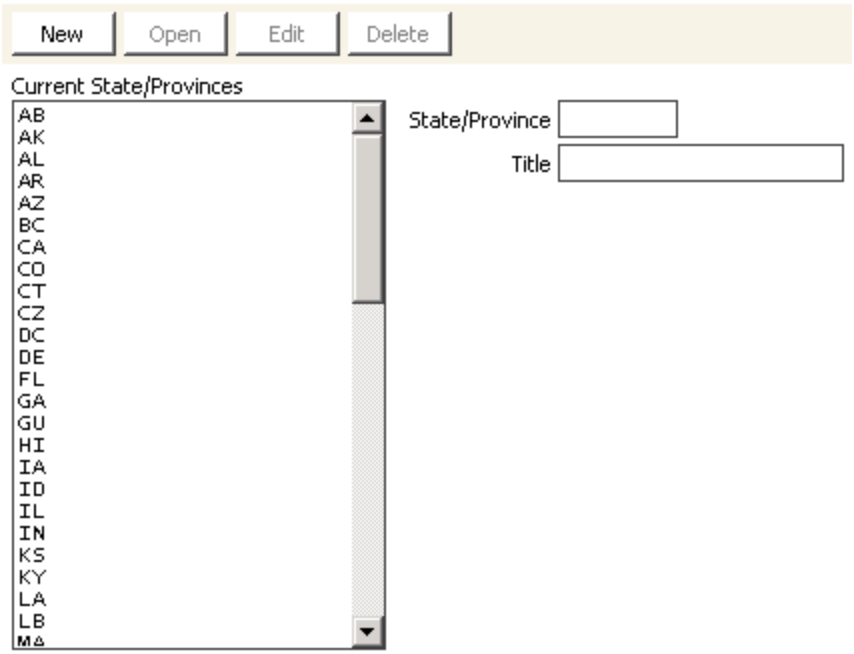
To delete an address format

1. From Customers, select Set up tables > Country address layouts to open the Country address layouts window.
2. Click Find.
3. Click the lookup icon in the Format field to choose the format code for the address format that you want to delete.
4. Click OK.
5. Click Delete.
6. Click Yes.

Set up state/province codes window

The State_Code table is a combination validation/expansion table for the St/Prov field used for customer addresses. This table is preloaded with all 50 two-character state abbreviations and full name descriptions. It also contains valid codes for the District of

Columbia, other related U.S. regions, and Canadian provinces. You can add any entries you need.



Admin Console: Configure > Membership > Set up tables > Set up state/province codes

Desktop: Customers > Set up tables > State/province codes

Current State/Provinces

This field contains a list of defined state/province codes.

State/Province

Enter the state/province code in this field.

Title

Enter the full name of the state/province in this field.

To define state/province codes

1. From Set up state/province codes window, click New.
2. Enter the code for the state/province you want to add to your validation/expansion table in the State/Province field.
3. Enter the full name of the state/province in the Title field.
4. Click Save.

Customer general lookup/validation and expansion tables

There are several general lookup/validation tables in iMIS (see General lookup/validation tables). Many of these tables are optional, but provide a way to maintain consistency in data entry. The following tables are most commonly set up to support Customers:

- ADDRESS_PURPOSE - enables you to have an unlimited number of addresses per customer.
- BAD_ADDRESS - enables you to mark address that do not pass validation with codes such as “moved”, “no_such_addr”, and so on.
- SALUTATION_CODE - provides pre-defined salutations such as “Dear Friends”, Dear <name>, and so on.
- DESIGNATION - provides a pre-defined list of designations such as “MD”, “CPA”, and so on.
- COMMITTEE_GROUPS - provides a pre-defined list of categories into which you can group committees. For example in a large organization there might be several committees that focus on outreach, education, and so on.
- GROUP_CODE - in order to use the Relationships module you must define the GROUP_CODE “Role”.

Setting up Chapter Management

Setting up Chapter Management consists of the following:

- Setting field prompts
- Defining chapter codes

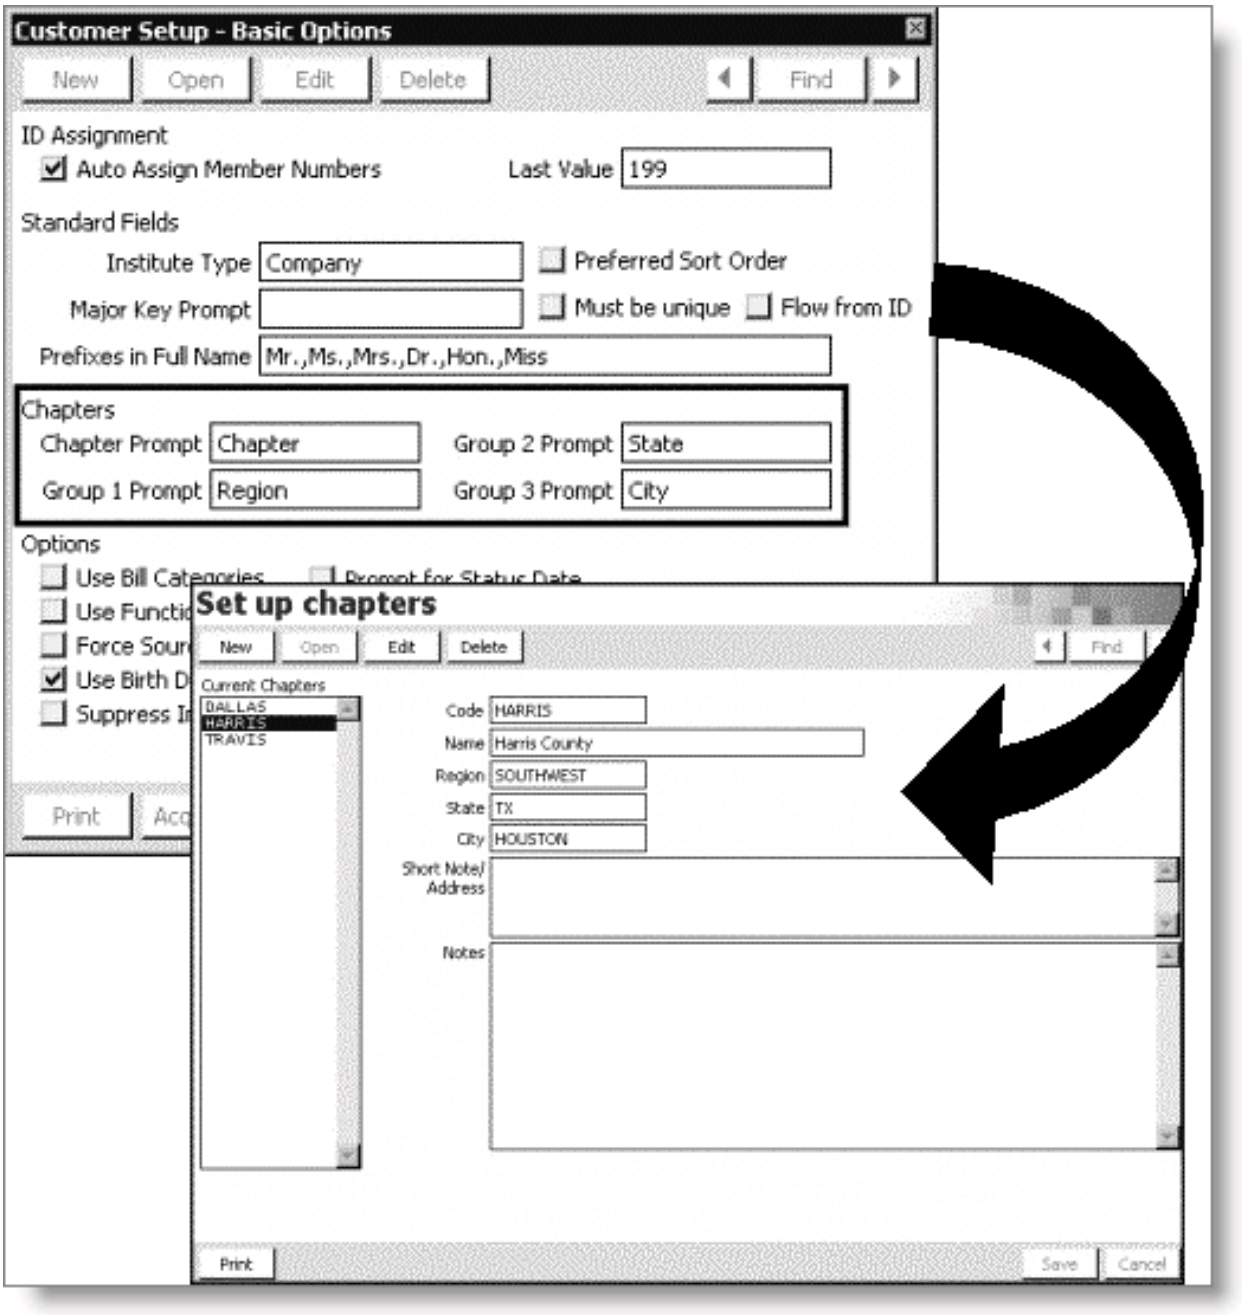
Once setup is complete, you can enter the chapter enrollments for anyone maintained in your customer database.

To use the chapter-tracking feature, your administrator must specify a Chapter Prompt field on the Customer Setup - Basic Options window.

If needed your administrator can also establish a hierarchical structure of up to three levels for your chapters by specifying group prompts on the Customer Setup - Basic Options window. For example, if your chapters are grouped by region, the proper region for the chapter can be designated. This will let you group customers by region (on reports, searches, etc.). With this added capability, you can produce detail or summary reports by region with the information sorted by region overall and chapter under that.

To set chapter prompts

1. From Customers, select Set up module > General, and click Basic Options to open the Customer Setup - Basic Options window.
2. Click Edit.
3. Enter a Chapter Prompt for tracking customers who belong to a particular chapter.
4. (optional) Enter a prompt in the Group 1 Prompt, Group 2 Prompt, and Group 3 Prompt fields. The prompts you define display between the Name and Short Note/Address fields on the Chapters window (from Customers, select Set up tables > Chapters). These groups allow you to specify and maintain hierarchies among your chapters, which facilitates targeted mailings and reporting. Examples of groupings include countries or regions, states, and counties and cities.
5. Click OK.



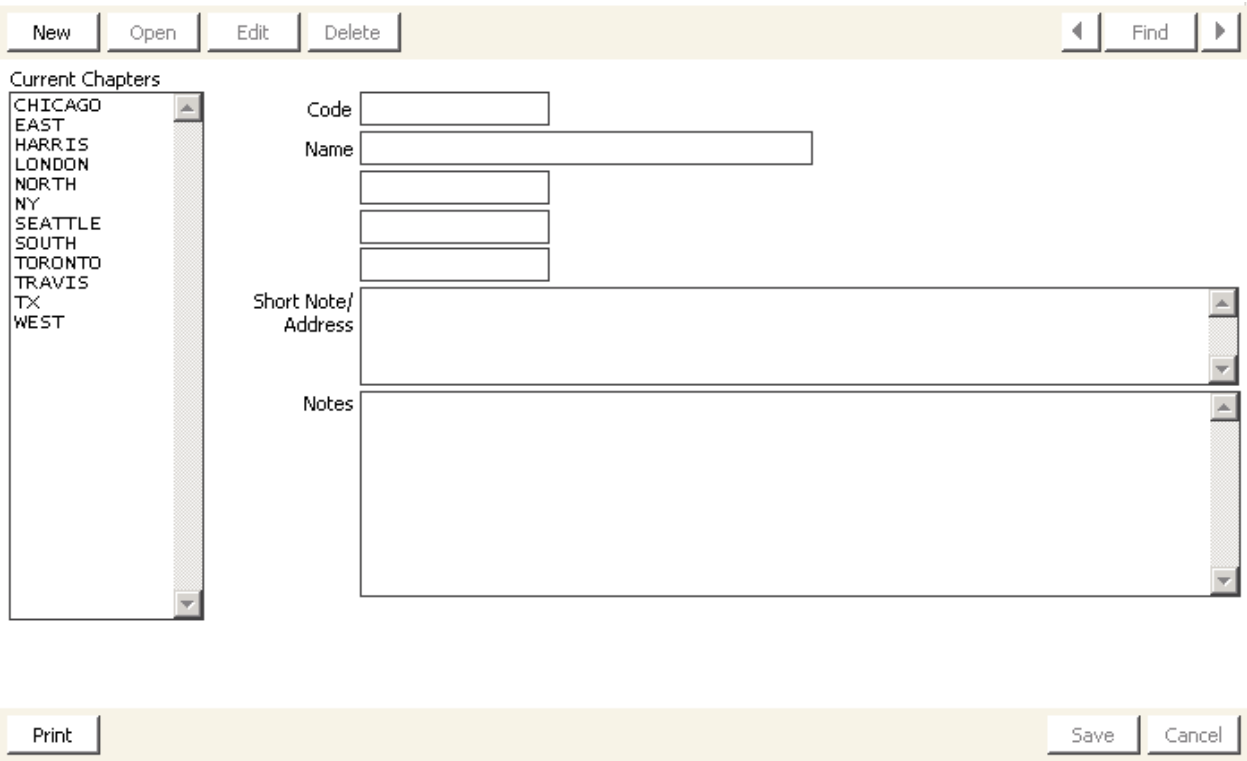
Sample chapter prompts defined on Customer Setup - Basic Options window displaying on Chapters window

Defining chapter codes

With the Chapter Codes table, you can easily track chapter members through iMIS. To maintain chapter designations, you only have to set up a table of chapters and enter a

chapter code for relevant customers in your file. The chapter table entry can be as simple as a chapter code and a chapter name, but you can add additional information such as an address or a note.

Set up chapters window



Admin Console: Configure > Management > Set up tables > Set up chapters

Desktop: Customers > Set up tables > Chapters

Current Chapters

Lists the codes assigned to each chapter.

Code

(required) Use this field to assign a unique code to each chapter. This field holds a maximum of 15 characters.

Name

Use this field to assign a name to each chapter.

Chapter prompts

Specify codes for three groups that correspond to the chapter hierarchy. You define the labels that display for these fields on the Customer Setup - Basic Options window

- Use the first field to enter a code for the highest level grouping of your chapter hierarchy (if applicable). For example, if you have a chapter organizational structure containing several sub-groupings, the Region code could represent the highest level.
- Use the second field to enter a code for the second-highest level grouping of your chapter hierarchy (if applicable).
- Use the third field to enter a code for the third-highest level grouping of your chapter hierarchy (if applicable).

Short Note/Address

Specifies miscellaneous notes about a chapter, as well as an address for the chapter.

Print

Prints information stored in the Chapter Description table.

To define a chapter code

1. From Set up chapters window, click New.
2. Enter an abbreviation for the chapter in the Code field.
3. Enter the full name of the chapter in the Name field.
4. (optional) Enter a code in the three fields between the Name and Short Note/Address fields.
5. (optional) Enter a note or address for the chapter in the Short Note/Address field.
6. (optional) Enter a note for the chapter in the Notes field.
7. Click Save.

To modify a chapter code

1. From Set up chapters window, select the Chapter code you wish to modify.
2. Click Edit.
3. Edit the fields you wish to change.
4. Click Save.

To delete a chapter code

1. From Set up chapters window, select the chapter code you wish to delete.
2. Click Delete.

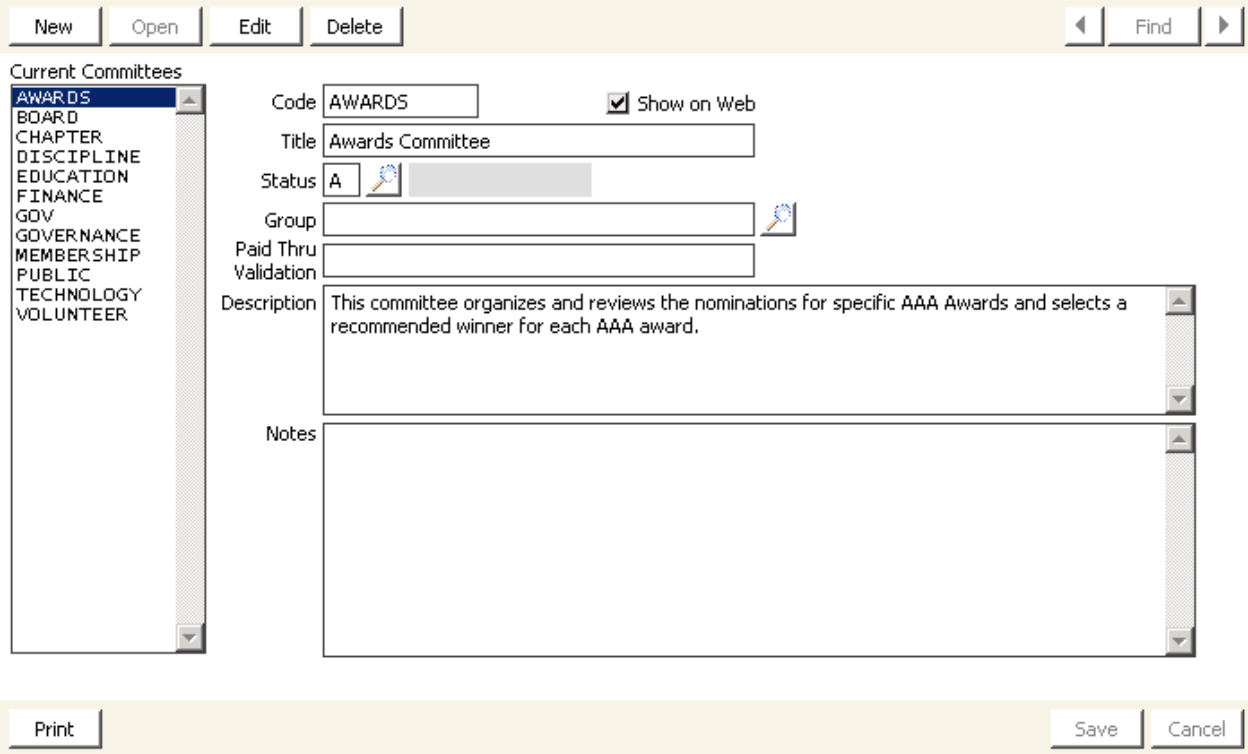
Setting up committees

To set up committees you must:

1. Define committee groups.
2. Define committee codes.
3. Define committee positions.
4. Set committee options and membership duration.

After you set up these tables and options, you can enter the committee assignments (current, future, and historical) for any individuals maintained in your customer file.

Set up committee codes window



Admin Console: Configure > Membership > Set up tables > Set up committee codes

Desktop: Customers > Setup tables > Committee codes

Current Committees

Lists the codes assigned to each committee.

Code

Specifies a unique code for each member. The maximum length is 15 characters.

Show on Web

Enables all committees and committee members associated with this committee code to be listed on the Committees page of the Public view components site. Clear this check-box to prevent the associated committees and committee members from being listed.

Title

Specifies a descriptive name for the committee. The maximum length is 60 characters.

Status

Use this field to identify the status of the committee as A for active or I for inactive. If you wish to discharge a committee, set its status to I for inactive. Click the lookup icon to select an available value.

> **Note:** Note: To use the search feature, the COMMITTEE_STS general look-up/validation table must be set up.

Group

Use to collectively group related committees together. Click the lookup icon and select an available value.

> **Note:** Note: To use the search feature, the COMMITTEE_GROUP general look-up/validation table must be set up.

Paid Thru Validation

Specifies a validation code that links a committee to a dues-product code for a given chapter or area. This field is used to verify that a potential committee member has purchased the required chapter or area dues-product. Click Edit to see a drop-down list of available chapters.

Description

Describes the purpose of the committee. This description is displayed in the committee roster and is available for printing on other reports. The maximum length is 255 characters.

Notes

Stores miscellaneous notes that are printed on reports and directories. The maximum length is 32,000 characters.

Print

Prints information stored in the Committee Codes tables.

To define committee codes

For each committee in your customer system, you must define an alphabetic committee code and a title for the committee that you are setting up in the Committee Codes table. Define committee codes and assign committees to groups after defining the committee groups.

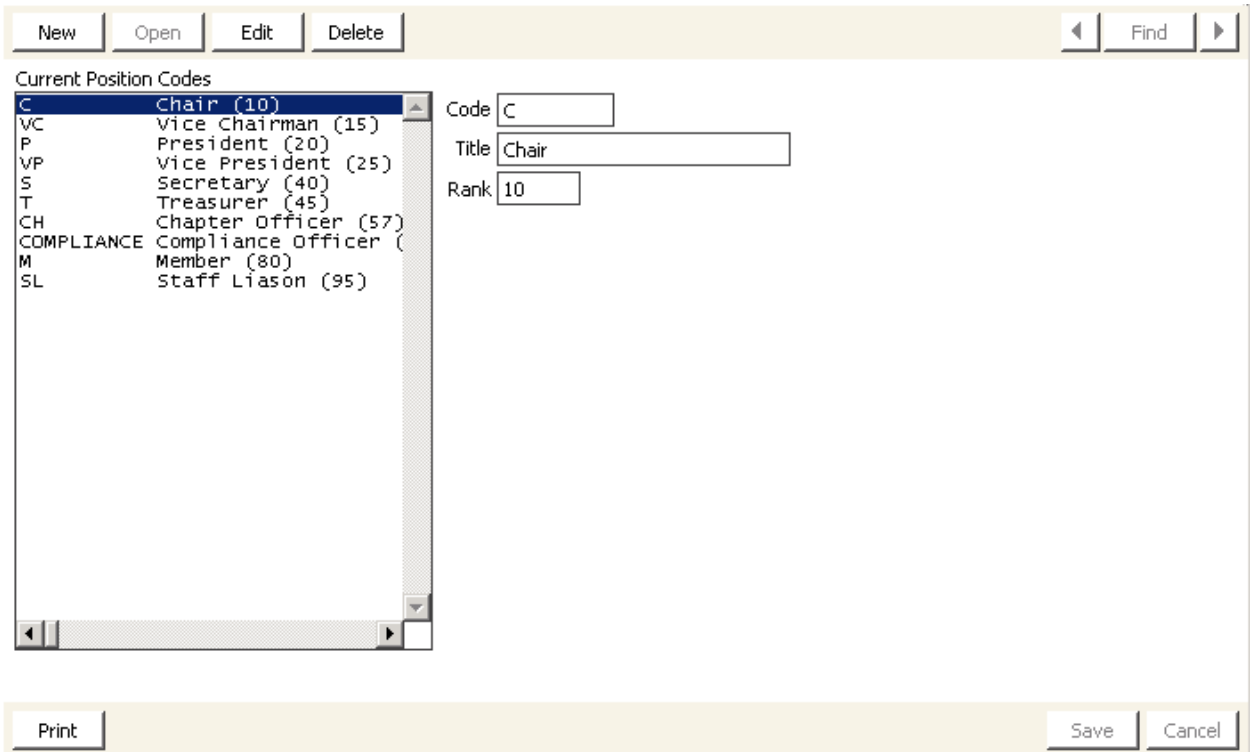
1. From Set up committee codes window, click New to create a new committee code, or select an existing one from the Current Committees list and click Edit to modify it (or click Delete to remove the committee code).
2. Specify the committee code information.
3. Click Save.

To change a committee status

1. From Set up committee codes window, from the Current Committees list, select the committee whose status you want to change.
2. Click Edit.
3. Enter I for Inactive in the Status field.
4. Click Save. A warning message box displays.

   Note: When you change a committee to inactive, iMIS searches the Activity table for any committee members with a Thru date greater than today. If any are found, iMIS will notify you and ask if you want those Thru dates automatically changed to yesterday's date. If you answer yes, iMIS will set those activities' Thru dates back to the previous day's date.
5. Click Yes.
6. Click Save on the Committee codes window.

Set up committee positions window



Admin Console: Configure > Membership > Set up tables > Set up committee positions

Desktop: Customers > Set up tables > Committee positions

Current Position Codes

Displays the various positions that can be held within any committee.

Code

Specifies a code that represents each position that can be held within any committee. Create codes to represent all committee appointees, even those who do not hold officer-level positions. Characters entered in this field are capitalized automatically.

Title

Specifies the descriptive name for the committee position.

Rank

Specifies a unique number that corresponds to the order in which you want committee members who hold this position to display on committee rosters and other related reports. For example, enter 1 for the Chair (to display first on the roster), enter 2 for the next most important position, and so on. Assign the highest number to the lowest position such as a regular committee member.

You can reassign these ranks at any point, but in order to more easily add new positions in the future, you may wish to skip numbers between ranks. For example, if Chair is ranked as a 1, enter a 3 for the second most important position. If you do not enter a rank, iMIS sorts the members in alphabetic order.

Print

Used to print information stored in the Committee Position tables.

To define committee positions

After setting up the Committee Codes table, you must set up the Committee Positions table before you can enter committee appointments. In the Committee positions window, you assign a code, a description, and a rank (order indicator) for each position that may be held within any committee.

1. From Set up committee positions window, click New.
2. Enter a code in the Code field that represents the position you are defining.
3. Enter the descriptive name for the committee position in the Title field.
4. (optional) Enter a unique number that represents the order of importance in the Rank field.
5. Click Save.

To set committee options and membership duration

By default, iMIS sets the membership duration (the date represented in the Thru field in the Manage committees window) to 12. For example, when you type a date in the From field, the Thru date will default to 12 months from that date.

1. From Customers, select Set up module > General, and click Advanced to open the Customer Setup - Advanced window.
2. Click Edit.
3. Set up the options and customer duration for your committees.
4. (optional) Enter labels in the Minutes 1, 2, 3, and 4 Prompts for options that activate in the Minutes window. The option(s) activate in the Minutes window only when a label is entered in a Minutes Prompt field in the Customer Setup - Advanced window.
5. (optional) Enter the number of months in the Default Duration (months) field that you want iMIS to use when calculating the default Thru date in the Manage committees window. To indicate that the committee appointment does not expire, leave this field blank or set it to 0.
6. (optional) Enable the Use Co ID Hierarchy option to link a committee to the ID of a company record. A sub-set of customers associated with the company branch of the committee is created.
7. Click Save.

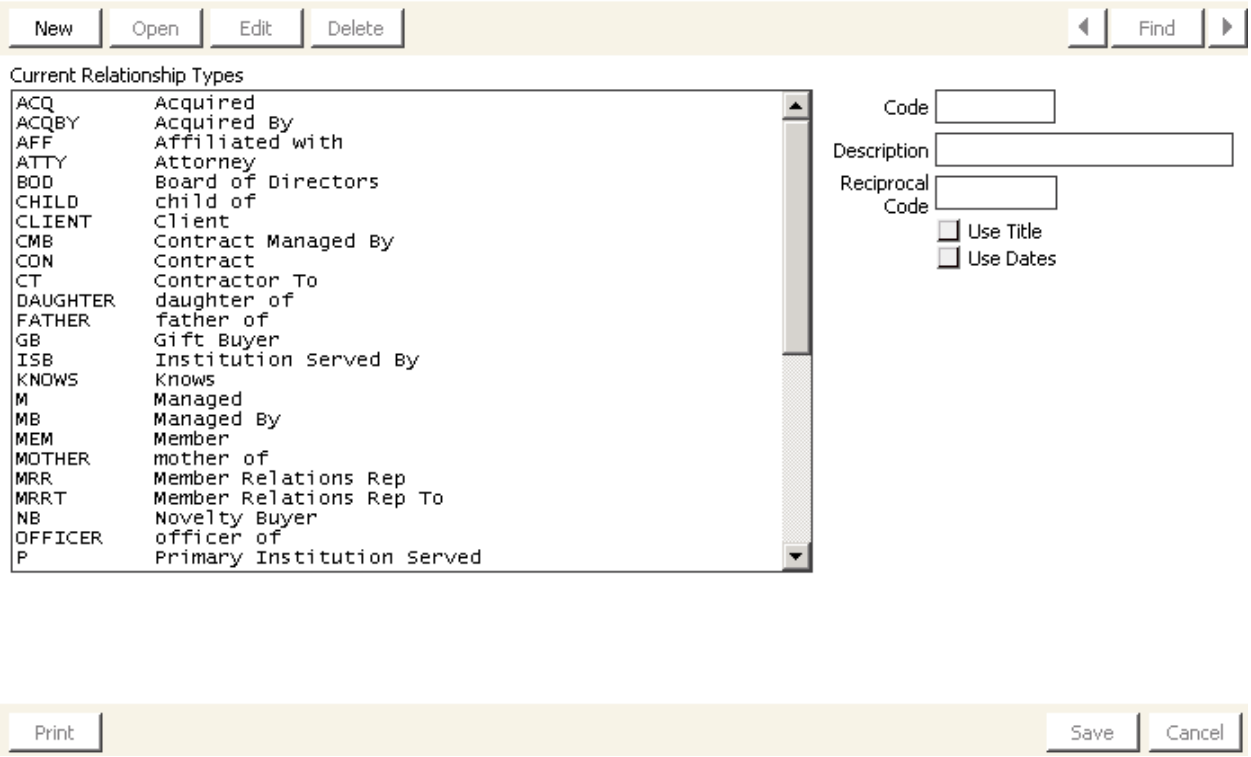
Setting up relationship types

Use the Relationship types window to add, edit, and delete relationship types.

Configuring Relationships

In order to use the Relationships module, you must set up a GROUP_CODE general look-up/validation table.

Set up relationship types window



Admin Console: Configure > Membership > Set up tables > Set up relationship types

Desktop: Manage customers > Set up tables > Relationship types

Code

Specifies a code that you want to represent the relationship.

Description

Use this field to describe the relationship code. Code descriptions display next to their corresponding code on the Relationship Detail window when you select the lookup icons for the Relationship and Reciprocal fields.

Reciprocal Code

(optional) Enter the code (existing or yet to be defined) for the relationship you want to link to this code to in order to create paired relationship records (for example, you can make MOTHER the reciprocal code for the relationship type DAUGHTER).

Use Title

(optional) Enable if you want the Title and Functional Title fields to display in the Relationship Detail window.

Use Dates

(optional) Enable if you want to display fields for the beginning (From) and ending (Thru) dates of the relationship in the Relationship Detail window. Use this option for time-bound activities such as appointments.

To add a new relationship type

1. In the Set up relationship types window, click New.
2. In the Code field, enter a value that you want to use to represent the relationship.
3. In the Description field, enter information that describes the relationship. The description displays on the Relationship Detail window for this code.
4. (optional) If desired, enter the code for the relationship you want linked to your new relationship type in the Reciprocal Code field.

   Note: If you leave the Reciprocal Code field blank for relationship type, two contacts connected with that relationship type will be displayed with that same type.
5. (optional) Enable the Use Title option if you want to display the Title and Functional Title fields in the Relationship Detail window.
6. (optional) Enable the Use Dates option if you want to display fields for beginning (From) and ending (Thru) dates of the relationship in the Relationship Detail window.
7. Click Save.

To edit a relationship type

You can change the Description, Reciprocal Code, and the Use Title or Use Dates options for any of the standard relationship types that are shipped with iMIS, and you can edit any customized relationship types that you created.

1. In the Set up relationship types window, select a code from the list of relationship types.

2. Click Edit.
3. Enter the new information.
4. Click Save to save the changes, or click Cancel to cancel your changes.

To delete a relationship type

1. In the Set up relationship types window, select a code from the list of relationship types.
2. Click Delete. A message displays asking you to confirm the deletion:

- Click Yes to remove the type.
- Click No to cancel the deletion.

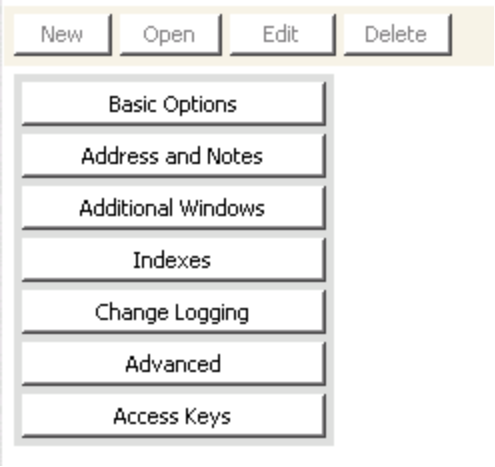
> **Note:** Note: Before deleting a relationship type, check to be sure that your system does not have any relationships set up that use that relationship type.

Customers: Set up module

Customer Management is usable out of the box but is designed to be customized to your specific organization's structure and operation. For this reason, you must work with your System Administrator to set up and configure it to meet the needs of your organization. This area outlines the steps required in setting up iMIS for maintaining your customer data according to organizational requirements for:

- Basic customer options.
- Customer addresses and notes.
- Lookup information for searching with the Find window.
- Fields in the Change Log.
- Advanced customer options.

Configure membership options window



Admin Console: Configure > Membership

Desktop: Customers > Set up module > General

Basic Options

Opens the Customer Setup - Basic Options window.

Address and Notes

Opens the Customer Setup - Address and Notes window.

Additional Windows

Opens the Customer Setup - Additional Windows window.

Indexes

Opens the Customer Setup - Indexes window.

Change Logging

Opens the Customer Setup - Change Logging window.

Advanced

Opens the Customer Setup - Advanced window.

Access Keys

Opens the Customer Setup - Access Keys window.

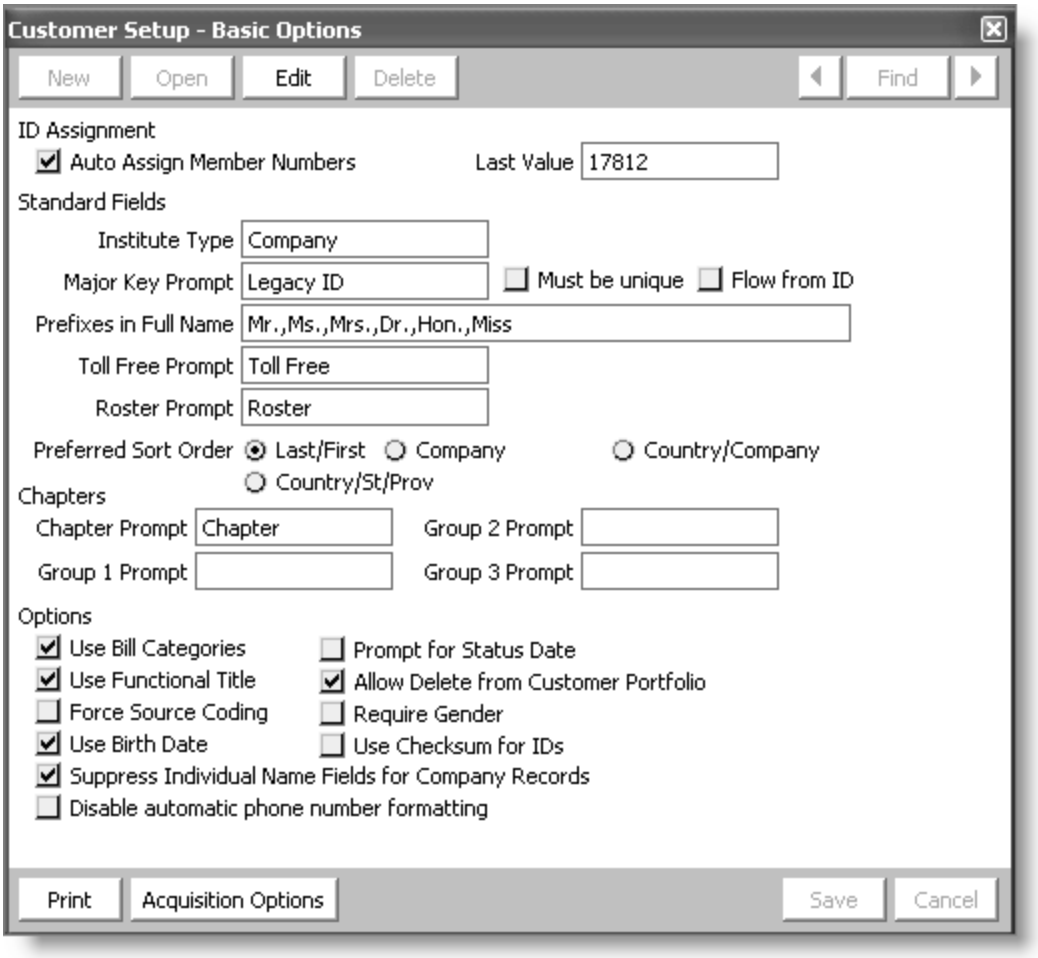
Print

Used to generate and send a system settings report to your report destination.

Setting basic customer options

The Customer Setup - Basic Options window lets you set up user-defined fields that, once defined, will be displayed in the appropriate data maintenance windows. In addition, you can enable and adjust several important system features through this window.

Customer Setup - Basic Options window



From Customers, select Set up module > General, and click Basic Options

Auto Assign Member Numbers

When selected, iMIS assigns a unique customer identification number (ID) to each new customer. This option is required if you allow users to create new accounts in iMIS Public or Web views.

Last Value

Displays the sequential counter iMIS uses in auto-assigning IDs and only has relevance if Auto Assign Member Numbers is enabled. Unless the auto-assign option is disabled, this value will be blank (or zero) for a newly installed system and cause the first ID to be assigned as one (1). If you need to have the first assigned ID be other than one, you can enter a value of one less than what you want the first number to be. You can only enter a value between 0 and 2147483647; otherwise an error will occur.

Institute Type

Assigns a label to the standard company field. The default label is Company. If you assign a different label, that label is used in the Customers Results tab, and in various reports and windows. You may want to assign this label according to the types of customers you serve. For example, if your customers are hospitals, assign Hospital.

Example of Institute Type with the Company label assigned

Preferred Sort Order

Designates the sort order of search results as one of the following:

- Last/First - results are sorted by last name, first name.
- Company - results are sorted by the designated company sort, last name, first name.
- Country/Company - results are sorted by country, state/province, company sort, last

name, first name.

- Country/St/Prov - results are sorted by country, state/province, last name, first name.

> **Note:** Note: The sort options use the labels you configured for Institute Type (by default "Company") and State/Province (by default "St/Prov").

With the exception of certain types of searches for which the default sort order would not be appropriate, results will are sorted according to the sort order chosen. The following types of searches override the default sort order:

- Name - results are sorted by last name, first name, then if prospects are included in searches, whether the person is an existing customer or a prospect.
- Company/Company Only - results are sorted by the designated company sort, then the preferred sort order.

  Note: The Company search (which includes personal records that are associated with company records) adds prospect status as the final sort column.
- Task Date - ignores the preferred sort order; data is not sorted.
- Ad Hoc - if the ad hoc search uses company ID as a criterion, the results are sorted by the designated company sort field. Otherwise, the preferred sort order is followed.

  Major Key Prompt

  (optional) Specifies a primary field through which you can retrieve records. Enable the option by entering a prompt (label) in the field. iMIS then makes the field available for referencing and searching for customer records throughout the system. Useful reference keys are social security numbers, certificate numbers, license numbers, and old customer ID numbers.

> **Note:** Note: The data entered in this field displays in parentheses next to the main ID on most customer reports.

  Must be unique

When selected, the Major Key Prompt field is validated for uniqueness during data entry.

Flow from ID

When selected, links the Major Key field with the Id field, populating the Major Key field with the user's ID.

Prefixes in Full Name

Specifies which prefixes from the PREFIX general lookup table are included in Name.FULL_NAME. The prefixes you enter in this field must match either the Code or the Expansion for the corresponding prefix entered in the PREFIX general lookup table. When entering a list of prefixes, values must be separated by commas. The total length of this field is 5000 characters.

Toll Free Prompt

Specifies a label for toll free numbers. This customized prompt is displayed on several iMIS windows in Orders, Fundraising, Events, Exhibitions, Exposition, and in the Customers area.

Roster Prompt

Specifies the a heading for the Roster tab.

Chapter Prompt

Specifies a prompt (label) for tracking customers who belong to a particular chapter or for similar tracking purposes. You can use the chapter-tracking feature for tracking at levels other than chapter such as district and region.

> **Note:** Note: The Chapter field will be activated only if you enter a label in the Chapter Prompt field. The Chapter field, with your user-defined label, displays on the Status tab.

The group prompt fields within the Chapters area of the Customer Setup - Basic Options window are used to further expand and define chapter affiliation and association. Think of the groups as levels with Group 1 being the first level and largest division of the

association. Chapter would be the fourth level and smallest division of the association. These prompts display in the Chapters window (from Customers, select Set up tables > Chapters).

Group 1 Prompt

Specifies the region the chapter is in. Examples could be country or region such as Western or Central.

Group 2 Prompt

Specifies the division the chapter is in and to further define Group 1. Examples could be states.

Group 3 Prompt

Specifies the area the chapter is in and to further define Group 2. Examples could be counties and cities.

Use Bill Categories

When selected, establishes a sub-grouping of customers. The Category field is shown to the right of the Type field in Customers > Manage customers. Its primary purpose is to sub-categorize customers for billing purposes. For example, if the dues amount for sustaining customers is any of five different sums based on organization size, you can track those size levels in the Category field.

Note: Note: Since it is best to maintain a small group of customer types, use the secondary Category field when you need to break down many different billing levels. See Billing for more.

Use Functional Title

Not implemented

Force Source Coding

When selected, requires a source code entry for income-oriented transactions.

Use Birth Date

Select to display the Birth Date field on the Other tab.

Suppress Individual Name Fields for Company Records

When selected, hides the Name area of Customers > Manage customers, and when a user views a company record, moves the Company area up.

When inserting a new company record, the fields in the Name area are dimmed (unavailable) and cleared of any values as soon as the Customer Type field is set to a company customer type. When a record is saved as a company record, the data is refreshed so that the company fields shift to the top of the area and the Name area is no longer visible.

Note: Note: If a customer type is later changed from a company to an individual, the fields in the Name area of the record are restored; however, any values that existed for those fields are not restored.

Disable automatic phone number formatting

When entering phone numbers in iMIS, the numbers are automatically formatted in the U.S. format of (xxx) xxx-xxxx. When this option is selected, no formatting is applied and the phone number is displayed as typed.

Prompt for Status Date

When selected, iMIS prompts the user to accept or override the customer's status date (not recommended for most users).

Allow Delete from Customer Portfolio

When selected, authorized users can delete customer records directly by clicking Delete on the Customers area (Customers > Manage customers). A warning box prompts the user to verify the deletion.

Note: Note: Disabling this option offers a safeguard against the accidental deletion of records. To delete customer records, mark them for deletion with “D” (or a code-

string beginning with D) in the Status field of Customers > Manage customers (recommended).

Require Gender

When selected, displays the Gender field on the Other tab. This option does not automatically require a gender (M or F) be entered in the field. iMIS automatically populates the Gender field based on the entry in the Prefix field of the Customers area. Prefixes that do not indicate gender (such as Dr.) will not be automatically populated, and the entry will need to be made manually.

Use Checksum for IDs

When selected, adds checksum digits to IDs that are automatically generated for Name records.

Note: Note: This checksum digit will only apply to IDs automatically generated for Name records. It is not used for other automatically assigned IDs.

Print

Generates and sends a system setting report to your report destination.

Acquisition Options

Opens the Customer Setup - Acquisitions Options window where you can specify the member types to use when converting prospect record to Name records.

Note: Note: This button is displayed when iMIS is licensed for Acquisition Management.

About iMIS IDs

iMIS uses the ID internally to store and access customer records. For this reason, you can never change the ID that you assign to a newly entered customer.

Most users should allow iMIS to assign IDs to new customers code for the following reasons:

- The ID must be unique to each customer record. Once it's assigned, you can never change it. If you enter an incorrect ID assignment, you have to delete the entire customer record and reenter it. This can create problems if other records are linked to the incorrect ID.
- The customer ID is not critical for searching, so it does not need to be easily remembered. iMIS provides search methods such as name, company, and customer type for finding customer records.
- You can label and use a second, optional user-entered ID (or major key) for iMIS to maintain. This Major Key field can serve as your primary look-up key throughout iMIS. This user-entered ID can be validated to be unique, such as a social security or license number.
- Having users assign IDs is complicated by the fact that iMIS tracks prospects in the main database, and all of these records must be assigned unique IDs. The volume of these records could make it hard to maintain a user-assigned series of IDs.
- Some features, such as Add to Master in iMIS Events, will auto-assign IDs.

Note: Note: If you allow iMIS to assign the ID, give some consideration to the starting ID. If you are doing an automatic conversion of records from another system and you are retaining the old ID numbers, set the last ID of the original record to any number equal to or higher than the highest pre-established ID number in the data you will be converting. The first system-assigned ID will be one greater than the last ID number of the original record.

Note: Note: If you allow users to create new accounts in iMIS Public or Web views, be sure to enable the Auto Assign Member Numbers option (Customers > Set up module > General > Basic Options).

To facilitate statistical reporting on your organization's customer activity, iMIS automatically tracks a customer's overall status (Name.MEMBER_STATUS) based on status-relevant events: customer type changes, status field changes, and billing payments. These changes are stored with the effective date of the change.

Source codes

Certain income-oriented data entry processes throughout iMIS let you enter a source code for each transaction. This source code, retained in the activity records generated from the transaction, lets you track the campaign or other source that motivated the purchase which can then be used for analysis or searches. Although the Source Code is a data entry field in all appropriate transaction entry windows, users do not have to enter a source code unless you enable this option.

Note: Note: To use this feature, you need to establish a table of valid source codes. See System Management for more.

Customer status

By default, iMIS automatically updates Name.MEMBER_STATUS_DATE to the current system date (or the dues payment's transaction date) for status changes (except when you enter a JOIN_DATE for a new record, in which case the JOIN_DATE is used).

If you select the Prompt for Status Date option, iMIS will prompt you to accept or override the default effective date for the change. The prompt will only occur if you change the status from an active status (status = A or begins with A) to an inactive status (S, I, D or statuses that begin with S, I, or D) and vice versa. A user-defined status that does not begin with those letters may not work with this feature. Most users do not need to manually control these dates, so they should not enable this setup option.

ID Checksum digits

Checksum digits give IDs a more unique value than simple sequentially assigned numbers. The checksum is not a random number; it is derived from the ID using a specific set

of algorithms. The check digit calculation used to derive a checksum is the standard Mod 11 check digit algorithm.

Allowed symbols in iMIS IDs

iMIS does not allow these symbols in the ID field: &, \, [,], |, \, ", ', #, +, <. Remember that the Auto Assign Member Numbers option must be cleared in order for you to enter IDs in the ID field.

Preferred sort order options

You can select from several options when configuring how search results are sorted in the Customers Results tab. The Customer Setup - Basic Options window offers you the following choices of Preferred Sort Order:

- Last/First - results are sorted by last name, first name.
- Company - results are sorted by the designated company sort, last name, first name.
- Country/Company - results are sorted by country, state/province, company sort, last name, first name.
- Country/St/Prov - results are sorted by country, state/province, last name, first name.

> **Note:** Note: The sort options use the labels you configured for Institute Type (by default "Company") and State/Province (by default "St/Prov").

The Preferred Sort Order options let you choose the order in which Find results are displayed

With the exception of certain types of searches for which the default sort order would not be appropriate, results are be sorted according to the sort order chosen. The following types of searches override the default sort order:

- Name - results are sorted by last name, first name, then if prospects are included in searches, whether the person is an existing customer or a prospect.
- Company/Company Only - results are sorted by the designated company sort, then the preferred sort order.

  Note: The Company search (which includes personal records that are associated with company records) adds prospect status as the final sort column.
- Task Date - Ignores the preferred sort order; data is not sorted.

  Ad Hoc - If the ad hoc search uses company ID as a criterion, the results are sorted by the designated company sort field. Otherwise, the preferred sort order is followed.

  To set basic customer options

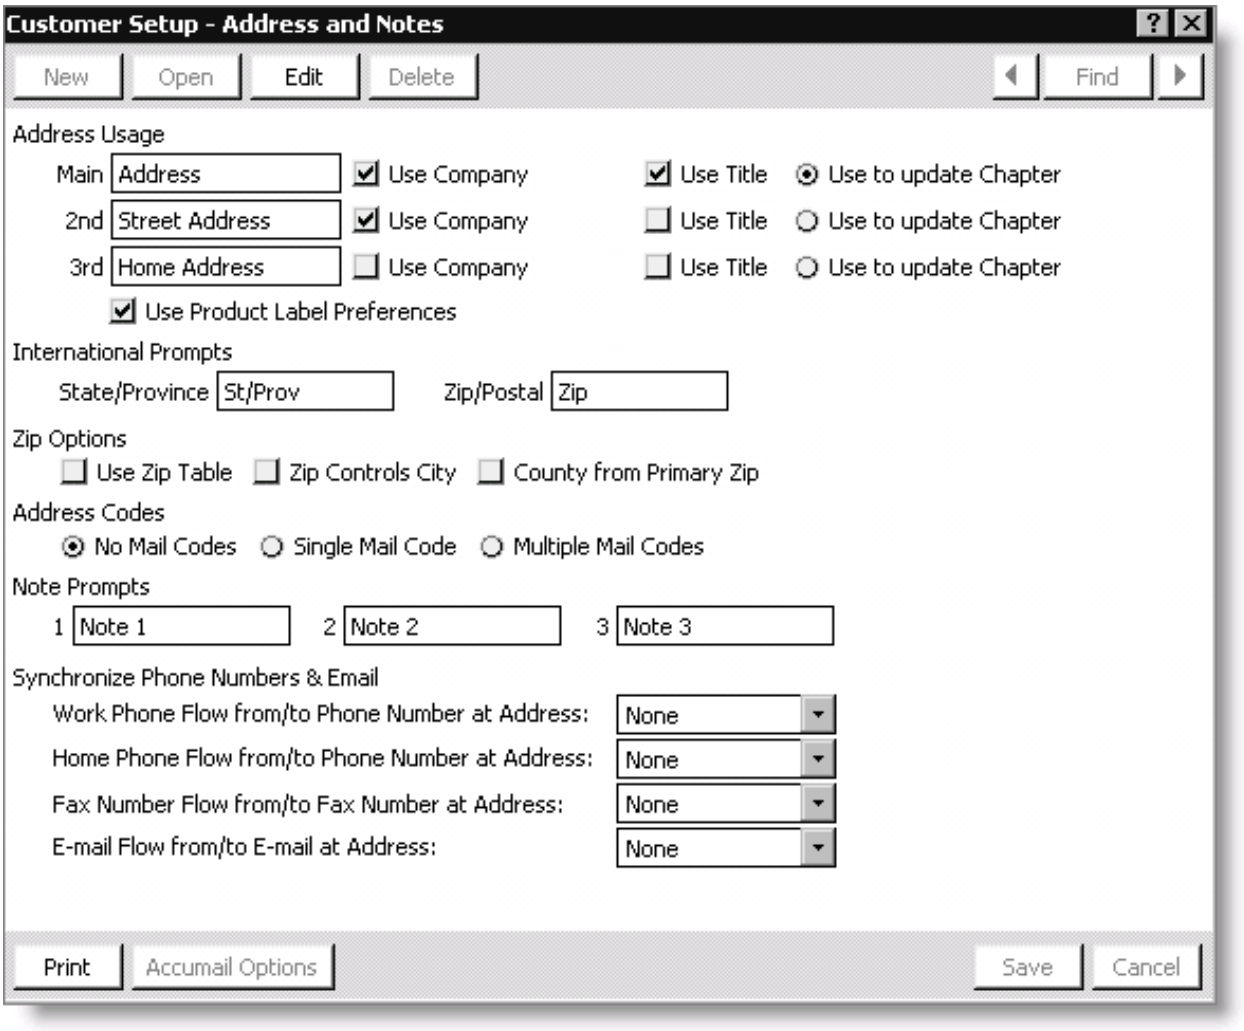
1. From Customers, select Set up module > General, and click Basic Options to open the Customer Setup - Basic Options window.
2. Click Edit.
3. Configure the iMIS options you prefer.
4. Click Save.

Setting customer address and notes

The Customer Setup - Address and Notes window gives you control over the address fields on the Address tab and Notes tab on the Manage customers window and enables you to identify or label the types of addresses you want to maintain for your customers. Within iMIS, up to three address blocks can be maintained for each entity or individual. By labeling the three addresses, you can designate which types of addresses to use in which address blocks. For your address labels or prompts, use a descriptor such as Street, Home, or Business.

> **Note:** Note: Additional address tabs can be added to the Manage customers window be defining an ADDRESS_PURPOSE general lookup/validation table (see "ADDRESS_PURPOSE (Validation)").

Customer Setup - Address and Notes window



From Customers, select Set up module > General, and click Address and Notes

Address Usage

Main - Specifies the label (purpose) for the primary (main) address block of the customer. The main address displays on both Customers > Manage customers and the Address tab.

2nd and 3rd - Use these fields to enter the labels (purposes) for the secondary addresses (if any) of the customer. These addresses display only on the Address tab.

Use Company and Use Title - Enable these fields to designate whether or not to print an individual's title and company name. For example, enable both options to include the title and company for a business address. For a home address, disable one or both options, as appropriate. If you use small (1-inch) labels, you may need to disable these options so that the address fits within the 5-line limit.

> **Note:** Note: You can toggle the Use Company and/or Use Title fields between special purpose label runs. For example, if you normally include titles on your larger labels but today need to run a set of 1-inch labels, temporarily disable the Use Title field.

Use to Update Chapter - Enable these fields to automatically update the chapter when inserting and editing an address.

> **Note:** Note: You will need to populate the Zip_Code.CHAPTER field using SQL for each zip code, or a range of zip codes, in the table before this option will automatically update the chapter. You must also enable the Use Zip Table and County from Primary Zip options located under Zip Options.

Use Product Label Preferences - Select to allow selecting specific label preferences for any mailing label on a per-customer basis. For example, you may wish to mail a social invitation to a customer's home address instead of the default office address.

> **Note:** Note: You can also use this feature to assign specific label addresses for billing products on a per-customer basis.

International Prompts

Specify labels for address information that varies depending on your locale.

State/Province - Specifies the appropriate label (prompt) for the state or province fields. For example, if most of your customers live in the United States, label the field State. If most live in Canada, label the field Province.

Zip/Postal - Specifies the appropriate label (prompt) for the zip code or postal code fields. For example, if most of your customers live in the United States, label the field ZIP. If most live in Canada, label the field Postal Code.

> **Note:** Note: The Customer Management system comes with a table of U.S. ZIP codes with their corresponding cities, states, and counties. Using this table, iMIS offers a variety of ZIP Code look-up features that you can activate.

Zip Options

Use Zip Table - When selected, speeds up the initial data entry process by automatically filling in the city and state values when a ZIP code is entered. With this option enabled, iMIS auto-fills the city and state when those fields are left blank.

Zip Controls City - When selected, causes ZIP code look-up to over-ride and correct any city and state values that don't match the city/state table values for the ZIP code. This correction only occurs when you enter or edit a ZIP code.

> **Note:** Note: If you enable the Use Zip Table and Zip Controls City options, you can still override the city name after you enter the zip code, if necessary. To do this, enter the zip code for the address; the city and state fields display default values. Replace the city name with the value you want and save the record (tabbing through the zip code field will not change the city back to the default). To revert to the default city, delete the city, state, and zip values. Then save and edit the record, and re-enter the zip.

County from Primary Zip - Select to fill in the county field from the ZIP code. The county is derived from the ZIP code entered in Customers > Manage customers.

> **Note:** Note: If you are licensed for AccuMail and have enabled the AccuMail option Update County/Congressional District, that AccuMail option will override the County from Primary Zip option.

Address Codes

No Mail Codes - Select this field if you do not need the Mail Code field. This deactivates the Mail Code field in Customers > Manage customers.

Single Mail Code - Select this field if you want to use the Mail Code field but only need a single mail code to apply to any of the available three addresses. This activates the single Mail Code field in Customers > Manage customers although it will be used with all of the customer's addresses.

Multiple Mail Codes - Select this field if you want to use the Mail Code field and need a distinct mail code for each alternative address. Choose this option if you have special groupings to apply to customers only when a certain address is specified, such as a business versus a home address.

> **Note:** Note: To use the Single Mail Code and Multiple Mail Codes options, the MAIL_CODE lookup/validation table must be set up. See System Management for more.

Note Prompts

Note 1, 2, and 3 - Use these fields to label the note field headings on the Notes tab and on the reports that include notes. As with other optional fields, these fields display on the Notes tab only if you labeled (activated) them.

Label the note fields to standardize their purpose or usage for all customers. For example, you could reserve one for internal-use notes or reminders, one for text to display in the customer directory, and the last to record directions to a customer's office.

Synchronize Phone Numbers & Email

Work Phone Flow from/to Phone Number at Address - Select the address purpose whose phone number field you want to map to the Work Phone field on the Profile tab.

Home Phone Flow from/to Phone Number at Address - Select the address purpose whose phone number field you want to map to the Home Phone field on the Profile tab.

> **Note:** Note: Home Phone Flow from /to Phone Number at Address and Work Phone Flow from/to Phone Number at Address cannot be mapped to the same address purpose.

Fax Number Flow from/to Fax Number at Address - Select the address purpose whose fax number field you want to map to the Fax field on the Profile tab.

E-mail Flow from/to E-mail at Address - Select the address purpose whose e-mail address field you want to map to the E-mail field on the Profile tab.

Print

Used to generate and send a system setting report to your report destination.

Accumail Options (QAS Options)

Opens an options window for your address verification software (either AccuMail or Quick-Address).

To set customer address and notes options

> **Note:** Note: We recommend specifying a prompt for each of the three default notes. If you do not specify a prompt for these notes, they display as disabled blank notes on the Notes tab.

1. From Customers, select Set up module > General, and click Address and Notes to open the Customer Setup - Address and Notes window.
2. Click Edit.
3. Configure Address and Notes options.
4. Click Save.

To identify your e-mail program

iMIS is programmed to look in the Windows™ System directory for the MAPI32.DLL file and access the e-mail program that is configured to the MAPI32.DLL. MAPI is the

Messaging Applications Programming Interface that enables you to send and receive e-mail.

To use the e-mail feature in iMIS, your e-mail program must be MAPI compliant. The versions (or later versions) of the following messaging programs are MAPI compliant.

- Outlook 97/98 or higher
- GroupWise 5.2 or higher
- Eudora Pro 2.2 or higher
- Eudora 3.0 and higher

> **Note:** Note: There is a conflict when both Eudora and Microsoft™ Exchange are installed. In order to use Eudora, you have to uninstall Microsoft Exchange.

You can tell what e-mail program your MAPI 32.DLL is configured to by looking at the properties of the MAPI32.DLL.

1. Right click on the Start button on your Windows Taskbar and select Explore.
2. Navigate to the \Windows\System or \Winnt\System32 directory.
3. Locate the MAPI32.DLL file.
4. Right click on the MAPI32.DLL file and select Properties.
5. Select the Version tab.
6. Highlight the Company Name. The Company Name will be the vendor of your e-mail package, for example, Microsoft, Eudora, and so forth.

> **Note:** Note: You may have to contact your software vendor to make sure they issue a MAPI32.DLL with their e-mail software package.

To create the EMAIL activity type

Sending e-mail to a customer will generate an activity record for that customer if the EMAIL activity type has been created.

1. From Customers, select Set up module > Activity types to open the Activity types window.
2. Click New.
3. Enter EMAIL in the Type field.
4. Enter a Description for the activity.
5. Enter a prompt for Description.
6. Enter a prompt for Note.
7. Enter a prompt for Source.
8. Enter additional prompts, if needed.

   The prompts entered in the Activity types window dictate which fields are enabled and visible in the Activity Detail window.
9. Click Save to update the activity type.

Troubleshooting: Email

Problem: Selecting the E-mail icon in iMIS prompts you to choose a profile.

Solution: A profile is a group of settings that define how your e-mail is set up for a particular user. If you get this message, choose a profile by typing in your profile name or selecting your name from a drop-down list. If you do not have profiles set properly, go back to your e-mail program and configure the profiles properly.

Problem: Multiple e-mail programs conflict with each other.

Solution: It is best not to have multiple e-mail programs loaded at one time. Uninstall the program(s) you are not using.

Problem: MAPI32.DLL was overwritten when a new software package was installed.

Solution: This is a common problem and often happens when installing any type of software, not just e-mail programs. After installing the software product, reinstall your e-mail

program in order to reinstall the e-mail version of the MAPI32.DLL. This problem often occurs when using the GroupWise e-mail program. After installing any software product, reinstall the GroupWise e-mail program.

Synchronizing phone and email data

You can map the Work Phone, Home Phone, Fax, and E-mail fields (Name table) on the Profile tab on the Manage customers window to the Phone, Fax, and E-mail fields (Name_Address table) on any address purpose defined in the Main, 2nd, or 3rd fields on the Customer Setup - Address and Notes window.

By mapping these fields, the data defined in these fields automatically populates the corresponding fields on the Profile tab or the address purpose tab (Name_Address data to Name data and vice versa). The data in the mapped address purpose field takes precedence over the data in the field on the Profile tab. Synchronization enables data to match and eliminates the need to enter data twice.

The following fields on the Customer Setup - Address and Notes window can be synchronized:

- Work Phone Flow from/to Phone Number at Address
- Home Phone Flow from/to Phone Number at Address
- Fax Number Flow from/to Fax Number at Address
- E-mail Flow from/to E-mail at Address

> **Note:** Note: User-defined company flow down does not support the Work Phone, Home Phone, Fax, and E-mail fields. No error message displays if you specify these fields in the User Defined Company Flow Down field on the Customer Setup - Advanced window, but specifying these fields in the User Defined Company Flow Down field has no effect on user-defined company flow down. The Work Phone and Fax fields are part of automatic company flow down, which can be used separately or in addition to user-defined company flow down.

The fields in the Profile tab of the Detail area and the fields in the Address area are listed in the following table. Also listed are the iMIS table names where the data is stored. A “Yes” is marked next to the fields that are automatically included in child records that are linked to company records.

Detail area Profile tab		
Work Phone	Name.WORK_PHONE	Yes
Home Phone	Name.HOME_PHONE	
Fax	Name.FAX	Yes
Toll Free	Name.TOLL_FREE	Yes
Email	Name.EMAIL	
Web Address	Name.WEBSITE	
Address area Main Address		
1st line Address	Name_Address.ADDRESS_1	Yes
2nd line Address	Name_Address.ADDRESS_2	Yes
City	Name_Address.CITY	Yes
State	Name_Address.STATE_PROVINCE	Yes
Zip	Name_Address.ZIP	Yes
Preferred Mail	Name_Address.PREFERRED_MAIL	
Preferred Bill	Name_Address.PREFERRED_BILL	
Phone	Name_Address.PHONE	
Fax	Name_Address.FAX	
Email	Name_Address.EMAIL	
2nd Address		
Address	Name_Address.ADDRESS_1	
2nd line Address	Name_Address.ADDRESS_2	
City	Name_Address.CITY	
State	Name_Address.STATE_PROVINCE	

Zip	Name_Address.ZIP
Preferred Mail	Name_Address.PREFERRED_MAIL
Preferred Bill	Name_Address.PREFERRED_MAIL
Phone	Name_Address.PHONE
Fax	Name_Address.FAX
E-mail	Name_Address.EMAIL
3rd Address	
Address	Name_Address.ADDRESS_1
2nd line Address	Name_Address.ADDRESS_2
City	Name_Address.CITY
State	Name_Address.STATE_PROVINCE
Zip	Name_Address.ZIP
Preferred Mail	Name_Address.PREFERRED_MAIL
Preferred Bill	Name_Address.PREFERRED_MAIL
Phone	Name_Address.PHONE
Fax	Name_Address.FAX
E-mail	Name_Address.EMAIL

Note: Note: You can include additional fields to flow down from company (parent) records to linked (child) records. From Customers, select Set up module > General, and click Advanced to open the Customer Setup -Advanced window. Enter the Table.FIELD in the User Defined Company Flow Down field. For example, to include the Web Address shown on the Profile tab as a company flow down field, enter Name.WEBSITE.

Customers synchronization behavior

Synchronization behavior is dependent on the address purpose selected in the Customer Setup - Address and Notes window (Synchronize Phone Numbers & Email area).

> **Note:** Note: If you populate a field on a mapped address tab that does not contain an address, make sure to enter an address to avoid blank address labels.

- If None is selected, the field on the Profile tab can be edited and the value in the field is not automatically synchronized with any field on any address purpose tab.
- If a value other than None is selected and:
- The mapped field on the address tab is not blank - The field on the Profile tab is automatically populated with the value from the mapped field on the address tab and is read-only.

  Note: If the field on the Profile tab previously contained a value, this value is overwritten by the value in the mapped field on the address tab.
- The mapped field on the Main address tab is blank, but the field on the Profile tab is not blank - The mapped field on the main address tab is automatically populated with the value from the field on the Profile tab.
- The mapped field on a secondary address tab is blank, but the field on the Profile tab is not blank - The mapped field on the secondary address tab is automatically populated with the value from the field on the Profile tab only if the secondary address record already exists.
- If the mapped field is on a secondary address tab and that secondary address record does not already exist, the mapped field on the secondary address tab is not automatically populated with the value from the Profile tab and the field on the Profile tab can be edited. If you click in the mapped field on the secondary address tab, this field is automatically populated with the value from the Profile tab and the field on the Profile tab becomes read-only. Any subsequent changes must be made in the mapped field on the address tab.
- Both the mapped field on the address tab and the field on the Profile tab are blank - Neither field contains a value and both fields can be edited.

- If you enter a value in the mapped field on the address tab, the field on the Profile tab is automatically populated with this value and the field on the Profile tab is read-only.
- If you enter a value in the field on the Profile tab, the mapped field on the address tab is automatically populated with the value from the Profile tab (unless the mapped field is on a secondary address tab and the secondary address record does not already exist) and the field on the Profile tab is read-only.

Imported records and synchronization

> **Note:** Caution! (Applies to records imported with iMIS Importer, NRDS, or any other import method) Due to the complexities of phone/e-mail synchronization, synchronization will only work one way from Name to Name_Address, and not from Name_Address to Name.

If you are importing data and using synchronization, the imported phone, fax, and e-mail data must be imported directly to the Name table. If updates are made directly to the Name_Address table through an import and you are synchronizing data, the Name_Address phone, fax, or e-mail value will immediately be overwritten by the current Name value, even if the Name value is blank.

Running the synchronization SQL script

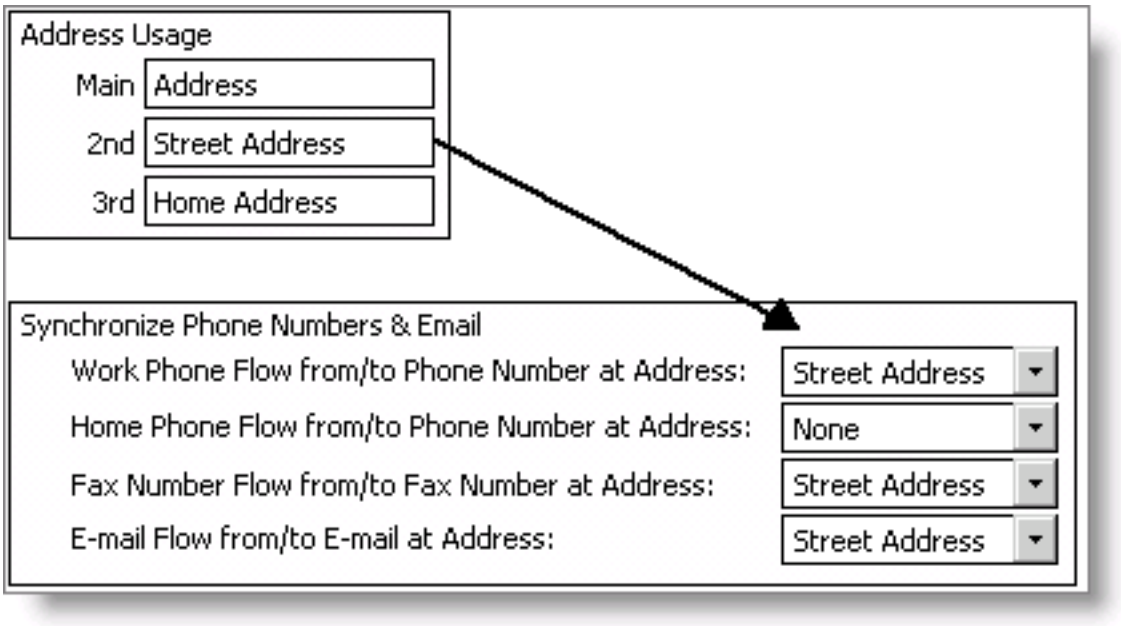
If you choose to synchronize phone numbers and e-mail addresses, you must run the Run Name_Address to Name Global Sync resynchronization SQL script located on the System Reports and Queries window (select Utilities > Reports and Queries, select Table Maintenance from the Report Types list, and select the Run Name_Address to Name Global Sync report). This script updates all existing records in the iMIS database based on the values you entered in the synchronized fields.

You must be logged into iMIS as the database administrator (dba or sa) to run this script. If the Name_Address field is not blank and is different than the Name field, a change log entry is created for each Name record changed. If multiple changes are made for a given Name record, there is a separate log entry for each field.

You must run the resynchronization SQL script every time a change is made to any of the Synchronize Phone Numbers & Email fields, except when changing a value to None. You must restart iMIS after running the synchronization SQL script.

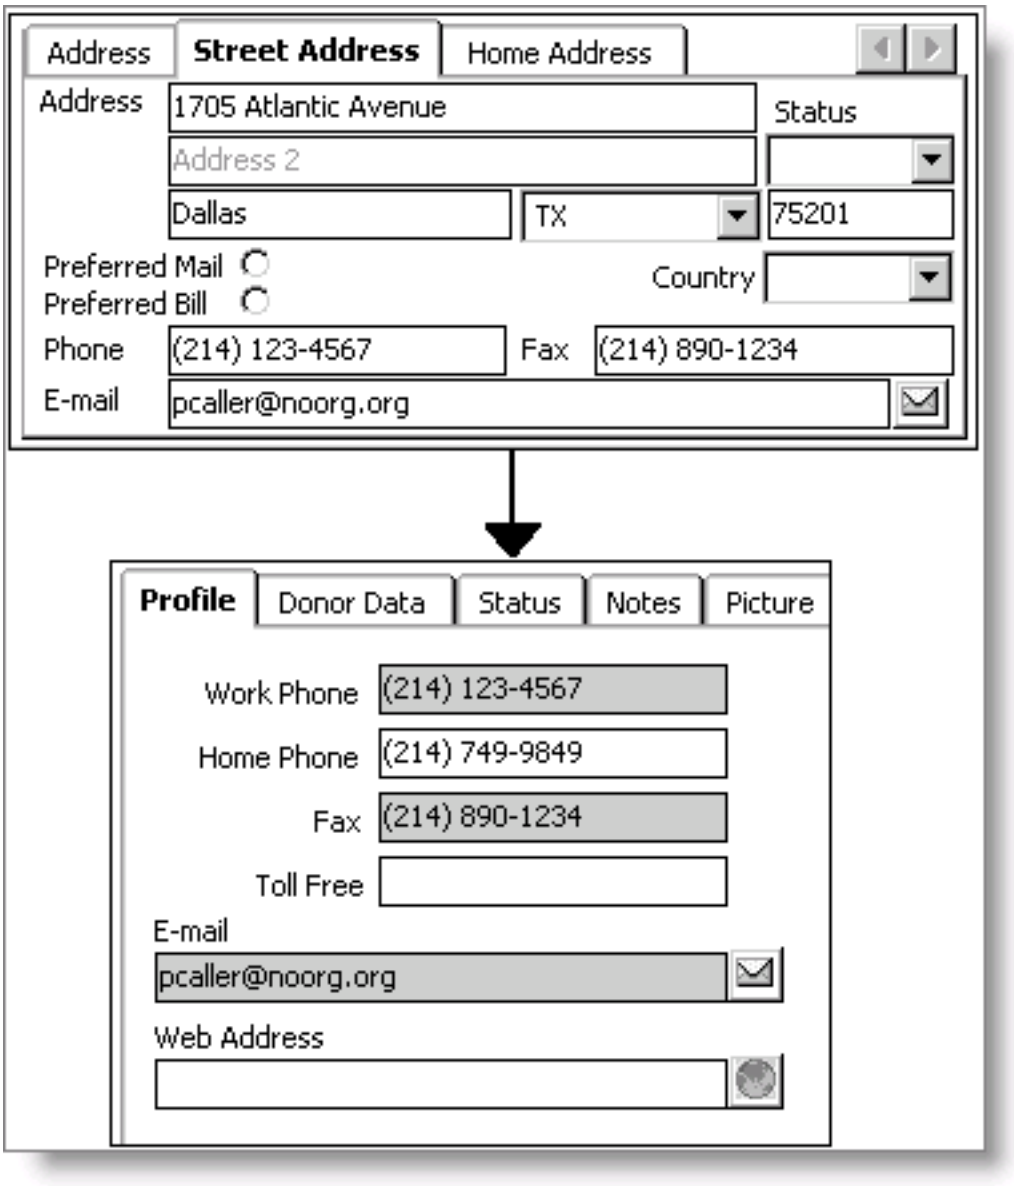
Synchronizing work phone, fax, and email example

In this example, the second address purpose, specified in the 2nd field on the Customer Setup - Address and Notes window, is Street Address. Street Address is selected from the Work Phone Flow from/to Phone Number at Address, Fax Number Flow from/to Fax Number at Address, and E-mail Flow from/to E-mail at Address drop-down lists.



Address flow down

The Work Phone, Fax, and E-mail fields on the Profile tab are automatically populated with the information from the Phone, Fax, and E-mail fields on the Street Address tab. The Work Phone, Fax, and E-mail fields are read-only since the Phone, Fax, and E-mail fields on the Street Address tab are not blank.



Phone number and email flow down

Automatic updating and synchronization

When a user or system action updates a customer's phone number, fax number, or e-mail address on the address tab that corresponds to the Profile tab specified in one of the Synchronize Phone Numbers & Email fields, iMIS automatically performs the following actions:

- Updates the Work Phone, Home Phone, Fax, and E-mail fields on the Profile tab as needed
- Performs any synchronization/flow-down tasks needed to keep the Work Phone, Home Phone, Fax, and E-mail fields accurately synchronized with the customer address record.

Avoiding blank address records

It is possible to create address records that contain a phone number but no address. For example, if you enter a value in a field on the Profile tab and the secondary address record that corresponds to the mapped field does not exist, the mapped field on the secondary address tab is not automatically populated with the value from the Profile tab. If you click in the mapped field on the secondary address tab, the field is populated with the value from the Profile tab, but the other fields, including the address fields, of the secondary address tab will still be empty. This can result in the printing of blank labels during a label run.

If you need to track secondary phone number values such as pager and cell phone numbers, you should create user-defined tables and custom tabs in Customers for this purpose rather than storing these numbers in address purpose fields. This prevents the creation of address records that contain a phone number but no address.

> **Note:** Note: If you populate a field on a secondary address tab that does not contain an address, make sure to enter an address to avoid blank address labels.

To synchronize phone numbers and e-mail

1. From Customers, select Set up module > General.
2. Click Address and Notes to display the Customer Setup - Address and Notes window.
3. Click Edit.
4. Select the work phone address mapping from the Work Phone Flow from/to Phone Number at Address drop-down list. The default address mapping is None.

5. Select the home phone address mapping from the Home Phone Flow from/to Phone Number at Address drop-down list. The default address mapping is None.

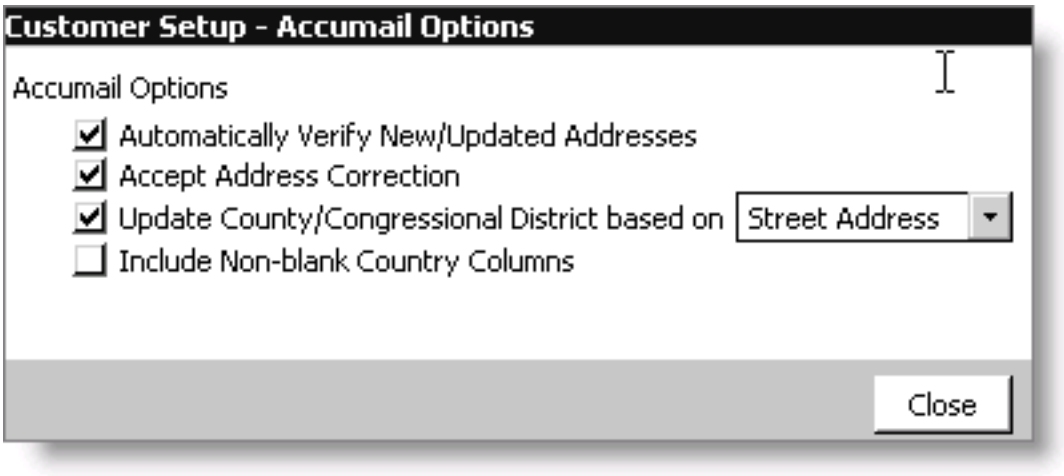
   Note: Home Phone Flow from/to Phone Number at Address and Work Phone Flow from/to Phone Number at Address cannot be mapped to the same address purpose.

6. Select the fax number address mapping from the Fax Number Flow from/to Fax Number at Address drop-down list. The default address mapping is None.
7. Select the e-mail address mapping from the E-mail Flow from/to E-mail at Address drop-down list. The default address mapping is None.
8. Click Save.
9. Ensure that no other users are logged in to iMIS.
10. Select Utilities > Reports and Queries.
11. Select Table Maintenance from the Report Types scrolling list.
12. Select Run Name_Address to Name Global Sync from the Available Reports scrolling list.
13. Click Run. The Run Name_Address to Name Global Sync window and a confirmation message display. Click Yes.
14. Exit and restart iMIS.

> **Note:** Note: You must exit and restart iMIS immediately after running the Run Name_Address to Name Global Sync script for synchronization to occur.

Setting Accumail options

The Accumail options are set on the Customer Setup - Accumail Options window.



From Customers, select Set up module > General, click Address and Notes, and click Accumail Options

- Automatically Verify New/Updated Addresses - Enable to ensure that the database will always contain certified address information.
- Accept Address Correction - Enable to standardize your addresses to meet the US Post Office preferences. For example, Avenue will be changed to Ave, and streets that have alias names will be changed to the accepted Postal street name.
- Update County/Congressional District based on - Enable to update the county/-congressional districts based on the address purpose chosen from the dropdown. Any of the three available addresses can be used.
- Include Non-blank Country Columns - Enable to cause iMIS to verify addresses with populated country fields.

To set customer Accumail options

1. From Customers, select Set up modules > General, and click Address and Notes to open the Customer Setup - Address and Notes window.
2. Click Edit.
3. Click Accumail Options to display the Customer Setup - Accumail Options window.
4. Enable or disable the Accumail options as desired.

5. Click Close.
6. Click Save.

Defining lookup indexes for the Find window

iMIS maintains a number of standard indexes that enable you to retrieve customer information quickly.

The customer ID is an indexed field, and all records are stored by their ID. You can locate records by ID at any time. In addition, iMIS keeps alternative indexes such as alphabetical key (combined last name, first name), company sort name (which displays to the right of the Company field in the Customer Portfolio), and the optional Major Key (social security number, license number, etc.).

Having iMIS maintain these keys is like having a filing system that uses multiple filing methods simultaneously: numerical, alphabetic, and alphabetic by company name. You can retrieve a record by entering the ID or all or part of the name key or company name.

In addition to these four standard indexed fields, you can establish up to four more indexes. These user-specified indexes can be based on any field in the customer file including user-defined demographics. For more power, you can designate a list string field as an index, causing index entries to be maintained for each of the codes in a list. You can also specify a formula based on a combination or manipulation of one or more fields. For example, you can specify a customer type/category combination, a set of initials (first letter of first, middle, and last fields), or the month/year of the join date.

If you define any additional indexes, they display as choices when you request a customer look-up (Find, lookup icon, or Ctrl+L) throughout iMIS.

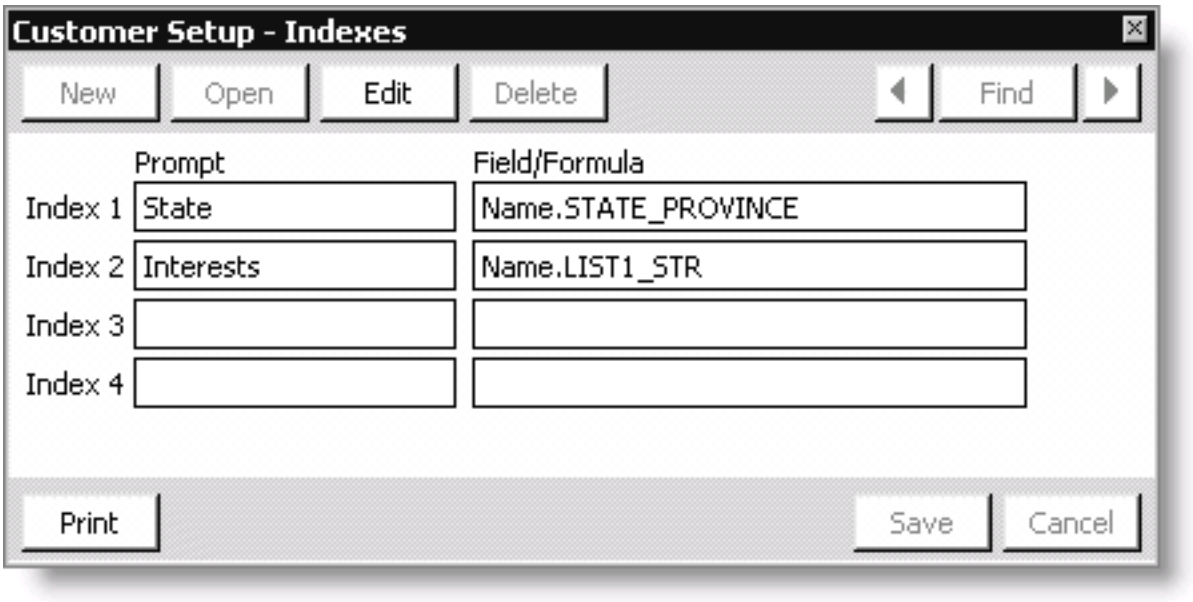
For best results, only create indexes for the key fields for which you plan to conduct daily searches. Every additional index increases the overhead burden on the system and affects performance. For less-critical searches by field, plan to use the ad hoc searching feature of the Find window.

Note: Note: When you create additional indexes on the Customer Setup - Indexes window, you must run the Rebuild Name_Indexes script to update the Name_ Indexes table and then change the parameters for report specifications to match the order of your indexes. For more information, see the iMIS Utilities Menu.

Note: Note: Results for user-defined indexes are returned in ID order.

Note: Note: You cannot create a user-defined index using a multi-instance table.

Customer Setup - Indexes window



From Customers, select Set up module > General, and click Indexes

The Customer Setup - Indexes window enables you to specify up to four additional indexes. Beginning at the top, fill in the fields for Index 1, and continue down for as many of the four available indexes as you need.

When you make a change in this window, you must update the Parameters for Report Specs to make the parameters to be the same order as your indexes.

Index 1, 2, 3, and 4 Prompts

Use these fields to enter the prompts (labels) to represent the indexes in the Find window. If an index is based on a single field (rather than a field combination or formula), use the same label that represents that field on other windows or reports.

Index 1, 2, 3, and 4 Field/Forms

Use these fields to define the indexes to be maintained by specifying the exact field name or formula based on one or more field names. The field name to specify here is the internal system name for the field versus the label that displays for that field on windows and reports.

To use the fields, you have to format the field names exactly. These names need precise capitalization and punctuation: File_Name.FIELD_NAME. File names display with initial capitals (with underscores as needed), field names display in all capitals (with underscores as needed), and the two parts are connected with a period.

> **Note:** Note: You can only assign indexes to fields in the Name and single instance user-defined tables

Print button

Used to generate and send a system setting report to your report destination.

To define user-defined lookup indexes

1. From Customers, select Set up module > General, and click Indexes to open the Customer Setup - Indexes window.
2. Click Edit.
3. Enter a label in the Prompt section (Index 1, Index 2, Index 3, and Index 4) to represent the index to display in the Find window.
4. Enter the field name or formula in the Field/Formula section to define the label.
5. Click Save.

Adding and deleting fields in the change log

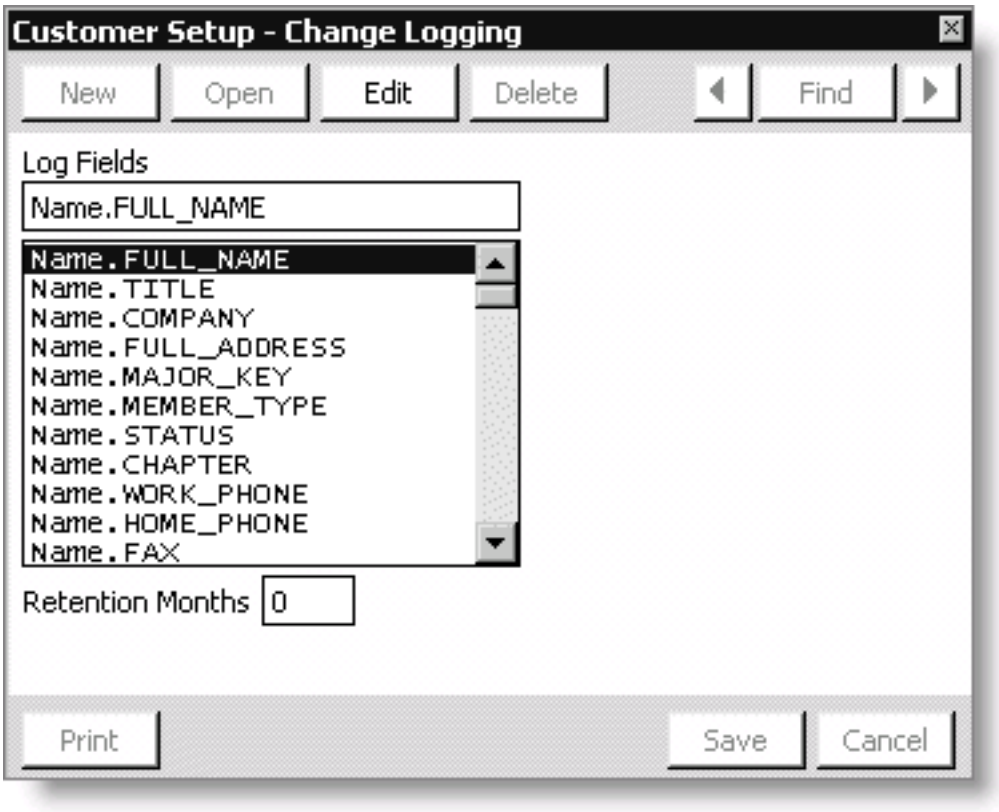
iMIS includes a change logging feature through which you can maintain before-and-after change histories for specified customer fields. While iMIS comes with a preset standard list of fields that it tracks, you can alter this list by adding or deleting fields through the Customer Setup - Change Logging window.

The only fields that can be added to change logging are:

- Any field from the Name table
- Any field from single instance user-defined tables
- The following fields from the Name_Fin table
- TAX_EXEMPT
- CREDIT_LIMIT
- BACKORDERS
- NO_STATEMENTS
- TERMS_CODE
- RENEW_MONTHS
- BT_ID
- TAX_AUTHOR_DEFAULT
- USE_VAT_TAXATION
- VAT_REG_NUMBER
- VAT_COUNTRY

> **Note:** Note: You cannot use Name_Fin.ID, Name_Fin.Renewed_Thru, or Name_Fin.TIME_STAMP in the Change Log.

Customer Setup - Change Logging window



From Customers, select Set up module > General, and click Change Logging

Log Fields

Lists the existing fields for which to track change log history.

Retention Months

Specifies the number of months you want to retain the change log history for a particular field.

Print

Generates and sends a system setting report to your report destination.

To add a field to Change Logging

Fields in the change log list must be in the format: TableName.FIELD_NAME. Most iMIS table names are spelled with initial capital letters; most iMIS field names are spelled with

all capital letters (with underscores as needed); iMIS table and field names are always connected by a period ".".

> **Note:** Note: You can only track fields from the Name and Name_Fin tables and from any single-instance user-defined table.

1. From Customers, select Set up module > General, and click Change Logging to open the Customer Setup - Change Logging window.
2. Click Edit.
3. Scroll to the bottom of the fields listed in the Customer Setup - Change Logging window, and select the space below the last field, highlighting the blank slot. The edit box at the top of the list is activated.
4. In the edit box, enter the field name you want to track in the format TableName.FIELDNAME.
5. Click Save.

To remove a field from Change Logging

1. From Customers, select Set up module > General, and click Change Logging to open the Customer Setup - Change Logging window.
2. Click Edit.
3. Scroll to and select the field you want to remove.

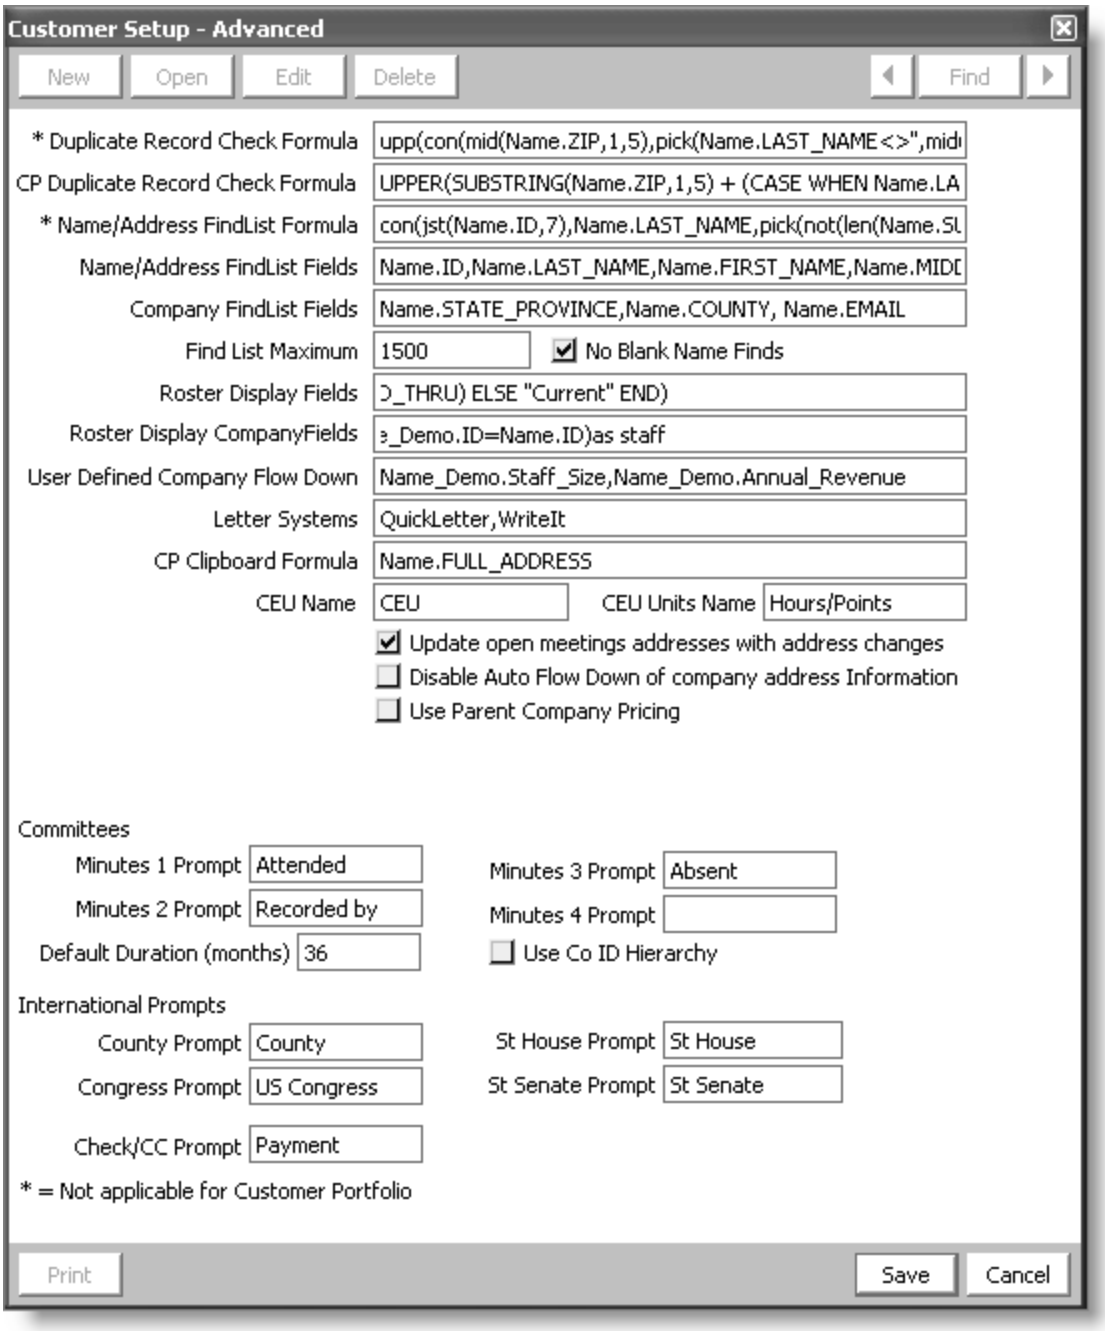
   The field name is displayed in the editing box at the top of the window.
4. In the editing box, delete the field name (press Backspace to delete the field name, or highlight the field name and press Delete).
5. Click Save.

Setting advanced customer options

The Customer Setup - Advanced window lets you enter formulas to customize the operation of the customer windows. Formulas combine fields or portions of fields according to

specified guidelines.

Customer Setup - Advanced window



From Customers, select Set up module > General, click Advanced

Duplicate Record Check Formula

Prevents duplicate records from being entered in iMIS by specifying an Omnis duplicate match key formula.

> **Note:** Note: The Duplicate Record Check formula does affect Customers. The CP Duplicate Record Check Formula governs duplicate checking within th at area.

CP Duplicate Record Check Formula

Prevents duplicate records from being entered in Customers > Manage customers by specifying a SQL duplicate match key formula.

> **Note:** Caution! To maintain data integrity, the two duplicate record check formulas must be equivalent. If the two formulas are not equivalent, duplicate record checking in Customers does not detect duplicates of entries made outside of Customers and duplicate record checking in areas other than Customers does not detect duplicates of entries made in Customers.

Name/Address FindList Formula

(required) Specifies, along with Name/Address Find List Fields, what is displayed in each line in the Find window. These lines are composed of the contents of specified fields from the Name table. This formula specifies the format for how those fields are displayed in each line.

> **Note:** Note: To have a field displayed in the Find window's display lines, include it in both the list formula and the list field.

> **Note:** Note: This field does not apply to Customers > Manage customers.

The default formula combines ID, customer name, customer type, title, and company (entity) name on each line. To improve the appearance of the output, it has provisions to print certain fields only when they have a value. If you change this formula, keep in mind

that the character limit is 255. To create space for fields you want to add, remove other fields such as Name.MIDDLE.

Name/Address FindList Fields

Specifies the fields that are displayed in the Results tab and the Record History tab of Customers > Manage customers. When you enter fields in the Name/Address FindList Fields field, use a comma to separate the fields. For example, enter Name.ID, Name.LAST_NAME, Name.FIRST_NAME, Name.TITLE, Name.COMPANY, Name.MEMBER_TYPE, Name.COMPANY_SORT to display the ID, Last Name, First Name, Title, Company, Member Type, and Company Sort for each customer record in the Results tab.

Note: Note: The following fields are required in the Name/Address FindList Fields field: Name.ID, Name.FIRST_NAME, Name.LAST_NAME, and Name.MEMBER_TYPE.

Note: Name.ID must be the first field shown in the list, and must be included even if you do not intend to display it.

Note: Note: Only fields from the Name table can be entered in the Name/Address FindList Display Fields field.

Note: Note: You must restart iMIS for your changes to take effect.

Company Find List Fields

Specifies the fields that are displayed in the Company Find window in Customers > Manage customers. This can be especially useful when you want to find a particular branch of a company.

> **Note:** Note: To include additional fields in the Results and Record History tabs, you must add the field names to the Name/Address FindList Fields configuration option, not the Company FindList Fields configuration option.

Find List Maximum

Specifies the limit on how many records the Find window locates before it stops the search. This provides a practical limit to boost performance. This maximum only comes into play when you enter non-specific selection criteria for the search that could return many or all records in the database.

No Blank Name Finds

Prevents blank space searches from being performed when selected. For example, when the option is enabled, searching for a name through the Find window requires that you enter a letter or series of letters in the Name field. When the option is cleared, searches can be completed without entering search criteria. Blank searches return all records.

Roster Display Fields

Specifies the display fields for member records (see "Customizing roster display fields") viewed in the Roster tab. Notes:

- If a customer record does not contain a value for a field specified in the Roster Display Fields field, a value will not exist for the field and the next value in the list is displayed.
- Only fields from the Name table can be entered in the Roster Display Fields field.
- You must restart iMIS for your changes to take effect.

Roster DisplayCompany Fields

Specifies the display fields for company records (see "Customizing roster display fields") viewed in the Roster tab.

User-defined Company Flow Down

Specifies the customer fields that flow down from a company (parent) record to a linked, child (non-company) record. By default, iMIS flows down main address, county, telephone, and company customer fields (as long as the user has not disabled the flowdown feature). This feature adds additional information to flow down. See also About User Defined Company Flow Down.

Note: Note: Table names in iMIS are case-sensitive. When entering fields in the User Defined Company Flow Down field, make sure the case is correct. For example, Name_Demo.STAFF.

Note: Note: Company flowdown is not implemented in iMIS web views.

Letter Systems

Specifies your preference the default tool within the standard letter system: QuickLetter or WriteIt. QuickLetter is the simplest to learn and use. It provides a quick mechanism for producing simple letters and memos. WriteIt provides traditional word processing formatting: font styles and sizes, tabs, etc.

To set your default preference, enter the keyword for your first choice followed by a comma and the keyword for the alternative; for example, QuickLetter,WriteIt.

CP Clipboard Formula

Specifies the fields that are copied to the clipboard (see "Customizing clipboard fields") when the Clipboard icon is clicked in Customers > Manage customers.

CEU Name

Specifies a label for iMIS CEU (Continuing Education Units) fields.

Note: Note: For iMIS to create activities for the label you enter in the CEU Name field, you must create an activity type with the same name on the Activity types window.

CEU Units Name

Specifies the label for the units awarded for continuing education. For example, Hours or Points. This label displays in appropriate CEU-related windows and reports.

Update open meetings addresses with address changes

Allows address changes in Customers > Manage customers to flow down to the Attendee tab on the Events > Register a customer window when selected.

Disable Auto Flow Down of company address Information

Disables the flow down of company (parent) address information to linked (child) records when selected.

Use Parent Company Pricing

Flows company (parent) pricing to linked (child) records in Orders and Events when selected. For example, if you enable this option, a non-member gets customer pricing if their parent company is a customer. This option forces iMIS to look at the company's status to ensure that they are active. It also forces iMIS to look at the customer type of the company record so it can calculate the correct pricing for the individual.

Minutes 1, 2, 3, and 4 Prompts

Specifies the labels for options that are active in the Manage committees > More > Minutes window.

> **Note:** Note: The option(s) are active in the Minutes window only when a label is entered in a Minutes Prompt field.

Default Duration (months)

Specifies the number of months that you want iMIS to use when calculating the default through date in the Manage committees window.

> **Note:** Note: To indicate that the committee appointment does not expire, leave this field blank or set it to zero.

Use Co ID Hierarchy

When selected, links a committee to the ID of a company record. A sub-set of customers associated with the company branch of the committee is created. For example, a committee called Awards has been set up. Your association has 25 branches with their own Awards committees. Normally, you would create 25 separate Awards committees with a different name for each branch. Now, you can create 25 company name records that represent each branch. You can then open the Manage committees window and set the filter to work with only one of the 25 branch company IDs. This feature also enables you to create separate customer rosters for each branch or a report of all Awards committee members regardless of branch.

You will see a Filter by Company ID option on the Manage committees window once the Use Co ID Hierarchy field has been enabled. Select Filter by Company ID to open the Find window to allow selecting a company record that represents a special division of your organization. When you make a selection in the Find window, the ID and name of the organization display in the top of the Manage committees window.

The Filter by Company ID option also filters the committee members. When an ID has been selected and is displayed in the top row of the window, inserting a new member to the committee will add the member to that company's committee.

County Prompt

Specifies the label for the County field on the Other tab.

Congress Prompt

Specifies the label for the US Congress field on the Other tab.

St House Prompt

Specifies the label for the St House field on the Other tab. (St stands for U.S. State.)

St Senate Prompt

Specifies the label for the St Senate field on the Other tab.

Check/CC Prompt

Specifies the label for the Check/CC field for all iMIS payment windows.

> **Note:** Note: The length of this field is limited to 10 characters.

Print

Generates a system setting report and sends it to your report destination.

To set up advanced options

> **Note:** Note: Advanced configuration fields are described in the topic Customer Setup - Advanced window.

1. From Customers, select Set up module > General, and click Advanced to open the Customer Setup - Advanced window.
2. Click Edit.
3. Enter your setup options.
4. Click Save.

About user defined company flow down

You can choose to have one or more customer fields flow down from company (parent) records to linked (child) records. iMIS already flows down, or synchronizes, the main address, county, telephone, and company customer type fields. This feature adds additional information to flow down.

> **Note:** Note: Do not include the Name.EMAIL field as a company flow down field because data synchronization is not properly maintained.

How company flow down works

iMIS automatically passes down key company information (main address, telephone, and company customer type) to individual customer records when the existing data matches. For example, when you edit a company's main address, iMIS checks each individual or branch record associated with that company to determine whether the main address matched the company's main address before the change was made. When it matches,

iMIS updates the individual's main address fields; when it does not, iMIS preserves the individual's main address. This flow down happens without any set up on your part.

The User Defined Company Flow Down field lets you identify extra customer data fields to be copied down automatically to the linked (child) records. This feature specifies fields in addition to the main address, telephone, and company customer type fields that iMIS inherently maintains. This feature minimizes data entry and allows you to broaden your search capabilities.

> **Note:** Note: If you are using list billing, do not enter Name.PAID_THRU in the User Defined Company Flow Down field since this may cause the parent and child records to not match.

The flow down of data to individual customers occurs whenever you edit a field in a company record that is specified in the synchronizing field.

Deciding which fields to flow down

Unlike the company name and address fields, a User-Defined Company Flow Down field will always be copied down, overwriting any existing data in the fields. Therefore, be sure to avoid selecting flow down fields that could cause you to lose data you meant to keep such as an individual's secondary address.

> **Note:** Note: Table names in iMIS are case-sensitive. When entering fields in the User Defined Company Flow Down field, make sure the case is correct. For example, Name_Demo.STAFF.

The following is the list of available fields from the Name table that you can specify to flow down from a company record to individual records.

- Name.CATEGORY
- Name.CHAPTER
- Name.COMPANY
- Name.DESIGNATION

- Name.EXCLUDE_DIRECTORY
- Name.EXCLUDE_MAIL
- Name.FIRST_NAME
- Name.FUNCTIONAL_TITLE
- Name.GENDER
- Name.INFORMAL
- Name.JOIN_DATE
- Name.LAST_NAME
- Name.MAJOR_KEY
- Name.MEMBER_STATUS
- Name.MEMBER_STATUS_DATE
- Name.MIDDLE_NAME
- Name.PAID_THRU
- Name.PREFIX
- Name.SIC_CODE
- Name.STATE_HOUSE
- Name.STATE_SENATE
- Name.STATUS
- Name.SUFFIX
- Name.TITLE
- Name.US_CONGRESS
- Name.WEBSITE

> **Note:** Note: If you enter Name.STATUS field in User Defined Company Flow Down, you must also include the Name.MEMBER_STATUS and Name.MEMBER_STATUS_DATE fields.

User-defined company flow down does not support the Work Phone, Home Phone, Fax, and E-mail fields. No error message displays if you specify these fields in the User Defined Company Flow Down field on the Customer Setup – Advanced window (from Customers, select Set up module> General, and click Advanced), but specifying these fields in the User Defined Company Flow Down field has no effect on user-defined company flow down. The Work Phone and Fax fields are part of automatic company flow down, which can be used separately or in addition to user-defined company flow down.

Customizing clipboard fields

You can choose which additional fields are copied to the clipboard when a user clicks the Clipboard icon. The default behavior is to copy the customer's Name.FULL_ADDRESS, but you can designate additional database fields to be copied.

When a user clicks the Clipboard icon, the following information is copied from the current contact's information:

- Full name followed by a carriage return
- Title followed by a carriage return
- Company followed by a carriage return

  Note: Title and Company are copied if the these options are selected in Customer Setup > Address and Notes.
- Administrator-selected fields from the following tables:
- Name
- Name_Fin
- Name_Address
- any single-instance user defined table

Configure the information that is copied to the clipboard by entering a CP Clipboard Formula in the Customer Setup - Advanced window that follows these rules:

- Fields must be named Table.FIELD_NAME and should be separated by the following special tags:
- [N] - insert a carriage return (new line)
- [C] - insert a comma
- [S] - insert a space
- [U] - convert the next field's value to uppercase
- No spaces can be included in the formula.

  For example, Name.WORK_PHONE[S]Name.HOME_PHONE not Name.WORK_PHONE [S] Name.HOME_PHONE
- Special tags must be in upper case.

  For example, [N] not [n], [S] not [s], [C] not [c], and [U] not [u].

  The following CP Clipboard Formula entry copies the customer's work phone number, adds a space, copies the home phone number, adds a comma, copies the email address, starts a new line, and copies the VAT country:

  Name.WORK_PHONE[S]Name.HOME_PHONE[C]Name.EMAIL[N]Name_Fin.VAT_COUNTRY

  Notes
- If there is no value in a particular field, it is treated as if it didn't exist in the copy to clipboard definition.
- This feature uses the same formatting conventions as International Address Formatting. See Customer Management (see "Customers") for more information.
- If you use the incorrect format in the CP Clipboard Formula field, nothing will be copied to

the clipboard when a user clicks the Clipboard icon.

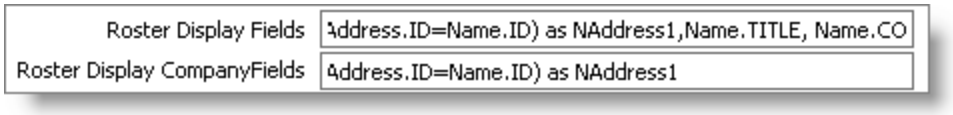
- You must restart iMIS before your changes take effect.

Customizing roster display fields

You can now configure the items displayed in the Roster listing to vary based on whether the record displayed is a member record or a company record. You can set the configuration options by selecting Customers > Set up module > General > Advanced.

The Roster Display Fields configuration option enables you to designate what is displayed when listing an individual member record in the Roster.

The Roster Display Company Fields configuration option enables you to designate what is displayed when listing a company record.

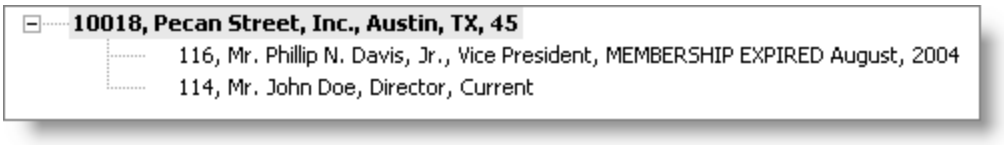


Configure the fields displayed for member and company roster listings in the Customer Setup - Advanced window.

A valid configuration line consists of a list of comma-separated field names in the format Name.FIELD_NAME, which is a maximum of 255 characters long. In addition to Name table fields, you can also include subqueries in your configuration subject to the following restrictions:

- only one value can be returned per subquery
- only one row can be returned per subquery

For example, in the configuration line Name.FULL_NAME, Name.ID,(select top 1 ADDRESS_1 from Name_Address where Name_Address.ID=Name.ID) as NAddress1,Name.TITLE, Name.COMPANY the subquery begins with "select top 1". This is necessary because the address table may have more than one address linked to a member.



Custom company and member roster display fields

Subqueries can select data from valid iMIS tables.

Example 1

The following Roster Display Fields entry displays the member's ID, full name, title (if any), and then displays either "current" or "MEMBERSHIP EXPIRED [Month, Year]" depending on the value in Name.PAID_THRU.

Name.ID, Name.FULL_NAME, Name.TITLE, (select expstat = case when Name.PAID_THRU < GETDATE() THEN "MEMBERSHIP EXPIRED " + DATENAME (Month, Name.PAID_THRU) + ", " + DATENAME (Year, Name.PAID_THRU) ELSE "Current" END)

Example 2

The following Roster Display Company Fields entry displays the company ID, name, city, state/province, country, and staff size:

Name.ID, Name.COMPANY, Name.CITY, Name.STATE_PROVINCE, Name.COUNTRY, (select Staff_Size from Name_Demo where Name_Demo.ID-D=Name.ID)as staff

Note: Note:

Roster display values assigned through a SELECT statement must be assigned a name, either by using (select [name] = ...)(shown in Example 1) or by using (select ...)as (shown in Example 2).

You must restart iMIS for your changes to take effect.

Formula for checking for duplicate records

You can create custom duplicate match key formulas to prevent the entry of duplicate customer records in the Name table. One formula, the Duplicate Record Check Formula, affects records entered anywhere in iMIS except in Customers > Manage customers. The CP Duplicate Record Check Formula is specific to Customers > Manage customers. In order for duplicates to be detected properly, these two formulas must be equivalent.

Your formulas can combine fields or portions of fields to compare a record being entered against records that already exist in the database. When a possible match is found, iMIS presents a match list and warns the data entry user that the record may be a duplicate. Based on this information, the user can continue or can cancel the insertion.

Default formulas

The default CP Duplicate Record Check Formula specifies the same criteria as the Duplicate Record Check Formula, but uses SQL instead of Omnis.

By default, the Duplicate Record Check Formula field contains the following Omnis formula:

upp(con(mid(Name.ZIP,1,5),pick(Name.LAST_NAME<>",mid(Name.COMPANY,1,5),-con(mid(Name.LAST_NAME,1,4),mid(Name.FIRST_NAME,1,1)))))

By default, the CP Duplicate Record Check Formula field contains the following SQL formula:

UPPER(SUBSTRING(Name.ZIP,1,5) + (CASE WHEN Name.LAST_NAME<>'' THEN (SUBSTRING(Name.LAST_NAME,1,4) + SUBSTRING(Name.FIRST_NAME,1,1)) ELSE SUBSTRING(Name.COMPANY,1,5) END))

Note: Caution! If you customize the Duplicate Record Check Formula and CP Duplicate Record Check Formula ensure that the formulas contain equivalent selection criteria. Although it is possible to specify different criteria in these fields, if you do not use equivalent formulas, identical records entered through different

modules will end up with different duplicate match keys and will therefore not be identified by iMIS as potential duplicates.

When entering a custom formula in the CP Duplicate Record Check Formula field, the formula can contain up to 255 characters, and the resulting duplicate match key can contain up to 20 characters. You can use the following Name fields when entering a custom duplicate check formula in the CP Duplicate Record Check Formula field:

Name.FIRST_NAME	Name.LAST_NAME
Name.COMPANY	Name.ZIP
Name.CITY	Name.STATE_PROVINCE
Name.COUNTRY	Name.ORG_CODE
Name.MEMBER_TYPE	Name.MAJOR_KEY
Name.WORK_PHONE	Name.HOME_PHONE
Name.FAX	Name.EMAIL
Name.COUNTY	Name.TOLL_FREE
Name.CHAPTER	Name.JOIN_DATE
Name.BIRTH_DATE	Name.GENDER

Note: Note: This facility cannot protect against all data-entry problems, such as address changes, variable name spellings, and typing errors. For best results, use standard lookup before adding questionable database records.

Example duplicate record check formulas

The following CP Duplicate Record Check Formula and Duplicate Record Check Formula specify a duplicate match key using the first three digits/characters of the zip code, the first four characters of the last name (if one exists), the first character of the first name, or if the customer did not have a last name, the first five characters of the company name:

CP duplicate record check formula

UPPER(SUBSTRING(Name.ZIP,1,3) + (CASE WHEN Name.LAST_NAME<>'' THEN (SUBSTRING(Name.LAST_NAME,1,4) + SUBSTRING(Name.FIRST_NAME,1,1)) ELSE SUBSTRING(Name.COMPANY,1,5) END))

Duplicate record check formula

upp(con(mid(Name.ZIP,1,3),pick(Name.LAST_NAME<>'',mid(Name.COMPANY,1,5),-con(mid(Name.LAST_NAME,1,4),mid(Name.FIRST_NAME,1,1)))))

For customer Diane Block with an address of 500 Main Street, Austin, Texas 78708, the following duplicate match key would be created:

787BLOCD

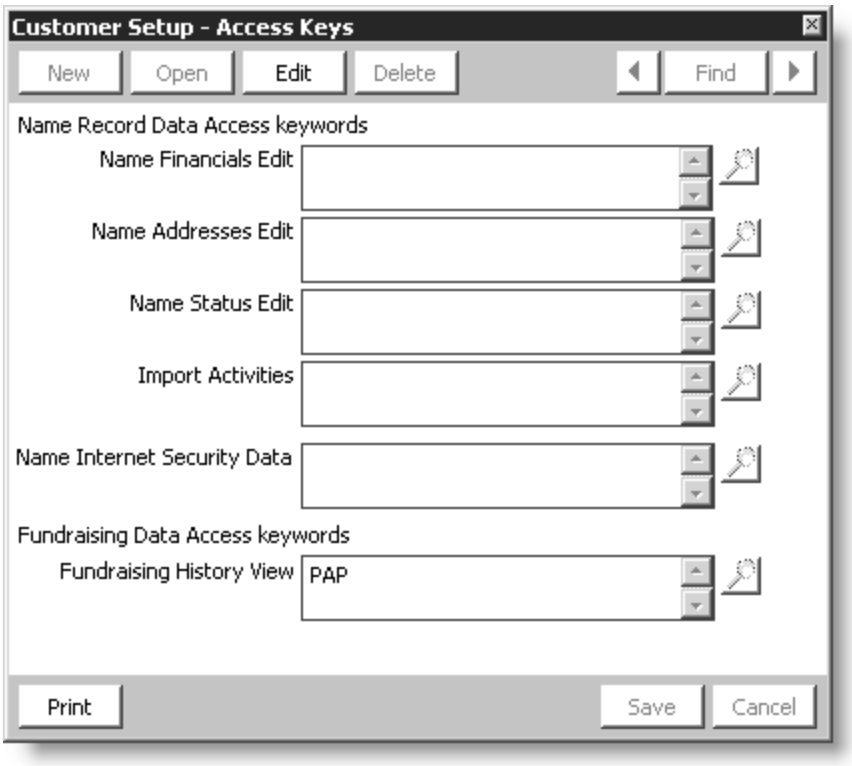
Customer Setup - Access Keys window

This window defines access keys that an administrator can assign to selected iMIS users for authorizing them to view and edit customer information such as fundraising or financials.

Note: Note: Prior to selecting these Access Keys, an administrator must set ACCESS_KEYWORDS in Customers > Set up tables > General lookup/validation.

Note: Note: After you assign the access keywords in this window, users cannot edit certain areas of customer data unless the user has been assigned at least one of the access keywords through the Customers > Set up module > General > Access Keys area.

Note: The authorization limit views in iMIS only, these access keys do not authorize or limit direct access to the database.



Customers > Set up module > General, and then click Access Keys

Name Record Data Access keywords

This area specifies access for financials, addresses, status, and whether the user can import activities.

- Name Financials Edit - When you assign an access keyword here, the user cannot edit customer financial data.
- Name Addresses Edit - When you assign an access keyword here, the user cannot edit customer addresses.
- Name Status Edit - When you assign an access keyword here, the user cannot edit customer status data.
- Import Activities - Limits access to activity import functions but only if other prerequisites are in place. Access controls whether the Input from Query and Transformation Query fields on the Import activities window are enabled.
- Name Internet Security Data - Limits access for changing passwords or revoking access.

This area specifies access for fundraising information on individuals.

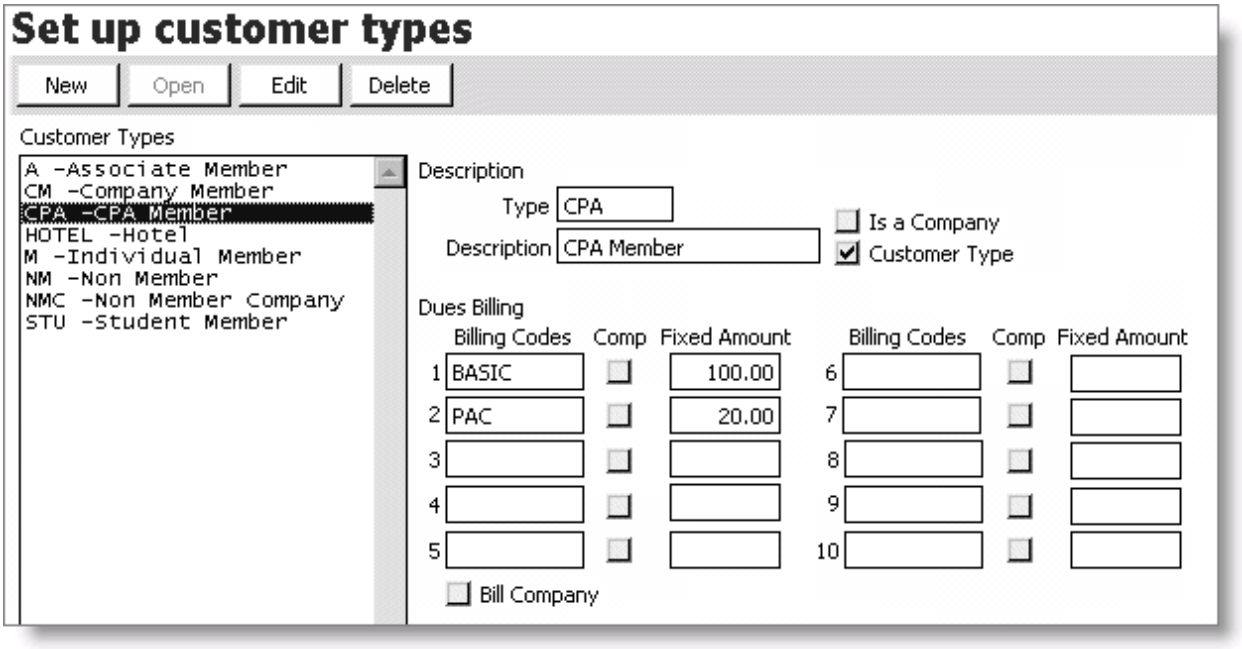
- Fundraising History View - When you assign an access keyword here, the user does not see a Fundraising tab on the Customer tab.

Defining customer types

The Customer types window defines the categories to which you assign each customer record. These types designate the broad classification of customer categories. Assign a different type to each major customer class (Individual Member, Associate Member, Student Member, Hotel, etc.) and at least one type to the Nonmember category.

When you define a type through the table, be sure to indicate whether the type represents a customer and whether the type defines a company/entity or an individual. This helps iMIS differentiate between the different records.

Customer types window



From Customers, select Set up module > Customer types

Customer Types

Lists the codes and descriptions for the defined customer types.

Type

Specifies a unique code to represent a specific grouping (Max. characters 5). This code corresponds to the Type field in the Manage customers window.

Description

Specifies the descriptive, full name of the customer or nonmember group that corresponds to the abbreviated type code you assigned. This description displays in the drop-down list on the Manage customers window. If the Description field does not contain a value, the value in the Type field is used.

Is a Company

Enable to indicate that the customer type you are defining represents companies or other entities rather than individuals. By enabling this option, iMIS will be able to maintain relationships between companies and individuals for the purpose of maintaining current company rosters and other related lists.

Is a Member

Enable to indicate that the group represents a customer category rather than a nonmember. By enabling this option, iMIS can distinguish between members and nonmembers regardless of how many types or categories you maintain. This provision lets you produce quick lists, reports, and counts by members or nonmembers.

Billing Codes

Use these fields to enter up to 10 product codes for each customer type. These entries dictate the dues products that automatically will be billed for each customer type. Only link dues products that should be billed to all members within the type. Do not enter add-on products that are optional or vary from member to member.

All codes entered here display on dues bills for this customer type unless the line item bills at zero dollars and the renewal notice option to suppress the printing of zero balance line items is active.

The first product cross-referenced is the key product because it controls the advancing of the overall membership paid thru date. For best results, enter the primary dues product code in the first Billing Codes field.

> **Note:** Note: Unless all line items for the type are complimentary or are to be billed zero dollars, do not insert a product in the first line that will have a zero price amount such as a complimentary product. When a product line item is billed and a zero amount has been set, the paid thru date will automatically advance.

Comp

Enable if the dues item will be provided at no charge for this customer type.

Fixed Amount

Specifies a fixed rate that applies to all or most customers of this type.

Bill Company

Enable if the parent company is to receive the bill for customers of this customer type that are linked to it; for example, if a List Bill requirement exists.

Print

Used to generate and send a customer type table report to your report destination.

To define customer types

1. From Customer types window, click New.
2. Enter a meaningful, unique code to represent a specific grouping in the Type field.
3. In the Description field, enter the descriptive, full name of the customer group that corresponds to the code you assigned in the Type field.
4. (optional) If the customer type you are defining represents a company or entity other than an individual, enable the Is a Company option.
5. (optional) If the customer type you are defining represents a member rather than a non-member category, enable the Is a Member option.

6. Click Save.
7. Exit iMIS.

To add billing codes to customer types

1. From Customer types window, click New.
2. Enter a meaningful, unique code to represent a specific grouping in the Type field.
3. In the Description field, enter the descriptive, full name of the customer group that corresponds to the code you assigned in the Type field.
4. (optional) If the customer type you are defining represents a company or entity other than an individual, enable the Is a Company option.
5. (optional) If the customer type you are defining represents a member rather than a non-member category, enable the Is a Member option.
6. (optional) Enter the Billing Codes that were set on the Set up products window (from Billing, select Set up module > Products). These entries dictate the dues products that will be automatically billed for each customer type. Only link dues products that should be billed to all customers within the type. Do not enter add-on products that are optional or that vary from customer to customer.

   Caution! Unless all line items for the type are complimentary or are to be billed zero dollars, do not insert a product in the first line that will have a zero price amount, such as a complimentary product. When a product line item is billed and a zero amount has been set, the Paid Thru date will automatically advance.

1. Enable the Comp option if the dues product will be provided at no charge (complimentary) for this customer type.
2. Enter a Fixed Amount if a fixed rate applies to all or most customers of this type.
3. Enable the Bill Company option if the parent company is to receive the bill for customers of this customer type that are linked to it.

7. Click Save.
8. Exit iMIS.

To use wildcard product codes to update PAID_THRU date

A special wildcard option enables you to control the overall customer term Paid Thru date when there is not a single main dues product (the product that is listed first on the Customer types window) to be billed for the customer type. In order to use the wildcard feature, all potential products, which may be used to control the customer term Paid Thru date, must be established with the same initial string of characters in their product codes. A partial product code string followed by % designates a wildcard in the first product code slot on the customer types table. This option allows different products to be the main dues product for one customer type. This feature enables ties to use dues product billing and to control the customer Paid Thru date even when there is not a consistent dues product billed to all customers.

Example

An organization bills only chapter dues products and the chapter codes vary from customer to customer. In this case, CHAPT% would be entered in the first Billing Codes field on the Customer types window because all chapter product codes automatically begin with CHAPT (for example, CHAPT-HARRIS, CHAPT-TRAVIS). Payment of the first product whose code begins with the wildcard string will update the overall customer term or name PAID_THRU date. An example of a wildcard used on the Set up customer types is shown in the following picture with the corresponding product code defined on the Set up products window (see Defining Product Codes) In this case, only chapter dues products are billed. Customers can join from a group of chapters. In this example, the wildcard option is used for all chapters that begin with CHAPT.

Note: Note: The customer's overall Paid Thru date will be advanced the first time a payment is fully applied to a line item whose product code begins with CHAPT.

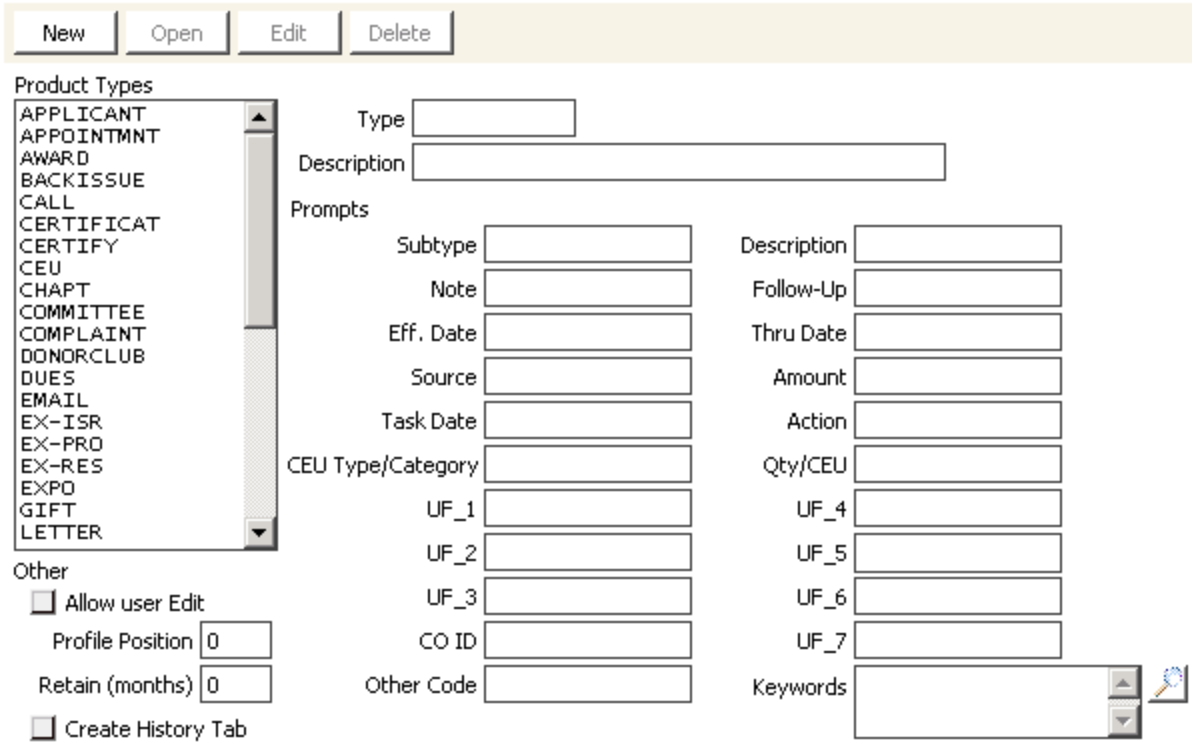
Implementing and managing activity types

The Activity Detail window contains both standard and user-defined fields. These fields are assigned according to your organization's needs and are set up in the Activity types window. You establish which fields are displayed for a given Activity Detail window.

> **Note:** Note: When creating an activity type you must enter a value in the Type and Description fields, and you must define at least one field prompt.

See the Fundraising Administration section for details about Setting up Request, Gift, and Pledge activity types.

Activity types window



Admin Console: Configure > Membership > Set up activity types

Desktop: Customers > Set up module > Activity types

Product Types

The Product Types field lists the activity types. iMIS comes with default activity product types which may be edited to include additional fields or to change field labels. Additional activity product types may be defined.

Type

(required) Specifies the activity category or code that corresponds to the code in the Activity Types table. This code determines which fields are used in the Activity Detail window and cannot be changed once the record is stored.

Description

(required) Describes the activity type.

Subtype

Specifies a sub-type of the activity type. The Subtype field enables you to sub-categorize the activity type. For example, a product code is a sub-type of the activity type Sales.

Description

Describes the sub-type. If this field is activated, a text box is created within the Activity Detail window that enables up to 255 characters of text.

Note

Specifies notes you want to keep. If activated, a large text box is created within the Activity Detail window that enables up to 32,000 characters.

Follow-Up

Specifies follow-up comments. If activated, a large text box is created within the Activity Detail window that enables you to enter up to 32,000 characters.

Eff Date

Specifies an additional date field (The activity date is system generated). Used if another date field is necessary for the activity. For example, for tracking the begin date of a committee appointment.

Thru Date

Specifies an end date. For example, the ending date of a committee appointment.

Source

Specifies either a marketing code, or an individual to which an item will be assigned. For example, if an order sale is made over the phone, the code used to track this information might be Phone. Codes may be set up for advertising, catalogs, salespeople, etc.

To track the source of Event registrations, enter Source in this field. This activates the Source lookup field on the Register for an Event window's Overview tab.

> **Note:** Note: For task or call logging activities, the name or user ID for which this reminder should be logged is entered in the Source field. If Assigned To is entered in this field, the lookup feature is available for all user IDs. If the field is blank, the reminder message will display in all users' task activities.

Amount

Specifies a monetary amount for the activity.

Task Date

Specifies the date on which an activity record will be displayed in the user's task list (user defined in Source).

Action

Specifies the type of action taken on a task item.

CEU Type

Specifies the type or category of educational credit awarded (With CEU add-on module only).

Qty/CEU

Specifies the number of credit hours awarded for a CEU course, or specifies the frequency of a recurring request.

> **Note:** Note: For SALES and ORDER activity types, the system stores the value entered in the Qty/CEU field in Activity.QUANTITY. For all other activity types, the system stores the value entered in the Qty/CEU field in Activity.UNITS.

UF_1, UF_2, and UF_3

Specify user-defined character information, that will be displayed in the bottom half of the Activity Detail window. For example, the GIFT and PLEDGE activities define these fields as List As, Campaign Code and Fund Code.

UF_4 and UF_5

Specify user-defined numeric information.

UF_6 and UF_7

Specify user-defined date information. For example, the REQUEST activity defines these fields as End Date and Last Reminder.

CO ID

Specifies an ID number. For example, the REQUEST, GIFT, and PLEDGE activity types define this field as Solicitor ID.

Other Code

Not implemented

Keywords

Specifies a keyword to restrict access to this type of activity record.

Allow user Edit

When selected, enables users to edit detailed activity records of this type.

Profile Position

Specifies the order in which you want this type of activity to be printed on the customer profile report. If this field is left blank, the activity type will not be printed on the customer profile report.

Retain (months)

Specifies the number of months you wish to retain this type of activity record. Items older than the retention period are deleted when your system administrator purges old activities.

Create History Tab

When selected, creates a new tab for this type of activity in the Customer Portfolio. The tab will contain a New Activity button that enables you to enter new activities of this type, provided that you have also selected the Allow user Edit checkbox.

Tab Name

(Displayed only when Create History Tab checkbox is selected) Specifies the name of the Customer Portfolio history tab that shows this type of activity.

> **Note:** Note: The activity tab will not be displayed in the history area of the Manage customers window until you select the tab from the Customer Portfolio Tab Preferences window.

Print

Generates and sends a customer type table report to your report destination.

> **Note:** Note: The Type, Subtype, and user-defined character fields can have a general lookup/validation table. The table can vary by activity type. For example, the CALL sub-type might generate a list of CALL types such as question, problem, or other while the EXPERIENCE activity sub-type might generate a list of experience subtypes such as work experience, academic, etc.

To create an activity type

1. From Activity types window, click New.
2. Enter the activity category or code in the Type field.
3. Enter a Description of the activity type.
4. Enter additional prompts, if needed.
5. Click Save to update the activity type.

To edit an activity type

1. From Activity types window, select an activity from the Product Types column.
2. Select the activity to open it in the Activity types window.
3. Click Edit.
4. Make any necessary edits.

   Note: The Type field cannot be edited.
5. Click Save to update the record.

To delete an activity type

1. From Activity types window, select an activity from the Product Types column.
2. Select the activity to open it in the Activity types window.
3. Click Delete. A system message prompts you to verify the deletion of the selected record.
4. Click Yes.

To create the LETTER activity type

1. Create a new activity type using the following settings:

- Type: LETTER
- Prompts for Description, Note, and Source.
- Additional prompts, if needed.

Note: The prompts entered in the Activity types window dictate which fields are enabled and visible in the Activity Detail and Activity Importer windows.

2. Click Save to update the activity type.

To display activity records in customer profiles

You can configure an activity type to be displayed in customer profiles. If a customer does not have an activity record for a particular activity type, then that activity type will not be displayed in the customer's profile. Activity records are grouped according to type, and you can specify the order in which the activity types display.

1. From Activity types window, select an activity type from the Product Types list.
2. Click Edit.
3. Enter a Profile Position to display the activity type and related activity records. You have several options:

- To not display an activity type and its related activity records, enter a Profile Position of zero. The default Profile Position is zero.
- To display an activity type and its related activity records in the customer's profile, assign a number greater than zero to the Profile Position to display the activity type. For example, enter a 1 for the Email activity type.
- To sort the order in which the activity types display, enter numbers in succeeding order for each activity type. An activity type with a Profile Position of 1 will display ahead of an activity type with a Profile Position of 2, and an activity type with a Profile Position of 2 will display ahead of an activity type with a Profile Position of 3.

  For example, if you want the customer's Call Log activity records to display first in the customer's profile and the customer's Award activity records to display second, enter a 1 for the Call activity's Profile Position and a 2 for the Award activity's Profile Position.
- To order the activity types alphabetically, assign the same Profile Position to each activity type. For example, enter a 1 for each activity type's Profile Position.

4. Click Save.

Creating tabs for activity types

You can create a History tab for specified activity types and display it according to your tab preferences.

To create a tab for an activity type

1. From Activity types window, select the activity type from the Product Types scrolling list.
2. Enable the Create History Tab option. The Tab Name field displays to the right of the Create History Tab option after the Create History Tab option is enabled.
3. Enter the tab name in the Tab Name field.
4. (optional) Enable the Allow user Edit option if you want to allow iMIS users, with a Customers authorization level of three (3) or higher, to edit the data on the Manage customers window.
5. Click Save to update the activity type.
6. Restart iMIS.

To display an activity tab

1. On the Manage customers window, place the cursor over the detail or history tabs, right-click, and select Edit Tab Preferences.

   The Customer Portfolio Tab Preferences window opens.
2. Select the History tab.
3. Move the new activity tab to the Visible History Tabs list.

   Note: The tab is initially placed at the end of the Visible History Tabs list. You can move the tab to the desired position by selecting the tab and clicking the Top, Up, Down, or Bottom buttons.
4. Click Save to update the tab preferences profile.
5. Restart iMIS.

Activity attachments

In some cases, you may want to attach a file to an activity record.

To enable the activity attachment feature

> **Note:** Note: Some activity types are system-generated (for example, Order) and are not intended for editing. However, if you want to attach a file to one of these activity types you must enable the Allow user Edit option. Enable the Allow user Edit option on the Activity types window.

1. Select File > System Setup to open the System Setup window.
2. Click Edit.
3. Enable the Activity Attachments allowed option.
4. Enter a value in the Maximum file size (KB) field. See Specifying maximum size of activity attachments for more information.

   A message informs you that the maximum file size you specified may not be practical and may have adverse effects on performance.
5. Click OK.
6. Click Save.

Activity attachment fields

To support the activity attachment feature, the following fields in the Activity_Attach table are used:

ACTIVITY_SEQN	long integer	Used to store a reference to an associated activity record
FILE_NAME	varchar (255)	Attachment's file extension
FILE_	Datetime	Date the attachment was last modified

TIMESTAMP		
ATTACH_IMAGE	image	File's binary data
INTENT_TO_EDIT	varchar (40)	Indicates whether a user has started an edit operation (Date/Time + "#" + <User ID>)
READ_ONLY	Boolean	Indicates whether the attachment is available for editing by non-administrator users

To purge activity attachments created before a specified date

To delete activity attachments with a timestamp before a specified date, you must modify the Purge old Activity attachments report spec to include a date in the purge script from which you want to delete activity attachments, and then run the purge script.

Note: Note: You must have an authorization level of 8 or higher to modify a report spec.

Note: Note: The FILE_TIMESTAMP date that you modify in the purge activity attachment script refers to the date that displays in the File Date column on the Activity Attachment window for the attachment. The File Date displays the date the attachment was last modified. However, if the attachment has not been modified, the date that displays corresponds to the date the file was created.

1. Select Utilities> Report Specs to open the Report Specifications window.
2. Scroll down to the SYSTEM module.
3. Select the SYSTEM-Purge-Purge old Activity attachments report.
4. Click Parameters to open the Detail Report Parameters window.
5. Click Edit.

6. Using the format YYYYMMDD, modify the FILE_TIMESTAMP value of the Purge old Activity attachments script. In the following example, the script has been modified so that activity attachments with a File Date earlier than October 10, 2002 will be deleted:

   delete Activity_Attach where FILE_TIMESTAMP< '20021010' and ACTIVITY_SEQN> 0 and READ_ONLY=0

7. Click Save.
8. Select Utilities> Reports and Queries.
9. Select Purge from the Report Types scrolling list.
10. Select Purge Old Activity attachments from the Available Reports scrolling list.
11. Click Run. A message displays informing you that you should make a backup of your database before running the activity attachment purge utility, and asks if you want to continue running the utility. Click Yes to continue running the utility, or No to cancel.
12. The Purge old Activity attachments window displays showing the number of attachments that were deleted from the iMIS database.

> **Note:** Note: In an environment where users are importing activities simultaneously, you must ensure that the users do not attempt to import the same files or run the same queries. To prevent a user from inadvertently affecting records another user is processing, you can limit access to the advanced Activity Importer features so that processing is restricted to records imported by a user's specific session.

Creating mailing and address lookup and validation

The Label Preferences tab enables you to select specific label addresses for any mailing label on a per-customer basis.

To enable product label preferences

The Label Preferences tab enables you to select specific label addresses for any mailing label on a per-customer basis. Before inserting product label preferences, you must enable the Use Product Label Preferences option.

1. From Customers, select Set up module > General, and click Address and Notes to open the Customers Setup - Address and Notes window.
2. Click Edit.
3. Enable the Use Product Label Preferences option.
4. Click Save to update the record.
5. Close iMIS Desktop to enable Use Product Label Preferences.
6. Ensure that your iMIS Administrator stops and restarts all websites that contain your iMIS 15 applications.

   If restarting the websites is problematic, you can wait for the cache to refresh (default is 15 minutes wait time, designated by the refresh cache interval) and then your changes appear.

   Note: Upon enabling Use Product Label Preferences, the Product Label Preference table activates, allowing you to create user-defined label codes. The Label Preferences tab displays on the Manage customers window when you enable this feature.

   To insert product label preference codes

1. From Customers, select Set up product label preferences to open the Set up product label preferences window.
2. Enter new codes:

- Click New.
- Enter a code for the label in the Code field and a name for the label in the Name field.
- Click Save.
- Repeat until you have entered all of the codes.

iMIS Customizer

The iMIS Customizer (Customer Setup – Additional Windows window) makes customization easy for both programmers and non-programmers. Through the Customizer,

users can create user-defined tables. The tables contain user-defined data fields that store data that is captured and displayed in user-defined or custom tabs.

Customizer features include the following:

- Customization of iMIS customer data
- Automatic and custom tab layout for capturing and displaying data
- Data lookup and validation
- Different demographics for different customer types
- Multiple instances of each window for each customer
- Custom fields with user-assigned names

> **Note:** Note: Excessive customization may slow processing when users log on to iMIS.

Custom table features

- Fields organized into multiple SQL tables
- Tables designed so that different customer types have unique demographic fields and tabs
- Option provided to have “multiple instances” of a table row for a single ID
- Table used for dues pricing identified and included in the Name_All view

Custom field features

- Create any number of custom fields
- Assign any valid SQL name (not just UF_1, UF_2...) to fields
- Designate a custom prompt for each field
- Use a wider variety of field types: characters, notes, numbers, integers, checkboxes, date, time, date/time

- Assign validation and lookup tables for single or multiple values
- Designate uppercase or upper/lower (title case) auto-formatting

Custom tab features

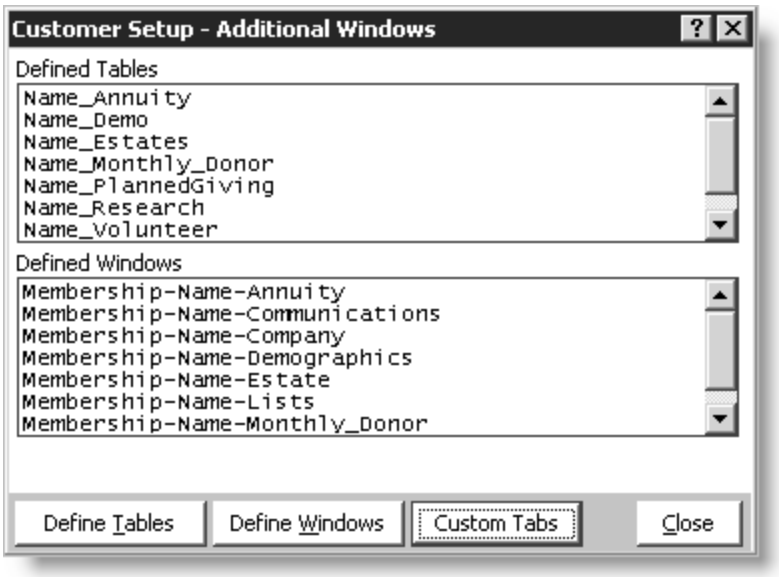
- Organize fields into multiple tabs
- Define your own layout and content for each tab; easy layout/definition process
- Mark tab fields as “display only”
- Provide different demographic subsets for different tabs (for example, for each department)
- Designate tab fields and data to display on customer profile reports
- Provide for "tab level” security; access modes include full, view only, and none (see Limiting Access and/or Hiding Tabs).

Apply demographics to a new task

The unprecedented flexibility in field, table, and page configuration allows you to implement many optimized uses for iMIS:

- Separate individual customer demographic data from organizational demographic data
- Define specific demographic data for different companies and organizations
- Define specific demographic data for special customers, such as chapters, legislators, and advertisers
- Define specialized window tabs for surveys and other detailed information

Customer Setup - Additional Windows window



Customers > Set up module> General, and click Additional Windows

Defined Tables

Displays existing user-defined tables. You can have an unlimited number of tables with many user-defined tabs accessing the same table.

Defined Windows

Displays existing user-defined tabs.

Define Tables button

Opens the User Defined Tables window used for defining tables.

Define Windows button

Opens the Window Designer window used for creating user-defined tabs.

Custom Tabs button

Opens the Custom Tab Designer window used for creating custom tabs.

To access the Customizer

Before you begin configuring your user-defined tables and user-defined tabs, be sure to launch iMIS in the proper mode for system alteration.

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Log onto iMIS as MANAGER.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.

Creating a user-defined table

To add a user-defined demographics tab, you first need to name and define its data table, unless a previously defined table contains the fields you want to add to the tab you are designing.

If you want to display the data from this newly designed table, after the table is defined, create the tab, and add the data fields that you want to display on the tab. Here's an overview of the process:

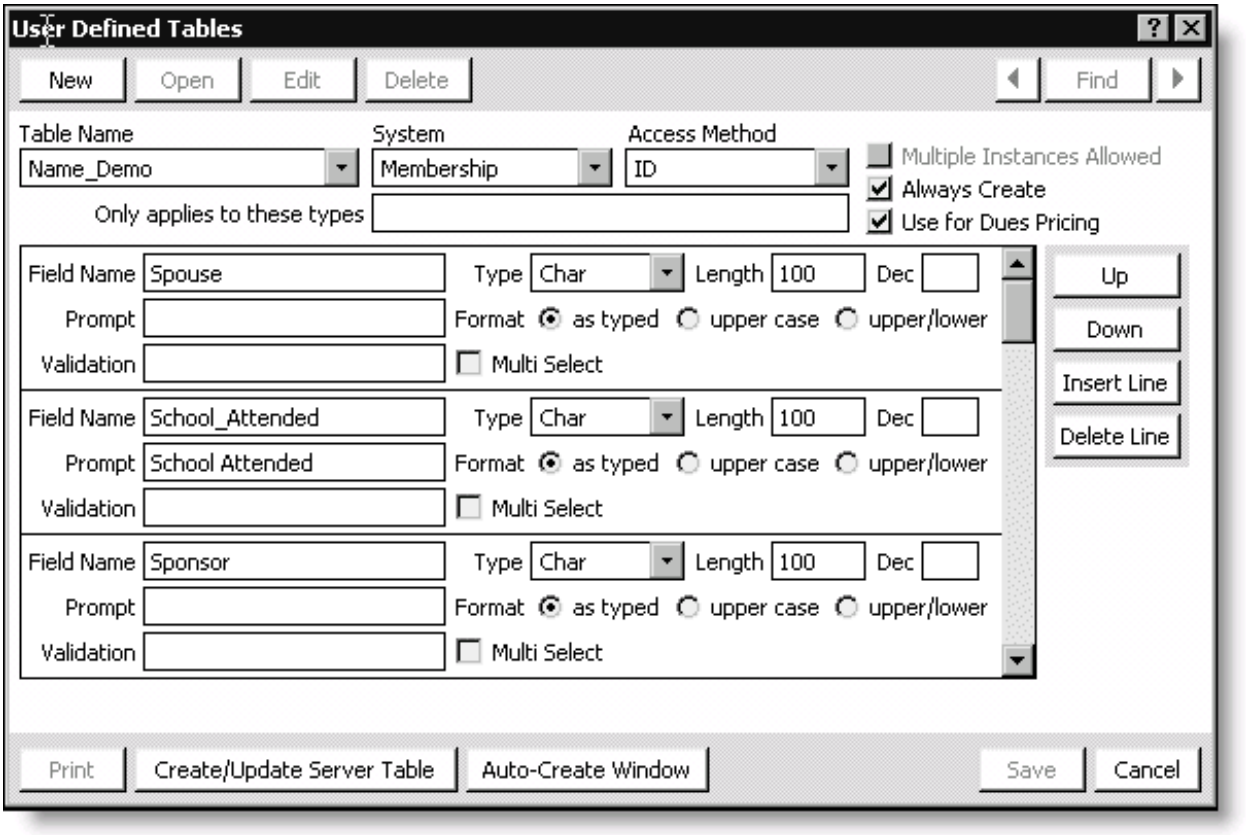
1. Create the table (see "To create a user-defined table") and add the fields.
2. Create a window (see "To create a user-defined tab") - either auto-created or create your own.
3. Use the Build command in Tools > User defined tables > Build to build the underlying business object.
4. Add the window to user tab preferences (see "To create custom tabs").
5. Enter data for members and then the definition is complete.

> **Note:** Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).

Note: Note: If you assign a numeric Type format to a field, iMIS automatically formats the numbers entered in the field with commas. If you do not want a user-defined field to be automatically formatted, assign the data type to Char.

User Defined Tables window

The User Defined Tables window is used to create new tables, add data fields, and modify existing tables.



From Customers, select Set up module> General, click Additional Windows, and click Define Tables

Table Name

Specifies the name of the table you are creating. Use an underscore (_) to separate words; do not use spaces.

System

(Not currently in use) Accept the default (Membership).

Access Method

(Not currently in use) Accept the default (ID).

Multiple Instances Allowed

Enable to allow multiple instances of each user-defined tab for each customer. For example, if you create a Survey tab for the year 2003 and want to re-use it in succeeding years, this feature allows customers to enter information in the same tab, using the same customer ID, for each year.

When creating multiple instance of a user-defined tab, a unique identifier is not required. However, we recommend using the first field as a unique identifier or key field that allows you to stack the data. When Multiple Instances Allowed is enabled, and you designate the first field as a key field, the first field Type must be designated as character (Char). The first field also should be a field that will designate the instance. For example, if you set up a tab for customer surveys, you would want to use SURVEY_YEAR as your first field.

If you select the Auto-Create Window option after defining a tab, iMIS automatically creates a tab with the tab title based on the table name. iMIS defines the table layout and includes all the fields with the Field Name used as the field label.

Always Create

Enable to create records automatically according to the Access Method selected for the appropriate customer types. Make sure to enable this option if the table contains fields used for Dues special pricing.

Use for Dues Pricing

Enable to use the table for Billing special pricing.

Note: Note: If the Always Create and Use for Dues Pricing options are enabled, the Name_All view is automatically created when you click Save.

Only applies to these types

Specifies specific customer types (separated by commas) if you want to restrict availability to a demographic table. Do not use this option if you plan to use the table for Billing special pricing.

Field Name

Use to define a SQL field name. Use an underscore (_) to separate words; do not use spaces.

Type

Select a field type from the drop-down list to define the field format: character, integers, numbers, money, checkboxes, date, time, date/time, and image. (Defaults to character.)

> **Note:** Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).

Length

Use to define the size of a character type field, for example, 20 characters.

Dec

Use to define the number of decimal places for specific field types.

Prompt

Specifies the field label you want displayed on the tab. (Defaults to the Field Name. For example, if the Field Name is TEST_EXAMPLE, the Prompt defaults to Test Example.)

Format

The character format option allows you to select an auto capitalization option: as typed, upper case (for codes), and upper/lower case (for titles). If you select upper case or upper-/lower, the character format will be auto-corrected. (Defaults to as typed.)

Validation

Specifies which general lookup/validation table to use for data entry. You must refresh the libraries to see the defined values when using the lookup feature on a user-defined field. (Defaults to all caps, exact spelling.)

> **Note:** Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).

Multi Select

Enable to allow users to make more than one selection from the validation table.

> **Note:** Note: When creating a general lookup/validation table for a multi-select field in a user-defined table, the Description field on the Set up general lookup/validation window must contain a unique value for each Code.

Up button

Used to move the selected field up in placement.

Down button

Used to move the selected field down in placement.

Insert Line button

Used to insert a new field.

Delete Line button

Used to delete an existing field.

Create/Update Server Table button

Used to update the selected table.

Auto-Create Window button

Used to create a user-defined tab automatically with the title based on the table name. iMIS defines the table layout and includes all of the fields with the Field Name used as the

field label. Use the automatic window creation feature when you add a new user-defined table or make changes to an existing user-defined table (for example, if you add or delete a field from a user-defined table).

To create a user-defined table

ID_207232 - no need to refresh libraries

A table is made up of data fields. You define your table's data fields so users can enter or select specific data in user-defined or custom tab.

> **Note:** Caution! Take a snapshot of your database with customizations. All customized objects (triggers, additional indexes, special permissions) are lost when user-defined tables are rebuilt.

1. Have all users exit iMIS.
2. Back up your data.
3. Log into iMIS as the database owner.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Tables to open the User Defined Tables window.
6. Click New.
7. Enter a new Table Name. The table names are case-sensitive, so plan to use ALL CAPS or Initial Caps consistently. Table names must be unique:

- Unique name across iMIS: Make sure any table or field you add does not match the name of any other iMIS table or field or any of the SQL Reserved Words. If you enter an iMIS table name, you are warned that the iMIS table may be overwritten.

8. Press Tab. When iMIS prompts you to verify the table creation, click Yes.

   Note: The scrolling list box of field entries is cleared until you complete the table's heading fields.

9. Accept the System and Access Method defaults.
10. (optional) Enable the Multiple Instances Allowed option if you want customers to have more than one user-defined tab that will contain the same fields, for example, quarterly or annual surveys.

    Note: If you enable the Multiple Instances Allowed option, the Always Create and Use for Dues Pricing options are grayed out. Enabling the Always Create and Use for Dues Pricing options grays out the Multiple Instances Allowed option.
11. (optional) Enable the Always Create option if you want records to be created automatically for the appropriate customer types and are using the fields for Dues special pricing. Press Tab.
12. (optional) Enter specific customer types in the Only applies to these types field to restrict access to the demographic table, and separate customer types by commas. Leave the field blank to allow access to all customers. Press Tab.
13. Enable the Use for Dues Pricing option if you are using the fields for Billing special pricing. Press Tab. iMIS displays a definition area for the first field for this table.
14. Enter a valid SQL Field Name, and press Tab.
15. (Multiple Instances Allowed only) If you are creating multiple instances of this table, we recommend making your first field contain the information that will distinguish the multiple instances from each other. For example, if you plan to have a table in each customer record for each year's survey data, the first field name should be Year.
16. Select a field format from the Type drop-down list. Press Tab.
17. (Multiple Instances Allowed only) Create multiple instance tables with a first field type of character (Char).

    Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).

Note: If you assign a numeric Type format to a field, iMIS automatically formats the numbers entered in the field with commas. If you do not want a user-defined field to be automatically formatted, assign the data type to Char.

18. Enter the field size in the Length field if it is a Character field. Press Tab.
19. (Optional for Int, Number, or Money fields) If a decimal can be entered in the field, enter the number of decimal places to be accepted in the Dec field.
20. In the Prompt field, enter the name of the field that will display on the tab. The default is Field Name.
21. Select the Format option for the data entered in the field on the tab.
22. (optional) In the Validation field, enter the general lookup/validation table that will be used to validate the data at the time of data entry. To enable this field you must build the corresponding general lookup/validation table in the Set up general lookup/validation window (from Customers, select Set up tables > General, and select General lookup/validation).

    A general lookup/validation table is required for a multiple instance table or if you enable the Multi Select option.

    Note: When creating a general lookup/validation table for a multi-select field in a user-defined table, the Description field on the Set up general lookup/validation window must contain a unique value for each Code.

    Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).
23. Enable the Multi Select option if you entered a table name in the Validation field and you want to allow the user to make more than one selection from the validation table.
24. Click Save. iMIS prompts you to set up the new table with the server.
25. Click Yes to have iMIS create the server table. This prompt is equivalent to clicking Create/Update Server Table.

26. (optional) Click Auto-Create Window. iMIS automatically creates a user-defined tab with the title based on the table name. iMIS defines the table layout and includes all the fields with the Field Name used as the field label.
27. Click OK if prompted to restart iMIS.
28. Click Close to close the User Defined Tables window.
29. From Tools > Utilities, select User defined tables. Click Build All to generate business objects from user defined tables.
30. Exit iMIS immediately.
31. (iParts using UD tables) Restart IIS so new fields are included as available fields in existing iParts.

To modify a user-defined table

ID_207232 - no need to refresh libraries

> **Note:** Caution! If your user-defined table contains customized objects (triggers, additional indexes, special permissions), they will be lost when the table is rebuilt.

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Log on as the database owner: MANAGER.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Tables to open the User Defined Tables window.
6. Select the Table Name drop-down list, and select the table you want to modify.
7. Make the necessary changes:

- To add a field to the table, place the cursor anywhere in the field row where you want the new field to follow, and click Insert Line on the User Defined Tables window. A new field

row is inserted, and the new field information can be added here.

- To delete a field on the table, place the cursor anywhere in the field, and click Delete Line on the User Defined Tables window.
- To reorder the fields, select the field, and click Up or Down on the User Defined Tables window.

8. Click Save. iMIS prompts you to update the server table.
9. Click Yes.
10. Click OK if prompted to restart iMIS.
11. Click Auto-Create Window.
12. Click Close to close the User Defined Tables window.
13. From Tools > Utilities, select User defined tables. Click Build All to generate business objects from user defined tables.
14. Exit iMIS immediately.
15. (iParts using UD tables) Restart IIS so any new field added to a user defined table is included as available fields in existing iParts.

To delete a user-defined table

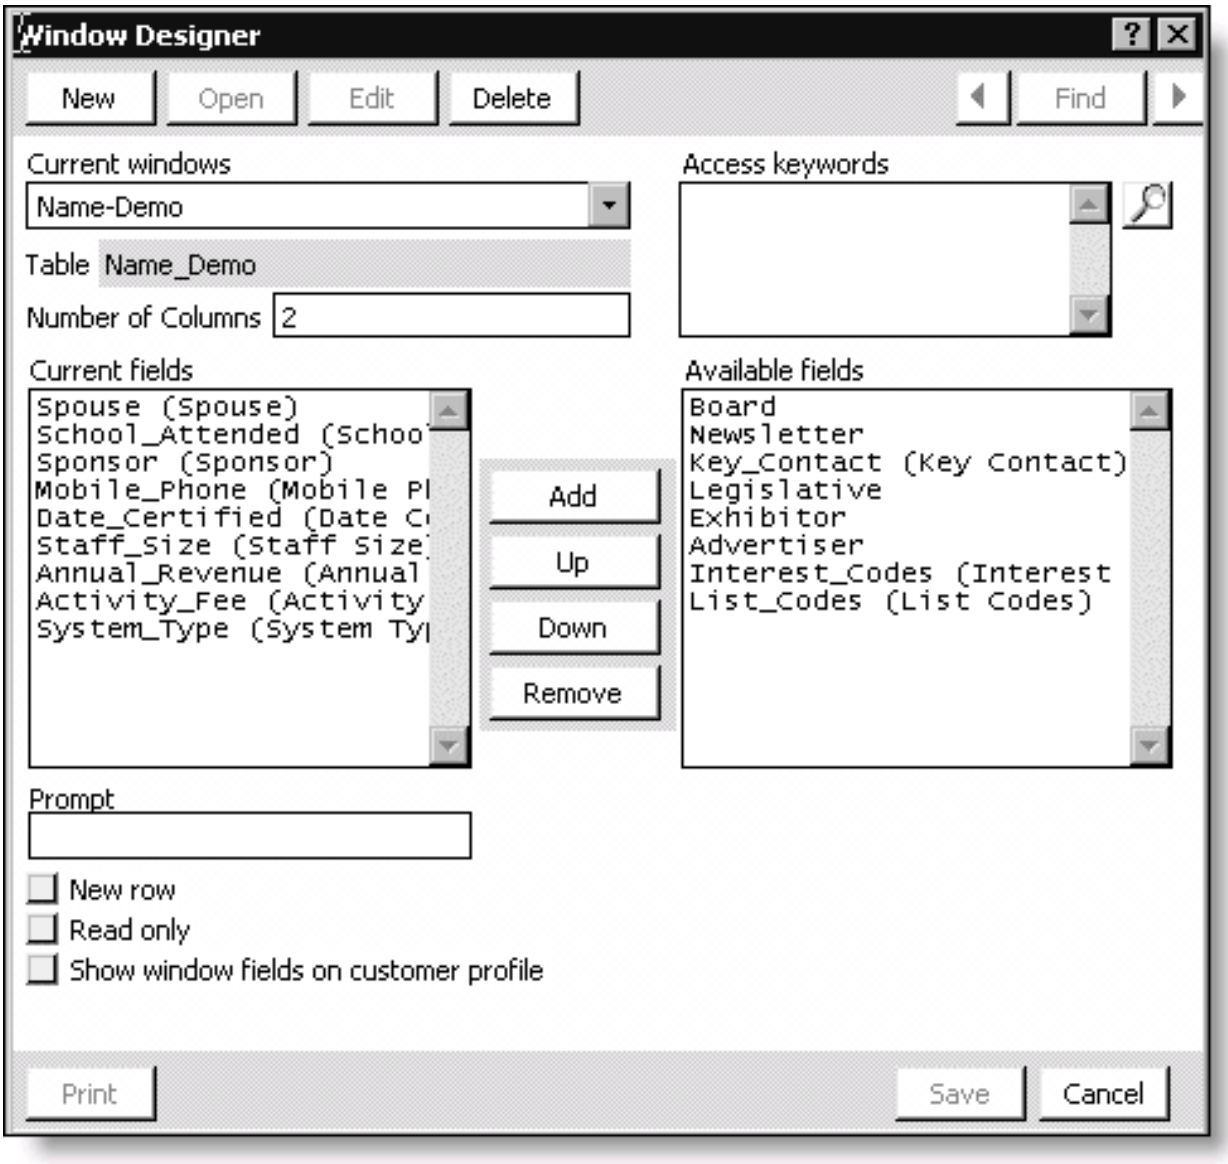
1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Log into iMIS with the MANAGER logon.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Tables to open the User Defined Tables window.
6. Select the table you want to delete from the Table Name drop-down list.
7. Click Delete. iMIS prompts you to confirm the deletion.

8. Click Yes to delete the table.
9. Click Cancel to close the User Defined Tables window.
10. Use SQL Server tools to drop the user-defined table that was deleted.
11. Exit iMIS immediately.

Creating a user-defined tab

The user-defined tab you create will use the data fields from a previously defined table (see To create a user-defined table).

Window Designer window



From Customers, select Set up module> General, click Additional Windows, and click Define Windows

Current windows

Displays a drop-down list of current user-defined tabs.

Access keywords

(optional) Specifies access keywords. Keywords prevent unauthorized users from entering data on the user-defined tab. See Limiting Access and/or Hiding Tabs for more. Select the Find icon to look up defined keywords.

Table

(read only) This field identifies the table used with the tab.

Number of Columns

(Required for single-instance tabs) Specifies the number of columns to display for a single-instance tab.

Current fields

Lists all of the fields that will display on the tab.

Available fields

Lists all of the fields that are available but not displayed on the tab.

Add button

Used to move the selected field from the Available fields list to the Current fields list.

Up/Down buttons

Click these buttons to move the selected field's placement up or down in the Current fields list.

Remove button

Used to move the selected field from the Current fields list to the Available fields list.

Prompt

Specifies the field label that will display on the tab.

New row

Enable if you want the field to display in a new row in the tab.

Read only

Enable to allow users to view but not edit a tab's data.

Show window fields on customer profile

Enable if you want all of the Current fields displayed when you print a customer's profile.

To create a user-defined tab

After you name and define a data table, you can create and customize a user-defined tab based on the data fields.

> **Note:** Note: If you selected Auto-Create Window when you defined the table, a user-defined tab based on the table name was created automatically. If a tab was created automatically, you can modify it (see "To modify a user-defined tab").

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Using the iMIS Desktop, connect to iMIS with the MANAGER logon.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Windows to open the Window Designer window.
6. In the Window Designer window, name the user-defined tab, enter the table name that contains the data fields, and select the fields you want displayed on the tab. In the following example, the Name-Demo tab is created using fields from the Name_Demo table. Although the Name_Demo table contains 17 data fields, only nine fields are used for this tab. The field labels that display on the tab are the same as the data field names unless prompts are defined for the fields. In this case, the field labels display in parentheses, for example (Mobile Phone).
7. Click New.
8. Enter the tab name in the Current windows field.
9. Press Tab. iMIS prompts you to confirm the creation of the new tab.

10. Click Yes. iMIS prompts you for the table name.
11. Enter the Table Name that contains the fields you want to use for the tab.
12. Click Save. iMIS prompts you for the tab title.
13. Click Save to accept the default title, or type in a different title.
14. Click Save. The Window Designer window displays the tab name and the Available fields from the selected table.
15. Press Tab.
16. (optional) Enter any Access keywords, or select the Find icon to select keywords (see "Limiting access and/or hiding tabs") for the tab.
17. (Required for single-instance tabs) Enter the Number of Columns you want to display for the tab.
18. Select a data field from the Available fields list, and click Add to move the field to the Current fields list. Repeat this step for every data field to be displayed on your tab.

    Note: If there is a subset of fields in your table that need to be confidential among a smaller group of users, remove them from the tab and create a new restricted-access tab containing only these confidential fields.
19. (optional) Select a data field from the Current fields list.
20. Click Up or Down to reorder the field as it appears on the tab.

1. If you want a different Prompt than the one specified in the User Defined Tables window, enter the new prompt.
2. (optional) Enable the New row option to display a field in the first column of a new row.
3. Select the Read only option to create a special display-only field that cannot be edited.

   Note: Use Read only to create versions of the same tab for different user groups: one group can enter data in those fields, while another only can view the data. The Read only option requires the Access Keywords (see "Limiting access and/or hiding tabs") feature.

21. (optional) Enable the Show window fields on customer profile option to show the Current fields on the customer's profile.
22. Click Save. iMIS saves the tab definition and creates the tab format.
23. Click OK if prompted to restart iMIS.
24. Click Close to close the Window Designer window.
25. Exit iMIS immediately for the changes to take effect.

To modify a user-defined tab

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Using the iMIS Desktop, connect to iMIS with the MANAGER logon.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Windows to open the Window Designer window.
6. Select the Current windows drop-down list, and select the tab you want to modify.
7. Make the necessary changes:

- To add a field to the tab, select the field from the Available fields list, and click Add on the Window Designer window.
- To remove a field from the tab, select the field from the Current fields list, and click Remove on the Window Designer window.
- To reorder the fields, select the field, and click Up or Down on the Window Designer window.

8. Click Save to save the changes.
9. Click OK if prompted to restart iMIS.

10. Click Close to close the Window Designer window.
11. Exit iMIS immediately for your changes to take effect.

To delete a user-defined tab

ID_207232 - no need to refresh libraries

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Log onto the iMIS Desktop as MANAGER.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Windows to open the Window Designer window.
6. Select the Current windows drop-down list, and select the user-defined tab you want to delete.
7. Click Delete. iMIS prompts you for confirmation of the deletion.
8. Click Yes to delete the tab.
9. Click Cancel to close the Window Designer window.
10. Exit iMIS immediately.

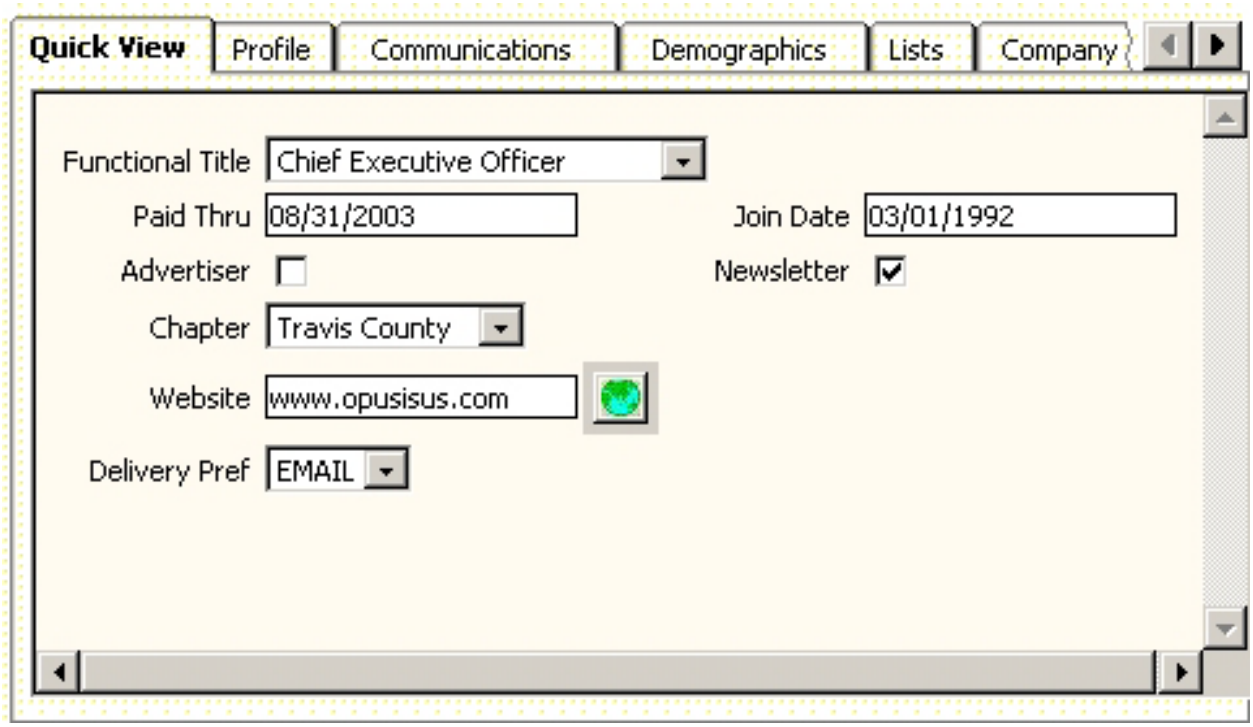
To display custom window fields in customer profiles

1. From Customers, select Set up module > General, and click Additional Windows to open the Customer Setup - Additional Windows window.
2. Click Define Windows to open the Window Designer window.
3. Enable the Show window fields on customer profile option.
4. Click Save.

   Note: You must restart iMIS for your settings to take effect.

Creating custom tabs

A system administrator can create custom tabs for the Details pane of the Customers > Manage customers window. For example, a custom tab can display your most frequently used contact information, so you do not have to look for these field values on separate tabs. In the following example, the Quick View tab contains the contact data your staff might need to view and edit frequently.



Customers > Custom tab example

The custom tabs you create in this way are similar to tabs you create by using iMIS Customizer, except that you can add fields from a wider variety of sources. You can use the following features for defining the tabs:

- Add fields from single-instance user-defined tables, the Name table, the Name_Fin table, or add SQL formula fields based on these tables.
- Specify the field prompt – the text that appears next to the field (optionally).
- Set individual field values to be read-only.
- Assign access keywords to limit which users have access to the tabs.

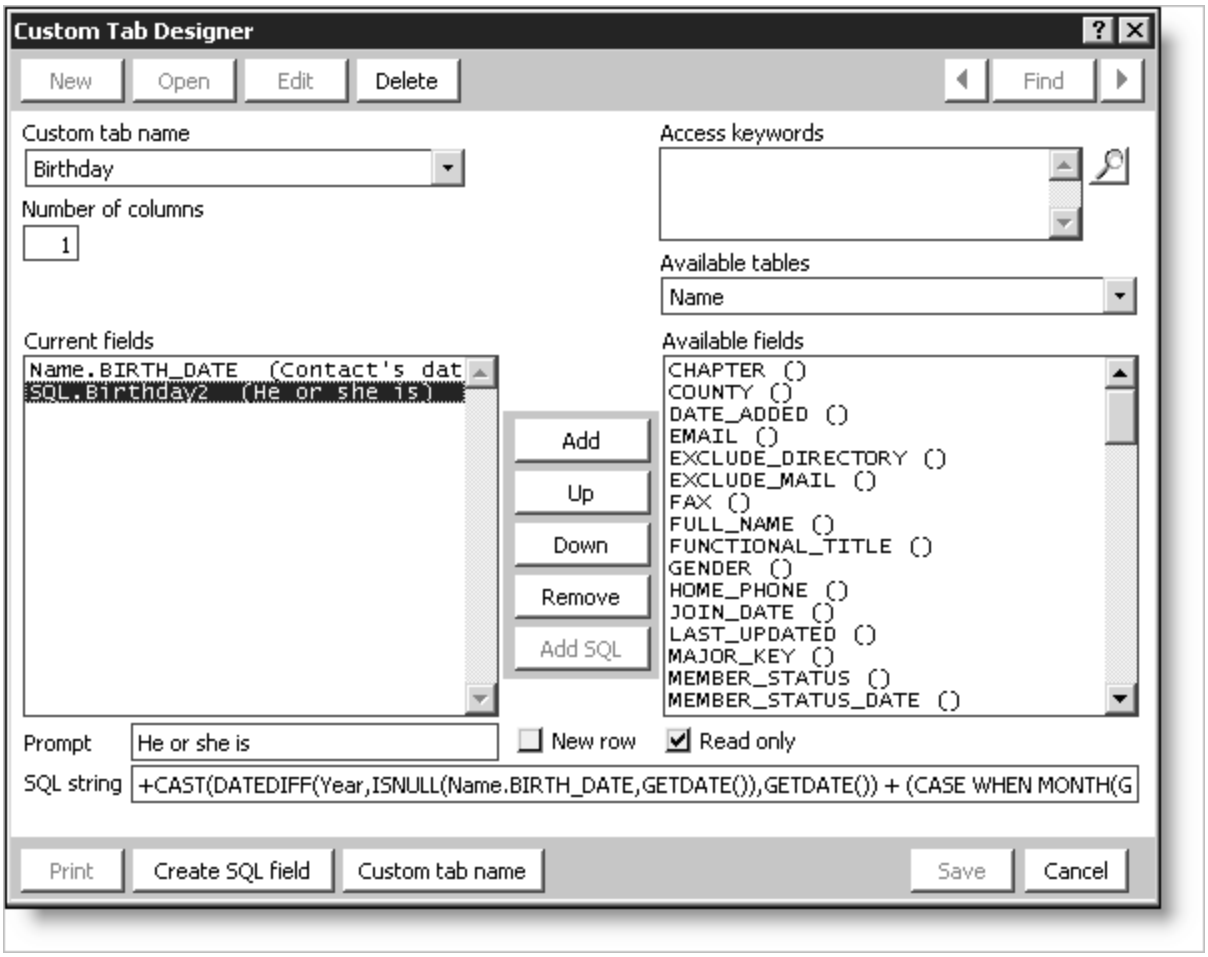
Fields that are always read-only

To protect data integrity, certain fields are read-only on custom tabs:

- Fields based on SQL formulas.
- System-generated fields (for example, Name.FULL_NAME, Name.DATE_ADDED, and Name.LAST_UPDATED).
- The Name_Fin.BILL_TO field.
- Any phone number or e-mail address field used in a synchronization rule: Name.WORK_PHONE, Name.HOME_PHONE, Name.FAX, and Name.EMAIL.
- The Name.COUNTY field, if either one of the options to auto-populate the county name is enabled in system setup:
- Zip Option - Customers > Setup Module> General> Address and Notes> Zip Options> County from Primary Zip
- Accumail Option - Customers> Setup Module> General> Address and Notes> Accumail Options> Update County/Congressional District based on [specified address purpose]
- Any field protected by an access keyword, if an access keyword is specified for any of the Name Record Data groups, such as Name Financials Edit, Name Addresses Edit, or Name Status Edit.

> **Note:** Note: If a user-defined Company Flow Down field is added to a custom tab, the field appears to be editable unless the Read only option is applied to it in the Custom Tab Designer window. If the record the user is editing is linked to a company record, however, the edits to the user-defined flow-down field do not take effect. As soon as the user selects Save, the edited value will be overwritten by the value associated with the company record.

Custom Tab Designer window



Customers > Set up module> General, click Additional Windows, and click Custom Tabs

Custom tab name

The name that displays on the custom tab.

Access keywords

(optional) Specifies access keywords. Keywords prevent unauthorized users from entering data on the user-defined tab. See Limiting access and/or hiding tabs for more. Select the Find icon to look up defined keywords.

Number of Columns

Specifies the number of columns to display for the tab.

Available tables

(read only) Select the table containing the fields you want displayed on the custom tab. You can select from a user-defined table or the Name or Name_Fin table.

Current fields

Lists all of the fields that will display on the tab.

Available fields

Lists all of the fields that are available but not displayed on the tab.

Add button

Used to move the selected field from the Available fields list to the Current fields list.

Up/Down buttons

Click these buttons to move the selected field's placement up or down in the Current fields list.

Remove button

Used to move the selected field from the Current fields list to the Available fields list.

Add SQL button

Used to move the selected SQL formula from the Current fields list to the Available fields list.

Prompt

Specifies the field label that will display on the tab.

New row

Enable if you want the field to display in a new row in the tab.

Read only

Enable to allow users to view but not edit a tab's data.

Create SQL field button

Used to create a SQL formula.

To create custom tabs

> **Note:** Note: In order to create custom tabs, the user must have authorization level 8 for Customers or log on as MANAGER.

1. Make sure all users exit iMIS before creating or modifying a tab.
2. Back up your data before creating or modifying a tab.
3. Make sure the field or tab does not have the same name as any table/field in iMIS or any SQL reserved word.
4. Log on to the iMIS desktop as MANAGER.
5. From Customers, select Set up module > General.
6. In the Set up general options window, select Additional Windows.
7. In the Customer Setup - Additional Windows window, select Custom Tabs.
8. Click <New custom tab> in the Custom tab name drop down list.

   If a custom tab already exists, click the Custom tab name drop down list, choose <New custom tab>, and then enter the name for the tab.
9. In the Custom Tab Designer window, specify the following options:

- Custom tab name field – Enter the text to use as the tab label. You can use spaces and underscores (_), but do not use punctuation (',"), special characters, or SQL reserved words.

  Caution! If you use unsupported characters in the tab name, the next time you start iMIS, the Customers module may be inaccessible.
- Number of columns field - Enter the number of columns to use for displaying the fields.

10. Add fields to the custom tab:

- Fields from Tables - For each field you want to add from an existing table, select the source table from the Available tables list, select the field name in the Available fields list, then click Add.
- Fields from SQL Formulas - For each field you want to create from a SQL formula, select Create SQL field, specify a Prompt value and a valid SQL formula, then click Add SQL.

  You can create SQL fields to display values calculated from values in any of the available tables. For example, the custom tab could display a contact's age (calculated from the birth date) or the tab could include extra information for a contact whose income is in a specified range.

11. (optional) To customize the prompt (text) that appears next to the active field (the field selected in the Current fields list), edit the text in the Prompt field. The Current fields list shows the Prompt setting for each field in parentheses after the field name.
12. (optional) To make the active field appear at the beginning of a row, select the New row check box.
13. (optional) To prevent users from editing the contents of the active field, select the Read only check box.
14. (optional) To assign keyword access to the tab so that only authorized users have viewing or editing rights, use the Access keywords field. Set up access keywords just as you would for any user-defined window (as described in iMIS Customer Management).
15. Optional: To reorder or remove fields, use the Up, Down, and Remove buttons.
16. When you finish specifying tab settings, select Save, then Close. (Close the Customer Setup Additional Windows window also.)
17. To set the new tab to appear at the next iMIS startup, right-click in the top of the History or Detail pane of the Manage customers window and select Edit Tab Preferences. In the Customer Portfolio Tab Preferences window, add the new tab to the Visible Detail tabs list. You can use the Top, Up, Down, and Bottom buttons to order the tabs. Select Save, then close the window.

After you create the table or field, a message notifies you to restart iMIS for your changes to take effect.

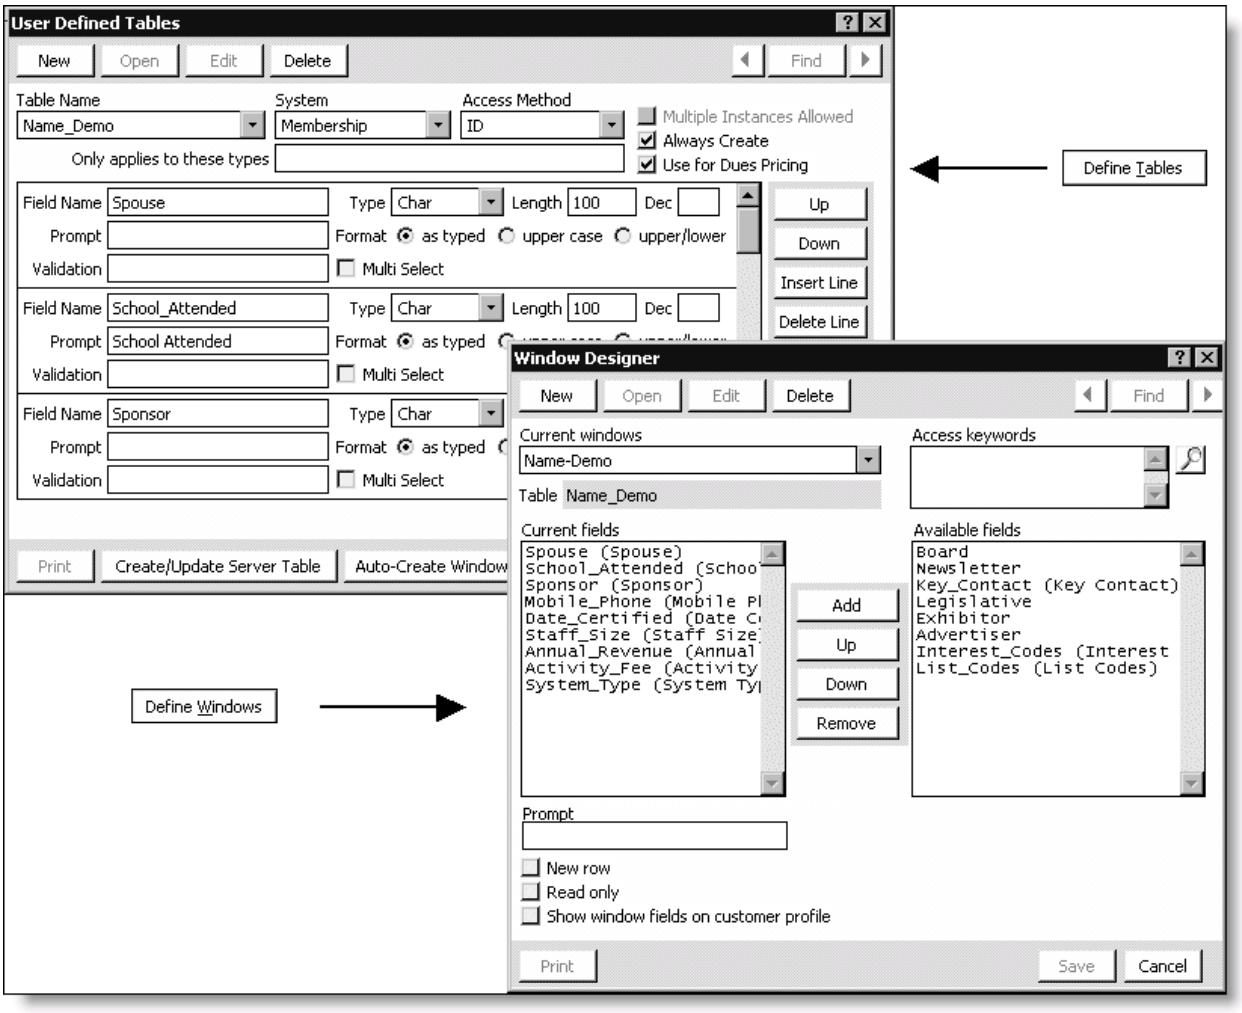
18. Restart iMIS and check for the custom tab you created.

    The next time a user starts iMIS, the newly created or edited custom tab appears in the Details pane of the Manage customers window, provided the following conditions are met:

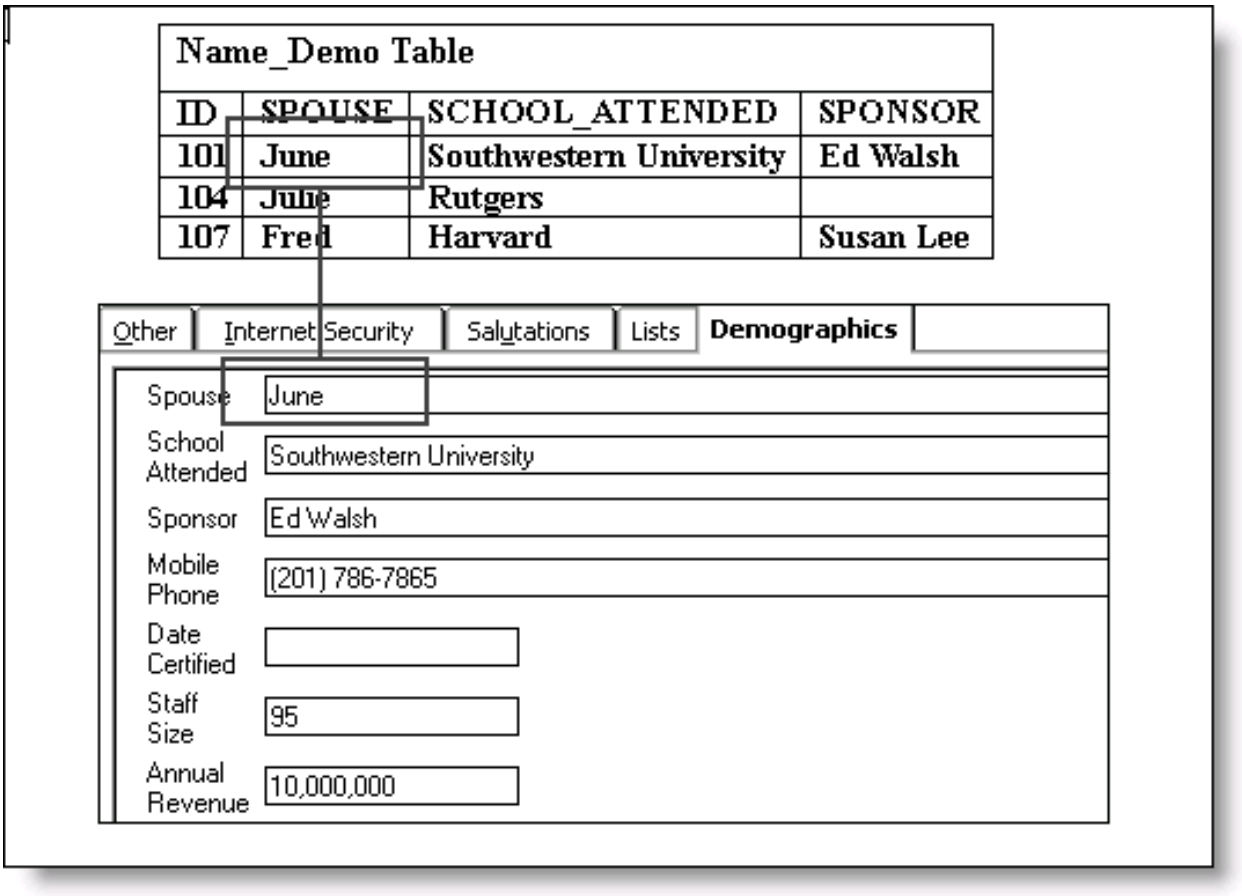
- The tab is included in the Visible Detail tabs list in the Customer Portfolio Tab Preferences window (as described in the previous step).
- The system administrator has added the custom tab to the default Tab Preferences profile, and the user does not have a customized personal Tab Preferences profile.
- If access keywords are assigned to hide the tab from unauthorized users, the system administrator has to assign the needed keywords to the user.

Reviewing the Customizer interface

The following diagram shows the iMIS Customizer windows that you access when you select Define Tables and Define Windows.



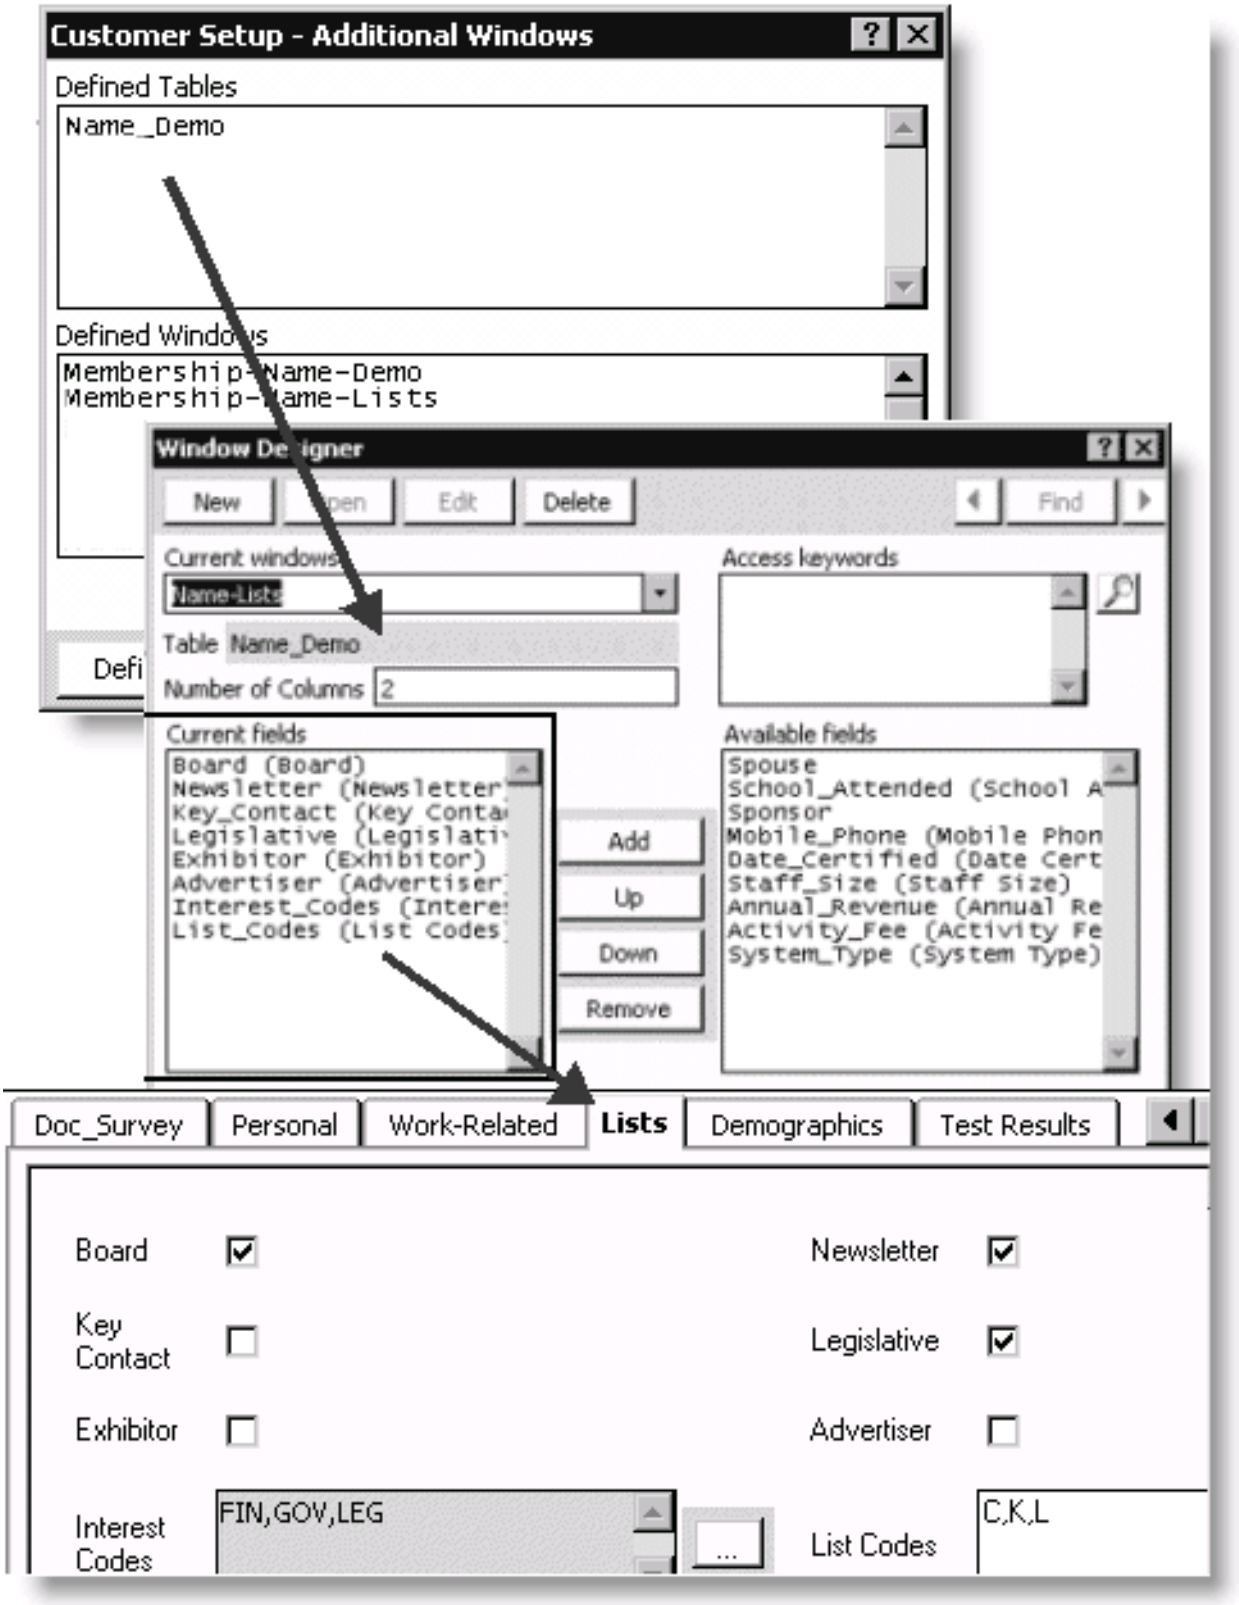
In the User Defined Tables window, we selected the Name_Demo table and defined the fields we wanted to use. When we created the user-defined Demographics tab, we chose the Name_Demo table, and selected only nine fields from the table to display in our Demographics tab.



When we enter data in the Demographics tab, the Name_Demo table stores the data, and the Demographics tab displays the data.

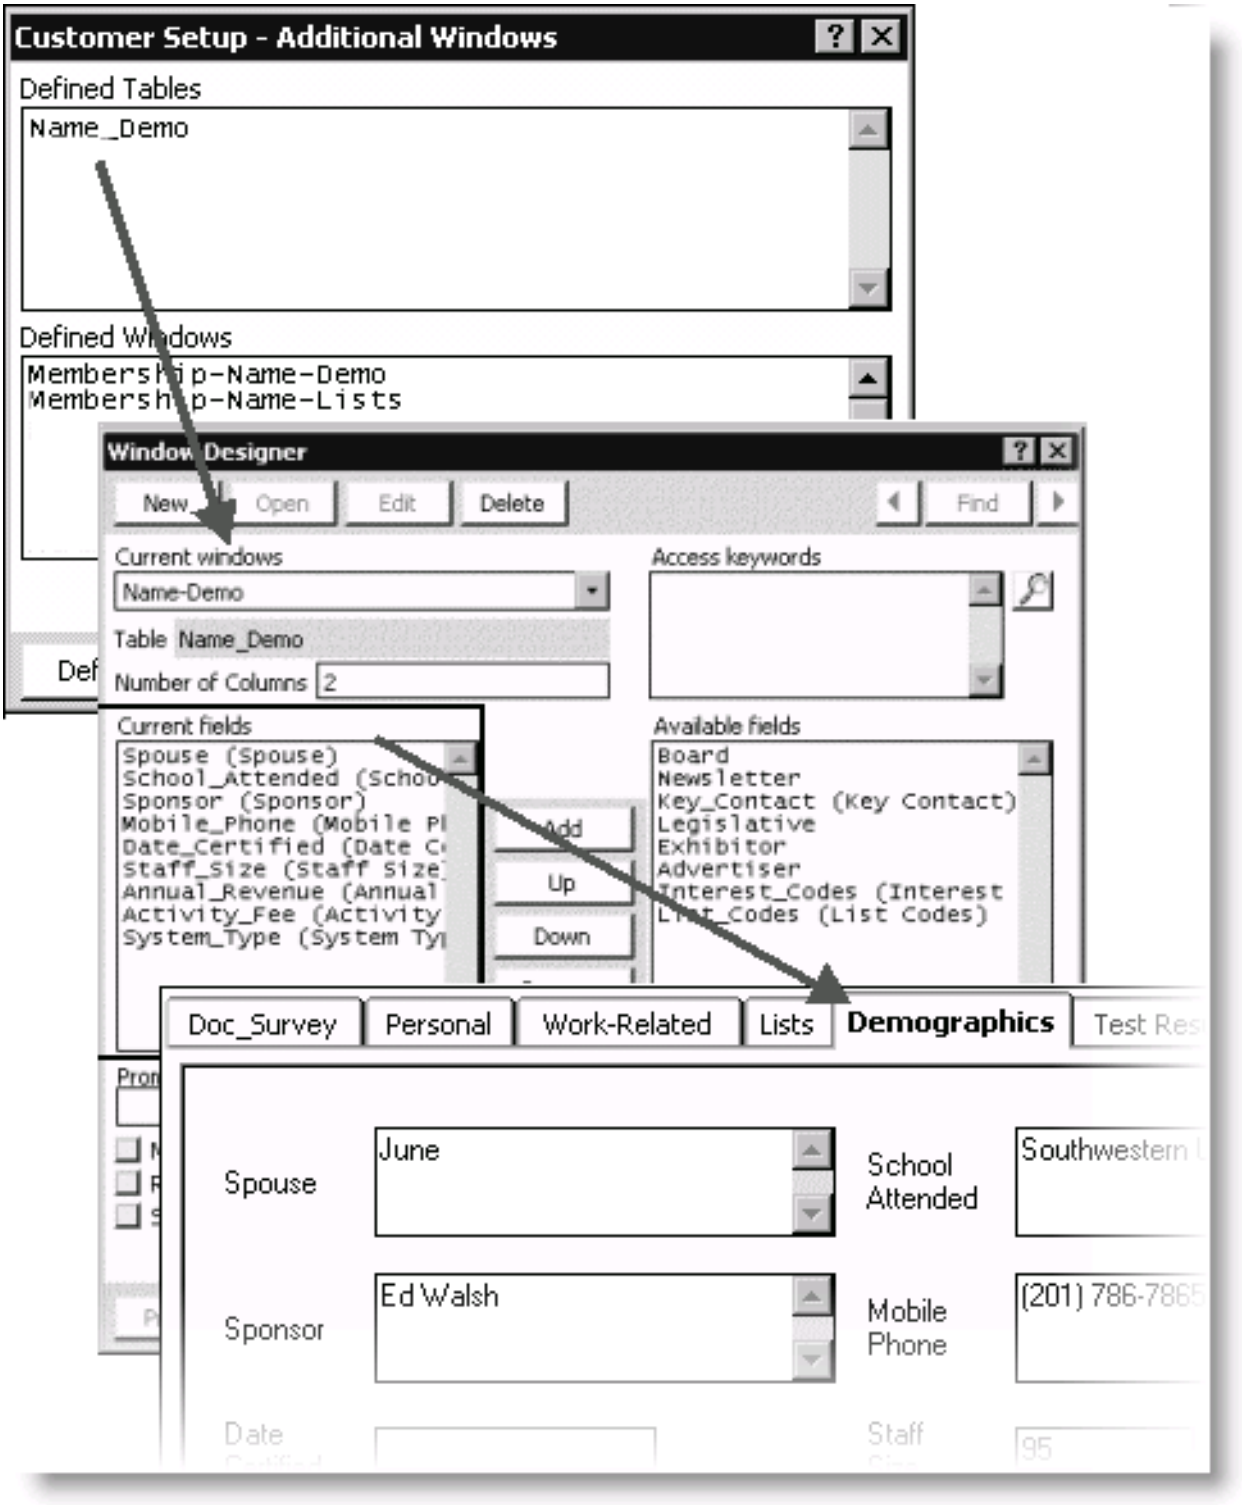
Sample user-defined tabs

The following example illustrates how the data fields in the Name_Demo table were used on the Name-Lists window to create the user-defined Lists tab.



Sample Lists window tab

The following example illustrates how the data fields in the Name_Demo table were used on the Name-Demo window to create the user-defined Demographics tab.



Sample Demographics window tab

Entering user-defined data

Before you begin, make sure you followed the instructions in Creating a User-Defined Table and in Creating a User-Defined Tab.

To enter single-instance, user-defined information

1. From Customers, select Manage customers to open the Manage customers window.
2. Open the customer's record.
3. Select the specific tab, and enter the appropriate data.

   Note: To select values for a field defined as a Multi Select field (for example, the Interest Codes field in the sample Lists user-defined tab), click the Select Values button located to the right of the field to open the Select Values – Web Page Dialog window.
4. Click Save to save the data.

To enter multi-instance, user-defined information

If you use the first field on a multi-instance tab as a key field, the first field must have a Type equal to Char and a general lookup/validation table. This field acts as the key field that allows you to stack data. For example, you may have a questionnaire that is distributed to customers, and you want to track responses for each occurrence. The questionnaire would be entered one time for each ID and could be tracked by the distinct name (key field).

> **Note:** Note: When creating a general lookup/validation table for a multi-select field in a user-defined table, the Description field on the Set up general lookup/validation window must contain a unique value for each Code.

1. From Customers, select Manage customers to open the Manage customers window.
2. Open the customer's record.
3. Select the specific tab in which you want to enter data.

4. Place your cursor in the first field of the bottom (empty) row. A drop-down list will display.

   Note: To select values for a field defined as a multi-select field, click the drop-down arrow on the field to open the Select Values window.

5. Select a value. Repeat this step for each additional field in the row.
6. Click Save.

   To edit a multi-instance, user-defined record

1. From Customers, select Manage customers to open the Manage customers window.
2. Open the customer's record.
3. Select the specific tab that you want to edit.
4. Place your cursor in the field that you want to edit. A drop-down list will display.
5. Expand the drop-down list, and select a value. Repeat this step for each additional field you want to modify.
6. Click Save.

   To view a multi-instance, user-defined record

1. From Customers, select Manage customers to open the Manage customers window.
2. Open the customer's record.
3. Select the tab containing the record you want to view.

   To delete a multi-instance, user-defined record

1. From Customers, select Manage customers to open the Manage customers window.
2. Open the customer's record.
3. Select the tab containing the record you want to delete and use one of the following methods:

- Select the entire row in a tab and press the Delete key on your keyboard. If you select this method, the entire row of data is deleted from the tab from which you are performing the

delete, as well as any other customer tab that contain those fields.

- Select the data in a field and press the Delete key on your keyboard. If you select this method, only the data from the field you select is deleted from the tab from which you are performing the delete, as well as any other tab using the field.

4. Place your cursor in the field containing the data to be deleted. A drop-down list will display.
5. Expand the drop-down list, and select an empty (blank) value from the bottom of the list. Repeat this step for each field in the record that you want to delete.
6. Click Save.

   Note: When deleting data from multi-instance tab, a data row is not permanently removed from the database until all the fields for the multi-instance table are deleted, either by selecting and deleting an entire row or blanking data from a field.

Viewing data on multiple-instance, user-defined tabs in non-grid format

You can view or enter/edit data in a multi-instance, user-defined tab in a non-grid format by opening a window for a specific row in the data grid. The row-specific data window displays if you double-click on an empty data grid row.

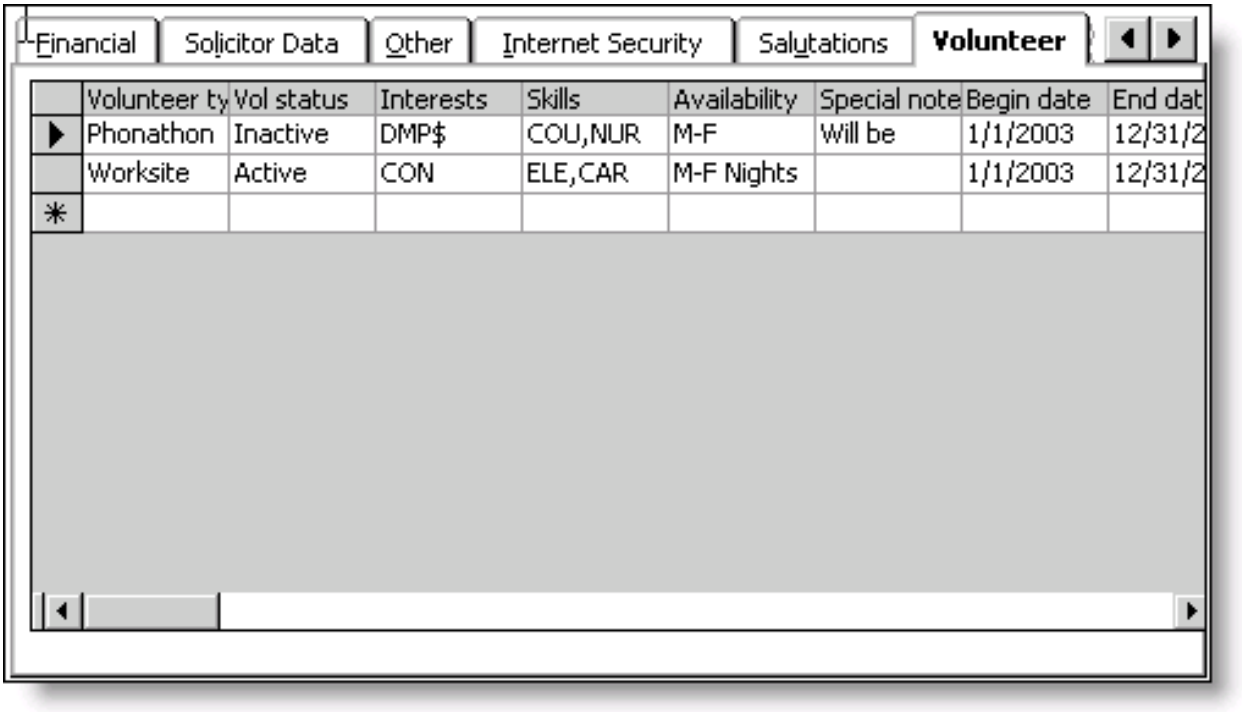
If you have permission to edit the values in the data grid, you can edit values in the row-specific data window. Any values changed in this window are automatically updated in the corresponding data grid rows when you click OK on this window. If you click Cancel, any values changed in the window will not be transferred to the corresponding grid row.

If you have permission to enter records in the data grid, you can enter new records directly in the row-specific data window. Records entered in the row-specific data window will be added to the data grid when you click OK.

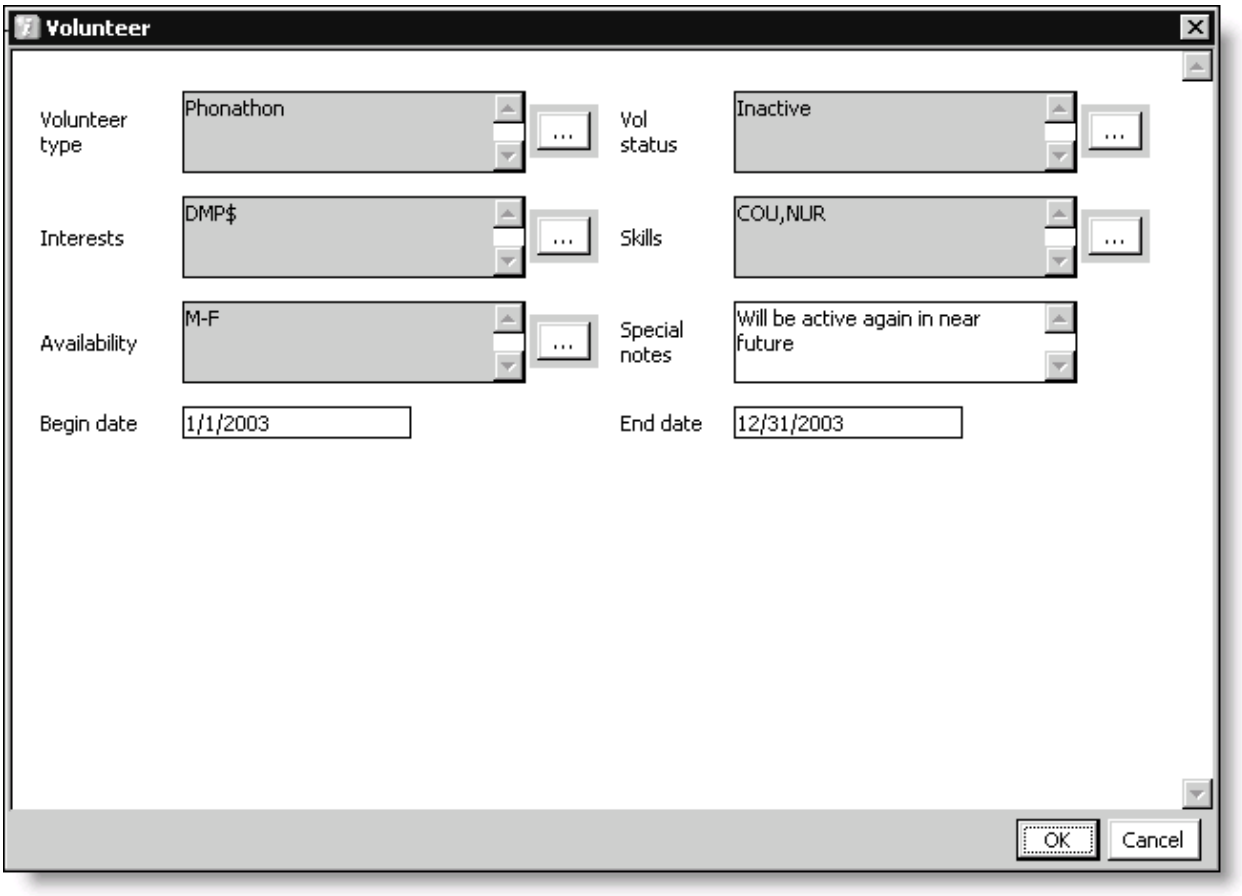
Changes or additions made in the row-specific data window are not saved to the database until you click Save on the Manage Customers window.

If the data grid is read-only, a record can be viewed in a row-specific data window, but the information in the window cannot be edited and you cannot enter new records in the window.

Validation of values entered in the row-specific data window uses the same logic as the validation of values entered in the data grid. Values entered in the row-specific data window are saved to the database after you click OK on the row-specific data window and then clicking Save on the Manage customers window.



Example of user-defined tab (from Customers, find a customer record, then select the user-defined tab)



Example of the first row from the multi-instance user-defined tab shown in previous example displayed in a window format (in the data grid, double-click on the gray box located to the left of the row you want to view)

To view data on multiple-instance, user-defined tabs in a non-grid data window

1. From Customers, click Find and open a customer record.
2. Select the multiple-instance, user-defined tab.
3. Double-click on the gray box located to the left of the row you want to display in a non-grid data window.
4. Click Cancel to close the non-grid data window.

To edit data on multiple-instance, user-defined tabs in a non-grid data window

1. From Customers, click Find and open a customer record.

2. Select the multiple-instance, user-defined tab.
3. Double-click on the gray box located to the left of the row you want to display in a non-grid data window.
4. Make any changes to fields in the window.
5. Click OK.
6. Click Save on the Manage Customers window.

Viewing read-only fields in user-defined windows

Tooltips make it easier to view read-only data in multi-select and text fields in user-defined tabs.

> **Note:** Note: To display user-defined tabs, you must add the tab to the list of visible tabs on the Customer Portfolio Tab Preferences window (from Customers, select Manage customers, then right-click on a tab and select Edit Tab Preferences or press Ctrl+T).

Converting existing fields

To help you upgrade your previously defined user demographics, use the iMIS templates that model the Name_Demo table. A set of window templates is also included to help you view or modify the data.

To convert pre-3.2x C/S versions

To help you upgrade your previously defined user demographics, iMIS includes templates that model the Name_Demo table that was provided with versions before 3.2x. A set of window templates is also included to help you view or modify the data.

MSSQL Only

If you have a database with existing data, you can load these templates, confirm they are working as expected, and proceed with your customizations. These templates are provided in four *.tab files and define the old 66-column Name_Demo table, as well as a

set of three predefined windows. After you confirm that the templates are working, you can rename the UF_* fields to more meaningful field names and define new windows to edit this data.

To convert iMIS LAN demographics

Most sites will want to take advantage of the enhanced custom demographics in iMIS, which will involve mapping old UF_* fields onto newly built tables of custom fields with logical field names. If this is your situation, build your custom tables first, then map your old UF_* fields from the Name file to your custom tables during conversion.

However, you may have such a complex structure in your iMIS LAN demographic fields that you want to bring all the fields over intact. If so, you can use any of four *.tab files that ship with iMIS to create UD tables in the old format, replicating the iMIS LAN demographics table structure and windows:

ud_field.tab	UD_Field
ud_table.tab	UD_Table
ud_wfld.tab	UD_WindowFields
ud_whead	UD_WindowHeader

Limiting access and/or hiding tabs

iMIS allows you to limit user access to confidential information on a user-defined or custom tab. You can restrict access to information and limit data entry and editing to only authorized users by setting access authorization levels (see "Access security levels") in iMIS.

To implement the iMIS security measures, you must perform the following steps:

1. Create the ACCESS_KEYWORDS lookup table.
2. Assign access keywords to user-defined or custom tab.
3. Assign access keywords to users.

To create access keywords

The first step in implementing security measures is to create the ACCESS_KEYWORDS lookup table for the user-defined or custom tab. The access keywords for your tab should include the reserved keyword HIDDEN and a code for each tab.

> **Note:** Note: HIDDEN is a reserved keyword that, when used with an access keyword for a tab, hides the tab to all users who have not been assigned the access keyword.

1. From Customers, select Set up tables > General lookup/validation tables to open the Set up general lookup/validation window.

   Note: Unlike other general lookup/validation tables, users must have an authorization level of 8 or higher to edit ACCESS_KEYWORDS.

2. Select (New Table) from the list of table types. The New Table Type window opens.
3. Enter ACCESS_KEYWORDS in the data entry field, and click Save to return to the Set up general lookup/validation window.
4. Click New.
5. Enter the Code and Description for the access keyword(s). The security for the customized windows is managed by the name of the tab; therefore, the Code entered should reflect the name of the user-defined or custom tab.
6. Click Save. Repeat the process for each additional access keyword.
7. Restart iMIS.

To assign access keywords to user-defined or custom tabs

User-defined or custom tabs can store detailed information about your customers such as annual salary, major gifts, and political affiliations. However, you might not want all system users to view this information or to enter or edit information in the tab.

iMIS allows you to assign access keywords that allow only certain users to view or to enter and edit information on user-defined or custom tabs. You can apply the access keywords on a tab-by-tab basis.

1. Create the tabs' access keywords in the ACCESS_KEYWORDS lookup table.
2. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.

- For a user-defined tab, click Define Windows to open the Window Designer window.
- For a custom tab, click Custom Tab to open the Custom Tab Designer window.

3. Select the user-defined or custom tab.
4. Enter the Access keywords. (Select the Find icon to open the Select ACCESS_ KEYWORDS value(s) window, and select from the available access keywords.) You can assign access keywords in three ways:

- Assign one or more access keywords to the tab, but do not assign the reserved keyword HIDDEN. In this case, all users will be able to see the tab, but only those with one of the access keywords will be able to enter and edit information on the tab.
- Assign both the reserved keyword HIDDEN and one or more access keywords to the tab. The tab will be hidden from all users except those who have one of the access keywords for the tab.
- Assign neither the reserved keyword HIDDEN nor the access keyword to the tab. In this case, everyone will be able to see the tab as well as enter and edit information on it.

5. (Using the Find icon/Select ACCESS_KEYWORDS value(s) window only) Double-click keywords to move them from the Available to the Selected field on.
6. (Using the Find icon/Select ACCESS_KEYWORDS value(s) window only) Click OK.

   The keywords selected display in the Access keywords field on the window.
7. Click Save to save the information.

   If you have assigned access keywords to a tab, follow the steps in the following section to give the appropriate users permission to view, enter, and edit information on a tab.

   To assign access keywords to users

   MB: The procedure was out-of-date. I embedded the accurate procedure.

Now that you have defined the ACCESS_KEYWORDS values and assigned the keywords to the tabs, you are ready to assign access keywords to the individuals who will be using the tabs.

If a multi-instance tab has an access keyword associated with it, only users that have the matching access keyword and a Customers authorization level of three or higher will be permitted to edit the tab; the tab will display in read-only mode for users who do not have the matching access keyword.

You may limit user access to information in the Customers feature of the Desktop view.

> **Note:** Note: You must create access keywords before you assign them to user records.

1. Log on to iMIS as MANAGER.
2. From System Setup, select Security administration > Users.
3. Find a Full or Casual user and open their user record.
4. In the bottom half of the User Access area of the Users window, enter one or more access keywords in the Access Keywords field, or click the Find icon to select keywords.

   Note: If you create access keywords and apply them to specific areas in Customers, but do not specify the keywords in a user record, that user cannot enter or edit information in those areas of Customers.
5. Click Save.

   Exit and restart iMIS Desktop.

**The Delete function is enabled only if the Allow Delete from Customer Portfolio option is enabled on the Customer Setup - Basic Options window (from Customers, select Set up module> General, and click Basic Options).

SQL reserved words

Do not use iMIS table or field names or SQL reserved words for user-defined tables and field names. Examples of reserved words for SQL Server include CLOSE, MANUAL, and VISIBLE.

Using iMIS or SQL reserved names may overwrite crucial existing tables and fields. Refer to the Microsoft SQL Server documentation for the SQL reserved keywords.

Customizer tips

The following are tips or useful information that help you create user-defined or custom tabs.

Troubleshooting user-defined or custom tabs

To make sure the user-defined or custom tabs are created properly, these pre-requisites must be in place.

1. Make sure all users exit iMIS before creating or modifying a tab.

2. You must have an authorization level of Customers level 8 to create a tab, (see "To create custom tabs") so either log on as a user with that authorization level or log on as MANAGER before creating a tab.
3. Back up your data before creating or modifying a tab.
4. Make sure the field or tab does not have the same name as any table/field in iMIS or any SQL reserved word (see "SQL reserved words").

   Unique table and field names

   When creating a user-defined table, you must use unique tables and fields. You cannot use an iMIS table name, an iMIS field name, or a SQL reserved word.

   > **Note:** Tip: To ensure unique naming, prefix acronyms to tables and fields you create. For example, organization ABC could define tables in the form ABC<TableName>; so, a table for the Discovery Conference could be ABC_DiscoveryConference, and its Name field could be DC_NAME.

   Limits for fields and window tabs

   There are no technical limitations on the number of fields for each user-defined tab; however, if a tab contains more than 50 fields, the tab becomes cluttered. This design may prevent users from viewing some fields.

   To see a list of the user-defined tabs displays in the Customer Setup – Additional Windows window, from Customers, select Set up module> General, and click Additional Windows. This menu can display up to 20 tabs. If your tabs exceed this amount, consider consolidating the data so fewer tabs are needed.

   The maximum length for a character field in a tab is 255 characters. If you define a field with over 255 characters, the data type becomes a Text data type.

   User-defined fields in iMIS special pricing

   If you have a user-defined field that contains a year and would like to use it in special pricing, you can use the datepart function. In the following example, the field is Name_

Custom.MEMBER_YEAR. It is a character field with a length of four. Add the field to the Name_All view, and you can use this calculation in special pricing:

```
If Name_All.MEMBER_YEAR >= datepart (year,Today(*))
Then 100
Else 200
Endif
```

The datepart function in this example takes the year from the current date, Today(*). The IF statement compares the current year to Name_All.MEMBER_YEAR, resulting in customers being charged 100 if the MEMBER_YEAR is greater than or equal to the current year, or 200 if the MEMBER_YEAR is less than the current year.

Troubleshooting Customizer

ID_207232 - no need to refresh libraries

The following are solutions to problems you may experience while creating user-defined or custom tabs:

- Problem: Tab not retaining data

  This is caused when the tabs get out-of-sync with the database, usually because more than one person was logged on while the tab was being created or edited.

  Solution: Make sure all users exit iMIS before creating or editing a tab. Edit the field or tab, change it back to activate the Save button, and then save the field or tab.

- Problem: Data not displaying correctly

  Solutions: If the data in a tab is not displaying correctly, verify the following solutions.

1. Delete and recreate the tab if the tab definition has not changed since the data was added, but fields were moved around in the tab.
2. No one was logged into iMIS when the table and tab were defined. Make a minor change to the table and tab (move fields up and down), and save.
3. Close iMIS after updating tables or tabs.

4. Run a query to determine if the data has been saved in the user-defined table but is not displaying in the tab.

- Problem: Validation table (the lookup feature) does not display for a custom field

  Solution: Make sure the validation table exists. Refresh the iMIS libraries.

Customer System Maintenance

Permanently deleting customer records

You can permanently delete iMIS customer records using two different methods:

- Permanently delete individual records (select the record in Manage Customers and click Delete) or
- Mark the record for deletion to be deleted at a later time by selecting the record in Manage Customers and changing the status to Marked for deletion. This will mark the record in the database with a status of D. You must then run the appropriate script for your database to permanently remove these customer records.

> **Note:** Note: iMIS contact records will continue to display in search, unless the record is “Marked for deletion”. If you do not want the publishing service to include contact records that were previously deleted, but not “Marked for deletion”, you will need to delete the search Contacts folder (ASI\iMIS\indexServiceProtected\Search\Contacts), and then delete the row in the SystemConfig table that is used by contacts publishing (e.g. DELETE FROM [dbo].[SystemConfig] WHERE [ParameterName] LIKE 'ContactsPublishing-<Publishing Server Code>'). The Contacts folder and the SystemConfig row will be recreated automatically.

iMIS does the following when you run a script to permanently delete customer records marked with a status of D:

- A record is added to the Name_Log table. The record will have the following values: Date/Time,CHANGE,DELETE,GUEST,id,last_first,company

- The Activity table is updated. For every customer record that is deleted, all of that customer's activity records will have the ID set to ''.
- All references to deleted customers are removed from user-defined tables.
- All records for deleted customers are removed from the following tables:
- Name
- Name_Address
- Name_Fin
- Name_Note
- Name_Picture
- Name_Indexes
- Name_Security
- Name_Security_Groups
- Prospect
- Subscriptions

  There are certain cases when the customer record will not be deleted:

- The customer has open orders. The script checks for the following field values in the Orders table:

  ID = ID to be deleted and

  STAGE <> "CLOSED" and STAGE <> "CANCELLED" and

  STAGE <> "COMPLETED"

- The customer has an outstanding invoice balance. The script checks for the following field values in the Invoice table:

  BT_ID = ID to be deleted and BALANCE <> 0

- The customer has active subscriptions. The script checks for the following field values in the Subscriptions table:

  STATUS LIKE 'A%'

- The customer has an entry in the Referral module, and this customer owes money. The script checks for the following values in the Referral table:

  PROVIDER_ID = ID to be deleted and

  REFERRAL_FEE > 0 and READY_TO_INVOICE = 1 and ORDER_NUMBER = 0

- Deleting this customer will leave orphaned records. Examples of orphaned records include the following:

- Name record with a Bill_TO ID, where the Bill_To ID no longer exists.

- Name record with a Company_ID, where the Company_ID no longer exists.

- Name_Fin record, where the Bill_To ID no longer exists.

- Cert_Register records, where the Bill_To ID no longer exists.

  For example, if ID 110 and 200 both have Cert_Register records with 110 as the Bill To Id, and ID is marked for deletion, and ID 200 isn't, ID 110 won't be deleted since that would leave ID 200 with a non-existent Bill To ID.

  To permanently delete a customer record (SQL database)

  Use the following instructions to permanently delete a customer record that has been marked for deletion (records in the database with a status of D). You can also run the Purge_MSSQL7.zip file available in the Tech Support Download area of the ASI website.

  > **Note:** Note: This procedure will only delete entries from Client Server tables. To remove entries from .NET tables, you need to use the DB Maintenance tool. See "Purging user and contact records".

1. Select Utilities> Reports and Queries to open the System Reports and Queries window.

2. Select the Purge report type.
3. Select the Membership Purge for MS SQL report for you database.
4. Click Run. A message displays asking you to confirm the deletion.
5. Click Yes.

Customer record database schema

The main contact-related tables within the iMIS database are Name, ContactMain, Individual and Institute. All basic contact information defined in customer portfolio is stored in the Name table and duplicated to the other three tables, depending on what kind of record it is (Individual, Institute or Combo*). ContactMain, Individual and Institute are often used in iMIS web features (Process Manger, Marketing Suite, WCM, etc.). For each row in Name, there is usually one row in ContactMain and one row in either Individual OR Institute. For a combo record* however, for each row in Name there are two rows in ContactMain (one for the individual and one for the institute), one row in Individual AND one row in Institute. The only place this difference surfaces is when using the NetContact business object as a source within IQA (see Finding customer records with IQA for details).

Over time, your database may end up with orphaned rows in the ContactMain, Individual and Institute tables. This can happen when a record type changes from an individual to an institute, or when a record has been deleted within iMIS Desktop. These orphaned records do not interfere with the application, as their references back to the original contact are removed and they are updated to have a status of 3 (deleted). But from time to time you may want to purge these orphans. If you wish to do so, refer to the section Purging user and contact records. Note that if an orphaned record is still in use (e.g. Updated By/Created By fields in iMIS web modules), then it cannot be purged.

*What is a combo record?

A combo record is a Company record that also contains a first or last name. This case will only occur if customer portfolio is not set to Suppress Individual Name Fields for Company Records (see Customer Setup - Basic Options window for details.)

Troubleshooting iMIS

Shortcut limitation with multiple instances

If you are using a Windows shortcut to access iMIS and you are opening multiple instances of the Manage customers window, you may encounter an Omnis error. If this happens, consult with your administrator.

This error appears to be related to the length of the target path shown in the shortcut.

Workaround

Try renaming the iMIS directory to a shorter name. Make sure to change the ODBC database path and the shortcut target path with the shorter name.

Error log files

The Customer Portfolio creates a log file (asiMMDDYYYY.log) each day. The log file records errors and other information. Error log files are deleted after five days. Depending on your operating system, the location for the log file varies. For any Windows operating system, you can go to Start > Run on the computer running the Desktop client. Type %TEMP%/asiTemp and then click OK to open an Explorer window with the temp directory opened. As another example, on Windows 2000, the log files are stored in the \Document and Settings\(Your username)\Local Settings\Temp\asiTemp directory.

Customers

Customers is the core area of functionality where back-office customer relationship management occurs.

Common commands and shortcuts (Desktop)

Standard toolbar commands

The toolbar provides a standard set of command buttons for working with records, and it is critically important to using the product. To help you recognize and use these commands consistently, the buttons appear in the same place within windows whenever possible. For example, New is always located at the top left of the toolbar, and Find is always located at the top right.

The standard toolbar above the work area

When a standard button does not apply to a given situation (for example, Delete when no record is open or selected), the button is disabled. You can recognize that a button is disabled by its muted gray text label (instead of black) and by the fact that you cannot tab to or select that button.

Toolbar Commands

New	Create a new record	Previous	Move to the previous record (if any)
Open	Open an existing record	Find	Open Search to find a record
Edit	Open an existing record for editing	Next	Move to the next record (if any)
Delete	Delete an existing record	Print	Open the Select Report window (disabled during data entry)

Keyboard shortcuts

Learning these built-in keyboard shortcuts will make data entry faster and easier. Use the right-click menu to Undo, Cut, Copy, Paste, Delete and Select All in the Name, Address

and Detail sections and in single-instance user-defined tabs. The right-click menu is not supported in the History section.

General Shortcuts

Ctrl+F	Find	Ctrl+C	Copy *
Ctrl+L	Lookup	Ctrl+V	Paste *
Ctrl+E	Edit	Ctrl+X	Cut *
Alt+S	Save	Spacebar	Execute button action
Alt+C	Cancel	Ctrl+T	Edit Customer Portfolio tab preferences
Ctrl+I	Insert new record	Ctrl+Q	Exit iMIS
Ctrl+N	Open a new instance of iMIS		* excluding single-instance UD tabs

Detail Tabs Shortcuts

Alt+P	Go to Profile tab	Alt+L	Go to Solicitor Data tab
Alt+D	Go to Donor Data tab	Alt+O	Go to Other tab
Alt+T	Go to Status tab	Alt+U	Go to Salutations tab
Alt+N	Go to Notes tab	Ctrl+Z	Undo (UD tabs only)
Alt+F	Go to Financial tab		

Data Grid (Table) Shortcuts

Ctrl+F9	Load next record from Results tab	Home	Move to first column of current row
Ctrl+F8	Load previous record from Results tab	End	Move to last column of current row
Ctrl+R	Load selected record (Results, Record History, Roster, Relationships, or Role tab)	Ctrl+Home	Move to first record
Ctrl+W	Load selected record in a new instance of iMIS	Ctrl+End	Move to last record
PageUp	Move UP one full screen in grid	Ctrl+Z	Zoom grid field (with length > 255 char-

			acters)
PageDown	Move DOWN one full screen in grid	Ctrl+Z	Undo (inside a zoomed field)

Customers Overview

Features found in the Customers area offer core iMIS functionality, designed for organizations. When you select Customers, you see a detailed view of your customer or member database. With this feature you can enter, edit, track, and maintain your organization's complex and dedicated customer information.

iMIS Customers integrates completely with other areas of iMIS. Much of the information these other areas use is sourced from the customer database, and the customer database is automatically updated whenever edits to customer data are performed within other areas. This constant flow of data makes iMIS an adaptable and expandable tool as the needs of your organization change.

iMIS customer management capabilities

The iMIS Customers feature enables you to perform the following tasks:

- Track and manage customers information, including eliminating duplicate records.
- Manage committees and chapter rosters.
- Store pictures (including logos).
- Plan and track activities (past, present, and future).
- Produce detailed standard reports (rosters, statistics, activity detail, and exports).
- Produce various types of correspondence helpers such as labels, letters, email, and user profiles.

Power of iMIS

Think of iMIS as a virtual filing cabinet filled with file folders that hold complete records for every customer you want to track. Regardless of the number of times these files are accessed, the records are not mislabeled or lost. Each customer file can grow as large as

needed. For example, you have the ability to continuously add information, such as what customers have done, where customers work, who customers know, what customers have contributed, and how much customers owe. You can store all of this information safely for as long as you need to keep it.

Designed for associations

iMIS provides the following powerful features:

- You can search for and retrieve customer information using many methods beyond simply scanning alphabetical lists. For example, you can search by ID, by company affiliation, by status, and by join date.
- You can display and print any type of customer information you are maintaining. This information can be analyzed in meaningful, organized, and easy-to-use reporting formats.
- You can view summaries of customer counts and statistics that iMIS maintains and updates automatically.
- You can quickly generate professional reports, personalized letters, mass e-mail, and labels for a selected group or for all of the customers in your file.
- You can create your own custom windows, tables, and fields that fit the specific requirements of your organization.

The iMIS design lets you work with your customer data in compact displays and feature-rich menus. Since no two associations are alike, iMIS has a flexible design that lets you customize the system to meet your specific requirements. For this reason, you will work with your System Administrator to set up iMIS to efficiently handle your needs. Pre-planning pays off in long-term usefulness and ease. In addition to customizing your system, you can also personalize the appearance of iMIS.

Tracking flexibility

iMIS provides a central database where you can track the companies and individuals that make up your association. Customers can include prospects, advertisers, exhibitors,

subscribers, fundraising donors, and legislators. Plan on your database keeping track of the following types of customers:

- Everyone who receives your promotional or regular mail, newsletters, and magazines
- Everyone whose receivables, cash receipts, or other history you want to track
- Everyone for whom you maintain telemarketing call logs and follow-up information

iMIS uses a single set of entry/edit windows to keep track of all customers in a single database. This unified database approach can:

- Simplify the data entry procedure by keeping all list entry restricted to a single set of windows or screens.
- Prevent errors by checking changes to data against lookup/validation tables and questioning or rejecting erroneous information.
- Eliminate duplication of effort by not requiring multiple data entry for all companies or individuals that simultaneously belong to different lists.
- Simplify the mailing and communication procedures, guaranteeing that individuals do not receive duplicate mailings when they are on several lists.

iMIS has several facilities to help you categorize and segregate the customer records into the groups you need.

Association list management

iMIS provides many tools that allow you to organize your customer database. Some common ways to group customers include:

- Customer type
- Customer status
- Category
- Committee
- Chapter
- Company/institute

- Activity
- Inclusion/exclusion category
- User-defined index
- Ad hoc search

By planning for and making appropriate use of iMIS organizational tools, you can easily track and report on various types of customer lists.

Type

You must assign a customer type code to each record you enter in iMIS. Some common customer types may include:

- Members
- Companies
- Individuals
- Customers according to billing level
- Categories for prospects, exhibitors, or advertisers

The primary strategy behind establishing customer types should be to distinguish different pricing levels. This usually pertains to billing, but can also include event registrations and order pricing. Customer types must be mutually exclusive; in other words, each customer may have only one customer type.

Customer types are extremely important. You should analyze the organization of your particular association before setting up customer types. Your System Administrator can assist you with this task.

Status

You can further divide types of customers by a status code. iMIS reserves the following status codes:

- A - for Active
- S - for Suspended
- I - for Inactive
- D - to mark for Deletion

All active customers begin with a status of A. A customer's status could change to S if, for example, they did not pay their dues by the end of the grace period. If, after a period they still did not pay their dues, you might change their status to I. Use a status of D only if you want the record to be marked for permanent deletion from the customer file.

Category

You can use Category as an additional way to categorize customers for billing purposes:

- Billing Category 1
- Billing Category 2
- Billing Category 3

Billing categories are assigned to customers in the Customers > Billing area.

Committees

You can organize customers into various committees through the Committee subsystem. Through this subsystem, you can track the following:

- Customers on particular committees
- Positions held
- Term of appointment
- Service history

You can use this information to customize print output for various committees. For example, you can print labels for mailings to a specific committee.

Chapters

iMIS lets you group your customers or members into separate and distinct chapters, or groups. Even if your organization does not have official chapters, you may find the chapter feature useful for organizing customers by state or pertinent regional areas.

Company/Institutes

You can keep lists of all individuals affiliated with a specific company or other entity by specifying a Company ID for those customers. Organizing customers by Company ID lets you easily view and work with a company roster or search for an individual by Company ID.

Another benefit of organizing customers by Company ID is that you have the ability to link the company address to the individual customer. When you enter a Company ID (Parent Record) for an individual record (Child Record) that currently has blank name, address, and telephone number fields, the parent company's Company Name, Address, and Telephone Number fields “flow down” to the child record. iMIS automatically populates the data from the company record. See Company flow down (see "Company flow down in iMIS") for more.

iMIS also lets you maintain multi-level company structures. For example, some individual records can point to intermediate company subsidiaries or branches that in turn point to higher level company records.

Activity

Activity types can include event attendance (system-assigned and generated), billing, fundraising, orders, awards received, volunteer service, and call logging. You can use the various activity types to organize customers into groups such as those who attended the last convention or who received a certain award. With the call-logging capability, you can list all task items that have a follow-up date in a certain date range. Task items are automatic reminders you can set up for activity types such as CALL.

Inclusion/Exclusion Categories

Another way to mark a company or individual's inclusion or exclusion from various groups is through user-defined check boxes. Use this feature to indicate yes/no or on/off

responses to single-choice lists or other designations. Some common inclusion categories could be:

- Send newsletter
- Participates in insurance program
- Key customer for legislative action
- Exclude from categories (exclude from certain mailing types, exclude from sold lists)

User-defined Indexes

During system setup, iMIS lets you specify up to four regular data fields as access keys (for screen lookup only). These fields will display in the Find window. iMIS will create and maintain a special index file for each designated index field. This index sorts the records according to the data in the specified field. For example, if you designate the State field as an index, iMIS would maintain an index list of all records, sorted in state order. This index lets you scan a customer list by state without searching the entire file. See Defining Lookup Indexes for the Find Window.

Note: Although user-defined indexes are useful, keep in mind that there is a performance tradeoff. Indexes can increase efficiency in accessing and searching; however, they do add overhead to data entry and maintenance functions. For this reason, only assign indexes to fields that will be routinely used as access keys.

Ad Hoc Searches

Beyond these list-maintenance features, iMIS also provides ad hoc searching where you can create complex formulas for searching any data fields stored for your customers. When executed, these ad hoc searches create temporary sub-lists that you can work with just as you do with permanent lists.

iMIS Customers feature terms

Before using iMIS Customers, you need to know these terms:

Database

A database is a collection of related information that is organized into meaningful units (for example, files, records, fields, graphics, and photos) for dedicated storage and access.

Table

A table is the highest organizational unit in the database. The iMIS files used most often in the Customer system are the Name tables. The convention for entering field definitions is to put the table name in title-case followed by a period and the field name in capital letters:

Table_Name.FIELD_NAME

Record

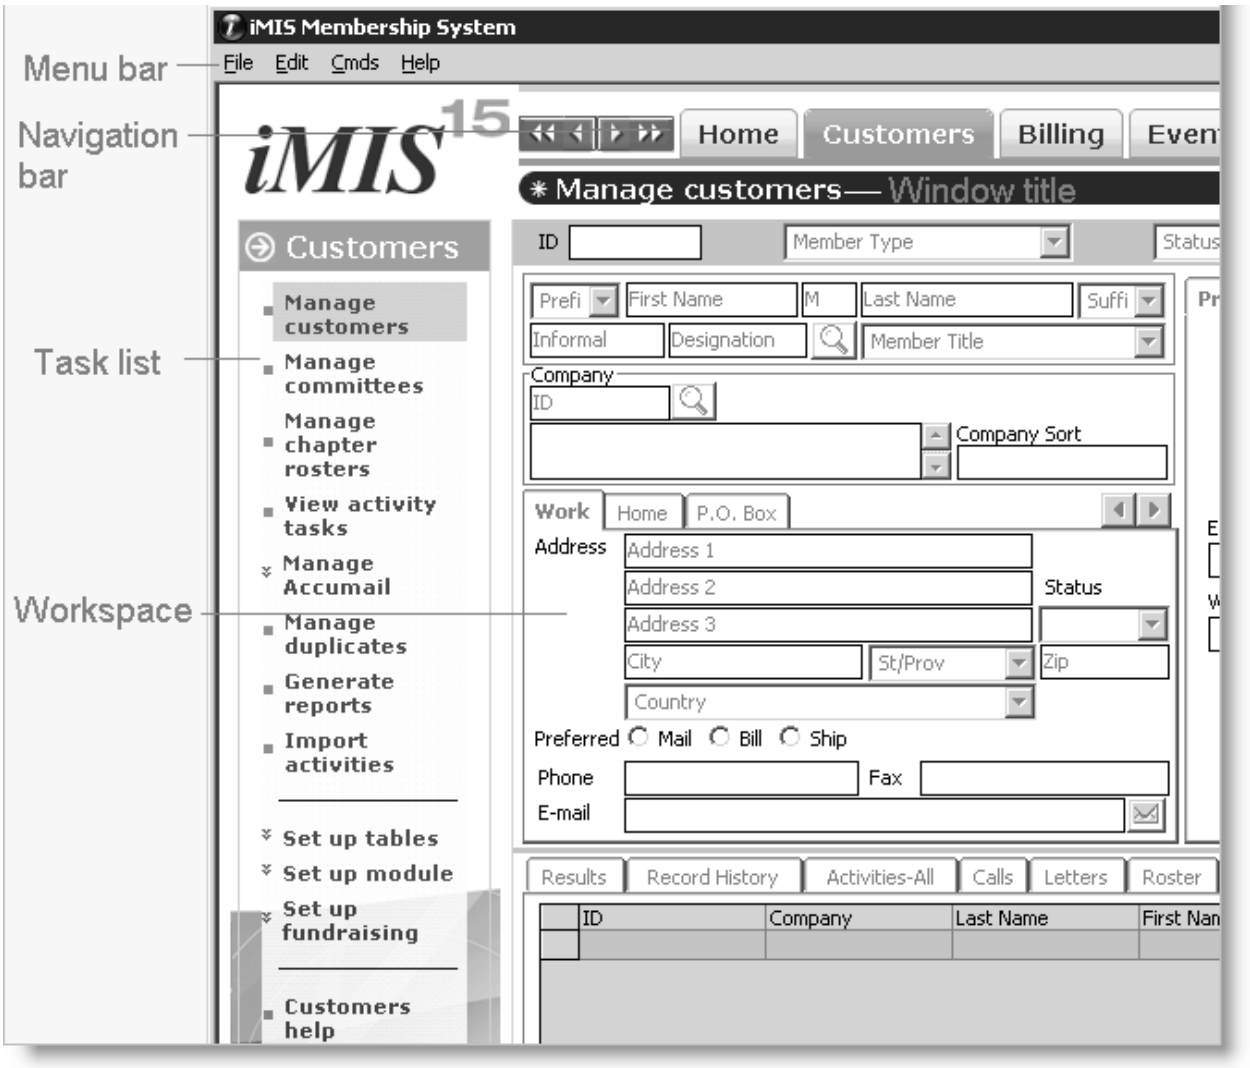
A record is an individual unit in a file containing a collection of fields. These fields are consistent in number and type from one record to the next. For example, a separate record is stored in the customer file for each individual or company in the system. (A record is also called a row).

Field

A field is an individual data element in a record (also called a row). A field may display in a data maintenance window in the form of a labeled text box or check box.

Reviewing the iMIS interface

The iMIS interface provides an effective way for you to complete tasks.



An example of the iMIS interface

Menu bar

The menu bar contains the commands for iMIS that are related to database functions and are rarely used.

Navigation bar

The navigation bar is located between the menu bar and the window title bar and consists of right and left arrows, a Home link, and the module names for which you have a license and a security level greater than zero (0). When you select Home, all windows will close and your designated home page will display in the workspace area.

Depending on the number of modules for which you have a license, you may not be able to see all of the modules. Previous and Next arrows are available on the navigation bar to scroll the modules. To navigate using the Next and Previous arrows, select a module name from the navigation bar. Use the Next and Previous arrow to move forward and backwards on the navigation bar.

Task list

The task list is an HTML-based navigation structure that is located in the left margins of the workspace area. The task frame includes the navigation bar and task list, which consists of links to windows that display in the workspace area.

When you select a link from the navigation bar, corresponding menu items display in the task list. A white arrow to the right of a task indicates a sub-task list exists and will display as a pop-up menu to the right of the selected task when you select the task. A white border will display around the task or sub-task item that has focus.

Workspace

Many tasks are accomplished within the workspace area, which is bordered by the navigation bar and task list.

Window title

The window title bar is located directly below the navigation bar. The window title replicates the task name you select on the task list. You can provide more information about the task you are performing by modifying the window title. The window title bar can also contain a right-justified image, for example, a logo.

The window title in the Manage customers window displays the task name with the Customer Type followed by the company's name when a company record type record is loaded. For example, Manage customers - Company Member - Prodigy Makers International. When all other records are loaded, the window title displays the Customer Type followed by the individual's name and designation.

Note: When selected, some task list items do not open a new window. The window title that displays for these items will replicate your previous selection.

Navigation for Customers

When you select Customers from the navigation bar, a specific task list appears on the left of your screen.

Note: Some task list items might not be visible, depending on the access granted by your iMIS administrator and whether you are licensed for certain iMIS features

Manage customers

Opens the Manage customers window that enables you to view, edit, or add customer records.

Manage committees

Opens the Manage committees window that enables you to enter or update committee rosters and appointee information, view or print lists, and produce labels or letters.

Manage chapter rosters

(visible only if licensed for Chapter Reporting) Opens the Manage chapter rosters window that enables you to access customer lists (all, current, future, and past) and data by chapter rosters.

View activity tasks

Opens the View activity tasks window that provides access to the built-in task reminder function in iMIS. You are presented with a summary of all open task activity records that includes items due for follow-up. You can review the open items in detail, print a detailed report, and remove closed items from the reminder list.

Manage Accumail (or Manage QAS)

(visible only if licensed for Accumail or QuickAddress) Opens a sub-menu of tasks for setting up and using the address verification system.

Manage duplicates

(visible only if licensed for Duplicate Merge Manager) Opens the Duplicate Merge Manager window that enables you to find, select, merge, delete, or keep possible duplicate records.

Generate reports

Opens the Generate reports window that enables you to print (or export) all standard output available through the Customers feature. The choices include a full array of detailed reports and rosters based on the customer file information, summary and statistical reports, labels, and table listings.

Import activities

Opens the Import activities window that enables you to create mass activity records.

IQA

Opens IQA in advanced mode and enables you to run predefined Intelligent Query Architect (IQA) queries on contacts and prospects.

Set up tables

Opens a sub-menu of tasks for configuring and maintaining the tables used by the Customers feature.

Set up module

Opens a sub-menu of tasks for configuring the behavior of the Customers feature.

Set up fundraising

Opens a sub-menu of tasks for configuring fundraising options.

Customer Data Management

The Customers feature is a collection point for customer information. In addition to basic contact information, the Customers feature also contains customer details and customer history. The customer data is managed using the Manage customers window.

Authorization levels for Customers

Your authorization level for Customers determines which functions you can access:

- To find and view customer records, you need at least authorization level 1.
- To run reports, you need at least authorization level 2.
- To create and edit customer records, you need at least authorization level 3.
- To add new addresses, you need at least authorization level 3.
- To delete customer records, you need at least authorization level 4 and the Allow Delete from Customer Portfolio option must be enabled by your administrator.
- To access the Manage tables window, you need at least authorization level 5.
- To access the Set up module window, you need authorization level 8.
- Access to the History area is based on security for each feature.

Customer data entry

The Manage Customers window enables you to add to and edit customer information.

iMIS features such as address verification and duplicate record checking help ensure that you enter useful and maintainable customer information. Your administrator can configure these options to best fit your organization's business rules.

To enter a new customer record

From the Manage customers window you can maintain name, address, and demographic data relating to customers. The unique feature of the Manage customers window is that you can activate virtually all customer-specific operations within one window.

1. From Customers, select Manage customers.
2. Click New.
3. (optional) Enter an ID number.

   Note: The ID field is grayed out when the Auto Assign Member Number option is enabled by your administrator.

   Note: If you do not have IDs auto-assigned, make sure you do not enter zero (0) for a customer ID.

4. (required) Select a Member Type description from the Member Type drop-down list .
5. Select a status other than Active, if appropriate.
6. (optional) Select a billing category description from the Category drop-down list.
7. (optional) Select a prefix from the Prefix drop-down list.
8. Enter the First Name, Middle initial, and Last Name.

   Note: When entering a new record, First Name, Last Name, or Company Name is required.
9. (optional) Select a Suffix from the drop-down list.
10. (optional) Update the Informal Name as needed.
11. (optional) Enter single or multiple (separated with a comma) Designation(s), or click the lookup icon to open the Select Values window and search designations defined by your administrator.
12. (optional) Select a Member Title from the drop-down list.
13. Click Save

    Note: You can continue with assigning a Company ID to this customer record next.

    To enter an address

    The three primary address tabs in the Manage customers window are titled according to the prompts entered for Main, 2nd, and 3rd on the Customer Setup - Address and Notes window (Customers> Set up module > General, Address and Notes). By default, the first address is set as the preferred address for mailing, billing and shipping purposes. However, you can customize which address is to be used for each purpose by setting the Preferred Mail, Preferred Bill, and/or Preferred Ship indicators on each of the three primary address tabs.

    Entering address information on the three primary address tabs:

1. Enter the address information for each tab as needed.
2. By default, the first address is automatically set as the preferred address for mailing, billing, and shipping purposes. However, you can customize which address is to be used for each purpose by setting the Preferred Mail, Preferred Bill, and/or Preferred Ship indicators on each of the three primary address tabs.
3. Click Save.

   If you need more addresses, populate the ADDRESS_PURPOSE general lookup/validation table with at least one value. (See “ADDRESS_PURPOSE (Validation)”). When you log back in to iMIS, a New address tab appears after the three primary address tabs, which lets you select an address purpose.

1. Select the New tab to open the New Address window.
2. Select an address purpose from the drop-down list.

   Note: You can create more than one address with the same custom purpose (defined in the General Lookup/Validation table for ADDRESS_PURPOSE), but multiples are not allowed for the standard purposes (defined in Customer Setup > Address and Notes).
3. Click OK.

   Note: When Accumail is licensed and installed, the Verify Addresses option is available.

   To enter a new company record in iMIS Desktop

1. From Customers, select Manage customers.
2. Click New.
3. (required) Select a Member Type description from the Member Type drop-down list.
4. Tab to the Company ID field and enter the company name or click the lookup icon to open the Find Company window and search available company records (see "Finding customer records").

   Note: When entering a new record, Company Name is required.

   Note: Company Sort is populated after you move out of the Company Name field.

5. Click Save, or continue with entering an address for this company customer record.

To select values for the Designation field

1. From Customers, select Manage customers.
2. Click the lookup icon on the Designation field to select a value.

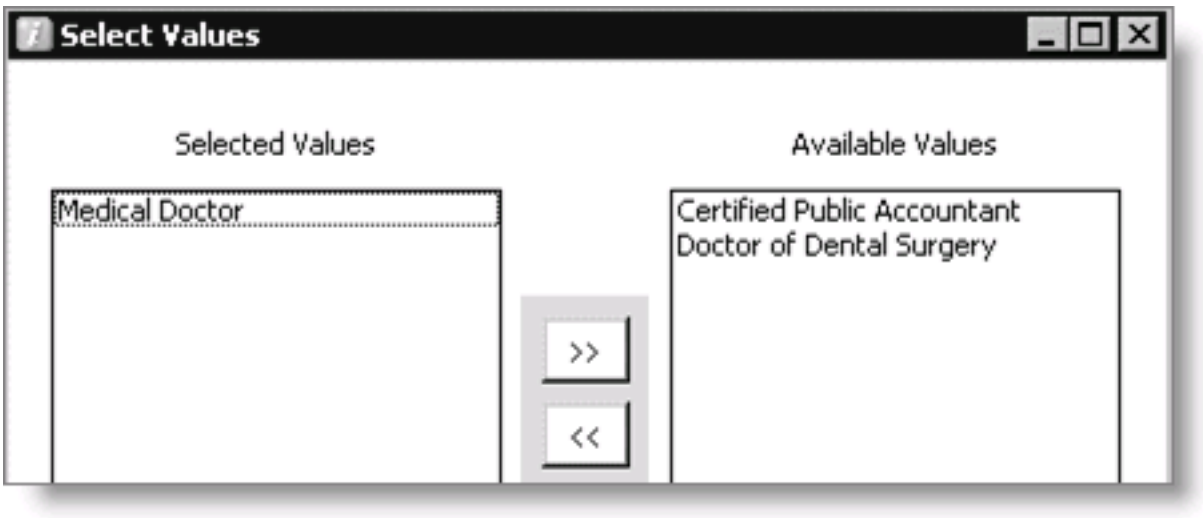
   The Select Values window opens.
3. Use one of the following methods to move items to the Selected Values list:

- Double-click the item in the Available Values list to move it to the Selected Values list.
- Select the item in the Available Values column and click << to move the item to the Selected Values list

4. Use one of the following methods to remove items from Selected Values list:

- Double-click the item in the Selected Values list to move it to the Available Values list.
- Select the item in the Selected Values list and click >> to move the item to the Available Values list.

5. Click OK to close the Select Values window.
6. Click Save on the Manage customers window to save the value(s) in the Designation field to the database.



The Select Values window

Finding customer records

Before you can view or edit a customer record, you must find the record. The Search and Find Company windows are available for locating customer records.

Opening customer records

You can open a customer's record from any of the following tabs in the History section:

- Results
- Record History
- Roster
- Relationships
- Role

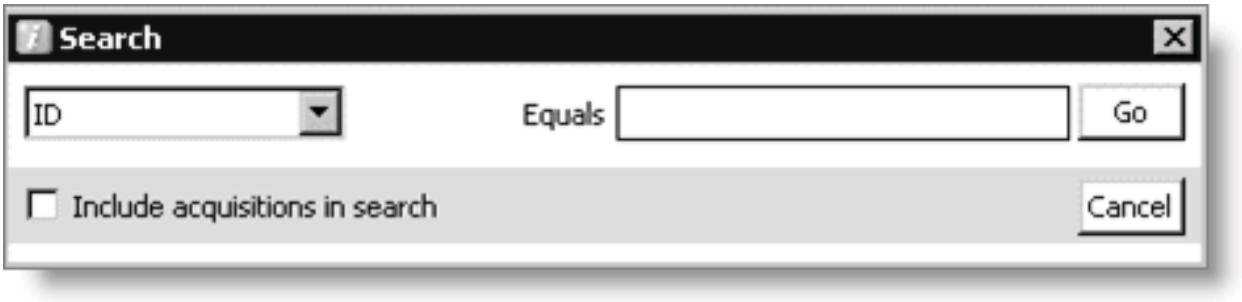
To open a customer's record, you can double-click anywhere within a customer's row in one of the above tabs (excluding the Relationships and Role tabs), you can use keyboard shortcuts, or you can use one of the two right-click menu items: Open and Open in New Window.

The Open menu item enables you to load the selected record in the active Manage customers window. The Open in New Window menu item enables you to open the selected record in a new iMIS instance.

Note: The menu items that are displayed below the Open and Open in New Window menu items enable you to navigate to a specific tab in the History section. For detailed information on navigating to tabs in the History section (see "Manage customers window - History tabs").

If you want to use keyboard shortcuts to open a customer's record, select the record in the tab and press Ctrl+R to open the record in the existing Manage customers window or press Ctrl+W to open the record in a new Manage customers window.

Search window



From Customers, select Manage customers, and click Find

Note: You can press Ctrl+F to open the Search window (perform a Find) only when the Manage customers window is not in edit mode and you are not in a single-instance, user-defined tab.

Drop-down list

Click the drop-down arrow to display a list fields on which you can search.

- ID - Returns the record for the ID specified, for example, 301.
- Name - Returns all records that meet the search criteria. For example, to search for all customers whose last name begins with Ski, enter SKI. To search for all customers with last name Skinner and first initial J, enter SKINNER, J.
- Company - Returns all records that meet the search criteria. For example, entering PRO will return all records where Name.COMPANY_SORT begins with Pro.

  Note: The company search feature is based on COMPANY_SORT, which uses the first 30 characters of the company name.
- Only Company - Returns company records only. For example, entering PRO will return all records where Name.COMPANY_SORT begins with Pro and Name.COMPANY_RECORD = 1.

  Note: The company search feature is based on COMPANY_SORT, which uses the first 30 characters of the company name.

- Major Key - (optional) User-defined field used for record searches. This option returns all records that meet the search criteria. For example, entering 526 will return all records whose Name.MAJOR_KEY starts with 526. The major key field is prefixed with the prompt configured by your administrator.
- Member Type Code - Returns all records that meet the search criteria. For example, entering N will return all records whose Member Type code starts with the letter N.

  Note: If you are using Acquisition Management to import records, the Imported List Code will display in the Member Type Code field.
- Indexes - (optional) Any of four data fields defined by your administrator to be used for searching. This index sorts the records according to the data in the specified field. For example, if your administrator designates
- State as one of the indexes, iMIS would maintain an index list of all records sorted in state order. This index lets you scan a customer list by state without searching the entire file.
- Interests as one of the indexes, iMIS would maintain an index list of all records sorted in interest order. This index lets you scan a customer list by interest without searching the entire file.

  Note: Results for user-defined indexes are returned in ID order.
- Chapter - Returns all records of those who have been billed dues for the chapter you enter as the search criteria (the full chapter name is required). For example, entering Travis will return all records where Subscriptions.CHAPTER is equal to Travis.
- Committee - Returns all records that meet the search criteria. The full committee name is required. For example, entering Technology will return all records where Activity.OTHER_CODE is equal to Technology
- Task Date - Returns all records that meet the search criteria.
  For example, entering 09/21/2000 will return all records where Activity.TICKLER_DATE is equal to 09/21/2000.

- Ad Hoc - Opens the Select Search Instructions window that enables you to enter search criteria to select specific records.

  Equals

  Specifies the search value. The prompt for this field will change depending on the search criteria shown. For example, when Name is chosen, the prompt displays as Begins with:

  Include acquisitions in search

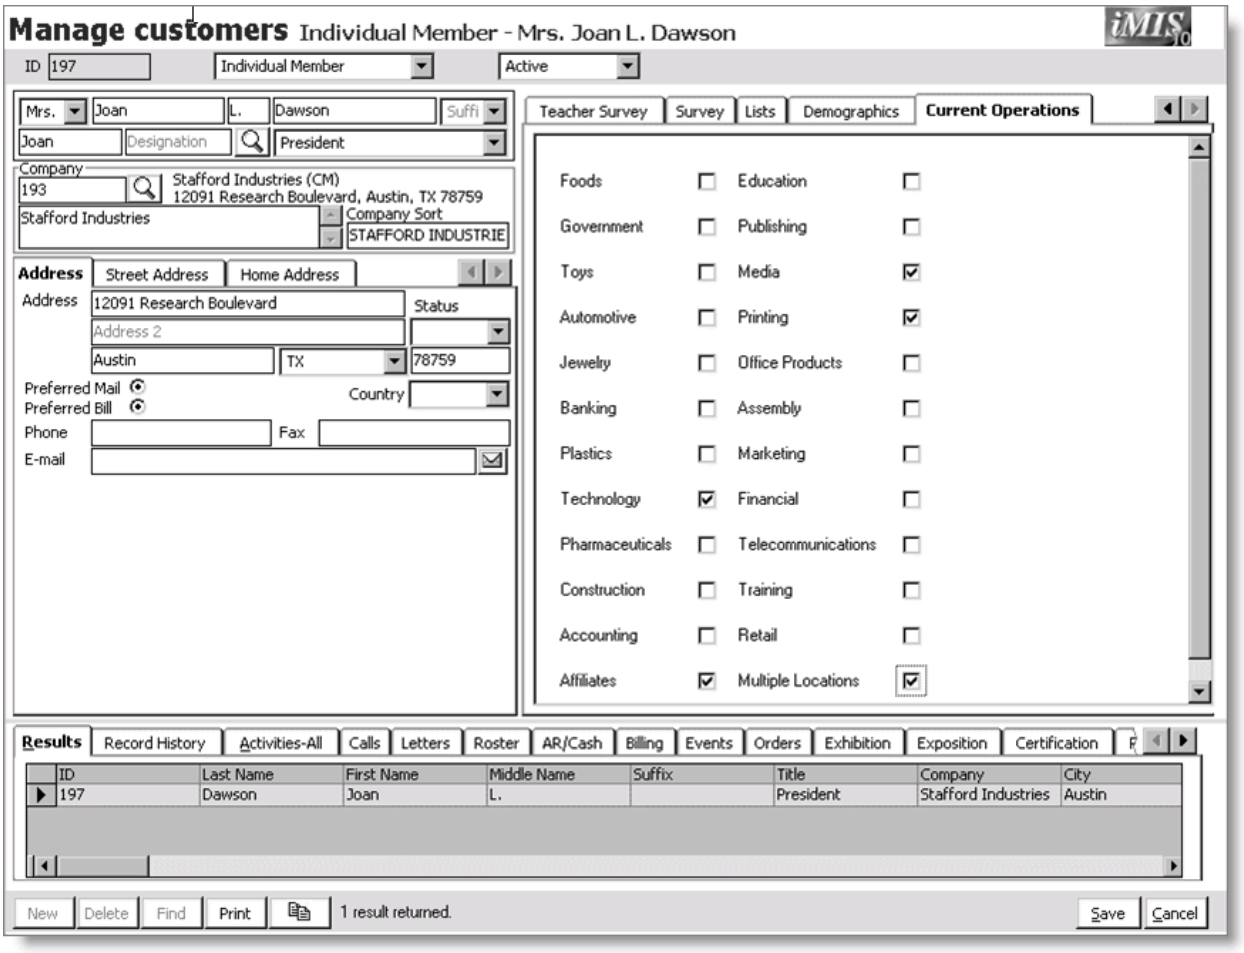
  Enable to include acquisitions from the Prospect table in the search. This option displays only when iMIS is licensed for Acquisition Management.

  To resize the Detail or History area

  A horizontal split window control, located between the Detail and History areas of the Manage customers window, enables you to view more data in the Detail and History areas and in user-defined tabs.

  A split window control is a vertical or horizontal bar that divides a window into areas referred to as frames. Moving the position of a split window control enables you to resize a frame as needed to view more data.

  To move the split window control, position your mouse pointer on the gray line between the History area and Main and Detail areas. Drag the control up to view more data in the History area or down to view more data in the user-defined tabs in the Detail area. Moving the split window control down will not change the Main area (Name, Company, and Address areas); the area below this area will display as blank space.



Manage customers window after moving split window control down

Note: Moving the split window control too far down will result in data in the History area becoming difficult to view.

To find and load a customer record

1. From Customers, select Manage customers.
2. To find a customer record,

- Click Find; or
- Press Ctrl+F to open the Search window.

Note: You can press Ctrl+F to open the Search window (perform a Find) only when the Manage customers window is not in edit mode and you are not in a single-instance, user-defined tab.

3. Select the search criteria from the drop-down list, for example, Name.

   Note: To bring up all customer records, leave the Equals field blank, and click Go. Depending on your setup, there may be a limit on the number of records returned. For large databases, blank name searches are not recommended.

   Note: The prompt for the search value field will change depending on the search criteria shown. For example, when ID is chosen, the prompt is Equals.

4. Enter the search value in the Begins with field.
5. Click Go. The Results tab is updated.
6. To view a record, select a row. Double-click a record on the Results tab to open it in the Manage customers window.
7. Select the tabs below to view additional information.

   To find and load a company record

   Note: The company search feature is based on COMPANY_SORT, which uses the first 30 characters of the company name.

1. Click the lookup icon in the Company area to open the Find Company window.
2. Select your search criteria, for example, Company.
3. Enter your search value, for example, the first letter of the company name in the Begins with field
4. Click Go to display the results.
5. Select the company and click OK, or double-click the company to link the company record with the customer record.

Note: If you select a company from the Find Company window and you have an existing value in the Company area, a system message asks if you want to overwrite the current company name and address.

Find Company window

From Customers, select Manage customers, and click the lookup icon in the Company area

Drop-down list

Click the drop-down arrow to display a list of searchable fields. These fields are configurable by your administrator.

Search value

Specifies the search value. The prompt for this field will change depending on the search criteria shown. For example, when Company is chosen, the prompt is Begins with.

Go

Used to start the search.

To open a record from a history tab

1. Select Customers > Manage customers.
2. Click Find.
3. Select or enter the search criteria and click Go. The Results tab displays the search results.
4. Double-click anywhere in the row of the record you wish to load.

5. Click on a history tab to show that tab's contents.
6. Double-click the record or the arrow on the left end of the record.

Modifying customer records

Use Customers to edit and delete existing customer records.

To edit a customer record

1. From Customers, select Manage customers.
2. Find the customer's record (see "Finding customer records").
3. When you load a record into the Manage customers window, iMIS is automatically in edit mode.
4. Make changes to the record, as appropriate.
5. Click Save.

To delete a customer record

Note: Your administrator can enable or disable the Delete button.

1. From Customers, select Manage customers.
2. Find the customer's record (see "Finding customer records").
3. Click Delete. A system message displays asking you to verify the delete.
4. Click Yes.

Data entry features

About customer data fields

Most fields on the Manage customers window do not display standard field labels to the left of each field. Instead, the field name is contained within the field as gray text. As data is entered in the field, the text changes to black as shown in the following example:

Fields in the Name area (Manage customers window)

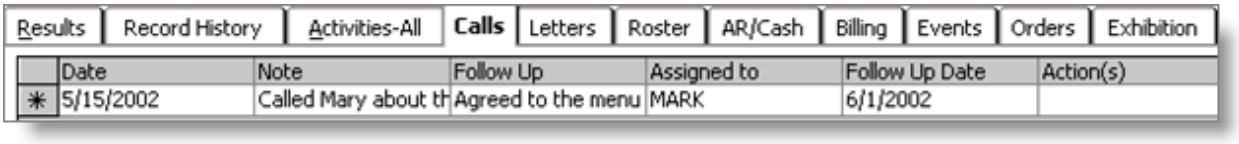
Fields on the Manage customers window are shown using different type colors or background colors to show their status.

- When there is no data in a field, the field label is shown inside the text box in gray, for example, the Prefix field in the previous example.
- When you select a field by selecting it directly or tabbing to it, the entire field label text is highlighted so that it can be easily replaced, for example, the Last Name field in the previous example.
- When the field has a value defined, the data is shown in black, for example, the First Name field in the previous example.

Field focus

Fields are color-coded to distinguish between data-entry fields and display-only fields.

Fields on the Calls tab have a white background, indicating that these fields are available for data entry.



Manage customers window - Calls tab

Fields on the Orders tab have a gray background, indicating that these fields are display-only.

Manage customers window - Orders tab

Duplicate record checking

iMIS checks for duplicate records using a formula that combines different parts of the customer's record to make a key. The formula that comes with iMIS is usually precise enough to catch duplicates, but in some situations, your administrator may need to customize (see "Formula for checking for duplicate records") the formula.

If iMIS detects one or more possible duplicate records, it will show a list of the possible matches and then gives you the choice of either continuing to add the record or canceling the addition.

Address verification

Address verification is an optional feature that may be implemented with your system. It checks addresses you enter against a database of valid addresses to help ensure that customers actually receive important communications and that your organization doesn't waste time and postal fees sending correspondence to invalid addresses. Your administrator configures the way address verification detects invalid addresses.

To select data from a drop-down list

A drop-down list displays pre-defined selections from which you can choose.

1. Click on the down arrow on the right side of the list to see the entire list.
2. Select an item from the list by clicking on the item.

   You can also perform a speed search, which can be helpful in selecting items from long lists. For example, if you type ca in the Country drop-down list, you immediately scroll to the first country that starts with the letters "Ca". You can then use the down arrow or up arrow keys to move to the next or previous items in the list.

   The speed search feature expects you to enter the search string quickly. If you pause typing for more than 2 seconds, the search is based on what you have entered up to that point. For example, if you type c in the Country drop-down list, wait a few seconds, and then type a, the list scrolls to the first country that starts with the letter "C", and then scrolls to the first country that starts with the letter "A".

Note: Some fields look like drop-down lists but are really combination fields that allow you to enter new values or choose from previously entered values. Combination fields do not support the speed search feature.

Reviewing undefined values

The Manage customers window displays (Undefined) beside values in fields that have been deleted from an iMIS table. Table deletions are allowed in iMIS, regardless of the entries in the Name tables.

You are not required to edit this value, but once another value is chosen from the drop down list, the (Undefined) value will no longer be available.

Date field data entry

iMIS can automatically format and complete dates for you when entering customer data.

Note: Dates entered in the Fundraising history tab are not automatically completed or formatted.

Date formatting

In Customers > Manage customers, you can enter a date in a date field using any type of date separators (slashes, dashes, periods, or spaces) or no date separators.

Dates can be entered in numeric or alpha-numeric format (“03/01/09” or “March 1, 2009”).

When you enter unformatted dates in customer-related date fields, iMIS interprets and formats the dates according to your workstation's date format (configured on the Windows Control Panel).

Note: Workstation date settings take precedence over the iMIS Date Format setting in File > System Setup.

Date completion

If you enter an incomplete date, such as 0304, in a date field, iMIS completes the date by adding the current year to the end of the date.

If you enter only one or two digits of a date, such as 3, iMIS attempts to interpret those digits as a day in the current month. If the number is not a valid date for the current month, for example, 33, a message informs you that you must enter a valid date.

Company flow down in iMIS

In order to flow down complete address, phone, and fax data from a company to linked individual records, data must be entered in both the Main address tab of the Address area and the Profile tab of the Detail area.

Enter the complete address that will flow down in the Main address tab of the Address area. The address entered in the Main address tab is the only data entered in the Address area that flows down from company to individual records. The phone and fax data entered in the Address area's address tabs are stored in the Name_Address table and do not flow down.

Enter the Phone and Fax numbers that will flow down in the Profile tab of the Detail area. The data entered in the Profile tab of the Detail area is stored in the Name table.

Note: User-defined company flow down does not support the Work Phone, Home Phone, Fax, and E-mail fields. No error message displays if you specify these fields in the User Defined Company Flow Down field on the Customer Setup - Advanced window, but specifying these fields in the User Defined Company Flow Down field has no effect on user-defined company flow down. The Work Phone and Fax fields are part of automatic company flow down, which can be used separately or in addition to user-defined company flow down.

Working in data grids

The History and Detail sections of the Manage customers window display information in a data grid. You can resize these sections of the window and resize the data grids, if needed.

To navigate within a data grid

Use the following keyboard controls to navigate within those tabs in the History and Detail sections of the Manage customers window that display information in a data grid (such as in the Salutations, Billing, or multi-instance, user-defined tab):

- Page Up - Press this key to move the focus on the grid up one full screen. If the current record is on the top page of the grid, pressing this key will move the focus to the top record of the grid.
- Page Down - Press this key to move the focus on the grid down one full screen. If the bottom visible row is already visible in the current display, pressing Page Down will move the focus to the last record in the grid.
- Home - Press this key to move the focus on the grid to the first column of the current row in the grid. If the cursor is in a cell and blinking and at least one character exists in the field (as in data entry mode), the tab focus will move to the beginning of the data in that cell. If you press Ctrl+Home, the focus moves to the top record in the entire grid, scrolling if necessary.
- End - Press this key to move the focus on the grid to the last column of the current row in the tab. If the cursor is in a cell and blinking and at least one character exists in the field (as in data entry mode), the tab focus will move to the end of the data in that cell. If you press Ctrl+End, the focus moves to the last record in the entire grid, scrolling if necessary.

To resize a data grid

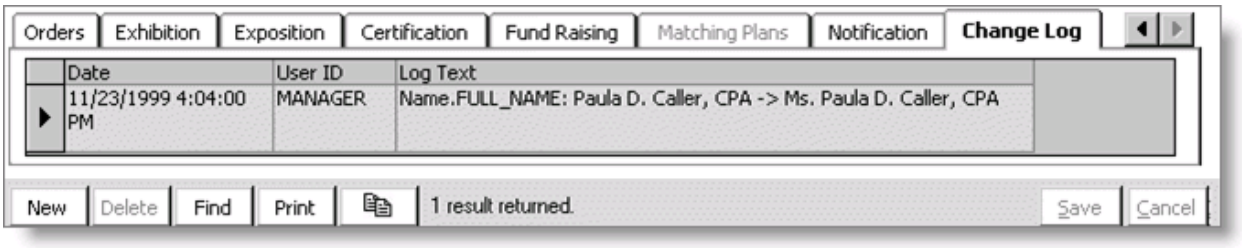
You can resize data grids in the Detail and History sections according to the following:

1. To adjust the width of a data grid, drag the boundary on the right side of the column heading until the column is the width you want.
2. To adjust the height of a data grid, drag the boundary on the row heading until the row is the height you want.

   Note: When the height of a row is increased and a field contains a drop-down list, a single drop-down arrow displays. To select a value, you must double-click the single drop-down arrow (a second drop-down arrow displays at the top of the column) and click the top drop-down arrow.
3. To hide an unused column of a data grid, drag the boundary on the left side of the column heading until the column you want to hide is no longer visible.

Example 1

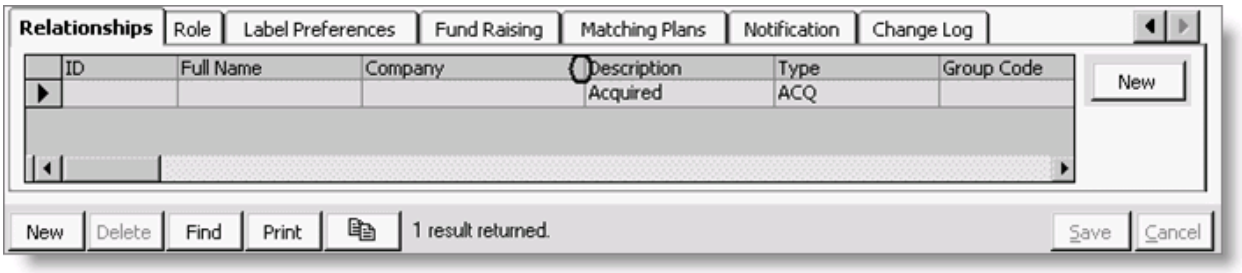
In the following example, to expand the Log Text field and lengthen the Date field to display more data, drag the boundary at the end of the Log Text field to the right and the boundary at the bottom of the field to the left of the Date field:



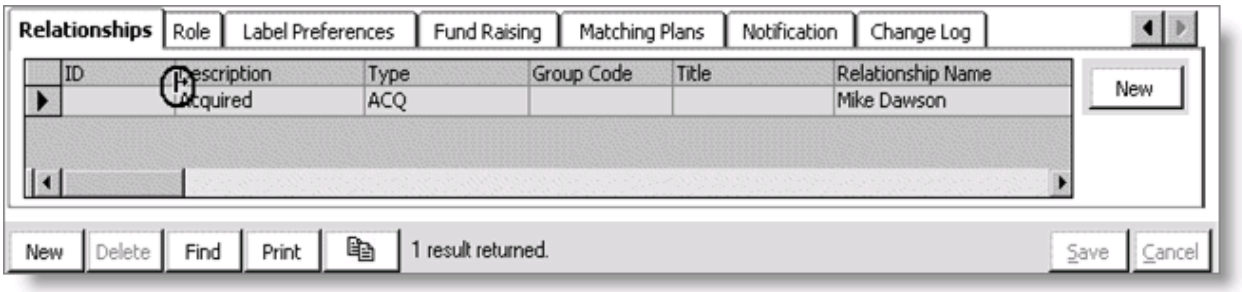
Sample Change Log tab after adjusting data grid

Example 2

To hide the Full Name and Company fields on the Relationships tab to view the Relationship Name without having to scroll, drag the boundary at the beginning of the Description field to the left until you reach the end of the ID column (the cursor changes to a half I-beam to indicate a field is hidden).



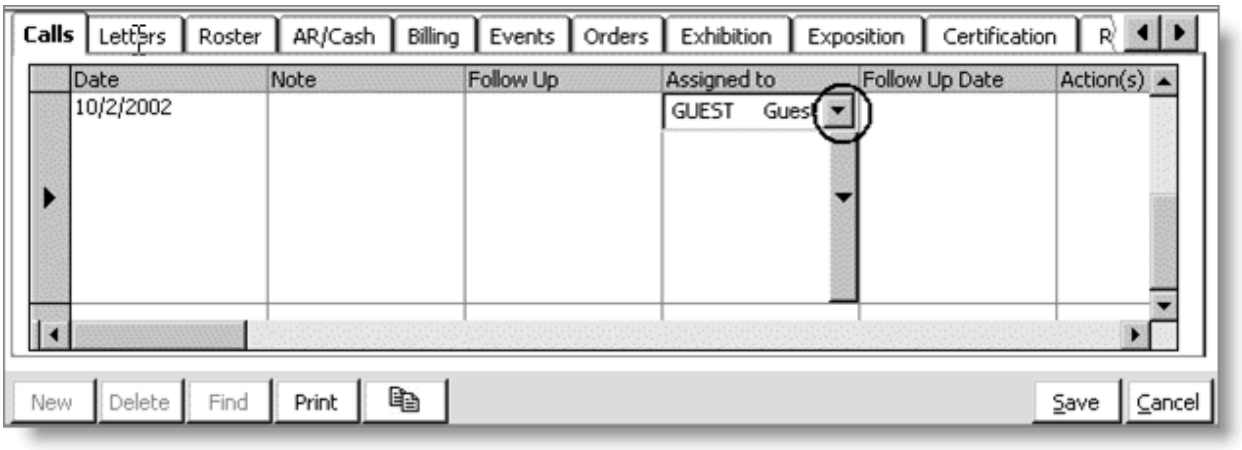
Sample Relationships tab showing boundary to select to hide Full Name and Company fields



Sample Relationships tab after moving Description field

Example 3

To select a value from the Assigned to drop-down list on the Calls tab after increasing the height of a row, double-click the single drop-down arrow (a second drop-down arrow displays), and click the top drop-down arrow.



Sample Calls tab showing the drop-down arrow from which to select a value

Selecting multiple values for user-defined fields

You can select more than one value for single-instance and multiple instance user-defined fields if your administrator has defined the fields as Multi Select.

A multi-select field for a single-instance, user-defined tab displays as a gray, read-only list box that displays the selected codes as a comma-delimited list.

- Single-instance multi select fields have a Select Values button located to the right of the field. When you click this button, the Select Values window opens, allowing you to make and modify selections for the field.
- Multiple instance multi-select fields have a drop down arrow to the left of the field. When you click this button, the Select Values window opens, allowing you to make and modify selections for the field.

The Select Values window contains two columns of text:

- The Selected Values column contains those values currently selected for the multi-select field.
- The Available Values column contains the values available for selection. These values are defined by your administrator.

  To move values between the two columns, click the Left and Right arrow buttons located between the Available Values column and the Selected Values column.

  All fields listed in the Selected Values column will be saved for the loaded customer when you click the Save button.

  If you click the Cancel button, when the page reloads the selected values will revert to the previously saved values (if any).

  If no values exist for a single-instance, multi-select field, no values will display in the Selected Values column.

  Note: If you make changes to a multi-instance tab, you must save or cancel your changes before selecting another tab. If you make any changes in a multi-instance, user-defined tab and attempt to change tabs, a message asking you to save or cancel your changes is displayed.

  To select multiple values for a user-defined field

1. From Customers, select Manage customers.
2. Select the user-defined tab that contains the multi-select field.
3. Click the Select Values button located to the right of the field to open the Select Values window.
4. Move items from the Available Values column to the Selected Values column:

- Click an item in the Available Values column to highlight it then click the Left arrow button to move the item to the Selected Values column - or - double click the item to move it from one column to the other.
- Repeat to move additional items.

5. Move items from the Selected Values column to the Available Values column:

- Click an item in the Selected Values column to highlight it then click the Right arrow button to move the item to the Available Values column - or - double click the item to move it from one column to the other.
- Repeat to move additional items.

6. Click OK. The values you selected in the Select Values window are displayed in the field.

To enter single-instance user-defined information

Once a user-defined window is chosen, you will need to select a field within the window to be able to Tab through the fields.

1. Open a customer's record in the Manage customers window.
2. Select the appropriate tab to display a single-instance user-defined window (for example, the Lists tab).
3. Select one of the following:

- Any option to enable or disable a field, for example, the Newsletter option.
- Any character field to enter text, for example, the List Codes field.
- Any scrolling-list to select values, for example, the Interest Codes scrolling-list.

Note: See Selecting multiple values for user-defined fields.

4. Click Save or continue entering additional detail information.

To enter multi-instance user-defined information

1. Open a customer's record in the Manage customers window.
2. Select the appropriate tab to open a multi-instance user-defined window.
3. Click in the first field on the tab to display the drop-down list.
4. Select the drop-down arrow and select the appropriate value.

5. Tab to each field and enter the appropriate values. Pressing Tab while in the last field of the row enables the next row.
6. Click Save when you are done entering data.

   To delete data from a multi-instance, user-defined record

   You can use the following two methods to delete data from multi-instance, user-defined tabs:

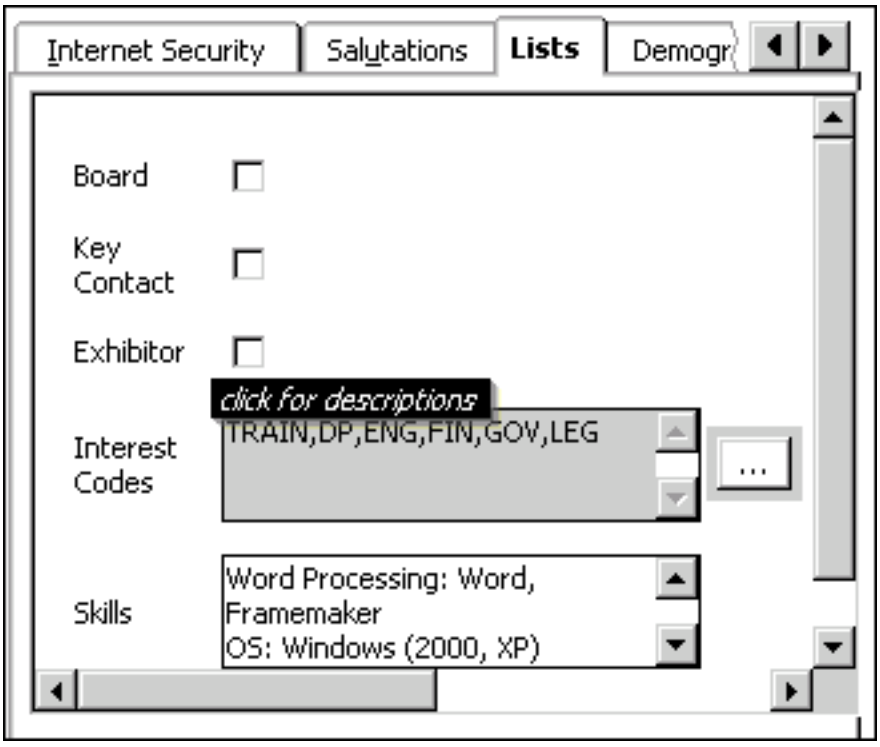
- Select the entire row in a tab and press Delete on your keyboard. When you select this method, all of the fields in the row are deleted from the user-defined tab from which you perform the delete, as well as any other multi-instance, user-defined tabs that contain those fields.
- Select the data in a field and press Delete on your keyboard. When you select this method, the data in the field is deleted from the user-defined tab from which you perform the delete, as well as any other multi-instance, user-defined tabs that contain the field.

  Note: When deleting data from multi-instance, user-defined tabs, a data row is not permanently removed from the database until all the fields for the multi-instance table are deleted, either by blanking data from a field or by selecting and deleting an entire row.

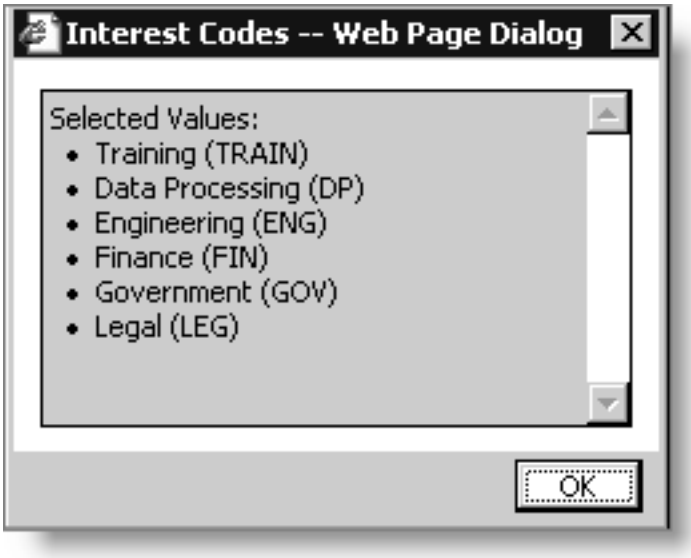
  To view multiple-select fields

  If a multi-select field contains any value, positioning the cursor over the field displays a tooltip containing the message click for descriptions above the cursor. To view the selected values for the field, click the mouse while the tooltip is displayed. The field contents display in a window even if the field is read-only for the current user. You can use the scroll bars or resize the window, if needed.

  Note: To display tabs for user-defined windows, you must add the window to the list of visible tabs on the Customer Portfolio Tab Preferences window.



Example of a multi-select field showing the click for descriptions message that displays when the cursor is over the field

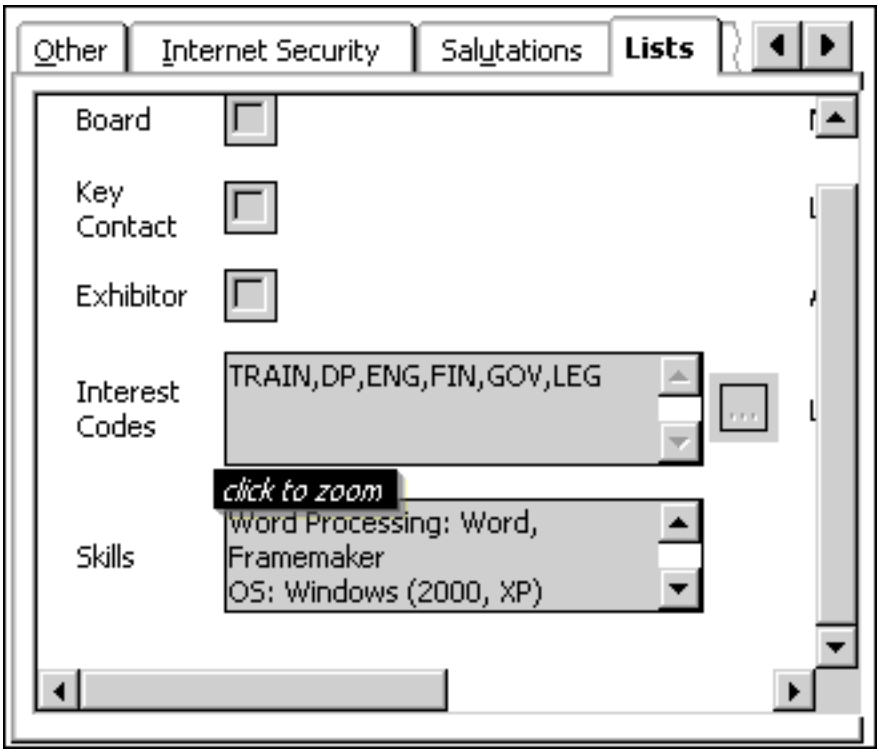


Example of window showing descriptions of currently selected values for the multi-select field shown in the previous example

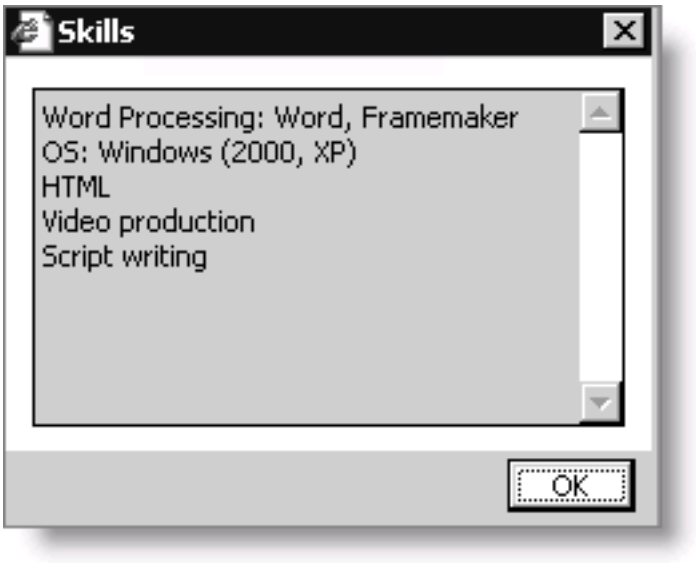
To view read-only text fields

When the data in a read-only text field is not fully visible because the data exceeds the field size, positioning the cursor over the field displays a tooltip containing the message click to zoom. To view the full contents of the field, click the mouse while the tooltip is displayed.

Note: To display tabs for user-defined windows, you must add the window to the list of visible tabs on the Customer Portfolio Tab Preferences window.



Example of a read-only text field showing the click to zoom message that is displayed when the cursor is over the field



Example of the window displaying the entire contents of the read-only text field from the previous example

The data in the window is display-only. You can use the scroll bars or resize the window if needed. Click OK to close the window.

To view data on multiple-instance, user-defined tabs in a non-grid format

You can view or enter/edit data in a multi-instance, user-defined tab in a non-grid format by opening a window for a specific row in the data grid. The row-specific data window displays if you double-click on a data grid row.

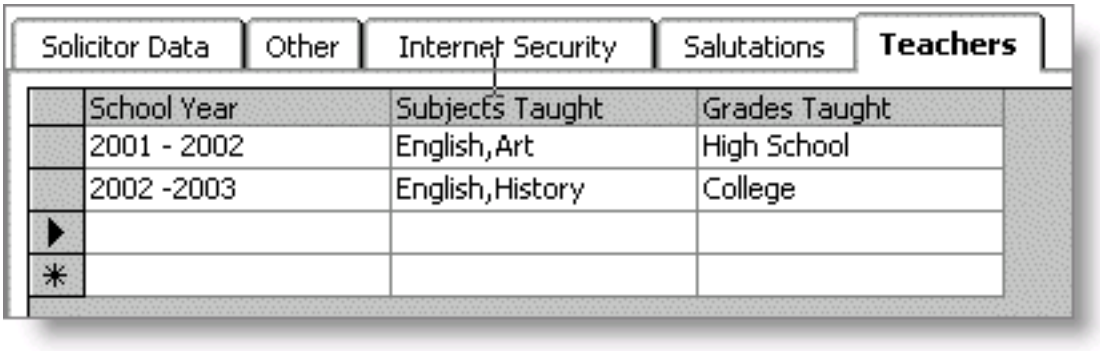
If you have permission to edit the values in the data grid, you can edit values in the row-specific data window. Any values that are changed in this window are automatically updated in the corresponding data grid rows when you click OK on this window. If you click Cancel, any values changed in the window will not be transferred to the corresponding grid row.

If you have permission to enter records in the data grid, you can enter new records directly in the row-specific data window. Records entered in the row-specific data window will be added to the data grid when you click OK.

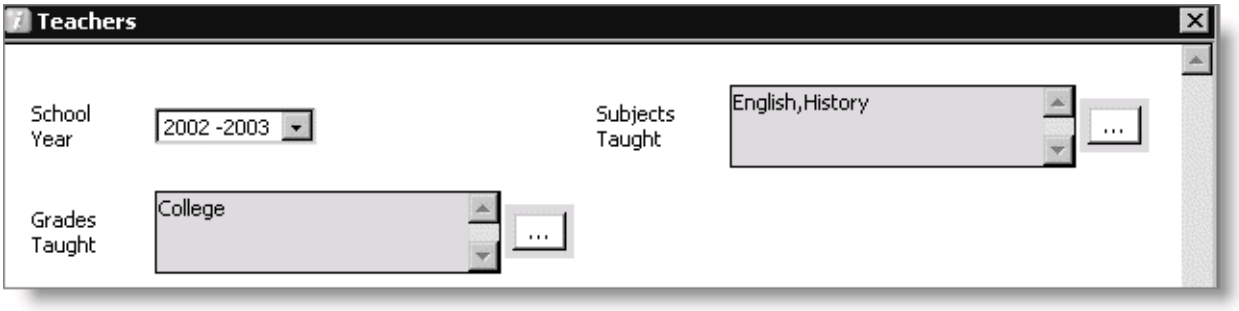
Changes or additions made in the row-specific data window are not saved to the database until you click Save on the Manage Customers window.

If the data grid is read-only, a record can be viewed in a row-specific data window, but the information in the window cannot be edited and you cannot enter new records in the window.

Validation of values entered in the row-specific data window uses the same logic as the validation of values entered in the data grid. Values entered in the row-specific data window are saved to the database after clicking OK on the row-specific data window and then clicking Save on the Manage customers window.



Example of a multi-instance, user-defined tab (from Customers, find a customer record, then select a multi-instance, user-defined tab)



Example of the second row from the multi-instance, user-defined tab show in the previous example displayed in a window format (in the data grid, double-click on the gray box located to the left of the row you want to view)

To view or edit data on multiple-instance, user-defined tabs

1. From Customers, find a customer record.

2. Select the multiple-instance, user-defined tab you want to view.
3. Double-click on the gray box located to the left of the row you want to display in a non-grid data window.
4. View or edit fields.

- Click Cancel to close the window without making changes.
- Edit fields in the window, then click OK and click Save on the Manage Customers window.

Using the Clipboard icon

The Clipboard icon enables you to copy the name and address information of the current customer onto your workstation's Windows clipboard. You can then copy or paste this information into other applications such as a word processing application.

The Clipboard icon

Your administrator can customize the fields that are copied to the clipboard (see "Customizing clipboard fields") to include more information.

To copy customer information to the clipboard

1. Load a customer record.
2. Click the Clipboard icon located at the bottom of the window. The customer's name and additional fields configured by your system administrator are copied to the system clipboard.

   Note: Many applications enable you to transfer information from the Clipboard using a menu option such as Edit > Paste or using the key combination Ctrl+V.

Running multiple iMIS instances

You can open multiple instances of the Manage customers window simultaneously and independently of each other. The number of instances that you can open depends on the number of licenses you have purchased and the system resources (memory, disk space, and so forth). For example, if you have a five-user license, you can open five instances of iMIS.

Note: If you open more than five instances of iMIS, we recommend you increase your system memory to 256 MB RAM.

Note: You may receive one of the following error messages when attempting to open multiple instances of iMIS:

“Error opening iMIS Standard Data file (iMISSTD.DF1). The file's read-only attribute may be set. Click OK to exit.”

“A new iMIS workspace cannot be started. You may have exceeded your license count. Click OK to exit.”

These error messages may indicate that the iMISSTD.DF1 file cannot be found, that the file is set as read-only, or that you are trying to open multiple instances of the Manage customers window without a multi-user license.

The first instance of the Manage customers window is opened by selecting Customers from the navigation bar and selecting Manage customers from the Customers task list. Subsequent instances are opened by repeating this action or from the Manage customers window (see To open a customer's record in the Manage customers window (see "Opening customer records")).

To help distinguish between multiple iMIS instances, the current customer information displays in the iMIS window title.

Managing tab preferences

The Customer Portfolio Tab Preferences window enables you to customize the Detail and History areas of Customers > Manage customers. You can hide tabs that you do not want

to display in the Detail and History area, and you can customize the order in which the tabs display in the area.

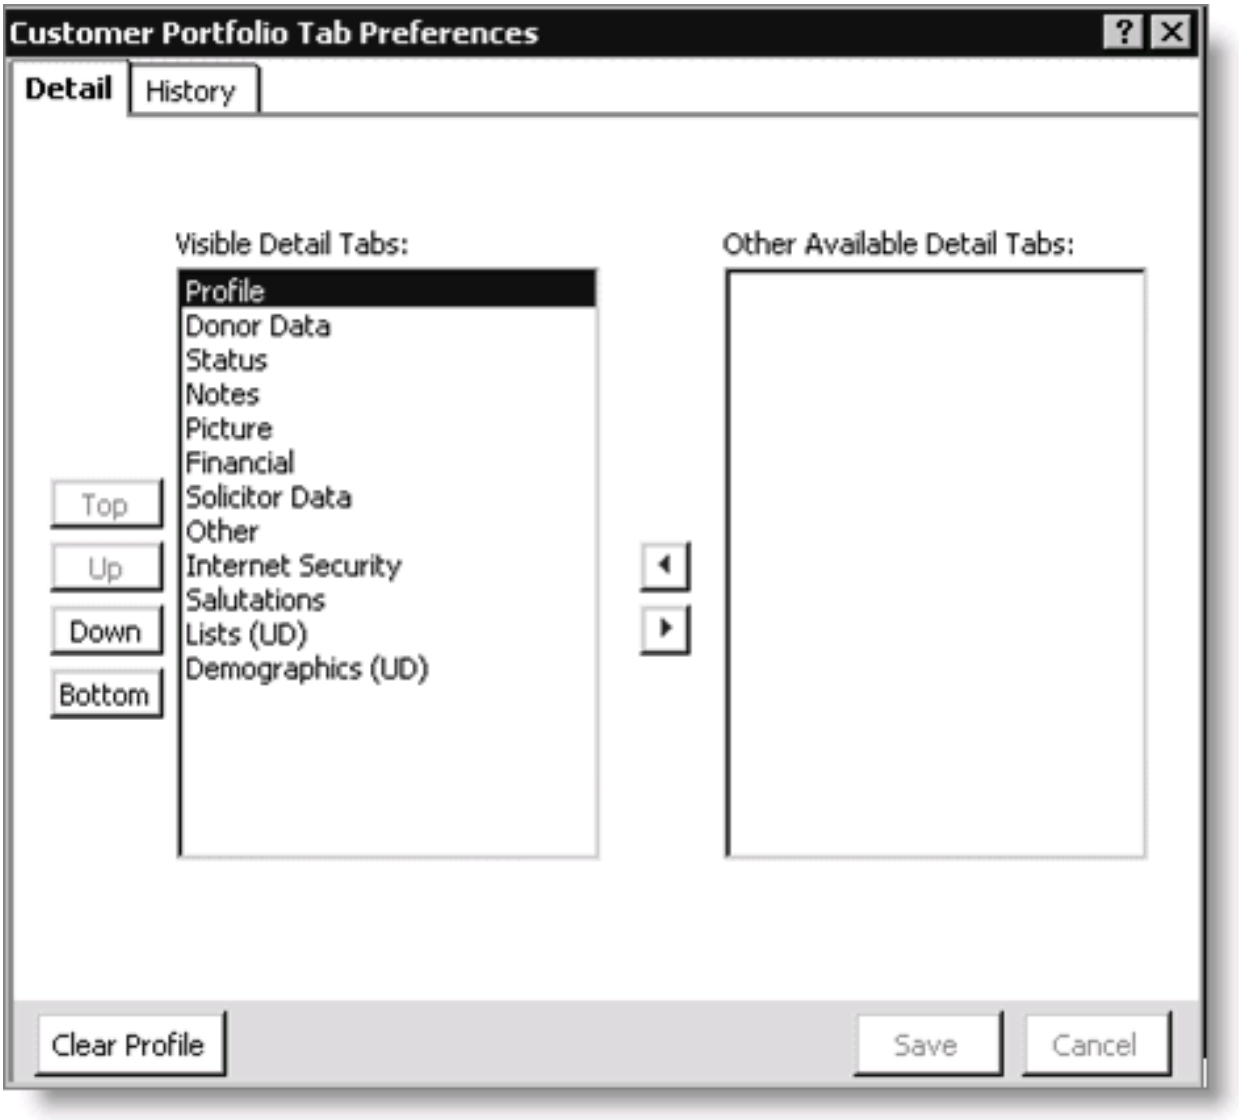
Note: A maximum of 60 tabs can be displayed for each profile (Detail and History), which can include up to 15 multi-instance user-defined tabs. If you attempt to add more than 60 tabs to the list of visible tabs on the Detail or History tab of the Customer Portfolio Tab Preferences window, a message informs you that the 60-tab limit has been reached and that no more tabs can be displayed.

Administrators can customize the default Customer Portfolio Tab Preferences, which will determine the tabs visible to users who do not set their own tab preferences.

User-defined, multiple-instance, and activity tabs do not display by default; you must add these tabs to your tab preference profile. If you do not have a tab preference profile, you must create one (from Customers, select Manage customers, place the cursor over the Detail tabs, right-click, and select Edit Tab Preferences) to display any tabs other than the iMIS-defined default tabs. See, Creating Tabs for Activity Types for more information about creating activity tabs.

Note: All user-defined, multiple-instance, and activity tabs in the Customer Portfolio Tab Preferences window display with (ACT) appended to the end of their name. For example, the Calls and Letters activities will display as Calls (ACT) and Letters (ACT) on the Customer Portfolio Tab Preferences window; however, in the History area of the Manage customers window the actual tabs will display as Calls and Letters, respectively.

Customer Portfolio Tab Preferences window



Right-click in either the Detail or History area and select Edit Tab Preferences

Detail

Select this tab to configure the tab preferences for the Detail area of Customers > Manage customer.

History

Select this tab to configure the tab preferences for the History area of Customers > Manage customer.

Visible Detail Tabs

Lists all of the tabs enabled to display in the Detail and History areas of Customers > Manage customer.

Detail area - When editing or setting up your profile, you must leave at least one tab listed in the Visible Detail Tabs field for the Detail area of your Customer Portfolio profile. If you do not leave at least one tab listed in the Visible Detail Tabs field, you cannot save the profile.

Other Available Detail Tabs

Lists all of the tabs that are hidden from view in the Detail and History areas of Customers > Manage customer. Tabs display in list order in the Detail and History areas.

Top

Moves the tab(s) selected in the Visible Tabs list to the top of the list and the beginning of the display order.

Up

Advances the tab(s) selected in the Visible Tabs list by one tab in the list and in the display order.

Down

Moves the tab(s) selected in the Visible Tabs list back by one tab in the list and in the display order.

Bottom

Moves the tab(s) selected in the Visible Tabs list to the bottom of the list and the end of the display order.

Left arrow

Moves the tab(s) selected from the Other Available Tabs list to the bottom of the Visible Tabs list. Moving a tab to the Visible Detail/History Tabs list displays the tab in its respective area of Customers.

Right arrow

Moves the tab(s) selected from the Visible Tabs list to the Other Available Tabs list. Moving a tab to the Other Available Tabs list removes the tab from its respective area of Customers.

Clear Profile

Clears any custom profile settings and returns the tab preferences to the default setting. This is useful when license keys have changed and new tabs exist that are not in the your profile. Clearing the profile will display all of the tabs in their default order in the Detail and History areas.

Customers tab security

User access to tabs is controlled by:

- iMIS module licensing - A module-specific tab can only be used if the iMIS installation is licensed for that module.
- iMIS authorization levels - A module-specific tab can only be used if the user has the appropriate module-specific authorization level.
- iMIS access keywords - A keyword-protected tab can only be used if the user has been assigned the appropriate keyword.

The rules governing tab availability in Customers > Manage customers determine tab availability in the Customer Portfolio Tab Preferences window.

A/R Cash, Billing, Events, Exhibition, Exposition, Orders, and Fundraising tabs

These tabs require users to have a module-specific Authorization Level of 1 or higher.

Label Preferences tab

This must be set up by your administrator.

Salutations and Role tabs

This must be set up by your administrator.

Call, Letters, and Fundraising tabs

This must be set up by your administrator.

User-defined tabs

User-defined tabs can be hidden by your administrator.

To open the Customer Portfolio Tab Preferences window

1. From the Detail section:

- Open a record in the Manage customers window.
- Right-click in the Detail section's tab-strip to display the right-click menu. If a record is not loaded in the Manage customers window, you will not be able to open the right-click menu from the Detail section's tab-strip.
- Select Edit Tab Preferences from the list to open the Customer Portfolio Tab Preferences window.

2. From the History section:

- Right-click in the History section's tab-strip to display the right-click menu (a record does not have to be loaded).
- Select Edit Tab Preferences from the list to open the Customer Portfolio Tab Preferences window.

To customize tabs in the detail and history areas

1. Open the Customer Portfolio Tab Preferences window.

- Place your cursor over the Detail tab and right-click.
- Select Edit Tab Preferences.

2. In the Customer Portfolio Tab Preferences window, click the Detail or History tab to configure tab preferences for the appropriate area of the Manage customers window.
3. Select the tab item(s) from the Other Available Detail Tabs or from the Other Available History Tabs list that you want to display in the Manage customers window.

Note: Press Ctrl or Shift to make multiple selections.

4. Select the Left-arrow button to move the selected tab item(s) to the bottom of the Visible Detail Tabs or Visible History Tabs list, or double-click to move tab items individually.

Customizing the default Tab Preferences

The Load default button is visible only to an administrator with a system management level of 8 or higher, and only when the administrator's own profile is loaded. If the default profile is currently loaded, the window title is System Default Tab Preferences and Load personal appears in place of Load default. (Selecting Load personal reloads the administrator's personal profile.)

To customize the default Tab Preferences profile

5. Go to Customers.
6. Right-click the top of the Details or History pane.
7. Select Edit Tab Preferences.

   The Customer Portfolio Tab Preferences window opens and the administrator's own profile is loaded.
8. Switch to the default profile by selecting Load default.
9. Edit the default settings.
10. Select Save.
11. Restart iMIS for your changes to take effect.

Detailed Customer Data

The Customers feature contains significant amounts of customer information. At times, however, you may need to access more specialized customer data. The Detail area of the Customers feature offers tabs that provide an additional means for accessing specialized customer data including:

- Profile, donor, and solicitor data
- Status
- Notes

- Picture
- Financial
- Salutations
- Log

Your administrator can also create a custom tab for the Details pane of the Customers feature.

About Detail and History tab preferences

Detail and history tabs are not displayed by default; you must add these tabs to your tab preference profile. If you do not have a tab preference profile, you must create one.

By default, the Results tab is the leftmost tab in the History tab area, but you can change the order in which tabs are displayed with the Customer Portfolio Tab Preferences window.

Note: Tabs that can be disabled cannot be selected as the first tab of the Detail area's profile, and you cannot to save a profile in which the first Detail tab is restricted according to customer type.

The Customer Portfolio Detail and History tab areas can each have up to 60 tabs displayed.

Manage customers - Detail area

The Detail area of the Customer Portfolio contains detailed customer information.

Tips

- Additional tabs appear if you are licensed for VAT or Fundraising, or have user-defined tabs.
- The slider control at the top right of the detail area lets you scroll across to see more tabs.
- Once you select a tab in the Detail area, click a field in the tab to activate the area.

For example, when the Profile tab is selected, click in the Work Phone field to activate the area. Press Tab to move the cursor to the next field.

- When you reach the last field on the Profile tab, select a tab in the Detail area and click any field to activate it.

  For example, if you need the Join Date on the Status tab, press Alt+T to activate the Status window, and click in the Join Date field.

  To navigate within the Detail area

  In most cases, more tabs exist in the Detail area than can be viewed at any one time without scrolling.

  To navigate to a specific tab:

- Select the right or left arrow buttons at the far right of the tab areas to scroll through the tabs. Select the specific tab when the tab you need to access displays, or
- Right-click to display a list of all the tabs in the area and select a menu item to display a specific tab.

  Note: You can navigate to a specific tab only when the Manage customers window is in New or Edit mode, and some tabs will be available only when in Edit mode.

  You can right-click anywhere on the Detail area's tab-strip to display a list of all the enabled Detail tabs (disabled tabs are grayed out and cannot be selected). The tab currently displayed is grayed out in the list. Selecting a tab from the menu's list directly opens that tab.

  Note: You can also select the right or left arrow to scroll through the tabs.

  To enter customer details

  Company flow down, an automatic process of updating specific fields when a Company ID is assigned to a Member ID, will automatically populate the Work Phone, Fax, and Toll Free fields. Additional flow-down options can be defined by your administrator.

1. Open a customer's record in the Manage customers window.

2. Select the appropriate detail section tab.
3. Tab to each field and enter the appropriate values.
4. Click Save, or continue to enter additional detail information.

Manage customers window - Profile tab

From Customers, select Manage customers, find customer record, and select Profile tab

Note: Your administrator can map the Work Phone, Home Phone, Fax, and E-mail fields on the Profile tab to the Phone, Fax, and E-mail fields on any address purpose defined in the Main, 2nd, or 3rd fields on the Customer Setup - Address and Notes window.

Work Phone

Specifies the business phone number, including any phone number extensions.

Home Phone

Specifies the home phone number.

Fax

Specifies the fax number.

Toll Free

Specifies the toll-free phone number.

E-mail

Specifies the e-mail address of the customer. If you have a MAPI32-compliant e-mail application software and Internet access on your system, select the envelope icon to send an e-mail directly from the customer record.

Web Address

Specifies the Web address of the customer. If you have Internet access on your system, select the world icon to open the Web address in your browser.

Major Key

Specifies a primary field with which you can retrieve records. iMIS will make this field available for referencing and searching for customer records throughout the system. For example, you can use social security numbers, certificate numbers, license numbers, and old customer ID numbers. You can make the major key unique in order to prevent duplicate entries.

The major key field is displayed with a prompt entered by your administrator.

Functional Title

Select the drop-down arrow on this field to select a larger grouping for the Title field. This drop-down list is set up by your administrator.

For example, you could use a Functional Title grouping for Accounting for specific mailings to officers related to the accounting function. If you specify functional titles for your customers, you can also display or print company rosters with the individuals listed by functional title grouping. You can also look up all individuals in a Functional Title grouping.

Manage customers window - Donor Data tab

From Customers, select Manage customers, open a customer record, and select the Donor Data tab

Solicitor

Enter the customer ID of the solicitor associated with the customer. The solicitor specified here is the default solicitor that displays in the Enter and edit gifts window.

Do not phone

Enable if the customer does not want to be called.

Do not email

Enable if the customer does not want to receive e-mail. This option is for informational purposes only and does not prevent e-mail from being sent to the customer.

Do not solicit

Enable if the customer does not want to receive solicitations.

Do not sell

Enable if the customer does not want to make donations.

Preferred Distribution/Premium

(Applies only to memorials and tributes) Enter the preferred distribution or premium for gifts that are made in memory of or in honor of the customer. If a preferred distribution or premium is specified, the preferred distribution or premium automatically populates the Distribution field on the Overview tab on the Enter and edit gifts window when a memorial or tribute donation is made in honor of this individual. This distribution or premium can be overridden.

List as

Specify how the customer is to be listed on printed materials and reports. This can be overridden.

Anonymous button

Enables you to specify that the “list as” information for this customer is Anonymous. Although Anonymous will display in the Enter and edit gifts window, you can override this while entering a gift.

Receipting Interval

There are four options for assigning a receipting interval to the customer that display in this area. All interval values are compared to the system date and the “last receipt printed” date to determine if a new receipt should be issued.

- None - If this option is enabled, no receipting interval is activated. This is the default setting. Any non-receipted gifts matching the selection criteria are issued a receipt.
- Quarterly - If this option is enabled, receipts are not automatically generated with another receipt batch until the quarterly interval (90 days) has passed.
- Monthly - If this option is enabled, receipts are not automatically generated with another receipt batch until the monthly (30 days) interval has passed. The monthly interval is always equal to 30 days.

- Annually - If this option is enabled, receipts are not automatically generated with another receipt batch until the annual interval (365 days) has passed.

  Last Receipt Date

  (System generated - Display only) Displays the date of the last receipt issued for the customer. Updates after a receipt is printed and cannot be updated manually.

Manage customers window - Status tab

From Customers, select Manage customers, find customer record, and select Status tab

Chapter

The prompt for this drop-down list displays when the Chapter prompt is set up by your administrator. Select the drop-down list on this field to select from chapter names defined by your administrator.

Join Date

Specifies the date the customer became active. Use a forward (/) to separate the month, day, and year values. When you enter a day, the system month and year is automatically entered.

Paid Through Date

Specifies the date that customer benefits expire. This date is updated upon Dues Payment (Cash Dues System) or Dues Billing (Accrual Dues System Option) processing.

Member Status

This display-only field displays one of the following status options:

- New - iMIS sets the status to N when you insert a new customer record and when you change a nonmember record to a customer record (except for records with status D). If a record's status is blank, posting a Billing payment (advancing the PAID_THRU) will trigger status N.
- Dropped - iMIS sets the status to D when you change a customer record to a nonmember record (which may already have status D) and when the Name.STATUS changes to an S* (suspended), I* (inactive) or D* (deleted) code from one that was neither S* nor D* (includes A* (active)).
- Renewed - iMIS sets the status to R when you post a Billing payment (advancing the PAID_THRU) for a record with status N.
- Reinstated - iMIS sets the status to S when you change a nonmember record with status D and Name.STATUS other than S* (suspended), I* (inactive), or D* (deleted) to a customer record and when the Name.STATUS for a customer record changes from an S* (suspended), I* (inactive), or D* (deleted) code to one that is neither S*, I*, or D*. If you post a Billing payment for a record with status D, iMIS sets the status to S and removes any Name.STATUS code set to S* (suspended), I* (inactive), or D* (deleted).

Member Status Date

This is a display-only field that defaults to the current system date (or the Billing payment transaction date) for each of these status changes except when you enter a JOIN_DATE for a new record, in which case the JOIN_DATE is used.

Date Added

This is a display-only field that displays the date the customer was originally entered in the database.

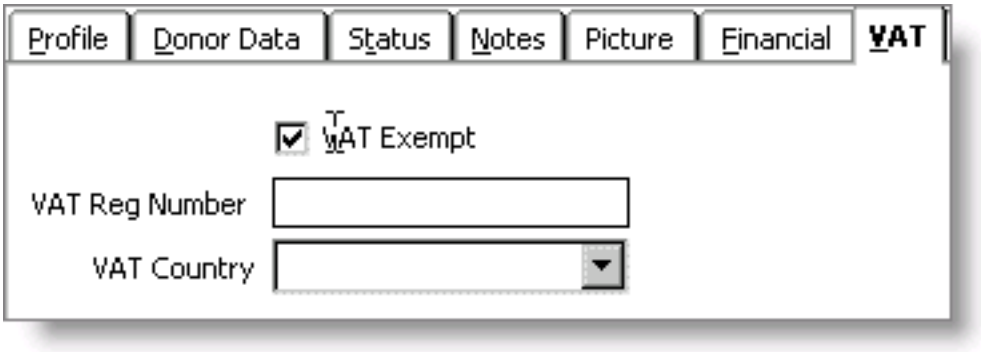
Last Update

This is a display-only field that displays the last date the customer's record was updated the database.

Last Updated By

This is a display-only field that displays the ID of the person who entered the update.

Manage customers window - VAT tab



From Customers, select Manage customers, find customer record, and select VAT tab

VAT Exempt

(optional) Enable if the customer is VAT exempt.

VAT Reg Number

(optional) This field specifies the VAT Registration Number for the customer. This information will display on the Full Order Entry window.

VAT Country

(optional) This field specifies the VAT country for the customer. This information will display on the Full Order Entry window.

Manage customers window - Solicitor Data tab

From Customers, select Manage customers, find customer record, and select Solicitor Data tab

Title

Specifies the solicitor's title.

Volunteer

Specifies whether the solicitor is a volunteer and not a paid staff member.

Solicitor

Specifies that the individual is a solicitor. When selected, solicitor information is available at gift/pledge entry and for reporting.

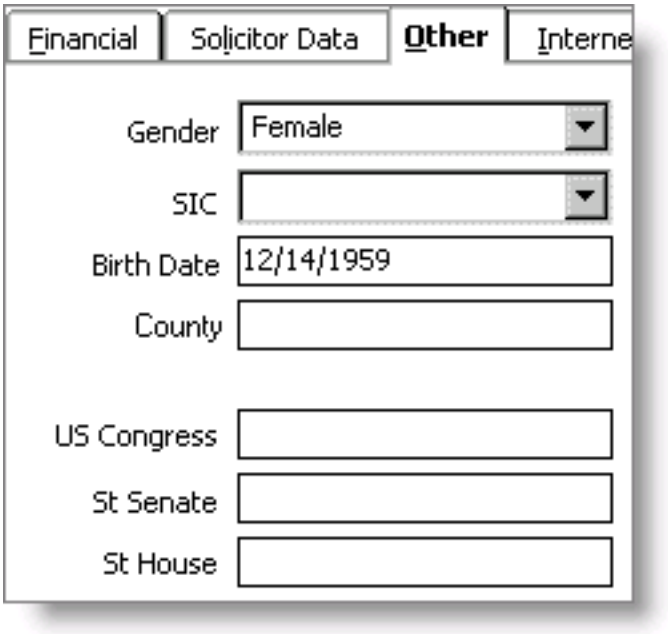
Hours/Week

Specifies the number of hours per week the solicitor works.

Comments

Contains comments associated with the solicitor. The character limit for this field is 255.

Manage customers window - Other tab



From Customers, select Manage customers, find customer record, and select Other tab

Gender

Specifies the gender of the customer.

Note: When possible, iMIS automatically populates this field based on the value in the Prefix field on the Customer Portfolio. Prefixes that do not indicate gender such as Dr., will not automatically populate.

SIC

Select the drop-down arrow on this field to select a SIC (Standard Industry Code). Values listed in this drop-down list are defined by your administrator. Codes entered before a SIC_CODE table is created will not be validated unless the field is edited.

Birth Date

Specifies the birth date of the customer.

County

Specifies the name or code for the county where the customer is located. iMIS auto-populates this field when the County from Primary Zip option is enabled by your administrator.

US Congress

Specifies the U.S. congressional district number for sending legislative alerts and target mailings.

St Senate

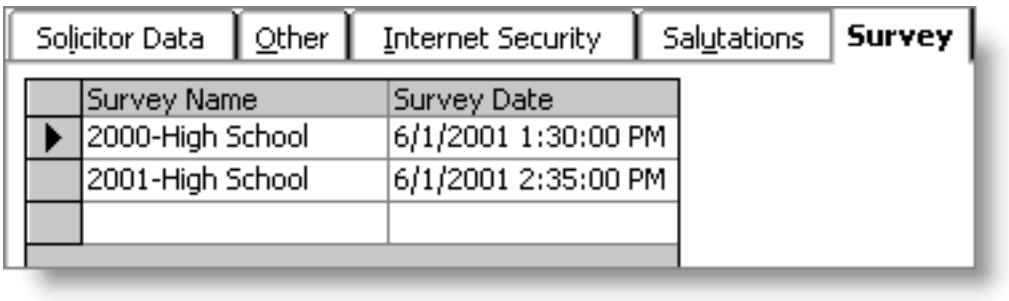
Specifies the state senatorial district number for legislative alerts and target mailings.

St House

Specifies the state representative district number for legislative alerts and target mailings.

Note: If you are using Accumail, the US Congress field, County field, and postal-related fields are auto-filled.

Manage customers window - User-defined tab



From Customers, select Manage customers, find customer record, and select user-defined tab

User-defined tabs can be displayed in the Detail area on the Customers tab. Multi-instance tabs are shown first, followed by single-instance tabs in the order they set up by your administrator.

User-defined tabs with values in Only applies to these types are shown as needed after you click Save and refresh the record.

Note: Your administrator can limit access to user-defined tabs.

Keyboard shortcuts in user-defined tabs

The following keyboard shortcuts are supported in user-defined tabs:

- Ctrl+V (Paste)
- Ctrl+C (Copy)
- Ctrl+Z (Undo)

Caution! Pressing Ctrl+Z in user-defined tabs does not zoom a text field as in other fields on the Customers area. Using Ctrl+Z in a user-defined tab will undo your most recent action.

The following are not supported in single-instance, user-defined tabs:

- Ctrl+C (Copy)
- Right-click menus

Only applies to these types

User-defined tabs can be defined to open for certain customer types. When this option is enabled and you are viewing a customer record, user-defined tabs will only be loaded for customers with those specific customer types. When editing a customer record, and updating the customer type from one that would not open a window, to one that would open a window, the window will only open after Save is clicked.

If a user-defined tab is set to only apply to certain customer types, the tab will not display in the detail area of a record when the record is inserted. The tab will only display after the record has been saved once, and then the user will need to reopen the tab to see all the tabs that the record should have.

Character entry

Character fields on single-instance, user-defined tabs display according to the character limit set for them by your administrator.

Fields on single-instance, user-defined tabs display according to the following:

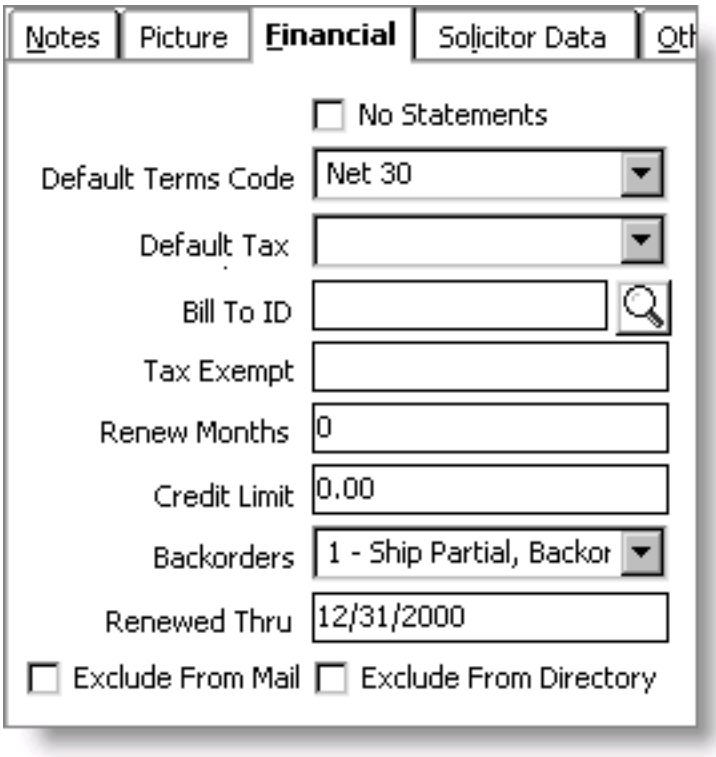
- Fields defined with a character limit of less than 33 characters display as a single line
- Fields defined with a character limit of 33 to 63 characters display as two lines
- Fields defined with a character limit of greater than 63 characters display as three lines
- Text fields specified with a character limit of more than 32 characters display with scroll bars to allow you to view the text

  Note: For field lengths greater than 32 characters, if you attempt to enter more characters than specified for a user-defined, single-instance tab, a message informs you that your text will be truncated. If you attempt to enter more characters than specified for a user-defined, multi-instance tab, a a message informs you of the maximum number of characters that can be entered in the field. The field will be blanked out and you will need to re-enter your value.

Entering financial information

Use the Financial tab to enter the customer's financial data preferences. Your administrator may limit access to the Financial tab.

Manage customers window - Financial tab



From Customers, select Manage customers, find customer record, and select Financial tab

No Statements

Enable if the customer will not receive statements.

Default Terms Code

Select the drop-down arrow on this field to select a default payment term for which the customer will pay invoices. Values that display on the drop-down list are defined by your administrator.

Default Tax

Select the drop-down arrow on this field to select a default tax authority. Values that display on the drop-down list are defined by your administrator.

Bill To ID

Specifies the ID number for the customer that will be handling charges as a third party. Used in Billing for List Billing.

Tax Exempt

Specifies any number to specify that this customer is tax exempt.

Renew Months

Use this field to override the normal billing period of 12 months. For example, if the customer is to be billed four times per year (quarterly), enter 3.

Credit Limit

Specifies the amount of credit assigned to the customer.

Backorders

Drop-down list of all backorder options used with Full Order Entry

Renewed Thru

Use this field to indicate the date through which the individual has been billed for the main Billing product, regardless of payment. This field is reset by iMIS when the main Customers Billing item is billed.

Exclude From Mail

Enable to exclude this customer from the Customers system mailings.

Exclude From Directory

Enable to exclude this customer from the directory.

To enter financial information

1. Open a customer's record in the Manage customers window.
2. Select the Financial tab and click in any field.
3. Tab to each field and enter the appropriate values.
4. Click Save, or continue entering additional detail information.

Entering note information

The Notes tab displays a scroll-down list that contains four notes. The first three Notes prompts are customized by your system administrator.

Note: Your administrator can customize notes to include more than four notes.

Manage customers window - Notes tab

From Customers, select Manage customers, find customer record, and select Notes tab

The fourth note displays a blank prompt, which will accept any value typed in the prompt (as long as the value is unique). As soon as you enter data in the last note field on the tab, the system automatically creates a new blank note below the last note.

The Notes tab can hold up to 70 notes.

To enter note information

1. Open a customer's record in the Manage customers window.
2. Select the Notes tab and click in any field.
3. Tab to each field and enter the appropriate values.
4. Click Save, or continue entering additional detail information.

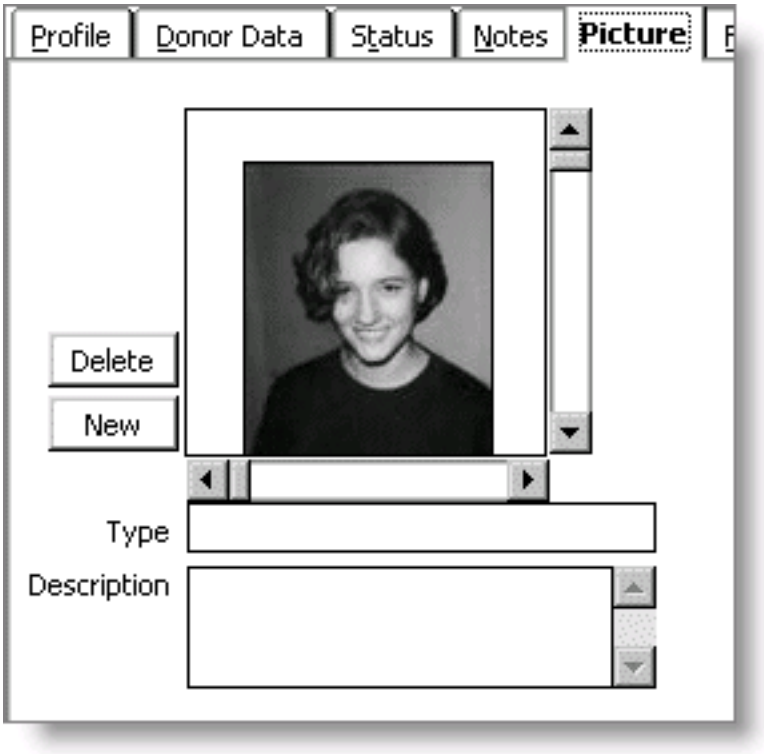
To view note information

To view the entire contents of a Note field in the Notes tab, click the Zoom button that corresponds to the Note field you want to view.

Adding a picture

Use the Picture tab to select and store a customer's picture.

Manage customers window - Picture tab



From Customers, select Manage customers, find customer record, and select Picture tab

Type

Specifies a title for the picture.

Description

Specifies a description for the picture.

To insert pictures

Images on the Manage customers window are limited to the BMP and JPEG formats. The preferred image size for the portrait is 130 pixels by 125 pixels. When a larger image is inserted, use the scroll bars to view the image.

1. Open a customer's record in the Manage customers window.
2. Select the Picture tab.
3. Click New to browse for the portrait file.

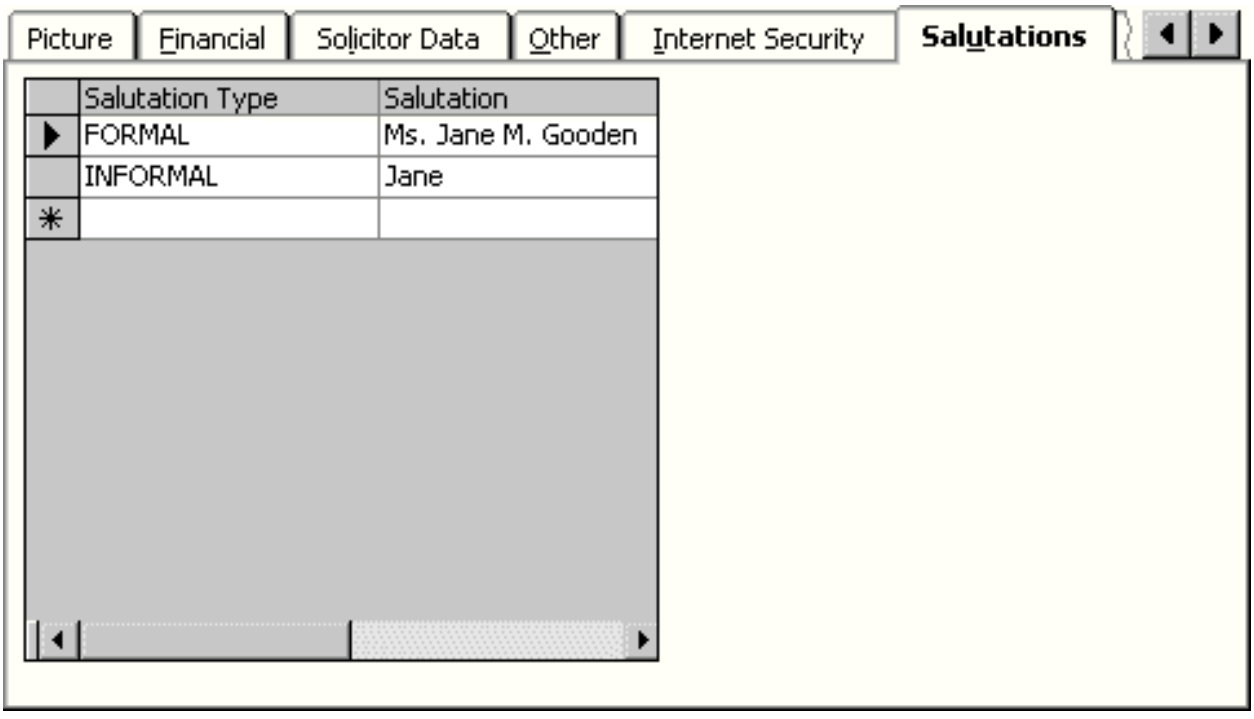
4. Select the file.
5. (optional) In the Type field, enter a value.
6. Tab to the Description field and enter a value.
7. Click Save, or continue entering additional detail information

   Note: When inserting a portrait that is larger than the viewing area, the portrait is centered after clicking Save.

Entering salutations information

Use the Salutations tab to define the salutation text used for customer correspondence and acknowledgements.

Salutations tab



From Customers, select Manage customers, find customer record, and select Salutations tab

Salutation Type

(required) Select the salutation code you want to use.

Select the right side of the Salutation Type cell to display a drop-down list of the descriptions defined for the salutation codes. Salutation codes are defined by your administrator.

Salutation

Specifies the salutation text for the corresponding Salutation Type. This field can automatically convert values entered to upper or lower case.

Note: Your administrator can limit your access to Salutations tab functionality.

To display the Salutations tab

The Salutations tab displays for all customer records if your administrator has defined salutation codes.

To assign a salutation code

1. Open a customer's record in the Manage customers window.
2. Select the Salutations tab.
3. Select the empty Salutation Type field to display a drop-down arrow.
4. Select the drop-down list and select the salutation code you want to use.
5. Enter salutation text in the Salutation field.
6. Click Save.

To edit a salutation code

When editing salutation codes, you can replace an existing code with one from the list of defined codes. However, you cannot replace an existing salutation code with a null value. No restrictions exist for editing salutation text, and you can leave the Salutation field blank if you want to remove the salutation text that has been assigned to a code.

1. Open a customer's record in the Manage customers window.
2. Select the Salutations tab.
3. Make any necessary changes.
4. Click Save.

To delete a salutation code

1. Open a customer's record in the Manage customers window.
2. Select the Salutations tab.
3. Select the row you want to delete and press the Delete key.
4. Click Save.

Historical Customer Data

You view comprehensive customer information in Customers. At times, however, you may need to access more specialized customer data. The history tabs offer a way to access detailed historical customer data.

The exact tabs that are displayed, and the order in which they are displayed are configured in the Customer Portfolio Tab Preferences window (see "Creating tabs for activity types").

Sorting history tab data

You can sort records by any column in any of the history tabs on the Manage Customers window except Record History and Roster. Click the heading of the column by which you want to sort and the rows will be sorted according to the following rules:

varchar (alphanumeric)	alphabetic ascending	(A-Z) (1,10,2,20)
numeric	numeric ascending	(1 - 99)
date	chronological ascending	(1/1/2001 - 12/12/2005)
money	numeric ascending	(1.02 -99.99, 1,02 - 99,99)

Clicking on the column header of the sort column toggles the sort between ascending and descending order. The column by which the data is sorted is marked with an asterisk (*).

	ID	* Last Name	First Name	Middle	Suffix	Title	Company	City	State
▶	156	Bachman	Peter	L.		Vice President	American Business	Houston	TX
	161	Bachman	Albert				Bachman Floral	Dallas	TX
	162	Bell	Duane	D.			Bell Cardiac	Minneapolis	MN
	134	Berry	Robert	L.		President	International Book	Fort Worth	TX
	123	Better	Charles	P.		Sales Manager	Software	Dallas	TX
	163	Blackwood	George				Blackwood Electric	Ft. Worth	TX

Click the column header to sort by that column

Limitations:

- To protect data integrity, column sort is disabled when you edit data.
- This change does not affect the Record History and Roster tabs.

Note: The number of records returned for a customer is limited by the Find List Maximum configuration option in the Customer > Setup > Advanced window. Re-sorting tab data only sorts data that has already been retrieved, it will not retrieve any additional records that were excluded when using the default sort order.

Reviewing the History area

Enter, edit, and view customer information in the History area of the Manage customers window.

Manage customers window - History tabs

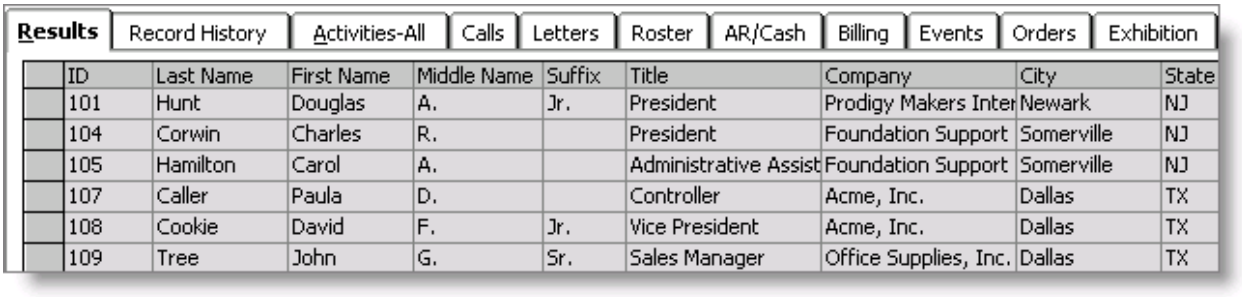
Depending on the tab configuration, the History area can contain the following tabs:

- Results (see "Manage customers window - Results tab")
- Record History (see "Manage customers window - Record History tab")
- Activities-All (see "Managing activity records")
- Calls (see "Manage customers window - Calls tab")
- Letters (see "Manage customers window - Letters tab")
- Roster (see "Manage customers window - Roster tab")
- AR/Cash (see "Manage customers window - AR/Cash tab")
- Billing (see "Manage customers window - Billing tab")

- Events (see "Manage customers window - Events tab")
- Orders (see "Manage customers window - Orders tab")
- Exhibition (see "Manage customers window - Exhibition tab")
- Exposition (see "Manage customers window - Exposition tab")
- Certification (see "Manage customers window - Certification tab")
- Label Preferences (see "Manage customers window - Label Preferences tab")
- Change Log (see "Manage customers window - Change Log tab")
- Relationships (see "Manage customers window - Relationships tab|topic=Managing relationships activity records)
- Fundraising
- Matching Plans (see "Manage customers window - Matching Plans tab")
- Notification (see "Manage customers window - Notification tab")
- Role (see "Manage customers window - Role tab")

Activity tabs created by your iMIS administrator can also be displayed in the History area.

You can add new records if the data grid is white.



ID	Last Name	First Name	Middle Name	Suffix	Title	Company	City	State
101	Hunt	Douglas	A.	Jr.	President	Prodigy Makers Inter	Newark	NJ
104	Corwin	Charles	R.		President	Foundation Support	Somerville	NJ
105	Hamilton	Carol	A.		Administrative Assist	Foundation Support	Somerville	NJ
107	Caller	Paula	D.		Controller	Acme, Inc.	Dallas	TX
108	Cookie	David	F.	Jr.	Vice President	Acme, Inc.	Dallas	TX
109	Tree	John	G.	Sr.	Sales Manager	Office Supplies, Inc.	Dallas	TX

From Customers, select Manage customers, and find customer record

To navigate within the history tabs

You can right-click on any history tab or from customers or companies listed in the Results, Record History, or Roster tabs to display a menu of available tabs (disabled tabs and the current tab are grayed out and cannot be selected). Selecting a tab from the list opens that tab.

The activity and module specific tabs, for example Fundraising and Calls, always display information about the record currently loaded in Customers > Manage customers.

To manually insert an activity record

See the specific tab areas for detailed instructions on entering activities.

Note: Your administrator can limit edit access to specific tabs.

1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab in the History section of the Manage customers window.
3. Select the drop-down list located directly below the Sort by area, and select the activity type you want to insert.
4. Enter the activity information in each cell.

   Note: Data entry can only be made in fields with a white background containing an * (asterisk) to the left of the field.
5. Press Tab to continue entering data in additional cells.
6. Click Save.

   Note: When entering activity records, the Date field is automatically populated with the system date. If only the Date field contains data when you save the record, the record will be assumed empty and will not be saved. However, if the activity record contains other data, the activity record will be saved.

   To expand a field

   You can press Ctrl+Z to enlarge (zoom) any field in the History section that can store 255 or more characters (such as in the Activities-All and Calls tabs). If the field is read-only, the enlarged field is also read-only. You can return to the normal view by clicking Cancel

or by using the “X” in the upper-right corner of the window. If the field is editable, when you are finished editing the text, you can return to the normal view by clicking OK.

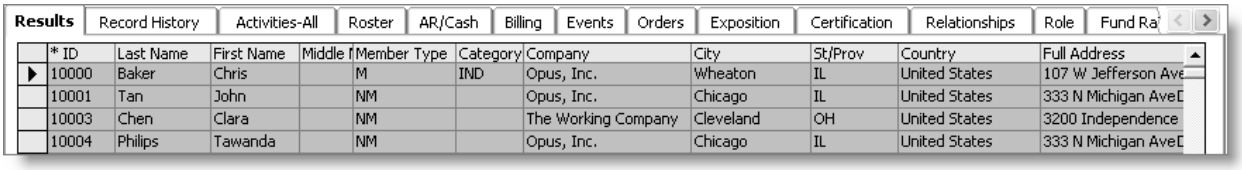
Note: If you want to enter multiple paragraphs in a field (separate text with a hard return), you must press Ctrl+Z.

Viewing results

The Results tab lists the records returned when you perform a search from the Search window.

Note: The columns that are shown in the Results tab can be specified by your system administrator.

Manage customers window - Results tab



From Customers, select Manage customers, click Find and perform a search

Viewing record history

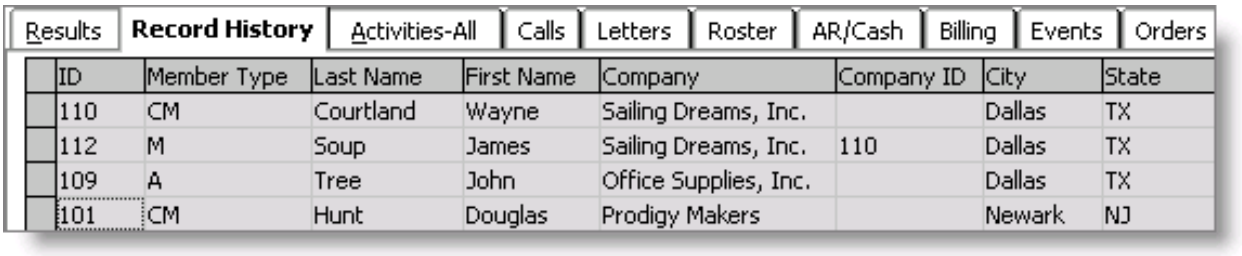
The Record History tab lists the customer records opened during the current session of the Manage customers window and enables you to quickly re-open any of the listed records without performing another search.

The most recently opened records are listed in the top row of the Record History tab, and records are listed only once in the tab regardless of the number of times they have been opened. If a record's information is updated, the changes will not be reflected in the Record History tab during the current session.

When you first open a customer's record in the Manage customers window, a row is added to the top of the Record History tab listing the customer's ID, Member Type, Last Name, First Name, Company, Company ID, City, and State. The fields you see on the Record History tab can be customized by your administrator.

Manage customers window - Record History tab

Record History tab data cannot be sorted because, unlike other history tabs, the data is meant to be viewed only in chronological order. The tab shows all of the records that you have edited, in most to least recent order, during your current iMIS session.



ID	Member Type	Last Name	First Name	Company	Company ID	City	State
110	CM	Courtland	Wayne	Sailing Dreams, Inc.		Dallas	TX
112	M	Soup	James	Sailing Dreams, Inc.	110	Dallas	TX
109	A	Tree	John	Office Supplies, Inc.		Dallas	TX
101	CM	Hunt	Douglas	Prodigy Makers		Newark	NJ

From Customers, select Manage customers and select Record History tab

The Record History tab cannot be sorted because, unlike other history tabs, the order of the data is meant to be viewed only in chronological order.

To open a record from the Record History tab

You can open a customer record from the Record History tab in the current window or in a new window.

1. Select a cell in the row of a customer record.
2. Open the record.

- To open in the current window, double-click on the record.
- To open in a new window, right-click the record and select Open in New Window.

Managing call activities

The Calls tab enables you to view all call activity records for a customer.
The following fields display on the Calls tab: Date, Attachments(s), Note, Follow Up, Assigned to, Follow Up Date, and Action(s).

Note: The fields that display on the Calls tab depend on the settings your administrator defines.

Manage customers window - Calls tab

From Customers, select Manage customers, find customer record, and select Calls tab

To enter a call activity

To insert new call activities, you must have a Customers authorization level of three (3) or greater.

1. Open a customer's record in the Manage customers window.
2. Select the Calls tab.
3. Select the Date field to the right of the * and enter the date for the Call activity.
4. Press Tab to continue entering data in additional cells.

- Continue to press Tab past the last cell to enter another activity; or
- Click Save.

To view a call activity

1. Open a customer's record in the Manage customers window.
2. Select the Calls tab.
3. Double-click the gray box to the left of the Date field to open the Activity Detail window for the call activity.

To edit a call activity

1. Open a customer's record in the Manage customers window.
2. Select the Calls tab.
3. Edit the call activity by selecting one of the following options:

- Double-click the gray box to the left of the date to open the Activity Detail window, click Edit, and then update the activity as needed. Click Save on the Activity Detail window; or
- Select the cell to edit, enter the appropriate data, and Tab to continue entering data in additional cells for this call activity; or
- Select a new activity to edit; or
- Click Save.

  Once the call activity is updated in the Manage customers window, you can select the box to the left of the date to view the changes on the Activity Detail window.

  To delete a call activity

  You can delete a call activity record that displays on the Calls tab provided your administrator has assigned you the appropriate permissions.

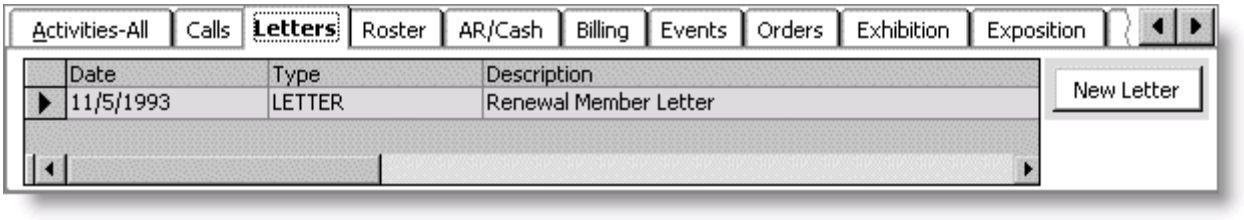
1. From Customers, select Manage customers.
2. Find a customer's record.
3. Select the Calls tab.
4. Select the call activity record you want to delete.
5. Press the Delete key on the keyboard.
6. Click Save.

   Note: If you select the Calls tab and it does not contain any records, pressing the Delete key will have no effect.

Managing letter activities

The Letters tab enables you to view all letter activity records for a customer. The following fields display on the Letters tab: Date, Type, and Description.

Manage customers window - Letters tab



From Customers, select Manage customers, find customer record, and select Letters tab

New Letter

Opens the Membership Standard Letters window when Microsoft Word (MS Word) is installed on the workstation. The QuickLetter system will be used if MS Word is not installed on the workstation.

To enter a letter activity

1. Open a customer's record in the Manage customers window.
2. Select the Letters tab.
3. Click New Letter to open the Membership Standard Letters window.

   Note: When you click New Letter, the MS Word Letter Integration (Letter System) will launch if it is installed. If it is not installed, then the standard QuickLetter will launch. For more information, see Creating Letters.

To view a letter activity

Note: Once a template is saved, all future letter activities will use the original template, regardless if the template is changed.

1. Open a customer's record in the Manage customers window.
2. Select the Letters tab.
3. Double-click the gray box to the left of the Date field to open the Activity Detail window for the letter activity.

To edit a letter activity

1. Open a customer's record in the Manage customers window.
2. Select the Letters tab.
3. Double-click the gray box to the left of the Date field to open the Activity Detail window.
4. Click Edit, and then update the activity as needed.
5. Click Save on the Activity Detail window.

To delete a letter activity

You can delete letter activity records that display on the Letters tab provided your administrator has assigned you the appropriate permissions.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Select the letter activity record you want to delete.
4. Press Delete on the keyboard.
5. Click Save.

Note: If you select the Letters tab and it does not contain any records, pressing Delete will have no effect.

Viewing company rosters

Company rosters in iMIS Desktop

On the Customers feature, the Roster tab enables you to view a list of customer records associated with a particular company record.

The Roster tab lists the company that is specified in the current record's Company field and all member records that list that same company in their Company fields. The list is shown in a tree configuration, so that subsidiary companies and their associated members are kept as a unit in the list. A status line at the bottom of the tab displays how many records are currently displayed as you expand and collapse the tree.

Special cases:

- If the current record is not associated with a company, iMIS lists only the current record.
- If the current record is a company record and the company is not a subsidiary of another company, then iMIS shows the roster of the current company.
- If the current record is a company record that is a subsidiary of another company, iMIS shows the parent company's roster, with the current company highlighted.

  Double-clicking any of the listed items (either a company or a member) highlights that line and loads its record in Customers > Manage customers. The item remains highlighted in the roster until another record is loaded from the Roster tab or from another location.

  Note: Your system administrator can specify the fields that are displayed in the Roster tab (see "Customizing roster display fields") and can also specify the display name of the Roster tab (see "Customer Setup - Basic Options window").

  Note: The Roster does not reflect changes you make to a record until you load a different roster and then reload the previous roster.

  Note: The Roster tab, like all of the history tabs, is not active until a record has been loaded in Customers > Manage customers.

Manage customers window - Roster tab

Select Customers > Manage customers, find a customer record, and click the Roster tab

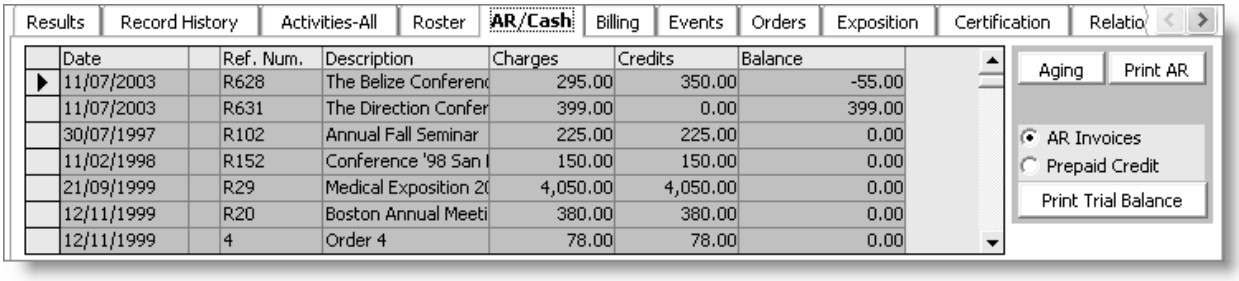
Note: You can also view a company roster in the Public view under My Account if your user record has the Company Administrator role assigned.

Viewing AR/Cash activity records

The AR/Cash tab enables you to view the Transaction Ledger(s) for the customer. The following fields are displayed on the AR/Cash tab: Date, Ref Num, Description, Charges,

Credits, and Balance. The information on the AR/Cash tab is view-only.

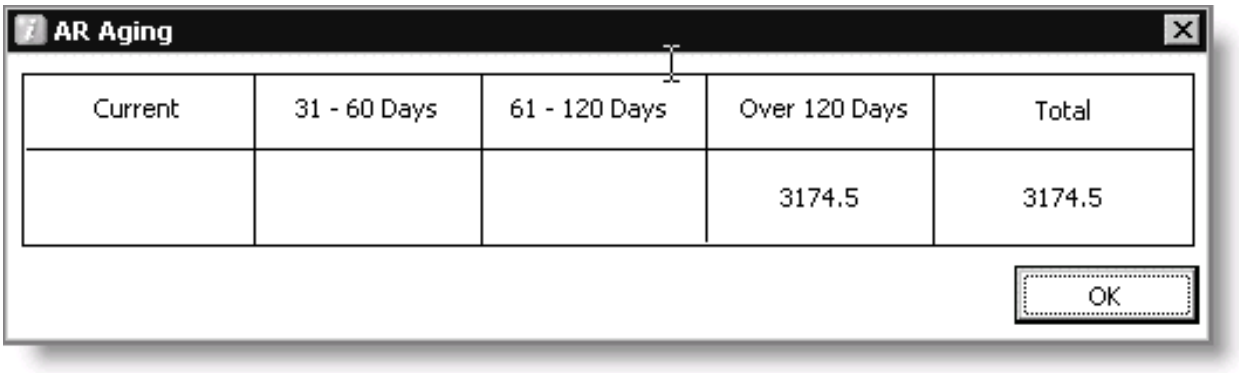
Manage customers window - AR/Cash tab



From Customers, select Manage customers, find customer record, and select AR/Cash tab

Aging

Opens the AR Aging window. The Current, 31-60 Days, 61-120 Days, and Over 120 Days columns are auto-generated from the AR/Cash module. The Total column shows the total invoice balance for the current Customer or Company ID.



Print AR

Generates and prints the Statement of Account for the current customer record to your selected print destination.

AR Invoices

Filters the transactions to only show invoices. You can prevent users from viewing Fundraising invoices on the AR/Cash tab by entering a Fundraising access keyword in the

Fundraising History View field on the Customer Setup – Access Keys window (from Customers, select Set up module > General, and click Access Keys).

Prepaid Credit

Filters the transactions to only show prepaid credits.

Print Trial Balance

Prints the Accounts Receivable Trial Balance Statement for the current customer record to your selected print destination.

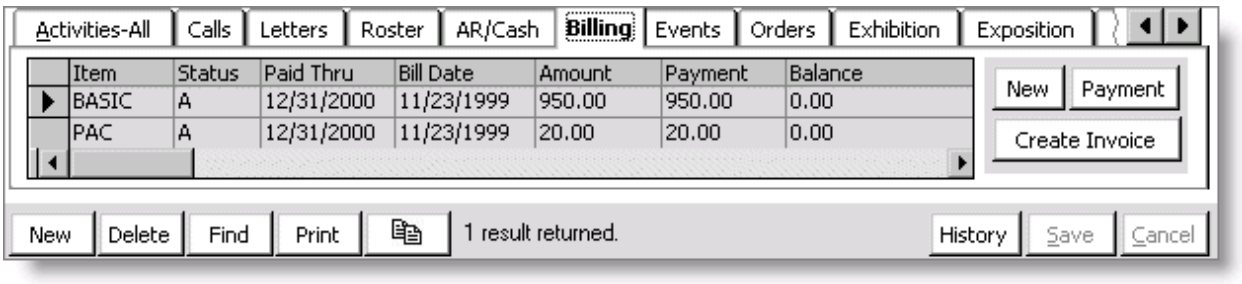
To view an AR/Cash activity

1. From Customers, select Manage customers.
2. Click Find and load a customer's record.
3. Select the AR/Cash tab.
4. Double-click the gray box to the left of the Date field to open the Transaction Ledger.
5. Review the transactions, and then click OK.
6. Click Aging on the AR/Cash tab to open the AR Aging window.
7. Review the information on the AR Aging window, and click OK.

Viewing billing items

The Billing tab enables you to view or enter Dues/Subscription Item Detail(s) for the customer. The following fields display on the Billing tab: Item, Member Type, Status, Paid Thru, Bill Date, Amount, Payment, Payment Method, and Balance.

Manage customers window - Billing tab



From Customers, select Manage customers, find customer record, and select Billing tab

Payment

Opens the Dues/Subscription Payments by Individual window for this customer record.

Create Invoice

Opens the Dues Billing Selections window where you can generate initial and renewal notices, produce bills for a large group of customers or subscribers, and process bills for groups that meet more specific selection criteria.

History/Current

Toggles between the current and history view of billing activities for this customer.

To view a billing item

1. Open a customer's record in the Manage customers window.
2. Select the Billing tab.
3. Select the gray box to the left of the Date field to open the Dues/Subscription Item Detail window for the billing item.
4. Review the information on the Dues/Subscription Item Detail window and then click OK.

To delete a billing record

You can delete billing records that display on the Billing tab, provided your administrator has assigned you the appropriate permissions.

Note: Accrual dues subscription records with a non-zero balance cannot be deleted from the Billing tab.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Select the Billing tab.

4. Select the record you want to delete.
5. Press Delete on the keyboard. A message displays asking you to confirm the deletion:

- Click Yes to have the record deleted from the tab and the database; or
- Click No to cancel the deletion.

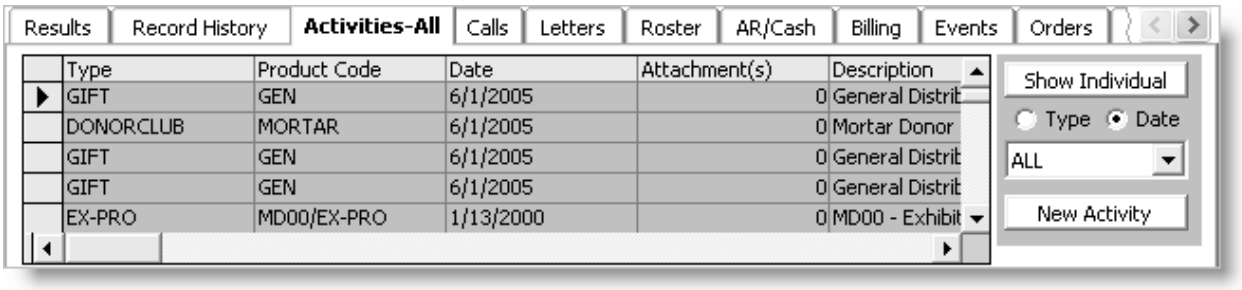
Note: If no record in the Billing tab has the focus, pressing Delete will have no effect.

Managing activity records

The Activities-All tab enables you to enter, edit, and view activity records for a customer record. The following fields display on the Activities-All tab: Type, Product Code, Date, Description, Note, Thru Date, Amount, Units, and Attachment(s).

Note: Your administrator can limit access to Activities-All tab functionality.

Manage customers window - Activities-All tab



From Customers, select Manage customers, find customer record, and select Activities-All tab

Show Individual

Toggles between viewing activities at the individual and company employee level, or the company level.

Note: When viewing an individual customer type record, the product does not display the Show Individual button.

Type

When selected, sorts activities alphabetically by type.

Date

When selected, activities by date.

Activity list

Specifies the activity type by which the list will be filtered.

New Activity

Opens the Activity Detail window so that you can enter an activity.

To enter an activity from the Activities-All tab

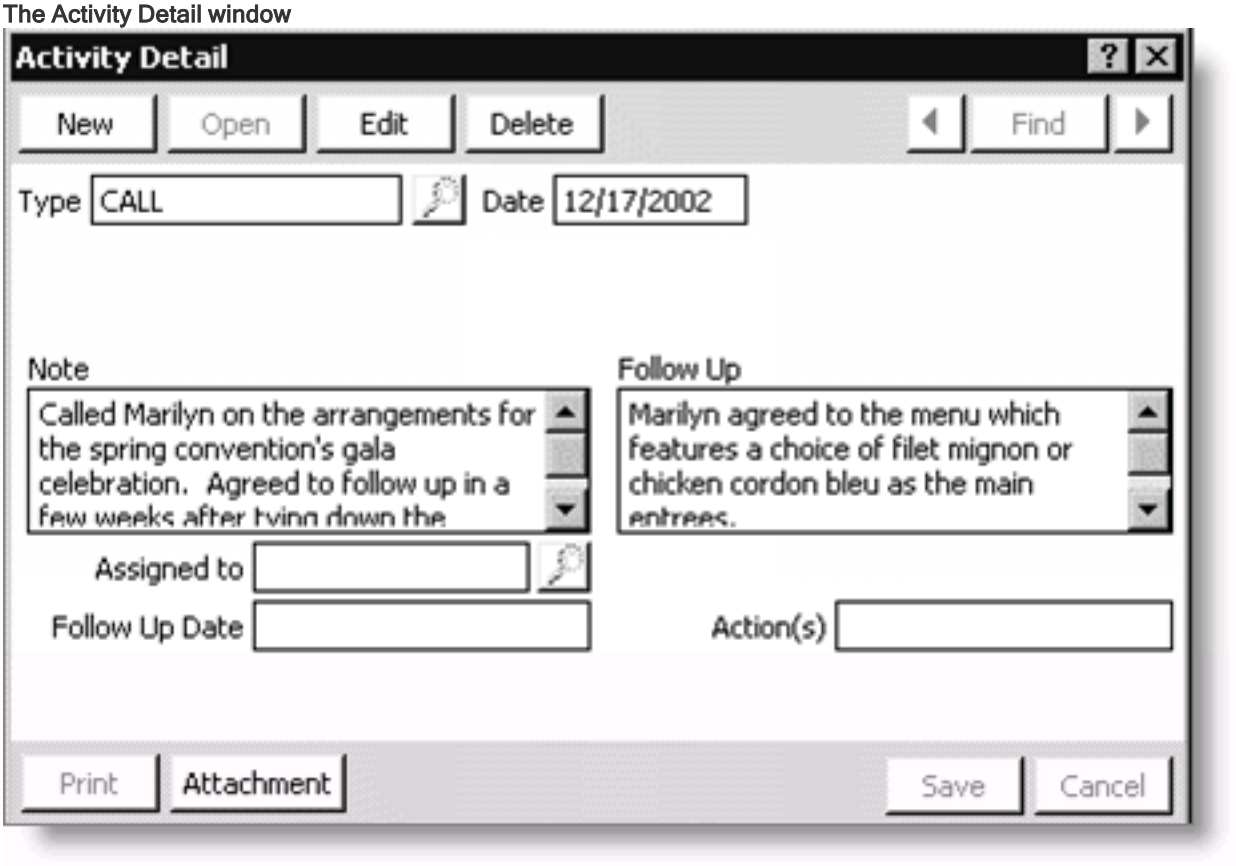
Note: Your administrator can limit access to Activities-All tab functionality. To enter and edit activities, the Customers authorization level needs to be set to three (3) or greater. To delete activities, the Customers authorization level needs to be set to four (4) or greater.

1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab.
3. Click New Activity.

   The Activity Detail window appears.
4. Click New and select an activity Type that allows user edits.

   Note: You cannot enter new system-generated activity types. You cannot enter user-defined activity types unless they have the Allow user Edit checkbox selected on the Set Up Activity Types window.
5. Enter values according to the fields that display.
6. Click Save.

The Activity Detail window



The Activity Detail window

To view all activities

1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab.
3. Double-click the gray box to the left of the Type field to open the Activity Detail window for the activity.

To edit an activity from the Activities-All tab

Note: Your administrator can limit access to Activities-All tab functionality. To enter and edit activities, the Customers authorization level needs to be set to three (3) or greater. To delete activities, the Customers authorization level needs to be set to four (4) or greater.

1. Open a customer's record in the Manage customers window.

2. Select the Activities-All tab.
3. Double-click the gray box to the left of the Type field to open the Activity Detail window.
4. Click Edit, and then update the activity as needed.
5. Click Save on the Activity Detail window.

To delete an activity from the Activities-All tab

Note: You can delete activity records provided your administrator has assigned you the appropriate permissions. If you attempt to delete an activity record and you do not meet the requirements to delete an activity, a message displays informing you that you either do not have sufficient privileges or the activity type cannot be deleted. If you have a Customers authorization level of 2 or less, the Activities-All tab is read-only-only and a message is displayed if you attempt to delete an activity record.

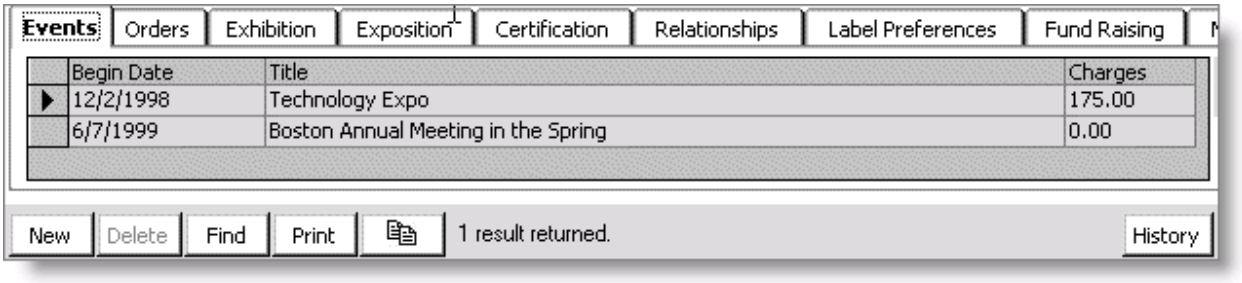
1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab.
3. Select the type of activity record you want to delete from the activity Type drop-down list.
4. Select the activity record you want to delete.
5. Press Delete on your keyboard.
6. Click Save.

Note: If no record on the Activities-All tab has the focus, pressing Delete has no effect.

Viewing event registrations and activities

The Events tab enables you to view Event registrations for the customer. The following fields display on the Events tab: Begin Date, Title, and Charges.

Manage customers window - Events tab



From Customers, select Manage customers, find customer record, and select Events tab

Registration

Opens the Register a customer window. When you click New on the Register a customer window, the system automatically populates the ID field with the customer's ID.

History

Used to toggle between the current and history view of event activities for this customer record.

To view an event registration

1. Open a customer's record in the Manage customers window.
2. Select the Events tab.
3. Select the gray box to the left of the Begin Date field to open the Event's module Register a customer window.
4. Review the information on the Register a customer window, and close the window.

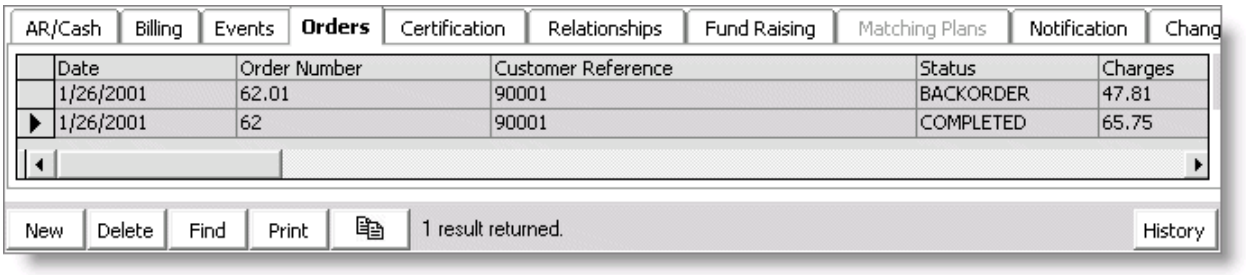
To view an event activity record

1. Open a customer's record in the Manage customers window.
2. Select the Events tab.
3. Click History to view the event activity records for the customer.
4. Double-click the gray box to the left of the Transaction Date field to open the Activity Detail window for the event activity.

Viewing orders and order activities

The Orders tab enables you to view open and complete orders for the customer. The following columns are displayed on the Orders tab: Date, Order Number, Customer Reference, Status, and Charges.

Manage customers window - Orders tab



From Customers, select Manage customers, find customer record, and select Orders tab

New Order

Opens the Enter and edit orders window. When you click New on the Enter and edit orders window, the system automatically populates the Bill to ID and Tax Authority fields on the Overview tab and the information on the Ship to Info tab with the customer's information.

History

Used to toggle between viewing current and historical order activities for this customer record. In Current view, all open orders display at the top of the grid with all completed orders at the bottom. Within each group of orders (open and completed), the orders sort by date and then by order number in descending order (so the newest orders display at the top of the grid).

To view orders

1. Open a customer's record in the Manage customers window.
2. Select the Orders tab.
3. Double-click the gray box to the left of the Date field to open the Order Entry window.
4. Review the information on the Order Entry window, and close the window.

To view an order activity record

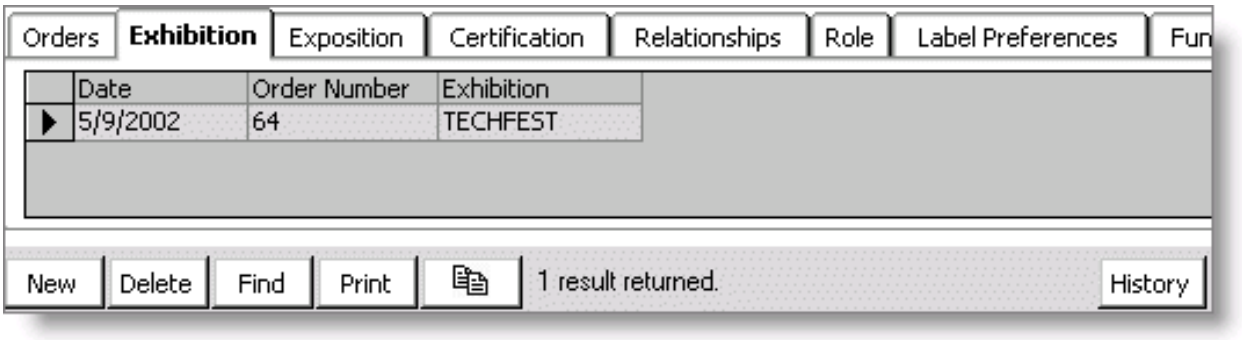
1. Select the Orders tab.
2. Click History to view the order activity records for the customer.
3. Double-click the gray box to the left of the Transaction Date field to open the Activity Detail window for the order activity.

Viewing exhibition registrations and activities

The Exhibition tab enables you to view Exhibition orders for the customer

The following fields display on the Exhibition tab: Date, Order Number, and Exhibition.

Manage customers window - Exhibition tab



From Customers, select Manage customers, find customer record, and select Exhibition tab

History

Used to toggle between the current and history view of exhibition activities for this customer record.

To view an exhibition registration

1. Open a customer's record in the Manage customers window.
2. Select the Exhibition tab.
3. Double-click the gray box to the left of the Date field to open the Exhibition module's Process orders window.
4. Review the information on the Process orders window, and close the window.

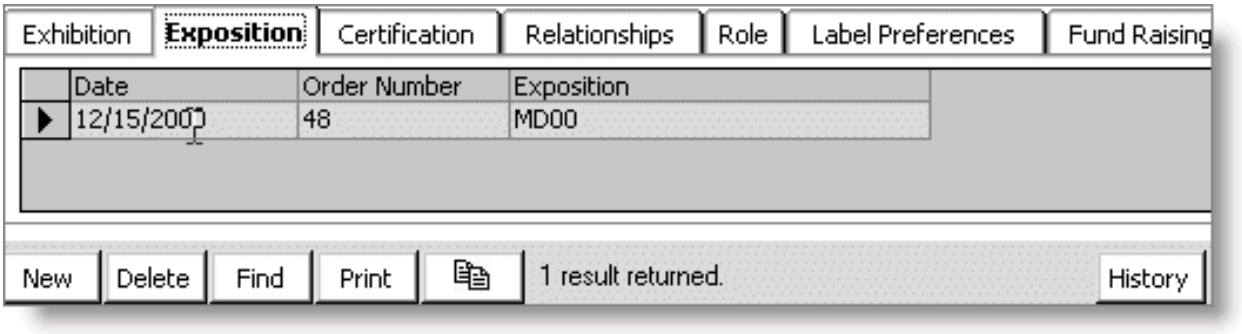
To view an exhibition activity record

1. Open a customer's record in the Manage customers window.
2. Select the Exhibition tab.
3. Click History to view the exhibition activity records for the customer.
4. Double-click the gray box to the left of the Source Code field to open the Activity Detail window for the exhibition activity.

Viewing exposition activities

The Exposition tab enables you to view or enter exposition orders for the customer. The following fields display on the Exposition tab: Date, Order Number, and Exposition. The Exposition tab does not allow editing or inserting of information.

Manage customers window - Exposition tab



From Customers, select Manage customers, find customer record, and select Exposition tab

History

Used to toggle between the current and history view of exposition activities for this customer record.

To view an exposition registration

1. Open a customer's record in the Manage customers window.

2. Select the Exposition tab.
3. Double-click the gray box to the left of the Date field to open the Exposition module's Process booth orders window.
4. Review the information on the Process booth orders window, and close the window.

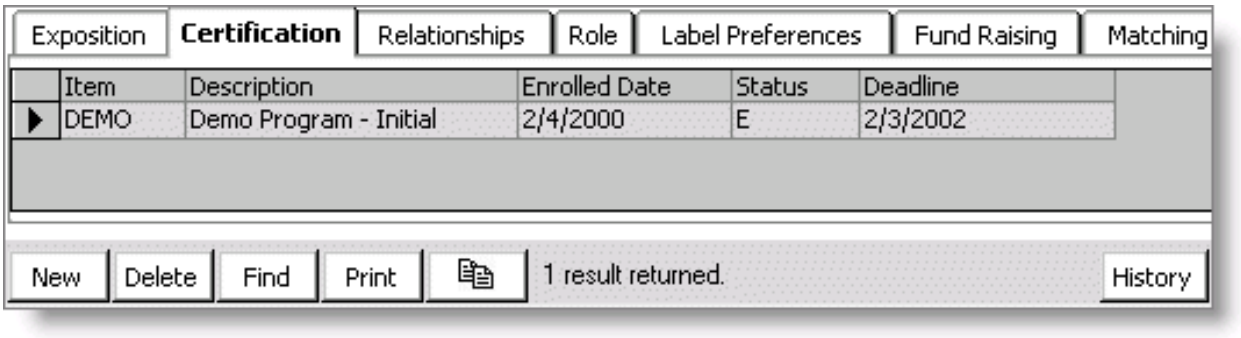
To view an exposition activity record

1. Open a customer's record in the Manage customers window.
2. Select the Exposition tab.
3. Click History to view the exhibition activity record for the customer.
4. Double-click the gray box to the left of the Source field to open the Activity Detail window for the exposition activity.

Viewing certification activities

The Certification tab enables you to view certification orders for the customer. The following fields display on the Certification tab: Item, Description, Enrolled Date, Status, and Deadline.

Manage customers window - Certification tab



From Customers, select Manage customers, find customer record, and select Certification tab

History

Used to toggle between the current and history view of certification activities for this customer record.

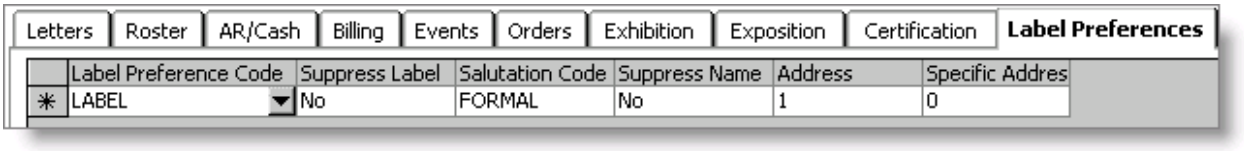
To view certification activities

1. Open a customer's record in the Manage customers window.
2. Select the Certification tab.

Managing label preferences

The Label Preferences tab enables you to select the salutation text, addresses, and options used when printing labels.

Manage customers window - Label Preferences tab



From Customers, select Manage customers, find customer record, and select Label Preferences tab

Label Preference Code

(required) Specifies a product label preference code. Select the right side of the cell to display a drop-down list of defined codes. These codes are defined by your administrator.

Suppress Label

Enable to suppress printing the label. Select the right side of the cell to display a drop-down list and select Yes or No.

Salutation Code

Specifies the code for the salutation text you want to print on the label. This field is enabled if salutation text has been defined for at least one salutation code. It will be read-only if no salutation text has been defined. Select the right side of the cell to display a drop-down list of defined codes.

Suppress Name

Enable to suppress printing the customer's name on the label. Select the right side of the cell to display a drop-down list and select Yes or No.

Address

(required) Select the address that will print on the label:

- Preferred Mailing Address - Select this address to print the customer's preferred mailing address.
- Preferred Billing Address - Select this address to print the customer's preferred billing address.
- Specific Address - Select this address if you want a specific address to print on a label. Selecting Specific Address enables the cell under the Specific Address column for the given row.

  Select the right side of the cell to display a drop-down list of addresses.

  Specific Address

  Select the specific address that will print on the label. Select the right side of the cell to display a drop-down list of specific addresses.

  To display the Label Preferences tab

  Label Preferences functionality is not applicable for customers that have no address data, and the Label Preferences tab is disabled for customer records that do not have a defined address. The tab enables once you save an address to the database for the customer. The Label Preferences tab is disabled (read-only) when the Manage customers window is in the data entry mode.

  The Label Preferences tab displays only after meeting label preferences have been set up by your administrator.

  To enter a label preference

1. Open a customer's record in the Manage customers window.
2. Select the Label Preferences tab.
3. Select the empty Label Preference Code field to display a drop-down arrow.
4. Select the drop-down list and select the label preference code you want to use.

5. Tab to the Suppress Label field and select Yes or No from the drop-down list.
6. Tab to the Salutation Code field and select the salutation code for the salutation text that you want to print on the label.

   Note: Salutation text is defined for salutation codes on the Salutations tab, and the Salutation Code field enables only if salutation text has been defined for at least one salutation code. If no salutation text has been defined, the Salutation Code field will be read-only.
7. Tab to the Suppress Name field and select Yes or No from the drop-down list.
8. Tab to the Address field and select the address that you want to print on the label. For example, select Specific Address if you want to use an address other than the Preferred Mail or Preferred Bill address. If you select Specific Address, the Specific Address field will enable.
9. (Required only if Specific Address is selected in the Address field) Tab to the Specific Address field and select the Specific Address that you want to print on the label. The addresses listed include all of the customer's defined addresses.
10. Click Save.

To edit a label preference

1. Open a customer's record in the Manage customers window.
2. Select the Label Preferences tab.
3. Make any necessary changes.
4. Click Save.

To delete a label preference

1. Open a customer's record in the Manage customers window.
2. Select the Label Preferences tab.
3. Select the row you want to delete and press Delete on your keyboard.
4. Click Save.

Viewing change log activity records

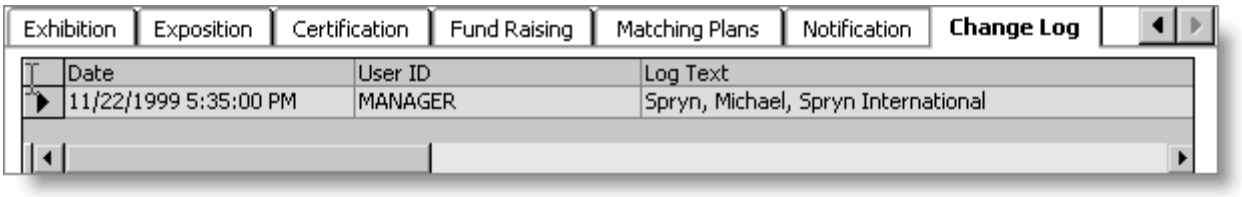
The Change Log tab enables you to view changes that have been made to a customer record. The following fields are shown on the Change Log tab:

- Date - the date the change was made
- User ID - the login ID of the person who made the change
- Log Text - the change that was made

Note: You cannot edit Change Log entries.

The changes that are tracked can be configured by your iMIS administrator (see "Adding and deleting fields in the change log").

Manage customers window - Change Log tab



From Customers, select Manage customers, find customer record, and select Change Log tab

To view change log activity

1. Open a customers record in the Manage customers window.
2. Select the Change Log tab.
3. Use the scroll bar to move up and down the log.

Viewing fundraising information

You can view customer fundraising activities and history through the donor's customer record: select Customers > Manage customers > Fundraising tab.

The Fundraising tab shows summarized and detailed fundraising information and provides access to essential Fundraising features: entering new gifts, printing a fundraising profile, and managing requests. The Fundraising history tab has four sub-tabs:

- Summary
- Donor History
- Donor Recognition
- Requests

Note: The values in the Pledge Amount column reflect the net pledge amount, including credit and debit memos that have been applied to the pledge since its initiation. This also applies to meeting gifts and pledges.

Need more?

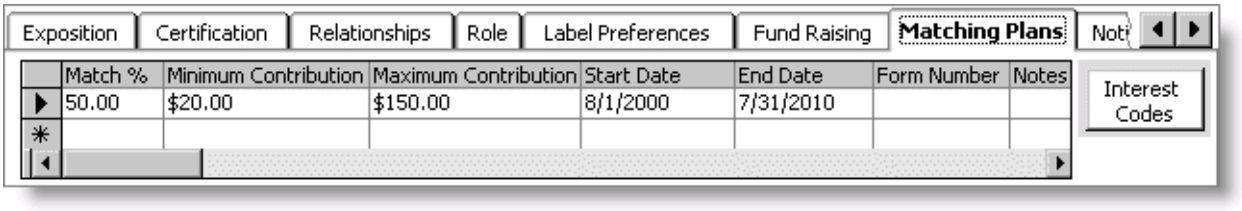
- For details about the Fundraising tab, see Customers Fundraising tab in the Fundraising section.
- For configuration help, see Customers: Set up fundraising.
- For more about granting access to the Fundraising tab, see About Fundraising tab access in the Fundraising section.

Managing matching plans information

Many companies have a matching plan through which they match the donations and pledges made by their company customers. The Matching Plans tab enables you to set up and create matching plans.

The Matching Plans tab is enabled if a customer's record is loaded into the Customers area and the customer type is Company Member (CM). If the customer type is other than CM, the tab disables. The Matching Plans tab is read-only for users not authorized to add, edit, and delete data, and iMIS must be licensed for Fundraising for the Matching Plans tab to display.

Manage customers window - Matching Plans tab



From Customers, select Manage customers, find customer record, and select Matching Plans tab

Match%

(required) Specifies the percentage of the company customer's contribution that the company will match. Numerals of 0.01 to 999.99 are acceptable.

Minimum Contribution

(required) Specifies the minimum monetary amount of the employee's contribution that the company will match.

Maximum Contribution

(required) Specifies the maximum monetary amount of the employee's contribution that the company will match.

Start Date

Specifies the starting date of the matching plan.

End Date

Specifies the ending date of the matching plan.

Form Number

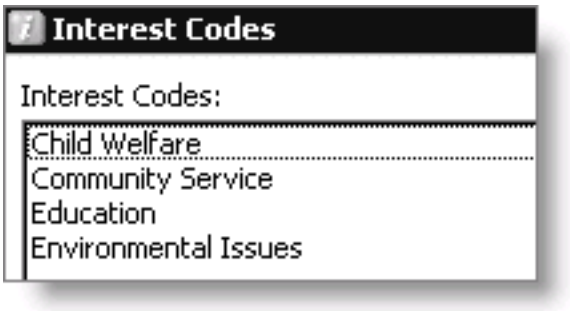
Specifies the matching plan's form number.

Notes

Specifies notes associated with the matching plan.

Interest Codes

Opens the Interest Codes window. The Interest codes window is used to apply a matching plan to a specific Interest Code. Interest Codes are defined by your administrator.



Sample Interest Codes window

Note: Your administrator can control access to the Matching Plans tab.

To create a matching plan

1. Open the record of the company member for whom you want to set up a matching plan.
2. Select the Matching Plans tab.
3. Set the focus on the empty row at the bottom of the data-grid.
4. (required) Enter the Match %. This is the percentage of the company member's contribution matched by the company.
5. (required) Enter the Minimum Contribution the company will match.
6. (required) Enter the Maximum Contribution the company will match.
7. Enter the Start Date of the matching plan.
8. Enter the End Date of the matching plan.
9. Enter the Form Number of the matching plan.
10. Enter any Notes associated with the matching plan.
11. Click Interest Codes to open the Interest codes window.
12. Select the interest code(s) for the matching plan (press Ctrl to select multiple codes).
13. Click OK on the Interest Codes window.
14. Click Save on the Manage customers window.

To edit a matching plan

1. Open the record of the company member for whom you have set up a matching plan.
2. Select the Matching Plan tab.
3. Set the focus on the matching plan you want to modify by selecting the box to the left of the row.
4. Make any necessary changes.
5. Click Save.

To delete interest codes from matching plans

1. Open the record of the company member for whom you have set up a matching plan.
2. Select the Matching Plan tab.
3. Set the focus on the matching plan for which you want to delete the interest code(s) by clicking the box to the left of the row.
4. Double-click to open the Interest Codes window.
5. While pressing Ctrl, click on the Interest Code(s) to deselect them.
6. Click OK on the Interest codes window.
7. Click Save on the Manage customers window.

To delete a matching plan

Note: The Delete button is enabled only if the Allow Delete from Customer Portfolio option is enabled by your administrator.

1. Open the record of the company member for whom you have set up a matching plan.
2. Select the Matching Plan tab.
3. Set the focus on the matching plan you want to delete by clicking the box to the left of the row.

4. Click Delete.
5. Click Save.

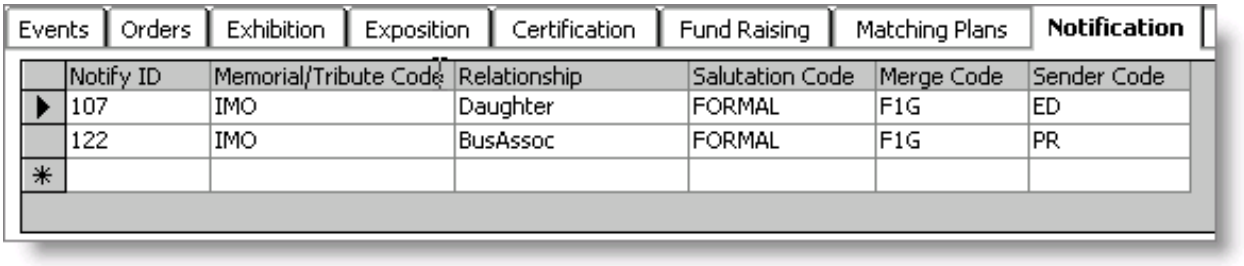
Note: Deleting a record from the Matching Plans tab deletes the corresponding Interest Code records as well.

Managing notification information

When memorial or tributary contributions are made for an individual, the recipient's family members and associates need to be notified of the contribution. The Notification tab enables you to add, edit, and delete notification information.

The Notification tab is read-only for users not authorized to add, edit, or delete data, and iMIS must be licensed for Fundraising for the Notification tab to display. It is enabled in edit mode and disabled in data entry mode.

Manage customers window - Notification tab



From Customers, select Manage customers, find customer record, and select Notification tab

Notify ID

(required) Displays the Notify IDs associated with this customer record. The Notify IDs are the IDs to be notified if a memorial or tribute donation is made in honor of this individual. You can enter a Notify ID or select a Notify ID from the drop-down list.

The Notify IDs that display for an ID in the Notification tab display in ID order. When you click Apply all Notify IDs on the Tribute tab of the Enter and edit gifts window, the Notify IDs defined for the specified Memorial ID display in alphabetical order.

Memorial/Tribute Code

Select the code for notifying an individual of the memorial or tributary contribution. Your administrator defines these codes. If no codes have been defined, the field is read-only. Select on the right side of the cell to display a drop-down list of the descriptions defined for the memorial/tribute codes. When you select a memorial/tribute code's description, the code will display in the field.

Relationship

Select the relationship code that describes the relationship between the notified individual and the individual being honored or recognized. Your administrator defines these codes. If no relationships have been defined, the Relationship field is read-only. Click on the right side of the cell to display a drop-down list of descriptions defined for the relationship codes. When you select a relationship code's description, the code displays in the field.

Salutation Code

Select the salutation code and corresponding salutation text used when notifying an individual of a memorial or tributary contribution. Select on the right side of the cell to display a drop-down list of descriptions defined for the salutation codes. When you select a salutation code's description, the code displays in the field. Your administrator defines these codes.

Merge Code

Select the merge code used when sending a notification. Select on the right side of the cell to display a drop-down list of descriptions defined for the merge codes. When you select a merge code's description, the code is displayed in the field. Your administrator defines these codes. If no merge codes have been defined, the Merge Code field is read-only.

Sender Code

Select the sender code used when sending a notification. Your administrator defines these codes. If no sender codes have been defined, the Sender Code field is read-only. Select on the right side of the cell to display a drop-down list of descriptions defined for

the sender codes. When you select a sender code's description, the code displays in the field.

Note: Your administrator can control access to the Notification tab. In order to modify the primary key (Notify ID field) or delete a row from the tab, a user must have an authorization level of 4 or higher. Users with an authorization level of 3 can enter new rows and edit the secondary keys (Memorial/Tribute Code, Relationship, Salutation Code, Merge Code, and Sender Code fields), but they cannot delete rows or edit the primary key.

To enter notification information

1. Open the recipient's record in the Manage customers window.
2. Select the Notification tab.
3. Set the focus on the empty row at the bottom of the tab.
4. Enter individuals to be notified:

- Enter the Notify ID. This is the ID of the individual who is being notified of the contribution.
- Tab to the Memorial/Tribute Code field and select a code from the drop-down list.
- Tab to the Relationship field and select a code from the drop-down list.
- Tab to the Salutation Code field and select a code from the drop-down list.
- Tab to the Merge Code field and select a code from the drop-down list.
- Tab to the Sender Code field and select a code from the drop-down list.
- Click Save.
- Repeat for each additional individual that you want to notify.

To edit notification information

1. Open the recipient's record in the Manage customers window.
2. Select the Notification tab.
3. Set the focus in the field you want to modify.

4. Make any necessary modifications.
5. Click Save.

To delete notification information

Note: The Delete button must be enabled by your administrator.

1. Open the recipient's record in the Manage customers window.
2. Select the Notification tab.
3. Set the focus on the record you want to delete by clicking the box to the left of the row.
4. Click Delete.
5. Click Save.

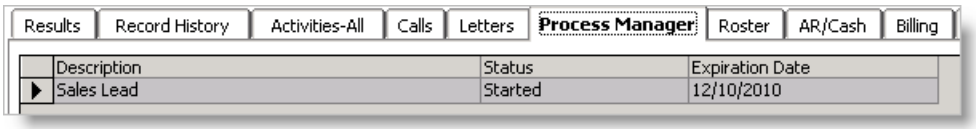
Viewing project information

The Process Manager tab enables you to view projects that meet the following criteria:

- The current contact is listed as the Primary Contact of one or more Process Manager projects.
- The current user is a member of an Opportunity security group with sufficient permissions to view the projects.

The following fields display on the Process Manager tab: Description, Status, Expiration Date. The Process Manager tab does not allow editing or inserting of information, however, you can double-click on any project listed to open the Process Manager and view more information or, with the proper permissions in place, make edits to a project.

Manage customers window - Process Manager tab



From Customers, select Manage customers, find customer record, and select Process Manager tab

To view projects

1. Load a customer's record in the Manage customers window.
2. Select the Process Manager tab.
3. Use the scroll bar to move up and down the log.
4. To see more information about a project, double-click on that project.

To edit projects

1. Open a customer's record in the Manage customers window.
2. Select the Process Manager tab.
3. Use the scroll bar to move up and down the log.
4. To see more information about a project, double-click on that project.

Customer Communication

iMIS Customer Management enables you to perform the following tasks in managing your customer communication options:

- Copy and paste customer information into other applications.
- Customize the information contained in customer profiles.
- Print customer profiles.
- Print customer address labels.
- Write and send letters to customers.
- Send email messages to customers.
- Open Microsoft Word documents from within iMIS.

Generating customer profiles

The iMIS customer profile is a customizable, résumé-style report that lists most of the information available for a customer's record. The profile is a convenient way to get a printed hard copy or on-screen summary of customer details including the following:

- Name
- Address
- Lists
- Customer activity records (grouped by type)

To customize customer profiles

The information generated in customer profiles is completely customizable. Your administrator can set up windows to display the content of custom window fields in customer profiles. When this option is enabled, the customer's information contained within custom window fields displays in a customer's profile.

Note: When the Show window fields on customer profile|topic=To display custom window fields in customer profiles option is enabled, the customer's profile information is generated in an Omnis report only. The profile information does not display in a Crystal report.

Individual activity types can also be enabled to display customer activity records. These activity records are grouped according to activity type, and you have control over the order in which the activity types display in the customer profiles.

To print a customer's profile

1. From Customers, select Manage customers.
2. Find the customer's record. (See Finding Customer Records for more.)
3. Select File> Report Destination> Screen to change the report destination to screen.
4. Click Print, located at the bottom of the Manage customers window.
5. If this is the profile you want to send to the printer, select the Print icon at the top of the Member Profile window.

Creating letters

In Customers, you can write and send letters while you have a customer's record open with one of the following tools:

- Microsoft Word™ Integration (Letter System)
- QuickLetter

Tip: If you have created the Letter activity type, creating a letter for an individual customer generates an activity record for that customer.

To create a letter for a single customer using QuickLetter

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Letters tab.
4. Click New Letter to display the Letter Text window.

   You can create a standard letter, which you may customize, or you can create your own letter.

   - To create your own letter, click New and type the text in the white text entry box.
   - To use a standard letter, select Standard Letter on the Letter Text window to open the Find window.
   - Select a standard letter and click OK or double-click the letter to open it in the Letter Text window.

   Note: The bracketed text in the window tells iMIS to automatically access this information from the current system settings. For example, [today] automatically generates the current date and enters it into the letter.
5. Enter text for the letter.
6. Click Save as Standard on the Letter Text window to save the letter for this customer.
7. Enter a Letter Name in the space provided.

Note: Do not choose the same name as an existing iMIS Standard Letter. If you choose the same name as an existing Standard Letter, your letter replaces the Standard Letter, but revisions are overwritten during a System upgrade.

8. Click Print. An activity record is created.

To add system variables to a letter created using QuickLetter

Designing a customized standard letter is much like setting up any mail merge template. You create a master letter that has field name markers where the merged data will display.

Where you want personalized information to display, you will enter the appropriate variable name enclosed in square brackets [ ]. For example, the format of the variables is [Table.FIELDNAME], and [Name.INFORMAL] brings in the informal name or nickname from the customer record (the Informal field of the Name table).

When you print the letter for a customer, the variable names will be replaced by the actual data from the customer's record or other appropriate places. The variables can call any field in the Name table and fields created in the Customizer.

In addition, iMIS supplies the following special variables that are preset to retrieve certain formatted fields or current system settings:

- [Today] - Prints the current date in the system.
- [Name.TITLE] - Prints the customer's title as it displays in the Manage customers window.
- [Name.INFORMAL] - Prints the customer's informal name as it displays in the Manage customers window.
- [Name.COMPANY] - Prints the customer's company name as it displays in the Manage customers window.
- [Name.FULL.ADDRESS] - Prints the customer's formatted preferred mail address.

To change a letter format in QuickLetter

In the iMIS standard letter system, you can use the Letter Format option to change the following:

- Heading (to print an organizational header across the top) or No Heading (to print on letterhead paper where the letterhead is across the top)
- Print Width (5 ½ inches or 6 ½ inches). The 5 ½-inch print width is designed for printing on letterheads where the letterhead is down the left side of the page.
- Signature or No Signature (to print at bottom) if you have a signature set up in Report Specifications

Note: When you change the format for a letter, the selected format is written to the report description so that the next time the report is selected from the Letter Text window, the most recently selected format will be used.

To modify any of these settings, follow these steps:

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Letters tab.
4. Click New Letter to open the Letter Text window.
5. Click Standard Letter on the Letter Text window.
6. Select and open a Standard Letter in the Find window.
7. Select Options on the Letter Text window (in the upper right corner).
8. Select Letter Format and choose a format for your letter.

Note: The Letter Format options correspond to the six available letter report formats on the Report Specifications window.

- If you want to print on letterhead paper (where your letterhead is at the top of your paper), make sure you pick a format that begins with the words No Heading. If your letterhead is along the left side of your paper, select a letter format that includes the words 5” Print

Width.

- If you want to print your organizational header at the top of the letter and your header was specified in system setup, pick a format that begins with the words iMIS Standard.

9. Click Save as Standard on the Letter Text window to save the letter for this customer and open the Letter Name window.
10. Enter a descriptive name for the letter and click OK to save the letter.
11. Set your report destination to screen (File> Report Destination) to see a preview of your letter. To actually print your letter once you approve of the page preview, select P in the top right corner of the window.

    When you close the customer record and then reopen it, you can select the Letters tab to see a history of the records sent to the customer. The letter you just created and printed will be listed there.
12. From Customers, select Manage customers.
13. Find the customer's record.
14. From Customers, select Generate reports to open the Generate reports window.
15. Select Letters from the Report Types column.
16. Select a letter from the Available Reports column.

    Note: Sample MS Word templates cannot be used with QuickLetter.
17. Click Run to open the Member/Contact Selections window.
18. Select Individual Only from the Member/Nonmember category.

    The template opens with the text displayed. Select the Print icon to print the letter.

    To merge a letter for a single customer using the Letter System

    Note: When using the Letter System, you will need to close any other instances of MS Word that you may have open.

1. From Customers, select Manage customers.

2. Find the customer's record.
3. Select the Letters tab.
4. Click New Letter to open the Membership Standard Letters window.
5. Select the letter to merge from the Membership Standard Letters window.
6. Click Merge and enable the activity options for your merge:
7. Enable the Create Activity records with merge option to create the LETTER activity for each customer record.
8. Enable the Create EMAIL Activities with merge option to create the EMAIL activity instead of the LETTER activity.

   Note: If you want to email the letter to customers and create an e-mail activity, you must enable both options. An EMAIL activity type must be defined in the database.
9. Enable the Include Bad Addresses with merge option to include in your merge, those addresses that have an invalid status.
10. Click Continue to open MS Word.

    The template opens in MS Word with the text and merge fields displayed.

    Note: An activity is automatically created for a merge completed on the Letters tab.
11. Start the merge process:

- In MS Word, select the Merge to New Document icon on the toolbar to open the Merge to New Document window.
- Select All records or enter a range.
- Click OK to display the letters.

    If you selected New document, the letters are shown.

12. Print the form letter.
13. Close the Form Letter window.

14. Close the template (.DOC) file.

To merge an email letter for a single customer using the Letter System

To ensure all letters are delivered by email, verify the E-mail field for each customer is populated on the Manage customers window.

Note: When using the Letter System, you will need to close any other instances of MS Word that you may have open.

1. Open your email program.
2. From Customers, select Manage customers.
3. Find or insert a customer record.
4. Select the Letters tab.
5. Click New Letter to open the Membership Standard Letters window.
6. Select the letter template to merge.
7. Click Merge to open the Membership Standard Letters window.
8. Enable the Create Activity records with merge option to create the LETTER activity.
9. Enable the Create EMAIL Activities with merge option to create the EMAIL activity for each customer record.

   Note: An activity is automatically created for a merge completed on the Letters tab. If you want to email the letter to customer and create an email activity, you must enable both options. An EMAIL activity type must be defined in the database.
10. Enable the Include Bad Address with merge option to include those addresses that have an invalid status.
11. Click Continue. The template opens in MS Word with the text and merge fields displayed.
12. In MS Word, select the Merge to E-mail icon on the toolbar to open the Merge to E-mail window.
13. Select NameEMAIL from the To drop-down list.

14. (optional) Enter a Subject line.
15. Select the Mail format drop-down list and select the appropriate format.

    Note: If you select the Attachment format or the Plain Text format, two message prompts will display for each record that is being merged. Click Yes for each prompt. The message prompts will not display if you select the HTML format.
16. Click OK to display the letters
17. Close the Form Letters window.
18. Close the template (.DOC) file.

    To view a letter or email activity

    You can view activities for a letter or email on the Letters tab or the Activities-All tab.

    Note: A given LETTER activity will reflect a letter's text only when that text differs from the permanent text stored in the letter template. For example, if you send a letter to all of your customers but add additional information (such as an answer to a customer's question) to only one of the letters, the entire text of that letter would be stored for that customer's LETTER activity.

    The letter text associated with the template is saved to the Activity_Attach.ATTACH_TEXT table. Once a template is saved, all future letter activities will use the original template, regardless if the template is changed.

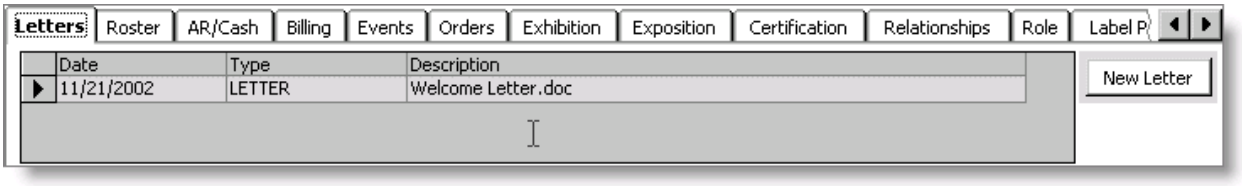
1. To view a letter from the Customers module:

- Select Manage customers.
- Find a customer record with a LETTER or EMAIL activity record.
- Select the Activities-All tab.
- Double-click an EMAIL or LETTER activity to open the Activity Detail window.

2. To view an EMAIL or LETTER activity through the Letters tab:

- From Customers, select Manage customers.
- Find a customer record with a LETTER or EMAIL activity record
- Select the Letters tab.

3. Double-click the letter or email line item to open the Activity Detail window.



The Letters tab

Emailing customers

You can send an email message to a customer if the following applies:

- An email address exists for the customer in the E-mail field of Customer > Manage customers
- You have Internet access
- You have an email client system that is MAPI compliant (such as Microsoft Outlook)

Sending an email to an individual customer will generate an activity record for that customer if you have created the EMAIL activity type.

To email a customer from the Manage customers window

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the E-mail icon on the E-mail field. The email message window opens for the email client system that you have.
4. Enter text for the email.

Note: If you use Outlook 98 as your email client, the autosignature will not work when you use the E-mail icon on the Manage customers window. This is a MAPI limitation in Omnis. As a workaround, manually insert the signature at the end of the email message.

To email a letter to a customer using QuickLetter

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Letters tab.
4. Click New Letter to open the Membership Standard Letters window.
5. Select Standard Letter to open the Letter Find window and select a standard letter to modify.
6. Enter text for the letter.
7. Click E-mail on the Letter Text window to open your email client system's message window.
8. Select Send.

To email a letter to multiple customers using QuickLetter

1. From Customers, select Generate reports to open the Generate reports window.
2. Select Letters from the Report Types field.
3. Select a letter in the Available Reports field to open the Member/Contact Selections window. Only certain letters will generate an email.
4. Click Run.
5. Select the customers you want the letter to be emailed to by selecting the appropriate options on the Member/Contact Selections window.
6. Click OK on the Member/Contact Selections window to send the email and open the View E-Mail Results window.

iMIS generates a detailed email Results list of the selected customers. The letter is emailed only to those customers that have an email address listed in the E-mail column. Those customers that are not sent the email are listed in the Error column of the list. The error “Email Address is Blank,” indicates that the E-mail field of the customer's record does not have an email address listed.

7. Click Print on the View E-Mail Results window to print the results.
8. Click Close to close the Member/Contact Selections window.

To send a broadcast email from Microsoft Word using an email merge

1. Make sure the Name.EMAIL field has been added to the iMIS export file.
2. Set up a Mail Merge in Microsoft Word by selecting Tools> Mail Merge.
3. When you are ready to Merge the data with the document (Step 3 in the Mail Merge process), select Merge.
4. Select the drop-down menu and select Merge to Electronic Mail.
5. Select Setup and choose the Email field as the Data field with Mail/Fax Address.
6. Select whether to send the document as an attachment.
7. Click OK in the Setup window.
8. Select Merge. The email will automatically send to all records included in your merge.

To view a customer's email activity record

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Activities-All tab.
4. Select Email from the drop-down list.
5. Select an email activity to open the Activity Detail window. The text that displays in the Email Text field is dependent upon how the email was sent:

- If the email was sent using the Email option on the Letters tab, the Email Text field displays the text of the email.
- If the email was sent using the Email option on the Manage customers window, the Email Text field displays the location from where the email was sent.

Printing customer address labels

iMIS prints customer address labels in bulk or one at a time.

- To print address labels in bulk, use the Labels report type from the Generate reports window.
- To print address labels one at a time, use the printer icon in the address area of the Manage customers window.

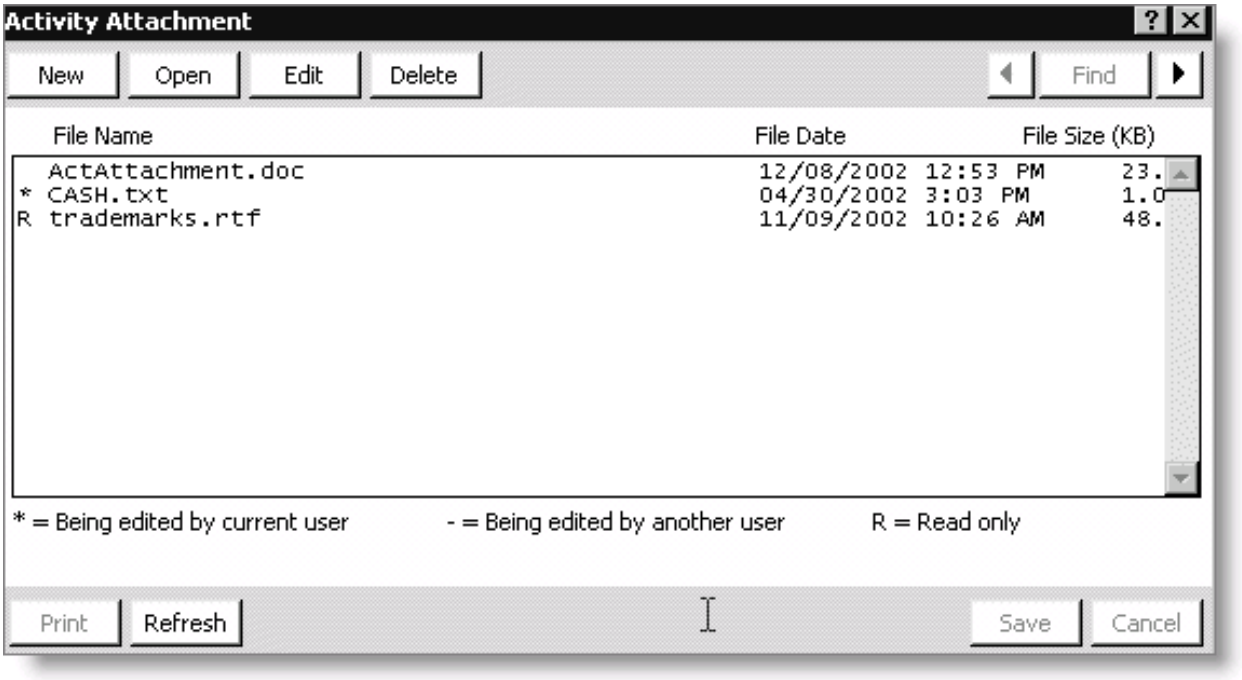
  Note: You must install a label printing device on your computer to print labels one at a time.

Attaching documents to activity records

When you open an activity record and click the Attachment button on the Activity Detail window, you can attach a file to the activity record and save it to the iMIS database. For example, you can attach a Microsoft Word document, PowerPoint slide presentation, spreadsheet, graphic, e-mail file, or html page. Once the file is saved to the iMIS database, you can open it on your system using the associated application and view, modify, or delete it from within iMIS.

Note: The Attachment button is enabled only if the Activity Attachments allowed option is enabled in the System Setup window. See Enabling attachments on activity records for details.

Activity Attachment window



From Customers, select Manage customers, select a customer record, select the Activities-All tab, double-click an activity, click Attachment

Attachment List

Lists of attachments.

Attachment Legend

Indicates the current status of an attachment:

- * - Indicates an attachment is being edited by the current user.
- - - Indicates an attachment is being edited by another user.
- R - Indicates an attachment is only editable by an administrator.

Refresh

Rebuilds the list of attachments.

Attaching files to activity records

Activity attachments are managed in the Activity Attachment window. When you click Attachment on the Activity Detail window, the Activity Attachment window displays with a list of attachments, listed alphabetically according to file name, for the current activity. You can access the Activity Detail window by double-clicking a record in the Activities-All, Call, or Letters tab, or by accessing the View activity tasks window and double-clicking an activity task.

The total number of activity attachments that exists for an activity record displays in the Attachment(s) column on the Calls tab for call activities, and on the Activities-All tab for all activities.

To attach a file to an activity record

Note: Your administrator must enable the Allow user Edit option for the activity for which you want to add an attachment.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Double-click the activity record to which you want to attach a file. The Activity Detail window displays.
4. Click Attachment to open the Activity Attachment window.
5. Click New. The Choose the file to attach to the Activity dialog displays. Browse to the file you want to attach to the activity record.
6. Click OK. A message box opens and gives you the option to save as read-only.
7. (optional) Enable the Save as read-only option to specify that only an administrator (a user with Customer authorization level of 8 or higher) is able to edit the attachment. If you do not enable this option, all users with appropriate permissions will be able to edit the attachment.
8. Click Yes to save the attachment to the database and to add it to the list of attachments on the Activity Attachment window. Clicking No will cancel the activity attachment process.

Note: If you attempt to attach a file that exceeds the value specified by your administrator, iMIS displays a message that the file exceeds the file limit.

To create an activity and attach a file

You can add an activity record and attachment at the same time.

1. From Customers, select Manage customers.
2. Open a customer record.
3. Select the Activities-All tab.
4. Select the drop-down list located directly below the Sort by area, and select the activity type you want to create.
5. Double-click the gray box containing the asterisk (*) to open the Activity Detail window.
6. Click New.
7. Enter an activity type in the Type field, or click the lookup icon to select an activity type.
8. Enter values according to the fields that display.
9. Click Attachment to open the Activity Attachment window. The activity record is automatically saved.
10. Click New. The Choose the file to attach to the Activity dialog displays.
11. Browse to the file you want to attach to the activity record.
12. Click OK. A message box opens and gives you the option to save as read-only.
13. (optional) Enable the Save as read-only option to specify that only an administrator (a user with a Customer authorization level of 8 or higher) is able to edit the attachment. If you do not enable this option, all users with appropriate permissions will be able to edit the attachment.
14. Click Yes to save the attachment to the database and to add it to the list of attachments on the Activity Attachment window. Clicking No will cancel the activity attachment process.

Viewing activity attachments

When you click the Open button on the Activity Attachment window, iMIS extracts a read-only version of the file from the Activity_Attach table and copies it to a subfolder under the temporary folder iMIS creates (for example, C:\Documents and Settings\Username\Local Settings\Temp\iMIS attachments). The associated document viewer for the file is then opened (for example, Microsoft Excel for files with an .xls extension). If the destination file already exists, a message displays informing you that the file has already been opened on your system. You will be given the opportunity to overwrite the existing file.

Note: Once you open an activity attachment, you can use the save functionality (usually the Save As feature) in the associated application to save a local copy of the file in a location other than the temporary folder created by iMIS. However, any changes you make to this copy will not be applied to the iMIS database.

To view activity attachments

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Double-click the activity with the attachment you want to view. The Activity Detail window displays.
4. Click Attachment to open the Activity Attachment window.
5. Select the attachment you want to view.
6. Click Open.

iMIS opens the document in the appropriate application, if the application associated with the file is on your system.

Note: If the application associated with the file is not on your system, iMIS informs you that there is no application available to open the file, and that a copy has been placed on your system. You can open the file from your Temp directory and choose an application in which to open the file. However, any changes you make to this copy will not be applied

to the iMIS database. Changes are only saved to the iMIS database when you click Save on the Activity Attachment window.

To edit activity attachments

Clicking Edit on the Activity Attachment window sets the INTENT_TO_EDIT column in the Activity_Attach table to the concatenated DateTime + User ID value to indicate that an attachment has been opened for editing by a specific user. If INTENT_TO_EDIT is populated, then a second user is not allowed to open the activity attachment for editing. If you attempt to edit a record that is being edited by another user, a message displays informing you that another user is editing the file, and that you can open a read-only copy of the file. If you attempt to edit a file that you already have open for editing, a message displays informing you that you are currently editing the file and that you should save or cancel your previous edits.

Once you have an activity attachment open for editing, you can make any necessary changes, and use the save functionality in the associated application (usually the Save As feature) to save a local copy of the file in a location other than the temporary folder created by iMIS. However, any changes you make to this copy will not be applied to the iMIS database. Changes are only saved to the iMIS database when you click Save on the Activity Attachment window.

Note: When activity attachments are saved to the database, iMIS creates a folder in a Temp directory (for example, C:\Documents and Settings\Username\Local Settings\Temp\iMIS attachments).

Note: If more than one user logs into a terminal server installation of iMIS as MANAGER and attempts to edit an activity attachment, iMIS saves to the database and to the Temp directory, the activity attachment that is first saved on the Activity Attachment window.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Double-click the activity with the attachment you want to edit. The Activity Detail window displays.

4. Click Attachment to open the Activity Attachment window.
5. Select the attachment you want to edit.
6. Click Edit. iMIS opens the attachment in the appropriate application, if the application associated with the file is on your system.

   Note: If the application associated with the file is not on your system, iMIS displays a message informing you that an application viewer is not available and that the file cannot be edited. You can still open the file from your Temp directory and choose an application in which to open the file. However, any changes you make to this copy will not be applied to the iMIS database. Changes are only saved to the iMIS database when you click Save on the Activity Attachment window.
7. (optional) Click Save on the Activity Attachment window to save your changes.

   To delete activity attachments

   An important maintenance step in working with activity attachments is deleting activity attachments that are no longer needed. You can delete activity attachments from the Activity Attachment window, or run a script to delete activity attachments that have a File Date earlier than a specific date. When an activity attachment is deleted, the Attachment (s) column on the Activities-All or Calls tab updates to reflect the deletion.

   You can delete an activity attachment only when another user does not currently have the file open for editing (indicated by a dash “-”), and the file is not read-only. If you click Delete on the Activity Attachment window and another user has the file open for editing, a message displays informing you that another user is editing the document.

   Caution! Deleting an activity attachment permanently removes the file from the iMIS database.

   Note: Only system administrators can modify activity attachments marked as read-only.

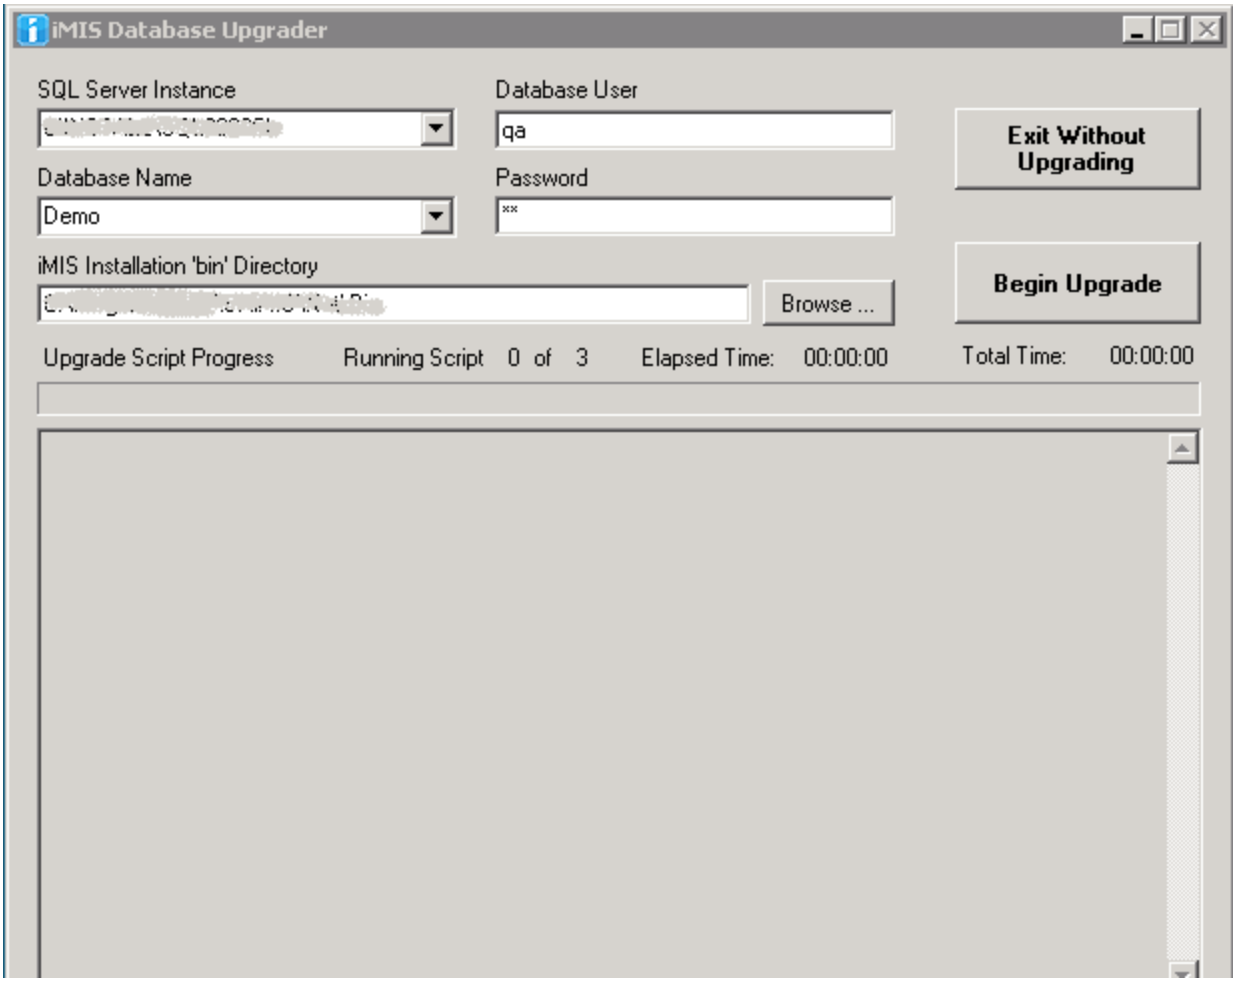
1. From Customers, select Manage customers.
2. Find a customer's record.
3. Select the Activities-All tab.

4. Double-click the activity record containing the attachment you want to delete. The Activity Detail window displays.
5. Click Attachment to open the Activity Attachment window.
6. Select the attachment you want to delete.
7. Click Delete. A message displays asking you to confirm the deletion.
8. Click Yes to permanently delete the attachment from the iMIS database, or No to cancel.

Database Utilities

iMIS Database Upgrader: DB Upgrader

You can run iMIS Database Upgrader (DB Upgrader) standalone from the iMIS program group. Use View Logs to quickly locate and view log outputs for all upgrades, completed and failed.



Important: Special characters in your sa password can disrupt command-line processing, so change the password to use only alphanumeric characters and ! # @, with no spaces. You may use hyphens and underscores after the first character, but avoid all other punctuation and symbols.

Begin Upgrade

This button runs a set of database upgrade scripts against the specified iMIS database. The specific scripts that are run depend on how many versions back the database is from the current version of iMIS. There is one upgrade script per version, so the upgrader upgrades the starting version to the next version, then the next, and so on until the final script updates the database to the current release of iMIS.

The following error message appears in the iMIS15DBUpgrade.log if the upgrade process fails:

*** UPGRADE PROCESS ENDED WITH ERRORS !!! ***

To determine how to retry the database upgrade after fixing the problems suggested by the point at which the failure occurred, you first must identify which upgrade script failed by scrolling up through the log until you find the header stamp that immediately precedes the error message. Header stamps look like this:

==========

= iMIS 15.0.2.x to iMIS 15.0.3.x Database Upgrade Driver Script =

==========

The version numbers shown in the header stamp determine how you must retry the database upgrade:

- If the first version number shown in the header stamp (the one on the left) is 15.1.1 or higher, you should fix the data in the current version of the database, then in the iMIS 15 Database Upgrader, click Begin Upgrade to resume the database upgrade from the beginning of the step that failed.

  If you want to restart the upgrade from some step earlier than the one in which the failure occurred, run the following UPDATE against the database, specifying a ParameterValue that is the step at which you want to restart the upgrade (use a value of 0 to force the upgrade to restart at the very beginning):

  UPDATE [dbo].[SystemConfig]

  SET [ParameterValue] = 3 -- The last completed step number

WHERE [ParameterName] = 'System.Database.State'

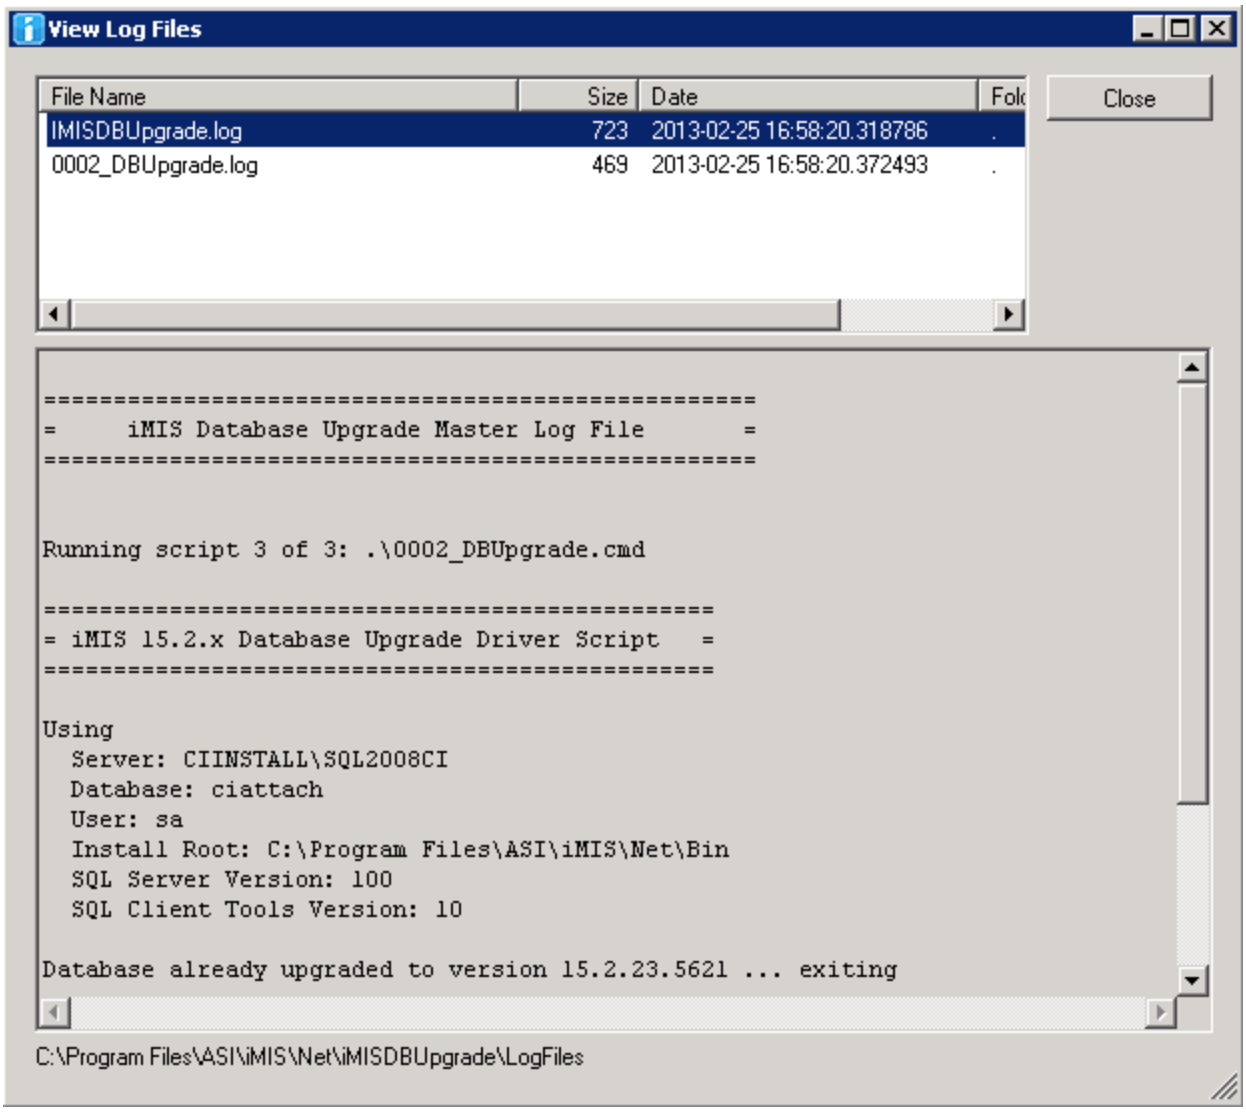
- If the first version number shown in the header stamp is lower than 15.1.1, you must first restore the database to the backup you made before beginning the upgrade process. Next, fix the data in that restored version of the database. Finally, in the iMIS 15 Database Upgrader, click Begin Upgrade to restart the entire database upgrade process. Note that you cannot click Begin Upgrade until you have restored the database to a backup preceding its failed upgrade state.

  View Log Files

  The log files appear chronologically by run time. To sort the list by any column, click on its header. To help you spot errors, *.err files have red highlighting.

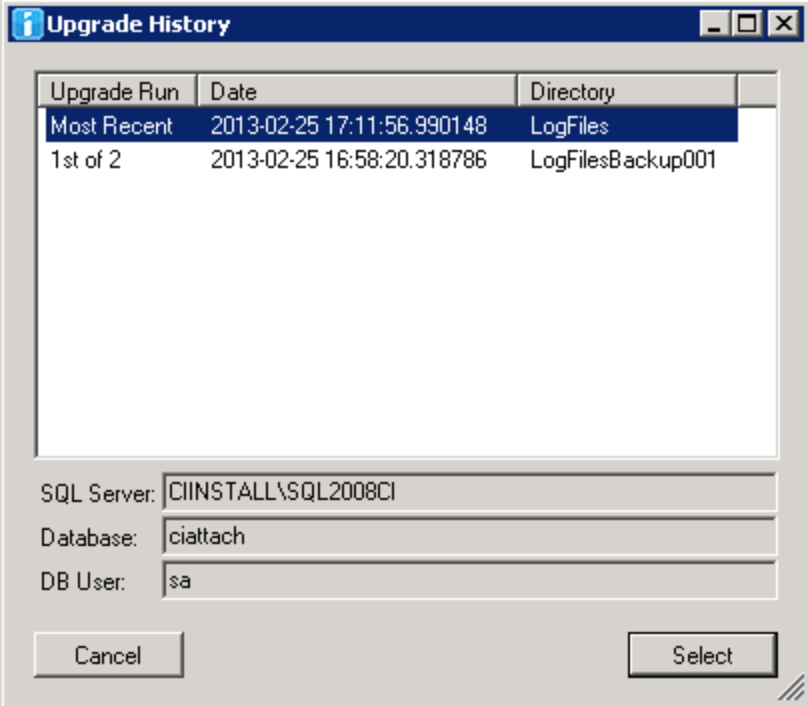
  The contents of the selected log display below the list, and the pathname displays at bottom. At top right, the Viewing: information and Log History command remain hidden until you have run multiple upgrades.

  Note: Tip: You can select and copy text within both the log contents and the pathname areas.



Upgrade History window

All logs of every run are preserved, so use this archive to access prior runs, for getting log file locations and copying log file text (such as error messages) into other applications or email. The Upgrade History lists the order, date, and location of all the upgrades that have ever been run. Below the list, you can see which user, server, and database name were used for the selected upgrade.



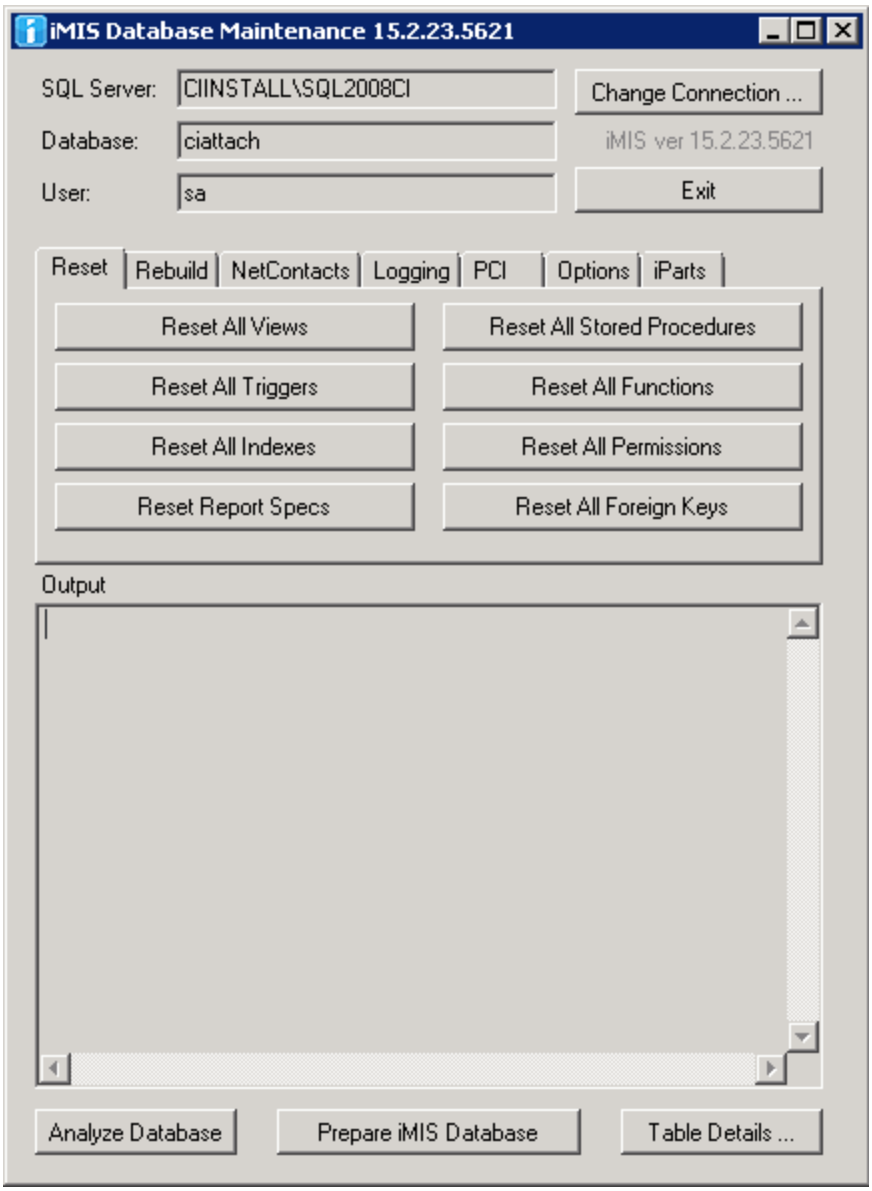
Click Select to return to the previous window with the selected run's logs displayed, rather than the most recent run (the default).

iMIS Database Maintenance: DB Maintenance

iMIS Database Maintenance (DB Maintenance) is a standalone application that replaced the iMIS 10 Table Analysis utility. This tool lets you rebuild, analyze, and manage all iMIS tables. It also lets you run special scripts that prepare your database to support advanced options, such as PCI, NRDS, and VAT.

Note: Tip: The DB Maintenance utility replaces DB Repair.

DB Maintenance runs as a separate, local application from the iMIS program group and organizes helpful database commands on a set of tabs.



- Change Connection – Switch to another iMIS database.
- Output – Displays information about the functions performed; this information also writes to a log file in the executable's directory.
- Analyze Database – Run a full analysis on the entire iMIS database. This process performs an extensive database analysis, so allow ample time for it to run.

  Table analysis testing:

- missing table
- missing or extra columns
- wrong column order, data type, length, or defaults
- wrong numeric precision, scale, radix
- missing index
- missing PK/unique/clustered index
- missing or disabled triggers
- missing or disabled/distrusted foreign keys
- Prepare iMIS Database – Prepare an iMIS database that has just been restored to a new location or under a new name.
- Table Details – Analyze, examine, reset, or rebuild individual tables.

  Precautions for using DB Maintenance

- Verify that you have a valid backup of your iMIS database before running DB Maintenance commands that modify the database.
- Ensure the database is protected from updates before modifying it, to prevent failures and data problems from changes occurring while entities are being reset/rebuilt/removed:

1. Have all users log out.

   Stop webservers from updating the database, such as by stopping the AppPool in IIS.

- While users are logged in, you can safely run Analyze Database and Table Details; however, analyzing the database can affect performance.

DB Maintenance tabs

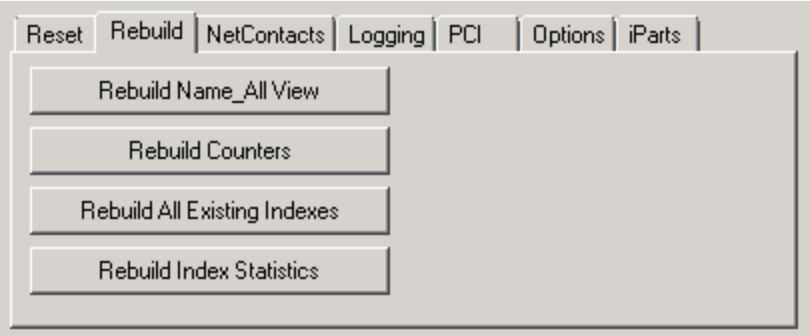
Reset tab

These functions restore database items to the states they held when last upgraded or installed.

- Reset All Views: Drop and recreate all iMIS System Views to what they were at the last install/upgrade. Custom Views are unaffected.
- Reset All Triggers: Drop and recreate all iMIS System Triggers to what they were at the last install/upgrade. Custom Triggers are unaffected.
- Reset All Indexes: Drop and recreate all iMIS System Indexes to what they were at the last install/upgrade. This preserves custom indexes, as well as primary and alternate key indexes, because of foreign key constraints (relevant only for newer .NET tables).

  Caution! This function will not complete successfully if your iMIS database contains any full-text indexes. You must first drop all full-text indexes that might exist in your iMIS database, and then manually re-create them after you have finished running this function.
- Reset Report Specs: Reset all iMIS Standard Report Specifications to what they were at the time of the last install or upgrade. These specifications are found in iMIS Desktop, from the menu Utilities > Report Specs. Custom report specifications are not affected.
- Reset All Stored Procedures: Drop and recreate all iMIS System Stored Procedures to what they were at the last install/upgrade. Custom Procedures are unaffected.
- Reset All Functions: Drop and recreate all iMIS System Functions to what they were at the last install/upgrade. Custom User Defined Functions (UDFs) are unaffected.
- Reset All Permissions: Reset the permissions on all iMIS System database objects to what they were at the last install/upgrade. This grants permissions to all iMIS System database objects to the iMIS group as required.

  Rebuild tab



- Rebuild Name_All View: Rebuild the Name_All View, which is not rebuilt by Reset All Views.
- Rebuild Counters: Rebuild all iMIS counters.
- Rebuild All Existing Indexes: Rebuild all iMIS System Indexes. This runs a DBCC REINDEX command against all existing iMIS table indexes.
- Rebuild Index Statistics: Update all iMIS System Index Statistics.

  NetContacts tab

  NetContacts

  NetContacts commands help you avoid errors when importing contact records into iMIS. (“NetContacts” takes its name from the CsNetContacts business object.)

  In iMIS 15, a Name table trigger copies data to numerous .NET tables (such as ContactMain, Individual, Institute); the NetContacts tab helps you achieve the same synchronization when you import contacts into iMIS (see "Importing contact records").

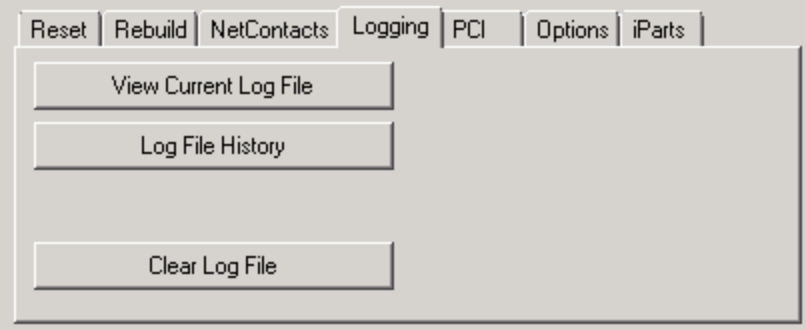
- Disable Name Table Trigger: Disable the trigger on the Name Table that keeps the NetContacts synchronized.
- Enable Name Table Trigger: Enable the trigger on the Name Table that keeps the NetContacts synchronized.
- Synchronize NetContacts: Synchronize the NetContacts after loading the Name table with the trigger disabled.

  Purge

Purge (see "Purging user and contact records") allows you to permanently delete entries from .NET tables.

- Purge Unused Users: Permanently removes user entries from .NET tables that were previously purged from Client/Server tables.
- Purge Unused Contacts: Permanently removes contact entries from .NET tables that were previously purged from Client/Server tables.

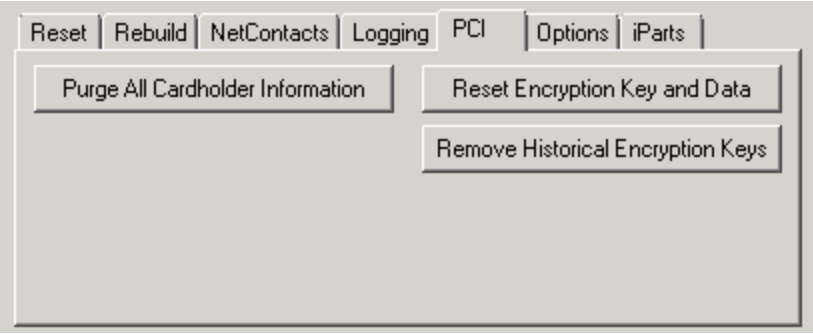
Logging tab



- View Current Log File: View logging information for current log file.
- Log File History: View list of log files, from most recent to oldest and select a file to view.
- Clear Log File: Back up the current log file to a history file, then clear the current log file. This is helpful to keep a shorter, recent list.

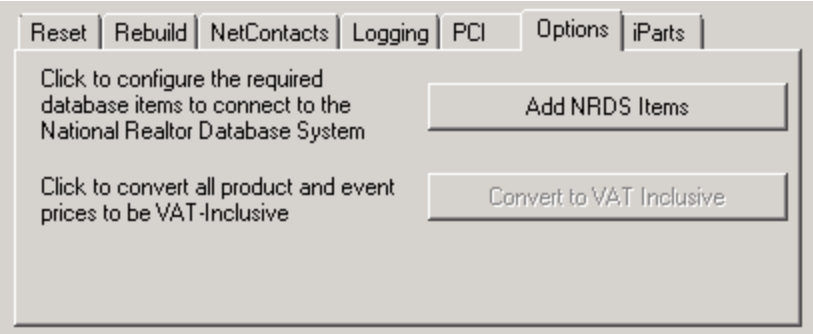
PCI tab

See Using DB Maintenance for PCI compliance.



- Purge All Cardholder Information: Removes all existing cardholder information from your iMIS database (one-time process).
- Reset Encryption Key and Data: (annual process) Resets the encryption keys and re-encrypts cardholder data; writes these events to the PCIAuditLog.
- Remove Historical Encryption Keys: (annual process) Deletes the prior encryption keys and writes the event to the PCIAuditLog. Once done, email links encrypted with such keys cannot resolve.

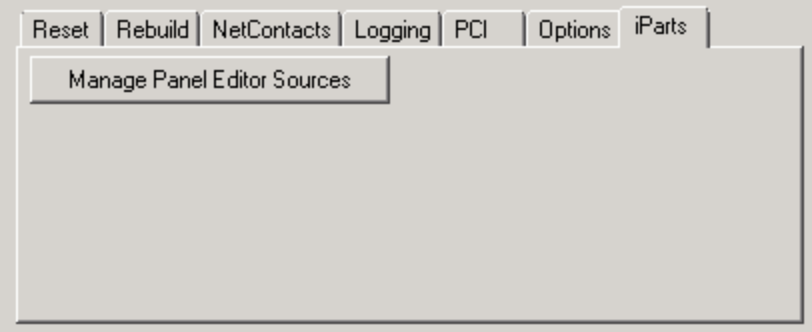
  Options tab



- Add NRDS Items: (NRDS clients only) Click this button to configure the required dataset items to connect to the National Realtor Database System. This creates the items needed for the data synchronization bridge. See Creating NRDS items.
- Convert to VAT Inclusive: (VAT organizations only) Click this button to convert all product and event prices to be VAT-Inclusive. If you enable Convert to VAT Inclusive in AR/Cash, lets you convert your existing product/event pricing to include the VAT tax amount. See Converting to VAT Inclusive.

  iParts tab

  This tab lists iPart-specific maintenance tasks.



- Manage Panel Editor Sources: Click this button to manage sources for the Panel Editor iPart. See Maintaining iParts with DB Maintenance.

DB Maintenance: Table Details

The iMIS Table Details page allows you to do analysis and apply fixes and changes at table level rather than globally. All iMIS tables are listed alphabetically. When you select a table, a mini-analysis runs on it and reports in the Output area.

Features of Table Details

- Number of rows: The top right shows a row count for the selected table.
- Output: For the selected table, a brief table analysis runs, testing whether the table is missing, is missing columns, or has columns of an incorrect type. The analysis runs when you click on a table name in the list. This read-only area shows system information and quick analysis results.
- OK: returns you to the main DB Maintenance page.

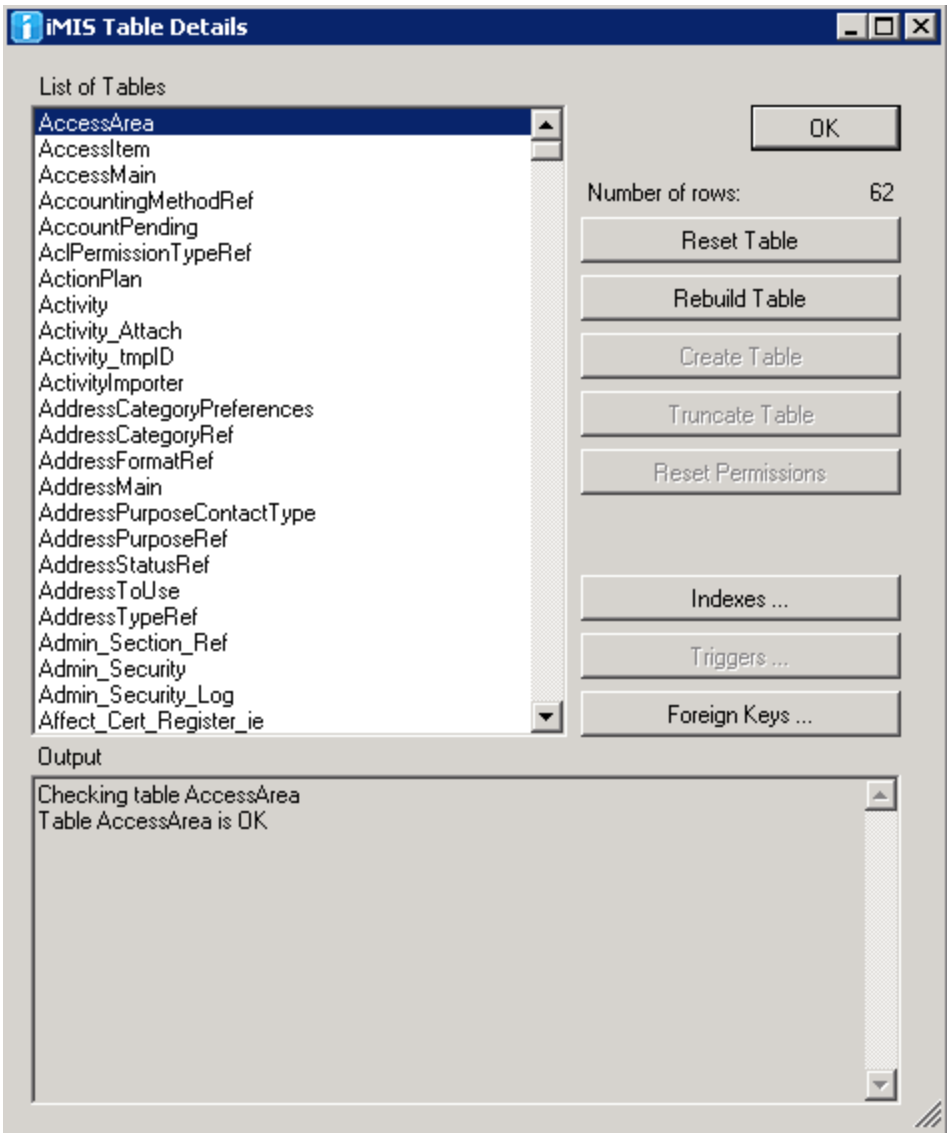


Table-level commands

- Reset Table: Performs a non-destructive reset of the table, replacing any missing triggers, indexes, permissions, or foreign keys.
- Rebuild Table: Performs a full rebuild of the table (rename the table, re-create the table schema, copy the data back over, re-establish all indexes, triggers, and permissions). It recreates the table from scratch, preserving data. If the table contains large amounts of data, allow ample time for this process to run.

Caution! You lose any user-added columns when you rebuild a table. The Rebuild Table button is only enabled for those tables that aren't involved in indexed views. Tables that are referenced by indexed views cannot be rebuilt with this tool, and the button will be grayed out.

- Create Table: Recreates the table schema, indexes, triggers, and permissions. Enabled only if the table is missing.
- Truncate Table: Deletes all the data in the table, following a prompt for confirmation. Truncating a table with zero rows has no effect, but it runs the command just like any other table, and is useful for testing.
- Reset Permissions: Ensures the table is granted the proper permissions to the iMIS Group.

  Indexes... lets you work with indexes associated with the selected table. Enabled only if there are indexes.

- Create Indexes: Creates any indexes that are missing, ensuring that the table has all of the iMIS indexes it needs.
- Drop Indexes: Drops the indexes associated with the table, except for indexes that are constraints; preserves user-added indexes. This does not affect primary or alternate keys, which may be the target of a foreign key constraint.
- Rebuild Indexes: Rebuilds all indexes associated with the table.

  Triggers... lets you work with triggers associated with the selected table. Enabled only if triggers exist.

- Enable Triggers: Re-enables disabled triggers, which is useful after importing records. Enabled only if there are or should be system triggers on the table (ignores user triggers).
- Disable Triggers: Preserves triggers but disables them, which is useful when importing records. Enabled only if there are or should be system triggers on the table (disables user triggers as well).

- Create Triggers: Creates any triggers that are missing.
- Drop Triggers: Drops the triggers associated with the selected table.

  Foreign Keys... lets you work with foreign keys on the selected table as well as other tables that reference it. Enabled only if such foreign keys exist.
- Enable Table FKs: Re-enables any disabled foreign keys on the table and checks them all. Enabled only if there are or should be foreign keys on the table.
- Disable Table FKs: Disables any foreign keys, which is useful when importing records. Enabled only if there are or should be foreign keys on the table.
- Create Table FKs: Creates the foreign keys on the selected table. Enabled only if there should be foreign keys on the table.
- Drop Table FKs: Drops the foreign keys on the selected table. Enabled only if there are foreign keys on the table.
- Create Referencing FKs: Creates the foreign keys on all tables that reference the selected table.
- Drop Referencing FKs: Drops the foreign keys on all tables that reference the selected table.
- Create ALL FKs: Creates the foreign keys on the selected table and on all tables that reference it.
- Drop ALL FKs: Drops the foreign keys on the selected table and on all tables that reference it.

Using DB Maintenance

> **Note:** Caution! If the version number of the database is higher than that supported by DB Maintenance, do not use any database commands until you resolve the version conflict.

To run DB Maintenance

1. From the Start menu, select DB Maintenance Utility in the iMIS program group.
2. When prompted, specify your server and database.
3. Log in using the sa user.

   The next time you run DB Maintenance, it remembers the connection and only requires your password.
4. Verify that the version number supported by DB Maintenance (which appears at top, in the title bar) is the same or greater than the version number displayed to the right of the Database name (which is that of the database you selected).

   Caution! Never run an older version of DB Maintenance against a newer database.
5. Click on any of the tabs to bring it to the front.
6. As needed, run the commands presented by the interface.
7. If you receive an error, check whether it's one of these known situations:

- Column ... has the wrong default. Expected ... '', found '': a harmless error that might be triggered by upgraded databases.
- "Wrong Ordinal" error on certain table columns may be triggered by upgraded databases. This message is generally harmless and affects only the ability to load the affected tables with BCP and the format files created by ASI.

Precautions for using DB Maintenance

- Verify that you have a valid backup of your iMIS database before running DB Maintenance commands that modify the database.
- Ensure the database is protected from updates before modifying it, to prevent failures and data problems from changes occurring while entities are being reset/rebuilt/removed:

1. Have all users log out.

   Stop webservers from updating the database, such as by stopping the AppPool in IIS.

- While users are logged in, you can safely run Analyze Database and Table Details; however, analyzing the database can affect performance.

  Rebuilding tables

  To rebuild a table

  > **Note:** Caution! Never run an older version of DB Maintenance against a newer database.

1. Have all users log out of iMIS.
2. Schedule downtime for rebuilding tables containing large amounts of data.
3. Back up all tables that you plan to rebuild.
4. From the Start menu, select DB Maintenance Utility in the iMIS program group.
5. Select the table to be rebuilt.
6. Click Rebuild Table.

   To rebuild a customized table

   If you have added custom objects (Foreign Key constraints, triggers, indexes) to iMIS tables, you must remove the customizations and then add them back.

1. Record all custom database objects that you have added to your iMIS tables, because you must manually recreate them.
2. Manually remove your objects; for example, drop all foreign key constraints on the table (both to and from the table, so you must also check other referencing tables and drop the relevant foreign keys there as well).
3. Restart DB Maintenance, select the tables, and click Rebuild Table.

   Manually run the script CreateFKs.sql, located by default in the C:\Program Files\ASI\iMIS15\net\iMIS15DBUpgrade\ScriptFiles\IMIS151DBUpgrade folder. This script replaces all standard iMIS 15 foreign keys that were dropped.
4. Manually recreate all custom foreign key constraints that you recorded.

Importing contact records

The NetContacts tab in DB Maintenance helps you import contact records so that your new Name table data is correctly synchronized with all associated .NET table structures.

To import contact records

1. Backup your database.
2. On your appserver, run the DB Maintenance tool.
3. After connecting, select the NetContacts tab.
4. Click Disable Name Table Trigger to disable triggers temporarily.
5. Import your records in iMIS Desktop: select Utilities > Data Transfer Utilities > Import Utility.
6. When the import is done, click Enable Name Table Trigger to restore the trigger.
7. Click Synchronize NetContacts to update the associated NET tables.

Purging user and contact records

DB Maintenance lets you permanently delete entries from .NET tables that were previously purged from Client/Server tables.

> **Note:** Caution! Be sure to follow the order here: complete your Client/Server membership purge before proceeding to those in DB Maintenance, and always purge user records before purging contact records.

> **Note:** Note: iMIS contact records will continue to display in search, unless the record is “Marked for deletion”. If you do not want the publishing service to include contact records that were previously deleted, but not “Marked for deletion”, you will need to delete the search Contacts folder (ASI\iMIS\indexServiceProtected\Search\Contacts), and then delete the row in the SystemConfig table that is used by contacts publishing (e.g. DELETE FROM [dbo].[SystemConfig] WHERE [ParameterName] LIKE 'ContactsPublishing-<Publishing

> Server Code>'). The Contacts folder and the SystemConfig row will be recreated automatically.

To purge membership records across iMIS

1. Purge member records in Name-related tables.

1. In iMIS Desktop, select Utilities > Reports and Queries from the menu.
2. Select Purge, Membership Purge for MS SQL and select Run. The Membership Purge is for the Name table and those tables related to it.

2. Purge user records in .NET tables.

1. In DB Maintenance, select the NetContacts tab.

   Click Purge Unused Users.

   Check the estimate for the number of records eligible for purging reported by the Purge Confirmation window, and troubleshoot if it seems wrong.

   Click Continue with Purge. The purge can take minutes or hours, depending on the number of records involved. Entries from the following .NET tables are deleted:

- aspnet_Profile
- aspnet_Membership
- aspnet_Users
- Users
- UserMain
- UserRole
- UserToken

   When the purge is done, check the history log that displays for the success and number of records that were purged.

3. Purge contact records in .NET tables.

1. Click Purge Unused Contacts.

   Check the estimate for the number of records eligible for purging reported by the Purge Confirmation window, and troubleshoot if it seems wrong.

   Click Continue with Purge. The purge can take minutes or hours, depending on the number of records involved. Entries from the following .NET tables are deleted:

- GroupMember
- GroupMemberDetail
- RFMMain
- Individual
- Institute
- ContactBiography
- ContactCommunicationReasonPreferences
- ContactLog
- ContactPicture
- ContactSalutation
- ContactMain
- PrimaryInstituteContactKey is set to null for all related institute records

  When the purge is done, check the history log that displays for the success and number of records that were purged.

  Using DB Maintenance for PCI compliance
  Depending on which option you choose in AR/Cash Setup, implementing advanced PCI Compliance support requires changes to your iMIS database, either by

- removing all existing cardholder information from your iMIS system that predates your new security measures, or

- resetting the encryption keys (including removal of previous keys) and re-encrypting cardholder data each year, as required

  DB Maintenance lets you complete these processes easily and reliably through the PCI tab.

  Precautions for using DB Maintenance

- Verify that you have a valid backup of your iMIS database before running DB Maintenance commands that modify the database.
- Ensure the database is protected from updates before modifying it, to prevent failures and data problems from changes occurring while entities are being reset/rebuilt/removed:

1. Have all users log out.

   Stop webservers from updating the database, such as by stopping the AppPool in IIS.

- While users are logged in, you can safely run Analyze Database and Table Details; however, analyzing the database can affect performance.

  To reset encryption keys and data

  To maintain PCI compliance with stored cardholder data, you must complete all of the steps below.

1. Choose a time when the database can be offline for several hours. Re-encryption can take minutes or hours, depending on your data; once started, it must not be stopped.
2. In DB Maintenance, open the PCI tab.
3. To start the purge, click Reset Encryption Key and Data. A warning prompts you to confirm the process.
4. Allow the process to complete without interruption.

   Caution! You risk data corruption if you interrupt the process or close DB Maintenance, which appears unresponsive.

   The output of the process displays in the main window of the DB Maintenance utility.

5. Click Remove Historical Encryption Keys, or, if postponing that purge, skip to the next step. (If you do the purge later, be sure to recycle the application pool then, too.)

   Caution! Once you remove previous keys, clicking on any encrypted links that have already been embedded in emails (such as "create new account" emails) will no longer work. The user will see the error "Your session has timed out. Please try your operation again".

6. Recycle the IIS Application Pool (iMISApp AppPool) for each application server that uses this database.

   To purge cardholder data

   > **Note:** Important: If you implement PCI Compliance with audit logging and later switch to storing no data, be aware that this purge routine leaves the existing audit log (PciAuditLog table) intact.

   Deferred transactions are lost in a purge, so you need to resolve deferred data and disable settings that allow it.

1. Find and change any gateway that is configured for Deferred Authorization:

- In iMIS Desktop, open AR/Cash > Set up module and select Credit Card Auth.
- Under Current Accounts, select the first gateway listed.
- If it is set to Deferred Authorization, change it to Immediate or Manual Authorization.
- Repeat for all other gateways.

2. Submit any deferred transactions that are pending: In iMIS Desktop, open AR/Cash > Credit card reporting and run Print Deferred Pre-authorization Report and Submit Deferred Authorizations. Any deferred transaction remaining after the purge has no payment information, so it must be re-entered manually.
3. In DB Maintenance, open the PCI tab.

4. To start the purge, click Purge All Cardholder Information. A query runs and the Purge Payment Card Information window opens, reporting the number of records with cardholder information in each table that will be cleared by the purge.
5. If the report surfaces no problems and you want to complete the purge, select Continue with Purge to clear the cardholder information from the database.

   The output of the process displays in the main window of the DB Maintenance utility.

   Fields affected by the purge

   Table: [dbo].[ASI_temp_trans] if exists

- [CC_NUMBER] - masked (shows last 4)
- [CC_EXPIRE] - masked
- [CC_NAME] - cleared

  Table: [dbo].[Trans]

- [CC_NUMBER] - masked (shows last 4)
- [CC_EXPIRE] - masked
- [CC_NAME] - cleared
- [ENCRYPT_CC_NUMBER] - cleared
- [ENCRYPT_CC_EXPIRE] - cleared
- [ENCRYPT_CSC] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

  Table: [dbo].[Orders]

- [PAY_NUMBER] - masked (shows last 4)
- [CREDIT_CARD_EXPIRES] - masked
- [CREDIT_CARD_NAME] - cleared

- [ENCRYPT_PAY_NUMBER] - cleared
- [ENCRYPT_CREDIT_CARD_EXPIRES] - cleared
- [ENCRYPT_CSC] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Table: [dbo].[Basket_Payment]

- [PAY_NUMBER] - masked (shows last 4)
- [CREDIT_CARD_EXPIRES] - masked
- [CREDIT_CARD_NAME] - cleared
- [ENCRYPT_CREDIT_CARD_EXPIRES] - cleared
- [ENCRYPT_PAY_NUMBER] - cleared
- [ENCRYPT_CSC] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Table: [dbo].[Order_Payments]

- [PAY_NUMBER] - masked (shows last 4)
- [CREDIT_CARD_EXPIRES] - masked
- [CREDIT_CARD_NAME] - cleared
- [ENCRYPT_CREDIT_CARD_EXPIRES] - cleared
- [ENCRYPT_PAY_NUMBER] - cleared
- [ENCRYPT_CSC] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Table: [dbo].[OrderCheckout]

- [CreditCardNumber] - masked (shows last 4)
- [CreditCardExpiration] - masked
- [CreditCardName] - cleared
- [CreditCardAddress] - cleared
- [CreditCardAddress2] - cleared
- [CreditCardAddress3] - cleared
- [CreditCardCity] - cleared
- [CreditCardState] - cleared
- [CreditCardPostalCode] - cleared
- [CreditCardCountry] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Creating NRDS items

(NRDS clients only)The National Association of REALTORS® (NRDS) bridge lets you share information between iMIS and NRDS through an automatic synchronization of changes made in either database. Setting up this data sharing includes a one-time command in DB Maintenance to create the needed items:

1. After downloading and installing the WebSphere MQ Client, restart you application server.
2. In DB Maintenance, select the NRDS tab and click Add NRDS Items.
3. Check the Output section below the button to verify that no errors occurred.

   For complete setup and configuration details, see NRDS bridge for data synchronization.

Converting to VAT Inclusive

(VAT organizations only) If you entered product and event pricing in iMIS 15.2.5 and earlier, it was exclusive of VAT. If you now enable VAT Inclusive pricing, you need to do a one-time conversion of your existing pricing to include the VAT tax amount.

See Configuring VAT options in AR/Cash. When you enable the option in AR/Cash, iMIS prompts you to run this conversion.

> **Note:** Caution: Always back up your database and ensure that you can restore it before running any data conversion.

Upgrade note for VAT: Now that iMIS stores all order and order line amounts as VAT-inclusive, DB Upgrader takes care of updating all of your existing order data to be consistent with your new order data. Flags on the record ensure that the update occurs only once, and your original data is backed up (Orders_BAK and Order_Lines_BAK). Note that this universal change to storing order amounts as VAT-inclusive is unrelated to whether you set AR/Cash VAT Options to be VAT Exclusive.

Maintaining iParts with DB Maintenance

When you click Manage Panel Editor Sources, the following window is displayed:

The source name is displayed in the first column. Then in the following columns, other information is displayed:

- Is Dynamic Source: This column indicates whether the source is a dynamic source (for example, created by Panel Editor), or a static source (for example, just a business object that Panel Editor is able to use).

- Is Single Row Source: This column whether the source is a single-row source (for example, there is one row for each contact), or a multi-instance source (for example, there are multiple rows for each contact).

  The check-boxes allow you to filter the list down to only what you're interested in.

  Click Add Static Source to add another source. For example, if you create a new business object that has an ID and represents data associated with Contacts, you can add the source here. This adds a row to the ObjectMetaData table.

  Click Remove Static Source if you have a business object (non-dynamic source) selected. This allows you to remove business objects to which you don't want Panel Editor have access. If the selection is a dynamic source, the button reads Purge Dynamic Source instead.

  If you click Remove Static Source, the following confirmation dialog is displayed:

  Click Yes to remove the associated row from the ObjectMetaData table. The source is no longer available to Panel Editor. No data is destroyed, and the source can be re-added using the Add Static Source button.

  If you click Purge Dynamic Source, the following confirmation dialog is displayed:

  If you click Purge Data Source while the checkbox is unselected, the dynamic data source is removed from the ObjectMetaData table. The dynamic source will no longer be available to Panel Editor to create new panel editor instances. However, the backing Business Object, View, and Data are all untouched. There is currently no way to restore access to a purge dynamic data source in this state, except for re-adding the row manually through SQL. Any panel editors currently using the source should continue to work, but might not be editable.

  If the checkbox is selected, then a red warning is displayed:

  Selecting this option will also delete the backing Business Object documents, drop the View, and delete all associated Data. This is useful when performing testing, and you have a number of test objects you want to remove.

Note: Note: Any Panel Editors using the source will break, and it's the responsibility of the customer to ensure that no Panel Editors are using the source when it is purged.

ANSI Conversion Utility - ConvertTableToANSI

iMIS Desktop requires ANSI settings to be enabled at all times. Whenever Desktop creates a connection (ODBC or otherwise), it does so with all ANSI options turned ON. To ensure that that the entire iMIS database has the correct ANSI settings, the upgrade utility rebuilds all tables and recreates all stored procedures, triggers, functions, and views.

Note: Note: Because of this extensive rebuilding, expect upgrading to be significantly slower for very large databases. Before upgrading, check that you have ample free disk space relative to the size of your database, as these tables will be copied during the process of conversion and rebuilding.

ANSI settings required by iMIS

iMIS requires that all tables be fully ANSI compliant, so they must be created with SET ANSI_NULLS ON and SET ANSI_PADDING ON. The ConvertTablesToANSI command-line utility rebuilds every table in the database that is not ANSI compliant, including user-defined and third-party tables.

If you are creating your own tables, procedures, triggers, views, etc., be sure to set these ANSI settings:

SET ANSI_DEFAULTS ON

SET IMPLICIT_TRANSACTIONS OFF

SET CONCAT_NULL_YIELDS_NULL ON

SET ARITHABORT ON

SET NUMERIC_ROUNDABORT OFF

Running a standalone ANSI conversion

The DB Upgrader runs the ConvertTablesToANSI utility as part of an iMIS upgrade, but you can run it standalone as well, from the command line. To ensure a smooth upgrade for a large and complex database, you can do a "pre-upgrade" conversion on a backup of the database to anticipate problems.

1. Create a backup, an off-line copy of your database.
2. If you haven't upgraded, run the iMIS installer to expand copies of the database utilities.
3. Locate the ConvertTablesToANSI utility, in the imis.net\IMISDBUpgrade\Utilities folder.
4. From the command line, run the utility against your database backup:

   ConvertTablesToANSI.exe -S sqlServerName -U sqlUser -P sqlPassword -D dbName

   If your database copy converts with no errors, you can use this converted database for your upgrade, which saves the time of reconverting. If there is an error, contact Support for assistance before upgrading.

Troubleshooting ANSI Conversion errors

The ANSI conversion utility rebuilds every table that is not ANSI compliant. These tables are listed in the upgrade log:

Rebuilding Tables For Full ANSI Compliance ...

Converting Table 1 of 89: Activity

…

Converting Table 88 of 89: UserMain

Converting Table 89 of 89: W_Reports

ANSI Conversion Successful

Step 4 Done.

The total number of tables rebuilt varies by database. Any errors appear the build log, flagged with three asterisks (***), before both the description of the problem and the end of the step:

Converting Table 219 of 234: UsedSourceCode

*** Unable to copy data into table UsedSourceCode

…

Converting Table 234 of 234: tempTypeNamesList

*** Errors during ANSI Conversion

Step 4 Done.

After such an error, the upgrade continues. Although the completed upgrade reports being "failed", the upgrade will be valid as long as there are no other errors. When a table fails to convert, the utility restores it to its original, unconverted condition, unless connectivity to the database is lost.

Duplicate Merge Manager

Duplicate Merge Manager overview

Duplicate Merge Manager allows you to merge multiple duplicate records under one ID that is selected as the Retain ID. Duplicate Merge Manager locates all potential duplicate records and organizes them into duplicate groups. You can manage these groups to determine which Name and Name_Address records to retain, which records to merge into the retained records, and which records to delete. After you have managed the groups, you can run merge or delete the selected records.

Duplicate Merge Manager performs the following procedures:

- Deletes the records marked for deletion.
- Copies into the Retain ID the subordinate records that are marked for merging.
- Assigns the correct addresses to the Retain ID.

Important: DMM will not merge any data from .NET tables (other than ContactMain and UserMain). Merging contact records that have associated .NET records may result in orphaned records. Examples include (but not limited to):

- DocumentMain.CreatedByUserKey
- DocumentMain.UpdatedByUserKey
- GroupMain.MemberContactKey

Requirements

- Make sure to add the Duplicate Merge Manager license key to the System Setup window.
- Make sure to grant sufficient access control. See Access control: Customers in the Security Administration section.

Duplicate Merge Manager terms

The following is a list of terms used with DMM.

- Duplicate Match Key – Parameter used to check for duplicate records.
- Group – When potential duplicate records are found, they are organized into groups to manage the records.
- Retain ID – ID of the customer record to be retained from the selected group.
- IDs to Merge – List of IDs to be merged and then deleted.
- IDs to Delete – List of IDs to be deleted.
- IDs to Keep – List of IDs to keep “as is” (these are not duplicate records).

Generated file layouts

The following tables are part of the iMIS database:

Duplicate_Group (stores information regarding actions to take for the group)

SEQN	Long	Primary key
DUP_MATCH_KEY	varchar(255)	Duplicate field values
MERGE_NOTE	varchar(255)	Notes to be stored in merged Activity Records
PREF_MAIL	Integer	Address for preferred mailing
PREF_BILL	Integer	Address for preferred billing
MERGE_IDS	varchar(255)	Comma delimited IDs to be merged
DELETE_IDS	varchar(255)	Comma delimited IDs to be deleted
KEEP_IDS	varchar(255)	Comma delimited IDs to keep unchanged
ADDR_1_NUM	Integer	Main Address to be retained
ADDR_2_NUM	Integer	Second Address to be retained
ADDR_3_NUM	Integer	Third Address to be retained
RETAIN_ID	varchar(12)	ID of the record to retain

Duplicate (stores information regarding each duplicate ID)

SEQN	Numeric	Related Key to Duplicate_Group

ID	varchar(12)	Name ID
FULL_NAME	varchar(50)	Name FULL_NAME
ADDR_1	Integer	Main Address of ID
ADDR_2	Integer	Second Address of ID
ADDR_3	Integer	Third Address of ID

Specifying an alternate data source

To use Duplicate Merge Manager with a data source other than the one that was in use the last time iMIS was started, you must specify the Data Source Name in the Local Preferences window.

1. Open iMIS and click Cancel when the log on window opens.
2. Select Logon > Set Host Location. The Local Preferences window displays.
3. Click Edit and enter the desired Application Servers exactly as shown in the ODBC configuration.
4. Click OK.
5. Select Logon > Logon to Host to display the iMIS Log On window.
6. Enter your User ID and Password and click OK to start iMIS.

Index on ID field

User-defined tables used in Find Duplicates, Manage Groups, and Choose Columns are required to have an index on the ID field. See your system administrator for further details.

Using Duplicate Merge Manager

The Duplicate Merge Manager window is used to find, select, merge, delete, or keep possible duplicate records.

You must have a Customers authorization level of 4 (select File> System Setup and click User Passwords) to use the Duplicate Merge Manager.

- From Customers, select Manage duplicates to display the Duplicate Merge Manager window.

  Multiple-user functionality is achieved through the use of temporary and permanent tables. Duplicate groups that are found, managed, and merged while using Duplicate Merge Manager without being saved to the permanent tables for use during a later Duplicate Merge Manager session are referred to as the current session. There is a set of temporary tables for each Duplicate Merge Manager user so that each user can perform duplicate group tasks individually. The following temporary tables are created when a Duplicate Merge Manager session is started, and are deleted when the session is closed:

- ##Duplicate_hh_mm_ss_ms
- ##Duplicate_Group_hh_mm_ss_ms
- ##Duplicate_Keys_hh_mm_ss_ms

  Each temporary table is exclusive to the individual user's current Duplicate Merge Manager session and is named using a unique, variable timestamp in the format hh_mm_ss_ms, where hh is hours, mm is minutes, ss is seconds, and ms is milliseconds. The data in the temporary tables is overwritten each time the Find Duplicates process is run.

  Duplicate groups stored in the temporary tables can be managed and merged in the current Duplicate Merge Manager session, or the groups can be saved to the permanent tables so that the groups can be managed and merged in a later Duplicate Merge Manager session. Any duplicate groups that are not saved to the permanent tables will no longer exist when the current Duplicate Merge Manager session is ended.

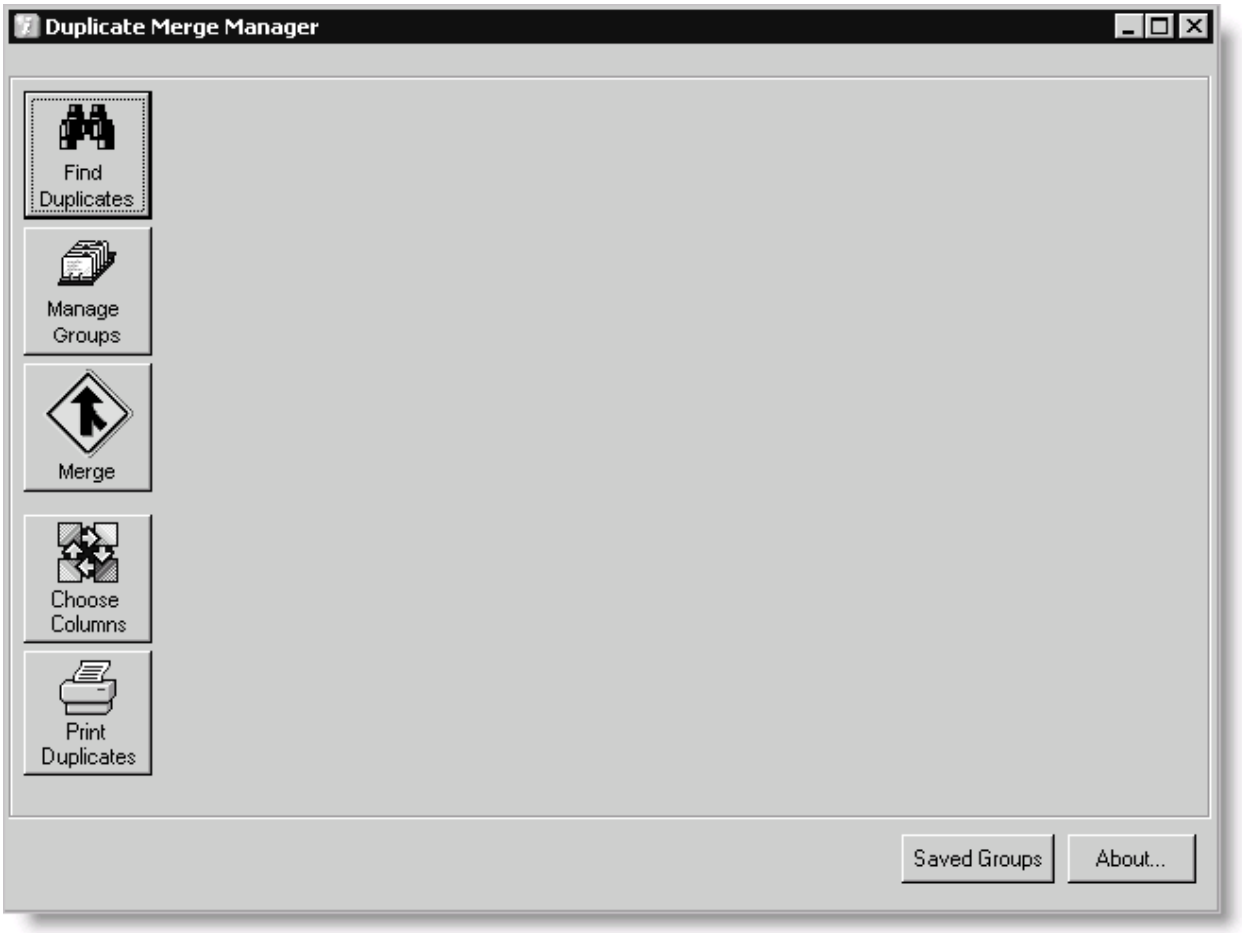
  When a duplicate group is saved, the group data is moved from the temporary tables to the following permanent tables:

- Duplicate
- Duplicate_Group

  The merge actions for saved duplicate groups are performed in the order that the groups were saved. Because of Duplicate Merge Manager's multiple-user functionality, it is

possible for two or more users to create multiple duplicate groups during their own Duplicate Merge Manager sessions that contain one or more of the same IDs. If more than one duplicate group contains the same ID when a Merge operation is performed, the merge actions for the second group (and any subsequent groups) may not be performed completely. For example, if the Retain ID for the second group was deleted during the merge actions for the first group, the merge actions for the second group (which contains the previously deleted Retain ID) will not be performed. You should review all saved duplicate groups for accuracy and any conflicts before performing the Merge operation.

Duplicate Merge Manager window



From Customers, select Manage duplicates

Find Duplicates button

Used to access the Find Duplicates options. You can use the current DupMatchKey field in iMIS to find possible duplicate records, specify a new set of criteria for finding possible duplicate records, or specify two known IDs to merge.

Manage Groups button

Used to display the Group and Action tabs.

Group tab

Select this tab to view the groups and records within the duplicate groups that have been created. The group includes the individuals associated with each group, and each individual's associated name and address information. The Status column indicates whether the duplicate record can be deleted (OK) or the reason why the record cannot be deleted.

To view more information about the individual records in a group, click Choose Columns to select additional fields or columns to display.

Action tab

After viewing the records in a duplicate group, select the Action tab. This tab allows you to select the Retain ID, the records that should be kept unchanged, the records that should be merged into the Retain ID, the records that should be deleted, the addresses to keep, and the addresses to use for preferred mailing and preferred billing. If you save a duplicate group to the permanent tables without specifying any actions for the group, the records in the group are not changed and the duplicate group still exists after a merge operation is performed.

Merge button

Used to run the merge procedure after you have determined which records are to be retained, merged, and deleted.

Choose Columns button

Used to select additional fields for viewing in order to evaluate possible duplicate records within a group.

Print Duplicates button

Used to print the iMIS Duplicate Merge Manager – Duplicate Group List, which lists the SEQN, Dup_Match_Key fields, and Retain ID.

Note: Clicking this button will print the iMIS Duplicate Merge Manager – Duplicate Group List, regardless of the setting specified on the Report Destination window.

Saved Groups button

Used to load the duplicate groups that were saved to the permanent tables during Duplicate Merge Manager sessions. You can then manage and merge these groups, as well as continue to find, manage, and merge new duplicate groups. Duplicate groups found and saved in previous sessions are not accessible until you click Saved Groups.

About button

Used to display the About DMM window. Duplicate Merge Manager version information displays in this window.

Identifying potential duplicate records

There are three options available for creating duplicate record groups:

- Use DUP_MATCH_KEY from Name Table
- Select fields which will be used to identify potential duplicates
- Specify two known IDs to Merge option to directly merge two IDs

Status column

For all options, the initial table of information about the potential duplicates includes the Status column, which contains either OK or reasons why a record cannot be discarded. The following table describes the reasons.

This record cannot be deleted while an open order exists	An open Order is associated with this Contact.
This record cannot be deleted while an invoice with a non-zero balance exists	An open Invoice is associated with this Contact.

This record cannot be deleted while an active subscription exists	An active Subscription record is associated with this Contact.
This record cannot be deleted while a dependent referral record exists	A Referral record dependency is associated with this Contact.
This record cannot be deleted while a dependent Name_Fin record exists with this ID as the Bill To ID	This Contact is designated as the Bill To on the Name_Fin record for another Contact.
This record cannot be deleted while a dependent Name record exists with this ID as the Bill To ID	This Contact is designated as the Bill To on the Name record for another Contact.
This record cannot be deleted while a dependent Name record exists with this ID as the Company ID	This Contact is designated as the Company on the Name record for another Contact.

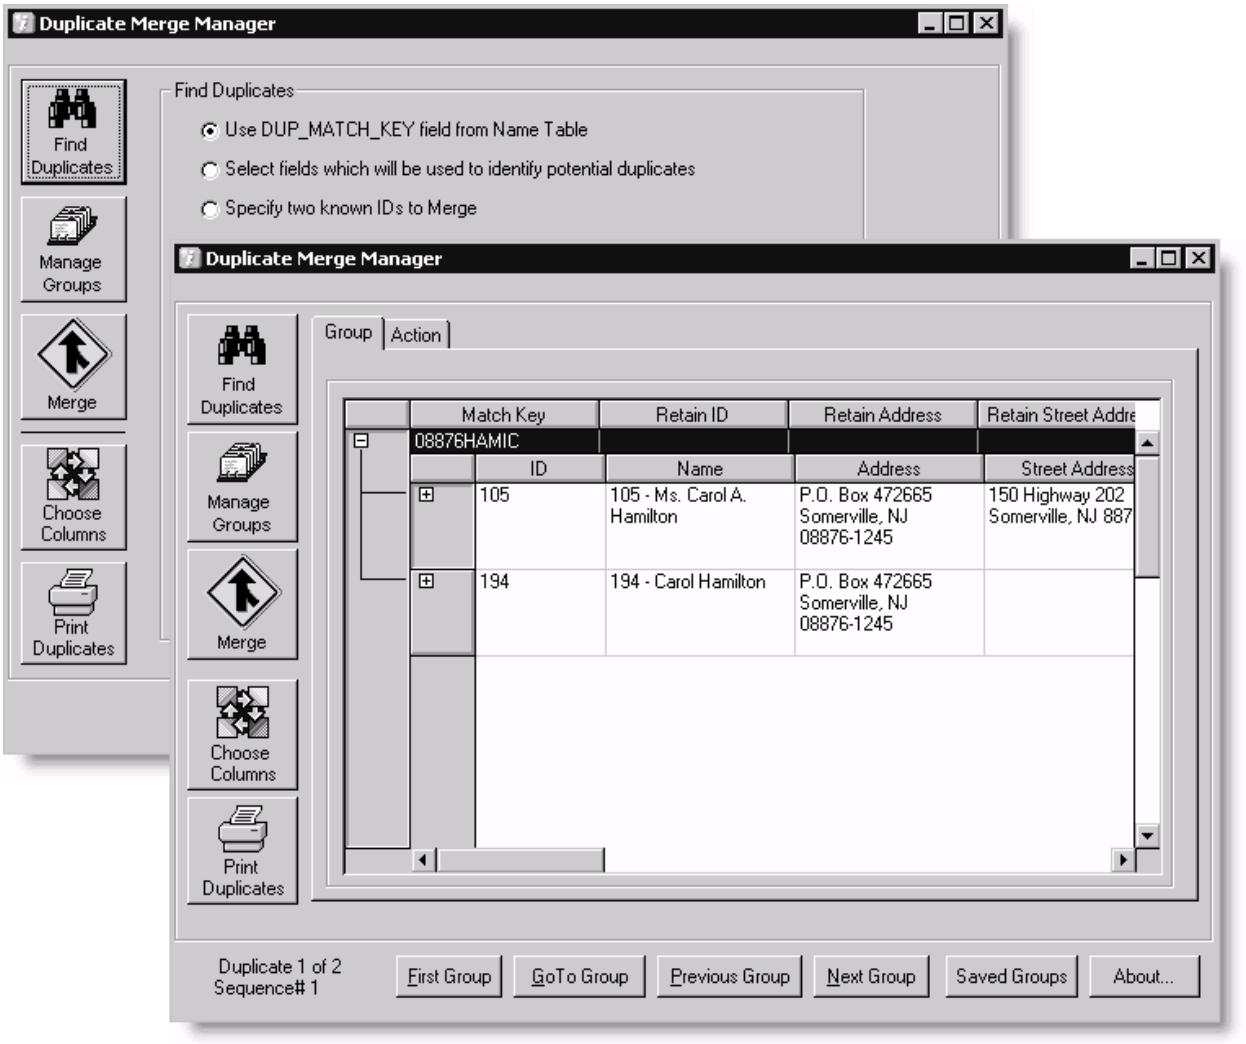
To find possible duplicate records using the DUP_MATCH_KEY field

Select the Use DUP_MATCH_KEY field from Name Table option to find all possible duplicates based upon the value in the Name.DUP_MATCH_KEY field, which contains the value that was calculated based on the Duplicate Record Check Formula field in the Customer Setup – Advanced window at the time the customer record was added or last edited. If the Duplicate Record Check Formula field was blank when the customer record was added or last edited, iMIS uses the default formula (the first five characters of the preferred mail address zip code, the first four characters of the last name, and the first character of the first name) to populate the Name.DUP_MATCH_KEY field.

Note: When the Duplicate Record Check Formula is changed, iMIS does not go back and recalculate the Name.DUP_MATCH_KEY field for existing customer records. The Name.DUP_MATCH_KEY field is initially populated when a new customer record is added, and is updated when the customer record is edited in the Manage customers window.

1. From Customers, select Manage duplicates.

2. Click Find Duplicates. The Find Duplicates options display on the Duplicate Merge Manager window.
3. Click Build Tables. A message displays informing you that the process may take from 2 to 20 minutes.
4. Click Yes. The first duplicate group found displays on the Group tab in the Manage Groups view on the Duplicate Merge Manager window. As you review the groups, the Duplicate x of y and Sequence# information displayed in the lower left corner of the window will update.
5. If no duplicate groups are found, a message displays indicating that no duplicate groups were found.



To find possible duplicate records using selected fields

Select the Select fields which will be used to identify potential duplicates option to specify your own criteria to find duplicate matches. This option overrides the value entered in each customer's Name.DUP_MATCH_KEY field, but does not update the Name.DUP_MATCH_KEY field in iMIS. You must choose at least one field from the Name table. For the best performance results, select the most unique fields first.

The Name.WORK_PHONE and Name.HOME_PHONE fields can be selected for display. Click Choose Columns on the Duplicate Merge Manager window.

1. From Customers, select Manage duplicates.
2. Click Find Duplicates. The Find Duplicates options display.
3. Select the Select fields which will be used to identify potential duplicates option. The Name table and any user-defined tables display in the Tables area.
4. Click the + symbol displayed to the left of the table name to expand the table and view all available fields.

   Note: You must choose at least one field from the Name table.
5. Select the desired field using one of the following methods:

- Double-click the field.
- Select the field and click >.
- Drag and drop the field onto the grid on the right side of the window.

Note: To remove a field so that it is not used when searching for potential duplicates, double-click the field or select the field and click <.

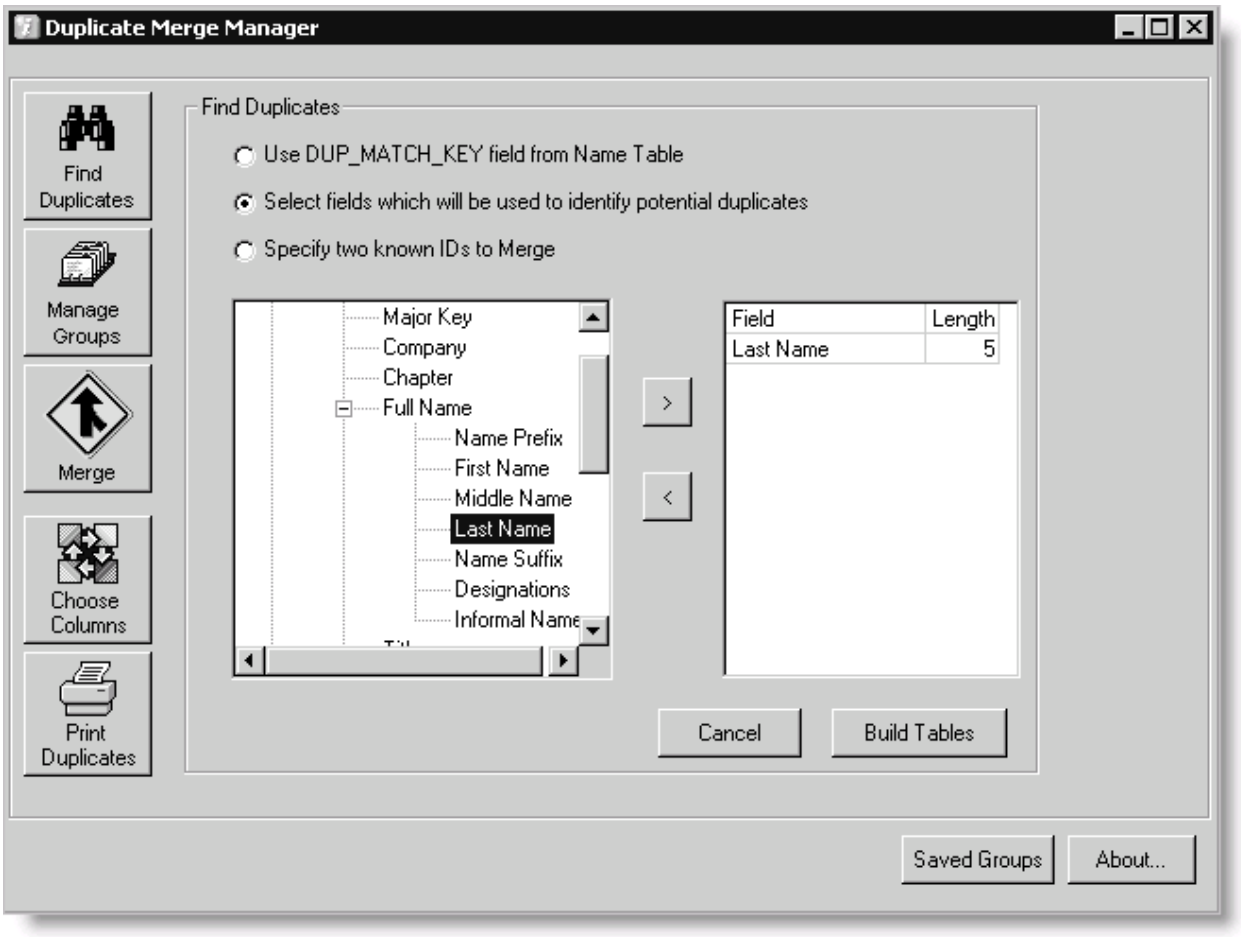
Note: For performance reasons, you should select the most unique field first and then select the remaining fields in descending order based on their uniqueness.

6. After the field displays on the selection grid on the right side of the window, click the corresponding Length cell and enter the number of characters to be used for the comparison.

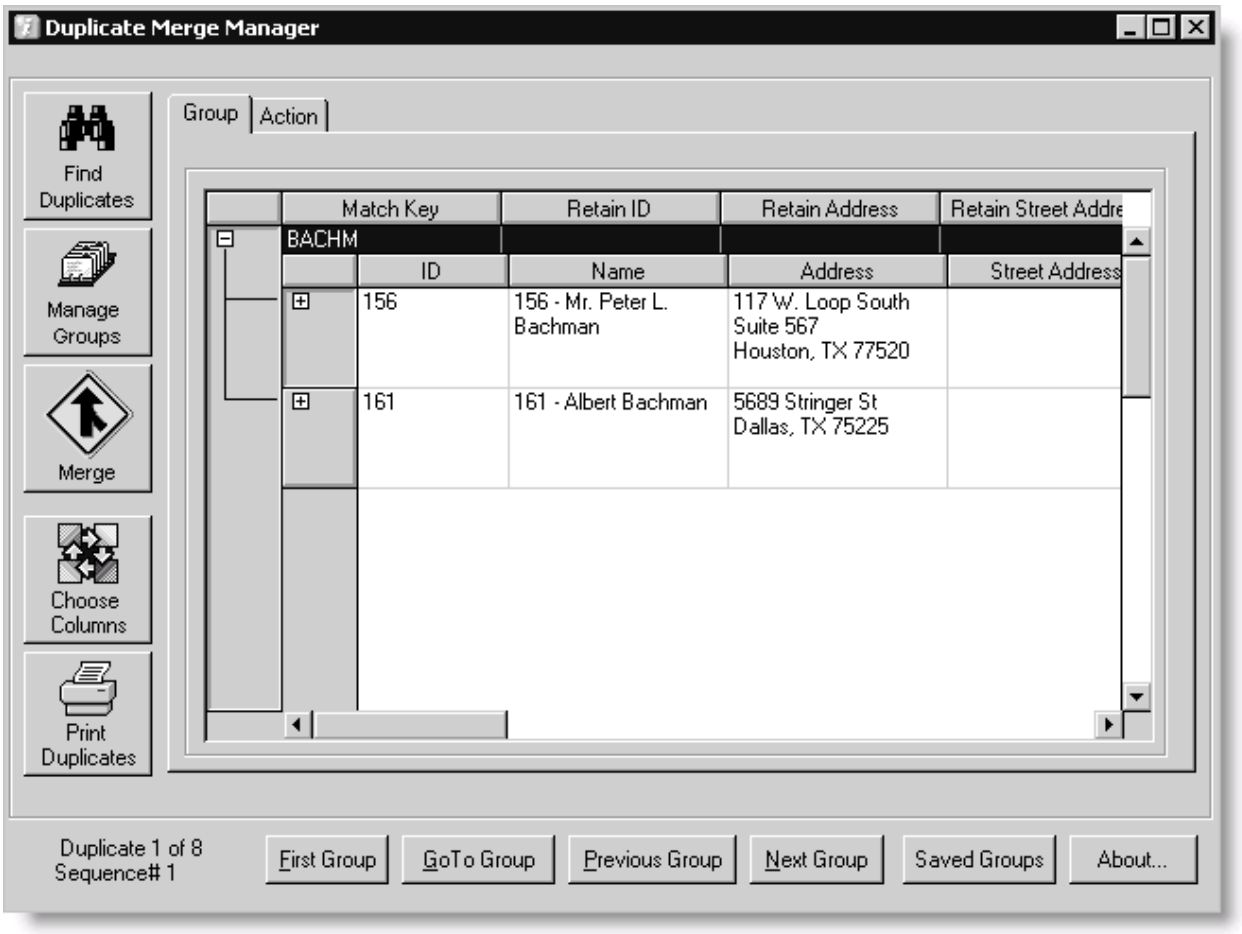
- A message displays if the length is not entered or if a non-numeric length is entered. Click OK and specify the Length.

  Note: If you decrease the number of characters used for the duplicate search, the match key is rebuilt. However, if you increase the number of characters used for the duplicate search, the match key is not rebuilt and the minimum number of characters previously specified is still used for the match key. To increase the number of characters used for the duplicate search, deselect the field, add the field back and specify the number of characters to be used for the duplicate search.

7. A message displays if the length is not entered or if a non-numeric length is entered. Click OK and specify the Length.
8. Repeat the process to create additional fields.
9. Click Build Tables. A message displays informing you that the process may take from 2 to 20 minutes.
   - If you click Build Tables before selecting any fields, a message displays informing you that you must select at least one field to identify duplicates. Click OK, select one or more fields and specify the Length for each field, and click Build Tables.
10. Click Yes. The first duplicate group found displays on the Group tab in the Manage Groups view on the Duplicate Merge Manager window. As you review the groups, the Duplicate x of y and Sequence# information displayed in the lower left corner of the window will update.
11. If no duplicate groups are found, a message displays indicating that no duplicates were found. Click OK.



In this example, DMM will search for all Name records in which the first five characters of LAST_NAME are identical. Records with the same criteria value or match key will be grouped together.



To directly merge two known IDs

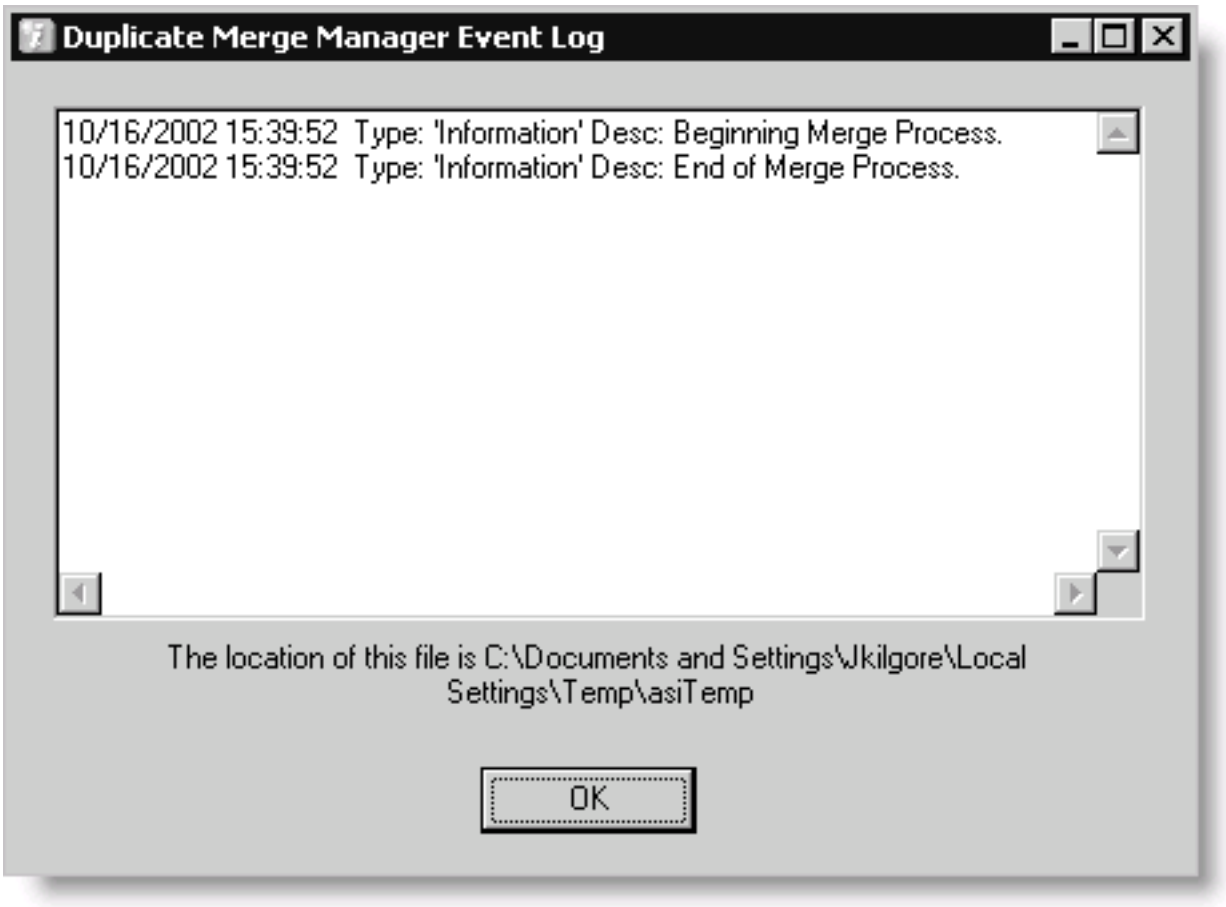
To skip the process of searching for possible duplicate records and directly merge two records which are known to be duplicates, you can use the Specify two known IDs to Merge option in the Find Duplicates view of the Duplicate Merge Manager window. See To Merge Two Known IDs.

To remove a duplicate group

You can delete a previously saved duplicate group without affecting any customer records in the group. This process involves viewing the Action tab for the group to be deleted, selecting any ID as the Retain ID, and moving all of the other IDs to the IDs to Keep list. When the Merge process is run, the duplicate group will be removed and the only changes that will be made to any of the customer records in the group are the Preferred Mail and Preferred Bill settings (if these settings have been changed).

1. From Customers, select Manage duplicates.
2. Click Saved Groups to display the Manage Groups view on the Duplicate Merge Manager window.
3. Click Find Group, GoTo Group, Previous Group, or Next Group to select the duplicate group to be removed.
4. Select the Action tab.
5. Select a Retain ID from the drop-down list of available duplicate record IDs.

   Note: Any ID can be selected as the Retain ID since no customer records in this duplicate group will be merged or deleted.
6. Select the Preferred Mail option for the Address, Street Address, or Home Address for the Retain ID.
7. Select the Preferred Bill option for the Address, Street Address, or Home Address for the Retain ID.
8. Move all of the IDs from the IDs to Merge list to the IDs to Keep list. The IDs in the IDs to Keep list will be ignored during the Merge process.
9. Move all of the IDs from the IDs to Delete list to the IDs to Keep list. The IDs in the IDs to Keep list will be ignored during the Merge process.
10. Click Save.
11. Click First Group, GoTo Group, Previous Group, or Next Group to view all other previously saved groups to confirm that any specified actions for these groups are correct.
12. Click Merge. A confirmation message displays indicating how many duplicate groups have been defined for merging.
13. Click Yes. When the Merge process has completed, a message displays indicating how many duplicate groups were processed.
14. Click Yes to view the event log, or click No to skip viewing the event log. If you click Yes, an event log displays.



Viewing duplicate groups

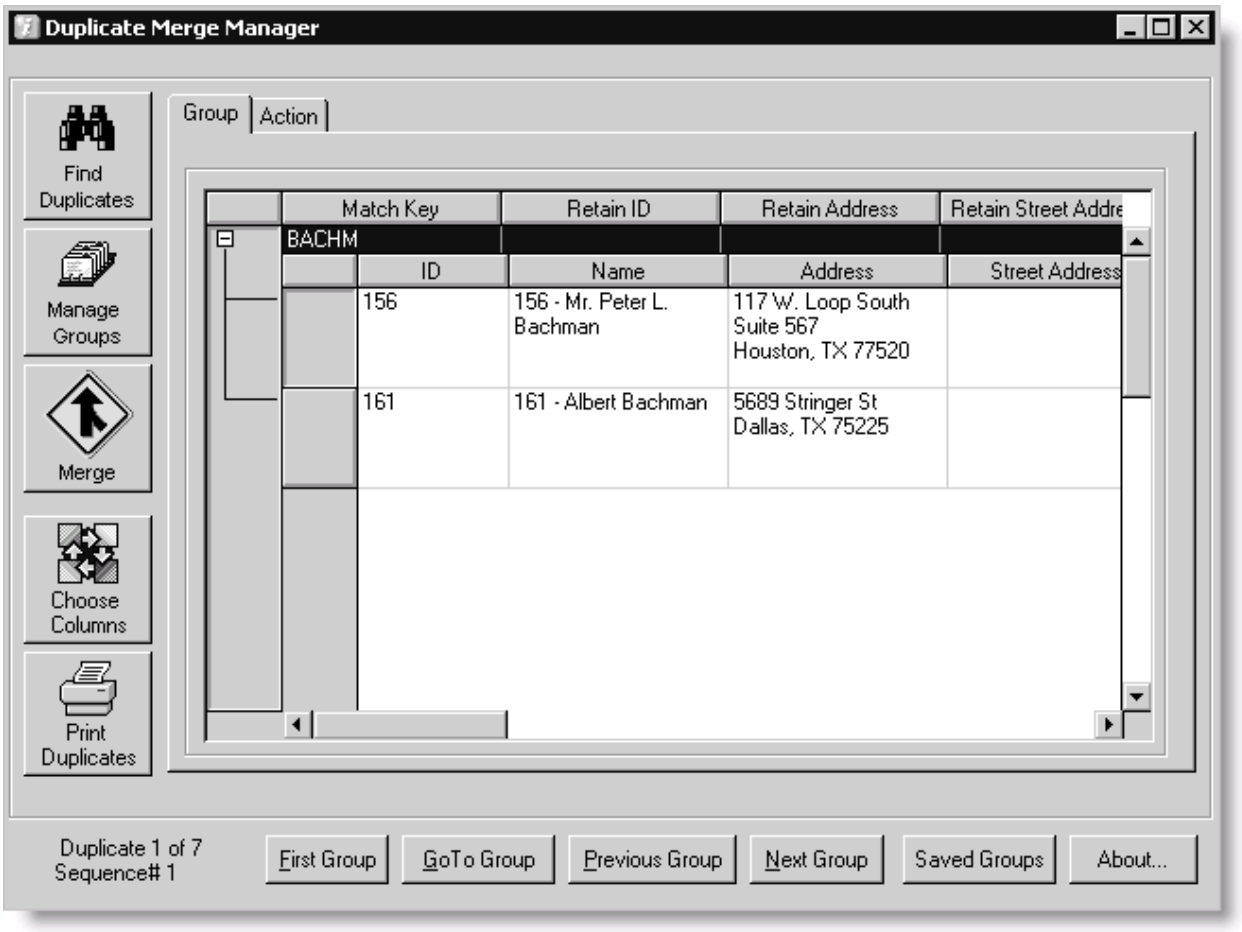
For performance reasons, the grid displays each duplicate group and its corresponding MatchKey one at a time. Compare the information from each individual record in the duplicate group to determine which ID to use as the Retain ID and which records should be kept, merged into the retained record, or deleted.

Duplicate Merge Manager uses temporary and permanent tables to store information on duplicate groups and the actions to be performed for these groups. When you run the Find Duplicates process, the results are stored in temporary tables. If you run the Find Duplicates process again or close the Duplicate Merge Manager session, this information is lost. The sequence numbers in the temporary tables are reset to begin at 1 and are reused each time the Find Duplicates process is run.

To save the information for a duplicate group, while viewing the group on the Action tab on the Manage Groups view of the Duplicate Merge Manager window, click Save. The group information and any specified actions are saved to the DMM permanent tables. The saved group information and specified actions can be recalled later by clicking Saved Groups and these groups can then be managed and merged.

When you save duplicate group information, the group is assigned a sequence number. This sequence number is permanent and does not change when Duplicate Merge Manager is closed and then restarted. Sequence numbers are never re-used, even after the duplicate group which was assigned the sequence number has been merged and no longer exists. For example, if you run the Find Duplicates process and duplicate groups 1 through 5 are returned, these groups are stored in the temporary tables as sequences 1 through 5. If you manage group 5 and save this group, a message displays informing you of the group's new sequence number (in the permanent tables). If the group's new sequence number is 17, it retains this sequence number when Duplicate Merge Manager is closed and then restarted. After all saved groups have been merged, the sequence numbers in the permanent tables do not restart at 1, but continue to increment. For example, if the last saved group was assigned sequence number 17 and all saved groups have been merged, the next group you save will be assigned the sequence number 18.

Group tab in Manage Groups view on Duplicate Merge Manager window



From Customers, select Manage duplicates, click Manage Groups, and select the Group tab. In this example, the Find Duplicates process found a total of seven possible duplicate groups. The first group is displayed.

Group tab

Select this tab to view the groups and records within the groups you have created. The group includes the records associated with each group and the name and address information for each record. To view more information about the individual records in a group, click Choose Columns and select the additional fields or columns to display.

Action tab

After viewing the records in a duplicate group, select the Action tab to select the record to retain, the addresses to keep, the addresses to use for preferred mailing and preferred

billing, the records to merge into the retained record, and the records to delete. The records in a duplicate group can also be retained without any changes.

Duplicate y of z

(read only) Displays the number of the currently displayed group (y) and the total number of duplicate groups (z).

Sequence#

(read only) Displays the sequence number of the currently displayed group.

First Group button

Displays the first duplicate group.

Go To Group button

Displays the DMM GoTo Sequence Number window, where you can enter the sequence number of a duplicate group to review.

Previous Group button

Displays the previous duplicate group.

Next Group button

Displays the next duplicate group.

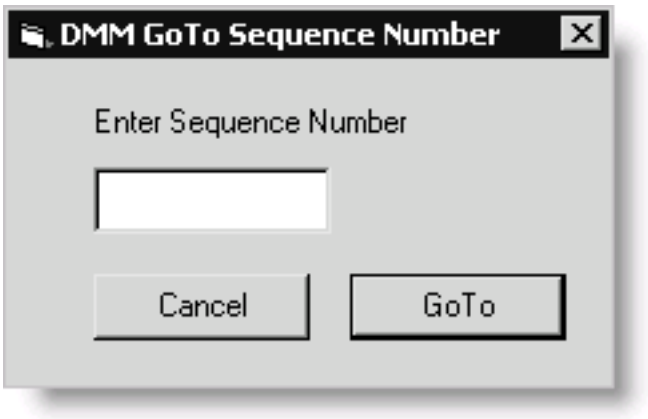
Saved Groups button

Used to load the duplicate groups that were saved to the permanent tables during the current or previous Duplicate Merge Manager sessions. You can then manage and merge these groups, as well as continue to find, manage, and merge new duplicate groups. Duplicate groups found and saved in previous Duplicate Merge Manager sessions are not accessible until you click the Saved Groups button.

About button

Used to display the About DMM window. Duplicate Merge Manager version information displays in this window.

DMM GoTo Sequence Number window



Click Manage Groups and click GoTo Group

Enter Sequence Number

Enter the sequence number of the duplicate group to review.

GoTo button

Used to display the specified duplicate group.

If the specified duplicate group does not exist, a message displays stating that there are no more Duplicate Groups to display.

To find specific duplicate groups

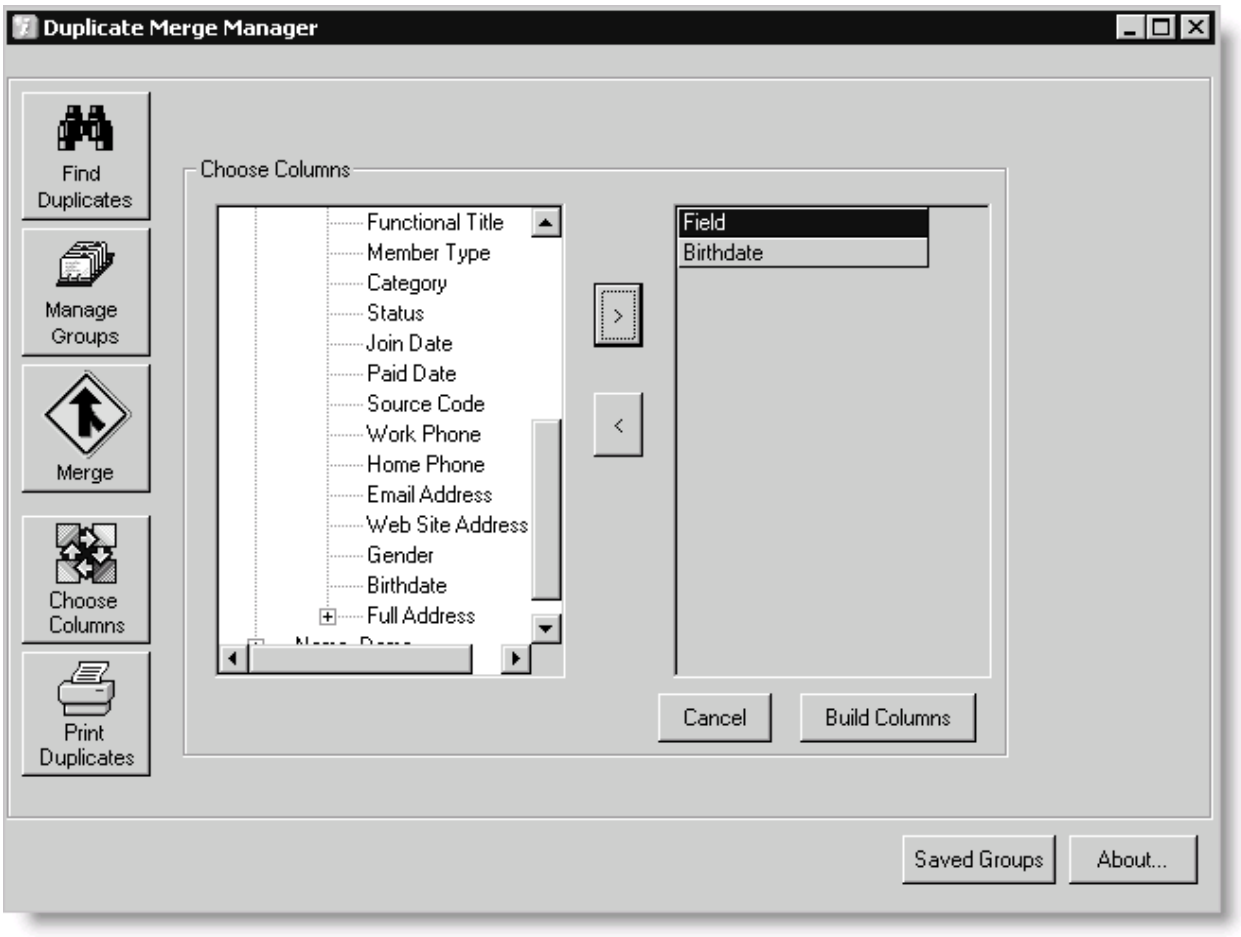
1. From the Manage Groups view on the Duplicate Merge Manager window, click GoTo Group to display the DMM GoTo Sequence Number window.
2. Enter the sequence number of the duplicate group to review in the Enter Sequence Number field.

- If a non-numeric value is entered, a message displays indicating that the sequence number must be numeric. Click OK and enter the sequence number.

3. Click GoTo to display the duplicate group.

- If the group does not exist, a message displays indicating that there are no duplicate groups to display. Click OK, enter the correct sequence number, and click GoTo.

Choose Columns view on Duplicate Merge Manager window



From Customers, select Manage duplicates, and then select Choose Columns

Choose Columns

Select the additional record fields to display on the Group tab on the Manage Groups view of the Duplicate Merge Manager window from this list. If a + symbol is displayed to the left of the table name, click the + symbol to expand the table and view all available fields.

Note: The Name.WORK_PHONE and Name.HOME_PHONE fields can be selected for display.

Note: User-defined tables used in Find Duplicates, Manage Groups, and Choose Columns must have an index on the ID field.

Field

To display a record field on the Group tab on the Manage Groups view of the Duplicate Merge Manager window, select the field in the Choose Columns list and copy it to the Field list using one of the following methods:

- Double-click the field.
- Select the field and click >.
- Drag and drop the field onto the grid on the right side of the window.

Cancel button

Used to cancel the selections you have made on the Choose Columns view and display the Duplicate Merge Manager window.

Build Columns button

Used to save your record field display selections. Your selections are saved and will be used when viewing records on the Group tab on the Manage Groups view of the Duplicate Merge Manager window until you specify a different set of selections on the Choose Columns view of the Duplicate Merge Manager window and click Build Columns again. (The specified set of Choose Columns selections are retained when the Duplicate Merge Manager is closed and then restarted.)

Saved Groups button

Used to load the duplicate groups that were saved to the permanent tables during the current or previous Duplicate Merge Manager sessions. You can then manage and merge these groups, as well as continue to find, manage, and merge new duplicate groups. Duplicate groups found and saved in previous Duplicate Merge Manager sessions are not accessible until you click the Saved Groups button.

To view additional fields in individual duplicate records

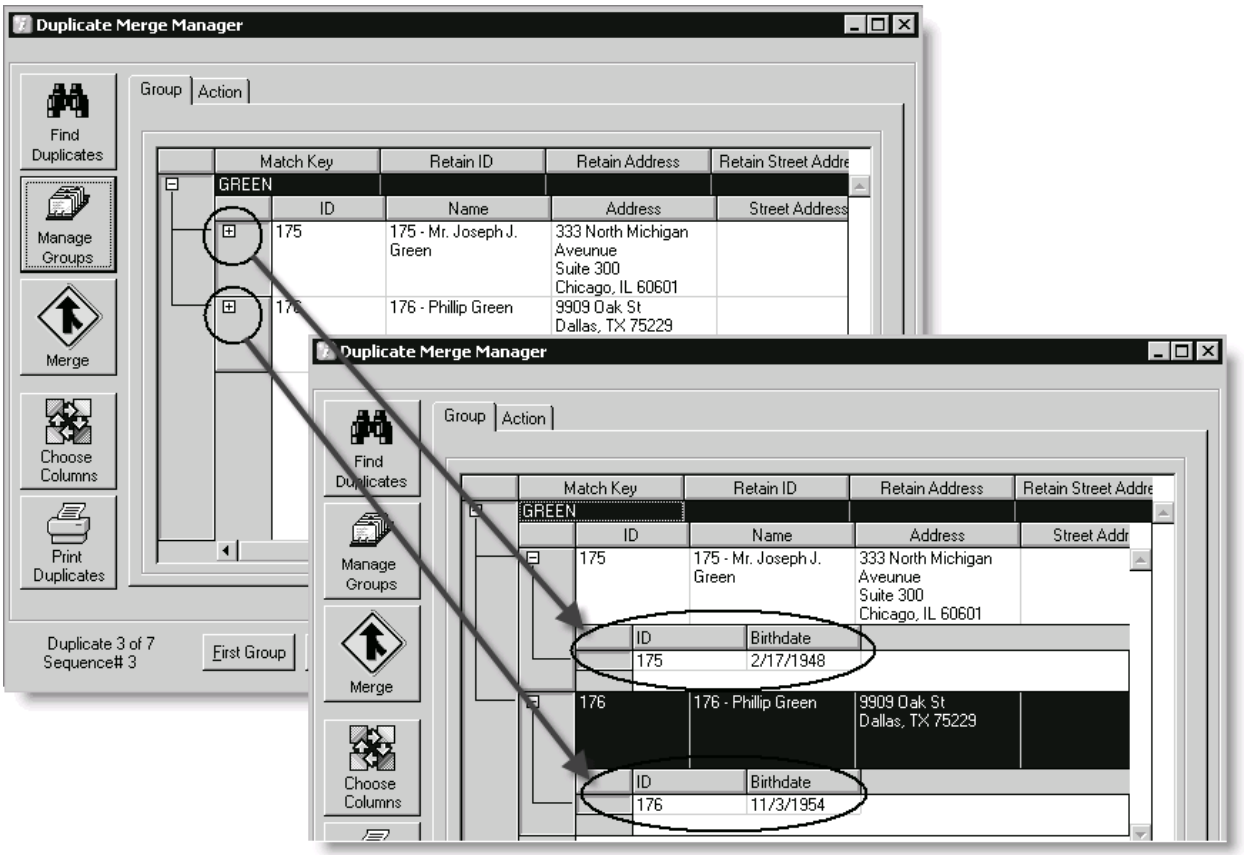
You can view other record fields in addition to the name and address fields.

1. Click Choose Columns to select additional columns to display in the individual grids.

2. Select the additional field to view using one of the following methods:

- Double-click the field.
- Select the field and click >.
- Drag and drop the field onto the grid on the right side of the window.

3. Repeat the process to view additional fields.
4. Click Build Columns to store the selected fields in the iMIS System_Params table with the ParameterName value of DuplicateMergeFields. A message displays indicating that your selected columns have been saved.
5. Click OK.
6. Click Manage Groups to display the Manage Groups view on the Duplicate Merge Manager window. The + button displayed to the left of the ID column indicates that additional fields were selected:
7. When you click the + button displayed to the left of the ID column, the additional fields expand so that they can be viewed.



Note: If you click Choose Columns again, the previously selected fields are not saved. You can select different fields to display, or click Cancel to retain the previously selected fields.

Note: When you select a different duplicate group to view or click Manage Groups again, the new fields you selected can be viewed for each record by clicking the + button displayed to the left of the ID column.

Note: The name of the table associated with each Chapter is displayed in a legend at the bottom of the grid area.

To print the Duplicate Group List

You can print the list of duplicate groups, which lists the sequence number, Match Key, and Retain ID (if a Retain ID is specified) for each current duplicate group. The user must have a Customers authorization level of 8 to print the Duplicate Group List.

The duplicate groups you are currently viewing, whether the result of running the Find Duplicates process or of clicking Saved Groups, are printed on the Duplicate Group List.

- Click Print Duplicates on the Duplicate Merge Manager window to print the Duplicate Group List.

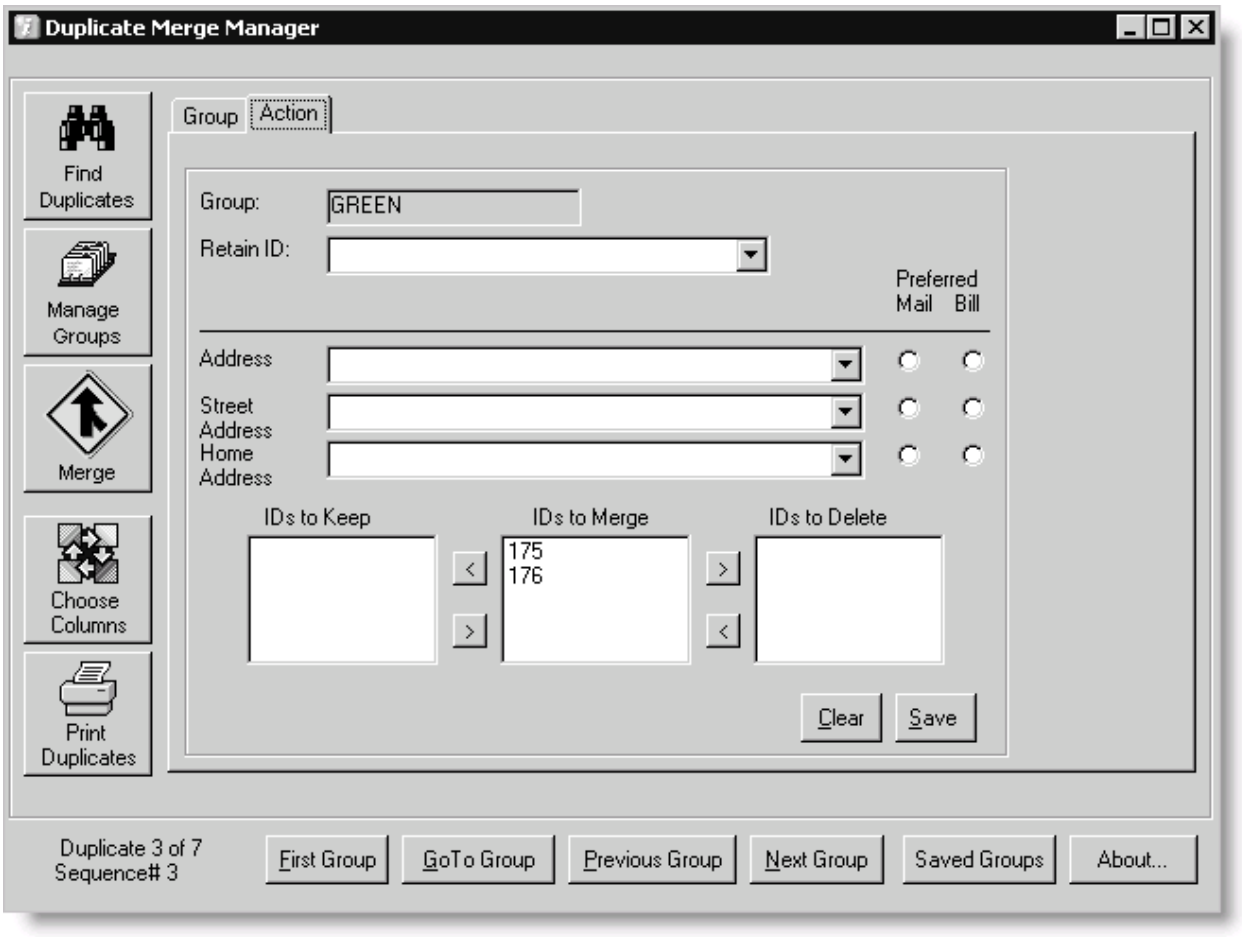
  Note: Clicking this button will print the iMIS Duplicate Merge Manager – Duplicate Group List, regardless of the setting specified on the Report Destination window.

Managing group records

After you have viewed the duplicate groups, you can select records to be merged, deleted, or kept.

Only one user at a time can manage a particular duplicate group. However, multiple users can simultaneously manage different duplicate groups. For example, user Tim can review groups 1 through 10 and user Susan can simultaneously review groups 11 through 20, but user Tim and user Susan cannot review group 30 at the same time.

Action tab in Manage Groups view on Duplicate Merge Manager window



From Customers, select Manage duplicates, click Manage Groups, and select the Action tab

Group tab

Select this tab to view the groups and records within the groups you have created. The group includes the records associated with each group, along with the name and address information for each record. To see more information about the individual records in the group, click Choose Columns and select additional fields or columns.

Action tab

After viewing the records in the duplicate groups, select the Action tab. Select the record to retain, the addresses to keep, the addresses to use for preferred mailing and preferred

billing, the records to merge into the retained record, and the records to delete. There is also an option to keep a record unchanged.

Group

(read only) Displays the duplicate group name.

Retain ID

Enter the Retain ID, or select the Retain ID from the drop-down list.

Address

Displays the address of the Retain ID. You can enter a new address or select an address from the drop-down list.

Street Address

Displays the street address of the Retain ID. You can enter a new street address or select a street address from the drop-down list.

Home Address

Displays the home address of the Retain ID. You can enter a new home address or select a home address from the drop-down list.

Preferred Mail

Select this option to specify the Address, Street Address, or Home Address as the preferred mailing address.

Preferred Bill

Select this option to specify the Address, Street Address, or Home Address as the preferred billing address.

IDs to Keep

Lists the IDs currently selected to be kept “as is.” You can use the < and > buttons to move the IDs that are to be kept “as is” to this list.

IDs to Merge

Lists the IDs currently selected for merging into the Retain ID. You can use the < and > buttons to move the IDs that are to be merged with the Retain ID to this list.

Note: Initially, all of the IDs in the duplicate group are placed in the IDs to Merge list.

IDs to Delete

Lists the IDs currently selected for deletion. You can use the < and > buttons to move the IDs that are to be deleted to this list.

Clear button

Used to clear the Retain ID field, the IDs to Keep list, and the IDs to Delete list.

Save button

Used to save your merge action selections for this group.

Duplicate y of z

(read only) Displays the number of the currently displayed group (y) and the total number of duplicate groups (z).

Sequence#

(read only) Displays the sequence number of the currently displayed group.

First Group button

Displays the first duplicate group. The group is displayed on the Group tab on the Manage Groups view of the Duplicate Merge Manager window.

Go To Group button

Displays the DMM GoTo Sequence Number window, where you can enter the sequence number of the next duplicate group to review.

Previous Group button

Displays the previous duplicate group. The group is displayed on the Group tab on the Manage Groups view of the Duplicate Merge Manager window.

Next Group button

Displays the next duplicate group. The group is displayed on the Group tab on the Manage Groups view of the Duplicate Merge Manager window.

Saved Groups button

Used to load the duplicate groups that were saved to the permanent tables during the current or previous Duplicate Merge Manager sessions. You can then manage and merge these groups, as well as continue to find, manage, and merge new duplicate groups. Duplicate groups that were previously found and saved are not accessible until you click the Saved Groups button.

About button

Used to display the About DMM window. Duplicate Merge Manager version information displays in this window.

To select the Retain ID and the IDs to Merge

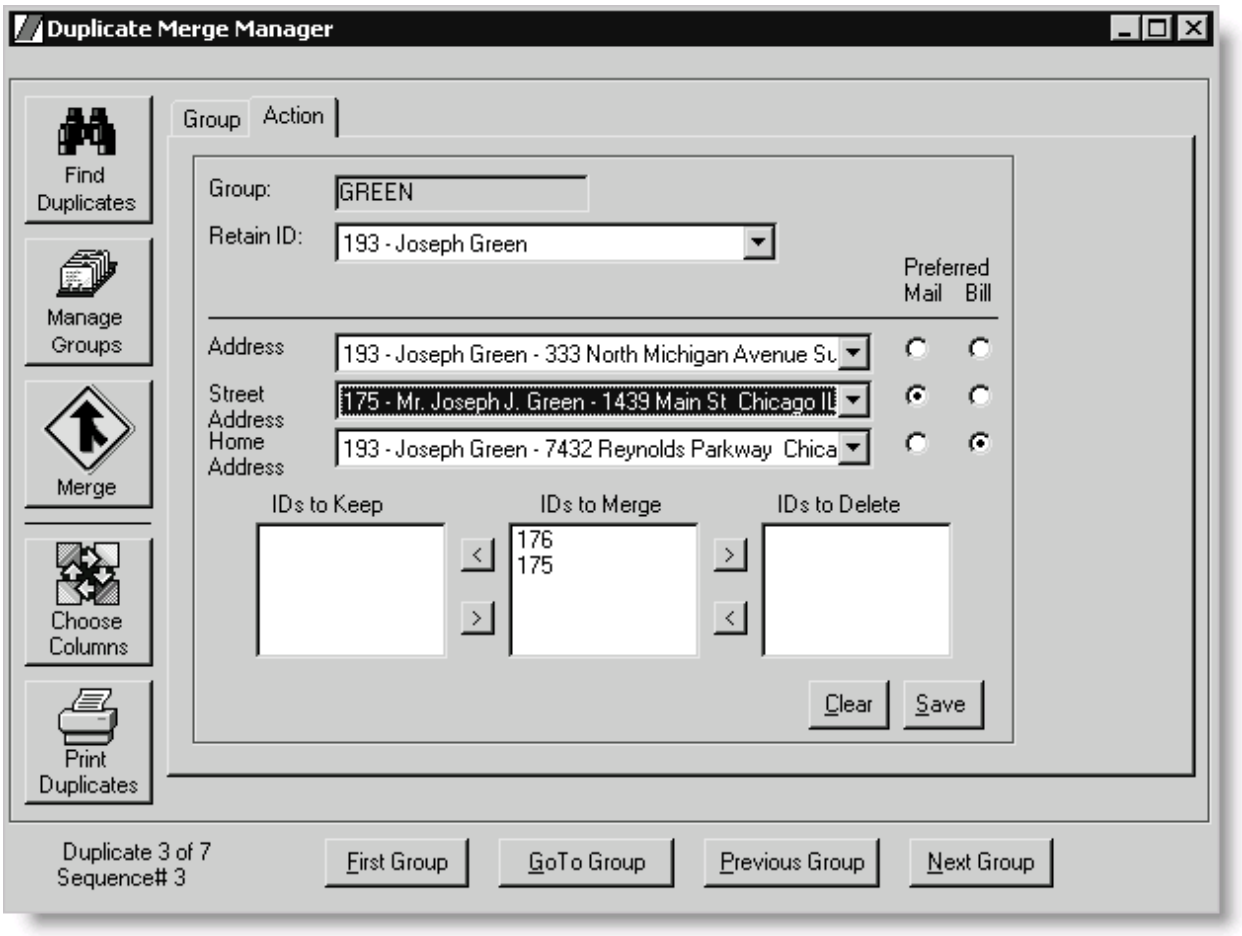
Note: A Retain ID is required in order to process the merge.

1. Select Manage Groups to display the Manage Groups view on the Duplicate Merge Manager window.
2. Click Find Group, GoTo Group, Previous Group, or Next Group to select the duplicate group for which you wish to make selections.
3. Select the Action tab. The Action tab displays on the Duplicate Merge Manager window.

   Note: Initially, all of the IDs in the duplicate group are placed in the IDs to Merge list.
4. Select the Retain ID from the drop-down list of available duplicate record IDs. Only one ID per group can be selected as the Retain ID.
5. Select the addresses to be retained[d] for the Address, Street Address, and Home Address (Main, 2nd, and 3rd) from the drop-down list.

   Note: Prompts for the three address fields are based on the prompt names set in the Customer Setup – Address and Notes window (from Customers, select Set up module> General, and click Address and Notes).

6. Select the preferred mail address by selecting the Preferred Mail option to the right of the Address, Street Address, or Home Address.
7. Select the preferred billing address by selecting the Preferred Bill option to the right of the Address, Street Address, or Home Address.



This example of the Action tab in the Manage Groups view on the Duplicate Merge Manager window shows the Preferred Mail and Preferred Bill options set for the Street Address and Home Address, respectively.

Note: If you do not change an Address selection or a Preferred Mail or Preferred Bill preference, the address information for the Retain ID remains the same as it was before the merge.

To select the IDs to Keep

There may be records in the duplicate group that you determine are not duplicates and that you want to maintain as they currently exist in iMIS. In this case, you can move these records from the IDs to Merge list to the IDs to Keep list.

1. Select the IDs to be kept “as is” in the IDs to Merge list.
2. Click < to move the selected IDs to the IDs to Keep list. These IDs will be ignored during the merge process.

Selecting the IDs to delete

When you select a record for deletion, Duplicate Merge Manager checks to make sure that the target ID can be deleted validly. An ID cannot be deleted if any of the following conditions are true:

- There is no Retain ID.
- There is an open invoice with a non-zero balance where the BT_ID equals the target ID.
- There is an open order where the BT_ID equals the target ID and the order stage is not completed, cancelled, closed, or empty.
- There is an active subscription record where the ID equals the target ID.
- There is a registration for an open event where the ST_ID equals the target ID.
- There is a dependent Referral record where the PROVIDER_ID equals the target ID (and REFERRAL_FEE > 0 and READY_TO_INVOICE = 1 and ORDER_NUMBER = 0).
- There is a Name record where the BT_ID or CO_ID equals the target ID.
- There is a Name_Fin record where the BT_ID equals the target ID.

To select IDs to delete

1. Select the IDs to be deleted in the IDs to Merge list.
2. Click > to move the selected IDs to the IDs to Delete list.

Note: If a record cannot be deleted, a warning message displays explaining why the record cannot be deleted. Minimize the Duplicate Merge Manager window and find the

customer record in iMIS to verify the error. For example, if the message indicates that an active subscription exists for this ID, check the Dues/Subscription Item Detail window for this ID (from Customers, find the customer record, select the Billing tab, and double-click on a line item) to see if there are any active subscriptions. A subscription can have a zero balance and still give this message when the status is A (Active).

To save the selections to merge during the current DMM session

1. After you have selected the Retain ID, the IDs to Keep, the IDs to Merge, and the IDs to Delete, click Save. A message displays asking if you want to store this group to be merged later.
2. Click No.
3. You can review another duplicate group by clicking the appropriate group button. You can override the saved data for a group by changing your selections on the group's Action tab and clicking Save.

To save the selections to merge during a later session

1. After you have selected the Retain ID, the IDs to Keep, the IDs to Merge, and the IDs to Delete, click Save. A message displays asking if you want to store this group to be merged later.
2. Click Yes. A message displays indicating the group's sequence number.
3. Click OK. The group can be merged by clicking Saved Groups and then Merge during the current Duplicate Merge Manager session or during a later session. You can continue reviewing duplicate groups. The next available duplicate group is displayed, or you can select a duplicate group by clicking the appropriate group button.

   Note: The next available duplicate group displayed is the group with the lowest sequence number that has not yet had any merge actions specified with the Manage Groups function.

To edit the selections

Values saved on the Action tab can be edited at any time prior to the Merge process.

1. Click Manage Groups to display the Manage Groups view on the Duplicate Merge Manager window.
2. Click Find Group, GoTo Group, Previous Group, or Next Group to display the group to edit.
3. Select the Action tab.
4. Edit the IDs to Keep, IDs to Merge, and IDs to Delete lists as needed, or click Clear to clear all of the lists.
5. Click Save. If you do not click Save, a message displays when you exit the Manage Groups view on the Duplicate Merge Manager window asking if you want to save the changes you have made on the Action tab. Click Yes to save the changes, or click No to cancel your changes.

Merging and deleting records

After you have used the Manage Groups view on the Duplicate Merge Manager window to select the records to be merged, deleted, and kept and have saved the groups, you can use Duplicate Merge Manager to merge the records. You can perform a Merge while other iMIS users are connected to the system.

Note: When you click Merge, all of the current duplicate groups are merged unless you are performing a merge of two known IDs. You should review all duplicate groups for accuracy and any conflicts before performing the Merge operation.

Caution! It is strongly recommended that you perform a backup of the database before merging records. The Merge process is final. If any records are merged or deleted in error, you will need to restore your database from a backup.

To merge duplicate groups

1. (optional) If you want to merge previously saved duplicate groups, click Saved Groups. A message displays to let you know that if you are currently viewing groups that have not been saved to the permanent table, they will not be maintained.

2. Click Yes. The first saved group displays on the Group tab on the Manage Groups view of the Duplicate Merge Manager window.
3. Click Merge. A confirmation message displays indicating how many duplicate groups have been defined for merging.

   Note: If two or more users have prepared the same group for a merge, Duplicate Merge Manager will probably log an error indicating that it was unable to merge the group because one of the IDs does not exist when it attempts to merge the group the second time. You can remove the extra duplicate group before running the Merge process to prevent this problem. See To remove a duplicate group for information on deleting a previously saved group.

   For performance reasons, indices are built on the following tables:

- Invoice
- Orders
- Trans
- Activity
- Name_FR (One on ID and one on SOLICITOR_ID)

   These indices will remain on the tables unless you restore the .lbr files or perform an iMIS upgrade.

4. Click Yes. After the indices have been built, the merge process automatically begins and a message indicating the merge progress displays in the Duplicate Merge Manager window.

   For each duplicate group that has a Retain ID selected, the utility re-verifies each ID's delete status against the current iMIS database. If a record does not pass the verification process, the error is logged to the event log file. All Merge process messages except for the initial warning, halting errors (errors that prevent the Merge process from continuing), and the final completion message are written to the event log rather than being displayed.

Note: When an error occurs for a group, the merge process continues with the next group; a group with an error will not be merged. For example, if there are four IDs to delete in a group and an error occurs with the first ID, the remaining IDs in the group to delete will not be verified (there may be additional errors on the remaining IDs) and Duplicate Merge Manager will verify the next group for the merge.

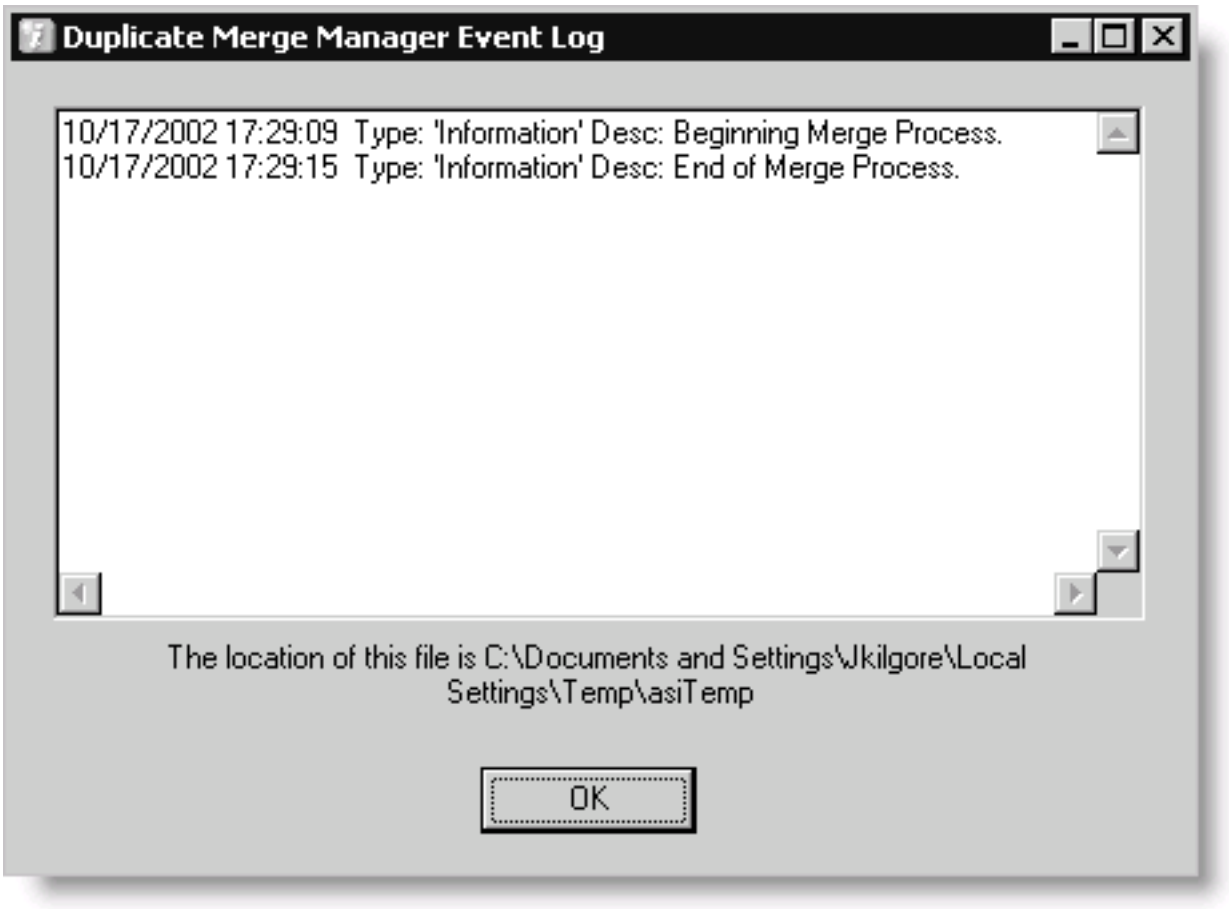
If a record passes the verification process, the address fields for the Retain ID are set to the values selected in the Action tab. All records marked for deletion that meet the deletion criteria are deleted. All subordinate records of the Merge IDs are copied to the Retain ID and the Merge IDs are then deleted.

5. After the Merge process has completed without errors, a message displays indicating how many duplicate groups were merged.

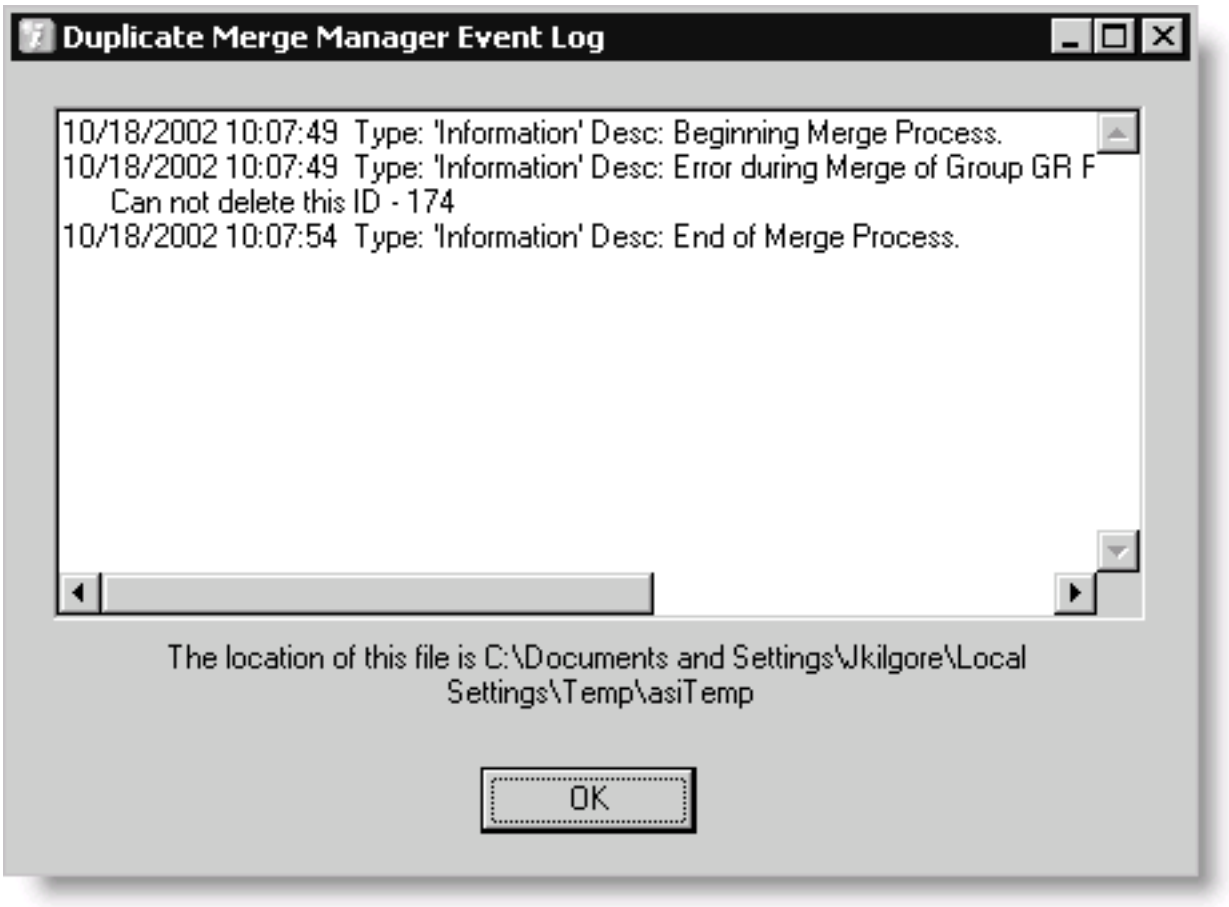
- If there are errors, a message displays with the number of groups processed and the number of groups in error.

  Note: The group Retain IDs that did not merge are stored in DUPLICATE_GROUP.Retain_ID.

6. Click OK. Fix the errors or update the action that was selected for the group and then run the merge again.
7. Click Yes to display the event log, or click No to skip viewing the event log.
8. If you click Yes, an event log displays.
9. After viewing the event log, click OK. The Duplicate Merge Manager window displays.
10. If you click No, the Duplicate Merge Manager window displays.



Example of Duplicate Merge Manager Event Log window after successful Merge process with no errors



Example of Duplicate Merge Manager Event Log window after a Merge process in which an error occurred

To merge two known IDs

1. From Customers, select Manage duplicates.
2. Click Find Duplicates. The Find Duplicates options display.
3. Select Specify two known IDs to Merge.
4. Enter the first ID in the ID 1 field and press Tab. The name and company for the first ID display. If the ID is not valid, a message displays indicating that the ID is not valid.
5. Enter the second ID in the ID 2 field and press Tab. The name and company for the second ID display. If the ID is not valid, a message displays indicating that the ID is not valid. The Duplicate Merge Manager window should appear similar to the following:

6. Click Build Tables. A message displays informing you that the process may take from 2 to 20 minutes.

   Note: If either ID is not valid, a message displays indicating that you must specify two existing IDs. Click OK, specify valid IDs for ID 1 and ID 2, and click Build Tables. A message displays informing you that the process may take from 2 to 20 minutes.

7. Click Yes. The duplicate group containing the two specified IDs displays on the Group tab in the Manage Groups view on the Duplicate Merge Manager window. The Duplicate Merge Manager window should appear similar, now containing tables and a Group tab and an Action tab.
8. Select the Action tab.
9. Select the Retain ID from the drop-down list.
10. Select the Preferred Mail option for the Address, Street Address, or Home Address.
11. Select the Preferred Bill option for the Address, Street Address, or Home Address.
12. Specify whether the ID that will not be retained should be merged with the Retain ID or deleted.

    - To merge the ID with the Retain ID, leave the ID in the IDs to Merge list.
    - To delete the ID, select the ID and use the > button to move the ID to the IDs to Delete list.

13. Click Save. A message displays.
14. You can perform the Merge operation for the two IDs now or save the group containing the two IDs so that the group can be merged later.

    - To perform the Merge operation for the two IDs now, click No and then click Merge.

      Note: If you click No, you must perform the Merge operation immediately. If you run another Find Duplicates process before merging the group containing the two IDs, the temporary tables are overwritten and you will not be able to merge these two IDs without first performing this entire procedure again.

15. Click Merge. A confirmation message displays indicating how many duplicate groups have been defined for merging. Click Yes. A message displays indicating that the merge has completed. Click Yes to view the event log, or click No to skip viewing the event log. For more information on the event log, see To merge duplicate groups.
16. To save the group containing the two IDs to be merged later, click Yes. A message displays indicating the sequence number for the saved group. Click OK. A message displays indicating that no duplicates were found. Click OK. The duplicate group containing the two IDs is saved in the permanent tables and can be recalled later by clicking Saved Groups. You can continue finding and managing duplicate groups or proceed to the Merge process as needed.

Merge actions performed for IDs to merge

During the merge process, the following fields are updated to the value of the Retain ID if they contain the value of any ID from the IDs to Merge list.

Cert_Register	STUDENT_ID, BT_ID
Comment_Log	ID
Comment_Types	ID
Invoice	BT_ID, ST_ID
Invoice_Lines	ST_ID
Meet_Hotel	ID
Meet_Master	CONTACT_ID
Name	CO_ID, BT_ID
Name_Fin	BT_ID
Name_FR	SOLICITOR_ID
Name_Log	ID
Orders	BT_ID, ST_ID, CO_ID (Non-meeting orders only)
Ref_Client	CLIENT_ID
Ref_Provider	PROVIDER_ID
Referral	CLIENT_ID, PROVIDER_ID

Relationship	ID, TARGET_ID
Trans	BT_ID, ST_ID, SOLICITOR_ID
User-defined tables	ID (If the Multiple Instances Allowed option for the table is enabled)

If the following fields contain the values of any of the IDs in the IDs to Merge list, they are also updated to the value of the Retain ID, but only if a record with the Retain ID value does not already exist.

Name_FR	ID
Name_Pic-ture	ID
Name_Note	ID (if a note record with the same Name_Note.PURPOSE does not exist for the Retain ID)
Name_Staff	ID
Subscriptions	ID (If a subscription with the same PRODUCT_CODE does not exist for the Retain ID)
User-defined tables	ID (If the Multiple Instances Allowed option for the table is disabled and the Always Create option is not enabled) Note: If the Always Create option for a user-defined table is enabled, the table will never be merged.

Merging records with open meeting records

When a Merge ID has open meeting records, records linked to the Merge ID in the Order_Badge and Orders tables may or may not be updated to the Retain ID, depending on whether the Disable Auto Flow Down of company address Information option is enabled (from Customers, select Set up module > General, and click Advanced). If the Disable Auto Flow Down of company address information option is enabled, these records are not updated to the Retain ID.

If the Update open meetings addresses with address changes option is enabled (from Customers, select Set up module > General, and click Advanced), the following fields in the Orders table are updated when SOURCE_SYSTEM=MEETING and ST_ID or CO_ID are being merged:

PREFIX

FIRST_NAME

MIDDLE_NAME

LAST_NAME

SUFFIX

DESIGNATION

INFORMAL

TITLE

COMPANY

ADDRESS_1

ADDRESS_2

CITY

STATE_PROVINCE

ZIP

BAR_CODE

COUNTRY

FULL_NAME

FULL_ADDRESS

CO_ID

ST_ID

COMPANY_SORT

EMAIL

DPB

CRRT

PHONE

FAX

LAST_FIRST

In addition, the following fields in the Order_Badge table are updated:

PREFIX FIRST_NAME

MIDDLE_NAME

LAST_NAME

SUFFIX DESIGNATION

INFORMAL

TITLE

COMPANY

ADDRESS_1

ADDRESS_2

CITY

STATE_PROVINCE

ZIP

BAR_CODE

COUNTRY

FULL_NAME

FULL_ADDRESS

If the Update open meetings addresses with address changes option is disabled (from Customers, select Set up module > General and click Advanced), none of these fields other than ST_ID and CO_ID in the Order_Badge and Orders tables are updated during a merge.

After the Merge IDs' records have been copied to the Retain ID and the addresses have been updated as selected on the Action tab, the Merge IDs' records are deleted from the following tables:

Name

Name_Address

Name_Fin

Name_FR

Name_Indexes

Name_Picture

Name_Security

Name_Security_Groups

Name_Staff

Merge actions performed for IDs to delete

During the merge process, the records in the following tables are deleted if any of the fields listed contain the value of any ID from the IDs to Delete list.

Cert_Register	ID, STUDENT_ID
Invoice	BT_ID
Invoice_Lines	Invoice.BT_ID
Meet_Hotel	ID
Meet_Master	CONTACT_ID

Name	ID
Name_Log	ID
Orders	BT_ID
Ref_Client	CLIENT_ID
Ref_Provider	PROVIDER_ID
Referral	CLIENT_ID, PROVIDER_ID
Relationship	ID, TARGET_ID
Subscriptions	ID
Trans	BT_ID
Name_Address	ID
Name_Fin	ID
Name_FR	ID
Name_Indexes	ID
Name_Note	ID
Name_Picture	ID
Name_Security	ID
Name_Security_Groups	ID
Name_Staff	ID

Note: If an Invoice.BT_ID is equal to a Delete ID and the Invoice.REFERENCE_NUM is equal to the Invoice_Lines.REFERENCE_NUM, the Invoice_Lines record is deleted along with the Invoice record.

The following fields are updated to empty if they contain the value of any ID from the IDs to Delete list:

Activity	ID, CO_ID, OTHER_ID, SOLICITOR_ID
Cert_Register	BT_ID
Invoice	ST_ID

Invoice_Lines	ST_ID
Name	CO_ID, BT_ID
Name_FR	SOLICITOR_ID
Orders	ST_ID, CO_ID
Subscriptions	BT_ID
Trans	ST_ID, SOLICITOR_ID
User-defined tables	All records for the Delete ID are deleted

Merge actions performed on ContactMain and UserMain records

As part of the merge process, the following actions are performed on all IDs that are merged or deleted:

ContactMain	SyncContactID	NULL
ContactMain	ContactStatusCode	3 (Delete)

Additionally, if the merged or deleted ID had an associated user record, the following actions are performed:

UserMain	ContactMaster, UserId	Empty
UserMain	IsDisabled	1 (True)

Tip: For optimal performance, purge unused users and contacts (see "Purging user and contact records") using the DB Maintenance Utility after you have merged contact records.

Important:

DMM will not merge any data from .NET tables (other than ContactMain and UserMain). Merging contact records that have associated .NET records may result in orphaned records. Examples include (but not limited to):

- DocumentMain.CreatedByUserKey
- DocumentMain.UpdatedByUserKey
- GroupMain.MemberContactKey
- GroupMain.MemberContactKey

e-Content Manager

e-Content Manager Implementation

Before you begin e-CM

Component Roles

Multiple components work together to deliver content to a website. Some of the more important components have been described below:

- Web Browser- The web browser serves up web pages from the webserver using the Hyper Text Transfer Protocol (HTTP). The browser interprets the Hyper Text Markup Language (HTML) contained in the web pages and to display text, graphics, tables, and other elements. The two most well-known browsers are Netscape Navigator and Internet Explorer.
- Webserver - Webservers answer requests from web browsers, retrieve the required web document, and deliver it to the browser. Webservers and web browsers communicate via the Hyper Text Transfer Protocol (HTTP).
- Internet Information Server- This is Microsoft's webserver application, which communicates with the web browser and other business applications via HTTP. It facilitates the publication and sharing of information. Information can also be shared securely over the Internet with the use of Secure Socket Layer (SSL) encryption. IIS allows you to apply a SSL key to web documents, which is then interpreted and decrypted by the web browser for display. e-Series and e-CM are implemented on IIS. You need to configure and administer IIS to install e-CM.
- Hypertext Markup Language (HTML) - Hypertext Markup Language (HTML) is the language used to create web documents. HTML defines the basic syntax and placement of special characters (tags) that tell the web browser how to display the web document to the end-user.
- ColdFusion (development environment) - ColdFusion is an application development system that includes ColdFusion Application Server and ColdFusion Studio. With

ColdFusion, you can produce webpages that interact with databases and deliver the results as HTML pages for the browser.

- ColdFusion Markup Language (CFML) - ColdFusion Markup Language is a scripting language that allows for the dynamic display of content based on database queries or user input. While HTML determines the layout and appearance of a web page, CFML determines the content that is displayed on the web page. Files created with CFML are given the extension .cfm. ColdFusion Markup Language (CFML) tags can be freely mixed with HTML tags on a webpage. The CFML tags signal the ColdFusion Application Server to perform specific operations and allow ColdFusion to see the ODBC data sources. Each tag identifies a particular operation, such as including a block of code from another file and setting a variable. CFML is a markup language modeled on and similar to HTML. All ColdFusion tags begin with the letters CF.In addition to HTML and CFML, your ColdFusion application pages can contain any client-side technology, including:
- Scripting, such as JavaScript, Jscript, and VBScript
- Executables, such as ActiveX and Java applets
- Dynamic HTML
- Other client technologies
- ColdFusion Server - The ColdFusion server interprets web documents that are written in ColdFusion and process requests accordingly. Generally, ColdFusion process request for dynamic data such as querying databases and returns the results to IIS, which then formats that data into HTML and sends it to the user's web browser.
- Template - e-CM uses a template methodology. By separating graphic design (implemented through the use of templates) and content (residing in a database), it's easy to maintain consistent branding and navigation, while allowing for the dynamic display of content within the site's standard template.
- Cascading Style Sheets - Cascading Style Sheets provide consistent style information such as font, color, and size for web documents. The use of Style Sheets ensures that style (provided by the style sheets) is kept separate from structure (provided by HTML),

leading to easier site maintenance and smaller document sizes. The term 'cascading' is applied to style sheets because more than one style sheet can affect the presentation of a single web document. The various sources of style information or style sheets are assigned weights based on a hierarchical system.

Managing Content for Multiple Websites

If you use e-Content Manager (e-CM) to manage content for multiple websites on a single server, we recommend that you do not use virtual directories on a single webserver instance. Instead, you should have separate instances of the webserver for each website (one IP with host headers rather than one IP with one website and multiple virtual directories).

Using Customized Triggers

Some sites choose to implement customized triggers on iMIS tables. Advanced Solutions International (ASI) does not support user-defined triggers. ASI reserves the right to add triggers to iMIS tables.

Be aware that if you have customized triggers, you will need to recreate them after the upgrade. The iMIS upgrade procedure will remove any non-iMIS triggers.

Pre-Tasks for New Installations

Perform the following steps before you begin the iMIS installation:

1. Install or verify access to a Microsoft SQL Server or SQL Express database server.
2. Locate your Omnis7 and iMIS license codes which include the appropriate e-CM licensed keys.

   Note: You need an iMIS license key that contains the e-CM keys as well as a license number for the Ektron WYSIWYG Editor that is supplied through ASI.
3. Have access to the iMIS installation image.
4. Verify that ColdFusion is installed on a Windows 2000 or Windows 2003 Server.
5. Install the latest Service Packs and updates per the system requirements.

6. Ensure access to the Internet, that IIS is installed, and that IP addresses are assigned accordingly.

e-CM Project Planning

Project planning helps you set expectations and estimate the costs of implementation. With proper planning, you can:

- Calculate project costs
- Set customer expectations
- Set management expectations
- Plan and coordinate resources
- Track progress

e-CM Implementation Project Plan

Advanced Solutions International (ASI) has developed an implementation plan and methodology to ensure a smooth implementation of e-CM. This process parallels the process used to implement the iMIS and e-Series modules. e-CM requires the same kind of planning and forethought that is required for a successful iMIS implementation. You should not take shortcuts even if clients want to implement e-business solutions quickly. Consider very carefully the issues that will encourage web visitors to use the new site.

The project plan has five major phases:

- Business Process Review
- Development
- User Acceptance
- Launch Process - Go Live
- Continuous Improvement

All project costs relate to one of these phases. The key to a successful implementation is to manage expectations throughout all phases of the process. To accomplish this, you

must present regular status reports to a designated customer staff member to review and update the project status. These meetings should occur at least bimonthly.

It is important to note that unlike iMIS, and e-Series to a lesser extent, e-CM is the organization's highly visible portal to their customers, so careful planning is imperative.

Proper project planning and adequate staff resources are critical to a successful e-CM implementation. The reseller should allocate four or more staff members to the implementation. These should include the following:

1. Project Manager - The project manager is responsible for managing project resources, preparing and modifying the project plan, tracking project status, facilitating status meetings with the client, and managing the overall project implementation. In addition to staff resources, the project manager works with clients to access client resources. The organization should provide an operations representative to provide hands-on implementation assistance. This would include tasks such as granting security access to the server, arranging hardware purchases, maintaining liaison with the ISP, configuring firewall or proxy servers to permit access to the site, and configuring software to match the identified business processes. The project manager should be in continual contact with the organization's decision-makers and managers to help determine and manage the expectations for the new e-Series site. This contact should be initiated at the very beginning of the project.
2. Consultant - The consultant should have strong iMIS and/or web experience and training in the setup and configuration of e-CM. The consultant is responsible for analyzing and prototyping key processes with key client personnel, as with other iMIS products. The consultant should be skilled in analyzing output requirements, documenting back-office processes for e-Series modules, and training administrators and customers.
3. Information Architect - The information architect is key to giving your site a logical order and flow of information. The Information Architect will be instrumental in developing a smooth-flowing website that is easy for the audience to navigate so that they can find the information they desire quickly.

4. Technical Consultant - The technical consultant should be experienced with Windows NT Server, Windows 2000 Server, SQL Server, and Macromedia ColdFusion. The technical consultant must ensure that the software and hardware requirements for e-Series modules are in place before setting up and configuring the application.

   e-CM Phase I - Business Process Review

   Before the kickoff meeting, an implementation survey should be given to the client team to answer baseline questions about project goals and intentions. The team will develop needs analysis from information gathered from the survey.

   The kickoff meeting with the client team and the reseller team is crucial to the project's success. Everyone involved in the project should be aware of the project's goals and issues. The kickoff meeting is the time to set realistic expectations. After the meeting, the reseller team should set up meetings with key department managers to gather the information for the needs analysis in greater detail.

   Note: These are estimates only and will vary from client to client based on the size of the current website and the desired functionality.

   Phase I time estimates - 30 Days

- Business Review / Needs Analysis
- Information Architecture to organize content (See section below on Information Architecture)
- Develop or Restructure Navigation
- Develop Tagging Structure
- Develop Sub Sites
- Creative
- Graphic Designers
- Look and Feel consensus
- Initial Template Creation

e-CM Phase II - Development

In this phase, the entire hardware and software infrastructure is installed and tested and development work is also started on any gap or special needs of the client. There are two sub-phases in Phase II:

First Sub-phase - This sub-phase involves reviewing and identifying the hardware and software requirements with the client and determining elements of the project, such as the location of servers, the relationship with the ISP, and the telecommunications requirements. During this phase, the organization will order software, hardware, and telecommunications lines. The telecommunications setup should be decided upon as early as possible because there often are weeks- or months-long lead times for the installation of these lines, especially for T1 lines.

Second Sub-phase - In this sub-phase, the reseller sets up and installs the software on the webserver. The reseller also begins to develop site templates as well as any additional custom work required. At this time, site layout and design are discussed with client and several prototype sites may be developed. The client and the reseller usually share in the assignment of resources during this phase. Typically, the client obtains the server and arranges the installation of telecommunications lines and server software. The reseller installs e-CM on the prepared server. However, some resellers with networking and hardware resources may provide a turnkey installation.

Carefully consider the issue of firewalls and proxy servers. ASI currently does not offer guidance on configuring these servers because there are so many vendors with both hardware and software solutions. A technician knowledgeable with the client's firewall or proxy server should be available to open a channel for traffic to get through the firewall. Depending upon the configuration, the SQL database server and/or the webserver may be inside the firewall. Whatever the configuration, the channel through the firewall must be open to allow either the ODBC connection from the webserver to the SQL database server, or the connection from the webserver to the ISP.

Once the navigation, tagging, and style of the site have been determined from Phase I, the reseller will begin Phase II by setting up an initial site as well as developing additional

ColdFusion templates and style sheets for all associated websites. Also during development, the migration of data from the existing site to the e-CM site will begin as outlined by the Information Architect.

A general rule of thumb for manually migrating pages from an existing site to e-CM is five pages per hour. If a site has greater than 300 pages, it is recommended that you discuss with ASI Consulting the best method for importing pages.

Any custom development or pages are created and integrated into e-CM during Phase II.

Phase II time estimates - 14 - 60+ Days

- Review hardware and software requirements with client.
- Order required hardware, telecommunications lines, and software.
- Set up Windows Server, ColdFusion, SQL Server links.
- Install e-CM on server.
- Web designers finalize design elements.
- Create and/or refine templates and style sheets for sites and subsites.
- Migrate content from existing site to e-CM.
- Rough configuration of e-Series modules if applicable.

e-CM Phase III - User Acceptance

In this phase, the applications consultant will sit down with the client's operations contact and key staff to discuss site management, training, and ongoing maintenance. Typically, these key personnel are membership managers, meeting directors, database administrators, marketing personnel, and so forth. Because their expectations are the ones that must be met, these managers should be involved in the project. Furthermore, their expectations should reflect those of the constituents who will use the site, and these constituents' expectations based on their user experience and the flow of the website.

Generally, the staff of the organization should have 30 days to test their site to verify that all content is present, that the database tables are being updated correctly, and that e-

Series processes are in place in the iMIS, as well as ensuring that any other issues are resolved before going live to the public.

Phase III time estimates - 30 Days

- Training of staff.
- Testing of website.
- Tweak look and feel.
- Verify data integrity.
- Document all setup parameters and any alterations to pages or scripting. Document back-office procedures for credit card processing, cancellations, password assignment, and so forth.
- Caution client about changes that may affect the upgrade path. Test processes and transactions on test database; obtain client sign-off.

e-CM Phase IV - Transition from Production Database to Live

In this phase, you will move the configured site to the production database and webserver, review the site, apply SSL certificates, and finally open the site to the Internet. The following steps involve connecting the site with the live production database and verifying that the custom pages, colors, and configuration parameters meet the client's requirements. It is the client's responsibility to market the site and to inform constituents, members, and the public that the site is up and running and why they should log on. However, the reseller should encourage the client to develop a site-marketing plan.

Phase IV time estimates - 1- 7 Days

- Move e-CM-related items from test database to production database.
- Copy files to production webserver.
- Review site to ensure that all elements are in place.
- Publicize the website and open it to the Internet.

e-CM Phase V - Continuous Improvement

Plan on at least eight hours of post-implementation and technical support. Caution the client not to make any alterations or changes to the site infrastructure, such as changes to ColdFusion, the IP address, or the network, without consulting the reseller. Most site failures are due to “do-it-yourself” alterations to enhance the site or to solve perceived problems. A website requires a close interaction of hardware and software to stay up and running. Casual changes can break the chain that keeps the site functional.

Information Architecture

When you go to a website and find exactly what you want in two or three mouse clicks, this is a good indication that the site has been constructed with good Information Architecture principles. No one ever thinks about it because if it works well, it's invisible.

According to Michael Brooks, Creative Director at Schema Studios in Chicago, “an Information Architect ensures for the client that the site being developed can be easily updated and expanded -- that it is scalable. On the developer side, the IA ensures that the development team has a solid foundation on which to build and can concentrate their efforts on graphic design, strategy and content development. For the end user, the IA designs a navigation system that users can easily move through without confusion”.

While it is not practical for us to go into great detail about Information Architecture, it is a topic that must be pursued and understood to successfully implement a content management system.

A good starting resource for Information Architecture is the O"Reilly publication Information Architecture for the World Wide Web by Louis Rosenfeld and Peter Morville, 2nd edition. The following chapters are particularly useful:

- Ch 3 User Needs and Behaviors
- Ch 4 The Anatomy of an Information Architecture
- Ch 5 Organization Systems
- Ch 6 Labeling Systems

- Ch 7 Navigation Systems
- Ch 9 Thesauri, Controlled Vocabularies, and Metadata

Once you have a good understanding of the information mentioned above, it will make your decisions easier on how to best implement e-CM for your client. Information Architecture decisions and plans need to be made and agreed upon before we can proceed with installing our content management system.

Four Phases of Information Architecture

ASI has a four-phase approach to Information Architecture:

1. Research
   - Assess current site
   - Assess goals/mission/vision
   - Complete competitive analysis
   - Hold stakeholder meetings
   - Complete content analysis/content inventory
2. Concept and Strategy
   - Creative process
   - Think and use whiteboard
   - Work through scenarios with team
   - Create strategic plan for future use and administration
3. Planning
   - Design and define navigation systems
   - Flow diagrams
   - Create detailed site maps
   - Label

- Semantics is hard
- Analyze and assess contextual possibilities
- Classify content
- Create page layouts
- Create controlled vocabularies/content tags
- Plan content migration

  Note: The more you plan, the better your site and its content will work.

4. Implementation

- Work with content management/delivery system
- Tweak any of the aforementioned steps

  If you do not have an Information Architect on staff, consider outsourcing to a local contractor or contact the ASI Consulting.

Working with Technical Support

FTP Access to webserver

In order to debug a problem with your e-Series website, Advanced Solutions Technical Support may need FTP access to the webserver where the e-Series source code is installed.

You can set up an FTP site in IIS. FTP site setup is similar to Website setup.

- Open IIS on the webserver.
- Right-click on the website and select New> FTP site.
- Enter the IP address and the required properties.

  Access to the iMIS database

To be able to debug a problem with your e-Series Website, Advanced Solutions Technical Support may need to access to your database. The iMIS database can be accessed with PC Anywhere, RAS access, or over the Internet.

Screenshots

If the e-Series Website is behind a firewall and cannot be viewed by Advanced Solutions Technical Support, you must send screenshots of all error messages. The preferred method for sending screenshots is to paste the screenshot into Microsoft Word and e-mail the Word document as an attachment.

Debugging in ColdFusion

To debug a problem with your e-Series Website, you may need to turn on ColdFusion debugging. Turn on debugging before you call Technical Support so they can go to the Website and gather all of the necessary information.

e-CM Support Tips

IP Address

To determine the IP address of a site, run the following file in the browser window:

http://www.yoursite.com/virtualdirectory//AM/setup/showip.cfm

Manually recreate Verity Collection

While not recommended, you may be directed by ASI to recreate your Verity collection. Contact ASI Technical Support before executing the search collection setup (http://www.yoursite.com/virtualdirectory/am%20/am/admin/search/searchcollectionsetup.cfm).

Problems Logging In to Site

Clear Cookies

During the installation and configuration stage, it is helpful to clear your site's cookies from the browser, especially when rerunning the application or the e-CM Wizards.

Rename the AM Directory

If you appear to have problems logging into e-CM and it is not clear if it is an e-Series issue or an e-CM issue, you can rename the AM folder in Customer and attempt to log in to a plain e-Series site (http://yourURL/Source/security/member-logon.cfm). If you can log into e-Series, the chances are that you have not run the e-CM Wizard correctly.

Error Running e-CM Wizard

If the e-Series Application Wizard runs but the e-CM Wizard fails, verify that the SQL database user has access to all the e-CM tables in the iMIS database. The iMIS role does not grant privileges to these e-CM tables.

Admin Portal Links Appear Not Active

If the Admin Flash Portal links do not appear to be active, right-click on the button to determine the version of the Flash Plug-in that is installed on your browser. Upgrade to version 7.0 or later.

Content Not Appearing on Site

Review Publishing Service in Admin Portal for messages and pending events.

Verify that the publishing server is configured correctly. To verify this, determine if the service starts. Review the log files found in the c:\Program Files\e-CM 5 directory for errors. If necessary, edit the PublishService.exe.config file to point to the correct database.

Verify that the publishing service is using a valid IP address.

Note: Do not use 127.0.0.1.

Use Sales Demo VM as an Example

The Sales Virtual Demo site is a good reference point for installing your own site, and also provides multiple examples of templates. Contact ASI Sales to obtain the demo virtual machine.

Installing and upgrading e-Series/e-CM

Note: This main procedure appears identically in both the e-Series and the e-CM reference guides.

About installing e-CM with iMIS

Note: Be sure to back up your iMIS database before performing the following steps.

Installing e-CM is very similar to installing e-Series, except that you do some database configuration with the e-CM Wizard. The following procedures outline the process of installing e-CM as well as creating a demo tutorial site.

Tip: Install the tutorial site first as a guideline and example before creating new e-CM sites for customers.

To install or upgrade e-Series and e-CM

To prepare for installation

1. Back up your customized files so that you can reapply the customizations after upgrading e-Series. All customizations are overwritten during the upgrade process.
2. Ensure that you have completed a successful installation or upgrade of iMIS 15 on the appserver where you plan to install e-Series and e-CM.

- If you performed a Custom installation of iMIS 15, you must have chosen e-Series as one of the options to install (The e-Series zip file is automatically installed as part of a Complete installation.)
- (e-CM only) You must have performed a Custom installation of iMIS 15, and you must have chosen Publishing Service as one of the options (Publishing Service is required for e-CM and is not part of a Complete installation.)

  Caution! If you performed a Complete installation, or you performed a Custom installation of iMIS 15 and did not choose these listed Optional Components, then you must first install these components before performing this procedure. You can easily add these components to an already installed instance of iMIS 15 by choosing Start > Control Panel > Add or Remove Programs. From the list of Currently installed programs, select iMIS15 and click Change/Remove. When the Welcome page appears, select Modify and click Next to proceed.

3. Ensure that you have planned your iMIS architecture and have ensured the prerequisite conditions for all hosts and clients.
4. Ensure that a version of ColdFusion supported by this version of iMIS is installed on the iMIS appserver.
5. Ensure that a version of iBO for COM supported by this version of iMIS is installed on the appserver.
6. Ensure that a mail server has been configured in ColdFusion.
7. (e-CM only) Ensure that you have configured ColdFusion to redirect the storage of client variables to a database instead of to the registry of the appserver.
8. If you installed ColdFusion in a location other than the root (C:\CFusionMX), adapt the affected file paths below accordingly.
9. Ensure that the Windows Explorer folder options on the host are set so that all files are visible in Windows Explorer.
10. Ensure that Internet Explorer's Temporary Internet File options on the host are set so that IE checks for newer versions of stored pages every time you visit the webpage.

To install or upgrade e-Series and e-CM into an iMIS 15 environment

Note: Some steps pertain only to e-Series or to e-CM. If you are not installing both into your iMIS 15 environment, you can skip the steps that are marked for the product that you are not installing.

1. (upgrades only) Back up all files located in your current e-Series directory. Any files that you customized in the \Customer folder will be overwritten during this procedure. You must have access to your customized versions of these files so that you can reapply your customizations after upgrading e-Series.
2. Locate the e-Series self-extracting zip file (eSeries.exe) on the appserver, which is in the folder C:\Program Files\ASI\iMIS15\eSeries.CF.

   Note: If this folder does not exist, you performed a Custom installation of iMIS 15 and did not specify to install e-Series. You must Modify the installation of iMIS 15 (Start > Control

Panel > Add or Remove Programs > iMIS15, and click Change/Remove) to install the e-Series optional component before continuing this procedure.

3. Run the eSeries.exe file.

   The WinZip Self-Extractor window appears.

4. Click Unzip without changing any of the default settings.

   A C:\eSeries\ folder is created on the appserver.

5. (e-Series only) Copy all files from the C:\eSeries\Customer\Source\CustomTags folder to the C:\CFusionMX\CustomTags folder.

6. (upgrades only) If you are not using the iMISpublic application in your iMIS 15 environment, you must slightly modify the instructions in all of the following steps. For any step that refers to the iMISpublic application's virtual directory in IIS or the corresponding local path in the file system, you must instead substitute your current e-Series virtual directory and local path.

   Caution! If you are using the iMISpublic application in your iMIS 15 environment, then you must follow the remaining steps exactly, without substitution, to ensure that e-Series and e-CM are properly integrated with the iMISpublic application.

7. Use IIS Manager to locate the file system folder that contains your iMISpublic application files.

- Open IIS Manager and expand the folder tree to display the folders beneath the Default Web Site.
- Right-click the iMISpublic application and choose Properties.

  The Properties window appears.

- Write down the Local Path value that is displayed in the Virtual Directory tab. (This is C:\Program Files\ASI\iMIS15\iMIS_public by default.)

8. Move the entire contents from the C:\eSeries\Customer folder to the file system folder that contains the root of your virtual directory for the iMISpublic application (for example,

to C:\Program Files\ASI\iMIS15\iMIS_public). If any file overwrite warnings are displayed, click Yes to All to approve the overwrites.

9. (e-CM only) Edit the IIS default documents and custom errors for the iMISpublic application.

- Open IIS Manager and expand the folder tree to display the folders beneath the Default Web Site.
- Right-click the iMISpublic application and choose Properties.

  The Properties window appears.
- On the Documents tab, click Add and specify the file name Template.cfm.
- Click OK and then click Move Up to position the Template.cfm file at the top of the list.
- On the Custom Errors tab, modify the error handler for 403;14 as follows:
- Message type: Select URL
- URL: Enter /iMISpublic/AM/404ErrorHandler.cfm (Assuming your iMISpublic application uses the default name. If you specified a different name for the iMISpublic application, use that name accordingly in the URL.)
- On the Custom Errors tab, modify the error handler for 404 as follows:
- Message type: Select URL
- URL: Enter /iMISpublic/AM/404ErrorHandler.cfm (Assuming your iMISpublic application uses the default name. If you specified a different name for the iMISpublic application, use that name accordingly in the URL.)
- Click OK.

10. Modify a key in the iMISpublic application's web.config file to prevent issues that can occur if e-Content Manager is not being used to customize e-Series or iMIS 15 Public view content.

    Note: Skip this step if you are not using the iMISpublic application.

- Open IIS Manager and expand the folder tree to display the folders beneath the Default Web Site.
- Right-click the iMISpublic application and choose Properties.

  The Properties window appears.
- On the ASP.NET tab, click Edit Configuration.

  The ASP.NET Configuration Settings window appears.
- On the General tab, in the Application Settings area, edit the EnableContentManager key to be true.
- Click OK.

11. Create a SQL Server login for e-Series and ColdFusion to use for ODBC and JDBC connections.

    Caution! Do not use the Create_CF_Login_For_Customer.sql script, as in previous releases. Instead, manually create the SQL Server login as follows.

- Open SQL Server Management Studio and log onto your iMIS database server host.
- In the Object Explorer pane, collapse the Databases folder so that you can locate the Security folder for the host itself. (As opposed to the Security folder for a specific database).
- Right-click the host's Security folder and choose New > Login.

  The Login - New window appears.
- In the Login name field, specify a meaningful name for this login so that other database administrators will recognize it as a special login used for e-Series and ColdFusion data sources (for example, CF_ESERIES).
- Select SQL Server authentication and specify a strong password for the new login.
- Record this login name and password for safekeeping. You will need these at several points in the process of installing and configuring e-Series and ColdFusion.

- If the following checkboxes are displayed on the window (this depends on whether the database server supports mixed authentication), set them as follows:
- Enforce password policy - Select this checkbox.
- Enforce password expiration - Clear this checkbox.
- User must change password at next login - Clear this checkbox.
- From the Default database field, select your iMIS 15 database.
- Click OK.
- In the Object Explorer pane, expand the Databases folder so that you can locate your iMIS database.
- Expand the node for your iMIS 15 database so that you can locate the database's Security folder.
- Right-click your database's Security folder and choose New > User.

  The Database User - New window appears.
- In the User Name field, enter the name of the SQL Server login that you defined for use by e-Series and ColdFusion (for example, CF_ESERIES).
- Select Login name and in the associated field, enter the name of the SQL Server login that you defined for use by e-Series and ColdFusion (for example, CF_ESERIES).
- In the Owned Schemas list, select the db_owner checkbox.
- Click OK.

12. (e-Series only) Create an ODBC data source for the e-Series connection to the iMIS 15 database.

- Choose Start > Administrative Tools > Data Sources (ODBC).

  The ODBC Data Source Administrator window appears.
- On the System DSN tab, click Add.

  The Create New Data Source window appears.

- From the list, select SQL Server and click Finish.

  The Create a New Data Source to SQL Server wizard appears.
- In the Name field, specify a meaningful name such as e-Series. You may optionally specify a Description too.
- From the Server drop-down list, select the SQL Server host that contains your iMIS 15 database.
- Click Next.

  The second page of the wizard appears.
- Select With SQL Server authentication using....
- Click Client Configuration.

  The Add Network Library Configuration window appears.
- From the Network libraries options, select TCP/IP.
- Click OK.

  Your focus returns to the Create a New Data Source to SQL Server window.
- Select the Connect to SQL Server to obtain... checkbox.
- In the Login ID field, enter the name of the SQL Server login that you defined for use by e-Series and ColdFusion (for example, CF_ESERIES).
- In the Password field, enter the password that you defined for the SQL Server login that you defined for use by e-Series and ColdFusion.
- Click Next.

  The third page of the wizard appears.
- Clear the Use ANSI quoted identifiers checkbox.
- Clear the Use ANSI nulls, paddings and warnings checkbox.
- Click Next.

The fourth page of the wizard appears.

- Select the Perform translation for character data checkbox.
- Click Finish.

  The ODBC Microsoft SQL Server Setup window appears.
- Click Test Data Source.

  If the test completes successfully, your data source for e-Series and ColdFusion is working properly.

13. (e-CM only) Create a JDBC data source for the e-CM connection to the iMIS 15 database.

- In ColdFusion Administrator, go to Data Sources.
- From the drop-down list of drivers, select Microsoft SQL Server.
- Click Add and specify the connection information for the SQL Server login that you defined for use by e-Series and ColdFusion in a preceding step.
- Continue with the section Configuring ColdFusion and all remaining implementation sections of the e-Series and/or e-CM references.
- (upgrades only) Reapply all customizations to your e-Series and e-CM content as needed.
- If you are using e-CM alongside iMIS 15.1 and later releases, you must make some modifications to the master page of every existing website that is set up to be an ASP.NET website. These modifications ensure that the websites will work properly in the 15.1 environment (and later releases). For more information, refer to To modify master pages for iMIS 15.1 and later.

To modify master pages for iMIS 15.1 and later

If you are using e-CM alongside iMIS 15.1 and later releases, you must make some modifications to the master page of every existing ASP.NET website. These modifications ensure that the websites will work properly in the newer iMIS environment.

You perform this modification only once for all existing ASP.NET websites. All new ASP.NET websites that are created after you've upgraded iMIS will already have these modifications.

Note: These changes do not apply to ColdFusion websites, because they use .cfm files instead of master pages.

1. Change the base class inherited by the master page.

- Locate the following code:

  <%@ Master Language="C#" AutoEventWireup="true" Inherits="Asi.ContentManagerNet.MasterPageBase" %>

- and change it to this:

  <%@ Master Language="C#" AutoEventWireup="true" Inherits="Asi.Web.UI.MasterPageBase" %>

2. Find the form element that has id="mainform" and change its id attribute to id="TemplateForm".
3. Insert the following element directly after the form element that you modified in the preceding step:

   <asp:ScriptManager ID="ScriptManager1" runat="server" EnablePageMethods="true" EnablePartialRendering="true" EnableScriptGlobalization="true" AsyncPostBackTimeout="3600"></asp:ScriptManager>

4. Add a new content placeholder for the iMIS 15.1 environment's template button bar, which is the control that conditionally displays Save and Cancel buttons, etc. at the bottom of the Main Content Area of an interior page.

- Find the tr element that contains an asp:ContentPlaceHolder element that has id="TemplateBody". The code for the entire tr element should look similar to this:

  <tr>

    <td class="interior_main_content interior_main_content_style">

```
    <div id="interior_ca_6_style">
      <CM:TemplateAreaSection ID="ContentArea6" TemplateAreaName="Content Area 6" runat="server" />
    </div>
    <div class="interior_main_content_breadcrumb_style">
      <CM:BreadCrumb ID="BreadCrumb1" runat="server" />

      <a id="content" class="skiplinks"></a>
      <asp:ContentPlaceHolder ID="TemplateBody" runat="server">
      </asp:ContentPlaceHolder>
    </div>
  </td>
</tr>
```

- Immediately following the tr element you found in step 4.a, add the following new tr element:

```
 <tr>
   <td style="width:100%">
     <div style="float:right; white-space:nowrap; margin-right: 10px; background-color:White; display:inline;">
       <asiweb:CommandButtonBar ID="ButtonBar" runat="server" TargetControlID="ContentDiv" />
       <asp:ContentPlaceHolder ID="TemplateButtonBar" runat="server"></asp:ContentPlaceHolder>
     </div>
   </td>
```

</tr>

5. Find every element that begins with <%= and change these to begin with <%# instead. In the default master pages for each of the Template Gallery templates in e-CM, the following elements will need to be changed like this. (The following list shows the original <%= value that must be changed to <%#.)

- 1501
- <%= GetContentAreaStyle(1) %>
- <%= GetContentAreaStyle(2) %>
- <%= GetContentAreaStyle(3) %>
- <%= GetContentAreaStyle(4) %>
- 1502 - contains none of these elements
- 1503 - contains none of these elements
- 1504
- <%= ContentAreaStyle %>
- 1505 - contains none of these elements
- 1506
- <%= GetContentAreaStyle(1) %>
- <%= GetContentAreaStyle(1) %>
- <%= HeaderStyle %>
- 1507
- <%= ContentArea1Style %>
- <%= FooterAreaStyle %>
- 1508
- <%= HeaderAreaStyle %>

- <%= FooterAreaStyle %>
- 1509
- <%= GetContentAreaStyle(1) %>
- <%= GetContentAreaStyle(2) %>
- <%= HeaderAreaStyle %>
- 1510
- <%= GetContentAreaStyle(1) %>
- <%= GetContentAreaStyle(2) %>
- <%= HeaderAreaStyle %>

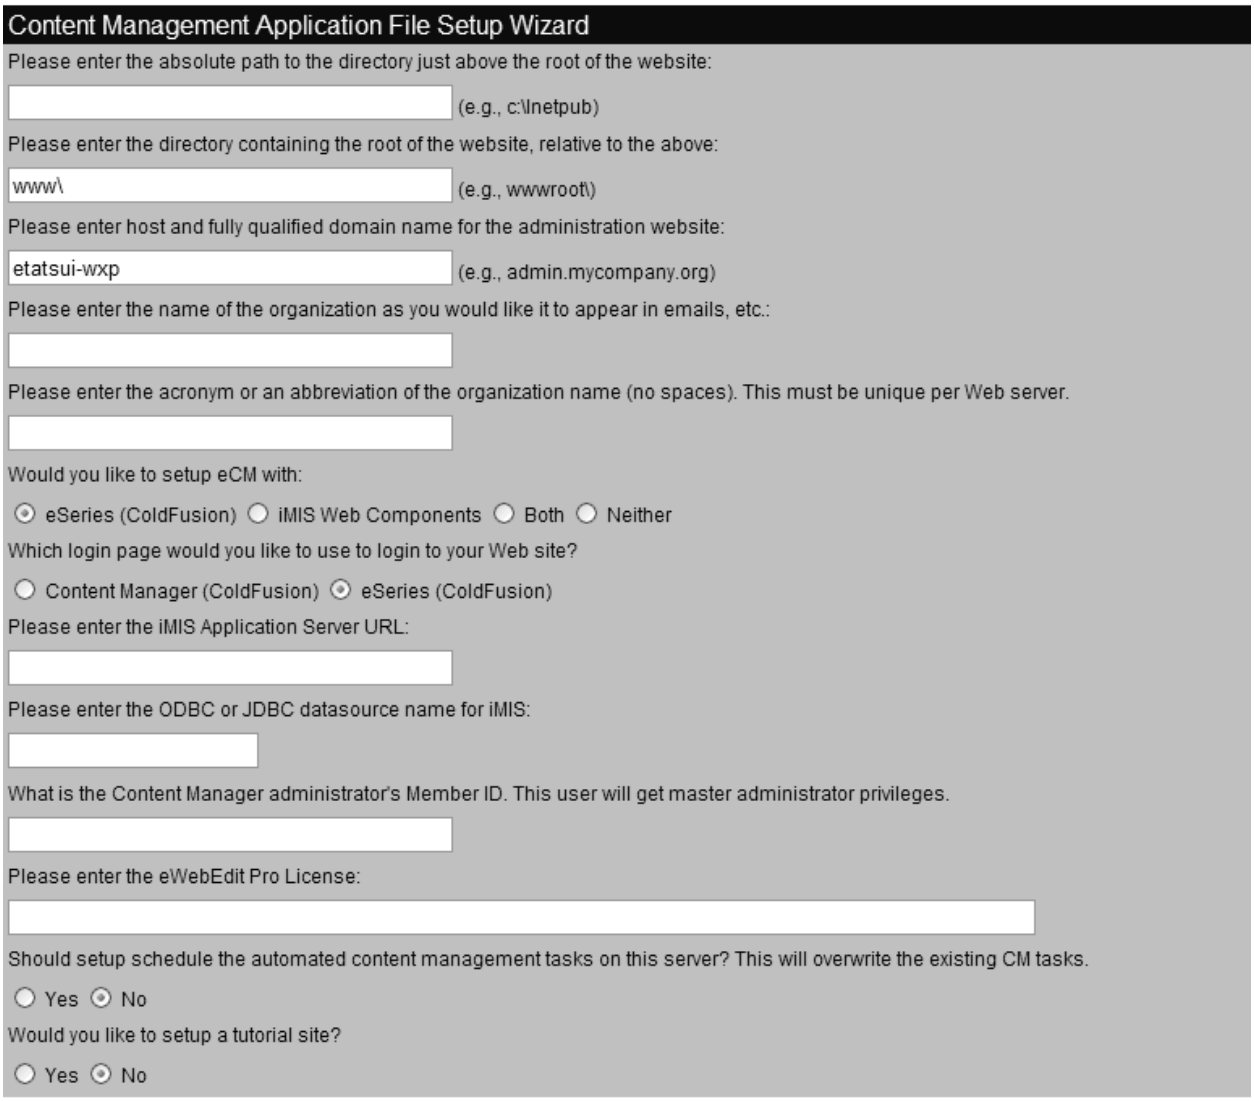
Running the e-CM Wizard

Required: Upgrading from Option 2 to Option 1

Content Manager 5.0 supported two e-CM configurations:

- Option One (one database): Implement e-CM as part of iMIS database.
- Option Two (two databases): Implement e-CM as a separate database, using iMIS for authentication.

iMIS 15's web-based structure and integral use of content management tools, as well as web-based security and performance advances, requires Option One for iMIS 15.0 and forward. If you are upgrading from Option Two, you must move to a single database setup in order to upgrade to iMIS 15.



Content Management Application File Setup Wizard

Enter the information for your website in the Content Management Application File Setup Wizard and click Continue.

Please enter the absolute path to the directory above the root of the website:	The Root Level of where the e-CM Files are installed. Example: c:\eCM
Please enter the directory containing the root of the website, rel-	Next level down from Root. Example: Customer

ative to the above:	
Please enter host and fully qualified domain name for the administration website:	Machine name or IP of where files are mapped in IIS. Example: 196.34.36.123 or my.machine.org
Please enter the name of the organization as you would like it to appear in emails, etc.:	Name that appears in emails that e-CM sends as well as Window Titles in e-CM Admin Portal
Please enter the acronym or an abbreviation of the organization name (no spaces). This must be unique per webserver.	Short abbreviation or acronym for client website. Name also is used when creating Verity Collections and scheduled tasks in ColdFusion
Would you like to setup e-CM with e-Series (ColdFusion), iMIS Web Components, Both, or Neither?	Choose the option that specifies which sources of iMIS web content you plan to use e-CM to manage. Note: Neither (Option 2) is unsupported.
Which login page would you like to use to login to your website?	If using e-Series or iMIS Back office choose e-Series.
Please enter the iMIS Application Server URL	URL of the iMISpublic virtual web server of iMIS 15 (The Public view of iMIS). Example: http://appserver-Name/imispublic
Please enter the ODBC or JDBC datasource name for iMIS:	Data Source pointing to the iMIS database Note: Running against an empty iMIS database (Option 2) is unsupported.
What is the e-CM administrator's Member ID. This user will get master administrator privileges.	iMIS ID or record ID of initial designated Administrator of e-CM
Please enter the eWebEdit Pro License:	License Key for Ektron WYSIWYG html editor. If License is not known or unavailable, enter “n/a”. Can be updated at a later time.
Should setup schedule the auto-	Used to schedule e-CM activities such as reindexing

mated content management tasks on this server? This will overwrite the existing CM tasks.	collections, deleting expired content, notifying producers for expiring content. These are all scheduled through the ColdFusion task scheduler
Would you like to setup a tutorial site?	Recommended for first time installs.

After running the e-CM Wizard

If successful, you will see the verity collections created using the name that was entered in the acronym field, and be prompted to log in to the e-CM Administrative Portal.

You may be prompted to install the Macromedia Flash Plug-in. If prompted, choose Yes.

If you chose the tutorial site for the e-CM Wizard, a new site has been copied to the web-server, which you need to configure.

The login and password will match the ID of the user inserted in the e-CM Wizard.

Caution! After you run the Wizards, disable all access to the Wizards folder in Internet Information Server.

To configure the Administration Portal site

If you installed e-CM into a virtual directory in IIS, you must modify some properties of the admin website.

1. Log in to the e-CM iMIS Website Administration Portal.
2. Go to the website properties page for the website Administration Portal site.
3. Under the prompt, "If you are using more than one website with the same URL entered above, please enter the unique URL that will go directly to this Website." add the virtual directory and append /admin to the end of the path. (In an iMIS 15 environment that uses the iMISpublic application, the virtual directory name is iMISpublic by default.) For example:

- www.examplesite.com/virtualdirectory/admin
- iMIS 15: www.examplesite.com/imispublic/admin

4. Save your changes.

Enabling search of HTML content

To enable searching of HTML content in ColdFusion, perform these steps:

1. Navigate to the Collections folder that is located at the root of the website.
2. Navigate to the OrganizationName_1_Content\style folder and delete the style.vgw file.
3. Navigate to the Collections folder that is located at the root of the website.
4. Navigate to the OrganizationName_2_Content\style folder and delete the style.vgw file.

Checklist: e-CM post-installation

- Review Database Tables Created and Populated
- Review ColdFusion Scheduled Task created
- Review Services Installed
- Review Folders created on server once Publishing service started

Configuring ColdFusion

Section Goal

The goal of this section is for you to gain the knowledge and skills needed for configuring ColdFusion.

After completing this section, you will be able to perform the following tasks:

- Register custom tags
- Connect ColdFusion to a data source
- Configure ColdFusion settings
- Map ColdFusion to the source directory
- Enable ColdFusion debugging

Registering Custom Tags

You must register the custom tags for ColdFusion to interpret SQL commands.

To register the TCPClient custom tag

You must register the CFX_TCPClient custom tag to verify the connection to the PayPal server.

1. Log in to ColdFusion Administrator.
2. Under Extensions, select CFX Tags to display the CFX Tags page.
3. Click Register C++ CFX to display the Add/Edit C++ CFX Tag page:

- Enter CFX_TCPClient for the Tag Name.
- Browse to the Server Library (.dll). For example, C:\C-fusionMX\CustomTags\TCPClient.dll).
- Enter ProcessTagRequest for the Procedure.
- Enable Keep Library Loaded.
- Enter a Description.

4. Click Submit to return to the CFX Tags page. The tag displays under Registered CFX Tags.

Connecting ColdFusion to a Data Source

ColdFusion requires a connection to a data source for e-Series to update your database.

To connect ColdFusion to a data source

Before connecting ColdFusion to a data source, make sure an ODBC data source has been created on the server.

1. Log in to ColdFusion Administrator.
2. Under Data & Services, select Data Sources to display the Data Sources page.
3. Add a new data source:

- In the Data Source Name field, enter the name of the data source created on the server for your e-Series installation.
- Select a Driver. (For combined e-Series and e-CM sites, you must select Microsoft SQL Server for the driver.)

- Click Add to open the Data Source Connection page (page name varies according to the Driver selected).

4. Click Show Advanced Settings to expand the page and view all connection options.
5. Enter the CF_Customer Username and Password.
6. (optional) For MSDE, limit simultaneous connections to five users:

- Enable Limit Connections.
- Restrict connections to 5.

7. Click Submit to update the data source and return to the Data Sources page. ColdFusion automatically verifies the connection (indicated by the Status of the data source). To verify all data source connections, click Verify All Connections.

Configuring ColdFusion Settings

e-Series requires the configuration of several ColdFusion settings.

To change variable storage from the Registry to a database

e-Series uses ColdFusion application and session variables. By default, ColdFusion stores client variables in the Windows registry for a period of 90 days. However, storing application and session variables in the registry may cause the registry to fill up, which can cause ColdFusion applications to stop and can seriously affect the performance of the Windows server. To prevent this, all variables should be stored in a table in a SQL Server or Access database using ODBC.

1. Create a new empty database using MS SQL Server or MS Access. Avoid using your iMIS database.
2. Create an ODBC data source named CFVariables that points to your new empty database. Use the administrator login without using a password, and test the data source connection.
3. Log in to ColdFusion Administrator.
4. Connect ColdFusion to the CFVariables data source.
5. Under Server Settings, select Client Variables to display the Client Variables page.

6. Under Select Data Source to Add as Client Store, select CFVariables from the drop-down list, and click Add to open the Add/Edit Client Store page.
7. Enable the following options:

- Create Client database tables (can be run only once).
- Purge data for clients that remain unvisited for xxx days (2-5 days is recommended).
- Click Submit Changes to add the data source and return to the Client Variables page.

8. Select CFVariables as the default storage mechanism for client sessions, and click Apply. (Do not select the registry as the default storage mechanism for client sessions.)
9. In SQL, give the CF_Customer user full permission for the CFVariables database.
10. Return to the CFVariables OBDC data source created in Step 2, and change the login and password to CF_Customer.

    Note: For SQL Server, it is not necessary to change the login in the ODBC data source because the password is not saved in the data source (assuming "sa" password is not blank).
11. In ColdFusion Administrator on the Data Sources page, select CFVariables to edit the data source connection, and change the Username and Password.

    Note: If you delete the default database or truncate tables after you set them, you will not be able to get back into ColdFusion.

To configure mail server settings

For e-Series to connect to your mail server, you must enter the mail server's IP address in ColdFusion. If a customer tries to register for a meeting or edit their record and the mail server's address is not populated, an error message displays:

No SMTP Server Specified for CFMAIL.

Note: The mail server IP address does not have to be a valid address until the e-Series site is public.

1. Log in to ColdFusion Administrator.

2. Under Server Settings, select Mail to display the Mail Settings page.
3. Enter the Mail Server IP address.
4. (optional) Accept the default Server Port, or enter a different one.
5. Enter the number of seconds for the Connection Timeout (the time ColdFusion should wait for a response from the mail server).
6. Click Submit Changes.

Mapping ColdFusion to the Source Directory

You must map ColdFusion to the source directory, which contains the encrypted business logic code for e-Series modules.

To map ColdFusion to the source directory

1. Log in to ColdFusion Administrator.
2. Under Server Settings, select Mappings to display the ColdFusion Mappings page.
3. In the Logical Path field, enter the IP Address of the machine where the site files are being staged. Because we are using a virtual directory for the customer site, add /eSeries (or your site name) after the IP address.
4. Enter the Directory Path by browsing to the eSeries folder. (The name in the directory path must match the name of the folder exactly.)
5. Click Update Mapping.

Enabling ColdFusion Debugging (optional)

The debugging features of ColdFusion are helpful when you are trying to determine the cause of problems that may occur when you install e-Series.

To enable ColdFusion debugging

1. Log in to ColdFusion Administrator.
2. Under Debugging & Logging, select Debugging Settings to display the Debugging Settings page.
3. Enable the following options:

- Enable Debugging.
- Enable Performance Monitoring.

4. Click Submit Changes.

Securing e-CM

In e-CM, authority groups must be assigned to navigation items and content folders. You can add content authority groups and content managers as needed. When you begin adding and organizing the website content, determine who will be responsible for specific site navigation items and content records. For example, if all staff members responsible for website content will be allowed to add, edit, and delete all website content, you may want to assign all of these staff members to the Master Admin content authority group. However, if you want to assign responsibility for specific website content areas to specific staff members, you can create several content authority groups and assign each staff member to the appropriate group.

A content authority group should normally give full permissions to the Webmaster and the core members of the website content team. Content managers who are only responsible for specific site navigation items and content records can be assigned the appropriate permissions. For example, if all changes made by a specialized contributor need to be approved by the Webmaster or a core member of the website content team, you can assign the specialized contributor edit permissions but not approval permissions.

Note: User permissions are read and stored in memory when the user logs in. Any changes made to the account of a user who is logged in do not take effect until the user logs out and then logs in again.

Master Admin Group

The “Master Admin” group, which is marked with an asterisk in the list of authority groups, is a special group. If a user is in “Master Admin,” they will carry at least the permissions they have in that group to all content owned by all groups, even if they are not a member of the group that owns the content. If their permissions in a specific group are higher than those they have in “Master Admin,” the higher specific permissions will apply.

Typically, your Webmaster and/or core web staff members should be assigned to Master Admin with full permissions. This will allow them to go anywhere on the website(s) and do whatever they need to any content without having to first add themselves to the groups that own the content.

Any member of the Master Admin “super group” can also publish all approved content in a website by clicking on the publish button at the top of the list of items or folders, regardless of what permissions they have in Master Admin.

Reviewing Security Manager Settings

To find client settings for Security Manager:

1. Log in to the e-CM administrative interface.
2. Select Admin.
3. Select Site Maintenance.
4. Select Security Manager from the list of installed modules.

   Note: When you enter e-CM settings, the Client Settings tab displays by default.
5. If you make any changes, click Save or Refresh. After navigating to the client settings page, change any settings you wish.

   Note: If you click Save, your settings will go live when Reset Server Variables is selected or when the application variables for the site time out.

Security Manager variables

eCM provides several settings or variables that assist in maintaining site security. These variables are accessible under Admin > Site Maintenance > Security Manager > Define. Not all of these variables will be useful to you, but reviewing the descriptions is worthwhile. For example, several useful variables help you block, track, and unlock logins.

To block simultaneous login

If SCBlockSimultaneousUsers is enabled, the system checks to see if someone with the same ContactID is already logged in. The system can detect that the same user has

logged in twice, after accidently closing the original browser window, and lets them back in. If the user credentials do not match, the system detects that the user is logging in from a different browser and blocks the second login. If the inactivity time limit has passed, the user can log back in immediately.

This prevents users from using the same login in two simultaneous sessions. When the user is blocked, they are presented with the message stored in SCSimUlUserBlockedMessage. If the user logs out, using the standard logout page, all of their information is cleared, and they can log back in immediately.

To release locked login

If user login tracking has been enabled, you can go to /AM/Admin/Security/showLoggedInUsers.cfm. This interface will show you all the users who have logged into CM, their names, email addresses, iMIS IDs, current location and when they got to that location.

The page that unblocks users is at /AM/Admin/Security/clearSimUserBlock.cfm. This page provides a mechanism for unlocking any specific person or all people in the system. If someone calls into the organization saying they are locked out, an e-Series administrator can use this page to unblock that specific user.

Managing Content Authority Groups

To create a content authority group

Note: When a new content authority group is created, it does not contain any members.

1. From the e-CM Admin page, select Website.
2. Select Content Managers.
3. Select View All Groups.
4. Enter the Group Name.
5. Select Create.

To change the name of a content authority group

1. From the e-CM Admin page, select Website.
2. Select Content Managers.
3. Select View All Groups.
4. Select the Edit icon displayed to the left of the group.
5. Enter the new name in the Group Name field.
6. Select Update.

To delete a content authority group

1. From the e-CM Admin page, select Website.
2. Select Content Managers.
3. Select View All Groups.
4. Select the Delete icon displayed to the left of the content authority group to be deleted. A confirmation message displays.
5. Click OK to delete the group.

Adding Content Managers to an Authority Group

To add a member to a content authority group

Note: If the user you wish to add is not in the member or user database, you must first add the user to the appropriate database.

1. From the e-CM Admin page, select Website.
2. Select Content Managers.
3. Select View All Groups.
4. Select the group to edit or select the Edit icon.
5. Select Add.
6. Select or enter the member information.

- To select an existing member, select the name from the drop-down list, or
- To select a user from the database that has never been a content producer, enter data into one of the following fields:
- First name and last name
- Member ID
- First name, last name, and member ID

7. Select Add.
8. Select the permissions for the member.
9. Select Update.

Selecting e-CM Permissions

The following permissions can be assigned to a content manager:

- Content Editor - A user with Content Editor permission can access and edit content that is owned by the authority group and can publish previously approved content, but cannot approve content. You should normally assign this permission to any user who needs to work with content that is owned by the group.
- Upload - A user with Upload permission can upload files and attach them to a content record. You should normally assign this permission to all content editors unless there is a specific reason not to assign this permission.
- Content Approver - A user with Content Approver permission can approve and publish any content record (either in a navigation item or a content folder) owned by the group. You should normally assign this permission to the lead content producer in the group (along with the Nav/Folder Editor permission, which gives the user the authority to publish navigation items and content folders).
- Nav/Folder Creator - A user with Nav/Folder Creator permission can create, update, and delete navigation menu items and content folders in areas of the website that are owned by the group. This is a high-level administrator permission that normally should be given to very few users. This permission allows the user to rearrange or delete entire sections

of the website.

- Nav/Folder Editor - A user with Nav/Folder Editor permission can edit settings on any navigation items or content folders owned by the group publish any content in navigation items or content folders owned by the group, and publish entire content folders or navigation items that are owned by the group.
- Default Owner - A user who is designated as the Default Owner is the default owner of any new navigation item or content folder if no owner is specified for the navigation item or content folder.

To set content manager permissions

1. From the e-CM Admin page, select Website.
2. Select Content Managers.
3. Select View All Groups.
4. Select the Authority Group.
5. Select the user.
6. Select the appropriate permissions for the user.
7. Select the toolbar you want the user to access.
8. Select Update.

Managing Security Assignment Permissions

Security assignment permissions give you general permissions to do things in e-CM (as opposed to ownership permissions over specific content). Here we will explain permissions as they apply to content producers.

Note: To view a list of managers in a group, select Website> Content Managers, View Groups by Editor.

Reviewing Content Producer Security Assignments

When a content producer is initially assigned to a group, they are automatically given the security assignment permission required to access navigation owned by their group(s).

They are also allowed to view the navigation items of any Website on which any of their groups is active. However, unless their security settings are altered they cannot:

- Access content folders
- Create, update or delete tagged page designs
- Edit the tagging categories
- Edit their own permissions in authority groups
- View or change website properties

If you want to give a user advanced permissions, you will have to alter their security settings.

To view security permissions

1. From the e-CM Admin page, select Admin.
2. Select Security Assignment.
3. Enter the user's search information and click Find.
4. Select the user's name to view their security assignment.

To modify a user's security settings

If you change a user's security assignments while the user is logged in, the user must log out and then log in again to receive their updated security assignments.

1. From the e-CM Admin page, select Admin.
2. Select Security Assignment.
3. Enter the user's search information and click Find.
4. Select the user's name to view their security settings.
5. Enable or disable the appropriate permissions.
6. Click Assign.
7. From the e-CM Admin page, select Website.

8. Select Content Managers.
9. Select View All Groups.
10. Select the content authority group that contains the member or select the Edit icon displayed to the left of the content authority group.
11. Select the Delete icon displayed to the left of the member. A confirmation message displays.
12. Click OK.

Managing Authority Groups

When you first set up e-CM, most of your content will probably be owned by one of the default groups set up when e-CM is installed.

As you begin to add and organize your content, think about who will be responsible for each navigation item and folder. If a small number of on-site staff members who work closely with each other will be responsible for all content, it might be fine to stick with the default groups and give staff members different permissions based on their authority over website content.

At the other extreme if you have a need to allow, for example, someone to maintain content in only one navigation item or folder and don't want that person to be able to make changes anywhere else in your website, you will want to set up a special authority group for just that item.

If you have a large organization with multiple departments, you also need to be aware of different work styles in different departments. Some may prefer a very restricted model giving only one person authority to approve and publish; others may be much more relaxed.

To disable an e-CM account

If you need to disable a Content Manager's ability to access site navigation and content folders and do not have time to remove them from each authority group, you can change their security assignment settings by removing the Content Folders and Site Navigation

permissions. For example, if a staff member resigns, you should also disable their security settings.

To remove a user from a group

1. From the e-CM Admin page, select Website.
2. Select Content Managers.
3. Select View All Groups.
4. Select the content authority group that contains the member or select the Edit icon displayed to the left of the content authority group.
5. Select the Delete icon displayed to the left of the member. A confirmation message displays.
6. Click OK.

To edit a user's permissions in a group

1. From the e-CM Admin page, select Website.
2. Select Content Managers.
3. Select View All Groups.
4. Select the content authority group that contains the member or select the Edit icon displayed to the left of the content authority group.
5. Select the member or select the Edit icon displayed to the left of the member.
6. Modify the member's permissions as needed.
7. Select Update.

Setting Security Assignments

Security Overview

Workflow Manager controls which content users can view and the content they are responsible for in e-CM, but there is one level of additional security in Content Manager. This security level controls two things:

- Which applications users can view as administrators
- What general powers users have as administrators

The specific permissions you assign to users will vary depending on which modules you have installed and whether you are using e-CM or Content Manager. If a user attempts to access e-CM but does not have the required permissions, a warning message displays.

To review or modify users' security assignment permissions, you must have at least one account with permission to modify security assignments.

Modifying a user's security assignments

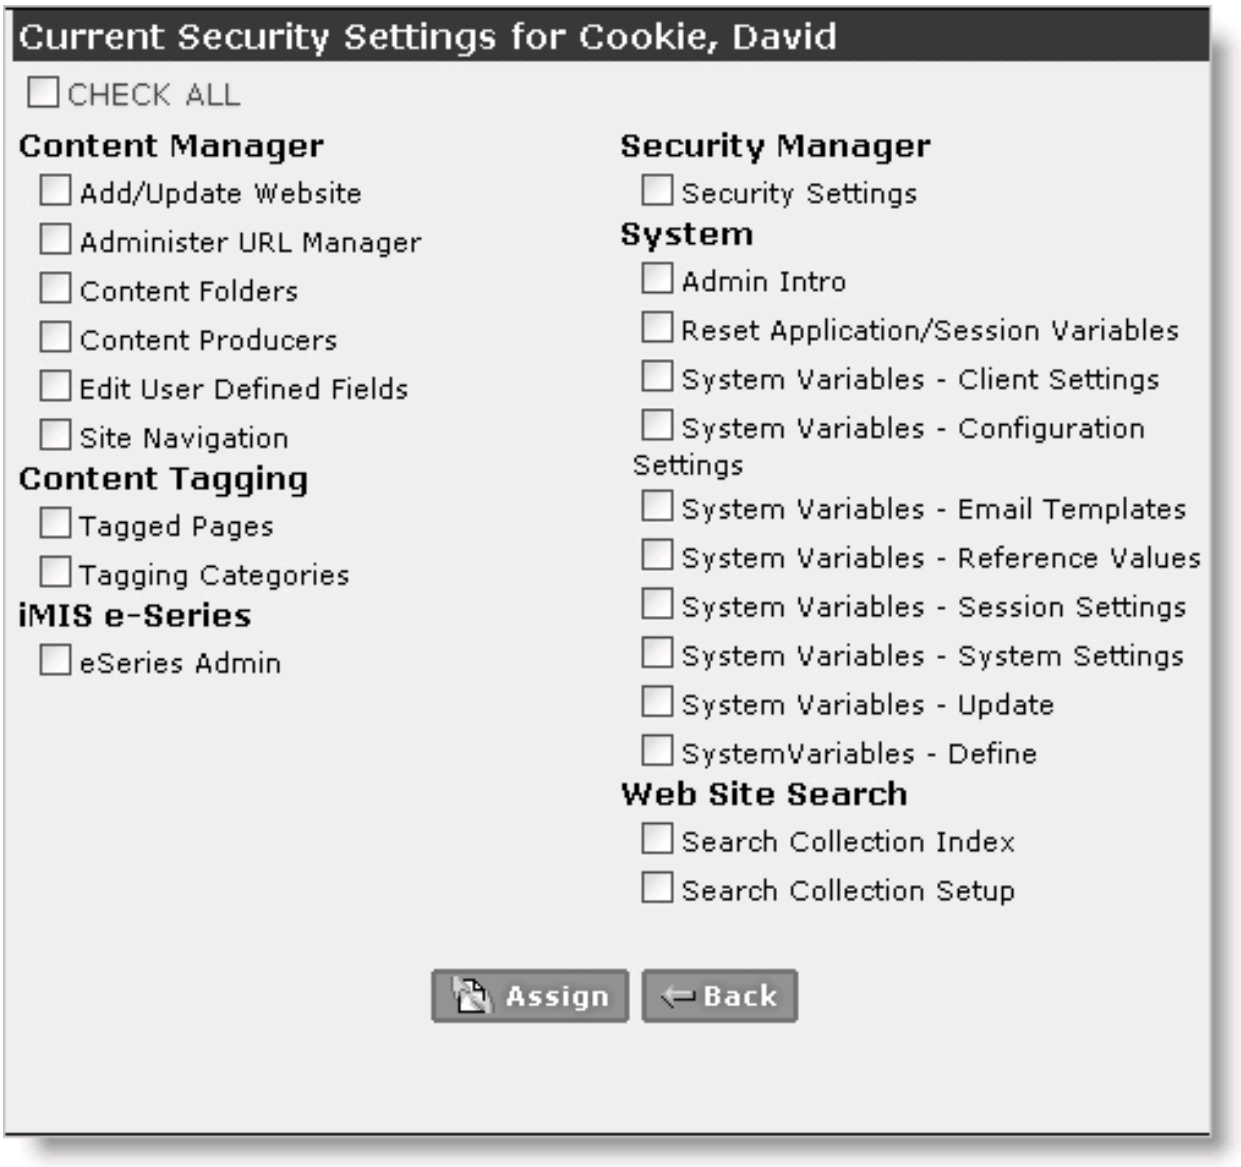
If you are logged in to an account that has permission to modify security assignments, perform the following steps to modify a user's security assignments:

1. From the e-CM Admin page, select Admin.
2. Select Security Assignment. A security assignments search page displays.
3. Enter the appropriate search information in the Find User area and select Find. The search results are displayed.

   Note: If the user does not have an account, you must create an account for the user in your database.
4. Select the user account from the Search Result list. The Current Security Settings page for the user displays.
5. Modify the user's security assignments as needed.
6. Select Assign. A message displays to confirm that the user's security assignments have been updated.

   Note: If you change a user's security assignments while the user is logged in, the user must log out and then log in again to receive their updated security assignments.

   Current Security Settings page



Current Security Settings

The Current Security Settings page contains the following options and icons:

CHECK ALL

Enable to enable all security assignments for the user.

Content Manager permissions

- Add/Update Website - Enable to allow the user to access the Sites selection on the Web-site navigation menu and create, edit, and delete websites.

- Administer URL Manager - Enable to allow the user to create shortcuts for long URLs. A confused or malicious user could cause minor problems by misusing this feature, but this option is not generally a significant security risk.
- Content Folders - Enable to allow the user to access content folders. The specific content folders the user can access and the operations the user can perform in these content folders are controlled by the user's authority group memberships and the user's specific permissions in these authority groups. If this option is not enabled, the user cannot access any content folders.
- Content Producers - Enable to allow the user to create, edit, and delete authority groups and content managers. This is a high-level permission which should only be given to administrators.
- Edit User Defined Fields - Enable to allow the user to edit user-defined fields. This is a high-level permission which should generally only be given to high-level administrators.
- Site Navigation - Enable to allow the user to access navigation menu items. The specific navigation menu items the user can access and the operations the user can perform in these navigation menu items are controlled by the user's authority group memberships and the user's specific permissions in these authority groups. If this option is not enabled, the user cannot access any navigation menu items.

  Content Tagging permissions

- Tagged Pages - Enable to allow the user to create, edit, and delete tagged pages and tagged page components.
- Tagging Categories - Enable to allow the user to create, edit, and delete tagging categories and perform other functions in the Tagged Pages administration menu (for example, search for tagged content records and reset cached pages).

  e-Series permissions

- e-Series - Enable to allow the user to administer e-Series.

  Security Manager permissions

- Security Settings - Enable to allow the user to access the security assignment interface. If this option is enabled, the user can modify the permissions of anyone on the site, so this option should only be enabled for high-level administrators who require access to the security assignment interface.

  System permissions

- Admin Intro - Enable to allow the user to view the administrative interface's "splash screen". This option does not present any security risk.
- Reset Application/Session Variables - Enable to allow the user to reset application and session variables.
- System Variables - Client Settings - Enable to allow the user to edit client settings.
- System Variables - Configuration Settings - Enable to allow the user to edit configuration settings.
- System Variables - Email Templates - Enable to allow the user to edit e-mail templates.
- System Variables - Reference Values - This option does not control any permissions relevant to Content Manager.
- System Variables - Session Settings - There is no need to edit session variables in Content Manager.
- System Variables - System Settings - Enable to allow the user to edit system settings in Content Manager.
- System Variables - Update - Enable to allow the user to access the editing module for all settings. This permission is required in order to access the specific types of variables the user has been given permission to access.
- System Variables - Define - Enable to allow the user to access the interface used to create the update interface. This option is not generally needed.

  Web Site Search permissions

Search collections are created during the e-CM installation process. You do not need to perform any additional setup for search collections.

Re-indexing is part of the automated process that runs nightly. It is recommended that you do not manually run the re-indexing process, because it is a resource-intensive process that generally takes 10-20 minutes to run and it normally reduces the website's performance.

If needed, you can re-index the search collections at any time from the Reindex Search Collections page (select Site Search and then select Reindex Search Collections).

- Search Collection Index - Enable to allow the user to manually re-index the site's search collections.
- Search Collection Setup - Enable to allow the user to modify the search collection setup.

Assign icon

Lets you assign the selected security assignments to the user.

Note: e-CM security settings are independent of e-Series security groups.

e-CM Settings

Content Manager's behavior is controlled in part by a variety of setting which can be found when you select Site Maintenance in the Admin section of the administrative interface.

e-CM settings are divided into several types:

- Client Settings: These are preferences about how the administrative and front-end interfaces work, some of which you may wish to change.
- Configuration Settings: Most configuration settings are set-up options which you are not likely to change once your site is set up.
- Session Settings: These are settings which apply to the “session” of a particular website visitor - there is no need to change them.

- System Settings: You will see a tab for system settings, but there are no system settings in Content Manager.
- Email Templates: These control the content and formatting of automated e-mails sent out by Content Manager.

  Note: These settings control the behavior of e-CM across all your websites.

Content Manager Settings tabs

Reviewing the e-CM settings

To find client settings for Content Manager:

1. Log in to the e-CM administrative interface.
2. Select Admin.
3. Select Site Maintenance.
4. Select Content Manager from the list of installed modules.

   Note: When you enter e-CM settings, the Client Settings tab displays by default.
5. If you make any changes, click Save or Refresh. After navigating to the client settings page, change any settings you wish.

   Note: If you click Save, your settings will go live when Reset Server Variables is selected or when the application variables for the site time out.

Client Settings Tab

Client settings allow you to control the behavior of the sites you are administering with your instance of Content Manager. While you may well want to leave most of the client

settings at their default values, it is worth at least taking a quick look at what preferences are available.

Quick Refresher on e-mail Reminders

Each individual content record in e-CM has an “expiration date,” set on a per-content record basis. As that expiration date is reached, the user who owns it will start to receive e-mail reminders indicating that the content needs to be updated.

Expiration Settings for a Content Record

CMExpAdditionalDays

Standard Description: The e-CM module has the ability to send automatic e-mail reminders to Content Managers at regular intervals, to ensure that content is current and updated. This variable sets the interval (number of days) at which reminders will be sent to the designated content managers.

What This Means: Like many of the variables on this page, this one controls the e-mails, which are sent out to owners of content which has expired (gone a specified number of days without being published and/or updated). The question asked by this variable is “how often do you want to bug people if they do not respond to the first e-mail?”

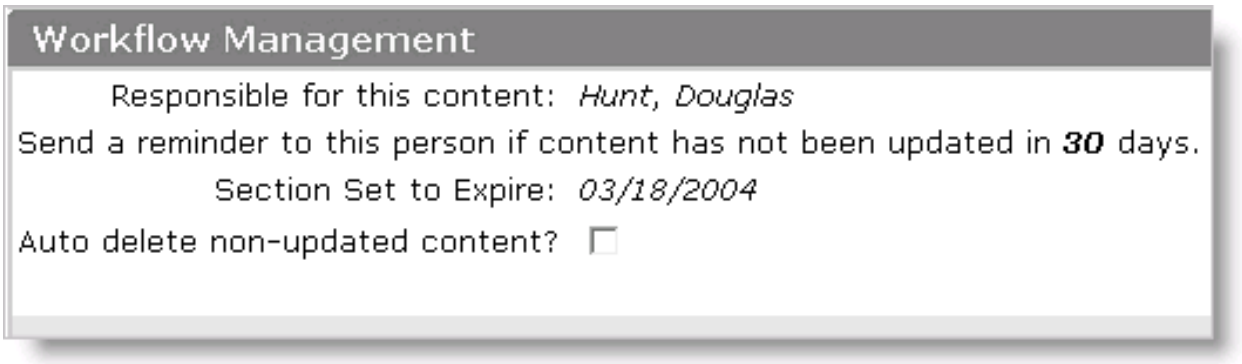
Default: The default is 7 days.

CMExpirationNotice1

Standard Description: e-CM is set up to send automatic e-mail notices to Content Managers for navigation menu items that have acquired an 'expired' status. This variable sets

the number of days after a section has 'expired' that the first e-mail notice is sent to the assigned content manager.

What This Means: When does the first e-mail go out to the owner after a content record has reached its expiration date?



Expiration Date

Default: 5

CMExpirationNotice2

Standard Description: e-CM is set up to send automatic e-mail notices to Content Managers about navigation menu items that have acquired an 'expired' status. This variable sets the number of days after a section has 'expired' that the second e-mail notice is sent to the assigned content manager.

What This Means: When does the second e-mail go out (if owner has not responded to the first by updating or re-publishing the content)?

Default: 10

CMExpirationWarning1

Standard Description: e-CM is set up to send e-mail reminders to Content Managers when navigation menu items are about to expire. This variable sets the number (which should always be a negative value) of days before a navigation menu section's expiration date, that the first e-mail warning is sent to the assigned content manager.

What This Means: How many days in advance of the expiration date should the owner of a content record receive the first warning that it is about to expire? Value should be a negative integer (should have a minus sign in front of it).

Default: -10

CMExpirationWarning2

Standard Description: e-CM is set up to send second e-mail reminders to Content Managers when navigation menu items are about to expire. This variable sets the number (which should always be a negative value) of days before a navigation menu section's expiration date, that the second e-mail warning is sent to the assigned content manager.

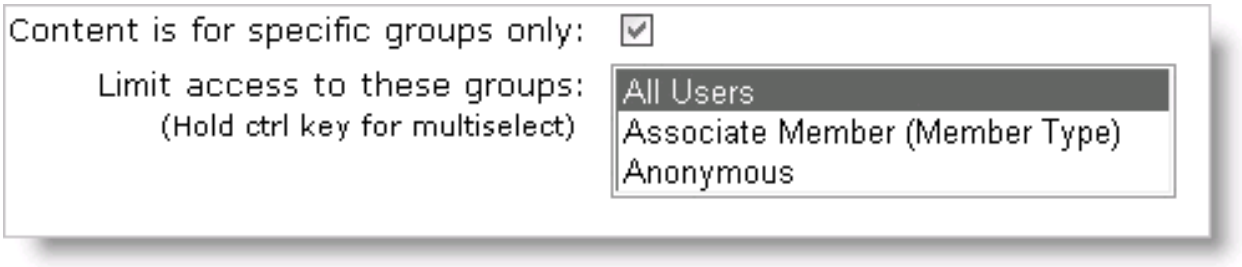
What This Means: How many days in advance of the expiration date should the owner of a content record receive the second warning that it is about to expire? Value should be a negative integer (should have a minus sign in front of it).

Default: -5

CMMemberTypeSelectSize

Standard Description: This variable determines the height of the member types multiple select box displayed on the content properties page.

What This Means: When a user selects the Limit access to these groups checkbox in a content record properties page, how many rows should there be in the multi-select box? If you have a large number of member types in use with e-CM, you will probably want to make this value larger to make it more convenient to find and select the groups.



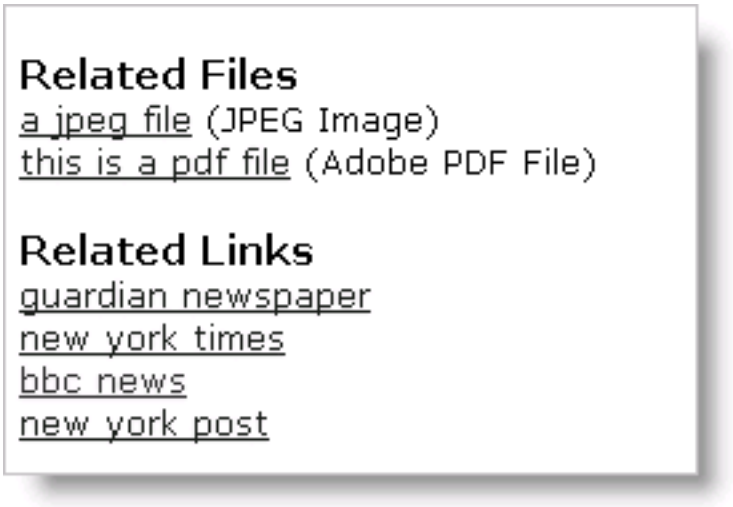
Limit Access Multi-Select, Content Record Properties Page

Default: 4

CMNewWindowFileTypes

Standard Description: With e-CM, you can upload different types of data (e.g., Word documents, Excel spreadsheets, and PDF files) in Content Records. This variable indicates which file types will be opened in a new browser window when the end-user clicks on the link at the front-end.

What This Means: When you upload files in a content record, which types should open in a new browser window? By default, the types are xls, pdf and doc. The overall list of types is built from the File_Type_Ref table.



Uploaded Files in a Content Record

Default: PDF,DOC,XLS

CMNewWindowParameters

Standard Description: Certain files such as Word documents, Excel spreadsheets, and PDF files may be opened in a new browser window (determined by the value of the CMNewWindowFileTypes variable) when an end-user clicks on the navigation link at the front-end. This variable allows you to modify the JavaScript that controls various attributes of the new window.

What This Means: This determines the size in pixels and the properties of new browser windows opened to show files. This takes the form of a comma-delimited list of name-e=value pairs. In this list, the value 0 is false; 1 is true.

Default: width-
=800,heigh-
ht=600,toolbar=0,directories=0,menubar=0,status=0,resizable=1,scrollbars=1.

CMResetAllContentExpDate

Standard Description: This variable determines whether or not to refresh expiration dates for content records, when a navigation item is published. If it's set to True, a content record will have a new expiration date every time it is published. If set to False, the content record will have a new expiration date when the content has actually been modified.

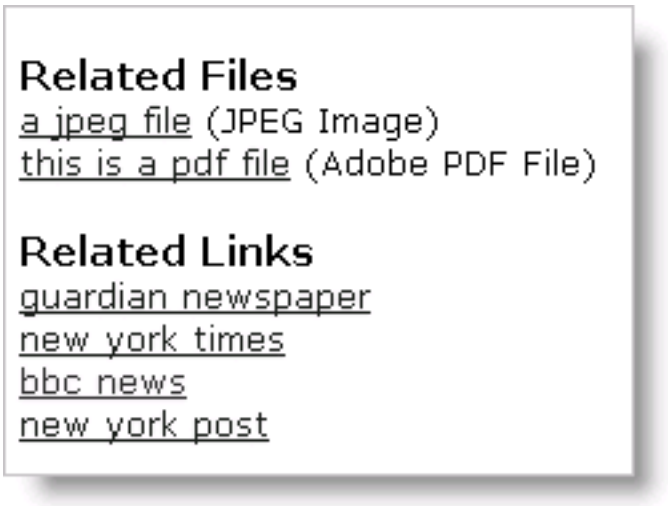
What This Means: In effect, this variable determines whether simply re-publishing a content record will re-set the expiration date (and thus stop the e-mails to the content record's owner) or if the user must actually modify the content as well. The advantage of the "True" setting is that it is easier for content producers. The advantage of the "False" setting is that it forces content producers to actually look at the expired content.

Default: True

CMShowFileTypes

Standard Description: With e-CM, you can display multiple content records as a list of records. These content records may contain data types such as Word, Excel and PDF files. Similarly, you may upload multiple files to a single content record. This variable indicates whether or not the file type description should be displayed at the front-end next to the content record title.

What This Means: When you upload files to a content record, will the filetype be displayed after the link. This is a nice courtesy to users, especially when clicking on the link will launch a helper application such as Acrobat Reader™ or result in the file being rendered in the browser.



File Types Displayed in a Content Record

Default: PDF,DOC,XLS

SMLevel1ExcludeLists

Standard Description: This variable determines the Level 1 navigation menu items that will not be displayed on the Site Map.

What This Means: When you choose content type Site Map in a navigation item, e-CM automatically creates a content record that will show users a site map on the front end. If there are level-one items that you do not wish to appear on the site map, you may select them in the SMLevel1ExcludeList multi-select box. The list in the multi-select includes all level-one items on all websites. A site map lists only the navigation items of the site it is on. Since the site map is dynamic, there is no need to re-publish it after changing your selections, although you will need to click the Refresh button at the bottom of the site settings page to make your changes “live.”

Default: Null

Client Settings Not Visible to User

CMWEPLicenseKey1

Standard Description: The variable sets the license key for the HTML Authoring tool (eWebEditPro 2.0 from Ektron) used in Content Manager.

What This Means: The web editor's license key. If this key is incorrect, not entered, or expired, users will see an “Invalid License” warning when they attempt to edit HTML in Content Manager.

Default: The default is not meaningful, as every instance of CM will have a unique license key.

Configuration Settings

There is generally no reason for customers to change configuration settings. We will include “what this means” explanations for a few of the settings which you might possibly have some reason to change.

CMDefaultContentTitleLength

Standard Description: This variable specifies the character limit for the name of published files.

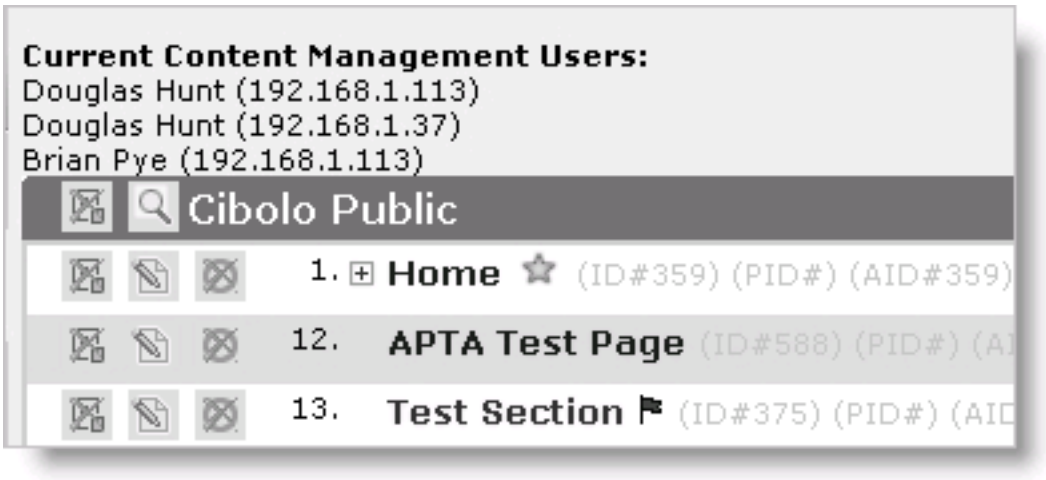
What This Means: When publishing very deeply-nested sites (many sub-levels of navigation), there is a possibility of bumping up against the 260-character limit for Windows 2002 path lengths. This variable can give a little extra “headroom” by limiting the length of the published files. This variable is not really needed except in sites with very deep navigation. It will only affect the names of the files, not what the user sees on the front end (unless they like to read long URLs).

Default: 20

CMDisplayDebugInfo

Standard Description: This variable determines whether or not information such as Nav_Menu items ID, parent ID, ancestor ID, and sort order is displayed in the administrative interface. Set the variable to 'false' to suppress the information.

What This Means: Debug information is often used during site setup and content migration. While debug information is not particularly annoying (it is “ghosted in” in light gray text) you probably won't want to use it on your site(s) once you are up and running. One useful feature of debug output is that it lists logged-in administrative users at the top of site navigation lists. Some customers use debug info because they like this feature.



A Site Navigation List w/ Debug Output

Default: False

CMe-CMFlag

Standard Description: Set this variable to 'True' for e-CM installations.

What This Means: This variable will be set to true if e-CM is integrated with e-Series, false when it is being run as a standalone application.

Default: True

CMGraphicalNavMenu

Standard Description: This variable indicates whether the graphic template used on your site will utilize graphics or HTML for navigation links at the front-end.

What This Means: Will your site use buttons for navigation. This would almost always be set to “True.”

Default: True

CMHTMLMaxLineLength

Standard Description: This variable sets the maximum number of characters for HTML content edited with eWebEdit Pro or the text editor. When saving HTML content, lines will

be broken at this value before going to the database. Set this variable to 0 (zero) to disable line breaking.

What This Means: This actually has nothing to do with how the user experiences HTML editing in Ektron, it has to do with where line breaks are put when the HTML file transmitted via SMTP. This variable is really here only for the convenience of helper programs which might allow users to subscribe to HTML content and can safely be left alone.

Default: 72

CMPublishingMaxNumOfAttempts

Standard Description: The number of tries publishing servers will attempt before marking a content record as failed.

What This Means: After the specified number of attempts, e-CM will stop trying to publish and write to the error log for the content folder or navigation item.

Default: 3

CMSendEmailOnApprovalRequest

Standard Description: Send e-mail to content approver when content is requested for approval.

What This Means: When a content producer without approval authority requests an approval, do you want the system to automatically send an e-mail to members of the authority group which owns the content who do have approval authority? If set to “False,” requests will still show up in the Task List, but no e-mails will be generated.

Default: True

CMSetSectionFromSession

Standard Description: This variable determines what section to pass to a template when loading content from content folder. If it's set to True, current section is passed. When its set to False, section specified in e-CM is passed.

Default: True

CMSetTemplateFromSession

Standard Description: This variable indicates whether to load a linked content in the current template or in the template specified in Content Manager. Set this to True to load in the current template.

Default: True

CMTagging

Standard Description: This variable determines whether or not the Content Tagging system will be used with the e-CM module. It should be set to 'true', if the Content Tagging module has been purchased.

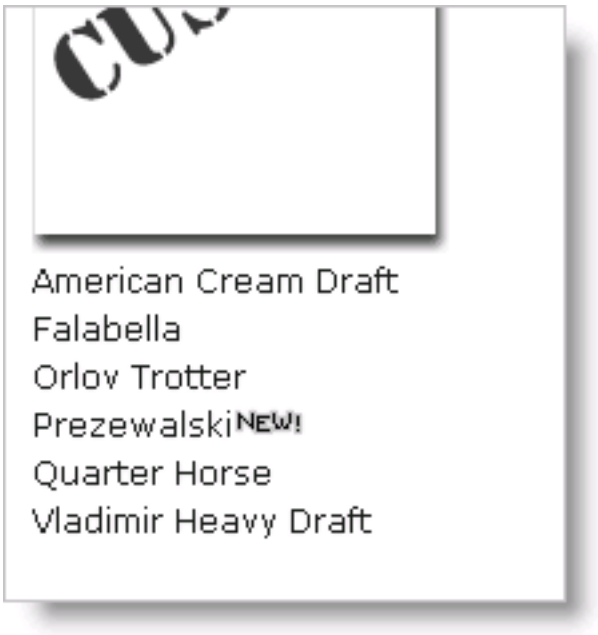
Default: True

CMUseImportantUntilDate

Standard Description: e-CM allows for the categorization and resultant display of content records based on date. This variable should be set to 'true' if this above functionality is used, i.e. if a system that will prioritize search results, or display a new icon next to certain items is used.

What This Means: If you set this to “false,” the ability to display a “new” icon next to links to content records on tagged pages goes away, and the “Mark as Important Until” input which drives this functionality is hidden in the content record properties form. The new icon is located at Graphics/new.gif.

Mark as Important Until



Content Record Marked as "New" on Tagged Page

Default: True

CMUseMembersOnly

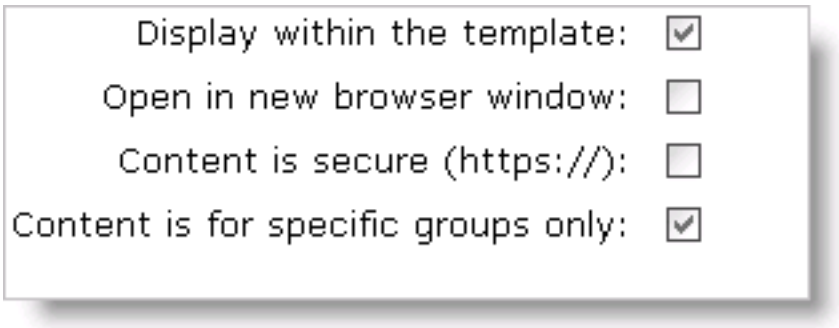
Standard Description: e-CM allows for the delineation of specific content as 'for members only'. This variable should be set to true if this function is to be used.

Default: True

CMUseMemberTypes

Standard Description: In addition to allowing for 'members only' content, e-CM allows you to set member access to content records based on member types. This variable determines whether or not 'member types' will be used in 'members only' content. The variable should be set to 'false' if 'members-only' content is to be made available to ALL members.

What This Means: When you check “Content is for specific groups only” in a content record properties page and this value is set to True, you see a multi-select box listing your member types. Only members of the selected types can see the content. If you set this value to False, no multi-select box appears. If you check the box, all members are allowed to see the content and all non-members are excluded.



CMUseMemberTypes Set to False (No Multi-Select List of Member Types)

Default: True

CMUsePrinterTemplate

Standard Description: This turns on printer template option and allows producers to specify printer template header and footer.

What This Means: If set to true, each website may have a printer template (typically a full-width page without graphics) specified in its properties form. This would generally be accessed via a link on the navigation section of the regular template.

Default: True

CMUseTextOnlyTemplate

Standard Description: This turns on text only template on Website form and allows producers to specify text only template header and footer.

What This Means: If set to true, each website may have a text-only template specified (no buttons or extraneous graphics). This would generally be accessed via a link on the navigation section of the regular template. Once the text-only template is selected, the choice “follows the user around” as they go through the site.

Default: True

CMWEPPath

Standard Description: This variable sets the web path for the Ektron web editor, when the license for the authoring tool has been purchased.

Default: Admin/eWebEditPro30/

CMWEPWebRoot

Standard Description: The variable sets the web path to the edit folder where Ektron web editor files are located.

What This Means: Full URL and path to the Ektron WYSIWYG editor files.

Default: Will vary, so default is not meaningful.

DefaultNavMenuSection

Standard Description: In Application.cfm, session.TemplatePath is initialized to be /Template.cfm?Section=#application.DefaultNavMenuSection#. The app var determines what Section of the site defaults to a first-time visitor who clicks a URL that doesn't specify a Section.

What This Means: Typically most e-CM URLs will contain a “Section=xxx” name value pair. Among other things, the section determines the appearance of navigation (for example, if the URL contains “Section=News,” the user will see the navigation for the News section). The value of this variable determines which section will be displayed if a user hits the website and immediately clicks a link on the site which, for whatever reason, includes a URL without a section (for example, a direct link to content in a folder). The default value, “Home,” is usually a good choice.

Default: Home

SourcePath

Standard Description: This variable stores the name of directory where content source files are stored. When changing this value, make sure to create a folder for it in the file root.

What This Means: When you upload files to attach them to a content record, they have to go somewhere. Where they go is a directory called “Source” which is one level up from the web root for security reasons. In other words, on a typical website, it is at Source/WWW, not WWW/Source. If you need to change the name of this directory (for

example, if there is already a directory with that name), you can change the value of SourcePath.

Default: Source\

Configuration Settings Not Visible to Clients

CMAdminWebsiteKey

Standard Description: This variable stores Website key for Admin website.

What This Means: The admin website is the administrative interface itself, which is built in Content Manager. It needs a license key in order to function.

Default: The default value is not meaningful.

CMContentGroupGreenBarColor

Standard Description: This variable determines alternate bar color in Content folders or tagging screens.

What This Means: This value, generally a “hex color,” determines the color of the “striping” in the administrative interface's display of the content folders and the tagged page editing interface.

Default: #F8E8B9

CMNavMenuGreenBarColor

Standard Description: This variable determines alternate bar color in Content folders or tagging screens.

What This Means: This value, generally a “hex color,” determines the color of the “striping” in the administrative interface's display of the navigation menu.

Default: #D1DDEA

CMShowComponentScriptDropDown

Standard Description: This variable determines whether or not to show "Type of content" drop down in navigation properties.

What This Means: The type of content drop-down list is used to display e-Series modules inside the website's template. It would be set to “False” for sites which do not have e-Series or do not intend to use it in this manner.

Default: True

Session Settings

Session settings, which control parts of an individual user's experience, exist in the database, but are often given their values by the code as the user performs certain actions. Their presence in the database simply serves to instantiate them (ensure that they exist) when needed. For this reason, most session variables do not actually have a value in the database (and do not need to have one). There are very few reasons to change the values of session variables, and most are not visible to clients.

CMBorderColor

Standard Description: This variable specifies border color used in Content Management System.

What This Means: Used as a border around HTML tables in various places in the administrative interface (e.g. the content record properties page).

Default: #D1CDBB

CMCurrentFolderID

Standard Description: This variable stores the ID of the content folder the user is currently looking at.

Default: NULL

CMEditorRedirectURL

Standard Description: This variable determines where the user will be directed after using the web editor.

Default: None.

CMFolderDisplay

Standard Description: List of directory names which determines whether a directory on ImageIndex.cfm is open, revealing the images it contains.

Default: None.

CMFolderSectionDisplay

Standard Description: List of NavMenuIDs which determines whether a section on ContentFolders.cfm is open, revealing its descendants.

Default: NULL

CMNavContentGroupInd

Standard Description: This variable indicates whether the user is currently in Site Navigation section or Content Folders section.

Default: N

CMSaveTemplatePath

Standard Description: This variable is used in Surf-to-Edit feature to take the user back to the page he/she came from.

Default: None.

CMSectionDisplay

Standard Description: List of NavMenuIDs which determines whether a section on NavMenuModify.cfm is open, revealing its descendants.

Default: None

CMSuperAdminFlag

Standard Description: This variable stores whether the current user is a super administrator for Content Management System. A user is a super administrator when he/she belongs to super administrator group.

Default: False

CMSurfToEditContentID

Standard Description: This variable stores the ID of a content record the user is trying to edit through Surf-to-Edit feature.

Default: 0 (zero)

CMSurfToEditReturnURL

Standard Description: This variable stores the URL of the page the user is trying to edit through Surf-to-Edit feature.

Default: NULL

CMTextOnlyTemplate

Standard Description: If true, side and top nav links remain dynamic so that the user can click around the site without being bounced back into the graphical template.

What This Means: Makes the “text-only template” choice “sticky” for a user's session, so they do not see the graphical template again until they select it.

Default: False

CMWebsiteKey

Standard Description: This variable stores the key of the current Website the user is managing.

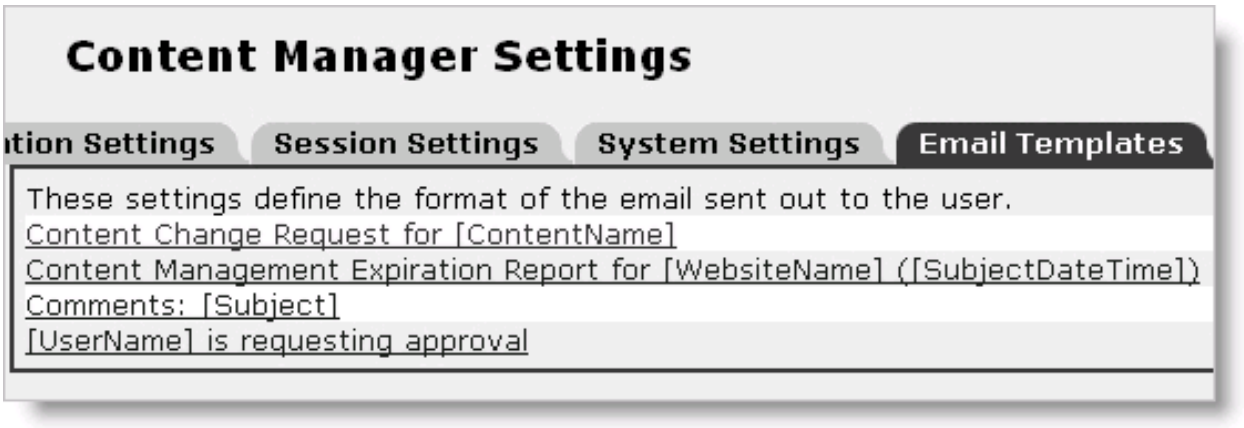
Default: NULL

System Settings

There are no system settings for Content Manager.

e-CM Email Templates

Email templates allow you to tailor e-mails sent by the application (for example, the notification sent to a content owner when a content record is expiring). Email templates contain both text and variables (for example, the name of the person being e-mailed).



To edit an email template

1. Log in to the e-CM administrative interface.
2. Select Admin.
3. Select Content Manager.
4. Select the Email Templates tab. Select the appropriate template link to edit.
5. You may change any text in the “Email text” box, using any of the variables listed on the right (the name of the variable and their use in the default text generally makes their purpose clear). Note that you may also add a specific “From” address as well as CC and BCC lines.
6. Click Save.
7. Click Send Test Email. A test e-mail is sent to the account to which you are logged in.

   Note: In the test e-mail, the variables will appear as they do in the form, for example, [TaskListURL]. When an e-mail is sent to an actual user, they will see the value of the variable, not the variable itself.

   Email Templates in e-CM

   e-CM uses the following email templates:

- Content Change Request for [ContentName]: Generated when someone using the surf-to-edit function has submitted a content request. E-mail is sent to content record owner.

- Content Management Expiration Report for [WebsiteName] ([SubjectDateTime]): Notifies producers when content and/or Nav_Menu sections are nearing their expiration date (note: text cannot be altered by admins).
- [UserName] is requesting approval: When a content producer who lacks approval rights requests approval of newly created/updated content, an e-mail will be sent to the producers with approval rights to notify them of that request.
- Indexing of Collection [CollectionID] [Action}: E-mail that is sent when the main collection processing is complete to notify administrators of the search indexing status.

Members-Only Text Files

e-CM gives you the option of protecting content so that it may be viewed only by logged in users. You may further restrict this to particular types of members. e-CM uses three text files to display messages to users who have requested a URL which contains members-only content. The text of these files should be changed before the site goes into production. Note that while these are text files, they do contain ColdFusion CFOUTPUT tags, which should not be removed.

The default text of each file includes a full physical path to the file so you can edit it to insert the text of your choice.

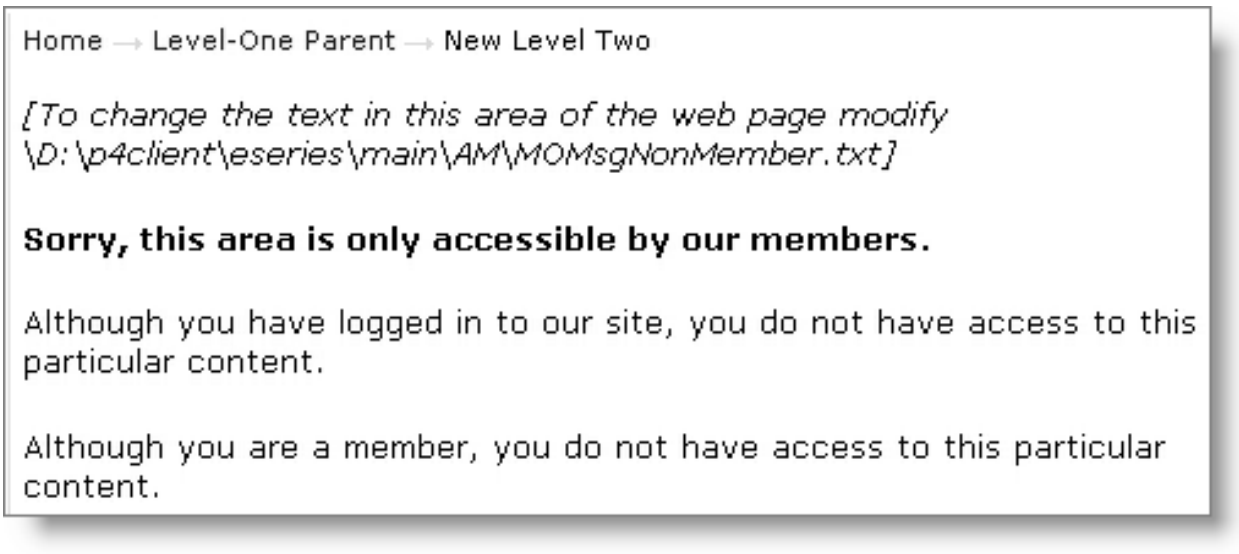
User Not Logged in

The first file, MOMsgNotLoggedIn.txt, is displayed to users who have not logged in.

Default MOMsgNotLoggedIn.txt

User Logged in, Not a Member

The second file, MOMsgNonMember.txt, is displayed to logged-in users who are not members.



Default MOMsgNonMember.txt

User is Logged-in Member, Not the Right Type of Member

The third file, MOMsgInvalidMember.txt, is displayed to logged-in members who do not match the member type(s) allowed to see the specific content requested.

Default MOMsgInvalidMember.txt

Note: When you edit these files, make sure not to remove the ColdFusion CFOUTPUT tags.

Tagged Page Settings

In the Tagged Page module, all settings are located under “Configuration Settings” and all are visible to the client.

Configuration Settings

GEImageMemberOnly

Standard Description: This variable indicates an image to show when content is members-only.

What This Means: On a tagged page displaying links to content records, some of the links may be to content-restricted to members only. This should be path information and a filename for an image to be displayed next to members-only links.

Default: Graphics/Key.gif

GEImageNewContent

Standard Description: This variable indicates the image to show when content is marked as new/important.

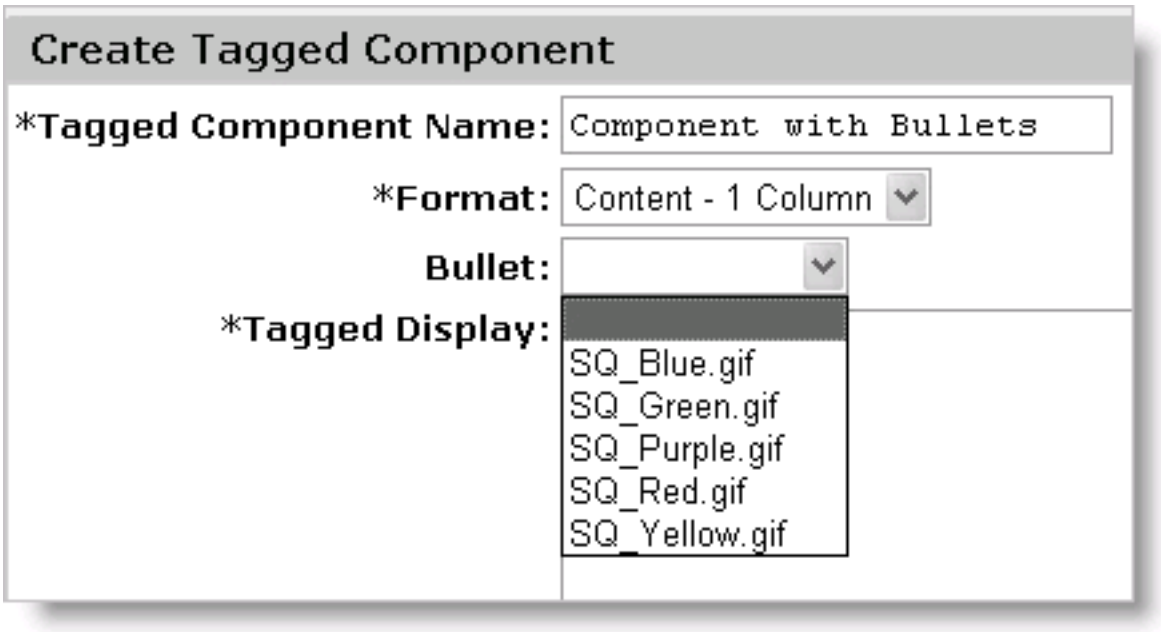
What This Means: One of the options for a content record is the “Mark as important until” date. If a date is entered, a “new” icon is displayed next to any tagged page links to the content record. This setting specifies the path and filename of the image.

Default: Graphics/New.gif

TPBulletList

Standard Description: List of bullet images.

What This Means: This should be a comma-delimited list of image files in the graphics directory. These will appear as a drop-down list for use in custom tagged page components. The images must actually exist in the Graphics directory or broken links will appear.



Bullet Images in Tagged Component Form

Default: SQ_Blue.gif,SQ_Green.gif,SQ_Purple.gif,SQ_Red.gif,SQ_Yellow.gif

TPCachedPageResetMinute

Standard Description: Number of minutes to pass before re-caching tagged pages.

What This Means: In order to speed response time when users retrieve tagged pages, which require extremely complex database operations to build, those pages are cached (stored) in the server's memory the first time a user views them, and then remain unchanged in memory until they “time out (the timeout interval depends on the value of tagged page configuration variable TPCachedPageResetMinute). When a page times out, it is removed from memory and re-cached by the first user who requests it.

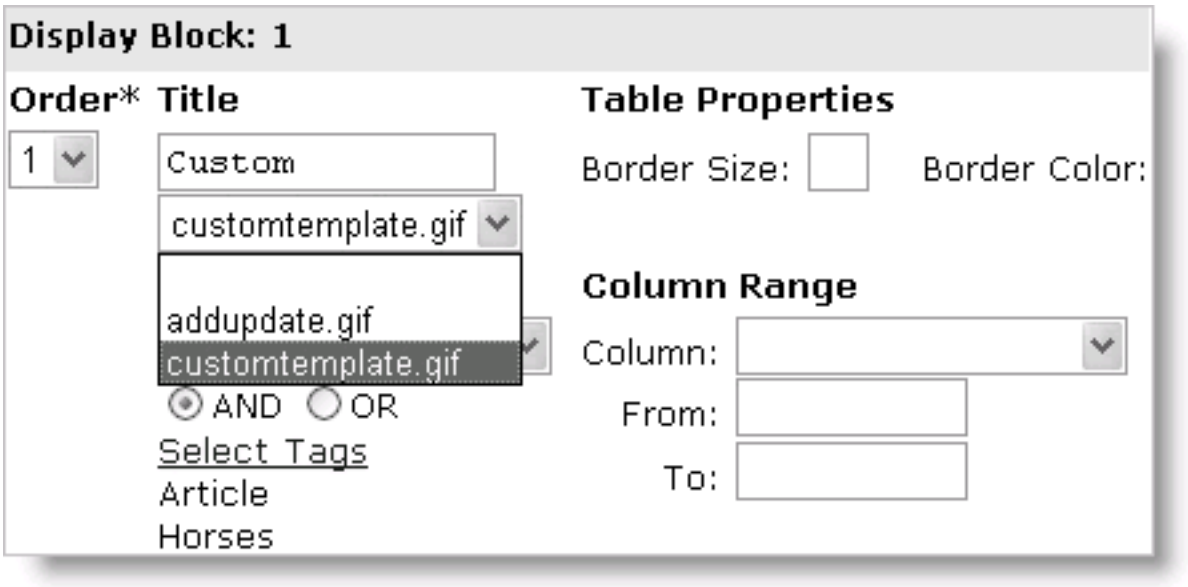
This produces much faster response times (since computer memory is much faster than computer hard disks), but it also means that updates which affect tagged pages will not “go live” immediately. If you want your updates to go live, you must clear cached pages. This removes the pages from memory and allows fresh copies to be re-cached when users next hit them.

Default: 1 (Note: this setting is intended to be an appropriate default for development, not for sites in production). For development, you can also set it to zero to turn off caching.

TPImageWebPath

Standard Description: Location of tagged page related images.

What This Means: Two sets of tagged page related images are stored here: Title images (replacing text headlines over an individual component) and view all images (used in place of text view all messages). Note that view all images must be located underneath the TPImageWebPath directory in a specially named directory called “ViewAll.”



Title Image

Default: Images/TPImage

TPRowPerPage

Standard Description: When "View All" is clicked, the maximum number of rows to show per page.

What This Means: When a user clicks on a “View All” link from a tagged page, a Next/Previous functionality is provided, allowing users to page through potentially long lists of records. This value determines how many records are shown per page.

Default: 20

Site-Search Settings

Client Settings Visible to the Client

SECollectionNoticeEmail

Standard Description: The e-mail to which the search collection notifications are to be sent. E-mail is sent after the main content files collection is indexed. You must set SESendCollectionNotice to True to enable the sending of this e-mail. The e-mail to be sent is maintained in the e-mail template; the e-mail template must be enabled.

Default: NULL

SEExceedMaxResultsMessage

Standard Description: This text message is displayed when the user exceeds the value of the CCSEMaximumResults variable.

Default: Your search criteria returned over 1000 records. To see more results, please modify your query to add more criteria.

SENoResultsMessage

Standard Description: This message is displayed to the user when there are no results matching their search criteria. This message could potentially include some tips on how to get results, such as trying fewer criteria or placing the search inside quotes.

Default: No search results match your specified criteria. Please try again.

SEProblemMessage

Standard Description: This message appears when there is a problem with the user's search criteria. This message should also include some hints on how the user can rewrite their search.

What This Means: If the search criteria is too broad, no items are returned by the search. If this occurs, the system automatically searches the collections for the value of the SESearchRetestTerm to determine if the search results are too broad or if there was another issue with the search.

Default: There was a problem running your search. Please try again.

SESearchRetestTerm

Standard Description: This term has very limited results in order to test whether or not a query is simply too broad or actually returns no results.

Default: 30

SESendCollectionNotice

Standard Description: This variable determines whether or not an e-mail should be sent once the collection processing has been completed.

Default: True

SETooManyResultsMessage

Standard Description: This message appears to the user when the search criteria is too broad and returns too many results.

Default: Your search criteria are too broad and return too many results (over 8,000). Please try your search again with more criteria selected.

SEUseAdvancedRelevancy

Standard Description: This variable determines whether or not to use the advanced relevancy scoring process. If true, then this processing will be used, otherwise the standard relevancy processing will be used.

What This Really Means: This setting controls the various relevancy settings (for example, “SESearchDescriptionHint”) that allow you to adjust the relevancy weightings of specific parts (Title, Keywords (including assigned tags), Description, and Body Content) of the content record. If SEUseAdvancedRelevancy is set to “True,” these settings are enabled. If set to “False,” these variables are disabled and the search will give equal weight to all parts of the content record which are indexed.

Default: False

Configuration Variables Visible to the Client

SEDocTypesICID

Standard Description: Tags displayed as document type in search form when "Search by type" is used.

What This Means: The drop-down list for SEDocTypesICID shows all the tagging categories used in this instance of Content Manager. When you select one of the tags, its children (but not the tag itself) will display as checkbox options in the “Search by Type(s)” section. This section appears if SEUseDocTypes is set to “True” (the default is “False”).

Only the first-level children of the tag you select will appear, not any children they might have.

Search by Type(s) Section

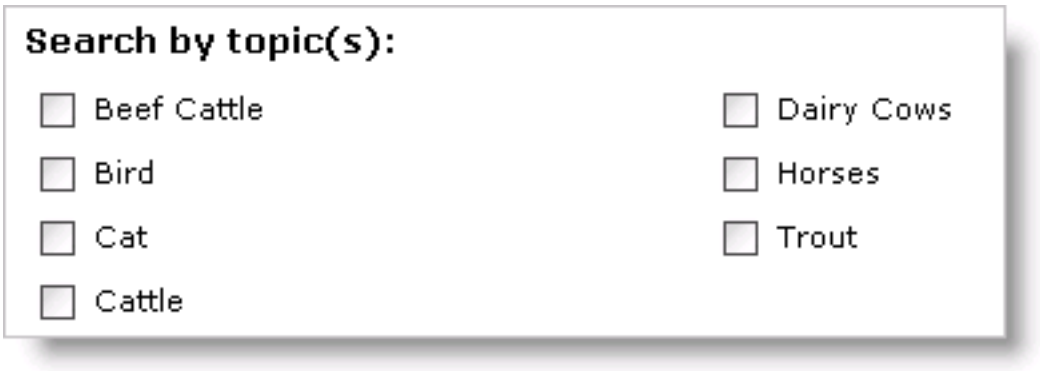
Default: 0 (zero)

SEInterestsICID

Standard Description: Tags to be displayed as topics in search form when "Search by topics" is used.

What This Means: The drop-down list for SEInterestsICID shows all the tagging categories used in this instance of Content Manager. When you select one of the tags, its children (but not the tag itself) will display as checkbox options in the “Search by Topic(s)” section. This section appears if SEUseInterests is set to “True” (the default is “False”).

Only the first-level children of the tag you select will appear, not any children they might have.



Search by Topic(s) Section

Default: 0 (zero)

SEMaximumResults

Standard Description: This variable defines the maximum number of results that are returned in a search. This value must be less than 8000.

Default: 1000

SESearchBodyHint

Standard Description: This value is the weight of relevancy given to the body text of a record.

What This Means: If SEUseAdvancedRelevancy is set to True, this variable will determine the relative weight given to the body text of a content record.

Default: 30

SESearchDescriptionHint

Standard Description: This value is the weight of relevancy given to the description for a record.

What This Means: If SEUseAdvancedRelevancy is set to True, this variable will determine the relative weight given to the description of a content record.

Default: 20

SESearchKeywordHint

Standard Description: This value is the weight of relevancy given to the keywords for a record.

What This Means: If SEUseAdvancedRelevancy is set to True, this variable will determine the relative weight given to the keywords section of a content record.

Default: 50

SESearchTitleHint

Standard Description: This value is the weight of relevancy given to the title for a record.

What This Means: If SEUseAdvancedRelevancy is set to True, this variable will determine the relative weight given to the title of a content record.

Default: 40

SESectionsICID

Standard Description: Tags to be displayed as sections in search form when "Search by sections" is used.

What This Means: The drop-down list for SESectionsICID shows all the tagging categories used in this instance of Content Manager. When you select one of the tags, its children (but not the tag itself) will display as checkbox options in the “Search by Site Section(s)” part of the search page. This section appears if SEUseSections is set to “True” (the default is “False”).

Only the first-level children of the tag you select will appear, not any children they might have.

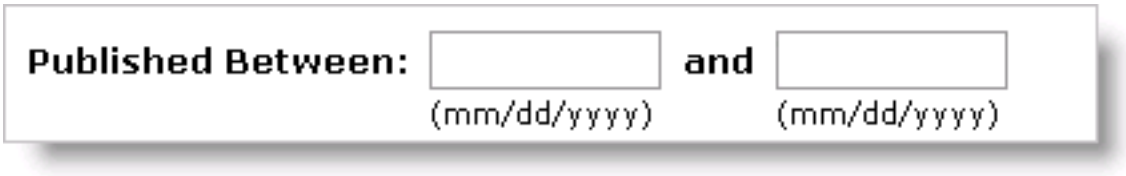
Search by Site Section(s)

Default: 0 (zero)

SEUseDateRange

Standard Description: Indicates whether to use date range in search form.

What This Means: The content's published date is used. Two specific dates can be specified and all content that was published between these two dates is returned.



Search Date Range

Default: True

SEUseDocTypes

Standard Description: Indicates whether to use "Search by type" (document type) in search form.

What This Means: If this value is set to “True,” a “Search by Type(s)” section will appear in the search form, including the tags selected in the SEDocTypesICID drop-down list.

Default: False

SEUseInterests

Standard Description: Indicates whether to use "Search by topic" in search form.

What This Means: If this value is set to “True,” a “Search by Topic(s)” section will appear in the search form, including the tags selected in the SEInterestsICID drop-down list.

Default: False

SEUsePostedWithin

Standard Description: Indicates whether to use "Posted Within" as a search criteria in search form.

What This Means: If SEUsePostedWithin is set to true, the search page will include the options.

SEUsePostedWithin Set to True

Default: False

SEUseSections

Standard Description: Indicates whether to use "Search by sections" in search form.

What This Means: If this value is set to True, a Search by Site Section(s) option will appear on the search page, using the tags selected in the drop-down list.

Default: False

SEUseSummaryOption

Standard Description: Indicates whether or not to allow users choose view search results withor without a summary. If this is false, the summary is always displayed in search results.

What This Means: Will user have choice whether or not to display summary (description) in search results?

Default: False

Configuration Settings not Visible to Client

SECollectionPath

Standard Description: This variable specifies the path to the collection files are, relative to FileRootPath.

Default: Collections\

Note: This setting must be correct!

SEComponentCodes

Standard Description: This variable holds the list of components to be used in search.

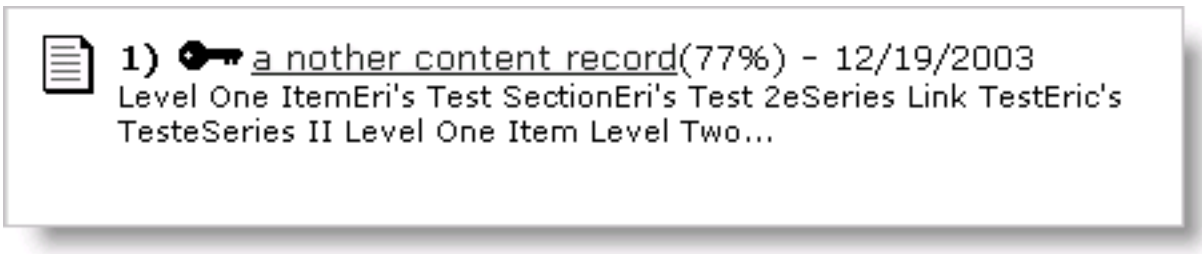
What This Means: For example, if CM is the only component to be searched, the value of the variable would be 'CM.' As other Active Matter components are added, you can use a comma-delimited list to specify other components, based on their ComponentCode in the Component_Ref table.

Default: CM

SEDisplayDefaultIcon

Standard Description: The default icon shown on search results.

What This Means: You can use this variable to specify a graphic in the Graphics/ directory that will display next to a document in search results.



SEDisplayDefaultIcon (Default Value)

Default: document2.gif

SEDisplayDefaultIconDesc

Standard Description: Search default icon description

What This Means: This is the “alt” text for the icon.

Default: Document

SEDisplayIconPath

Standard Description: Path to the folder that contains the search icon images. This path is referred to in a search operation for icons.

Default: Graphics\Search\

SEDisplayIcons

Standard Description: Toggles search result Icons

What This Means: This variable turns the display of icons in the search lists on and off.

Default: True

SEDisplayShowKey

Standard Description: Indicates that the Member Only key (icon) should be displayed

What This Means: If this option is set to true, a “members only” symbol such as a key will be displayed on any search results.

Default: False

SEExcludeList

Standard Description: A list of search collections to exclude from the site search.

What This Means: If you have any other applications which use Verity™ search collections, you may wish to exclude these collections from site search.

Default: Resume,ResumeFile

SEResultsPerPage

Standard Description: Maximum number of records to display per search page on SearchDisplay.cfm.

Default: 25

SESummaryBreak

Standard Description: Maximum number of characters to display in the Search Results Summary for each matching record.

What This Means: If the summary exceeds this number of characters, only the first n characters will be shown in search results.

Default: 200

SEVerityExePath

Standard Description: The file path to the Verity mkvdk.exe file.

What This Means: Full path to verity search mkvdk.exe file.

Default: D:\CF\lib_nti40\bin\mkvdk.exe

Note: This setting must be correct! This setting often changes when moving to a other servers. If the reindex.out file is empty or the indexing process takes a very long time to run, the SEVerityExePath setting is probably not correct.

Setting Content Producer Preferences

Setting Producer Preferences

e-CM allows content producers to set preferences which control many aspects of their administrative experience.

To view or change preferences

1. From the e-CM Admin page, select Content Managers.
2. Make the appropriate changes.
3. Click Save.

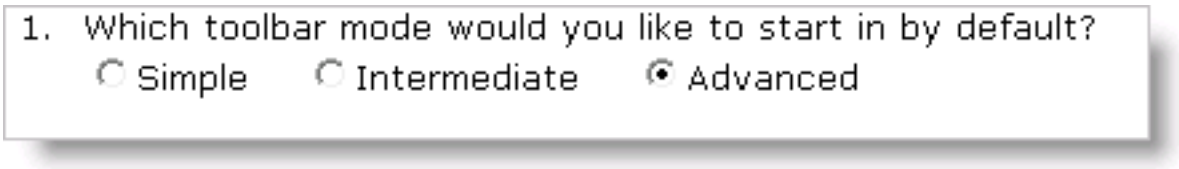
Note: When a new producer is set up for the first time, all of their preferences will be set to default values. For this reason, the following discussion of the individual preference settings includes information on the default.

Reviewing the Producer Preferences

The Producer Preferences page is set up as a series of questions. How you answer the questions determines the preferences allowed for the user.

Default Toolbar

This option determines which version of the toolbar the user will start with when working with content.

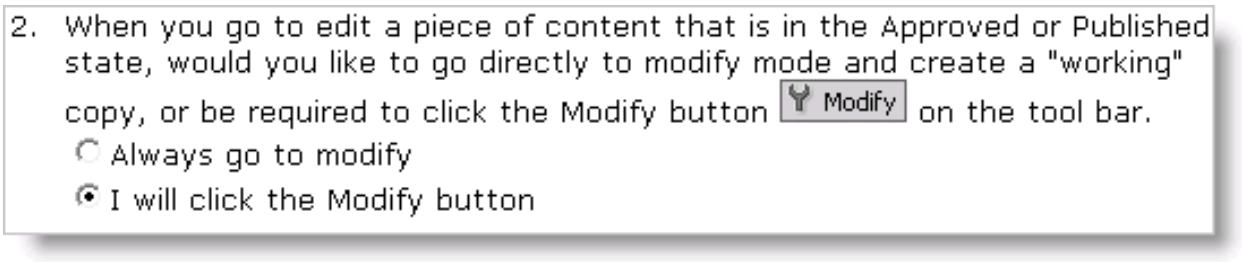


Default Toolbar Options

This does not override the toolbar settings for a user in a particular authority group. If the toolbar selected in preferences is not authorized in the authority group settings, the user will start with the highest level allowed. For example, if a user's preference is Advanced, but the user only has Intermediate permissions in a particular authority group, the user will start with the Intermediate toolbar when working on content owned by that group.

Default: The default toolbar option defaults to Advanced.

Modify Button



Modify Button Options

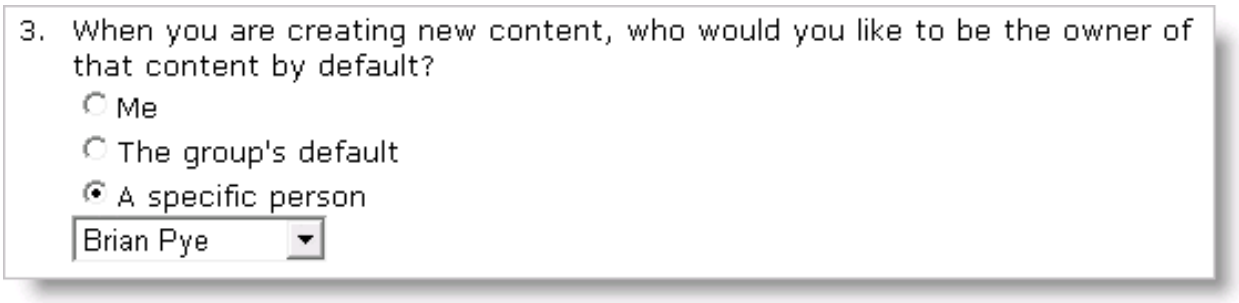
If this option is set to Always go to modify, you will not have to click the Modify button in order to edit content records which are in the “published” state. When you save a change in a content record, it will place the content in a working (red light) state.

If the option is set to I will click the Modify button, the content record will not be placed in a working state until the user clicks the Modify button on the content producers' toolbar. In addition, no editing features (buttons, etc.) will appear until the user clicks Modify.

Default: The modify button option defaults to “Always go to modify.”

Default Owner

This option allows the user to choose who will become the default owner when the user creates a new content record.



Default Owner Options

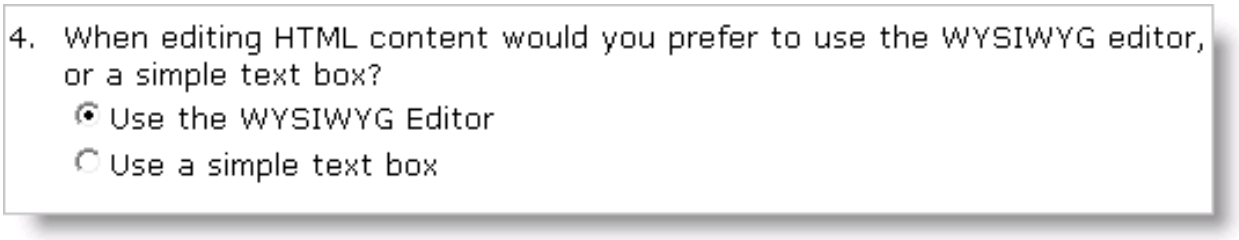
Me - the default owner will be the user.

The group's default - the default owner will be the default owner for the group that owns the navigation item.

A specific person - the ownership will default to that person unless they are not in the group that owns the navigation item, in which case, the default owner will be the default owner for the group that owns the navigation item.

Default: The option defaults to Me.

Editor Preference



Editor Preference Options

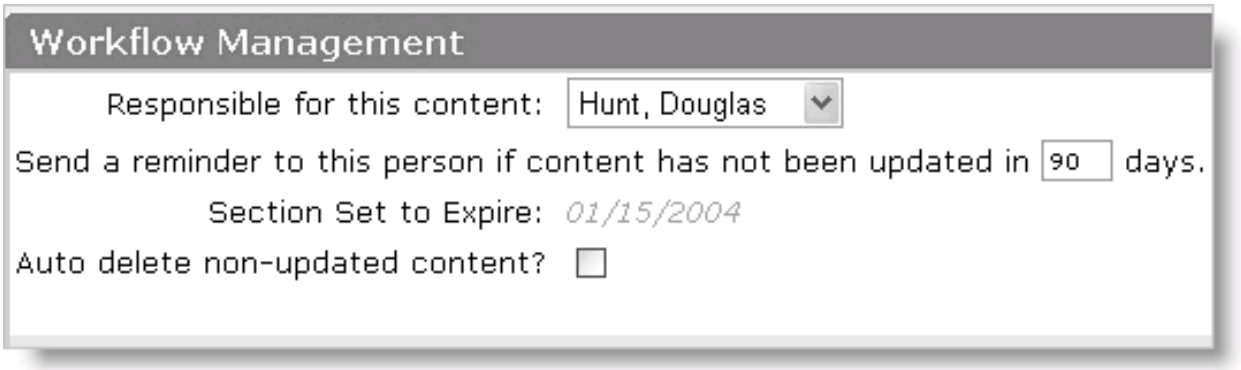
This option allows the user to choose either the WYSIWYG editor or a simple (text area) box for editing HTML content in content records.

Default: The editor preference option defaults to Use the WYSIWYG editor.

Reminder Preference

This option determines the default setting for reminders in any new content records created by the user.

Reminder Preference Options



Reminder in Content Record Properties Page

Default: This setting has no default. If no preference is set by a user, new content will default to whatever the system-wide reminder setting is (90 days by default).

Site Navigation Edit Button

This option determines where the user goes when they click on the Edit Content button on the list of Site Navigation items.

Site Navigation Edit Button Options

Note: If there are multiple content records in the navigation item, the user will be taken to the first content record in the sort order.

Default: The default for the Site Navigation edit button option is The Content Properties page.

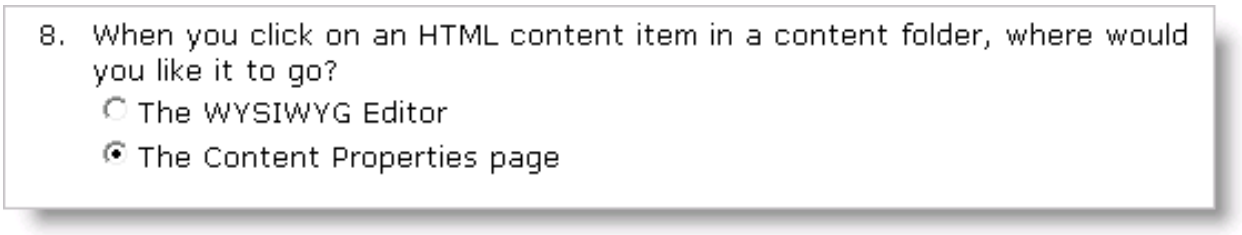
Site Navigation New Content Button

This option determines the function of the New Content button in the list of navigation items.

Site Navigation New Content Button Options

Default: The default for the Site Navigation new content button option is The Content Properties page.

Content Folder HTML Editing



Content Folder HTML Editing Options

When a user clicks on an HTML content icon in a content folder (representing a content record containing only HTML), they can go to the properties page for the content record or directly to the WYSIWYG editor. This setting determines which behavior is enabled (in either case, the user goes to the properties page after saving the HTML file).

Default: The default setting for the content folder HTML editing options is The Content Properties page.

Content Folder New Button

Content Folder New Button Options

Default: The default setting for the content folder new button option is The Content Properties page.

Default Website

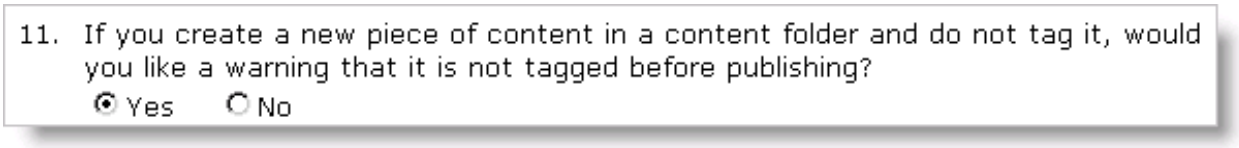
The default website option appears only if a user is a member of an authority group with access to more than one website. This determines which website the user will see by default when they first click on the Site Navigation link in the administrative interface.

Default Website Options

Default: Defaults to the first website in the list.

Tag Warning

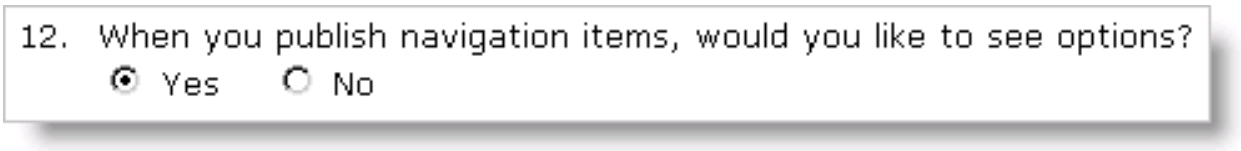
The tag warning option will not appear unless tagging is licensed and the user is a member of an authority group that owns at least one content folder.



Tag Warning Options

Default: The default for the tag warning options is Yes.

Publishing Options



Publishing Options with "Yes" Selected

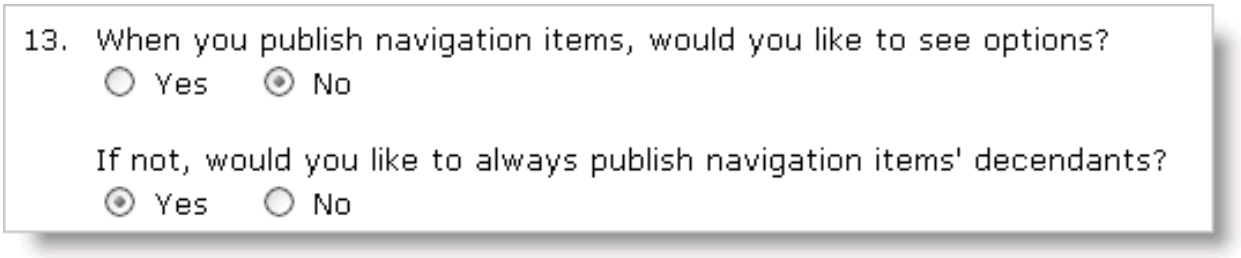
Yes - The user will always see a publishing option screen when publishing a navigation item.

If there are any child navigation items under the item being published, the screen will ask whether any descendant(s) should also be published. In addition, the user will have the option of regenerating content, meaning that all selected content will be published even if CM does not think the content has been changed.

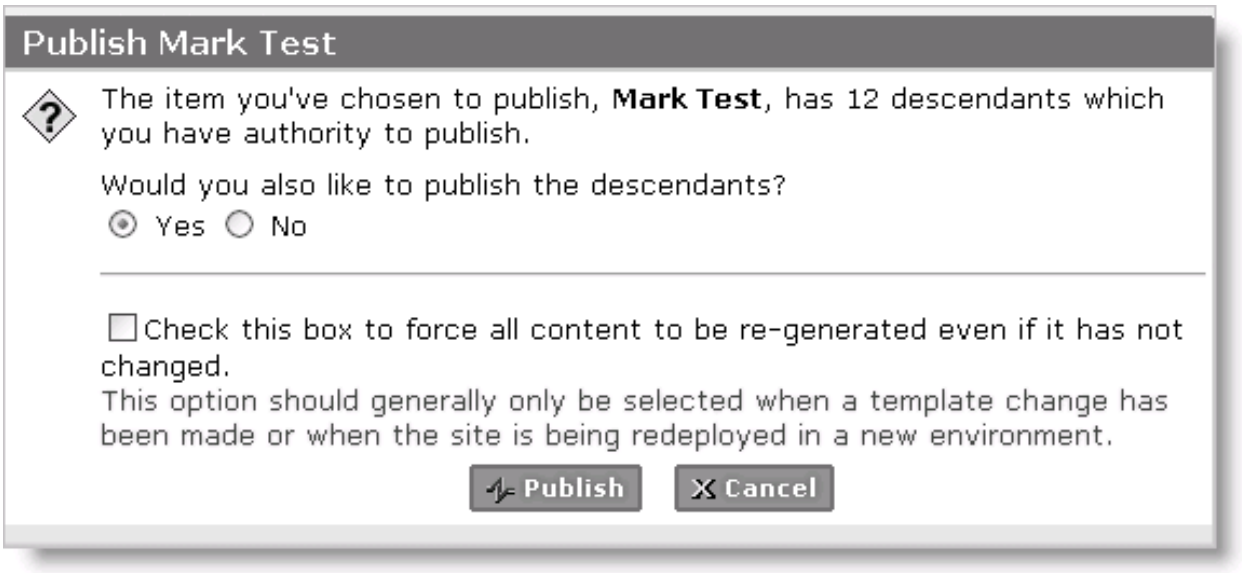
No - If you select no, an additional publishing option displays.

If the user selects No and Yes, any child navigation items will always be published along with the selected parent navigation item.

If the user selects No and No, child navigation items will not be published.



Publishing Options with “No” Selected

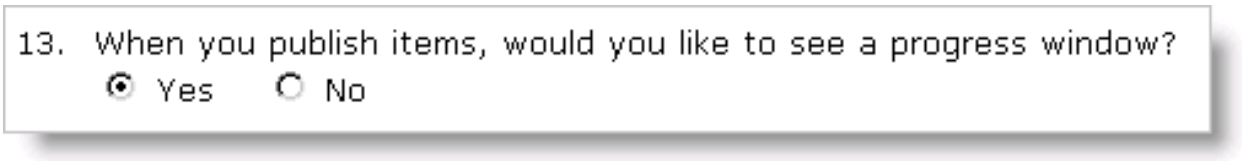


Publishing Option Screen

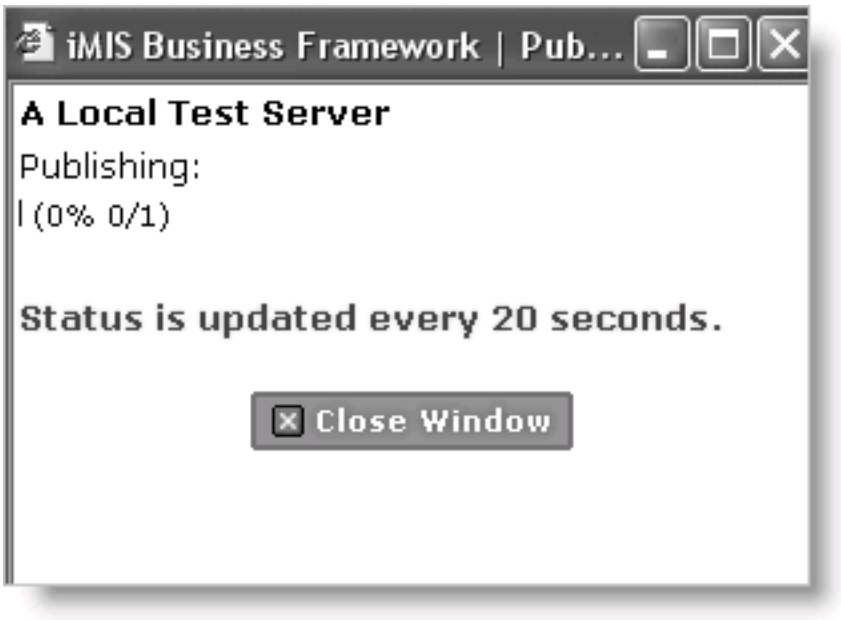
Default: The default for the publish option is Yes.

Progress Window

This setting determines whether the user sees a pop-up progress window during publishing.



Progress Window Options



Publishing Progress Window

Default: The default for the progress window options is Yes.

e-CM Publishing Servers

What is Publishing?

To review, e-CM stores the information that users save in content records (in either navigation items or content folders) and then uses this information to publish the content records as HTML files. The aim of this process is to speed response times for users. web-servers are very quick at serving files, but response times are much longer when pages must be built “on the fly” by retrieving information from a database.

What Does the Publishing?

Publishing is accomplished by one or more Microsoft .NET-based publishing servers (these are “servers” in the software sense of the term, not physical machines). When a user asks e-CM to publish something, e-CM calculates which files need to be republished, then makes an entry in a database table. The publishing server looks at that table every n seconds, and when it finds a job, sends instructions to the ColdFusion application server, which begins publishing. It is the ColdFusion server which actually writes out the

published files (and the ColdFusion server which consumes the lion's share of the resources required for publishing).

There are a number of advantages to this approach as compared to simply submitting a publishing request to the ColdFusion server directly:

- Requests can be queued up, preventing slow downs and “collisions” when multiple users make publishing request in the same time period.
- Since the information required to do the publishing is stored in a database table, it is persistent, which makes the process much more robust. If, for example, the webserver is restarted during the middle of a publishing job, the job will continue to run to completion when the server is started again. If the publishing server runs into an error, it can both store information about the error and re-try the publishing job.
- While there is no way to directly control the % of CPU taken up by the ColdFusion server during publishing, the publishing server parameters can be set up to limit the amount of time publishing will take place before giving the site a “rest.” This is especially significant on large sites with heavy traffic which regularly do large publishing jobs.
- Users can request that one or more pages of content be published without having to wait for the results - if the user moves on to another task after requesting a publishing job, the job will continue to conclusion.
- The results may be monitored with a progress bar, and the user will be alerted when the publishing process is complete.
- Multiple instances of the publishing server may be run on one or more servers allowing for publishing to multiple servers or sites in one step.
- Publishing of specified pages can also be scheduled to happen in the future or at a periodic interval.

What is a Publishing Service?

A publishing service is a Windows .NET service and can support multiple instances of publishing servers and multiple publishing servers can talk to a single instance of Content

Manager. The publishing service must be on the same physical machine as any publishing server(s) which use it. The service must be able to see both the database physical machine and the web/application server physical machine.

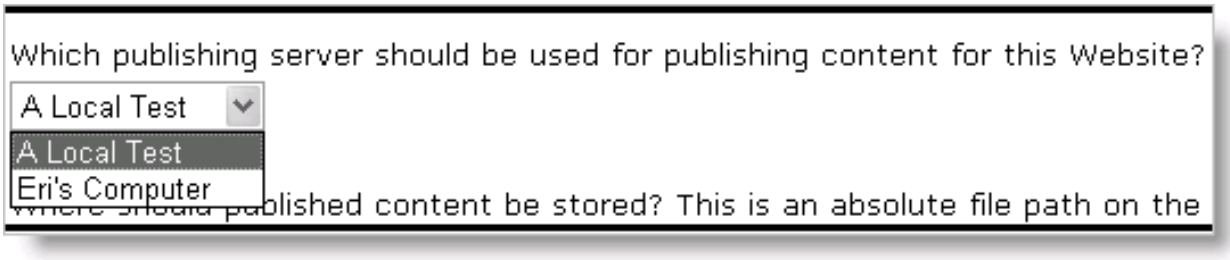
Typical Publishing Configuration

Since there are a number of parts involved in e-CM publishing, it is useful to take a look at a typical configuration. If your site has already been configured and you just want to know more about the parameters you can use to control publishing, see Understanding Publishing Server Configuration.

- Servers: Application, web and Database - Each instance of e-CM runs on a physical machine which would typically include the ColdFusion application server and the Windows IIS (Internet Information Service) webserver. A typical configuration would include a separate physical server for a SQL Server database, although some smaller websites combine web, application, and database software on the same physical machine.
- e-CM Publishing Server - The publishing server can be on any machine that can "see" the machine with the ColdFusion application server installed. It will often be on the same physical machine at the application and webserver, but it can run anywhere on your network. The publishing server must have a publishing service installed on its physical machine in order to function.

Selecting a Publishing Server for a Website

Administrators can use the drop-down list shown in to select a publishing server for a specific website on the website properties page. You can run multiple websites using a single publishing server.

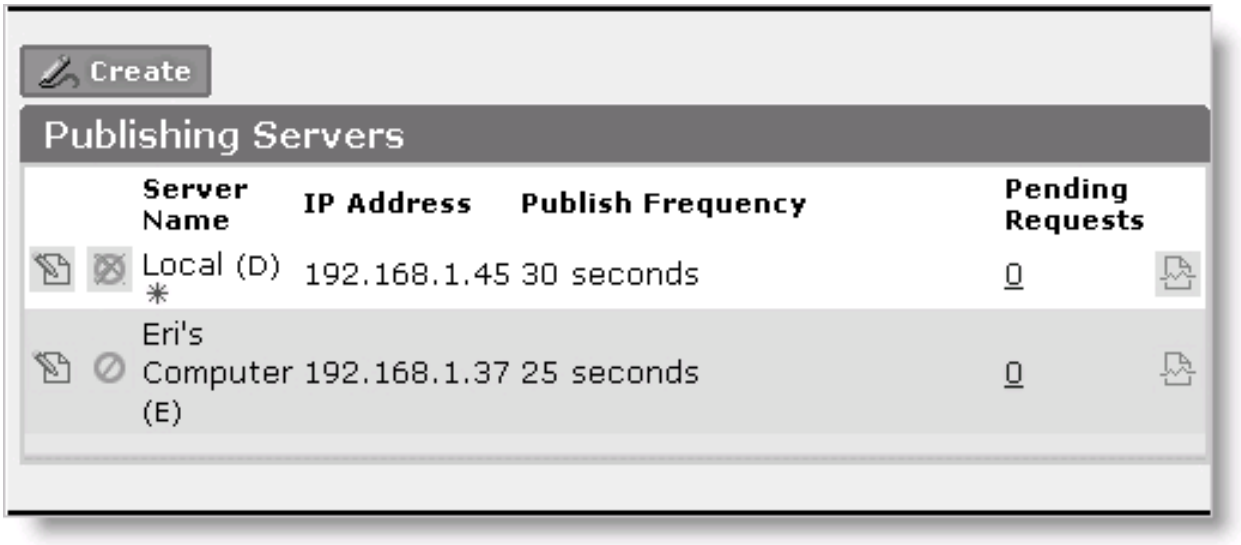


Selecting a Publishing Server

Viewing the List of Existing Servers

To view a list of existing publishing servers on your instance of content manager:

1. After logging into the administrative interface, click on the Sites button in the “Websites” section of the interface.
2. Click on the “Publishing Servers” link to see the list of existing servers.

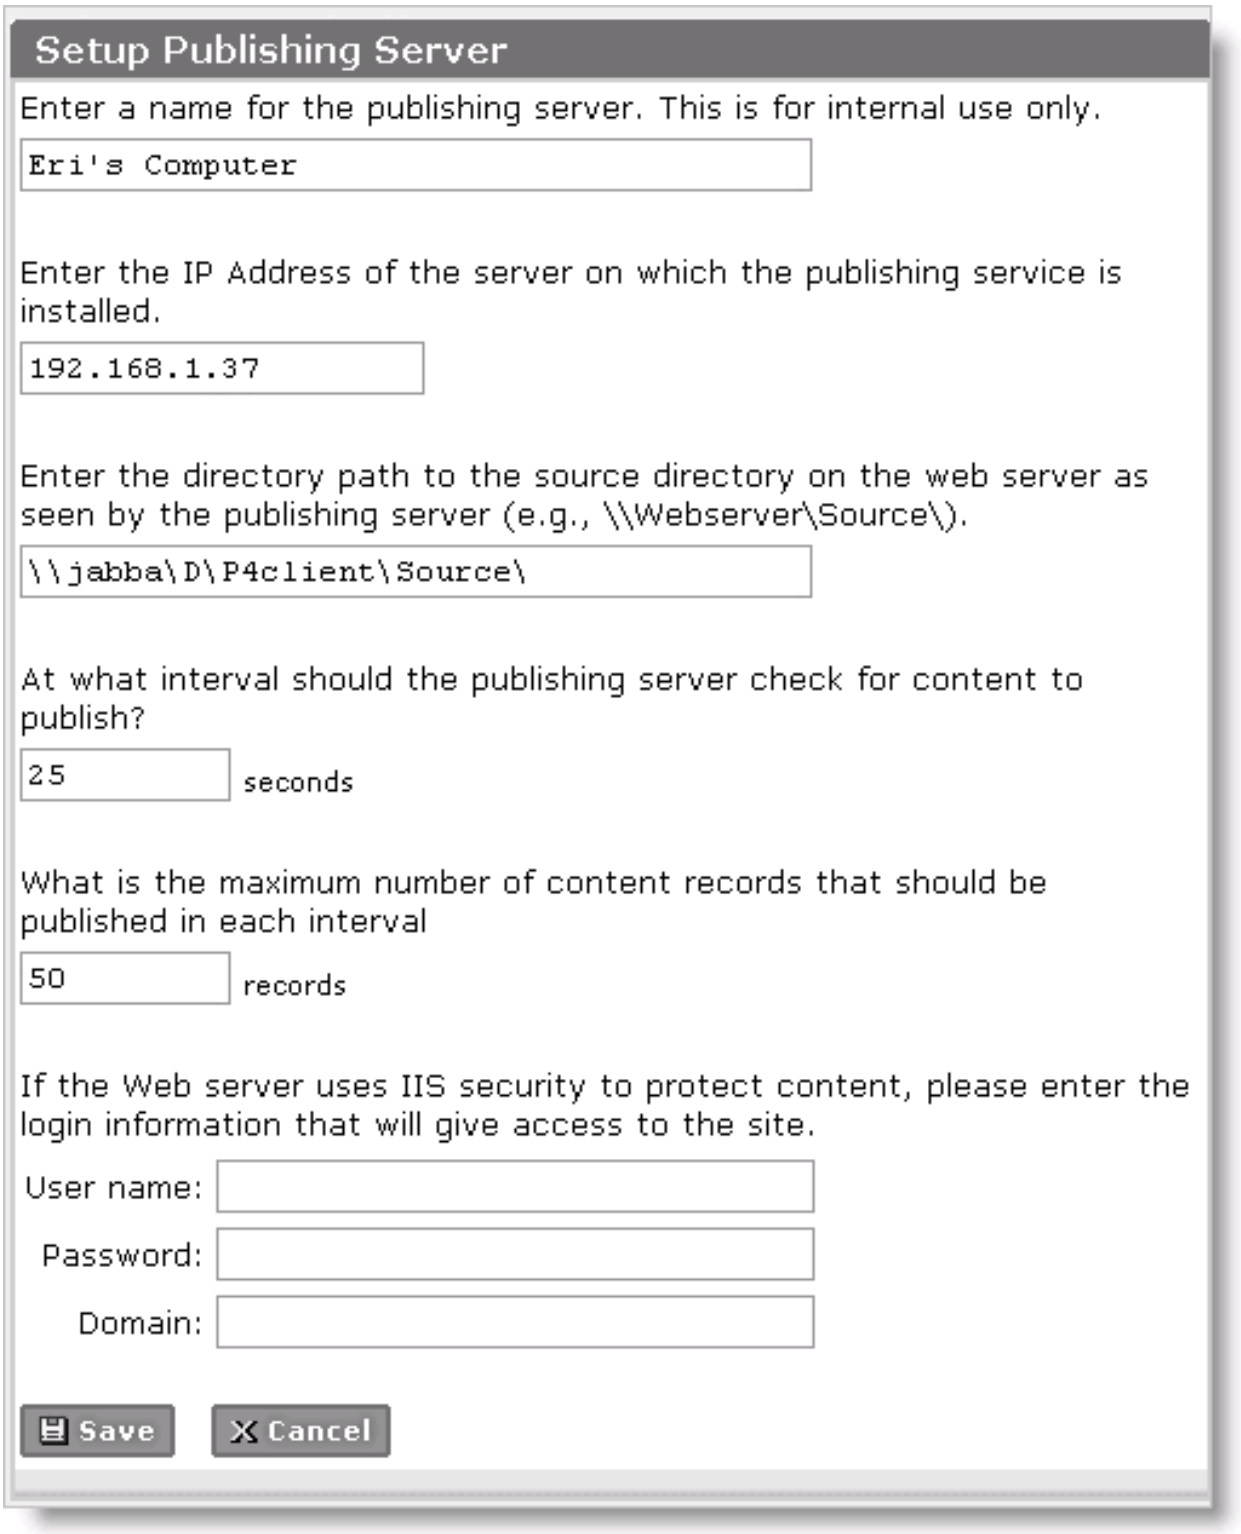


List of Publishing Servers

When e-CM is first set up it will include one server called “Default Publishing.” You may set up additional servers later but the default server may not be deleted.

Understanding Publishing Server Configuration

Unless you are a developer setting up sites, you do not need to know all the details of publishing server configuration. However, there are a few settings that you should understand.



Publishing Server Configuration Form

Publishing Server Name

This is a name for internal use, although content producers will see it in the publishing progress pop-up window while they are publishing, so make sure it is something sensible.

IP Address

This should be the IP address of the physical machine where the Windows service is running. Usually, this will be the IP address of the webserver. In theory, you can run this service anywhere (even on a desktop machine with a fixed IP address), but there is no particular advantage to doing so. By far the largest portion of resources consumed by the publish process will be consumed by the ColdFusion server, not the publishing service, so by installing the service on a separate machine, you are simply creating an unnecessary dependency.

Directory Path

This should be the full directory path to the Source directory as seen from the point of view of the machine on which the Windows service is running. Source, located above the web root for security reasons, is where uploaded files are placed when they are first attached to a content record. The publishing server must know where these files are located so it can copy them over to the proper directory when it publishes the content records. If the publishing server is located on the same physical machine as the webserver (which will usually be the case), this value will typically start with a drive letter.

Publishing Interval

The publishing server knows when it has work to do by polling the database for new requests. This value determines how many seconds elapse between each check. A typical value for this setting would be somewhere between 20 and 60 seconds. Since this is also the refresh rate on the publishing progress pop-up window, setting it much longer than 60 seconds may start to annoy impatient content producers. In some cases, however, more important considerations my override this concern. For example, if you have a large and heavily trafficked main site which publishes often and a collection of lower-priority simple sites, you might want to set the lower-priority sites up with separate publishing server(s) with the interval set to several minutes (remember that the interval must be specified in seconds).

Maximum Records per Interval

This setting determines how many content records will be published each time the publishing server polls the database for new requests. If publishing typically consists of small and infrequent jobs, this is not a particularly critical setting. However, if the site is very large and content is frequently added and updated, it becomes an important way to spread the load across several request intervals, ensuring that users will not see long slow downs as the application server creates the published files. The downside of setting a long interval and a relatively low number of content records is that publishing may occasionally back up.

You may have to adjust these two values (interval and maximum records) based on experience to find the best balance for your site(s).

User Name, Password and Domain

The user name, password and domain settings are used only when Windows IIS security is used to protect content. In this case, the publishing server must run under an account that has permission to create, update and delete content in the publishing directories.

To set up Publishing server on separate server

1. Perform the installation/configuration steps for eCM.
2. Go to the admin website > Publishing servers.
3. Edit the publishing server's information giving the IP address of the physical server that runs the publishing server application.
4. Enter the source file path, so that the path points to the c:\Program Files\ASI\iMIS15\iMIS_public\Source folder on the web server from the publishing server's point of view.

   Example:

   The web server is running on server1 and the publishing server is installed on server2, the source path should be: \\server1\c$\Program Files\ASI\iMIS15\iMIS_public\Source

5. Once the website is created, you must edit the path to web server from the publishing server's point of view. These paths are specified in the Website Properties page. Do this for every website. Add the paths at the following prompts.

- Where should published content be stored? This is an absolute file path on the Web server at or below the web root from the publishing server. Should be changed to \\server1\c$\Program Files\ASI\iMIS15\iMIS_public
- Where should secure published content be stored? This is an absolute file path on the Web server above the web root from the publishing server. Should be changed to \\server1\c$\Program Files\ASI\iMIS15\

6. Run the publishing service as a user who has access to the web server not as a user with a local system account. This assures that the publishing service has read/write access to the folders specified in the Website properties page.

- Go to Services manager.
- Click on Properties for AsiPublishing15.
- Go to the Log On tab.
- Enter account information not a local system account.

7. (Optional) If the servers are running as standalone, you may need to associate a user name and password for the web server with an account on the server with the publishing service. This assures that the account running the publishing service has automatic access to the folders specified in the Website properties page.

   For windows 2003:

- On the server that has publishing server installed, go to Control Panels -> Stored User Names and Passwords.
- Store the username and password for the server that is running eCM site.

  For windows XP:

- Find the instructions on the Microsoft support center. http://support.microsoft.com/kb/306541

  Note: There are other ways to set up the security so that the publishing service can write to files to the web server, such as using a share folder. Check with your network administrator as each organization has different network setup and policies.

e-CM Websites

Support for Multiple Websites

In e-CM, you can purchase the right to run a specified number of simple and advanced websites. While these websites share some properties in common (for example, a common pool of administrative users and authority groups), you can specify many properties, including the look-and-feel template, on a per-website basis.

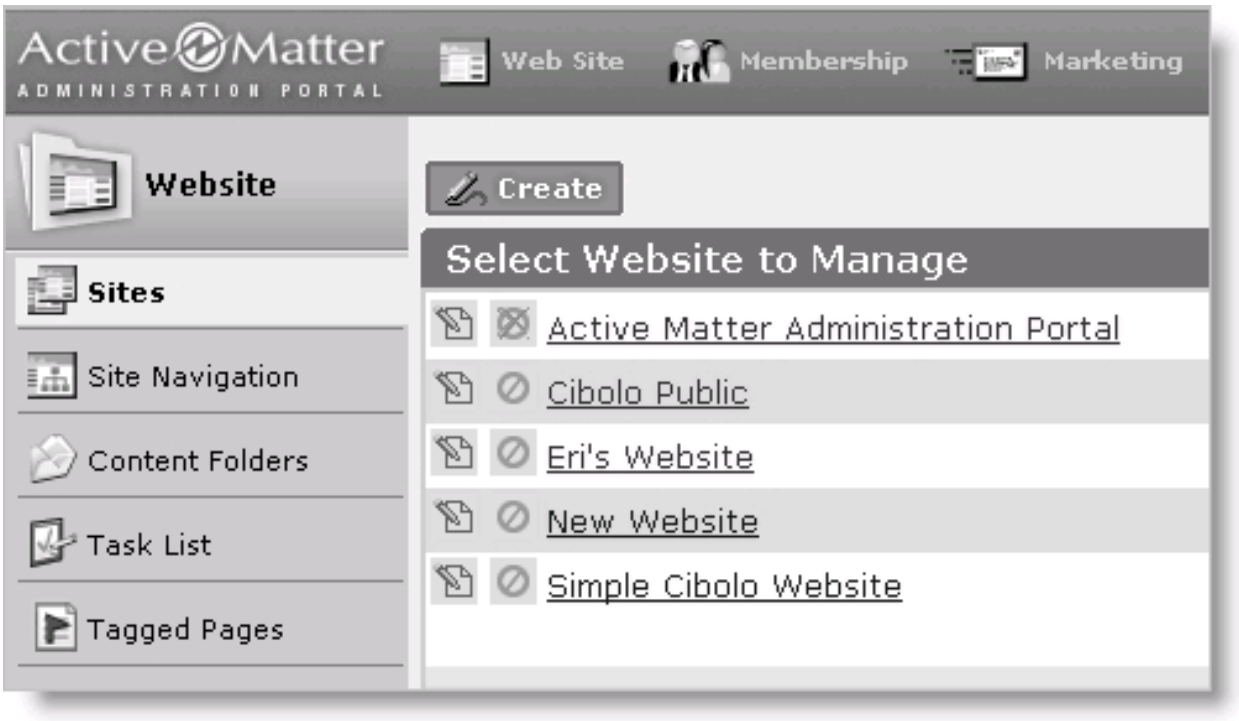
How to Select an Individual Website to Manage

Every user will have a default website set up in their user preferences. This is the website whose navigation you see when you click the Site Navigation button.

If you wish to view the navigation for a website other than your default website, there are two ways to do it.

Accessing a Website via the Sites Link

If a user clicks on the Sites link under the Websites link, they will see a list of websites to manage.



Selecting a Website to Manage in CM5

The user can:

- Click on the edit ( ) button to the left of the name to edit the properties of the website.
- Click on the delete ( ) button to the left of the name to delete the website.
- Click on the website's name to go to the navigation for that site.
- Click on the preview ( ) button on the far right to preview the website as a front-end user would see it.

In order to access the Select a Website to Manage form the user must have the Add/Update Website permission checked in the Security Assignment section, which is located under the Admin button.

Add/Update Website Permission

Note: Every instance of e-CM will include the “Active Matter Administration Portal” website. This is not a website for users. It is the administrative interface itself, which is built in Content Manager. For obvious reasons, you want to be very careful about altering this website, and the delete button has been disabled.

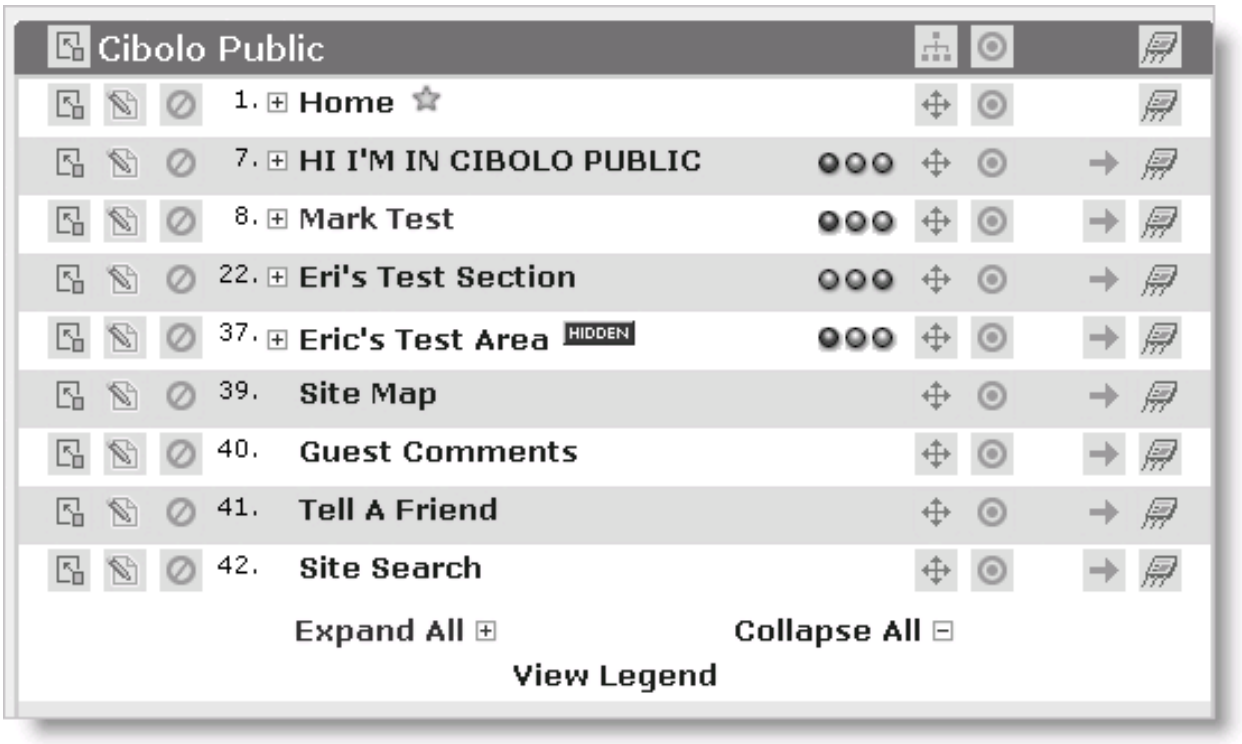
Using the Sites Link at the Top of Any Navigation Menu

If a user does not have permission to access the Select a Website to Manage form, they can still navigate between any websites containing content they have access to (owned by an authority group of which they are a member) by using the sites button located at the top of the navigation item display. This pops up the manage/create site form in a new window, showing only those sites which the user has access to.

The user may then:

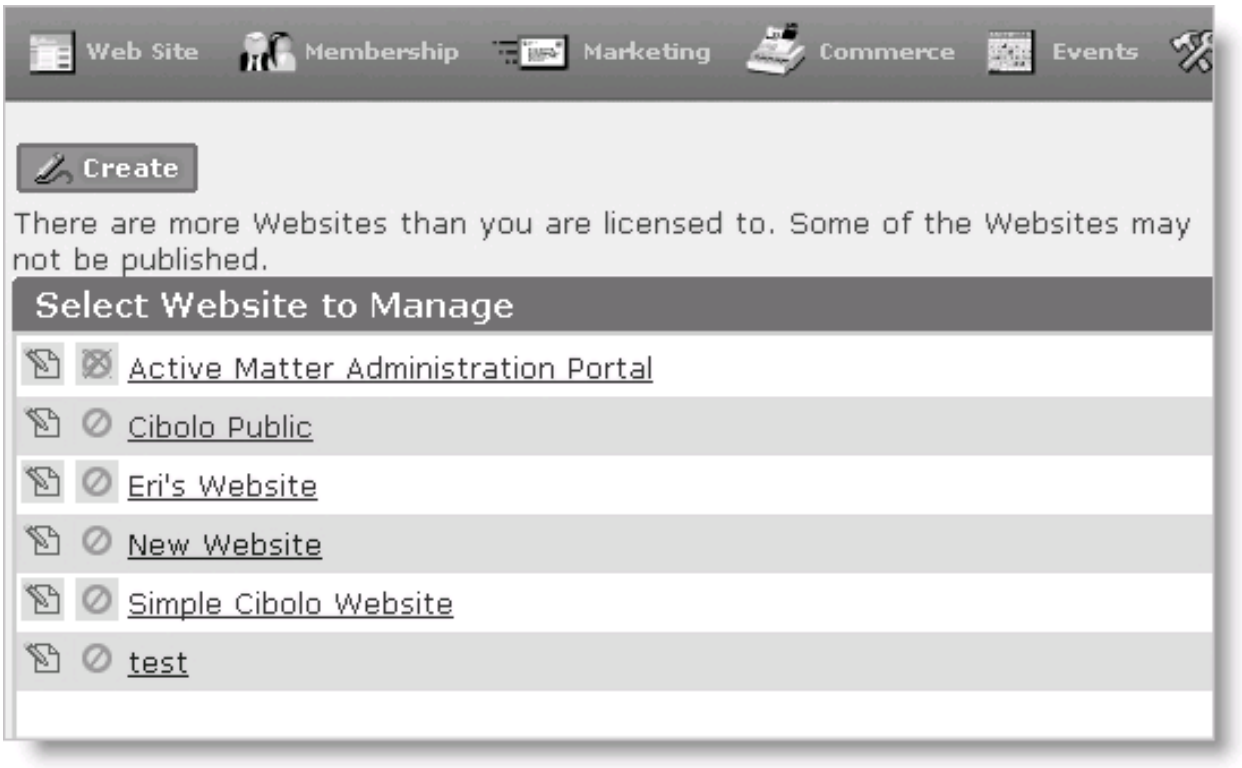
- Click on the edit ( ) button to the left of the name to edit the properties of the website.
- Click on the delete ( ) button to the left of the name to delete the website.
- Click on the website's name to go to the navigation for that site.

- Click on the preview ( ) button on the far right to preview the website as a front-end user would see it.



Website License Enforcement

If the number of websites, either simple or advanced, exceeds the licensed amount, the user will be alerted when creating a new website or changing a website from simple to advanced or vice versa. The website can still be created, but will not be published.



License Warning on Top of Website Management List

Website Creation/Properties Form

When the administrator is creating a website, the properties form is presented as a two-step “wizard.” After the site is created, the same elements are found in the one-part web-site properties form.

Who Can Access the Website Creation/Properties Form

In order to access the Website Creation Form, a user must have Add/Update Website permission checked in the Security Assignment section. This gives access to the Sites link, which in turn contains the Create button, which allows a user to access the form.

To access the Website Creation Form

To access the website creation form:

1. Click on the web Site link on the top admin navigation bar.

2. Click on the Sites link to display a list of existing websites.
3. Click the Create button at the top of the list of websites:

Website Creation Button, Above Website Management List

To access the Website Properties form

To access the properties form for an individual website:

1. Click on the web Site link on the top admin button bar.
2. Click on the Sites link to display a list of existing websites.
3. Click on the small edit ( ) button to the left of the site's name.

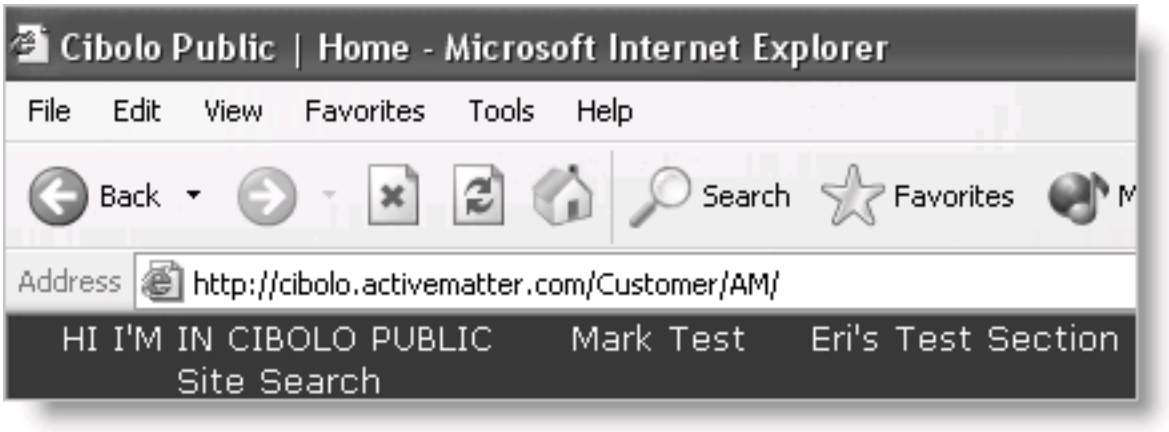
Form Inputs Step 1

If you are working through the set-up wizard, the following settings will appear in page one of the wizard (if you are looking at the properties page of an existing site, all settings will be displayed in a single page).

Internal Website Name

The first input on the form is the internal name for the website. This name will appear in the administrative interface, and will also be part of the title in the front end of the website (and will thus appear in the browser title bar)

Internal Website Name



Website Name as Part of Title

Website URL

The next input is the URL of the website. This must also be registered in IIS if host headers are being used and with a DNS service, but entering it here effectively tells CM5 which URL to point to. Note that all websites in a particular instance of CM5 must be located under a single directory structure, since there is only one ColdFusion application. However, each can have a different URL, including a subdomain, domain, directory or virtual directory.

Website URL

Secure URL

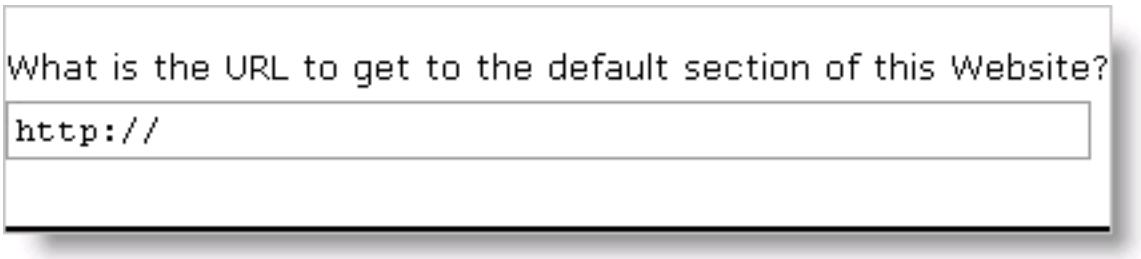
Enter the secure URL of the website, if used.

Secure URL

Default Section URL

This can be used to create a shortcut to the website URL (optional). For example, if a site's actual URL is http://cibolo.activematter.com/Template.cfm?Section=Magazine, this field could be used to create an alias such as http://cibolo.activematter.com/magazine/ which will re-direct users to the actual URL.

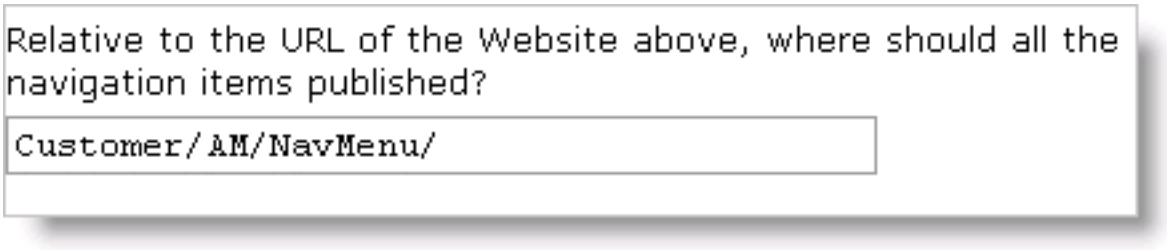
This functionality takes advantage of IIS's ability to map a custom 404 error handler. In the example above, the directory “magazine” does not actually exist, but the custom error handler sees “magazine/” and knows to go to the actual URL.



Default Section URL

Navigation Item Publish Location

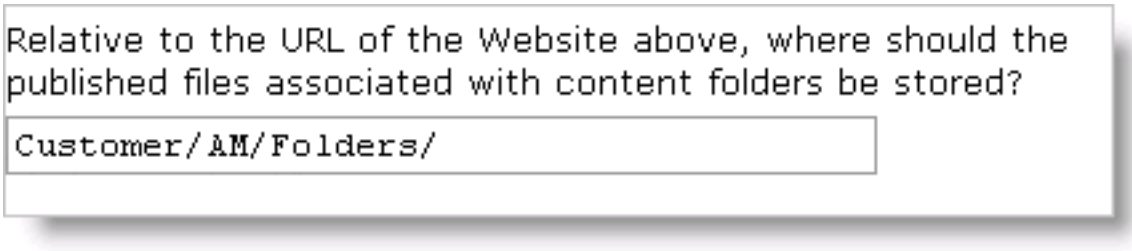
The relative path, from the website URL, where published content associated with navigation items will be stored.



Navigation Item Publish Location

Content Folder Publish Location

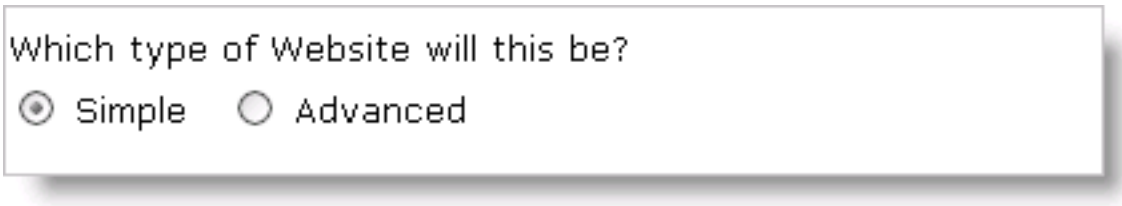
The relative path, from the website URL, where published content associated with content folders will be stored.



Content Folder Publish Location

Website Type

The two radio buttons shown below determine whether the newly created site will be a simple or advanced website.



Website Type

Tagging Y/N?

The two radio buttons determine whether or not the newly created site will use tagging.

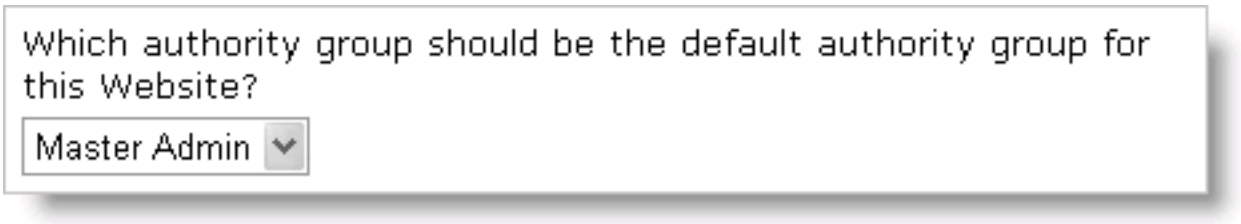
Tagging Properties Setting

Selecting No does the following:

- Disables the tag button in toolbars.
- Turns off the Switch to Tagged Page option for content records.
- Stops the tag warning for content in content folders.

Default Authority Group

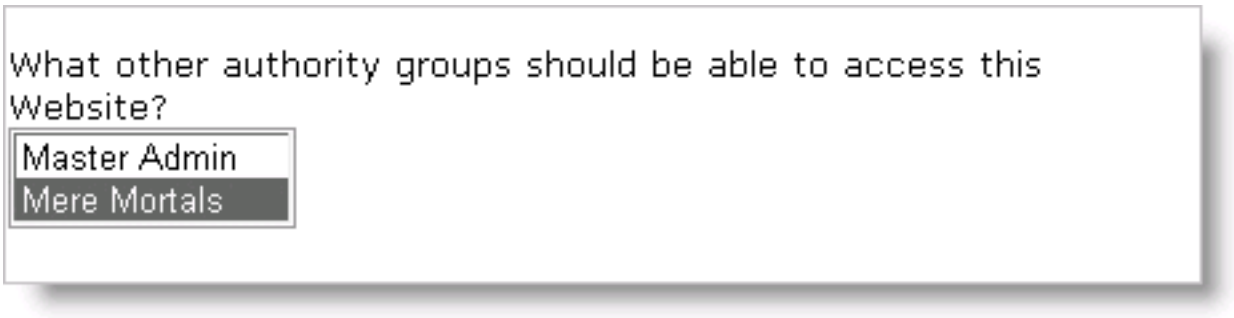
This determines the authority group to which all navigation items and content folders will default to if no other group is chosen.



Default Authority Group

Additional Authority Groups (Advanced Websites Only)

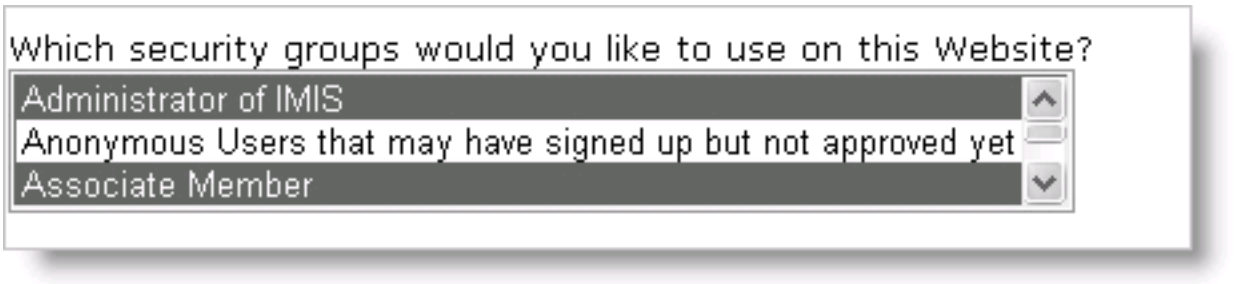
Simple websites use only one authority group. On an advanced website, you have the option of enabling additional authority groups. As soon as a group is enabled, it will appear on the drop-down lists in the workflow section of the navigation item properties page.



Additional Authority Groups

Security Groups

This multi-select box determines which groups will be available for security group protection on the website. In earlier versions of e-CM, these groups generally corresponded to member types. In e-CM 5, they can be defined via queries and thus do not have to be directly linked to your member types.



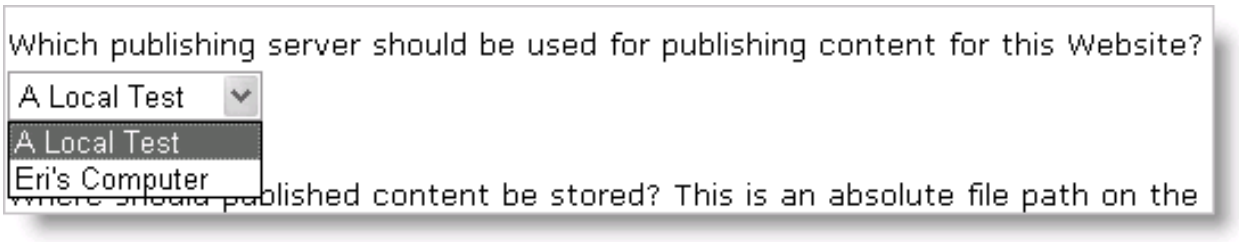
Security Groups

Form Inputs Step 2

If you are working through the set-up wizard, the following settings will appear in page two of the wizard (if you are looking at the properties page of an existing site, all settings will be displayed in a single page).

Selecting a Publishing Server

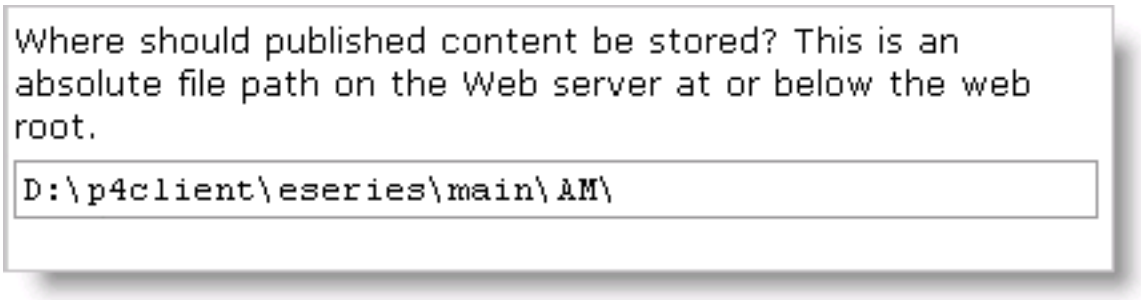
Administrators can use the drop-down list to select a publishing server.



Selecting a Publishing Server

Published Content Location

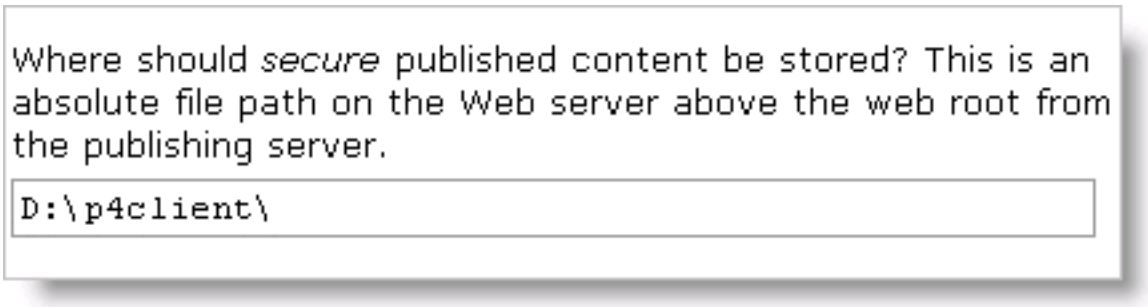
An absolute file path to the storage location for published non-secure content.



Published Content Location

Secure Published Content Location

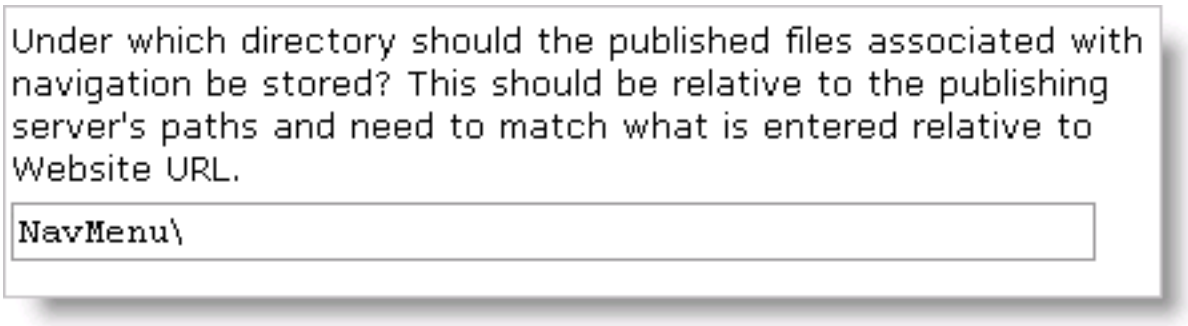
An absolute file path to the storage location for published secure content.



Secure Published Content Location

Navigation Menu Publication Directory

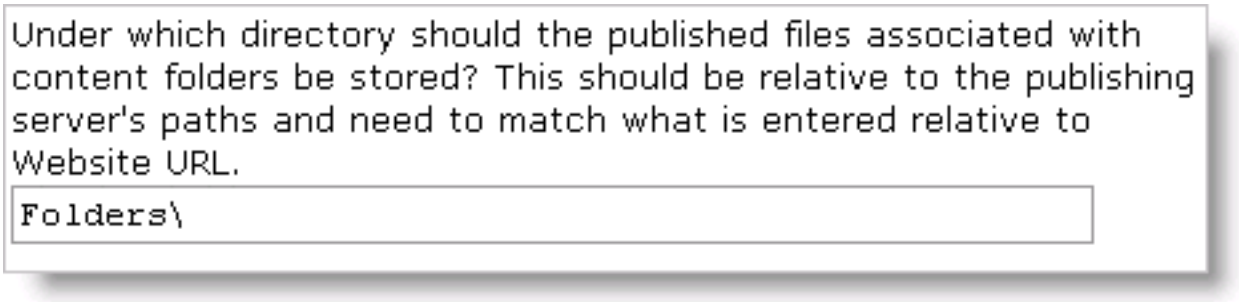
In which folder should published files associated with navigation items be stored?



Navigation Menu Directory

Content Folders Publication Directory

In which folder should published files associated with content folders be stored?



Content Folders Publication Directory

Default Page

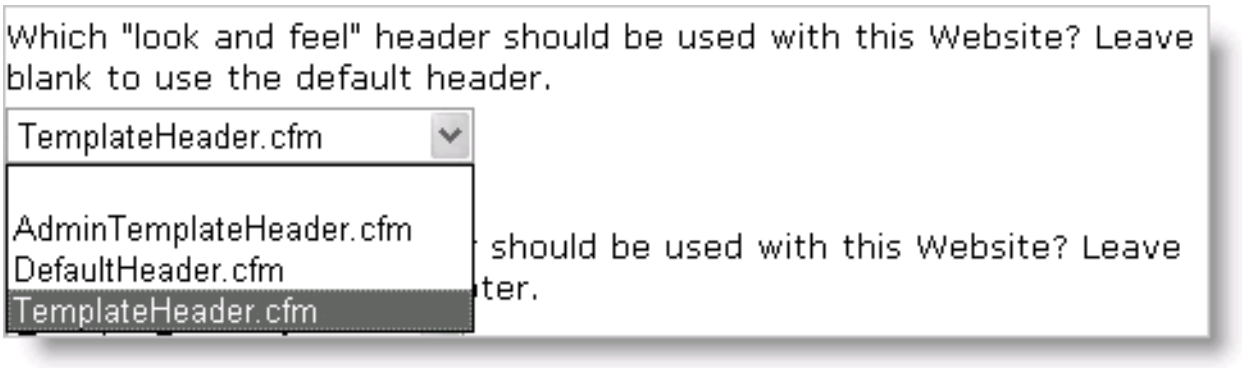
If there is a value entered here (e.g. “Default.htm”) each navigation item will create a default file of that name in the directory used to publish content, allowing the user to access the content with a URL such as http://cibolo.activematter.com/UpcomingEvents/

The file name entered must be set up as a default document in IIS.

Graphics Directory

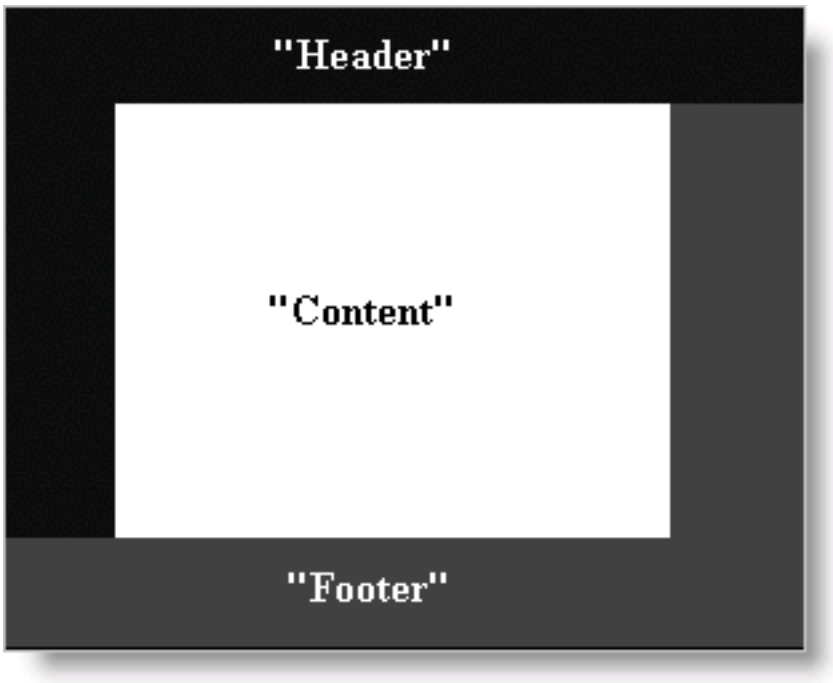
This dictates the storage location of the directory used to hold button graphics, allowing each website to have its own set of buttons (if needed).

Look and Feel Header Select



Look and Feel Header Drop-Down

The look and feel header drop-down lists the choices for website look found in the Templates/TemplateHeader directory. The header includes graphics, content and navigation found above and to the left of the main content area.



Schematic Structure of CM5 Page

Look and Feel Footer Select

The look and feel footer drop-down lists the choices for website look found in the Templates/TemplateHeader directory. The header includes graphics, content and navigation found below and to the right of the main content area.

Stylesheet Select

The list of options is read from the Styles directory. A different style sheet, specifying fonts, colors, etc. can be selected for each website. Changing style sheets does not require a website re-publish.

Header for Printer Template

This list is generated from Templates/PrinterHeader. An application-wide option controls whether to show this option, which presents a navigation-free “printer friendly” template.

Footer for Printer Template

This list is generated from Templates/PrinterFooter, and forms the bottom of the page in printer-friendly view.

Text-Only Header

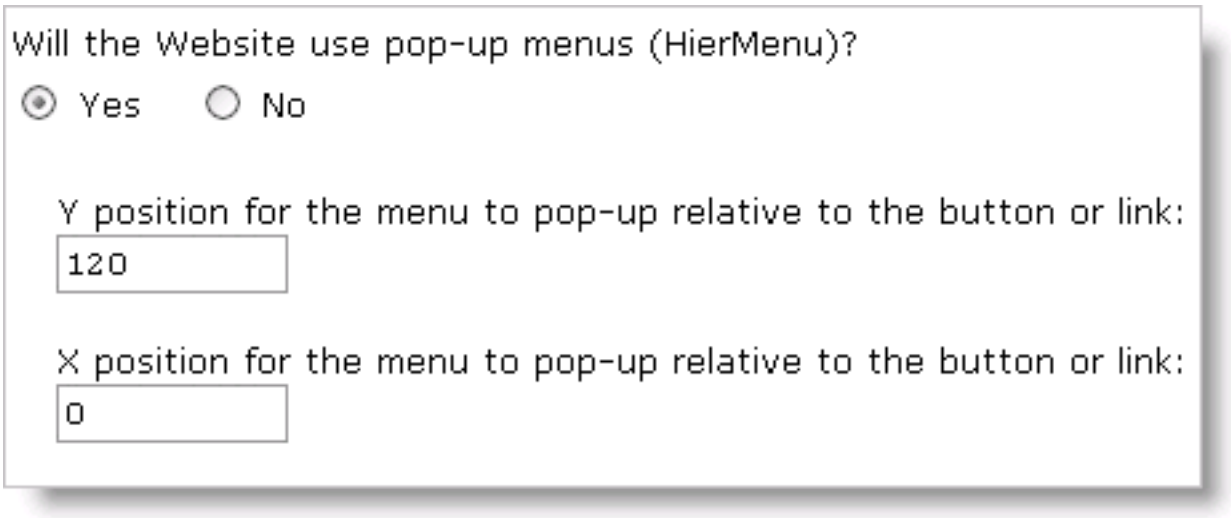
This list is generated from Templates/TextTemplateHeader. Intended for no-graphics presentation for users with low-bandwidth connections.

Text-Only Footer

This list is generated from Templates/TextTemplateHeader. Intended for no-graphics presentation for users with low-bandwidth connections.

Pop-up Menus Y/N?

If this setting is checked, it creates pop-up menus of every primary (ShowInTopFlag) item listing its immediate children. It will work only if the site uses a graphical template, not in the bare “wireframe” text-only default template.

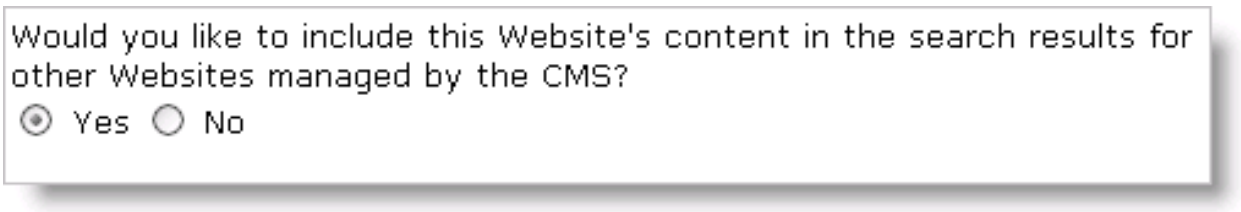


Pop-up Menu Settings

Breadcrumbs Y/N?

Turns the bread crumb trail navigation feature on or off. After changing this setting, the entire website must be re-published.

Include this Site's Content in Cross-Site Search?

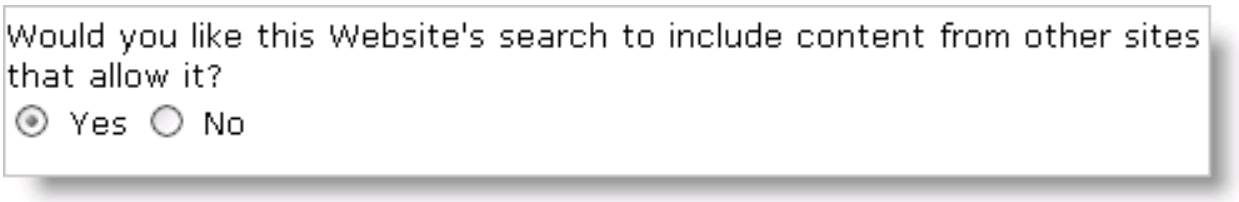


Include Content in Search Settings

If Yes is selected, content from this site will be available to be indexed for search on other sites, if those sites have the Include content from other sites option set to Yes.

If No is selected, content from this site will not be available for indexing by other sites in this instance of CM5.

Include Content from Other Sites in this Site's Search?

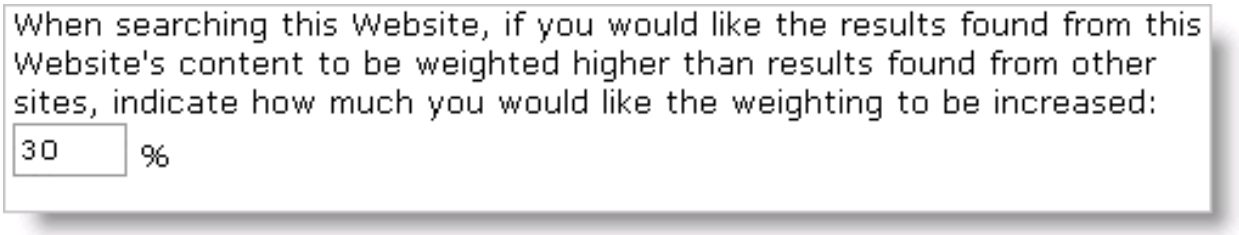


Enable/Disable Cross-Site Search

If Yes is selected, content from other sites which allow their content to be indexed for cross-site search will be included in this website's search index.

If No is selected only content from this site will be indexed in this site's search.

Search Weighting



Cross-Site Search Weighting Setting

If cross-site searching is enabled, this input can be used to give search results from this website a higher weight in search results than those of content from other sites.

If cross-site search is not enabled, this setting is moot.

Content Records Header

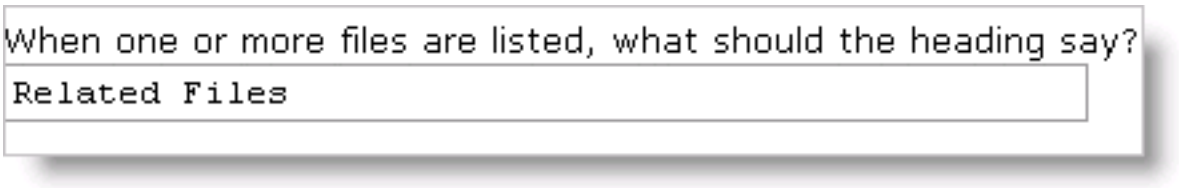
Content Records Header Setting

This setting determines the text of the default header which is displayed when a navigation item has more than one content record and the navigation item setting “view the

default content record in its entirety, followed by a list of links to the other content records" has been selected.

Uploaded Files Header

When uploaded files are added to a content record, they appear underneath a headline. This setting determines the text of the headline.



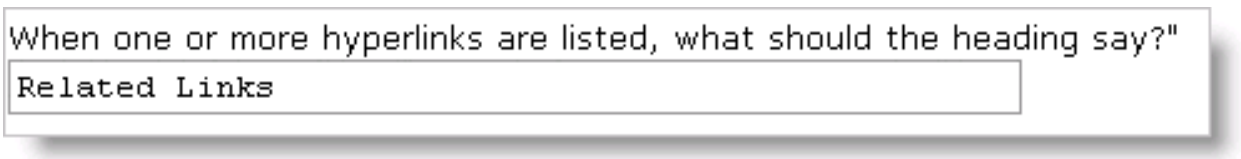
Uploaded Files Header Settings

This shows both the file and links headers in a content record:

File and Link Headers

Links Header

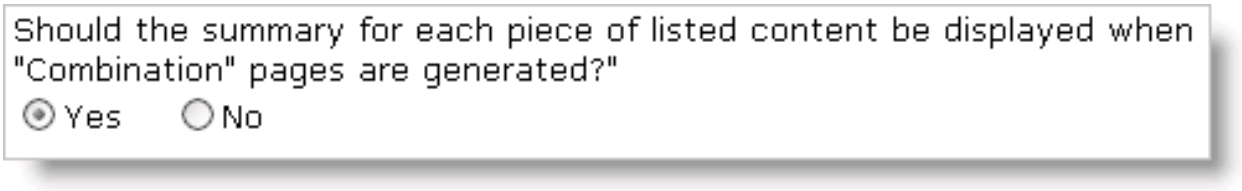
When links are added to a content record, they appear underneath a headline. This setting determines the text of the headline.



Links Header Settings

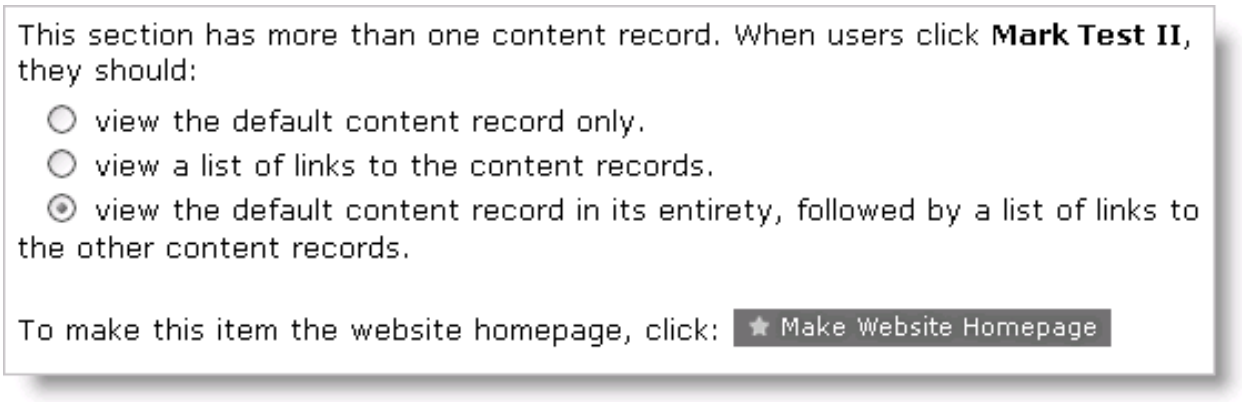
Combo Display Summary Y/N?

This setting determines whether or not content record descriptions are shown on a combination page.



Combo Display Summary Display

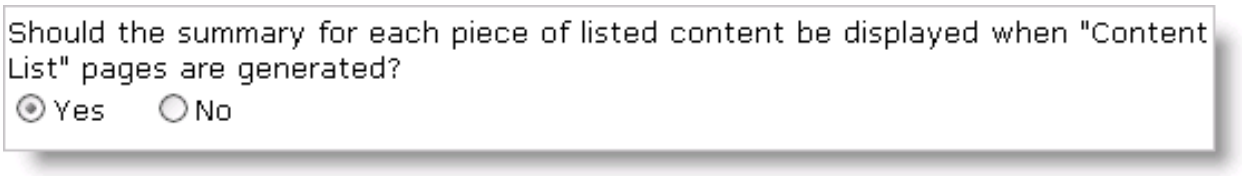
A Combination or “Combo” page can be generated when a navigation item contains more than one content record. When the combo option is selected the default content record (the first record in the list of content records at the bottom of the navigation item properties page) is shown in its entirety, followed by a list of links to other content records in the navigation item. If this setting is Yes, each content record's summary will be shown beneath its link.



Combo View Selected in a Navigation Item

Content List Summary Y/N?

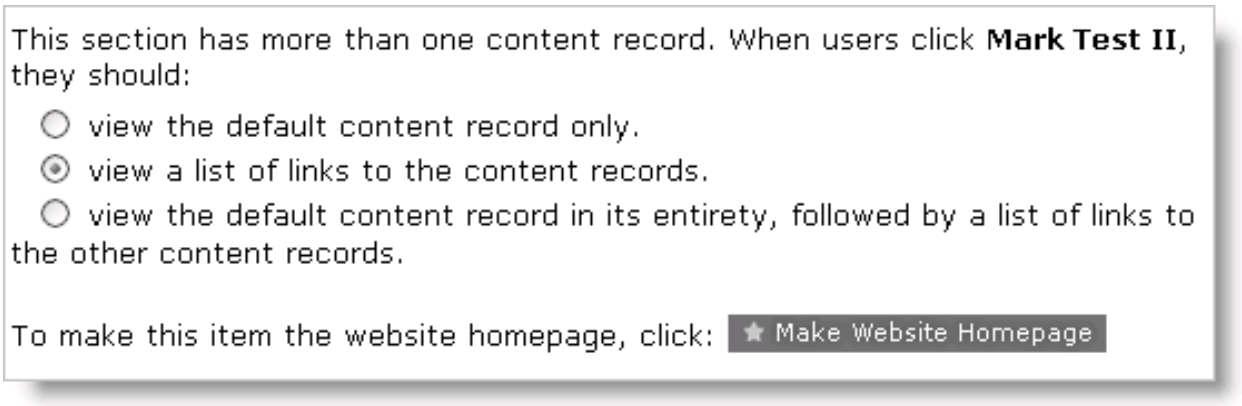
This setting determines whether or not content record descriptions are shown on a content list page.



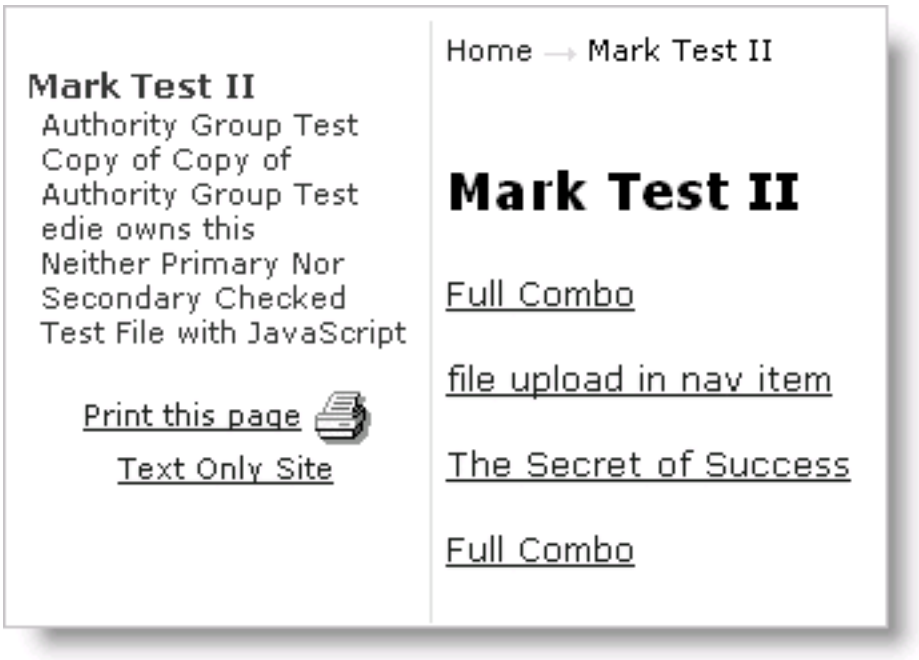
Content List Summary Setting

A content list page can be generated when a navigation item contains more than one content record. When the content list option is selected, the page shows only a list of links to content records in the navigation item.

This shows a combo page set not to display summaries:



List View Selected in a Navigation Item

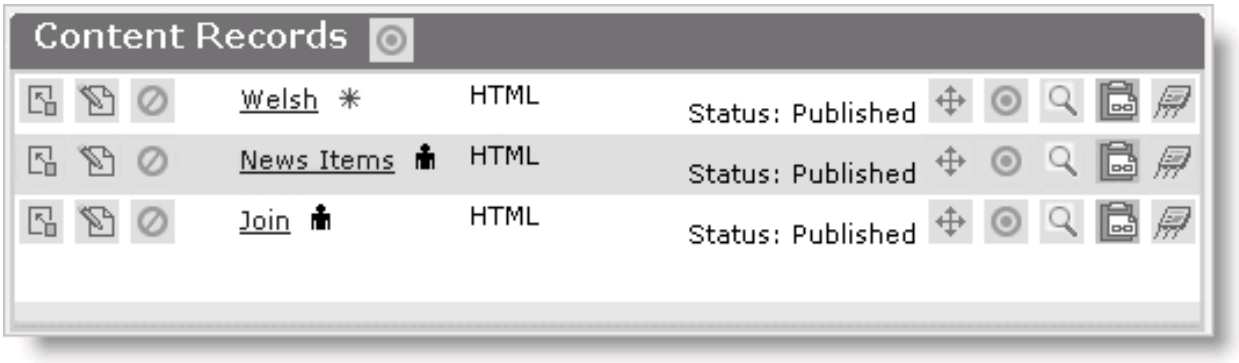


List View, No Summaries Displayed

Content List Sort

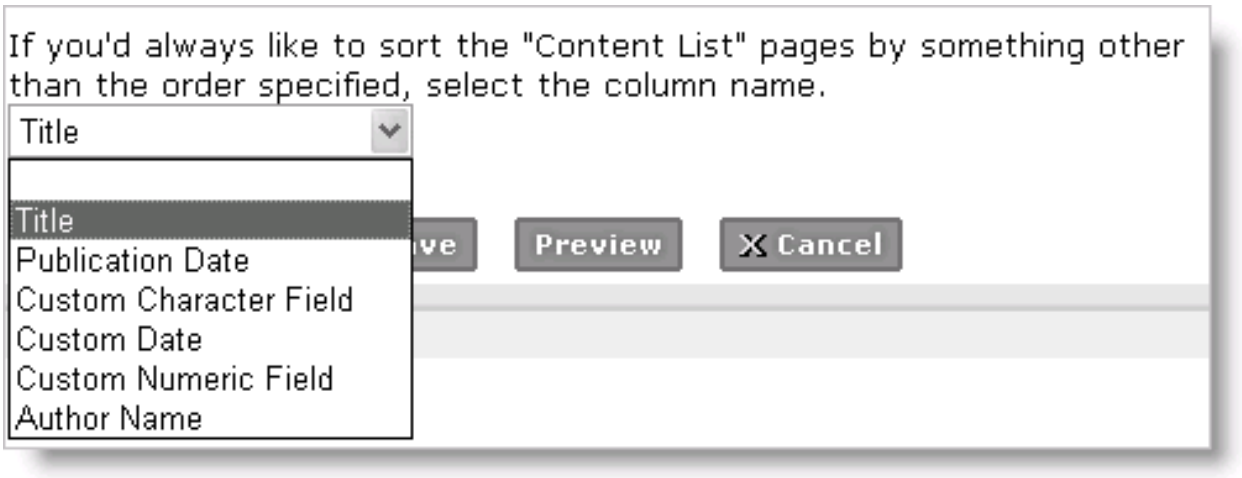
If you have more than one content record in a navigation item, you have the option of displaying either the default record only, a list of all content records, or the default record in full with links to other content records below.

Ordinarily, these lists of records will be sorted by the order shown in the navigation item properties page.



Multiple Content Records in a Navigation Item

If you would like to over-ride that default sort order in all cases, you can specify another sort criteria using the drop-down list. The available choices include Title, Publication Date and any user-defined fields. Sort will be ASCII order (0-9, A-Z, a-z).



Simple versus Advanced Websites

Every e-CM license includes a specified number of advanced and simple websites. Advanced websites in are full-featured websites with all the features described in this document. Simple websites have a slimmed down feature set designed, for example, to be used by an organization's chapters.

Overview of Simple Website Functionality

The following restrictions are imposed on simple websites:

No Workflow

Simple websites have no workflow-related features. Content being edited can be saved or published only. There is no submit for approval or approve step available. Only one Content Authority Group is available.

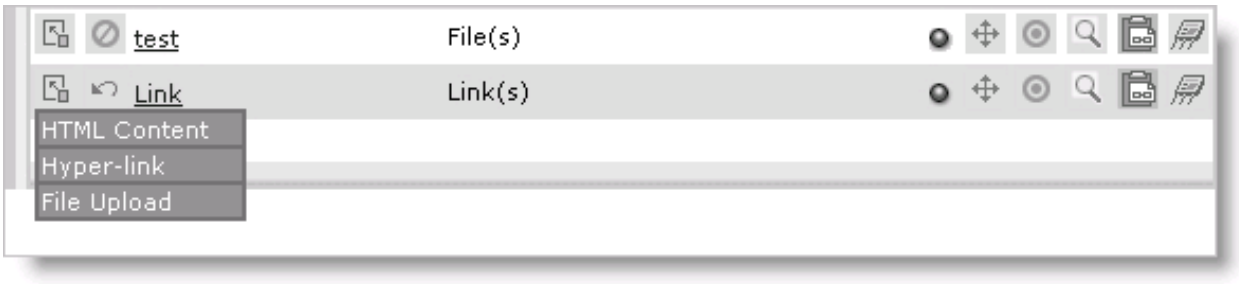
Other Restrictions

- Users are restricted to the simple toolbar, which has the effect of eliminating a number of capabilities, including the ability to view the properties page.
- There are no tagged pages (but tags can still be used to support site search).

- There is no versioning of content. The simple toolbar does not show the button. The system will still make versions, but the user will have no access to the functionality.
- Content can only be a single HTML document, or a single link, or a single uploaded document.
- There is no access to the content record properties page, meaning:
- There is no way to enter description and keyword meta tags
- There is no publish in the future
- There is no automatic publication
- There is no way to mark content as secure (HTTPS). This would have to be done through a link.
- Content has to be marked for members only at the navigation item level.
- The editing of both links and files is handled via pop-up windows (these forms would normally appear on the content record properties page).
- Editing content always goes to the WYSIWYG editor
- Surf-to-edit is available.
- User can still select between all three options for navigation items (default only, list, or default plus list of others).

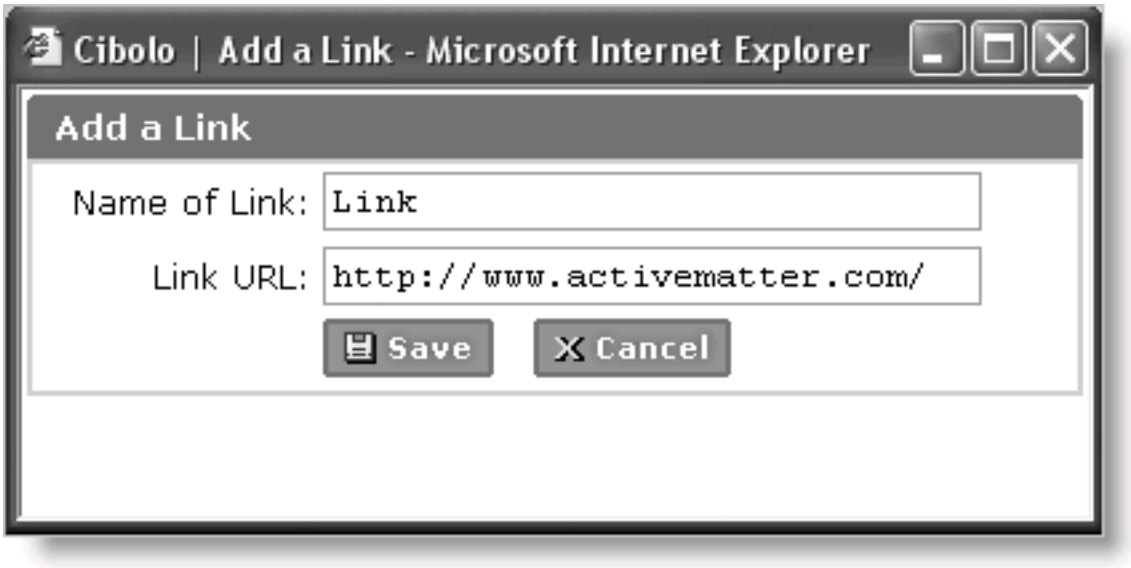
  Selecting a Type of Content to Enter

  When you insert a new content item in a simple website, you have to choose what type of content to insert in the record (since only one piece of content - HTML, link, or file may be inserted). This is accomplished via a pop-up menu which appears when the user clicks on the button.



Choosing Which Type of Content to Enter, Simple Website

After selecting a type of content, the user either goes to the HTML editor (for HTML Content) or to an appropriate pop-up form for a link or a file.



Pop-Up Editing Form for a Link, Simple Website

Site Maintenance

The activities and variables described apply to all websites on your e-CM instance.

This section addresses the variables that can be viewed and updated in the “Site Maintenance” section of the website, plus items that are found elsewhere but fall under the general heading of site maintenance.

Clearing Cached Pages

Clearing cached pages is an operation which requires the “tagging categories” security assignment permission.

In order to speed response time when users retrieve tagged pages, which require extremely complex database operations to build, those pages are cached (stored) in the server's memory the first time a user views them, and then remain unchanged in memory until they “time out (the timeout interval depends on the value of tagged page configuration variable TPCachedPageResetMinute). When a page times out, it is removed from memory and re-cached by the first user who requests it.

This produces much faster response times (since computer memory is much faster than computer hard disks), but it also means that updates which affect tagged pages will not go live immediately. If you want your updates to go live, you must clear cached pages. This removes the pages from memory and allows fresh copies to be re-cached when users next hit them.

Note: Your home page will probably also be cached.

To clear cached pages

1. Log in to the e-CM administrative interface.
2. Select Tagged Pages.
3. Select the Clear Cached Pages link. A message indicating that the cached pages were reset displays.

Resetting Server Variables

Server variables are all the stored application variables which make the website function. For all practical purposes, there is no reason to reset these values in the server's memory except during site development (although aside from slowing down site response while the variables are re-cached in memory, it will not break anything either).

To reset server variables

1. Log in to the e-CM administrative interface.

2. Select Admin on the top navigation bar.
3. Select Reset Server.
4. Select Reset Variables.

Creating Sites

Demo Tutorial Site

To get users up and running quickly, ASI has included a demo tutorial site that is installed when the e-CM Wizards are executed.

When the site is initially installed, it is created as a simple site without workflow, tool bar options, tagged pages, and versioning. To change the tutorial site to an advanced site, we need to change the configuration of our Demo Tutorial site.

Simple Tutorial Site Setup

Once the Tutorial Site is created by the e-CM Wizards, it still needs to be configured if a virtual directory is being used. Make the following changes to add the virtual path into the site.

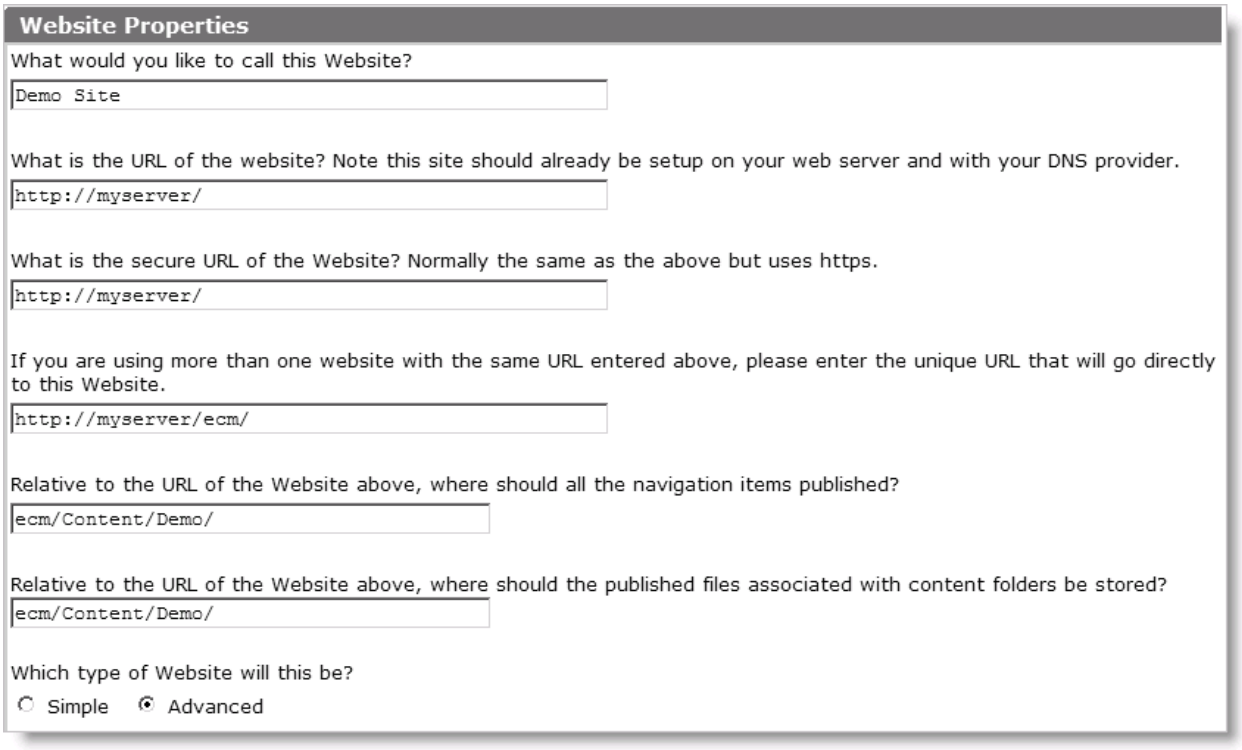
1. On line four of the properties page, add your virtual directory to the URL, replacing “Demo” with your virtual directory name (for example, http:/myserver/eContentManager instead of http://myserver/demo).
2. On line five, add the virtual directory to the beginning of the URL.
3. Save and republish the site. When previewing the Demo site, all links should be accurate.

Switch Demo Tutorial Site to Advanced Site

1. If you have not already done so, run the e-Series Application and e-CM Wizards as outlined above, making sure that the “Would you like to setup a tutorial site?“ option is selected.
2. Log in to the Administrative Portal and click the Edit button next to the Demo Site to go to the Website Properties screen.

3. Choose “Advanced” for the Type of Website. Notice more options become available for the implementer which are discussed in detail in the following “Create New Website section. For now, we will configure the Demo tutorial site to take advantage of the Advanced Features of e-CM.
4. Once the site is configured and saved, make sure to republish the website.

   Note: The iMIS license key must have ECMADVXX to use advanced e-CM features.



Website Properties page

Switching Simple Demo Tutorial Site to Advanced Site

What would you like to call this Website?	By Default, labeled Demo Site. Name of the website as well as what appears in browser title bar. Example: Demo Site

What is the URL of the website? Note this site should already be setup on your web-server and with your DNS provider.	Generally the domain name assigned to the IP address of the server or an actual IP address. Example: http://myserver.com
What is the secure URL of the Website? Normally the same as the above but uses https.	If a security certificate is available on the server, those pages designated requiring SSL will refer to this URL. If no SSL certificate is available, leave the same as the URL of the website. Example: https://myserver.com
If you are using more than one website with the same URL entered above, please enter the unique URL that will go directly to this Website.	If e-CM is installed under a virtual directory, the name of the virtual directory included in the URL Example: http://myserver.com/e-CM
Relative to the URL of the Website above, where should all the navigation items published?	Where the files are mapped to in IIS. For virtual directories: ecm/Content/Demo/
Relative to the URL of the Website above, where should the published files associated with content folders be stored?	Where the files are mapped to in IIS. If a Simple site, this option does not display. For virtual directories: ecm/Content/Demo/
Which type of Website will this be?	Will this be a simple or advanced for site. Choose Advanced
Will the site use tagging?	Will the Demo site use Tagging? For the Demo site choose yes
Which authority group should be the	Since this is a Demo site, there is only one

default authority group for this Website?	option - Master Admin. As we configure the Demo site, we can come back and edit to add more groups
What other authority groups should be able to access this Website?	Since this is a Demo site, there is only one option - Master Admin. As we configure the Demo site, we can come back and edit to add more groups. Note: This is an Advanced Website option only.
Which security access rights should be used with this Website?	Allows the user to choose eSeries Security Groups or iMIS Member Types to assign access to the site. Using the CTRL key, you can choose more than one group. For Demo Site, make sure Administrator is chosen.
Where should published content be stored? This is an absolute file path on the webserver at or below the web root from the publishing server.	Location on server where published content is stored. Example: c:\ecm\customer\
Where should secure published content be stored? This is an absolute file path on the webserver above the web root from the publishing server.	Location on server where secure published content is stored. Example: c:\ecm\customer\MembersOnly
Under which directory should the published files associated with navigation be stored? This should be relative to the publishing server's paths and need to match what is entered relative to Website URL.	Content\Demo\
Under which directory should the published files associated with content folders be stored? This should be relative to the publishing server's paths and need to	Content\Demo\

match what is entered relative to Website URL.	
What is the default page for this site? Make blank if not using defaults.	Default.htm
Under which directory are the graphics buttons for this Website stored? This should be relative to URL of the Website.	DemoGraphics/
Which "look and feel" header should be used with this Website? Leave blank to use the default header.	DemoTemplateHeader.cfm
Which "look and feel" footer should be used with this Website? Leave blank to use the default footer.	DemoTemplateFooter.cfm
Which stylesheet should be used for this Website?	DemoStyle.css
Which header should be used for printer template?	DefaultPrinterHeader.cfm
Which footer should be used for printer template?	DefaultPrinterFooter.cfm
Which header should be used for text only template?	DefaultTextHeader.cfm
Which footer should be used for text only template?	DefaultTextFooter.cfm
Will the Website use pop-up menus (HierMenu)?	Yes
Y position for the menu to pop-up relative to the button or link:	120. Note: Only visible if pop-up menus are active
X position for the menu to pop-up relative to the button or link:	0. Note: Only visible if pop-up menus are active

Will the site use bread crumbs?	No
Would you like to include this Website's content in the search results for other Web-sites managed by the CMS?	Yes
Would you like this Website's search to include content from other sites that allow it?	Yes
30	75%
When multiple content records are listed for a single navigational item, what should the heading say?	Related Documents
When one or more files are listed, what should the heading say?	Related Files
When one or more hyperlinks are listed, what should the heading say?"	Related Links
Should the summary for each piece of lis-ted content be displayed when "Com-bination" pages are generated?"	Yes
Should the summary for each piece of lis-ted content be displayed when "Content List" pages are generated?	Yes
If you'd always like to sort the "Content List" pages by something other than the order specified, select the column name.	Title

Virtual directory for Template Gallery and Demo Tutorial sites

If a Template Gallery or Demo Tutorial site is setup to use a virtual directory, the user must go back and edit these fields after the website is created. The Website properties page does not update the file locations for the following prompts when the website is cre-ated:

- Relative to the URL of the website above, where should all the navigation items published?
- Relative to the URL of the website above, where should the published files associated with content folders be stored?

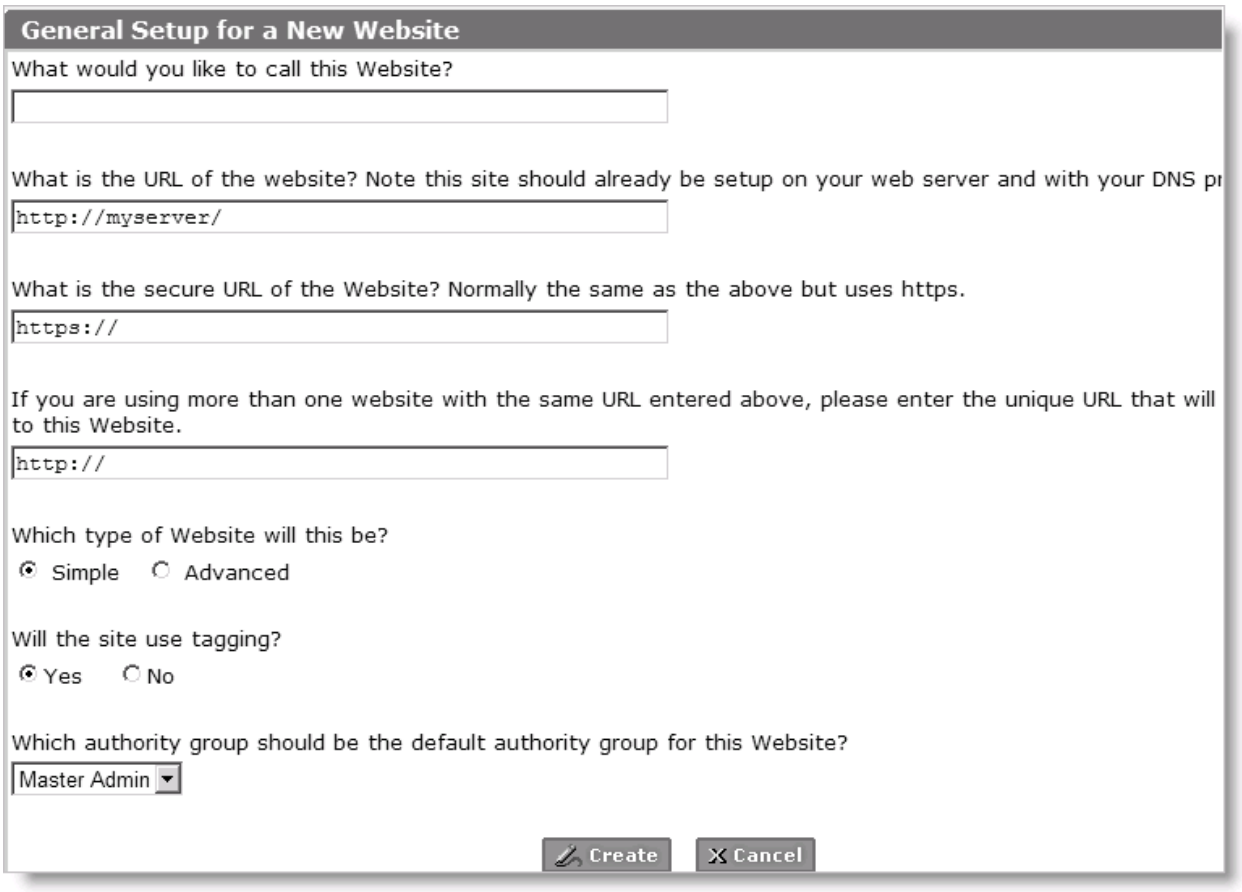
  The correct virtual directory must be entered on the Website properties page after the website is created, otherwise the site will not behave as expected.

Create New and Additional Sites

Creating a new site is a two-step process that is very similar to editing the tutorial site. If you are licensed for additional sites, you can create sites that can be customized based on your clients needs. For example, if you have an organization that has chapters, you can create a separate web page per chapter, giving each chapter its own template and customization to make each chapter's web page unique. In addition, you can assign separate content producers as well as assign security independently per website.

The first step is to create the site. The next step is to edit the properties for the site.

1. In the Admin Portal, go to Sites.
2. Click the Create button.
3. Populate the new site settings by populating the Website name, URL type of site, tagging, and which Authority Group to use for this site.
4. When all fields are populated, click Create. You will be taken back to the Manage web Site screen.



General Setup for a New Website

5. Once the site is created, click on the new sites properties screen to continue setting up the new site. Refer to the settings table for the demo website for field properties definition,

Content folders must be deleted before website in e-CM

In e-Content Manager, if you delete a website, all corresponding folders, content, and navigation items will also be deleted.

Configure e-Series

If you are using e-Series, now is the time to configure the system parameters and security for the e-Series modules.

To access the e-Series settings

1. Log in to the e-CM Portal

Example: http://yourserver/virtualdirectory/source/Security/Site-Logon.cfm?Section=Site_Maintenance

2. Choose eSeries on the left-hand index.
3. Click System Parameters.

Appearance and Content Migration

While e-CM provides the framework and functionality of the client's website, the customer will want to customize e-CM to fit their needs and brand image.

Web Design

Web design and graphic layout should not be confused with Information Architecture. web design communicates the client's branded recognition to its members or organization and sets the web visitor's first impression of the organization when visiting the website.

An implementer should work closely with clients to determine the right balance of branding, audience strategy, and visual impact to arrive at a website design that is rooted in a forward-looking strategy.

Web Design and graphic creation should be contracted out to professionals if the reseller does not have someone on staff that can fulfill these functions.

Some important considerations in website design:

- Form and function should be one - Otherwise, the medium will obscure the message rather than effectively project it
- Adhere to the following qualities - Simplicity, consistency, and convention
- Take advantage of the following web conventions:
- Persistent Navigation
- Local Navigation
- Breadcrumbs
- Text-only navigation (usually in the footer)

- Search box if a large site
- The home page - This is the most valuable piece of real estate in your site
- Use colors carefully - web monitors and offset printers treat colors differently
- Finally, design what works best for your users with regard to content, marketing, and branding

Template Overview and Editing

e-CM uses templates and style sheets to display site visual properties consistently throughout the site so that when a user clicks on one page, its appearance is similar to all other pages on the website.

Header and Footer

There are several good examples of headers and footers, such as the Demo Template Header and Footer, as well as the Default Header and Footer. These files are found in the Templates\TemplateHeader and Templates\TemplateFooter directories.

The starting point should be the unencrypted files TemplateHeader.cfm and TemplateFooter.cfm.

Note: If a demo site is set up, the demo template is a good starting point since you can review your edits as they are made.

In general, the header file should include everything that is rendered before the content and the footer file should include everything that is rendered after the content.

The easiest thing you can do is to add HTML (images, links) and edit the stylesheet (whichever stylesheet is selected in the website properties). In a stylesheet, there is a section toward the end dedicated for the template.

Also for top nav and side nav, there are certain settings that can be passed:

Top:

<cfset l_NavColumnsAcross = 6> (How many columns to show across)
<cfset l_NavShowAcross = True> (Should the nav show horizontally?)
<cfset l_NavTableWidth = "100%"> (Table width for the navigation)

<cfset l_AlwaysShowAsOff = False> (If images or text rollover is used, should the current item be highlighted or always shown as off.)
<cfset l_TextRollover = False> (Text rollover is what the demo template uses.)
<cfset l_ShowDivider = False> (When text rollover is used, divider can be displayed between each item)

Side:

<cfset l_ShowCategoryDepth = 1> (The depth of the navs to show on the side)
<cfset l_HighlightFirstItem = "True"> (Whether or not to highlight the first item as selected. i.e, whether or not to use "Selected" style class.)

Other ColdFusion code in the files should not be modified unless the user is an experienced ColdFusion developer. It is best to avoid hard-coding URLs as much as possible, since these normally change between the development environment and the production environment. Graphic paths should not be hard-coded either, since these also change between the test and production sites.

Advanced users who want to modify the way top navigations and side navigations are displayed can modify the Templates\TemplateTopNav.cfm and Templates\TemplateSideNav.cfm files. However, the user should not modify anything other than the HTML part of the code since these files also include logic for which nav items to show. Also, when modifying these two files, the user should be aware that any changes may be lost during upgrades.

Stylesheets

For all of your templates, you should put your stylesheets in the /AM/Styles folder. The template can only call one stylesheet (which you can define in the properties of the website). If you need to add additional stylesheets and/or include JavaScript code that has to be placed between the HEAD tags of the HTML, then you should use code similar to below to help. The following is an example you need to modify for your particular site.

<cfset request.l_HTMLHeadContentInformation = request.l_HTMLHeadContentInformation & '<LINK REL="StyleSheet" HREF-F="#application.GECodePath#Styles/ClientStyles.css" type="text/css">'>

Custom Home Pages

If the site design requires a custom home page with a different look and feel (for example, a top navigation but no side navigation), you should set a flag in the header and footer files you use. This flag can be used to display the HTML and layout only for the home page and to display everything else for the interior pages.

```
<cfset l_HomePageFlag = FALSE>
<cfif l_Section IS application.WebsiteRef.DefaultSectionName[l_WebsiteIndex]>
   <cfset l_HomePageFlag = TRUE>
</cfif>
```

For any custom dynamic content that needs to be displayed on the home page, you can create a stored procedure and custom ColdFusion file and place it on the root of the AM folder. Then in e-CM, have the "Home" record (or the record that is the default section) link to it.

The 10.4.27.01 Sales VM image has an example Homepage.cfm for demonstration purposes.

Content Migration

Once the templates and navigation are in place, it is time to transfer existing web content to e-CM. Hopefully by this point, the Information Architect has identified the locations of existing pages that need to be copied into e-CM.

A general rule of thumb for the time required to manually migrate pages from an existing site to e-CM is five pages per hour. If a site has more than 300 pages, it is recommended that you discuss the best method for importing pages with ASI Consulting, which has the experience and tools needed to migrate large amounts of existing content into e-CM.

Transitioning to Live Site

Once the customer has finished the user acceptance phase it is time to transition our work to the live website and database. These steps can also be used to move a website. If moving a website, simply back up the database and restore to a new server and update the System Variables table with new values as outlined below.

Note: Make a backup of the live database before migrating data from development to the live database!

Another option is configure the website using the live iMIS database. Since the e-CM tables do not directly affect the iMIS, changes can be made to e-CM without affecting iMIS. The exception would be if you are testing e-Series transactions.

Note: Before attempting migration, check the ASI website for updated instructions.

Transfer e-Series tables

Note: Any e-Series-specific values in the COUNTER table should be updated in the production database. The LAST_VALUE field in the test database should be set to match the LAST_VALUE field in the production database if this part of the setup needs to be transferred to the production site. Other e-Series-specific values in the COUNTER table that should be updated in the production database include Cmty_Discussion_Forum, Cmty_News, Cmt_Shared_Files, Cmty_Shared_Folders, Community, Content_Pages, and Reports.

- Make a backup of your production database.
- Verify that all users are out of the database.
- Add the SQL Login and Password used for ColdFusion access to the database
- Create ODBC to live database
- Truncate the following tables in the production database.
- gen_descriptions
- security_groups
- security_filters
- security_modes
- security_tables
- style_options
- contacts

- content_pages
- w_reports
- comment_types
- comment_log
- urls
- Community
- Cmty_Discussion_Forums
- Cmty_News
- Cmty_Shared_Files
- Cmty_Shared_Folders
- Run MSSQL Data Transfer Service (DTS) (in Enterprise Manager, select Tools> Data Transformation Service) and transfer the data from the same tables in the test database to the production database.

  Note: It is probably best to recreate this data in the live database, rather than transferring the data, as there could be IDs in both databases that represent different records (since test records have been added to the test database while actual records were being added to the live database).
- (optional) Run the SQL scripts that were used to populate the tables in the test database on the following tables.

  Note: Make sure the ID used for e-CM as the “Super Admin” is present.
- Name_security
- Name_security_groups
- (optional) The following table may also be transferred.
- Mail_lists

Note: If you have been altering the production database parameters independently of the test database, you may encounter problems with the System_Params table. Generally, you should be able to truncate the System_Params table and DTS the System_Params table from the test database. Be sure to back up a copy of the System_Params table so that you can restore this one table if you get unexpected results.

- Change the database that the ODBC data source points to from the test to the production database, or create a new ODBC data source for the production database and set it up in ColdFusion with a password.
- If you created a new ODBC data source that points to the production database, re-run the AppWiz to make sure that ColdFusion is pointing to the correct ODBC data source.
- Verify that the ODBC data source used by any reports is on the production server and pointing to the production database, not the test database.
- Run the All_Security_Triggers.sql and Update_Security_Cursors.sql scripts on the production database.

  Note: Whenever you make a change to your system setup, the e-Series variables are reset in the System_Params table. To correct this, log in as administrator and update the system variables (Admin> Lookups> Update System Variables).

Transfer e-Content Manager tables

1. Run the Prepare database script on your live database. This will install the stored procedures and triggers required by e-CM.
2. Copy the e-CM and e-Series files to the production server. If possible, try and keep the directory structure similar on both sites (for example, c:\e-CM on dev server to c:\e-CM on live server).
3. Empty the collection folder that contains the Verity search files.
4. Run the CMDDW.exe file included in the release to move the only the e-CM tables from your test database to your production database.
5. Rerun the e-CM Wizard to install the admin site on the production server as well as recreate the Verity collections and stored procedures.

6. Log in and select the Admin navigation item and then select the Site Maintenance navigation item.
7. Scroll to the bottom of the Installed Modules list and select the Deployment Variables item.

- Review the deployment variables to see if any information needs to be updated before launching the site. Few will need to be updated, but review them to be sure.
- MAKE SURE THE TPCachedPageResetMinute VARIABLE IS SET TO SOME TIME GREATER THAN 0! The higher the value, the better since this increases the cache time for tagged pages, which allows better performance for the system.

8. Verify that the Publishing Service is using the correct database. Edit the PublishService.exe.config file.
9. Once you have reviewed and updated all the deployment variables, select the Reset Server Variables navigation item.

   To publish the production site

1. After logging back into the Administrative Interface, select Website > Site Search > click Index collection.
2. Select Website Properties for the production site and reset the urls to the address of the production site.
3. Select Publishing Servers and change the IP address to the production server.
4. Go to your main website's navigation page.
5. Select the Publish Entire Site icon for your site.

   Note: Republishing the site will take some time. Do not refresh this page while waiting.

   Manually transfer tables (not recommended)

- While time consuming, you can truncate and transfer via DTS the following tables in the production to live database.
- I_Content

- I_Content_File
- i_NavMenu
- Product_Type_Delete
- U_Content
- u_NavMenu
- Admin_Section_Ref
- Admin_Security
- Admin_Security_Log
- Component_Email
- Component_Email_Variable_Ref
- Component_Interest_Category
- Component_Interest_Group
- Component_Ref
- Component_Script_Ref
- Content
- Content_Authority_Group
- Content_Authority_Producer
- Content_Authority_Ref
- Content_Change_Request
- Content_File
- Content_HTML
- Content_Link
- Content_Pages

- Content_Publish_Server
- Content_Security_Group
- Content_Workflow_Log
- Data_Type_Ref
- Directory
- Duplicate
- Duplicate_Group
- Duplicate_Keys
- Email_Contact
- Microsite
- Name_Security*
- Name_Security_Groups*
- Nav_Menu
- Nav_Menu_Feature
- Nav_Menu_Security_Group
- Nav_Menu_Setup_Log
- Nav_Menu_Website
- Nav_Menu_Workflow_Log
- Publish_Message_Log
- Publish_Priority_Ref
- Publish_Request
- Publish_Request_Detail
- Publish_Request_Status_Ref

- Publish_Server_Ref
- Sub_Component_Ref
- System_Variable
- Tagged_Page_Color_Ref
- Tagged_Page_Component_Column
- Tagged_Page_Format_Ref
- Tagged_Page_Format_Type_Ref
- Tagged_Page_Interest_Category
- Tagged_Page_Layout
- Tagged_Page_Portlet
- Tagged_Page_PortletIC
- Tagged_Page_Section
- Tagged_Page_Title_Ref
- Tagged_Portlet
- Tagged_Section
- Tagged_Section_Template
- Tagged_Template
- Tagged_Template_Field
- URL_Mapping
- User_Defined_Content_Labels
- User_Defined_Field
- Website
- Website_Content_Authority

- Website_Security_Group
- Workflow_Status_Ref
- Copy physical files from the dev server to the production server. If possible, try and keep the directory structure similar on both sites (for example, c:\e-CM on dev server to c:\e-CM on the live server).
- Create site mappings on the live server in IIS similar to the development site. Make sure to add the Template.cfm file to the list of default documents and edit the Custom Error codes.).
- Rerun the e-Series Application Wizard.

  Note: Do not select the Create Default Content option.
- Update the System_Variables table. Verify that the System_Variable.Name column matches the settings required for your live production database. This can also be configured through the Admin Portal under the Deployment Variables link.
- GECodeDirectory
- FileRootPath
- RootPath
- SecurePath
- SiteName
- CMWEPLicenseKey1
- CMWEPWebRoot
- SECollectionPath
- Delete files in the collections folder.
- In a browser, run the SearchCollectionSetUp.cfm file that is located in the AM\Admin\Search folder to manually recreate the collections.

- Verify that the Publishing Service is using the correct database. Edit the PublishService.exe.config file.
- Republish the entire site.
- Test, test, test!

Implementing the Template Gallery

The Template Gallery works with e-Content Manager (e-CM) to give your organization a professionally designed website without the need for custom software development. The Template Gallery provides 10 floor plans for homepage and interior page layouts with starter designs that define the look and feel of your website. A wizard guides you through the setup of the template. You browse for a design, read about the recommended uses for each template, and select and install the template onto your new Website.

The Template Gallery provides predefined floor plan designs. The floor plans include placeholders called content areas. These areas can hold various types of content (images, URLs, and HTML) that can be populated using the functionality of e-CM. You can modify the template to reflect your organization's branding and place appropriate content in homepage and interior page content areas.

The floor plan specifies the placement and dimension of the content areas and the navigational properties of the site. The floor plan is defined by ColdFusion files. The starter design provides the graphic elements of the site. Cascading style sheets define the starter design and set the background colors and fonts for the pages.

To work with the templates, it will help to be familiar with the following:

- Concepts of external cascading style-sheets (CSS)
- Web-safe color palettes and hexdec codes
- Advanced HTML (tagging and layout)
- Graphic design applications (sizing and cropping)
- Basic ColdFusion knowledge

In e-CM you should be able to:

- Change the title of a navigation item
- Work within the navigation structure
- Edit a content record
- Create links to content and functionality

Installation Requirements for Template Gallery

The Template Gallery requires the following:

- e-Series version 10.5.28.02 or greater
- ColdFusion
- e-CM and e-Series or e-CM only
- Template Gallery license

Note: When updating from a previous release, make sure to review all documents from each release so that you can fully understand how the updates will impact your business.

Installing the Template Gallery

These procedures apply to implementations using an iMIS database or to implementations using a e-CM only database. A separate license key is required.

Note: Contact ASI for a license key. If you run e-CM only, contact ASI for a license key and instructions.

To install the Template Gallery

When upgrading from a previous release, make sure to review all documents from each release so you can fully understand the impact on your business.

1. Make sure e-Series version 10.5.28.02 or greater is installed.
2. Back up your \Customer folder.
3. Request your license key from ASI.

4. Download the iMIS Template Gallery v1.0.exe file from the ASI Tech Support page (Product Releases, e-Series).

   Note: When the iMIS Template Gallery v1.0.exe file is downloaded and applied, the most current version of the e-Series maintenance release is also included.

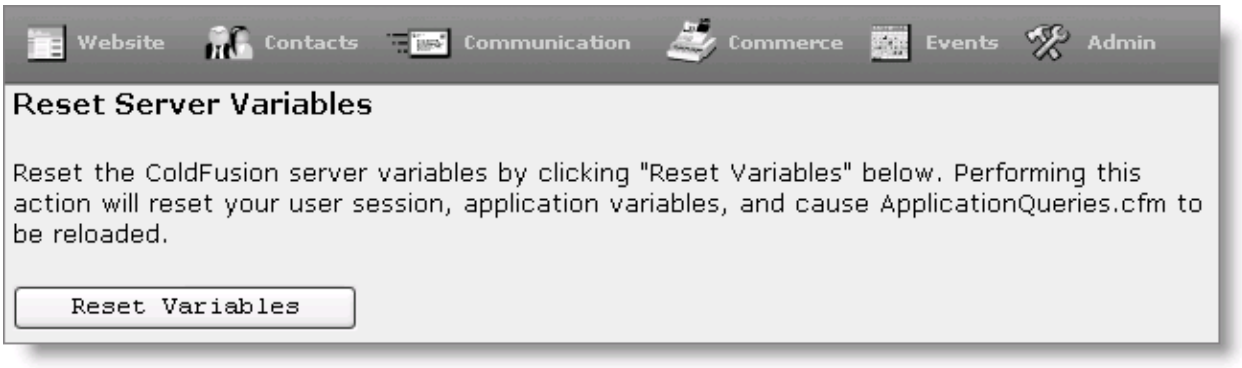
5. Extract the iMIS Template Gallery v1.0.exe file to the \Customer folder under your e-CM directory. A new Template Gallery folder with the appropriate files is added.
6. Run the appropriate database upgrade script from the \Customer\SQLScripts folder.

- For e-CM with iMIS, run the ASIUpgradeDBeSeries.exe script.
- For e-CM only, run the StandAloneCM5Setup.sql script.

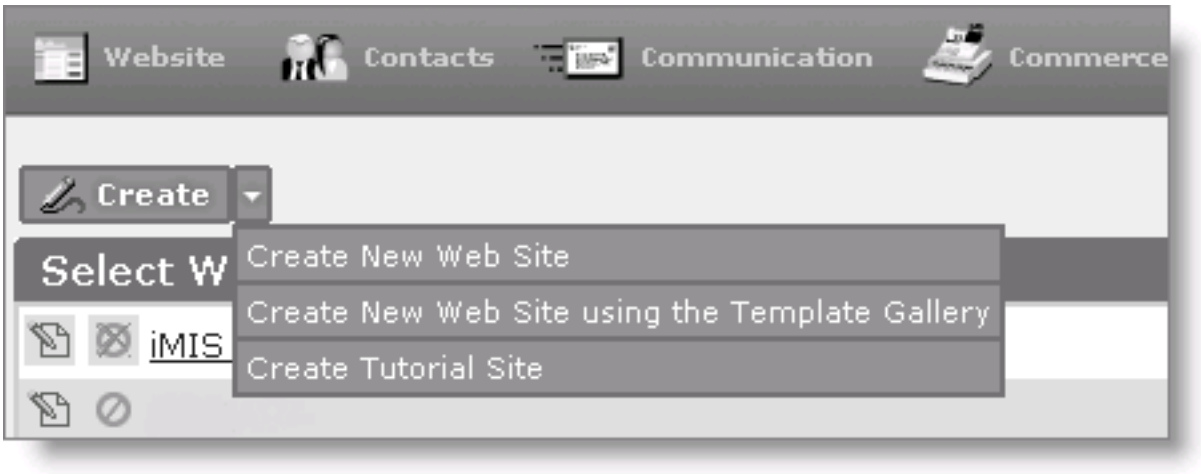
7. For sites using an iMIS database, re-run the e-Series application wizard maintaining your previous settings. This is not needed for e-CM only implementations.

   Caution! Do not run the e-CM wizard.

8. In the e-CM iMIS Website Administration Portal, select Admin in the top menu.
9. From the left menu, select Reset Server Variables.
10. Click Reset Variables.
11. Reapply all customization to your site as needed.
12. Select Website in the top menu.
13. From the left menu, select Sites. The Select Website to Manage page displays.
14. Verify that the new option, Create New Website using the Template Gallery, is in the Create drop-down list.



Reset Server Variables page



Create > Create New Website using the Template Gallery option

Creating a Website from the Template Gallery

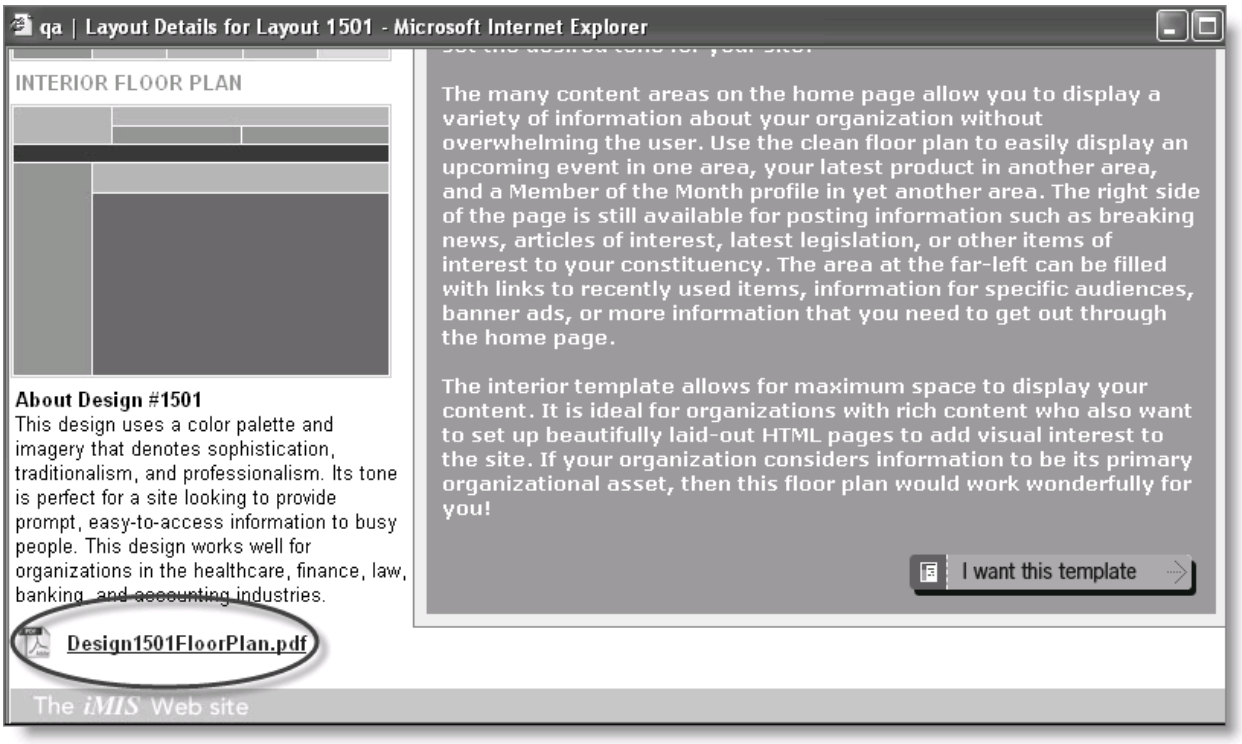
Each floor plan defines the content areas for your new site. The designs are described in the Template Gallery Wizard. A PDF file illustrates the design as applied to the template.

Note: A pop-up blocker can prevent use of the Template Gallery, publication of content, and dragging Surf to Edit icon to the browser links toolbar.

To create a website from the Template Gallery

1. Verify that the e-CM Publishing Server is running.
2. In the e-CM iMIS Website Administration Portal, select Sites in the left menu. The Select Website to Manage page displays.

3. Select Create New Website using the Template Gallery from the Create drop-down list.
4. On the General Setup for a New Website page:
   - Enter the website name and URLs.
   - If you are using more than one website, add the unique URL for your site.
   - Leave the defaults for the other options selected.
   - Click Create. The Gallery View page displays.
5. Select a template from the thumbnail images. The Layout Details page displays.
6. Scroll down and download the template layout PDF. You will use this to determine the size and placement of the graphics and other content you plan to insert.
7. Click I want this template. You may choose a different template by clicking Return to gallery view.
8. Select Yes, install this design. The system requires a few minutes to create your site.



Layout Details page

Applying a Different Template to an Existing Website

You can apply a different template to a website you created using the Template Gallery. However, the template layouts may contain different content areas. After you apply a new template, you may need to modify the content from your old template to fit the mismatched content areas.

Any new content areas will be added, and any additional content areas will not appear on the site. Use this chart to determine the results of applying the templates to an existing template site.

Note: The content areas are numbered so that they correspond with content areas in other templates with the same number. For example, if the original template has a content area 6, the associated content record will appear in content area 6 on the new template.

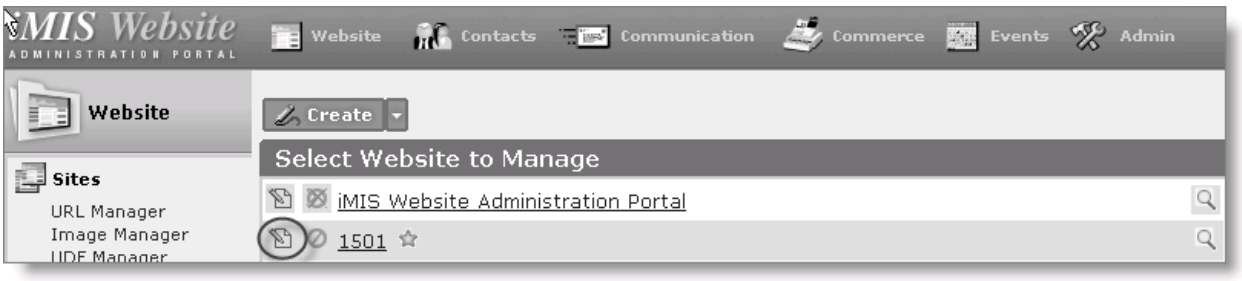
Changes to the Templates

Are more content areas on the new template than on the old template	You will have new content areas.	Add content to the new content records.
Are fewer content areas on the new template than on the old template	You will be missing content on your page, but no content records will be deleted.	Select the most important content and place that in the new content areas.
Are changes to the original template and you reapply the same template	You will see distortions to any content areas you may have resized.	Change the dimensions of the content again.
Are any differences in the size of the content areas	You will see distortions to the images in your website.	Resize the images to fit the new dimensions of the content areas.
Is e-Series functionality added to the site	The e-Series portal may not fit into the content area.	Resize the e-Series display area.

Navigation features are carried over to the new site. Therefore, the changes you made to the menus on the original site, such as adding drop-down menus, will be inherited by the new site.

To apply a different template

1. In the e-CM iMIS Website Administration Portal, select Sites on the left menu. The Select Website to Manage page displays.
2. Select the Edit Website Settings icon next to your website name. The Website Properties page displays.
3. Select the template image shown below the To choose a template… option. The Gallery View page displays.
4. Select a template from the thumbnail images. The Layout Details page displays.
5. Scroll down and download the template layout PDF. You will use this to determine the size and placement of the graphics and other content you plan to insert.
6. Click I want this template. You may choose a different template by clicking Return to gallery view.
7. Select Yes, install this design. The system will then take a few minutes of processing time to apply your template.



The Select Website to Manage page

The Website Properties page, template selection

e-Content Manager Usage

e-Content Manager (e-CM) is a powerful tool that allows you to organize and present content on a website. It provides a robust, yet easy to use content authoring, site navigation management, and workflow management features. e-CM provides the following features and benefits:

- Allows for maximum distributed content ownership throughout your organization regardless of technical ability or publishing authority
- Simplifies Website management with dynamically generated, database-driven content areas
- Maximizes the value of site content by targeting it to your site audiences, delivering more relevant content to the right audiences
- Delivers branded content to your web audiences with design template management

e-CM gives you the flexibility of working with a variety of content:

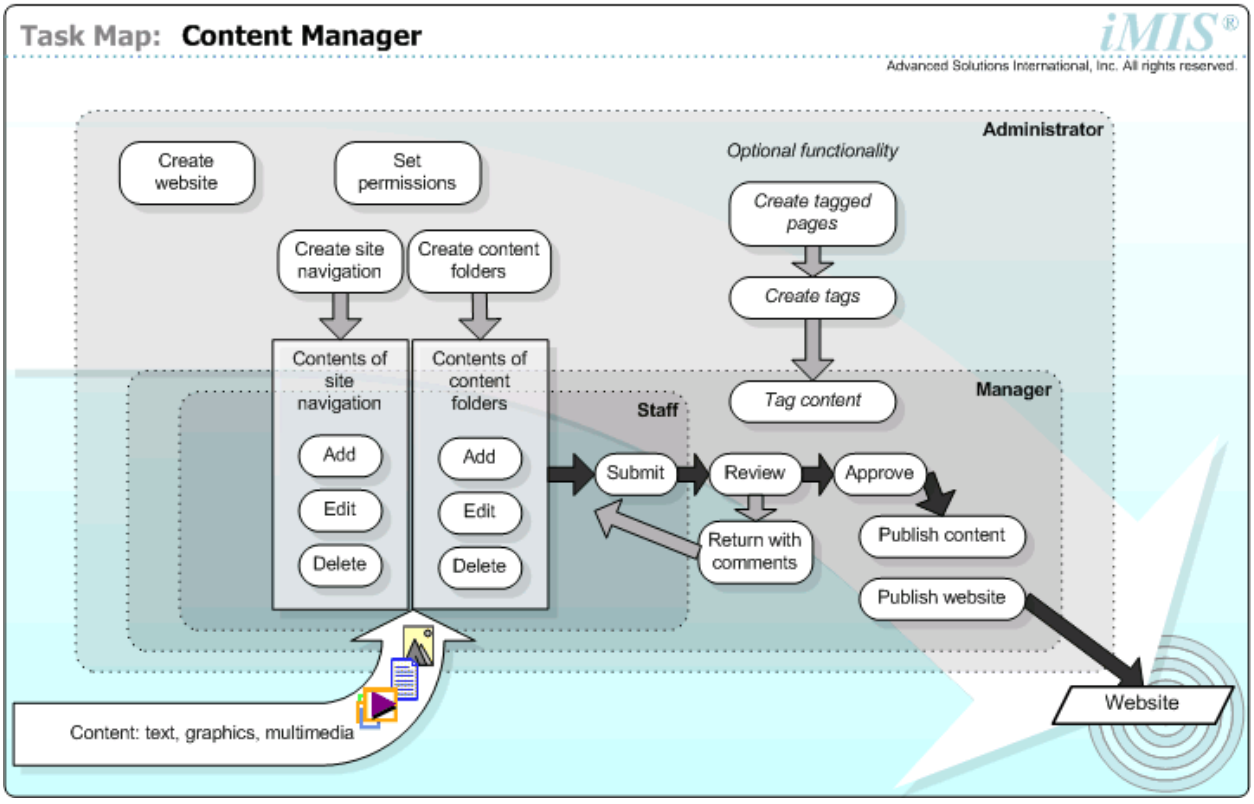
- HTML (Web pages)
- Files (for example, .pdf, .jpeg, .gif, and .doc files)
- Links (either to another page on your own website or to a page on the web)
- Tagged pages (“smart” pages)

Getting Started

To effectively use e-CM, you must learn the following:

- How to enter content
- Where to store content
- How to approve and publish content
- How tagging can be used
- How to build tagged pages

Note: Since the e-CM administrative interface uses pop-up windows for some functionality, you should disable any pop-up blocking software (for example, the Google toolbar) while using Content Manager. Otherwise, significant portions of the e-CM administrative interface will effectively be disabled.



e-CM Task Map

e-CM Permissions

Depending on the permissions you are assigned in e-CM, toolbars and pages may not display all of the options and information displayed in this guide.

Tagging for dynamic content

Website content can be associated with tagging categories, a process referred to as tagging. Tagging allows you to create categories for website searches and for personalization, but its primary purpose in e-CM is to tag content so that it can be displayed in special pages called tagged pages. A tagged page allows you to specify what type of content to retrieve and how to display this content. Tagging categories should be based on an analysis of how the information on the website is structured.

Site Navigation and Content Folders

Content in e-CM can be stored in Site Navigation items and Content Folders. By default, the Website page displays when you first select the e-CM administrative interface.

To access navigation items

- Select Site Navigation from the e-CM Admin interface.

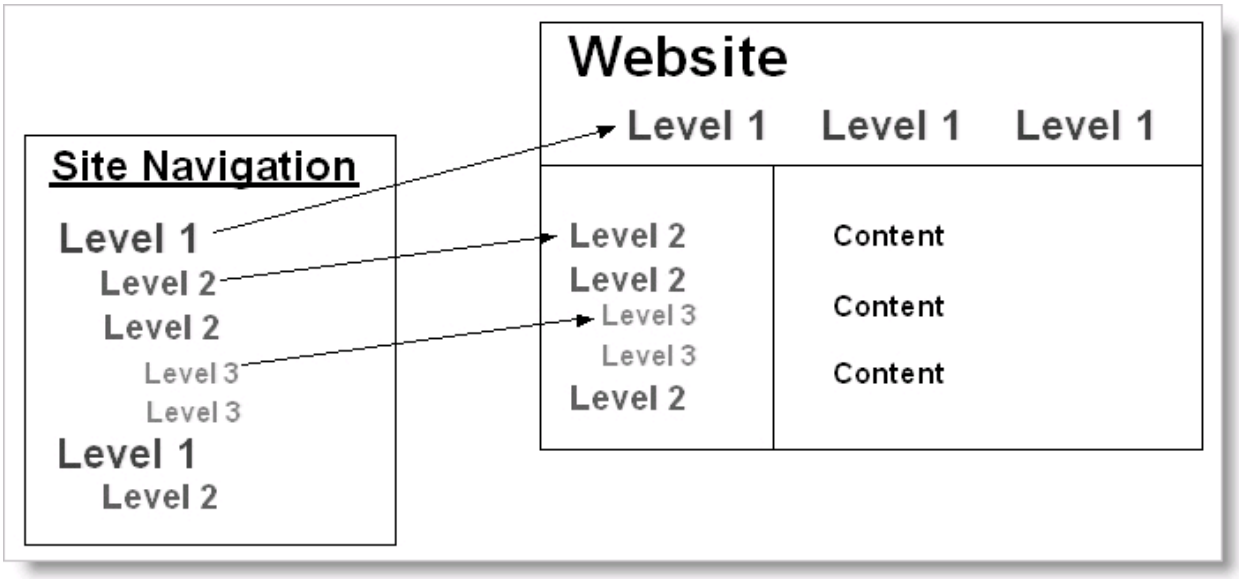
To access content folders

- Select Content Folders from the e-CM Admin interface

Note: You cannot access the Sites selection if you do not have permissions to work on more than one site. If you only have permission to work on one site, you must select Site Navigation to access the site for which you have permission.

Understanding Site Navigation Pages

Site navigation items correspond directly to the website's front-end interface. Depending on how the website is configured, level-one items that display to the left in bold correspond to graphical icons on the website's front end, while child items correspond to text links in the website's navigation.



Site Navigation

The branching structure of the Site Navigation page on the back end (the e-CM administrative interface) corresponds exactly to the branching structure of the website's navigation menu on the front end (the website as viewed by customers). Each level-one item (the ones in bold and all the way over on the left) generally corresponds to a graphical icon on the front end. The child items that display when you expand the menu on the Site Navigation page form the text links that can be seen when a link is selected on the website's front end.

Note: Use the plus icon displayed to the left of an item's name to expand the item and see its child nodes, and use the - icon to collapse the item. An empty icon displays next to an item if the item has no child items.

Note: A good way to see the relationship between the Site Navigation page and the website's front end is to view the website's front end in one browser window and the Site Navigation page in another browser window. For example, if there is a link labeled About Us, select this link on the front end and look at the links displayed, then look at the About Us navigation item and its child items on the back end.

Understanding Content Folders

Unlike the branching structure in site navigation items, the branching structure in content folders serves only to assist in organizing the website's content. A content folder is a place to store content for retrieval by:

- Site search
- Special dynamic pages called “Tagged pages”

The organization of a content folder does not affect the navigation or function of the web-site on the front end.

Understanding Content Records

Site navigation items and content folders do not actually contain content; they contain content records. Actual content (HTML files, other types of files, links, and tagged pages) is stored in content records. Content records are found inside site navigation items and content folders. A navigation site item or content folder can contain one or more content records. To add, edit, or delete content, you must be in the appropriate content record.

Note: You should not apply e-CM security to a content record when an e-Series link has been added to the navigation item's properties page. e-Series security controls access to e-Series modules.

Understanding Tagged Pages

A normal web page that is stored in a site navigation page consists of content that has been created for the specific site navigation item. On the other hand, a tagged page retrieves content based on how the content is tagged rather than where the content is located in a site navigation item or content folder. The retrieved content is then displayed on the tagged page. The simplest method to display tagged content is to display a list of links to the content, but tagged pages can also display HTML files and images.

Normal pages in e-CM are static. When you publish a content record, the content is written to a file on the webserver's hard drive. Tagged pages are dynamic, with self-contained instructions to retrieve content with specified tags and display this content. Tagged pages can retrieve content from site navigation items, but tagged content is usually stored in content folders.

Tagged pages can retrieve tagged content from your site navigation list, but most tagged content is normally stored in content folders.

Understanding Content Tagging

Website content can be associated with tagging categories, a process referred to as tagging. Tagging allows you to create categories for website searches and for personalization. A tagged page allows you to specify what type of content to retrieve and how to display this content. Tagging categories should be based on an analysis of how the information on the website is structured.

Before you begin flagging content for inclusion on tagged pages and creating tagged pages to display the flagged content, you must determine what types of content should be tagged, how to tag this content (naming conventions for tags), and whether content should be stored in site navigation items or content folders.

Tagging involves not only flagging relevant content and specifying the tags to display on a tagged page, but also specifying how the tagged content should be displayed.

Note: To assist in setting up your tagged content and tagged pages so that the desired content is displayed in the desired manner, it can be helpful to view your tagged content and tagged pages in one browser window and the website in another browser window.

Understanding Tags

A tag is used to flag relevant content. For example, if you determine that a particular piece of content is related to Energy Conservation, you can put an Energy Conservation tag on the content. You can then set up a tagged page to retrieve content related to Energy Conservation, and the tagged page will retrieve and display all content that is related to Energy Conservation.

Reviewing the e-CM Interface

The content producer's toolbar provides a single consistent set of controls. Simple, intermediate, and advanced versions of the toolbar are available to suit each user's needs. Functions that are not available to a user (due to the state of the content or the user's security permissions) are hidden and disabled.

Since some options apply only to navigation items and some apply only to content records, the toolbar provides different functions in navigation items and content records. Because of these differences, the toolbars will be referred to in this documentation as the navigation item toolbar and the content record toolbar.

Note: The navigation item toolbar also displays when viewing a content folder properties page.

Understanding the Content Record Toolbar

The content record toolbar displays in the content record properties page and in the HTML editing window.

Viewing the Navigation Item/Content Folder Toolbar

The navigation item toolbar displays when viewing a navigation item properties page if the content producer has permissions to edit navigation items. No toolbar displays if the content producer does not have permissions to edit navigation items.

The toolbar for navigation items and content folders is only available to users who can create and edit navigation items and content folders. The navigation item/content folder toolbar displays only for users who have Nav Creator and Nav Editor permissions in the authority group that owns the navigation item or content folder.

To access the toolbars

1. From the e-CM Admin page, select Website.
2. Select Site Navigation.

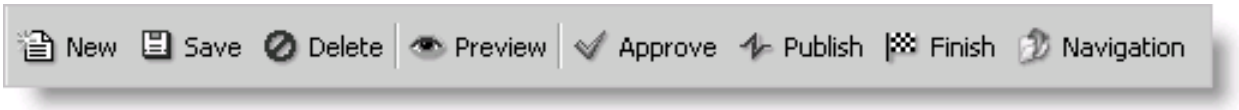
   Note: If you are using e-CM to run a single site, you will now see your site's navigation items. If you have more than one site, you will see the navigation items for your login account's default website, a preference which can be changed on your content producer preferences page (select Content Managers).

   While the toolbars in content folders and navigation items display differently, the toolbars function the same in both. The navigation item/content folder toolbar displays when viewing the properties page for an individual folder. The content record toolbar displays when viewing a content record in a content folder.

Simple toolbar mode for a content record

Intermediate toolbar mode for a content record

Advanced toolbar mode for a content record



Advanced toolbar mode for a navigation item properties page

Advanced toolbar mode for a content folder properties page

Setting a Toolbar Ceiling for Content Producers

You can set a toolbar “ceiling” for each user on a per-authority group basis with respect to content owned by the authority group. This can be used to restrict access to certain functions. For example, if you specify a toolbar ceiling of intermediate, a user can view only the simple or intermediate toolbars for content owned by the authority group.

Access for Intermediate or Advanced Toolbars Only

Toolbar access to properties is available only on the intermediate and advanced toolbar modes. Since a user with access to the properties page will see the properties page while entering a content record, this affects only the toolbar display and does not restrict any functionality.

The following functions are available only on the advanced toolbar:

- Copying content records: Because the advanced toolbar is the only way to copy content records, this effectively restricts this function to users who have advanced toolbar access.
- Moving content records: Because the advanced toolbar is the only way to move content records, this effectively restricts the function to users who have advanced toolbar access.
- Versioning: Because the advanced toolbar is the only way to use versioning, this effectively restricts this function to users who have advanced toolbar access.

Toolbar icons

- New – always displays. In a content record, select this icon to create a new piece of content in the current content folder or under the current navigation item. If you do not have permission to create content in the current location, an error message displays and the operation fails. In a navigation item, select this icon to display a list of navigation items and opens the insert box underneath the user's current navigation item (you insert a new navigation item).
- Save – always displays. In a content record, this icon is disabled in the intermediate and advanced toolbar modes if the content is Approved, Published, or Archived and the Always go to modify option on the user's Producer Preferences page is not enabled. You must first select Modify to put the content into modify mode unless the Always Modify option is enabled. Select Save to save the current page and return to the current location. In a navigation item, this icon is always enabled and saves any changes made to the navigation item's properties.
- Delete – always displays. In a content record, this icon is disabled if you do not have approval rights and the content state is Approved, Published, or Archived. A confirmation message displays when you select this icon. In a navigation item, select this icon to

delete the navigation item, all of the navigation item's content records, and all of the navigation item's child navigation items and their children. A confirmation message displays when you select this icon. The confirmation indicates how many child items will be deleted.

- Tag – (only if e-CM is licensed for Tagging) always displays on the intermediate and advanced toolbars for content records if tagging is licensed. This icon is disabled if the content is Approved, Published, or Archived and the Always go to modify option on the user's Producer Preferences page is not enabled. You must first select Modify to put the content into modify mode unless the Always Modify option is enabled. Lets you open the content tagging form in a new pop-up window.
- Preview – always displays. In a content record, select this icon to open a new window displaying the content (as last saved) inside the template associated with the navigation menu Item or content folder. In a navigation item, selecting this icon also displays the content (as last saved) inside the associated template unless there is more than one content record in the navigation item and the view the default content record only option is not enabled. If there is more than one content record in the navigation item and the view the default content record only option is not enabled, the preview will display all content records as last saved according to the specified option:
- Request Approval – displays only on the content record properties toolbar and only if the user does not have permissions to approve the content record. This icon does not display on any toolbar for simple sites, since simple sites do not include workflow. If the user has approval rights for the content record, the Approve icon displays instead. This icon is only enabled if the content record is in the Working state (if the content record is not in the Working state, there is nothing for which to request approval). Lets you save the current work and place the content in the Pending Approval state. The content approver for the content authority group will be notified that the content is awaiting approval. This notification always occurs in the content approver's e-CM task list, and can also occur by e-mail.
- Approve – displays only if the user has permissions to approve the selected content. This icon does not display on any toolbar for simple sites, since simple sites do not include

workflow. If the user does not have approval rights, the Request Approval icon displays instead. This icon is only enabled if the content record is in the Working state (if the content record is not in the Working state, there is nothing to approve). Lets you save the current work and place the content in the Approved state. The content can then be published.

- Publish – always displays on the content record properties and navigation item properties toolbar. This icon is only enabled if the content record is in the Working or Approved state and the user has approval permissions. Lets you save the current work and send a request to the publishing server to publish the content.
- Modify – displays only on the intermediate and advanced toolbars and only if the Always go to modify option on the user's Producer Preferences page is not enabled. This icon is disabled if the user does not have content editor permissions for the content record. Lets you place content that was in the Pending Approval or Approved state back in the Working state, or to copy content that was in the Published or Archived state to a new content record and place the new content record in the Working state (after selecting Save).
- Revert – displays only on the intermediate and advanced toolbars for content records. This icon does not display if the Always go to modify option on the user's Producer Preferences page is enabled. This icon is disabled if the user does not have content editor permissions for the content, if the content is in the Published or Archived state, or if this is the first version of the content. Lets you delete content that is in the Working, Pending Approval, or Approved state and return the content to its state as previously published.
- Properties – displays on the intermediate and advanced toolbars in content records. If you are editing an HTML file, select this icon to display the Content Properties page.
- Editor – displays on the intermediate and advanced toolbars in content records. Lets you display the Content Editor page (either the Ektron editor or the text area, depending on the user's preferences).
- Versions – displays only on the advanced toolbar for content records. This icon is disabled if there is only one version of the content. Lets you display a pop-up window that lists all previous versions of the content. You can copy any version from this list to the

Content Editor or Content Properties page.

- Copy – displays only on the advanced toolbar. Lets you make a copy of the content, which is then treated as new content.
- Move – displays only on the advanced toolbar for content records. Lets you move the current content to selected website, navigation item, or content folder.
- Folder – displays for content records. Lets you display the Content Folders page.
- Simple – displays only on the intermediate and advanced toolbars. Since there is only one toolbar mode for navigation items and content folders, this icon displays only on the content record toolbar. Lets you change the toolbar to simple mode.
- Intermediate – displays only for content records. Lets you change the toolbar to intermediate mode.
- Advanced – displays for content records. Lets you change the toolbar to advanced mode.
- Finish – displays on all toolbars. Lets you save any unsaved work and return to the previous page. For example, selecting Finish while using surf-to-edit returns the user to the website. Selecting Finish while creating pages in content folders returns the user to the folder that contains the content that was being edited.

Tab Icons

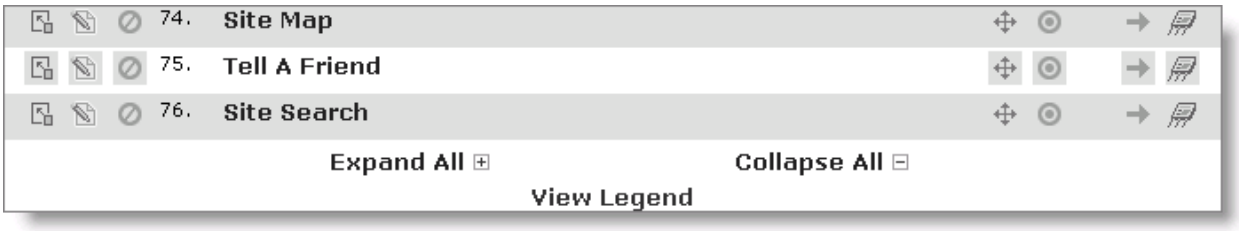
There are gray icons displayed next to the items on the Site Navigation and Content Folders pages. The icons displayed to the left of an item perform the following functions:

- Allows you to insert a new navigation menu item or bucket
- Allows you to edit content inside the item or bucket
- Will delete a navigation menu item or bucket and all of its “children”

The icons displayed to the right of an item allow you to move items and promote or demote the items in the e-CM hierarchy. The last icon is used to publish content in a site navigation item or content folder.

To see the function of the icons and symbols on the e-CM interface, select the View Legend link at the bottom of the Site Navigation page.

There are also links to expand the entire tree of parent/child items (Expand All) and to collapse the tree to display only parent items (Collapse All).



Links in the Navigation List

Creating Navigation Items

Section Goal

In this section, you will learn how to set up your website's navigation, create, approve and publish navigation items, and add content records to the navigation list.

Inserting a Site Navigation Item

The site navigation you create is tied directly to your website navigation so review it carefully before you publish your website.

You can create a new navigation item on the Site Navigation page. New navigation items can be previewed before they are published, but they are not visible on the front end until they have been published. You can edit navigation items before or after they have been published.

Insert a new navigation menu item or bucket

Edit content inside the item or bucket

Delete a navigation menu item or bucket and all of its “children”

Move a navigation item

Move navigation item below target item

The icons displayed to the right of an item allow you to move items and promote or demote the items in the e-CM hierarchy. The last icon is used to publish content in a site navigation item or content folder.

To insert a navigation item

1. From the e-CM Admin page, select Website> Site Navigation.
2. Select the Insert New Item icon to insert a top-level navigation item, or select the parent navigation item and select New to create a child navigation item.

   Note:

- You can change the location and hierarchical level of a navigation item after it has been created if necessary.
- Do not use DOS reserved words in the name of the navigation item. (NUL, AUX, CON, COM1-4, LPT1-3, and PRN)

3. Enter the name of the new navigation item.
4. Select Go.

To enter navigation properties

1. From the e-CM Admin page, select Website> Site Navigation.
2. Select the new navigation item.
3. Enter the Properties for the navigation item.
4. Enable the appropriate display option you the user to see.
5. If you want the navigation item to become the website's homepage, select Make Website Homepage.
6. Select the Authority Group and Section Owner. The Section Owner will receive e-mail reminders if the content in the section is not published within the specified number of days.

Note: If you do not want to be notified if content in a navigation item is not published, change the number in the Section considered expired if field to 0. This may be appropriate if the navigation item contains content that will rarely be updated.

7. (optional) Insert graphical images.
8. Select Save on the navigation item toolbar.

Entering Navigation Item Properties

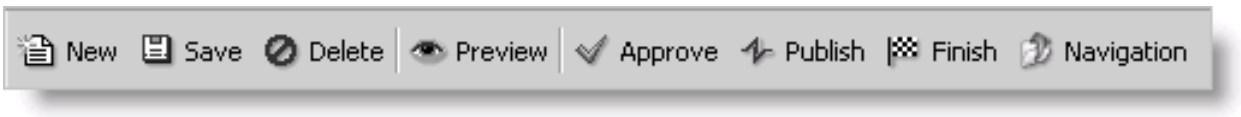
Note: If you do not have permission to edit the navigation item's properties, only the navigation item name and the name of the authority group that owns the navigation item display on the navigation item properties page.

Note: It is generally not a good practice to change navigation buttons after a site is set up. It is also recommended that you do not insert buttons on level-two or level-three text links.

To access the navigation Properties page, select the navigation item. The Properties page is divided into the following sections:

- Content Producer's Toolbar
- Properties
- Workflow Management
- Navigation Images
- Content Records

Toolbar

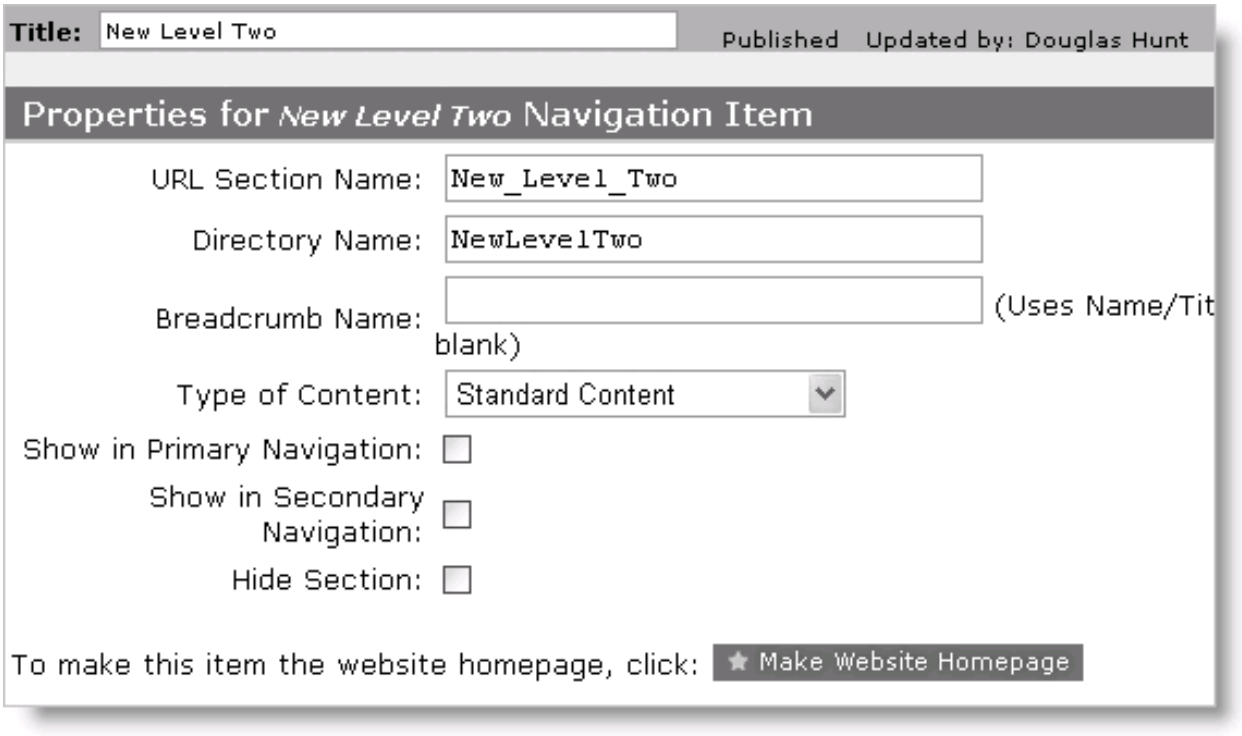


Advanced toolbar mode for a navigation item properties page

- New - insert new navigation item
- Save - save navigation information

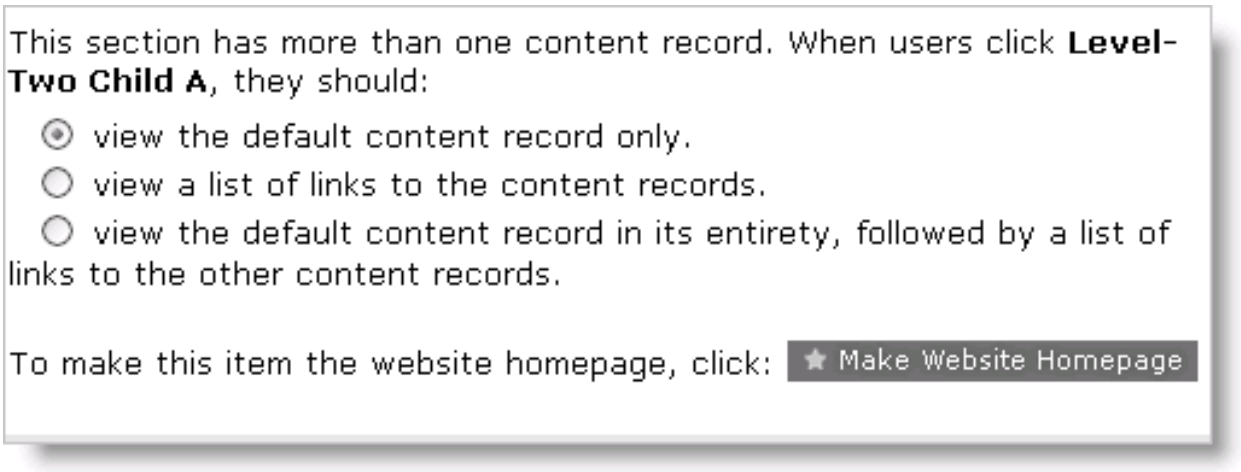
- Delete - delete the navigation item, all associated child records, all child navigation items and their associated records
- Preview - preview the navigation item as it will appear on the website
- Approve - approve all content; changes status of Working (red light) or Pending Approval (yellow light) to Approved (green light, ready to publish); if user does not have approval rights, the Request Approval icon is shown
- Request Approval - change the status of content to Pending Approval (yellow light); if user has approval rights, the Approve icon is shown
- Publish - publish any approved content
- Finish - save work
- Navigation - return to the Site Navigation page

Navigation Properties

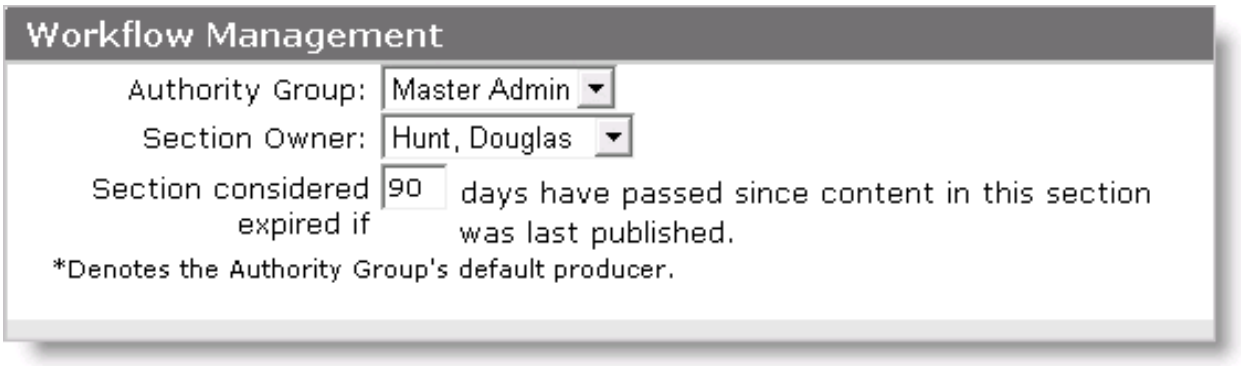


Properties for New Level Two Navigation Item

- Unless the navigation item uses a button, the text in the Title field is the text (link) that displays on the front end of website.
- The URL Section Name is system-generated. If you have to change the URL name, be sure not to put any spaces or non-standard characters in the name.
- The Directory Name, which specifies the directory in which the navigation item content is stored when published, is system-generated. You should not change this unless you have a specific need to create a particular directory name.
- If the Breadcrumb Name field is empty, the breadcrumb trail displays the name of the navigation item. An alternate breadcrumb name can be entered.
- You should leave the default Standard Content setting for the Type of Content option unless you want to insert an e-Series page in the navigation item.
- You generally should not enable the Show in Primary Navigation option for new navigation items unless you are redesigning your website's template.
- You generally should not enable the Show in Secondary Navigation option for new navigation items unless you are redesigning your website's template.
- If you do not want the navigation item to display on your website's front end, you can enable the Hide Section option. This is useful if the navigation item is currently under construction.
- Display options:
- Default - display only the default record (first content record marked by a red star)
- List of links - display a list of links to the content records; records are listed in the same order as they appear on the properties page
- Combo - display the default record followed by a list of links to the other content records; this option cannot be used if the default record is a tagged page.



Choose the Level-Two Child properties



Workflow Management window

The drop-down lists at the top show which authority group owns the content in the navigation item and who the Section Owner is. Being a section owner means that you will get the e-mail reminders if content in the section is not published for the specified number of days (the default is 90 days). Permissions and authority groups will be discussed in a later section.

Note: If you never want to be notified if content in a navigation item is not published, change the number in the “Section considered expired” box to 0. This may be perfectly appropriate if the navigation item contains content that will be updated very rarely.

Navigation Images

This section is used to upload graphical images for the navigation item. The images would replace the text used for the navigational item. However, we do not recommend that you use images for level two or three text links and you should avoid adding images after your website is set up.

Content Records

In this section, you can add links to content records.

Inserting Content Records

The content records section of the navigation item properties page will show all content records in the navigation item. By default, the order of the records will be the order entered, with the first record entered on top. The first record will have a red star next to its name, indicating that it is the default record. The default record is an important distinction when a navigation item has more than one content record.

To insert a new content record

To insert a new content record into an empty navigation item:

1. Select Create. Depending on your preferences, this will take you to the content record properties page or directly to the WYSIWYG editor.
2. To insert an additional content record into a navigation item that already contains content:
3. Select Insert next to an existing content record. Your new record will appear beneath the record whose insert button you used). Depending on your preferences, this will take you to the content record properties page or directly to the WYSIWYG editor.

To delete content records

To delete an existing content record:

1. Select the Delete ( ) icon to the left of the content record's name.
2. Click OK when the confirmation window displays.

To edit existing content records

To edit an existing content record:

1. Select the Edit ( ) icon to the left of the content record's name, or on the name itself. Depending on your preferences, this will take you to the content record properties page or directly to the WYSIWYG editor.

To move content records

To move a content record:

1. Select the Move ( ) icon to the right of the name of the content record you wish to move.
2. Select the Target ( ) icon to the right of the name of the content record you want to move it below or the Target icon on the top bar of the content record section to make it the default record (first in the list).
3. Re-publish the navigation item to make your changes live on the front end.

To preview a content record

To see what an individual content record will look like on the front end:

1. Select the Preview ( ) icon to the right of the content record's name. If you wish to preview the appearance of the entire navigation item, use the preview button on the content producer's toolbar.

To copy a link to the content record

If you wish to create a link to an individual content record (for example, to insert in a web page elsewhere on your site):

1. Select the small clipboard icon ( ) to the right of a content record's name. This will copy the path information required to create a link to the content record into your system clipboard.
2. Go to the location where you wish to create the link to this content record and use your system's paste functionality (Ctrl+V) to paste the path information into the link. Finish editing your link as you otherwise would.

To publish individual content records

You can use the Publish ( ) icon to the right of a content record's name to publish that individual content record. Be sure to check your work on the front end - you may also need to re-publish the item, depending on the display options and number of content records.

Using e-Series Pages in e-CM

You can display e-Series pages on your website's front end inside your website's template. You can also connect applications and interactive pages (for example, an ASP page or an abstract management system) to your website.

Note: You should not use e-Series pages in navigation items that contain other content records. If you leave the e-Series page as the default record and set the navigation item to show the default record only, this will work. However, if the navigation item's display options are later changed to show other content records (for example, to show a list of content records), the options will not work properly.

To display e-Series pages in e-CM

1. Select Site Navigation.
2. Select the Insert New Item icon.
3. Enter the name of the new navigation item and click Go.
4. Select the new navigation item to display the navigation item's properties page.
5. Select the e-Series page to display in the navigation item from the Type of Content drop-down list.
6. Select Save.
7. Select the Publish icon on the content producer's toolbar.

To display other special pages in e-CM

You can create links to other special pages (for example, Advanced Search, Site Map, and Tell A Friend). These special content types display a special page when the website user selects the navigation item.

1. Select Site Navigation.
2. Select the Insert New Item icon.
3. Enter the name of the new navigation item and select Go.
4. Select the new navigation item to display the navigation item's properties page.
5. Select the special page to display in the navigation item from the Type of Content drop-down list.
6. Select Save.
7. Select the Publish icon on the content producer's toolbar.

Working with Navigation Items

Once you are comfortable with editing content records and setting basic options for navigation menu items, you can look at the navigation menu items list - the main CM interface.

Understanding Navigation Items

Here are some key facts about the navigation menu:

- The navigation menu corresponds directly to the point-and-click interface on the front end of the website.
- Level-one items, the ones which appear in bold and are not indented, generally correspond to a graphical button on the front end of the website.
- Navigation items below level one generally correspond to text navigation links on the front end.
- Content Folders, which use a different interface, is a place to store content used by special “smart” pages called “tagged pages.”

- Parent navigation items can have “child items” and those child items can have child items of their own (and so on).
- The actual content is stored in content records.
- A navigation item may have one content record or many.
- When you publish content in a navigation item, you can publish an entire item and all of its content records or choose to publish an individual content record.
- You can expand items or folders to reveal their children by clicking the plus (⊞) button to the left of the item's (or folder's) name.
- You can collapse items or folders to hide their children by clicking the minus (⊟) button to the left of the name.
- If you see neither a plus nor a minus next to a navigation item, it has no children.
- There is a link at the bottom of the navigation menu page (View Legend) that will show you what all the buttons on the list mean.
- There are also Expand All and Collapse All links at the bottom of both the Navigation Menu list and the Content Folders list. Expand All shows all children of all items, and clicking Collapse All will collapse the menu and show you only level-one items.

  To manage the navigation list

  These are some functions you can perform from the list:

- Move navigation items
- Delete navigation items
- Promote navigation items (make children parents)
- Demote navigation items (make parents children)
- Publish navigation items (and all their approved content)
- Insert new navigation items

Note: In order to move, delete, promote, demote, and insert new navigation items, you will need to have “Nav Creator” privileges in the group owning the items or in the special “Master Admin” group. In order to publish an entire navigation item, you need “Nav Editor” permissions.

Levels on the Navigation Items List

Items on the navigation items list have a parent-child structure, with “level-one” items being the ultimate parents. In general, level-one items are usually represented on the front-end by graphical icons, while most items at level two and below are text links (this may vary depending on your site's design). The parent-child structure of navigation items mirrors the parent-child structure of navigation on the front end of the website.

Which navigation items a user will see when looking at the list will depend on authority group membership. Anyone who is a member of the Master Admin group will see all navigation items. Other users will see a “family” of items (starting with the level-one parent) only if at least one of the items is owned by an authority group to which they belong.

Parent-Child Navigation Relationship on Back End

Navigation Items on Front End, Showing Same Relationship

To view all parent-child relationships

To show all parent-child relationships in your site's navigation menu, select the Expand All link at the bottom of the navigation item list.

To view level-one items only

To collapse the display of navigation items:

- Select the Collapse All link at the bottom of the Navigation Menu page to see only “level-one” items.
- Select the “+” buttons next to a parent item to see its immediate children.

Note: You generally will not be creating new level-one items because your website's front-end is constructed very carefully with an HTML table, which holds graphical buttons. To add a new level one, you would need to add a new button and modify the design your website's template so that the button will display properly.

Inserting New Navigation Items

When a new navigation item is inserted:

- It is inserted below the place where you insert it.
- It will become a child of the item you insert it below (for example, if you insert below a level-one item, the new item will be a level-two).
- It will become a last child item if the item below already has children.

To insert a new item as a child of an existing item

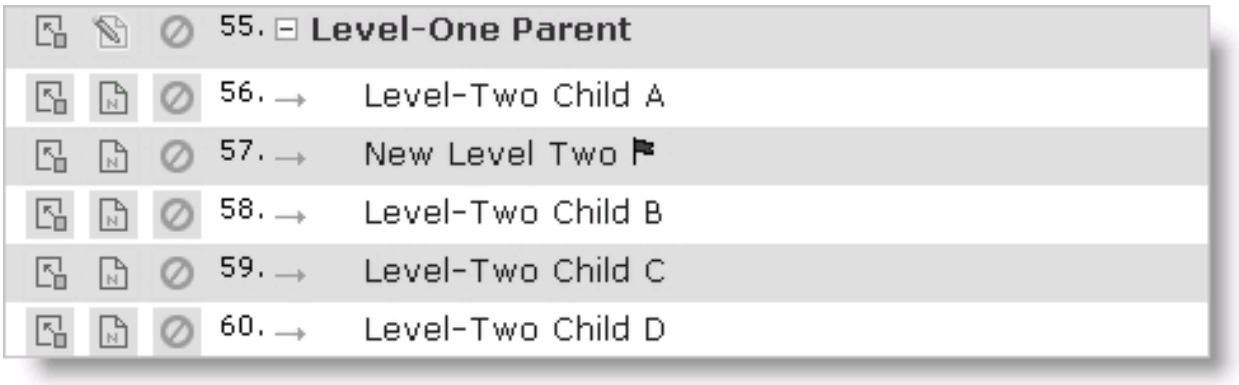
1. Select the Insert Item ( ) icon to the left of the item above where you want to insert it.
2. Enter the name of the item you want to insert.
3. Click Go.

After your item is inserted, you will see a red flag to the right of the item, indicating that it needs to be published before it will be visible to users on the front end.

To change or move an item

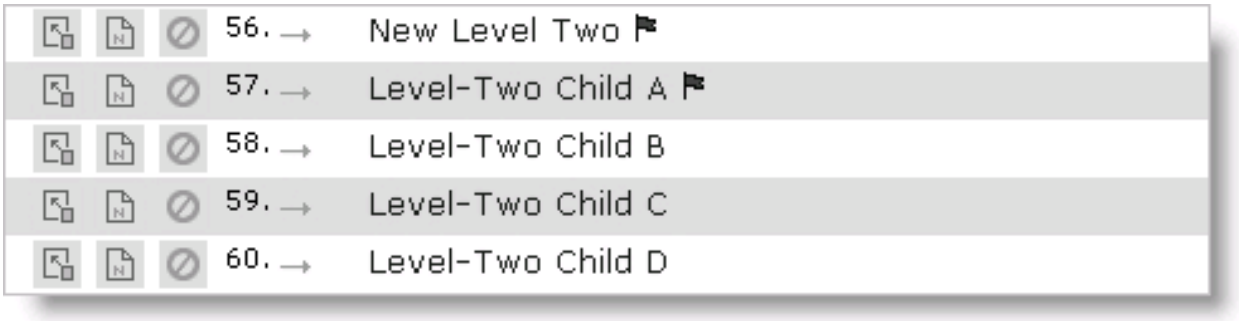
1. Insert your new item by selecting the Insert Item icon to the left of “Level-One Parent.”

   The new item will become the last level-two child of “Level-One Parent” (following the rule stated above that if an item already has children, the newly inserted item will become the last child item).
2. Move your new item up by selecting the Move icon to the right of your new item and the Target icon to the right of “Level-Two Child A.” This will place “New Level Two” as the second level-two, right under “Level-Two Child A.”



New Item Now Second in List

3. Click the Move icon next to “Level-Two Child A” and the Target icon next to “New Level Two.” This will move “Level-Two Child A” below “New Level Two.”



New Item Now First in List

To insert an item as a level-one

If you need to create a new level-one item, you can do it one of two ways:

- You can use the Insert icon on the top bar of the navigation items list to insert an item directly as a level-one.
- You can simply create an item as a child of another item and then promote your new item until it reaches level one.

Moving Items

The two icons involved in moving an item are the Move ( ) icon and the Target ( ) icon, which appear on the right side of the list across from each item.

When you start moving menu items around, you are performing some fairly complicated operations. You are moving things that have children under other things that have children, and dealing with different levels in the menu. It is common to move items to the wrong place now and then. If you move something to the wrong place, you can always move it again, and nothing is going to affect the front end of the website until you re-publish.

To move an item

1. Click the move button to the right of the item's name.
2. Click the target button to the right of the item under which you want to move it.

When you move an item, e-CM follows two rules about where it should go:

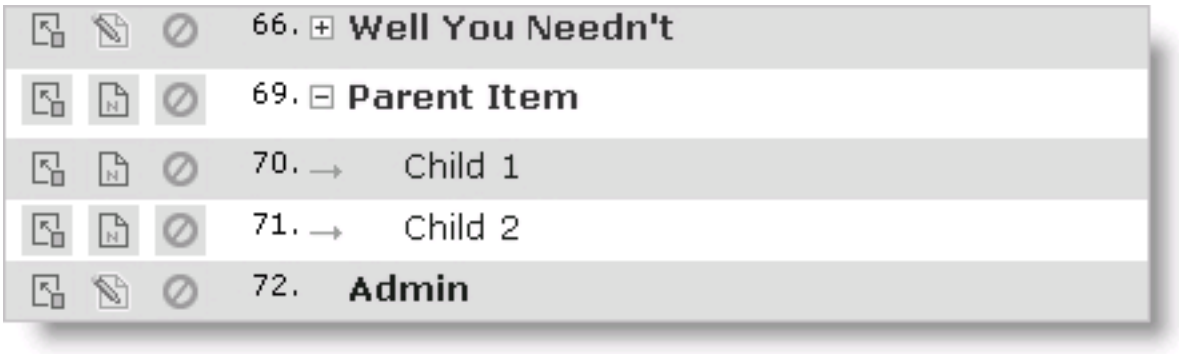
- It will be inserted after (below) the targeted item.
- It will be inserted at the same level at the targeted item.

This sounds simple, but the results are not always what you would expect.

For example, consider a level-one item, “Parent Item” with two level-two child items called “Child 1” and “Child 2.” If you wanted to move “Child 2” up to the first position right under “Parent Item,” there are two obvious things to do, neither of which will work.

- If you click the move button to the right of “Child 2” and the target button to the right of “Parent Item,” Child 2 will actually become the next level-one item, above “Admin.”
- If you click the move button to the right of “Child 2” and the target button to the right of “Child 1” Child 2 will not move - it is already the next item after “Child 1” at the same level.

How would you do it? You would click the move icon next to “Child 1” and then the target icon next to “Child 2.” This will make “Child 1” the next item in the list after “Child 2” and at the same level. In other words, in this case, you don't move Child 2 up, you move Child 2 down.

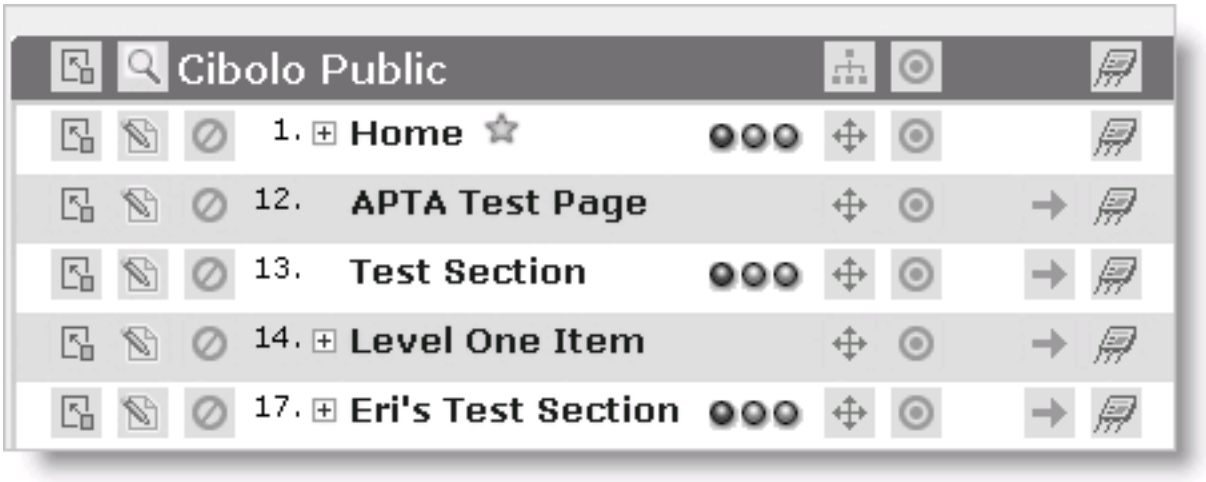


Moving Example

To move an item to the beginning of the list

1. Click the move icon to the right of the item you wish to move.
2. Click the target icon on the bar at the top of the navigation item list.

   Your item will now appear at the top of the list, and will be a level-one item. Any children will be moved along with the item, as is always the case.



Top bar of Navigation Item List Showing Target Icon

Deleting Items

Deleting navigation menu items is extremely simple, although it does require “nav creator” permission in the authority group controlling the item or in the “Master Admin” group.

To delete a navigation item:

1. After logging in to the administrative interface, go to the site navigation list.
2. Select the Delete icon to the left of the name of the item you wish to delete.
3. After carefully reading the warning message, click OK to delete the item. This will delete the item and any children.

   Note: When you delete an item with child items, e-CM will delete all the child items as well. If you want to save the children, but delete the parent, you must move the child items to another parent first. It is important to read the warning messages carefully before you click OK, because the message will indicate if child records will also be deleted.

   #### Promoting and Demoting Navigation Items

   You can promote or demote navigation items in the parent-child hierarchy by using the Promote ( ) and Demote ( ) icons to the right side of the navigation menu. You will need “nav creator” permission in the authority group controlling the items involved (or in the “Master Admin” group).

   Note: After an item is promoted or demoted, a red flag will appear next to it, indicating that it needs to be published before it will appear in its new location on the front end of the web-site.

   You will notice that the buttons do not appear to the right of every item.

   Level-one items don't have a promote button because they can't be promoted any further (they are already at the top level).

   Any item that is already one level down from the item immediately above it will lack a button because demoting it further would make it an “orphan” with no direct parent. The practical reason for the “no orphans” rule is that in front end web pages the links to a child item are contained in the parent item's navigation. An “orphan item” with no parent would have no link to it in the website's front-end navigation.

   The best way to learn how to promote demote and move items is to create some test items without any content in them and experiment. Unless you publish your items they will not be visible on the front end, so you can do this even when your website is fully “live.” Make sure that you clean up when you are done.

To demote a navigation item

1. After logging into the administrative interface and going to the navigation item list, click the demote ( ) button to the right of the item's name.
2. Re-publish the item to make your changes visible on the front end of the website.

After you demote an item, it will become a child of the item immediately above it in the list.

To promote a navigation item

1. After logging into the administrative interface and going to the navigation item list, click the promote ( ) button to the right of the item's name.
2. Re-publish the item to make your changes visible on the front end of the website.

After you promote an item, it will go under the next item above it in the list, which is at the level you have promoted it to.

Approving and Publishing Navigation Items

New and revised content must be approved and published before it can be viewed on the website's front end. You can approve and publish an entire navigation item or a single content record.

After you select the Approve icon, the page will reload and go to the properties page of the navigation menu item where you can select the Publish icon at the upper-right corner to publish. A publishing status window will display. After the publishing is done, you can look at the new content on the front end. You may need to press Shift and select Refresh so that your browser does not display an outdated cached version of the page.

Note: Publishing takes place at the navigation item level, not at the content record level.

Note: If you have authority to approve and publish a content record, selecting Publish in the content record will both approve and publish the content.

Approving and Publishing Content

1. Select Website.

2. Select Site Navigation.
3. Select the navigation item to be approved and published.
4. Select Approve.

   Note: The Approve icon that displays on the navigation item toolbar approves all modified content in the navigation item. The Approve icon that displays in the content record properties toolbar approves only the content record whose properties are currently displayed.
5. Select Publish. A confirmation message displays if you are publishing an entire navigation item. Select Publish to publish the navigation item.
6. (optional) To force all content to be regenerated, select the checkbox.
7. Select Publish. A window displays to indicate the publishing status.

   Note: If your web browser has a pop-up blocker (for example, the Google Toolbar) enabled, the window that displays the publishing progress will not display and a blank page will display after publishing has been completed. You should disable any pop-up blocker before publishing navigation items.
8. Select Close Window to close the publishing status window.

   Who Can Approve Content

   To approve content, a user must have “Content Approver” authority in the group which controls the content (or in the “super group” Master Admin).

   Who Can Publish Content

   Several authority group permissions have some affect on publishing.

   Content Editors

   Users who can edit but not approve content (Content Editor) can publish only content records which have already been approved by someone else and are owned by their authority group(s).

   Content Approvers

Users who, can edit and approve content (Content Editor and Content Approver) can approve and then publish any content record owned by their authority group(s).

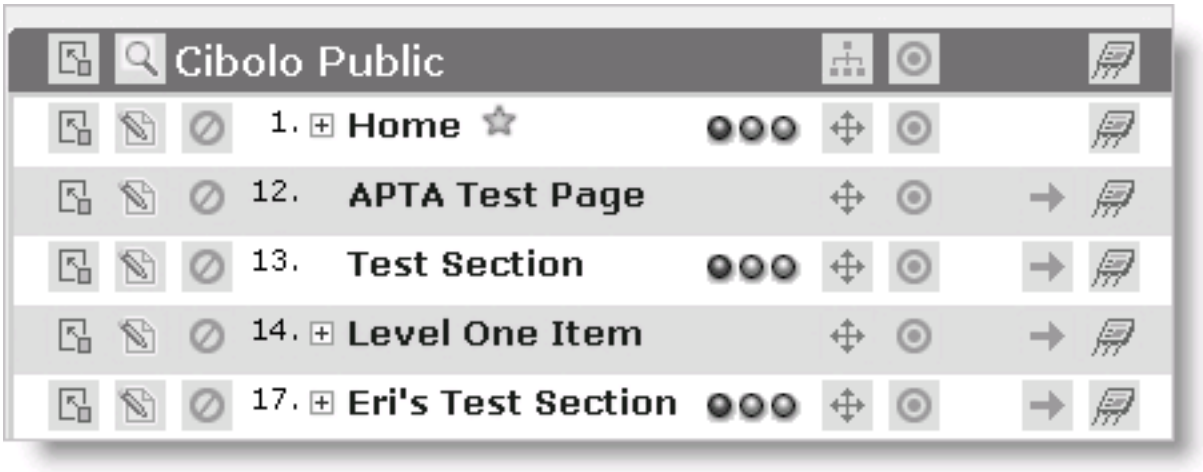
Nav/Folder Editors

Users who can edit and approve content and have Nav/Folder Editor permission can publish all approved content in a navigation item or folder. In the case of folders, this is mostly a convenience. In navigation items, Nav/Folder Editors have some abilities that other publishers do not:

- They can publish a new item which has never been published before (this must be done by a Nav/Folder Editor before any content in the new item will appear on the front end.
- They can see and change settings for a navigation item or folder. This means that a Nav/Folder Editor should be involved in the publishing of any item which requires such a change (for example, if a second content record has been added to a navigation item which formerly contained only a single record).

Members of Master Admin

Any member of the Master Admin “super group” can publish all content in a website by clicking on the publish ( ) button at the top of the list of items or folders, regardless of what permissions they have in Master Admin.



Top of Navigation Item List, Showing Publish Button

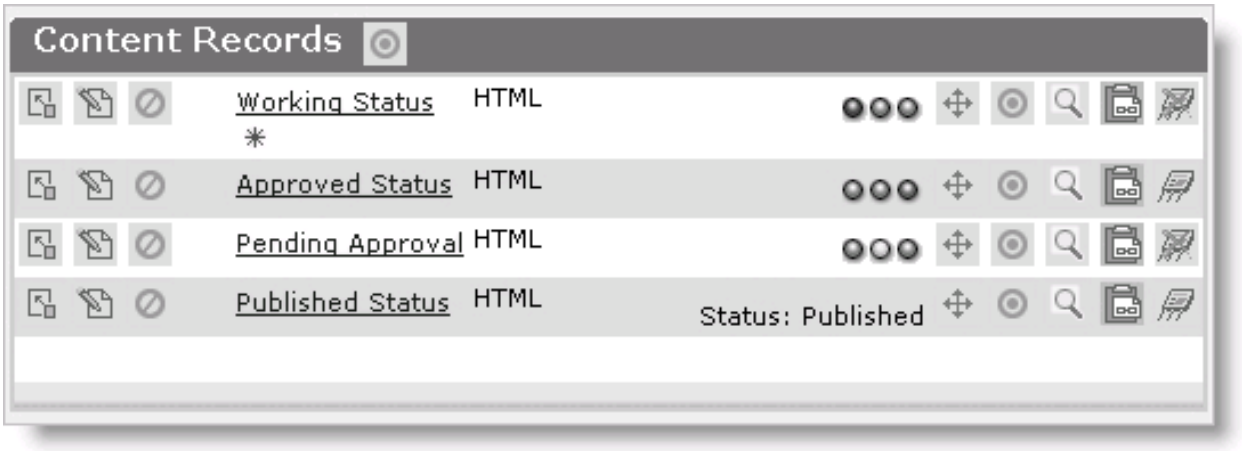
Content Status: Red, Green, and Yellow Lights

An individual content record, whether it is in a navigation item or a content folder can be in one of the following states:

1. Published: Published content has been published at least once and has not been changed in any way since it was last published.
2. Working (red): Working content is indicated by a red light. Working content is currently being edited, but has not yet been approved for publication. Any new content record will always be in the working state when it is first created. Any previously published content will be put in the working state as soon as a user begins the editing process.
3. Pending Approval (yellow): Content pending approval is indicated by yellow light. This means that a content producer without content approver authority has finished creating or editing the content and has requested an approval.
4. Approved (green): Approved content is indicated by a green light. Approved content is ready to be published.

In the Navigation Item Properties Page

Below are four content items as they are listed at the bottom of a navigation item's properties page.

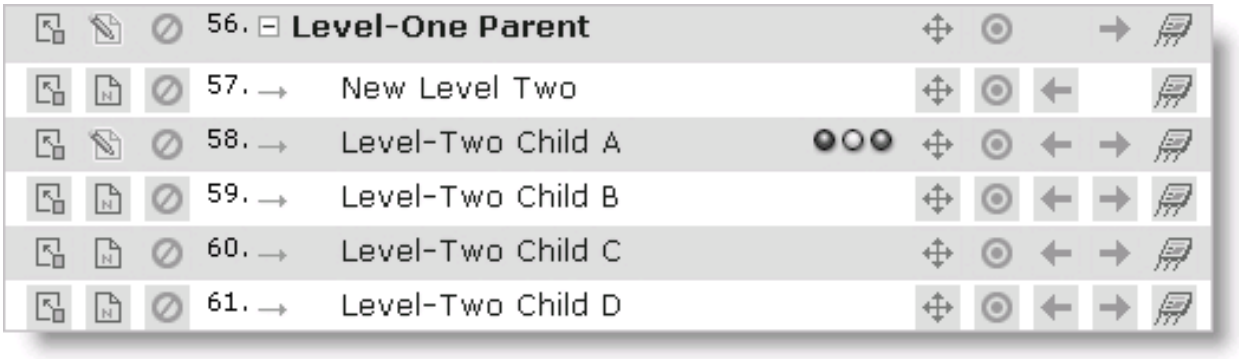


Content in Various States, Navigation Item Properties Page

On the Navigation Items List

Below are the status indicators as they appear on the list of navigation items. Note that all three status indicators appear to the right of the item “Level-Two Child A.” This indicates that there is at least one content record in the item in a working state, at least one record in a pending approval state, and at least one in an approved state.

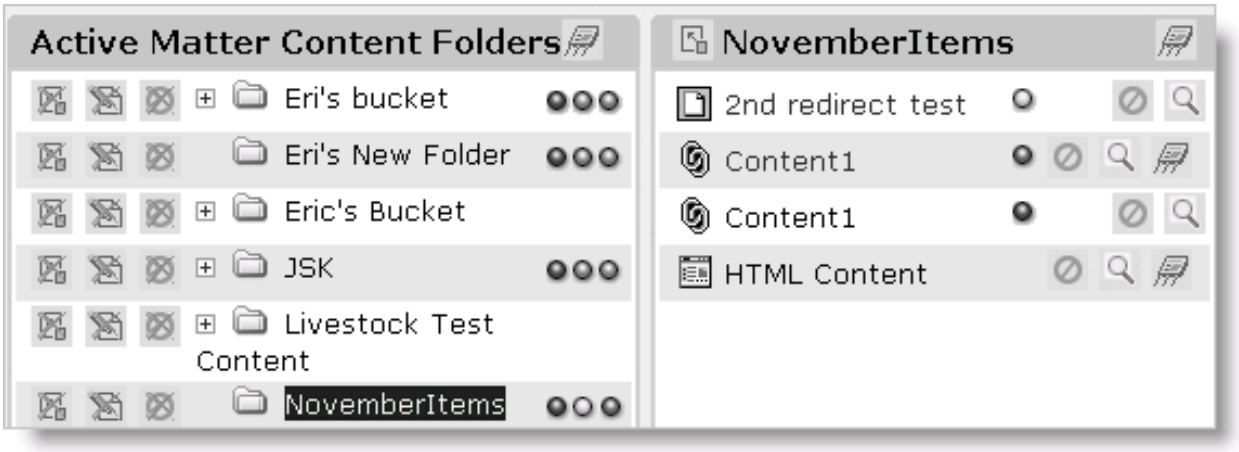
If there is no status indicator to the right of an item in the navigation list, it indicates that the item either contains no content or only content which is in a published state (unchanged since last publication).



Status Indicators on Navigation Item List

In Content Folders

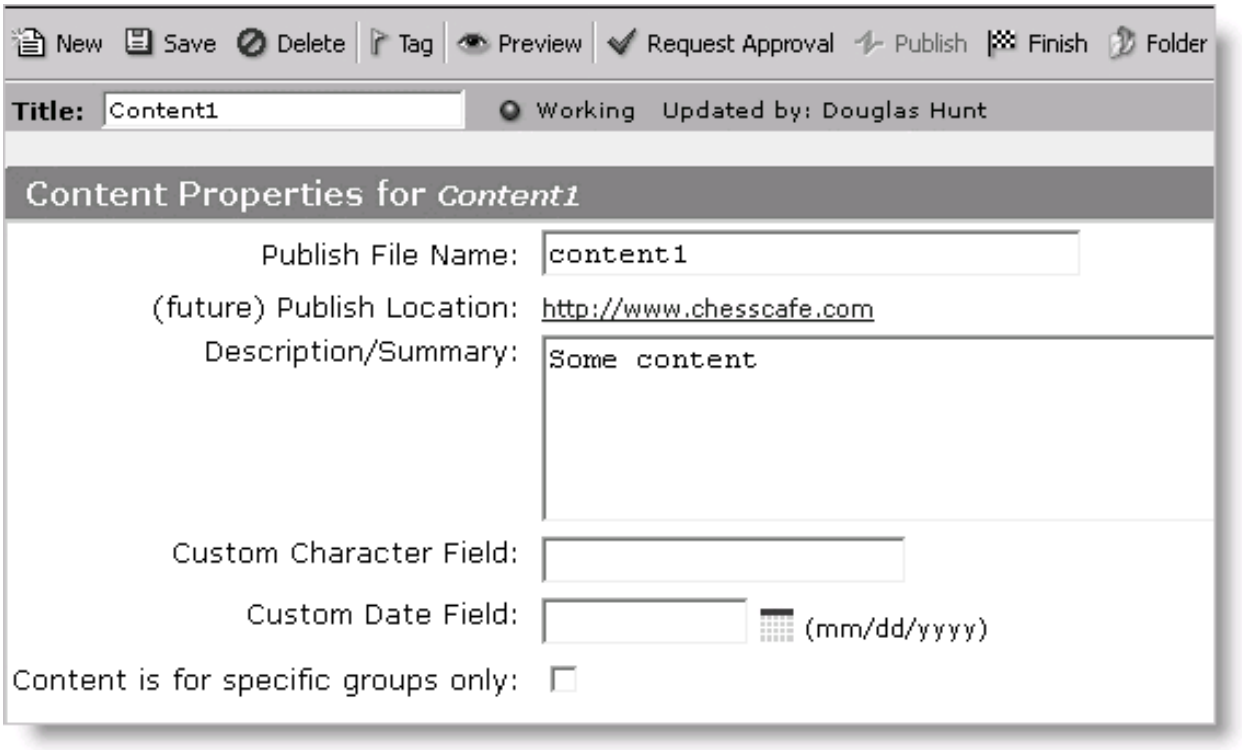
Below are status indicators as they appear in the content folders section of the interface. Note that the selected folder, “November Items,” shows the red, yellow and green indicators, and that its content records, visible on the right, include one record of each status (including published).



Status Indicators in Content Folders

On the Content Producers Toolbar

Below is the working status indicator as it appears on the Content Record version of the content producer's toolbar. In the first case, we are looking at the toolbar on a content record properties page, in the second we are looking at the same toolbar inside a content record's HTML file. The toolbar appears above the toolbar of the WYSIWYG editor.



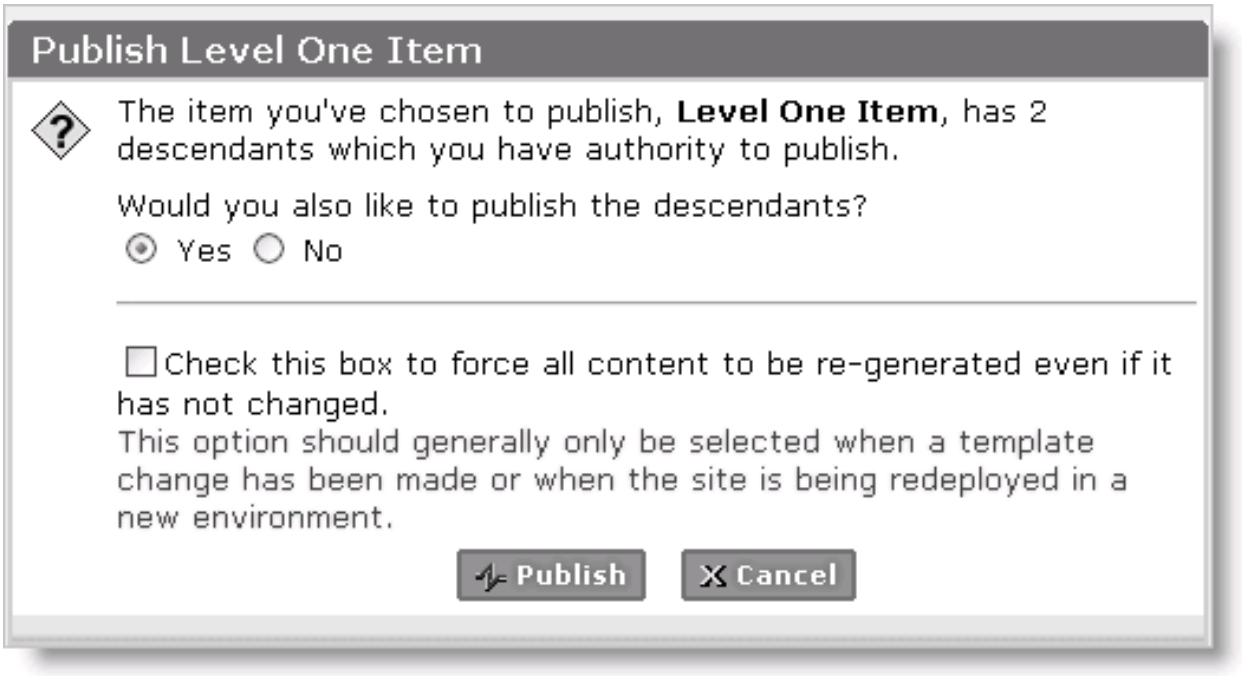
Status Indicator (Working) Content Record Properties Page

To publish navigation items from the navigation list

If a content producer has Nav/Folder editor permission in the group owning an item, they can also publish items from the navigation menu items list, using the publish ( ) button to the extreme right of the item's name.

If you publish an item without children, it will publish every piece of changed (and approved) content in that item's content records.

If you choose to publish an item with children, e-CM will show you a publish option screen. This screen allows you to pick and choose whether content in any of the descendants of your item should be published (children, their children, and so forth).



Publish Option Screen

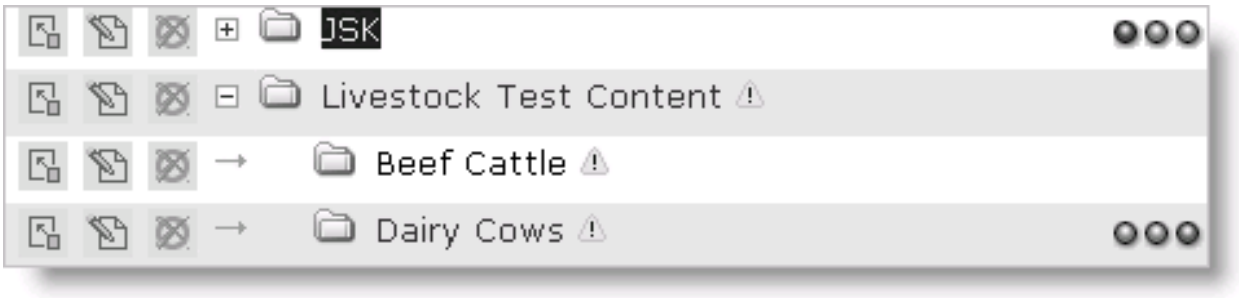
Note that there is an option at the bottom saying Check this box to force all content to be re-generated even if it has not changed. If you do not check this box, only changed and approved (“publishable”) content will be published, which is typically what you will want to happen.

Generally, you do not want to select this option unless you have just installed e-CM in a new hardware environment (for example, installed a new hard disk, or moved e-CM to a different machine. There is usually no reason to publish content that hasn't been changed since the last time it was published, and it doing so uses computer resources, slowing down your site.

Publishing Errors

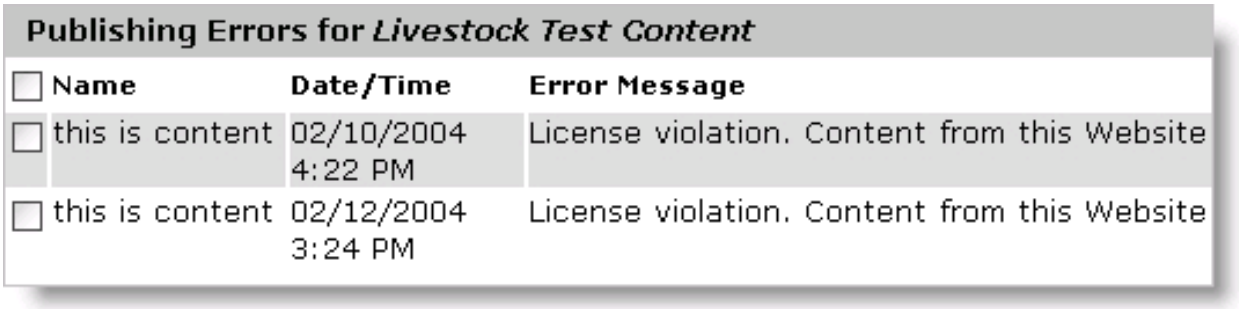
When something happens that stops e-CM from publishing, it will try three times and then report an error back to the user. If the user who publishes leaves the publishing progress window open until the error has been reported back, they will see the error in the window.

Since a busy content producer may well close the publishing window and move on before the error is reported back, e-CM will also put a small warning indicator (⚠) on the navigation item, or content folder list.



Publishing Error Indicators

When a user clicks on the warning indication, they will see an error log for that item or folder in a pop-up form. The publishing server error log files are stored in the C:\Program Files\e-CM5\PublishServiceErrorLog directory. Error log files use a yyyymmdd.txt naming convention.



Item/Folder Log

To clear the error log

1. While viewing the log for an item or folder, check the boxes to the left of the errors you want to remove and click Remove. Checking the box to the left of “Name” on the top line

of the form will check all errors.

2. When you are done, click Close Window.

Creating Content Records

Overview of creating content records

You can add content records to display when the navigation item is selected. The content records will display on the website in the order in which they are shown in the Content Records section of the Properties page.

- Insert a new content record
- Edit content record
- Delete content record
- Move content record below the Target record selected
- Target content below record selected
- Preview content
- Copy link to the content record
- Publish content record

Reviewing Content Properties

The Content Properties page is divided into the following sections:

- Content Producer's Toolbar
- Properties
- Workflow Management

- Current Items
- Current Tags

Toolbar

Advanced toolbar mode for a content record

Simple Toolbar

- New - insert new content
- Save - save content record; changes content to a Working state (red light); icon disabled if the user has chosen to use the Modify icon
- Delete - delete content record; icon disabled if user does not approval rights and if the content state is Approved, Published, or Archived; after deletion the content record is moved to the content folders recycle bin
- Tag - apply tagging categories to content record
- Preview - preview content
- Approve - approve content; changes status of Working (red light) or Pending Approval (yellow light) to Approved (green light, ready to publish); if user does not have approval rights, the Request Approval icon is shown
- Request Approval - change the status of content to Pending Approval (yellow light); if user has approval rights, the Approve icon is shown
- Publish - publish any approved content; icon disabled if user does not approval rights and if the content state is Working or Pending Approval

Intermediate Toolbar

In addition to the Simple toolbar icons, the Intermediate toolbar includes:

- Modify - edit content; changes content in the Pending Approval or Approved state to Working state; icon disabled if content is automatically placed in a Working state
- Revert - revert content to previously published version (content in the Working, Pending Approval, or Approved state is deleted); icon disabled if the user does not have editor rights, if the content is in the Published or Archived state, or if it is first version of the content
- Properties - Navigate to the Content Properties pages
- Editor - Edit the HTML content file
- Finish - Save, approve, and publish content record

Advanced Toolbar

In addition to the Intermediate toolbar icons, the Advanced toolbar includes:

- Copy - Copy the current content record; the Publish File Name is incremented with an integer
- Move - Move the content record to a different navigation menu item or to a content folder
- Versions - open a list of all prior versions

To restrict a user to a toolbar ceiling

On a per-authority group basis, the CM administrator can set a toolbar “ceiling” for each user with respect to content owned by that authority group. For example, if Intermediate is selected, the user can go no higher than the intermediate toolbar when working on content owned by the specific authority group. This effectively restricts access to certain functions.

To create a new content record

1. From the e-CM Admin page, select Website> Site Navigation.
2. Select the navigation item.
3. Select Create in the Content Records section.

Note: If content records exist in the Content Records section, select the Insert icon to insert additional records.

4. Enter the information for the new content record in the Title, Content Properties, Workflow Management, Current Items, and Current Tags sections.
5. In the Current Items section, select Create to create the HTML document.

   Note: If the Ektron WYSIWYG editor was installed, an additional toolbar displays allowing you to edit and format the HTML file.
6. Enter the text.
7. Select the Save icon on the content record toolbar.
8. Select Approve.
9. Select Publish.

Reviewing the HTML section

The HTML document section of the content record properties page contains the name or your file in the middle and several buttons to the left and right.

- The paper-and-pencil icon on the left is the universal “edit” icon in e-CM and will take you back to the WYSIWYG editor.
- The circle-and-slash-icon is e-CM's universal “delete” button (you will always get an “are you sure?” message before e-CM deletes anything).
- The small magnifying glass icon is the universal “preview” icon in e-CM and will show a preview of what your HTML file will look like on the front end.
- The small clipboard icon is a tool to create a link from somewhere else on your site to this HTML file. It copies the text required to make an internal web link to the page to your system clipboard so you can paste it into a link elsewhere. We will return to the whole subject of creating links later. There are so many ways to create links in e-CM that we will devote entire sections to it .

Approving and Publishing Your First Content

We have now created a piece of content! But before we can look at it on the front end of the website, we have to approve and publish it.

At the top of your content record's properties page, you will find the content record version of the toolbar. (This has a lot more buttons than the toolbar in navigation items.)

To approve and publish your content record

1. Click the Approve button.
2. Click the Publish button.
3. A window should pop up showing you the progress of the publishing job. When it indicates that the publishing is finished, look on the website's front end and see if your new page showed up.

Modifying your HTML File

If you followed the instructions in the last chapter, you have a content record with a very simple HTML file in it (a line or two of text).

These are some common things you might want to do to produce a more interesting page.

To find your HTML file

1. Select the name of the Site Navigation item that contains your content record.
2. At the bottom of the navigation item's properties page, select the name of your content record.
3. Select the Edit icon in the “HTML Document” section of the content record's properties page.

Current Items Section, Showing HTML Document

To use WYSIWYG Toolbar

When you enter your HTML file, the toolbar of the WYSIWYG editor will appear beneath the content producer's toolbar. Because it is a logical way to proceed and because the buttons are grouped functionally, we will “march across” the editor's toolbar left to right and top to bottom.

Left to right:

- Cut (cut selected text)
- Copy (copy selected text)
- Paste (paste previously copied text)
- Search
- Print
- Un-do
- Re-do
- Spell-check
- Spell-check as you type.

To add links to your HTML file

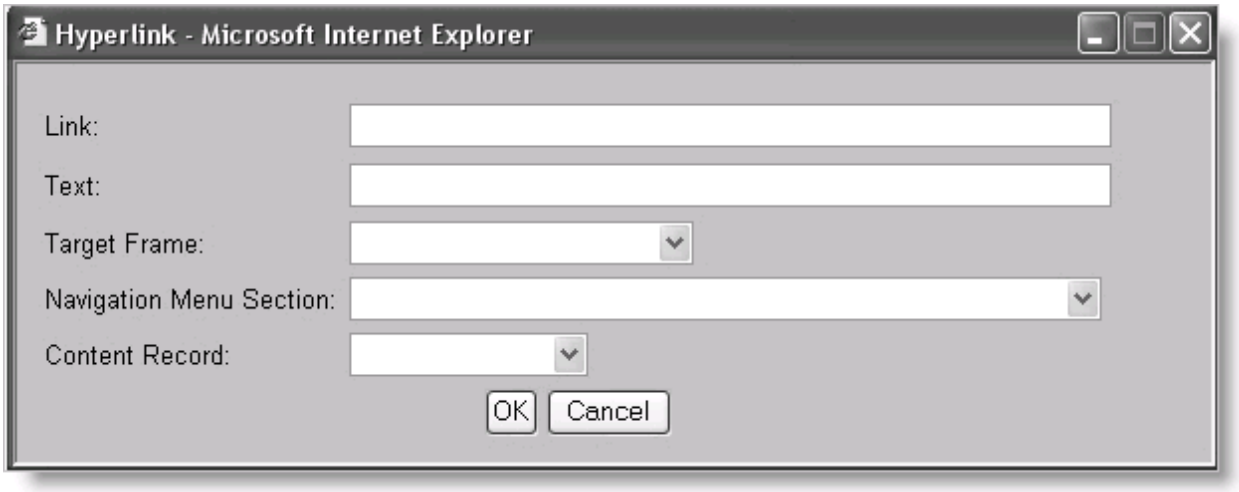
From left to right, the buttons are as follows:

- The blue flag helps you create internal page anchors.
- The globe with the link of chain and starburst creates new links.
- The plain globe and link button is useful for creating mailto: (e-mail) links.
- The globe and link button with the red “X” through the link will delete a selected link (leaving the text behind).

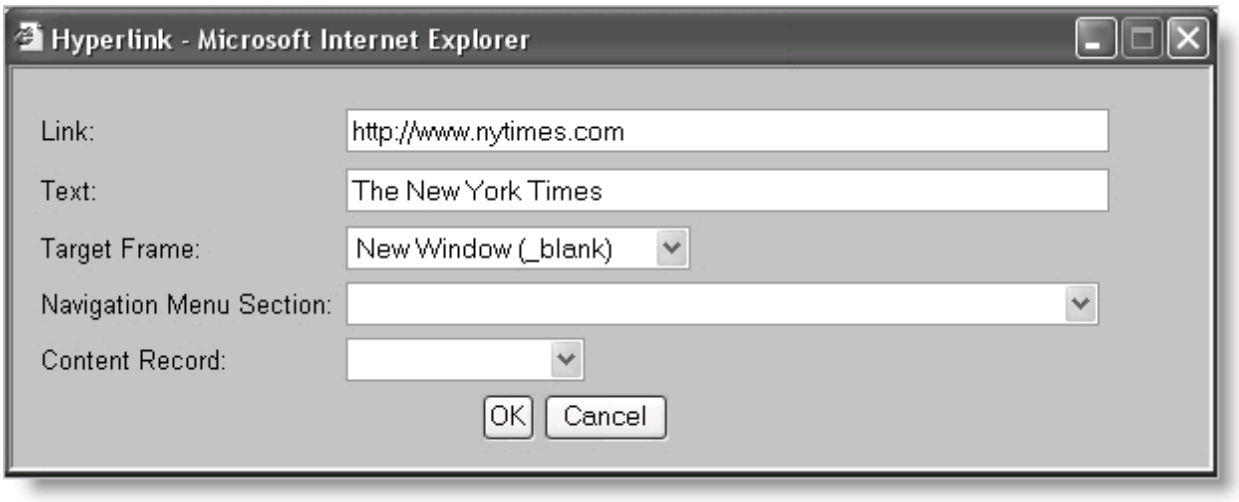
To create an external link (outside your website)

To create a link to an external web page:

1. Go to the HTML file where you wish to insert the link.
2. Select New Hyperlink at the top bar of the WYSIWYG editor.”
3. In the Link field, type the full URL starting with http://s-g.biz.yahoo.com/051110/15/3wdkg.html.
4. In the Text field, type the text you want the user to see when they see the link on the page.
5. Click OK and your link will be inserted in your HTML file.



WYSIWYG Link Window



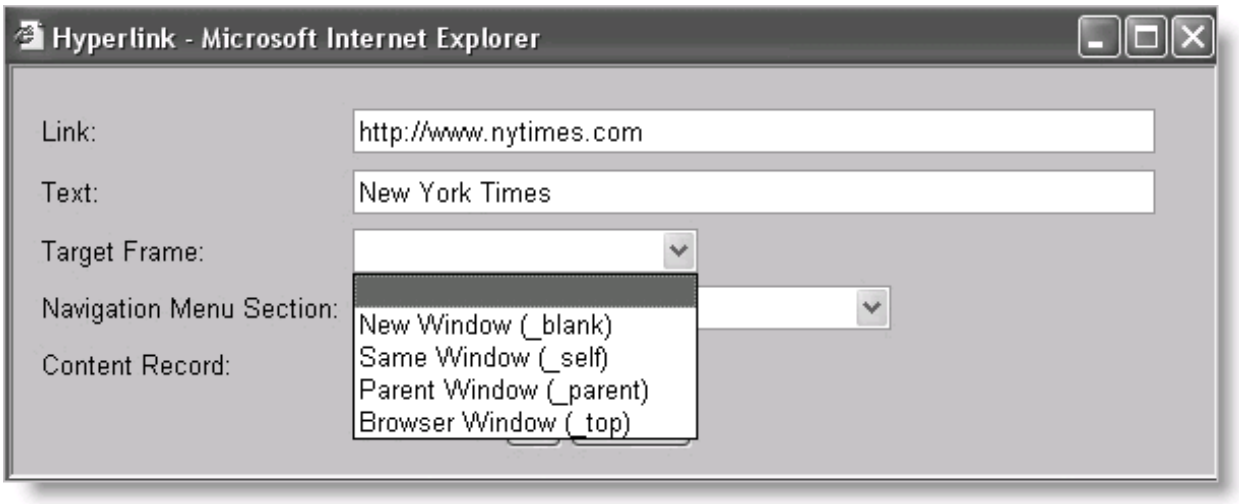
Link to External Site

To choose a target for your link

One other choice you can make when creating a link is where the user goes when they select the link. By default, links on web pages are targeted at the same window - meaning that when a user selects a link, they leave the current page and go to the page specified in the link. You can also make your links target a new window, meaning that the user will still have the original page open, and will see the page specified in the link open up in a new window.

As a starting point, many organizations decide that all external links (links to a page on another website) should be targeted at a new window so the organization's website will still be available to the user. In most cases, it does not make sense to make an internal link (a link to another page on your own site) open a new window, since the user would end up with multiple copies of your website open.

- Same Window (_self) - displays the linked file in the same browser window
- New Window (_blank) - displays the link file in a new window
- Parent Window (_parent) and Browser Window (_top) - relate to sites with frames



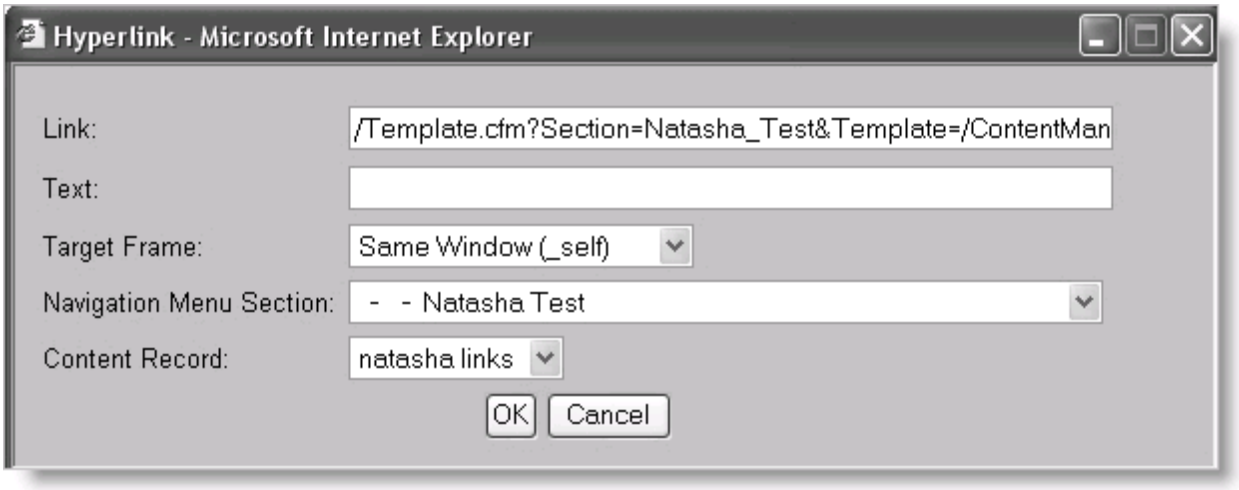
Target Frame Options

To make a link open in a new window

1. Fill in a link and text as described elsewhere in this section.
2. Select New Window (_blank) from the Target Frame drop-down list.
3. Click OK.

To create an internal Link (to another place on your Website)

Another thing you can do with the WYSIWYG editor is to create a link to a specific item navigation menu (and even to a specific content record in that item).



Link to a Content Record

To create an internal link:

1. Go to the HTML file where you wish to insert the link.
2. Select the New Hyperlink icon on the top bar of the WYSIWYG editor.
3. Select the Navigation Menu Section drop-down list and select the navigation menu item (button or link) you want the user to see.
4. After you select an item, a drop-down list of the content records in the selected item will appear below. If you wish to specify a particular content record you want the user to see (for example, if there are multiple content records in the navigation item), select the Content Record drop-down list to select it. If you do not specify a specific content record, a user who follows your link will see the same content they would have seen if they had clicked on the selected navigation item.
5. In the Text field, enter the text you want the user to see when they see the link on the page.
6. Click OK.
7. Click Save and close the editor.
8. Select the Preview icon next to the content record.

Any navigation item, which appears with a gray background in the Navigation Menu Section drop-down list, is a level-one item.

Note: The functionality shown above (the Navigation Menu and Content Record drop-down lists) only appears when you are creating new links, not editing existing ones. For this reason, if you need to edit an existing internal link, it is sometimes easier to use the Remove Link icon (the one with the red “x” through the link symbol). The Remove Link icon removes only your link, not the text. To re-insert a new link, select the text and select the New Hyperlink icon again.

To add images to your HTML

The images icon is the second from the left:

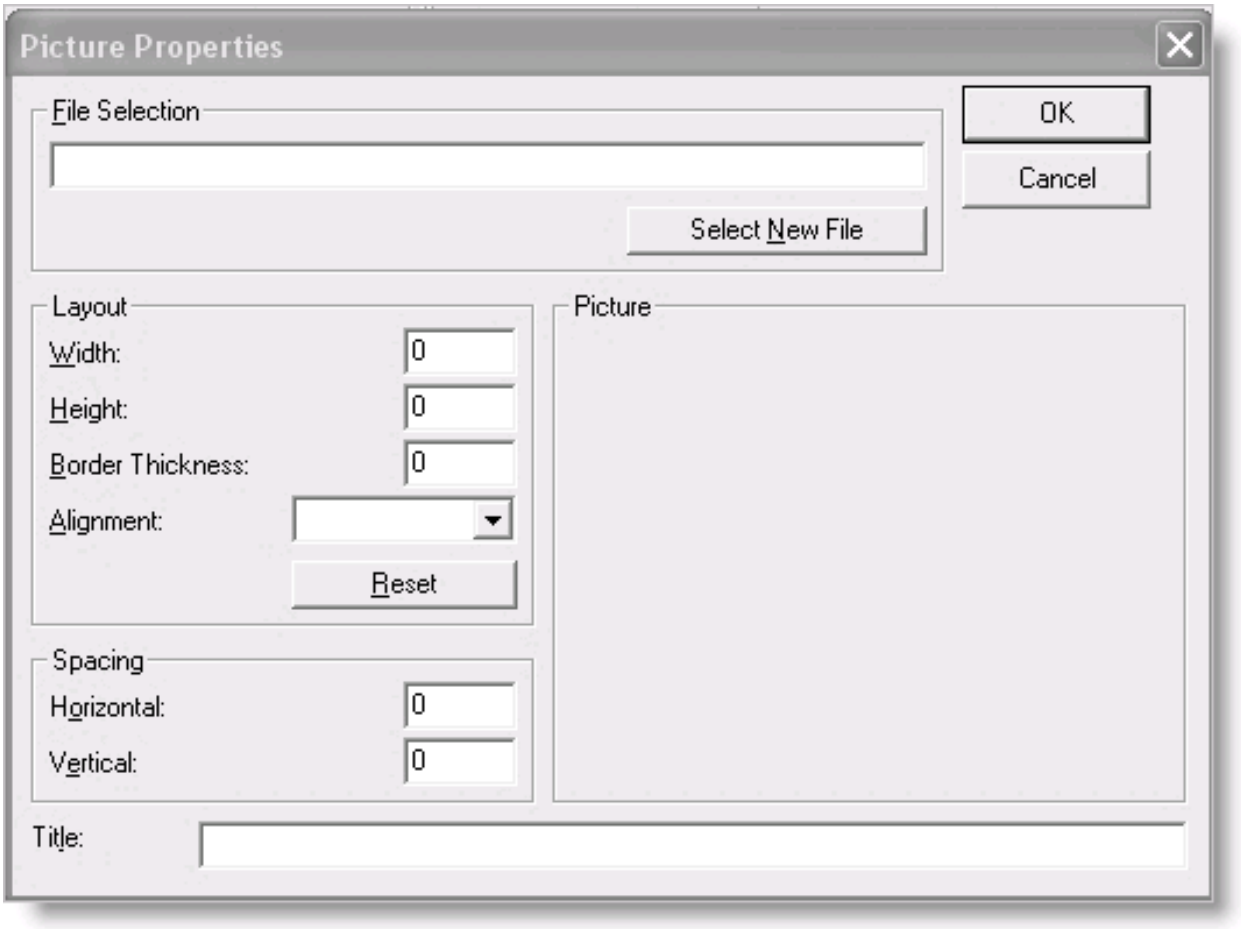
- The button with a horizontal line adds a horizontal rule (the <hr> tag) to your page.
- The button with the mountain sunrise is the image button.
- The button with the tabular design and the downward pointing arrow allows you to insert tables.
- The button with four little boxes turns table borders on and off (making HTML tables visible and invisible inside the WYSIWYG editor).
- The plain right arrow makes paragraph marks visible, and works much like the similar option in word processing programs.
- The two buttons on the far right switch the view between WYSIWYG and the actual HTML.

  There are two good reasons to look at the actual HTML: it's a good way to learn a little HTML if you don't know any, and it can sometimes be useful to fix little problems - for example, to remove an extra set of paragraph tags ( ) which are adding a vertical line to your page.

1. Open your HTML file in the WYSIWYG editor and position the cursor where you would like to insert the image.
2. Select the Image icon. This will open editor's Picture Properties form.
3. Click the Select New File Button and you will see the Image Manager window.
4. Click Browse to navigate to the location of the image you wish to insert on your local machine or network.
5. Select or double-click the image.

   Note: Make sure the image file name does not contain spaces. If the name contains spaces, rename the file and remove the spaces.

6. Click Upload Image. After a brief pause, a preview of the image will display.
7. Click OK to insert the image.
8. Click OK to return to the editor's Picture Properties form.
9. Click OK to insert your image.



Ektron Picture Properties Form

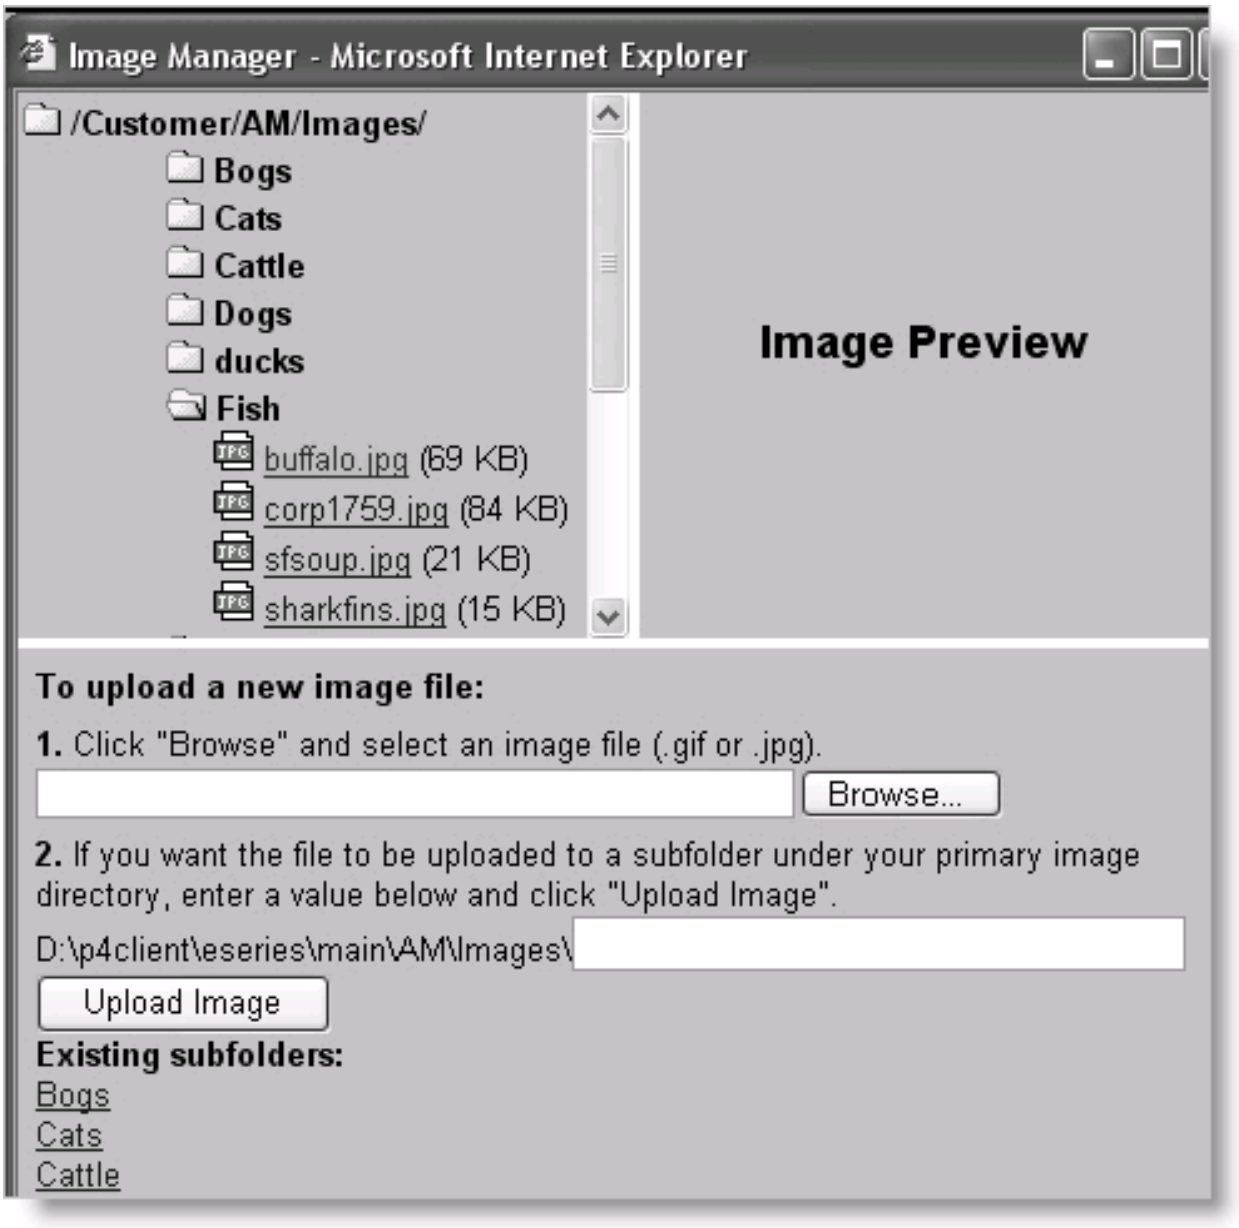


Image Manager Window

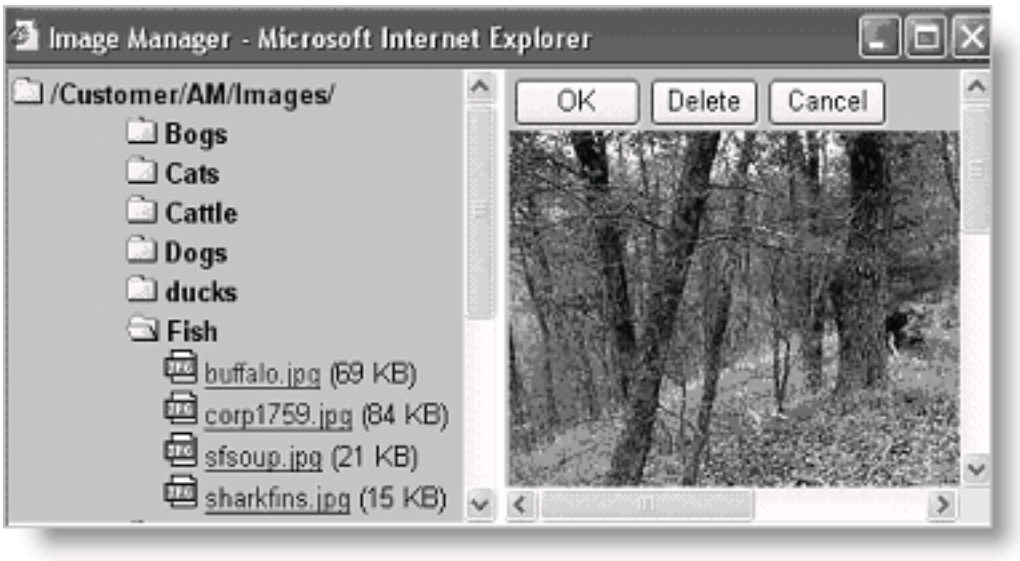

Image Ready for Insertion

To create a numbered list and align text

The following icons control lists and alignment.

- Set preferences for display of HTML in non-WYSIWYG mode) grayed out unless you are viewing HTML.
- Create a numbered list.
- Create a bulleted list.
- Out dent selected text.
- Indent selected text.
- Align selected text left (the default).
- Align selected text center.
- Align selected text right.

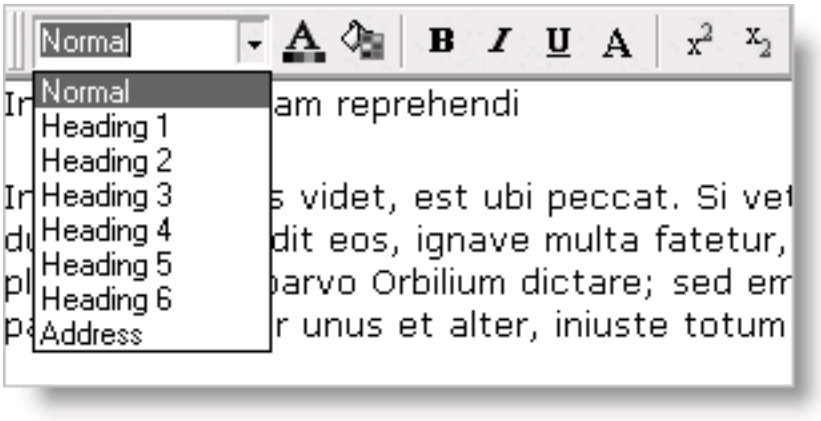
- Justify selected text.
- Displays Ektron editor version.

These buttons work as any user of a word processing program would expect.

To use heading styles

The drop-down list allows you to change selected text to one of eight styles, all determined by your site's cascading style sheet: normal paragraph font (the default), Heading 1 through Heading 6, and a style called Address, which is usually set to a monospace (all characters the same width) font. To use it, select your text, and then select the style you wish to apply.

Note: If you want to change the appearance of any of the styles, you will have to ask your webmaster to edit the style sheet for your site. Any changes made will apply to all pages on your site.

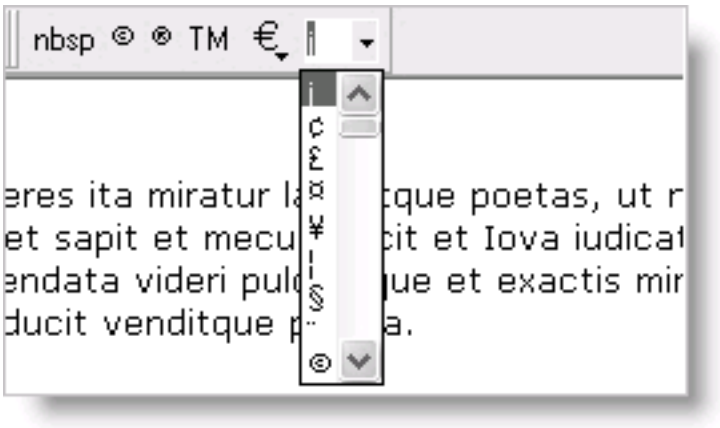


The other icons do the following:

- Allow you to create colored text.
- Allow you to create colored backgrounds.
- Create bold text.
- Create italicized text.
- Create underlined text (do not use, users will think it's a link).

- Re-set all styles (bold, italic, etc.) to normal.
- Create superscript text (above the line).
- Create subscript text (below the line).

To insert special characters



To save you the trouble of looking up the “HTML entities” which are used to display special characters in HTML, the editor includes the buttons and drop-down lists. The four buttons insert a non-breaking space, the copyright symbol, the registered trademark symbol and the “™” symbol. The two drop-down lists include many non-English letters with accents and other useful symbols (organized in a rather random matter).

To access other options (right-click)

When you are working in the WYSIWYG editor, you can right-click to see contextual menus that will give you various options related to your entire document and the particular element you may have selected.

Learning More About HTML

If you are using the Ektron WYSIWYG editor, most HTML will be generated for you. However, you will occasionally have to go in and look at the actual HTML (using the little < > button on Ektron's toolbar) to fix things. The two tables below will give you an idea of what you are looking at.

HTML Tags

This is an XML-style break tag. If you use a <br />, it will create a break in your text, as if you had pressed Enter. If you want to break and skip a line, put in two tags one after the other.

this is my important text

Strong tags get wrapped around text that you want to appear in bold. Use where you want the bold to start and a where you want the bold to end. You can also use and for the same purpose, but the tag is not handled as well by web page readers used by those with impaired vision.

this is my little note to the reader

 tags (short for “emphasis”) get wrapped around text you want to see in italics. The italics will start after the and stop at the tag. You can also use the and tags for the same purpose, but is better supported by web page readers used by the disabled.

this will be in bold italics

You can combine the and tags to produce text in bold italics. It doesn't matter if you put the tags on the outside and the tags on the inside or the other way around.

HTML Elements

Link to the NY Times

This is the basic syntax for a web link. The target attribute determines where the link will go (_blank will open a new page, _self will load the link in the same page, and _top will load the link in the same browser window even if there are multiple “frames” in the browser window.

<img src=”/Images/myPicture.gif”>

This is the basic syntax of a link to an image. These links are created for you when you use the Image icon.

<A HREF="mailto:name@company.com">
send email</A>

This is the basic syntax for an e-mail link.

You can also do things like this:

<A HREF-
="mailto-
o:joe@acme.com?cc=bob@acme.com&subject=The%20Readme%20File">Super
Email Link</A>

This will pre-populate a CC and a Subject in most e-mail clients. Notice that the spaces in the subject line have been replaced with “%20”, that there's a "?" after the main e-mail address, and that the other two elements are separated by an “&”.

Adding Links and Files to Content Records

We have now created a navigation item with only one content record. That content record contains only an HTML file. We will now add links and files to our content record.

The following types of content can be put in a content record:

- HTML: Only one HTML file is allowed per content record.
- Links: A content record can contain any number of links. These can include both “internal” links to web pages inside your site or “external” links to other websites.
- Files: Files such as PDFs or Word documents may be uploaded to a content record. You can upload as many files as you want.
- Tagged Pages: Tagged pages are a special case that we will talk about later. Tagged pages must be by themselves in their own content record.

If you add links or uploaded files to your content record, they will appear underneath standard headings below the HTML file. The default headings are Related Files for uploaded files and Related Links.

Links and Files in a Content Record

To navigate back to your content record

If you are not at your content record, your first challenge is to find your way back to it:

1. In the Site Navigation list, find your navigation item.
2. Select the navigation item to go to the navigation item properties page.
3. At the bottom of the page, select the link to your content record's properties page.

Link to Content Record

To add a link to a content record

To add the first link to a content record:

1. Open the content record properties page and scroll down to the Links section.
2. Type the full URL in the top text box (starting with http://).
3. Type whatever text you wish to display on the link on the bottom.
4. Click Save.
5. Select the Preview icon on the toolbar to see where the link will appear on the front end (they will appear under a standard heading beneath the HTML file).
6. Select the Preview icon to the right of the link to make sure it works.

   Note: Because it is so easy to make small typos in links, you should make a habit of always previewing newly added links before you approve and publish your content records.

Link Editing Interface

Link after Clicking Save

Additional links

e-CM will hold an editing form open until you save your first link. After you have a link, use the insert icon to enter another link. Using the insert button to the left of an existing link will always insert the new link below it.

Content Record after Adding First Link

To enter a second link:

1. Select the Insert icon next to your first link.
2. Fill out the form as before (URL above, link text below).
3. Click Save.

4. Select the Preview icon to the right of the link to make sure it works.

   Enter at least three or four more links so you will have enough to practice moving links.

   To edit links

   To edit a link:

1. Select the Edit icon to the left of the link.
2. When the form opens, populated with the URL and Link Name (text), make your changes.
3. Click Save to save your changes (the form will close again).

   To delete links

   To delete a link:

1. Select the Delete icon to the left of the link you want to delete.
2. Click OK to the confirmation message.

   To upload a file to a content record

   The process for uploading a file is much like doing an e-mail attachment.

1. From the Content Record Properties page, click Browse to locate the file.
2. Select or double-click the file.
3. Enter the description you to appear on the link.
4. Click Save.
5. Select the Preview icon.

   Note: Make sure the image file name does not contain spaces. If the name contains spaces, rename the file and remove the spaces.

Browse for a file to upload

As with link, e-CM will hold open the file form until you have uploaded your first file. Use the Insert icon to the left of an existing file to insert a new file in the list. The new file will be inserted below the file whose insert button you have clicked.

Editing files

To edit a file, select Edit icon to the right of the file's name. This will open up the form and insert the description, but it will leave the Browse button open.

Whatever you change will be changed after you click Save, and whatever you do not change will be left alone.

In other words:

- If you click Save after changing the name, only the file name will change.
- If you click Save after uploading a new file, you will have a new file, but the old name.
- If you change both the name and the file, you will have a new file and a new name.

To delete files

To delete a file:

1. Select the Delete icon to the left of the file you want to delete.
2. Click OK to the confirmation message.

To sort (move) files and links

Links and files will be shown on the front end in the same order that they are shown on the back end. If you want to change the order on the front end, move the links or files on the back-end and then republish the content record.

To move a link or file:

1. Select the Move ( ) icon to the right of the link or file you want to move.
2. Select the target ( ) icon to the right of the link or file you want to move it below.

Note: If you want to make a link or file the first one in the list, you will have to make it second by clicking the target next to the top link, then use move and target again to move the top link down to second position.

To tag your content

If you wish to tag your new content, you use the Tag icon in the content producers' toolbar or at the top of the Current Tags section at the lower-right corner of the properties page.

To tag your content record:

1. Select the Tag icon.
2. When the pop-up list of tags appears, check your selections, clicking on the “+” images or “Expand All” if necessary to show the tag(s) you want to use.
3. Click the Save and Close button at the bottom of the pop-up window.
4. The tags you have selected will now appear in the Current Tags section of the properties page. The selected tags will appear in bold; their parents, if any, will appear in regular type.

Current Tags Section of Properties Page

Publishing your new content

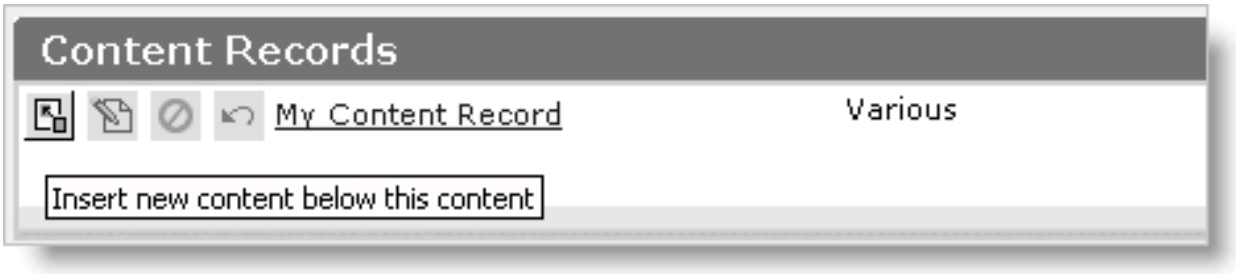
If you have been working through the instructions in this section, you should now have a content record with HTML, files, and links. To view your content record, select the Pre-view icon on the toolbar at the top of the page.

If you would like to publish the content record, click on the publish button on the toolbar at the top of the content record page (if you have publishing authority, this will both approve and publish your content).

To add multiple content records to a navigation item

With the exception of a tagged page, you have now added every type of content you can to your content record. The next step is to see what choices we have when we add two (or more) content records to one Navigation Item.

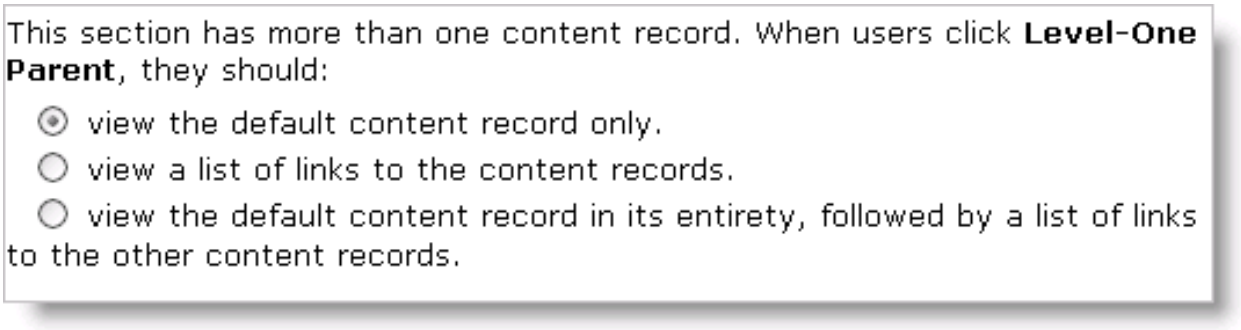
1. In the same navigation item where you inserted your first content record, go to the content records section at the bottom of the properties page.
2. Select the Insert icon to the left of your first content record to open the content record properties page for your new content record.
3. Insert an HTML file in your new content record.
4. From the properties page of your new content record, select the Navigation icon on the toolbar to go back to the properties page of the navigation item.



Getting Ready to Insert New Content Record

Reviewing Content Record Display Options

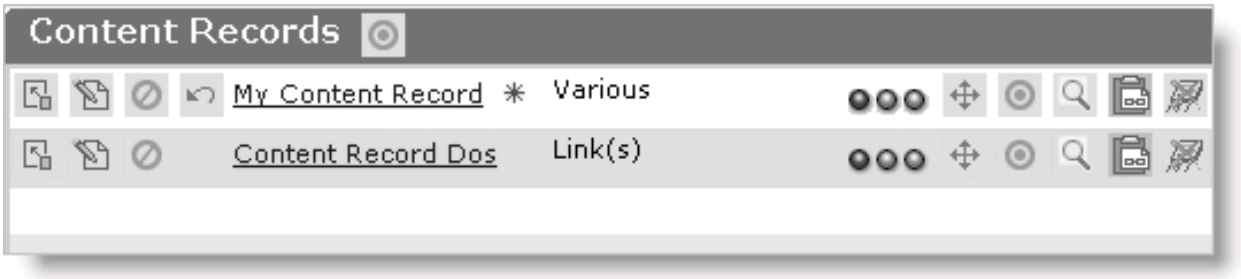
In the properties section of the page, you will see the following display options whenever a navigation item contains more than one record:



Navigation Item Settings for Multiple Content Records

The Default Content Record

The default content record is simply the first content record in the list at the bottom of the navigation item properties page. As soon as you have more than one content record in a navigation item, a red asterisk is used to mark the default record.



Default Content Record, Marked by Asterisk

To change the default record you simply move a new record into the first position in the list. If you have only two records:

1. Select the Move icon to the right of the first record.
2. Select the Target icon to the right of the second record.

   This will move the first record down below the second record (records are always moved into the slot after the target button).

If you have more than two records, you can change the default by making it #2, then moving the default record below it:

1. Select the Move icon to the right of the first record you want to make the default.
2. Select the Target icon to the right of the current default record. This will move the record into the second slot.
3. Select the Move icon to the right of the current default record and the target button next to the record you moved. This will move the default below it, and make your record the new default.

Note: After changing the default record or any of the display options, make sure you re-publish the navigation item to make your changes live.

Setting the display options

The content record display options are reasonably self-explanatory:

Default Only

If you choose the show default record only option, only the default record will be visible. All other records in the navigation item will be hidden (although still available via site search or tagged pages).

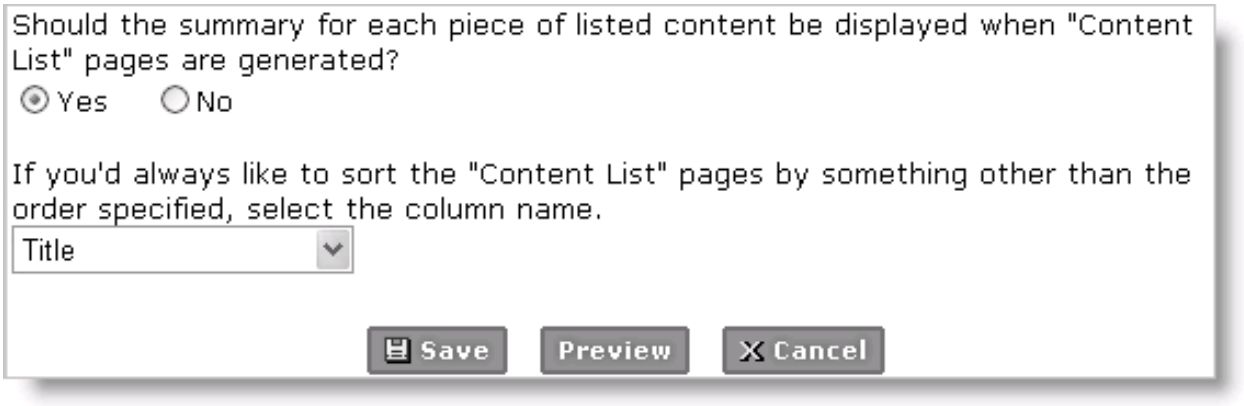
Content List (“Show a List of Links”)

If you choose the content list option, the user will see a list of links to the content records. If there are any descriptions entered for the content records, these will be shown (by default) below the links. Whether descriptions will be displayed with this option enabled can be specified on a per-website basis on the website properties form. You may also choose to arrange the links by something other than the order of the list in the navigation properties form.

Combo (Default plus Links)

If you choose the third option, the “Combo” mode, the default record will be displayed in its entirety, followed by a list of links to other content records. You can also choose

whether to display content record descriptions beneath these links. The setting is found in the website properties form.



Content List Settings, Website Properties Form

Reviewing default content record properties

Empty navigation items with children

If any navigation item with child items is empty (no content records), the user will automatically be taken to the first child item and will see exactly what they would see if they clicked on the child link directly. If the first child is empty, they will see the standard “this page is temporarily unavailable” message unless the first child of the child has content, in which case they will see the content of the “grandchild” page.

Note that while e-CM will keep recursively looking through multiple levels of first children (although we can't imagine why you would ever want to go beyond one level); it will not look in the second child if the first child does not contain content.

One Content Record with Only a Link

If a navigation item contains only a single content record and the content record contains only a link, when a user clicks on the item, they will simply go to the URL (either internal or external) specified by the link. If the “open in new window” option is checked in the content record, clicking on the navigation item will launch the URL in a new window.

One way to use this feature is to create internal links. For example, if you would like to create a link to your online store in several sections of your website, you can simply create a navigation item with one content record containing only a link to the store and title the

navigation item “Online Store.” When a user clicks on the link, they will be automatically taken to the online store.

A Content Record with Only a File

Content records with only an uploaded file behave a little differently from normal content records.

If such a content record is the only content record in a navigation item, selecting the link will display the file in a new browser window.

If the content record is not the only record in a navigation item and is not the default record, any links built to it by e-CM in list or combo modes will open in a new window.

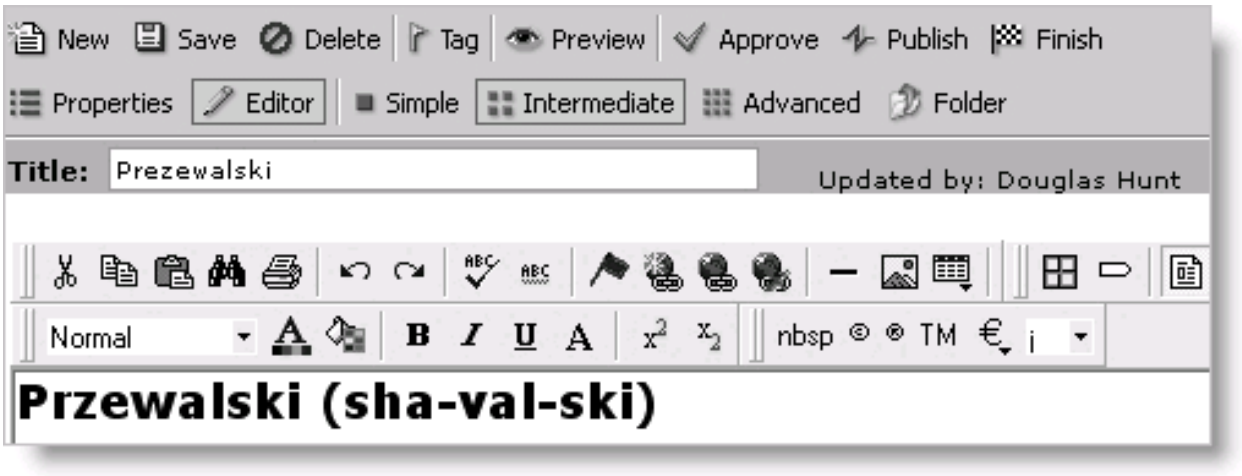
If the content record is the default record for a navigation item and there are other content records, it will either:

- Ignore the other records and open up in a new window (if the content record display options are set to “combo” mode) or
- Open the list of content records in a new window (if options are set to display a list of content records). You generally would not want to make a content record containing only a file the default record in a navigation item with multiple content records.

Reviewing Content Record Properties Page Settings

Now that we've entered our first piece of content, we've already been playing around with the content record properties page, but let's take a closer look at the settings at the top of the page, which control many things about how your content is displayed on the front end.

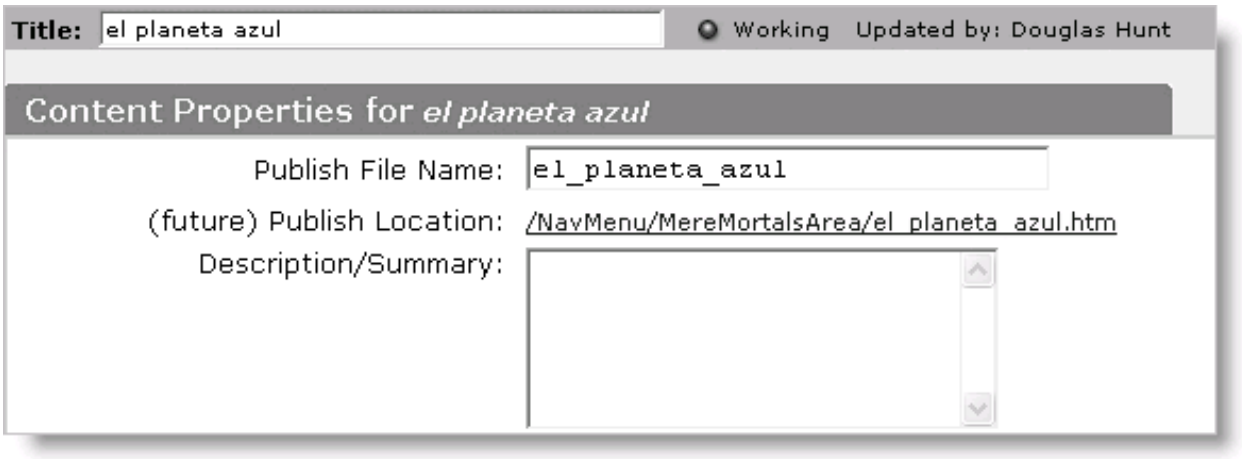
Note: If you have your preferences set-up to always take you directly to the WYSIWYG editor rather than to the content record properties page, you can always get to the properties page by selecting the Properties icon in the left-hand side of the content producers toolbar. This icon is available in the intermediate and advanced versions of the toolbar.



Content Producers Toolbar Showing Properties Button

Content Record Properties Window

There are a fairly large number of settings in the properties section of the content record properties page. As is the case with the settings for Navigation Items, most of them can be left at their default settings most of the time.



Top of Content Record Properties Form

Title

This is the name that will be used for any links that point to this record if it is retrieved by a tagged page, or if there is more than one content record in a navigation item (we'll get to that). The title will also be indexed and displayed by your internal site search engine and

by commercial search engines. The most important thing to remember is that it should be a name you want users to see, not just a name for your own reference. Ideally, it should be brief and should meaningfully describe the content.

Publish File Name

This is the name of the file that will be published from the content in this record (with ".htm" on the end). By default, it will be the title with any special characters removed and all spaces replaced by "_" characters. You can change it if, for whatever reason, you wish the published file to have a different title.

(Future) Publish Location

The (future) publish location is an absolute path link to the location where the content record will be published. In other words, this is where e-CM will put the files when it publishes this content record (the "future" is there to remind you that if you haven't yet published the content, it will not be there yet). You can use it to create a link to this content record. The publish location is determined by the system and cannot be changed by the user.

Description/Summary

The important thing to remember about the description field is that what you type here will be seen by website visitors and will also be used by search engines (both internal and external). It should be a brief but meaningful description of what the record contains. It is not essential to include a description (especially if the name of the content record makes what it contains extremely obvious), but it is usually a good idea.

Here are the details on where this description will appear to front end web users:

- The description will appear beneath any links to the record if you have more than one content record in a navigation item and choose to display a link rather than the full record.
- In addition, the description will show up in the meta section of the HTML page generated from this content record. Without going too far into the technical details, that means that if your site search or an external search engine pulls up the page generated from this content record, what you enter here will be displayed as the page's description.

- If you want the technical details, entering a description will generate a meta tag with a name “description” and the description will be in the content attribute of that tag.
- Tagged pages can also be constructed so they show a content record description (this is only relevant if your site includes tagged pages).
- Again, if this seems like a little too much information to absorb right now, the most important thing to keep in mind is that the description will be seen by website visitors in a variety of circumstances so it is probably a good idea to enter something useful in this field.

  User-Defined Fields

  Following are two examples of user-defined fields. If you have custom fields activated, they will appear directly below Description/Summary. These fields are used with tagged pages and/or search and allow you to enter and then display (on tagged pages) information, which is not part of e-CM's standard data. For example, if you have a large collection of articles and want to display an author name (and/or sort by author) in a tagged page, you could enable a custom character field called Author Name.

  Since the name and purpose of user-defined will vary, if you are unsure how to use them, you should ask your supervisor or webmaster.

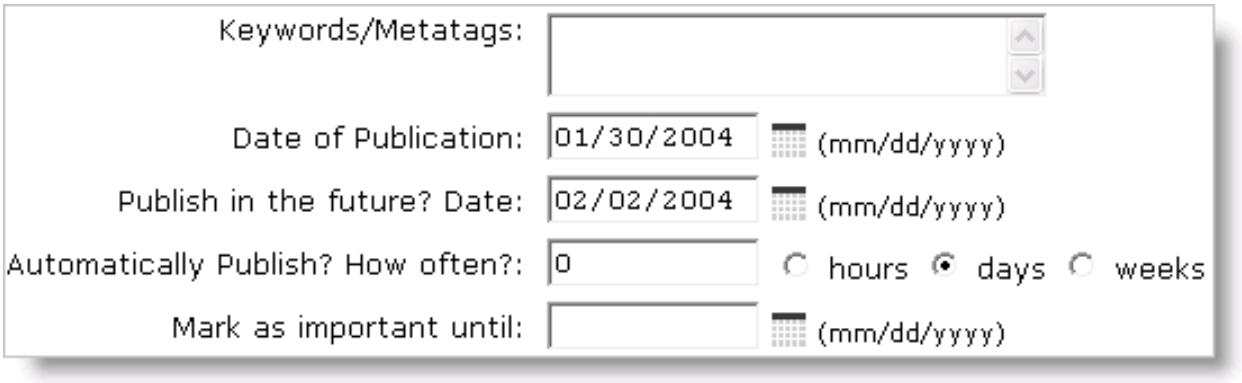
  Example Custom Fields

  Keywords

  If you enter keywords for your content, they will not appear on the front end. They are used by your site's internal search engine to find content. There are two reasons for using keywords.

  The first case is if you have a document that does not contain a specific word or phrase that a user might use to search. For example, if you have a document that is about tax

policy, but does not actually contain the phrase “tax policy,” you could enter “tax policy” as a keyword.



Content Record Properties Page Detail

The second reason you might want to use keywords is to change the position of a document when a user searches on a particular word or phrase. The Verity™ search engine used with e-CM is smart enough not to fall for the old trick of repeating a keyword many times, but a document with “tax policy” in the keywords and in the description and in the body of the document will rank higher than one where it occurs only in the document (exact details will vary depending on the way your site search settings are configured).

If you want to use keywords to ensure that certain documents always rank at or near the top of the list when a user searches on a given keyword, you should use them sparingly. For example, if you want one document to be #1 when “tax policy” is searched on, you would not want to enter it as a keyword for every document on the site relating to tax policy or the advantage of having the keyword would cancel out.

External search engines (such as Google) will ignore your keywords.

If you want the technical details, entering keywords will generate a meta tag with the name “keywords” and whatever you enter in keywords will be the content of that tag.

The description and keywords properties both generate “meta tags” which are used by search engines to classify pages. The subject of meta tags and search engines is extremely complex and has spawned its own industry of consultants, but Search Engine

Watch (http://searchenginewatch.com/webmasters/meta.html) includes a brief and opinionated description of the description and keywords meta tags.

One thing to keep in mind is that while, as the link above points out, no major external search engines (e.g. Google) use keywords meta tags, your site's internal Verity™ search engine does use them, so keywords are an effective way to ensure that a page is retrieved by your site search.

Date of Publication

The Date of Publication field gives you the ability to associate a fixed date of your choice with a particular content record - a date that will not depend, for example, on when the record was last published or when it was first entered into e-CM.

If you are using advanced site search, the Date of Publication field is extremely important - this is the date search results will be sorted by when the user chooses to sort by date. The field can also be used to sort records and/or display a fixed date in tagged pages (for example, if you have a series of dated press releases).

Format should be mm/dd/yyyy (if you are using tagged pages, you will be able to change the way the date is displayed when you set up your tagged pages). You can use the small calendar icon to the right of any date field to populate the date in the proper format.

Publish in the Future?

If you enter an mm/dd/yyyy date in “Publish in the Future?” the content in the record will be published overnight by a scheduled task at the date you choose. This is a good way to create content now and have it appear for users at an appropriate date in the future.

This feature can also be used to embargo content until a specified date. Once you set a content record to publish in the future, e-CM will ignore any attempts to publish it “by hand.” If you insert a date in this field, the assumption is that you want it to “go live” on the specified date in the future and not before. If you later change your mind and want to publish the record manually, simply remove the date, click on the Save button to save the change, and then publish the record in the normal way.

Note: If you use this feature, remember that your content must still be approved.

Automatically Publish

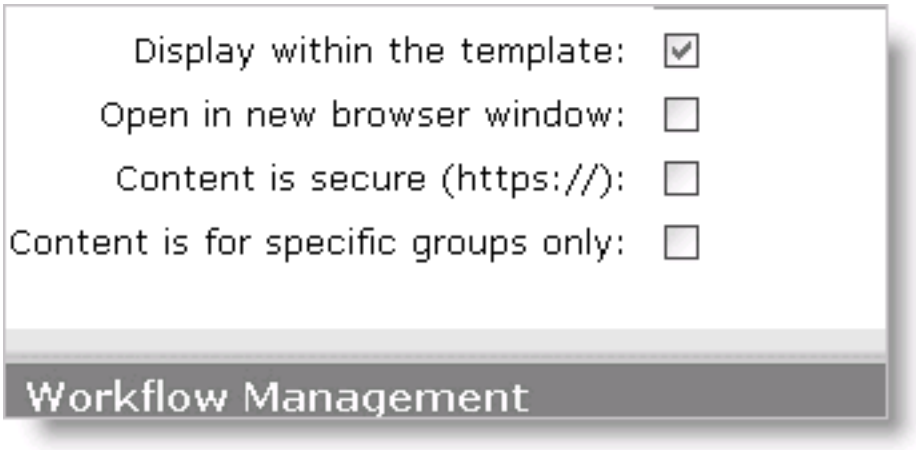
If you enter an integer n in this field, it will automatically republish the content record (via a scheduled task) every n days. If you leave it at the default, zero, the content record will not automatically be republished.

Mark as Important Until (New Image)

If you enter a date here, e-CM will display a “new” icon next to any links to the record in a tagged page until the date specified is reached. The feature does not relate to whether the content is important.

Display within the Template

The template is the standard ColdFusion page, which is designed to surround all the content records in your site. In plain language, it includes your site's navigation and your buttons and associated graphics. If you un-check “Display within the Template,” the content in the content record will be displayed without any of the typical navigation and design elements in your “normal” pages.



Content Record Properties Page Detail

You may want to un-check the box, for example, if your content record displays a “print and mail” form or a letter from a board member or any other content in which standard navigation and design elements would be inappropriate.

You do not need to worry about this setting with respect to files or links. If, for example, you create a link to the New York Times website, e-CM will not try to display that site inside your template. Also, if the content record contains only a single file (for example, a jpg or a pdf) the navigation link will not attempt to display it within the template.

Open in New Browser Window

By default, navigation links to content records will open in the same browser window. If you check this box, the content record will cause the record open in a new browser window.

Content is Secure (https://)

If you check this box, any content in the record will be encrypted before it is sent over the web (assuming your site is properly set up with a secure certificate). This would be appropriate, for example, for a page containing highly confidential business information (which you would presumably also want to protect by restricting access to specific groups of members).

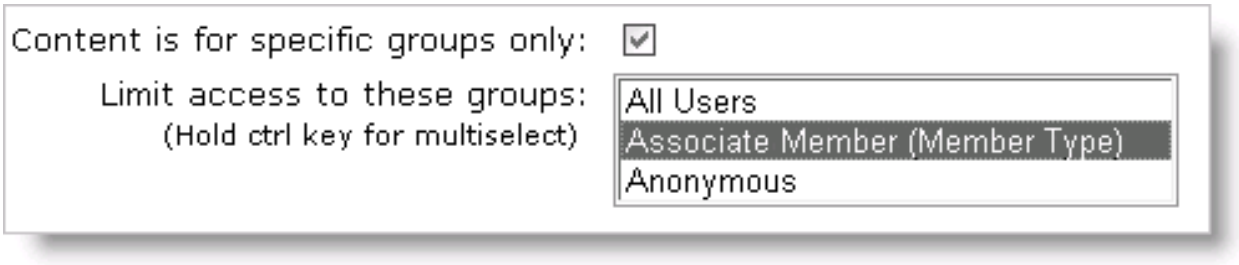
Content is for Specific Groups Only (Members Only)

If you check this box, access to the content record will be restricted to your members, who will have to login to the site before they can view it (if they click on a link to it before logging in, they will be prompted to login). If your site features integration with your membership database, checking this box will cause a multi-select box to appear, allowing you to select which membership types may see the content.

The list of member types will typically come from your back-end member database. The special type “All Users” is generally included. Selecting “All Users” will require users to be logged in to view a page, but will not require them to belong to any specific membership category.

If a user tries to access members-only content when not logged in, they will be prompted to login. If, during login, they are determined to belong to an appropriate type, they will be shown the content. If not they will be shown another message thanking them for logging

in, but telling them that they do not have the right to access the content. These messages are configurable.

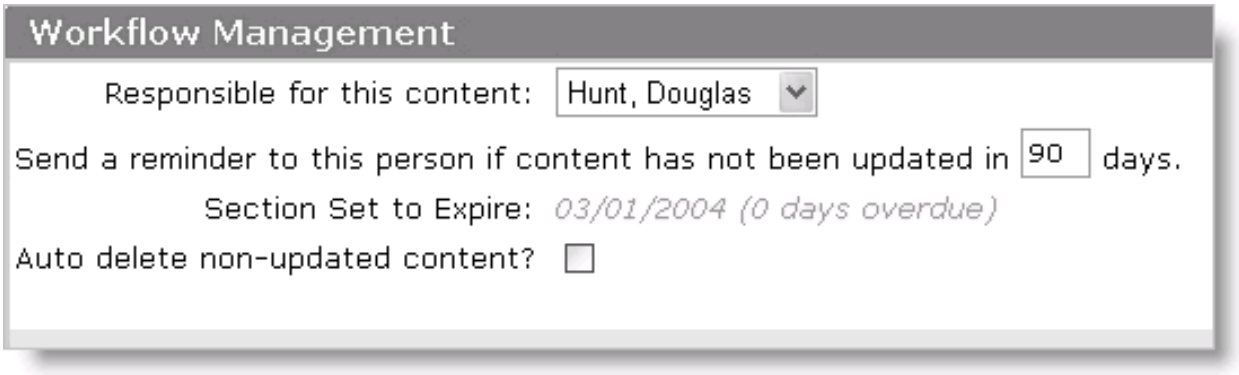


Members Only

Note: These groups can, but do not have to be, based on your back-end database's member types. They groups are set up as database queries, so they can be defined any way you wish.

Workflow Management

Below the content settings is the Workflow Management section. The general purpose of this section is to control how often this content will be refreshed and who will receive e-mail notifications when it needs to be updated.



Content Record Workflow Management

Responsible for This Content

The drop-down list in this part of the workflow section indicates who will receive the e-mail “nastygrams” when the content record reaches its expiration date. The drop-down list con-

sists of all the members of the content management group which controls the navigation item holding the content record.

Send a Reminder

The number of days entered in the box after “Send a reminder…” determines when e-mail reminders will be generated for this content. Content nearing its expiration date will also show up in the Task List of the responsible content producer. The default for number of days is a configurable system variable. You may adjust the number of days depending on the content. If the number is zero, no reminders will be sent.

Section Set to Expire

This simply lists the date that the content will have reached the date determined by the “Send a reminder…” feature. The content will not expire in the sense of disappearing from the website unless you check the “Auto delete” checkbox.

Auto Delete Non-Updated Content

If you check this box, the content will simply be deleted when it reaches its expiration date.

Managing Content Records

You can copy and move content records to a different content folder or content record, or to another website.

Copying a content record

1. From the e-CM Admin page, select Website.
2. Select Content Folders.
3. Select the content folder that contains the content record to be copied.
4. Select the content record to be copied.
5. Select Copy.
6. The Content Properties page for the new (copied) content record displays. The new content record is an exact copy of the content record with the exception of the Publish File

Name, which is incremented to ensure that the new content record Publish File Name is unique.

Moving a content record

1. From the e-CM Admin page, select Website.
2. Select Content Folders.
3. Select the content folder that contains the content record to be moved.
4. Select the content record to be moved.
5. Select Move. The Move Content pop-up window displays:
6. To move the content record to another content folder, enter the name of the content folder where the content record should be moved and select Move.
7. To move the content record to a different website, select Navigation Menu. Select the website and menu item where the content record should be moved and select Move.

Content History and Recovery

e-CM records and stores every published version of content. You can recall any previously published version of any content document. You can view the previous version, replace a newer version with the previous version, or work with the pervious version as a new document in a different location.

Deleted content goes to a recycle bin located in the content folder that contains the content record. You can drag deleted content to another content folder or use the Move icon on the content producer's toolbar to move the content to a navigation item.

Note: You can revert or retrieve content items such as HTML, links, and uploaded files. You cannot revert or retrieve tagged pages.

When you select the Versions icon on the advanced content producer's toolbar, a pop-up window displays the earlier versions of the current content record.

The pop-up window lists every version of the content that was ever published in a direct line back from the currently selected content record.

Note: You can make a new version of a content record by recovering an older version as a new content item. These branches will not be shown in the content history of the original content record, but will instead have their own content history since this content is now a new content record.

You can preview any prior version of the content, view the content properties for the content, revert the current published or working version to any prior version, or retrieve any version to create a new content item (and branch). Once an item has been retrieved or reverted it can be edited. Archived versions cannot be edited.

To revert a content record to an earlier version

1. From the e-CM Admin page, select Website.
2. Select Content Folders.
3. Select the content folder that contains the content record to be reverted.
4. Select the content record.
5. Select Versions.
6. In the Content History window, use the preview buttons to determine the version to which you want to revert.
7. Select the Revert icon displayed to the right of the desired content record's name. A second pop-up window displays.
8. Select overwrite current content to overwrite the current content record and revert to the selected previous content version, or select create a new content to insert the select previous content version into the navigation item or folder you are working in.

Working with Content Folders

When you select a content record on a navigation item's properties page, the content record properties display. Content records display at the bottom of the navigation item's properties page. Most navigation items contain one or more content records. Each content record has a properties page.

The properties page for a content record contains the following sections:

- Content properties for the content record
- Workflow management
- Current items
- Current tags

Content folders are used to store items that will be displayed by tagged pages; items in content folders are not directly displayed on the website. You can create new content folders and content records on the Content Folders page. New content records can be previewed before they are published, but they are not visible on the front end until they have been published. You can modify content folders and content records before or after they have been published.

When a content folder is selected, the content records contained in the folder display on the right. The icons on the right indicate the type of content that the record contains.

You can modify the folder placement and hierarchy by dragging and dropping content folders.

Note: If you need to move a sub-folder to the root level, drag and drop the folder onto the folder icon that displays to the left of the Content Folders heading above the list of folders.

Individual content records can be in one of the following states:

- Published - Published content has been published at least once and has not been changed since it was last published. If no status indicator is displayed, the content is in the published state.
- Working - Working content is indicated by a red light. Working content is currently being edited, but has not yet been approved for publication. A new content record is always in the working state when it is first created. Any previously published content is placed in the working state when a user begins editing the content.
- Pending Approval - Content that is pending approval is indicated by a yellow light. This indicates that a content producer without content approver authority has finished creating or editing the content and has requested approval for the content.

- Approved - Approved content is indicated by a green light. Approved content is ready to be published.

Requirements for setting content record properties

- You should specify a meaningful title in the Title field, since this is the title that is used for any links that point to the content record if it is retrieved by a tagged page or if there is more than one content record in a navigation item. The title is also indexed and searched by the internal site search engine and by external commercial search engines. The title should be one that you want your users to see, and should be a brief and meaningful description of the content.
- The default Publish File Name is the title with any special characters removed and all spaces replaced by underscore (_) characters. You can change the Publish File Name if needed.
- The (future) Publish Location is an absolute path to the location where the content record will be published. This is the location where e-CM places the files when the content record is published. The (future) Publish Location is automatically determined by the system and cannot be changed.
- The Description/Summary is seen by website visitors and is also used by the internal site search engine and by external commercial search engines. You do not have to enter a description or summary, but it is recommended that you include a description or summary for each content record.
- The description in the Description/Summary field on the Content Properties page can be used for the search engine, displayed on tagged pages, and to display if a list of links or a “combo view” is selected for a navigation item with multiple records.
- The content record's initial publication date displays in the Date of Publication field on the Content Properties page. The content record's most-recent publication date displays in the Published Date field on the Content Properties page.
- To display the content without the typical navigation and design elements in your normal pages (for example, the breadcrumb trail), uncheck the Display within the template box.

You may want to disable this option, for example, if you content record displays a form or a letter from a board member or other content in which standard navigation and design elements would be inappropriate. You do not need to disable this setting with respect to files or links. For example, if you create a link to the New York Times website, e-CM will not attempt to display this site inside your template. Also, if the content record contains only a file (for example, a .jpg or .pdf file), the navigation link will not attempt to display the file within the template.

- If your site features integration with your membership database, enabling the Content is for specific groups only option causes a multi-select box to display, allowing you to select which membership types may view the content record.

  Recommended best practices for setting content record properties

- You can copy the location in the Publish Location field on the Content Properties page. This can be useful for linking from elsewhere on the site.

Understanding Keywords and Metatags

If you enter keywords for your content, the keywords do not appear on the front end. They are used by your site's internal search engine to find content. There are two reasons for using keywords.

If you have a document that does not contain a specific word or phrase that a user might use to search for the document, you can add this keyword. For example, if you have a document about tax policy that does not actually contain the phrase “tax policy”, you can enter “tax policy” as a keyword so that a search for this phrase will list the document.

You can also use keywords to change the position of a document when a user searches for a particular word or phrase. Your site's internal search engine sorts results by word occurrence (for example, a document that contains several occurrences of the phrase “tax policy” will be higher on the list of search returns than a document that only contains one occurrence of this phrase). If you want to ensure that a particular document is the first one that users see when they search on “tax policy,” you can enter the phrase as many times as needed, with each phrase entry separated by commas.

External search engines such as Google generally use your descriptions, but ignore your keywords.

The description and keywords properties both generate “meta tags” which are used by search engines to classify pages. The subject of meta tags and search engines is extremely complex and has spawned its own industry of consultants, but Search Engine Watch (http://searchenginewatch.com/webmasters/meta.html) includes a brief and opinionated description of the description and keywords meta tags.

Note: No major external search engines (such as Google) use keyword meta tags, but your site's internal Verity™ search engine does use them, so keywords are an effective way to ensure that a page is retrieved by your site search.

Managing Content Folders and Content

To create a new top-level content folder

1. Select Website.
2. Select Content Folders.
3. Select Create a new top level folder.
4. Enter the name for the new folder.
5. Select Go.

To create a new nested content folder

1. Select Website.
2. Select Content Folders.
3. Select the Create New Folder icon displayed to the left of the folder that will contain the new folder.
4. Enter the name for the new folder.
5. Select Go.

To edit a content folder

1. Select Website.

2. Select Content Folders.
3. Select the Edit icon displayed to the left of the folder that is to be edited.
4. Edit the folder's Properties and Workflow Management sections as needed.
5. Select the Save icon on the content folder toolbar.

To add content to a content folder

1. Select Website.
2. Select Content Folders.
3. Select the content folder that will contain the new content.
4. Select the Create new content icon.
5. Enter the information for the content in the Title, Content Properties, Workflow Management, Current Items, and Current Tags sections.
6. Select the Save icon on the content record toolbar.

To add a link to a content record

1. Select Website.
2. Select Content Folders.
3. Select the content folder that contains the content record to be edited.
4. Select the content record.
5. Select the Insert New Link icon in the Links section of the Current Items section.
6. Enter the link's URL in the URL field in the Current Items section.
7. Enter the name to display for the link in the Link Name field.
8. Select Save.

To edit a content record

1. Select Website.

2. Select Content Folders.
3. Select the content folder that contains the content record to be edited.
4. Select the content record.
5. Edit the content record information in the Title, Content Properties, Workflow Management, Current Items, and Current Tags sections as needed.
6. Select the Save icon on the content record toolbar.

To upload a file to a content record

Note: e-CM allows users to upload approximately a dozen file types, but does not place any other constraints on uploaded files. For example, a user with upload permission can upload a 4000- by 2000-pixel graphic file, but this would normally not be recommended.

1. Select Website.
2. Select Content Folders.
3. Select the content folder that contains the content record that will contain the uploaded file.
4. Select the content record that will contain the uploaded file.
5. Select Browse in the Files section of the Current Items section. A browser window displays.
6. Browse to the folder that contains the file to be uploaded and double-click the file or select the file and select Open).
7. Enter the file description in the Description field.
8. Select Save.

To preview a content record

1. Select Website.
2. Select Content Folders.
3. Select the content folder that contains the content record to be previewed.

4. Select the content record to be previewed.
5. Select Preview.

To publish a content record

1. Select Website.
2. Select Content Folders.
3. Select the content folder that contains the content record to be published.
4. Select the content record to be published.
5. Select the Publish icon. The publishing status displays in a pop-up window.
6. After the content publishing has been completed, select Close Window on the pop-up window.

Note: You must disable any pop-up blockers (such as the Google toolbar) for the publishing status window to display.

To delete a content record

1. Select Website.
2. Select Content Folders.
3. Select the content folder that contains the content record.
4. Select the Delete icon displayed to the right of the content record. A confirmation message displays.
5. Click OK.

To sorting files and links

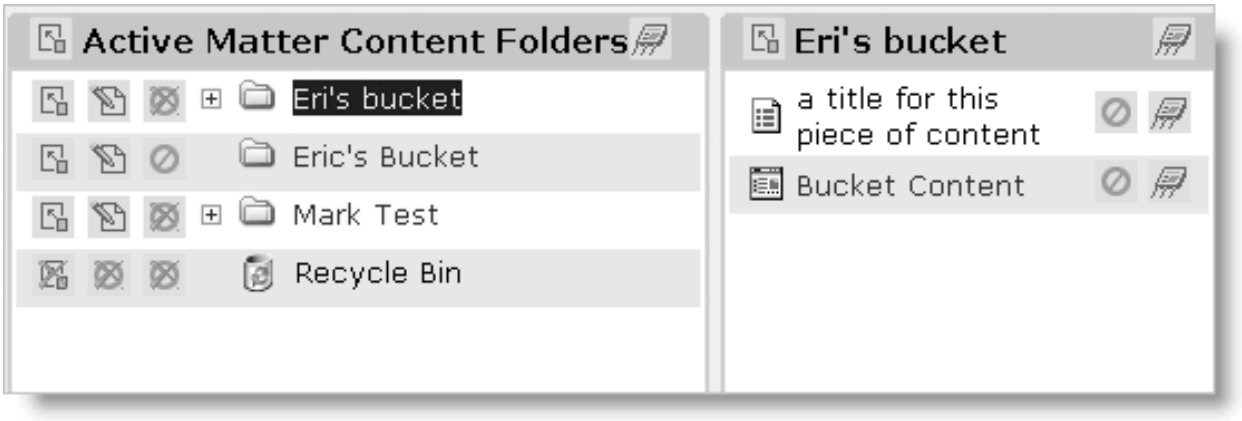
Links and files display on the website front end in the same order that they display on the back end. You can move the links or files on the back end and then republish the content record to change the display order.

Note: To move a link or file to the top of the list, you must first move the file to the second place in the list, and then move the file that is first in the list to second in the list.

1. Select Website.
2. Select Content Folders.
3. Select the Move this file icon displayed to the right of the file to be moved.
4. Select the Below this file icon displayed to the right of the file after which to place the moved file.

To delete a folder using drag and drop

To delete a folder via drag-and-drop, you drag the folder to the “Recycle Bin” at the bottom of the folder list.



Content Folders Showing Recycle Bin

1. Click and hold down your mouse button on the folder icon of the folder you wish to move (not on its name).
2. Drag the folder to the Recycle Bin icon, which appears at the bottom of the list of folders.
3. When the delete icon turns to an insert icon, let go of your mouse button.
4. When you see the confirmation message, click OK to delete the folder. If the folder is not empty, you will see a message telling you that the folder cannot be deleted until all content and child folders are removed.

To publish content in folders

There are three ways you can publish content in folders, all of which use the familiar publish ( ) button.

- You can publish all approved (“green light”) content in all folders.
- You can publish all approved content in a specific folder.
- You can publish an individual approved content record.

You probably won't have many reasons to publish all content in all folders, but you can do so if you are a member of Master Admin authority group by clicking on the publish button on the top bar of the left-hand pane of the folders interface.

Using the Recycle Bin

The Recycle Bin ( ) is the destination of all content records deleted from navigation items or content folders. This is a useful thing to know in case someone throws out a content record by mistake.

To recover content from the Recycle Bin

In order to retrieve content from the recycle bin, you will need access to content folders and also to the advanced version of the content producers' toolbar (since only the advanced version contains the Move icon). You must also be a member of the Master Admin group.

1. Go to the content folder interface and click on the name of the recycle bin. The page will re-load and all the content records in the recycle bin will be listed in alphabetical order.
2. Select the content record you want to recover to open the properties page for the content record.
3. You will note that nearly all of the icons on the toolbar are grayed out, but not the Move icon. If you do not see the Move icon, make sure that you have selected Advanced as your toolbar option.
4. Click the Move icon on the toolbar.

5. When the Move Content pop-up form displays, select Navigation Menu or Content Folder as your general destination.

- If you select Navigation Menu, select a website and menu item.
- If you select Content Folder, select a folder.

6. Click the Move icon at the bottom of the pop-up form.
7. If you moved your content record to an item, you will be taken to the item's properties page.

   Note: In the “Move Content” form, only items and folders which are owned by authority groups you belong to will appear. Unless you are a member of the Master Admin “super-group” you cannot move content to an item or folder owned by a group you do not belong to.

8. If you moved your content record to a folder, you will be taken to the content folder interface with the destination folder selected to show content records.
9. In both cases, your recovered content will now be in a working (red light) state. You may now approve, edit, and publish normally. Note that the record will not appear on the front end of the website until it is approved and published.

Destination Selected, Ready to Move

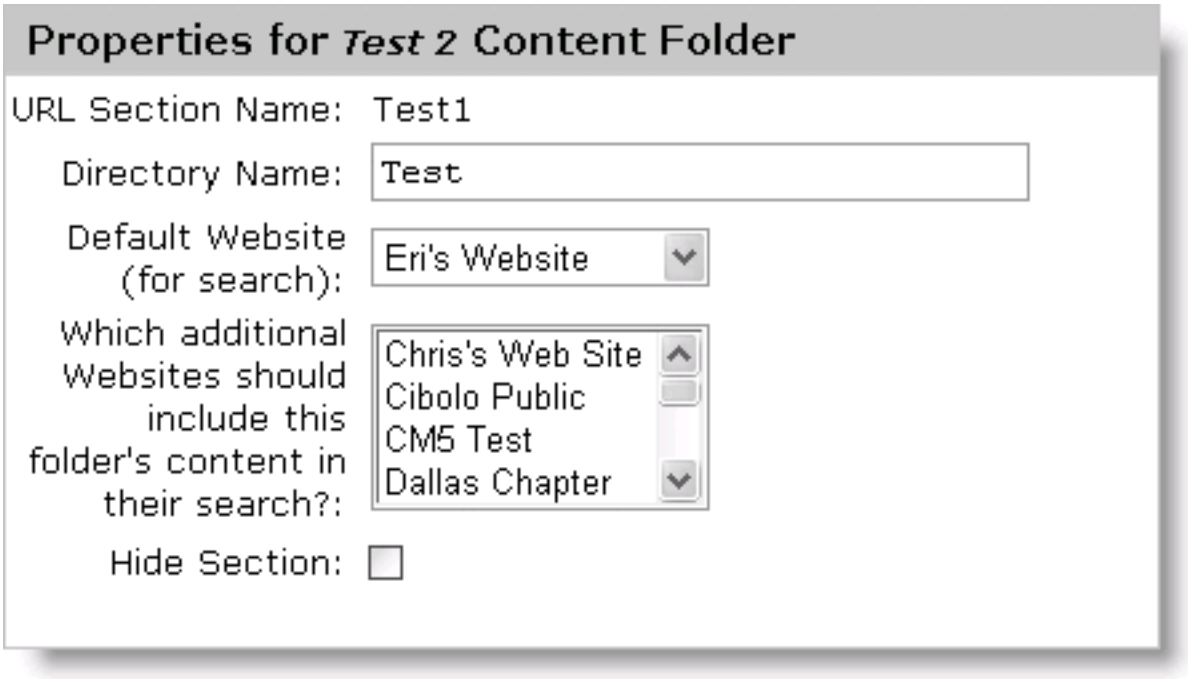
Note: You can drag content from the recycle bin to a content record, but you must open content in the recycle bin and move it in order to move the content to a navigation item.

Reviewing Content Folders Properties Page Settings

Like navigation items, individual content folders have a properties page which includes various settings which control the behavior of the folder. Since they are not linked to site navigation, the properties page is simpler and shorter than that of a navigation item, but it also includes some settings not found on a navigation item.

To view a folder's Properties page

- To view a content folder's properties page, you will need “Nav/Folder Editor” permissions in the authority group, which owns the folder or in the Master Admin “super group”.
- To view a content folder properties page, select the Edit icon to the left of an individual folder.



Content Folder Properties page

Title

The title of the content folder is what will appear to administrators in the administrative interface. It is not displayed to users.

URL Section Name

This is a unique character string generated by content manager to ensure that the content in this folder will be published in a unique location. It cannot be changed by the administrator and is not displayed to users.

Default Website (For Search)

If you are supporting multiple websites, you may select a default website for which this folder's content will be “native” content (and thus ranked higher in search returns). The folder must also be owned by an authority group with is active for the default website.

Additional Websites

Any websites selected in the multi-select list underneath the default website will also include content folder in their site search.

Hide Section

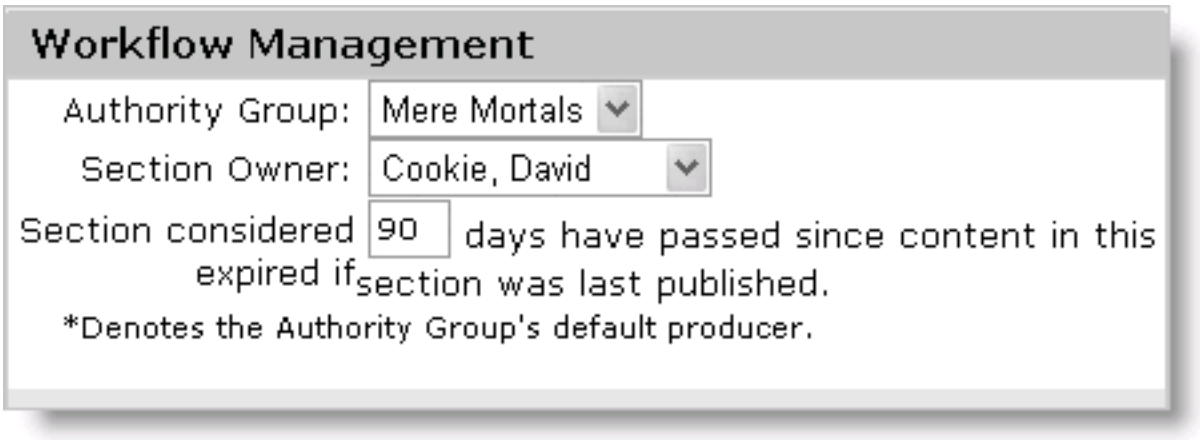
If the “Hide Section” box is checked, content in the folder will be hidden from both tagged pages and site search.

Content Folder Workflow Management

The workflow section in a content folder properties page determines who can access the content and who will receive e-mail notifications if the folder's content is not re-published.

Authority Group

The authority group drop-down list determines which users will be able to access content in the folder. Here, the “Mere Mortals” group owns the folder, so in order to access the folder's content, a user would have to be a member of that group (or the Master Admin super-group).



Content Folder Workflow

Note: The folder must also be owned by an authority group which is active for the default website, so the drop-down list will include only authority groups from the selected default website.

Section Owner

The section owner, who must be a member of the selected authority group, is the person who will receive e-mail notifications if the content goes more than the selected number of days without being refreshed.

Expiration Date

The expiration date determines how many days must go by without re-publication before e-CM begins sending e-mail notifications to the section owner. “Expired” folder content is not deleted and is still visible to web users.

Security Assignments and Content Folders

Regardless of what authority groups a user may belong to, they cannot access content folders without the “Content Folders” security assignment permission.

Security Assignment Showing "Content Folders" Permission Checked

Content Record Icons

The icons shown to the left of the content record's name in the right pane of the content folder indicate what type of content will be found in the record.

The right hand pane lists all of the content items in the folder highlighted in the left. Items in this pane have the following properties

- Icons are as follows:
- - HTML
- - Excel™ Spreadsheet
- - Form
- - Graphic file (e.g. gif or jpeg)
- - Link
- - Combo-mode Content (more than one type of content, e.g. html and files).
- - PDF Document

- - QuickTime™ Movie
- - Word Document
- The traffic light icons on the right indicate the current publishing state of the item:
- Content is being worked on
- Content is pending approval
- Content is approved and ready to be published
- Clicking on the icon next to an individual piece of content deletes the piece of content (after the user confirms the action via a JavaScript confirm pop-up).

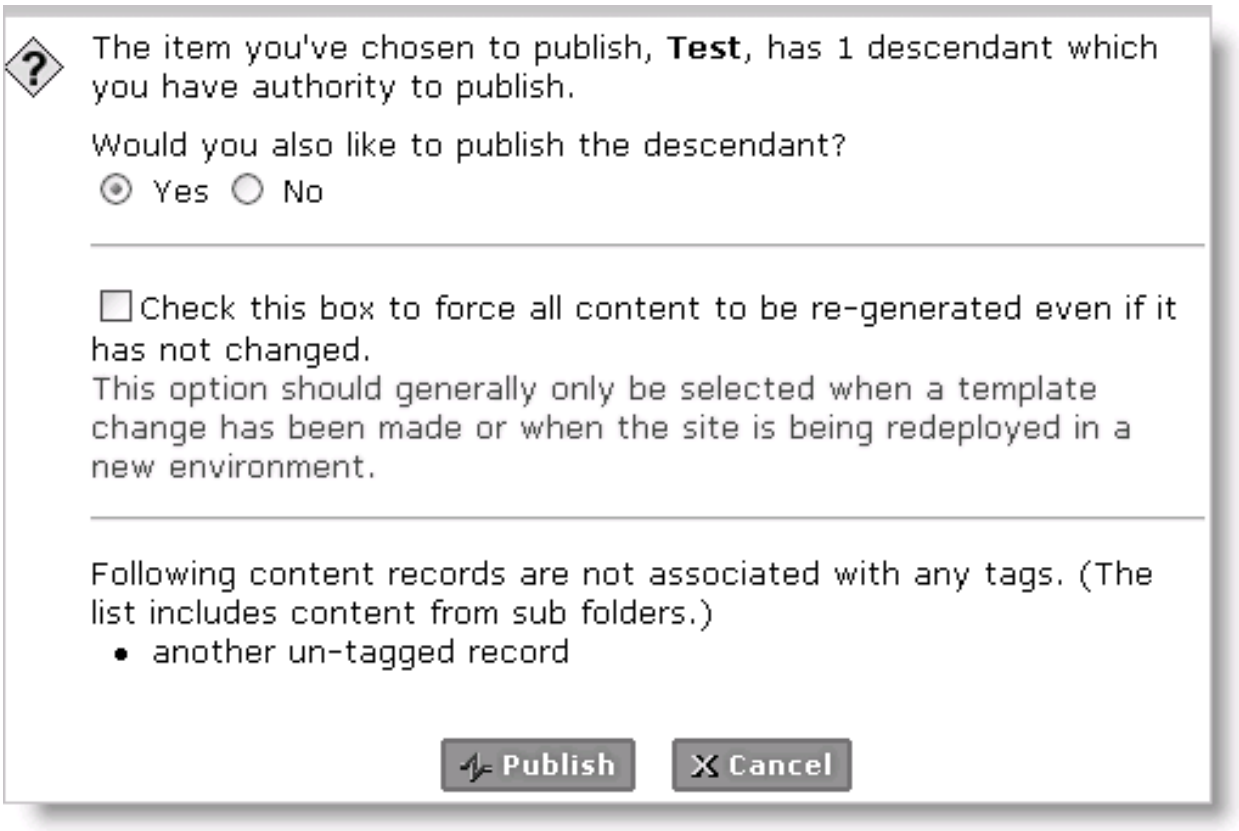
Publishing in Content Folders

Publishing in Content Folders is relatively straightforward:

- Clicking the Publish icon to the right of the content item publishes that content item.
- Clicking on the Publish icon at the top right of the pane publishes all content (required Nav/Folder Editor permission in the authority group which owns the folder or in the Master Admin group).

The No Tags Advisory

When you publish all the content in a folder, e-CM asks two familiar questions seen in navigation items, whether you want to publish the child folders and whether you want to re-publish all content even if it has already been published. It also advises you if there are any content records in the folder or its child folders which have not yet been tagged. There is nothing wrong with publishing un-tagged records in a content folder - unless you expect them to show up on tagged pages (instead of only site search).



Folder Publish Screen Showing "No Tags" Advisory

Working with Task Lists

The task list helps users keep track of content that requires some action on their part. The task list is divided into four queues:

- The content that the user is working on
- The content that is awaiting approval
- The user's content that will expire soon
- The content that the user has been requested to change via surf-to-edit

Note: Simple websites do not include the task list functionality. If the user has access to both simple and advanced websites, only the content from advanced websites will be listed in the task list queues.

Content record titles display as links in the task list queues. These links go to the editor or the content properties page properties, depending on the specified preference of the user.

Any content producer can access their own task list. Members of a content authority "super group" can also view other user's task lists.

Managing the Task List

To access the task list

1. From the e-CM Admin page, select Website.
2. Select Task List.

The following sections display in the user's task list.

Content You are Working on Queue

The Content You Are Working On queue lists all content that is in Working status, where the last user to modify the listed content is the currently logged-in user. Preview and Approve (or Submit for Approval) icons display to the right of each content link.

Content Awaiting Your Approval Queue

The Content Awaiting Your Approval queue lists all content with a Pending Approval (approval requested) status which the user has the authority to approve. Preview and approval buttons display to the right of each content record link.

Note: If more than one user has the authority to approve a particular content record, the record may display in more than one user's Content Awaiting Your Approval queue.

Content Expiring Soon Queue

The Content Expiring Soon queue lists all content owned by the user which expires in the next n days (where n is the number of days determined by the content producer preference). Preview and Approve or Publish icons display to the right of each content record link.

Content Requests Queue

If you select the surf-to-edit link but do not have edit privileges, you can send a request to the content producer (the user currently working on the content or the user who most recently worked on the content). When you send a request, an e-mail message is sent to the content producer and the request displays in the user's Content Requests queue.

The Content Requests queue includes the following:

- A Delete icon (to delete the request)
- A link to the content (the name of the content record)
- The name of the person who made the request; when selected opens a new e-mail window
- A Preview icon
- A Mark this as complete icon (to remove the request from the queue)
- A Reassign icon (to forward the request to another content producer)

To reassign a request to another producer

To reassign a request to another content producer:

1. Select the Reassign ( ) icon to the right of the request text.
2. Select the Send to drop-down list and select the person to whom you wish to reassign the request.
3. (optional) Add to or change the original request message.
4. Click Send. It will now appear in the selected user's request queue.

Note: When you reassign a request, e-CM will also send an e-mail to the person you have reassigned it to.

Reviewing Other Users' Tasks Lists

If the user is a member of a “super group” such as Master Admin, the user can view any user's task list. This feature is not available for users who are not in a “super group”.

Note: Personal preferences for the logged-in user are used, regardless of which user's task list is being viewed.

1. From the e-CM Admin page, select Website.
2. Select Task List.
3. Select the user whose task list you want to view from the View task list for drop-down list.
4. Select Refresh.

Using the Ektron Editor

The Ektron WYSIWYG ("What You See Is What You Get") Editor allows you to create and edit HTML files. Before you install the Ektron WYSIWYG Editor, be sure to review the following section before you begin the installation process.

Note: Use the version of the eWebEditPro editor that is bundled with youre-CM release. Other versions may be incompatible with e-CM.

Read This First

The WYSIWYG editor must be installed on each machine that you use it on. The installation is simple and easy, generally takes no more than a minute or two (a little longer on slower connections), and does not require you to restart the machine.

However, if you are working in a network environment where you do not have the authority to install software, you will have to contact an IT person to either login as an administrator and do the installation for you, or to temporarily grant your login permissions to install software.

Note: You do not have to install Ektron separately for each login that may use a machine. Once the software is installed, it will work for any login.

If the installation fails, check to see if:

- You have permission to install software
- Your site has a valid Ektron license

- Your firewall prevents you from installing Ektron over the network
- You have pop-up blocking software installed

Firewall Issues

If you have a highly protective firewall installed on your network, you may well have a problem doing the normal installation, which simultaneously downloads and installs the Ektron editor from the web.

Pop-up Blocker

If you have pop-up blocking software on your computer, the installation page will not appear. This will prevent you from installing the software. Be sure to disable pop-up blocking software before you install.

Note: Since various parts of the administrative interface depend on pop-up windows, if you have pop-up blocking software on your computer, it will effectively disable the interface.

Installing the Ektron Editor

Make sure your browser's security settings are set to Medium or below to download and run the ActiveX controls which make Ektron work.

Note:

Note: If you are an IT person and you just want to install the editor without going into e-CM, you can obtain a URL from your project manager or consultant that will allow you to directly access the installation file. To start the installation process, you simply add the file path to your base URL and press Enter.

1. Login to the e-CM Admin page. Make sure you have the appropriate account permissions (authority to edit content is adequate). You can force a login by adding “AdminTemplate.cfm” to your base URL.

2. Select Website> Site Navigation.
3. Select a site navigation item.
4. Scroll down to the Content Records section and select a content record in which you have authority to edit.
5. Scroll down to the Current Items section of the content record properties page.
6. Select Edit or Create to open the basic HTML page.
7. At the bottom of the page, there are two links available to install eWebEditPro (Ektron Editor). Select a link to start the installation process.
8. Click Install Now.

   Note: During the installation process, several security alerts may display. If the alerts are from Ektron or Microsoft, click Yes.
9. Click Install Now to begin the installation process. If the installation is successful, Installation Complete will display.
10. Click Close.

Accessing the Ektron Documentation

To get detailed instructions on using Ektron, you can download the user guide from the Ektron site (Ektron eWebEditPro doc landing page - http://www.ektron.com/ewebeditpro-html-editor.aspx?id=1277). Find the manual for the version of the eWebEditPro editor that is bundled with your e-CM release.

Manuals are available in both PDF and HTML formats.

To determine your Ektron version number, open the Ektron editor and select the Ektron icon (blue “e” button) located on the extreme right of the Ektron editor's top toolbar.

Using the Ektron Editor with HTML Files

The Ektron Editor allows you to create and edit HTML files to be used with e-CM. There are several differences between using Ektron and writing your own HTML. If you wish to continue writing your HTML, please consider the following:

- HREFs to external sites - Make sure any HREFs to external sites contain absolute URLs (starting with http://).
- Internal links - Make sure to verify internal links. The Copy to Clipboard feature may be useful when inserting internal links.
- Images - Periodically make a local copy of your site's entire /Image directory (including subdirectories) to a location relative to your HTML editing directories. You can then create a relative link to your images. For example, <IMG SRC-C="../../Images/Logos/2006/myImage.gif">. When you are ready to upload the file, you can do a global replacement of the relative path with the appropriate absolute path to your site's Images folder.

  For further details, refer to the Ektron Editor documentation (Ektron eWebEditPro doc landing page - http://www.ektron.com/ewebeditpro-html-editor.aspx?id=1277).

  Reviewing Cascading Style Sheets

  Your Website will be controlled by cascading style sheets; therefore, any special font or paragraph specifications in the HTML that are not in the style sheet will be ignored by e-CM.

  Using Span Tags in HTML

  If you learned to write HTML before the widespread use of HTML, you may be used to using font tags (for example, <font size=+1 face=arial>) to create specific effects. The bad news is that you generally cannot do that in a site with cascading style sheets because attributes for the font tag (including size and face) are already specified in the style sheet. The good news is that with the use of the tag, you can access any of the many styles in your cascading style sheet and use them in your text. For example, the standard CM style sheet (located at /Styles/Styles.css) contains a style called “Error” which is generally a bold red font face. If you wanted to use this style in your HTML document, you would type something like the following in HTML view, not in WYSIWYG view:

  This is a really important message that should appear in bold red

This book will not provide a detailed explanation of cascading style sheets. If you want to download a copy of your style sheet, select View> Source from your browser's main menu. Look for a line similar to this:

<LINK REL="StyleSheet" HREF="/Styles/Styles.css" type="text/css">

The text after HREF specifies the location of your style sheet. To access your style sheet append your base URL address with HREF listed (for example, /Styles/Styles.css) and press Enter.

Depending on how your site is designed, and which pages you are viewing, you may see more than one style sheet (for example, a general style sheet and a specific one for the particular page you accessed).

You may not be able to download your style sheet if it is protected on your network. The style sheet should provide enough information about the styles that are available to you. For example, here is an excerpt from a style sheet defining the appearance of the heading level four <h4> tag:

h4 {font-size: 13px; color: #000000;}

Note: If you have access to the /Styles/ directory and you modify cascading style sheet, keep in mind that any change you make to a style will affect the way that style looks on your entire site. Be sure to make a back-up of the style sheet in its original form before you start.

Working with Images

It may be difficult to open large image files on the Web. We recommend that you upload gif or jpeg (or jpg) images files. These file types generally produce smaller files that will be easier to render on most web browser. Try to avoid uploading tiff image files.

Note: Make sure the image file name does not contain spaces. If the name contains spaces, rename the file and remove the spaces.

To insert a new image

1. Open your HTML file in the Ektron editor and position the cursor where you would like to insert the image.

2. Select the Picture icon on the editor toolbar to open the Picture Properties form.
3. Click Select New File to open the Image Manager window.

   To insert a new file (not located on the server):

- Click Browse to navigate to the image location.
- Select the image file.
- Click Upload Image from the Image Manager window. A preview of the image will display in the upper-right pane of the Image Manager window.
- Click OK to return to the Picture Properties form.

  To insert a file from the Image Manager:

- Expand the folder and select the image file. A preview of the image will display in the upper-right pane of the Image Manager window.

4. Click OK to insert the image.

   To delete an image from an HTML file

   Use the following procedures to delete an image from an HTML file, but leave it on the server:

1. From the Ektron editor (WYSIWYG view), select the image.
2. Press the Delete key on your keyboard.

   To delete an image from the server

   Use the following procedures to remove an image from the server and the HTML file:

1. From the Ektron editor (WYSIWYG view), access the Image Manager.
2. Open folders as needed to find the image you wish to delete.
3. Select the image.
4. Click Delete.
5. Click OK when the confirmation window opens.

Note: Do not remove an image from the server that is currently included on your Website.

Altering Image Properties

The Picture Properties form allows you to resize images and change their ALT (mouse-over) text.

There are a number of less frequently used image attributes on the Picture Properties form as well. These include:

- Border: You can add a border around an image. The border width is specified in pixels and the border color is black.
- Alignment: You can specify a number of alignments for your image (including left and right). Note that these alignments will generally override any alignments you have specified within a table.
- Spacing: You can add a horizontal or vertical space around an image. Values are in pixels.

Consider the following when resizing images:

- Web images can be made smaller than the actual size, but rarely look good if made larger.
- Since you are dealing with length times the width, you need to be aware that any change you make will be multiplied. For example, if you make the width half the original value and the height half the original value, the resulting image size will be one-fourth as large, since ½ * ½ = ¼.
- Proportion is critical. If you reduce the height of an image by half and the width by a third, it will look very strange. If the original size divides easily (for example, an image 200 pixels wide and 100 pixels high), you can probably do the re-sizing math in your head. If the image has an original pixel size that does not lend itself easily to division, use a calculator to make sure you reduce both dimensions by the same percentage.
- When you resize an image, you are not changing the dimensions of the original image on the server - you are only making it look smaller in this particular place.

- It is not generally a good idea to work with extremely large images and then resize them in HTML. Large files are still large files, and they will still display slowly to users with slow Internet connections. It would be better to have the actual file edited to a more appropriate size.

  To resize an image

1. From the Ektron editor (WYSIWYG view), right-click the image.
2. Select Picture.
3. Click Reset. The Width and Height values are restored to the actual image values in pixels.
4. Change the Width and Height values to the pixel size you want displayed.
5. Click Preview.
6. Click OK.

   To add “Alt” text to Images

   Alt text is the text that appears when you place your mouse cursor over an image. This feature is helpful to those users with impaired vision who are use text readers. By default, the Ektron editor will automatically insert the word Image as the Alt text. Use the following procedures to add descriptive text:

1. Right-click on an image and select Picture to display the Picture Properties form.
2. In the Title, replace Image with your preferred Alt text.
3. Click OK to make your changes and close the form.

   Note: The WYSIWYG editor will not display Alt text when you place your mouse pointer over an image. Alt text will appear when you preview your HTML file or content record using the preview buttons.

Images and Directories

To place an image into a specific folder

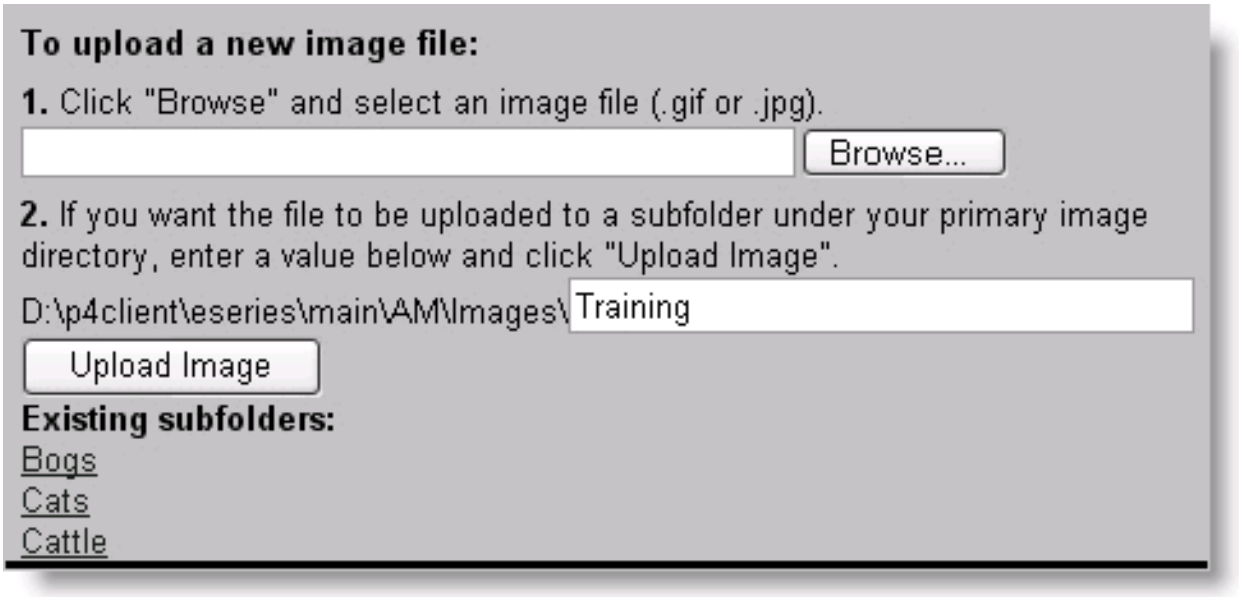
If you wish to place an image in a particular folder when you upload it, do the following:

Note: You will not be able to rename or delete folders in the Image Manager once they are created.

1. Follow the instructions for inserting a new image, but do not click OK.
2. Select or enter a folder in which you want to upload the image.

- To select an existing folder from Image Manager, select the folder.
- To create a new folder, enter the folder name in the path field located above the Upload Image button.
- To create a new sub-folder, enter the folder name in the path field located above the Upload Image button. Add a “\” after the folder name and enter the sub-folder name.

  Note: Please careful not to misspell the folder name(s), because you will not be able to remove the folder once it is created.



Upload to a Specific Directory

To create a new sub-directory

Creating a new sub-directory to place your image into is easy. If you want to create a new main directory (right under “Images”):

1. Follow the step-by-step instructions for uploading a new image, but before you click OK, type the name of the new main folder you would like to create into the box right after "...\Images\".
2. Continue with your upload in the normal manner. When you click Upload Image, the new directory will be created and the image will be placed in it.

If you want to create a new sub-directory (a "child" of one of the existing directories):

1. Follow the instructions for uploading a new image, but, before you click OK, click on the link with the name of the parent folder you want to create your new sub-directory in. Alternatively, you can click on the folder icon of the parent in the upper-right portion of the interface.
2. The directory path box will now be populated with the proper sub-directory information for the parent folder. Add a "\" and then the name of your new folder (no spaces) after the automatically inserted directory information.
3. Continue with your upload in the normal manner. When you click Upload Image, the new subdirectory will be created and the image will be placed in it.

Using Image Manager Directly

You don't have to use Image Manager from within an HTML file. It can also be launched by clicking the Sites button in the "Website" portion of the administrative interface, then clicking the "Image Manager" link.

When launched this way, Image Manager can perform all of its usual functions except placing an image into a specific HTML file. You can look through your image directories, create new directories, upload images and delete images.

What You Can't Do With Image Manager

Image Manager will not allow you to re-name or delete directories. It will not allow you to move sub-directories from one parent to another. It will not allow you to re-name files. Why? Because doing so is likely to cause problems with broken image links in your existing pages.

Breaking the Rules in Image Management

If you've read the limitations immediately above and are thinking “I'm an experienced web-master and those rules should not apply to me!” we're now going to tell you how to break all the rules. Remember, those deliberately designed limitations in Image Manager protect you from causing broken image links. If you do an end-run around Image Manager (for example, to clean out a large number of old unused images when your site is first set up), it's your responsibility to ensure that you don't cause problems.

So here's how you do it: Assuming you have access to your webserver, select an existing image with the Image Manager and right-click on it to get its properties in the upper-right preview pane. File paths vary somewhat, but you should be able to “reverse engineer” the actual directory location from the URL in the properties page. If for example, the URL is: http://www.mywebsite.org/Customer/AM/Images/myPicture.gif

then you know that your images are at WWW/Customer/AM/Images. Once you get there, you can edit, change, or move anything you like, and those changes will be reflected in Image Manager next time you open it. Remember to be careful.

Another method is simply to look at the page information to the left of Upload Image.

Linking to Other Documents

You can include links to a page on the web or to another page on your Website. It is normally safe to include a link to a file that is set to open in a new window. When including links, make sure to consider the following:

- Avoid linking to content records in Content Folders - Content Folders should be used for content that will be retrieved by tagged pages and site searches. Because they are outside the navigation structure defined by Navigation Items, your template will not know which navigation buttons or links to display if a user clicks through directly to a content record in a folder.
- Avoid linking to individual files in Content Folders - Content Folders will be renamed, moved, and reorganized as your content grows; therefore, causing links to break.

The following situations can cause also links to break:

- Changing the URL Section Name of a navigation item.
- Changing the Directory Name of a navigation item.
- Replacing a file with a new file with a different name and/or file extension.
- Changing parent-child relationships in a navigation item.
- Moving a navigation item.

Inserting Links

You can create external links to files located on a different website or you can create internal links to files on your website. You can also choose a target frame (window) where the link will open.

To create a link to an external web page

1. Place your cursor in the HTML file where you wish to insert the link.
2. From the Ektron editor (WYSIWYG view), click New Hyperlink.
3. Enter the full URL starting with “http://” in the Link field.
4. Enter the Text you want the user to see when they see the link on the page.
5. Select the Target Frame to display the link.
   - Same Window (_self) - displays the linked file in the same browser window
   - New Window (_blank) - displays the link file in a new window
   - Parent Window (_parent) and Browser Window (_top) - relate to sites with frames
6. Click OK.

To create an internal link

To create a link to an external web page:

1. Place your cursor in the HTML file where you wish to insert the link.

2. From the Ektron editor (WYSIWYG view), click New Hyperlink.
3. Enter the full URL starting with “http://” in the Link field.
4. Enter the Text you want the user to see when they see the link on the page.
5. Select the Target Frame to display the link.

- Same Window (_self) - displays the linked file in the same browser window
- New Window (_blank) - displays the link file in a new window
- Parent Window (_parent) and Browser Window (_top) - relate to sites with frames

6. Select the Navigation Menu Section drop-down list and select the navigation item (button or link) you want the user to see.
7. Select the Content Record drop-down list and select the content record.
8. Click OK.

   Note: The Navigation Menu and Content Record drop-down lists only appear when you are creating new links, not editing existing ones. If you need to edit an existing internal link, select the Remove Link icon and then insert a new link.

   To preview links

   After inserting or editing a new link, it is important to preview the link to make sure the link is correct and that it opens correctly. The link should be previewed from the Content Record Properties page.

   To insert a link with the Copy to Clipboard feature

   You can also use the Copy Publish Path to Clipboard icon, which looks like a small clip-board ( ) to copy the link information from a file to your system clipboard. You can click New Hyperlink to open the link editing form and then press Ctrl+V to paste the information into the link form.

   This icon appears in the following places on the e-CM's interface:

- To the right of each content record in the list of content records at the bottom of the navigation item properties page.
- To the right of an individual HTML files within content records, on the content record properties page
- To the right of each file in a content record

1. Select the Copy Publish Path to Clipboard icon.
2. Select the New Hyperlink icon in the WYSIWYG editor to open the link editing form.
3. Press Ctrl+V to paste the path information into the Link input on the form.
4. Enter the text for the link.
5. Click OK.

   Note: You can also use the Publish Location feature to copy path information for a content record to your system clipboard. Click on the link to the right of (future) Publish Location field as you would on the clipboard icon and then paste the information into your link forms.

Creating Bookmarks (Internal Links)

Bookmark links allow users to jump to the proper place on a page. For example, you may want to create a bookmark link that goes from the top of the page to a section heading near the bottom of the page.

To insert a bookmark

1. Position your cursor where you want to insert a bookmark.
2. Select the Insert Bookmark icon (blue flag to the left of the New Hyperlink icon).
3. Enter the bookmark name (spaces will automatically be replaced with an underline).
4. Click Add.

To insert a link to an internal bookmark

1. Enter and select the text you wish to use for the link.

2. Select the New Hyperlink icon.
3. Select the Quick Link drop-down list and select the bookmark.
4. Click OK.
5. Save the HTML file and then select the link to test it.

Note: After inserting a new bookmark link, it is important to preview the link to make sure the link is correct and that it opens correctly. The link should be previewed from the Content Record Properties page.

To insert a link to an external bookmark

1. From the website, select the bookmark link. A link to the bookmark will display in your browser's address bar. The URL address is appended with the # symbol and the name of the bookmark.
2. Copy (Ctrl+C) everything after the # symbol.
3. From the WYSIWYG editor, open the HTML file and place the cursor where you want to insert the link.
4. Select the New Hyperlink icon.
5. Press Ctrl+V and paste the bookmark information at the end of the URL Link.
6. Click OK.

Content Tagging in e-CM

A normal web page that is stored in a site navigation page consists of content that has been created for a specific site navigation item. On the other hand, a tagged page retrieves content based on how the content is tagged rather than based on where the content is located in a site navigation item or content folder. The retrieved content is then displayed on the tagged page. The simplest method to display tagged content is to display a list of links to the content, but tagged pages can also display HTML files and images.

Normal pages in e-CM are static. When you publish a content record, the content is written to a file on the webserver's hard drive. Tagged pages are dynamic, with self-

contained instructions to retrieve content with specified tags and display this content. Tagged pages can retrieve content from site navigation items, but tagged content is usually stored in content folders.

You can create tags and assign these tags to content so that relevant content is automatically included in web pages. This helps avoid unnecessary duplication of content and ensure that all relevant content is included in the appropriate web pages.

Before you can tag content, you must first create the appropriate tags. In order to create useful and meaningful tags, you should analyze your website's current and future content needs before you start actually creating tags.

Anatomy of a Tagged Page

The basic idea of a tagged page is simple: It is a template with instructions that allow it to grab content and display it in a particular way. The mechanics of how pages get put together, though, can be complicated. So we're going to start with a very simple page. We will take a look at the parts of a tagged page as we go, and then talk about them in a little more detail when we're done.

These are the basic ingredients in a tagged page:

- Components are the widgets that grab the content (based on how it has been tagged) and determine how it gets displayed.
- One or more components are held in a display block, a rectangular area in a page that holds components.
- A tagged page is a page containing one or more display blocks.
- The layout (number and arrangement of display blocks) of a tagged page is determined by a page plan.

These are the seven page plans that come with e-CM:

Plan 1 Plan 2 Plan 3 Plan 4 Plan 5 Plan 6 Plan 7

Plan 1 is the simplest (one display block); the other plans have as many as four display blocks, arranged in various ways.

At the most basic level, your tasks to create a tagged page are as follows:

1. Choose a page plan to determine the basic layout of your tagged page.
2. Put one or more components into each display block in that page.
3. Add appropriate tags to the component(s), so that appropriate content will be retrieved.
4. Insert a link to the tagged page in a content record in a navigation menu item (this is how the website visitor will actually see your tagged page).

How Content Actually Gets Tagged

The first and most obvious question is: what gets tagged? You tag content records. Not items, not folders, just content records. As with most other functions in e-CM, you tag content using the content producer's toolbar.

Note: Notice that this means that you don't want to mix items which need to be tagged differently in the same content record - for example, a large group of uploaded PDF files.

To tag a content record

1. Go to the content record properties page.
2. If you have set your preference to require you to click the Modify button before modifying a content record, do so.
3. Click Tag on the content producers toolbar.
4. Select the tags you want to apply to the content record from those on the pop-up form by checking the appropriate boxes.
5. Click the Save and Close button at the bottom of the tagging form.
6. Click the Save button on the content producer's toolbar to save your changes.

Note: If you do not click the Save button on the toolbar as well as the Save and Close button on the tagging form, your changes will not be saved.

Tag Button on Content Producers Toolbar

Tagging Form

Note: Understand that all tags are independent of each other. Selecting a “parent” tagging category does not select all its children (or vice versa). For example, if the animal tag-

ging category contains cat and bird tagging categories, selecting the animal tagging category does not automatically select the cat and bird tagging categories.

How Do The Tagged Pages Know Which Tags to Look For?

If you've been paying close attention, you might notice that we've explained how to tag content, but not how to tell a tagged page component which tags to look for when it searches for content. We'll get to that next when we built the world's simplest tagged page.

Summary

- The process of tagging involves associating pieces of content with tagging categories, which have been chosen to match the overall structure of content in your site
- Tagging allows you to use “smart” pages called tagged pages to retrieve content based on how it is tagged.
- Tagging can also be used to supports site search and personalization.
- Tagged pages are made up of rectangular blocks called “display blocks”
- The arrangement of the blocks is determined by which “page plan” a tagged page uses.
- Each display block contains one or more “components."
- Components are content-gathering engines that grab content based on how the content is tagged and what tags the components have been instructed to look for.
- Content is tagged on the content record properties page by clicking the tag button on the content producer's toolbar.

Building Your First Tagged Page

If you are teaching yourself tagged pages on a “live” website, there are some things you need to keep in mind to make sure that you don't affect the content on the front end.

Things that are fine to do:

- Using previously tagged content without changing the tagging.
- Creating a tagged page design and preview it.

- Creating new custom components.

Things you should not do include:

- Putting your tagged page in a content record and publishing it (stick to viewing your tagged page via preview on the back end).
- Creating new tags or deleting old ones.
- Putting additional tags on any pre-existing content or removing any of the tags that are already there.
- Editing any of the existing tagged page designs or custom components (it is fine to look at them, but don't save any changes).

Permissions You Will Need to Edit Tagged Pages

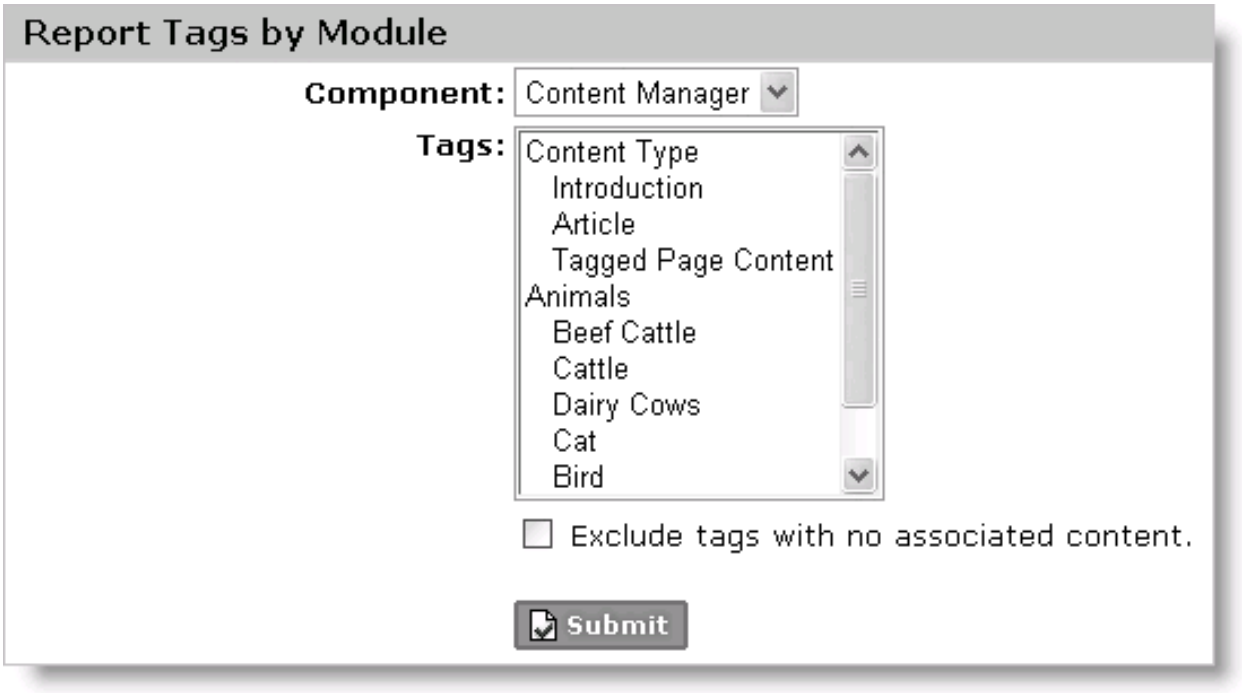
Simply being a member of one or more authority groups (even “Master Admin”) will not give you access to the tagged page editing interface or to the list of content tags. You will also need the “Tagged Pages” and “Tagging Categories” security settings.

Tagging-Related Security Settings

To see if you have tagged content

Before you start building your first tagged page, you need some tagged content records or your page will have nothing to display. They can either be in navigation items, content folders or both. If you do not have any tagged content, you will need to either tag some existing content or to create new content to tag.

1. After logging into the administrative interface, click on Websites in the upper-left.
2. Click on Tagged Pages on the left.
3. Click on the Report Tags by Module link.



Report Tags by Module Form

4. You should now be looking at the Report Tags by Module form. If e-CM is not already selected in the Component drop-down list, select it. Check the Exclude tags with no associated content box.
5. Click the Submit button at the bottom of the form.

Sample Output from Report Tags by Module Form

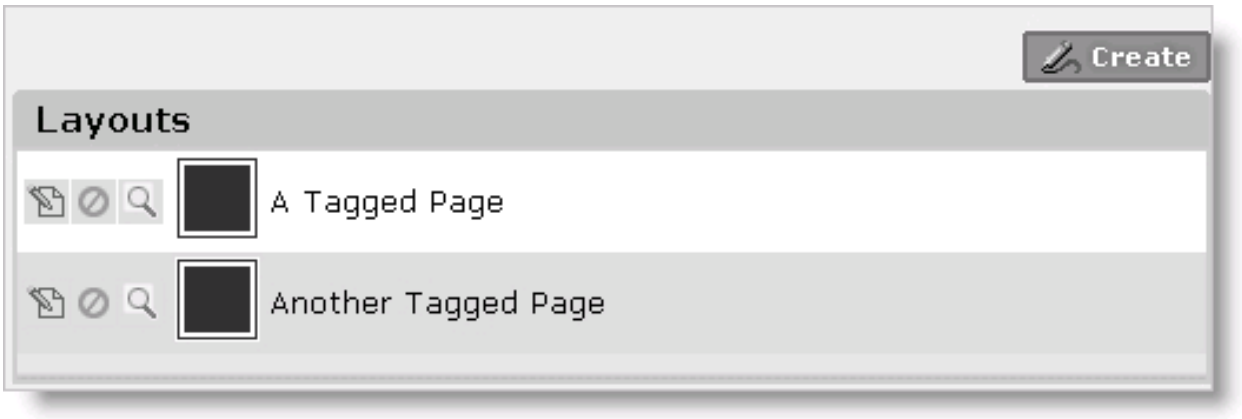
6. You should now be looking at the output from the Report Tags by Module form. Note which tags are in use - you might want to jot down a few tag names. You will be instructing your tagged pages to look for tagged content, and if you tell it to look for tags which are not in use, you will end up with a perfectly functioning but blank tagged page.
7. If you do not have any tagged content on the site you are using, you will have to tag some existing content records (or create some for practice and tag them).

Multiple Tags Selected for a Content Record

To find the Tagged Page Editing/Creation Form

By now, you have determined that you have at least some tagged content to use in your first tagged page. Time to get started. To find the tagged page editing form:

1. From the website part of the administrative interface, click on Tagged Pages.
2. Click on the Layouts link. You will see a list of existing tagged pages (if there are any).
3. Click Create.



Tagged Page Layouts

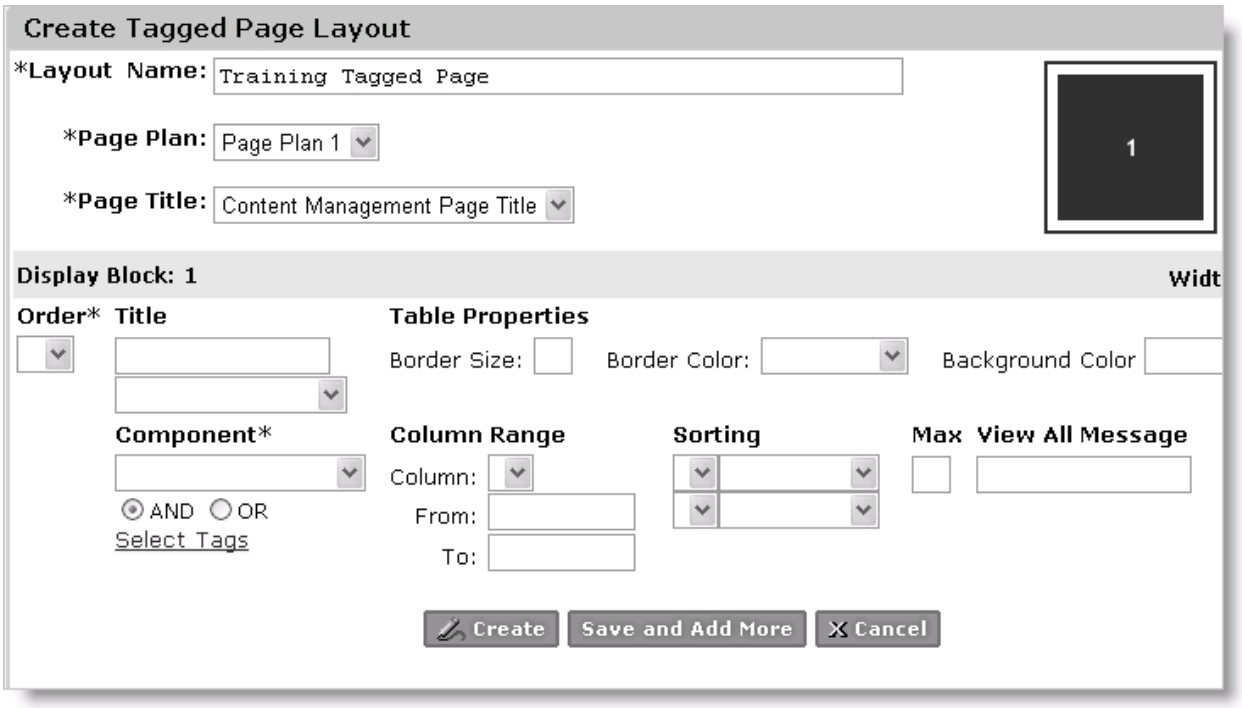
To create your tagged page

1. Fill in the information on the form, using the guidelines below.

- Template Name: What you want to call your page. If you are creating a practice page, type anything. If you are creating a page you will use on your site, choose a name.
- Page Plan: When you use the drop-down list to select a page plan, you are selecting one of the built-in layouts. For now, choose Page Plan 1, which is the simplest plan (one large display block takes up the entire page. When you select the plan, JavaScript completely redraws the page.
- Page Title: Enter one.

2. Click the Create button.

Your page should now look something like this:



Tagged Page Editing Form

Taking a First Look at the Tagged Page Form

After you create your new tagged page, the icon at upper-right shows you the basic lay-out of your page. It has one display block handily named “1”. The part of the form shown below is where you enter and add components to your block. If we had chosen a page plan with more blocks, you would just see more of these component editing modules, stacked up one after another.

Note: While this is the “world's simplest tagged page,” it has all the basic ingredients. When you build more complex pages later, for the most part you will just be adding more blocks and more components.

The Component Editing Section

The component editing section of the tagged page form allows one or more comonents in the numbered display block. As soon as you save one component, an empty editing mod-ule to add a new component will appear below it.

Component Editing Interface

You can also create your own components, but that's a subject for later. For now, use the standard built-in ones.

A component finds content records based on the tags that you associate with it in that “Select Tags” link. Then it displays the records inside the display block where you have put it.

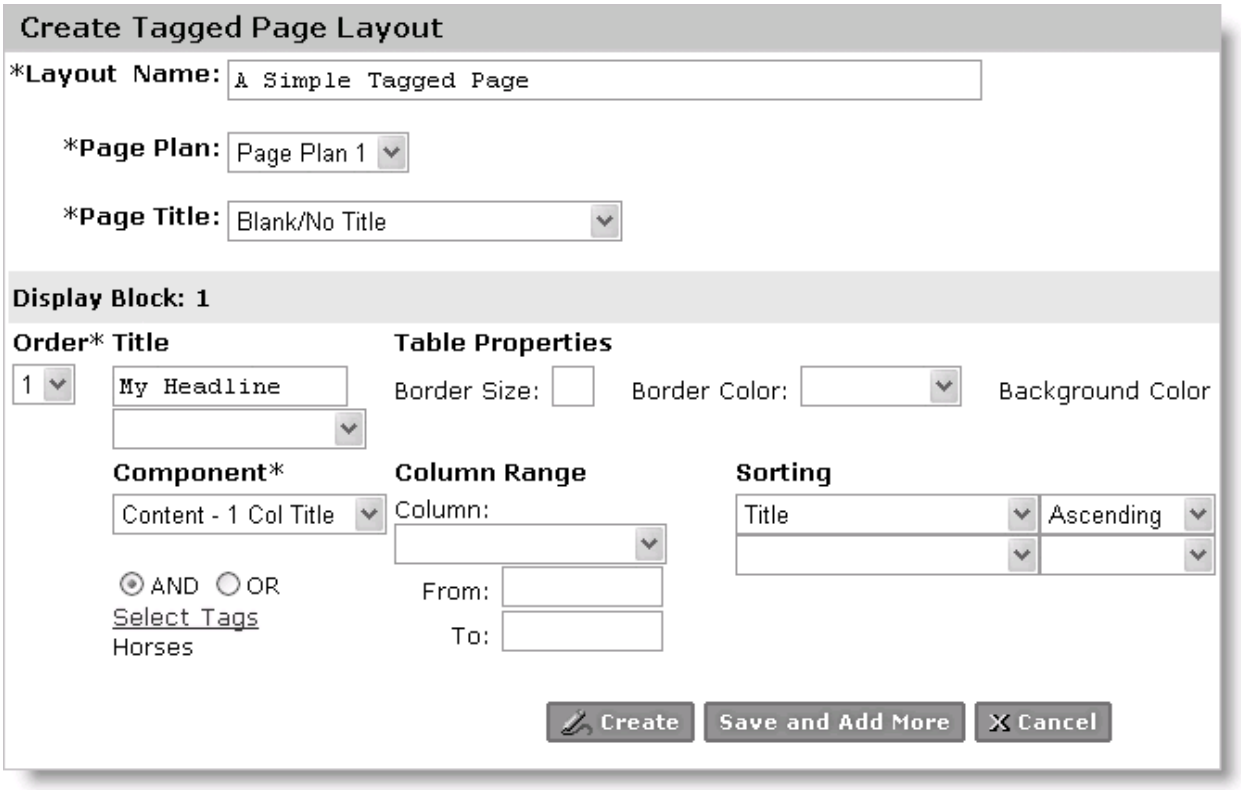
If you want to think about it this way, the chain goes something like this.

1. The user requests a tagged page
2. The tagged page “knows” how many display blocks it has and which components go in which blocks
3. The components know what sort of content they are supposed to look for (via tags) and how they are supposed to display it
4. When the blocks and components get together to form the page, the components are sent out to look for content
5. When the components grab their content and bring it back, the page is built “on the fly” and displayed to the user
6. Moving left to right on the portion of the form:

- Under “Title,” type in “My First Component” or anything else you like - this text will appear as a headline over the links your component builds.
- In the “Component” drop-down, select “Content - 1 Col Title.”

- Use the “Select Tags” link to select one tag for which you know there is some matching content in either content folders or a navigation menu. If you select more than one tag, you probably want to change the radio button to “OR,” or you will get only content which matches all your tags.
- Under order, select “1”
- In the two sorting drop-downs, select something (doesn't matter what).

7. Click the Create button.



Tagged Page Form Filled In

Previewing Your Tagged Page

You should now see your new tagged page in the list of layouts. To preview your page, use the small magnifying glass icon to the right of your layout's name.

No content?

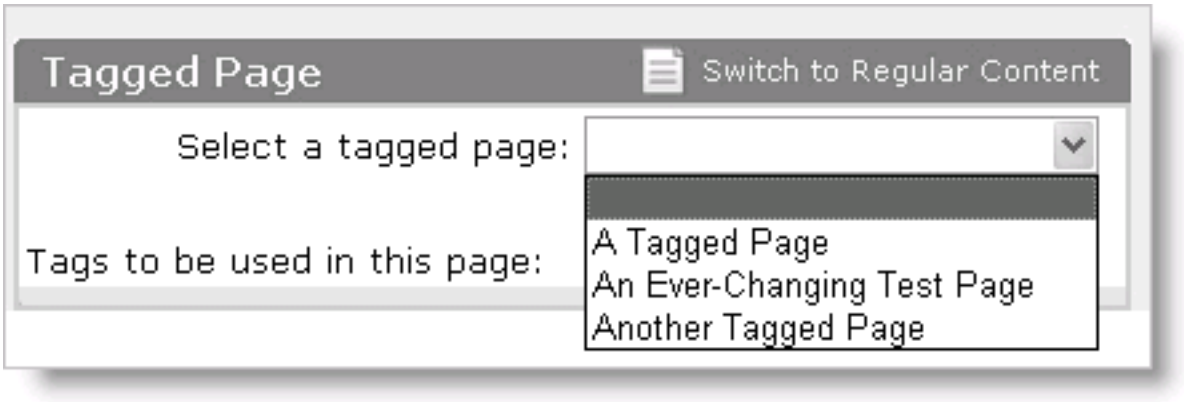
Your page shows up on preview, but has no content? Make sure:

- You did not select several tags and use “AND” in your tagged page design.
- There actually is tagged content matching your tags.

Inserting a Tagged Page in Content Record

If you are working on a practice site (for example, your development site) or creating a real tagged page for your live site you will want to insert your tagged page in a content record so you can see it from the front end.

1. In a newly created or previously existing content record, select the Switch to Tagged Page link. If you are using an existing content record, you will be warned that all previous content (HTML, etc.) will be deleted.
2. After selecting the Switch to Tagged Page link, select the tagged page you wish the user to see when viewing this content record on the front end.
3. Save, approve and publish your content record as you normally would.



Tagged Page window

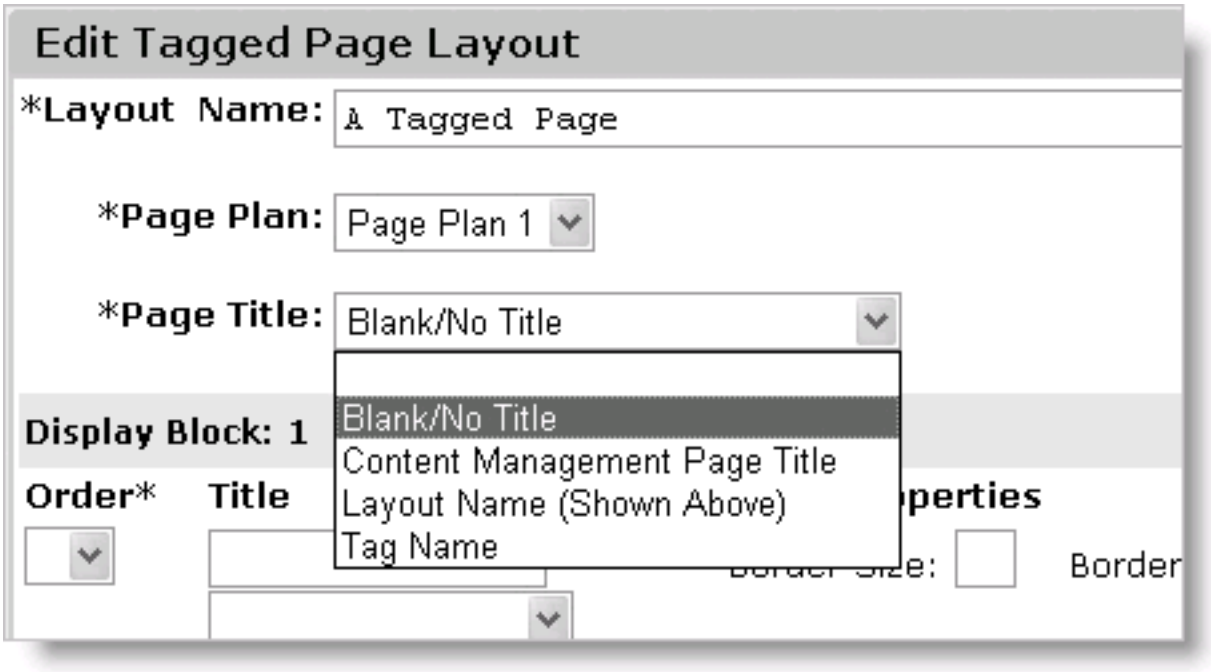
Note: Tagged components retrieve content records. They do not care where those records come from. They only care about how those records are tagged. Tagged components do not retrieve navigation menu items. They do not retrieve content folders. They do not retrieve individual pieces of content (such as an HTML file). Only content records. And a tagged component will look through all the content in your site for records with matching tags - in both navigation items and content folders.

Reviewing the Tagged Page Layout Options

Title Options

Below are the options you have for displaying a title on a tagged page. Here is what each option will show on the front end when you link a page into the navigation menu.

- Blank/No Title: As the name indicates, your page will have no heading on the front end (other than the headings you may have created for individual components).
- Content Management Page Title: The page will have a heading corresponding to the title of the content record which it is linked into. If it is linked into more than one content record, the name will vary depending on which content record the user is viewing.
- Tag Name: The page will have a heading corresponding to the tag added at the link. Will not display anything if you add multiple tags at the link.
- Layout Name: The page will have the template name (in this example “A Tagged Page”) on the front end.



Tagged Page Title Options

Order Drop-Down List

The order drop-down list specifies the vertical order within a display block (the rectangles that divide the page layout) in which records retrieved by different components will be displayed.

In other words, in a display block with five components, the records retrieved by the component with order number 1 will appear on top. Records retrieved by the component with order number 2 will appear beneath number 1 and so on.

Every time you save the editing form for a page, the order numbers:

- Must be selected for each component.
- Must not duplicate each other (you can't have two component 4's)
- Must not contain any gaps (you can't save 1, 2, and 4)

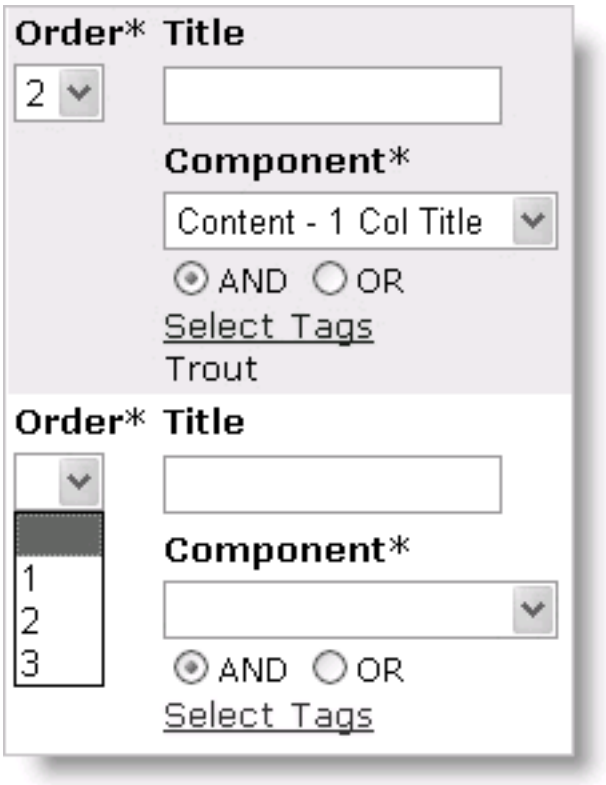
Each time you save a new component, the order list will be updated to include a new number for the next component you might want to insert (in other words, after you save your second component, the list will read 1,2,3).

Re-Ordering Components

You can change order numbers to re-arrange the display order of your page, but if you do so, you must make sure that you do not select duplicates (for example give two different components number 3). It will not break anything, but you will get an error message and e-CM will not save your changes.

When you do change order numbers, the components will be re-sorted in the editing interface after the page re-loads (lowest numbered component on top).

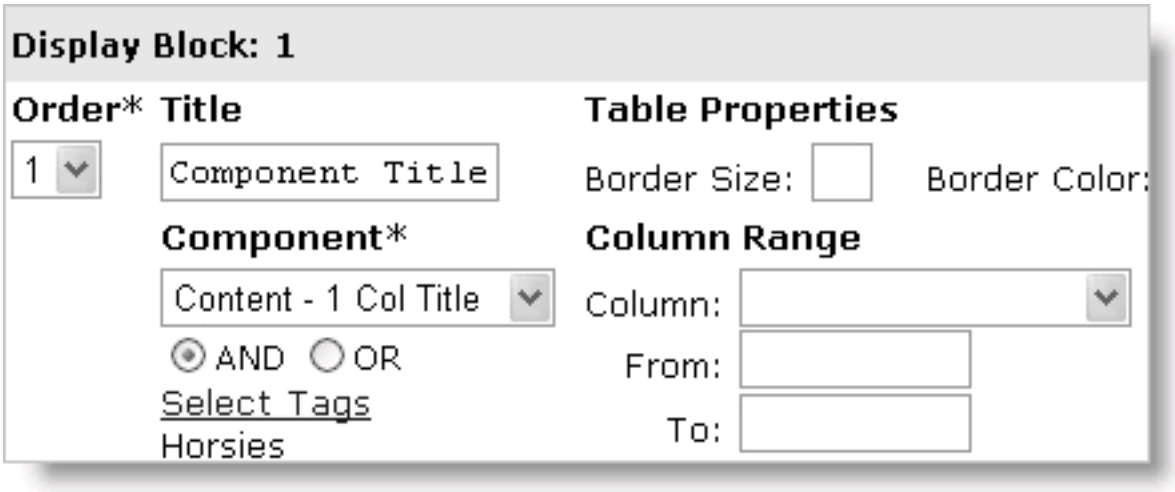
When you delete a component, you must re-select the orders for the rest of the components before you delete (in other words, if you are deleting component 3 and there are four components, you must re-number the components which will not be deleted 1, 2, and 3.



Order Drop-Down List

Component Title

The component title (which is optional) simply displays a headline over whatever content is retrieved by the tagged page component (if no records are retrieved, the title is not displayed unless you check the req box on the far-right margin of the form).



A Component Title Entered

A Component Title, Front-End View

Using Graphics for Titles

One non-obvious feature of tagged pages is the ability to use graphics in place of text component titles.

In order to enable this feature, you must create a sub-directory of your Images directory called “TPImage” (a special name that tagged pages look for) and use the Image Manager to upload one or more gif or jpeg images to that sub-directory.

To create and populate the TPImage Directory

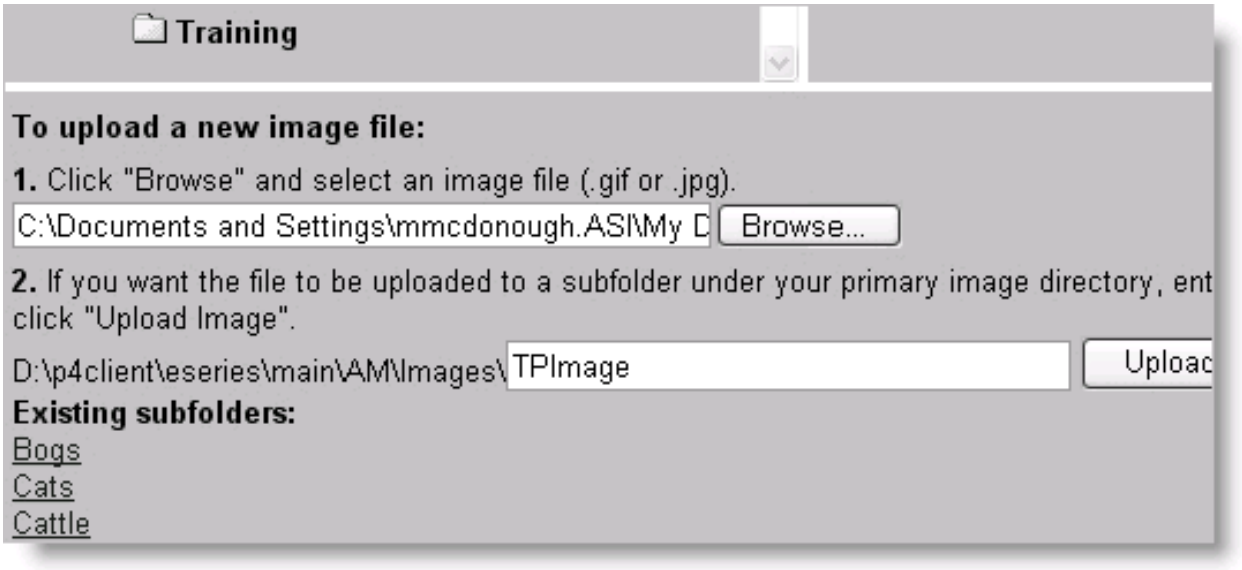
To create the TPImage directory, you will need to use the image manager, which you can do either by clicking on the Sites button in the Websites portion of the administrative interface or from within any HTML file in a content record by clicking on the image button in the WYSIWYG editor's top bar.

Once you have the image manager open do the following:

1. Browse to an image you wish to use as a tagged page title (or a test image - you can always delete it later).
2. Enter TPImage in the folder text input to the left of the Upload Image button.
3. Click the Upload Image button. When you click Upload Image, the image manager will

both create the directory and upload your image into it. After a pause, the file will be uploaded and will appear in the upper-right pane.

Note: There is no need to click OK or Cancel. If you click Delete, the file will be deleted. You may now upload additional images to the directory.

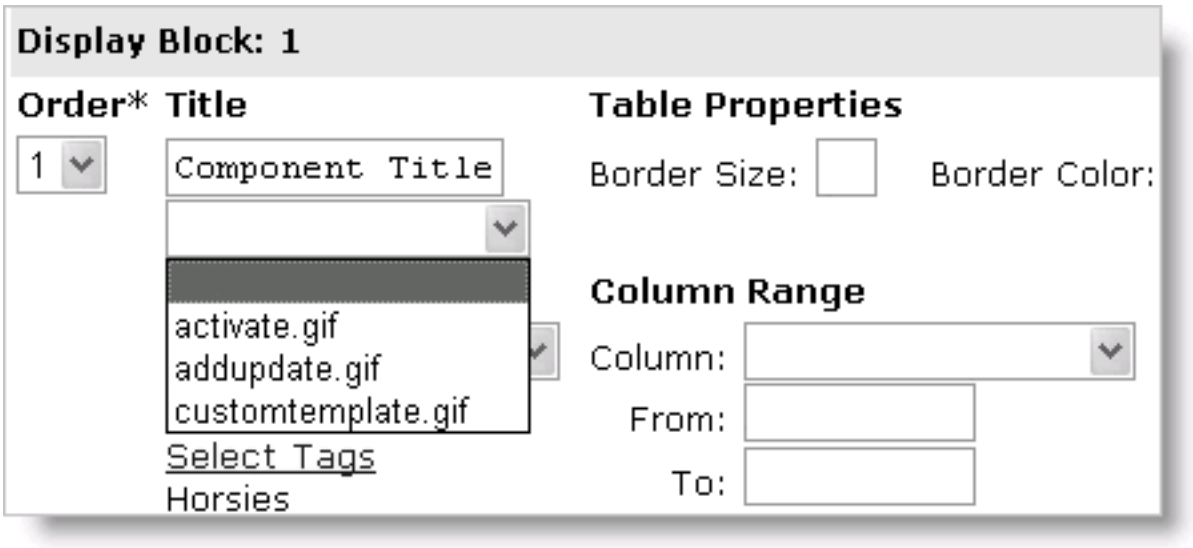


Preparing to Create and Populate the TPImage Directory

To use title images in tagged page designs

Once you have created and populated the TPImage directory, you may use images in the TPImage directory in place of simple text titles in your tagged pages.

When you next go back to the tagged page editing interface, you will see a drop down below the Title input box for the component title.



Title Image Drop-Down List

If you want to use a text title on your component, simply enter it as usual and do not select and image from the drop-down list.

If you want to use an image:

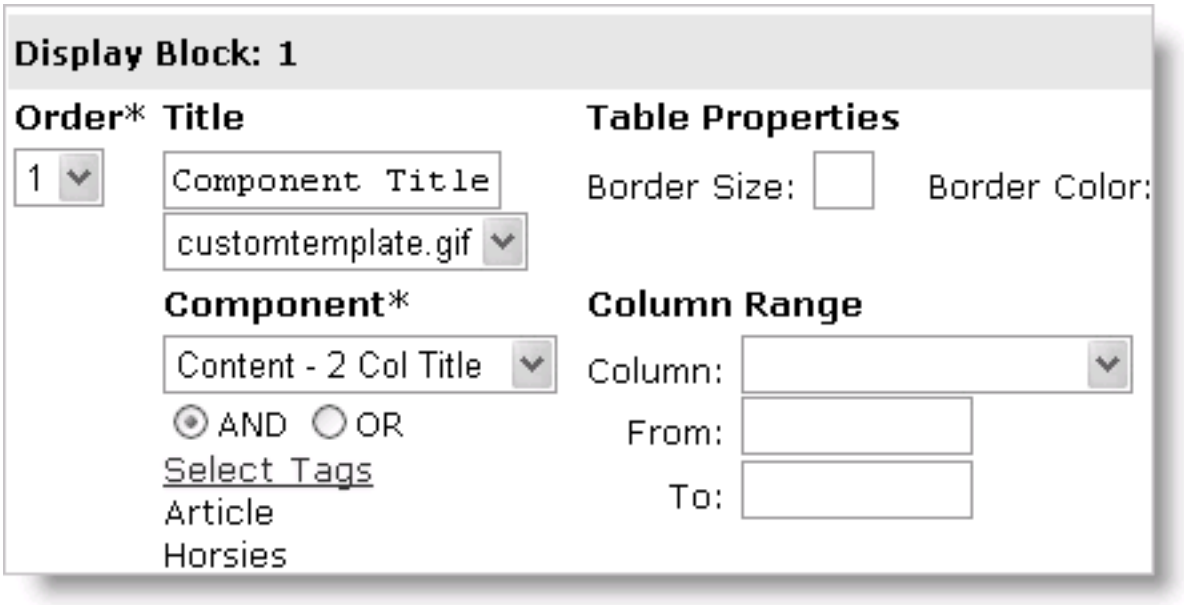
1. Enter a text title; this will become the alt ("mouseover") text for the image.
2. Select a file from the drop-down list.
3. Save your work. The title image will display over any content retrieved by the component.

Note: Since you will see the filename in the drop-down list, it makes sense to give your files names that will mean something to you before you upload them (you cannot rename a file once you have uploaded it). If you are looking at the title image drop-down, "logo.-gif" is going to make much more sense than "x234EP.gif."

And vs. Or

If you use multiple tags with a particular components, you can either chose an "And" relationship or an "Or" relationship between the tags by selecting one of the radio buttons. In this example, if you selected "And" (which is the default), the component would retrieve only content records tagged to "Horsies" and "Articles." If you select "Or," it will find con-

tent records tagged to “Horsies” or “Articles.” In general, you use “And” to narrow your retrieval criteria and “Or” to make them wider.



Multiple Tags with "And" Selected

Border Size, Border Color and Background Color

To the right of the component title are a set of form inputs which can be used to place a visible HTML table around the content which is retrieved by the component. There are no absolutes in graphic design, but these are probably best used to set off relatively small elements (for example a list of the 4 latest news articles or a short piece of HTML) in relatively complex pages.

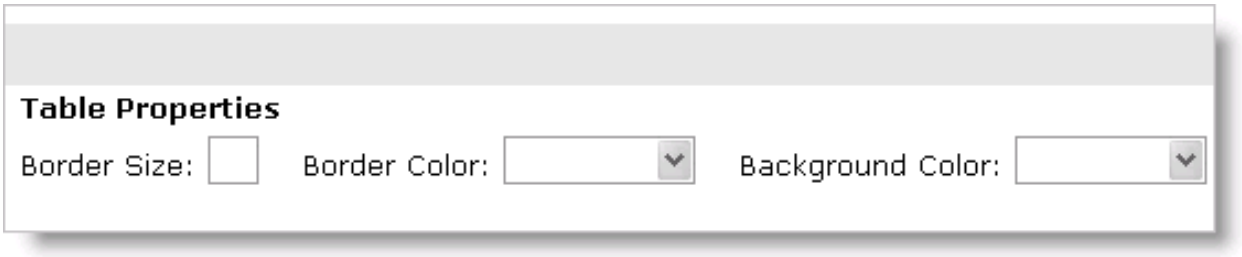


Table Properties

To create a table around the output from a particular component:

1. Enter an integer as a border size (1 is a good starting point).
2. Use the drop-down list to choose a border color.
3. Use the drop-down list to choose a background color.

   You may use a border without a background, or a background without a border, but if you use a border, you must choose a border color.

   Note: These colors are stored in a table called Tagged_Page_Color_Ref.

   Specifying a Column Range

   The column range functionality, which is found beneath the table inputs, allows the user to select a particular range of dates (in mm/dd/yyyy format) to filter the records retrieved by the component.

   For example, you could use this feature to create a page that listed news releases by month, using a separate component for each month.

   Date Range

   To specify a date range for a particular component's output:

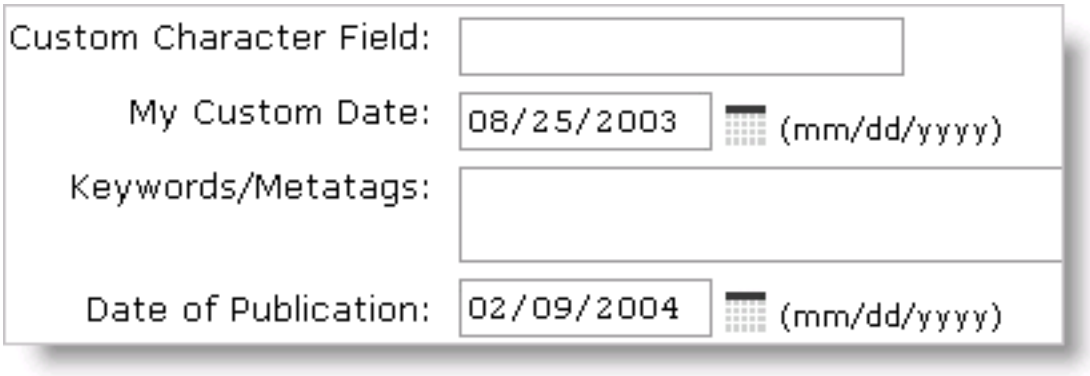
1. Select a date field to filter by from the Column drop-down list (more about that in a second).

2. Enter a From date (a beginning date) in mm/dd/yyyy format.
3. Enter a To date (an ending date) in mm/dd/yyyy format.
4. Save your work.

What Date?

The most obvious question about filtering content records by date is “What date?” Two dates end up in the column by default. The first is “Date of Publication,” which you can enter for each content record in the content record properties field. The second is “Published Date Time,” which is simply the last date on which the content record was published. Since this may have nothing to do with the actual date associated with the content and will be re-set every time the record is re-published, you would not generally use Published Date Time except in unusual circumstances, for example if a custom automated process was publishing your content and the Published Date Time was actually meaningful.

In addition any User-Defined Date fields you have enabled to work with tagged pages will appear in this list. User-defined fields can also be entered on the content record properties page.



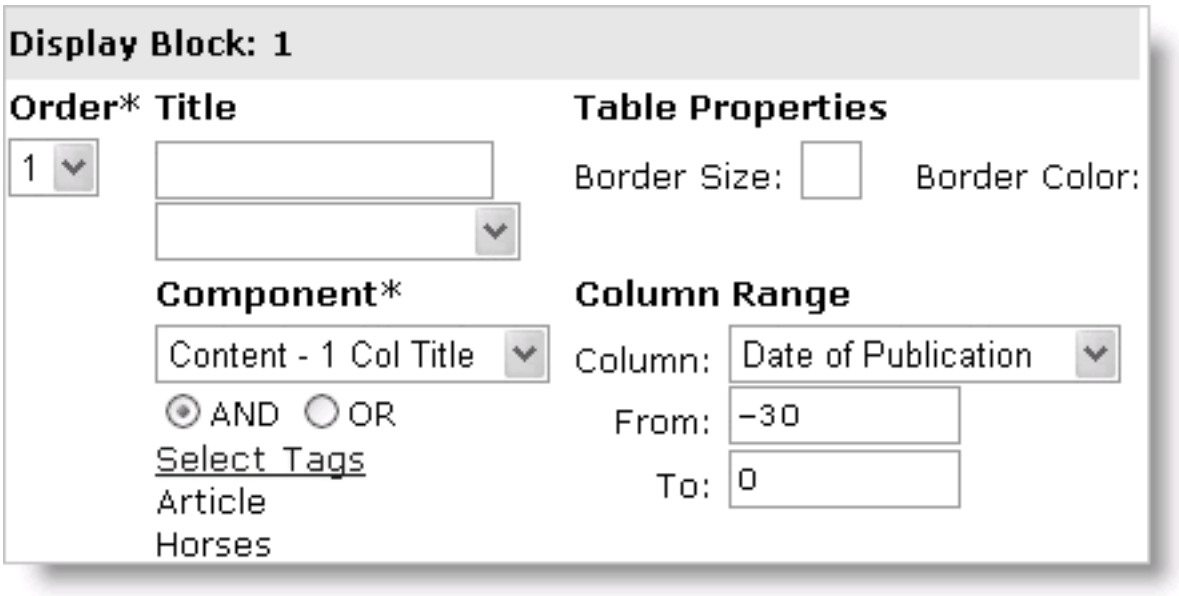
Date Fields in a Content Record Properties Page

To create a Rolling Date Criteria

To create a rolling date criteria (for example “Date of Publication” in the last 30 days):

1. Select a date field to filter by from the Column drop-down list.

2. Enter a From date (a beginning date) in the format “-n” - for example, if you want to create a rolling criteria of the last 30 days, you would type “-30.”
3. Enter a To date (an ending date) in the same format (using zero if you want the ending date to be today).
4. Save your work.



Specifying a Rolling Date Criteria

To show only future dates

Imagine that one of your tagged pages will show courses and you are using a user-defined field to enter the date on which the course will be held. You want the tagged page to show only courses that are in the future, not courses that have already run. To show all future dates:

1. Select the date you want to filter by in the Column drop-down.
2. Enter “0” (zero) as the From: and leave To: blank to display records matching today's date and in the future OR
   Enter “1” as the From: and leave To: blank to display records starting with tomorrow's date.

To show all past dates

If you want to show all records matching a past date:

1. Select the date you want to filter by in the Column drop-down.
2. Enter “0” (zero) as the To: and leave From: blank to display records matching today's date and in the past OR
   Enter “-1” (note the minus sign) as the To: and leave From: blank to display records starting with yesterday's date and all past dates.

Sorting the Records Retrieved by a Component

The “Sorting” drop-downs, to the right of the Date/Column range area, allow you to sort the records retrieved by the individual component. You have a choice between several “built-in” fields such as content record title and any user-defined fields you have activated for use in tagged pages.

You may specify a primary and secondary sort criteria (for example, if you are sorting a collection of press releases by date, you may wish to sort them by title if they have the same date).

The drop-downs also give you the ability to sort in ascending order (A-Z) or descending order (Z-A). In the case of sorting by date, you will most often want to use descending order - most recent dates on top.

To show Max and View All Messages

If there are multiple components on a page which could generate long lists of records, you may wish to display only the first few records and then give users a link that will take them to the rest of the records retrieved by the component.

In this case, you can specify both a number of records to show and the text for the link to more records in the View All section of the tagged page form. In the example shown below, the component has been told to show only 1 record, and then a link titled See More to the rest of the records it retrieves.

Max/View All

If you specify, for example, a maximum of 3 records and the component only finds 2, it will not display the link (since there are no more records to see). Somewhat less intuitively, the feature will simply be ignored unless there are at least two components on the page.

Note: View All can be used with any component on a page, but it will not work until there are at least two components on the page.

To add “ViewAll” Images

You can also use images in place of the text View All messages by setting up a directory with the special name View All underneath the “TPImage” directory. To do this, input the directory name “TPImage\ViewAll” instead of “TPImage.”

Once the ViewAll (note lack of spaces in name) exists and is populated, the image(s) will appear as a drop-down list below the View All Messages form input. The feature looks and works just like the graphical title feature.

Req and Del

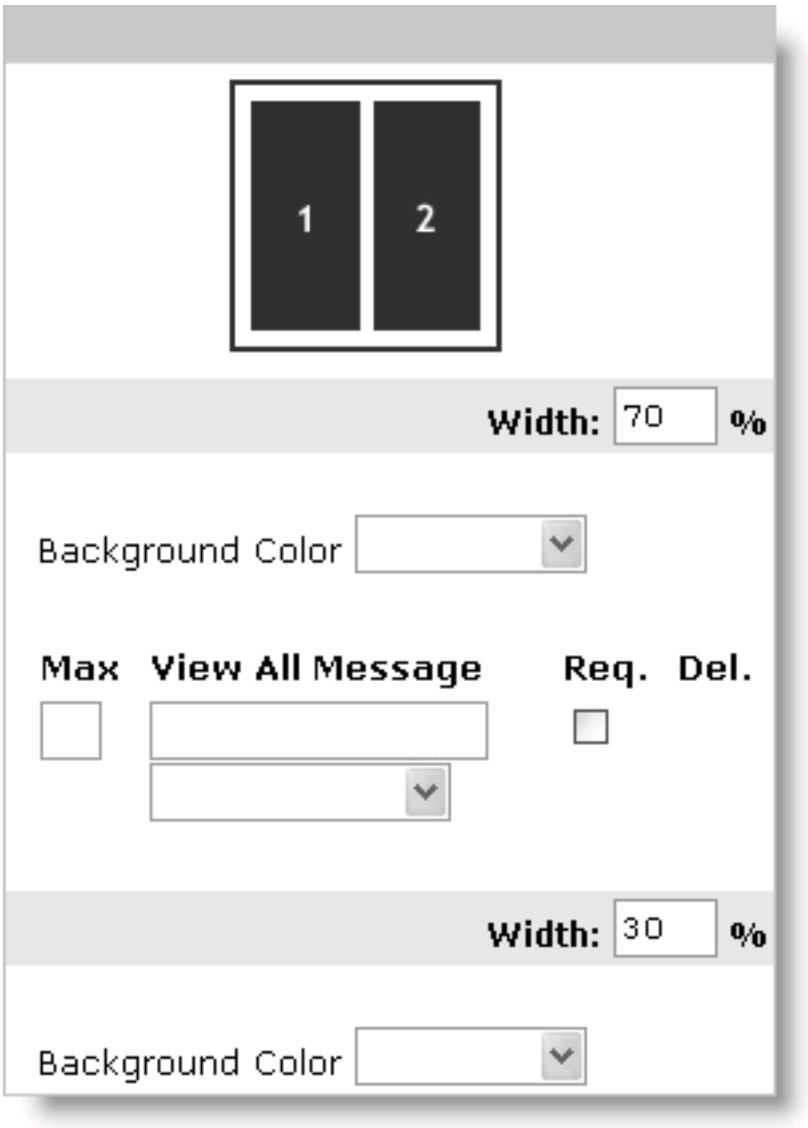
The small Req and Del checkboxes are located at the extreme right-hand edge of the form. One set of checkboxes appears for each component.

- The Req checkbox will show the component's title text or image even if the component retrieves no records. It is used primarily during page editing and setting.
- The Del checkbox will delete the component for which it is checked. If you are deleting any component except the last one on a page, you will have to remember to change the “order” numbers first so that the remaining components will be in the proper sequence with no gaps in the numbering.

Specifying a Block Width

If you are using Page Plan 1, which simply has one large block, block width is irrelevant, since the one block will take up your entire page.

However, if you are using a more complex page design with multiple blocks, you can use the Width setting on the far right side of the form to specify what % of the page is taken up by each block. In the example below, illustrating Page Plan 3, block number 1 has been set to take up 70% of the page and block number 2 30%.



Specifying Block Widths

Save vs. Save and Add More

There are two buttons at the bottom of the tagged page form, Save and Save and Add More. Both buttons will save your work, but Save will take you back to the list of tagged page layouts (for example, so you can preview your page). Save and Add More will save your work and reload the form, allowing you to continue editing your page.

Re-Using Tagged Pages

Very often you want the website user to see several essentially identical tagged pages with an identical design. One way to do this is to create absolutely identical pages and set them to look for different tags. Sometimes, depending on how your content is tagged, this may be the only way to do things. But often, you can create one page, insert it in your navigation at several different places, and give it instructions in each place which result in it displaying different information in exactly the same format. This way, you only have to create one tagged page, and if you decide to change your page design, you only have to change it in one place, instead of updating several identical pages.

By way of illustration, imagine that you want to display four basically identical pages of links to press releases. Each page should display in the same format, but show press releases related to a different subject area.

Each content record containing a press release will have two tags: “Press Release” (describing the type of content) and an additional tag describing the subject area.

In our example, let's say your four subject areas are:

- Legislative Issues
- General News
- Events
- Industry News

If you wanted to re-use a single tagged page, you would first create a page whose only instruction was to look for everything tagged to “Press Release.” If you view this page in preview mode, it will show every press release on the site, regardless of subject area.

However, when you insert the tagged page into a content record in your navigation, you will insert an extra tag in the content record.

To do this:

1. After inserting your tagged page in a content record, click the Select Content Tags link below the tagged page drop-down list.
2. When the Content Tags window pops up, select your additional tags and click Save and Close.
3. The additional tags will now appear under the tagged page drop-down, and the link will change to Modify Content Tags.

Tagged Page in Content Record

Additional Tag Applied

Any additional tags you apply in this manner at the content record level will have an “AND” relationship to the tags you have told your components to look for on your tagged

page. In other words, if we add “Legislative Issues” when we place the press release page in a content record, users who look at the tagged page here will see only records tagged to “Press Release” AND “Legislative Issues.” Now we could put this page somewhere else entirely, perhaps in a completely different navigation item in a different part of the site and add the tag “General News,” and users will see exactly the same page design, but only those items tagged to “Press Release” and “General News.” And, yes, if a press release is tagged to both “Legislative Issues” and “General News”, it will show up on both pages.

Managing Your Tagging Categories

This section of the training is designed (even more so that usual) to be used as a self-study guide, since it's been our experience that by this point in the training most people have absorbed about all the information they can without a rest! And besides, once your tagging categories are set up, you may go for months without having to edit or change them.

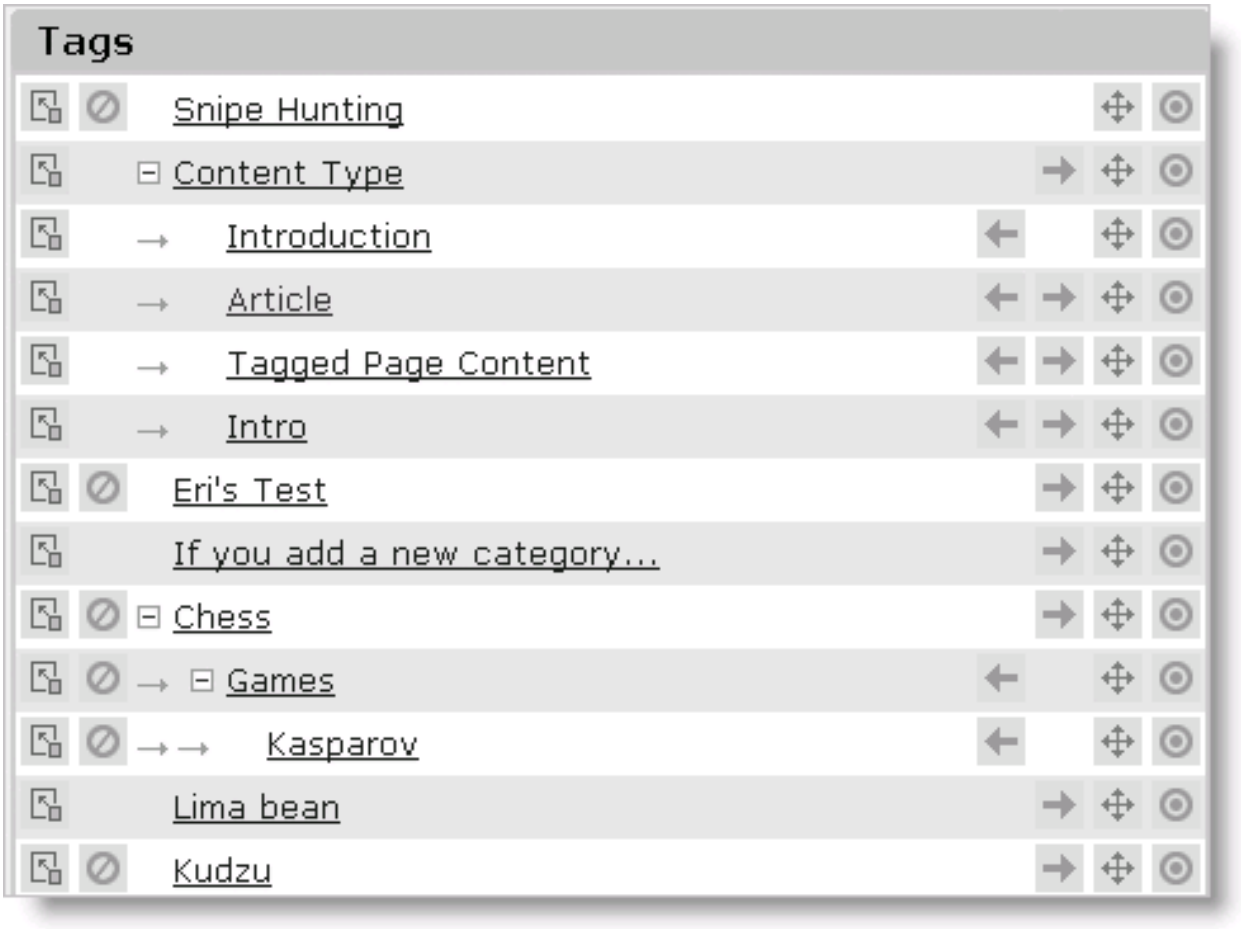
Some customers have tagging categories 100% fixed before they begin using tagging; others start with a basic set of tags and expand them as they go. Wherever you fall on that continuum, it is useful to know how to manage and modify your categories.

Looking at Your Tagging Categories

If you've entered tagging categories already, you probably already know where to go to find the list of categories, but just in case, when you click the Tagging Categories button on the administrative interface, you will see the list of categories. From this list, you can add, delete, and modify categories. You will find it works much like the Navigation Menu Item interface.

- You click on the name of an item to modify it.
- You can promote, demote and move items.
- You can expand and collapse either individual “trees” with the plus and minus buttons or the entire page (via Expand All and Collapse All links that the bottom of the page.

- You can delete categories with the delete button.
- You can insert items with the insert button.



Tagging Category List

Tagging Category Levels

One of the first things you'll notice about the list of tagging categories is that they are organized in parent-child relationships, just like folders and navigation menu items.

With one important exception, this organizational scheme of parent categories and child categories is for your own convenience. From the point of view of tagging content, a tag is a tag is a tag. Tagging a content record with a “parent” tag, for example, does not automatically tag it with all the children of that tag. Neither does tagging a content record with a “child” tag automatically tag it with the parent.

Each tag operates completely independently. If it is appropriate for your information structure, you can have two child tags with the same name. For example, you might have a parent category called “Audience” and a parent category called “Events” and both might have a child category called “Students.” The first “Students” tag would be used for content which had students as the intended audience, and the second would be used for content related to events for students.

Level-One Tagging Categories Must Be Assigned to a Module

If you've been setting up your own tagging categories, you may have already done this:

- You create a new “level-one” tagging category by using the insert button.
- You add a child tags under the new level-one.
- You go to tag a content record and your new tagging categories don't show up.

Why is this? Because you need to assign them to a particular module (for example, e-CM or Event Manager) before they will actually be available for tagging in that component.

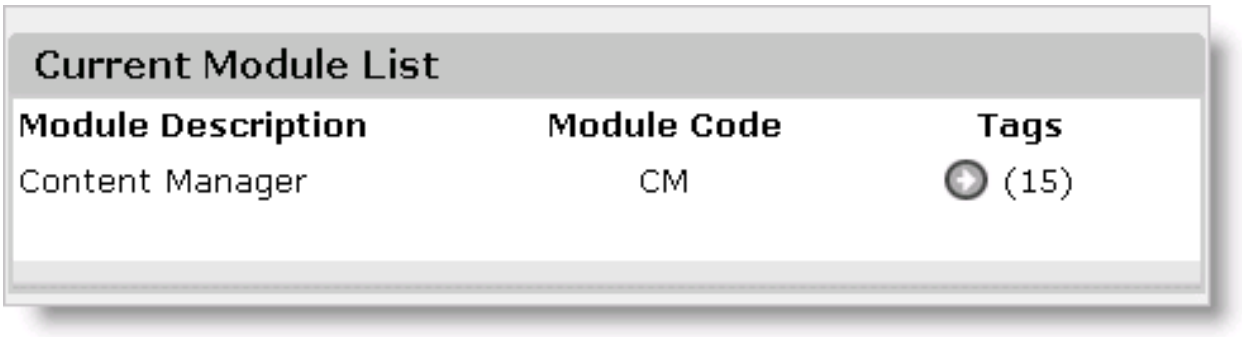
Remember that this has to be done, rather than try to memorize all the details of doing it.You probably won't need to do it all that often, and you can always look up the details.

To assign Tagging Categories to a Module

Before you can use a level-one (main) tagging category or any of its children with Content Manager (or any other taggable modules you may have purchased), you need to associate that category with the application.

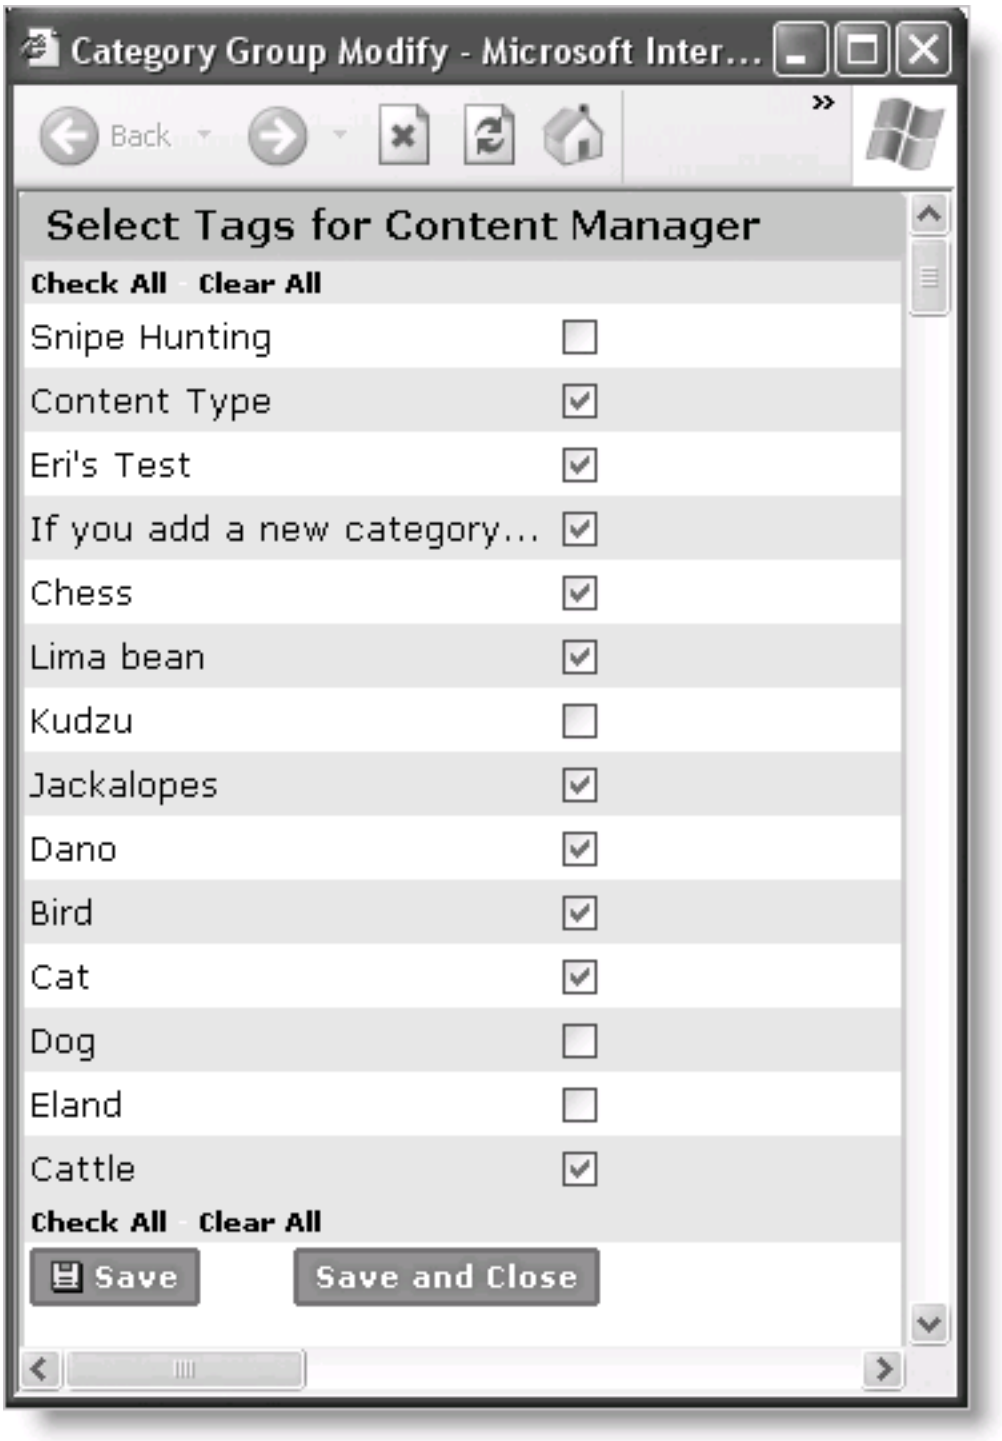
1. After logging into the administrative interface, click on the Tagged Pages button.
2. Click on “Modules.”

In this example below, e-CM is the only active taggable component. If other modules such as Event Manager were active, they would also appear in this list.



Module List

3. Click on the arrow button to the right of “Content Manager”.
4. A window will pop up showing all the level-one tagging categories
5. Select any additional level-one categories you want to associate with CM and click the Save button.
6. When the warning screen pops up, click “OK” (the warning applies to un-selecting categories, not adding them).



List of Level-One Tags

To remove a Level-One Tagging Category from a Module (Be Careful!)

You can also de-associate a group of tagging categories from a particular module by following all the same steps and then un-checking the level-one tag(s) you wish to remove and clicking Save. This will remove the tagging category and all of its children from the list of tagging categories in the module. It will also un-tag any items which have been previously tagged with any of the tags you are removing.

Note: If you remove a level-one tagging category from a module, it is important to understand that this will not only remove the tag and its children from the tagging window, it will also un-tag any content records which have previously been tagged with the level-one or any of its children. For this reason, it is extremely important to make sure that you think carefully about what you are going to do.

Here's a worst-case to illustrate the issue (and yes, this actually happened). Let's say all the most important pages on your website are tagged pages and your site's homepage also is driven by tagging. A site administrator goes to the module list, selects e-CM, and unchecks every level-one tag on the list and then clicks Save.

At this point, every content record in e-CM is now un-tagged. Because tagged pages are cached in memory, nothing bad happens immediately. However, the next time the pages expire from the memory cache, the homepage and most of the website suddenly becomes a collection of blank pages. You will now discover how good your hosting company (or internal IT department) is at making back-ups and doing quick restores (in the case of this user, the hosting company did excellent back-ups and was able to restore the database within about 10 or 15 minutes, at which point the website re-appeared).

Because of the high stakes involved in removing level-one categories from a module, the warning that pops up when you try to do this is particularly frightening. Do not worry. If you know what you are doing and you really need to do it, go ahead. But definitely take a minute to think before you click OK.

Now that we are through the warnings, here's how to remove a level-one tag and its children from e-CM:

1. From the modules interface, click on the arrow button to the right of Content Manager

2. A window will pop up showing all the level-one tagging categories
3. Un-check any level-one categories you want to remove from e-CM and click the Save button.
4. When the warning screen pops up, take a very close look at the tag(s) you have un-checked, and if you are confident that your choices are correct, click OK.

Searching for Tagged Content

To find tagged content

To see what pieces of content have been tagged with which tagging categories:

1. After logging into the administrative interface, click Tagged Pages.
2. Click Report Tags by Module.

You should now see a search form.

Tagging Category Search Form

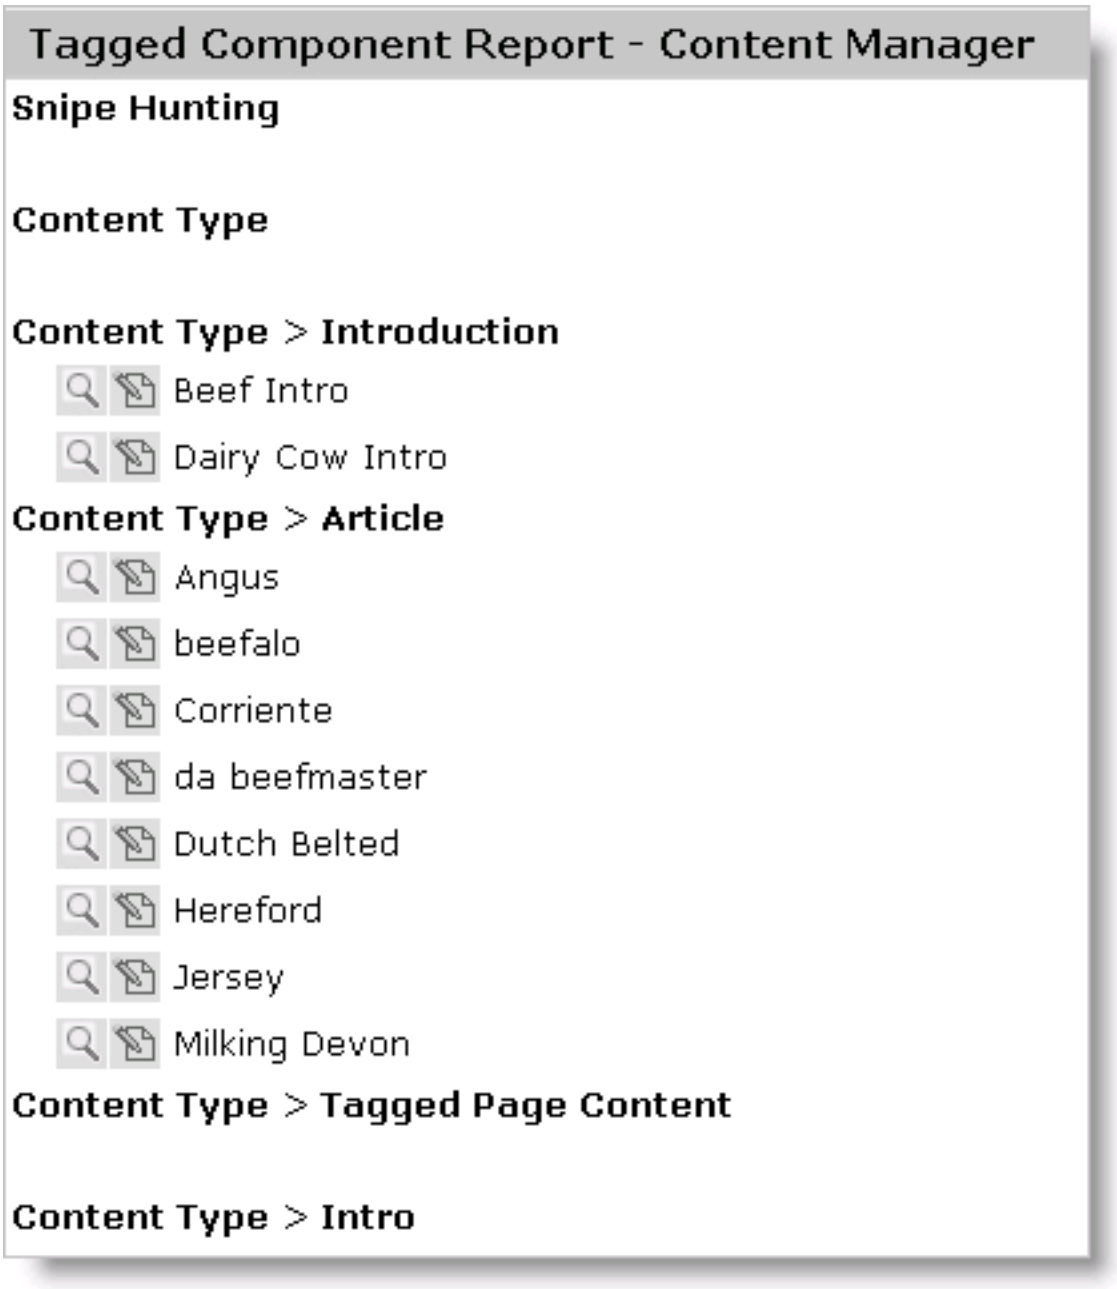
To Get a Complete Report of All Tagged Content in a Product

If you want to see what content has been tagged in a particular product:

1. Make sure Content Manager is selected in the Component drop-down list.
2. Click the Submit button.

   You will now see a report listing all tagging categories and then all content tagged with that category. Next to the name of each content record (or product, or event - depending on which component you are looking at) you will see a button with a graphic of a magnifying glass that allows you to preview the content and an edit button with a pen and paper graphic, which allows you to edit the content (assuming that you have the proper permissions to do so).

   Clicking the Exclude tags with no associated content checkbox simply tightens up the output by omitting the listing of any tags which aren't being used.



Sample Output from Search Form

To Get Information on Specific Categories

- If you want to find out which content records have been tagged with a particular category, you go to the same form and select the tag (or tags) you wish to find out about.

- If you want to select more than one tag, you can use hold down your control key while clicking. By holding down your shift key while clicking, you can select a range of tags.

  If a content record is tagged more with more than one tagging category, it will appear more than once on the report - once for each category.

  Creating a New Tagging Category
  To create a new tagging category

1. After logging in to the administrative interface, click on the Tagged Pages button on the administrative menu.
2. Click on the Tags link.
3. Use any of the insert buttons on the list of tagged pages.
4. Enter the name of your new tag in the Name box on the form.
5. If you wish, you can add a description (this is strictly for your own information).
6. Click on the Submit button to insert the new tag. It will become the first level-one tag at the top of the list.

Add Tagging Category Form

Moving, Promoting and Demoting Tagging Categories

The most important thing to remember about moving, promoting and demoting categories is that if your category ends up in the wrong place, you can always move it again.

To move a tagging category

1. After logging into the administrative interface, click on the Tagged Pages button.
2. Click on the Tags link to show the list of tags.
3. You can now use the move ( ) and target ( ) buttons to move a tagging category.

- Click the move button to the right of the tagging category you wish to move.
- Click the target icon to the right of the category you wish to move it underneath. When you click target, the category will become the next item in the list at the same level as the target.

Remember, if you don't like where your category ends up, you can always move it using the move and target buttons.

To Promote or Demote a Category

To promote or demote a tagging category use the promote ( ) and demote ( ) buttons on the right side of the list. Clicking the promote button to the right of a category's name will move it up one level. Clicking the demote button to the right of a category's name will move it down one level.

Note that level-one categories to not have a promote button (because you can't promote them any higher - there is no level beyond one). Also, if demoting a category would make it an “orphan” (no direct parent), it will not have a demote button.

How to Change the Name or Description of a Tagging Category

To change the name/description of a tagging category

1. After logging into the administrative interface, click on the Tagged Pages button.
2. Click on the Tags link to show the list of tags.
3. Click on the name of the tag you wish to edit.

4. When the form appears, make your changes and click the Submit button.

Deleting an Unused Tagging Category

You probably won't have to delete tagging categories very often (because un-used categories don't really hurt anything), to do so:

1. After logging into the administrative interface, click on the Tagged Pages button.
2. Click on the Tags link to show the list of tags.
3. Click the delete button to the left of the tag you want to delete.
4. When the confirm message asks you if you are sure you want to delete the tag, click OK. The page will refresh and the tag will be removed from the list.

   If you want to delete a parent category without deleting the children, you should promote the children (or move them to a different parent) first.

   If even one content record (including an archived record) makes use of a tag, the delete button will not appear next to it. If you wish to get obsolete tags out of your way, but find you cannot delete them at present, you can create a parent tagging category called “Unused” and make all your unwanted tags children of that tag.

Advanced Tagging

Many customers quickly learn to “push the envelope” when it comes to implementing tagged pages. For this reason, we thought it might be useful to have some additional documentation on tagged pages, and how they are employed. This chapter assumes that you have a basic understanding of tags and tagged pages and have at least a little experience with designing tagged pages. It does not attempt to explain every possible thing you might do with tagged pages, but lays out some basic ground rules and explains the processes involved.

Specifics of Applying Tags

Tags Can Be Used in Three Different Places

One of the things that makes the process of tagging a little confusing at first is that there are three different places you can use tags, and they do something a bit different in each

place. Below summarizes the different locations where you can use tags.

Content Record	Associates content with a tagging category so it can be retrieved and displayed by a tagged page. Serves the same purpose in a variety of components (for example, in Event Manager, you can tag an event, in the Online Store you can tag a product, etc.).
Inside a Tagged Page	In a tagged page, each tagged page component (the little data-gathering engines that retrieve and display the content) typically is associated with one or more tags. This tells the component what sort of content to retrieve.
Associated with a Tagged Page Link	Tagged pages are displayed by linking them within a content record inside a navigation item. When you create this link in a content record, you have the option of adding additional tagging categories which will apply to the tagged page only at that specific location. They have the effect of adding an “and” to whatever tagging categories are applied to the tagged page components on the page.

Applying Tags at the Tagged Page Link

Because the process of applying tags at a tagged page link is a little complicated, first we are going to explain the “how,” then the “why.”

When you want to display a tagged page on the front end of the website, you link it to a specific content record, by clicking the Switch to Tagged Page button and then selecting a tagged page from the drop-down list.

Tagged Page Link Before Saving

Once you have saved a content record containing a tagged page, you can apply further tags by clicking the Select Content Tags link (which will not appear until you have saved the content record at least once).

Tagged Page Link with "Select Content Tags" Link

When you click the Select Content Tags link, the familiar tagging category list window will pop up, and when you click Save and Close, any tags you have selected will appear after the link:

Tagged Page Link with Tag Selected

Why You Would Apply Tags at a Tagged Page Link

We have covered how you apply tags at a tagged page. We will next talk about the “why.” When you apply additional tags at the tag page link, they have the effect of adding an “AND” to any tags that are present on the tagged page. Every single component on that

tagged page will look for any tagged records matching both the criteria set in the page design and the tag(s) you add at the link level.

This ability apply tags at the tagged page link is generally used to narrow the retrieval criteria of a fairly general tagged page design. This allows you to use a single page design in multiple places.

For example, imagine a website with five major subject-area-based sections (e.g. “Legislative Issues,” “Regulation,” “Industry News,” etc.). You want to create a News page for each one which will feature an HTML introduction at the top and a list of press releases underneath.

One way to do this is to create a separate news tagged page for each section, using the specific subject-area tags in each design.

However, this means that you now have five separate tagged page designs to create and maintain, and any changes you want to make in the future will have to be done five times.

Example Tagging Categories

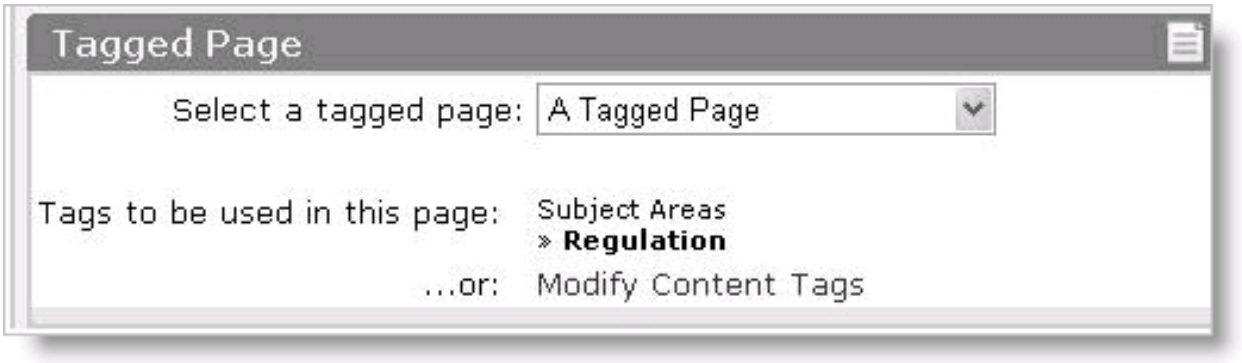
Another way to accomplish the same thing is to create one page which in its “raw” state will retrieve all HTML introductions for news pages and all press releases and then add in a subject-area tag to filter the output when you link the page into each navigation item.

Your page design (to keep the example simple) would then have a full-HTML custom component at the top which would look for all records tagged to “News Introduction” and a custom or standard component showing links to all content records tagged to “Press Release.”

Example Page Design

If you use the preview button to look at this design, you would see five HTML introductions at the top, followed by a list of all press releases on your site.

When you link this page into the proper navigation item for the “Regulation” news page, you would add the “Regulation” tag at the link in the specific content record holding the tagged page link. This will “filter” the output of the tagged page to show only items tagged to “New Introduction” and “Regulation” (you would have just one such content record) followed by a list of links to press releases tagged to “Press Release” and “Regulation.”



Tag Added to Filter Output to "Regulation"

Since re-using pages this way requires your content records to be tagged in a very specific way, it does require some thinking ahead and may require you to add some new tagging categories, but it saves work and ensures design consistency.

Using Components to Display Information from Other Modules

The process of using tagged components to display information from other modules is very similar to displaying content records from e-CM, but there are a few things you need to know first.

How to Activate Tagging for a Particular Module

Typically, a particular module (e.g. Event Manager) will be activated for tagging during your website's initial configuration. There is no interface for activating a module. Doing so requires database access. Under the assumption that a user with database access will be technically sophisticated, we will keep the explanation at a high level.

To activate tagging in a particular component

1. Find the row corresponding to the module in the Component_Ref table.

2. Set the value of the TaggableFlag column to “Y.”
3. In the website's administrative interface, click the Admin button at the top of the page.
4. Click Reset Server Variables on the left side of the Admin section.
5. Click the Reset Variables button.

Associating Tag “Families” With a Module

Before you can display, for example, products from a store in a tagged page, the products have to be tagged, and before any items in the module (for example, events in Event Manager) can be tagged, you need to associate one or more “tag families” (a level one tag and all of its descendants) with that module. No module (including Content Manager) is associated with all tag families automatically.

Creating Custom Components

You might have wondered where the components in the “Component” drop-down list actually come from. Wonder no more. That list contains some standard components, but you can also create your own, based on the standard ones.

To create a custom component

1. Click Tagged Pages in the Website section of the administrative interface.
2. Click Components.
3. Click the Create button on the upper-right corner of the list of custom components.
4. In the box after Tagged Component Name type a name for your component. Since we are creating a component for content manager, start the name of your component with “Content -“.
5. In the Format drop down select Content-1 Column. When you select Content-1 Column, a list of variables and other information will appear on the right side of the form.

   The limited size of the form means the information is a little cryptic, but the names listed inside square brackets are variables available to your component. And yes, we're getting right to the edge of doing actual programming, but fear not, this isn't that tough. You

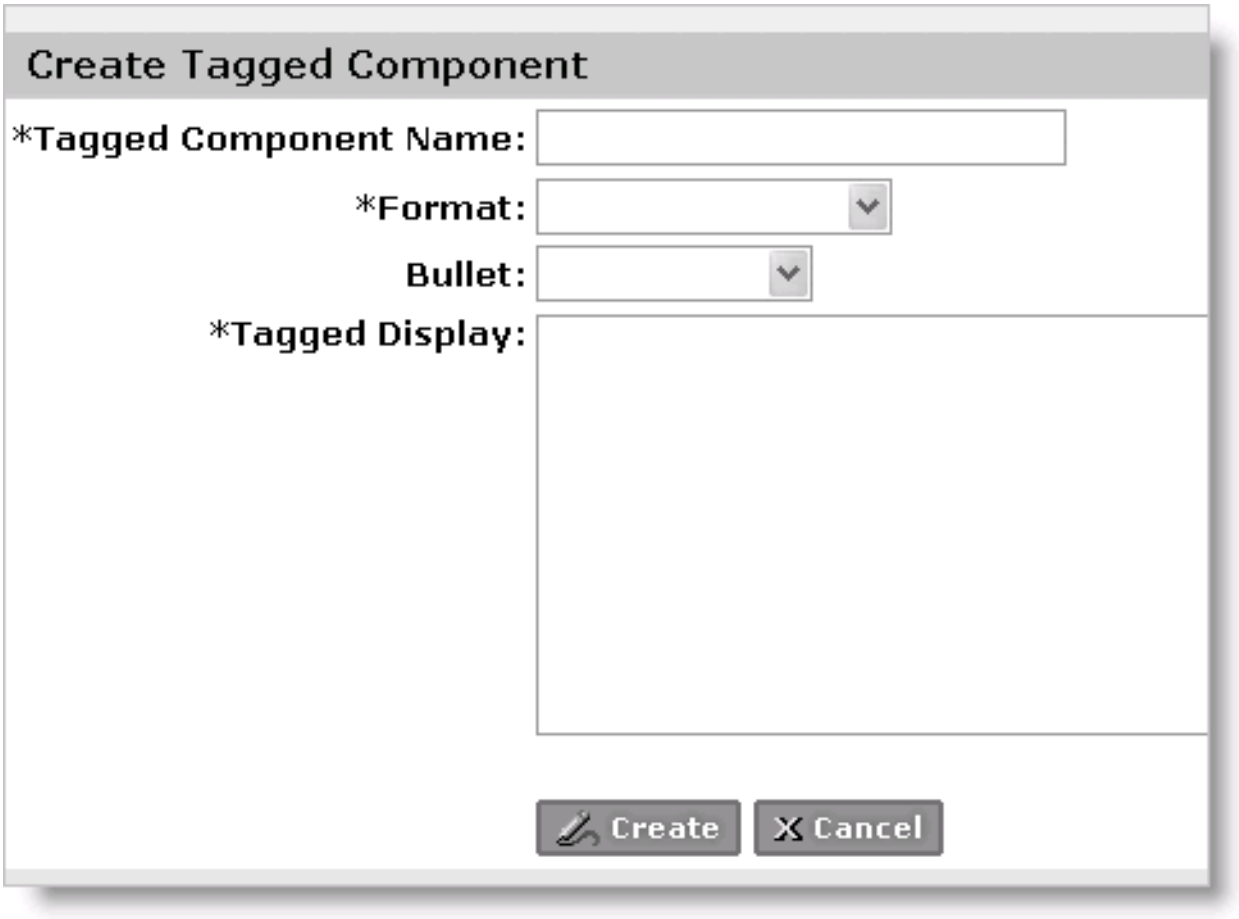
basically put one or more of these variables, along with whatever text and HTML you want, in the “Tagged Display” section of the form, and that's what the component will display on your page. For example, if you put “[Description]” in your display section, the component will display the description of any content records it retrieves. If you put “<Description>”, it will display the description and make it a link to the record.

Likewise “[Name]” will display the name of any content records the component retrieves.

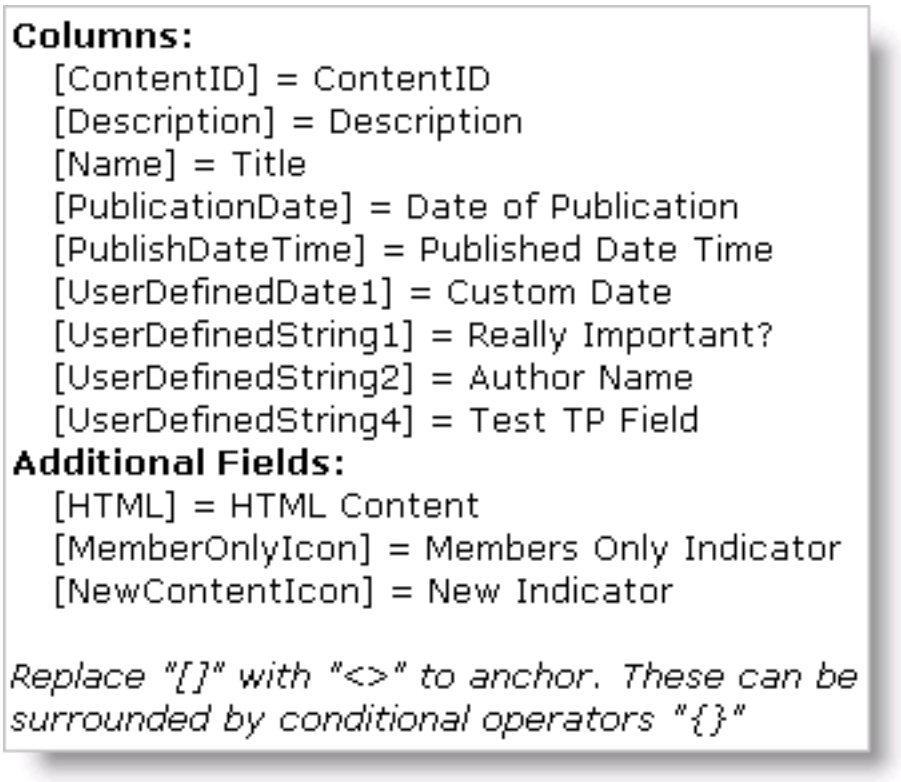
6. In the Tagged Display box, type “<Name> -- [Description]”.
7. Click Create.

You have now created a component that will show the name of a content record as a link to the full content record follow by two hyphens, then the description.

Note: Variable names are not case-sensitive.



Tagged Component Form



Fields Available in Content - 1 Column (includes UDFs)

Previewing Your Custom Component

Now that we've created your first tagged component, we're going to go back to your simple tagged page, add it in, apply tags, and see the results.

1. After saving your component, click on Layouts to return to the list of tagged pages.
2. Click the Edit button to edit an existing tagged page design (don't use one that's “live” on the front end!).
3. Using the component drop-down list, select the new component you just created.
4. Click the Save button.
5. Preview the tagged page to see how your component looks.

Things to Remember When Creating Custom Components

The process of creating custom components can give you great flexibility over how your information is displayed. Here are some good things to remember.

What Can Go Into the Tagged Display Field

The tagged display portion of your custom component determines what the component will actually display. This can be any combination of:

- Text
- HTML
- Variables

Again, variables displayed inside square brackets will output the value of the variable as text; variables inside greater than/less than signs will display the value of the variable as the text of a link to the full piece of content. Which variables are available will depend on the built-in component you have selected from the Format drop-down list.

There are some things you cannot do inside a custom component, but you can get very creative. One general principle to keep in mind is that whatever is inside the component will be executed once for every piece of content retrieved by the component. This means, for example, that you can not put a headline designed to be output only once into a component that may retrieve multiple pieces of content (if your component retrieves six pieces of content, it will repeat your headline six times).

Note: While the component editing form is small, you will be unlikely to run out of room when writing your tagged component code - the field can hold up to 4,000 characters.

Using the Conditional Feature

In the latest version of Tagged Pages, a conditional operator using “curly braces” {} is included. This is extremely useful if you have a variable that may not be populated 100% of the time - for example a content record description/summary.

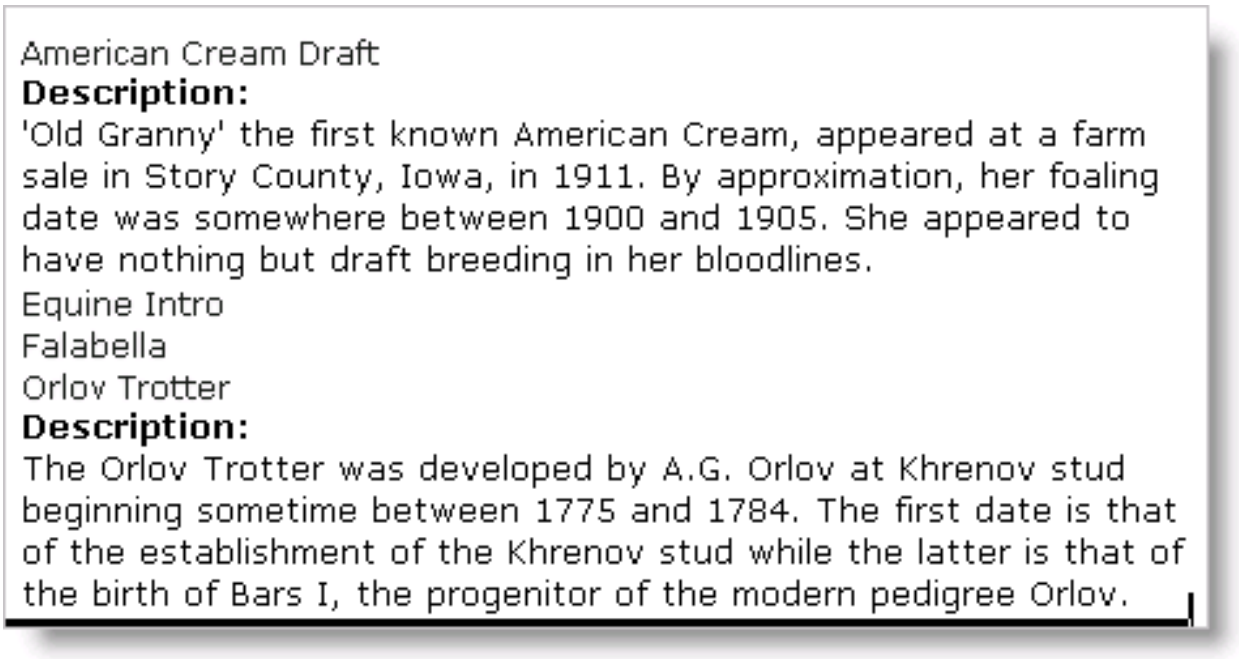
If you surround a portion of your custom tagged component code containing only one variable with curly braces and the variable has no value, nothing between the curly braces

will be output on the front end. This is very helpful if you want to output text and/or HTML formatting tags that will only be useful if the variable actually has a value.

For example, if most (but not all) of your content record have a description, you could do the following:

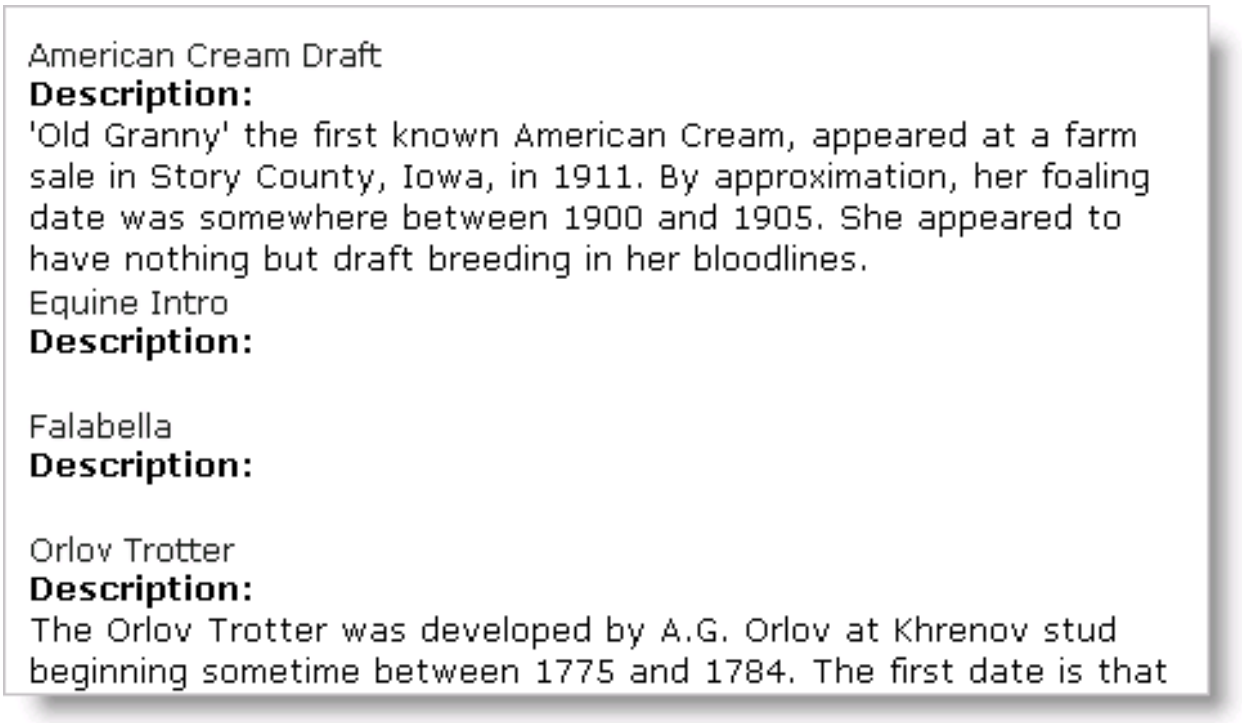
<Name>{
Description:
 [Description]
}

On the page, your component will output the description. Unless there is a description, the section of code between the curly braces will output nothing: no text, no bold tags, no break tags.



Output with Conditional Logic

The same component, without conditional logic, would output empty placeholders - there will be a heading that says “Description:” whether or not there is really a description.



American Cream Draft
Description:
'Old Granny' the first known American Cream, appeared at a farm sale in Story County, Iowa, in 1911. By approximation, her foaling date was somewhere between 1900 and 1905. She appeared to have nothing but draft breeding in her bloodlines.
Equine Intro
Description:

Falabella
Description:

Orlov Trotter
Description:
The Orlov Trotter was developed by A.G. Orlov at Khrenov stud beginning sometime between 1775 and 1784. The first date is that

Output, no Conditional Logic

Creating Bulleted Lists

One thing many users wish to do with custom components is build bulleted lists of links.

Using List Item Tags

The easiest (but probably not the best) way to create a bulleted list is to simply wrap list item (“
” and “”) tags around your link in your custom tagged component. Yes, it's true, strictly speaking, you haven't actually opened or closed your list using <UL> tags, but modern browsers will overlook this and display the results properly. For example, the code below will output a bulleted list of links using the name of each item as a link to the full content record. This produces a very simple output, but it is also reasonably clean looking and works well with a variety of background colors (except very dark ones).

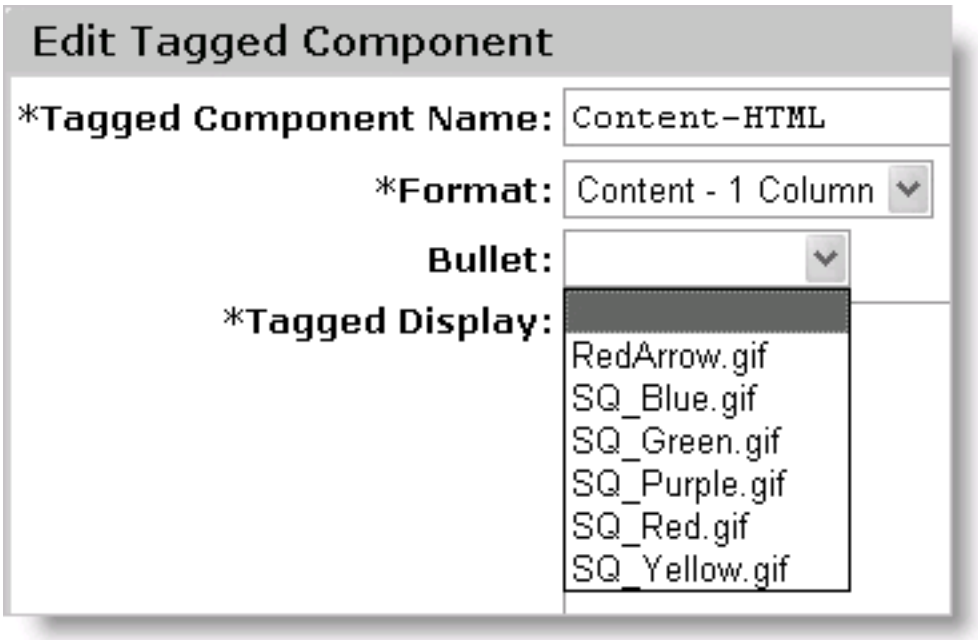
<name>

Bulleted List Using List Item Tags

Using Existing Graphical Bullets

The tagged page configuration setting TPBulletList includes a comma-delimited list of images stored in the Graphics directory which are intended to be used as graphical bullets for tagged page lists.

If TPBulletList contains at least one image, you will see a drop-down list for using bullets in the custom component editing interface. If you select one of the bullets, it will appear to the left of each record retrieved by the component.



Edit Tagged Component window

Adding Bullets to the List

Adding (or removing) bullets from the list requires directory permission to the Graphics directory for your site. In general terms, the process is as follows:

1. Find the Graphics directory for your Content Manager. One way is to use an existing bullet in a tagged page and then right-click on the bullet to show its properties. You can derive the directory information from the URL of the image.
2. Find the Admin/Graphics directory (used for back-end tagged page preview). Follow the same procedure as for the main Graphics directory, except instead of looking at the properties of a bullet in a front-end tagged page, look at the properties of a bullet in a back-end tagged page preview.
3. Place the bullet in the Graphics and Admin/Graphics directories.
4. Update the TPBulletList variable in the Tagged Pages section of the Site Settings interface.

We will assume that anyone with directory access will be familiar with the process of uploading images. To update the TPBulletList variable once you have uploaded your image(s):

1. From the administrative interface, click the Admin button. The list of Installed Modules will load by default.
2. Click on the Content Tagging link.
3. Click on the Configuration tab.
4. Add the filename of your new bullet to the comma-delimited list in the TPBulletList input.
5. Click the Refresh button at the bottom of the configuration settings page.
6. Be sure to set up a test component using the image, but it in a test tagged page and make sure it works on the front end and for back-end preview.

Note: Since tagged pages can use background colors, you want to make sure that your bullet images have a transparent background, not a white one. If your image is a white square with a red arrow in the middle, for example, it will look very odd on a gray page.

Removing Bullets from the List

To remove a bullet from the list

1. Look through all of your existing custom components and make sure you either choose a new bullet or no bullet (save with nothing selected on the bullet drop-down list) for each custom component using the bullet you plan to remove.
2. Update the list in Content Tagging configuration setting TPBulletList to remove your bullet (this will remove the bullet from the drop-down list in the component editing form).
3. Click the Refresh button at the bottom of the configuration settings page.
4. If you want to remove the bullet permanently, remove the file from both the Graphics and Admin/Graphics directory.

Using Files in the Images Directory for Bullets

While it is a better idea to use “official” bullets for the sake of consistency, there are times when you might want to use one of the images in your Images directory (the one accessible via the Image Manager). For example, if you don't have permission to access the Graphics directories and are only planning to use the bullet in a single component, using one of the files in the Images directory is a reasonable choice.

To do this you can simply insert an image (IMG) tag directly into your custom component code. All you need to do is the location and name of an appropriate gif or jpg in your /Images directory. The code below shows an example:

<IMG SRC=”/Customer/AM/Images/Bullets/BlueBullet.jpg”> <Name>

Note: You should be able to derive the location of your Images folder by previewing any image in the Image Manager and then right-clicking on the image to show its properties. The directory path will follow the base URL.

If you want to format your list more precisely, you can create a table around each item in the list (be sure to close any table you open inside the component so it doesn't affect the

overall table structure of your page). The code below shows an example (note that the TD holding the graphical bullet is fixed width, but TD holding the <Name> variable has no width specified, allowing it to “grow” as needed depending on the length of the Name variable's value.

```
<table border=”0” cellpadding=”1” width=”100%”>
 <tr>
 <td width=”15” align=”right”>
<IMG SRC=”Customer/AM/Images/Bullets/BlueBullet.jpg”>
 </td>
 <td><Name></td>
 </tr>
</table>
```

Using Inline Styles

The format of your website is controlled by a cascading style sheet (CSS), which will generally override any attempts to, for example, specify a particular font face. The thought behind this is to give your site a clean, professional look. However, when you are working in a custom component, you may want to do something very specific which isn't supported by any of the styles in your CSS. Yes, you could always add styles to your CSS, but that requires FTP or other access to your server, and any error you make will affect your entire website.

Another solution is to use inline styles inside a or tag. Inline styles are supported by all modern browsers, but nearly any book you get on cascading style sheets will tell you that inline styles are not a very good idea. It is true that using ad hoc inline styles in your HTML pages is not a good way to go - it can get you back into the same sort of “every page looks completely different” problem that cascading style sheets were designed to avoid. However, inline styles are an excellent way to create very specific effects within a custom component.

If you want to learn all the things you can specify in an inline style, you should get a good book on cascading style sheets. Inline style sheets use the same syntax as cascading style sheets, and while the syntax makes sense once you learn it, you'll definitely need to crack the books if you have no experience with CSS.

As an example of what you can do with inline styles, the following code will create a list of links. Each link in which there is a description (note the curly braces) will be followed by description in 10-pixel bold type, indented 15 pixels from the left margin to create a “hanging indent.”

<Name>{
 [Description] }

Note: You will not be able to use inline styles (or HTML) to affect the appearance of automatically generated links. Links created from variables (e.g. <Name>) carry their own style defined by a class attribute within the <a href=> tag, and will ignore your inline styles.

If you have a very specific idea in mind and want to create a different style just for the links generated by one component, it may be possible to “reverse engineer” links and create them yourselves in the component's code (you will have to insert ContentID as a variable in the Tagged_Page_Component_Column table). Getting such links to work will require some experimentation. If you want to change the style of all links on all tagged pages, you should edit the style sheets controlling tagged pages on the front end and tagged page preview on the back end.

Using Styles from the Style Sheet

In addition to defining inline styles, you can also use span tags in the following manner to apply any style in your site's style sheets.

This will appear as bold red text and this will appear as normal text.

A More Complex Inline Style Example

If you have web design skills (or someone on your staff does), you can use inline styles to move far away from the “list of links” appearance of a simple tagged page. The following example includes several non-obvious uses of styles and variables to create a bulleted list with graphical bullets and a rollover effect (spaces have been inserted for clarity). Note that the example uses the [ContentID] variable, which returns the unique numeric key of a particular content record. If this variable has not been set up in your software, you will have to do so by adding a row to the Tagged_Page_Component_Column table.

<SPAN onMouseOver="document.pic[ContentID].src='/Images/Training/Balcyan.gif'"
onMouseOut="document.pic[ContentID].src='/Images/Training/Balblue.gif'">

<img src="/Images/Training/Balblue.gif" name="pic[ContentID]" border="0">

</SPAN>

<Name>

[Description]

{ Last Updated: [UserDefinedDate1|dddd, dd, mmmm, yyyy]}

Let's take a look at the above example section by section. The first chunk of code, starting with “<Span onMouseOver=” sets up the graphical bullet with a rollover effect. In order to make the rollover effect work, we need to give each image in the list a unique name. To do this, we use the [ContentID] variable simply as a unique number generator. Note that each name also includes the string “pic,” which will result in an output such as “pic1178.” This is a necessary step. If you simply use an integer as an image name, the rollover will not work (and if you're an expert on the document object model, you probably know why).

We next output the name of the content record followed by a break tag. This will give us a link in the default tagged page link style class.

The next section, starting with the “<div” tag, is used to display the content record's description using an inline style that will display the description in small bold type with a hanging indent specified by the margin-left attribute.

And the last section, starting with “{<span”, will create an output such as “Last Updated: Monday, October 12, 2003” if the variable “UserdefinedDate1” has a value. The output will be further indented to the left, and will also be underline in pink. Since we are using curly braces, if the variable has no value, there will be no output from this section of code. And no, there is no particular reason why you would want to underline a date in pink.

Using Full-HTML Components to Display Text and Graphics

One of the simplest and most useful custom components you can create is one that simply displays the [HTML] variable. If a full-HTML component retrieves a content record with an HTML file, it will display the entire file (and only the file - any uploaded files or links will not be shown).

Some Things to Keep In Mind about Formatting

While some of the effects you can achieve by customizing tagged page components are amusing, you need to make sure that you don't end up with a strange and gimmicky looking output. One limitation to be aware of is that everything you add to the component will be produced once for each item found by the tagged page. If your tagged component retrieves 20 press releases and you've added an image link to the tagged component, your image will be repeated 20 times. For this reason, some of the effects described above are probably most useful if you know that your component will retrieve one and only one record (because you know that at any given time there will only be one record available with the unique combination of tags specified for the component).

Things You Cannot Do Inside a Component

While you can do many things inside a tagged component, there are some limits.

Components Cannot Execute ColdFusion Code

Components cannot execute ColdFusion code, so you can't (for example) add “CFIF” statements or use CFOUTPUT. Generally speaking, any ColdFusion code found inside a

tagged component will simply be written out in the page. Most browsers will simply ignore it.

You Cannot Change the Appearance of Links Generated by Variables

Wrapping greater than/less than brackets (< >) around a variable name will automatically generate a link to that record when the tagged page is viewed. The format of these automatically-generated links is controlled by a style sheet class called “TPLink.” There is no practical way to override this class definition from within a component, you would have to change the class definition in the style sheet (which will change it for all automatically generated tagged page links on your entire site).

Using Conditional Logic in Tagged Components

Consider a custom component with code such as the following:

<Name>
Description: [Description]

This will look fine if you are absolutely sure that your content records will always have a description. However, if a content record does not have a description, you will see the heading “Description:” followed by empty space.

The way to get around this problem is using curly braces {}. If you use curly braces to surround any collection of text, HTML and only one variable, nothing inside the curly braces will be output if the variable has no meaningful value. If you put [Description] inside curly braces, nothing will be output if there is no description in the content record.

To re-do our example using conditional logic, we would go back to the list of components, edit our component and replace the original text with:

<Name>{
Description: [Description]}

Formatting Dates in Custom Components

If you've tried to use a date variable in a custom component, you probably found that the output looked something like this:

2004-02-13 09:07:24.94

Beneath the list of variables on the component editing form, you'll see some instructions for formatting dates in friendlier format. The best way to learn how this works is to experiment. Write something like the examples but replace the “XdateTime” with the name of one of your date variables (for example “PublishDateTime”).

Some examples of date formatting would be:

[PublishDateTime|mm/dd/yyyy]	06/10/2004
[PublishDateTime|mmmm dd, 2004]	June 10, 2004
[PublishDateTime|dddd]	Monday

Time can be output in a similar way, except that instead of using the “|” character (called a “pipe” by programmers) to separate the variable and the output format, you use a colon.

Note: The PublishDateTime variable is a good one to practice with because it's simply the date and time when a content record was last published, and every published content record will have one.

User-Defined Fields (UDFs) in e-CM

e-CM provides five user-defined date fields, five user-defined character string fields, and five user-defined numeric fields. These user-defined fields can only be used with tagged pages and custom pages.

Requirements for using user-defined fields

- The Variable column displays the actual (system) name of the user-defined field as a link. You can select this link to populate the field's information in the form in the Modify Existing User Defined Field area so that the field can be edited.
- The Label column displays what users actually see in the user-defined field in a content record.
- The Req column indicates whether the field is required. If Y, the label displays in bold on the content record properties form and server-side validation will require that the field be populated when the form is saved (server-side validation also enforces the data type for

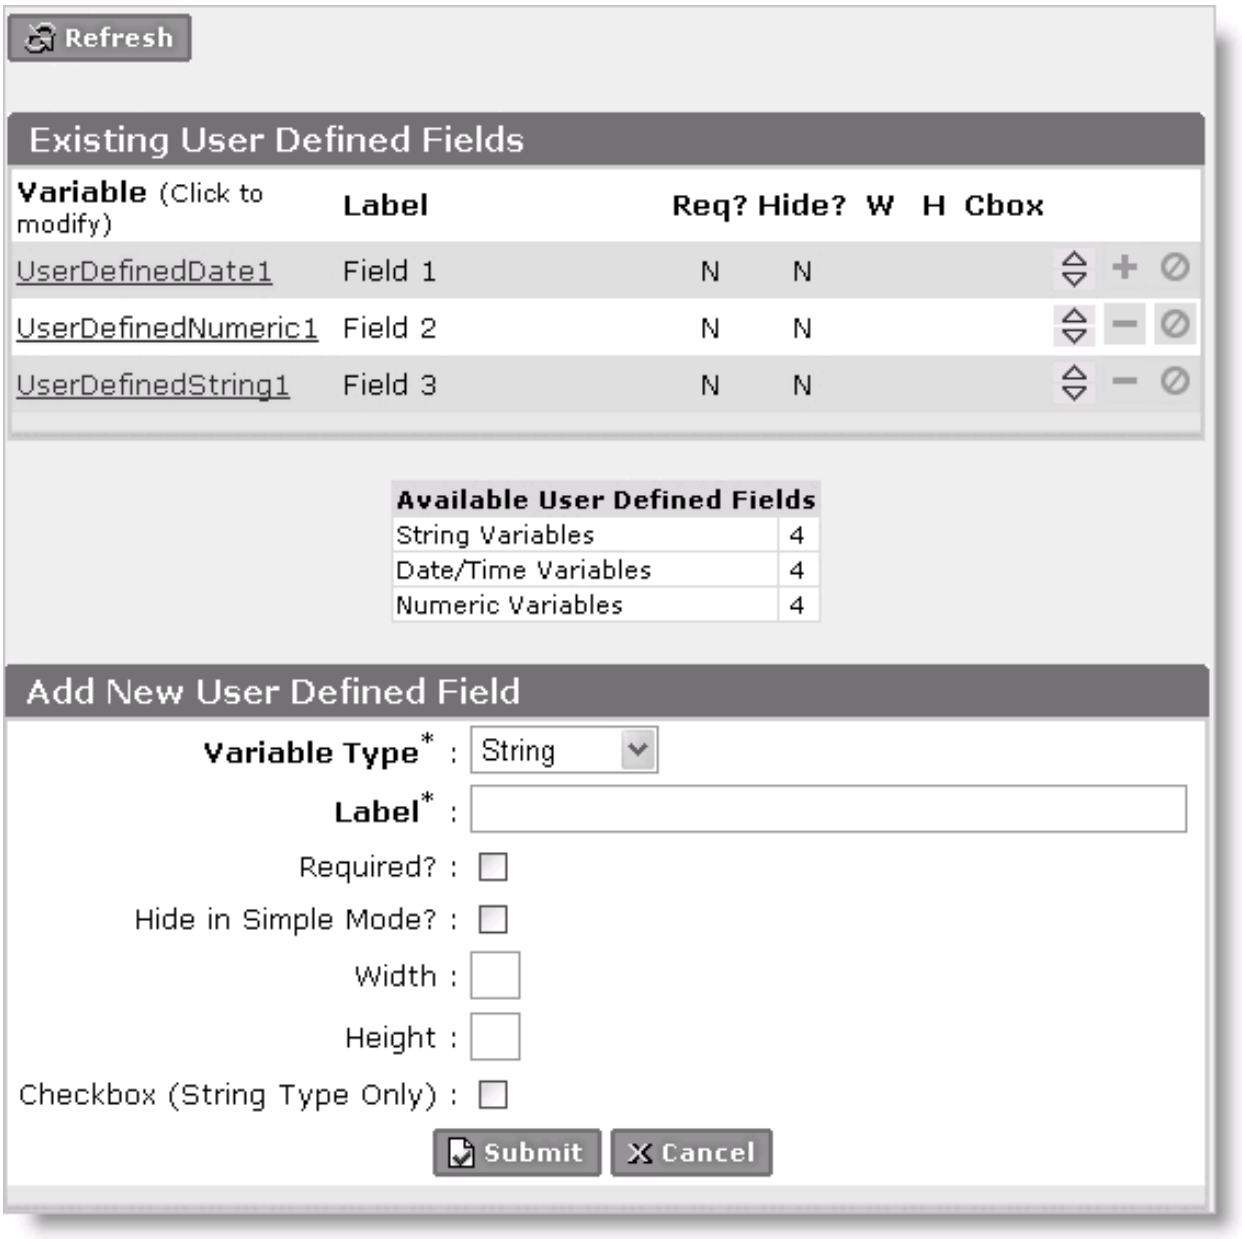
numeric and date UDFs).

- The Hide column indicates whether the field is hidden in simple mode.
- The W and H columns indicate the width of the field. If no value is displayed, the default width is used.
- The Cbox column indicates whether the field is displayed as a checkbox rather than as a text input. Checkboxes can be used to collect Y/N data in string-type UDFs.
- The Delete icon deactivates the field, but does not delete it, making the field available again for use as a user-defined field. All previously entered data for the field is cleared.

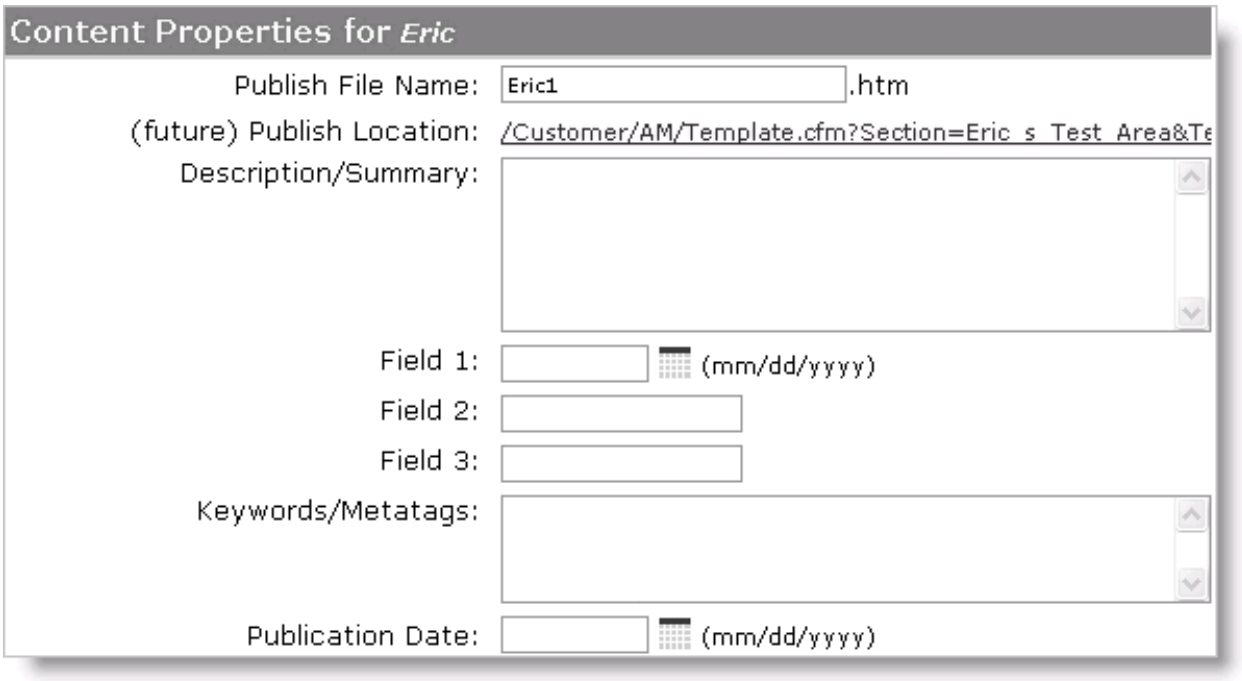
Understanding the UDF Editing Interface

The UDF interface has three parts:

- Existing User Defined Fields - Displays the configuration of the currently defined user-defined fields
- Available User Defined Fields - Displays the number of user-defined fields of each type that are not currently defined
- Add New User Defined Field - Used for editing existing user-defined fields and for defining new user-defined fields



User-Defined Field Editing Interface



User-Defined Fields in a Content Record Properties Page

What fields appear in a content record properties page is a result of the settings. Note that UDFs appear between the “Description/Summary” box and the “Keywords/Metatags” box, and that date fields include a pop-up JavaScript calendar which allows users to easily select an mm/dd/yyyy-formatted date.

Description of UDF Interface

The UDF interface has three parts: a top form which shows the configuration of fields already activated, a central display of how many fields of each type remain un-activated, and a form on the bottom for editing existing fields and activating new UDFs.

The List of Existing UDFs

The top of the UDF interface shows any existing UDFs and their status. Left to right:

Column Name

The actual column name in the Content table (e.g. “UserDefinedDate1”) appears as a link. Clicking on the link populates the UDFs information in the form at the bottom so that it can be edited.

Label

“Label” is what the user will actually see in a content record.

Req?

“Req?” indicated whether the field will is required - whether users will have to supply a value when they create or edit a content record. If “Y,” the label will appear in bold on the content record properties form and server-side validation will require that it be populated when the form is saved (note that server-side validation also enforces datatype for numeric and date UDFs).

Hide?

If this feature is checked, the UDF will be hidden from users in simple toolbar mode.

W and H (Width and Height)

“W” and “H” indicate width and height, if specified. If you don't specify a height and width, you get default values, which are a height of 1 for all types, and widths of 10 characters for date fields, 20 characters for character and numeric fields.“Cbox” indicates whether the field is to be displayed as a checkbox rather than a text input. Checkboxes can be used to collect Y/N data in character (“string”) type UDFs. When checked, the field will store “Y.” When not checked, it will be null.

Move Up or Down

The up and down arrows can be used to move UDFs up and down in the list. The order of the list reflects the order in which they will be displayed in the content record properties form. Moving the UDFs in the list will move their position in the content record properties form.

Plus and Minus

The plus + and minus - buttons indicate whether the fields should be activated as tagged page columns. If a UDF is activated as a tagged page column, it means three things:

- It will be available as a sort criterion in tagged pages.
- If the UDF is a date field, it will be available to specify a date range for the records retrieved.

- It will available as a variable when building custom components to display records in tagged pages.

To define a new user-defined field

1. Select Website.
2. Select Sites.
3. Select UDF Manager.
4. Define the field in the Add New User Defined Field area.
5. Select Submit.

To edit an existing user-defined field

1. Select Website.
2. Select Sites.
3. Select UDF Manager.
4. Select the user-defined field to edit in the Existing User Defined Fields area.
5. Edit the field in the Modify Existing User Defined Field area.
6. Select Submit.

To delete an existing UDF

The delete button does not delete the field, but inactivates it, throwing it back into the “pool” of unused UDFs. It also clears all previously entered data users have entered in the field, so consider carefully before doing this.

How to use UDFs in taggedpages

In a tagged page, you can use UDFs for three purposes:

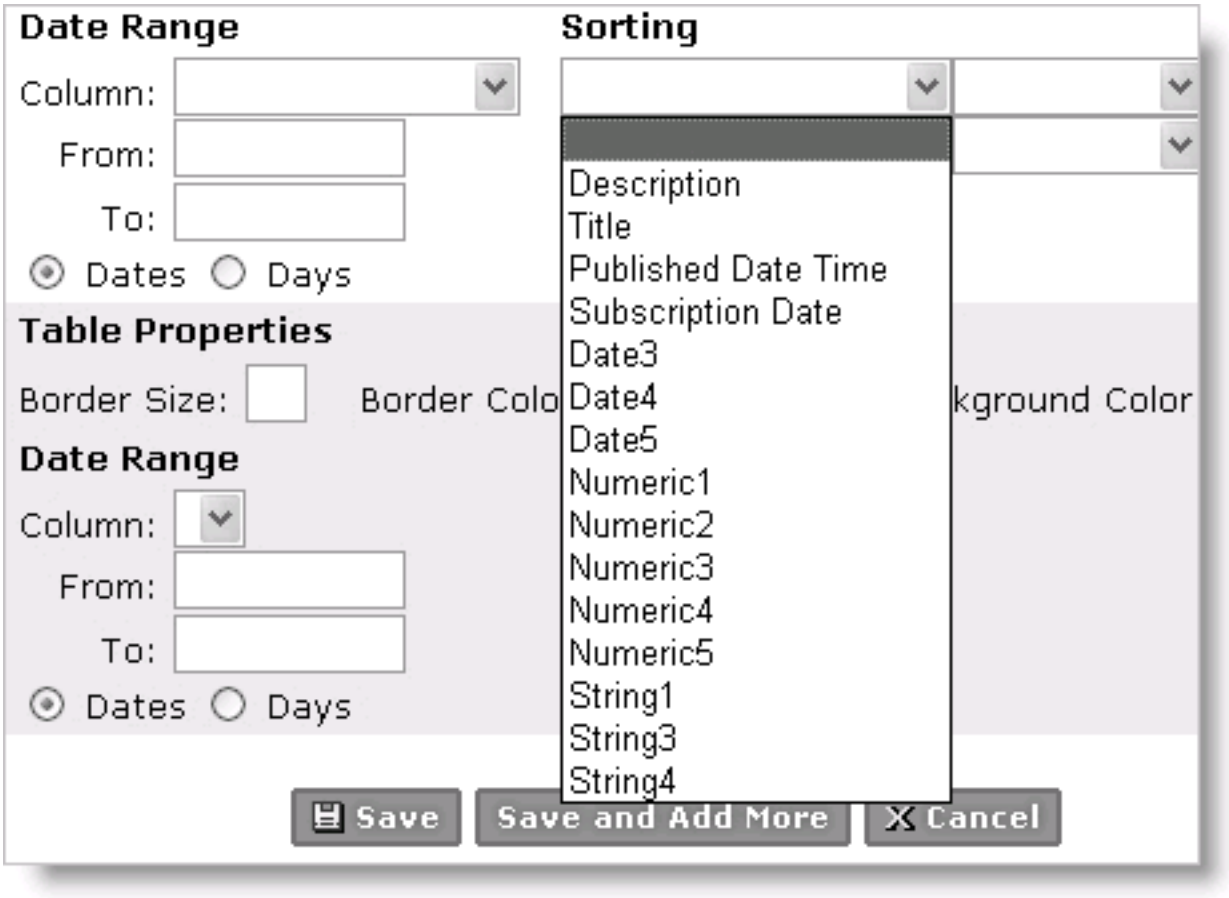
- Using a custom component, you can display the value of the field on a tagged page.
- Date UDFs can be used with the “Date/Column Range” feature to filter the records shown

by the page by date.

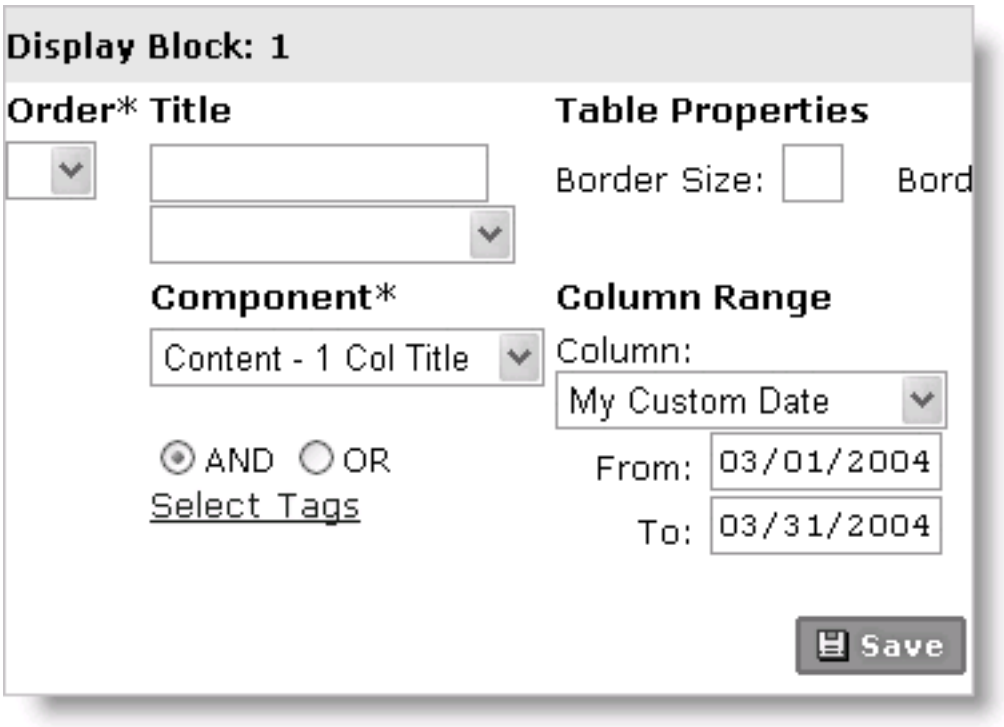
- Any UDF can be used to sort the records shown by a page.

  Sorting by a UDF

  You can use any UDF to sort the records retrieved by a tagged page. Several user-defined fields appear. To sort by a UDF, simply select it as either the primary or secondary sorting criteria and then specify Ascending or Descending order using the drop-down list to the right of the sorting drop-down.



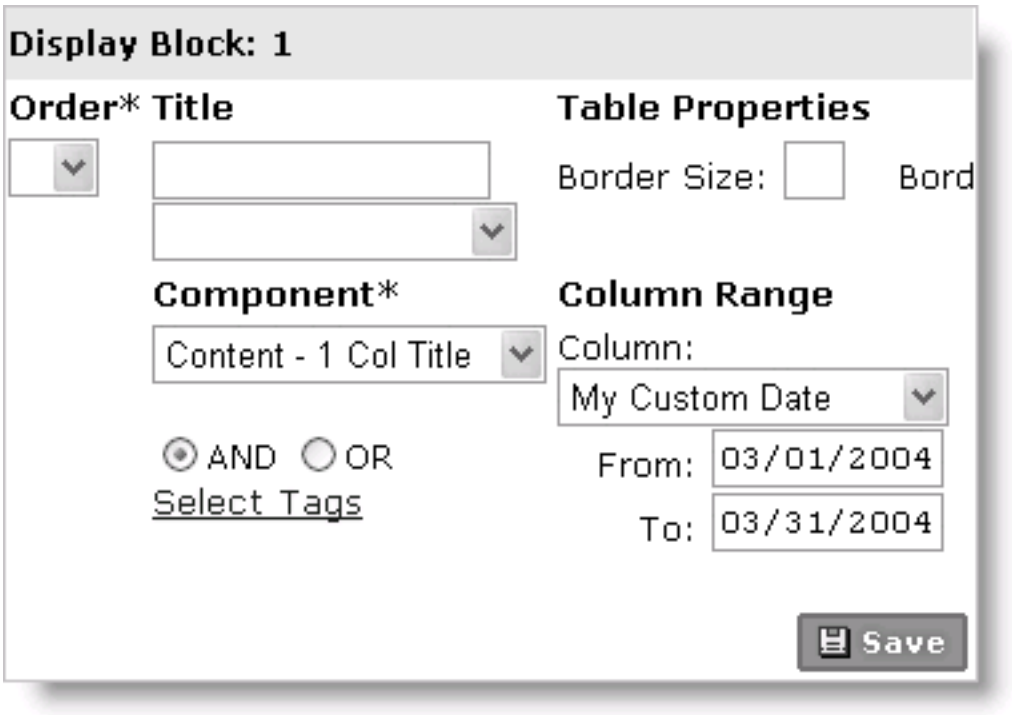
Sorting by UDF



Specifying a Sort Criteria in a Tagged Page Layout

Using Date UDFs to Filter by Date

Any “Date/Time” UDF will appear as a choice in the Date/Column Range feature in a tagged page. Here, a date UDF filters the output:

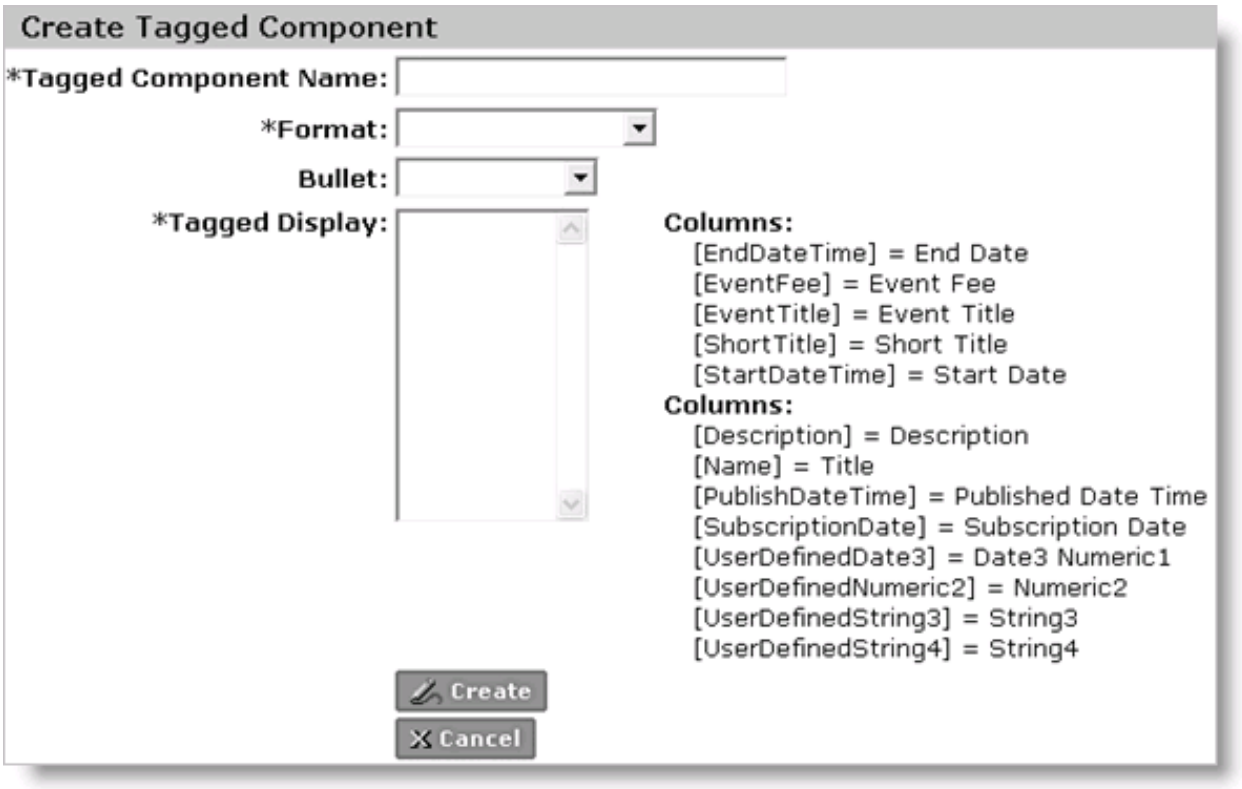


A Date Criteria Specified in a Tagged Page

Using UDFs in Custom Components

When user-defined fields (UDFs) are enabled for use in tagged pages, they will also appears as variables in the component editing form. The variable names will be the actual column name in the database (e.g. “[UserDefinedString3]” and the label used with the UDF will appear to the right of the variable name. If, for example, you wanted to display a field you are using to hold an Author Name in your tagged pages, and that UDF was using the UserDefinedString1 column in the database, you might put code in your custom component such as the following:

{
Author: [UserDefinedString1] }



Variable Names in Custom Component Form (Simplified and Compressed for Space)

Date of Publication and Search

If your website includes advanced search, you should be aware that UserDefinedDate1 is the date field which will be used when a user chooses to order search results by date.

Content Tagging and UDF Tables

This chapter is provided for reference purposes for site configuration and troubleshooting. If you use database administration tools to directly alter data in any of these tables, you may well disable important tagged page features, or make tagged pages unusable.

There are some cases in which you can accomplish certain “tweaks” by directly altering data. The information is accurate to the best of our ability to make it so, but the presence of information about altering data should not be interpreted as a guarantee from Advanced Solutions or its resellers and agents that doing so will not cause the application to malfunction.

Component_Interest_Category (Basic Linking Table for Tagging)

Component_Interest_Category is the basic linking table that is written to when a user tags something (for example, a content record in e-CM, an event in Event Manager, etc.).

The table has only three columns:

- Component Code: Two-letter code for the product involved (e.g. “CM” if the row reflects the tagging of a content record).
- InterestCategoryID: The unique numeric ID of the tagging category.
- ComponentID: The unique numeric ID of the item being tagged (the content record, the event, the product, etc.).

Should You Edit this Table Directly?

Unless you are doing mass tagging via a script or utility, you would generally use the ordinary e-CM interface to alter data in this table.

Component_Interest_Group (Active Matter Modules and Tag Families)

Component_Interest_Group is the table which determined which components (meaning products such as CM) can use which main (level-one) tagging categories and their descendants. This is what you are affecting when you use the Modify Components button on the admin interface.

In structure, it is a straight linking table containing only the two-letter component code and the InterestCategoryID.

Should You Edit this Table Directly?

Since altering data in this table is accomplished simply via the “Modify Components” interface, there is no reason to directly alter data.

Content (Holds Content Records)

This is the table that holds content records in e-CM. The fields relevant to tagging are the ContentID itself (which gets linked to Interest_Category when a content record is tagged) and the various user-defined fields which can be enabled in tagged pages.

Should You Edit this Table Directly?

You generally would not directly alter data in the Content table except during initial content migration to populate content.

Interest_Category (Tagging Categories)

General Purpose of Interest_Category

This is the table which stores the tagging categories. The fields used by tagged pages are the unique identifier InterestCategoryID and the Name column, holding the primary key and the description of the tag as seen by admin users respectively.

Should You Edit this Table Directly?

Since an interface exists and since some of the columns determining parent-child relationships between categories are not intuitively obvious, there is no obvious reason to alter data directly in this table. In fact, doing so would be ill-advised.

Tagged_Page_Color_Ref (Colors for Tagged Page Tables)

General Purpose of Table

This table holds colors (hex values and descriptions for administrators) used for the table and border colors in the tagged page design interface. Default colors are:

TaggedPageColor TaggedPageColorDesc

---------- ----------

#000000 Black

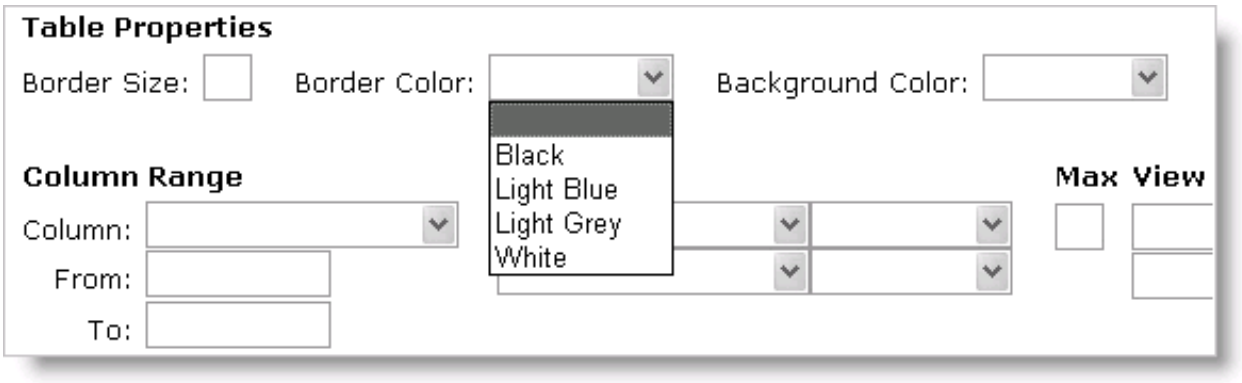
#CCCCCC Light Grey

#FFFFFF White

Typically, additional colors would be loaded into this table (there is no interface) to match a client's design colors.

Should You Edit this Table Directly?

This table should have its data directly altered before deployment to provide additional color choices in the tagged page editing interface.



Tagged_Page_Color_Ref in Action

Tagged_Template (Built-In Components)

The Tagged_Template table holds information about “built-in” tagged page components such as “Content - 1 Col Title.” In effect, this table “registers” these components, and includes information about which components belong to which programs (for example, Event Manager). Components in this table will appear in the drop-down list of components in the tagged page editing interface if their parent application is activated in the Component_Ref table.

Should You Edit this Table Directly?

You would not alter data in this table under normal circumstances. If your aim is to remove un-needed components (e.g. to remove Event Manager components if Event Manager is not being used), you would want to set Component_Ref.TaggableFlag to “N,” not remove rows from “Tagged_Template.” If you remove rows from Tagged_Template and the customer later purchases the module involved, the module's components will not appear, causing much puzzlement.

Tagged_Template_Field and Tagged_Page_Component_Column

Tagged_Template_Field and the somewhat similar Tagged_Page_Component_Column table together hold information that enables, disables and configures the variables that are available to tagged pages and their components.

Note: Which variables end up in which table is a reflection of the internal design of the tagged page code. The only practical implication of the difference for administrative

users is knowing that only the fields in the Tagged_Page_Component_Column table can be used for sorting and filtering tagged page output.

Tagged_Template_Field

The Tagged_Template_Field table holds variables that the built-in components are hard-coded to recognize and associates those variables with a specific component. In CM, these are the variables [HTML], [MemberOnlyIcon] and [NewContentIcon]. These variables are available for display in custom components, but are not used for sorting or for the column range feature. Columns in the table:

- TaggedTemplateID: Which specific built-in component in the Tagged_Template table does this apply to?
- FieldName: Actual column name in the Content table.
- FieldDisplayName: Name to show administrator in component editing interface.
- ActiveFlag: If “Y” variable is active.

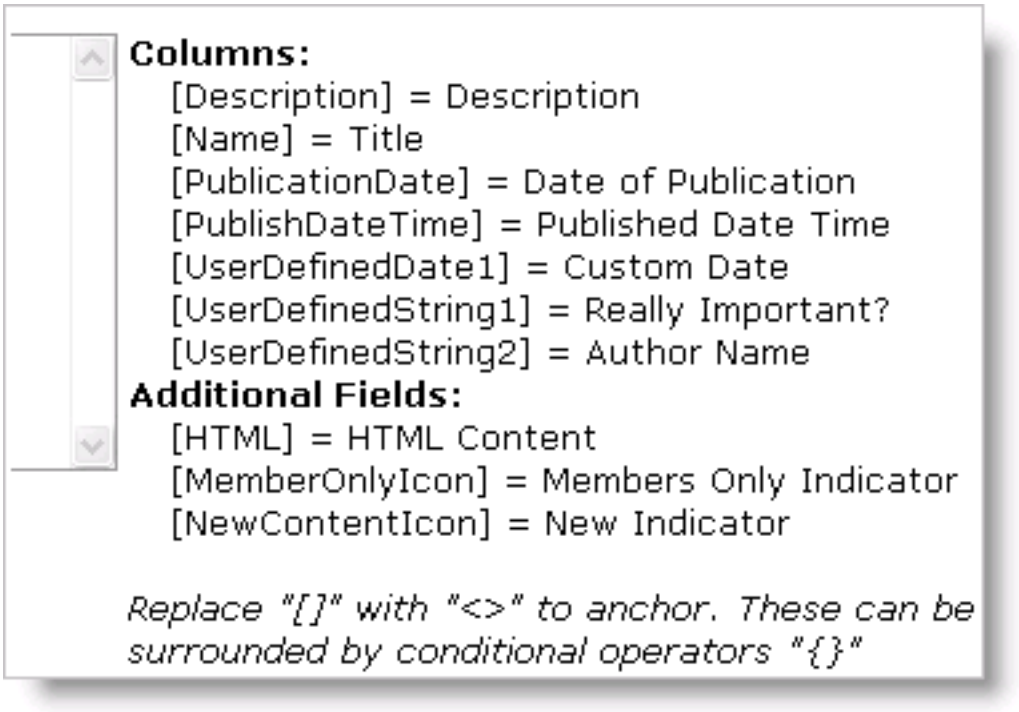
Tagged_Page_Component_Column (UDFs and Standard Variables)

Tagged_Page_Component_Column handles user-defined fields (UDFs) and a collection of standard variables which are available to all custom components associated with a particular program (e.g., Content Manager). In e-CM, the two standard variables are [Name] and [Description]. The names of variables match the actual column names in the database. The variables in Tagged_Page_Component_Column can be used in sort or the column range feature. Important columns in this table include:

- Component Code: Two-letter code for component (e.g. if this is an e-CM variable, “CM”).
- ColumDisplayName: A descriptive name displayed to the user (for example, the descriptive name for [Name] is, by default “Title”).
- RangeFlag: If “Y,” variable is active in tagged page column range feature.
- ActiveFlag: If “Y,” variable is active in tagged pages - it appears in custom component editing interface and also as a sorting criteria on the tagged page design interface.

- ColumnType: This column needs to be populated only if the field is a datetime or numeric datatype, in which case it must say “date” or “numeric.”

  Note: The typical symptom of problems with the data in these tables is a partial or complete lack of variable information on the right side of the interface when a user is attempting to create or edit a custom component.



Variable Information Properly Displayed in Component Form

Should You Edit this Table Directly?

The only common reason to directly alter data in Tagged_Template_Field would be if you do not want one of the default variables to be active. In that case, you could set ActiveFlag to “N” in the appropriate row(s) - remember, you will have to do it once for each component you wish to inactivate the variable in.

You could also activate additional variables corresponding to other columns in the Content tables by adding rows for those fields, but be careful, test your work carefully, and keep in mind that Advanced Solutions makes no guarantees that any specific variable will work as you intend it.

The UDF Manager currently handles all data in the Tagged_Page_Component_Column table with the exception of the RangeFlag, which enables a variable to appear in the Column Range feature in tagged pages.

Note: If you are copying and pasting data into either of these tables via Enterprise Manager, you should first copy and paste to a text editor such as Notepad in order to ensure that you do not include any newline/linefeed characters, which will break the JavaScript on the Tagged Page editing interface and make it unusable.

It holds information on user-defined fields, including the following:

ColumnName: The actual name of the field in the Content table, for example, “UserDefinedDate1.”

ColumnDisplayName: The name that users will see in the tagged page interface and the tagged page component interface.

Tagged_Page_Format_Ref (Images Representing Layouts)

This is a purely internal table which sets up names and big and small images for the tagged page plans (1 through 7).

You would never want to change any data in this table.

Tagged_Page_Format_Type_Ref

Another purely internal table which sets up two types of tagged pages, T for tagged (the designs 1 through 7) and C for custom pages (pages built by users based on the 7 built-in plans). You would never want to change any data in this table.

Tagged_Page_Interest_Category (Adding Tags at Link)

This is the table which is populated when you add an additional filtering tag at a tagged page link. The only two columns are the ID of the content record involved and the ID of the tag involved.

You would never want to change any data in this table.

Filtering Tag Applied at a Tagged Page Link

Tagged_Page_Layout

Stores basic info about tagged pages, including what plan (1-7) they are based on and what their name is.

You would never want to change any data in this table.

Tagged_Page_Portlet (Each Component in a Specific Tagged Page)

Each component in each specific user-designed page is registered here, including things like headline, max rows, border color, whether to use “AND” or “OR” for tags, sorting criteria, and in the case of custom components the user-defined content (the stuff you type into the textarea). Foreign keys also link the specific component instance to the tagged page section (individual display block in an individual user-designed page) it is in and the built-in component (e.g. “Content - 1 Col Title”) that is being used to support output.

You would never want to change any data in this table.

Tagged_Page_PortletIC (What Tags Used by Each Component)

Determines which tagged page categories are associated with which component in specific tagged pages (which tagging categories the components are looking for.) In other words, if you tell a specific component to grab content based on 3 tags, it will write 3 rows in this table. It connects the TaggedPagePortletID from the Tagged_Page_Portlet table on the InterestCategoryID from the InterestCategory table. That's all - just a straight linking table with those two fields.

You would never want to change any data in this table.

Tagged_Page_Section

Holds information about each display block in a user-defined page, including which specific display block it is in, the width (if specified), and what user-designed page it is in.

Tagged_Page_Title_Ref

Populates the drop-down for user-defined page title options (e.g. “Blank/No Title”).

You would never want to change any data in this table.

Tagged_Portlet

Holds basic info on all the components, built in and user-defined. Also holds info about which standard components the user-defined ones are based on.

If you are getting components you don't want in tagged pages, (e.g. newsletter components for a customer who does not have Newsletter Manager), you can eliminate them by deleting rows in this table, but a better way (because it's easily reversed) is to set ComponentRef.TaggableFlag to “N” for the component involved.

Tagged_Section

This sets up the display blocks in each built-in tagged page layout (1-7). Each display block within each page has a unique numeric id and 2-letter code. Each block/section gets a name for display - simply a number, before which “Display Block” is inserted in the interface.

You would never want to change any data in this table.

Tagged_Section_Template

Relates display blocks (unique display blocks, of which there are currently 19 on the 7 built-in page designs) to the built-in tagged page components (of which there are currently 18) which may be used within them. This is a simple two-column linking table with integers in each column.

Be aware that two-column components are not linked to some of the narrower sections (but could be if the data were added to link them).

Tagged_Template

Relates the built-in components to their actual files and their components (for example, Content Manager, Press Releases, etc.).

You would never want to change any data in this table.

Tagged_Template_Field

Registers the “Additional Fields” on a component-by-component basis for built-in components. For example, this is where the Content-1 Column Title component receives the [HTML] variable. The tagged template ID (the first column in the table) corresponds to the primary key of the built-in component (see “Tagged_Template” above).

You would generally not want to alter the data in this table.

User_Defined_Field

This table holds the basic information for each currently active user-defined field. There is no reason to access this data directly because it can all be changed via the UDF Manager. The table contains one row for each active UDF. The nature of most of the data in the table is straightforward with the exception of the mysterious-sounding “SimpleAdvancedFlag” column. This field (either “S” or “A”) determines whether the UDF is shown in “Simple” toolbar mode, which collapses the content record properties form to show only essential form inputs. If “A” it is hidden in simple mode, if “S” it is not hidden in simple mode.

URL Manager

The URL Manager allows you to create a short form URL for links to your website.

To create a url map

1. Go to the iMIS Website Administrative Portal.
2. Select URL Manager from the left menu.
3. Click Add.
4. Enter a directory name for your web page.

/map

5. Enter short form URL for the web page.

   AM/Template.cfm?Section=Asia_Pacific11&Tem-
   plate=/TaggedPage/TaggedPageDisplay.cfm&TPLID=19&ContentID=9682

6. Click Save.

   Note: You must use https:// and the fully qualified path for pages which are SSL enabled.

Using .NET pages on .ASP sites

eCM 5.1 and Template Gallery - support ASP pages

Content Manager version 5.1 allows you to serve ASP pages. Options for standard templates, printer-friendly pages, and text-only pages are subsequently added to the Website Properties page. All existing templates have been added in an ASP format as well. This supports your .NET applications and websites.

Create a template in ASP.NET

The Website Properties page provides an option to construct ASP.NET templates in place of ColdFusion templates. This option is provided when you are creating the website. Depending on your choice, template header and footer drop-downs and master page drop-downs are hidden or displayed dynamically on the website properties page.

- If you use Template Gallery to create the website, a master page and HomePage.aspx are generated.
- If you manually create a website, there are three new prompts: the website master page, printer template master page, and text-only template master page.
- If you use the Create Tutorial Site using ASP.NET template option, you see the same master page prompts as when you create a website manually.

  Note: It is also possible to create both ColdFusion and ASP.NET templates for the same website.

ASP.NET master template options

You can create an ASP.NET template on the Website Properties page. Set the Which platform will the site template use, prompt to ASP.NET. This choice can be changed later from the Website properties page.

Once the ASP.NET option is selected, three drop-down menus allow you to choose the master pages which control the look and feel of the template.

The options are:

Standard Template - Which master page file should be used with this website?

Printer friendly version - Which master page file should be used for the printer template?

Text only version - Which master page file should be used for text template?

To create an ASP.NET template

To use both ColdFusion template and the ASP.NET master page simultaneously in e-Content Manager 5.1 you need to save the website properties changes twice.

1. On the Website Properties page, specify the platform for the website as ColdFusion.
2. Select header and footer files for the ColdFusion site.
3. Save the changes.
4. On the Website Properties page, switch to the ASP.NET platform.
5. Select the ASP.NET master page.
6. Save changes.

Note: Saving the second time does not clear the header and footer choices made for the website.

Creating the tutorial website for ASP.NET

From the Create drop-down, select Create Tutorial Site using ASP.NET template. The setup wizard has an option for choosing ColdFusion or ASP.NET for the tutorial site. This enables you to choose an ASP.NET master page for the tutorial site.

Templates determine type of page

You can set the search properties of each website to include or exclude other e-CM sites. The search results can include content that was placed in both .asp and ColdFusion templates. Search items are displayed in the templates from which they originated. The url of the search item will indicate the type of the original template, .asp or ColdFusion.

If you don't want to allow searches on other e-CM sites, on the Website Properties page, you must set, Would you like this website's search to include content from other sites that allow it?, to No.

Reviewing Surf to Edit

Content producers can add an icon to their web browser to allow them to surf the website as a normal user and then select this icon when they see a page they need to edit. The user must have permissions to access Site Navigation. If a properly authenticated user selects the CMS Admin icon, the administrative page that allows editing of the particular content the user was viewing is displayed. This is especially useful for locating pages that need to be changed based on content tags or keyword search results.

Understanding How Surf to Edit Works

The surf-to-edit icon that is created on the user's web browser tool bar is a link to the Surf-To-Edit page within the CMS system. This page determines which content the user wants to edit based on the URL that the user was viewing when the AM CMS link was selected.

Once the location of the page to be edited has been determined, the user is redirected to this page and the user's modification permissions for the page are verified. If the user has permissions to modify the content, the user's web browser displays the Content Editor (Ektron) with the content item automatically placed in the Working state. For other types of content (for example, product display within the store or event display within Event Manager), the user's web browser displays the administrative interface for the item.

Understanding Surf to Edit Requests

If a user surfs to a piece of content that the user does not have authority to edit, a message displays and the user can send an edit request to the content owner if needed. The

user must have permissions to access Site Navigation.

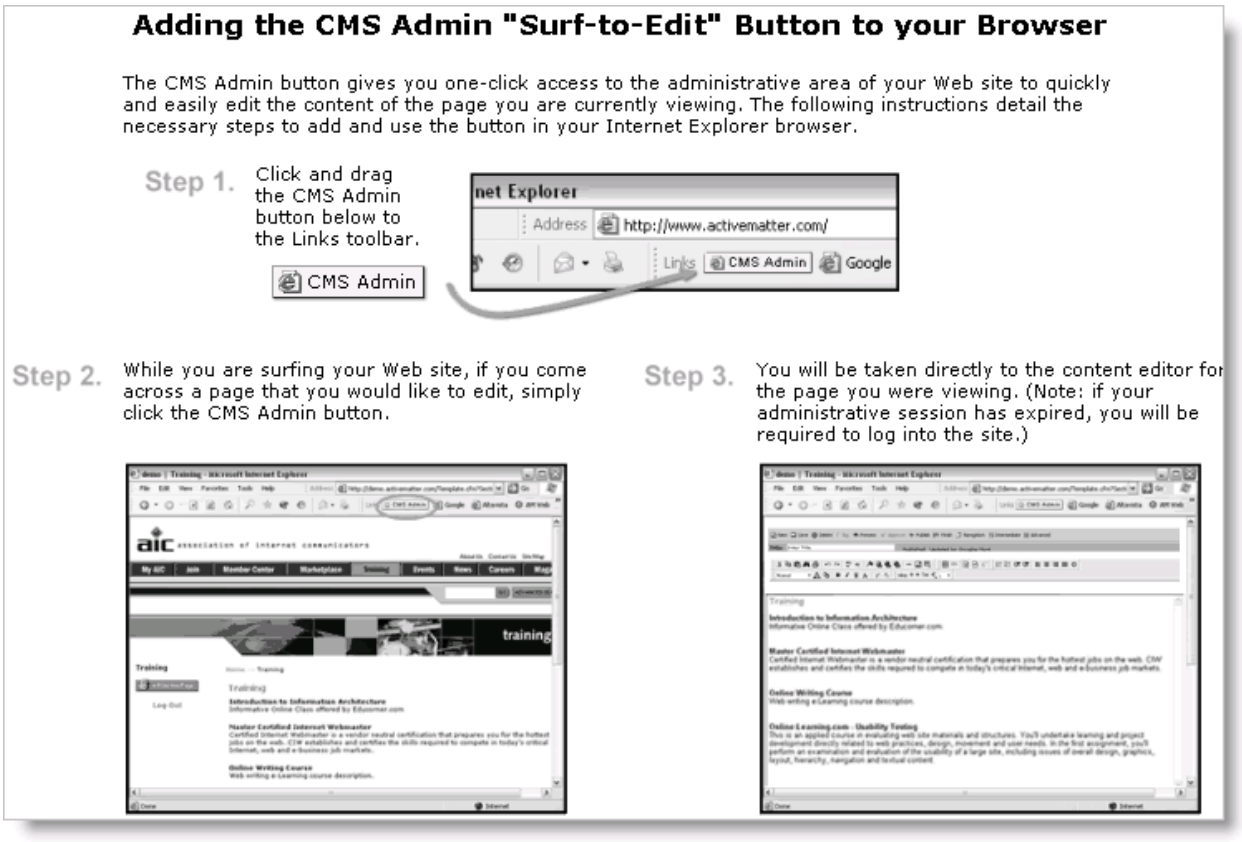
If the user elects to send an edit request to the content owner, a page displays to allow the user to send the request to the content owner. If the content is in the Working state, the request is sent to the user who is working on the content. If the request is in any state other than Working, the request is sent to the user who most recently modified the content.

Note: In some cases, the request may be sent to a user who recently modified the content, but who does not have authority to approve and publish the content. This user should be familiar with the content and will probably know how to get approval for any changes.

Setting up Surf to Edit

To enable Surf to Edit

1. From the e-CM Admin page, select Site Navigation.
2. Select Surf to Edit.
3. Follow the instructions on the page to set up surf-to-edit for your web browser.



Adding the CMS Admin Surf to Edit

To send a request

To send a request to modify a particular piece of content you must first be logged in to e-CM so the system will “know” who you are. Once you are logged in:

1. If you have not yet installed the surf-to-edit link on your browser, go to the administrative interface; select Website> Site Navigation> Surf to Edit. Follow the instructions on the right to install the link on your browser.
2. Find the page you would like to modify on the front end of the website.
3. Select the surf-to-edit link from your browser's links section.
4. When asked if you would like to send a request, click OK.
5. Fill out the form.
6. Click Send.

The request will now appear in the user's request queue and the user will also be notified via e-mail.

Note: In some cases, e-CM will not be able to determine which content is being displayed on the front-end. In that case, you will be given a link to the content management interface.

This table contains only one row, and one column for each potentially active UDF. Each column name corresponds to a specific UDF (e.g. “UserDefinedDate1”). If the field is active, the column contains the UDFs label (the name for the field displayed to the user on the content record properties page).

Using the Template Gallery

Each template of the Template Gallery is associated with several designs. The designs contain the color scheme, font definitions, and placeholder images that appear in the template you choose. You can modify any template to reflect your organization’s branding and place appropriate content in the pages.

Changing the Content Areas

The content areas on each template define where you will place your own content, images, or functionality on the page. Each template is divided into several content areas with associated content records. Each content area can hold a variety of material — images, HTML, tagged pages, a list of links, and functionality. For example, you could put in a login box or news feed.

The template layout PDF identifies the content areas on your website. While choosing a template from the Template Gallery, you downloaded the template layout PDF from the Layout Details for Layout page.

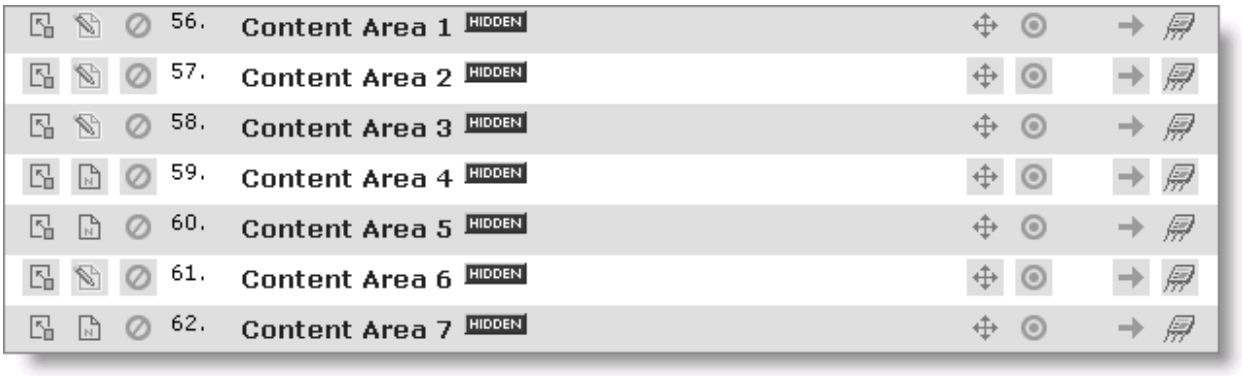
To modify the template content areas

1. Review the template layout guide PDF and choose the content areas you would like to customize.

2. From the list of navigation items for your website, find the content areas that are listed for your template marked as Hidden. If a navigation item doesn't contain a content record, you can delete or add content.
3. Edit the content record.

- Note: If you plan to insert a new graphic into the content area, you need to resize the graphic to fit the new content area.
- Note: You cannot add content areas without using ColdFusion to edit the Header, Footer, and Template files.

4. Republish the site.



Content areas marked as Hidden

Modifying the Template Style Sheet

Cascading Style Sheets (CSSs) are a simple mechanism for adding style elements to a website, including fonts, colors, and spacing. e-CM uses the CSS to control the look and feel of your website. Each template has a unique CSS. The Template Gallery does not lock you into any of the style definitions. You can modify the template CSS to suit your needs.

Templates have an associated style sheet that is identified on the template layout PDF. Each CSS contains the number of the associated template in the file name. For example, the style sheet for template 1501 is named 1501_layout.css.

To modify the CSS

1. Review the colors, font sizes, and other design elements in your website.

   Note: When picking new colors for your site, choose web-safe colors.

2. Choose the styles you plan to change. Here are some common elements you may want to change.

- Width and height of image areas
- Background colors
- Font family, size, and color
- Search Box styles
- Breadcrumb styles

3. Open the style sheet identified on the template layout PDF. The original Template Gallery style sheets are located in \Customer\AM\Templates\LayoutCatalog\[LayoutID]\CSS

   Note: If you have applied a new template, the template file will be saved to a different directory (see "Locating Template Gallery Files"), and the file name will include a date stamp.

4. Change the styles to your preferences.

5. Refresh the site.

Modifying HierMenus

Javascript HierMenus are very powerful and flexible hierarchical menu scripts that control the drop-down menu behavior on websites. The Template Gallery Layout Footer file contains a custom tag that defines the attributes for the drop-down menus on the home page. You can modify the HierMenu drop-down attributes in the footer file.

To modify the HierMenu

1. Locate the LayoutFooter ColdFusion file for your template in the Customer\AM\Templates\TemplateFooter directory.

The footer file name consists of the last saved date, the template name, and the cfm extension, example: ...1502_layoutFooter.cfm.

2. Search in the file for <TemplateDropDownRenderTag.cfm>.
3. Modify this code to change the Heir Menu font, color, background, etc.

   Note: You can adjust the X and Y cooridinates of the HierMenus from the Website Properties page under the Will the Website use pop-up windows? option. Negative values move it to the left or move it up; positive values move it to the right or move it down.
4. Save the file.

Locating Template Gallery Files

The Template Gallery wizard creates the files which comprise your website. The floor plan is an encrypted template ColdFusion file that calls on other files to build your website. Only files that control the website look and feel can be edited. Locating the correct file is critical to your success in modifying the website.

Master File Locations Set in Website Properties

The following is an example of the filename and location setup by the wizard and displayed in the Website Properties page. This is the filename and directory for the master file.

- 1501_Layout.css
  \Customer\AM\Templates\LayoutCatalog\1501\CSS

  Note: Any change made to the master files of a template will propagate to websites subsequently created using the template.

New File Locations after Reapplying a Template

Each time the wizard is run for a site, it will generate new files and new directories for the new layout. To prevent new files from overwriting files used with existing websites, the following prefix notation is appended onto certain file and directory names.

[Prefix] = [SiteName]_[LayoutID]_[DateTimeStamp]

Example of New Prefix

For example, a site was originally named MTFuji and the wizard is rerun with the layout for template 1502 on June 29, 2005 at 4:05:33 PM (server time).

- Master File Name
  [MTFuji]_[1502]_20050629T160533.css
- New Directory Name
  Customer\AM\Styles\LayoutStyles\[MTFuji]_[1502]_20050629T160533

  Note: Changes made to the timestamped file will only appear in the corresponding web-site.

Customizable Template Gallery Files

CFM Files

The layouts are described by three ColdFusion files which contain the logic and cfmodule tag calls used to render the site with its mapped navigation and content items. When a new template is applied, these files are placed in a new directory and renamed. These files are not encrypted and can be customized. The three cfm files are described below.

Layout Homepage File

The [LayoutID]_HomePage.cfm file renders the home page table which contains all of the homepage content areas.

- Master Location and Filename
  \Customer\AM\Templates\LayoutCatalog\[LayoutID]\CFM\[LayoutID]_Lay-outHomePage.cfm
- New Location and Filename
  \Customer\AM\Templates\TemplateHomepage\[SiteName]_[LayoutID]_
  [DateTimeStamp]_LayoutHomepage.cfm

Layout Header File

The [Layout]_LayoutHeader.cfm file includes the primary and secondary navigation calls and utility module calls, such as text only, breadcrumbs, and print this page. The struc-ture of the interior pages is defined by the table styles and definitions in this file. The first

table defined in this file contains the content areas that are constantly displayed at the top of the homepage and interior pages.

- Master Location and Filename
  \Customer\AM\Templates\TemplateHeader\[LayoutID]LayoutHeader.cfm
- New Location and Filename
  \Customer\AM\Templates\TemplateHeader\[SiteName]_[LayoutID]_
  [DateTimeStamp]_LayoutHeader.cfm

  Layout Footer File

  The [LayoutID]_LayoutFooter.cfm file can contain cfm module calls for content areas and utility calls for footer area utility links. The main menu on the template is controlled by the LayoutFooter file. This file contains a custom tag that defines the attributes for the primary menus. The code for the HierMenu controls the font, color, background color, etc. of the drop-down menus.

- Master Location and Filename
  \Customer\AM\Templates\TemplateFooter\[LayoutID]LayoutFooter.cfm
- New Location and Filename
  \Customer\AM\Templates\TemplateFooter\[SiteName]_[LayoutID]_
  [DateTimeStamp]_LayoutFooter.cfm

  Style Sheet CSS Files

  There are two css files for each layout, the [LayoutID]_Layout_Styles.css and the [LayoutID]_styles.css. Modify these style sheets in order to change the look and feel of the design of your website.

  Layout Styles File CSS

  The main style classes that control the site layout are located in the [LayoutID]_Layout.css file.

- Master Location and File Name
  \Customer\AM\Templates\LayoutCatalog\[LayoutID]\CSS\[LayoutID]_Layout_styles.css

- New Location and Filename
  \Customer\AM\Styles\LayoutStyles\[SiteName]_[LayoutID]_
  [DateTimeStamp]\[LayoutID]_Layout_styles.css

  Styles File

  The style elements and classes for general HTML attributes for the e-Series modules are contained in the [LayoutID]_styles.css file. To modify the default styles used by e-CM or e-Series, change the tags in this style sheet.

- Master Location and File Name
  \Customer\AM\Templates\LayoutCatalog\1501\CSS\[LayoutID]_styles.css

- New Location and Filename
  \Customer\AM\Styles\LayoutStyles\[SiteName]_[LayoutID]_
  [DateTimeStamp]\[LayoutID]_styles.css

  Layout Images File

  These images are used as filler content for the design. Some of the images are place-holders for the content in the content areas. Their widths and heights are the prescribed dimensions of each content area. Changes to the master files would affect all subsequent websites created from that template. Change the new files to modify an individual site. These images can be accessed through the e-CM Image Manager utility or changed out in the content record.

- Example Master Location and File Name
  C:\eSeries\Customer\AM\Templates\LayoutCatalog\[LayoutID]\Images\Home-Content-Area-1.gif

- Example New Location and Filename
  \Customer\AM\Images\Layout_Assets\[SiteName]_[LayoutID]_
  [DateTimeStamp]\ Home-Content-Area-1.gif

  Template Style Sheet (CSS) Definitions

  The style sheet contains definitions for the look and feel of the navigation, feature set, and site content. You will find the following items defined in the template style sheets.

  Homepage Layout Content Areas and Interior Layout Content Areas

Defines the height, width, and vertical alignment of the content areas.

Interior Look and Feel Style

Defines the column style and background color for interior page columns.

Standard Feature Set

Defines print styles, email a friend styles, search box styles, and iMIS trademark styles.

Breadcrumb Styles

Defines margin, padding, font size, color, and code for the breadcrumb feature.

Base Text-only Nav Styles

Defines color, inline display, margin, and padding for the text only navigation features.

Primary Navigation Styles

Defines margin, padding, text alignment, list style type, and text and font styles, as well as code for the primary navigation container.

Primary Navigation Styles with a Background Image

Defines margin, padding, text alignment, list style type, text and font styles, as well as image and code for the primary navigation container.

Utility Navigation Styles

Defines text alignment, color, and padding, as well as the code for container navigation.

Footer Navigation Styles

Defines text alignment, color, and padding, as well as the code for container navigation.

Base Interior Navigation Styles

Sets up defaults for all navigation levels – margin, padding, font styles, and link status colors.

Style Class Names for e-Series and e-CM

The following key style class names can be modified if elements other than those used on the primary templates need to be changed.

Key Style Class Names for e-Series

Buttonbar

- .buttonbar1 - Used in e-Events.
- .buttonbar2 - Used in e-Series Admin.
- .buttonbar3 - Used throughout e-Series. Usually has Submit, Reset, or other buttons.

ETitleBar

- .ETitleBar - Use in e-Orders.
- .EToolBar - Used throughout e-Series.
- .ETaskBar - Used throughout e-Series. Usually contains the breadcrumbs or a task list title.

ERSN

- .ERSNavBar - Used throughout e-Series when a paged record navigation is displayed.
- .ERSHeader - Used throughout e-Series.
- .EFunctionBar - Used mostly in e-Communities.

ETH and ETD Style Class Names

- .ETHRow - Used throughout e-Series.
- .ETH - Used throughout e-Series. Usually the prompt field table cell.
- .ETD - Used throughout e-Series. Usually the value field table cell.
- .ETDALT - Used throughout e-Series. Alternating row color.

Key Style Class Names for e-CM

Login

/* Content Manager Login */

.SCLoginBar,.HeaderBar

Site Search

/* Site Search */

.SEHeaderBar

Site Map

/* Site Map */

.SiteMap

a.SiteMap, a.SiteMap:link, a.SiteMap:visited, a.SiteMap:hover, a.SiteMap:visited:hover, a.SiteMapTitle, a.SiteMapTitle:link, a.SiteMapTitle:visited, a.SiteMapTitle:hover, a.SiteMapTitle:visited:hover

a.SiteMapTitle, a.SiteMapTitle:link, a.SiteMapTitle:visited, a.SiteMapTitle:hover, a.SiteMapTitle:visited:hover

.SiteMapTitleSub

.SiteMapTitleSubAlt

e-Series

e-Series Implementation

Planning Your Project

The goal of this section is to prepare you for a successful e-Series implementation.

After completing this section, you will be able to perform the following tasks:

- Describe the benefits of project planning
- Discuss the implementation phases
- Describe and implement key processes

Benefits of Project Planning

Project planning helps you set expectations and estimate the costs of implementation. With proper planning, you can:

- Calculate project costs
- Set customer expectations
- Set management expectations
- Plan and coordinate resources
- Track progress

e-Series Implementation Project Plan

Advanced Solutions International (ASI) has developed an implementation plan and methodology to ensure a smooth implementation of e-Series modules. This process parallels the process used to implement the iMIS modules. e-Series modules require the same kind of planning and forethought required for a successful iMIS implementation. You should not take shortcuts even if clients want to implement e-business solutions quickly. Consider very carefully the issues that will encourage Web visitors to use the new site.

The project plan has five major phases:

1. Business Process Review
2. Server Setup
3. Prototype Training and Configuration
4. Live Cutover
5. Continuous Improvement

All project costs relate to one of these phases. The key to a successful implementation is to manage expectations throughout all phases of the process. To accomplish this, you must present regular status reports to a designated customer staff member to review and update the project status. These meetings should occur at least bimonthly.

Proper project planning and adequate staff resources are critical to a successful e-Series module implementation. The Reseller should allocate three staff members to the implementation. These should include the following:

Project Manager - The project manager is responsible for managing project resources, preparing and modifying the project plan, tracking project status, facilitating status meetings with the client, and managing the overall project implementation.

In addition to staff resources, the project manager works with clients to access client resources. The organization should provide an operations representative to provide hands-on implementation assistance. This would include tasks such as granting security access to the server, arranging hardware purchases, maintaining liaison with the ISP, configuring firewall or proxy servers to permit access to the site, and configuring software to match the identified business processes. The project manager should be in continual contact with the organization's decision-makers and managers to help determine and manage the expectations for the new e-Series site. This contact should be initiated at the very beginning of the project.

Consultant - The consultant should have strong iMIS experience and training in the setup and configuration of e-Series modules. The consultant is responsible for analyzing and prototyping key processes with key client personnel, just as with the iMIS products. The

consultant should be skilled in analyzing output requirements, documenting back-office processes for e-Series modules, and training administrators and customers.

Technical Consultant - The technical consultant should be experienced with Windows NT Server, Windows 2000 Server, SQL Server, and Macromedia ColdFusion. The technical consultant must ensure that the software and hardware requirements for e-Series modules are in place before setting up and configuring the application.

Phase I - Business Process Review

Before the kickoff meeting, ASI will provide an implementation survey to the client team to answer baseline questions about project goals and intentions. The team will develop a needs analysis from information gathered from the survey.

The kickoff meeting with the client team and the Reseller team is crucial to the project's success. Everyone involved in the project should be aware of the project's goals and issues. The kickoff meeting is the time to set realistic expectations. After the meeting, the Reseller team should set up meetings with key department managers to gather the information for the needs analysis.

Phase I time estimates

e-Series Implementation Survey	8 hours (including report of findings)
Kickoff meeting	2 hours
Needs Analysis	8 hours for each module

Phase II - Server Setup

In this phase, the entire hardware and software infrastructure is installed and tested. There are two sub-phases in Phase II:

1. First Sub-phase - This sub-phase involves reviewing and identifying the hardware and software requirements with the client and determining elements of the project, such as the location of servers, the relationship with the ISP, and the telecommunications requirements. During this phase, the organization will order software, hardware, and telecommunications lines. The telecommunications setup should be decided upon as early

as possible because there often are weeks-long or months-long lead times for the installation of these lines, especially for T1 lines.

2. Second Sub-phase - In this sub-phase, the Reseller sets up and installs the software on the webserver. Microsoft provides an extensive checklist for the installation of this software. This checklist should be followed to the letter. Although Site Server is very robust after it is installed, you must adhere to these guidelines when integrating it with other system software.

   You can install ColdFusion and the e-Series modules quickly if the server is properly prepared with the required software.

   The client and the Reseller usually share in the assignment of resources during this phase. Typically, the client obtains the server and arranges the installation of telecommunications lines and server software. The Reseller installs e-Series modules on the prepared server. However, some Resellers with networking and hardware resources may provide a turnkey installation.

   Carefully consider the issue of firewalls and proxy servers. ASI currently does not offer guidance on configuring these servers because there are so many vendors with both hardware and software solutions. A technician knowledgeable with the client's firewall or proxy server should be available to open a channel for traffic to get through the firewall. Depending upon the configuration, the SQL database server and/or the webserver may be inside the firewall. Whatever the configuration, the channel through the firewall must be open to allow either the ODBC connection from the webserver to the SQL database server, or the connection from the webserver to the ISP.

   Phase II time estimates

- Review hardware and software requirements with client 4 hours
- Order required hardware, telecommunications lines, and software 4 hours
- Set up Windows Server 8 hours
- Set up and test ColdFusion 2 hours
- Set up and test the ODBC link to the SQL server 2 hours
- Install e-Series modules and perform rough configuration 8 hours

Phase III - Prototype Training and Configuration

In this phase, the applications consultant will sit down with the client's operations contact and key staff to discuss site management. Typically, these key personnel are membership managers, meeting directors, database administrators, marketing personnel, and so forth. Because their expectations are the ones that must be met, these managers should be involved in the project. Furthermore, their expectations should reflect those of the constituents who will use the site, and their expectations based on their user experience and the flow of the website.

Phase III time estimates

• Hands-on survey of module with key personnel	1 hour per module
• Review of implementation survey and needs analysis for department relative to features of the e-Series module	2 hours per module
• Discuss and implement look and feel issues with marketing and/or design team	8 hours *
• Maintain issues list and write up findings	4 hours per module
• Run configuration reports as part of documentation	2 hours
• Complete setup of each module	8 hours per module
• Document all setup parameters and any alterations to pages or scripting. Document back office procedures for credit card processing, cancellations, password assignment, and so forth	8-16 hours
• Caution client about changes that may affect the upgrade path. Test processes and transactions on test database; obtain client signoff	8-16 hours

*Site design requirements vary greatly from client to client. e-Series modules provide many flexible design options. The hours listed are for a minimal site dress-up.

Phase IV - Transition from Production Database to Live on the Net

In this phase, you will move the configured site to the production database (e-Series implementation), review the site, and finally, open it to the Internet. The following steps involve connecting the site with the live production database and verifying that the custom pages, colors, and configuration parameters meet the client's requirements. It is the client's responsibility to market the site and to inform constituents, members, and/or the public that the site is up and running and why they should log on. However, the Reseller should encourage the client to develop a site- marketing plan.

Phase IV time estimates

- Move e-Series-related tables from test to production database 4 hours
- Redirect to the production database 4 hours
- Review site to ensure that all elements are in place 4 hours
- Publicize and open to the Internet

Phase V - Continuous Improvement

Plan on at least eight hours of post-implementation and technical support. Caution the client not to make any alterations or changes to the site infrastructure, such as changes to ColdFusion, the IP address, or the network without consulting the Reseller. Most site failures are due to “do-it-yourself” alterations to enhance the site or to solve perceived problems. A website requires a close interaction of hardware and software to stay up and running. Casual changes can break the chain that keeps the site functional.

e-Series Installation Requirements

The following resources are required to set up your site:

Webserver

You must install ColdFusion, e-Series, and Microsoft Internet Information Services (IIS) software on the webserver. The webserver can reside at your location or at a remote location, depending on your needs.

Database Server

Use a server with MS SQL Server (MSSQL) or Sybase Adaptive Server Anywhere (SASA) software to host the iMIS database.

ColdFusion

ColdFusion is the application that runs e-Series. With ColdFusion, you write HTML pages marked-up with special tags and logic in ColdFusion Markup Language (CFML). When a browser requests a ColdFusion page, the webserver passes the page to the ColdFusion server which processes the ColdFusion tags and sends the results back to the webserver as HTML. The webserver merges that output with the HTML on the original page and returns it to the browser.

Server Configuration

When setting up your e-Series site, you must determine where your site will be hosted. There are four common options for hosting a website:

- The organization hosts the webserver
- Co-location
- Dedicated server
- Virtual hosts

Organizationhosted webserver

With this configuration, an organization hosts both the database server and the web-server.

To host the webserver at your site, you must have a high-speed Internet connection and an Internet service provider (ISP). You must purchase, install, and configure com-munications hardware and pay monthly connection fees.

This option gives you complete control over the webserver because it is located at your site. You are responsible for all software backups, security, upgrades, monitoring, and other security procedures.

Best Practice: Host both the database and the webserver on separate servers.

Advantages: With this option you have complete control over the webserver.

Disadvantages: This option is expensive because you must purchase the server and the communications equipment, pay for high-speed Internet access, and pay staff to maintain the webserver. In addition, rebooting your server will take down the website unless you have more than one server.

Colocation

With this configuration, you own and maintain the database server, but the webserver resides at the ISP's location.

If you select this option, you must purchase and configure your own webserver, but the server resides at the ISP. The server is connected to the ISP's network, and the ISP takes care of the high-speed Internet connection.

This hosting option allows you to have a high-speed Internet connection, but is much less expensive than paying for your own in-house, dedicated connection.

With the co-location option, your organization administers the machine. The ISP may monitor the machine's activity and notify you when the network is down, but is up to you to provide backups, upgrades, and security.

The ISP may allow you a few hours a month to physically visit its site to perform upgrades or swap out backup tapes.

Advantages: You have control over your webserver.

Disadvantages: You have to purchase and maintain the machine, even though the hardware is offsite. Most ISPs use Linux or UNIX platforms, which are not compatible with Windows platforms.

Dedicated server

With this hosting option, the webserver is owned by, maintained by, and resides at the ISP. A dedicated server is considered the preferred setup for server configuration.

This scenario is similar to co-location, except that the ISP provides the dedicated server for your use. The ISP configures the server and provides ongoing maintenance, such as creating user accounts, performing backups, monitoring the system, and producing

usage reports. Most ISPs provide monitoring services seven days a week, 24 hours a day.

With a dedicated server, you populate the webpages and programs and pay the ISP for their services.

This option is good for organizations that want to do their own Web development, but not their own system administration.

Advantages: Although you do not have to purchase hardware, you still have full control over the server content.

Disadvantages: The hardware is offsite.

Virtual host

With this hosting option, you share a server with several other sites. The server is owned by, maintained by, and resides at the ISP. You have your own domain name, but you share a server (and server resources) with several other sites. However, it appears to your customers that you have a dedicated site. This option is much cheaper than having a dedicated server.

Because you are sharing a server with other sites, you may be limited in the types of applications you can run. You also do not have as much control over software versions and upgrades, since these affect all sites hosted on this server. You also may be limited in the types of e-commerce solutions available to you.

Advantages: This is an inexpensive way to have your own domain name without having to maintain a server.

Disadvantages: The server is shared with other people. You have limited access to the server.

Installation Checklist

The following checklist includes the steps you should follow when installing an e-Series site:

1. Verify that the server has all of the required software.

2. Download the latest e-Series code, and review the release documentation.
3. Install e-Series:

- In your browser options under Check for newer versions of stored pages, enable Every visit to the page.
- Install e-Series on your webserver:
- Create an e-Series folder in the root directory (such as C:\e-Series), and unzip the files (make sure that all files are visible and that none are hidden).
- Copy all files from the C:\e-Series\Customer\Source\CustomTags folder into the C:\CFusionMX\CustomTags folder.
- Extract the contents of the CFX_PFPro_Java.zip file.
- In MS Internet Information Server (IIS), set up your website by entering the complete path to the directory.
- Manually create a SQL Server login for e-Series and ColdFusion to use for ODBC and JDBC connections.
- Create an ODBC data source for e-Series using the CF_Customer username and password.

4. Configure ColdFusion:

- Register the TCPClient and PayFlowPro custom tags.
- Connect ColdFusion to your data source.
- Configure ColdFusion settings:
- Change the client variable storage from the Registry to a new database.
- Configure your mail server settings.
- Map ColdFusion to your source directory.
- (optional) Enable ColdFusion debugging.

5. Run the e-Serieswizards and scripts:
   - Run the Application wizard.
   - Run the Script wizard.
   - Run the SQL security script.
6. Test your e-Series installation.

   Note: All e-Series site administrators should administer their site with the latest version of Internet Explorer.
7. Secure the webserver.
8. Secure the SQL server.
9. Configure SSL security.
10. Prepare to go live.

Installing and upgrading e-Series/e-CM

Note: This main procedure appears identically in both the e-Series and the e-CM reference guides.

To install or upgrade e-Series and e-CM

To prepare for installation

1. Back up your customized files so that you can reapply the customizations after upgrading e-Series. All customizations are overwritten during the upgrade process.
2. Ensure that you have completed a successful installation or upgrade of iMIS 15 on the appserver where you plan to install e-Series and e-CM.
   - If you performed a Custom installation of iMIS 15, you must have chosen e-Series as one of the options to install (The e-Series zip file is automatically installed as part of a Complete installation.)
   - (e-CM only) You must have performed a Custom installation of iMIS 15, and you must

have chosen Publishing Service as one of the options (Publishing Service is required for e-CM and is not part of a Complete installation.)

Caution! If you performed a Complete installation, or you performed a Custom installation of iMIS 15 and did not choose these listed Optional Components, then you must first install these components before performing this procedure. You can easily add these components to an already installed instance of iMIS 15 by choosing Start > Control Panel > Add or Remove Programs. From the list of Currently installed programs, select iMIS15 and click Change/Remove. When the Welcome page appears, select Modify and click Next to proceed.

3. Ensure that you have planned your iMIS architecture and have ensured the prerequisite conditions for all hosts and clients.
4. Ensure that a version of ColdFusion supported by this version of iMIS is installed on the iMIS appserver.
5. Ensure that a version of iBO for COM supported by this version of iMIS is installed on the appserver.
6. Ensure that a mail server has been configured in ColdFusion.
7. (e-CM only) Ensure that you have configured ColdFusion to redirect the storage of client variables to a database instead of to the registry of the appserver.
8. If you installed ColdFusion in a location other than the root (C:\CFusionMX), adapt the affected file paths below accordingly.
9. Ensure that the Windows Explorer folder options on the host are set so that all files are visible in Windows Explorer.
10. Ensure that Internet Explorer's Temporary Internet File options on the host are set so that IE checks for newer versions of stored pages every time you visit the webpage.

    To install or upgrade e-Series and e-CM into an iMIS 15 environment

Note: Some steps pertain only to e-Series or to e-CM. If you are not installing both into your iMIS 15 environment, you can skip the steps that are marked for the product that you are not installing.

1. (upgrades only) Back up all files located in your current e-Series directory. Any files that you customized in the \Customer folder will be overwritten during this procedure. You must have access to your customized versions of these files so that you can reapply your customizations after upgrading e-Series.
2. Locate the e-Series self-extracting zip file (eSeries.exe) on the appserver, which is in the folder C:\Program Files\ASI\iMIS15\eSeries.CF.

   Note: If this folder does not exist, you performed a Custom installation of iMIS 15 and did not specify to install e-Series. You must Modify the installation of iMIS 15 (Start > Control Panel > Add or Remove Programs > iMIS15, and click Change/Remove) to install the e-Series optional component before continuing this procedure.
3. Run the eSeries.exe file.

   The WinZip Self-Extractor window appears.
4. Click Unzip without changing any of the default settings.

   A C:\eSeries\ folder is created on the appserver.
5. (e-Series only) Copy all files from the C:\eSeries\Customer\Source\CustomTags folder to the C:\CFusionMX\CustomTags folder.
6. (upgrades only) If you are not using the iMISpublic application in your iMIS 15 environment, you must slightly modify the instructions in all of the following steps. For any step that refers to the iMISpublic application's virtual directory in IIS or the corresponding local path in the file system, you must instead substitute your current e-Series virtual directory and local path.

   Caution! If you are using the iMISpublic application in your iMIS 15 environment, then you must follow the remaining steps exactly, without substitution, to ensure that e-Series and e-CM are properly integrated with the iMISpublic application.

7. Use IIS Manager to locate the file system folder that contains your iMISpublic application files.

- Open IIS Manager and expand the folder tree to display the folders beneath the Default Web Site.
- Right-click the iMISpublic application and choose Properties.

  The Properties window appears.
- Write down the Local Path value that is displayed in the Virtual Directory tab. (This is C:\Program Files\ASI\iMIS15\iMIS_public by default.)

8. Move the entire contents from the C:\eSeries\Customer folder to the file system folder that contains the root of your virtual directory for the iMISpublic application (for example, to C:\Program Files\ASI\iMIS15\iMIS_public). If any file overwrite warnings are displayed, click Yes to All to approve the overwrites.
9. (e-CM only) Edit the IIS default documents and custom errors for the iMISpublic application.

- Open IIS Manager and expand the folder tree to display the folders beneath the Default Web Site.
- Right-click the iMISpublic application and choose Properties.

  The Properties window appears.
- On the Documents tab, click Add and specify the file name Template.cfm.
- Click OK and then click Move Up to position the Template.cfm file at the top of the list.
- On the Custom Errors tab, modify the error handler for 403;14 as follows:
- Message type: Select URL
- URL: Enter /iMISpublic/AM/404ErrorHandler.cfm (Assuming your iMISpublic application uses the default name. If you specified a different name for the iMISpublic application, use that name accordingly in the URL.)
- On the Custom Errors tab, modify the error handler for 404 as follows:

- Message type: Select URL
- URL: Enter /iMISpublic/AM/404ErrorHandler.cfm (Assuming your iMISpublic application uses the default name. If you specified a different name for the iMISpublic application, use that name accordingly in the URL.)
- Click OK.

10. Modify a key in the iMISpublic application's web.config file to prevent issues that can occur if e-Content Manager is not being used to customize e-Series or iMIS 15 Public view content.

    Note: Skip this step if you are not using the iMISpublic application.

    - Open IIS Manager and expand the folder tree to display the folders beneath the Default Web Site.
    - Right-click the iMISpublic application and choose Properties.

      The Properties window appears.
    - On the ASP.NET tab, click Edit Configuration.

      The ASP.NET Configuration Settings window appears.
    - On the General tab, in the Application Settings area, edit the EnableContentManager key to be true.
    - Click OK.

11. Create a SQL Server login for e-Series and ColdFusion to use for ODBC and JDBC connections.

    Caution! Do not use the Create_CF_Login_For_Customer.sql script, as in previous releases. Instead, manually create the SQL Server login as follows.

    - Open SQL Server Management Studio and log onto your iMIS database server host.
    - In the Object Explorer pane, collapse the Databases folder so that you can locate the Security folder for the host itself. (As opposed to the Security folder for a specific

database).

- Right-click the host's Security folder and choose New > Login.

  The Login - New window appears.

- In the Login name field, specify a meaningful name for this login so that other database administrators will recognize it as a special login used for e-Series and ColdFusion data sources (for example, CF_ESERIES).
- Select SQL Server authentication and specify a strong password for the new login.
- Record this login name and password for safekeeping. You will need these at several points in the process of installing and configuring e-Series and ColdFusion.
- If the following checkboxes are displayed on the window (this depends on whether the database server supports mixed authentication), set them as follows:
- Enforce password policy - Select this checkbox.
- Enforce password expiration - Clear this checkbox.
- User must change password at next login - Clear this checkbox.
- From the Default database field, select your iMIS 15 database.
- Click OK.
- In the Object Explorer pane, expand the Databases folder so that you can locate your iMIS database.
- Expand the node for your iMIS 15 database so that you can locate the database's Security folder.
- Right-click your database's Security folder and choose New > User.

  The Database User - New window appears.

- In the User Name field, enter the name of the SQL Server login that you defined for use by e-Series and ColdFusion (for example, CF_ESERIES).

- Select Login name and in the associated field, enter the name of the SQL Server login that you defined for use by e-Series and ColdFusion (for example, CF_ESERIES).
- In the Owned Schemas list, select the db_owner checkbox.
- Click OK.

12. (e-Series only) Create an ODBC data source for the e-Series connection to the iMIS 15 database.
    - Choose Start > Administrative Tools > Data Sources (ODBC).

      The ODBC Data Source Administrator window appears.
    - On the System DSN tab, click Add.

      The Create New Data Source window appears.
    - From the list, select SQL Server and click Finish.

      The Create a New Data Source to SQL Server wizard appears.
    - In the Name field, specify a meaningful name such as e-Series. You may optionally specify a Description too.
    - From the Server drop-down list, select the SQL Server host that contains your iMIS 15 database.
    - Click Next.

      The second page of the wizard appears.
    - Select With SQL Server authentication using….
    - Click Client Configuration.

      The Add Network Library Configuration window appears.
    - From the Network libraries options, select TCP/IP.
    - Click OK.

      Your focus returns to the Create a New Data Source to SQL Server window.

- Select the Connect to SQL Server to obtain… checkbox.
- In the Login ID field, enter the name of the SQL Server login that you defined for use by e-Series and ColdFusion (for example, CF_ESERIES).
- In the Password field, enter the password that you defined for the SQL Server login that you defined for use by e-Series and ColdFusion.
- Click Next.

  The third page of the wizard appears.
- Clear the Use ANSI quoted identifiers checkbox.
- Clear the Use ANSI nulls, paddings and warnings checkbox.
- Click Next.

  The fourth page of the wizard appears.
- Select the Perform translation for character data checkbox.
- Click Finish.

  The ODBC Microsoft SQL Server Setup window appears.
- Click Test Data Source.

  If the test completes successfully, your data source for e-Series and ColdFusion is working properly.

13. (e-CM only) Create a JDBC data source for the e-CM connection to the iMIS 15 database.

- In ColdFusion Administrator, go to Data Sources.
- From the drop-down list of drivers, select Microsoft SQL Server.
- Click Add and specify the connection information for the SQL Server login that you defined for use by e-Series and ColdFusion in a preceding step.

- Continue with the section Configuring ColdFusion and all remaining implementation sections of the e-Series and/or e-CM references.
- (upgrades only) Reapply all customizations to your e-Series and e-CM content as needed.
- If you are using e-CM alongside iMIS 15.1 and later releases, you must make some modifications to the master page of every existing website that is set up to be an ASP.NET website. These modifications ensure that the websites will work properly in the 15.1 environment (and later releases). For more information, refer to To modify master pages for iMIS 15.1 and later.

Configuring ColdFusion

The goal of this section is for you to gain the knowledge and skills needed for configuring ColdFusion.

After completing this section, you will be able to perform the following tasks:

- Register custom tags
- Connect ColdFusion to a data source
- Configure ColdFusion settings
- Map ColdFusion to the source directory
- Enable ColdFusion debugging

Registering Custom Tags

You must register the custom tags for ColdFusion to interpret SQL commands.

To register the TCPClient custom tag

You must register the CFX_TCPClient custom tag to verify the connection to the PayPal server.

1. Log in to ColdFusion Administrator.

2. Under Extensions, select CFX Tags to display the CFX Tags page.
3. Click Register C++ CFX to display the Add/Edit C++ CFX Tag page:

- Enter CFX_TCPClient for the Tag Name.
- Browse to the Server Library (.dll). For example, C:\C-fusionMX\CustomTags\TCPClient.dll).
- Enter ProcessTagRequest for the Procedure.
- Enable Keep Library Loaded.
- Enter a Description.

4. Click Submit to return to the CFX Tags page. The tag displays under Registered CFX Tags.

Connecting ColdFusion to a Data Source

ColdFusion requires a connection to a data source for e-Series to update your database.

To connect ColdFusion to a data source

Before connecting ColdFusion to a data source, make sure an ODBC data source has been created on the server.

1. Log in to ColdFusion Administrator.
2. Under Data & Services, select Data Sources to display the Data Sources page.
3. Add a new data source:

- In the Data Source Name field, enter the name of the data source created on the server for your e-Series installation.
- Select a Driver. (For combined e-Series and e-CM sites, you must select Microsoft SQL Server for the driver.)
- Click Add to open the Data Source Connection page (page name varies according to the Driver selected).

4. Click Show Advanced Settings to expand the page and view all connection options.
5. Enter the CF_Customer Username and Password.
6. (optional) For MSDE, limit simultaneous connections to five users:

- Enable Limit Connections.
- Restrict connections to 5.

7. Click Submit to update the data source and return to the Data Sources page. ColdFusion automatically verifies the connection (indicated by the Status of the data source). To verify all data source connections, click Verify All Connections.

Configuring ColdFusion Settings

e-Series requires the configuration of several ColdFusion settings.

To change variable storage from the Registry to a database

e-Series uses ColdFusion application and session variables. By default, ColdFusion stores client variables in the Windows registry for a period of 90 days. However, storing application and session variables in the registry may cause the registry to fill up, which can cause ColdFusion applications to stop and can seriously affect the performance of the Windows server. To prevent this, all variables should be stored in a table in a SQL Server or Access database using ODBC.

1. Create a new empty database using MS SQL Server or MS Access. Avoid using your iMIS database.
2. Create an ODBC data source named CFVariables that points to your new empty database. Use the administrator login without using a password, and test the data source connection.
3. Log in to ColdFusion Administrator.
4. Connect ColdFusion to the CFVariables data source.
5. Under Server Settings, select Client Variables to display the Client Variables page.

6. Under Select Data Source to Add as Client Store, select CFVariables from the drop-down list, and click Add to open the Add/Edit Client Store page.
7. Enable the following options:

- Create Client database tables (can be run only once).
- Purge data for clients that remain unvisited for xxx days (2-5 days is recommended).
- Click Submit Changes to add the data source and return to the Client Variables page.

8. Select CFVariables as the default storage mechanism for client sessions, and click Apply. (Do not select the registry as the default storage mechanism for client sessions.)
9. In SQL, give the CF_Customer user full permission for the CFVariables database.
10. Return to the CFVariables OBDC data source created in Step 2, and change the login and password to CF_Customer.

    Note: For SQL Server, it is not necessary to change the login in the ODBC data source because the password is not saved in the data source (assuming "sa" password is not blank).
11. In ColdFusion Administrator on the Data Sources page, select CFVariables to edit the data source connection, and change the Username and Password.

    Note: If you delete the default database or truncate tables after you set them, you will not be able to get back into ColdFusion.

    To configure mail server settings

    For e-Series to connect to your mail server, you must enter the mail server's IP address in ColdFusion. If a customer tries to register for a meeting or edit their record and the mail server's address is not populated, an error message displays:

    No SMTP Server Specified for CFMAIL.

    Note: The mail server IP address does not have to be a valid address until the e-Series site is public.

1. Log in to ColdFusion Administrator.

2. Under Server Settings, select Mail to display the Mail Settings page.
3. Enter the Mail Server IP address.
4. (optional) Accept the default Server Port, or enter a different one.
5. Enter the number of seconds for the Connection Timeout (the time ColdFusion should wait for a response from the mail server).
6. Click Submit Changes.

Mapping ColdFusion to the Source Directory

You must map ColdFusion to the source directory, which contains the encrypted business logic code for e-Series modules.

To map ColdFusion to the source directory

1. Log in to ColdFusion Administrator.
2. Under Server Settings, select Mappings to display the ColdFusion Mappings page.
3. In the Logical Path field, enter the IP Address of the machine where the site files are being staged. Because we are using a virtual directory for the customer site, add /eSeries (or your site name) after the IP address.
4. Enter the Directory Path by browsing to the eSeries folder. (The name in the directory path must match the name of the folder exactly.)
5. Click Update Mapping.

Enabling ColdFusion Debugging (optional)

The debugging features of ColdFusion are helpful when you are trying to determine the cause of problems that may occur when you install e-Series.

To enable ColdFusion debugging

1. Log in to ColdFusion Administrator.
2. Under Debugging & Logging, select Debugging Settings to display the Debugging Settings page.

3. Enable the following options:

- Enable Debugging.
- Enable Performance Monitoring.

4. Click Submit Changes.

Running e-Series Wizards and Scripts

Running e-Series Wizards

Included with e-Series code are script wizards that automate and speed up the process of building a customer site. The wizards, which are executed through a browser, run scripts that populate tables, create default security groups, and create style options. You should run the wizards only once per site. In fact, it may be a good idea to remove the wizards after you run them.

Note: All e-Series site administrators should administer their site with the latest version of the Internet Explorer browser.

To run e-Series wizards

You should run the wizards only once per site. Always make a backup of your iMIS database before running the wizards.

Note: The iMIS SQL Query utility cannot use any stored procedures or the TRUNCATE, DROP, DELTE, or CMDSHELL commands.

1. Install e-Series.
2. Configure ColdFusion.
3. Open your browser, and enter the following URL to display the Quick Start Wizard page: http://<yourIPAddress>/e-Series/wizards/index.cfm.
4. Run the applicable wizards.

   Quick Start Wizard page

   Open your browser, and enter <yourIPAddress>/e-Series/wizards/index.cfm

   ScriptWiz

Use the ScriptWiz (Script wizard) to set up security tables, security groups, security modes, security filters, style options, Gen_Descriptions and Gen_Tables, member types, system parameters, and states and countries against the database.

AppWiz

Use the AppWiz (Application wizard) to create the Default document and the Default Static Content document. The AppWiz automates the application.cfm file-editing process for the website.

Note: The application wizard should be used when making changes to the application.cfm file because a copy of this file is propagated to each directory in the source folder to support jumping directly to a page in the site.

CM Setup

Select to open the Active Matter Content Management Setup Wizard.

Home

This link takes you back to the Quick Start Wizard page.

To run the Application wizard

The only wizards you must run to activate the customer site are the AppWiz and the ScriptWiz. The application.cfm file is created when you run the AppWiz. This file gives ColdFusion the instructions to run e-Series.

1. On the Quick Start Wizard page, select AppWiz to display the Create Application.cfm page.
2. In the Datasource field, enter the name of the ODBC data source that you defined for the e-Series connection to the iMIS database.
3. In the Database Connection Username and the Database Connection Password fields, enter the name and password of the SQL Server login that you defined for use by e-Series and ColdFusion

4. In the iMIS System Admin Username and iMIS System Admin Password fields, enter your iMIS MANAGER logon name and corresponding password. This user record is needed to enable e-Series to interact with iMIS webservice methods. This logon information is encrypted when you execute the Application Wizard.
5. (iMIS 15 environments) In the iMIS Application Server URL field, enter the iMIS virtual root URL that you use to connect to iMIS with iMIS Desktop (for example, http://appserverName/imis15). This URL is used to enable access to the iMIS webservice for unified logons.
6. In the IP, DNS or Machine name field, enter the URL to your website virtual root.
   - (iMIS 15 environments) This should be the Public virtual root URL that you use to connect a web client to the iMIS public website (for example, http://appserverName/imispublic).
   - (iMIS 10.6 or earlier environments) This should be the virtual root URL that you use to connect a web browser to your e-Series website (for example, http://serverName/eSeries).
7. In the Customer Directory Path field, enter the path to your e-Series Customer folder.
   - (iMIS 15 environments) This path is C:\Program Files\ASI\iMIS15\iMIS_public.
   - (iMIS 10.6 or earlier environments) This path is C:\eSeries\Customer.
8. In the Webmaster Email field, enter the email address that should be the target of the webmaster contact hyperlink at the bottom of each page.
9. In the Contact Email field, enter the email address that should be the target of the information contact hyperlink at the bottom of each page.
10. From the Website Type options, select Combined eSeries & Content Management if you have a license to e-CM. Otherwise, select eSeries Only.
11. If this is a first-time installation, enable the Create Default Document option, and enter default.htm. (Make sure default.htm is specified for that site under the Document tab. When you enable this option, the Application wizard creates the Default document, which is the actual website.)

12. If this is an upgrade from an earlier version of e-Series, disable the Create Default Document option.
13. If this is a first-time installation, enable the Create Default Content option. When you enable this option, the Application wizard creates the Default Static Content document.
14. If this is an upgrade from an earlier version of e-Series, disable the Create Default Content option. If you enable the option, you will re-create your Static Content document and remove all customized files.
15. (Communities only) Enable the Registry Time Stamps option to build community e-mail notification with the server's time.
16. (Communities and Verity Indexing only) Enable the Create Scheduled Tasks option to create scheduled tasks in ColdFusion Administrator.
17. Click Continue to execute the Application wizard.
18. The Application wizard notifies you when the files are built. Click OK.

Script Wizard

Script wizards set up security tables, security groups, security modes, security filters, style options, Gen_Descriptions and Gen_Tables, Member Types, system parameters, and states and countries in the selected database for a selected application type. Following is list of the Script wizards and a brief description of what each wizard does.

Note: You can modify scripts if you need to run only part of a script.

Security Tables

Run this script to insert the records for the security filters.

Security Groups

Run this script to insert the default security groups: Administrator, Anonymous, Remote Chapter, Web Developers, and Site Administrators.

Security Modes

Run this script to insert the security modes: Browse, Search, Insert, Edit, and Delete.

Security Filters

Note: You must run the Administrator and Anonymous security filters; the others are optional.

- Administrator - Run this script to insert the security filters for the Administrator security group.
- Anonymous - Run this script to insert the security filters for the Anonymous security group.
- RemoteChapter - (optional) Run this script to insert security filters for the Remote Chapter security group.
- WebDevelopers - (optional) Run this script to insert security filters for the Web Developers security group.
- SiteAdministrators - (optional) Run this script to insert security filters for the Site Administrators security group
- Activity - (optional) Run this script to insert security filters for Activities.
- Custom Windows - (optional) Run this script to populate security tables and insert security filters for custom windows.

Style Options

Run this script to insert the records of the default style options.

Name Address Insert

If you are installing e-Series without iMIS, run this script wizard to insert a single record into the Name_Address and Name tables.

Name Security

If you are installing e-Series without iMIS, run this script to insert logins and passwords into the Name_Security table.

Gen Descriptions

Run this script to insert records that are related to Lookups into the Gen_Descriptions and Gen_Tables.

Member Types

If you are installing e-Series without iMIS, run the Web Member Type script.

Do not run this script if you are using e-Series with iMIS. If you do, it overwrites the existing Member Types in the iMIS database.

To run the Script wizard

1. On the Quick Start Wizard page, select ScriptWiz to display the Available ODBC Data Sources page.
2. Enter your Datasource.
3. Select the Application Type: e-Series SQL.

   Note: Run the same Script wizards in order, and run them all the way through. For example, do not change your data source and application type while running scripts.
4. Click Show Scripts to display the list of available scripts.

   Note: You must run the scripts one at a time. Follow the red arrow to run them in sequence so that you do not overlook any of the scripts.
5. Select the script you want to run, and the Selected Script Ready to Run window will open.

   Note: You can edit the scripts. For example, you may want to remove the WebDeveloper security filter value by simply removing it from the script.
6. Click Run This Script. A message displays if the script has run successfully.
7. Click OK.
8. Repeat the steps for each script.

Available Scripts list

Running SQL Security Scripts

When running the e-Series installation Script wizards, records, filters, and tables are inserted, and default security groups, style options, and several other items are created for the site.

The Security_Triggers_SQL.sql script (applicable only for SQL databases licensed for e-Series) sets up the application so that when security groups, products/activities, and custom windows are created, filters are created.

For example, when you define a new security group, a trigger directs the application to create the filters for the security detail settings for the new group. When this is complete, you can configure the new group's security detail.

By running the Update_Security_Cursors.sql script, changes made in iMIS are updated in e-Series. For example, if a new table or a new activity is added or deleted in iMIS, that change is reflected in e-Series if you have run the Update_Security_Cursors.sql script. Run this script each time you add or delete a table in iMIS.

To run SQL security scripts (MSSQL)

When iMIS is upgraded, the Security_Triggers_SQL.sql script runs automatically on SQL databases licensed for e-Series.

If the iMIS tables are rebuilt after iMIS is upgraded, the Security_Triggers_SQL.sql script must be run manually after each rebuild of the iMIS tables.

Note: You must run these scripts for each customer database. Do not run them on the master database.

1. Run the Security_Triggers_SQL.sql script on the Server Table Status window in iMIS (from Utilities, select Table Analysis, and click Make Triggers).
2. Run the Update_Security_Cursors.sql script in SQL Query Analyzer:

- Open Microsoft SQL Query Analyzer (Start> Programs> Microsoft SQL Server).
- Select the Load SQL Script folder at the top of the window.
- Navigate to the \Source\Scripts directory.
- Run the script.
- Close SQL Query Analyzer.

Test the installation

Now that you have installed e-Series, go to your website to test the installation.

To view your security filters

If you want to view the security filters set on each screen, add this string to the url.

&showfilters=yes

Securing the Webserver

The goal of this section is for you to gain the knowledge and skills needed to install an e-Series host site.

After completing this section, you will be able to:

- Set properties for the ScriptContent directory
- Set properties for the Source directory
- Set properties for the StaticContent directory
- Set properties for the Wizards directory

Setting Directory Properties

After installing your site, you need to secure the webserver. Starting in IIS, set up the correct permissions for the ScriptContent, Source, StaticContent, and Wizards directories.

To set properties in the ScriptContent directory

1. In IIS, navigate to the eSeries\Customer folder. Open the folder and highlight the ScriptContent folder.
2. Right-click the ScriptContent folder and select Properties. The ScriptContent Properties window opens.
3. Select the Directory tab.

- Enable the Script source access, Read, and Log visits options.
- Select Scripts only from the Execute Permissions drop-down list.

4. Click OK.

To set properties in the Source directory

1. In IIS, navigate to the eSeries\Customer folder. Open the folder and highlight the Source folder.
2. Right-click the Source folder and select Properties. The Source Properties window opens.
3. Select the Directory tab.

- Enable the Log visits and Index this resource options.
- Select Scripts and Executables from the Execute Permissions drop-down list.

Note: To properly display images, turn on READ permissions for the Source/Images directory in IIS. An image included in this folder is warning.gif.

4. Click OK.

To set the properties for the StaticContent directory

1. In IIS, navigate to the eSeries\Customer folder. Open the folder and highlight the StaticContent folder.
2. Right-click the StaticContent folder and select Properties to open the StaticContent Properties window.
3. Select the Directory tab:

- Enable the Read and Log Visits options.
- Select None from the Execute Permissions drop-down list.

4. Click OK.

To set the properties for the Wizards directory

It is very important that no one except the administrator should have access to the Wizards directory. If someone else has access to this directory, they are capable of running scripts and damaging the iMIS database.

1. In IIS, navigate to the eSeries\Customer folder. Open the folder and highlight the Wizards folder.
2. Right-click the Wizards folder and select Properties to open the Wizards Properties window.
3. Disable all permissions.
4. Set the Execute Permissions drop-down list to None.
5. Click OK.

Alternatives

Two alternative methods would require that the administrator have direct or remote access to the Webserver to make the scripts available:

- Back up and remove the Wizards directory.
- Leave the read and execute permissions enabled. Set SQL Server security, such that the user would be prompted for a database login and password when attempting to access the Wizards directory.

Securing the SQL Server

The goal of this section is for you to gain the knowledge and skills to be able to secure the SQL database server.

After completing this section, you will be able to:

- Enable encryption on MSSQL and SASA
- Enable encryption on the webserver

Overview of securing the database

After you have installed your website, the next step is to secure the SQL database server. This involves creating a login for e-Series in iMIS and enabling encryption on both the database server and the webserver.

Enabling Encryption on the MS SQL Server

Security for e-Series sites is implemented at several levels:

1. Security settings in Windows and ColdFusion are applied to e-Series.
2. MS SQL Server provides an additional level of security through encryption, which must be enabled from both ends of the Web connection: the webserver and the MSSQL or SASA database server. The options for enabling MSSQL server are:

- Enabling Multiprotocol encryption for all connections; or
- Enabling encryption for specified clients.

Note: The instructor will complete this step in class. For a customer's site, the actual database administrator enables encryption.

To enable Multiprotocol encryption for all connections (MSSQL)

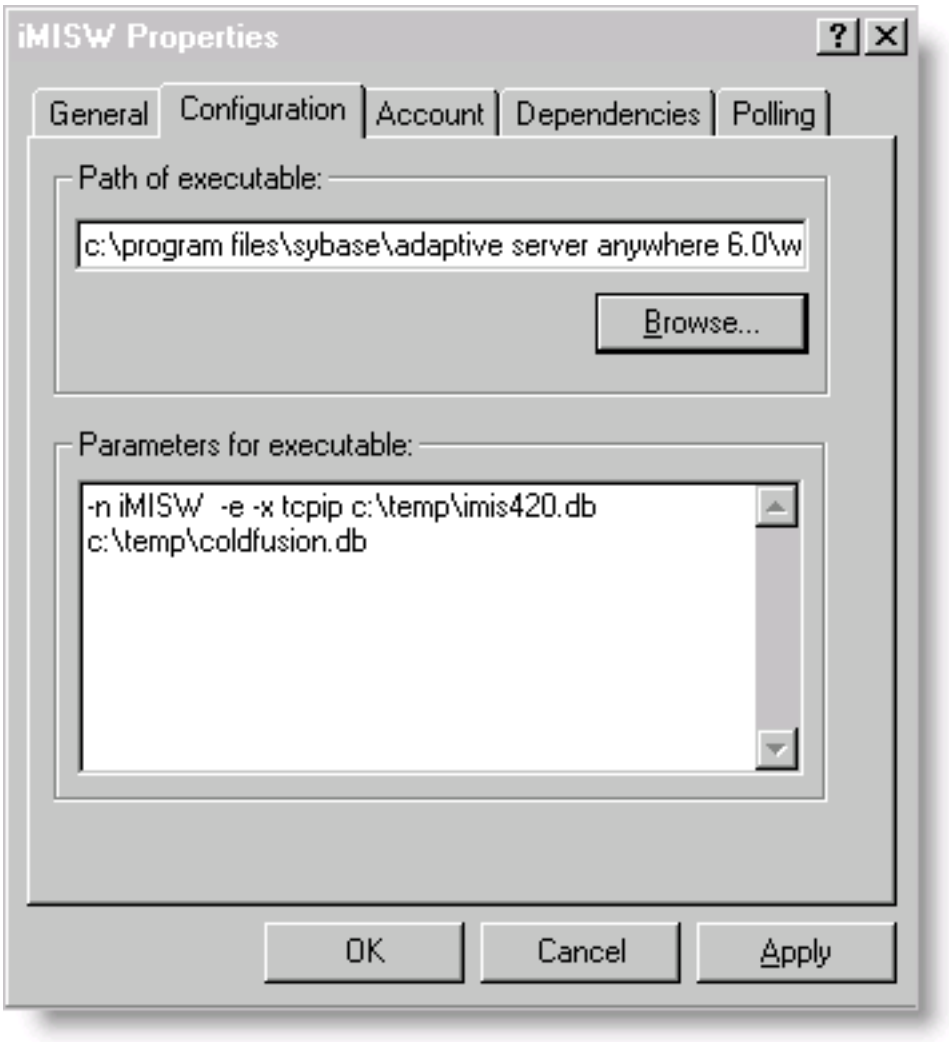
1. Configure the SQL Server to listen on Multiprotocol by adding or editing the Multiprotocol library.
2. For server-wide encryption, select the Enable Multiprotocol option.
3. Stop and restart the MSSQL Server service.
4. In the SQL Server Client Network Utility dialog box, select the General tab and then click Add.
5. Select Multiprotocol as the Network library.
6. Enter the SQL Server name in the Server alias text box.

To enable encryption for specific clients (MSSQL)

1. Configure the SQL Server to listen on Multiprotocol by adding or editing the Multiprotocol library.
2. Clear the Enable Multiprotocol option.
3. Stop and then restart the MSSQL Server service.

To enable encryption (SASA)

To encrypt all network packets transmitted to and from all clients with SASA 6.03, add the -e switch to your SASA 6.03 service. (For more information on SASA switches, see the Adaptive Server Books Online.)



iMISW Properties window

Use the -e switch on the dbsrv6 command line to encrypt packets for all clients, regardless of whether the encryption parameter is used by the client. Similarly, if the client asks for encryption, the server will encrypt.

Enabling SQL Server Client Encryption on the Webserver

We have enabled encryption on the SQL server. Now, we will turn on the SQL encryption mechanism at the webserver for the SQL server client. With encryption in place on both of the servers, any data passed between them is secure. Secure Socket Layers protects the data as it travels from the webserver through the Web back to the person initiating the request.

To enable encryption on the webserver

1. Select Start> Programs> Microsoft SQL Server 6.5 (or 7.0)> SQL Client Configuration Utility to open the SQL Server Client Configuration Utility window.
2. Click the Advanced tab.
3. Enter the following values:

Field	Value	Example
Server	SQL Server Name	CUSTNAMEA_SQL
DLL Name	Multi-Protocol	Multi-Protocol
Connection String	ncacn_ip_tcp:<ip_address> [<port>]	ncacn_ip_tcp:111.111.111.111 [1500]

Note: The IP address is the address of the remote SQL server. The port is the port assigned to multi-protocol on the remote SQL server. [1500] is the port number in the previous example.

4. Click Locate to open the ODBC SQL Server Setup window.
5. Modify the ODBC data source to use the new SQL Server entry you created using the ODBC Administrator.
6. Click OK.

Configuring SSL Security

The goal of this section is for you to gain the knowledge and skills to be able to configure SSL Security.

After completing this section, you will be able to:

- Enable encryption on MSSQL and SASA
- Enable encryption on the webserver

Overview of SSL

After you have secured the SQL database server, you need to add another layer of security, the Secure Sockets Layer (SSL).

SSL is a protocol layer placed between a reliable connection-oriented network protocol layer (TCP/IP) and an application protocol layer (HTTP). It provides for secure communication between client and server by allowing mutual authentication, encryption for privacy, and digital signatures on messages.

Suggestions for SSL Configuration and Operation

Use separate content directories for secure and public content, for example, C:\InetPub\Wwwroot\Secure-Content and C:\InetPub\Wwwroot\Public-Content.

Save your key file in a safe place in case you need it in the future. It is a good idea to store your key file on a floppy disk or tape and remove it from the local system after completing all setup steps. Do not forget the password you assigned to the key file.

Generating a Key Pair and Certificate Request

As part of the process of enabling Secure Sockets Layer (SSL) technology on your webserver, generate a certificate request and then acquire an SSL certificate. This is a simple procedure with Microsoft Internet Information services (IIS).

To generate a key pair and certificate request

1. Open Internet Information Services.
2. Right-click on the web site and select Properties.
3. Select the Directory Security tab.
4. Click Server Certificate to open the Webserver Certificate Wizard.
5. Click Next.
6. Select Create a New Certificate and click Next.
7. Enter the name for the new certificate and select the bit length.

Note: Do not select Server Gated Cryptography unless you have an SGC certificate and need the capabilities provided by SGC. Server-Gated Cryptography is an SSL extension that allows financial institutions with export versions of IIS to use strong 128-bit encryption. SGC capabilities are provided in IIS 5.0, but a special SGC certificate is required to use SGC.

8. Click Next.
9. Enter the Organization and Organizational Unit and click Next.
10. Enter the common name for the site and click Next.
11. Enter the Country/Region, State/Province, and City/Locality, and click Next.
12. Enter the filename for the certificate request, or click Browse and navigate to the directory and filename.
13. Click Next.
14. Click Next.

Acquiring a Certificate

The certificate request generated by Internet Information Services is not valid for use on the Internet until you obtain a valid certificate for it from a Certificate Authority, such as PayPal. This certificate authenticates your site to any client that accesses the server and provides the mechanisms for the client to initiate the secure session. Server-side certificates are necessary to establish an SSL-protected channel.

The process for obtaining a secure server certificate is as follows:

1. Generate a certificate request (see previous section for instructions).
2. Request a certificate by sending the certificate request file to a Certificate Authority.
3. Install the assigned certificate.
4. Activate SSL for your server.

For more information on acquiring certificates, refer to Implementing Web Site Client Authentication Using Digital IDs (http://www.verisign.com/clientauth/kit/details.html) on the VeriSign website.

Note: When processing a request for a certificate, the organization with Certificate Authority requests information including the person who applied for the e-Series domain name (the person who signed for the domain name); the address used when applying for the domain name, and the ISO 9000 official organization name. This process may take two weeks or longer to complete.

Installing a Certificate

After you complete your certificate request, you will receive a signed certificate from the Certificate Authority. Contact your Certificate Authority for complete details.

To install a certificate

1. Open Internet Information Services.
2. Right-click on the web site and select Properties.
3. Select the Directory Security tab.
4. Click Server Certificate to open the Webserver Certificate Wizard.
5. Click Next.
6. Select Process the pending request and install the certificate.
7. Enter the path and file name for the certificate, or click Browse and find the certificate.
8. Click Next.
9. Follow the wizard directions to complete the installation of the certificate.
10. Back up the certificate.

Note: If you do not specify an IP address when you install your certificate, the same certificate is applied to all virtual servers created on the system. If you are hosting multiple

sites on a single server, specify that the certificate be used only for a particular server IP address by adding the IP address.

Securing Data Transmissions with SSL

Internet Information Services provides a protocol for providing data security layered between its service protocols (HTTP and TCP/IP). This security protocol, called Secure Sockets Layer (SSL), provides data encryption, server authentication, and message integrity for a TCP/IP connection.

SSL provides a security “handshake” that is used to initiate the TCP/IP connection. The client and server agree on the level of security that will be used and that will fulfill the authentication requirements for the connection.

Thereafter, SSL's only role is to encrypt and decrypt the byte stream of the application protocol being used (for example, HTTP). This means that all of the information in the HTTP requests and responses is fully encrypted. This includes the URL requested by the client, submitted form contents (such as credit card numbers), HTTP access authorization information (user names and passwords), and all data returned from the server to the client.

An SSL-enabled server can send and receive private communication across the Internet to SSL-enabled clients (browsers). Because SSL-encrypted transmissions are slower than unencrypted transmissions, use SSL only for virtual folders that deal with highly sensitive information, such as form submissions that contain credit card information.

Configuring a Website to Require SSL

After you apply the certificate, you must enable the SSL feature from Internet Information Services. You should use Internet Information Services to configure the entire e-Series website to require SSL. You can then configure the SSL settings for specific folders and files in the e-Series system parameters.

For information on configuring e-Series system parameters, see e-Series Applications.

To configure a website to require SSL

1. Open Microsoft Internet Information Services.

2. Right-click the website and select Properties to display the website's Properties window.
3. Select the Directory Security tab.
4. In the Secure communications area, click Edit.
5. Select the Require secure channel (SSL) option.
6. Click OK.

Copying or Moving a Certificate to Another Server

After creating a certificate, you can use Internet Information Services to copy or move the certificate to another server.

To copy or move a certificate to another server

1. Open Internet Information Services.
2. Select Action> Connect.
3. Enter the name of the server where the certificate will be copied or moved and click OK. The server name appears in the list of servers (in the side index).
4. Select the certificate to move.
5. Select Edit> Copy to copy the certificate or Edit> Cut to move the certificate.
6. Select the server where the certificate will be copied or moved.
7. Select Edit> Paste.

Backing Up a Certificate and Key Pair

With Internet Information Services, you can create a certificate backup file and copy it to a floppy disk, CD, or tape for safekeeping.

To back up a certificate and key pair

1. Open Internet Information Services.
2. Locate and select the certificate.
3. Select Action> All tasks> Export to open the Certificate Manager Export Wizard.

4. Select Yes, export the private key.
5. Use the default wizard settings and enter a password for the certificate backup file when prompted.

   Note: Do not select Delete the private key if export is successful; this will disable your current certificate.
6. Complete the remaining wizard steps to export the certificate backup.

   The backup certificate file is given a .req filename extension and is saved to your hard disk. You can then copy or move the file to a floppy disk, CD, or tape.

Installing a Certificate Backup

You can install a certificate backup with Internet Information Services.

To install a certificate backup

1. Open Internet Information Services.
2. Right-click on the web site and select Properties.
3. Select the Directory Security tab.
4. Click Server Certificate to open the Webserver Certificate Wizard.
5. Click Next.
6. Select Process the pending request and install the certificate.
7. Enter the path and file name for the certificate, or click Browse and find the certificate.
8. Click Next.
9. Follow the wizard directions to complete the installation of the certificate.

Preparing to Go Live

The goal of this section is for you to gain the knowledge and skills necessary to prepare the e-Series site to go live.

After completing this section, you will be able to:

- Go live with your e-Series site with MSSQL
- Go live with your e-Series site with SASA

Completing the e-Series Implementation

The following procedures guide you through the transfer of data to the production database. You will have to create an administrative login in the production database before logging into the production site.

To create an administrative login

1. Open iMIS.

   Note: iMIS must be licensed for e-Series.

2. Enter or open a customer's record in the Manage customers window.

   Note: See Customer Management (see "Customers") for more.

3. Select the Internet Security tab in the Detail section of the Manage customers window.
4. Enter the customer's Internet Security information:

- Enter a Login.
- Enter a Password at least six characters long.
- Re-enter the password in the Verify Password field.

5. Enter an Expiration Date for the customer's login.
6. Select Administrator from the Security Group drop-down list.
7. Click Save.

To complete the e-Series implementation for MSSQL

1. Verify that all users are out of the databases.
2. Make a backup of your production and e-Series test databases.
3. Truncate the following tables in the production database:

- Cmty_Administrators
- Cmty_Discussion_Forums
- Cmty_Discussion_Posts
- Cmty_Email_Notification
- Cmty_Invitees
- Cmty_News
- Cmty_Read_Tracking
- Cmty_Shared_Files
- Cmty_Shared_Folders
- Cmty_Subscription
- Comment_Types
- Comment_Log
- Community
- Contacts
- Content_Pages
- Gen_Descriptions
- Name_Security
- Name_Security_Groups
- Security_Filters
- Security_Groups
- Security_Modes
- Security_Tables
- Style_Options

- URLs
- W_Reports

To transfer data using MSSQL Data Transfer Service (DTS)

1. Run MSSQL Data Transfer Service (in Enterprise Manager, Tools> Data Transformation Service)
2. Transfer the data from tables in the test database to the same tables in the production database, as follows:

- Gen_Descriptions
- Security_Filters
- Security_Groups
- Security_Modes
- Security_Tables
- Style_Options

To implement e-Communities on the production site

If you are implementing e-Communities, your best option is to create your communities and content on the production site, rather than transferring the setup from the test database.

When you create the communities on the production site, you should not copy any files in the /StaticContent/CmtyStorage directory from the test site to the production site. These folders will be created when you create the communities on the production site.

To transfer e-Communities with extensive content

Use the following guidelines for transferring e-Communities setup data only if extensive e-Communities content has been set up on the test site, and it would not be feasible to re-create the communities.

1. Copy all folders from the /StaticContent/CmtyStorage directory on the test site into the production site directory on the webserver.
2. Transfer the Community table from the test database.
3. Review the data in the following tables, noting any ID numbers referenced in the data.

   Note: Make sure that the ID numbers in this data correspond with the appropriate Name records in the production database. You can use a SELECT DISTINCT ID FROM… query to find the IDs referenced in each table.
4. Transfer these tables.

- Cmty_Administrators
- Cmty_Discussion_Forums
- Cmty_Discussion_Posts
- Cmty_Email_Notification
- Cmty_Inviteees
- Cmty_News
- Cmty_Read_Tracking
- Cmty_Shared_Files
- Cmty_Shared_Folders
- Cmty_Subscription

Note: If the ID numbers correspond with different records, some data cleanup will be necessary following the transfers.

5. Update the ID numbers in the tables as necessary.

To transfer optional e-Series tables

1. Transfer these tables which are used for optionale-Series applications.

- Contacts
- Content_Pages
- Mail_Lists
- Urls
- W_Reports

2. Carefully review any tables that include ID numbers. ID numbers that are different in the production database must be updated following the transfer.

   Note: Make sure the ID numbers correspond with the proper Name records in the production database.

   To transfer the login and password data

   If new records were added to the test database during the e-Series configuration, these ID numbers will likely overlap the ID numbers of new records added to the production database during that same time period.

- The Generate Login utility can be used to populate these tables in the production database.

  If you choose to transfer the data, transfer these tables from the test to the production database and review the ID numbers:

- Name_Security
- Name_Security_Groups

  To update the Counter table in the production database

  Since data has been imported into the production database, the Counter table must be updated so that the LAST_VALUE field for e-Series-related tables is updated according to the data now present in those tables.

1. Log into iMIS as an administrator.

2. Navigate to Utilities > Table Analysis.
3. Click Build Counter.

To point the ODBC connection to the production database

1. Change the ODBC data source (on the webserver) so that it points to the production database.

Alternatively,

- Create a new ODBC data source for the production database.
- Set up the new ODBC data source with a password in ColdFusion Administrator.
- Re-run the Application Wizard (AppWiz) to make sure that the e-Series site is pointing to the correct ODBC data source.

Note: Do not select the Create Default Content option.

2. Verify that the ODBC data source used by any Crystal reports is set to the production database, and not the test database.

Note: If you experience a slowdown in the reporting process on your SQL server, consider implementing a “reporting server” to alleviate any loading of your production database.

To create the e-Series security triggers

To create the e-Series security triggers, you must run the Update_Security_Cursors script in the production database.

1. Log into iMIS as an administrator.
2. Navigate to Utilities > Table Analysis.
3. Click the Make Triggers button.
4. From a SQL query tool, run the Update_Security_Cursors script.

To set the e-Series System Parameters

The System_Params table includes parameters for both iMIS and e-Series. It is not advisable to truncate this table in the production database. e-Series System Parameters must be set in the production database.

1. Re-enter the e-Series system parameters manually (Admin > Lookups > System Parameters) once the production site is set up.
2. Save screenshots of the system parameter settings while the test site is still accessible if the test site will be made inaccessible.

   Note: System parameter settings can also be found in the System_Params table of the test database. It is more efficient to view the information in screenshots rather than locating specific rows in the System_Params table.
3. Log into the production site as an administrator and update the system variables (Admin> Lookups> Update System Variables).

   To complete the e-Series implementation for SASA

   The e-Series implementation for SASA is the same process as implementation for MSSQL with two exceptions.

   Exception 1

   Instead of using MSSQL DTS to transfer data, you must unload the tables from the test database (into a text file) and load the data into the production database.

1. To unload a table from the test database, run the following SQL script against the test database for each table you need to transfer:

   unload table [table_name] to'[path]\\[file_name].txt'

   For example:

   unload table gen_descriptions to C:\\eseries\\transfer\\gen_desc.txt'

   Note: The text files names provided are examples. Paths are relative to the server, but the scripts can be run from any workstation via iSQL.

2. To load a table into the production database, run the following SQL script against the production database for each table you need to load:

   load table [table_name] from '[path]\\[file_name].txt'

   For example:

   load table gen_descriptions from 'C:\\eseries\\transfer\\gen_desc.txt'

   Exception 2

   Instead of using the Update_Security _Cursors script, use Sybase iSQL to run the Security_Triggers_Sybase.sql and Update_Security_Cursors_Sybase.sql scripts on the production database.

Troubleshooting e-Series implementation

Installation Troubleshooting Tips

All e-Series site administrators should administer their site with the latest version of the Internet Explorer browser.

Custom tags

1. Copy the entire contents of the custom tags folder \eSeries\Source\CustomTags into the \CFUSION\CustomTags directory.

Wizards

1. Run the Application wizard.

- If this is a new installation, enable (click Yes) the Create Default Document and Create Default Content options.
- If this is an upgrade, disable (click No) the Create Default Document and Create Default Content options. If you click Yes for an upgrade, you lose any customizations you have made.

2. Specify which scripts in the Script wizard to run against your database.

- If this is a new installation of e-Series with a new iMIS database, execute every single script against the database.

- If this is a new installation of e-Series with an existing iMIS database, run scripts only as appropriate. For example, for the script that inserts Member Types, insert only the “WEB” Member Type.

  Tip: You do not have to run the following scripts on an existing iMIS database: States_ Countries, Name_Address_Insert, Name_Security.

Common Error Messages

CFINCLUDE Error

If you use relative paths (for example, TEMPLATE=“index.cfm” or TEMPLATE-E=“\index.cfm”), you do not have to create any special mappings. We recommend that you use relative paths with CFINCLUDE whenever possible.

This particular CFINCLUDE looping error message does not give a clear diagnosis of the problem and actually is masking the real error message. You should refresh the error-request.cfm file:

1. Take the original e-Series source code zip file and extract the files again into a new folder.
2. Navigate to Customer\ScriptContent.
3. Copy the errorrequest.cfm file and paste it into your working e-Series folder's ScriptContent sub-folder.
4. Return to your website. Now you can see a better error message with an explanation of the real issue.

Access Denied

If you get the “Access Denied” error message, right-click on the webpage and select View Source. A second window pops up. Scroll to the bottom of that window. e-Series tells you which security filter must be enabled in order to have access to that area of the website.

HTTP 404 Object Not Found

This error occurs when there is an incorrect mapping. There are several things to check when you get the HTTP/1.0 404 Object Not Found error message:

1. Verify that the path to your website is correct in ColdFusion. Open the ColdFusion Administrator and go to Mappings. Check your logical path and IP address. If this is a virtual site, the logical path should be the IP address/name of the virtual site.
2. Open the default.htm file. Verify that all paths to the website are correct in this file.

   Note: There are other problems that may cause 404 errors.

Report Not Completed Error while Running Crystal Reports

Several sources including ActiveX Viewer, proxy servers, or NT security, could cause this error message. For more information see the Crystal Decisions (http://support.crystaldecisions.net/communitycs/technicalpapers/scr8_activexviewerissues.pdf) (formerly Seagate Software) website posting to help troubleshoot this issue. To access this technical paper, you may need your Crystal Reports Software Registration number.

Transaction Error Message during Checkout Process

For a PayPal gateway, a transaction error will be generated if any errors in the CheckOut Process occur that are outside the credit card gateway. If the gateway is enabled and a transaction error occurs the credit card information will have already been sent to the gateway.

Error message when editing a profile online

Sometimes Name.LAST_UPDATED is left unpopulated during a conversion. In this case, a customer/member encounters an error when trying to edit their profile online, “The update has failed, please try again!” You must populate the records where Name.LAST_UPDATED is null.

Error committing data from user defined windows

If a user defined window contains fields that access the same table in the iMIS database, only the data in the last user defined field is committed.

Error Executing Database Query. [Macromedia][SQLServer JDBC Driver][SQLServer-]Cannot convert a char value to money. The char value has incorrect syntax.

Password verification in e-Series

The password used in e-Series must be six characters in length and must contain at least one numeric and one alpha character. If you try to create a password that has single

quotes, double quotes, pound signs, or spaces, you will receive an error message.

An application variable, Application.PasswordValidationMessage, is located in the _eSeriesConfig.txt. This variable can be used to customize the password validation message.

QSI gateway connection not verified in e-Series

The QSI gateway cannot be successfully verified through e-Series. You must use the Dialect Payment Client Test on the server to test the QSI gateway connection. Only the gateway for Verisign/PayPal can be verified through e-Series.

When attempting to verify the QSI gateway connection iMIS displays the following message:

The credit card gateway has been configured but cannot be verified through e-Series. To verify the connection, you must use the Dialect Payment Client Test on the server.

Common Issues

See Customizing Confirmation emails for help with testing and troubleshooting those customizations.

Verifying the Gateway Connection

You can test and verify the connection between your e-Series site and the Verisign gateway to ensure credit card transactions process successfully. To verify this connection, select Verify gateway connection on the Credit Card Authorization Options window (from Admin, select Lookups> Credit Card Gateway).When you select Verify gateway connection, a message displays indicating if the connection was verified successfully or was not verified.

Note: If the credit card gateway is Disabled on the Credit Card Authorization Options page, the Verify gateway connection link will not display. The Enabled option must be enabled for the Verify gateway connection link to display.

Webmaster email Notification

When credit card transactions do not process successfully, webmaster notification will be sent by email when a customer is making a purchase and the gateway is unavailable. Logic has been added to the CCValidation.txt file that tests the connection before starting

an online transaction. If the connection fails, an email message is sent to your site's web-master.

The interval between email messages sent to the webmaster can be set in minutes when the gateway is unavailable and customers are trying to make purchases. The interval between email messages that are sent to the webmaster when the credit card gateway is unavailable for customers attempting to make purchases can be set in the Unresponsive gateway message interval field on the Credit Card Authorization Options window (from Admin, select Lookups> Credit Card Gateway).

When a change is made on the web, an email message is sent to the site administrator. This email contains a reference to a hyperlink, such as

http://www.txca.org/Source/Lookups/Memberlog.cfm?ID=13809

The site administrator must be logged on before clicking the hyperlink; otherwise an error is displayed on the referenced website.

Note: If the credit card gateway is Disabled on the Credit Card Authorization Options page, the Unresponsive gateway message interval field will not display. The Enabled option must be enabled for the Unresponsive gateway message interval field to display.

Disabling Online Purchases

You can temporarily disable online purchases if needed (for example, if the credit card authorization gateway is temporarily unavailable). To disable or enable online purchases, toggle the Disable online purchases/Enable online purchases link on the Credit Card Authorization Options window.

Note: If the credit card gateway is Disabled on the Credit Card Authorization Options page, the Disable online purchases/Enable online purchases link will not display. The Enabled option must be enabled for the Disable online purchases/Enable online pur-chases link to display.

Anonymous Users and Security Filters

Security filters do not adapt easily to anonymous user access. The problem is that when a security filter is evaluated, the filter is thrown into a query that includes Name.ID-

='#Client.ID#.' Since anonymous users do not have a Client.ID, the query will never return any rows.

A variable is created from the PreserveSingleQuotes (Variables.Filter) function that sets the AND criteria for search results, allowing search results to be returned for anonymous users.

If you want to allow anonymous users to search your site's Directory, only the Browse - Member filter should have a filter query; the Search - Member filter should not have a filter query.

For example, anonymous users will not be able to search your site's Directory if filter queries are defined for the following filters:

- Browse - Member: Name.MEMBER_TYPE='CM'
- Search - Member: Name.MEMBER_TYPE='CM'

The Search - Member filter is for page level security. If the Search - Member filter is enabled, anonymous users will not be able to access the search fields.

The Browse-Member filter is for record level security, and only the Browse - Member filter should have a filter query if you want anonymous users to have access.

Correcting Corrupt UserDefined Table Data

e-Series inserts Expansion codes into the database if Expansion codes have been defined in the general lookup/validation tables for user-defined tables (from Customers, select Set up tables > General lookup/validation). User-defined tables are accessible in e-Series by clicking more info on a customer's profile page.

iMIS will correct a customer's user-defined table data the first time the customer's record is edited in Customer Portfolio.

The following rules govern which code e-Series inserts into the database when inserting customer data in user-defined tables:

- If only the Code and Description fields are defined for a general lookup/validation table created for a user-defined table, then the Code is inserted into the database.

- If the Code, Description, and Expansion fields are defined for a general lookup/validation table created for a user-defined table, then the Expansion code is inserted into the database.

  Note: User-defined table fields of the type Money cannot exceed 22 characters in length. For larger numbers, use the Number type for user-defined table fields.

  Special characters

- Do not put special characters or spaces in meeting codes, function codes, product codes, activity types, pay types, and custom tables and windows. For example, hyphens are not allowed.
- The only special character that is allowed in custom tables and windows is the underscore. For example, using the naming convention "_eSeries" is acceptable.

  Modification of Unencrypted Files

  Below is a list of unencrypted files under the Source directory. These files control the characteristics of e-Series pages. For files that refer to tables, TableStandard_0.txt, TableStandard_0.txt, and TableStandard_0.txt the default pixels settings is 100%.

- Source/Body.txt - (All pages) Any parameter for the body tag can be added.
- Source/IncorrectPassword.txt - Displayed in the login page upon failed login.
- Source/Member-Logoff.txt - Text displayed when the logout link is used on a no-frames site.
- Source/Site-Logon.txt - Text displayed on the logon screen if jumping directly to a page before logging on.
- Source/TableButtons.txt - (All pages) Change or add parameters to the table that holds the buttons.
- Source/TableStandard_0.txt - (All pages) Controls the table width for the first table on the checkout basket page.
- Source/TableStandard_1.txt - (All pages) Change or add parameters to the tables that format the display of forms and retuned data.

- Source/TableStandard_2.txt - (All pages) Change or add parameters to the tables that format the display of forms and retuned data if it is in a child table.
- Meetings/CCValidation.txt - Access to CC_Validate and CT_ custom tags. Additional error handling or parameters can be added for the credit card gateway tag.
- Meetings/QuantityAdjustment.txt - Message displayed when in the check-out page if a function quantity is adjust.
- Meetings/NoFunctionsForMeeting.txt - Displayed in the meeting pages if no functions are available for the meeting.
- Meetings/NotRegistered.txt - Displays in the checkout basket page if you have not register for any meeting functions.
- Meetings/AllowRegSelect.txt - JavaScript pop-up message if meeting registration fails.
- Meetings/regclass.txt

Changing the Contents of Default Home Pages for a Frameless Site

Modify these files that are located in the Customer/StaticContent/StaticPages directory:

- eSeriesHome.htm
- eCustomerHome.htm
- eEventsHome.htm
- eOrdersHome.htm
- AdminHome.htm

Any valid HTML, ColdFusion, or JavaScript can be used in the home page files.

Useful Local Variables Available upon Login

The following variables are available when a customer has logged in:

- Client.ID
- Client.CHAPTER
- Client.CO_ID

- Client.COMPANY
- Client.IP_ADDRESS
- Client.MAJOR_KEY
- Client.MEMBER_TYPE
- Client.ORG_CODE
- Client.REGISTRANT_CLASS
- Client.SECURITY_GROUP
- Client.TITLE
- Client.FULL_NAME
- Client.FIRST_NAME,
- Client.FULL_ADDRESS
- Client.LAST_NAME
- Client.CITY
- Client.STATE_PROVINCE
- Client.ZIP
- Client.COUNTRY
- Client.TAX_EXEMPT
- Client.EMAIL

NT/IIS Security

For more information on NT/IIS security, see

http://www.macromedia.com/devnet/security (http://www.macromedia.com/devnet/security)

Third address line in outgoing email

Caution! When you enable third address line in iMIS for the first time, any customization you have previously done to the email that notifies customers of record edits will be lost.

ColdFusion Issues

Testing your ColdFusion installation

Before you begin installing e-Series, you should perform a quick and simple test of your ColdFusion server installation.

Registry

e-Series uses ColdFusion application and session variables. By default, ColdFusion stores client variables to the System Registry for a period of 90 days. Storing application and session variables in the Registry may cause the Registry to fill up, which could stop any ColdFusion applications and could seriously affect the performance of the Windows Server.

ASI recommends that all variables be stored to a table on a SQL server or Access database using ODBC.

Mappings

Verify that your mappings in ColdFusion are correct.

If you are using virtual directories for several customers, add the customer name after the IP address when entering the logical path.

Mail

The Mail Server field must be populated in e-Series. The Mail Server field is located in ColdFusion in the side index under Miscellaneous> Mail.

If the field is not populated, iMIS returns an error message stating No SMTP Server Specified for CFMAIL when customers try to register for a meeting or edit their records.

Note: The mail server address does not have to be a valid address until the e-Series site is public.

Configuring an Exchange Server to relay mail for a ColdFusion Server

1. Select the Internet Mail Connector in Microsoft Exchange Administrator.

2. Click on the Routing tab, and then enable the Reroute incoming SMTP mail option that is required for POP2/IMAP4 support.
3. Click Add, and then enter all the available domains that your Exchange server recognizes. For example, if you receive mail for csiinc.com and csisupport.com, enter both of these domains.
4. Click on the Routing Restrictions tab.
5. Enable the Hosts and clients that successfully authenticate and Hosts and clients with these IP addresses options.
6. Enter the public IP address of your ColdFusion Server in the IP Address and Mask fields.
7. (optional) If you are using NAT, enter the internal IP address provided if both the Exchange Server and ColdFusion server are on the same side of the firewall.
8. (optional) If you want to allow a single IP address, enter the Mask as 255.255.255.255.
9. (optional) If you want to allow a full c-class range of IP addresses, enter the IP address ending in a zero (for example, 192.168.1.0) and a Mask of 255.255.255.0.
10. Restart your Internet Mail Connector.

Securing the ColdFusion Service for Windows 2000 Server

The first step is to control access to the ColdFusion service by creating a new user account for ColdFusion in Windows 2000, and configuring the security settings.

Note: The steps to control access to the ColdFusion service may appear excessive to some administrators, and are optional security measures.

ColdFusion recommends that the ColdFusion service account should not log in as the system account; therefore, use the Windows 2000 Computer Management window to configure security.

To add a ColdFusion user (Windows 2000)

1. Select Start> Settings> Control Panel> Administrative Tools> Computer Management.

2. On the Computer Management window, select System Tools> Local Users and Groups> Users.
3. Right-click on Users to open the New User window.

- Enter CF_Manager for the User name.
- Enter ColdFusion Manager for the Full Name.
- Enter a Password, and confirm the password by reentering it in the Confirm Password field.
- Enable the User cannot change password option.
- Enable the Password never expires option.
- Click Create on the New User window.

4. On the Computer Management window, select System Tools> Local Users and Groups> Groups.
5. Right-click on Users to open the Users Properties window.
6. Select CF_Manager in the Members area of the window, click Remove and then click Apply.
7. Select Programs> Administrative Tools> Local Security Policy to open the Local Security Settings window.
8. Select Security Settings> Local Policies> User Rights Assignment.

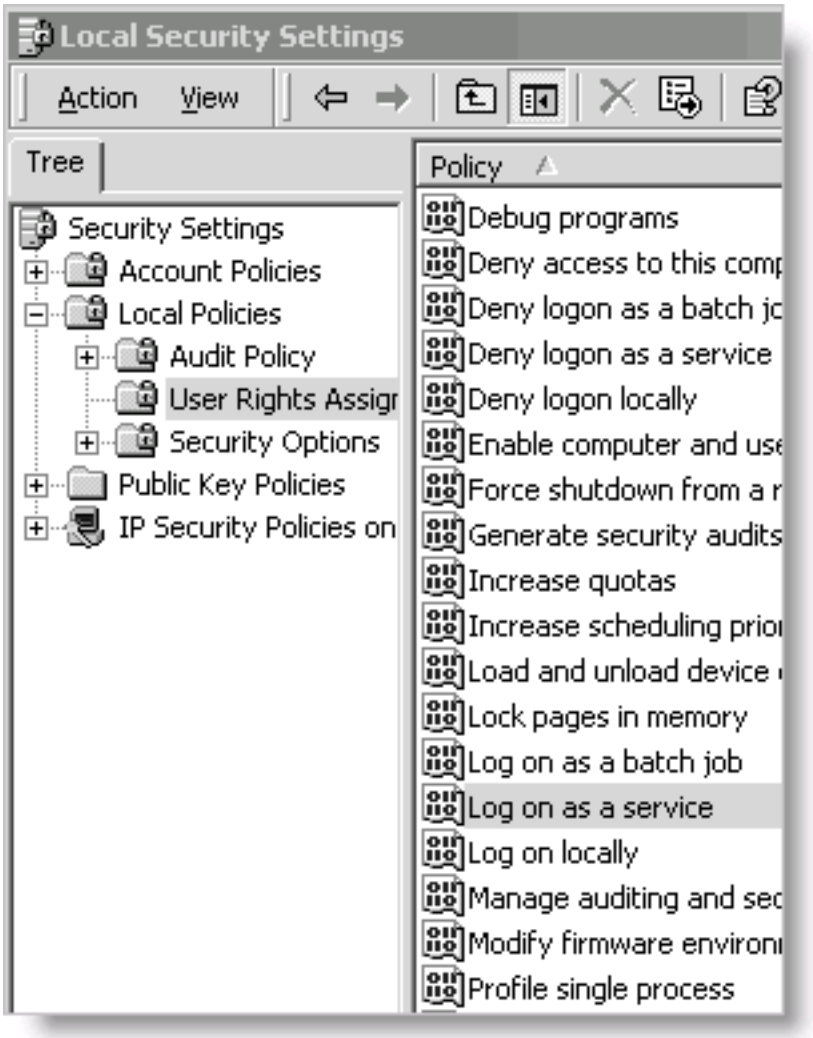
- From the available policies, double-click on Log on locally to open the Local Security Policy Setting window.
- Select CF_Manager from the scroll-down list.

9. Click Add on the Local Security Policy Setting window to open the Select Users and Groups window.

- Select CF_Manager from the scroll-down list.
- Click Add on the Select Users and Groups window.

- Click OK twice.

10. On the Local Security Settings window, double-click on Log on as a service to go to the Local Security Policy Setting window.
11. Select CF_Manager from the scroll-down list.
12. Click Add on the Local Security Policy Setting window.
13. Select CF_Manager from the scroll-down list.
14. Click Add on the Select Users and Groups window.
15. Click OK.



Local Security Settings window

To set directory permissions for CF_Manager (Windows 2000)

In the following procedure, you will set directory permissions for CF_Manager in the ColdFusion, InetPub, and eSeries directories.

1. Using Windows 2000 Explorer, navigate to the Cfusion directory.
2. Right-click the Cfusion directory and select Properties. The CFusion Properties window opens.

- Click the Security tab, and select ColdFusion Customer.

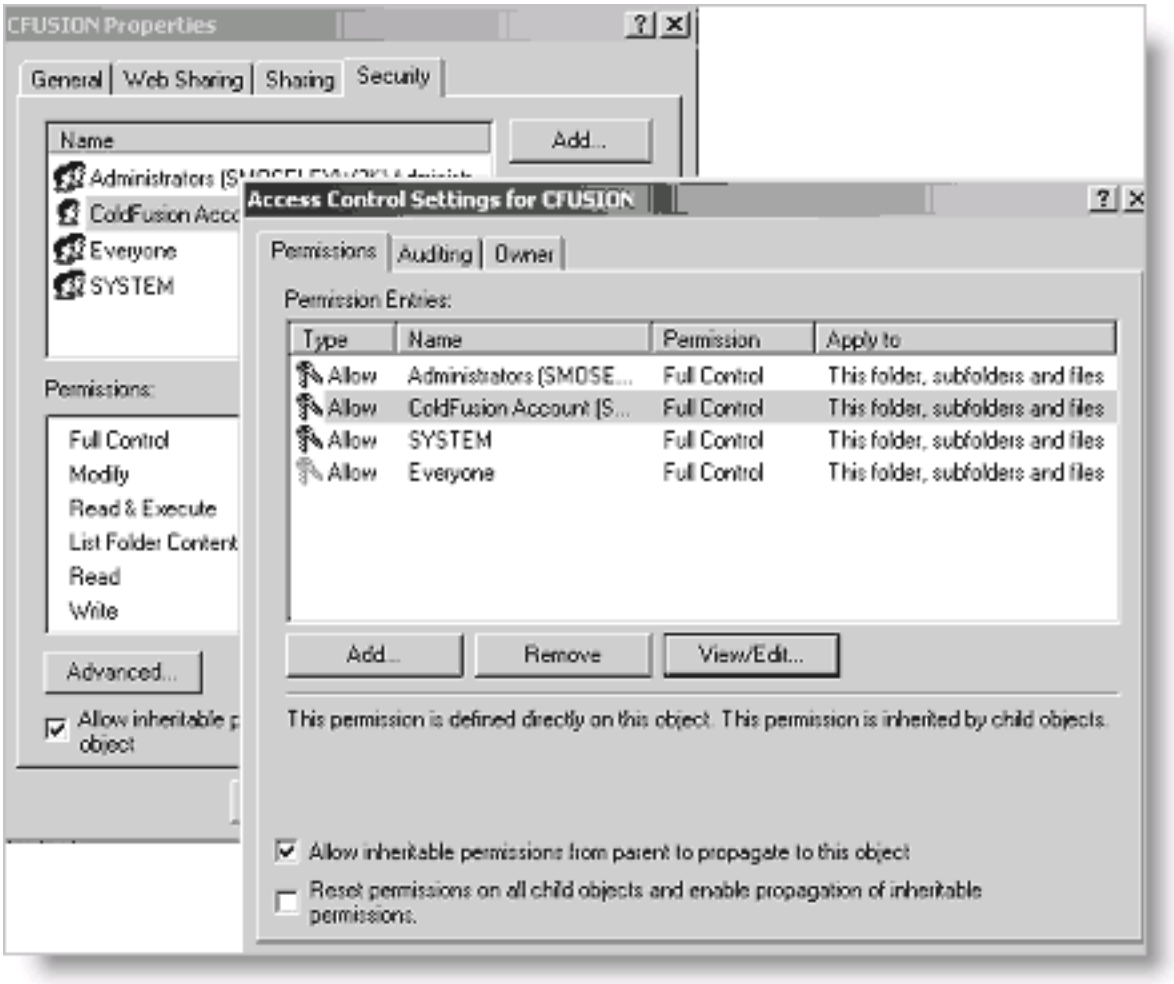
  If CF_Manager does not display, click Add and select CF_Manager from the Select Users or Groups window. You may need to change the selection in the Look-in drop-down list to the local computer's account.

  Note: If the Security tab does not appear on the CFusion Properties window, you will need to enter C:/fs:ntfs in the Run window (Start> Run), and then reboot your computer.

- Click Add,
- Click OK.

3. Under Permissions, select the Full Control, Modify, Read & Execute, List Folder Contents, Read and Write options.
4. Select the Allow inheritable permissions from parent to propagate to this object option.
5. Click Apply.
6. On the CFUSION Properties window, click Advanced to open the Access Control Settings for CFUSION window.
7. Verify that the ColdFusion account has the Full Control and This folder, subfolders and files options set.
8. Click OK on the CFUSION Properties window.
9. Repeat the previous steps for the following directories:

- C:\InetPub
- C:\eSeries



Set Access Control Settings

To grant CF_Manager limited access to the Registry (Windows 2000)

1. Select Start> Run to open the Run window.
2. Enter regedt32 (the Windows 2000 Registry Editor program).
3. Click OK to open the Registry Editor.
4. Using regedt32, navigate to the following registry key: HKEY_LOCAL_MACHINE> SOFTWARE> Macromedia.

5. Select the Macromedia folder, and then select Security> Permissions to open the Permissions for Macromedia window.
6. Click Add to open the Select Users or Groups window.
7. Select CF_Manager from the list of users.
8. Click Add, and return to the Registry Key Permissions window. CF_Manager now displays in the window.
9. Click OK.
10. Enable the Replace Permissions on Existing Subkeys option.
11. Select CF_Manager (ColdFusion Account) from the list of users.
12. Enable the Read and Full Control options.
13. Enable the Allow inheritable permissions from parent to propagate to this object option.
14. Click Apply.
15. Repeat the steps to apply Full Control rights to e-Communities.

    Note: The key for e-Communities is Software> Advanced Solutions International> iMIS e-Series. Since the registry is being updated every time the CF Scheduler runs to send out emails, the CF_Manager needs to have Full Rights added to the IMIS eSeries registry key similar to the settings for ODBC and INETPUB. E-mails will not be sent unless CF_Manager has appropriate permissions.
16. (optional) If Advanced ColdFusion Security is installed, repeat the steps to add Full Control rights for CF_Manager to HKEY_LOCAL_MACHINE/SOFTWARE/NETEGRITY.
17. To grant CF_Manager access to the OBDC, repeat the steps to add Full Control rights for CF_Manager to HKEY_LOCAL_MACHINE/SOFTWARE/ODBC.

    To start or stop the ColdFusion services (Windows 2000)

    Next, you need to start the ColdFusion services, then stop and restart the services.

1. Select Start> Settings> Control Panel> Administrative Tools> Services to open the Services window.
2. Right-click on ColdFusion Application Server to open the ColdFusion Application Server Properties (Local Computer) window.
3. Select the Log On tab and enable the This account option.
4. Browse to CF_Manager to verify that the correct domain is entered.
5. Enter your password in the Password field and reenter the password in the Confirm Password field.
6. Click OK to return to the Service window.
7. Right-click on ColdFusion Application Server to open the ColdFusion Application Server Properties window.
8. Select the Hardware Profile, and click Enable.
9. Repeat the steps for ColdFusion Executive and ColdFusion RDS.

Setting up CF_Manager with ColdFusion Advanced Security

If you install Advanced Security with ColdFusion and are running the ColdFusion services under the CF_Manager account, you have to add additional registry rights to the that account to be able to start the ColdFusion Application and RDS Services. You will need to grant Full Control to CF_Manager for the HKEY_LOCAL_MACHINE>> SOFTWARE>> Netegrity keys and all subkeys.

Enabling ColdFusion debugging for e-Series

When trying to determine e-Series and installation problems, you can benefit from the debugging features of ColdFusion. Enabling these settings allows you to determine the SQL query, data source name, and which .cfm files are being used by e-Series.

1. In ColdFusion, select Miscellaneous> Debugging in the side index.
2. If desired, specify the users who will also see this information.

Forgot your ColdFusion Administrator password?

The password is stored in the systems registry. To turn off the password, set UseAdminPassword to 0. If you are running ColdFusion 4.5 or a later version, you will need to restart your application for this change to be detected.

Referring IP Address Error Message

Errors messages from the ColdFusion server list a referring IP address. This IP address should be the IP of the client workstation, not the IP address of the ColdFusion server.

Assistance from Technical Support

FTP Access to Webserver

In order to debug a problem with your e-Series website, Advanced Solutions Technical Support may need FTP access to the webserver where the e-Series source code is installed.

You can set up an FTP site in IIS. FTP site setup is similar to website setup.

1. Open IIS on the webserver.
2. Right-click on the website and select New> FTP site.
3. Enter the IP address and the required properties.

Access to the iMIS database

To be able to debug a problem with your e-Series website, Advanced Solutions Technical Support may need to access to your database. The iMIS database can be accessed with PC Anywhere, RAS access, or over the Internet.

Sending screenshots to Support

If the e-Series website is behind a firewall and cannot be viewed by Advanced Solutions Technical Support, you must send screenshots of all error messages. The preferred method for sending screenshots is to paste the screenshot into Microsoft Word and email the Word document as an attachment.

Debugging in ColdFusion

To debug a problem with your e-Series website, you may need to turn on ColdFusion debugging. Turn on debugging before you call Technical Support so they can go to the website and gather all the necessary information.

e-Series Applications

Introduction

This guide teaches you how to set up and use iMIS e-Series™. It walks you through the most important tasks in setting up your site and defining the parameters for iMIS e-Customer Management™, iMIS e-Billing™, iMIS e-Events™, iMIS e-Orders™, and iMIS e-Communities™.

Upon completion, you will be able to do the following:

- Administer, set up, and use the iMIS e-Series modules
- Configure security
- Customize your e-Series site

Terms for e-Series applications

Some explanations in this document may vary depending on the database used with iMIS. In these situations, the following nomenclature is used to identify the database:

- Microsoft SQL Server®: (MSSQL)
- Sybase Adaptive Server Anywhere™: (SASA)

Browser

Browsers request pages from webservers, process HTML and client-side scripting (such as JavaScript and VBScript), and display pages.

Dynamic webpage

Dynamic webpages are interactive and allow the user to display custom information. Usually, the information is queried from a database and then displayed on the page. Dynamic page processing includes the following steps:

1. The user requests the page by entering a URL in a browser.

2. The browser requests the page from the webserver.
3. If the requested page has a .cfm extension, the webserver sends the page to the ColdFusion Application Server for processing.
4. The ColdFusion server processes the ColdFusion tags and outputs the data in HTML.
5. The webserver sends the resulting HTML page to the browser.
6. The browser interprets the HTML and displays the page to the user.

HTML

(Hypertext Markup Language) HTML is the markup language used to format documents on the World Wide Web.

HTTP

(Hypertext Transfer Protocol) HTTP is the client/server protocol used to access information on the World Wide Web.

Static webpage

Static webpages are pages that do not change and have little interactivity except hyperlinks. The information on a static page changes only when an HTML developer updates it. Browsers and webservers process static pages by following these steps:

1. The user requests the page by entering a URL in a browser.
2. The browser requests the page from the webserver.
3. The webserver sends the page to the browser in HTML.
4. The browser interprets the HTML and displays the page to the user.

e-Series Overview

The iMIS e-Series products give you the ability to provide online functions and e-commerce for your customers so that they can enter customer information, make dues payments, purchase products over the Web, and join communities.

e-Series includes the following modules:

- e-Customer Management
- e-Billing
- e-Events
- e-Orders
- e-Communities

You must purchase e-Customer Management to use the e-Events and e-Orders modules. To use e-Events, you must purchase the iMIS e-Event Management module so that your customers can register for events and event functions online. To use e-Orders, you must purchase the iMIS Orders module so that your customers can place orders online.

e-Series Features

e-Series allows organizations running iMIS to access the member database through the Internet. Customers, traveling staff, and staff at remote offices can enter customer information, register for events, purchase products over the Web, and join communities.

The e-Series features include the following:

- Real-time processing - Because your Web pages integrate with the iMIS database, transactions are processed as they happen
- Microsoft SQL Server (MSSQL) or Sybase Adaptive Server Anywhere (SASA) database support
- Customizable interface and modules
- PayPal support to validate and authorize credit card payments
- Configurable security levels - Create up to 99 security groups including the default logins for Administrator, Web Administrator, Remote Chapter, and Anonymous
- Comments - Receive customer input and store email messages in a database with unlimited comment types
- Integration with the iMIS Orders module

- Value Added Tax (VAT) and Canadian taxation integration
- e-Customer Management functions:
- International date formatting
- Customer sign up
- Enable anonymous user sign up
- Customer search/query screens
- Customer data maintenance
- Security on almost every field allowing limited filtered access
- Security on custom windows
- e-Billing functions:
- Credit card payment verification
- View outstanding balances
- Make online payments
- e-Events functions:
- Event search capability
- Registration options
- E-mail registration
- View only
- Online registration
- View/confirm event registration
- Conflict checking for event functions
- View rosters
- View order detail of registration

- Function links for more information
- e-Orders Functions:
- Define credit card accounts
- Set up batch control
- Define tax codes
- Define Web order types
- Enable products and product categories for the Web
- View products on the Web
- Purchase products on the Web
- e-Communities Functions:
- Create and manage communities
- Create and manage email lists
- Create and manage community news items
- Archive community news items
- Create and manage community discussion forums
- Participate in discussion forums
- Create and manage community documents
- Subscribe to communities
- Set email preferences
- Mark items as read
- Search communities
- Verity Indexing set up and maintenance

Using e-Customer Management

Overview of e-Customer Management

e-Customer Management connects directly to the iMIS customer database to provide online access and functionality. Customer information submitted through e-Customer Management is accessible instantly in the iMIS system.

e-Customer Management provides you with many powerful features that allow you to perform the following actions:

- Search and view the directory, export selected records, and email customers returned by a search
- Sign up and edit customer records
- View, modify, and insert customer activity records

The goal of this section is to give you the knowledge and skills necessary to use the e-Customer Management module.

After completing this section, you will be able to perform the following functions:

- Using Directories
- Using the Search Utility
- Using the Speed Search Utility
- Signing Up a New Customer
- Editing Logins and Passwords in e-Series
- Resetting User Passwords
- Logging In as Another User
- Editing Records in e-Series
- Viewing Customer Activity Records
- Viewing Additional Customer Information

- Recording Relationships
- Entering Notes

Using Directories

The Directory feature of e-Customer Management allows you to find an individual or company name quickly. Do not use this feature for large databases because of the time required to return results. As an alternative, you can use the Speed Search utility.

Note: Make sure that field names and activity type names do not contain spaces. If they do, you will receive a ColdFusion error if you conduct a search and any of these fields contain spaces.

To view the director

Note: You can change the list sort order by clicking the column headers.

1. Log in to the e-Series website.
2. Select Directory in the top navigation bar to display the Directory Search utility.
3. Select the letter that matches the first letter of the customer's last name or the first letter of the company name to display the Search Results page.

To export selected records

After you conduct a directory search, you can export selected fields from the returned records to a .csv file that you then can download.

1. On the Search Results page, click export to display the Export page.
2. Select the Address Type to export.
3. In the Fields to Export list, press Ctrl and select each field you want to export.
4. Click submit to view the Export Results page.
5. Click the report hyperlink to open or download the spreadsheet and view the export as shown in the following example.

Note: You must have Microsoft Excel loaded on your computer for the file to display in an Excel spreadsheet. Excel limits the name of the workbook to 32 characters, so if your search query results in a long name, you may see an error that Excel cannot resolve the workbook name. The data is still exported though.

Export Custom Windows

The export utility includes the Custom Windows (or User Defined Fields). The Export function has an option to select a custom window and select various fields of the table to export a file. Refer to Customizing e-Series Scripts.

Using the Search Utility

e-Series includes a powerful search utility that allows you to conduct searches on the following:

- Standard fields such as ID, Last_Name, Company, Chapter, State, and Zip
- User-defined fields
- Any combination of standard fields and user-defined fields
- Security groups

The search fields that display in the Advanced Search page are determined by the configuration of the customer's security group, and you can limit the number of fields that display for each security group. The MEMBER - Search security filter restricts search results at the query level. The MEMBER - Browse security filter restricts search results at the browse level; users are restricted from seeing a record.

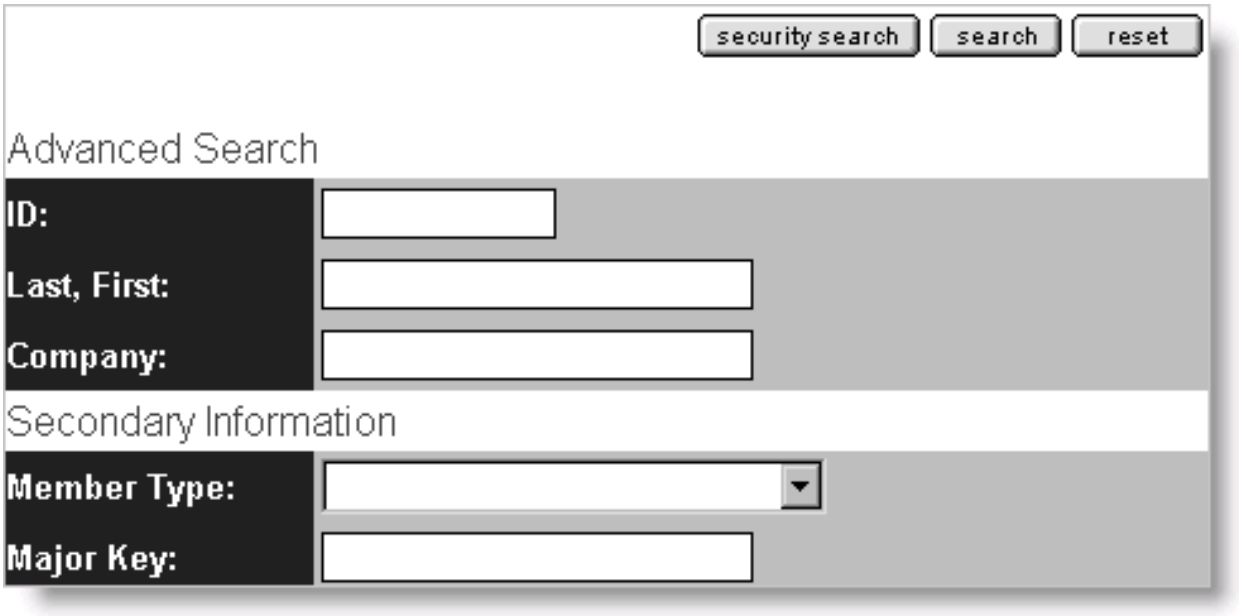
Depending on the user's security group, users can perform several functions after a search:

- View and edit customer records
- Send email messages
- Export records

For better performance and to limit risk to large databases, restricting the number of records returned from a search is recommended. Refer to “Maximum Rows Returned by Search” for more.

To conduct a search

1. Log in to the e-Series site.
2. Select Directory in the top navigation bar.
3. Select Directory> Search in the side index to display the Advanced Search page.
4. Enter the criteria upon which you want to base the search. For example, if you want to search for customers whose last names begin with the letter H, enter H in the Last, First field.
5. Click search to display the Search Results page(s).



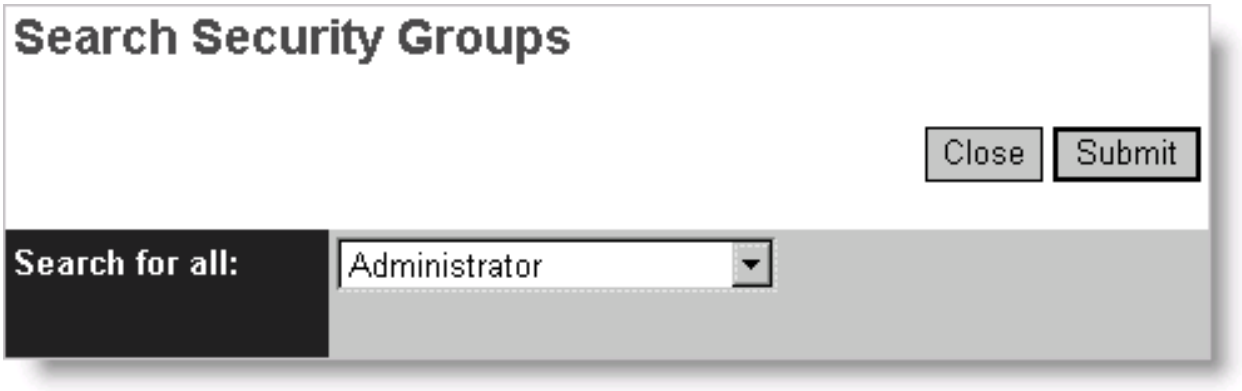
Advanced Search page

To conduct a security search

The Security Search function allows you to search by security group.

1. Log in to the e-Series site.

2. Select Directory in the top navigation bar.
3. Select Directory> Search in the side index to display the Advanced Search page.
4. Click security search to display the Search Security Groups page.
5. Select a security group from the Search for all drop-down list.
6. Click Submit to display the Search Results page.

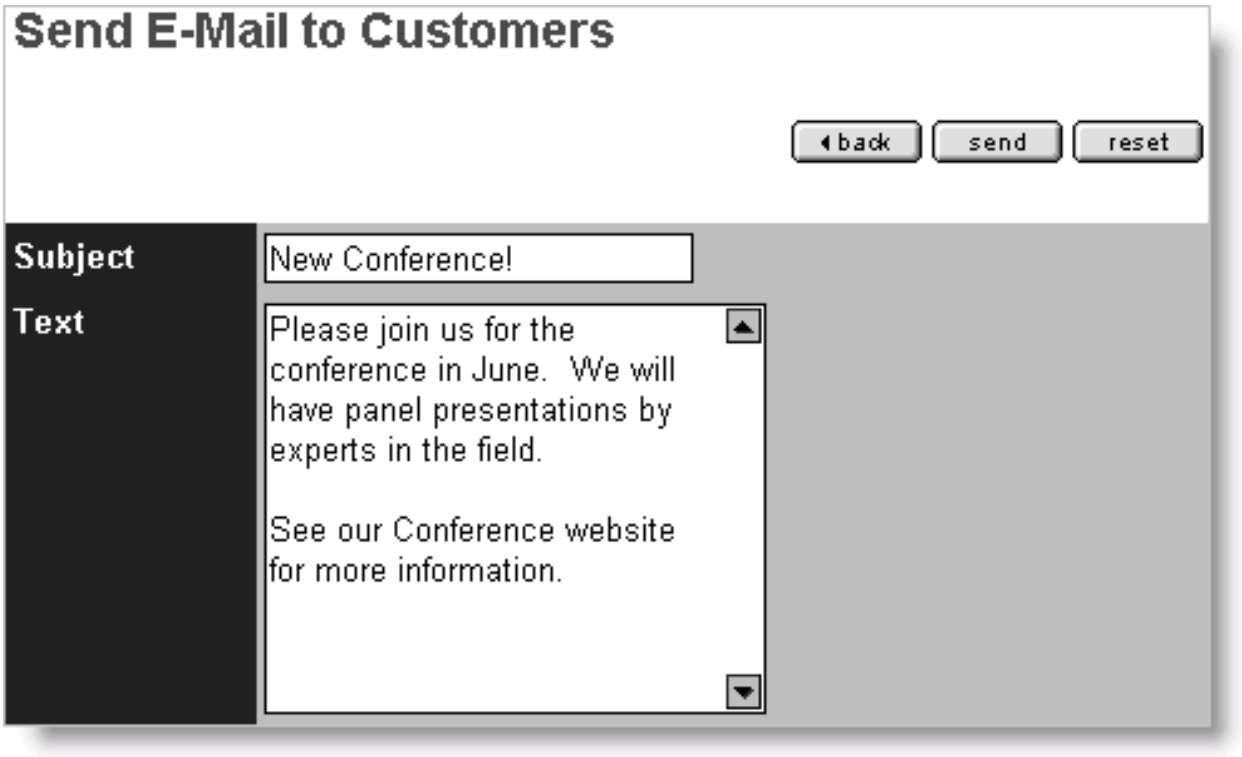


Security Groups page

To email customers returned by a search

After you conduct a search, you can e-mail the customers whose records were returned from the search.

1. On the Search Results page (Directory> Search> click search), click email members to display the Send E-Mail to Customers page.
2. Enter the Subject of the e-mail message.
3. Enter the content of the e-mail message in the Text field.
4. Click send.



Send email to Customers page

Hands-on exercise: Use the directory search feature

1. Find Marcie Farmhaven's customer record using the directory.
2. Export the following fields:

- FULL_NAME
- ADDRESS

Using the Speed Search Utility

The Speed Search utility is similar to the Search utility except that fewer, more specific fields are searched. The fields on the Speed Search page are pre-defined and non-configurable.

To conduct a speed search

1. Log in to the e-Series site.

2. Select Directory in the top navigation bar.
3. Select Directory> Speed Search in the side index to display the Speed Search page.
4. Enter the criteria upon which you want to base the search.
5. Select the appropriate Chapter from the drop-down list.

   Note: The Chapter drop-down list defaults to the logged-in user's chapter entered in the Chapter table, so be sure to select the correct chapter.
6. Click search to display the Search Results page.

   Note: At the conclusion of a search, click the reset button on the Search page to remove the existing search criteria.

Signing Up a New Customer

e-Series allows enables customers to sign up directly for an e-Series site and simultaneously create a user login and password. You also can sign up other customers and create security logins and passwords for them.

When a customer submits a site registration to an organization using e-Customer Management, that information is entered directly into the iMIS database and is accessible instantly within the iMIS system (note that this is not an application process).

New site users are assigned to a security group that you configure in the e-Customer System Parameters. After you set up your security groups, you can limit the fields that customers can view and edit. If you log in as an administrator, all available fields are visible.

You have the option of allowing new users to create their own login and passwords. Typically, a new user is assigned to the Web member type and the Anonymous security group, and their assignment is valid for three months.

An email message is sent to the designated staff person notifying the organization that a person has signed up. The prospective customer receives an email message (which you can customize) that confirms receipt of the user's information.

About signup fields

When a user opens the Sign Up page in e-Series, each signup field is verified against its related security filter to determine the user's privileges and whether the field is a required field. A key at the top of the Sign Up page shows the symbols for required fields.

Required field validation

Customers who try to submit an incomplete signup form are informed that their entry is incomplete and that their information has not been submitted. The message may also include information on the State, Country, and Zip fields if the option requiring these fields has been enabled. A red notation is displayed next to the required fields that have been left blank on the Sign Up page.

Email format validation

Email addresses entered in e-Series are checked to ensure that they are properly formatted, that is, they contain the @ symbol, they have no embedded spaces, and they end in characters separated by a period.

Note: Only the email address format is validated, not the address itself. Therefore a customer could enter a properly formatted, invalid email address, and it would be accepted.

About Address Flow Down

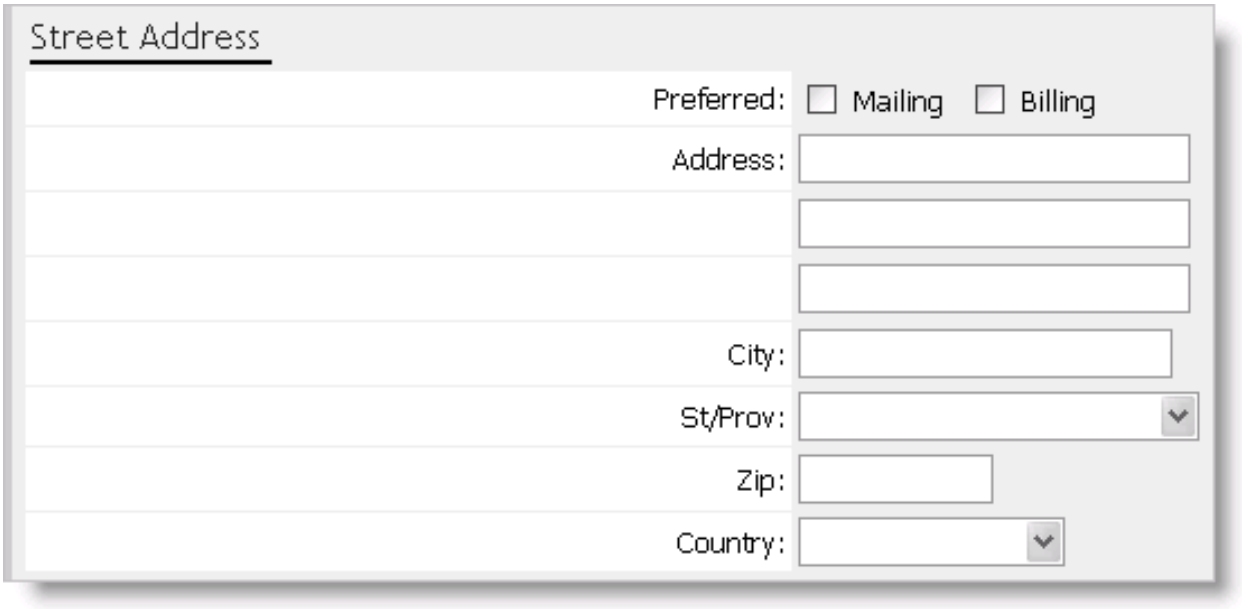
The flow down of company information to new records functions only when Disable Auto Flow Down of company address Information is disabled in the iMIS Customer Setup - Advanced window.

When a user selects a company record, the following fields automatically populate with the company information: Company, Work Phone, Fax, Toll Free, and Address1.

Note: To enable the Company Search function and the flow down of the company information, Insert must be enabled for both the Member - Company Name and Member - Company ID security filters. If these filters are not enabled, but the Search for Member - Company ID is enabled, the company record will not be associated with the member record.

Third address line support in e-Series

e-Series supports a third address line for all postal/street address areas. You can enter a third line for an address wherever the address appears in e-Series.



Example of the third address line for a Street Address

Example of the third address line in a customer record

To sign up a new customer

When you open the Sign Up page, the Company Search page also opens, requesting your company affiliation. If you enable Yes for company affiliation, Company ID and Company Name fields display which allow the values in the text fields to be searched. A search result of matching companies based on the entries in the text fields will display. You have the choice of selecting a record or returning to the search function.

1. Select Sign Up in the top navigation bar to display the Company Search page.

2. (optional) If you are affiliated with a company, enable Yes on the Company Search page to display the Company ID and Company fields.

- Enter your Company ID. This ID is associated with the parent company for the customer who is signing up.
- If you do not know your company's ID, enter the full or partial company name in the Company field.
- If you want to search for your company, click Search to display the Company Search Results page. If your company is listed, select the company's ID. If your company is not listed, click back to search again, or click close to go to the Sign Up page.

3. (optional) If you are not affiliated with a company, enable No and click Next to display the Sign Up page.
4. (optional) If you are affiliated with a company and did not enter your company information in the Company Search page,

- Enter your Company ID.

  If you do not know your company's ID, click company search to display the Company Search page and repeat Step 2.

- Enter the name of your Company.

5. Enter your customer information in the Sign Up page(s). If custom pages have been created, sign up fields will display either on a single Sign Up page or on multiple Sign Up pages depending upon the settings in the e-Customer System Parameters.

   Note: An asterisk denotes a required field.

6. Click submit.
7. (optional) If the Sign Up Confirmation Screen option is disabled in the e-Customer System Parameters, a message displays confirming that your customer information was inserted successfully.

   Click OK to log in to the site and open your customer profile.

8. (optional) If the Sign up Confirmation Screen option is enabled in e-Customer System Parameters, the Confirm Information page displays:

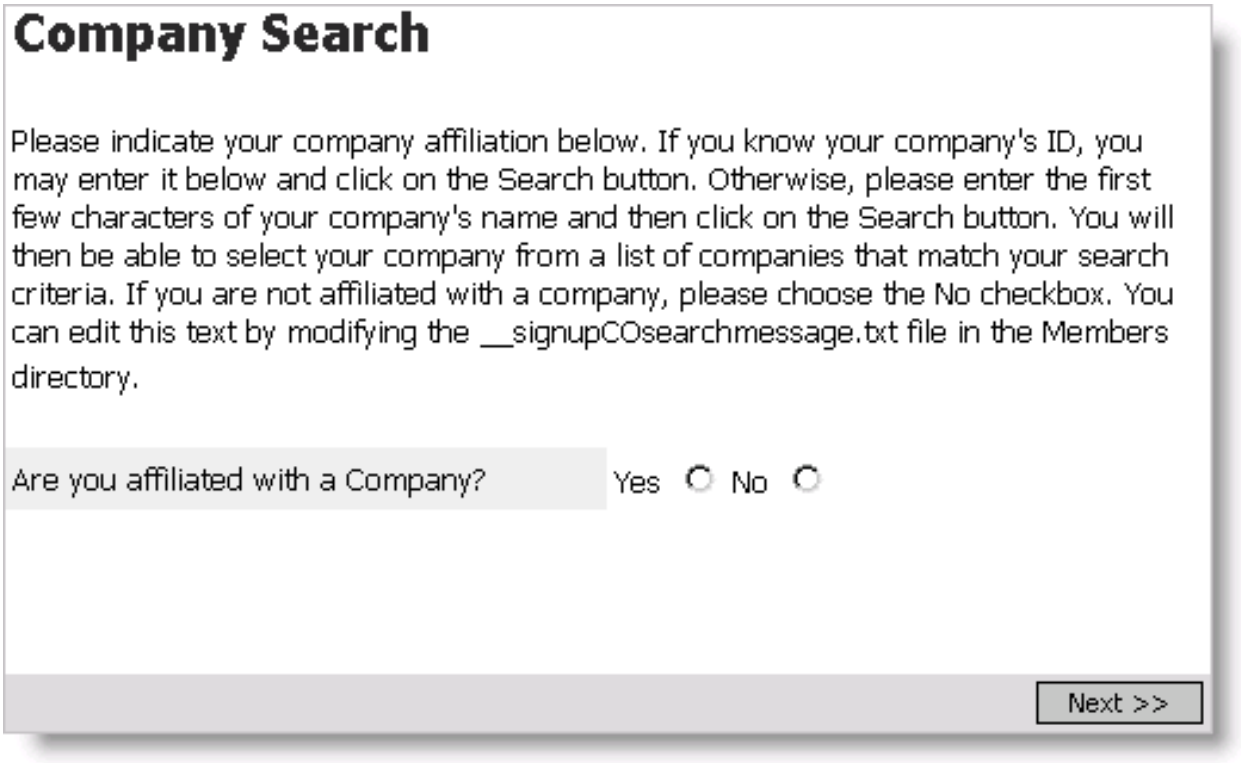
- Verify that the information is correct.
- Click edit and make any necessary changes.
- Click submit. The More Information page displays.

9. Select Create Login and Password to open the Security Insert page, and enter your Login and New Password.

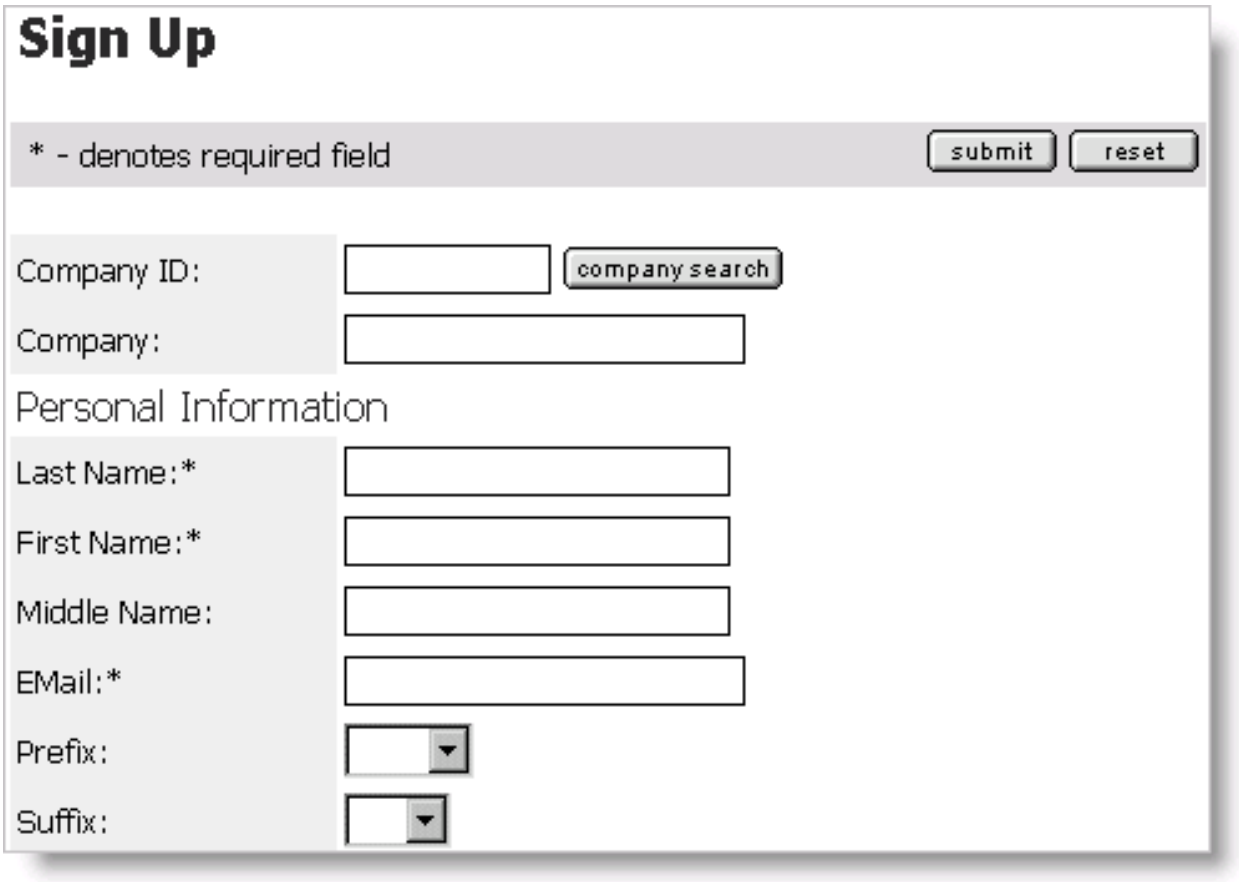
   Note: The Login and New Password fields may display at the bottom of the Sign Up page if the Single page with all user-defined windows option is enabled in the e-Customer System Parameters.

10. Click submit, and click OK.

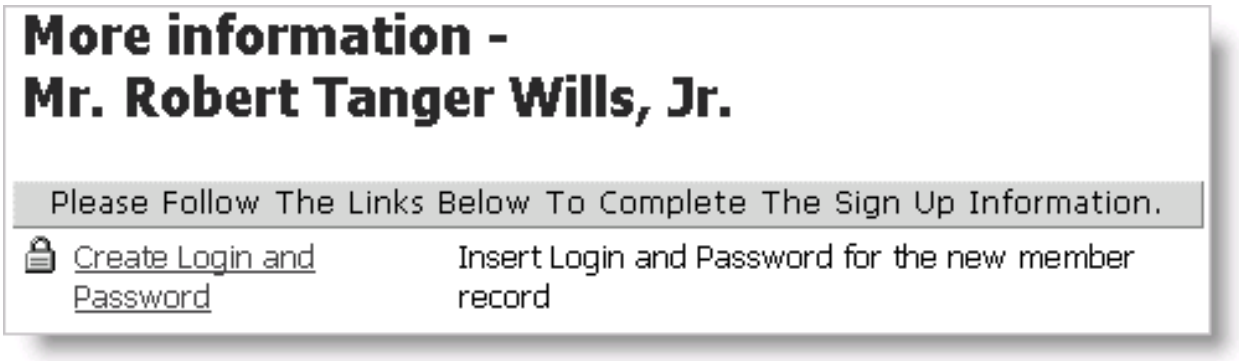
    Note: When the new member record has been submitted, the organization contact is sent an email.



Company Search page



Sign Up page



More information page

Hands-on exercise: Sign up a new customer

1. Log in to your e-Series site and enter the following name and address information:

- Name: Michael Benton
- Address: 3323 Elmwood, Houston, TX 71344

2. Enter the following login security information:

- Login: Benton
- Password: Mike01
- Expiration Date: 09/28/01

Editing Logins and Passwords in e-Series

All user passwords are hashed in the database. Hashed passwords cannot be unencrypted, and users must reset their passwords if they are lost or forgotten.

User passwords also are hashed when sent across networks. They are hashed when sent from the Security Edit page to the server before being saved to the database, and users must know their existing passwords to change them.

Hashing is a form of encryption that transforms a string of characters into a fixed-length value or key that represents the original string. Hashing functions are always a one-way operation, and this type of encryption commonly is used to protect user passwords since they cannot be unencrypted.

e-Series users can change their passwords in e-Series. However, any password changes made in e-Series do not result in the user's password being updated on the User Passwords window in iMIS (select File> System Setup, and click User Passwords). For this reason, staff users should change their password on the User Passwords window. When a password is changed on the User Passwords window, the user's e-Series password is also changed to the new password.

To edit your login and password

Non-administrative users are required to enter their old passwords when changing and submitting their passwords, and the passwords will be encrypted when uploaded to the server as an additional measure of security.

1. Log in to your e-Series site.

2. Select your record from the side index to display your profile.
3. Click security to display the Security Edit page.
4. (optional) Edit your Login.
5. Enter your New Password.
6. Reenter your new password in the Verify New Password field.
7. (For non-administrative users only) Enter your Old Password.
8. Click submit to save your new password.
9. Click OK.

To edit another customer's login and password

You must have either administrator privileges or the correct security privileges to edit a customer record other than your own. If for any reason an administrator changes another user's password, the administrator must supply the user with the new password in order for the user to log in to their site.

Note: Any changes an administrator makes to a user's record are logged in the system.

1. Log in to the e-Series site.
2. Search for the customer's record that you want to edit. Refer to “Using the Search Utility” for more.
3. Select the customer's record to open the customer's profile.
4. Click security to display the Security Edit page.
5. Make any necessary changes and click submit.

Resetting User Passwords

You must reset your password when it is lost or forgotten. Requiring users to reset their passwords provides an additional level of security in preventing unauthorized users from

gaining access to logins and passwords. To reset your password, you must have a valid email address listed in your record.

Authenticating User Information

For a user to reset their password, they must be able to authenticate specific information stored in their record in the iMIS database. If a user does not authenticate all of the required information, they will not be able to reset their password.

A user's email address is the only information that always requires authentication when resetting passwords. It is required so that e-Series can send the Reset my password link to the correct email address for the authorized user who needs to reset their password.

e-Series administrators may, however, require authentication of any or all of the following information in addition to the user's email address:

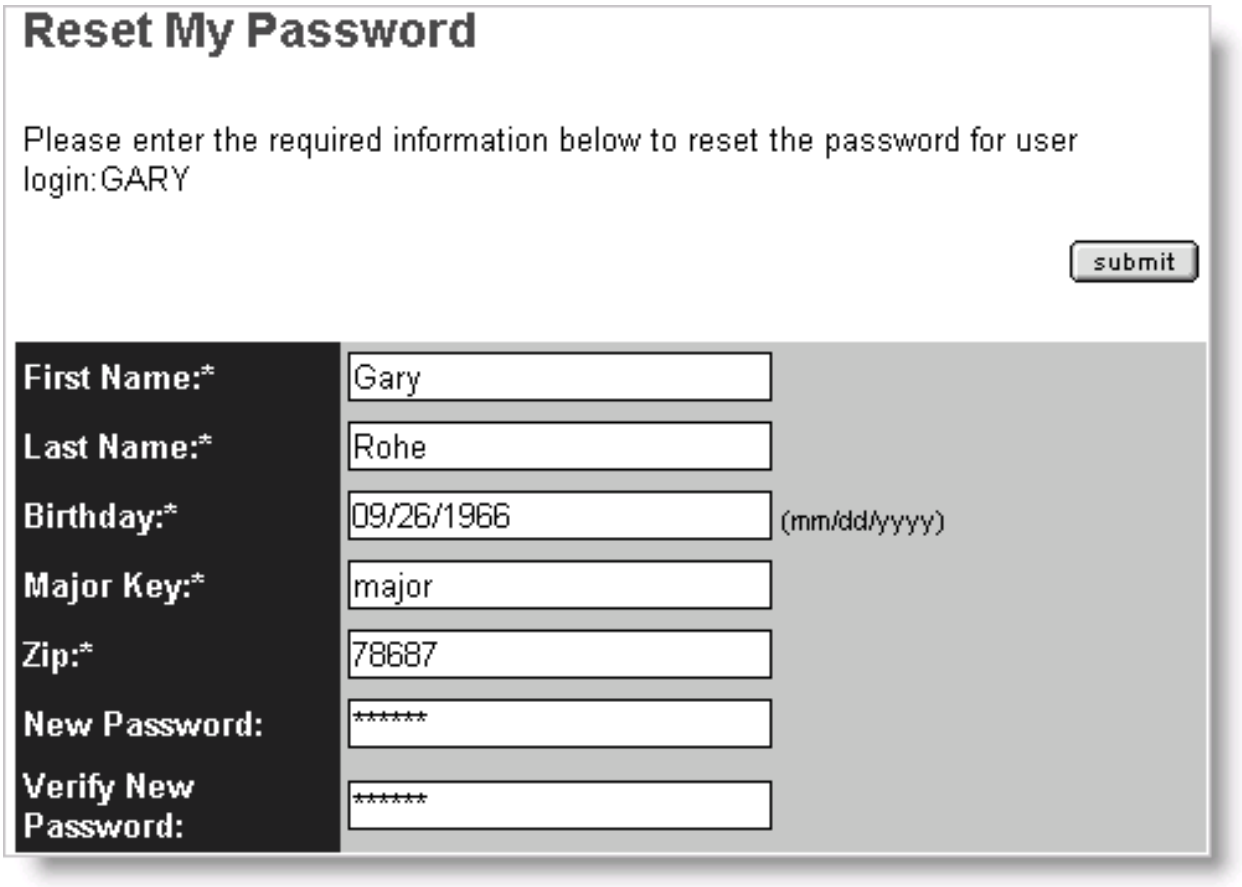
1. First Name
2. Last Name
3. Birthday
4. Major Key
5. Zip (from the preferred address) - Users are not required to enter their entire zip. They can enter a subset, and iMIS will match it with the value in Name.ZIP.

If an administrator requires authentication of any information in addition to the user's email address, the user will be required to enter the correct information in the Reset My Password page before the system will accept their new password. If an administrator does not require authentication of additional information, the user will have to enter only their new password.

Requiring authentication of additional user information serves two purposes:

1. It provides an additional level of security that helps prevent unauthorized users from accessing other users' logins and passwords. Only an authorized user should be able to authenticate the information required for resetting their login and password.

2. It helps eliminate the possibility of multiple users having identical logins and passwords. If more than one user's record matches the information submitted for authentication, no email containing the Reset my password link will be sent. The user will have to contact the e-Series administrator in order to reset their password. This should not happen if the administrator requires users to authenticate several fields.



Example of the Reset My Password page

To reset your password

If you lose or forget your login and password and have a valid e-mail address listed in your record, you can request that e-Series email a link to you so that you can reset your password. If you do not have a valid email address listed in your record, you will have to contact your site's administrator in order to reset your password.

1. Open your e-Series site and select Login in the top navigation bar.

2. Select Reset my password to open the Reset My Password page.
3. Enter your email address in the e-Mail field.
4. Click submit. An email containing the Reset my password link will be sent to you.
5. Click OK.
6. Open your email program to receive the email containing the Reset my password link.
7. Select the Reset my password link to open the Reset My Password page. Your user login will be included on the page.

   Note: The email contains a link that you can copy and paste into your browser's address field.
8. Enter the correct information in any of the fields requiring authentication:

- First Name
- Last Name
- Birthday
- Major Key
- Zip (You are not required to enter your entire zip. You can enter a subset or partial value, and iMIS will match the value with the zip in the database.)

9. Enter your New Password.
10. Reenter your new password in the Verify New Password field.
11. Click submit.

Logging In as Another User

Administrators can log in as another user without entering the user's login and password by simply opening. An administrator simply has to open a user's record on the Profile page and click the login as button to log in as the user

When an administrator logs in as another user, the administrator goes directly to the user's home page without logging in. The administrator sees the same information the user sees and has the same authorization levels as the user. The administrator literally becomes the user in the system and can make any necessary changes for a user that is having problems. If an administrator wants to log back in as Administrator after logging in as another user, the administrator will have to log in again.

Note: To log in as another user, the user must be in either the same or a lower security group than the administrator. An administrator cannot log in as another administrator who is a member of a higher security group.

Logging administrative access

If an administrator changes a user's data while logged in as that user, the data will appear to have been changed by the user. However, by viewing the change log, you can determine whether or not an administrator made any changes to the user's data while logged in as the user.

All administrative 'login as' entries are logged in a text file. This log reflects all instances when an administrator assumes another user's identity and any changes an administrator makes to another user's data. The text file is named loginas_log.txt and is stored in the StaticContent/StaticPages directory. The flat file format is:

User 1120 Logged in as 1155 from 172.16.10.106 on 12/07/2002 @ {t '10:17:12'}

User 1120 Logged in as 1126 from 172.16.10.106 on 12/09/2002 @ {t '13:04:33'}

To log in as another user

1. Log in to your e-Series site as an administrator.
2. Select the user's record from the directory and open it on the Profile page.
3. Click the login as button.
4. Click OK to open the user's Home page.
5. Make any necessary updates to the user's record and then log back in as yourself using your own login and password.

Editing Records in e-Series

You can edit your own record in e-Series as well as other customer records if you are an administrator or have the appropriate security privileges.

Remember that information access is governed by the security filters enabled for a particular user group on the Detail Security page. For example, if a designation is defined for a customer in iMIS, but the MEMBER-DESIGNATION filter is disabled for your user group, you will not be able to see or edit a user's designation.

Consider the following before editing records in e-Series:

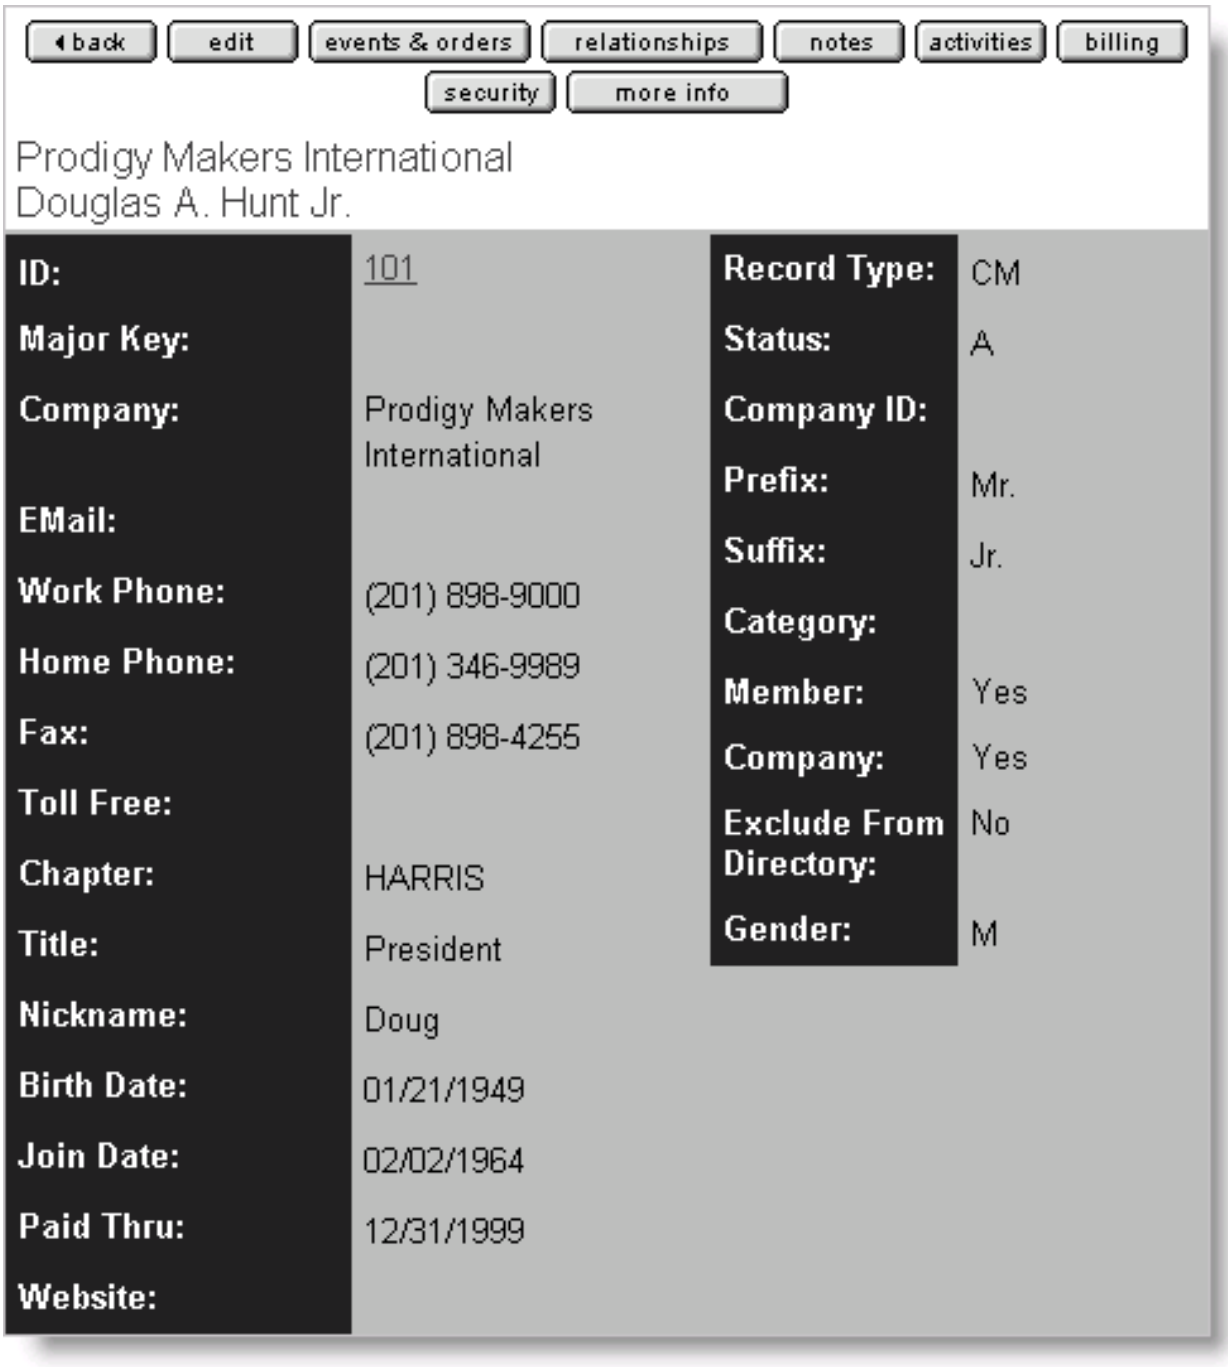
- In e-Series, you can edit only the three addresses defined in iMIS.
- Customers whose member status begins with the letter “D” are not allowed to log in.
- Do not edit or add member types in e-Series, only in iMIS.

Determining who changed records

Administrators can determine who made changes to records, and whether the changes were made in iMIS or in e-Series. For changes made to user records, the Change Log shows the user's name if the record was edited in iMIS or the user's ID if the record was edited in e-Series.

To edit your customer record

1. Log in to your e-Series site.
2. Select your record from the side index to display your profile.
3. Click edit to display the Edit page.
4. Edit the information.
5. Click submit. A message displays confirming that the information updated successfully.
6. Click OK to return to your profile. An email message is sent to the organization indicating that a customer's record has been updated.



Customer Profile

To edit another customer's record

You must have either administrator privileges or the correct security privileges to edit a customer record other than your own.

1. Log in to the e-Series site.
2. Search for the customer's record that you want to edit. Refer to “Using the Search Utility” for more.
3. Select the customer's record to open the customer's profile.
4. Click edit to open the customer's Edit page.
5. Edit the customer's record.
6. Click submit. A message displays confirming that the customer's information updated successfully.
7. Click OK to return to the selected record.

Viewing Customer Activity Records

e-Series allows you to view and modify your existing activity records. Some activity types, such as AWARD, CALL, CEU, and LETTER, also allow you to insert new activity records in e-Series.

To insert customer activity records

1. Log in to your e-Series site.
2. Select your record from the side index to display your profile.
3. Click activities to open the Activities Available page.
4. Select an activity type to open the Activities page.
5. Click insert activity to open the Activity page.
6. Enter the information for the activity.
7. Click submit.
8. Click OK.

Activity page

To view and modify existing customer activity records

1. Log in to your e-Series site.
2. Select your record from the side index to display your profile.
3. Click activities to open the Activities Available page.
4. Select an activity from the list to open the Activities page and view the related activities.

5. Select a specific activity to open the Activity page and view the activity details.
6. (optional) Click modify activity to open the Activity Modification page.
7. Make any necessary modifications.
8. Click update.
9. Click OK.

Viewing Additional Customer Information in e-Series

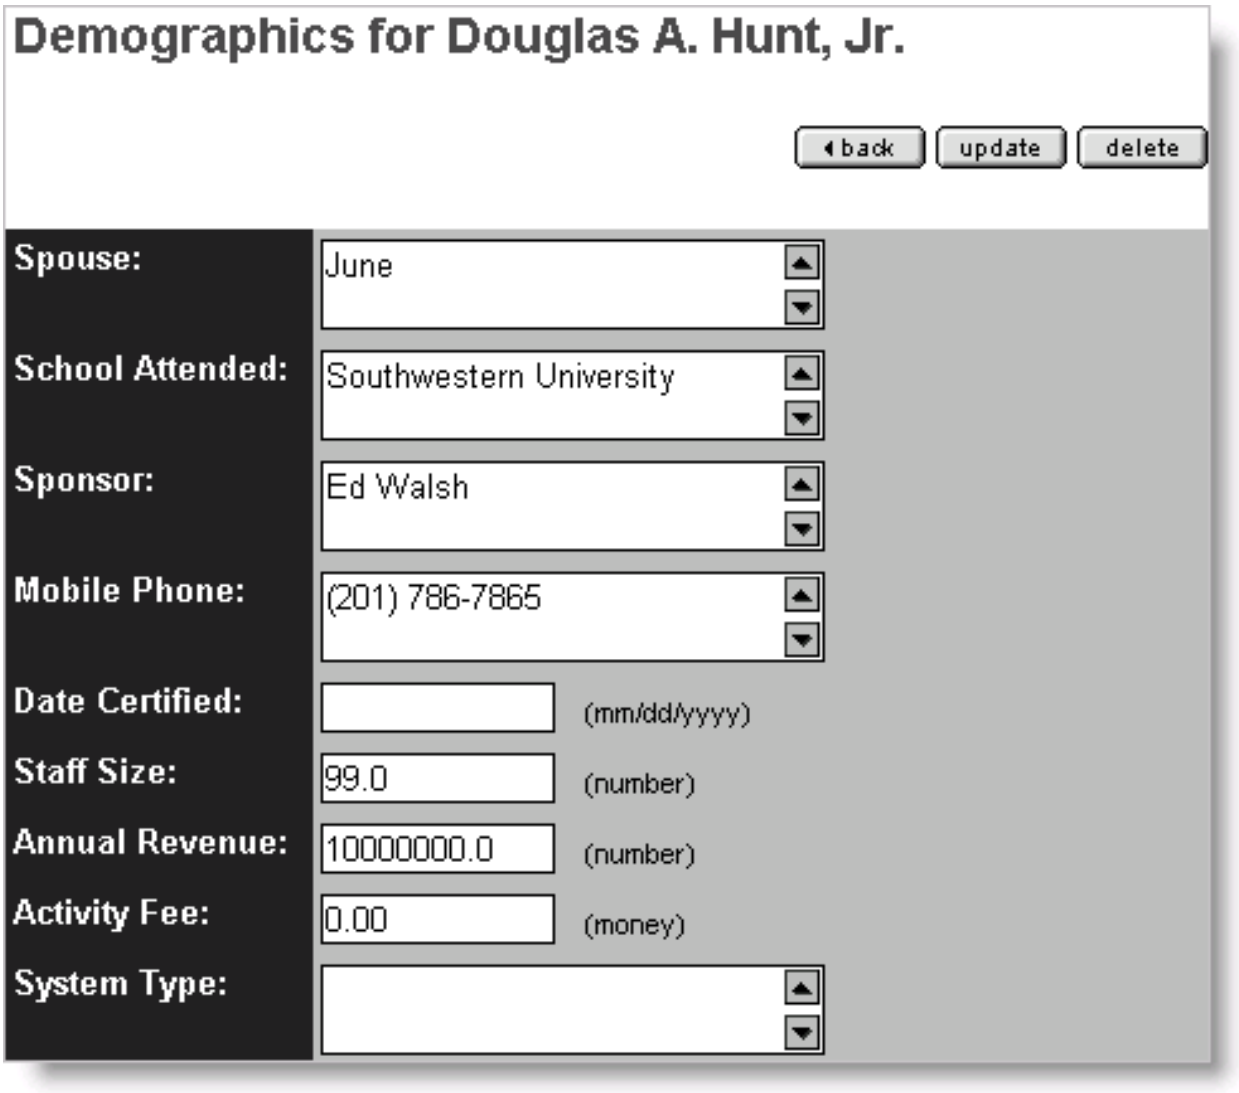
If custom windows have been set up for your e-Series site, you can view, modify, and delete the information they contain. The information contained within these windows will vary depending on organizational needs.

To view, edit, and delete additional customer information

1. Log in to your e-Series site.
2. Select your record from the side index to display your profile.
3. Click more info to open the Edit Information page.
4. Select a link to open its corresponding page and view your information.
5. (optional) If you want to edit or delete the information,

- Make any necessary edits and click update, or
- Click delete to delete the information.

Edit Information page



Demographics page

Recording Relationships

e-Series allows you to record relationships between individuals, customers, and organizations. For example, you could create and record a relationship that reflected your organization's affiliation with another organization.

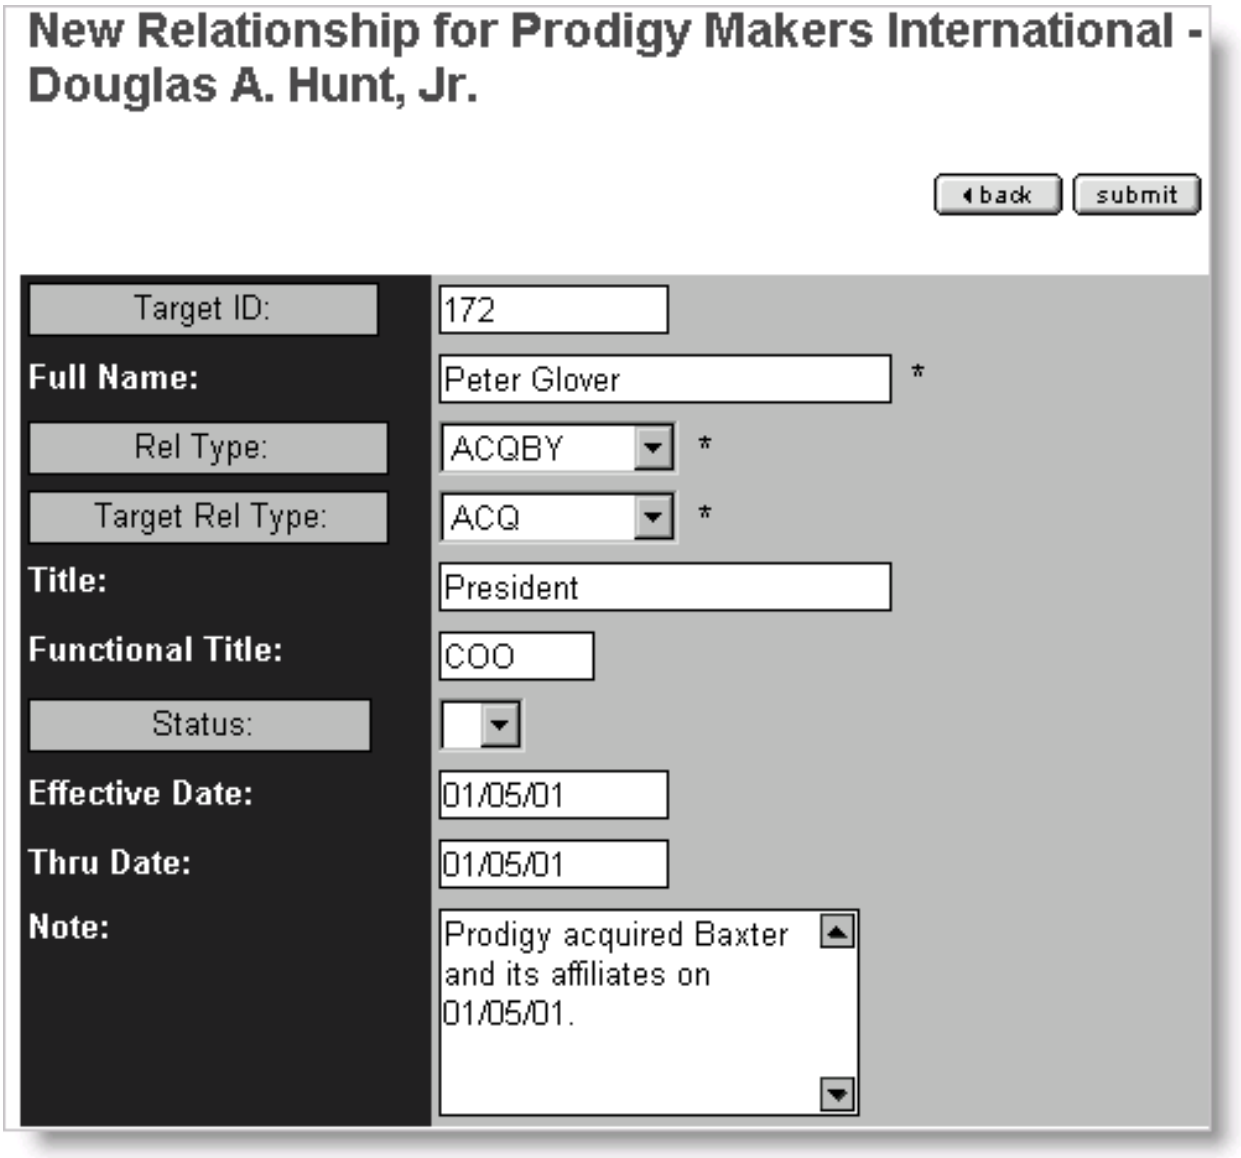
To record a relationship

1. Log in to your e-Series site.

2. Select your record from the side index to display your profile.
3. Click relationships to open the Relationships page.
4. Click new relationship to open the New Relationship page.
5. Enter the contact's relationship information. The following fields are required to be populated before submitting the relationship:

- Full Name - Enter the contact's full name.
- Rel Type - Select your or your organizations position in the relationship.
- Target Rel Type - Select the contact's or the contact organization's position in the relationship.

6. Click submit.



New Relationship page

To view, edit, and delete a relationship

1. Log in to your e-Series site.
2. Select your record from the side index to display your profile.
3. Click relationships to open the Relationships page.
4. Select the Full Name to view the relationship information.
5. (optional) If you want to edit or delete the relationship,

- Make any necessary edits and click update, or
- Click delete to delete the relationship.

Entering Notes

e-Series allows you to add notes to your customer record. Notes are good places to record personal and professional accomplishments and any information that you want to access quickly and easily.

To enter notes

1. Log in to your e-Series site.
2. Select your record from the side index to display your profile.
3. Click notes to open the Notes of page.
4. Click Note 1 or another note prompt to open the New Note page.
5. Enter your Note in the available text area.
6. Click Submit.
7. Click OK.

5. (optional) If you want to edit the note,

- Make any necessary edits and click Update.
- Click OK.

6. (optional) If you want to delete the note,

- Click Delete.
- Click OK.

Using e-Billing

e-Billing allows customers to pay for Dues items through an e-Series site and provides many powerful features:

- Client/Server transaction processing
- Unified basket for single payment across licensed e-Series modules (e-Events, e-Orders, and e-Billing)
- Customer control of voluntary items and contribution amounts
- Ability to display required items as one-line summaries or individual line items

The goal of this section is to give you the knowledge and skills necessary to set up and use the e-Billing module.

After completing this section, you will be able to do the following:

1. View outstanding balances

2. Make and edit online payments
3. Describe the financial aspects of e-Billing

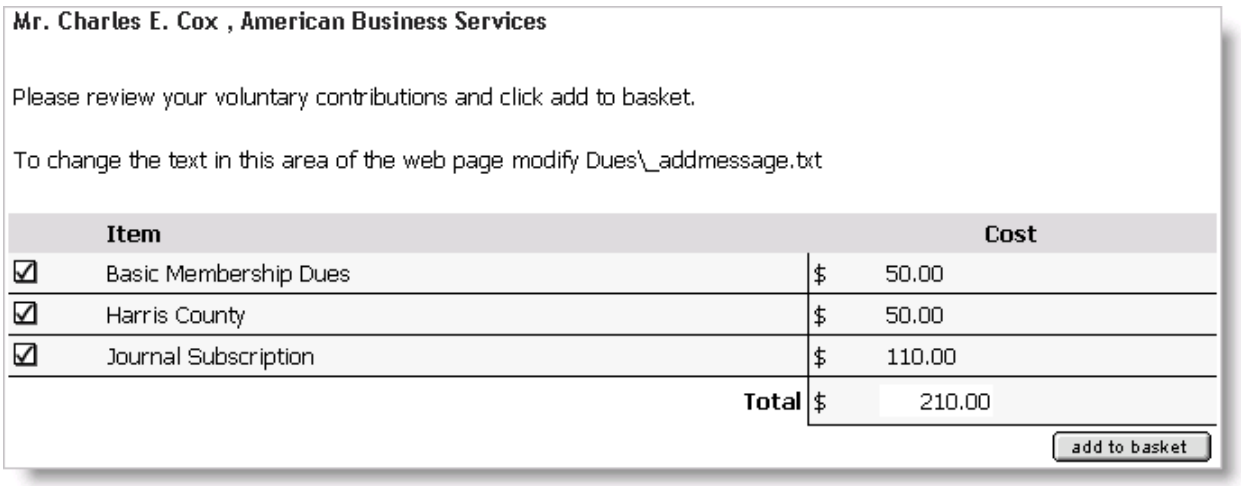
Viewing an Outstanding Balance

In e-Billing, customers and administrators can view outstanding Dues balances.

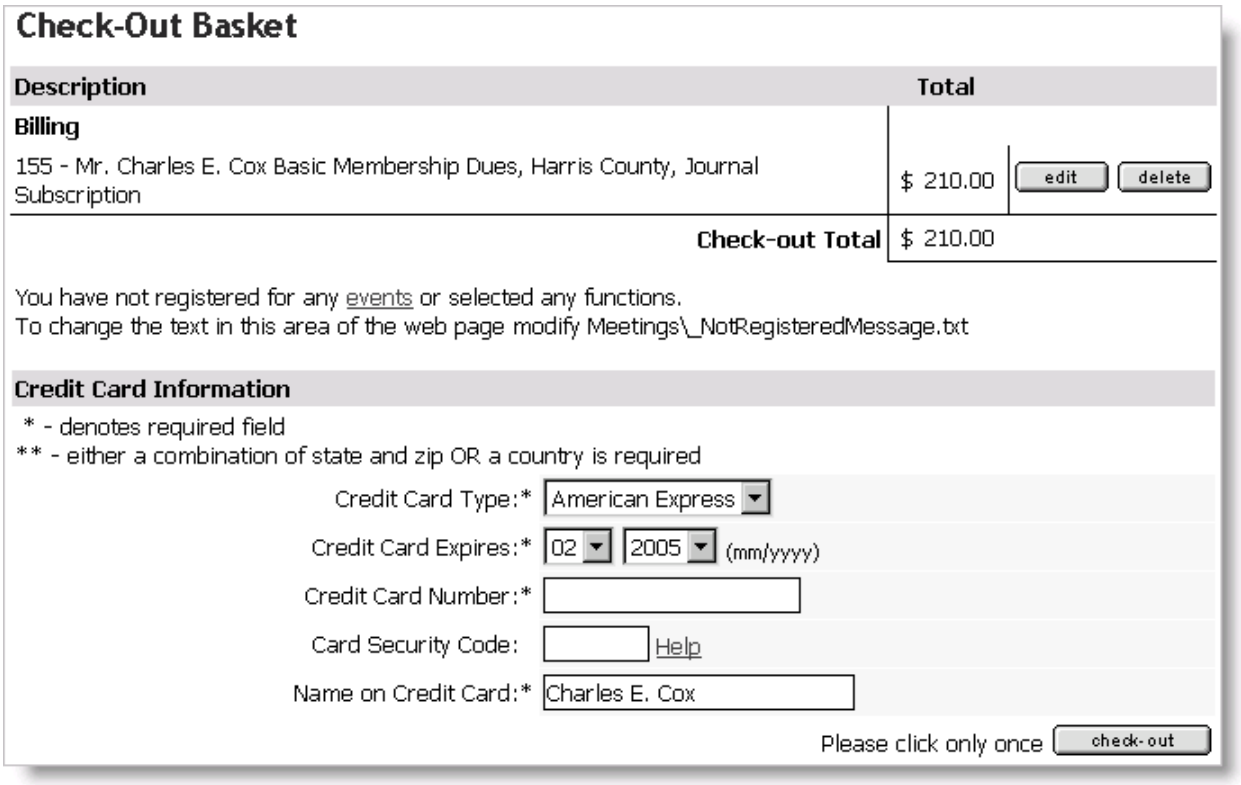
To view an outstanding balance

If the e-Billing Notice option is enabled in the e-Billing System Parameters, e-Billing Reminder links display in the side index and top navigation bar for customers with outstanding Dues balances. Logged in customers with outstanding Dues balances can select the links to go directly to the
e-Billing page.

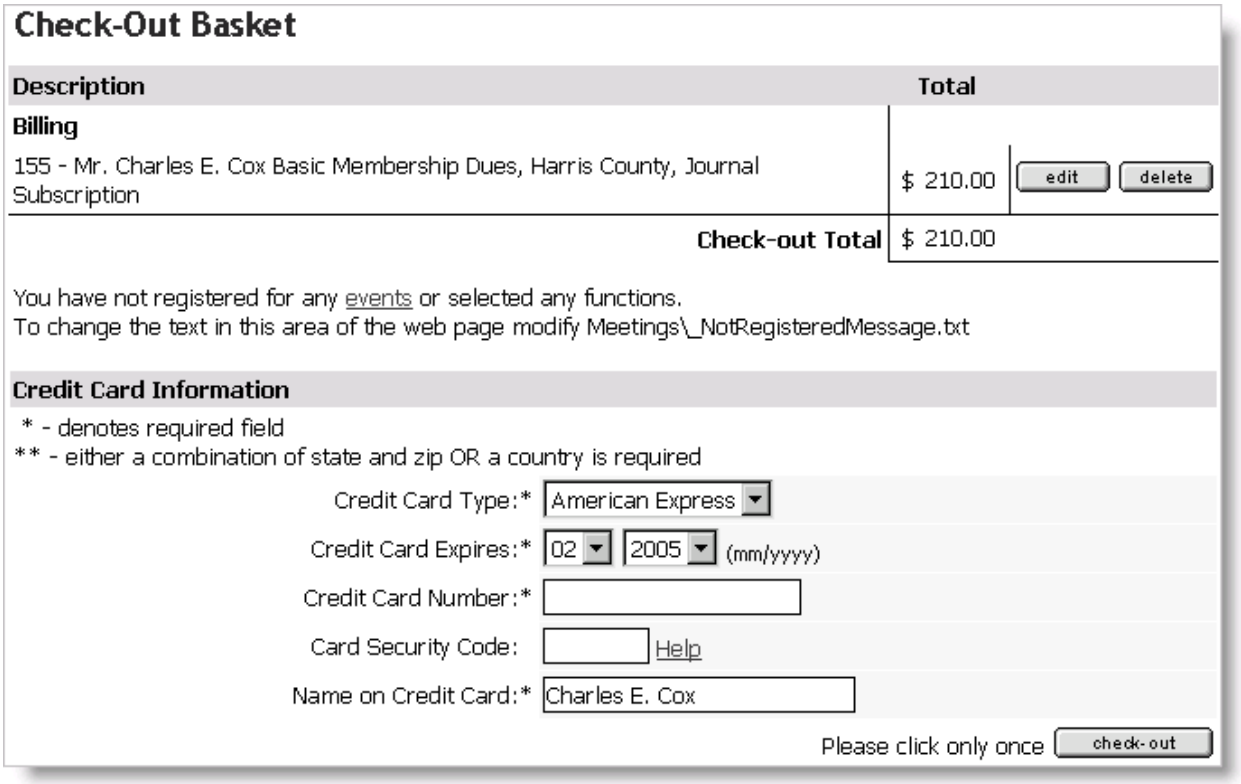
1. Log in as the customer whose balance you want to view.
2. Select Profile> [customer name] to display the Customer Information page.
3. Click billing or select one of the e-Billing Reminder links (if displayed) to display the e-Billing page.
4. Click add to basket to display the Check-Out Basket page and view any outstanding items.



View outstanding balance on Customer Information page



e-Billing page



Check-Out Basket page

Making Online Payments

In e-Billing, customers can make online credit card payments if the Enable e-Billing option is enabled in the e-Billing System Parameters.

To make an online payment

Customers with outstanding Dues balances are required to make payments in full at the time of check-out.

If the e-Billing Notice option is enabled in the e-Billing System Parameters, e-Billing Reminder links display in the side index and in the top navigation bar for customers with outstanding Dues balances. Logged in customers with outstanding Dues balances can select the links to go directly to the e-Billing page.

1. Log in to your e-Series site.
2. Select Profile> [customer name] to display the Customer Information page.
3. Click billing to display the e-Billing page.
4. Select the item(s) you wish to pay for by enabling the checkbox.

   If you have an outstanding mandatory Dues balance, the Dues item is selected automatically and cannot be deselected. You will be required to make the payment in full for the Dues item at the time of check-out.
5. (optional) If you want to pay a different amount than the amount listed for a voluntary item such as a PAC Contribution or a donation, enter the desired amount in the voluntary item's text box under the Cost category.
6. Click add to basket to display the Check-Out Basket page.

   Note: If PayPal is enabled, additional information is requested in the Credit Card Information area.
7. Enter the credit card information and click check-out to display the Purchase Detail page.

You will receive a Purchase Confirmation by e-mail containing both billing and order information.

To edit an online payment

1. Navigate to the Check-Out Basket page.

   If the e-Billing Notice option is enabled in the e-Billing System Parameters, e-Billing Reminder links display in the side index and in the top navigation bar for customers with outstanding Dues balances. Logged in customers with outstanding Dues balances can select the links to go directly to the e-Billing page.

2. On the Check-Out Basket page, click edit to display the e-Billing page. The e-Billing page has three buttons:

   cancel button - Click to return to the Check-Out Basket page without making any edits.

   remove all button - Click to remove all the items from the check-out basket.

   check-out button - Click to save any edits and return to the Check-Out Basket page.

3. Perform one of the following functions to edit your billing payment:

- Deselect individual items to remove them from the check-out basket.

  Or

- Click remove all to remove all the items from the check-out basket. A message displays asking you to confirm that all items should be removed from the check-out basket. Click OK.

4. Click check-out to save your edits and to return to the Check-Out Basket page.

Financial Aspects of e-Billing

The following summarizes the financial aspects of e-Billing:

- Customers with outstanding Dues balances are required to make payments in full at the time of check-out.

- If only dues items are in the basket, they are processed during check-out using traditional iMIS processing with a DIST line for each dues item and an overall PAY line inserted into the Trans table.
- For a mixed basket with a combination of two or more billing, events, and orders items, the following transactions are generated:
- An AR Cash receipt transaction for the full payment amount that is fully applied to a brand new prepayment invoice
- A cash-based billing payment transaction that is similar to the normal cash dues payment, except that the PAY line is an AR debit to the prepayment credit invoice
- An order payment *TAB transaction that is similar to a normal order payment, except that the PAY line is a debit to AR that is linked to the prepayment credit invoice generated by the first transaction
- A meeting transaction containing a *TAB transaction that is similar to a normal order payment, except that the PAY line is a debit to AR that is linked to the prepayment credit invoice generated by the first transaction
- Subscription date calculations occur according to iMIS processing.
- Billing items have a PAY line and two Transfer/Clearing lines (TR). Each dues item has a DIST line in addition to the two AR lines for split credit card payment, and the appropriate lines for orders and events processing.
- Items in a mixed or dues-only basket retain a balance until payment is posted.
- A new batch is created with the first transaction that occurs after midnight each day. If that batch is posted during that same day, another new batch will be created with the first transaction that occurs after the previous batch has been posted.
- Billing payments entered in e-Series are not visible in e-Series until batches are posted. This means that the opportunity exists for an overpayment to occur. For example, if a customer pays a bill in
  e-Series and returns to the site before the payment's batch posts, the site does not reflect

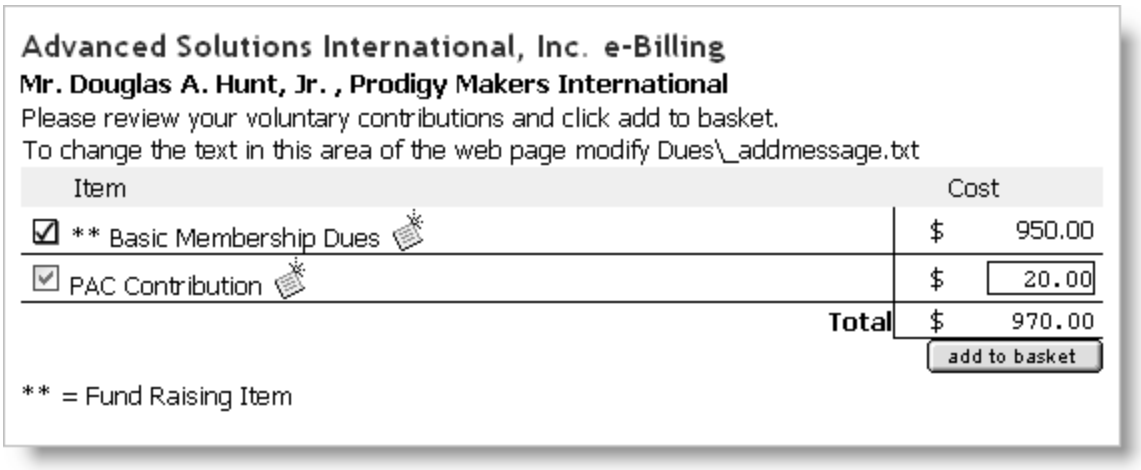
the payment, and the outstanding balance still exists.

Note: To avoid applying the payment incorrectly, close the batch containing the over-payment before closing the batch that contains the Billing payment.

Multi-entity support for e-Billing

Multi-entity support for e-Billing

You can identify items that are assigned to a Fundraising entity on the Purchase Detail screen. Two asterisks (**) appear next to the item. Multi-entity is supported at the product level in iMIS Dues billing.



e-Series supports multi-entity billing

Using e-Events

Overview of e-Events

e-Events connects to the iMIS Events module. As with e-Customer Management, all e-Series transactions are in real-time and affect the database immediately.

e-Events includes several advanced features which enable you to do the following:

- Search for and view events and event functions
- Register for an event online or by email

- View event rosters and email registrants listed on the roster
- Create and edit badge information for event registrants
- Sign up directly from the Event Registration page
- View registration order details
- View function links for more information

The goal of this section is to give you the knowledge and skills necessary to use e-Events.

After completing this section, you will be able to do the following:

- Search for an event
- Register for an event
- View event rosters
- Create badges
- View e-Events registration and payment information in iMIS
- Explain the financial aspects of e-Events

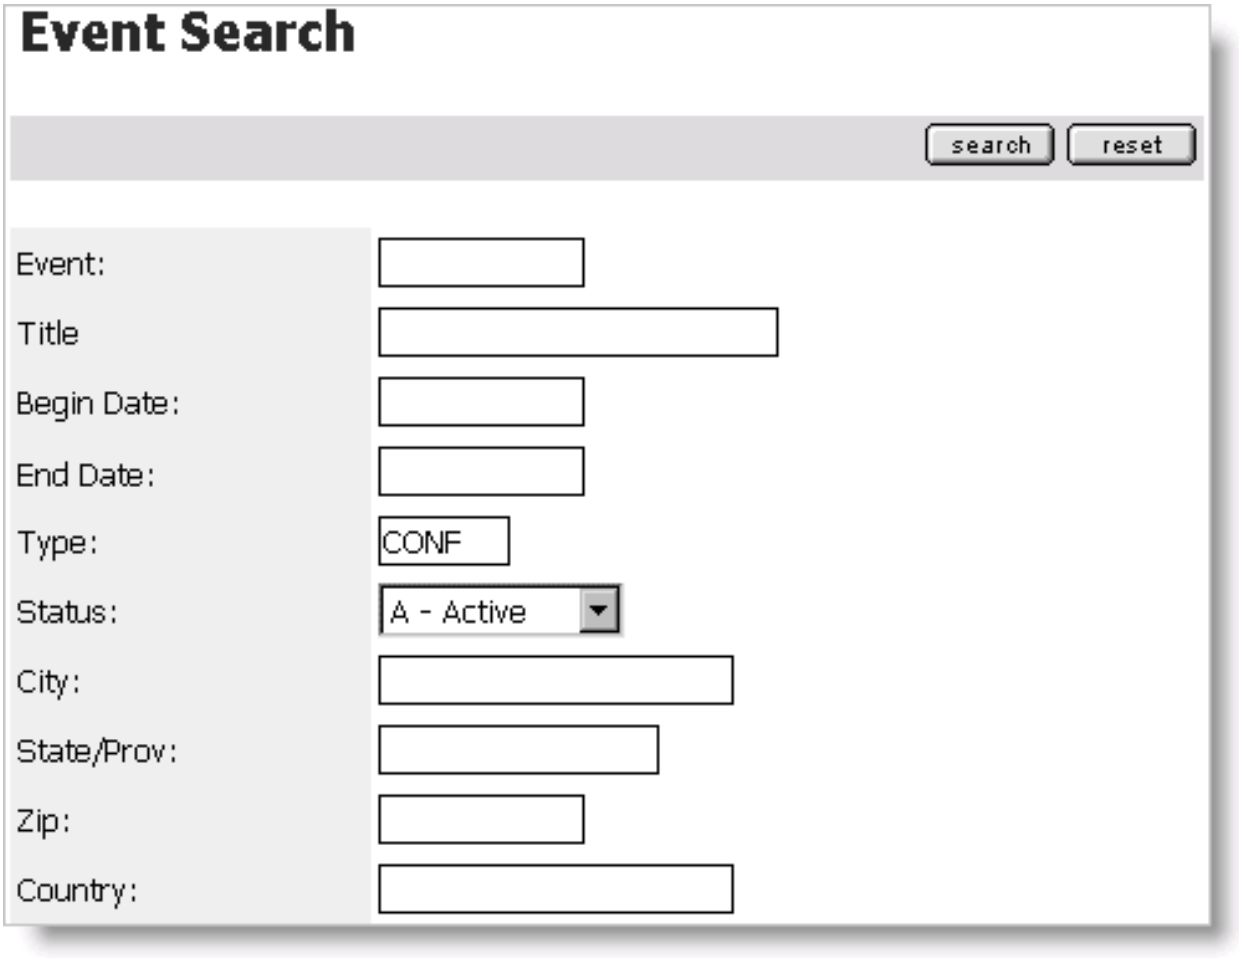
Searching for Events

Use the Events Search utility to search for specific events. You can search by event, title, date, status, location, or any combination of these options. After searching for an event, you can view all of the event information including specific event functions.

To search for an event

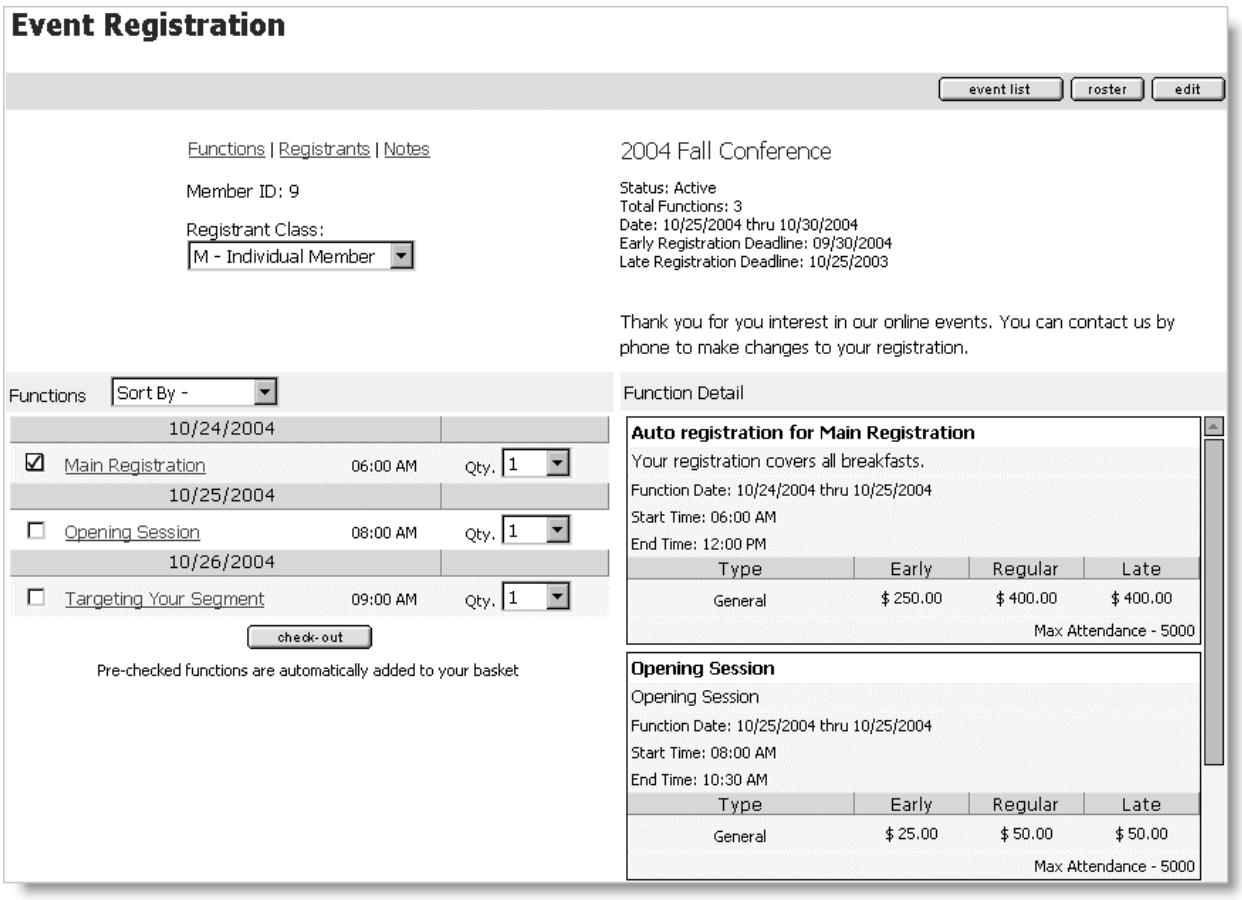
1. Log in to the e-Series site.
2. Select Events in the top navigation bar to display the Event Search page.
3. Enter the search criteria.
4. Click search. The Available Events page displays the search results.

5. Select the event to open the Event Registration page and view the event and event function details.



Event Search page

Available Events page



Event Registration page

Registering for an Event

After you set up an event, you can begin accepting registrations. Two email messages are sent when an event registration is received in e-Events: one to the staff person responsible for entering event registrations and another to the customer registering for the event.

To register for an event

1. Log in to the e-Series site.
2. Select an event to open the Event Registration page.
3. Enter your registrant information (depending on the settings in the e-Events System Parameters, these steps may not be required):

- Enter a Member ID. (If entering event registrations for other company members, select all registrants from the Member drop-down list.
- Select a Registrant Class.

4. Register for all applicable event Functions (depending on the settings in iMIS Events, these steps may not be required):

- Enable the appropriate checkbox for each event Function to be attended (required functions cannot be deselected).
- For each selected Function, select the registration Qty being purchased. (If the function is limited to one registration, the Qty field does not display. If the function is limited to a specific number of registrations, only that number of registrations can be purchased.)

5. Click check-out to display one of the following:

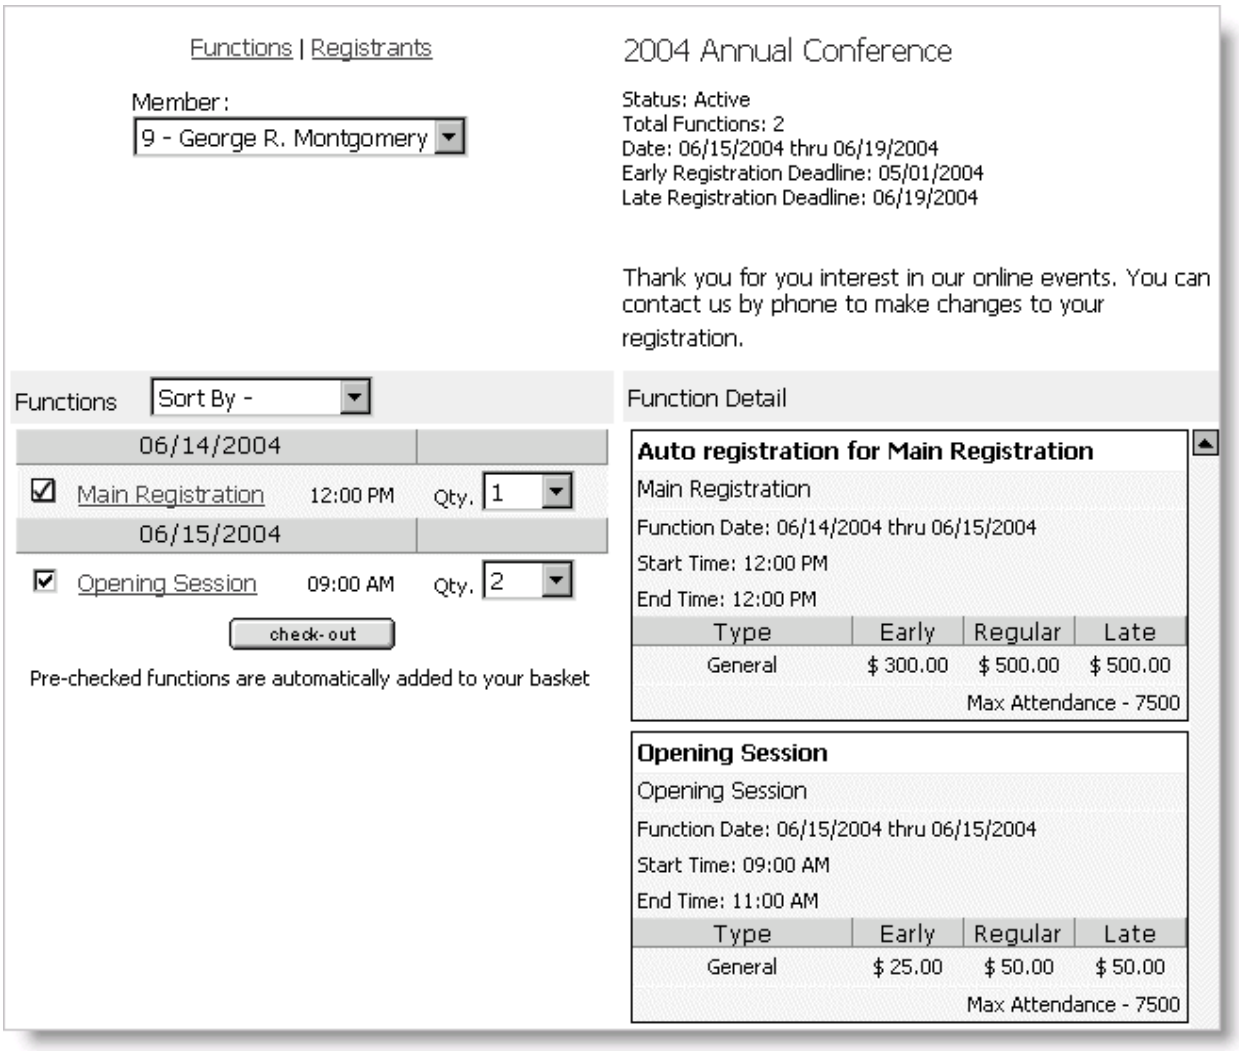
- The Badge Maintenance page. (Displays only if Include Badges in Check Out is enabled in the e-Events System Parameters.)
- The Check-Out Basket page.

6. Verify the accuracy of the information on the Check-Out Basket page, and edit or delete as necessary:

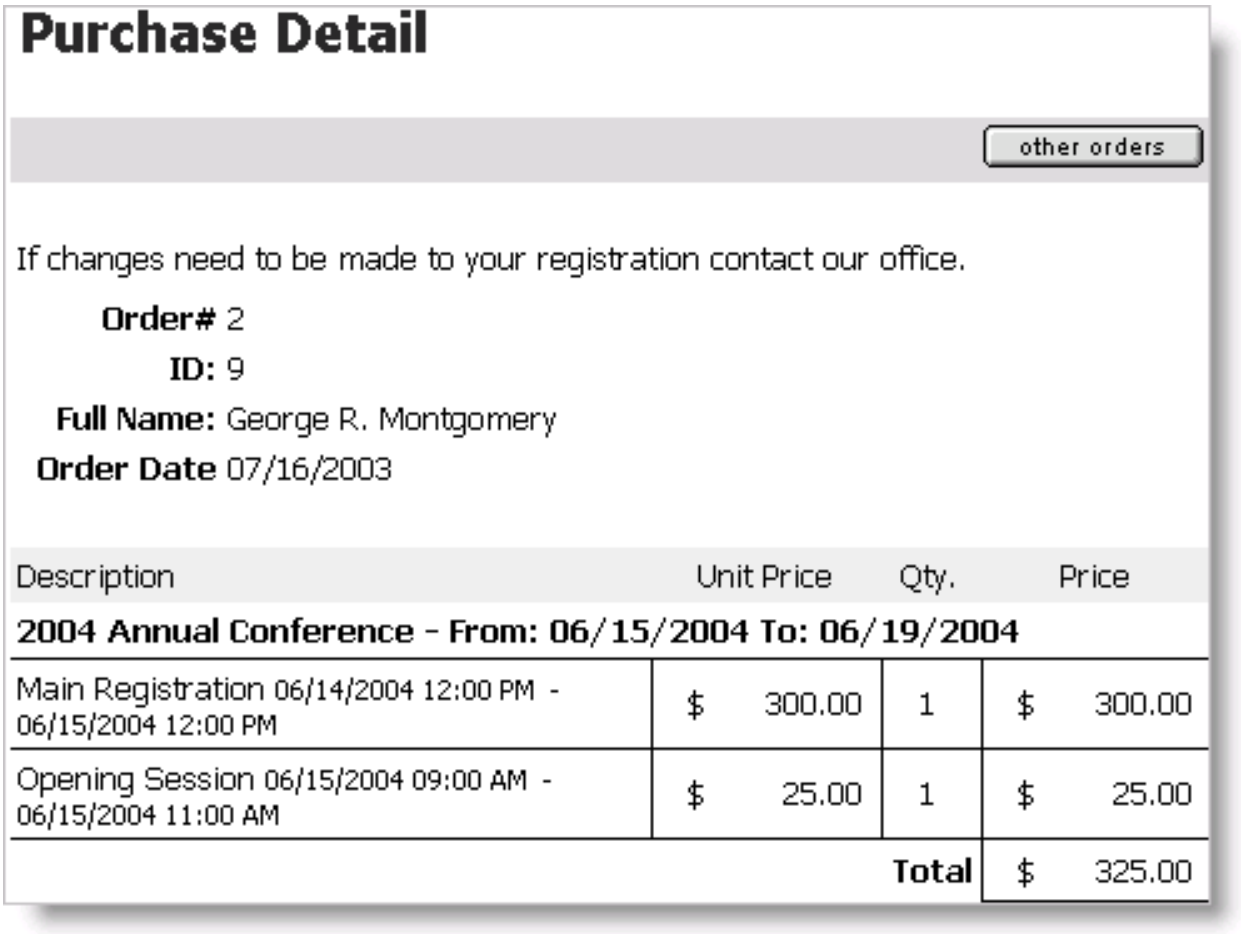
- Select Badge Maintenance (if displayed) to enter or edit badge information before checking out.
- Select Your Events to return to the Event Registration page and make any necessary changes.
- Select Add Purchase Comments to display the Purchase Comments field and submit comments.

7. (required) Enter the correct Credit Card Information. You must fill out all of the fields.
8. Click check-out. The Purchase Detail page displays.

   After registering for an event, the system automatically e-mails a purchase confirmation containing billing and order information to the customer and a transaction confirmation that contains event, billing, and order information to the appropriate staff person.



Function Detail page



Purchase Detail page

To view event order activities

The Events and Orders page displays your event order activities. All of the events you have registered for are displayed on this page.

1. Log in to your e-Series site.
2. Select your record in the side index to display your profile page.
3. Click events & orders to open the Events and Orders page and display all of your event order activities.
4. (optional) Select an event title to open the Event Registration page and view the event and event function details, or select the order number to open the Purchase Detail page.
5. (optional) Select the Badges link to open the Badge Maintenance page.

Events and Orders page

Entering Event Registrations for Other Company Members

Non-anonymous users who are company members can enter event registrations for other company members that have active records. For users to enter registrations for fellow company employees, the Select option must be enabled under the e-Event Registration ID Field Type options in the e-Events System Parameters.

When Select is enabled, two options are presented.

- Continue using the currently logged in customer?
- Register a different customer?

If you are registering yourself for an event, choose the first option. The system will automatically register you using your login information. When the Event Registration page opens, you can then sign up for an event function and edit your registration information.

If you are registering someone else, choose the second option. When the Event Registration page opens, you can then register someone else up for an event using an ID number, enter relevant information, and sign them up for an event function.

Viewing Event Rosters

If the Meetings Roster security filter is enabled for non-Administrative security groups, users can view event rosters that list all of the registrants for an event.

To view an event roster in e-Series

1. Log in to your e-Series site.
2. Select Events in the top navigation bar to display the Event Search page.
3. Select Events> Register in the side index to display the Available Events page.
4. Select an event to open the Event Registration page.
5. Click roster to open the Event Scheduled page and view all of event registrants.
6. (optional) If you want to e-mail a message to all of the event registrants on the roster, click email members to open the Send E-mail to Roster page.

- Enter a Title for the e-mail.
- Enter the Subject text of the e-mail.
- Click send.

Event Scheduled page

Entering and Editing Badge Information

When Include Badges in Check Out is enabled in the e-Events System Parameters (and the Insert and Edit Meeting Badges security filters are enabled), registrants can view, enter, and edit badge information. Event registrants can enter badge information before or after checking out, and they can add badges for guests.

When Include Badges in Check Out is disabled, registrants are unable to view or edit badge information for any event. Badges links are hidden from view on all applicable pages (including the Events and Orders page), and registrants cannot access the Badge Maintenance page at any stage of the event registration process.

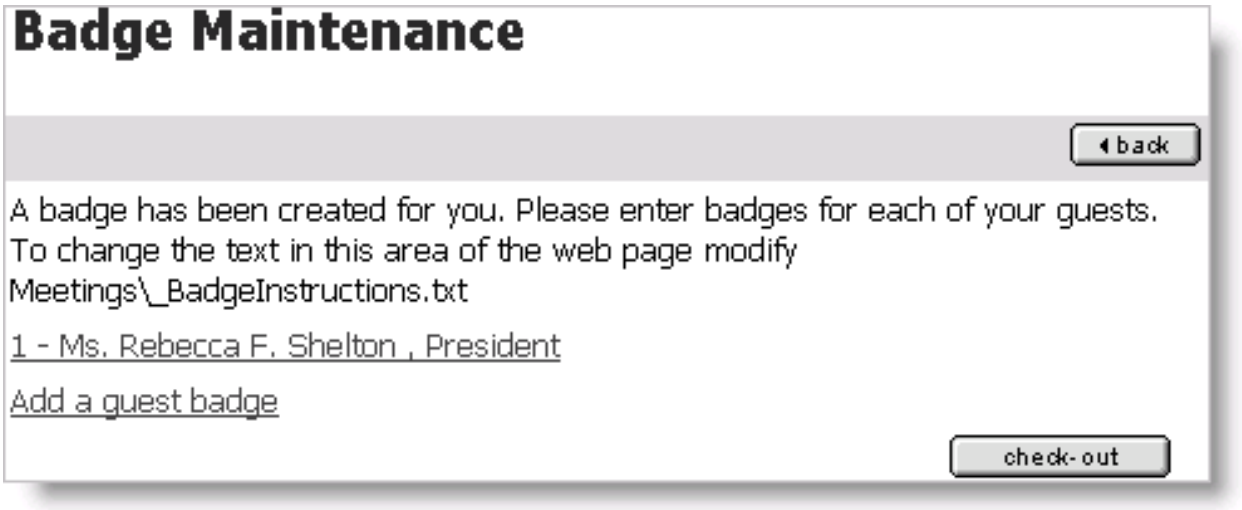
Note: Text that displays on the Badge Maintenance page can be customized through the eEventsConfig.txt file found in the Module Config Files page (select Admin> Style Form, and select Edit Config Files).

To enter badge information before check out

1. Register for an event, and click check-out to display the initial instance of the Badge Maintenance page.
2. Select the link that is your name to display the second instance of the Badge Maintenance page.
3. Enter or edit your badge information.
4. Click continue to return to the initial instance of the Badge Maintenance page.
5. (optional) Enter a guest's badge information:

- Select the Add a guest badge link to display the second instance of the Badge Maintenance page.
- Enter your guest's badge information.
- Click continue to return to the initial instance of the Badge Maintenance page. (The guest's name displays as a link to the second instance of the Badge Maintenance page.)

6. Click check-out to proceed to the Check-Out Basket page.



Badge Maintenance page

To enter, edit, or delete badge information after check out

1. Open the Events and Orders page:
   - Open the registrant's Profile page from the side index.
   - Click events & orders.
2. Select an event's Badges link to open the Badge Maintenance page.
3. Select the registrant's name to display the second instance of the Badge Maintenance page.
4. Enter, edit, or delete the badge information.
5. Click continue to return to the initial instance of the Badge Maintenance page.
6. (optional) Enter a guest's badge information:
   - Select the Add a guest badge link to display the second instance of the Badge Maintenance page.
   - Enter the guest's badge information.
   - Click continue to return to the initial instance of the Badge Maintenance page. (The guest's name displays as a link to the second instance of the Badge Maintenance page.)

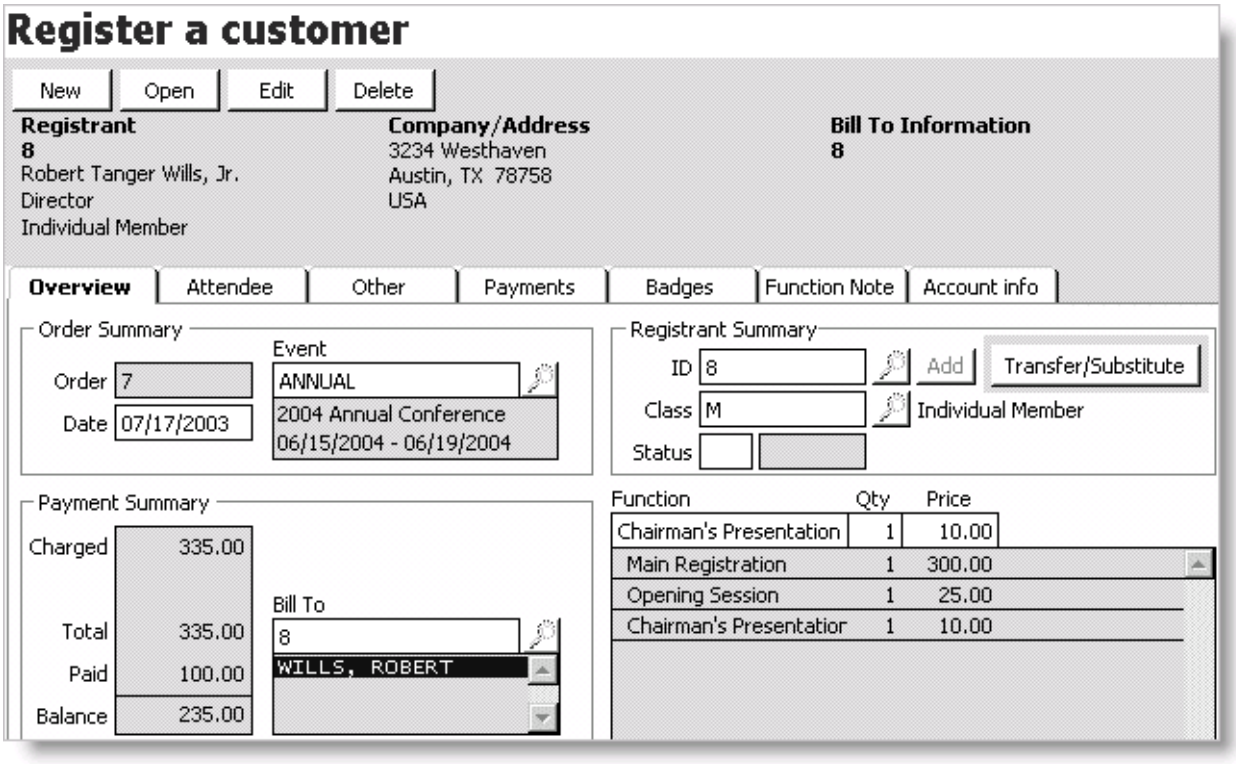
7. Click check-out to return to the Events and Orders page.

Viewing e-Events Registration and Payment Information in iMIS

After registering for an event, event registration and payment information is viewable in iMIS.

To view an eEvent registration in iMIS

1. From Events, select Register a customer to open the Register a customer window. The Overview tab displays by default.
2. Click Open, and enter the Event code.
3. Enter the registrant's ID. The event registration displays.



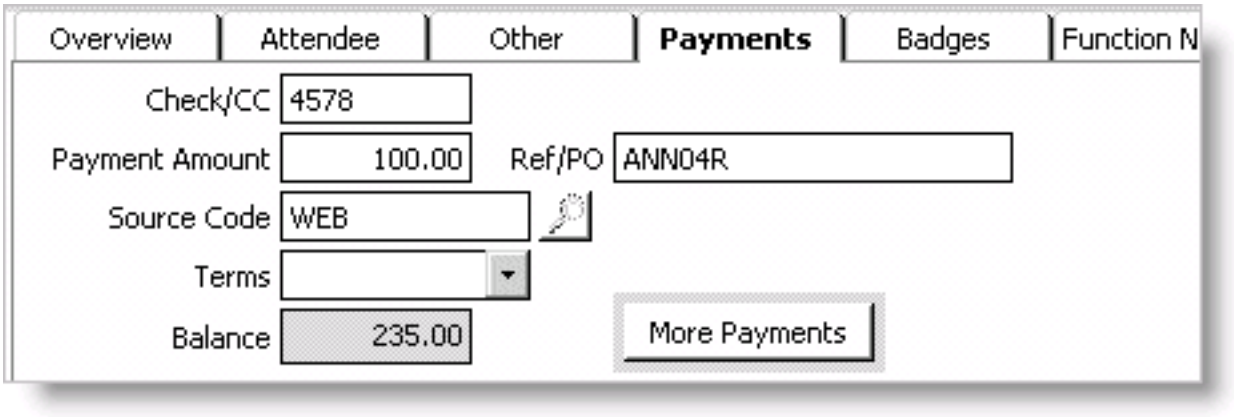
Register a customer page in iMIS

To view e-Event payment information in iMIS

1. Open the event registration. -

2. Select the Payments tab to view the registration payment information.
3. Click Print, and select Confirmation from the drop-down list to print a confirmation notice.

   Note: You must edit and cancel event registrations in Events. You cannot edit or cancel event registrations in e-Events. Refer to iMIS Events for more.



Payments tab in iMIS

Delayed Login for e-Events

The Sign Up and Log In links on the Event Registration page allow a customer or guest to select an event, enter their sign-up or login information, and return directly to the event to complete their registration or make a payment. The guest user can select an event to view from the event list or click a link to go directly to the event.

Guest users cannot register for events until they have logged in from the Sign Up link on the Event Registration page. When the guest user signs up, their record is added to the iMIS database and a new customer type is created for them based on the value set in the Member Type used for Anonymous Sign Up field (Admin> Lookups> System Parameters> e-Customer). The user then is returned to the Event Registration page where they can register for events.

Existing customers also can access and view e-Events without logging in. However, customers cannot register for events until they have logged in from the Log In link on the Event Registration page. Once the customer logs in, they are returned to the Event Registration page where they can register for events.

Financial Aspects of e-Events

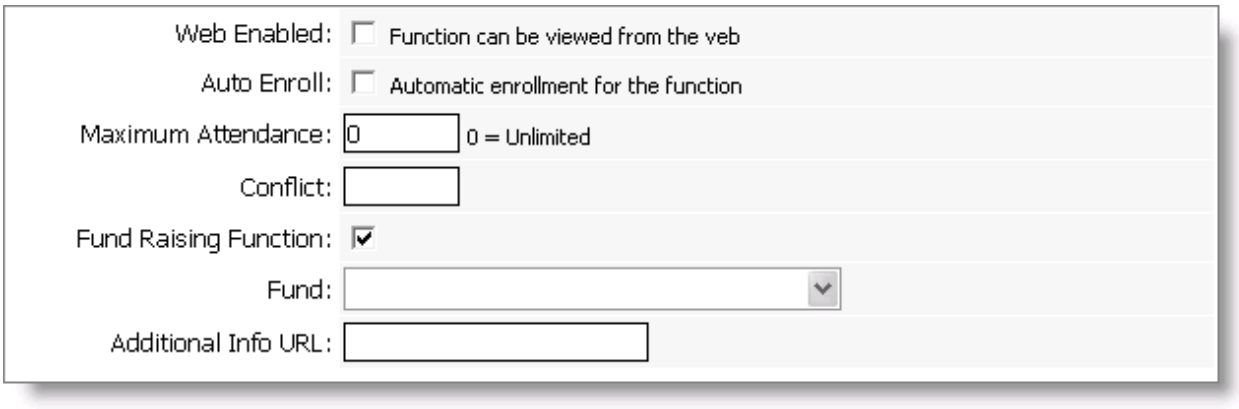
Consider the following when accepting e-Events registrations:

- Payment in full is required at the time of the event registration.
- Only credit card payments are accepted when registering for an event online.
- When a user registers for an event over the Web, a batch is created automatically. The batch is designated by an “I” at the end of the batch number to indicate that it was created over the Internet.
- Invoice lines are not created until batches are posted.

Fundraising for e-Events

To create a Fundraising Function in e-Series

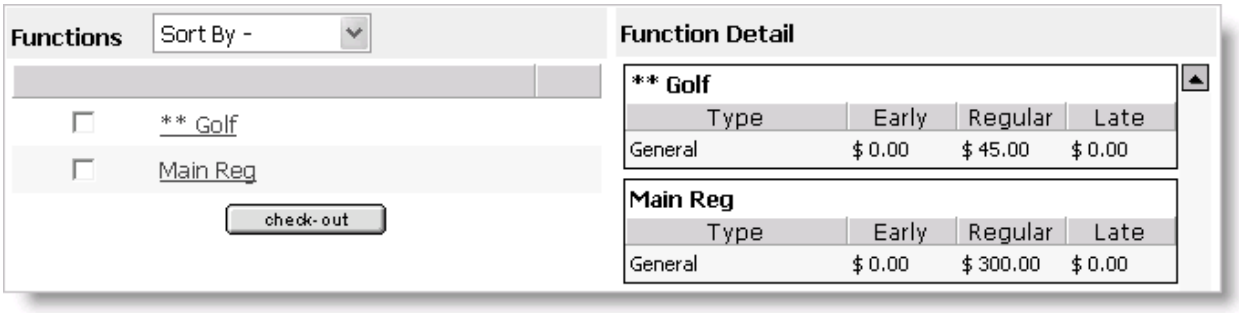
1. In the Events module, navigate to the Available Events window.
2. To add a function, click on the event name in the list. The Event Registration window appears.
3. Click Edit. The Edit Event window appears.
4. Click the Functions & Pricing. The Event Function List window appears.
5. Click Insert Function. The Insert Event Function window appears.
6. Enter the specifics of your function.
7. Click the Fundraising Function checkbox.
8. Select a Fund from the drop-down list.
9. Click Submit.



Fundraising Function in e-Series

Identifying a Fundraising function in e-Series

You can identify a Fundraising function on the Event Registration window by the double asterisks (**) next to the title of the function.



Fundraising function in e-Series

Using e-Orders

e-Orders Overview

e-Orders is the Web extension of the iMIS Orders module and includes advanced features that allow customers to order and pay for products over the Internet. e-Orders is similar to iMIS Orders with the following exceptions:

- All e-Orders purchases must be made with a credit card and are treated as prepaid transactions
- e-Orders are entered as pro-forma (quote) orders

For authorizing credit card purchases, e-Orders uses PayPal, a third-party credit card validation vendor. Administrators can enable or disable it (the default is disabled). If you elect not to use the vendor, orders entered in e-Orders bypass the connection and forward the transaction to the iMIS Orders module.

Administrators also can enable e-Orders for anonymous user access so that only a mailing address and credit card information are required for purchases. To use e-Orders, you must be licensed for both e-Orders and the iMIS Orders module.

The goal of this section is to give you the knowledge and skills necessary to set up and use the e-Orders module.

After completing this section, you will be able to do the following:

- Purchase products over the Web
- Describe the financial aspects of using e-Orders

Entering Orders

All orders entered using e-Orders are entered as pro-forma orders. They are created as quotes and converted to regular orders after verification.

e-Orders payments are entered as prepaid cash and must be paid using a credit card. iMIS uses PayPal to authorize and validate credit card payments. When a product is purchased through e-Orders, a batch is created automatically.

When converting a pro-forma order or quote to a regular order, you must identify the batch. Complete the order invoicing process, and then post the e-Orders batch.

To purchase products online

1. Select Orders from the top navigation bar to open the e-Orders page (a list of Featured Products displays by default).
2. Make a selection from the list of Departments to display the products page, which lists all of the products belonging to that department.

3. Select a product's title to open the product detail page, and enter any required Additional Information about the product.
4. Select add to your products to go to your products page.
5. Enter the product Qty being purchased, and click update qty (click remove all to empty the Qty field).

   Verify the order information on your products page, and make any necessary changes:

- To remove the product from the order and return to the e-Orders page, click remove next to the product.
- To add additional products to the order, click keep shopping.

6. Click select freight to display the select freight page, and enter all applicable shipping information.

   (If you are not logged in, you will be asked to log in or create a new account. You can indicate interest in becoming a member of the organization by enabling Contact me about becoming a member of your organization. Click sign on or new account to display the Shipping Address page:

- Enter the shipping address information. Asterisks designate required fields. State and ZIP Code information is not required if the address is international. The e-mail address is required.
- If you are logged in (or after completing the previous step), the Select Freight page displays.)

7. Click products total to display the Products Total page.
8. Click check-out to display the Check-Out Basket page, and enter the credit card information (click edit or delete to make any necessary changes to the order before checking out).
9. Click check-out to process the order and display the Purchase Detail page:

- You will receive an order confirmation by email containing detailed order information.
- If you also registered for an event, an transaction confirmation email containing event, billing, and order information is sent to the organization.

To purchase products online

Financial Aspects of e-Orders

Consider the following when using e-Orders:

- Payment in full is required at the time of a purchase.
- Payments must be made by credit card.
- Items purchased through e-Orders are treated as prepaid transactions.
- You must enable batch control for e-Orders.
- New batches are created automatically and are designated by an “I” at the end of the batch number. A new batch is not created if an existing batch is open.
- Invoice lines are not created until a batch is posted.
- Orders are entered in iMIS as pro-forma orders.

- Anonymous users can purchase products through e-Orders.
- The Batch-per-Meeting-per-Day functionality is not compatible with e-Orders. The use of a single checkout basket for several modules conflicts with the use of the Batch-per-Meeting-per-Day option. Therefore, all items purchased within a unified basket must be processed as one batch.

Using e-Communities

Overview of e-Communities

The e-Communities module of e-Series is an area where customers and visitors with similar interests can do the following:

- Subscribe to communities
- Browse topics of common interest
- Set global and community level email preferences
- Mark items as read
- View new and archived community news items
- Create and participate in discussions
- Contribute and download shared documents

The facilities available to users of these communities are identical regardless of community type. However, certain communities are open to the public while others may be available only to customers and dues paying members of an organization. Both customers and members of the general public must be logged in to “subscribe” to specific communities. Subscribing to a community allows you access to different community levels and provides you with a dynamic personal home page.

The goal of this section is to give you the knowledge and skills necessary to use the e-Communities module.

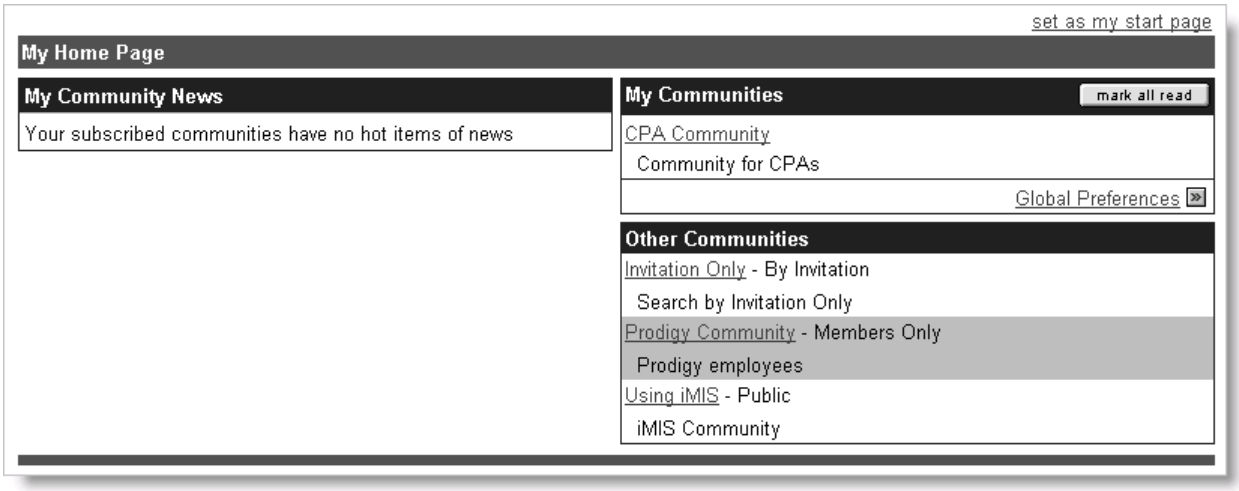
After completing this section, you will be able to do the following:

- Configure your Community home page
- Search communities
- View Community news items
- Participate in discussions
- View documents

Configuring “My Communities” Home Page

The User Home Page represents the user's dynamic personal home page and displays links to the user's subscribed communities and community news items. Links to the communities the user is subscribed to are listed in the My Communities area. Hot news items from the user's subscribed communities are listed under My Community News. Links to communities the user may be interested in joining are listed under Other Communities.

My Home Page



Communities

set as my start page

Select to set your User Home Page as the default start page on login. If your User Home Page is set as the default start page, the link remove from being my start page displays and deselects your User Home Page as the default start page.

Note: The set as my start page option is not available for combined e-Series/Content Manager sites. This option is applicable to e-Series alone.

My Community News

Lists the news documents associated with a particular community. Only 'HOT' news items are displayed in this section. They are displayed in time order with the most recent first.

A maximum of five news items are displayed. If more than five are available, a line displays the number of items that are not visible, and a link displays to allow the user to view all of the items. If the user selects this link, the page is redrawn with all available items displayed.

A New graphic will display to the right of the news item title in the My Community News section if the item has been posted since the last time the user has marked news items as read.

My Communities

Lists the user's subscribed communities in alphabetical order

A maximum of five subscribed communities is displayed. If more than five are available, a line displays the number of items that are not visible, and a link displays to allow the user to view all of the items. If the user selects this link, the page is redrawn with all available items displayed.

In the My Communities section, a New graphic and the number of new posts will display to the right of each community name if there are new items available in the community.

mark all read

Click to mark all news items, discussion posts, and uploaded files as read for all of the user's subscribed communities. Items in unsubscribed communities will not be marked as read.

Global Preferences

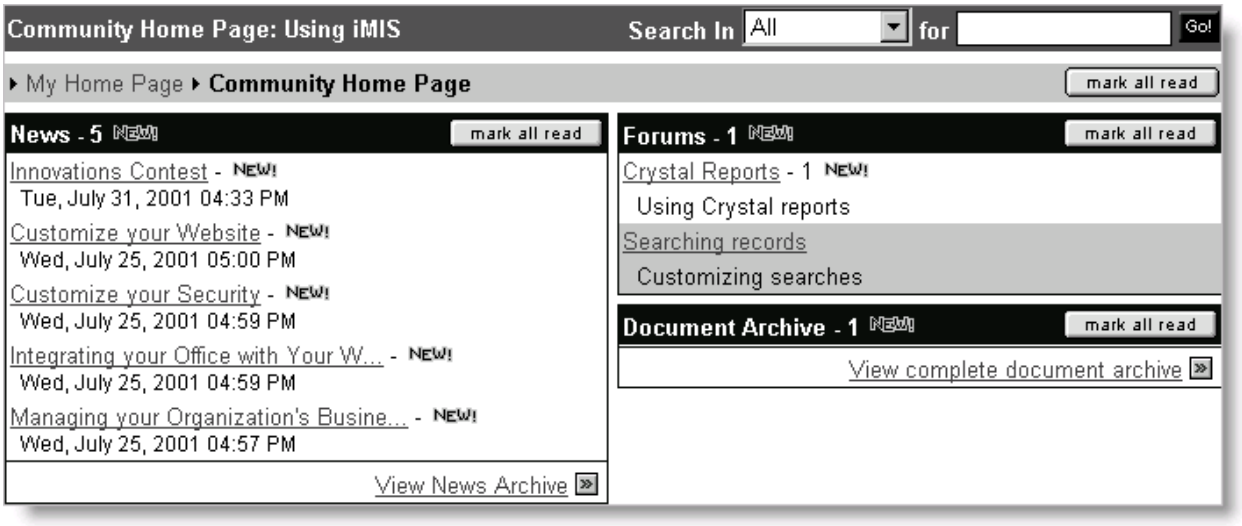
Select to open the Global Preferences page.

Other Communities

This area displays non-subscribed communities. Invitation only communities are listed first followed by the remaining communities in alphabetical order.

Community Home Page

The Community Home Page is the home page for a particular community. Each community has its own page that includes a list of community news items, a list of discussion forums, and an area from where you can access community documents.



Communities> My Communities

set as my start page

Select to set your User Home Page as the default start page on log in. If your User Home Page is set as the default start page, the link remove from being my start page displays and deselects your User Home Page as the default start page.

Note: The set as my start page option is not available for combined e-Series/Content Manager sites. This option is applicable to e-Series alone.

Search In

Select an area of a community in which to search from the drop-down list. Options include All, Discussions, News, and Shared.

for

Enter the topic or item for which you are searching.

Go

Click to execute your search.

mark all read

Click to mark all news items, discussion posts, and shared documents as read for the specific community.

News

Lists the news documents the community administrator has posted for the given community. News items are sorted primarily by priority (hot, normal) and secondarily by date. Both hot and normal priority news items are listed. Hot news items are designated by a HOT graphic displayed to the left of the news item title.

A New graphic will display to the right of the news item title in the My Community News section if the item has been posted since the last time the user has marked news items as read.

A maximum of five news items will be displayed. If more than five news items are available, a line displays the number of items that are not visible, and the View All Current News Items link displays to allow the user to view all of the items. If the user selects the View All Current News Items link, the page is redrawn with all of the current news items displayed.

mark all read

Click to mark all news items as read for the specific community.

View News Archive

Click to view all archived news items. Only news items with a status of Archived are displayed. Archived news items are sorted in date order.

Forums

Lists the discussion forums created and maintained by the community administrator for the given community. Discussion forums are associated with a particular community and cannot be shared between multiple communities. Administrators can add, edit, and remove discussion forums, topics, and items. Community members may start a new discussion topic within a discussion forum or post documents to an existing discussion topic.

The number of new discussion posts and the New graphic display to the right of the forum section caption if items have been posted since the last time the user marked discussion posts as read. For each forum, the number of new discussion posts and the New graphic display to the right of each forum title for items that have been posted since being marked as read.

Discussion forums are listed in alphabetical order, and a maximum of five forums are displayed. If more than five forums are available, a line displays the number of items that are not visible, and a link displays to allow the user to view all of the forums.

mark all read

Click to mark all discussion posts as read for the specific community.

Document Archive

Lists the shared documents posted by members that are specific to the given community. Community members may post any document to a public area (specific to the community) if the community is set up to allow documents to be updated. Community members can browse and download documents from this area. Administrators maintain the document archive area (create a hierarchical file structure and add or remove documents).

A maximum of five hot documents are displayed. If more than five hot documents are available, a line will display the number of documents that are not visible. The user must click View complete document archive to view other documents.

mark all read

Click to mark all shared documents as read for the specific community.

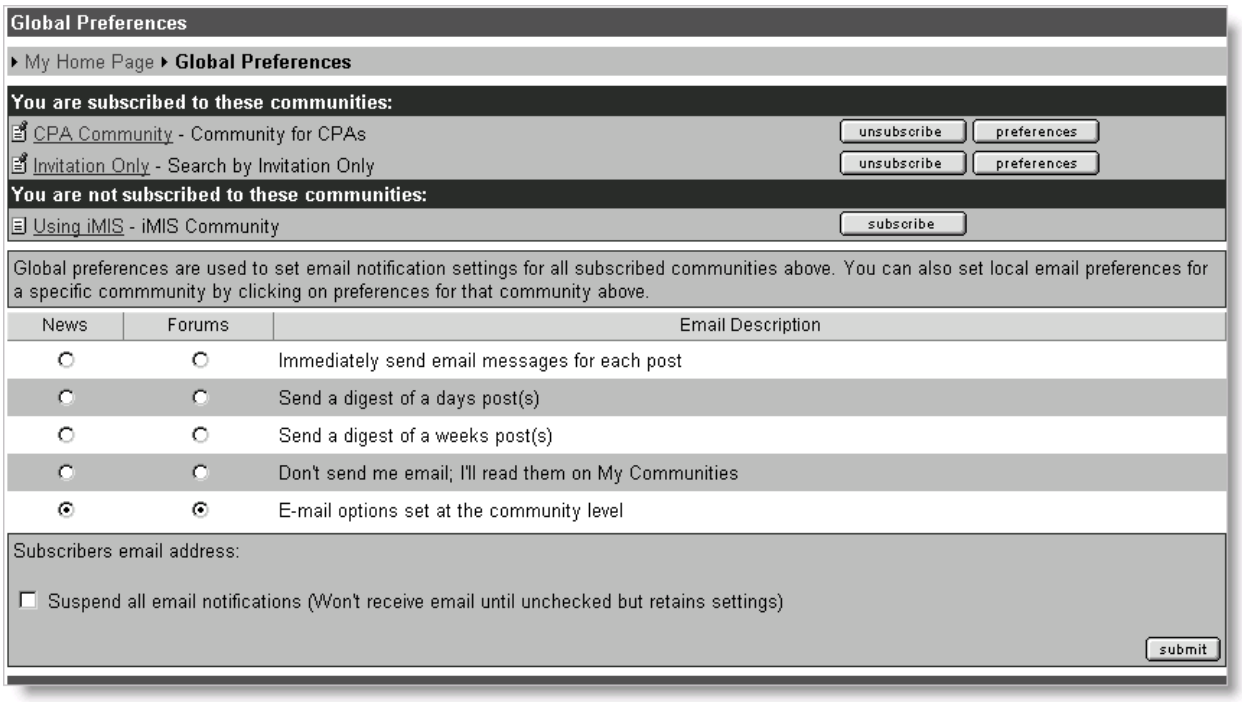
View complete document archive

Click to view all archived documents.

Global Preferences page

Users have the ability to customize their home page through the Global Preferences link. Clicking this link opens the Global Preferences page where users can subscribe and unsubscribe to communities as well as change their email settings.

The Global Preferences page displays links to the communities the user is subscribed to and links to the communities to which the user has permission to subscribe. Links to communities that the user does not have permission to subscribe to are not displayed. Users that are members of the Administrators security group will have access to all communities regardless of whether the community criteria is Public, Members Only, or By Invitation.



Communities> Global Preferences

You are subscribed to these communities

Lists the communities in alphabetical order to which the user is subscribed.

unsubscribe

Used to unsubscribe from the given community and move the community to the appropriate section.

preferences

Opens the Community Preferences page and set community level email preferences.

You are not subscribed to these communities

Lists the communities, in alphabetical order, to which the user is not subscribed

subscribe

Used to subscribe to the given community and move the community to the appropriate section.

Immediately send email messages for each post

Select to send email for each new News and/or Forums posting.

Send a digest of a days post(s)

Select to send a daily email containing a digest of News and/or Forums posts.

Send a digest of a weeks post(s)

Select to send a weekly email containing a digest of News and/or Forums posts.

Don't send me email; I'll read them on My Communities

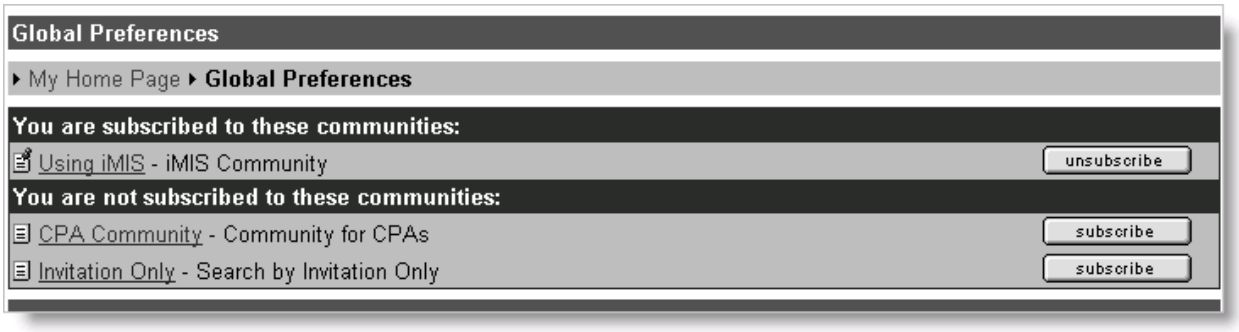
Select to send no email for News and/or Forums posts.

email options set at the community level

This option enables when preferences are set at the community level for the News and/or Forums posts.

Note: The email options set at the community level option is only included in the Global Preferences page when email settings are set at the community level for a given community.

If the administrator has configured e-Communities with email notifications disabled, then the Global Preferences page displays without any email options available:



Global Preferences page

To use Breadcrumb Navigation Aids

e-Communities uses Breadcrumb Navigation Aids. Breadcrumbs are visual indicators of the pages you have visited that function as hyperlinks. These hyperlinks allow you to navigate to any link (page) in the breadcrumb trail with only one click.

In the following example, the breadcrumb shows the path as My Home Page> Community Home Page> View Discussion Forum. The current page is shown in black text while the hyperlinks to the previous pages are shown in red. You can click any hyperlink to navigate to that page. For example, if you click Community Home Page, the Community Home Page opens.

In the following example, the breadcrumb shows the path as Admin Home> Manage Communities> Edit Community> Edit Community Properties. The current page is shown in black text while the hyperlinks to the previous pages are shown in red. You can click any hyperlink to navigate to that page. For example, if you click Manage Communities, the Manage Communities page opens.

To subscribe to a community

1. Select Communities to open your home page.
2. Click the Global Preferences link to open the Global Preferences page.
3. Click subscribe on the same line that corresponds to the community to which you want to subscribe. The community name automatically moves to the list of subscribed communities.

To unsubscribe from a community

1. Select Communities to open your home page.
2. Click the Global Preferences link to open the Global Preferences page.
3. Click unsubscribe on the same line that corresponds to the community to which you want to subscribe. The community name automatically moves to the list of unsubscribed communities.

To set global email preferences

The default setting for all email preferences is that no email will be sent to the user without the user setting their preferences at either the global or community level.

Note: Setting global preferences will overwrite any community level preferences previously set.

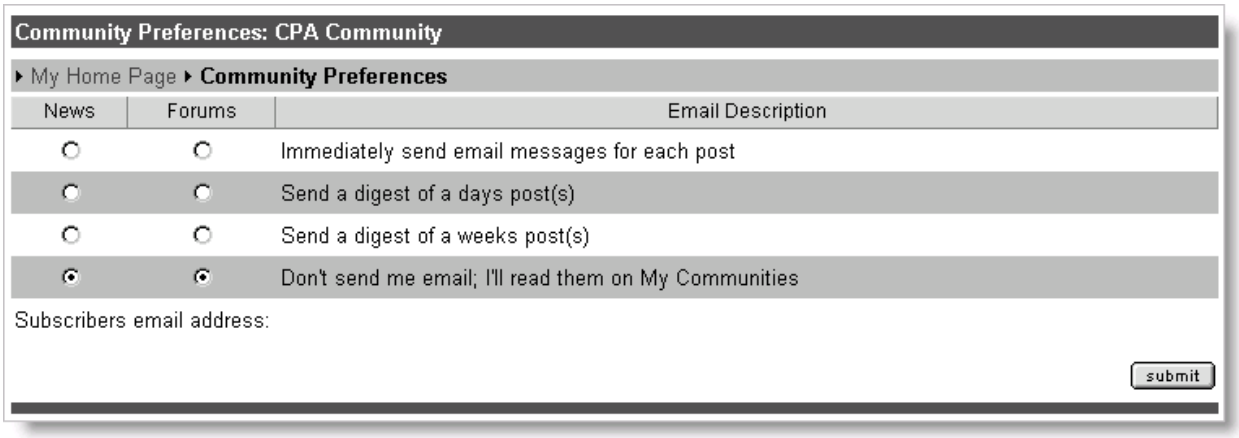
1. Select Communities to open your home page.
2. Click the Global Preferences link to open the Global Preferences page.
3. Enable the appropriate radio buttons for your Community News and/or Discussion Forums posts.
4. Click submit.
5. Click OK on the message box.

To set community level email preferences

The default setting for all email preferences is that no email will be sent to the user without the user setting their preferences at either the global or community level.

1. Select Communities to open your home page.
2. Click the Global Preferences link to open the Global Preferences page.
3. Click preferences on the same line that corresponds to the community for which you want to set community preferences. The Community Preferences page opens.
4. Enable the appropriate radio buttons for your Community News and/or Discussion Forums for the given community.
5. Click submit.
6. Click OK on the message box to update the Global Preferences page.

Note: Setting preferences at the community level modifies the Global Preferences page to include the E-mail options set at the community level option.



Global Preferences page

To mark items as read

Users have the option of marking news items, discussion posts, and uploaded files as read. The mark all read function can be applied to all of the user's communities, to individual communities, and to specific areas of a community.

1. Select Communities to open your home page.

2. To mark all items as read for all of the subscribed communities:

- Click mark all read.

3. To mark all items as read for all of the items in a specific community:

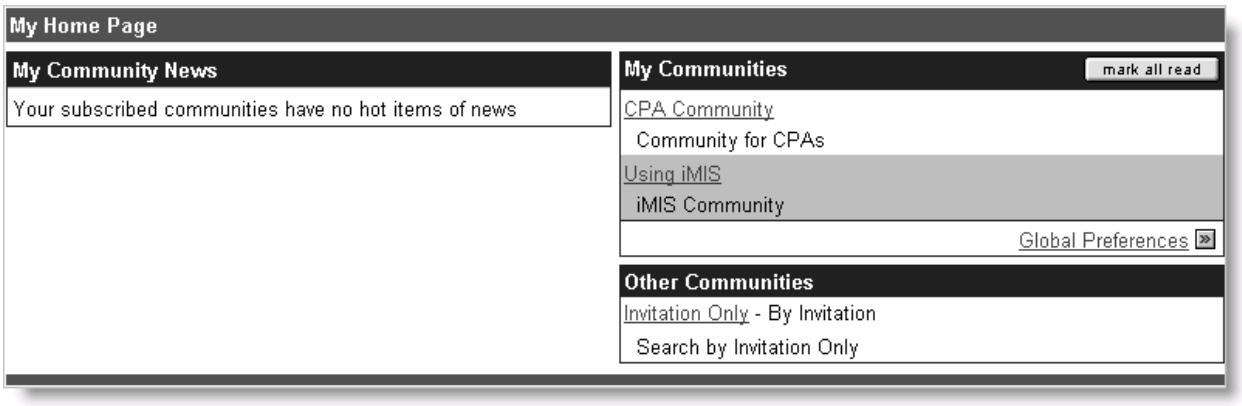
- Select the community from the My Communities area that you want to view and open the Community Home Page.
- Click mark all read to mark all items in the community as read.

4. To mark all items in specific areas of a community as read:

- Click mark all read in the area for which you want to mark all items as read. For example, if you want to mark all News items, click mark all read in the News area.

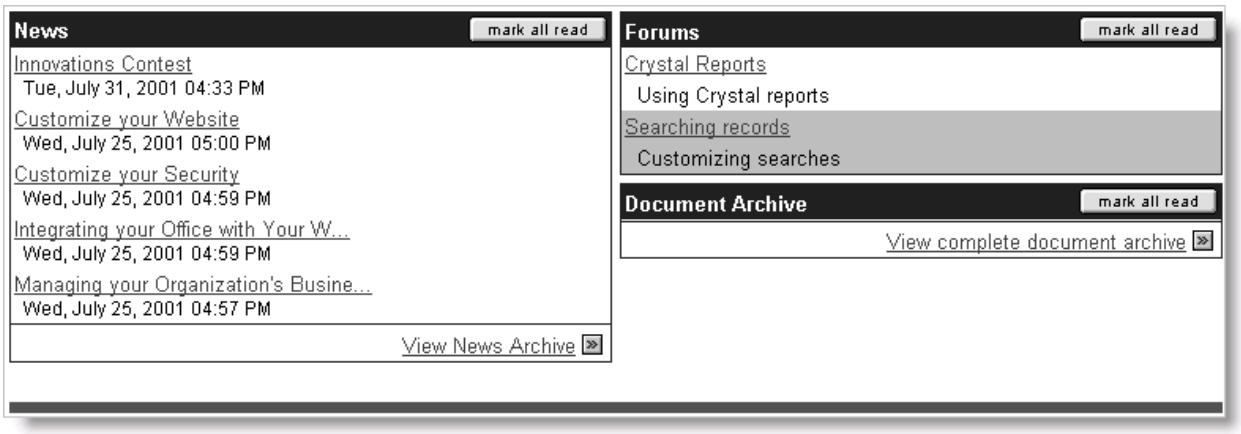
5. To mark a specific forum as read:

- Click the forum to open the View Discussion Forum page.
- Click mark all read to mark all items in the forum as read.

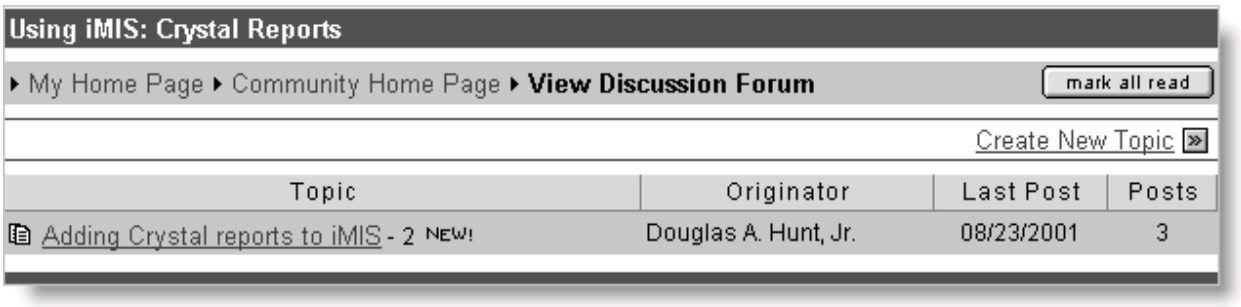


My Community News page

Communities Home page



News and Forums page



Using iMIS: Crystal Reports discussion forum

Searching e-Communities

The Verity Indexing and the Verity search engine are used for performing searches in e-Communities. Before e-Communities can be searched, Verity must first index data into a collection. Once Verity Indexing is set up and the Communities collection is created, community search fields become available for the Community Home Page. Users are then able to perform community level searches.

Users can search whatever communities they select provided those communities are accessible from their User Home Page. Anonymous users do not have the ability to perform searches. Users have the option to search an entire community or to narrow their focus and search specific community areas:

- News
- Forums

- Documents

  Note: The Verity search does not search on the Discussion Subject field or the News Title field, unless the <title></title> parameter is added to a news item when it is created. Only content, not titles, is searched.

  Note: Content returned from a Discussion or News item will not reference a document title, unless the <title></title> parameter is added to a news item when it is created. The reference will be No document title found.

  To search the Community Home Page

  Community search fields become available in the Community Home Page only after the Verity Indexing is set. Users can then perform community level searches.

1. Log in to the e-Series site.
2. Select Communities to open the My Home Page.
3. Click an item or area that you want to search to open the Community Home Page and access the community search fields. For example, click Using iMIS under My Communities.
4. Select an area in the Search In drop-down list that you want to search. For example, select News. Search options include:

- All - Searches all areas of the community
- Discussions - Searches only items in the Forums area
- News - Searches only items in the News area
- Shared - Searches only items in the Document Archive area

5. Enter the content to be searched in the for field. For example, enter security.
6. Click Go to open the Search Results page and view the returned results.
7. Select a returned item(s) and view the returned content.

Viewing Community News Items

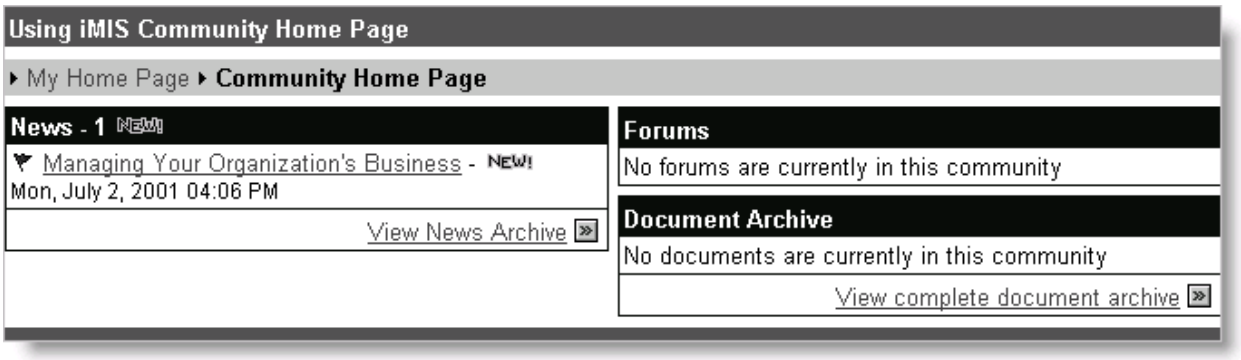
Community news items are the news documents associated with your particular community. Only 'HOT' news items are displayed on your Community Home Page, and they are displayed in time order with the most recent news item listed first.

A maximum of five news items are displayed. If more than five are available, a line displays the number of items that are not visible, and a link displays to allow you to view all of the items. If you select this link, the page is redrawn with all available items displayed.

A New graphic will display to the right of the news item title in the My Community News section if the item has been posted since the last time you marked news items as read.

To view news items

1. Select Communities in the top navigation bar.
2. Click the appropriate community to display the Community Home Page.
3. Click the news item.



Community Home Page - News

To view archived news items

1. Log in to your e-Series site.
2. Select Communities in the top navigation bar.
3. Click the appropriate community to display the Community Home Page.

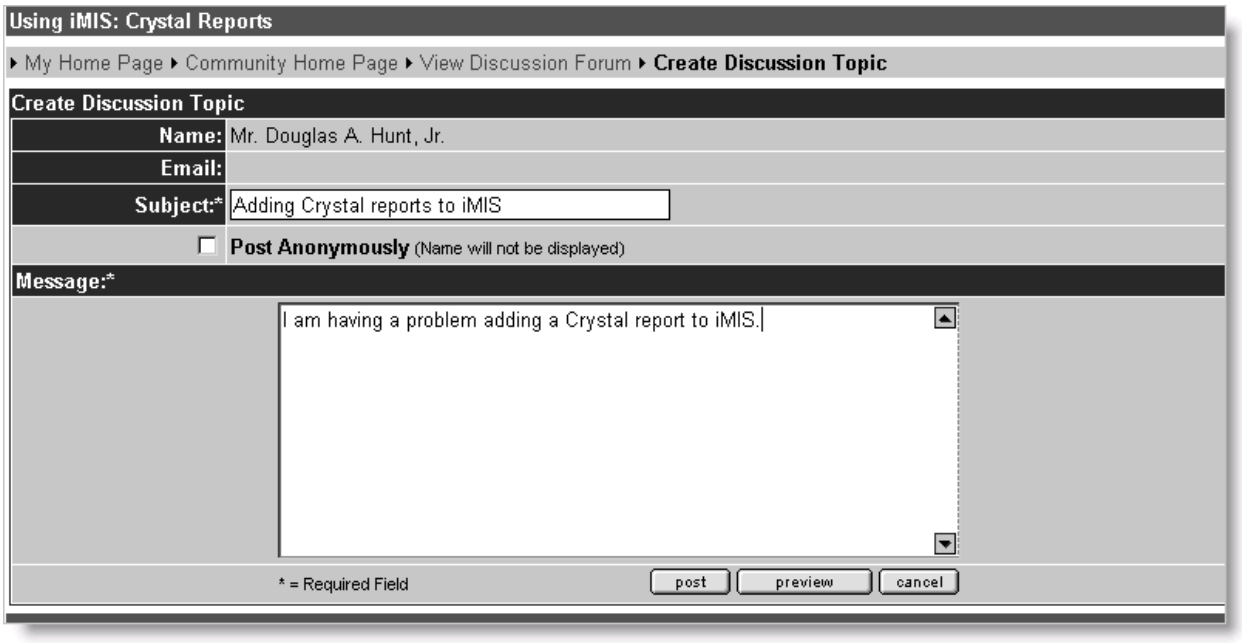
4. Click View News Archive. The news items with a status of Archive are sorted in date order.
5. Click the news item.

Participating in a Discussion

A customer can add discussion topics to any forum within a community they can access.

To create a discussion topic

1. Log in to your e-Series site.
2. Select Communities in the top navigation bar.
3. Click the appropriate community to open the Community Home Page.
4. Click the forum for which you want to add a discussion topic.
5. Click Create New Topic to open the Create Discussion Topic page.
6. Enter the Subject.
7. (optional) Enable the Post Anonymously option if you want to hide your user name when this topic displays on other discussion pages.
8. Enter the Message.
9. Click preview if you want to view the content before it is posted.
10. Click post to create the discussion topic.
11. A message indicating the discussion item was created successfully displays. Click OK.



Create a Discussion Topic page

To respond to or post a discussion topic

1. Log in to your e-Series site.
2. Select Communities in the top navigation bar.
3. Click the appropriate community to open the Community Home Page.
4. Click the forum. If a forum contains any new posts, the number of new posts is listed next to the forum.
5. Click the topic to display the View Discussion Topic page.

   The top section displays all topic postings in a tree view. A user can reply to any posting and the reply will display in the appropriate branch of the tree. A NEW graphic will display next to the title if a topic was posted since the last time the user marked the discussion item(s) as read.

   Note: The Edit this post option only displays if the current user posted the topic or if the current user is a member of the Administrator security group. The Delete this post option displays only if the current user is a member of the Administrator security group.

6. Click the Reply option that corresponds to the topic to which you want to respond.

   The Reply to Discussion Topic page opens with the user name or company name pre-filled into read only fields. The subject field is pre-filled with RE: and the subject of the message.

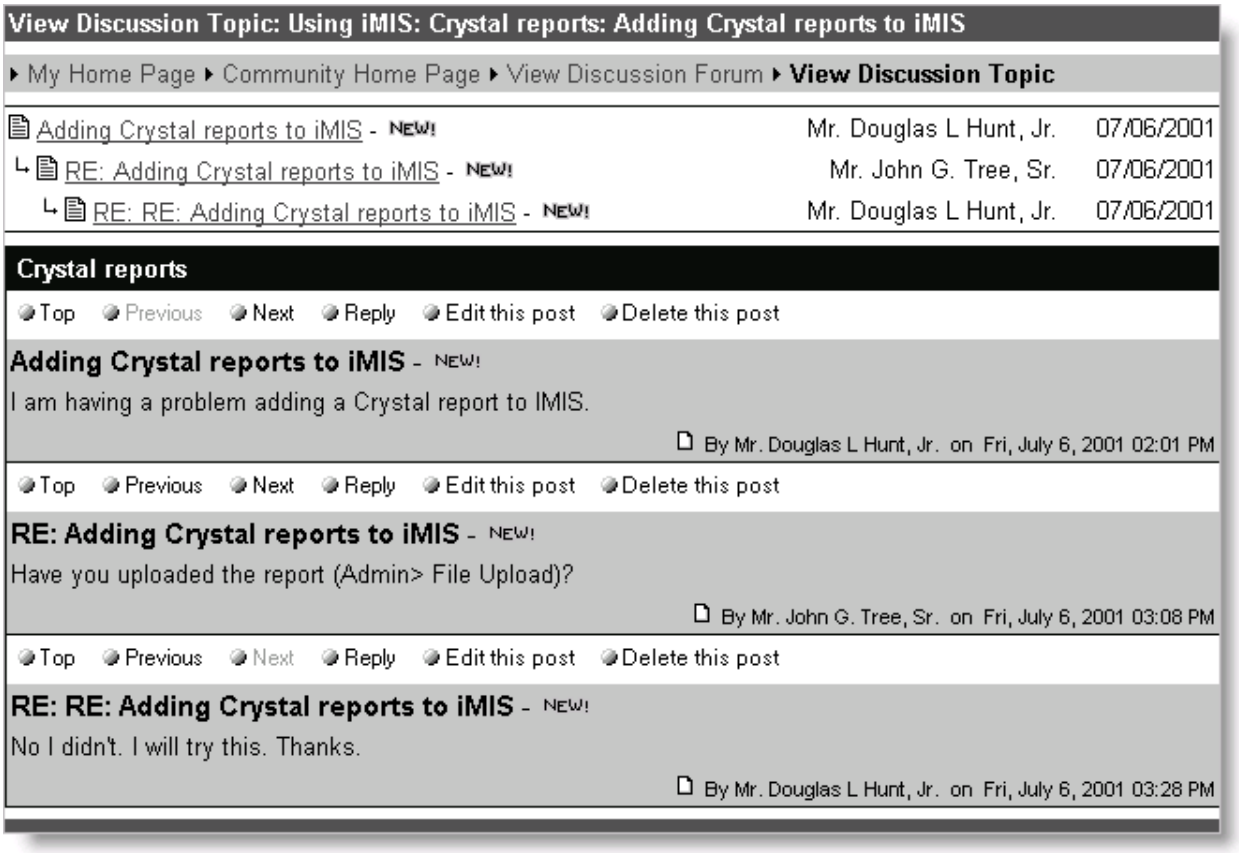
7. The Reply option is enabled by default. If you click New, the Subject line does not clear. However, you can enter a new subject.

8. (optional) Enable the Post Anonymously option if you want to hide your user name when this topic is displayed on other discussion pages.

9. Enter the Message.

10. Click post to create the discussion topic. A message indicating the discussion item was created successfully displays.

11. Click OK.



View Discussion Forum page

To view a discussion topic

1. Log in to your e-Series site.
2. Select Communities in the top navigation bar.
3. Click the appropriate community to open the Community Home Page.
4. Click the forum you want to view. If a forum contains any topics, the number of new posts is listed next to the forum. Discussion topics are sorted in date order.
5. Click the topic to display the View Discussion Topic page.

To edit a discussion post

You can only edit a topic that you posted.

1. Log in to your e-Series site.
2. Select Communities in the top navigation bar.
3. Click the appropriate community to open the Community Home Page.
4. Click the forum containing the topic you want to edit. If a forum contains any topics, the number of topics is listed next to the forum.
5. Click the topic to display the View Discussion Topic page.
6. Click Edit this post that corresponds to the posting. The Edit Discussion Post page displays.
7. Modify the topic.
8. Click post. A message indicating the discussion post was updated successfully displays.
9. Click OK.

To delete a discussion post

You can only delete a posting that you posted.

1. Log in to your e-Series site as an administrator or as a community administrator.

2. Select Communities in the top navigation bar.
3. Click the appropriate community to open the Community Home Page.
4. Click the forum. If a forum contains any posts, the number of new posts is listed next to the forum.
5. Click the topic to display the View Discussion Topic page.
6. Click Delete this post that corresponds to the post you want to delete.

   Note: Deleting a post also removes any posts that have replied to the post you are deleting.
7. A system message prompts you to verify the deletion of the posting. Click OK. The View Discussion Topic page updates.

Viewing archive documents

You can view documents and document folders in the document archive of your community.

Each document listing includes its file name, document description, document submitter, document posting date, and document size.

Each folder listing includes its folder name, folder description, document count, and the last date a document was posted to the folder.

Note: If the document count for a folder is 0, there is no last posting date.

Change the sort order of documents or folders by clicking the appropriate column heading. You can sort documents by their names, descriptions, posting dates, or sizes. You can sort folders by their names or their descriptions.

To view archive documents

1. Log in to your e-Series site.

2. Select Communities in the top navigation bar.
3. Click the appropriate community to display the Community Home Page.
4. The documents set with a priority as Hot are listed below the Document Archive area. You can click any document in this area to open the document.
5. Click View complete document archive to view all documents and folders.

   The documents located in the top half of this page open when selected.
6. If you want to view a document located in a folder, click the Folder Name to open the View Document Folder page.
7. Click the document you want to view.

View Document Archive page

Setting e-Series System Parameters

Overview of e-Series System Parameters

This section includes the system settings that apply to your entire e-Series site. Use only the latest version of Internet Explorer when administering your e-Series site and performing the following procedures:

- Setting up and editing Web, e-Customer, e-Billing, e-Events, e-Orders, and e-Communities System Parameters
- Displaying the save password option
- Saving user passwords
- Setting session variables
- Setting standard and European date formats
- Modifying locale code values
- Selecting required fields for new member records
- Setting the display mode for custom windows
- Customizing e-Communities prompts and fields
- Enabling e-Communities for security groups

The goal of this section is to give you the knowledge and skills necessary to set up, define, and use the system settings that are applicable to your entire iMIS e-Series site.

After completing this section, you will be able to do the following:

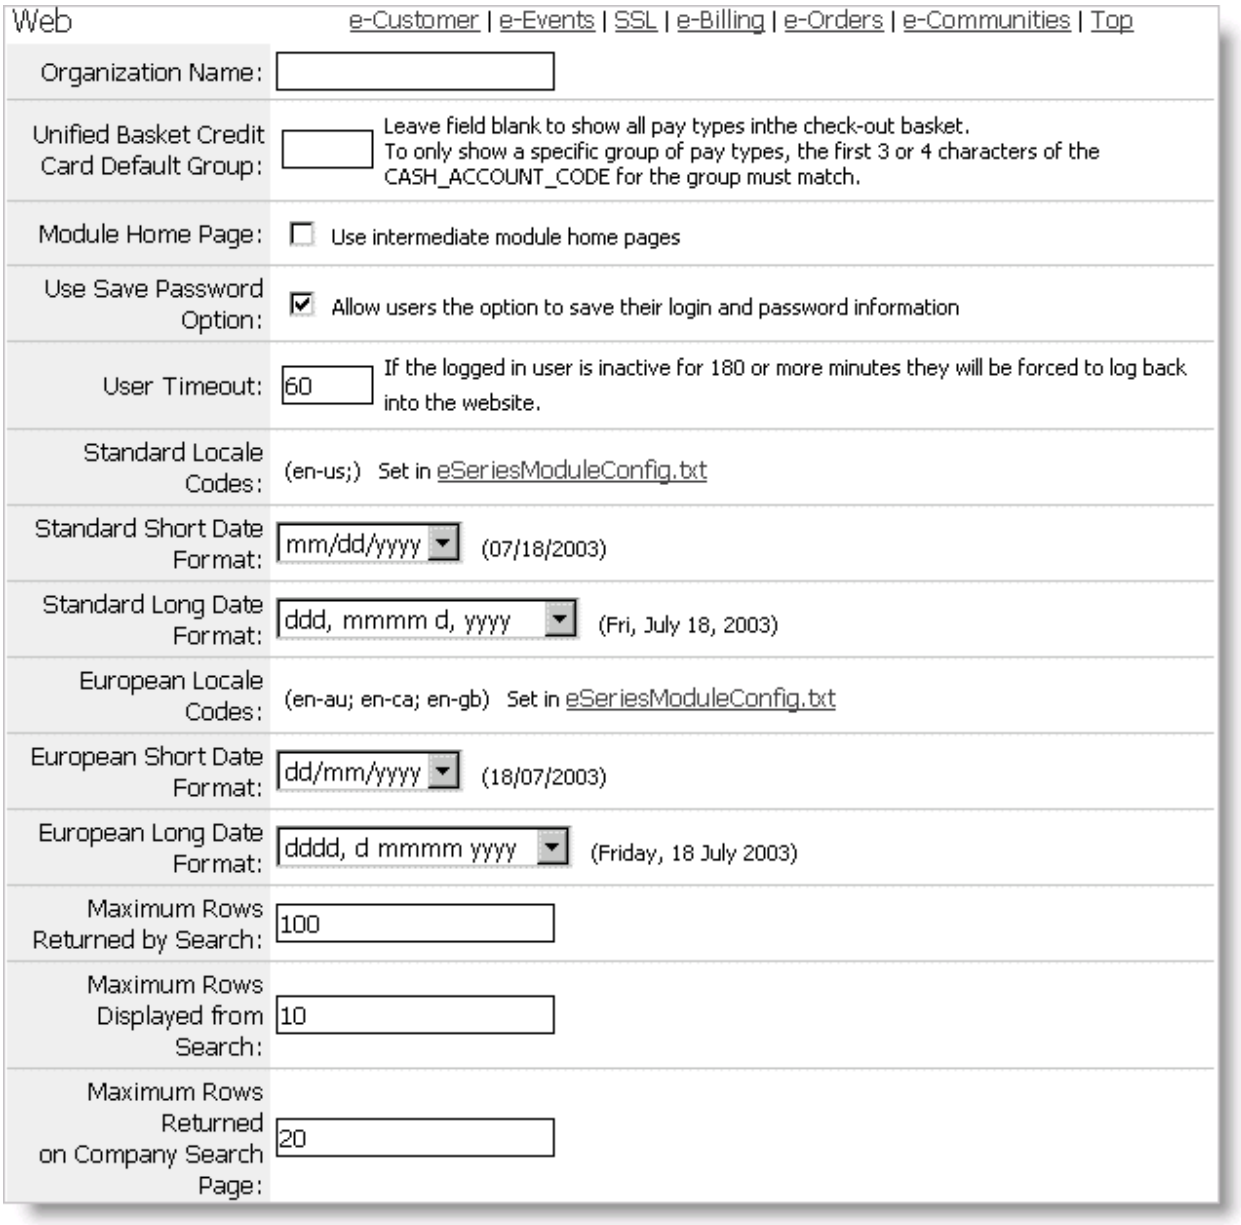
- Set Web, e-Customer, e-Billing, e-Events, e-Orders, and e-Communities System Parameters
- Save user passwords
- Set session variables and International date formats
- Use the Sign Up feature

Setting Web System Parameters

The Web System Parameters specify general display options (global defaults) for your e-Series site and are accessible only by Administrators. Define the Web System Parameters before defining the e-Customer System Parameters.

Caution! Changing settings in the System Parameters not only changes e-Series setup, but also affects the iMIS database. For this reason, be very careful when editing the System Parameters.

Web System Parameters page



Admin> Lookups> System Parameters> Web

Organization Name

Specifies the organization's name. The value you enter in this field displays in the side index and at the top of each page.

Caution: The value you enter in this field overrides the organization name in iMIS.

Unified Basket Credit Card Default Group

Enter a cash account to display a specific group of pay types on the Check-Out Basket page (the first four characters of the group's CASH_ACCOUNT_CODE must match). Leave the field blank to display all pay types on the Check-Out Basket page.

Module Home Page

Enable to allow the use of intermediate module home pages.

Use Save Password Option

Enable so users can save their passwords when logging in to e-Series (the Save password option displays on the Login page only when this option is enabled). If a user saves their password, the Password field on the Login page automatically populates each time the user logs in.

If session variables (User Timeout) have been set and a user has saved their password, the logged in user will not be required to log back into the site when the session variables time out.

If a user has not saved their password, the current time stamp is monitored. If the logged in user is inactive within the site for a period greater than or equal to the time limit set in the session variables, a system message displays requiring the user to log back into the site.

User Timeout

Specify the time a logged in user can be inactive before being forced to log back into the website. If a logged in user is inactive within the site for a period greater than or equal to the time limit set, the user will be required to log back into the site. This e-Series feature allows both the client and the session variables to be cleared upon logout.

Note: This time limit does not apply to users who have chosen to save their passwords. Only users who have not saved their passwords are required to log back into the site at the end of the session.

Standard Locale Codes

List of codes designated to use the US date format of MMDDYYYY to view or edit data. These codes are set in the _eSeriesConfig.txt file and define standard language and country codes. For example, en is the abbreviation used for the English language, and us is the abbreviation used for the United States.

To configure these settings, edit the eSeriesConfig.txt file to designate which input locale codes use the Standard (Western or US) format of MMDDYYYY (separate locale codes by semicolons):

<cfset Application.System.ST="(any locale code entered here will display as MMDDYYYY)">

For example, the following would allow all members with an input locale of en-us (United States) to see the MMDDYYYY format:

<cfset Application.System.ST="en-us;">

Standard Short Date Format

Select one of the three standard short date formats from this list:

- mm/dd/yyyy (default)
- mm-dd-yyyy
- mm dd yyyy

The system default values for the date formats are pre-defined in the ini-tializeapplicationvariables.cfm file. The date format selection is based on the locale set-tings of the web browser.

Standard Long Date Format

Select one of the three standard long date formats from this list:

- ddd, mmmm d, yyyy (default)
- dddd, mmmm dd, yyyy
- dddd, dd mmmm, yyyy

The system default values for the date formats are pre-defined in the initializeapplicationvariables.cfm file. The date format selection is based on the locale settings of the web browser.

European Locale Codes

List of codes designated to use the European date format of DDMMYYYY. These codes are set in the _eSeriesConfig.txt file and define standard European language and country codes. For example, en is the abbreviation for the English language and gb is the abbreviation used for Great Britain.

To configure these settings, edit the eSeriesConfig.txt file to designate which input locale codes use the European format of DDMMYYYY (separate locale codes by semicolons):

<cfset Application.System.EU="(any locale code entered here will display as DDMMYYYY)">

For example, the following would allow all members with an input locale of en-au (Australian), en-ca (Canadian), and en-gb (Great Britain) to see the DDMMYYYY format:

<cfset Application.System.EU="en-au; en-ca; en-gb">

European Short Date Format

Select one of the three European short date formats from this list:

- dd/mm/yyyy (default)
- dd-mm-yyyy
- dd mm yyyy

The system default values for the date formats are pre-defined in the initializeapplicationvariables.cfm file. The date format selection is based on the locale settings of the web browser.

European Long Date Format

Select one of the four European long date formats from the list:

- dddd, d mmmm yyyy (default)
- dddd, d mmmm yyyy
- dd mmmm yyyy
- d mmmm yyyy

The system default values for the date formats are pre-defined in the initializeapplicationvariables.cfm file. The date format selection is based on the locale settings of the web browser.

Maximum Rows Returned by Search

Use this field to limit the number of records (rows) returned when a user performs a search. For better performance and to limit risk to large databases, restricting the number of records returned from a search is recommended.

If the returned records exceed the maximum setting, the search ends, and users receive a message telling them to further define their search.

Maximum Rows Displayed from Search

Specifies how many records (rows) display on each returned search page.

Maximum Rows Returned on Company Search Page

Enter the number of records (rows) returned on the Company Search page.

Web Source Code

Select the source code to track how a record was entered in iMIS.

Security Filters Start

Enter the number of filters you can view when using the Find Filter security option.

Primary Forum

Specifies the name of the Primary Forum link that displays in the side index of the Home page.

Primary Path

Specifies the primary path or URL to the Primary Forum.

Secondary Forum

Specifies the name of the Secondary Forum link that displays in the side index of the Home page.

Secondary Path

Specifies the primary path or URL to the Secondary Forum.

Base Currency Code

Use this field to select the currency in which transactions are accounted. Though customers may display prices in their currency, the underlying price will still be stored in the database in the base currency.

Note: If the Display Alternative Currency prompt is checked, the Base Currency Code must be selected.

Display Alternative Currency

Use this check box to allow customers to display prices in the currency of their choice.

- Enabling this option places a drop-down currency list on web pages with price listings.
- Disabling this option displays price listings on web pages in the base currency, and the option to convert the price to an alternative currency is not displayed on web pages.

To edit Web System Parameters

1. Log in to your e-Series site as an administrator.

2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to display the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select Web to display the Web System Parameters page.
6. Enter the parameter information in the appropriate fields.

   Note: Do not enter the Organization Name if you are using iMIS. This parameter overrides the organization name in iMIS.

7. Update the System Parameters:

- Click Update. A message displays confirming that the system parameter information updated successfully.
- Click OK to return to the Lookup Lists page.
- Click Update System Variables.
- Click OK.

Hands-on exercise: Edit the Web System Parameters

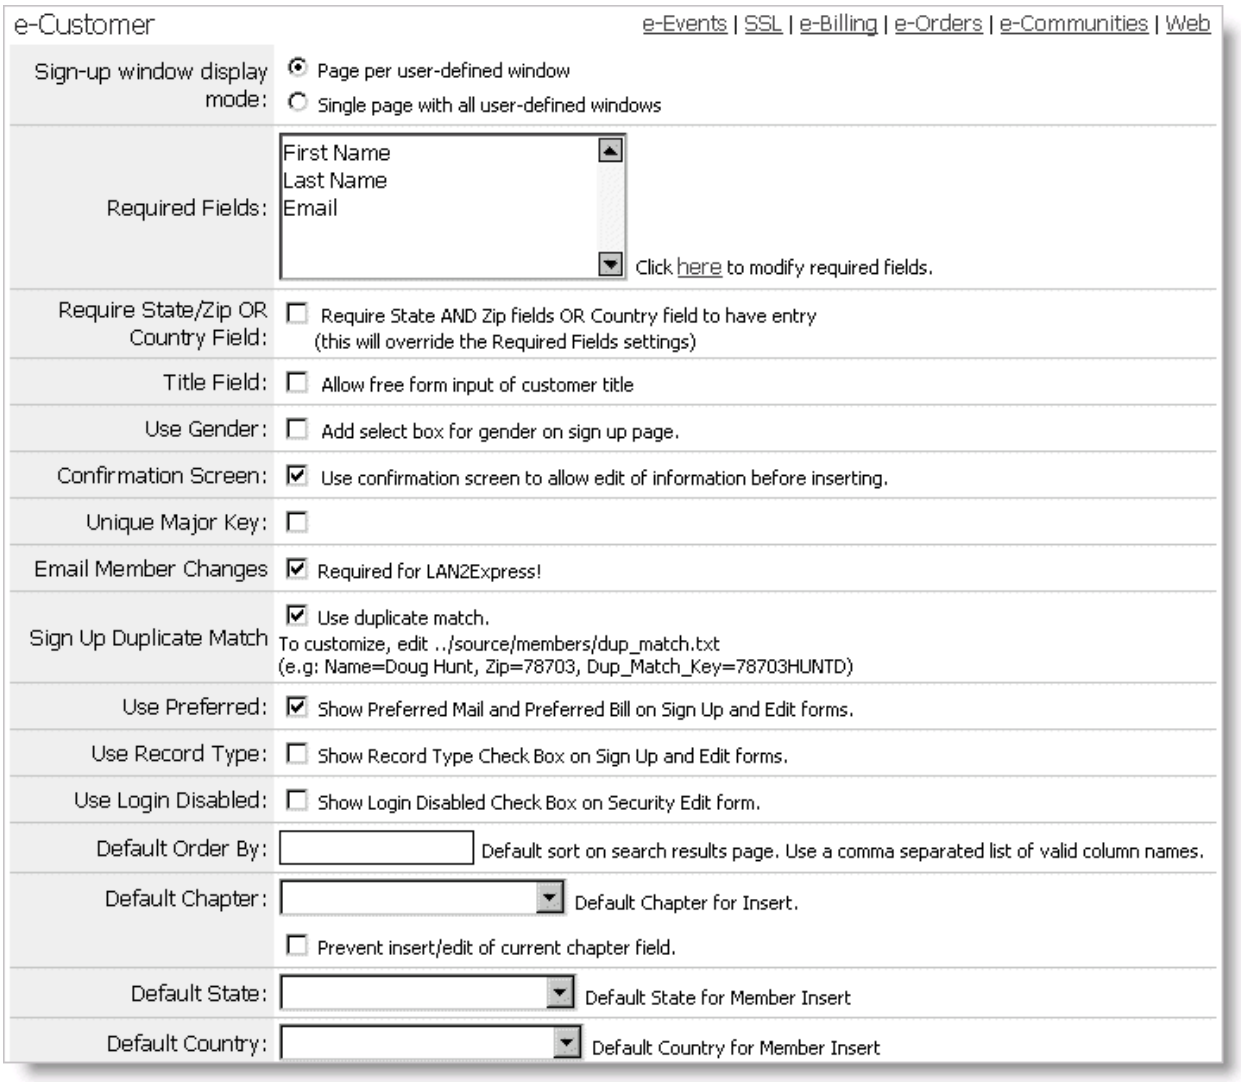
1. Enter the following Web System Parameters:

- Maximum Rows Returned by Search: 100
- Maximum Rows Displayed from Search: 10
- Web Source Code: Web
- Validation Screen Delay: 10
- Security Filters Start: 10
- Primary Forum: Primary Forum
- Primary Path: http//www.newsforum.com

2. Update the parameters.

Setting e-Customer System Parameters

e-Customer System Parameters page



Admin> Lookups> System Parameters

Sign-up window display mode

Enable the appropriate display mode to display either one page per user-defined Sign Up window or one page that contains all of the user-defined Sign Up windows:

- Page per user-defined window - Generates only the company name, address, and company ID fields (current layout).

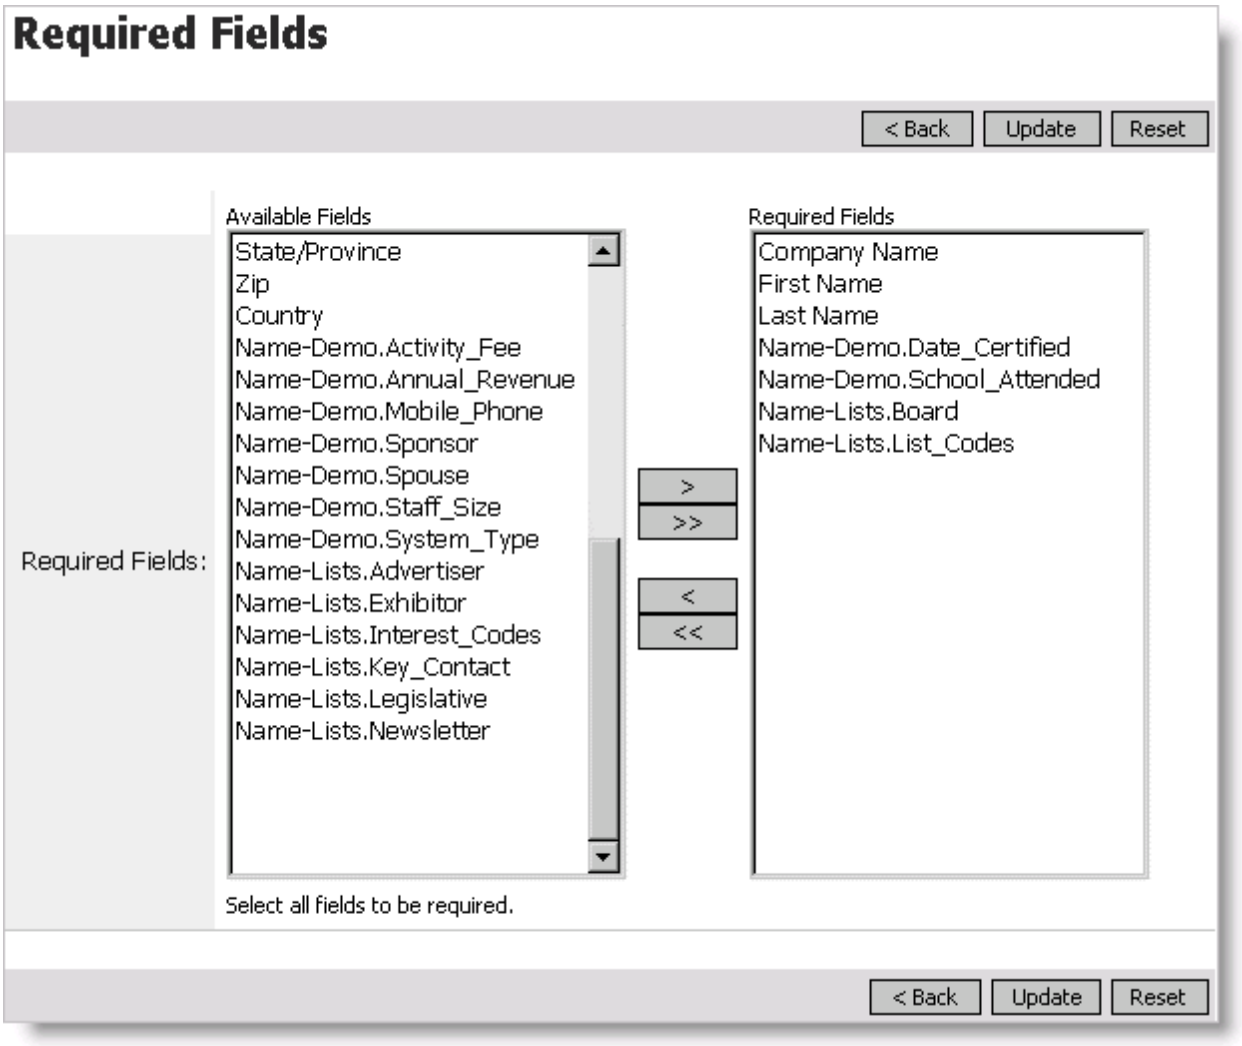
- Single page with all user - defined windows - Displays all user-defined windows attached to the Sign Up page such as home address and demographics.

  (If you want members or anonymous users to enter information in the custom windows, you will have to enable the Custom Windows filters on the Detail Security page. The user-defined and security windows will display on the page according to their security filter settings for anonymous users. Only the first instance of multi-instance windows will be allowed for entry on the Sign Up page. Additional instances will need to be added through the member profile.)

  Required Fields

  Displays the fields that require population by new users during sign up. Click here to open the Required Fields page and modify the required fields. From the list of Available Fields, select the field(s) you want to designate as required, and then update your selection.

  The Required Fields page allows you to designate which fields require population when entering new user records in e-Series. For all fields requiring population, users must populate the fields with the requisite data before proceeding.



Example of the Required Fields page showing both system and user-defined fields

Note: Ship Phone is a reference to the phone number field used in e-Orders. For logged in users, this field populates automatically with the user's work phone unless it is blank, then it populates automatically with the user's home phone. If both of these fields are blank, the Ship Phone field will be blank as well. For anonymous users, the shipping address information is stored in the Name table for later reference.

Require State/Zip OR Country Field

Enable to require the State and Zip fields or the Country field to have an entry.

Title Field

Enable to allow the free form input of the customer title.

Use Gender

Enable to display the Gender field on the Sign Up page.

Confirmation Screen

Enable to display a confirmation screen when a customer signs up.

Unique Major Key

(Overrides the setting in iMIS) The unique value entered in this field becomes the major key value if your organization selects a value for the major key other than the member ID.

Email Member Changes

Enable to have an email sent automatically to your organization's contact whenever a customer's record is added or changed. The email is sent whenever changes occur to the Name table.

Sign Up Duplicate Match

If enabled, this option prevents users from inserting duplicate records. If a customer's record is already on file and they try to sign up, they receive the error message, Another member has a profile similar to your own, and your application cannot be processed. Please contact the association directly to sign up.

Use Preferred

Enable to use the preferred billing and mailing addresses on the Sign Up and Edit pages.

Use Record Type

Enable to display the Record Type checkbox on the Sign Up and Edit pages.

Use Login Disabled

Enable to show the Login Disable checkbox on the Security Edit pages.

Default Order By

Specifies the default sort order for the Search Results page.

Default Chapter

Select the default chapter for new customer records.

Prevent insert/edit of current chapter field

Enable to prevent the entering/editing of the current Chapter field.

Default State

Select the default state for new customer records.

Default Country

Select the default country for new customer records.

Days to Expire

Enter the number of days until a password expires after being entered in the system. Use this option to require users to update their passwords.

Member Type used for Anonymous Sign Up

Specifies the customer type that will be assigned to anonymous users when they sign up. Web is the default customer type.

Security Group Auto-Assign

Enable an option for automatically assigning security groups to new customer records (you can enable only one option at a time):

- Default - Enable to assign all new records to the Anonymous security group.
- Security Group - Enable to assign all new records to an existing security group (select a security group from the drop-down list).

Additional Info Insert Title

Enter the title of the prompt that is used to inform customers that more information is available.

Additional Info Sign-Up Message

(optional) Specifies the additional information that displays on the Additional Information Signup page.

Additional Info Edit Title

Specifies the title of the message that will be sent to individuals who edit customer information.

Additional Info Edit Message

Enter the information sent to users who edit their customer information.

Currency Type

Enter the symbol for the currency type used when processing customer information. For example, enter $ for dollars. Any symbol and/or letters may be used. This field does not calculate currency exchanges.

Chapter Prompt

(Overrides the setting in iMIS) Specifies the Chapter field prompt that displays on the Sign Up page.

Address One Prompt

(Overrides and changes the default address purpose setting in iMIS) Enter the first Address field prompt that displays on the Sign Up page.

Address Two Prompt

(Overrides and changes the default address purpose setting in iMIS) Enter the second Address field prompt that displays on the Sign Up page.

Address Three Prompt

(Overrides and changes the default address purpose setting in iMIS) Enter the third Address field prompt that displays on the Sign Up page.

State/Province Prompt

(Overrides the setting in iMIS) Specifies the State/Province field prompt that displays on the Sign Up page. This is a required field.

Zip/Postal Prompt

e-Series with iMIS: This prompt is set in iMIS in the Membership Setup - Addresses and Notes window (Membership> Utilities> System Setup> click Address and Notes). If you change this prompt in e-Series, it changes the setting in iMIS.

Note One Prompt

e-Series with iMIS: This prompt is set in iMIS in the Membership Setup - Addresses and Notes window (Membership> Utilities> System Setup> click Address and Notes). If you change this prompt in e-Series, it also changes the setting in iMIS.

Note Two Prompt

e-Series with iMIS: This prompt is set in iMIS in the Membership Setup - Addresses and Notes window (Membership> Utilities> System Setup> click Address and Notes). If you change this prompt in e-Series, it also changes the setting in iMIS.

Note Three Prompt

e-Series with iMIS: This prompt is set in iMIS in the Membership Setup - Addresses and Notes window (Membership> Utilities> System Setup> click Address and Notes). If you change this prompt in e-Series, it also changes the setting in iMIS.

CEU Prompt

e-Series with iMIS: This prompt is set in iMIS in the Membership Setup - Advanced window (Membership> Utilities> System Setup> click Advanced). If you change this prompt in e-Series, it changes the setting in iMIS.

Major Key Prompt

e-Series with iMIS: This prompt is set in iMIS in the Membership Setup - Basic Options window (Membership> Utilities> System Setup> click Basic Options). If you change this prompt in e-Series, it changes the setting in iMIS.

Institute Prompt

e-Series with iMIS: This prompt is set in iMIS in the Membership Setup - Basic Options window (Membership> Utilities> System Setup> click Basic Options). If you change this prompt in e-Series, it changes the setting in iMIS.

To edit e-Customer System Parameters

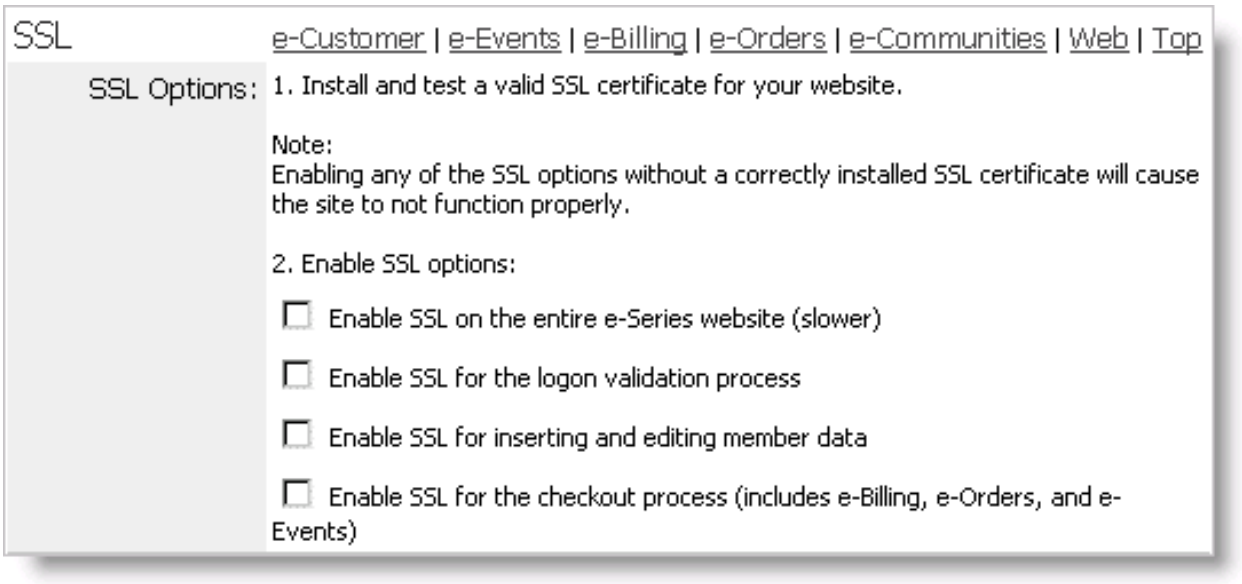
1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to display the Lookup Lists page.
4. Select System Parameters to open the e-Customer System Parameters page.
5. Enable the desired options, and enter the parameter information in the appropriate fields.
6. Update the System Parameters:

- Click Update. A message displays confirming that the system parameter information updated successfully.
- Click OK to return to the Lookup Lists page.
- Click Update System Variables.
- Click OK.

Setting the SSL System Parameters

The SSL System Parameters allow you to define the Secure Sockets Layer protocols for your e-Series site.

SSL System Parameters page



Admin> Lookups> System Parameters> SSL

Enable SSL on the entire e-Series website (slower)

Enable SSL for the entire e-Series website.

Enable SSL for the logon validation process only

Enable SSL for the logon validation process only.

Enable SSL for inserting and editing member data

Enable SSL for entering and editing customer data.

Enable SSL for the checkout process

Enable SSL for the checkout process.

To edit SSL System Parameters

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to display the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select SSL to display the SSL System Parameters page.

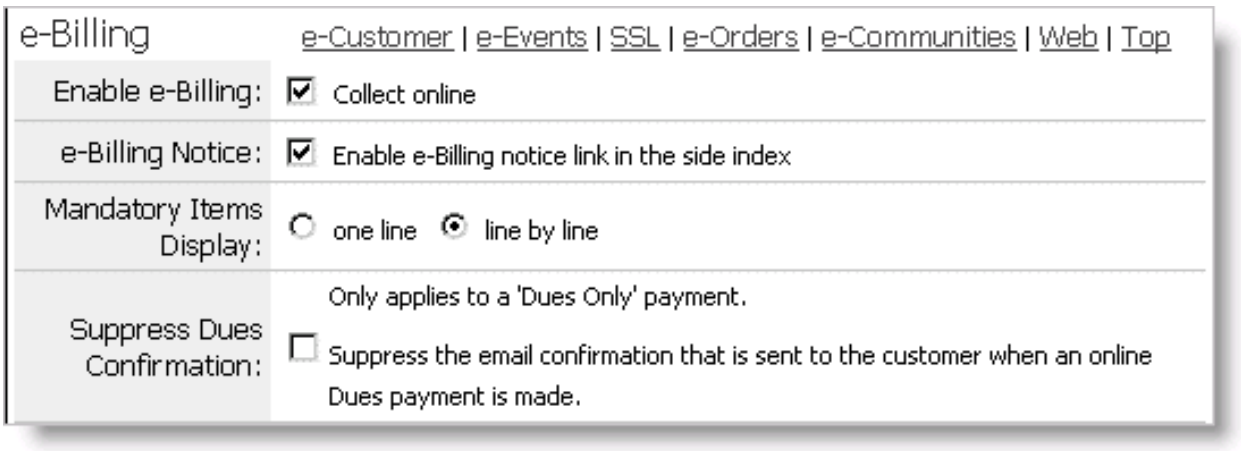
6. Enable the desired options.
7. Click Update. A message displays confirming that the system parameter information updated successfully.
8. Click OK to return to the Lookup Lists page.
9. Click Update System Variables.
10. Click OK.

    Note: You must click both the Update button on the System Parameters page and the Update System Variables button on the Lookup Lists page for the changes to the system to take place.

Setting e-Billing System Parameters

The e-Billing System Parameters allow you to collect payments online and to display Billing notices.

e-Billing System Parameters page



Admin> Lookups> System Parameters> e-Billing

Enable e-Billing

Enable to allow customers to make online payments.

e-Billing Notice

Enable to display e-Billing notice links in the side index. An e-Billing Reminder link will display under the customer's Profile section and in the top navigation bar if the customer has unpaid Dues.

Mandatory Items Display

Enable one of the options to display mandatory items in either a one line display or in a line-by-line display.

If line by line is enabled for the Mandatory Items Display option in the e-Billing System Parameters, and if a description is defined for the product in iMIS on the Billing Set up products window (from Billing, select Set up module> Products), a Note icon displays next to a dues-billing product's title on the e-Billing Reminder page.

The Note icon indicates that a description of the product is available. When users mouse-over a product's title or Note icon, the product's description displays.

Caution! For this feature to work, you must enable line by line. If you enable the one line option, the mouse-over functionality will not work.

Suppress Dues Confirmation

Enable to suppress the confirmation email sent to customers for Dues payments.

To edit e-Billing System Parameters

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to display the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select e-Billing to display the e-Billing System Parameters page.
6. Enable the desired options.
7. Click Update. A message displays confirming that the system parameter information updated successfully.

8. Click OK to return to the Lookup Lists page.
9. Click Update System Variables.
10. Click OK.

    Note: You must click both the Update button on the System Parameters page and the Update System Variables button on the Lookup Lists page for the changes to the system to take place.

Setting the e-Orders System Parameters

You can open your store for business by enabling the Open Store option in the e-Orders System Parameters page.

e-Orders System Parameters page

Open Store

Enable when you are ready to allow online ordering.

To set the e-Orders System Parameters

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to display the Lookup Lists page.
4. Select System Parameters to display the System Parameters page.
5. Select e-Orders.
6. Enable the Open Store option to open your online store.
7. Click Update. A message displays confirming that the system parameter information updated successfully.

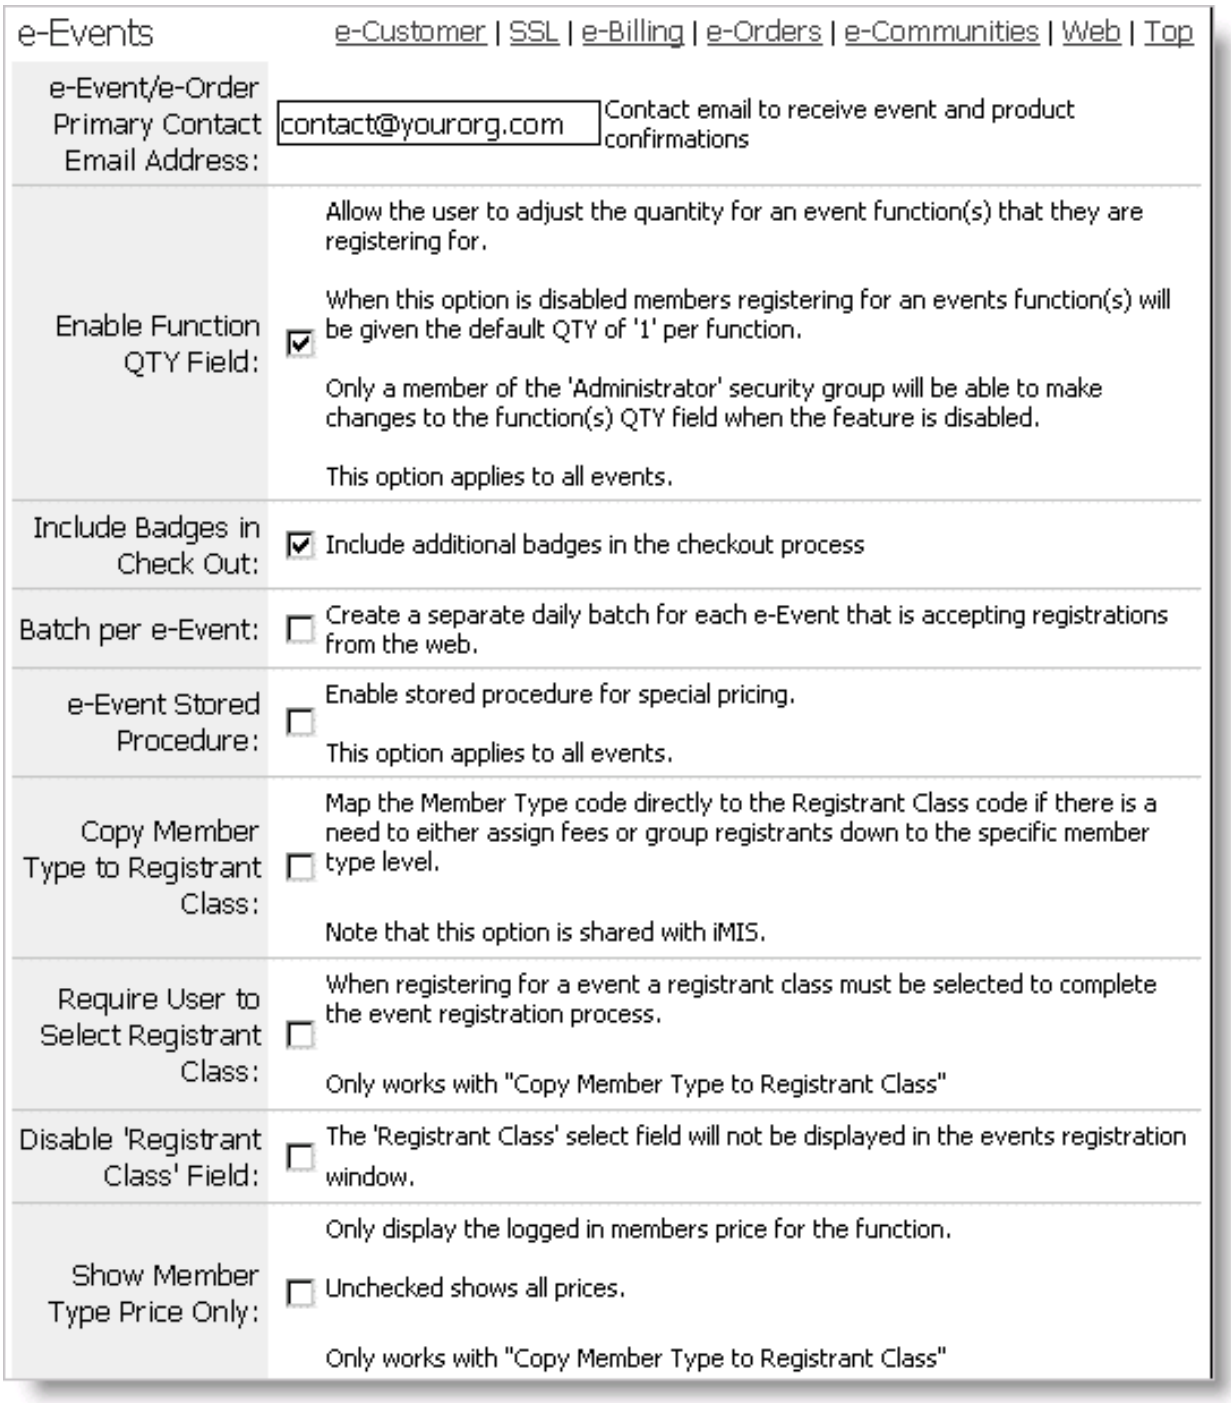
8. Click OK to return to the Lookup Lists page.
9. Click Update System Variables.
10. Click OK.

    Note: You must click both the Update button on the System Parameters page and the Update System Variables button on the Lookup Lists page for the changes to the system to take place.

Setting e-Events System Parameters

The e-Events System Parameters specify information about your events and how they display in your e-Series site.

e-Events System Parameters page



Admin> Lookups> System Parameters> e-Events

e-Event/e-Order Primary Contact Email Address

Enter the contact email address for receiving event and product confirmation messages. The email address entered in this field is used as the From address when an email confirmation is sent to a registrant.

Enable Function QTY Field

(Enabled by default) Applicable for all customers registering for event functions on the Event Registration page:

- Enable Function QTY Field enabled - Customers can edit the registration Qty field of the event functions for which they are registering.
- Enable Function QTY Field disabled - Customers cannot edit the registration Qty field of the event functions for which they are registering; they will be limited to the default of one registration per function. (Only members of the Administrator security group can edit an event function's Qty field on the Event Registration page when the Enable Function QTY Field option is disabled.)

Include Badges in Check Out

Enable to allow e-Events registrants to enter and edit badge information before checking out:

- Include Badges in Check Out enabled (and the Insert and Edit Meeting Badges security filters are enabled) - Registrants are able to view, enter, and edit badge information for any event. Registrants are taken directly to the Badge Maintenance page after clicking check-out on the Event Registration page.
- Include Badges in Check Out disabled - Registrants are unable to view or edit badge information for any event. Badges links are hidden from view on all applicable pages, and registrants cannot access the Badge Maintenance page at any stage of the event registration process.

Batch per e-Event

Enable to create a separate daily batch for each e-Event that is accepting online registrations (cannot be used in unified basket).

e-Event Stored Procedure

Enable to activate a stored procedure for special pricing. When the e-Event Stored Procedure option is enabled, e-Events is instructed to call the stored procedure sp_asi_event_price during checkout. The stored procedure is called with arguments for ID, IP_ADDRESS, and MEETING code. These codes correspond to:

Basket_Meeting.ID

Basket_Meeting.IP_ADDRESS

Basket_Meeting.MEETING

Basket_Function.ID

Basket_Function.IP_ADDRESS

Basket_Function.MEETING

Copy Member Type to Registrant Class

Enable to determine function fees for event registrants by mapping the registrant class with the customer type and to display the Registrant Class drop-down list on the Event Registration page.

When the Copy Membership Type to Registrant Class option is enabled in the iMIS Event System Preferences window (from Events, select Set up module, and click Preferences), iMIS looks for the registrant class that matches the registrant's customer type when a customer registers for an event. The registrant class is mapped to the customer type if they match. If the registrant class and customer type do not match, then iMIS maps the registrant class according to whether the customer is a Member or Non-Member.

The Copy Member Type to Registrant Class parameter duplicates the functionality of the iMIS option. In addition, the Registrant Class drop-down list also displays on the Event Registration page when the Meet Reg Class Over Ride security filter is enabled (Yes) on the Detail Security page (Admin> Security> Filters). The Registrant Class drop-down list allows logged-in users to select their registrant class when registering for events.

However, some e-Events administrators do not want customers to be able to select or override their Registrant Class when registering for events.

Require User to Select Registrant Class

Enable to require the customer to select a registrant class when registering for an event. This option works only when the Copy Member Type to Registrant Class option is enabled.-

Disable Registrant Class Field

When the Disable Registrant Class Field option is enabled, the Registrant Class drop-down list will be disabled on the Event Registration page; however, the registrant classes that display in the Function Detail section of the Event Registration page will not change. -

Note: The Registrant Class drop-down list displays on the Event Registration page only when the Copy Member Type to Registrant Class option and the Meet Reg Class Over Ride security filter (Detail Security page) are enabled.

Note: In addition to the Disable Registrant Class Field option, the Registrant Class drop-down list also can be disabled by disabling the Meet Reg Class Over Ride security filter on the Detail Security page.

Show Member Type Price Only

Shows the member type price, non-member or member, on the Function Detail window. This only applies when Copy Member Type to Registrant Class is selected.

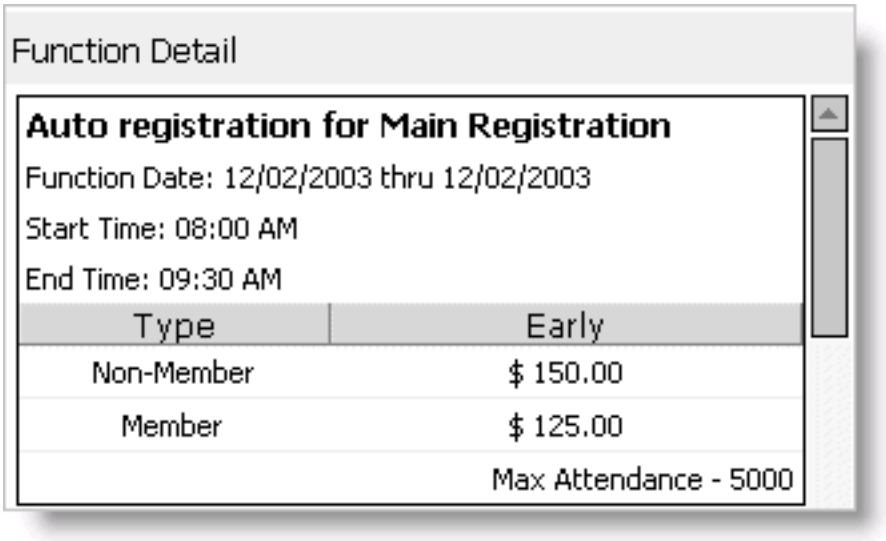
Show Current Date Price Only

Enable to display event function fees according to the date the fees become effective. When this option is enabled, the effective date of event function fees is determined by the following:

1. Early, Regular, and Late function fees defined for a customer's Registrant Class on the Event Function Definition - Fees window in iMIS.
2. Early Cutoff and Reg Cutoff dates defined for the event on the Define an event window in iMIS.

If you have defined Early, Regular, and Late function fees for a customer's Registrant Class, the function fees that display for the registrant on the Event Registration page in e-Series are dependent on the event's Early Cutoff and Reg Cutoff dates.

For example, if a customer registers for an event function before the Early Cutoff date (as determined by the server's system date), only the Early fee defined for the customer's Registrant Class on the Event Function Definition - Fees window displays on the Event Registration page in e-Series.



Example of the Event Registration page when the Show Current Date Price Only parameter is enabled (for a registrant who registers before the Early Cutoff date)

Example of the Event Registration page when the Show Current Date Price Only parameter is disabled

Note: To customize the text that displays for Early, Regular, and Late on the Event Registration page, edit the eEventsConfig.txt file on the Module Config Files page (select Admin> Style Form, and select Edit Config Files).

e-Event Registration ID Field Type

Determines a user's specific registration capabilities when registering for events on the Event Registration page:

- No Field - Enable if you want only a logged in user to be able to register for events. When the No Field option is enabled, the Member ID field on the Event Registration page is not editable.
- Text - Enable if you want users to have the ability to register other users that have valid customer IDs. When the Text option is enabled, the Member ID field on the Event Registration page is editable.
- Select - Enable if you want company members to be able to select and register fellow company members for events. The Select option uses a select statement to populate the Member drop-down list on the Event Registration page (the Member drop-down lists all of the name records that have the same Name.CO_ID that have not registered for the event).

  Note: The Select option is not applicable for anonymous users. If an anonymous user is logged in to e-Series, the Member drop-down list on the Event Registration page will display only that user's name if the Select option is enabled.

e-Event Registration ID Select Argument field

A select statement entered in the e-Event Registration ID Select Argument field populates the Member drop-down list on the Event Registration page. This select statement is only in effect when the Select option is enabled in the e-Event Registration ID Field Type. This select statement is used to further define the list of returned name records.

Enable Duplicate Registration Checking

Enable to activate duplicate registration checking.

Warning for Maximum Registrants

Enable to display a warning when the number of registrants for an event exceeds the limit. Once the limit has been met, potential registrants receive a message stating that the event is full, and they are not allowed to register.

e-Event Function Default Order By

Enter the table name and the column name to sort event functions. Separate multiple column names with commas.

Maximum Rows for e-Event Functions

Enter the maximum number of event functions that will be returned from a search.

Maximum Rows Displayed from e-Event Functions

Enter the maximum number of event functions that will be displayed per page after performing a search.

Maximum Rows for e-Event Meetings

Enter the maximum number of events that will be returned from a search.

Maximum Rows Displayed from e-Event Meetings

Enter the maximum number of events that will be displayed per page after performing a search.

Maximum Time to Cache e-Event Queries

Enter the time limit to specify the length of time that you want ColdFusion to cache queries run through e-Events. The format is CreateTimeSpan(Days, Hours, Minutes, Seconds).

This setting is useful for sites that expect heavy volumes of traffic and that have large and numerous events. When the Event Registration page is opened, several standard and complex queries run in addition to a simple query per function. Constant execution of these queries increases the load on the database server and could result in performance

problems. An alternative is to enable the e-Events cache for an appropriate period of time so that ColdFusion can use the cached queries to build the page and avoid hitting the database.

However, if you are toggling between iMIS and e-Series while setting up a new event with the cache enabled, changes will not be reflected until the cached query has expired. If changes made to your event are not reflected automatically in your e-Series site, either wait for the cache to expire or disable it altogether while you are testing.

To disable the cache, set all of the values to zero: CreateTimeSpan(0,0,0,0).

Early Registration Prompt

Enter the prompt that displays on the Event Registration page reminding customers of the early registration deadline.

Late Registration Prompt

Enter the prompt that displays on the Event Registration page reminding customers of the late registration deadline.

Conflict Code Message

Enter the message that displays when there is a scheduling conflict.

Conflict codes are used in determining conflicts at the time of registration such as date and time conflicts or event content conflicts. Registering for conflicting functions will yield the warning message that you define in this field.

e-Event Edit Message

Enter the message that displays on the Purchase Detail page.

e-Event General Message

Enter the message that displays on the Event Registration page above the event function price list.

Registrant e-Mail Greeting

Enter the message that displays when a customer registers for an event.

Full e-Event Prompt

Enter the message that displays when the event is at registration capacity.

Full Function Prompt

Enter the message that displays when the event function is at registration capacity.

Web Instructions

Enter the message that displays on the Event Registration page if the customer has forgotten to log in or if the customer's login is not recognized by the system.

Sign Up Instructions

Enter the message that displays on the Event Registration page for the link to the Sign Up page.

Log In Instructions

Enter the message that displays on the Event Registration page for the link to the Login page.

Lost Registration Instructions

Enter the message that displays explaining the process to investigate a lost customer registration.

To edit e-Events System Parameters

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to display the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select e-Events to display the e-Events System Parameters page.
6. Enable the desired options.
7. Enter the parameter information in the appropriate fields.

8. Click Update. A message displays confirming that the system parameter information updated successfully.
9. Click OK to return to the Lookup Lists page.
10. Click Update System Variables.
11. Click OK.

    Note: You must click both the Update button on the System Parameters page and the Update System Variables button on the Lookup Lists page for the changes to the system to take place.

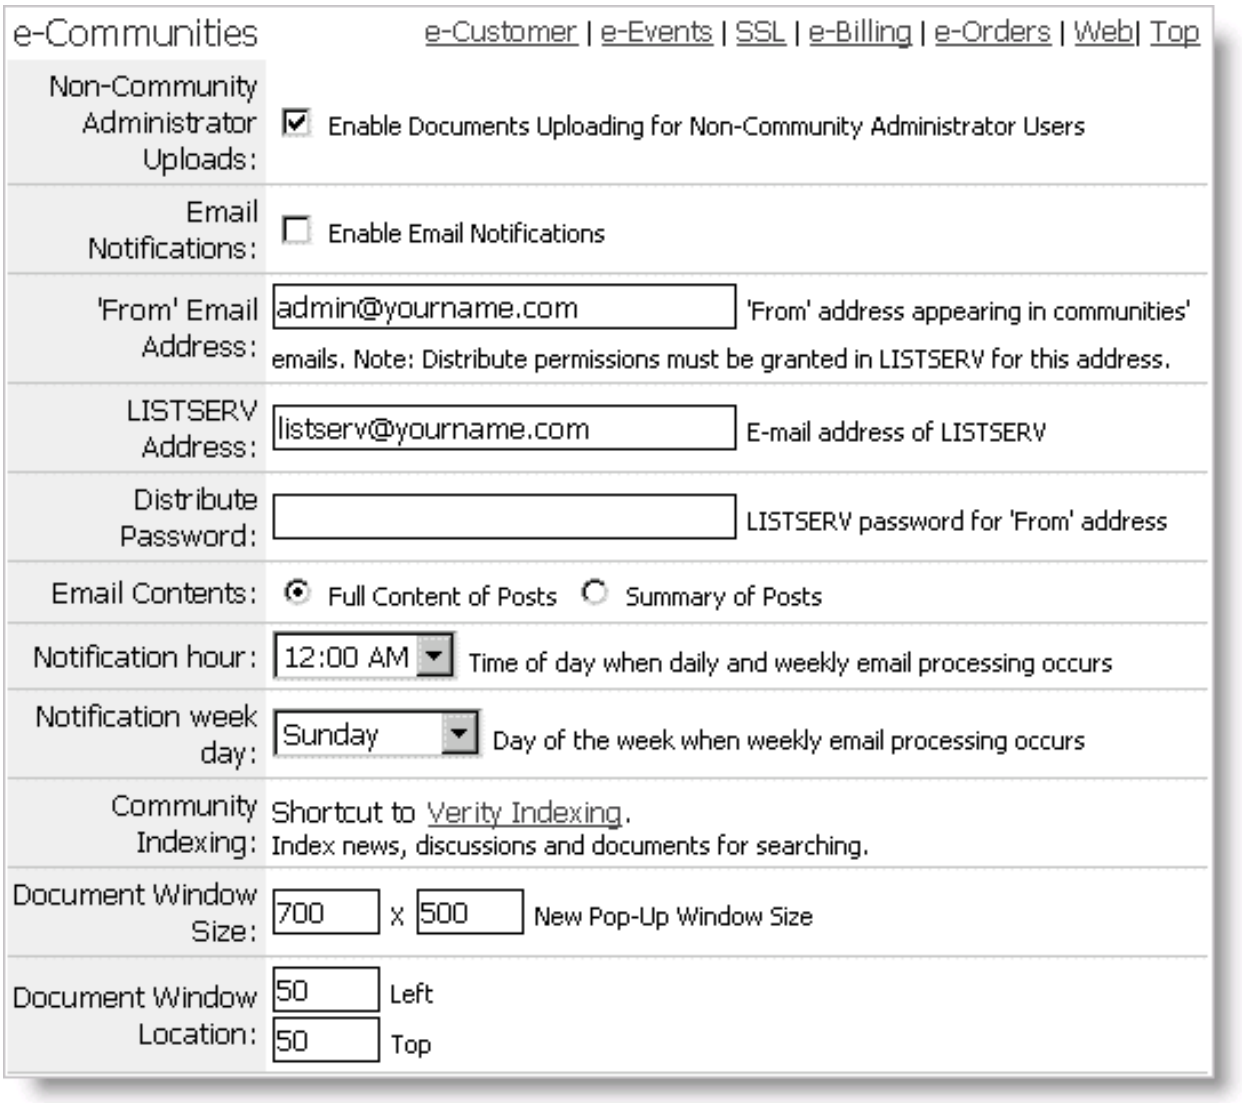
    Hands-on exercise: Set e-Events System Parameters
    Set the following e-Events System Parameters:

- Enable the Enable Duplicate Registration Checking option.
- Enable the Warning for Maximum Registrants option.
- Maximum Rows for e-Event Functions: 100.
- Maximum Rows Displayed from e-Event Functions: 10.
- Maximum Time to Cache e-Event Queries: 0.
- Early Registration Prompt: Early Registration Deadline.
- Late Registration Prompt: Late Registration Deadline.
- e-Event Edit Message: If Meeting Registrations need to be edited, contact our office.
- e-Event General Message: Thank you for your interest in our online events. Contact us if you want to make changes to your registration.
- Registrant e-Mail Greeting: You are registered for the following functions.
- Full e-Event Prompt: This event is full. If you would like to be placed on a wait list, contact us.
- Full Function Prompt: If the function is full, contact us for availability.

- Web Instructions: It appears that you are not a member or that you have forgotten to log in.
- Sign Up Instructions: If you are not currently a member, sign up and submit your information for membership.
- Log In Instructions: If you are a member, login and register for the event.
- Lost Registration Instructions: If you are using Netscape and resize your browser when entering your event registration, the registration may be lost.

Setting e-Communities System Parameters

The e-Communities System Parameters specify information about your communities and how they are displayed in your e-Series site.



Admin> Lookups> System Parameters> e-Communities

Non-Community Administrator Uploads

Enable to allow users to upload documents to the community.

Email Notifications

Enable to notify community members by email of new community items.

From Email Address

Enter the email address that will display as the 'from' address on all emails sent from communities.

LISTSERV Address

Enter the address used to send jobs to LISTSERV.

Distribute Password

Enter the password that matches the password set in LISTSERV. This password is used by LISTSERV to determine if documents received are from a valid user.

Email Contents

Enable the appropriate option:

Full Content of Posts - Enable if you want emails to list the complete contents of all new posts.

Summary of Posts - Enable if you want emails to list a summary of the contents of all new posts.

Notification hour

Select the time of the day when both daily and weekly email notifications are processed (setting this time to a night when activity is low is recommended).

Notification week day

Select the day when both daily and weekly email notifications are processed.

Community Indexing

Select the shortcut to Verity Indexing to open the Collection Actions page and set up Verity Indexing.

Document Window Size

Enter a size for pop-up windows.

Document Window Location

Enter a location for pop-up windows.

To edit the e-Communities parameters

1. Log in to your e-Series site as an administrator (or as a member of a security group that allows browsing and editing of Admin Style Forms).
2. Select Admin in the top navigation bar.
3. Select Admin > Lookups in the side index to open the Lookup Lists page.
4. Select System Parameters to display the System Parameters page.
5. Select e-Communities.
6. Enable the desired options, and enter the parameter information in the appropriate fields.
7. Click Update. A message displays confirming that the system parameter information updated successfully.
8. Click OK to return to the Lookup Lists page.
9. Click Update System Variables.
10. Click OK.

    Note: You must click both the Update button on the System Parameters page and the Update System Variables button on the Lookup Lists page for the changes to the system to take place.

Setting Up e-Communities

Overview of Setting Up e-Communities

The e-Communities module of e-Series provides the framework and applications that allow you to create and manage a wide variety of communities for your organization's website. These communities are areas where visitors with like interests can do the following:

- Browse topics of common interest
- Subscribe to communities
- View community news

- Participate in discussion forums
- Contribute and download shared documents

Community Types

When setting up and customizing the e-Communities module, you can create three different types of communities:

- Public - available to all site visitors including contacts and guests.
  Users that have not logged in may only browse the community, but a login is required to post documents and participate in discussions. This is referred to as 'read-only' access to the community.
- Members Only - available only to members of the association that meet the membership filter requirements.
- By Invitation - available to any contact that the association administrator chooses to add to the invitation list.

The facilities available to users of these communities are identical regardless of community type. However, certain communities are open to the public while others may be available only to dues paying members of the organization. Members and the general public must be logged in to “subscribe” to specific communities, which may give them deeper levels of access and a home page that consolidates news from the various communities they are interested in.

The goal of this section is to give you the knowledge and skills necessary to use the e-Communities module.

After completing this section, you will be able to do the following:

- Manage communities, community e-mail lists, community news items, community discussion forums, and documents
- Set up and maintain Verity indexing
- Schedule Verity collection maintenance

Managing e-Communities

e-Communities can be set up as public or can be made available only to certain members of an organization.

Note: We recommend that you use Internet Explorer to manage your communities. Javascript is used in e-Communities preview windows. Many browsers will have the javascript disabled for security reasons. This will prevent e-Communities from displaying preview windows.

e-Communities Administrators

The following tasks may be performed by a member who is designated as an e-Communities administrator.

- Add members to a community
- Remove members from a community
- Edit a community
- Delete a community
- Search and add other administrators to a community
- Search and remove other administrators from a community
- Create and delete folders
- Start discussion topics
- Edit posts
- All tasks available to ordinary members of a community, such as placing or deleting documents

Note: Only e-Series administrators have permissions to create new communities.

To create a community

- All site visitors can access a Public community. However, users not logged in may only browse a community.

- A Members Only community allows only members in selected chapters, selected committees, or selected member types to access the community. If multiple chapters, committees, or member types are selected, members must be in at least one of the selected chapters, committees, or member types to access the community.

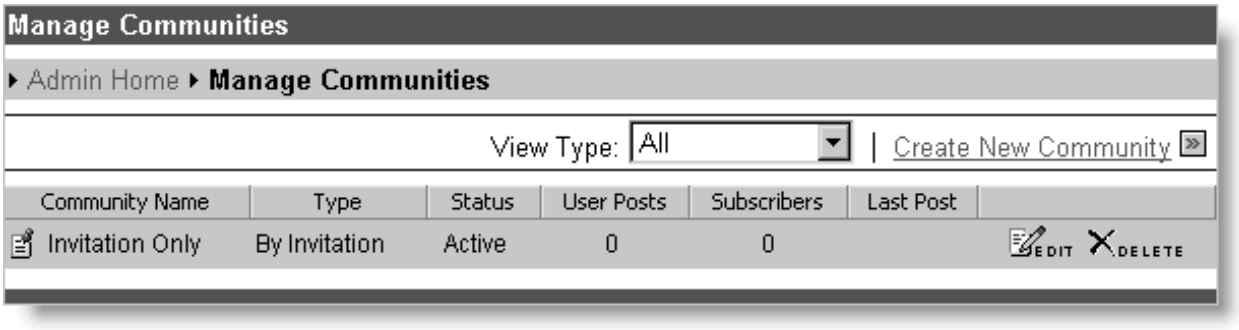
  Members Only communities that are restricted by chapter must have a chapter code listed in the member's subscription record. You can use a SQL Advanced restriction to limit by Name.CHAPTER.

- A By Invitation community allows only those members invited to the community to access the community.

1. Log in to your e-Series site as an administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Create New Community to open the Create Community page.
5. Enter the Title of the community.
6. Enter a short Description for the community. This description displays below the community name on the User Home Page.
7. Click the Status drop-down list and select Active. You may want to set the status to Inactive when first creating a community, and then change the status to Active after everything has been configured.
8. Click the Type drop-down list and select Public, Members Only or By Invitation.
9. (optional) If Members Only, click the Restrict Access By drop-down list and select Chapter, Committee, Member Type, or SQL (Advanced Only). The following field changes depending on the Restrict Access By selection. For example, if you select to restrict access by Chapter, a list of all chapters displays.
10. The Maximum Discussion Topic Age is the number of days after a topic is posted that the topic and comments will display in the View Discussion Topic page. After the maximum

number of days is met, the topic and comments are archived and can only be viewed by an administrator.

11. Click submit.
12. A message indicating that the community was created successfully displays. Click OK.



Manage Communities page

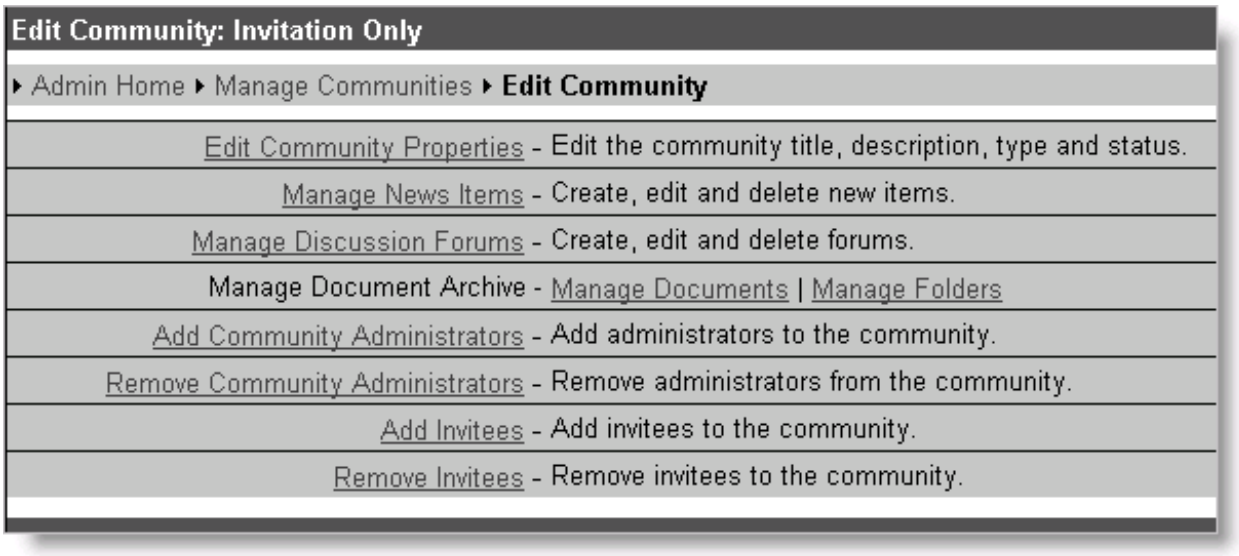
Create a Community page

To add invitees to By Invitation communities

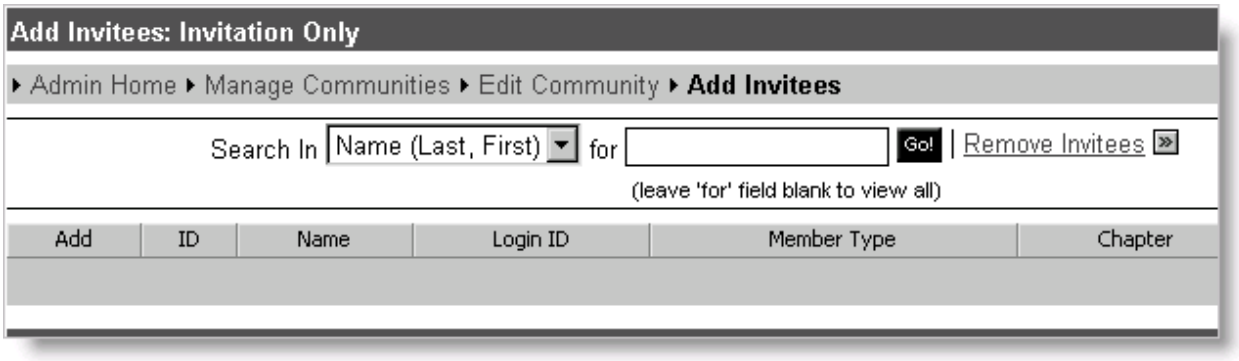
In order to invite members, you will have to search the database and then select the members from the search results.

Note: A web login and password must be created for the user before they can log in as an invitee. Refer to “Assigning Security Logins and Passwords” for more.

1. Log in to your e-Series site as an administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the By Invitation community. The Edit Community page displays.
5. Click Add Invitees.
6. Click the Search In drop-down list and select Name (Last, First), ID, Member Type, or Chapter.
7. (optional) Press Tab and enter specific information you want to search for based on the Search In selection. Leave the field blank to view all records.
8. Click Go. A list of members fitting the search criteria displays on the page.
9. Click the Add checkbox that corresponds to the member(s) you want to add to the list of invitees or click select all to include all members listed.
10. Click add selected. A message indicating that the invitees were added successfully displays.
11. Click OK.
12. (optional) If your list continues on multiple pages and you want to add additional members, click the page number that contains the names of the members you want to invite or click Next to view the next page.



Edit Community: Invitation Only page



Add Invitees: Invitation Only page

To remove invitees from a community list

1. Log in to your e-Series site as an administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the By Invitation community. The Edit Community page displays.
5. Click Remove Invitees.

6. Click the Search In drop-down list and select Name (Last, First), ID, Member Type, or Chapter.
7. (optional) Press Tab and enter specific information you want to search for based on the Search In selection. Leave the field blank to view all records.
8. Click Go. A list of members currently invited to the community displays.
9. Click the Remove checkbox that corresponds to the member(s) you want to remove from the list of invitees or click select all to remove all members listed.
10. Click remove selected.
11. A message indicating the invitees were removed successfully displays. Click OK.

To create a Members Only community with a SQL query

There is an advanced SQL query feature that you can use when creating a Members Only community. The SQL query defines the filter that determines what members have access to the community. For example, you may to create a community for members who live in a particular zip area or in a particular state.

1. Log in to your e-Series site as an administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Create New Community to open the Create Community page.
5. Enter the Title of the community.
6. Enter a short Description for the community. This description displays below the community name.
7. Click the Status drop-down list and select Active.
8. Click the Type drop-down list and select Members Only. Two additional fields display.
9. Click the Restrict Access By drop-down list and select SQL (Advanced).

10. Enter the SQL query in the Member only Criteria field. In the following example, a community has been created for Prodigy employees with the SQL query entered as:
    from Name where Name.COMPANY = 'Prodigy Makers International'
11. The Maximum Discussion Topic Age is the number of days after a topic is posted that the topic and comments will display in the View Discussion Topic page. After the maximum number of days is met, the topic and comments are archived and can be viewed by an administrator.
12. Click submit.
13. A message indicating that the community was created successfully displays.
14. Click OK.

    Note: A system error displays if the SQL criteria is not correct.

    To edit or delete a community

- Editing a community updates the properties of the community.

  Note: When you change the properties, you may be changing the community's membership. If a current member does not meet the criteria defined by the new properties, that member will be excluded, unless the member is a member of the Administrator security group.

- Deleting a community removes all archived documents, discussion forums, and news items. However, a community's corresponding folder in Customer\StaticContent\CmtyStorage is not deleted when the community is deleted.

  Note: Deleting a community does not delete the community's corresponding folder from the CmtyStorage directory.

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.

4. (optional) Click the View Type drop-down list and select the type of communities you want to display.
5. Choose to edit or delete the community.

- To edit, click Edit on the same line that corresponds to the community you want to modify. The Edit Community page displays.
- To delete, click Delete on the same line that corresponds to the community you want to delete. A system message prompts you to verify the deletion of the community.

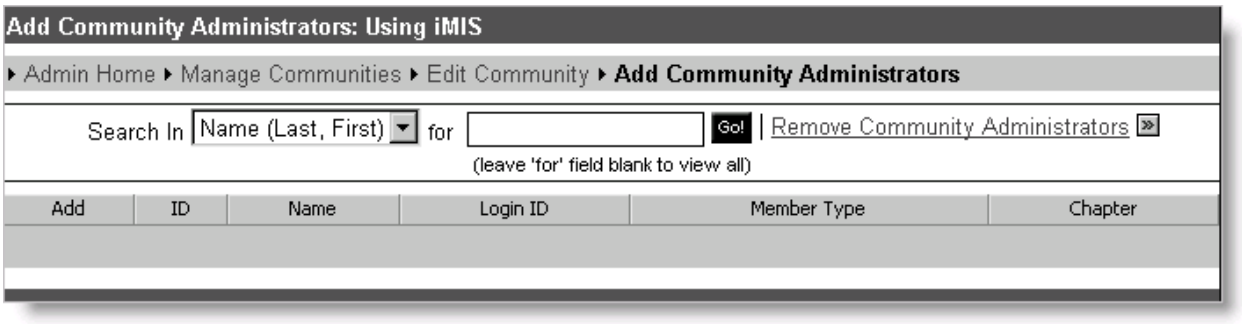
6. Click Edit Community Properties to change the properties of the community. All fields are pre-filled with the current settings.
7. Modify the properties.
8. Click submit. A message indicating the community was updated successfully displays.
9. Click OK.

To add administrators to a Community

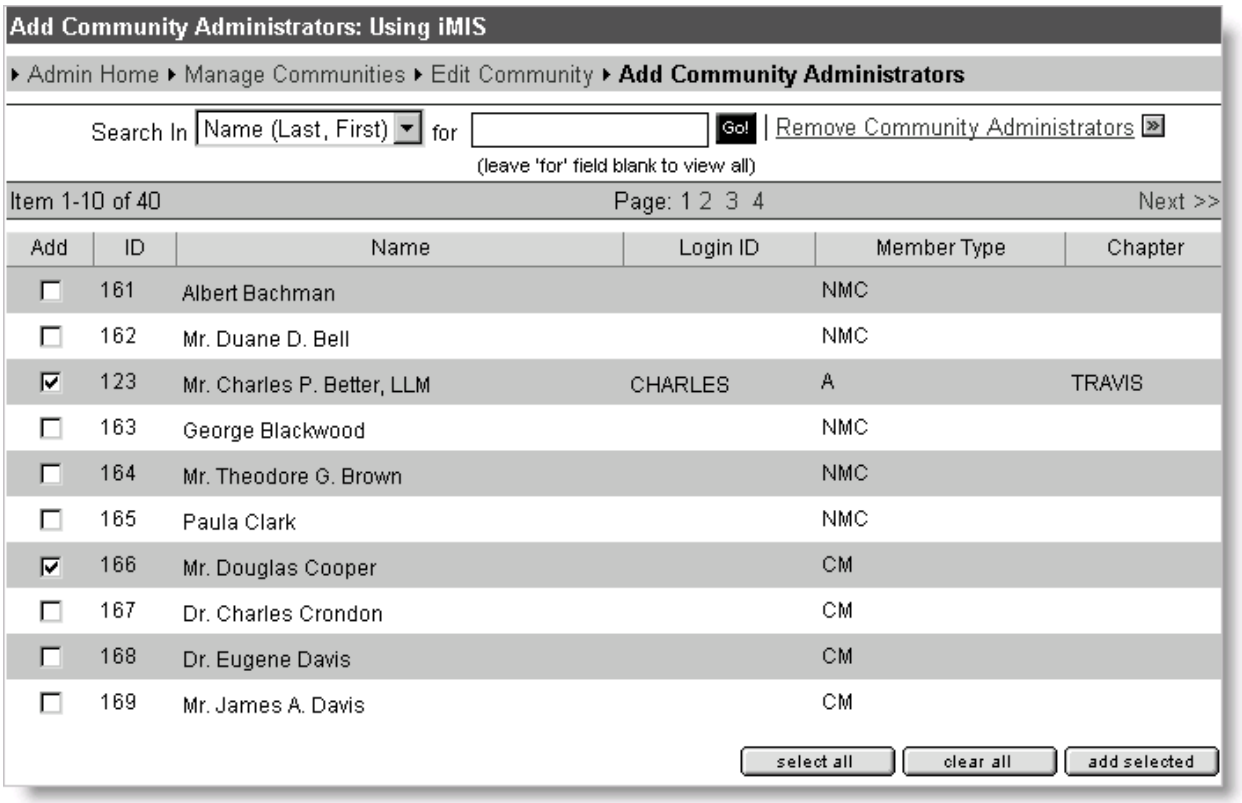
A web login and password must be created for the user before they can log in as a community administrator. Refer to Assigning Security Logins and Passwords (see "Assigning Security Logins and Passwords for e-Series").

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community. The Edit Community page displays.
5. Click Add Community Administrators.
6. Click the Search In drop-down list and select Name (Last, First), ID, Member Type, or Chapter.

7. (optional) Press Tab and enter specific information you want to search for based on the Search In selection. Leave the field blank to view all records.
8. Click Go. A list of members fitting the search criteria displays on the page.
9. Click the Add checkbox that corresponds to the member(s) you want to add as an administrator or click select all to include all members listed.
10. Click add selected.



Add Community Administrators: Using iMIS



Add Community Administrators list

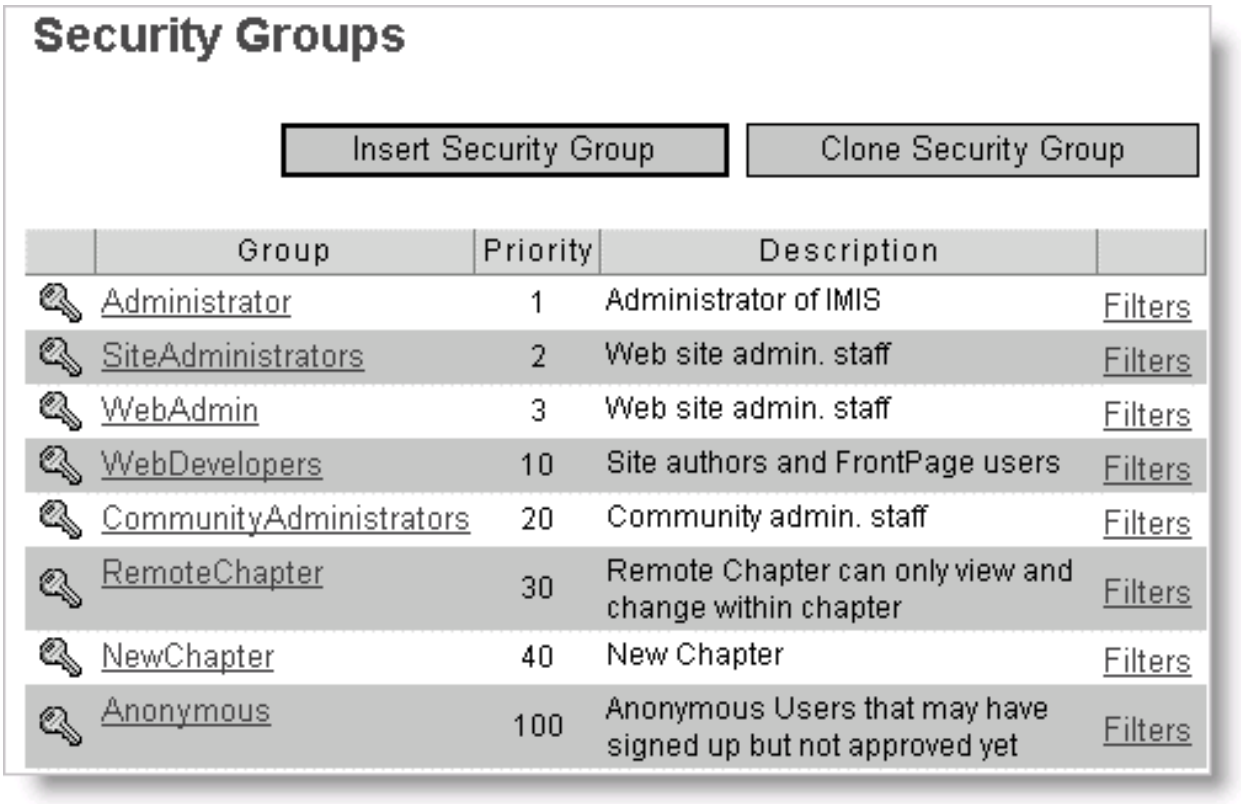
To remove administrators from a Community

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community. The Edit Community page displays.
5. Click Remove Community Administrators.
6. Click the Remove checkbox that corresponds to the member(s) you want to remove as an administrator.
7. Click remove selected.

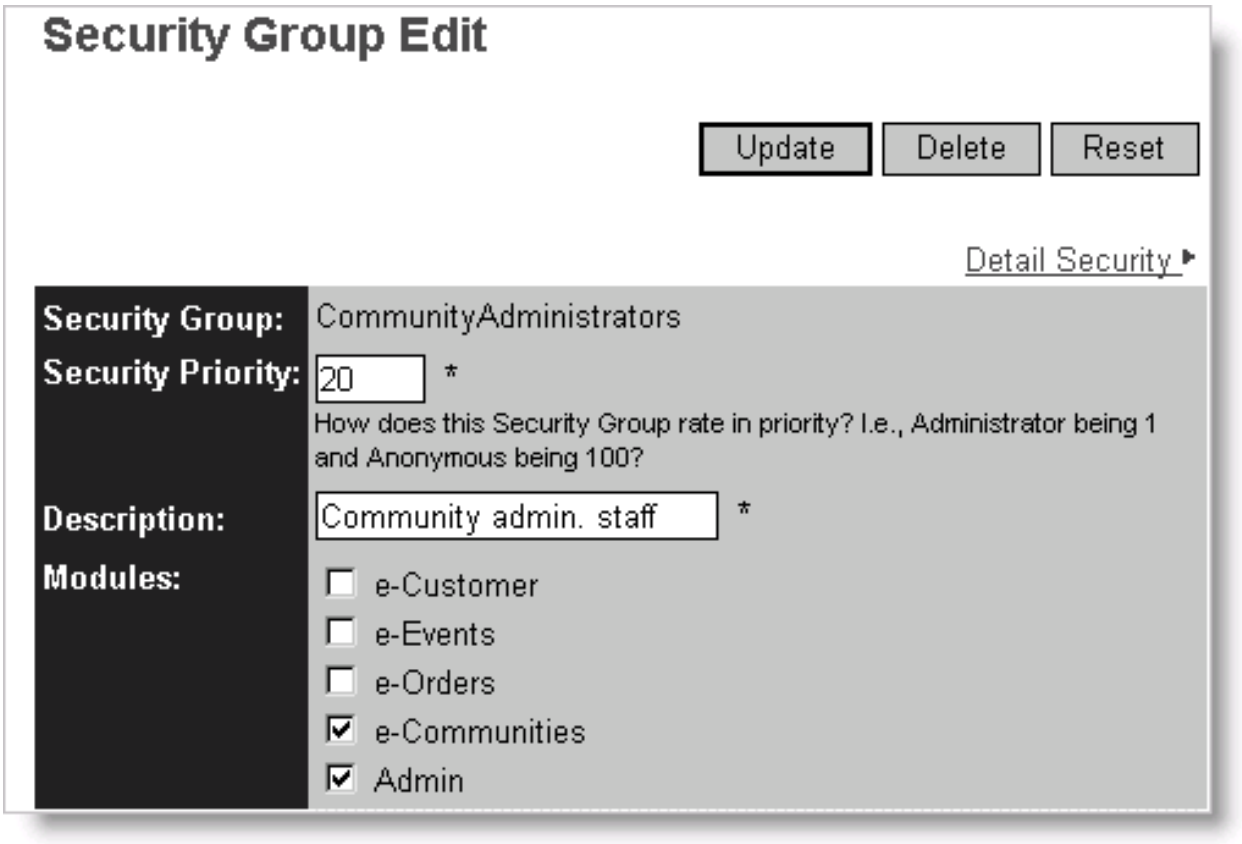
To enable e-Communities for Security Groups

A user will not be able to access e-Communities unless e-Communities is enabled for the security group to which they are assigned.

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Security in the side index to display the Security Groups page.
4. Click the security group name for which you want to enable the e-Communities module.
5. Enable the e-Communities option.
6. Click Update.
7. Click OK.



Security Groups list



Security Group Edit page

Managing community email lists

To simplify managing email lists, an email list management software solution is required. This software is capable of disseminating a single message simultaneously to a group of people and performs several functions that would otherwise have to be managed manually.

Note: If you simply want to use e-Communities as an online forum, you do not need LISTSERV.

e-Communities uses a process that is similar to, but less complicated and more automated, the one described above. e-Communities dynamically creates its own email list from the subscribed users who have set their preferences to send email. This list is then sent to ColdFusion. ColdFusion processes according to the schedule you have defined in the Add/Edit Schedule Task page and the schedule the users have defined in their Global

Preferences page. Depending on the schedule you have set in ColdFusion, the list of users is sent to the email list management software solution (LISTSERV). LISTSERV then distributes the emails to the subscribed users.

The email list management software supported by the e-Communities module is L Soft's LISTSERV (http://www.lsoft.com/)® . LISTSERV is a separate software application that must be purchased separately from L-Soft. L-Soft will determine which version of LISTSERV is required for your organization.

Using LISTSERV with e-Communities

The following list provides some basic information about using LISTSERV with iMIS e-Communities.

- All subscriber information is maintained in the iMIS database.
- All subscribe and un-subscribe operations are handled via the iMIS e-Series web interface.
- The LISTSERV world wide web interface is not used with e-Communities.
- There are no LISTSERV lists per se. All lists are maintained in the iMIS database.

Creating private and public respond email addresses

You can specify a From address for e-Communities email messages that is different than the From address that appears on notifications you send to LISTSERV. The LISTSERV-directed From address is private, keeping these operation more secure.

- The From address for e-Communities email corresponds to the value in the LISTSERV Public Respond Email Address field of the System Parameters page. To display the System Parameters page, go to the Admin area of your e-Series website, then select System Parameters on the Lookup Lists page (see "Setup for LISTSERV addresses for e-Communities").
- The From address for LISTSERV-directed email corresponds to the value in the LISTSERV Private Respond Email Address field.

  If you do not enter a LISTSERV Public Respond Email Address value, the From address field for e-Communities email is blank.

Note: A blank or poorly specified From field can cause email to be rejected by filtering software at the recipient's site.

Separate address for bounced email notifications

You can send bounced email notifications to a separate address. This address is specified in the LISTSERV Bounced Address field on the System Parameters page. If you do not enter a value for this field, the LISTSERV Public Respond Address is used for returning bounced emails.

To set up LISTSERV for e-Communities

Several steps are required in setting up LISTSERV for e-communities. The basic setup procedure is dependent upon the parameters established by L-Soft.

1. Configure and install L-Soft's LISTSERV software in accordance with their installation instructions and guidelines.

   Note: Make sure the DIST_ALLOWED_USERS address in LISTSERV matches the address entered in the 'From' Email Address field of the e-Communities System Parameters page (Admin> Lookups> System Parameters> e-Communities). See Set up the

- Refer to L Soft's documentation (http://www.lsoft.-com/products/default.asp?item=manuals). The specific documentation needed for setting up e-Series with LISTSERV is in the LISTSERV for Windows NT Installation Guide (http://www.lsoft.com/manuals/1.8d/ntinst.html) and the LISTSERV Site Manager's Manual (http://www.lsoft.com/manuals/1.8d/siteindex.html).

2. Verify that the LISTSERV configuration is set up correctly by sending an email to LISTSERV. The address fields can be found in the e (see "Setup for LISTSERV addresses for e-Communities")-Communities System Parameters page (see "Setup for LISTSERV addresses for e-Communities"). (Admin> Lookups> System Parameters> e-Communities).

   If LISTSERV was installed correctly, LISTSERV will send you their most commonly used commands.

1. Register the Distribute password by sending an email to LISTSERV with the email fields populated with the following information:

- To: address shown as the LISTSERV address that was set when you installed LISTSERV. For example, LISTSERV@advsol.com (mailto:listserv@advsol.com).
- From: address shown as the address from where email for the community will be sent. For example, cmmty1@imis.com (mailto:cmmty1@imis.com).
- Subject: (Optional, can be blank) PW ADD Password.
- Body: PW ADD Password
  where Password is the password set in LISTSERV - must match the password entered in the Distribute Password field of the e-Communities System Parameters page (Admin> Lookups> System Parameters> e-Communities).
- LISTSERV will send an email with the subject shown as Command confirmation request with a request for you to “Reply to add password command from listserv.” Click Reply.
- After you reply, LISTSERV will send an email indicating that your new password was registered successfully.

2. Schedule email notifications in e-Communities. .
3. Schedule email notifications in ColdFusion. -.

   LISTSERV Fully Qualified Domain Name (FQDN) for firewalls

   You can setup LISTSERV behind a firewall, but you must use a FQDN. LISTSERV will not run under IP address only. The Mail Server (LSMTP or other) needs a Public FQDN and access to the internet through a firewall.

   To add permissions to the registry to support LISTSERV automated emailing

   Make sure you have secured the ColdFusion Service before you change the following registry key. Refer to the e-Series Guide (Implementation - Securing the ColdFusion Service) for detailed instructions.

The registry is updated every time the ColdFusion Scheduler sends out e-mail notifications; therefore, the CF_Customer needs to have full rights/permissions added to the e-Series registry key. - Emails will not be sent unless CF_Customer has appropriate permissions.

1. Using regedt32, navigate to the following registry key: HKEY_LOCAL_MACHINE\SOFTWARE\Advanced Solutions International\iMIS eSeries.
2. Select Security> Permissions to open the Permissions window.
3. Click Add to open the Add Users and Groups window
4. Click Show Users.
5. Select CF_CUSTOMER from the list of users.
6. Click Add and return to Permissions window. CF_Customer now displays in the window.
7. Enable the Replace Permission on Existing Subkeys option.
8. Select CF_Customer (ColdFusion Customer) and select Full Control privileges to the iMIS eSeries registry key for the CF_Customer.

Managing Community Email Notification Capabilities

The e-Communities module of e-Series allows you to implement email notification capabilities. These capabilities include the ability to integrate and set up a third-party email list management application (LISTSERV) and schedule email notification. E-mail notification processing is based on parameters that both the Administrator and user have defined and applies to:

- News items
- Discussion posts

e-Series administrators have the ability to define parameters used in processing email notification. These parameters interact directly with the parameters the user has established in the Global Preferences page.

Administrators can configure the exact time and day email processing occurs by setting the email Notification hour and email Notification week day in the System Parameters page. The following are the types of email processing the administrator can schedule:

Each - Processes each time the cmtyEmail.cfm is called for each community news item and discussion post. The processing time is defined in ColdFusion, and can occur as often as once every minute.

Tip: We recommend setting Each processing to run once every 15 minutes.

Daily - Processes at a specified time during the day for each community news item and discussion post. Daily processing is defined in the e-Communities page of System Parameters, and occurs at a specified time of the day.

Weekly - Processes on a specified day and time during the week for each community news item and discussion post. Weekly processing is defined in the e-Communities page of System Parameters, and occurs at a specified time on a specified day in the week.

Note: A Registry Time Stamps option has been added to the AppWiz with the default set to No. If you select Yes, existing time stamps will be overwritten and discussion or news items created since the last notification will not be sent.

To schedule email notifications in System Parameters

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to open the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Click e-Communities to display the e-Communities System Parameters page.
6. Enable the Email Notifications option to be able to notify Community members through e-mail.

- This option is disabled by default because LISTSERV must be installed to use this option.
- Failure to enable the option results in no e-mail being sent when using LISTSERV.

7. Enter the 'From' Email Address that will be shown as the “from,” or return, address on all e-mail sent from e-Communities to Community members.

   Note: Distribute permissions must be granted in LISTSERV for this address. This is the same “from” address used by LISTSERV and must be entered exactly the same in both System Parameters and LISTSERV.

8. Enter the LISTSERV Address that will be used to send jobs to LISTSERV. This is the actual e-mail address of LISTSERV.
9. Enter the LISTSERV Distribute Password that matches the password set in LISTSERV. This password will be used by LISTSERV to determine if documents received are from a valid distributed user.
10. Enable the appropriate Email Contents option.
    - Enable the Full Content of Posts option if you want e-mails to contain full contents of posts.
    - Enable the Summary of Posts option if you want e-mails to contain a summary of each post made.
11. Click the Notification hour drop-down list and select the time of day when both daily and weekly e-mail notifications are processed.

    Tip: Setting this to a time at night when activity is lower is recommended.

12. Click the Notification week day drop-down list and select the day of the week when weekly notifications are processed.
13. Click Update. A message displays confirming that the system parameter information updated successfully.
14. Click OK to return to the Lookup Lists page.
15. Click Update System Variables.
16. Click OK.

Note: You must click both the Update button on the System Parameters page and the Update System Variables button on the Lookup Lists page for the changes to the system to take place.

Scheduling Email Notifications for ColdFusion

The e-Series Application Wizard sets up email notification tasks employing the ColdFusion Administrator. You can also schedule e-Community email notifications using the Scheduled Tasks feature in the ColdFusion Administrator, instead of the wizard. Refer to ColdFusion help for instructions on how to find and edit these tasks.

- To change email notifications using ColdFusion Administrator, enter the path to .../Source/communities/cmtyemail.cfm.

Managing Community News Items

Community administrators can post news items that are relevant to a community. A news item is sorted by status (Active or Archive) and by priority (Hot or Normal). A news item can be typed into a text input field or a file (HTM, HTML, or TXT) can be uploaded.

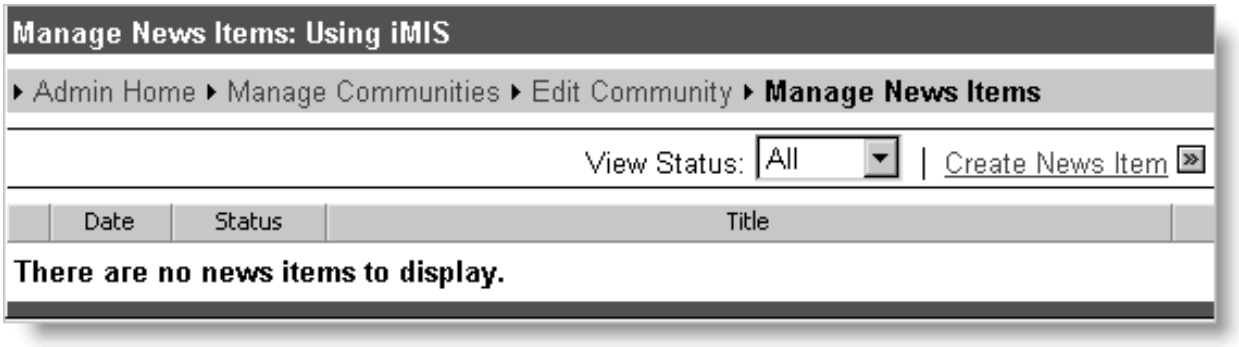
To add news items

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community for which you are adding a news item. The Edit Community page displays.
5. Click Manage News Items.
6. Click Create News Item.
7. Enter the Title of the news item.
8. Click the Priority drop-down list and select:

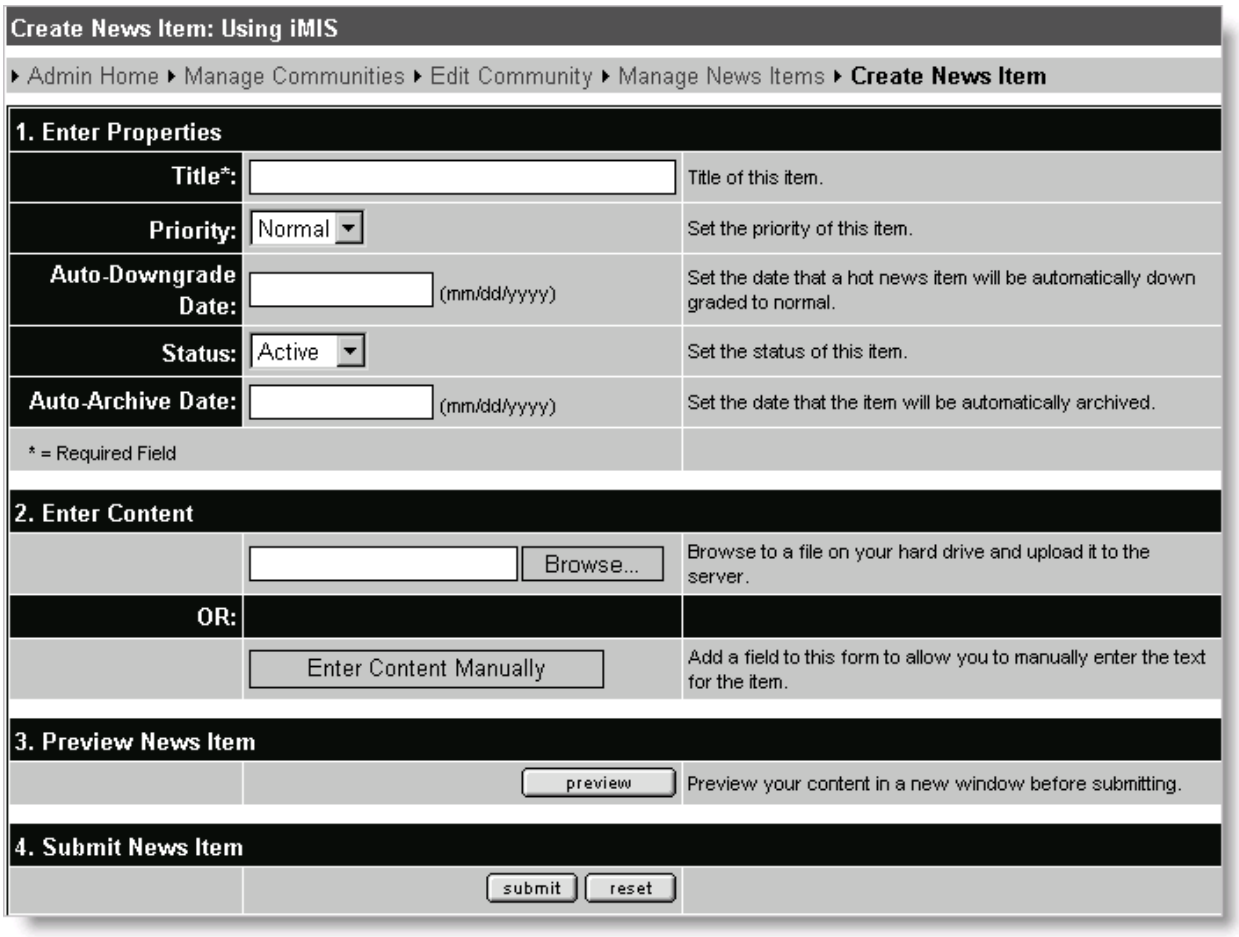
- Normal or
- Hot (a red flag graphic will display on the User Home Page)

9. Enter the Auto-Downgrade Date that the priority for a hot news item should be automatically changed to normal.
10. Click the Status drop-down list and select Active.
11. Enter the Auto-Archive Date when you want the news item to be automatically archived.
12. Enter the news item content.
    - Click the Browse button to locate the file containing the news item. Valid file types are HTM, HTML, or TXT.
      OR
    - Click Enter Content Manually to type or paste the contents. An input text box displays where you can enter or paste the text.

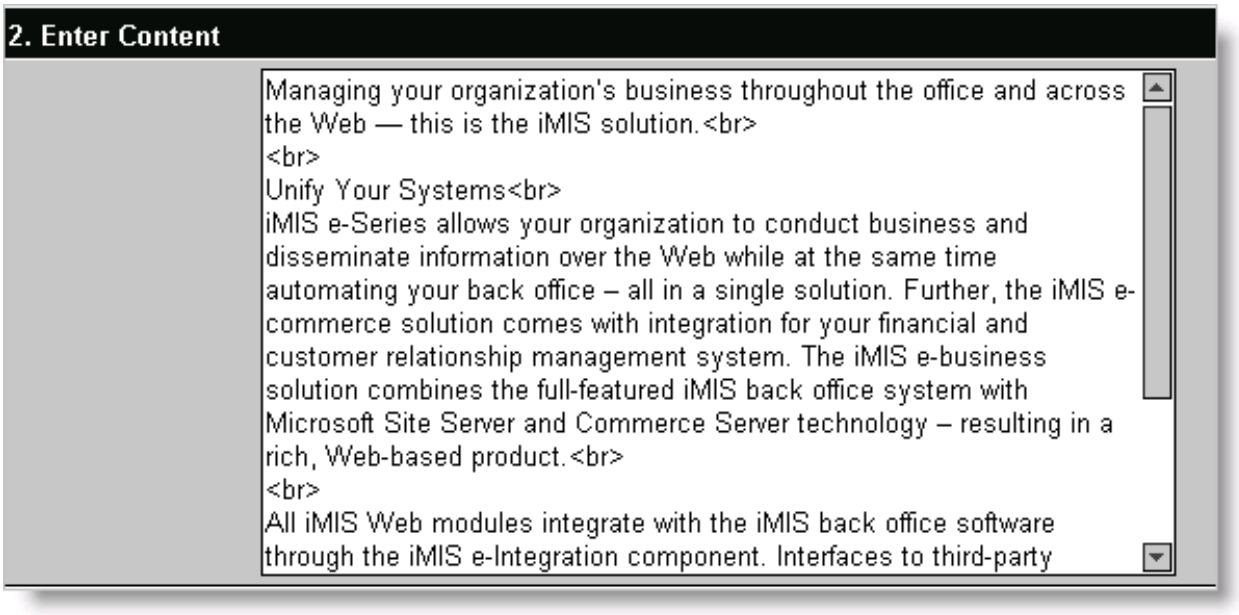
      Note: If you want line breaks to separate paragraphs, make sure to enter <br> to indicate an HTML line break.
13. Click preview. The news item displays in a separate browser window.
14. Click submit when you have completed entering the news item properties.
15. A message indicating the news item was created successfully displays. Click OK.



Manage News Items: Using iMIS page



Create News Items: Using iMIS page



Enter Content page

To add news items with images

A news item can contain images. However, the image is not included in the HTML file until you:

- Copy or upload the image to your server,
- Modify the HTML to include the correct path of the image on your server, and
- Add the HTML file as a news item

1. Copy the image file to your server or use the following procedures to upload the image with e-Series:

   Note: If you upload an image, make sure the image size does not exceed 10 MB. You may encounter difficulty or errors when trying to upload larger files.

- Log in to your e-Series site as an administrator.
- Click Admin> File Upload in the side index to display the File Upload page.
- Click the File Destination drop-down list and select StaticContent--Images.
- Click Browse, navigate to the directory, and select the image file.
- Click Send File to Server. A system message indicating the file was uploaded displays. Click OK.

2. Modify the HTML file to include the URL address where the image was copied or uploaded. For example, http://<your server>/<your site name>/StaticContent/Images/<image file>.

- If you are using Microsoft Word to modify the HTML file, remove the current image. Select Insert> Picture> From File and enter the http address in the File name field. Click the drop-down arrow next to the Insert button and select Link to File. Save your document as an HTML file.

- If you are using Microsoft FrontPage to modify the HTML file, remove the current image. Select Insert> Picture> From File and enter the http address in the URL field. Click OK. Save your document.

3. Add the news item:

- Log in to your e-Series site as an administrator.
- Click Communities in the top navigation bar.
- Click Communities> Manage in the side index to display the Manage Communities page.
- Click Edit on the same line that corresponds to the community for which you are adding a news item. The Edit Community page displays.
- Click Manage News Items.
- Click Create News Item.
- Enter the Title of the news item.
- Click the Priority drop-down list and select Normal or Hot.
- Enter the Auto-Downgrade Date that the priority for a hot news item should be automatically changed to normal.
- Click the Status drop-down list and select Active.
- Enter the Auto-Archive Date when you want the news item to be automatically archived.
- Click the Browse button to locate the HTML file containing the news item.
- Click preview. The news item displays in a separate browser window.
- Click submit when you have completed entering the news item properties.
- A message indicating the news item was created successfully displays. Click OK.

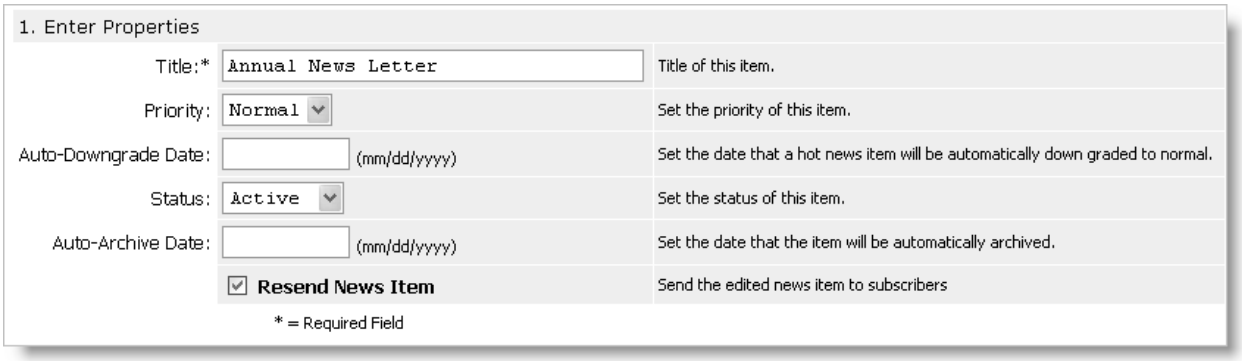
4. Go to the Community Home Page and select the news item. The news item displays on the page.

   To edit news items

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community for which you are editing a news item. The Edit Community page displays.
5. Click Manage News Items.
6. Click Edit on the same line that corresponds to the news item you are editing. The Edit News Item page displays with all fields pre-filled with the current settings.

- If the Priority is changed from Normal to Hot (or from Hot to Normal), the Auto-Downgrade Date automatically clears.
- If the Status is changed from Archived to Active, the Auto-Archive Date automatically clears. The date of the news item is reset only if the news item content is changed.

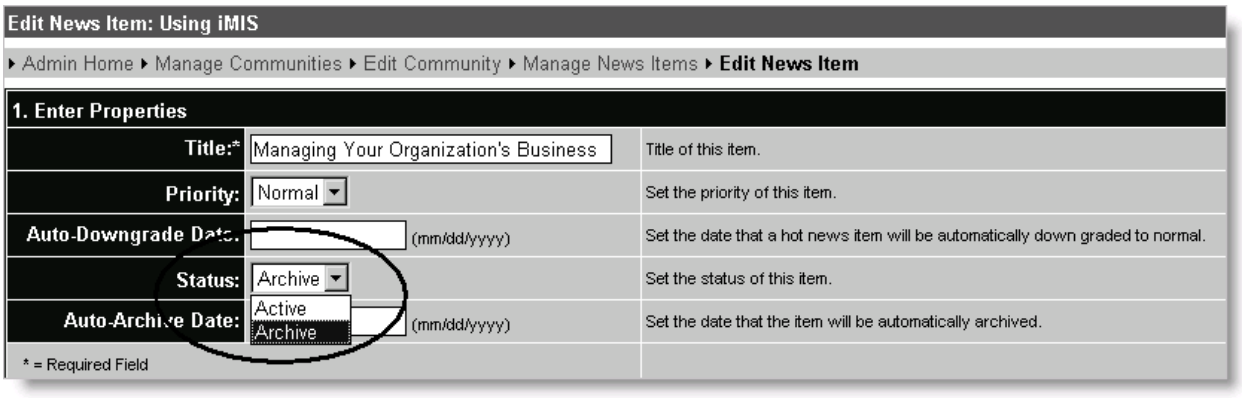
7. Select Resend News Item, if you want to notify the members of the change.
8. Make the necessary changes.
9. Click submit. A message indicating the news item was updated successfully displays.
10. Click OK.



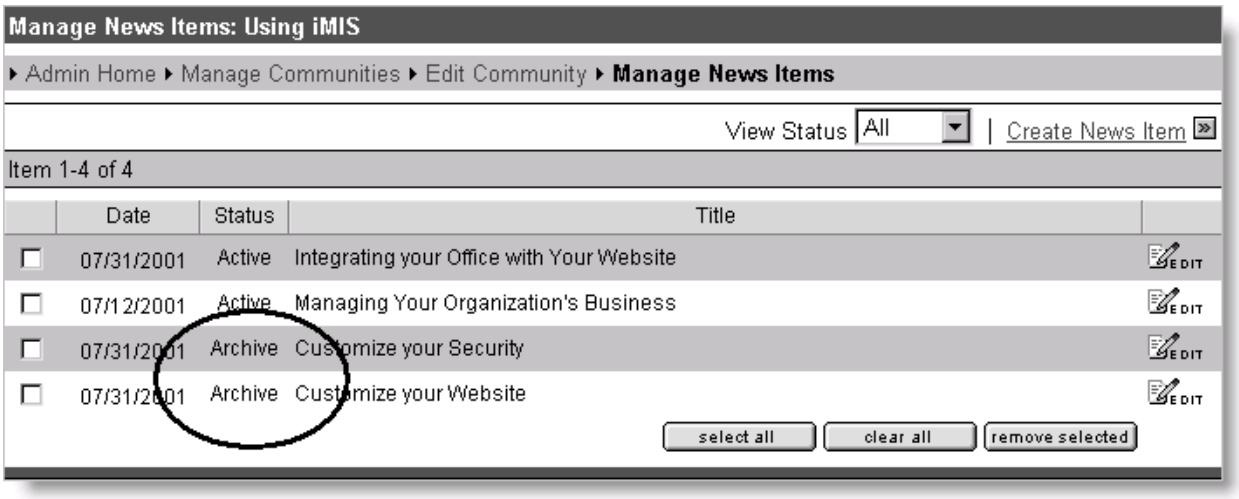
Select Resend News Item option

To archive news items

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community for which you are archiving a news item. The Edit Community page displays.
5. Click Manage News Items.
6. Click Edit on the same line that corresponds to the news item you want to archive.
7. Click the Status drop-down list and select Archive.
8. Click submit. A message indicating the news item was updated successfully displays.
9. Click OK. The status of the news item is updated on the Manage News Items page.



Archive status



New status in list of news items

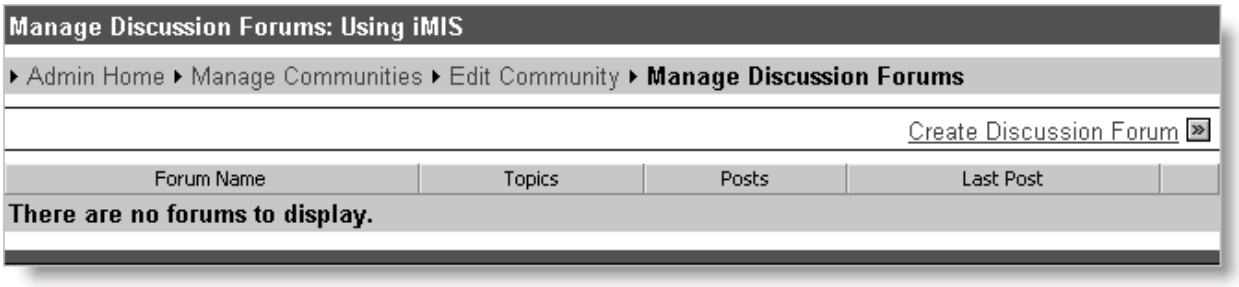
Managing Community Discussion Forums

A forum is a public meeting place where discussions can be held. An administrator creates the forums to which users can later add discussion topics.

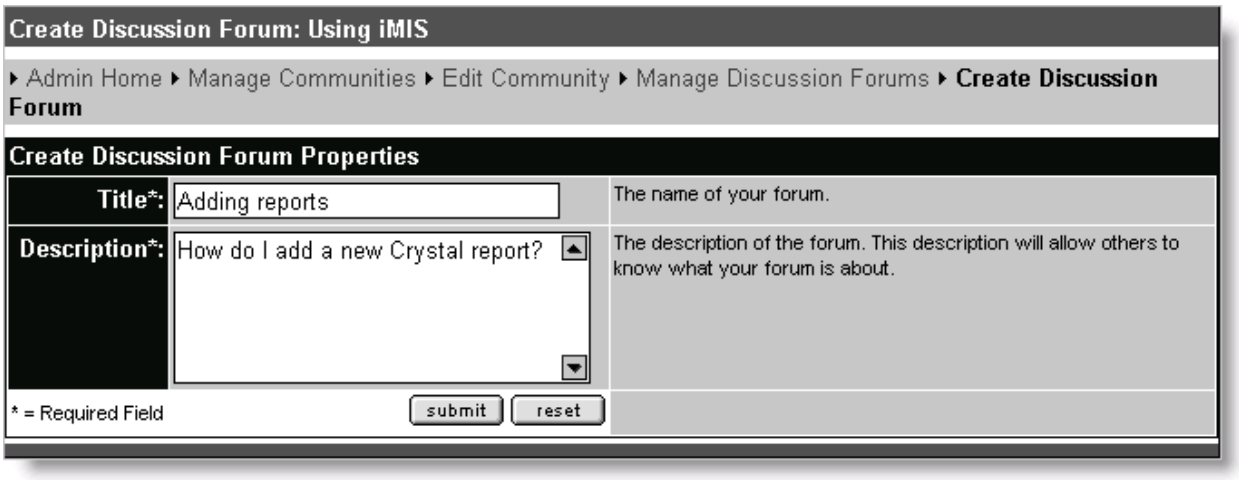
To create discussion forums

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community for which you want to add a discussion forum. The Edit Community page displays.
5. Click Manage Discussion Forums.
6. Click Create Discussion Forum.
7. Enter the Title of the forum.
8. Enter a Description of the forum.

9. Click submit.
10. A message indicating the forum was created successfully displays. Click OK.



Manage Discussion Forums: Using iMIS page



Create Discussion Forum: Using iMIS page

To edit a discussion forum

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community that contains the discussion forum you want to edit. The Edit Community page displays.
5. Click Manage Discussion Forums.

6. Click Edit on the same line that corresponds to the forum you want to edit.
7. Modify the Title or the Description.
8. Click submit.

To delete a discussion forum

When you delete a forum, all discussions posted to the forum are also deleted.

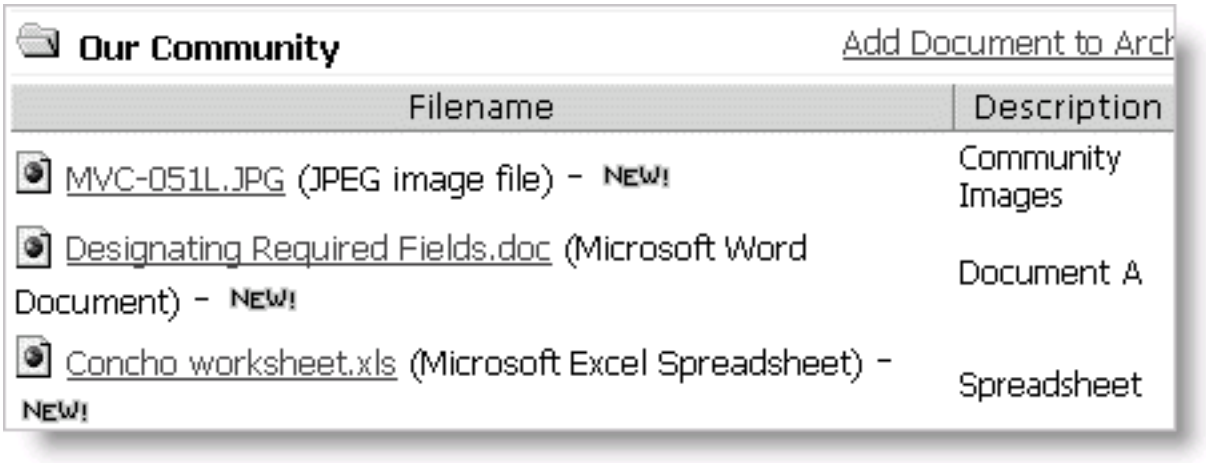
1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community that contains the discussion forum you want to delete. The Edit Community page displays.
5. Click Manage Discussion Forums.
6. Click Delete on the same line that corresponds to the forum you want to delete. A system message prompts you to verify the deletion of the forum.
7. Click OK to delete the forum.

Managing Documents

The Document Archive area of e-Communities enables visitors to view and contribute or download shared documents. The Document Archive displays a document's title followed by the document's type shown in parentheses. For example, a file named My Document.doc will display as My Document.doc (Microsoft Word document).

e-Communities Administrators can modify and add to the list of file type extensions and descriptions recognized by e-Series. This list is located in the eCommunitiesConfig.txt file on the Module Config Files page (select Admin> Style Form, and select Edit Config Files). The application variable (Application.Communities.EditDocProperties.ExtDescriptions) contains a file type's display value as well as the corresponding file extension.

If a file contains an extension value that is not listed in the application variable (or a file does not contain an extension), then e-Communities displays the file with no description.



Example of several document types displayed in a community's View Document Archive

Note: If SSL is enabled for e-Communities, users will not be able to right-click a document in the Document Archive and use the Save As function to save the document. For security, HTTPS (SSL) does not permit caching data on the server. Disable HTTPS for e-Communities if you want end users to be able to right-click on a link to save a document.

To upload or replace a document

When uploading a document, make sure the document size does not exceed 10 MB. You may encounter difficulty or errors when trying to upload larger files. Adding additional physical RAM to the server may help alleviate this problem.

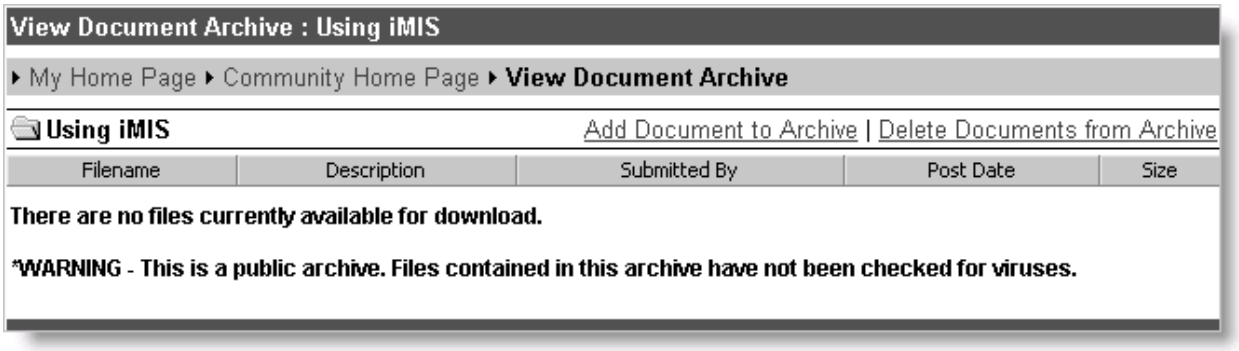
In addition, loading large documents requires the same amount of memory on the ColdFusion server. For example, uploading a 50 MB file will require that 50 MB of memory be available to ColdFusion.

If you want to allow non-administrative users to upload documents, be sure and enable the Non-Community Administrator Uploads option in the e-Communities System Parameters.

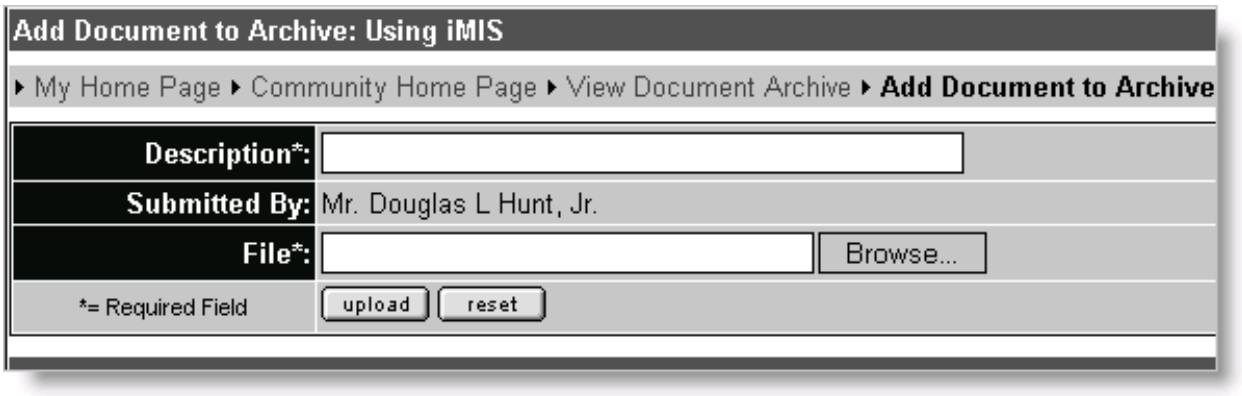
Authorized users also can upload a new copy of an existing file to the Document Archive without first having to delete the original version. When an authorized user uploads a new file, and the uploaded file's name is identical to a file already in the Document Archive folder, e-Communities prompts the user to verify replacing the older file with the new one:

- Replace the original file - e-Communities deletes the original file and saves the new file in the same location.
- Do not replace the original file - e-Communities terminates the upload, and you will need to rename the file before attempting to upload the file again.

1. Log in to your e-Series site.
2. Select Communities in the top navigation bar.
3. Click the appropriate community to display the Community Home Page.
4. Click View complete document archive.
5. Click Add Document to Archive.
6. Enter a Description for the document.
7. Click Browse to locate the file.
8. Click upload.
9. (optional) If uploading a new copy of an existing file, click OK to overwrite the existing file.



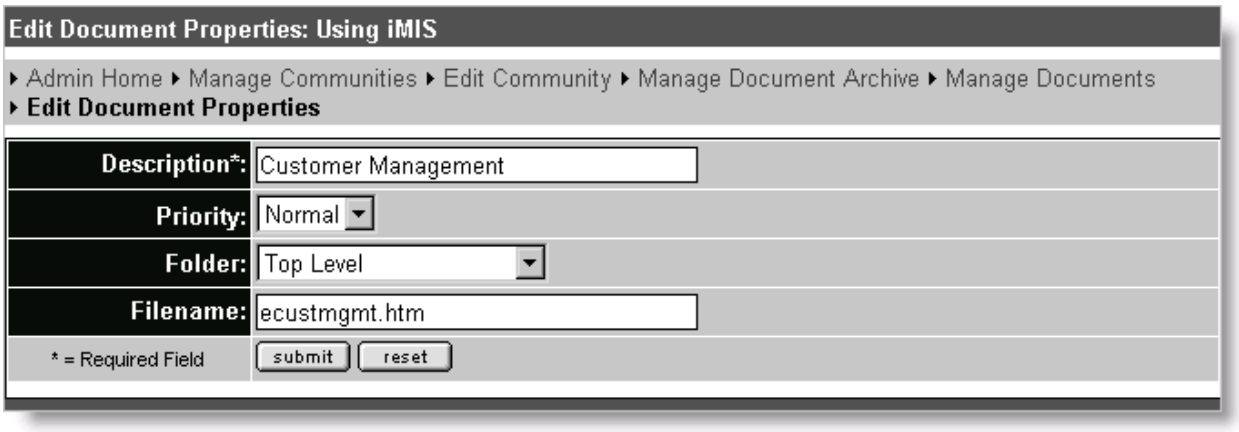
View Document Archive: Using iMIS page



Add Document to Archive: Using iMIS page

To modify document properties

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community for which you are adding a news item. The Edit Community page displays.
5. Click Manage Documents.
6. Click Edit on the same line that corresponds to the appropriate document.
7. Change the Description, if necessary.
8. Click the Priority drop-down list and select Normal or Hot.
9. Click the Folder drop-down list and select the folder in which you want the document placed.
10. Modify the file name, if necessary.
11. Click submit. A message appears stating that the properties were updated successfully.
12. Click OK.

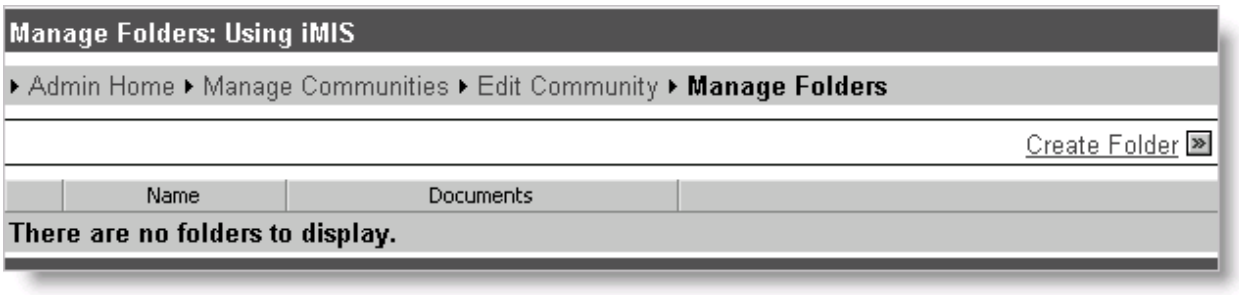


Edit Document Properties: Using iMIS page

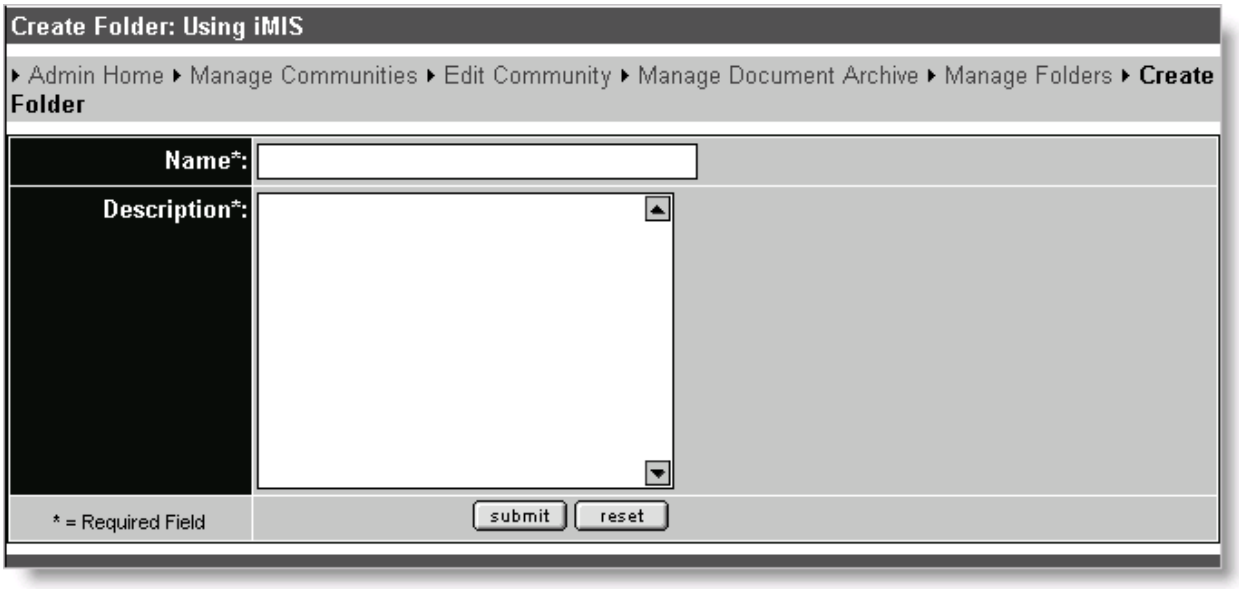
To create a document folder

You can use folders to help organize documents. To avoid problems accessing the folders, create your e-Series document folders as an administrator from e-Series. Do not change or add the folders from the Microsoft operating system.

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community for which you are adding a news item. The Edit Community page displays.
5. Click Manage Folders.
6. Click Create Folder.
7. Enter the Name of the folder.
8. Enter a Description of the folder.
9. Click submit. A message appears that the Document Archive Folder was created successfully.
10. Click OK.



Manage Folders: Using iMIS page



Create Folder: Using iMIS

To modify a document folder

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community for which you are adding a news item. The Edit Community page displays.
5. Click Manage Folders.

6. Click Edit on the same line that corresponds to the folder you want to modify.
7. Modify the folder properties.
8. Click submit. A message appears that the Folder Properties were updated successfully.
9. Click OK.

To create a hierarchical folder structure

e-Communities allows administrators to set up a multi-tiered, hierarchical folder structure for the Document Archive of a community. Authorized administrators can add sub-folders as necessary using standard naming conventions.

No limit exists to the number of nested subfolders you can create. However, folders in the same parent directory cannot have the same name, and files in the same folder cannot have the same name.

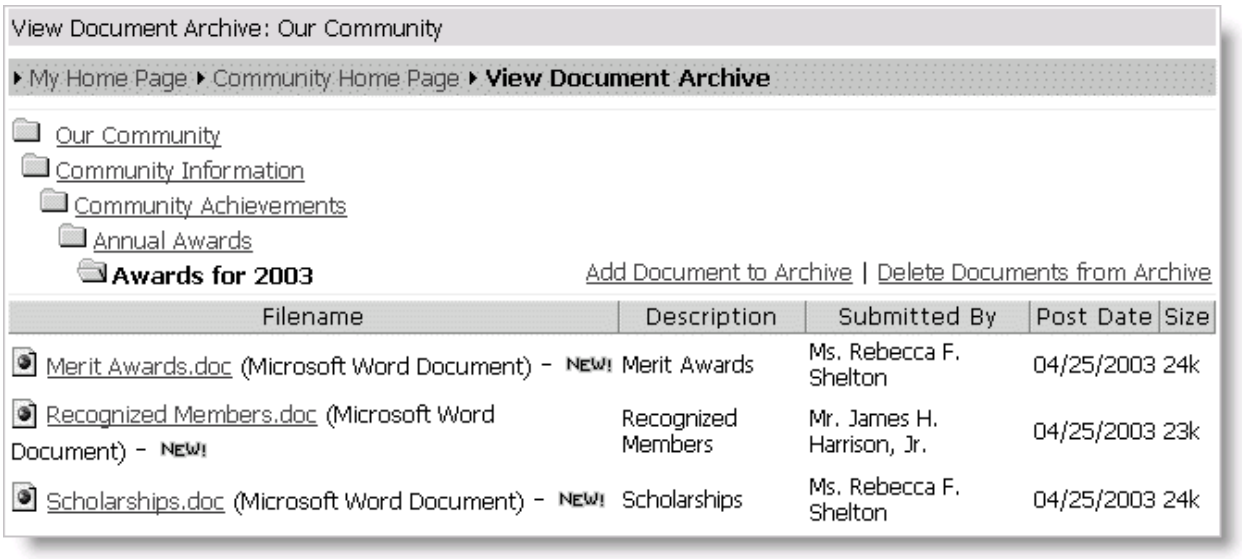
1. Log in to your e-Series site as an administrator.
2. Open the Manage Folders page:

- Select Communities> Manage to display the Manage Communities page.
- Select Edit for the community in which you want to create hierarchical folders to display the Edit Community page.
- Select Manage Folders to display the Manage Folders page.

3. Select an existing folder to display that folder's instance of the Manage Folders page.
4. Create a subfolder:

- Select Create Folder to display the Create Folder page.
- Enter a Name and Description for the folder.
- Click submit to return to the parent folder's instance of the Manage Folders page.

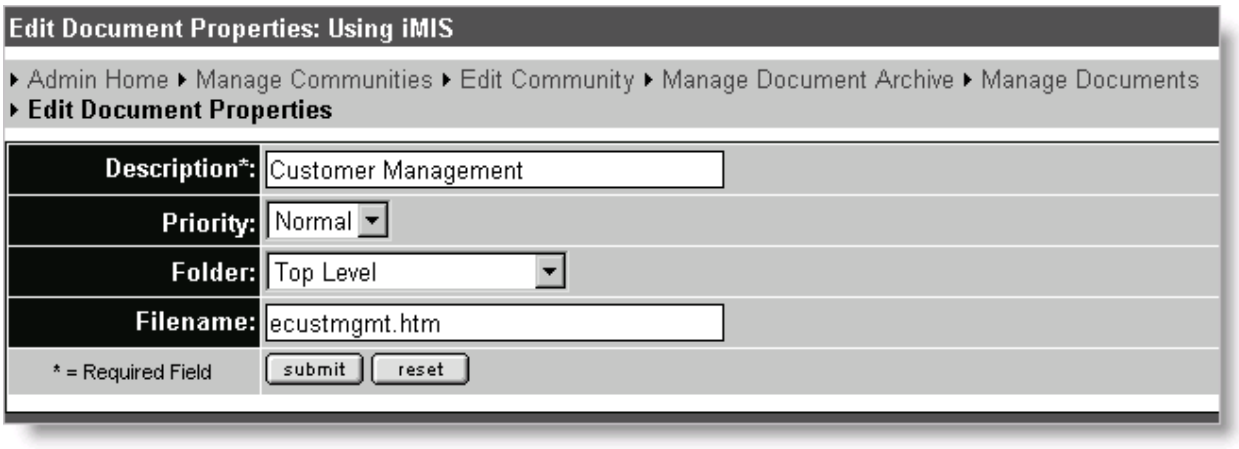
5. Create additional subfolders if needed.



Example of a hierarchical subfolder and its files

To place documents into a folder

1. Log in to your e-Series site as an administrator or as a community administrator.
2. Select Communities in the top navigation bar.
3. Select Communities> Manage in the side index to display the Manage Communities page.
4. Click Edit on the same line that corresponds to the community for which you are adding a document. The Edit Community page displays.
5. Click Manage Documents.
6. On the Manage Documents window, click Edit on the same line that corresponds to the appropriate document.
7. On the Edit Document Properties window, click the Folder drop-down list and select the folder in which you want the document placed.
8. Click submit.



Edit Document Properties: Using iMIS page

To delete a document from the archive

Only the person who uploaded the document to the community or an administrator can delete a document. Use the procedures shown under step 1 if you are the person who uploaded the document. Use the procedures shown under step 2 if you are an administrator.

Use the following steps to delete a document from the archive if you are the person who uploaded the document:

1. Log in to your e-Series site.
2. Select Communities in the top navigation bar.
3. Click the appropriate community to display the Community Home Page.
4. Click View complete document archive.

- If the document is listed in the top half of this page, click Delete Documents from Archive. If the document is listed in a folder, click the folder to open the View Document Folder page, then click Delete Documents from Archive. The Delete Documents from Archive page displays.

5. Click delete on the same line that corresponds to the document you want to delete. A system message prompts you to verify the deletion of the document.

6. Click OK to remove the document from the Document Archive. The file no longer displays in the Document Archive, but still exists and can be uploaded later.

   To delete a document from the archive as an administrator

   Use the following steps to delete a document from the archive if you are an administrator.

1. Click Admin in the top navigation bar.
2. Click Admin> Communities in the side index to display the Manage Communities page.
3. Click Edit on the same line that corresponds to the community for which you are adding a news item. The Edit Community page displays.
4. Click Manage Documents.
5. Click the checkbox located to the left of the document to select the document you want to delete.
6. Click remove selected.
7. A message indicating the document was deleted successfully displays. Click OK.

Setting up Verity Indexing

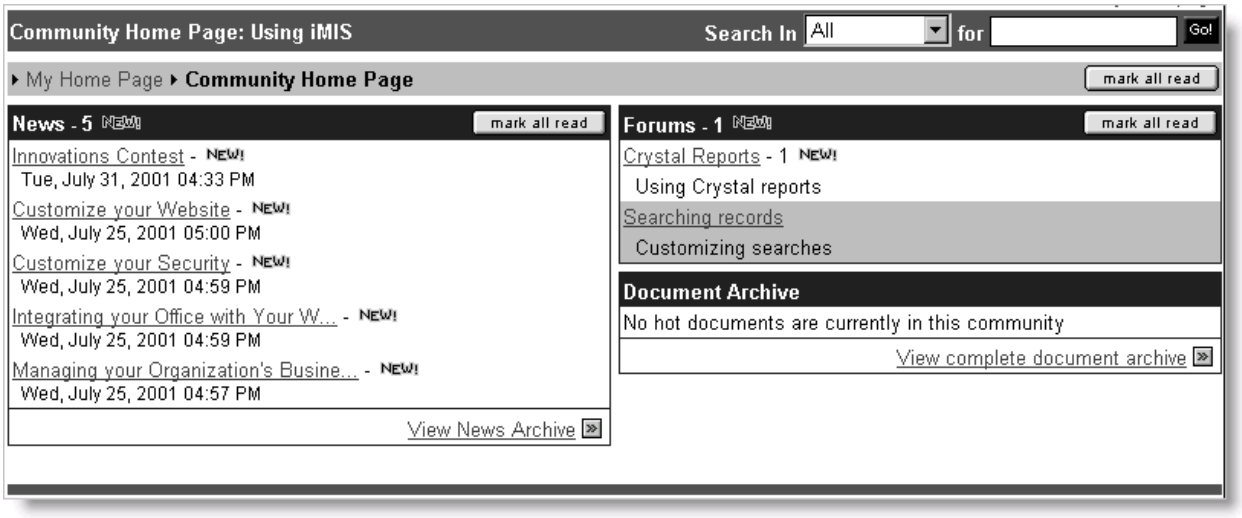
During setup, Verity indexes data into a collection. This collection is a set of files that represents a group of files optimized for searching. The specific information stored in this collection includes the following:

- Various word indexes
- An internal documents table containing document field information
- Pointers to the actual document files for file and path indexes

When the Communities collection is created, the storage location is server:\e-Series\Customer\StaticContent\, and the default collection name is CmtyStorage_Index.

Once the CmtyStorage_Index collection is created, it will be populated from shared files, news items, and discussions added through e-Communities.

The community search fields will be available only if the CmtyStorage directory is indexed by Verity and the CmtyStorage_Index directory is created successfully. If the CmtyStorage_Index directory is not created successfully, the community search fields will not be available in the Community Home Page.



Sample Community Home Page with the community search fields available

If the CmtyStorage_Index collection is deleted from the ColdFusion Administrator interface or the e-Series Verity interface, or, if the CmtyStorage_Index directory is deleted from the file system, the search fields will not be available to use for searching.

To create the CmtyStorage_Index directory

1. Log in to the e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to open the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Click e-Communities to open the Communities page.
6. Click Verity Indexing to open the Collection Actions page.
7. Click Create from the top menu to create the CmtyStorage_Index directory.

- Verity automatically creates the CmtyStorage_Index directory.
- Once created, the CmtyStorage_Index directory populates from shared files, news items, and discussions added through e-Communities.

8. Verify that the CmtyStorage_Index was created by looking at the Last action in the Collection Actions page.

   Note: If the CmtyStorage_Index directory is not created successfully, the community search fields will not be available in the Community Home Page.

Maintaining Verity Indexing

The maintenance requirements of a Verity collection are dictated by the amount, frequency, and type of changes that occur in the records. When site activity is high and users are making frequent and voluminous changes to data, such as posting new documents and discussion comments, maintenance requirements increase.

Perform the following maintenance tasks to maintain data integrity within the CmtyStorage_Index directory and to ensure Verity Indexing of e-Communities functions efficiently:

- Update
- Refresh
- Repair
- Optimize
- Delete

To update the CmtyStorage_Index directory

Updating the CmtyStorage_Index directory performs two functions:

- The collection is repopulated with changed and/or new records
- A key is added if one is not part of the collection

Note: Updating the CmtyStorage_Index directory does not delete records that have been deleted from the data source.

1. Log in to the e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to open the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select e-Communities to open the Communities page.
6. Click Verity Indexing to open the Collection Actions page.
7. Click Update to update the CmtyStorage_Index directory.

To refresh the CmtyStorage_Index directory

Refreshing the CmtyStorage_Index directory deletes all of the data and re-populates the collection.

1. Log in to the e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to open the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select e-Communities to open the Communities page.
6. Click Verity Indexing to open the Collection Actions page.
7. Click Refresh to refresh the CmtyStorage_Index directory.

To repair the CmtyStorage_Index directory

Repairing the CmtyStorage_Index runs internal Verity routines that fix corrupted records.

Note: If you suspect a collection has become corrupted, it is probably safest to delete and then recreate it.

1. Log in to the e-Series site as an administrator.

2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to open the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select e-Communities to open the Communities page.
6. Click Verity Indexing to open the Collection Actions page.
7. Click Repair to repair the CmtyStorage_Index directory.

   To optimize the CmtyStorage_Index directory

   Optimizing the CmtyStorage_Index directory condenses the indexed data for better performance. This procedure is similar to database optimization and can be used as part of routine maintenance.

1. Log in to the e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to open the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select e-Communities to open the Communities page.
6. Click Verity Indexing to open the Collection Actions page.
7. Click Optimize to optimize the CmtyStorage_Index directory.

   To delete the CmtyStorage_Index directory

   Deleting the CmtyStorage_Index directory deletes the entire collection. If you believe the data within your collection is corrupted, or, if Verity Indexing is not responding to performed maintenance tasks, you may want to simply delete and recreate the CmtyStorage_Index directory.

1. Log in to the e-Series site as an administrator.

2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to open the Lookup Lists page.
4. Select System Parameters to open the System Parameters page.
5. Select e-Communities to open the Communities page.
6. Click Verity Indexing to open the Collection Actions page.
7. Click Delete to delete the CmtyStorage_Index directory.

   Note: Once the CmtyStorage_Index directory is deleted, the community search fields will no longer be available in the Community Home Page. The CmtyStorage_Index directory will have to be recreated for the search fields to become available.

Displaying User-Defined Fields in e-Series

Security filters are available for controlling the display and functionality of user-defined fields in e-Series. For new sites, the wizards and triggers are modified to build new security filters for user-defined fields. For existing sites, run the Update_Security_Cursors script to add the user-defined tables and fields.

Naming User-defined Fields

When naming user-defined fields that have similar names (such as MRM_CAMP_DATE and MRM_CAMP), do not use names that end in _integer, _float, _range, _date, _time, or _eurodate if the fist custom field is a checkbox.

To export custom windows to a report

The export utility includes the option of exporting Custom Windows (or User Defined) fields.

Edit the CustomReport.cfm file to select custom fields contained in the custom windows Export file. This file is found in the following directory.

1. \ScriptContent\Reports\Custom Report.cfm

   As an administrator or member of a group with a member export filter,

1. Perform a search.
2. From the search results window. Click Export.
3. Click Custom View Report.
4. On the Export Results window, click Custom Window Export. The Export Results window displays the report.

   Custom Window Export CustomReport.cfm file

   The custom window export uses a customizable file, ScriptContent\Reports\CustomReport.cfm, that allows a single table name and x number of fields to be exported. Any table that can be joined with the Name table can be used with the custom export.

   An AND statement can be hard coded into the select statement that exports the record set. This provides additional control of report output. There are two options. You can specify a field, or you can create a ColdFusion variable for the value of the query criteria. The CustomReport.cfm file is annotated and provides an example of how to use the new field.

   Note: Since the custom export is using a user configurable file, security filters do not apply to the data export.

Defining Lookups

Overview of Defining Lookups

This section includes the system settings that are set up through the Lookup Lists page.

The goal of this section is to give you the knowledge and skills necessary to manage and administer the Lookup options.

After completing this section, you will be able to do the following:

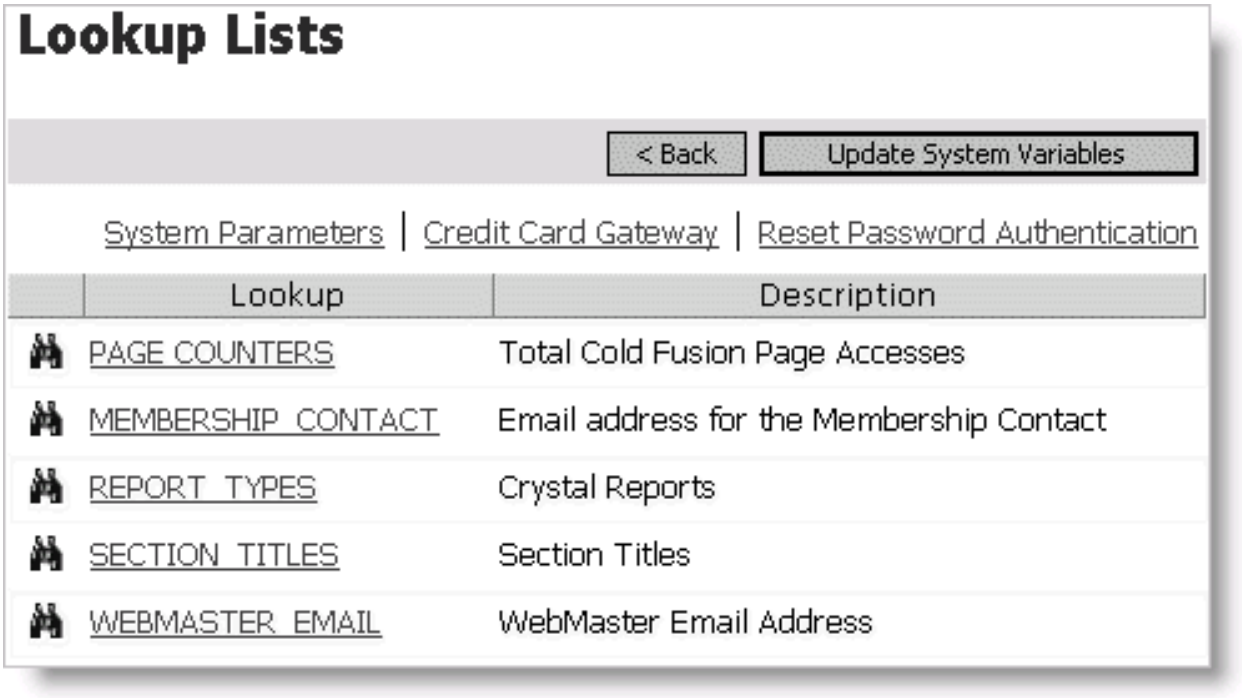
- Configure and manage Lookup options
- Verifying the Credit Card Gateway

- Resetting Password Authentication
- Insert organization contacts

Configuring and Managing Lookup Options

An important administrative tool in e-Series is the ability to configure the Lookup options. With the Lookup options, you can set parameters for the items you want to track in e-Series. View the Lookup options in the Lookup Lists page.

Lookup Lists page



Admin> Lookups

System Parameters

System Parameters set module-wide and site-wide functions.

Credit Card Gateway

Select to open the Credit Card Authorization Options window used for enabling PayPal and verifying the gateway connection.

Reset Password Authentication

Select to open the Reset Password Authentication page used for selecting the fields users are required to populate when resetting their passwords.

PAGE_COUNTERS

Page Counters allow the administrator to see which ColdFusion pages have been visited and how many times. This information is not visible to Web customers.

ACTIVITY_TYPES

Activity Types allow you to track system-defined and user-defined member activities.

CHAPTER

Create chapters and up to three sub-groupings of chapters for your organization.

COMMENT_TYPES

Comment Types allow you to respond to, delete, and archive comments submitted by customers. Comments are stored in the database. Follow-up and staff notification email messages are sent when comments are received.

COUNTRY

Insert country names.

MEMBER_TYPES

Insert member types and enter descriptions.

PAY_TYPES

Set up and track various payment types such as credit cards and cash.

RELATIONSHIP_TYPES

Define and track the types of relationships that can exist between one customer and another.

STATE

Insert state or province names.

CATEGORY

Create special billings or other categories that can be assigned to chapters.

CONTACT_SERVICES

Create codes for specific types of services such as PRINT for printers.

GL_ACCOUNT

Specify the GL Account to be used.

MEET_REG_CLASS

Insert event registration classes and enter descriptions.

MEMBER_STATUS

Insert member statuses and enter descriptions.

MEMBERSHIP_CONTACT

Enter the email address for your organization's Membership contact.

PREFIX

Insert name prefixes and enter descriptions.

REPORT_TYPES

Insert report types and enter descriptions.

SECTION_TITLES

Insert titles for page areas and enter descriptions.

SOURCE_CODE

Insert codes for source of order and enter descriptions.

SUFFIX

Insert name suffixes and enter descriptions.

TITLE

Insert name titles and enter descriptions.

WEBMASTER_EMAIL

Enter the email address for your organization's Webmaster contact.

Notes about the Lookups feature

- The Lookups feature in e-Series is very powerful, so allow only a few people in the organization to insert and edit the Lookup options.
- Inserting a new chapter with the e-Series Lookup option actually adds new chapters into the iMIS database; therefore, you should add new chapters only in the iMIS Set up chapters window (Customers> Set up tables > Chapters) and not in e-Series.
- Although you can add new member types in e-Series, those changes will affect the iMIS database. We recommend that you do not edit or change a member type in e-Series.
- A Category List can be added in e-Series, but it should not be edited or deleted.
- Do not use a space in the name of an activity type. The system will not accept it.
- The e-Series System Parameters go into the iMIS System Parameter tables.
- The Address One value is set in iMIS and should not be edited in e-Series.
- The Organization Name is the default Org Name in iMIS.
- The Functional Title is the default in iMIS.
- The GL_ACCOUNT in e-Series is the real GL account.
- The Hold Code is not supported in e-Series.
- Title is not supported in e-Series.
- The Max Number of Rows Displayed option is available to save your server's resources during large search requests.
- A search that produces more than 10,000 records generates an error message.
- The Major Key value pulls from iMIS.
- Several items in the Lookup options should be edited only if you are configuring an e-Series site without iMIS. These include:

- System Parameters - Several System Parameter fields should not be edited in e-Series because changes made to those fields affect the iMIS database.
- Member Types
- Chapter
- Country
- Pay Types
- Relationship Types
- State
- Category
- GL Account
- Meet Reg Class
- Member Status
- Prefix
- Source Code

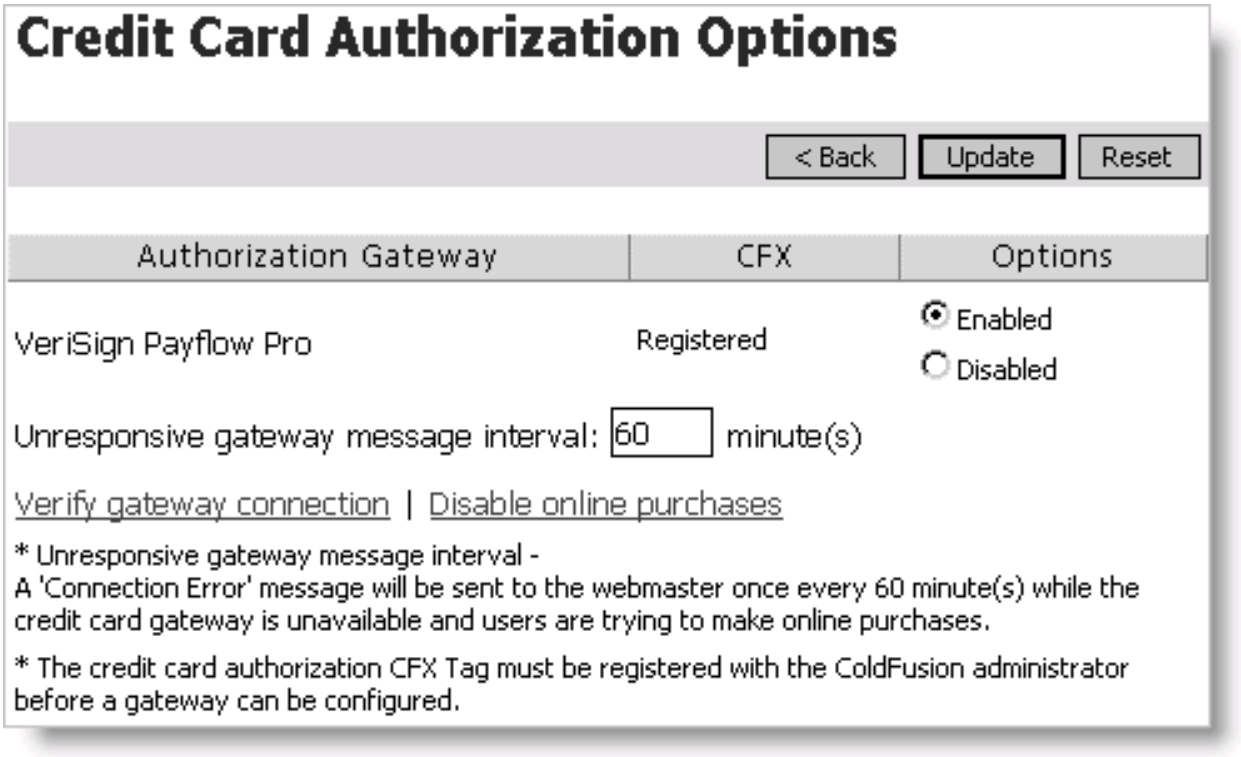
The other Lookup options are safe to edit in e-Series with or without iMIS Business Framework.

Verifying the Credit Card Gateway

You can test and verify the connection between your e-Series site and the gateway to ensure credit card transactions process successfully. When credit card transactions do not process successfully, webmaster notification is sent by email when a customer is making a purchase and the gateway is unavailable. Logic in the CCValidation.txt file tests the connection before starting an online transaction. If the connection fails, an email message is sent to your site's webmaster.

The interval between email messages sent to the webmaster can be set in minutes when the gateway is unavailable and customers are trying to make purchases. When the

gateway is unavailable, you can disable online purchases until the gateway can be re-established.



Example of the updated Credit Card Authorization Options page (from Admin, select Lookups> Credit Card Gateway)

Authorization Gateway

Enable or Disable your site's authorized credit card gateway.

Unresponsive gateway message interval

(Default is 60 minutes) Enter the interval in minutes between emails sent to the web-master when the credit card gateway is unavailable and customers are trying to make pur-chases. For example, if the interval is set to 60 minutes, 60 minutes will elapse between the emails that are sent automatically to the webmaster each time a customer tries to make a purchase when the gateway is unavailable.

Verify gateway connection link

Select to verify the connection to the credit card gateway. When the credit card gateway connection is verified, a message displays stating that the connection was verified successfully. If the credit card gateway connection is not verified, a message displays stating that the connection was not verified.

Enable/Disable online purchases link

Toggle to enable and disable online purchases by customers. When online purchases are enabled (the Disable online purchases link is displayed), customers can make purchases from your e-Series site.

When online purchases are disabled (the Enable online purchases link is displayed), customers will not be able to make purchases from your
e-Series site, and they will receive the following message when they try to make a purchase:

Online purchases are unavailable at this time. Please check back later.

To change the text in this area of the web page add a file named 'OnlinePurchases.txt' to the Source directory.

Remember to Update any changes each time you enable or disable online purchases.

Note: If the credit card gateway is Disabled on the Credit Card Authorization Options page, none of the new options will display. The Enabled option must be enabled for the new options to display on the page.

Resetting Password Authentication

e-Series administrators determine which information requires user authentication when users reset their passwords. However, to authenticate the required information when resetting their passwords, all users must already have the information stored in their records.

To ensure that all users have the necessary information entered in their records, the information requiring authentication in the Reset My Password page also must require population in the Sign Up page when users first sign up for an e-Series site. If the fields do not require population in the Sign Up page, a user may not enter all of the information

necessary for authentication. The user then would not be able to reset their password because the information that requires authentication would be missing in their record.

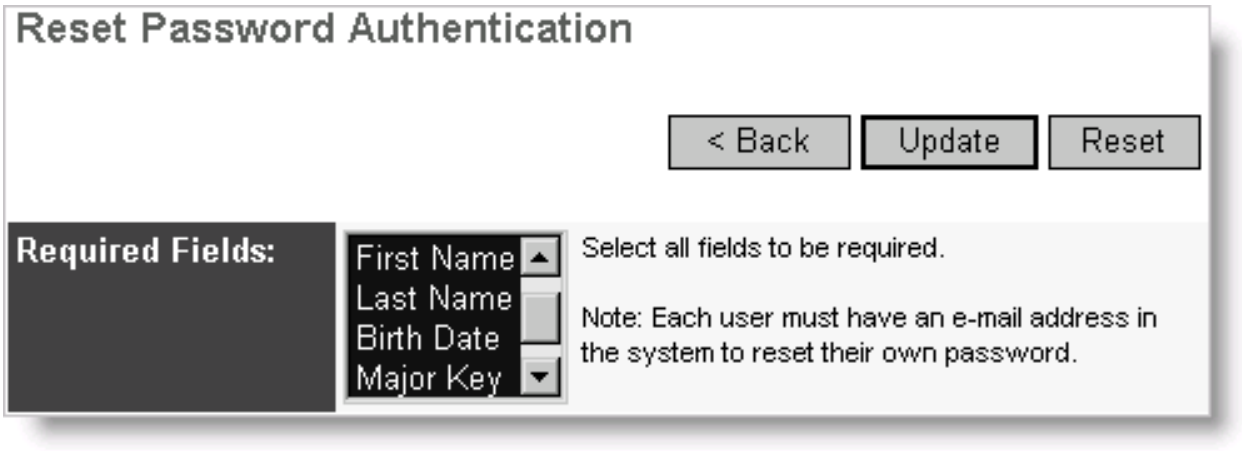
Administrators can enable the appropriate fields to require population in the Sign Up page by selecting the fields that require population on the Required Fields page in the e-Customer System Parameters.

Caution! Any time an administrator changes their site's required fields in the e-Customer System Parameters, they also must reset the password authentication fields. All users must have valid data entered in their record for all specified authentication fields in order to reset their logins and passwords.

To require password authentication

Before you can select the fields for which you want to require authentication, ensure that the same fields are selected on the Required Fields page in the e-Customer System Parameters. If the same fields are not selected, they will not display in the Required Fields list on the Reset Password Authentication page.

1. Log in to your e-Series site as an administrator.
2. Select Admin> Lookups to open the Lookup Lists page.
3. Select the Reset Password Authentication link to open the Reset Password Authentication page.
4. Select the fields for which you want to require authentication from the Required Fields list.
5. Click Update.



Example of the Reset Password Authentication page

Inserting Organization Contacts

When setting up your e-Series site, identify the individuals within your organization who will be the organization's customer contacts. These contacts are defined through the Lookup options.

To insert a Membership contact

The person assigned as the organization's Membership contact receives e-mail messages notifying the organization when a customer submits a site registration or updates their record (if this option is enabled). The system generates these notifications automatically.

1. Log in to the e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to display the Lookup Lists page.
4. Select MEMBERSHIP_CONTACT to display the MEMBERSHIP_CONTACT List page.
5. Click Insert MEMBERSHIP_CONTACT to display the Insert MEMBERSHIP_CONTACT page.
6. Enter the name of the customer contact in the MEMBERSHIP_CONTACT field.
7. Enter the e-mail address of the customer contact in the Substitute field.

8. Enter a brief description in the Description field.
9. Click Submit. A confirmation message displays.
10. Click OK.

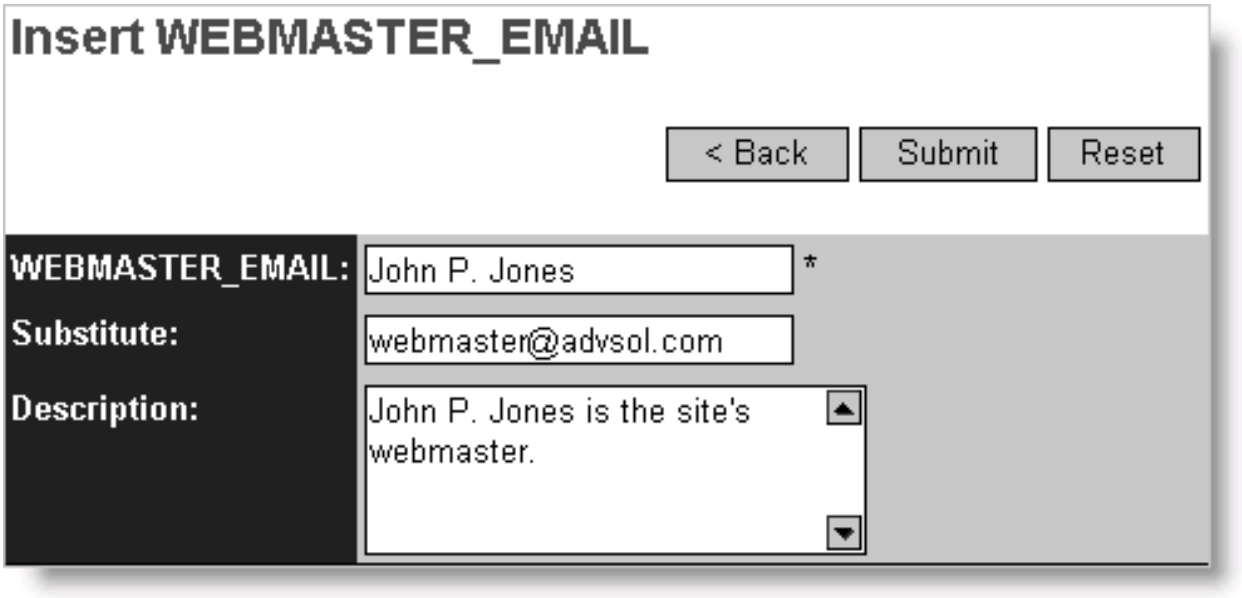
Insert MEMBERSHIP_CONTACT page

To insert a Webmaster contact

The person you assign to be the organization's Webmaster contact will receive all of the e-mail messages that users send when contacting your site's Webmaster.

1. Log in to the e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Lookups in the side index to display the Lookup Lists page.
4. Select WEBMASTER_EMAIL to display the WEBMASTER EMAIL_List page.
5. Click Insert WEBMASTER_EMAIL to open the Insert WEBMASTER_EMAIL page.
6. Enter the name of the Webmaster in the WEBMASTER_EMAIL field.
7. Enter the e-mail address of the Webmaster contact in the Substitute field.

8. Enter a brief description in the Description field.
9. Click Submit. A confirmation message displays.
10. Click OK.



Insert WEBMASTER_EMAIL page

Hands-on exercise: Insert yourself as the customer contact

Enter yourself as the customer contact with the following information:

- MEMBERSHIP_CONTACT: Your name
- Substitute: Your e-mail address
- Description: Name of individual doing this exercise

Setting up and Managing e-Series

Overview of Managing e-Series

Note: Customer records should be edited only in iMIS, not in e-Series.

This section includes the system settings necessary for managing your e-Series site.

1. Assigning Logins and Passwords in iMIS

2. Assigning Security Logins and Passwords for e-Series
3. Generating Logins for e-Series
4. Uploading Files

The goal of this section is to give you the knowledge and skills necessary to set up iMIS for your e-Series site. After completing this section, you will be able to do the following:

1. Assign security groups in iMIS
2. Assign security logins and passwords
3. Generate logins for e-Series
4. Upload files

Assigning Security Logins and Passwords for e-Series

You will need to create a security login and password for your e-Series site if a user has not created a login and password and you want to invite the user to an Invitation Only community or you want to add the user as a community administrator.

To assign a security login and password to a user

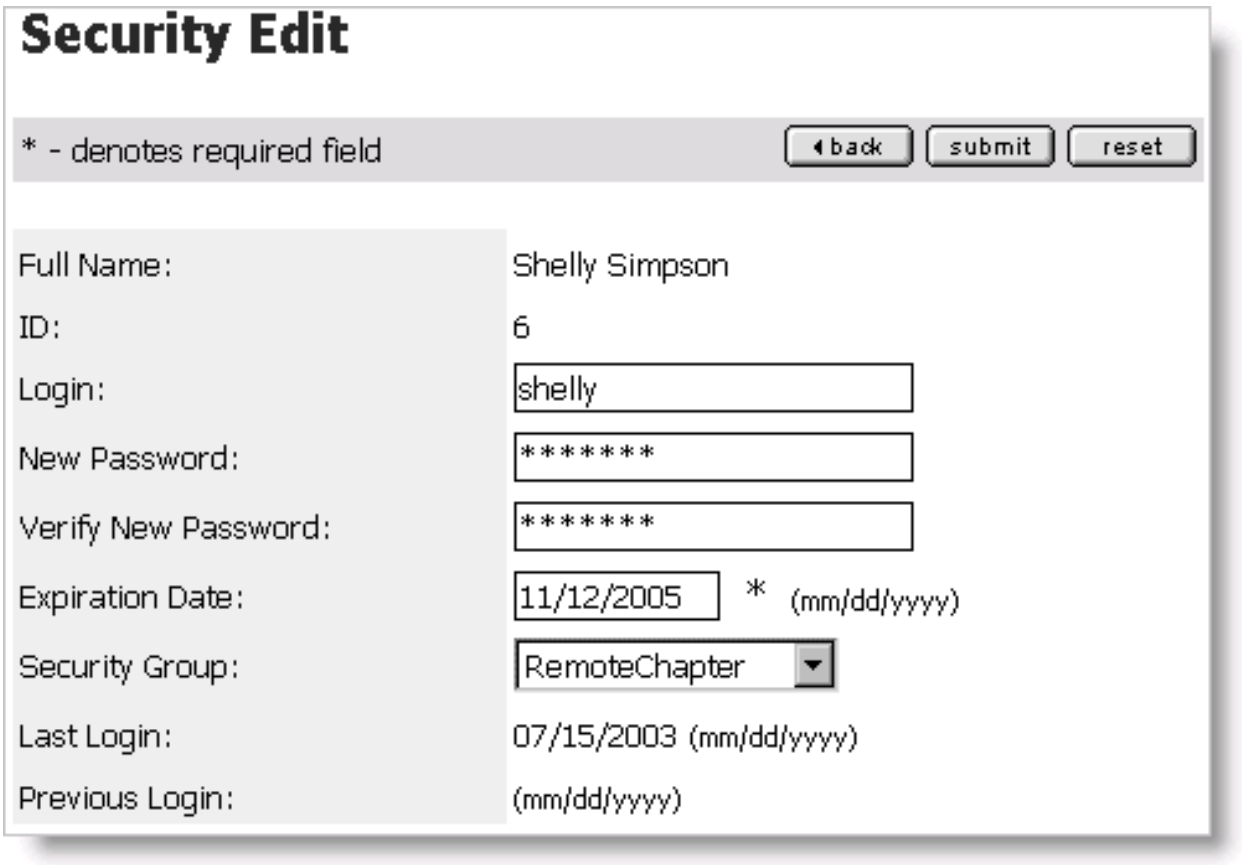
1. Log in to your e-Series site as an administrator.
2. Select Directory in the top navigation bar.
3. Search for and display the user's record for which you want to assign a security login and password. The user's Profile page displays.
4. Click security to open the Security Edit page.
5. Enter the user's security information:

- Enter a Login for the user.
- Enter a New Password for the user.
- Re-enter the password in the Verify New Password field.

- Enter the Expiration Date.
- Select a Security Group from the drop-down list.

  Note: Make sure the security group has access to the module(s) you want the user to access.

6. Click submit.
7. Click OK.



Security Edit page

Generating Logins for e-Series

The Generate Logins wizard allows e-Series administrators to automate and abbreviate the process of creating mass logins and passwords for new e-Series users.

Note: If more than one email address is entered for the e-Series MEMBERSHIP_CONTACT (either multiple values in the MEMBERSHIP_CONTACT general look-up/validation table or a single value with multiple email addresses), email generated by the Generate Logins wizard will not be sent out. Remove any additional membership contact email addresses so that only one exists.

Generate Logins wizard

Admin> Generate Login

Restrict by

The Restrict by field provides administrators with four options for defining specific user groups:

- None - Select this option to restrict login generation according to Security Group only.
- Chapter - Select this option to enable the Chapter field and restrict login generation according to specific chapter affiliation and Security Group.

- Member Type - Select this option to enable the Member Type field and restrict login generation according to specific member type and Security Group.
- SQL (Advanced Only) - Select this option to enable the SQL (Advanced Only) field and restrict login generation according to a specific SQL query and Security Group.

  Email Links to Members

  Enable to email the Add My Password link to the users of the defined group when the wizard runs.

  Expiration Date

  Enter the expiration date for the generation of logins for users in the defined group. Users defined in the group will not be able to enter their own personalized logins and passwords after the expiration date.

  To extend the Expiration Date after running the wizard, perform the following query:

  Update Name_Security

  Set EXPIRATION_DATE='Future_Date'

  Where EXPIRATION_DATE='Original_Date'

  Security Group

  Select the security group for which you want to restrict login generation.

Using the Generate Logins Wizard

When a new e-Series site is installed, logins and passwords have to be created for each of the site's new users. The Generate Logins wizard allows e-Series administrators to generate user logins automatically for all users or to restrict login generation to specific and defined user groups. Administrators set up specific user groups using parameters defined through the Restrict by and Security Group fields. After a user group has been set up in the wizard, the administrator clicks submit to run the Generate Logins wizard.

When the wizard runs, it simulates and creates logins and passwords for all of the users defined in the group. For example, entering a specific SQL query in the SQL (Advanced Only) field and selecting RemoteChapter in the Security Group field generates simulated

logins for all members of the Administrator security group who meet the parameters of the SQL query. Once the simulated logins and passwords have been created, users then can enter their own personalized logins and passwords.

Note: Performance testing indicates that the Generate Logins wizard may take some time to process on large databases. Make sure to run this process at night or when the database activity is low.

Disabling Login Authentication

If Login is one of the criteria enabled in the Reset Password Authentication page to require authentication in the Reset My Password page, new users will be required to authenticate their existing logins when creating their own logins and passwords. Since new users will not know their system generated logins, they will not be able to authenticate them and will not be allowed to create their own logins and passwords.

If an e-Series administrator does not want to require new users to authenticate their system generated logins, they can edit the GenerateLoginResponseText.cfm file found in ScriptContent/MailMessages by removing the #ucase(temp_logon)# Login variable.

For additional information on authenticating user information, refer to Resetting Password Authentication.

Notifying users to enter their logins and passwords

e-Series administrators have two options when running the Generate Logins wizard regarding notifying users to enter their own logins and passwords:

1. E-mail Links to Members option enabled - If an administrator enables the E-mail Links to Members option, then each user will receive an email containing the Add My Password link when the Generate Logins wizard runs. Users can select the link to go to a page where they then can reset the simulated login generated by the wizard and enter their own personalized logins and passwords. The Add My Password link essentially functions like the Reset my password link.
2. E-mail Links to Members option disabled - If an administrator does not enable the Email Links to Members option, then the Add My Password link is not sent to the users. The

administrator then will have to notify users by either email or letter to enter their own personalized logins and passwords using the Reset my password link.

To run the Generate Logins wizard

The Generate Logins wizard is applicable only for users whose records are stored in the iMIS database but who have never logged in to the e-Series site. The wizard is not applicable for users who have already created their logins and passwords. Existing e-Series users will have to change their logins and passwords through either the Security Edit page or the Reset My Password link on the Login page.

Note: Performance testing indicates that the Generate Logins wizard may take some time to process on large databases. Make sure to run this process at night or when the database activity is low.

1. Log in to your e-Series site as an administrator.
2. Select Admin> Generate Login to open the Generate Logins wizard.
3. Select the appropriate parameter from the Restrict by drop-down list that you want to use to restrict login generation:

- None - Select this option to not restrict login generation.
- Chapter - Select this option to enable the Chapter field and restrict login generation according to specific chapter affiliation.
- Member Type - Select this option to enable the Member Type field and restrict login generation according to a specific customer type.
- SQL (Advanced Only) - Select this option to enable the SQL (Advanced Only) field and restrict login generation according to a specific SQL query.
- If you select SQL(Advanced Only), you must add Name_Security.WEB_LOGIN='' and Name_Security.PASSWORD='' to your criteria. Otherwise, erroneous e-mails may be sent to members since their security information will not be updated.
- These clauses also are required to prevent overwriting existing users' valid logins.

4. (optional) Enable the Email Links to Members option. If the Email Links to Members option is not enabled, then no e-mail containing the Add My Password link is sent to the users. You then will have to manually notify users by either e-mail or letter to enter their own personalized logins and passwords using the Reset my password link.
5. Enter the Expiration Date.
6. Select the appropriate user Security Group.
7. Click submit.

Setting time span for changes to e-Series login information

Users can be prevented from logging on immediately after they change their e-Series password. The time span can be specified using a cfparam application variable. The default length is 0.

Example:

<cfparam name="application.logoncachequery" default="CreateTimeSpan(0,0,0,0)" type-e="string">

A variable can be added to the Security folders Module.cfm or Application.cfm file to set a time span to cache the query.

Example:

<cfset application.logoncachequery = "CreateTimeSpan(0,0,5,0)">

Uploading Files

The File Upload utility allows you to transfer files located on your local computer to the Webserver where they reside in your directory. Files also can be deleted from the server remotely. Files that are added or removed are recorded in a 'file.log' file in the customer directory. The File Upload utility is controlled through the Security Detail page.

It is important to place files where they belong. For example, upload headers you created to the StaticPages/HeaderImages directory and place bullets in the Bullets directory.

Note: Never remove any files that end with “.cfm.”

Be careful about uploading large files. If your Internet connection is slow or unreliable, limit uploading to small files.

To upload files

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> File Upload in the side index to display the File Upload page.
4. Select the File Destination directory.
5. Click Browse to find the new file.
6. Click Send File to Server to send the file. If you have multiple files, send one file at a time.

Hands-on exercise: Upload a file

1. Select Admin> File Upload in the side index.
2. Select Reports in the File Destination drop-down list.
3. Browse to your C:\eSeries folder and double-click Membertype.rpt.
4. Send the file to the server.

Ability to disable U.S. phone formatting in e-Series

An iMIS system setup option enables an administrator to disable formatting on all phone fields. This setting also applies to e-Series. By default this option is disabled and will not affect current customers.

Enabling European debit cards in e-Series

European users can make payments in iMIS using debit cards. Any cash account set up in iMIS of the type Debit Card appears in the Credit Card Type drop-down list on the Check-Out Basket page in e-Series. This is in addition to any credit card types that are currently displayed. See Set up cash accounts window.

Although e-Series supports debit card transactions, it does not validate the debit card information. Arranging immediate authorization of the debit card using an alternative

third-party gateway is the responsibility of the consultant or AiSP performing iMIS implementation.

Note: Debit cards are only supported outside of the United States.

Optional Issue Number and Issue Date

To support the use of European debit cards for making payments in e-Series, two optional fields, Issue Number and Issue Date, can be added. To place these two fields on the Check-Out Basket page, add <cfset application.enableissuefields = 1> to the _eSeriesConfig.txt file.

Date range for Issue Date

The date range for the Issue Date field can be configured by adding the application.issueyear variable to the _eSeriesConfig.txt file. This controls the years listed in the drop-down box for the Issue Date field on the Checkout Basket page.

Example:

<cfset application.issueyear = "2001;2002;2003;2004;2005">

GSTINC now supported in e-Series

GST Included pricing, purchasing, and registration is supported in e-Orders and e-Events. When a user purchases a GSTINC product or registers for a GSTINC event or event function, e-Series checks to see whether a user is required to pay taxes on this item, and if so, calculates the amount of the included tax and separates it from the product price when creating financial transaction records.

Note: GSTINC must be configured in iMIS and Canadian Taxation must be enabled for the organization in iMIS System Setup before e-Series can use GSTINC features. See Canadian Taxation.

GSTINC Events setup notes

To use GSTINC pricing with any part of an event, the Tax Authority must be defined as GSTINC on the iMIS Define an event window. Event functions can then be designated as GST by checking the GST box on the Event Function Detail window.

GSTINC Orders setup notes

To apply GSTINC to orders, you must check the Use Taxation box on the iMIS Set up country names window for each country to which GST applies and to which orders can be shipped.

If Use Taxation is not checked for the customer's Ship To country, iMIS will subtract the tax, based on the GSTINC tax rate, from any GSTINC products in the order.

If the customer's Ship To country is not specified in the order, iMIS assumes that the customer's country is the same as the iMIS default organization's country to determine GST status.

All products which are to be treated as GSTINC must have the GSTINC box checked on the manager products window.

Note: The Ship To address does not apply to events. Because events occur in a specified place, iMIS uses the Tax Authority defined in the Define an Event window.

Tax exempt status and GSTINC

Some customers are entitled to tax exempt status. iMIS recognizes the tax exempt status of customers whose tax exemption code or number has been entered in the Tax Exempt field on the Customers > Financial tab. When a tax exempt customer places an order or registers for an event, iMIS will subtract the tax amount, based on the GSTINC tax rate, from the price of any items defined as GSTINC.

Anonymous users and GSTINC pricing

If a customer is not logged in and adds items to the shopping basket, items will be displayed at their listed price. If the customer then logs in to check out and is either tax exempt, or is having the product shipped to a country to which GST is not applied, tax is subtracted from items that are defined as GSTINC.

Setting up iMIS for e-Events

Overview of Setting up iMIS for e-Events

Before you can accept online registrations for your events, you must set up the events in both iMIS Events and in e-Series.

1. Create the event in iMIS. We strongly recommend that all events be set up and edited in iMIS rather than e-Series. Refer to the iMIS Events guide.
2. Set up the e-Events System Parameters.
3. Enable batch control in iMIS.
4. Accept and process event registrations.

The goal of this section is to give you the knowledge and skills necessary to set up iMIS for e-Events.

After completing this section, you will be able to do the following:

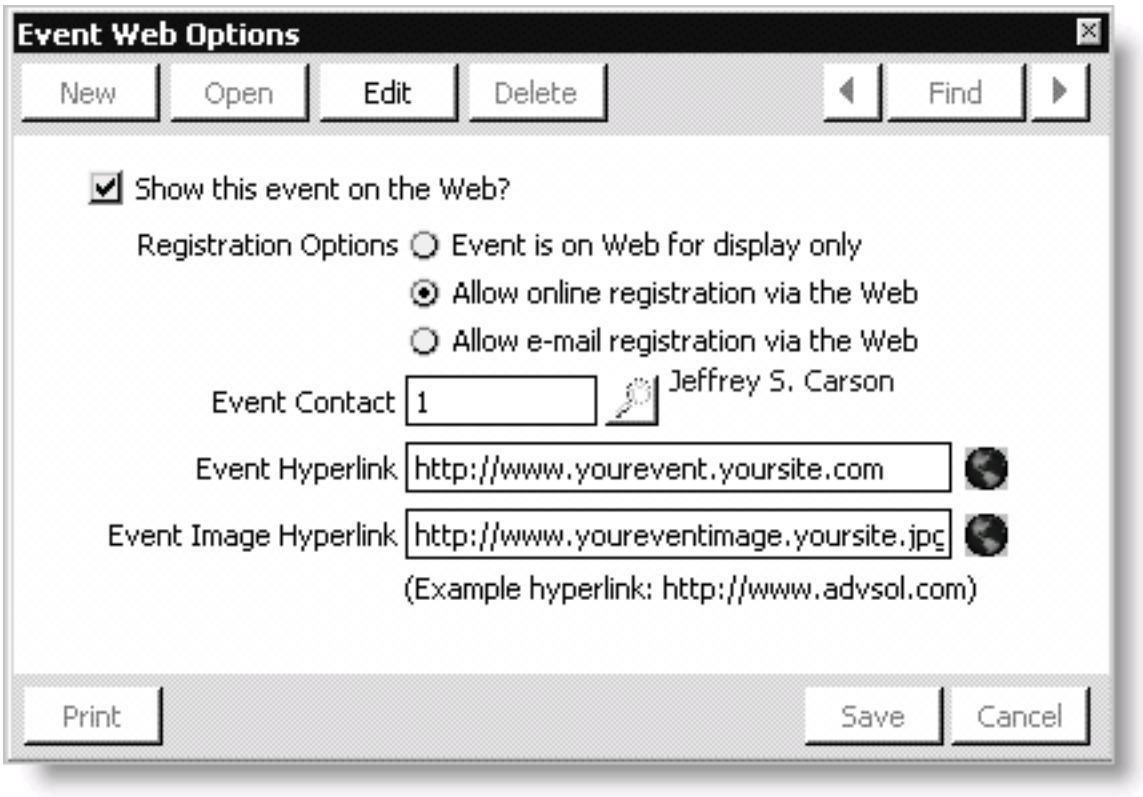
- Enable events for the Web
- Enable event functions for the Web

Enabling Events for the Web

If your system is licensed for e-Series, the Web Options menu item is accessible by clicking More on the Define an event window. Select Web Options to open the Event Web Options window and enable your events.

Note: To prevent registrants from registering for closed events (Status is C), make sure to disable the Show this event on the Web option for the event on the Event Web Options window.

Event Web Options window



From Events, select Define an event, select an event, click More, and select Web Options

Show this event on the Web

Select to display the event on the Web.

When an Administrator logs in to e-Series, every event is available for viewing in e-Events regardless of whether they are enabled to be viewed or sold on the Web. However, this functionality exists only for Administrators. Users logging in to e-Series without administrative privileges will see only the events that have been enabled for viewing on the Web.

Note: Do not enable an event for viewing on the web without setting up pricing information for the event. Site users can still register for events even if the pricing information has not been set up. This could result in a user being registered but not charged for an event.

Registration Options

Event is on Web for display only - Select to allow customers to view the event on the Web only. They cannot register for the event.

Allow online registration via the Web - Select to allow customers to register and pay for the event online.

Allow email registration via the Web - Select to allow customers to register for the event by email.

Event Contact

Enter the ID number of the event contact. When a site user registers for an event, an email is sent to the event contact notifying them of the user's registration.

Event Hyperlink

Enter the hyperlink to information about the event.

Event Image Hyperlink

(optional) Enter the hyperlink to the event logo or image.

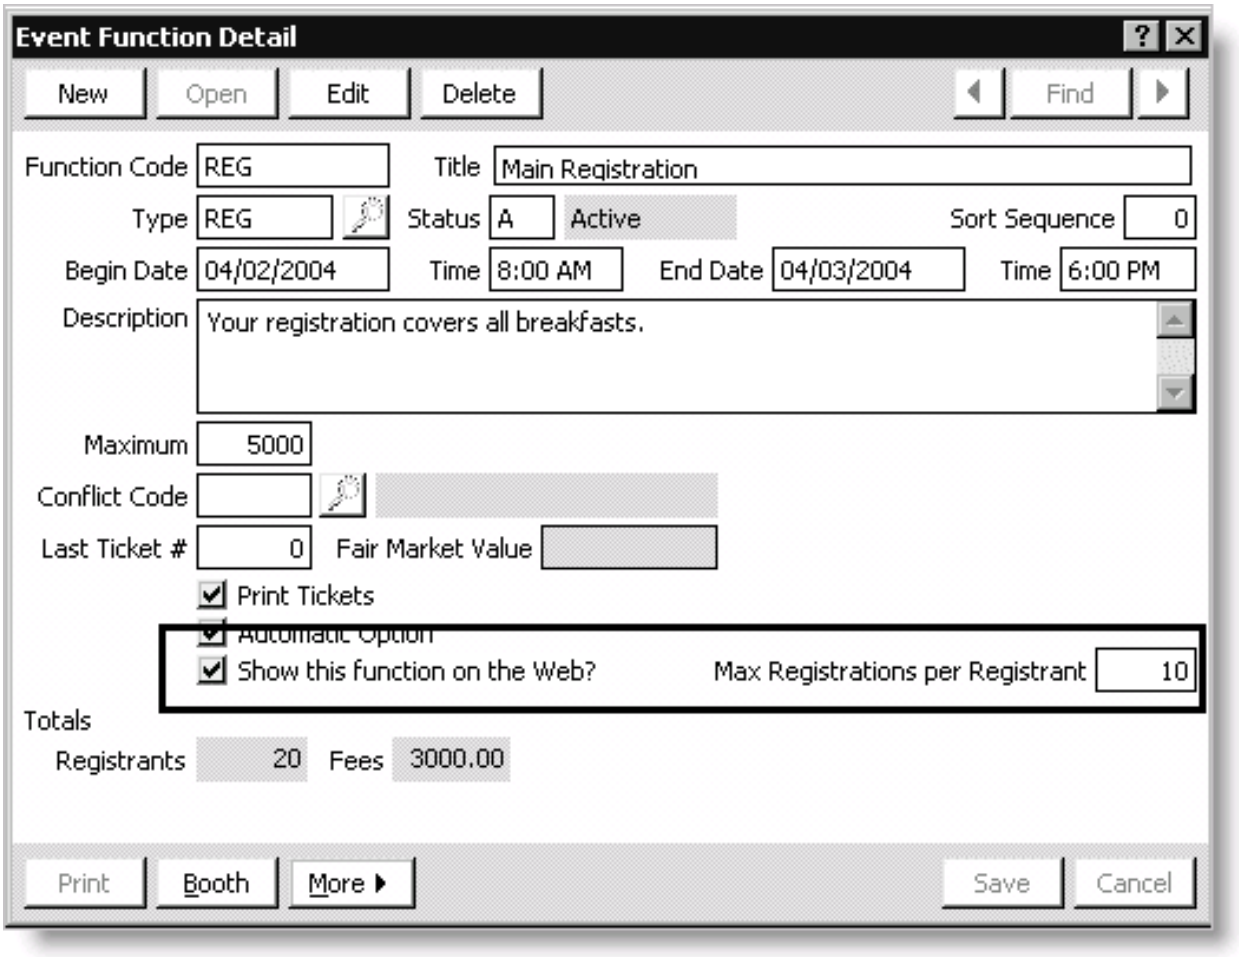
To enable an event for the Web

1. Open the Event Web Options window for an event:
   - From Events, select Define an event to open the Define an event window.
   - Double-click an event to open a second instance of the Define an event window.
   - Click More, and select Web Options to open the Event Web Options window.
2. Click Edit.
3. Enable the Show this event on the Web option.
4. Enable one of the Registration Options.
5. (optional) Enter an Event Contact.
6. (optional) Enter an Event Hyperlink.

7. (optional) Enter an Event Image Hyperlink.
8. Click Save.

Enabling Event Functions for the Web

Event functions are enabled for the Web on the Event function detail window. See the iMIS Events guide for more on defining an event function.



From Events, select Define an event, and double-click an event

Limiting the Number of Web Registrants for an Event Function

You can limit the number of Web registrations a single registrant can enter for a function in e-Events by entering a non-zero value in the Max Registrations per Registrant field.

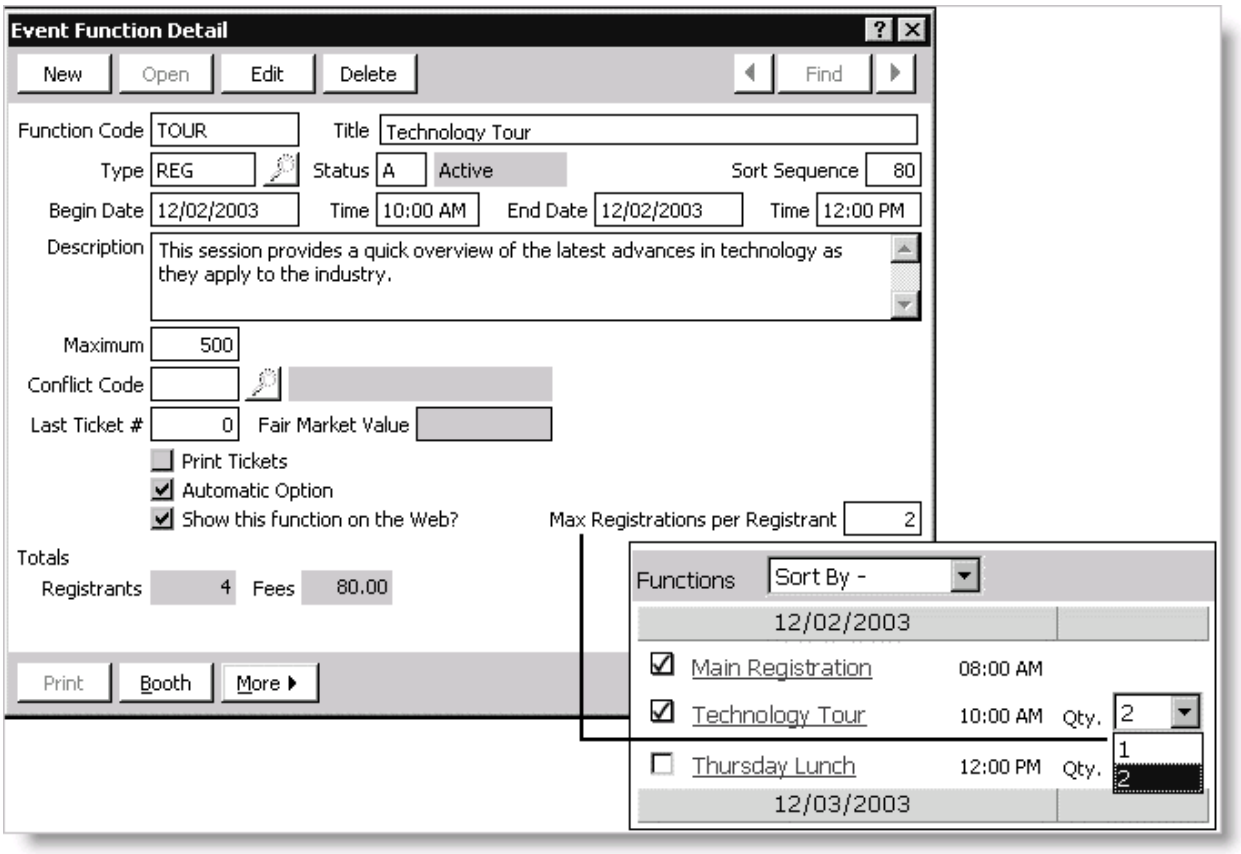
Note: The Max Registrations per Registrant field is only displayed if the Show this function on the Web option is enabled. The Show this function on the Web option only displays if the Show this event on the Web option is enabled for the event on the Event Web Options window (from Events, select Define an event, double-click an event, click More, and select Web Options).

The number of function registrations a single online registrant can purchase is dependent on the value in the Max Registrations per Registrant field, which governs the Qty drop-down list on the Event Registration page.

If you do not want to limit the number of function registrations that a single online registrant can purchase, then you should set the maximum value as high as is realistic for a single registrant at your event.

For example, if one (1) is entered as the Max Registrations per Registrant, then the function displays on the Event Registration page, but the Qty drop-down list does not display. A registrant is limited to purchasing only one function registration.

If five (5) is entered as the Max Registrations per Registrant, then the function displays with the Qty drop-down list showing the values of 1, 2, 3, 4, and 5. A registrant has the ability to purchase up to five function registrations.



Max Registrants per Registrant field

This is an example of the Max Registrations per Registrant field as it governs the Qty drop-down list on the Event Registration page. Max Registrations per Registrant is set to one for the Main Registration function and to two for the Technology Tour function.

Calculate Registration Eligibility in e-Events

You can set up a requirement for registrant eligibility using the SQL Registration Verification Calculation field in the Event Notes window. Set this option while logged in as an administrator in iMIS. (Events>Define an Event>New>More>Notes)

Enter a SQL calculation that results in either 1(pass) or 0(fail). If the event fails, the customer gets a registration failure error.

To enable an event function for the Web

1. Open the Event Function Detail window for an event:

- From Events, select Define an event to open the Define an event window.
- Double-click an event to open a second instance of the Define an event window.

2. Click Edit.
3. Enable the Show this function on the Web option.
4. Enter the number of Max Registrations per Registrant.
5. Click Save.

Hands-on exercise: Create an eEvent

1. Create the following e-Event:

- Meeting Code: SPRCONF
- Title: Spring Conference
- Begin Date: April 2, 2002
- End Date: April 5, 2002

2. Create the following functions:

- Code: GEN SESSION
- Title: General Session
- Cost: $35 Members; $50 Non-members

3. Make the event available for online registration.

Setting up iMIS for e-Orders

Overview of Setting up iMIS for e-Orders

Before using e-Orders, be sure to complete the following tasks in iMIS:

- Define credit card accounts
- Enable batch control
- Define tax codes

The goal of this section is to give you the knowledge and skills necessary to set up iMIS for your e-Series site.

After completing this section, you will be able to do the following:

- Define a Web order type
- Set up Web order options
- Set up order status defaults
- Set up inventory defaults
- Use multiple warehouses with e-Orders
- Create and enable product categories for the Web
- Create and enable products for the Web
- Calculate freight charges in e-Orders
- View batches, orders, and activity records in iMIS

Defining a Web Order Type

Before getting started with e-Orders, you must define a Web order type. All e-Orders are entered initially as pro-forma orders to ensure user validation. After you validate the order, the order converts to the default order type and processes through the required staging activities.

To define Web order types

1. From Orders, select Set up tables > Order types to open the Set up order types window.
2. Click New.
3. Enter a Code for the Web order type.
4. Enter a Description for the Web order type.
5. Enter a description of the invoice in the Invoice Desc field.
6. Select the Pro-Forma order type from the list of Categories.

7. (optional) Enable Print a Quote.
8. Enter an order type in the Convert to Order Type field.
9. Click Save.

Setting up Web Order Options

Enter the Web Customer Type and Web Order Type in the iMIS Web Order Options window. The settings defined in the Web Order Options window determine whether taxes are applicable for purchases made over the Web.

See these details in iMIS Orders Administration:

- Defining web order options
- Defining order status defaults

Hands-on exercise: Set up Order Status defaults

1. Enable the following Standard Orders options:

- Pick List
- Shipping Paper
- Invoice
- Affect Inventory

2. Debit Orders: Enable Invoice
3. Credit Orders: Enable Invoice
4. Pro Forma Orders: Print Quote
5. Convert to Order Types: REG

Creating Product Categories for the Web

The next step in setting up e-Orders is to set up product categories for the Web. Product categories allow you to classify your products, and you must define your product cat-

egories before defining your individual products. Each time you define a product, you must assign it to one of your product categories.

Product categories are used to assign default accounts and to enable category options for groups of products.

Web Options

From Orders, select Set up tables > Product categories

Current Categories

This list displays the defined product categories.

Category

Enter a code for the product category.

Description

Enter a description of the product category.

Category Options

Enable the options that you want enabled by default when defining new products on the Manage products window (from Orders, select Manage inventory> Manage products). You can override all settings at the product level.

- Commissionable - Enable if you want the sale of a product within a category to generate a commission. The Comm % field displays when you enable the Commissionable option.
- Comm % - (Displays only when the Commissionable option is enabled) Enter the default commission rate generated by the sale of a product in this category. For example, a 5.00 % commission rate would generate a $5.00 commission on a $100.00 sale. Make sure to enter the rate as a percentage and not as a decimal.
- Stock Item - Enable to indicate that products within this category have physical inventory. You can track inventory only for items stocked in inventory.
- Taxable - Enable to indicate that the product category is taxable.
- Use Publication Demographics - Enable to define publication demographic information for a category's products. If the option is enabled, the Publication button displays and enables on the Manage products window for products belonging to that category. Clicking the Publication button on the Manage products window opens the Publication Demographics window used for defining demographic information for publications. e-Orders displays the demographic information defined for each product in the category on the

product detail page.

- Product Kit - Enable to indicate that the product category consists of product kits.

  User Defined Field Captions

  If the User Defined Field Captions (UF_1 through UF_4) are defined for a product category in Orders, then e-Orders will display the user-defined fields for each product in the category on the product detail page. If the User Defined Field Captions are not defined, the user-defined fields will not display on the product detail page.

  If general lookup/validation tables have been defined for the user-defined fields, each user-defined field's drop-down list will display the predefined data. Customers can customize their product orders by selecting specific options from the drop-down lists. However, customers cannot enter free-form data in the fields for which general lookup/validation tables have been defined.

  If general lookup/validation tables have not been defined for the user-defined fields, customers can enter any necessary order information for their products.

  Any Additional Information entered or selected for a product on the product detail page will display on each succeeding order-entry page up to but excluding the Check-Out Basket page.

Sailing, A Sport for Young and Old **Price: $ 32.00**

This book introduces you to the world of sailing. Topics discussed include an indepth history of sailing and sailing craft development, sailing terminology, and sailing maneuvers.

Product Demographics

Author:	Forrester, John R.
Publisher:	White Cap Publishing
Date of Publication:	02/20/2002
ISBN Number:	8905872AD
Format:	Hardcover
Edition:	Second
Pages:	438

Product Description

John R. Forrester introduces readers of all ages to the world of sailing. The history of sailing and craft development are covered, and sailing terminology and maneuvers are discussed in layman's terms. Detailed and descriptive illustrations are included.

Additional Information

Binding: Leather Cover

Paper: Acid Free Paper

Illustration: Color Illustrations

Edition: Limited Edition

add to your products

Example of the User Defined Field Captions set up for the product detail page

Default Accounts

These accounts allow you to define the default accounts for products within this category. You can override the accounts at the product level on the Accounting window and at the warehouse level on the Warehouses window if Multi-Warehouses is enabled.

When defining product-level accounts, the most specific accounting information takes precedence. For example, iMIS first looks for warehouse level accounts. iMIS then looks for product level accounts. If you have not defined product-level accounts, iMIS uses the default product category accounts. If you have not defined default product category accounts, iMIS uses the accounts defined on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

- Income - Enter a product category's default income account number.
- Inventory - Enter a product category's default inventory account number.
- Cost of Goods Sold - Enter a product category's default cost of goods sold account number.
- Adjustments - Enter a product category's default adjustments account number.

Web Options button

Opens the Web Options window for the selected product category. The Web Options window is used for enabling products either for sale or for viewing on the Web.

To define product categories for e-Series

1. From Orders, select Set up tables > Product categories to open the Set up product categories window.
2. Click New.
3. Enter a code for the product category in the Category field.
4. Enter a Description of the product category.
5. Enable the applicable Category Options.

6. Enter the User Defined Field Captions that will display and generate text boxes on the Product Detail window.
7. Enter any applicable Default Accounts.
8. Click Save.

Note: If you are licensed for and plan to use product kits, you must define a product kit category by enabling the Kit category option. See Orders for details about product kits.

Hands-on exercise: Create a Web product category

Create the following product category:

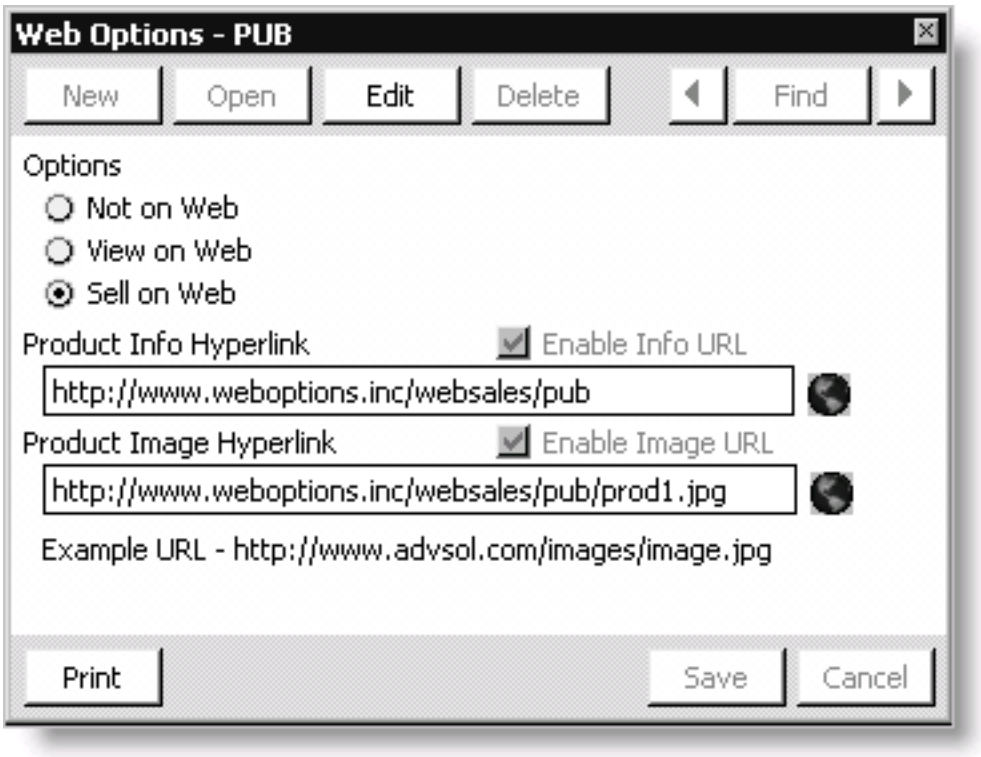
- Code: WEB_CAT
- Description: Web Products Category
- Enable the Stock Item option
- Enable the Taxable option

Enabling Product Categories for the Web

After defining your product categories, you can enable any of the categories for viewing or sale on the Web. Product categories are enabled for the Web through the Web Options window.

Note: Changing the Web options in the Web Category window after Web products have been created changes the Web options for all the products in that category.

Web Options window



From Orders, select Set up tables > Product categories, select a category, and click Web Options

Edit button

Click to define and edit a product category's Web options.

Options

- Not on Web - Enable to prevent the product category from being viewed or sold on the Web.
- View on Web - Enable to allow the product category to be viewed, but not sold, on the Web.
- Sell on Web - Enable to allow the product category to be viewed and sold on the Web.

Product Info Hyperlink

Enter a URL to information about the product category.

Enable Info URL

Enable to enable the hyperlink to the product category's information.

Product Image Hyperlink

Enter a URL to an image representing the product category.

Enable Image URL

Enable to enable the hyperlink to the product category's image.

To enable a product category for the Web

1. From Orders, select Set up tables > Product categories to open the Set up product categories window.
2. Select a product category from the list of Current Categories.
3. Click Edit.
4. Click Web Options to open the Web Options window.
5. Enable the product for the Web:

- Enable the View on Web option if you want the product category to be viewed, but not sold, on the Web.
- Enable the Sell on Web option if you want the product category to be viewed and sold on the Web.
- Enable Not on Web option if you want to prevent the product category from being viewed or sold on the Web.

6. Enter the Product Info Hyperlink.
7. Enable the Enable Info URL option.
8. Enter the Product Image Hyperlink.
9. Enable the Enable Image URL option.
10. Click Save.

Hands-on exercise: Enable a product category to be viewed on the Web

Enable the following product category to be viewed on the Web:

- Option: Sell on Web
- Product Info Hyperlink: URL supplied by your instructor
- Product Image Hyperlink: URL supplied by your instructor
- Thumbnail Image Hyperlink: URL supplied by your instructor

Creating e-Order Products

After defining your Web product category, you can define your individual Web products. Products are defined and managed on the Manage products window, which allows you to enter and access product codes, titles, descriptions, prices, accounting information, and other specific product options. The Manage products window also is used for accessing and displaying product inventory information and for designating a product's Process Manager items.

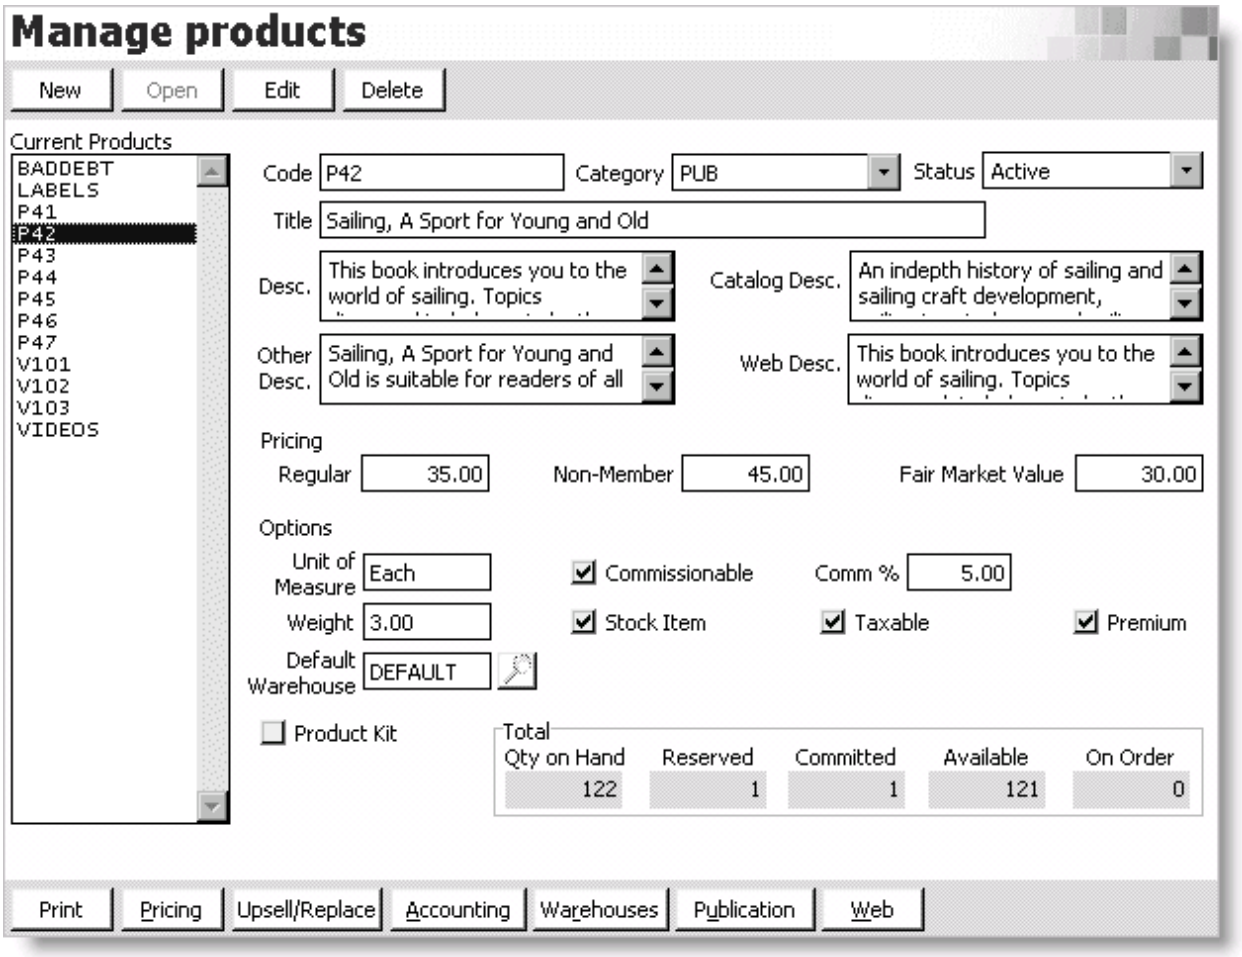
Using Product Status with e-Orders

The default status for all new products is Active, and you can assign the following status codes to your products at any time during a product's life cycle:

- Active (A) - Display and can be ordered in e-Orders (dependent on inventory level and/or the AllowOutofStockOrder configuration file).
- Inactive (I) - Do not display and cannot be ordered in e-Orders.
- Mark for Deletion (D) - Do not display in e-Orders and are no longer available. The only reason to keep these products in the system is for historical reporting or to prevent reusing an assigned product code.
- Not Available (N) - Display in e-Orders but are no longer available (the inventory level is set to zero, and the AllowOutofStockOrder configuration file should be set to No so the products cannot be ordered). The primary reason to keep these products in the system is to identify replacement products.

- Out of Production (O) - Display and can be ordered in e-Orders (dependent on inventory level and/or the AllowOutofStockOrder configuration file). Once stock is depleted, an Out of Production product's status is changed to Not Available.

Manage products window



From Orders, select Manage inventory > Manage products

Current Products

Lists all of the defined product codes. Select a product code from the drop-down list to view the product's details on the Manage products window.

Code

(required) Enter a specific code for an individual product.

Category

(required) Select a product's category from the drop-down list. Product categories are defined on the Set up product categories window (from Orders, select Set up tables > Product categories).

Status

Select a product's status from the drop-down list. The default status for all new products is Active, and you can assign the following status codes to your products at any time during a product's life cycle:

- Active (A)
- Inactive (I)
- Mark for Deletion (D)
- Not Available (N)
- Out of Production (O)

See Product Status Codes for more on product status code functionality.

Title

Enter a brief, descriptive product title. A product's title displays next to the product's code on windows and reports; product titles can be edited when entering orders.

If the Print 1st Line Desc on Statement option is enabled on the AR/Cash Set up module window (from AR/Cash, select Set up module), the product title entered in the Description field on the Overview tab of the Enter and edit orders window prints on invoices and statements. The product title entered in the Description field also displays on the AR/Cash tab on the Manage customers window and on the AR/Cash Enter and edit cash receipts window. If the Print 1st Line Desc on Statement option is disabled on the AR/Cash Set up module window, only the order number prints on statements and displays on windows.

Description Fields

All description fields hold product descriptions, to a maximum of 5000 characters:

- Desc

  Enter the product description to be seen by staff. The text entered in the Desc field does not appear on printouts, but it will appear on the product's web description if none exists in Web Desc.

- Catalog Desc

  (Applicable for e-Orders) Enter the description for a product catalog; the description can be used for reporting.

- Other Desc

  (Applicable for e-Orders) Enter additional product information; the description can be used for reporting.

- Web Desc

  (Displays only if you are licensed for e-Orders) Enter the description to display on the Product Detail page; otherwise, the web page uses the Desc text, if any.

  Note: Place key search terms within the first 300 characters of the description. In the Public view, search truncates the description to 300 characters, so only text within that range yields search results for users.

  Pricing

- Regular - Enter a product's default unit price. The price entered in the Regular field will apply for all customers unless you enter a different price in the Non-Member field. You can override a product's default price at order entry.

  The Use Member Pricing option on the Overview tab of the Enter and edit orders window allows you to apply Regular product pricing for non-member customers.

- Non-Member (optional) - Enter a product price for non-member customers. This price applies automatically when you sell a product to any customer with Non-Member status, allowing you to avoid most manual price overrides.

If the Non-Member field is blank, a product's price defaults to the value entered in the Regular field for non-member customers. You can override a product's default price at order entry, and the Use Member Pricing option on the Overview tab of the Enter and edit orders window allows you to apply Regular product pricing for non-member customers.

- Fair Market Value (Displays only when the Premium option is enabled) - Enter a fair market value for a product used as a premium. You must enter a value in this field, which can be 0.00. The default value is 0.00.

Options

- Unit of Measure - Enter a product's unit of measure, such as individually, each, foot, yard, sheet, book, or pack.
- Commissionable - Enable if a product's sale generates a commission.
- Comm % - (Displays only when the Commissionable option is enabled) Enter the commission percentage a product's sale will generate.
- Weight - Enter a product's weight. When defining product kits, be sure to enter a Weight. Freight by weight charges will not calculate for a product kit unless a weight has been defined, regardless of whether weight has been defined for the individual kit components.
- Stock Item - Enable to indicate that a product is stored in inventory. When the Stock Item option is enabled, both products in inventory and backorders are tracked in the Qty on Hand, Reserved, Committed, Available, and On Order fields on the Manage products window.
- Taxable - Enable if a product is taxable. When the Taxable option is enabled, iMIS automatically calculates any applicable taxes for a product according to the tax code entered for an order. When defining a new product, the Taxable option on the Manage products window enables by default if the Taxable option on the Set up product categories window is enabled for the new product's category.
- Premium - Enable this option to use a product as a premium for gifts and pledges. This option only displays only if Allow Premiums as Products is enabled on the Fundraising Set up module page.

When an order is generated for a product used as a Fundraising premium, the Notes field on the Order Details tab of the Enter and edit orders window displays the text “Premium order for Transaction TransNum, Batch BatchNum” (for example, Premium order for Transaction 1438, Batch 08062004). See Fundraising Management (see "Fundraising") for details about using premium products.

- Default Warehouse - (Required/Displays only if using Multi-Warehouses) Enter a stock item's default warehouse location. Select the Find icon to look up a warehouse; warehouse locations are defined on the LOCATION general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

  The Default Warehouse field displays only if a product is a stock item and the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory). If a default warehouse is defined on the Inventory System Setup window, the Default Warehouse field defaults to the warehouse defined on the Inventory System Setup window. A product's default warehouse can be overridden at order entry on the Product Detail window with a warehouse that is pre-defined for the product.

  Individual warehouses are set up for products on the Warehouses window (from Orders, select Manage inventory > Manage products, select a product from the list of Current Products, and click Warehouses).

- Entity - (Optional/displays only if Multiple Entities is enabled on the AR/Cash Set up module window) Enter an owner entity for an individual product. Select the Find icon to look up an entity; entities are defined in the Org Codes field on the Organization Names window (select File > System Setup, and click Organization Names).

  An Entity value can be left blank if the entity owner is the same as the default Orders entity assigned on the AR/Cash Set up module window.

  See Understanding Multiple Entities and Orders for more on product-level entities.

  Product Kit

Enable if a product is a kit. A kit is a group of individual products sold as a single unit. The Product Kit option displays only if your system is licensed for product kitting.

Kit button

(Not shown in example, displays only when the Product Kit option is enabled) Opens the Kitting window used for defining product kits.

Total

The totals are display only:

- Qty on Hand - the total number of products in inventory. If using Multi-Warehouses, Qty on Hand includes the total number of products in inventory across all warehouses.
- Reserved - the number of products that are in “open order” status, including backorders. If using Multi-Warehouses, Reserved includes the total number of products reserved across all warehouses.
- Committed - the number of shippable products in inventory excluding backorders. If using Multi-Warehouses, Committed includes the total number of products committed across all warehouses.
- Available - the number of products on hand excluding reserved products. If using Multi-Warehouses, Available includes the total number of products available across all warehouses.
- On Order - the number of products on order from suppliers. If using Multi-Warehouses, On Order includes the total number of products on order across all warehouses.

  The number of products displayed depends on the number of products entered in the On Order field on the Inventory / Warehouses window (click Inventory / Warehouses on the Manage products window).

Pricing button

Opens the Special Pricing window used for setting up specific product price calculations.

Upsell/Replace button

Opens the Upsell/Replace window used for designating Upsell, Cross-sell, and Replacement items for products.

Accounting button

Opens the Accounting window used for entering product account information.

Inventory / Warehouses button

- Inventory button - (Disabled for non-stock items) Opens the Inventory window used for entering product inventory information. The Inventory button displays and replaces the Warehouses button when Multi-Warehouses is disabled.
- Warehouses button - (Disabled for non-stock items) Opens the Warehouses window used for entering inventory information for a product's individual warehouses. The Warehouses button displays and replaces the Inventory button when Multi-Warehouses is enabled.

Publication button

Opens the Publication Demographics window used for defining additional information for publications. The Publication button displays only if the Use Publication Demographics option is enabled for a product's category on the Set up product categories window (from Orders, select Set up tables > Product categories).

Web button

(Displays only if you are licensed for e-Orders) Opens the Web Options window to display a product on the Web.

To define a product

1. From Orders, select Manage inventory > Manage products to open the Manage products window.
2. Click New.
3. Define the product:

- Enter a Code for the product. The product code should not contain any spaces or special characters other than an underscore.
- Select a product Category from the drop-down list of available categories.
- Enter a Title for the product.

4. Enter any applicable product descriptions:

- Enter a general product description in the Desc field.
- Enter a product description for a product catalog in the Catalog Desc field.
- Enter any other product description in the Other Desc field.
- (e-Orders only) Enter a product description for an e-Orders site in the Web Desc field.

5. Enter the product's Pricing information:

- Enter a default price for the product in the Regular field.
- (optional) Enter a Non-Member price for the product if applicable.

  Note: If products are used only as kit components, you do not need to enter prices for the individual products that make up the kit. Only the kit itself requires product pricing information.

6. Enter the product's Options:

- Enter the product's Unit of Measure, such as each or sheet.
- (optional) Enable the Commissionable option if a product's sale generates a commission (enter a commission percentage in the Comm % field if you enable the Commissionable option).
- Enter the product's Weight.
- Enable the Stock Item option.
- (optional) Enable the Taxable option if the product is taxable.

- (Optional/For use with Fundraising) Enable the Premium option to use the product as a premium for gifts and pledges, and enter a Fair Market Value.
- (Multi-Warehouses only) Enter the product's Default Warehouse location if you are using Multi-Warehouses. Select the Find icon to look up a warehouse.
- (Multi-Entities only) Enter an Entity for the product.

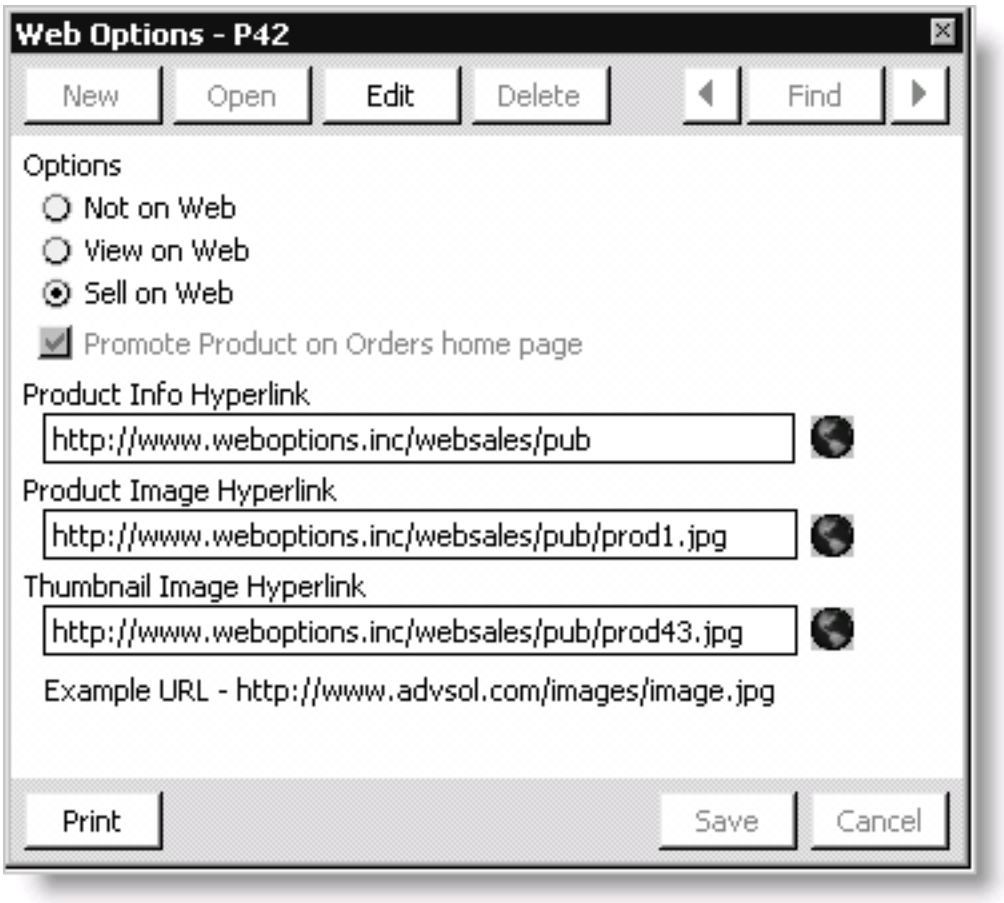
7. Click Save.

Enabling Products for the Web

After defining your Web products, you can enable any of the products for either viewing or sale on the Web. To enable products for the Web, your system must be licensed for e-Orders.

If your system is licensed for e-Orders, the Web button displays on the Manage products window. If your system is not licensed for e-Orders, this button will not be visible. Clicking the Web button opens the Web Options window used for enabling products for the Web.

Web Options window



From Orders, select Manage inventory> Manage products, select a product from the list of Current Products, and click Web

Edit button

Click to define and edit a product's Web options.

Options

- Not on Web - Enable to prevent the product from being viewed or sold on the Web.
- View on Web - Enable to allow the product to be viewed, but not sold, on the Web.
- Sell on Web - Enable to allow the product to be viewed and sold on the Web.
- Promote Product on Orders home page - Enable to promote the product as a Featured Product on the e-Orders main page and on every search e- Orders results page.

Product Info Hyperlink

Enter a URL to information about the product category. Click the Web icon to view the product category's information on the Web.

By default, this field populates with the value entered for the product's category in the Product Info Hyperlink field on the Web Options window (from Orders, select Set up tables > Product categories, select a category, and click Web Options).

Product Image Hyperlink

Enter a URL to an image representing the product category. Click the Web icon to view the product category on the Web.

By default, this field populates with the value entered for the product's category in the Product Image Hyperlink field on the Web Options window (from Orders, select Set up tables > Product categories, select a category, and click Web Options).

Thumbnail Image Hyperlink

Enter a URL to an image of the product. Click the Web icon to view the product on the Web.

Example URL

Displays an example of the proper format for entering a URL.

To enable a product for the Web

1. From Orders, select Manage inventory > Manage products to open the Manage products window.
2. Select a product from the list of Current Products.
3. Click Edit.
4. Click Web to open the Web Options window.
5. Enable the product for the Web:

- Not on Web - prevents it from being viewed or sold on the web.
- View on Web - allows it to be viewed, but not sold, on the web.

- Sell on Web - allows it to be viewed and sold on the web.

6. Enable Promote Product on Orders home page option if you want to promote the product as a Featured Product on your e-Orders main page and on every search results page.
7. Enter the Product Info Hyperlink.
8. Enter the Product Image Hyperlink.
9. Enter the Thumbnail Image Hyperlink.
10. Click Save.

Hands-on exercise: Define a Web product

1. Define the following Web product:

- Product Code: WLABELS
- Product Category: Web_CAT
- Title: Customer labels
- Desc: Set of mailing labels sold over the Web

2. Enter the following pricing information:

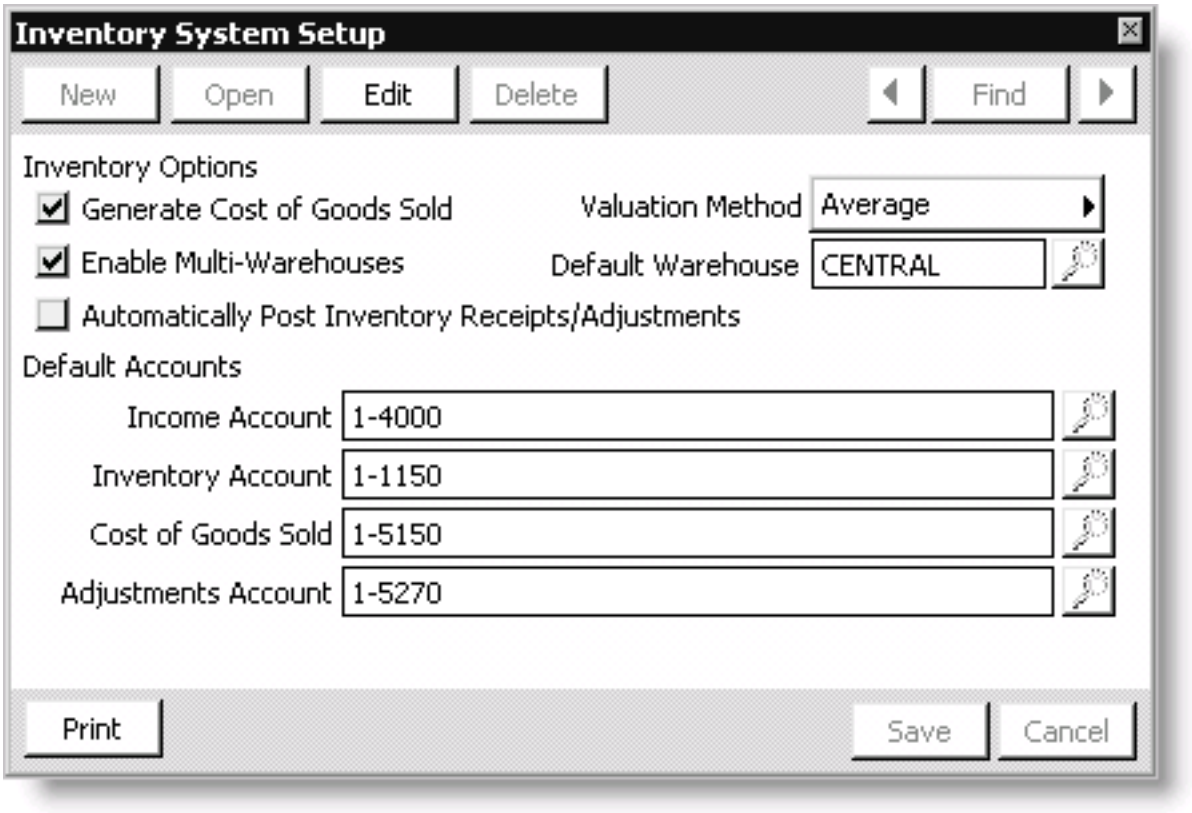
- Regular: 250
- Non-member: 375

3. Enable the Sell on Web option.

Setting up Inventory Defaults

Inventory defaults are the values that the system defaults to if you do not specify options or accounts at order entry. Set the inventory defaults in the Inventory System Setup window.

Inventory System Setup window



From Orders, select Set up module, and click Inventory

Inventory Options

Generate Cost of Goods Sold - Enable to track the cost of the products you sell. The cost of the products sold posts to the Inventory and Cost of Goods Sold accounts during the Invoice orders process. The Valuation Method field displays when you enable the Generate Cost of Goods Sold option.

Valuation Method - (Displays when the Generate Cost of Goods Sold option is enabled) Select the method you want to use to value your product inventory:

- Average - Select this method to determine the cost of goods sold as averaged over time.

  Average unit cost is calculated by dividing average total inventory cost by inventory on hand. Average total inventory cost is calculated using a two-step process:

- The total average unit cost of all invoiced products is subtracted from the average total inventory cost.
- The average total inventory cost then is divided by the updated product inventory on hand.

  A product's inventory on hand is recalculated each time products are invoiced. A product's average unit cost and average total inventory cost are recalculated each time inventory transactions are posted. The Product_Inventory.AVERAGE_COST field updates upon invoicing.

  When you invoice a product order, the product's average unit cost is calculated according to the product quantity on hand and the average total product inventory cost. This average total inventory cost can change every time you post an inventory transaction.

  For example, if you post inventory receipts for an individual product at a cost of $10 and $15 per unit, the total inventory on hand is two units, the average total inventory cost is $25, and the average product cost is $12.50. If you then sell one product and invoice the order, the total inventory on hand is one unit, the average total inventory cost is $25, and the average product cost is $12.50.

  However, if you then post another single product receipt for $15, the total inventory on hand is again two units, but the average total inventory cost and average product cost will be different: The average total product inventory cost will be $27.50 and the average product cost will be $13.75.

  To calculate the average total product inventory cost, subtract the total average product cost of the invoiced products ($12.50) from the average total product inventory cost ($40 - $12.50 = $27.5). To calculate the average product cost, divide the new average total product inventory cost ($27.5) by the current product inventory on hand ($27.5 / 2 = $13.75).
- Standard Cost - Select this method to use a fixed cost to determine the cost of goods sold. Depending on whether Multi-Warehouses is enabled, the Standard Cost is entered manually on either the Inventory or the Warehouses window, allowing you to build overhead costs into your cost of goods sold.

Enable Multi-Warehouses - Enable if individual products are stored in multiple warehouse locations. Warehouse locations are defined on the LOCATION general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

Enabling the Enable Multi-Warehouses option after posting products to inventory does not directly affect product inventory. As with all system setup changes throughout iMIS, changes do not update existing records. You simply need to enter your products' warehouses and inventory information on the Warehouses window (from Orders, select Manage inventory > Manage products, select a product from the list of Current Products, and click Warehouses).

Default Warehouse - (Enables only if the Enable Multi-Warehouses option is enabled) Enter the default warehouse you want to use when defining new products. Select the Find icon to look up a warehouse; warehouse locations are defined on the LOCATION general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

The warehouse entered displays by default in the Default Warehouse field on the Manage products window when defining new products. You can override a product's default warehouse on the Manage products window at any time.

Automatically Post Inventory Receipts/Adjustments - (Most users should not enable this option) Enable to post inventory transactions automatically. If you do not enable this option, you still can verify and edit your inventory transactions before posting them.

Since posted inventory transactions cannot be edited, automatically posting inventory receipts, adjustments, and transfers is not recommended. Also, if you automatically post inventory receipts, iMIS automatically commits the products in inventory and releases backorders.

Default Accounts

Income Account - Enter the default income account to which income posts. This account is used when an income account is not defined at the warehouse, product, or category level. If you leave this field blank, the income account will not be populated.

Inventory Account - Enter the default inventory account used for recording inventory reductions. This account is used when an inventory account is not defined at the warehouse, product, or category level. If you do not track your product inventory, you do not need to enter an account number.

Note: iMIS does not create an accounting entry when inventory is received. The system assumes that the entry is made to the General Ledger or Accounts Payable when receiving or paying for inventory.

Cost of Goods Sold - Enter the default account used for recording inventory costs when invoicing orders. This account is used if you do not define a cost of goods sold account at the warehouse, product, or category level.

Adjustments Account - Enter the default account used for posting inventory adjustments. This account is used if you do not define an inventory account at the warehouse, product, or category level. The Adjustments Account offsets inventory when you post inventory adjustments, for example, when inventory cost and quantity are adjusted for loss or damage.

To define inventory options

1. From Orders, select Set up module to open the Set up module window.
2. Click Inventory to open the Inventory System Setup window.
3. Click Edit.
4. Enable the applicable Inventory Options.
5. Enter the Default Accounts.
6. Click Save.

Using Multiple Warehouses with e-Orders

e-Orders supports multi-warehouse functionality. See the iMIS Orders guide for more on setting up the Orders module for multi-warehouses.

Placing Orders for Products with Sufficient Inventory

If Multi-Warehouses is enabled in iMIS, e-Orders always places product orders from each product's default warehouse. If a product's default warehouse does not have sufficient inventory in stock to fill an order, but all of the product's warehouses combined do have sufficient inventory to fill the order, then e-Orders will allow the customer to place the order.

e-Orders looks at the total product quantity available but only allocates product orders from a product's default warehouse.

Caution! As long as all of a product's warehouses combined have sufficient inventory to fill an order, the order will be placed.

Placing Orders for Products with Insufficient Inventory

If all of a product's warehouses combined do not have sufficient inventory to fill an order, then e-Orders processes the order just as it currently does when Multi-Warehouses is not enabled. How e-Orders processes an order for a product with insufficient inventory depends on whether backorder processing is enabled or disabled for e-Orders on the Module Config Files page:

- AllowOutofStockOrder = “No” - e-Orders reduces the ordered product quantity to equal the amount available in inventory, and the customer is notified that an adjustment has been made to the items in their basket.
- AllowOutofStockOrder = “Yes” - e-Orders allows the customer to place the order even though insufficient inventory is in stock.

Processing Pro Forma Orders in iMIS

Because all orders entered through e-Orders are entered as pro forma orders, no e-Series order is complete until it is converted to a standard order and processed through the appropriate order processing stages in iMIS.

For orders for which a product's default warehouse does not have sufficient inventory in stock to fill the order, the order then becomes backordered in iMIS, and the product quantity ordered is reserved at the default warehouse. The user processing the order in iMIS then is responsible for determining how the order should be processed.

User Considerations for Processing Pro Forma Orders when MultiWarehouses is Enabled

Users need to consider the following when processing pro forma orders in iMIS when Multi-Warehouses is enabled:

- Determine how to fill a pro forma order for a product when the product's default warehouse does not have sufficient inventory to fill the order. You have three choices:
- Transfer a sufficient amount of product inventory to the default warehouse to fill the order; or
- Edit the order using the Product Detail window to ship the product from a different warehouse location or from multiple warehouse locations; or
- Let the order wait in backorder status until the default warehouse has sufficient inventory to fill the order.
- Process all pro forma orders in a way that minimizes shipping costs. Shipping a product from its default warehouse may not always by the most efficient or inexpensive method of processing an order.

Selling Product Kits in e-Orders

e-Orders supports selling product kits. A product kit is a collection of products sold together as an individual unit for a single price. You define the kits in iMIS and then map the individual products to the product kits. Before you can map individual products to specific product kits, however, you first must define the individual products. Once you define your products, you then can map them to any number of product kits. Refer to iMIS Orders for more on product kits.

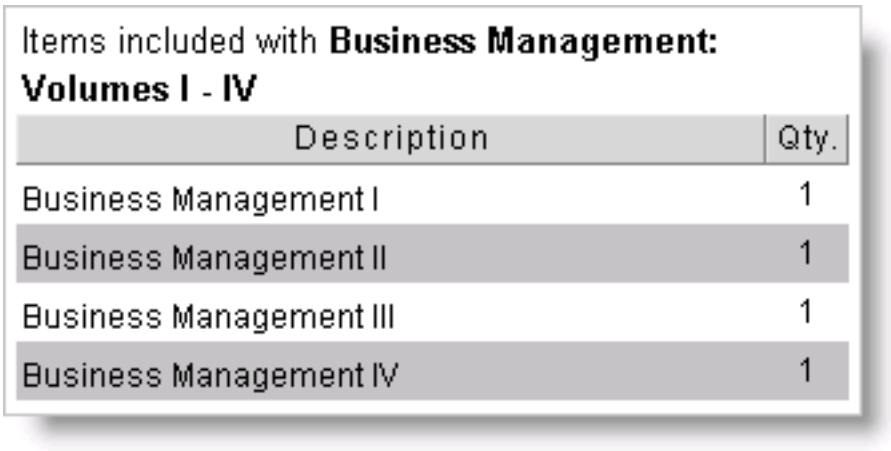
Note: iMIS must be licensed for Kitting before e-Series will use the e-Orders kitting logic.

Displaying and Selling Product Kits on the Web

Product kits function and display the same as individual products sold through e-Orders. Just as with all individual products, you can enable product kits either to sell or only to display on the Web, or you can disable the kits from displaying on the Web entirely.

Viewing Kit Items

Customers can view a list of the items that make up a product kit by selecting the new, customizable view kit items link on the products page. Selecting the link opens a window displaying all of the kit items.



Items included with **Business Management: Volumes I - IV**

Description	Qty.
Business Management I	1
Business Management II	1
Business Management III	1
Business Management IV	1

Example of the view kit items page listing the items in a product kit

Both the view kit items link and the text at the top of the view kit items window are customizable through the Module Config Files page (Admin> Style Form> Edit Config Files> select _eOrdersConfig.txt):

- view kit items link - Application.Orders.LinkTitle.ViewKitItems
- view kit items window text - application.orders.kitlistinfo1 and application.orders.kitlistinfo2

Product Kit Inventory

A benefit of product kitting is that you are able to maintain the inventory of your individual products even when they sell as part of a kit. Each time a customer purchases a product kit, the inventory of the individual products sold in the kit automatically updates within the Orders module of iMIS. By default, e-Orders allows customers to purchase products that are not in stock. This functionality also applies to product kits.

Product kits can be purchased even if individual kit items are not in stock. However, the Stock Item option must be enabled in the iMIS Manage products window for each item

that will be sold in a kit. Individual products that do not have the Stock Item option enabled cannot be sold as part of a kit.

Unless the items used in a product kit are in stock, the kit will be incomplete, and the customizable Out of stock message will display for the product kit on the products page. If your site is set up to accept out-of-stock orders, then the add to your products and view kit items links will display even if insufficient products are in inventory to complete the kit.

If your site is not set up to accept out-of-stock orders, then the add to your products link will not display for an out-of-stock product kit, and customers will not be able to purchase the product kit.

The view kit items link displays even if your site is not set up to accept out-of-stock orders, and customers can select the link to display the individual product kit items. Any out-of-stock item will display an out-of-stock message next to the item's description.

See Orders for more on managing product inventory.

Disabling the Acceptance of OutofStock Orders

To disable the acceptance of out-of-stock orders, the Application.Order.AllowOutofStockOrder variable must equal No in the _eOrdersConfig.txt file (Admin> Style Form> Edit Config Files> select eOrdersConfig.txt).

When the Application.Order.AllowOutofStockOrder variable is set to No, a validation check is performed against both the products available in inventory and the ordered quantity of the product or kit. If the ordered quantity exceeds the amount available in inventory, then the order adjusts automatically to the available amount, and the customer can purchase only the items currently in stock.

The order adjustment displays in the item's Qty field of the e-Orders your products page, and a customizable message displays in the page stating that the quantity requested exceeds the quantity in inventory. This message can be customized by modifying the Application.Orders.QtyAdjustment variable in the _eOrdersConfig.txt file (Admin> Style Form> Edit Config Files> select eOrdersConfig.txt).

Product Kit Confirmation

Both the Purchase Detail page and the Order Confirmation email include information about the individual products that make up a product kit.

On the Purchase Detail page, the Product Kit line lists the kit title, unit price, quantity, and total price of the kit. Each product used in the kit is listed as a bulleted item under the Product Kit line. The quantity of the individual products used in the kit displays next to the product titles. Any out-of-stock item will display an out-of-stock message next to the item's description.

An Order Confirmation email lists the product kit and the individual products that make up the kit. If your site allows out-of-stock orders, then a message displays next to the product line item that is out of stock.

Calculating Freight Charges in e-Orders

e-Orders supports the freight charge calculation methods implemented in iMIS Orders:

- Freight by Weight
- Freight by Total Value Ordered
- Freight by Total Quantity Ordered

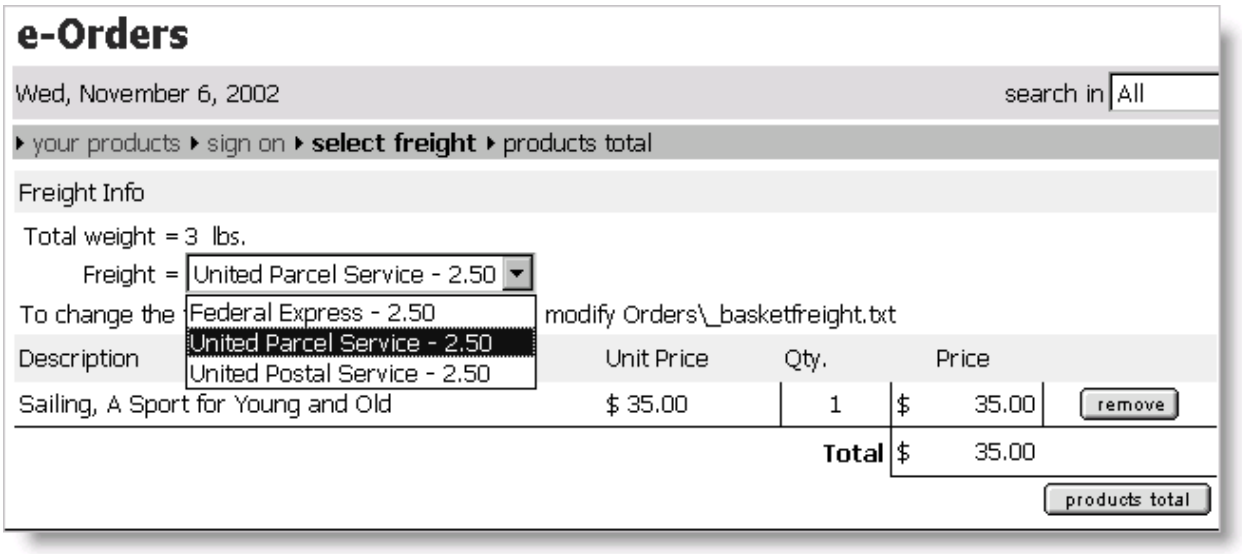
See Orders for more on setting up the Orders module for the new freight charge calculation methods.

Note: If the Automatic Calculation of Freight Charge option is disabled on the Add-on Charges window in Orders (from Orders, select Set up module, and click Add-on Charges), then freight charges will not be calculated for e-Orders, and shipping will be free.

Freight by Weight in e-Orders

When the Freight by Weight option is enabled on the Add-on Charges window in Orders (from Orders, select Set up module, and click Add-on Charges), e-Orders calculates order freight charges by weight.

The Freight Info area on the select freight page displays the Total weight of the order and the Freight drop-down list. Users can select which shipping method they want to use from the Freight drop-down list. The shipping methods that display in the list are limited to those for which weight tables have been defined on the Set up freight by weight window in Orders (from Orders, select Set up tables > Freight by weight).

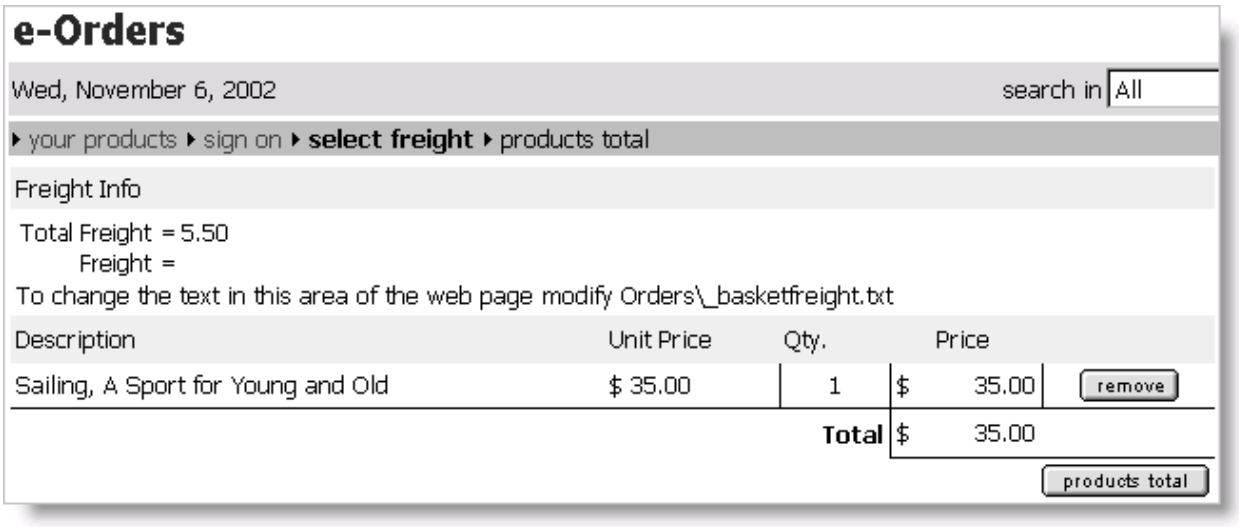


Example of the select freight page with the Freight by Weight calculation option enabled

Freight by Total Value Ordered

When the Freight by Total Value Ordered option is enabled on the Add-on Charges window in iMIS Orders (from Orders, select Set up module, and click Add-on Charges), e-Orders calculates order freight charges by order value.

The Freight Info area on the select freight page displays the Total Freight charge for the order, and the Freight drop-down list is disabled.



Example of the select freight page with the Freight by Total Value Ordered option enabled

Freight by Total Quantity Ordered

When the Freight by Total Quantity Ordered option is enabled on the Add-on Charges window in iMIS Orders (from Orders, select Set up module, and click Add-on Charges), e-Orders calculates order freight charges by order quantity.

The Freight Info area on the select freight page displays the Total Freight charge for the order, and the Freight drop-down list is disabled.

Example of the select freight page with the Freight by Total Quantity Ordered option enabled

Automatic Freight Calculation for International Addresses

e-Orders supports automatic freight calculation for international addresses when calculating freight charges by weight. As with Orders, freight calculation for international addresses is applicable only when calculating freight charges by weight. See Calculating Freight Charges for more.

Note: Shipping costs will not be calculated correctly for orders placed from countries for which shipping rates and zones have not been set up. See Orders System Setup for more on defining shipping rates and shipping zones.

Viewing Batches, Orders, and Activity records in iMIS

There are several things to remember about batches and activity records with e-Series:

- Batches are designated by an “I” at the end of the batch number.
- An activity record is created after a product is invoiced.
- You can view orders and payments made over the Web as you would in iMIS.

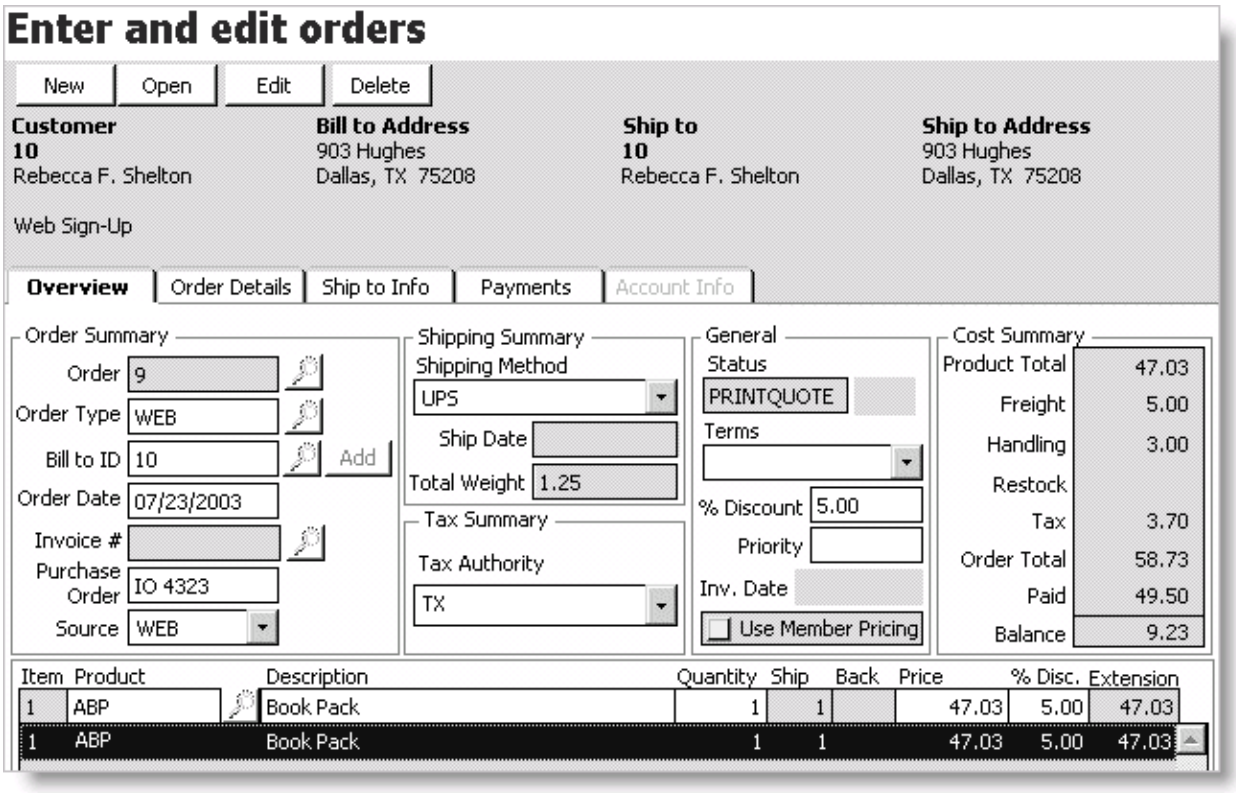
Viewing a Web batch in iMIS

Web batches are designated by the "I" at the end of the batch number. From AR/Cash, select Manage batches to open the Manage batches window.

To view e-Orders in iMIS

Because all e-Orders are pro-forma orders, you must convert a Web order to a regular.

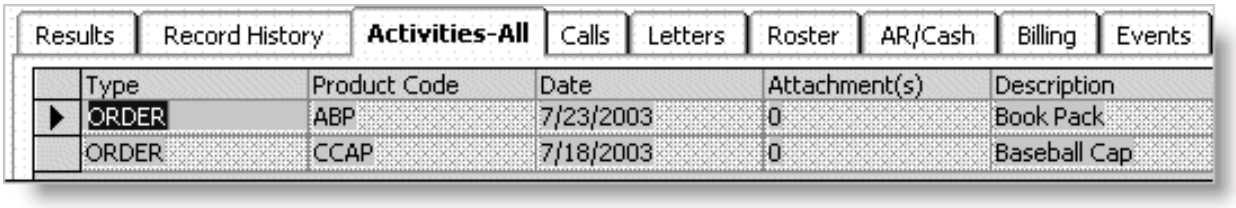
1. From Orders, select Enter and edit orders to open the Enter and edit orders window.
2. Click Open.
3. Enter the Order number, and press Tab to view the order:



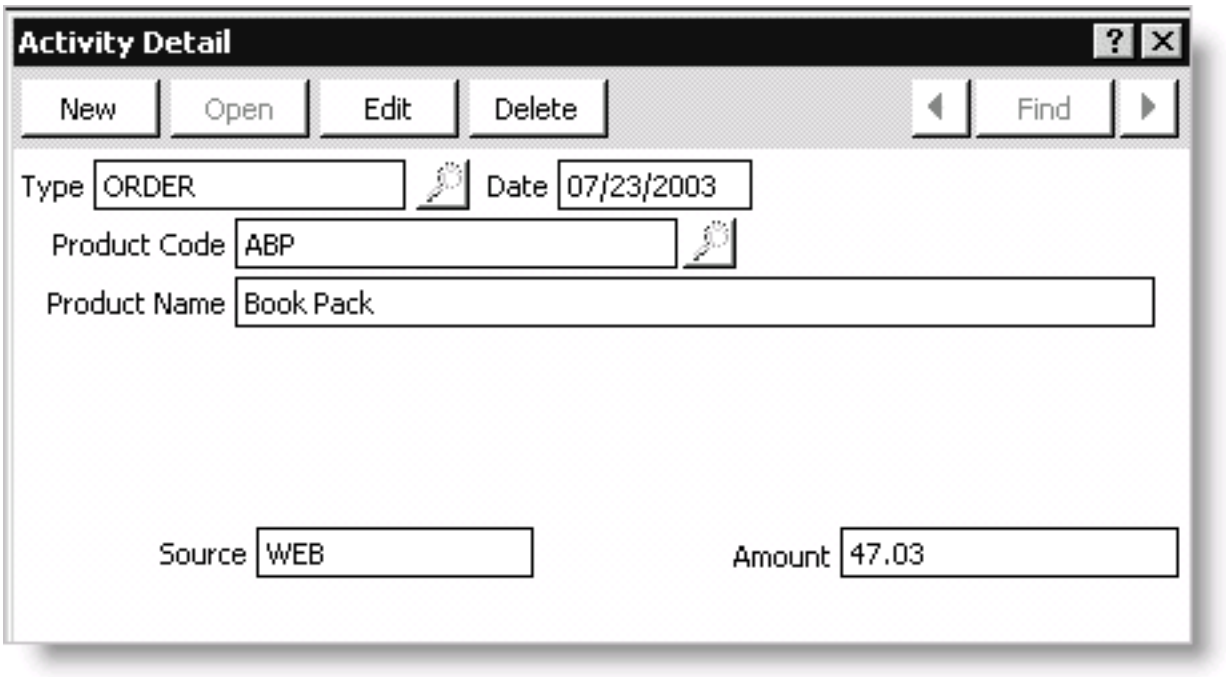
Enter and Edit Orders page

To view Web order activities

1. From Customers, select Manage customers to open the Manage customers page.
2. Open a customer's record.
3. Select the Activities-All tab in the History section.
4. Double-click an order activity line to open the Activity Detail window.



Activities-All tab



Activity Detail tab

Configuring Security

Overview of e-Series security

Security in e-Series is configured using security groups. Each security group allows the e-Series site administrator to grant different levels of access to the site and, ultimately, to the iMIS database.

Note: Configuring security groups is time-consuming, so plan accordingly.

e-Series supports up to 99 security groups. To simplify security group administration, you can do the following:

- Clone a security group
- Sort and organize by Access, Mode, Module, or Filter

The goal of this section is to give you the knowledge and skills necessary to configure security for your e-Series site.

After completing this section, you will be able to do the following:

- Create a security group
- Configure a security group
- Attach a security filter to a security group

Creating and Configuring Security Groups

The following items are required to successfully set up and configure security groups:

- e-Series installed on an active server
- Administrator authority and login ID for the application components
- Microsoft Internet Explorer 4.x (or later) or Netscape Navigator 4.x

With the e-Series security tool, you can identify groups of users who share similar access needs and requirements. Examples of these groups include the public, members of an organization, staff, regional offices, site administrators, and organization administrators.

The e-Series security feature allows you to create security groups and grant access authorization to specific modules and to individual fields within those modules.

Note: Although e-Series uses cookies, you do not have to worry about your customers' privacy because only the login is stored in a cookie.

To create or modify a security group, you must have authorization to access the Administrator security group and the administrative functions.

There are several considerations to keep in mind when setting up a security group:

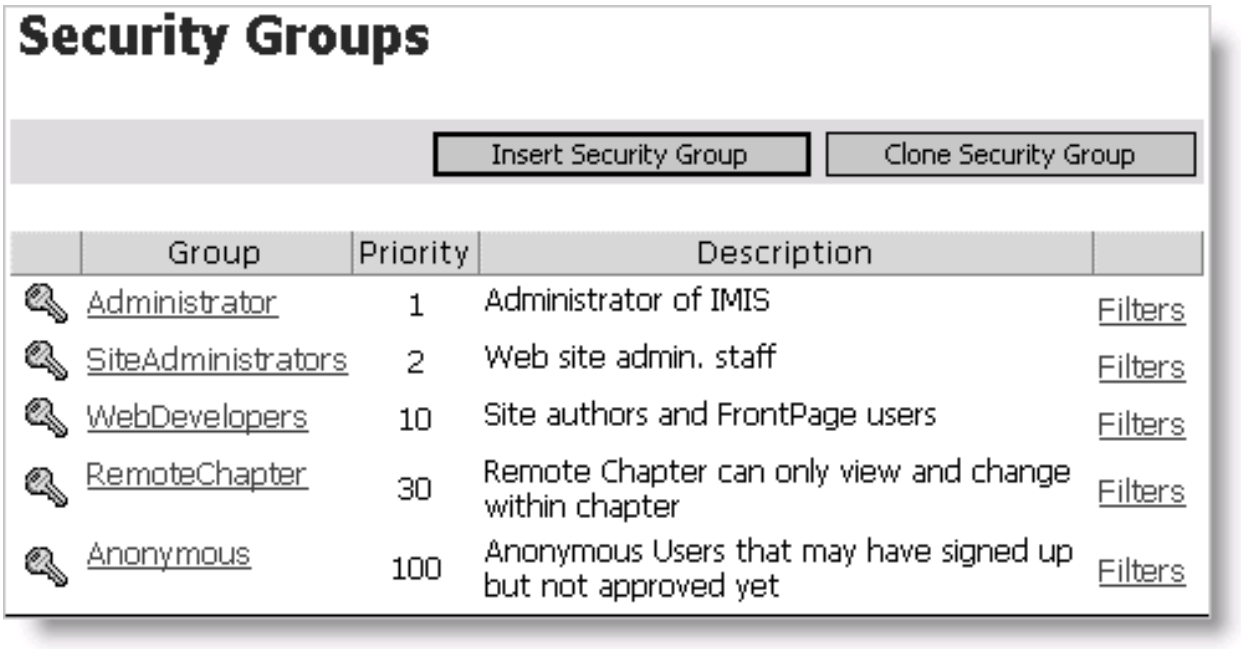
- When you run the Script wizards, the following default security groups are created: Anonymous, Administrator, Remote Chapter, Member, Site Administrator, and Web Developer. The Administrator and Anonymous security groups cannot be deleted.
- You can configure up to 99 security groups.
- You can create new security groups or you can clone existing groups.
- The Description field for a security group allows up to 255 characters.

- Security permissions for each group determine the data items the members of the group can view (Browse, Search) and change (Insert, Edit, Delete).
- A security group's privileges determine which individual or company records the group can access and what functions they can perform.

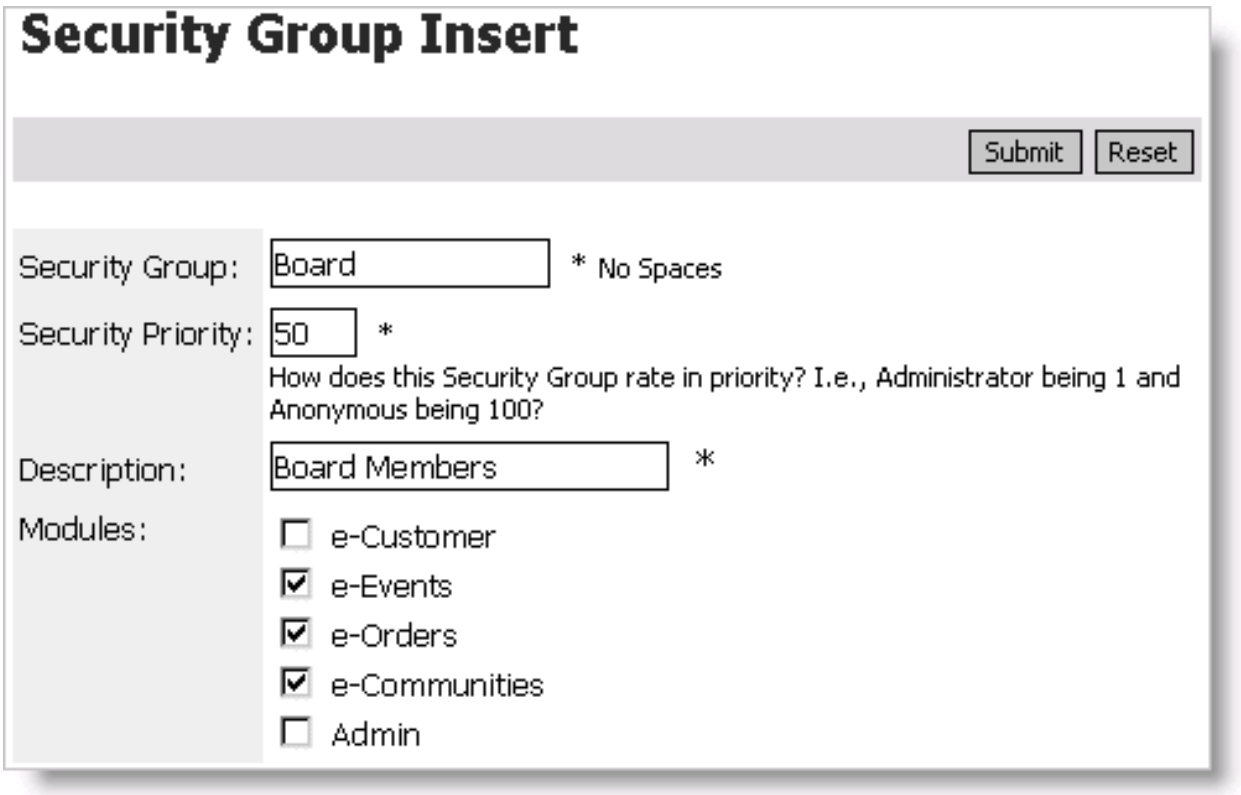
  Note: Although you can configure a security group so that its members may view member types and Paid Thru dates, those fields cannot be edited in e-Series. You can edit customer types and Paid Thru dates in iMIS only.

  To create a security group

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Security in the side index to display the list of default security groups.
4. Click Insert Security Group to display the Security Group Insert page.
5. Enter the name of the Security Group.
6. Enter the Security Priority. The priority number ranges from 1 = Administrator for full access to 100 = Anonymous for minimal access.
7. Enter a brief Description of the new security group.
8. Enable the Modules that this security group can access.
9. Click Submit. A message displays confirming that the security group information was inserted successfully.
10. Click OK to return to the Security Groups page.



Security Groups list

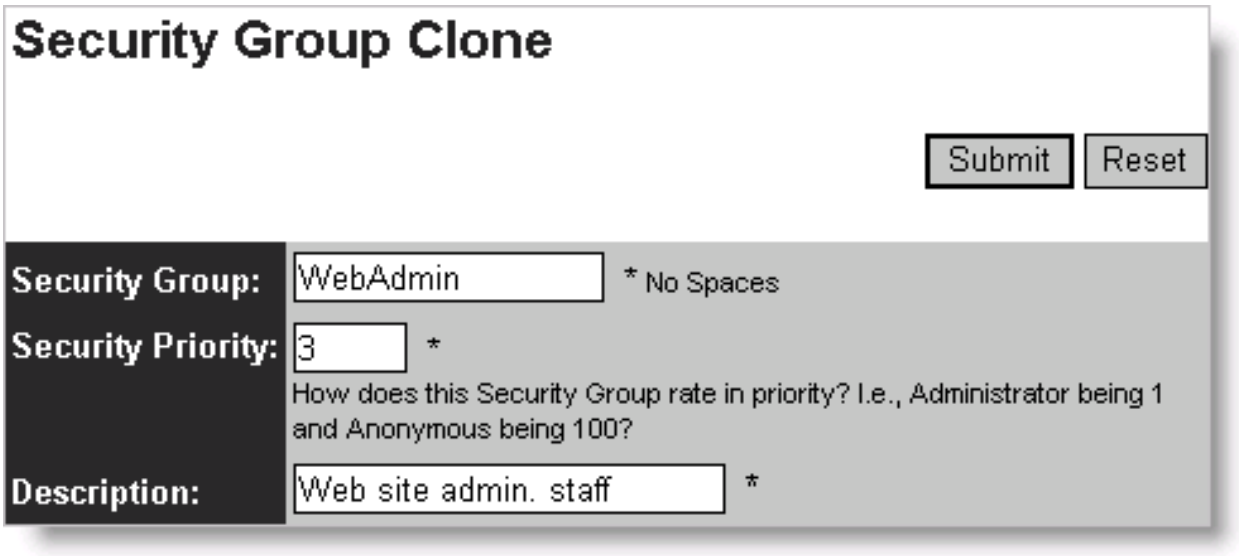


Security Group Insert page

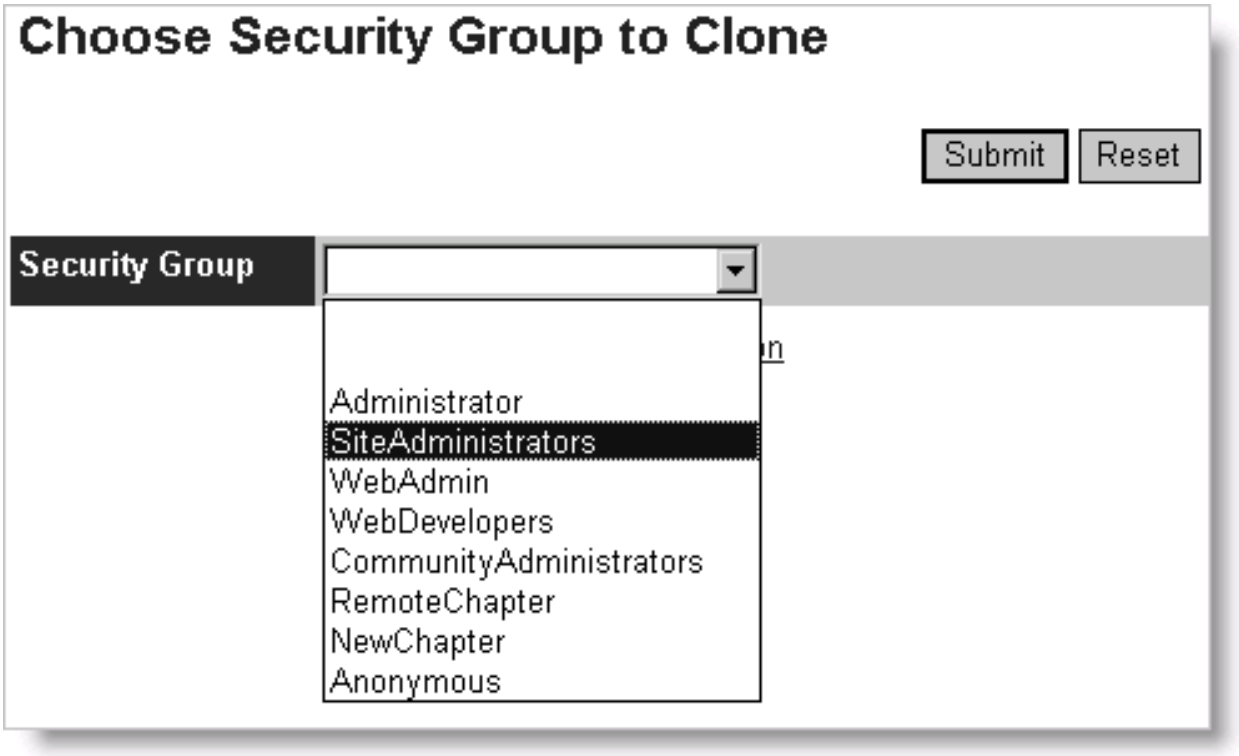
To clone a security group

Note: Sybase administrators cannot clone security groups and must create and configure new security groups as necessary.

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Security in the side index to display the list of default security groups.
4. Click Clone Security Group to display the Security Group Insert page.
5. Enter the name of the Security Group.
6. Enter the Security Priority. The priority number ranges from 1 = Administrator for full access to 100 = Anonymous for minimal access.
7. Enter a brief Description of the new security group.
8. Click Submit to open the Choose Security Group to Clone page.
9. Click the Security Group drop-down list and select the security group you want to clone.
10. Click Submit. A message displays confirming the security group information was cloned successfully.
11. Click OK.
12. The Detail Security filters and the modules the security group can access are the same as the cloned security group.



Security Group Clone page

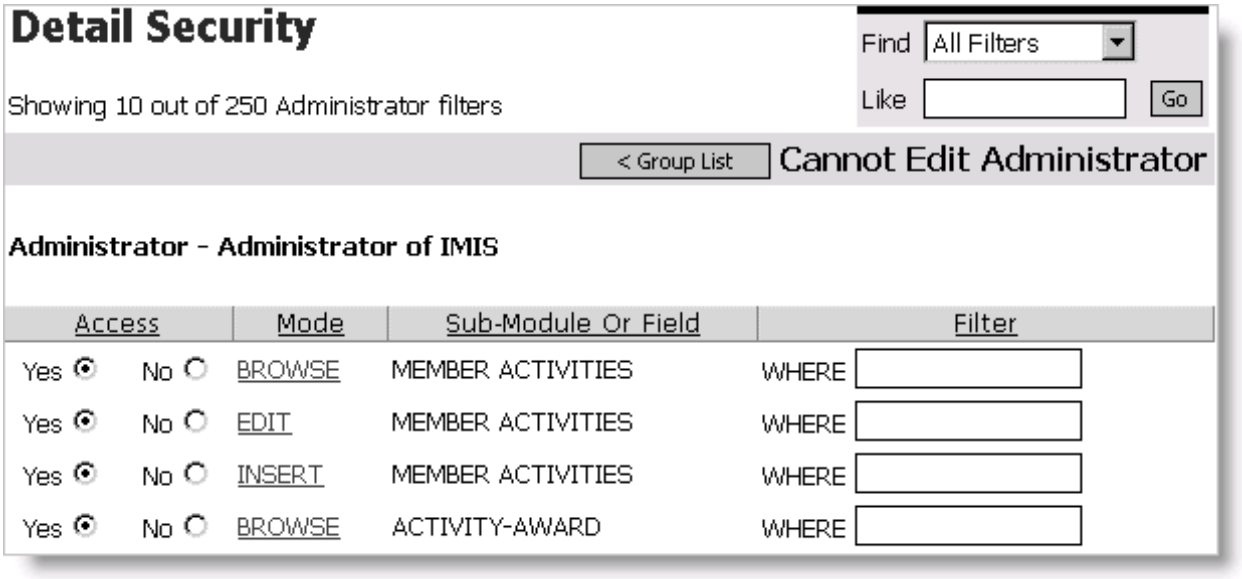


Chooser Security Group to Close page

Configuring a Security Group

Now that you have created a security group, the next step is to configure the security group. You will define the mode, sub-modules, and activities that members of that group can access. For example, you may allow the security group to view a record but not insert or edit a record.

Security groups are configured in the Detail Security page.



Detail Security page

Find

Select a security filter to view.

Like

Enter the title of the sub-module or field for which you are searching.

Go button

Used to perform the search.

Group List button

Used to return to the Security Group page.

Enable All button

Used to enable all security filters.

Disable All button

Used to disable all security filters.

Update All button

After you have edited the information, click this button to update all security filters.

Note: Clicking on the column headers will sort the filters by that column.

To configure a security group

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Security in the side index to display the Security Groups page.
4. Select a security group's Filters link to display the Detail Security page.
5. Find a specific activity or sub-module, or click Go to show all.
6. Configure the security group so that its members are able to view (Search and Browse), Insert, Edit, or Delete information.
7. Click the mode you have selected in each of the line items for the security group. The Detail Security Edit page displays.
8. Enable the Is this Security Detail Accessible? option if desired.
9. Leave the Which members are allowed Access? field blank to allow all members access to the security details.
10. Copy the filter definition that you want to use for the security of the line item selected (highlight and press Ctrl+C). Click Back to return to the Detail Security page.
11. Position your cursor in the appropriate field. Press Ctrl+V to paste the filter definition into the appropriate field in the Detail Security Edit page. If necessary, modify the filter definition.

12. Repeat steps 10 and 11 for each line item.
13. Click OK.

Allowing Anonymous Users to Search your Site's Directory

Security filters do not adapt easily to anonymous user access. The problem is that when a security filter is evaluated, the filter is thrown into a query that includes Name.ID-='#Client.ID#.' Since anonymous users do not have a Client.ID, the query will never return any rows.

A variable is created from the PreserveSingleQuotes (Variables.Filter) function that sets the AND criteria for search results, allowing search results to be returned for anonymous users.

If you want to allow anonymous users to search your site's Directory, only the Browse - Member filter should have a filter query; the Search - Member filter should not have a filter query.

For example, anonymous users will not be able to search your site's Directory if filter queries are defined for the following filters:

- Browse - Member: Name.MEMBER_TYPE='CM'
- Search - Member: Name.MEMBER_TYPE='CM'

The Search - Member filter is for page level security. If the Search - Member filter is enabled, anonymous users will not be able to access the search fields.

The Browse-Member filter is for record level security, and only the Browse - Member filter should have a filter query if you want anonymous users to have access.

Hands-on exercise: Configure the Member security group

Configure the Member security group you created in the previous exercise so that its members are:

- Able to View (Search and Browse) all aspects of their own member/contact record except notes, financial records, and relationships

- Able to Insert and Edit their own addresses, phone numbers, company name and ID, member security, and e-mail addresses
- Able to View (Search and Browse) another member record for name, company name and ID, address, fax, telephone numbers, and e-mail addresses
- Not able to View (Search and Browse) another member's home phone, home address, financial records, activities, relationships, notes, or meeting registration
- Not able to Insert, Edit, or Delete any data in any sub-module or field for another member's record
- Able to Register themselves for meetings

Setting up Security Filters

Security filters (sometimes referred to as WHERE clauses) allow the e-Series site administrator to display certain areas of a website only to a specified group of members. For example, an organization may want the logged-in user to view only their record information and no one else's. You can accomplish this by adding a security filter that states Name.ID='#Client.ID#'. The #Client.ID# variable has been created in ColdFusion and is used throughout the user's session.

View the list of available #Client.ID# variables in your /ScriptContent/appenv.cfm file.

Tip: Turn on ColdFusion debugging so you can see where the filter is being placed in the SQL query. You will then know what tables you can use, what format they should be in, and what they can do to maximize functionality.

Note: ColdFusion recognizes only the first variable and ignores all others. Therefore, use only one variable at a time.

When setting up Member Security on your e-Series page, you can use “where” clauses to narrow down the members' access to a feature. Any search condition available to your SQL Server can be used. List one ColdFusion parameter per where clause, and each parameter must be surrounded by pound signs (#).

The following are examples of where clauses with more detailed restrictions:

Name.ID='#Client.ID#' or '101'=Name.ID

Name.CO_ID = '101' and Name.MEMBER_TYPE = 'CM'

For members of a Security group to be able to change their login information on the web-site, you enable the following filters:

Browse - MEMBER SECURITY

where Name.ID = '#Client.ID#'

Edit - MEMBER SECURITY

where Name.ID = '#Client.ID#'

Browse - MEMBER-NAME SECURITY LOGIN

where Name.ID = '#Client.ID#'

Edit - MEMBER-NAME SECURITY LOGIN

where Name.ID = '#Client.ID#'

To attach a security filter to a security group

1. Log in to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin> Security in the side index to display the list of security groups.
4. Select the desired security group to display the Security Group Edit page.
5. Click Detail Security to open the Detail Security Edit page. Ten filters (by default) display on the page. The number of filters that display is set in the System Parameters.
6. Click on a Mode to open the Detail Security Edit page.
7. Enable the Is this Security Detail Accessible? option.
8. Leave the Which members are allowed Access? field blank. Leaving this field blank gives all members access to this security detail.
9. Copy a filter definition and click Back to return to the Detail Security page.

10. Select Paste or press Ctrl+V to paste the filter definition into the appropriate field on the Detail Security page.
11. Repeat steps 9 and 10 for each line item.
12. When you finish configuring the security group, click Update.
13. Click OK.
14. Select Admin> Lookups in the side index and click Update System Variables to update the security information.

Multi-Instance Filter e-Series

Browse filters are used on the multi-instance UD_DisplayList.cfm page.When viewing the Multi-Instance User Defined field, the max columns that display on the ud_dis-playdetailList.cfm page is four. If more than four columns were allowed to display, the user would have to scroll to the left to see the additional columns.

The UD_DisplayList.cfm page will use the security filter setting of the fourth field on the window for all fields on the window and will only display the first four fields. If you enable showfilter you can demonstrate that only the filter on the fourth field is used.

Customizing e-Series

Overview of e-Series site customization

e-Series provides you with the ability to customize the interface of your e-Series site in order to reflect the image of your organization. You have the ability to customize:

- Site styles
- Site options
- Prompts and labels
- Headers and footers
- The side index, top banner, and top navigation bar

The goal of this section is to give you the knowledge and skills necessary for customizing your e-Series site.

After completing this section, you will be able to do the following:

- Customize the e-Series interface
- Customize e-Billing
- Customize e-Communities
- Customize e-Customer Management
- Customize e-Events
- Customize e-Orders

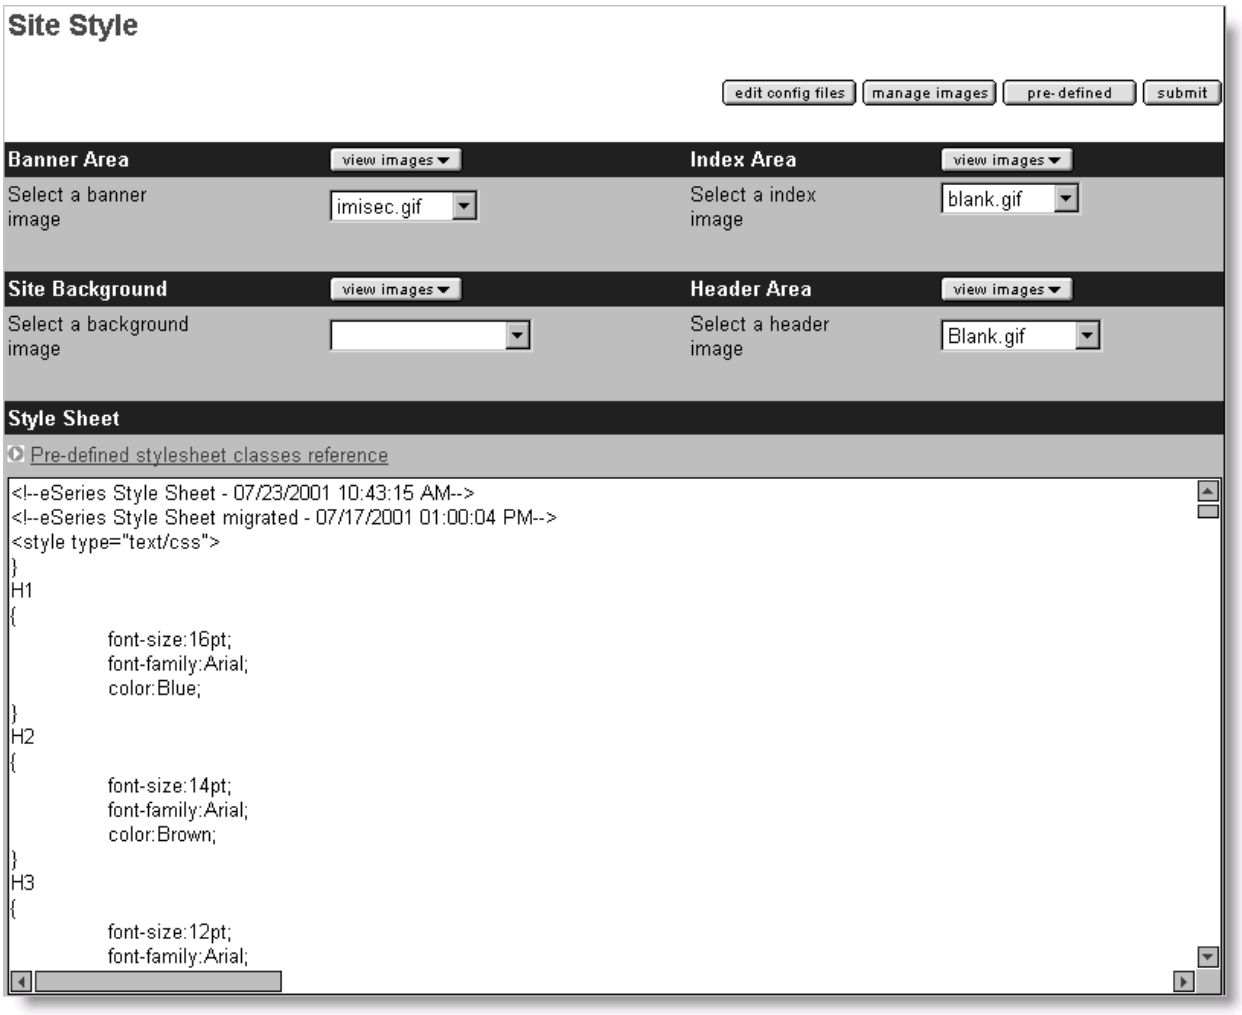
Customizing the e-Series Interface

This version of e-Series provides a style sheet structure (.css files) to specify display appearance. In addition, all e-Series modules have configuration files that allow you to customize onscreen text in prompts and labels.

This customization is accomplished through a user-friendly interface with edit capability. Or, you can download one of the pre-defined style sheets and edit it with an external style sheet editor using our defined style classes.

Image buttons are located in the Customer\Source\Images directory. Use an image editing tool such as Paint Shop Pro or Photoshop to change the text on a button image.

Site Style Page



Admin> Style Form> Edit Site Options

edit config files button

Opens the Module Config Files page and edit your sites configuration files.

manage images button

Opens the Manage Images - Upload page and upload images to your e-Series site.

pre-defined button

Opens the Pre-Defined Style page and select an existing style sheet template for your site.

Submit button

Click to submit any changes you have made to the site style.

Banner Area

view images button - Click to view the available banner images.

Select a banner image - Select a banner from the drop-down list.

Index Area

view images button - Click to view the available index images.

Select a index image - Select a index from the drop-down list.

Site Background

view images button - Click to view the available background images.

Select a background image - Select a background image from the drop-down list.

Header Area

view images button - Click to view the available header images.

Select a header image - Select a header image from the drop-down list.

Style Sheet

Pre-defined stylesheet classes reference - Click to display the pre-defined class names and the areas of the site where they are used.

Style Sheet Area - This area displays the active style sheet.

Button Bar

Select to activate the hover effect on normal form buttons.

To customize prompts, fields, and config variables

1. Log on to your e-Series site as an administrator.

2. Select Admin in the top navigation bar.
3. Select Admin > Style Form in the side index to display the Website Style and Prompts page.
4. Click Edit Config files to open the Module Config Files page.
5. Click the drop-down list and select the appropriate config file.

   The config file is opened in an edit box.
6. Edit the text within quotation marks to change the onscreen text. Use the scroll bars on the edit box to view more text if necessary.
7. On the upper right portion of the Module Config Files window, click submit changes to save the changes.

   A message informs you that site variables and styles have been updated.

   To customize site options

1. Log on to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select Admin > Style Form in the side index to display the Website Style and Prompts page.
4. Click Edit Site Options to display the Site Style page or click download the body style sheet to use an external style sheet editor.
5. Click manage images to display the Manage Images - Upload page and upload images to your e-Series site.
6. Select the desired file destination from the drop-down list:

- Images
- Site Background
  - Header Area
  - Index Area
  - Banner Area

- Bullets
- Icons

- Source - images

7. Enter the image file name or browse to the file.
8. Click send to upload the image to your e-Series site. A message displays confirming that the image was uploaded.
9. Click the back button on your browser to return to the Site Style page.
10. Click pre-defined to select an existing style sheet template for your site: iMIS 10, ASI, Standard, or Black and White, and click submit. Click close to return to the Site Style page and make modifications to the pre-defined style sheet.
11. Select an image for the top of all pages from the banner image drop-down list. Click view images to view the available banner images.
12. Select an image for the top left area from the index image drop-down list. Click view images to view the available index images.
13. Select a background image from the drop-down list. Click view images to view the available background images.
14. Select an image for the top area of the body section from the header image drop-down list. Click view images to view the available header images.
15. The Style Sheet area displays the active style sheet. Click pre-defined style sheet classes references to display the pre-defined class names and the areas of the site where they are used.
16. Select whether to turn the Button Bar on or off to activate the hover effect on normal form buttons.
17. Click submit to save the changes. A message displays confirming that the style variables have been updated. Click OK.

    To customize the header and footer

You can customize the header and footer on your static pages.

1. Open the eSeries\Customer\ScriptContent\header.cfm or footer.cfm file with a text editor, such as NotePad or WordPad.

   Note: Do not open the header.cfm or footer.cfm files with FrontPage.

2. Modify the header or footer. You can copy and paste to modify the header or footer.
3. Save the changes and close the cfm file.

   To customize the top banner

   Change the size of the top banner or replace the banner with your own HTML page by modifying the Top.cfm file.

1. Open the Top.cfm file with a text editor, such as NotePad or Word Pad.
2. Change the following line:

   150<FRAMESET FRAMEBORDER-R=”0”FRAMESPACING=”1”border=”0”ROWS=”55”,*”>.

3. Save the changes and close the Top.cfm file.

   To customize the side index

   Change the width of the side index by modifying the Side_Index.cfm file.

1. Open the Side_Index.cfm file with a text editor, such as NotePad or Word Pad.
2. Change the following line:

   150<FRAMESET FRAMEBORDER-R=”0”FRAMESPACING=”1”border=”0”COLS=”150”,*”>.

3. Save the changes and close the Side_Index.cfm file.

Customizing e-Billing

You can extensively customize the display appearance and content of the e-Billing module by editing a set of text-based settings files. This section identifies the files you can

customize and explains the options in the module configuration file.

The settings files are all unencrypted and can utilize standard text, HTML, or ColdFusion to display customized content. The file names begin with an underscore (_) so that they sort to the top of the directory and are easy to identify.

Settings files

_addmessage.txt	Content displayed on the Add to Basket page
_duesoffmessage.txt	Content displayed when e-Billing is turned off in System Parameters
_editmessage.txt	Content displayed on the Edit Payment page
_ebillingconfig.txt *	Sets numerous instances of text, prompts, colors, and other formatting used repeatedly throughout the site.
_noduesmessage.txt	Content displayed on the Add to Basket page when the customer has not been billed for any dues items

Customizing e-Communities

e-Communities is an area where visitors with like interests can browse, learn, collaborate, and participate in discussions on a topic of common interest. The e-Communities module allows you to create and manage a wide variety of communities for your organization's website. You can define an unlimited number of communities to discuss a number of general interest topics, or you can facilitate a group setting such as a committee or board.

Visitors or members can view community news, contribute to discussion forums, and contribute or download shared documents.

Setting document archive default sort orders

You can configure the default sort order of e-Communities archived documents to be one of the following:

- FILE_NAME
- FILE_DESCRIPTION

- DATE_STORED
- FILE SIZE

  You can configure the default sort order of document archive folders to be one of the following:

- FOLDER_TITLE
- FOLDER_DESCRIPTION

  Use the Module Config Files window (see "To customize prompts, fields, and config variables") to find and modify the following lines in the eCommunities configuration file:

  <!--- Folder and File Sort--->

  <CFSET Application.Communities.DefaultFolderSort = "FOLDER_DESCRIPTION">

  <CFSET Application.Communities.DefaultFileSort = "DATE_STORED">

  To change date formats for e-Communities email

  You can set the e-Communities email date to the local date format by editing the emtyE-mail.txt file located in the /Source/Communities folder.

  Add a line as in the following example.

  <!---Change Client.System.DateMaskShort to mm-dd-yyy Example: 08-10-2002 --->

  <cfset Client.System.DateMaskShort = “dd/mm/yyy”>

  Note: Only edit this file if you are an experienced administrator and know the syntax requirements of ColdfUsion.

  To change the email notification colors

  If you use LISTSERV and you update the cmtyemail.cfm file, users will receive HTML e-mail notifications with color-coded cells as shown in the following example:

Advanced Solutions International, Inc.	
Forum: Crystal Reports	
Topic: Adding Crystal reports to iMIS Author: Douglas A. Hunt, Jr.	09/14/2001
Title: Adding Crystal reports to iMIS Author: Douglas A. Hunt, Jr.	09/14/2001
I'm having a problem adding a Crystal report to iMIS.	

To customize email notification colors

If you want to change the colors, modify the following section in the cmtyEmail.txt file (…\Source\Communities\CmtyEmail.txt):

<!---Header and footers contained in email body--->

<!---Change cell and text colors of html emails--->

To set the default remailing option for news item updates

1. Log on to your e-Series site as an administrator.
2. Select Admin in the top navigation bar.
3. Select e-Series in the side index to display the Lookups List page.
4. Select System Parameters from the menu at the top of the page to display the System Parameters page.
5. Select e-Communities from the menu at the top of the page to move to the e-Communities section
6. Select the Default setting for News Items to be re-emailed when edited option.

Setup for LISTSERV addresses for e-Communities

You can specify the LISTSERV email address options on the System Parameters page.

LISTSERV Public Respond Email Address

Appears in the From address of e-Communities email messages. If this is not specified, the From address field for e-Communities is left blank. This can cause email to bounce.

LISTSERV Private Respond Email Address

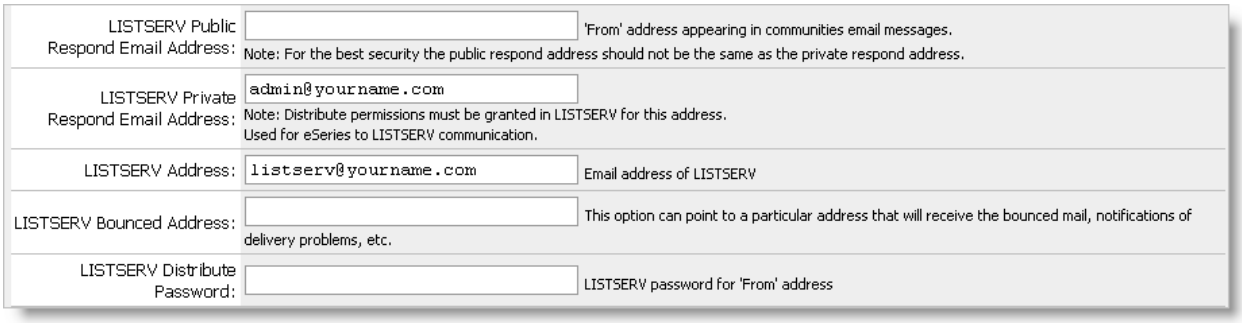
Specifies the From address for email directed to LISTSERV.

LISTSERV Address

Specifies the address used to send LISTSERV jobs (and LISTSERV commands) to the LISTSERV server address for LISTSERV email. This is the To email address for LISTSERV. This address is set when you install LISTSERV.

LISTSERV Bounced Address

Specifies the email address for bounced email. If you do not enter a value for this field, the LISTSERV Public Respond Email Address is used for returning bounced email.



System Parameters LISTSERV options

Customizing e-Customer Management

The _eCustomerConfig.txt file is the main location for specifying custom text, prompts, color, and formatting for the entire e-Customer Management module. Some of the settings by default accept site-wide application settings that are set in the _eSeriesConfig.txt file.

Customizing e-Events

e-Series provides configuration files for e-Events that allow you to customize prompts and labels.

e-Series provides web facilities for administrators to access configuration files with customizable prompts on the organization webserver. A new configuration file, _

eEventsConfig.txt, has been added to the Source/ModuleConfig directory, which can be selected from a list and edited through a text area provided by the interface. The configuration files are backed up when upgraded allowing the customization to be saved and migrated back into the site.

Only administrators or users with security privileges for the style options area access the interface to edit the configuration files for the e-Series site.

Number of Members Listed on Events Registration Page

You can specify the number of members listed in the drop-down list on the Events Registration page. By default the Members list is limited to 100. Modify either the Source/Meeting/Application.cfm file or the EventsConfig.txt file.

Place the maximum number of members you want to appear in the Members drop-down list by inserting the following line.

<cfset application. eventscoMembersSelectListMaxRows = “1000”>

You may substitute your maximum number for “1000”.

Note: You will see this drop-down list on the Events Registration page if you have enabled the Select option under the e-Event Registration ID Field Type. (Admin>Lookups>System Parameters>e-Events>e-Event Registration Type ID Field) The Select option allows you to register multiple company members.

Customizing e-Orders

You can extensively customize the display appearance and content of the e-Orders module by editing a set of text-based settings files. This section identifies the files you can customize and explains the options in the module configuration file.

The settings files are all unencrypted and can utilize standard text, HTML, or ColdFusion to display customized content. The file names begin with an underscore (_) so that they sort to the top of the directory and are easy to identify.

Settings files

_addressmessage.txt	Content displayed on the Shipping Address page above shipping address form entries

_applyproductsmessage.txt	Content displayed on the final Checkout page if products have not yet been applied to the basket
_contactmessage.txt	Body of the email message sent to the Membership contact when a customer indicates that they are interested in becoming a member
_customcontent.txt	Content displayed on the right side of the site pages under Search/Department/Product navigation
_moduleconfig.txt	Sets numerous instances of text, prompts, colors, and other formatting used throughout the site. See the following section for more information on this file.
_promoteareatext.txt	Content displayed when there are no products featured or set to promote in iMIS
_signonmessage.txt	Content displayed on the Sign on page above member login and new customer/account creation
_storeclosedmessage.txt	Content displayed when the e-Orders store is not set to open in the System Parameters
_welcomemessage.txt	Content displayed above the featured products when the customer navigates to Home
stylesheet.css	Style settings used throughout the e-Orders module. Not all colors and settings for this module come from this style sheet. For example, the color of table headings in the body of the e-Orders pages comes from the main StyleSheet.cfm file unless that is overridden in the _moduleconfig.txt file.

Hands-on Exercise: Change customization settings

The following exercise demonstrates how easy it is to change the customization settings. Note that you can develop any number of pre-designed _moduleconfig.txt files and simply replace the “standard” version with one of those replacements during the prototyping stage.

1. Rename the “..\Source\orders_moduleconfig.txt” file to “..\Source\orders__moduleconfig.org”.

2. Rename the "..\Source\orders_moduleconfig.new" file to "..\Source\orders__moduleconfig.txt".
3. Log back into the e-Orders module.

Setting up Registrant Class Fees in e-Events

How a Registrant Class is Assigned to a Registrant

How a registrant class is assigned to a registrant depends on whether the Copy Member Type to Registrant Class option is enabled or disabled in the e-Events System Parameters:

1. Copy Member Type to Registrant Class enabled - The registrant's customer type is copied to the registrant class ONLY if the registrant's customer type and registrant class match. For example, if a registrant has a customer type of A and a registrant class of A, then A will populate the Registrant Class drop-down list on the Event Registration page by default. If the registrant's customer type and registrant class do not match, then the following rule applies.
2. Copy Member Type to Registrant Class disabled (or enabled but no match exists between the registrant's customer type and registrant class) - The registrant class will default to either Member or Non-Member depending on whether the registrant is a member or non-member customer. The following rules dictate member pricing eligibility:

- If the Use Parent Company Pricing option is disabled (or the Company ID field (CO_ID) is not populated for the customer's record), then the registrant's own member status is used to determine which class is assigned. Otherwise, if the Use Parent Company Pricing option is enabled (and the Company ID field is populated for the customer's record), then the registrant's class is dependent on the member status of the parent company.
- If the Is a Member option is enabled for the registrant's (or parent company's) customer type in iMIS on the Set up customer types window (from Customers, select Set up module> Customer types), and the registrant's (or parent company's) customer status does

not begin with S, I, or D, then the registrant will be eligible for member pricing, and the registrant class will default to Member.

Allowing Users to Select a Registrant Class

Specific parameters can be set that allow users to select or override their Registrant Class when registering for events. This feature typically is reserved for an administrator and for specific security groups. The following parameters must be set to allow users to select or override their Registrant Class:

- Enable the Copy Member Type to Registrant Class option
- Disable the Disable Registrant Class field option
- Enable (Yes) the Meet Class Reg Over Ride security filter for user security group(s)

The Application.cfm file controls which registrant classes display in the Registrant Class drop-down list. By default, the drop-down list will include registrant classes that match the member types plus Member and Non-member.

Set the appropriate system variable options based on the following settings (...\Source\Meetings\application.cfm):

- Default setting - Only the Administrator security group can view Registrant Classes that do not have corresponding Member Types:

  APPLICATION.REGCLASSEXTGROUP_U = "NA"

  APPLICATION.REGCLASSEXTGROUP_G = "NA"

- All groups setting - All security groups can view Registrant Classes that do not have corresponding Member Types:

  APPLICATION.REGCLASSEXTGROUP_U = "All"

  APPLICATION.REGCLASSEXTGROUP_G = "NA"

- Specific group setting (only one) - Only the Administrator security group and the one other security group specified (in this case, Members) can view Registrant Classes that do not have corresponding Member Types:

  APPLICATION.REGCLASSEXTGROUP_U = "NA"

APPLICATION.REGCLASSEXTGROUP_G = "Members"

- Custom setting - Reads from a custom array to allow everyone the same Registrant Class view:

  APPLICATION.REGCLASSEXTGROUP_C = "Custom"

  The regclass.txt file (...\Source\Meetings\regclass.cfm) can be modified to set a list of hard coded registrant class options into an array that displays on the Event Registration page.

  Note: At a minimum, M and NM custom options should be used, and pricing should be defined on the Event Function Definition - Fees window (from Events, select Define an event, double-click an event, double-click an event function, click More, and select Fees). If a custom value is entered that does not have pricing set up and is selected during a registration, the registrant class pricing will default to General pricing.

Restricting Users from Selecting a Registrant Class

To prevent the Registrant Class drop-down list from displaying when the Copy Member Type to Registrant Class option is enabled, you have two options:

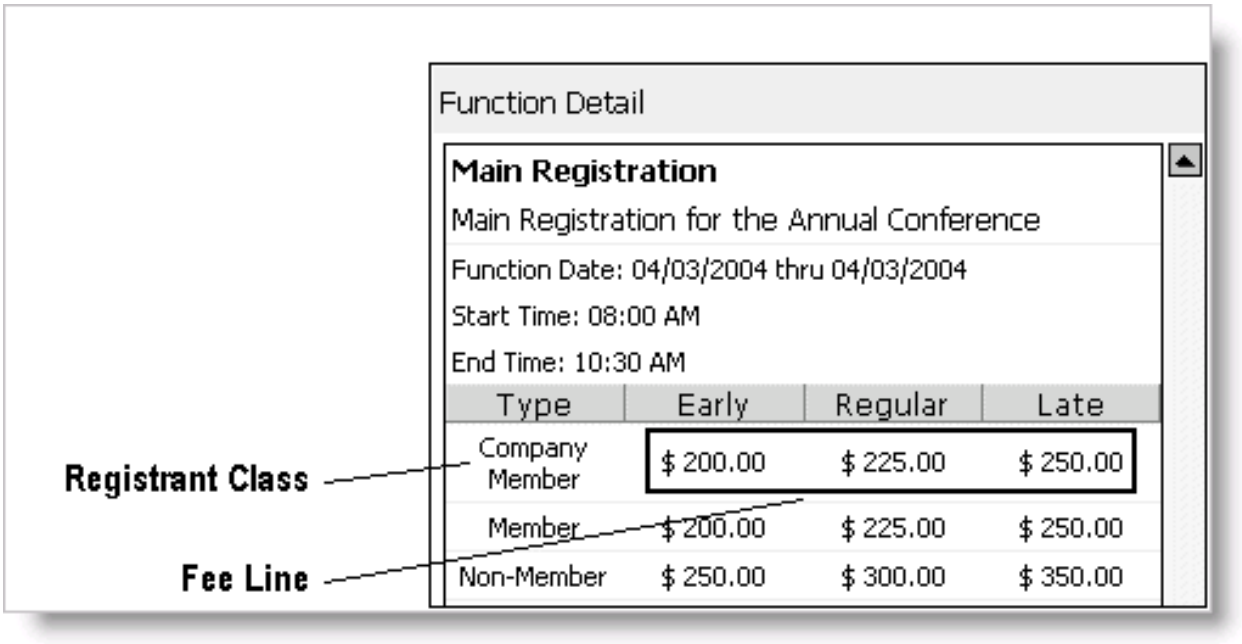
- Preventing all users from selecting a registrant class:
  Enable the Disable Registrant Class field option in the e-Events System Parameters to disable the Registrant Class drop-down list on the Event Registration page.

  Or

- Preventing security groups from selecting a registrant class:
  Disable the Meet Class Reg Over Ride security filter on the Detail Security page to prevent the Registrant Class drop-down list from displaying on the Event Registration page.

  By disabling the Meet Reg Class Over Ride filter, the Copy Member Type to Registrant Class parameter duplicates the functionality of the Copy Membership Type to Registrant Class option in iMIS without allowing customers to edit their Registrant Class when registering for events.

Reviewing the Function Detail section of the Event Registration page



Example of the Function Detail section of the Event Registration page

Registrant Class

The Description defined for the registrant class on the Set up registration classes window (from Events, select Set up tables > Registration classes) displays in the Function Detail section of the Event Registration page. If a Description is not defined for a registration code, the registrant Type will be blank in the Function Detail section. General displays for the Default registrant class if it displays in the Function Detail section.

Fee Line

A registrant class's fee line will display in the Function Detail section only if fees have been defined for the Registrant Class on the Event Function Definition - Fees window (from Events, select Define an event, double-click an event, double-click an event function, click More, and select Fees). If fees have not been defined for a specific Registrant Class or the Default registrant class, then no fee lines will display in the Function Detail section. The following is required on the Event Function Definition - Fees window for a fee line to display for a Registrant Class:

- The Comp option is enabled for the Registrant Class; or
- At least one of the fees (Early, Regular, or Late) is defined (non-zero) for the Registrant Class

Applying Fees to Registrants

The following rules govern which fees display in the Function Detail section and apply to a registrant:

- If fees are defined for the user's registrant class, then the fees defined for the user's registrant class apply.
- If fees are not defined for the user's registrant class, then the fees defined for the Default (General) registrant class apply (if defined).
- If fees are not defined for either the user's registrant class or the Default (General) registrant class, then no fee lines will display.

Displaying Registrant Class Fees in the Function Detail Section

This section summarizes the setup options required for displaying registrant class fees in the Function Detail section of the Event Registration page.

The function fees that display in the Function Detail section will depend on the following setup options:
