Try renaming the iMIS directory to a shorter name. Make sure to change the ODBC database path and the shortcut target path with the shorter name.

Error log files

The Customer Portfolio creates a log file (asiMMDDYYYY.log) each day. The log file records errors and other information. Error log files are deleted after five days. Depending on your operating system, the location for the log file varies. For any Windows operating system, you can go to Start > Run on the computer running the Desktop client. Type %TEMP%/asiTemp and then click OK to open an Explorer window with the temp directory opened. As another example, on Windows 2000, the log files are stored in the \Document and Settings\(Your username)\Local Settings\Temp\asiTemp directory.

Customer Service

Your Advanced Accounting Console includes a Customer Service page with quick access to often-used features. The Customer Service area allows your staff to process event registrations, orders, fundraising gifts and pledges, and payments. In addition, your organization can sell products and services from various areas and apply payment for the products or services with a single check or credit card transaction.

The license keys needed for each area are:

- Customer Service (SERVCEN)

Customer Service
Customer requests
Billing
Register
Gifts
Sales transactions
Orders
Payments

Customer Service features

The Customer Service module has many unique and useful capabilities. The following list is an overview of Customer Service module capabilities:

- Apply events and orders payments using a single point of entry
- Pay and view cash dues and subscription list payments for both the company and the individual
- Apply fundraising gift/pledge payments
- Authorize or validate credit card payments
- Apply payment for any open balance for any module within iMIS

- Calculate and display a Total Amount due as you enter items on the Customer requests window
- Option to Auto-apply payment to the oldest items or to apply payment to individual outstanding items in the Payments window by selecting or deselecting the line item
- Display Fundraising items with a Balance Due on the Payments window
- Option to search by customer ID, date, or transaction number from the Payments window
- Easy access to all iMIS modules
- Display All, Outstanding, and Current batch transactions
- Display All, Outstanding, and Today non-batch transactions

Customer Service Restrictions

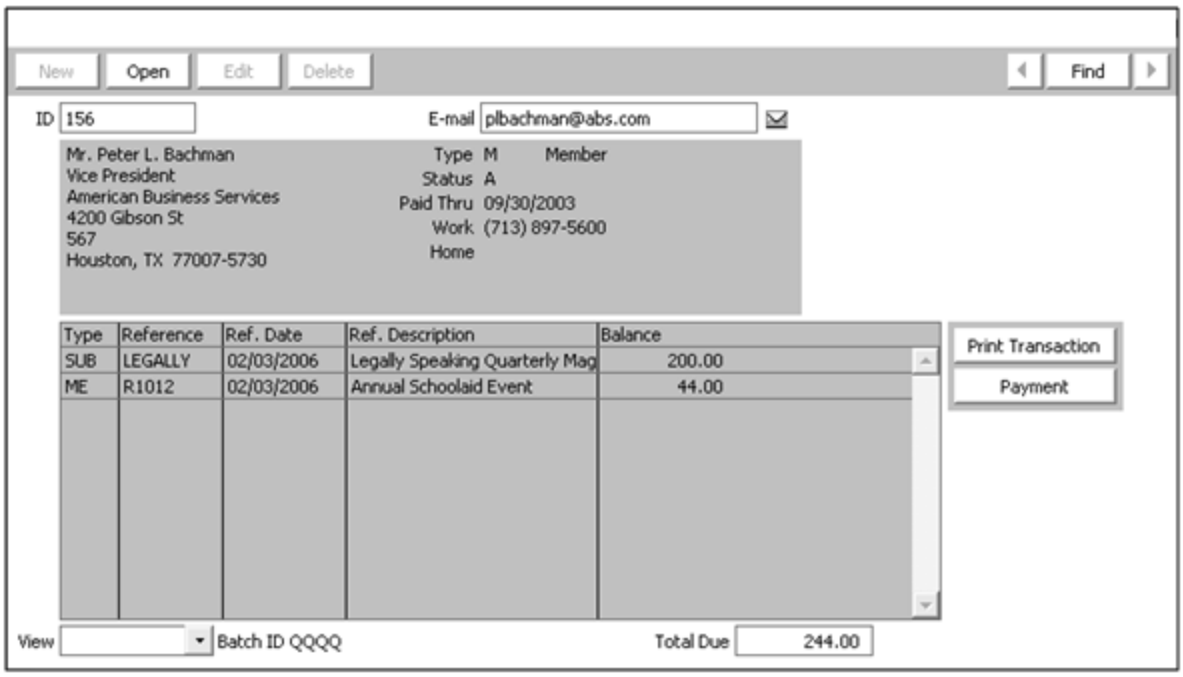
- Open credit balance line items and Fundraising items are not selected for Auto-apply on the Payments window when you open it from the Customer requests window.
- Do not apply overpayments to Fundraising items, which results in a credit balance. Instead, apply overpayments to the Pre-Pay line.
- Separate Posting Required, an AR/Cash function is not compatible with Customer Service.
- Accrual Dues Billing is not compatible with Customer Service.
- Do not create credit and debit memos using the Customer Service module; create credit and debit Memos only in the AR/Cash module.

> **Note:** Note: Processing customer credit card authorization and batch control transactions in Customer Service is optional. These features must be set up by your administrator. See Credit Card Auth.

Processing customer requests

The Customer requests window allows you to process and complete orders and transactions. After you open a customer's record in the Customer requests window, that record will automatically display in all the Customer Service windows.

Customer requests window



Customer Service > Customer requests

ID

This field specifies the customer identification number.

E-mail

Displays customer's e-mail address.

Message (envelope)

This icon opens the Confirmation of Transaction – Summary – Message (e-mail) window where you can send a Transaction Summary. You must select Current Batch from the View drop-down list.

Print Transaction

This button sends the Transaction Summary report to the user's designated location (for example, Screen or Printer). It is available in the Current Batch view if you are using the Batch Control option. You must select the batch that contains transactions for the selected customer.

Payment

This button opens the Payment Entry window. By default, the Pay Amount field auto-populates with the total amount due for any unpaid open item(s) and each open item displays with the order type, date, description, and balance due with the Pay option auto-selected for each item.

Type

Displays the source module or the transaction type.

Reference

Displays a number the system assigns to the transaction.

Ref Date

Displays the date the referenced transaction occurred.

Ref Description

Displays a description of the referenced transaction.

> **Note:** Note: A detailed description displays for Orders (OE) if your administrator has enabled 1st Line Desc. on Statement in the AR/Cash module. If this option is not enabled, only the transaction name, Order displays in this field.

Balance

Displays the amount the customer owes for the referenced transaction.

View

Specifies which requests are shown for the current customer ID:

- All – Shows all customer requests for the specified customer ID.
- Outstanding – Shows only outstanding customer requests for the customer ID.
- Current Batch – Shows only requests in the current batch for the customer ID.

  Total Due

  Displays the total amount (balance) of all line items displayed.

Billing a customer for a cash dues item

You can apply a payment to both cash and cash accrual dues, but the two types of payments display differently on the Customer Service windows.

- Only cash dues subscriptions invoke the Paid Thru dates and display as individual line items on the Payments window
- You can bill a customer for cash dues, but not accrual dues through the Customer Service module
- You can only bill the customer once using Customer Service for dues products from the Member Type table.
- Accrual billings are included in one line item, as in the Cash Receipts window. After the initial billing, only additional dues and non-dues items may be processed for a customer in Customer Service.

To create an open dues item

1. From Customer Service, select Billing.
2. Click New to populate the window with the customer information.
3. Click the checkbox to enable the Bill New Mem. Type Items feature. New fields display when you process a dues item that has not been billed.
4. Click Bill New on the Billing window to create a cash dues open line item.
5. Click Save.

6. From Customer Service, select Customer requests to open the Customer requests window with the new dues/subscription line item (SUB).

Registering a customer

To register a customer for an event

1. From the Register window, click New.

- If you already have an ID selected, it automatically populates the ID field.
- Otherwise, enter or look up a customer ID.

2. Register the customer for an event. For more information about registering customers, see the iMIS Events guide.
3. Click Save.
4. Select Customer requests.

   The event registration (ME) is a new line item on the Customer requests window. The system keeps a running total of the Balance field in the Total Due field.

   Note: You can double-click on any line item on the Customer requests window to view and edit data specific to that item. For example, if you double-click the ME (event) Type line item, the Register a customer window displays with the event the customer requested. You can also edit the registration by deleting a line item or adding another function.

   Example: To pay for an order and a registration with one credit card payment

   If you have added an event registration (ME) and placed an order (OE) for the active contact, you need to process only one credit card payment for the two open line items (ME and OE).

1. From Customer Service, select Payments.

- All transactions processed for this customer display when All is the View on the Customer requests window.
- The line items listed on the Customer requests window are listed on the Enter and edit payments window for the Current Batch, if any.

- By default, items entered during the current session (except Fundraising and credit balance line items) are checked for payment when you open the Payment Entry window from the Customer requests window. You can deselect any item and apply a partial payment.

2. Enter a credit/debit card code in the Check/CC field and complete the customer's card information.
3. Click Save to apply the Pay Amount to the checked items.
4. Close the window to return to the Customer requests window, which now shows the line items with a zero balance.

   After you apply the payment, you can view the items and transaction history:

- Open the customer's event registration record in the Customer requests window by double-clicking on the event line item.
- Select Finance > Search credit card info (see "Searching credit card information"), and enter the customer ID or Credit Card # to search for and review the customer's credit card payment history window.

Entering gifts from Customer Service

Where you process fundraising gifts and pledges depends on their type. You can pay single gifts through the Fundraising Gifts or Customer Service Gifts window. Single pledge and installment pledges can be paid through the Fundraising Process payments window or through the Customer Service Payments or Cash receipts (Finance > Transactions) windows if the Allow Payment though AR/Cash and Service Central option is enabled (Settings > Fundraising > Configure fundraising options).

A pledge is a contribution that will be paid at a later date. A pledge can be either a single pledge or an installment pledge. For example, a customer might pledge $1,000, which they agree to pay at a particular date in the future, either in one payment (single pledge) or in a series of predefined payments (installments). You can customize the amount and the payment schedule.

You can also process acknowledgements, member tributes, split gifts, and set up an installment pay plan for pledges.

To enter a single gift or pledge (Customer Service)

Payments for single gifts must be made at the time the gift is entered. You can pay for a single gift by entering a check number, credit card number, an in-kind non-cash asset account (if you are entering an in-kind or asset contribution), or by applying an open credit.

A pledge is a donation to be paid at a later date and can be a single pledge or an installment pledge.

> **Note:** Note: In-kind contributions can only be made for gifts. iMIS Fundraising does not track single in-kind pledges or installment in-kind pledges.

1. From the Gifts window, click New.
2. Enter the donor ID, or click the lookup icon to select an ID. The donor's name and address information display in the Donor and Address areas.
3. Enter the date the gift was received in the Date Received field. The default is the batch date if batch control is enabled, or the current system date if batch control is not enabled.
4. Select Single Pledge or Single Gift from the Gift Type drop-down list.
5. Enter the total amount of the donation in the Gift Amount field.
6. Enter the Request, Distribution, Appeal, Campaign, and Fund information as necessary.
7. (optional) Enter the List as name.
8. (optional) Enter the Solicitor ID, or click the lookup icon to select a solicitor ID.
9. (optional) If there is an individual partially responsible for this donation who is not the donor, enter the Soft Credit ID, or click the lookup icon to select a soft credit ID.
10. For Single Gifts only:

- Enter the payment information in the Check #/CC/In-kind/Asset field and its related fields as appropriate.
- (optional) Enter a manual receipt number in the Receipt Number field.
- (optional) Enable the Do not Print Receipt option to skip the printing of a receipt for this gift.

11. Click Save.

    To process an installment pledge

    Scenario: A customer wants to make an installment pledge for $1000 to be paid in monthly installments.

    > **Note:** Note: If you select an installment pledge; select a down payment; and the customer is paying by credit card, only the installment down payment is charged to the credit card. The remaining installments populate on the Customer requests and Payment Entry windows for payment at a later date.

    > **Note:** The credit card is not automatically billed monthly.

    > **Note:** You do not have to click the down payment option, if the customer is paying with cash or check at a later date. Individual installments for a pledge populate on the Customer request and Payment Entry windows until paid.

1. From the Customer requests window, click Open and enter the donor ID.
2. From the Gifts window, click New.
3. Select Installment from the Gift Type drop-down list. The Payment Info area of the window is grayed out because a pledge means that the money will be paid at a later date.
4. Enter the Total Amount of the installment pledge.
5. Enter the Distribution or income account where the pledge will be credited or, click the lookup icon to select a value.

Note: Although you predefined the Distribution, you can override the value by manually entering a different combination of a fund, appeal, or campaign if your setup allows.

6. (optional) Enter the Appeal code and Campaign code if there is one associated with the pledge, or click the lookup icon to select a value.
7. Enter the Fund code associated with this pledge, or click the lookup icon to select a value.
8. Enter a credit card code in the Check #/CC/In-Kind/Asset field and complete the credit card information.
9. Click the Installments tab and specify the installment details:
10. Click the Installment Frequency from the drop-down list.
11. Click to enable Pay a downpayment. The down payment amount displays under the Pre-pay column.

    Note: If the customer is making a credit card payment, you must select Pay a down-payment or when you return to the Gifts window and you click Save, a message informs you that you must first select the Pay a downpayment option.
12. Click Save.
13. From Customer Service, select Customer requests window.

Processing sales transactions

The Sales transactions window can be used to enter sales transactions that are processed and tracked through Finance. This window should only be used for transactions that are not processed indirectly through another module.

The purpose for entering data on this window is to record after-the-fact any sales-related transactions, such as manually prepared invoices. iMIS uses the information entered on this window to track several items:

- Product sales items that are passed on to sales history.
- Any outstanding AR amount.

- Any open AR amount that is reduced or eliminated, which is reported on daily and monthly transaction reports.

  Use Sales transactions to record miscellaneous sales and cash receipts that do not fit into any category processed by other iMIS modules, such as Billing, Events, and Order Processing.

  Use Sales transactions for sales-related entries when you do not need to produce an invoice or a bill. For example, enter sales transactions to record open sales items for a manual (handwritten) invoice and to document paid-in-full transactions without a printed invoice (miscellaneous cash receipts).

  To record sales transactions

1. From the Sales transactions window, click New.
2. Enter the customer Id and press Enter, or use the lookup icon to select a value and click OK.
3. Place the cursor in the Product field and use the lookup icon.
4. Select a value and click OK.
5. (optional) Place the cursor in the GL Account field and enter or change the GL account number. If the Allow GL Account Edit for Sales Transactions option is not enabled (from AR/Cash, select Set up module), the GL Account field is display-only and the GL account number cannot be added or changed.
6. Place the cursor in the Quantity field and enter the Quantity.
7. Place the cursor in the Check/CC field and enter the check or credit card information.
8. Enter the payment amount in the Payment Amount field.
9. Click Save.

Entering orders from Customer Service

Scenario: A current customer calls to purchase two sets of customer labels and would like to register for an annual event. The customer is paying by credit card and needs a receipt. This requires you to:

- Use the Customer requests window to place an order and register a customer for an event,
- Apply a single payment for two open items using a credit card,
- Print and/or electronically mail a receipt, called a Transaction Summary.

To enter an order

1. From the Orders window, select New.
2. Enter the Order Summary information.

   Note: The Order Date defaults to the batch date if you use batch control; otherwise, the date defaults to the system date.
3. Enter General order information.
4. Enter a Product.

   Note: Entering a product-level discount in the % Disc field overrides any order-level discount entered in the % Discount field. However, product-level discounts are applicable only for a given product and do not affect entire order-level discounts.
5. Enter additional products.
6. Click Save.
7. Notice that the order (OE) you just processed is now a line item on the Customer requests window.

   Note: You can click and drag the vertical lines between items on the Customer requests window so that you can see all the information in a column.

Entering payments from Customer Service

You can payments for outstanding items using the Payments window. There are three different payment scenarios:

- Applying a specified Pay Amount to all unpaid line items (full payment)
- Applying a payment toward specific unpaid line items
- Applying a payment to multiple unpaid line items using the Auto-apply button

To apply a specified payment amount to all unpaid items

1. From the Payments window, click New.
2. Enter an Id and press Tab to populate the Payment Entry window, or click the lookup icon on the Id field to select a customer record.
3. Enter a check number or credit/debit card code in the Check/CC field and enter the required card information.
4. Enter a dollar amount equal to the Unpaid Balance and press Tab in the Pay Amount field. Notice the Pay Amount, Unapplied Amount, and Unpaid Balance fields are equal because no line items have been selected for payment.
5. Click the checkbox in the Pay column to select the line item(s) where payment will be applied.
6. Click Save to update the customer's record with the payment.

To select open items for a payment

1. From the Payments window, click New.
2. Enter an Id, or click the lookup icon on the Id field.
3. Enter a check number or credit/debit card code in the Check/CC field and enter the required card information. Do not enter any information in the Pay Amount field.
4. Click the checkbox in the Pay column for each line item that you want to select for payment.

Note: The Pay Amount field increases by the line item amount as you select each line item. If you select the wrong line item, click to deselect (uncheck) the checkbox.

5. Click Save.

To apply a payment to multiple items using Auto-apply

1. From the Payments window, click New.
2. Enter an Id and press Tab to populate the Payment Entry window, or click the lookup icon on the Id field to select an ID.
3. Enter a check number or credit/debit card code in the Check/CC field and enter the required card information.
4. Enter the amount of the check in the Pay Amount field.
5. Click Auto-apply. The Pay Amount is applied to the oldest line items first. Open Dues (SUB) items have the highest priority.

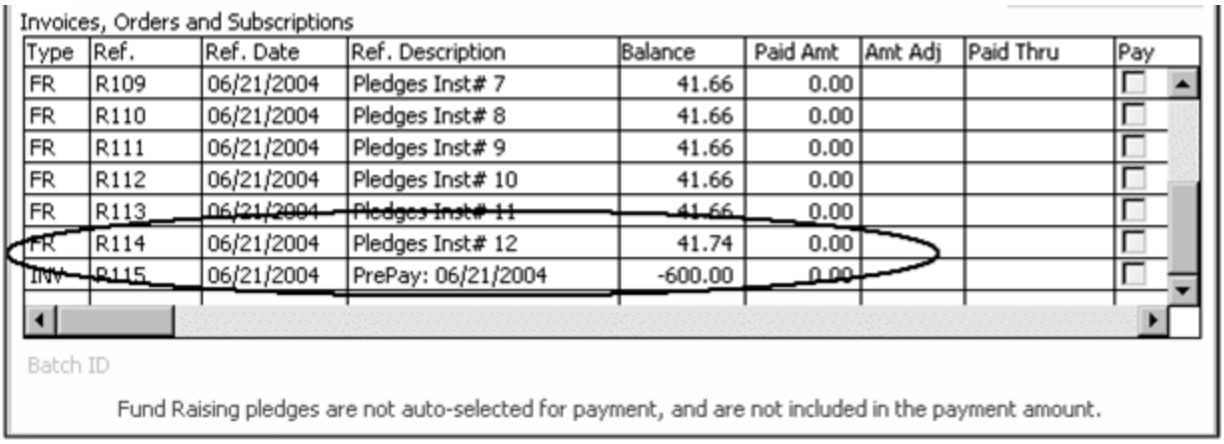
   Note: Auto-apply does not automatically select Fundraising items for payment, you must manually select them.
6. Click Save.

Applying a Credit Balance to a Specific Item

A credit balance is an overpayment that occurs when a customer unknowingly sends in too much money to pay an Unpaid Balance. You can apply an open credit balance in Customer Service by selecting Customer requests, and clicking Payment.

> **Note:** Note: Do not create credit and debit memos using the Customer Service module; perform credit and debit memos from Finance.

Note: Overpayments (credit balances) to Fundraising items are not recommended. Apply these overpayments to the Pre-Pay line. A message stating this appears at the bottom of the Payment Entry window.



Example of a credit balance line item

Scenario: A customer calls and places an order that is processed through the Customer requests window. Now the customer wants to pay the Unpaid Balance. The customer has an open credit balance. When you open the Payment Entry window from the Customer requests window, all items except the credit balance are automatically selected (checked) for payment. The Pay Amount has been generated to equal the amount of all selected line items (except Fundraising line items).

To apply a credit balance through the Customer requests window

1. From the Payments window, click Open.
2. Open the customer's transaction record.
3. Select the credit item by clicking the Pay checkbox. This applies the credit to all items that were automatically selected for payment.
4. Click Save.

Note: If you only select the open credit line item for payment or multiple open credit line items, when you click Save to apply the credit, a message displays informing you that you have only selected credit items for payment. Click No to select more unpaid items for payment, or click Yes to have the system apply the credit.

To apply a credit balance using Auto-apply

A customer sends a check to make a partial payment on an unpaid balance. The customer has an open credit balance. In this scenario, you would open the Payments window from the Customer Service menu.

When you open the customer record, no line items are selected for payment. You will enter a check number and the amount of the check. To apply the open credit, select the credit line item by checking the box in the Pay column.

The amount of the credit is added to the Unapplied Amount and the Pay Amount is not affected. If you press the Auto-apply button, the entire Unapplied Amount (including the Pay Amount and credit) is auto-applied to the Unpaid Balance in order of priority.

> **Note:** Note: Fundraising line items (FR) are not paid using Auto-apply.

1. From the Payments window, click New.
2. Enter an Id and press Tab to populate the Payment Entry window, or click the lookup icon on the Id field to select an Id.
3. Enter a check number in the Check/CC field.
4. Enter the amount of the check in the Pay Amount field.
5. Select the credit line item by clicking the checkbox in the Pay column.
6. Click Auto-apply to apply the credit line item and check payment.
7. Click Save.
8. Close the window.

Note: If you reopen the Payment Entry window or the Customer requests window with the same record, the credit does not display in either window.

To apply a credit balance using *TAB

The *TAB feature allows you to apply a credit to a customer record. A credit balance is a result of an overpayment that occurs when a customer sends in too much money to pay an Unpaid Balance. You can use *TAB in Customer Service for dues/subscriptions

(including cash and accrual methods (SUB)), Meeting (ME), Orders (OE), Fundraising (FR) and AR/Cash (INV) transactions.

There are some differences in how payment information is presented depending on which process you choose to use.

1. From the Payments window, click Open.
2. Open the customer's transaction record.

   Note: The Pay Amount field is the total of the line items checked for payment in the Pay column. Line items are automatically checked for payment except, Fundraising (FR) and credit balances. If you go directly to the Enter and edit payments window (from Customer Service, select Enter and edit payments), checkboxes in the Pay column are not automatically checked for payment.
3. Place your cursor in the Check/CC field and enter an asterisk (*), and press Tab to open the Select Open Payments window.

   The view defaults to an individual view. If you press All, all customer records with an open credit balance displays.

   Note: All credit balances from overpayments to Fundraising or Accrual Dues items are filtered out and will not display on the Select Open Payments window.
4. Make a mental or written note of the available credit balance. Double-click on the line item or, select the line item and click OK. The system returns to the Payment Entry window.
5. Enter the amount of the available credit balance you wish to apply in the Pay Amount field. Do not enter more than the amount of the available credit balance.
6. Click Save. The system populates the Check/CC field with the invoice reference number of the original transaction that resulted in a credit balance.

To apply a credit balance from the Payments window

1. From the Payments window, click New.

2. Press Tab and enter an Id, or click the lookup icon to select an Id.
3. Press Tab. The system populates the window with the individual's payment information.
4. Place your cursor in the Check/CC field and enter an asterisk (*), and press Tab to open the Select Open Payments window.

   The view defaults to an individual view. If you press All, all customer records with an open credit balance displays. The above view is All.

   Note: All credit balances from overpayments to Fundraising or Accrual Dues items will be filtered out and will not display on the following window.
5. Double-click on the line item or, highlight the line item and click OK. The system populates the Check/CC field with the invoice reference number of the original transaction that resulted in a credit balance. Make a mental or written note of the available credit balance.
6. Enter the amount of the available credit balance you wish to apply in the Pay Amount field. Do not enter more than the amount of available credit balance.
7. Select line item(s) by clicking the checkbox in the Pay column that you wish to pay with the credit balance.
8. Click Save.

Processing List Payments

The list payments feature allows you to apply a payment for dues products (membership dues and subscriptions) to a list of individuals that share a Bill To contact. For example, if a company sends in a dues payment billed for their employees that are members of your organization, you can apply that payment to each individual record from a single page.

Dues products billed to the company will appear in the list based on the following criteria:

- The company record is assigned the company member (CM) Member Type
- The company's ID is either:

- Entered in the Bill To ID field on the individual's Financial tab (from Customers, select Manage customers, find the customer record, and select the Financial tab)
- Entered in the individual's subscription Bill To field (from Customers, select Manage customers, find the customer record, select the Billing tab, and create or open a subscription)

To process list payments

1. From the Payments window, click New.
2. Accept the default date or enter another value.
3. Enter an Id or click the Find icon to select a company ID.
4. Press Tab to populate the window.

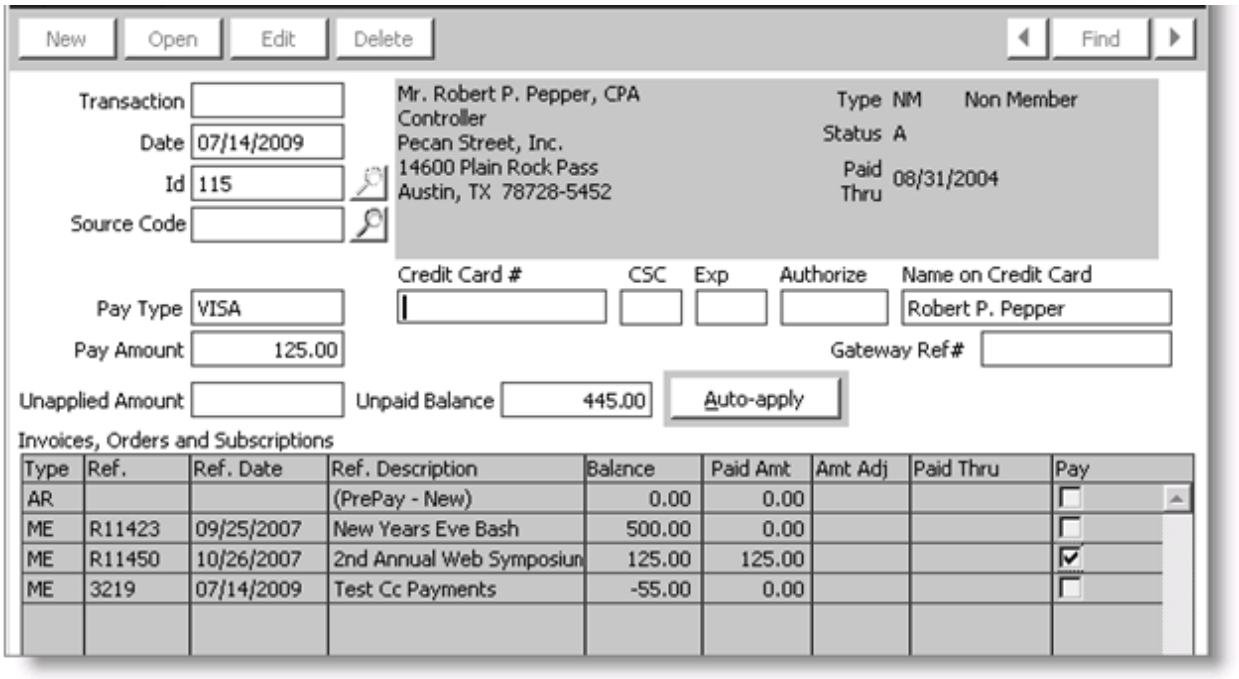
   Note: The items in the list vary depending on whether they are billed as cash dues or accrual dues. A cash dues billing list includes the balances for each individual. An accrual dues billing list only displays a single balance and line per billing type, regardless of how many individual records were billed against the company ID.
5. Enter the Pay Amount.
6. Apply the payment in one of two ways:

- Select Auto-apply to automatically apply the Pay Amount
- Select the Pay checkboxes to choose line items to be paid

7. Click Save.

   The window is updated to only display the paid items.

Payments window



Customer Service > Payments

Transaction

Displays the transaction number.

Date

Defaults to the current system date or the batch date if you are using the Batch Control option.

Id

Specifies the customer identification number or if the company is responsible for the payment, this is the company ID. You can click the lookup icon to select a value.

Source Code

(optional) Use to indicate how the payment was made (for example, phone or mail).

Check/CC

Specifies a check number or a credit/debit card code (for example, MC, VISA, AMEX, and DISC). If you enter a valid credit/debit card code, additional payment fields display:

- CC # - Enter the credit/debit card number.
- CSC - (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code. CSC can be a required value (see "Requiring a Card Security Code (CSC) for credit/debit card transactions") for specific cash accounts.
- Exp - Enter the card's expiration month and year (mm/yy).
- Authorize - Enter any authorization code here. (If credit card authorization is enabled, this field populates when the payment is approved.)
- Name on CC - Enter the name as it appears on the payment card.
- Issue # - (Displays only if the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date - (Displays only if the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).
- Gateway Ref # - Read only: Populates when the gateway provider returns the reference number for the transaction.

> **Note:** Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Pay Amount

The system populates this field with the customer's current session balance due (except Fundraising and credit balance line items) when a customer's record is opened in the Customer requests window. This field can be overridden if the customer wants to pay a different amount.

Unapplied Amount

Displays the amount of the current payment that has not yet been applied.

Unpaid Balance

Displays the total of balance due for items not selected (checkbox enabled) for payment.

Auto-apply

Used to enable the system to automatically apply a payment.

Type

Displays the source module or the transaction type.

Ref

Displays a number the system assigns to the transaction.

Ref Date

Displays the invoice reference date.

Ref Description

Displays a description of the referenced transaction. A detailed description displays for Orders (OE) if you enable 1st Line Desc. on Statement on the AR/Cash System Setup window. If you do not enable 1st Line Desc. on Statement, only the transaction name, Order displays in this field.

Balance

Displays the balance for a specific transaction.

Paid Amt

Displays the dollar amount the customer designated to be applied to the specific line item.

Amt Adj

Displays the positive difference between the Balance and Paid Amt used for cash Dues/Subscription billing only.

Paid Thru

Displays the Paid Thru date associated with the specific cash-basis Dues/Subscription line item. This field is populated only if the item has been paid in full.

Pay

Use this checkbox to select or deselect a line item for payment.

Batch Id

Displays the batch number of the current open batch if you are using Batch Control.

Customers

Customers is the core area of functionality where back-office customer relationship management occurs.

Common commands and shortcuts (Desktop)

Standard toolbar commands

The toolbar provides a standard set of command buttons for working with records, and it is critically important to using the product. To help you recognize and use these commands consistently, the buttons appear in the same place within windows whenever possible. For example, New is always located at the top left of the toolbar, and Find is always located at the top right.

The standard toolbar above the work area

When a standard button does not apply to a given situation (for example, Delete when no record is open or selected), the button is disabled. You can recognize that a button is disabled by its muted gray text label (instead of black) and by the fact that you cannot tab to or select that button.

Toolbar Commands

New	Create a new record	Previous	Move to the previous record (if any)
Open	Open an existing record	Find	Open Search to find a record
Edit	Open an existing record for editing	Next	Move to the next record (if any)
Delete	Delete an existing record	Print	Open the Select Report window (disabled during data entry)

Keyboard shortcuts

Learning these built-in keyboard shortcuts will make data entry faster and easier. Use the right-click menu to Undo, Cut, Copy, Paste, Delete and Select All in the Name, Address and Detail sections and in single-instance user-defined tabs. The right-click menu is not supported in the History section.

General Shortcuts

Ctrl+F	Find	Ctrl+C	Copy *
Ctrl+L	Lookup	Ctrl+V	Paste *
Ctrl+E	Edit	Ctrl+X	Cut *
Alt+S	Save	Spacebar	Execute button action
Alt+C	Cancel	Ctrl+T	Edit Customer Portfolio tab preferences
Ctrl+I	Insert new record	Ctrl+Q	Exit iMIS
Ctrl+N	Open a new instance of iMIS		* excluding single-instance UD tabs

Detail Tabs Shortcuts

Alt+P	Go to Profile tab	Alt+L	Go to Solicitor Data tab
Alt+D	Go to Donor Data tab	Alt+O	Go to Other tab
Alt+T	Go to Status tab	Alt+U	Go to Salutations tab
Alt+N	Go to Notes tab	Ctrl+Z	Undo (UD tabs only)
Alt+F	Go to Financial tab		

Data Grid (Table) Shortcuts

Ctrl+F9	Load next record from Results tab	Home	Move to first column of current row
Ctrl+F8	Load previous record from Results tab	End	Move to last column of current row
Ctrl+R	Load selected record (Results, Record History, Roster, Relationships, or Role tab)	Ctrl+Home	Move to first record

Ctrl+W	Load selected record in a new instance of iMIS	Ctrl+End	Move to last record
PageUp	Move UP one full screen in grid	Ctrl+Z	Zoom grid field (with length > 255 characters)
PageDown	Move DOWN one full screen in grid	Ctrl+Z	Undo (inside a zoomed field)

Customers Overview

Features found in the Customers area offer core iMIS functionality, designed for organizations. When you select Customers, you see a detailed view of your customer or member database. With this feature you can enter, edit, track, and maintain your organization's complex and dedicated customer information.

iMIS Customers integrates completely with other areas of iMIS. Much of the information these other areas use is sourced from the customer database, and the customer database is automatically updated whenever edits to customer data are performed within other areas. This constant flow of data makes iMIS an adaptable and expandable tool as the needs of your organization change.

iMIS customer management capabilities

The iMIS Customers feature enables you to perform the following tasks:

- Track and manage customers information, including eliminating duplicate records.
- Manage committees and chapter rosters.
- Store pictures (including logos).
- Plan and track activities (past, present, and future).
- Produce detailed standard reports (rosters, statistics, activity detail, and exports).
- Produce various types of correspondence helpers such as labels, letters, email, and user profiles.

Power of iMIS

Think of iMIS as a virtual filing cabinet filled with file folders that hold complete records for every customer you want to track. Regardless of the number of times these files are accessed, the records are not mislabeled or lost. Each customer file can grow as large as needed. For example, you have the ability to continuously add information, such as what customers have done, where customers work, who customers know, what customers have contributed, and how much customers owe. You can store all of this information safely for as long as you need to keep it.

Designed for associations

iMIS provides the following powerful features:

- You can search for and retrieve customer information using many methods beyond simply scanning alphabetical lists. For example, you can search by ID, by company affiliation, by status, and by join date.
- You can display and print any type of customer information you are maintaining. This information can be analyzed in meaningful, organized, and easy-to-use reporting formats.
- You can view summaries of customer counts and statistics that iMIS maintains and updates automatically.
- You can quickly generate professional reports, personalized letters, mass e-mail, and labels for a selected group or for all of the customers in your file.
- You can create your own custom windows, tables, and fields that fit the specific requirements of your organization.

The iMIS design lets you work with your customer data in compact displays and feature-rich menus. Since no two associations are alike, iMIS has a flexible design that lets you customize the system to meet your specific requirements. For this reason, you will work with your System Administrator to set up iMIS to efficiently handle your needs. Pre-planning pays off in long-term usefulness and ease. In addition to customizing your system, you can also personalize the appearance of iMIS.

Tracking flexibility

iMIS provides a central database where you can track the companies and individuals that make up your association. Customers can include prospects, advertisers, exhibitors, subscribers, fundraising donors, and legislators. Plan on your database keeping track of the following types of customers:

- Everyone who receives your promotional or regular mail, newsletters, and magazines
- Everyone whose receivables, cash receipts, or other history you want to track
- Everyone for whom you maintain telemarketing call logs and follow-up information

iMIS uses a single set of entry/edit windows to keep track of all customers in a single database. This unified database approach can:

- Simplify the data entry procedure by keeping all list entry restricted to a single set of windows or screens.
- Prevent errors by checking changes to data against lookup/validation tables and questioning or rejecting erroneous information.
- Eliminate duplication of effort by not requiring multiple data entry for all companies or individuals that simultaneously belong to different lists.
- Simplify the mailing and communication procedures, guaranteeing that individuals do not receive duplicate mailings when they are on several lists.

iMIS has several facilities to help you categorize and segregate the customer records into the groups you need.

Association list management

iMIS provides many tools that allow you to organize your customer database. Some common ways to group customers include:

- Customer type
- Customer status
- Category

- Committee
- Chapter
- Company/institute
- Activity
- Inclusion/exclusion category
- User-defined index
- Ad hoc search

By planning for and making appropriate use of iMIS organizational tools, you can easily track and report on various types of customer lists.

Type

You must assign a customer type code to each record you enter in iMIS. Some common customer types may include:

- Members
- Companies
- Individuals
- Customers according to billing level
- Categories for prospects, exhibitors, or advertisers

The primary strategy behind establishing customer types should be to distinguish different pricing levels. This usually pertains to billing, but can also include event registrations and order pricing. Customer types must be mutually exclusive; in other words, each customer may have only one customer type.

Customer types are extremely important. You should analyze the organization of your particular association before setting up customer types. Your System Administrator can assist you with this task.

Status

You can further divide types of customers by a status code. iMIS reserves the following status codes:

- A - for Active
- S - for Suspended
- I - for Inactive
- D - to mark for Deletion

All active customers begin with a status of A. A customer's status could change to S if, for example, they did not pay their dues by the end of the grace period. If, after a period they still did not pay their dues, you might change their status to I. Use a status of D only if you want the record to be marked for permanent deletion from the customer file.

Category

You can use Category as an additional way to categorize customers for billing purposes:

- Billing Category 1
- Billing Category 2
- Billing Category 3

Billing categories are assigned to customers in the Customers > Billing area.

Committees

You can organize customers into various committees through the Committee subsystem. Through this subsystem, you can track the following:

- Customers on particular committees
- Positions held
- Term of appointment
- Service history

You can use this information to customize print output for various committees. For example, you can print labels for mailings to a specific committee.

Chapters

iMIS lets you group your customers or members into separate and distinct chapters, or groups. Even if your organization does not have official chapters, you may find the chapter feature useful for organizing customers by state or pertinent regional areas.

Company/Institutes

You can keep lists of all individuals affiliated with a specific company or other entity by specifying a Company ID for those customers. Organizing customers by Company ID lets you easily view and work with a company roster or search for an individual by Company ID.

Another benefit of organizing customers by Company ID is that you have the ability to link the company address to the individual customer. When you enter a Company ID (Parent Record) for an individual record (Child Record) that currently has blank name, address, and telephone number fields, the parent company's Company Name, Address, and Telephone Number fields “flow down” to the child record. iMIS automatically populates the data from the company record. See Company flow down (see "Company flow down in iMIS") for more.

iMIS also lets you maintain multi-level company structures. For example, some individual records can point to intermediate company subsidiaries or branches that in turn point to higher level company records.

Activity

Activity types can include event attendance (system-assigned and generated), billing, fundraising, orders, awards received, volunteer service, and call logging. You can use the various activity types to organize customers into groups such as those who attended the last convention or who received a certain award. With the call-logging capability, you can list all task items that have a follow-up date in a certain date range. Task items are automatic reminders you can set up for activity types such as CALL.

Inclusion/Exclusion Categories

Another way to mark a company or individual's inclusion or exclusion from various groups is through user-defined check boxes. Use this feature to indicate yes/no or on/off responses to single-choice lists or other designations. Some common inclusion categories could be:

- Send newsletter
- Participates in insurance program
- Key customer for legislative action
- Exclude from categories (exclude from certain mailing types, exclude from sold lists)

User-defined Indexes

During system setup, iMIS lets you specify up to four regular data fields as access keys (for screen lookup only). These fields will display in the Find window. iMIS will create and maintain a special index file for each designated index field. This index sorts the records according to the data in the specified field. For example, if you designate the State field as an index, iMIS would maintain an index list of all records, sorted in state order. This index lets you scan a customer list by state without searching the entire file. See Defining Lookup Indexes for the Find Window.

Note: Although user-defined indexes are useful, keep in mind that there is a performance tradeoff. Indexes can increase efficiency in accessing and searching; however, they do add overhead to data entry and maintenance functions. For this reason, only assign indexes to fields that will be routinely used as access keys.

Ad Hoc Searches

Beyond these list-maintenance features, iMIS also provides ad hoc searching where you can create complex formulas for searching any data fields stored for your customers. When executed, these ad hoc searches create temporary sub-lists that you can work with just as you do with permanent lists.

iMIS Customers feature terms

Before using iMIS Customers, you need to know these terms:

Database

A database is a collection of related information that is organized into meaningful units (for example, files, records, fields, graphics, and photos) for dedicated storage and access.

Table

A table is the highest organizational unit in the database. The iMIS files used most often in the Customer system are the Name tables. The convention for entering field definitions is to put the table name in title-case followed by a period and the field name in capital letters:

Table_Name.FIELD_NAME

Record

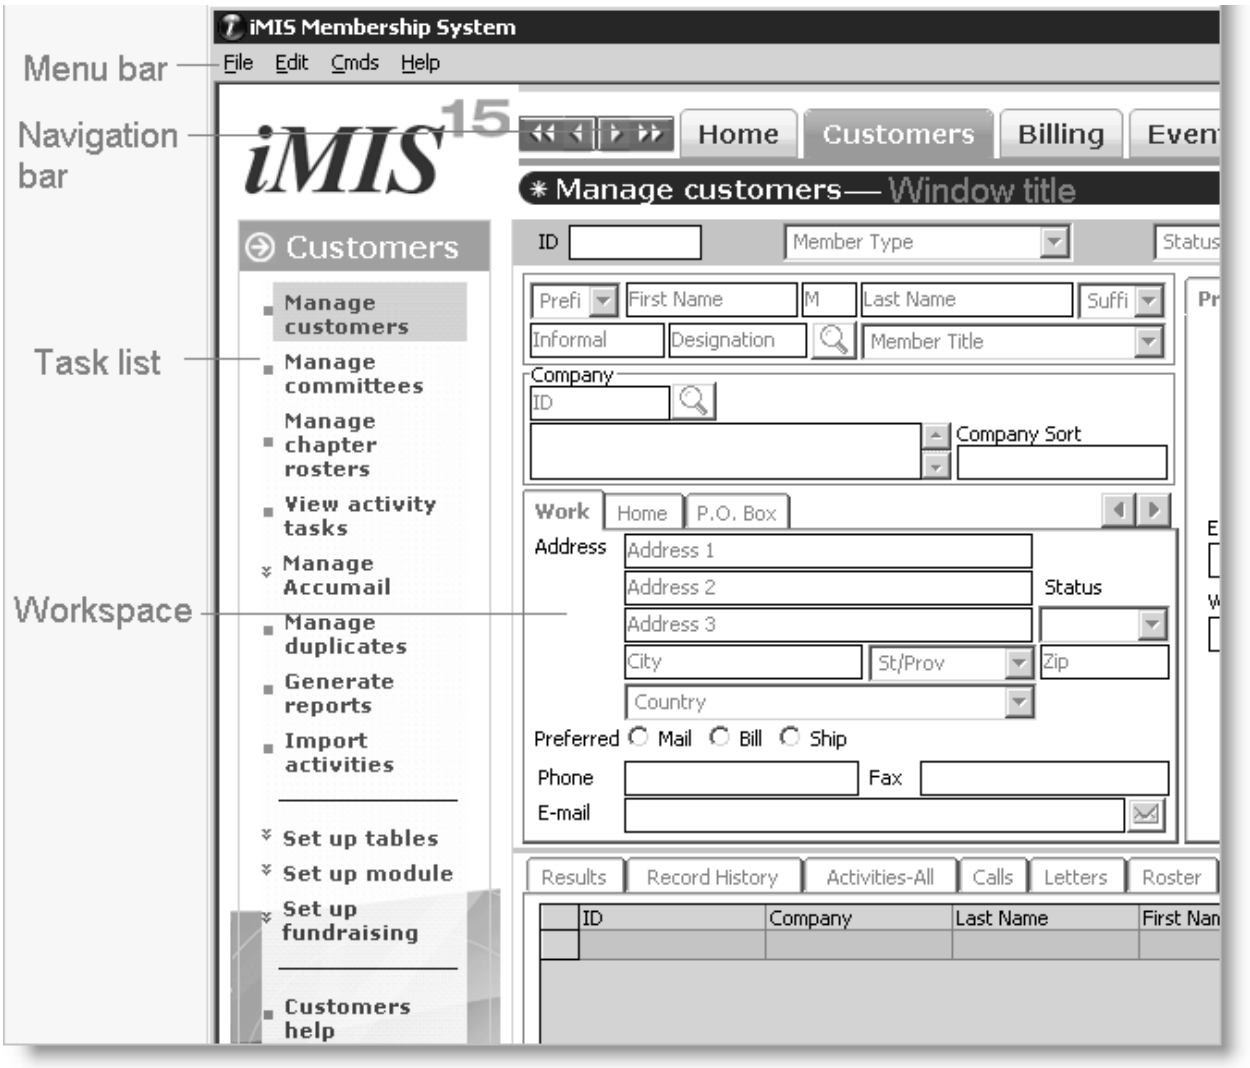
A record is an individual unit in a file containing a collection of fields. These fields are consistent in number and type from one record to the next. For example, a separate record is stored in the customer file for each individual or company in the system. (A record is also called a row).

Field

A field is an individual data element in a record (also called a row). A field may display in a data maintenance window in the form of a labeled text box or check box.

Reviewing the iMIS interface

The iMIS interface provides an effective way for you to complete tasks.



An example of the iMIS interface

Menu bar

The menu bar contains the commands for iMIS that are related to database functions and are rarely used.

Navigation bar

The navigation bar is located between the menu bar and the window title bar and consists of right and left arrows, a Home link, and the module names for which you have a license and a security level greater than zero (0). When you select Home, all windows will close and your designated home page will display in the workspace area.

Depending on the number of modules for which you have a license, you may not be able to see all of the modules. Previous and Next arrows are available on the navigation bar to scroll the modules. To navigate using the Next and Previous arrows, select a module name from the navigation bar. Use the Next and Previous arrow to move forward and backwards on the navigation bar.

Task list

The task list is an HTML-based navigation structure that is located in the left margins of the workspace area. The task frame includes the navigation bar and task list, which consists of links to windows that display in the workspace area.

When you select a link from the navigation bar, corresponding menu items display in the task list. A white arrow to the right of a task indicates a sub-task list exists and will display as a pop-up menu to the right of the selected task when you select the task. A white border will display around the task or sub-task item that has focus.

Workspace

Many tasks are accomplished within the workspace area, which is bordered by the navigation bar and task list.

Window title

The window title bar is located directly below the navigation bar. The window title replicates the task name you select on the task list. You can provide more information about the task you are performing by modifying the window title. The window title bar can also contain a right-justified image, for example, a logo.

The window title in the Manage customers window displays the task name with the Customer Type followed by the company's name when a company record type record is loaded. For example, Manage customers - Company Member - Prodigy Makers International. When all other records are loaded, the window title displays the Customer Type followed by the individual's name and designation.

Note: When selected, some task list items do not open a new window. The window title that displays for these items will replicate your previous selection.

Navigation for Customers

When you select Customers from the navigation bar, a specific task list appears on the left of your screen.

Note: Some task list items might not be visible, depending on the access granted by your iMIS administrator and whether you are licensed for certain iMIS features

Manage customers

Opens the Manage customers window that enables you to view, edit, or add customer records.

Manage committees

Opens the Manage committees window that enables you to enter or update committee rosters and appointee information, view or print lists, and produce labels or letters.

Manage chapter rosters

(visible only if licensed for Chapter Reporting) Opens the Manage chapter rosters window that enables you to access customer lists (all, current, future, and past) and data by chapter rosters.

View activity tasks

Opens the View activity tasks window that provides access to the built-in task reminder function in iMIS. You are presented with a summary of all open task activity records that includes items due for follow-up. You can review the open items in detail, print a detailed report, and remove closed items from the reminder list.

Manage Accumail (or Manage QAS)

(visible only if licensed for Accumail or QuickAddress) Opens a sub-menu of tasks for setting up and using the address verification system.

Manage duplicates

(visible only if licensed for Duplicate Merge Manager) Opens the Duplicate Merge Manager window that enables you to find, select, merge, delete, or keep possible duplicate records.

Generate reports

Opens the Generate reports window that enables you to print (or export) all standard output available through the Customers feature. The choices include a full array of detailed reports and rosters based on the customer file information, summary and statistical reports, labels, and table listings.

Import activities

Opens the Import activities window that enables you to create mass activity records.

IQA

This functionality is no longer available in iMIS Desktop. You can access it from the Staff site.

Set up tables

Opens a sub-menu of tasks for configuring and maintaining the tables used by the Customers feature.

Set up module

Opens a sub-menu of tasks for configuring the behavior of the Customers feature.

Set up fundraising

Opens a sub-menu of tasks for configuring fundraising options.

Customer Data Management

The Customers feature is a collection point for customer information. In addition to basic contact information, the Customers feature also contains customer details and customer history. The customer data is managed using the Manage customers window.

Authorization levels for Customers

Your authorization level for Customers determines which functions you can access:

- To find and view customer records, you need at least authorization level 1.
- To run reports, you need at least authorization level 2.
- To create and edit customer records, you need at least authorization level 3.
- To add new addresses, you need at least authorization level 3.
- To delete customer records, you need at least authorization level 4 and the Allow Delete from Customer Portfolio option must be enabled by your administrator.
- To access the Manage tables window, you need at least authorization level 5.
- To access the Set up module window, you need authorization level 8.
- Access to the History area is based on security for each feature.

Customer data entry

The Manage Customers window enables you to add to and edit customer information.

iMIS features such as address verification and duplicate record checking help ensure that you enter useful and maintainable customer information. Your administrator can configure these options to best fit your organization's business rules.

To enter a new customer record

From the Manage customers window you can maintain name, address, and demographic data relating to customers. The unique feature of the Manage customers window is that you can activate virtually all customer-specific operations within one window.

1. From Customers, select Manage customers.
2. Click New.
3. (optional) Enter an ID number.

Note: The ID field is grayed out when the Auto Assign Member Number option is enabled by your administrator.

Note: If you do not have IDs auto-assigned, make sure you do not enter zero (0) for a customer ID.

4. (required) Select a Member Type description from the Member Type drop-down list .
5. Select a status other than Active, if appropriate.
6. (optional) Select a billing category description from the Category drop-down list.
7. (optional) Select a prefix from the Prefix drop-down list.
8. Enter the First Name, Middle initial, and Last Name.

   Note: When entering a new record, First Name, Last Name, or Company Name is required.
9. (optional) Select a Suffix from the drop-down list.
10. (optional) Update the Informal Name as needed.
11. (optional) Enter single or multiple (separated with a comma) Designation(s), or click the lookup icon to open the Select Values window and search designations defined by your administrator.
12. (optional) Select a Member Title from the drop-down list.
13. Click Save

    Note: You can continue with assigning a Company ID to this customer record next.

    To enter an address

    The three primary address tabs in the Manage customers window are titled according to the prompts entered for Main, 2nd, and 3rd on the Customer Setup - Address and Notes window (Customers> Set up module > General, Address and Notes). By default, the first address is set as the preferred address for mailing, billing and shipping purposes. However, you can customize which address is to be used for each purpose by setting the

Preferred Mail, Preferred Bill, and/or Preferred Ship indicators on each of the three primary address tabs.

Entering address information on the three primary address tabs:

1. Enter the address information for each tab as needed.
2. By default, the first address is automatically set as the preferred address for mailing, billing, and shipping purposes. However, you can customize which address is to be used for each purpose by setting the Preferred Mail, Preferred Bill, and/or Preferred Ship indicators on each of the three primary address tabs.
3. Click Save.

If you need more addresses, populate the ADDRESS_PURPOSE general lookup/validation table with at least one value. (See "ADDRESS_PURPOSE Validation"). When you log back in to iMIS, a New address tab appears after the three primary address tabs, which lets you select an address purpose.

1. Select the New tab to open the New Address window.
2. Select an address purpose from the drop-down list.

Note: You can create more than one address with the same custom purpose (defined in the General Lookup/Validation table for ADDRESS_PURPOSE), but multiples are not allowed for the standard purposes (defined in Customer Setup > Address and Notes).

3. Click OK.

Note: When Accumail is licensed and installed, the Verify Addresses option is available.

To enter a new company record in iMIS Desktop

1. From Customers, select Manage customers.
2. Click New.
3. (required) Select a Member Type description from the Member Type drop-down list.

4. Tab to the Company ID field and enter the company name or click the lookup icon to open the Find Company window and search available company records (see "Finding customer records").

   Note: When entering a new record, Company Name is required.

   Note: Company Sort is populated after you move out of the Company Name field.

5. Click Save, or continue with entering an address for this company customer record.

   To select values for the Designation field

1. From Customers, select Manage customers.
2. Click the lookup icon on the Designation field to select a value.

   The Select Values window opens.

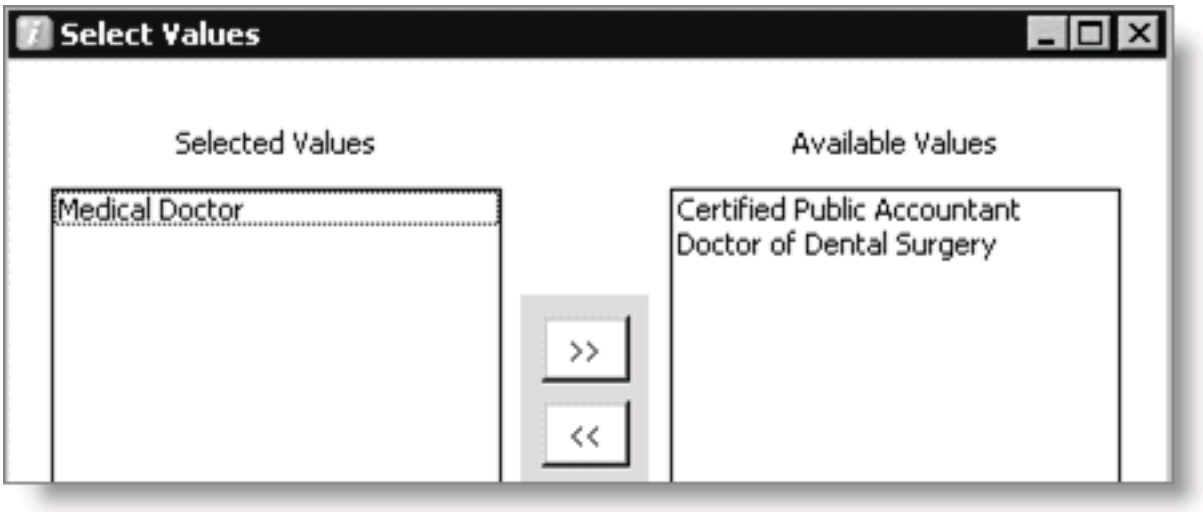
3. Use one of the following methods to move items to the Selected Values list:

- Double-click the item in the Available Values list to move it to the Selected Values list.
- Select the item in the Available Values column and click << to move the item to the Selected Values list

4. Use one of the following methods to remove items from Selected Values list:

- Double-click the item in the Selected Values list to move it to the Available Values list.
- Select the item in the Selected Values list and click >> to move the item to the Available Values list.

5. Click OK to close the Select Values window.
6. Click Save on the Manage customers window to save the value(s) in the Designation field to the database.



The Select Values window

Finding customer records

Before you can view or edit a customer record, you must find the record. The Search and Find Company windows are available for locating customer records.

Opening customer records

You can open a customer's record from any of the following tabs in the History section:

- Results
- Record History
- Roster
- Relationships
- Role

To open a customer's record, you can double-click anywhere within a customer's row in one of the above tabs (excluding the Relationships and Role tabs), you can use keyboard shortcuts, or you can use one of the two right-click menu items: Open and Open in New Window.

The Open menu item enables you to load the selected record in the active Manage customers window. The Open in New Window menu item enables you to open the selected record in a new iMIS instance.

Note: The menu items that are displayed below the Open and Open in New Window menu items enable you to navigate to a specific tab in the History section. For detailed information on navigating to tabs in the History section (see "Manage customers window - History tabs").

If you want to use keyboard shortcuts to open a customer's record, select the record in the tab and press Ctrl+R to open the record in the existing Manage customers window or press Ctrl+W to open the record in a new Manage customers window.

Search window

From Customers, select Manage customers, and click Find

Note: You can press Ctrl+F to open the Search window (perform a Find) only when the Manage customers window is not in edit mode and you are not in a single-instance, user-defined tab.

Drop-down list

Click the drop-down arrow to display a list fields on which you can search.

- ID - Returns the record for the ID specified, for example, 301.
- Name - Returns all records that meet the search criteria. For example, to search for all customers whose last name begins with Ski, enter SKI. To search for all customers with last name Skinner and first initial J, enter SKINNER, J.

- Company - Returns all records that meet the search criteria. For example, entering PRO will return all records where Name.COMPANY_SORT begins with Pro.

  Note: The company search feature is based on COMPANY_SORT, which uses the first 30 characters of the company name.

- Only Company - Returns company records only. For example, entering PRO will return all records where Name.COMPANY_SORT begins with Pro and Name.COMPANY_RECORD = 1.

  Note: The company search feature is based on COMPANY_SORT, which uses the first 30 characters of the company name.

- Major Key - (optional) User-defined field used for record searches. This option returns all records that meet the search criteria. For example, entering 526 will return all records whose Name.MAJOR_KEY starts with 526. The major key field is prefixed with the prompt configured by your administrator.

- Member Type Code - Returns all records that meet the search criteria. For example, entering N will return all records whose Member Type code starts with the letter N.

  Note: If you are using Acquisition Management to import records, the Imported List Code will display in the Member Type Code field.

- Indexes - (optional) Any of four data fields defined by your administrator to be used for searching. This index sorts the records according to the data in the specified field. For example, if your administrator designates

- State as one of the indexes, iMIS would maintain an index list of all records sorted in state order. This index lets you scan a customer list by state without searching the entire file.

- Interests as one of the indexes, iMIS would maintain an index list of all records sorted in interest order. This index lets you scan a customer list by interest without searching the entire file.

  Note: Results for user-defined indexes are returned in ID order.

- Chapter - Returns all records of those who have been billed dues for the chapter you enter as the search criteria (the full chapter name is required). For example, entering Travis will return all records where Subscriptions.CHAPTER is equal to Travis.
- Committee - Returns all records that meet the search criteria. The full committee name is required. For example, entering Technology will return all records where Activity.OTHER_CODE is equal to Technology
- Task Date - Returns all records that meet the search criteria.
  For example, entering 09/21/2000 will return all records where Activity.TICKLER_DATE is equal to 09/21/2000.
- Ad Hoc - Opens the Select Search Instructions window that enables you to enter search criteria to select specific records.

  Equals

  Specifies the search value. The prompt for this field will change depending on the search criteria shown. For example, when Name is chosen, the prompt displays as Begins with:

  Include acquisitions in search

  Enable to include acquisitions from the Prospect table in the search. This option displays only when iMIS is licensed for Acquisition Management.

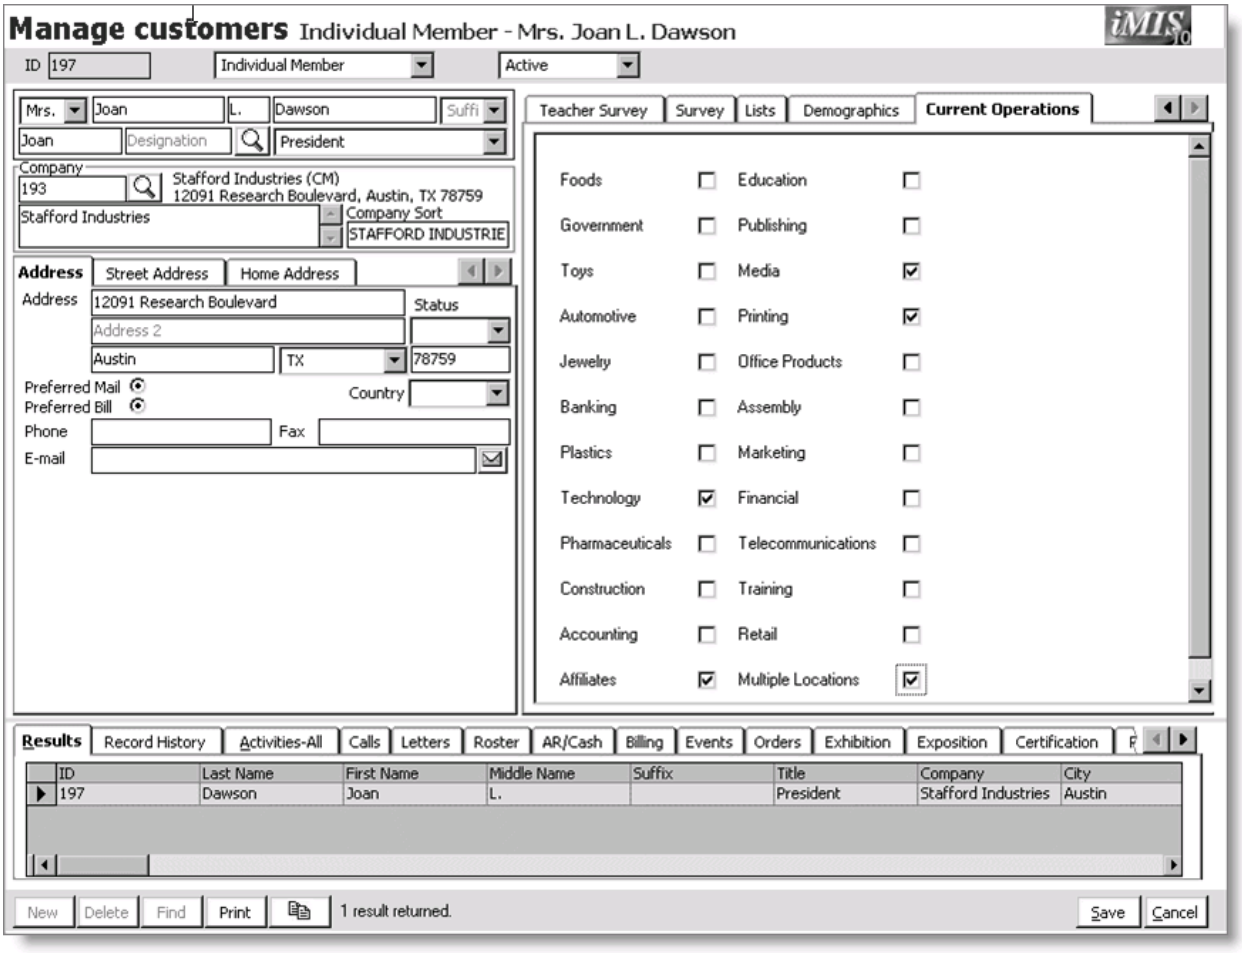
  To resize the Detail or History area

  A horizontal split window control, located between the Detail and History areas of the Manage customers window, enables you to view more data in the Detail and History areas and in user-defined tabs.

  A split window control is a vertical or horizontal bar that divides a window into areas referred to as frames. Moving the position of a split window control enables you to resize a frame as needed to view more data.

  To move the split window control, position your mouse pointer on the gray line between the History area and Main and Detail areas. Drag the control up to view more data in the History area or down to view more data in the user-defined tabs in the Detail area. Moving

the split window control down will not change the Main area (Name, Company, and Address areas); the area below this area will display as blank space.



Manage customers window after moving split window control down

Note: Moving the split window control too far down will result in data in the History area becoming difficult to view.

To find and load a customer record

1. From Customers, select Manage customers.
2. To find a customer record,

- Click Find; or
- Press Ctrl+F to open the Search window.

Note: You can press Ctrl+F to open the Search window (perform a Find) only when the Manage customers window is not in edit mode and you are not in a single-instance, user-defined tab.

3. Select the search criteria from the drop-down list, for example, Name.

   Note: To bring up all customer records, leave the Equals field blank, and click Go. Depending on your setup, there may be a limit on the number of records returned. For large databases, blank name searches are not recommended.

   Note: The prompt for the search value field will change depending on the search criteria shown. For example, when ID is chosen, the prompt is Equals.

4. Enter the search value in the Begins with field.
5. Click Go. The Results tab is updated.
6. To view a record, select a row. Double-click a record on the Results tab to open it in the Manage customers window.
7. Select the tabs below to view additional information.

   To find and load a company record

   Note: The company search feature is based on COMPANY_SORT, which uses the first 30 characters of the company name.

1. Click the lookup icon in the Company area to open the Find Company window.
2. Select your search criteria, for example, Company.
3. Enter your search value, for example, the first letter of the company name in the Begins with field
4. Click Go to display the results.
5. Select the company and click OK, or double-click the company to link the company record with the customer record.

Note: If you select a company from the Find Company window and you have an existing value in the Company area, a system message asks if you want to overwrite the current company name and address.

Find Company window

From Customers, select Manage customers, and click the lookup icon in the Company area

Drop-down list

Click the drop-down arrow to display a list of searchable fields. These fields are configurable by your administrator.

Search value

Specifies the search value. The prompt for this field will change depending on the search criteria shown. For example, when Company is chosen, the prompt is Begins with.

Go

Used to start the search.

To open a record from a history tab

1. Select Customers > Manage customers.
2. Click Find.
3. Select or enter the search criteria and click Go. The Results tab displays the search results.
4. Double-click anywhere in the row of the record you wish to load.

5. Click on a history tab to show that tab's contents.
6. Double-click the record or the arrow on the left end of the record.

Modifying customer records

Use Customers to edit and delete existing customer records.

To edit a customer record

1. From Customers, select Manage customers.
2. Find the customer's record (see "Finding customer records").
3. When you load a record into the Manage customers window, iMIS is automatically in edit mode.
4. Make changes to the record, as appropriate.
5. Click Save.

To delete a customer record

Note: Your administrator can enable or disable the Delete button.

1. From Customers, select Manage customers.
2. Find the customer's record (see "Finding customer records").
3. Click Delete. A system message displays asking you to verify the delete.
4. Click Yes.

Data entry features

About customer data fields

Most fields on the Manage customers window do not display standard field labels to the left of each field. Instead, the field name is contained within the field as gray text. As data is entered in the field, the text changes to black as shown in the following example:

Fields in the Name area (Manage customers window)

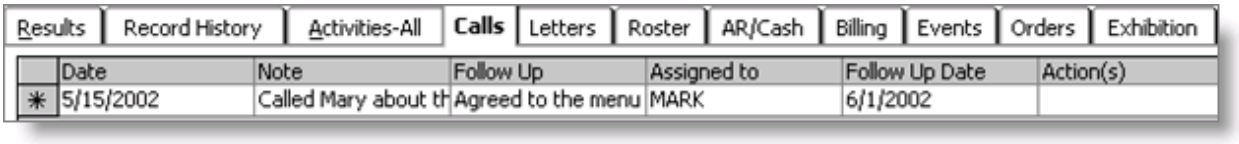
Fields on the Manage customers window are shown using different type colors or background colors to show their status.

- When there is no data in a field, the field label is shown inside the text box in gray, for example, the Prefix field in the previous example.
- When you select a field by selecting it directly or tabbing to it, the entire field label text is highlighted so that it can be easily replaced, for example, the Last Name field in the previous example.
- When the field has a value defined, the data is shown in black, for example, the First Name field in the previous example.

Field focus

Fields are color-coded to distinguish between data-entry fields and display-only fields.

Fields on the Calls tab have a white background, indicating that these fields are available for data entry.



Manage customers window - Calls tab

Fields on the Orders tab have a gray background, indicating that these fields are display-only.

Manage customers window - Orders tab

Duplicate record checking

iMIS checks for duplicate records using a formula that combines different parts of the customer's record to make a key. The formula that comes with iMIS is usually precise enough to catch duplicates, but in some situations, your administrator may need to customize (see "Formula for checking for duplicate records") the formula.

If iMIS detects one or more possible duplicate records, it will show a list of the possible matches and then gives you the choice of either continuing to add the record or canceling the addition.

Address verification

Address verification is an optional feature that may be implemented with your system. It checks addresses you enter against a database of valid addresses to help ensure that customers actually receive important communications and that your organization doesn't waste time and postal fees sending correspondence to invalid addresses. Your administrator configures the way address verification detects invalid addresses.

To select data from a drop-down list

A drop-down list displays pre-defined selections from which you can choose.

1. Click on the down arrow on the right side of the list to see the entire list.
2. Select an item from the list by clicking on the item.

You can also perform a speed search, which can be helpful in selecting items from long lists. For example, if you type ca in the Country drop-down list, you immediately scroll to the first country that starts with the letters "Ca". You can then use the down arrow or up arrow keys to move to the next or previous items in the list.

The speed search feature expects you to enter the search string quickly. If you pause typing for more than 2 seconds, the search is based on what you have entered up to that point. For example, if you type c in the Country drop-down list, wait a few seconds, and

then type a, the list scrolls to the first country that starts with the letter "C", and then scrolls to the first country that starts with the letter "A".

Note: Some fields look like drop-down lists but are really combination fields that allow you to enter new values or choose from previously entered values. Combination fields do not support the speed search feature.

Reviewing undefined values

The Manage customers window displays (Undefined) beside values in fields that have been deleted from an iMIS table. Table deletions are allowed in iMIS, regardless of the entries in the Name tables.

You are not required to edit this value, but once another value is chosen from the drop down list, the (Undefined) value will no longer be available.

Date field data entry

iMIS can automatically format and complete dates for you when entering customer data.

Note: Dates entered in the Fundraising history tab are not automatically completed or formatted.

Date formatting

In Customers > Manage customers, you can enter a date in a date field using any type of date separators (slashes, dashes, periods, or spaces) or no date separators.

Dates can be entered in numeric or alpha-numeric format (“03/01/09” or “March 1, 2009”).

When you enter unformatted dates in customer-related date fields, iMIS interprets and formats the dates according to your workstation's date format (configured on the Windows Control Panel).

Note: Workstation date settings take precedence over the iMIS Date Format setting in File > System Setup.

Date completion

If you enter an incomplete date, such as 0304, in a date field, iMIS completes the date by adding the current year to the end of the date.

If you enter only one or two digits of a date, such as 3, iMIS attempts to interpret those digits as a day in the current month. If the number is not a valid date for the current month, for example, 33, a message informs you that you must enter a valid date.

Company flow down in iMIS

In order to flow down complete address, phone, and fax data from a company to linked individual records, data must be entered in both the Main address tab of the Address area and the Profile tab of the Detail area.

Enter the complete address that will flow down in the Main address tab of the Address area. The address entered in the Main address tab is the only data entered in the Address area that flows down from company to individual records. The phone and fax data entered in the Address area's address tabs are stored in the Name_Address table and do not flow down.

Enter the Phone and Fax numbers that will flow down in the Profile tab of the Detail area. The data entered in the Profile tab of the Detail area is stored in the Name table.

Note: User-defined company flow down does not support the Work Phone, Home Phone, Fax, and E-mail fields. No error message displays if you specify these fields in the User Defined Company Flow Down field on the Customer Setup - Advanced window, but specifying these fields in the User Defined Company Flow Down field has no effect on user-defined company flow down. The Work Phone and Fax fields are part of automatic company flow down, which can be used separately or in addition to user-defined company flow down.

Working in data grids

The History and Detail sections of the Manage customers window display information in a data grid. You can resize these sections of the window and resize the data grids, if needed.

To navigate within a data grid

Use the following keyboard controls to navigate within those tabs in the History and Detail sections of the Manage customers window that display information in a data grid (such as in the Salutations, Billing, or multi-instance, user-defined tab):

- Page Up - Press this key to move the focus on the grid up one full screen. If the current record is on the top page of the grid, pressing this key will move the focus to the top record of the grid.
- Page Down - Press this key to move the focus on the grid down one full screen. If the bottom visible row is already visible in the current display, pressing Page Down will move the focus to the last record in the grid.
- Home - Press this key to move the focus on the grid to the first column of the current row in the grid. If the cursor is in a cell and blinking and at least one character exists in the field (as in data entry mode), the tab focus will move to the beginning of the data in that cell. If you press Ctrl+Home, the focus moves to the top record in the entire grid, scrolling if necessary.
- End - Press this key to move the focus on the grid to the last column of the current row in the tab. If the cursor is in a cell and blinking and at least one character exists in the field (as in data entry mode), the tab focus will move to the end of the data in that cell. If you press Ctrl+End, the focus moves to the last record in the entire grid, scrolling if necessary.

To resize a data grid

You can resize data grids in the Detail and History sections according to the following:

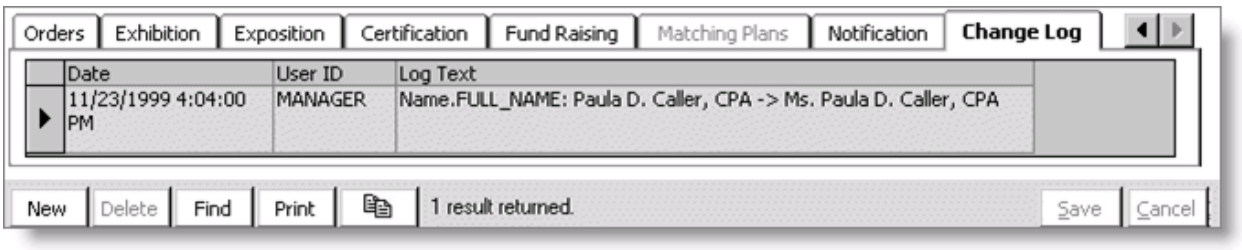
1. To adjust the width of a data grid, drag the boundary on the right side of the column heading until the column is the width you want.
2. To adjust the height of a data grid, drag the boundary on the row heading until the row is the height you want.

Note: When the height of a row is increased and a field contains a drop-down list, a single drop-down arrow displays. To select a value, you must double-click the single drop-down arrow (a second drop-down arrow displays at the top of the column) and click the top drop-down arrow.

3. To hide an unused column of a data grid, drag the boundary on the left side of the column heading until the column you want to hide is no longer visible.

   Example 1

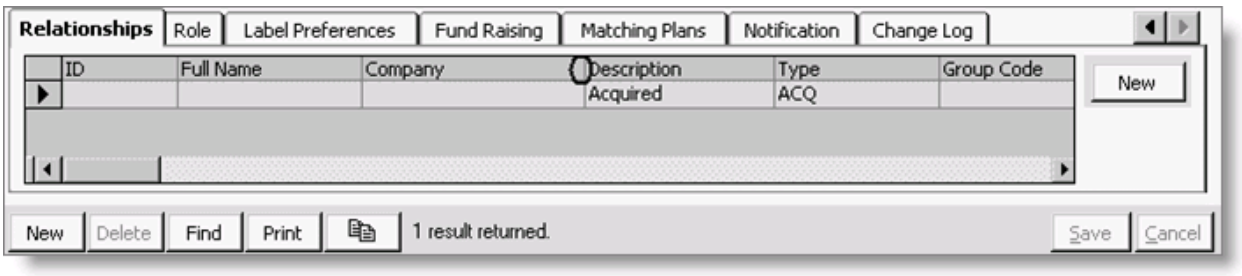
   In the following example, to expand the Log Text field and lengthen the Date field to display more data, drag the boundary at the end of the Log Text field to the right and the boundary at the bottom of the field to the left of the Date field:



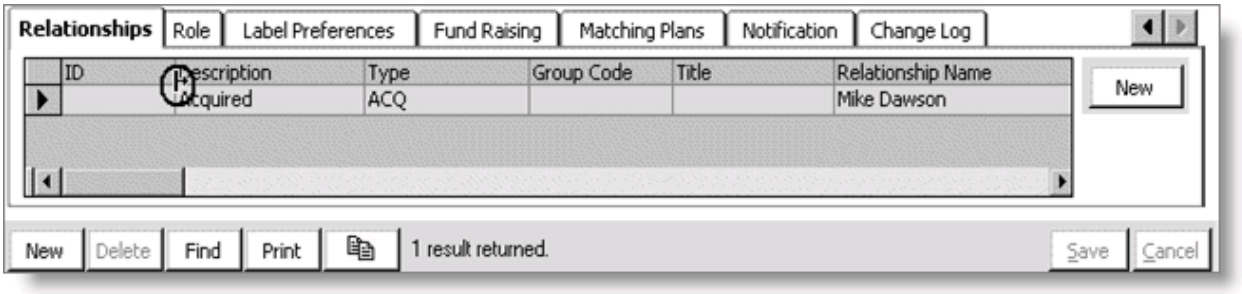
Sample Change Log tab after adjusting data grid

   Example 2

   To hide the Full Name and Company fields on the Relationships tab to view the Relationship Name without having to scroll, drag the boundary at the beginning of the Description field to the left until you reach the end of the ID column (the cursor changes to a half I-beam to indicate a field is hidden).



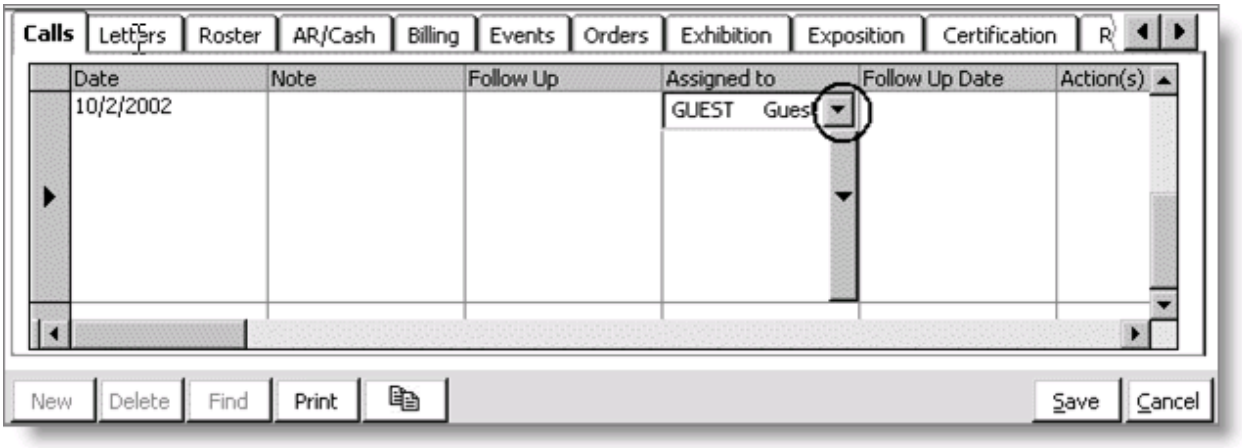
Sample Relationships tab showing boundary to select to hide Full Name and Company fields



Sample Relationships tab after moving Description field

Example 3

To select a value from the Assigned to drop-down list on the Calls tab after increasing the height of a row, double-click the single drop-down arrow (a second drop-down arrow displays), and click the top drop-down arrow.



Sample Calls tab showing the drop-down arrow from which to select a value

Selecting multiple values for user-defined fields

You can select more than one value for single-instance and multiple instance user-defined fields if your administrator has defined the fields as Multi Select.

A multi-select field for a single-instance, user-defined tab displays as a gray, read-only list box that displays the selected codes as a comma-delimited list.

- Single-instance multi select fields have a Select Values button located to the right of the field. When you click this button, the Select Values window opens, allowing you to make and modify selections for the field.
- Multiple instance multi-select fields have a drop down arrow to the left of the field. When you click this button, the Select Values window opens, allowing you to make and modify selections for the field.

  The Select Values window contains two columns of text:

- The Selected Values column contains those values currently selected for the multi-select field.
- The Available Values column contains the values available for selection. These values are defined by your administrator.

  To move values between the two columns, click the Left and Right arrow buttons located between the Available Values column and the Selected Values column.

  All fields listed in the Selected Values column will be saved for the loaded customer when you click the Save button.

  If you click the Cancel button, when the page reloads the selected values will revert to the previously saved values (if any).

  If no values exist for a single-instance, multi-select field, no values will display in the Selected Values column.

  Note: If you make changes to a multi-instance tab, you must save or cancel your changes before selecting another tab. If you make any changes in a multi-instance, user-defined tab and attempt to change tabs, a message asking you to save or cancel your changes is displayed.

  To select multiple values for a user-defined field

1. From Customers, select Manage customers.

2. Select the user-defined tab that contains the multi-select field.
3. Click the Select Values button located to the right of the field to open the Select Values window.
4. Move items from the Available Values column to the Selected Values column:

- Click an item in the Available Values column to highlight it then click the Left arrow button to move the item to the Selected Values column - or - double click the item to move it from one column to the other.
- Repeat to move additional items.

5. Move items from the Selected Values column to the Available Values column:

- Click an item in the Selected Values column to highlight it then click the Right arrow button to move the item to the Available Values column - or - double click the item to move it from one column to the other.
- Repeat to move additional items.

6. Click OK. The values you selected in the Select Values window are displayed in the field.

To enter single-instance user-defined information

Once a user-defined window is chosen, you will need to select a field within the window to be able to Tab through the fields.

1. Open a customer's record in the Manage customers window.
2. Select the appropriate tab to display a single-instance user-defined window (for example, the Lists tab).
3. Select one of the following:

- Any option to enable or disable a field, for example, the Newsletter option.
- Any character field to enter text, for example, the List Codes field.
- Any scrolling-list to select values, for example, the Interest Codes scrolling-list.

Note: See Selecting multiple values for user-defined fields.

4. Click Save or continue entering additional detail information.

To enter multi-instance user-defined information

1. Open a customer's record in the Manage customers window.
2. Select the appropriate tab to open a multi-instance user-defined window.
3. Click in the first field on the tab to display the drop-down list.
4. Select the drop-down arrow and select the appropriate value.
5. Tab to each field and enter the appropriate values. Pressing Tab while in the last field of the row enables the next row.
6. Click Save when you are done entering data.

To delete data from a multi-instance, user-defined record

You can use the following two methods to delete data from multi-instance, user-defined tabs:

- Select the entire row in a tab and press Delete on your keyboard. When you select this method, all of the fields in the row are deleted from the user-defined tab from which you perform the delete, as well as any other multi-instance, user-defined tabs that contain those fields.
- Select the data in a field and press Delete on your keyboard. When you select this method, the data in the field is deleted from the user-defined tab from which you perform the delete, as well as any other multi-instance, user-defined tabs that contain the field.

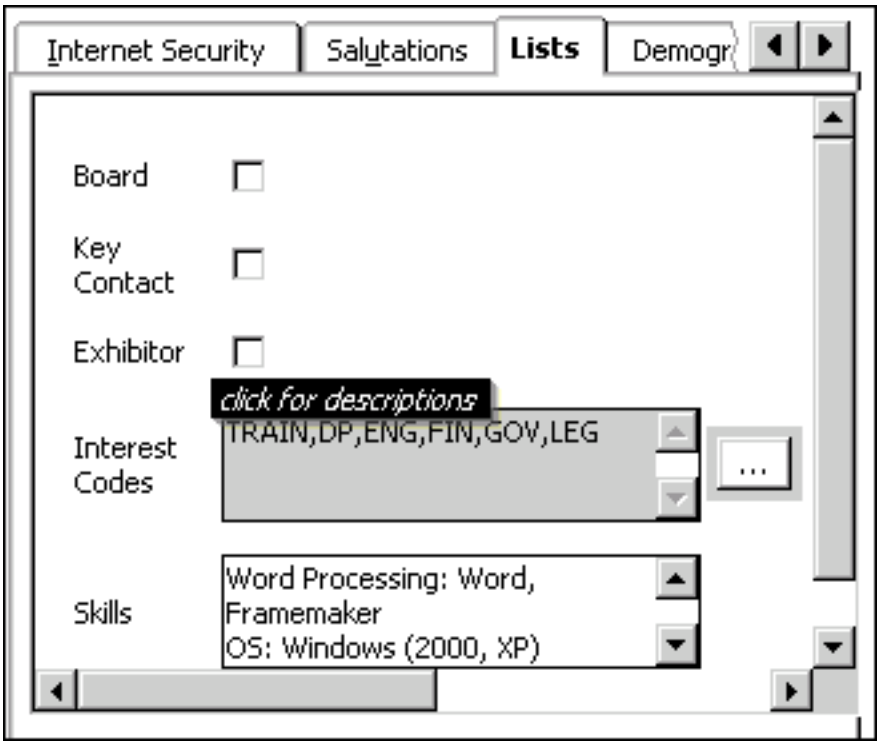
Note: When deleting data from multi-instance, user-defined tabs, a data row is not permanently removed from the database until all the fields for the multi-instance table are deleted, either by blanking data from a field or by selecting and deleting an entire row.

To view multiple-select fields

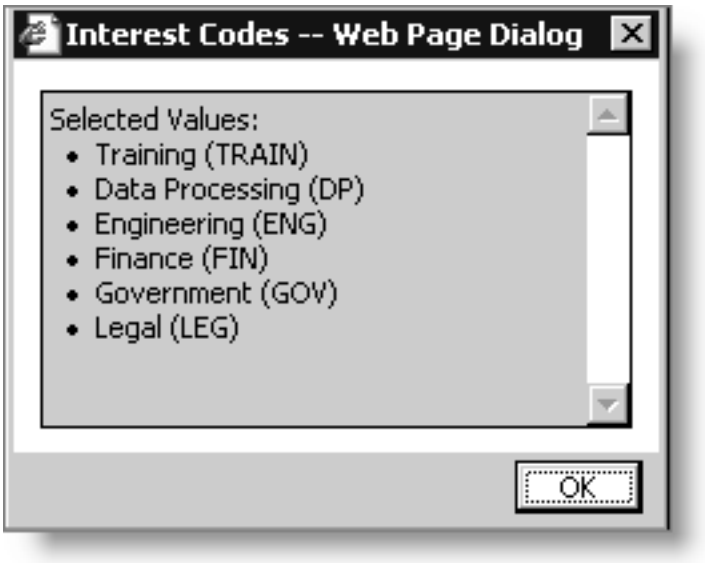
If a multi-select field contains any value, positioning the cursor over the field displays a tooltip containing the message click for descriptions above the cursor. To view the selected values for the field, click the mouse while the tooltip is displayed. The field contents

display in a window even if the field is read-only for the current user. You can use the scroll bars or resize the window, if needed.

Note: To display tabs for user-defined windows, you must add the window to the list of visible tabs on the Customer Portfolio Tab Preferences window.



Example of a multi-select field showing the click for descriptions message that displays when the cursor is over the field

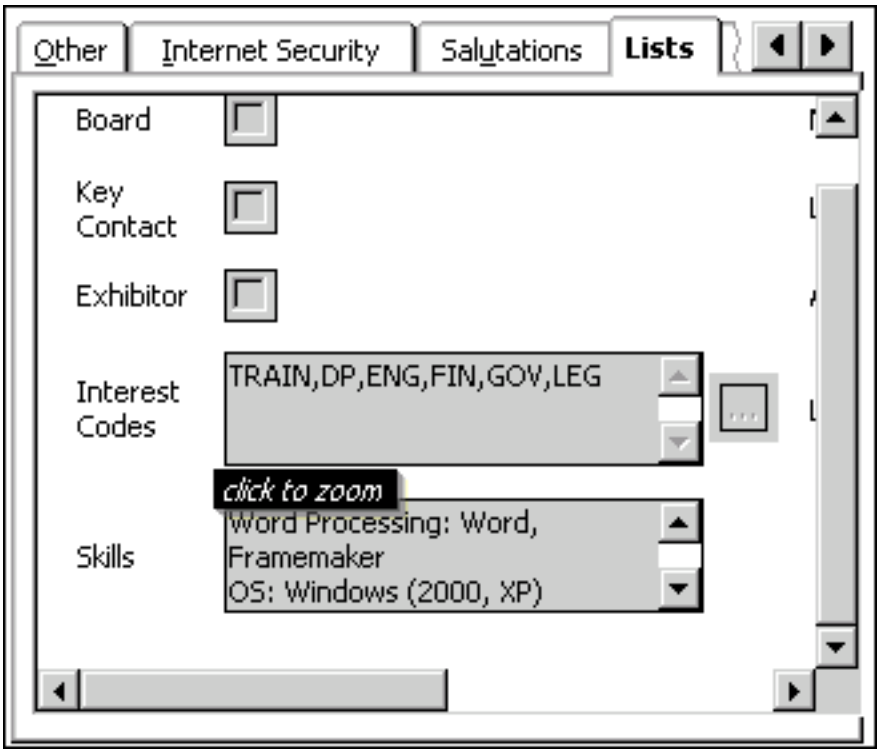


Example of window showing descriptions of currently selected values for the multi-select field shown in the previous example

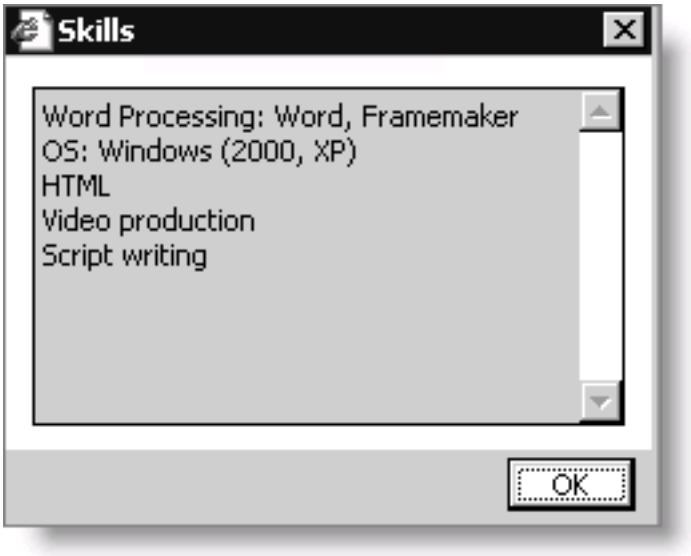
To view read-only text fields

When the data in a read-only text field is not fully visible because the data exceeds the field size, positioning the cursor over the field displays a tooltip containing the message click to zoom. To view the full contents of the field, click the mouse while the tooltip is displayed.

Note: To display tabs for user-defined windows, you must add the window to the list of visible tabs on the Customer Portfolio Tab Preferences window.



Example of a read-only text field showing the click to zoom message that is displayed when the cursor is over the field



Example of the window displaying the entire contents of the read-only text field from the previous example

The data in the window is display-only. You can use the scroll bars or resize the window if needed. Click OK to close the window.

To view data on multiple-instance, user-defined tabs in a non-grid format

You can view or enter/edit data in a multi-instance, user-defined tab in a non-grid format by opening a window for a specific row in the data grid. The row-specific data window displays if you double-click on a data grid row.

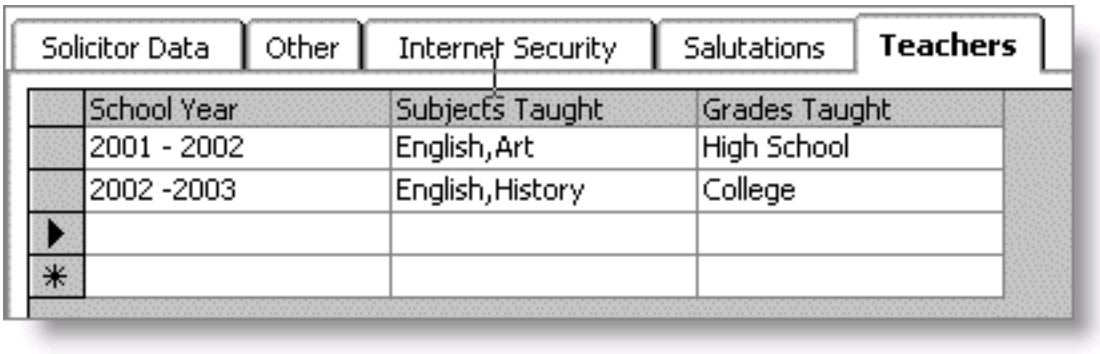
If you have permission to edit the values in the data grid, you can edit values in the row-specific data window. Any values that are changed in this window are automatically updated in the corresponding data grid rows when you click OK on this window. If you click Cancel, any values changed in the window will not be transferred to the corresponding grid row.

If you have permission to enter records in the data grid, you can enter new records directly in the row-specific data window. Records entered in the row-specific data window will be added to the data grid when you click OK.

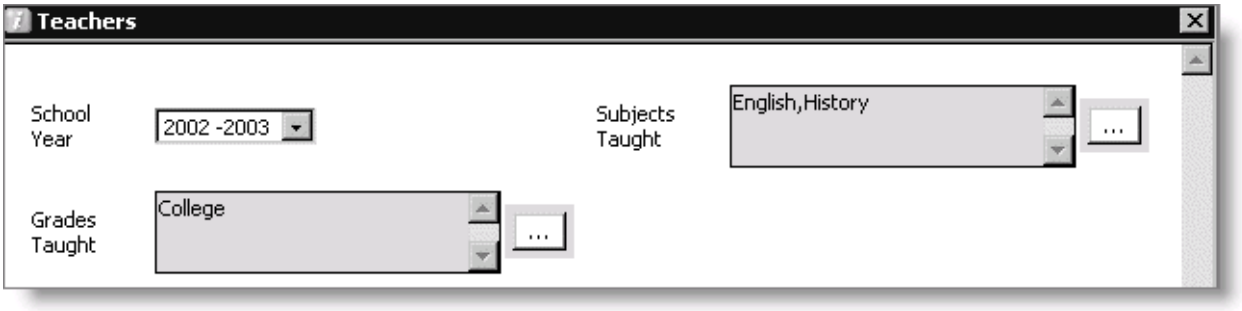
Changes or additions made in the row-specific data window are not saved to the database until you click Save on the Manage Customers window.

If the data grid is read-only, a record can be viewed in a row-specific data window, but the information in the window cannot be edited and you cannot enter new records in the window.

Validation of values entered in the row-specific data window uses the same logic as the validation of values entered in the data grid. Values entered in the row-specific data window are saved to the database after clicking OK on the row-specific data window and then clicking Save on the Manage customers window.



Example of a multi-instance, user-defined tab (from Customers, find a customer record, then select a multi-instance, user-defined tab)



Example of the second row from the multi-instance, user-defined tab show in the previous example displayed in a window format (in the data grid, double-click on the gray box located to the left of the row you want to view)

To view or edit data on multiple-instance, user-defined tabs

1. From Customers, find a customer record.
2. Select the multiple-instance, user-defined tab you want to view.
3. Double-click on the gray box located to the left of the row you want to display in a non-grid data window.
4. View or edit fields.

- Click Cancel to close the window without making changes.
- Edit fields in the window, then click OK and click Save on the Manage Customers window.

Using the Clipboard icon

The Clipboard icon enables you to copy the name and address information of the current customer onto your workstation's Windows clipboard. You can then copy or paste this information into other applications such as a word processing application.

The Clipboard icon

Your administrator can customize the fields that are copied to the clipboard (see "Customizing clipboard fields") to include more information.

To copy customer information to the clipboard

1. Load a customer record.
2. Click the Clipboard icon located at the bottom of the window. The customer's name and additional fields configured by your system administrator are copied to the system clipboard.

   Note: Many applications enable you to transfer information from the Clipboard using a menu option such as Edit > Paste or using the key combination Ctrl+V.

Running multiple iMIS instances

You can open multiple instances of the Manage customers window simultaneously and independently of each other. The number of instances that you can open depends on the number of licenses you have purchased and the system resources (memory, disk space, and so forth). For example, if you have a five-user license, you can open five instances of iMIS.

Note: If you open more than five instances of iMIS, we recommend you increase your system memory to 256 MB RAM.

Note: You may receive one of the following error messages when attempting to open multiple instances of iMIS:

“Error opening iMIS Standard Data file (iMISSTD.DF1). The file's read-only attribute may be set. Click OK to exit.”

“A new iMIS workspace cannot be started. You may have exceeded your license count. Click OK to exit.”

These error messages may indicate that the iMISSTD.DF1 file cannot be found, that the file is set as read-only, or that you are trying to open multiple instances of the Manage customers window without a multi-user license.

The first instance of the Manage customers window is opened by selecting Customers from the navigation bar and selecting Manage customers from the Customers task list. Subsequent instances are opened by repeating this action or from the Manage customers window (see To open a customer's record in the Manage customers window (see "Opening customer records")).

To help distinguish between multiple iMIS instances, the current customer information displays in the iMIS window title.

Managing tab preferences

The Customer Portfolio Tab Preferences window enables you to customize the Detail and History areas of Customers > Manage customers. You can hide tabs that you do not want to display in the Detail and History area, and you can customize the order in which the tabs display in the area.

Note: A maximum of 60 tabs can be displayed for each profile (Detail and History), which can include up to 15 multi-instance user-defined tabs. If you attempt to add more than 60 tabs to the list of visible tabs on the Detail or History tab of the Customer Portfolio Tab Preferences window, a message informs you that the 60-tab limit has been reached and that no more tabs can be displayed.

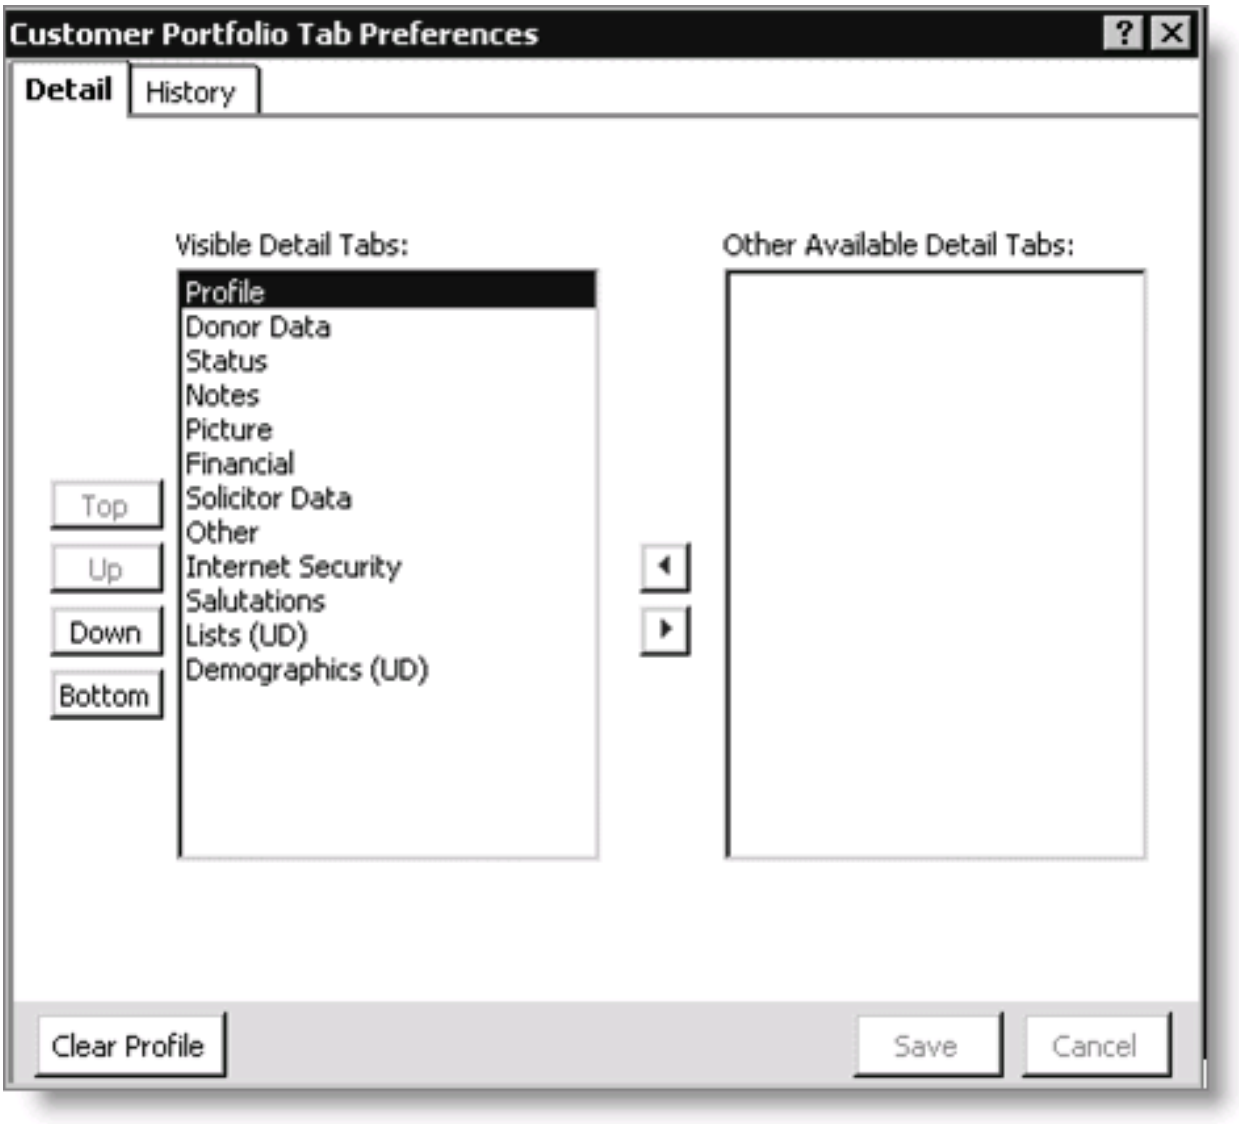
Administrators can customize the default Customer Portfolio Tab Preferences, which will determine the tabs visible to users who do not set their own tab preferences.

User-defined, multiple-instance, and activity tabs do not display by default; you must add these tabs to your tab preference profile. If you do not have a tab preference profile, you

must create one (from Customers, select Manage customers, place the cursor over the Detail tabs, right-click, and select Edit Tab Preferences) to display any tabs other than the iMIS-defined default tabs. See, Creating Tabs for Activity Types for more information about creating activity tabs.

Note: All user-defined, multiple-instance, and activity tabs in the Customer Portfolio Tab Preferences window display with (ACT) appended to the end of their name. For example, the Calls and Letters activities will display as Calls (ACT) and Letters (ACT) on the Customer Portfolio Tab Preferences window; however, in the History area of the Manage customers window the actual tabs will display as Calls and Letters, respectively.

Customer Portfolio Tab Preferences window



Right-click in either the Detail or History area and select Edit Tab Preferences

Detail

Select this tab to configure the tab preferences for the Detail area of Customers > Manage customer.

History

Select this tab to configure the tab preferences for the History area of Customers > Manage customer.

Visible Detail Tabs

Lists all of the tabs enabled to display in the Detail and History areas of Customers > Manage customer.

Detail area - When editing or setting up your profile, you must leave at least one tab listed in the Visible Detail Tabs field for the Detail area of your Customer Portfolio profile. If you do not leave at least one tab listed in the Visible Detail Tabs field, you cannot save the profile.

Other Available Detail Tabs

Lists all of the tabs that are hidden from view in the Detail and History areas of Customers > Manage customer. Tabs display in list order in the Detail and History areas.

Top

Moves the tab(s) selected in the Visible Tabs list to the top of the list and the beginning of the display order.

Up

Advances the tab(s) selected in the Visible Tabs list by one tab in the list and in the display order.

Down

Moves the tab(s) selected in the Visible Tabs list back by one tab in the list and in the display order.

Bottom

Moves the tab(s) selected in the Visible Tabs list to the bottom of the list and the end of the display order.

Left arrow

Moves the tab(s) selected from the Other Available Tabs list to the bottom of the Visible Tabs list. Moving a tab to the Visible Detail/History Tabs list displays the tab in its respective area of Customers.

Right arrow

Moves the tab(s) selected from the Visible Tabs list to the Other Available Tabs list. Moving a tab to the Other Available Tabs list removes the tab from its respective area of Customers.

Clear Profile

Clears any custom profile settings and returns the tab preferences to the default setting. This is useful when license keys have changed and new tabs exist that are not in the your profile. Clearing the profile will display all of the tabs in their default order in the Detail and History areas.

Customers tab security

User access to tabs is controlled by:

- iMIS module licensing - A module-specific tab can only be used if the iMIS installation is licensed for that module.
- iMIS authorization levels - A module-specific tab can only be used if the user has the appropriate module-specific authorization level.
- iMIS access keywords - A keyword-protected tab can only be used if the user has been assigned the appropriate keyword.

The rules governing tab availability in Customers > Manage customers determine tab availability in the Customer Portfolio Tab Preferences window.

A/R Cash, Billing, Events, Exhibition, Exposition, Orders, and Fundraising tabs

These tabs require users to have a module-specific Authorization Level of 1 or higher.

Label Preferences tab

This must be set up by your administrator.

Salutations and Role tabs

This must be set up by your administrator.

Call, Letters, and Fundraising tabs

This must be set up by your administrator.

User-defined tabs

User-defined tabs can be hidden by your administrator.

To open the Customer Portfolio Tab Preferences window

1. From the Detail section:

- Open a record in the Manage customers window.
- Right-click in the Detail section's tab-strip to display the right-click menu. If a record is not loaded in the Manage customers window, you will not be able to open the right-click menu from the Detail section's tab-strip.
- Select Edit Tab Preferences from the list to open the Customer Portfolio Tab Preferences window.

2. From the History section:

- Right-click in the History section's tab-strip to display the right-click menu (a record does not have to be loaded).
- Select Edit Tab Preferences from the list to open the Customer Portfolio Tab Preferences window.

To customize tabs in the detail and history areas

1. Open the Customer Portfolio Tab Preferences window.

- Place your cursor over the Detail tab and right-click.
- Select Edit Tab Preferences.

2. In the Customer Portfolio Tab Preferences window, click the Detail or History tab to configure tab preferences for the appropriate area of the Manage customers window.
3. Select the tab item(s) from the Other Available Detail Tabs or from the Other Available History Tabs list that you want to display in the Manage customers window.

Note: Press Ctrl or Shift to make multiple selections.

4. Select the Left-arrow button to move the selected tab item(s) to the bottom of the Visible Detail Tabs or Visible History Tabs list, or double-click to move tab items individually.

Customizing the default Tab Preferences

The Load default button is visible only to an administrator with a system management level of 8 or higher, and only when the administrator's own profile is loaded. If the default profile is currently loaded, the window title is System Default Tab Preferences and Load personal appears in place of Load default. (Selecting Load personal reloads the administrator's personal profile.)

To customize the default Tab Preferences profile

5. Go to Customers.
6. Right-click the top of the Details or History pane.
7. Select Edit Tab Preferences.

   The Customer Portfolio Tab Preferences window opens and the administrator's own profile is loaded.
8. Switch to the default profile by selecting Load default.
9. Edit the default settings.
10. Select Save.
11. Restart iMIS for your changes to take effect.

Detailed Customer Data

The Customers feature contains significant amounts of customer information. At times, however, you may need to access more specialized customer data. The Detail area of the Customers feature offers tabs that provide an additional means for accessing specialized customer data including:

- Profile, donor, and solicitor data
- Status

- Notes
- Picture
- Financial
- Salutations
- Log

Your administrator can also create a custom tab for the Details pane of the Customers feature.

About Detail and History tab preferences

Detail and history tabs are not displayed by default; you must add these tabs to your tab preference profile. If you do not have a tab preference profile, you must create one.

By default, the Results tab is the leftmost tab in the History tab area, but you can change the order in which tabs are displayed with the Customer Portfolio Tab Preferences window.

Note: Tabs that can be disabled cannot be selected as the first tab of the Detail area's profile, and you cannot to save a profile in which the first Detail tab is restricted according to customer type.

The Customer Portfolio Detail and History tab areas can each have up to 60 tabs displayed.

Manage customers - Detail area

The Detail area of the Customer Portfolio contains detailed customer information.

Tips

- Additional tabs appear if you are licensed for VAT or Fundraising, or have user-defined tabs.
- The slider control at the top right of the detail area lets you scroll across to see more tabs.
- Once you select a tab in the Detail area, click a field in the tab to activate the area.

For example, when the Profile tab is selected, click in the Work Phone field to activate the area. Press Tab to move the cursor to the next field.

- When you reach the last field on the Profile tab, select a tab in the Detail area and click any field to activate it.

  For example, if you need the Join Date on the Status tab, press Alt+T to activate the Status window, and click in the Join Date field.

  To navigate within the Detail area

  In most cases, more tabs exist in the Detail area than can be viewed at any one time without scrolling.

  To navigate to a specific tab:

- Select the right or left arrow buttons at the far right of the tab areas to scroll through the tabs. Select the specific tab when the tab you need to access displays, or
- Right-click to display a list of all the tabs in the area and select a menu item to display a specific tab.

  Note: You can navigate to a specific tab only when the Manage customers window is in New or Edit mode, and some tabs will be available only when in Edit mode.

  You can right-click anywhere on the Detail area's tab-strip to display a list of all the enabled Detail tabs (disabled tabs are grayed out and cannot be selected). The tab currently displayed is grayed out in the list. Selecting a tab from the menu's list directly opens that tab.

  Note: You can also select the right or left arrow to scroll through the tabs.

  To enter customer details

  Company flow down, an automatic process of updating specific fields when a Company ID is assigned to a Member ID, will automatically populate the Work Phone, Fax, and Toll Free fields. Additional flow-down options can be defined by your administrator.

1. Open a customer's record in the Manage customers window.

2. Select the appropriate detail section tab.
3. Tab to each field and enter the appropriate values.
4. Click Save, or continue to enter additional detail information.

Manage customers window - Profile tab

From Customers, select Manage customers, find customer record, and select Profile tab

Note: Your administrator can map the Work Phone, Home Phone, Fax, and E-mail fields on the Profile tab to the Phone, Fax, and E-mail fields on any address purpose defined in the Main, 2nd, or 3rd fields on the Customer Setup - Address and Notes window.

Work Phone

Specifies the business phone number, including any phone number extensions.

Home Phone

Specifies the home phone number.

Fax

Specifies the fax number.

Toll Free

Specifies the toll-free phone number.

E-mail

Specifies the e-mail address of the customer. If you have a MAPI32-compliant e-mail application software and Internet access on your system, select the envelope icon to send an e-mail directly from the customer record.

Web Address

Specifies the Web address of the customer. If you have Internet access on your system, select the world icon to open the Web address in your browser.

Major Key

Specifies a primary field with which you can retrieve records. iMIS will make this field available for referencing and searching for customer records throughout the system. For example, you can use social security numbers, certificate numbers, license numbers, and old customer ID numbers. You can make the major key unique in order to prevent duplicate entries.

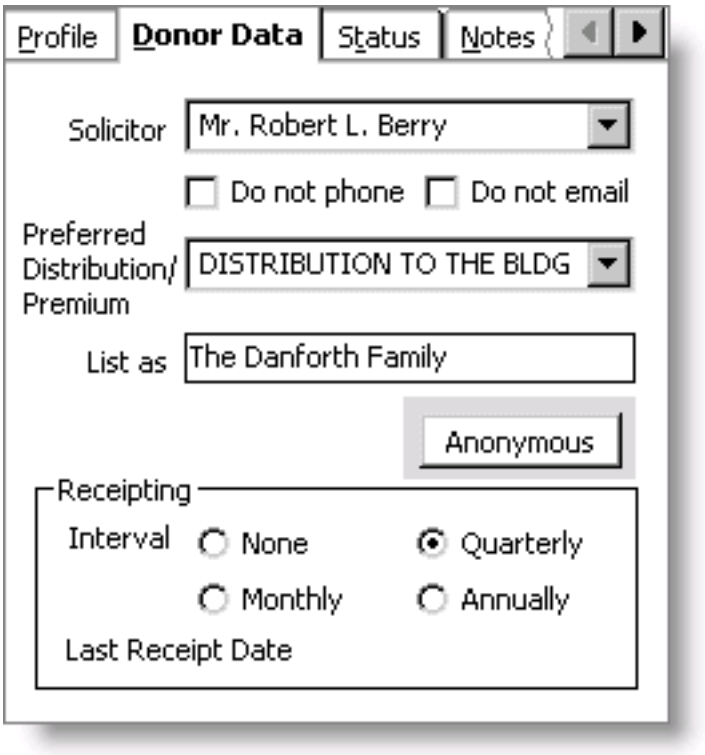
The major key field is displayed with a prompt entered by your administrator.

Functional Title

Select the drop-down arrow on this field to select a larger grouping for the Title field. This drop-down list is set up by your administrator.

For example, you could use a Functional Title grouping for Accounting for specific mailings to officers related to the accounting function. If you specify functional titles for your customers, you can also display or print company rosters with the individuals listed by functional title grouping. You can also look up all individuals in a Functional Title grouping.

Manage customers window - Donor Data tab



From Customers, select Manage customers, open a customer record, and select the Donor Data tab

Solicitor

Enter the customer ID of the solicitor associated with the customer. The solicitor specified here is the default solicitor that displays in the Enter and edit gifts window.

Do not phone

Enable if the customer does not want to be called.

Do not email

Enable if the customer does not want to receive e-mail. This option is for informational purposes only and does not prevent e-mail from being sent to the customer.

Do not solicit

Enable if the customer does not want to receive solicitations.

Do not sell

Enable if the customer does not want to make donations.

Preferred Distribution/Premium

(Applies only to memorials and tributes) Enter the preferred distribution or premium for gifts that are made in memory of or in honor of the customer. If a preferred distribution or premium is specified, the preferred distribution or premium automatically populates the Distribution field on the Overview tab on the Enter and edit gifts window when a memorial or tribute donation is made in honor of this individual. This distribution or premium can be overridden.

List as

Specify how the customer is to be listed on printed materials and reports. This can be overridden.

Anonymous button

Enables you to specify that the “list as” information for this customer is Anonymous. Although Anonymous will display in the Enter and edit gifts window, you can override this while entering a gift.

Receipting Interval

There are four options for assigning a receipting interval to the customer that display in this area. All interval values are compared to the system date and the “last receipt printed” date to determine if a new receipt should be issued.

- None - If this option is enabled, no receipting interval is activated. This is the default setting. Any non-receipted gifts matching the selection criteria are issued a receipt.
- Quarterly - If this option is enabled, receipts are not automatically generated with another receipt batch until the quarterly interval (90 days) has passed.
- Monthly - If this option is enabled, receipts are not automatically generated with another receipt batch until the monthly (30 days) interval has passed. The monthly interval is always equal to 30 days.

- Annually - If this option is enabled, receipts are not automatically generated with another receipt batch until the annual interval (365 days) has passed.

  Last Receipt Date

  (System generated - Display only) Displays the date of the last receipt issued for the customer. Updates after a receipt is printed and cannot be updated manually.

Manage customers window - Status tab

From Customers, select Manage customers, find customer record, and select Status tab

Chapter

The prompt for this drop-down list displays when the Chapter prompt is set up by your administrator. Select the drop-down list on this field to select from chapter names defined by your administrator.

Join Date

Specifies the date the customer became active. Use a forward (/) to separate the month, day, and year values. When you enter a day, the system month and year is automatically entered.

Note: When a member joins online, the Join Date populates automatically with the current system date. Staff users can manually override this date if needed before processing the join.

Paid Through Date

Specifies the date that customer benefits expire. This date is updated upon Dues Payment (Cash Dues System) or Dues Billing (Accrual Dues System Option) processing.

Member Status

This display-only field displays one of the following status options:

- New - iMIS sets the status to N when you insert a new customer record and when you change a nonmember record to a customer record (except for records with status D). If a record's status is blank, posting a Billing payment (advancing the PAID_THRU) will trigger status N.
- Dropped - iMIS sets the status to D when you change a customer record to a nonmember record (which may already have status D) and when the Name.STATUS changes to an S* (suspended), I* (inactive) or D* (deleted) code from one that was neither S* nor D* (includes A* (active)).
- Renewed - iMIS sets the status to R when you post a Billing payment (advancing the PAID_THRU) for a record with status N.
- Reinstated - iMIS sets the status to S when you change a nonmember record with status D and Name.STATUS other than S* (suspended), I* (inactive), or D* (deleted) to a customer record and when the Name.STATUS for a customer record changes from an S* (suspended), I* (inactive), or D* (deleted) code to one that is neither S*, I*, or D*. If you post a Billing payment for a record with status D, iMIS sets the status to S and removes any Name.STATUS code set to S* (suspended), I* (inactive), or D* (deleted).

Member Status Date

This is a display-only field that defaults to the current system date (or the Billing payment transaction date) for each of these status changes except when you enter a JOIN_DATE for a new record, in which case the JOIN_DATE is used.

Date Added

This is a display-only field that displays the date the customer was originally entered in the database.

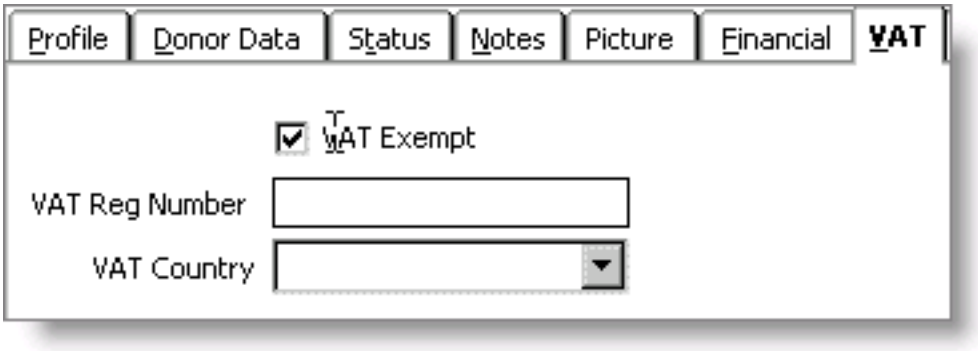
Last Update

This is a display-only field that displays the last date the customer's record was updated the database.

Last Updated By

This is a display-only field that displays the ID of the person who entered the update.

Manage customers window - VAT tab



From Customers, select Manage customers, find customer record, and select VAT tab

VAT Exempt

(optional) Enable if the customer is VAT exempt.

VAT Reg Number

(optional) This field specifies the VAT Registration Number for the customer. This information will display on the Full Order Entry window.

VAT Country

(optional) This field specifies the VAT country for the customer. This information will display on the Full Order Entry window.

Manage customers window - Solicitor Data tab

From Customers, select Manage customers, find customer record, and select Solicitor Data tab

Title

Specifies the solicitor's title.

Volunteer

Specifies whether the solicitor is a volunteer and not a paid staff member.

Solicitor

Specifies that the individual is a solicitor. When selected, solicitor information is available at gift/pledge entry and for reporting.

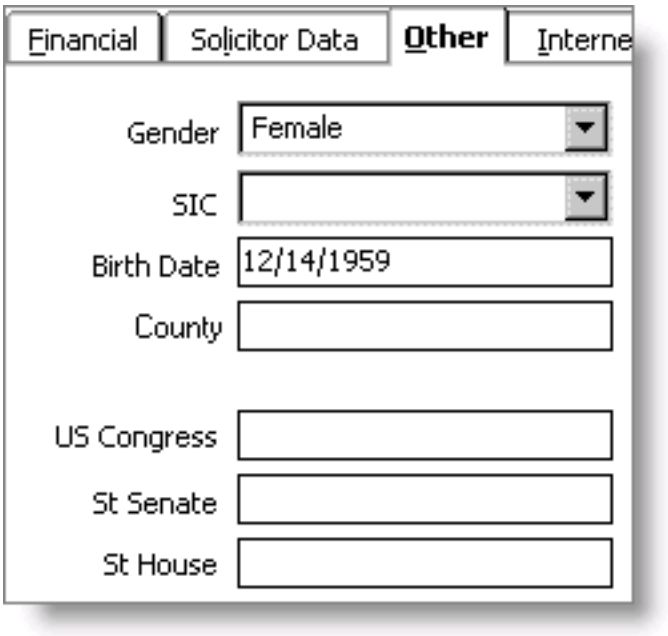
Hours/Week

Specifies the number of hours per week the solicitor works.

Comments

Contains comments associated with the solicitor. The character limit for this field is 255.

Manage customers window - Other tab



From Customers, select Manage customers, find customer record, and select Other tab

Gender

Specifies the gender of the customer.

Note: When possible, iMIS automatically populates this field based on the value in the Prefix field on the Customer Portfolio. Prefixes that do not indicate gender such as Dr., will not automatically populate.

SIC

Select the drop-down arrow on this field to select a SIC (Standard Industry Code). Values listed in this drop-down list are defined by your administrator. Codes entered before a SIC_CODE table is created will not be validated unless the field is edited.

Birth Date

Specifies the birth date of the customer.

County

Specifies the name or code for the county where the customer is located. iMIS auto-populates this field when the County from Primary Zip option is enabled by your administrator.

US Congress

Specifies the U.S. congressional district number for sending legislative alerts and target mailings.

St Senate

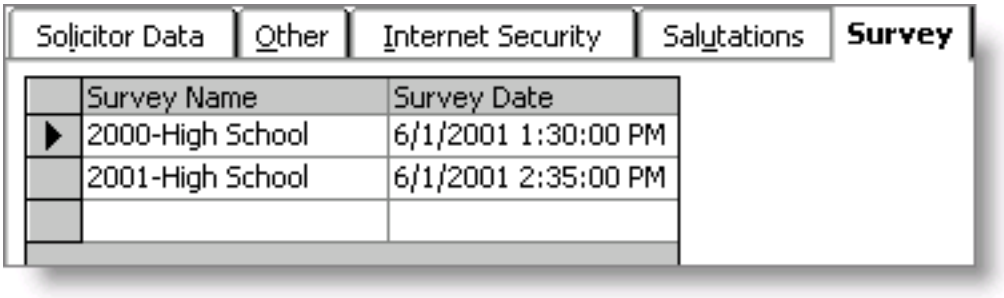
Specifies the state senatorial district number for legislative alerts and target mailings.

St House

Specifies the state representative district number for legislative alerts and target mailings.

Note: If you are using Accumail, the US Congress field, County field, and postal-related fields are auto-filled.

Manage customers window - User-defined tab



From Customers, select Manage customers, find customer record, and select user-defined tab

User-defined tabs can be displayed in the Detail area on the Customers tab. Multi-instance tabs are shown first, followed by single-instance tabs in the order they set up by your administrator.

User-defined tabs with values in Only applies to these types are shown as needed after you click Save and refresh the record.

Note: Your administrator can limit access to user-defined tabs.

Keyboard shortcuts in user-defined tabs

The following keyboard shortcuts are supported in user-defined tabs:

- Ctrl+V (Paste)
- Ctrl+C (Copy)
- Ctrl+Z (Undo)

Caution! Pressing Ctrl+Z in user-defined tabs does not zoom a text field as in other fields on the Customers area. Using Ctrl+Z in a user-defined tab will undo your most recent action.

The following are not supported in single-instance, user-defined tabs:

- Ctrl+C (Copy)
- Right-click menus

Only applies to these types

User-defined tabs can be defined to open for certain customer types. When this option is enabled and you are viewing a customer record, user-defined tabs will only be loaded for customers with those specific customer types. When editing a customer record, and updating the customer type from one that would not open a window, to one that would open a window, the window will only open after Save is clicked.

If a user-defined tab is set to only apply to certain customer types, the tab will not display in the detail area of a record when the record is inserted. The tab will only display after the record has been saved once, and then the user will need to reopen the tab to see all the tabs that the record should have.

Character entry

Character fields on single-instance, user-defined tabs display according to the character limit set for them by your administrator.

Fields on single-instance, user-defined tabs display according to the following:

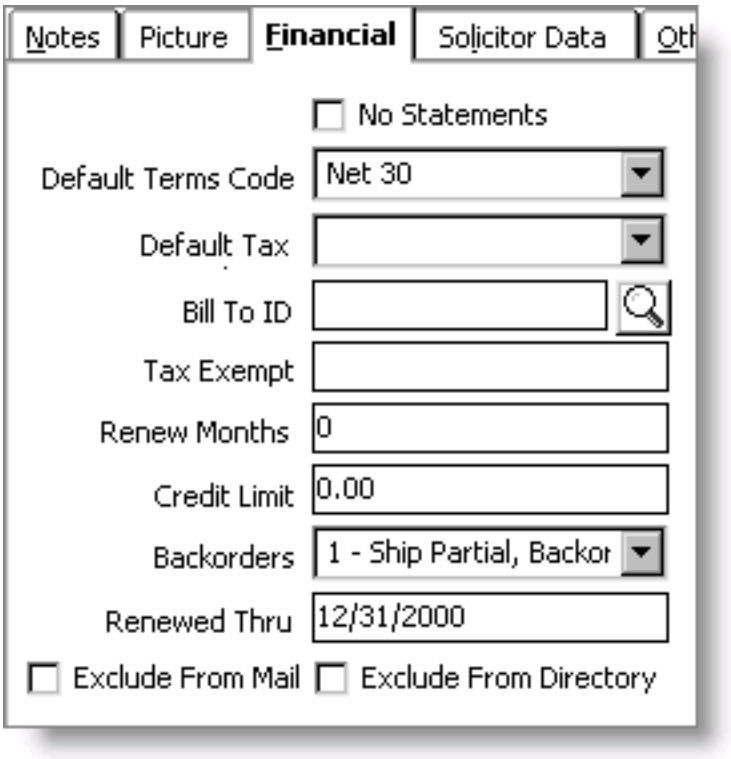
- Fields defined with a character limit of less than 33 characters display as a single line
- Fields defined with a character limit of 33 to 63 characters display as two lines
- Fields defined with a character limit of greater than 63 characters display as three lines
- Text fields specified with a character limit of more than 32 characters display with scroll bars to allow you to view the text

Note: For field lengths greater than 32 characters, if you attempt to enter more characters than specified for a user-defined, single-instance tab, a message informs you that your text will be truncated. If you attempt to enter more characters than specified for a user-defined, multi-instance tab, a a message informs you of the maximum number of characters that can be entered in the field. The field will be blanked out and you will need to re-enter your value.

Entering financial information

Use the Financial tab to enter the customer's financial data preferences. Your administrator may limit access to the Financial tab.

Manage customers window - Financial tab



From Customers, select Manage customers, find customer record, and select Financial tab

No Statements

Enable if the customer will not receive statements.

Default Terms Code

Select the drop-down arrow on this field to select a default payment term for which the customer will pay invoices. Values that display on the drop-down list are defined by your administrator.

Default Tax

Select the drop-down arrow on this field to select a default tax authority. Values that display on the drop-down list are defined by your administrator.

Bill To ID

Specifies the ID number for the customer that will be handling charges as a third party. Used in Billing for List Billing.

Tax Exempt

Specifies any number to specify that this customer is tax exempt.

Renew Months

Use this field to override the normal billing period of 12 months. For example, if the customer is to be billed four times per year (quarterly), enter 3.

Credit Limit

Specifies the amount of credit assigned to the customer.

Backorders

Drop-down list of all backorder options used with Full Order Entry

Renewed Thru

Use this field to indicate the date through which the individual has been billed for the main Billing product, regardless of payment. This field is reset by iMIS when the main Customers Billing item is billed.

Exclude From Mail

Enable to exclude this customer from the Customers system mailings.

Exclude From Directory

Enable to exclude this customer from the directory.

To enter financial information

1. Open a customer's record in the Manage customers window.
2. Select the Financial tab and click in any field.
3. Tab to each field and enter the appropriate values.
4. Click Save, or continue entering additional detail information.

Entering note information

The Notes tab displays a scroll-down list that contains four notes. The first three Notes prompts are customized by your system administrator.

Note: Your administrator can customize notes to include more than four notes.

Manage customers window - Notes tab

From Customers, select Manage customers, find customer record, and select Notes tab

The fourth note displays a blank prompt, which will accept any value typed in the prompt (as long as the value is unique). As soon as you enter data in the last note field on the tab, the system automatically creates a new blank note below the last note.

The Notes tab can hold up to 70 notes.

To enter note information

1. Open a customer's record in the Manage customers window.
2. Select the Notes tab and click in any field.
3. Tab to each field and enter the appropriate values.
4. Click Save, or continue entering additional detail information.

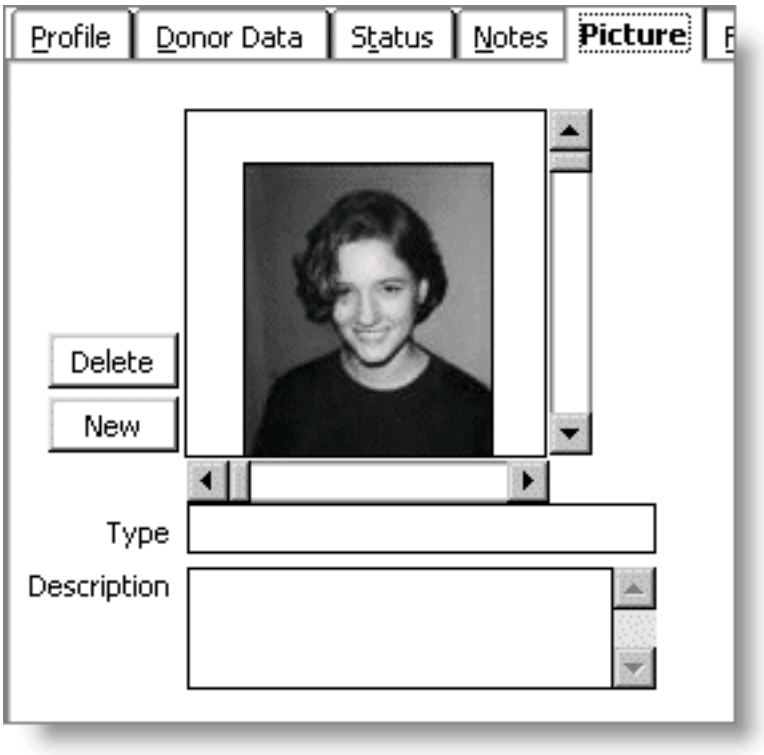
To view note information

To view the entire contents of a Note field in the Notes tab, click the Zoom button that corresponds to the Note field you want to view.

Adding a picture

Use the Picture tab to select and store a customer's picture.

Manage customers window - Picture tab



From Customers, select Manage customers, find customer record, and select Picture tab

Type

Specifies a title for the picture.

Description

Specifies a description for the picture.

To insert pictures

Images on the Manage customers window are limited to the BMP and JPEG formats. The preferred image size for the portrait is 130 pixels by 125 pixels. When a larger image is inserted, use the scroll bars to view the image.

1. Open a customer's record in the Manage customers window.

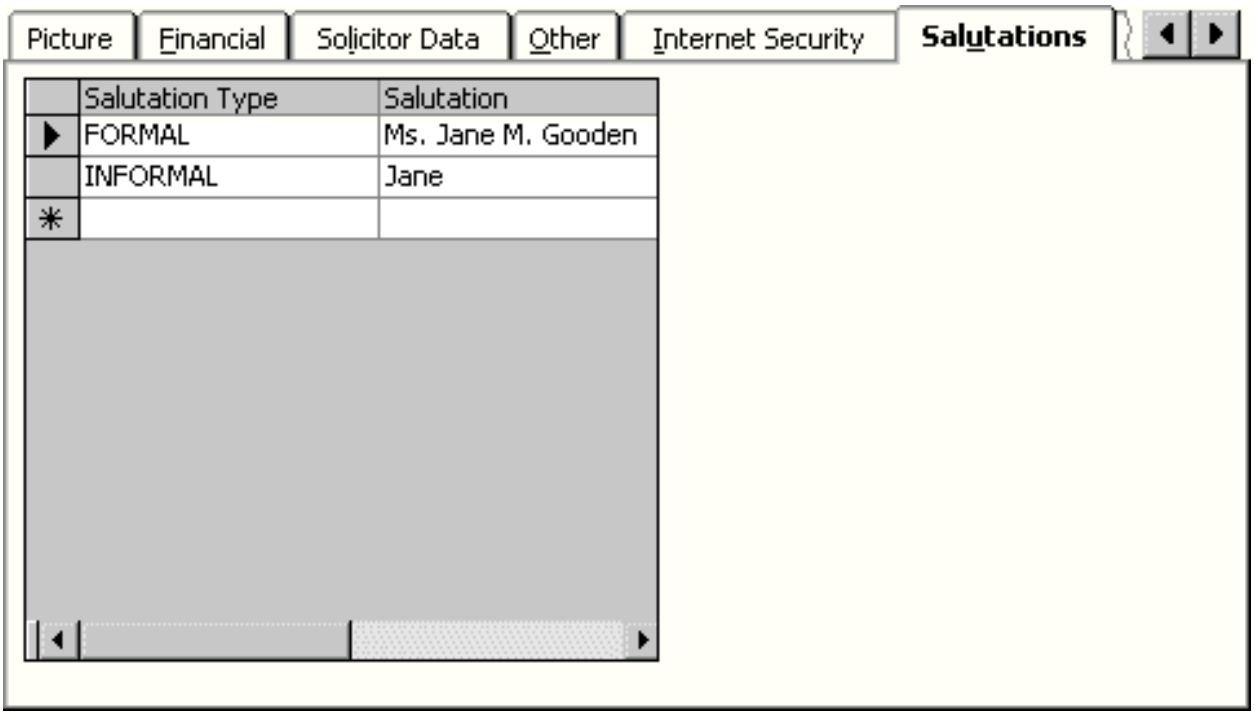
2. Select the Picture tab.
3. Click New to browse for the portrait file.
4. Select the file.
5. (optional) In the Type field, enter a value.
6. Tab to the Description field and enter a value.
7. Click Save, or continue entering additional detail information

   Note: When inserting a portrait that is larger than the viewing area, the portrait is centered after clicking Save.

Entering salutations information

Use the Salutations tab to define the salutation text used for customer correspondence and acknowledgements.

Salutations tab



From Customers, select Manage customers, find customer record, and select Salutations tab

Salutation Type

(required) Select the salutation code you want to use.

Select the right side of the Salutation Type cell to display a drop-down list of the descriptions defined for the salutation codes. Salutation codes are defined by your administrator.

Salutation

Specifies the salutation text for the corresponding Salutation Type. This field can automatically convert values entered to upper or lower case.

Note: Your administrator can limit your access to Salutations tab functionality.

To display the Salutations tab

The Salutations tab displays for all customer records if your administrator has defined salutation codes.

To assign a salutation code

1. Open a customer's record in the Manage customers window.
2. Select the Salutations tab.
3. Select the empty Salutation Type field to display a drop-down arrow.
4. Select the drop-down list and select the salutation code you want to use.
5. Enter salutation text in the Salutation field.
6. Click Save.

To edit a salutation code

When editing salutation codes, you can replace an existing code with one from the list of defined codes. However, you cannot replace an existing salutation code with a null value. No restrictions exist for editing salutation text, and you can leave the Salutation field blank if you want to remove the salutation text that has been assigned to a code.

1. Open a customer's record in the Manage customers window.
2. Select the Salutations tab.
3. Make any necessary changes.
4. Click Save.

To delete a salutation code

1. Open a customer's record in the Manage customers window.
2. Select the Salutations tab.
3. Select the row you want to delete and press the Delete key.
4. Click Save.

Historical Customer Data

You view comprehensive customer information in Customers. At times, however, you may need to access more specialized customer data. The history tabs offer a way to access detailed historical customer data.

The exact tabs that are displayed, and the order in which they are displayed are configured in the Customer Portfolio Tab Preferences window (see "Creating tabs for activity types").

Sorting history tab data

You can sort records by any column in any of the history tabs on the Manage Customers window except Record History and Roster. Click the heading of the column by which you want to sort and the rows will be sorted according to the following rules:

varchar (alphanumeric)	alphabetic ascending	(A-Z) (1,10,2,20)
numeric	numeric ascending	(1 - 99)
date	chronological ascending	(1/1/2001 - 12/12/2005)
money	numeric ascending	(1.02 -99.99, 1,02 - 99,99)

Clicking on the column header of the sort column toggles the sort between ascending and descending order. The column by which the data is sorted is marked with an asterisk (*).

	ID	* Last Name	First Name	Middle	Suffix	Title	Company	City	State
▶	156	Bachman	Peter	L.		Vice President	American Business	Houston	TX
	161	Bachman	Albert				Bachman Floral	Dallas	TX
	162	Bell	Duane	D.			Bell Cardiac	Minneapolis	MN
	134	Berry	Robert	L.		President	International Book	Fort Worth	TX
	123	Better	Charles	P.		Sales Manager	Software	Dallas	TX
	163	Blackwood	George				Blackwood Electric	Ft. Worth	TX

Click the column header to sort by that column

Limitations:

- To protect data integrity, column sort is disabled when you edit data.
- This change does not affect the Record History and Roster tabs.

Note: The number of records returned for a customer is limited by the Find List Maximum configuration option in the Customer > Setup > Advanced window. Re-sorting tab data only sorts data that has already been retrieved, it will not retrieve any additional records that were excluded when using the default sort order.

Reviewing the History area

Enter, edit, and view customer information in the History area of the Manage customers window.

Manage customers window - History tabs

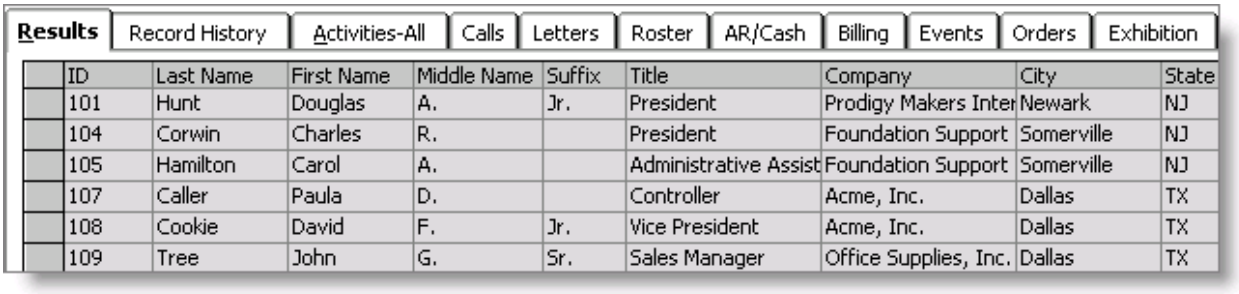
Depending on the tab configuration, the History area can contain the following tabs:

- Results (see "Manage customers window - Results tab")
- Record History (see "Manage customers window - Record History tab")
- Activities-All (see "Managing activity records")
- Calls (see "Manage customers window - Calls tab")
- Letters (see "Manage customers window - Letters tab")

- Roster (see "Manage customers window - Roster tab")
- AR/Cash (see "Manage customers window - AR/Cash tab")
- Billing (see "Manage customers window - Billing tab")
- Events (see "Manage customers window - Events tab")
- Orders (see "Manage customers window - Orders tab")
- Exhibition (see "Manage customers window - Exhibition tab")
- Exposition (see "Manage customers window - Exposition tab")
- Certification (see "Manage customers window - Certification tab")
- Label Preferences (see "Manage customers window - Label Preferences tab")
- Change Log (see "Manage customers window - Change Log tab")
- Relationships (see "Manage customers window - Relationships tab)
- Fundraising
- Matching Plans (see "Manage customers window - Matching Plans tab")
- Notification (see "Manage customers window - Notification tab")
- Role (see "Manage customers window - Role tab")

Activity tabs created by your iMIS administrator can also be displayed in the History area.

You can add new records if the data grid is white.



ID	Last Name	First Name	Middle Name	Suffix	Title	Company	City	State
101	Hunt	Douglas	A.	Jr.	President	Prodigy Makers Inter	Newark	NJ
104	Corwin	Charles	R.		President	Foundation Support	Somerville	NJ
105	Hamilton	Carol	A.		Administrative Assist	Foundation Support	Somerville	NJ
107	Caller	Paula	D.		Controller	Acme, Inc.	Dallas	TX
108	Cookie	David	F.	Jr.	Vice President	Acme, Inc.	Dallas	TX
109	Tree	John	G.	Sr.	Sales Manager	Office Supplies, Inc.	Dallas	TX

From Customers, select Manage customers, and find customer record

To navigate within the history tabs

You can right-click on any history tab or from customers or companies listed in the Results, Record History, or Roster tabs to display a menu of available tabs (disabled tabs and the current tab are grayed out and cannot be selected). Selecting a tab from the list opens that tab.

The activity and module specific tabs, for example Fundraising and Calls, always display information about the record currently loaded in Customers > Manage customers.

To manually insert an activity record

See the specific tab areas for detailed instructions on entering activities.

Note: Your administrator can limit edit access to specific tabs.

1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab in the History section of the Manage customers window.
3. Select the drop-down list located directly below the Sort by area, and select the activity type you want to insert.
4. Enter the activity information in each cell.

   Note: Data entry can only be made in fields with a white background containing an * (asterisk) to the left of the field.
5. Press Tab to continue entering data in additional cells.
6. Click Save.

   Note: When entering activity records, the Date field is automatically populated with the system date. If only the Date field contains data when you save the record, the record will be assumed empty and will not be saved. However, if the activity record contains other data, the activity record will be saved.

   To expand a field

You can press Ctrl+Z to enlarge (zoom) any field in the History section that can store 255 or more characters (such as in the Activities-All and Calls tabs). If the field is read-only, the enlarged field is also read-only. You can return to the normal view by clicking Cancel or by using the “X” in the upper-right corner of the window. If the field is editable, when you are finished editing the text, you can return to the normal view by clicking OK.

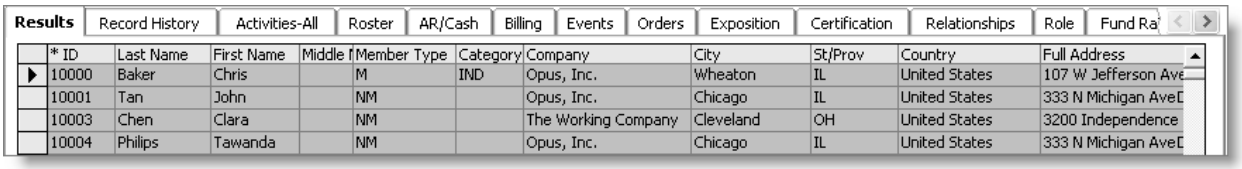
Note: If you want to enter multiple paragraphs in a field (separate text with a hard return), you must press Ctrl+Z.

Viewing results

The Results tab lists the records returned when you perform a search from the Search window.

Note: The columns that are shown in the Results tab can be specified by your system administrator.

Manage customers window - Results tab



From Customers, select Manage customers, click Find and perform a search

Viewing record history

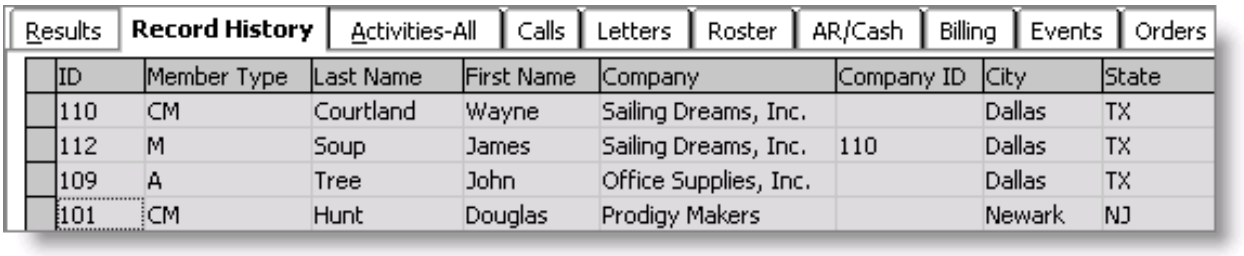
The Record History tab lists the customer records opened during the current session of the Manage customers window and enables you to quickly re-open any of the listed records without performing another search.

The most recently opened records are listed in the top row of the Record History tab, and records are listed only once in the tab regardless of the number of times they have been opened. If a record's information is updated, the changes will not be reflected in the Record History tab during the current session.

When you first open a customer's record in the Manage customers window, a row is added to the top of the Record History tab listing the customer's ID, Member Type, Last Name, First Name, Company, Company ID, City, and State. The fields you see on the Record History tab can be customized by your administrator.

Manage customers window - Record History tab

Record History tab data cannot be sorted because, unlike other history tabs, the data is meant to be viewed only in chronological order. The tab shows all of the records that you have edited, in most to least recent order, during your current iMIS session.



ID	Member Type	Last Name	First Name	Company	Company ID	City	State
110	CM	Courtland	Wayne	Sailing Dreams, Inc.		Dallas	TX
112	M	Soup	James	Sailing Dreams, Inc.	110	Dallas	TX
109	A	Tree	John	Office Supplies, Inc.		Dallas	TX
101	CM	Hunt	Douglas	Prodigy Makers		Newark	NJ

From Customers, select Manage customers and select Record History tab

The Record History tab cannot be sorted because, unlike other history tabs, the order of the data is meant to be viewed only in chronological order.

To open a record from the Record History tab

You can open a customer record from the Record History tab in the current window or in a new window.

1. Select a cell in the row of a customer record.
2. Open the record.

- To open in the current window, double-click on the record.
- To open in a new window, right-click the record and select Open in New Window.

Managing call activities

The Calls tab enables you to view all call activity records for a customer.
The following fields display on the Calls tab: Date, Attachments(s), Note, Follow Up,

Assigned to, Follow Up Date, and Action(s).

Note: The fields that display on the Calls tab depend on the settings your administrator defines.

Manage customers window - Calls tab

From Customers, select Manage customers, find customer record, and select Calls tab

To enter a call activity

To insert new call activities, you must have a Customers authorization level of three (3) or greater.

1. Open a customer's record in the Manage customers window.
2. Select the Calls tab.
3. Select the Date field to the right of the * and enter the date for the Call activity.
4. Press Tab to continue entering data in additional cells.

- Continue to press Tab past the last cell to enter another activity; or
- Click Save.

To view a call activity

1. Open a customer's record in the Manage customers window.
2. Select the Calls tab.
3. Double-click the gray box to the left of the Date field to open the Activity Detail window for the call activity.

To edit a call activity

1. Open a customer's record in the Manage customers window.
2. Select the Calls tab.
3. Edit the call activity by selecting one of the following options:

- Double-click the gray box to the left of the date to open the Activity Detail window, click Edit, and then update the activity as needed. Click Save on the Activity Detail window; or
- Select the cell to edit, enter the appropriate data, and Tab to continue entering data in additional cells for this call activity; or
- Select a new activity to edit; or
- Click Save.

Once the call activity is updated in the Manage customers window, you can select the box to the left of the date to view the changes on the Activity Detail window.

To delete a call activity

You can delete a call activity record that displays on the Calls tab provided your administrator has assigned you the appropriate permissions.

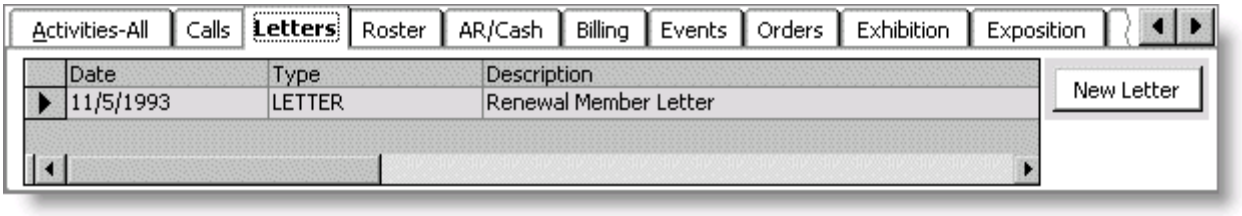
1. From Customers, select Manage customers.
2. Find a customer's record.
3. Select the Calls tab.
4. Select the call activity record you want to delete.
5. Press the Delete key on the keyboard.
6. Click Save.

Note: If you select the Calls tab and it does not contain any records, pressing the Delete key will have no effect.

Managing letter activities

The Letters tab enables you to view all letter activity records for a customer. The following fields display on the Letters tab: Date, Type, and Description.

Manage customers window - Letters tab



From Customers, select Manage customers, find customer record, and select Letters tab

New Letter

Opens the Membership Standard Letters window when Microsoft Word (MS Word) is installed on the workstation. The QuickLetter system will be used if MS Word is not installed on the workstation.

To enter a letter activity

1. Open a customer's record in the Manage customers window.
2. Select the Letters tab.
3. Click New Letter to open the Membership Standard Letters window.

   Note: When you click New Letter, the MS Word Letter Integration (Letter System) will launch if it is installed. If it is not installed, then the standard QuickLetter will launch. For more information, see Creating Letters.

To view a letter activity

Note: Once a template is saved, all future letter activities will use the original template, regardless if the template is changed.

1. Open a customer's record in the Manage customers window.

2. Select the Letters tab.
3. Double-click the gray box to the left of the Date field to open the Activity Detail window for the letter activity.

To edit a letter activity

1. Open a customer's record in the Manage customers window.
2. Select the Letters tab.
3. Double-click the gray box to the left of the Date field to open the Activity Detail window.
4. Click Edit, and then update the activity as needed.
5. Click Save on the Activity Detail window.

To delete a letter activity

You can delete letter activity records that display on the Letters tab provided your administrator has assigned you the appropriate permissions.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Select the letter activity record you want to delete.
4. Press Delete on the keyboard.
5. Click Save.

Note: If you select the Letters tab and it does not contain any records, pressing Delete will have no effect.

Viewing company rosters

Company rosters in iMIS Desktop

On the Customers feature, the Roster tab enables you to view a list of customer records associated with a particular company record.

The Roster tab lists the company that is specified in the current record's Company field and all member records that list that same company in their Company fields. The list is shown in a tree configuration, so that subsidiary companies and their associated members are kept as a unit in the list. A status line at the bottom of the tab displays how many records are currently displayed as you expand and collapse the tree.

Special cases:

- If the current record is not associated with a company, iMIS lists only the current record.
- If the current record is a company record and the company is not a subsidiary of another company, then iMIS shows the roster of the current company.
- If the current record is a company record that is a subsidiary of another company, iMIS shows the parent company's roster, with the current company highlighted.

Double-clicking any of the listed items (either a company or a member) highlights that line and loads its record in Customers > Manage customers. The item remains highlighted in the roster until another record is loaded from the Roster tab or from another location.

Note: Your system administrator can specify the fields that are displayed in the Roster tab (see "Customizing roster display fields") and can also specify the display name of the Roster tab (see "Customer Setup - Basic Options window").

Note: The Roster does not reflect changes you make to a record until you load a different roster and then reload the previous roster.

Note: The Roster tab, like all of the history tabs, is not active until a record has been loaded in Customers > Manage customers.

Manage customers window - Roster tab

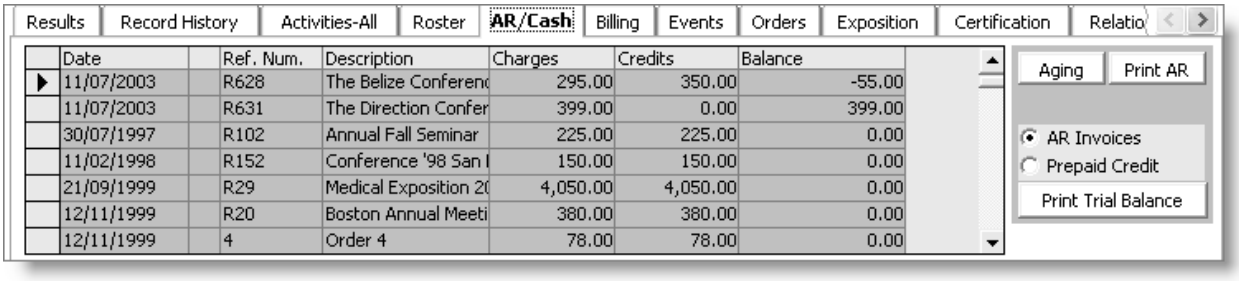
Select Customers > Manage customers, find a customer record, and click the Roster tab

Note: You can also view a company roster in the Public view under My Account if your user record has the Company Administrator role assigned.

Viewing AR/Cash activity records

The AR/Cash tab enables you to view the Transaction Ledger(s) for the customer. The following fields are displayed on the AR/Cash tab: Date, Ref Num, Description, Charges, Credits, and Balance. The information on the AR/Cash tab is view-only.

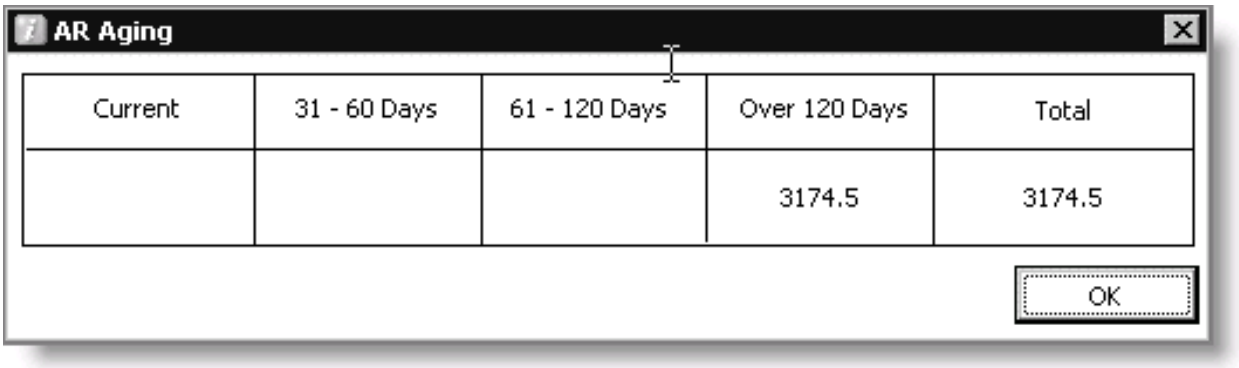
Manage customers window - AR/Cash tab



From Customers, select Manage customers, find customer record, and select AR/Cash tab

Aging

Opens the AR Aging window. The Current, 31-60 Days, 61-120 Days, and Over 120 Days columns are auto-generated from the AR/Cash module. The Total column shows the total invoice balance for the current Customer or Company ID.



Print AR

Generates and prints the Statement of Account for the current customer record to your selected print destination.

AR Invoices

Filters the transactions to only show invoices. You can prevent users from viewing Fundraising invoices on the AR/Cash tab by entering a Fundraising access keyword in the Fundraising History View field on the Customer Setup – Access Keys window (from Customers, select Set up module > General, and click Access Keys).

Prepaid Credit

Filters the transactions to only show prepaid credits.

Print Trial Balance

Prints the Accounts Receivable Trial Balance Statement for the current customer record to your selected print destination.

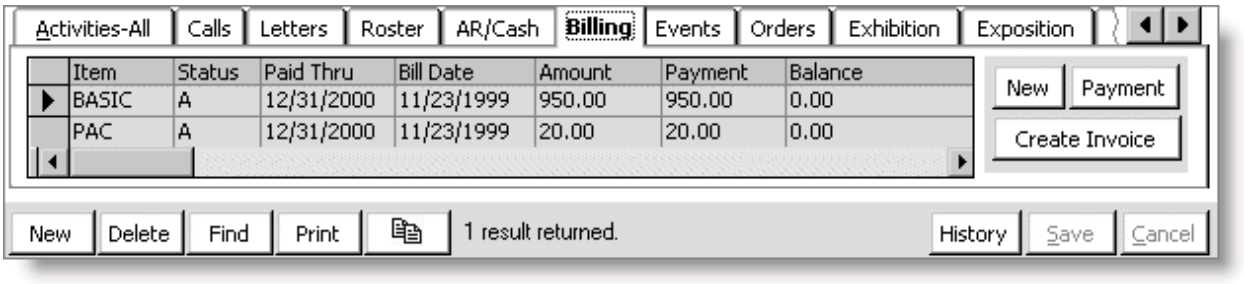
To view an AR/Cash activity

1. From Customers, select Manage customers.
2. Click Find and load a customer's record.
3. Select the AR/Cash tab.
4. Double-click the gray box to the left of the Date field to open the Transaction Ledger.
5. Review the transactions, and then click OK.
6. Click Aging on the AR/Cash tab to open the AR Aging window.
7. Review the information on the AR Aging window, and click OK.

Viewing billing items

The Billing tab enables you to view or enter Dues/Subscription Item Detail(s) for the customer. The following fields display on the Billing tab: Item, Member Type, Status, Paid Thru, Bill Date, Amount, Payment, Payment Method, and Balance.

Manage customers window - Billing tab



From Customers, select Manage customers, find customer record, and select Billing tab

Payment

Opens the Dues/Subscription Payments by Individual window for this customer record.

Create Invoice

Opens the Dues Billing Selections window where you can generate initial and renewal notices, produce bills for a large group of customers or subscribers, and process bills for groups that meet more specific selection criteria.

History/Current

Toggles between the current and history view of billing activities for this customer.

To view a billing item

1. Open a customer's record in the Manage customers window.
2. Select the Billing tab.
3. Select the gray box to the left of the Date field to open the Dues/Subscription Item Detail window for the billing item.
4. Review the information on the Dues/Subscription Item Detail window and then click OK.

To delete a billing record

You can delete billing records that display on the Billing tab, provided your administrator has assigned you the appropriate permissions.

Note: Accrual dues subscription records with a non-zero balance cannot be deleted from the Billing tab.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Select the Billing tab.
4. Select the record you want to delete.
5. Press Delete on the keyboard. A message displays asking you to confirm the deletion:

- Click Yes to have the record deleted from the tab and the database; or
- Click No to cancel the deletion.

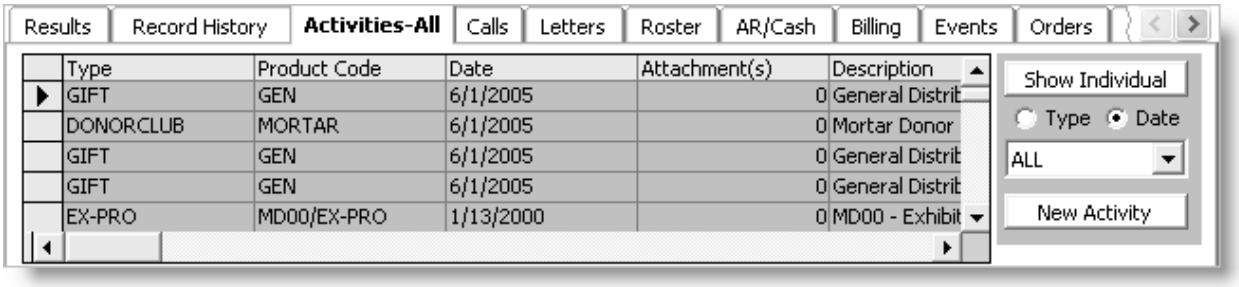
Note: If no record in the Billing tab has the focus, pressing Delete will have no effect.

Managing activity records

The Activities-All tab enables you to enter, edit, and view activity records for a customer record. The following fields display on the Activities-All tab: Type, Product Code, Date, Description, Note, Thru Date, Amount, Units, and Attachment(s).

Note: Your administrator can limit access to Activities-All tab functionality.

Manage customers window - Activities-All tab



From Customers, select Manage customers, find customer record, and select Activities-All tab

Show Individual

Toggles between viewing activities at the individual and company employee level, or the company level.

Note: When viewing an individual customer type record, the product does not display the Show Individual button.

Type

When selected, sorts activities alphabetically by type.

Date

When selected, activities by date.

Activity list

Specifies the activity type by which the list will be filtered.

New Activity

Opens the Activity Detail window so that you can enter an activity.

To enter an activity from the Activities-All tab

Note: Your administrator can limit access to Activities-All tab functionality. To enter and edit activities, the Customers authorization level needs to be set to three (3) or greater. To delete activities, the Customers authorization level needs to be set to four (4) or greater.

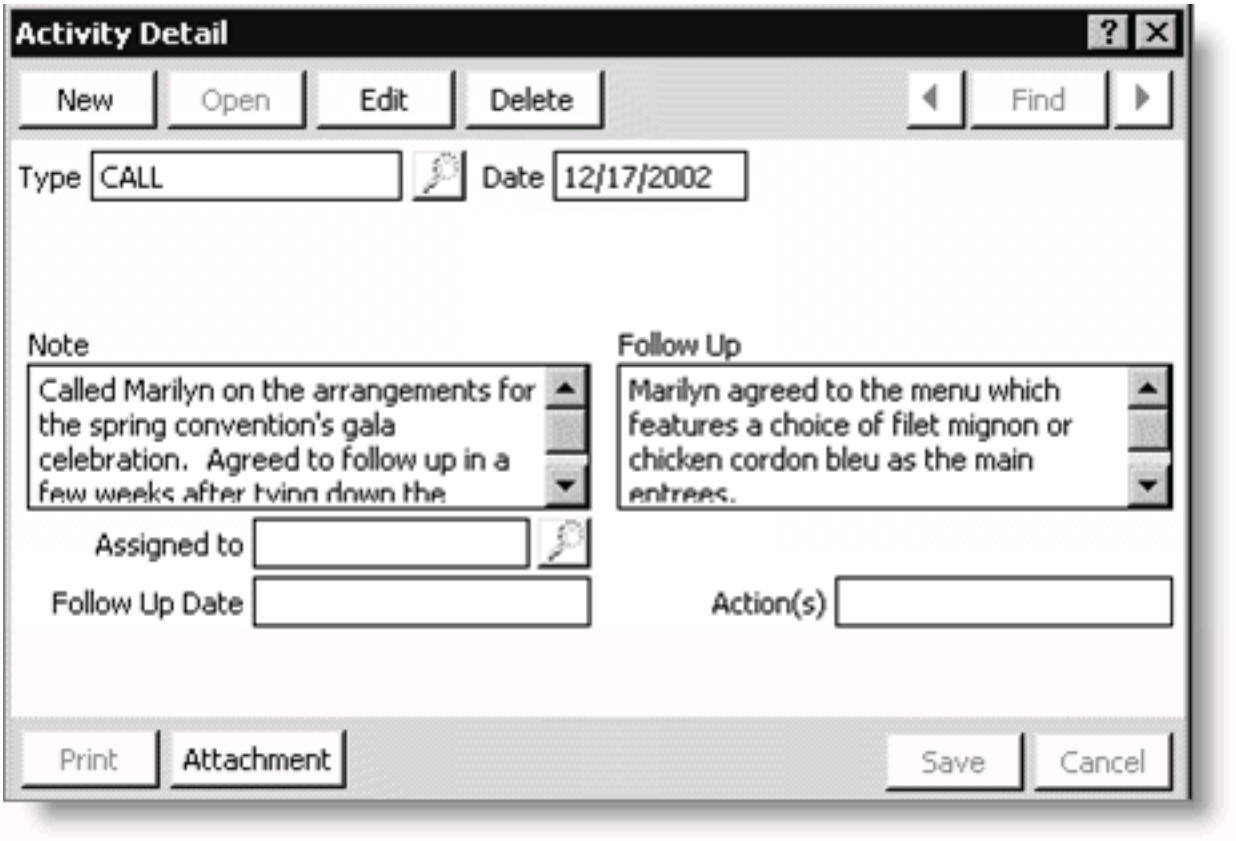
1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab.
3. Click New Activity.

   The Activity Detail window appears.
4. Click New and select an activity Type that allows user edits.

   Note: You cannot enter new system-generated activity types. You cannot enter user-defined activity types unless they have the Allow user Edit checkbox selected on the Set Up Activity Types window.

5. Enter values according to the fields that display.
6. Click Save.

The Activity Detail window



The Activity Detail window

To view all activities

1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab.
3. Double-click the gray box to the left of the Type field to open the Activity Detail window for the activity.

To edit an activity from the Activities-All tab

Note: Your administrator can limit access to Activities-All tab functionality. To enter and edit activities, the Customers authorization level needs to be set to three (3) or greater.

To delete activities, the Customers authorization level needs to be set to four (4) or greater.

1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab.
3. Double-click the gray box to the left of the Type field to open the Activity Detail window.
4. Click Edit, and then update the activity as needed.
5. Click Save on the Activity Detail window.

To delete an activity from the Activities-All tab

Note: You can delete activity records provided your administrator has assigned you the appropriate permissions. If you attempt to delete an activity record and you do not meet the requirements to delete an activity, a message displays informing you that you either do not have sufficient privileges or the activity type cannot be deleted. If you have a Customers authorization level of 2 or less, the Activities-All tab is read-only-only and a message is displayed if you attempt to delete an activity record.

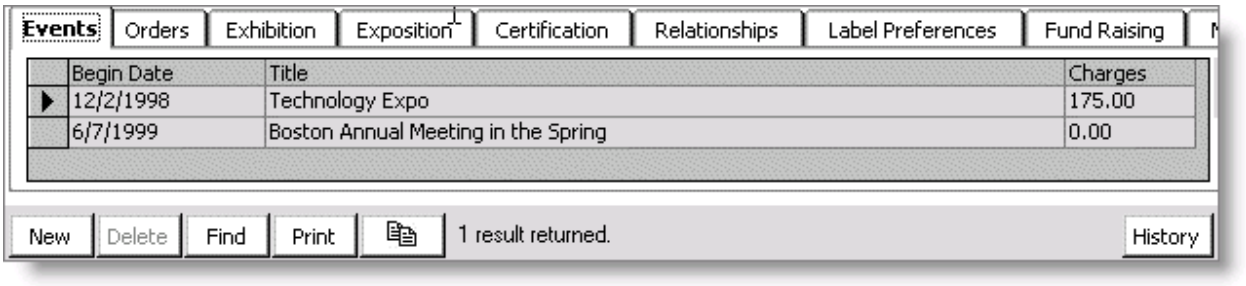
1. Open a customer's record in the Manage customers window.
2. Select the Activities-All tab.
3. Select the type of activity record you want to delete from the activity Type drop-down list.
4. Select the activity record you want to delete.
5. Press Delete on your keyboard.
6. Click Save.

Note: If no record on the Activities-All tab has the focus, pressing Delete has no effect.

Viewing event registrations and activities

The Events tab enables you to view Event registrations for the customer. The following fields display on the Events tab: Begin Date, Title, and Charges.

Manage customers window - Events tab



From Customers, select Manage customers, find customer record, and select Events tab

Registration

Opens the Register a customer window. When you click New on the Register a customer window, the system automatically populates the ID field with the customer's ID.

History

Used to toggle between the current and history view of event activities for this customer record.

To view an event registration

1. Open a customer's record in the Manage customers window.
2. Select the Events tab.
3. Select the gray box to the left of the Begin Date field to open the Event's module Register a customer window.
4. Review the information on the Register a customer window, and close the window.

To view an event activity record

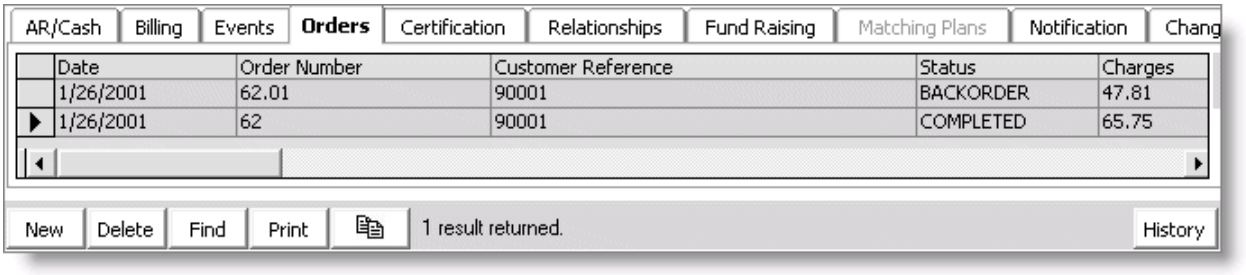
1. Open a customer's record in the Manage customers window.
2. Select the Events tab.
3. Click History to view the event activity records for the customer.

4. Double-click the gray box to the left of the Transaction Date field to open the Activity Detail window for the event activity.

Viewing orders and order activities

The Orders tab enables you to view open and complete orders for the customer. The following columns are displayed on the Orders tab: Date, Order Number, Customer Reference, Status, and Charges.

Manage customers window - Orders tab



From Customers, select Manage customers, find customer record, and select Orders tab

New Order

Opens the Enter and edit orders window. When you click New on the Enter and edit orders window, the system automatically populates the Bill to ID and Tax Authority fields on the Overview tab and the information on the Ship to Info tab with the customer's information.

History

Used to toggle between viewing current and historical order activities for this customer record. In Current view, all open orders display at the top of the grid with all completed orders at the bottom. Within each group of orders (open and completed), the orders sort by date and then by order number in descending order (so the newest orders display at the top of the grid).

To view orders

1. Open a customer's record in the Manage customers window.

2. Select the Orders tab.
3. Double-click the gray box to the left of the Date field to open the Order Entry window.
4. Review the information on the Order Entry window, and close the window.

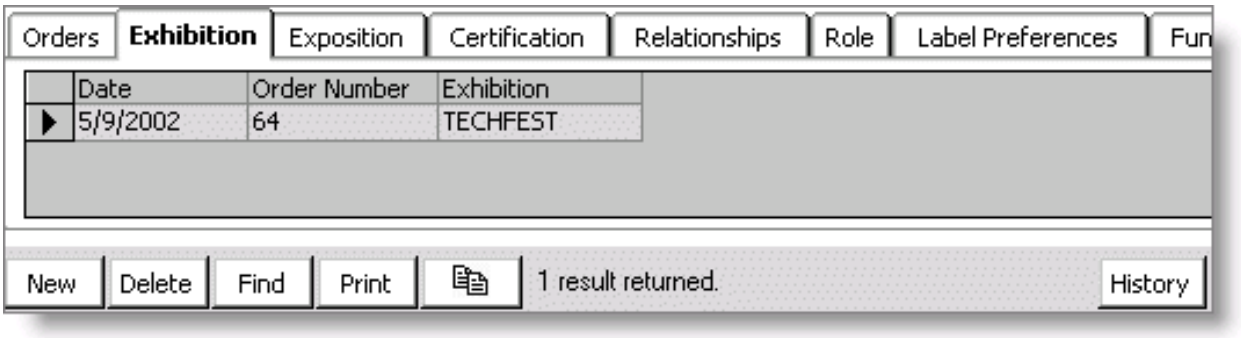
To view an order activity record

1. Select the Orders tab.
2. Click History to view the order activity records for the customer.
3. Double-click the gray box to the left of the Transaction Date field to open the Activity Detail window for the order activity.

Viewing exhibition registrations and activities

The Exhibition tab enables you to view Exhibition orders for the customer
The following fields display on the Exhibition tab: Date, Order Number, and Exhibition.

Manage customers window - Exhibition tab



From Customers, select Manage customers, find customer record, and select Exhibition tab

History

Used to toggle between the current and history view of exhibition activities for this customer record.

To view an exhibition registration

1. Open a customer's record in the Manage customers window.

2. Select the Exhibition tab.
3. Double-click the gray box to the left of the Date field to open the Exhibition module's Process orders window.
4. Review the information on the Process orders window, and close the window.

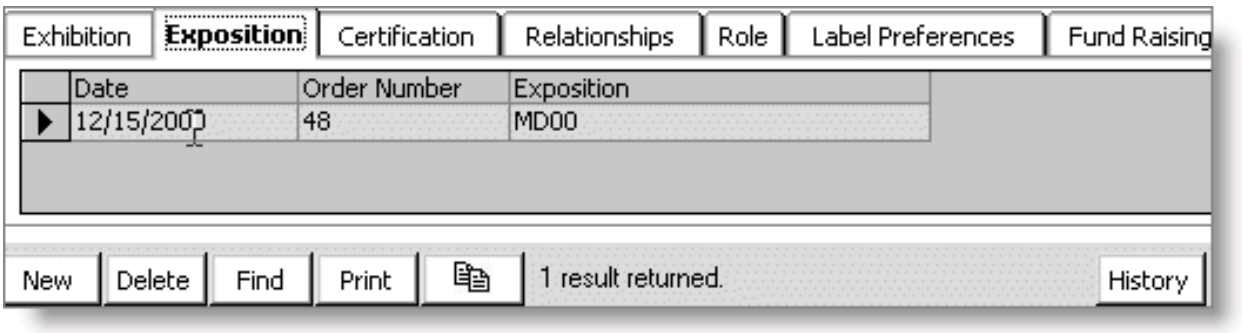
To view an exhibition activity record

1. Open a customer's record in the Manage customers window.
2. Select the Exhibition tab.
3. Click History to view the exhibition activity records for the customer.
4. Double-click the gray box to the left of the Source Code field to open the Activity Detail window for the exhibition activity.

Viewing exposition activities

The Exposition tab enables you to view or enter exposition orders for the customer. The following fields display on the Exposition tab: Date, Order Number, and Exposition. The Exposition tab does not allow editing or inserting of information.

Manage customers window - Exposition tab



From Customers, select Manage customers, find customer record, and select Exposition tab

History

Used to toggle between the current and history view of exposition activities for this customer record.

To view an exposition registration

1. Open a customer's record in the Manage customers window.
2. Select the Exposition tab.
3. Double-click the gray box to the left of the Date field to open the Exposition module's Process booth orders window.
4. Review the information on the Process booth orders window, and close the window.

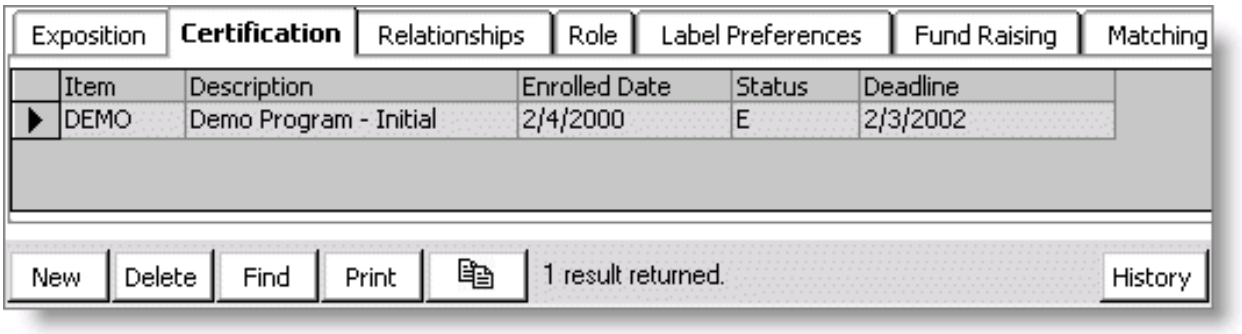
To view an exposition activity record

1. Open a customer's record in the Manage customers window.
2. Select the Exposition tab.
3. Click History to view the exhibition activity record for the customer.
4. Double-click the gray box to the left of the Source field to open the Activity Detail window for the exposition activity.

Viewing certification activities

The Certification tab enables you to view certification orders for the customer. The following fields display on the Certification tab: Item, Description, Enrolled Date, Status, and Deadline.

Manage customers window - Certification tab



From Customers, select Manage customers, find customer record, and select Certification tab

History

Used to toggle between the current and history view of certification activities for this customer record.

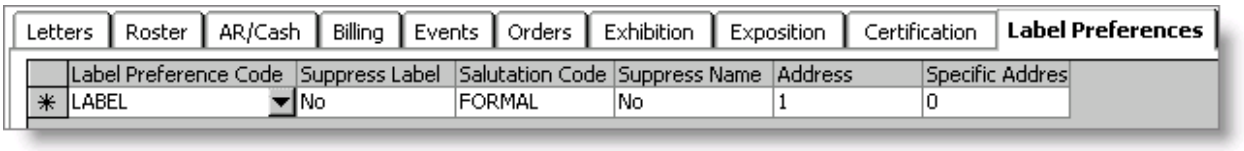
To view certification activities

1. Open a customer's record in the Manage customers window.
2. Select the Certification tab.

Managing label preferences

The Label Preferences tab enables you to select the salutation text, addresses, and options used when printing labels.

Manage customers window - Label Preferences tab



From Customers, select Manage customers, find customer record, and select Label Preferences tab

Label Preference Code

(required) Specifies a product label preference code. Select the right side of the cell to display a drop-down list of defined codes. These codes are defined by your administrator.

Suppress Label

Enable to suppress printing the label. Select the right side of the cell to display a drop-down list and select Yes or No.

Salutation Code

Specifies the code for the salutation text you want to print on the label. This field is enabled if salutation text has been defined for at least one salutation code. It will be read-only if no salutation text has been defined. Select the right side of the cell to display a drop-down list of defined codes.

Suppress Name

Enable to suppress printing the customer's name on the label. Select the right side of the cell to display a drop-down list and select Yes or No.

Address

(required) Select the address that will print on the label:

- Preferred Mailing Address - Select this address to print the customer's preferred mailing address.
- Preferred Billing Address - Select this address to print the customer's preferred billing address.
- Specific Address - Select this address if you want a specific address to print on a label. Selecting Specific Address enables the cell under the Specific Address column for the given row.

  Select the right side of the cell to display a drop-down list of addresses.

  Specific Address

  Select the specific address that will print on the label. Select the right side of the cell to display a drop-down list of specific addresses.

  To display the Label Preferences tab

  Label Preferences functionality is not applicable for customers that have no address data, and the Label Preferences tab is disabled for customer records that do not have a defined address. The tab enables once you save an address to the database for the customer. The Label Preferences tab is disabled (read-only) when the Manage customers window is in the data entry mode.

The Label Preferences tab displays only after meeting label preferences have been set up by your administrator.

To enter a label preference

1. Open a customer's record in the Manage customers window.
2. Select the Label Preferences tab.
3. Select the empty Label Preference Code field to display a drop-down arrow.
4. Select the drop-down list and select the label preference code you want to use.
5. Tab to the Suppress Label field and select Yes or No from the drop-down list.
6. Tab to the Salutation Code field and select the salutation code for the salutation text that you want to print on the label.

   Note: Salutation text is defined for salutation codes on the Salutations tab, and the Salutation Code field enables only if salutation text has been defined for at least one salutation code. If no salutation text has been defined, the Salutation Code field will be read-only.
7. Tab to the Suppress Name field and select Yes or No from the drop-down list.
8. Tab to the Address field and select the address that you want to print on the label. For example, select Specific Address if you want to use an address other than the Preferred Mail or Preferred Bill address. If you select Specific Address, the Specific Address field will enable.
9. (Required only if Specific Address is selected in the Address field) Tab to the Specific Address field and select the Specific Address that you want to print on the label. The addresses listed include all of the customer's defined addresses.
10. Click Save.

To edit a label preference

1. Open a customer's record in the Manage customers window.

2. Select the Label Preferences tab.
3. Make any necessary changes.
4. Click Save.

To delete a label preference

1. Open a customer's record in the Manage customers window.
2. Select the Label Preferences tab.
3. Select the row you want to delete and press Delete on your keyboard.
4. Click Save.

Viewing change log activity records

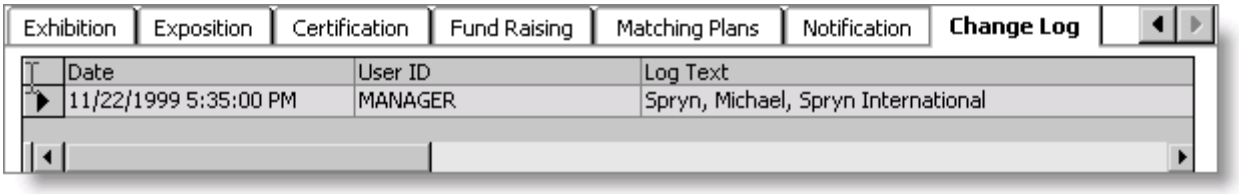
The Change Log tab enables you to view changes that have been made to a customer record. The following fields are shown on the Change Log tab:

- Date - the date the change was made
- User ID - the login ID of the person who made the change
- Log Text - the change that was made

Note: You cannot edit Change Log entries.

The changes that are tracked can be configured by your iMIS administrator (see "Adding and deleting fields in the change log").

Manage customers window - Change Log tab



From Customers, select Manage customers, find customer record, and select Change Log tab

To view change log activity

1. Open a customers record in the Manage customers window.
2. Select the Change Log tab.
3. Use the scroll bar to move up and down the log.

Viewing fundraising information

You can view customer fundraising activities and history through the donor's customer record: select Customers > Manage customers > Fundraising tab.

The Fundraising tab shows summarized and detailed fundraising information and provides access to essential Fundraising features: entering new gifts, printing a fundraising profile, and managing requests. The Fundraising history tab has four sub-tabs:

- Summary
- Donor History
- Donor Recognition
- Requests

Note: The values in the Pledge Amount column reflect the net pledge amount, including credit and debit memos that have been applied to the pledge since its initiation. This also applies to meeting gifts and pledges.

Need more?

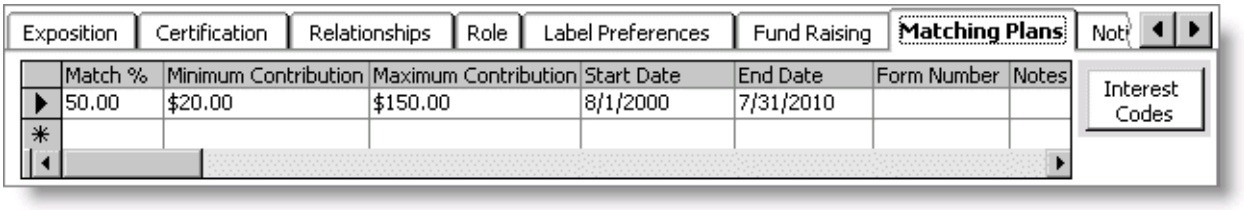
- For details about the Fundraising tab, see Customers Fundraising tab in the Fundraising section.
- For configuration help, see Customers: Set up fundraising.
- For more about granting access to the Fundraising tab, see About Fundraising tab access in the Fundraising section.

Managing matching plans information

Many companies have a matching plan through which they match the donations and pledges made by their company customers. The Matching Plans tab enables you to set up and create matching plans.

The Matching Plans tab is enabled if a customer's record is loaded into the Customers area and the customer type is Company Member (CM). If the customer type is other than CM, the tab disables. The Matching Plans tab is read-only for users not authorized to add, edit, and delete data, and iMIS must be licensed for Fundraising for the Matching Plans tab to display.

Manage customers window - Matching Plans tab



From Customers, select Manage customers, find customer record, and select Matching Plans tab

Match%

(required) Specifies the percentage of the company customer's contribution that the company will match. Numerals of 0.01 to 999.99 are acceptable.

Minimum Contribution

(required) Specifies the minimum monetary amount of the employee's contribution that the company will match.

Maximum Contribution

(required) Specifies the maximum monetary amount of the employee's contribution that the company will match.

Start Date

Specifies the starting date of the matching plan.

End Date

Specifies the ending date of the matching plan.

Form Number

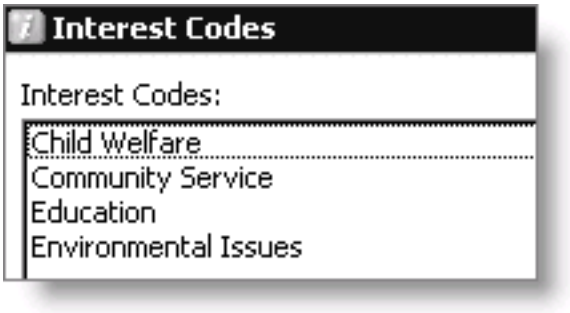
Specifies the matching plan's form number.

Notes

Specifies notes associated with the matching plan.

Interest Codes

Opens the Interest Codes window. The Interest codes window is used to apply a matching plan to a specific Interest Code. Interest Codes are defined by your administrator.



Sample Interest Codes window

Note: Your administrator can control access to the Matching Plans tab.

To create a matching plan

1. Open the record of the company member for whom you want to set up a matching plan.
2. Select the Matching Plans tab.
3. Set the focus on the empty row at the bottom of the data-grid.
4. (required) Enter the Match %. This is the percentage of the company member's contribution matched by the company.
5. (required) Enter the Minimum Contribution the company will match.

6. (required) Enter the Maximum Contribution the company will match.
7. Enter the Start Date of the matching plan.
8. Enter the End Date of the matching plan.
9. Enter the Form Number of the matching plan.
10. Enter any Notes associated with the matching plan.
11. Click Interest Codes to open the Interest codes window.
12. Select the interest code(s) for the matching plan (press Ctrl to select multiple codes).
13. Click OK on the Interest Codes window.
14. Click Save on the Manage customers window.

To edit a matching plan

1. Open the record of the company member for whom you have set up a matching plan.
2. Select the Matching Plan tab.
3. Set the focus on the matching plan you want to modify by selecting the box to the left of the row.
4. Make any necessary changes.
5. Click Save.

To delete interest codes from matching plans

1. Open the record of the company member for whom you have set up a matching plan.
2. Select the Matching Plan tab.
3. Set the focus on the matching plan for which you want to delete the interest code(s) by clicking the box to the left of the row.
4. Double-click to open the Interest Codes window.
5. While pressing Ctrl, click on the Interest Code(s) to deselect them.

6. Click OK on the Interest codes window.
7. Click Save on the Manage customers window.

To delete a matching plan

Note: The Delete button is enabled only if the Allow Delete from Customer Portfolio option is enabled by your administrator.

1. Open the record of the company member for whom you have set up a matching plan.
2. Select the Matching Plan tab.
3. Set the focus on the matching plan you want to delete by clicking the box to the left of the row.
4. Click Delete.
5. Click Save.

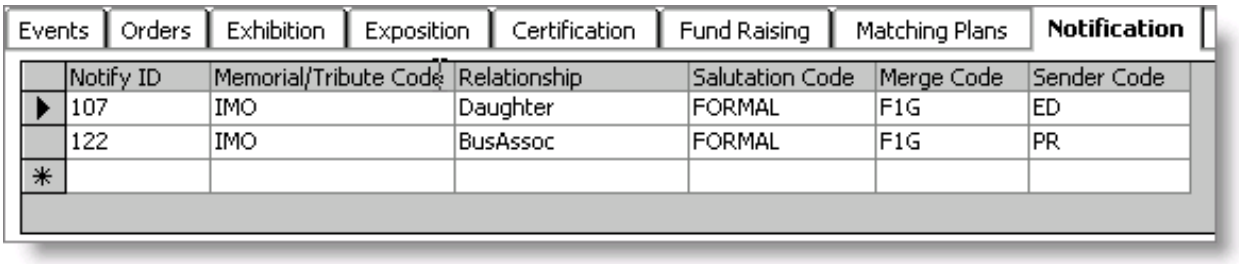
Note: Deleting a record from the Matching Plans tab deletes the corresponding Interest Code records as well.

Managing notification information

When memorial or tributary contributions are made for an individual, the recipient's family members and associates need to be notified of the contribution. The Notification tab enables you to add, edit, and delete notification information.

The Notification tab is read-only for users not authorized to add, edit, or delete data, and iMIS must be licensed for Fundraising for the Notification tab to display. It is enabled in edit mode and disabled in data entry mode.

Manage customers window - Notification tab



From Customers, select Manage customers, find customer record, and select Notification tab

Notify ID

(required) Displays the Notify IDs associated with this customer record. The Notify IDs are the IDs to be notified if a memorial or tribute donation is made in honor of this individual. You can enter a Notify ID or select a Notify ID from the drop-down list.

The Notify IDs that display for an ID in the Notification tab display in ID order. When you click Apply all Notify IDs on the Tribute tab of the Enter and edit gifts window, the Notify IDs defined for the specified Memorial ID display in alphabetical order.

Memorial/Tribute Code

Select the code for notifying an individual of the memorial or tributary contribution. Your administrator defines these codes. If no codes have been defined, the field is read-only. Select on the right side of the cell to display a drop-down list of the descriptions defined for the memorial/tribute codes. When you select a memorial/tribute code's description, the code will display in the field.

Relationship

Select the relationship code that describes the relationship between the notified individual and the individual being honored or recognized. Your administrator defines these codes. If no relationships have been defined, the Relationship field is read-only. Click on the right side of the cell to display a drop-down list of descriptions defined for the relationship codes. When you select a relationship code's description, the code displays in the field.

Salutation Code

Select the salutation code and corresponding salutation text used when notifying an individual of a memorial or tributary contribution. Select on the right side of the cell to display a drop-down list of descriptions defined for the salutation codes. When you select a salutation code's description, the code displays in the field. Your administrator defines these codes.

Merge Code

Select the merge code used when sending a notification. Select on the right side of the cell to display a drop-down list of descriptions defined for the merge codes. When you select a merge code's description, the code is displayed in the field. Your administrator defines these codes. If no merge codes have been defined, the Merge Code field is read-only.

Sender Code

Select the sender code used when sending a notification. Your administrator defines these codes. If no sender codes have been defined, the Sender Code field is read-only. Select on the right side of the cell to display a drop-down list of descriptions defined for the sender codes. When you select a sender code's description, the code displays in the field.

Note: Your administrator can control access to the Notification tab. In order to modify the primary key (Notify ID field) or delete a row from the tab, a user must have an authorization level of 4 or higher. Users with an authorization level of 3 can enter new rows and edit the secondary keys (Memorial/Tribute Code, Relationship, Salutation Code, Merge Code, and Sender Code fields), but they cannot delete rows or edit the primary key.

To enter notification information

1. Open the recipient's record in the Manage customers window.
2. Select the Notification tab.
3. Set the focus on the empty row at the bottom of the tab.
4. Enter individuals to be notified:

- Enter the Notify ID. This is the ID of the individual who is being notified of the contribution.
- Tab to the Memorial/Tribute Code field and select a code from the drop-down list.
- Tab to the Relationship field and select a code from the drop-down list.
- Tab to the Salutation Code field and select a code from the drop-down list.

- Tab to the Merge Code field and select a code from the drop-down list.
- Tab to the Sender Code field and select a code from the drop-down list.
- Click Save.
- Repeat for each additional individual that you want to notify.

To edit notification information

1. Open the recipient's record in the Manage customers window.
2. Select the Notification tab.
3. Set the focus in the field you want to modify.
4. Make any necessary modifications.
5. Click Save.

To delete notification information

Note: The Delete button must be enabled by your administrator.

1. Open the recipient's record in the Manage customers window.
2. Select the Notification tab.
3. Set the focus on the record you want to delete by clicking the box to the left of the row.
4. Click Delete.
5. Click Save.

Viewing project information

The Process Manager tab enables you to view projects that meet the following criteria:

- The current contact is listed as the Primary Contact of one or more Process Manager projects.
- The current user is a member of an Opportunity security group with sufficient permissions to view the projects.

The following fields display on the Process Manager tab: Description, Status, Expiration Date. The Process Manager tab does not allow editing or inserting of information, however, you can double-click on any project listed to open the Process Manager and view more information or, with the proper permissions in place, make edits to a project.

Manage customers window - Process Manager tab

From Customers, select Manage customers, find customer record, and select Process Manager tab

To view projects

1. Load a customer's record in the Manage customers window.
2. Select the Process Manager tab.
3. Use the scroll bar to move up and down the log.
4. To see more information about a project, double-click on that project.

To edit projects

1. Open a customer's record in the Manage customers window.
2. Select the Process Manager tab.
3. Use the scroll bar to move up and down the log.
4. To see more information about a project, double-click on that project.

Customer Communication

iMIS Customer Management enables you to perform the following tasks in managing your customer communication options:

- Copy and paste customer information into other applications.
- Customize the information contained in customer profiles.

- Print customer profiles.
- Print customer address labels.
- Write and send letters to customers.
- Send email messages to customers.
- Open Microsoft Word documents from within iMIS.

Generating customer profiles

The iMIS customer profile is a customizable, résumé-style report that lists most of the information available for a customer's record. The profile is a convenient way to get a printed hard copy or on-screen summary of customer details including the following:

- Name
- Address
- Lists
- Customer activity records (grouped by type)

To customize customer profiles

The information generated in customer profiles is completely customizable. Your administrator can set up windows to display the content of custom window fields in customer profiles. When this option is enabled, the customer's information contained within custom window fields displays in a customer's profile.

Note: When the Show window fields on customer profile option is enabled, the customer's profile information is generated in an Omnis report only. The profile information does not display in a Crystal report.

Individual activity types can also be enabled to display customer activity records. These activity records are grouped according to activity type, and you have control over the order in which the activity types display in the customer profiles.

To print a customer's profile

1. From Customers, select Manage customers.
2. Find the customer's record. (See Finding Customer Records for more.)
3. Select File> Report Destination> Screen to change the report destination to screen.
4. Click Print, located at the bottom of the Manage customers window.
5. If this is the profile you want to send to the printer, select the Print icon at the top of the Member Profile window.

Creating letters

In Customers, you can write and send letters while you have a customer's record open with one of the following tools:

- Microsoft Word™ Integration (Letter System)
- QuickLetter

Tip: If you have created the Letter activity type, creating a letter for an individual customer generates an activity record for that customer.

To create a letter for a single customer using QuickLetter

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Letters tab.
4. Click New Letter to display the Letter Text window.

You can create a standard letter, which you may customize, or you can create your own letter.

- To create your own letter, click New and type the text in the white text entry box.
- To use a standard letter, select Standard Letter on the Letter Text window to open the Find window.

- Select a standard letter and click OK or double-click the letter to open it in the Letter Text window.

  Note: The bracketed text in the window tells iMIS to automatically access this information from the current system settings. For example, [today] automatically generates the current date and enters it into the letter.

5. Enter text for the letter.
6. Click Save as Standard on the Letter Text window to save the letter for this customer.
7. Enter a Letter Name in the space provided.

   Note: Do not choose the same name as an existing iMIS Standard Letter. If you choose the same name as an existing Standard Letter, your letter replaces the Standard Letter, but revisions are overwritten during a System upgrade.

8. Click Print. An activity record is created.

   To add system variables to a letter created using QuickLetter

   Designing a customized standard letter is much like setting up any mail merge template. You create a master letter that has field name markers where the merged data will display.

   Where you want personalized information to display, you will enter the appropriate variable name enclosed in square brackets [ ]. For example, the format of the variables is [Table.FIELDNAME], and [Name.INFORMAL] brings in the informal name or nickname from the customer record (the Informal field of the Name table).

   When you print the letter for a customer, the variable names will be replaced by the actual data from the customer's record or other appropriate places. The variables can call any field in the Name table and fields created in the Customizer.

   In addition, iMIS supplies the following special variables that are preset to retrieve certain formatted fields or current system settings:

- [Today] - Prints the current date in the system.
- [Name.TITLE] - Prints the customer's title as it displays in the Manage customers window.
- [Name.INFORMAL] - Prints the customer's informal name as it displays in the Manage customers window.
- [Name.COMPANY] - Prints the customer's company name as it displays in the Manage customers window.
- [Name.FULL.ADDRESS] - Prints the customer's formatted preferred mail address.

To change a letter format in QuickLetter

In the iMIS standard letter system, you can use the Letter Format option to change the following:

- Heading (to print an organizational header across the top) or No Heading (to print on letterhead paper where the letterhead is across the top)
- Print Width (5 ½ inches or 6 ½ inches). The 5 ½-inch print width is designed for printing on letterheads where the letterhead is down the left side of the page.
- Signature or No Signature (to print at bottom) if you have a signature set up in Report Specifications

Note: When you change the format for a letter, the selected format is written to the report description so that the next time the report is selected from the Letter Text window, the most recently selected format will be used.

To modify any of these settings, follow these steps:

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Letters tab.
4. Click New Letter to open the Letter Text window.

5. Click Standard Letter on the Letter Text window.
6. Select and open a Standard Letter in the Find window.
7. Select Options on the Letter Text window (in the upper right corner).
8. Select Letter Format and choose a format for your letter.

   Note: The Letter Format options correspond to the six available letter report formats on the Report Specifications window.

- If you want to print on letterhead paper (where your letterhead is at the top of your paper), make sure you pick a format that begins with the words No Heading. If your letterhead is along the left side of your paper, select a letter format that includes the words 5” Print Width.
- If you want to print your organizational header at the top of the letter and your header was specified in system setup, pick a format that begins with the words iMIS Standard.

9. Click Save as Standard on the Letter Text window to save the letter for this customer and open the Letter Name window.
10. Enter a descriptive name for the letter and click OK to save the letter.
11. Set your report destination to screen (File> Report Destination) to see a preview of your letter. To actually print your letter once you approve of the page preview, select P in the top right corner of the window.

    When you close the customer record and then reopen it, you can select the Letters tab to see a history of the records sent to the customer. The letter you just created and printed will be listed there.
12. From Customers, select Manage customers.
13. Find the customer's record.
14. From Customers, select Generate reports to open the Generate reports window.
15. Select Letters from the Report Types column.
16. Select a letter from the Available Reports column.

Note: Sample MS Word templates cannot be used with QuickLetter.

17. Click Run to open the Member/Contact Selections window.
18. Select Individual Only from the Member/Nonmember category.

    The template opens with the text displayed. Select the Print icon to print the letter.

    To merge a letter for a single customer using the Letter System

    Note: When using the Letter System, you will need to close any other instances of MS Word that you may have open.

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Letters tab.
4. Click New Letter to open the Membership Standard Letters window.
5. Select the letter to merge from the Membership Standard Letters window.
6. Click Merge and enable the activity options for your merge:
7. Enable the Create Activity records with merge option to create the LETTER activity for each customer record.
8. Enable the Create EMAIL Activities with merge option to create the EMAIL activity instead of the LETTER activity.

   Note: If you want to email the letter to customers and create an e-mail activity, you must enable both options. An EMAIL activity type must be defined in the database.
9. Enable the Include Bad Addresses with merge option to include in your merge, those addresses that have an invalid status.
10. Click Continue to open MS Word.

    The template opens in MS Word with the text and merge fields displayed.

    Note: An activity is automatically created for a merge completed on the Letters tab.

11. Start the merge process:
    - In MS Word, select the Merge to New Document icon on the toolbar to open the Merge to New Document window.
    - Select All records or enter a range.
    - Click OK to display the letters.

    If you selected New document, the letters are shown.
12. Print the form letter.
13. Close the Form Letter window.
14. Close the template (.DOC) file.

    To merge an email letter for a single customer using the Letter System

    To ensure all letters are delivered by email, verify the E-mail field for each customer is populated on the Manage customers window.

    Note: When using the Letter System, you will need to close any other instances of MS Word that you may have open.

1. Open your email program.
2. From Customers, select Manage customers.
3. Find or insert a customer record.
4. Select the Letters tab.
5. Click New Letter to open the Membership Standard Letters window.
6. Select the letter template to merge.
7. Click Merge to open the Membership Standard Letters window.
8. Enable the Create Activity records with merge option to create the LETTER activity.
9. Enable the Create EMAIL Activities with merge option to create the EMAIL activity for each customer record.

Note: An activity is automatically created for a merge completed on the Letters tab. If you want to email the letter to customer and create an email activity, you must enable both options. An EMAIL activity type must be defined in the database.

10. Enable the Include Bad Address with merge option to include those addresses that have an invalid status.
11. Click Continue. The template opens in MS Word with the text and merge fields displayed.
12. In MS Word, select the Merge to E-mail icon on the toolbar to open the Merge to E-mail window.
13. Select NameEMAIL from the To drop-down list.
14. (optional) Enter a Subject line.
15. Select the Mail format drop-down list and select the appropriate format.

    Note: If you select the Attachment format or the Plain Text format, two message prompts will display for each record that is being merged. Click Yes for each prompt. The message prompts will not display if you select the HTML format.
16. Click OK to display the letters
17. Close the Form Letters window.
18. Close the template (.DOC) file.

To view a letter or email activity

You can view activities for a letter or email on the Letters tab or the Activities-All tab.

Note: A given LETTER activity will reflect a letter's text only when that text differs from the permanent text stored in the letter template. For example, if you send a letter to all of your customers but add additional information (such as an answer to a customer's question) to only one of the letters, the entire text of that letter would be stored for that customer's LETTER activity.

The letter text associated with the template is saved to the Activity_Attach.ATTACH_TEXT table. Once a template is saved, all future letter activities will use the original template, regardless if the template is changed.

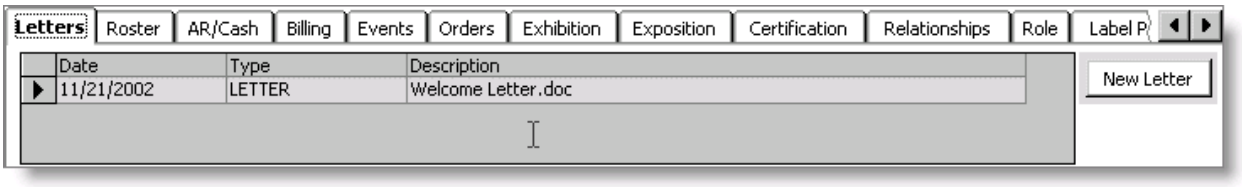
1. To view a letter from the Customers module:

- Select Manage customers.
- Find a customer record with a LETTER or EMAIL activity record.
- Select the Activities-All tab.
- Double-click an EMAIL or LETTER activity to open the Activity Detail window.

2. To view an EMAIL or LETTER activity through the Letters tab:

- From Customers, select Manage customers.
- Find a customer record with a LETTER or EMAIL activity record
- Select the Letters tab.

3. Double-click the letter or email line item to open the Activity Detail window.



The Letters tab

Emailing customers

You can send an email message to a customer if the following applies:

- An email address exists for the customer in the E-mail field of Customer > Manage customers
- You have Internet access
- You have an email client system that is MAPI compliant (such as Microsoft Outlook)

Sending an email to an individual customer will generate an activity record for that customer if you have created the EMAIL activity type.

To email a customer from the Manage customers window

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the E-mail icon on the E-mail field. The email message window opens for the email client system that you have.
4. Enter text for the email.

Note: If you use Outlook 98 as your email client, the autosignature will not work when you use the E-mail icon on the Manage customers window. This is a MAPI limitation in Omnis. As a workaround, manually insert the signature at the end of the email message.

To email a letter to a customer using QuickLetter

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Letters tab.
4. Click New Letter to open the Membership Standard Letters window.
5. Select Standard Letter to open the Letter Find window and select a standard letter to modify.
6. Enter text for the letter.
7. Click E-mail on the Letter Text window to open your email client system's message window.
8. Select Send.

To email a letter to multiple customers using QuickLetter

1. From Customers, select Generate reports to open the Generate reports window.

2. Select Letters from the Report Types field.
3. Select a letter in the Available Reports field to open the Member/Contact Selections window. Only certain letters will generate an email.
4. Click Run.
5. Select the customers you want the letter to be emailed to by selecting the appropriate options on the Member/Contact Selections window.
6. Click OK on the Member/Contact Selections window to send the email and open the View E-Mail Results window.

   iMIS generates a detailed email Results list of the selected customers. The letter is emailed only to those customers that have an email address listed in the E-mail column. Those customers that are not sent the email are listed in the Error column of the list. The error “Email Address is Blank,” indicates that the E-mail field of the customer's record does not have an email address listed.
7. Click Print on the View E-Mail Results window to print the results.
8. Click Close to close the Member/Contact Selections window.

   To send a broadcast email from Microsoft Word using an email merge

1. Make sure the Name.EMAIL field has been added to the iMIS export file.
2. Set up a Mail Merge in Microsoft Word by selecting Tools> Mail Merge.
3. When you are ready to Merge the data with the document (Step 3 in the Mail Merge process), select Merge.
4. Select the drop-down menu and select Merge to Electronic Mail.
5. Select Setup and choose the Email field as the Data field with Mail/Fax Address.
6. Select whether to send the document as an attachment.
7. Click OK in the Setup window.
8. Select Merge. The email will automatically send to all records included in your merge.

To view a customer's email activity record

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Activities-All tab.
4. Select Email from the drop-down list.
5. Select an email activity to open the Activity Detail window. The text that displays in the Email Text field is dependent upon how the email was sent:

- If the email was sent using the Email option on the Letters tab, the Email Text field displays the text of the email.
- If the email was sent using the Email option on the Manage customers window, the Email Text field displays the location from where the email was sent.

Printing customer address labels

iMIS prints customer address labels in bulk or one at a time.

- To print address labels in bulk, use the Labels report type from the Generate reports window.
- To print address labels one at a time, use the printer icon in the address area of the Manage customers window.

  Note: You must install a label printing device on your computer to print labels one at a time.

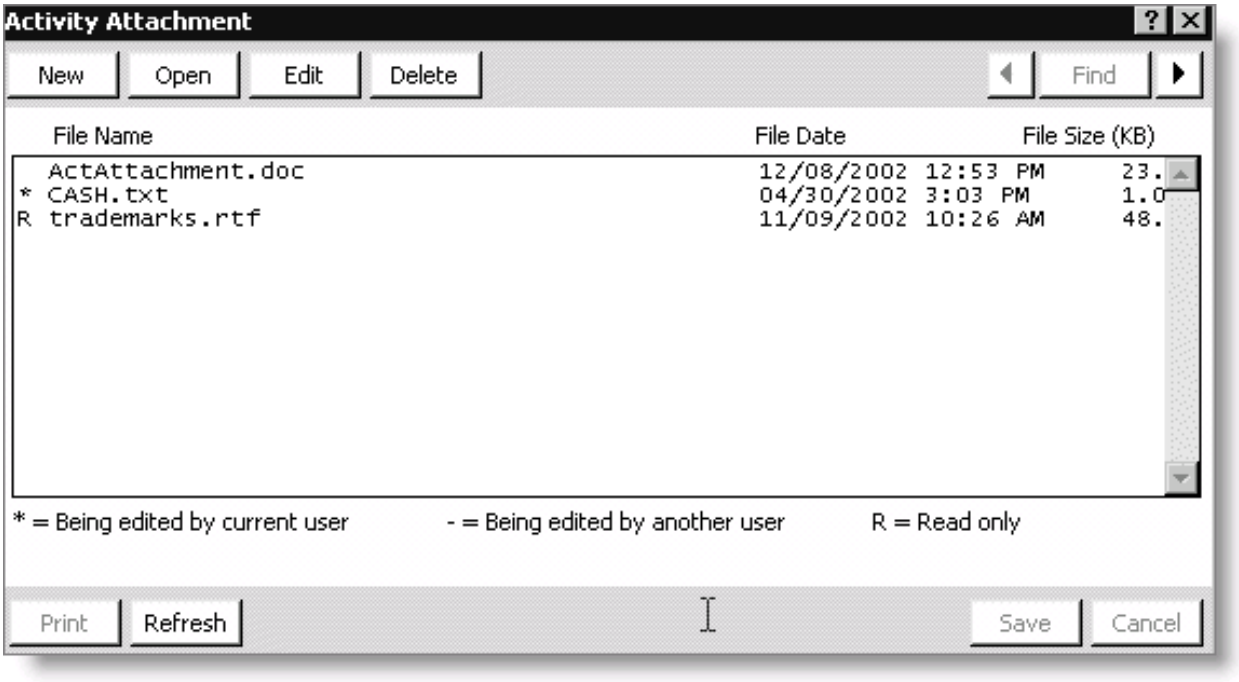
Attaching documents to activity records

When you open an activity record and click the Attachment button on the Activity Detail window, you can attach a file to the activity record and save it to the iMIS database. For example, you can attach a Microsoft Word document, PowerPoint slide presentation, spreadsheet, graphic, e-mail file, or html page. Once the file is saved to the iMIS data-

base, you can open it on your system using the associated application and view, modify, or delete it from within iMIS.

Note: The Attachment button is enabled only if the Activity Attachments allowed option is enabled in the System Setup window. See Enabling attachments on activity records for details.

Activity Attachment window



From Customers, select Manage customers, select a customer record, select the Activities-All tab, double-click an activity, click Attachment

Attachment List

Lists of attachments.

Attachment Legend

Indicates the current status of an attachment:

- * - Indicates an attachment is being edited by the current user.
- - - Indicates an attachment is being edited by another user.

- R - Indicates an attachment is only editable by an administrator.

  Refresh

  Rebuilds the list of attachments.

  Attaching files to activity records

  Activity attachments are managed in the Activity Attachment window. When you click Attachment on the Activity Detail window, the Activity Attachment window displays with a list of attachments, listed alphabetically according to file name, for the current activity. You can access the Activity Detail window by double-clicking a record in the Activities-All, Call, or Letters tab, or by accessing the View activity tasks window and double-clicking an activity task.

  The total number of activity attachments that exists for an activity record displays in the Attachment(s) column on the Calls tab for call activities, and on the Activities-All tab for all activities.

  To attach a file to an activity record

  Note: Your administrator must enable the Allow user Edit option for the activity for which you want to add an attachment.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Double-click the activity record to which you want to attach a file. The Activity Detail window displays.
4. Click Attachment to open the Activity Attachment window.
5. Click New. The Choose the file to attach to the Activity dialog displays. Browse to the file you want to attach to the activity record.
6. Click OK. A message box opens and gives you the option to save as read-only.
7. (optional) Enable the Save as read-only option to specify that only an administrator (a user with Customer authorization level of 8 or higher) is able to edit the attachment. If you

do not enable this option, all users with appropriate permissions will be able to edit the attachment.

8. Click Yes to save the attachment to the database and to add it to the list of attachments on the Activity Attachment window. Clicking No will cancel the activity attachment process.

   Note: If you attempt to attach a file that exceeds the value specified by your administrator, iMIS displays a message that the file exceeds the file limit.

   To create an activity and attach a file

   You can add an activity record and attachment at the same time.

1. From Customers, select Manage customers.
2. Open a customer record.
3. Select the Activities-All tab.
4. Select the drop-down list located directly below the Sort by area, and select the activity type you want to create.
5. Double-click the gray box containing the asterisk (*) to open the Activity Detail window.
6. Click New.
7. Enter an activity type in the Type field, or click the lookup icon to select an activity type.
8. Enter values according to the fields that display.
9. Click Attachment to open the Activity Attachment window. The activity record is automatically saved.
10. Click New. The Choose the file to attach to the Activity dialog displays.
11. Browse to the file you want to attach to the activity record.
12. Click OK. A message box opens and gives you the option to save as read-only.

13. (optional) Enable the Save as read-only option to specify that only an administrator (a user with a Customer authorization level of 8 or higher) is able to edit the attachment. If you do not enable this option, all users with appropriate permissions will be able to edit the attachment.
14. Click Yes to save the attachment to the database and to add it to the list of attachments on the Activity Attachment window. Clicking No will cancel the activity attachment process.

Viewing activity attachments

When you click the Open button on the Activity Attachment window, iMIS extracts a read-only version of the file from the Activity_Attach table and copies it to a subfolder under the temporary folder iMIS creates (for example, C:\Documents and Settings\Username\Local Settings\Temp\iMIS attachments). The associated document viewer for the file is then opened (for example, Microsoft Excel for files with an .xls extension). If the destination file already exists, a message displays informing you that the file has already been opened on your system. You will be given the opportunity to overwrite the existing file.

Note: Once you open an activity attachment, you can use the save functionality (usually the Save As feature) in the associated application to save a local copy of the file in a location other than the temporary folder created by iMIS. However, any changes you make to this copy will not be applied to the iMIS database.

To view activity attachments

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Double-click the activity with the attachment you want to view. The Activity Detail window displays.
4. Click Attachment to open the Activity Attachment window.
5. Select the attachment you want to view.
6. Click Open.

iMIS opens the document in the appropriate application, if the application associated with the file is on your system.

Note: If the application associated with the file is not on your system, iMIS informs you that there is no application available to open the file, and that a copy has been placed on your system. You can open the file from your Temp directory and choose an application in which to open the file. However, any changes you make to this copy will not be applied to the iMIS database. Changes are only saved to the iMIS database when you click Save on the Activity Attachment window.

To edit activity attachments

Clicking Edit on the Activity Attachment window sets the INTENT_TO_EDIT column in the Activity_Attach table to the concatenated DateTime + User ID value to indicate that an attachment has been opened for editing by a specific user. If INTENT_TO_EDIT is populated, then a second user is not allowed to open the activity attachment for editing. If you attempt to edit a record that is being edited by another user, a message displays informing you that another user is editing the file, and that you can open a read-only copy of the file. If you attempt to edit a file that you already have open for editing, a message displays informing you that you are currently editing the file and that you should save or cancel your previous edits.

Once you have an activity attachment open for editing, you can make any necessary changes, and use the save functionality in the associated application (usually the Save As feature) to save a local copy of the file in a location other than the temporary folder created by iMIS. However, any changes you make to this copy will not be applied to the iMIS database. Changes are only saved to the iMIS database when you click Save on the Activity Attachment window.

Note: When activity attachments are saved to the database, iMIS creates a folder in a Temp directory (for example, C:\Documents and Settings\Username\Local Settings\Temp\iMIS attachments).

Note: If more than one user logs into a terminal server installation of iMIS as MANAGER and attempts to edit an activity attachment, iMIS saves to the database and to the Temp directory, the activity attachment that is first saved on the Activity Attachment window.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Double-click the activity with the attachment you want to edit. The Activity Detail window displays.
4. Click Attachment to open the Activity Attachment window.
5. Select the attachment you want to edit.
6. Click Edit. iMIS opens the attachment in the appropriate application, if the application associated with the file is on your system.

   Note: If the application associated with the file is not on your system, iMIS displays a message informing you that an application viewer is not available and that the file cannot be edited. You can still open the file from your Temp directory and choose an application in which to open the file. However, any changes you make to this copy will not be applied to the iMIS database. Changes are only saved to the iMIS database when you click Save on the Activity Attachment window.
7. (optional) Click Save on the Activity Attachment window to save your changes.

   To delete activity attachments

   An important maintenance step in working with activity attachments is deleting activity attachments that are no longer needed. You can delete activity attachments from the Activity Attachment window, or run a script to delete activity attachments that have a File Date earlier than a specific date. When an activity attachment is deleted, the Attachment (s) column on the Activities-All or Calls tab updates to reflect the deletion.

   You can delete an activity attachment only when another user does not currently have the file open for editing (indicated by a dash “-”), and the file is not read-only. If you click

Delete on the Activity Attachment window and another user has the file open for editing, a message displays informing you that another user is editing the document.

Caution! Deleting an activity attachment permanently removes the file from the iMIS database.

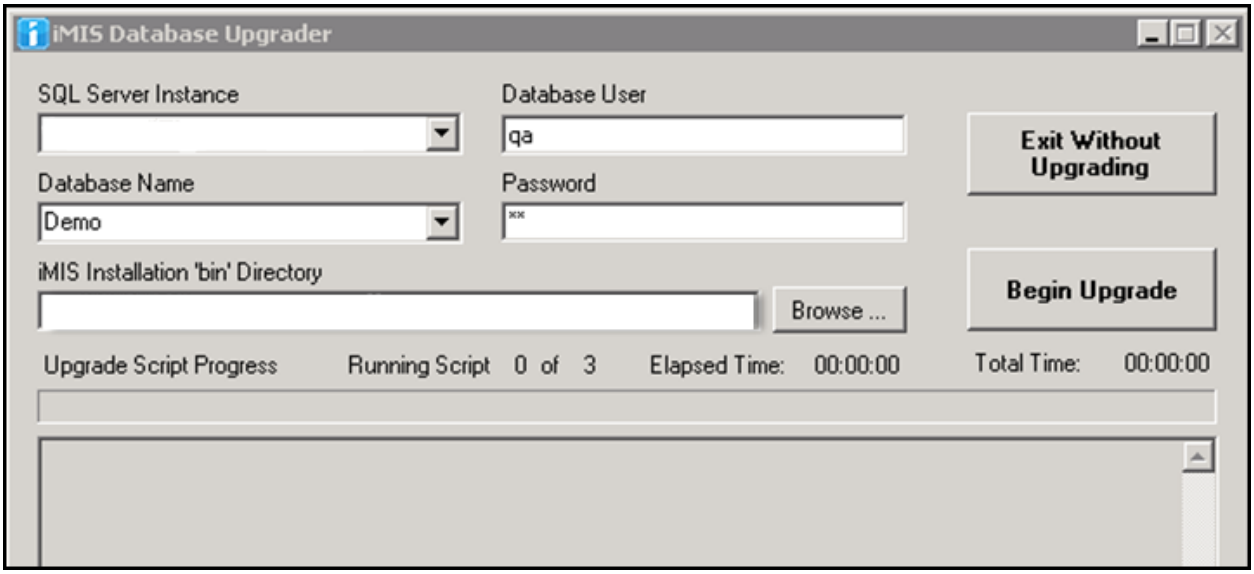
Note: Only system administrators can modify activity attachments marked as read-only.

1. From Customers, select Manage customers.
2. Find a customer's record.
3. Select the Activities-All tab.
4. Double-click the activity record containing the attachment you want to delete. The Activity Detail window displays.
5. Click Attachment to open the Activity Attachment window.
6. Select the attachment you want to delete.
7. Click Delete. A message displays asking you to confirm the deletion.
8. Click Yes to permanently delete the attachment from the iMIS database, or No to cancel.

Database Utilities

iMIS Database Upgrader: DB Upgrader

You can run iMIS Database Upgrader (DB Upgrader) standalone from the iMIS program group. Use View Logs to quickly locate and view log outputs for all upgrades, completed and failed.



Important: Special characters in your sa password can disrupt command-line processing, so change the password to use only alphanumeric characters and ! # @, with no spaces. You can use hyphens and underscores after the first character, but avoid all other punctuation and symbols.

Begin Upgrade

This button runs a set of database upgrade scripts against the specified iMIS database. The specific scripts that are run depend on how many versions back the database is from the current version of iMIS. There is one upgrade script per version, so the upgrader upgrades the starting version to the next version, then the next, and so on until the final script updates the database to the current release of iMIS.

The following error message appears in the iMIS15DBUpgrade.log if the upgrade process fails:

*** UPGRADE PROCESS ENDED WITH ERRORS !!! ***

To determine how to retry the database upgrade after fixing the problems suggested by the point at which the failure occurred, you first must identify which upgrade script failed by scrolling up through the log until you find the header stamp that immediately precedes the error message. Header stamps look like this:

==========

= iMIS 15.0.2.x to iMIS 15.0.3.x Database Upgrade Driver Script =

==========

The version numbers shown in the header stamp determine how you must retry the database upgrade:

- If the first version number shown in the header stamp (the one on the left) is 15.1.1 or higher, you should fix the data in the current version of the database, then in the iMIS 15 Database Upgrader, click Begin Upgrade to resume the database upgrade from the beginning of the step that failed.

  If you want to restart the upgrade from some step earlier than the one in which the failure occurred, run the following UPDATE against the database, specifying a ParameterValue that is the step at which you want to restart the upgrade (use a value of 0 to force the upgrade to restart at the very beginning):

  ```
  UPDATE [dbo].[SystemConfig]
    SET [ParameterValue] = 3  -- The last completed step number
    WHERE [ParameterName] = 'System.Database.State'
  ```

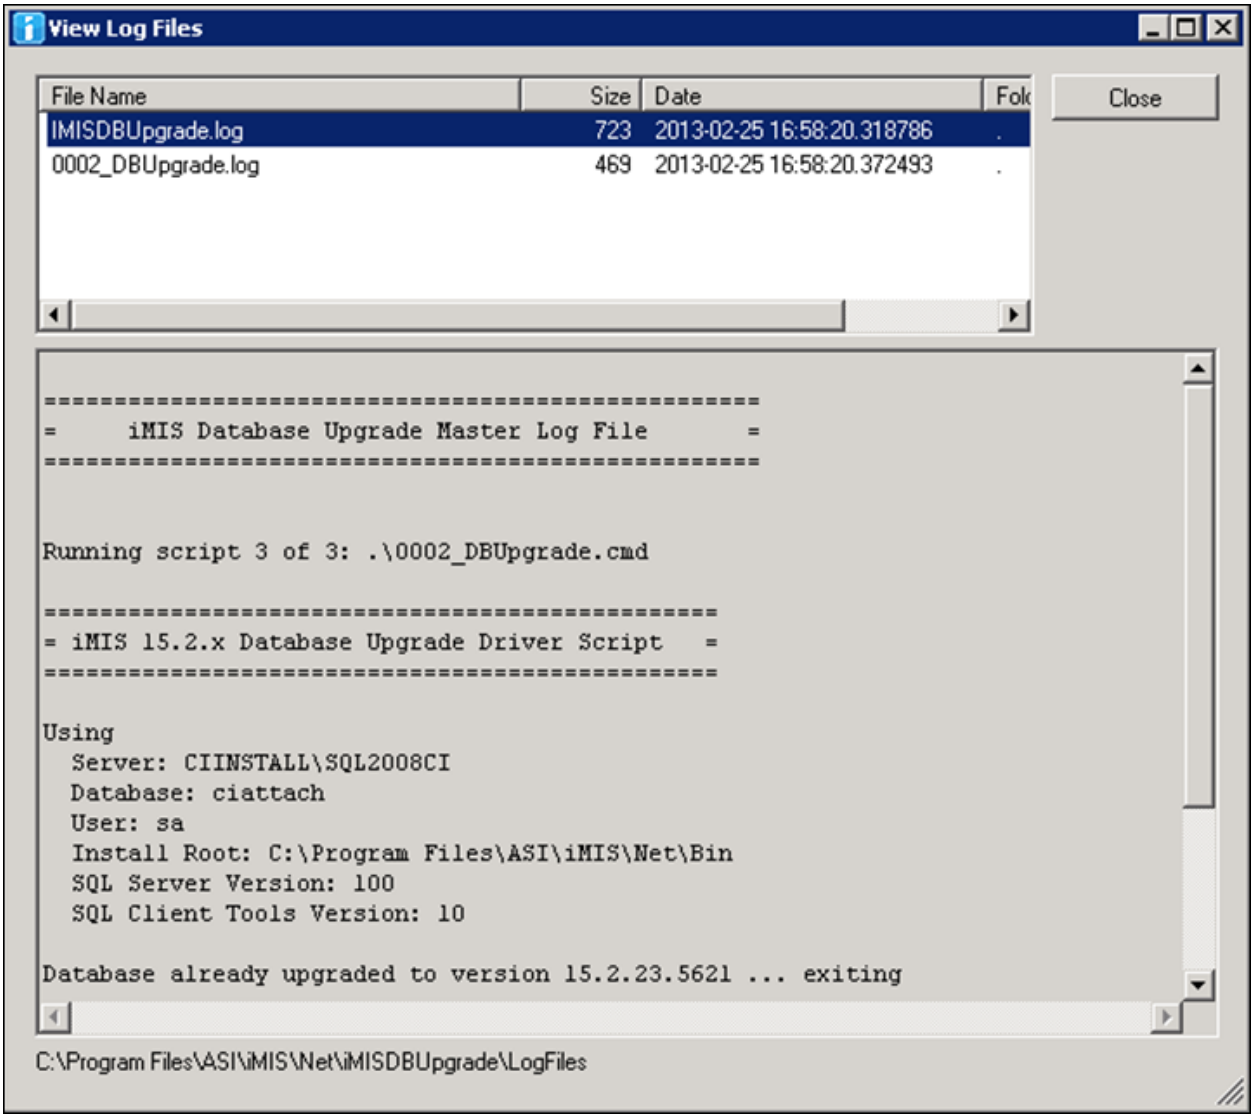
- If the first version number shown in the header stamp is lower than 15.1.1, you must first restore the database to the backup you made before beginning the upgrade process. Next, fix the data in that restored version of the database. Finally, in the iMIS 15 Database Upgrader, click Begin Upgrade to restart the entire database upgrade process. Note that you cannot click Begin Upgrade until you have restored the database to a backup preceding its failed upgrade state.

View Log Files

The log files appear chronologically by run time. To sort the list by any column, click on its header. To help you spot errors, *.err files have red highlighting.

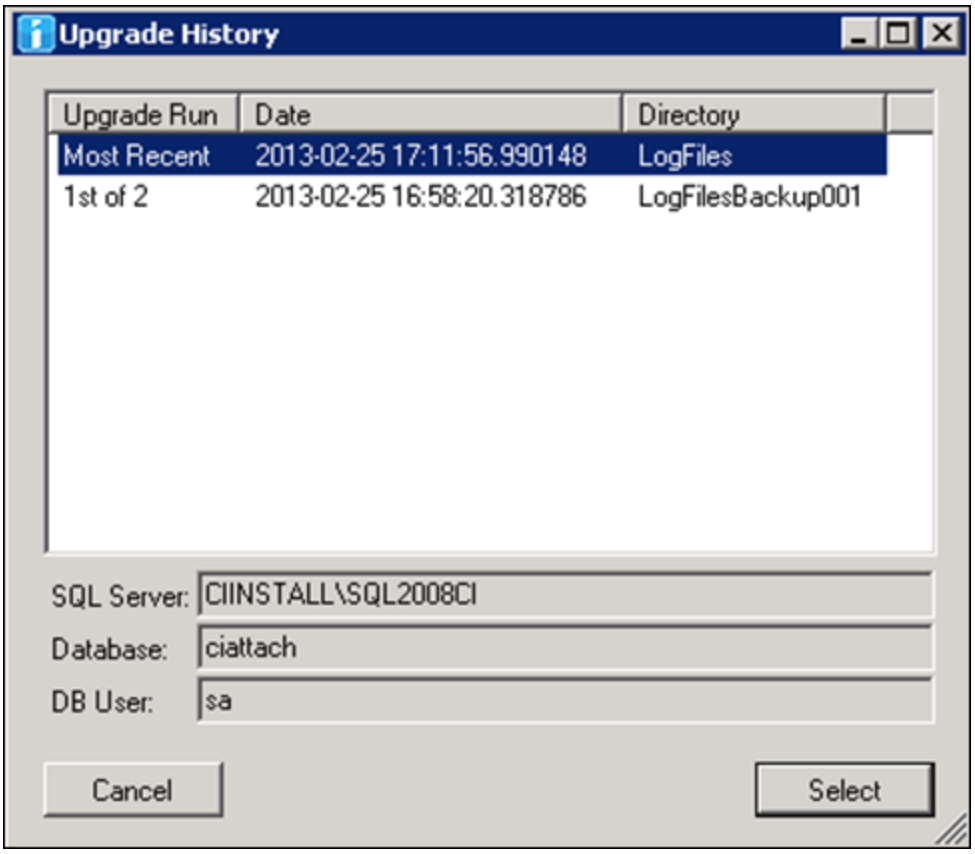
The contents of the selected log display below the list, and the pathname displays at bottom. At top right, the Viewing: information and Log History command remain hidden until you have run multiple upgrades.

Tip: You can select and copy text within both the log contents and the pathname areas.



Upgrade History window

All logs of every run are preserved, so use this archive to access prior runs, for getting log file locations and copying log file text (such as error messages) into other applications or email. The Upgrade History lists the order, date, and location of all the upgrades that have ever been run. Below the list, you can see which user, server, and database name were used for the selected upgrade.



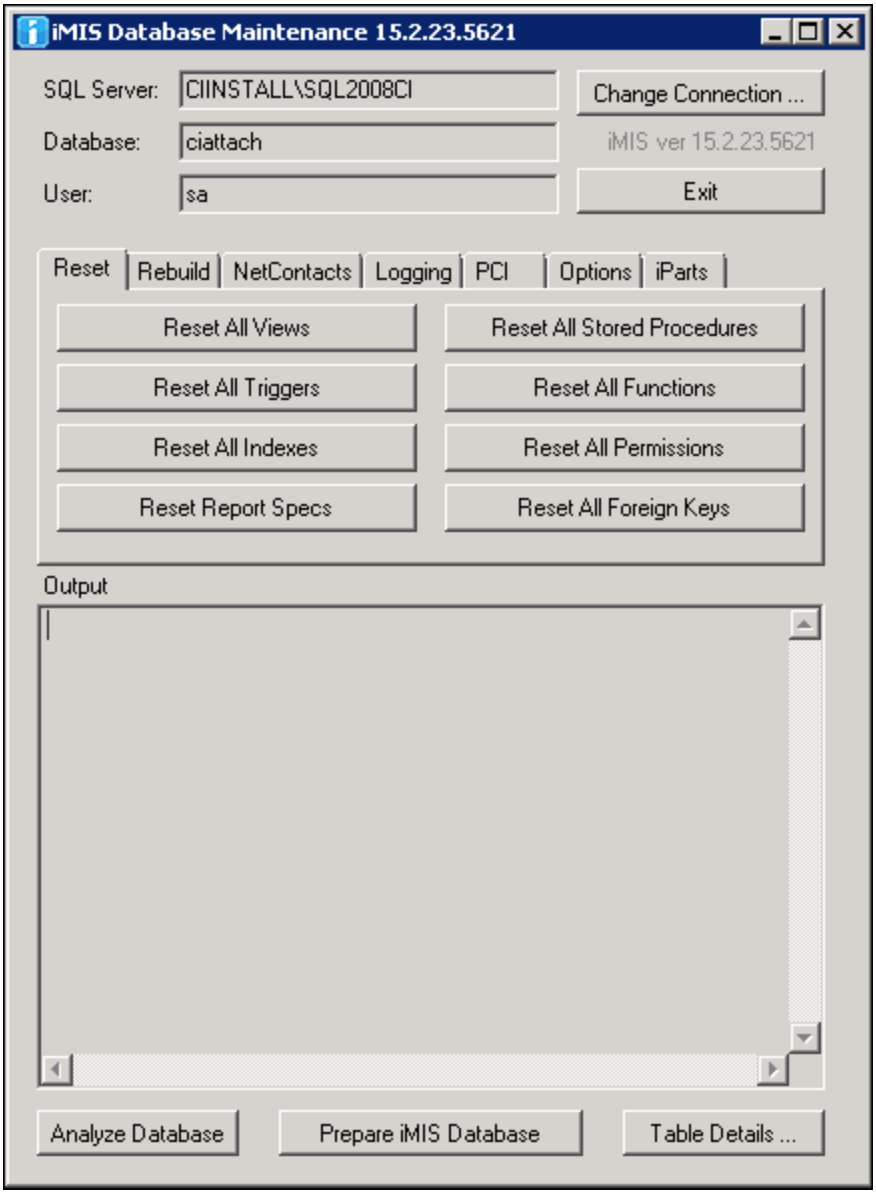
Click Select to return to the previous window with the selected run's logs displayed, rather than the most recent run (the default).

iMIS Database Maintenance: DB Maintenance

iMIS Database Maintenance (DB Maintenance) is a standalone application that replaced the iMIS 10 Table Analysis utility. This tool lets you rebuild, analyze, and manage all iMIS tables. It also lets you run special scripts that prepare your database to support advanced options, such as PCI, NRDS, and VAT.

Tip: The DB Maintenance utility replaces DB Repair.

DB Maintenance runs as a separate, local application from the iMIS program group and organizes helpful database commands on a set of tabs.



- Change Connection – Switch to another iMIS database.
- Output – Displays information about the functions performed; this information also writes to a log file in the executable's directory.
- Analyze Database – Run a full analysis on the entire iMIS database. This process performs an extensive database analysis, so allow ample time for it to run.

Table analysis testing:

- missing table
- missing or extra columns
- wrong column order, data type, length, or defaults
- wrong numeric precision, scale, radix
- missing index
- missing PK/unique/clustered index
- missing or disabled triggers
- missing or disabled/distrusted foreign keys
- Prepare iMIS Database – Prepare an iMIS database that has just been restored to a new location or under a new name.
- Table Details – Analyze, examine, reset, or rebuild individual tables.

Precautions for using DB Maintenance

- Verify that you have a valid backup of your iMIS database before running DB Maintenance commands that modify the database.
- Ensure the database is protected from updates before modifying it, to prevent failures and data problems from changes occurring while entities are being reset/rebuilt/removed:

1. Have all users log out.
2. Stop webservers from updating the database, such as by stopping the AppPool in IIS.

- While users are logged in, you can safely run Analyze Database and Table Details; however, analyzing the database can affect performance.

DB Maintenance tabs

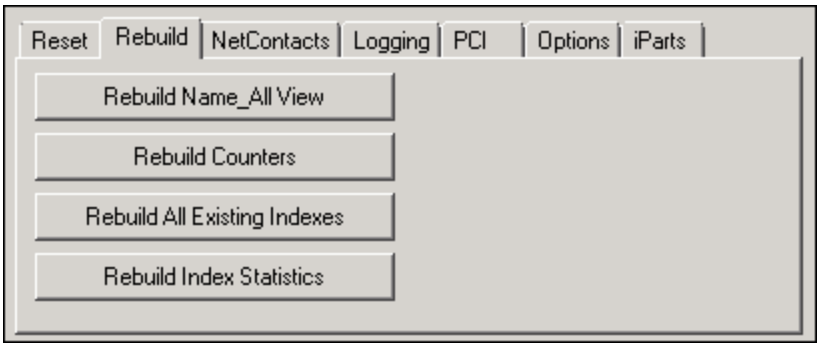
Reset tab

These functions restore database items to the states they held when last upgraded or installed.

- Reset All Views: Drop and recreate all iMIS System Views to what they were at the last install/upgrade. Custom Views are unaffected.
- Reset All Triggers: Drop and recreate all iMIS System Triggers to what they were at the last install/upgrade. Custom Triggers are unaffected.
- Reset All Indexes: Drop and recreate all iMIS System Indexes to what they were at the last install/upgrade. This preserves custom indexes, as well as primary and alternate key indexes, because of foreign key constraints (relevant only for newer .NET tables).

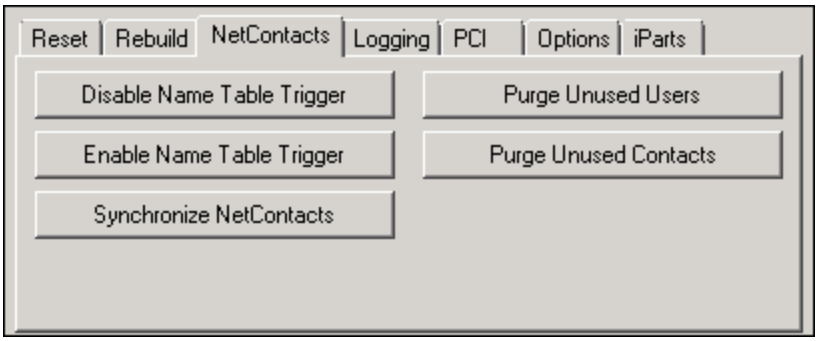
  Caution! This function will not complete successfully if your iMIS database contains any full-text indexes. You must first drop all full-text indexes that might exist in your iMIS database, and then manually re-create them after you have finished running this function.
- Reset Report Specs: Reset all iMIS Standard Report Specifications to what they were at the time of the last install or upgrade. These specifications are found in iMIS Desktop, from the menu Utilities > Report Specs. Custom report specifications are not affected.
- Reset All Stored Procedures: Drop and recreate all iMIS System Stored Procedures to what they were at the last install/upgrade. Custom Procedures are unaffected.
- Reset All Functions: Drop and recreate all iMIS System Functions to what they were at the last install/upgrade. Custom User Defined Functions (UDFs) are unaffected.
- Reset All Permissions: Reset the permissions on all iMIS System database objects to what they were at the last install/upgrade. This grants permissions to all iMIS System database objects to the iMIS group as required.

  Rebuild tab



- Rebuild Name_All View: Rebuild the Name_All View, which is not rebuilt by Reset All Views.
- Rebuild Counters: Rebuild all iMIS counters.
- Rebuild All Existing Indexes: Rebuild all iMIS System Indexes. This runs a DBCC REINDEX command against all existing iMIS table indexes.
- Rebuild Index Statistics: Update all iMIS System Index Statistics.

  NetContacts tab



NetContacts

NetContacts commands help you avoid errors when importing contact records into iMIS. (NetContacts takes its name from the CsNetContacts business object.)

In iMIS 15, a Name table trigger copies data to numerous .NET tables (such as ContactMain, Individual, Institute); the NetContacts tab helps you achieve the same synchronization when you import contacts into iMIS (see Importing contact records).

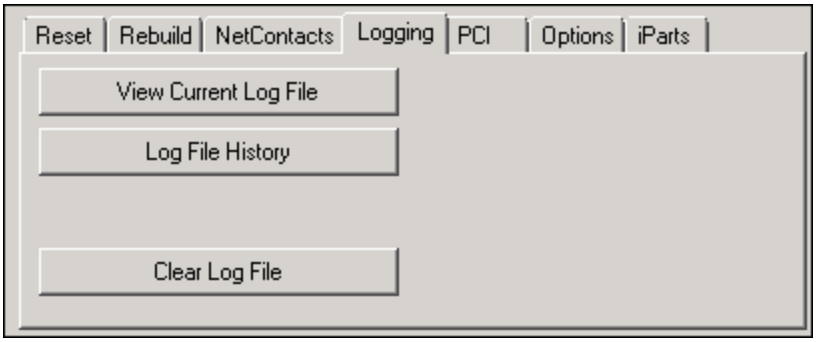
- Disable Name Table Trigger: Disable the trigger on the Name Table that keeps the NetContacts synchronized.
- Enable Name Table Trigger: Enable the trigger on the Name Table that keeps the NetContacts synchronized.
- Synchronize NetContacts: Synchronize the NetContacts after loading the Name table with the trigger disabled.

  Purge

  Purge (see "Purging user and contact records") allows you to permanently delete entries from .NET tables.

- Purge Unused Users: Permanently removes user entries from .NET tables that were previously purged from Client/Server tables.
- Purge Unused Contacts: Permanently removes contact entries from .NET tables that were previously purged from Client/Server tables.

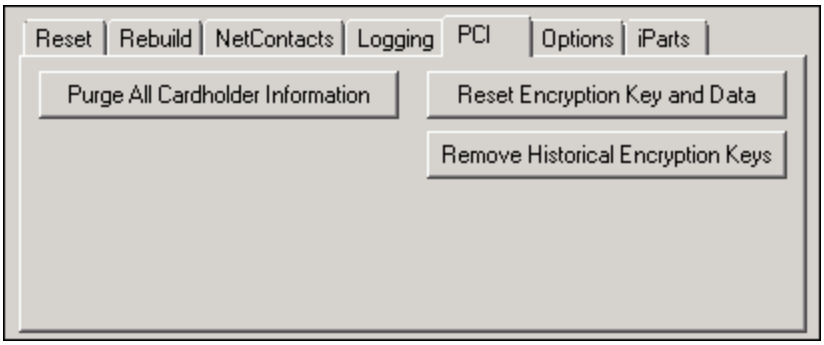
  Logging tab



- View Current Log File: View logging information for current log file.
- Log File History: View list of log files, from most recent to oldest and select a file to view.
- Clear Log File: Back up the current log file to a history file, then clear the current log file. This is helpful to keep a shorter, recent list.

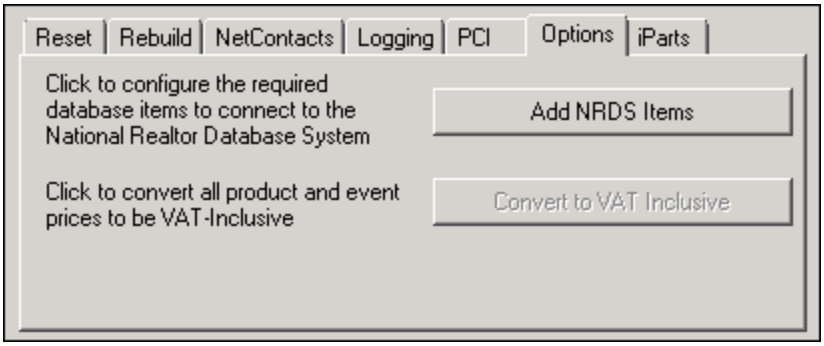
  PCI tab

  See Using DB Maintenance for PCI compliance.



- Purge All Cardholder Information: Removes all existing cardholder information from your iMIS database (one-time process).
- Reset Encryption Key and Data: (annual process) Resets the encryption keys and re-encrypts cardholder data; writes these events to the PCIAuditLog.
- Remove Historical Encryption Keys: (annual process) Deletes the prior encryption keys and writes the event to the PCIAuditLog. Once done, email links encrypted with such keys cannot resolve.

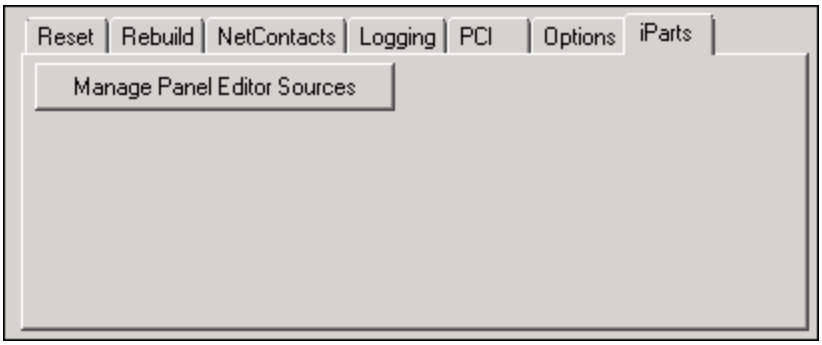
  Options tab



- Add NRDS Items: (NRDS clients only) Click this button to configure the required dataset items to connect to the National Realtor Database System. This creates the items needed for the data synchronization bridge. See Creating NRDS items.
- Convert to VAT Inclusive: (VAT organizations only) Click this button to convert all product and event prices to be VAT-Inclusive. If you enable Convert to VAT Inclusive in AR/Cash, lets you convert your existing product/event pricing to include the VAT tax amount. See Converting to VAT Inclusive.

iParts tab

This tab lists content item-specific maintenance tasks.



- Manage Panel Editor Sources: Click this button to manage sources for the Panel Editor content item. See Maintaining content items with DB Maintenance.

DB Maintenance: Table Details

The iMIS Table Details page allows you to do analysis and apply fixes and changes at table level rather than globally. All iMIS tables are listed alphabetically. When you select a table, a mini-analysis runs on it and reports in the Output area.

Features of Table Details

- Number of rows: The top right shows a row count for the selected table.
- Output: For the selected table, a brief table analysis runs, testing whether the table is missing, is missing columns, or has columns of an incorrect type. The analysis runs when you click on a table name in the list. This read-only area shows system information and quick analysis results.
- OK: returns you to the main DB Maintenance page.

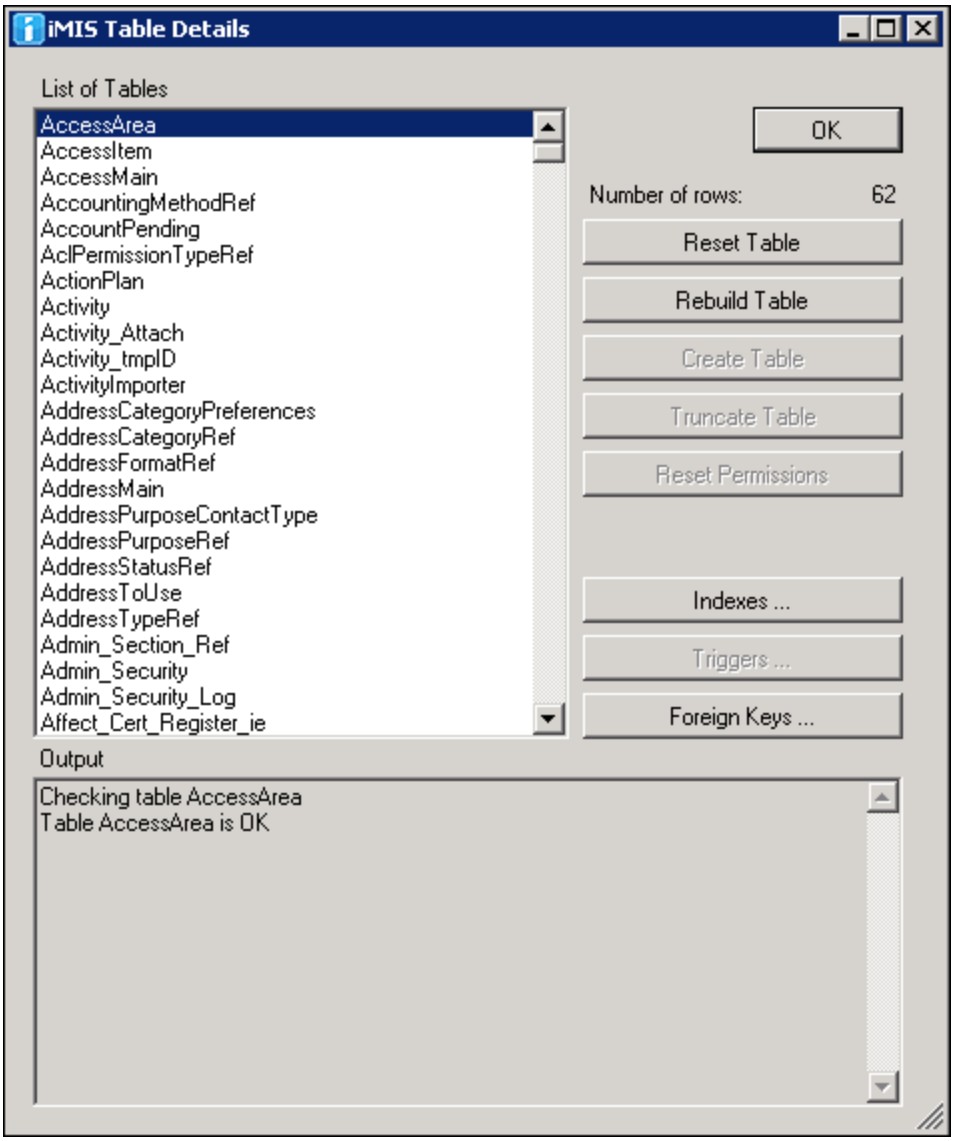


Table-level commands

- Reset Table: Performs a non-destructive reset of the table, replacing any missing triggers, indexes, permissions, or foreign keys.
- Rebuild Table: Performs a full rebuild of the table (rename the table, re-create the table schema, copy the data back over, re-establish all indexes, triggers, and permissions). It recreates the table from scratch, preserving data. If the table contains large amounts of data, allow ample time for this process to run.

Caution! You lose any user-added columns when you rebuild a table. The Rebuild Table button is only enabled for those tables that aren't involved in indexed views. Tables that are referenced by indexed views cannot be rebuilt with this tool, and the button will be grayed out.

- Create Table: Recreates the table schema, indexes, triggers, and permissions. Enabled only if the table is missing.
- Truncate Table: Deletes all the data in the table, following a prompt for confirmation. Truncating a table with zero rows has no effect, but it runs the command just like any other table, and is useful for testing.
- Reset Permissions: Ensures the table is granted the proper permissions to the iMIS Group.

  Indexes... lets you work with indexes associated with the selected table. Enabled only if there are indexes.

- Create Indexes: Creates any indexes that are missing, ensuring that the table has all of the iMIS indexes it needs.
- Drop Indexes: Drops the indexes associated with the table, except for indexes that are constraints; preserves user-added indexes. This does not affect primary or alternate keys, which may be the target of a foreign key constraint.
- Rebuild Indexes: Rebuilds all indexes associated with the table.

  Triggers... lets you work with triggers associated with the selected table. Enabled only if triggers exist.

- Enable Triggers: Re-enables disabled triggers, which is useful after importing records. Enabled only if there are or should be system triggers on the table (ignores user triggers).
- Disable Triggers: Preserves triggers but disables them, which is useful when importing records. Enabled only if there are or should be system triggers on the table (disables user triggers as well).

- Create Triggers: Creates any triggers that are missing.
- Drop Triggers: Drops the triggers associated with the selected table.

  Foreign Keys... lets you work with foreign keys on the selected table as well as other tables that reference it. Enabled only if such foreign keys exist.
- Enable Table FKs: Re-enables any disabled foreign keys on the table and checks them all. Enabled only if there are or should be foreign keys on the table.
- Disable Table FKs: Disables any foreign keys, which is useful when importing records. Enabled only if there are or should be foreign keys on the table.
- Create Table FKs: Creates the foreign keys on the selected table. Enabled only if there should be foreign keys on the table.
- Drop Table FKs: Drops the foreign keys on the selected table. Enabled only if there are foreign keys on the table.
- Create Referencing FKs: Creates the foreign keys on all tables that reference the selected table.
- Drop Referencing FKs: Drops the foreign keys on all tables that reference the selected table.
- Create ALL FKs: Creates the foreign keys on the selected table and on all tables that reference it.
- Drop ALL FKs: Drops the foreign keys on the selected table and on all tables that reference it.

Using DB Maintenance

Caution! If the version number of the database is higher than that supported by DB Maintenance, do not use any database commands until you resolve the version conflict.

To run DB Maintenance

1. From the Start menu, select DB Maintenance Utility in the iMIS program group.

2. When prompted, specify your server and database.
3. Log in using the sa user.

   The next time you run DB Maintenance, it remembers the connection and only requires your password.
4. Verify that the version number supported by DB Maintenance (which appears at top, in the title bar) is the same or greater than the version number displayed to the right of the Database name (which is that of the database you selected).

   Caution! Never run an older version of DB Maintenance against a newer database.
5. Click on any of the tabs to bring it to the front.
6. As needed, run the commands presented by the interface.
7. If you receive an error, check whether it's one of these known situations:

- Column ... has the wrong default. Expected ... '', found '': a harmless error that might be triggered by upgraded databases.
- "Wrong Ordinal" error on certain table columns may be triggered by upgraded databases. This message is generally harmless and affects only the ability to load the affected tables with BCP and the format files created by ASI.

  Precautions for using DB Maintenance

- Verify that you have a valid backup of your iMIS database before running DB Maintenance commands that modify the database.
- Ensure the database is protected from updates before modifying it, to prevent failures and data problems from changes occurring while entities are being reset/rebuilt/removed:

1. Have all users log out.
2. Stop webservers from updating the database, such as by stopping the AppPool in IIS.

- While users are logged in, you can safely run Analyze Database and Table Details; however, analyzing the database can affect performance.

Rebuilding tables

To rebuild a table

Caution! Never run an older version of DB Maintenance against a newer database.

1. Have all users log out of iMIS.
2. Schedule downtime for rebuilding tables containing large amounts of data.
3. Back up all tables that you plan to rebuild.
4. From the Start menu, select DB Maintenance Utility in the iMIS program group.
5. Select the table to be rebuilt.
6. Click Rebuild Table.

To rebuild a customized table

If you have added custom objects (Foreign Key constraints, triggers, indexes) to iMIS tables, you must remove the customizations and then add them back.

1. Record all custom database objects that you have added to your iMIS tables, because you must manually recreate them.
2. Manually remove your objects; for example, drop all foreign key constraints on the table (both to and from the table, so you must also check other referencing tables and drop the relevant foreign keys there as well).
3. Restart DB Maintenance, select the tables, and click Rebuild Table.
4. Manually recreate all custom foreign key constraints that you recorded.

Importing contact records

The NetContacts tab in DB Maintenance helps you import contact records so that your new Name table data is correctly synchronized with all associated .NET table structures.

To import contact records

1. Backup your database.
2. On your appserver, run the DB Maintenance tool.
3. After connecting, select the NetContacts tab.
4. Click Disable Name Table Trigger to disable triggers temporarily.
5. Import your records in iMIS Desktop: select Utilities > Data Transfer Utilities > Import Utility.
6. When the import is done, click Enable Name Table Trigger to restore the trigger.
7. Click Synchronize NetContacts to update the associated NET tables.

Purging user and contact records

DB Maintenance lets you permanently delete entries from .NET tables that were previously purged from Client/Server tables.

Caution! Be sure to follow the order here: complete your Client/Server membership purge before proceeding to those in DB Maintenance, and always purge user records before purging contact records.

Note: iMIS contact records will continue to display in search, unless the record is “Marked for deletion”. If you do not want the publishing service to include contact records that were previously deleted, but not “Marked for deletion”, you will need to delete the search Contacts folder (ASI\iMIS\indexServiceProtected\Search\Contacts), and then delete the row in the SystemConfig table that is used by contacts publishing (e.g. DELETE FROM [dbo].[SystemConfig] WHERE [ParameterName] LIKE 'ContactsPublishing-<Publishing Server Code>'). The Contacts folder and the SystemConfig row will be recreated automatically.

To purge membership records across iMIS

1. Purge member records in Name-related tables.

1. In iMIS Desktop, select Utilities > Reports and Queries from the menu.
2. Select Purge, Membership Purge for MS SQL and select Run. The Membership Purge is for the Name table and those tables related to it.
2. Purge user records in .NET tables.

1. In DB Maintenance, select the NetContacts tab.
2. Click Purge Unused Users.
3. Check the estimate for the number of records eligible for purging reported by the Purge Confirmation window, and troubleshoot if it seems wrong.
4. Click Continue with Purge. The purge can take minutes or hours, depending on the number of records involved. Entries from the following .NET tables are deleted:

- aspnet_Profile
- aspnet_Membership
- aspnet_Users
- Users
- UserMain
- UserRole
- UserToken

5. When the purge is done, check the history log that displays for the success and number of records that were purged.
6. Purge contact records in .NET tables.

1. Click Purge Unused Contacts.
2. Check the estimate for the number of records eligible for purging reported by the Purge Confirmation window, and troubleshoot if it seems wrong.

3. Click Continue with Purge. The purge can take minutes or hours, depending on the number of records involved. Entries from the following .NET tables are deleted:

- GroupMember
- GroupMemberDetail
- RFMMain
- Individual
- Institute
- ContactBiography
- ContactCommunicationReasonPreferences
- ContactLog
- ContactPicture
- ContactSalutation
- ContactMain
- PrimaryInstituteContactKey is set to null for all related institute records

4. When the purge is done, check the history log that displays for the success and number of records that were purged.

Using DB Maintenance for PCI compliance

Depending on which option you choose in AR/Cash Setup, implementing advanced PCI Compliance support requires changes to your iMIS database, either by

- removing all existing cardholder information from your iMIS system that predates your new security measures, or
- resetting the encryption keys (including removal of previous keys) and re-encrypting cardholder data each year, as required

DB Maintenance lets you complete these processes easily and reliably through the PCI tab.

Precautions for using DB Maintenance

- Verify that you have a valid backup of your iMIS database before running DB Maintenance commands that modify the database.
- Ensure the database is protected from updates before modifying it, to prevent failures and data problems from changes occurring while entities are being reset/rebuilt/removed:

1. Have all users log out.
2. Stop webservers from updating the database, such as by stopping the AppPool in IIS.

- While users are logged in, you can safely run Analyze Database and Table Details; however, analyzing the database can affect performance.

To reset encryption keys and data

To maintain PCI compliance with stored cardholder data, you must complete all of the steps below.

1. Choose a time when the database can be offline for several hours. Re-encryption can take minutes or hours, depending on your data; once started, it must not be stopped.
2. In DB Maintenance, open the PCI tab.
3. To start the purge, click Reset Encryption Key and Data. A warning prompts you to confirm the process.
4. Allow the process to complete without interruption.

   Caution! You risk data corruption if you interrupt the process or close DB Maintenance, which appears unresponsive.

   The output of the process displays in the main window of the DB Maintenance utility.
5. Click Remove Historical Encryption Keys, or, if postponing that purge, skip to the next step. (If you do the purge later, be sure to recycle the application pool then, too.)

Caution! Once you remove previous keys, clicking on any encrypted links that have already been embedded in emails (such as "create new account" emails) will no longer work. The user will see the error "Your session has timed out. Please try your operation again".

6. Recycle the IIS Application Pool (iMISApp AppPool) for each application server that uses this database.

To purge cardholder data

Important: If you implement PCI Compliance with audit logging and later switch to storing no data, be aware that this purge routine leaves the existing audit log (PciAuditLog table) intact.

Deferred transactions are lost in a purge, so you need to resolve deferred data and disable settings that allow it.

1. Find and change any gateway that is configured for Deferred Authorization:

- In iMIS Desktop, open AR/Cash > Set up module and select Credit Card Auth.
- Under Current Accounts, select the first gateway listed.
- If it is set to Deferred Authorization, change it to Immediate or Manual Authorization.
- Repeat for all other gateways.

2. Submit any deferred transactions that are pending: In iMIS Desktop, open AR/Cash > Credit card reporting and run Print Deferred Pre-authorization Report and Submit Deferred Authorizations. Any deferred transaction remaining after the purge has no payment information, so it must be re-entered manually.
3. In DB Maintenance, open the PCI tab.
4. To start the purge, click Purge All Cardholder Information. A query runs and the Purge Payment Card Information window opens, reporting the number of records with cardholder information in each table that will be cleared by the purge.

5. If the report surfaces no problems and you want to complete the purge, select Continue with Purge to clear the cardholder information from the database.

   The output of the process displays in the main window of the DB Maintenance utility.

   Fields affected by the purge

   Table: [dbo].[ASI_temp_trans] if exists

- [CC_NUMBER] - masked (shows last 4)
- [CC_EXPIRE] - masked
- [CC_NAME] - cleared

  Table: [dbo].[Trans]

- [CC_NUMBER] - masked (shows last 4)
- [CC_EXPIRE] - masked
- [CC_NAME] - cleared
- [ENCRYPT_CC_NUMBER] - cleared
- [ENCRYPT_CC_EXPIRE] - cleared
- [ENCRYPT_CSC] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

  Table: [dbo].[Orders]

- [PAY_NUMBER] - masked (shows last 4)
- [CREDIT_CARD_EXPIRES] - masked
- [CREDIT_CARD_NAME] - cleared
- [ENCRYPT_PAY_NUMBER] - cleared
- [ENCRYPT_CREDIT_CARD_EXPIRES] - cleared

- [ENCRYPT_CSC] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Table: [dbo].[Basket_Payment]

- [PAY_NUMBER] - masked (shows last 4)
- [CREDIT_CARD_EXPIRES] - masked
- [CREDIT_CARD_NAME] - cleared
- [ENCRYPT_CREDIT_CARD_EXPIRES] - cleared
- [ENCRYPT_PAY_NUMBER] - cleared
- [ENCRYPT_CSC] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Table: [dbo].[Order_Payments]

- [PAY_NUMBER] - masked (shows last 4)
- [CREDIT_CARD_EXPIRES] - masked
- [CREDIT_CARD_NAME] - cleared
- [ENCRYPT_CREDIT_CARD_EXPIRES] - cleared
- [ENCRYPT_PAY_NUMBER] - cleared
- [ENCRYPT_CSC] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Table: [dbo].[OrderCheckout]

- [CreditCardNumber] - masked (shows last 4)
- [CreditCardExpiration] - masked
- [CreditCardName] - cleared
- [CreditCardAddress] - cleared
- [CreditCardAddress2] - cleared
- [CreditCardAddress3] - cleared
- [CreditCardCity] - cleared
- [CreditCardState] - cleared
- [CreditCardPostalCode] - cleared
- [CreditCardCountry] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Creating NRDS items

(NRDS clients only)The National Association of REALTORS® (NRDS) bridge lets you share information between iMIS and NRDS through an automatic synchronization of changes made in either database. Setting up this data sharing includes a one-time command in DB Maintenance to create the needed items:

1. After downloading and installing the WebSphere MQ Client, restart you application server.
2. In DB Maintenance, select the NRDS tab and click Add NRDS Items.
3. Check the Output section below the button to verify that no errors occurred.

   For complete setup and configuration details, see NRDS bridge for data synchronization.

Converting to VAT Inclusive

(VAT organizations only) If you entered product and event pricing in iMIS 15.2.5 and earlier, it was exclusive of VAT. If you now enable VAT Inclusive pricing, you need to do a one-time conversion of your existing pricing to include the VAT tax amount.

See Configuring VAT options in AR/Cash. When you enable the option in AR/Cash, iMIS prompts you to run this conversion.

Caution: Always back up your database and ensure that you can restore it before running any data conversion.

Upgrade note for VAT: Now that iMIS stores all order and order line amounts as VAT-inclusive, DB Upgrader takes care of updating all of your existing order data to be consistent with your new order data. Flags on the record ensure that the update occurs only once, and your original data is backed up (Orders_BAK and Order_Lines_BAK). Note that this universal change to storing order amounts as VAT-inclusive is unrelated to whether you set AR/Cash VAT Options to be VAT Exclusive.

Maintaining content items with DB Maintenance

When you click Manage Panel Editor Sources, the following window is displayed:

The source name is displayed in the first column. Then in the following columns, other information is displayed:

- Is Dynamic Source: This column indicates whether the source is a dynamic source (for example, created by Panel Editor), or a static source (for example, just a business object that Panel Editor is able to use).

- Is Single Row Source: This column whether the source is a single-row source (for example, there is one row for each contact), or a multi-instance source (for example, there are multiple rows for each contact).

  The check-boxes allow you to filter the list down to only what you're interested in.

  Click Add Static Source to add another source. For example, if you create a new business object that has an ID and represents data associated with Contacts, you can add the source here. This adds a row to the ObjectMetaData table.

  Click Remove Static Source if you have a business object (non-dynamic source) selected. This allows you to remove business objects to which you don't want Panel Editor have access. If the selection is a dynamic source, the button reads Purge Dynamic Source instead.

  If you click Remove Static Source, the following confirmation dialog is displayed:

Click Yes to remove the associated row from the ObjectMetaData table. The source is no longer available to Panel Editor. No data is destroyed, and the source can be re-added using the Add Static Source button.

If you click Purge Dynamic Source, the following confirmation dialog is displayed:

If you click Purge Data Source while the checkbox is unselected, the dynamic data source is removed from the ObjectMetaData table. The dynamic source will no longer be available to Panel Editor to create new panel editor instances. However, the backing Business Object, View, and Data are all untouched. There is currently no way to restore access to a purge dynamic data source in this state, except for re-adding the row manually through SQL. Any panel editors currently using the source should continue to work, but might not be editable.

If the checkbox is selected, then a red warning is displayed:

Selecting this option will also delete the backing Business Object documents, drop the View, and delete all associated Data. This is useful when performing testing, and you have a number of test objects you want to remove.

Note: Any Panel Editors using the source will break, and it's the responsibility of the customer to ensure that no Panel Editors are using the source when it is purged.

Purging Single-Instance Panel Editor Source Orphans

Do the following to purge orphaned properties from your Panel Editor source:

1. Launch DB Maintenance. From the Start menu, go to ASI > iMIS > Tools > iMIS DB Maintenance Utility.
2. Connect to the database.
3. Click the iParts tab.
4. Click Manage Panel Editor Data.
5. Verify there are orphaned properties in your selected source.
6. Select the source that has the orphaned property.
7. Click Purge Orphans.
8. Click Purge Property and Data. The following message is displayed:

   Are you SURE you want to remove all the data associated with orphaned property '<Property Name>'?
9. Click Yes. This will remove all data associated with the orphaned property. This action cannot be reversed. If you return to the Panel Editor content item, and recreate the property, there will be no data available for that property.
10. Click Close.
11. Select the source that has the orphaned property.
12. Click Purge Data. This deletes all the data for the source. The following message is displayed:

    Are you SURE you want to remove all the data associated with Panel Editor Source '<PanelEditorSourceName>'?

13. Click Yes. This will remove all data associated with the Panel Editor source. This action cannot be reversed. If you return to the Panel Editor content item, and view the source, there will be no data available.

ANSI Conversion Utility - ConvertTableToANSI

iMIS Desktop requires ANSI settings to be enabled at all times. Whenever Desktop creates a connection (ODBC or otherwise), it does so with all ANSI options turned ON. To ensure that that the entire iMIS database has the correct ANSI settings, the upgrade utility rebuilds all tables and recreates all stored procedures, triggers, functions, and views.

Note: Because of this extensive rebuilding, expect upgrading to be significantly slower for very large databases. Before upgrading, check that you have ample free disk space relative to the size of your database, as these tables will be copied during the process of conversion and rebuilding.

ANSI settings required by iMIS

iMIS requires that all tables be fully ANSI compliant, so they must be created with SET ANSI_NULLS ON and SET ANSI_PADDING ON. The ConvertTablesToANSI command-line utility rebuilds every table in the database that is not ANSI compliant, including user-defined and third-party tables.

If you are creating your own tables, procedures, triggers, views, etc., be sure to set these ANSI settings:

SET ANSI_DEFAULTS ON

SET IMPLICIT_TRANSACTIONS OFF

SET CONCAT_NULL_YIELDS_NULL ON

SET ARITHABORT ON

SET NUMERIC_ROUNDABORT OFF

Running a standalone ANSI conversion

The DB Upgrader runs the ConvertTablesToANSI utility as part of an iMIS upgrade, but you can run it standalone as well, from the command line. To ensure a smooth upgrade for a large and complex database, you can do a "pre-upgrade" conversion on a backup of the database to anticipate problems.

1. Create a backup, an off-line copy of your database.
2. If you haven't upgraded, run the iMIS installer to expand copies of the database utilities.
3. Locate the ConvertTablesToANSI utility, in the imis.net\IMISDBUpgrade\Utilities folder.
4. From the command line, run the utility against your database backup:

   ConvertTablesToANSI.exe -S sqlServerName -U sqlUser -P sqlPassword -D dbName

   If your database copy converts with no errors, you can use this converted database for your upgrade, which saves the time of reconverting. If there is an error, contact Support for assistance before upgrading.

Troubleshooting ANSI Conversion errors

The ANSI conversion utility rebuilds every table that is not ANSI compliant. These tables are listed in the upgrade log:

Rebuilding Tables For Full ANSI Compliance ...

Converting Table 1 of 89: Activity

...

Converting Table 88 of 89: UserMain

Converting Table 89 of 89: W_Reports

ANSI Conversion Successful

Step 4 Done.

The total number of tables rebuilt varies by database. Any errors appear the build log, flagged with three asterisks (***), before both the description of the problem and the end of the step:

Converting Table 219 of 234: UsedSourceCode

*** Unable to copy data into table UsedSourceCode

…

Converting Table 234 of 234: tempTypeNamesList

*** Errors during ANSI Conversion

Step 4 Done.

After such an error, the upgrade continues. Although the completed upgrade reports being "failed", the upgrade will be valid as long as there are no other errors. When a table fails to convert, the utility restores it to its original, unconverted condition, unless connectivity to the database is lost.

Content Browser utility

A standalone Content Browser utility lets you analyze all content across the entire Document System of any iMIS database. This tool helps you to see where content items are used, and how content is referenced by navigation. The Content Browser also allows you to identify and even delete orphaned content without having to locate the content through the Document System. This is especially useful since not all content is required to live in a Document System hierarchy.

Do the following to run the Content Browser:

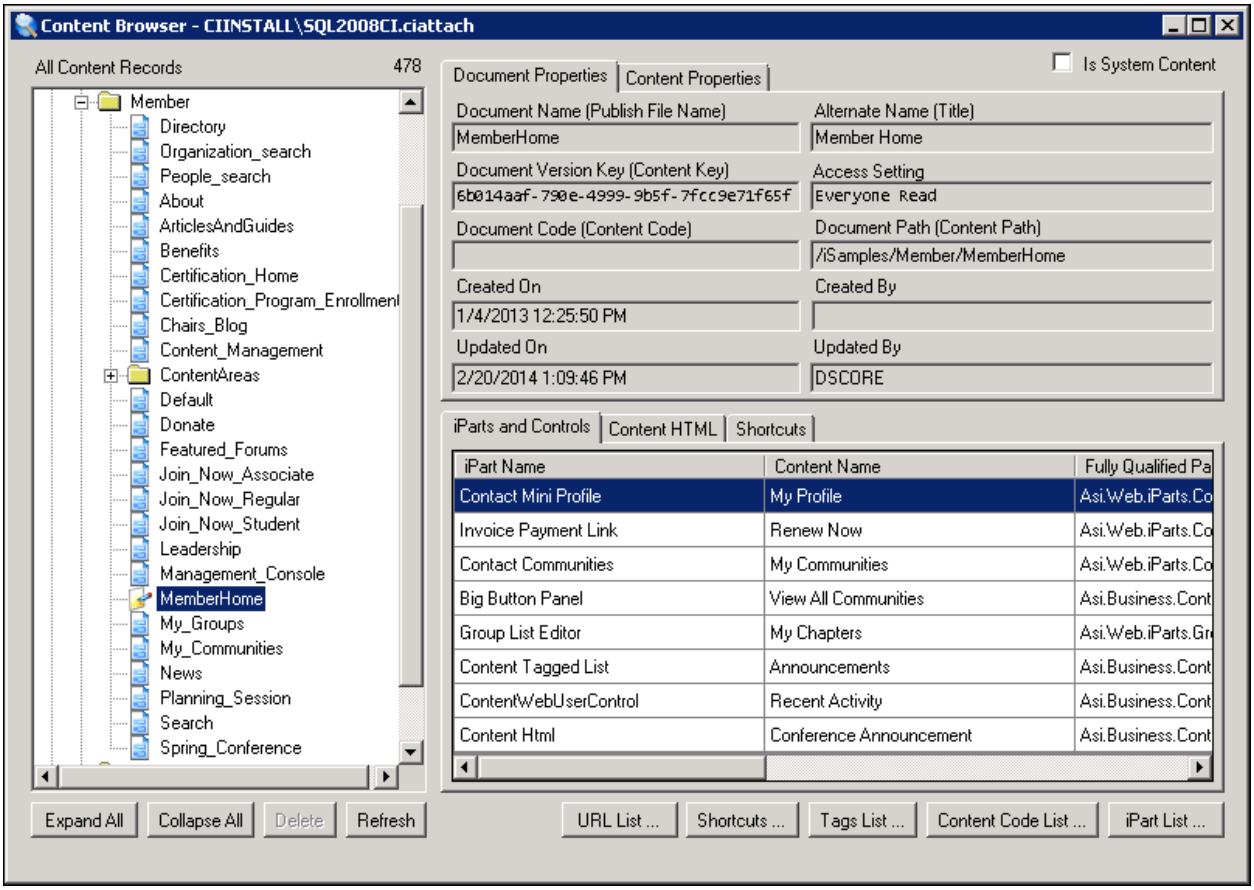
1. Back up the database so that it can be restored. You cannot undo permanent deletions.

Important: If you copy ContentBrowser.exe to a new system, you must reconfigure it:

1. Copy the C:\Program Files (x86)\ASI\iMIS\Net\bin\ContentBrowser.exe and ContentBrowser.exe.config files to the …\net\bin folder of an iMIS install.

2. Edit the connection string in the ContentBrowser.exe.config file to point to the corresponding iMIS database on the new system.
2. Go to the ...\net\bin folder and launch ContentBrowser.exe.

   Note: Content Browser can take some time to open, because it must load all the content in the database and scan all the navigation.
3. Check the <server>.<database> that is displayed in the title bar after loading, to verify that the database you're connected to is the correct one.
4. Once Content Browser has loaded all content, you can navigate using the tree control. Use the Expand All and Collapse All buttons to help manipulate the display in the All Content Records area.
5. Click any content record to see it displayed.

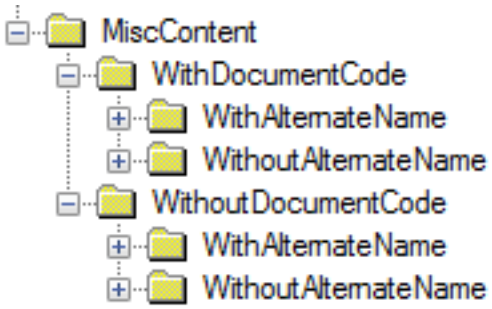


The tree-view shows all the content folders and content records found in the system. Clicking on any node will show information about that content. The right pane contains two tab controls: Document Properties and Content Properties. At the bottom of the tree control on the left are Expand All and Collapse All buttons that expand all the nodes in the tree view or collapse them all back to folders, respectively.

At the bottom of the tree control is a special node, MiscContent, which will show any content that is found that is not in the document system hierarchy. This content is divided into nodes by the following:

- Records with document codes
- Records without document codes
- Records with alternate names/title
- Records without alternate names/title

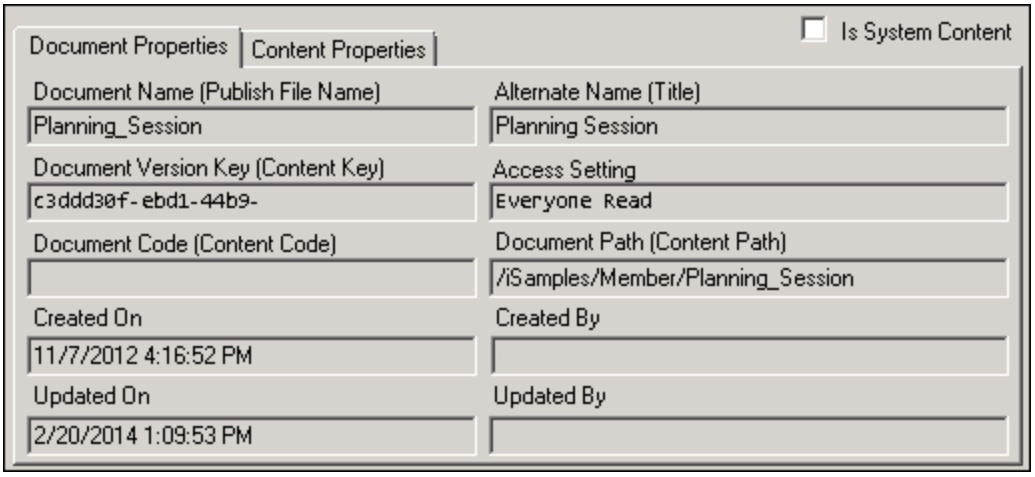
Most likely, any content found in the WithoutDocumentCode > WithoutAlternateName node can be deleted. However, because content does not have to exist in the Document System hierarchy, there could be valid content in any of these nodes, depending on how the content is referenced. These nodes look like the following:



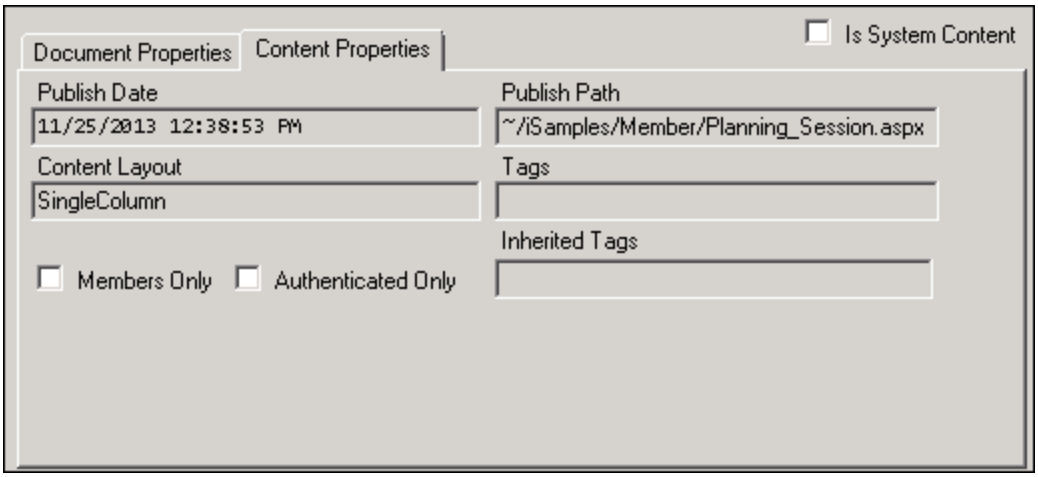
Properties Tabs

- Document Properties – Displays all document-related properties, including:
- When the document was last updated
- Who updated the document

- The document name
- The path to the document in the document system
- The access settings



- Content Properties – Displays all content-related properties, including:
- The relative publish path
- The content layout
- Content tags
- Flags such as whether the content is for authorized (logged-in) users only



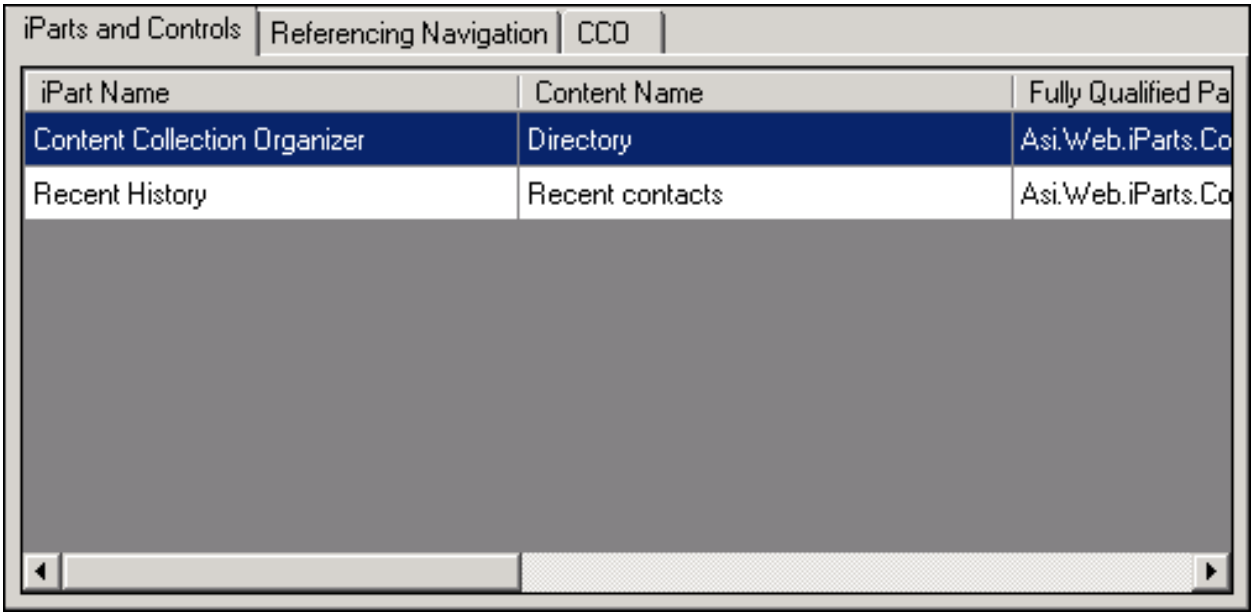
Content Tabs

The content tab set can contain from 0 to 6 tabs, depending on the content selected. Folders will show blank (0 tabs), while most content will show between 1 and 6 tabs:

- iParts and Controls
- Referencing Navigation
- Content HTML
- CCO (Content Collection Organizer)
- Referencing CCO
- Shortcuts

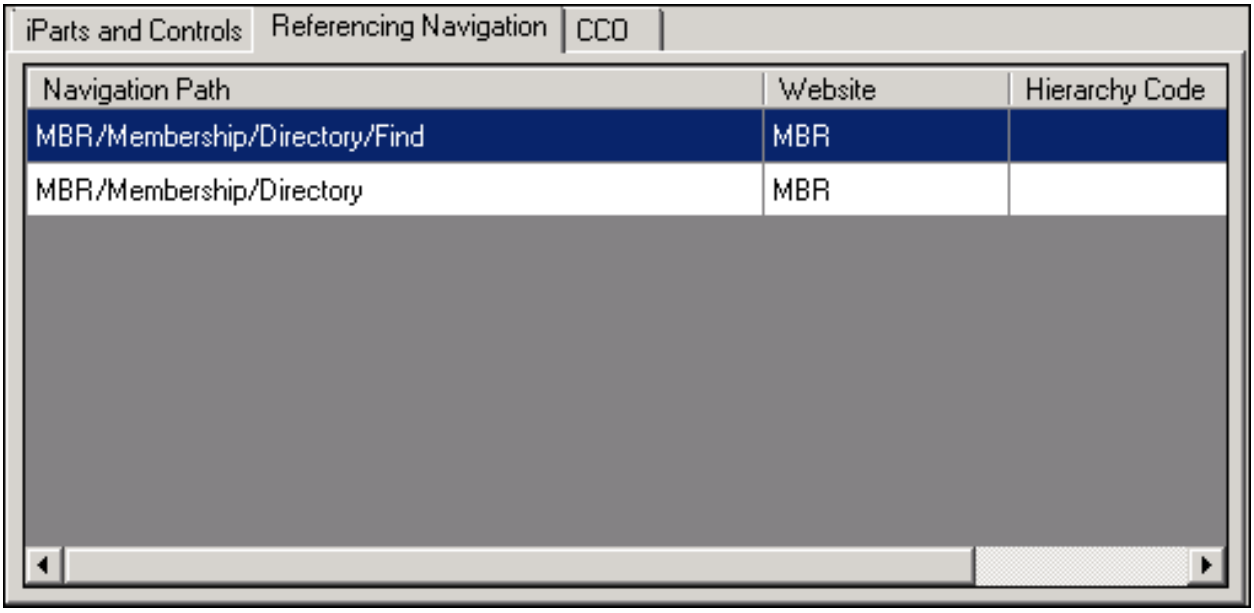
iParts and Controls

The iParts and Controls tab lists all the content items or controls hosted by the content. If this tab is not present, then the content does not contain any controls or content items. Each content item has a row on the tab, containing the name of the control, the name of the content, the fully qualified content item name (useful for developers), and the assembly name of the content item (useful for developers).



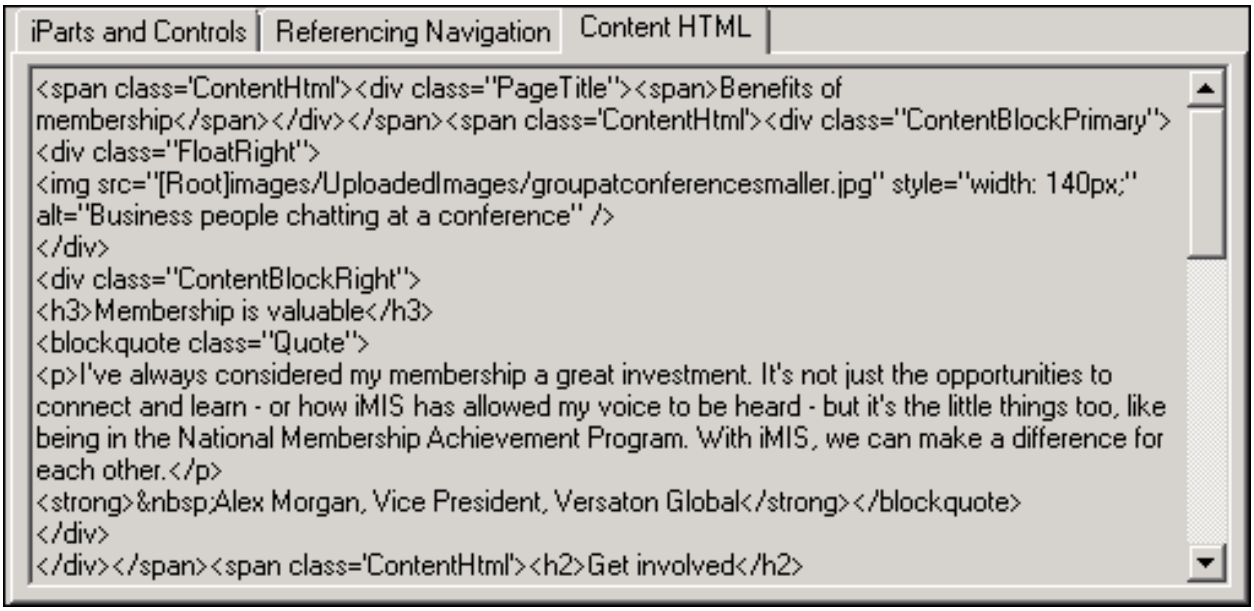
Referencing Navigation

The Referencing Navigation tab is displayed if there are any navigation items that point directly to this content. You can see the navigation path, the website associated with the navigation, and any hierarchy code that is present.



Content HTML

The Content HTML tab is displayed if there is any HTML defined in the content. You can view the HTML, but you cannot edit the HTML.

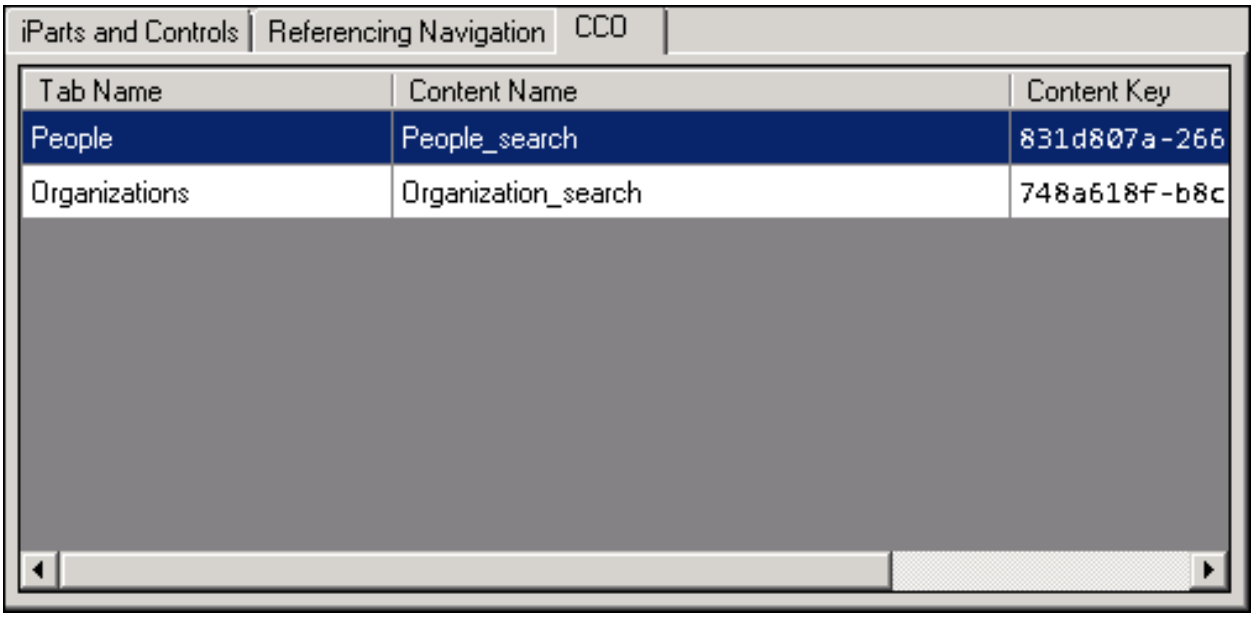


Note: If there are any clickable URL links in the Content HTML block, a drop-down listing all the URLs is displayed at the bottom of the Content HTML Tab. This drop-down initially appears blank. Click the down arrow to see all the URLs.

If you select a URL, you are taken to the URL List so you can see any other content that also contains that same URL. See URL List for more information.

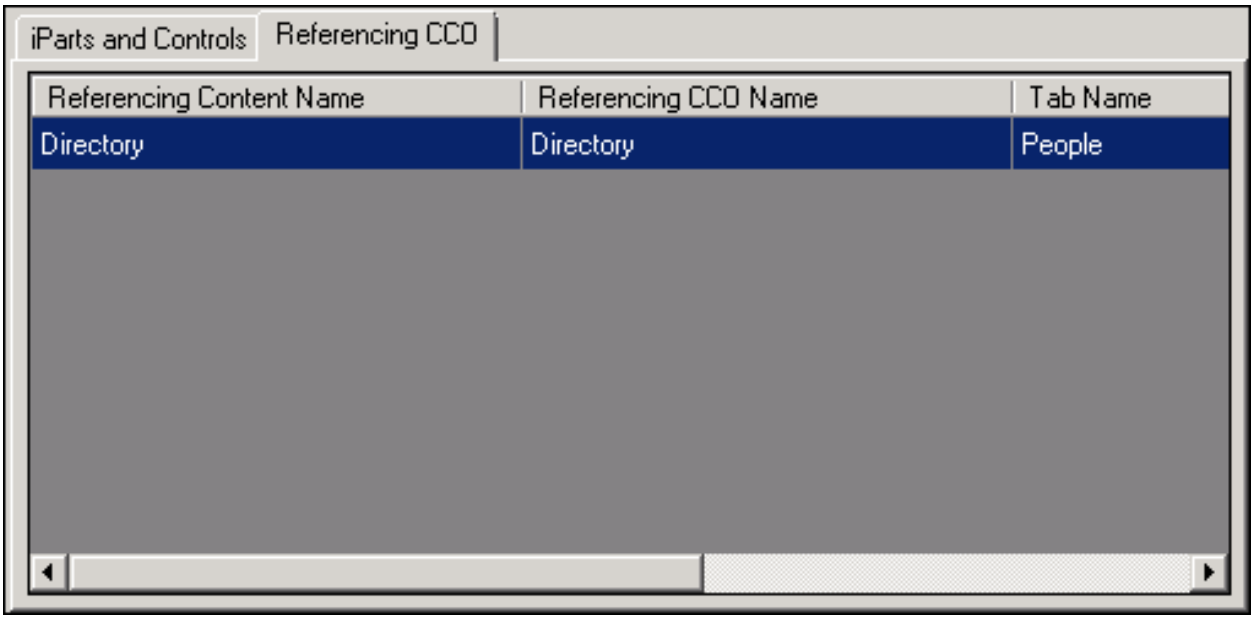
CCO (Content Collection Organizer)

The CCO tab displays the content referenced by any Content Collection Organizer present in the content. The Content Collection Organizer is a special content item that allows you to collect references to other content into a tab control. The information in this tab includes the names of all the tabs in the CCO control, the name of the content that they reference, and the content key. Double-clicking on any referenced content will take you to that content, selecting the content in the tree control, and displaying information about the content in the panes on the right side of the window.



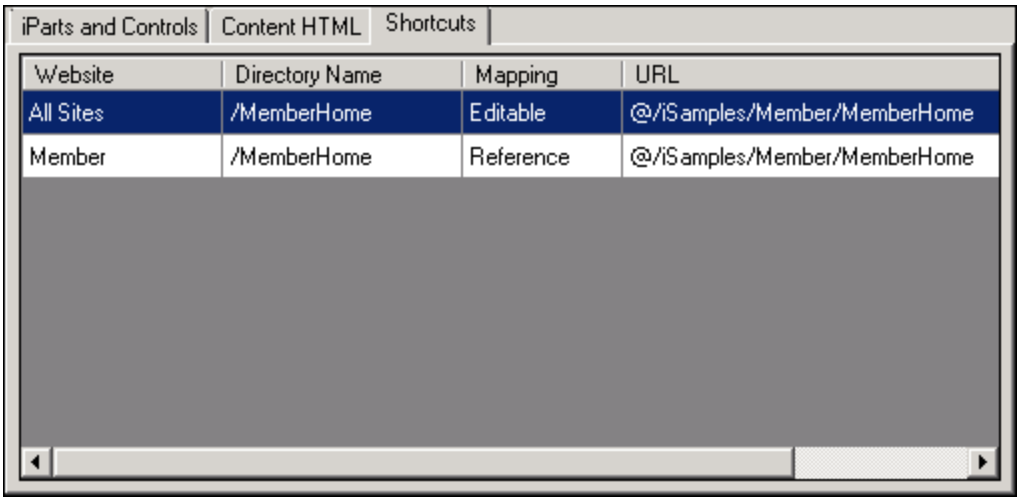
Referencing CCO

The Referencing CCO tab displays any content that is referencing the currently selected content. It will show the referencing content's name, the name of the CCO control, and the name of the tab within the CCO control that is performing the referencing. Double-clicking the row will take you directly to the referencing content. This allows you to easily navigate between the content hosting the CCO, and the content the CCO references.



Shortcuts

The Shortcuts tab displays any shortcuts that are referencing the content. It will show the website, the directory name, the mapping type, and the URL string associated with the shortcut.

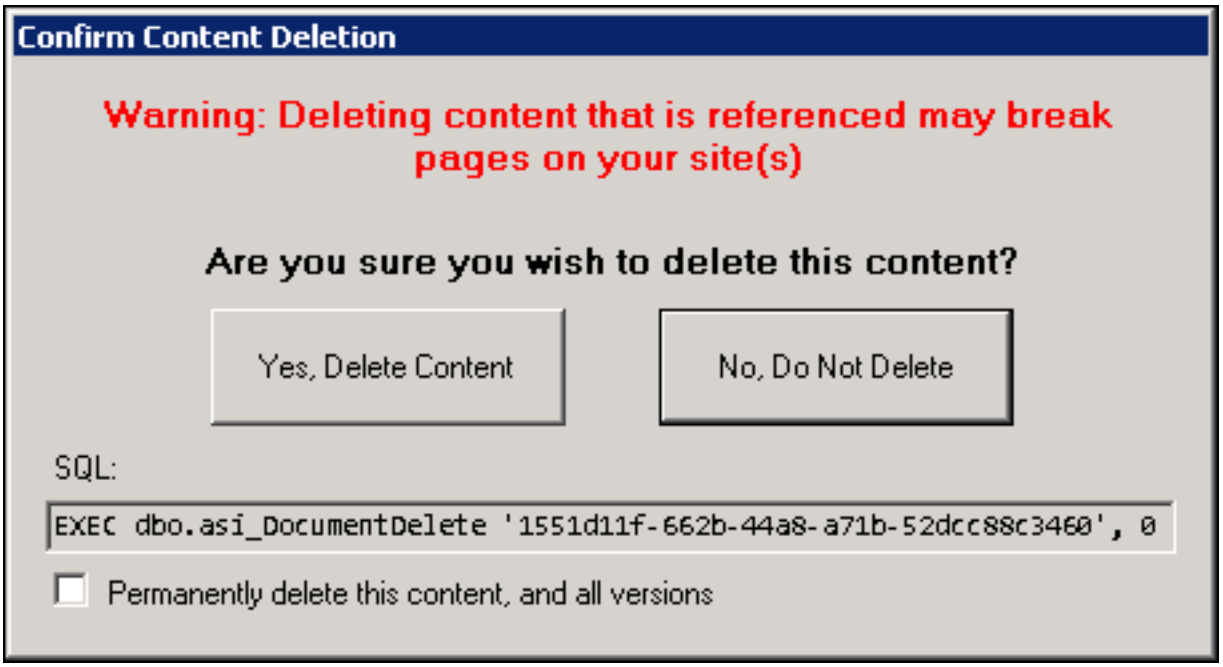


Delete

The Delete button is enabled any time there is content selected that is:

- Not a folder
- Not directly referenced by navigation
- Not directly referenced by a Content Collection Organizer content item

Be aware that other references might exist. There could be references to content codes, URLs, and codes embedded in HTML, references that are programmatically generated at run time, and so forth. For this reason, delete content at your own risk. If the button is enabled, it means that there are no direct references to the content of which this tool is aware. Ensure there are no other references to content in other places. If you are certain you want to delete the content currently selected in the tree control, click Delete. The following warning dialog is displayed:



The Permanently delete this content, and all versions checkbox is clear by default, which means the content will be recycled. The content will be logically deleted, but still present. No rows are deleted from the database. Content deleted in this way could theoretically be recovered.

Selecting the Permanently delete this content, and all versions checkbox permanently deletes the content, including any archived versions or history, and removes the rows from the database. The only way to restore content deleted in this way is to restore from backup.

The SQL field shows the SQL script that is being run when the delete occurs. You can copy this SQL if you want to create a script for deleting content in bulk, for example, should you want to delete the same content from multiple databases.

Note: Selecting the Permanently delete this content, and all versions checkbox changes the SQL displayed in the SQL field.

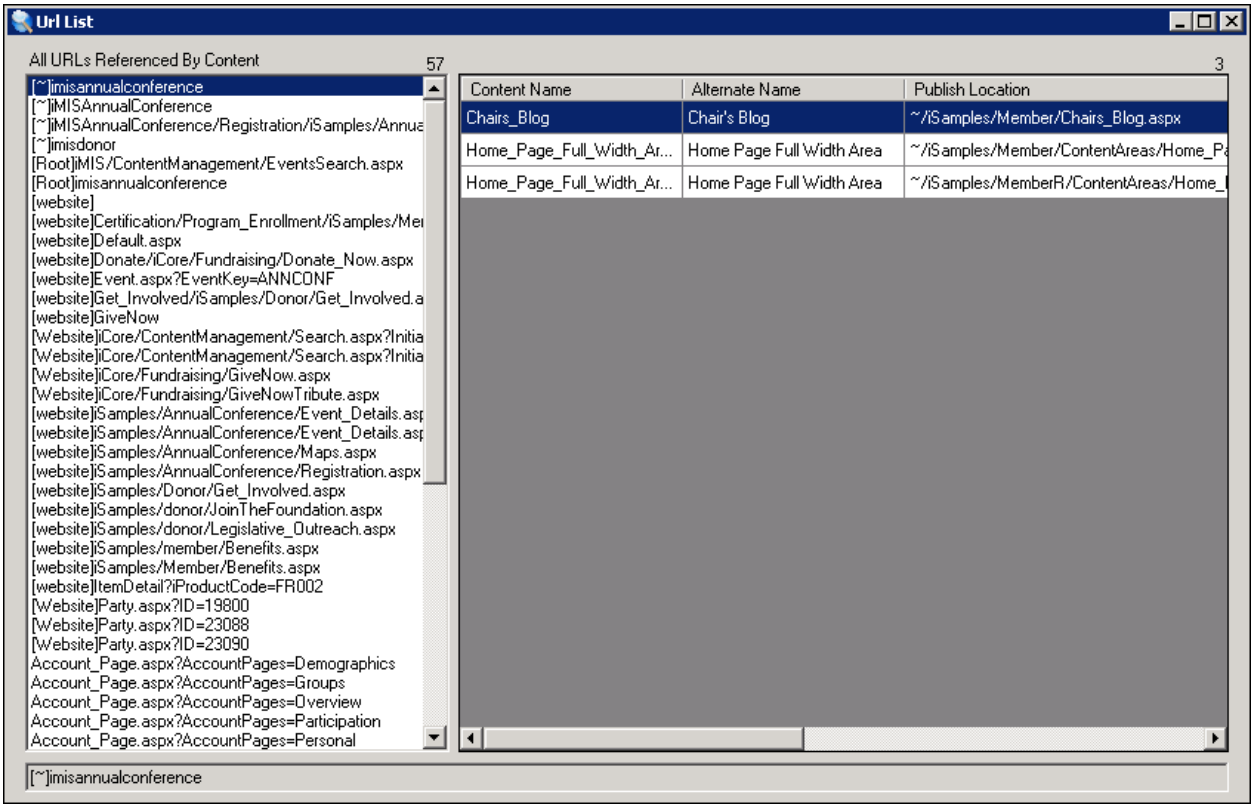
Refresh

The Refresh button reloads all content and rescans all of the navigation. If you are using WCM to modify content while this tool is running, you will need to click Refresh to see

your changes reflected in the tool. The Content Browser caches all the information and relationship for performance reasons, so real-time changes made with any other tool or interface will not be reflected unless you click Refresh.

URL List

The URL List button displays a new window that shows all of the URLs referenced by clickable links in a Content HTML content item for any content. While the window is open, this button will be grayed out. You can move between this window and the main window freely. The URL List window is not a modal window. It allows you to see all the content that references a given URL, and easily jump to that content for more information.

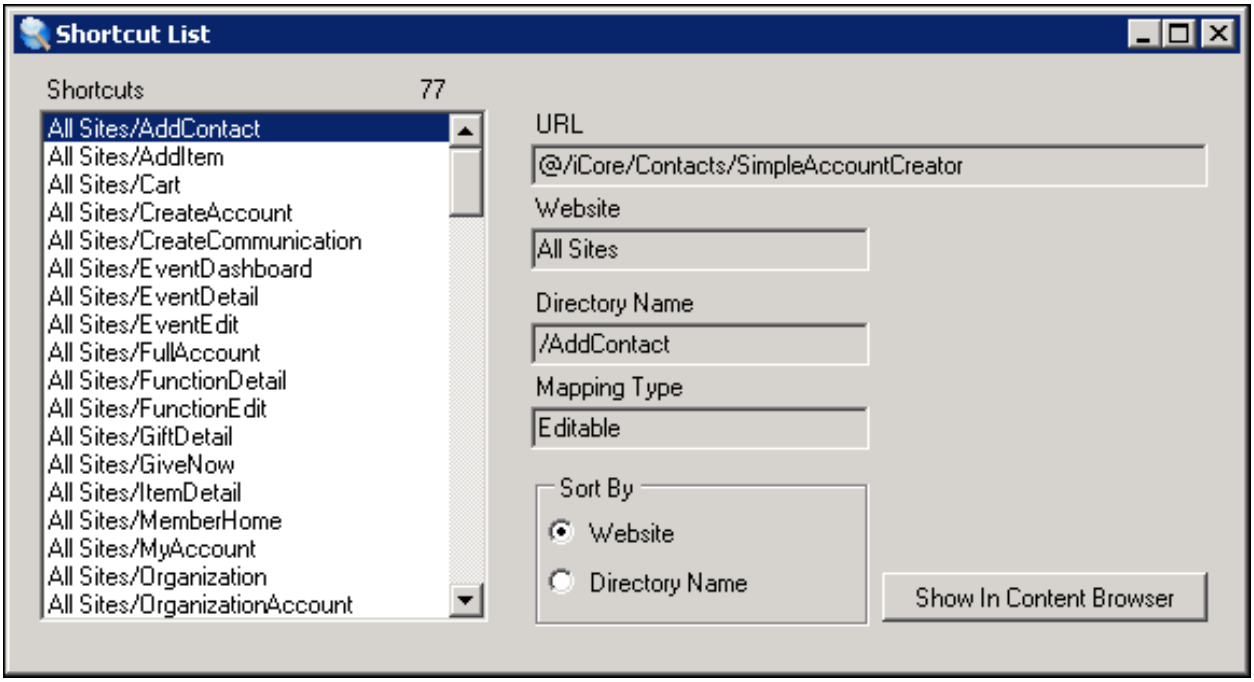


The URL List window lists in alphabetical order all the URLs currently used in any content in the All URLs Referenced By Content area. When a URL is selected, all the content that contains an instance of that URL will be displayed to the right. At the very bottom of the window, the full URL will be displayed, for those URLs that are too long to view completely in the list. Each URL you select will be displayed here.

Double-clicking on any content record will select that content in the tree control on the main Content Browser window. This allows you to easily locate and navigate to specific content that is using any given URL, and get an overview of how URLs are used on your sites.

Shortcuts

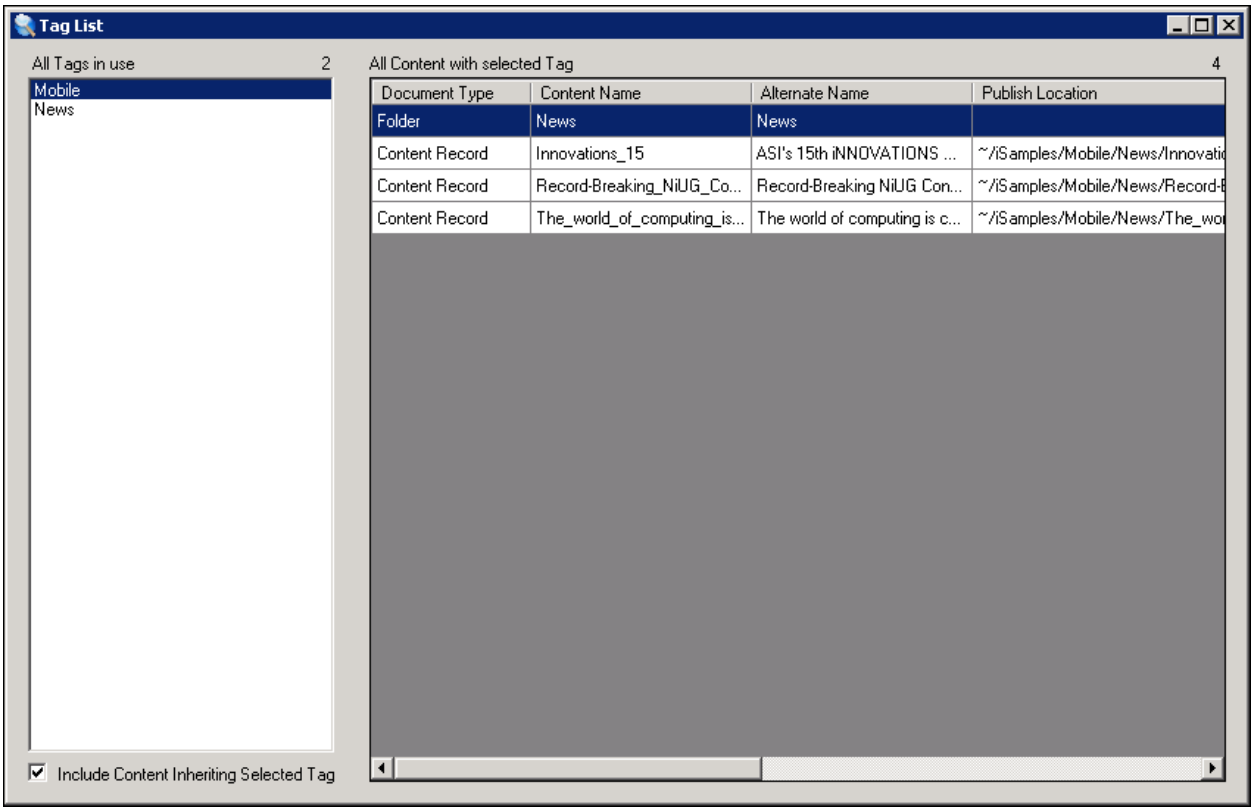
The Shortcut List window shows all the shortcuts, sorted either by website or by directory name. While the window is open, this button is grayed out. You can move between this window and the main window freely. The Shortcut List window is not a modal window.



Double-clicking on any shortcut in the Shortcuts list will open the referenced content item in the main Content Browser window. You can also click Show In Content Browser to open the referenced content item in the main Content Browser window.

Tags List

The Tags List button displays a new window that lists all the tags used by all the content in the system. This is another way to view the data, and see how the content is used. While the window is open, this button will be grayed out. You can move between this window and the main window freely. The Tag List window is not a modal window.



The Tag List window will list all the tags currently used in any content in alphabetical order in the All Tags in use area. When a tag is selected, all the content with the selected tag will be displayed in All Content with selected Tag on the right.

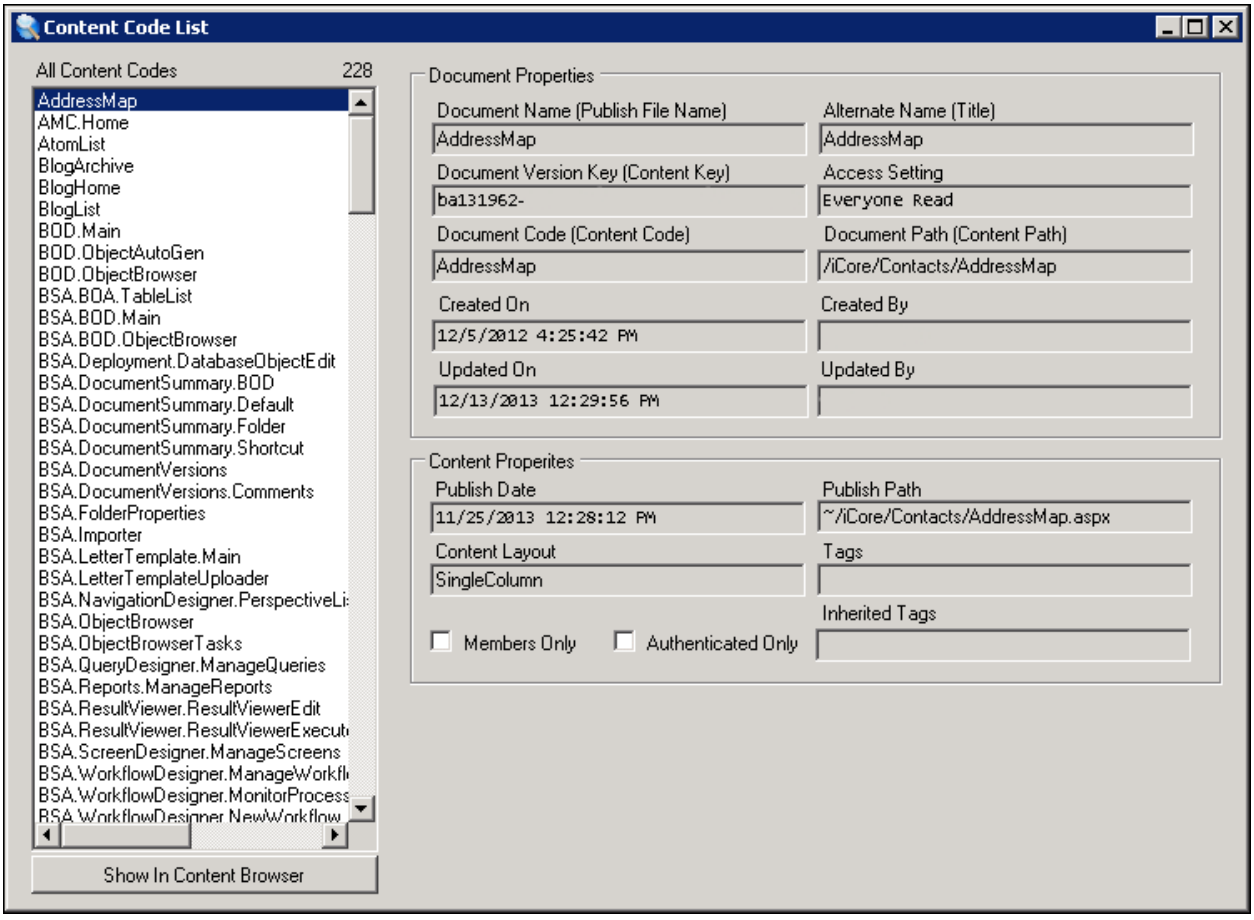
If the Include Content Inheriting Selected Tag checkbox is selected, then you see not only the content that is directly tagged, but all content in folders that are directly tagged.

Double-clicking on any content record in the All Content with selected Tag area will select that content in the tree control in the main Content Browser window. This allows you to easily locate and navigate to specific content that is referenced by any given tag, and get an overview of how tags are used on your sites.

Content Code List

The Content Code List button opens a new window that lists all the content codes used by all the content in the system. This is another way to view the data, and see how the content is used. While the window is open, this button will be grayed out. You can move

between this window and the main window freely. The Content Code List window is not a modal window.



The Content Code List window lists all the content codes currently used in any content in alphabetical order in the All Content Codes pane. When a content code is selected, all the properties of the content with that content code will be displayed. The information is the same as you would see in the main Content Browser window.

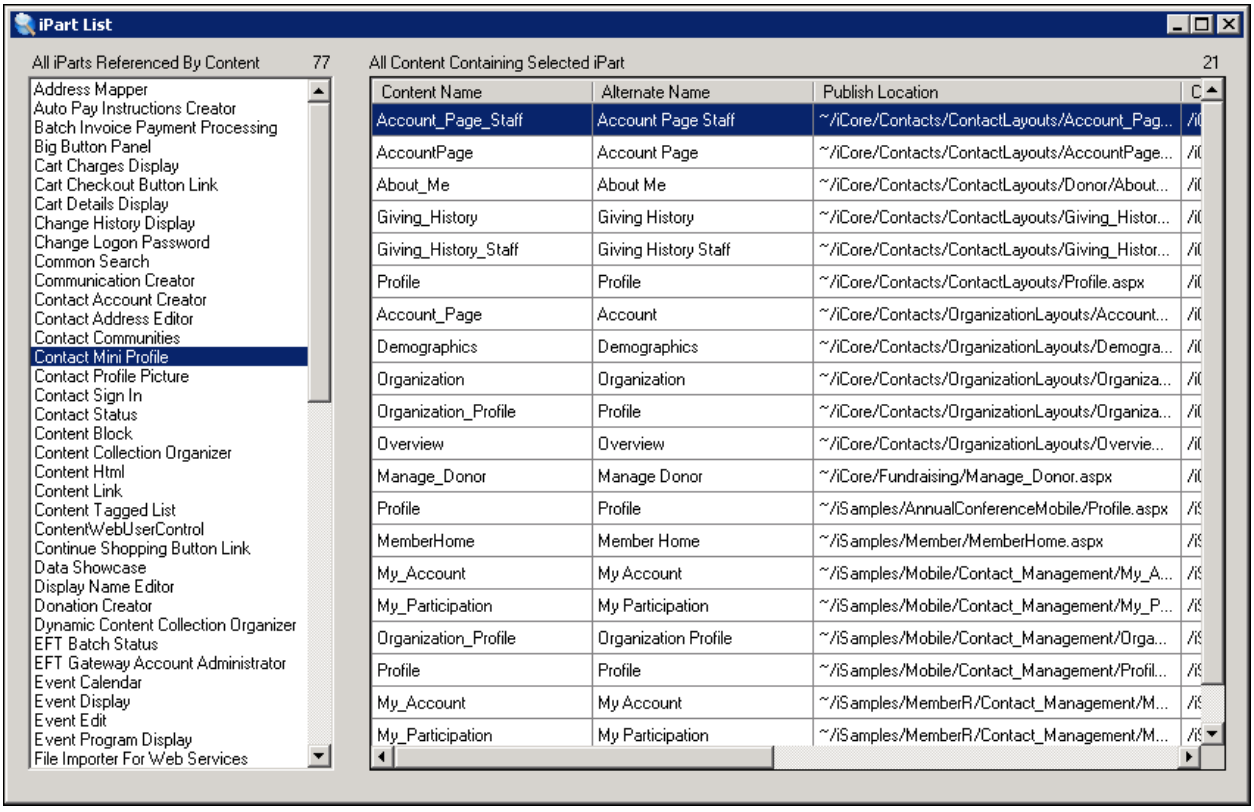
Click Show in Content Browser to select the content in the tree-view of the main window. You can also double-click on the content code in the list to have the same effect as clicking Show in Content Browser.

Two pieces of content should not have the same content code. If they do, then selecting the content code causes the following error message to be displayed:

Click Dup 1 or Dup 2 to display the properties of each content record. Whichever content record is active will be the content record you see in the main window when you click Show In Content Browser. You can delete one of the two content records at this point.

iPart List

The iPart List button opens a new window that lists all the content items used by all the content in the system. This is another way to view the data, and see how the content is used. While the window is open, this button will be grayed out. You can move between this window and the main window freely. The iPart List window is not a modal window.



The iPart List window lists all the content items and controls currently used in any content in alphabetical order in the All iParts Referenced By Content area. When a content item is

selected, all the content that contains an instance of that content item or control will be displayed in the All Content Containing Selected iPart area.

Double-clicking on any content record in the All Content Containing Selected iPart area will select that content in the tree control on the main Content Browser window. This allows you to easily locate and navigate to specific content that is using any given content item, and get an overview of how content items are used on your sites.

Query Browser utility

The Query Browser utility enables you to analyze all IQA queries across the entire Document system of any iMIS database. This tool helps you find your known, good queries, and identify broken queries that need to be deleted or fixed without having to locate the queries through the Document system.

Note: This tool is designed to be used to find and fix broken queries. For general query editing, you should always use IQA.

Do the following to run the Query Browser:

1. Back up the database so that it can be restored. You cannot undo query deletions.

Important: If you copy QueryBrowser.exe to a new system, you must reconfigure it:

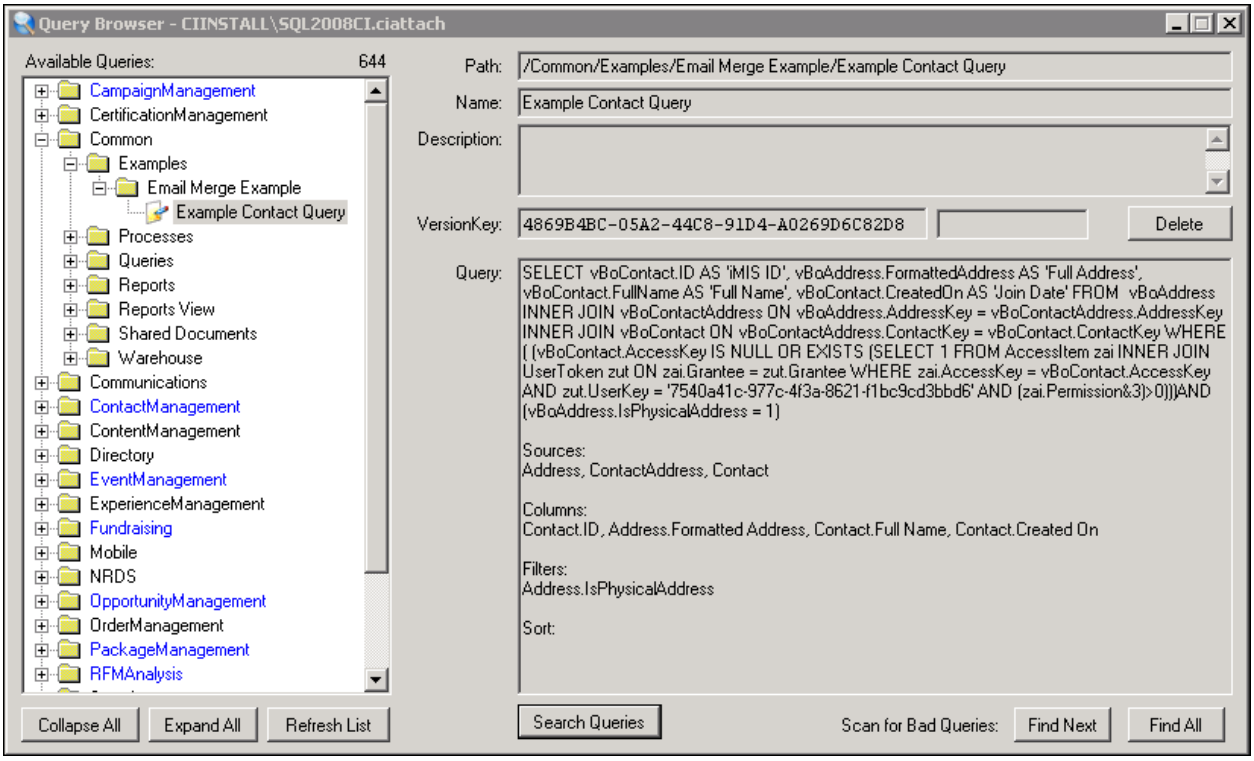
1. Copy the C:\Program Files (x86)\ASI\iMIS\Net\bin\QueryBrowser.exe.config file.
2. Edit the connection string in the QueryBrowser.exe.config file to point to the correct database on the new system.

2. Run Query Browser:

1. Go to the ...\net\bin folder.
2. Launch QueryBrowser.exe.

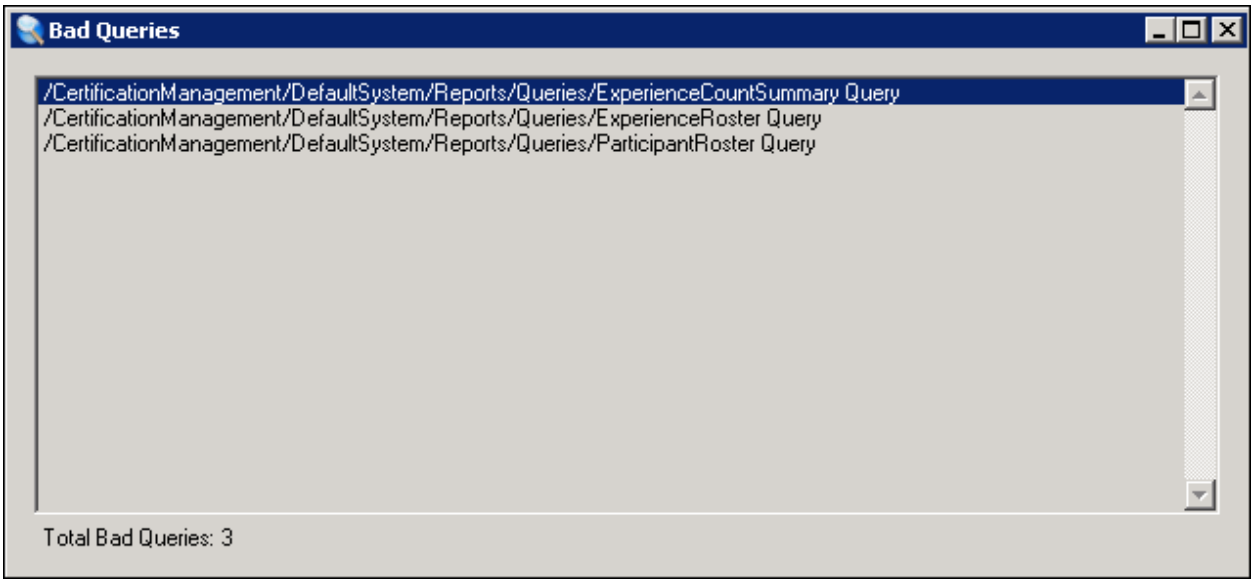
Note: Query Browser can take some time to open, because all queries in the database must be loaded.

3. Verify the the server.database that is displayed in the title bar is the database to which you want to be connected.
4. After Query Browser has loaded all queries, navigate using the tree control.
5. Click any query to view the panel.



From this main window, you can navigate through available queries, or search for queries:

- Click Find All to search for a list of all broken queries. When you click Find All, a Bad Queries window is displayed, listing all bad queries.
- Double-click any query to navigate to that query in the main window.



You can also do the following from the main window:

- Click Delete to permanently delete a query.

  Caution: There is no undo function. If you delete a query that iMIS requires, you might break the iMIS installation.

- Click Search Queries to open the Search/Replace Queries window. You can then search for all queries that use given sources. Double-clicking a query in the results list locates it in the main tree view, with the details displayed.

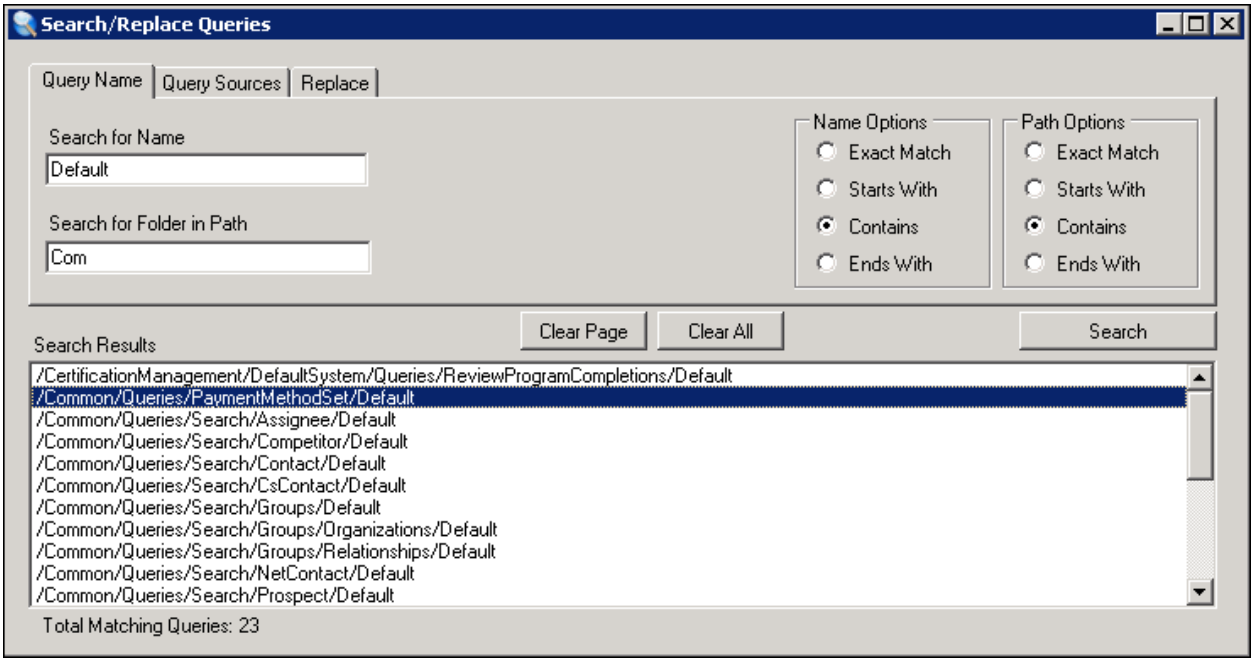
- Click Find Next to search for bad queries from the currently selected tree node. The search will start from the top of the Available Queries navigation tree if no node is selected.

- Click Find All to scan the entire set of queries to locate any problem queries, and then display the results in a list. Double-clicking a result locates the query in the main tree view.

- Click Refresh List to reload all the queries and scan the queries again. This is useful if you made changes to the Document system, such as fixing a query, restoring a missing DLL, and so forth.

Searching for Queries

You can search for query names, paths, and up to three sources joined with an and operation. Click Search Queries to open the Search/Replace Queries window.



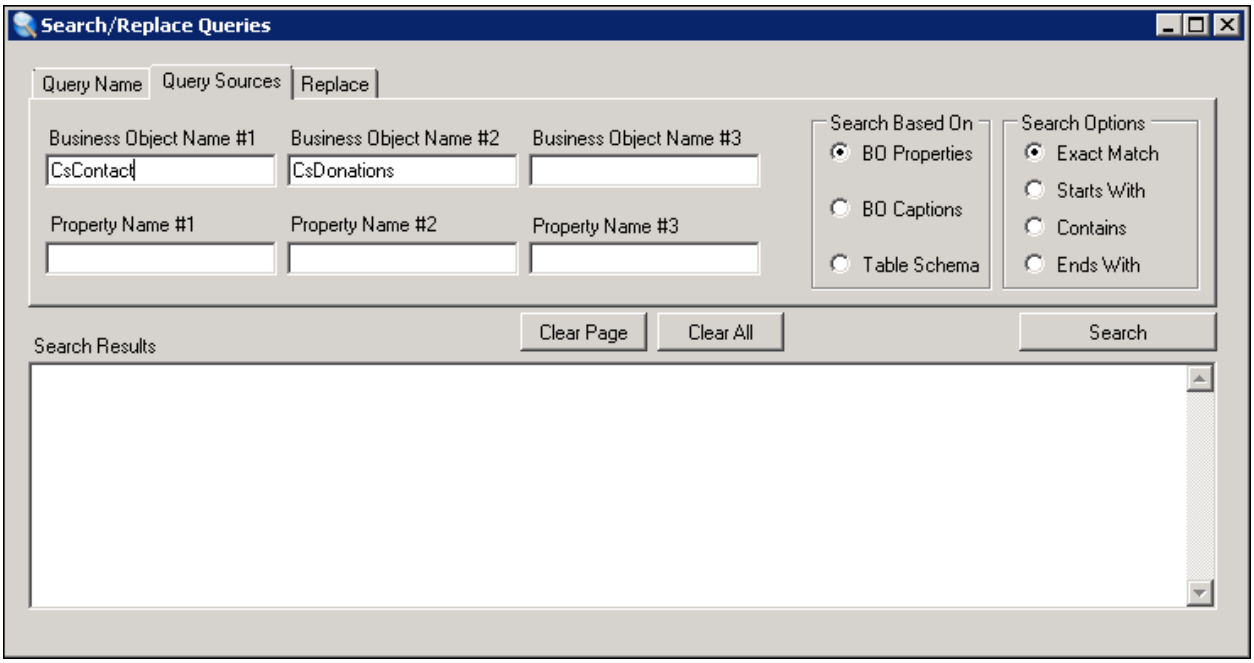
The Query Name tab allows you to specify a query or path in which to search. In the Search for Name field, the value entered will match any query name, based on the specified Name Options. In the Search for Folder in Path field, the value entered will match any folder based on the Path Options. For example, create a search using Contains as the name and path option:

1. Set Name Options to Contains.
2. Set Path Options to Contains.
3. Enter Default in the Search for Name field.
4. Enter Com in the Search for Folder in Path field.
5. Click Search.

   The search returns the query $/Common/Queries/PaymentMethodSet/Default, as the query name contains Default. The search will not return

$/Content/Queries/PaymentMethods/Default, as the path does not contain Com in the pathname. If you enter text in both fields, the query must pass both filters. If you leave both fields blank, any query will match.

Note: In order to perform a search with both of these fields empty, you must have some value entered on one of the tabs. If there is no value entered on any tab, the Search button is disabled.



The Query Sources tab lets you specify up to three business objects or table names, and up to three properties or column names. The values are joined with an and operation, so if you use the Exact Match search option, and enter CsContact in the Business Object Name #1 field, and enter CsDonations in the Business Object Name #2 field, the search will only find queries that use both of those business objects as sources. There is no way to perform an or search. The more information you provide, the more narrow the search parameters become.

Note: This tab can be used in addition to information on the Query Name tab. If you want to find a query named Default that uses the CsContact business object, then you could have values on both tabs.

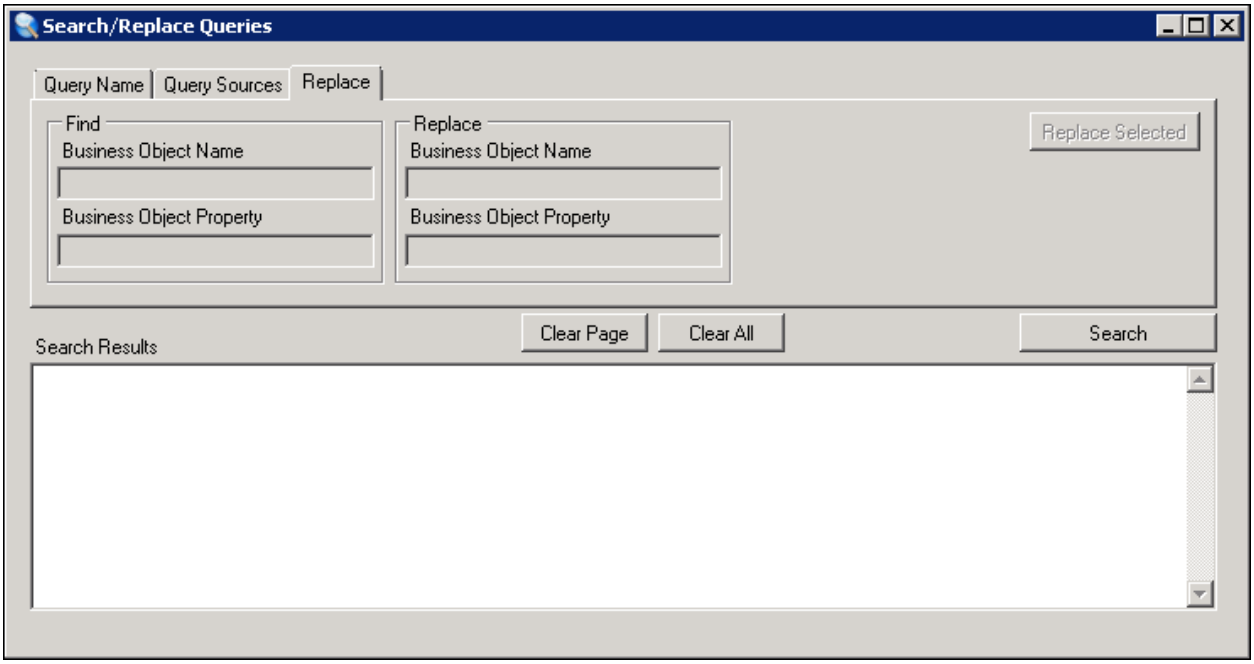
The Search Based On option tells the search utility whether the values are business objects or table names, and properties or column names. The search field names change when you specify a different Search Based On option:

- The BO Properties option will search based on the Business Object Property names as defined in Business Object Designer.
- The BO Captions option will search based on the label provided in the UI. This option is useful if you do not know the BO Property name, and are using what is visible in the UI.
- The Table Schema option will search based on the underlying SQL Table and Column names in the database.

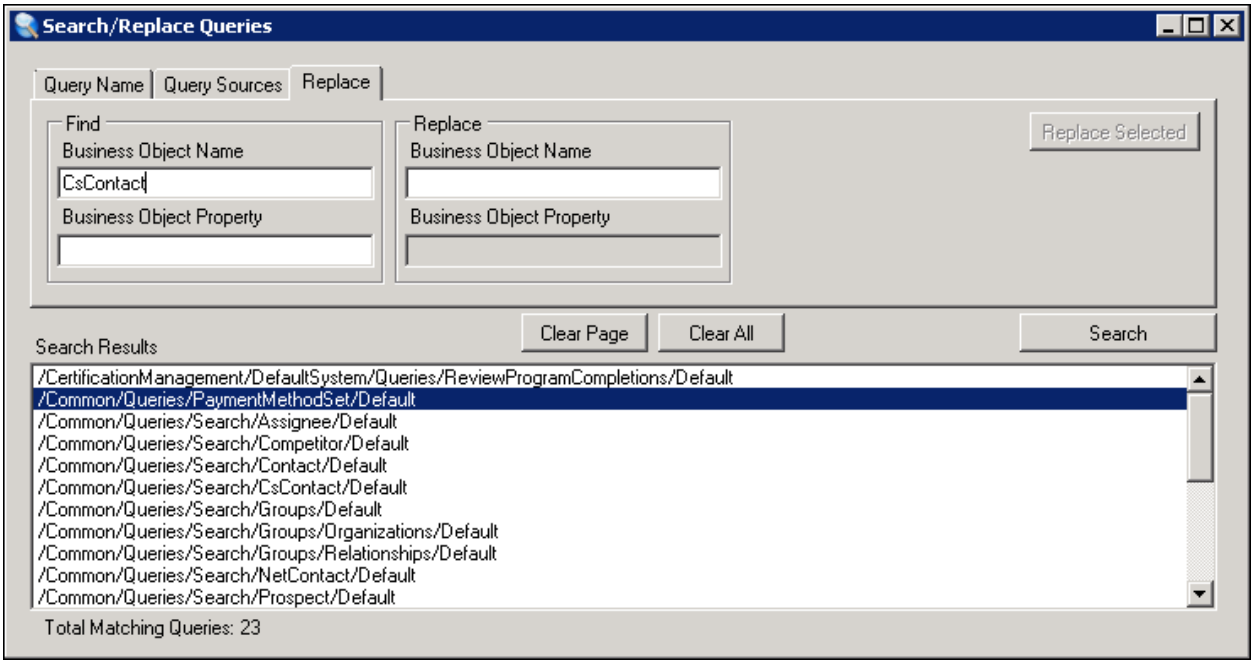
The Search Options apply to all fields on this tab. You cannot perform an Exact Match on a table name or business object along with a Starts With search on the column name or property.

Using find and replace to fix broken queries

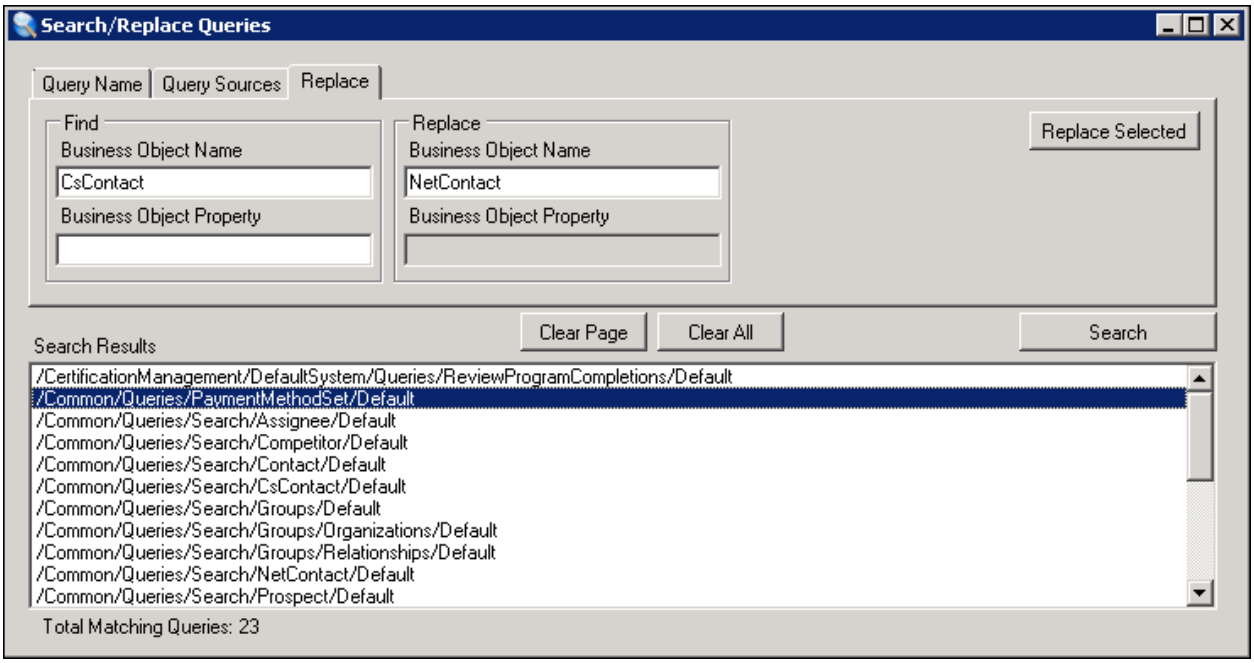
All controls on the Replace tab are disabled until you select one of the result queries in the Search Results box.



When a single query is selected, the Find text boxes are enabled. When a value is entered in one of those text boxes, the corresponding Replace text boxes are enabled. This allows you to replace specific sources and properties with other sources and properties.



This is used to repair a query that is broken because a business object or property was renamed. If you specify only a Business Object Name, the utility will replace all instances of that Business Object Name (regardless of property) in the query with the new one. If you specify only a Business Object Property, the utility will replace all matching properties (regardless of business object) with the new one. If both are specified, then only that specific property on that specific business object is replaced.



The Replace functionality should be used with care. You can experience problems if you replace a critical item with an item that does not exist, for example, if you misspell the replacement Business Object Name or Business Object Property. It is recommended that you have a good backup before performing this kind of activity on queries. This functionality is useful for repairing queries that cannot be viewed in IQA because they're broken, and should only be used for this purpose. If a query is not broken, it's always better to edit or update the query using IQA.

- Click Clear Page to clear the current tab, leaving data in the other tabs.
- Click Clear All to clear the data in all the tabs, and clear out the results pane as well.
- Click Search to search all queries using the specified filters in the Query Name and Query Sources tabs.
- Double-click on any query in the Search Results list to open that query in the main Query Browser window.

Which iMIS Tables are Already Referenced by your Business Objects?

The following SQL can be used to find which iMIS tables are used by your existing business objects. If you are looking to create a new business object or IQA query that references a specific iMIS table, you can first use the following SQL to see which business objects are referencing the table you are searching for. Then, you can use Query Browser to determine which queries are using the given business object.

```
SELECT DocumentMain.DocumentName, DocumentMain.DocumentTypeCode, DocumentMain.DocumentStatusCode

    , DocumentStatusRef.DocumentStatusDesc

    , [Path] = [dbo].[asi_DocumentPathFromHierarchyKey](Hierarchy.HierarchyKey)

    , o.[name] AS ObjectName, s.[definition] As ObjectDefinition

FROM Hierarchy

    INNER JOIN HierarchyRoot ON Hierarchy.RootHierarchyKey = HierarchyRoot.RootHierarchyKey

    INNER JOIN DocumentMain ON Hierarchy.UniformKey = DocumentMain.DocumentVersionKey

    INNER JOIN DocumentStatusRef ON DocumentMain.DocumentStatusCode = DocumentStatusRef.DocumentStatusCode

    INNER JOIN sys.objects o ON 'vBo' + DocumentMain.DocumentName = o.[name]

    INNER JOIN sys.sql_modules s ON o.[object_id] = s.[object_id]

WHERE DocumentMain.DocumentStatusCode = 40

AND     DocumentMain.DocumentTypeCode = 'BOD'

AND     s.[definition] LIKE '%Name_Fin%' -- Table name you are looking for
```

Order by DocumentMain.DocumentName

The following query lists all business objects and the schema (tables or views) they reference, in order by the referenced schema:

```
SELECT d.DocumentName AS [BOName], o.[name] as [BOView],
    CASE WHEN CHARINDEX(' WHERE ', m.[definition]) = 0
      THEN SUBSTRING(m.[definition], CHARINDEX(' FROM ', m.[definition]) + 6, LEN(m.[definition]) - 5)
      ELSE SUBSTRING(m.[definition], CHARINDEX(' FROM ', m.[definition]) + 6,
            CHARINDEX(' WHERE ', m.[definition]) - CHARINDEX(' FROM ', m.[definition]) - 5)
    END AS [ReferencedSchema]
 FROM DocumentMain d
    INNER JOIN sys.objects o ON 'vBo' + d.DocumentName = o.[name]
    INNER JOIN sys.sql_modules m ON o.[object_id] = m.[object_id]
WHERE d.DocumentTypeCode = 'BOD' and d.DocumentStatusCode = 40
ORDER BY [ReferencedSchema]
```

Document System

The Document System is the web-based document management system for your entire iMIS system, providing unified management, versioning, and security of your organizational content assets. It lets you view and maintain the full range of definition objects for iMIS:

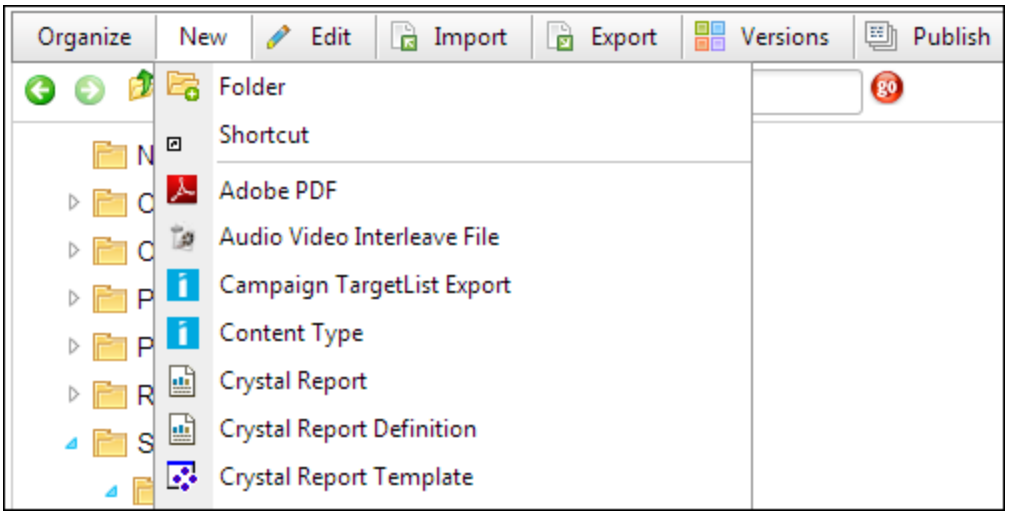
- Business objects, used by Business Object Designer (BOD)
- Queries, used by Intelligent Query Architect (IQA)
- Workflow definitions
- Reports
- HTML files and Microsoft Word files, used for mail merge output

Filtered views

When you use the Document System, you see every type of object (document), but when you see the Document Browser throughout the rest of iMIS, the view is filtered to show you only what you need for that situation. For example, when working with IQA, the Document Browser only shows you queries. In the same way, toolbar commands such as New are filtered so that, when you are working in Business Object Designer, you can create only business objects.

Shortcuts

In the Document System, you can move and copy objects and folders to other folders. Beyond this, you can also create a virtual link (alias) in one folder that points to another object or folder, which keeps you from duplicating objects or folders that you want to share in different contexts.



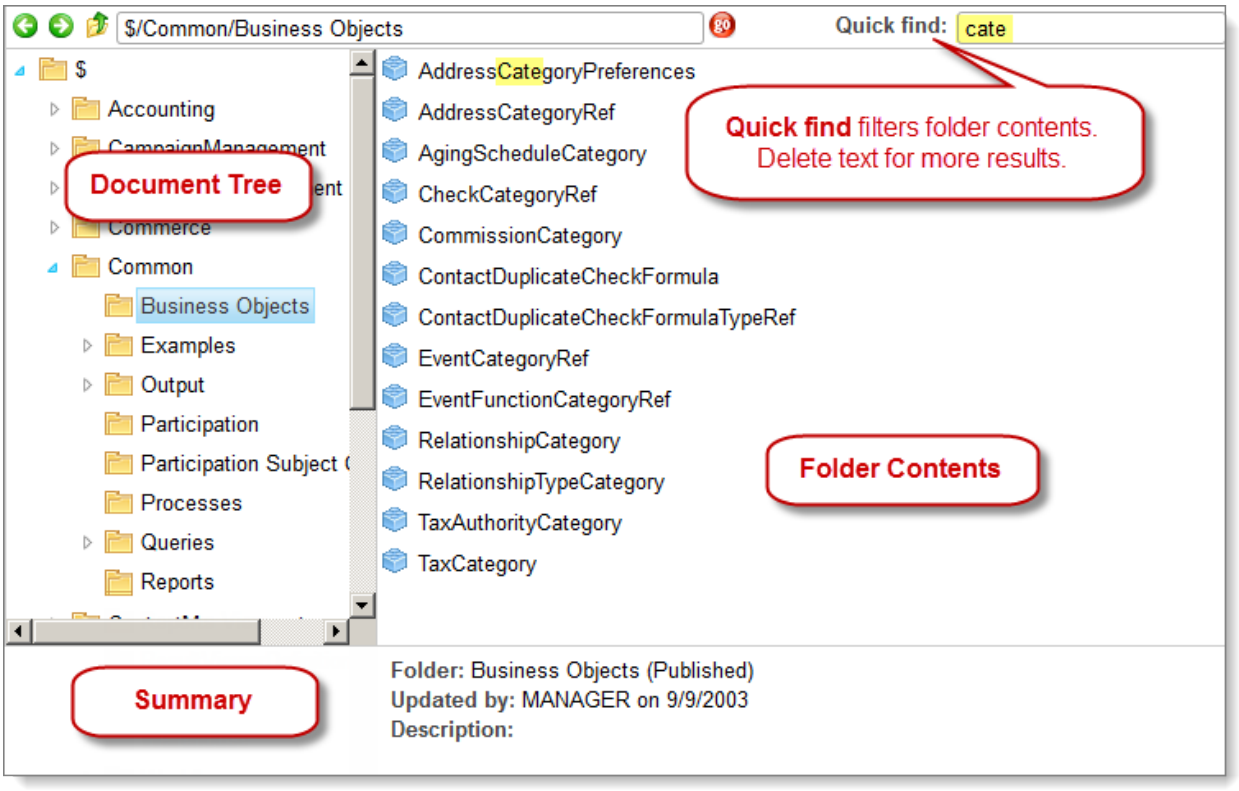
Security access

iMIS users that belong to the SysAdmin security role can see and maintain all definition objects that exist in the Document System. Users who do not belong to the SysAdmin role see a more limited set of definition objects that is determined by the security privileges (see "Setting security access for folders and objects") that are set on each object or on each folder that contains objects.

For example, you can limit the visibility of an entire folder and its definition objects to a specific user-defined security role such as Fundraising Users. Alternatively, you could define that same folder to be visible to Everyone, but limit a few definition objects in that folder to be visible only to Fundraising Users.

Document Browser

Selecting Tools > Document System opens the Document System, which has a toolbar at the top and the three-pane Document Browser below it:



The Document Browser also appears throughout iMIS for locating relevant objects, which it does by filtering the view so that you only see folders and objects that are appropriate for your current task. The Document Browser always appears with these three panes:

1. Document tree (left pane): displays all folders that are relevant to the context in which the Document System is displayed.
2. Folder contents (right pane): displays the contents of the folder that is selected in the document tree area. Folder contents can comprise definition objects, subfolders, or links to items that are located in a different folder.

   Tip: The Quick find box dynamically filters the folder contents, to help you to find items quickly when there are large numbers in the folder. Delete text to see more results. In Desktop, press F12 to apply the filtering.
3. Summary (bottom pane): summarizes the basic properties of the item that is selected in the folder contents area. To show or hide the summary area, select Organize > Display Summary.

Managing document folders

The document tree area of the Document System lists the folders available in the current view of the Document System. The folders that are visible depend on the roles and groups assigned to your user record as well as by what feature of iMIS you are using. The full extent of the folders available in the Document System can be seen only by SysAdmins.

Multiple hierarchies, different roots

There are several Document System hierarchies, each used for different areas of iMIS:

- $/ – Business Object Designer (BOD) has its own hierarchy of business objects. The root is represented by a $ character.
- @/ – Content folders and content records exist in their own hierarchy. The root is represented by a @ character.
- ~/ – Sitemaps each exist as their own hierarchy. The roots are represented by ~ characters.
- $/– All other definition objects exist in the main Document System hierarchy, portions of which are also exposed in other features of iMIS. The root is represented by a $ character.

Tasks that you can perform

- Click an item to select it for use with a toolbar command and to display a read-only summary of its basic properties in the summary area.
- Double-click a folder to open the folder and display its contents.

Toolbar behavior when folders are selected

When a folder in the document tree area is selected, the toolbar commands behave as follows:

- Organize > Refresh refreshes the document tree.
- Organize > Cut, Organize > Copy, and Organize > Paste enable you to copy or move entire folders, including all of their descendants. The cut or copied folder and all of its descendants are placed inside the folder that is selected when you use the Organize > Paste command.
- Organize > Select All selects all contents within the selected folder.
- Organize > Delete moves the selected folder and all of its descendants to the Recycle Bin.
- Organize > Properties shows a read-only summary of the selected folder's basic properties.
- Organize > Display Summary shows or hides the summary panel for the object selected.
- New displays a drop-down list from which you can choose a new folder or definition object type to create in the selected folder. When you select an object type, a properties window appears in which you can define the object. The object types shown in the drop-down list are determined by the properties of the selected folder, which you can examine by using the Edit toolbar command.
- Edit opens a window that enables you to edit the definition of the selected folder.
- Import imports an external XML file (created by the Export command on a different iMIS database) into objects in the Document System. (You cannot use Export and Import to make copies of objects within the same iMIS database.)

  The Upload button reads the XML file contents and displays a list of the definition objects that were exported to the XML file. You can select which of the objects to import, and whether to overwrite objects with the same database GUID in the destination folder or to create new copies of the objects. You can also opt to import the objects to the folder from which they were originally exported, or to override that default destination with the selected folder.

For versioned document types, if a newer version of the object exists in the Document System, then the newer version is not overwritten during the import. Instead, the imported object is added as an archived version of the object. To replace the newer version of the object with the imported object, select Versions from the toolbar, choose the correct version, and click Revert.

- Export exports all selected folders and definition objects into a single XML file, which can later be used to import those objects into the same folder or a different folder in a different iMIS database. (You cannot use Export and Import to make copies of objects within the same iMIS database. To make copies, use Organize > Copy and Organize > Paste.)
- Versions displays a list of the existing versions of the folder, from which you can:
- Export a specific version to an XML file.
- Purge a specific version from the version list, removing all traces of that version from the system.
- Copy a specific version to a new folder with a different name.
- Create a new version based on any existing version by selecting the version, clicking Revert (which creates a new working version), and then publish the working version. If you make no changes to the working version you are effectively reverting to the state of the selected version, although technically it becomes a more recent version in the list of versions.
- Run cannot be used in this context. You must use this command from the folder contents area.
- Publish transforms all working versions of the descendant definition objects in the selected folder into published versions of those objects. Only the most recent published version (of a versionable object) is actively used by the system. You must select the Publish children as well? checkbox when publishing a folder.

To manage folders and objects in the Recycle Bin

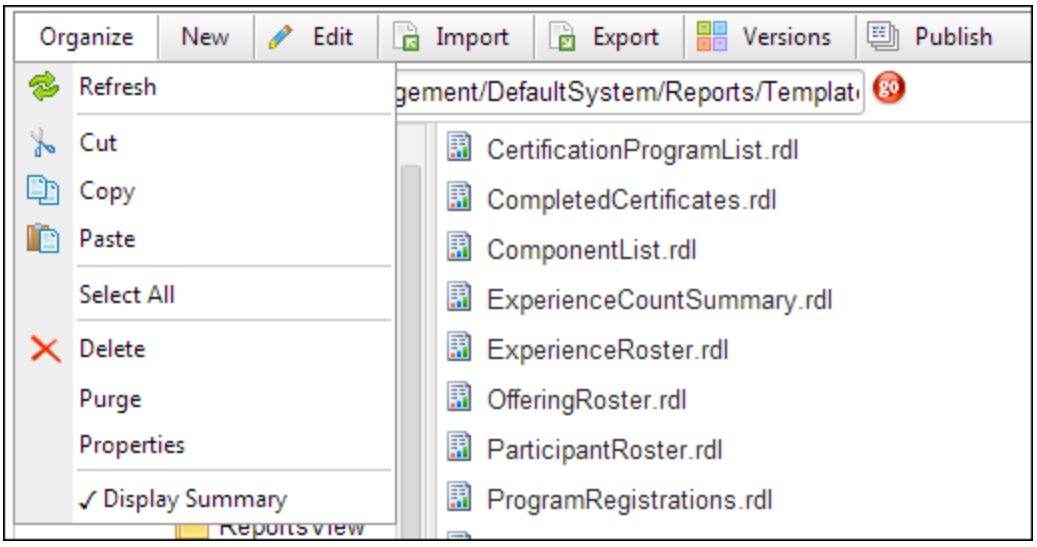
Folders and definition objects that have been deleted are moved to the Recycle Bin at the bottom of the Document System hierarchy.

- To permanently delete individual folders and definition objects that you do not think you'll ever need again, select an object listed in the recycle bin and from the toolbar choose Organize > Purge. To permanently delete the entire contents of the recycle bin, select the Recycle Bin itself and from the toolbar choose Organize > Empty the Recycle Bin.
- To restore a deleted definition object, select it and from the toolbar choose Versions. In the version history that appears, click the Recycled version at the top of the list and click Revert. The definition object is moved to its original parent folder in the hierarchy, and its status changes to Working. You must then re-publish the definition object to make it active again.

> **Note:** Note: If the definition object's original parent folder no longer exists, the restored object is placed in the root folder of the Document System hierarchy. You must move it out of the root into another folder before you'll be able to publish the object.

Managing folder contents

The folder contents area of the Document System lists the definition objects, subfolders, and links that are stored in the folder selected in the document tree area.



Example of the folder contents area of the Document System

Tasks that you can perform

- Click an item to select it for use with a toolbar command and to display a read-only summary of its basic properties in the summary area.
- Select multiple items for use with a toolbar command or right-click command by holding down Shift or Ctrl while clicking each item. The last object you select is the one whose properties are displayed in the summary area.
- Double-click a definition object to perform one of the following actions (depends on the type of object):
- Open a properties window that enables you to edit the definition of the object.
- Open the Document Utility.
- Double-click a folder to open the folder and display its contents.

Toolbar behavior when items are selected

When an item in the folder contents area is selected, the toolbar commands behave as follows:

- Organize > Refresh refreshes the document tree.
- Organize > Cut, Organize > Copy, and Organize > Paste enable you to copy or move the selected definition objects. The cut or copied objects are placed inside the folder that is selected when you use the Organize > Paste command.
- Organize > Select All selects all contents within the folder.
- Organize > Delete moves the selected objects to the Recycle Bin.
- Organize > Properties shows a read-only summary of the selected object's basic properties.
- Organize > Display Summary shows or hides the summary panel for the object selected.

- New displays a drop-down list from which you can choose a new folder or definition object type to create. When you select an object type, a properties window appears in which you can define the object. The object types shown in the drop-down list are determined by the properties of the folder in which you are working. You can examine these folder properties by selecting the folder in the document tree area, then choosing the Edit toolbar command.
- Edit opens a window that enables you to edit the definition of the selected folder, object, or of the object to which a selected link points.
- Import imports an external XML file (created by the Export command on a different iMIS database) into objects in the Document System. (You cannot use Export and Import to make copies of objects within the same iMIS database.)

  The Upload button reads the XML file contents and displays a list of the definition objects that were exported to the XML file. You can select which of the objects to import, and whether to overwrite objects with the same database GUID in the destination folder or to create new copies of the objects. You can also opt to import the objects to the folder from which they were originally exported, or to override that default destination with the current folder.
- Export exports all selected folders and definition objects into a single XML file, which you can use later to import those objects into the same folder or a different folder in a different iMIS database. (You cannot use Export and Import to make copies of objects within the same iMIS database; to make copies, use Organize > Copy and Organize > Paste.)
- Versions displays a list of the existing versions of a versionable object, from which you can:
- Export a specific version to an XML file.
- Purge a specific version from the version list, removing all traces of that version from the system.
- Copy a specific version to a new definition object with a different name.

- Create a new version based on any existing version by selecting the version, clicking Revert (which creates a new working version), and then publish the working version. If you make no changes to the working version, you are effectively reverting to the state of the selected version, although technically it becomes a more recent version in the list of versions.
- Run executes a selected query, report, or other object types that are designed to be run.

  Note: If the selected object is an .RDL report file, click Run to open the report in a new window.
- Download the selected object (PDF, .DOC, or .XLS file). You can open the file in its assigned editor.
- Preview displays a fully rendered view of the selected navigation item, content record, or other CM object types that are designed to be previewed.
- Publish transforms a working version of an object into a published version. Only the most recent published version (of a versionable object) is used actively by the system.

Virtual linking among folders

Many Document System folders in iMIS contain a default virtual link to the Common > Shared Documents folder, which is the central location for definition objects that are available without restriction to all staff users. These virtual links enable users who are given only limited access to the Document System functionality to easily navigate back to the top of the Shared Documents sub-tree.

> **Note:** Caution! These default virtual links to the Shared Documents folder can be deleted by any user that belongs to the SysAdmin role.

There are also some hard-coded virtual links within the Document System, which exposes specific folders in various locations throughout the iMIS interface.

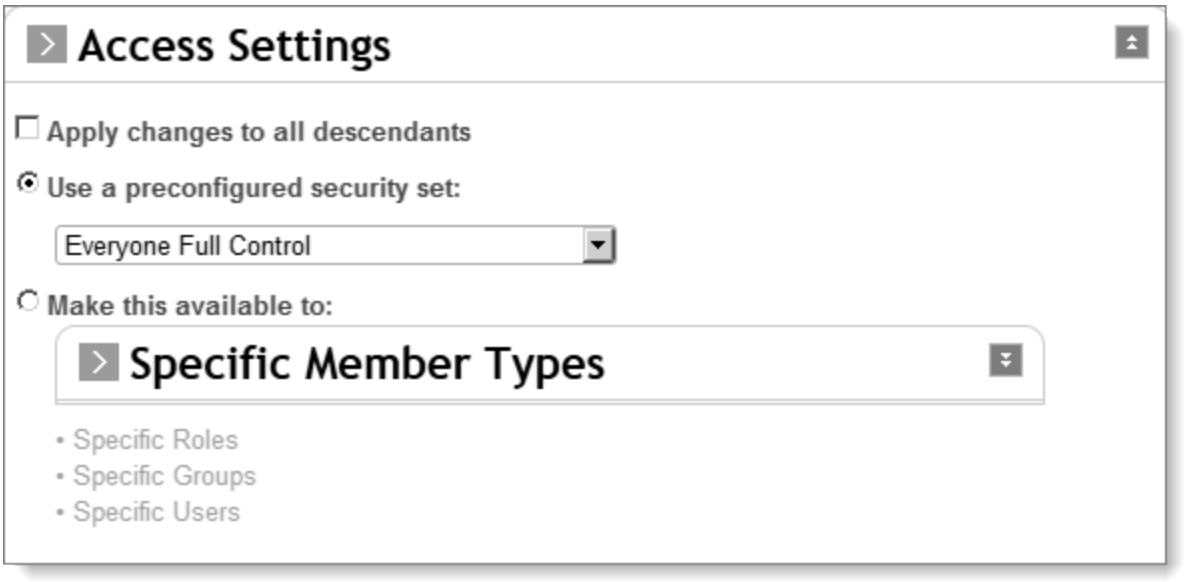
CampaignManagement >	Marketing > Campaign Management > Generate Reports

DefaultSystem > Reports View	
Common > Output	Marketing > View Output
Common > Shared Documents	Marketing > Campaign Management > select a source code > Source Lists tab > from Select Type drop-down list, choose Query
	Marketing > Segmentation > select a segment job > Definition tab > in Universe field click Shortcut to queries
	Marketing > Segmentation > select a segment job > Segments tab > select a segment > in Population field click Shortcut to queries
	Tools > Document system > New Object > Project Process Outputs > Definition tab > in Query field click …
Common > Shared Documents > Processes	Marketing > Inserts > select an insert > Definition tab > in Output Process field click Browse for Process Engine
	Process Mgr > Set up module > Action Plans tab > select an action plan > select an email notification > in Process Name field click …
Common > Shared Documents > ReportsView	Home page (Desktop view) > Generate Reports
ContactManagement > DefaultSystem > Queries > Advanced > Contact	Home page (Desktop view) > Advanced Queries > Contacts
	Customers > Advanced Queries > Contacts
ContactManagement > DefaultSystem > Queries > Advanced > Prospect	Home page (Desktop view) > Advanced Queries > Prospects
	Customers > Advanced Queries > Prospects
EventManagement > DefaultSystem > Queries >	Home page (Desktop view) > Advanced Queries > Events

Advanced > Event	Events > Advanced Queries
OpportunityManagement > DefaultSystem > ReportsView	Process Mgr > Generate Reports
OrderManagement > DefaultSystem > Queries > Advanced > Order	Home page (Desktop view) > Advanced Queries > Orders Orders > Advanced Queries
RFMAnalysis > DefaultSystem > ReportsView	Marketing > RFM Analytics > Generate Reports
RFMAnalysis > DefaultSystem > Process Engines	Marketing > RFM Analytics
RFMAnalysis > DefaultSystem > Process Engines > User Queries	Marketing > RFM Analytics > edit an RFM definition object > Definition tab > in Population Query or Transaction Query fields click Shortcut to queries
SegmentManagement > DefaultSystem > ReportsView	Marketing > Segmentation > Generate Reports

Using Access Settings

Access Settings give you a consistent way to apply security (grant permissions) to folders and objects throughout iMIS: entire websites, individual navigation items, content records, queries, business objects, and the wide array of objects that you can define, import, and store in the Document System.



Access Settings are immensely flexible: they let you tie an object's permissions to iMIS security roles, security groups, specific users, member types, or your organization's staff (licensed iMIS users).

> **Note:** Tip: You can meet most of your needs using the preconfigured security sets that ship with iMIS, so become familiar with those.

- Apply changes to all descendants – (Document System folder objects) Changes to this section, when saved, flow automatically to all descendant definition objects. When cleared, changes to this section apply only to the current definition object.
- Use a preconfigured security set - Specifies a preconfigured security configuration to use for this definition object, which is the default and preferred way to set permissions for definition objects. You can see the specific permissions that make up the security set in the Make this available to area.

  Tip: If a preconfigured security set is close to what you need, select it and then select Make this available to, so that the permissions granted by the security set are copied for you to work from.
- Make this available to - Lists the roles, groups, users, member types, or authorization levels that may define or view rendered output from this object. If none of the

preconfigured security configurations meets your needs, you can set custom permissions here.

The SysAdmin, Content Administrator, and Everyone roles are default system-defined security roles that are assigned to every definition object. The SysAdmin role is assigned in the definition of an iMIS user record, but the Content Administrator role is automatically assigned to every iMIS user who is a member of a content authority group (CAG) that is designated as a Master Admin CAG.

The permissions that can be assigned to each entry in the list are:

- Full Control - Enables all of the following permissions.
- Read - Enables users to see this object both in definition windows and as rendered output in websites, but they cannot change the object's definition.
- Add - Enables users to create new objects, or to paste or import an object into the Document System.
- Edit - Enables users to edit this object's definition, but not to delete the object.
- Delete - Enables users to delete this object.
- Select - Enables users to assign a tag to content folders and content records.

Custom security groups (use sparingly)

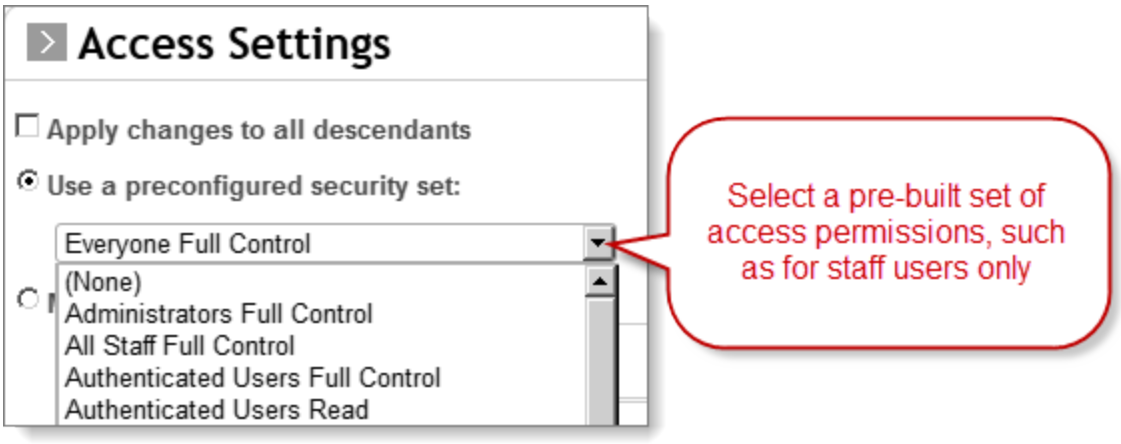
You can add/remove specific Roles, Groups, and Users and assign them each a specific set of permissions. Making this type of change to the security for an object results in a new unique AccessKey for the specified Access List permissions.

You can create a custom security group by tweaking a predefined group or building your own from scratch (using the Make available to radio button). While a custom security group offers great flexibility, it jeopardizes performance, because it adds several rows per object. If the security tables get too large (given that they are joined on every query), your system can slow significantly.

> **Note:** Caution! To minimize performance impacts, avoid using custom security groups where their effect multiplies: folders, Navigation items, and all children the same (unless you are using shared security, or it is mission-critical).

Preconfigured security sets

Throughout iMIS, whenever you configure Access Settings, you see a drop-down list of available security settings that you can apply to individual folders and objects. These security sets offer you easier control and faster iMIS performance than defining custom ones.



These are the key security sets you should use, from most permissive to least:

- Everyone * – no restrictions, including the public (if they can access this level/context).
- Authenticated Users * – restricts access to users who are signed in (both staff and public members).
- * Staff * – restricts access to users by licensing: Full Staff Full Control limits to Full users, Casual Staff Full Control limits to Casual users, and All Staff Full Control limits to Full and Casual users.
- Administrators * – restricts access to users with the SysAdmin role.

> **Note:** Tip: If you do not have the feature named in the security set (such as Certification), do not use the set.

iMIS ships with these pre-built security sets to cut down on the customization you need, for objects that should be neither unsecured (Share) nor locked for you alone (Private). Each security set contains a predefined Access List and permissions (Full Control, Read, Add, Delete, Edit) that are constant for all objects that use it. A Select permission is also available for tagged objects.

When you choose a set, the Current Access List below it updates to show the settings it includes. Look at those details to decide if the selected security set has the permissions you need.

Feature-specific default security

Most feature-specific security sets have three levels (Admin, Manager, User), each of which allows access for any level above it. For example, "Certification Users" grants access for Managers and Admins as well. Note that you can define your own access settings based on User-level security: Roles and Groups.

For example, applying Segmentation Job Default Access security means that

- users in the "SegAdmin" group get control privileges
- users in the "SegMgr" group get Read+Add+Edit+Delete privileges
- users in the "SegUser" group get Read-only privileges
- users in the "SysAdmin" role get control privileges

Setting access for folders and objects

iMIS SysAdmins have Full Control access to all folders and objects in the Document System, so they can also define security privileges for every folder and object.

Caution

- New folders have unrestricted access: When a new folder is created, the Everyone role is granted Full Control by default.
- Folder permissions are not the same as per-object permissions: you can set Control/Read/Add/Edit/Delete privileges individually for most definition object types in the Security page of its properties window, independent of the folder.
- IQA folders are special: Certain folders within the Document System are exposed through the IQA task list item in Customers, Events, Billing, Fundraising, and Orders. These folders and all sub-folders that they contain behave differently when viewed from the IQA task list item:
- You can create only queries in these folders even if the folder is defined to allow any type of definition object. Only members of the SysAdmin role who edit these folders from Tools > Document System can create the other types of allowable objects.
- If any user modifies the folder definition to disallow the creation of Query objects, the folder and all of its contents become invisible from within an IQA task list item. Only members of the SysAdmin role who are viewing the entire Document System via Tools > Document System are subsequently able to see the folder.

To define security access for a folder

1. In the Document System, select a folder and click the Edit toolbar command.
2. In the Only allow certain types of objects in the folder? area, specify the objects to be allowed in the folder.

   Multi-select object types from the list by holding Shift or Ctrl while clicking items in the list.
3. For the Access Settings, select Private or else select Use a preconfigured security set and select a set from the list, if any apply.

   Tip: For best performance, use Preconfigured security sets.
4. If you need custom access settings, enable Make this available to and complete the panel.

- For Specific Roles, select the checkbox for each system-defined role that should have access to the folder. For each role, you can click the Edit icon next to the role name to define the specific privileges for that role.
- For Specific Groups and Specific Users areas, add the groups and users that should have access to this folder, and click the Edit icon next to each entry to define the specific privileges for that entry.

5. At the bottom of the folder security definition window, click Save to commit the changes.

Workflow

You can use RiSE to view the workflow queue. You can view workflow queue items that are currently running or that are waiting to be run. You can also view failed workflow queue items and delete or reschedule any failed workflow queue items.

Note: Note: If multiple workflow processes are queued, processing of these items will continue until all workflow services associated with the database are stopped.

Workflow engine

Understanding process workflows

Throughout iMIS, there are many examples of workflow processes:

- Processing orders through order entry, confirmation, approval, shipping, shipping notification, invoicing
- Processing a member application
- Signing up an exhibitor and following and tracking the process through the various contracts and order requirements
- Processing opportunities
- Issue Management
- Marketing campaigns
- Timed responses to inactivity
- Multi-part mailings: Letters and labels to go with the letters

These are examples of what we will call process workflow and generally are thought of as persistent workflows, which might take a few minutes, days, or even months to complete.

Workflows typically:

- Have an ownership structure.
- Are related to a specific parent object, like an order, complaint, and so on.
- Have a set of tasks that must be executed according to business rules.

Workflow engine components

To deal with this pattern of needs on a consistent basis, iMIS provides a Workflow Engine.

There are two primary components of the workflow engine:

- Process Definition Rules – Process definitions list all of the tasks for the workflow as well as the rules as to when the tasks are to be executed, and what the subsequent actions are to be initiated upon task completion. Tasks need not all execute serially. For instance, a workflow might have a step that requires approval from multiple sources, not necessarily sequentially.
- Workflow Instances – Workflow instances are the actual workflows in action. Workflows might carry their own process definition rules within, or might simply refer to the standard definition for the workflow type. When rules are carried by the workflow, they might be constructed or modified dynamically by applications. Workflow instances have one or more owners with specific roles.

How iMIS workflows work

As workflows progress and workflow rules are interpreted, work items (or tasks) are generated. Tasks are generally assigned to specific individuals or process queues. Automatic processes are executed without human intervention. People-oriented queues show as tasks to your users. Tasks are never deleted; they are only marked complete. Tasks record time and, in some cases, effort for completion. The analysis of task data performance data can be a good source of information for process improvement.

The workflow itself can carry state data, document attachments, references to customers and their roles.

Workflows can run totally off their static definitions, or be created or modified by runtime processes.

Workflows are always used for system processes such as print invoices, print AR statements, and so on. Since workflows are extensible, field users can add or subtract steps to these processes. Workflows are used to move most all of the older hard-coded processes like print invoice, convert order, do due billing run from hard-coded processes to extensible processes and allow installers to mold these processes to customer needs in a consistent way.

Workflows can be executed in a number of environments. They can run silently in the background as queues of work are worked off by the workflow engine's background and scheduled processes, or can be run interactively. In the interactive situation, a standard dialog, similar to an installer dialog, displays progress and asks for intervention as required.

An initial implementation of the workflow engine exists in Process Manager. However, that implementation did not implement business rules or automatic application execution.

Process engine

Understanding list-based processes

Another common pattern in iMIS is the situation in which there is a list of objects (1-n), where you would like a particular process to be performed across the list. Examples of this pattern:

List	<—	Process	Template
Subscription Group	>	Print a Crystal report	Report.rpt
		Print an HTML Report	XSL template
IQA Query		Print Labels	Labels.rpt
		Send an e-mail	Letter template
Individual person		Send best available of: report, fax, or e-mail	Customer parameters, report/letter templates
		Create a subscription group	Group, role, etc.
		Register people for a event	Event, standard functions
		Transmit to another site	Custom parameters
		Add list to a marketing campaign	Campaign information
		Render a web roster	XSL Template
		Exchange Export	Custom parameters
		Specialized exports	As Needed

Though there are many occurrences of this pattern, perhaps it would be helpful to isolate our study of this problem to the single situation of an ad hoc query tool. Typical tasks could include:

- creating a query that selects a particular group of customers
- sending something to the list: perhaps an e-mail, a letter, a fax, or add them to a marketing campaign (a subscription group)
- naming or editing our own letter or e-mail template
- scheduling for subsequent execution

We would also like to be able to carry out these types of processes over time on or to new types of processes, without having to update our query selection tool constantly.

Process engine services

Our implementations that deal with this pattern are known as Process engines. Process engines are generally services, encapsulated in objects that are sub classed upon the base Process Engine.

Process Engines must inherit the base process engine class and provide a few basic services (methods).

- On demand, they must supply a visual template editor which is sub classed from the Process Engine Template base class. The template editor interacts to select or define a template specific to the type of process. For instance:
- Crystal reports template editor allows a user to specify the location of a crystal report and any parameters that will be needed to execute the report.
- Mail merge process engines specify or define on the fly a mail-merge template.
- A multi-output process engine may specify the rules about when to choose which media type and what letter templates will be used. A multi-output process engine is an application that receives an initial input then delegates subsets of the input list downstream to other process engines.
- Provides standard methods to execute a process, monitor progress, log errors, and report results.

  Process Engine objects are frequently bound to query objects. Template Process Engine objects (such as a process engine for Crystal Reports but no report specified), and specific process engines (such as a process engine for a specific Crystal report), are generally persisted in document libraries with or without bound query objects that, in term, provides a catalog of available processes to users and administrators. In fact, process engines bound to query objects present a major part of the iMIS application to user, especially for the standard and ad hoc reports users use continuously.

  Process Engine objects with bound query objects are frequently queued as tasks within a workflow for subsequent execution. Multiple process object tasks can be included into a single workflow for report sets or multi-step processes.

  Example process engines

- Crystal reports
- XSL/HTML reports
- E-mail system
- Word Merge
- Create subscription group from query
- Add people to marketing campaign (same as above)
- Register people from query
- Multi-output process engine

  Uses for process engines (with bound query objects)
- Data-oriented web pages
- Reports and the report catalogs
- Dues billing run definitions

Task Viewer

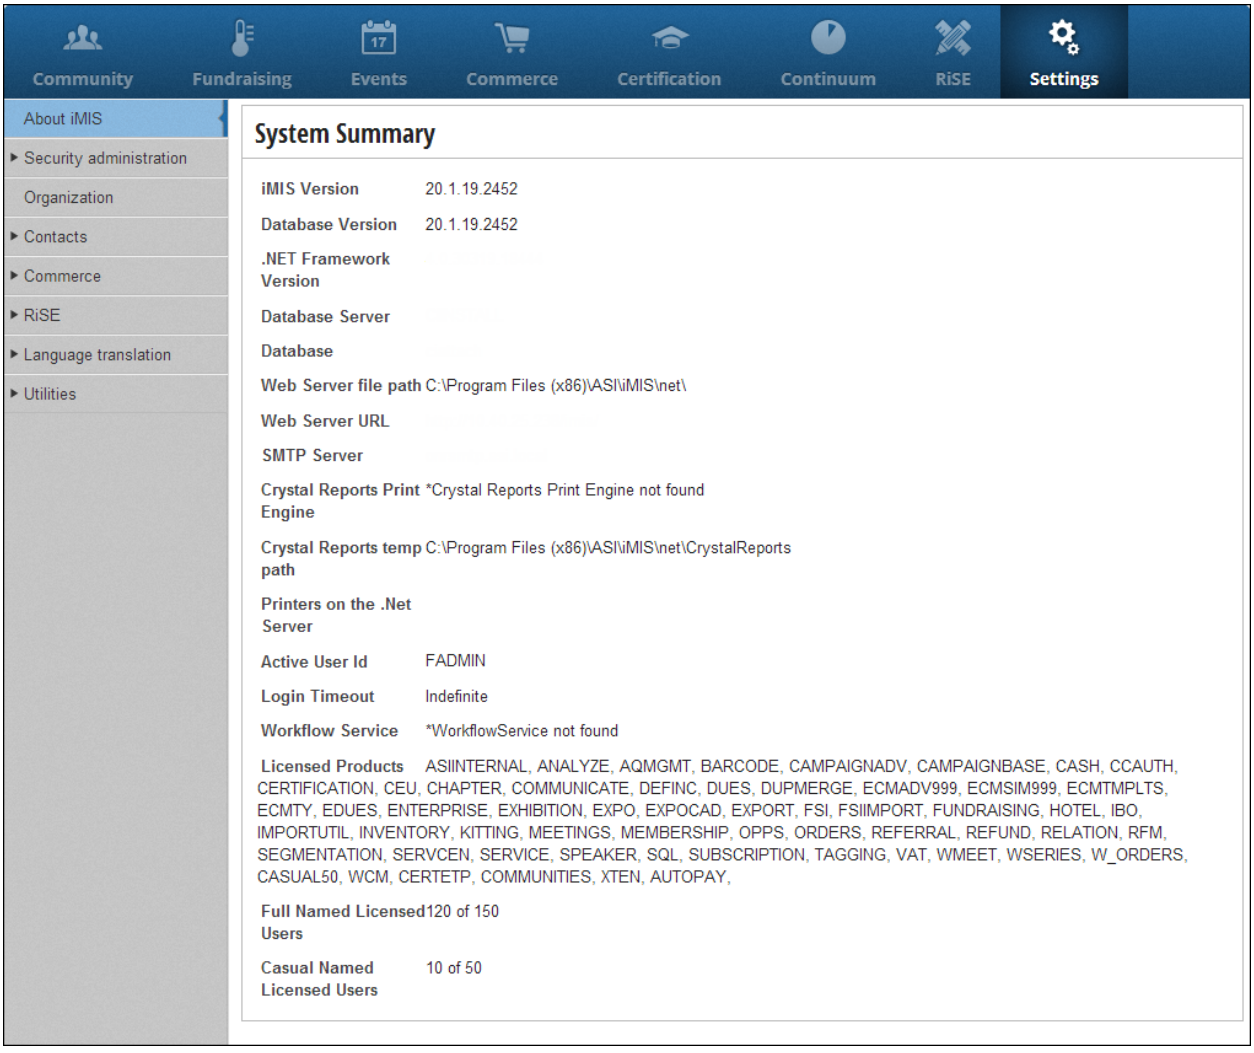
You can use the Task Viewer to view, edit, delete, and add tasks.

Tips for managing tasks

- You can access the Task Viewer from your Home page or RiSE. To access tasks from your Home page, select Home and select View tasks.
- Any user can modify the status of any task at any time, even if the task has already been completed.
- By default, a task can only be seen by its creator, an administrator, or a user who has been assigned the task.
- By default, only tasks that are currently in progress display. You can view completed tasks if needed.
- When adding more than one task, you must save and close the window after adding each task.

Settings

The Staff site Settings page provides an overview of your system' s licenses and configurations. From the Settings navigation, you are also able to set system-wide preferences from the web for things like contact security, payment gateways, and language translation settings.



Security administration

Security Administration provides options for administering user records and the roles you can associate with user records.

> **Note:** Note: To administer user records and roles, your User Credentials must include the SysAdmin role.

Logons and authorization persistence

Following is information to help you control user logon behavior and troubleshoot logon issues.

Conflicts from shared Windows logins

iMIS employs the ASP.NET login controls and uses HTTP cookies for state information. If two different iMIS users share the same Microsoft Windows login on the same client system, iMIS features that use cookie data may appear to confuse one user with the other. To avoid this problem, always ensure that every iMIS user has a unique Windows login.

Authorization persistence: web clients

By default, web client users can make their authentication record authorization persistent. To disable this option, edit the Web.config file used for the iMIS application. By contrast, iMIS Advanced Accounting Console users must always log on and be reauthorized each time.

Authorization changes: locating and disabling

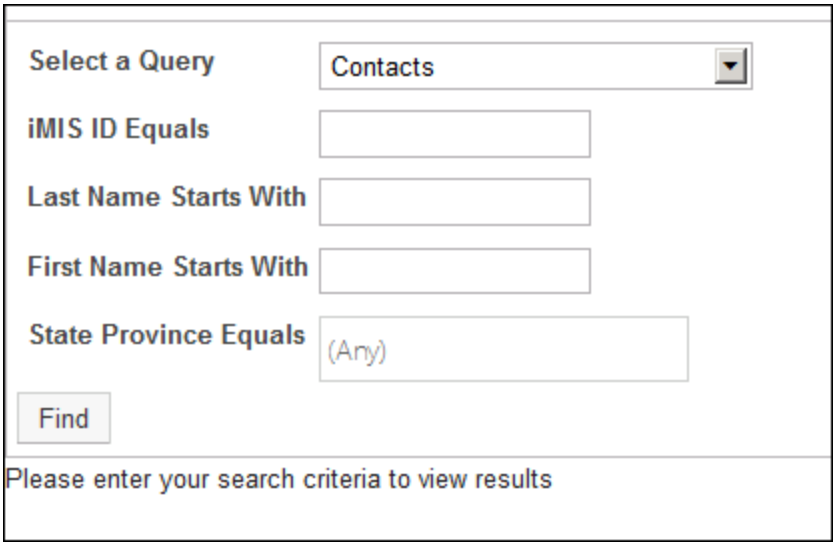
By default, users are allowed to change their password, but not the logon information. To enable the option to change their logon, edit the content record that contains the Change Logon Password content item and select the checkbox Allow username change. The option to change their password can be enabled or disabled in the same way.

- All users, Casual, Public, and Full, can change their own logon name and password through the My Account page.
- Full users who belong to the SysAdmin role can change the logon name and password for other users through the Security Administration section of Settings in the Staff site. (Settings > Security administration > Users).

Security administration - Users

Go to Settings > Security administration > Users:

This window provides options for finding contacts or users, and creating and modifying iMIS user records.

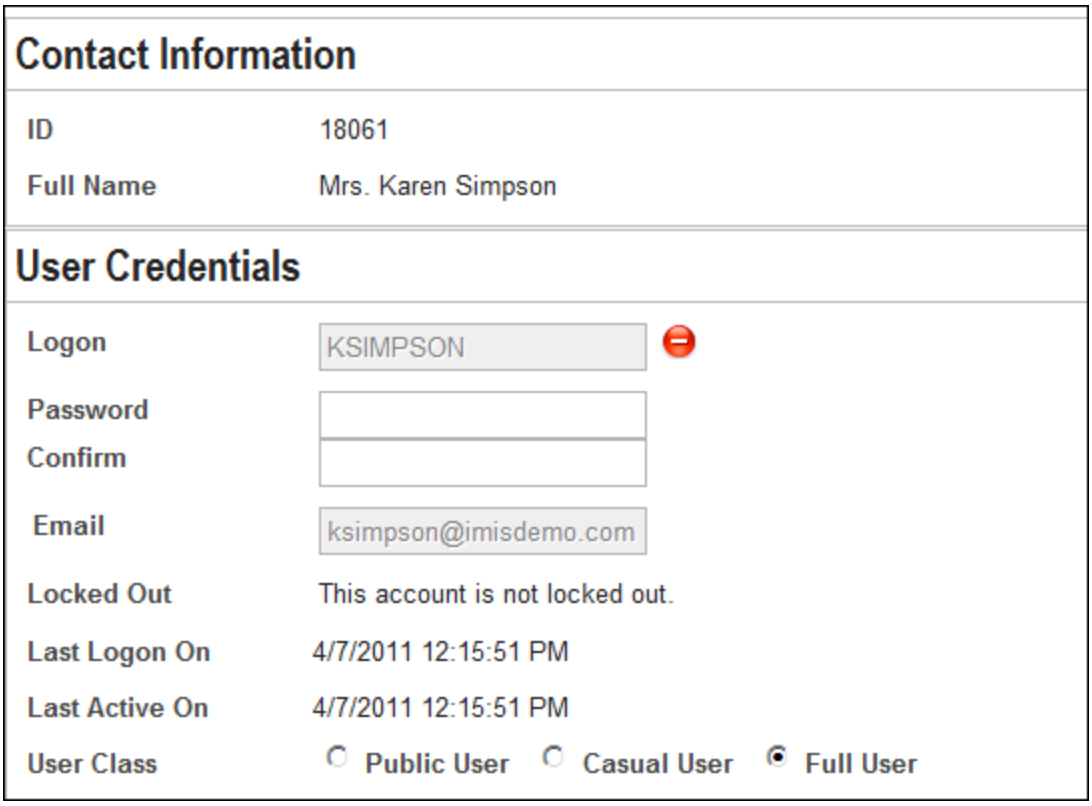


1. From the query drop-down, you can choose to find Contacts, All Full and Casual users, or Users. Depending on the query you select, additional search filters are provided to help you narrow the search results.
2. After you click Find, you can select the record from the search results.

   The contact information displays with three main sections: User Credentials, User Information, and Staff Access.

   User Credentials

   The credentials shown are retrieved from the ASP.NET authentication store. If the contact listed in the Contact Information area is not an iMIS user, the fields in the User Credentials area are empty. To change the logon information, click the red minus (-) icon.



- Logon - Displays this authentication record's logon name, or No User Selected when the authentication record is not linked to a user record.
- Password/Confirm - Input fields for changing an existing password.

  Tip: By default, passwords must contain at least 6 characters. You can change the default password complexity requirements by editing the Web.config file for the iMIS application.
- Email - When you create a new authentication record, if the iMIS contact record includes an email address, iMIS populates the Create User Logon window with that address. However, the value that is displayed in this area of the Users window is always the value that is stored in the ASP.NET authentication store.
- Locked Out - Indicates whether this authentication record is temporarily blocked from gaining access to iMIS.

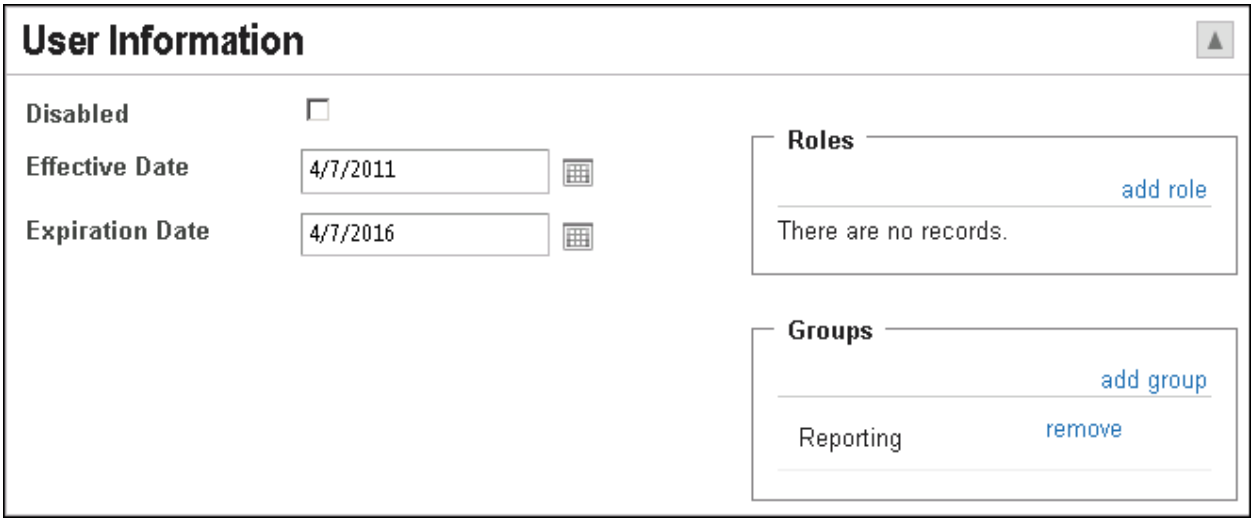
  Tip: By default, iMIS locks out an authentication record after 5 failed attempts to log on. You can change the default by editing the Web.config file for the iMIS application.

- User Class - Specifies the license to apply to this user, which controls all subsequent authorization.

  Note: Only those contacts with the user class of Full User are able to see the Staff Access areas and be assigned to the On Behalf Of role.

  User Information

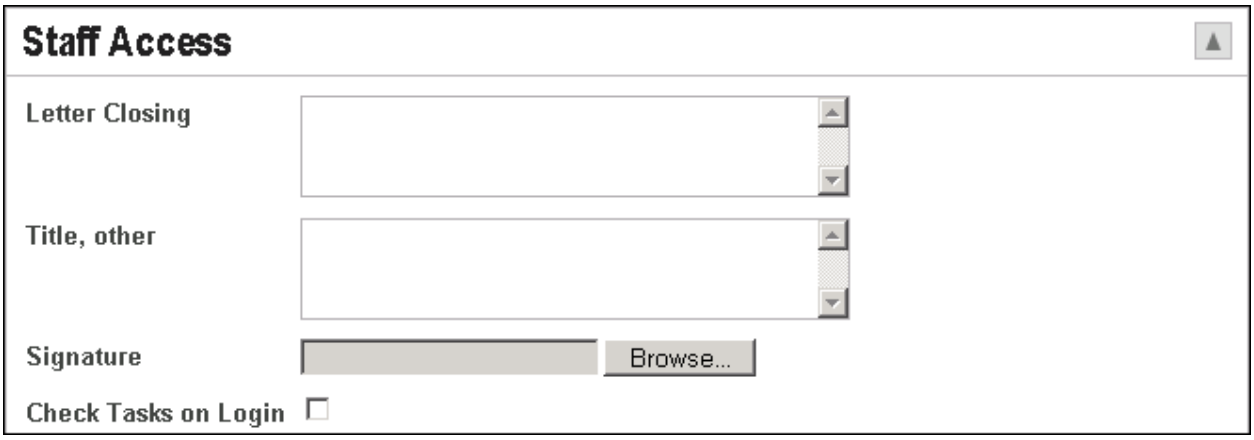
  You can sets the membership dates and assign the user to specific roles and group (see "User-level security: Roles and Groups").



> **Note:** Caution! Do not remove a user's SysAdmin role without also lowering the Sys Mgmt level see About authorization levels: parts of the system that consider them an administrator will conflict with the parts that do not. Make sure they have both or neither.

  Staff Access

  The Staff Access area includes the user information to include on letters sent by the user and authorization levels to functional in iMIS:

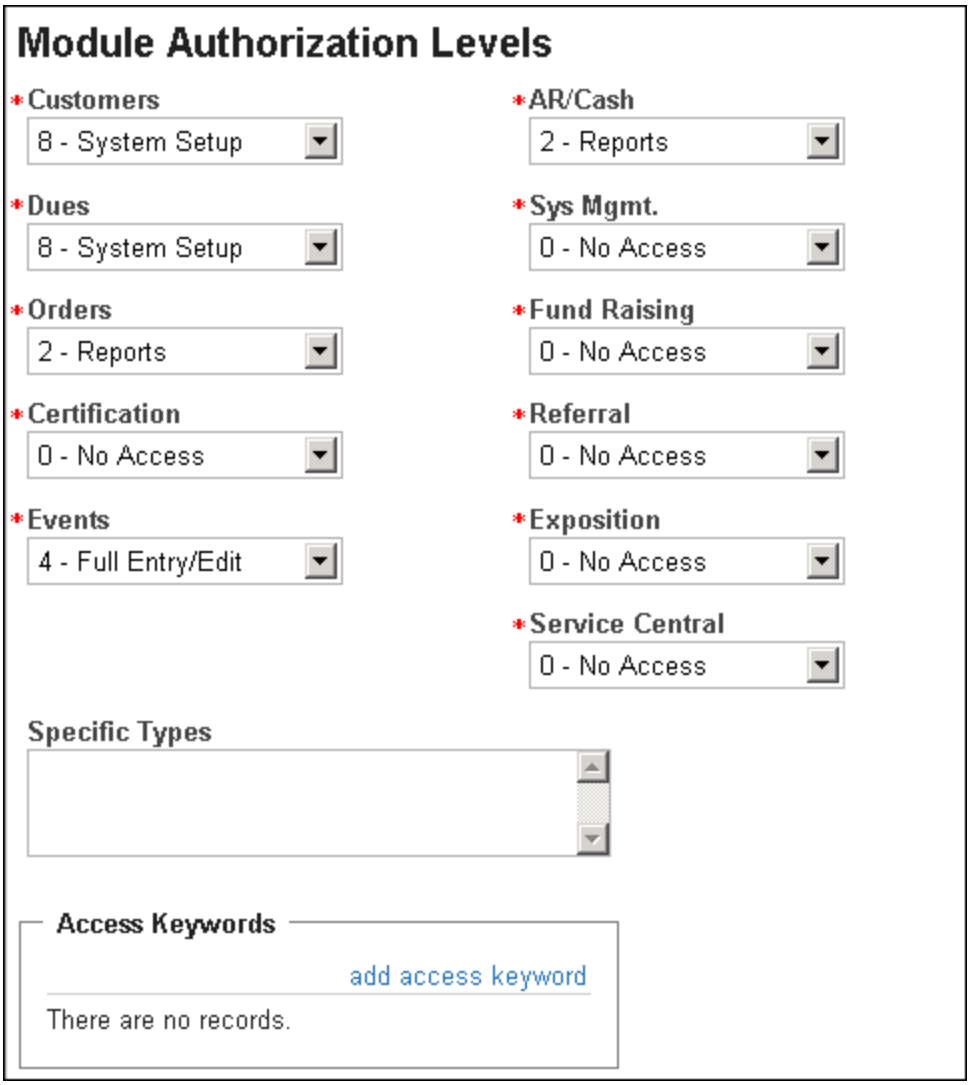


- Letter Closing - The text that closes letters sent by the user. For example, Sincerely.
- Title, other - The user's role, to use in letters. For example, Certification Specialist.
- Signature - An image of the user's signature, to use in letters. The image may be in one of the following formats:
- Microsoft Bitmap (BMP)
- Windows Meta File (WMF)
- Graphics Interchange Format (GIF)
- Portable Network Graphics (PNG)
- JPEG Interchange Format (JPG)

  iMIS converts the image into a BMP file before storing it in the database.
- Check Tasks On Login - Displays the user's View activity tasks window when they first log on. When cleared, displays the standard administrative view instead.

  Module Authorization Levels

  The authorization levels set will determine what functionality the contact will see in iMIS Advanced Accounting Console, which also affects some web features. See authorization access for details.



- Specific Types - Controls the customer types that the user can edit in Customers. The types listed in this field can be edited by this user. For example, if you only want the user to be able to edit records with customer type CM, add CM to the Specific Types field. The user will have read-only access to all other records. Separate customer types with spaces or commas.
- Access Keywords - The access keyword that restrict the user from viewing secured windows, tabs, reports, or windows. Separate access keywords with spaces or commas.

Authorization levels: Staff site (../Staff)

Full and Casual users can access the Staff site based on their authorization levels.

Authorization levels: Community (../Staff)

Roles

Security roles grant specific administrative privileges to user records. For example, one security role might let you use and edit an iMIS definition object in the Document System, while another role might let you use that object but not edit (or even see) its properties.

- CompanyAdministrator
- OnBehalfOf (this role can only be assigned to a Full User)
- SysAdmin

> **Note:** Note: For more information, see Roles.

Groups

The following table describes the security groups that affect user privileges.

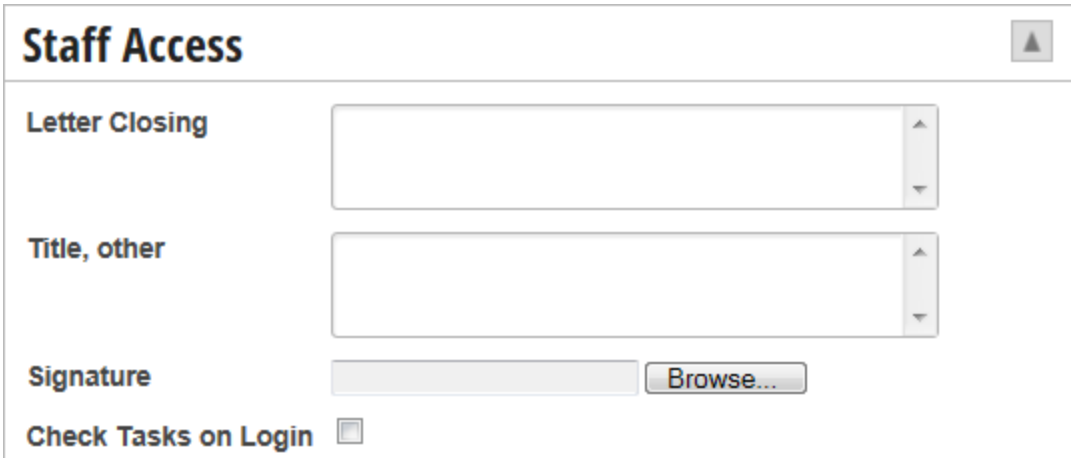
CampaignAdmin	Enables full-control access to the Campaign functionality and its objects
CampaignMgr	Enables read/add/edit/delete access to the Campaign functionality, and read/edit access to its objects
CampaignUser	Enables read-only access to the Campaign functionality and its objects
Certification Admin	Enables full-control access to the Certification functionality and its objects
Certification Manager	Enables read/add/edit/delete access to the Certification functionality, and read/edit access to its objects
Certification User	Enables read-only access to the Certification functionality and its objects
EventUser	Controls security for IQA integration
FRUser	Controls security for IQA integration
OpportunityAdmin	Enables full-control access to Process Manager and its objects
OpportunityCreator	In Process Manager, enables add privileges for projects, and read/edit/delete access to created projects, but read-only access to projects created by others
OpportunityMgr	Enables read/add/edit/delete access to Process Manager, and read/edit access to its objects
OpportunityOwners	Enables addition to a project's Owner or Contact group
OpportunityUser	Enables read-only access to Process Manager and its objects
OrderUser	Controls security for IQA integration
Reporting	Enables access to IQA query links
RFMAdmin	Enables full-control access to the RFM application and its objects
RFMMgr	Enables read/add/edit/delete access to the RFM application, and read/edit access to its objects
RFMUser	Enables read-only access to the RFM functionality and its objects
SegAdmin	Enables full-control access to the Segmentation functionality and its

	objects
SegMgr	Enables read/add/edit/delete access to the Segmentation functionality, and read/edit access to its objects
SegUser	Enables read-only access to the Segmentation functionality and its objects

Staff Access

> **Note:** Note: By default, this section is collapsed. Simply click on the arrow next to Staff Access to expand this section.

Sets options for iMIS Desktop client users:



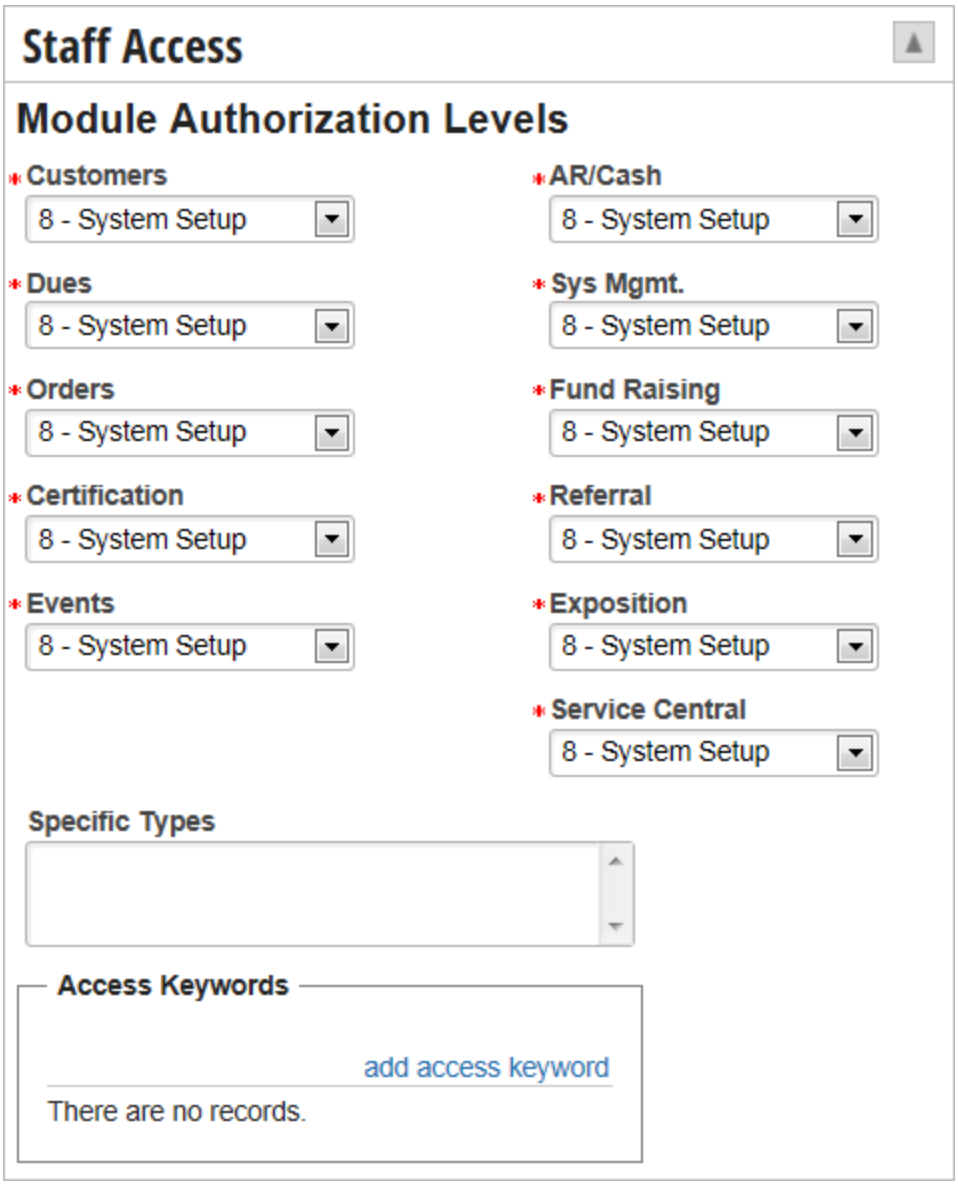
- Letter Closing - The text that closes letters sent by the user. For example, Sincerely.
- Title, other - The user's role, to use in letters. For example, Certification Specialist.
- Signature - An image of the user's signature, to use in letters. The image may be in one of the following formats:
- Microsoft Bitmap (BMP)
- Windows Meta File (WMF)

- Graphics Interchange Format (GIF)
- Portable Network Graphics (PNG)
- JPEG Interchange Format (JPG)

  iMIS converts the image into a BMP file before storing it in the database.

- Check Tasks On Login - Displays the user's View activity tasks window when they first log on. When cleared, displays the standard administrative view instead.

  Sets module authorization access (see Access control) for iMIS Desktop and Advanced Accounting Console users, which also affects some web client behaviors:



- Specific Types - Controls the customer types that the user can edit in Customers. The types listed in this field can be edited by this user. For example, if you only want the user to be able to edit records with customer type CM, add CM to the Specific Types field. The user will have read-only access to all other records. Separate customer types with spaces or commas.
- Access Keywords - The access keywords that restrict the user from viewing secured windows, tabs, reports, or windows. Separate access keywords with spaces or commas.

Roles

Security roles grant specific administrative privileges to user records. In iMIS, there are five system roles that you cannot delete: SysAdmin, CompanyAdministrator, OnBehalfOf, Everyone, and Content Administrator. Additional security roles can be added (Settings > Security administration > Roles).

Two roles are dynamically assigned to users, Everyone and Content Administrator. These roles are hidden and cannot be added to a users' role. The role, Everyone, is assigned to authenticated and guest users. While the role, Content Administrator, is assigned to members of any Master Admin Content Authority Group.

> **Note:** Caution! Do not remove a user's SysAdmin role without also lowering the Sys Mgmt level (see About authorization levels): parts of the system that consider them an administrator will conflict with the parts that do not. Make sure they have both or neither.

	Name	Description	IsSystem	UpdatedOn
select	CompanyAdministrator	Members of this role can administer the records of all contacts associated with the same company.	True	8/28/2007 9:59:54 AM
select	Content Administrator	Member of a Master Admin Content Authority Group	True	9/29/2008 2:27:02 PM
select	Everyone	Everyone	True	2/9/2005 3:40:27 PM
select	OnBehalfOf	Members of this role can perform commerce transactions on behalf of other contacts	True	10/13/2011 2:29:33 PM
select	SysAdmin	Administrators	True	2/9/2005 3:40:27 PM

From RiSE, select Security administration > Roles

Company Administrator Role

The Company Administrator for an organization can manage organization profile information, manage the roster, view and update account information for organization members, and register members for events, and manage billing for the organization. A

member of an organization can be designated as the Company Administrator by a staff user.

Managing organization profile information and roster

When Company Administrators view the profile page for their organization, they have the ability to update account and profile details that appear. This includes the organization name, addresses, and public profile details.

They can also update the organization roster that appears in the profile page. They can remove members from the organization or update a member's role. They can also add new contacts to the roster. They cannot, however, choose an existing contact to add to the roster.

Managing member information

Company Administrators have the ability to update contact and profile information for members of their organization. When they view the profile page for a contact who is a member of the organization which they administer, they see options to edit this information - including name, title, organization, addresses, and public profile details. They can also view participation information for the contact, such as billing history.

Managing billing for the organization

Company Administrators can make purchases which are billed to the organization, review past orders and invoices, and pay the most recently billed renewal invoice.

When making a purchase, Company Administrators have the option to choose their organization as the Bill To contact for the order. If they choose to pay later, an open invoice will be created which is billed to the organization.

When viewing the profile record for their organization, Company Administrator can review past orders and invoices which have been billed to the organization. They can pay invoices billed to the organization and invoices billed to a member of the organization.

For organizations that are members of the association, when their membership renewals are billed the Company Administrator can pay for the renewal using the Renew Now button on the profile page.

Registering members for events

Company Administrators can register members of their organization for events. When viewing an event, they choose Register Someone Else and can then choose a member of their organization. They complete the registration options and select program items, and can then purchase the registration.

> **Note:** Note: This feature is also available to any member of the organization, not just the Company Administrator.

The registration can be billed to the organization during purchase if desired.

To assign the Company Administrator role

A staff user can assign a Company Administrator from the organization roster. Open the membership details for the member you wish to grant the role, and edit their role details. This option is only available if the contact has a username and password in the system.

Enabling CAPTCHA security

iMIS uses CAPTCHAs for security when users create a new account and when users have forgotten their username or password. CAPTCHA is a program that can generate and grade tests that humans can pass but current computer programs cannot. For example, humans can read the distorted text below, but computers can't.

To enable CAPTCHA security

1. Create an account with reCAPTCHA.

2. Follow reCAPTCHA's instructions to create your Public and Private keys.
3. On your production iMIS appserver host, open the web.config files for each iMIS application.

- iMIS default location: C:\Program Files\ASI\iMIS\net

4. If you have a license for Web Content Management and have the WCM application installed on one or more external web servers, open the web.config file for the WCM application on each external web server.

- WCM default location: C:\Program Files\ASI\WCM\Net

5. In each web.config file, add the Public and Private keys generated by reCAPTCHA to the values of the following entries:

   <add key="RecaptchaPublicKey" value=""/>

   <add key="RecaptchaPrivateKey" value=""/>

6. Save the files.

   CAPTCHA security is now enabled.

Organization Settings

The full name of the organization that owns the site

Enter the name to appear in the title tag of the front page of your sites.

The abbreviated name of the organization that owns the site

Enter an abbreviated name if desired. You may leave this field blank.

The default email address for the site

Enter the email address to receive all email by default when errors occur with the site. Typically this email address is for the webmaster and the primary contact for the organization. This email address also receives the order email confirmation when a contact makes a purchase but does not have an email address listed in the Personal Details section of their account page.

Note: Note: When you change the default email address for the site, it is a global change that updates many of the settings in iMIS Desktop, including the default address set up at Desktop > System Setup > Set up web components > Quick setup.

The default email address for logon changes

Enter the email address to receive all emails by default when password resets and logon name changes are set.

The default email address for product sales

Enter the email address to receive all emails by default that notify when a product is sold.

The default Customer Type to use when creating new customers online

(Required) Specifies the default Member Type to use when creating a new iMIS contact record for anonymous users who register themselves through the web views of iMIS.

The default Customer Type to use when creating new organizations online

Specifies the default Member Type to use when creating a new iMIS contact record for non-individual entities. This relates to creating non-individual accounts in the Web view (see "Creating non-individual accounts in Web view"), for Full and Casual users to enter new accounts.

The default Customer Type for event guests added by members

Specifies the default Customer Type to use when creating new iMIS contact records for event guests of registered members. If you do not define the type, these new contacts will be assigned as the system default.

The default Customer Type for event guests added by non-members

Specifies the default Customer Type to use when creating new iMIS contact records for event guests registered by individuals who are not members of your organization. If you do not define the type, these new contacts will be assigned as the system default.

Contacts

Managing rosters is easy for Staff and Company Administrators. You also have the option to empower your users to self-manage their group memberships. To do this, simply enable the feature which permits automatic additions to the roster when members join a group or organization. Some organizations might want to limit this functionality.

General

Go to Settings > Contacts > General:

Set the default country (SystemDefaultCountry)

Determines the system default country. The drop-down is a list of hundreds of available countries to select from.

Allow all users to link to an organization checkbox

- When selected:
- All users, including Public users, are able to add themselves directly to groups without approval from an administrator.
- When not selected:
- Public users (members) are able to enter an organization during registration, but this does not add them to the organization group or organization roster.
- Company administrators can use the Group List Editor to add contacts to the roster for the company (or group) they moderate (or administer).
- Staff users (full, casual, or with administrative privileges) can add contacts to groups or organizations using Group List Editor, Account Creator, or through the mini profile.

Users who can bill to their organization (AllowAllUsersToBillToOrg)

A Company Administrator can bill to their company; however, if your organization allows users to bill to their organization, you can extend that functionality to all users.

- Company administrators only is set by default. If this option is selected, only a Company Administrator or Staff user acting “On Behalf Of” a user can select their organization as the Bill To contact.
- All users enables all users, including public users, the ability to select their organization as the Bill To contact. When this option is selected, the Bill To payment detail in the cart will default to Myself with the organization also listed as an option.
- All users – organization selected by default allows all users to select their organization as the Bill To contact. When this option is selected, the Bill To payment detail in the cart will default to the user’s organization with Myself also listed as an option.

> **Note:** Important! Do not allow all users to link to an organization if you also allow users to bill an organization. This would allow anyone to create an account and link and bill to any organization.

Regular expression to validate email addresses (Contact.Email.RegularExpression)

The regular expression rule is used to determine if the email entered contains valid characters as specified in the regular expression syntax. You can modify the regular expression to specify your own rule. The components of the default regular expression, \w+([-+!$%&*/=?{|}.']\w+)*@\w+([-.]\w+)*\.\w+([-.]\w+)*, allow email addresses to contain specific characters.

Rules:

- A "word character" is any word or numeric characters from the groups a-z, A-Z, 0-9 and _.
- The email address must begin with word or numeric characters from the groups a-z, A-Z, 0-9 and _, any of which can be entered one or more times.
- Next specific special characters - -+!$%&*/=?{|}.' - are allowed if they are followed by at least one word character. Special characters are not required.
- Next the “@” is required.
- Next word characters are allowed but not required.

- Next “-“ and “.” are allowed after the “@”. They are not required, but if they are used, they must be followed by word characters.
- Next a "." is required.
- Next “-“ and “.” are allowed after the “@”. They are not required, but if they are used, they must be followed by word characters.

  Note: Note: This validation expression does not allow foreign characters.

  Examples of email addresses regarded as valid when using the default regular expression:

- niceandsimple@example.com
- very.common@example.com
- a.little.lengthy.but.fine@dept.example.com
- disposable.style.email.with+symbol@example.com
- other.email-with-dash@example.com

  Examples of email addresses regarded as invalid when using the default regular expression:

- user@[IPv6:2001:db8:1ff::a0b:dbd0]
- "much.more unusual"@example.com
- "very.unusual.@.unusual.com"@example.com
- üñîçøðé@example.com
- üñîçøðé@üñîçøðé.com

  Password requirements text (PasswordRequirementsText)

  Specifies the message that is displayed when an account is created or a password is changed. The default message is “The password must be at least {0} characters long”. Two variables can be added to the message: {0} or {1}. The {0} variable refers to the

minimum password length allowed and the {1} variable refers to the minimum non-alpha-numeric characters allowed.

The values for these variables are set in the web.config file in the CustomizedProvider line. The default for the variable {0} is 6 (minRequiredPasswordLength). The default for the variable {1} is 0 (minRequiredNonalphanumericCharcters).

Message if sign in fails. (SignInFailedMessageSystemText)

Specifies the message that is displayed when a sign in attempt fails. The default message is “The username or password you entered is incorrect”. If you would like to configure this message to be unique for a particular sign in situation, you can edit the Contact Sign In content item directly.

Contact Security

Go to Settings > Contacts > Contact Security:

These system settings allow for granular security settings for viewing contact records. This is accomplished by providing separate security settings for 3 different user types in iMIS. These settings are separate from individual user authorization levels and provide system-wide cascading permission to view the public profile information of other users.

When making changes to these user access queries, it is vital that you update the search index in order for your updates to take effect.

For example, the AllUsersAccessQuery returns only contact A. AuthenticatedUsersAccessQuery returns only contact B. MemberAccessQuery returns only contact C. When an unauthenticated user browses the site, they will only get access to contact A. An authenticated non-member will have access to A and B. And a member will have access to all 3 contacts.

All website visitors can view contacts included in this query. (AllUsersAccessQuery)

Create or edit a query for this field to determine which contacts' public profiles are visible to visitors who have not logged in.

> **Note:** Caution! If this field is left blank, visitors will not be able to see the public profiles of any of your iMIS contacts and an error message will be displayed.

Authenticated users can view contacts included in this query. (AuthenticatedUsersAccessQuery)

Create or edit a query for this field to determine which public profiles all logged-in users can view. By default this query returns all contacts. ($/ContactManagement/DefaultSystem/Queries/Contacts/All Contacts)

> **Note:** Caution! If the AuthenticatedUsersAccessQuery is blanked out, logged-in non-members will effectively have the same level of access as unauthenticated users.

Members can view contacts included in this query. (MemberAccessQuery)

Create or edit a query for this field to determine which public profiles members of your organization are allowed to view.

> **Note:** Caution! If the MemberAccessQuery is blanked out, members will effectively have the same level of access as logged-in non-member user.

Tip! When creating or editing an Online User Access query, you must use the NetContact business object and have Contact Key and iMIS ID properties in the display tab. It is recommended to have an iMIS ID property in the filters tab as well. iMIS provides example queries that you can copy and adjust to fit your organization's needs:

- $/Samples/Security/UserAccess/Contacts available to all users
- $/Samples/Security/UserAccess/Contacts available to members

Visitors to your site might receive an error if they click on the name link of a contact they don’t have permission to view. If your customers report seeing these messages frequently, you may want to review your queries in these fields to loosen the restrictions.

> **Note:** Note: Once you have selected a query to determine your online user access, you can edit it directly from this page by clicking Edit source query.

Communication preferences

Setting the communication Type

Staff users can configure the types of communications that can be sent by your organization. This enables you to enforce the preferences of members who do not want to receive certain types of communications.

On the Staff site, go to Settings > Contacts > Communication preferences. You can add a new communication type or edit a selected communication type.

To add a new communication type:

1. Click Add new.
2. Select a communication type.
3. (optional) Provide a description of the communication type.
4. Define the subscription properties of the communication type:

- Users cannot opt out - Users are not able to elect to remove themselves from these communications.

  Note: If the Type is system-defined, this is the only option available and cannot be edited.

- Users must subscribe (Opt-in) - Users will not receive communications unless they subscribe.
- Subscribe by default (Opt-out) - Users will receive communications until they choose explicitly to no longer receive communications.

5. Select the status of the communication type:

- Active -- the subscription properties for the communication type are applied.
- Inactive -- the subscription properties for the communication type are not actively applied

Note: Inactive type cannot be assigned to communication templates or documents.

6. Save.

Note: System-defined Types (Primary, Shipping, and Billing) cannot be edited.

Commerce

> **Note:** Note: The documentation might not match your product. Your organization can customize iMIS, license fewer features, or limit your security access, all of which affect the fields that you see in the product interface. Windows and fields that are clearly defined in the product interface itself, or that should otherwise be intuitive, are not described in the documentation.

Administrators can use Settings > Commerce configuration to customize organization information including labels for the various areas of the site and email and graphics settings.

General

This window defines variables that affect the handling of alternative currencies, and which control the title and contents of site-wide error windows.

Go to Settings > Commerce > General:

DefaultCurrencyCode

Specifies the default currency code that will be used to pass the correct currency values to PayPal Express, Payflow Pro, and TNSPay. The currency code must be three character ISO-4217 code.

Automatic Payments for Billing Renewals (Asi.Billing.AllowAutomaticPayments)

This setting is disabled by default. To enable automatic payments for membership renewals, adjust the setting from the dropdown to be enabled by default, required, disabled, or users can elect to use this setting allow users to enable.

> **Note:** Note: The Automatic payments for membership renewals system configuration is available only to those with the AutoPay license.

Recurring Donations (Asi.Fundraising.AllowRecurringDonations)

This setting is disabled by default. To enable automatic payments for recurring donations, adjust the setting from the dropdown to be enabled by default, required, disabled, or allow users to enable.

> **Note:** Note: The Recurring Donations system configuration is available only to those with the AutoPay license.

RiSE Settings

Review the following setup pages, modifying the default values as desired:

Quick setup

Go to Settings > RiSE > Quick setup:

These fields configure the basic global behavior of RiSE Content.

Note: All of these fields are duplicated in the other windows beneath Settings > RiSE > Quick setup. The presence of those fields in the default Quick setup window is meant to ensure that at least these very important basic configuration properties are set.

Tips

- The default text in several of these setup fields includes text enclosed in brackets, such as [WebsiteName], [PageLinkURL], and so on. These are system variables that are replaced dynamically with context-specific information. You can remove them entirely if you don't want to use them, but you must not change them in any way if you plan to use them, or you'll get unexpected results.
- If you are getting unexpected results in the things that these setup fields create (such as boilerplate text in "Email a friend" emails), the cause might be that some of these system

variables were changed slightly. You can use the Reset to default value button to restore the default text (and therefore the original system variables).

The path where the Image Manager should store images used in RiSE. The path should begin eith ~/ and be a relative path from the website's root folder (CM.ImagePath)

- Specifies the relative path of the file system folder on the iMIS application server and external web servers where images uploaded for use by CM should be stored. The root (~) of the path is the same as the physical path for the iMIS application in IIS (...\ASI\iMIS\Net by default). The default value for this field is ~/images.

The maximum number of results returned for a search. (SE.MaximumResults)

- Specifies the maximum number of search results that the system will display.

The number of results to show per page (SE.ResultsPerPage)

- Specifies how many search results to display per page. If there is more than one page of search results, links appear at the bottom of each page that enable navigation among the result pages.

Any content record with a Cache duration of "Default" will use this value. (CM.CacheDurationDefault)

- Specifies the default system setting that will be used if Default is selected in the Cache duration field for a content record (Properties tab). Any content record with a Cache duration of "Default" will use this value.

The confirmation message displayed after sending Email a Friend emails. (CM.EmailAFriendConfirmationMessage)

Specifies the text of the confirmation message displayed to the user after an "email a friend" email has been successfully sent by the system.

The subject line used for Email a Friend emails. (CM.EmailAFriendSubject)

Specifies the template text of the subject line used in "email a friend" emails. You can use the same variables here as for the CM.EmailAFriendTemplate field.

The template used for the body of Email a Friend emails. (CM.EmailAFriendTemplate)

Specifies the template for the email sent by the "email a friend" feature. The following variables can be used in the template:

- [WebsiteName] - The name of the website.
- [WebsiteURL] - The URL of the website.
- [PageLinkTitle] - The title of the content record.
- [PageLinkURL] - The URL of the content record
- [SendToEmailAddress] - The user-supplied value of the Send this page to field on the Email this page to a friend window.
- [SenderMessage] - The user-supplied value of the Personal message field on the Email this page to a friend window.
- [SenderEmailAddress] - The user-supplied value of the Your email address field on the Email this page to a friend window.

Site builder configuration

Settings > RiSE > Site builder configuration

This field configures the global behavior of the Site Builder tool. By default, these fields are found in the following locations:

Document System path to the folder containing the website objects managed by Site Designer (ND.WebsiteRootFolder)

Specifies the full Document System path to the folder that contains all the CM definition objects used by the Site Designer tool.

Page builder configuration

Settings > RiSE > Page builder configuration

These fields configure the global behavior of the Page Builder tool. By default, these fields are found in the following locations:

Tips

The default text in several of these setup fields includes text enclosed in brackets, such as [WebsiteName], [PageLinkURL], and so on. These are system variables that are replaced dynamically with context-specific information. You can remove them entirely if you don't want to use them, but you must not change them in any way if you plan to use them, or you'll get unexpected results.

If you are getting unexpected results in the things that these setup fields create (such as text in "Email a friend" emails), the cause might be that some of these system variables were changed slightly. You can use the Reset to default value button to restore the default text (and therefore the original system variables).

CM.ImagePath

Specifies the relative path of the file system folder on the iMIS application server and external web servers where images uploaded for use by CM should be stored. The root (~) of the path is the same as the physical path for the iMIS application in IIS (C:\Program Files\ASI\iMIS\Net by default). The default value for this field is ~/images.

CM.ShowFileTypes

Specifies which file extensions should prefixed before the content record's Title in the rendered results of a ContentTaggedList content item, if the content record contains a ContentFile content item that will download a file with the listed extension.

CM.UseImportantUntilDate

Enables the behavior of the Mark as important until field in content records. When cleared, disables the field's behavior.

CM.PublishingMaxNumOfAttempts

Specifies how many times each publishing service will attempt to process a system publishing request for a content record before it flags the request as failed. This prevents overconsumption of system resources if there is a connection issue or other issue that is preventing the publishing service from successfully processing the request.

CM.SendEmailOnApprovalRequest

Sends an email to all people who have Content Approver permissions in at least one content authority group (CAG) to which they belong whenever anyone submits a content record publishing request. When cleared, disables email notification of publishing requests.

CM.CacheDurationDefault

Specifies the default system setting that will be used if Default is selected in the Cache duration field for a content record (Properties tab). Any content record with a Cache duration of "Default" will use this value.

Email A Friend

CM.EmailAFriendSubject

Specifies the template text of the subject line used in "email a friend" emails. You can use the same variables here as for the CM.EmailAFriendTemplate field.

CM.EmailAFriendTemplate

Specifies the template for the email sent by the "email a friend" feature. The following variables can be used in the template:

[WebsiteName] - The name of the website.

[WebsiteURL] - The URL of the website.

[PageLinkTitle] - The title of the content record.

[PageLinkURL] - The URL of the content record

[SendToEmailAddress] - The user-supplied value of the Send this page to field on the Email this page to a friend window.

[SenderMessage] - The user-supplied value of the Personal message field on the Email this page to a friend window.

[SenderEmailAddress] - The user-supplied value of the Your email address field on the Email this page to a friend window.

CM.EmailAFriendConfirmationMessage

Specifies the text of the confirmation message displayed to the user after an "email a friend" email has been successfully sent by the system.

Search configuration

Go to Settings > RiSE > Search configuration.

These fields configure the global behavior of the search functionality.

SE.NoResultsMessage

Displays the message presented to the user when no results matching the search criteria were found.

SE.MaximumResults

Specifies the maximum number of search results that the system will display.

SE.ExceedMaxResultsMessage

Specifies the search exceeded the maximum number of results set in SE.Maximum-Results.

SE.ResultsPerPage

Specifies how many search results to display per page. If there is more than one page of search results, links appear at the bottom of each page that enable navigation among the result pages.

SE.ProblemMessage

Specifies what should be displayed to users when the search engine has a problem trying to perform the search. (This is not the same as when a search finds no results.) Adding the string {0} in this field passes through the system message for the actual error.

SE.DisplayShowKey

Displays a graphic icon shaped like a key next to every item in the search results list that is visible only to members of your organization. When cleared, no "key" icon is displayed even if the item is visible only to members.

Only users who are logged on to the website, and whose iMIS user record is associated with an iMIS contact record that is assigned a member type, will see this icon. For a content record to trigger this icon in search results, in the Properties section of the content record, the Content is restricted to members checkbox must be selected.

SE.UseAdvancedRelevancy

When enabled, uses the variables SE.SearchKeywordHint, SE.SearchTitleHint, SE.SearchDescriptionHint, and SE.SearchBodyHint to score search results.

SE.SearchBodyHint

Specifies the search relevancy weighting given to results found in the body of the rendered content record (all the content item in the content record). The relevancy weighting for title, description, keywords, and body does not need to total 100. Instead, these weightings are both cumulative and relative to each other.

SE.SearchDescriptionHint

Specifies the search relevancy weighting given to results found in the content record's Description/Summary field. The relevancy weighting for title, description, keywords, and body does not need to total 100. Instead, these weightings are both cumulative and relative to each other.

SE.SearchKeywordHint

Specifies the search relevancy weighting given to results found in the content record's Keywords/Metatags field. The relevancy weighting for title, description, keywords, and body does not need to total 100. Instead, these weightings are both cumulative and relative to each other.

SE.SearchTitleHint

Specifies the search relevancy weighting given to results found in the content record's Title field. The relevancy weighting for title, description, keywords, and body does not need to total 100. Instead, these weightings are both cumulative and relative to each other.

Workflow configuration

> **Note:** Note: In the RiSE Workflow Settings window, be sure to change the default values of the ND.ExpirationEmailFromAddr and CM.ExpirationEmailFromAddr fields to the email address of a person in your organization.

Troubleshooting

- You must be a member of the iMIS SysAdmin security role to access the Set up content management features.

  These fields configure the global behavior of content authoring workflow. By default, these fields are found in the following locations:

  Settings > RiSE > Workflow configuration

  Tips

- In the following fields that specify the variables Individual.FirstName and Individual.LastName, you can use any property from the Individual business object as long as you can express it with the format Individual.[property].

  ND.ExpirationWarningDays1

  Specifies the number of days before a navigation item has expired to send the first expiration warning email (ND.ExpirationWarningText). This value must be larger than the value specified for ND.ExpirationWarningDays2.

  ND.ExpirationWarningDays2

  Specifies the number of days before a navigation item has expired to send the second expiration warning email (ND.ExpirationWarningText). This value must be smaller than the value specified for ND.ExpirationWarningDays1.

  ND.FinalExpirationNoticeDays

  Specifies the number of days after a navigation item has expired to send the additional expiration notice email (ND.AddExpNoticeText).

ND.ExpirationEmailFromAddr (Required)

Specifies the email address from which emails are sent before or after a navigation item expires.

ND.ExpirationSubjectText (Required)

Specifies the text that appears as in the subject field of all navigation item expiration emails. You can use the [Individual.FirstName] and [Individual.LastName] variables to personalize the text with the name of the email recipient.

ND.ExpirationOpeningText

Specifies the text that appears as the opening paragraph in the body of all navigation item expiration emails. You can use the [Individual.FirstName] and [Individual.LastName] variables to personalize the text with the name of the email recipient.

ND.ExpirationWarningText (Required)

Specifies the text that appears as the main body of the first and second expiration warning emails that is sent n days before a navigation item has expired. The value of n is specified in ND.ExpirationWarningDays1 and ND.ExpirationWarningDays2. You can insert the variable [ExpireDays] to display the value of n.

Following this text is an automated list of the navigation items that will be expiring on that day and for which the email recipient is designated as the person to notify about expiration in the Workflow Management section of the navigation item definition.

ND.ExpirationNoticeText (Required)

Specifies the text that appears as the main body of the expiration notice email that is sent on the day that a navigation item expires. Following this text is an automated list of the navigation items that have expired on this day and for which the email recipient is designated as the person to notify about expiration in the Workflow Management section of the navigation item definition.

ND.AddExpNoticeText (Required)

Specifies the text that appears as the main body of the additional expiration notice email that is sent n days after a navigation item has expired. The value of n is specified in ND.FinalExpirationNoticeDays. You can insert the variable [ExpireDays] to display the value of n.

Following this text is an automated list of the navigation items that expired on that day and for which the email recipient is designated as the person to notify about expiration in the Workflow Management section of the navigation item definition.

ND.ExpirationTableHeader

Specifies the HTML code to use inside the table header of the list of navigation records that are automatically added to the body of all navigation item expiration emails. You should not delete, change, or add to the number of <th> elements, but it is safe to change the content of each element.

ND.ExpirationTableRow (Required)

Specifies the HTML code to use inside the table rows of the list of navigation items that are automatically added to the body of all navigation expiration emails. You should not delete, change, or add to the number of <td> elements, but it is safe to change the content of each element. The following variables can be useful in this context:

- [Navigation.NavigationName] - The Navigation Link Text of the navigation item.
- [EditLink] - A system-generated link to the Site Designer definition window for the navigation item. You must be currently logged on iMIS through a web browser for this link to resolve correctly.

CM.ExpirationWarningDays1

Specifies the number of days before a content record has expired to send the first expiration warning email (CM.ExpirationWarningText). This value must be larger than the value specified for CM.ExpirationWarningDays2.

CM.ExpirationWarningDays2

Specifies the number of days before a content record has expired to send the second expiration warning email (CM.ExpirationWarningText). This value must be smaller than the value specified for CM.ExpirationWarningDays1.

CM.FinalExpirationNoticeDays

Specifies the number of days after a content record has expired to send the first additional expiration notice email (CM.AddExpNoticeText). This value must be smaller than the value specified for CM.ExpAdditionalDays.

CM.ExpAdditionalDays

Specifies the number of days after a content record has expired to send the second additional expiration notice email (CM.AddExpNoticeText). This value must be larger than the value specified for CM.FinalExpirationNoticeDays.

CM.ExpirationEmailFromAddr (Required)

Specifies the email address from which emails are sent before or after a content item expires.

CM.ExpirationSubjectText (Required)

Specifies the text that appears as in the subject field of all content record expiration emails. You can use the [Individual.FirstName] and [Individual.LastName] variables to personalize the text with the name of the email recipient.

CM.ExpirationOpeningText

Specifies the text that appears as the opening paragraph in the body of all content record expiration emails. You can use the [Individual.FirstName] and [Individual.LastName] variables to personalize the text with the name of the email recipient.

CM.ExpirationWarningText (Required)

Specifies the text that appears as the main body of the first and second expiration warning emails that are sent n days before a content record has expired. The value of n is specified in CM.ExpirationWarningDays1 and CM.ExpirationWarningDays2. You can insert the variable [ExpireDays] to display the value of n.

Following this text is an automated list of the content records that will be expiring on that day and for which the email recipient is designated as the content owner in the Workflow Management section of the content record definition.

CM.ExpirationNoticeText (Required)

Specifies the text that appears as the main body of the expiration notice email that is sent on the day that a content record expires. Following this text is an automated list of the content records that have expired on this day and for which the email recipient is designated as the content owner in the Workflow Management section of the content record definition.

CM.AddExpNoticeText (Required)

Specifies the text that appears as the main body of the additional expiration notice emails that are sent n days after a content record has expired. The value of n is specified in CM.ExpAdditionalDays. You can insert the variable [ExpireDays] to display the value of n.

Following this text is an automated list of the content records that expired on that day and for which the email recipient is designated as the content owner in the Workflow Management section of the content record definition.

CM.ExpirationTableHeader

Specifies the HTML code to use inside the table header of the list of content records that are automatically added to the body of all content record expiration emails. You should not delete, change, or add to the number of <th> elements, but it is safe to change the content of each element.

CM.ExpirationTableRow (Required)

Specifies the HTML code to use inside the table rows of the list of content records that are automatically added to the body of all content record expiration emails. You should not delete, change, or add to the number of <td> elements, but it is safe to change the content of each element. The following variables can be useful in this context:

- [Content.ContentName] - The Title of the content record.

■ [EditLink] - A system-generated link to the Content Designer definition window for the content record. You must be currently logged on iMIS through a web browser for this link to resolve correctly.

Utilities

User defined tables

You can generate business objects from user defined tables created in the Advanced Accounting Console. Refer to Business Object Designer for details on business objects. When you click Build All, the Build Results area will display a log of the business objects that were built, compiled, and published.

> **Note:** Note: Rerunning the Build All command will cause your changes to be over-written and lost. The business objects for user defined tables are recreated by that operation.

Package Installer Utility

Go to RiSE > Utilities > Package installer:

Use Package Installer Utility to select packages for installation, view currently installed packages, and view failed installations. Although making content items deployable is the most common use for packages, they can also include:

- iMIS document system objects, such as queries, business objects, and content types
- SQL Scripts, which run against the iMIS database during installation
- Files, such as ASCX pages, images, and Word templates

To install a package

You can use the Package Installer to update the content items on a system and to revert them. When you run the installer multiple times on the same package, it installs only one content item. When you run the installer with multiple packages that install the same con-

tent item, only one content item is created, using the data in the last package you installed.

> **Note:** Note: Where you see local paths specified, be sure to use the path appropriate for your system, such as C:\Program Files (x86)\ for C:\Program Files\.

1. Stop the AsiScheduler application pool in IIS.
2. Save the .ipackage file to the C:\Program Files\ASI\iMIS\Net\package\pending folder. Create the pending folder if it does not exist yet.

   Go to RiSE > Utilities > Package installer:
3. Select Packages to be Installed from the Show dropdown list.
4. Click Install.
5. Restart the Publishing Service.
6. If you installed any ActiveX controls, register the OCX files.
7. If your package includes a control (content item or ActiveX), repeat this process on each additional application server that needs to host it. For example, if you host your staff site on your production iMIS application server and your Public view on an external web-server, add the Package Installer to a content record that displays in both websites. Make sure you set up the correct security permissions to the content item's page so that only authorized users are able to access it.

   Since iMIS runs with a single database, you do not have to install a package on multiple servers if it only includes database-related objects. But a control is an application component, so you need to deploy it on each server that hosts it. A package can install multiple times on the same database.

   To create a package
1. From the command line, change the directory to the following folder:

   cd C:\Program Files\ASI\iMIS\Net\bin

2. Execute the command to create the manifest: PackageBuilder.exe -create <packageFolder>

- Replace <packageFolder> with a path to the folder that contains the source files to be included in the package. For example:

  PackageBuilder.exe -create C:\MyNewContentItem

- A package.manifest file is created for you in the <packageFolder> location.

  Note: If a package.manifest file already exists in that folder, it is overwritten when you run this command.

3. In a text editor, edit package.manifest to specify the package description and the install path for each of the package's files.

   Note: The install path is relative to the Net directory, which defaults to C:\Program Files\ASI\iMIS\Net

- ASCX files (content items) usually install to: <InstallPath>iparts/Custom</InstallPath>
- DLL files usually install to: <InstallPath>bin</InstallPath>
- For <Type>Document</Type>, the <InstallPath> refers to a path in the document system. You can either enter a file system path or a document system path, such as $/Folder-/SubFolder.
- For <Type>Sql</Type>, the <InstallPath> is not required, because the SQL in the file specified by <Name> is executed. If the <InstallPath> is specified, then the corresponding SQL file is saved to that path. Additionally, the file extension for an SQL file must be .sql, or it will be treated as the File type during the PackageBuilder -create step.

4. Execute the command to build the package: PackageBuild.exe -build <packageFolder> <packageFileName>:

- packageFolder is the path to the folder that contains the source files to be included in the package, such as: C:\MyNewContentItem

- packageFileName is the pathname of the package file to be generated (which must have the extension .ipackage), such as: C:\Program Files\ASI\iMIS\Net\package\pending\ASIEUGiftAidWebPart.ipackage

  The following is a sample package.manifest file:

```
<Package xmlns="http://schemas.imis.com/2008/01/DataContracts/iParts/PackageInstaller"
xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
<Name>Exampleipart</Name>
<Description>TODO: description of Exampleipart</Description>
<Files xmlns:a="http://schemas.imis.com/2008/01/DataContracts/iParts/PackageInstaller/">
<a:PackageFileData>
<Name>Example-iPart-InstallScripts.sql</Name>
<Type>Sql</Type>
<InstallPath>SqlScripts</InstallPath>
</a:PackageFileData>
<a:PackageFileData>
<Name>Example-ContentType.xml</Name>
<Type>Document</Type>
<InstallPath>$/ContentManagement/DefaultSystem/ContentTypes</InstallPath>
</a:PackageFileData>
<a:PackageFileData>
<Name>MetaBuilders.WebControls.dll</Name>
<Type>File</Type>
<InstallPath>bin</InstallPath>
</a:PackageFileData>
<a:PackageFileData>
<Name>ExampleiPart.mycompany.dll</Name>
<Type>File</Type>
<InstallPath>bin</InstallPath>
</a:PackageFileData>
<a:PackageFileData>
<Name>xDisplayExampleiPart.ascx</Name>
<Type>File</Type>
<InstallPath>iparts\mycompany\exampleipart</InstallPath>
</a:PackageFileData>
<a:PackageFileData>
<Name>xEditExampleiPart.ascx</Name>
<Type>File</Type>
<InstallPath>iparts\mycompany\exampleipart</InstallPath>
</a:PackageFileData>
</Files>
</Package>
```

Duplicate Merge Manager

Duplicate Merge Manager overview

Duplicate Merge Manager allows you to merge multiple duplicate records under one ID that is selected as the Retain ID. Duplicate Merge Manager locates all potential duplicate records and organizes them into duplicate groups. You can manage these groups to determine which Name and Name_Address records to retain, which records to merge into the retained records, and which records to delete. After you have managed the groups, you can run merge or delete the selected records.

Duplicate Merge Manager performs the following procedures:

- Deletes the records marked for deletion.
- Copies into the Retain ID the subordinate records that are marked for merging.
- Assigns the correct addresses to the Retain ID.

Important: DMM will not merge any data from .NET tables (other than ContactMain and UserMain). Merging contact records that have associated .NET records may result in orphaned records. Examples include (but not limited to):

- DocumentMain.CreatedByUserKey
- DocumentMain.UpdatedByUserKey
- GroupMain.MemberContactKey

Requirements

- Make sure to add the Duplicate Merge Manager license key to the System Setup window.
- Make sure to grant sufficient access control. See Access control: Customers in the Security Administration section.

Duplicate Merge Manager terms

The following is a list of terms used with DMM.

- Duplicate Match Key – Parameter used to check for duplicate records.
- Group – When potential duplicate records are found, they are organized into groups to manage the records.
- Retain ID – ID of the customer record to be retained from the selected group.
- IDs to Merge – List of IDs to be merged and then deleted.
- IDs to Delete – List of IDs to be deleted.
- IDs to Keep – List of IDs to keep “as is” (these are not duplicate records).

Generated file layouts

The following tables are part of the iMIS database:

Duplicate_Group (stores information regarding actions to take for the group)

SEQN	Long	Primary key
DUP_MATCH_KEY	varchar(255)	Duplicate field values
MERGE_NOTE	varchar(255)	Notes to be stored in merged Activity Records
PREF_MAIL	Integer	Address for preferred mailing
PREF_BILL	Integer	Address for preferred billing
MERGE_IDS	varchar(255)	Comma delimited IDs to be merged
DELETE_IDS	varchar(255)	Comma delimited IDs to be deleted
KEEP_IDS	varchar(255)	Comma delimited IDs to keep unchanged
ADDR_1_NUM	Integer	Main Address to be retained
ADDR_2_NUM	Integer	Second Address to be retained
ADDR_3_NUM	Integer	Third Address to be retained
RETAIN_ID	varchar(12)	ID of the record to retain

Duplicate (stores information regarding each duplicate ID)

SEQN	Numeric	Related Key to Duplicate_Group

ID	varchar(12)	Name ID
FULL_NAME	varchar(50)	Name FULL_NAME
ADDR_1	Integer	Main Address of ID
ADDR_2	Integer	Second Address of ID
ADDR_3	Integer	Third Address of ID

Specifying an alternate data source

To use Duplicate Merge Manager with a data source other than the one that was in use the last time iMIS was started, you must specify the Data Source Name in the Local Preferences window.

1. Open iMIS and click Cancel when the log on window opens.
2. Select Logon > Set Host Location. The Local Preferences window displays.
3. Click Edit and enter the desired Application Servers exactly as shown in the ODBC configuration.
4. Click OK.
5. Select Logon > Logon to Host to display the iMIS Log On window.
6. Enter your User ID and Password and click OK to start iMIS.

Index on ID field

User-defined tables used in Find Duplicates, Manage Groups, and Choose Columns are required to have an index on the ID field. See your system administrator for further details.

Using Duplicate Merge Manager

The Duplicate Merge Manager window is used to find, select, merge, delete, or keep possible duplicate records.

You must have a Customers authorization level of 4 (select File> System Setup and click User Passwords) to use the Duplicate Merge Manager.

- From Customers, select Manage duplicates to display the Duplicate Merge Manager window.

  Multiple-user functionality is achieved through the use of temporary and permanent tables. Duplicate groups that are found, managed, and merged while using Duplicate Merge Manager without being saved to the permanent tables for use during a later Duplicate Merge Manager session are referred to as the current session. There is a set of temporary tables for each Duplicate Merge Manager user so that each user can perform duplicate group tasks individually. The following temporary tables are created when a Duplicate Merge Manager session is started, and are deleted when the session is closed:

- ##Duplicate_hh_mm_ss_ms
- ##Duplicate_Group_hh_mm_ss_ms
- ##Duplicate_Keys_hh_mm_ss_ms

  Each temporary table is exclusive to the individual user's current Duplicate Merge Manager session and is named using a unique, variable timestamp in the format hh_mm_ss_ms, where hh is hours, mm is minutes, ss is seconds, and ms is milliseconds. The data in the temporary tables is overwritten each time the Find Duplicates process is run.

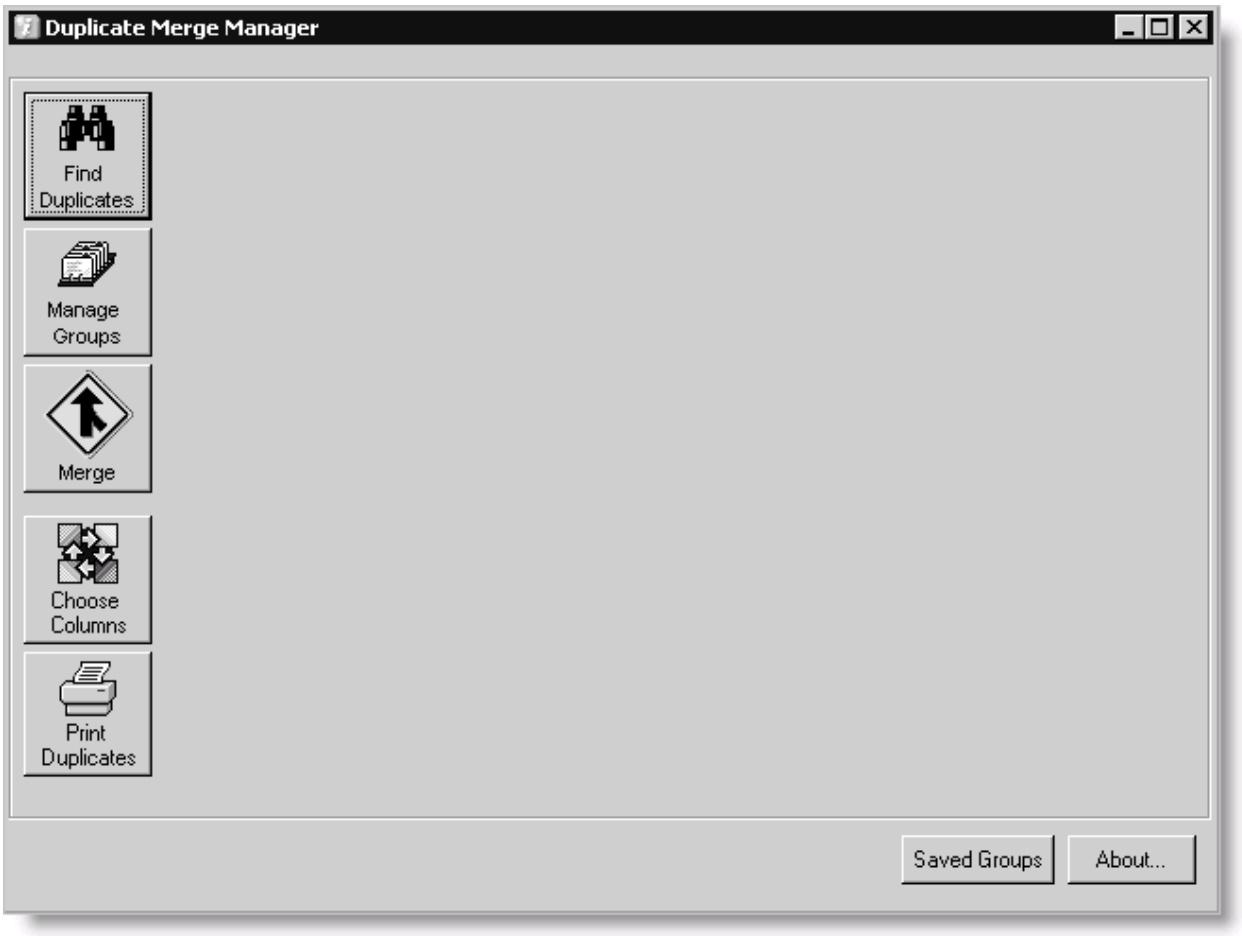
  Duplicate groups stored in the temporary tables can be managed and merged in the current Duplicate Merge Manager session, or the groups can be saved to the permanent tables so that the groups can be managed and merged in a later Duplicate Merge Manager session. Any duplicate groups that are not saved to the permanent tables will no longer exist when the current Duplicate Merge Manager session is ended.

  When a duplicate group is saved, the group data is moved from the temporary tables to the following permanent tables:

- Duplicate
- Duplicate_Group

The merge actions for saved duplicate groups are performed in the order that the groups were saved. Because of Duplicate Merge Manager's multiple-user functionality, it is possible for two or more users to create multiple duplicate groups during their own Duplicate Merge Manager sessions that contain one or more of the same IDs. If more than one duplicate group contains the same ID when a Merge operation is performed, the merge actions for the second group (and any subsequent groups) may not be performed completely. For example, if the Retain ID for the second group was deleted during the merge actions for the first group, the merge actions for the second group (which contains the previously deleted Retain ID) will not be performed. You should review all saved duplicate groups for accuracy and any conflicts before performing the Merge operation.

Duplicate Merge Manager window



From Customers, select Manage duplicates

Find Duplicates button

Used to access the Find Duplicates options. You can use the current DupMatchKey field in iMIS to find possible duplicate records, specify a new set of criteria for finding possible duplicate records, or specify two known IDs to merge.

Manage Groups button

Used to display the Group and Action tabs.

Group tab

Select this tab to view the groups and records within the duplicate groups that have been created. The group includes the individuals associated with each group, and each individual's associated name and address information. The Status column indicates whether the duplicate record can be deleted (OK) or the reason why the record cannot be deleted.

To view more information about the individual records in a group, click Choose Columns to select additional fields or columns to display.

Action tab

After viewing the records in a duplicate group, select the Action tab. This tab allows you to select the Retain ID, the records that should be kept unchanged, the records that should be merged into the Retain ID, the records that should be deleted, the addresses to keep, and the addresses to use for preferred mailing and preferred billing. If you save a duplicate group to the permanent tables without specifying any actions for the group, the records in the group are not changed and the duplicate group still exists after a merge operation is performed.

Merge button

Used to run the merge procedure after you have determined which records are to be retained, merged, and deleted.

Choose Columns button

Used to select additional fields for viewing in order to evaluate possible duplicate records within a group.

Print Duplicates button

Used to print the iMIS Duplicate Merge Manager – Duplicate Group List, which lists the SEQN, Dup_Match_Key fields, and Retain ID.

> **Note:** Note: Clicking this button will print the iMIS Duplicate Merge Manager – Duplicate Group List, regardless of the setting specified on the Report Destination window.

Saved Groups button

Used to load the duplicate groups that were saved to the permanent tables during Duplicate Merge Manager sessions. You can then manage and merge these groups, as well as continue to find, manage, and merge new duplicate groups. Duplicate groups found and saved in previous sessions are not accessible until you click Saved Groups.

About button

Used to display the About DMM window. Duplicate Merge Manager version information displays in this window.

Identifying potential duplicate records

There are three options available for creating duplicate record groups:

- Use DUP_MATCH_KEY from Name Table
- Select fields which will be used to identify potential duplicates
- Specify two known IDs to Merge option to directly merge two IDs

Status column

For all options, the initial table of information about the potential duplicates includes the Status column, which contains either OK or reasons why a record cannot be discarded. The following table describes the reasons.

This record cannot be deleted while an open	An open Order is associated with this

order exists	Contact.
This record cannot be deleted while an invoice with a non-zero balance exists	An open Invoice is associated with this Contact.
This record cannot be deleted while an active subscription exists	An active Subscription record is associated with this Contact.
This record cannot be deleted while a dependent referral record exists	A Referral record dependency is associated with this Contact.
This record cannot be deleted while a dependent Name_Fin record exists with this ID as the Bill To ID	This Contact is designated as the Bill To on the Name_Fin record for another Contact.
This record cannot be deleted while a dependent Name record exists with this ID as the Bill To ID	This Contact is designated as the Bill To on the Name record for another Contact.
This record cannot be deleted while a dependent Name record exists with this ID as the Company ID	This Contact is designated as the Company on the Name record for another Contact.

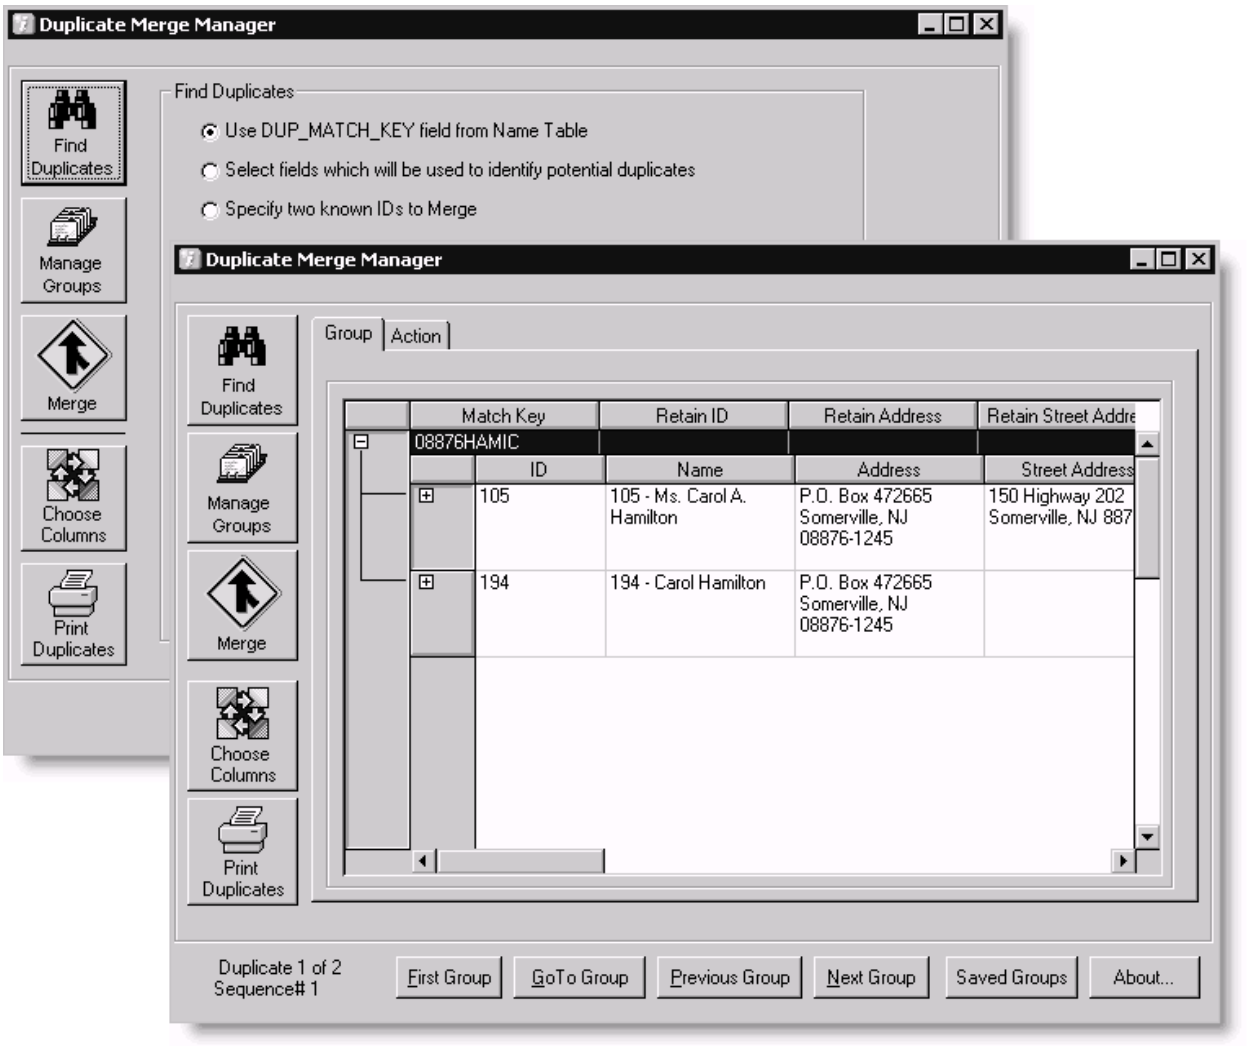
To find possible duplicate records using the DUP_MATCH_KEY field

Select the Use DUP_MATCH_KEY field from Name Table option to find all possible duplicates based upon the value in the Name.DUP_MATCH_KEY field, which contains the value that was calculated based on the Duplicate Record Check Formula field in the Customer Setup – Advanced window at the time the customer record was added or last edited. If the Duplicate Record Check Formula field was blank when the customer record was added or last edited, iMIS uses the default formula (the first five characters of the preferred mail address zip code, the first four characters of the last name, and the first character of the first name) to populate the Name.DUP_MATCH_KEY field.

Note: Note: When the Duplicate Record Check Formula is changed, iMIS does not go back and recalculate the Name.DUP_MATCH_KEY field for existing customer

> records. The Name.DUP_MATCH_KEY field is initially populated when a new customer record is added, and is updated when the customer record is edited in the Manage customers window.

1. From Customers, select Manage duplicates.
2. Click Find Duplicates. The Find Duplicates options display on the Duplicate Merge Manager window.
3. Click Build Tables. A message displays informing you that the process may take from 2 to 20 minutes.
4. Click Yes. The first duplicate group found displays on the Group tab in the Manage Groups view on the Duplicate Merge Manager window. As you review the groups, the Duplicate x of y and Sequence# information displayed in the lower left corner of the window will update.
5. If no duplicate groups are found, a message displays indicating that no duplicate groups were found.



To find possible duplicate records using selected fields

Select the Select fields which will be used to identify potential duplicates option to specify your own criteria to find duplicate matches. This option overrides the value entered in each customer's Name.DUP_MATCH_KEY field, but does not update the Name.DUP_MATCH_KEY field in iMIS. You must choose at least one field from the Name table. For the best performance results, select the most unique fields first.

The Name.WORK_PHONE and Name.HOME_PHONE fields can be selected for display. Click Choose Columns on the Duplicate Merge Manager window.

1. From Customers, select Manage duplicates.

2. Click Find Duplicates. The Find Duplicates options display.
3. Select the Select fields which will be used to identify potential duplicates option. The Name table and any user-defined tables display in the Tables area.
4. Click the + symbol displayed to the left of the table name to expand the table and view all available fields.

   Note: You must choose at least one field from the Name table.
5. Select the desired field using one of the following methods:

- Double-click the field.
- Select the field and click >.
- Drag and drop the field onto the grid on the right side of the window.

  Note: To remove a field so that it is not used when searching for potential duplicates, double-click the field or select the field and click <.

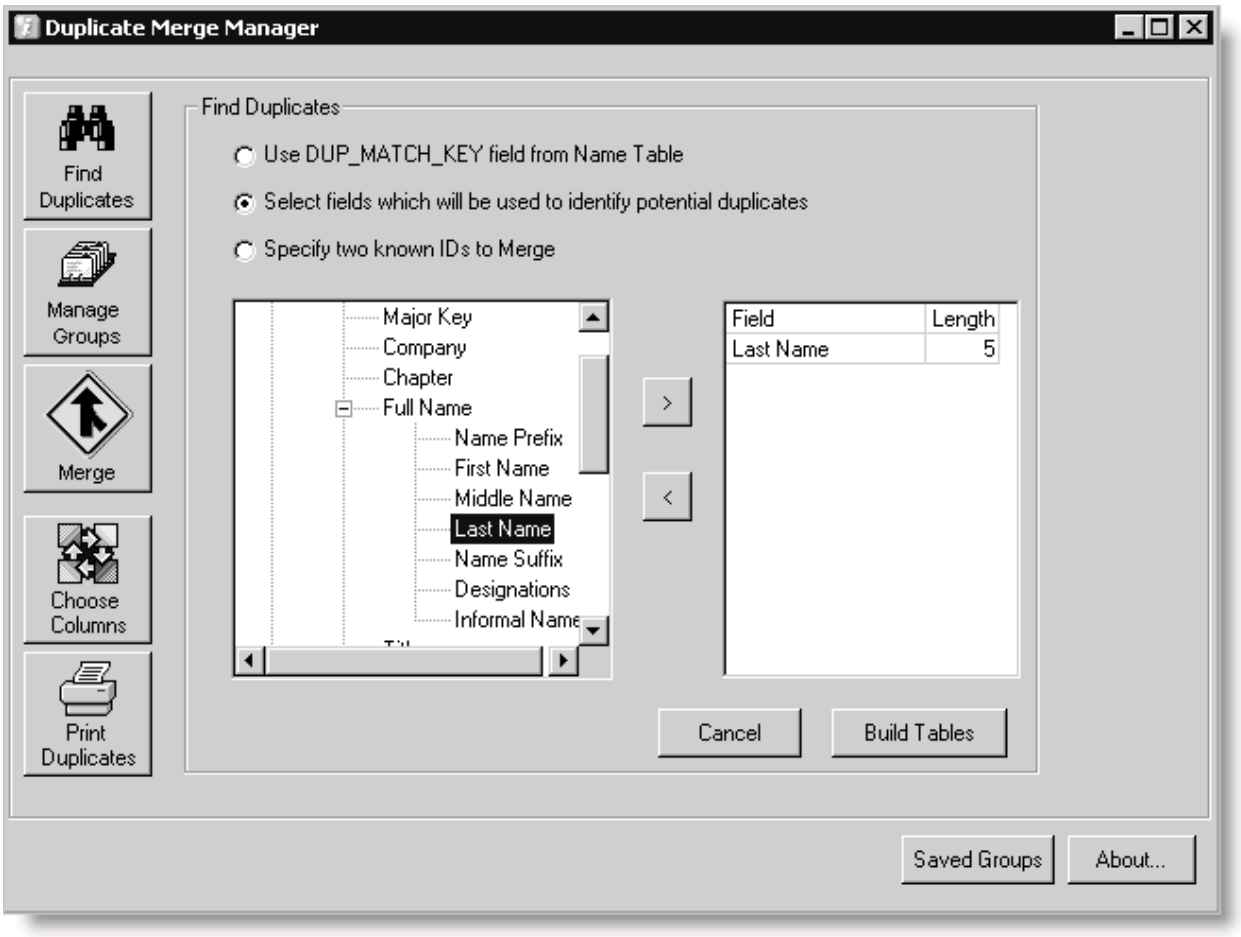
  Note: For performance reasons, you should select the most unique field first and then select the remaining fields in descending order based on their uniqueness.

6. After the field displays on the selection grid on the right side of the window, click the corresponding Length cell and enter the number of characters to be used for the comparison.

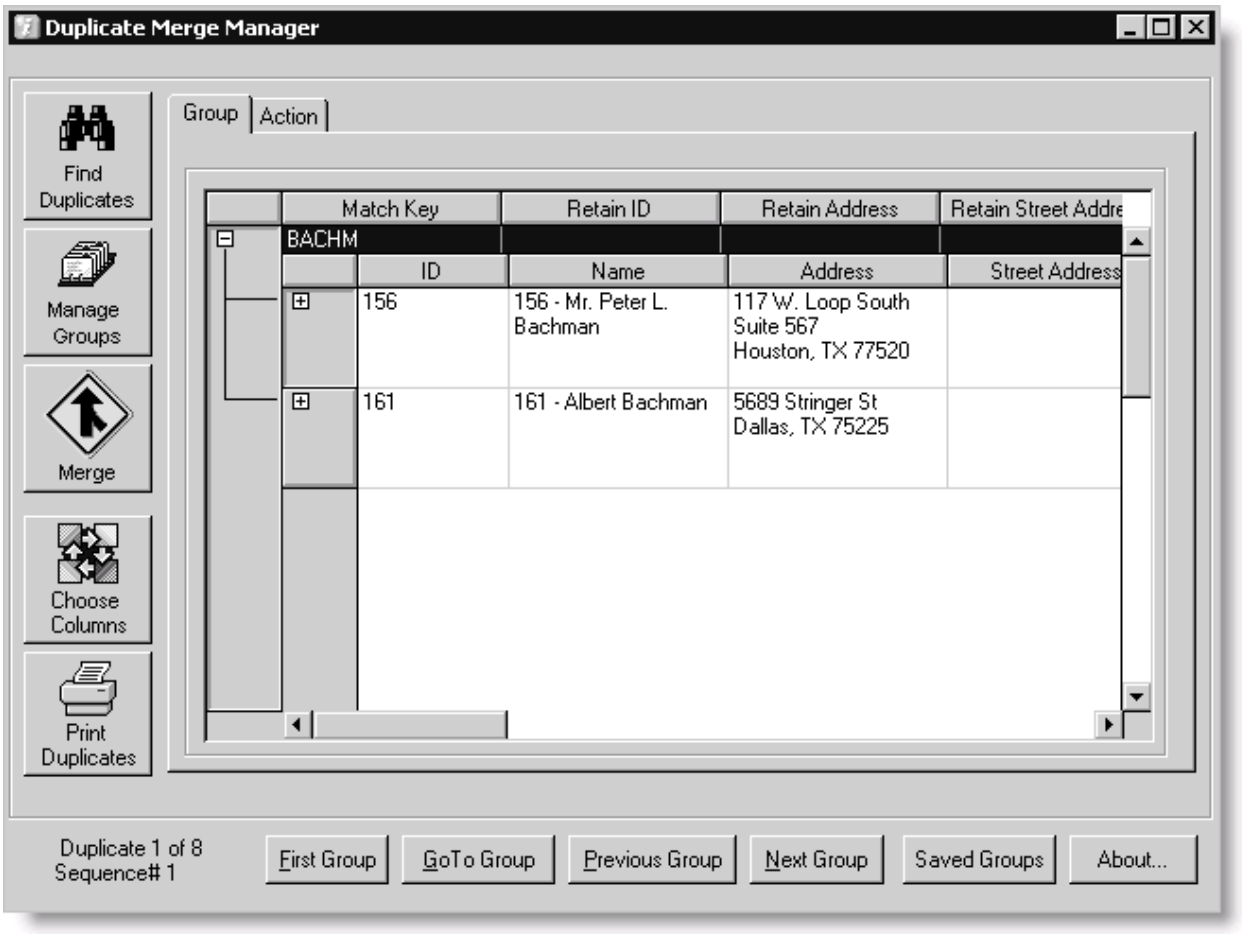
- A message displays if the length is not entered or if a non-numeric length is entered. Click OK and specify the Length.

  Note: If you decrease the number of characters used for the duplicate search, the match key is rebuilt. However, if you increase the number of characters used for the duplicate search, the match key is not rebuilt and the minimum number of characters previously specified is still used for the match key. To increase the number of characters used for the duplicate search, deselect the field, add the field back and specify the number of characters to be used for the duplicate search.

7. A message displays if the length is not entered or if a non-numeric length is entered. Click OK and specify the Length.
8. Repeat the process to create additional fields.
9. Click Build Tables. A message displays informing you that the process may take from 2 to 20 minutes.
   - If you click Build Tables before selecting any fields, a message displays informing you that you must select at least one field to identify duplicates. Click OK, select one or more fields and specify the Length for each field, and click Build Tables.
10. Click Yes. The first duplicate group found displays on the Group tab in the Manage Groups view on the Duplicate Merge Manager window. As you review the groups, the Duplicate x of y and Sequence# information displayed in the lower left corner of the window will update.
11. If no duplicate groups are found, a message displays indicating that no duplicates were found. Click OK.



In this example, DMM will search for all Name records in which the first five characters of LAST_NAME are identical. Records with the same criteria value or match key will be grouped together.



To directly merge two known IDs

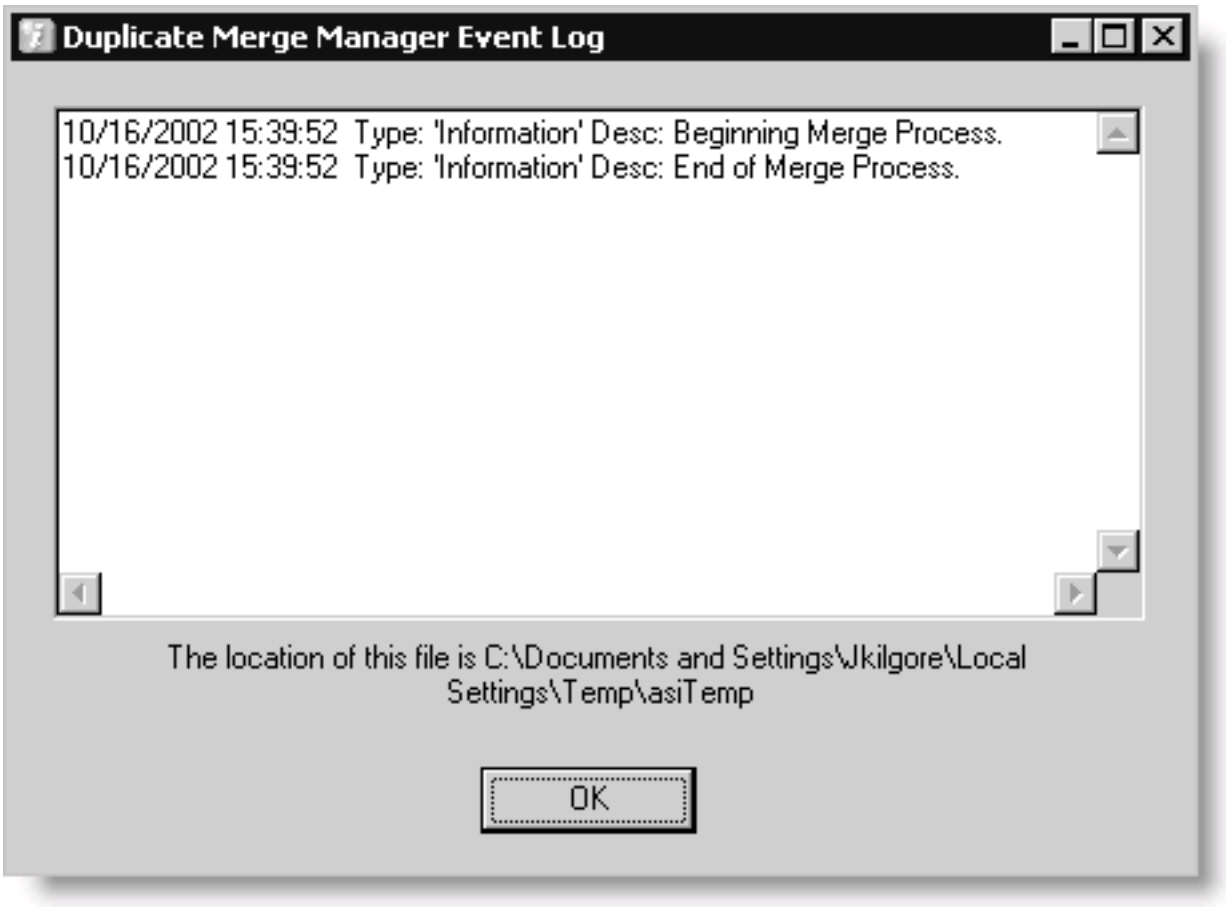
To skip the process of searching for possible duplicate records and directly merge two records which are known to be duplicates, you can use the Specify two known IDs to Merge option in the Find Duplicates view of the Duplicate Merge Manager window. See To Merge Two Known IDs.

To remove a duplicate group

You can delete a previously saved duplicate group without affecting any customer records in the group. This process involves viewing the Action tab for the group to be deleted, selecting any ID as the Retain ID, and moving all of the other IDs to the IDs to Keep list. When the Merge process is run, the duplicate group will be removed and the only changes that will be made to any of the customer records in the group are the Preferred Mail and Preferred Bill settings (if these settings have been changed).

1. From Customers, select Manage duplicates.
2. Click Saved Groups to display the Manage Groups view on the Duplicate Merge Manager window.
3. Click Find Group, GoTo Group, Previous Group, or Next Group to select the duplicate group to be removed.
4. Select the Action tab.
5. Select a Retain ID from the drop-down list of available duplicate record IDs.

   Note: Any ID can be selected as the Retain ID since no customer records in this duplicate group will be merged or deleted.
6. Select the Preferred Mail option for the Address, Street Address, or Home Address for the Retain ID.
7. Select the Preferred Bill option for the Address, Street Address, or Home Address for the Retain ID.
8. Move all of the IDs from the IDs to Merge list to the IDs to Keep list. The IDs in the IDs to Keep list will be ignored during the Merge process.
9. Move all of the IDs from the IDs to Delete list to the IDs to Keep list. The IDs in the IDs to Keep list will be ignored during the Merge process.
10. Click Save.
11. Click First Group, GoTo Group, Previous Group, or Next Group to view all other previously saved groups to confirm that any specified actions for these groups are correct.
12. Click Merge. A confirmation message displays indicating how many duplicate groups have been defined for merging.
13. Click Yes. When the Merge process has completed, a message displays indicating how many duplicate groups were processed.
14. Click Yes to view the event log, or click No to skip viewing the event log. If you click Yes, an event log displays.



Viewing duplicate groups

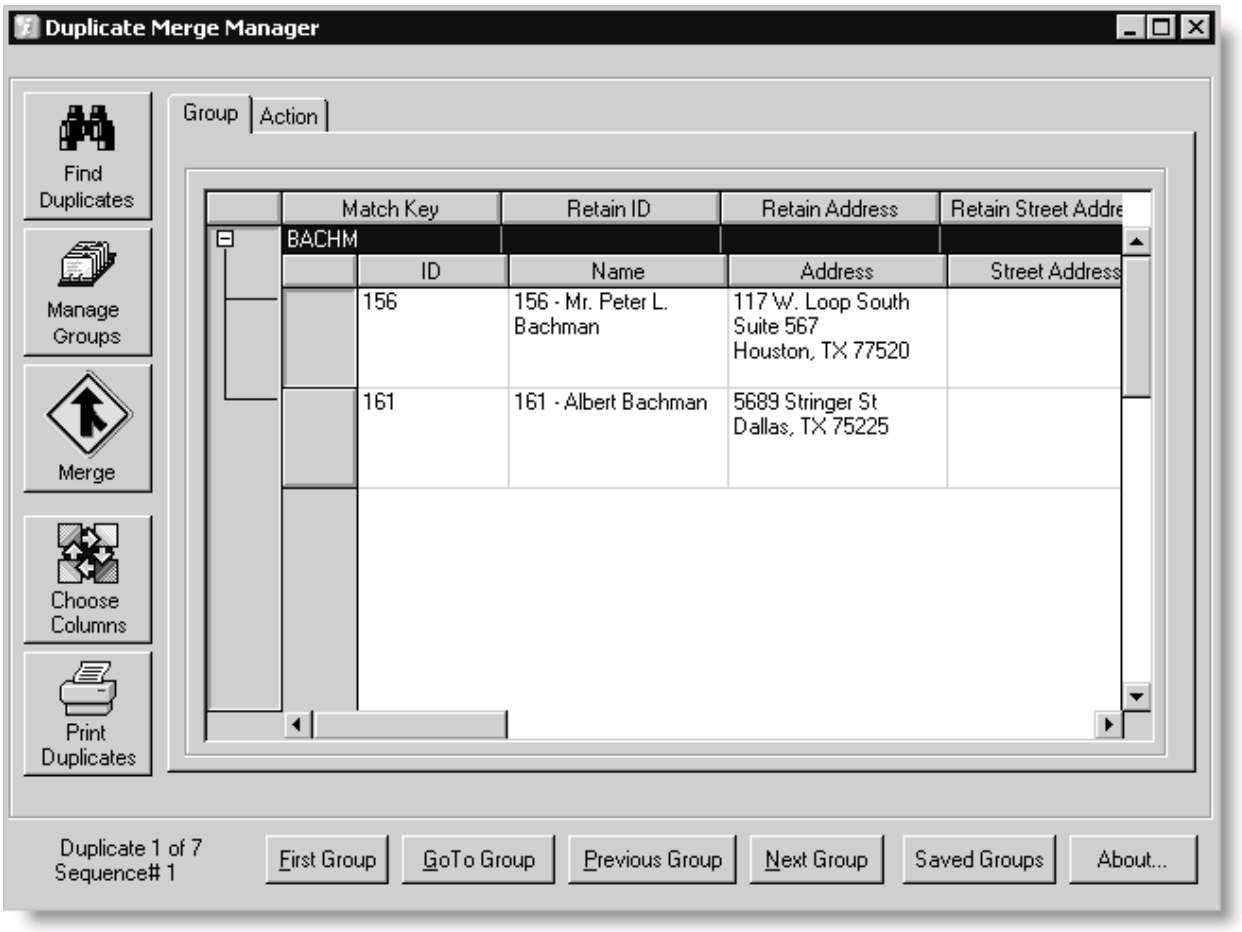
For performance reasons, the grid displays each duplicate group and its corresponding MatchKey one at a time. Compare the information from each individual record in the duplicate group to determine which ID to use as the Retain ID and which records should be kept, merged into the retained record, or deleted.

Duplicate Merge Manager uses temporary and permanent tables to store information on duplicate groups and the actions to be performed for these groups. When you run the Find Duplicates process, the results are stored in temporary tables. If you run the Find Duplicates process again or close the Duplicate Merge Manager session, this information is lost. The sequence numbers in the temporary tables are reset to begin at 1 and are reused each time the Find Duplicates process is run.

To save the information for a duplicate group, while viewing the group on the Action tab on the Manage Groups view of the Duplicate Merge Manager window, click Save. The group information and any specified actions are saved to the DMM permanent tables. The saved group information and specified actions can be recalled later by clicking Saved Groups and these groups can then be managed and merged.

When you save duplicate group information, the group is assigned a sequence number. This sequence number is permanent and does not change when Duplicate Merge Manager is closed and then restarted. Sequence numbers are never re-used, even after the duplicate group which was assigned the sequence number has been merged and no longer exists. For example, if you run the Find Duplicates process and duplicate groups 1 through 5 are returned, these groups are stored in the temporary tables as sequences 1 through 5. If you manage group 5 and save this group, a message displays informing you of the group's new sequence number (in the permanent tables). If the group's new sequence number is 17, it retains this sequence number when Duplicate Merge Manager is closed and then restarted. After all saved groups have been merged, the sequence numbers in the permanent tables do not restart at 1, but continue to increment. For example, if the last saved group was assigned sequence number 17 and all saved groups have been merged, the next group you save will be assigned the sequence number 18.

Group tab in Manage Groups view on Duplicate Merge Manager window



From Customers, select Manage duplicates, click Manage Groups, and select the Group tab. In this example, the Find Duplicates process found a total of seven possible duplicate groups. The first group is displayed.

Group tab

Select this tab to view the groups and records within the groups you have created. The group includes the records associated with each group and the name and address information for each record. To view more information about the individual records in a group, click Choose Columns and select the additional fields or columns to display.

Action tab

After viewing the records in a duplicate group, select the Action tab to select the record to retain, the addresses to keep, the addresses to use for preferred mailing and preferred

billing, the records to merge into the retained record, and the records to delete. The records in a duplicate group can also be retained without any changes.

Duplicate y of z

(read only) Displays the number of the currently displayed group (y) and the total number of duplicate groups (z).

Sequence#

(read only) Displays the sequence number of the currently displayed group.

First Group button

Displays the first duplicate group.

Go To Group button

Displays the DMM GoTo Sequence Number window, where you can enter the sequence number of a duplicate group to review.

Previous Group button

Displays the previous duplicate group.

Next Group button

Displays the next duplicate group.

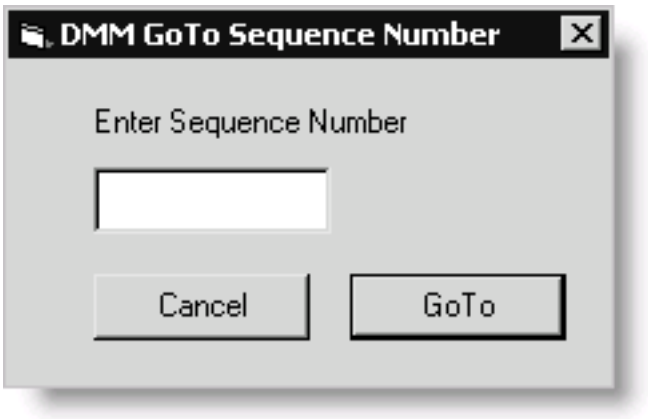
Saved Groups button

Used to load the duplicate groups that were saved to the permanent tables during the current or previous Duplicate Merge Manager sessions. You can then manage and merge these groups, as well as continue to find, manage, and merge new duplicate groups. Duplicate groups found and saved in previous Duplicate Merge Manager sessions are not accessible until you click the Saved Groups button.

About button

Used to display the About DMM window. Duplicate Merge Manager version information displays in this window.

DMM GoTo Sequence Number window



Click Manage Groups and click GoTo Group

Enter Sequence Number

Enter the sequence number of the duplicate group to review.

GoTo button

Used to display the specified duplicate group.

If the specified duplicate group does not exist, a message displays stating that there are no more Duplicate Groups to display.

To find specific duplicate groups

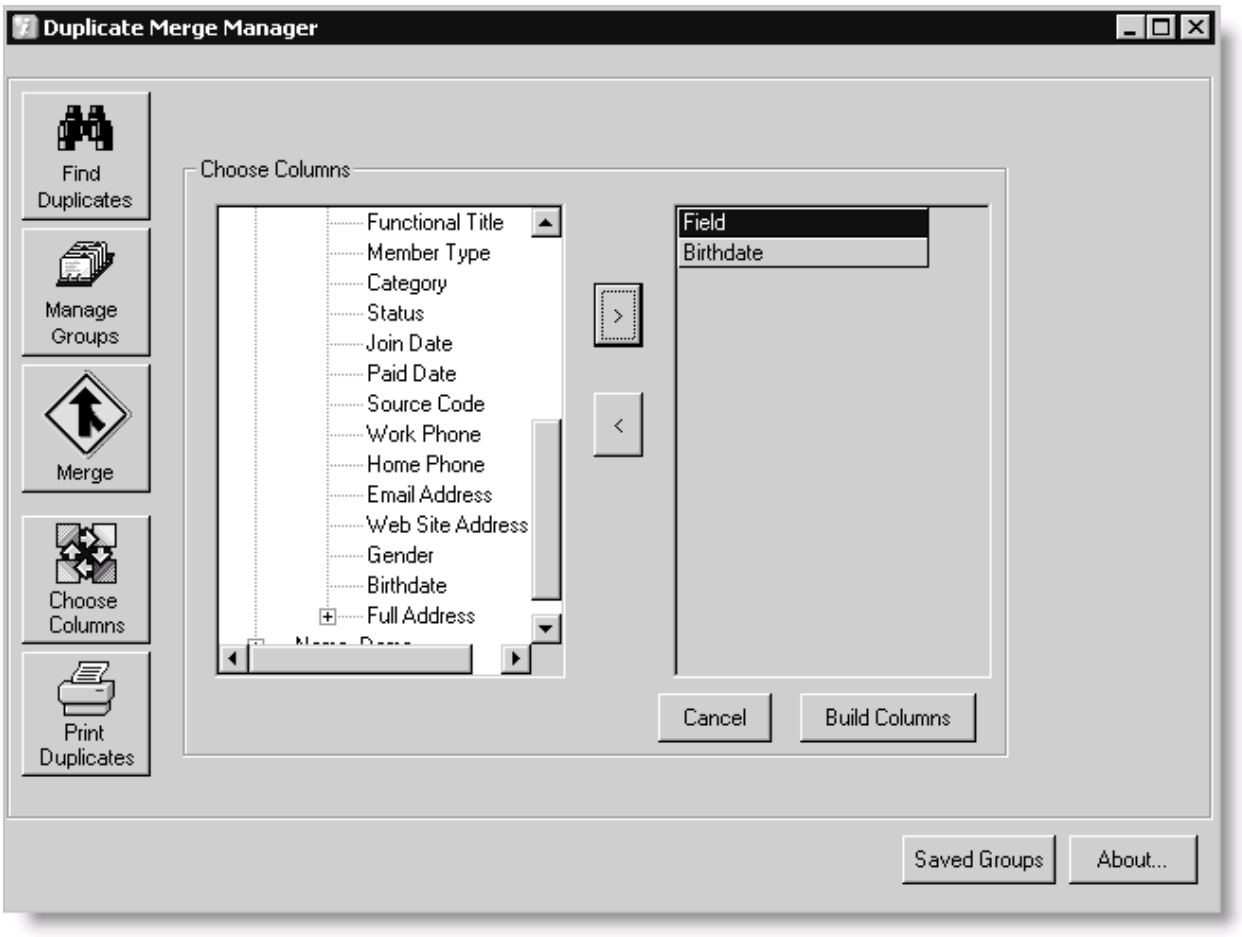
1. From the Manage Groups view on the Duplicate Merge Manager window, click GoTo Group to display the DMM GoTo Sequence Number window.
2. Enter the sequence number of the duplicate group to review in the Enter Sequence Number field.

- If a non-numeric value is entered, a message displays indicating that the sequence number must be numeric. Click OK and enter the sequence number.

3. Click GoTo to display the duplicate group.

- If the group does not exist, a message displays indicating that there are no duplicate groups to display. Click OK, enter the correct sequence number, and click GoTo.

Choose Columns view on Duplicate Merge Manager window



From Customers, select Manage duplicates, and then select Choose Columns

Choose Columns

Select the additional record fields to display on the Group tab on the Manage Groups view of the Duplicate Merge Manager window from this list. If a + symbol is displayed to the left of the table name, click the + symbol to expand the table and view all available fields.

Note: Note: The Name.WORK_PHONE and Name.HOME_PHONE fields can be selected for display.

> **Note:** Note: User-defined tables used in Find Duplicates, Manage Groups, and Choose Columns must have an index on the ID field.

Field

To display a record field on the Group tab on the Manage Groups view of the Duplicate Merge Manager window, select the field in the Choose Columns list and copy it to the Field list using one of the following methods:

- Double-click the field.
- Select the field and click >.
- Drag and drop the field onto the grid on the right side of the window.

Cancel button

Used to cancel the selections you have made on the Choose Columns view and display the Duplicate Merge Manager window.

Build Columns button

Used to save your record field display selections. Your selections are saved and will be used when viewing records on the Group tab on the Manage Groups view of the Duplicate Merge Manager window until you specify a different set of selections on the Choose Columns view of the Duplicate Merge Manager window and click Build Columns again. (The specified set of Choose Columns selections are retained when the Duplicate Merge Manager is closed and then restarted.)

Saved Groups button

Used to load the duplicate groups that were saved to the permanent tables during the current or previous Duplicate Merge Manager sessions. You can then manage and merge these groups, as well as continue to find, manage, and merge new duplicate groups. Duplicate groups found and saved in previous Duplicate Merge Manager sessions are not accessible until you click the Saved Groups button.

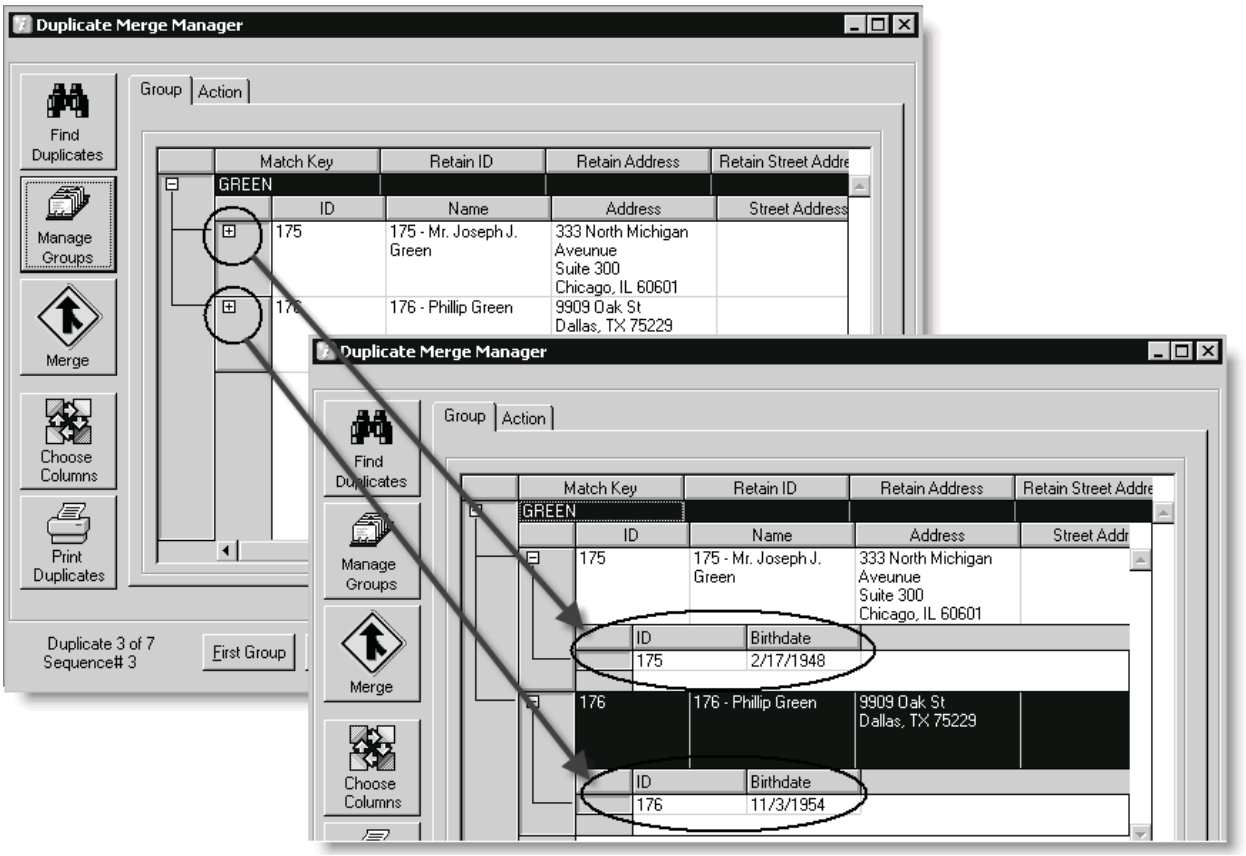
To view additional fields in individual duplicate records

You can view other record fields in addition to the name and address fields.

1. Click Choose Columns to select additional columns to display in the individual grids.
2. Select the additional field to view using one of the following methods:

- Double-click the field.
- Select the field and click >.
- Drag and drop the field onto the grid on the right side of the window.

3. Repeat the process to view additional fields.
4. Click Build Columns to store the selected fields in the iMIS System_Params table with the ParameterName value of DuplicateMergeFields. A message displays indicating that your selected columns have been saved.
5. Click OK.
6. Click Manage Groups to display the Manage Groups view on the Duplicate Merge Manager window. The + button displayed to the left of the ID column indicates that additional fields were selected:
7. When you click the + button displayed to the left of the ID column, the additional fields expand so that they can be viewed.



Note: Note: If you click Choose Columns again, the previously selected fields are not saved. You can select different fields to display, or click Cancel to retain the previously selected fields.

Note: Note: When you select a different duplicate group to view or click Manage Groups again, the new fields you selected can be viewed for each record by clicking the + button displayed to the left of the ID column.

Note: Note: The name of the table associated with each Chapter is displayed in a legend at the bottom of the grid area.

To print the Duplicate Group List

You can print the list of duplicate groups, which lists the sequence number, Match Key, and Retain ID (if a Retain ID is specified) for each current duplicate group. The user must have a Customers authorization level of 8 to print the Duplicate Group List.

The duplicate groups you are currently viewing, whether the result of running the Find Duplicates process or of clicking Saved Groups, are printed on the Duplicate Group List.

- Click Print Duplicates on the Duplicate Merge Manager window to print the Duplicate Group List.

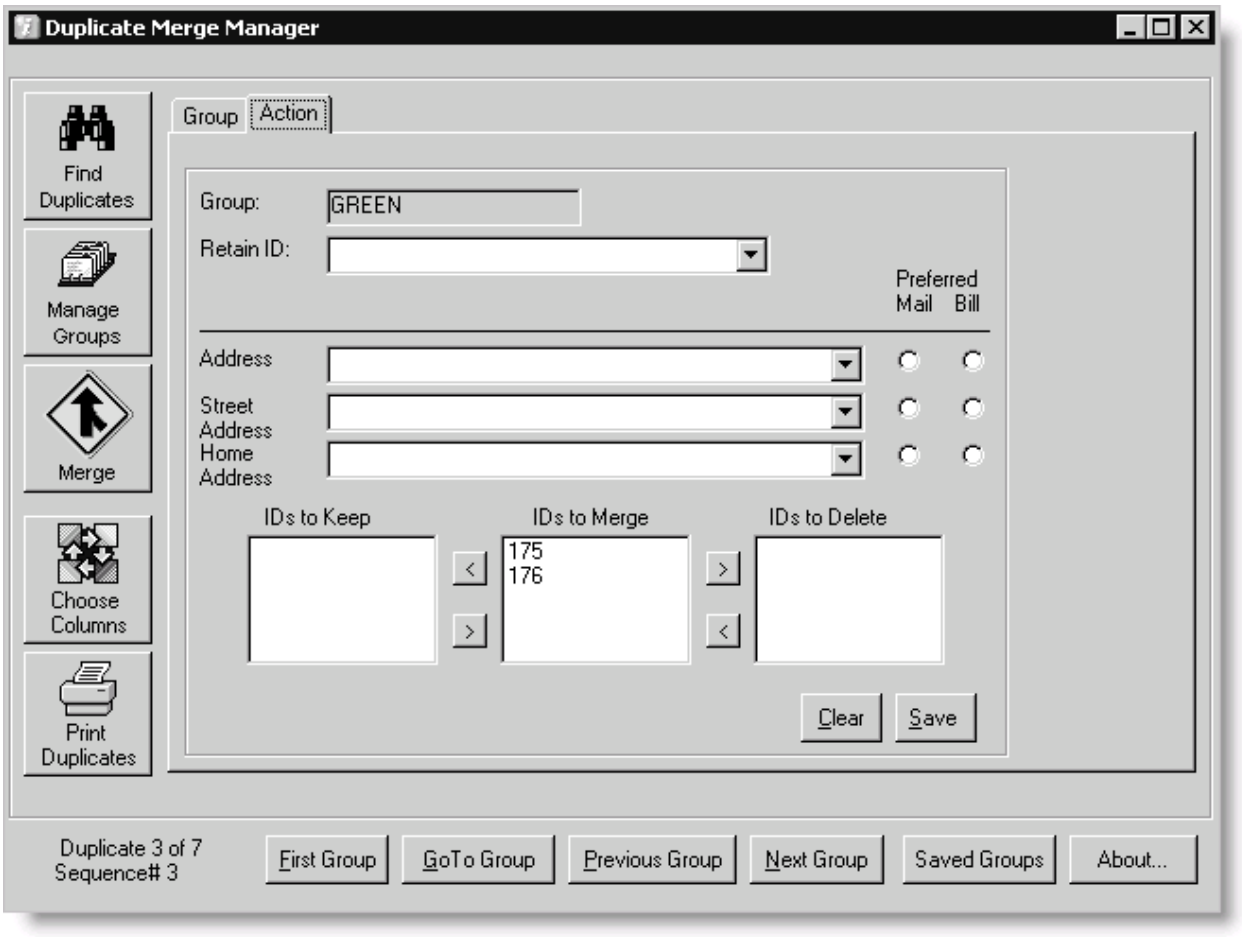
> **Note:** Note: Clicking this button will print the iMIS Duplicate Merge Manager - Duplicate Group List, regardless of the setting specified on the Report Destination window.

Managing group records

After you have viewed the duplicate groups, you can select records to be merged, deleted, or kept.

Only one user at a time can manage a particular duplicate group. However, multiple users can simultaneously manage different duplicate groups. For example, user Tim can review groups 1 through 10 and user Susan can simultaneously review groups 11 through 20, but user Tim and user Susan cannot review group 30 at the same time.

Action tab in Manage Groups view on Duplicate Merge Manager window



From Customers, select Manage duplicates, click Manage Groups, and select the Action tab

Group tab

Select this tab to view the groups and records within the groups you have created. The group includes the records associated with each group, along with the name and address information for each record. To see more information about the individual records in the group, click Choose Columns and select additional fields or columns.

Action tab

After viewing the records in the duplicate groups, select the Action tab. Select the record to retain, the addresses to keep, the addresses to use for preferred mailing and preferred

billing, the records to merge into the retained record, and the records to delete. There is also an option to keep a record unchanged.

Group

(read only) Displays the duplicate group name.

Retain ID

Enter the Retain ID, or select the Retain ID from the drop-down list.

Address

Displays the address of the Retain ID. You can enter a new address or select an address from the drop-down list.

Street Address

Displays the street address of the Retain ID. You can enter a new street address or select a street address from the drop-down list.

Home Address

Displays the home address of the Retain ID. You can enter a new home address or select a home address from the drop-down list.

Preferred Mail

Select this option to specify the Address, Street Address, or Home Address as the preferred mailing address.

Preferred Bill

Select this option to specify the Address, Street Address, or Home Address as the preferred billing address.

IDs to Keep

Lists the IDs currently selected to be kept “as is.” You can use the < and > buttons to move the IDs that are to be kept “as is” to this list.

IDs to Merge

Lists the IDs currently selected for merging into the Retain ID. You can use the < and > buttons to move the IDs that are to be merged with the Retain ID to this list.

> **Note:** Note: Initially, all of the IDs in the duplicate group are placed in the IDs to Merge list.

IDs to Delete

Lists the IDs currently selected for deletion. You can use the < and > buttons to move the IDs that are to be deleted to this list.

Clear button

Used to clear the Retain ID field, the IDs to Keep list, and the IDs to Delete list.

Save button

Used to save your merge action selections for this group.

Duplicate y of z

(read only) Displays the number of the currently displayed group (y) and the total number of duplicate groups (z).

Sequence#

(read only) Displays the sequence number of the currently displayed group.

First Group button

Displays the first duplicate group. The group is displayed on the Group tab on the Manage Groups view of the Duplicate Merge Manager window.

Go To Group button

Displays the DMM GoTo Sequence Number window, where you can enter the sequence number of the next duplicate group to review.

Previous Group button

Displays the previous duplicate group. The group is displayed on the Group tab on the Manage Groups view of the Duplicate Merge Manager window.

Next Group button

Displays the next duplicate group. The group is displayed on the Group tab on the Manage Groups view of the Duplicate Merge Manager window.

Saved Groups button

Used to load the duplicate groups that were saved to the permanent tables during the current or previous Duplicate Merge Manager sessions. You can then manage and merge these groups, as well as continue to find, manage, and merge new duplicate groups. Duplicate groups that were previously found and saved are not accessible until you click the Saved Groups button.

About button

Used to display the About DMM window. Duplicate Merge Manager version information displays in this window.

To select the Retain ID and the IDs to Merge

> **Note:** Note: A Retain ID is required in order to process the merge.

1. Select Manage Groups to display the Manage Groups view on the Duplicate Merge Manager window.
2. Click Find Group, GoTo Group, Previous Group, or Next Group to select the duplicate group for which you wish to make selections.
3. Select the Action tab. The Action tab displays on the Duplicate Merge Manager window.

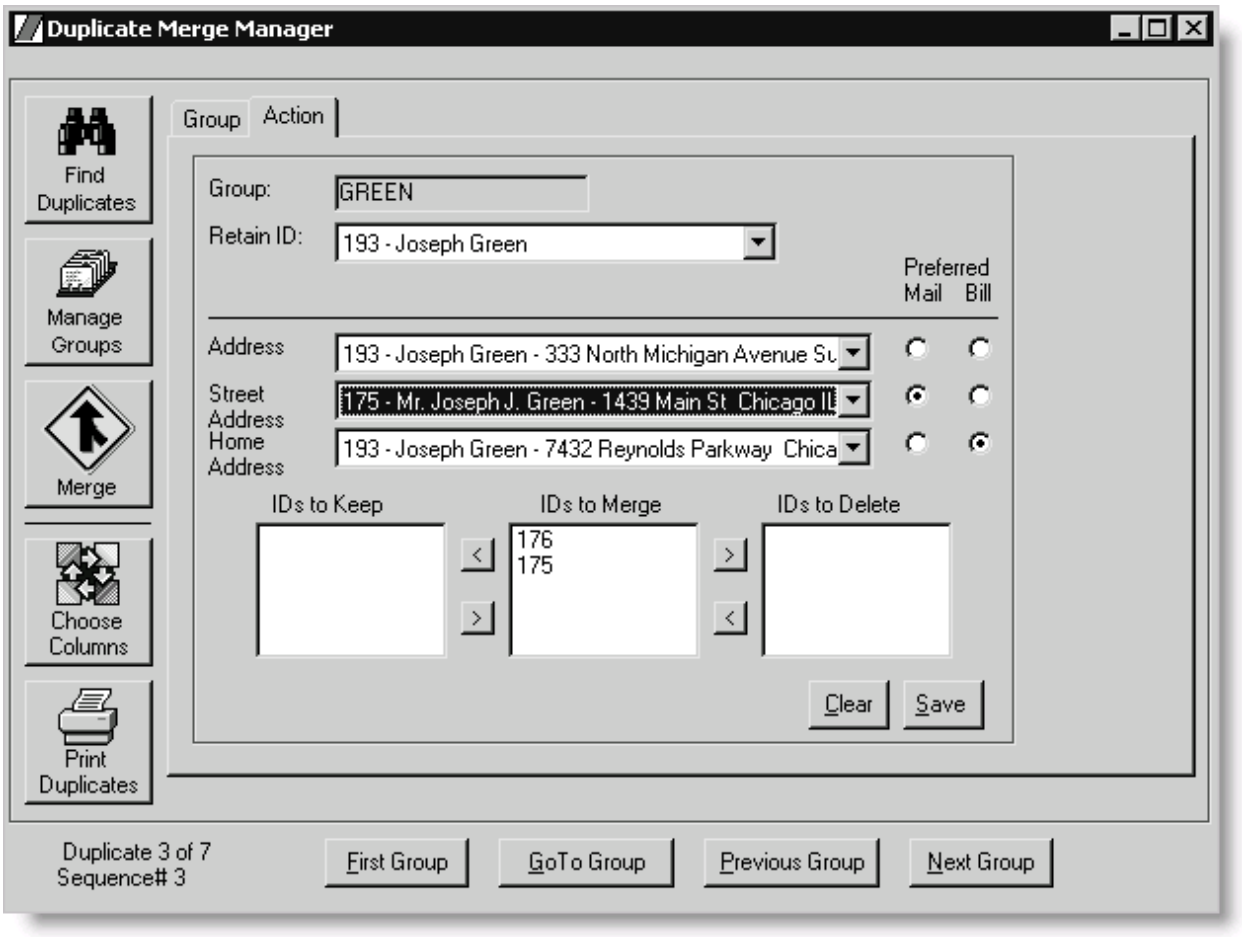
   Note: Initially, all of the IDs in the duplicate group are placed in the IDs to Merge list.
4. Select the Retain ID from the drop-down list of available duplicate record IDs. Only one ID per group can be selected as the Retain ID.

5. Select the addresses to be retained[d] for the Address, Street Address, and Home Address (Main, 2nd, and 3rd) from the drop-down list.

   Note: Prompts for the three address fields are based on the prompt names set in the Customer Setup – Address and Notes window (from Customers, select Set up module> General, and click Address and Notes).

6. Select the preferred mail address by selecting the Preferred Mail option to the right of the Address, Street Address, or Home Address.

7. Select the preferred billing address by selecting the Preferred Bill option to the right of the Address, Street Address, or Home Address.



This example of the Action tab in the Manage Groups view on the Duplicate Merge Manager window shows the Preferred Mail and Preferred Bill options set for the Street Address and Home Address, respectively.

> **Note:** Note: If you do not change an Address selection or a Preferred Mail or Preferred Bill preference, the address information for the Retain ID remains the same as it was before the merge.

To select the IDs to Keep

There may be records in the duplicate group that you determine are not duplicates and that you want to maintain as they currently exist in iMIS. In this case, you can move these records from the IDs to Merge list to the IDs to Keep list.

1. Select the IDs to be kept “as is” in the IDs to Merge list.
2. Click < to move the selected IDs to the IDs to Keep list. These IDs will be ignored during the merge process.

Selecting the IDs to delete

When you select a record for deletion, Duplicate Merge Manager checks to make sure that the target ID can be deleted validly. An ID cannot be deleted if any of the following conditions are true:

- There is no Retain ID.
- There is an open invoice with a non-zero balance where the BT_ID equals the target ID.
- There is an open order where the BT_ID equals the target ID and the order stage is not completed, cancelled, closed, or empty.
- There is an active subscription record where the ID equals the target ID.
- There is a registration for an open event where the ST_ID equals the target ID.
- There is a dependent Referral record where the PROVIDER_ID equals the target ID (and REFERRAL_FEE > 0 and READY_TO_INVOICE = 1 and ORDER_NUMBER = 0).

- There is a Name record where the BT_ID or CO_ID equals the target ID.
- There is a Name_Fin record where the BT_ID equals the target ID.

To select IDs to delete

1. Select the IDs to be deleted in the IDs to Merge list.
2. Click > to move the selected IDs to the IDs to Delete list.

Note: If a record cannot be deleted, a warning message displays explaining why the record cannot be deleted. Minimize the Duplicate Merge Manager window and find the customer record in iMIS to verify the error. For example, if the message indicates that an active subscription exists for this ID, check the Dues/Subscription Item Detail window for this ID (from Customers, find the customer record, select the Billing tab, and double-click on a line item) to see if there are any active subscriptions. A subscription can have a zero balance and still give this message when the status is A (Active).

To save the selections to merge during the current DMM session

1. After you have selected the Retain ID, the IDs to Keep, the IDs to Merge, and the IDs to Delete, click Save. A message displays asking if you want to store this group to be merged later.
2. Click No.
3. You can review another duplicate group by clicking the appropriate group button. You can override the saved data for a group by changing your selections on the group's Action tab and clicking Save.

To save the selections to merge during a later session

1. After you have selected the Retain ID, the IDs to Keep, the IDs to Merge, and the IDs to Delete, click Save. A message displays asking if you want to store this group to be merged later.

2. Click Yes. A message displays indicating the group's sequence number.
3. Click OK. The group can be merged by clicking Saved Groups and then Merge during the current Duplicate Merge Manager session or during a later session. You can continue reviewing duplicate groups. The next available duplicate group is displayed, or you can select a duplicate group by clicking the appropriate group button.

   Note: The next available duplicate group displayed is the group with the lowest sequence number that has not yet had any merge actions specified with the Manage Groups function.

   To edit the selections

   Values saved on the Action tab can be edited at any time prior to the Merge process.

1. Click Manage Groups to display the Manage Groups view on the Duplicate Merge Manager window.
2. Click Find Group, GoTo Group, Previous Group, or Next Group to display the group to edit.
3. Select the Action tab.
4. Edit the IDs to Keep, IDs to Merge, and IDs to Delete lists as needed, or click Clear to clear all of the lists.
5. Click Save. If you do not click Save, a message displays when you exit the Manage Groups view on the Duplicate Merge Manager window asking if you want to save the changes you have made on the Action tab. Click Yes to save the changes, or click No to cancel your changes.

Merging and deleting records

After you have used the Manage Groups view on the Duplicate Merge Manager window to select the records to be merged, deleted, and kept and have saved the groups, you can use Duplicate Merge Manager to merge the records. You can perform a Merge while other iMIS users are connected to the system.

> **Note:** Note: When you click Merge, all of the current duplicate groups are merged unless you are performing a merge of two known IDs. You should review all duplicate groups for accuracy and any conflicts before performing the Merge operation.

> **Note:** Caution! It is strongly recommended that you perform a backup of the database before merging records. The Merge process is final. If any records are merged or deleted in error, you will need to restore your database from a backup.

To merge duplicate groups

1. (optional) If you want to merge previously saved duplicate groups, click Saved Groups. A message displays to let you know that if you are currently viewing groups that have not been saved to the permanent table, they will not be maintained.
2. Click Yes. The first saved group displays on the Group tab on the Manage Groups view of the Duplicate Merge Manager window.
3. Click Merge. A confirmation message displays indicating how many duplicate groups have been defined for merging.

   Note: If two or more users have prepared the same group for a merge, Duplicate Merge Manager will probably log an error indicating that it was unable to merge the group because one of the IDs does not exist when it attempts to merge the group the second time. You can remove the extra duplicate group before running the Merge process to prevent this problem. See To remove a duplicate group for information on deleting a previously saved group.

   For performance reasons, indices are built on the following tables:

- Invoice
- Orders
- Trans

- Activity
- Name_FR (One on ID and one on SOLICITOR_ID)

  These indices will remain on the tables unless you restore the .Ibr files or perform an iMIS upgrade.

4. Click Yes. After the indices have been built, the merge process automatically begins and a message indicating the merge progress displays in the Duplicate Merge Manager window.

   For each duplicate group that has a Retain ID selected, the utility re-verifies each ID's delete status against the current iMIS database. If a record does not pass the verification process, the error is logged to the event log file. All Merge process messages except for the initial warning, halting errors (errors that prevent the Merge process from continuing), and the final completion message are written to the event log rather than being displayed.

   Note: When an error occurs for a group, the merge process continues with the next group; a group with an error will not be merged. For example, if there are four IDs to delete in a group and an error occurs with the first ID, the remaining IDs in the group to delete will not be verified (there may be additional errors on the remaining IDs) and Duplicate Merge Manager will verify the next group for the merge.

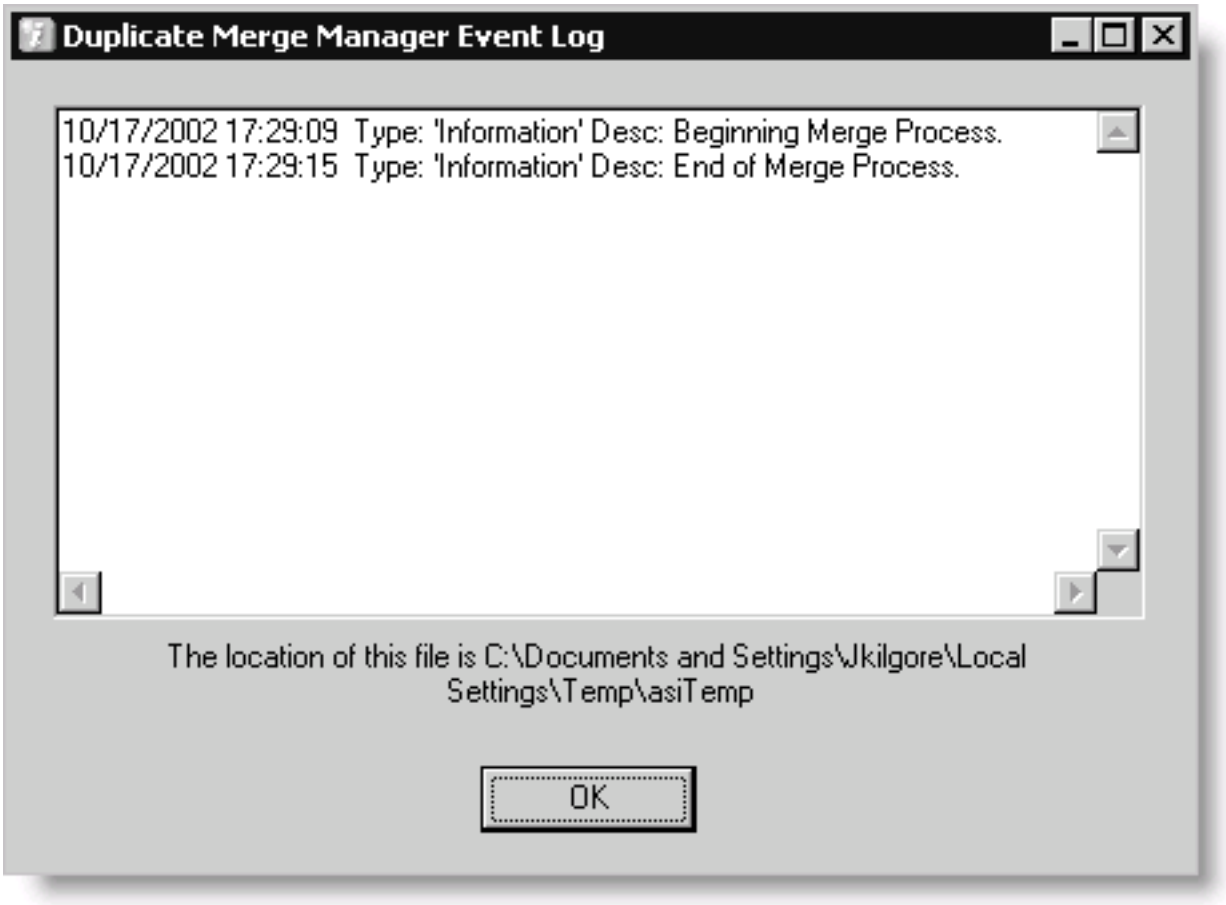
   If a record passes the verification process, the address fields for the Retain ID are set to the values selected in the Action tab. All records marked for deletion that meet the deletion criteria are deleted. All subordinate records of the Merge IDs are copied to the Retain ID and the Merge IDs are then deleted.

5. After the Merge process has completed without errors, a message displays indicating how many duplicate groups were merged.

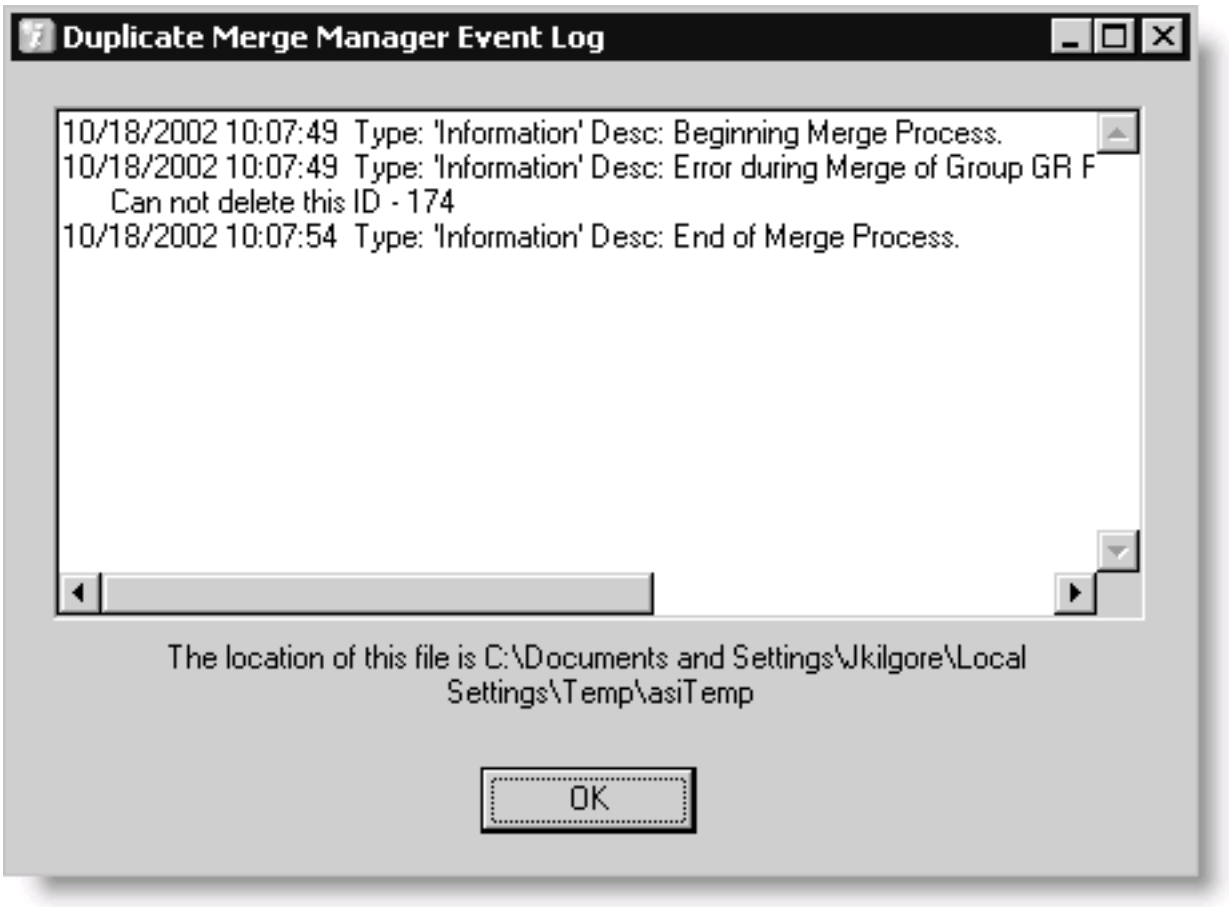
- If there are errors, a message displays with the number of groups processed and the number of groups in error.

  Note: The group Retain IDs that did not merge are stored in DUPLICATE_GROUP.Retain_ID.

6. Click OK. Fix the errors or update the action that was selected for the group and then run the merge again.
7. Click Yes to display the event log, or click No to skip viewing the event log.
8. If you click Yes, an event log displays.
9. After viewing the event log, click OK. The Duplicate Merge Manager window displays.
10. If you click No, the Duplicate Merge Manager window displays.



Example of Duplicate Merge Manager Event Log window after successful Merge process with no errors



Example of Duplicate Merge Manager Event Log window after a Merge process in which an error occurred

To merge two known IDs

1. From Customers, select Manage duplicates.
2. Click Find Duplicates. The Find Duplicates options display.
3. Select Specify two known IDs to Merge.
4. Enter the first ID in the ID 1 field and press Tab. The name and company for the first ID display. If the ID is not valid, a message displays indicating that the ID is not valid.
5. Enter the second ID in the ID 2 field and press Tab. The name and company for the second ID display. If the ID is not valid, a message displays indicating that the ID is not valid. The Duplicate Merge Manager window should appear similar to the following:

6. Click Build Tables. A message displays informing you that the process may take from 2 to 20 minutes.

   Note: If either ID is not valid, a message displays indicating that you must specify two existing IDs. Click OK, specify valid IDs for ID 1 and ID 2, and click Build Tables. A message displays informing you that the process may take from 2 to 20 minutes.

7. Click Yes. The duplicate group containing the two specified IDs displays on the Group tab in the Manage Groups view on the Duplicate Merge Manager window. The Duplicate Merge Manager window should appear similar, now containing tables and a Group tab and an Action tab.
8. Select the Action tab.
9. Select the Retain ID from the drop-down list.
10. Select the Preferred Mail option for the Address, Street Address, or Home Address.
11. Select the Preferred Bill option for the Address, Street Address, or Home Address.
12. Specify whether the ID that will not be retained should be merged with the Retain ID or deleted.

    - To merge the ID with the Retain ID, leave the ID in the IDs to Merge list.
    - To delete the ID, select the ID and use the > button to move the ID to the IDs to Delete list.

13. Click Save. A message displays.
14. You can perform the Merge operation for the two IDs now or save the group containing the two IDs so that the group can be merged later.

    - To perform the Merge operation for the two IDs now, click No and then click Merge.

      Note: If you click No, you must perform the Merge operation immediately. If you run another Find Duplicates process before merging the group containing the two IDs, the temporary tables are overwritten and you will not be able to merge these two IDs without first performing this entire procedure again.

15. Click Merge. A confirmation message displays indicating how many duplicate groups have been defined for merging. Click Yes. A message displays indicating that the merge has completed. Click Yes to view the event log, or click No to skip viewing the event log. For more information on the event log, see To merge duplicate groups.
16. To save the group containing the two IDs to be merged later, click Yes. A message displays indicating the sequence number for the saved group. Click OK. A message displays indicating that no duplicates were found. Click OK. The duplicate group containing the two IDs is saved in the permanent tables and can be recalled later by clicking Saved Groups. You can continue finding and managing duplicate groups or proceed to the Merge process as needed.

Merge actions performed for IDs to merge

During the merge process, the following fields are updated to the value of the Retain ID if they contain the value of any ID from the IDs to Merge list.

Cert_Register	STUDENT_ID, BT_ID
Comment_Log	ID
Comment_Types	ID
Invoice	BT_ID, ST_ID
Invoice_Lines	ST_ID
Meet_Hotel	ID
Meet_Master	CONTACT_ID
Name	CO_ID, BT_ID
Name_Fin	BT_ID
Name_FR	SOLICITOR_ID
Name_Log	ID
Orders	BT_ID, ST_ID, CO_ID (Non-meeting orders only)
Ref_Client	CLIENT_ID
Ref_Provider	PROVIDER_ID
Referral	CLIENT_ID, PROVIDER_ID

Relationship	ID, TARGET_ID
Trans	BT_ID, ST_ID, SOLICITOR_ID
User-defined tables	ID (If the Multiple Instances Allowed option for the table is enabled)

If the following fields contain the values of any of the IDs in the IDs to Merge list, they are also updated to the value of the Retain ID, but only if a record with the Retain ID value does not already exist.

Name_FR	ID
Name_Pic-ture	ID
Name_Note	ID (if a note record with the same Name_Note.PURPOSE does not exist for the Retain ID)
Name_Staff	ID
Subscriptions	ID (If a subscription with the same PRODUCT_CODE does not exist for the Retain ID)
User-defined tables	ID (If the Multiple Instances Allowed option for the table is disabled and the Always Create option is not enabled)

> **Note:** Note: If the Always Create option for a user-defined table is enabled, the table will never be merged.

Merging records with open meeting records

When a Merge ID has open meeting records, records linked to the Merge ID in the Order_Badge and Orders tables may or may not be updated to the Retain ID, depending on whether the Disable Auto Flow Down of company address Information option is enabled (from Customers, select Set up module > General, and click Advanced). If the Disable Auto Flow Down of company address information option is enabled, these records are not updated to the Retain ID.

If the Update open meetings addresses with address changes option is enabled (from Customers, select Set up module > General, and click Advanced), the following fields in the Orders table are updated when SOURCE_SYSTEM=MEETING and ST_ID or CO_ID are being merged:

PREFIX

FIRST_NAME

MIDDLE_NAME

LAST_NAME

SUFFIX

DESIGNATION

INFORMAL

TITLE

COMPANY

ADDRESS_1

ADDRESS_2

CITY

STATE_PROVINCE

ZIP

BAR_CODE

COUNTRY

FULL_NAME

FULL_ADDRESS

CO_ID

ST_ID

COMPANY_SORT

EMAIL

DPB

CRRT

PHONE

FAX

LAST_FIRST

In addition, the following fields in the Order_Badge table are updated:

PREFIX FIRST_NAME

MIDDLE_NAME

LAST_NAME

SUFFIX DESIGNATION

INFORMAL

TITLE

COMPANY

ADDRESS_1

ADDRESS_2

CITY

STATE_PROVINCE

ZIP

BAR_CODE

COUNTRY

FULL_NAME

FULL_ADDRESS

If the Update open meetings addresses with address changes option is disabled (from Customers, select Set up module > General and click Advanced), none of these fields other than ST_ID and CO_ID in the Order_Badge and Orders tables are updated during a merge.

After the Merge IDs' records have been copied to the Retain ID and the addresses have been updated as selected on the Action tab, the Merge IDs' records are deleted from the following tables:

Name

Name_Address

Name_Fin

Name_FR

Name_Indexes

Name_Picture

Name_Security

Name_Security_Groups

Name_Staff

Merge actions performed for IDs to delete

During the merge process, the records in the following tables are deleted if any of the fields listed contain the value of any ID from the IDs to Delete list.

Cert_Register	ID, STUDENT_ID
Invoice	BT_ID
Invoice_Lines	Invoice.BT_ID
Meet_Hotel	ID
Meet_Master	CONTACT_ID

Name	ID
Name_Log	ID
Orders	BT_ID
Ref_Client	CLIENT_ID
Ref_Provider	PROVIDER_ID
Referral	CLIENT_ID, PROVIDER_ID
Relationship	ID, TARGET_ID
Subscriptions	ID
Trans	BT_ID
Name_Address	ID
Name_Fin	ID
Name_FR	ID
Name_Indexes	ID
Name_Note	ID
Name_Picture	ID
Name_Security	ID
Name_Security_Groups	ID
Name_Staff	ID

Note: Note: If an Invoice.BT_ID is equal to a Delete ID and the Invoice.REFERENCE_NUM is equal to the Invoice_Lines.REFERENCE_NUM, the Invoice_Lines record is deleted along with the Invoice record.

The following fields are updated to empty if they contain the value of any ID from the IDs to Delete list:

Activity	ID, CO_ID, OTHER_ID, SOLICITOR_ID
Cert_Register	BT_ID

Invoice	ST_ID
Invoice_Lines	ST_ID
Name	CO_ID, BT_ID
Name_FR	SOLICITOR_ID
Orders	ST_ID, CO_ID
Subscriptions	BT_ID
Trans	ST_ID, SOLICITOR_ID
User-defined tables	All records for the Delete ID are deleted

Merge actions performed on ContactMain and UserMain records

As part of the merge process, the following actions are performed on all IDs that are merged or deleted:

ContactMain	SyncContactID	NULL
ContactMain	ContactStatusCode	3 (Delete)

Additionally, if the merged or deleted ID had an associated user record, the following actions are performed:

UserMain	ContactMaster, UserId	Empty
UserMain	IsDisabled	1 (True)

Note: Tip: For optimal performance, purge unused users and contacts (see "Purging user and contact records") using the DB Maintenance Utility after you have merged contact records.

Important:

DMM will not merge any data from .NET tables (other than ContactMain and UserMain). Merging contact records that have associated .NET records may result in orphaned records. Examples include (but not limited to):

- DocumentMain.CreatedByUserKey
- DocumentMain.UpdatedByUserKey
- GroupMain.MemberContactKey
- GroupMain.MemberContactKey

Events Administration

Event Definition

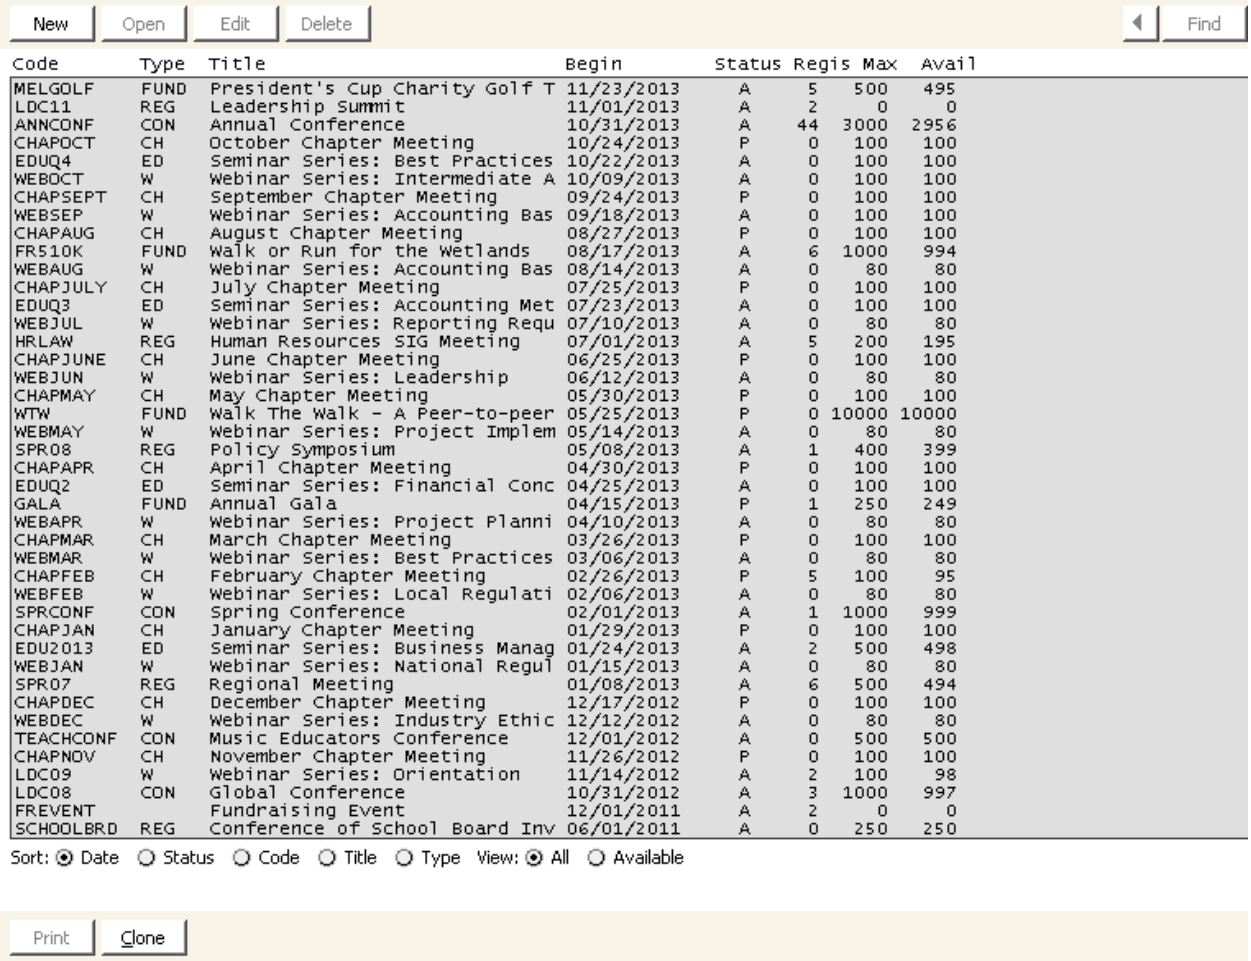
When defining and planning events, you enter the key information iMIS uses for each event and its functions. This information, in turn, enables all other Events operations from registrations and confirmations to inquiries and reporting. Defining and planning events involves the following steps:

- Defining and cloning an event
- Entering basic event information
- Defining separate function data
- Linking to primary functions
- Defining event fee information
- Entering event resources information.

Viewing available events

You can view defined events and their status through the Define an event window.

Define an event window



Desktop: Events > Define an event

Code

Lists the user-defined event codes defined in the Define an event window (from Events, select Define an event, and double-click an event).

Type

Lists the user-defined event types defined in the Define an event window (from Events, select Define an event, and double-click an event).

Title

Lists the user-defined event titles defined in the Define an event window (from Events, select Define an event, and double-click an event).

Begin

Lists the event's start date defined in the Define an event window (from Events, select Define an event, and double-click an event).

Status

Lists the event status as defined in the Define an event window (from Events, select Define an event, and double-click an event):

- A - Active (registrations are accepted)
- P - Pending (default, still in the planning stages)
- F - Frozen (currently unavailable for registration)
- C - Closed (registrations no longer accepted)
- X - Canceled

Regis

Lists the current number of registrants excluding cancelled, cancelled/transferred, and guests.

Max

Lists the maximum number of registrants allowed as defined in the Define an event window (from Events, select Define an event, and double-click an event).

Avail

Lists the number of open registrations remaining (Max minus Regis).

Sort

Specifies the sort order of the displayed events. The events can be sorted in descending order by begin Date, or alphabetically by Status, Code, Title, or Type. If an event has no begin date, it appears at the bottom of the list when ordered by Date. When sorted by

Date, multiple events with the same begin date are sorted in ascending order by the event Code.

View

Specifies whether the list displays All events or only Available events (Status = A).

Clone

Clones an event.

To view and sort the list of events

1. From Define an event window, sort the list by selecting the appropriate Sort option.
2. Filter the list by selecting the appropriate View option.

Cloning an event

Cloning enables you to copy and duplicate an event and its functions rather than having to create a new event. Cloning is useful when you need to set up events that are identical except for the dates and times. When you clone an event, the event and function definitions are copied from the cloned event to the new event.

To clone an event

1. From Define an event window, select the event you want to clone.
2. Click Clone to open the Event Clone window.
3. Enter a new event code for the cloned event.
4. Click Save.
5. (optional) If iMIS is licensed for Hotels, and hotel information is defined for the event that is being cloned, iMIS asks if you want to copy hotel information:

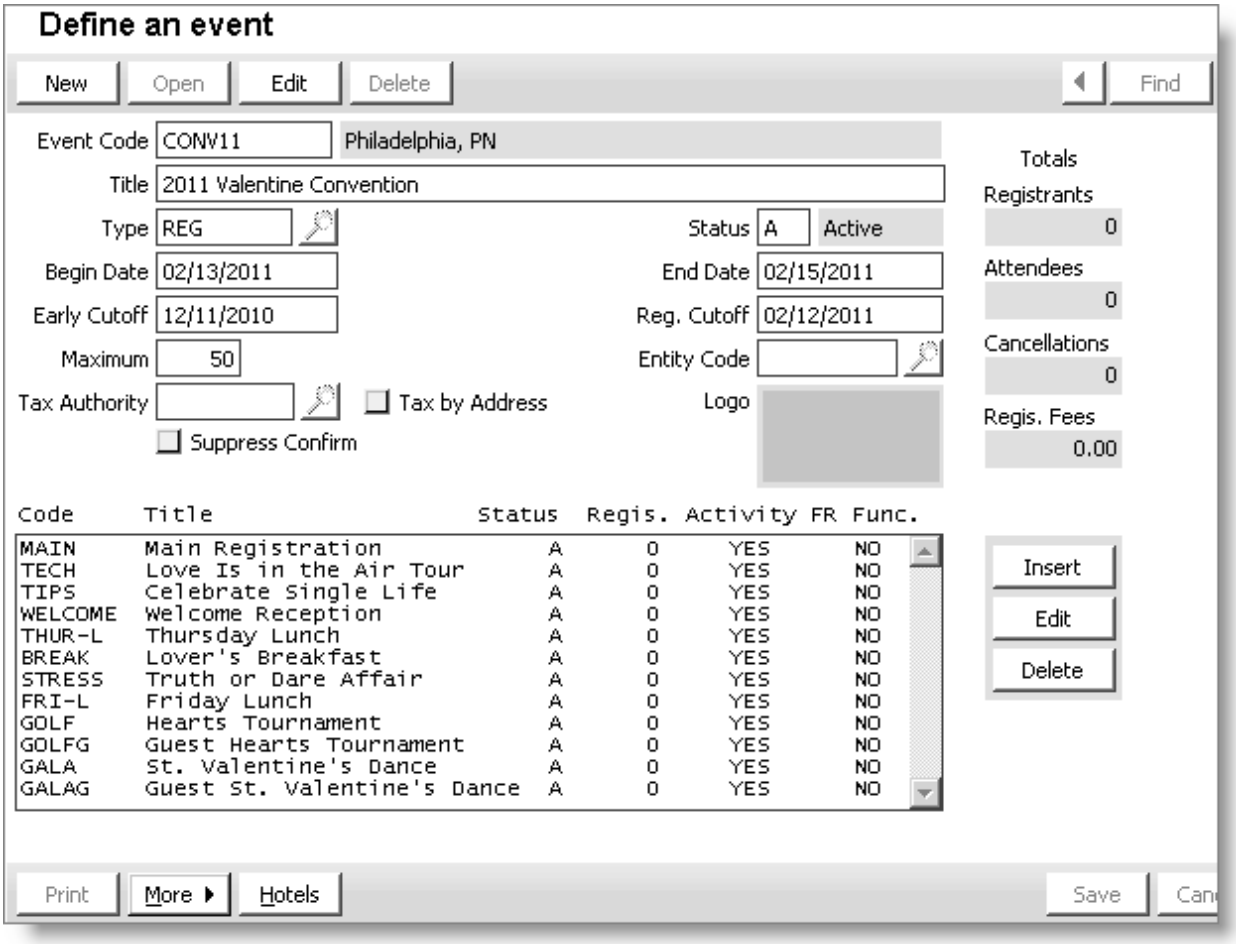
- Click Yes to copy the hotel information (including room types).
- Click No if you do not want to copy the hotel information.

6. Double-click the new event on the Define an event window to open it in the Define an event window.
7. Click Edit to make changes to the event dates, times, and details.
8. Click Save.

Defining a new event

Whether you are planning a conference, seminar, or any large or small event, you define an event in the Define an event window. Enter the basic information that defines the event in the window's fields.

Define an event - event details window



From Events, select Define an event, and click New

Event Code

Designates a unique code for the event. You can use a combination of letters and/or numbers to represent the event (do not use spaces, apostrophes, quotation marks, forward slash (/), or dashes).

Note: The content displayed in the Event Code field can be customized. See "Setting up advanced features".

Title

Specifies the name of the event. This title appears in windows and reports generated for this event.

Type

Specifies an event type.

The type defaults to EXPO for exposition events created using the Exposition module. Events to be managed using the Exhibition module should be set to EX.

Note: You can define additional type values on the MEETING_TYPE general lookup/validation table. For example, you can add AWARD for award ceremonies. For details, see Creating General Lookup/Validation Tables.

Status

This field specifies the event status:

- A - Active
- P - Pending (default, still in planning stage)
- F - Frozen (currently unavailable for active ordering., for example, on-site orders after an event has already started)
- C - Closed (orders no longer accepted)
- X - Canceled

Note: When you change the status of an event that is displayed on the web, it will take a few minutes before that change is reflected in the web view.

Begin Date

Specifies the event start date.

Note: The Begin Date determines when deferred income is transferred to earned income for an event.

End Date

Specifies the date the event ends.

Early Cutoff

Specifies the last calendar date a discounted rate can be applied for early registrations.

Note: If you do not vary fees for functions based upon the registration date, leave this field blank.

Reg Cutoff

Specifies the last calendar date the regular rate can be applied. If regular and late fees are set up as part of the event definition, any registrations entered after the regular cutoff date are automatically charged a late fee. If you do not charge a higher fee for late orders, leave this field blank.

Maximum

Specifies the maximum attendance limit for the event. The attendance limit and the number of available registrations (attendance limit minus registrations to date), displays for this event on the Define an event window.

Entity Code

(Displayed only when Multiple Entities is checked on the AR/Cash Set up module window) Specifies the accounting entity to which event income will be assigned. Event functions that do not specify an entity code will use this entity code. Event functions that specify their own entity code will ignore this code.

Tax Authority

(Appears only when Canadian taxation is enabled) Specifies the Canadian tax authority that applies to the event.

Tax by address

(Appears only when Canadian taxation is enabled) For HST, designates this event as taxable according to the registrant's address, as for virtual events.

Tax by address causes the appropriate tax to be charged based on the province specified in the registrant's Preferred Shipping Address. If that is unavailable, iMIS defaults to the tax authority of the event. Registrants see the HST amounts itemized in their carts and receipts.

Note: Events not using Tax by Address still charge tax using the event's tax authority, and iMIS respects the Tax Exempt designation on the Name Fin tab.

Suppress Confirm

Specifies that confirmation notices will not be printed for this event.

Logo

Specifies an event logo that can be printed on badges. If there is no logo in this area, iMIS uses your organization's default logo stored in the Organization Names window for badges.

Function list

Lists the functions that have been defined for the event. A value of YES in the Activity column indicates which event functions have the Create Detail Activity checkbox selected on the Event Function Detail window, which results in MEETFUNC activity records being created for the function when the event is closed.

Totals

- Registrants - Displays the total number of registrants including cancelled and cancelled/transferred registrants, but excluding guests.

- Attendees - Displays the total number of registrants including guests, but excluding cancelled and cancelled/transferred registrants.
- Cancellations - Displays the total number of cancelled and cancelled/transferred registrations.
- Regis Fee - Lists the total registration charges for all of the event registrations.

  Insert

  Opens the Event Function Detail window.

  Edit

  Opens the selected function in the Event Function Detail window.

  Delete

  Deletes the selected function.

  More

  Displays a menu of the following event setup options:

- Description - Opens the Event Description window used for entering a text description of the event.

  Note: Place key search terms within the first 300 characters of the description. In the Public view, search truncates the description to 300 characters, so only text within that range yields search results for users.

- Address - Opens the Event Address window used for entering the event address and directions to the event.
- Coordinators - Opens the Event Coordinators window used for entering the names of event coordinators.
- Notes - Opens the Event Notes window used for entering additional event information as well as a SQL Registration Verification Calculation.
- Roster - Opens the Event Roster window, which displays a list of event registrants.

- Close Current Event - Closes the event.
- Cancel Current Event - Cancels the event.
- Exhibit Rules - Opens the Rules for Exhibition Complimentary Registrations window used to enter text table rules and calculations for awarding complimentary registrations.
- Web Options - Opens the Event Web Options window, which lets you set the appearance and behavior of registration on the web.

  Important: Some options apply to content item-based events only: See Configuring content item-based event registration for details.
- Web Setup Wizard – Launches the Event Web Setup wizard to define details to be displayed on the web (Public view only).

  Hotels

  (Displayed when licensed for Hotels) Opens the Hotels window.

  To define an event

1. From Events, select Define an event to open the Define an event window.
2. Click New to open another instance of the Define an event window.
3. Enter an Event Code.
4. Enter an event Title.
5. Enter an event Type.
6. Enter an event Status.

   Note: Events must be active before registrations can be processed. Online event registration is only available for events with an Active status.
7. Enter a Begin Date for the event.
8. Enter an End Date for the event.
9. Enter an Early Cutoff date.

10. Enter a Reg Cutoff date.
11. Enter the Maximum number of registrants you will allow to register for the event.
12. (optional) Enter the Entity Code that will receive event income.

    Note: The event entity code can be overridden at the function level.
13. (optional) Enable the Suppress Confirm option.
14. Click Save.

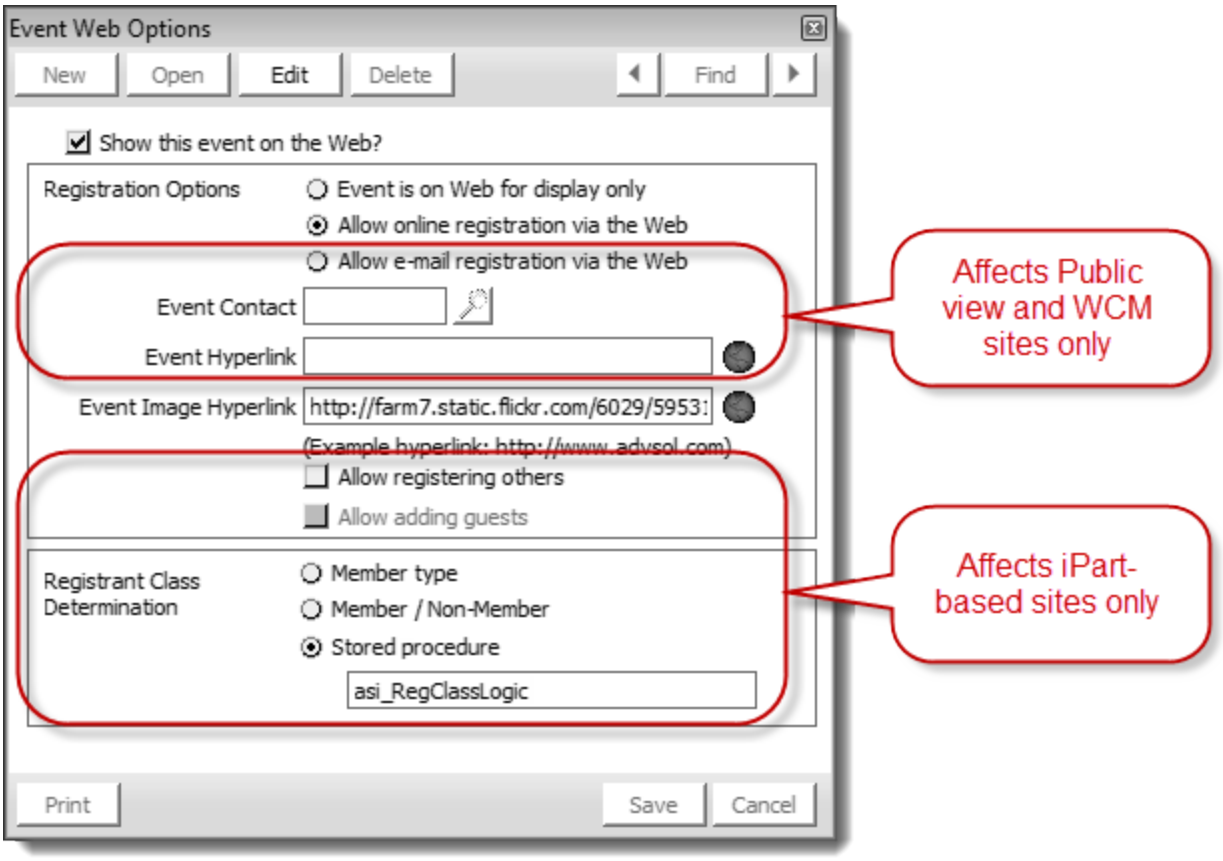
    To modify an event

1. Select Events > Define an event to open the Define an event window.
2. Double-click the event you want to modify to open it in the detailed Define an event window.
3. Click Edit.
4. Make any necessary changes.
5. Click Save.

Defining Event Web Options

After defining the basics of the event, you can define how you want the event to appear and registration to behave on the web. Only two options (Show this event on the Web? and Event Image Hyperlink) affect every type of member-facing website; the other options apply to specific platforms only:

Note: Staff users can search for all events, including events that are not web-enabled. You can only register for an event that has an Active status.



For Public view sites, note that you configure many of these content item-only options using the Web setup wizard for events.

For content item-based sites, see Configuring content item-based event registration for details on using these settings. The Web setup wizard for events does not apply.

To make an event available on the web

Online event registrations are only available for events with an Active status.

1. In the Event Details window, click More > Web Options.
2. Enable the Show this event on the Web? checkbox.
3. (optional) Add an image to display on the web: enter a link in the Event Image Hyperlink field:

- Full path: Refer to an existing URL, such as http://example.com/myImage.jpg
- Relative path: Upload or select an image in Content Management > Manage images, and refer to it like this: /images/uploadedimages/myImage.jpg

  Tip: Image Manager lets you create subfolders, so you can group and organize images.

4. (Public view and WCM sites only) Specify these options:

- Select which Registration Option should be in effect:
- Event is on the Web for display only (useful for times before and after open registration)
- Allow online registration via the Web
- Allow e-mail registration via the Web
- (optional) Enter the Event Contact.
- (optional) Enter the Event Hyperlink.

5. (content item-based sites only) Specify these options:

   Tip: You can use the Registration Option of Event is on the Web for display only to delay registration for an upcoming event while still allowing all details and pricing information to be viewable by your site visitors. Enabling this option disables the registration buttons and links.

- (optional) Enable Allow registering others, so that users can register others. When Registering Someone Else, staff and authorized members are able to search for an existing contact to register or add a new contact all from a single screen.

  Note: The ability to add a new contact when Registering Someone Else is not configurable. If you select Allow registering others, staff and authorized members can always add a new contact when Registering Someone Else.

- (optional) If you have functions for which this is appropriate, enable Allow adding guests. When enabled, the registrant can add a new contact and register that person as a guest for an event via the Add a Guest link. When you register someone as a guest, their registration is dependent upon the registration of the host. The host can be the person you are

working on behalf of, an individual registered using Register Someone Else, or yourself.

- Select which Registration Class Determination should be in effect:
- (default) Member type, for pricing by registrant class
- Member/Non-Member, for pricing simply by membership status
- Stored procedure, for overriding the registrant class to implement pricing promotions, such as 50% off additional registrants from a given company. Your stored procedure can use the current registrant ID (which is supplied as a parameter to the procedure), calculate which class to assign, and return a valid registrant class; if it does not return one, default pricing remains in force.

6. Click Save.

Web setup wizard for events

(Public view only) The web setup wizard for events allows you to configure events and functions for online registration. You can access the setup wizard in two ways.

- From System Setup, select Set up events web components > Event setup, and select an event.
- From Events, select Define an event, select or create an event, and click More > Web Setup Wizard.

  You must log on as a user with rights to the Administrator or EventCoordinator security key to perform Event setup.

  Note: Staff users can search for all events, including events that are not web-enabled. You can only register for an event that has an Active status.

  Understanding Event setup steps

  You complete the tabs in the sequence given and click Next to proceed. First, you set up an Options page; at the end, you review a Summary page. This list encompasses all the tabs available and summarizes the options you set for each.

- Options: Determines which general information to enable or require from registrants.
- Reg. Steps: Allows the administrator to assign specific steps for the registration process.
- Registrant: Determines which prompts to use to gather contact information about a registrant.
- Func. Groups: Determines which functions are in Function Groups to ensure that people are registered for assigned functions. These assignments are only needed for functions not defined with the "Automatic Option" in iMIS Desktop view.
- Guest: Determines which general information to enable or require concerning guests.
- Survey: Allows the administrator to ask questions and select answer types.
- Summary: Offers remaining miscellaneous options.

Note: The documentation might not match your product. Your organization can customize iMIS, license fewer features, or limit your security access, all of which affect the fields that you see in the product interface. Moreover, the documentation does not cover every window or window element. Windows and fields that are clearly defined in the product interface itself, or that should otherwise be intuitive, are not described in the documentation.

Public view administrators can use the Setup web components task list on the System Setup feature to configure items for the Public view including labels for the various areas of the site and email and graphics settings.

Defining event setup Options

The Options tab of Event setup allows you to enter optional information for the registration process.

On-line registration cutoff date

Set a date to cutoff registrations by using the calendar provided in the On-line registration cutoff date field. This date can differ from the Early Cutoff or Reg. Cutoff dates in iMIS Event setup.

Tip: Registration cutoff dates are enforced for Public users only. Cutoff dates apply differently by user type (Public, Casual, or Full) to allow staff more flexibility in handling registration.

Registrant class determination

This area lets you specify how to determine registration fees.

- Map Type: Bases pricing on the registrant class that corresponds to the registrant's iMIS customer type. If an administrator chooses the Map Type method, a registrant's iMIS customer type corresponds directly to the registrant class for that individual. An administrator must determine pricing for every registrant class for each function recorded for this method to assign pricing properly. If no registrant class is created for a specific customer type, the pricing for that customer type will be incorrect.
- Member/Non-Member: Bases pricing on one of two registrant classes: members and non-members. The iMIS customer type assigned to each registrant is either member or non-member, regardless of the registrant class.
- Stored Procedure: Bases pricing on the registrant class that is returned by your stored procedure, which takes the registrant’s ID as its input parameter. Such stored procedures let you implement complex pricing promotions, such as 50% off additional registrants from a given company. If iMIS cannot find the stored procedure specified or if it fails, default pricing applies.

  Parameters - Your procedure must take one parameter, the registrant’s ID. Your stored procedure must contain all logic needed (including the Use Parent Company Pricing rules) to return a registrant class. Here is a simple stored procedure that returns a specific registrant class:

```
CREATE PROCEDURE [dbo].[asi_TestGetRegistrantClass]
   @RegistrantId varchar(10),
AS
BEGIN
   SELECT case @ RegistrantId when '146' then 'SPKR' else 'STD' END
```

END

Here is simple code to test this stored procedure:

exec asi_TestGetRegistrantClass '146'

Defining event setup Registration Steps

In the Reg. Steps tab, you can make modifications to the current default registration steps by optionally changing the names of individual steps in the Step 1, Step 2 and so on fields.

Order / Include under Step 3

Use the Order column to specify the order in which the included group names should appear. Specify the number of groups for functions by using the Include column. At least one group must be formed for attendees to register. Group1 is the Default Auto Enroll Group.

Optionally, enter names of specific groups attending the event under Step 3. If a new name is not entered, the default name will be used. The groups appear in online registration pages only if you check the Include checkbox.

The Default Auto Enroll Group must always be the first group.

Defining event setup Registrant information

Use the Registrant tab determine the content viewed by registrants during the Registrant step.

Registrant page message

Enter text that you want to appear on the page where the registrant enters or verifies their contact information.

Select the fields you want the user to submit

The Enable checkbox displays that field for the registrant to update but does not require them to add or update the data. The Require checkbox forces the registrant to add the data for that field. Required fields will have a bold field label.

For example, if the Enable and Require checkboxes are checked for the Email prompt field, the registrant is required to enter or update their e-mail address.

Defining event setup Function Groups

The modifications made in the Funct. Groups tab determine the content viewed by registrants during the Groups step.

You must enter information individually for every group created in Step 1. Beginning with Group1, you can complete a specific Group page message, assign functions, and move to another page concerning the next group, until each group has been configured.

- Group Page Message – Enter a message to inform the user that they are automatically enrolled for a function, if applicable.
- Select an Auto Enroll option – If the Automatic Option has been checked for a function in iMIS Desktop view Events > Define an event, the registrants are automatically registered for that function and assigned the pricing for that function based on their registrant class.
- iMIS Auto Enroll Functions – Selecting this option presents a list of functions assigned to the group at the user registration page. The administrator must choose at least one function from the Unassigned Functions box and move it to the Assigned Auto Enroll Functions box. The registrant may choose several functions during online registration, but then cannot continue registration until at least one of the Assigned Auto Enroll Functions is selected.

  Note: Functions that have the Guest Function option enabled do not appear in the list of available functions.
- Assigned Auto Enroll Functions – Many administrators decide to form several groups for registration and assign specific functions to those groups. Assigning functions allows an administrator to build customized tracks for registrants. Assigning functions to groups also allows an administrator to offer pricing for individual days or functions, rather than offering one set price for the entire event.

  Note: When you create new Group pages, you are creating sub-tabs on the web-based interface that users cannot use the Previous and Next buttons to click through. This

means your users are warned that Previous and Next navigate through the larger steps of the registration process, but not through the Groups tabs. Because of this navigation design, web users need to click and fill out each tab while completing their registration.

Defining event setup Guests

The modifications made on the Guest tab determine the content viewed by registrants during the Guest step.

These are some important considerations when defining guest-attendee registrations, functions, and pages.

- If the Guest Function has not been enabled on the Event Function Detail window in iMIS Desktop, the guest registration process is not available on the web.
- If a guest badge function has not been created, no options will be available on the drop-down menu and Public view will not allow guest registrations.
- You can change the field label for these demographic fields using the Prompt fields. Changing the field labels does not change the field type.
- The Enable checkbox displays that field for the registrant to update but does not require them to add or update the data.

  Guests page message

  Enter text that you want to appear on the page where the registrant enters or verifies their guest's contact information.

  Select the fields you want the user to submit

  The Enable checkbox displays that field for the registrant to update but does not require them to add or update the data. The Require checkbox forces the registrant to add the data for that field. Required fields will have a bold field label.

  For example, if the Enable and Require checkboxes are checked for the Email prompt field, the registrant is required to enter or update their e-mail address.

Note: The Public view administrator can also change the field label for these demographic fields using the Prompt fields. Changing the field labels does not change the field type.

Defining event setup Survey questions

The modifications made on the Survey tab determine the content viewed by registrants during the "Questions" step. You can enter questions related to the event or to specific groups. These questions allow you to collect additional information about the registrant that may apply to their registration for this event.

Answer Type

There are six different answer types available:

- Numeric – The registrant may enter only numbers.
- Multiple Selection – The registrant may select multiple (up to 10) answers. You must designate the number of choices offered to users, and write the answers that correspond to the question.
- Single Selection – The registrant may choose only one answer (of up to 10 choices).
- Multiple Line Text – The registrant may enter lengthy answers in a text box.
- Single Line Text – The registrant may enter a short answer of only one line in a text box.
- Yes/No – The registrant may only choose "Yes" or "No".

Note: After entering a question in the Question field, click Save to add it to the Select Questions box.

Verifying event setup with the Summary page

The Summary page contains all of the administrator's modifications and customized messages.

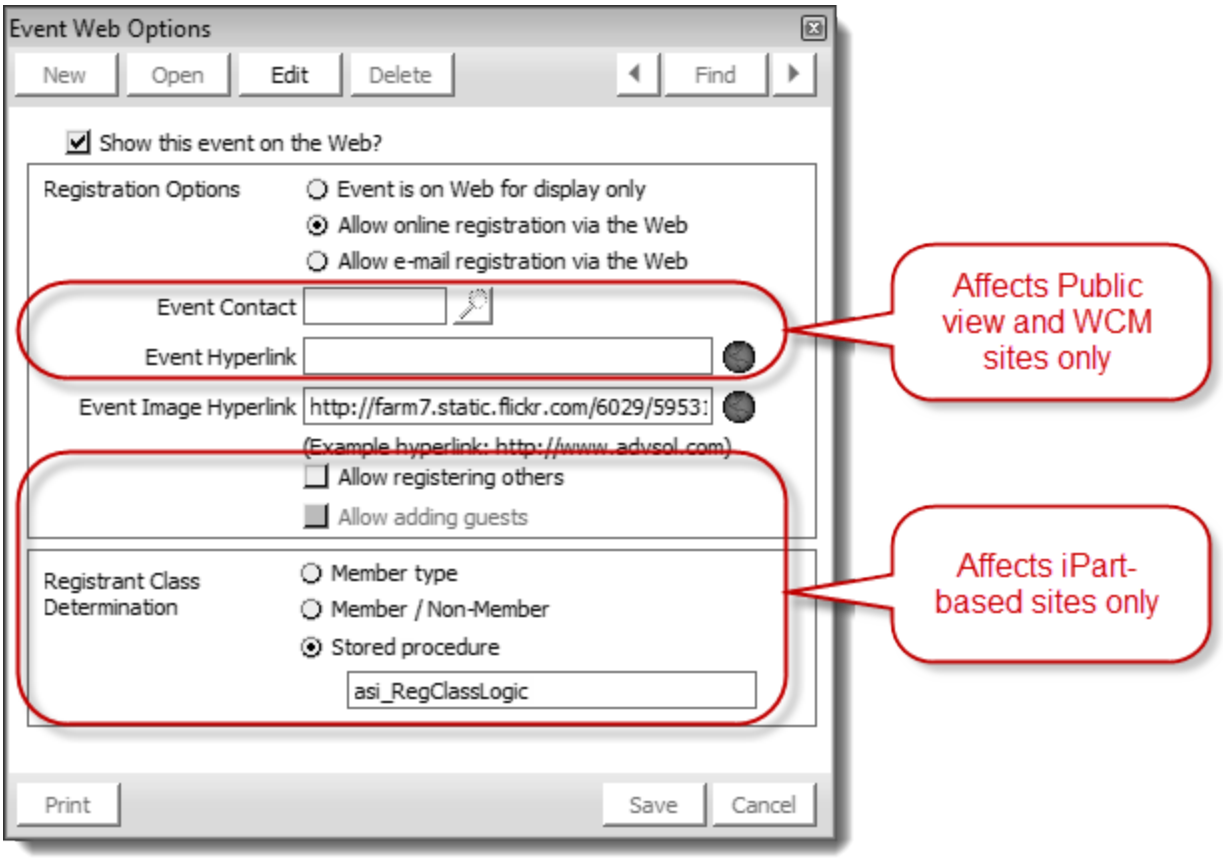
After reviewing the summary, you can edit the information by clicking the Previous button to go back to the previous tab. Click Next to save all the Event setup settings.

Configuring content item-based event registration

Note: The options managed by the Web setup wizard for events do not affect content item-based registration.

These are the key steps in Desktop for enabling web registration with content items:

1. In Desktop, select Events > Define an event, and Edit the event.
2. Select More > Web Options to configure the event's appearance and behavior on the web.



3. On the Event Web Options window, enable event-level visibility: select Show this event on the Web?

   Note: In the event definition on the Staff site, you can specify the date and time ranges when the event displays in search results and is open to registration for public users on

your website. See Creating an Event for information about configuring events through the Staff site.

4. (optional) Add an image to display on the web: enter a link in the Event Image Hyperlink field:

- Full path: refer to an existing URL, such as http://example.com/myImage.jpg
- Relative path: Upload or select an image in Content Management > Manage images, and refer to it like this: /images/uploadedimages/myImage.jpg

  Tip: Image Manager lets you create subfolders, so you can group and organize images.

  This option lets the event's image appear throughout content items and search results.

5. (optional) Enable Allow registering others, so that users can register others.

- (only available with Allow registering others) If you have an event for which this is appropriate, enable Allow adding guests.

6. Specify which Registrant Class Determination method to use for pricing your functions.

- Member type: Bases pricing on the registrant's member type; if the member type is not set or found or the price is undefined, iMIS uses the default pricing.
- Member/Non-Member: Bases pricing on the registrant's member status, using the configured price; if the member or non-member price is not found or the price is undefined, iMIS uses the default pricing.
- Stored Procedure: Bases pricing on the registrant class returned by a stored procedure. Such stored procedures let you implement complex pricing promotions, such as 50% off additional registrants from a given company. If iMIS cannot find the stored procedure specified or if it fails, default pricing applies.

  Parameters - Your procedure must take one parameter but could take two. If your procedure takes one parameter, iMIS passes in the registrant ID only; if it takes two parameters, iMIS passes in the registrant ID and the event ID, in that order. Using both parameters lets you manage multiple events in the same procedure.

Your stored procedure must contain all logic needed (including the Use Parent Company Pricing rules) to return a registrant class. Here is a simple stored procedure that uses both parameters and returns a specific registrant class:

```
CREATE PROCEDURE [dbo].[asi_TestGetRegistrantClass]
  @RegistrantID varchar(10),
  @EventID varchar(10)
AS
BEGIN
  SELECT case @EventId when 'SPRCONF' then 'M' else 'NM' END
END
```

Here is simple code to test this stored procedure:

```
exec asi_TestGetRegistrantClass '146', 'SPRCONF'
```

7. Select Save to close the Event Web Options window.
8. (optional) Set a Maximum for the number of registrants for the event.

   When the registration maximum is reached, the Event display disables the Register button to prevent additional registrations. Be aware that simultaneous or bulk registrations (using Register Someone Else) could result in a few registrations being accepted beyond the maximum.

   Note: The Register button is disabled whenever the event is unavailable for the given user selected, whether for maximum reached or another constraint.
9. Unless the event itself is free, set one or more event-level pricing options: enable Is an Event Option on each function that you want to appear as a choice under Registration Options. If you flag only one function with this option, it alone sets the event pricing (based on its Fees); if you flag several, the content item displays a Registration Option panel, based on those functions and their fees:

Registration Options	Price
○ One Day Attendance	100.00
○ Two Day Attendance	250.00
○ Exhibit Only	50.00
◉ Full Conference	350.00

Because they have this special purpose, Is an Event Option functions do not appear in the Event Program Display listings.

Tip: You can set Maximum values on the functions that you use for your event's Registration Options and have those capacity limits selectively prevent registration as they fill up, option by option. For example, you can have the Conference fill up while still permitting registration to the Exhibition alone. When an option fills up (or if pricing is not yet defined), registrants must select another option.

10. Edit each function that you want to make available for web registration and do the following:

- Enable Show this function on the Web?

  Tip: You can disable Show this function on the web to keep your program item hidden until you are ready to accept registrations.

- Choose REG as the Type; other types will not be available for web registration.

- Verify the Fees that will apply, making sure to price all free functions as Comp (Complimentary). Enter only positive amounts for fees.

Important: If you leave a function fee at zero without enabling Comp., iMIS hides the program item or registration option from your customers, although non-Public users see it

with “pricing undefined.” Hiding functions safeguards you from revenue loss that would occur if customers could register successfully when pricing is missing.

Tip: Function hiding lets you present different registration choices to different registrant classes. That is, if you keep *Default* pricing undefined, but add pricing for certain registrant classes (such as Company Members), you can offer a registration option that only Company Members can see and select.

- (optional) Add values to the Track and Category fields. Users will be able to sort functions by these values in the Event Program Display content item.

  You can enter multiple tracks and categories to a function by entering semicolons between values; you can also leave some functions blank for these fields.

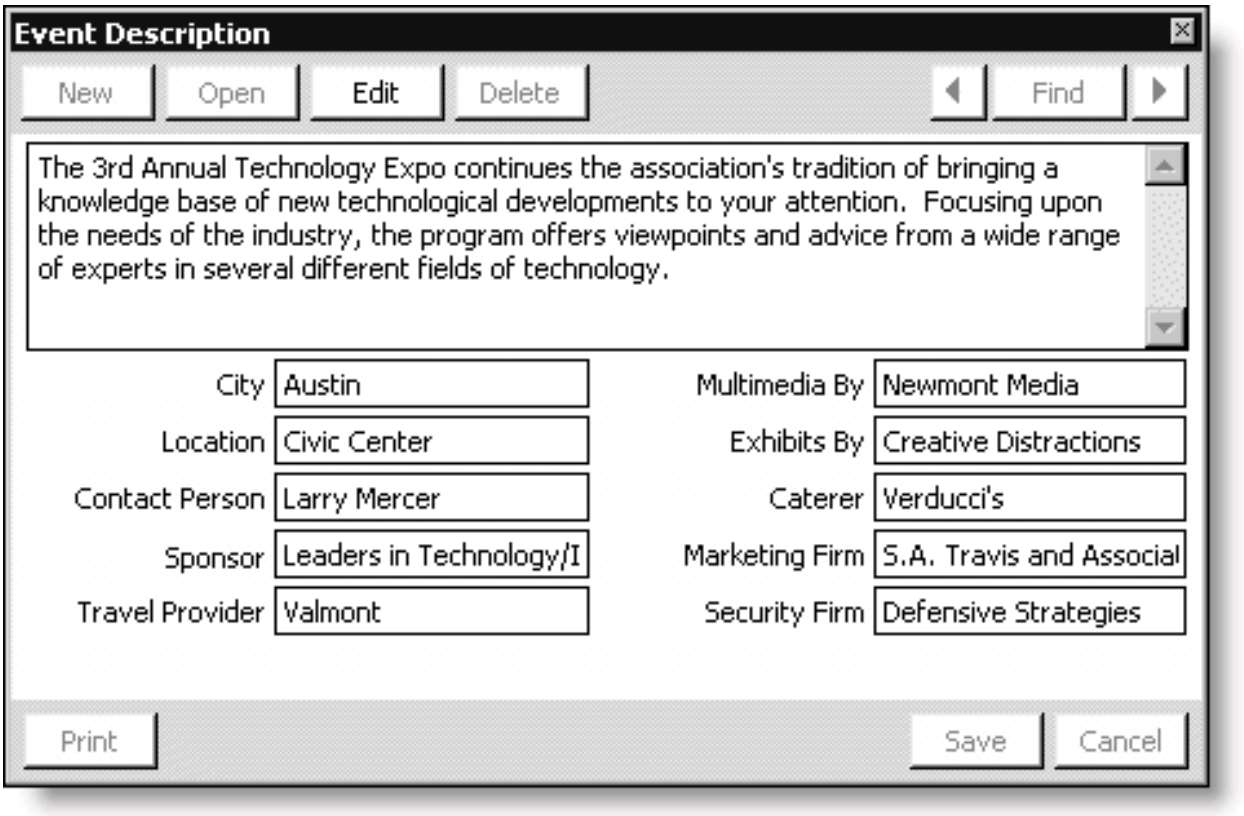
Entering event descriptions and addresses

Use the Event Description window to enter a description of the event.

Use the Event Address window to enter the address of the event, including directions.

Event Description window

The Event Description window enables you to enter a description (up to 1000 characters) of the event.



From Events, select Define an event, double-click an event, click More, and select Description

Description text box

By default, the Event Description window contains a text box for the event description. Your administrator may define additional fields for event information (see "Set up module window for Events").

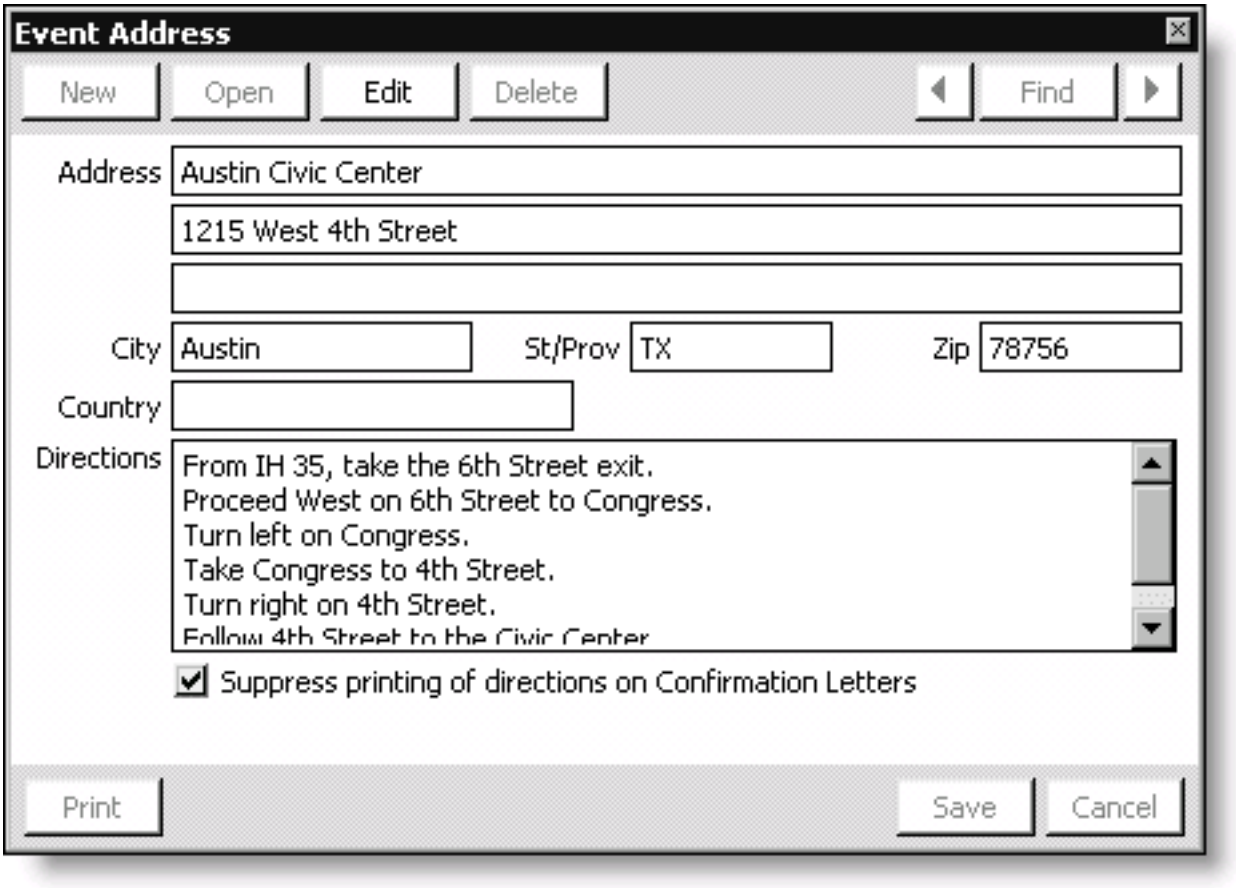
To enter event description information

1. Select Events > Define an event to open the Define an event window.
2. Double-click an event title to open it in the detailed Define an event window.
3. Click Edit.
4. Click More, and select Description to open the Event Description window.
5. Enter a description of the event.

Note: Your administrator may have configured the Event Description window to show more fields.

6. Click Save.

Event Address window



From Events, select Define an event, double-click an event, click More, and select Address

Address

Use these fields to enter the event's address (maximum field size of 50 alphanumeric characters).

City

Specifies the city where the event is being held (maximum field size of 40 alphanumeric characters).

St/Prov

Specifies the state or province where the event is being held (maximum field size of 15 alphanumeric characters).

Zip

Specifies the ZIP code where the event is being held (maximum field size of 10 numeric digits).

Country

Specifies the country where the event is being held (maximum field size of 20 alpha-numeric characters).

Directions

Specifies directions to the event (maximum field size of 256 alphanumeric characters).

Suppress printing of directions on Confirmation Letters

Enable if you do not want to print directions to the event on confirmation letters.

To enter an event's address

1. Select Events > Define an event to open the Define an event window.
2. Double-click an event title to open the detailed Define an event window.
3. Click More and select Address to open the Event Address window.
4. Click Edit.
5. Enter the address information for the event.

   Note: This information appears on default confirmation letters, and you can include it on other reports.

6. Check the Suppress printing of directions on Confirmation Letters check box if you do not want the directions to be printed on the confirmation letter.
7. Click Save.

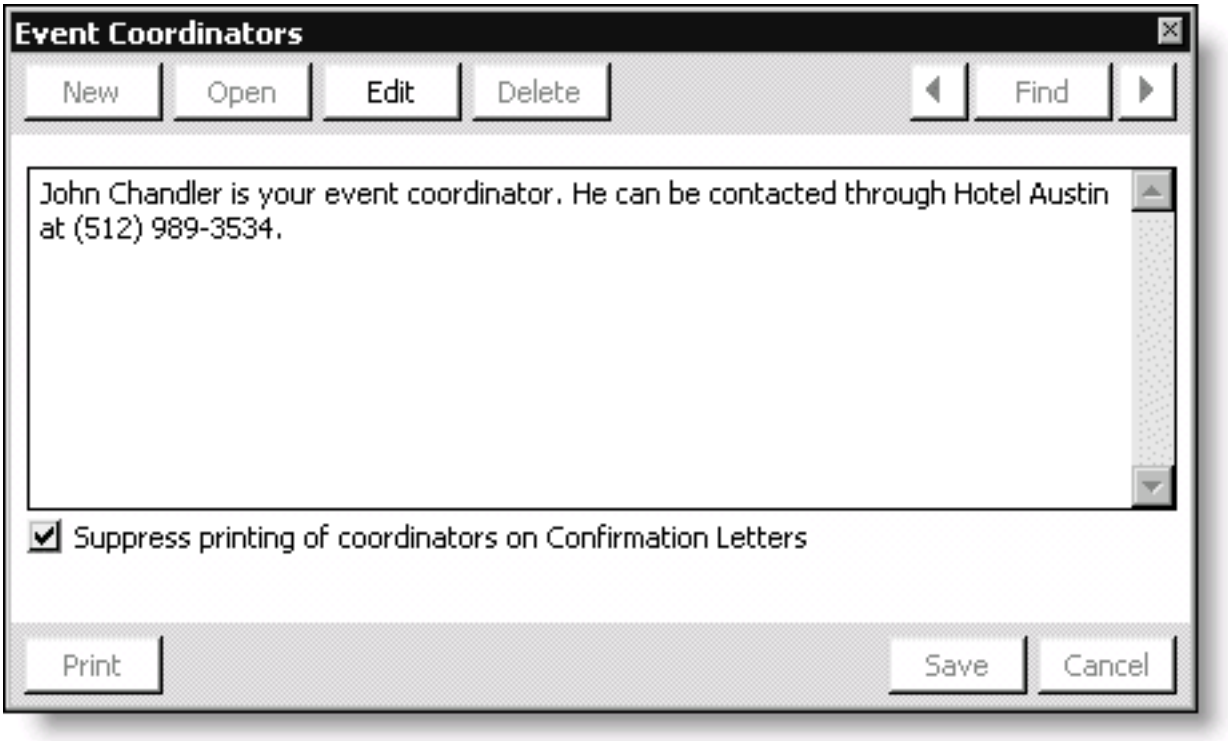
Entering event coordinators and notes

Use the Event Coordinators window to enter a list or description of the event coordinators.

Use the Event Notes window to enter additional information about an event.

Event Coordinators window

You can enter a list or description of the event coordinators on the Event Coordinators window.



From Events, select Define an event, double-click an event, click More, and select Coordinators

Coordinators

Specifies a description of the event coordinators (maximum field size of 256 alpha-numeric characters).

Suppress printing of coordinators on Confirmation Letters

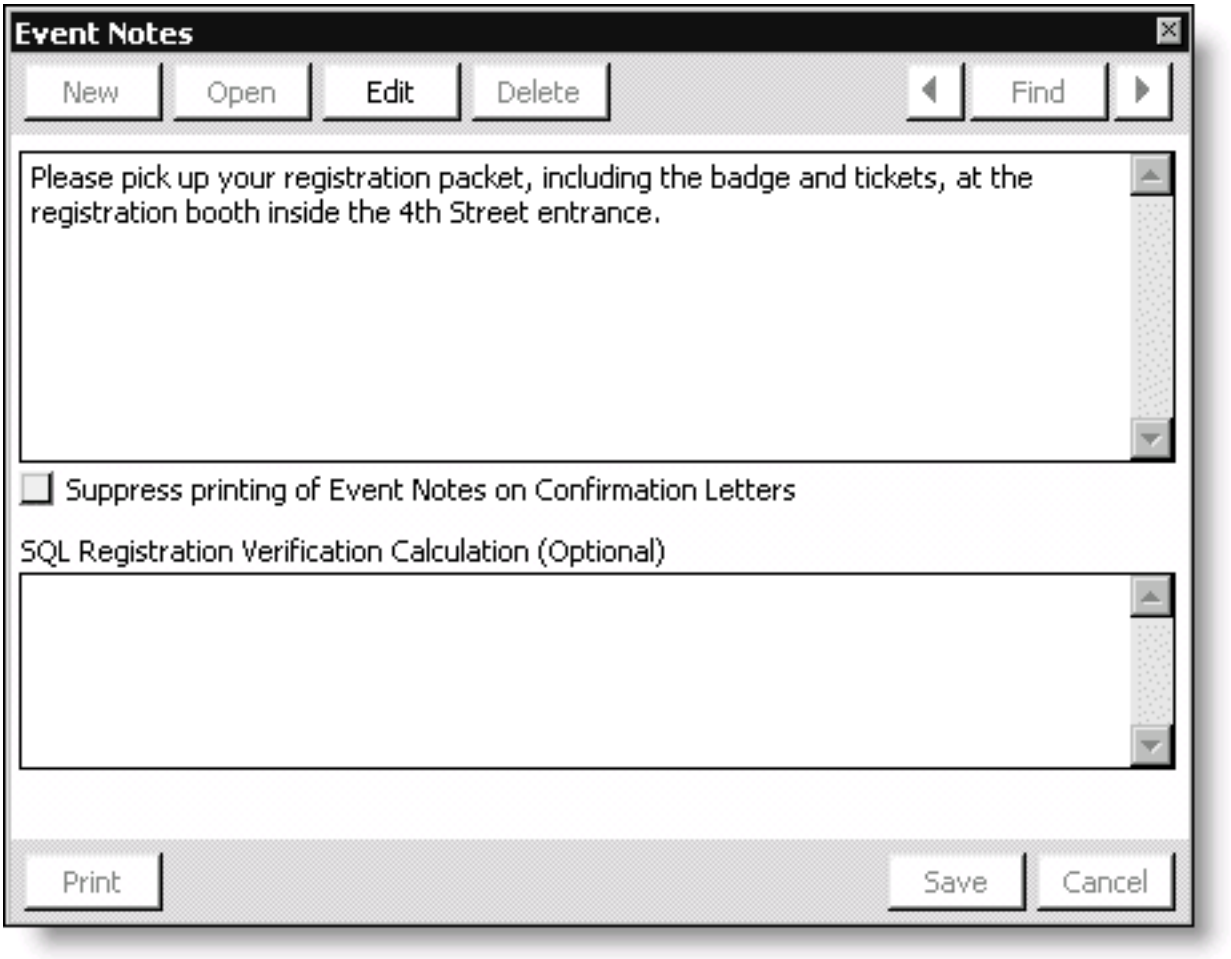
Enable if you do not want to print event coordinator information on confirmation letters.

To enter event coordinator information

1. Select Events > Define an event to open the Define an event window
2. Double-click an event title to open the detailed Define an event window.
3. Click More and select Coordinators to open the Event Coordinators window.
4. Click Edit.
5. Enter the event coordinator information.

   Note: This information appears on default confirmation letters, and you can include it on other reports.
6. (optional) Check the Suppress printing of coordinators on Confirmation Letters check box if you do not want coordinator information printed on confirmation letters.
7. Click Save.

Event Notes window



From Events, select Define an event, double-click an event, click More, and select Notes

Notes

Specifies any applicable event notes (maximum of 256 alphanumeric characters).

Suppress printing of Event Notes on Confirmation Letters

Enable if you do not want to print event notes on confirmation letters.

SQL Registration Verification Calculation (optional)

Specifies a SQL calculation. When you enter a SQL calculation, registrants who try to place an order and do not meet the required criteria defined in the calculation cannot sign up for the event.

To enter event notes

The Event Notes window enables you to enter additional information about an event.

1. Select Events > Define an event to open the Define an Event window.
2. Double-click an event title to open the detailed Define an event window.
3. Click More and select Notes to open the Event Notes window.
4. Click Edit.
5. Enter any applicable event notes. A maximum of 1,000 alphanumeric characters can be entered.
6. (optional) Enable the Suppress printing of Event Notes on Confirmation Letters option so that the event notes do not print on the confirmation letter.
7. Click Save.

To enter a SQL verification calculation

If you enter a SQL Registration Verification Calculation, iMIS tests a registrant's eligibility based on the requirements defined in the calculation. The SQL calculation results in either a 1 or a 0. If the result is a 1, then iMIS enables you to create an order for the registrant. If the result is a 0, then a message is displayed indicating that the registrant is not eligible, and the registration is canceled.

1. From Events, select Define an event, double-click an event, click More, and select Notes to open the Event Notes window.
2. Click Edit.
3. Enter a verification calculation in the SQL Registration Verification Calculation (optional) field.

   The following is a sample calculation (the calculation varies from organization to organization). The sample calculation searches for all CM (company member) types, and, if the registrant is not a CM, iMIS displays a message indicating that the registration cannot be processed.

select COUNT(*) from Name where MEMBER_TYPE='CM' and ID = [AsiSQL(Orders.ST_ID)]

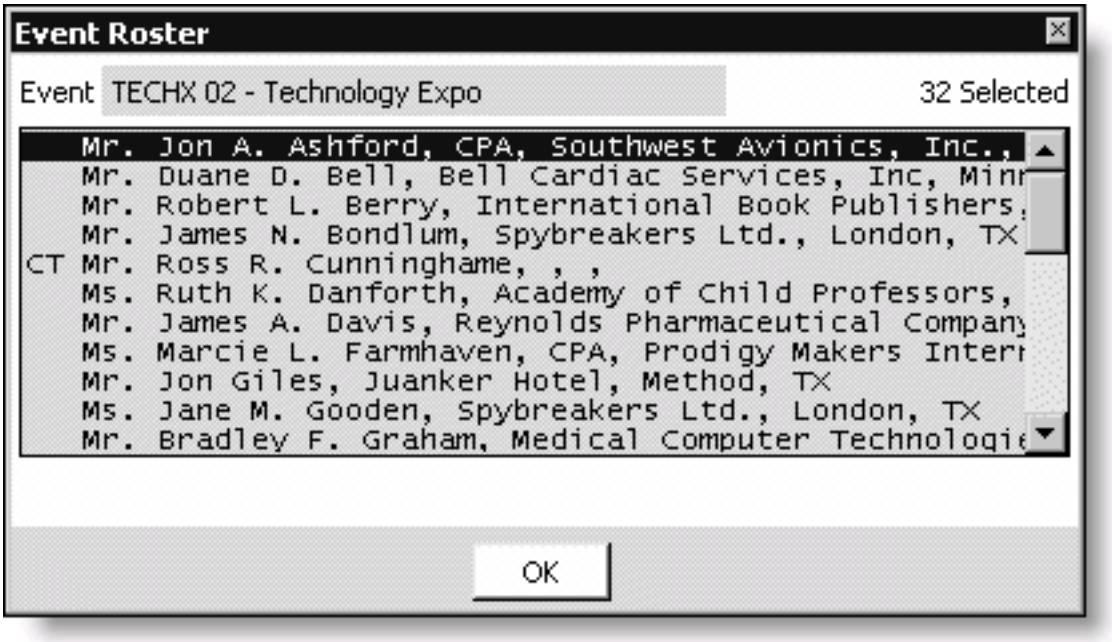
4. Click Save.
5. Restart iMIS.

Viewing the event roster

Use the Event Roster window to view a list of event registrants.

To view a roster

1. From Events, select Define an event, double-click an event, click More, and select Roster to open the Event Roster window.
2. The letter C in the first column designates a canceled registration. CT in the first column designates a transferred registration.



Example of the Event Roster window

Closing an event

You must close an event before event MEETING and MEETFUNC activity records can be created. When closing a completed event, a registrant's order data is replaced with an event MEETING activity record.

If the Create Detail Activity checkbox is selected on the Event Function Detail window for a specific function, a MEETFUNC activity record will be created for this function when the event is closed. You can tell at a glance which event functions have this checkbox selected by looking at the function list in the Define an Event - event details window. The Activity column specifies YES if the checkbox is selected.

Note: You must ensure that you have selected the Create Detail Activity checkbox for the desired functions before you close the event.

If the Delete Event Definition on Close option is enabled on the Event System Preferences window the definition and planning records for the event are purged when you close the event. If this option is disabled, the event and product planning information remains in iMIS, the event detail is purged, and a C appears in the Status field to indicate that the event has been closed.

You can close an event any time after completing all event registrations. Open receivables are tracked in AR/Cash for any outstanding balances.

Note: If you are licensed for CEU and tracking continuing education units for one or more functions within the event that you are closing, you must update the attendance for those functions before closing the event. If an individual is marked as a no-show, you must remove that individual from the function to avoid creating a MEETFUNC activity record for the no-show.

To close an event

1. Select Events > Define an event to open the Define an event window.

2. Double-click a completed event to open it in the detailed Define an event window.
3. Review the Activity column in the function list to ensure that a value of YES is displayed for every function for which you want MEETFUNC activity records created when you close the event.

   To change an Activity value to YES, edit the function and select the Create Detail Activity checkbox in the Event Function Detail window.
4. Click More and select Close Current Meetings.

   If the system finds current registrants, a message is displayed stating that the event has current registrants.
5. Click Yes.

   A system message prompts you to verify closing the event.
6. Click Yes.

   A message is displayed notifying you that all event details will be removed and that activity history will be generated for all of the registrants.
7. Click Yes to close the event.

Canceling an event

When you cancel an event, iMIS automatically reverses the accounting entries that were created during order processing. The income accounts are debited and AR/Cash is credited. All open receivable balances for unpaid orders are closed (brought to zero balance). For registrants who have already paid, the reversed entry results in open credits. Open credits can be refunded or can be applied to other orders or event registrations.

If you enable the Delete Event Definition on Close option on the Event System Preferences window the event definition is deleted when you cancel the event. If the option is not enabled, the event you are canceling appears on the list of events on the Define an event window with a status of X.

Canceling an event, unlike canceling a registration, is irreversible. All registration details are always deleted after an event is canceled.

To cancel an event

1. Select Events > Define an event to open the Define an event window.
2. Double-click the event you want to cancel to open it in the detailed Define an event window.
3. Click More and select Cancel Current Meeting.

- If the system finds current registrants, a message prompts you to verify the cancellation of the event.

  Click Yes if you receive this message.

  A system message prompts you to verify canceling the event.

4. Click Yes.

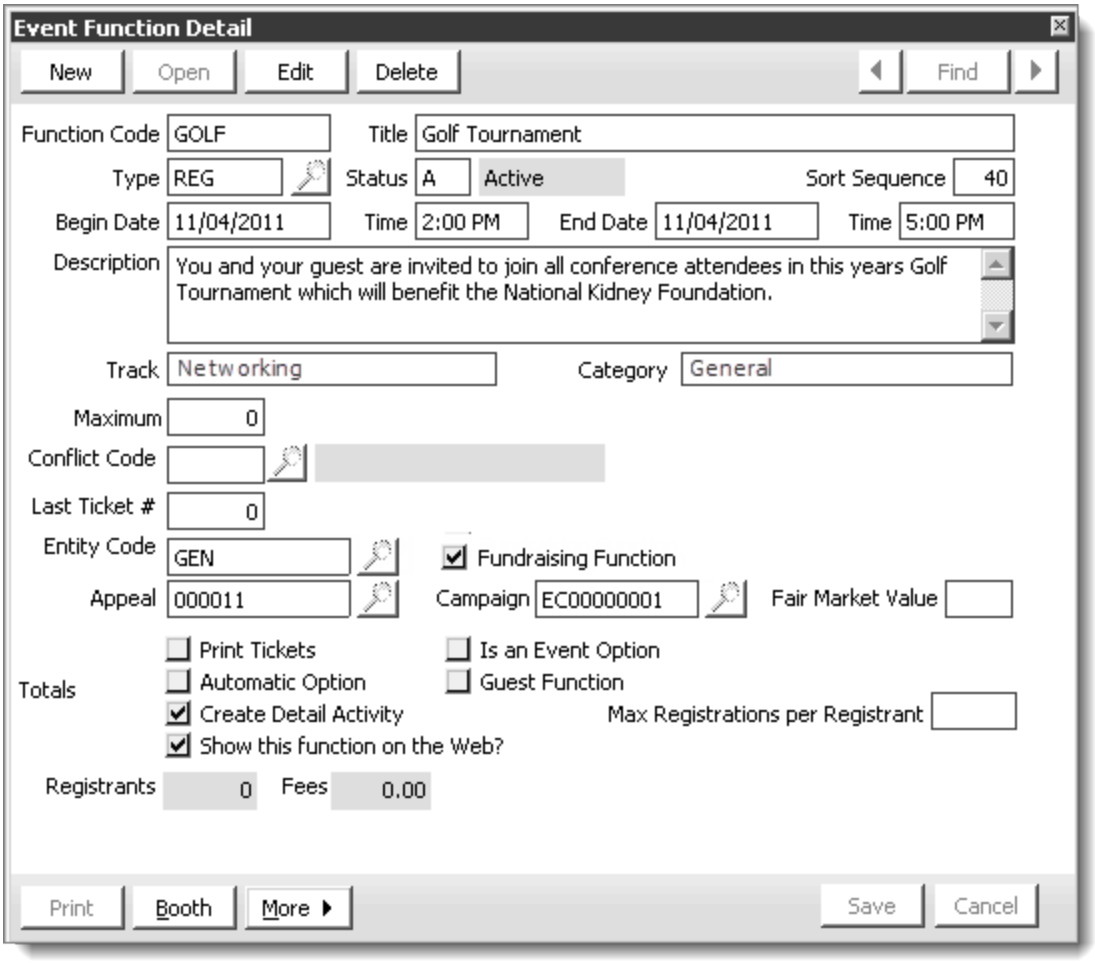
   A message prompts you to verify canceling the event because the action is not reversible.

5. Click Yes to cancel the event.

Event Function Definition

Many of the details you define about an event, both required and optional, are maintained at the individual function level. An event function definition includes a general description of the function, the location and schedule, the registration fee information including account and fundraising data, and optional room setup and planning details.

Event Function Detail window



From Events, select Define an event, double-click an event, select an event function, and click Edit

Function Code

Designates a unique code for the event function. You can use a combination of letters and/or numbers to represent the function (do not use spaces, apostrophes, quotation marks, forward slash (/), or dashes).

Title

Specifies a title for the event function. The title appears on all lists and reports that show individual event functions, such as confirmation letters, tickets, and detailed rosters. Maximum size: 60 characters.

Type

Specifies the event function type. The field defaults to REG for normal registrations. Use the lookup icon to find a function type.

- REG - This type is used for regular event registrations. It is displayed on the registration window, confirmations, and invoices.
- MEMO - This type is used when the function type should not be displayed on the registration window or be printed on invoices or confirmations. Tickets may be printed if this function is linked to a REG function.
- EX (iMIS Exhibition Management only) - This type is used for booth functions when processing exhibitor orders within the Exhibition Management system.

Status

Specifies an event function status code:

- A - Active (available for registration - default)
- P - Pending (still in planning stage)
- F - Frozen (currently unavailable for active registration, due to events such as registration currently occurring at the site)
- C - Closed (registrations no longer accepted)
- X - Canceled

Sort Sequence

This field specifies the sort sequence of functions that have the same start date and time (the first two sort criteria).

When used, this third-level sort function places functions with lower values ahead of those with higher ones: 1 sorts ahead of value 2, which sorts ahead of 3.

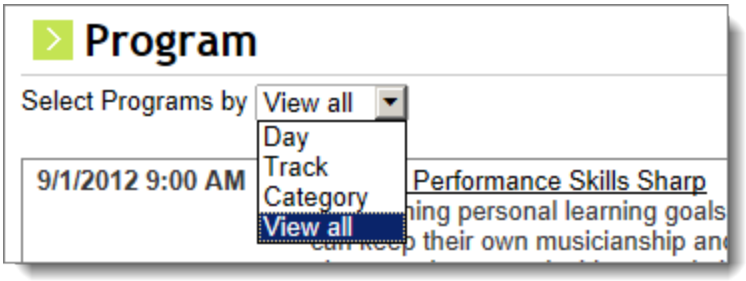
Note: Functions display by starting date, starting time, and sort sequence on the Define an event window and, initially, on the Register a customer window. If you later add functions for an existing registrant, those new functions will appear at the bottom of the list on displays and reports.

Begin Date

Specifies the beginning calendar date of the event function. If the function spans more than one day, enter the beginning date.

Track

(content items only) Designates one or more terms, separated by semicolons, as being relevant tracks for this function. For example, if the function serves both managers and technologists, you might enter Management;Technical. You may leave this blank for some or all of your functions.



Track and Category entries allow registrants to view and collapse (hide) those groupings in the Event Program Display.

Category

(content items only) Designates one or more terms, separated by semicolons, as being relevant categories for this function. For example, if the function targets both intermediate and advanced practitioners, you might enter Intermediate;Advanced. You may leave this blank for some or all of your functions.

Maximum

Specifies the total number of attendees for this function (for example, due to space limitations).

Taxable

(VAT taxation enabled) Designates that the function fees are taxable under VAT.

Tax Code

(VAT taxation enabled and Taxable enabled) Specifies the VAT tax code for this function's fee.

GST/HST

(Canadian taxation enabled) Specifies that the function fee is subject to General or Harmonized Sales Tax.

PST

(Canadian taxation enabled) Specifies that the function fee is subject to Provincial Sales Tax

Conflict Code

Designates an optional code used to label time slots or content areas to prevent scheduling conflicts. Registering for conflicting event functions will produce a warning message. Your administrator can set up conflict codes using a lookup/validation table.

Last Ticket

Specifies the number of the last ticket printed for this function, which is zero (blank) until tickets are printed.

Fair Market Value

Specifies the fair market value for the function if there is one.

Print Tickets

Specifies that tickets should be printed for this function.

Automatic Option

(optional) Specifies that new registrants will be registered for the function automatically.

Create Detail Activity

(optional) Specifies that a MEETFUNC activity record will be created for this function when the event is closed. The activity record is listed in the Activities-All tab in the history area of the Manage Customers window. The activity record is created only for the function registrants who are listed in the Event Roster window at the time the event is closed.

Is an Event Option

(content items only) Specifies that the function appears as the event's overall registration option or, if you designate additional, as one of several Registration Options that registrants can choose from. iMIS prevents registration for the function until you define its pricing.

Limiting numbers of registrations: Enabling this along with a Maximum value, you can set capacity restrictions on the functions that you use for your event's Registration Options and have those capacities selectively prevent registration as they fill up, option by option. For example, you can have the Conference Workshops fill up while still permitting registration to the Conference itself. When the number of registrations for a specific Registration Option is met (or if pricing is not yet defined), users cannot register for that registration option, and they are prompted to select another option.

Guest Function

(optional) Specifies that the function allows guest registration. If this option and the Show this function on the Web option are enabled, the function will not show as a separate function on the web. Instead, it will show up as a guest type.

Show this function on the Web

This option is enabled by default when the parent event is visible on the Web.

Note: If this option is deselected in order to hide a function from registrants, it will also be hidden from Staff users and System Administrators on the Web. While the functions will

still be visible through the Desktop, Staff users will be unable to edit the function on the website.

Max Registrations per Registrant

Displayed only if Show this function on the Web is checked. Specifies the maximum number of function registrations a single online registrant can purchase.

Totals

- Registrants - Displays the total number of registrants for the given function. Canceled and canceled/transferred registrants are not included in these numbers.
- Fees - Displays the total of fees for current registrants for this function.

Booth

(Displayed when licensed for Exhibition) Opens the Booths window that enables you to generate a group of booths, add an individual booth, remove a booth, and import booths. See Exhibition Management for more information.

More

Displays the following drop-down menu items:

- Fees - Opens the Event Function Definition - Fees window.
- Plan - Opens the Event Function Definition - Plan window.
- CEU - Opens the Event Function Definition - CEU window. See Tracking Credits for Continuing Education for more.
- Speakers - Opens the Event Function Definition - Speakers window.
- Staff - Opens the Event Function Definition - Staff window.
- Links - Opens the Function Links window.
- Roster - Opens the Function Roster window.

To define event functions

1. From Events, select Define an event to open the Define an event window.

2. Double-click an event to open it in the Define an event (detail) window.
3. Click Insert to open the Event Function Detail window.
4. Enter a unique Function Code using any combination of letters and/or numbers.
5. Enter a Title (function name) of up to 60 characters. The title you enter here appears on reports that show individual products, such as confirmation letters and detailed rosters.

   Note: The function Type defaults to REG, and the Status defaults to A.
6. In the Type field, accept the REG default, or select the lookup icon to select a value.
7. In the Status field, accept the A default, or select the lookup icon to select a value.
8. (optional) Enter a numeric Sort Sequence.
9. (optional) Enter a Begin Date for the function.
10. (optional) Enter a beginning Time for the function.
11. (optional) Enter an End Date for the function.
12. (optional) Enter an ending Time for the function.
13. (optional) Enter a Description.
14. (optional) Enter a Maximum number of registrants.
15. (optional) Enter a Conflict Code, or if conflict codes have been defined, select the lookup icon to search for a code.

    Note: You can set up Conflict Code validation by editing the CONFLICT_CODE table (from Customers, select Set up tables > General lookup/validation, and edit or create the table named CONFLICT_CODE).
16. (optional) Enter the Last Ticket #. If printing tickets for the function, enter a specific start number, or accept the 0 default.
17. Check the Fundraising Function checkbox. The Fundraising specific fields (Appeal, Cam-

paign, and Fair Market Value) appear, and the Entity Code field changes to the Fund field.

Note: The Fund field is restricted to codes that are marked "Is Fund" in iMIS setup. Entity Code can contain any Org Code defined in iMIS setup.

18. Fill in the following fundraising information (all fields are optional):
    - Fund
    - Appeal
    - Campaign
    - Fair Market Value
19. (optional) Select Print Tickets if you want to generate tickets for this function.
20. (optional) Select Automatic Option if you want new registrants to be registered for the function automatically.
21. (optional) Select Create Detail Activity if you want MEETFUNC activity records to be created for the registrants for this function at the time the event is closed.
22. Click Save.

Using the Event Function Detail window and its child windows

Some tips for entering data to the Events Function Detail window and its child windows will help you enter your data more efficiency.

- If the Event Function Detail window is in insert or edit mode, you cannot select a new function from the Define an Event window. You must cancel or save first.
- If the Event Function Detail window and any of its child windows are open, but not in edit mode, you can click on the Define an event window and select another function. If you select a new function, you can enter data to the Event Function Detail window and its child windows listed under More.

- When the Event Function Detail window is in insert or edit mode, all of its child windows are also in insert and edit mode. A save in one window will save data in all windows.
- An exception is, if the Function Links window is open, the user cannot click behind it to access the Function Detail window, a child window, or the function list on Define an Event window.

Using the Booths window and its child windows

Some tips for entering data to the Booths window and its child windows will help you enter your data more efficiency.

- If the Booth window is open, you can click on child windows and select another function. The Booth window will refresh and display the booths for the newly-selected function.
- If the Function Detail window or any of its child windows is in insert/edit mode, then the Booth window is not in edit mode, and vice versa. If the Booth Generator or the Add an Individual Booth dialog boxes are open, other windows are disabled.

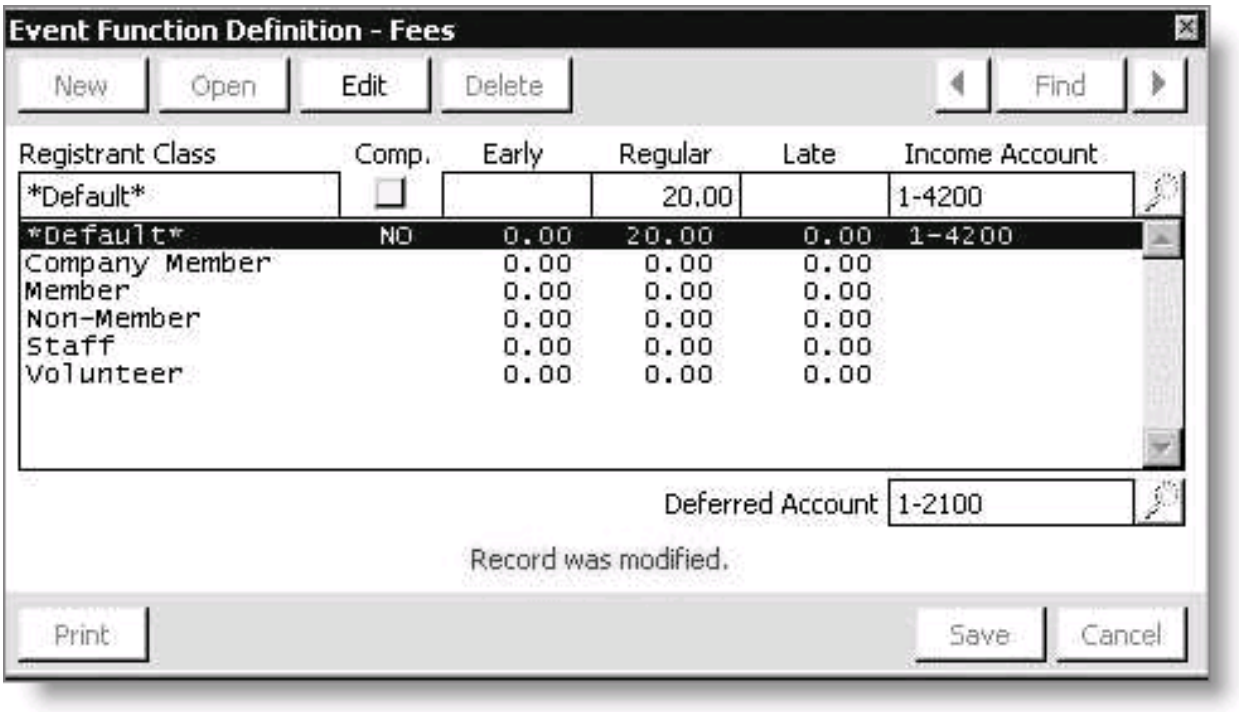
Setting fees

Registration fees may be based on the registration date (early, regular, and late), the registrant class (member or non-member), or a combination of registration date and registrant class.

You also can choose to charge all of your registrants the same price, regardless of registrant class or registration date by defining a default regular price.

The Event Function Definition - Fees window displays a list of each registrant class and one labeled *Default*. These lines are where you enter the various fees for this function and the General Ledger accounts to which the fees apply. You must supply information on the Event Function Definition -- Fees window for each function, even if you only enable the Comp option and no fees apply.

Event Function Definition - Fees window



From Events, select Define an event, enter or open an event, enter or open an event function, and select More > Fees

Registrant Class

Displays the registrant class selected from the list below the field. You have the option of charging different registration fees for different registration classes. If the Default registrant class is selected, all registrant classes will be charged the same registration fees.

Comp

Designates functions which are complimentary (free of charge) for one or more registrant class.

Early

Specifies the fee charged when a registrant places an order on or before the established Early Cutoff date as defined on the Define an event window.

Regular

Specifies the fee charged when a registrant places an order after the Early Cutoff date but on or before the Reg Cutoff date.

Late

Specifies the fee charged when a registrant places an order after the established Reg Cutoff date as defined on the Define an event window.

Income Account

Specifies the general ledger account number assigned to the function for this specific registrant class.

Deferred Account

Specifies the general ledger number that records the fee until it is transferred to earned income. (This field is visible only if you are licensed for Deferred Income)

To define event function fees and GL information

Note: Although this procedure describes assigning a flat fee for all registrant classes and all registration dates, you can assign different fees for different registrant classes and registration dates.

1. Define an event.
2. Define an event function.
3. On the Event Function Detail window, click More and select Fees from the drop-down list.

   The Event Function Definition - Fees window opens.
4. Click Edit.
5. Choose a registrant class or the *Default* class.
6. Enter the amount for the Early, Regular, and Late fees or check the Comp box if you will not charge members of this registrant class a fee for this function.
7. (optional) Enter the general ledger account number where the income should be credited in the Income Account field, or click the lookup icon to select an account.

Note: If you are using a General Ledger interface, you must assign a GL account number to all fees other than complimentary.

8. (optional) Enter the deferred income account in the Deferred Account field, or click the lookup icon to select an account.
9. Click Save.

Fee structure scenarios

Just as event definitions vary from simple to complex, so do the fee and accounting structures. You can choose from:

- No fees charged
- Single fee and income account
- Early and regular fees for all classes
- Multiple fees and income accounts by class
- Multiple fees by class, single income account
- Single fee and multiple income accounts by class
- Multiple fees for some classes, single fees for others
- Some functions with fees by class, some with fees for all

Use the Event Function Definition - Fee window to set up these structures.

No Fees Charged

1. Define a single event function through the Event Function Detail window so that you can process registrations for the event.
2. To speed registration, enable the Automatic Option.
3. Because no fees apply to any registrant class, enable the Comp option for the Default registrant class.

4. No accounting information is involved, so leave the Income Account blank.
5. Click Save.

Single Fee and Income Account

1. Define a single event function through the Event Function Detail window so that you can process registrations for the event.
2. To speed registration, enable the Automatic Option.
3. Enter a single fee amount in the Regular field for the Default registrant class.
4. Enter the single General Ledger account number for the Default registrant class if you are using the iMIS General Ledger (G/L) interface or want to track and report on the accounting entries.
5. Click Save.

Early and Regular Fees for All Classes

Assume you are offering early rates to encourage people to mail in their registrations. You lower the fee from the regular $55 to $45 for all registrations received on or before May 15, but you still only have one class of registrant. Use this function/fee setup:

1. Define a single function to record registrations.
2. To speed registration, enable the Automatic Option.
3. Enter 45 in the Early column and 55 in the Regular column. Enter the 5/15 date in the Early Cutoff field on the Define an event window.
4. Enter the single General Ledger account number for the Default registrant class if you are using iMIS General Ledger (G/L) interface or want to track and report on the accounting entries.
5. Click Save.

Multiple Fees and Income Accounts by Class

Assume you are charging different rates for a single event based on the membership status (class) of the registrant. You have separate income accounts for recording the fees, and early and regular fees are $75 and $90 for customers, and $125 and $150 for nonmembers. Follow these steps to define the fees:

1. Define a single function to record registrations.
2. To speed registration, enable the Automatic Option.
3. Because the fees vary according to status and class, skip the Default registrant class; instead, enter fees of $75 and $90 in the Early and Regular columns for the Member registrant class and $125 and $150 in the Early and Regular columns for the Nonmember registrant class.
4. If you have more groups to register (such as speakers or staff), either record their fee information in their class lines or as a whole in the *Default* line.
5. If you are tracking the income accounts, enter them separately on the Member and Nonmember lines, respectively.
6. Click Save.

Multiple Fees by Class, Single Income Account

This setup is similar to the scenario above except there is only one income account, rather than several, for recording the fees. To set up these fees:

1. You still must enter the different fee amounts on each Registrant Class line.
2. Although you could enter the same account for both the Member and Nonmember registrant classes, you simply can enter the single account for the Default registrant class.
3. Click Save.

Single Fee and Multiple Income Accounts by Class

This is an uncommon situation, but you can set up such a scenario. You can process identical fees in separate income accounts based on registrant class by following these

steps:

1. The same fee structure (early, regular, and late) applies to all registrant classes. Record the fees for each registrant class instead of the Default registrant class.
2. Record the different income account numbers for each registrant class instead of the Default registrant class.
3. Click Save.

Multiple Fees for Some Classes, Single Fees for Others

In this scenario, you will set member and nonmember fees separately as before. However, you also are providing complimentary (free) registrations for speakers, exhibitors, and staff customers. To set up this fee structure:

1. Enter the fee for the Default registrant class because all nonstandard registrant classes are assigned the same fee.
2. Record the different fee amounts for the Member and Nonmember registrant classes.
3. Although you could mark Comp for each remaining registrant class, you also can enable it for the Default registrant class.
4. Click Save.

Some Functions with Fees by Class, Some with Fees for All

In this situation, you need to set up a conference in which some functions, such as the registration, require that fees vary by class and date, but other functions have a single fee or none at all. While this sounds complex, the setup is simple:

- For each function, record variable fee amounts for each registrant class;
  or
- Edit the Default registrant class by enabling the Comp option or entering a fixed amount.

Function planning

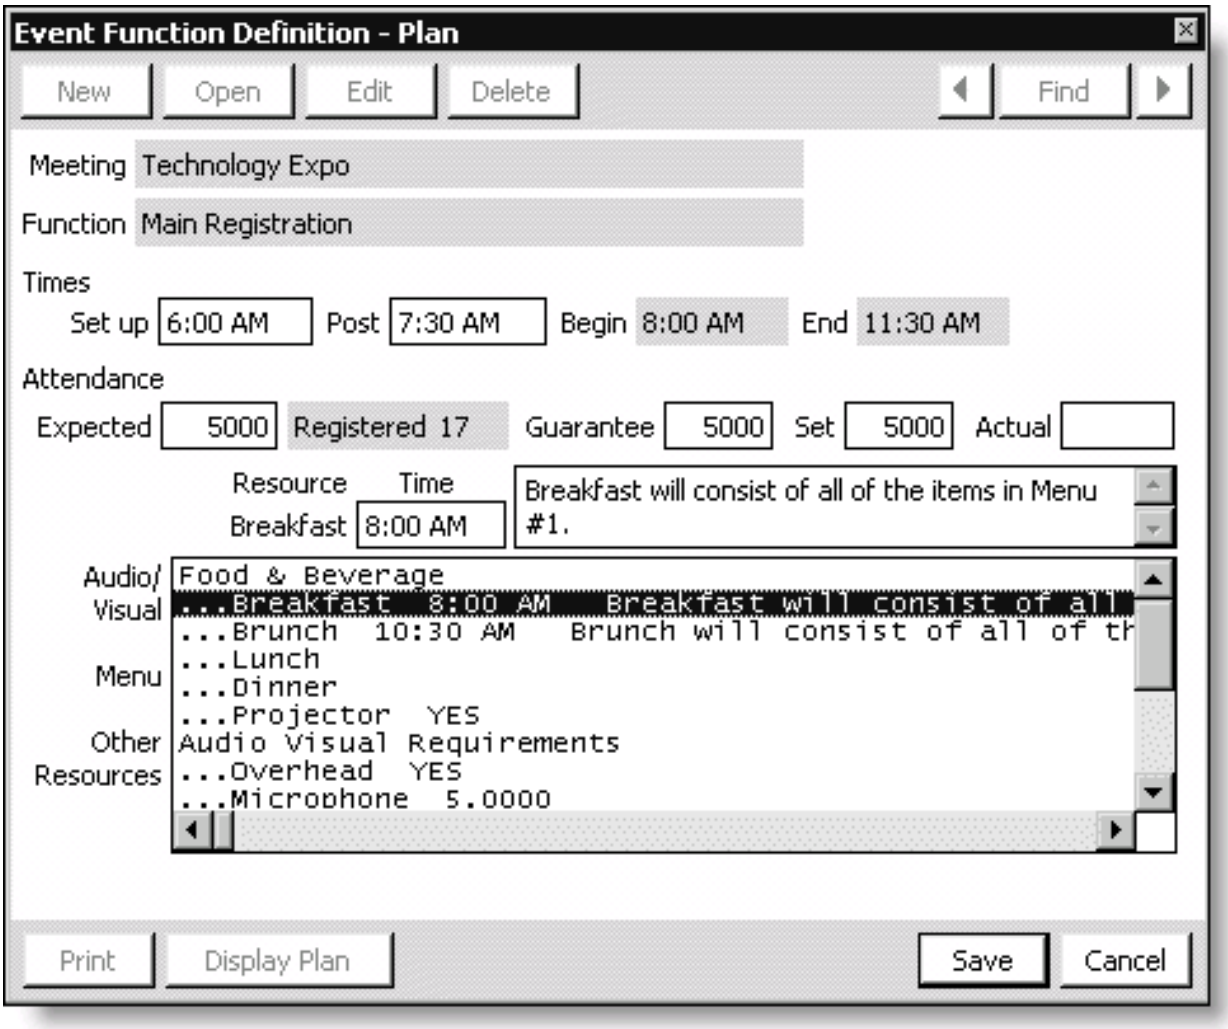
iMIS enables you to plan each function to the smallest detail, including information on food and beverages, equipment, room arrangements, and notes. This information is

important for internal usage and for communicating your plans to hotels and conference centers. Detailed plans may be printed and sent to hotel staff or other personnel in charge of planning and arranging event function facilities.

The Event Function Definition - Plan window is used for:

- Room planning and setup information, including scheduling
- Expected attendance and related figures
- Notes about required resources

Event Function Definition - Plan window



From Events, select Define an event, double-click an event, double-click an event function, click More, and select Plan

Meeting

Displays the event Title defined on the Define an event window.

Function

Displays the event function Title defined on the Event Function Detail window.

Times

- Set up - Specifies the time for room setup to begin. The format for entering time is [hour] (space) [minutes] (space) [pm]. For example, 7:15 a.m. would be entered as 7 15 (because the default is a.m.) and 2:00 p.m. would be entered as 2 pm..
- Post - Specifies the time for room setup to be completed.
- Begin - (read only) Displays the event function Begin Time from the Event Function Detail window.
- End - (read only) Displays the event function End Time from the Event Function Detail window.

Attendance

- Expected - Specifies the number of registrants expected to attend the function.
- Registered - (read only) Displays the total number of function registrants from the Event Function Detail window.
- Guarantee - Specifies the total number of attendees you guarantee will attend the function.
- Set - Specifies the total number of attendees for which the room should be set or arranged.
- Actual - After the function is complete, Specifies the actual number of attendees.

Resource

- Title - (read only) Displays the resource's title when a resource is selected from the Resource list.
- Qty - (Displays only if enabled for the resource in the Set up event resources window (from Events, select Set up tables > Event resources)) Specifies the number of the selected resources needed.
- Time - (Displays only if enabled for the resource in the Set up event resources window) Specifies the time the resource will be needed.
- Check Box - (Displays only if enabled for the resource in the Set up event resources window) Enable to indicate that a projector will be needed for the function.
- ID - (Displays only if enabled for the resource in the Set up event resources window) Displays the resource ID number.
- Text - (Displays only if enabled for the resource in the Set up event resources window) Specifies any applicable note for the resource.

  Resources

  Lists the resources defined in the Set up event resources window.

  Display Plan button

  Used to display the Room Setup Report.

  To define a plan

1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the Define an event window.
3. Select an event function, and click Edit to open the Event Function Detail window.
4. Click More, and select Plan to open the Event Function Definition - Plan window.
5. Enter the Set up and Post times.
6. Enter the Expected number of attendees.
7. (optional) Enter the number of attendees you want to Guarantee.

8. (optional) Enter the Set number of attendees for which the room should be set up or arranged.
9. Select the resource items, and the prompts enabled for the resource in the Set up event resources window will display.
10. Define the details for each resource item. For example, enter a Time for breakfast to be set up or served and any additional information in the Text field.
11. Click Save.
12. Select Display Plan to display the Room Setup Report on the screen:

Room Setup Report as of April 5th, 2002

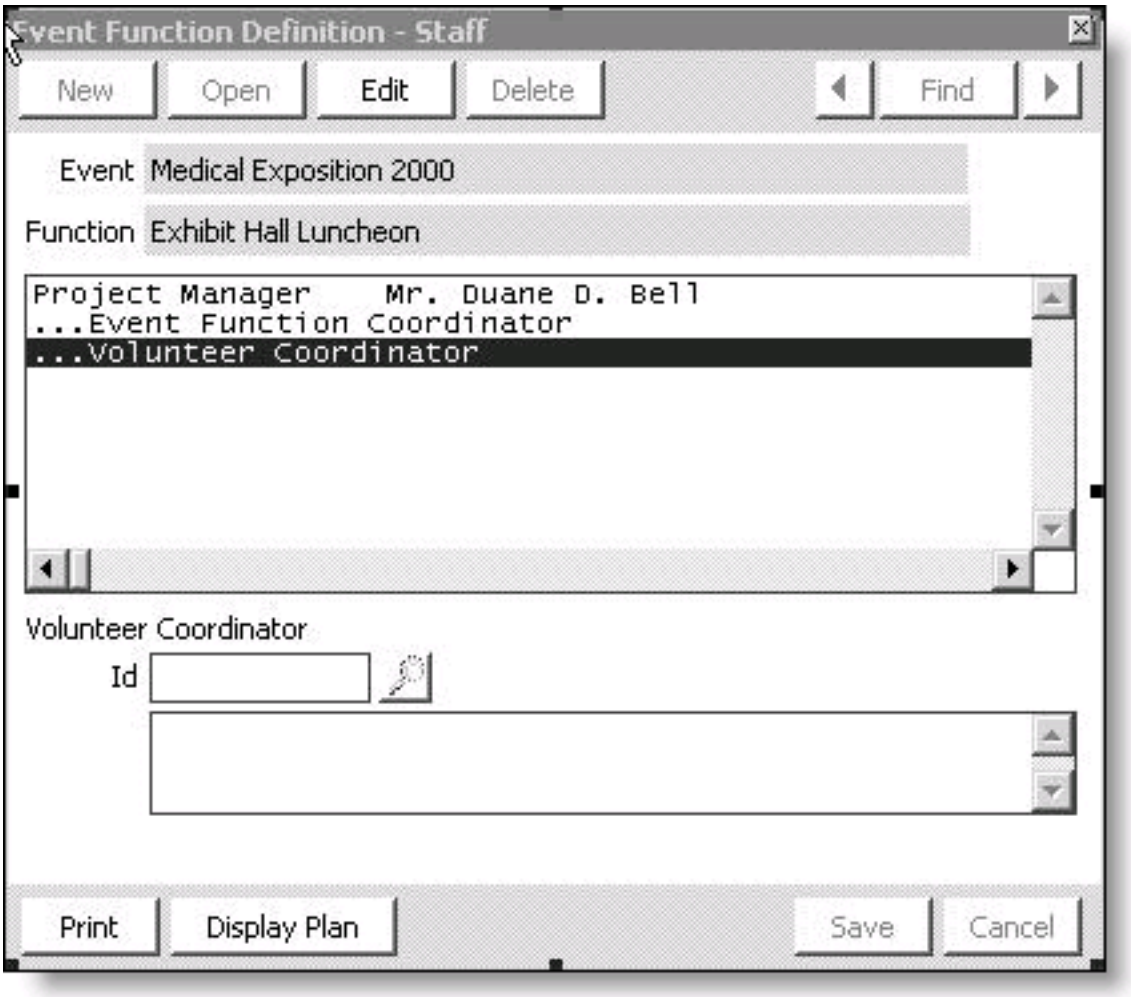
Example of the Room Setup Report

View and assign event function staff

Use the Event Function Definition - Staff window to:

- View all event staff roles as defined by your organization using Events > Set up tables > Event Resources
- View any staff members that have been assigned roles for an event function
- Assign staff to an event function
- Run a report containing basic details about the event function, staff members assigned to the event function, and each staff member's role for that event function

Event Function Definition - Staff window



From Events, select Define an event, double-click an event, double-click an event function, click More, and select Staff

To view staff assigned to an event function

1. Go to Events.
2. Select Define an event.
3. From the list of events, double-click the event you want to open.
4. From the list of event functions at the bottom, double-click the function to be staffed.
5. On the Event Function Detail window, select More > Staff.

To assign staff to an event function

1. Go to the Event Function Definition - Staff window.
2. Select Edit.
3. Select a staff role from the list. Once a role is highlighted, the Id field appears at the bottom of the window.

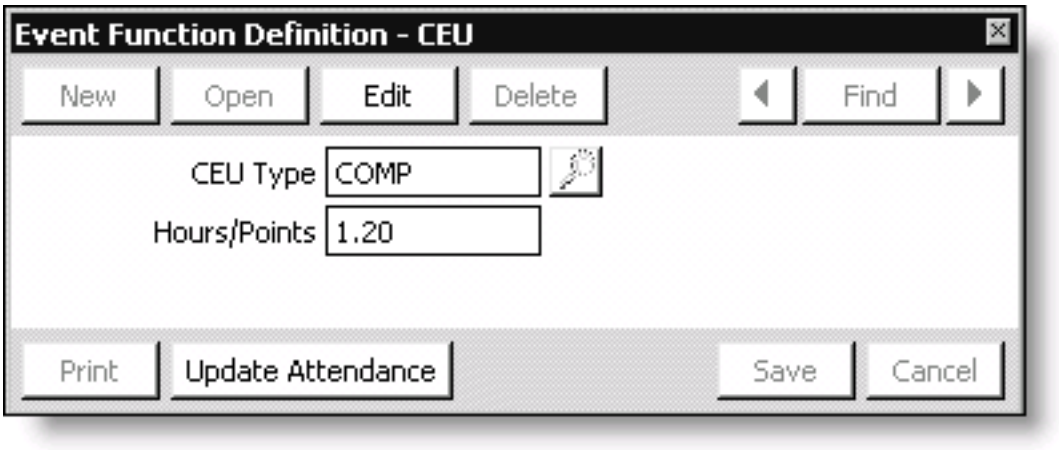
   Note: If the Id field does not appear, return to the Set up tables > Event Resources window, select the staff role you wish to assign, and make sure that Id has been selected in the Field 1 Usage option.
4. Enter the ID in the Id field, or use Find to locate the individual: select the QuickLook button to the right of the Id field. When you locate the staff member, double-click the name to assign it to the event function.
5. Select Save.
6. Close the Event Function Definition - Staff window.

Tracking credits for continuing education

If your system is licensed for iMIS Continuing Education (CEU), you can track the education credits awarded to function attendees. Because CEU data is managed at the function level, you can easily track multiple functions that offer different awards and credits during a single event.

Event Function Definition - CEU window

The Event Function Definition - CEU window enables you to record education credits to be awarded to function attendees. Because CEU data is managed at the function level, you easily can track multiple functions for the same event.



From Events, select Define an event, double-click an event, double-click an event function, click More, and select CEU

Note: You can access the Event Function Definition - CEU window only if the CEU Name field is populated on the Customer Setup - Advanced window. The entry in the CEU Name field is shown on the Event Function Detail window's More menu.

CEU Type

Designates the continuing education category of the course. Valid codes are defined in a lookup table according to the following rules:

If you are not licensed for Certification, you must create and populate the CEU_TYPE general lookup/validation table (see "Events: Set up tables") to use the lookup and validation features of this field.

If you are licensed for Certification, lookup and validation of this field is performed against types defined in Certification. You can also use the CEU_TYPE table in combination with Certification types. In this case, codes are listed alphabetically when using the lookup function.

Note: If a CEU code appears both in Certification and in the CEU_TYPE table, the code from Certification is used.

This field's prompt can be customized on the Customer Setup - Advanced window.

Hours/Points

Specifies the number of units or hours to be awarded for attending the course.

This field's prompt can be customized on the Customer Setup - Advanced window.

Update Attendance

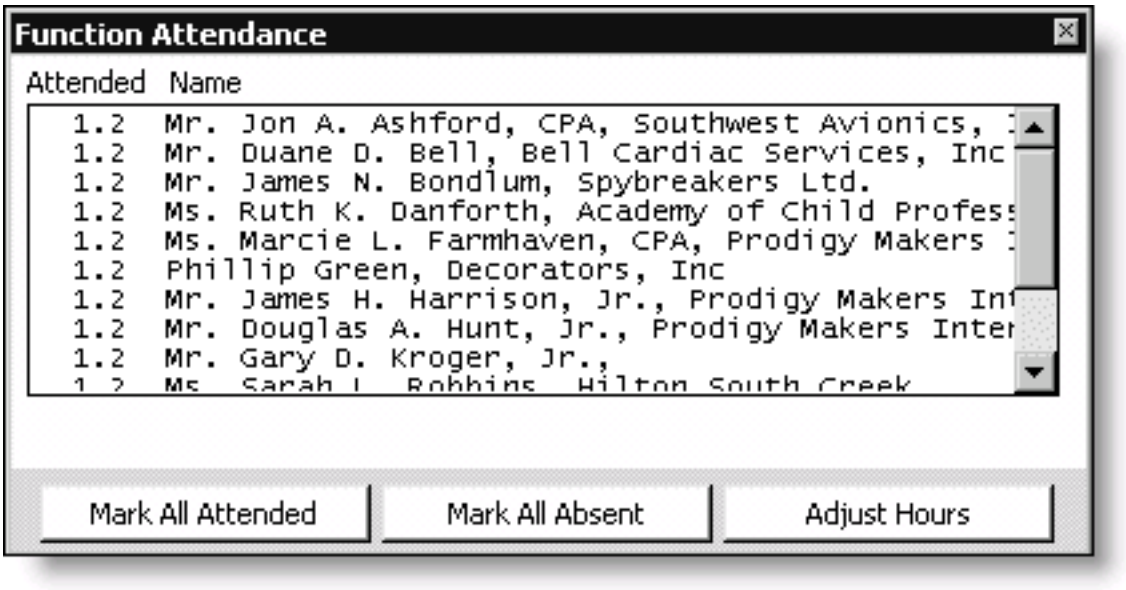
Opens the Function Attendance window used for awarding CEU hours/points.

To track credit for continuing education

1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the Define an event window.
3. Select an event function, and click Edit to open the Event Function Detail window.
4. Click More, and select CEU to open the Event Function Definition - CEU window.
5. Enter the CEU Type (use the lookup icon to find a CEU type).
6. Enter the Hours/Points.
7. Click Save.

Function Attendance window

The Function Attendance window displays a list of non-canceled registrants for a selected function and is used for awarding CEU hours/points.



From Events, select Define an event, double-click an event, double-click an event function, click More, select CEU, and click Update Attendance

Mark All Attended

Changes the attendance status for all individuals on the roster to “Attended.”

Mark All Absent

Changes the attendance status for all individuals on the roster to “Absent.”

Adjust Hours

Adjusts the default credit hours set for this function.

To mark attendance

The first time you open the Function Attendance window for a function, all registrants appear on the list with an unmarked attendance status. When a registrant's status is changed to “Attended,” a pointer and the amount of continuing education credits awarded appear in the Attended column.

Mark attendance by double-clicking on the individual's name to change the attendance status as follows:

- If the line is unmarked (no pointer and zero hours/points in the Attended column), double-clicking marks it as Attended.
- If the line is marked, double-clicking will unmark it.

This toggling action lets you mark attendance by either of these two approaches:

- Manually mark each individual who attended.
- Globally mark the group and, on an exception basis, only unmark those who did not attend (no-shows).

To update attendance (CEU)

1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the Define an event window.
3. Select an event function, and click Edit next to the list of functions to open the Event Function Detail window.
4. Click Cancel.
5. Click More, and select CEU to open the Event Function Definition - CEU window.
6. Click Update Attendance to open the Function Attendance window.
7. Mark the registrants as attended. You have two options:

- Click Mark All Attended to select all the registrants, click Yes, and then double-click the registrants who did not attend the function to mark them as absent.
- Double-click each registrant individually to mark them as attended.

8. If you make mistakes or lose track of your changes, return all individuals to the unmarked status, click Mark All Absent, click Yes, and start over with the attendance marking.

To adjust continuing education credits

Complete the following steps to adjust the continuing education credits awarded to a registrant to an amount other than that defined for the function:

1. From Events, select Define an event to open the Define an event window.

2. Double-click an event to open it in the Define an event window.
3. Select an event function, and click Edit next to the list of functions to open the Event Function Detail window.
4. Click Cancel.
5. Click More, and select CEU to open the Event Function Definition - CEU window.
6. Click Update Attendance to open the Function Attendance window.
7. Select a registrant on the Function Attendance window.
8. Click Adjust Hours to open the Adjust Hours window. You may have to reposition the Function Attendance and Event Function Definition - CEU windows.
9. Enter the correct credit amount for the registrant.
10. Click Save.

Linking event functions

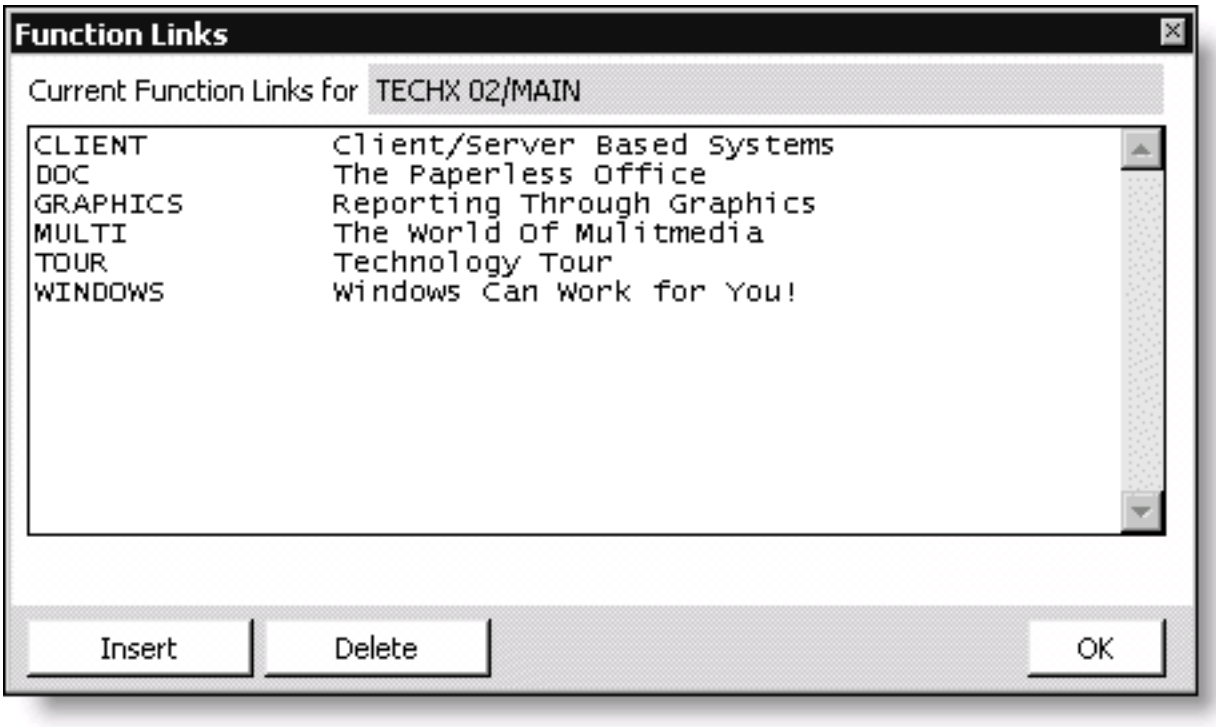
The Links option enables you to associate a primary (parent) event function to secondary (child) event functions. When a registrant registers for the primary event function, iMIS automatically registers the registrant for all secondary functions that are linked to the primary function.

Linking event functions is a shortcut for data entry. If you clear the primary function, then iMIS leaves the linked function(s) selected (that is, selecting the parent also selects the children, but clearing the parent affects only the parent).

You have the option of individually selecting and clearing linked functions at any point during the event registration process. However, if you have no cost associated with an optional child function, such as a banquet that does not have an additional cost, you should set up the child function to be complimentary (with pricing) so that your headcount is accurate even when you remove someone from a parent function registration list.

Note: The linking feature does not affect pricing or complimentary functions.

Function Links window



From Events, select Define an event, double-click an event, double-click an event function, click More, and select Links

Current Function Links for

Displays the primary event function name.

Function Links

Lists the secondary event functions that are linked to the primary function.

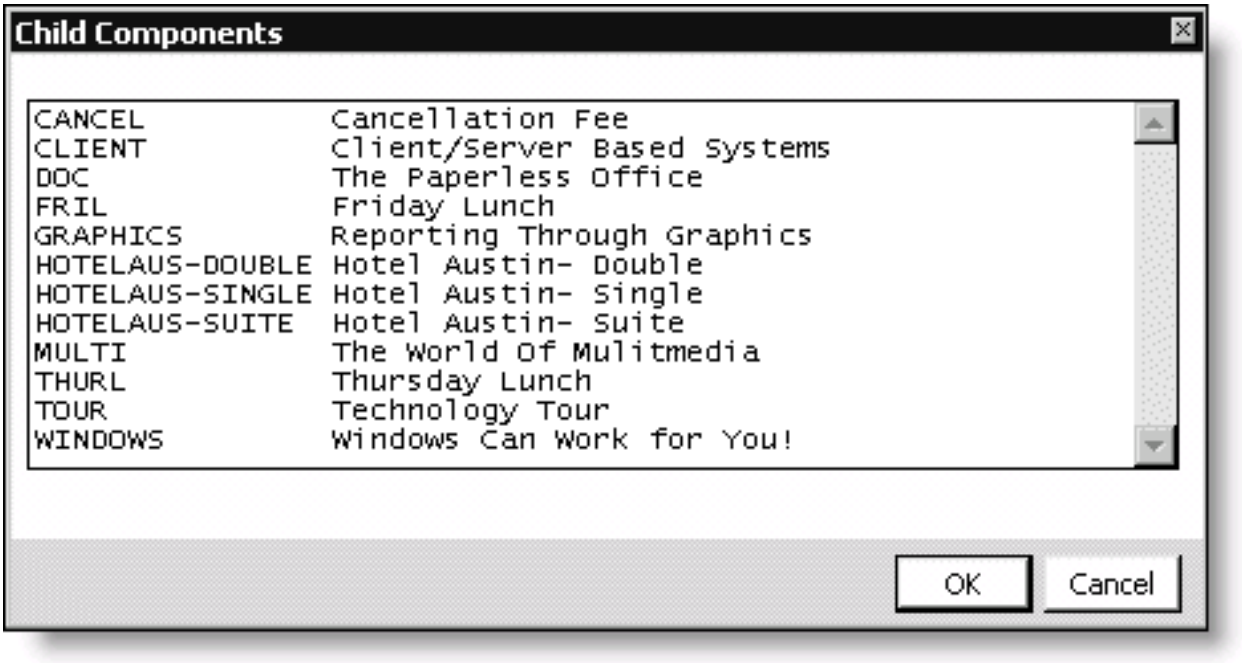
Insert button

Opens the Child Components window. The Child Components window lists all of the secondary event functions.

Delete button

Used to disable a linked secondary event function.

Child Components window



From Events, select Define an event, double-click an event, double-click an event function, click More, select Links, and click Insert

Secondary Functions

Lists all of the secondary event functions that are not linked to the primary event function.

To link event functions

1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the Define an event window.
3. Select an event function, and click Edit to open the Event Function Detail window.
4. Click Cancel.
5. Click More, and select Links to open the Function Links window.
6. Click Insert to open the Child Components window.
7. Select a secondary event function that you want to link to the primary function.

8. Click OK to link the secondary function to the primary function. The Child Components window will close, and the linked function will be added to the Function Links window.
9. Click OK.

Note: To print tickets for a MEMO function, it must be linked to a REG function, and Print Tickets must be enabled for the REG function.

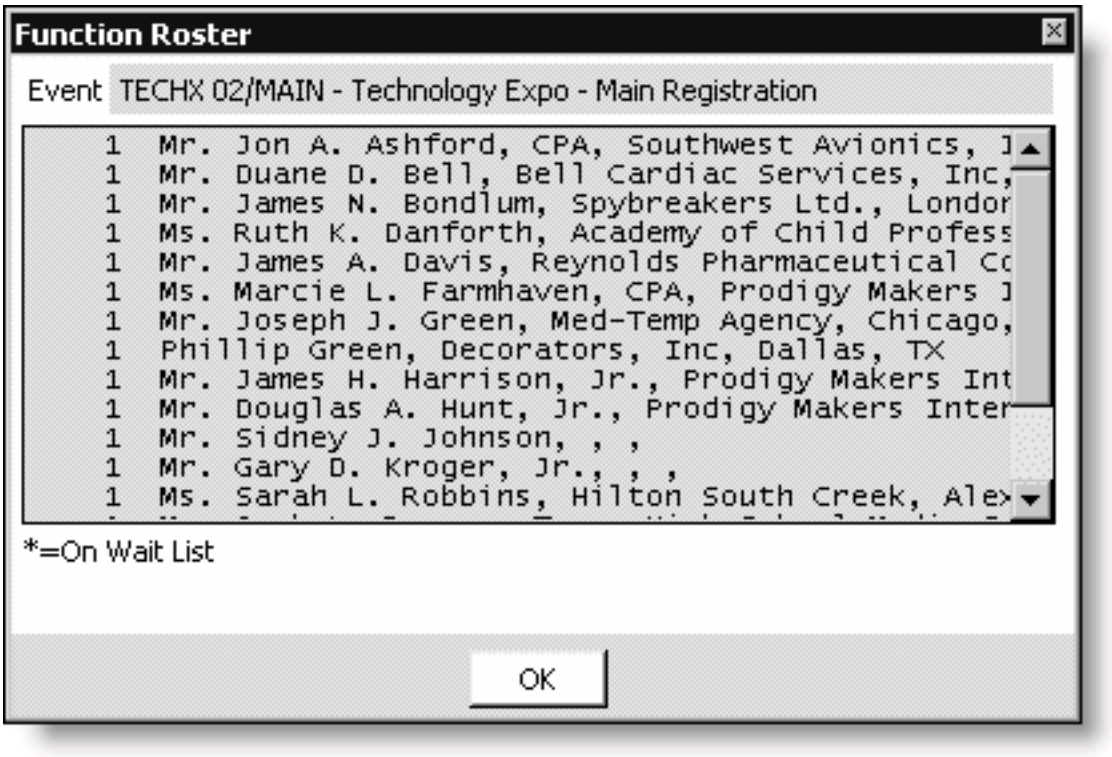
To delete an event function link

1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the Define an event window.
3. Select an event function, and click Edit to open the Event Function Detail window.
4. Click Cancel.
5. Click More, and select Links to open the Function Links window.
6. Select the linked secondary event function you want to delete.
7. Click Delete.
8. Click Yes.
9. Click OK.

Note: The primary and deleted secondary function(s) are no longer linked. You did not delete any functions. If you completed a registration with a primary function linked to a secondary function, you manually must delete the linked (secondary) function from the registration.

Viewing the function roster

Use the Function Roster window to view a list of registrants who have signed up for a function.



From Events, select Define an event, double-click an event, double-click an event function, click More, and select Roster

Event

Lists the event code, event title, and function title.

Function Roster

Lists all of the event function's registrants.

To view an event function roster

1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the Define an event window.
3. Select an event function, and click Edit to open the Event Function Detail window.
4. Click Cancel.
5. Click More, and select Roster to open the Function Roster window.

Editing event functions

All available event functions appear in the scrolling area of the Define an event window. You can edit and delete functions using the buttons next to the list of functions.

To edit event functions

1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the detailed Define an event window.
3. Select an event function, and click Edit to open the Event Function Detail window.
4. Make any necessary changes.
5. Click Save.

To delete an event function

1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the Define an event window.
3. Select an event function, and click Delete.

   A system message prompts you to verify the function's deletion.
4. Click Yes to delete the function.

   Note: You cannot delete a function until you cancel all registrations for the function. If you attempt to delete a function that has registrants, a system message explains why you cannot delete the function.

Events Setup

Events: Set up module

iMIS Events has its own system setup where you define global parameters, such as user-defined descriptions and registration fields.

Based on your organization's requirements, you will select from a number of options on the Set up module window. These options have global implications for the management of your events.

Events includes a wait list feature that enables you to add potential registrants to a wait list when an event function is full. By enabling the wait list options, you can take full advantage of this feature.

Events also provides several advanced features that enable you to customize your module. By mapping additional fields to event activity records, you can extend the range of the information you collect about an event.

See AR/Cash "Deferred Income in iMIS" for "Deferring dues/subscriptions income" and "Deferring events/exhibition/exposition income".

Events: Set up tables

Events provides several General Lookup/Validation tables that help you manage your events:

BADGE_TYPE

Stores the badge types needed for your events. The Events module comes with two predefined badge types: Free_Pass and Paid_Pass. Free passes come with the purchase of a booth. For example, when setting up your event, if you indicate that each booth unit receives two free passes, that is the number of free passes available to the registrant for each booth unit.

A Paid_Pass is a specific product defined at the event function level. For example, registrants may want to purchase additional badges with their booth order. The BADGE_TYPE information is available from the Register a customer window's Badges tab. As you issue each badge, you can see the number available for each Paid and Free Pass type displayed below the data entry area.

Although the Events module comes with the Free_Pass and Paid_Pass badge types already defined, you can define as many badge types as you need for your particular

event. Badge types will be available on the Badges tab only if they have been defined in the BADGE_TYPE General Lookup/Validation table.

CEU_TYPE

Stores continuing education units (CEU) type codes used for validation and lookup of CEU credit entries if you are not licensed for the Certification module.

If you are licensed for Certification, lookup and validation of CEU Type fields are performed against CEU type codes that are defined in Certification. If this CEU_TYPE table is also populated with CEU type codes, then the codes from both sources are combined and listed alphabetically when you click the CEU Type field's Lookup icon.

Note: If an identical CEU type code exists both in Certification and in the CEU_TYPE table, the code from Certification is used.

CONFLICT_CODE

Stores codes used in determining date/time conflicts and content conflicts between events. Registering for conflicting event functions will display a warning message.

GL_ACCOUNT

Stores accounting codes. If the Validate G/L Accounts option is enabled on the AR/Cash General Ledger Interface window, then the table will be used to validate accounting codes. If the option is not enabled, you may enter codes that are not in the table.

MEETING_TYPE

Stores codes used in distinguishing different types of events, such as CONF for conference and SEM for seminar.

PREFIX

Stores titles and abbreviated titles that precede a customer's formal name, such as Mr., Ms., and Dr.

SOURCE_CODE

Stores codes used in specifying the marketing program or contact type that generated an accounting transaction, such as phone and mail. Enable the Force Source Coding option on the Customer Setup - Basic Options window to require source coding.

SUFFIX

Stores titles and abbreviated titles that follow a customer's formal name, such as Jr., Sr., II, and III.

TITLE

Stores professional titles and positions, such as CEO, COO, and CMO.

To create General Lookup/Validation tables for events

1. Select Customers > Set up tables > General lookup/validation to open the Set up general lookup/validation window.
2. Select the drop-down arrow to display a list of table types.
3. Scroll to the bottom of the list, and select (New Table). A data entry window opens.
4. Enter a New Table Type in the window.
5. Click Save to return to the Set up general lookup/validation window.
6. Click New.
7. Enter the table information:

- Enter a Code for the new definition.
- (optional) Enter an expansion value for the code.
- (optional) Enter a brief Description of the defined item.

8. Click Save.

Setting up basic event information

You must perform basic system setup activities before you can begin using the Events module. System setup information is entered on the Set up module and Event System

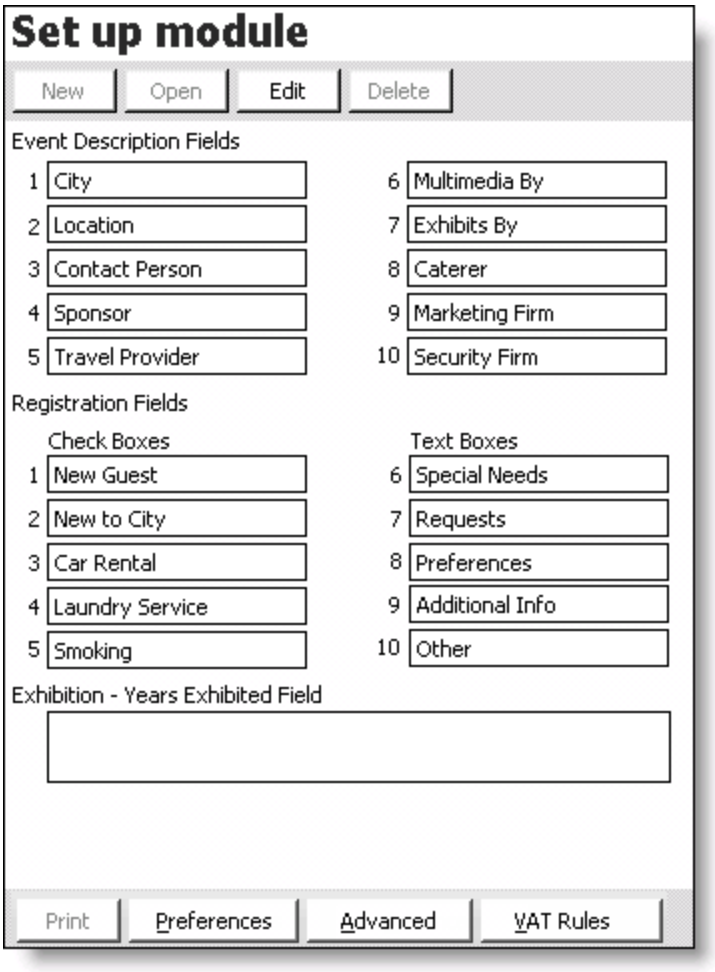
Preferences windows. Some setup also is performed on the Events Advanced Features window (see "Setting up advanced features").

The Set up module window contains options grouped into three areas: Event Description Fields, Registration Fields, and the Exhibition - Years Exhibited Field. By entering user-defined information in these fields, you customize the information that appears on the Event Description window and the Register a customer window's Other tab.

Information you define in the Event Description Fields appears as labels on the Event Description window. For example, you may want to have fields that specify the location of the event, who the event contact is, or other pertinent event information. These fields will not appear on the Event Description window unless they are given labels on the Set up module window.

Information added in the Registration Fields appears as fields on the Register a customer window's Other tab. This is helpful if you want to track information about registrants, such as first-time attendee status, the registrant has special room needs, or other information that might be helpful for analysis and future planning.

Set up module window for Events



From Events, select Set up module (VAT Rules appears only if VAT is enabled)

Event Description Fields

These user-defined description fields display on the Event Description window.

Registration Fields

These user-defined registration fields display on the Register a customer window's Other tab.

Exhibition - Years Exhibited Field

This custom field stores the number of years exhibited. You must be licensed for Exhibition in order to use this field.

Preferences button

Opens the Event System Preferences window where you can enable several options.

Advanced button

Opens the Events Advanced Features window.

VAT Rules button

(if licensed and enabled at the organization level) Opens the VAT Rules window, for optionally defining rule sets for “place of supply” requirements. See “Defining VAT Rules for Events” in International Taxation.

To add user-defined Event Description Fields

1. From Events, select Set up module to open the Set up module window.
2. Click Edit.
3. Enter the field names in the Event Description Fields that you want to display on the Event Description window. The user-defined fields entered on the Set up module window display as data entry fields on the Event Description window.
4. Click Save.

To add user-defined event Registration Fields

1. From Events, select Set up module to open the Set up module window.
2. Click Edit.
3. Enter the field names in the Registration Fields that you want to display on the Register a customer window's Other tab. The user-defined fields entered on the Set up module window display as data entry fields on the Other tab.
4. Click Save.

To add field names to the Exhibition - Years Exhibited Field

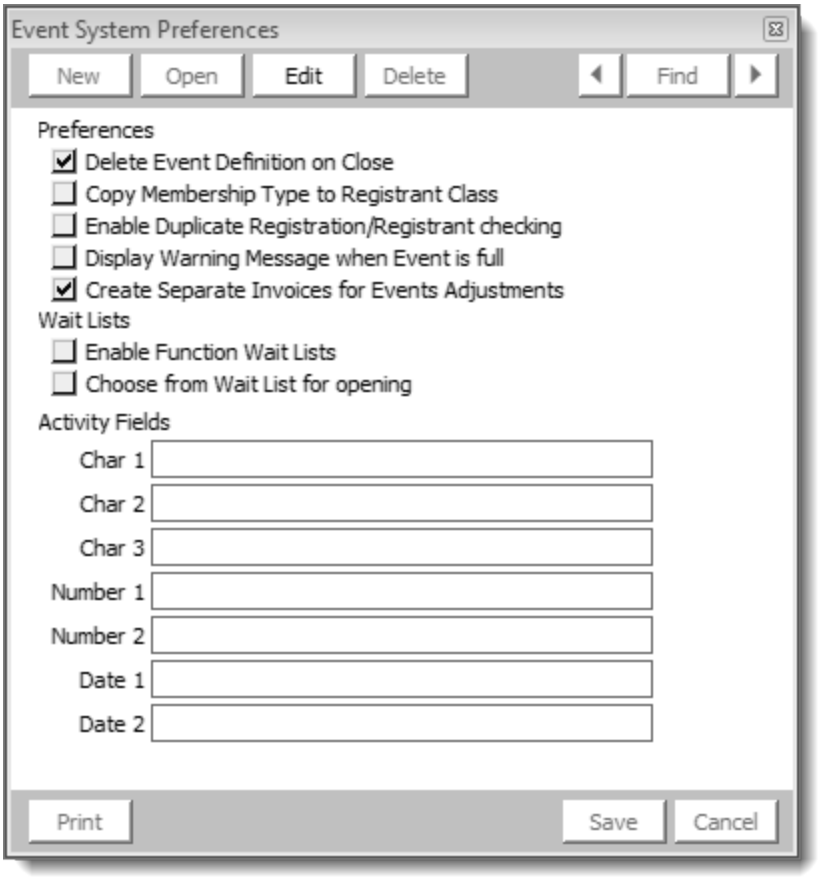
1. From Events, select Set up module to open the Set up module window.

2. Click Edit.
3. Enter the field name in the Exhibition - Years Exhibited Field that will store the calculated number of years exhibited.
4. Click Save.

Enabling event system preferences

The Event System Preferences window has several setup options you need to consider when planning your management system for Events. Each of these options is discussed in detail in the following procedures.

Event System Preferences window



From Events, select Set up module, and click Preferences

Preferences

Delete Event Definition on Close - Enabling this option has significant implications. If enabled, all event definition records and function definition records are deleted when you close the event.

If you do not enable this option, you can retain the event definition and summary records, which may be important to you when cloning events. The event remains listed on the Define an event window with a status of C for closed.

Copy Membership Type to Registrant Class - iMIS can copy the customer type code directly to the registrant class code if you need to assign fees or group registrants at the customer type level. All non-represented types map to the basic Member (M) or Non Member (NM) classes. You can directly override any system-assigned class on the Event Registration window. If you want to use customer types to define your registrant classes, you can copy the existing customer types from the Set up customer types window to the Set up registration classes window. For example, if you have a student type (customer type = STU) that you need to assign different product fees to, enter the same customer type code on the Set up registration classes window. You can select the customer types that you want to use only by entering matching codes for those types.

Enable Duplicate Registration/Registrant checking - This option compares registrants without customer IDs to the customer database. When this option is enabled and iMIS finds a customer with the same first and last name as the registrant, a warning message displays informing you that the person may already exist in the database.

Display Warning Message when Event is full - This option enables a warning message when the maximum event registration limit has been reached. This option is not related to the Wait Lists options.

Create Separate Invoices for Events Adjustments – (option only available for organizations whose Taxation Method is set to VAT) To comply with regulations related to VAT invoicing, enable this option so that new invoices are generated for financial adjustments made to event registrations. Once the original invoice is printed, then the line items, quantities, and amounts in that document will not change. With this option, every adjustment generates a new invoice document (credit note or positive adjustment), which uses

the date of the adjustment, lists any credits or debits, and references the original invoice. These invoices can be viewed and printed from Events > Register a customer > Account Info tab.

Note: Enabling this option affects new event registrations only; existing registrations retain their consolidated, single invoice.

Wait Lists

Enable Function Wait Lists - This option enables the wait list for all event functions that have an entry in the Maximum field.

Choose from Wait List for opening - When this option is enabled, you can select from the wait list which registrant you want to register for a function when it becomes available.

Activity Fields

These seven mapped fields can be defined to capture and store order information in the registrant's activity records. See "To map user-defined fields to event activities" for details.

To delete an event definition on close

1. From Events, select Set up module to open the Set up module window.
2. Click Preferences to open the Event System Preferences window.
3. Click Edit on the Event System Preferences window.
4. Enable the Delete Event Definition on Close option.
5. Click Save on the Event System Preferences window.

To copy customer type codes to registrant class codes

1. From Events, select Set up module to open the Set up module window.
2. Click Preferences to open the Event System Preferences window.
3. Click Edit.

4. Enable the Copy Membership Type to Registrant Class option.
5. Click Save.

Note: You must have the same information on both the Set up registration classes and Set up customer types windows for the customer types to display in the Event Function Definition - Fees window.

To enable Duplicate Registration/Registrant checking

The Enable Duplicate Registration/Registrant checking option on the Event System Preferences window (Events > Set up module, Preferences) turns on duplicate checking for registrants. It may be useful if you routinely register customers who do not have records in the customer database. When this option is enabled and a suspected duplicate registrant is entered, a message appears on the Register a customer window stating that the customer is already registered for the event.

1. From Events, select Set up module to open the Set up module window.
2. Click Preferences to open the Event System Preferences window.
3. Click Edit.
4. Enable the Enable Duplicate Registration/Registrant checking option.
5. Click Save.

To display a warning message when an event is full

1. From Events, select Set up module to open the Set up module window.
2. Click Preferences to open the Event System Preferences window.
3. Click Edit.
4. Enable the Display Warning Message when Event is full option.
5. Click Save.

Enabling event wait lists

The Enable Function Wait List option allows iMIS to maintain and check wait lists for event functions that have specified enrollment limits. Wait listing is useful for registrants when another registrant cancels their order, the maximum attendance limit is increased, or both. To use the wait list option, you must have a value in the Maximum field in the Event Function Detail window, and you must enable the Enable Function Wait List option on the Event System Preferences window at system setup.

Note: Enable only if you intend to use it; wait list checking makes registration processing more complex, which could affect system performance.

If you enable the Enable Function Wait Lists option, the system assigns the opening to the first registrant on the wait list. If you enable the Choose from Wait List for opening option, you can select a registrant from the wait list to fill the opening if a registrant cancels his order or the attendance limit is increased.

To enable function wait lists

The Enable Function Wait List option applies only to event functions that have a non-zero Maximum amount specified. You can view the registrants on the wait list for a specific function by clicking More and selecting Roster on the Event Function Detail window.

1. From Events, select Set up module to open the Set up module window.
2. Click Preferences to open the Event System Preferences window.
3. Click Edit.
4. Enable the Enable Function Wait Lists option.
5. Click Save.

During registration, as long as the Maximum attendance limit has not been reached (or is not set to 0), registrations proceed as usual. However, after a function reaches its maximum attendance limit, iMIS prompts you to place new registrants on a wait list for that function. You can easily cancel the function request at this point to prevent the registrant

from being added to the wait list. If the registrant is added to the wait list for a function, that function is prefaced with an asterisk on the registrant's list of enrolled functions.

If you cancel (clear) a registration for a particular function for which a wait list exists and the Choose from Wait List for opening option is activated, iMIS prompts you to select a replacement registrant from the wait list to complete the cancellation. Select from the wait list iMIS presents (sorted so that the first person added appears at the top). When you click Save, iMIS updates both attendees' registration records.

iMIS will automatically select replacements from the wait list under the following conditions:

- The Maximum attendance limit is increased in the Event Function Detail window.
- A registration is canceled.
- An individual registration function is canceled, and the Choose from Wait List for opening option is not activated.

To enable the Choose from Wait List for opening option.

1. From Events, select Set up module to open the Set up module window.
2. Click Preferences to open the Event System Preferences window.
3. Click Edit.
4. Enable the Choose from Wait List for opening option.
5. Click Save.

Mapping user-defined fields to event activity records

iMIS has the ability to map user-defined fields to event activity records. This system setup function lets you specify up to seven event-related data fields (three character, two numeric, and two date fields) to be added to each registrant's activity record when an event is closed. The data can come from the individual registration data, such as the user-defined fields, or from event definition information from the following tables:

- Meet_Master
- Order_Meet
- Order_Badge (Primary badge only)
- Orders

If you want to view the added data on the Manage customers window's Activities-All tab for the registrant, you can edit the Event activity type and provide meaningful prompts for the user-defined fields.

To map user-defined fields to event activities

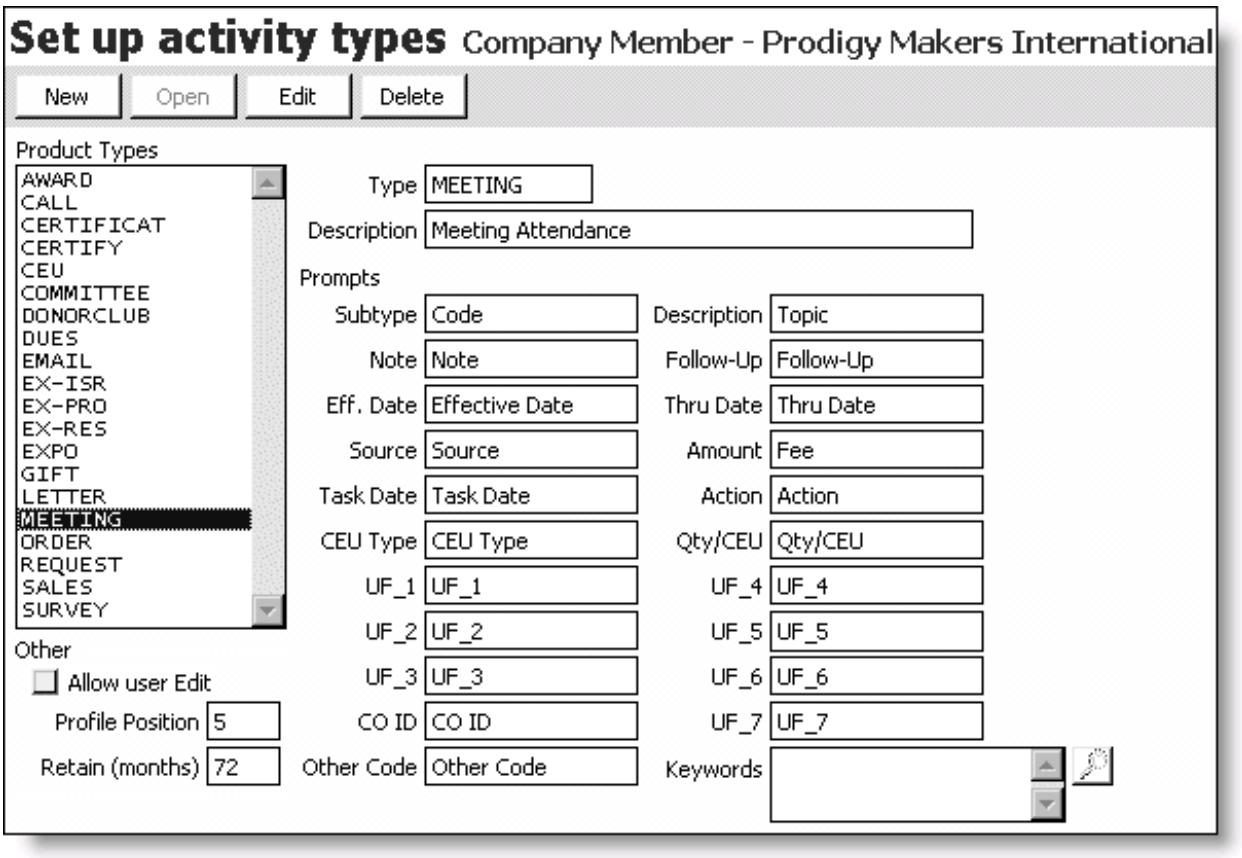
1. From Events, select Set up module to open the Set up module window.
2. Click Preferences to open the Event System Preferences window.
3. Click Edit.
4. Enter additional activity fields for iMIS to track. For example, to track the first user-defined registration text field, enter Order_Meet.UF_6.
5. Click Save.
6. From Customers, select Set up module> Activity types to open the Set up activity types window.
7. Select MEETING from the Product Types list.
8. Click Edit.
9. Enter the field labels you want to appear in the individual activity records. The seven UF fields listed under Prompts correspond to the seven fields on the Event System Preferences window.

- UF_1-UF_3 map to Char 1-Char 3
- UF_4-UF_5 map to Number 1-Number 2
- UF_6-UF_7 map to Date 1-Date 2

10. Click Save.

    After an event is closed, you can view event-related activities on the Manage customers window's Activities-All tab for registrants with customer records.

Set up activity types window for Events



From Customers, select Set up module > Activity types

Product Types

Lists all of the defined activity types.

Type

Specifies an activity type prompt.

Description

Specifies a description prompt for the activity type.

Prompts

- Subtype - Specifies a subtype prompt.
- Description - Specifies a description prompt for the subtype.
- Note - Specifies a note prompt.
- Follow-Up - Specifies a follow-up prompt.
- Eff Date - Specifies an effective date prompt.
- Thru Date - Specifies a thru date prompt.
- Source - Specifies a source prompt.
- Amount - Specifies an amount prompt.
- Task Date - Specifies a task date prompt.
- Action - Specifies an action prompt.
- CEU Type - Specifies a CEU type prompt.
- Qty/CEU - Specifies a CEU quantity prompt.
- UF1 - UF3 - Use these fields to enter prompts for the values entered in the Char 1 - Char 3 fields on the Event System Preferences window.
- UF4 - UF5 - Use these fields to enter prompts for the values entered in the Number 1 - Number 2 fields on the Event System Preferences window.
- UF6 - UF7 - Use these fields to enter prompts for the values entered in the Date 1 - Date 3 fields on the Event System Preferences window.
- CO ID - Specifies the company ID prompt.
- Other Code -Specifies another code prompt.

  Keywords

  Specifies keywords (use the lookup icon to open the Select ACCESS_KEYWORDS value(s) window and search for defined keywords.

  Other

- Allow user Edit - Enable to allow users to edit activity records.
- Profile Position - Specifies the profile position.
- Retain (months) - Specifies the number of months the activity record will be retained.

To view event activities for a registrant

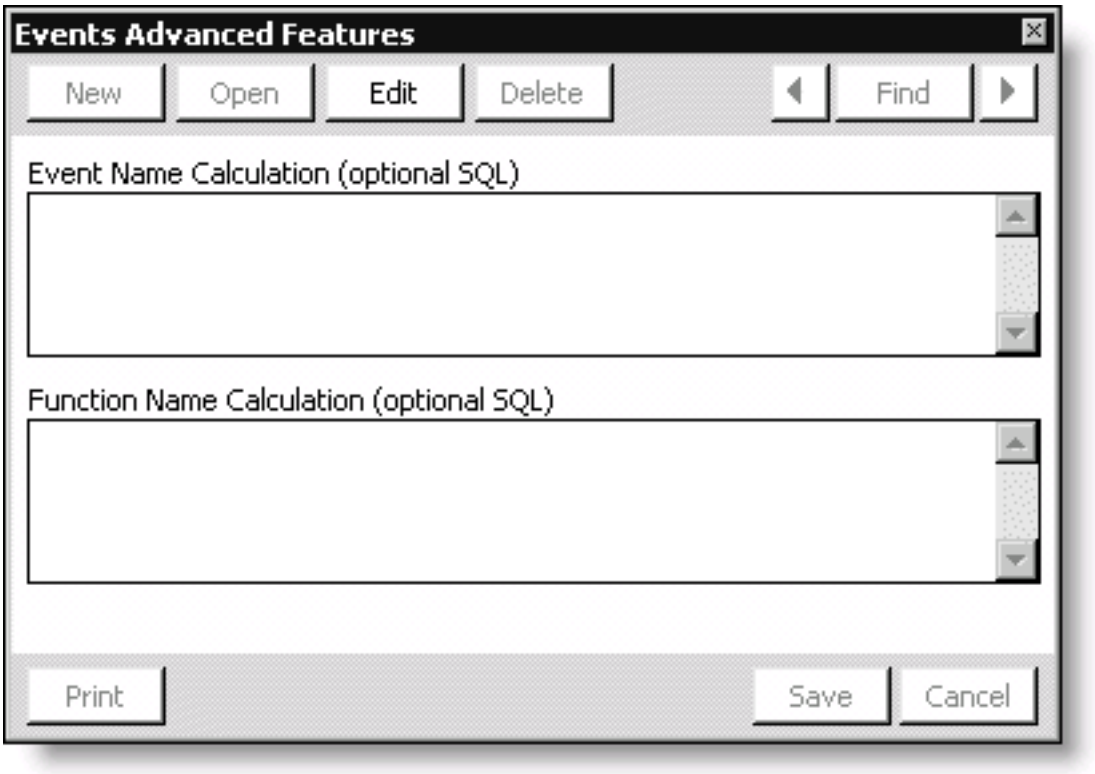
1. Select Customers > Manage customers to open the Customer Portfolio.
2. Find the registrant's record.
3. Select the Activities-All tab.
4. Select MEETING from the drop-down list under the Sort by options.

   Note: MEETING activities, which are created when events are closed, do not include fundraising information, such as GIFT activities generated by a fundraising function registration.
5. Double-click an event to open the Activity Detail window.

Setting up Advanced features

You can set up instructions on the Events Advanced Features window so overall event codes or function codes are automatically assigned or auto-generated according to a formula of your own choosing (as opposed to user-assigned codes). For example, if you create an auto-generated formula (an appropriate SQL script is entered in the Event Name Calculation field) when you insert a new event or function, a system-assigned code is automatically inserted, rather than the system prompting you to type a user-assigned code.

Events Advanced Features window



From Events, select Set up module, and click Advanced

Event Name Calculation (optional SQL)

Specifies the name of the SQL string used to store the procedure that automatically assigns event codes.

Function Name Calculation (optional SQL)

Specifies the name of the SQL string used to store the procedure that automatically assigns function codes.

To create a stored procedure

1. From the menu bar, select Utilities > SQL Query to open the SQLQuery window.

2. Click New.
3. Enter the SQL command in the SQL Command Text field. For example, the following SQL command will create a stored procedure to generate unique, consistent event codes that include the year and event number count:

```
CREATE PROCEDURE Meeting_Calc @MeetingCounterName varchar (30) AS

Declare @MeetingCounter int, @Count int
select @Count=Count(*) from Counter
where COUNTER_NAME=@MeetingCounterName
if @Count=0
begin
insert into Counter (COUNTER_NAME,LAST_VALUE)
values (@MeetingCounterName,1)
select @MeetingCounter=1
end
else
begin
update Counter set LAST_VALUE=LAST_VALUE+1
where COUNTER_NAME=@MeetingCounterName
select @MeetingCounter=LAST_VALUE from Counter
where COUNTER_NAME=@MeetingCounterName
end
select convert(varchar,datepart(yy,getdate()))+convert(varchar,@MeetingCounter)
```

4. Click Execute.

To set up event and function name calculations

1. From Events, select Set up module to open the Set up module window.
2. Click Advanced to open the Events Advanced Features window.
3. Click Edit.

4. Enter the SQL string that executes the stored procedure in the Event Name Calculation field or the Function Name Calculation field. For example, enter Meeting_Calc 'MeetingCounterName' in the Event Name Calculation field.
5. Click Save.

Events Table Maintenance

Table maintenance enables you to manage the two tables that iMIS Events refers to during its daily operations.

- Set up registration classes lets you define which classes display as categorization options for individuals registering for your events.
- Set up event resources lets you define which resource options display for the room/-function planning subsystem.

Defining event registration classes

Set up registration classes lets you manage the categories for customers that you plan to register for an event.

You should create categories for all groups for which you need to do the following:

- Charge different fees
- Track
- Print badges
- Report on separately

A set of registrant classes can include member, non-member, exhibitor, speaker, staff, student, and volunteer. When you set up your categories, include all of the classes that you will need for tracking and differentiating the registrants attending the largest events that you will process through iMIS.

At its basic level, iMIS Events will categorize each event registrant into either the member (M) or non-member (NM) class because most organizations commonly assign

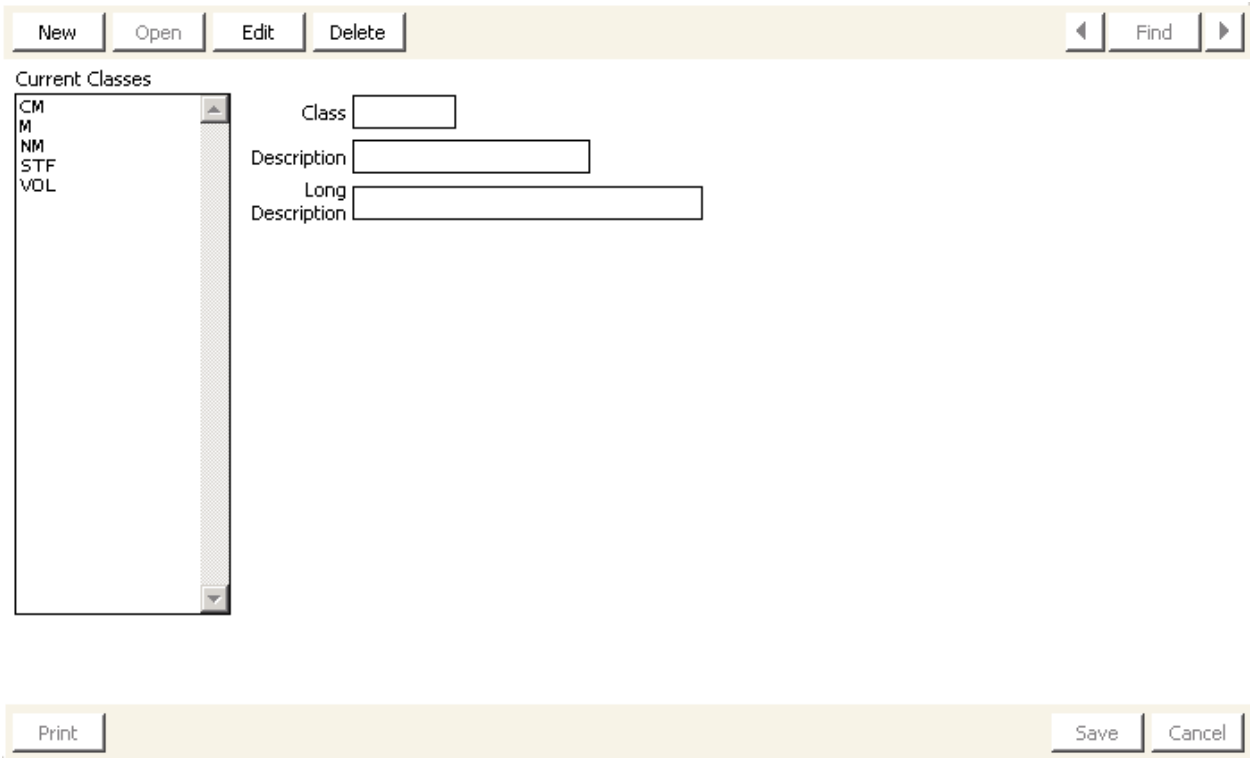
registration fees at those levels. This determination is made based upon the registrant's customer type and whether or not the registrant's record is on file in the database.

Note: A non-member class will be assigned if the customer's status is set to suspended, inactive, or deleted (begins with S, I, or D).

These are three possible scenarios for defining event classes:

- Let the registrant class default to the M = Member or NM = Non-member type in the Member Type table. Using this scenario, all registrants are either members or non-members based upon their customer record.
- Map customer types to registrant classes. Using this scenario, you may or may not want to map all customer types. For example, you may want to map only M = Member, NM = Non-member, and CM = Company Member.
- Define your own registrant classes without using customer types. Using this scenario, you must override the M = Member and/or NM = Non-member status during the event registration process by entering the appropriate registrant class.

Set up registrant classes window



Desktop: Events > Set up tables > Registration classes

Current Classes

Lists all of the defined registrant classes.

Class

Specifies an abbreviation or alphanumeric code that represents a specific class or category of registrants.

Description

Specifies a description of the registrant class. The description entered displays in the Event Function Definition - Fees window.

Long Description

(optional) Specifies a detailed description of the registrant class.

To define event registration classes

1. From Set up registrant classes window, click New.
2. Enter the Class, Description, and Long Description.
3. Click Save.

Defining event standard resources

The Set up event resources window enables you to define all of the potential room/-function resource groups and items.

Standard resources define the elements you need in preparing the physical setting for an event function:

- Facilities
- Tools
- Refreshments

- Furniture
- Supplies

On the Set up event resources window, you can outline major planning resource groups and detail items (indented from the group heading). After you establish the groups and detail items, including assigning codes, descriptions, and the order in which they appear on the planning report, those resource groups and items are available when you activate any room setup/planning sheet.

Keep in mind that you can define any number of resource groups and detail items so you can cover the anticipated needs of any particular event or function. Extra resources will not clutter your planning reports; while you may have defined many resource areas on the window, only the ones that you need and activate for a particular event function appear on its planning report.

The Set up event resources window has three purposes and enables you to do the following:

- Define a full range of event planning resources (both groups and detail items) to accommodate and plan for any size and type of event
- Establish a print/display order for resource groups and items on the planning report (and related windows)
- Dictate the type of information that you can enter for a resource item when you define a plan, such as quantity, time, and notes

iMIS Events includes a sample set of resource entries. You are free to use and build on this skeleton sample or discard it. You can add, delete, and edit resource table records as needed.

When you define a resource group (such as Audio-Visual), you name, describe, and set the order in which each group should appear on reports and windows. Similarly, if a resource group has multiple detail items such as projectors and microphones, assign a ranking for these items as well.

Depending on the resources you select for a function, iMIS may prompt you for a quantity (of the resource needed) or a time (for which the resource is needed), or require you to verify that the resource applies. A large text area may appear for you to enter notes in the resource area. When you define a resource group or item, you also can specify which kinds of information it will accept.

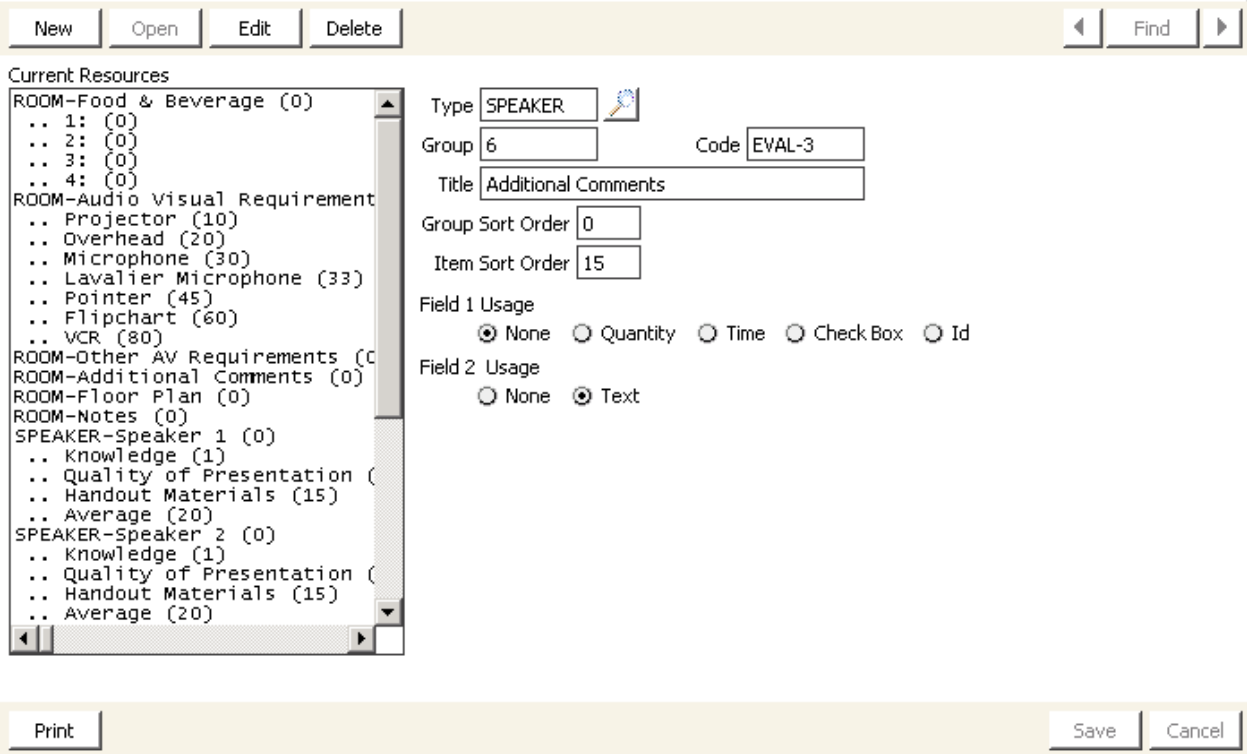
Sometimes a group may not have any detail items. Conversely, planning data may use only detail-level items (such as Audio-Visual: Microphone). In this case, the group entry provides a heading for its detail items included in the plan. When a group has no detail items, you enter planning information directly at the group level (as with Floor Plan and Notes above).

The Set up event resources window enables you to define the options that appear in the function/room setup and planning facility. If your license includes iMIS Speaker Evaluation, this window also lets you define the event/speaker evaluation areas you want to track.

The Room Setup facility provides planning reports and inquiry tools to help you organize the setup requirements for any function. Within iMIS Events, the room setup categories and items that you can specify for any function are referred to as resources. You determine the type of resource groups and items to have available for a planning facility. Overall resource groups include Audio-Visual (A/V) Equipment and Food and Beverage; items within the A/V group include microphones and overhead projectors.

When you plan your available resource groups and items, list all of the items that you may want to include for complex events in a planning sheet that you can give to hotel or other setup personnel.

Set up event resources window



Desktop: Events > Set up tables > Event resources

Current Resources

Lists the defined current resources and their detail items. Resource groups, such as ROOM-Audio Visual Requirements and Room-Other AV Requirements, sort according to the order you define. Detailed group items, such as Projector, Overhead, and Microphone, are indented and sorted under their respective groups.

Type

Specifies the event resource type. The type defaults to ROOM for the Room Setup event resource. Standard Ctrl+L lookup is available, and the codes listed in the lookup window are hard coded in iMIS.

Group

Specifies a subgroup if you want the event resource divided into groups. For example, F&B and A/V are subgroups of ROOM.

Code

Specifies a unique code for a specific resource or item in a group. For example, PROJ and OVER are items in the A/V group.

Title

Specifies a description of the resource group or code, depending on which you are currently defining. For example, the title for A/V is Audio Visual Requirements; the title for PROJ is Projector. This title appears on planning reports.

Sort Order

Specifies the sort order of the resources on lists and reports.

- Group Sort Order - Enter a number indicating the sequence of this group in relation to other groups.
- Item Sort Order - Enter a number indicating the sequence of this item in relation to other items in the same group.

Field 1 Usage

Select one of these options for each type/group/code combination. Data is entered on the Event Function Definition - Plan window during the setup of the event:

- None (default) - When defining a group, enable this default option when the following options are not required.
- Quantity - Enable when you need to enter a quantity for a specific item, such as 2 microphones.
- Time - Enable to enter a specific time the item is required. For example, coffee will be needed at 7:00 am.
- Check Box - Enable if a specific item is required (the resource does not require quantity or time indications).
- ID - Enable when the Type is SPEAKER to link the speaker's customer record to ratings data. The ratings data will be transferred to an activity record at the close of the event.

Field 2 Usage

Select one of these options for each type/group/code combination. Data is entered on the Event Planning Definition - Plan window during the setup of the event:

- None (default) - Enable when text is not required.
- Text - Enable to enter text notes or comments for groups or specific items.

To define event resource groups

1. From Set up event resources window, click New.
2. Enter a resource Type (press Ctrl+L to select a value).
3. Enter a Group code, for example, A/V.
4. Enter a Title for the group, for example, Audio Visual Requirements.
5. Enter the Group Sort Order, for example, 10.
6. (optional) Enable the Text option under Field 2 Usage.
7. Click Save.

To define resources for a group

After defining an event resource group, you will need to define the resources for the group.

1. From Set up event resources window, click New.
2. Enter a resource Type (press Ctrl+L to select a value).
3. Enter the Group code established in the above procedure, for example, A/V.
4. Enter a resource Code for the group.
5. Enter a Title for the resource code.
6. Enter the Group Sort Order defined in the above procedure.
7. Enter an Item Sort Order.

8. (optional) Enable a Field 1 Usage option.
9. (optional) Enable the Text option under Field 2 Usage.
10. Click Save.

Events Accounting

When you finish entering a new event registration or updating an existing one, files are simultaneously updated (unless you have enabled the Separate Posting Cycle Required option on the AR/Cash Batch Control window).

Orders and Order_Lines

A record in Orders (header record) is generated for each new event/registrant combination, and one Order_Lines record is generated for each function for which a customer registers.

Note: Existing order lines do not change if a function's Entity, Appeal, Campaign, and Fair Market Value are changed unless the customer un-registers for that function and re-registers after the new values are in place.

Trans

When you enter a new registration, a multiple-line/record transaction entry is generated for each of the following:

- Payment in Full - Generates a debit to cash for the amount of the payment and a credit to income/deferred for total amount of fees
- No Payment - Generates a debit to the default AR account and a credit to income/deferred in the amount of the total fees
- Under Payment - Generates a debit to cash for the amount of the payment, a credit to income/deferred for the total amount of fees, and an additional debit to the default AR account for the remaining amount owed
- Over Payment - Generates a debit to cash for the payment amount, a credit to income/de-

ferred for the total amount of fees, and an additional credit to the default AR account for the amount overpaid.

Invoice (for registration)

One record is generated for each registration, showing the overall balance, if any. Changes made to an existing registration, such as payments, functions, or cancellations, generate a set of new Trans entries and update pre-existing records in the Orders, Order_Lines and Invoice Tables.

Note: Unlike other accounting software, direct payments made through AR/Cash (direct Trans Table entries) post to the payment accumulator in both the related Invoice and the orders record, to keep the balances synchronized. Using this feature, you can process late event-related payments efficiently on the Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions> Cash receipts).

Invoices for event adjustments

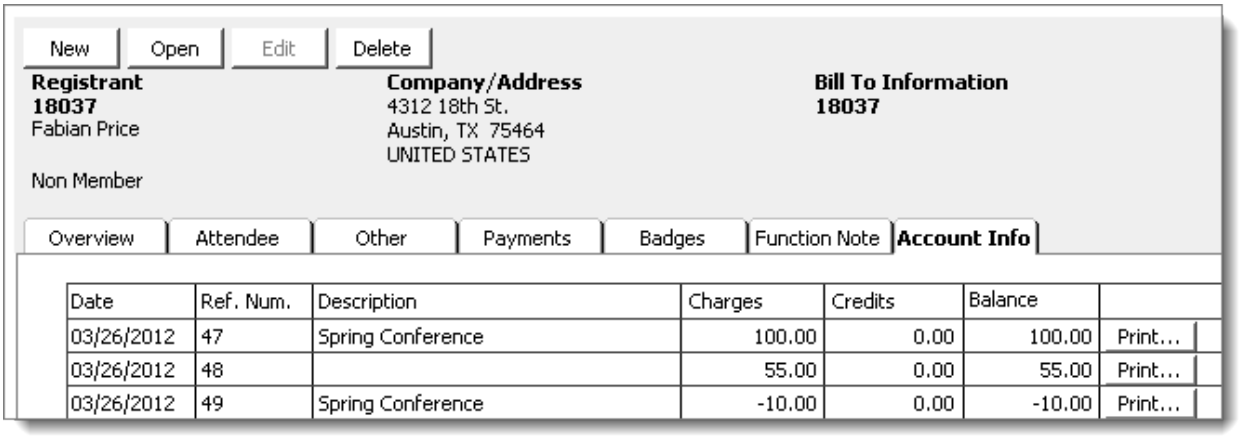
Note: This option is currently only available to organizations whose Taxation Method is set to VAT.

The new Event System Preferences option to Create Separate Invoices for Events Adjustments makes it easier to track and print registration adjustments for both online and on-site events, to help you comply with regulations related to VAT invoicing. With this option, every adjustment generates a new invoice document (credit note or positive adjustment), which uses the date of the adjustment, lists any credits or debits, and references the original invoice.

This option links multiple invoices to a single user event registration, so that, when a user registers for an event, any billing information is associated with an initial invoice. Once that invoice is printed, any subsequent changes are then associated with a new invoice. You can view and print these invoices from Events > Register a customer > Account Info tab. Double-click the line to view a full transaction ledger for each invoice, including any event transfers or substitutions.

Note that enabling this option affects new event registrations only; existing registrations retain their consolidated, single invoice.

Note: Only Crystal Reports currently support event adjustment invoices.



Multiple entities in events

If multi-entity is enabled in your iMIS system, you can use multiple income entities within event registrations. The income entity for an event function is designated by the most specific income entity defined. For example:

- if the event function has an entity defined on the Event Function Detail window that entity is used, otherwise
- if the event has an entity defined on the Define an event window that entity is used, otherwise
- if there is a default meeting entity defined in the AR/Cash module that entity is used, otherwise
- the default system entity is used

Note: You must enable the Multiple Entities checkbox option on the AR/Cash Set up module window to use Entity Codes with Events and Event Functions.

Individual order lines to support different entities for functions

Each event function can have its own income entity, therefore each event function has its own order line.

Note: Existing order lines do not change if a function's Entity, Appeal, Campaign, and Fair Market Value are changed unless the customer un-registers for that function and re-registers after the new values are in place.

Income GL Account Hierarchies for event function Registrations

The income GL account recorded in the Trans table for event function DIST lines is determined in the following way:

- if there is an account defined in the Event function detail > Fees window that account is used, otherwise
- if the event function has a fund defined, that fund's default income account is used if it has one, otherwise
- if the event has an entity defined on the Define an event window, that entity's default income account is used, otherwise
- if there is a default meeting entity defined in the AR/Cash module, that entity's income account is used, otherwise
- the default income account for the default system entity is used.

Events Field Formats

This section provides the lists of fields in the main tables used by iMIS Events. You can reference these internal system field names from certain functions within iMIS:

- Custom Report Writer
- Ad Hoc Search
- Built-in letter-writing facility

You also can enter these fields in the Sort Fields area of certain event reports.

There are many tables within iMIS that are used to store data for various modules. iMIS Events interacts with several of these tables. This chapter outlines the most important tables/fields that you may need to reference.

Events key tables

The primary registration table is the Orders table, which is shared by many modules including iMIS Order Processing and iMIS Exhibition Management. In addition to the primary Orders table, there are a number of secondary Orders-related tables that contain registration data. The Orders and related tables (those whose names start with Order_) are linked by a common ORDER_NUMBER value for each registration.

The Events fields include the following tables and their descriptions:

Orders

Contains the primary name, address, status, and related information for each registrant you enter through the Events system. This table also contains summary information for the total fees charged to the registrant, the total payments applied to those fees, and the resulting balance.

Order_Badge

Contains the name, address, and company information that prints on registrant badges

Order Lines

Maintains the ticket quantity and fee information for the functions that registrants select

Order Meet

Contains the event code, registrant class, traveling arrangements and general-purpose notes, as well as information contained in user-defined fields

Order Payment

Maintains information on payments made after the primary payment

Meet_Master

Contains the definition for the overall event

Product

Contains the code, title, description, and default fees data for the individual functions

Product_Function

Maintains a wide variety of additional function definition elements, including function dates and times, projected and maximum attendance counts, CEU setup elements, and more

At the end of this chapter, there are record layouts for each field or data element in field position order for each of these main tables. Separate preliminary sections list the key registration fields as they appear on the registration windows.

A follow-up section lists other key fields that do not appear on any window, but that do play important roles (see Events Field Formats).

Accessing the events fields

Often when you want to access or reference a particular field, you can make your selection from a scrolling list. For example, the Ad Hoc Search facility lets you select from scrolling lists of tables and fields within the chosen table. In the following cases, however, no scrolling lists are available and you must enter field names in a text box, alone or imbedded in a character string:

- Identifying fields for merging in the Standard Letter System
- Specifying sort sequence for a report or other output
- Referencing additional fields to add to certain reports or output
- Setting up system areas
- Identifying programmers' statements that are available in certain functions for advanced requirements

Field syntax

When you enter data in a field, use the following form: Table_Name.FIELD_NAME

You must prefix the field name with the name of the table that maintains it, separated by a period. Capitalization is Caution! You must enter the table name with the first letter of each word capitalized, and the field all capitalized.

Note: Do not enter any spaces. Instead, enter underscores Shift+_ in place of spaces, for example, FULL_NAME.

For example, reference the first name, last name, and system-maintained full-name fields in the Orders (event registration) table as follows:

- For the first name, use: Orders.FIRST_NAME
- For the last name, use: Orders.LAST_NAME
- For the full name, use: Orders.FULL_NAME

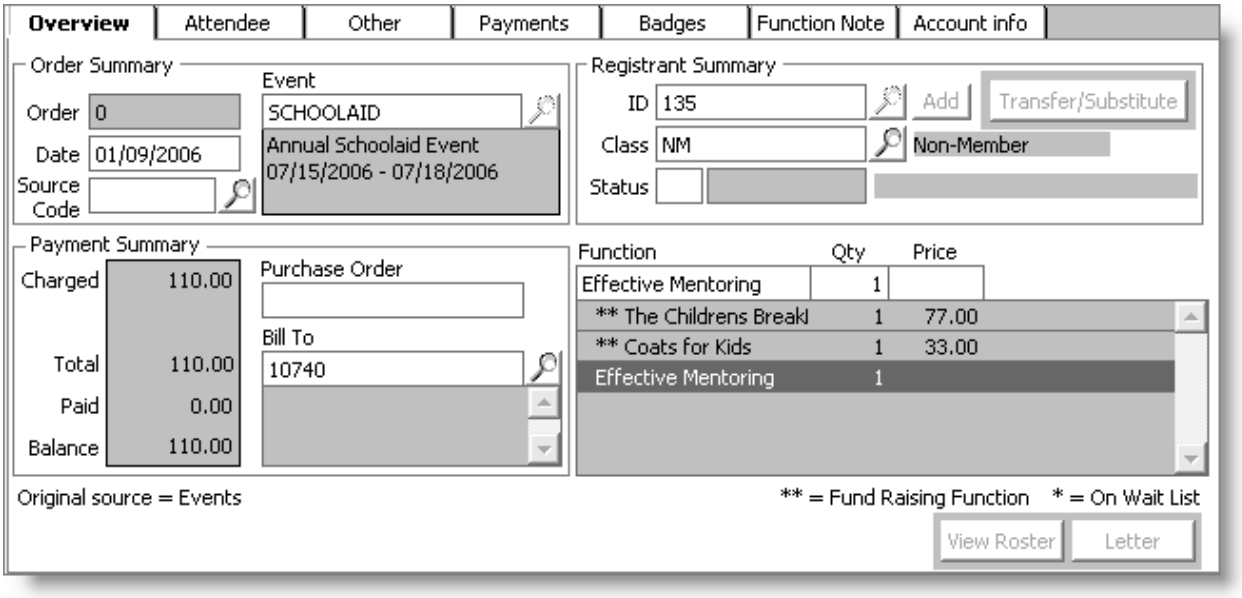
Events registration fields

The registration fields are spread across Orders and several Orders-related tables. Also, because the large Orders table serves many purposes for different iMIS modules, it contains fields that do not apply to iMIS Events directly. For these reasons, the following section reviews the fields that appear on various registration windows and indicate where those fields reside.

At the end of this window-by-window field outline is a section listing other key Events fields (see Events Field Formats). While they do not appear on any window, you may find these fields important for special-purpose sorting, searching, and reporting.

Note: The iMIS table layouts are not static; they may vary with product releases. Due to ongoing enhancement and reorganization of the iMIS product, the number of fields within a table, the field names, and the field types and/or lengths will change. Therefore, refer to the database schema documentation that accompanies new releases.

Fields: Register a customer window - Overview tab



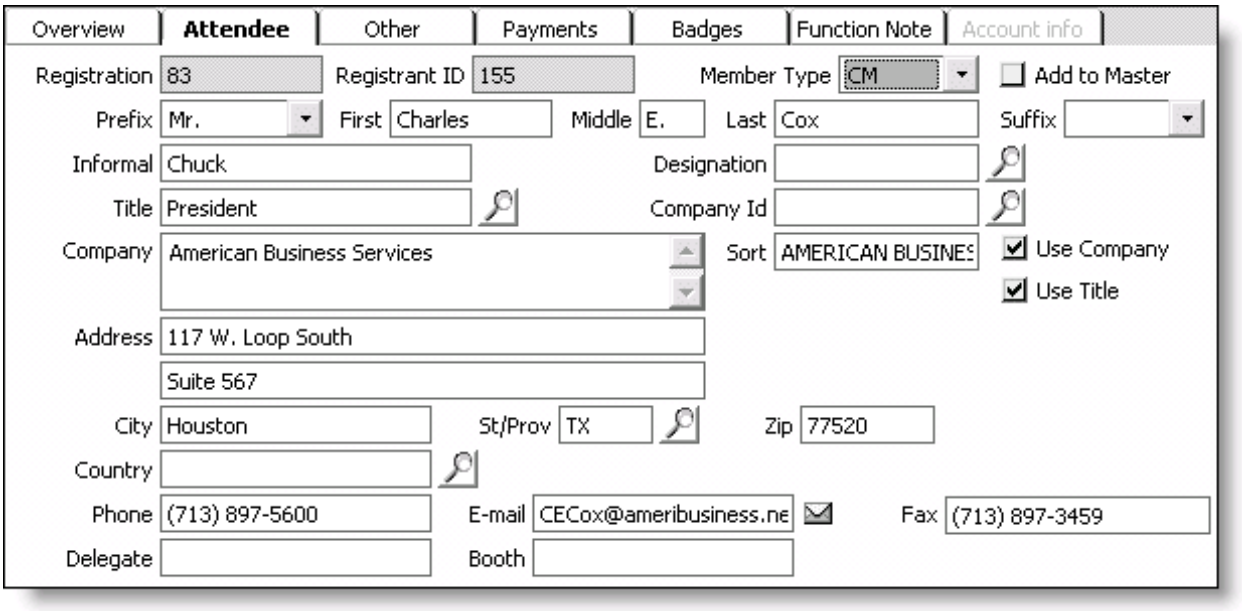
From Events, select Register a customer, and select the Overview tab

Data in the scrolling list of event functions is maintained within the Order_Lines table (each registered function is stored in a separate record). Most of the other fields are stored in the Orders table, except those noted.

Order: ORDER_NUMBER	Number	(Order Summary area) Sequential registrant order number assigned to each new order.
Event: Order_Meet.MEETING	Character 10	(Order Summary area) Event code
Date: ORDER_DATE	Date	(Order Summary area) Registration date, which affects assigned fee amounts
ID: ST_ID	Character 10	(Registrant Summary area) Registrant's customer ID
Class: Order_Meet.REGISTRANT_CLASS	Character 5	(Registrant Summary area) Code for broad category of registrants

Status: STATUS	Character	5	(Registrant Summary area) Code that remains blank unless a registrant is canceled normally (C) or canceled for purposes of a substitution or transfer (CT)
Charged: TOTAL_ CHARGES	Money	4 dp	(Payment Summary area) Grand total of all fees charged
Paid: TOTAL_ PAYMENTS	Money	4 dp	(Payment Summary area) Grand total of all payments applied to this order (both from payment window and Enter and edit cash receipts window)
Balance: BALANCE	Money	4 dp	(Payment Summary area) Net balance computed by subtracting payments from charges
Purchase Order: CUSTOMER_ REFERENCE	Character	40	(Payment Summary area) Reference number for the order
Bill To: BT_ID	Character	10	(Payment Summary area) Customer ID of party responsible for paying registrant's fees; may be the same as the registrant's customer ID

Fields: Register a customer window - Attendee tab



From Events, select Register a customer, and select the Attendee tab

All fields are stored in the Orders table, except those noted.

Registration: ORDER_NUMBER	Number		Sequential registrant order number assigned to each new order
Registrant ID: ST_ID	Character	10	Customer File ID; blank if new registrant is not added to Master
Member Type: MEMBER_TYPE	Character	5	Customer type
Prefix:PREFIX	Character	10	
First: FIRST_NAME	Character	20	
Middle:MIDDLE_NAME	Character	20	
Last: LAST_NAME	Character	30	
Suffix: SUFFIX	Character	10	
Informal:INFORMAL	Character	20	
Designations:	Character	30	

DESIGNATION		
Title:TITLE	Character	80
Company ID: CO_ID	Character	10
Company: COMPANY	Character	80
Sort: COMPANY_SORT	Character	30

StProv:STATE_PROVINCE	Character	15
ZIp:ZIP	Character	10
Country:COUNTRY	Character	20
Delegate:DELEGATE	Character	10

Events Additional Features

Continuing Education

iMIS Continuing Education (CEU) provides many advanced features:

- Defining a program type and credit category for each educational program
- Awarding continuing education credits to each attendee according to either automatic program defaults or manually-entered overrides
- Recording attendance rosters
- Printing continuing education completion certificates
- Retaining long-term continuing education records for documentation purposes, transcript requests, and inquiry and data analysis

The Customer Setup - Advanced window enables you to customize the continuing education program name and the units name in order to meet the needs of your organization. For example, in the healthcare profession, Continuing Medical Education (CME) or Continuing Nursing Education (CNE) could be used instead of Continuing Education Units (CEU).

CEU system setup

The Event Function Definition - CEU window enables you to assign continuing education units for a selected function through two fields, CEU Type and Hours/Points.

To customize the CEU field prompts

1. From Customers, select Set up module > General to open the Set up general options window.
2. Click Advanced to open the Customer Setup - Advanced window.
3. Click Edit.
4. Enter an appropriate field name that represents your CEU program in the CEU Name field. For example, enter CME, CLE, or CPE.
5. Enter a term for the units awarded (for example, hours or credits) in the CEU Units Name field.
6. Click Save.

   Note: For iMIS to create activities for the label you enter in the CEU Name field, you must create an activity type with the same name using the Customers > Set up activity types window.

   Note: These assigned field names will appear on all CEU-related windows and reports. They also will be mapped to the Activity.TYPE field when continuing education activity details are generated at the close of an event.

CEU record keeping

With iMIS Continuing Education, long-term CEU activity or history records are created when an event is closed. The module produces one Continuing Education activity record for each course for which the registrant received credit. The combined event and course code, course description, CEU credit type, and number of credits earned is recorded for these activity records.

You can close an event any time after registration activity is complete and attendance has been marked.

Speaker Evaluation

iMIS Speaker Evaluation enables you to evaluate and rate the individuals who speak at your events. The compiled evaluation data is stored in numeric fields, and you can average the data to determine a speaker's overall rating. You also have the ability to print a report based on the evaluation data. After an event is closed, iMIS creates activity records that contain the evaluation data for the speaker.

The functions provided by iMIS Speaker Evaluation include the following:

- Setting up an activity type for your speaker evaluations
- Defining speaker rating groups and criteria
- Entering speaker evaluation data by function
- Generating speaker evaluation reports upon event completion

Defining speakers and evaluation criteria

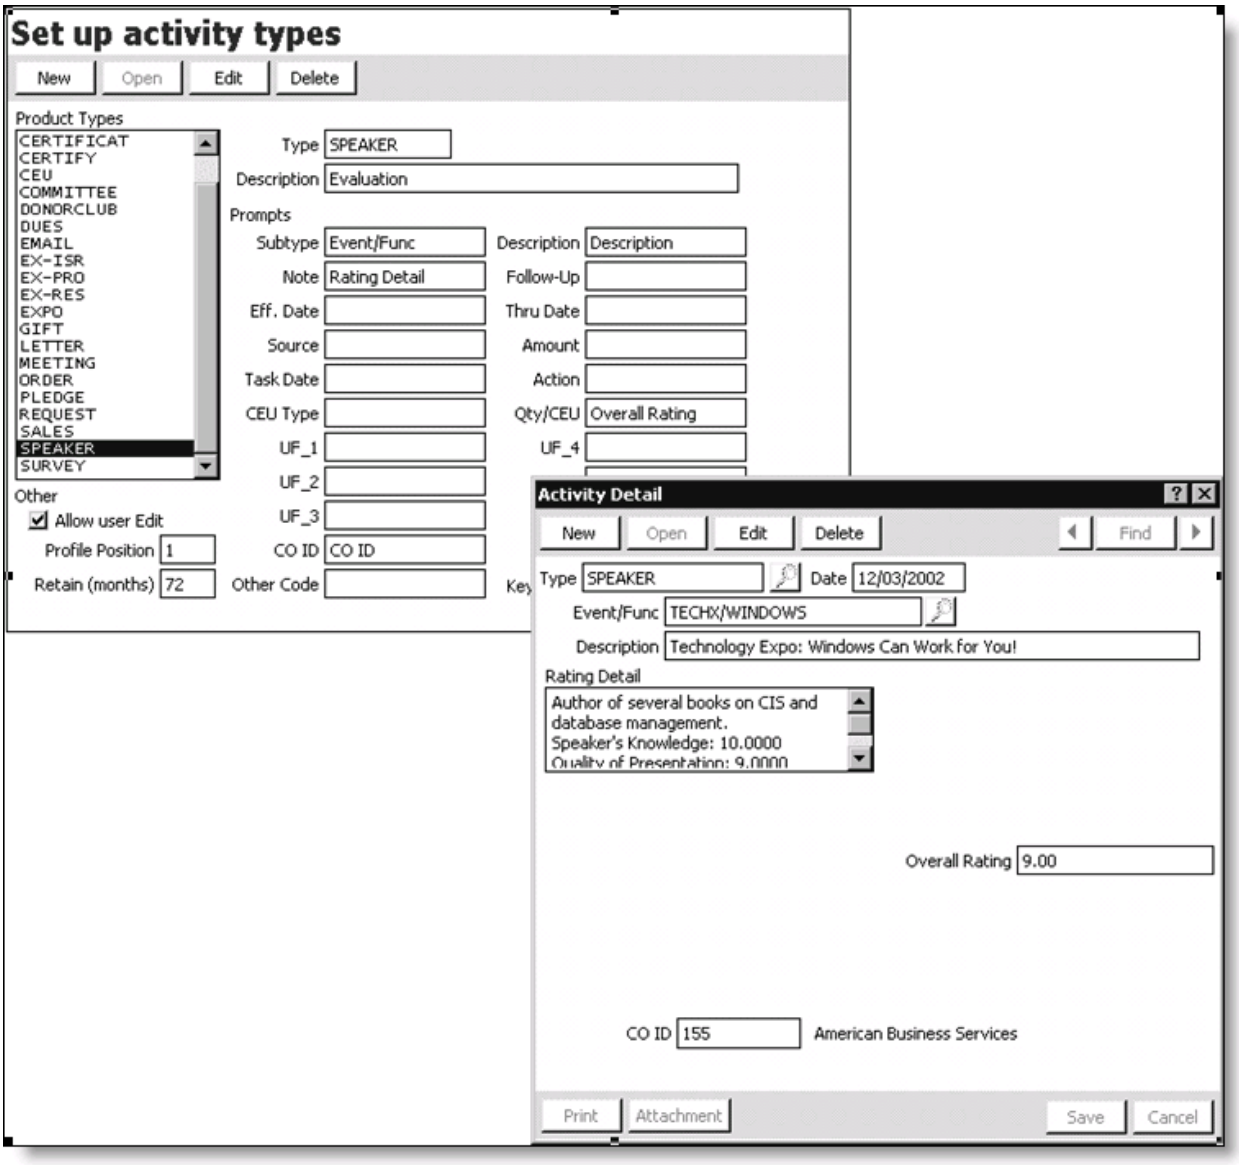
Before you can evaluate a speaker, you first must define the speaker activity type and the speaker evaluation criteria.

To set up a speaker activity type

1. From Customers, select Set up module> Activity types to open the Set up activity types window.
2. Click New.
3. Enter SPEAKER in the Type field.
4. Enter a description of the activity in the Description field (for example, Evaluation).
5. Enter a prompt for the Subtype (for example, Meet/Func).
6. Enter a prompt for the Description (for example, Description).
7. Enter a prompt for the note area in the Note field (for example, Rating Detail).
8. Enter a prompt for the overall or average rating in the Qty/CEU field (for example, Overall Rating).

Note: iMIS will automatically populate the rating for any line item within the detail section that contains the word “average” or “overall” in its description. However, you first must enter the prompt in the Qty/CEU field for the field to display on the Activity Detail window.

9. Enter a prompt in the CO ID field (for example, CO ID).
10. Under Other, enable or disable the Allow user Edit option.
11. Enter a value in the Profile Position field.
12. Enter a value in the Retain (months) field.
13. Click Save. The values defined for the activity type on the Set up activity types window display on a speaker's Activity Detail window.



How many speaker groups?

In most cases, you will organize your evaluation questions into groups, and you will create one group for each speaker. The groups will contain detailed records of the ratings, questions, comments, and other evaluation criteria for the speakers belonging to them.

Set up a sufficient number of speaker groups to accommodate the maximum number of speakers who may participate and who you may want to rate for any event function. For example, if five speakers will be presenting at a single function and you want to rate them individually, then you will need five speaker groups.

In addition to evaluating speakers, you also can set up groups for evaluating non-speaker categories. You could rate the facilities or report statistics on the demographics of the attendees. These additional groups will print on the speaker evaluation report.

Note: Long-term activity records can be created only for groups that are linked to customer IDs through the Field 1 Usage field on the Set up event resources window.

To enter rating groups and evaluation criteria

Set up your evaluation criteria to match each question that you ask on any of your speaker/event evaluation questionnaires.

1. From Events, select Set up tables > Event resources to open the Set up event resources window. See Defining Event Standard Resources for details on using this window.
2. Click New.
3. Override the default in the Type field, and enter SPEAKER to create the speaker group.
4. Enter the name (or number) for the Group (for example, SPKER1).
5. Enter a Title for the group (for example, Speaker One).
6. Enter the Group Sort Order to control the order in which the groups display for each Type. Entering numerically lower numbers will display the group ahead of those groups with higher numbers.
7. Under Field 1 Usage, select the Id option.
8. (optional) If you want to enter comments in addition to the evaluation score, select the Text option under Field 2 Usage.
9. Click Save.
10. Click New to enter the evaluation criteria for each group.
11. Enter the group Type for which you are entering evaluation criteria (for example, SPEAKER). This is the same Type entered in Step 3.

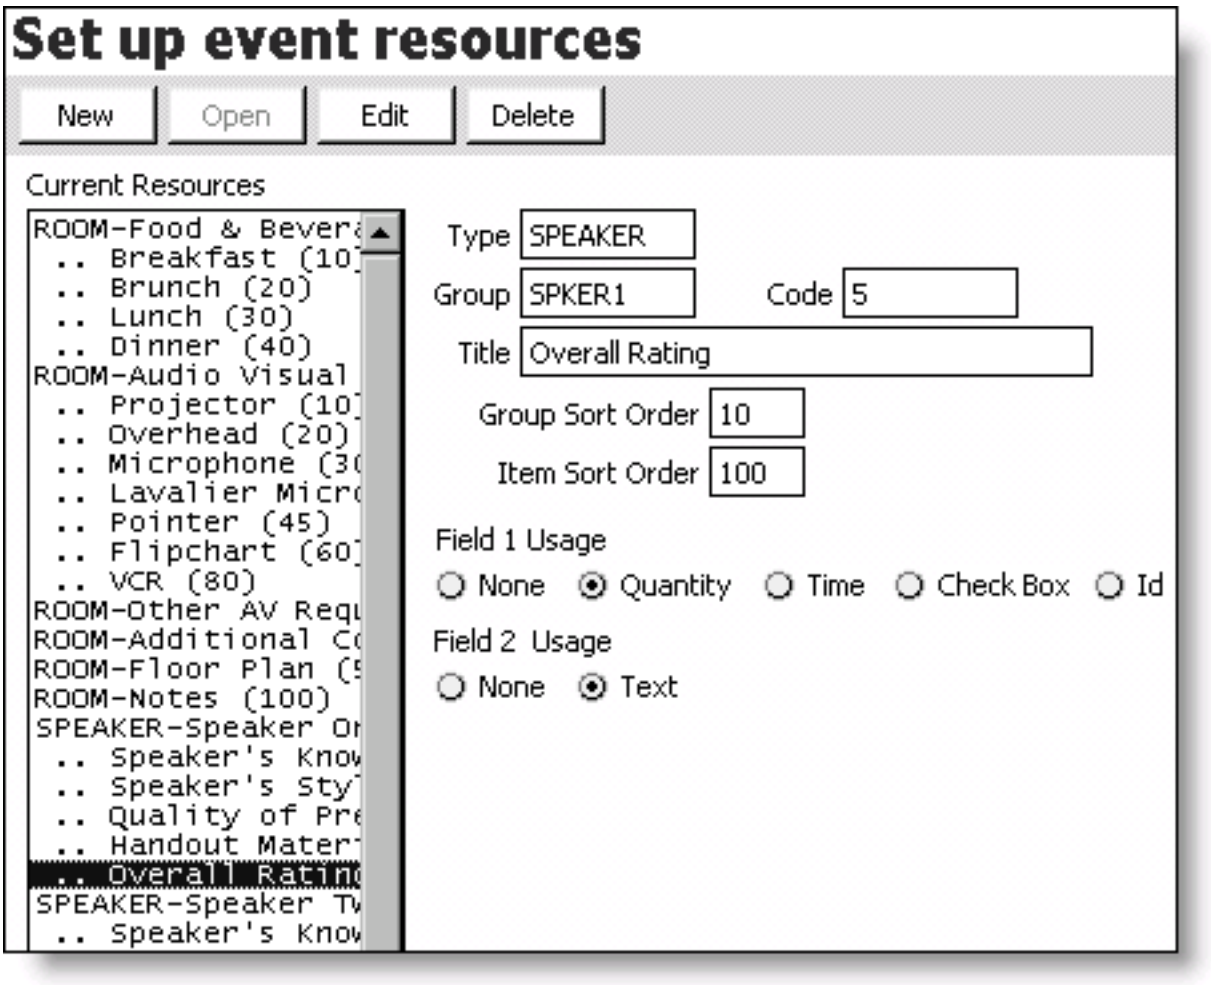
12. Enter the Group name for which you are entering evaluation criteria (for example, SPKER1). This is the same Group entered in Step 4.
13. Enter a Code for the evaluation criterion (for example, 2).
14. Enter a unique Title for the criterion you want to track (for example, Quality of Presentation).
15. Enter the same Group Sort Order entered for the group in Step 6.
16. Enter the Item Sort Order to control the order in which the evaluation criteria display for each group. Entering numerically lower numbers will display the criterion ahead of those criteria with higher numbers.
17. Select the Quantity option under Field 1 Usage (if the criterion is to have a numerical evaluation score). Long-term activity records can be created only for groups that are linked to customer IDs through the Field 1 Usage field.
18. (optional) If you want to enter comments in addition to the evaluation score, select the Text option under Field 2 Usage.
19. Click Save after entering each evaluation criterion.

    Speaker resources example

    In this example, two speaker groups have been set up and labeled as SPKER1 and SPKER2. For each speaker group, evaluation criteria have been set up to record the ratings and any text comments. The evaluation criteria include Speaker's Knowledge, Speaker's Style, Quality of Presentation, Handout Materials, and Overall Rating. These criteria use the Quantity option under Field 1 Usage to allow entering averages with two decimal places. We chose Text under Field 2 Usage so we could enter comments for the criteria ratings. These criteria link to their common group, but each criterion has a unique code.

    The final category, Overall Rating, records our calculated average of the speaker's ratings. In our previous example (“To set up a speaker activity type”), we entered Overall Rating as the prompt that displays on the Activity Detail window for the Qty/CEU field.

Because this record contains the word “overall,” its rating will be placed in the Qty/CEU field of the activity record so it can be used for analysis.



Example of the Set up event resources window

Evaluating speakers

Enter any evaluation data that you want to record for a speaker's activity record before closing an event. The data used to generate the activity records consists of the evaluation criteria within the speaker's group. This evaluation criteria is defined on the Event Function Definition - Speakers window and is indented underneath the group's heading.

You can enter several speaker evaluations for a given function, one for each speaker resource group defined on the Set up event resources window (from Events, select Set up tables > Event resources).

To enter evaluation data

Before you can evaluate a speaker, you first must define the speaker activity type and the speaker evaluation criteria. See Defining Speakers and Evaluation Criteria for more.

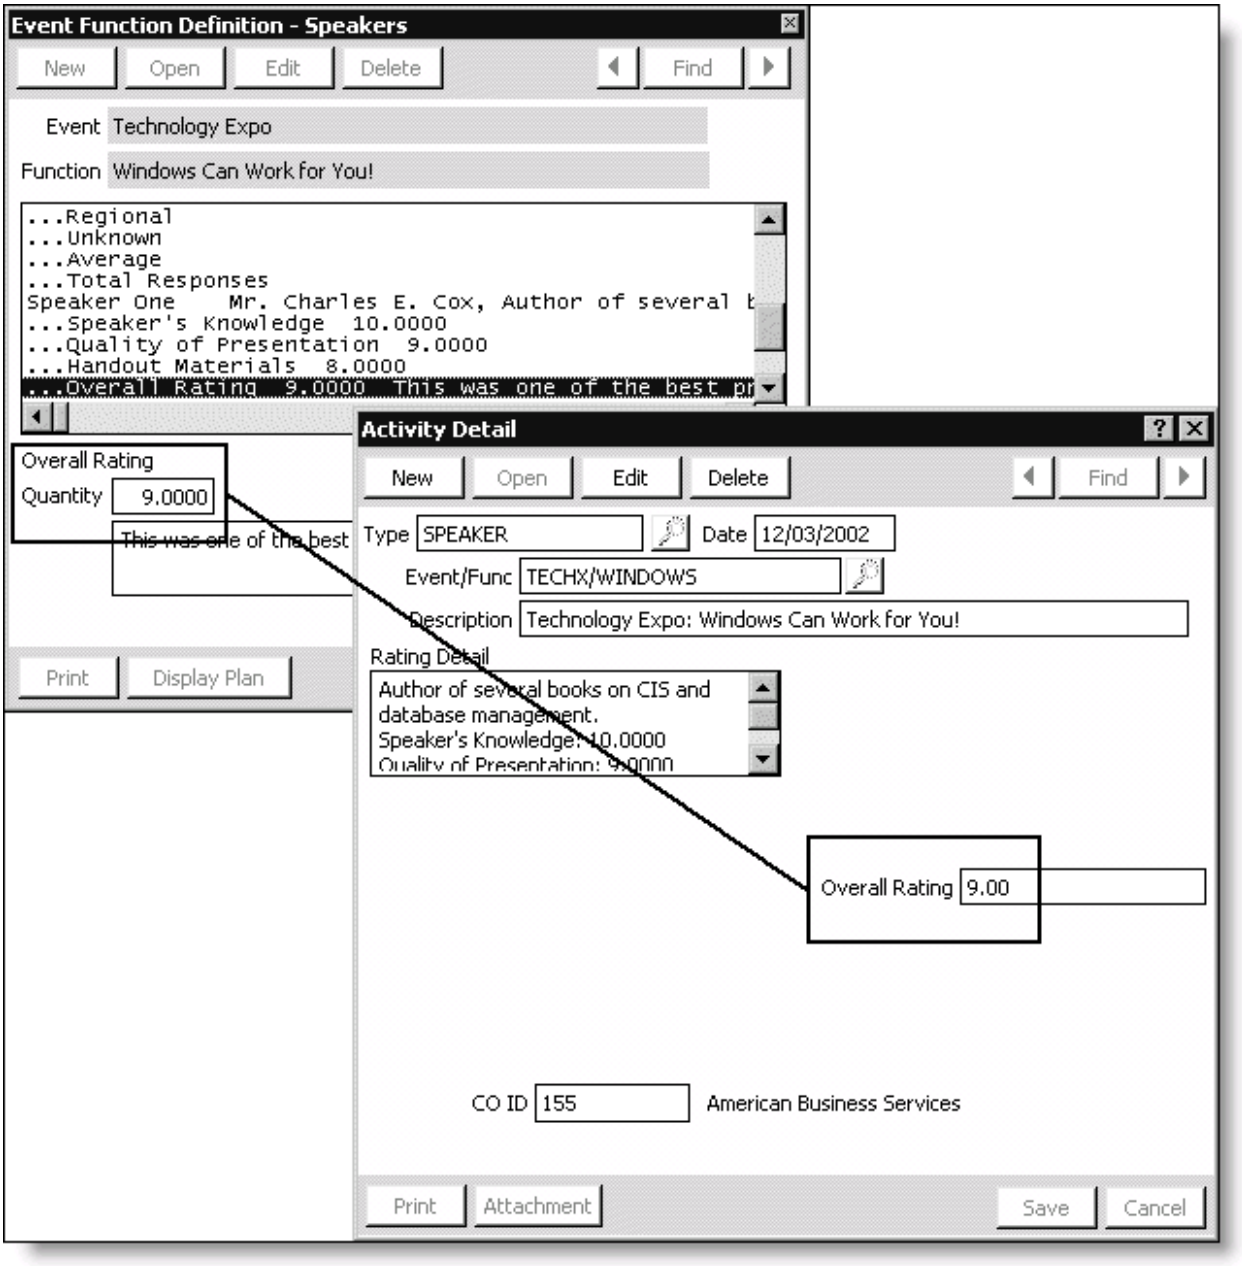
1. From Events, select Define an event to open the Define an event window.
2. Double-click an event to open it in the Define an event window.
3. Select the event function for which you want to enter evaluation data, and click Edit to open the Event Function Detail window.
4. Click More, and select Speakers to open the Event Function Definition - Speakers window.
5. From the list, select the speaker group for which you want to enter evaluation data.
6. Enter the Id of the speaker (use the lookup icon to search for an ID).
7. In the text box below the Id field, enter any identifying information, such as a presentation title.
8. From the list, select the first evaluation criterion.
9. In the Qty field, enter the numeric score you calculated from the evaluations (record digits with up to two decimal places).
10. In the text box below the Qty field, enter any additional comments.
11. Repeat the process for the remaining group evaluation criteria.
12. Click Save.

Speaker activity records

Activity records are created for speakers when an event is closed. The data used to generate the activity records consists of the evaluation criteria defined on the Event Function Definition - Speakers window.

Because the Overall Rating record contains the word “overall,” its Quantity, as defined for the speaker on the Event Function Definition - Speakers window, will populate the Qty/CEU field (Overall Rating prompt) on the Activity Detail window for future analysis.

Note: The calculation of the Overall Rating is not performed automatically for a speaker's activity record. You must define a value (Quantity) for the Overall Rating on the Event Function Definition - Speakers window for it to be recorded for a speaker's activity record and display on the Activity Detail window.



Example of a speaker's Overall Rating recorded on the Event Function Definition - Speakers window and displayed on the speaker's Activity Detail window

Hotel Room Block Management

iMIS Hotel Room Block Management is an extension of iMIS Events and enables you to book hotel room blocks quickly and efficiently for specific events.

This section provides information on the following topics:

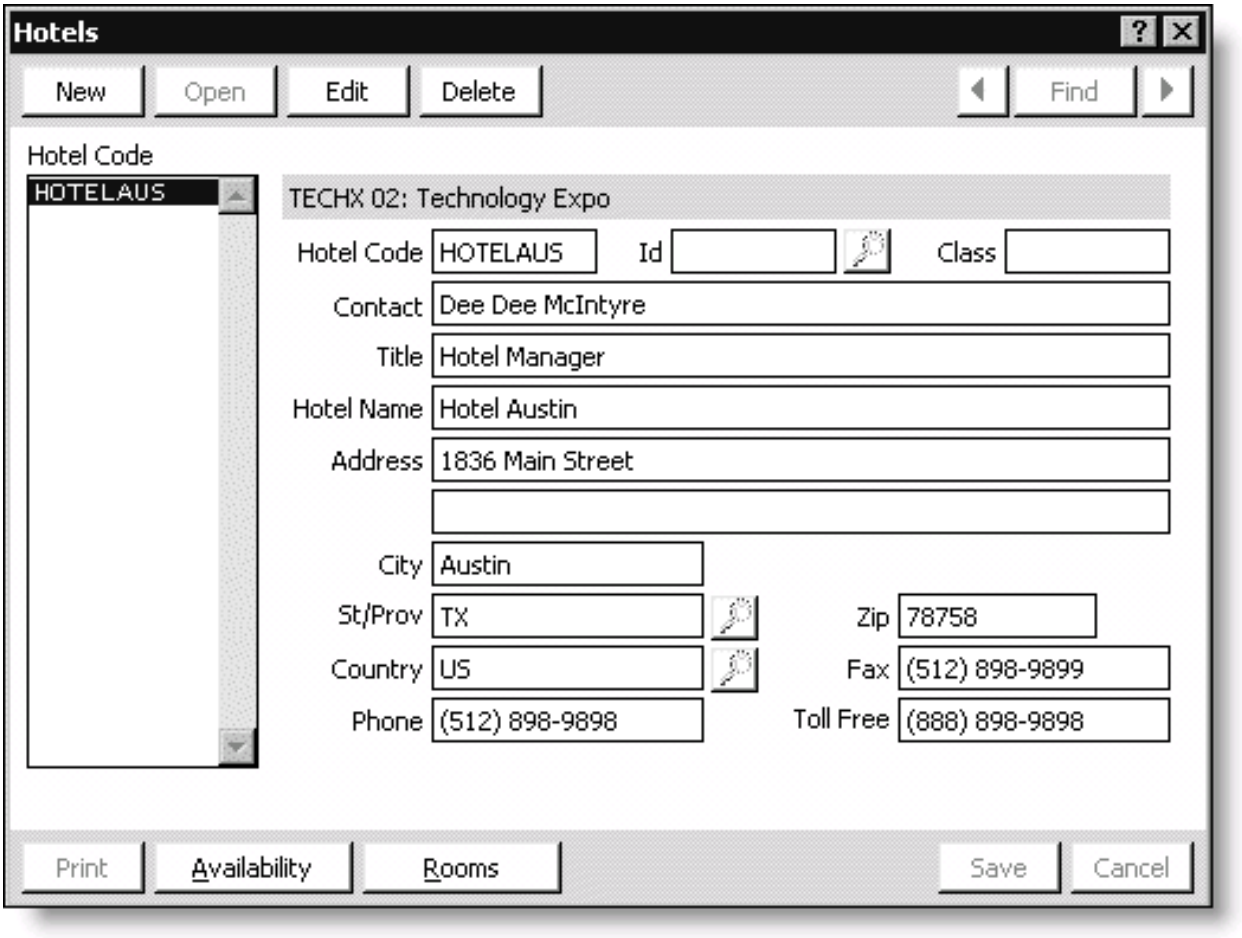
- Defining hotels and room availability for your events
- Booking rooms through the event registration process
- Setting up rooms for registrants to share
- Canceling reservations and overbooking rooms
- Generating rosters and reports for distribution to hotel personnel and other associated services

The rosters included in your Standard Reports provide a list of persons assigned to each room per night, so hotel personnel can manage the reservations according to their needs and policies. Additional output and inquiry information helps event managers track room reservations and room availability.

Defining hotels

You will need to create a list of available hotels for each event. If you routinely use the same hotels for your events, set up an ID for each hotel. This will allow you to generate hotel information automatically when setting up future events. If no ID exists for a hotel, you can enter the hotel contact and address information directly through the Hotels window.

Hotels window



From Events, select Define an event, double-click an event, and click Hotels

Hotel Code

Lists defined hotel codes.

Event

(read only) Displays the event code and event name.

Hotel Code

Specifies a code for the hotel.

Id

Specifies the hotel's ID (applicable only if you created a record for the hotel in the Manage customers window).

Class

Specifies a class for the hotel.

Contact

Specifies the contact for the hotel.

Title

Specifies the hotel contact's title.

Hotel Name, address fields

Specifies the name and address of the hotel.

Availability button

Opens the Hotel Availability window used for determining room availability.

Rooms button

Opens the Room Types window used for setting up hotel rooms.

To enter hotel information

1. From Events, select Define an event to open the Define an event window.
2. Double-click the event for which you need to set up hotel rooms to open the event in the Define an event window.
3. Click Hotels to open the Hotels window.
4. Click New.
5. Enter the hotel information:

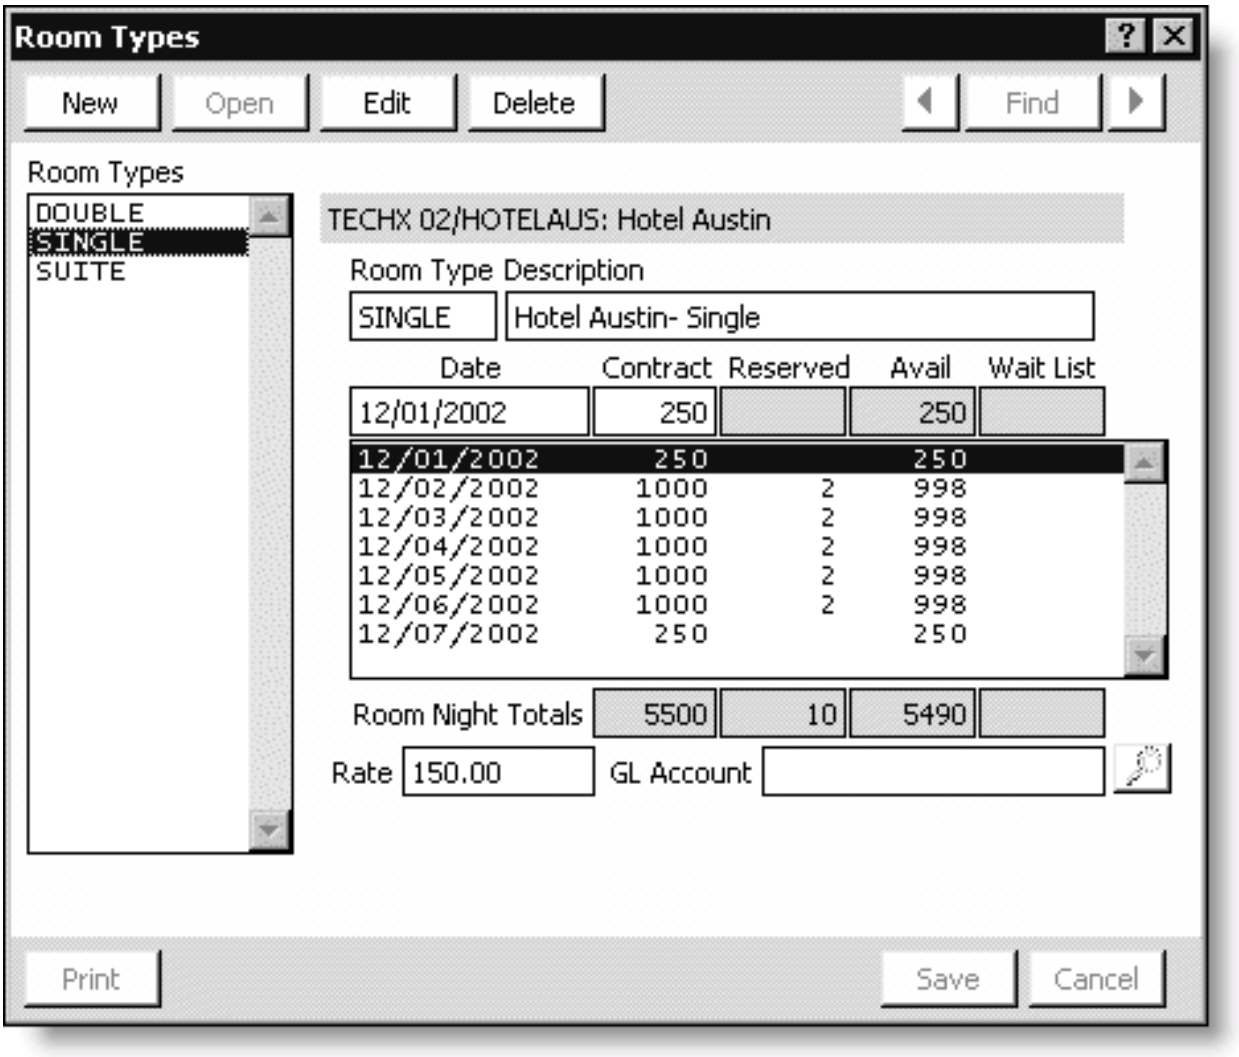
- If you created a record for the hotel in the Manage customers window, enter the Id for the hotel to populate the appropriate fields automatically. If you set up a specific customer type for your hotels, search by customer type to locate those records.

Note: To locate your hotel records easily, maintain a customer type specifically for them.

- If the hotel's record links to an associated customer record, the contact name, hotel name, address, and telephone data automatically populate the appropriate fields on the Hotels window.
- If you have not created a record for the hotel, manually enter the hotel's information.

6. Click Save.
7. Click New for each additional hotel you want to define, and then repeat the process.

Room Types window



From Events, select Define an event, double-click an event, click Hotels, and click Rooms

Room Types

Lists defined room types.

Event

(read only) Displays the event code and name of the event.

Room Type

Specifies a code for the room type.

Description

Specifies a description for the room type.

Date

Specifies a reservation date.

Contract

Specifies the number of hotel rooms contracted for the event.

Reserved

(read only) Displays the number of hotel rooms that have been reserved.

Avail

(read only) Displays the number of contracted hotel rooms that have not been reserved and are still available.

Wait List

(read only) Displays the number of registrants on the wait list for rooms.

Room Nights

(read only) Displays a summary of the number of Contract, Reserved, Avail, and Wait List rooms for each Date.

Room Night Totals

(read only) Displays the total number of Contract, Reserved, Avail, and Wait List rooms.

Rate

Specifies the daily hotel room rate.

GL Account

Specifies the GL account for the hotel charges (use the lookup icon to search for an account number).

To define hotel room inventory

1. From Events, select Define an event to open the Define an event window.
2. Double-click the event for which you need to set up hotel rooms to open the event in the Define an event window.
3. Click Hotels to open the Hotels window.
4. Select the hotel for which you need to set up a room inventory.
5. Click Rooms to open the Room Types window.
6. Click New.
7. Enter a code for the Room Type (for example, DOUBLE or SINGLE).
8. Accept the default Description, or enter another Description for the room type.

   For each reservation date, enter the date in the Date field and the number of rooms needed in the Contract field. To add dates, select the empty line directly below the last table entry, and then enter Date and Contract information for that date.

   Note: The Reserved quantity updates automatically as rooms are booked. The Avail quantity equals the contracted quantity minus the number of room nights reserved (available = contracted - reserved).
9. (optional) If you also will be billing registrants for their hotel room reservations, enter the amount (per night) in the Rate field for each room type and the GL account into which the charges will be booked. This GL account may represent a liability account (for example, payable to the hotel) or an income account.

10. If VAT is applicable to the room rate, enable the Taxable option and enter the appropriate tax code.
11. Click Save.
12. To define additional room types, click New, and repeat the process.

Managing reservations

Use the Register a customer window's Other tab to enter and cancel hotel reservations. Click Available to view hotel availability.

Use the Register a customer window's Other> Sharing tab to enable the room sharing option.

To enter hotel reservations

Hotel reservations are entered through the Register a customer window's Other tab.

1. From Events, select Register a customer to open the Register a customer window.
2. Click Open or Find.
3. Enter the Event code (use the lookup icon to search for the event), and Tab to the registrant ID field.
4. Enter the registrant's ID (use the lookup icon to search for the registrant) and press Tab. The customer's current registration information displays in the Register a customer window's Other tab.
5. Click Edit.
6. Select the Other tab.
7. To reserve a hotel room, select a hotel room from the Function drop-down list.
8. Enter a non-zero number in the Qty field (defaults to 1) for the number of rooms needed.

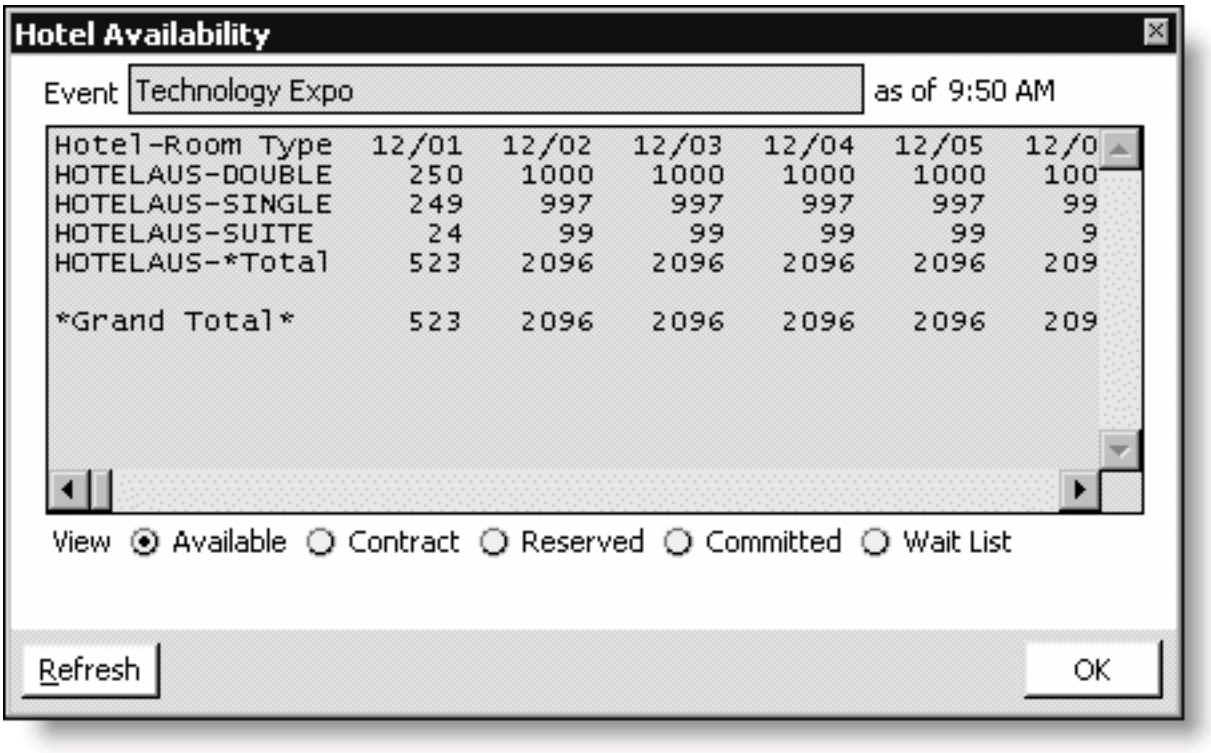
   Note: If your reservation is for multiple-nights, treat the reservation as a single unit. For example, a hotel reservation for four nights would display with a Qty of 1 and Room

Nights of 4. The hotel reservation lists as a single order with the cost calculated for each reserved night.

9. Enter the room Rate.
10. Enter the Confirmed date of the reservation.
11. Enter dates in the Arrival and Departure fields. The number of Room Nights calculates and displays.

    iMIS alerts you if the Arrival date is equal to or later than the Departure date or if you book a room for a date that is sold-out or undefined in the Room Types window. However, iMIS will allow you to overbook and reserve a sold-out room. Click Available to open the Hotel Availability window to determine hotel room availability.
12. (optional) Enter any other relevant registrant information that the hotel will need in the Note and Other Fields. The Other Fields are user-defined fields and only display if they have been set up in the Set up module window (from Events, select Set up module).
13. Click Save.

    Hotel Availability window



From Events, select Register a customer, select the Other tab, and click Available

Event

(read only) Displays the name of the event.

Time

(read only) Displays the time the window was last updated. Selecting Refresh updates both the window and the time.

Hotel Rooms

(read only) Displays the available hotel rooms by room type.

View

- Available - Enable to view the total number of rooms available.
- Contract - Enable to view the total number of rooms contracted for the event.
- Reserved - Enable to view the total number of rooms that have been reserved.

- Committed - Enable to view the total number of rooms for which registrants have committed their registrations. (Committed is the amount of the Contract “committed” to open orders. The Committed quantity mirrors the Reserved quantity but cannot exceed the Contract quantity. The difference between the Reserved and Committed quantities equals the backorder quantity.)
- Wait List - Enable to view the total number of registrants on a wait list for the rooms.

Refresh button

Click to update the data.

To determine hotel room availability

1. From Events, select Register a customer to open the Register a customer window.
2. Click Open or Find.
3. Enter the Event code (use the lookup icon to search for the event).
4. Enter the registrant's ID (use the lookup icon to search for the registrant), and press Tab. The customer's current registration information displays on the Register a customer window's Overview tab.
5. Click Edit.
6. Select the Other tab.
7. Click Available to open the Hotel Availability window.
8. Select the View option to narrow your search.
9. Click Refresh.
10. Click OK.

Room Sharing window

From Events, select Register a customer, select the Other tab, and click Sharing

Share Status

- Not Sharing - Enable if the registrant is not sharing a room.
- Wants to Share - Enable to indicate that the registrant wants to share a room with another registrant.
- Sharing - Enable to indicate that the registrant is sharing a room with another registrant.

Primary Room Holder Registration Number

Specifies primary registrant's registration number. Use the lookup icon to search for the registration number.

RoomMates

Lists all of the registrant's roommates.

To use room sharing

1. Register the primary registrant for a room.
2. From Events, select Register a customer to open the Register a customer window.
3. Open the record of the registrant who will share the room with the primary registrant.
4. Click Edit.
5. Select the Other tab.
6. Click Sharing to open the Room Sharing window.
7. Enable the Sharing option.
8. Enter the Primary Room Holder Registration Number (use the lookup icon to locate the primary registrant).
9. Double-click on the roommate's name. The registration number of the primary registrant will display, and the primary registrant's name will display in the RoomMates field.
10. Click Save.

    When you return to the Register a customer window's Other tab, note that nothing displays in the function list for hotels. The room only appears in the primary room holder's function list because it is a shared room.

    Generate the Hotel Room Roster Report to see the primary room holder's functions, qty/-price information, the other registrant who is sharing the room, and the primary registrant's arrival/departure dates (if entered).

    To cancel a reservation

    To cancel a room reservation, simply edit the registration and change the room quantity of the canceled reservation to zero.

    Cancel and change rooms manually (rather than allowing iMIS to automatically change when a registrant changes a room) so registrants can register for two or more room types.

    To overbook rooms

An overbooked room will display as an amount in parenthesis (1) in the Hotel Room Bookings Availability Report. The Reserved Rooms inventory will reflect this also by adding the quantity to its total.

Each time you overbook, the quantity is added to all of the totals just as with a regular booking, except that the Availability number appears in parentheses to signify a negative number. The Contract totals will be less than the reserved quantity for this room type.

Exhibitions

See AR/Cash: Deferred Income for how to defer dues/subscriptions income and events/exhibition/exposition income.

Note: To authorize credit card payments for Events, Exhibition, Exposition, and Orders, enter them through Service Central > Enter and edit payments (if licensed for SERVCEN) or AR/Cash > Cash receipts (if licensed for CCAUTH).

Printing individual reports and reviewing rosters

iMISEvents contains reports that are specific to planning and administering events. You can run reports from the Generate reports window (from Events, select Generate reports) as well as generate several individual reports by selecting one of the following options on the Register a customer window's Overview tab:

- Print - Opens the Select Report window and generate one of these individual reports: Confirmation, Invoice, Ticket, or Badge.
- View Roster - Opens the Event Roster window and view all of an event's registrants.
- Letter - Opens the Meeting Standard Letters window (Letter Text window if using Quick Letter) and the event letter subsystem. You can use an existing standard letter or compose a new letter specifically for an individual registrant.

To set the report destination

Reports print to the destination you select, and Printer is the default destination. To change the report destination to Screen, select File> Report Destination> Screen.

To print individual reports from the Register a customer window's Overview tab

1. From Events, select Register a customer to open the Register a customer window.
2. Find an event registration.
3. Select File> Report Destination, and select the output destination.
4. Click Print to open the Select Report window.
5. Select a Report Option:

- Confirmation
- Invoice
- Ticket
- Badge

6. Click Print to send the selected Report Option to the current output destination.

To view an event roster

1. From Events, select Register a customer to open the Register a customer window.
2. Find an event registration.
3. Click View Roster to open the Event Roster window.
4. Double-click a registrant's name on the Event Roster window to view and open their registration information on the Register a customer window.

Viewing a registrant's account information

iMIS updates the Transaction Ledger after you apply a payment. You can view the transaction details for a particular order on the Register a customer window's Account info tab.

To view a registrant's account information

1. From Events, select Register a customer to open the Register a customer window.
2. Find an event registration.
3. Select the Account info tab. This tab displays the transaction details for the selected registrant's order, including invoice number charges and the balance.

Substituting registrants

Times may exist when a registrant cannot attend a particular event because of a conflict or some other unforeseen occurrence. However, another registrant may want to take over the order purchased by the first registrant. This can be accomplished easily in the iMIS Events module.

To substitute registrants

1. From Events, select Register a customer to open the Register a customer window.
2. Find the event registration for which you want to substitute registrants.
3. Click Transfer/Substitute.
4. Your cursor is now in the Event field. Tab to the ID field and enter the substitute registrant's ID (select the Find icon to search for an ID). Notice that when you pressed Tab, the Bill To and Function field information disappeared. When you enter the substitute registrant ID, the Bill To and Function fields are populated with the new information.
5. Click Save.

Note: CT displays on the event roster by the name of the original registrant, indicating that the registrant's order was canceled and transferred.

Transferring a registrant to another event

When a registrant cannot attend a particular event because of a conflict or unforeseen occurrence, you can transfer the registrant to another event.

To transfer a registrant to another event

1. From Events, select Register a customer to open the Register a customer window.
2. Find the event registration from which you want to transfer the registrant.
3. Click Transfer/Substitute.
4. Your cursor is now in the Event field. Enter the event code to which you want to transfer the registrant (select the Find icon to search for an event).
5. Click Save.

Note: CT displays on the original event roster by the name of the registrant, indicating that the registrant's order was canceled, then transferred to another event.

To transfer a registrant back to the original event

If a registrant registers for an event, transfers to another event, and then decides to transfer back to the original event, cancel the second event registration and edit the original event registration to remove the Canceled status. Any payments made towards the second event will have to be applied to the original event.

1. From Events, select Register a customer to open the Register a customer window.
2. Find the event registration from which you want to transfer the registrant.
3. Click Delete.
4. Click Yes to cancel the registration.

5. Click Open or Find.
6. Enter the Event code of the original event to which the registrant wants to transfer.
7. Enter the registrant's ID.
8. Click Save.
9. Click Edit.
10. Click Yes to un-cancel the registration.
11. Click Save.
12. Find any payment credits for the registrant, and apply the credit to the open, unpaid registration. Refer to the following two procedures:

To use the *Tab method to find open credit items

1. From A/R Cash, select Enter and edit transactions> Cash receipts to open the Enter and edit cash receipts window.
2. Click New.
3. Enter the ID number of the registrant in the Id field to locate their record.
4. Press Tab to populate the window with the registrant's information.
5. Enter * in the Check/CC field.
6. Press Tab to open the Select Open Payments window and find any open credits for the individual.

To apply a prepaid amount to an open item

When a registrant prepays for an event and then transfers to another event, use this feature to apply the payment credit for the cancelled event to the new, open event.

1. From A/R Cash, select Enter and edit transactions> Cash receipts to open the Enter and edit cash receipts window.
2. Click New.
3. Enter the ID number of the registrant in the Id field to locate their record.
4. Press Tab to populate the window with the registrant's information.
5. Select the event with the credit (negative) Balance.
6. Enter a negative amount in the Amt Paid field.
7. Select the event with the debit (zero or positive) Balance.
8. Enter a positive amount in the Amt Paid field equal to the amount entered in Step 6. For example, enter 125.00 as opposed to
   -125.00.
9. Click Save. The prepaid amount will be applied to the open event.

Invoice	Date	Description	Balance	Amt Paid
R89	03/28/2002	Fall Conference	-125.00	0.00
		(PrePay - New)	0.00	0.00
R87	03/20/2002	Technology Expo	640.00	0.00
R89	03/28/2002	Fall Conference	-125.00	0.00
11	01/25/2001	Order 53	0.00	0.00
R88	03/20/2002	Annual Conference	0.00	0.00

Managing wait lists

Wait listing is a strategy that helps you manage events by allowing registrants the opportunity to sign up for currently unavailable functions. In order to use wait listing, the Enable Function Wait Lists option must be enabled on the Event System Preferences window (from Events, select Set up module, and click Preferences).

The wait list option is triggered when function registrations exceed a function's maximum attendance limit. A message displays when a function's maximum attendance limit is exceeded, allowing you to add registrants to a wait list.

When a function becomes available, you have the option of manually choosing attendees on the wait list. You must enable the Choose from Wait List for opening option on the Event System Preferences window if you want to select registrants manually. If this option is not enabled, iMIS automatically selects the registrants in chronological order from the wait list and registers them for the function when and if it becomes available.

Functions become available when one of the following occurs:

- A function's maximum attendance limit is increased.
- A registrant is un-registered for a function with a wait list.
- A registration that includes a wait-listed function is cancelled.

To place a registrant on a wait list

1. From Events, select Register a customer to open the Register a customer window.
2. Find an event registration.
3. Click Edit.
4. Double-click a function. If the maximum attendance for the function has been reached, a message displays asking whether you wish to add the attendee to the wait list.
5. Click Yes to add the registrant to the wait list. The function will display with an “*” to the left of the function title.
6. Click Save to update the registration order.

To view wait lists

1. From Events, select Define an event to open the Define an event window.

2. Double-click an event to open it in the Define an event window.
3. Double-click an event function to open the Event Function Detail window.
4. Click More, and select Roster to open the Function Roster window and view the registrants on the wait list.

To create a wait list report

The Function Roster can be cloned, and new search criteria can be added to create either a Function Roster that includes wait list registrants or a Function Roster listing only wait list registrants.

1. Select Utilities> Report Specs to open the Report Specifications window.
2. Select MEETING - Rosters - Function Roster.
3. Click Clone.
4. Tab to the Title, and change the title, for example, Function Roster Including Wait List Registrants.
5. Click Parameters to open the Detail Reports Parameters window.
6. Place your cursor in the Search field.
7. Update the search criteria to read as follows:

   Order_Lines.QUANTITY_ORDERED>0 or Order_Lines.QUANTITY_BACKORDERED>0 or Orders.STATUS like 'C%'
8. Click Save.

To increase a function's maximum attendance limit

Use the following steps to increase a function's maximum attendance limit.

1. From Events, select Define an event to open the Define an event window.

2. Double-click an event to open it in the Define an event window.
3. Select the event function for which you want to increase the maximum attendance limit.
4. Click Edit to the right of the list of event functions to open the Event Function Detail window.
5. Increase the number in the Maximum field.
6. Click Save. When there is a wait list for this function, a message displays alerting you that you have increased the max allowed, and asking if you want the system to enroll as many as it can.
7. Click Yes to increase the maximum allowed.
8. Click Save.

   Note: Increasing a function's Maximum attendance limit will enroll registrants automatically from a wait list regardless of whether the Choose from Wait List for opening option is enabled or disabled on the Event System Preferences window (from Events, select Set up module, and click Preferences).

   To cancel a registration and add an attendee from a wait list

   Use the following procedure when the Choose from Wait List for opening option on the Event System Preferences window is enabled:

1. From Events, select Register a customer to open the Register a customer window.
2. Find the registration you want to cancel that contains the wait-listed function.
3. Click Delete. A system message prompts you to verify the cancellation of the registrant.
4. Click Yes to cancel the registration and display the Wait List window.
5. Double-click the attendee that you want to attend the function. A '>' appears to the left of the attendee's name.
6. Click OK.

Use the following procedure when the Choose from Wait List for opening option on the Event System Preferences window is disabled:

1. From Events, select Register a customer to open the Register a customer window.
2. Find the registration you want to cancel that contains the wait-listed function.
3. Click Delete. A system message prompts you to verify the cancellation of the registrant.
4. Click Yes to cancel the registration, and iMIS will register the first wait-listed attendee on the list.

To remove a wait-listed registrant from a wait list

You can use this process to remove an attendee from a wait list.

1. From Events, select Register a customer to open the Register a customer window.
2. Find the registration for the attendee you want to remove from a wait list.
3. Click Edit.
4. Double-click the wait-listed function which is marked with an ' *.' A system message prompts you to verify the removal of the attendee from the wait list.
5. Click Yes to remove the attendee from the wait list.
6. Click Save.

Note: If the registrant decides to sign up for this function later, and the function is not available at the time of ordering, you can place the attendee on the wait list again.

Events

From your Staff site, Events offers a quick-view Dashboard of your organization's event progress and figures:

- Event registrations last year
- Registrations by member type
- Revenue by event this year
- Total event registrations this year
- Event revenue this year
- Recent & upcoming events

[Event-Specific Console]

Each event displays an event-specific console page that provides a detailed display of information about the event such as its description and up-to-date registration figures.

Event Content Items

Specific event content items are designed to present your events with self-service registration in the public facing iMIS website.

Creating an Event

From a large annual conference with numerous program items to a weekly committee meeting, iMIS is built for you to create events smoothly and efficiently.

Searching for Events

Searching events is made easy through the use of the event search, list, and calendar. You can search for events by month, event name, city, state, or province, or topic in the event search. The event list displays an overview of all the events that are available for registration. The event calendar displays all available events in a calendar format.

Registering for Events

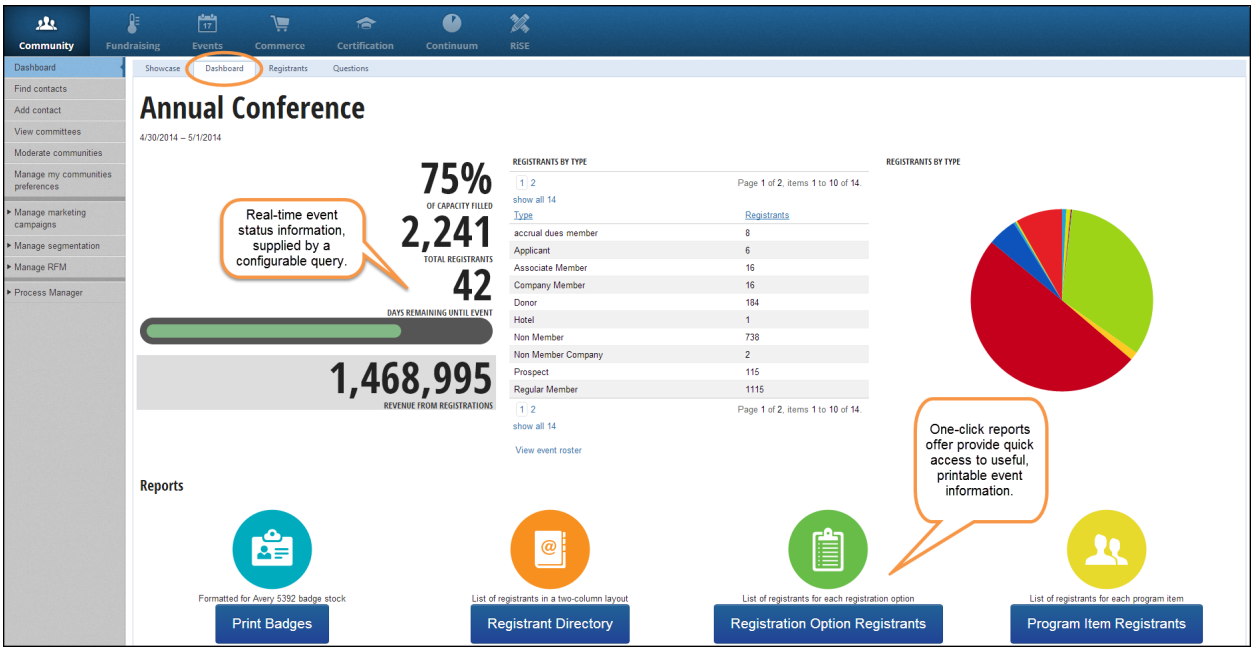
In staff and member sites, you can register yourself, another person using the On Behalf Of feature, or others from your company according to how the meeting is set up. These steps describe how to register people from your same company if the event is configured to do so.

Event-Specific Console

Every event in iMIS has its own unique console. From a single location, staff event managers are able to see at-a-glance statistical information, run reports and print badges, view registrants, and view and edit event and program item details.

Dashboard

The event-specific Dashboard tab is the landing page for Events. It provides a quick view of important, up-to-date registration information and statistics for a specific event. The dashboard information is configurable.



Reports

The Reports area displays a graphic panel with links to Print Badges, Registrant Directory, Registration Option Registrants, and Program Item Registrants:

- Print Badges displays a report containing registrant badge information. The badges display the full name, informal name, title, organization, city, state/province, and country of each registrant. This report is configured to print badges on Avery 5392 badge stock.

  To configure the Print Badges report results, you can adjust the following parameters:

- Event Code: The unique event identification code determined during your initial event set up.
- First Name (optional): Enter a first name to display badges only for people with that name.
- Last Name (optional): Enter a last name to display badges only for people with that name.
- Include Guests: Select Yes or No from the dropdown list.

  If you select Yes, guests are grouped together with the primary registrant and their badge will display only their name and a note that they are a guest of their primary registrant.

- PDF and Excel icons: Select an icon to export the report as the designated file type.

  Note: You must export a report as a PDF in order to preserve the Avery 5392 formatting for printing.

- Registrant Directory displays a 2-column report that lists all event registrants and their information.

  To configure the Registrant Directory report results, you can adjust the following parameters:

- Report Title (optional): Enter a descriptive title for your report.
- Include Guests: Select Yes or No from the dropdown list.

  If you select Yes, guests are grouped together with the primary registrant and their badge will display only their name and a note that they are a guest of their primary registrant.

- Include Cancelled: Select Yes or No from the dropdown list.

  If you select Yes, cancelled registrations are included in the report and are distinguished by an asterisk (*).

- Event Code: The unique event identification code determined during your initial event set up.
- PDF and Excel icons: Select an icon to export the report as the designated file type.

  Note: You must export a report as a PDF in order to preserve formatting for printing.

- Registration Option Registrants displays a list of registrants and the organizations they belong to for each registration option.

  To configure the Registration Option Registrants report results, you can adjust the following parameters:

- Report Title (optional): Enter a descriptive title for your report.
- Include Cancelled: Select Yes or No from the dropdown list.

If you select Yes, cancelled registrations are included in the report and are distinguished by an asterisk (*).

- Show Registrants for:
- Event Code: The unique event identification code determined during your initial event set up.
- Include Waitlist: Select Yes or No from the dropdown list.

  If you select Yes, guests are grouped together with the primary registrant and their badge will display only their name and a note that they are a guest of their primary registrant.
- PDF and Excel icons: Select an icon to export the report as the designated file type.

  Note: You must export a report as a PDF in order to preserve formatting for printing.
- Program Item Registrants displays a list of registrants and the organizations they belong to for each program item.

  To configure the Program Item Registrants report results, you can adjust the following parameters:
- Report Title (optional): Enter a descriptive title for your report.
- Include Cancelled: Select Yes or No from the dropdown list.

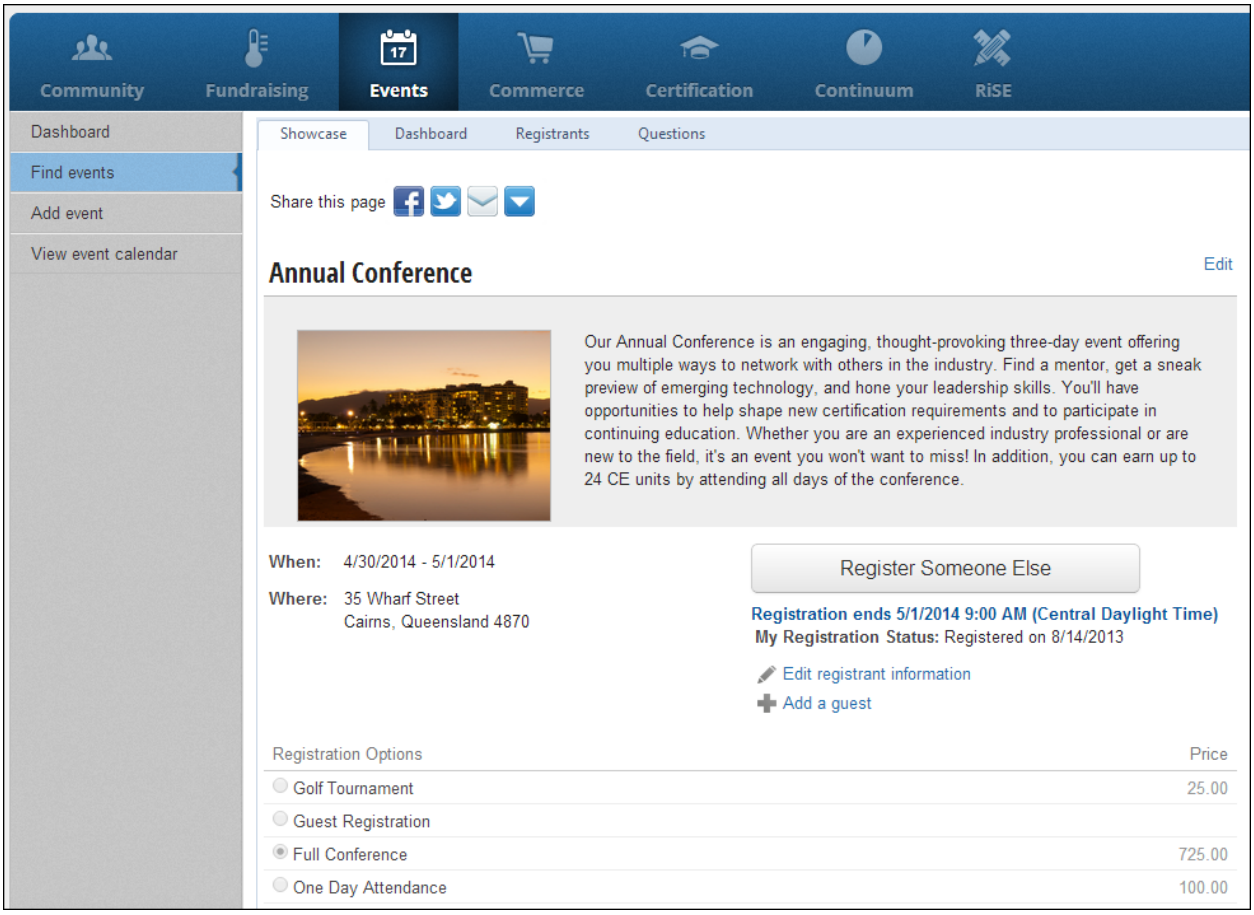
  If you select Yes, cancelled registrations are included in the report and are distinguished by an asterisk (*).
- Show Registrants for:
- Event Code: The unique event identification code determined during your initial event set up.
- Include Waitlist: Select Yes or No from the dropdown list.

  If you select Yes, guests are grouped together with the primary registrant and their badge will display only their name and a note that they are a guest of their primary registrant.
- PDF and Excel icons: Select an icon to export the report as the designated file type.

Note: You must export a report as a PDF in order to preserve formatting for printing.

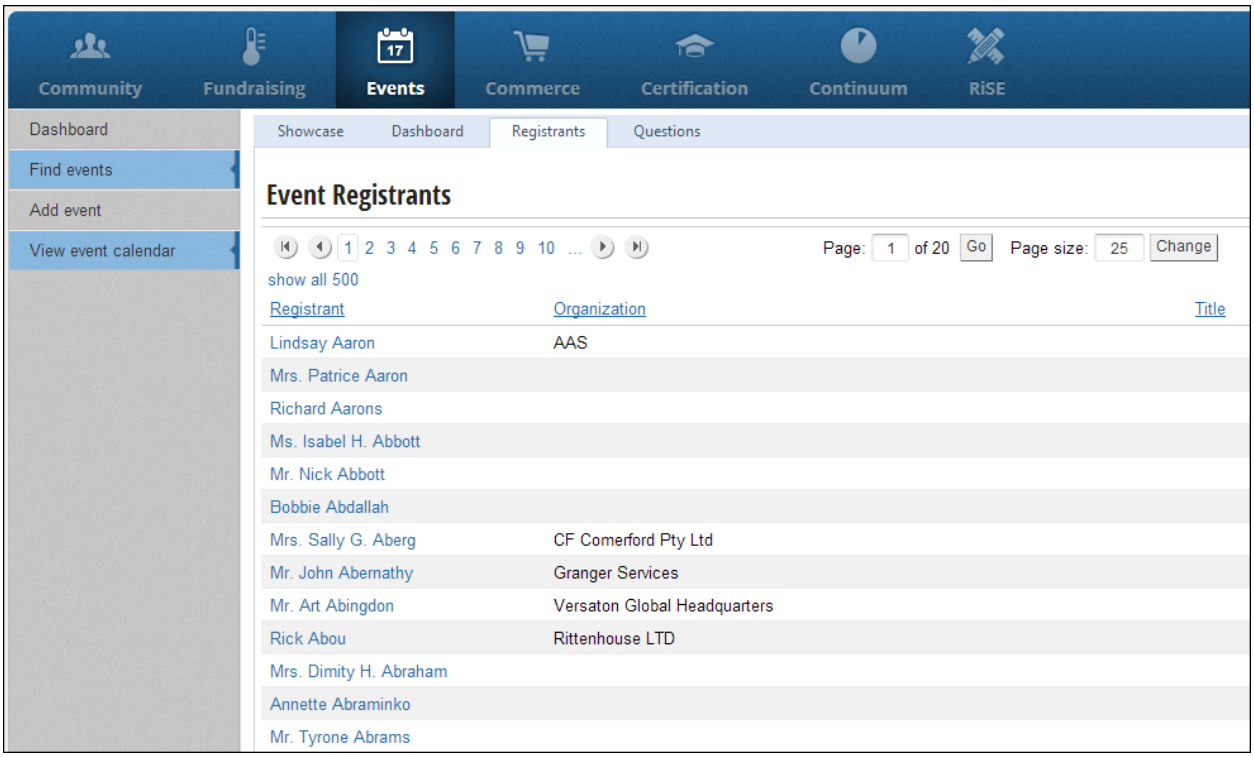
Showcase

The event-specific Showcase displays the same information your event registrants see. Event details, functions, and options are configurable from this section. For more information about using the showcase tab, please see Creating an Event and Registering for Events.



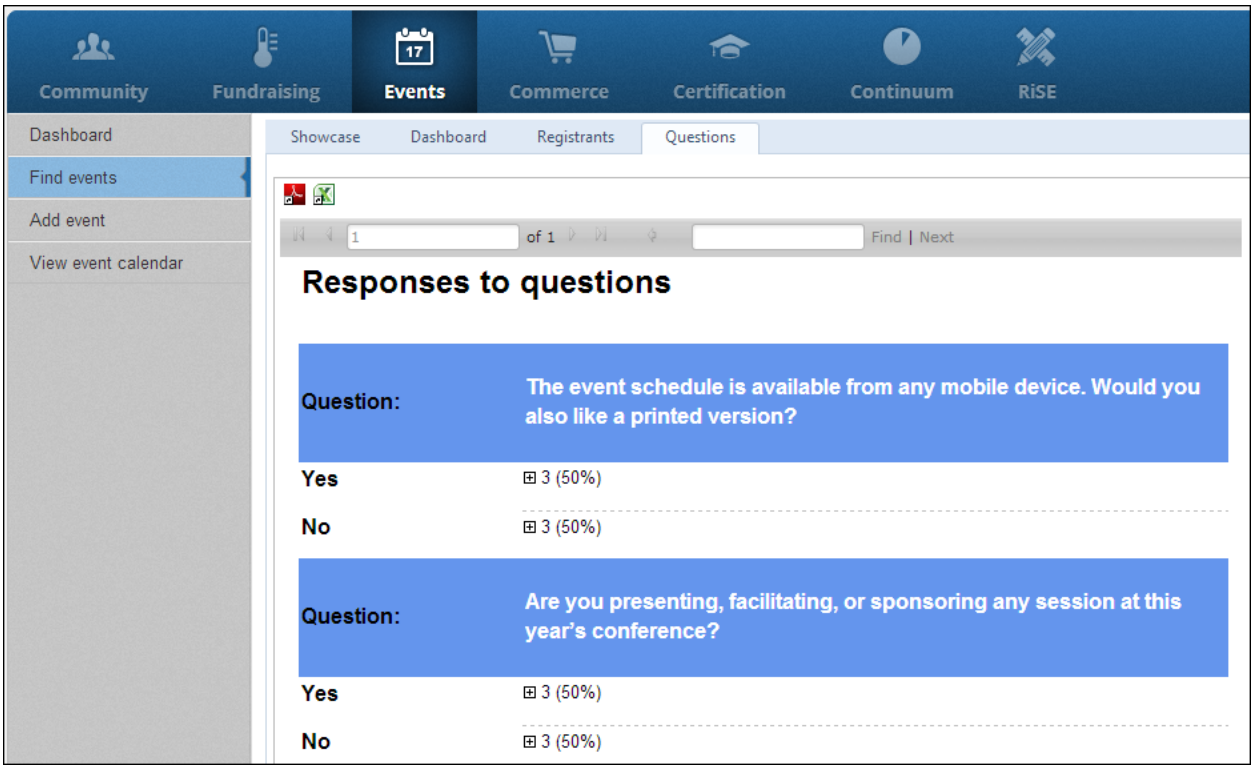
Registrants

The Registrants tab presents a listing of all the registrants for a selected event.



Questions

The Questions tab displays registrant responses to event-level questions. Answers are displayed in a percentage format for yes/no questions, in a graph format for multiple-choice questions, and as a collapsible list for open-ended response questions.



Creating an Event

Go to Staff Site > Events > Add Event:

To create an event:

To create an event do the following:

1. Navigate to the (Info) tab.

   Note: The time displayed for the date and time fields is determined by the time zone of your database server.

2. General Information Section:

- Enter the Event Code.

  Important: Code must be alphanumeric, contain no spaces, and be unique among all events.

- Enter the Event Name.
- Enter a Description.

- Specify the inclusive dates and times.
- Enter a Capacity if you want iMIS to limit the number of registrations to accept.
- To display an image with the event listing, choose an Image from the list or browse to Upload New Image.
- Specify a date and time range for when events Show in search display to the public in search results and the event calendar.

3. Registration Section:

- (optional) In the Registration opens and Registration closes fields, enter the date and time range when you want to allow public users to register for events.

  Note: Staff users and system administrators can always register themselves and other contacts for the event, regardless of the date range entered in the Registration opens and Registration closes fields.

- (optional) In the Registration closed message field, enter a message to display on the event Showcase page after the registration has closed to public users. The default message is Registration is closed.
- (optional) Enable the Register Someone Else button to allow users to register others by selecting the Allow registering others checkbox. When Registering Someone Else, Staff and authorized members are able to search for an existing contact to register or add a new contact all from a single screen.

  Note: The ability to add a new contact when Registering Someone Else is not configurable. If you select Allow registering others, staff and authorized members can always add a new contact when Registering Someone Else.

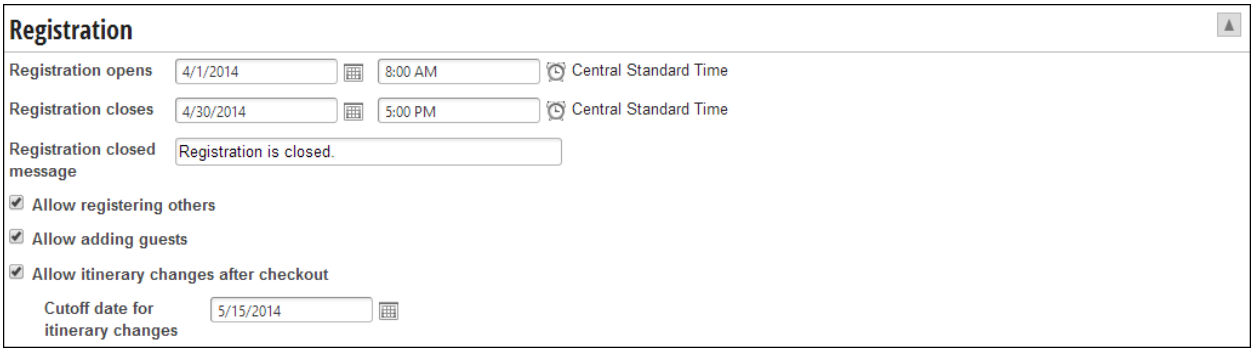
  Note: The user who pays for the registrant's event fees is listed as the Bill To party on those registrations. All accounting and invoice transactions are tracked under the Bill To ID.

- (optional) If you have an event for which this is appropriate, enable Allow adding guests. When enabled, the registrant can add a new contact and register that person as a guest

for an event via the Add a Guest link. When you register someone as a guest, their registration is dependent upon the registration of the host. The host can be the person you are working on behalf of, an individual registered using Register Someone Else, or yourself.

- (optional) To allow users to change their program items after checkout, enable Allow itinerary changes after checkout. If there is a cutoff date for changes, enable Cutoff for itinerary changes.

  Note: If Allow itinerary changes after checkout is enabled for the event and the Cutoff date for itinerary changes has not passed, public users can still change program item registrations even after the event registration has closed.



4. Additional Information Section:

- To include Additional Information, enter HTML text in the editing panel. There is no limit on size.

5. Click Save.

   Note: When an event date is changed, each of the associated program items will need to be reconfigured as well.

   Defining Event Pricing and Registration Options:

   You must define at least one registration option or program item in order for users to be able to register for your event. For example, you might choose to create several registrations to include your members, students, vendors, staff members, and presenters. Each registration option allows you to set a price and registration cut-off date that is unique from other registration options.

1. Navigate to the (Pricing) tab.
2. Enter the Early Cut-Off date and Regular Cut-Off date for the registration prices, if applicable.

   Note: The dates entered are inclusive. As an example, Early Cut-Off date is the last day for the early discount price.
3. If you have enabled Canadian taxation or VAT taxation in iMIS, you can specify the taxation rules to apply. The taxation method is set up for your default organization in iMIS Desktop or the Advanced Accounting Console. See Organization names window for more information.

- If your organization uses the Canadian taxation method with either GST or GSTINC as the taxation authority, enter the Tax Authority.
- Organizations using the GST tax authority can also choose to Tax by Address.
- If your organization uses the VAT taxation method, specify the VAT Rule.

   See International Taxation for more information on setting up Canadian and European taxation methods in iMIS.

4. In the Registration Options section, click Add.
5. On the (Info) tab, add a Registration Option Code and a Registration Option Name.

   Important: Code must be alphanumeric, contain no spaces, and be unique among all registration options and program items in the event.

   Note: Once you have saved your Function Code, you are unable to change it.
6. Enter any other optional fields that apply to the registration option.
7. Open the Registration Options (Pricing) tab and set the prices for the registration option.
8. You can set both Standard and Discount Price fields, so that your members (those with IsMember status) can enjoy the benefit of a reduced fee. Note that the price you enter auto-fills the Discount Price; leave it (to prevent any discounting) or override the price: lower the amount, or set it to zero for those members to not be charged a fee. When your

members view an event, they will see only the appropriate fee.

9. If you entered an Early Cut-Off date for your event, the Early pricing fields will be available. If you entered a Regular Cut-Off date, Late pricing fields will be available.
10. To make the registration option complimentary, select Comp for Standard and/or Discount prices.
11. Select the (Accounting) tab to review the settings and make any required changes for the item.
    - The Tax Category specifies the taxation rules to be applied. The options available depend on the taxation method set up for your default organization in iMIS Desktop or the Advanced Accounting Console. See Organization names window for more information.
    - If your organization uses the default taxation method, select Taxable or Non-Taxable.
    - If your organization uses the Canadian taxation method with GST as the taxation authority, select GST/HST or PST. If the Registration Option is non-taxable, do not select an option. If the Registration Option is taxable, select one or both options.
    - If your organization uses the Canadian taxation method with GSTINC as the taxation authority (generally countries in the Asia-Pacific region), select Taxable or Non-Taxable.
    - If your organization uses the VAT taxation method, select Taxable or Non-Taxable. If the Registration Option is Taxable, enter the VAT Tax Code you want to apply.
    - See International Taxation for more information on setting up Canadian and European (VAT) taxation methods in iMIS.
    - From the Income dropdown, choose the GL account to assign to the registration option. The Default option will use the system default account for events.
    - (Optional) Enter a Fair Market Value. This amount is the value that a donor receives for making a Gift and and allows the portion of their Gift that is eligible for tax reporting to be calculated correctly.

      Note: The Fair Market Value option is only available if you have a FUNDRAISING iMIS license.

12. On the (Questions) tab, click Add New to include Registration Option-specific questions. If you would like to adjust an existing question, select a row and click Edit Selected.

    Note: If you would like to hide a question from registrants, select the Hidden checkbox in the Questions configuration area.

    Note: If you would like change the presentation order of your questions, click the up and down arrows on the questions tab.

1. Type in your question.
2. Select the checkbox if you would like to indicate that an answer to the question is required.
3. Select the answer type from the drop down.

    There are five different answer types available:

- Numeric Integer – The registrant can enter only whole numbers (positive or negative).
- Numeric Decimal – Registrant can enter any number with up to 4 decimal places. If more are entered, they will be truncated to the fourth place (not rounded).
- Multiple Line Text – The registrant can enter lengthy answers in a multiple-line text box.
- Single Line Text – The registrant can enter an answer of only one line in a text box.
- Yes/No – The registrant can only choose "Yes" or "No".
- Dropdown list – The registrant can select one of several listed options.

    Note: Event organizers configure drop-down lists either explicitly, defining each option manually, or by query, defining a static group of list options for an individual question through a pre-arranged query.

    Note: The Display Value field determines the text seen by registrants. The Data Value field is only used in the database. For example, if you chose to display long sentence answers to registrants, the Data Value field would enable you to record abbreviated versions of those options in the database.

4. Click Save.

13. Repeat steps a-d to add additional questions to a single Registration Option.

    Note: The modifications made on the (Questions) tab determine the content viewed by registrants after they have selected a Registration Option.

    Note: In order for responses to each group of questions to be saved, registrants must select Save Response before checking out.

    Tip: If a SysAdmin makes changes to questions while a registrant is completing a question, it is possible that either the question or the registrant response will be lost. Ensure that your changes and updates are conducted at a time that few people will be registering.

14. Click Save & Close.

    If needed, you can define additional registration options so that registrants can choose between different options.

    Setting up questions for Events:

1. Navigate to the (Questions) tab.
2. Select Add New to add new questions. Select a row and click Edit Selected to edit an existing question.
3. Type in your question.
4. Select the checkbox if you would like to indicate that an answer to the question is required.
5. If you would like to hide a question from registrants, select the Hidden checkbox in the Questions configuration area.
6. Select the answer type from the drop down.

    There are five different answer types available:

- Yes/No – The registrant may only choose "Yes" or "No".
- Numeric Integer – The registrant may enter only whole numbers (positive or negative).

- Numeric Decimal – Registrant may enter any number with up to 4 decimal places. If more are entered, they will be truncated to the fourth place (not rounded).
- Single Line Text – The registrant may enter an answer of only one line in a text box.
- Multiple Line Text – The registrant may enter lengthy answers in a multiple-line text box.
- Dropdown list – The registrant may select one of several listed options.

  Note: The answer type cannot be edited after saving a question.

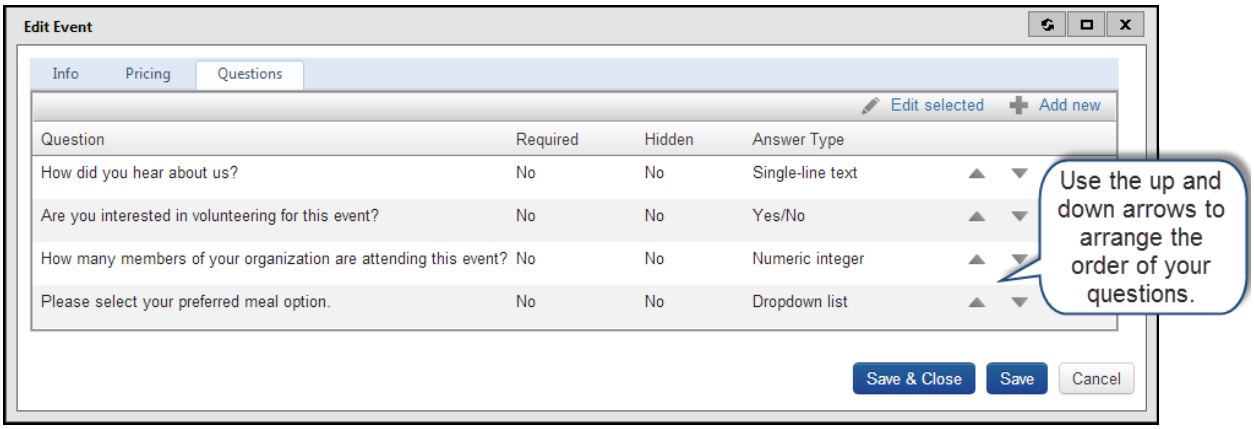
  Note: Event organizers configure drop-down lists either explicitly, defining each option manually, or by query, defining a static group of list options for an individual question through a pre-arranged query.

  Note: The Display Value field determines the text seen by registrants. The Data Value field is only used in the database. For example, if you chose to display long sentence answers to registrants, the Data Value field would enable you to record abbreviated versions of those options in the database.

7. Click Save.
8. Repeat steps 2-3 to add additional questions.

   Note: If you would like to change the presentation order of your questions, click the up and down arrows on the (Questions) tab.

9. When you have finished adding your questions, click Save & Close.



> **Note:** Note: The modifications made on the (Questions) tab determine the content viewed by registrants after they have elected to “Register Myself”.

> **Note:** Tip: If an event organizer with administrative privileges makes changes to forms while a registrant is completing a form, it is possible that either the question or the registrant response will be lost. Make sure to conduct your changes and updates at a time that few people will be registering.

Adding program items to an event

1. Navigate to Event Showcase.
2. In the Program area, click Add.
3. Enter a Program Item Code and Program Item Name for the program item.

   Important: Code must be alphanumeric, contain no spaces, and be unique among all registration options and program items in the event.
4. Enter values for Capacity, Maximum Registrations per Registrant, Category, or Track if needed; these fields are optional:

- Capacity – If you set a maximum capacity, once that limit is reached, iMIS disables relevant registration buttons and links and prompts registrants to review any registrations pending in the cart, if affected. Entering no value allows unlimited registrations.
- Maximum Registrations per Registrant – If the Maximum Registrations per Registrant attribute for this event was set to greater than 1, you can add a number of guests to your registration. For example, if the attribute was set to 4, you can specify up to a maximum of four registrants as part of your registration (yourself and three guests).
- Category – Designates one or more terms, separated by semicolons, as being relevant categories for this function. For example, if the function targets both intermediate and advanced practitioners, you might enter Intermediate;Advanced.

- Track – Designates one or more terms, separated by semicolons, as being relevant tracks for this function. For example, if the function serves both managers and technologists, you might enter Management;Technical.

5. If there are multiple program items with the same start date and time, you can enter a Sort Sequence to determine what order they appear in the program. Program items with the same start date and time will be sorted by this value, lowest to highest (items with a value of 0 will be the first in the order).
6. To display an image with the program item listing, choose an Image from the list or browse to Upload New Image.
7. To include Additional Information, enter HTML text in the editing panel; there is no limit on size.
8. Open the (Pricing) tab and set the prices for the program item.
9. You can set both Standard and Discount Price fields, so that your members (those with IsMember status) can enjoy the benefit of a reduced fee. Note that the price you enter auto-fills the Discount Price; leave it (to prevent any discounting) or override the price: lower the amount, or select Comp for those members to not be charged a fee. When your members view an event, they will see only the appropriate fee.
10. If you entered an Early Cut-Off date for your event, the Early pricing fields will be available. If you entered a Regular Cut-Off date, Late pricing fields will be available.
11. To make the program item complimentary (or to include it as part of the event registration), select Comp for Standard and/or Discount prices.
12. Select the (Accounting) tab to review the settings and make any required changes for the item.

- The Tax Category specifies the taxation rules to be applied. The options available depend on the taxation method set up for your default organization in iMIS Desktop or the Advanced Accounting Console. See Organization names window for more information.
- If your organization uses the default taxation method, select Taxable or Non-Taxable.

- If your organization uses the Canadian taxation method with GST as the taxation authority, select GST/HST or PST. If the program item is non-taxable, do not select an option. If the program item is taxable, select one or both options.
- If your organization uses the Canadian taxation method with GSTINC as the taxation authority (generally countries in the Asia-Pacific region), select Taxable or Non-Taxable.
- If your organization uses the VAT taxation method, select Taxable or Non-Taxable. If the program item is Taxable, enter the VAT Tax Code you want to apply.

  See International Taxation for more information on setting up Canadian and European (VAT) taxation methods in iMIS.
- From the Income dropdown choose the GL account to assign to the program item. The Default option will use the system default account for events. If needed, you can also choose a Deferred Income account to assign to the program item.

  Important: The Deferred Income option is available with a DEFINC iMIS license.
- (Optional) Enter a Fair Market Value. This amount is the value that a donor receives for making a Gift and and allows the portion of their Gift that is eligible for tax reporting to be calculated correctly.

  Note: The Fair Market Value option is only available if you have a FUNDRAISING iMIS license.

13. Open the (Questions) tab.
14. Select Add New to include Registration Option-specific questions. If you would like to adjust an existing question, select a row and click Edit Selected.

    Note: If you would like to hide a question from registrants, select the Hidden checkbox in the Questions configuration area.

    Note: If you would like to change the presentation order of your questions, click the up and down arrows on the (Questions) tab.
15. Type in your question

1. Select the checkbox if you would like to indicate that an answer to the question is required.
2. Select the answer type from the drop down.

   There are six different answer types available:

- Numeric Integer – The registrant may enter only whole numbers (positive or negative).
- Numeric Decimal – Registrant may enter any number with up to 4 decimal places. If more are entered, they will be truncated to the fourth place (not rounded).
- Multiple Line Text – The registrant may enter lengthy answers in a multiple-line text box.
- Single Line Text – The registrant may enter an answer of only one line in a text box.
- Yes/No – The registrant may only choose "Yes" or "No".
- Dropdown list – The registrant may select one of several listed options.

  Note: Event organizers configure drop-down lists either explicitly, defining each option manually, or by query, defining a static group of list options for an individual question through a pre-arranged query.

  Note: The Display Value field determines the text seen by registrants. The Data Value field is only used in the database. For example, if you chose to display long sentence answers to registrants, the Data Value field would enable you to record abbreviated versions of those options in the database.

3. Click Save.
4. Repeat steps a-d to add additional questions to a single program item.

   Note: The modifications made on the (Questions) tab determine the content viewed by registrants after they have added a program item to their itinerary.

   Note: In order for responses to each group of questions to be saved, registrants must select Save Response before checking out.

Tip: If a SysAdmin makes changes to forms while a registrant is completing a form, it is possible that either the question or the registrant response will be lost. Make your changes and updates at a time that few people will be registering.

16. Click Save & Close.

Additional options for event definition may be available in the Advanced Accounting Console. Events and program items created on the web using content items can be updated in the Advanced Accounting Console, if needed. See Event Definition and Event Function Definition for more details.

> **Note:** Troubleshooting: You must populate the Default Terms Code field in AR/Cash > Set up module > Aging with a value. If not, Event program items and registration options do not appear when users register on the web. You may also see the following error in the Error log: "COrder.TermsCode: The supplied value '0' is not defined in the Financial Terms reference table."

> **Note:** Note: When an event date is changed, each of the associated program items will need to be reconfigured as well.

> **Note:** Note: If the option to Show this function on the Web has been disabled, the program item will not be visible to members or to Staff users on the Web. This option can be enabled through the Advanced Accounting Console.

To define how program items display for a specific registration option

As an event planner, you can easily customize how program items should display for each registration option. You can define the display options from the context of a specific registration option or a specific program item.

1. Edit an event, and on the (Pricing tab) open a registration option.
2. Select the (Program Options) tab.

3. For each program item, choose how the item should display when a registrant chooses this registration option:

- Display and allow user to add/remove – The program item is displayed for this registration option, and the registrant can register for it. This option is available only if the program item allows registration.
- Display and do not allow user to add/remove – The program item is displayed for this registration option, but the registrant cannot register for it.
- Do not display – The program item is not displayed for this registration option.

4. When you have chosen display options for each program item, click Save & Close.

To define how a specific program item displays for each registration option

As an event planner, you can easily customize how program items should display for each registration option. You can define the display options from the context of a specific registration option or a specific program item.

1. Edit a Program Item and select the (Registration Option) tab.
2. For each registration option, choose how the current program item should display when a registrant chooses this registration option:

- Display and allow user to add/remove – The current program item displays the registration option, and the registrant can register for it. This option is available only if the item allows registration.
- Display and do not allow user to add/remove – The current program item displays for the registration option, but the registrant cannot register for it.
- Do not display – The program item does not display for the registration option.

3. When you have chosen display options for each registration option, click Save & Close.

To register by default related registration options

As an event planner, you can easily customize whether to register by default registrants for your related Program Items and Registration Options. You can also choose how each will display for registrants:

1. Edit an event, and on the (Pricing) tab open a registration option.
2. Select the (Program Options) tab.
3. For each program item, select Register by default.
4. For each program item, choose how the item should display when a registrant chooses this registration option:

- Display and allow user to add/remove – The program item is displayed for this registration option, and the registrant can register for it. This option is available only if the program item allows registration.
- Display and do not allow user to add/remove – The program item is displayed for this registration option, but the registrant cannot register for it.
- Do not display – The program item is not displayed for this registration item.

5. When you have chosen the display options, click Save & Close.

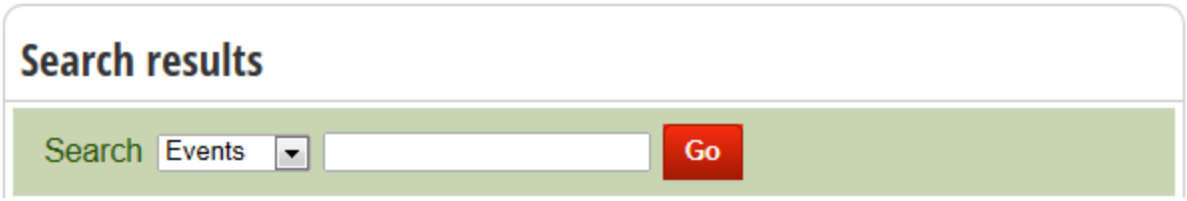
> **Note:** Note: When Register by default is selected and either Display and do not allow user to add/remove or Do not display are chosen, registrants will be auto-enrolled for that program item.

Searching for Events

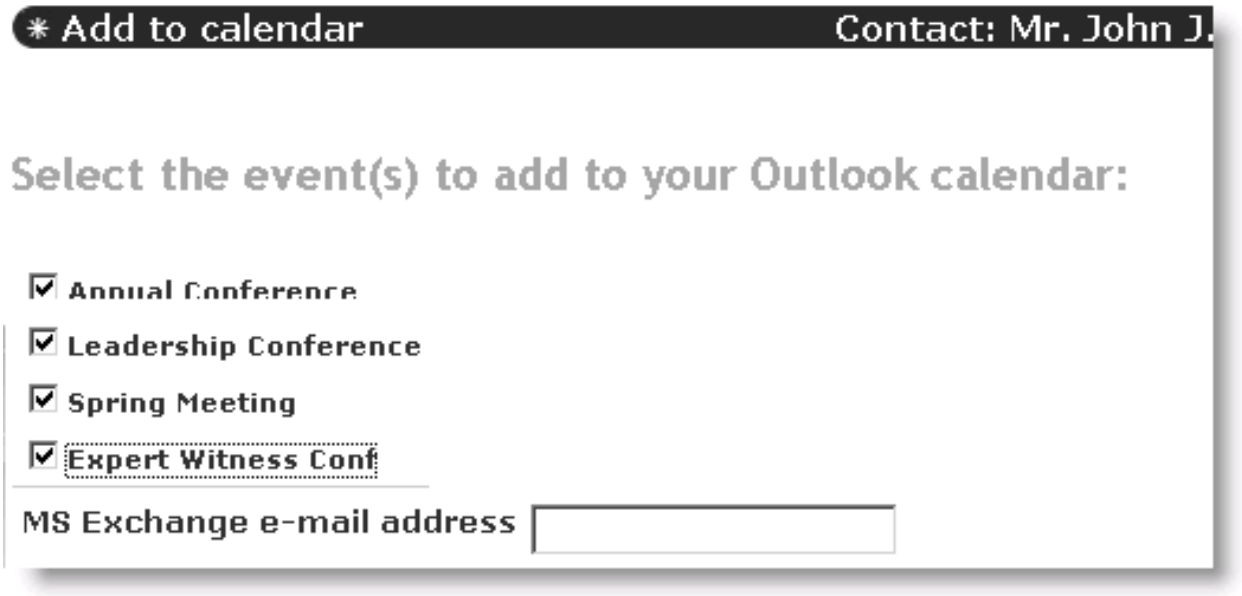
Event search

You can search for events by month, event name, city, state, or province, or topic in Events > Find events. Staff users can search for all events, including events that are not web-enabled when defined from the Advanced Accounting Console or Desktop.

Note: Tip: When searching for multiple locations for City and State, put each value in quotations and use commas between multiple values. For example, enter "Austin," "Dallas," "Houston" to search for Events in those three cities.



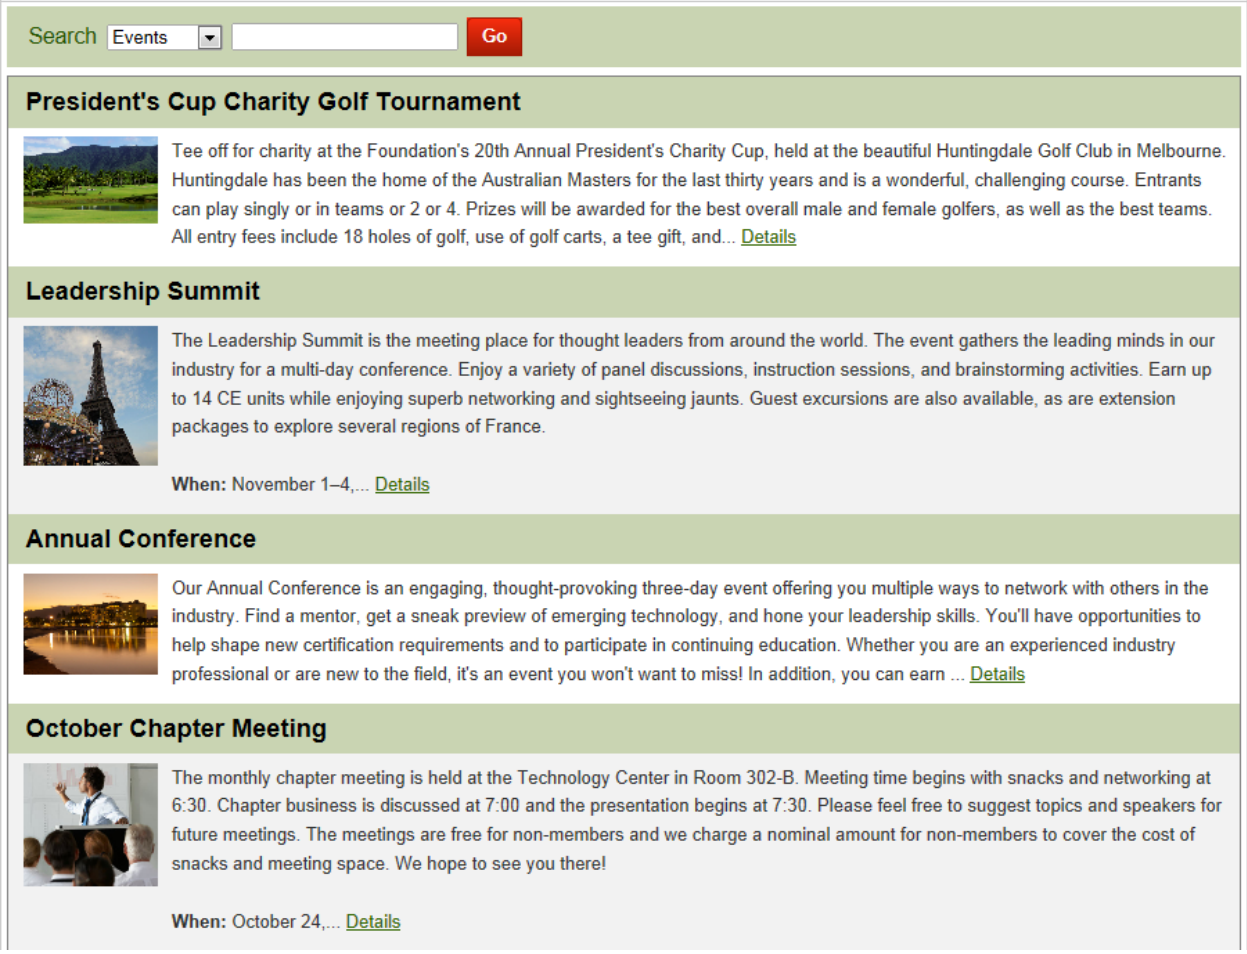
Note: Note: This page can be configured to list any type of event using the ViewAll query. Access this query from RiSE > IQA > EventManagement > DefaultSystem > Queries > EventSearch to add a filter for the event Type.



Event list

List active events by selecting (Event tab) > Find events.

Note: Note: You can configure this page to list any type of event using the ViewAll query. Access this query from RiSE > IQA > EventManagement > DefaultSystem > Queries > EventList to add a filter for the event Type.

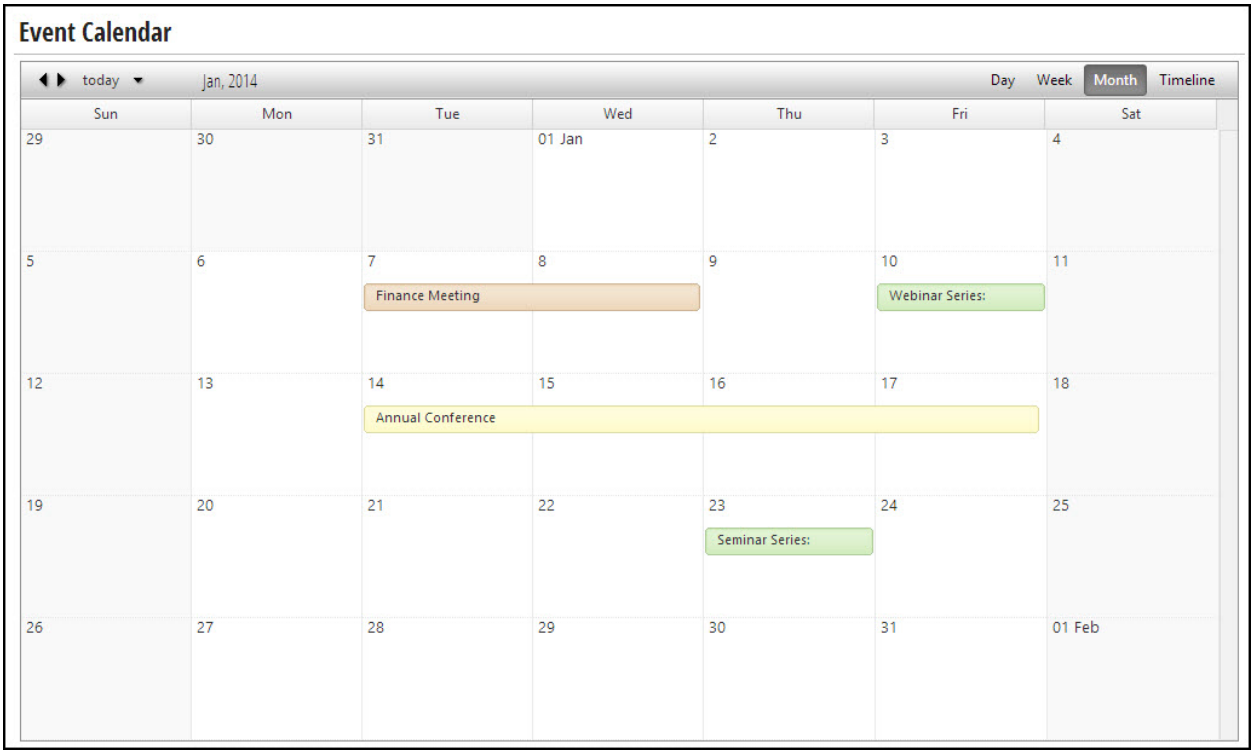


Event calendar

Go to Event> Event calendar to view events by Day, Week, Month, or Timeline. Events listed on the Event Calendar are color-coded to indicate visibility and availability for registration:

- Green indicates that the event is visible to all users and open to registration.
- Yellow indicates that the event is visible to all users but not open to registration.
- Orange indicates that the event is visible only to staff users.

Tip: If you would like to display an explanation of the event colors on the Event Calendar page, add a Content Html content item that includes the relevant information.



Registering for events

For yourself or On Behalf Of another contact, you can view contacts' events and register them for events. Public and Casual users are able to register other contacts from the same company. You can also register guests for yourself or other contacts if the event permits it.

If a staff user has specified a time range that the event is open for registration, public users can only register for the event if the current date falls within the time range. Staff users and system administrators can always register themselves and other contacts for the event.

An added feature for staff users: when registering yourself or others, you can ignore warning messages and errors related to:

- Event or Program Item capacity
- Itinerary conflicts
- Editing existing registrations
- Unanswered but required survey questions
- Simply ignore these errors during registration and proceed to checkout. You can also ignore the error messages at checkout.

  Note: If you have opened a contact record, you can click the name of the event and proceed through the registration process to checkout.

  To register for an event

  All available events are listed on the Event Calendar and in the general events list (Events > Find events). Events listed on the Event Calendar are color-coded to indicate visibility and availability for registration:

- Green indicates that the event is visible to all users and open to registration.
- Yellow indicates that the event is visible to all users but not open to registration.
- Orange indicates that the event is visible only to staff users.

  You can browse this list or use the Search box to search for a word or phrase. Registrations appear in your cart along with any other items added, such as products and donations.

  Note: Note: Event registration is only available for events with an Active status.

  Note: Troubleshooting: If double-clicking an event in the Event Calendar returns the error The resource cannot be found, ensure that the EventDetail shortcut is configured correctly in Site Builder > Manage Shortcuts.

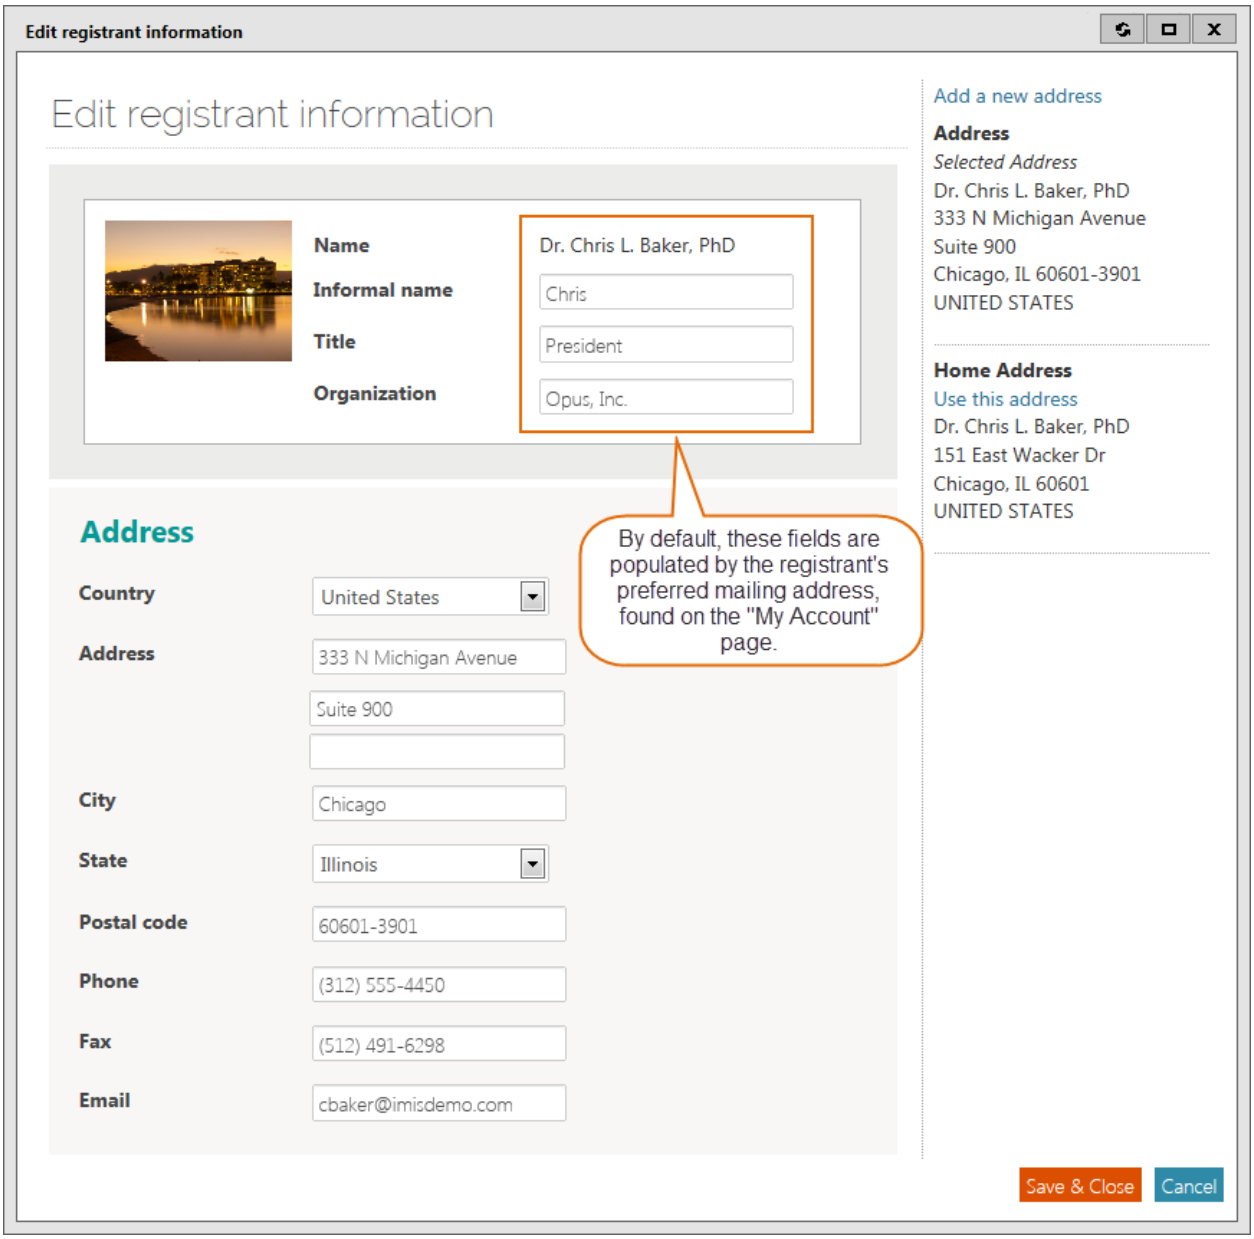
1. Select Events > Find events or Search for the event.

2. Select the event. Navigate to the (Showcase) tab.
3. Click Register Myself.

   Note: If you would like to register On Behalf Of a contact, click the select contact drop-down, then search for the contact by name, company, or ID.

   Note: Staff users have the option to define a registration time range when creating events. If an event is not available for registration then the registration buttons are disabled for public users. When a registration period is defined, notification messages display The messages inform the user when a registration period begins or ends. The time noted in these messages is populated by the time in your database server.

4. Answer any questions that appear below your registration status and click Save Response.
5. Click Edit registrant information to manage the registrant details (Informal name, Title, Organization, and Selected Address). This information is used for badges and other event-related reports. Registrants can edit this information or add a new address:



To override this default (Preferred Mail) address, select a different address or add one to the user's account.

Note: Any changes made to these registrant details update every instance of that address throughout iMIS. If you would like to create unique badge information for a registration, choose Add a new address and include your desired information.

Note: If you would like to leave the Informal name, Title, or Organization blank, this information must be removed from the My Account page. When a user simply deletes this

information while registering for an event, it is repopulated by the information on the My Account page.

6. If the event has registration options, select one for the registrant.

   Note: If items in the itinerary are no longer available based on the selected registration option, they are removed from the itinerary. A message is displayed indicating which items have been removed. Hidden program items are not included in the displayed message.

   If a registration is removed from the cart, the selected program items are still in the itinerary. They can be removed on the event page.

7. Select the program items the registrant will attend.

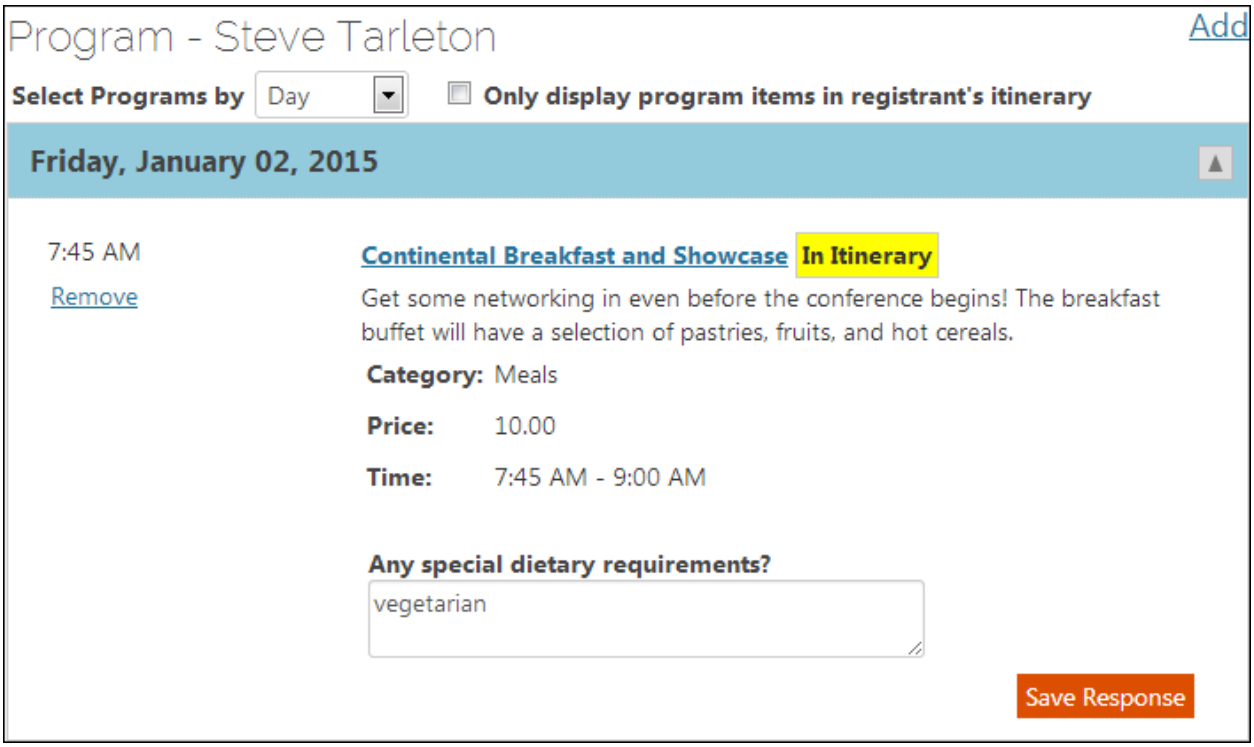
1. Click on the program item group headings to expand and collapse the group sections.
2. (Optional) If the Maximum Registrations per Registrant attribute for this event was set to greater than 1, you can add a number of guests to your registration. For example, if the attribute was set to 4, you can specify up to a maximum of four (yourself and three guests) in the Quantity field on the program item. If you specify a number greater than the maximum value for this attribute, you will see an error message, and the quantity will not update.

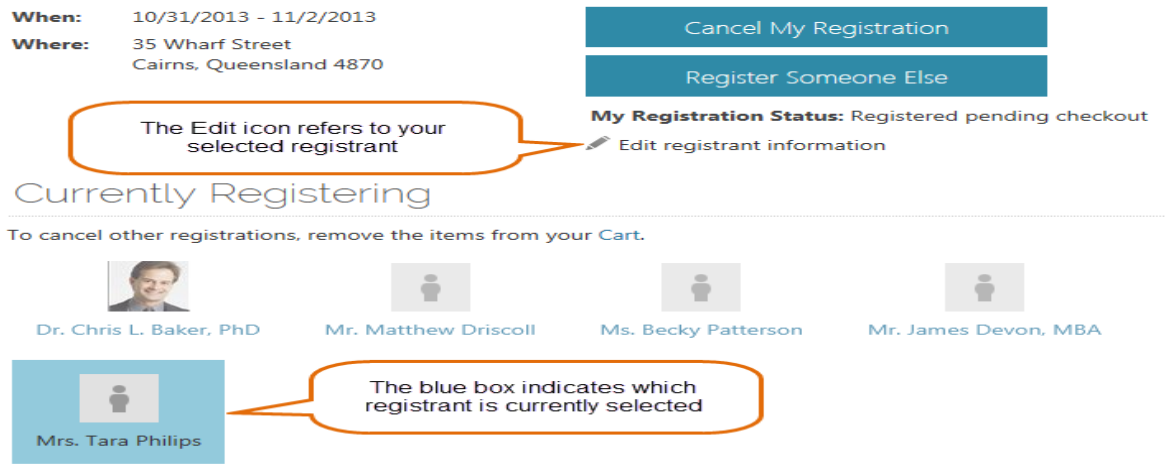
3. Click Add.

Note: Functions set up for automatic enrollment do not have an Add link.

- For each program item added, the text In Itinerary appears next to the program item name.
- If there are any conflicting program items in the itinerary, such as two program items at the same time, you will receive a conflict message and will not be able to complete the registration process. You can easily clear up the conflict by removing one of the conflicting items

4. If the added program item has questions, complete the question form and click Save Response.





Note: Using the Register Someone Else feature will place all additional registrations in your shopping cart. If you would like to register a different user and place the registration in their shopping cart, elect to work On Behalf Of, and select another user.

8. The Cart will contain your registration checkout details.

   iMIS guides you through the payment process.

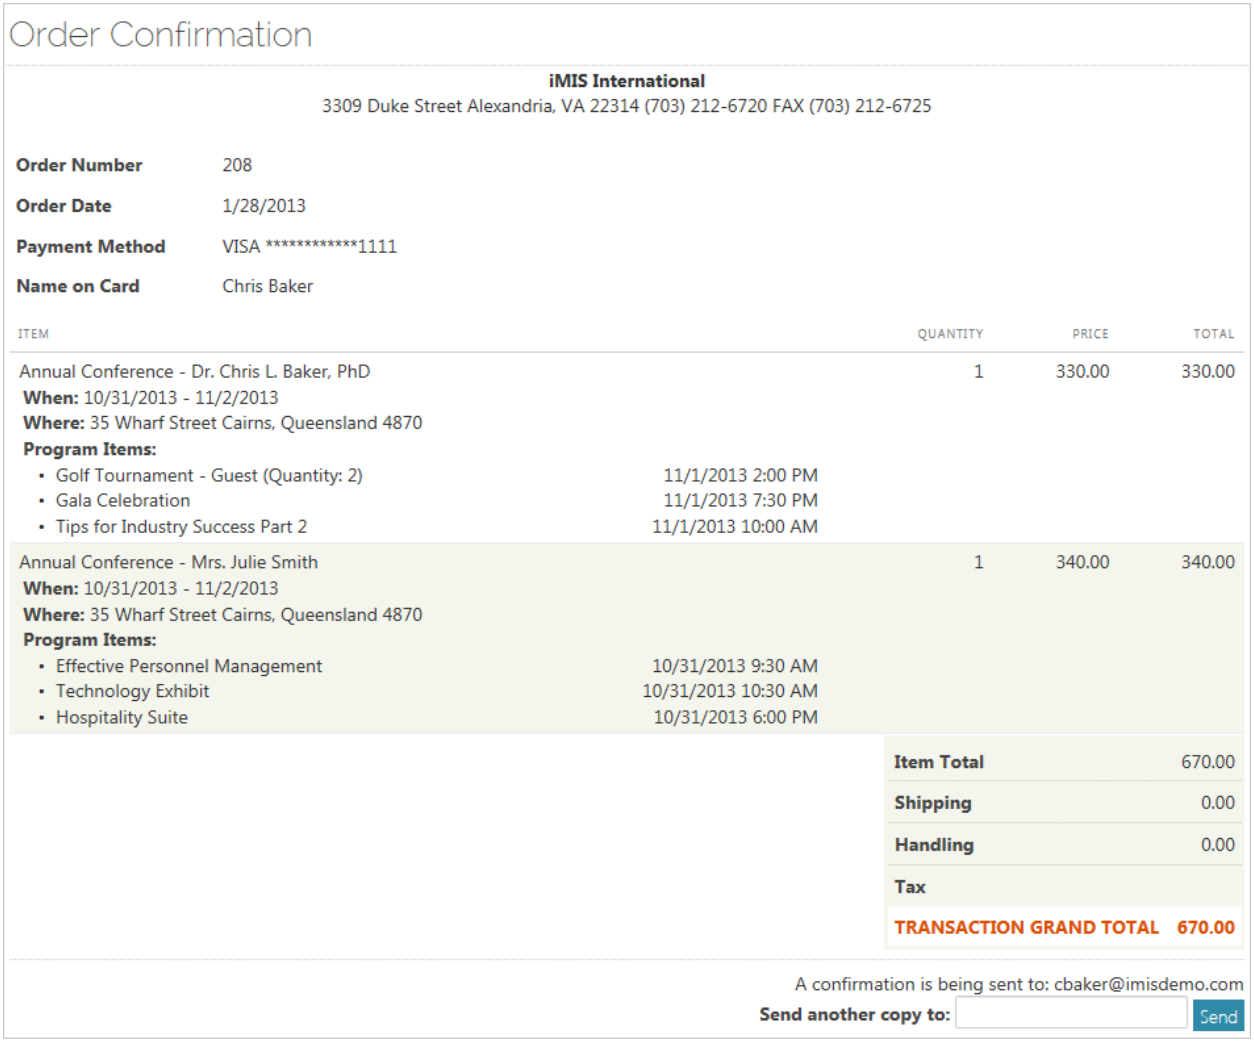
   Event and program item registrations appear in the shopping cart. Registrants may continue shopping or proceed to checkout. The pending registration is noted in the cart counter at the top of the page, and it shows up in the cart along with any other items selected for purchase.

   Note: If you have registered for an event that contains required questions, a reminder message displays in the shopping cart alerting you to return to the event and answer any missed required questions.

Note: If a public user adds an event to the cart on a date outside the registration period, a message notifies him or her that registration for the event is unavailable and to remove the event from the cart.

Links in the cart let users:

- Cancel the pending registration by removing it.
- Click back to the event showcase (the page with both event details and the program items).
- After checking out from the Cart, an Order Confirmation page appears. This reflects all registration details, including additional registrants and program item details.



Order Confirmation

iMIS International
3309 Duke Street Alexandria, VA 22314 (703) 212-6720 FAX (703) 212-6725

Order Number	208
Order Date	1/28/2013
Payment Method	VISA **********1111
Name on Card	Chris Baker

ITEM		QUANTITY	PRICE	TOTAL
Annual Conference - Dr. Chris L. Baker, PhD **When:** 10/31/2013 - 11/2/2013 **Where:** 35 Wharf Street Cairns, Queensland 4870 **Program Items:**		1	330.00	330.00
• Golf Tournament - Guest (Quantity: 2)	11/1/2013 2:00 PM			
• Gala Celebration	11/1/2013 7:30 PM			
• Tips for Industry Success Part 2	11/1/2013 10:00 AM			
Annual Conference - Mrs. Julie Smith **When:** 10/31/2013 - 11/2/2013 **Where:** 35 Wharf Street Cairns, Queensland 4870 **Program Items:**		1	340.00	340.00
• Effective Personnel Management	10/31/2013 9:30 AM			
• Technology Exhibit	10/31/2013 10:30 AM			
• Hospitality Suite	10/31/2013 6:00 PM			

Item Total	670.00
Shipping	0.00
Handling	0.00
Tax	
TRANSACTION GRAND TOTAL	**670.00**

A confirmation is being sent to: cbaker@imisdemo.com
Send another copy to: Send

Note: When you have submitted the order, iMIS sends an email confirmation. This online confirmation serves only as an acknowledgement of registration from the web. It does not update the registration record for a confirmation. The message, "This registration has been confirmed," does not appear in the Register a customer window.

9. After you have completed a registration for yourself or someone else, you can return to the event and view registration details. Select the desired registrant from the Registrants carousel. You can add and remove program items if the event permits it, or add a guest for yourself or others you have registered. You can also edit the registrant information for anyone you have registered.

   To cancel an event registration

   Users can cancel an event registration if they have not yet paid for it.

1. Select Events > Find event or Search for the event.
2. Select the desired event.
3. Click Cancel Registration.

   Cancelling an event registration before checkout has the effect of canceling registration for any and all of its program items as well.

   > **Note:** Tip: If the ability to register someone else is enabled, you can delete others' registrations in bulk from the shopping cart.

   To change program item registrations after registration is complete

   If Allow itinerary changes after checkout is enabled for the event (and the Cutoff for itinerary changes date has not passed), users can change their program item registrations after completion of the registration process, with the following exceptions:

- Fundraising program items
- Program items with a promotion discount applied

- VAT or Canadian taxation methods
- Canceled registrations

  Note: The above scenarios are supported through Advanced Accounting Console and Desktop.

1. In the program area of an event you have already registered for, add, remove, or update the quantity for any program item.
2. After completing all desired changes to program items, click Proceed to Checkout or view the Cart.
3. The Cart will contain a line for the adjusted event with the total charge or credit for all adjustments.

   iMIS guides you through the payment process.
4. An Order Confirmation page will appear, reflecting all of your registration and program item details.

   To cancel a program item registration

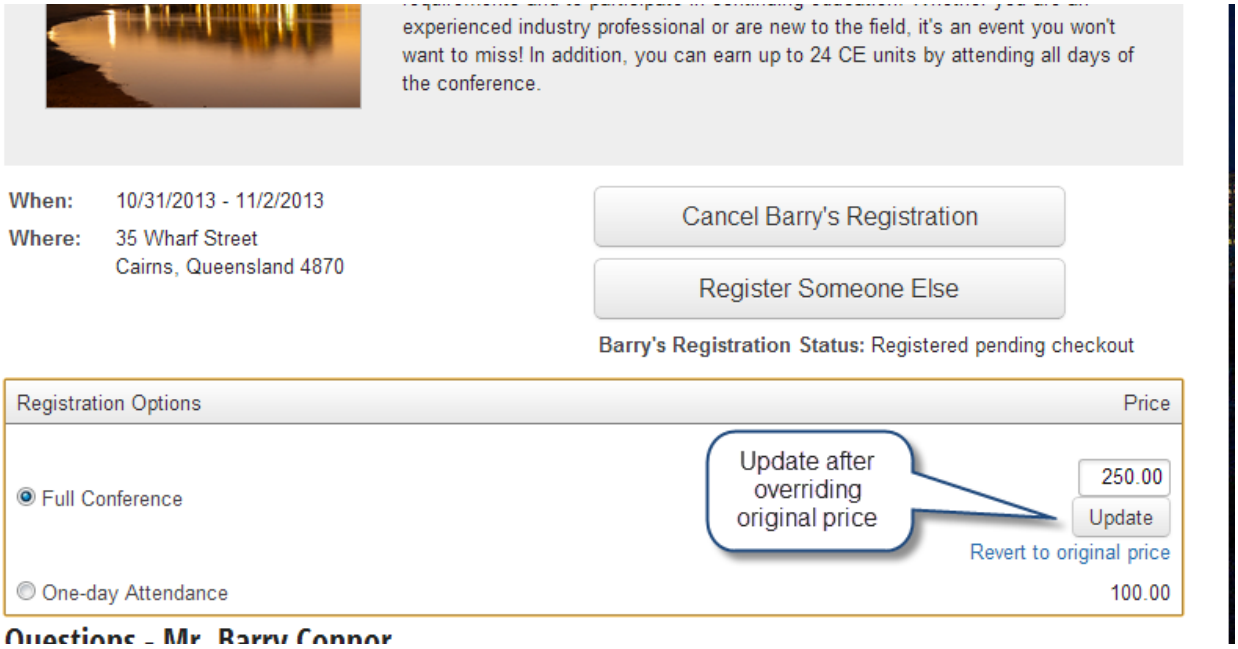
1. Users can also cancel a program item registration if they have not yet paid for it.
2. Select Events > Find events or Search for the event.
3. Select the desired event.
4. Click Remove for the desired program item.

   To override event pricing

   If you are a staff user, you can manually override event pricing to give your organization's members (and non-members) one-time discounts on event registration options and related program items. Registrations and program items can then be added to the cart with the price override included. This can also be done working On Behalf Of a user.

   Note: Note: The ability to override the price of an event is disabled if the system-wide taxation method is set to GSTINC.

1. Go to Events > Find events, and then search for the event.
2. Click the event you wish to register the user for.
3. On the resulting event display, choose the desired registration option, Register the user, and manually edit the price in the editable Price field. The Revert to original price link will appear. If you want to to return to the original price, click this link.
4. Click Update.
5. (optional) Repeat this step for any program items you have added to the user's itinerary, and would like to override. Click Update for each overridden program item.



6. Click Proceed to Checkout when you are ready to check out with the new prices.
7. Once in the cart, you will see the new price under Items. You can proceed through check-out as normal.

> **Note:** Note: After a price is overridden, no further discounts or promotions may be applied.

Register a Guest, Register Someone Else, and Register On Behalf Of: What's the difference?

There are three different ways to register someone other than yourself using iMIS.

- Register Someone Else enables the logged in user to register a new contact or an existing contact from a list. This registration method is added to the cart of the logged-in user, but does not depend on the logged in users' registration. You are able to use the Add a Guest feature with Register Someone Else.
- On Behalf Of enables Staff users to assume the identity of one of their contacts. When you select Register Myself, you are doing so as the user you have assumed. You are able to Register Someone Else and Add a Guest to your Register Someone Else while working On Behalf Of an individual. Any Registrations you create while working On Behalf Of a contact will be added to their Cart.

  When enabled, Add a Guest allows users to add guests to their registrations. Guest registrations are tied to the host registration. If that registration is canceled for any reason, the Guest's registration will be cancelled as well. Guest registrants are not able to use the Add a Guest feature.

  What if the person isn't already in the database?

  If the registrant has no record in the database, go to Contacts > Create Account to enter one. Use this opportunity to make the record as complete as you can (company, address, phone, email, and so on).

  Registering Someone Else

  When Registering Someone Else, Staff and authorized members are able to search for an existing contact to register or add a new contact all from a single screen. Staff may also complete bulk registrations using Register Someone Else when they work On Behalf Of.

1. Select an Event.
2. Click Register Someone Else.

Note: When this option is disabled, users can only register for themselves.

Note: Staff users have the option to define a registration time range when creating events. If an event is not available for registration then the registration buttons are disabled for public users. When a registration period is defined, notification messages display The messages inform the user when a registration period begins or ends. The time noted in these messages os populated by the time in your database server.

You will have two options:

- Add a new Contact: Only first and last name are required, but you are able to include Prefix, Suffix, and Designation, Informal Name and Title, Organization, Email, Phone, Address.
- Select an existing contact: Choose a contact from the dropdown list.

  Note: You will be alerted if the contact has already registered for the event.

  Note: This option will appear as a list of co-members from your company or organization. If you have no co-workers or do not have administrative privileges, you will only be able to add a new contact.

3. Click Save & Close.

   The registration will appear in the Event Carousel. Continue to the registration process as you would for any other event, answering questions and selecting the appropriate registration options and program items as desired.

4. (Optional) Add a guest:

1. Select a Registrant from the Carousel.
2. Click + Add a Guest for [registrant name]
3. Create a new contact.

The Guest registration will appear in the carousel as [Full Name] Guest of [Selected Registrant]

5. Click Proceed to Checkout to complete the registration process.

   Note: You are able to cancel or edit the registration information of any registrant in your event carousel before you checkout. Simply select the registration you would like to edit and click Edit [Registrant Name] registrant information.

   Adding Guests to Event Registrations

   If you have configured your event to Allow Adding Guests, you are able to add a guest to a registration. When you register someone as a guest, their registration is dependent upon the registration of the host. The host can be the person you are working on behalf of, an individual registered using Register Someone Else, or yourself. If the Host registrant cancels their registration, all of their guests' registrations cancel also. Your guest registrants will appear in the carousel just after the host.

   You can configure the Customer Type that is assigned to your newly created guest contacts based on the membership status of the host registrant. These Customer Types are configured in the system settings|topic= Quick setup.

   > **Note:** Note: Adding guests to registrations does not create a system-wide contact record in the database. You will need to add a new contact manually to each individual event.

1. Select an event.
2. Register yourself or Register Someone Else.

   Note: Staff users have the option to define a registration time range when creating events. If the event is not open for registration, the registration buttons are disabled for public users. When a registration period is defined, notification messages display, informing the user when the registration period begins or ends. In these notification messages, the time uses the time zone of the server that hosts your website.

3. Click Add a Guest.
4. Complete the guest registration form and click Save & Close.

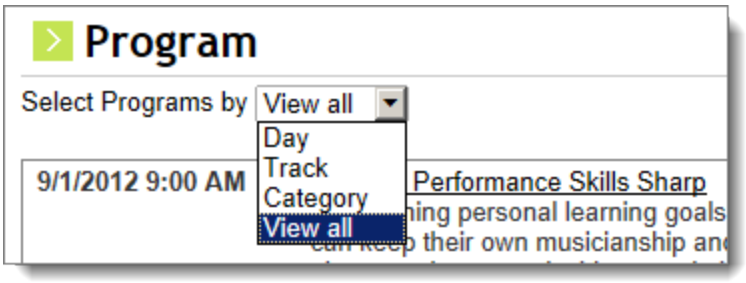
   Note: By default the Host's information populates the address field. If the Host has no default address selected, guest information will remain blank. You can change or remove your guest's address as needed.

   Note: After upgrade, all event settings will be cleared and the Allow adding guests option will be disabled by default. Event Administrators can edit the event setup in the Desktop or Advanced Accounting Console to enable the option to allow adding guests.

Event Content Items

Use the Events content items (Content Gallery > Offering) to design and present your events for self-service registration in your public-facing iMIS website:

- Event Display – shows event information, manages registration status, and (optionally) permits users to register others
- Event Program Display – lists all program items within an event that the registrant can select, with the ability to group the program items by day, track, and category, if they are defined:

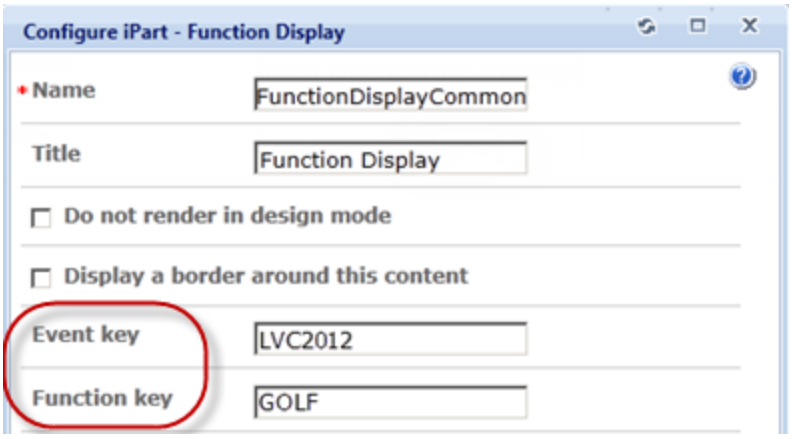


- Function Display – shows program item information and modifies registration status
- Event Edit – edits details about an event and allows users to create new events when no event key is specified
- Function Edit – edits details about a program item and allow users to create new program items when no function key is specified

> **Note:** Note: Anonymous visitors to your website (both non-members and members who have not signed in yet) and can view information about events and program items. However, to register, they must sign in.

Referencing by Key

These content items reference specific events and program items directly by use of a key. Usually keys are passed by the URL, but you can also specify a key when configuring a content item. Keys in the URL override those in the configuration.



Keys are required for the Display content items. If a key is missing (that is, a key is neither passed on the URL nor specified in the configuration) in a Display content item, then the content item hides itself from your users. If a key is missing in the Edit content items, then the content item will create a new event or program item.

> **Note:** Note: It takes a while for the indexing service to remove a deleted event. If a content item cannot hide itself because of this delay, it reports that the event was deleted.

Finding event keys

How you identify the key for a specific item depends on whether it is an event or a program item:

- Event key (Meet_Master.MEETING column): This comes from the Event Code defined in the event.
- Function key (Product_Function.PRODUCT_CODE column): This comes from the Program Item Code defined in the program item.

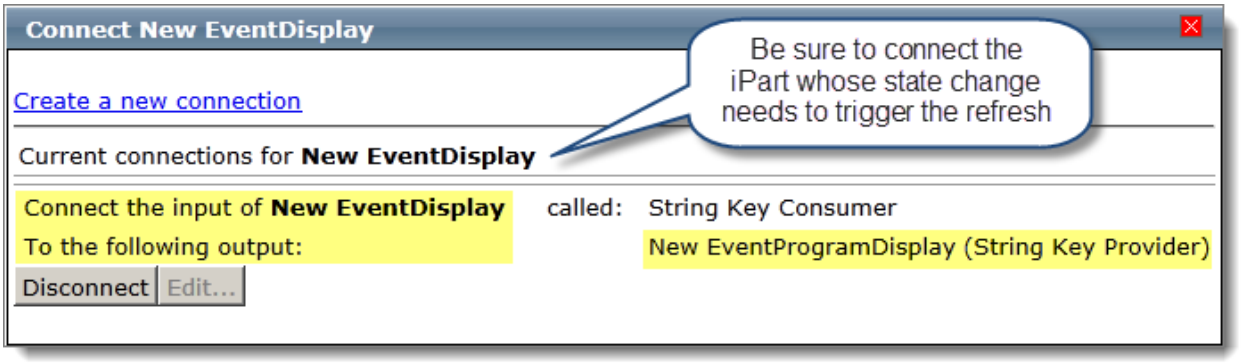
To connect event content items for dynamic updating

1. Edit the content record that contains the event content items (Event Display, Event Program Display).
2. Set up the connection:

- Select Connect on the Event Display content item's title-bar menu. The Connect box that opens shows you any current connections and lets you disconnect them.
- Select Create a new connection. The Connect box that pops up prompts you to create one of four connection types.

Tip: Do not be misled by the language of connection. The Consumer is the actor that triggers a refresh on another content item, and the Provider provides a pointer to itself to the Consumer.

3. From the String Key Consumer drop list, select your Event Program Display content item.
4. Select Connect.



5. Click Save.
6. Publish the content record.

Connecting content items to refresh program items

In order for the Program Display content item to refresh automatically whenever a user changes the selected registrant, it needs a connection to the Event Display content item on the content record that they share. You will need to create connections for any event pages that you design from scratch using the content item's Connect feature, which you enable separately from Configure.

Note: Note: Check a content item's Configuration Help topic to find out if it supports any connection options. A content item has no connection support (neither consumer nor provider) unless its author added it.

EXPOCAD Interface

Overview: EXPOCAD Interface

Welcome to iMIS EXPOCAD interface. iMIS integrates EXPOCAD into iMIS Exposition Management. This product allows you to work within the graphical interface of EXPOCAD to create and modify booth assignments and then transfer that data to the iMIS Exposition Management system for invoicing and tracking of exhibitor information.

The purpose of the EXPOCAD interface is to allow booth selection and assignments to occur in EXPOCAD while maintaining billing and prospecting capabilities in iMIS. The EXPOCAD interface and iMIS Exposition Management system work independently, but collectively:

- Booth inventory numbers are maintained in EXPOCAD.
- The ExpoCadExp event file contains all the data pertinent to renting, un-renting, or editing existing rented booth information
- EXPOCAD booth information is imported into iMIS based on booth assignment activity within EXPOCAD.
- All order processing is completed in the Exposition Management system.

Note: To authorize credit card payments for Events, Exhibition, Exposition, and Orders, enter them through Service Central > Enter and edit payments (if licensed for SERVCEN) or AR/Cash > Cash receipts (if licensed for CCAUTH).

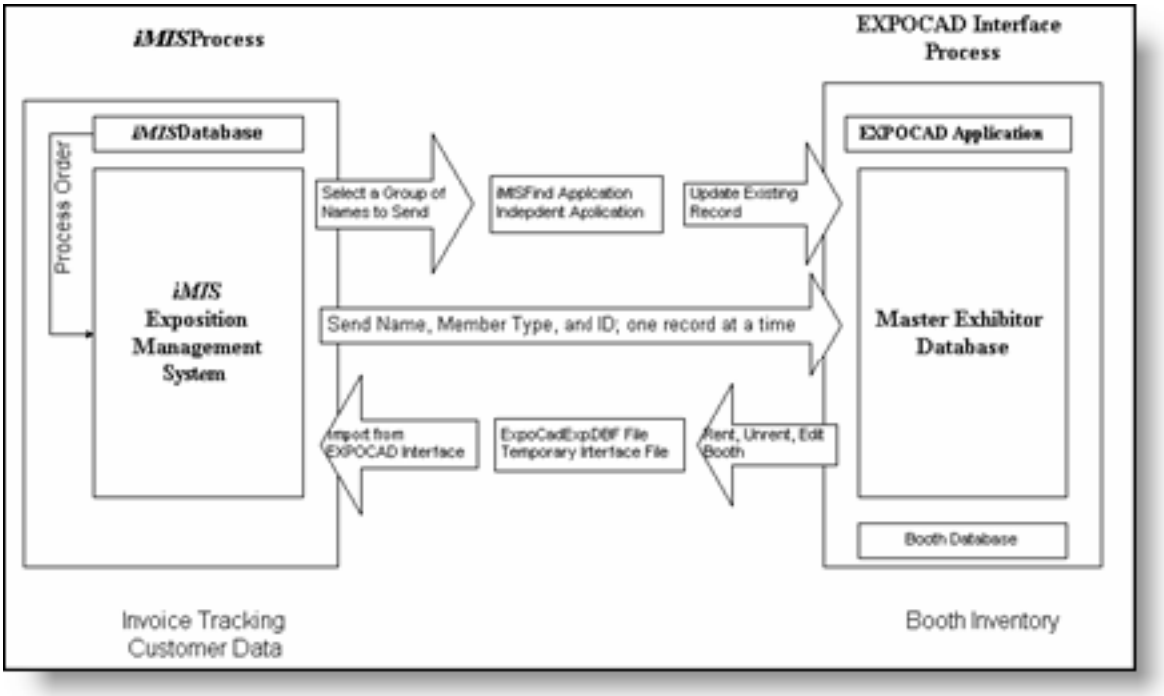
> **Note:** Note: This document describes how EXPOCAD interfaces with the iMIS Exposition Management system. EXPOCAD functionality is only discussed in reference to the iMIS interface. For detailed instructions on EXPOCAD, see the EXPOCAD User's Guide.

EXPOCAD Interface Capabilities

The EXPOCAD interface automates the booth inventory process. Your initial floor layout and booth numbering provide standards for a database of exposition booths. With EXPOCAD booths, you can create islands and peninsulas, or booths can be combined to conform to your layout needs.

The following diagram shows how the EXPOCAD interface works. Exhibitor names are imported using an independent iMISFind application. You can also import Member Type and member ID from one iMIS exhibitor at a time to an EXPOCAD Master Exhibitor database. All booth renting activity takes place in EXPOCAD, and is stored in a temporary interface file called ExpoCadExp. Information in the ExpoCadExp file is then exported into iMIS for order processing.

EXPOCAD Components



The following are the three main components required for using the EXPOCAD interface with iMIS:

- iMISFind application
- EXPOCAD application and ExpoCadExp file
- iMIS modules

iMISFind

This is a Visual Basic executable file. You must use the iMISFind application to log in to the iMIS database and retrieve records, and also to export them to the EXPOCAD Exhibitor database. Users must have at least a level 1 security for both Membership and Exposition Management in iMIS to use iMISFind.

To use iMISFind you must have an iMIS ODBC setup.

For an export to be successful:

- Both iMISFind and EXPOCAD must be open; and
- An event has to be open in EXPOCAD.

You can find exhibitors (all from the Name table) using the following:

- Member ID
- Name
- Company
- Member Type
- Prospect on Event

The Name and Company searches can be partial searches on a “begins with” basis. If you do enter a search value, a system message displays warning you that it may take a long time for the system to complete the search.

If an Exhibitor ID already exists in EXPOCAD, the system automatically compares the Group, Name, and Displayed Name. If any of the fields do not match the corresponding Exhibitor ID in EXPOCAD, the system automatically updates the record with the current information imported from iMIS.

EXPOCAD and ExpoCadExp file

The ExpoCadExp file contains the following information: rented booths, un-rented booths, booth number changes for rented booths, and booth class changes that involve aisle booths that occur in EXPOCAD. This file is updated by all booth activities from the EXPOCAD database. Each time a booth is rented, or un-rented, or when a previously rented booth has a number change, or a previously rented booth has a class change to/from aisle booth in the EXPOCAD database, the system writes transactions to the ExpoCadExp file.

The first time you open an event in EXPOCAD, the ExpoCadExp file is created in the same location as the EXPOCAD Master and/or Event Exhibitor database. The system uses the same file for all EXPOCAD events.

The iMIS Import will process records from the ExpoCadExp file into Exhibition Management.

iMIS Modules

To import and export information to and from EXPOCAD, you will use the following iMIS modules:

- Customer Management – iMISFind displays exhibitor records in this module which you can export to EXPOCAD.
- Exposition Management – You will use this module with EXPOCAD to accomplish the following:
- Define exposition code, begin/end date, and early/regular cutoff dates (product related)
- Choose the exposition category (iMIS or EXPOCAD)
- Insert exposition products and fees

The EXPOCAD Import in iMIS imports records from the ExpoCadExp file to create or update orders. To use the EXPOCAD Import, you must enable Batch Control (AR> System Setup, click Batch Control, select a batch control option). A batch must be selected before any ExpoCadExp orders can be imported to iMIS Orders.

Before you import exhibitor records to iMIS, you can run an iMIS ExpoCadExp report that prints all records in the file.

Benefits of the EXPOCAD Interface

The following are benefits of using the EXPOCAD interface with the Exposition Management System:

- Saves you time by reducing data entry.
- Booth assignments can be managed in one place and then imported into iMIS for order processing. When you use the EXPOCAD interface, booth assignments are made in EXPOCAD. You will not use the Exposition Management System to manage booths.
- Promotes accurate record management by lessening the chance of user error as wait listing is not used and booth assignments are made in the EXPOCAD interface.
- Allows you to see the floor plan in a graphical image.
- You can see where a booth is located on the floor, whether the booth is rented, and to whom it is rented.

EXPOCAD Interface Terms

The following are EXPOCAD terms. In the definitions, you are also given the Exposition Management System related term.

Event

Events are your shows. They are also the same as an exposition. The EXPOCAD event file contains all booth layout information, booth graphics, and text associated with your event. This includes the size, number, and location of each individual booth, as well as all exhibitor booth assignments.

Event Exhibitor List

This is a database of potential or actual exhibitors. This database in conjunction with the Master Exhibitor List must contain all the assigned exhibitors. If you do not use the

Master Exhibitor List, you should change to the alternate database before any booth assignments are made.

Exhibitors

Exhibitors are your clients or prospects (potential clients). Exhibitors can also be companies. These files contain exhibitor information that may be used for assigning and managing your clients. The exhibitor file is associated with the iMIS Membership list, a specific event's exhibitor list, or a contact management file.

Import

This function imports booth files and exhibitor information into iMIS.

Master Exhibitor List

This is a database of potential or actual exhibitors. This database in conjunction with the Event Exhibitor List must contain all of the assigned exhibitors.

Pack

The primary function of Pack is to remove a record marked for deletion in the ExpoCadExp file. Records are marked 'Deleted' once they are successfully imported, or upon deletion from the Import Error List. Using Pack physically deletes the marked records from the file, reducing the file size.

Rent

This is the same as "assigning" exhibitors to booths in iMIS Exposition.

Table Structures for EXPOCAD

These are the tables and fields involved in EXPOCAD:

Expo_Control

Stored in System_Params where ParameterName = Expo_Control. Additional fields have been added to the Expo_Control table. These fields will be used in the Expo System Setup window.

UseQtyOrSqrFt	Boolean	0 if using Quantity 1 if using Area (Square Units)
ImportRunning	Boolean	1 if import is running

ExpoCad_Prod

Stores the product mapping between EXPOCAD and iMIS.

MEET_ID	Char(10)	Event in EXPOCAD Exposition code in iMIS
ExpoCad_Type	Char(40)	Booth Type in EXPOCAD Island, Peninsula, Corner, Inline, Custom and Aisle Booth
Product_Code	Char(31)	Exposition ‘Booth’ product code
Premium_1	Char(31)	Exposition ‘Other’ or ‘Paid Pass’ product code
Qty_1	Numeric	Quantity for Premium_1
Premium_2	Char(31)	Exposition ‘Other’ or ‘Paid Pass’ product code
Qty_2	Numeric	Quantity for Premium_2

Meet_Master

Additional field has been added.

Meet_Category	Numeric	0 if iMIS exposition 1 if EXPOCAD exposition

Exhb_Booth

Additional field has been added.

Booth_Type	Char(40)	Stores the Booth Type from EXPOCAD

EXPOCAD: ExpoCadExp

A FoxPro database file created when an event in EXPOCAD is initially setup.

Count_Val	Numeric (18)	Value of the current counter. Equal to 0 when Proc_Desc ='iMISCounter'
UniqueID	Numeric (18)	Unique ID generated from the increment of Count_Val
Orig_ Booth	Char(20)	Original Booth Number
New_ Booth	Char(20)	New Booth Number
Booth_ Size	Numeric (18)	Size of booth in square units
Booth_ Type	Char(40)	Booth Type in EXPOCAD Island, Peninsula, Corner, Inline, Custom and ab
Exhb_ID	Char(20)	Exhibitor ID
Event_ Name	Char(20)	Event name in EXPOCAD Exposition name in iMIS
Proc_ Desc	Char(100)	Description of EXPOCAD activity 'Rent Booth','Unrent Booth','Booth Num Change','Booth Class Change', and 'iMISCounter'
Insert_Dat	Char(22)	Date record was added in EXPOCAD stored in CCYYMMDD HH:MM:SS format
Retrv_By	Char(100)	Upon successful import, stores the UserID+RetrieveDate, marking that line for deletion.

If the record fails the import, stores FAIL_UserID+RetrieveDate

EXPOCAD Known Issue

If you change the class of a rented booth to Aisle, then go to Booth> View Booth to verify the class change, to close that window you only have the choices of OK or Cancel.

- If you close the window using the OK button, then Booth> Booth Class to change the class back to Standard, the Booth Type in EXPOCAD remains at Aisle. Depending on your Product Mapping and pricing in iMIS, using the OK button would create orders with incorrect pricing and an incorrect booth product code.
- If you close the window using the Cancel button, then Booth> Booth Class to change the class back to Standard, the class does revert to Inline, as it should.

Overview of EXPOCAD Requirements

The following steps must be completed before you can begin using EXPOCAD:

- Install EXPOCAD
- Install iMISFind
- Setup an ODBC driver for Microsoft Visual FoxPro 6.01.8629.01 or higher

> **Note:** Note: You must be on Sybase Adaptive Server Anywhere 6.0 or MSSQL Server 6.5 or 7.0.

> **Note:** Note: You may receive a warning message within iMIS when using MSSQL Server 6.5 that you are unable to connect due to the maximum number of configured user connections already connected. A higher value can be configured with sp_configure.

Defining an Event (Exposition) in EXPOCAD

To define an event in EXPOCAD, you must do three things:

- Define the default booth size
- Define the event
- Create the floor plan

Defining the Default Booth Size in EXPOCAD

In order to define the default booth size, you will need to first set the default unit of measure that will be used, and then set the size of the smallest booth.

> **Note:** Note: See the EXPOCAD User's Guide for additional information on how to use EXPOCAD.

To set the default unit of measurement

The Unit window is used to set the default unit of measurement (for example, inches or meters) that will be used to describe the booth size.

1. Open the EXPOCAD application (Start> Programs> EXPOCAD).
2. Select Options> Unit to open the Unit window. The default values shown in the Unit window are set for English measurements.
3. Select the units.
4. Click OK.

To set the booth default values

The default booth sizes are based on 10' 0" x 10' 0" (U.S.) and 3.0m x 3.0m (Europe). You will set the smallest booth size needed as a building block for the floor plan.

1. In EXPOCAD, select Options> Default to open the EXPOCAD – Default Values window.
2. Change the default values, if necessary.

Note: Note: These defaults are what appear on the EXPOCAD – Max Fit window.

Defining the Event (Exposition) in EXPOCAD

The event you define will be used in EXPOCAD and iMIS for importing and exporting records. Make sure to create an iMIS exposition with the same name as the event you define in EXPOCAD. See Defining an EXPOCAD Exposition (Event) in iMIS.

To define the company database and event in EXPOCAD

The steps below demonstrate defining both a Company Database and an Event in EXPOCAD, however, you are not required to create a new Company Database for each Event.

1. In EXPOCAD, select File> Open File to open the EXPOCAD – File Open window.
2. Enable the Company Database option.

   Note: At this point, you could select a Company Database, or continue with step 3 and enter a new one. If you select a Company Database, continue with step 6.
3. Enter the File Name of the company database in the File Name field.
4. Click OK. The EXPOCAD – Add New Exhibitor window opens, expecting you to enter an individual exhibitor name. You won't need to enter exhibitor information because you will later import this information from iMIS.
5. Click Cancel.

   Note: If you click OK, a message displays stating that a client number and name must be entered. Click OK to close the message and then click Cancel.
6. Select File> Open to open the EXPOCAD – File Open window again.
7. Enable the Event option and enter the EXPOCAD event name, which is the same name you will enter in as the exposition code in iMIS.

   Note: This field must match the iMIS Exposition Code, so it is both case sensitive (use all capital letters) and character specific.

8. Click OK to display the EXPOCAD – Event Information window.

   Note: At this point you need to decide if your exhibitor list is going to be specific for this event, or if you're going to use a master list (one used in other events).

   When importing exhibitor names into EXPOCAD, it will first look to see if there is a file name entered for the Master Exhibitor List. If no file name is entered, it will import to the default file name entered for the Event Exhibitor List.

9. Click the Event Exhibitor List or Master Exhibitor List button to open the Open file window, or accept the Event Exhibitor List default.

   Note: EXPOCAD does not allow you to create an event without a Master Exhibitor List or Event Exhibitor List referenced. If both these fields are left blank, EXPOCAD creates a default Event Exhibitor List and populates the field when the window is closed.

10. Select the company database and click Open. The database name is automatically populated in the corresponding list field.

11. Click OK to display the EXPOCAD tool bar.

12. Click X in the right hand corner to close this window.

Creating an EXPOCAD Floor Plan

Now that you have defined your event in EXPOCAD, you will create a graphical layout of the event floor plan using the EXPOCAD – Max Fit window. Using the floor plan you can rent (order), un-rent, or reassign booths, and perform other booth management tasks.

To create an EXPOCAD floor plan

1. In EXPOCAD, select Booth> Max Fit to open the EXPOCAD – Max Fit window.

   Note: The layouts are based on the smallest booth size set in the EXPOCAD – Default Values window (Options> Defaults). The size can be any value that you want and it may vary in a single event.

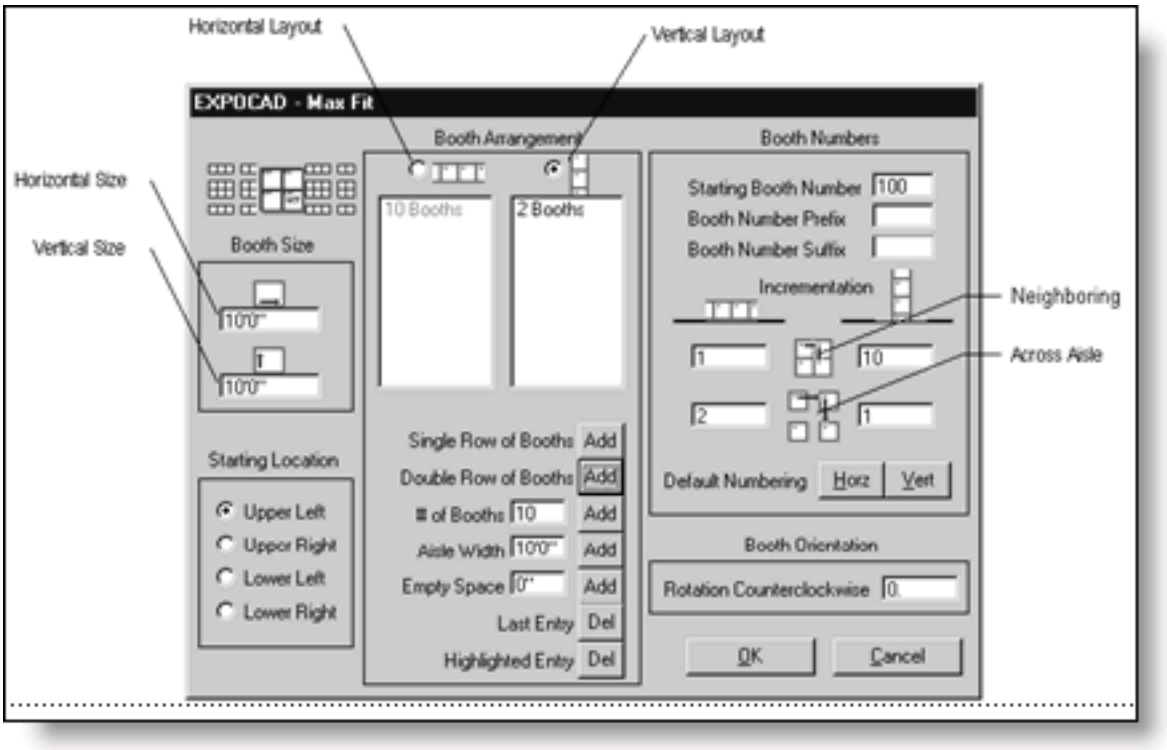
2. Create the floor plan based on your exposition needs.

Note: Tabbing through the Default Numbering Horz and Vert buttons will save the Incrementation as you entered it. Clicking the Horz button will revert to the default Incrementation of 2, 99, 2, 1.

3. Click OK. This will close the EXPOCAD – Max Fit window.
4. Click on the main EXPOCAD window to view the floor plan.

   Note: If you do not click on the main EXPOCAD window, you will lose the setup you have just done.

5. Select View> Fit to fit the plan to the window. The floor plan will display in your EXPOCAD window.
6. Select File> Close.



Installing the EXPOCAD Components

Installing EXPOCAD

You must purchase EXPOCAD version 6.8 or later from Applied Computer Technology, Inc. (www.expocad.com). Follow the installation instructions provided with the EXPOCAD CD.

Program files must be installed on your local drive while data files can be installed on the server.

Installing iMISFind

iMISFind is a Visual Basic executable file. iMISFind allows you to log on to the iMIS database and retrieve any necessary Name record(s) and import that information into an EXPOCAD database. The ODBC used for iMIS is also used for the iMISFind application. Your logon name and password for iMISFind are the same as the ones you use for iMIS.

> **Note:** Note: Installing iMISFind prior to creating events in EXPOCAD is required. The installation of iMISFIND replaces the expo1.dll file.

To install iMISFind

The current version of the iMISFind utility will need to be uninstalled prior to installing a newer version.

1. Uninstall iMISFind.

1. Click Start and select Settings> Control Panel.
2. Double-click Add/Remove Programs on the Control Panel.
3. Select iMISFind and click Add/Remove.
4. Run the setup program for iMISFind.
5. A message box indicates “Copying Files, please stand by.”

6. A message box displays that welcomes you to the iMISFind Installation program and recommends that you close any applications you are running before proceeding.
7. Click OK. If you do have other programs open, click Exit Setup, close any open applications and resume the setup.
8. A message displays telling you that you can begin the installation by clicking the button below. The installation program prompts you to place the iMISFind program in the default location, C:\Program Files\iMISFind\, or to select another destination folder.
1. Click the Change Directory button to specify that the iMISFind program be installed in the EXPOCAD\Program directory.
2. Browse to the EXPOCAD\Program directory, double-click the destination directory and click OK.
3. To begin the installation, click the button that has the computer graphic on it.
4. A message displays telling you that setup will add items to the group shown in the Program Group box. Click Continue to create the iMISFind group. The install process begins copying the files.
5. When the message appears telling you that the iMIS Find Setup was completed successfully, click OK.

   Note: The St6unst.log file is created as part of the installation process. This file is located in the same directory as the iMISFind.exe. Do not modify or delete this file. The St6unst.log file contains information about the installation, and it is used to automatically remove all application components when you remove the program through Start> Settings> Control Panel> Add/Remove Programs.

ODBC setup for the iMISFind application

The ODBC setup for iMIS can be used as the ODBC for the iMISFind application.

Creating an ODBC for FoxPro

An ODBC must be set up to use the Microsoft Visual FoxPro driver, which is required to retrieve records from the ExpoCadExp file. The ExpoCadExp file stores the EXPOCAD

activity records, which are then available for import (Expo> EXPOCAD Import).

To set up a FoxPro ODBC

1. Click Start> Settings> Control Panel, and select Data Sources (ODBC) to open the ODBC Data Source Administrator window.
2. Click the System DSN tab.
3. Click the Add button. The Create New Data Source window opens.
4. In the list of drivers shown, highlight Microsoft Visual FoxPro Driver and click Finish. The ODBC Visual FoxPro Setup window opens.
5. Enter a Data Source Name and Description.
6. Check the Free Table directory option. This specifies the data source you want to connect to the directory for free tables (.dbf).
7. Enter or browse to the Path to the directory where you have your EXPOCAD\Company file folder. This path will be used by iMIS to find the ExpoCadExp file, which will be created in the Company folder of EXPOCAD.
8. Click Options to view additional ODBC setup options:
9. Select Machine from the Collating sequence drop-down list. The following options are ODBC defaults. Do not disable the defaults.

- Null – allows an insert on a null value
- Deleted – prevents deleted records from being retrieved. This option should remain enabled because the FoxPro database does not physically remove deleted records from the database until a Pack command is run. Disabling this option will cause deleted records to be retrieved.
- Fetch data in background – determines whether records can be retrieved in the background (progressive fetching)

10. Click OK on the ODBC Visual FoxPro Setup window:

- If the path for your EXPOCAD\Company folder is incorrect, a message displays telling you that you have an invalid free table directory specification.

11. Verify the path and click OK.

- If the path for your EXPOCAD\Company folder is correct, click OK on the ODBC Data Source Administrator window.

Setting up iMISFind for use with EXPOCAD

You must specify a Data Source Name in the Local Preference window of the iMISFind application before you run the iMISFind application. The Data Source Name is the same one used for iMIS.

To determine the data source name used with iMIS

1. Click Start and select Settings> Control Panel.
2. Double-click Data Sources (ODBC).
3. Click the System DSN tab.

   The data source name is shown in the Name column.

To specify the data source in iMISFind

1. Open the iMISFind application (Start> Programs> iMISFind).
2. Click Cancel when the Logon window opens.
3. Select Logon> Set Host Location. The Local Preference window opens.
4. Enter the Data Source Name.
5. Click OK.
6. Select Logon> Logon to Host to log on to iMISFind.

Setting up iMIS for use with EXPOCAD

There is an additional license key for EXPOCAD in iMIS. You must have both the Exposition Management System license key and the EXPOCAD license key to use the

EXPOCAD interface. Without the EXPOCAD license key, EXPOCAD buttons are hidden and graphic features cannot be seen or used. In addition to adding the EXPOCAD license key, you must do the following:

- Set the iMIS authorization levels
- Select the booth measurement option
- Define the EXPOCAD local setup

To set iMIS authorization levels

The following authorization levels must be set in iMIS before you can use EXPOCAD:

1. Log on to iMIS as MANAGER.
2. From System Setup, select Security administration > Users.
3. Find a Full or Casual user and open their user record.
4. Set the following authorization levels:

- To allow the user to have access to both the EXPOCAD Local Setup menu item (Expo> EXPOCAD Local Setup) and the EXPOCAD Import menu item (Expo> EXPOCAD Import), the user must have an Expo Mgmt authorization level of 4 or higher.
- To allow the user to have access to the Delete button on the EXPOCAD Import window, the user must have an Expo Mgmt authorization level of 8 or higher.
- To allow the user to have access to the iMISFind application, the user must have a Members and Expo Mgmt authorization level of 1 or higher. When a user with an unauthorized level tries to use the utility a message displays telling the user the level of authorization needed to access that feature and to contact your system administrator to obtain the necessary authorization.

  Note: EXPOCAD security is independent of iMIS Security.

5. Click Save.

To select the booth measurement option

With the addition of EXPOCAD, booth pricing can be calculated in one of two ways: quantity or area.

Calculating by Quantity calculates booth pricing based on the quantity of booths ordered that are of the dimension defined in the booth product code. The booth price is multiplied by the quantity ordered to calculate the total price. This is the way Exposition has worked in the past, and is the default setting for this option.

EXPOCAD defines all booth products by total square units. The Area (Square Units) option allows iMIS to calculate pricing in this manner as well.

> **Note:** Note: This is a System Setup option and not exposition-specific; therefore, booth pricing for all expositions will be calculated using either Quantity or Area.

> **Note:** Note: Do not change these options while an exposition is in progress. When this option is changed, it will affect orders entered from that point on. Changing this option will not update or change previous orders.

1. Select Expo> System Setup to open the Expo System Setup window.
2. Click Expocad. The ExpoCad System Options window opens.
3. Click Edit on the palette.
4. Enable the measurement option that iMIS will use to calculate orders.

- Quantity (default) – When this option is selected, iMIS will prompt you to enter the required booth product code dimensions. Booth price is determined by the number (quantity) of booths of the defined dimension multiplied by the product fee. The product fee is setup as the total fee for that booth. For example, a booth is defined in iMIS with dimensions of 10’ x 10’ for a cost of $1,000. An exhibitor rents two booths in EXPOCAD, which exports as 200 square units. 200 square units (coming from EXPOCAD) divided by 100 square units (dimensions in iMIS) equal a quantity of 2. The quantity is multiplied by the product fee of $1,000 for a total cost of $2,000.

- Area (Square Units) – iMIS-defined booth dimensions do not apply to the calculation. The price of the booth is a per square unit price. For example, a booth is defined in iMIS with a cost of $10 per square unit. An exhibitor rents two standard (100 square units each) booths in EXPOCAD, which exports as 200 square units. 200 square units (coming from EXPOCAD) multiplied by $10 (price per square unit in iMIS) equals a total cost of $2,000.

5. Click OK.
6. Click X to close the window.

To define the EXPOCAD local setup

1. Select Expo> EXPOCAD Local Setup to display the ExpoCad Local Setup window.
2. Click Edit on the palette.
3. Click Browse to locate the path to the EXPOCAD\expocad.dll file (C:\EXPOCAD\-program). This path enables the Send ID to EXPOCAD button to find the expocad.dll so that it can send the Exhibitor ID to the EXPOCAD event list.
4. Click OK to select the path to Expocad.dll.
5. Enter the EXPOCAD ODBC Data Source that was created using the Microsoft FoxPro driver. This enables iMIS to log into the ExpoCadExp file.
6. Click OK.
7. Click X to close the window.

Exporting Exhibitor Records into EXPOCAD

Exhibitor records can be exported from iMIS into EXPOCAD without an exposition in iMIS being defined, with one exception. If you export prospects, the exposition and the pro-spect list need to be defined in iMIS before the export can occur.

To successfully export exhibitor records from iMISFind to the EXPOCAD Exhibitor List (database):

- Both iMISFind and EXPOCAD must be open
- An EXPOCAD event must be open

Opening the Event in EXPOCAD

Before you can export records from iMIS into EXPOCAD, you must open the EXPOCAD event that will use the exported records.

To open the EXPOCAD event

1. To open the event, click Start> Programs> EXPOCAD.
2. Select File> Open to open the EXPOCAD – File Open window.
3. Select an event. The name appears in the File Name field.
4. Click OK to display a message telling you how many other users are on show, and the current user number.
5. Click OK. The EXPOCAD Tool Box and floor plan opens.
6. Close the EXPOCAD Tool Box.

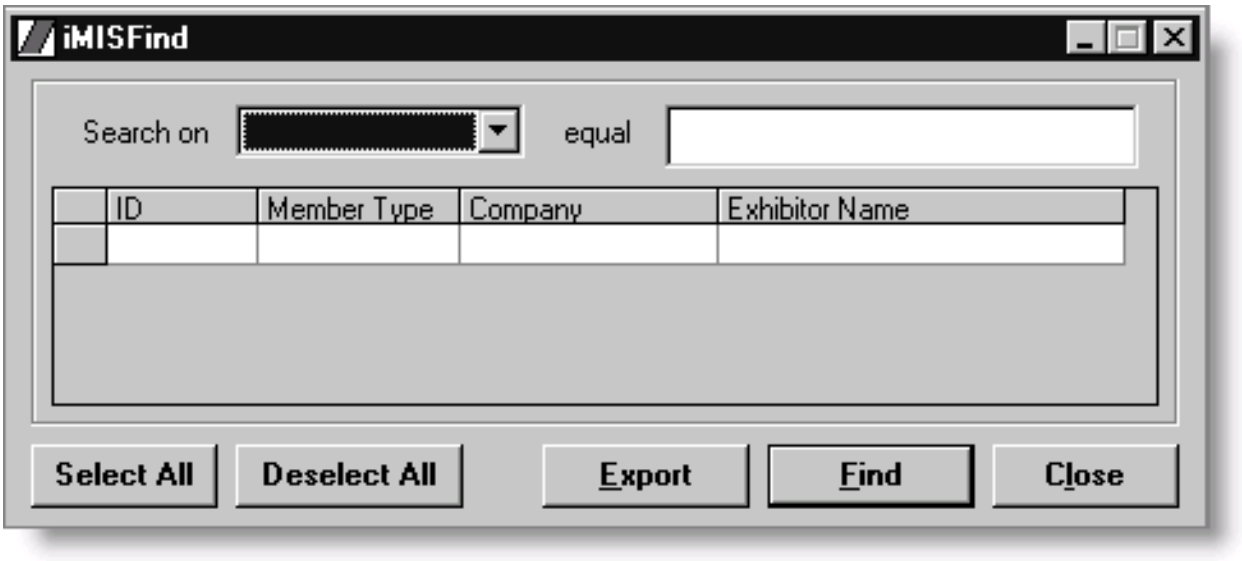
   Note: When exporting records with iMISFind, the Master Exhibitor List is populated with new records. Upon creating the event, if the Master Exhibitor List field was left blank, the Event Exhibitor List field was populated. If both fields were left blank, a default database was created and stored in the Event Exhibitor List when the window was closed.
7. (optional) Select Event> Information to open the EXPOCAD – Event Information window.

- You can click the Event Exhibitor List button to locate the database files. Use this procedure if you are choosing an alternative database for your event.
- Click OK to accept the event information.

Using iMISFind to Retrieve iMIS Records

The iMISFind application is a Visual Basic executable file that allows users to log on to the iMIS database, and retrieve records to import into the EXPOCAD Exhibitor Database.

iMISFind window



Start> Programs> iMISFind

Search on

This is a drop-down list of search options.

Exhibitor Id – Searches on Name.ID

Name – Searches on Name.LAST_FIRST

Company/Institute – Searches on Name.COMPANY_SORT

Prospect on Event – Searches on Activity Type = 'EX-PRO' and exposition code equal to that of the event selected

Member Type – Searches on Name.MEMBER_TYPE

equal

You can enter a search qualifier, for example, if you Search on by Name or Company, you can enter an alphabetic character and the system returns a list of all the last names in database that begin with that character.

Display area

This is where the information found displays

Select All button

Highlights to select all the information in the list display area

Deselect All button

Deselects all the information highlighted

Export button

Exports the selected records into the Exhibitor List in EXPOCAD

Find button

Searches the iMIS database for records that meet the search criteria

Close button

Closes the iMISFind window

The following fields are exported from iMIS into EXPOCAD

Name.ID	Exhibitor #
Name.Member_Type	Group
Name.COMPANY or Name.FULL_NAME	Name
Name.COMPANY or Name.FULL_NAME	Displayed on Drawing

iMISFind menu commands

- File> Exit – closes the iMISFind Application
- Edit> Cut – deletes the value in equal field
- Edit>Copy – copies the value in equal field
- Edit>Paste – pastes a copied value into equal field

- iMIS Find – Opens the iMISFind window – reopens the window once the Close button has been clicked
- Administrator> Pack ExpoCadExp – allows you to physically remove the deleted records from the database.

  You must have exclusive access to the file as well as an Exposition Management authorization level of 8 or higher in order to run this option. It is recommended that an administrator occasionally run this option to remove the deleted records from the ExpoCadExp file. This will prevent the ExpoCadExp file from getting too large.

To export iMIS records into EXPOCAD

1. To open iMISFind, click Start> Programs> iMISFind.
2. Log on to iMISFind.
3. Select a find option from the Search on drop-down list.
4. Enter a value in the equal field to assist with the system find. For example, if you select Prospect on Event as a find option, enter the exposition codes to find prospect exhibitors for that exposition.
5. Click Find. The records that match the search criteria display in the window.
6. To select records to be exported,

1. Highlight one record,
2. Press Ctrl and click on each record to select, or
3. Click Select All to select all records, as shown in the following window.
4. Click Export. When the export is complete, a message displays telling you that the export is successful.

   Note:

- If a company record contains a carriage return in iMIS, it is exported into EXPOCAD with a space.

- Records retrieved from the Name.COMPANY and Name.FULL_NAME tables are truncated to 50 characters when exported into EXPOCAD.
- Any exhibitor information exported to EXPOCAD should not be edited in EXPOCAD. Records should be edited in iMIS. After a record is edited, you can use iMISFind or click Send ID to EXPOCAD to export the updated record to EXPOCAD.

8. Click OK. Close the iMISFind application.
9. (optional) Close the EXPOCAD application.

Importing EXPOCAD Booth Data into iMIS

Booth information is stored as event activities in the ExpoCadExp.dbf file, which is imported into iMIS. You can view the records to be imported by running the ExpoCadExp Crystal report. The report prints all records in the ExpoCadExp.dbf file that have not yet been processed. In order for the event activities to import into iMIS, an exposition with the same name as the event must be set up in iMIS.

Importing Booth Information into iMIS

Make sure you have defined an iMIS exposition with the same name as the EXPOCAD event. If a corresponding exposition is not defined in iMIS, the event activities will be deleted from the ExpoCadExp.dbf file after importing the EXPOCAD records.

Booth information from EXPOCAD is imported into iMIS by using the EXPOCAD Import window.

To import booth information into iMIS

The steps below assume that batch control is enabled in iMIS.

1. From iMIS, select Expo> Reports.
2. Select EXPOCAD from the Report Types area.
3. Select ExpoCadExp from the Available Reports area.
4. Select your report destination to screen and click Run to display the report.
5. After you have reviewed the report, select Expo> EXPOCAD Import.

Note: If Batch Control is disabled, you will be prompted to create a batch.

6. The EXPOCAD Import window opens.
7. Click Import.

- If the import is in use by another user, a message displays telling you to try again when that import is complete. Click OK to close the message.

8. A system message displays Processing Order… Stand by. When the process is complete, a message displays telling you that the import is complete.
9. Click OK to display the Import Error List.

- If all EXPOCAD activities were imported, the Import Error List is blank.
- If errors occurred, they will display in the Import Error List.

To print the Import Error List

You can print the Import Error List one of two ways:

- To print all errors on the list, click Select All and click Print.
- To print selected errors on the list, press Ctrl and select the error or errors.

> **Note:** Note: The Import Error List (Expo_EXPOCADError.rpt) cannot be printed to the Print Manager (File> Print Manager).

To fix an error on the Import Error List

If any EXPOCAD activity did not import, the Import Error List displays one line for each activity that was not imported. A description of the error displays next to the record.

The following table provides a list of the error descriptions with a solution to fix the error. Once you fix the error, rerun the EXPOCAD Import. The activities will import and then be removed from the Import Error List.

Name ID not found	Membership> Enter/Edit Member, verify that ID exists

Exposition Status is not Active	Expo> Define/Plan Exposition, double-click exposition, Status must be A
Last First Name and Company name are both blank	Membership> Enter/Edit Member, find member ID. Record must have a Last Name or First Name or Company Name
Product Mapping does not exist (Each Booth Type will be specified at the start of the error message)	Expo> Define/Plan Exposition, double-click exposition, click More and select EXPOCAD Product Mapping and add the product mappings for the Booth Type(s) that are missing
Booth Dimension is not entered (Each Booth Type will be specified at the start of the error message)	Expo> Define/Plan Exposition, double-click exposition, select booth product, click Edit. Booth Length and/or Booth Width are missing
Product Pricing does not exist	Expo> Define/Plan Exposition, double-click exposition, select booth product, click Edit, click More and select Fees. Product Fees are missing
Booth has not been rented	Rent a booth in EXPOCAD. Delete the Product Mapping in iMIS. Run the import from EXPOCAD to iMIS. Error report will show that Product Mapping does not exist. Delete the error from the list. Un-rent the booth in EXPOCAD. Add the Product Mapping in iMIS. Run the import from EXPOCAD to iMIS.
Booth has been rented	Rent a booth in EXPOCAD. Run the import from EXPOCAD to iMIS. Delete the Product Mapping in iMIS. Un-rent the booth in EXPOCAD. Run the import from EXPOCAD to iMIS. Delete the error from the list. Add the Product Mapping in iMIS. Rent the booth again in EXPOCAD. Run the import from EXPOCAD to iMIS.

Previous transaction failed	Indicates that an initial transaction has failed. The initial transactions will have one of the above Error Descriptions. If one transaction for a booth fails, any additional transaction belonging to that booth will also fail.
Unable to find exhibitor ID for current booth	Indicates that data has been altered.
Unable to find booth type	Indicates that data has been altered.
Order does not exist	Indicates that data has been altered.

To delete a record from the Import Error List

To delete a record from the list, select the record and click Delete. This button is disabled if you do not have an iMIS Expo Mgmt authorization level of 8.

> **Note:** Note: Deleting a record from the Import Error List will be rare. For example, a booth was rented in EXPOCAD to an exhibitor that was manually added through EXPOCAD and assigned an ID of 899. ID 899 does not exist in iMIS, and the error description "Name ID not found" has displayed on the Import Error List. In order to fix this error, you would add ID 899 to iMIS or un-rent the booth in EXPOCAD and then rerun the EXPOCAD Import. If you were to un-rent the booth, two activity records for ID 899 would display, one for the rented booth and one for the un-rented booth. These records would need to be deleted from the Import Error List.

1. Select line items and click the Delete button. A message displays asking if you're sure you want to continue with the deletion.
2. Click Yes to delete the selected line.
3. Click Close.

Reviewing the iMIS and EXPOCAD Fields

There are several differences in the fields that are used for an iMIS exposition and EXPOCAD exposition. The field differences are shown with examples.

Order_Lines

In an iMIS exposition, Order_Lines for each booth number are maintained. In an EXPOCAD exposition, Order_Lines for each product are maintained.

Example: Order_Lines for an iMIS Exposition for booths 101 and 102

Order_Number	Line_Number	Quantity_Ordered	Lot_Serial	Booth_Numbers
1	1	2		101,102
1	1.01	1	101	101,102
1	1.02	1	102	101,102

Example: Order_Lines for an EXPOCAD Exposition for booths 101 and 102 (when 101 and 102 are the same product code) with AREA system setup

Order_Number	Line_Number	Quantity_Ordered	Booth_Numbers
1	1	200	101,102

Example: Order_Lines for an EXPOCAD Exposition for booth 103 and the corresponding Premium product

Order_Number	Product_Code	Location	Booth_Numbers
2	HIST00/BOOTH		103
2	HIST00/CORNER	EXPOCAD	

Exhb_Booth

In an EXPOCAD exposition, Exhb_Booth.Booth_Units will reflect the quantity ordered:

Example: Exhb_Booth for an iMIS Exposition for booths 101 and 102

Exhb_ID	Meet_ID	Booth_Number	Booth_Units
124	HIST00	101	1
124	HIST00	102	1

Example: Exhb_Booth for an EXPOCAD Exposition for booths 101 and 102 with QUANTITY system setup

Exhb_ID	Meet_ID	Booth_Number	Booth_Units
124	HIST00	101	1
124	HIST00	102	1

Example: Exhb_Booth for an EXPOCAD Exposition for booths 101 (200 Sq Units) and 102 (100 Sq Units) with AREA system setup

Exhb_ID	Meet_ID	Booth_Number	Booth_Units
124	HIST00	101	200
124	HIST00	102	100

Defining an Exposition (Event) in iMIS

An exposition is categorized as either an iMIS or and EXPOCAD exposition. An exposition with an iMIS category will not use the EXPOCAD program. An exposition with an EXPOCAD category will enable the EXPOCAD Product Mapping option, allowing booth selection and assignments to occur in EXPOCAD, while maintaining billing and prospecting capabilities in iMIS.

To define an EXPOCAD exposition, you will do the following:

- Create an exposition with an EXPOCAD category
- Define exposition products and pricing
- Define product mapping

Defining an EXPOCAD Exposition (Event) in iMIS

When you define an exposition in iMIS, the Exposition Category selected determines whether the exposition is an iMIS exposition or an EXPOCAD exposition. You will define an exposition with an iMIS or EXPOCAD category in the Exposition Definition window.

iMIS features disabled when defining an EXPOCAD exposition

When you define an EXPOCAD exposition, the following occurs in iMIS:

- Product conflict checking is disabled. Products can still be set up as conflicting, but the checking is disabled. (Select Expo> Table Maintenance> Exhibited Product Maintenance, select a product, click Conflict List)
- Company conflict checking is disabled. Companies can still be set up as conflicting, but the checking is disabled. (Select Expo> Order Processing, find exposition, find exhibitor, click More, select Company Conflicts)
- Booth preferences are disabled. (Select Expo> Order Processing, click Insert, select exposition with a P status, insert exhibitor, double-click a booth product)
- Booth Waitlist is grayed out. (Select Expo> Order Processing, find exposition, find exhibitor, click More, select Booth Waitlist)
- Booth Proximity is grayed out. (Select Expo> Define/Plan Exposition, double-click exposition, click More, select Booth Proximity)
- Link is disabled. (Select Expo> Define/Plan Exposition, double-click exposition, select product code, click Edit, click More)
- Booth button in the Exposition Product Detail window has been removed. (Select Expo> Define/Plan Exposition, double-click on exposition, highlight booth product, click Edit)
- Max. Available field in the Exposition Product Detail window has been removed. (Select Expo> Define/Plan Exposition, double-click on exposition, highlight booth product, click Edit)
- Reserve Booth button in the Expo Sales window has been removed. (Select Expo> Prospect Management/Sales, choose exposition, highlight prospect, click Exhibitor Sales)

- Exposition code will not appear on the Booth Preference Management Expo drop-down list. (Select Expo> Booth Preference Mgmt, click Expo drop-down list)
- Exposition code will not show in the Exposition Search window on the Wait List Processing screen. (Select Expo> Wait List Processing, click Find Exposition)
- The Transfer/Substitution feature for an Exposition registration issues a system message indicating that Transfer/Substitution is not allowed for an Exposition that is EXPOCAD category. (Select Expo> Order Processing, find exposition, find exhibitor, click Transfer/Substitution button)

To define an EXPOCAD exposition (event) in iMIS

1. In iMIS, select Expo> Define/Plan Exposition to open the Available Expositions window.
2. Click Insert in the palette to open the Exposition Definition window.

   Note: Expositions can also be created with the clone function. EXPOCAD expositions that are cloned will include EXPOCAD Product Mapping.
3. Enter information in the following fields:

- Exposition code
- Title
- Begin Date
- End Date
- Status
- Early Cutoff (optional)
- Reg Cutoff (optional)

4. Enable the EXPOCAD option for the Exposition Category.
5. Click OK.

Note: Defining an EXPOCAD exposition in iMIS will not automatically create an event in EXPOCAD.

To change an exposition category

The exposition category can be updated from iMIS to EXPOCAD, or from EXPOCAD to iMIS as long as orders have not been entered for the exposition. After orders have been entered, the category may not be updated.

1. Select Expo> Define/Plan Exposition to open the Available Expositions window.
2. Double-click the exposition you want to change. The Exposition Definition window opens.
3. Click the Edit button on the palette.
4. Enable the appropriate Exposition Category.

   Note: If you change the category from iMIS to EXPOCAD and there is booth inventory or a wait list, a message warns that changing Exposition Category from iMIS to EXPOCAD will result in deletion of existing Booth Inventory and Wait Lists for the current Exposition, and asks whether you wish to proceed. Click Yes or No.
5. Click OK.

   Changing an Exposition Category from iMIS to EXPOCAD will result in the following system changes for the selected exposition:

- Deletes Booth Inventory (Product_Lot records for current exposition)
- Deletes Wait List (Exhb_Wait_List records for current exposition)
- Deletes Booth Preferences (Exhb_Booth records for current exposition)
- Sets Max. Available Booth to zero (Product_Function.MAXIMUM_ATTENDANCE)

Changing an Exposition Category from EXPOCAD to iMIS will result in the following system change for the selected exposition:

- Deletes all EXPOCAD Product Mapping (ExpoCad_Prod records for current exhibition)

Defining Exposition Products and Pricing

At this point, you have created an iMIS exposition and defined it as EXPOCAD event. You have also created the EXPOCAD floor plan (graphical layout). You will now add products and fees to the iMIS exposition. These products will reflect the booths set up in EXPOCAD, as well as any additional products needed for the exposition.

To define booth products and pricing

The booth product and booth pricing you enter will depend on whether you selected Quantity or Area (Square Units) as the measurement to use with your orders (Expo> System Setup, ExpoCad button). For example, if you selected Quantity as the measurement, and you had a booth defined as 10' x 10' with a fee of $2,000.00. The total cost charged for renting three booths would be $6,000.00.

1. Open the Exposition Definition window (select Expo> Define/Plan Exposition, double-click exposition).
2. Click Insert in the window. The Exposition Product Detail window opens.
3. Enter a unique Product Code (for example, BOOTH).
4. Enter a Title of up to 60 alphanumeric characters (for example, 10 x 10 Booth).
5. (optional) Enter a Product Description (for example, 10 x 10 Booth).
6. The data entered in the Booth Length and Booth Width fields are dependent on the measurement selected in the ExpoCad System Options window (Expo> System Setup, ExpoCad button). If the measurement used for orders is based on:

- Quantity, enter the Booth Length and Booth Width. If you omit the booth length and booth width, a system message indicating that this is required will display.
- Area (Square Units), leave the Booth Length and Booth Width blank.

7. Enable the Booth option to designate the type of product.
8. Click More and select Fees. The Exposition Booth & Product Fees window opens.

9. The fees entered for a Booth type product are dependent on the measurement selected in the ExpoCad System Options window (Expo> System Setup, ExpoCad button). If the measurement used for orders is based on:

- Quantity, enter the price per booth. In the following example, we set the rate for a 10' x 10' booth for a member to $2,000.00 (early registration), $2,500.00 (regular registration), and $3,000.00 (late registration).
- Area (Square Units), enter the price per square unit. In the following example, we set the rate for a 100 square unit booth to 20.00 per square unit (members early registration). The total cost for a 100 square unit booth would be calculated by multiplying 20 by 100 square units for a total cost of $2,000.00).

10. Click OK.
11. Click X to close the Exposition Booth & Product Fees window.
12. Click X to close the Exposition Product Detail window.
13. Repeat the process to enter additional products.

To define other products and pricing

Products other than booth products are defined with a type of Other or Paid Pass. For example, a registration fee may be defined with a type of Other.

Products with a type of Other or Paid Pass can also be used in the EXPOCAD Product Mapping window as Premiums. For example, you could set up one iMIS booth product code that is the base booth and fee, the set up additional charges with a type of Other to be used as Premium codes.

1. Open the Exposition Definition window (select Expo> Define/Plan Exposition, double-click exposition).
2. Click Insert in the window. The Exposition Product Detail window opens.
3. Enter a unique Product Code (for example, CORNERFEE).
4. Enter a Title of up to 60 alphanumeric characters (for example, Corner Fee).

5. (optional) Enter a Product Description (for example, Additional fee for corner booth).
6. Enable the Paid Pass, or Other option to designate the type of product.

   Note: Products that are going to be used as Premium products on the EXPOCAD Product Mapping window must be enabled as Other or Paid Pass.

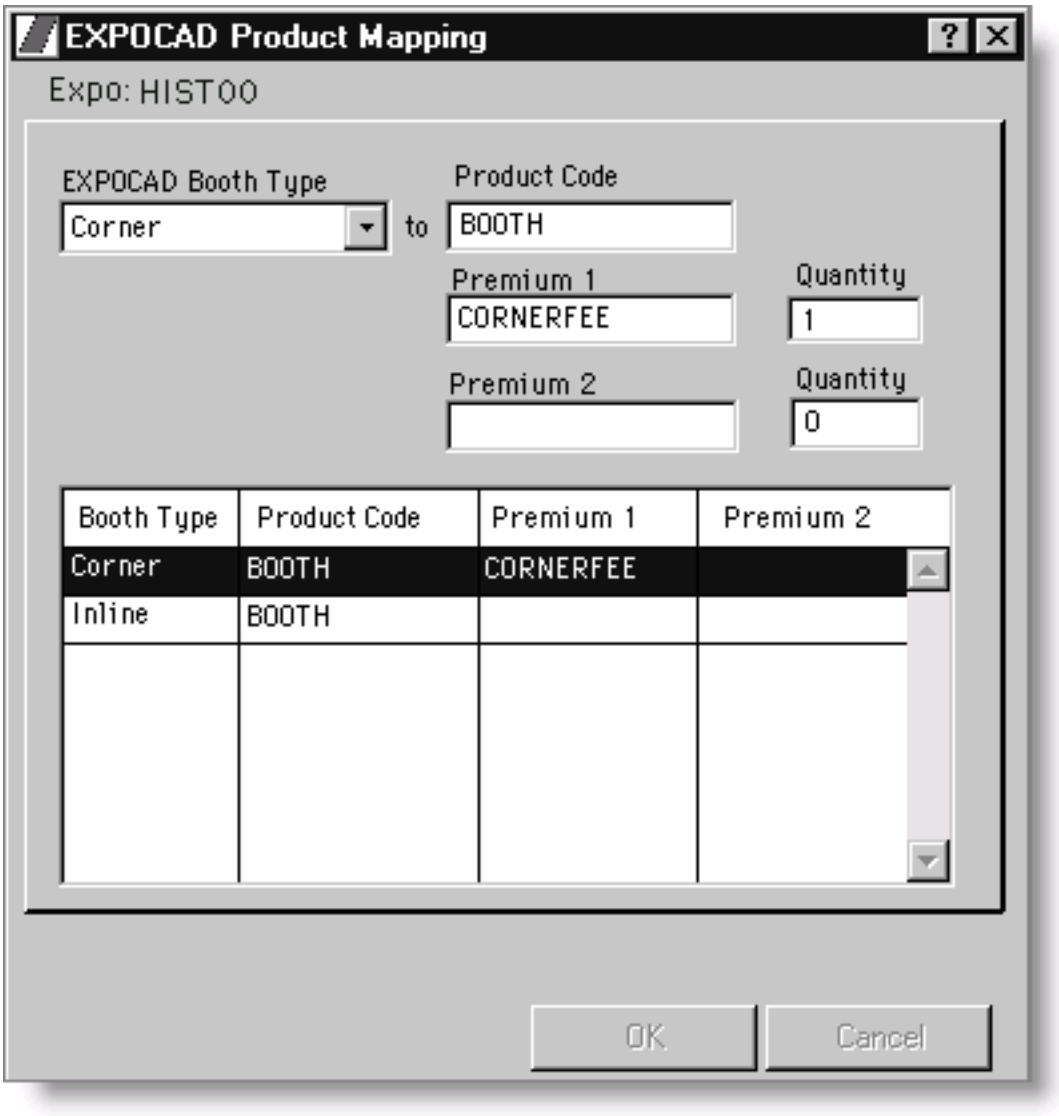
   Note: Once Paid Pass or Other is selected, the Booth Width and Booth Length fields are disabled.
7. Click More and select Fees.
8. The fees entered for a Paid Pass or Other type product use pricing based on Quantity, regardless of the measurement selected in the ExpoCad System Options window (Expo> System Setup, ExpoCad button). In the following example, we set the rate for a corner booth fee to $1000.00 (regular default registration)
9. Click OK.
10. Click X to close the Exposition Booth & Product Fees window.
11. Click X to close the Exposition Product Detail window.
12. Repeat the process to enter additional products.

Defining Product Mapping

The booth information in EXPOCAD must be mapped to an iMIS exposition booth product code. The mapping is done in the EXPOCAD Product Mapping window. Each EXPOCAD Booth Type can be mapped to one booth product code and up to two premium codes.

For example, you may want to set up one iMIS booth product code for each EXPOCAD Booth Type, so there is a one-to-one correlation. In this case, you may or may not use the Premium codes. Or, you could set up one iMIS booth product code that is the basic booth and fee, then set up additional charges with a type of Other to be used as Premium codes.

After the product mapping has been set up and exposition orders have been added, do not edit the product mapping. EXPOCAD uses this setup for renting and un-renting booths.



Expo> Define/Plan Exposition, double-click an exposition, click More, EXPOCAD Product Mapping

EXPOCAD Booth Type

A drop-down list of Booth Types used in EXPOCAD

- Custom – Non-rectangular booths
- These booths have only an area dimension. They do not have horizontal and vertical dimensions.
- Island – A single, rectangular booth
- This booth has 4 open corners.
- Inline – A booth with no open corners
- Corner – A booth with one open corner
- Peninsula – Anything not covered above
- The end of a single row is considered a peninsula, not a corner, since it has two open corners.
- Aisle Booth – Booth space that is rented, but no actual booth is present. For example, if your floor plan does not have room to configure an island, you may want to rent 2 booths at the end of a single row and eliminate the inline booth, leaving an aisle between the peninsula booth (or end) and the rest of the row.

  Product Code

- List of iMIS product codes identified as Booth that have Booth Length and Booth Width entered in the Exposition Product Detail window for this exposition when Expo> System Setup, ExpoCad is set to Quantity
- List of iMIS product codes identified as Booth entered in the Exposition Product Detail window for this exposition when Expo> System Setup, ExpoCad is set to Area (Square Units)

  Premium 1

  This field shows a list of product codes identified as Other or Paid Pass in the Exposition Product Detail window for this exposition. If you have only one basic booth product code in iMIS, you can specify a Premium code to further identify the booth. For example, you might have a basic booth, but charge an additional fee for a corner. In the Exposition

Product Detail window, the corner product code would have the Other option enabled, and you would choose it as a Premium product code. Each product can have up to two premiums.

Quantity

This is the number of Premium 1 products to associate with this EXPOCAD Booth Type and Product Code. This is a required field if the Premium1 field is used.

Premium 2

This field shows a list of product codes identified as Other or Paid Pass in the Exposition Product Detail window for this exposition. If you have only one basic booth product code in iMIS, you can specify a Premium code to further identify the booth. For example, you might have a basic booth but charge an additional fee for a corner. In the Exposition Product Detail window, the corner product code would have the Other option enabled, and you would choose it as a Premium product code. Each product can have up to two Premiums.

Quantity

This is the number of Premium 2 products to associate with this EXPOCAD Booth Type and Product Code. This is a required field if the Premium 2 field is used.

Booth Type

Displays the mapped Booth Types available for this exposition (event)

Product Code

Displays the booth product codes that are mapped to Booth Types for this exposition (event)

Premium1

Displays the ‘Other’ or ‘Paid Pass’ product codes that are mapped to booth product codes for this exposition

Premium2

Displays the ‘Other’ or ‘Paid Pass’ product codes that are mapped to booth product codes for this exposition

To define product mapping

Product mapping allows you to map EXPOCAD Booth Types to iMIS booth products.

1. Open the Exposition Definition window (select Expo> Define/Plan Exposition, double-click exposition).
2. Click More in the Exposition Definition window and select EXPOCAD Product Mapping to open the EXPOCAD Product Mapping window.
3. Click Insert on the palette.
4. Select an EXPOCAD Booth Type from the drop-down list.
5. Press Ctrl+ L on the keyboard to open the list of available booth Product Codes.
6. Double-click the booth product code for the EXPOCAD Booth Type.
7. (optional) Press Ctrl+L on the keyboard to open the list of available Other and Paid Pass Product Codes in the Premium 1 field.

1. Double-click the Premium product for the EXPOCAD Booth Type and iMIS Product Code.
2. Enter a quantity for Premium 1. Press Tab
3. (optional) Press Ctrl+L on the keyboard to open the list of available Other and Paid Pass Product Codes in the Premium 2 field.

1. Double-click the Premium product for the EXPOCAD Booth Type and iMIS Product Code.
2. Enter a quantity for Premium 2.
3. Click OK.
4. Repeat the process to map all EXPOCAD Booth Types to iMIS booth products.

Note: Once the booth product mapping has been set up and orders have been placed, the mapping should not be changed. Changing the mapping after an order is placed may cause the un-rent booth process to take out a quantity from an incorrect product code.

Creating Activities in EXPOCAD

As activities are created in EXPOCAD, the ExpoCadExp.dbf file is updated. The following processes are reported when the ExpoCadExp file is updated:

- Rent Booth
- Un-rent Booth
- Booth Num Change
- Booth Class Change for Aisle Class

Renting Booths in EXPOCAD

Renting booths in EXPOCAD updates the ExpoCadExp.dbf file. This file is located in the same folder as the Master Exhibitor and/or Event Exhibitor dbf file. The file is updated as follows:

- COUNT_VAL field is equal to the last UNIQUEID field
- ORIG_BOOTH field holds the booth number
- BOOTH_SIZE is the total booth area
- BOOTH_TYPE is the type of booth rented
- EXHB_ID is the Exhibitor ID
- EVENT_NAME is the name of the Event in EXPOCAD and the name of the Exposition in iMIS
- PROC_DESC displays Rent Booth
- INSERT_DAT is the date and time that the booth was rented in EXPOCAD

Note: It is not recommended that the Booth Type be changed after a booth has been rented. The booth type is the key to product mapping in iMIS. If you change the Booth Type in EXPOCAD, the ExpoCadExp.dbf will not be updated.

Note: Do not select File> Event Copy after a booth has been rented, as this will prevent an activity record from being inserted in the ExpoCadExp.dbf file for the new event.

To rent booths

The booth number needs to be selected in order to rent a booth. For more detailed instructions, see the EXPOCAD User's Guide.

1. Open the EXPOCAD event (select File> Open File, highlight the event and click OK).
2. Click OK on the system message. Close the EXPOCAD Tool Box.
3. Select the booth number for the booth you are going to rent.
4. Select Booth> Rent Booth. The EXPOCAD – Rent Booth window opens. The company names from the Event Exhibitor List file displays. The booth number selected displays in the title bar.
5. Highlight the company that will be renting the booth.
6. Click the OK to Rent button. The EXPOCAD Rent Booth window closes and the company name selected displays with the booth number on the floor plan.
7. Repeat the process to rent additional booths.
8. Select File> Close to close the event.

Un-renting Booths in EXPOCAD

When you un-rent booths, the EXPOCADEXP.dbf file is updated with the following:

- COUNT_VAL field is equal to the last UNIQUEID field
- ORIG_BOOTH field holds the booth number
- BOOTH_SIZE is the total booth area
- BOOTH_TYPE is deleted
- EXHB_ID is deleted

- EVENT_NAME is the name of the Event in EXPOCAD and the name of the EXPOSITION in iMIS
- PROC_DESC displays Un-rent Booth
- INSERT_DAT is the date and time that the booth was un-rented in EXPOCAD

To un-rent booths

The booth number needs to be selected in order to un-rent a booth. For more detailed instructions, see the EXPOCAD User's Guide.

1. Open the EXPOCAD event (select File> Open File, highlight the event and click OK).
2. Click OK on the system message. Close the EXPOCAD Tool Box.
3. Select the booth number for the booth you are going to un-rent.
4. Select Booth> Unrent Booth. The company name is deleted from the booth.
5. Repeat the process to un-rent additional booths.
6. Select File> Close to close the event.

Changing the Booth Number in EXPOCAD

As booth numbers are changed, the EXPOCADEXP.dbf file is updated with the following:

- COUNT_VAL field is equal to the last UNIQUEID field
- UNIQUEID field increments by one
- ORIG_BOOTH field holds the original booth number
- NEW_BOOTH field holds the new booth number
- BOOTH_SIZE is the total booth area
- BOOTH_TYPE holds the Booth Type
- EXHB_ID holds the Exhibitor ID

- EVENT_NAME is the name of the Event in EXPOCAD and the name of the EXPOSITION in iMIS
- PROC_DESC displays Booth Number Change
- INSERT_DAT is the date and time that the booth number was changed in EXPOCAD

To change a booth number

The booth number needs to be selected in order to change the number. For detailed instructions, see the EXPOCAD User's Guide.

1. Open the EXPOCAD event (select File> Open File, highlight the event and click OK).
2. Click OK on the system message. Close the EXPOCAD Tool Box.
3. Select the booth number you want to change.
4. Select Booth> Change Booth Number to display the EXPOCAD – Change Booth Number window.
5. Enter the new booth number in the to field.
6. Click OK.
7. Repeat the process to change additional booth numbers.
8. Select File> Close to close the event.

Changing the Booth Class in EXPOCAD

As booth class for the Aisle booth are changed, the EXPOCADEXP.dbf file is updated with the following:

- COUNT_VAL field is equal to the last UNIQUEID field
- UNIQUEID field increments by one
- ORIG_BOOTH field holds the original booth number
- BOOTH_SIZE is the total booth area.
- BOOTH_TYPE holds the new Booth Type

- EXHB_ID holds the Exhibitor ID
- EVENT_NAME is the name of the Event in EXPOCAD and the name of the EXPOSITION in iMIS
- PROC_DESC displays Booth Class Change
- INSERT_DAT is the date and time that the booth number was changed in EXPOCAD

To change the booth class

The booth number needs to be selected in order to change the class. For more detailed instructions, see the EXPOCAD User's Guide.

1. Open the EXPOCAD event (select File> Open File, highlight the event, and click OK).
2. Click OK on the system message. Close the EXPOCAD Tool Box.
3. Select the booth number for which you want to change the booth class.
4. Select Booth> Booth Class. The EXPOCAD – Set Booth Class window opens.
5. Click the appropriate button to select the new booth class.
6. Repeat the process to set additional booth classes.
7. Select File> Close to close the event.

EXPOCAD Expositions in iMIS

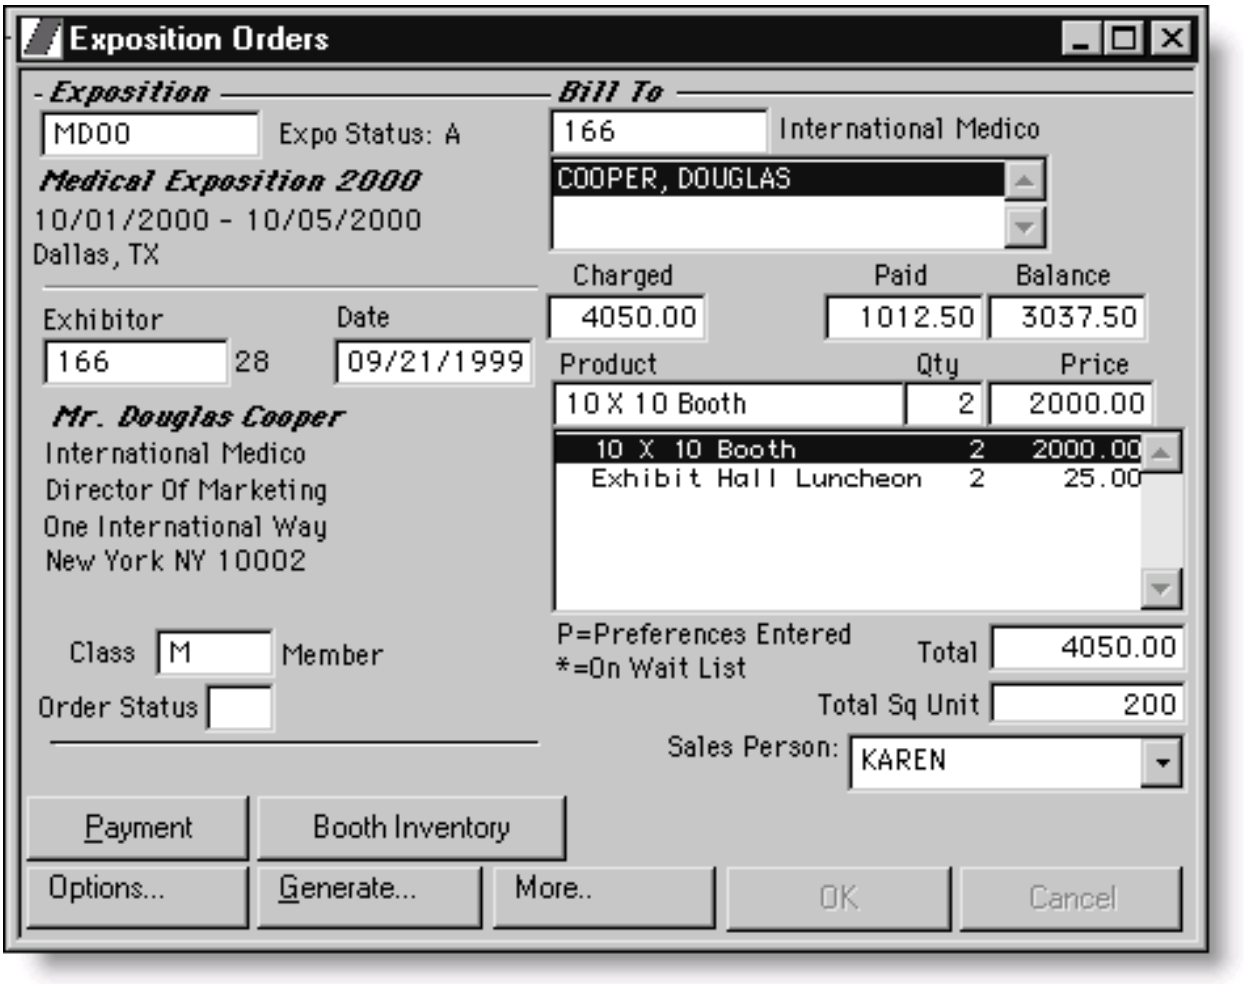
Once the booth information has been imported into iMIS, the order can be viewed in iMIS. An order can also be processed in iMIS first, the ID sent to EXPOCAD, and then a booth rented in EXPOCAD. You can also:

- Edit an EXPOCAD order
- Cancel an EXPOCAD order
- Close an EXPOCAD exposition

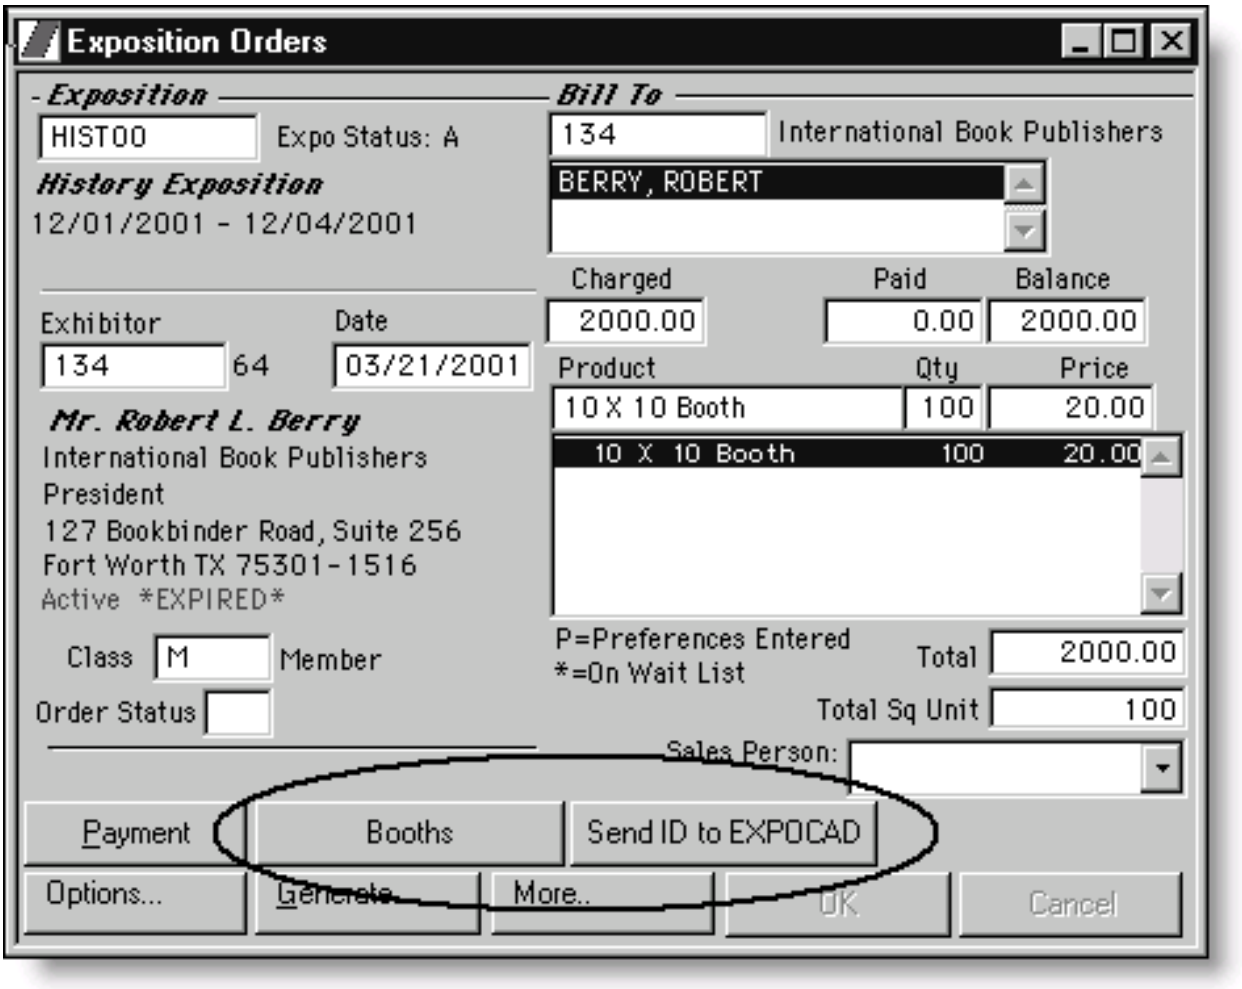
Reviewing changes in the Exposition Orders Window

If you are inserting a new EXPOCAD order or viewing an existing EXPOCAD order, the Exposition Orders window will show the following changes:

- In place of a Booth Inventory button, there is a Booths button.
- There is a Send ID to EXPOCAD button, which allows you to send the current Exhibitor ID to the EXPOCAD Exhibitor database. When this button is clicked, iMIS uses the EXPOCAD Application Path that was set in the ExpoCad Local Setup window (Expo> EXPOCAD Local Setup) to find the expocad.dll. The expocad.dll will then update the Exhibitor database with the Name.ID and Name.COMPANY_SORT or Name.FULL_ NAME for the exhibitor.



Sample Exposition Orders window for an iMIS category exposition order



Sample Exposition Orders window for an EXPOCAD category exposition order

Processing an EXPOCAD Order in iMIS

Exposition orders can be initiated in iMIS with the Exhibitor ID, Member Type, and Company or Full Name exported to EXPOCAD using the Send ID to EXPOCAD button.

To enter an EXPOCAD order

1. Select Expo> Order Processing to open the Exposition Orders window.
2. Click Insert on the palette.
3. Enter the Exposition Code and Tab to the Exhibitor field or press Tab three times to select an exposition.

4. Enter the Exhibitor Id or press Ctrl+L to find an exhibitor's record in the database. The exhibitor's name and address information displays. If the exhibitor is not in the Member database, press Tab in the Exhibitor Id field to open the Name/Address Info window and add a record.
5. (optional) Enter the Date. The date defaults to the batch date if batch control is used; otherwise, the date defaults to the system date.
6. (optional) Override the Class code if necessary.

   Note: The following are three scenarios for defining Exhibitor Classes:

- Let the Exhibitor Classes default to the M = Member or NM = Non-Member Types in the Member Types Table in Customer Management. Here, all exhibitors are either a Member or Non-Member based on their member record.
- Map Member Types to Exhibitor Classes. Here, you map all or only key Member Types (such as M = Member, NM = Non-Member, and CM = Company Member).
- Define your own Exhibitor Classes without using Member Types. Here, you must override the M = Member and/or NM = Non-Member status at order entry, entering the appropriate Exhibitor Class.

7. Enter the Bill To information if it is different than the name and address that displays in the window, or press Ctrl+L and select a value.
8. (optional) Override the Bill To Address information, if necessary.
9. To continue the order, select from one of the following options:

- If the order will consist of booth products only, click OK to update the order. The Product and Qty will be imported from EXPOCAD.
- If the order will consist of non-booth products as well as booth products, for example, a main registration:

10. Double-click the product and enter a quantity in the Qty field.
11. Click OK.

12. Click Send ID to EXPOCAD.
    - If the event is set up in EXPOCAD, but EXPOCAD is not running, a message displays asking if you would like to start EXPOCAD now. Click Yes.
    - If the event is not set up in EXPOCAD, a message displays telling you that the Exhibitor ID could not be sent to EXPOCAD because the matching Event could not be found in EXPOCAD. Click OK. The event will need to be set up in EXPOCAD.
13. In EXPOCAD, select File> Open to open the event you are registering for in iMIS.
14. In the EXPOCAD – File Open window, highlight the event and click OK. Click OK on the system message. The event is now open in EXPOCAD.
15. In iMIS, click OK when you see a message asking you to please click the Send ID to EXPOCAD button again to send the Exhibitor ID.
16. In iMIS, click Send ID to EXPOCAD. A message displays telling you that the specific Exhibitor ID number has been sent to EXPOCAD.
17. You can now assign booths to this exhibitor in EXPOCAD. See Renting Booths in EXPOCAD.

Viewing an EXPOCAD Order

To view an EXPOCAD order

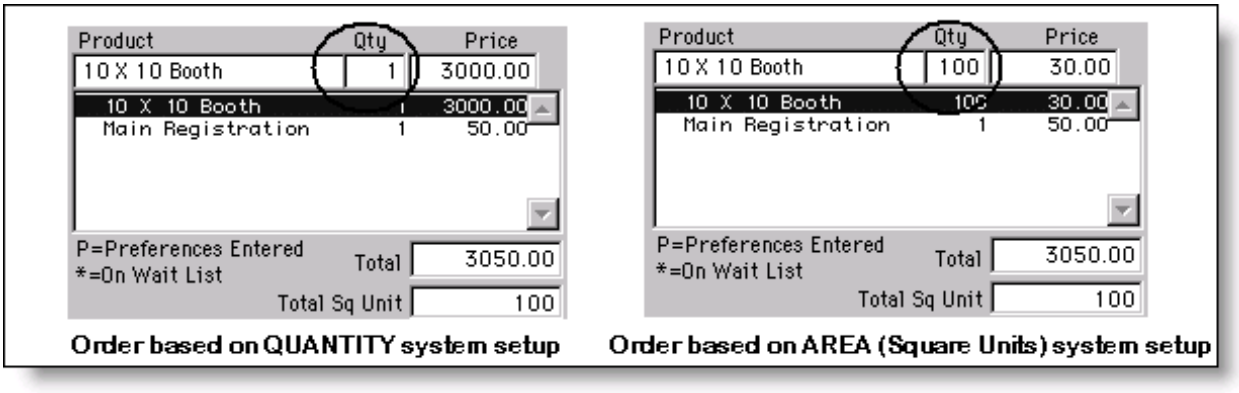
1. Select Expo> Order Processing to open the Exposition Orders window.
2. Click Find on the palette.
3. Enter Exposition code or press Tab three times to open the Expo Find window, select the exposition, and click OK.
4. Enter the Exhibitor ID or press Tab three times to search for the exhibitor.
5. The Qty field will differ depending on the booth measurement option selected in the iMIS system setup.

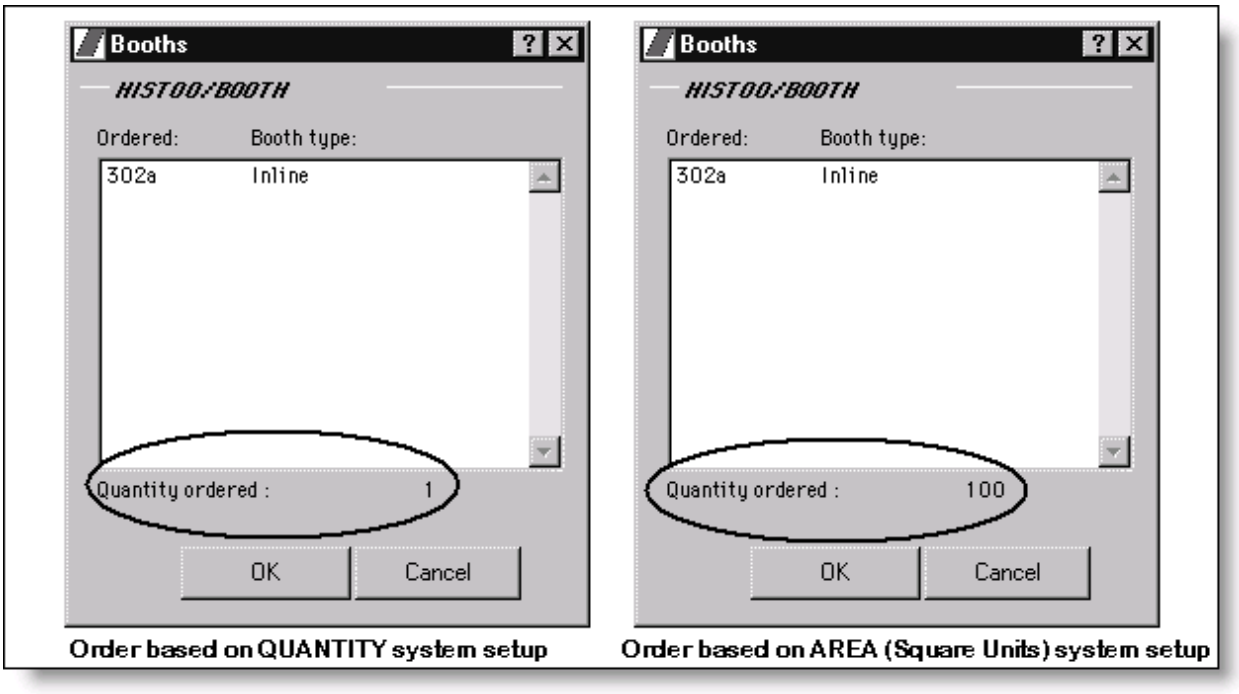
- If booths are based on Quantity, the Qty field represents the total square units in EXPOCAD divided by the total dimensions in iMIS. For example, if the square units in EXPOCAD are defined as 100 and the total dimensions in iMIS are 100 (10 x 10), then the quantity would be 1 (100¸100).
- If booths are based on Area (Square Units), the Qty field represents the total area of booth spaced rented in EXPOCAD.

6. Click Booths to view the booth number and booth type per order line.
7. The Quantity Ordered field will differ depending on the booth measurement option selected in the iMIS system setup. This window is for viewing purposes only. Only product codes that were defined as a Booth will display booth numbers.

- If booths are based on Quantity, the Qty field represents the total square units in EXPOCAD divided by the total dimensions in iMIS. For example, if the square units in EXPOCAD are defined as 1000 and the total dimensions in iMIS are 100 (10 x 10), then the quantity would be 1 (100¸100).
- If booths are based on Area (Square Units), the Quantity Ordered field reflects the total area for this booth.

8. Click OK to close the Booths window.





Viewing EXPOCAD Booth Changes

Use the Booth Change History window to view a history of all booth changes related to a particular exhibitor. Each transaction/change in EXPOCAD creates four Booth History records: Booth Number Change, Booth Units Change, Booth Dimension Change, and Booth Type Change. Booth Type Change has been added for EXPOCAD expositions. The Date shown is the date the booth activity took place in EXPOCAD, not the date of the import.

To view EXPOCAD booth changes

1. Select Expo> Exhibitor Information, click Find Exposition, double-click an exposition, and double-click an exhibitor to open the Exhibitor Information window.
2. Click More and select Booth Changes to open the Booth Change History window.

- If booths are based on Quantity, the Booth Units Change line item (in the Change List box) represents the total square units in EXPOCAD divided by the total dimensions in iMIS. For example, if the square units in EXPOCAD are defined as 1000 and the total dimensions in iMIS are 100 (10 x 10), then the quantity would be 1 (100¸100).

- If booths are based on Area (Square Units), the Booth Units Change line item (in the Change List box) reflects the total square units.

3. Click an item in the Change List to see a description of any booth changes, as well as who made the changes in the Description area in the bottom of the window.
4. Click Close to return to the Exhibitor Information window.

Editing an EXPOCAD Order in iMIS

After an EXPOCAD order is imported into iMIS, the Product and Qty fields for a booth product cannot be edited in iMIS. Changes in booths or booth quantity must be made in EXPOCAD, and then imported into iMIS through the ExpoCadExp file.

Products designated as “Other” or “Paid Pass” (products not rented through EXPOCAD) can be edited within iMIS.

All other information on the order, such as Payment Schedule and Address information is maintained and edited in iMIS.

In addition, a Transfer/Substitution is not allowed for an EXPOCAD exposition order. A message indicating that this is not allowed will display if you click the Transfer/Substitution button.

Canceling an EXPOCAD Order in iMIS

Before you can cancel an order in iMIS, you must unrent the booths in EXPOCAD. If you try to cancel an order in iMIS that has booths assigned, a message displays stating that you cannot cancel an EXPOCAD registration that has imported booths from EXPOCAD until you unrent the booths in EXPOCAD.

Closing an EXPOCAD Exposition in iMIS

Closing an EXPOCAD exposition in iMIS does not close the event in EXPOCAD. Closing an EXPOCAD exposition in iMIS deletes the Exhb_Booth records associated with the exposition.

- When you close an EXPOCAD exposition, a message displays stating that if you close this Exposition it will delete Order records and not close the matching Event in ExpoCad,

and asking if you wish to proceed.

- If you click Yes, another message displays stating that closing the current meeting will remove all meeting details and create history, and asking if you're sure you wish to purge that meeting.
- Click Yes or No.
- An EXPOCAD exposition cannot be closed if the End Date is greater than today's date. If that happens, a message stating that rule displays.

Expositions

Exposition Overview

Exposition Management helps you manage your day-to-day exposition activities by tracking all phases of the exposition process from initial floor plan requirements to the close of the exposition.

Exposition Management enables you to perform the following tasks effectively and efficiently:

- Enter, edit, and process exposition orders
- Find and track orders
- Manage exhibitor, exhibitor contact, company conflict, and service contractor information
- Assign and manage booths, booth preferences, and booth proximity
- Generate specific inquiries and reports
- Manage exposition-related forms, such as contracts and insurance documents
- Add new prospects and activity records
- Create and use sales scripts
- Define, clone, close, and cancel expositions
- Define exposition products
- View exposition rosters
- Define and configure the setup options used for customizing Exposition Management

iMIS Exposition Management System Capabilities

The following is an overview of the features of the Exposition Management module:

Exposition Definition and Planning

This setup area enables you to define specific exposition details, such as the following:

- Various booth products (sizes and types)
- Pricing schedules
- Other services, such as utilities, furniture, and carpet

Detailed Prospect List Maintenance

This component enables you to create prospect lists both from historical exhibitor files and specified additions of your own. Use this component to do the following:

- Scan through the special prospect working list as often as you want, inquiring about adding or updating records as you develop your marketing database
- Write notes to yourself with tickler follow-up dates
- Create mass mailings and generate mailing labels from the entire prospect list or any defined subset

Detailed Information Tracking

This feature enables you to track and review the short-term and long-term history of exhibitor booth and participation activity, including exhibits currently booked and past exhibits. In addition, all of the standard iMIS database features, including notes and custom demographics, and other tracking fields are available to the Exhibitor's Profile function. For example, Notes fields can store exhibitor products and service information.

Exposition Order Processing

The feature includes all aspects of signing up exhibitors, such as the following:

- Booking specific booths and booth materials for each exhibitor
- Registering booth personnel for tracking reports and producing badges
- Recording deposits and other ongoing payments as they are made
- Placing booths on hold for a specified period of time while waiting for contracts and deposits

> **Note:** Note: To authorize credit card payments for Events, Exhibition, Exposition, and Orders, enter them through Service Central > Enter and edit payments (if licensed for SERVCEN) or AR/Cash > Cash receipts (if licensed for CCAUTH).

Exposition Reporting

This feature includes many letters and reports, including the following:

- Status inquiries by exhibitor or by booth
- Inquiries and reports on booths sold and booths available
- Inquiries and reports on exhibitor orders, including booth numbers, fees, and payments made or due
- Badges
- Confirmations
- Invoices

iMIS Exposition Terminology

The following terms are used frequently in the Exposition Management module:

Badges

Name tags given to each attendee/exhibitor to wear at an exposition. Badges are usually formatted with the individual's nickname or first name, enlarged for readability, and include various identifying information: full name, title, company, city, state. Badges can be marked with a color-coded strip to differentiate groups of attendees, such as members, nonmembers, and exhibitors.

Booth Inventory

Total number of items that have been generated for a particular booth product. For example, the total number of 10' x 10's would be the booth inventory for that product.

Booth Preference Management

Strategy for selling booths where preferences are assigned to exhibitors based on priority points or a ranking system other than the first-come, first-served method. This is typically used by organizations that use the lottery method of assigning booths. With booth preferences, exhibitors can select their first, second, and third choices for booths and are assigned preferences based upon specific criteria, such as how long they have been exhibiting and the amount of space they purchase.

Classes (Exposition)

Categories or types of exhibitors (for example, member, non-member, and staff).

Company Conflicts

Strategy that lets you identify companies that are in conflict with other companies. For example, the companies may be exhibiting the same or similar products and do not want their booths in proximity. By defining proximity areas, you can ensure that these conflicting companies do not exhibit their products or services close to one another.

Exhibitor Products

Product(s) or service(s) that exhibitors show, demonstrate, and/or sell.

Exhibitor

Individual representing a company who exhibits the company's products or services at an exposition.

Exposition

Large event featuring many companies exhibiting products and services usually associated with one another by the industry they serve or by a similarity of the products and services they exhibit.

Exposition Products

Products that are sold by the exposition organizers to the exposition participants, usually called exhibitors. Exposition products are most commonly booths but also include passes and other products, such as sponsorships and advertisements.

Fees

Amounts charged to exhibitors for the various exposition products. Fees can be set by exposition classes/types and by when a product is purchased.

Linked Product

Associates a “primary” or parent product with a “child” or secondary product. When exhibitors order a primary (parent) product, iMIS automatically adds the linked “child” product to the order.

Mapping

Translates one value into another. For example, iMIS might translate (map) a virtual address into a physical address.

Order (Exposition)

Commitment by the exhibitor to participate in an exposition by purchasing booth space and possibly some other exposition products.

Product Conflicts

Strategy for ensuring that companies exhibiting similar products do not exhibit in the same area. Product conflicts are managed by defining proximity areas and only assigning booths to companies exhibiting certain products in those areas.

Prospect

Contact who is likely to participate in an upcoming exposition.

Proximity

You can identify and define proximity areas as a strategy for managing company and product conflicts. Proximity is defined by location relative to certain areas of the floor, such as the Food Court, or relative to location, such as the Southeast Quadrant. You also can use proximity to group similar vendors together on the floor, such as in the Technology Center or the Education area.

Reservations

Companies can reserve exposition products without making a payment or placing an order. Exposition products are reserved in the Reservation window where you can assign booth numbers and proximity area. Not all organizations allow companies to reserve exposition products.

Standard Report

Pre-set iMIS report formats including rosters, labels, and statistical reports. Most standard reports allow you to select which records you want, and most let you override the sort order. However, you may be limited to the amount of control you have over the format or layout of the report.

Upsell

Associates a product with another product as an upsell potential. For example, an exposition may offer other products, such as show directory ads, market research rooms, and sponsorship opportunities. Via such relating, salespeople can view the upsell options available when marketing a specific product.

Wait Listing

Strategy that allows an exhibitor to be placed on a waiting list to purchase an unavailable booth or other exposition product. Exhibitors placed on a wait list have the opportunity to buy the exposition product when it does become available due to an order cancellation or expansion of the floor plan.

Navigation for Exposition

The Exposition task list consists of the items that launch your Exposition Management windows.

Set up an exposition

Opens the Set up an exposition window to define, edit, and clone expositions.

Manage prospect lists

Opens the Manage prospect lists window to manage prospect lists and assign prospects to salespeople.

Process booth orders

Opens the Process booth orders window to record the sale of exposition products, including booths. You can edit, transfer, cancel, and reinstate exposition orders.

View exhibitor information

Opens the View exhibitor information window to search for an exposition and display a list of exhibitors. If you double-click on an exhibitor, the Exhibitor Information window opens, which enables you to view, enter, and edit exhibitor contacts, exhibited products, conflicts with other exhibitors, booth changes, and much more.

Manage wait lists

Opens the Manage wait lists window to record and maintain detailed records of wait-listed exhibitors.

Manage booth preferences

Opens the Manage booth preferences window, which lists all of the booth preferences requested by exhibiting companies for an exposition. You can accept, decline, convert, or delete booth preferences on this window.

Process EXPOCAD

(EXPOCAD only) Select to view the Process EXPOCAD sub-task list. You must be licensed for EXPOCAD for this item to display. See Using iMIS EXPOCAD Interface for additional information about the EXPOCAD module.

Set up EXPOCAD ODBC - Opens the Set up EXPOCAD ODBC window.

Import EXPOCAD - Opens the Import EXPOCAD window.

Generate reports

Opens the Generate reports window where you can select from a variety of standard reports including badges, confirmation letters, invoices, labels, products, rosters, status report, and transaction lists.

Set up tables

Select to display a sub-task list of the following set-up table options:

- Product master list - Opens the Set up product master list window.
- Forms master list - Opens the Set up forms master list window.
- Prospect list - Opens the Set up prospect list window.
- Sales scripts - Opens the Set up sales scripts window.
- Exhibitor classes - Opens the Set up exhibitor classes window.

Set up module

Opens the Exposition Set up module window to set up and customize your Exposition Management module.

Exposition Orders

Overview of exposition order processing

Processing an exposition order involves entering exhibitor information, selecting products to purchase, setting up payment schedules, making payments, and generating badges. Use the Process booth orders window to process orders.

Process booth orders window

From Exposition, select Process booth orders

Exposition

Enter the exposition's code name. Select the Find icon to look up valid exposition codes.

Exposition Information

Displays the exposition's name, dates, and location.

Expo Status

Displays the status of the exposition (A = active, P = Pending, or X = canceled).

Exhibitor

Enter the exhibitor's identification number. Select the Find icon to look up valid exhibitor identification numbers.

Exhibitor Information

Displays the exhibitor's full name, company, title, and address.

Order

Displays the order number.

Date

(Defaults to the current system date) The Date field can be overridden at order entry if you are not using batch control. If you are using batch control, the date defaults to the batch date.

Class

Enter the customer type. The field defaults to M = member or NM = nonmember. This can be overwritten to an exhibitor class as specified on the Set up exhibitor classes window.

Status

The status of the order if a cancellation or transfer has occurred displays in this field. (C = canceled or CT = canceled or transferred). If there has been no cancellation or transfer, the field is blank.

Bill To

Enter the customer identification number of the individual responsible for paying the fees associated with the order. The customer name and company also display.

Purchase Order

Enter a purchase order number or other reference number.

Charged

Displays the total amount charged for the current order.

Paid

Displays the amount paid to date toward the balance of the order.

Balance

Displays the total amount due for the current order.

Product

Select a product from the list of available exposition products.

Qty

Enter the number of products ordered.

Price

The cost of the selected exposition product displays in this field, which is editable. Product pricing is defined in the Exposition Booth & Product Fees window and may vary according to the date of the order and exhibitor class.

Total

Displays the total amount for the current order.

Total Sq Unit

Displays the total square units of booth products purchased by the exhibitor.

Sales Person

Select a salesperson from the drop-down list of available salespeople.

Payment button

Opens the Payments window for entering order payments.

Booth Inventory button

Opens the Booth Inventory Assignment window, which displays all available, sold, and reserved booths for the selected exposition.

Letter button

Opens the Letter Text window.

View Roster button

Opens the Expo Roster window to view all exposition exhibitors.

Options button

Click to display a drop-down list of additional functions:

- Address - Opens the Expo Registration - Name/Address window where you can add or edit exhibitor information.
- Payment Schedule - Opens the Payment Schedule window where you set up or adjust an existing payment schedule.
- Badges - Opens the Badges window where you insert, edit, or delete exhibitor badge information.
- Line Note - Opens the Expo Order Line Note window where you can enter a note about the product and/or the exhibitor.
- Ledger - Opens the Transaction Ledger window and display all accounting activity for the exhibitor.
- Other - Opens the Expo Registration - Other window used for entering additional registration information.

More button

Click to display a drop-down list of additional functions:

- Exhibited Products - Opens the Exhibitor Company Product Maintenance window used for designating exhibited products.
- Company Conflicts - Opens the Company Conflicts window used for determining the Conflicting Companies and Companies Not Conflicting.
- Booth Waitlist - Opens the Wait List Processing window used for processing exhibitors on wait lists.

Entering Exposition Orders

Exposition orders range from primary booth products to advertising inserts that display on the exposition program. Booth and other product sales are the primary activities associated with managing an exposition.

To enter an exposition order

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Click New.
3. Enter an Exposition product code (select the Find icon to look up an exposition).
4. Enter an Exhibitor ID (select the Find icon to look up an ID). The exhibitor's name and address information displays. If the exhibitor is not in the member database, press Tab in the Exhibitor Id field to open the Name/Address Info window and add a record.
5. (optional) Override the Date if necessary. The date defaults to the batch date if batch control is used; otherwise, the date defaults to the system date.
6. (optional) Override the Class code if necessary.
7. (optional) Enter a Bill To ID if it is other than the Exhibitor ID (select the Find icon to look up an ID), and override the Bill To Address information if necessary.
8. Enter a Purchase Order number.
9. Double-click exposition products to add them to the order:
   - Enter the order Qty.
   - (optional) Override the product Price if necessary.
10. Select a Sales Person.
11. Click Save.

Editing Exposition Orders

Managing expositions includes editing orders. For example, an exhibiting company may decide to change its order from a standard 10' x 10' booth to a 20' x 20' booth, add other products, or move a booth to a different location.

The iMIS automatic re-pricing feature is unique. When an order's registrant class or registration date is changed, the price for that particular registration changes respectively. For example, if early and regular cutoff dates are defined for the exposition, and the product being ordered has early, regular, and late fees defined, when the registration order date is updated, iMIS automatically re-prices the product based on the date and established fees.

To edit an exposition order

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Find the order (see Finding Exposition Orders).
3. Click Edit.
4. Make any necessary changes.
5. (optional) To add a product to an existing order, do the following:

- Select the product you want to add to the order.
- Enter the Qty.
- (optional) Override the Price if necessary.

6. (optional) To delete a product from an order, double-click the product.
7. Click Save. The Total price updates automatically.

Finding Exposition Orders

In the Exposition Management module, four ways are available for finding an order:

- From a list of all expositions
- Using the Expo Find window

- From a list of all exhibitors
- Using the Roster Search window

To find exposition orders from a list of all expositions

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Click Open or Find.
3. Tab three times. The Expo Find window opens.
4. Select the desired exposition from the list.
5. Click OK.
6. Enter the Exhibitor ID (select the Find icon to look up an ID).

To find exposition orders using the Expo Find window

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Click Open or Find.
3. Tab to display the Expo Find window.
4. Select from the list of Search Types.
5. Enter the search criteria in the Search field at the bottom of the window, and click OK. A list of expositions matching the criteria displays.
6. Select an exposition.
7. Click OK.
8. Enter the Exhibitor ID (select the Find icon to look up an ID).

To find exposition orders from a list of all exhibitors

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Click Find.
3. Enter the Exposition code, and Tab to the Exhibitor field.

4. Tab three times. The Roster Search for (Exposition Name) window opens.
5. Select an exhibitor from the list.
6. Click OK.

To find exposition orders using the Roster Search window

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Click Find.
3. Enter the Exposition code, and Tab to Exhibitor field.
4. Tab twice. The Roster Search for (Exposition code) window opens.
5. Select the Search Type.
6. Enter the search criteria in the All field at the bottom of the window, and click OK. A list of exhibitors matching the search criteria displays.
7. Select an exhibitor from the list, and click OK.

Canceling Exposition Orders

If you must cancel an order for which an exhibitor has already paid, all charges are reversed and the payment becomes an open credit in Accounts Receivable. When this happens, you can apply the money to other products, such as an order or a dues payment, or you may issue a refund through AR.

Within the Exposition Management module, the procedure for canceling an order is the same regardless of whether a payment has been received. If booths are assigned and the order is canceled, the booths become available for assignment to other orders.

When canceling an exhibitor's exposition order, consider the following:

- Are you canceling an order with no cancellation fees? If so, iMIS automatically reverses the charges.
- Are you charging a cancellation fee? If so, you should have defined a cancellation fee product when defining your products. (See Defining Product Fees).

To cancel an exposition order

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Find the order you want to cancel (see Finding Exposition Orders).
3. Click Delete. A message prompts you to verify canceling the order.
4. Click Yes. A “C”, indicating that the order was canceled, displays in the Status field.

To cancel an exposition order with a cancellation fee

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Find the order you want to cancel (see Finding Exposition Orders).
3. Click Delete. A message prompts you to verify canceling the order.
4. Click Yes.
5. Click Edit. A message prompts you to reverse the cancelled order.
6. Click Yes.
7. Select the Cancellation Fee product.
8. Enter a C in the order Status field.
9. Click Save.

> **Note:** Note: The cancellation fee must be the only product ordered, and the order's Status must be C. If the cancellation fee is not the only charge, iMIS reverses all other charges. The record is preserved until the exposition is closed, which allows you to reactivate it later during order processing. However, the exhibitor does not appear on reports unless you enable the Include Canceled option.

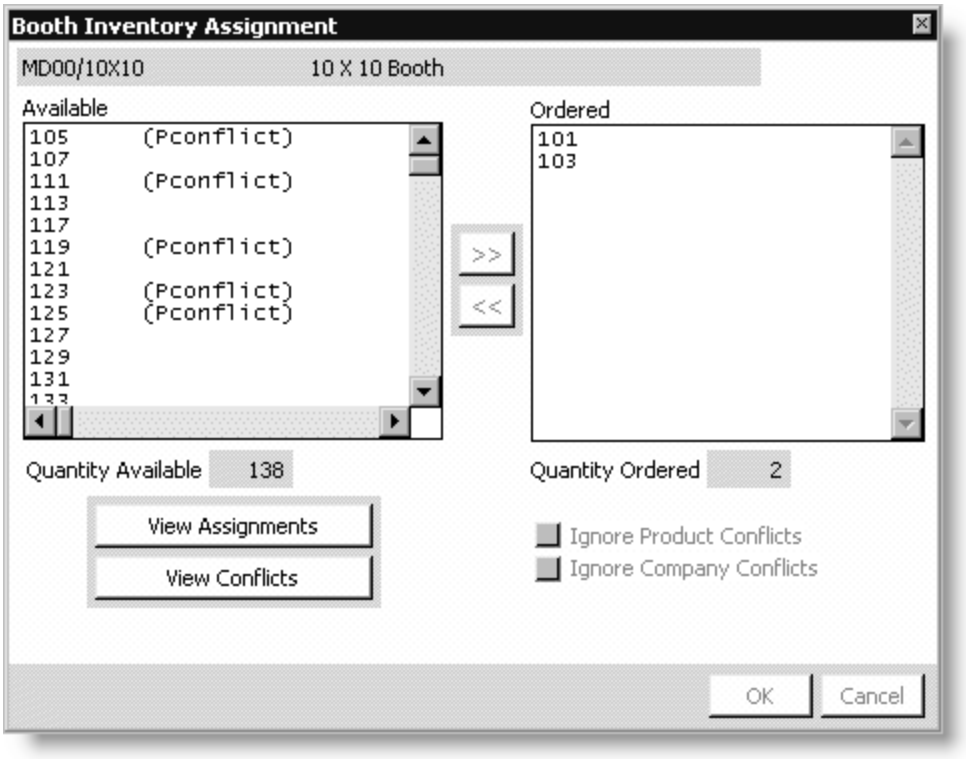
Assigning Booths

After you establish your floor layout and set up booth numbers, you can assign booths when you enter an order. This ensures that you maintain a current inventory of available

booths as well as assigned booths or products. To assign a booth to an order, the booth must be defined as a booth product (see Defining Exposition Products).

All booths are assigned through the Booth Inventory Assignment window.

Booth Inventory Assignment window



From Exposition, select Process booth orders, open an order, click Booth Inventory

Available

Lists all available booths for the booth product selected on the Process booth orders window. Reserved products and conflicting products display in this area if you enabled the Product Conflict Checking or Company Conflict Checking options for the exposition on the Expo Options window (from Exposition, select Set up an exposition, double-click an exposition, click More, and select Options).

Ordered

Lists the booths ordered by the exhibitor.

Quantity Available

Displays the total number of Available booths.

Quantity Ordered

Displays the total number of booths ordered by the exhibitor.

View Assignments button

Opens the Current Booth Assignments window, which lists all of the booths, booth numbers, and exhibitors associated with the booths.

View Conflicts button

Opens the Conflicting Booths/Products window. The button is disabled if no conflicts exist.

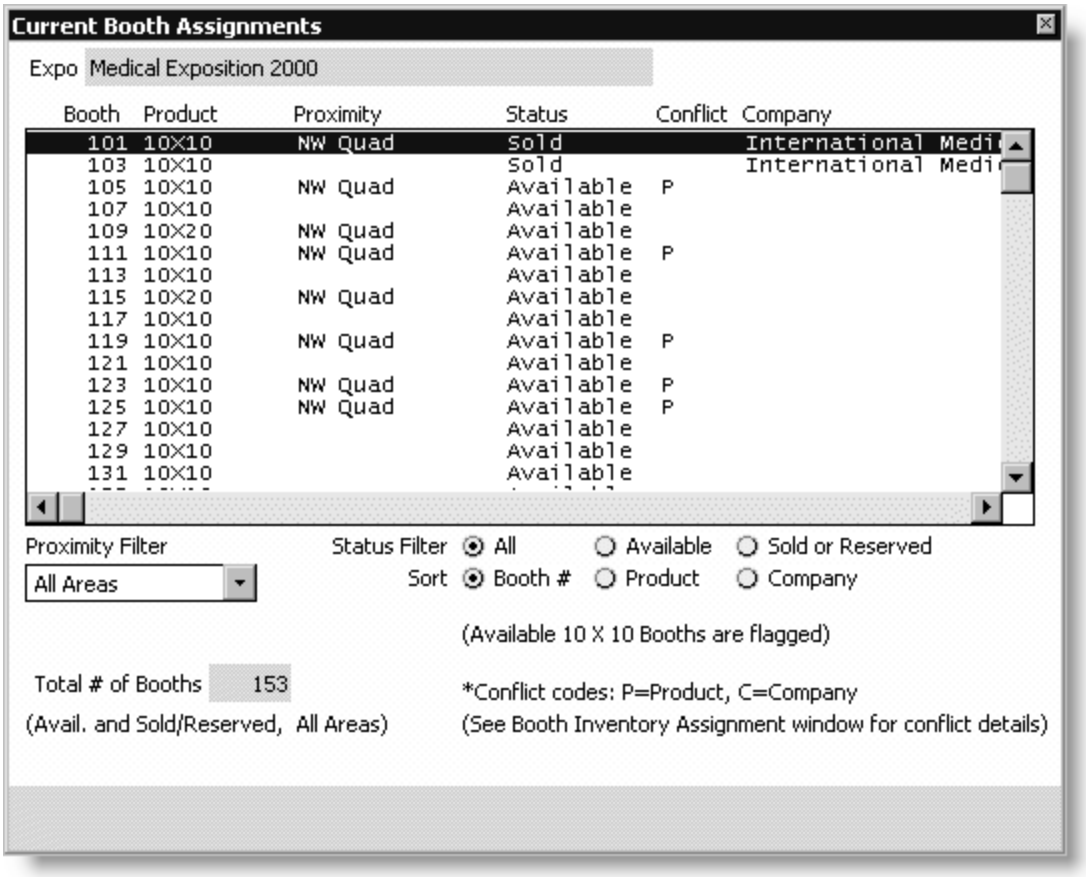
Ignore Product Conflicts

Enable to ignore and not display the order's conflicting products.

Ignore Company Conflict

Enable to ignore and not display the order's company conflicts.

Current Booth Assignments window



From Exposition, select Process booth orders, open an order, click Booth Inventory, and click View Assignments

Expo

Displays the name of the current exposition.

Booth

Displays the system-generated booth number.

Product

Displays the booth product type, such as booth, aisle, and corner.

Proximity

Displays the area on the exposition floor where the booth is located.

Status

Displays the status of the booth product (Available or Sold).

Conflict

Displays conflict information (C = company conflict or a P = product conflict).

Company

Displays the name of the exhibiting company that has purchased the booth product.

Proximity Filter

Select the booth area that you want to display.

Status Filter

Enable an option to display only booths with a status of All, Available, or Sold or Reserved.

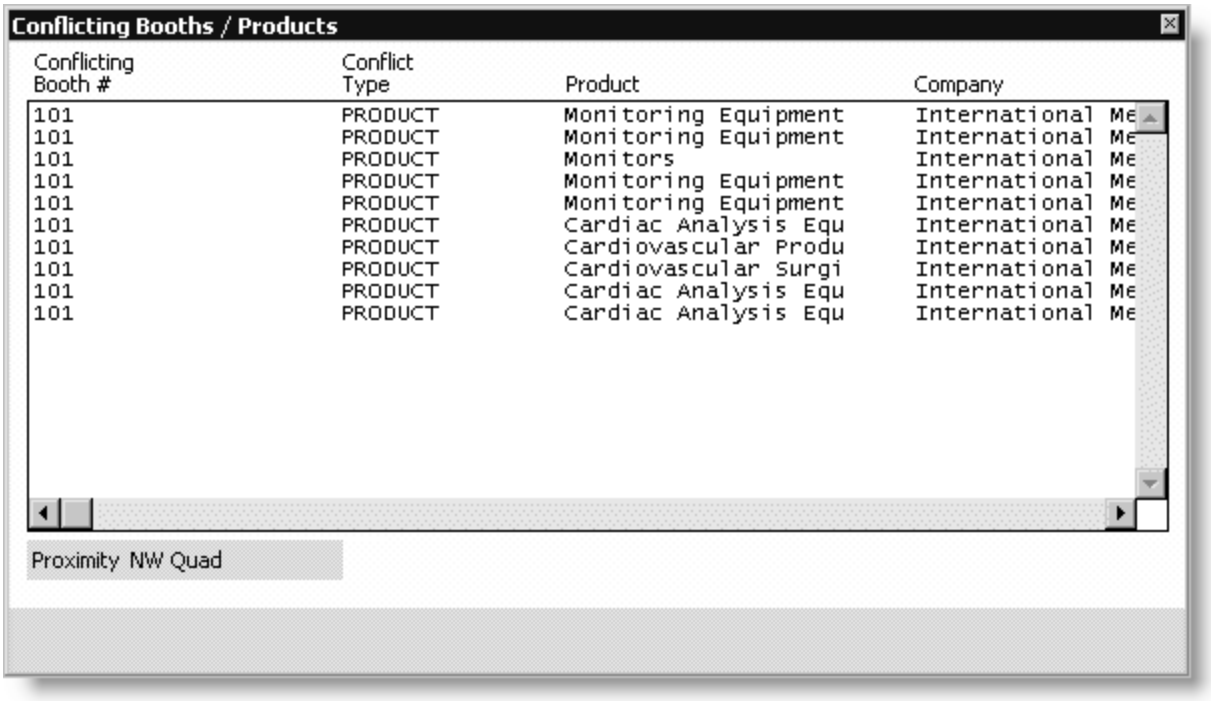
Sort

Enable the sort order for viewing booth assignments.

Total # of Booths

Displays the total number of booths.

Conflicting Booths/Products window



From Exposition, select Process booth orders, open an order, click Booth Inventory, and click View Assignments

Conflicting Booth #

Displays the booth number in conflict with the product selected on the Booth Inventory Assignment window.

Conflict Type

Displays the conflict type (C = company or P = product).

Product

Displays the product in conflict with the booth product selected on the Booth Inventory Assignment window.

Company

Displays the name of the company in conflict with the booth selected on the Booth Inventory Assignment window.

To assign a booth

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open an order (see Finding Exposition Orders).
3. Click Edit.
4. Select a Product.
5. Click Booth Inventory to open the Booth Inventory Assignment window.

   Note: If "(Pconflict) = product conflict" is listed beside a booth number, the booth has been assigned to an exhibitor with products that are in conflict. These products may be in conflict with the current exhibitor's products or with another company.
6. Double-click an Available booth (or click >>) to move the booth to the Ordered list. Repeat to assign more booths.
7. Click OK to return to the Process booth orders window.
8. Click Save.

Editing Address Information (Expo)

You can edit a registrant's name, title, company, and address information on the Expo Registration - Name/Address window. Updates on the Expo Registration - Name/Address window are specific to an exposition registration and do not update the information on the Manage customers window. If necessary, make sure to update the Manage customers window with the correct information.

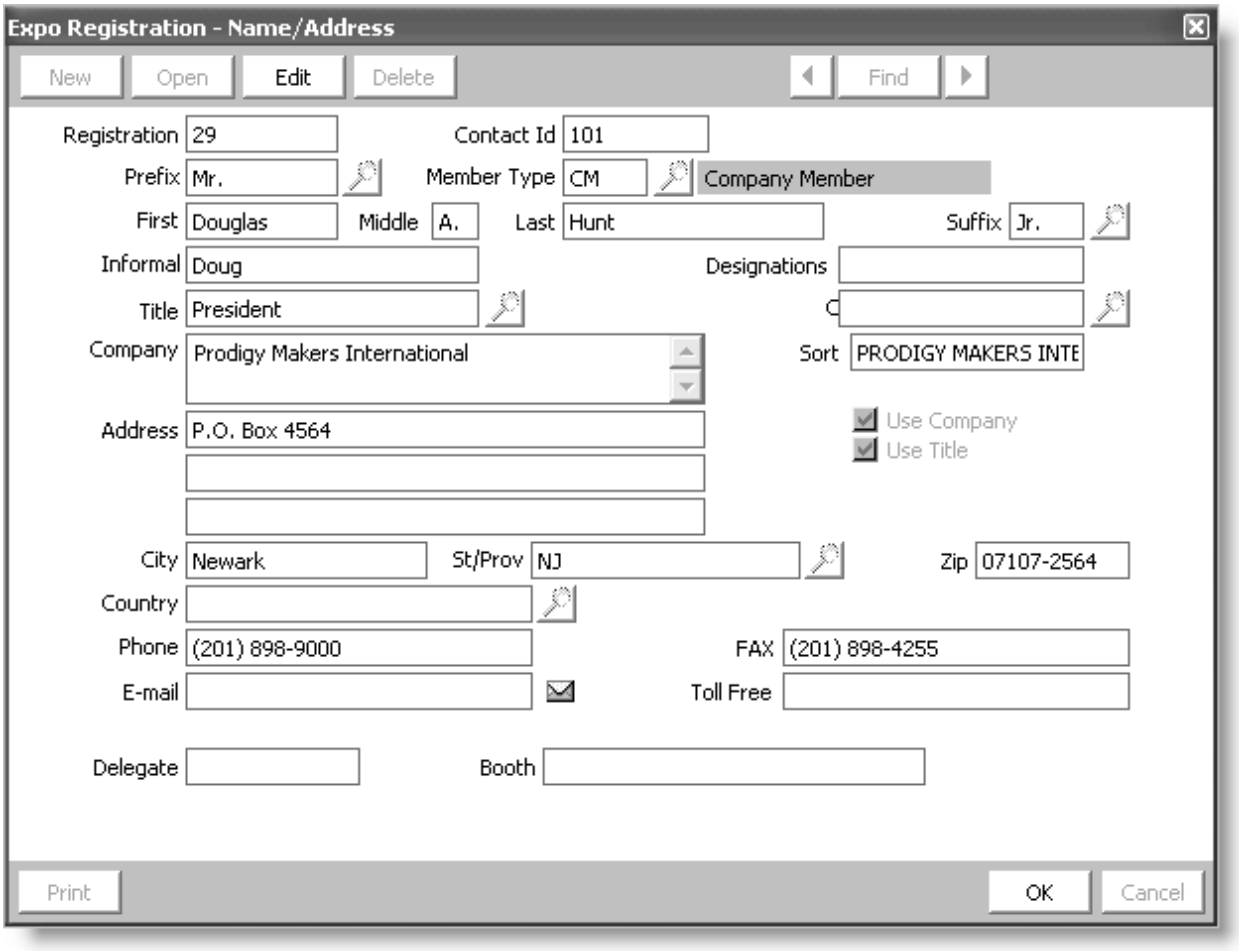
Information Flowdown to Open Expositions

Changes to name, title, company, and preferred mailing address information in Customer Portfolio flow down to open expositions when Update open meetings addresses with address changes is enabled on the Customer Setup - Advanced window.

Updates to name, title, company, and Preferred Mail address information on the Manage customers window will flow down to the Expo Registration - Name Address window if the information on each window is identical prior to the change.

If you designate a different Preferred Mail address on the Manage customers window, this change also will flow to the Expo Registration - Name Address window.

Expo Registration - Name/Address window



From Exposition, select Process booth orders, open an order, click Options, and select Address

Registration

Displays the registration number.

Contact Id

Displays the exhibitor's ID.

Prefix

Enter a prefix, such as Mr., Ms., and Mrs.

iMIS

Member Type

Select a customer type.

First

Enter a first name.

Middle

Enter a middle name.

Last

Enter a last name.

Suffix

Enter a suffix, such as Jr., Sr., or II.

Informal

Enter an informal name.

Designations

Enter a professional status, such as Ph.D. or MD.

Title

Enter a professional title, such as president or executive director.

Company Id

Enter a company ID.

Company

Enter a company name.

Sort

Enter the name by which you want to sort the company.

Use Company

Select to include the company name with the 'Ship to' address that prints on reports. The Use Company option does not apply to the 'Bill to' address; the 'Bill to' (preferred billing) address's Use Company option is defined on the Customer Setup - Address and Notes window.

You can configure iMIS to set the Use Company option automatically. For details, see Automatic Settings for “Use Company” and “Use Title” Options (see "Name Address window - "Use Company" and "Use Title").

Note: Note: The label for the Use Company option is customizable, so your system may display another label for this option. The value entered in the Institute Type field on the Customer Setup - Basic Options window defines the option's label.

Use Title

Select to include the registrant's title with the 'Ship to' address that prints on reports. The Use Title option does not apply to the 'Bill to' address; the 'Bill to' (preferred billing) address's Use Title option is defined on the Customer Setup - Address and Notes window.

You can configure iMIS to set the Use Title option automatically. For details, see Automatic Settings for “Use Company” and “Use Title” Options (see "Name Address window - "Use Company" and "Use Title"").

Address

Enter an address.

City

Enter a city.

St/Prov

Enter a state or province code.

Zip

Enter a postal zip code.

Country

Enter a country.

Phone

Enter a phone number.

Fax

Enter a fax number.

E-mail

Enter an e-mail address.

Toll Free

Enter a toll free phone number.

Delegate

Enter the name of a delegate.

Name Address window - "Use Company" and "Use Title"

When entering exposition registrations, iMIS automatically sets the Use Company and Use Title options on the Expo Registration - Name Address window to equal the settings on the Customer Setup - Address and Notes window for the registrant's preferred mailing address (designated on the Manage customers window).

You can override the settings on the Expo Registration - Name Address window as necessary for the registrant's 'Ship to' address (does not affect the 'Bill to' address).

Automatic Updates

The Expo Registration - Name Address window's Use Company and Use Title settings are updated automatically by changing the registrant's designated preferred mail address only if all of the following are true:

1. Update open meetings addresses with address changes is enabled on the Customer Setup - Advanced window.

2. The address on the Expo Registration - Name Address window is identical to the original preferred address prior to the change.
3. The new preferred mail address's settings differ from the original.

   Automatic Settings for New Records

   For new records added on the Expo Registration - Name Address window during exposition registration, iMIS automatically sets the Use Company and Use Title options on the Expo Registration - Name Address window to equal the Main address field's settings on the Customer Setup - Address and Notes window.

   You can override the settings on the Expo Registration - Name Address window as necessary for the new record's Ship To address (does not affect the Bill To address).

   To edit a registrant's address (Expo)

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open an order (see Finding Exposition Orders).
3. Click Edit.
4. Click Options, and select Address to open the Expo Registration - Name/Address window.
5. Make any necessary changes.
6. Click OK to return to the Process booth orders window.
7. Click Save.

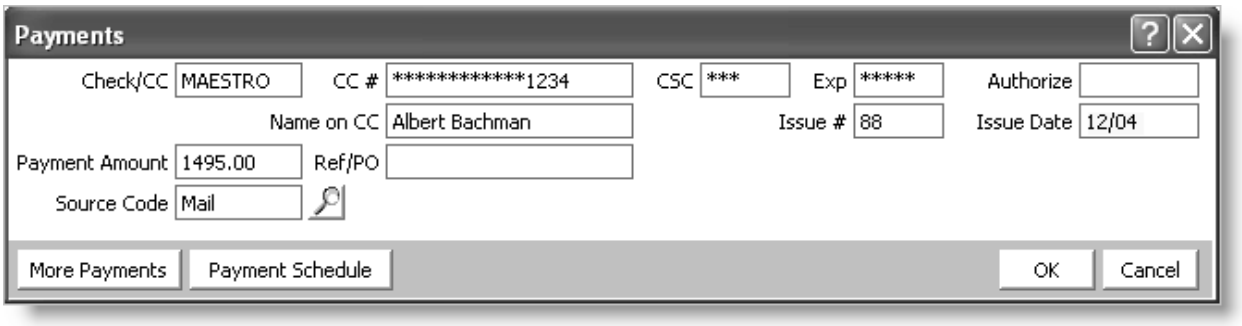
Entering Payments

An exhibitor can pay for an order at the time of order entry or at a later date, depending upon your organization's requirements. Payments can be made with a check, credit/debit card, or by billing the company directly. You may use a combination of payment methods. iMIS allows you to enter single or multiple payments for each order.

The multiple payments feature is used primarily when an order is secured with a partial payment and the balance is paid later.

> **Note:** Note: There is no limit to the number of payments that can be applied to an order. Payment plans and schedules are established by your organization.

Payments window



From Exposition, select Process booth orders, open an order, and click Payment

Check/CC

Enter the check number or credit/debit card code. Credit/debit card codes are defined on the Set up cash accounts window (from AR/Cash, select Set up tables > Cash accounts).

Payment card fields

- CC #

  (Required when a credit/debit card code is entered in the Check/CC field) Specifies a credit/debit card number. When a payment is saved, all but the last four digits of the card number are masked.

- CSC

  (Displayed when a European debit card code is entered in the Check/CC field and the associated card authorization account uses the Other gateway and accepts a CSC number for deferred authorization) Specifies the European debit card CSC number. When a payment is saved, the CSC number is masked.

- Exp

(Required when a credit/debit card code is entered in the Check/CC field) Specifies a credit/debit card expiration date (mm/yy). When a payment is saved, the expiration date is masked.

- Authorize

  (Displayed when a credit/debit card code is entered in the Check/CC field) Specifies an authorization code for the credit/debit card.

- Name on CC

  Enter the name on the credit/debit card.

- Issue #

  (Required/Displays when a debit card code is entered in the Check/CC field and the associated cash account requires an issue number) Enter the debit card issue number.

- Issue Date

  (Required/Displays when a debit card code is entered in the Check/CC field and the associated cash account requires an issue date) Enter the debit card issue date.

  > **Note:** Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

  Payment Amount

  Enter the amount of the check or credit/debit card payment.

  Ref/PO

  (optional) Enter the reference or purchase order number.

  Source Code

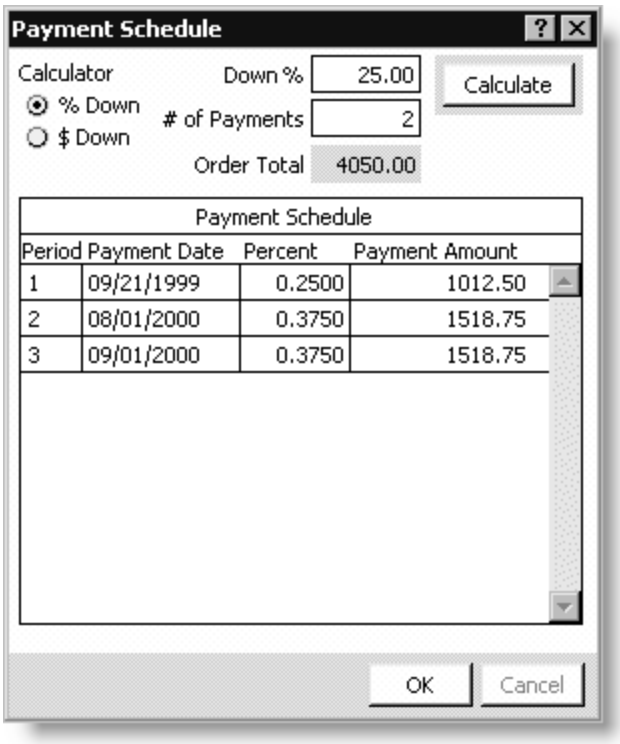
  (optional) Enter the source of the payment; for example, mail or telephone. Select the Find icon to look up a source code.

  More Payments button

Click to open an additional Payments window for recording additional payments made on the order.

Payment Schedule button

Opens the Payment Schedule window used for scheduling payments and overriding the payment schedule on the Expo General Setup window:



Calculator

% Down - Enable to indicate that the down payment is a percentage of the amount due.

$ Down - Enable to indicate that the down payment is a specific dollar amount.

Down (% or $) - Enter the required down payment (percentage or dollar amount).

# of Payments - Enter the number of payments.

Order Total - Displays the total payment amount.

Calculate button - Click to calculate the payment schedule.

Payment Schedule - Override the payment schedule defined for the exposition on the Expo General Setup window.

To enter a single payment for an order

Follow this procedure when an order is purchased with a single payment. See To enter multiple payments for an order for orders purchased with multiple payments.

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open an order (see Finding Exposition Orders).
3. Click Edit.
4. Click Payment to open the Payments window.
5. Enter the payment information:

- Enter either a check number or credit/debit card code (if you enter a credit card code, additional fields display, requiring population).

  Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.
- Enter the Payment Amount.
- (optional) If the exhibitor has sent a purchase order, enter the number or reference key in the Ref/PO field.
- (optional) Enter a Source Code.

6. Click OK to return to the Process booth orders window.
7. Click Save.

To enter multiple payments for an order

Follow this procedure when an order is purchased with multiple payments.

1. From Exposition, select Process booth orders to open the Process booth orders window.

2. Open an order (see Finding Exposition Orders).
3. Click Edit.
4. Click Payments to open the Payments window (first instance), and enter the Payment Amount of the first payment.
5. Click More Payments to open the Payments window (second instance):

- Enter the payment information.
- Click OK to return to the Payments window (first instance).

6. Click OK to return to the Process booth orders window
7. Click Save.

To create or modify a payment schedule

Although you defined the default settings for the exposition payment schedule on the Expo General Setup window, you can override the settings on the Payment Schedule window (defaults to the settings defined on the Expo General Setup window).

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open an order (see Finding Exposition Orders).
3. Click Edit.
4. Open the Payment Schedule window:

- Click Payment to open the Payments window.
- Click Payment Schedule.

5. Enable either the % Down or the $ Down option, and enter the required Down payment:

- If you select the % Down option, the down payment is a percentage of the amount due.
- If you select the $ Down option, the down payment is a specified dollar amount.

6. Enter the required # of Payments, and Calculate the amount due on each payment.
7. Click OK to return to the Payments window.

8. Click OK to return to the Process booth orders window.
9. Click Save.

Entering Expo Badge Information

The Badges window is used for entering the registrant, guest, and address data used when printing badges and labels. By default, the Primary badge type does not exist for Exposition Management.

To create the Primary badge type (or additional non-Primary and Secondary badge types), add Primary to the list of badge types on the BADGE_TYPE general look-up/validation table. For details, see Creating General Lookup/Validation Tables for Exposition Management.

Information Flowdown to Expo Badges

Information flowdown to the Badges window is dependent on badge type:

Primary badge

Updates to name, title, company, and address information in Customer Portfolio or on the Expo Registration - Name Address window will flow down to a Primary badge if the information matches prior to the change.

Any name, title, company, or address change on the Manage customers window that updates the Expo Registration - Name Address window also updates Primary badges. A Primary badge can be overwritten, but a subsequent change on the Expo Registration - Name Address window will update the badge.

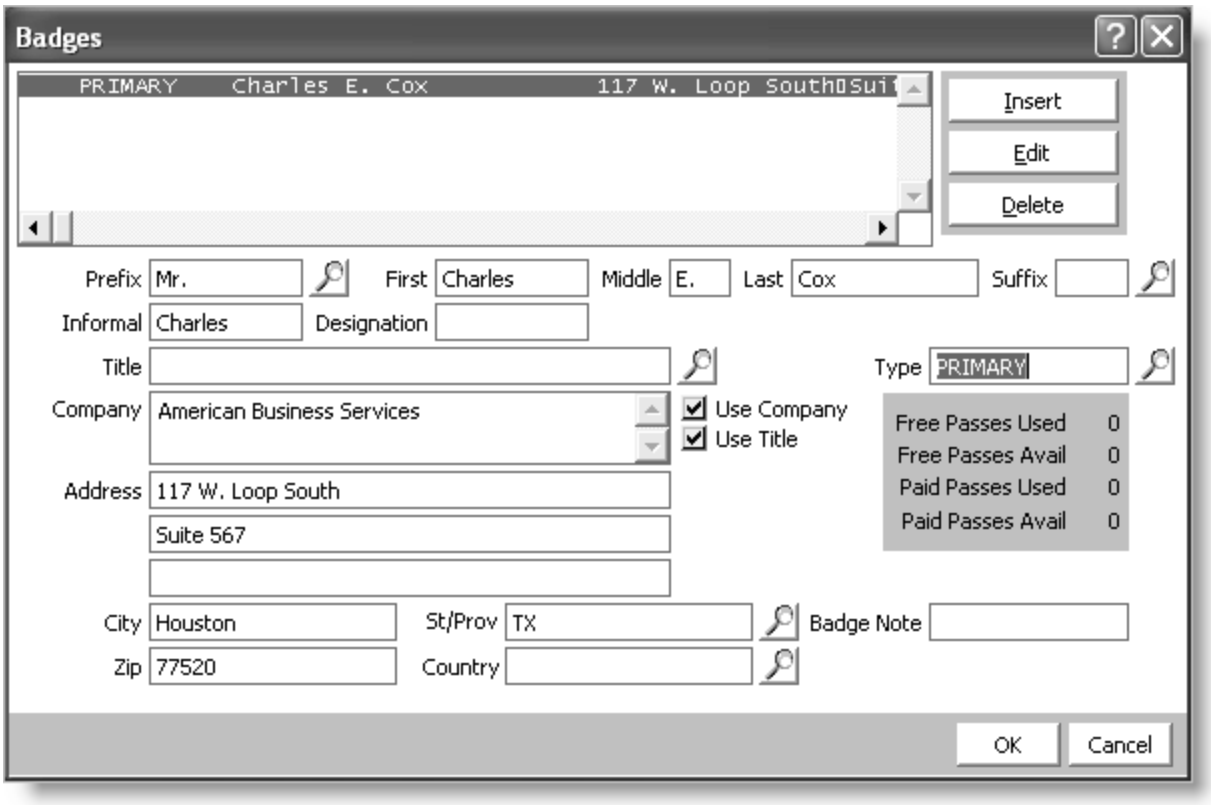
Non-Primary and Secondary badges

Updates to company and address information on the Expo Registration - Name Address window will flow down to non-Primary and Secondary badges if the information matches prior to the change. Name and title changes do not flow down for non-Primary and Secondary badges.

Any company or address information change on the Manage customers window that updates the Expo Registration - Name Address window also will update non-Primary and Secondary badges if the information matches prior to the change.

> **Note:** Note: Changes on the Badges window do not flow up to the Expo Registration - Name Address window or to Customer Portfolio.

Badges window



From Exposition, select Process booth orders, open an order, click Options, and select Badges

Badge Information

The information defined on the Badges window prints on exhibitor badges and reports and is not related to (and does not update) the exhibitor's record or order.

- Prefix - Enter the badge recipient's prefix, such as Mr., Ms., and Mrs.
- First - Enter the badge recipient's first name.

- Middle - Enter the badge recipient's middle name.
- Last - Enter the badge recipient's last name.
- Suffix - Enter a suffix, such as Jr., Sr., or II.
- Informal - Enter the badge recipient's informal name.
- Designation - Enter the badge recipient's professional status, such as Ph.D. or MD.
- Title - Enter the badge recipient's professional title, such as president or executive director.
- Company - Enter the badge recipient's company name.
- Use Company - Select to print the company name on badges and reports. You can configure iMIS to set the Use Company option automatically. For details, see Automatic Settings for “Use Company” and “Use Title” Options (see "Name Address window - "Use Company" and "Use Title"").

  Note: The label for the Use Company option is customizable, so your system may display another label for this option. The value entered in the Institute Type field on the Customer Setup - Basic Options window defines the option's label.
- Use Title - Select to print the registrant's title on badges and reports. You can configure iMIS to set the Use Title option automatically. For details, see Automatic Settings for “Use Company” and “Use Title” Options (see "Name Address window - "Use Company" and "Use Title"").
- Address - Enter the badge recipient's address.
- City - Enter the city in which the badge recipient lives.
- St/Prov - Enter the two-digit abbreviation for the state or province.
- Zip - Enter the postal zip code for the badge recipient.
- Country - Enter the badge recipient's country.

  Badge Status

Displays the amount and type of badges available to the exhibiting company. As badges are processed, the information in this area changes.

- Free Passes Used - Displays the number of free passes used. If the exposition uses free passes, the total number of free passes available to an exhibitor is determined by the options defined on the Expo General Setup window.
- Free Passes Avail - Displays the number of free passes available.
- Paid Passes Used - Displays the number of paid passes used.
- Paid Passes Avail - Displays the number of paid passes available.

Type

Select the type of badge being issued, such as Free_Pass or Paid_Pass.
Badge types are defined on the Set up general lookup/validation window.

Badge Note

(Optional, 10-character limit) Enter specific information about the badge. This information prints in the upper right hand corner of the badge.

Expo Badges window - "Use Company" and "Use Title"

When entering exposition registrations, iMIS automatically sets the Use Company and Use Title options on the Badges window to equal the settings on the Expo Registration - Name Address window.

You can override the settings on the Badges window as necessary for Primary and Secondary badges.

Automatic Updates

Primary badge - The Use Company and Use Title settings are updated automatically by the following:

- Changing the settings on the Expo Registration - Name Address window.
- Changing the registrant's designated preferred mail address (ONLY if all of the following are true):

- Update open meetings addresses with address changes is enabled on the Customer Setup - Advanced window.
- The address on the Expo Registration - Name Address window is identical to the original preferred address prior to the change.
- The new preferred mail address's settings differ from the original.

  Secondary badge - The Use Company and Use Title settings are never updated automatically.

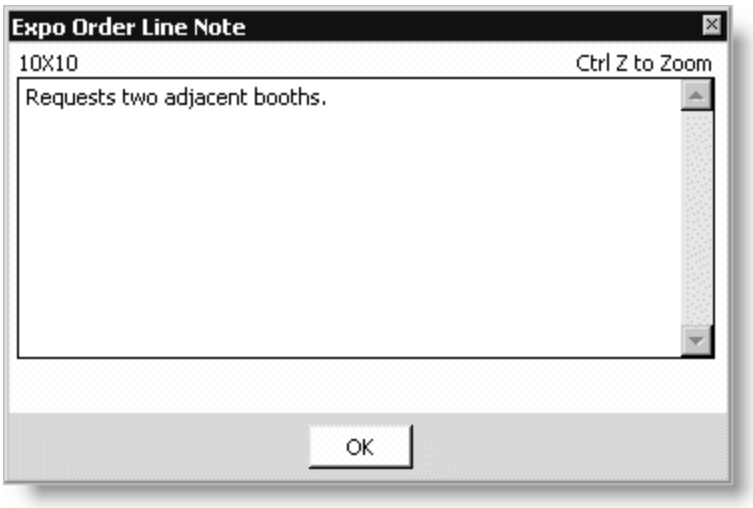
  To enter badge information

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open an order (see Finding Exposition Orders).
3. Click Edit.
4. Click Options, and select Badges to open the Badges window.
5. Click Insert.
6. Enter the badge information.
7. Click OK to return to the Process booth orders window.
8. Click Save.

Entering Order Line Notes

Use the Expo Order Line Note window to generate special notes about a product or line item on an exhibitor's order. For example, an exhibitor may have special decorating requirements that need to be communicated to the decorator.

Expo Order Line Note



From Exposition, select Process booth orders, select a line item, click Options, and select Line Note

Product

Displays the name of the product line item.

Note

Enter a note about the order line item.

To enter an order-line note

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open an order (see Finding Exposition Orders).
3. Click Edit.
4. Select an order line.
5. Click Options, and select Line Note to open the Expo Order Line Note window.
6. Enter the order-line note. Press Ctrl+Z to enlarge the data entry area.
7. Click OK.
8. Click Save.

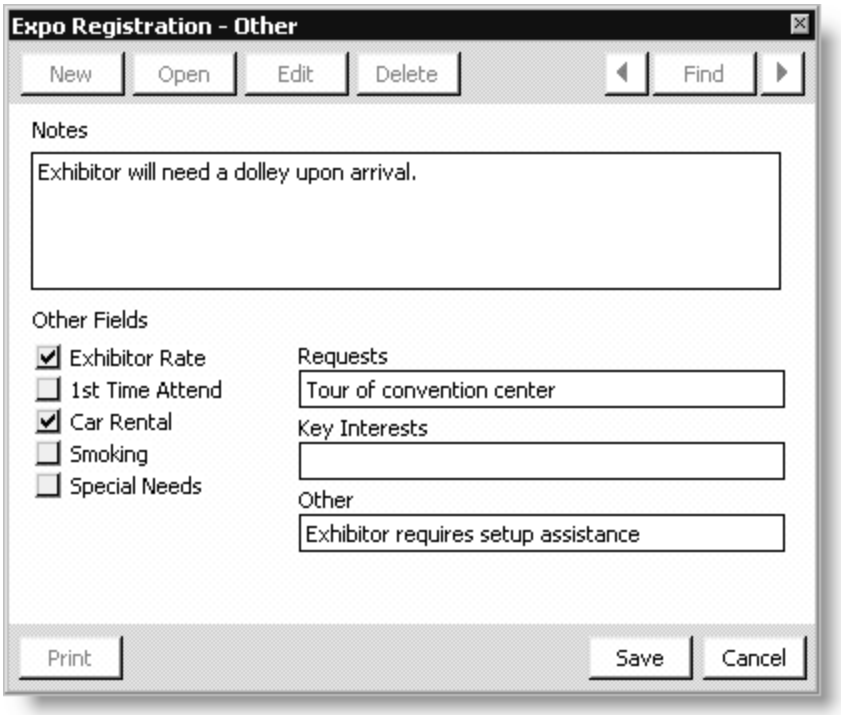
Viewing an Exhibitor's Transaction Ledger

iMIS updates the Transaction Ledger after you apply a payment. You can view the transaction details for an order on the Transaction Ledger window.

Entering Other Registration Information

Use the Expo Registration - Other window to enter additional registration information. The window's Other Fields are defined on the Exposition Set up module window.

Expo Registration - Other window



From Exposition, select Process booth orders, open an order, select a line item, click Options, and select Other

Notes

Enter additional registration information.

Other Fields

(Enabled on the Exposition Set up module window) Enable all applicable fields, and enter all applicable information.

To enter other registration information

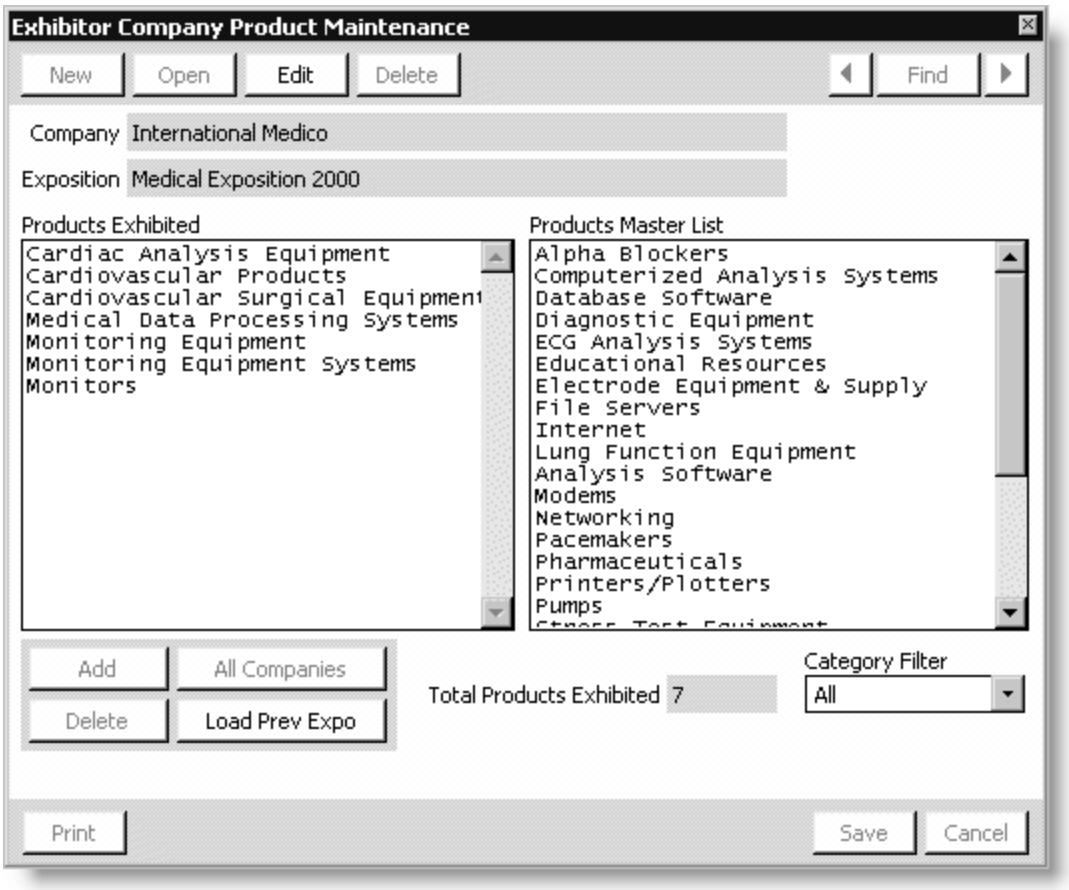
1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open an order (see Finding Exposition Orders).
3. Click Options, and select Other to open the Expo Registration - Other window.
4. Enter any applicable Notes.
5. Enable all applicable options and enter all applicable information under Other Fields.
6. Click Save to return to the Process booth orders window.
7. Click Save.

Managing an Exhibitor's Product List

You can view, add, or delete products from an exhibitor's product list on the Exhibitor Company Product Maintenance window. You can see which companies are exhibiting the same products (conflicting products) so that you can relocate an exhibitor to eliminate the conflict. You also can load products from previous expositions.

Note: Note: You cannot check for product conflicts until you define products for the exhibiting company.

Exhibitor Company Product Maintenance window



From Exposition, select Process booth orders, open an order, click More, and select Exhibited Products

Company

Displays the name of the exhibiting company (if applicable).

Exposition

Displays the name of the exposition.

Products Exhibited

Lists products being exhibited.

Products Master List

Lists all exposition products.

Add button

Click to move a selected product from the Products Master List to the Products Exhibited list.

Delete button

Click to move a selected product from the Products Exhibited list to the Products Master List.

All Companies button

Opens the All Companies Exhibiting Product window, which displays a list of other companies that are exhibiting the selected product.

Load Prev Expo button

Opens the Load Products from Previous Exposition window where you can load a previous exposition's product list into the exhibiting company's product list.

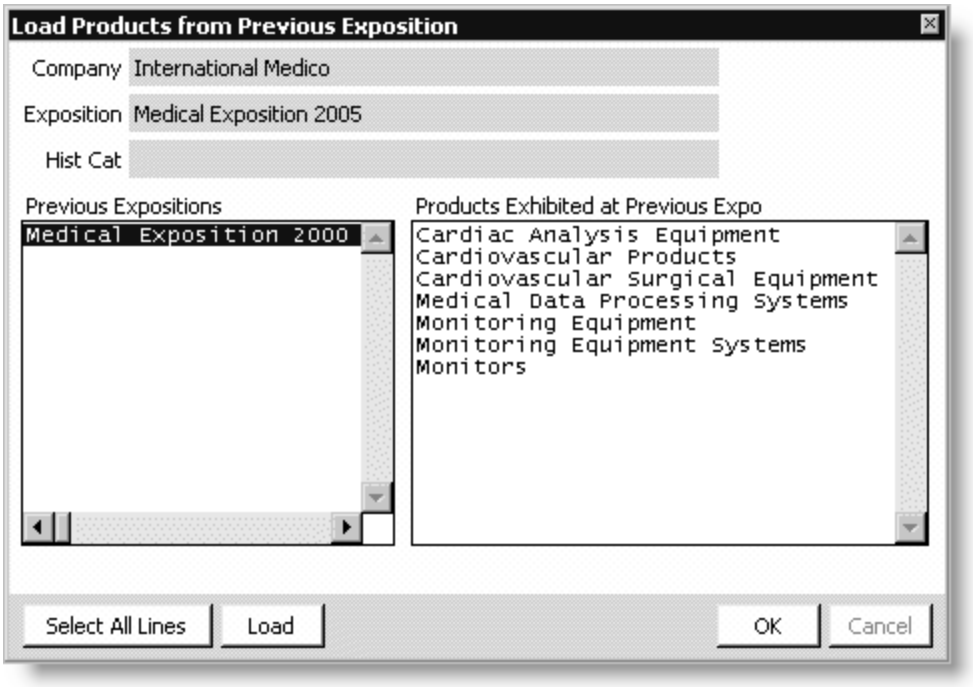
Total Products Exhibited

Displays the total number of products exhibited.

Category Filter

Select the product category you want to view. Product categories are defined on the EXPO_PROD_CAT general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

Load Products from Previous Exposition window



From Exposition, select Process booth orders, open an order, click More, select Exhibited Products, and click Load Prev Expo

Company

Displays the name of the exhibiting company (if applicable).

Exposition

Displays the name of the exposition.

Hist Cat

Displays the historical category.

Previous Expositions

Lists previous expositions.

Products Exhibited at Previous Expo

Lists previously exhibited products.

Select All Lines button

Click to select each line item under the Products Exhibited at Previous Expo list.

Load button

Click to load the selected products.

To add a product to an exhibitor's product list

1. Open the Exhibitor Company Product Maintenance window:

- From Exposition, select Process booth orders to open the Process booth orders window.
- Open an order (see Finding Exposition Orders).
- Click More, and select Exhibited Products.

2. Click Edit.
3. Select a product from the Products Master List, and click Add (press Ctrl to select multiple products).
4. Click Save.

To delete a product from an exhibitor's product list

1. Open the Exhibitor Company Product Maintenance window:

- From Exposition, select Process booth orders to open the Process booth orders window.
- Open an order (see Finding Exposition Orders).
- Click More, and select Exhibited Products.

2. Click Edit.
3. Select a product from the Products Exhibited list, and click Delete (press Ctrl to select multiple products).
4. Click Save.

To view other companies exhibiting the same products

1. Open the Exhibitor Company Product Maintenance window:

- From Exposition, select Process booth orders to open the Process booth orders window.
- Open an order (see Finding Exposition Orders).
- Click More, and select Exhibited Products.

2. Select a product from the Products Exhibited list.
3. Click All Companies to open the All Companies Exhibiting Product window. A list of all companies exhibiting the same product displays.
4. Click OK to return to the Exhibitor Company Product Maintenance window.

To load a product list from a previous exposition

> **Note:** Note: The previous exposition that you are loading from must have a list of products exhibited for the selected exhibiting company. Also, the products you are loading cannot be duplicates of the current exposition products list.

1. Open the Exhibitor Company Product Maintenance window:

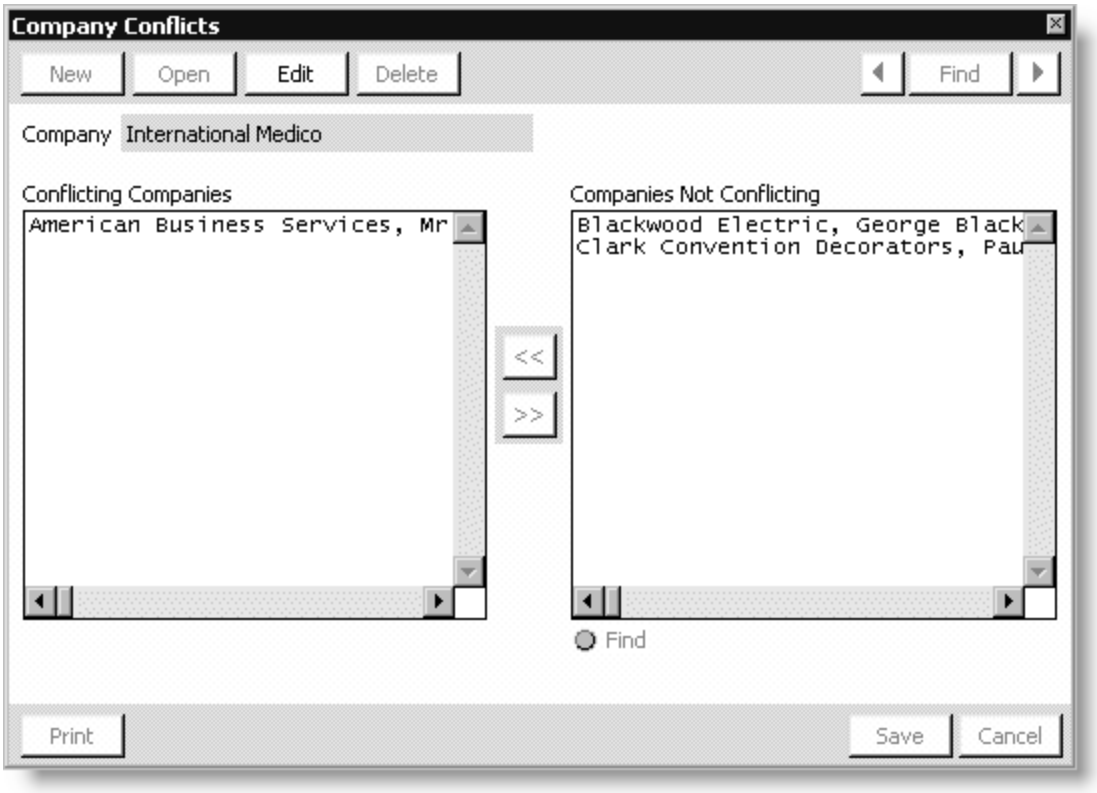
- From Exposition, select Process booth orders to open the Process booth orders window.
- Open an order (see Finding Exposition Orders).
- Click More, and select Exhibited Products.

2. Click Load Prev Expo to open the Load Products from Previous Exposition window.
3. Select an exposition from the Previous Expositions list.
4. (optional) Select a product from the Products exhibited at Previous Expo list (click Select All Lines to select all products).
5. Click Load. A message prompts you to verify loading the products.
6. Click Yes.

Managing Company Conflicts

Company conflicts occur when you have companies selling the same products or services at the same exposition. For example, several companies may sell telecommunications or educational software. Because they sell the same product, these competing companies may not want to exhibit in the same area. Identifying conflicting companies ensures that they are not placed in close proximity to one another.

Company Conflicts window



From Exposition, select Process booth orders, open an order, click More, and select Company Conflicts

Company

Displays the name of the exhibiting company.

Conflicting Companies

Lists companies that conflict with the exhibiting company.

Companies Not Conflicting

Lists companies that do not conflict with the exhibiting company.

Find

Enable to search for companies to add to the Companies Not Conflicting list.

To edit the list of conflicting companies

Before you begin

- Ensure that display fields for rosters of company records have been defined in the Customer Setup-Advanced window (Customers > Setup Module > General, and click Advanced). Specifically, values must be defined in the Roster Display CompanyFields field. Refer to Customizing Roster Display fields in iMIS Customer Management for more information.
- Ensure that all booths to be evaluated for company conflicts have been assigned to defined proximity areas. Refer to Managing Proximity Assignments for more information.
- Ensure that the specific exposition for which you are managing company conflicts is configured to check for company conflicts in the Expo Options window (Exposition > Setup an Exposition, edit the exposition, click More, and choose Options). Specifically, the Company Conflict Checking checkbox must be selected. Refer to Defining Exposition Options for more information.

Procedure

1. Open the Company Conflicts window:
   - From Exposition, select Process booth orders to open the Process booth orders window.
   - Open an order (see Finding Exposition Orders).
   - Click More, and select Company Conflicts.
2. Click Edit.
3. (optional) To add companies to the list of Conflicting Companies, do the following:

- Enable the Find option to open the Find window.
- Select a Search Type, and Tab twice to display a list of companies.
- Select a company, and click OK.

  The company is added to the list of Companies Not Conflicting.
- Double-click the company.

  The company is moved to the Conflicting Companies list.
- Repeat this process for each additional company.
- Click Save.

4. (optional) To remove companies from the list of Conflicting Companies, do the following:

- Double-click a company from the Conflicting Companies list.
- Repeat for each additional company.
- Click Save.

> **Note:** Note: When you reopen the Company Conflicts window, no companies are listed under the Companies Not Conflicting list because the system returned the record(s) to the data files.

Managing Wait Lists for Exhibitors

Wait listing is a strategy to help you manage booth inventory by allowing an exhibitor the opportunity to purchase a currently unavailable booth product if it becomes available later. Booth products become available when an exhibitor cancels a booth or when more booths are added to the floor plan.

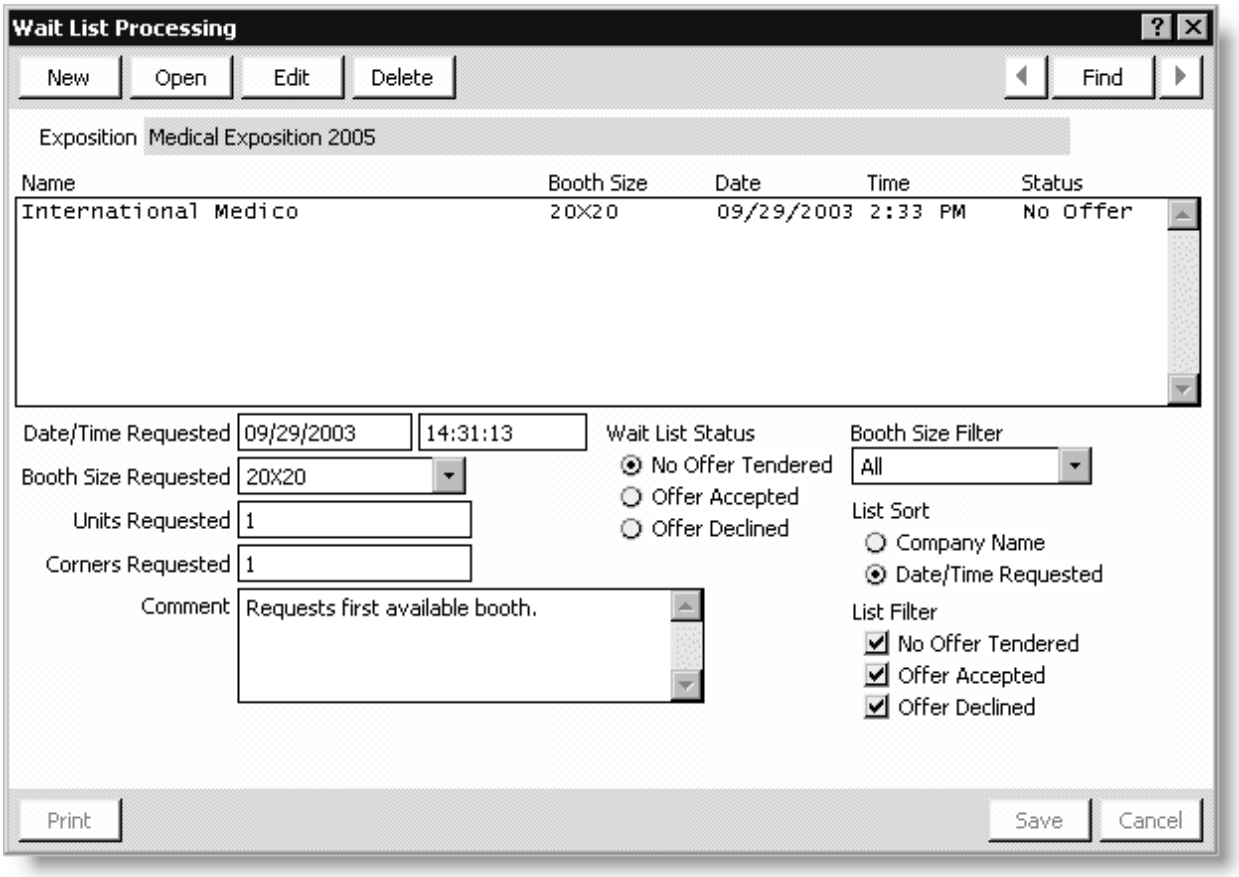
The wait list option is triggered when a product order exceeds the maximum number of units designated for a particular product. An exhibitor can be placed on a wait list even if the maximum number has not been exceeded or if no maximum has been set. iMIS dis-

plays a warning message when the maximum number of booths is exceeded. This allows you to add the exhibitor to the wait list on the Wait List Processing window.

You can process an order with a wait-listed booth product in one of three ways:

- Increase the maximum availability for the product
- Add additional booths for the product
- Cancel a wait-listed booth product

Wait List Processing window



From Exposition, select Process booth orders, open an order, click More, and select Booth Waitlist

Exposition

Displays the name of the current exposition.

Name

Displays the name of the exhibiting company on a wait list.

Booth Size

Displays the size of the booth product for which the exhibiting company is wait-listed.

Date

Displays the system date the exhibiting company was placed on the wait list.

Time

Displays the system time the exhibiting company was placed on the wait list.

Status

Displays the wait listing status for the exhibiting company.

Date/Time Requested

Enter the actual date and time that the exhibiting company requested to be on the wait list.

Booth Size Requested

Enter the size of the booth requested by the exhibitor.

Units Requested

Enter the number of booths requested by the exhibiting company (units represent the standard booth dimensions for the exposition).

Corners Requested

Specify whether corners were requested for the booth.

Comments

Enter notes regarding the wait list.

Wait List Status

Enable the current wait list status; for example, has the wait list offer been accepted or declined?

Booth Size Filter

Select a filter to shorten the list of the displayed booth products.

List Sort

Organize the wait list by Company Name or Date/Time Requested.

List Filter

Select from among three options for viewing the list. You can select one, two, or all three of these options:

- No Offer Tendered - Lists companies eligible to be placed on a wait list but that have not received an offer to be placed on the list.
- Offer Accepted - Lists companies that have accepted and have been placed on the wait list.
- Offer Declined - Lists companies that were offered the opportunity to be placed on the wait list but declined the offer.

To add an exhibitor to a wait list

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Enter or open an order (see Finding Exposition Orders).
3. Double-click a booth product, and enter a Qty:

- If the inventory for that booth is filled, and the booth product is not available, a message states that no more booths are available. Click OK.
- If the booth inventory is not yet 0, but the quantity you are ordering is greater than the remaining inventory, a message states only X number of booths are available. Click OK. The order quantity is reset to its original value. Re-enter the order quantity.

Note: If you have sold the maximum number of booths but have not inventoried those booths, the non-inventoried booths still display under the Available list on the Booth Inventory Assignment window. These booths actually are not available because the total number of booths for the selected product has been sold. If you try to add the booths to the current order, the system displays the wait list message.

4. Click Save to add the order.
5. Add the exhibitor to a booth wait list:

- Click More, and select Booth Waitlist to open the Wait List Processing window. A message states that you must enter values for booth size and quantity requirements.
- Click OK. The name of the exhibitor displays on the window, and the Date/Time Requested field is populated automatically.
- Select the Booth Size Requested.
- Enter the number of Units Requested.
- (optional) Enter the number of Corners Requested.
- (optional) Enter a Comment.
- Enable the appropriate Wait List Status.

6. Click Save. When viewing an order, a product that has been placed on a wait list displays with an asterisk (*) next to it.

To view wait lists

1. From Exposition, select Manage wait lists to open the Manage wait lists window.
2. Click Open to display the Exposition Search window.
3. Double-click the exposition you want to view to open it in the Manage wait lists window.
4. Select a Booth Size Filter (Select ALL or a specific booth size).
5. Select a List Sort option.
6. Enable the appropriate List Filter options.

To remove an exhibitor from a wait list

1. From Exposition, select Manage wait lists to open the Manage wait lists window.
2. Find an exhibitor on a wait list:

- Click Open to display the Exposition Search window.
- Double-click an exposition to display all exhibitors on wait lists.

3. Select an exhibitor.
4. Click Delete. A message prompts you to verify removing the exhibitor from the wait list.
5. Click Yes to remove the exhibitor from the wait list.

> **Note:** Note: If the company decides to order this product at a later time, and the product is not available at the time of ordering, you can place the company on the wait list again.

To increase booth availability for an exhibitor on a wait list

1. Open a product on the Exposition Product Detail window:

- From Exposition, select Set up an exposition to open the Set up an exposition window.
- Double-click the exposition to open it on the Set up an exposition window (second instance).
- Select a product from the list of Exposition Products.
- Click Edit to open the Exposition Product Detail window.

2. Increase the Max. Available quantity. (If a wait list exists for the product, a message indicates the number of companies on the wait list. Click OK.)
3. Click Save to update the Exposition Product Detail window.
4. Open a wait-listed company's order on the Process booth orders window.
5. Edit the company's order:

- Click Edit.
- Select the booth product that is on the wait list.
- Update the order Qty as availability allows.
- Click Booth Inventory, and assign booth number(s) for the product on the Booth Inventory Assignment window.

  Note: If booth numbers are not assigned, the wait list * will not be removed from the product.

  Note: A message displays if you try to update the quantity for more than the amount available. Click OK, and update the order Qty based on the number of booths that are available.

6. Click Save to update the order. If booth numbers were assigned to the booth product, a message prompts you to delete the wait list entry:

- If the order is for the quantity specified on the wait list, click Yes to remove the company from the wait list.
- If the order is for less than the quantity specified on the wait list, click No. Manually update the wait list entry to reflect the number of booths required and the status of the wait list:

7. Open the Manage wait lists window (from Exposition, select Manage wait lists).

- Find the company whose entry you need to edit.
- Click Edit, adjust the Units Requested, and enable the No Offer Tendered under Wait List Status.
- Click Save.

  To add additional booths for an exhibitor on a wait list

1. Open a product on the Exposition Product Detail window:

- From Exposition, select Set up an exposition to open the Set up an exposition window.
- Double-click the exposition to open it on the Set up an exposition window (second instance).
- Select a product from the list of Exposition Products.
- Click Edit to open the Exposition Product Detail window.

2. (optional) Add a single booth:

- Click Booth to open the Booths window.
- Click Add Individual.
- Enter a New Booth Number.
- Click Save.

  A message states that the maximum available quantity is being adjusted.

- Click OK.

  A message lists the number of companies on the wait list and prompts you to view the wait list.

- (optional) Click Yes to open the wait list, and note the companies listed.

3. (optional) Add a series of booths:

- Click Booth Generator to open the Booth Generator window.
- Enter the Starting Booth #, # of Booths, and Increment By number.
- Click Save.

  A message states that the maximum available quantity is being adjusted.

- Click OK.

  A message lists the number of companies on the wait list and prompts you to view the wait list.

- (optional) Click Yes to open the wait list, and note the companies listed.

4. Open a wait-listed company's order on the Process booth orders window.
5. Edit the company's order:

- Click Edit, then select the booth product that is on the wait list.
- Update the order Qty as availability allows.
- Click Booth Inventory, then assign booth number(s) for the product on the Booth Inventory Assignment window.

  Note: If booth numbers are not assigned, the wait list * will not be removed from the product.

  Note: A message displays if you try to update the quantity for more than the amount available. Click OK, and update the order Qty based on the number of booths that are available.

6. Click Save to update the order. If booth numbers were assigned to the booth product, a message prompts you to delete the wait list entry:

- If the order is for the quantity specified on the wait list, click Yes to remove the company from the wait list.
- If the order is for less than the quantity specified on the wait list, click No. Manually update the wait list entry to reflect the number of booths required and the status of the wait list.

7. Open the Manage wait lists window (from Exposition, select Manage wait lists).

- Find the company whose entry you need to edit.
- Click Edit, adjust the Units Requested, and enable the No Offer Tendered under Wait List Status.
- Click Save.

To cancel an order for a wait-listed booth

1. Cancel the order. See Canceling Exposition Orders.
2. Remove the exhibitor from the wait list. See To remove an exhibitor from a wait list.

To delete a product (that has a wait list) from an order

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open an order (see Finding Exposition Orders), and click Edit.
3. Double-click the booth product for which a wait list exists.
4. (Applicable only if booth numbers are assigned) If a booth number is assigned to the product on the Booth Inventory Assignment window, a message prompts you to un-assign booth numbers to reduce the quantity ordered:

- Click Yes to open the Booth Inventory Assignment window.
- Double-click the Ordered booth number to move it under the list of Available booth numbers, and click OK.

5. A message displays that states the number of companies on the wait list and prompts you to open the wait list after completing the order. Click OK to delete the product from the order.
6. Click Save to update the order.

Printing Individual Reports and Reviewing Rosters

The Exposition module contains reports that are specific to planning and administering expositions. You can run several reports from the Process booth orders window.

The Print button opens the Select Report window, which allows you to print an invoice, confirmation, or badge. The Letter button opens the Letter Text window where you can compose a letter for the exhibitor whose record you are editing. Output prints to the report destination you select. To change the report destination to screen, select File> Report Destination> Screen.

To print individual Expo orders

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Enter or open an order (see Finding Exposition Orders).
3. Click Print to open the Select Report window.

4. Select a Report Option.
5. Click Run.

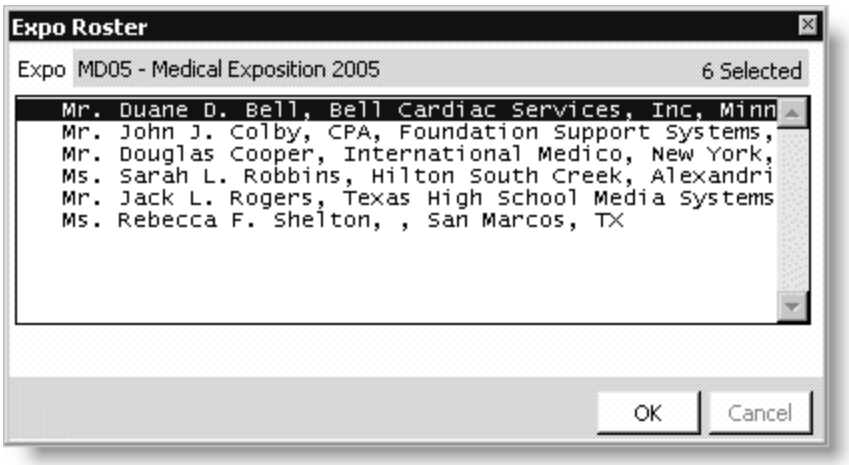
To print a letter

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Enter or open an order (see Finding Exposition Orders).
3. Click Letter to open the Letter Text window.
4. Enter a letter.
5. Click Print.

Viewing Exposition Rosters

View exposition rosters on the Expo Roster window.

Expo Roster window



From Exposition, select Process booth orders, open an order, and click View Roster

Expo

Displays the name of the exposition.

Exhibitors

Lists exhibitors.

To view an exposition roster

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Enter or open an order (see Finding Exposition Orders).
3. Click View Roster to view all of the exposition's registered exhibitors.

Substituting Exhibitors

Times may exist when an exhibitor cannot exhibit at a particular exposition because of a conflict or other unforeseen occurrence. However, another exhibitor may want to take over the order purchased by the first exhibitor. This can be accomplished easily in the iMIS Exposition Management module.

To substitute exhibitors

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open the order of the exhibitor whose order you want to substitute (see Finding Exposition Orders).
3. Click Transfer/Substitute. Your cursor is now in the Exposition field.
4. Tab to the Exhibitor field, and enter the substitute Exhibitor ID. Notice that when you press Tab, the Bill To and Product field information disappear. When you enter the substitute exhibitor ID, the Bill To and Product fields are populated with the new information.
5. Click Save.

   After performing a substitution, CT appears on the Expo Roster window and the Roster Search window by the name of the original exhibitor, indicating that the exhibitor's order was canceled and transferred.

   Also, the Transaction Ledger window lists the details of the transferred booth order, including the name to whom the order was transferred.

Transferring Exhibitors

When an exhibitor cannot attend a particular exposition because of an unforeseen occurrence, you can transfer the exhibitor's order to another exposition.

To transfer an exhibitor to another exposition

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Open the order of the exhibitor whose order you want to transfer (see Finding Exposition Orders).
3. Click Transfer/Substitute. Your cursor is now in the Exposition field.
4. Overtype the Exposition Code with the Code of the new exposition.
5. Click Save.

> **Note:** Note: Any positive balance from the original booth order is applied as a credit towards the exposition to which the exhibitor was transferred.

After performing a substitution, CT appears on the Expo Roster window and the Roster Search window by the name of the original exhibitor, indicating that the exhibitor's order was canceled and transferred.

Also, the Transaction Ledger window lists the details of the transferred booth order, including the exposition code to which the order was transferred.

Exhibitor Information

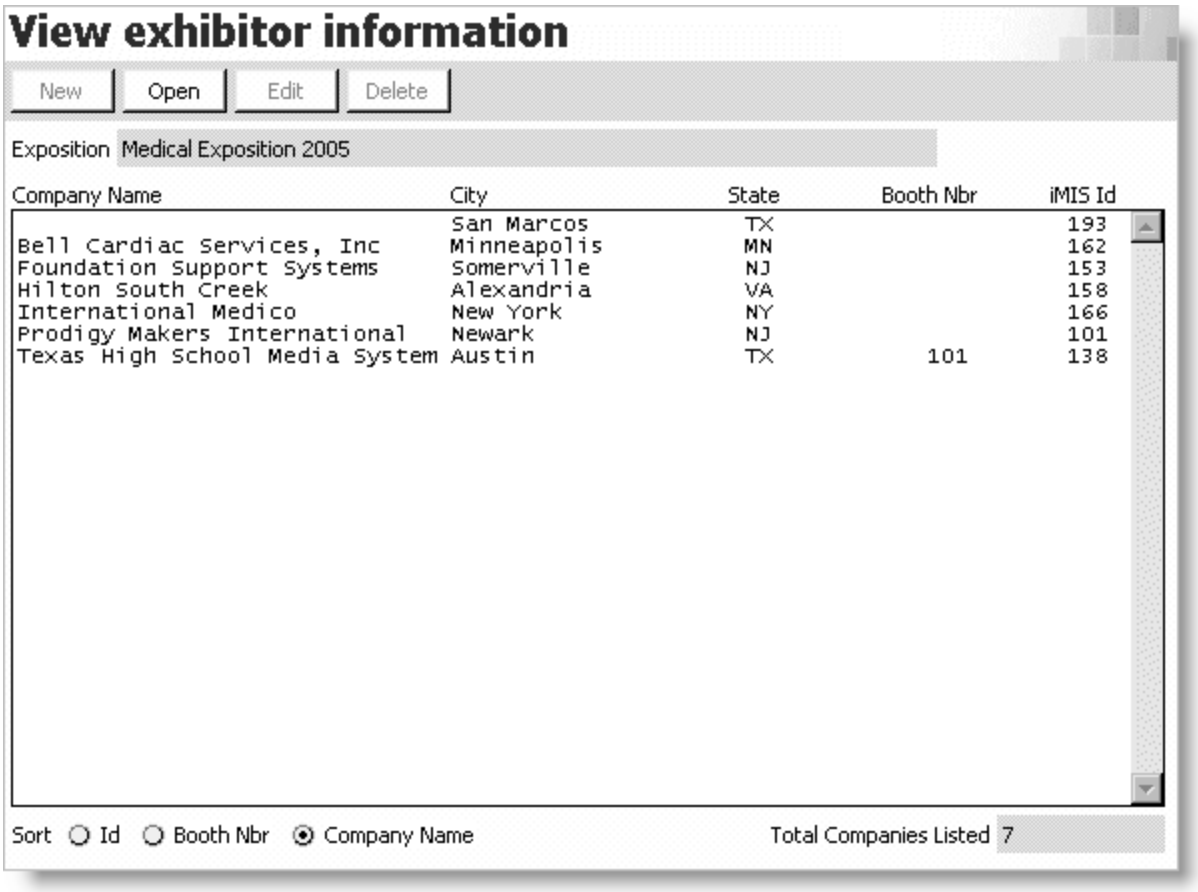
Overview of exhibitor information

Keeping exhibitor information current is critical to effectively managing your exposition. iMIS allows you to view a profile of an exhibiting company through the Exhibitor Information window.

Viewing Exhibitor Information

You can view all companies exhibiting at your exposition on the View exhibitor information window. It is through this window that you access the Exhibitor Information window, which is where you manage and track information about exhibiting companies.

View exhibitor information window



From Exposition, select View exhibitor information

Exposition

Displays the name of the selected exposition.

Company Name

Displays the name of an exhibiting company at the exposition.

City

Displays the city where the exhibiting company is located.

State

Displays the state where the exhibiting company is located.

Booth Number

Displays the booth numbers assigned to the exhibiting company.

iMIS Id

Displays the identification number assigned to the exhibiting company.

Sort Options

Id - Enable to view the list by customer identification number.

Booth Nbr - Enable to view the list by assigned booth number.

Company Name - Enable to view the exhibiting companies alphabetically.

Total Number of Companies Registered

Displays a running total of registered companies exhibiting at the selected exposition.

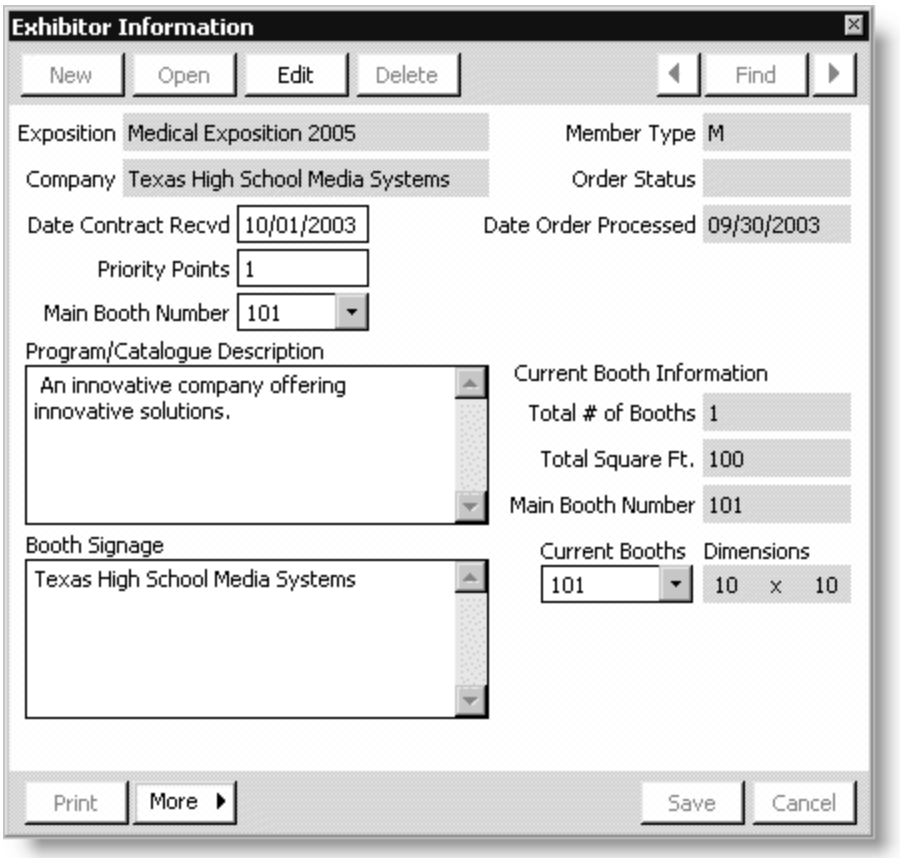
To view exhibitor information

1. From Exposition, select View exhibitor information to open the View exhibitor information window.
2. Click Open to display the Exposition Search window.
3. Double-click an exposition to display a list of all companies exhibiting at the selected exposition.

Entering Exhibitor Information

Use the Exhibitor Information window to enter specific information about exhibiting companies. You can keep the company's list of products up-to-date, as well as manage forms and service contractor information. You also can edit existing orders or set up conflicting companies.

Exhibitor Information window



From Exposition, select View exhibitor information, open an exposition, and double-click an exhibitor

Exposition

Displays the name of the current exposition.

Company

Displays the name of the exhibiting company.

Member Type

Displays the exhibitor's customer type.

Order Status

Displays the status of the order if a cancellation or transfer has occurred (C = canceled or CT = canceled or transferred).

Date Contract Recvd

Enter the date the contract was received. Leave this field blank if a contract has not been received.

Priority Points

Enter the number of Priority Points earned by this particular exhibitor.

Main Booth Number

Select the primary booth number.

Program/Catalogue Description

Enter information to be included on an exposition program.

Booth Signage

Enter information to be included on booth signage (company banner).

Current Booth Information

Total # of Booths - Enter the total number of booths ordered by the exhibitor.

Total Square Ft. - Enter the total number of booth square footage ordered by the exhibitor.

Main Booth Number - Enter the primary booth number (the first one entered) for the exhibitor.

Current Booths - Lists the booth numbers that are part of the order. Select a booth number to display the dimensions of the booth.

Dimensions - Displays the dimensions of the booth selected from the list of Current Booths.

More button

Click to display the following options:

- Contact Maintenance - Opens the Exhibitor Contacts window, which allows you to add or delete contacts and assign the contact type (primary or default).
- Display Contacts List - Opens the Contacts List window listing the company contact information.
- Exhibited Products - Opens the Exhibitor Company Product Maintenance window, which lists the products the company is exhibiting and the product master list. See Managing an Exhibitor's Product List for more.
- Booth Changes - Opens the Booth Change History window, which displays the company's booth history.
- Company Conflicts - Opens the Company Conflicts window, which displays the companies that conflict with the selected company. See Managing Company Conflicts for more.
- Service Contractors - Opens the Current Service Contractors window, which displays a list of approved service contractors.
- Form Tracking - Opens the Forms Status window, which lists the required forms, the date the form must be received, the received date, and the contact person's name.
- AR Ledger - Opens the Accounts Receivable window, which includes a list of the company's accounting transactions.

To enter exhibitor information

1. Open the Exhibitor Information window:
   - From Exposition, select View exhibitor information to open the View exhibitor information window.
   - Click Open to display the Exposition Search window, and double-click an exposition.
   - Double-click an exhibitor.
2. Click Edit.
3. Enter all applicable information.

4. Click Save.

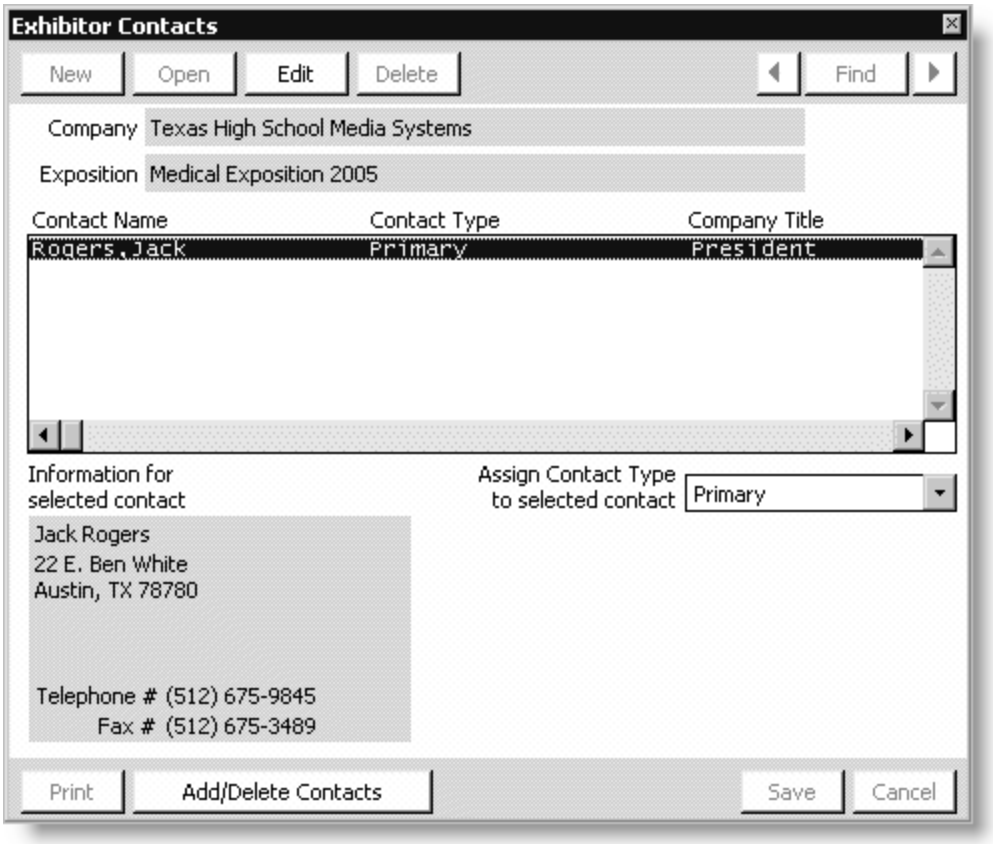
Managing Exhibitor Contacts

An important task in managing your exposition is maintaining an up-to-date contact list for each of the exhibiting companies. From time to time, you may need to add or delete contacts for the exhibiting companies.

For example, your initial contact with the company may have been the sales and marketing person who arranges booth purchases. Once the sale is complete, all future contact may be with the accounts payable clerk.

You manage exhibitor contacts through the Exhibitor Contacts window.

Exhibitor Contacts window



From Exposition, select View exhibitor information, open an exposition, double-click an exhibitor, click More, and select Contact Maintenance

Company

Displays the name of the exhibiting company.

Exposition

Displays the current exposition selected.

Contact Name

Displays the name of the contact for the exhibiting company.

Contact Type

Displays the type of contact, for example, primary, accounting, or sales.

Company Title

Displays the contact's title within the exhibiting company.

Information for Selected Contact

Displays the contact's name and address information.

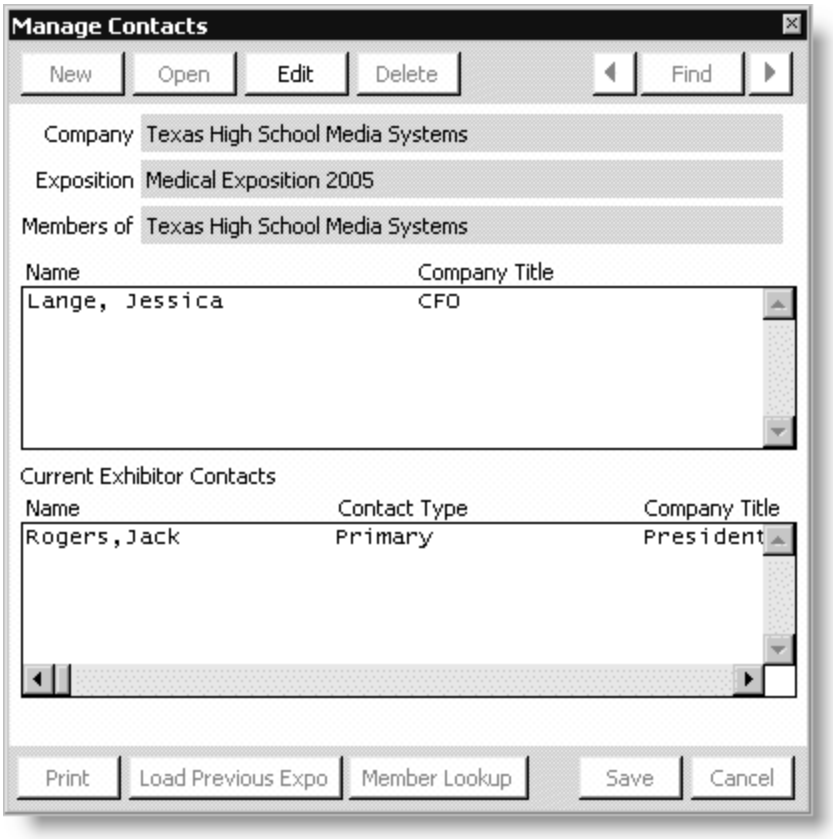
Assign Contact Type to selected contact

Select a contact type from the list (Primary is the default type). Define other contact types on the Set up general lookup/validation window.

Add/Delete Contacts button

Opens the Manage Contacts window where you add or delete contacts for the selected exhibitor.

Manage Contacts window



From Exposition, select View exhibitor information, open an exposition, double-click an exhibitor, click More, select Contact Maintenance, and click Add/Delete Contacts

Available Contacts

Name - Displays the name of an available contact for the exhibiting company.

Company Title - Displays the contact's title within the exhibiting company.

Current Exhibitor Contacts

Name - Displays the name of an available contact for the exhibiting company.

Contact Type - Displays the type of contact, such as primary, accounting, or sales.

Company Title - Displays the contact's title within the exhibiting company.

Load Previous Expo button

Opens the Load Contacts from Previous Exposition window.

Member Lookup button

Opens the Find window to search for an exhibitor.

To add an exhibitor contact

1. Open the Exhibitor Contacts window:

- From Exposition, select View exhibitor information to open the View exhibitor information window.
- Click Open to display the Exposition Search window, and double-click an exposition.
- Double-click an exhibitor to open the Exhibitor Information window.
- Click More, and select Contact Maintenance.

2. Click Add/Delete Contacts to open the Manage Contacts window.
3. Click Edit, and add a contact by doing one of the following:

- Double-click an individual in the list of Available Contacts to add them to the list of Current Exhibitor Contacts (linked by CO_ID).
- Click Load Previous Expo to add contacts from a previous exposition.
- Click Member Lookup to find an individual contact.

4. Click Save, and return to the Exhibitor Contacts window.
5. Select an exhibitor contact, and click Edit.
6. Assign a contact type to the selected contact (select a type from Assign Contact Type to selected contact), and click Save.

To delete a contact

1. Open the Exhibitor Contacts window:

- From Exposition, select View exhibitor information to open the View exhibitor information window.
- Click Open to display the Exposition Search window, and double-click an exposition.

- Double-click an exhibitor to open the Exhibitor Information window.
- Click More, and select Contact Maintenance.

2. Click Add/Delete Contacts to open the Manage Contacts window.
3. Click Edit.
4. Double-click a contact in the list of Current Exhibitor Contacts to remove the contact from the list.
5. Click Save.

To view a list of contacts

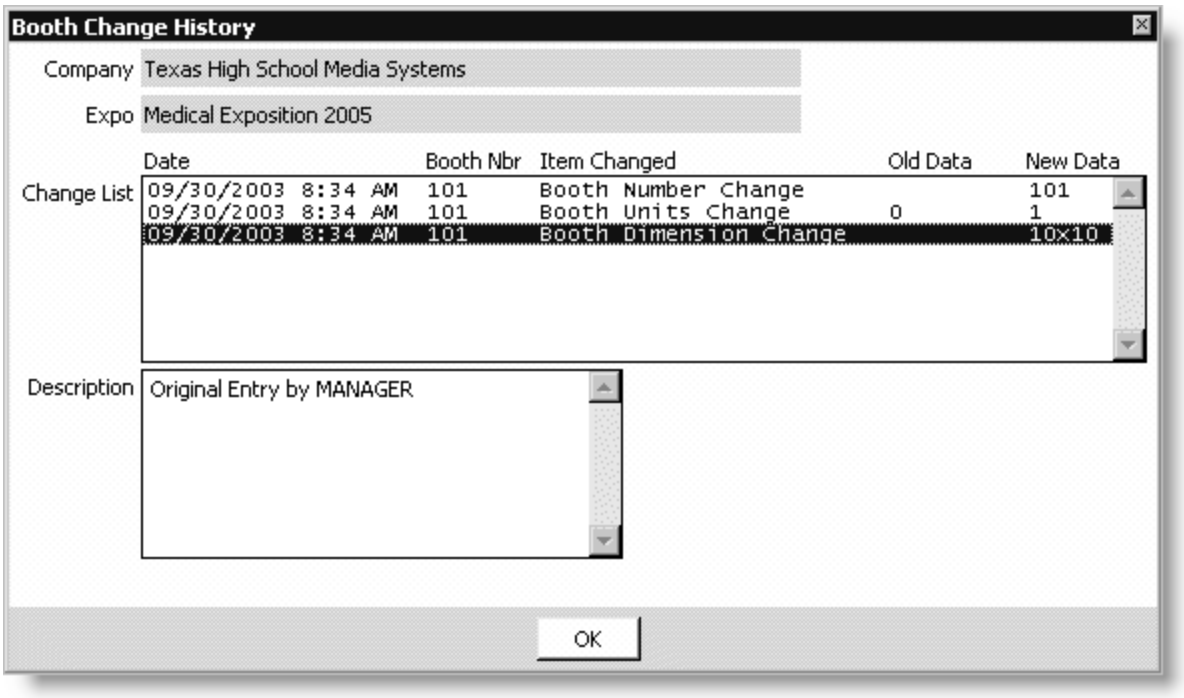
1. From Exposition, select View exhibitor information to open the View exhibitor information window.
2. Click Open to display the Exposition Search window, and double-click an exposition.
3. Double-click an exhibitor to open the Exhibitor Information window.
4. Click More, and select Display Contacts List.

> **Note:** Note: The contacts list can be set to display automatically if you enable the Contacts Pop Up Window option on the Expo Options window.

Viewing Booth Changes

Use the Booth Change History window to view a history of all booth changes related to a particular exhibitor.

Booth Change History window



From Exposition, select View exhibitor information, open an exposition, double-click an exhibitor, click More, and select Booth Changes

Company

Displays the name of the exhibiting company.

Expo

Displays the name of the current exposition.

Change List

Lists all changes for booths.

Description

Lists all additional booth-change information.

To view booth changes

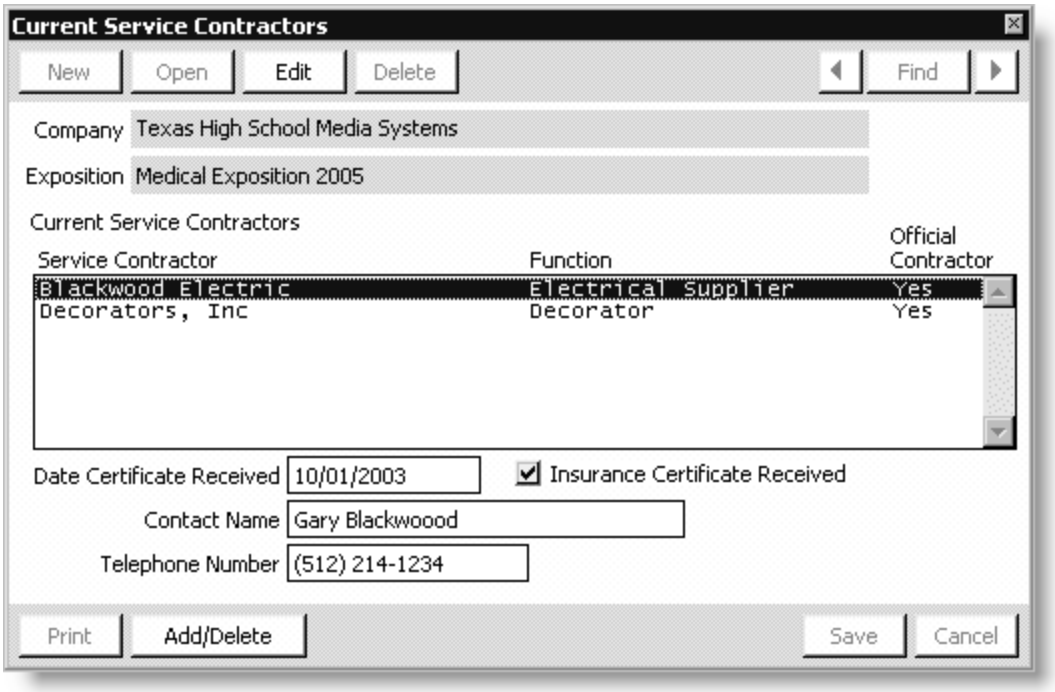
1. From Exposition, select View exhibitor information to open the View exhibitor information window.

2. Click Open to display the Exposition Search window, and double-click an exposition.
3. Double-click an exhibitor to open the Exhibitor Information window.
4. Click More, and select Booth Changes.
5. Select an item from the Change List to see a Description of any booth changes (and who made the changes).

Managing Service Contractors

Use the Service Contractor Find window to add and delete service contractors for an exhibiting company. You also can edit a service contractor's information using the Current Service Contractor window, which you access through the Service Contractor Find window.

Current Service Contractors window



From Exposition, select View exhibitor information, open an exposition, double-click an exhibitor, click More, and select Service Contractors

Company

Displays the name of the exhibiting company.

Exposition

Displays the selected exposition.

Current Service Contractors

Service Contractor - Displays the name of the selected service contractor.

Function - Displays the service contractor's specialty.

Official Contractor - Indicates whether the selected contractor is an authorized contractor.

Date Certificate Received

Enter the date when the contract with the contractor is received.

Insurance Certificate Received

Enable to indicate that an insurance certificate was received from the contractor.

Contact Name

Enter the name of the contact for the service contractor.

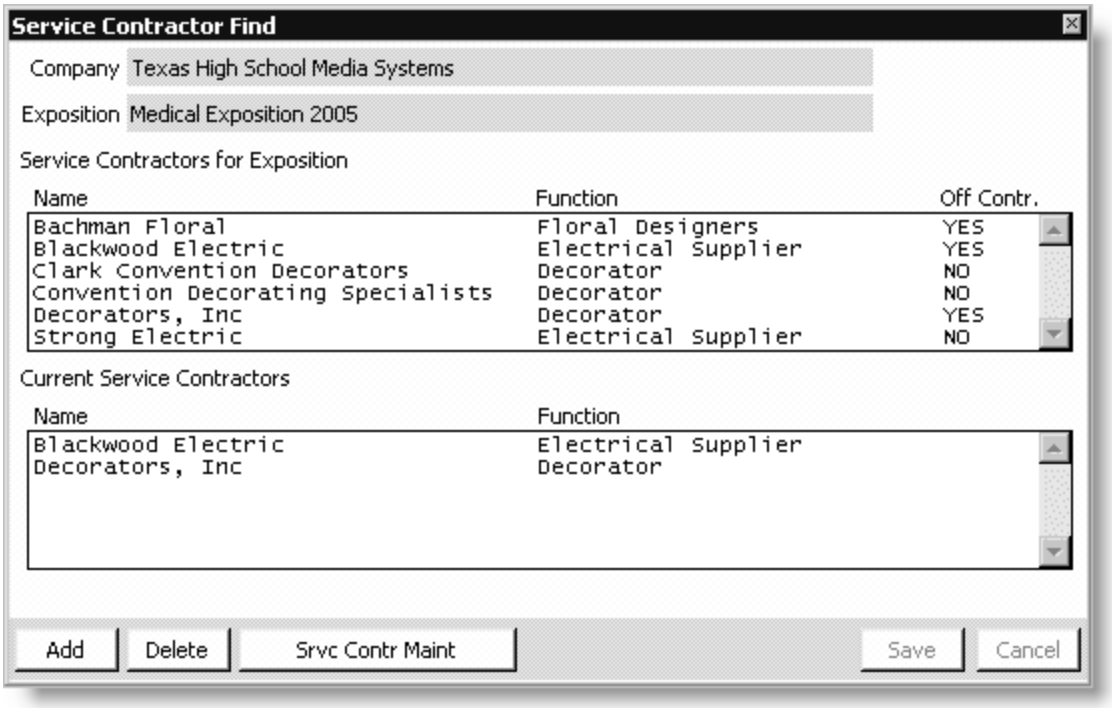
Telephone Number

Enter the contact's telephone number.

Add/Delete button

Opens the Service Contractor Find window used for adding and deleting service contractors.

Service Contractor Find window



From Exposition, select View exhibitor information, open an exposition, double-click an exhibitor, click More, select Service Contractors, and click Add/Delete

Company

Displays the name of the exhibiting company.

Exposition

Displays the name of the selected exposition.

Service Contractors for Exposition

Lists exposition service contractors available to exhibiting companies. This list is generated from the exposition's Service Contractor Maintenance window.

Current Service Contractors

Displays the contractors currently assigned to the exhibitor for the exposition.

Add button

Click to add a contractor to the list of Current Service Contractors for an exhibiting company.

Delete button

Click to delete a contractor from the list of Current Service Contractors for an exhibiting company.

Srvc Contr Maint button

Opens the Service Contractor Maintenance window used for defining service contractors. See Managing Service Contractors for more.

To add a service contractor

1. Open the Current Service Contractors window:

- From Exposition, select View exhibitor information to open the View exhibitor information window.
- Click Open to display the Exposition Search window, and double-click an exposition.
- Double-click an exhibitor to open the Exhibitor Information window.
- Click More, and select Service Contractors.

2. Click Add/Delete to open the Service Contractor Find window.
3. Select a contractor from the Service Contractors for Exposition list, and click Add to move the contractor to the list of Current Service Contractors.
4. Click Save, and return to the Current Service Contractors window.
5. Select a contractor from the list of Current Service Contractors, and enter all applicable information for the contractor.
6. Click Save.

To delete a service contractor

1. Open the Current Service Contractors window:

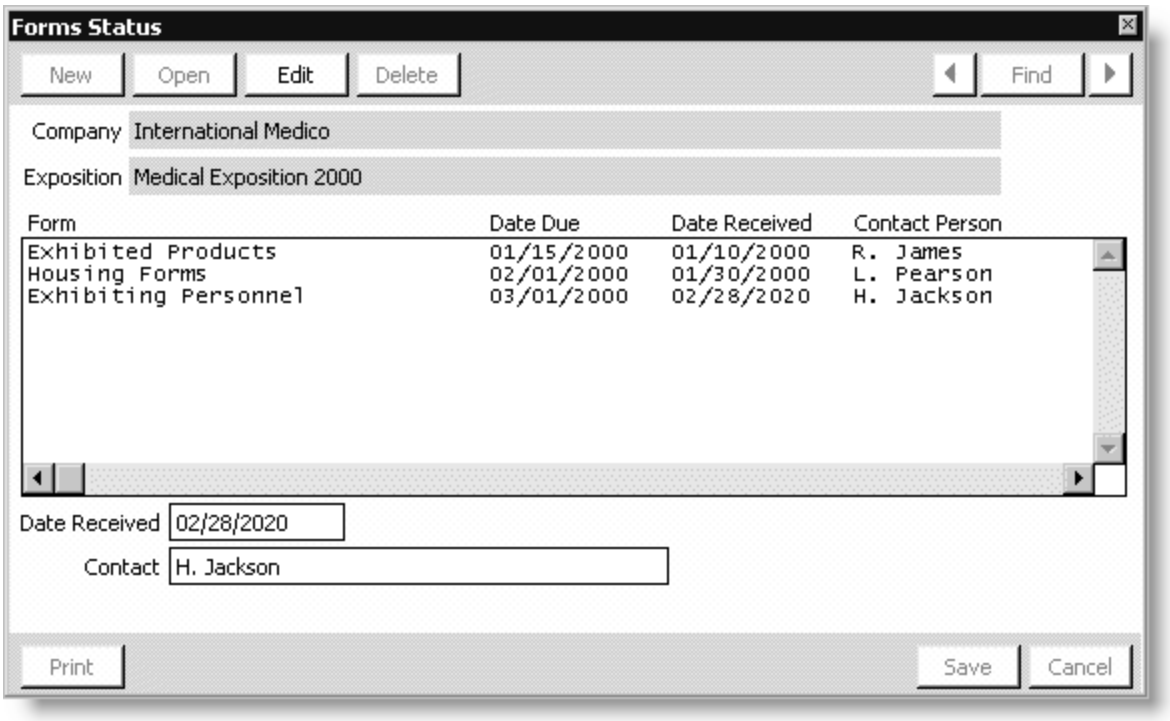
- From Exposition, select View exhibitor information to open the View exhibitor information window.
- Click Open to display the Exposition Search window, and double-click an exposition.
- Double-click an exhibitor to open the Exhibitor Information window.
- Click More, and select Service Contractors.

2. Click Add/Delete to open the Service Contractor Find window.
3. Select a contractor from the list of Current Service Contractors, and click Delete to move the contractor to the Service Contractors for Exposition list. A message prompts you to verify deleting the contractor.
4. Click Yes.
5. Click Save.

Tracking Forms

When you define an exposition, you identify the required forms. You can track these forms through the Forms Status window.

Forms Status window



From Exposition, select View exhibitor information, open an exposition, double-click an exhibitor, click More, and select Form Tracking

Company

Displays the name of the exhibiting company.

Exposition

Displays the name of the current exposition.

Form

Lists all forms identified when you defined the exposition and includes the following:

- Date Due - Displays the date the form should be returned to the contact.
- Date Received - Displays the date that this form was received by the contact.
- Contact - Displays the name of the individual who is the contact for the form.
- Date Received - Enter the date the form was returned.

Contact

Enter the name of the contact person for the form.

To track forms

Forms are added to an exposition when an exposition is set up. If a form you are processing is not on the list, you must add the form to the exposition. (See Managing Exposition Forms.)

1. Open the Forms Status window:

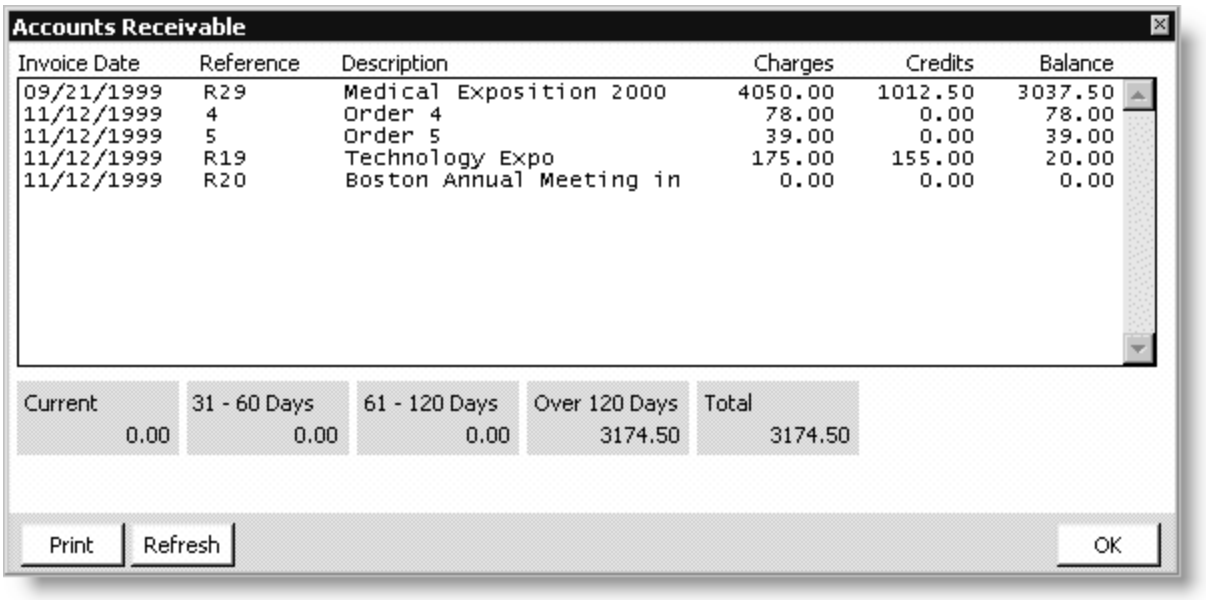
- From Exposition, select View exhibitor information to open the View exhibitor information window.
- Click Open to display the Exposition Search window, and double-click an exposition.
- Double-click an exhibitor to open the Exhibitor Information window.
- Click More, and select Form Tracking.

2. Select one of the forms listed on the Forms Status window.
3. Click Edit.
4. Enter the Date Received.
5. Enter the Contact for this form.
6. Click Save.

Viewing an Exhibitor's Ledger

The Accounts Receivable window displays an exhibitor's cash transactions, and the Transaction Ledger window displays the details of each cash transaction.

Accounts Receivable window



From Exposition, select View exhibitor information, open an exposition, double-click an exhibitor, click More, and select AR Ledger

Invoice Date

Displays the invoice issue date.

Reference

Displays the product order number the invoice is referencing.

Description

Displays a brief description of the order the invoice is referencing.

Charges

Displays the charges for the invoiced item.

Credits

Displays the credits (if any) for the invoiced item.

Balance

Displays the outstanding balance for the invoiced item.

Current

Displays the outstanding balance for which payments are current.

31 - 60 Days

Displays the outstanding balance for which payments are late by 31 to 60 days.

61 - 120 Days

Displays the outstanding balance for which payments are late by 61 to 120 days.

Over 120 Days

Displays the outstanding balance for which payments are late by over 120 days.

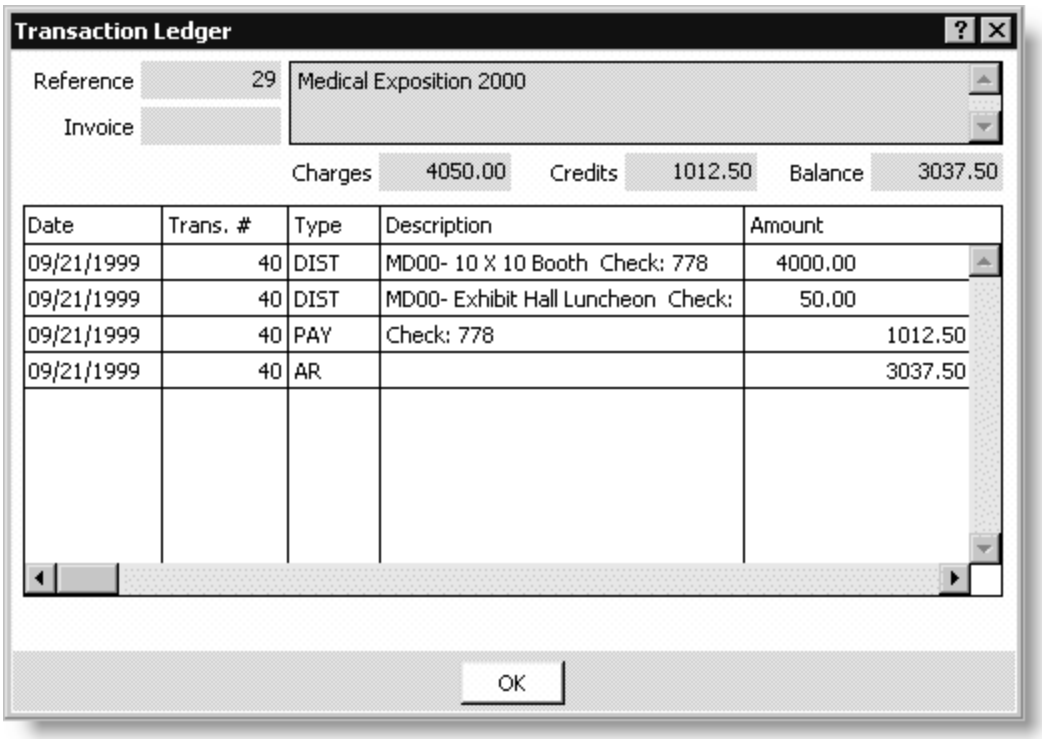
Total

Displays the total outstanding balance for all invoiced items.

Refresh button

Click to refresh the information displayed on the window.

Transaction Ledger window for Exhibitors



From Exposition, select View exhibitor information, open an exposition, double-click an exhibitor, click More, select AR Ledger, and double-click a transaction

Reference

Displays the product order number.

Invoice

Displays the invoice number of the transaction.

Description

Displays the name of the exposition.

Charges

Displays the total charges of the transaction.

Credits

Displays the total credits of the transaction.

Balance

Displays the total balance of the transaction.

To view an exhibitor's ledger

1. Open the Accounts Receivable window:

- From Exposition, select View exhibitor information to open the View exhibitor information window.
- Click Open to display the Exposition Search window, and double-click an exposition.
- Double-click an exhibitor to open the Exhibitor Information window.
- Click More and select AR Ledger.

2. Double-click a line item to open the Transaction Ledger window and view the details of the transaction.

Prospect Lists

Overview of prospect lists

In Exposition Management, prospects are managed primarily as lists, and you add and modify prospects throughout the exposition management process. See Managing Exposition Prospects for more on setting up prospect lists.

Loading Prospect Lists

On the Manage prospect lists window, you can view all prospects for an exposition as well as any individual prospect lists you have created. You also can change a prospect's status, add prospects, view a prospect's activity records, and view a prospect's exposition and registration history.

By default, the number of records that will display on the Manage prospect lists window is 5000. This default can be overridden using the following iSQL statement:

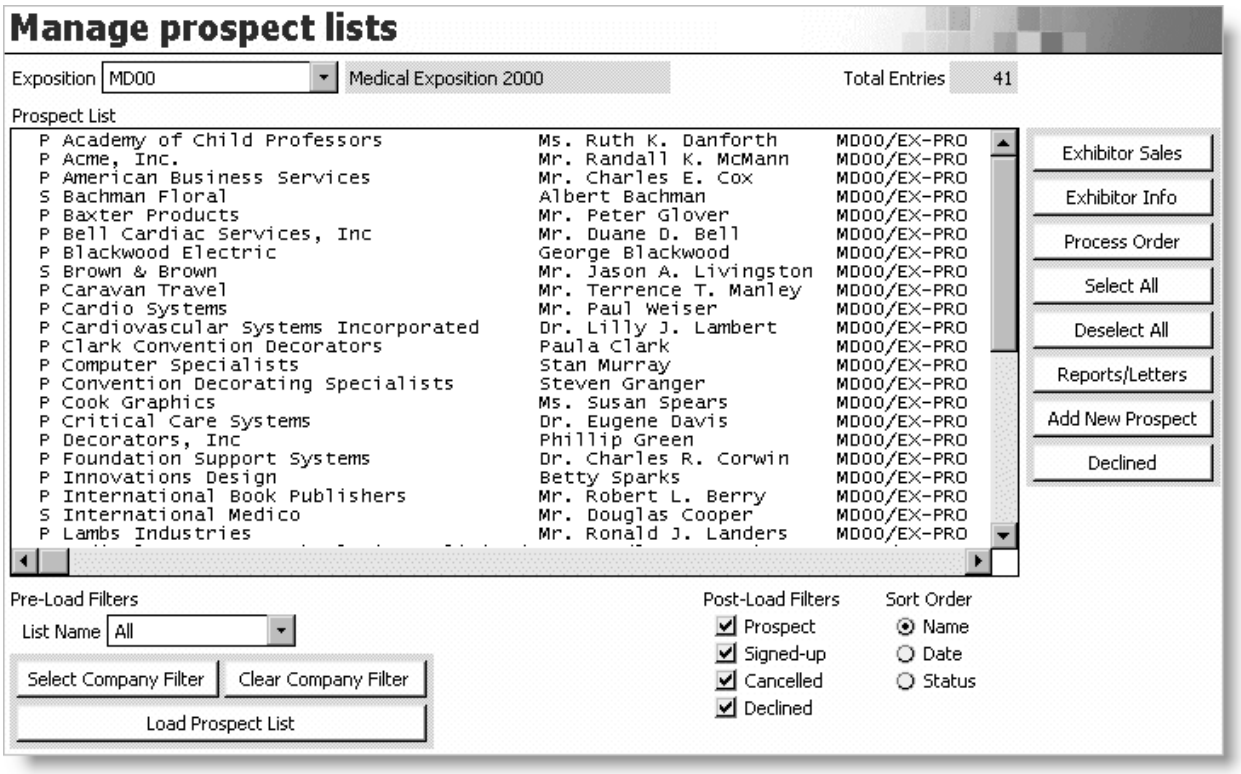
Update System_Params

Set ShortValue = 'xxxx' where ParameterName = 'ExpoControlProspectListMax'

The new default will equal 'xxxx'.

Note: Note: ASI recommends that individual prospect lists be reduced to 5000 or fewer records whenever possible. This will avoid the use of excessive resources.

Manage prospect lists window



From Exposition, select Manage prospect lists

Exposition

Select an exposition from the list. A detailed Description of the exposition displays to the right.

Total Entries

Displays the total number of prospects.

Prospect List

Lists all prospects for the exposition, including name, date, and status. Scroll to the right to see the prospect's last activity and customer type.

Pre-Load Filters

List Name - Select the list of prospects you want to display.

If Enforce list Security by Logon Id is enabled when defining the exposition, only the prospect list assigned to the logon name for a specific iMIS user will display. See Defining Exposition Options for more.

Post-Load Filters

Prospect - Enable to display prospects that have not signed up (and are not on the wait list) but have not declined to exhibit.

Signed-up - Enable to display prospects who already have purchased an exposition product.

Cancelled - Enable to display prospects who have canceled an order.

Declined - Enable to display prospects who have declined to exhibit.

Sort Order

Name - Enable to list prospects alphabetically by last name.

Date - Enable to list prospects by the date that prospect was first added or entered.

Status - Enable to list prospects according to status (Prospect, Signed up, Canceled, or Declined).

Select Company Filter button

Opens the Select Company Filter window to display specific company records.

Clear Company Filter button

Click to clear the filter entered on the Select Company Filter window.

Load Prospect List button

Click to display the prospect list.

Exhibitor Sales button

Opens the Expo Sales window, which lists the exhibiting company's sales activities. You also can view predefined scripts for soliciting exhibitors and information about reserved booths.

Exhibitor Info button

Opens the Exhibitor Information window used for defining exposition-specific information for the exhibitor, such as products exhibited or contractors selected. See Entering Exhibitor Information for detailed information.

Process Order button

Opens the Exposition Orders window used for entering and editing orders. See Processing Orders (see "Exposition Orders") for detailed information.

Select All button

Click to select all records. iMIS places a > next to all records, indicating they are selected.

Deselect All button

Deselects all records. iMIS removes the > next to all records, indicating they are no longer selected.

Reports/Letters button

Opens the Expo Prospect Reports window used for processing letters, labels, and mail merges.

Add New Prospect button

Opens the Add a Prospect window used for adding individual prospects to the prospect list.

Declined button

Click to set the selected prospect's status to Declined.

To load a prospect list

1. From Exposition, select Manage prospect lists to open the Manage prospect lists window.
2. Select an Exposition from the list.
3. Filter the list:

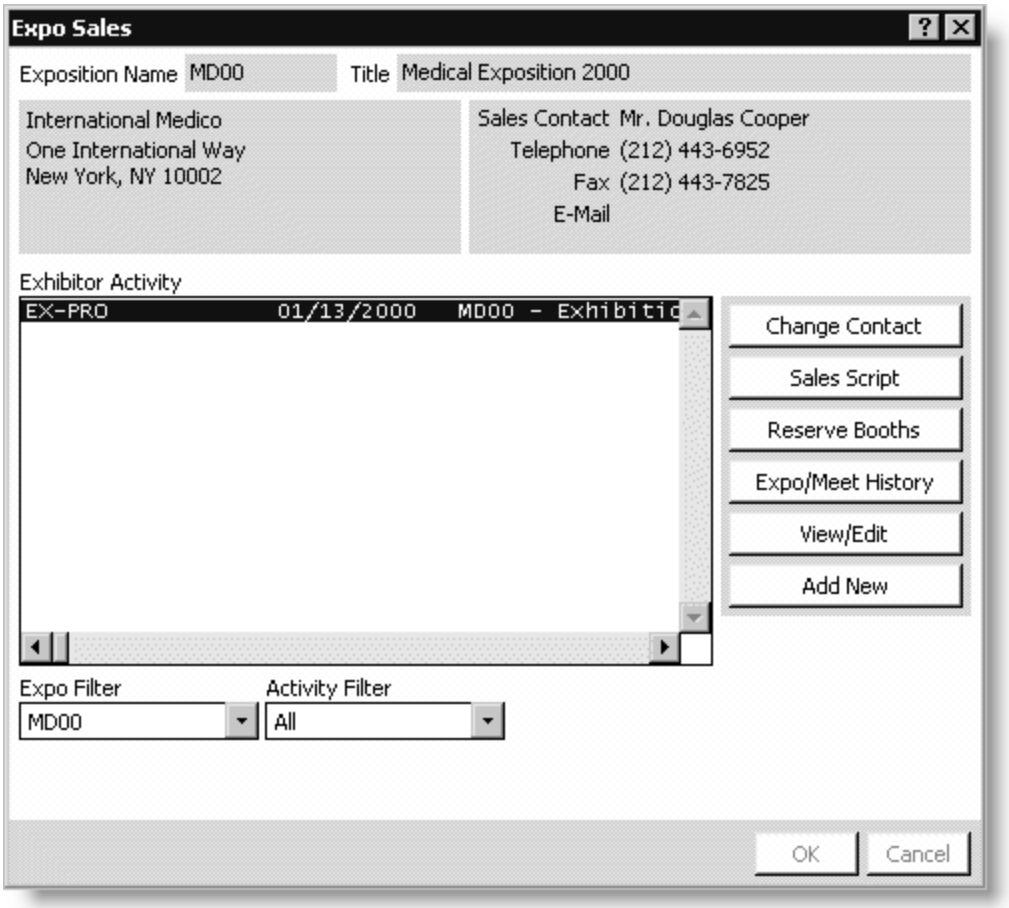
- Select a List Name filter (defaults to All).
- (optional) Click Select Company Filter to open the Select Company Filter window. Enter a company search string. For example, enter a C to view all companies that start with the letter C.

4. Click Load Prospect List to display a list of prospects. If a message prompts you to narrow your search, click OK, and refine your prospect list filters.

Managing Exhibitor Sales

Use the Expo Sales window to manage exhibitor and prospect sales.

Expo Sales window



From Exposition, select Manage prospect lists, select an exposition, click Load Prospect List, and click Exhibitor Sales

Exposition Name

Displays the exposition where the company is exhibiting.

Title

Displays the title of the exposition.

Exposition Address

Displays the address of the exposition.

Contact Information

Displays the exposition's contact information.

Exhibitor Activity

Lists the prospect's exposition-related activities.

Expo Filter

Select an exposition for the prospect whose activities you want to view (defaults to current exposition). When both the Expo Filter and Activity Filter are set to ALL, all activities (regardless of type) display for the prospect.

Activity Filter

Select an activity type for the prospect whose activities you want to view (defaults to ALL - which includes user defined activities).

Change Contact button

Opens the Find window where you can select and assign another sales contact from the customer database. See Finding Exposition Orders for more.

Sales Script button

Opens the Sales Script window where you can predefine your sales scripts.

Reserve Booths button

Opens the Reserve Products window to reserve products for the prospect.

Expo/Meet History button

Opens the Expositions/Meetings for (Name of exhibitor) window where you can view the Current Expos/Meetings for which the prospect is registered and their Attendance History.

View/Edit button

Opens the prospect's Activity Detail window. See Enabling System Options for more on exposition activities.

Add New button

Opens the Activity Detail window where you can add an activity for the prospect. See Enabling System Options for more on exposition activities.

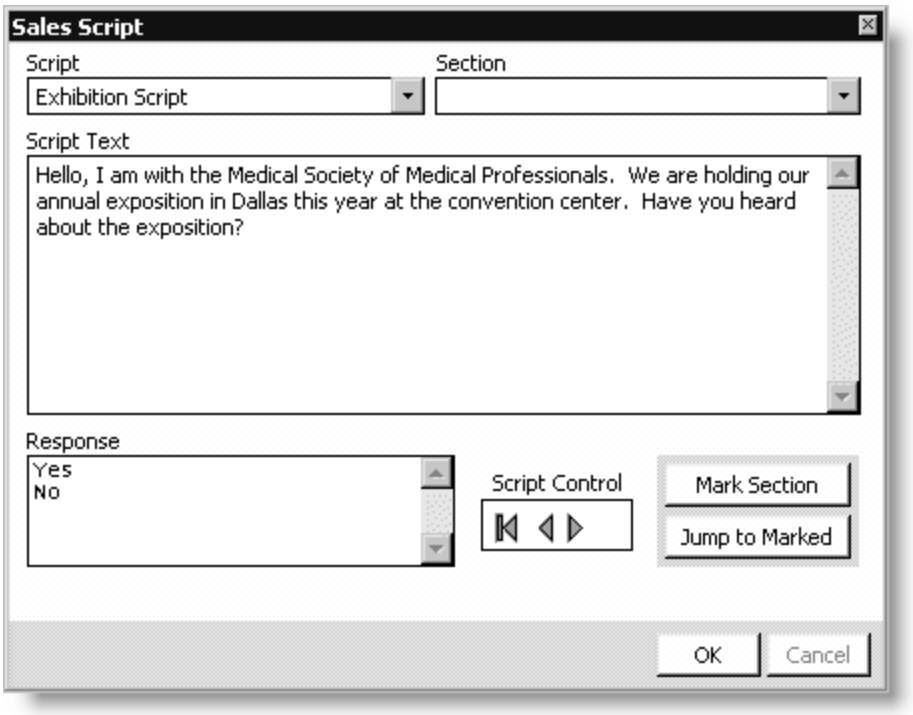
To open the Expo Sales window

1. From Exposition, select Manage prospect lists to open the Manage prospect lists window.
2. Load a prospect list. See To load a prospect list for more.
3. Select a prospect from the Prospect List.
4. Click Exhibitor Sales.

Using Sales Scripts

Using a standard sales script for your exposition allows you to have multiple salespeople even if they are not members of your staff. Using the script you created for the exposition, which includes prompts for each response, all salespeople appear knowledgeable about the show.

Sales Script window



From Exposition, select Manage prospect lists, select an exposition, click Load Prospect List, click Exhibitor Sales, and click Sales Script

Script

Select a list.

Section

Select a section of a list.

Script Text

Displays the text of the selected section.

Response

Lists responses associated with the selected section.

Script Control

Select to move forward and backward through the script sections.

Mark Section button

Click to mark a section of the script.

Jump to Marked button

Click to jump to marked sections of the script.

To use sales scripts

1. Open the Expo Sales window:

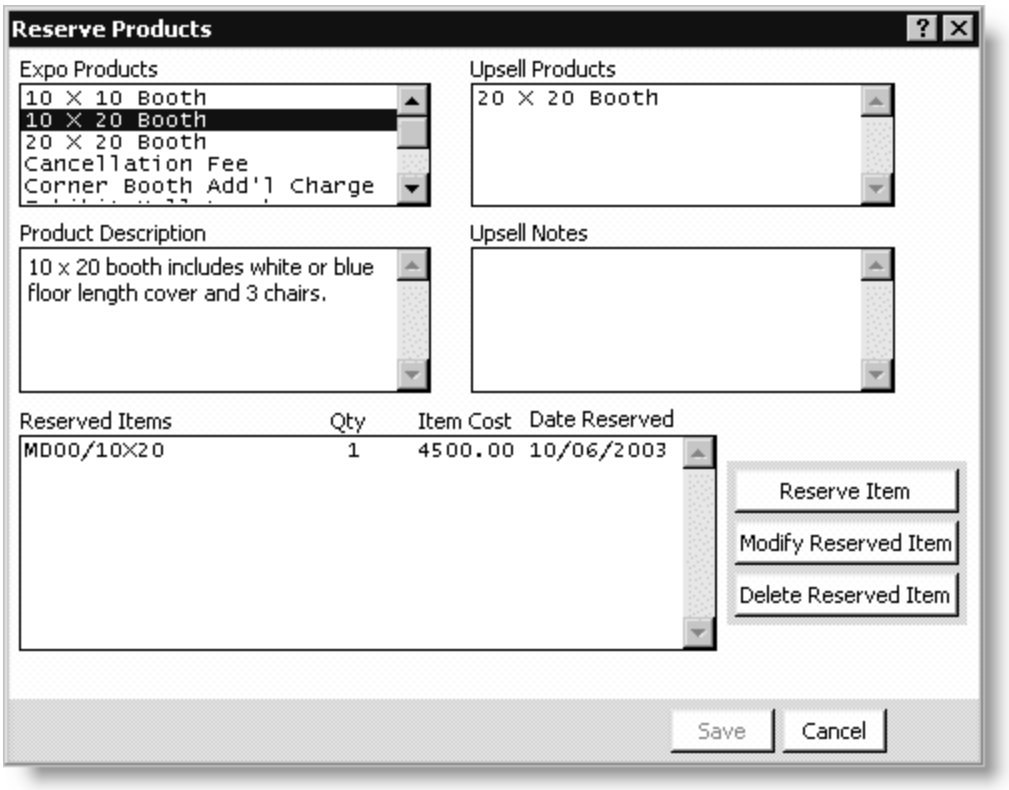
- From Exposition, select Manage prospect lists to open the Manage prospect lists window.
- Load a prospect list. See To load a prospect list for more.
- Select a prospect from the Prospect List.
- Click Exhibitor Sales.

2. Click Sales Script to open the Sales Script window.
3. Select a Script from the drop-down list.
4. Select a script Section from the drop-down list. The Script Text displays.
5. Read the script text, and double-click the appropriate Response. Based on the response you select, move to the next appropriate section.
6. Click Mark Section to put a temporary placeholder on a section. You can continue to move forward with the script, but if you need to return to the marked section, click Jump to Marked.
7. Click the Script Control arrows to jump back to the beginning of your script or to move forward or backward through the script.
8. Click OK.

Reserving Products

Use the Reserve Products window to reserve booths and other exposition products. Reserving an exposition product is not the same as ordering an exposition product. Unlike orders, reservations usually are made without payments or contracts.

Reserve Products window



From Exposition, select Manage prospect lists, select an exposition, click Load Prospect List, click Exhibitor Sales, and click Reserve Booths

Expo Products

Select from a list of available exposition products.

Upsell Products

Select from a list of available upsell products for the product selected from the list of Expo Products.

Product Description

Displays a description of the selected exposition product.

Upsell Notes

Displays comments relating to the selected upsell exposition product.
The upsell product must be selected for the note to display.

Reserved Items

Lists reserved exposition products.

Qty

Displays the number of reserved exposition products.

Item Cost

Displays the cost of the reserved exposition product.

Date

Displays the date the exposition product was reserved.

Reserve Item button

Opens the Reservation window where you can select from the list of available booths.

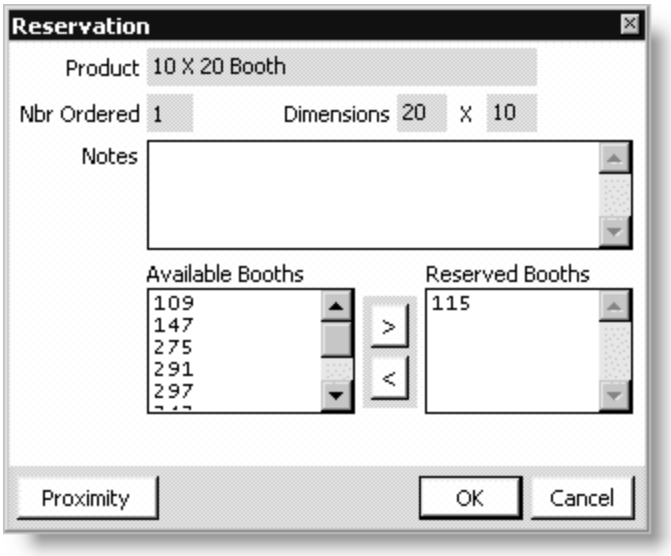
Modify Reserved Item button

Opens the Reservation window where you can modify the reservation information for the selected product.

Delete Reserved Item button

Click to delete the selected product from the list of Reserved Items.

Reservation window



From Exposition, select Manage prospect lists, select an exposition, click Load Prospect List, click Exhibitor Sales, click Reserve Booths, select a product, and click Reserve Item

Product

Displays the selected product.

Nbr Ordered

Displays the number of the selected products ordered.

Dimensions

Displays the dimensions of the selected product.

Notes

Displays additional information about the product.

Available Booths

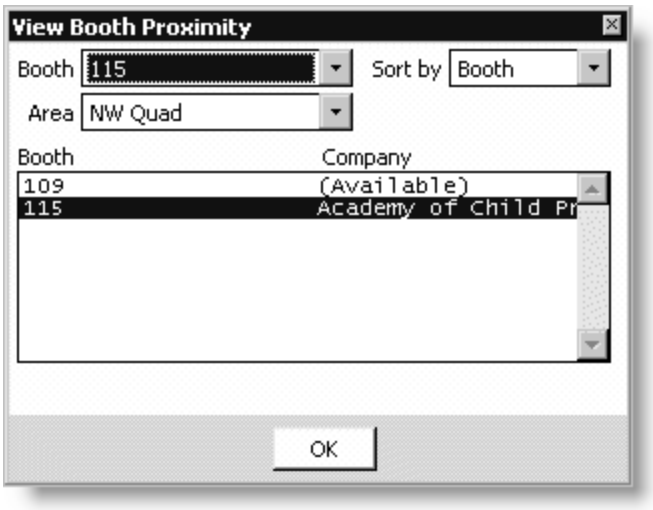
Lists the booths that are available.

Reserved Booths

Lists the booths that have been reserved.

Proximity button

Opens the View Booth Proximity window.



Booth - Select a booth.

Sort by - Select a sort method.

Area - Select an area of proximity.

To reserve a product and view booth proximity

1. Open the Expo Sales window:

- From Exposition, select Manage prospect lists to open the Manage prospect lists window.
- Load a prospect list. See To load a prospect list for more.
- Select a prospect from the Prospect List.
- Click Exhibitor Sales.

2. Click Reserve Booths to open the Reserve Products window.
3. Select a product from the list of Expo Products.
4. Click Reserve Item to open the Reservation window.
5. Double-click a booth from the Available Booths list to move the booth to the Reserved

Booths list.

6. (optional) View booth proximity:

- Click Proximity to open the View Booth Proximity window.
- Select a Booth for the product selected on the Reserve Products window.
- Select the proximity Area.
- Click OK to return to the Reservation window.

7. Click OK to return to the Reserve Products window.
8. Click Save.

> **Note:** Note: At this point, the EX-RES activity is created for the reserved product (s). This activity is deleted once the booth size that was reserved is actually ordered. Reserved products display as “reserved” when processing booth inventory assignments for other orders, which can be viewed on the Booth Inventory Assignment window.

> **Note:** Note: See Enabling System Options for more on activities.

To modify or delete a reserved product

1. Open the Expo Sales window:

- From Exposition, select Manage prospect lists to open the Manage prospect lists window.
- Load a prospect list. See To load a prospect list for more.
- Select a prospect from the Prospect List.
- Click Exhibitor Sales.

2. Click Reserve Booths to open the Reserve Products window.
3. Select the product from the list of Expo Products that you want to modify or delete.

4. (optional) To modify a product, do the following:

- Click Modify Reserved Item to open the Reservation window.
- Make any necessary changes.
- Click OK to return to the Reserve Products window.
- Click Save.

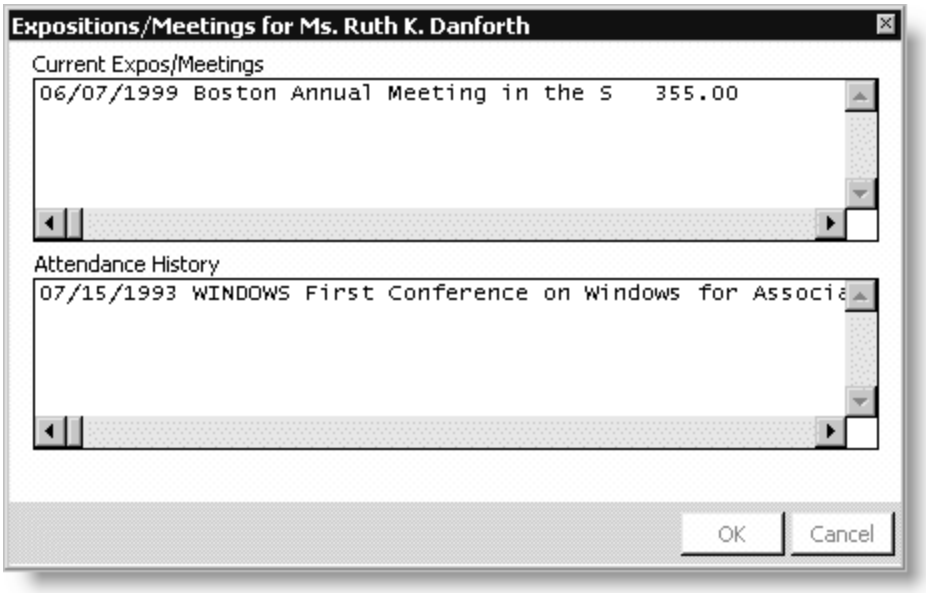
5. (optional) To delete a product, do the following:

- Click Delete Reserved Item.
- Click Save.

Viewing Exposition History

Use the Expositions/Meetings for window to track your prospects' exhibit history with your organization.

Expositions/Meetings for window



From Exposition, select Manage prospect lists, select an exposition, click Load Prospect List, click Exhibitor Sales, and click Expo/Meet History

Current Expos/Meetings

Displays the expositions and events for which the prospect is currently registered.

Attendance History

Displays the prospect's attendance history.

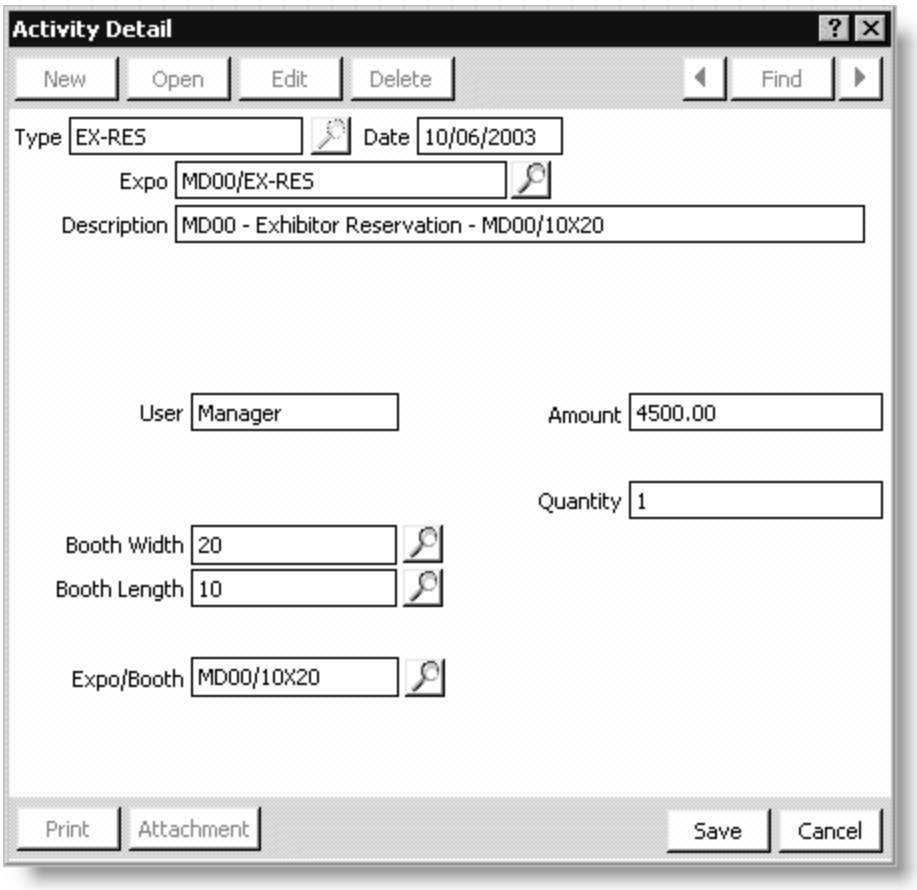
To view a prospect's exposition order history

1. From Exposition, select Manage prospect lists to open the Manage prospect lists window.
2. Load a prospect list. See To load a prospect list for more.
3. Select a prospect.
4. Click Exhibitor Sales to open the Expo Sales window.
5. Click Expo/Meet History to open the Expositions/Meetings for window, which displays all expositions and events the prospect has attended.

Managing Activity Records for Exhibitors

Through the Expo Sales window, you can access the Activity Detail window and add information to an exhibitor's activity record.

Exposition Activity Detail window



From Exposition, select Manage prospect lists, select an exposition, click Load Prospect List, click Exhibitor Sales, and click View/Edit

Type

Select an activity type, such as CALL, COMMITTEE, or EXPO. Select the Find icon to look up an activity type.

Date

Enter the date of the activity.

Additional Fields

Additional fields display on the Activity Detail window depending on the activity type and which user-defined fields are mapped to the window. See Enabling System Options for more on mapping user-defined fields and default exposition activity types.

Attachment button

Not applicable.

To view or edit an Exposition activity record

1. Open the Expo Sales window:
   - From Exposition, select Manage prospect lists to open the Manage prospect lists window.
   - Load a prospect list. See To load a prospect list for more.
   - Select a prospect from the Prospect List.
   - Click Exhibitor Sales.
2. Select an Expo Filter and an Activity Filter.
3. Select the Exhibitor Activity you want to view.
4. Click View/Edit to open the Activity Detail window.
5. (optional) Make any necessary changes.
6. Click Save.

To add an activity record

1. Open the Expo Sales window:
   - From Exposition, select Manage prospect lists to open the Manage prospect lists window.
   - Load a prospect list. See To load a prospect list for more.
   - Select a prospect from the Prospect List.
   - Click Exhibitor Sales.

2. Click Add New to open the Activity Detail window.
3. Enter an Activity Type (select the Find icon to look up an activity type). Press Tab to display the appropriate fields for the activity type.
4. Enter all applicable information.
5. Click Save.

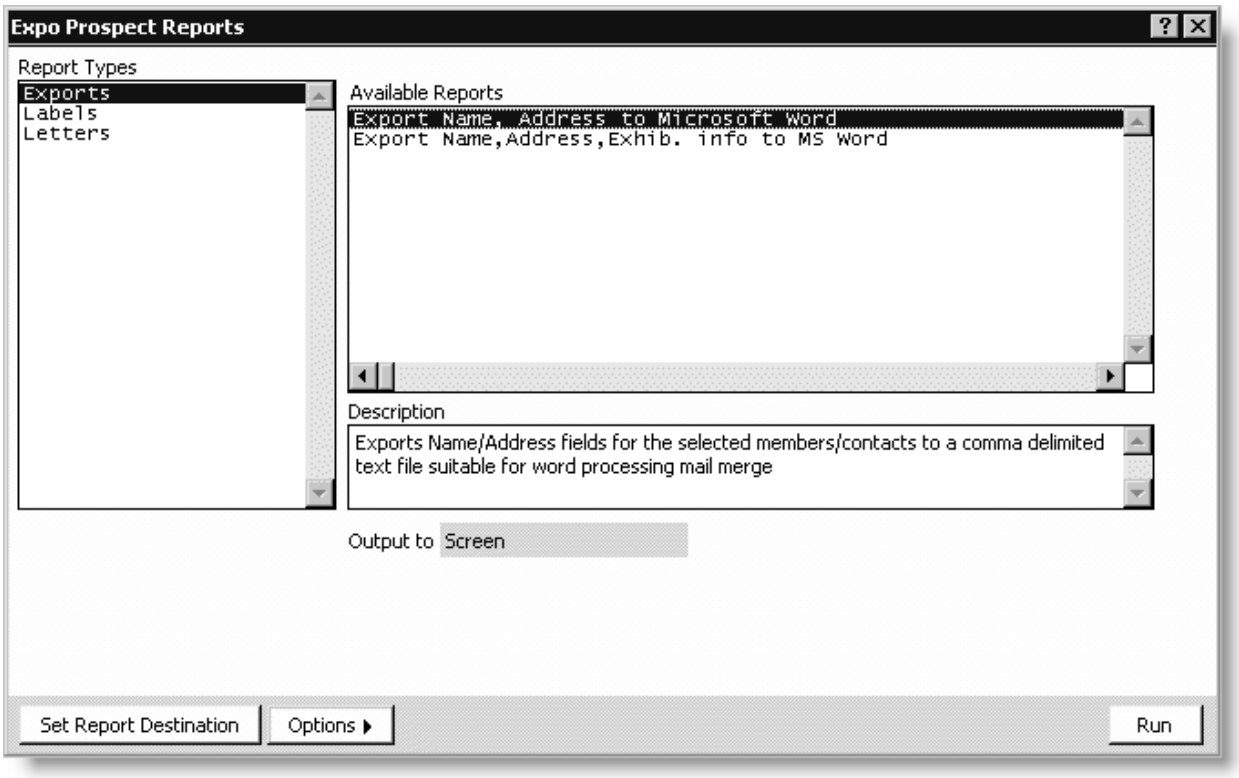
To view Exposition activities from Customer Management

1. From Customers, select Manage customers to open the Manage customers window.
2. Click Open or Find to find a record.
3. Select the Exposition tab, and double-click an activity to open the Process booth orders window.

Generating Expo Letters and Reports

Exposition Management allows you to generate standard letters and labels, and create exports for mail merges from the Manage prospect lists window. This is convenient when you want to send just one letter. Letters can be generated for one prospect or multiple prospects, and you can generate reports by selecting all prospects or just those from specified prospect lists. You also can generate an export report in the Expo Sales window for an individual prospect.

Expo Prospect Reports window



From Exposition, select Manage prospect lists, select an exposition, click Load Prospect List, and click Reports/Letters

Report Types

Lists available report types.

Available Reports

Lists available reports for the selected Report Type.

Description

Displays a description of the report you have selected.

Output to

Displays the report destination.

Set Report Destination button

Opens the Report Destination window to select the report destination, such as Printer or Screen.

Options button

Click to display a menu of options available for the selected report. Options are disabled when they are not available for a selected report.

- Margins - available for Labels Report Types
- Search Format - available for all Report Types
- Sort Fields - available for all Report Types
- Export Format - available for Exports Report Types
- Additional Fields - available for Labels Report Types
- Letter Text - available for Letters Report Types
- Save - available for all Report Types
- Save As - available for all Report Types

Run button

Click to generate the letter or report you have selected.

To generate a report from the Expo Prospect Reports window

1. Open the Expo Prospect Reports window:

- From Exposition, select Manage prospect lists to open the Manage prospect lists window.
- Load a prospect list. See To load a prospect list for more.
- Select a prospect (or prospects) from the Prospect List.
- Click Select All to select all prospects.
- Click Reports/Letters.

2. Select a report type from the list of Report Types.
3. Select a report from the list of Available Reports.
4. Click Set Report Destination, and set the report destination.
5. Click Run to generate the letter.

To create or edit a letter from the Expo Prospect Reports window

1. Open the Expo Prospect Reports window:

- From Exposition, select Manage prospect lists to open the Manage prospect lists window.
- Load a prospect list. See To load a prospect list for more.
- Select a prospect (or prospects) from the Prospect List.
- Click Select All to select all prospects.
- Click Reports/Letters.

2. Select Letters from the list of Report Types.
3. Select a letter from the list of Available Reports.
4. Click Options, and select Letter Text to open the Letter Text window.
5. Edit the text of the letter.
6. To save the edited letter as a new letter, do the following:

- Click Save as Standard to open the Letter Name window.
- Enter the name of the new letter.
- Click Save.

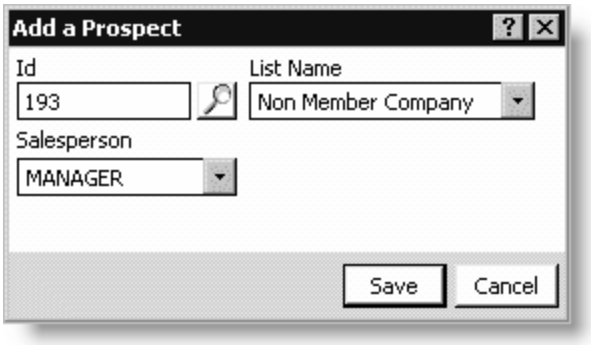
7. Click Print to generate the letter.

Adding Prospects

Exposition Management gives you the flexibility to add new prospects to existing prospect lists while marketing your expositions. All new prospects must have a record in the customer database.

> **Note:** Note: To allow your salespeople to add prospects, you must enable the Allow Sales People to Add Prospects option on the Expo Sales window.

Add a Prospect window



From Exposition, select Manage prospect lists, select an exposition, click Load Prospect List, and click Add New Prospect

Id

Enter the ID of the prospect you are adding. Select the Find icon to look up an ID.

List Name

Select a prospect list.

Salesperson

Select a salesperson.

To add a prospect

1. From Exposition, select Manage prospect lists to open the Manage prospect lists window.

2. Select an Exposition.
3. Click Add New Prospect to open the Add a Prospect window.
4. Enter the prospect's Id (select the Find icon to look up an ID). If adding a new prospect that does not have an ID, do the following:

- Press Tab in the Id field to open the Expo Prospect - Name/Address window.
- Enter a Member Type (required) and all other applicable information about the new prospect.
- Click Save to return to the Add a Prospect window.

5. Select a List Name (select NONE if you do not want to assign the prospect to a specific list).
6. Select a Salesperson (select NONE if you do not want to assign the prospect to a specific salesperson).
7. Click Save.

Booth Preferences

Overview of booth preferences

Many organizations sell their booth products using a lottery method - assigning booth preferences to exhibitors based on priority points or rank rather than the first-come, first-served method. Using a lottery system, exhibitors select first, second, third, and succeeding booth preferences.

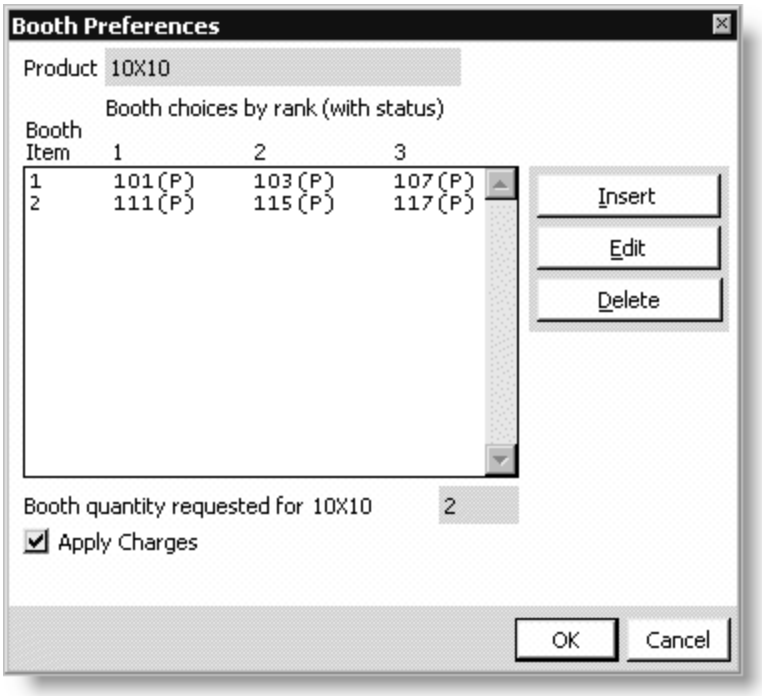
Exhibitors usually are assigned booth preferences based on exhibition history, amount of space purchased, date of contract, or other criteria useful in establishing exhibitor rank. iMIS Exposition Management enables you to enter booth preferences for exhibitors and then assign booths based on your established criteria.

Assigning Exhibitor Booth Preferences

iMIS Exposition Management enables you to assign exhibitor booth preferences for pending expositions (P status). If Check Booth Inventory for Preferences is enabled on the exposition's Expo Options window, you can assign booth preferences only for inventoried booths (see Managing Booth Inventory for additional information).

Enter exhibitor booth preferences on the Booth Preferences and Preference Booth Select windows.

Booth Preferences window



From Exposition, select Process booth orders, insert or edit an order for an exposition with a P status, and double-click a booth product

Product

Displays the selected booth.

Booth Item

Displays the sequentially numbered booth products that have been purchased.

Booth choices by rank (with status)

Displays the exhibitor's booth preferences. For example, an exhibitor selects booth 101 as the first choice, booth 103 as the second choice, and booth 105 as the third choice for the first Booth Item.

Insert button

Opens the Preference Booth Select window to enter an exhibitor's preferred booth numbers.

Edit button

Opens the Preference Booth Select window to edit an exhibitor's preferred booth numbers.

Delete button

Click to delete the selected booth preferences.

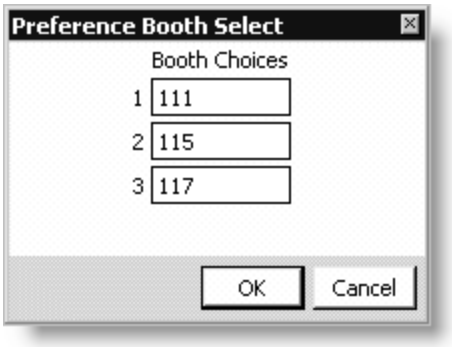
Booth quantity requested for

Displays the number of selected booth items.

Apply Charges

Enable to charge an exhibitor for the pending booths when setting booth preferences. The Qty and Price fields populate automatically for the order on the Process booth orders window.

Preference Booth Select window



From Exposition, select Process booth orders, insert or edit an order for an exposition with a P status, double-click a booth product, and click Insert

Booth Choices

Enter your first, second, and third booth preferences for a specific booth product.

To assign booth preferences

1. From Exposition, select Process booth orders to open the Process booth orders window.
2. Enter or edit an order for a pending exposition (see Finding Exposition Orders).
3. (optional) If entering an order, a message prompts you to continue with the registration as you Tab out of the Exposition field. Click Yes.
4. While in edit mode, double-click the appropriate booth Product to open the Booth Preferences window (opens only for pending expositions).
5. Click Insert on the Booth Preferences window to open the Preference Booth Select window.
6. Enter the booth number of the first, second, and third choice for each booth requested by the exhibitor. For example, if the exhibitor plans to purchase four booths, click Insert four times, each time entering the first, second, and third choice for each booth. Room for four booth entries exists on the Booth Preferences window.

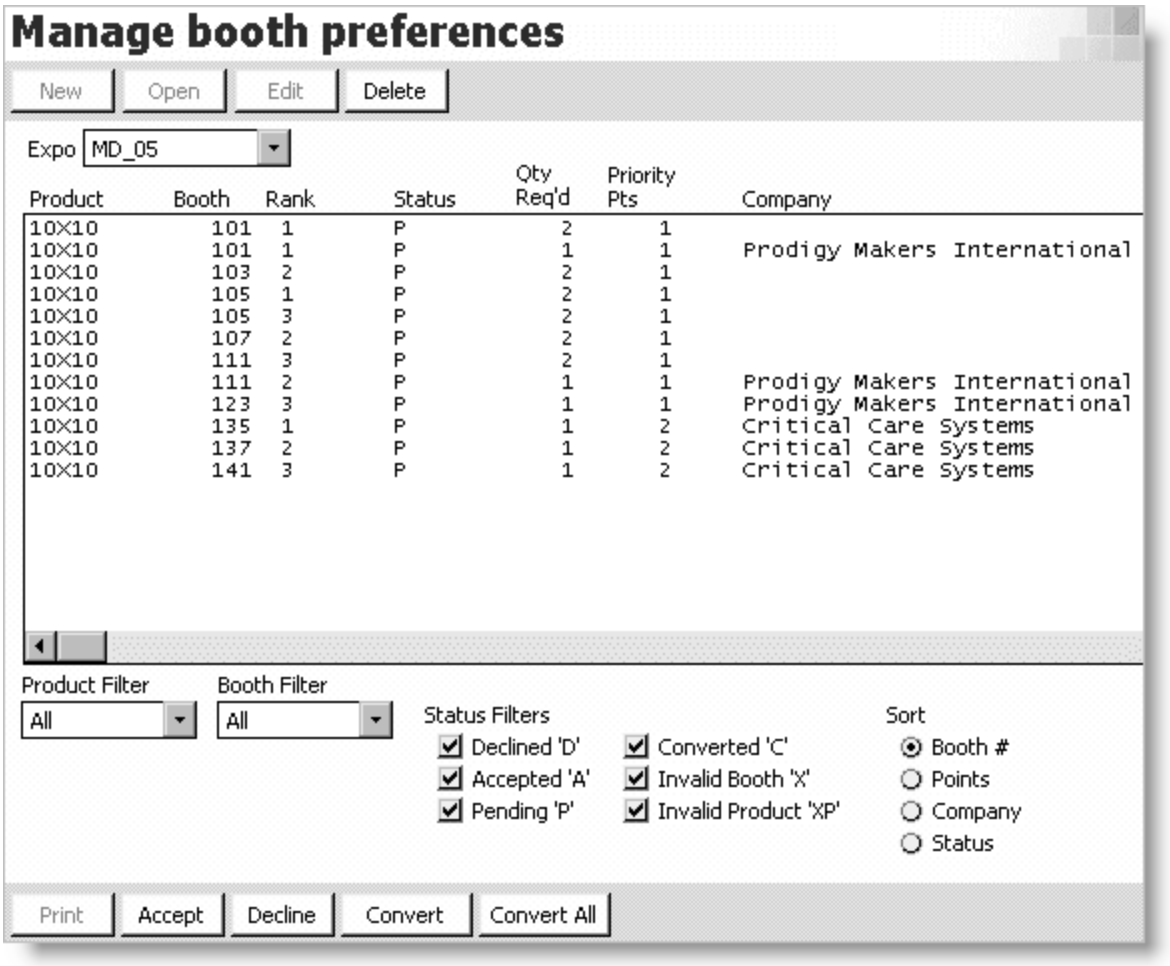
   Note: If Check Booth Inventory for Preferences is enabled for the pending exposition, you cannot enter a booth number that is not part of booth inventory.
7. (optional) Enable Apply Charges to charge the exhibitor for the pending booths. The order can be billed as soon as the preferences are recorded for the exhibitor.
8. Click OK to return to the Booth Preferences window, and click OK to return to the Process booth orders window.
9. Click Save.

Accepting, Declining, Converting, and Deleting Exhibitor Booth Preferences

After you enter exhibitor booth preferences, you can assign booths. Most exposition managers use priority points (defined on the Exhibitor Information window) to determine who has first preference for booth products. Regardless of the criteria used to assign booth preferences, you must use some method for determining who will have first preference.

Booth preferences are analyzed and managed on the Manage booth preferences window. This window lists all the booth preferences that have been requested by exhibiting companies for a specific exposition. On this window, you can accept, decline, convert, or delete booth preferences. When you accept a booth preference, you indicate that that booth will be assigned to the exhibitor requesting it. After an exhibitor accepts a booth, the selection of that booth by any other company is automatically declined. This prevents you from assigning duplicate booths.

Manage booth preferences window



From Exposition, select Manage booth preferences

Expo

Select an exposition from the list.

Exhibitor Booth Preferences

Displays all exhibitors' booth preferences for the selected exposition.

Product Filter

Select a specific filter from the list. Only Exhibitor Booth Preferences for that product display.

Booth Filter

Select a booth for the product selected from the Product Filter list. Only Exhibitor Booth Preferences for that booth display.

Status Filters

Enable the appropriate filters:

- Declined D - Enable to view booth preferences that have been declined.
- Accepted A - Enable to view booth preferences that have been accepted and will be converted to assigned booths.
- Pending P - Enable to view booth preferences that have not been accepted or declined.
- Converted C - Enable to view booth preferences that have been accepted and converted.
- Invalid Booth X - Enable to view booth preferences that are assigned or booths that do not exist.
- Invalid Product XP - Enable to view exposition products that do not exist.

Sort

Enable the appropriate options:

- Booth # - Enable to sort the list by booth number.
- Points - Enable to sort the list by priority points.
- Company - Enable to sort the list alphabetically by company name.
- Status - Enable to sort the list by status.

Status buttons

This group of buttons allows you to process and apply preferences:

- Accept button - Click to accept booth preferences prior to conversion.
- Decline button - Click to decline booth preferences.
- Convert button - Click to convert accepted booth preferences into actual booth orders.

- Convert All button - Click to convert all booth preferences that have been accepted into product orders.
- Delete button - Click to delete individual booth preferences.

To accept booth preferences

You must accept exhibitor booth preferences before converting booth preferences.

1. From Exposition, select Manage booth preferences to open the Manage booth preferences window.
2. Select an exposition from the Expo list to display all booth preferences.
3. (optional) Filter and sort the list:

- Select a Product Filter.
- Select a Booth Filter.
- Sort the list.

4. Select the Exhibitor Booth Preferences you want to accept, and click Accept. A message prompts you to continue.
5. Click Yes. All unaccepted booth preferences have a D (declined) status.

To decline booth preferences

1. From Exposition, select Manage booth preferences to open the Manage booth preferences window.
2. Select the booth preferences you want to decline from the list of Exhibitor Booth Preferences.
3. Click Decline. A message prompts you to verify declining the selected entries.
4. Click Yes.

To convert booth preferences

After accepting booth preferences, convert the preferences to orders. You can convert preferences individually or all together.

1. From Exposition, select Manage booth preferences to open the Manage booth preferences window.
2. Accept all applicable booth preferences for the selected exposition. See To accept booth preferences for more.
3. (optional) To convert selected booth preferences, do the following:
4. Select the booth preferences you want to convert.

- Click Convert. A message prompts you to continue.
- Click Yes to convert the selected booth preferences.

5. (optional) To convert all booth preferences, do the following:

- Click Convert All. A message prompts you to continue.
- Click Yes to convert all the accepted booth preferences.

To delete booth preferences

1. From Exposition, select Manage booth preferences to open the Manage booth preferences window.
2. Select the booth preferences you want to delete.
3. Click Delete. A message prompts you to verify deleting the selected booth preferences.
4. Click Yes.

Exposition System Setup

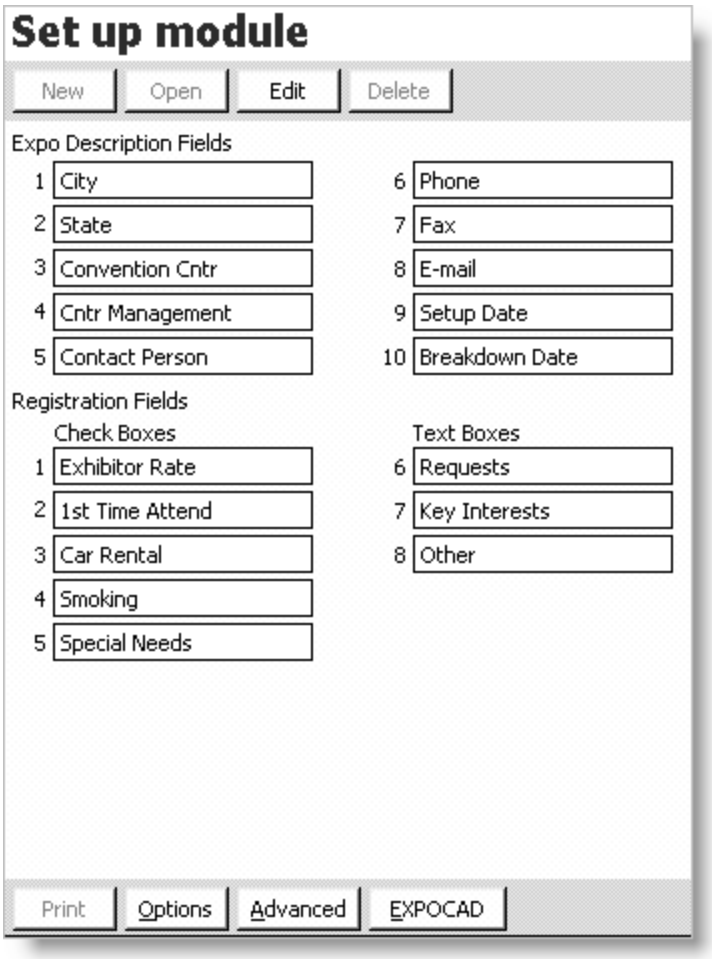
Overview of Exposition Setup

Exposition has many advanced features that enable you to customize your module. Based on your organization's requirements, you can select from a number of options that have global implications for managing your expositions.

You set up and customize your Exposition Management module through the Exposition Set up module window.

See AR/Cash: Deferred Income for how to defer dues/subscriptions income and events/exhibition/exposition income.

Set up Expo module window



From Exposition, select Set up module

Expo Description Fields

Enter the field labels that will display on the Expo Description window (from Exposition, select Set up an exposition, double-click an exposition, click More, and select Description).

The user-defined Expo Description Fields will display on the Expo Description window only if labels are defined for the fields on the Set up module window.

Registration Fields

Enter the field labels that will display on the Expo Registration - Other window (from Exposition, select Process booth orders, open an order, click Options, and select Other).

The user-defined Registration Fields will display on the Expo Registration - Other window only if labels are defined for the fields on the Set up module window. Both checkboxes and text boxes are available.

Options button

Opens the Expo System Options window.

Advanced button

Opens the Expo Advanced Features window.

EXPOCAD button

(Displays only if licensed for ExpoCad) Opens the ExpoCad System Options window.

Creating User-Defined Fields

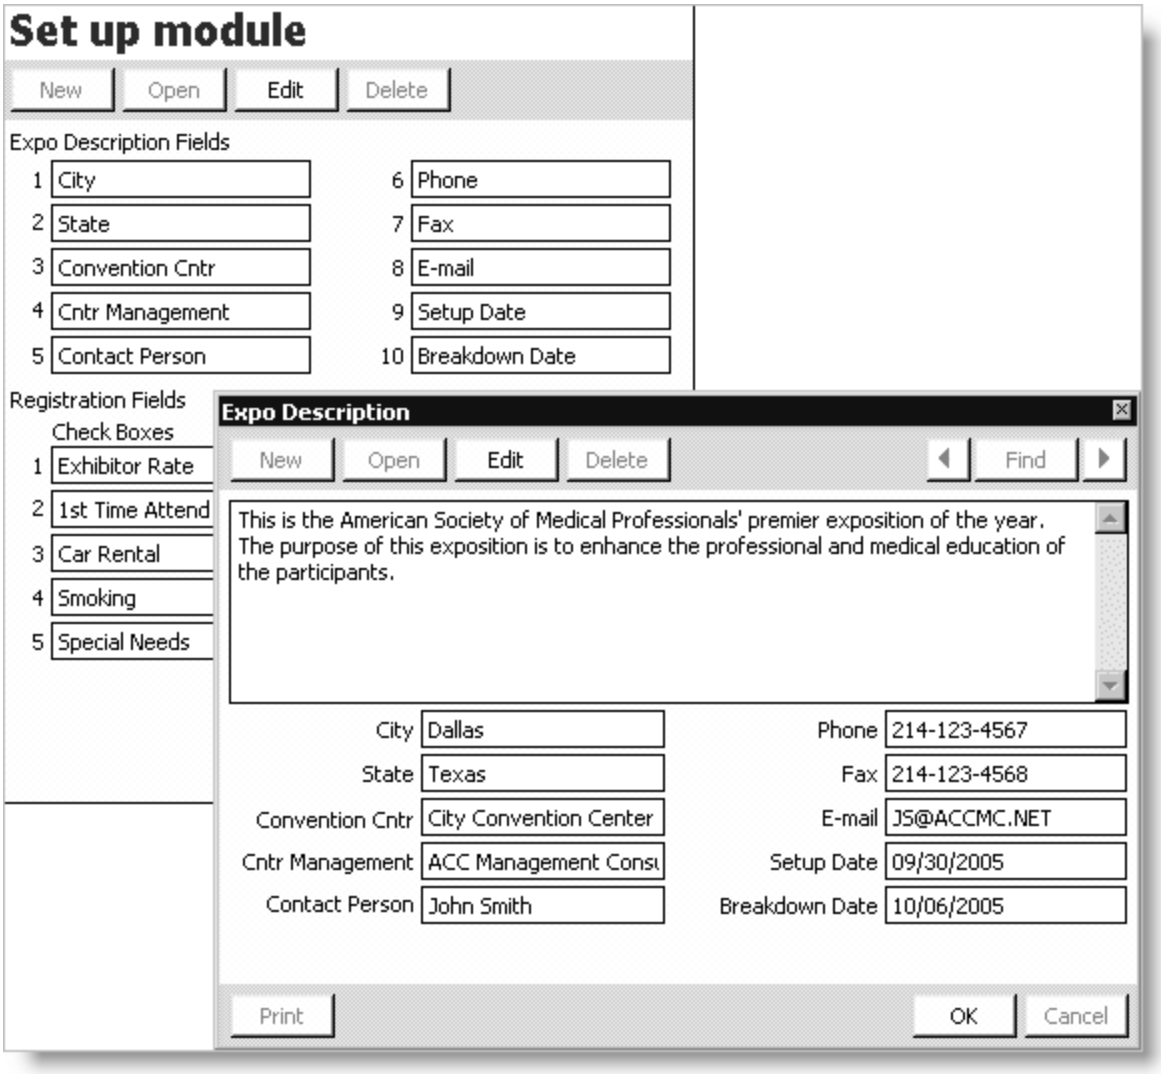
On the Exposition Set up module window, create the custom, user-defined fields that you want to display on the Expo Description and Expo Registration - Other windows.

> **Note:** Note: The user-defined fields display on the Expo Description and Expo Registration - Other windows only when labels are created for the user-defined fields on the Exposition Set up module window.

To create user-defined fields for the Expo Description window

1. From Exposition, select Set up module to open the Set up module window.

2. Click Edit.
3. Enter the Expo Description Fields that you want to display on the Expo Description window.
4. Click Save.

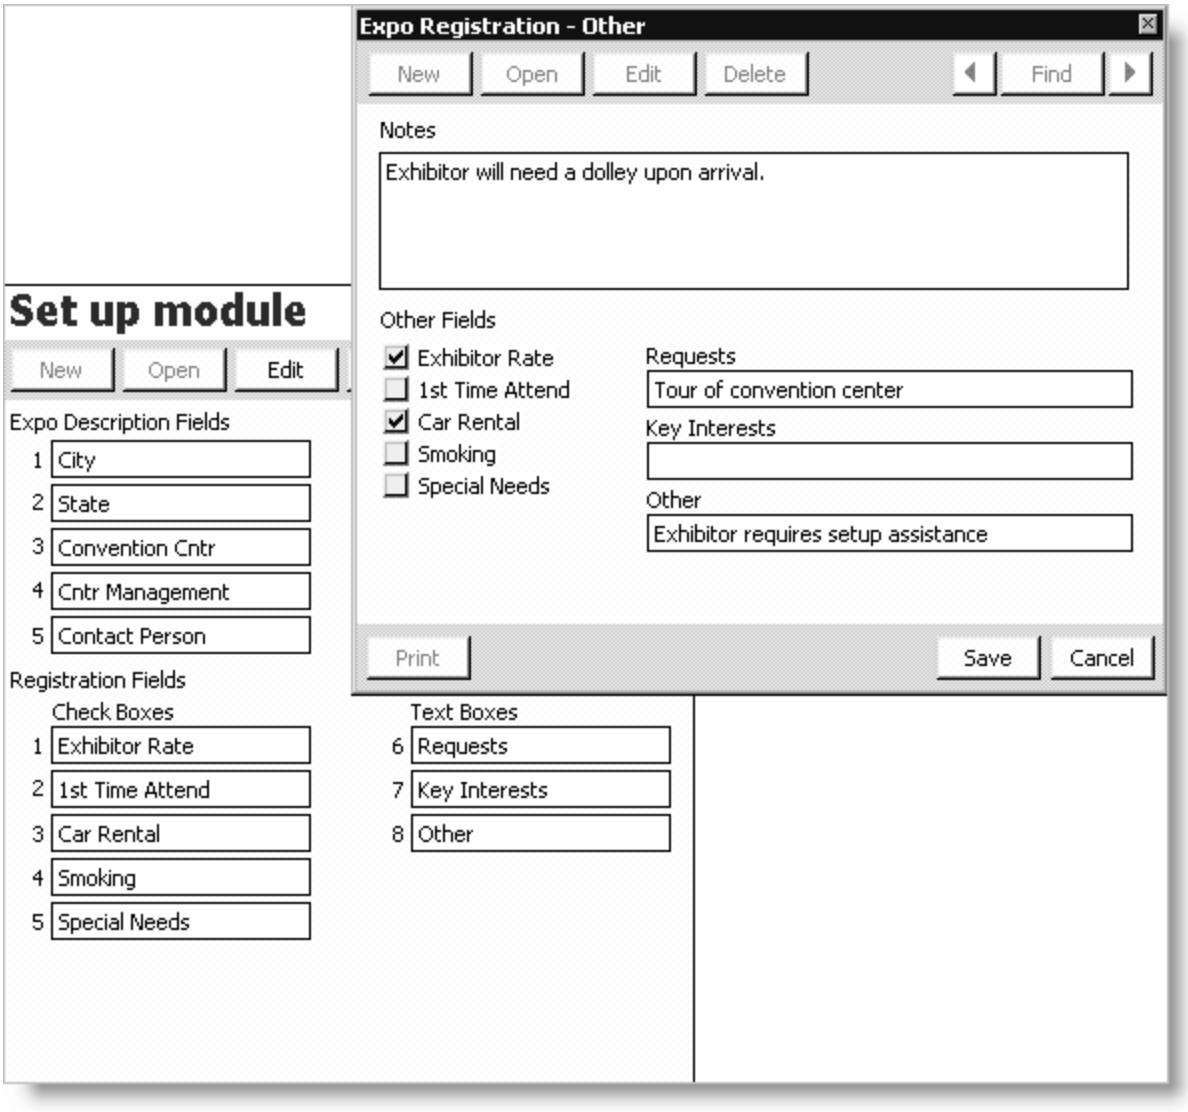


Example of the user-defined Expo Description Fields displayed on the Expo Description window

To create user-defined fields for the Expo Registration - Other window

1. From Exposition, select Set up module to open the Set up module window.

2. Click Edit.
3. Enter the Registration Fields that you want to display on the Expo Registration - Other window. Both checkboxes and text boxes are available.
4. Click Save.

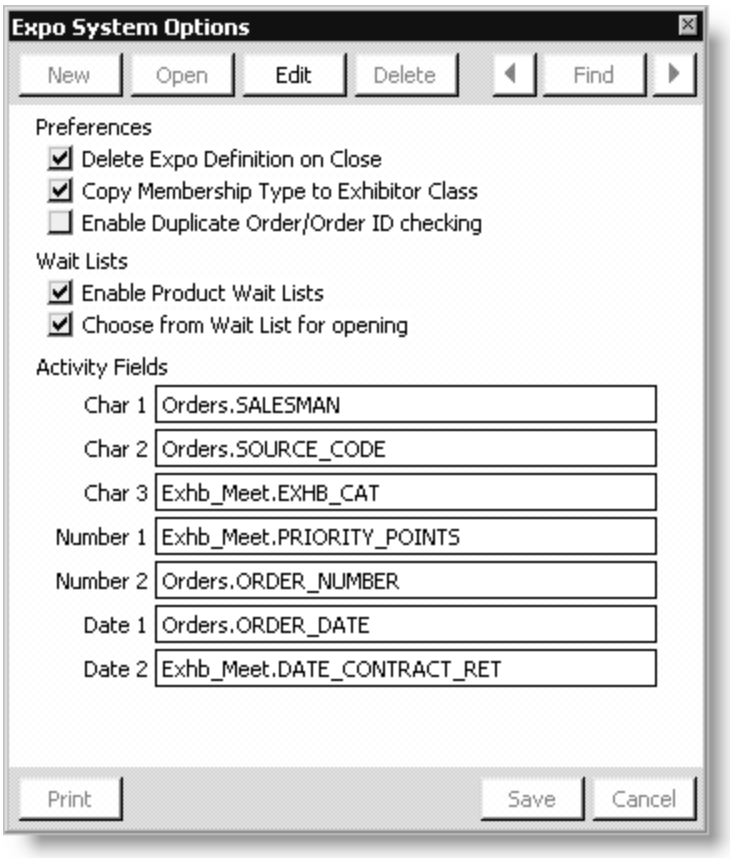


Example of the user-defined Registration Fields displayed on the Expo Registration - Other window

Enabling System Options

Several important options are available on the Expo System Options window for setting up your Exposition Management module. Carefully consider your organization's needs before enabling these options.

Expo System Options window



From Exposition, select Set up module, and click Options

Preferences

Delete Expo Definition on Close - Enable to delete all of an exposition's definition and function records upon closing the exposition.

If you do not enable this option, you can retain the exposition definition and summary records, which you will need when cloning expositions. The exposition is retained on the Set up an exposition window with a status of “C” for closed.

Copy Membership Type to Exhibitor Class - Enable to copy the customer type code directly to the exhibitor class code if you need to assign fees or group exhibitors at the customer-type level. All non-represented types map to the basic Individual Member (M) or Non Member (NM) classes.

You can override any system-assigned class on the Process booth orders window. If you want to use customer types to define your exhibitor classes, you can copy the existing customer types from the Set up customer types window to the Set up exhibitor classes window. For example, if you have a customer type (such as STU) for which you need to assign different product fees, enter that customer type Code on the Set up exhibitor classes window. You can select the customer types that you want to use only by entering matching codes for those types.

Enable Duplicate Order/Order ID checking - Enable to activate duplicate checking for exhibitor orders. When this option is enabled, and a suspected duplicate order is entered (either a Name/ID record or an order record), a window displays for verification of the record.

To verify that the record is a duplicate, double-click the line with the exhibitor's name on the popup window. This cancels the new order. You then can proceed with a new order and ignore the duplicate warning by closing or canceling the duplicate display window.

Wait Lists

The wait list feature allows you to add potential exhibitors to a wait list when an exposition product is sold out (maximum availability is reached). Potential exhibitors are added to wait lists in priority order as they attempt to purchase products (each exhibitor has priority over each succeeding exhibitor added to the list).

When other exhibitors cancel orders (or an exposition product is expanded), iMIS assigns an available exposition product to the first exhibitor on the wait list.

Note: Note: Wait lists are applicable only for exposition products that have an entry in the Max Available field on the Exposition Product Detail window.

Enable Product Wait Lists - Enable to activate the wait list function for all exposition products that have an entry in the Max Available field on the Exposition Product Detail window. When enabled, iMIS assigns an available exposition product to the first exhibitor on the wait list.

Choose from Wait List for opening - Enable to select exhibitors from exposition wait lists when additional exposition products become available (requires enabling the Enable Product Wait Lists option).

Activity Fields

Define the exposition-related data fields (three character, two numeric, and two date) that you want to map to exhibitor activity records when expositions are closed.

By mapping additional fields to exposition activity records, you extend the range of collectable exposition data. Data can come from either individual orders (such as user-defined fields) or from exposition definitions.

To display the mapped data on exhibitor Activity Detail windows, edit the EXPO product type on the Set up activity types window. Enter the UF field labels you want to display on individual activity records (these seven UF fields correspond to the Activity Fields on the Expo System Options window).

To enable system options

1. From Exposition, select Set up module, and click Options to open the Expo System Options window.
2. Click Edit.
3. Enable all applicable options (Preferences and Wait Lists).
4. Define all applicable Activity Fields, and click Save.

To enable wait lists for exposition products

1. Enter a Max Available value on the Exposition Product Detail window for each exposition product that will use wait lists.

2. Enable the Enable Product Wait Lists option on the Expo System Options window.
3. (optional) Enable Choose from Wait List for opening on the Expo System Options window (overrides automatic assignment of exposition products to the first exhibitors on wait lists, and requires selecting exhibitors manually).

To map user-defined fields to Expo activities

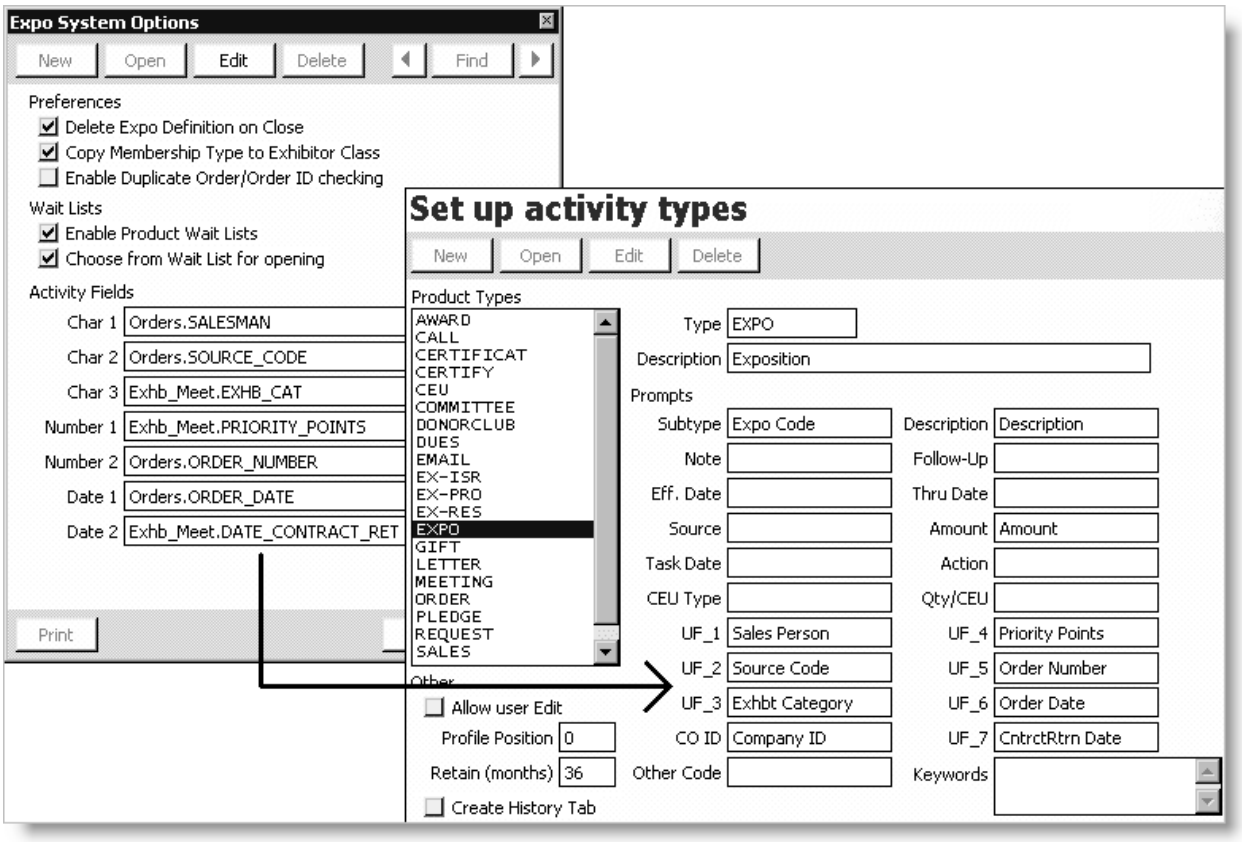
1. Define the Activity Fields on the Expo System Options window (from Exposition, select Set up module, and click Options).

   These fields map to exhibitor activity records when expositions are closed.
2. Enter the UF field labels on the Set up activity types window (from Customers, select Set up module> Activity types).

   The UF fields display on exhibitors' Activity Detail windows and correspond to the Activity Fields on the Expo System Options window:

- UF_1-UF_3 map to Char 1-Char 3
- UF_4-UF_5 map to Number 1-Number 2
- UF_6-UF_7 map to Date 1-Date 2

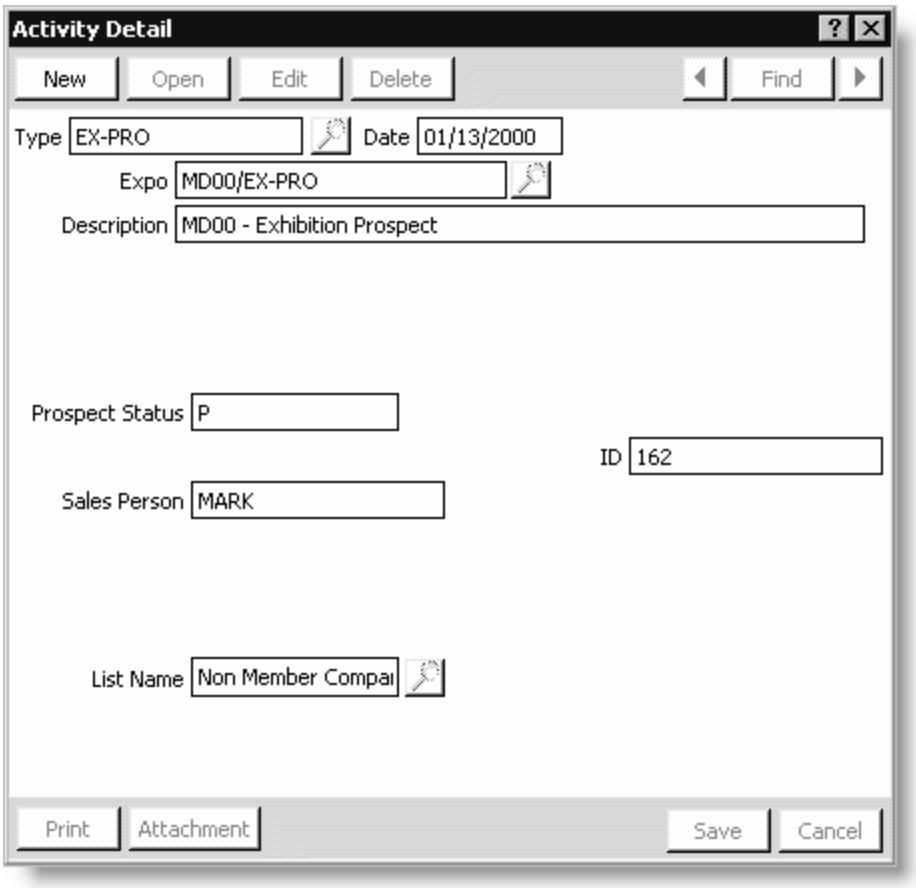
3. View an exhibitor's exposition information on the Activity Detail window after closing the exposition.



Example of the Activity Fields mapped to the EXPO product type

To view an exhibitor's exposition-related activities

1. From Customers, select Manage customers to open the Manage customers window.
2. Open an exhibitor's record.
3. Select the Activities-All tab.
4. Double-click an exposition activity to open the Activity Detail window.



Using default exposition activity types

Exposition Management ships with the following default activity Product Types as defined on the Set up activity types window:

EX-ISR (Expo Initial Size Request)

Activity generated when an exhibitor makes an initial size request for an exposition booth product. By default, no Prompts are enabled:

- Type - Activity product type (EX-ISR)
- Description - Description of activity type (Expo Initial Size Request)

EX-PRO (Exposition Prospect)

Activity generated when a customer becomes a prospect for an exposition. The following Prompts are enabled by default (items in parentheses display on the Activity Detail window):

- Type - Activity product type (EX-PRO)
- Description - Description of activity type (Expo Prospect)
- Subtype - Displays the exposition activity type (Expo)
- Description - Displays the exposition code - exhibition prospect (Description)
- Source - Displays the status of the prospect (Prospect Status):
- P = Prospect
- S = Signed up
- C = Canceled
- D = Declined
- Action - Displays the ID of the prospect (ID)
- CEU Type - Displays the sales person for the prospect (Sales Person)
- Other Code - Displays the list name of the prospect (List Name)

EX-RES (Exposition Reservation)

Activity generated when an exhibitor reserves an exposition product. The following Prompts are enabled by default (items in parentheses display on the Activity Detail window):

- Type - Activity product type (EX-RES)
- Description - Description of activity type (Expo Booth Reservation)
- Subtype - Displays the exposition activity type (Expo)
- Description - Displays the exposition code - exhibition prospect (Description)
- Source - Displays the name of the user who created the booth reservation (User)

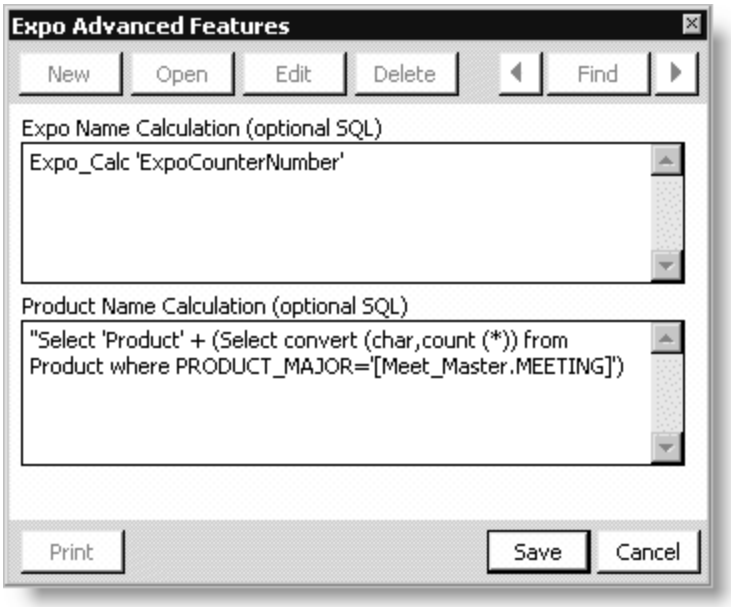
- Amount - Displays the total cost of the booths that have been reserved (Amount)
- Qty/CEU - Displays the total number of booths that have been reserved (Quantity)
- UF_1 - Displays the total booth width for booths that have been reserved (Booth Width)
- UF_2 - Displays the total booth length for booths that have been reserved (Booth Length)
- Other Code - Displays the Exposition Code/booth Product Code (a new activity is created for each unique Exposition Code and Product Code)

Setting up Advanced Exposition Features

You can set up instructions on the Expo Advanced Features window so that exposition and product codes are automatically assigned or generated according to a formula you choose (as opposed to user-assigned codes).

For example, if you create an auto-generated formula (an appropriate SQL script is entered in the Expo Name Calculation area) when you insert a new exposition or product, a system-assigned code is automatically inserted, rather than iMIS prompting you to enter a user-assigned code.

Expo Advanced Features window



From Exposition, select Set up module, and click Advanced

Expo Name Calculation (optional SQL)

Enter the name of the SQL string used to store the procedure that automatically assigns exposition codes.

Product Name Calculation (optional SQL)

Enter the name of the SQL string used to store the procedure that automatically assigns product codes.

To set up advanced exposition features

1. From Exposition, select Set up module, and click Advanced to open the Expo Advanced Features window.
2. Click Edit.
3. Enter the SQL string that executes the stored procedure in the Expo Name Calculation (optional SQL) and Product Name Calculation (optional SQL) text boxes.
4. Click Save.

Exposition Table Maintenance

Overview of Exposition Tables

Set up tables sub-task list (Exposition)

Exposition has its own tables that must be set up before you can use the module. You access these tables through the Set up tables sub-task list.

Note: Note: From Exposition, select Set up tables.

Product master list

Opens the Set up product master list window for defining and managing exposition products.

Forms master list

Opens the Set up forms master list window for defining and managing exposition forms.

Prospect list

Opens the Set up prospect list window for defining and managing exposition prospect lists.

Sales scripts

Opens the Set up sales scripts window for defining and managing exposition sales scripts. Salespeople use the sales scripts for marketing.

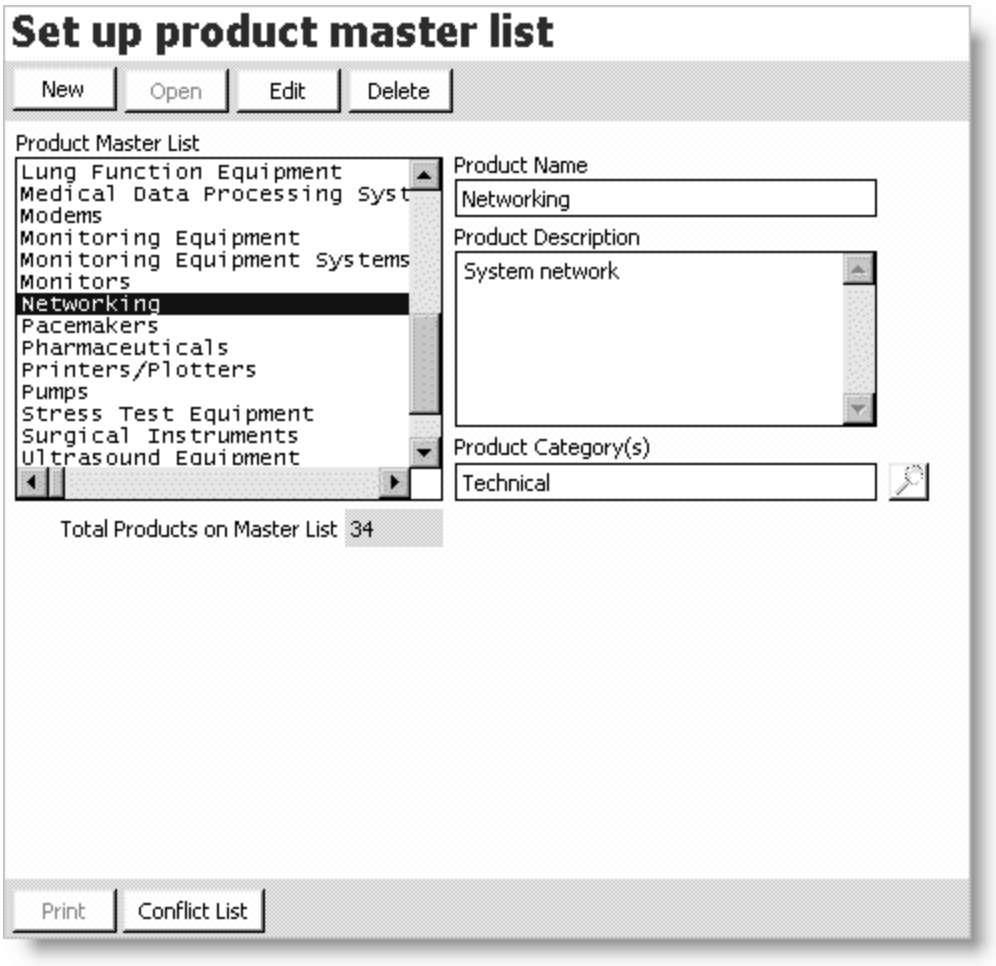
Exhibitor classes

Opens the Set up exhibitor classes window for defining and managing exhibitor classes. Exhibitor classes categorize the exhibitors displayed on the Process booth orders window. You also can create classes (or categories) for all groups that you need to charge different fees or track separately.

Managing Exposition Products

Exposition products are defined on the Set up product master list window.

Set up product master list window



From Exposition, select Set up tables > Product master list

Product Master List

Lists all products available for exhibition at specific expositions.

Product Name

Enter a name for a product being added to the master list.

Product Description

Enter a description of the product.

Product Category

Enter a category for the product (select the Find icon to look up a category). Exposition-product categories are defined on the EXPO_PROD_CAT general lookup/validation table.

Total Products on Master List

Displays the total number of products on the Product Master List.

Conflict List button

Opens the Exhibited Product Conflicts window used for defining and managing lists of conflicting products. See Managing Conflicting Products for more.

To define an exposition product

1. From Exposition, select Set up tables > Product master list to open the Set up product master list window.
2. Click New.
3. Define the product:

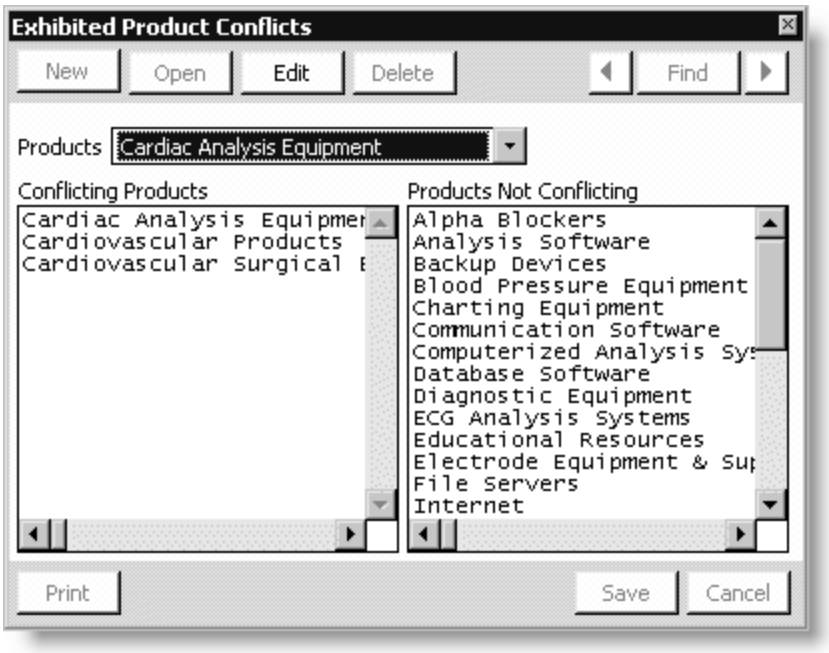
- Enter the Product Name.
- Enter the Product Description.
- Enter the Product Category (select the Find icon to look up a category).

4. Click Save.

Managing Conflicting Products

iMIS Exposition Management allows you to create lists of conflicting products for use when setting up expositions. For example, similar products displayed by competing exhibitors could be considered conflicting products. You might want to identify these conflicting products so that competing exhibitors are not assigned booths in close proximity with one another. (See Managing Proximity Assignments.)

Exhibited Product Conflicts window



From Exposition, select Set up tables > Product master list, and click Conflict List

Products

Select a product for which you want to define a list of conflicting products.

Conflicting Products

Lists a selected product's conflicting products.

Products Not Conflicting

Lists a selected product's non-conflicting products.

To manage conflicting products

1. Open the Exhibited Product Conflicts window:

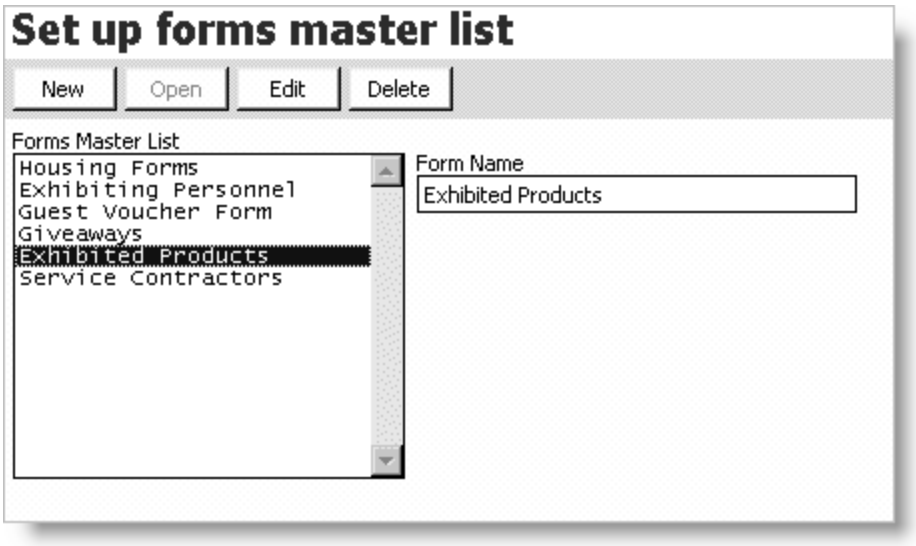
- From Exposition, select Set up tables > Product master list to open the Set up product master list window.
- Click Conflict List.

2. Select a product from the Products list.
3. Click Edit.
4. (optional) To add conflicting products, double-click a product in the Products Not Conflicting list. The product moves to the Conflicting Products list.
5. (optional) To delete conflicting products, double-click a product in the Conflicting Products list. The product moves to the Products Not Conflicting list.
6. Click Save.

Managing Exposition Forms

Managing forms is an important part of any exposition, and the completion and submission of exposition forms is important to exposition staff. Forms might include contracts, service kits, or a form listing electrical needs. Forms are managed on the Set up forms master list window.

Set up forms master list window



From Exposition, select Set up tables > Forms master list

Forms Master List

Lists all available forms.

Form Name

Enter the name of the form you are adding to the Forms Master List.

To add, edit, and delete forms

1. From Exposition, select Set up tables > Forms master list to open the Set up forms master list window.
2. (optional) To add a form, do the following:

- Click New.
- Enter the Form Name.
- Click Save.

3. (optional) To edit a form, do the following:

- Select a form from the Forms Master List.
- Click Edit.
- Edit the Form Name.
- Click Save.

4. (optional) To delete a form, do the following:

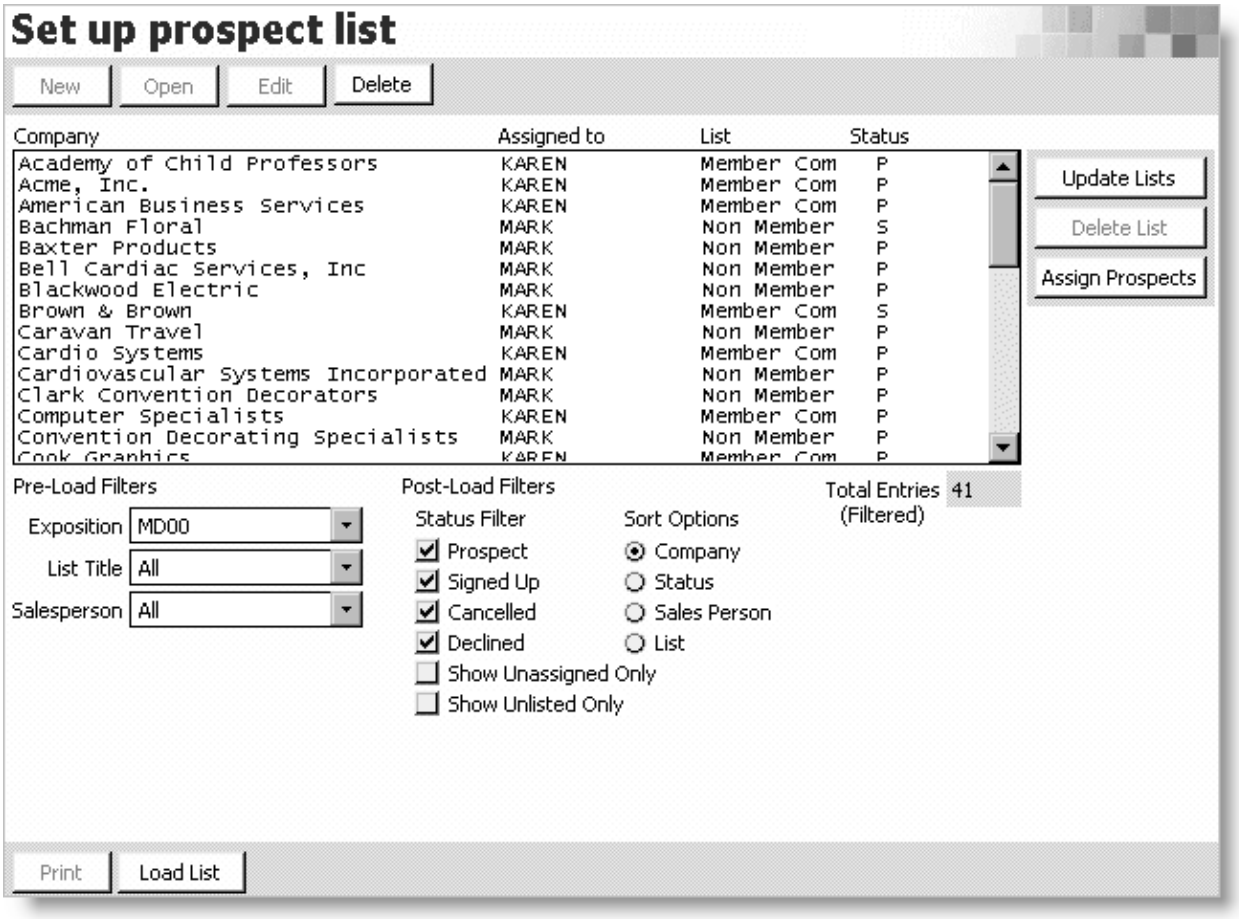
- Select a form from the Forms Master List.
- Click Delete.
- Click Yes to delete the form.

Managing Exposition Prospects

When marketing your expositions, you need to maintain a list of current prospects. This list is based on previous exhibitors as well as other prospects in the customer database. Throughout the marketing process, you can add prospects, import prospect lists, and select records from your customer database.

View, add, delete, update, and create prospect lists through the Set up prospect list window.

Set up prospect list window



From Exposition, select Set up tables > Prospect list

Prospect List

Lists all available prospects by Company name.

Update Lists button

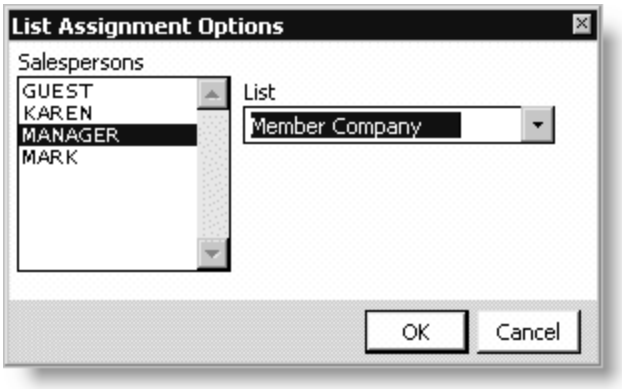
Opens the Update Prospect Lists window for updating prospect lists.

Delete List button

Click to delete a single prospect list (disabled when all prospects are displayed).

Assign Prospects button

Opens the List Assignment Options window used for assigning an exhibitor/prospect to a specific salesperson (enables only when prospects are selected from the Prospect List).



Salespersons - Select a salesperson.

List - Select the list you are assigning to the salesperson.

Pre-Load Filters

Exposition - Select the exposition's associated prospect list.

List Title - Select the customer type of a specific list of prospects (defaults to ALL).

Salesperson - Select the salesperson(s) associated with the list (defaults to ALL).

Post-Load Filters

Status Filter - Separate your list using any combination of the following:

- Prospect - Lists prospective exhibitors. These prospects are individuals who have exhibited at a previous exposition.
- Signed Up - Displays exhibitors who have already signed up for the selected exposition.
- Cancelled - Displays exhibitors who have canceled their order.
- Declined - Displays prospects who have declined to exhibit in the selected exposition.
- Show Unassigned Only - Displays only exhibitors/prospects who are not assigned to a specific salesperson.

- Show Unlisted Only - Displays only those exhibitors/prospects who are not assigned to a specific prospect list.

  Sort Options - Sort your list using any combination of the following:

- Company - Lists exhibitors/prospects alphabetically by company name.
- Status - Lists exhibitors/prospects by status in the following order:
- S = signed up
- P = prospect
- W = wait list
- D = declined
- C = cancelled
- Sales Person - Lists exhibitors/prospects alphabetically by salesperson.
- List - Lists exhibitors/prospects alphabetically by list title.

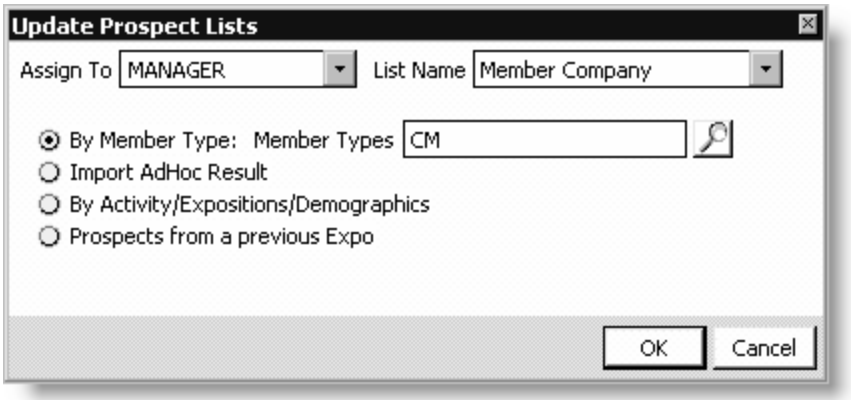
  Total Entries (Filtered)

  Displays the total number of prospects listed.

  Load List

  Click to display the Prospect List on the window.

Update Prospect Lists window



From Exposition, select Set up tables > Prospect list, click Load List, and click Update Lists

Assign To

(optional) Select a salesperson to assign to the selected prospect list. The salesperson is also referred to as the login because iMIS recognizes the salesperson by their login name.

List Name

Select or enter a name that is representative of the prospect list.

By Member Type

Enable to create a prospect list by Member Type.

Member Types - Enter the customer type used to create the list (select the Find icon to select from available customer types). To enter more than one customer type, place a comma (no spaces) between codes (for example, M,NM,CM).

Import AdHoc Result

Enable to create a prospect list using an AdHoc search (opens the Select import file window). Once the search selects the records that meet your criteria, you can import that file as a prospect list.

By Activity/Expositions/ Demographics

Enable to define specific search instructions for creating a new list (opens the Select Search Instructions window).

Prospects from a previous Expo

Enable to select prospects from a previous exposition (opens the Previous Expo window):

- Exhibition - Select from the list.
- Include - Select a status filter:
- Prospect - Lists prospective exhibitors. Prospects are individuals who have exhibited at a previous exposition.
- Signed Up - Displays exhibitors who have already signed up for the selected exposition.
- Cancelled - Displays exhibitors who have canceled their order.
- Declined - Displays prospects who have declined to exhibit in the selected exposition.

To load a prospect list

1. From Exposition, select Set up tables > Prospect list to open the Set up prospect list window.
2. Select the Pre-Load Filters:

- Select an Exposition.
- (optional) Select a List Title.
- (optional) Select a Salesperson.

3. Click Load List to display the list of prospects, and select one or more Post-Load Filters for the prospect list.

To update a prospect list

Before you can create a prospect list, you first must define an exposition for the list.

1. Load a prospect list. See To load a prospect list.

2. Click Update Lists to open the Update Prospect Lists window.
3. (optional) Select a salesperson from the Assign To field.
4. (optional) Enter or select a List Name.
5. Enable an option for updating your prospect list:

- By Member Type
- Import AdHoc Result
- By Activity/Exposition/Demographics
- Prospects from a previous Expo

6. Click OK.

To load a prospect list from a previous Expo

1. Update a prospect list. See To update a prospect list.
2. Enable Prospects from a previous Expo to open the Previous Expo window.
3. Make a selection from the Exhibition list, and enable the status filters you want to Include.
4. Click OK to generate the results of the search.
5. Click Yes to view the results of the search on the Search Results window.
6. Click OK on the Search Results window.
7. Click Yes to add the results of the search to the prospect list.

To delete a prospect list

The Exposition Management module allows you to delete a prospect list. For example, you may have created a short-term list assigned to a particular salesperson that is no longer with your organization, and now you want to delete the records assigned to that individual.

1. From Exposition, select Set up tables > Prospect list to open the Set up prospect list window.

2. Select an Exposition.
3. Select the List Title for the prospects you want to delete.
4. Click Load List to display the prospects.
5. Click Delete List. A warning message displays.
6. Click Yes to delete the list of prospects.

To delete an individual prospect from a list

1. Load a prospect list. See To load a prospect list.
2. Select a prospect from the Prospect List.
3. Click Delete. A message prompt displays.
4. Click Yes to delete the prospect from the list.

To assign prospects to salespeople

Assigning prospects to salespeople is a key feature of the Exposition Management module. Organizations with several salespeople can track and manage their sales activities by assigning prospects and prospect lists to each salesperson.

1. Load a prospect list. See To load a prospect list.
2. Select one or more prospects from the Prospect List (enables the Assign Prospects button).
3. Click Assign Prospects to open the List Assignment Options window.
4. Select from the list of Salespersons (press Shift to assign the prospects to multiple salespeople).
5. Select or enter a List you are assigning to the salesperson(s).
6. Click OK to assign the list. (If assigning prospects to multiple salespeople, a message prompt displays.)

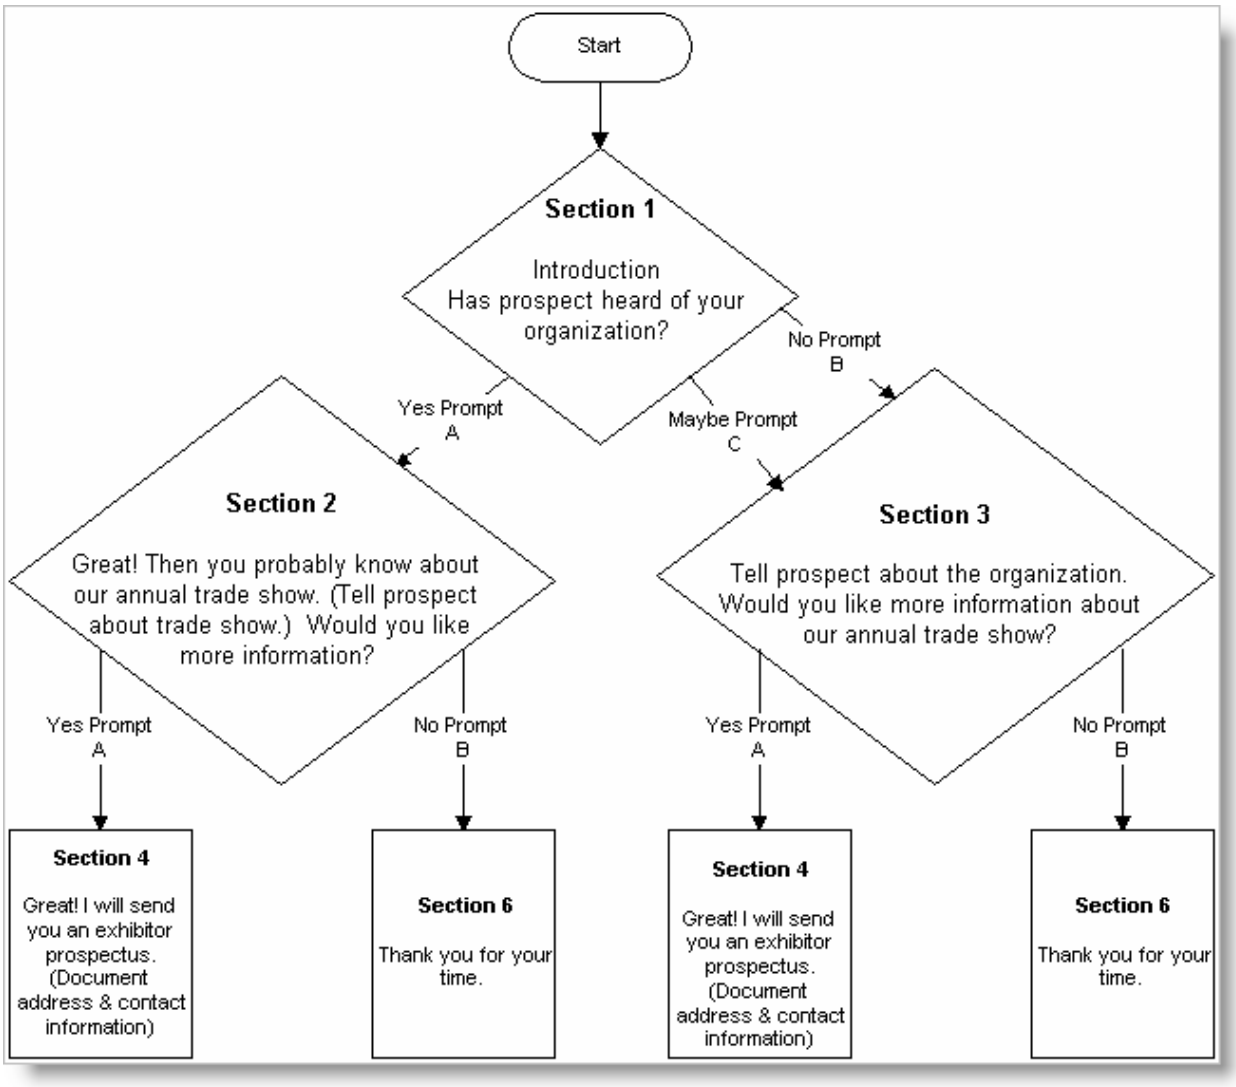
7. (Multiple salespeople only) Click Yes to randomly assign prospects to multiple salespeople.

Managing Sales Scripts

Often several salespeople are involved in selling booths and other products for an exposition. The Exposition Management module allows you to set up a structured sales script that all permanent or temporary sales people can follow. Sales scripts help ensure that the individuals selling booths and other exposition products appear knowledgeable. You also may want to vary the scripts within a single exposition to measure responses or to market to different types of exhibitors.

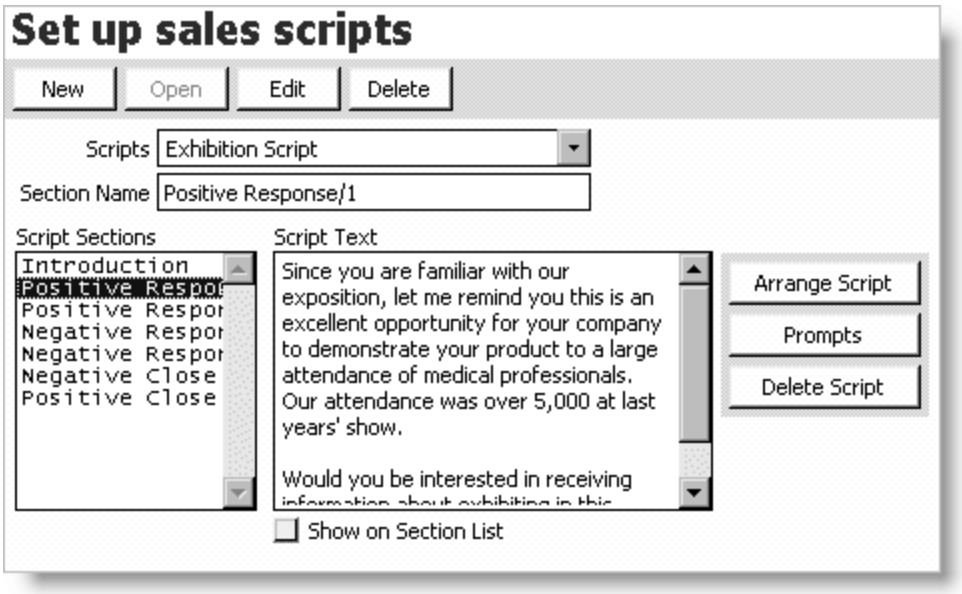
Set up hierarchical scripts on the Set up sales scripts window. You will use the scripts you have entered while in the Expo Sales window. See Managing Sales Scripts.

To help you understand how iMIS manages scripts, study the following diagram, which illustrates the hierarchical layout of a prototype script.



Sample prospect script

Set up sales scripts window



From Exposition, select Set up tables > Sales scripts

Scripts

Select a script from the drop-down list.

Section Name

Enter the name of the script section.

Script Sections

Displays all of the script sections.

Script Text

Enter the script content.

Arrange Script button

Opens the Arrange Script Sections window used for arranging a script's logical sequence based upon responses or prompts.

Prompts button

Opens the Section Prompts window used for prompts for script sections.

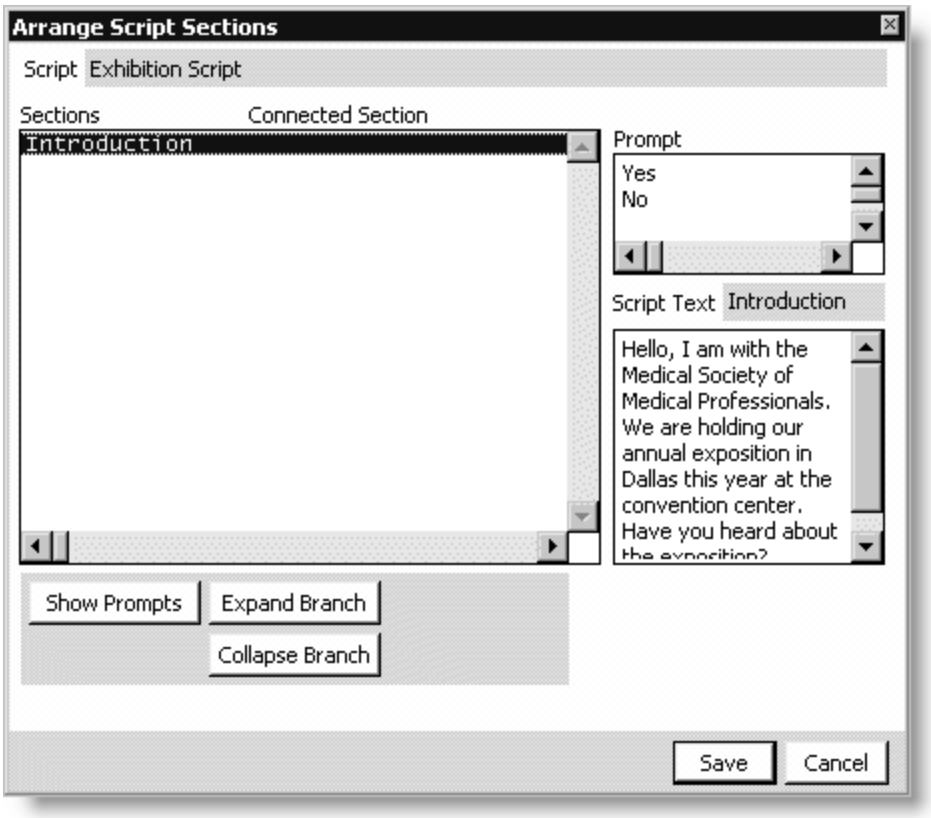
Delete Script button

Click to delete the selected script.

Show on Section List

Enable to display the section name in the Script Sections list.

Arrange Script Sections window



From Exposition, select Set up tables > Sales scripts, select a script, and click Arrange Script

Script

Displays the name of the script.

Sections

Lists the section names of a particular script.

Connected Section

Displays the prompt response that is connected to the listed section (displays only when you click Show Prompts).

Prompt

Displays the response a customer might give after hearing a particular script.

Script Text

Displays the content communicated to customers. This is the script text that is the response to the selected prompt (answer given by the customer) or the initial marketing text.

Show Prompts button

Click to display the Script Section, Prompts, and the Connected Section associated with the script, as well as three additional buttons:

- Connect Section - Opens the Select a Section window where you select script sections to connect to the highlighted prompt.
- Disconnect Sect - Click to break the link between the script section and the prompt. The system removes the information in the Connected Section.
- Show Sections - Click to display Sections, Prompts, and Script Text.

Expand Branch button

Click to display the Script Section with the Connected Section data.

Collapse Branch button

Click to display the Script Section data only.

To create scripts

Before you create a script, write it down on paper first. Break it into logical sections prompted by positive, negative, and maybe responses. This helps you structure your script correctly when entering it.

1. From Exposition, select Set up tables > Set up scripts to open the Set up sales scripts window.
2. Select (New Script) from the Scripts drop-down list. This opens the New Script Name window.
3. Enter a Script Name and click Save to return to the Sales Script Entry window.
4. Click New.
5. Enter a Section Name for the script and Script Text for the section. For example, Section 1 might be your introductory comments in which you state the name of your organization and end with a question, such as "Are you familiar with our organization?"
6. Click Save.
7. Repeat this process for each section you create. Each section is based upon a response or "prompt" to the previous section.
8. Create section prompts after creating all of your sections:

- Select a script section.
- Click Prompts to open the Section Prompts window.
- Connect the prompts for the selected section.
- Repeat this step for each prompt that you create.
- Click Save.

To arrange scripts

Now that you have created the sections and prompts for your script, you are ready to arrange the script.

1. From Exposition, select Set up tables > Set up scripts to open the Set up sales scripts window.

2. Select Introduction under Script Sections.
3. Click Arrange Script to open the Arrange Script Sections window. In this window, you see the Introduction section and associated prompts and text.
4. Click Show Prompts to see the prompts connected to the Introduction section.
5. Select a prompt, and click Connect Section to open the Select a Section window.
6. Select the section on the Select a Section window that you want to connect to the high-lighted prompt. For the Yes prompt, select Positive Response/1. For the No prompt, select Negative Response/1.
7. Click OK.
8. Click Save. At this point, you have assigned scripts for both a positive (Yes) and negative (No) response to the Introduction script. The following steps will allow you to continue to assign scripts based on additional questions and answers:
9. From the Set up sales script window, (Introduction is still highlighted) click Arrange Script to reopen the Arrange Script Sections window.
10. Click Expand Branch.
11. Select Positive Response/1.
12. Click Show Prompts. The Yes prompt is highlighted.
13. Click Connect Section.
14. Select Positive Response/2, and click OK.
15. Click Save. Repeat the process until the script sequence is complete.

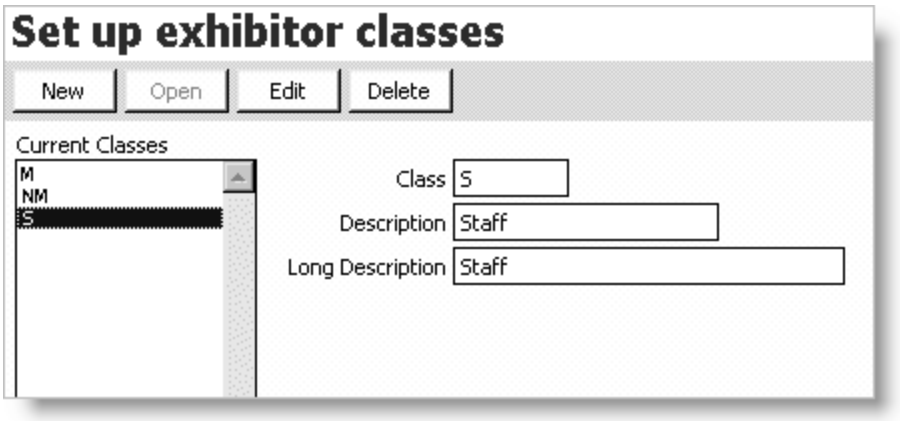
Managing Exhibitor Classes

The Set up exhibitor classes window allows you to define which classes appear as options for categorizing exhibitors and registrants on the Process booth orders window. Create categories for all groups for which you charge different fees, print badges, or print reports.

There are three scenarios for defining your exhibitor classes:

- Let the exhibitor classes default to Member or Non-Member. Using this scenario, all exhibitors are either a member or non-member based upon their customer record.
- Map member types to exhibitor classes. Using this scenario, you may or may not want to map all member types. For example, you may want to map only Member, Non-Member, and Company Member.
- Define your own exhibitor classes without taking member types into consideration. Using this scenario, you have to override the Member/Non-Member status at order entry and enter the appropriate exhibitor class.

Set up exhibitor classes window



From Exposition, select Set up tables > Exhibitor classes

Current Classes

Displays the exhibitor class codes used by all expositions.

Class

Enter a code for the class name.

Description

Enter a short description of the class.

Long Description

Enter a detailed description of the class.

To define exhibitor classes

1. From Exposition, select Set up tables > Exhibitor classes to open the Set up exhibitor classes window.
2. Click New.
3. Enter a Class.
4. Enter a Description.
5. Enter a Long Description.
6. Click Save.

> **Note:** Note: If you define classes that do not map to customer types, override the M or NM that displays in the Class field on the Process booth orders window.

To map a customer type to an exhibitor class

1. Enter the customer type on both the Set up customer types and Set up exhibitor classes windows. If you do not enter this in both places, the new customer type does not show up on the Exposition Booth & Product Fees window.
2. Enable the Copy Membership Type to Exhibitor Class option (this class maps to the basic M = Member or NM = Non Member classes).

Creating General Lookup/Validation Tables for Exposition Management

You must set up four general lookup/validation tables for the Exposition Management module.

BADGE_TYPE

This table includes the badge types needed for your expositions. The Exposition Management module comes with two badge types predefined: Free_Pass and Paid_Pass. Free passes come with the purchase of the booth. For example, when setting up your

exposition, if you indicate that each booth unit receives two free passes, that is the number of free passes available to the exhibitor for each booth unit.

A Paid_Pass is a specific product defined at the exposition product level. For example, exhibitors may want to purchase additional badges with their booth order. The BADGE_TYPE information is available on the Badges window, which you gain access to from the Process booth orders window.

As you issue each badge, you can see the number available for each Paid and Free Pass type displayed below the data entry area. Badge types are only available on the Badges window if they have been defined on the Set up general lookup/validation window. Although the Exposition Management module comes with Free_Pass and Paid_Pass already defined, you can define as many badge types as you need for your particular exposition.

CONTACT_TYPE

This table contains the contact types for the exhibiting company. The Exposition Management module comes with Primary contact defined, although you may want to define several contact types for the companies exhibiting at your exposition, such as accounts payable, sales, and so forth.

EXPO_CAT

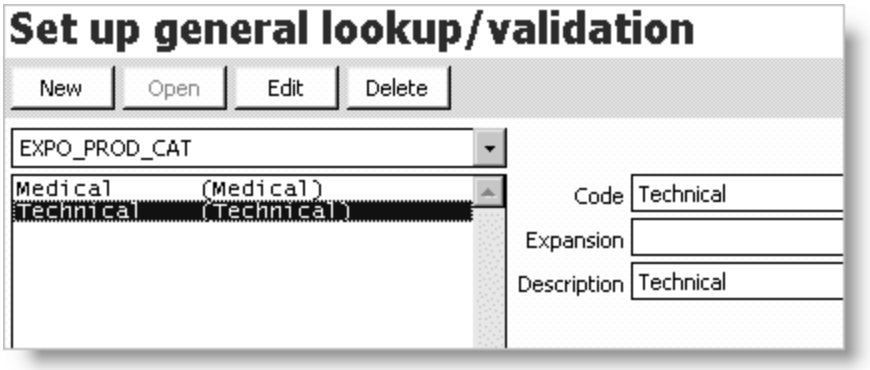
This table contains the historical category types of expositions. You can define the category types depending upon the types of expositions you conduct. For example, you might hold several different types of expositions, such as technology conferences, educational shows, and so forth.

EXPO_PROD_CAT

This table allows you to define categories for grouping the products you enter in the Product Master File. For example, you might group your products based upon the types of expositions you hold, such as technology products for the technology conference, or educational products for an educational show, and so forth. You can define the category

types depending upon the types of expositions you conduct. Even if you hold only one category of exposition, you still might have several product categories you want to define.

Tables window



From Customers, select Set up tables > General lookup/validation

Code

Enter an abbreviation for the table (can be 60 characters long).

Expansion

(Does not apply for Exposition Management) Allows you to expand the character length for the code.

Description

Enter detailed information about the table type.

Import button

Opens the Importing Tab-Delimited Table window, where you can import tables from tab-delimited files.

To create general lookup/validation tables for Exposition Management

1. From Customers, select Set up tables > General lookup/validation to open the Set up general lookup/validation window.
2. Scroll down the list and select (New Table). A data entry window opens.
3. Enter the New Table Type in the pop-up window.

4. Click Save to return to the Set up general lookup/validation window.
5. Click New.
6. Enter a Code for the new table type.
7. (optional) Enter a brief Description of the table type.
8. Click Save.

Exposition Definition

Overview of exposition definition

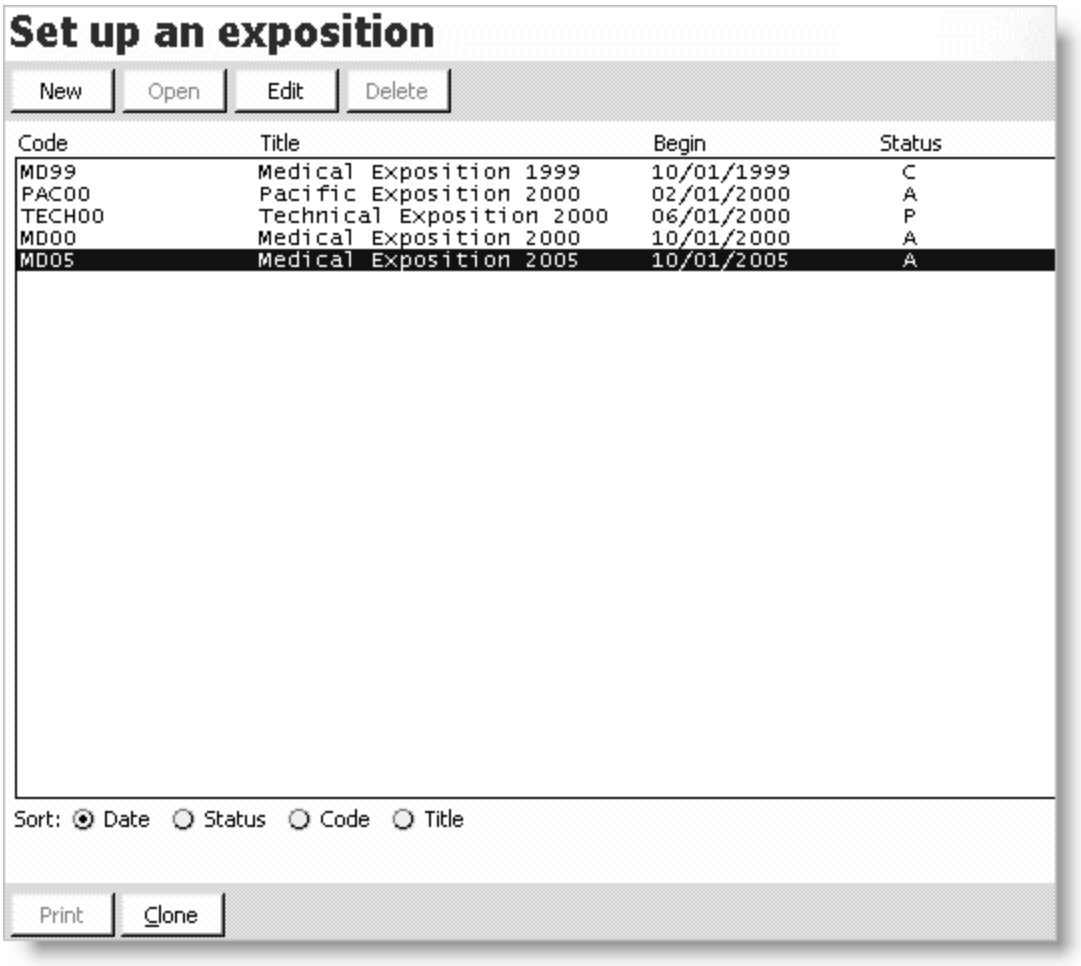
Defining an exposition involves entering basic exposition information (such as description and location) as well as defining service contractors and forms that are required for the exposition.

Managing an exposition entails adding, modifying, and deleting predefined information.

Viewing Available Expositions

You can view defined expositions and their status through the Set up an exposition window.

Set up an exposition window



From Exposition, select Set up an exposition

Code

Displays the exposition code.

Title

Displays the exposition title.

Begin

Displays the exposition's start date.

Status

Displays the exposition's status:

- P = Pending (default, still in the planning stages)
- F = Frozen (currently locked from order)
- C = Closed (orders no longer accepted)
- X = Canceled

Sort

Enable the appropriate options for sorting the listed expositions.

Clone button

Click to create a copy of the selected exposition.

To view and sort the list of expositions

1. From Exposition, select Set up an exposition to open the Set up an exposition window.
2. Sort the list by enabling the appropriate Sort option:

- Date organizes the expositions chronologically by start date.
- Status organizes the expositions alphabetically by status code, displaying all open, active expositions (with A = Active status codes) first, followed by the closed, pending, and canceled expositions.
- Code organizes the expositions alphabetically by exposition code.
- Title organizes the expositions alphabetically by exposition title.

See these related topics:

- To clone an exposition (how to create a new exposition by copying an existing exposition)
- To define an exposition
- To modify an exposition

Cloning an Exposition

Cloning allows you to copy an existing exposition rather than create a new exposition. Cloning is useful when you need to set up expositions that are identical except for the dates and times. When you clone an exposition, the exposition definition, product definitions, and sales scripts are copied from the cloned exposition to the new exposition.

To clone an exposition

1. From Exposition, select Set up an exposition to open the Set up an exposition window.
2. Select the exposition you want to clone.
3. Click Clone to open the Specify a new Expo Code window.
4. Enter the new exposition code for the cloned exposition.
5. Click Save.
6. Double-click the new exposition on the Set up an exposition window to open a second instance of the Set up an exposition window.
7. Click Edit, and make any necessary changes to the exposition dates, times, and details.
8. Click Save.

Defining an Exposition

This section explains how to define an exposition and edit exposition information using the Set up an exposition window. Additional exposition setup options are discussed later in this chapter.

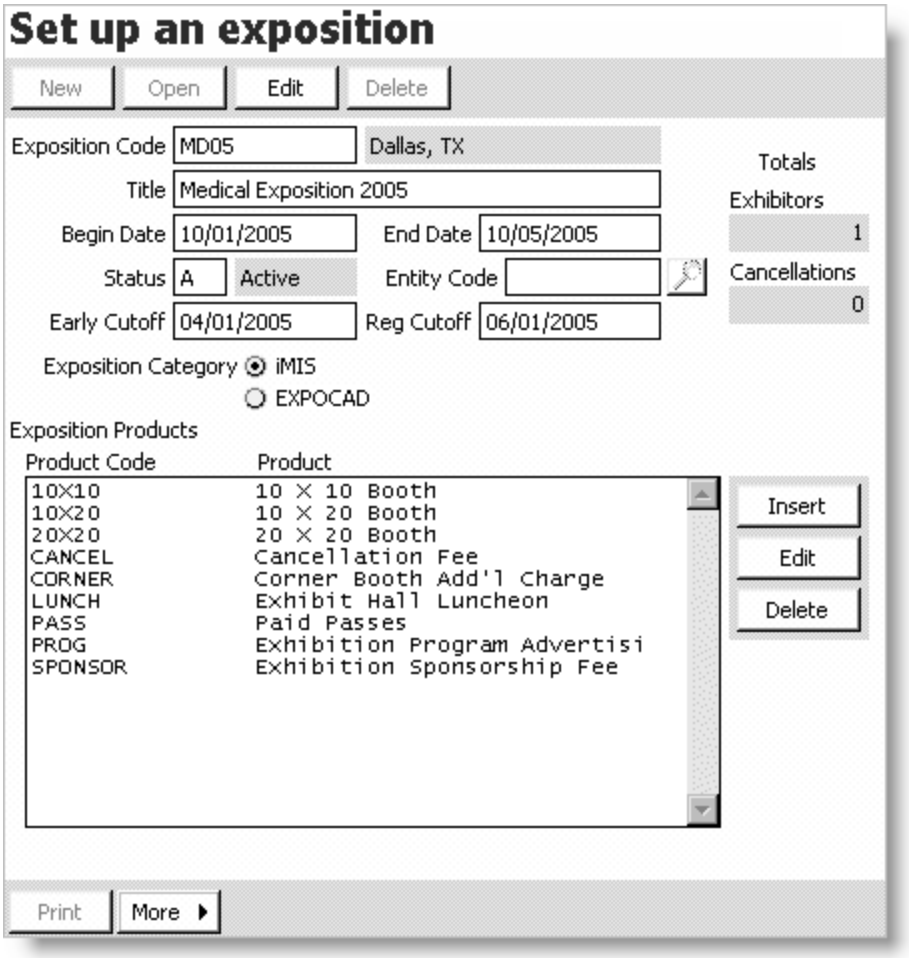
Defining an exposition involves the following:

- Entering the exposition dates
- Selecting global default options
- Identifying service contractors

- Establishing form tracking
- Entering descriptions, address, and notes

> **Note:** Note: For detailed instructions on adding booths to a proximity area, see Managing Proximity Assignments.

Set up an exposition window (second instance)



From Exposition, select Set up an exposition, and double-click an exposition

Exposition Code

Enter a unique, abbreviated code that represents the exposition. Do not use spaces or special characters (such as “or”). The code can be any combination of letters and

numbers as long as the code is different from that of other expositions being maintained in iMIS.

Title

Enter the name of the exposition you are defining. This title appears on windows and reports generated for this exposition.

Begin Date

Enter the start date of the exposition. The Begin Date determines the accounting method in which deferred income is transferred to current income for this exposition.

End Date

Enter the date the exposition ends.

Status

Enter the status of the exposition:

- A = Active
- P = Pending (still in planning stage)
- F = Frozen (currently locked from active order, due to events, such as on-site orders after an exposition has already started)
- C = Closed (orders no longer accepted)
- X = Canceled

> **Note:** Note: An exposition must have a pending (P) status to use the Booth Preferences Management feature.

Entity Code

Enter the entity assigned to the exposition income account if using the non-default exposition entity (a blank field uses the default). Select the Find icon to look up an entity.

The Entity Code field displays only if you enable multiple entities on the AR/Cash Set up module window (where you also can change the default entity). For detailed information on processing multiple entities and assigning entity codes, see Accounts Receivable and Cash Receipts.

Early Cutoff

Enter the last calendar date a discounted rate can be applied for early orders.

Reg Cutoff

Enter the last calendar date the regular rate can be applied. If regular and late fees are set up as part of the exposition definition, any orders after the regular cutoff date are automatically charged the late fee. If you do not charge a higher fee for late orders, leave this field blank.

Totals

Exhibitors - Displays the total number of exhibitors.

Cancellations - Displays the total number of cancellations.

Exposition Category

Enable the applicable category.

Tax Authority

(Canadian tax only) Enter the tax code used for the exposition. Select the Find icon to look up the current tax codes defined on the Set up tax codes window (from AR/Cash, select Set up tables > Tax codes).

The Tax Authority field displays only if the Canadian Taxation Method is enabled on the Organization Names window (File> System Setup, click Organization Names).

Exposition Products

Displays the products defined for the exposition on the Exposition Product Detail window.

Insert button

Opens the Exposition Product Detail window used for defining exposition products.

More button

Click to display a menu of additional exposition set up options:

- General - Opens the Expo General Setup window used for setting default options.
- Options - Opens the Expo Options window used for enabling prospect list security, product and company conflict checking, and booth preferences.
- EXPOCAD Product Mapping - Applicable only for EXPOCAD.
- Service Contractors - Opens the Service Contractor Maintenance window where you enter service contractor information. You can designate official contractors and the function the contractor is performing for the exposition.
- Form Tracking - Opens the Expo Forms window where you define the forms required for the exposition and assign due dates for the forms.
- Roster - Opens the Expo Roster window, which displays a list of exhibitors registered to attend the exposition.
- Booth Proximity - Opens the Proximity Assignment window where you create special areas within the exposition and assign selected booths to these special areas. These areas are used to determine product conflicts.
- Description - Opens the Expo Description window where you enter a text description of the exposition. A maximum of 1,000 alphanumeric characters can be entered. This window also displays user-defined fields created on the Set up module window.
- Address - Opens the Expo Address window where you enter the exposition address.
- Notes - Opens the Expo Notes window where you enter additional exposition information, as well as a SQL Registration Verification calculation.
- Close Current Expo - Closes the exposition, deletes exposition details, creates activity records, and changes exposition status to C = Closed.
  Choosing this option also deletes the exposition definition, depending on the preferences enabled on the Expo System Options window.

- Cancel Current Expo - Changes the exposition status to X = Canceled and deletes order information. Also, it may delete the exposition definition, depending on the preferences enabled on the Expo System Options window.

To define an exposition

Enter the basic information that defines the exposition in the main definition fields.

1. From Exposition, select Set up an exposition to open the Set up an exposition window.
2. Click New to open a second instance of the Set up an exposition window.
3. Enter an Exposition Code.

   Note: You can automate what appears in the Exposition Code field of the Set up an exposition window by entering a SQL calculation in the Expo Name Calculation field of the Expo Advanced Features window. See Setting up Advanced Exposition Features.
4. Enter all other applicable exposition information.
5. Click Save.

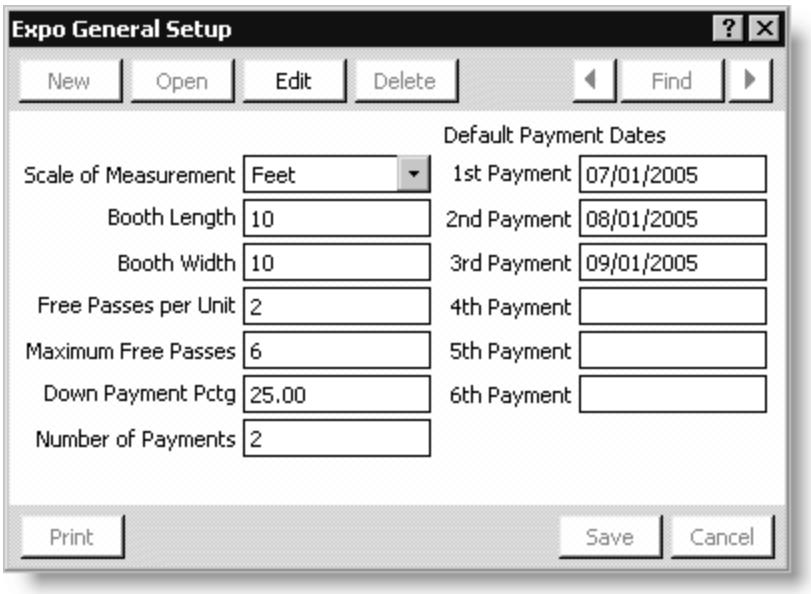
To modify an exposition

1. From Exposition, select Set up an exposition to open the Set up an exposition window.
2. Double-click the exposition you want to modify. The exposition displays on the second instance of the Set up an exposition window.
3. Click Edit.
4. Make any necessary changes.
5. Click Save.

Defining General Exposition Options

Use the Expo General Setup window to define the general options for the exposition, including default booth measurements, number of free passes per booth, down payment percentage, and remaining payment dates.

Expo General Setup window



From Exposition, select Set up an exposition, double-click an exposition, click More, and select General

Scale of Measurement

Select the unit of measure: Feet or Meters.

Booth Length

Enter the default booth length for the exposition booth products.

Booth Width

Enter the default booth width for the exposition booth products.

Free Passes per Unit

Enter the number of free passes designated for each booth (unit).

Maximum Free Passes

Enter the maximum number of free passes regardless of booth units ordered. The maximum number of free passes should be equal to or greater than the number of passes

entered in the Free Passes per Unit field. Passes do not display on the Badges window if zero is entered as the maximum.

Down Payment Pctg

Enter the default down-payment percentage that appears on the Payment Schedule window. This is informational only and does not interface with AR/Cash.

Number of Payments

Enter the default number of payments that appears on the Payment Schedule window. This is informational only and does not interface with AR/Cash.

Default Payment Dates

Enter the default dates for the payment schedule of the exposition. This is informational only and does not interface with AR/Cash.

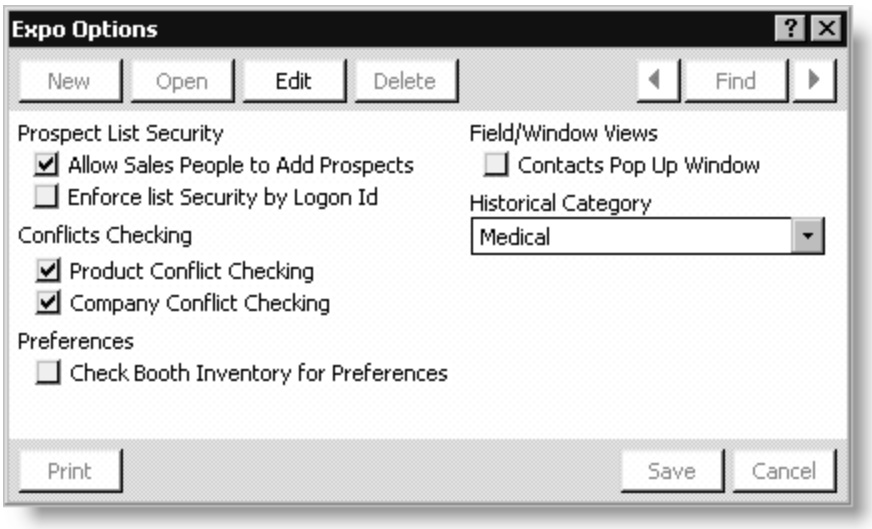
To define general exposition options

1. Open the Expo General Setup window:
   - From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
   - Click More and select General.
2. Click Edit.
3. Enter the setup information.
4. Click Save.

Defining Exposition Options

Use the Expo Options window to enable system features such as enabling iMIS to check for product and company conflicts.

Expo Options window



From Exposition, select Set up an exposition, double-click an exposition, click More, and select Options

Prospect List Security

Allow Sales People to Add Prospects - Enables Add New Prospect on the Manage prospect lists window, allowing salespeople to add prospects to the prospect list.

Enforce list Security by Logon Id - Enable so that iMIS verifies system security by logon identification. Prospect lists will display prospects assigned to the login ID only. List filters will display filters for the login ID only.

Conflicts Checking

Product Conflict Checking - Enable to enforce product-conflict checking when you process an order. Exhibitor product and proximity data must be set up for product conflict checking to function.

Company Conflict Checking - Enable to enforce company-conflict checking when you process an order.

Preferences

Check Booth Inventory for Preferences - Enable so that iMIS verifies whether the booth product exists and inventory is available before assigning a preference.

Field/Window Views

Contacts Pop Up Window - Enable so that the Contacts List window is available from the Exhibitor Information window.

Historical Category

Select the historical category you want to assign to the exposition. The categories that display are set up on the EXPO_CAT general lookup/validation table.

To define exposition options

1. Open the Expo Options window:

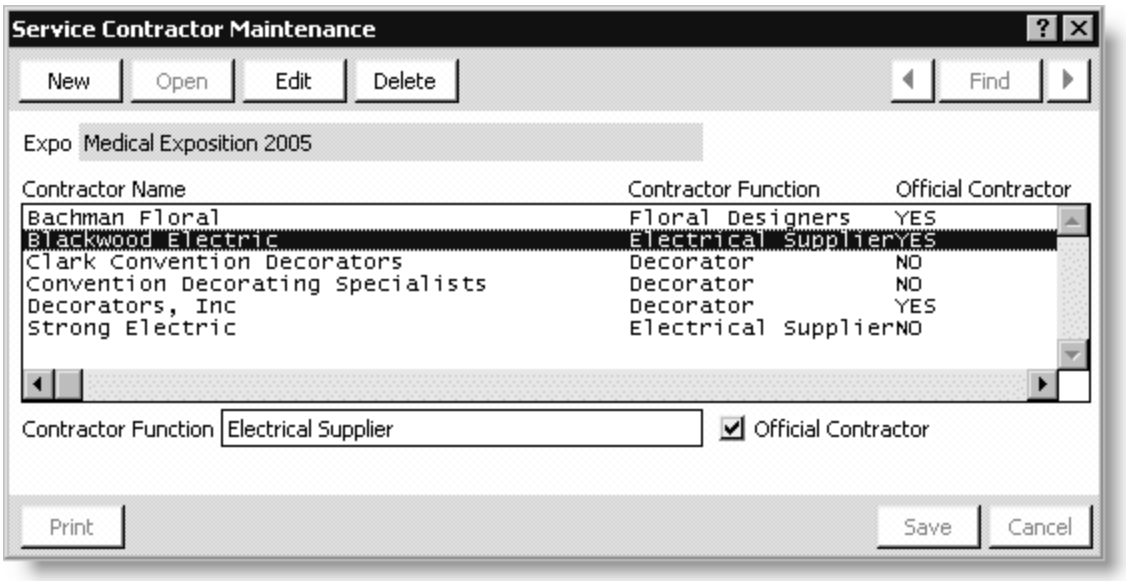
- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More and select Options.

2. Click Edit.
3. Enable all applicable options.
4. Click Save.

Managing Service Contractors

Use the Service Contractor Maintenance window to manage exposition contractors and contractor functions.

Service Contractor Maintenance window



From Exposition, select Set up an exposition, double-click an exposition, click More, and select Service Contractors

Expo

Displays the name of the exposition.

Service Contractor List

Lists all of the contractors servicing the exposition.

Contractor Function

Enter the contractor's service type.

Official Contractor

Enable if the contractor is an official exposition contractor.

To add service contractors to an exposition

To add a service contractor to an exposition, the contractor must have a record in the customer database.

1. Open the Service Contractor Maintenance window:

- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More and select Service Contractors.

2. Click New to open the Find window. Search for a contractor.
3. Double-click a record. The company name associated with the record automatically displays in the Service Contractors List.
4. Enter the Contractor Function that best describes the contractor. A maximum of 30 alphanumeric characters can be entered.
5. (optional) Enable the Official Contractor option if the contractor is designated as an official contractor for the exposition.
6. Click Save.

To edit or delete a service contractor

1. Open the Service Contractor Maintenance window:

- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More, and select Service Contractors.

2. Select a contractor from the Service Contractor List.
3. (optional) To edit a service contractor, do the following:

- Click Edit, and make any necessary changes.
- Click Save.

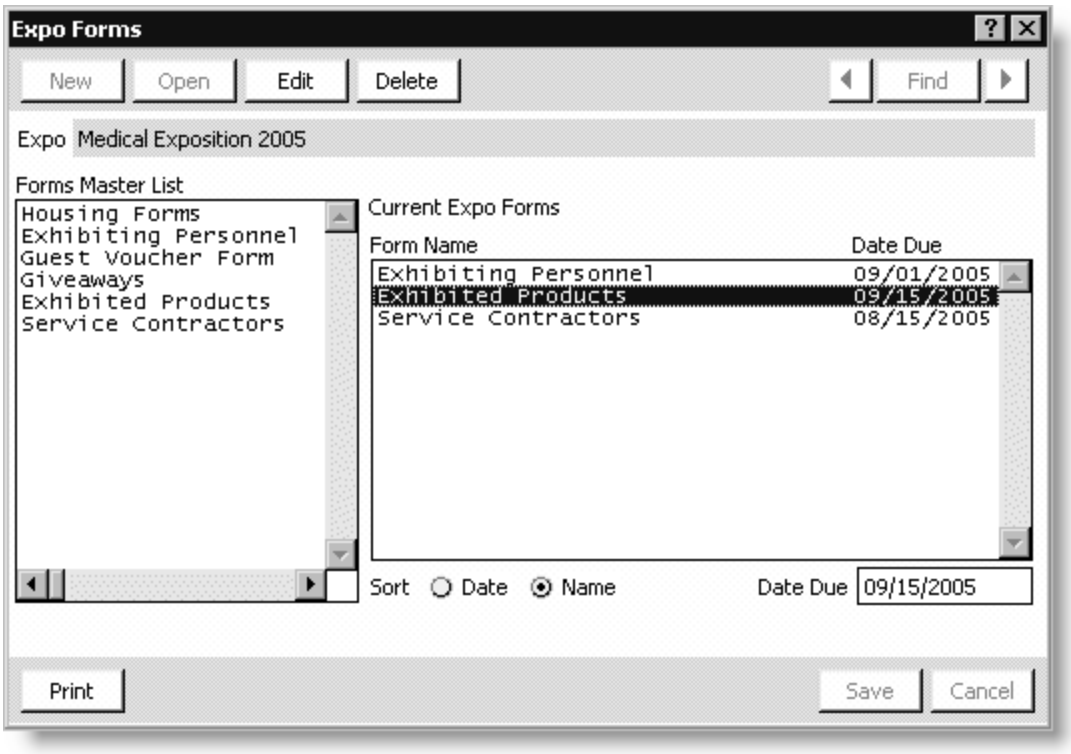
4. (optional) To delete a service contractor, do the following:

- Click Delete. A message prompts you to verify deleting the contractor.
- Click Yes to delete the service contractor from the list.

Managing Exposition Forms

Use the Expo Forms window to add forms (defined on the Set up forms master list window) to an exposition. Most expositions require that all forms be signed and returned prior to the exposition Begin Date.

Expo Forms window



From Exposition, select Set up an exposition, double-click an exposition, click More, and select Form Tracking

Expo

Displays the name of the exposition.

Forms Master List

Displays the list of available forms. Forms are defined on the Set up forms master list window.

Current Expo Forms

Displays the forms assigned to the exposition.

Sort

Enable a sort option for displaying the list of Current Expo Forms.

Date Due

Enter a final submission date for a form.

To add forms to an exposition

1. Open the Expo Forms window:

- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More and select Form Tracking.

2. Select a form from the Forms Master List, and click New to add the form to the list of Current Expo Forms.
3. Enter the Due Date for the form.
4. Click Save.

To edit or delete exposition forms

1. Open the Expo Forms window:

- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More and select Form Tracking.

2. Select the form from the Current Expo Forms list that you want to edit or delete.
3. (optional) To edit a form, do the following:

- Click Edit.
- Change the Date Due.
- Click Save.

4. (optional) To delete a form, do the following:

- Click Delete. A message prompts you to verify deleting the form.
- Click Yes to delete the form from the exposition.

Managing Proximity Assignments

Booth proximity is the relative closeness of one booth to another within a specific area on the exposition floor. Using the Proximity Assignments window, you can assign booths to specific areas on the exposition floor.

For example, if you do not want vendors with competitive products to be within five booths of each other, then define your proximity assignments so that these vendors are not near one another.

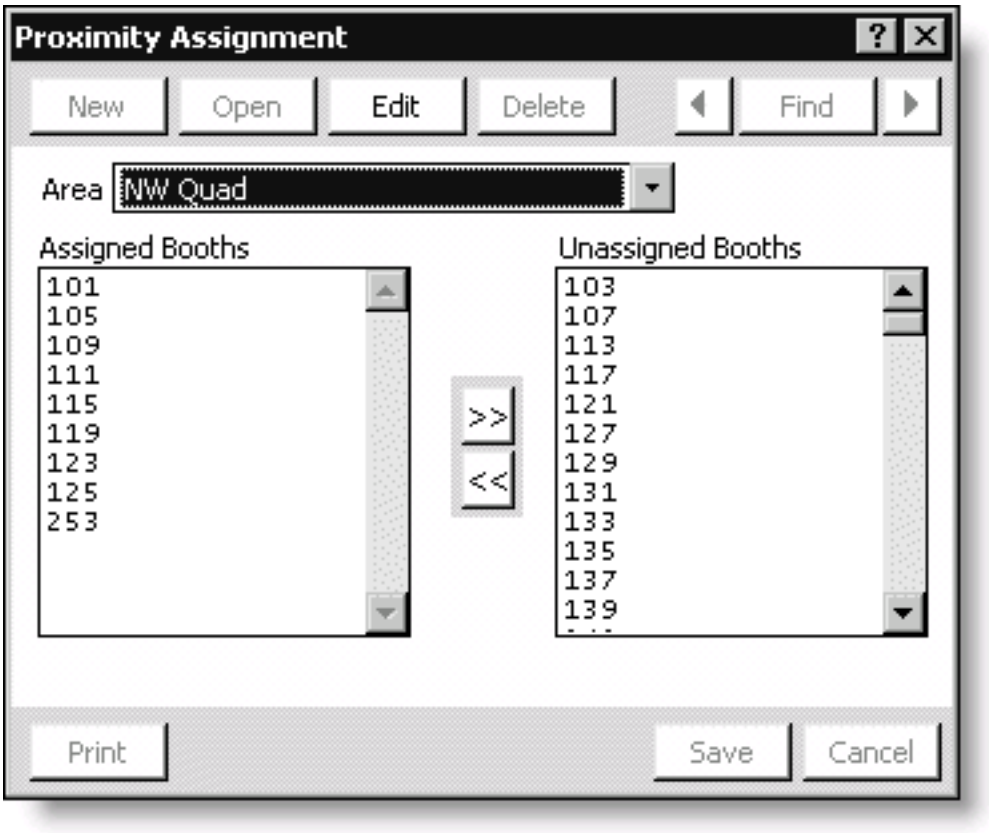
> **Note:** Note: When you define proximity assignments, you must assign at least one booth to an exposition area.

You also can use proximity assignments to group certain types of vendors. For example, you may define an area specifically for research companies.

This section address the following topics:

- Defining (creating) a booth proximity
- Adding booths to a proximity
- Removing a booth from a proximity

Proximity Assignment window



From Exposition, select Set up an exposition, double-click an exposition, click More, and select Booth Proximity

Area

Select a booth-proximity area. When naming an Area, provide a name that relates to something on the exposition floor (limit 38 alphanumeric characters). For example, if the booth area is near the food court, name the proximity area Food Court.

Assigned Booths

Lists the booths assigned to the Area (proximity).

Unassigned Booths

Lists the booths available for assignment to the Area (proximity).

To define a proximity area

1. Open the Proximity Assignment window:

- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More and select Booth Proximity.

2. Click Edit.
3. Select New Area from the Area list. The Add New Area window opens.
4. Enter the new Area Name.
5. Click OK to return to the Proximity Assignment window and add booths to the new area.

To modify booth proximity assignments

1. Open the Proximity Assignment window:

- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More and select Booth Proximity.

2. Select the Area you want to modify.
3. Click Edit.
4. (optional) To assign booths to an area, do the following:

- Select the booths from the Unassigned Booths list that you want to assign to the area. Press Ctrl to select multiple booths.
- Click << to assign the booths to the area. The selected booths display in the list of Assigned Booths.

5. To remove booths from an area, do the following:

- Select the booths from the Assigned Booths list that you want to remove from the area. Press Ctrl to select multiple booths.

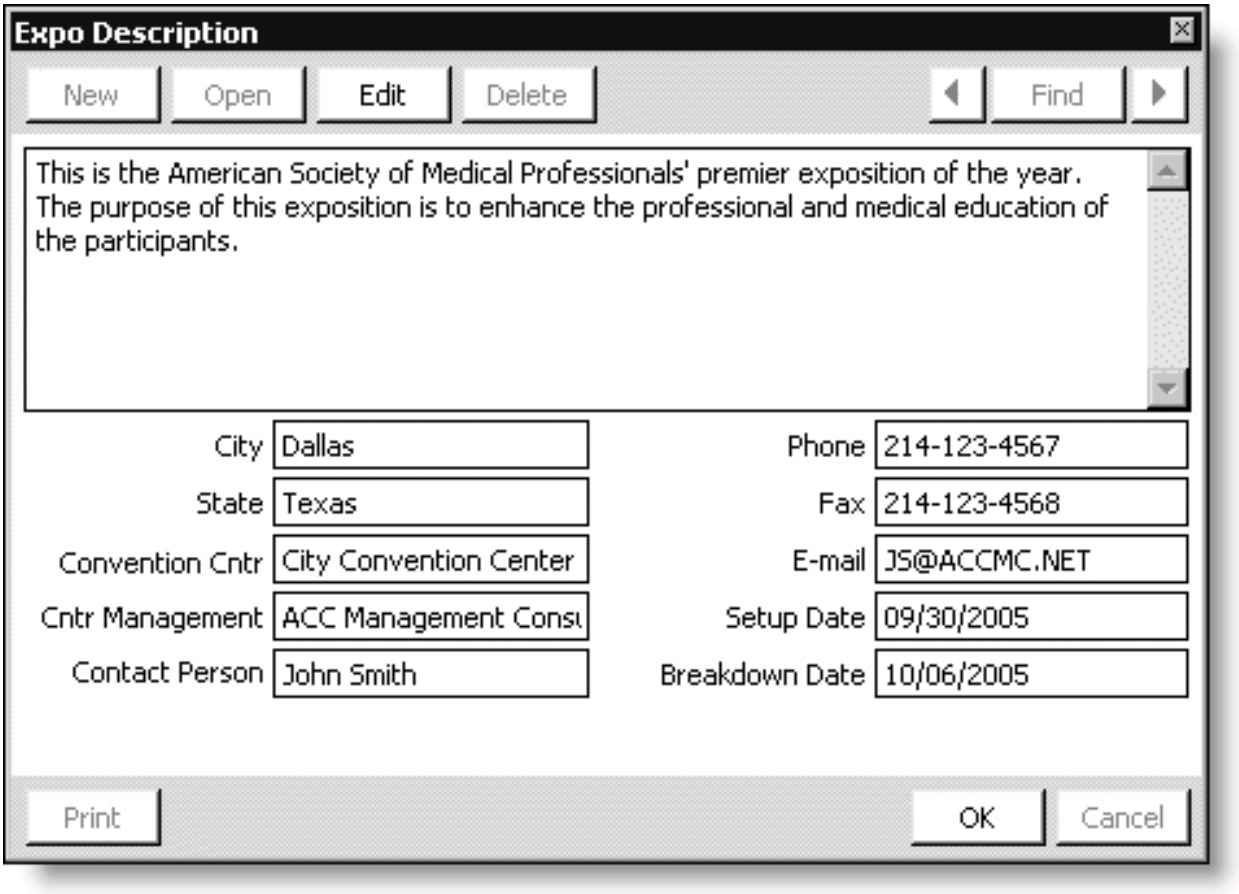
- Click >> to remove the booths from the area. The removed booths display in the list of Unassigned Booths.

6. Click Save.

Defining Exposition Descriptions

Define exposition descriptions on the Expo Description window.

Expo Description window



From Exposition, select Set up an exposition, double-click an exposition, click More, and select Description

Description

Enter a description of the exposition (1000 alphanumeric characters). Use the Description for inquiries, to paste content into word-processing documents, or to print on reports you design.

User-defined Fields

Enter all applicable exposition information. The user-defined fields are enabled under the Expo Description Fields area of the Exposition
Set up module window.

To define an exposition description

1. Open the Expo Description window:

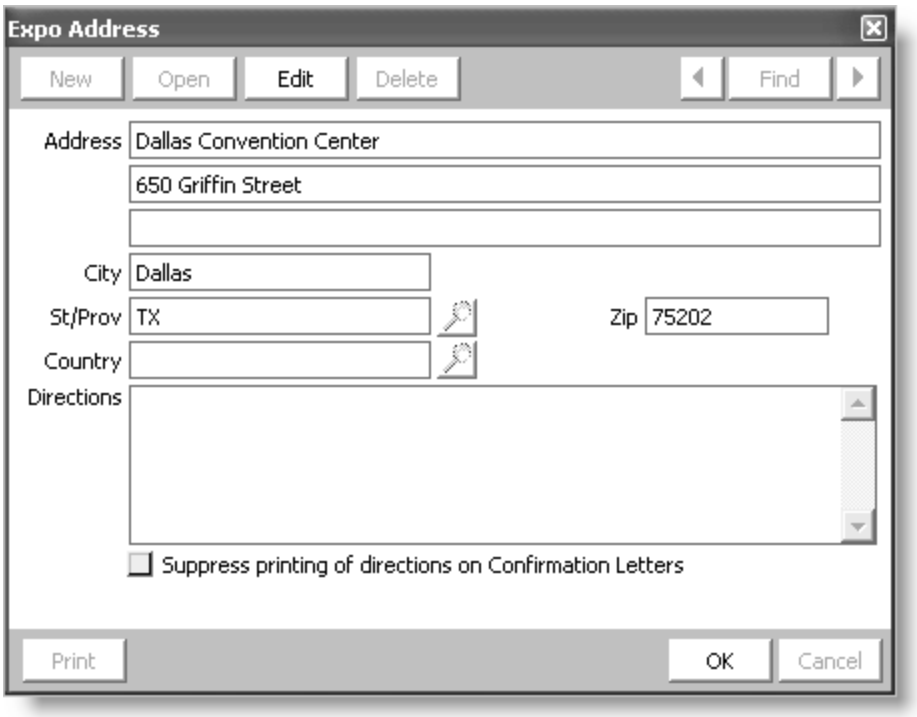
- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More and select Description.

2. Click Edit.
3. Enter a Description of the exposition.
4. Enter any other applicable information in the User-defined Fields.
5. Click OK.

Defining Exposition Addresses

Define exposition addresses on the Expo Address window.

Expo Address window



From Exposition, select Set up an exposition, double-click an exposition, click More, and select Address

Address

Enter the location of the exposition (maximum of 50 alphanumeric characters). The Address displays on default confirmation letters, and you can include it on other reports.

City

Enter the city where the exposition is being held (maximum of 50 alphanumeric characters).

St/Prov

Enter the state or providence where the exposition is being held (maximum of 15 alphanumeric characters). Select the Find icon to look up a state or province code.

Zip

Enter the ZIP code where the exposition is being held (maximum of nine numeric digits).

Country

Enter the country where the exposition is being held (maximum of 20 alphanumeric characters). Select the Find icon to look up a country code.

Directions

Directions to the exposition location, with a maximum field size of 256 alphanumeric characters

Suppress printing of directions on Confirmation Letters

Enable to prevent printing directions to the exposition on confirmation letters.

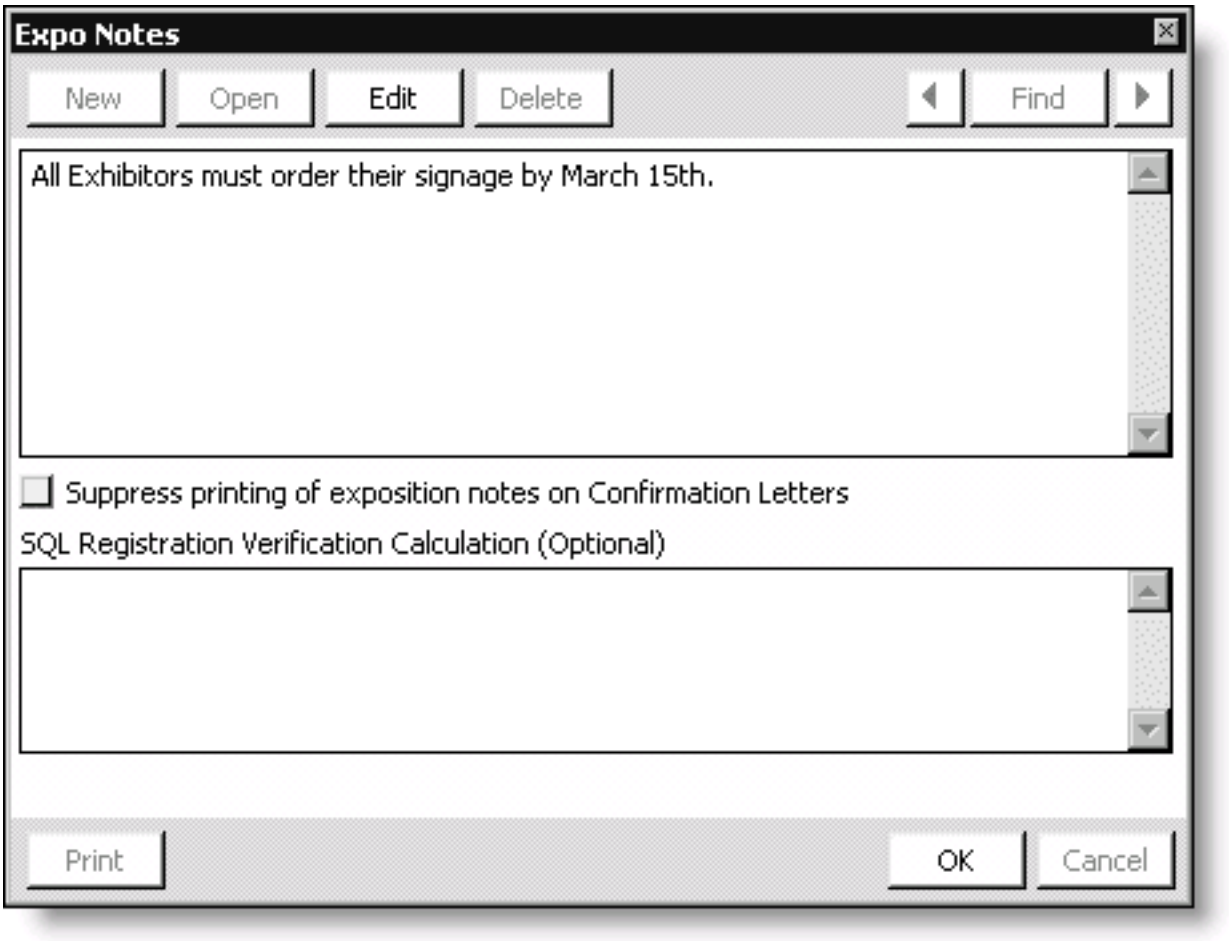
To define an exposition address

1. Open the Expo Address window:
   - From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
   - Click More and select Address.
2. Click Edit.
3. Enter the Address information for the exposition.
4. (optional) Enable Suppress printing of directions on the confirmation Letters to prevent printing the address on confirmation letters.
5. Click OK.

Defining Exposition Notes

Define exposition notes on the Expo Notes window.

Expo Notes window



From Exposition, select Set up an exposition, double-click an exposition, click More, and select Notes

Note

Enter a note or comment about the exposition (maximum of 256 alphanumeric characters).

Suppress printing of exposition notes on Confirmation Letters

Enable to prevent printing notes on confirmation letters.

SQL Registration Verification Calculation (optional)

Enter a SQL calculation. If you enter a SQL calculation, iMIS tests an exhibitor's eligibility based on the calculation's requirements.

The field stores a SQL calculation that results in either a 1 or a 0. If the calculation produces a 1, then iMIS allows you to create an order for the exhibitor. If the calculation results in a 0, then a message displays indicating that the exhibitor is not eligible and the order insertion is canceled.

The following is a sample calculation (the calculation varies from organization to organization). The sample calculation searches for all CM (company member) types:

select COUNT(*) from Name where MEMBER_TYPE='CM' and ID = [AsiSQL(Orders.ST_ID)]

To enter an exposition note

1. Open the Expo Address window:

- From Exposition, select Set up an exposition, and double-click an exposition to open the Set up an exposition window (second instance).
- Click More and select Notes.

2. Click Edit.
3. Enter a note or comment.
4. (optional) Enable Suppress printing of directions on the confirmation Letters.
5. (optional) Enter a SQL Registration Verification Calculation. (You must restart iMIS if entering a SQL calculation).
6. Click OK.

Canceling an Exposition

When you cancel an exposition, iMIS automatically reverses the accounting entries that were created during order processing. The income accounts are debited and Accounts Receivable is credited. All open receivable balances for unpaid orders are closed (brought to zero balance). For exhibitors who paid, the reversed entry results in open

credits. This credit can either be refunded or applied to other purchases or exposition orders. If product orders exist, they are purged.

If Delete Exposition Definition on Close is enabled on the Expo System Options window (from Exposition, select Set up module, and click Options), the exposition definition is deleted when you cancel the exposition. If the option is not enabled, the exposition you are canceling displays on the Set up an exposition window with a status of X.

Canceling an exposition is irreversible. Regardless of whether the Delete Exposition Definition on Close option is enabled, the product detail is deleted once the exposition is canceled.

To cancel an exposition

1. Open the exposition that you want to cancel:
   - From Exposition, select Set up an exposition to open the Set up an exposition window.
   - Double-click the exposition to open it on the Set up an exposition window (second instance).
2. Click More and select Cancel Current Expo. (If current exhibitors are found, a message prompts you to cancel the expo. Click Yes.)
3. A message prompts you to verify canceling the expo. Click Yes.
4. A final message prompts you to verify canceling the expo. Click Yes to cancel the exposition.

Closing an Exposition

You must close the exposition before exposition activity records can be created. When closing a completed exposition, the order data is replaced with activity records.

If the Delete Expo Definition on Close option is enabled in the Expo System Options window (from Exposition, select Set up module, and click Options), the definition and planning records for the exposition are purged when you close the exposition. If this option is disabled, the exposition and product planning information remains in iMIS, the exposition

detail is purged, and a “C” displays in the Exposition Status field to indicate that the exposition has been closed.

To close an exposition

1. Open the exposition that you want to close:
   - From Exposition, select Set up an exposition to open the Set up an exposition window.
   - Double-click the exposition to open it on the Set up an exposition window (second instance).
2. Click More and select Close Current Expo. (If active orders are found, a message prompts you to close the exposition and create activity records. Click Yes.)
3. A message prompts you to verify closing the exposition. Click Yes.
4. A final message warns you that all exposition details are removed and that activity history is generated for all the exhibitors. Click Yes to close the exposition.

Exposition Product Definition

Overview of exposition product definition

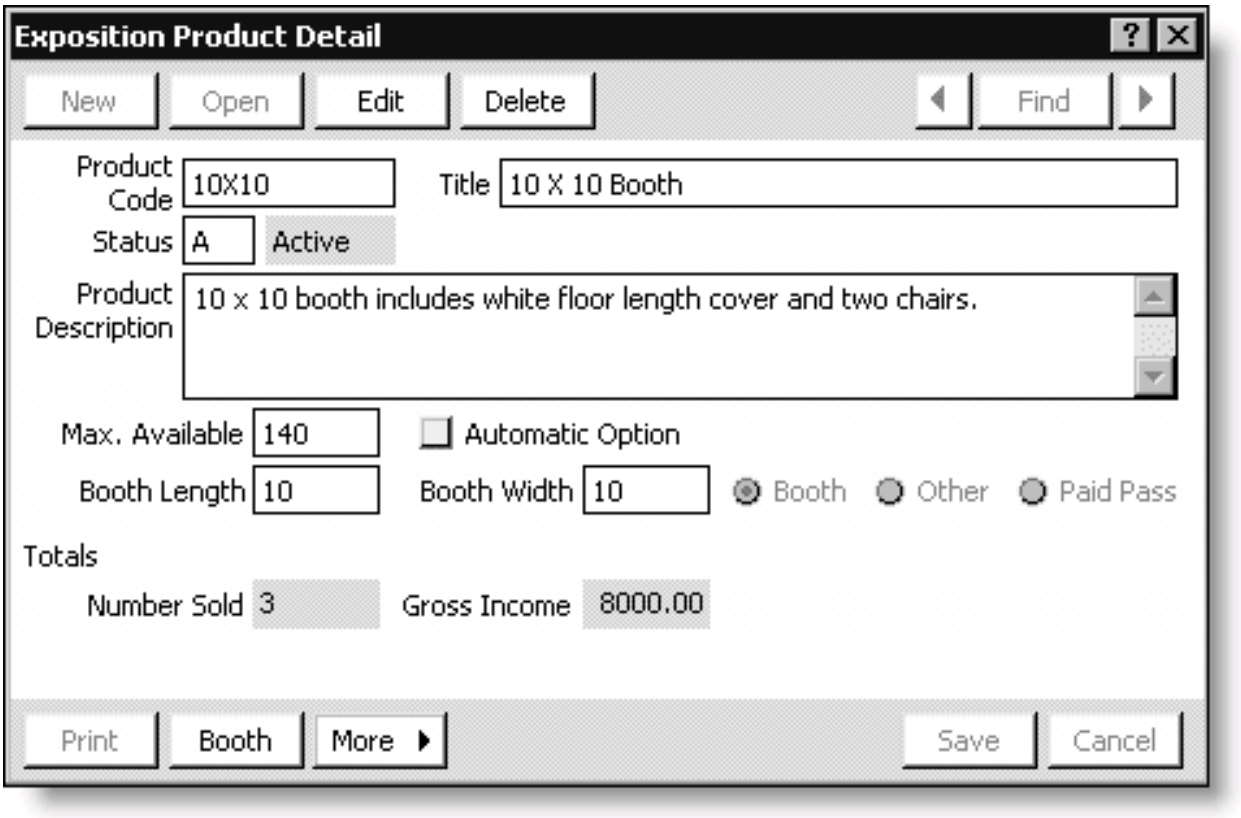
Exposition products are items sold to exhibitors to generate revenue. The booth product is the primary product sold, but examples of other exposition products include paid and free passes, sponsorships, and advertising.

Use the Exposition Product Detail window to define exposition products. After you define your exposition products, you can enter the pricing structure (Exposition Booth & Product Fees window), define linked products, and define upsell products.

Defining Exposition Products

Before you can define exposition products, you first must define the exposition. See Defining and Managing Expositions (see "Exposition Definition") for more. Exposition products and product information are defined using the Exposition Product Detail window.

Exposition Product Detail window



From Exposition, select Set up an exposition, double-click an exposition, and double-click an exposition product

Product Code

Enter a code for the exposition product. The code must be unique within each exposition.

Title

Enter a name for the product. The product Title displays on all lists and reports that show individual products, such as confirmation letters, tickets, and detailed rosters (maximum characters: 60).

Status

Enter the product's status:

- A = Active (accepting orders) is the default
- P = Pending (still in the planning stages)
- F = Frozen (currently locked from ordering)
- C = Closed (orders no longer accepted)
- X = Canceled

> **Note:** Note: Product status is not related to exposition status.

Product Description

Enter a description of the product, such as size or color. The Product Description does not print on reports, but it can be used to store data for exporting to a directory.

Max Available

Enter the maximum number of products available for this exposition (maximum characters: four). Once booths are created, you cannot edit this number without first removing booths.

Automatic Option

(optional) Enable to automatically add the product to each new order.

Booth Length

(Displays only when Booth is enabled for a product) Enter the length of the booth (integer-/whole number).

Booth Width

(Displays only when Booth is enabled for a product) Enter the width of the booth (integer-/whole number).

Taxable

(Not shown/Canadian tax only) Enable the appropriate tax authority: GST or PST. These options display only if the Canadian Taxation Method for the default organization is enabled in the Organization Names window.

Booth

Enable to indicate that the product is a booth. The Booth Length field, Booth Width field, and Booth button display when Booth is enabled.

Other

Enable to indicate that the product is anything but a booth or paid pass, such as program advertisement or sponsorship.

Paid Pass

Enable to indicate that the product is a paid pass.

Totals

Number Sold - Displays the number of products sold.

Gross Income - Displays the product's expected gross income.

Booth button

(Displays only when Booth is enabled for a product) Opens the Booths window used for generating, adding, removing, and importing booths.

More button

Click to display a menu of additional exposition-product set up options.

To define an exposition product

1. Open an exposition:

- From Exposition, select Set up an exposition to open the Set up an exposition window.
- Double-click the exposition to open it on the Set up an exposition window (second instance).

2. Click Insert to open the Exposition Product Detail window.
3. Enter a unique Product Code.
4. Enter all applicable product information.
5. Click Save.

To edit or delete an exposition product

If you edit a booth product and change the product type from Booth to Other or Paid Pass, the booth numbers are deleted. You must regenerate the booth numbers if you change the product's type back to Booth.

When deleting products, only products for which no open orders exist can be deleted. If open orders exist for a product, you must either process the orders or remove the product from the orders before deleting the product.

1. Open an exposition:

- From Exposition, select Set up an exposition to open the Set up an exposition window.
- Double-click the exposition to open it on the Set up an exposition window (second instance).

2. Select a product from the list of Exposition Products.
3. To edit the product, do the following:

- Click Edit to open the Exposition Product Detail window.
- Make any necessary changes.
- Click Save.

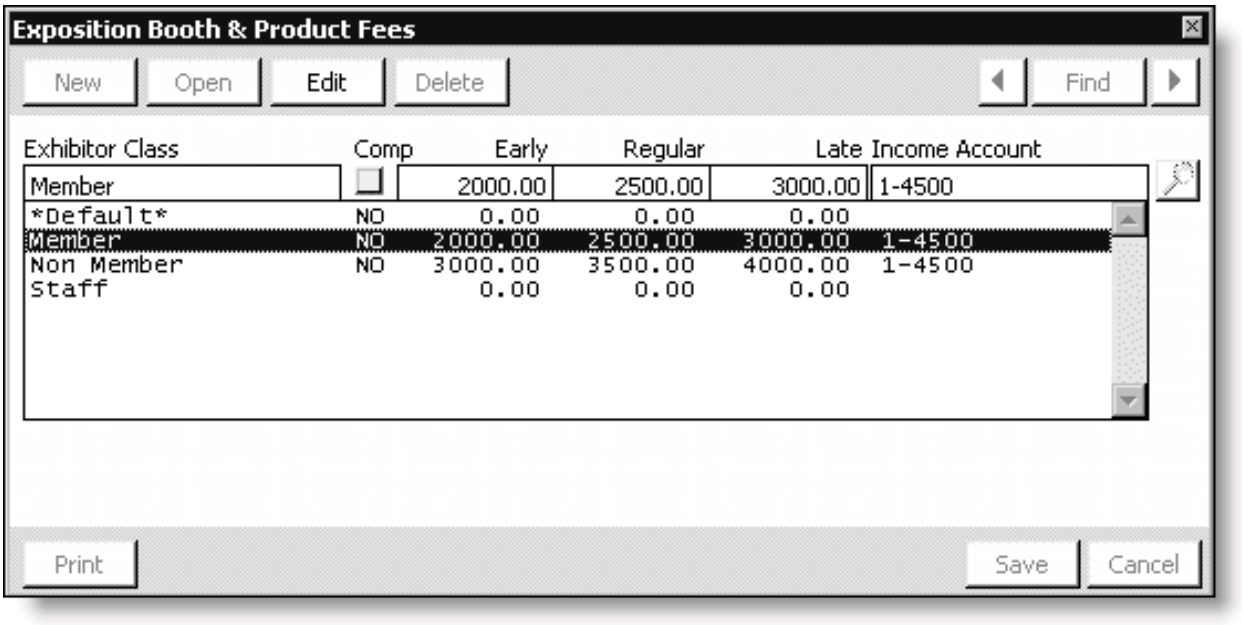
4. To delete the product, do the following:

- Click Delete. A message prompts you to verify deleting the product.
- Click Yes to delete the product.

Defining Product Fees

Follow these procedures to set pricing (fees) for exposition products and to assign a general ledger account number to record the income from those fees. Exposition product fees are set up on the Exposition Booth & Product Fees window.

Exposition Booth & Product Fees window



From Exposition, select Set up an exposition, double-click an exposition, double-click an exposition product, click More, and select Fees

Exhibitor Class

Displays the exhibitor's class as defined on the Set up exhibitor classes window. If Default is assigned, the product fees apply to all exhibitor classes (customer types). The following are examples of exhibitor classes:

- M = Member
- NM = Non-Member
- SP = Speaker
- STAFF = Staff

Comp

Enable to NOT charge the selected exhibitor class a fee for the product.

Early

Enter the rate that applies when an exhibitor places an order on or before the established Early Cutoff date as defined on the Set up an exposition window.

Regular

Enter the rate that applies when an exhibitor places an order for a product after the Early Cutoff date but before the Late Cutoff date.

Late

Enter the rate that applies when an exhibitor places an order after the established Late Cutoff date as defined in the Set up an exposition window.

Income Account

Enter the general ledger account number for the selected product. Select the Find icon to look up an account.

Deferred Account

Enter the general ledger number that records the fee until it is transferred to current income (when the exposition is presented). The Deferred Account field only displays if you are licensed for Deferred Income. Select the Find icon to look up an account.

To define product fees

1. Open an exposition product on the Exposition Product Detail window:

- From Exposition, select Set up an exposition to open the Set up an exposition window.
- Double-click the exposition to open it on the Set up an exposition window (second instance).
- Double-click a product.

2. Click More, and select Fees to open the Exposition Booth & Product Fees window.
3. Click Edit.
4. (optional) Enable the Comp option if the Exhibitor Class will not be charged for the exposition product.
5. Enter product fee information for each Exhibitor Class (iMIS automatically populates the decimal point and zeros):

- Early
- Regular
- Late

6. Enter an Income Account for each Exhibitor Class.

   Note: If you select *Default* and enable Comp, all exhibitors receive the selected product at no charge. If you select a specific Exhibitor Class and enable Comp, then only exhibitors in that class receive the product at no charge. See Editing Exposition Orders.

7. (optional) Enter a Deferred Account number for the *Default* line.
8. Click OK.

Linking Exposition Products

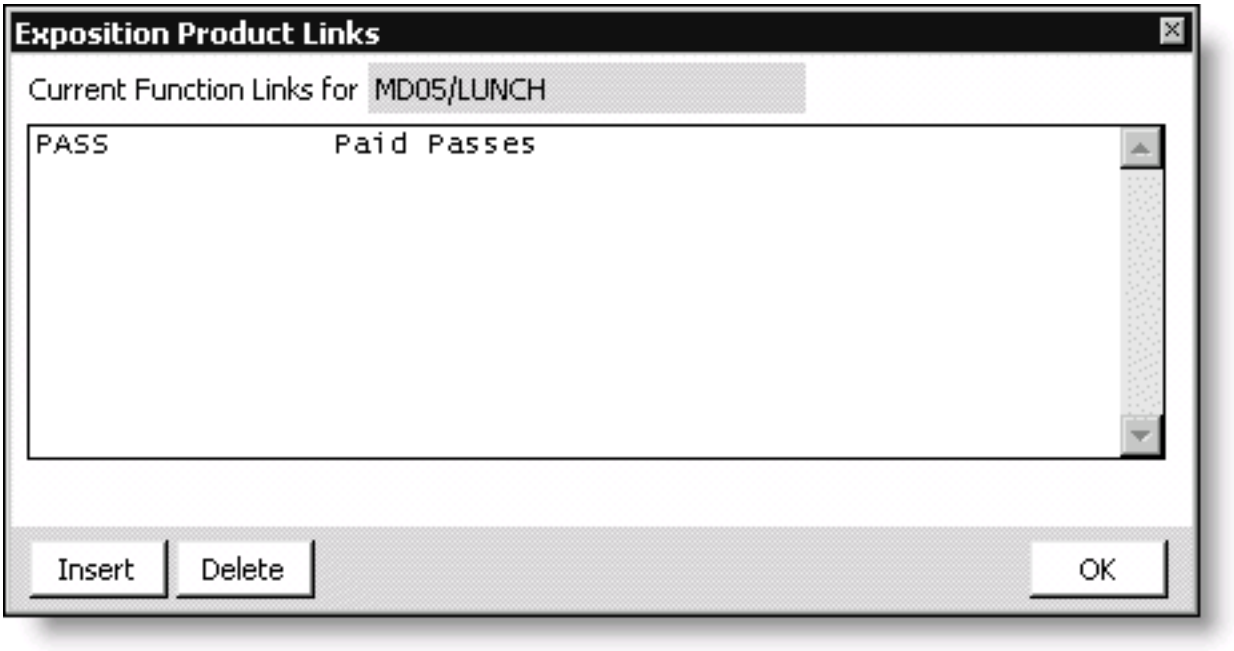
The Links option allows you to associate a primary (parent) product to a secondary (child) product. When an exhibitor orders a primary product, iMIS automatically adds all of the primary product's linked secondary products to the order.

Linking products is a shortcut for data entry. If you deselect the primary product, then iMIS leaves the linked products selected (selecting the parent also selects the children, but deselecting the parent affects only the parent). You have the option of individually selecting and deselecting linked products at any point during the exposition management process.

Use the Exposition Product Links window to link products.

Note: Note: The linking feature does not affect either product pricing or complementary functions.

Exposition Product Links window



From Exposition, select Set up an exposition, double-click an exposition, double-click an exposition product, click More, and select Links

Current Function Links for

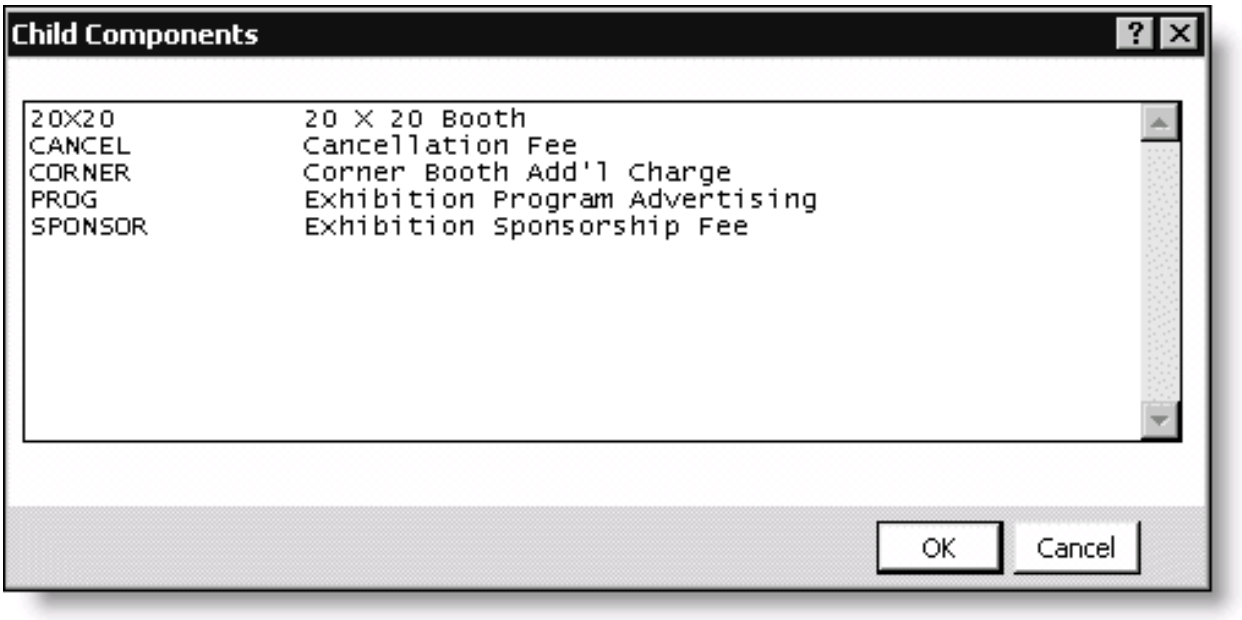
Displays the name of the parent product.

Linked Products

Displays the primary product's linked secondary products.

Insert button

Opens the Child Components window used for selecting secondary products:



Secondary Products - Lists all available (non-linked) products.

Delete button

Click to break the link to a selected secondary product.

To define a product link

1. Open an exposition product on the Exposition Product Detail window:
   - From Exposition, select Set up an exposition to open the Set up an exposition window.
   - Double-click the exposition to open it on the Set up an exposition window (second instance).
   - Double-click a product.
2. Click More, and select Links to open the Exposition Product Links window.
3. Click Insert to open the Child Components window.
4. Select a secondary product, and click OK to link the secondary product to the primary product.

To delete a product link

1. Open an exposition product on the Exposition Product Detail window:

- From Exposition, select Set up an exposition to open the Set up an exposition window.
- Double-click the exposition to open it on the Set up an exposition window (second instance).
- Double-click a product.

2. Click More, and select Links to open the Exposition Product Links window.
3. Select the secondary product link you want to delete, and click Delete. A message prompts you to verify deleting the link.
4. Click Yes to delete the link.

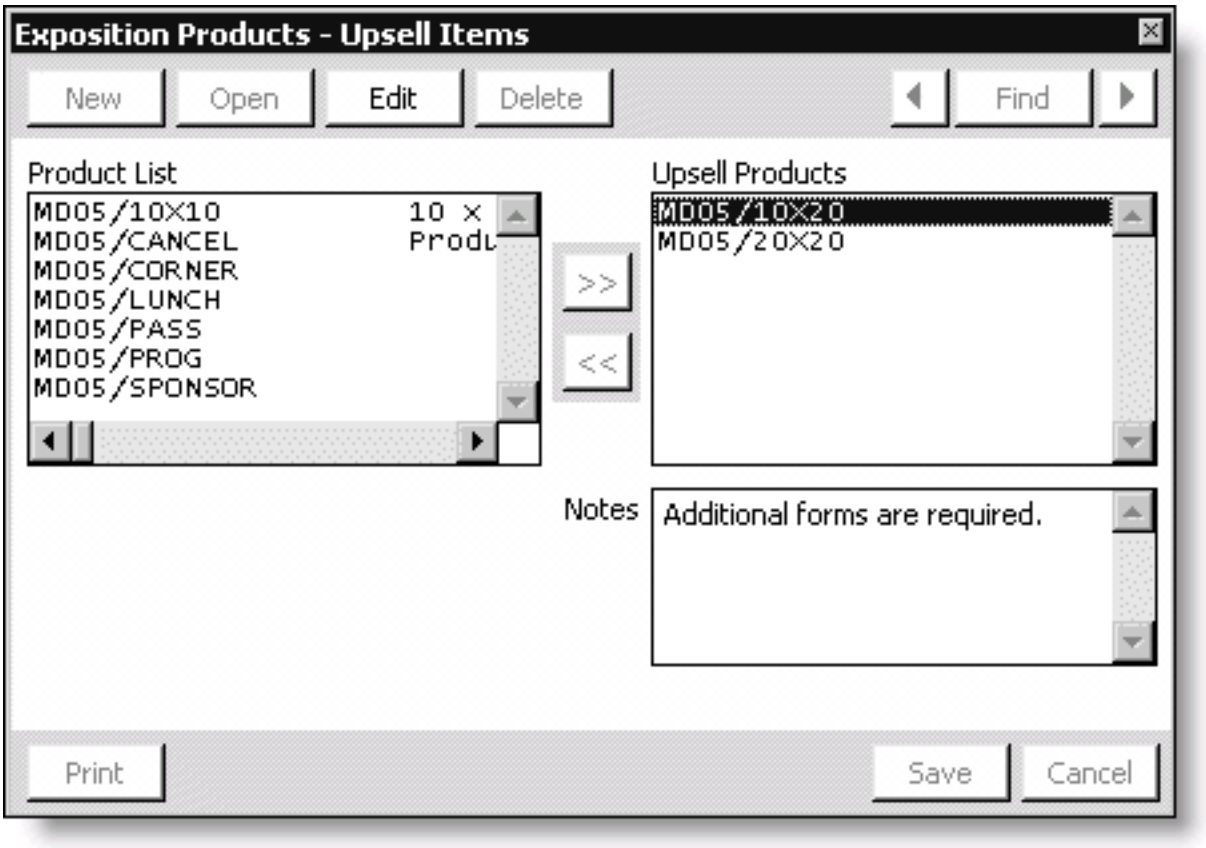
> **Note:** Note: The primary and secondary products are no longer linked. You did not delete any products. If you filled an order with a primary product linked to a secondary product, you must delete the linked (secondary) product from the order manually. See Editing Exposition Orders for detailed procedures.

Defining Upsell Items

When exhibitors order products, additional items often are available that complement the products ordered initially. Upsell functionality allows you to designate and associate these items with other exposition products.

By relating items, salespeople can view available upsell products when marketing a specific product. Upsell items are designated on the Exposition Products - Upsell Items window.

Exposition Products - Upsell Items window



From Exposition, select Set up an exposition, double-click an exposition, double-click an exposition product, click More, and select Upsell

Product List

Lists available products.

Upsell Products

Displays all upsell products selected from the Product List.

Notes

Enter any additional information about an upsell product. (Enter up to 640 characters or 20 rows of data containing 32 characters each.)

To define an upsell product

1. Open an exposition product on the Exposition Product Detail window:

- From Exposition, select Set up an exposition to open the Set up an exposition window.
- Double-click the exposition to open it on the Set up an exposition window (second instance).
- Double-click a product.

2. Click More, and select Upsell to open the Exposition Products - Upsell Items window.
3. Click Edit.
4. Select an item from the Product List, and click >> to add the selected product to the list of Upsell Products.
5. Enter any applicable Notes for the selected upsell product.
6. Click Save.

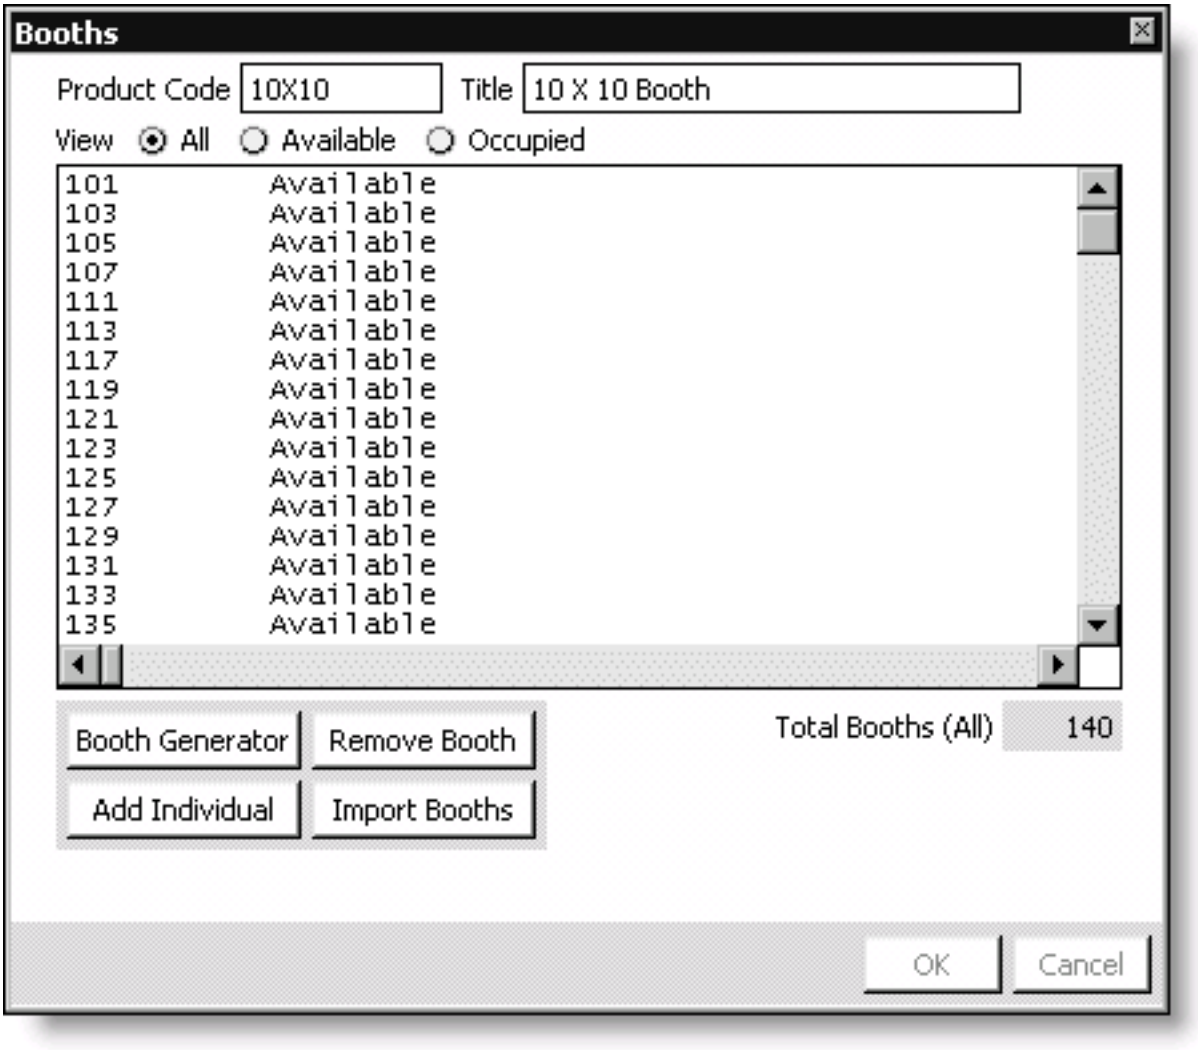
Managing Booth Inventory

Booths are primary exposition products. How you generate booths depends on the number of booths needed and whether your numbering scheme allows you to generate a range of booths. For example, if the booth numbers are sequential within a given range of booths (such as an aisle), or if the numbers are all odd or even within that range, then the fastest way to generate booth inventory is to use the booth generator.

Perform the following tasks using the Booths window:

- Add and delete booths
- Define and modify booth inventory
- Monitor booth status (available and sold)
- Import booth product files, such as from Excel

Booths window



From Exposition, select Set up an exposition, double-click an exposition, double-click an exposition product, and click Booth

Product Code

Displays the booth's product code.

Title

Displays the booth's title.

View

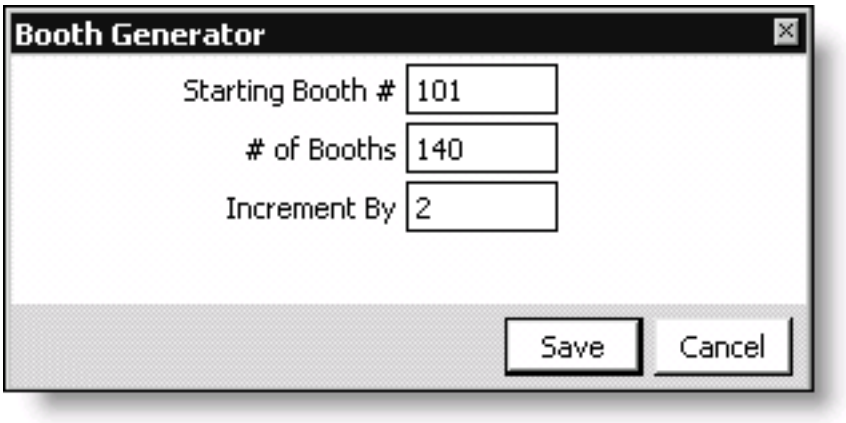
All - (Default) Enable to display all booths, available and occupied

Available - Enable to display all unassigned booths

Occupied - Enable to display all assigned (sold) booths

Booth Generator button

Opens the Booth Generator window used for defining a range of booths:



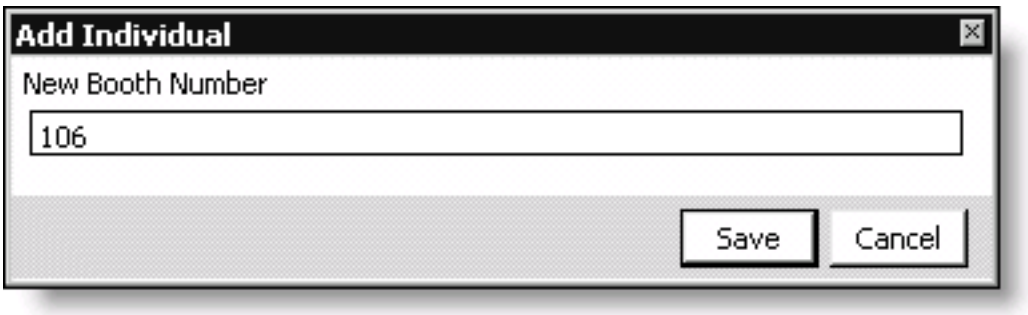
Starting Booth # - Enter the starting booth number.

# of Booths - Enter the total number of booths you want to generate.

Increment By - Enter the number by which you want to separate booth numbers.

Add Individual button

Opens the Add Individual window used for defining individual booths:



Remove Booth button

Click to delete a booth.

Import Booths button

Click to import booths from an external file.

Total Booths (All)

Displays the total number of booths.

To generate booths

Generate a range of booths (or an individual booth) after defining a booth product. You can generate booths as often as necessary for a booth product as exposition requirements change.

1. Open an exposition product on the Exposition Product Detail window:
   - From Exposition, select Set up an exposition to open the Set up an exposition window.
   - Double-click the exposition to open it on the Set up an exposition window (second instance).
   - Double-click a product.
2. Click Booth to open the Booths window.
3. Generate a range of booths:
   - Click Booth Generator to open the Booth Generator window.
   - Enter the Starting Booth # for the range of booths.
   - Enter the # of Booths.
   - Enter the number you want to Increment By.

   Note: Booth numbers can be generated up to 15 digits in length. If you enter an originating number greater than 15 digits, or if you enter a booth number range that generates a number greater than 15 digits, an error message is provided. You must begin with a new booth number or range.
4. Generate an individual booth:
   - Click Add Individual to open the Add Individual window.
   - Enter a New Booth Number.

Note: Individual booth numbers cannot exceed 20 digits. If you add an individual booth number that exceeds 20 digits, the booth number is not saved, and an error message is not provided.

5. Click Save to generate the booth(s).

To remove booths

While managing your booth inventory, you may need to remove a booth from time to time. You may encounter a numbering error or a change in exposition floor layout. You also may want to remove individual booths to create small gaps within a large range of booths.

> **Note:** Note: You cannot remove a booth from inventory if the booth has been ordered. See Editing Exposition Orders to delete the booth from the order before removing the booth from inventory.

1. Open an exposition product on the Exposition Product Detail window:

- From Exposition, select Set up an exposition to open the Set up an exposition window.
- Double-click the exposition to open it on the Set up an exposition window (second instance).
- Double-click a product.

2. Click Booth to open the Booths window.
3. Select the booth(s) you want to remove from inventory, and click Remove Booth. A message prompts you to verify deleting the selected booth.
4. Click Yes to remove the selected booth(s).
5. (optional) If you entered a Max. Available quantity for the booth product on the Exposition Product Detail window, a message prompts you to adjust the maximum available quantity. Click Yes to adjust the Max. Available quantity to match the number of remaining booths.

To import booths

You can import booth numbers from other database files if the numbers are stored in a tab delimited file (fields are separated by a tab).

1. Open an exposition product on the Exposition Product Detail window:
   - From Exposition, select Set up an exposition to open the Set up an exposition window.
   - Double-click the exposition to open it on the Set up an exposition window (second instance).
   - Double-click a product.
2. Click Booth to open the Booths window.
3. Click Import Booths to open the Select import file window.
4. Select the File name that contains the booth numbers you want to import.
5. Click Open to import the files.

> **Note:** Note: It is not necessary to assign a status to the booths. iMIS assigns a status of Available as the files are imported.

Finance Console

Your Advanced Accounting Console includes a Finance console with quick access to tools most often needed to maintain your organization's financial transactions:

Transactions are where you easily enter and edit cash receipts, opt to import transactions, quickly enter and edit sales transactions, and even search credit card information.

From Processes, you can manage your organization's batches, process month-end procedures, and print transaction journals.

Adjustments are where pledge credit and debit memos are processed, as well as other types of credit and debit memos. Also from Adjustments, you can easily edit your accrual dues credit memos.

The area of Options is all about setting up the codes and accounts you need: products, terms, tax codes, cash accounts, payment method sets, and due to/due from accounts. You can also configure accounting options such as Aging, G/L Interface, Batch Control, and more.

Depending on your license keys, some areas might not be listed in your Finance console. The license keys needed for each area are:

- Transactions (CASH)
- Processes (CASH)
- Adjustments (CASH)
- Options (CASH)

Finance > Transactions	Finance > Processes
Cash receipts	Manage batches
Import transactions	Month-end procedures
Sales transactions	Print transaction journal
Search credit card info	

Finance > Adjustments	Finance > Options
Credit memos	Configure accounting options
Debit memos	Set up tables
Pledge credit memos	
Pledge debit memos	
Accrual dues credit memos	
Accrual dues debit memos	

Transactions

Entering cash receipts

Cash receipts allow you to record payments that are applied against open items, received in advance of sales orders or requests, or of unknown purpose. Typically, cash receipts are the most frequently entered transaction types.

The Cash receipts window records amounts received that apply to open AR items. Similar to the Sales transactions window, the Cash receipts window has a heading section that identifies the following:

- Transaction date
- Customer account ID
- Overall payment information

Below the heading section, the window details the open items where cash can be applied.

To enter AR payments

> **Note:** Note: If the Cash Application Auto apply option is not enabled on the Configure accounting options window (see Configure accounting options), iMIS enables you to decide the line items where the payment should be applied.

1. From the Cash receipts window, click New.
2. Enter the customer ID and press Enter, or use the lookup icon to select a value and click OK.
3. If you want to apply a credit balance to an item, perform the following steps:

1. Enter an asterisk (*) in the Check/CC field and press Tab.
2. Select the credit from the drop-down list on the Select Open Payments window (you can toggle between viewing the individual's available credits and all available third-party credits by clicking the Indiv/All toggle button) and click OK.
3. Enter the credit amount in the Payment Amount field.
4. In the Check/CC field, enter the check number or credit/debit card type, and press Tab. If you entered a valid credit/debit card type in the Check/CC field, enter the following information:

- CC # – Enter the credit/debit card number.
- CSC – (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code. CSC can be a required value (see "Requiring a Card Security Code (CSC) for credit/debit card transactions") for specific cash accounts.
- Exp – Enter the card's expiration month and year (mm/yy).
- Authorize – Enter any authorization code here. (If credit card authorization is enabled, this field populates when the payment is approved.)
- Name on CC – Enter the name as it appears on the card.

- Issue # – (Displays only if the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date – (Displays only if the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).

  Note: If Advanced PCI Compliance (see Implementing Advanced PCI Compliance options) > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

5. Enter the payment amount in the Payment Amount field, and press Tab.
6. Select one of the following transaction options:

- To apply cash to an item, double-click on the item in the list and enter the amount to apply to the item in the Amt Paid field.
- To undo the cash application, double-click the item again.
- To apply cash as a future or unidentified credit, double-click the (Pre-Pay - New) line (or single-click and fill in the Amt Paid with the prepayment amount), which creates an item named PrePay: transaction date.
- To partially apply cash to an item, select the line and enter the amount to apply to the item in the Amt Paid field.

7. Click Save.

   To automatically apply AR payments

   Note: Note: You can edit only transactions that are in an open batch or that have not been transferred to the GL.

   The method for finding and editing AR payment transactions is similar to the sales transaction editing process.

1. From the Cash receipts window, click Open.

2. Enter the customer ID and press Enter, or use the lookup icon to select a value and click OK.
3. Select the line item for the transaction you wish to alter.
4. Click Edit.
5. Enter the payment amount in the Payment Amount field.
6. Enter the payment amount in the Amt Paid field.
7. Click Save.

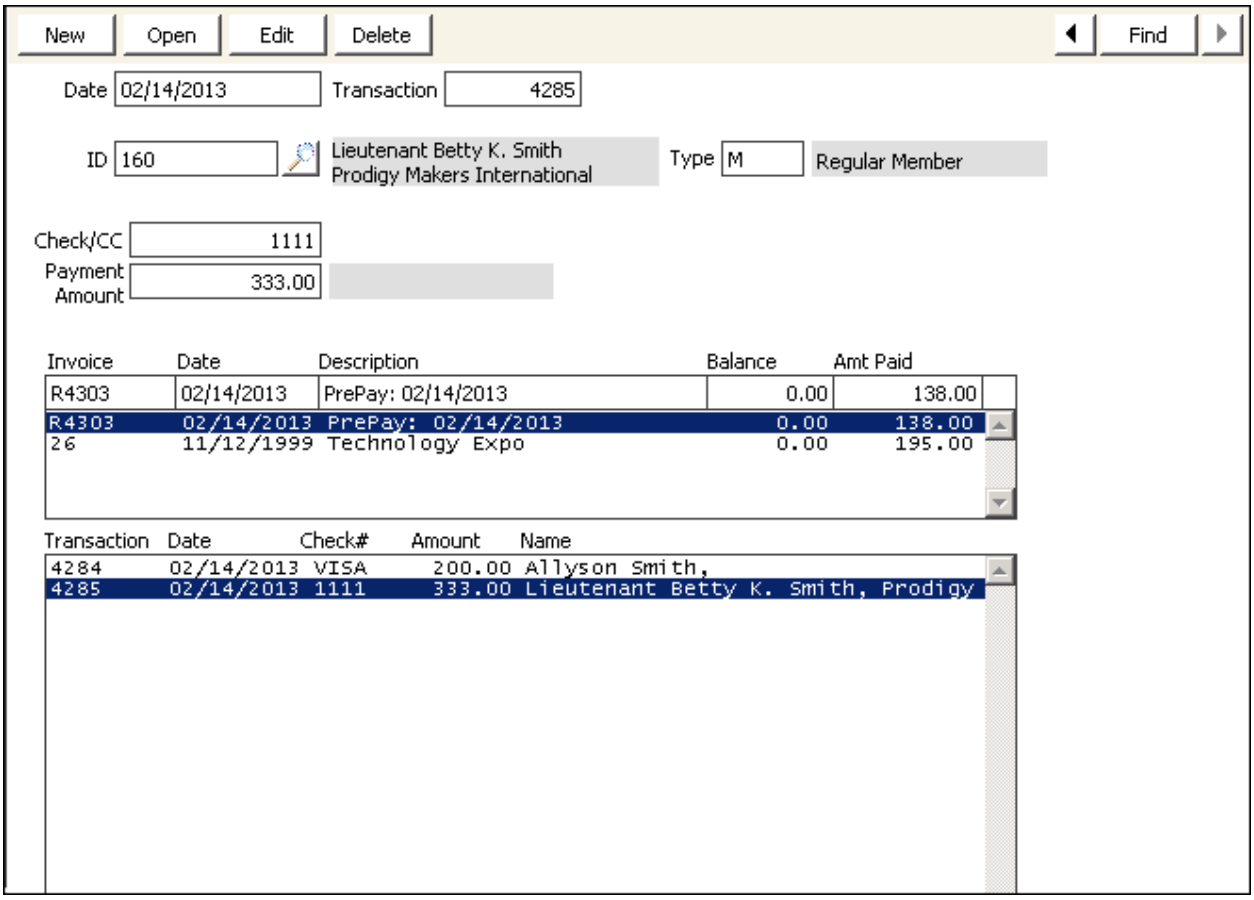
To reverse a payment and record returned checks

Use the Cash receipts window to record returned checks, or to reverse all or a portion of a payment for a sales transaction or simple order entry transaction if the payment was made through Cash Receipts. The following procedure records a returned check.

1. From the Cash receipts window, click New.
2. Enter the customer ID and press Enter, or use the lookup icon to select a value and click OK.
3. Enter the original check number or credit card information.

   Note: If you are recording a returned check, you can preface the Check/CC field entry with RET or a similar abbreviation to make it easier to identify return checks in reports and window displays.
4. Enter a negative amount in the Payment Amount field.
5. Select the line item where the payment is to be removed.
6. Enter a negative amount in the Amt Paid field.
7. Click Save. The Cash receipts window opens.

Cash receipts window



Advanced Accounting Console: Finance > Transactions > Cash receipts

Date

iMIS automatically enters the current system date (or the date you entered earlier in the session) for the transaction date.

To override this date, click on the field (or press Shift+Tab to return to the Date field) and enter a new value.

> **Note:** Note: If you are using batch control, this field defaults to the active batch date, which you cannot override.

Transaction

(read only) The transaction number is automatically assigned by iMIS after the transaction has been processed.

Invoice Number

Enter the numeric code listed on the manual (paper) invoice. If no code exists and you leave this field empty, iMIS supplies a sequential reference number that appears on all related windows and reports. Reference numbers have a prefix of R.

ID

Enter the customer ID that applies to the cash receipt, or use the lookup icon to select a value.

Type

(read only) The customer type that corresponds to the customer ID.

Check/CC

If payment is made by check, then enter the check number. If the payment is made by credit/debit card, then enter the abbreviation for the credit/debit card.

To apply a credit balance to an item, enter an asterisk (*) in the Check/CC field and press Tab. Select the credit from the drop-down list on the Select Open Payments window (you can toggle between viewing the individual's available credits and all available third-party credits by clicking the Indiv/All toggle button) and click OK. Enter the credit amount in the Payment Amount field.

AR credit/debit card codes should already be set up on the Cash accounts window. See Setting up Cash Accounts for information on this procedure.

If you enter a valid credit/debit card code, additional payment fields display:

- CC # – Enter the credit/debit card number.
- CSC – (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code. CSC can be a required value (see "Requiring a

Card Security Code (CSC) for credit/debit card transactions") for specific cash accounts.

- Exp – Enter the card's expiration month and year (mm/yy).
- Authorize – Enter any authorization code here. (If credit card authorization is enabled, this field populates when the payment is approved.)
- Name on CC – Enter the name as it appears on the payment card.
- Issue # – (Displays only if the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date – (Displays only if the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).
- Gateway Ref # – Read-only: Populates when the gateway provider returns the reference number for the transaction.

> **Note:** Note: If Advanced PCI Compliance (see Implementing Advanced PCI Compliance options) > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Payment Amount

Enter the payment amount, whether the payment is made by check or credit/debit card.

Invoice

Displays the invoice reference number.

Date

Displays the invoice date.

Description

Displays a brief description of the selected invoice.

Balance

Displays the invoice balance.

Amt Paid

Displays the amount that is being applied to the selected invoice.

Transaction list

Displays the transaction date, check number or credit/debit card type, transaction amount, and customer name.

Importing transactions

Order data is imported in the form of tab- or comma-delimited files. Before using the Orders Importer to import your files, be sure to back up your iMIS database. If your import fails, you can restore your original data from the backup copy. Otherwise, you must manually delete each transaction in the imported batch.

When importing orders, you need to be aware of the following:

Product status codes

Only products with an Active status can be imported. If an order line's product does not have an Active status, the Importer will not import the order line, and the order line will be inserted into an error log along with any other order line failures. No other order lines will be affected; the Importer will process the order's remaining order lines.

Payments

The iMIS Orders Importer does not support entering multiple payments. Only single payments can be imported.

Freight charges

If you want freight charges to calculate automatically for an imported order, you must enable the Automatic Calculation of Freight Charge and Freight by Weight options on the Add-on Charges window (go to Settings > Commerce > Configure commerce options, and click Add-on Charges). The Orders Importer does not support the Freight by Total Value Ordered or Freight by Total Quantity Ordered options.

Multiple warehouses

The iMIS Orders Importer supports Multi-Warehouses when the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (go to Settings > Commerce > Configure commerce options, and click Inventory).

If the Enable Multi-Warehouses option is disabled, the Importer will ignore any warehouse location entered when an order is imported. The Importer then determines whether the product is a stock item:

- Product is not a stock item – Order_Lines.LOCATION is left blank.
- Product is a stock item – Order_Lines.LOCATION is populated with Default.

If the Enable Multi-Warehouses option is enabled, the Importer first verifies whether the product is a stock item:

- Product is not a stock item – Order_Lines.LOCATION is left blank.
- Product is a stock item – The Importer verifies whether Order_Lines.LOCATION is populated:
- Order_Lines.LOCATION is not populated – The Importer populates Order_Lines.LOCATION with the Default Warehouse defined on the Inventory System Setup window.
- Order_Lines.LOCATION is populated – The Importer uses the defined warehouse location. If the defined warehouse location does not have sufficient products in inventory, the import will fail, and an error message will be generated.

To import orders

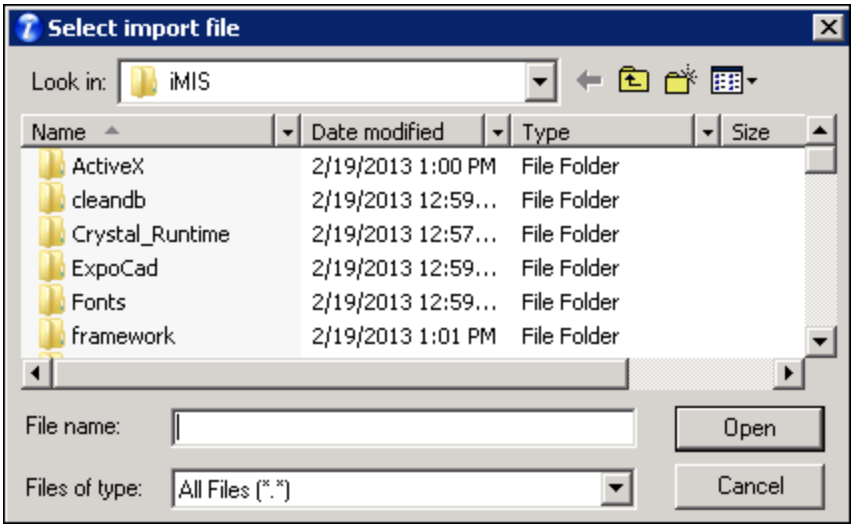
> **Note:** Note: Only products with an Active status can be imported.

1. Create the files that you want to import in either a tab- or comma-delimited file format. After creating a file, you can import it into iMIS. For more information, refer to Formatting import data.

2. From the Select import file window, find and select the tab- or comma-delimited file that you want to import.
3. Click Open. A system message will indicate that the transactions are processing.
4. If there are any problems while importing the file, an Order Import Error Report will print:

- A Warning message indicates that a problem exists with an order but that the file was still imported.
- A Fatal Error message indicates that the file was not imported. If an import does fail, check the import file for stray spaces, missing tabs, or other errors.

Select import file window



Viewing imported orders

You have several options when viewing imported orders. You can view them in the Orders window just as with orders entered manually, or you can view them in reports.

If you want to edit an imported order, you will need to open the order in the Orders window.

If you want to view your imported orders in reports, whether or not you enable batch control when importing orders determines which reports you use:

- Batch Control Disabled – If batch control is not enabled, you can view the imported orders on the Order Detail Report (go to Continuum > Events and Orders Reports > Order processing reports, select Order Status, select Order Detail Report, click Run, select the date range, and click OK).
- Batch Control Enabled – If batch control is enabled, you can view the imported orders on the following reports:
- Order Detail Report by Batch report (go to Continuum > Events and Orders Reports > Order processing reports, select Order Status, select Order Detail Report by Batch, click Run, select the batch, and click OK)
- Batch Transaction Listing report (go to Finance > Processes > Manage batches, select the open import batch, and click Print Selected) – Lists the batch's prepaid orders
- Batch Posting Listing report (go to Finance > Processes > Manage batches, select the open import batch, and click Post Selected)

Entering sales transactions

Use the Sales transactions window to enter sales transactions that are processed and tracked through iMIS AR/Cash. This window should only be used for transactions that are not processed indirectly through another module.

The purpose for entering data on this window is to record after-the-fact any sales-related transactions, such as manually prepared invoices. iMIS uses the information entered on this window to track several items:

- Product sales items that are passed on to sales history.
- Any outstanding AR amount.
- Any open AR amount that is reduced or eliminated, which is reported on daily and monthly transaction reports.

Use sales transactions to record miscellaneous sales and cash receipts that do not fit into any category processed by other iMIS modules, such as Billing, Events, and Order Processing.

Use sales transactions for sales-related entries when you do not need to produce an invoice or a bill. For example, enter sales transactions to record open sales items for a manual (handwritten) invoice and to document paid-in-full transactions without a printed invoice (miscellaneous cash receipts).

To record sales transactions

1. From the Sales transactions window, click New.
2. Enter the customer Id and press Enter, or use the lookup icon to select a value and click OK.
3. Place the cursor in the Product field and use the lookup icon.
4. Select a value. Press OK.
5. (optional) Place the cursor in the GL Account field and enter or change the GL account number. If the Allow GL Account Edit for Sales Transactions option is not enabled (from AR/Cash, select Set up module), the GL Account field is display-only and the GL account number cannot be added or changed.
6. Place the cursor in the Quantity field and enter the Quantity.
7. Place the cursor in the Check/CC field and enter the check or credit card information.
8. Enter the payment amount in the Payment Amount field.
9. Click Save.

To edit existing sales transactions

To edit a transaction that is still in the system, find the transaction, select edit mode, and make the necessary changes.

Note: Note: You cannot edit transactions that are in a posted or closed batch or transactions that have been transferred to the GL.

You can search for an existing transaction using any of the first three heading fields. After the search, iMIS either displays the transaction you requested or presents a list of transaction options.

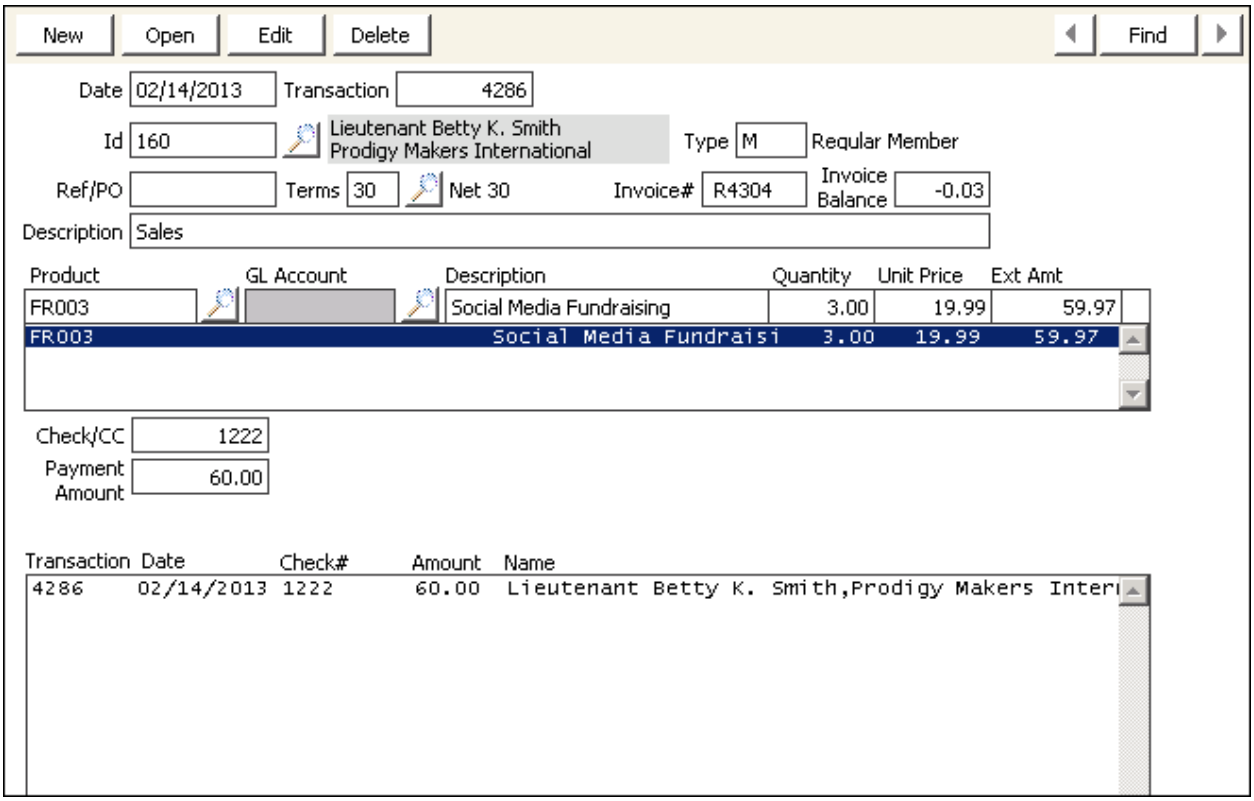
> **Note:** Note: iMIS only searches on one field at a time.

1. From the Sales transactions window, click Open.
2. Enter a value into one of the first three data entry fields (Date, Transaction, or Id) and press Enter.

- If iMIS finds your record, then iMIS opens the record in display mode.
- If iMIS finds multiple transactions matching your criteria such as date or ID, it returns a list of potential matches. Double-click on the desired line to open the record in the display mode.

3. Click Edit.
4. Make the necessary changes.
5. Click Save.

Sales transactions window



Finance > Transactions > Sales transactions

Date

iMIS automatically enters the current system date (or the date entered earlier in the session) for the transaction date.

To override this date, click on the field (or press Shift+Tab to return to the Date field) and enter a new value.

> **Note:** Note: If you are using batch control, this field defaults to the active batch date and cannot be overridden.

Transaction

(read only) The transaction number is automatically assigned by iMIS after the transaction has been processed.

Id

Enter the customer ID that relates to the sale, or click Find to select a value.

Type

(read only) The customer type that corresponds to the customer ID.

Ref/PO

Enter the customer's purchase number or other reference number that should appear on the invoice. The reference/purchase order value will display on the AR statement.

Terms

(optional) Enter the code for the type of sale terms that apply to this invoice, or click Find to select a value.

Invoice #

Enter the numeric code listed on the manual (paper) invoice. If no code exists and you leave this field empty, iMIS supplies a sequential reference number that appears on all related windows and reports. Reference numbers have a prefix of R.

Invoice Balance

(read only) Running invoice balance automatically updated by iMIS.

Description

Enter the invoice description. This description prints or displays on key reports and creates output, such as statements, trial balances, and account status displays.

Product

Enter a valid product code from the Product codes window, or use the lookup icon to select a value.

GL Account

Automatically populated with the GL account number if a GL account number is defined for the product. If the Allow GL account edit for sales transactions option is enabled (go to Finance > Options > Configure accounting options), you can enter a GL account number

if the GL Account field is blank or enter a different GL account number if the GL Account field is populated.

If a GL account number is not defined for the product and you leave the GL Account field blank, the GL Account field is automatically populated with the default Income Account for the transaction's owner entity.

If the Allow GL Account Edit for Sales Transactions option is disabled, this field is display-only and the GL account number cannot be added or changed.

Description

Automatically entered by iMIS, but can be overridden manually.

Quantity

Enter the Quantity of the product being sold. This quantity is applied against the unit price to arrive at the extended amount.

Enter quantities as whole numbers unless you are designating time or other partial quantities. For time or other partial quantities, enter fractions as decimals: (for example, enter 1.5 for 1-1/2)

Unit Price

iMIS automatically fills in the Unit Price if a product price has been defined on the Product Code window.

To override this price, click on the field (or press Shift+Tab to return to the Unit Price field), and enter a new value.

Ext Amt

(read only) iMIS automatically calculates the extended price.

Check/CC

If the payment is made by check, enter the check number. If the payment is made by credit/debit card, enter the abbreviation for the credit/debit card.

To apply a credit balance to an item, enter an asterisk (*) in the Check/CC field and press Tab. Select the credit from the drop-down list on the Select Open Payments window (you can toggle between viewing the individual's available credits and all available third-party credits by clicking the Indiv./All toggle button) and click OK. Enter the credit amount in the Payment Amount field.

> **Note:** Note: Most *Tab transactions generate extra transfer lines to provide the proper audit trail for both invoice summary lines involved in the transfer and to off-set each other to provide a net effect of zero.

AR credit card codes should already be set up on the Cash accounts window.

If you enter a valid credit/debit card code, additional payment fields display:

- CC # – Enter the credit/debit card number.
- CSC – (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code. CSC can be a required value (see "Requiring a Card Security Code (CSC) for credit/debit card transactions") for specific cash accounts.
- Exp – Enter the card's expiration month and year (mm/yy).
- Authorize – Enter any authorization code here. (If credit card authorization is enabled, this field populates when the payment is approved.)
- Name on CC – Enter the name as it appears on the payment card.
- Issue # – (Displays only if the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date – (Displays only if the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).
- Gateway Ref # – Read only: Populates when the gateway provider returns the reference number for the transaction.

> **Note:** Note: If Advanced PCI Compliance (see Implementing Advanced PCI Compliance options) > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Payment Amount

Enter the payment amount, whether the payment is made by check or credit/debit card.

Transaction list

Displays the transaction date, check number or credit/debit card type, transaction amount, and customer name.

Searching credit card information

After you enter credit/debit card transactions, search iMIS for transactions using the Credit Card #, the customer Id, the Trans Number, or any combination of these criteria.

Unencrypted card information can be viewed in this window only if a user has an AR/Cash authorization level of 8 or higher.

> **Note:** Note: If Advanced PCI Compliance (see Implementing Advanced PCI Compliance options) > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

To search credit/debit card transactions

1. From the Search credit card info window:

- Select the Last Four option to search on the last four numbers of the credit/debit card.
- Select the Full option to search on the full card number.

Note: If Advanced PCI Compliance (see Implementing Advanced PCI Compliance options) > Do not retain cardholder information is enabled, iMIS saves transactions

without cardholder data and shows only gateway reference number and authorization code fields. Therefore, the Full option is disabled, because only the last four credit card digits are saved.

2. Enter the card number in the Credit Card # field to search for a specific card number.
3. Enter the customer or company ID in the Id field to search by record. You search by both the card number and ID, or by one field only.
4. Enter the transaction number in the Trans Number field to search by transaction number.
5. Press Enter. A list of transactions for the selected card and/or customer record displays in the window.
6. To view an individual transaction through the Search credit card info window, double-click the line item. The original transaction window opens.

Troubleshooting

- The Status field is populated by Trans.STATUS for transactions entered through Service Central and iBO.
- When entering an order and paying by credit card over the web, the order must be processed to the invoice stage before it will display in the Search credit card info window.
- When viewing credit card transaction status, the details of the transaction are shown, not the details of the actual order payment or the event payment.

Credit Card #

The credit/debit card number associated with the search

Id

The customer or company ID whose credit/debit card transactions are associated with the search

Display fields

- Credit Card # – The card numbers associated with the search.
- Exp. – The expiration date for each card number.
- Authorize – The authorization code for the card transaction.
- Gateway Reference # – (Read only) Populates when the gateway provider returns the reference number for the transaction.
- Paid Amt – The amount paid with the card transaction.
- Status – This field indicates the authorization status of the transaction. The status options are: A (authorized), D (deferred), and C (captured). If this field is blank, it is either a manual transaction or the transaction was denied.
- Name on Credit Card – The name on the card associated with the transaction.

- Id – The ID associated with the card transaction.
- Source – This field indicates the module source for the card transaction. For example, if the payment were a fundraising gift, FR would display in this field.
- Ref # – A transaction number or order ID that is generated by the authorization gateway. This information is stored in the Description field of the transaction entry, and must be referenced in order to delete any transactions.
- Ref Date – Specifies the date the transaction was entered in iMIS.

Processes

Managing batches

The Manage batches window enables you to perform several different batch functions:

- Create new batches
- View/list existing batches
- Control which batches display on the window
- Print and post existing batches

> **Note:** Note: If iMIS is configured to hide batches created by other users, you can view only your own batches, unless your logon's authorization level for AR/Cash is 8. This restriction applies to batches that are created automatically by iMIS or by importing transaction data.

This window displays a table of the batches that are available to you and the commands for editing and managing them. The authorizations (see Authorization level privileges (Desktop)) and credentials of each user record (see Creating iMIS user records) control what aspects of this feature can be seen and used.

> **Note:** Note: The batches that are available to you depend upon the authorization level and access keywords assigned to your login, and the batch control options

that the administrator has selected for your site.

Note: Note: The Manage batches and Open Batches windows are equivalent. The Manage batches window appears only in Finance. The Open Batches window appears when (a) you are in an iMIS module other than Finance and (b) no open batch is selected when you attempt to enter or edit a transaction.

Note: Note: System-generated batches are designed to be posted unmodified. When you edit a system-generated batch, or add transactions to a system-generated batch, you must designate a cash account for the batch before your changes can be saved, and before the batch is posted.

Note: Note: Window items that are self-explanatory for the typical users of this window are not described.

To create a new batch

1. From the Manage batches window, click New.
2. Enter the batch information.

   Note: You must designate a cash account type in the Cash Table field before you can save a new batch.
3. Click Save.

Selecting an open batch

If you enable batch control, a batch must be selected before you can process transactions. If you do not select a batch after starting an iMIS session, the Open Batches window opens automatically when you attempt to insert or edit a transaction, so that you can select an open batch. After you select an open batch or create a new batch, the batch remains selected until you select a different batch or exit iMIS.

You can only edit transactions for the currently selected batch. If you try to edit a transaction that was entered in another batch, iMIS prompts you to switch to the originating batch.

To select an open batch

1. Open the Manage batches window.
2. In the batch table, double-click a batch to select it.
3. (optional) Click View Batch. The Batch window opens, in the lower-left corner of the page.
4. Close the Manage batches window.

To find a specific open batch

1. From the Manage batches window, click Find. The Batch field becomes available for data entry. All other fields remain unavailable.
2. Enter as many characters as required to identify the batch.
3. Press Tab. iMIS highlights the first batch that matches the characters entered.
4. Repeat steps 3 and 4 as desired.
5. Click Save. iMIS cancels the find and populates the fields on the right side with the highlighted batch's data.

To print batches

After you have entered all of the transactions for a batch or group of batches, click Print Selected or Print Open to print the batch transaction report, where you can review the batch details and check the batch balancing

From the Manage batches window:

- To print a report for a selected batch, select the batch and click Print Selected.
- To print reports for all open batches, click Print Open.

The batch report lists the detail of each transaction entered and lets you compare the actual figures against the control totals, warning you if they are different. The report also provides a GL accounting summary report.

Posting batches

After you finish your batch transaction work and have verified that the information is accurate and in balance, complete the process by posting the batch. Until you post the batch, you can make changes edit or delete any transaction within the batch (even if you are using the hot posting feature).

> **Note:** Note: If your administrator has selected Require balanced batches for posting (see AR/Cash Batch Control window), iMIS will not post a batch unless both the control amount equals the actual amount, and the control count equals the actual count. When you click Post Ready or Post Selected on the Manage batches window and a batch is unbalanced, iMIS displays an error message and does not post the batch.

To post a single batch

1. From the Manage batches window, select the batch to be posted.
2. Click Post Selected. A warning window asks you to confirm that you want to post the batch.
3. Agree to post the batch. For each batch posted, iMIS prints the final detail and summary batch transaction report and marks the batch as Posted or Closed.

   Note: After a batch is closed, you cannot add, modify, or delete any transactions in that batch.

To post a group of batches

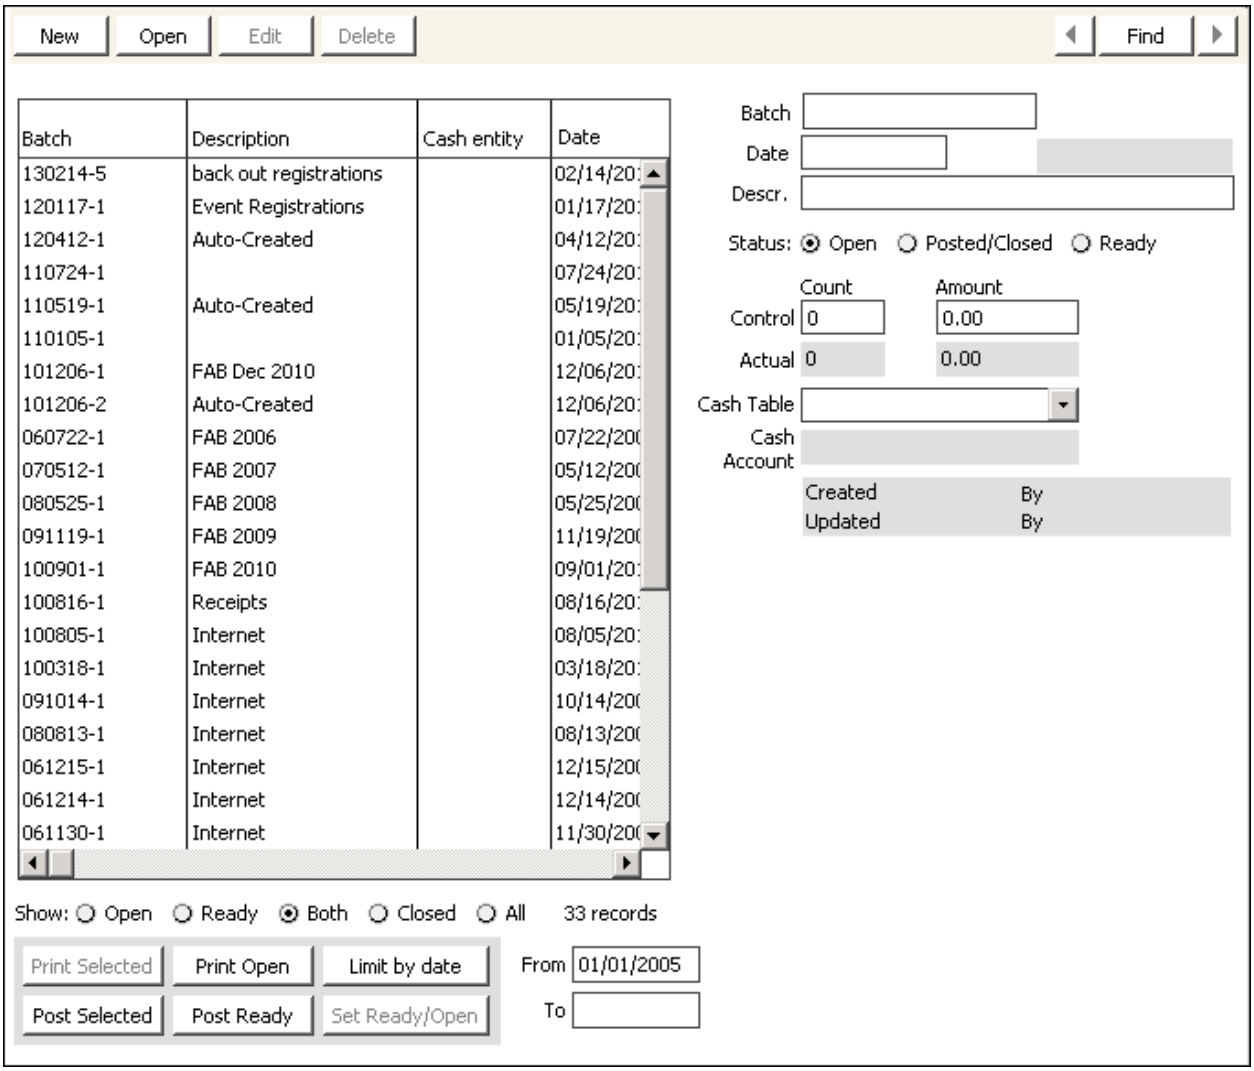
1. From the Manage batches window, choose the Show: Both option beneath the batch list. This will filter the batches to show only those with an Open or Ready status. Ready batches are ready for posting.
2. Ensure that any batches you want to post have a status of Ready:

1. Select an Open batch.
2. Click Set Ready/Open.
3. Repeat for each Open status batch that you want to post.

3. Ensure that any batches you do not want to post do not have a Ready status:

1. Select a Ready batch.
2. Click Set Ready/Open.
3. Repeat for each Ready batch that you do not want to post.
4. Click Post Ready. A warning window asks you to confirm that you want to post the batches.
5. Agree to post the batches. All batches with a Ready status are posted.

Manage batches window



Finance > Processes > Manage batches

Batch table

This table displays the batches that are available to you. You can sort the batch table by clicking on the column headings. The batch table includes these columns:

- Batch – The batch available for selection.
- Description – Description of the batch.
- Cash entity – Specifies the entity that owns the cash account for the cash received.

- Date – Specifies the transaction date of the batch.
- Date created – Specifies the date that the batch was created.
- Created by – Specifies by whom the batch was created.
- To GL – Specifies whether at least one transaction in the batch has been exported to the General Ledger.
- Status – The current status of the batch.
- Last updated – Specifies the last date that a change was made to the batch status or transactions in the batch.
- Updated by – Specifies by whom a change was made to the batch status or transactions in the batch.
- Event – When a user registers for an event over the Web, a batch is created automatically.
- Meeting – (if enabled) Specifies whether the batch is closed when the corresponding meeting is closed.

  If the table contains too many batches to view easily, filter the table with the display controls.

  Batch table display controls
- Open – Open batches are open and in process.
- Ready – Ready batches are ready for posting.
- Both – Displays both open and ready batches.
- Closed – (if enabled) Displays only closed/posted batches.
- All – (if enabled) Displays all of the batches that are available to you.

  Batch controls
- Print Selected – Prints a transaction report for all selected batches
- Print Open – Prints a transaction report for all open batches

- Limit by date – Displays only batches with creation dates that fall between the dates in the From and To fields
- Post Selected – Posts the selected batch

  Note: To post a batch, the sum of all transaction debits in the batch must equal all transaction credits. In addition, your login must have an authorization level of 4 or higher.
- Post Ready – Posts all ready batches
- Set Ready/Open – Changes the status of the selected batch from open to ready, or from ready to open
- View Batch – Displays the Batch window, which remains open in the area below the task list when you switch to different iMIS modules.

  Batch creation/editing

  The Manage batches window data edit/entry area

- Batch – (read-only, unless batch auto-numbering is not enabled) The unique identifier of this batch. (if no auto-numbering) For new batches, you must specify this identifier (maximum of 15 characters).
- Date – The accounting date of all transactions in this batch. For new batches, the default is the current system date.

- Descr. – The description of this batch (maximum of 60 characters).
- Status – (read-only, except authorization level 8) The status of this batch.
- Open – Entry/editing/balancing of data is in progress. Authorized users are allowed to add or modify transactions in this batch, and to change the status to Ready.
- Posted/Closed – All entry/editing/balancing of data is finalized. No users are allowed to modify transactions in this batch, but authorized users can change the status of this batch to Open or Ready.
- Ready – Temporary transition between Open and Posted/ Closed. A batch should only be marked Ready if it is balanced and ready for posting individually or in a group. No users are allowed to modify transactions in this batch but authorized users can change the status of this batch to Open or Posted/ Closed.
- Control Count – The maximum number of transactions this batch can contain.
- Control Amount – The total value of cash receipts or deposits that can apply to this batch. This enables you to validate the batch balance after data entry.
- Actual Count – (read-only) The current number of transactions in this batch.
- Actual Amount – (read-only) The current total value of all transactions in this batch. As you enter transactions, the system keeps an internal count of accumulated transactions.
- Cash Table – (read-only) The cash account code to which all cash receipts in this batch are assigned.

  Note: This field is required for all user-created batches, even if you only have one cash account, and even if you do not process any cash receipt transactions in this batch.
- Cash Account – (read-only) The GL account associated with the selected Cash Table value.

  Batch window

  The Batch window displays information about the current open batch, and provides a button for selecting a different open batch.

This window specifies the following information.

- Batch – The name and description of the current open batch
- Control – The control count and control amount
- Actual – The actual count and actual amount
- Diff – The differences between the control and actual values
- Select Batch – Displays the Open Batches window

Processing month-end procedures

> **Note:** Note: Several configuration options on the Process month-end procedures window are documented within the iMIS Desktop. Links in the following sections might display iMIS Desktop documentation. This saves you time and effort when configuring month-end procedures.

There are several month-end procedures associated with AR/Cash.

From the Month-end procedures window, complete one of the following month-end procedures:

- Create a GL journal
- Create credit invoices

- Implementing mass write-off of debit/credit balances
- Schedule deferred income records

> **Note:** Note: After all transactions have been entered for a month, all batches for the month should first be posted before creating the GL journal, creating credit invoices, and purging old invoices and transactions.

> **Note:** Note: See Deferred Income in iMIS.

Create GL Journal

> **Note:** Note: This feature is available only if you are licensed for General Ledger Interfaces.

The GL Journal feature allows you to transmit your cumulative iMIS-generated accounting transactions to the GL module monthly or more frequently.

Before exporting your GL journal data, print an audit trail report. Go to Continuum > Commerce and Customer Service Reports > Accounting Reports. Select Transaction Lists from the Report Types drop-down list to review what you are about to export. The appropriate report choice may depend upon the summary level you selected for the GL interface entry. If you summarize at the monthly level, a recommended selection is Transaction Lists from the Report Types drop-down list and then the AR/Cash Distribution Summary report from the Available Reports drop-down list. You should also print a trial balance by selecting Account Status from the Report Types drop-down list and Trial Balance from the Available Reports drop-down list.

When the GL interface is run, the following actions are performed:

- Entries are created to move deferred income to current income
- Due To-Due From tables are created as needed
- The transaction posting flag is set so that the transaction cannot be posted again

> **Note:** Note: For more on the GL Journal feature and specific GL packages, see General Ledger Interfaces.

Transaction lists report format

Transaction lists reports include the following:

- AR/Cash Daily Distribution Summaries – Provides an accounting entry recap by day for each of the days included in the Select Date Range window.
- AR/Cash Distribution (Detail or Summary) – Lists entries generated throughout all iMIS modules, sorted by pseudo-account number and listing actual GL account numbers, if assigned.
- AR/Cash Transactions – Yields the same format as the transaction journal, but prints transactions generated throughout all iMIS modules. Like the AR/Cash journal, this report lists detail audit trails of transactions and a summary report by GL account (or pseudo GL account). It lists any transactions not purged in the specified date range.

To run the Transaction Lists Distribution Summary

The Transaction Lists: AR/Cash Distribution Summary report provides a simple summary by GL account number. If there is anything wrong (such as invalid account numbers), you can address these errors before proceeding.

1. Go to Continuum > Commerce and Customer Service Reports > Accounting reports.
2. Select Transaction Lists from the Report Types drop-down list.
3. Select AR/Cash Distribution Summary from the Available Reports drop-down list.
4. Click Set Report Destination and select a report destination (for example, printer, screen, or file).
5. Select any desired options (for example, margins) from the Options drop-down menu.
6. Click Run.

7. The AR/Cash Distribution Summary: Select Date Range window displays. Enter the date range of the transactions to include in the GL interface entry.
8. Click OK.

To create the GL Journal

1. From the Month-end procedures window, click Create GL Journal. A message appears requesting verification of the request.
2. Click Yes. The General Ledger Interface: Select Date Range window appears.
3. Enter the date range of the transactions to include in the GL interface entry.
4. Click OK. The search will not include any previously exported transactions, regardless of the date. If iMIS finds qualified transactions, iMIS displays a message identifying your GL package.
5. Click Yes.

Credit Invoices

The credit invoices feature identifies and lists all AR items with a current credit balance. It provides the necessary options to select and process credit items for refund.

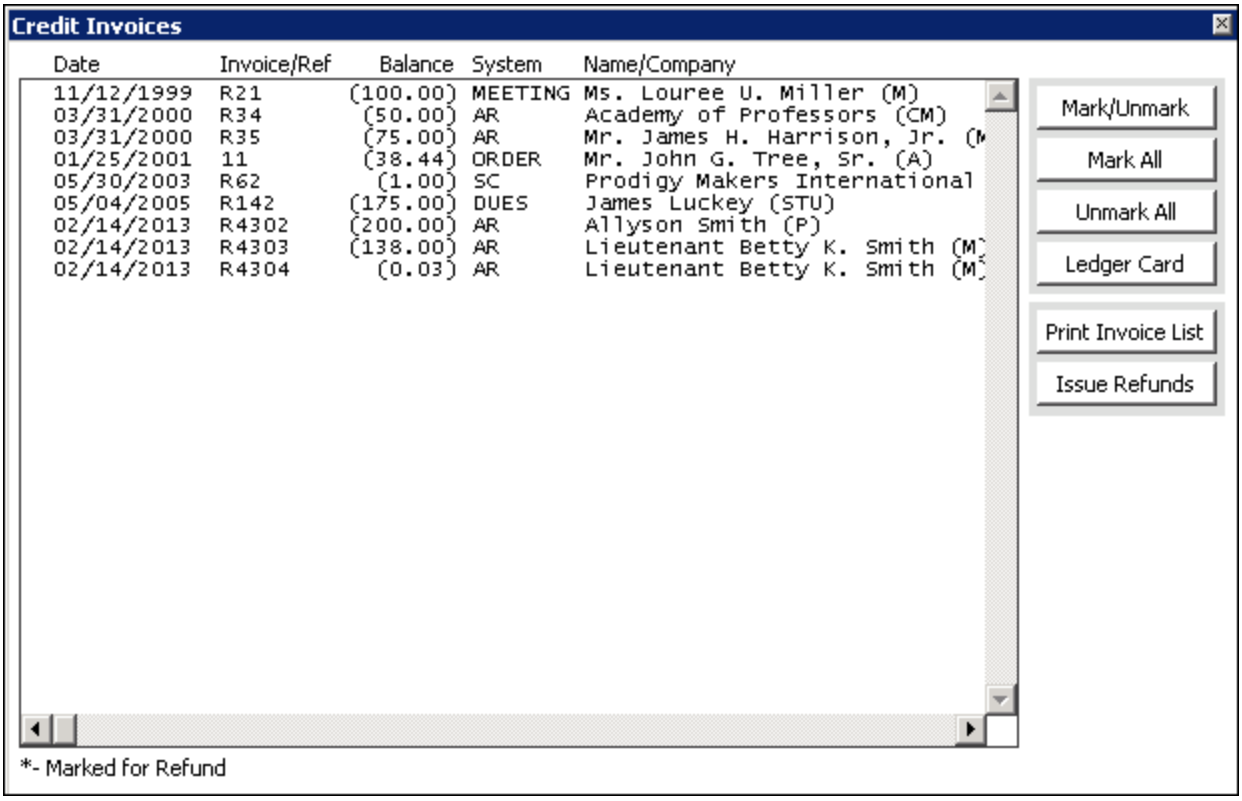
Before using the credit invoices feature, you must assign a refund clearing account for all appropriate entities on the AR/Cash Default Accounts window (go to Finance > Options > Configure accounting options, and then click Default Accounts). Assign a default account number in the Refund Clearing field.

The Refund Clearing account represents a bridge or clearing account between AR and AP. Use the Refund Clearing account for the debit distribution entries in the AP entries in the same manner that you use the clearing account for the credit side of the AR reversal entries.

To create credit invoices (refunds), use the Credit Invoices window. From Process month-end procedures, click Credit Invoices. You can use the Credit Invoices window to perform the following tasks:

- View credit items
- Mark credit items for refunds
- Print the list of open invoice credits
- Issue refunds

Credit Invoices window



- Credit Invoices scrolling list – This area contains a list of all credit invoices, including Date, Invoice/Ref, Balance, System, and Name/Company. Each item is labeled with the initial transaction date, invoice or reference number, credit balance, source system, and customer/customer name.
- Mark/Unmark – Select to mark individual items for refund, which is indicated by an asterisk at the far left. The button toggles (turns off or on) the marking of any selected items.
- * = marked
- (no *) = unmarked

- Mark All – Select to mark all items for refund. Click the Mark/Unmark button to individually unmark each item you do not want refunded.
- Unmark All – Select to unmark from all items.
- Ledger Card – Select to view an item's transaction detail or ledger card history on the Transaction Ledger window. To display this detail, double-click on a line item, or click on a line item and click Ledger Card.
- Print Invoice List – Select to print a report of credit items, including initial transaction date, reference or invoice number, source system, general item description, total charges, total credits and resulting (credit) balance, and the customer ID and name.
- Issue Refunds – Select to reverse the balances (for the marked items only) by generating the necessary debit-adjusting entries and print a report documenting the refunds (reversals).

  The entries debit the appropriate AR account for the full balance and credit the default refund clearing account.

  In a multiple-entity situation, the owner entity for the generated transaction is assigned according to the owning entity of the initial sales-related transaction. iMIS appropriately uses AR from the initial transaction, and uses the refund clearing account from the default tables for the owning entity.

  Note: Note: Use the generated report as the basis for the refund items, which should be processed in AP. The refund clearing account should be entered as the AP offset or distribution account, bringing the net effect on the clearing account to zero.

Credit/Debit Write-Offs

The Accounting module allows you to perform a mass write-off of debit/credit balances based on a user-defined cutoff date and a maximum dollar amount.

The system setup options for this feature include an option that allows you to define the maximum default dollar amount to write off. During the write-off process, all debit or credit

balances less than or equal to this amount are written off. You can overwrite this default during the actual write-off process.

A default GL account number, entered on the AR/Cash Default Accounts window, that offsets the credit or debit created by the write-off process will be written. For example, if you write off credit balances, iMIS creates a debit to the default AR account and a credit to the write-off offset account specified on the AR/Cash Default Accounts window.

To set the default write-off amount

1. Go to Finance > Options > Configure accounting options.
2. Click Edit.
3. Enter a default dollar amount in the Default cut off amount for write-offs field.
4. Click Save.

To enter the default write-off offset account

1. Go to Finance > Options > Configure accounting options.
2. Click Default Accounts to open the AR/Cash Default Accounts window.
3. Click Edit.
4. Enter the GL account number to which you will be recording the write-offs in the Write-off/Offset field.
5. Click Save.

To process mass write-offs

1. From Process month-end procedures window, click Credit/Debit Write-Offs to open the Credit/Debit Invoices Write-Off window.

   Note: The Cutoff Date field defaults to the system date and the Amount field defaults to the amount specified on the Configure accounting options window. You can overwrite either or both of these fields as needed. iMIS writes off all debit or credit balances where

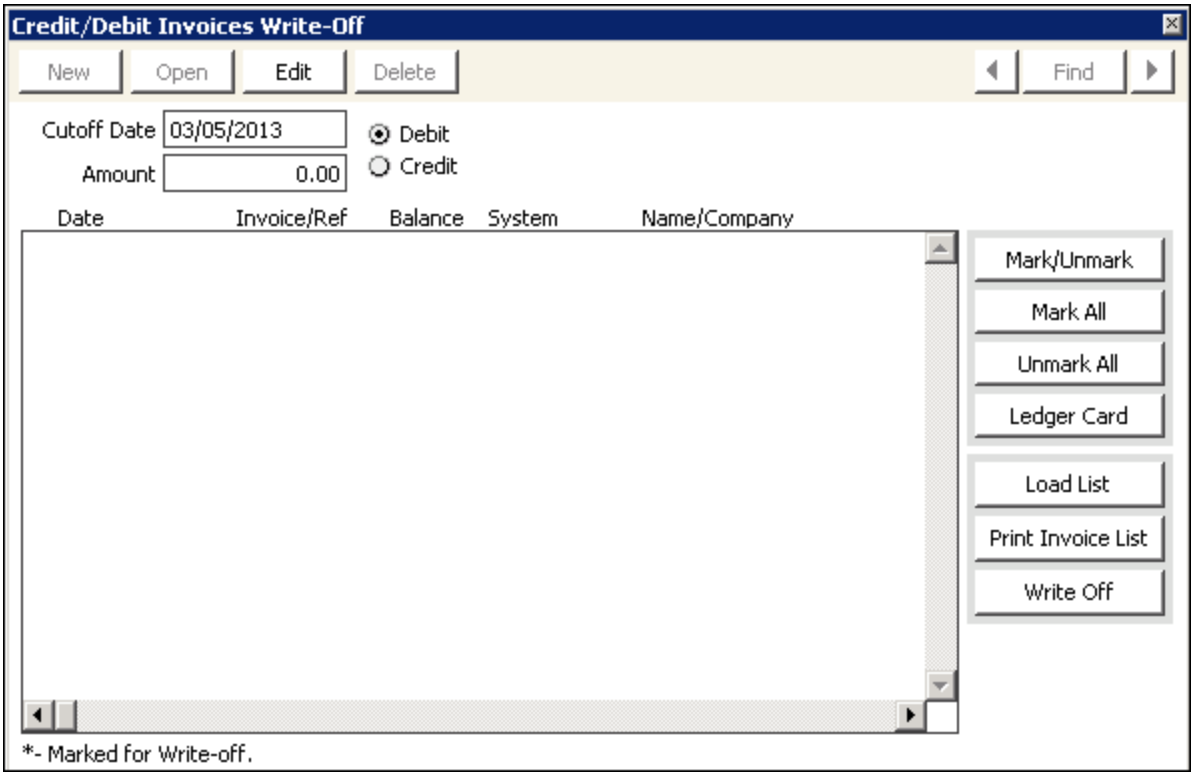
the INVOICE_DATE is equal to or older than the date specified in the Cutoff Date field and the balance is equal to or less than the amount specified in the Amount field.

2. Enable Debit or Credit and click Load List. A list of all records that meet the Cutoff Date and Amount criteria are displayed. Select these records for write-off by:

- Selecting an individual record by selecting the item and clicking Mark/Unmark.
- Selecting all records by clicking Mark All.

3. If you need to view the detail for an item, select the item and click Ledger Card. The Transaction Ledger window displays the balance details.
4. Print a list of all displayed items by clicking Print Invoice List for an audit report before processing the actual write-offs.
5. After you verify that the records selected for write-off are correct, click Write Off on the window to process the actual write-offs.
6. You can view the results of the write-off on the customer's Transaction Ledger window.
7. Click Find.
8. Enter the ID for the customer who had the write-off applied to their account.

Credit/Debit Invoices Write-Off window



- Cutoff Date – The Cutoff Date field defaults to the system date. You can overwrite this field as needed.
- Amount – The Amount field defaults to the amount specified on the Configure accounting options window. You can overwrite this field as needed.
- Debit – Enable this option to see Debit invoices.
- Credit – Enable this option to see Credit invoices
- Mark/Unmark – Select to mark individual items for refund, which is indicated by an asterisk at the far left. The button toggles (turns off or on) the marking of any selected items.
- * = marked
- (no *) = unmarked
- Mark All – Select to mark all items for refund. Click the Mark/Unmark button to individually unmark each item you do not want refunded.
- Unmark All – Select to unmark from all items.

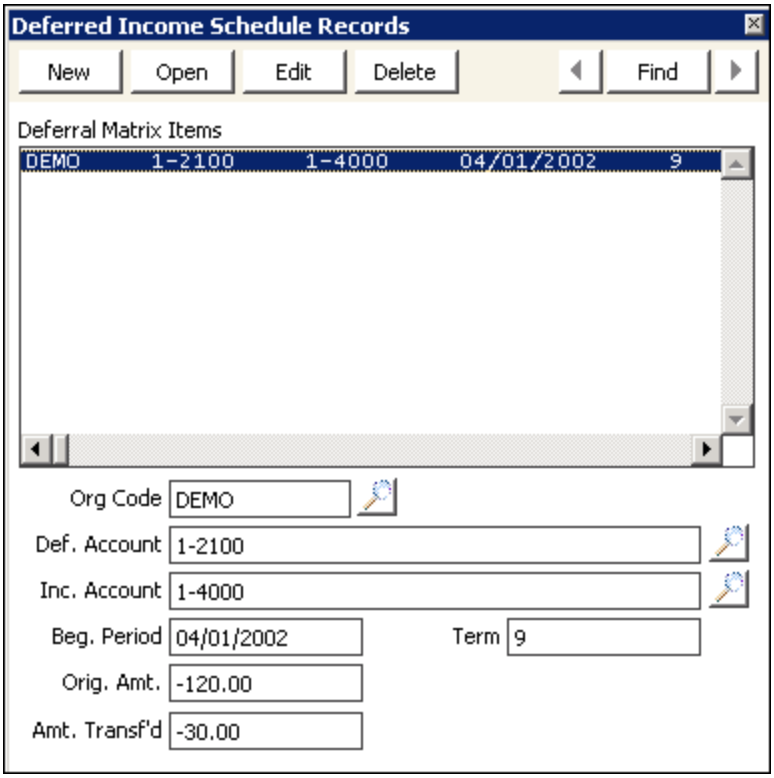
- Ledger Card – Select to view an item's transaction detail or ledger card history on the Transaction Ledger window. To display this detail, double-click on a line item, or click on a line item and click Ledger Card.
- Print Invoice List – Select to print a report of credit items, including initial transaction date, reference or invoice number, source system, general item description, total charges, total credits and resulting (credit) balance, and the customer ID and name.
- Write Off – Click to process the actual write-offs.

Deferred Income Records

To build the initial deferral matrix

1. From Process month-end procedures, click Deferred Income Records to open the Deferred Income Schedule Records window.
2. To build the table, you must create one entry for each combination of Deferred Account – Income Account – Beginning Period – Term (number of months).
3. Click New.
4. Enter data into the Org Code, Def. Account, Inc. Account, Beg. Period, Term, Orig. Amt., and Amt. Transf'd fields, or click the Find icon to select a value.
5. Click Save.

Deferred Income Schedule Records window



To build the deferred income matrix initially, use the Deferred Income Schedules Records window. This window contains the following fields:

- Find – Select to find a deferred income entry. You can specify the Org Code, Def Account, Inc Account, Beg Period, Term, Orig Amt, or Amt Transf'd of the deferral income entry for the search. The first deferral income entry that matches the search criteria will be selected.
- Deferral Matrix Items – The list of existing deferred income entries is displayed in this scrolling list.
- Org Code – Enter the organization or entity code as established on the Organization Names window (select File> System Setup), or use the lookup icon to select a value.
- Def. Account – Enter the GL deferred income (liability) account number to which the original amount was initially posted (to await subsequent recognition and transfer to regular income), or use the lookup icon to select a value.

- Inc. Account – Enter the GL income account to which the amounts will be transferred as the income is earned and recognized, or use the lookup icon to select a value.
- Beg. Period – Enter the accounting date (typically month, first day of the month, year) either for which the income was initially recognized or will be recognized (Conversion method 1), or for which you want iMIS to begin generating the necessary transfer entries to recognize income and reduce deferred income (Conversion method 2).
- Term – Enter the number of months over which the original amount is to be recognized as income. This may be the original term (Conversion method 1), the net number of months remaining within the original term for which income is yet to be transferred, or 1 (Conversion method 2).
- Orig. Amt. – Enter the total dollar amount that will be recognized in prorated monthly amounts over the term of the deferred income item. Because deferred income accounts carry a credit balance, enter only negative amounts (enter a minus sign followed by the digits that represent the amount).

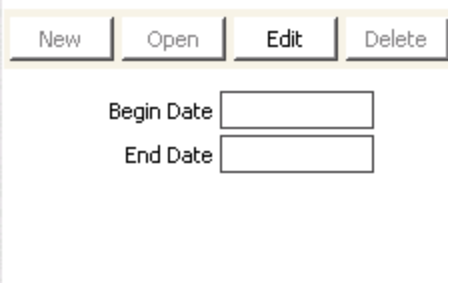
  This field should contain one of the following:

- Original amount posted in the starting month to this deferred income/regular income/term combination (Conversion method 1)
- Net amount remaining to be recognized over the remainder of the term (Conversion method 2)
- Total amount of the existing deferred income balance to be transferred from the deferred income account identified to the regular income account identified for the single-month term (Conversion method 2)
- Amt. Transf'd – Enter the dollar amount portion of the original amount already recognized in previous periods. As with the original amount, the amount transferred must be represented by a negative amount. (This field should only be used when using conversion method 1. See “Conversion Methods for Building the Initial Matrix”.)

Printing transaction journal reports

After specifying a date range, you can print AR transaction reports, which includes the Transaction Recap, Debit Memo Journal, Revenue-Sales Journal, and Payments Journal reports.

Print transaction journal window



Accounting > Processes > Print transaction journal

The Print Transaction Journal window includes the following fields:

Begin Date

Enter the beginning date for the AR transactions to be printed.

End Date

Enter the ending date for the AR transactions to be printed.

Print button

Click to print the AR transactions for the specified date range.

Adjustments

Entering credit memo adjustments

To apply credit memos to multiple funds

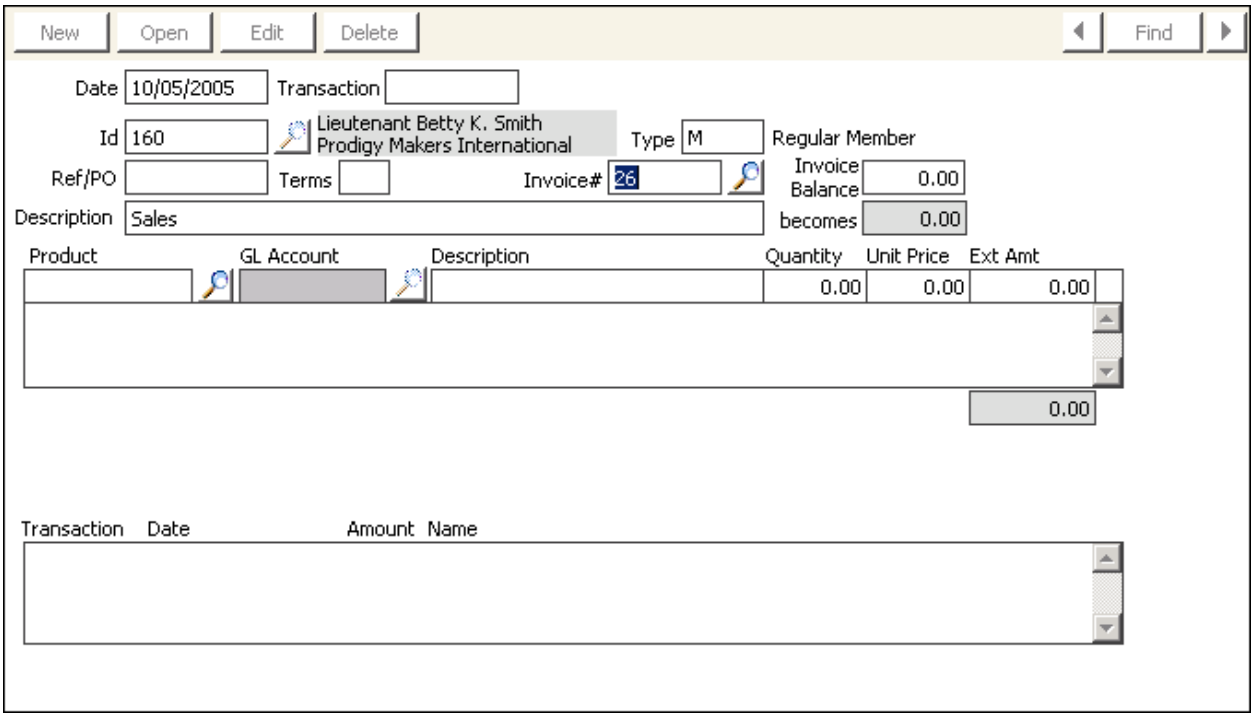
To apply credit memo adjustments to multiple funds for a split gift, use the Credit memos window.

1. From the Credit memos window, click New.

2. Enter the donor ID in the Id field, or click the lookup icon to select a donor ID.
3. Enter the transaction number in the Invoice# field and press Tab, or press Ctrl+L to look up a transaction number. The split gifts per fund pertaining to this gift or pledge display.
4. Enter the distribution or premium code in the Product field, or click the lookup icon to select a distribution or premium, and press Tab.

   Note: If more than one distribution is assigned to the same fund, only one line displays for the fund, showing the combined charges for these distributions. You must know the distribution or premium code that you wish to adjust and its value per the installment invoice.
5. Enter 1 in the Quantity field.
6. Enter the credit memo adjustment amount in the Unit Price field.
7. (optional) Repeat to apply a credit memo adjustment to additional distributions or premiums.
8. Click Save.

Credit memos window



Finance > Adjustments > Credit memos

Date

iMIS automatically enters the current system date (or the date you entered earlier in the session) for the transaction date.

To override this date, click on the field (or press Shift+Tab to return to the Date field) and enter a new value.

> **Note:** Note: If you are using batch control, this field defaults to the active batch date and cannot be overridden.

Transaction

(read only) The transaction number is automatically assigned by iMIS after the transaction has been processed.

Id

Enter the customer ID that relates to the sale, or use the lookup icon to select a value.

Type

(read only) The customer type that corresponds to the customer ID.

Ref/PO

Enter the customer's purchase number or other reference number that should appear on the invoice. The reference/purchase order value will display on the AR statement.

Terms

(optional) Enter the code for the type of sale terms that apply to this invoice, or use the lookup icon to select a value.

Invoice#

Enter the numeric code listed on the manual (paper) invoice. If no code exists and you leave this field empty, iMIS supplies a sequential reference number that appears on all related windows and reports. Reference numbers have a prefix of R.

Invoice Balance

(read only) Running invoice balance automatically updated by iMIS.

becomes

(read only) Invoice balance after the credit adjustment (only displays when you click New).

Description

(read only) This description is populated by the description in the invoice to which the credit memo is related.

Product

Enter a valid product code from the Products window, or use the lookup icon to select a value.

GL Account

Automatically populated with the GL account number if a GL account number is defined for the product. If the Allow GL Account Edit for Sales Transactions option is enabled (go to Finance > Options > Configure accounting options), you can enter a GL account number if the GL Account field is blank or enter a different GL account number if the GL Account field is populated.

If a GL account number is not defined for the product and you leave the GL Account field blank, the GL Account field is automatically populated with the default Income Account for the transaction's owner entity.

If the Allow GL Account Edit for Sales Transactions option is disabled, this field is display-only and the GL account number cannot be added or changed.

(Product) Description

Automatically entered by iMIS, but can be overridden manually.

Quantity

Enter the Quantity of the product being sold. This quantity is applied against the unit price to arrive at the extended amount.

Enter quantities as whole numbers unless you are designating time or other partial quantities. For time or other partial quantities, enter fractions as decimals: (for example, enter 1.5 for 1-1/2)

Unit Price

iMIS automatically fills in the Unit Price if a product price has been defined on the Product Code window.

To override this price, click on the field (or press Shift+Tab to return to the Unit Price field) and enter a new value.

Ext Amt

(read only) iMIS automatically calculates the extended price.

Transaction list

Displays the transaction date, check number or credit card type, transaction amount, and customer name.

Entering debit memo adjustments

To apply debit memos to multiple funds

To apply a debit memo to multiple funds for a split gift, use the Debit memos window.

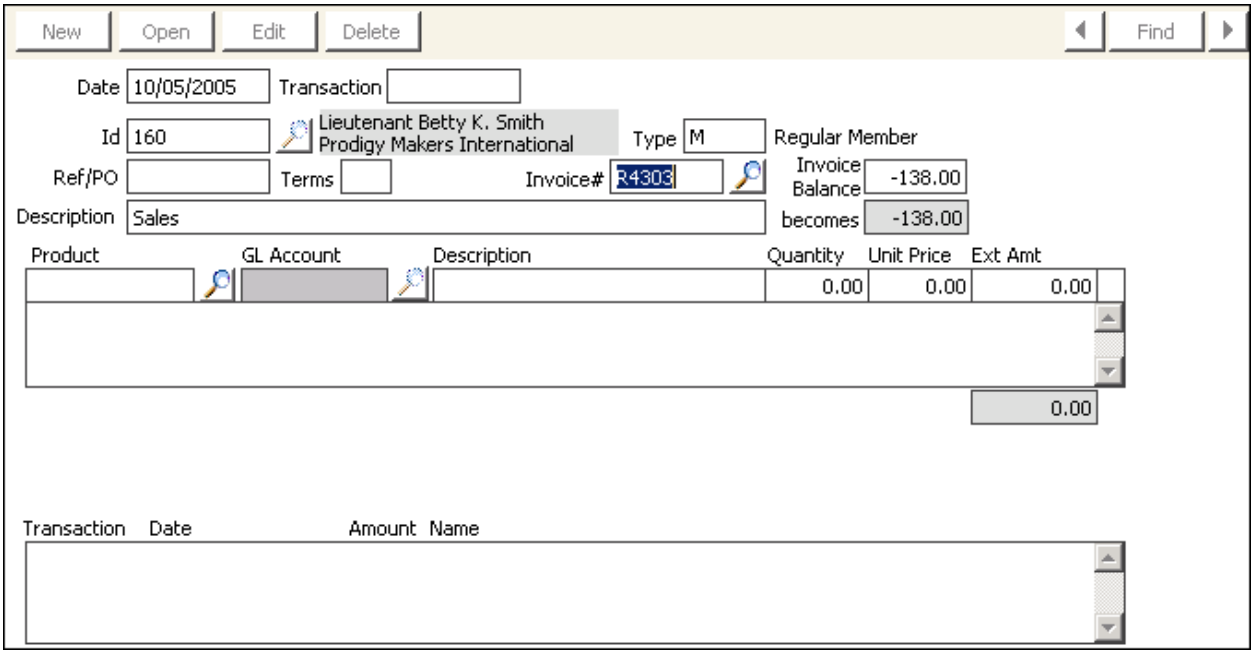
1. From the Debit memos window, click New.
2. Enter the donor ID in the Id field, or click the lookup icon to select a donor ID.
3. Enter the transaction number in the Invoice# field and press Tab. The split gifts per fund for the transaction display.

4. Enter the distribution or premium code in the Product field, or click the lookup icon to select a distribution or premium, and press Tab.

   Note: If more than one distribution is assigned to the same fund, only one line displays for the fund, showing the combined charges for these distributions. You must know the distribution or premium code that you wish to adjust and its value per the installment invoice.

5. Enter 1 in the Quantity field.
6. Enter the debit memo amount in the Unit Price field.
7. (optional) Repeat to apply the debit memo to additional distributions or premiums.
8. Click Save.

Debit memos window



Finance > Adjustments > Debit memos

Date

iMIS automatically enters the current system date (or the date entered earlier in the session) for the transaction date.

To override this date, click on the field (or press Shift+Tab to move the cursor back to the Date field) and enter a new value.

> **Note:** Note: If you are using batch control, this field defaults to the active batch date and cannot be overridden.

Transaction

(read only) The transaction number is automatically assigned by iMIS after the transaction has been processed.

Id

Enter the customer ID that relates to the sale, or use the lookup icon to select a value.

Type

(read only) The customer type that corresponds to the customer ID.

Ref/PO

Enter the customer's purchase order number or other reference number that should appear on the invoice. The reference/purchase order value will display on the AR statement.

Terms

(optional) Enter the code for the type of sale terms that apply to this invoice, or use the lookup icon to select a value.

Invoice#

Enter the numeric code listed on the manual (paper) invoice. If no code exists and you leave this field empty, iMIS supplies a sequential reference number that appears on all related windows and reports. Reference numbers have a prefix of R.

Invoice Balance

(read only) Running invoice balance automatically updated by iMIS.

becomes

(read only) Invoice balance after the credit adjustment displays in this field (only displays when you click the New button)

Description

(read only) This description is populated by the description in the invoice to which the credit or debit memo is related.

Product

Enter a valid product code from the Products window, or use the lookup icon to select a value.

GL Account

Automatically populated with the GL account number if a GL account number is defined for the product. If the Allow GL Account Edit for Sales Transactions option is enabled (go to Finance > Options > Configure accounting options), you can enter a GL account number if the GL Account field is blank or enter a different GL account number if the GL Account field is populated.

If a GL account number is not defined for the product and you leave the GL Account field blank, the GL Account field is automatically populated with the default Income Account for the transaction's owner entity.

If the Allow GL Account Edit for Sales Transactions option is disabled, this field is display-only and the GL account number cannot be added or changed.

(Product) Description

Populated automatically by iMIS, but can be overridden manually.

Quantity

Enter the Quantity of the product being sold. This quantity is applied against the unit price to arrive at the extended amount.

Enter quantities as whole numbers unless you are designating time or other partial quantities. For time or other partial quantities, enter fractions as decimals: (for example, enter 1.5 for 1-1/2)

Unit Price

iMIS automatically fills in the Unit Price if a product price has been defined on the Products window.

To override this price, click on the field (or press Shift+Tab to return to the Unit Price field), and enter a new value.

Ext Amt

(read only) iMIS automatically calculates the extended price.

Transaction list

Displays the transaction date, check number or credit card type, transaction amount, and customer name.

Entering pledge credit memo adjustments

To enter a pledge credit memo

1. From the Pledge credit memos window, click New.
2. The Date field defaults to:

- The batch date if batch control is enabled. If an active, open batch is not selected, the Open Batches window opens. After selecting or creating a batch, click New on the Pledge credit memos window again.
- The system date if batch control is not enabled. If you override the system date, the new date becomes the default date for new credit memos until the Pledge credit memos window is closed and reopened.

3. Enter the donor ID in the ID field, or click the lookup icon to select a donor ID, and press Tab. After the ID field is populated and Tab is pressed, an address block for the customer displays in the Pledge credit memos window and the Type and Status fields are

populated.

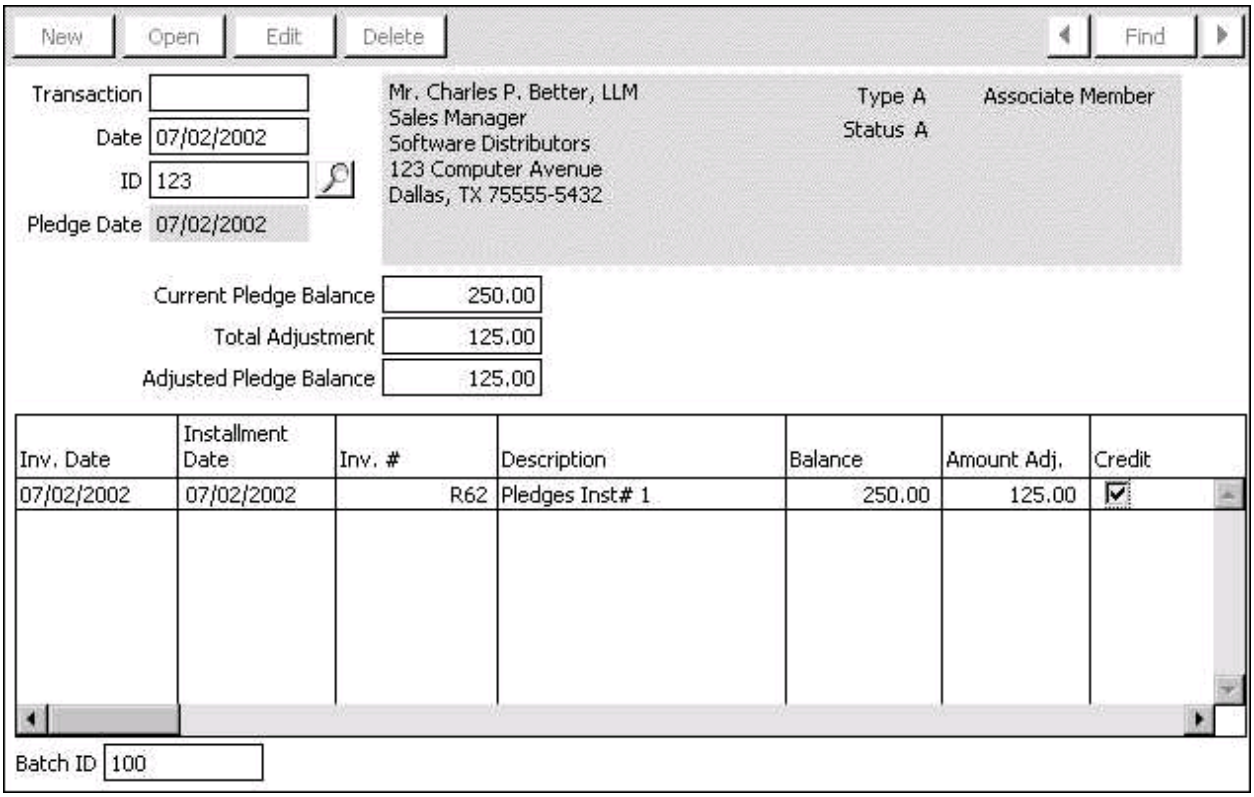
4. Click Find Pledge to display the Find window.
5. Select the pledge to be adjusted and click OK.
6. Use one of the following methods to specify the credit memo adjustment:

- Click Adjust All to issue a credit memo against all installments associated with a pledge that has a non-zero balance.
- Select the Credit checkbox to credit specific line items. For example, enable the Credit option for invoice number R65, and the full amount displays in the Amount Adj field for this invoice number.

7. Enter the amount to credit in the Amount Adj field for the line item. For example, enter 25.00 in the Amount Adj field for invoice number R64 and press Tab. This will automatically enable the Credit checkbox for this line item.
8. Click Save. The total amount of the credit memo displays in the Total Adjustment field.

> **Note:** Note: Line items that were not adjusted are no longer displayed in the Pledge credit memos window after you click Save.

Pledge credit memos window



Finance > Adjustments > Pledge credit memos

Transaction

Displays the completed transaction number. You can click Open and enter the transaction number to look up an existing credit memo transaction.

Date

Displays the batch date or current system date. You can override this date if batch control is not enabled. You can click Open and enter the transaction date to look up an existing credit memo transaction.

ID

Enter the ID of the customer whose record is being adjusted.

Pledge Date

Displays the date of the selected pledge.

Current Pledge Balance

Displays the total balance due for all installment invoices.

Total Adjustment

Displays the total amount of the pledge credit memo adjustment for the selected line items.

Adjusted Pledge Balance

Displays the remaining pledge balance after the pledge credit memo adjustment (the difference between the Current Pledge Balance and Total Adjustment fields).

Inv. Date

Displays the invoice date of the pledge transaction (displays all Invoice.INVOICE_DATE fields associated with the Transaction).

Installment Date

Displays the date of each installment transaction (displays all Invoice.INSTALL_BILL_DATE fields associated with the Transaction).

Inv. #

Displays the invoice number of each installment transaction (displays all Invoice.INVOICE_NUM (if non-zero, else a concatenation of 'R' and Invoice.REFERENCE_NUM) fields associated with the Transaction).

Description

Displays a description of the pledge transaction (displays all Invoice.DESCRIPTION fields associated with the Transaction).

Balance

Displays all Invoice.BALANCE fields associated with the Transaction.

Amount Adj.

This is the dollar amount to be adjusted from this line item. Entering an amount in this field automatically enables the Credit checkbox.

Credit

Enable this checkbox for the line item that will receive the credit memo. If you enter an amount in the Amount Adj field and press Tab, the Credit checkbox is automatically enabled. If you enable this checkbox without entering a value in the Amount Adj field, the Amount Adj field is automatically populated to offset the remaining pledge installment balance, resulting in a net pledge installment balance of zero.

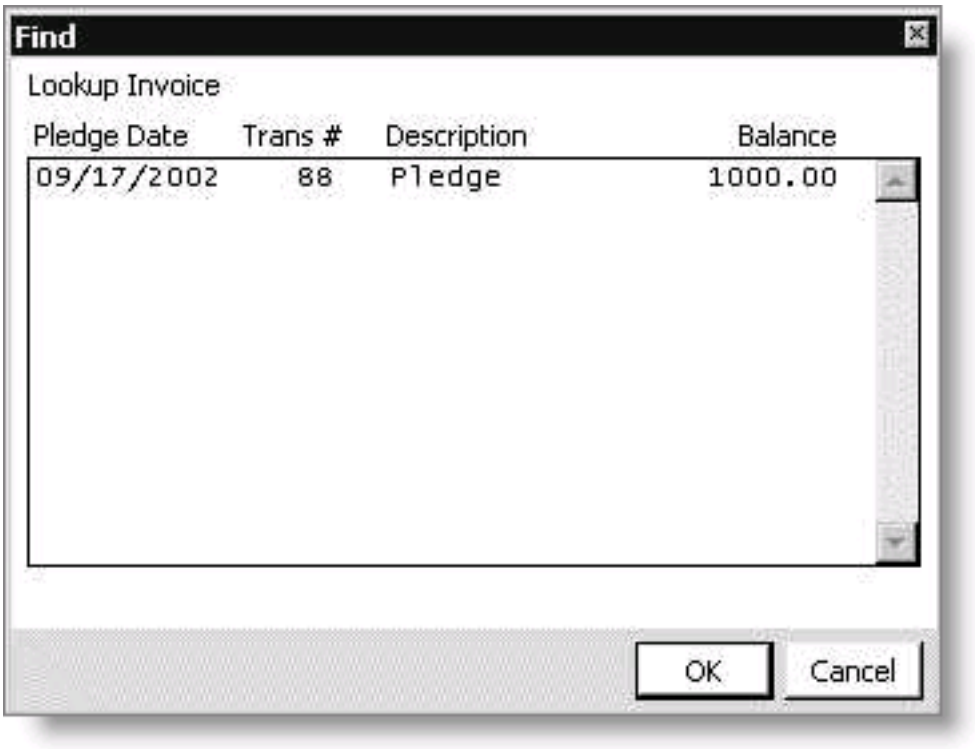
Batch ID

Displays the ID of the batch associated with the selected line item if batch control is enabled.

Find Pledge

Enables you to find the pledges for the current donor ID. This button is only enabled after clicking New and entering a donor ID.

Find window



Pledge Date

Displays the Invoice.INVOICE_DATE of any invoice with common Invoice.ORIGINATING_TRANS_Nums.

Trans #

Displays the Invoice.OPRIGINATING_TRANS_NUM for the pledge.

Description

Displays the word Pledge.

Balance

Displays the sum of Invoice.BALANCE for all invoice records equal to the Invoice.ORIGINATING_TRANS_NUM.

Line items are summary information and are displayed in descending order by Pledge Date and then in descending order by Trans # within date from the following:

- Invoice.SOURCE_SYSTEM is equal to FR.
- Invoice.INSTALL_BILL_DATE is not null.
- Invoice.ORIGINATING_TRANS_NUM is the same for all Trans #.

Adjust All

Enables you to issue a credit memo against all installments associated with a pledge that have a non-zero balance.

Entering pledge debit memo adjustments

Debit memos have the opposite effect of credit memos, increasing the balance of open accounts receivable items.

Use debit memos for the following tasks:

- Increase or add a line item charge.
- Bring a credit balance to zero due to an overpayment, credit memo, or cancellation transaction.

To enter a pledge debit memo

1. From the Pledge debit memos window, click New.
2. The Date field defaults to one of the following:

- If batch control is enabled, the Date field defaults to the batch date. If an active, open batch is not selected, the Open Batches window opens. After selecting or creating a batch, click New on the Pledge debit memos window again. You cannot override the date if batch control is enabled.
- If batch control is not enabled, the Date field defaults to the system date. You can override this date. If you override the system date, the new date becomes the default date for new debit memos until the Pledge debit memos window is closed and reopened.

3. Enter the donor ID in the ID field, or click the lookup icon to select a donor ID, and press Tab. After the ID field is populated, an address block for the customer displays in the

Pledge debit memos window and the Type and Status fields are populated.

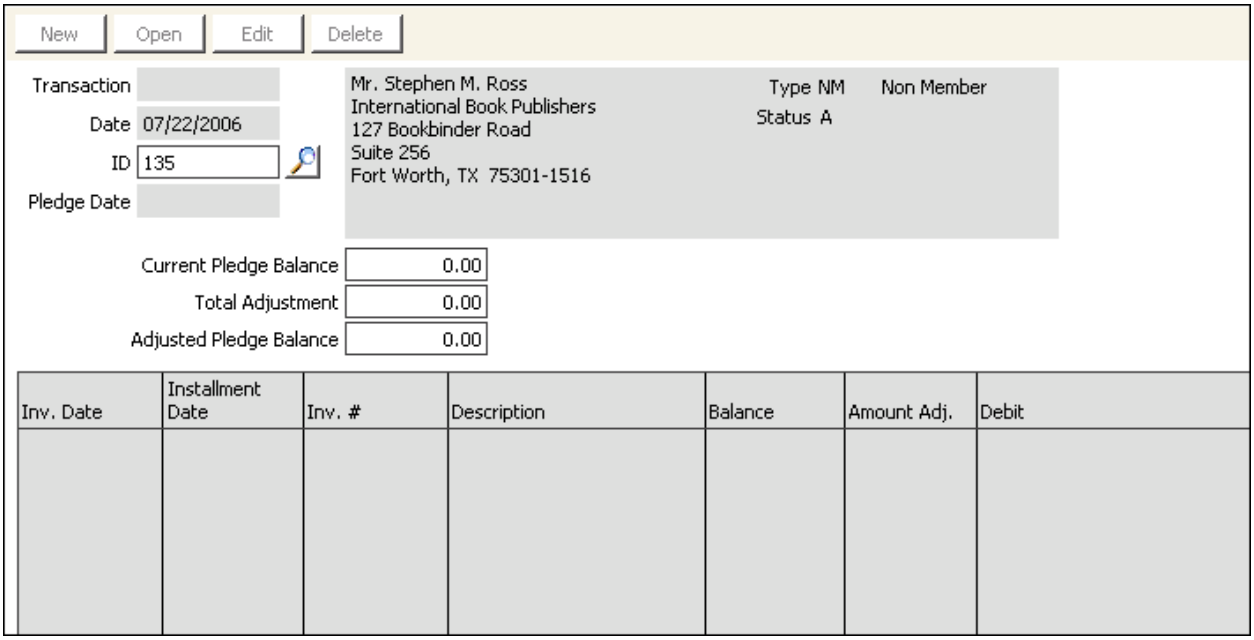
4. Click Find Pledge to display the Find window.
5. Select the pledge installment for the pledge debit memo adjustment.
6. Click OK.
7. Use one of the following methods to specify the debit memo adjustment:

- Click Adjust All to select all line items with a balance to debit. The full amount displays in the Amount Adj field for each line item, the Debit checkbox is selected for each line item with a balance, and the total amount of all debit memo adjustments displays in the Total Adjustment field. The Adjust All button is only enabled if the total pledge balance is negative.
- Select the Debit checkbox to debit specific line items. For example, enable the Debit checkbox for invoice number R65 and the full amount displays in the Amount Adj field for this invoice number.
- Enter the amount to debit in the Amount Adj field for the line item. For example, enter 25.00 in the Amount Adj field for invoice number R64. This will automatically enable the Debit option for this line item.

8. Click Save. The total amount of the debit memo displays in the Total Adjustment field.

> **Note:** Note: Line items that were not adjusted are no longer displayed in the Pledge debit memos window after you click Save.

Pledge debit memos window



Home > Fundraising > Pledge debit memos

Transaction

Displays the completed transaction number. You can click Open and enter the transaction number to look up an existing debit memo transaction.

Date

Displays the batch date or system date. You can override this date if batch control is not enabled. You can click Open and enter the transaction date to look up an existing debit memo transaction.

ID

Enter the ID of the customer whose record is being adjusted.

Pledge Date

Displays the date of the selected pledge.

Current Pledge Balance

Displays the total balance due for all installment invoices.

Total Adjustment

Displays the total amount of the pledge credit memo adjustment for the selected line items.

Adjusted Pledge Balance

Displays the remaining pledge balance after the pledge credit memo adjustment (the sum of the Current Pledge Balance and Total Adjustment fields).

Inv. Date

Displays all Invoice.INVOICE_DATE fields associated with the Transaction.

Installment Date

Displays the date of each installment transaction (displays all Invoice.INSTALL_BILL_DATE fields associated with the Transaction).

Inv. #

Displays the invoice number of each installment pledge transaction (displays all Invoice.INVOICE_NUM (if non-zero, else a concatenation of 'R' and Invoice.REFERENCE_NUM) fields associated with the Transaction).

Description

Displays a description of the pledge transaction (displays all Invoice.DESCRIPTION fields associated with the Transaction).

Balance

Displays all Invoice.BALANCE fields associated with the Transaction.

Amount Adj.

This is the dollar amount to be adjusted from this line item. Entering an amount automatically enables the Credit checkbox.

Debit

Enable this checkbox for the line item that will receive the debit memo. If you enter an amount in the Amount Adj field and press Tab, the Debit checkbox is automatically enabled. If you enable this checkbox without entering a value in the Amount Adj field, the Amount Adj field is automatically populated to offset the remaining pledge installment balance, resulting in a net pledge installment balance of zero.

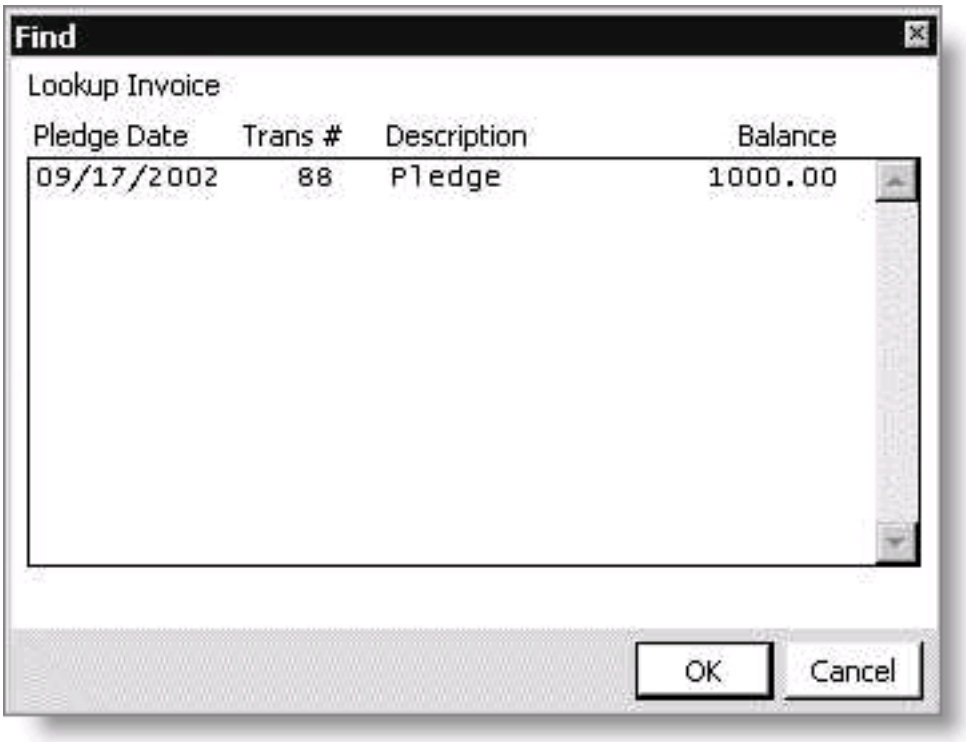
Batch ID

Displays the ID of the batch associated with the selected line item.

Find Pledge

Enables you to find the pledges for the current donor ID. This button is only enabled after clicking New and entering a donor ID.

Find window



Pledge Date

Displays the Invoice.INVOICE_DATE of any invoice with common Invoice.ORIGINATING_TRANS_Nums.

Trans #

Displays the Invoice.OPRIGINATING_TRANS_NUM for the pledge.

Description

Displays the word Pledge.

Balance

Displays the sum of Invoice.BALANCE for all invoice records equal to the Invoice.ORIGINATING_TRANS_NUM.

Line items are summary information and are displayed in descending order by Pledge Date and then in descending order by Trans # within date from the following:

- Invoice.SOURCE_SYSTEM is equal to FR.
- Invoice.INSTALL_BILL_DATE is not null.
- Invoice.ORIGINATING_TRANS_NUM is the same for all Trans #.

Adjust All

Enables you to issue a debit memo against all installments associated with a pledge that have a non-zero balance. This button is only enabled when the total pledge balance is negative.

Entering accrual dues credit memo adjustments

Use credit memos to perform the following tasks:

- Write off an open item that cannot be collected
- Reduce or reverse a line item charge
- Reverse a previously entered transaction
- Record product returns and credit the customer

You can process reversals of open accrual dues items on a line-by-line basis on the Enter and edit credit memos window. After the credit memo is processed, the balance reduction is reflected appropriately in the various inquiry windows.

For example, if a customer cancels a single line item on a bill and pays for the remaining items, you should reverse the charge of the canceled item.

> **Note:** Note: Accrual dues credit memos must be processed on the Billing Enter and edit credit memos window. If you attempt to process an accrual dues credit memo from the Accounting Enter and edit credit memos window, a message is displayed at the bottom of the window.

Authorization levels for credit memos

The Enter and edit credit memos window adhere to the same security rules as the Payments window:

- To find and view an existing credit memo, you must have a Billing authorization level of one (1) or greater.
- To enter new accrual dues credit memos, you must have a Billing authorization level of three (3) or greater. A Billing authorization level of three (3) will allow you to edit or delete credit or debit memos you have entered.
- If the View Batch by User option is enabled on the AR/Cash Batch Control window, to edit or delete another user's accrual dues credit memo, you must have a Billing authorization level of four (4) or greater.

To process an accrual dues credit memo

You can process reversals of accrual dues items on a line-by-line basis through the Credit memos window. For example, if a customer cancels a single line item, you can reverse that one line.

> **Note:** Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income

> and any income recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

1. From the Accrual dues credit memos window, click New.

   The Date field defaults to:

- Batch date if Batch Control is used.

  If Batch Control is enabled and an active open batch is not selected, the Batch Control List is displayed. Select or create a batch and click New.

  If Batch Control is enabled and an active open batch is selected, the Date field is populated with the date of the batch.

- System date, if Batch Control is not used

  If the system date is overridden, the new date becomes the default value for inserts until the window is closed and reopened.

2. Enter an ID or select the lookup icon to find a customer's record. After the ID field is populated, an address block for the customer displays at the top of the window and the fields labeled Type, Status, Paid Thru, and Category populate. The calculated address block contains a concatenation of the full name, title, company, and full address.

   Note: The CATEGORY field displays prefixed with the label Category if your administrator has enabled the Use Bill Categories option. If this option is not enabled, neither the category value nor the category label will display.

3. Tab to the Invoice Number field.

- Enter the accrual billing invoice number and press Enter, or
- Select the lookup icon to select an invoice.

  Invoice or reference numbers are validated for the following:

- Invoice.SOURCE_SYSTEM is equal to DUES and at least one Invoice_Lines row is linked to the invoice.

- The Invoice.BT_ID is equal to the ID entered for the credit memo.

4. After the invoice number is entered, select from the following options:

- Click Adjust All to select all line items to credit.

  The balance amount displays in the Amt Adj field and the Credit option is selected for each line item.

- Select the Credit option to credit specific line items. For example, select this option for Line 2.

  The balance amount displays in the Amt Adj field.

- Enter an amount to credit in a line item's Amt Adj field. For example, enter 100.00 in the Amt Adj field for Line 1.

  This will automatically enable the Credit option:

5. Click Save to update the record.

   The Total Adjustment field displays the total amount of the credit memo. Line items not adjusted are no longer displayed on the window.

   To find an accrual dues credit memo using a transaction number

1. From the Accrual dues credit memos window, click Find or Open.
2. Enter the transaction number and press Enter.

   iMIS verifies that the transaction number is the correct type based on whether Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM. If the transaction number is not correct, a message is displayed informing you that the transaction could not be located.

> **Note:** Note: Accrual dues credit memos must be processed on the Billing Enter and edit credit memos window. If you attempt to process an accrual dues credit memo from the AR Enter and edit credit memos window, a message is displayed at the bottom of the window. See To process an accrual dues credit memo for details.

To find an accrual dues credit memo using a transaction date

1. From the Accrual dues credit memos window, click Find or Open.
2. Tab to the Date field and enter a valid date, for example, 04152001, and press Enter.

   iMIS builds a list of potential matches, looking for a match with that date and of the correct type (Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM). If no transactions are found, a message is displayed informing you that no transactions match your criteria.

   The most recent transaction to meet the criteria is displayed. If there is more than one transaction that meets the criteria, the most recent transaction is displayed and the Left arrow is activated. After viewing the previous transaction, the Right arrow is activated, allowing you to scroll through all transactions based on the date entered (Trans.SOURCE_SYSTEM equal to DUES and Trans.JOURNAL_TYPE equal to CM).

   > **Note:** Note: Accrual dues credit memos must be processed on the Billing Enter and edit credit memos window. If you attempt to process an accrual dues credit memo from the AR Enter and edit credit memos window, a message is displayed at the bottom of the window. See To process an accrual dues credit memo for details.

To find an accrual dues credit memo using the customer ID

1. From the Accrual dues credit memos window, click Find or Open.
2. Tab to the ID field, enter a valid ID, and press Enter.

   iMIS will build a list of potential matches, looking for a match with that ID and of the correct type (Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM). If the ID is not correct, a message is displayed informing you the transaction could not be located.

   The most recent transaction to meet the criteria is displayed. If there is more than one transaction that meets the criteria, the most recent transaction is displayed and the Left arrow is activated. After you have viewed the previous transaction, the Right arrow is

activated, allowing you to scroll through all valid transactions (Trans.SOURCE_SYSTEM equal to DUES and Trans.JOURNAL_TYPE equal to CM) based on the date entered.

> **Note:** Note: Accrual dues credit memos must be processed on the Billing Enter and edit credit memos window. If you attempt to process an accrual dues credit memo from the AR Enter and edit credit memos window, an error displays at the bottom of the window. See To process an accrual dues credit memo for details.

If more than one Find criteria is entered, iMIS will search on the following:

- Transaction number first, if populated, and ignore the other search criteria.
- Date second, if populated, and ignore the ID.
- ID third, if both Transaction and Date are blank.

To edit an accrual dues credit memo with Batch Control enabled

You can edit an accrual dues credit memo only if it has not been exported through a General Ledger interface. After this occurs, Trans.POSTED is equal to 4, and you will not be able to edit the credit memo.

1. From the Accrual dues credit memos window, find an accrual dues credit memo.
2. Click Edit.

   Note: If a batch is not selected, iMIS will ensure that the batch containing the credit memo is still in an open state and then open the Batch window.

   If a batch is selected, but is not the batch containing the credit memo, a message is displayed asking you to confirm loading a batch other than the one selected. Click No to cancel the edit or click Yes to proceed. Before changing the batch, iMIS will ensure that the batch is still in an open state. If the batch is not open, a message is displayed informing you that the batch is not open and cannot be edited.
3. Tab to the Amt Adj field to edit the amount.
4. Click Save.

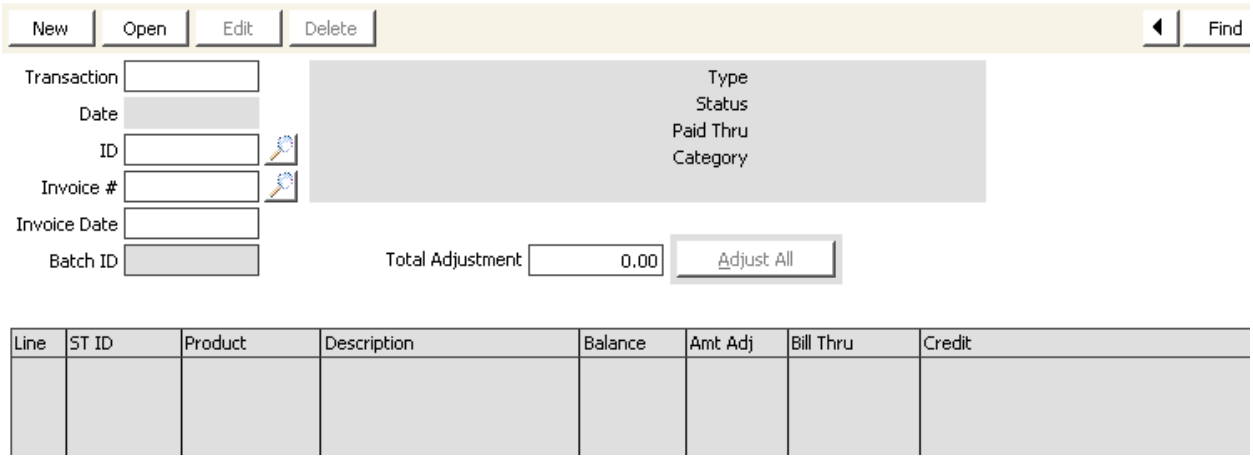
To cancel an accrual dues credit memo with Batch Control enabled

You can cancel an accrual dues credit memo only if it has not been exported through a General Ledger interface. After this occurs and the Trans.POSTED_FLAG is equal to four, you will not be able to edit the credit memo.

1. From the Accrual dues credit memos window, find an accrual dues credit memo.
2. Click Delete.

- If a batch is not selected, iMIS will ensure that the batch containing the credit memo is still in an open state, open the Batch window, and ask you to confirm the deletion. Click Yes to delete the transaction or click No to cancel the deletion.
- If a batch is selected, but is not the batch containing the credit memo, a message is displayed asking you to confirm loading a batch other than the one selected. Click Yes to proceed. Before changing the batch, iMIS will ensure that the batch is in an open state. If the batch is open, a message is displayed asking you to confirm the deletion. Click No to cancel the delete or click Yes to delete the transaction. If the batch is not open, a message is displayed informing you that the batch is not open and cannot be edited.

Accrual dues credit memos window



Finance > Adjustments > Accrual dues credit memos

Transaction

This field is automatically populated with the transaction number.

Date

Defaults to the current system date, or the batch date if you are using the batch control option.

ID

Specifies the billed customer identification number or. You can also select the lookup icon to select a value.

Invoice #

Specifies the invoice number assigned to the billing transaction or select the lookup icon to select a value.

Invoice Date

This field is automatically populated with the invoice date when you enter a value in the Invoice# field.

Batch ID

This field is automatically populated with the batch number of the current, open batch if batch control is enabled on the AR/Cash Batch Control window.

Original Invoice Balance

Displays the total balance due from the original billing invoice. This option displays when a record is entered.

Total Adjustment

Displays the total amount to be adjusted for the line items as you select them.

Adjusted Invoice Balance

Displays the difference between the Original Invoice Balance and Total Adjustment fields. This option is displayed when a record is entered.

Adjust All button

Used to automatically mark the credit checkbox for all line items.

Line

This column displays all the Invoice_Lines.LINE_NUM fields associated with the Invoice Number.

ST ID

This column displays all the Invoice_Lines.ST_ID fields associated with the Invoice Number.

Product

This column displays all the Invoice_Lines.PRODUCT_CODE fields associated with the Invoice Number.

Description

This column displays the description of the product code. If the invoice is a List Bill, the name of the ST_ID will be concatenated with the product title (for example, Bill Smith, Basic Dues).

Balance

This column displays all Invoice_Lines.BALANCE fields associated with the Invoice Number.

Amt Adj

This column displays the dollar amount to be adjusted from this line item. Entering an amount in this field then tabbing automatically marks the Credit checkbox.

Bill Thru

This column displays all Invoice_Lines.BILL_THRU fields associated with the Invoice Number.

Credit

Select to select a line item to be credited in full.

Entering accrual dues debit memo adjustments

Use debit memos to perform the following tasks:

- Increase a line item charge
- Bring a credit balance to zero due to an overpayment, credit memo, or cancellation transaction

Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

Authorization levels for debit memos

The Accrual dues debit memos window adhere to the same security rules as the Payments window:

- To find and view an existing debit memo, you must have a Billing authorization level of one (1) or greater.
- To enter new accrual dues debit memos, you must have a Billing authorization level of three (3) or greater. A Billing authorization level of three (3) will allow you to edit or delete credit or debit memos you have entered.
- If the View Batch by User option is enabled on the AR/Cash Batch Control window, to edit or delete another user's accrual dues debit memo, you must have a Billing authorization level of four (4) or greater.

To process an accrual dues debit memo

You can process reversals of accrual dues items with a credit balance on a line-by-line basis through the Billing Enter and edit debit memos window. For example, if a customer overpays an invoice and you do not intend to refund the overpayment, you should process a debit memo for that amount.

> **Note:** Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any income recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

1. From the Accrual dues debit memos window, click New.

   The Date field defaults to:

- Batch date if Batch Control is used.

  If Batch Control is enabled and an active open batch is not selected, the Batch Control List is displayed. Select or create a batch and click New.

  If Batch Control is enabled and an active open batch is selected, the Date field is populated with the date of the batch.

- System date, if Batch Control is not used

  If the system date is overridden, the new date becomes the default value for inserts until the window is closed and reopened.

2. Press Tab and enter an ID or select the lookup icon to find a customer's record.

   After the ID field is populated, an address block for the customer displays in the upper right-hand corner and the fields labeled Type, Status, Paid Thru, and Category are populated.

   The calculated address block contains a concatenation of Name.FULL_NAME, Name.TITLE (if Use Title is enabled for the preferred mailing address type), Name.COMPANY (if Use Company is enabled for the preferred mailing address type), and Name.FULL_ADDRESS.

   Note: Name.CATEGORY displays prefixed with the label Category: as long as the Use Bill Categories option is enabled on the Customer Setup - Basic Options window. If this option is not enabled, neither the category value nor the category label will display.

3. Tab to the Invoice Number field.

- Enter the invoice number and press Enter, or
- Select the lookup icon and select an invoice:

  Invoice or reference numbers are validated for the following:

- Invoice.SOURCE_SYSTEM is equal to DUES and at least one Invoice_Lines row is linked to the invoice.
- The Invoice.BT_ID is equal to the ID entered for the credit memo.

4. After the invoice number is entered, select from the following options:

- Select Adjust All to select all line items to debit.

  The balance amount times -1 displays in the Amt Adj field and the Debit option is selected for each line item.

  Note: Adjust All is available only when the overall balance is negative.

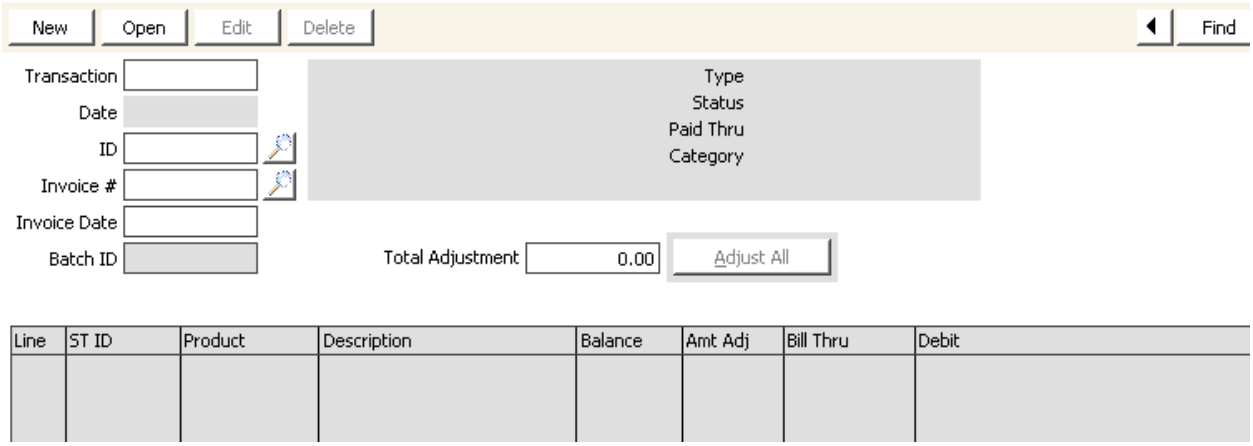
- Select the Debit option to debit specific line items.
- Enter an amount to debit in the line item's Amt Adj field.

5. Click Save to update the record.

   The Total Adjustment field displays the total amount of the debit memo and line items not adjusted are no longer displayed on the window.

   After an accrual dues debit memo is applied to an invoice, the Transaction Ledger displays the detail for each amount adjusted.

Accrual dues debit memos window



Finance > Adjustments > Accrual dues debit memos

Transaction

This field is automatically populated with a transaction number.

Date

Defaults to the current system date, or the batch date if you are using the batch control option.

ID

Enter the customer identification number or, if a company is responsible for the payment, enter the company ID in this field. You can also select the lookup icon to select a value.

Invoice Number

Specifies the invoice number assigned to the transaction or select the lookup icon to select a value.

Invoice Date

The current date automatically displays in this field when a record is entered.

Batch ID

Displays the batch number of the current open batch if batch control is enabled on the AR/Cash Batch Control window.

Original Invoice Balance

Displays the total current balance of the original invoice.

Total Adjustment

Displays the total amount to be adjusted for the selected line items.

Adjusted Invoice Balance

Displays the Original Invoice Balance plus the Total Adjustment field. The value in the Total Adjustment field is typically a negative amount and is therefore deducted from Original Invoice Balance. If Total Adjustment is a positive amount, it is added to Original Invoice Balance.

Adjust All

Used to automatically debit all line items. This button can be used if the overall balance is negative.

Line

This column displays all Invoice_Lines.LINE_NUM fields associated with the Invoice Number.

ST ID

This column displays all the Invoice_Lines.ST_ID fields associated with the Invoice Number.

Product

This column displays all the Invoice_Lines.PRODUCT_CODE fields associated with the Invoice Number.

Description

This column displays the description of the product code. If the invoice is a List Bill the name of the ST_ID will be concatenated with the product title, for example, Bill Smith, Basic Dues.

Balance

This column displays all Invoice_Lines.BALANCE fields associated with the Invoice Number.

Amt Adj

This column displays the dollar amount to be adjusted from the specified line item. Entering an amount in this field automatically enables the Debit option.

Bill Thru

This column displays all Invoice_Lines.BILL_THRU fields associated with the Invoice Number

Debit

Select to have the line item debited.

Options

Configuring accounting options

> **Note:** Note: Several configuration options on the Configure accounting options window are documented within the iMIS Desktop. Links in the following sections might display iMIS Desktop documentation. This saves you time and effort when configuring accounting options.

Configuring the Accounting module includes setting up the following options:

- Basic accounting options
- Default Accounts
- Aging

- Batch Control
- G/L Interface
- Credit Card Authorization
- Advanced PCI Compliance (see Implementing Advanced PCI Compliance options) options
- (VAT only) Taxation methods (see "Configuring VAT options in AR/Cash")

Financial entities

Before you configure several of the Accounting module features, you must define one or more financial entities in the iMIS system setup. Entities are also known as organizations, or in the case of fundraising financial entities, funds.

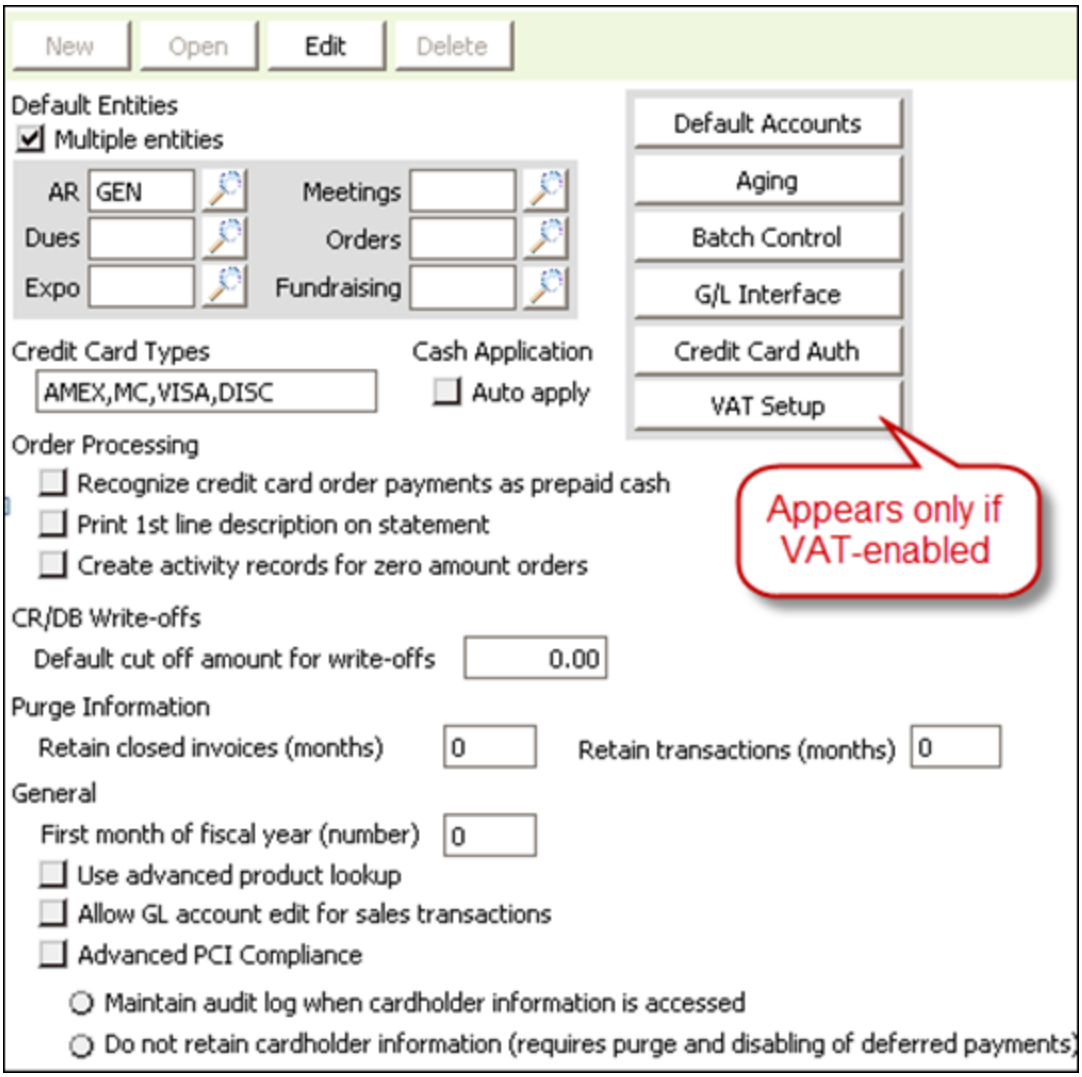
> **Note:** Note: A fund is an organization or entity that serves as an asset account for fundraising activities. If the entity currently being defined represents a Fund to which Fundraising gifts and pledges may apply, select the Is Fund checkbox in the Organization Names window.

See the System Admin Console section for help with "Defining an organizational entity".

Setting basic accounting options

Use the Configure accounting options window to define high-level options such as:

- Default Entities
- Credit Card Types
- Cash Application information
- Order Processing information
- Credit/debit (CR/DB) Write-offs
- Purge Information



Finance > Options > Configure accounting options

Default Entities

- Multiple Entities – For most organizations, this option should be disabled. When enabled, iMIS separates and processes transactions for multiple financial entities that share a common customer database, and the following fields designate the default entities for their modules:
- AR – entity code for iMIS AR/Cash
- Meetings – entity code for iMIS Events
- Dues – entity code for iMIS Billing

- Orders – entity code for iMIS Orders
- Expo – entity code for iMIS Exposition Management
- Fundraising – entity code for iMIS Fundraising

Credit Card Types

- Designates a comma-delimited list of acronyms (which iMIS stores as uppercase) for credit cards you accept. Common acronyms include Master Card (MC), Visa (VISA), Discovery (DISC), and American Express (AMEX). If you use iMIS authorized forms, such as preprinted invoices that contain a credit card payment box, this list is printed in that box, which allows the customer to see the available credit choices.

  Note: This does not provide credit card validation or credit card processing within iMIS. See Credit Card Authorization for setup details.

Cash Application

- Auto apply – When enabled, incoming cash receipts are automatically applied to invoices beginning with the oldest outstanding balance on an individual's record. This setting can be overridden when entering cash receipts.

  Tip: If you have heavy transaction volumes, do not enable Cash Application: Auto apply.

  Note: Auto apply only affects the functionality of the Cash receipts window and AR Importer; if Auto apply is disabled, payment records in AR Importer files must contain the invoice number.

Related windows

- Default Accounts opens the AR/Cash Default Accounts window.
- Aging opens the AR/Cash Aging window.
- Batch Control opens the AR/Cash Batch Control window.
- G/L Interface opens the AR/Cash General Ledger Interface window.

- Credit Card Auth opens the AR/Cash Credit Card Authorization window. (Enabled only if your system is licensed for CCAUTH.)

  Order Processing

- Recognize credit card order payments as prepaid cash – When enabled, iMIS allows the credit card payment to be handled in the same manner as a cash payment and immediately record the payment into the batch, with an immediate debit to Cash and credit to the Prepaid account. When disabled, iMIS follows standard accounting practices and does not recognize cash for credit card payments until an order is shipped.

  Note: Credit card payments on orders placed in Orders and Service Central are always recognized as prepaid cash regardless of whether Recognize credit card order payments as prepaid cash is enabled.

- Print 1st line description on statement – When enabled, the first line of an order or a user comment appears in the AR/Cash tab on the Manage customers window and on the Cash receipts window, and it prints on AR Statements. When disabled, only the order number appears.

- Create activity records for zero amount orders – When enabled, activity records are created for orders that are no-charge orders.

  CR/DB Write-offs

- Default cut off amount for write-offs – Sets the maximum default amount to be written off. During the write-off process, all debit or credit balances less than or equal to this amount are written off. This value can be overridden during the actual write-off process.

  Purge Information

- Retain closed invoices (months) and Retain transactions (months) – Designates how long records can be viewed in iMIS after being closed. Set up your organization's overall purging parameters (months) for the Accounting module's housekeeping function.

  General

- First month of fiscal year (number) – Designates the first month of your organization's fiscal year. Some GL interface choices will export the fiscal period along with the calendar transaction date of the transactions.

  Note: Annual dues uses this field to determine the Effective Date on the Process billing window.

- Use advanced product lookup – When enabled, enables users to use the Lookup icon to find products when entering and editing AR/Cash sales transactions.
- Allow GL account edit for sales transactions – When enabled, allows editing of the GL Account field for each product selected during sales, credit memo, and debit memo transactions. When disabled, the GL Account field cannot be edited on the Sales transactions, Credit memos, and Debit memos windows.
- Advanced PCI Compliance – Enables iMIS-wide enforcement of the PCI Compliance support (see "Implementing Advanced PCI Compliance options") option that you choose:
- Maintain audit when cardholder information accessed – Directs iMIS to save encrypted cardholder data and to log every system event in which card information is accessed. The log is kept in the PciAuditLog table (see "Reading the PciAuditLog table").
- Do not retain cardholder information – Directs iMIS to save transactions without storing any cardholder data and to show only gateway reference numbers and authorization codes in windows and reports.

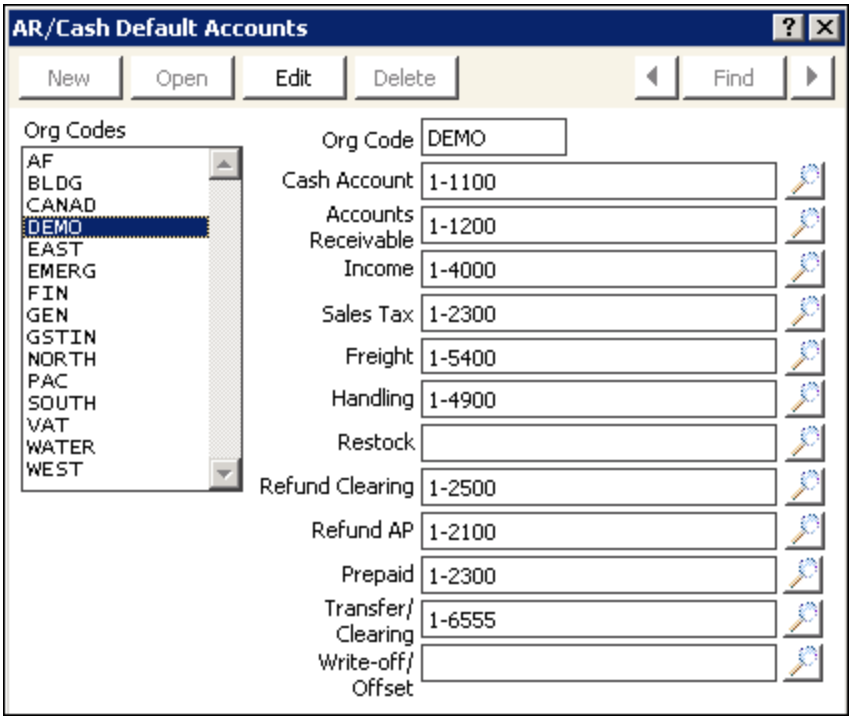
  Caution! To use this option, you must purge existing cardholder data from your database and disable all deferred payment processing in iMIS. See "Implementing Advanced PCI Compliance options".

Default Accounts

To assign AR/Cash default accounts codes

1. From the Configure accounting options window, click Default Accounts to open the AR/Cash Default Accounts window.

2. From Org Codes, choose an organizational code.
3. Click Edit.
4. Enter the account number (or click the lookup icon to select a value) in each field.
5. Click Save.



Org Codes

The Org Codes listed are set up in the Organization Names window using the iMIS system setup menu. The selected organization is displayed in the Org Code field.

Cash Account

(Required unless you are using batch control) If you are using batch control, all cash account codes are set by the Cash Account table entry for that batch.

This account is used for all iMIS cash-related transactions unless batch control is enabled or a credit card override account is specified. Multiple cash accounts can be defined and used at the batch control level.

Accounts Receivable

(required) This is the only place you can enter the main AR account code.

This is the main account that iMIS uses whenever full payment is not received for any order (for example, sales item or event registration). You can only have one Accounts Receivable account per organization.

Income

(Required if a specific income account is not supplied at the product level) iMIS uses this default income account only for those transactions where an income account is not specified at the product level.

Sales Tax

(Required if any account codes are not supplied at the tax authority level) iMIS uses this default sales tax account only for those transactions where a sales tax account is not specified at the product level.

Freight

(required) Enter an account code for the freight charges associated with orders.

Handling

(required) Enter an account code for the handling charges associated with orders.

Restock

Enter an account code for the charges associated with restocking returned orders.

Refund Clearing

This default account is the offsetting account that iMIS uses when it clears credit balances marked for refunds. Refund processing is performed on the Credit Invoices window (from AR/Cash, select Process month-end procedures, and click Credit Invoices). For more information, see Creating Credit Invoices.

This account also serves as a suspense (or bridge) account between AR and AP.

Each time iMIS generates a refund, accounts receivable is debited (to clear the credit balance) and the refund clearing account is credited. This credit balance is debited and cleared only when you enter the parallel account payable (AP) entry.

Refund AP

(Required only if you are licensed for the iMIS AP interface and you are importing into your third-party accounts payable software) This account is the accounts payable control account for the AP interface.

Prepaid

iMIS uses this account when a prepaid order is initially entered. The Cash account is debited and the Prepaid account is credited. When the order is invoiced, iMIS clears the prepaid amount and credits (transfers to) the appropriate income account.

This is a required account that is used in conjunction with prepaid order processing (simple or full order entry). The prepaid account is typically a deferred income balance sheet account.

Note: Note: Non-credit card cash order prepayments will involve the prepaid account, because check and currency receipts are immediately recognized upon order entry. Credit card payments will also use the Prepaid account if the Recognize Credit Card Order Payments as Prepaid Cash option is enabled (from AR/Cash, select Set up module). Otherwise, credit card payments are recognized when the order is invoiced.

Transfer/Clearing

This account is reserved for transaction generation where forced balancing is required.

iMIS uses the Transfer/Clearing account for two different system processes:

- Used in conjunction with prepaid order processing (simple and full order entry). It is used as a clearing account in the process to transfer the prepayment offset from prepaid (deferred income) to income.

- Used in the GL interface procedure for certain GL package choices. It is used when GL journal entries are generated and a restricted number of transaction lines are mandated.

  > **Note:** Note: When the Transfer/Clearing account is used in a line item within a transaction, there will always be an offsetting line item(s) in an associated transaction to ensure that entries to the transfer account will always balance to zero.

  Write-off/Offset

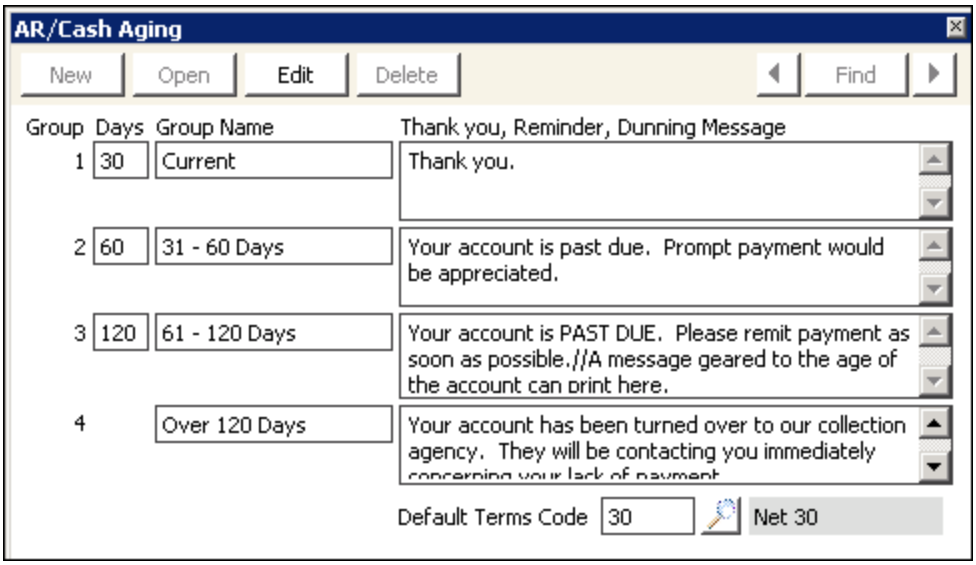
  This is the GL account to which the offset credit or debit created by the credit/debit write-off process (from AR/Cash, select Process month-end procedures, and click Credit/Debit Write-Offs) will be written.

Aging

You must define the guidelines for determining the aging groups to use for statements, aged trial balances, and account inquiries. Aging is the length of time an amount is past due for payment on an invoice.

To define aging groups

1. From the Configure accounting options window, click Aging to open the AR/Cash Aging window.
2. Click Edit.
3. Enter the aging information.
4. Click Save.



Group

Four groups define the guidelines for determining the Aging Groups to use for statements, aging trial balances, and account inquiries.

Days

The number of days indicates how many days old the invoice can be before the invoice moves out of this particular age group. When the invoice passes this age group by one day, the system automatically moves the invoice to the next age group.

Group Name

Enter a short name for each age group that names the group for all statements, aged trial balances, and account inquiries.

Thank you, Reminder, Dunning Message

If you would like a message to appear on statements when an account reaches a certain age, enter the message next to the appropriate age group. You can have different messages print for different ages.

Note: Note: Currently, aging is based on the date of the invoice, not on a due date calculated from payment terms.

Default Terms Code

The Default Terms Code applies to all levels of order entry. Enter the code of the terms you defined on the Set up terms window (go to Finance > Options > Set up tables > Terms) that you want to use by default, or use the lookup icon to select a value. For example, a default term code of 30 would represent Net 30 days.

> **Note:** Note: You must populate the Default Terms Code field in order for Events functions to show for people to register for events on the Public view.

Batch Control

> **Note:** Note: Links might display iMIS Desktop documentation. This saves you time and effort when configuring Batch Control options.

Setting up batch control consists of enabling batch control, configuring numbering and viewing options, and setting up cash accounts. These steps are required even if you only have one account.

> **Note:** Note: AR Importer batches are auto-created and auto-numbered and do not recognize specific iMIS users. These batches are assigned to the Manager user in iMIS, and require a security level of 8 to view, edit, or delete transactions when the View Batch by User option is selected.

AR/Cash Batch Control window

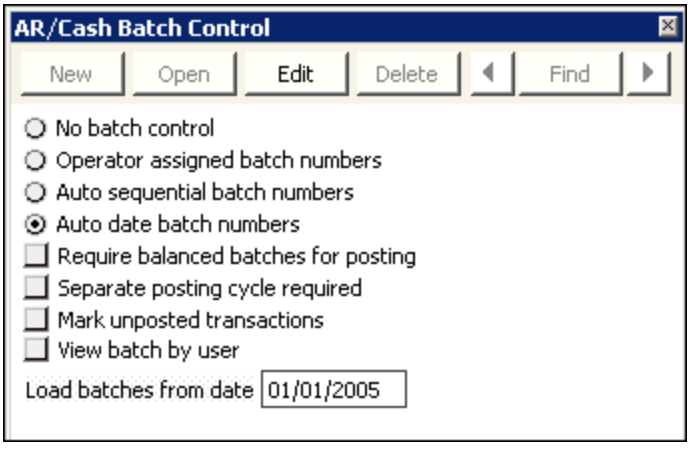
This window specifies whether batch control is enabled, and if it is, the options that apply to batches throughout iMIS.

To set up Batch Control

1. From the Configure accounting options window, click Batch Control to open the AR/Cash Batch Control window.

2. Click Edit.
3. Select a batch control numbering option. The Auto sequential batch numbers option or the Auto date batch numbers option is recommended.
4. (Recommended) Select the Require balanced batches for posting option to require that the control amount equals the actual amount, and the control count equals the actual count, before posting.
5. (optional) Select the Separate posting cycle required checkbox.

   Note: This option is incompatible with Service Central.
6. (optional) Select the Mark unposted transactions (see About marking unposted transactions) checkbox.
7. (optional) Select the View batch by user (see Limits on editing and deleting transactions) checkbox.
8. Click Save.
9. Go to Finance > Set up tables > Cash accounts to open the Cash accounts window.
10. Make an entry for all cash accounts.
11. Click Save.



Batch control

The following options govern batch control in iMIS:

No batch control – Specifies that no batch control is used. This is a good option for simple or low-volume systems.

Operator assigned batch numbers – Specifies that batch control is used and that data-entry operators can create their own batch numbers when needed. The batch number may be a combination of up to 15 alphanumeric characters.

Auto sequential batch numbers – Specifies that batch control is used and that iMIS automatically assigns batch numbers to new batches using a sequential numbering system.

Auto date batch numbers – Specifies that batch control is used and that iMIS automatically assigns batch numbers to new batches using a date-oriented technique. Multiple batches created on the same date are distinguished from each other with a sequential suffix attached to each new batch generated in a day. For example, 020515-1, 020515-2, and so forth.

> **Note:** Note: The following options are not displayed unless you enabled batch control by selecting one of the batch numbering options (Operator assigned batch numbers, Auto sequential batch numbers, or Auto date batch numbers).

Require balanced batches for posting

(Recommended) Specifies that unbalanced batches cannot be posted. For this option, iMIS considers a batch balanced when the following statements are true:

- The control amount is equal to the actual amount.
- The control count is equal to the actual count.

If either or both of the following statements are false, iMIS displays an error message, and does not post the batch.

> **Note:** Note: Hot posting (the default) reports transactions immediately.

Separate posting cycle required

Specifies that transactions are not hot posted. Most users should not enable this option, because it prevents iMIS from automatically posting and updating accounting events to AR/Cash. Instead, transactions are posted only when the batch is posted.

Only in very high volume situations should you consider giving up the hot posting convenience, which saves processing time and speeds data entry.

> **Note:** Note: This option is not compatible with Service Central.

Mark unposted transactions

When selected, unposted transactions are preceded by (U) in the Description field on the Transaction Ledger window.

> **Note:** Note: If the Separate Posting Cycle Required option is enabled, transactions are not displayed in the Transaction Ledger window until the batch is posted, so no transactions will be preceded by (U) if the Separate Posting Cycle Required option is enabled.

View batch by user

Hides batches created by others from users whose authorization level for AR/Cash is less than 8. When this option is not selected, displays batches created by others. Hidden batches include the following batches:

- Accrual billing batches
- Orders with the Create New Batch for Invoicing option enabled
- AVAIL_CREDIT batches
- Importer batches (Billing, AR/Cash, Orders)

Load batches from date

specifies a default date that is used to filter batches displayed in the manage batches window. users can override this filter.

Limits on editing and deleting transactions

When the View batch by user checkbox is selected, users can only edit or delete transactions contained in unposted batches that they create. If users attempt to edit or delete a transaction that was created by another user, a message instructs them to select a different transaction.

About marking unposted transactions

You must enable a batch control option and select the Mark unposted transactions checkbox on the AR/Cash Batch Control window before transactions can be marked as unposted.

If the Separate posting cycle required option is enabled, unposted transactions will not be displayed in the Transaction Ledger window.

An invoice will be visually marked as unposted with (U) if there is at least one transaction record linked to that invoice (a payment or an adjustment to that invoice) that meets all three of the following requirements:

- The transaction is linked to a batch.
- The batch has not been closed or posted (the batch has a status of Open or Ready on the Manage batches window).
- The transaction has not been exported through the General Ledger.

> **Note:** Note: Only future transactions are marked as unposted after the Mark unposted transactions option is selected.

> **Note:** Note: If the Separate posting cycle required option is enabled, unposted transactions will not show up in the Transaction Ledger window.

G/L Interface

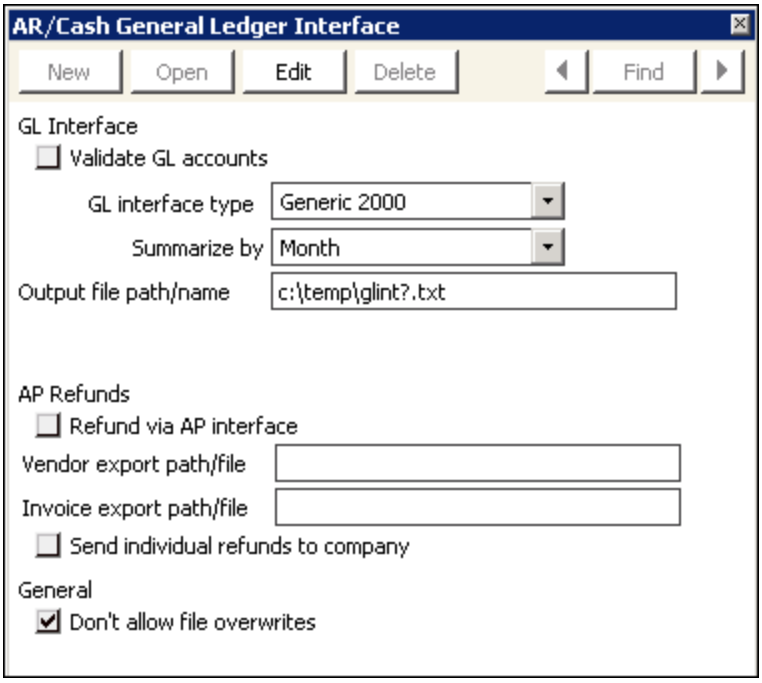
The AR/Cash General Ledger Interface window is used to validate general ledger accounts, configure the general ledger interface type, and configure how refunds for the accounts payable are exported.

To configure the GL interface

> **Note:** Note: These options apply only if you have purchased a license for the iMIS Financial Systems interface or AP interface.

The AR/Cash General Ledger Interface window lets you configure the iMIS GL and AP interfaces, which both require a license.

1. From the AR/Cash General Ledger Interface window, click Edit.
2. Select a general ledger accounting package from the GL interface type drop-down list.
3. Select a level of transaction detail from the Summarize by drop-down list.
4. Enter the file path and file name.
5. Enable the Refund via AP interface, Send individual refunds to company, and Don't allow file overwrites options if desired.
6. Click Save.



GL Interface

Validate GL Accounts – Enable the Validate GL Accounts option if you intend to maintain GL accounting details with true GL account numbers instead of iMIS-generated account numbers and require that the system verify that GL accounts entered throughout the system exist on the GL Accounts table. To integrate iMIS-generated transactions with an outside GL package, you must maintain true GL accounts.

iMIS can validate account numbers entered on the AR/Cash Default Accounts window and in all product code and related tables throughout iMIS.

> **Note:** Note: To define valid GL accounts, build a table (called GL_ACCOUNT) to include all available account numbers on the Lookup/validation tables window.

> **Note:** Note: The Import button on the Lookup/validation tables window lets you import your chart of accounts from your third-party GL package.

GL interface type – Select a third-party GL software option from this drop-down list. All current third-party GL software options are included on this drop-down list. Select the None option if you are not planning to use a third-party GL software package.

Summarize by – Select one of the following options from this drop-down list to determine the level of summary applied in the creation of the GL interface entries:

- Month – Summarizes all transactions for the entire month (or the date range requested in Create GL Journal, if less than a month) on a per GL account/pseudo-account basis. These entries are posted into a single journal entry in the GL Interface.
- Day – Within the requested date range, this posts a journal entry for each day that contains individual entries summarized per date per GL account/pseudo-account.
- Batch – Within the requested date range, this posts a journal entry for each batch that contains the batch number and a summary on a per GL account/pseudo-account basis.
- Detail – Within the requested date range, this posts a journal entry for each date, but summarizes only the Accounts Receivable entry. Although iMIS supports full detail, export

and import procedures can be time consuming. You can produce detail transaction reports directly in iMIS to support more summarized entries.

Output file path/name – Designating an Output file path/name allows the iMIS interface to automatically create an output file with this path and file name. See Using special characters in file path/name for information on using special characters in the file path/name.

If the Output file path/name field is left blank, the system prompts you to provide a valid path and file name when the interface is run. If you do not specify the path and file type for the export file in this field, you can only specify an Omnis print file with a .prn extension when the interface is run.

> **Note:** Note: iMIS creates the export file and flags the included transactions (so that these transactions are skipped in future interface operations).

If the Output file path/name entered is not correct (for example, the referenced directory does not exist), an error message will display and the export is aborted.

Conversion Program File Path/Name – This field specifies the conversion program that will be executed for any GL interface type that begins with generic (not case-sensitive). This field is only displayed for GL interface types that begin with generic.

AP Refunds

- Refund via AP interface – Enable this option if you want the iMIS AP interface to process refunds.
- Vendor export path/file – Contains the file/pathname for the vendor export file.
- Invoice export path/file – Contains the file/pathname for the invoice export file.
- Send individual refunds to company (applies only to refunds) – Enable this option if you want the refund checks that are issued for a non-company member to be issued in the name of the company rather than the individual (even when the Bill To ID is the individual).

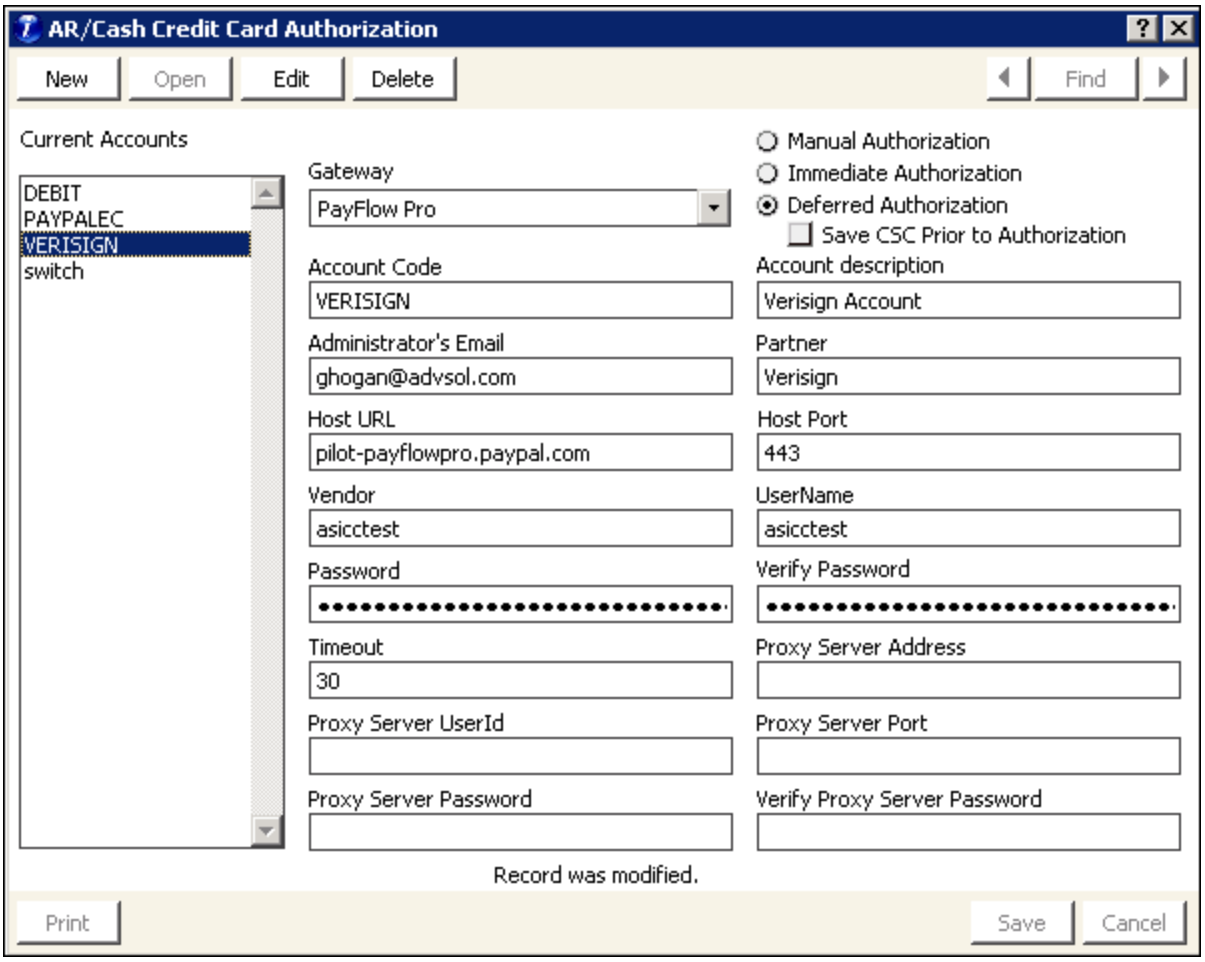
Note: (Solomon only) With this option enabled, the individual's name will be placed into the contact name field of the created Solomon vendor record. However, the Solomon vendor name will be set to the iMIS company name, and the refund invoice will therefore be created payable to the company's name, not the individual. If this option is not selected (disabled), the vendor name for the refund in Solomon will be set to the individual's name and the individual will receive the payment. This option has no impact on the processing or refunds for Bill To IDs where the member type is a company, in which case the vendor name is populated with the company name.

General

Don't allow file overwrites – Enable to prevent iMIS from running the next GL interface and creating duplicate files and file names. Enabling this option also protects your export files from being accidentally overwritten if you have not imported the data into your third-party GL package before the next exports are produced. This option is needed only if you designate fixed file names (export.asc). However, if your third-party GL package prompts you for or allows for a unique import path/file name at run time, use the ? symbol to archive exported files and prevent overwrites.

Credit Card Auth

The AR/Cash Credit Card Authorization window specifies authorization options for credit cards and European debit cards.



Current Accounts

Lists the currently defined card authorization accounts.

Gateway

Lists the authorization gateways supported by iMIS:

- TNSPay – authorizes international credit cards.
- Payflow Pro – authorizes domestic credit cards.
- Moneris – authorizes Canadian credit cards.
- Other – for European debit cards, enables storage of encrypted CSC values and unencrypted issue number and issue date values so that a custom gateway for deferred

authorization of European debit card transactions can be implemented.

- Custom – custom gateways you can write and install on your system.

  Authorization options

  Specifies the type of authorization that will be performed for all credit/debit card cash accounts that use this card authorization account.

- Manual Authorization – Disables automated authorization through a gateway. The payment information can be edited or deleted at any time until invoiced.
- Immediate Authorization (Payflow Pro and TNSPay gateways only) – Performs automated authorization through a gateway. Payment information can be edited or deleted the same day only. Because the Other gateway is not supported, immediate authorization cannot be used for European debit card transactions. The following authorization process is used:

1. Credit card payment is entered.
2. Credit card information is immediately sent for authorization.
3. Authorization is returned and transaction is saved for later capture.
4. Transaction is saved and completed.

- Deferred Authorization – Performs automated authorization through a gateway. Payment information can be edited or deleted until the transaction is captured. The following authorization process is used:

5. Credit/debit card payment is entered.
6. Transaction information is saved for later batch processing.
7. Transactions are periodically sent in a batch for authorization and capture.
8. Transactions in the batch are saved and completed.

   Save CSC Prior to Authorization

(only for Deferred Authorization) Saves the card security code (CSC) value in an encrypted format in the iMIS database, so that the CSC information can be sent with all other transaction information in the batch for deferred authorization.

If the associated Gateway is Payflow Pro or TNSPay, iMIS automatically deletes the saved CSC information after successful deferred authorization. If the associated gateway is Other, however, the custom gateway implemented by your AiSP for European debit card authorization is responsible for ensuring that the saved CSC information is deleted from your iMIS database.

Account Code

Specifies a short name for the account.

Account description

(optional) Specifies a description for the account.

Administrator's Email

(Payflow Pro and TNSPay gateways only) Specifies the email address of your iMIS administrator so that the gateway service can contact the administrator if necessary.

Partner

(Payflow Pro gateway only) Specifies the Payflow Pro partner name that was obtained when you created your account.

Host URL

(Payflow Pro gateway only) Specifies the web address of the Payflow Pro gateway.

Host Port

(Payflow Pro gateway only) Specifies the port number of the Payflow Pro gateway.

Vendor

(Payflow Pro and TNSPay gateways only) Specifies your Payflow Pro user name or your TNSPay merchant administration login (username) that was obtained when you created your account.

UserName

(Payflow Pro and TNSPay gateways only) Specifies your Payflow Pro user name or your TNSPay merchant ID that was obtained when you created your account.

Password, Verify Password

(Payflow Pro and TNSPay gateways only) Specifies your Payflow Pro password or your TNSPay merchant administration login password.

Timeout

(Payflow Pro gateway only) Specifies the gateway connection timeout value, in seconds. ASI recommends a timeout value of 30 seconds.

Proxy Server Address

(optional, Payflow Pro gateway only) Specifies the IP address of your organization's proxy server.

Proxy Server UserId

(optional, Payflow Pro gateway only) Specifies the user ID of your organization's proxy server.

Proxy Server Port

(optional, Payflow Pro gateway only) Specifies the port number of your organization's proxy server.

Proxy Server Password

(optional, Payflow Pro gateway only) Specifies the password required by your organization's proxy server.

Verify Proxy Server Password

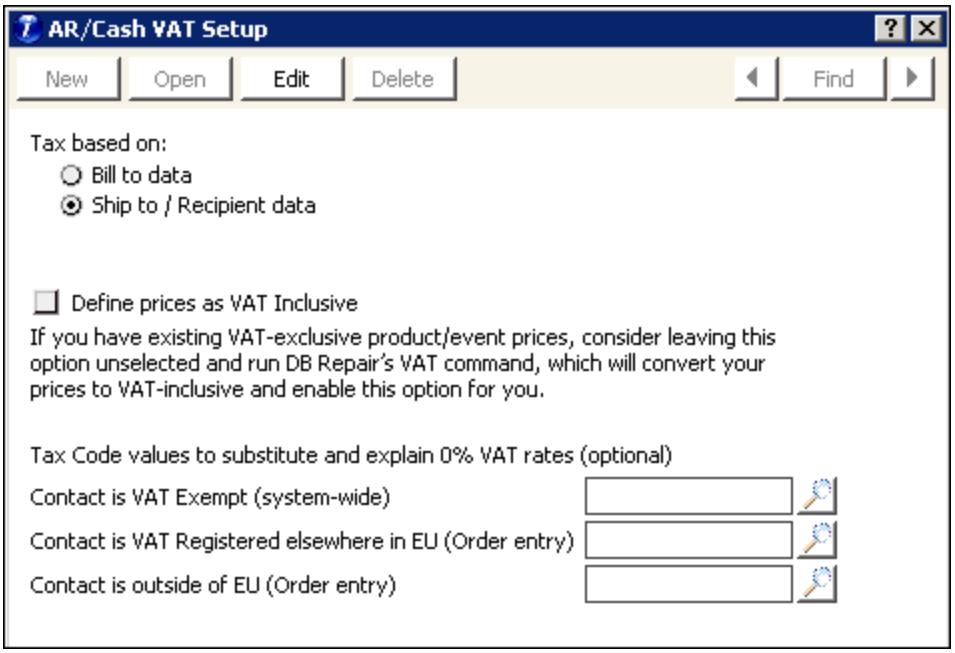
(optional, Payflow Pro gateway only) Specifies the password required by your organization's proxy server.

VAT Setup

Because organizations differ in how they need to charge VAT and handle pricing, iMIS gives you several global options that affect tax calculation and pricing of your order processing and events, across Desktop and the web views.

> **Note:** Tip: For technical discussions and examples of VAT issues and scenarios, sign in to iMIS Community: http://www.imiscommunity.com/value_added_taxation_vat.

If your default organization is configured for VAT, then you see a VAT Setup button.



- Tax based on: – lets you change the method for evaluating taxation.
- Bill to data – Applies VAT based on the Bill to contact's location and VAT tab settings.
- Ship to / Recipient data – (default) Applies VAT based on the Ship to location and the recipient's VAT tab settings. This supports point-of-sale requirements for which contacts have different Ship to addresses or make purchases intended for others, such as a manager registering an employee at a different site.

- Define prices as VAT Inclusive – (non-reversible) When enabled, all system-defined prices for taxable products, events, shipping, and handling are considered VAT Inclusive. This means that you can define products and registration fees with the gross (tax-included) amounts that you will advertise to your members and the public. Once you enable VAT-inclusive pricing, the option appears grayed out, because the setting is permanent.

  Tip: To upgrade quickly to VAT Inclusive pricing, back up your database and run the DB Maintenance standalone utility, whose VAT tab performs a one-time conversion of your VAT-exclusive product prices and registration fees to be VAT-inclusive. Once your data is converted, the command enables the Define prices as VAT Inclusive setting for you.

  Remaining VAT Exclusive: Because some organizations need to handle order and registration prices as VAT-exclusive (such as for B2B sales), iMIS allows you to remain VAT exclusive. In this mode, all of the prices you define or override for events, products, freight, and handling are net amounts that exclude the VAT component, and iMIS adds the VAT separately during product ordering and event registration in Desktop.

  Understanding VAT Exclusive:

- VAT-inclusive under the hood: Even though VAT-exclusive pricing appears the same as before, all order and registration pricing is now saved as VAT-inclusive. That is, being configured to remain VAT Exclusive just controls how you see and enter the data, converting your net amounts to and from the underlying VAT-inclusive amounts dynamically.
- Upgrading VAT-exclusive order data: Because iMIS now stores all order and order line amounts as VAT-inclusive, DB Upgrader takes care of updating all of your existing order data to be consistent with your new order data. Flags on the record ensure that the update occurs only once, and your original data is backed up (Orders_BAK and Order_Lines_BAK). This universal change to storing order amounts as VAT-inclusive is unrelated to whether you enable Define prices as VAT Inclusive.
- VAT-inclusive public prices: Even if you use VAT-exclusive pricing, the cart on your website will show your shoppers VAT-inclusive product prices and shipping/handling fees (if you enable taxing when defining add-on charges), to comply with sales tax rules. Order

data is always stored VAT-inclusive.

- Tax Code values to substitute and explain 0% VAT rates (optional) – If you populate them, these optional fields help you document the reason for VAT exemptions. The look-up lets you select from your existing zero-rated VAT tax codes to specify ones to globally substitute as "reason" codes for each of three situations: the contact is VAT Exempt, is registered in a different EU country, or is outside of the EU altogether. In the same way, Event VAT Rules also let you select a Substitute Tax Code for any rule that prevents taxation (see Defining VAT Rules for Events). These codes allow you to report and document tax exemptions as required.

Implementing Advanced PCI Compliance options

Implementing Advanced PCI Compliance options in iMIS is only one small part of your organization's journey. Completing the questionnaire is your first step toward certification: you then arrange for an Authorized Scanning Vendor to test each of your e-commerce IP addresses for security flaws, and after that you apply for certification. It can cost about $100 for scanning of one IP address and help in submitting the questionnaire.

The Payment Card Industry Self Assessment Questionnaire lets your organization determine if you meet mandated security levels for handling credit card transactions. The bulk of the questionnaire deals with firewalls and with clerical and network procedures. It focuses on the effects of software such as Microsoft Windows and SQL Server, as well as network authorizations and security. It does not apply to the vendors of the software you use, but the design of the software can affect what you must do to stay in compliance. Be sure to follow our guidelines for how to implement iMIS for optimal security.

> **Note:** Note: There are a number of versions of the Questionnaire. Customers that maintain the audit log (option 1, below), must use version SAQ-D. However, if you do not retain cardholder information (option 2) and if you meet other security requirements, including segmenting iMIS from less secure systems, you may be able to use the much shorter SAQ-C. Note that iMIS version 15.1.2 was validated as meeting PCI requirements and is listed on the PCI web site as such.

To set up Advanced PCI Compliance support

1. From the Configure accounting options window, select Edit.
2. Check Advanced PCI Compliance.

   Caution! If you bypass these options by putting payment card data into user-defined tables or by using custom encryption methods, you are responsible for PCI Compliance in the handling of that data.
3. Select one of the following options:

   Maintain audit log when cardholder information is accessed

   This option causes iMIS to perform audit logging each time a user accesses any card-holder information; no log entries exist for access that occurs before the option is enabled or after it is subsequently is disabled. It also logs attempts to access this information by outside processes, such as SQL scripts.

   Do not retain cardholder information (requires purge and disabling of deferred payments)

   This option prevents iMIS from storing any cardholder data. To use this option, you have to disable all CCAuth accounts configured for deferred authorization (or have all related Cash Accounts removed). If you need to support deferred payment card processing, you must use the other option.

   Note: If Do not retain cardholder information (requires purge and disabling of deferred payments) is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.
4. Click Save.
5. If you chose Do not retain cardholder information (requires purge and disabling of deferred payments, open DB Maintenance (Start > ASI > iMIS > Tools > iMIS DB Maintenance Utility) and complete the database preparation steps for your option on the PCI tab, below.

   DB Maintenance: PCI Compliance

Depending on which option you choose in AR/Cash Setup, implementing advanced PCI Compliance (see Implementing Advanced PCI Compliance options) support requires changes to your iMIS database:

- remove all existing cardholder information from your iMIS system that predates your new security measures
- reset the encryption keys (including removal of previous keys) and re-encrypt cardholder data each year, as required

DB Maintenance lets you complete these processes easily and reliably.

Precautions for using DB Maintenance

- Verify that you have a valid backup of your iMIS database before running DB Maintenance commands that modify the database.
- Ensure the database is protected from updates before modifying it, to prevent failures and data problems from changes occurring while entities are being reset/rebuilt/removed:

1. Have all users log out.
2. Stop webservers from updating the database, such as by stopping the AppPool in IIS.

- While users are logged in, you can safely run Analyze Database and Table Details; however, analyzing the database can affect performance.

To reset encryption keys and data

To maintain PCI compliance with stored cardholder data, you must complete all of the following steps:

1. Choose a time when the database can be offline for several hours. Re-encryption can take minutes or hours, depending on your data. Once started, re-encryption must not be stopped.
2. In DB Maintenance, open the PCI tab.
3. To start the purge, click Reset Encryption Key and Data.

A warning prompts you to confirm the process.

4. Allow the process to complete without interruption.

   Caution! You risk data corruption if you interrupt the process or close DB Maintenance, which appears unresponsive.

   The output of the process displays in the main window of the utility.

5. Click Remove Historical Encryption Keys, or, if postponing that purge, skip to the next step. If you do the purge later, be sure to recycle the application pool then, too.

   Caution! Once you remove previous keys, clicking on any encrypted links that have already been embedded in emails (such as create new account emails) will no longer work. The user will see the error "Your session has timed out. Please try your operation again".

6. Recycle the IIS Application Pool (iMISApp AppPool) for each application server that uses this database.

   To purge cardholder data

   > **Note:** Important: If you implement PCI Compliance (see "Implementing Advanced PCI Compliance options") with audit logging and later switch to storing no data, be aware that this purge routine leaves the existing audit log (PciAuditLog table) intact.

   Deferred transactions are lost in a purge, so you need to resolve deferred data and disable settings that allow it.

1. Find and change any gateway that is configured for Deferred Authorization:

1. From the Configure accounting options window, click Credit Card Auth.
2. Under Current Accounts, select the first gateway listed.
3. If it is set to Deferred Authorization, change it to Immediate Authorization or Manual Authorization.
4. Repeat for all other gateways.

2. Submit any deferred transactions that are pending:

1. Go to Continuum > Commerce and Customer Service Reports > Credit card reports.
2. Run Print Deferred Pre-authorization Report.
3. Run Submit Deferred Authorizations.

   Any deferred transaction remaining after the purge has no payment information, so it must be re-entered manually.

3. In DB Maintenance, open the PCI tab.
4. To start the purge, click Purge All Cardholder Information. A query runs and the Purge Payment Card Information window opens, reporting the number of records with card-holder information in each table that will be cleared by the purge.
5. If the report identifies no problems and you want to complete the purge, select Continue with Purge to clear the cardholder information from the database. The output of the process displays in the main window of the utility.

Using special characters in file path/name

Use two special characters, question mark (?) and number sign (#), in designated file names to have iMIS generate incremental and entity-specific file names when it creates export files.

Question mark symbol

Use the ? symbol to create file names that iMIS increments sequentially at each export. This value is stored in Counter.LAST_VALUE for Counter_name='GL Interface' and will continue to increment indefinitely.

For example, glint?.txt produces glint1.txt, glint2.txt, and so forth.

Number sign symbol

If you are using multiple entities and need separate export/import files generated for each entity, then use the substitution character # to insert the entity code into the generated file names.

For example, if you are exporting data for an entity called NFP (not-for-profit) and the file name designation is #glint.txt, the export file NFPglint.txt will be generated containing only the transactions that belong to the NFP entity.

The new data is not appended to the NFPglint.txt file each time you export data for this entity. The NFPglint.txt file is overwritten, unless you enable the Don't allow file over-writes option in the General Ledger Interface window.

? and #

These special characters can be combined in a single file name.

For example, #glint?.txt produces NFP export files NFPglint1.txt, NFPglint2.txt, and so on.

> **Note:** Note: There are no character limitations in iMIS for the file name. However, you should verify any limitations that may be imposed by your third-party GL package.

Set up tables

This section lists the different set up options for the Finance console:

- Products
- Terms
- Tax codes
- Cash accounts
- Payment method sets
- Due to/due from

Defining products

The following iMIS windows use the information on the Products window:

- Sales transactions – You must first define all sales-related detail items recorded in a sales transaction as products on the Products window.
- Enter and edit orders – As you enter sales line items, you must enter the product codes directly or use the standard lookup window to select a value.
- Credit memos – All adjustment-related line items recorded on the Credit memos window must reference a product code entered on the Products window.
- Debit memos – All adjustment-related line items recorded on the Debit memos window must reference a product code entered on the Products window.

To define product codes

1. From the Products window, click New.
2. Enter a Product Type, or click the lookup icon to select a value.
3. Enter the product Code. Special characters such as hyphens are not allowed.
4. Enter a Title that you want displayed on reports.
5. Enter a description of the product in the Desc. field.
6. Enter a Regular Price and a Non-Member Price.
7. Enter the G/L Acct, or click the lookup icon to select a value.
8. Enable the appropriate Taxable option if the product is subject to a sales tax.
9. Click Save.
10. (optional) Click Special Prices to open the Special Pricing window.
11. Click New.
12. In the Type field, enter a Customer Type or Customer Type/category combination.
13. In the Description field, enter a name for the special pricing rule.
14. Select a pricing option. For example, select Numeric Table for quantity pricing.

15. In the Source Field, enter the field whose value is the basis for determining the Special Price. For example, for quantity discounts, the ordered quantity is the determining field:

    Order_Lines.QUANTITY_ORDERED

    For each quantity discount pricing level, enter the following:

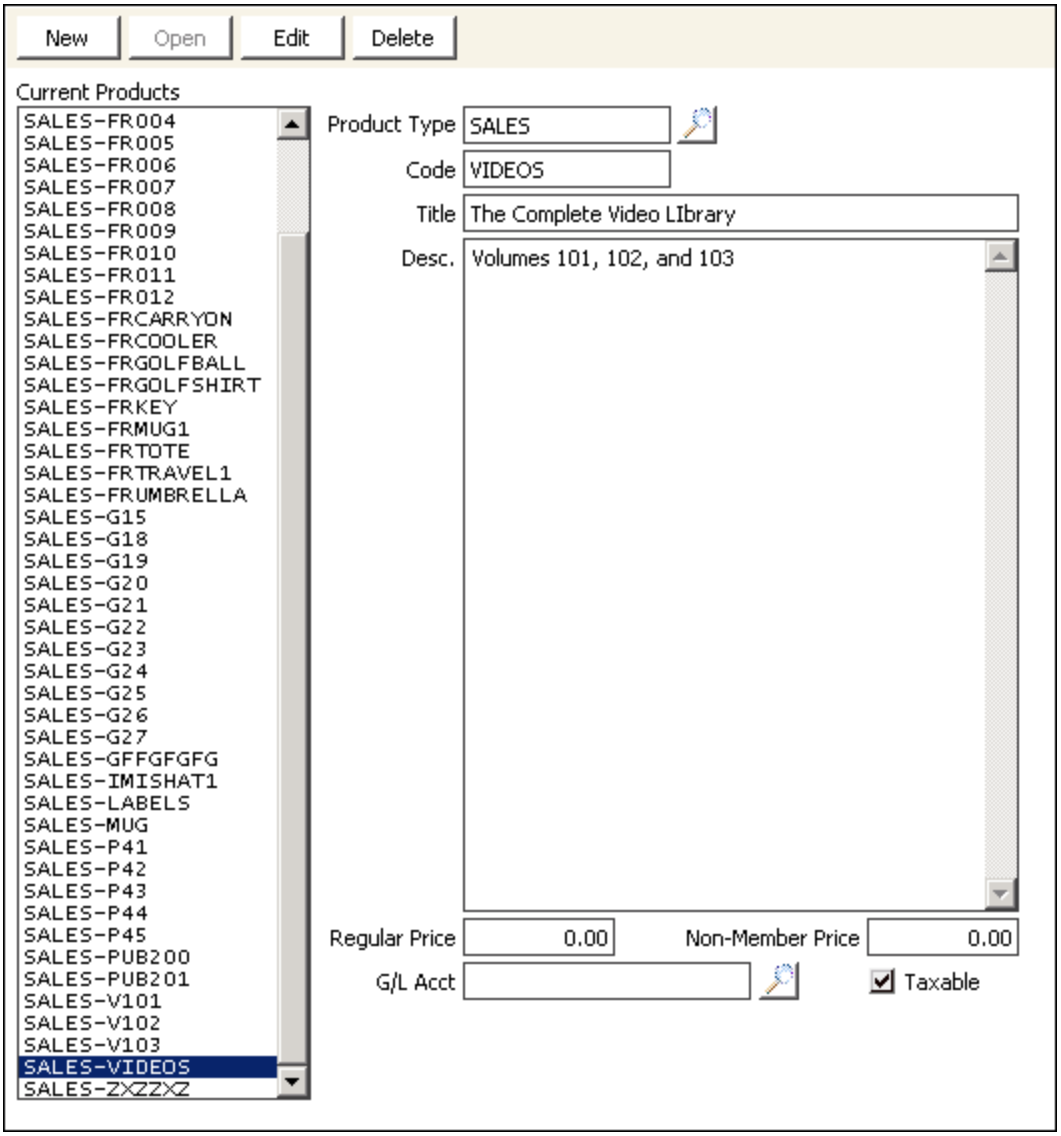
- Units/Code – The required quantity necessary to receive the quantity price break
- Base Amount – The extended amount of the initial quantity, for example, the value in the Units/Code field times the Amt/Add'l Unit (special unit price) = Base Amount
- Amt/Add'l Unit –The per unit special price amount

    The following is a calculation example to determine the special price (discount) if a customer orders a product in volume.

- Line 1 = $50 per unit
- Line 2 = $40 per unit, if the customer orders 10 or more
- Line 3 = $30 per unit, if the customer orders 25 or more

16. Click Save.

Products window



Finance > Options > Set up tables > Products

Current Products

All defined products are displayed in this drop-down list.

Product Type

Dictates which iMIS module relates to the product record. All AR window data entry products must share the common product type of SALES. You can use the lookup icon and select a value.

Code

Assign a primary abbreviation or identification code to represent this product, sales, or adjustment item. There must be one product code for each billable product.

Title

Enter a longer descriptive title for the product or item type. When this product record is referenced on related data-entry windows or reports/inquiries, the product title appears next to the product code.

Desc.

(optional) Enter a note, description, or comment(s) that relates to the product.

Regular Price

Enter the main (default) unit price or the customer price that is automatically applied when you enter a sales line item for this product. You can override this default price while entering data.

Non-Member Price

If you charge a different price for non-members, enter that amount here so that the system can automatically apply the price when this item is purchased by anyone with a non-member status.

G/L Acct

Identifies the GL income account that is credited when entries are made for this product. You can use the lookup icon and select a value.

If you leave this field blank, iMIS records the income for this product in the default Income account you designated on the AR/Cash Default Accounts window.

It is not necessary to establish GL accounts on the product code tables if you are not using a GL interface and you are not relying on specific accounting reports from iMIS.

Taxable

Enable if the product is subject to sales tax.

Tax Code

(Full Order Entry only) Enter the state sales tax code or use the lookup icon and select a value.

Taxable (GST)

(Canadian Taxation only) Enable the Taxable (GST) option to apply Canadian GST taxation to the product.

Taxable (PST)

(Canadian Taxation only) Enable the Taxable (PST) option to apply Canadian PST taxation to the product.

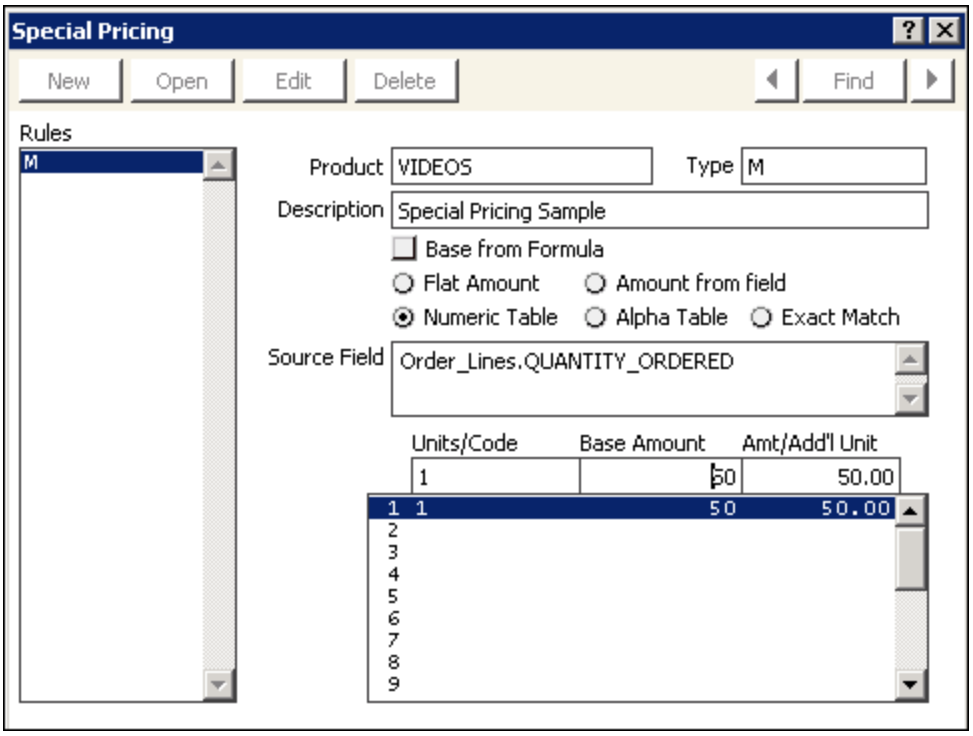
Print

Select to print information on all currently defined products. This information includes product type, product code, product title, and product price.

Special Prices

Opens the Special Pricing window where you can specify pricing based on the Customer Type and other optional categories. The most common use for Special Prices is to provide quantity discounts when someone orders a particular product.

Special Pricing window



Rules

A list of defined special pricing rules.

Product

Displays the product type that was selected on the Products window.

Type

Specifies the customer type or the customer type/optional category combination (customer type and category codes are separated by a forward (/) slash.)

To define special prices for a predefined category, open the Set up general look-up/validation window to check for the correct category. To create a new category, see Setting Up Customer Type Categories for Special Pricing.

Description

Enter a detailed description of the billing rule for the specified customer type. This field is for reference only and is not displayed on any bill or report.

Base from Formula

Enable when a formula is to be added to the base amount. This option is available only when the Numeric Table, Alpha Table, or Exact Match option is enabled.

Flat Amount

Use this setting for assigning customer type fees that vary by billing category or rates for non-customer type products whose fees vary by customer type. If you select this option, enter a Base Amount value.

Amount from field

Use this setting to reference an exact rate or to enter a formula that calculates a rate based upon a field. If you select this option, enter
a user-defined field in the Source Field. For example, Name_All.ACTIVITY_FEE, or an SQL calculation that references such fields.

Numeric Table

Use this setting to vary rates according to numeric values. You can establish sliding rates based on income/volume, or rates based on length of certification. This option supports a maximum of 20 rows and prompts you to enter numeric values (units/code) and rates (base amount) that serve as starting levels for applying pricing guidelines. An optional additional per-unit charge can be entered in the Amt/Add'l Unit field.

Alpha Table

This field prompts you to complete a table of alphanumeric values. Like the Numeric Table option, this option looks for a range rather than an exact match. Use this setting to create sliding rates based on values matched to alphanumeric or character fields.

Exact Match

Use this field to restrict a character field to an exact match. Enter a setting to create exact rates based on values exactly matched to character fields.

Source Field

Specifies a user-defined field that references the value entered in the Amount from field field. This option is available only when the Amount from field, Numeric Table, Alpha Table, or Exact Match option is enabled.

Units/Code

Specifies the numeric values that serve as starting levels for applying pricing guidelines. This option is available only when the Numeric Table, Alpha Table, or Exact Match option is enabled.

Base Amount

Specifies a rate that serve as a starting level for applying pricing guidelines. This option is available only when the Flat Amount, Numeric Table, Alpha Table, or Exact Match option is enabled.

Amt/Add'l Unit

Specifies an optional additional per-unit charge. This option is available only when the Numeric Table option is enabled.

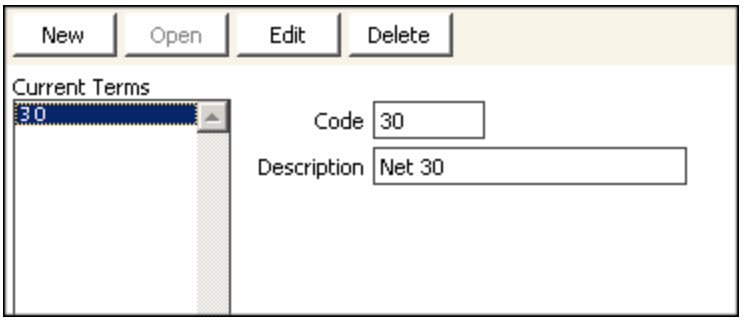
Defining payment terms

The Set up terms window allows you to define the various customer payment terms that your organization allows. Terms allow you to print an appropriate term's description on Order Entry invoices.

To set up the payment terms

1. From the Terms window, click New.
2. In the Code field, enter the code or abbreviation to create the term category.
3. In the Description field, enter the longer description that you want to see printed on invoices for the term category (for example, Net 30).
4. Click Save.

Terms window



Finance > Options > Set up tables > Terms

Current Terms

This list displays the currently defined terms.

Code

This field specifies the code for the terms.

Description

This field contains a description of the terms.

Setting up tax codes

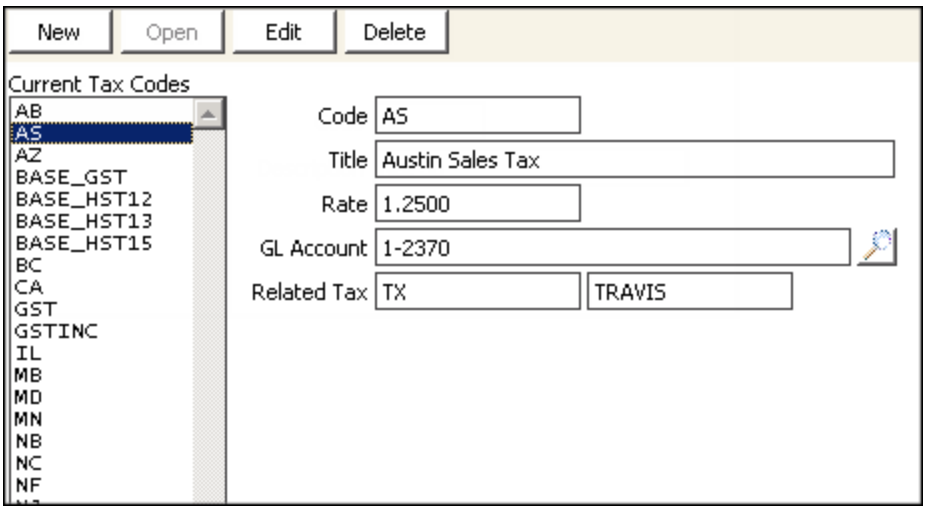
The Tax codes window lets you record and use tax information that applies to your product orders.

To enter a new tax code

1. From the Tax codes window, click New.
2. In the Code field, enter the abbreviation you want to assign to the tax category.
3. In the Title field, enter the full name assigned to the tax.
4. In the Rate field, enter the percentage rate assigned to the tax.
5. In the GL Account field, enter the GL account number assigned to the tax, or click the lookup icon to select a value.

6. In the Related Tax field, enter the codes for any other taxes you want to relate to the tax, such as a city or county tax code.
7. Click Save.

Tax codes window



Finance > Options > Set up tables > Tax codes

Current Tax Codes

This list displays the currently defined tax codes.

Code

Enter the abbreviation you want to assign to the tax category.

Title

Enter the full name to assign to the tax code. This description helps users select from the available taxes using the look-up function.

Rate

Enter the percentage rate assigned to the tax.

GL Account

Enter the general ledger account number assigned to the tax code, or use the lookup icon to select a value.

If you leave this field blank, iMIS records this entry in the Sales Tax account that you designated on the AR/Cash Default Accounts window.

Related Tax

These fields allow you to use multiple additional Tax Authority codes.

Enter the codes for any other taxes you want to relate to the tax code. As shown on the previous Tax codes window, a city tax may always be associated with a county and a state tax. These tax codes must always be set up in distinct accounts so that the taxes can be tracked separately but calculated for the customer as a single amount.

Defining cash accounts

Use the Cash accounts window to define the cash accounts where you will record cash deposits and credit and debit card deposits.

It is necessary to create entries on the Cash accounts window under the following circumstances:

- If you accept and process credit/debit card receipts, you must create a cash account code to represent each credit/debit card type, along with the cash account where the card receipts should be posted if the card type is unique.
- If you are using batch control, a cash account is required to represent each checking account (even if you have only a single account).
- If you accept in-kind or asset fundraising donations you must set up a cash account for each GL account to which these gifts will be posted.

Defining credit/debit card codes and accounts

In order to process credit/debit card receipts, you must define the card codes on the Cash accounts window. This setup allows each card to have a unique bank account, for example, VISA=1020, AMEX=1030, DISC=1040 and so forth. This setup also allows card payments to override the batch bank account, because each card has its own bank account.

If the batch control option is not enabled, assigning a GL account number to a credit/debit card code takes precedence over the cash account selected for the batch and the default cash account number.

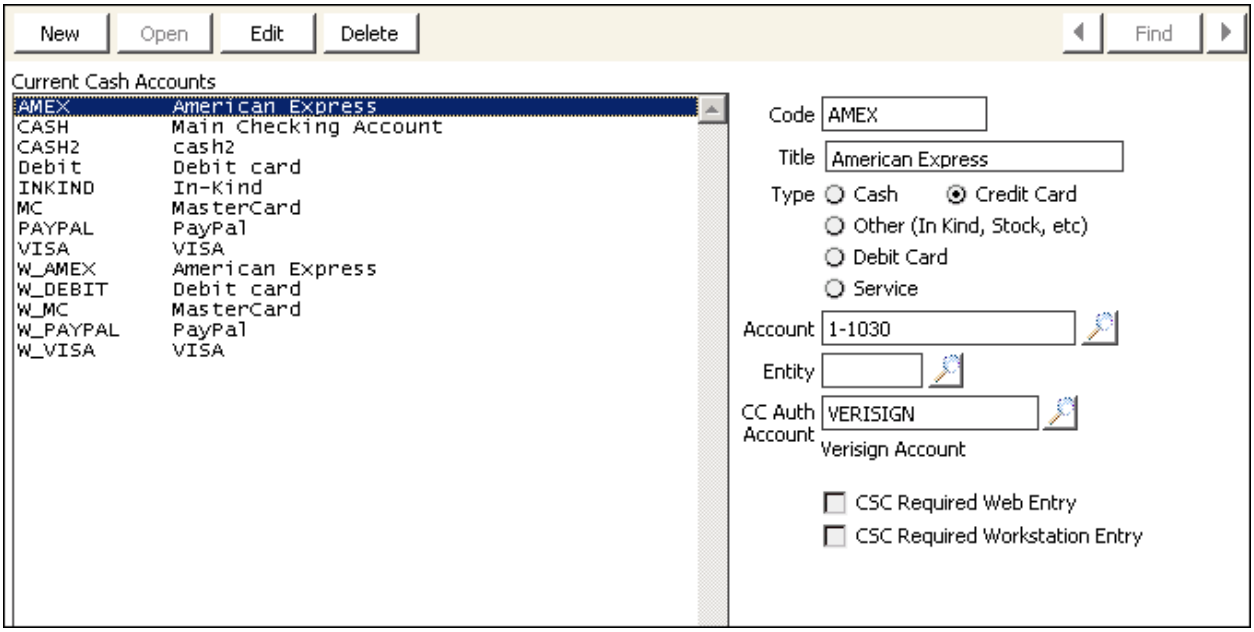
When you use batch control to define credit/debit card code accounts, you can enter both cash transactions and credit/debit card transactions, creating a mixed batch. iMIS splits and posts the payment transactions accordingly.

To define cash and credit/debit card codes and accounts

1. From the Cash accounts window, click New.
2. In the Code field, enter the abbreviation you want to assign to the cash account or credit/debit card type you are creating.

   Note: You can use any code you prefer for a credit/debit card, and you can specify a different entity for each credit/debit card code. For example, you can assign VISA1 to GEN, and VISA2 to BLDG.
3. In the Title field, enter the full name you want to assign to the account.
4. Under Type, select Cash, Credit Card, Other, Debit Card, or Service.
5. In the Account field, enter the GL chart of accounts number for the cash account assigned to this table entry, or click the lookup icon to select a value.
6. (optional) For multiple entities, enter the Entity code, or click the lookup icon to select a value.
7. For the Service option, select a gateway such as PayPal Express.
8. Click Save.

Cash accounts window



Finance > Options > Set up tables > Cash accounts

Current Cash Accounts

This column lists all currently defined cash accounts for recording cash deposits.

Code

Specifies the abbreviation assigned to the currently selected cash account or credit card type.

Title

Specifies the full name assigned to the cash account. This description helps users select from the available cash accounts in a lookup window.

Type

Specifies one of the following account types:

- Cash – Specifies that the account is a checking or other deposit account (other than a credit card account).
- Credit Card – Specifies that the account is a credit card account.

- Other – Specifies that the account is a non-cash asset account.
- Debit Card – Specifies that the account is a European debit card account.
- Service – Specifies that the account is a third-party payment service, such as PayPal Express.

Account

Specifies the GL chart of accounts number for the cash account.

Entity

(Only required for multiple entities (see "Multiple Entity Processing")) Specifies the code for the entity that owns this cash account.

> **Note:** Note: The following items are available when an item is selected in the Current Cash Accounts list only.

CC Auth Account

Specifies the Account Code of the credit card authorization account as set up in the AR/Cash Credit Card Authorization window.

CSC Required Web Entry

Requires entry of a card's CSC number in payment entry windows in the web-based views of iMIS. When cleared, card information can be submitted without the CSC number in web payment entry windows. This must be set up for each individual credit card or debit card account.

CSC Required Workstation Entry

Requires entry of a card's CSC number in payment entry windows in iMIS. When cleared, card information can be submitted without the CSC number in payment entry windows in iMIS.

Display Issue Number

Displays a field for entering a European debit card's issue number in payment entry windows. When cleared, the Issue Number field is not displayed in payment entry windows.

Display Issue Date

Displays a field for entering a European debit card's issue date in payment entry windows. When cleared, the Issue Date field is not displayed in payment entry windows.

Setting up payment method sets

Payment method sets are collections of allowable payment methods for a particular context. For example, you might want to present only a few payment methods to online users for a specific website, such as a special event website you have created, but allow the full array of payment methods for a staff user on your staff website. After defining your payment method set, you can easily tailor the payment methods associated with the set.

Payment methods defined here are surfaced in the Payment Creator content item.

System payment method sets

Two system payment method sets are pre-defined in iMIS, Public and Staff. Public is the default payment method set for non-staff users, and Staff is the default for staff users.

These system sets cannot be deleted, and their name and context cannot be changed. However, the payment methods included in these sets can be modified.

To set up and edit payment method sets

Use the Payment method sets window to define payment method sets.

1. From the Payment method sets window, click Add or Edit.

   Note: Note: You will only see the add button if a website has been created in RiSE (see Creating websites).

2. Enter the information for this payment method set:

- Enter the Method set name and Description.
- Select a Specific context (for example, an existing website). The context determines when users are presented with this set of payment methods.

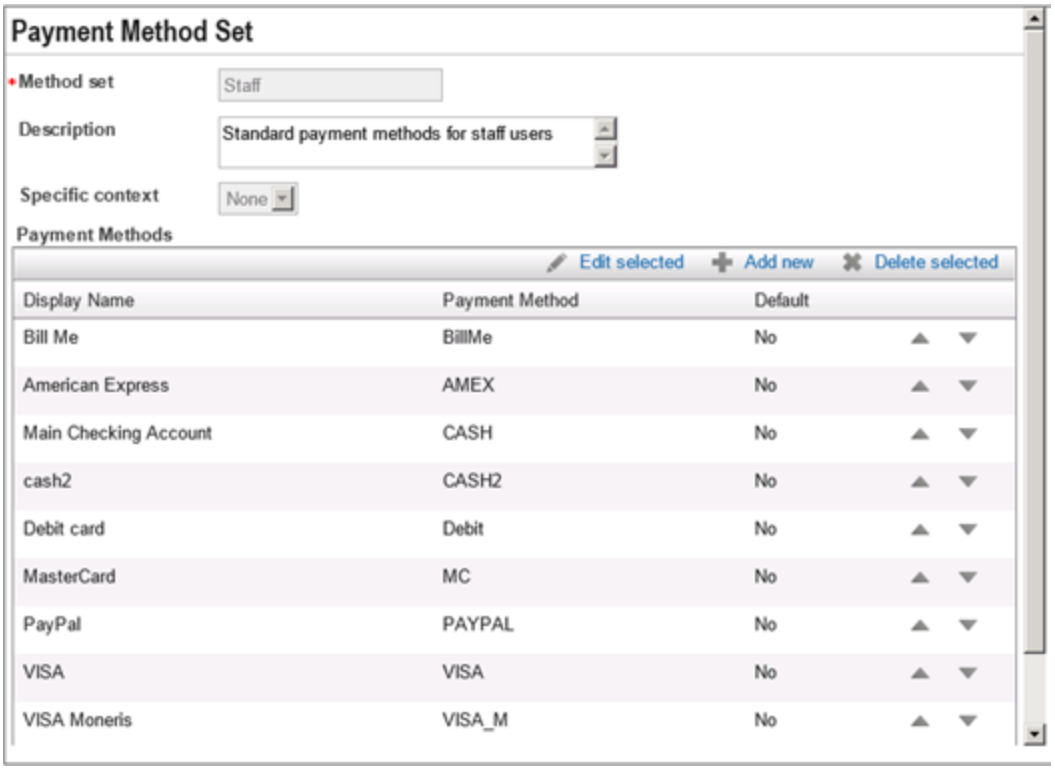
3. Click Save.
4. Click Add new (or Edit selected) to add or update a payment method.

- (optional) Enter the Display Name that is presented to users. If you do not enter a Display Name, the Payment Method name appears to users.
- Select the Payment Method. Available payment methods are determined by the cash accounts defined in iMIS.
- Each payment method may only be used one time per payment method set.
- INKIND or SERVICE cash accounts other than PayPal are not available as payment methods.
- (optional) Default – Select this option to display this payment method as the default choice within the set.

5. You can use the up and down arrows to adjust the order of the payment methods.
6. Click Save to save the payment method set.

> **Note:** Important: For WCM content item sites: in order to display as a payment option at checkout, Cash Accounts created after iMIS version 20.0.7.1298 require an additional setup to the Payment Method Set.

Payment method set window



Settings > Commerce > Payment method sets

Method set

Specifies the full name assigned to the payment method set.

Description

Can be used to describe the type of payment method and user types.

Specific context

The specific context (or website) associated with the method set.

Display Name

The payment method name users will see.

Payment Method

The payment method you are adding to the set.

Default

If selected, the payment method that will be at the top of the list to users.

> **Note:** Note: You will only see the add button if a website has been created in RiSE (see Creating websites).

Setting up due to/due from accounts

If you use one entity's cash account to receive income meant for a different entity, you must set up DueTo/DueFrom accounts to ensure that your accounting records are correct.

Correcting balancing problems

iMIS generates DueTo/DueFrom entries for configured entity relationships when transactions are sent to the general ledger. These entries correct balancing problems created by entities receiving cash for which they do not have matching income, and entities receiving income for which they do not have matching cash.

Due to owner entity

This liability entry is created for the entity that owns the cash account that received the money but is not entitled to the income. This liability entry offsets the cash the entity received but did not own.

Due from cash entity

This receivable entry is created for the entity that owns the income to make up for the asset it is entitled to but did not receive.

To set up Due To/Due From accounts

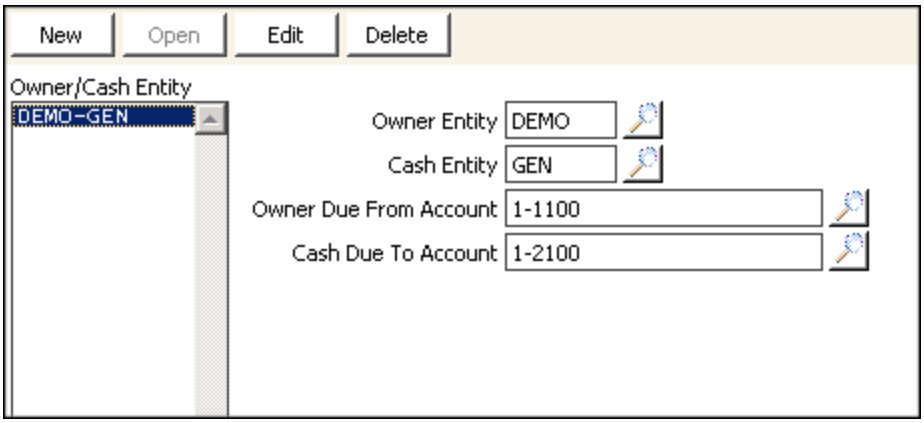
Due To/Due From accounts are set up in the Due to/due from window. Create one entry for each multiple-entity combination where cash will be received by one entity for a transaction that belongs to a different entity.

The Due to/due from window enables you to define the Due To/Due From relationships between your general ledger accounts.

In this window, you can set up entries for each multiple-entity combination in which cash is received by one entity for transactions that belong to another entity.

1. From the Due to/due from window, click New.
2. Enter the Org Code for the entity that owns the income or accounts receivable in the Owner Entity field, or use the lookup icon to select a value.
3. Enter the Org Code for the entity that received the cash in the Cash Entity field, or use the lookup icon to select a value.
4. In the Owner Due From Account field, enter the GL account in which to record the inter-company receivable (debit) transaction for the entity that owns the income, or use the lookup icon to select a value.
5. In the Cash Due To Account field, enter the GL account in which to record the inter-company payable (credit) transaction for the entity in which the cash account resides (cash entity), or use the lookup icon to select a value.
6. Click Save.

Due to/due from window



Finance > Options > Set up tables > Due to/due from

Owner/Cash Entity

Lists Due To/Due From accounts specifying the source entity and the destination entity.

Owner Entity

Specifies the entity that owns the income.

Cash Entity

Specifies the entity that owns the cash account for the cash received.

Owner Due From Account

Specifies the receivables account number for the entity that owns the income (debit).

Cash Due To Account

Specifies the liability account number for the entity that received the cash (credit).

Financial Importers

Orders Importer

iMIS Orders allows you to import third-party orders using the iMIS Orders Importer. The iMIS Orders Importer is designed to import and process order data en masse from external tab- or comma-delimited files. Importing orders prevents you from having to enter large amounts of order data manually.

> **Note:** Caution! Only products with an Active status can be imported. If an order line's product does not have an Active status, the Importer will not import the order line, and the order line will be inserted into an error log along with any other order line failures. No other order lines will be affected; the Importer will process the order's remaining order lines.

Using the iMIS Orders Importer

To import and process order data from external files, you must be licensed for the iMIS Orders Importer.

Formatting import data

Order data is imported in the form of tab- or comma-delimited files, with various types of records allowed in a single stream.

Individual orders are defined by an order header record (OH) and its subordinate records. Subordinate record types include order address (OA), order payment (OP), and order line (OL). If you are using batch control, a batch header record (BH) can be used to create a new batch.

All subordinate records must follow the order header record for individual orders. For an imported order to be valid, you must define an order header record and at least one order line record. Order payment and order address records are optional but, if they are used, they must be placed between the order header and order line records.

Batch Header Record (BH)

If you are going to use a BH record to create a new batch, the BH record must be the first record in the import file.

1	Record Type	BH	Use a batch header record to create a new batch during the import process. If batch control is not enabled, the BH record is not needed. If a batch is already open in iMIS at the time of import, a BH record is not needed.
2	Batch Number	Char (10) Uppercase	
3	Batch Date	Date	Date of batch
4	Batch Description	Char (60)	
5	Control Count	Numeric	Optional field
6	Control Amount	Money	Total amount of the batch payments
7	Cash Account Code	Char (10) Uppercase	Code assigned through the Set up cash accounts window (from AR/Cash, select Set up tables > Cash accounts); indicates the cash account where the funds are deposited.

Order Header Record (OH)

1	Record Type	OH	Required - Always OH

2	Batch Number	Char (10) Uppercase	If batch control is disabled in AR/Cash, the batch number field is ignored, and the current batch is cleared. If batch control is enabled, a batch number starting with an asterisk (*) is inserted automatically and becomes the current batch for subsequent transactions. If the batch already exists and is open, it becomes the current batch. If this field contains only an asterisk (*), the batch is inserted automatically using a system-assigned identifier. If an 'IMPORT' cash account is set up, the following also is true: • Batch entity = IMPORT entity • Batch cash account = IMPORT • Batch GL account = IMPORT GL account If an 'IMPORT' cash account is not set up, the following is true: • Batch entity = Default system entity • Batch cash account = empty • Batch GL account = Default system entity If the Batch Number field is left empty, the current batch is used. Batch numbers that are not prefixed with an asterisk (*) must already exist in the iMIS database. A BH record placed anywhere before the OH record in the input stream may be used to create the

			batch.
3	Order Number	Float	It is recommended that this field be left blank or contain an asterisk (*), which auto-assigns an identifier. If an order number is specified, the order will be rejected if the order number already exists in the iMIS database.
4	Order Type	Char (10) Uppercase	Required: Must be a valid order type as defined on the Set up order types window.
5	Order Date	Datetime	Optional: If not used, the system or batch date will be the order date.
6	Bill to Id	Char (10)	Required: Must be a valid iMIS Customer ID.
7	Ship to ID	Char (10)	Optional: If not used, the 'Ship to' ID will be the same as the 'Bill to' ID. If used, must be a valid iMIS Customer ID. Use an asterisk (*) to create new customer records. If an asterisk is used, the OA record is required.
8	Invoice Number	Int	Optional: Valid for credit and/or debit Order Types only. This field is ignored for all other Order Types.
9	Number Lines	Int	Optional: If specified, this is verified against the number of order line records (OL) read from the import file.
10	Shipping Method	Char (10)	Optional: If specified, must be a valid shipping method from the SHIP_METHOD general validation table. Default: Default Shipping Method defined on the Add-on Charges window.
11	Freight	Money	Optional: If specified, overrides Auto Freight Calculation.
12	Handling	Money	Optional: If specified, overrides Auto Handling Cal-

			culation.
13	Taxation Authority	Char (15)	Optional: If specified, overrides Taxation Authority.
14	Terms Code	Char (5) Uppercase	Optional: If specified, must be a valid terms code from the Terms Table and will override the Terms Code.
15	Source Code	Char (10) Uppercase	Optional: If specified, must be a valid source code from the SOURCE_CODE general validation table and will override the FSI default.
16	Salesperson	Char (15)	Optional
17	Priority	Int	Optional
18	Discount Rate	Numeric	Optional: If specified, use a whole number for the discount rate percentage (no decimals or fractions).
19	Customer Reference	Char (40)	Optional: If specified, value will display in the Purchase Order field.
20	Auto Calc Freight	Bit	Optional: Only used to turn the option OFF.
21	Auto Calc Handling	Bit	Optional: Only used to turn the option OFF.
22	Auto Calc Restocking	Bit	Optional: Only used to turn the option OFF.
23	Notes	Char (32000)	Optional

Order Address Record (OA)

An OA record is required if the 'Ship to' ID is being created by the import file. Otherwise, you can use an OA record to override the 'Ship to' Address information on an order.

An OA record must follow the applicable OH record immediately. Fields that are not specified in the OA record are populated from the 'Ship to' customer's address records.

Note: Note: A single space placed in an OA field blanks out that field on an order.

1	Record Type	OA	Required: Always OA
2	Title	Char (80)	Optional
3	Company	Char (80)	Optional
4	Prefix	Char (10)	Optional
5	First Name	Char (20)	Optional
6	Middle Name	Char (20)	Optional
7	Last Name	Char (30)	Optional
8	Suffix	Char (10)	Optional
9	Address 1	Char (40)	Optional
10	Address 2	Char (40)	Optional
11	Address 3	Char (40)	Optional
12	City	Char (20)	Optional
13	State/Province	Char (15)	Optional
14	Zip	Char (10)	Optional
15	Country	Char (25)	Optional
16	Phone	Char (25)	Optional
17	Fax	Char (25)	Optional

Order Payment Record (OP)

You cannot make multiple payments when using the Orders Importer.

1	Record Type	OP	Required: Always OP
2	Amount	Money	Required
3	Check Number or Credit Card	Char (10) Uppercase	Required: If specifying a Credit Card, the credit card must be a valid credit card type from the Cash

	Type		Account table.
4	Credit Card Number	Char (25)	Required if using a credit card. Allowable length varies by credit card.
5	CC Expiration Date	Char (10)	Required if using a credit card. Format is MM/YY.
6	Credit Card Holder	Char (30)	Required if using a credit card.
7	Credit Card Authorization Code	Char (10)	Optional

Order Line Record (OL)

Add OL records in the order in which you want them to display in the transaction field. The total number of order lines following an OH record is verified against the number of lines specified in the header.

1	Record Type	OL	Required: Always OL
2	Product Code	Char (31)	Optional: If not used, the Description becomes a required field. If specified, must exist in the Product table.
3	Product Description	Char (225)	Required if product code is left blank. Optional if product code is used. Used to override the product description for this order.
4	Quantity Ordered	Numeric	Optional
5	Unit Price	Money	Optional: Used to override the unit price in the Product table.

6	Taxable	Boolean	Optional: Used to override the product taxation status.
7	Commission Rate	Numeric	Optional: Used to override the commission rate contained in the Product table. (Do not express the commission rate percentage as a decimal or fraction. Use a whole number.)
8	Discount	Numeric	Optional: Used to enter product-level discounts. Product-level discounts override order-level discounts for product line-items.
9	Location	Char (10)	Optional: Used to enter a warehouse location when using multiple warehouses.
10	Bin	Char (10)	Optional: Used to enter a storage bin within a warehouse.
11	UF_1	Char (30)	Optional: Used to enter and define specific order information for products.
12	UF_2		
13	UF_3		
14	UF_4		

Importing orders

Order data is imported in the form of tab- or comma-delimited files. Before using the Orders Importer to import your files, be sure to back up your iMIS database. If your import fails, you can restore your original data from the backup copy; otherwise, you must manually delete each transaction in the imported batch.

When importing orders, you need to be aware of the following:

Product status codes

Only products with an Active status can be imported. If an order line's product does not have an Active status, the Importer will not import the order line, and the order line will be

inserted into an error log along with any other order line failures. No other order lines will be affected; the Importer will process the order's remaining order lines.

Payments

The iMIS Orders Importer does not support entering multiple payments. Only single payments can be imported.

Freight charges

If you want freight charges to calculate automatically for an imported order, you must enable the Automatic Calculation of Freight Charge and Freight by Weight options on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges). The Orders Importer does not support the Freight by Total Value Ordered or Freight by Total Quantity Ordered options.

Multiple warehouses

The iMIS Orders Importer supports Multi-Warehouses when the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

If the Enable Multi-Warehouses option is disabled, the Importer will ignore any warehouse location entered when an order is imported. The Importer then determines whether the product is a stock item:

- Product is not a stock item - Order_Lines.LOCATION is left blank.
- Product is a stock item - Order_Lines.LOCATION is populated with Default.

If the Enable Multi-Warehouses option is enabled, the Importer first verifies whether the product is a stock item:

- Product is not a stock item - Order_Lines.LOCATION is left blank.
- Product is a stock item - The Importer verifies whether Order_Lines.LOCATION is populated:

- Order_Lines.LOCATION is not populated - The Importer populates Order_Lines.LOCATION with the Default Warehouse defined on the Inventory System Setup window.
- Order_Lines.LOCATION is populated - The Importer uses the defined warehouse location. If the defined warehouse location does not have sufficient products in inventory, the import will fail, and an error message will be generated.

To import orders

Only products with an Active status can be imported.

1. Create the file(s) that you want to import in either a tab- or comma-delimited file format. After creating a file, you can import it into iMIS. For more information, refer to Formatting import data.
2. From AR/Cash, select Enter and edit transactions > Import transactions to open the Select import file window.
3. Find and select the tab- or comma-delimited file that you want to import.
4. Click Open. A system message will indicate that the transactions are processing.
5. If there are any problems while importing the file, an Order Import Error Report will print:

- A Warning message indicates that a problem exists with an order but that the file was still imported.
- A Fatal Error message indicates that the file was not imported. If an import does fail, check the import file for stray spaces, missing tabs, or other errors.

Viewing imported orders

You have several options when viewing imported orders. You can view them in the Enter and edit orders window just as with orders entered manually, or you can view them in reports.

If you want to edit an imported order, you will need to open the order in the Enter and edit orders window.

If you want to view your imported orders in reports, whether or not you enable batch control when importing orders determines which reports you use:

- Batch Control Disabled - If batch control is not enabled, you can view the imported orders on the Order Detail Report (from Orders, select Generate reports, select Order Status, select Order Detail Report, click Run, select the date range, and click OK).
- Batch Control Enabled - If batch control is enabled, you can view the imported orders on the following reports:
- Order Detail Report by Batch report (from Orders, select Generate reports, select Order Status, select Order Detail Report by Batch, click Run, select the batch, and click OK)
- Batch Transaction Listing report (from AR/Cash, select Manage batches, select the open import batch, and click Print Selected) - Lists the batch's prepaid orders
- Batch Posting Listing report (from AR/Cash, select Manage batches, select the open import batch, and click Post Selected)

AR Payment Importer

The AR Importer provides you with the ability to import financial transactions into iMIS, also referred to as “lockbox processing.” The AR Importer is designed to import and process mass AR payment data from an external import file, allowing you to avoid entering this data manually, transaction by transaction. AR Importer helps you if your AR payments are received and recorded by an outside organization, such as a bank (lockbox) or an affiliated association, if this organization can supply the payment data in a usable electronic form.

> **Note:** Note: This module requires that you use the batch control feature for processing financial transactions.

This module requires at least two data elements to be resident in your import files: the customer ID (either the primary ID or the Major Key of each customer who has paid), and the payment amount. For example, if you will be receiving data from an affiliated organization, such as the national or state association, and the receiving organization does not

know the customer ID, you can use an organization-wide common identifier (such as a certificate number). You must maintain this common identifier in the Major Key field.

In addition to the customer ID (primary ID or Major Key) and payment amount, the invoice number is also required if the Cash Application Auto Apply option is not enabled (from AR/Cash, select Set up module).

The benefits of using this interface instead of simply importing the data include the following:

- Provides a single interface for iMIS AR payment transactions
- Uses the payment records to create AR payment transactions, which debit cash and credit income or deferred income
- Automatically applies each customer payment record amount to that customer's open AR balances until those balances are closed
- Any residual payment amount creates open credit balances, which you can refund or apply to future sales

The payment data that is imported will only be applied to a line item that already exists on the customer AR/Cash tab and has an outstanding positive balance. Importing payment data will not create new line items or apply an amount against a line item that has a zero or negative balance. If the imported payment exceeds the balance, an overpayment will be applied to the line item. If the line item does not exist, an open AR credit invoice will be created for the payment amount.

Using iMIS AR Importer

To implement the AR Importer:

1. Make sure you are licensed for AR Importer.
2. Format AR data for import.
3. Perform the import.
4. Verify the import.

To enable the iMIS AR Importer module

As with all iMIS modules, you must have this system enabled on the iMIS System Setup level. If necessary, open the System Setup window (select File > System Setup) and edit your iMIS licensing to enable the iMIS AR Importer.

To format AR data for import

The transaction format is tab- or comma-delimited input, with various types of records allowed in a single stream. The import file must contain a single batch header record, followed by any number of cash payment records. There should not be any empty lines between record entries.

Note: Note: You can use the AR Importer for accrual dues billing.

The major transaction formats include the following:

All records

1	Record Type		Identifies the type of record
2	Batch Number	10 chars, all upper case	

Batch header

1	Record Type	BH	Always "BH"
2	Batch Number	10 chars, all upper case	
3	Batch Date	Date	Date of batch (mm/dd/yy)
4	Batch Description	60 chars	

5	Control Count	Numeric	Optional
6	Control Amount	Monetary	Total of the batch of payments
7	Cash Account Code	10 chars, all upper case	Code assigned through the Set up cash accounts window. Indicates the cash account into which the funds were deposited.

Cash payment record

1	Record Type	PAY	Always "PAY"
2	Batch Number	10 chars, all upper case	Optional. If blank, defaults to batch header's batch number.
3	System	AR	
4	Customer ID	10 chars, customer ID	Can substitute with Major Key, if prefixed with * (asterisk)
5	Date	Date	Optional. If blank, defaults to batch header date.
6	Invoice	Alphanumeric	The invoice number. This field is required if the Auto Apply option is not enabled in the AR/Cash Set up module window.
7	Amount	Individual payment amount	Total amount of the check or credit card payment. Do not enter a $ (dollar sign).
8	Check/CCType	Check number or credit card type	Optional
9	CCNumber	Credit card number	Optional
10	CCExp	Credit card	Optional

		expiration date	
11	Name on CC	Name on credit card	Optional
12	CCAuthorize	Credit card authorization code	Optional
13	Name	60 chars for audit trail	Optional but important. This value is printed on the transaction report to identify the customer.
14	Comment	255 chars	Optional but important. This value is printed on the transaction report and related inquiries to explain the transaction, such as "Dues Payment" or "Subscription Payment".

Example AR Import File

In the following example import file, one cash payment record follows the batch header line. Make sure that your cash account code exactly matches the setting on the AR/Cash Default Accounts window (from AR/Cash, select Set up module, and click Default Accounts).

BH,AR051502,05/15/02,AR Payments for 5/15/02,,265.00,CASH

PAY,,AR,105,05/15/02,,265.00,1234,,,,,Carol Hamilton,AR Payment

Note: Note: If your import fails, check your import file for stray spaces, missing tabs or commas, empty lines, proper date format, and so forth.

To review history before importing AR transactions

Before you introduce third-party transactions into your iMIS data file, view the relevant payment history for items such as AR payments for a sample customer (one who will be affected by the incoming data).

1. From Customers, select Manage customers to open the Manage customers window.
2. Click Find to select the customer record.
3. Select the AR/Cash tab to view the customer's AR/Cash information.
4. Make note of the contents of the AR/Cash tab. The imported transactions should be displayed in the AR/Cash tab after you perform the import procedure.

> **Note:** Note: You can review the outstanding AR balances by printing an A/R Statements report.

To perform the AR import

Before performing the import, it is very important that you make a current backup of your iMIS database. If your import is in error, you can restore your database from the backup copy; otherwise, you must manually delete each transaction in the imported batch.

> **Note:** Caution! Back up your database.

1. From AR/Cash, select Enter and edit transactions> Import transactions to open the Select import file window.
2. Select the tab- or comma-delimited file that you prepared and click Open.

   Note: If you receive an error saying the Cash Account Code does not exist, click OK and check that the name of the Cash Account code in your import file matches the one in your iMIS-system Cash Account Table on the Set up cash accounts window (from AR/Cash, select Set up tables > Cash accounts).
3. When the import is complete, from AR/Cash, select Manage batches to open the Manage batches window.

4. To review the results of the import, select the open import batch on the Manage batches window, and click Print Selected.
5. (optional) To finalize the imported transactions, select the open import batch on the Manage batches window, and click Post Selected.

To verify the AR import

To verify that your transactions have correctly posted to your iMIS data file, view the relevant AR/Cash information again for your sample customer.

1. From Customers, select Manage customers to open the Manage customers window.
2. Click Find to locate the customer's record.
3. Select the AR/Cash tab to view the customer's AR/Cash information. The new AR payment should be included.

To view open credits from an AR import

If the payment amount imported was larger than the total outstanding balance for a customer, the amount of the overpayment automatically creates an open credit. To view overpayments by an individual, perform the following steps:

1. From Customers, select Manage customers to open the Manage customers window.
2. Click Find and enter the customer ID, then click OK.
3. Select the AR/Cash tab to view the customer's AR/Cash information.
4. Double-click the entry with the overpayment to open the Transaction Ledger window.

iMIS

Fundraising Administration

Fundraising Event Management

In iMIS, when an individual registers for a fundraising event function, the registration fee for the function is counted as a donation. For example, if an event has two functions, a fundraising banquet with a $50 registration fee and a non-fundraising seminar with a $25 registration fee, $50 of the registration for both functions counts as a gift.

When you designate an event function as a fundraising function, you can also specify other fundraising information, such as campaign, appeal, and fair market value.

Defining an event as a fundraising event

Events are defined in the Events > Define an event window (see "Define an event - event details window"). Procedures for defining a fundraising event are the same as those for defining a regular event except for a few fundraising features.

Multiple entities

If your system is configured to use multiple financial entities (see "Multiple Entity Processing"), you can define a default entity code for an event and assign different entities to some or all of your event functions. This enables you to offer a mix of fundraising and non-fundraising functions, and a mix of entities receiving income, within the same event.

Need more?

For details about event and function definition and fees, see the Events section:

- Define an event - event details window
- To define an event
- Event Function Detail window
- To define event functions

Receipts, reports, and summaries

Registration fees for fundraising functions are included in Fundraising reports and summaries. Fundraising function fees are marked as fundraising items in Events reports and summaries and in customer receipts and invoices.

Setting event function fees

After you define your functions, define the fees associated with each function. Set function fees in the Event Function Definition - Fees window.

You can charge different fees for early, regular, and late registrations, and you can charge different fees for different registrant classes.

Need more?

For details about setting function fees, see the Events section:

- Setting fees
- Event Function Definition - Fees window
- To define event function fees and GL information

About multi-entity and function fees

If you have enabled multi-entity in the AR/Cash setup, you can use different entities for different functions of the same event. When you hold an event that has both fundraising and non-fundraising components, you can track the income from these components separately, and you can issue registrant receipts that separate donations from other registration fees for tax purposes.

Note: Non-fundraising functions can be assigned any entity, but fundraising functions can only be assigned entities for which the Is Fund checkbox has been checked in System Setup.

Fundraising Online

You can collect donations online through a WCM website or through the Public view ("Donate now! (Public view)").

Donate now! (Public view)

You can solicit and accept online donations through the Public view of iMIS using the Gift.aspx file, which creates a simple web page for processing donations.

The Administrator can:

- Modify the page properties, such as the donation messages and eligible distributions.
- Add multiple donation pages to the Public view.

The donor can:

- Make a donation whether or not they are logged on.
- Choose from the specified donation amounts or enter an amount.
- Apply the donation to a distribution.

Each donation is considered a single gift. It can not be split within a fund or distributed among more than one fund as a split gift.

Setting up online donations in iMIS Desktop

You must be licensed for Donate to use the online donations feature.

Follow these setup steps in iMIS Desktop to enable online donations. You may have already set up these features for other parts of your iMIS system.

1. Create a payment gateway (see "Setting up card authorization") (AR/Cash > Set up module > Credit Card Auth).
2. Configure iMIS to use batch control (see "Setting up batch control") (AR/Cash > Set up module > Batch Control). Online donations are automatically placed in system-generated Internet Gifts batches that are created based on the date the transaction took place. All of

the transactions from a single day are placed in a batch with the same date. If today's Internet Gifts batch is closed, and a new transaction takes place, a new batch is created with today's date.

3. Determine which distributions will be credited with online donations. Either define a new distribution (see "Defining distributions and premiums") or select from existing distributions (Fundraising > Set up tables > Distributions and premiums).
4. (optional) Set up a Donor Club (see "Defining donor clubs") (Fundraising > Setup tables > Donor clubs > Gift Amount). A Donor Club used for online donations must be set up for cash only payment.

   Removing the Donate link from the homepage

   A link to the donation page appears on the Public view's homepage even if your organization is not licensed for the feature.

   To remove the donation link, delete the following line of code from the Default.aspx file using a text editor. In a typical installation, the Default.aspx file is located in the local directory for the iMIS application - c:\Program Files\ASI\iMIS\iMIS_public\Default.aspx.

   Donate to our organization!

   Contact records created by online donations

   After clicking the donation link in the Public view, donors are taken directly to the I want to donate page.

   The donor is able to make an online donation in three different capacities.

- Current contacts who are logged on (authenticated users) – The information from the I want to donate page is submitted to the iMIS contact's existing record.
- Current contacts who are not logged on (unauthenticated user) – The information from the I want to donate page creates a duplicate contact record for existing contacts, but it does not create a new public user record. The new contact record is assigned the default contact type (System Setup > Set up web components > Quick setup).

- Public users who are not registered on the website (anonymous user) – The information from the I want to donate page creates a new iMIS contact record, but it does not create a public user record. The new contact record is assigned the default contact type (System Setup > Set up web components > Quick setup).

Customizing Public view online donations

You can customize the online donations feature by modifying the Gift.aspx page properties and the Web.sitemap file.

Modifying the donation page

You can customize the donation page for specific purposes by modifying the Gift.aspx page properties. For example, you can change the eligible distributions, the messages displayed, or the types of payment accepted.

In a typical installation, the Gift.aspx page is located in the local directory for the iMIS application: c:\Program Files\ASI\iMIS\iMIS_public\Core\Donations\Gift.aspx. You can also use a url to see the file: http://[servername]/imispublic/Core/Donations/Gift.aspx.

Note: Be sure to change the default values of EmailSmtpHost and EmailFromAddress to values specific to your organization. If your SMTP server requires authentication, then you must also include values for the EmailSmtpLoginId and EmailSmtpLoginPassword properties in your Gift.aspx page.

The following Gift.aspx page has been modified for land trust donations.

```
<%@ Register TagPrefix="uc1" TagName="GiftUserControl" Src="Gift.ascx" %>

<asp:Content ID="Content1" ContentPlaceHolderID="TemplateBody" runat="server">

  <uc1:GiftUserControl runat="server" ID="GiftUserControl1"

 GiftPanelTitle="Invest in our community - make a donation now!"

      ContactPanelTitle="Donor Information"

      PaymentPanelTitle="Payment Method"

      SummaryPanelTitle="Thank you!"
```

SuggestedGiftAmounts="25,50,100,250,500"

DistributionMessage="to the following:"

EligibleDistributions="BLDG,GEN"

KnownUserMessage= "Hello, {0}! Your donation will help to make our community facilities and housing affordable for the people who live and work in our town. Please select a gift amount:"

UnknownUserMessage="Welcome! Your donation will help to make our community facilities and housing affordable for the people who live and work in our town. Please select a gift amount:"

CreditDebitCardCashAccountPrefix="W_"

SubmitButtonText="Submit my donation now"

RequiredFieldDescription="* Indicates a required field"

ProcessedSuccessfullyMessage="Your donation will help us to preserve our community. Thank you for your gift."

EmailSmtpHost="yourmailservr.yourdomain"

EmailSmtpPort="25"

EmailSmtpLoginId="youremail@yourhost.yourdomain"

EmailSmtpLoginPassword="yourpassword"

EmailFromAddress="youremail@yourhost.yourdomain"

EmailConfirmationSubject="Thank you for your donation"

EmailConfirmationAddressPrompt="Send confirmation email to:" />

</asp:Content>

Gift.aspx page properties

The following Gift.aspx page properties can be modified.

ContactPanelTitle – Specifies the title of the Contact panel.

CreditDebitCardCashAccountPrefix – The default value of this property (“”) results in all iMIS Credit/Debit Cash Accounts being listed in the Pay By drop-down list. Enter your web Credit card prefix to filter this list (from System Setup, select Set up web components > General configuration). Only Credit/Debit Cash Accounts where the Cash Account Code begins with this prefix will be populated.

DefaultCountry – Sets the default country that will appear in the Country drop-down list.

DistributionMessage – Specifies the text displayed to the left of the drop-down list of distributions.

EligibleDistributions – Specifies a comma-separated list of distribution codes. A distribution must be added to this list for it to appear on the donations web page. When the web page is rendered, each code is translated into the full distribution name and displayed in a drop-down list in the same order as the code list. Distribution codes that do not match the codes defined in iMIS will not appear online. For a list of distributions defined in your system, open the Distributions and premiums window in iMIS Desktop (from Fundraising, select Set up tables > Distributions and premiums).

EmailConfirmationSubject – Specifies the subject line in the donation confirmation email.

EmailFromAddress – Specifies the From address of the confirmation email message. Be sure to change the default value in the GIft.aspx page to one that is specific to your organization.

EmailSmtpHost – Specifies the name or IP address of the host server used for SMTP transactions. Be sure to change the default value in the GIft.aspx page to one that is specific to your organization.

EmailSmtpLoginId and EmailSmtpLoginPassword – Specifies the login credentials required for authentication on your SMTP server. These properties are not included in the Gift.aspx page by default. If your SMTP server requires authentication, then you must add these properties to your Gift.aspx page. If your SMTP server does not require authentication, then these properties should not be included in the Gift.aspx page.

EmailSmtpPort – Specifies the port used for SMTP transactions. The default is 25.

GiftPanelTitle – Specifies the title of the Gift panel.

KnownUserMessage – Specifies the message displayed when a logged-on user navigates to the donation page. If this message contains the string {0} (brace zero brace), the logged-on user's first name (Contact.FirstName) is substituted for that string. Otherwise, the message is displayed without modification.

PaymentPanelTitle – Specifies the title of the Payment panel.

ProcessedSuccessfullyMessage – Specifies the message displayed when a donation is processed successfully.

RequiredFieldDescription – Specifies the text that appears if a user fails to supply a required field. The default text is "* Indicates a required field."

SubmitButtonText – Specifies the words that appear on the button used to submit the donation. The default is "Donate!"

SuggestedGiftAmounts – This is a comma-separated list of values displayed as radio buttons for the user to select. The user also has the option to enter an amount of their choice. The values specified in this list are interpreted as decimal numbers. Any values that can't be interpreted as a decimal number (for example "xyz") will not be displayed.

SummaryPanelTitle – Specifies the title of the Summary panel. The Summary panel is displayed after the donation has been successfully processed.

ThankYouMessage – Specifies the message displayed after a donation has been successfully processed. If the message contains the string {0} (brace zero brace), the logged-on user's first name (Contact.FirstName) is substituted for that string.

UnknownUserMessage – Specifies the message displayed when a non-logged-on user navigates to the donation page.

Adding distributions to the donation page

Out of the box, no distributions appear on the donation page in the Public view. You must add one or more iMIS defined distribution codes to the EligibleDistributions property of

the Gift.aspx file. From the donation web page, donors can then select which of the distributions to credit with their donation. You can also specify a distribution to be selected by default when donors visit the page.

To add distributions to the donation page

1. Using iMIS Desktop, create or find distribution codes to add to the Gift.aspx file.
   - From Fundraising, select Set up tables > Distributions and premiums.
   - Either define a new distribution or select an existing distribution to view its code.
2. Open the Gift.aspx file with a text editor. In a typical installation, the Gift.aspx file is located in the local directory for the iMIS application: c:\Program Files\ASI\iMIS\iMIS_public\Core\Donations\Gift.aspx.
3. Add the distribution codes to the EligibleDistributions property, separated by commas.

   For example: EligibleDistributions=”BLDG,GEN”
4. Save your changes to the Gift.aspx page.

   When the donation web page is rendered, each of the codes will be translated into the full distribution name and displayed in a drop-down list in the same order as the EligibleDistributions list.

To specify a default distribution code

1. Open the Web.sitemap file with a text editor. In a typical installation, the Web.sitemap file is in the local directory for the iMIS application - c:\Program Files\ASI\iMIS\iMIS_public\Web.sitemap.
2. Find the "Donate now!" siteMapNode:

   <siteMapNode title="Donate now!" url="~/Core/Donations/Gift.aspx" />
3. Append ?DistributionCode=[default distribution code] to the URL. For example, the following URL tells the donation page to open with the BLDG distribution code selected by default:

<siteMapNode title="Donate now!" url-
l="~/Core/Donations/Gift.aspx?DistributionCode=BLDG" />

Adding multiple donation pages

You can create multiple versions of the Gift.aspx page by saving it under a different name and modifying the page properties. Once you have created the new page, you can add it to your Public view by modifying the Web.sitemap file. In a typical installation, the Web.s-itemap file is located in the local directory for the iMIS application - c:\Program Files\ASI\iMIS\iMIS_public\Web.sitemap.

The original Web.sitemap file contains the following reference to the Gift.aspx page.

<siteMapNode title="Donate now!" navigateChild="0" roles="*" visible="true">

<siteMapNode title="Donate now!" url="~/Core/Donations/Gift.aspx" />

</siteMapNode>

To add an additional donation page to your sitemap, open the Web.sitemap file and add a siteMapNode with a title and url specific to your new page. In this example, two .aspx pages have been added to the Web.sitemap file. The sitemap can be modified to accom-modate several donation pages.

<siteMapNode title="Donate now!" navigateChild="0" roles="*" visible="true">

<siteMapNode title="Donate now!" url="~/Core/Donations/Gift.aspx" />

<siteMapNode title="Invest in our community!" url-
l="~/Core/Donations/Community.aspx" />

<siteMapNode title="Donate to some special causes!" url-
l="~/Core/Donations/GiftWithOtherDistributions.aspx" />

</siteMapNode>

Required online donation information

The required information cannot be reconfigured on the donation page. iMIS checks all required fields before accepting the donation. If the required information is not entered in the correct format, the donor receives an error message.

Required donation fields

- Donation amount
- Distribution
- First Name
- Last Name
- Email
- Authenticated users see two email fields automatically populated with the email address in the contact record. If the user enters a different default email address, iMIS updates the contact's email in the database.
- Unauthenticated users are prompted to enter their email address twice, for confirmation.
- Address 1
- City
- Country
- Payment Information

Optional donation fields

- Prefix
- Suffix
- Company Name
- Home Phone
- Work Phone

- Address 2
- Address 3
- State/Province
- Postal Code

Default credentials sent with SMTP requests

Some SMTP servers require that the client be authenticated before the server sends e-mail on its behalf. In this case, you can include the EmailUseDefaultCredentialsProperty in the definition of the Gift.aspx control to specify that authentication uses the default credentials of the currently logged on user.

Note: For ASP.NET applications, the default credentials are the user credentials of the logged-on user or the user being impersonated. See the MSDN documentation for System.Net.SmtpClient Class.

Fundraising System Setup

Customers: Set up fundraising

To set up fundraising in Customer Management, you will:

- Define activity types
- Create general lookup/validation tables
- Set up fundraising options
- Add information to a customer record
- Set up matching plans in company records

Defining activity types

iMIS makes extensive use of the activity table to help you keep track of your organization's contact with individuals and other organizations. The following activity types are specific to fundraising efforts:

- REQUEST - a specific request for a donation from a donor. Requests are recorded when they occur.
- GIFT - a donation in which the donor transfers funds immediately.
- PLEDGE - a donation in which the donor promises funds, but does not transfer them immediately. Pledges can be either single or installment pledges.
- DONORCLUB - a level of recognition accorded donors based on their giving histories. The DONORCLUB activity is recorded in the customer's record each time a donor club is achieved by the customer.

  Note: If a gift or pledge is deleted, the DONORCLUB activity is not adjusted. The Allow User Edit option must be enabled or the DONORCLUB activity cannot be modified or deleted when a gift or pledge is deleted.

Setting up REQUEST, GIFT, and PLEDGE activity types

The Fundraising activity types REQUEST, GIFT, and PLEDGE, must be set up properly to help iMIS import, track, and report on donations and requests for donations.

To set up REQUEST, GIFT, and PLEDGE Activity Types

1. From Customers, select Set up module > Activity types.
2. From Product Types, look for the appropriate item (REQUEST, GIFT, or PLEDGE).

- If the product type is listed, select it and click Edit.
- If the product type is not listed, click New and enter the product type in the Type text box.

3. Set the activity type values according to the reference tables following this procedure.
4. Click Save.

The Request Activity Type

Type	REQUEST
Description	Request Activity
Subtype	Distribution
Note	Notes
Eff. Date	Begin Date
Thru Date	Gift Date
Source	Appeal Code
Amount	Requested Amt.
Qty/CEU	Frequency
UF_1	List As
UF_2	Request Type
UF_3	Fund Code
UF_5	Resulting Gift
UF_6	End Date

UF_7	Last Reminder
CO_ID	Solicitor ID

The Gift Activity Type

Type	GIFT
Description	Gift Activity
Subtype	Distribution
Note	Notes
Eff. Date	Receive Date
Source	Appeal Code
Amount	Amount
Task Date	Reminder Date
UF_1	List As
UF_2	Campaign Code
UF_3	Fund Code
CO ID	Solicitor ID

The Pledge Activity Type

Type	PLEDGE
Description	Pledge Activity
Subtype	Distribution
Note	Notes
Eff. Date	Receive Date
Source	Appeal Code
Amount	Amount
Task Date	Reminder Date

UF_1	List As
UF_2	Campaign Code
UF_3	Fund Code
CO ID	Solicitor ID

General lookup/validation tables for Fundraising

There are several general lookup/validation tables to define when setting up Fundraising. See the General lookup/validation tables section for details.

APPEAL_TYPE	A code that designates a short term activity with a specific goal.	FLOODRELIEF. LEGALDEFENSE. ROOFREPAIR
EXPENSE_TYPE	A code that enables you to categorize and keep track of money spent for fundraising efforts.	PHONE. ELECTRIC. RENT. POSTAGE
FUNDRAISER_TYPE	A code that designates the type of campaign that generates a donation.	NEIGHBOR_REACH. FAMILY_FRIENDS. CORP_RACE
MEM_TRIB_ RELATIONSHIP	A code that indicates relationship of a notification contact to the honoree of a memorial/tribute donation.	SIBLING. PARENT. SPOUSE.
REQUEST_TYPE	A code that indicates what kind of request is made.	PHONE. LETTER. VISIT
SOURCE_CODE	A code that indicates the marketing program or mailing that solicited a donation.	LTR_Q2_05. TELETHON

Customer - Set up Fundraising options

There are a few Fundraising options that are set from the Customer module including:

Interest Codes	Interest codes indicate specific areas that an organization or fund supports (for example, education, health, or literacy). These codes can be assigned to your organization, to funds, and to company matching plans. Specifying interest codes is optional, but if an interest code is specified in a company matching plan, matching donations can only be made to funds that have that same code. For example, if the “ED” interest code is specified for the matching plan, but the GEN fund only has the “CHILD” code, you cannot enter a matching donation to the GEN fund.
Sender Codes	Sender codes enable you to assign a signature line to requests, acknowledgements, and other correspondence that iMIS generates. For example, different letters may be signed by the head of your organization, a committee chairperson, or a customer support representative. You must define one sender code for each different signature line that you wish to include in correspondence. When a new gift is entered, the sender code can be assigned by clicking Acknowledge on the Enter and edit gifts window.
Memorial/Tribute Codes	Provides memorial/tribute codes to identify the type of memorial gift or pledge (for example, “In Memory of,” “In Tribute to,” and “In Honor of”). Memorial/tribute codes help you track memorial and tribute donations and help to generate correspondence related to these donations. Memorial/tribute codes designate how a donation is dedicated. For example, the code “MEMOR” could stand for “in memory of”, the code

"HONOR" could stand for "in honor of". When a memorial/tribute donation is made, the iMIS user who records the donation chooses from pre-defined memorial/tribute codes.

To enter interest codes

1. From Customers, select Set up Fundraising > Interest codes to display the Set up interest codes window.
2. Click New.
3. Enter the Interest Code.
4. Enter a brief Interest Description of the interest code.
5. Click Save.

To create sender codes

1. From Customers, select Set up Fundraising > Sender codes to display the Set up sender codes window.
2. Click New.
3. Enter the Sender Code.
4. Enter the Sender Description, which specifies the exact name and title to be used for the sender code. You can include a Carriage Return in the Sender Description.
5. Click Save.

To enter memorial/tribute codes

1. From Customers, select Set up Fundraising > Memorial/tribute codes to display the Set up memorial/tribute codes window.

2. Click New.
3. Enter the Memorial/Tribute Code.
4. Enter the Description of the memorial or tribute. This description is printed or included on the letters sent to the Notify ID and to the donor.
5. Click Save.

Adding solicitor data to a customer record

A solicitor is an individual who is responsible for petitioning for gifts and pledges. The solicitor typically is the staff member responsible for fundraising. However, in some organizations solicitors are volunteers, such as board members and committee members. An organization may have zero, one, or multiple solicitors.

The purpose of defining solicitors is to determine who is responsible for obtaining specific gifts and pledges and to track this information. Each person identified as a solicitor must have a record in the customer database.

Tip: For details about the solicitor fields, see Manage customers window - Solicitor Data tab in the Customer section.

To add solicitor data to a customer record

1. From Customers, select Manage customers to display the Manage customers window.
2. Click Find, enter the customer ID, and click Go.
3. Select the Solicitor Data tab.
4. Enter the solicitor's title in the Title field.
5. (optional) Enable the Volunteer option.
6. Enable the Solicitor option.
7. (optional) Enter the Hours/Week.
8. (optional) Enter any comments in the Comments field.
9. Click Save.

Adding fundraising information to a customer record

You can add specific fundraising information to a customer record in the Donor Data tab on the Manage customers window.

Tip: For details about fields on this tab, see Manage customers window - Donor Data tab in the Customers section.

To add fundraising information to a customer record

1. From Customers, select Manage customers to display the Manage customers window.
2. Click Find, enter the customer ID, and click Go.
3. Select the Donor Data tab.
4. Select the Solicitor from the drop-down list.
5. (optional) Enable the Do not phone option.
6. (optional) Enable the Do not email option.
7. (optional) Enable the Do not solicit option.
8. (optional) Enable the Do not sell option.
9. (optional) Select the Preferred Distribution or Premium to be associated with this customer from the drop-down list. (This information is used only when this customer is being honored with a memorial or tribute.)
10. (optional) Enter the List as information, or click Anonymous to display Anonymous in the List as field.

    Note: The List as information does not affect how invoices are printed for this customer. Most reports include both the full name and the List as information.

    Note: The List as information on the Donor Data tab on the Manage customers window specifies how the customer is listed unless you override the List as information in the Enter and edit gifts window. If you override the List as information in the Enter and edit

gifts window, this override only affects that particular gift. All future gifts default to the List as information defined in the Donor Data tab on the Manage customers window.

11. Select a Receipting Interval. The default is None.
12. Click Save.

Adding notification information to a customer record

When your organization receives a memorial or tribute, you must notify the honoree's family members and business associates that a donation has been made. Before you can notify the family or friend, you must create a list of individuals to be notified in the honoree's record.

Enter notification information in the honoree's customer record in the Notification tab on the Manage customers window.

Tip: For details about using the fields on this window, see these topics in the Customers section:

- Managing notification information
- To enter notification information
- To edit notification information
- To delete notification information
- Manage customers window - Notification tab

To enter notification information for a customer record

1. From Customers, select Manage customers to display the Manage customers window.
2. Click Find, enter the customer ID, and click Go.
3. Select the Notification tab.
4. On a blank row in the Notification tab, enter the Notify ID.
5. (optional) Select the Memorial/Tribute Code from the drop-down list.

6. (optional) Select the Relationship from the drop-down list.
7. (optional) Select the Salutation Code from the drop-down list.
8. (optional) Select the Merge Code from the drop-down list.
9. (optional) Select the Sender Code from the drop-down list.
10. Click Save.

To search for a Notify ID

1. From Customers, select Manage customers to display the Manage customers window.
2. Click Find, enter the customer ID, and click Go.
3. Select the Notification tab.
4. Click the blank Notify ID field and then click the down arrow to display the Find ID window.
5. Find and select the desired ID, then click OK. The Notify ID field is populated with the selected ID.

Creating matching plans in company records

You will need to set up a matching plan for the company before entering a matching gift. Typically, the matching plan is set as a percentage of the gifts within a specified date range or amount range made by company employees. For example, Company ABC matches 50 percent of employee gifts that range from $10 to $100. Interest codes can also optionally be assigned to the company's matching plans. If interest codes are assigned to a matching plan, at least one of the interest codes assigned to the matching plan must exist in the fund where a matching donation is made.

Matching plans are defined on the Matching Plans tab on the Manage customers window. All matching plans created for the company record display on the Matching Plans tab on the company's Manage customers window.

Note: The Matching Plans tab is only enabled for company records.

Need more?

For details about matching plans, see these topics in the Customer section:

- Manage customers window - Matching Plans tab
- To create a matching plan

To create a matching plan

To create a matching plan

1. From Customers, select Manage customers to display the Manage customers window.
2. Click Find, enter the company ID, and click Go.
3. Select the Matching Plans tab.
4. Enter the percentage of the matching contribution in the Match % field.
5. (optional) Enter the minimum contribution needed to qualify for the matching plan in the Minimum Contribution field.
6. Enter the maximum contribution that qualifies for the matching plan in the Maximum Contribution field.
7. (optional) Enter the start and end dates for the matching plan in the Start Date and End Date fields. If no Start Date is specified, the matching plan is effective immediately. If no End Date is specified, the matching plan is effective until it is deleted.
8. (optional) Click Interest Codes to display the Interest Codes window. Select one or more interest codes and click OK.
9. (optional) Enter the Form Number associated with the matching plan.
10. (optional) Enter any Notes associated with the matching plan.
11. Click Save.

Fundraising: Set up module

Fundraising setup overview

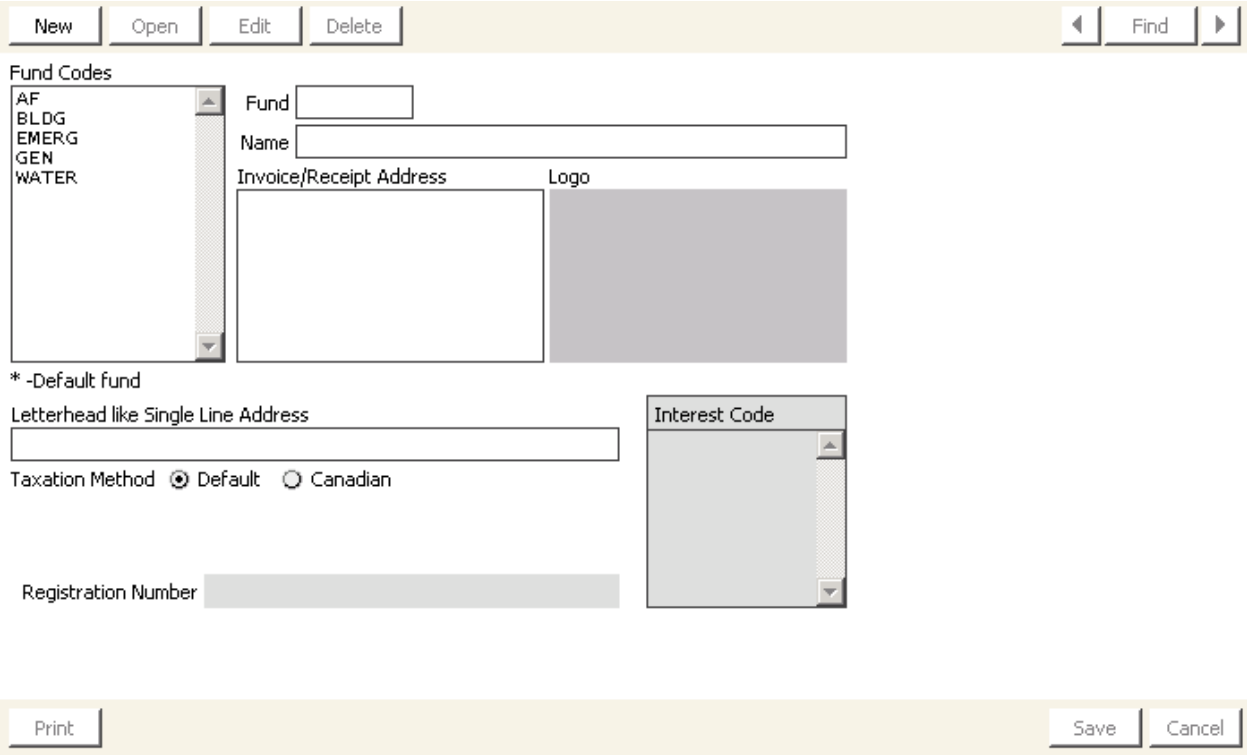
With iMIS Fundraising, you can create a customized fundraising management system for entering and tracking fundraising gifts and pledges. You can create several types of

tracking categories such as funds, appeals, and campaigns.

Designating your organization as a fund

If your organization is small and does not use multiple funds, you can designate your organization as a fund in your system setup. If you use more than one fund, you must define the individual funds that you use.

Set up funds window



Desktop: Fundraising > Set up tables > Funds

Fund Codes

Lists all currently defined fund codes.

Fund

Designates the currently selected or the new fund code.

Name

Designates the full name of the organization or fund.

Invoice/Receipt Address

Designates the mailing address of the fund.

Logo

Designates the fund's logo that will be used on reports that include the logo.

Letterhead like Single Line Address

Designates the fund's letterhead if it is a single line address line.

Interest Code

(optional) Enter the interest codes associated with the fund.

Taxation Method

Designates the taxation method used for this organization/fund. Choose one of the following options:

- Default - Uses the default taxation method defined in system setup.
- Canadian - Uses the Canadian taxation method. This method requires the following additional fields:
- Tax Authority - The Canadian tax authority.
- GST/HST Remittance # - The GST/HST Remittance number.

Note: Canadian taxation (see "Canadian Taxation (GST and HST)") requires additional configuration.

Registration Number

(optional) Designates the registration number associated with the fund. The registration number is used with the Fundraising receipting function.

To designate your organization as a fund

1. Select File > System Setup to open the System Setup window.

2. Click the Organization Names button to open the Organization Names window.
3. Select an item from the Org Codes list.
4. Click Edit.
5. Check the Is Fund checkbox.
6. Enter the Registration Number associated with the organization if applicable.
7. Click Save.

Defining funds

Funds are the entities within your organization that serve as asset accounts for your fundraising activities. Frequently, for legal and accounting reasons, an organization must maintain separate accounting records for each fund.

In iMIS, a fund is an organization. Gifts and pledges are directed to a fund (for example, a capital fund, a fixed asset fund, or a general unrestricted fund).

Information that is entered in the Set up funds window is displayed in the Organization Names window. Entities that have the Is Fund option enabled in the Organization Names window are also displayed in the Set up funds window.

Note: If you add a fund, restart iMIS to enable access to the new fund information.

Caution! Do not delete funds after you have completed fundraising transactions. Deleting funds affects the completed transactions. If you delete a fund, you must manually delete the fund from the appeals, campaigns, distributions, and donor levels associated with the fund.

To define a fund

1. From Set up funds window, click New.
2. Enter the Code for the fund.
3. Enter the Name of the fund
4. (optional) Enter the fund's Invoice/Receipt Address.

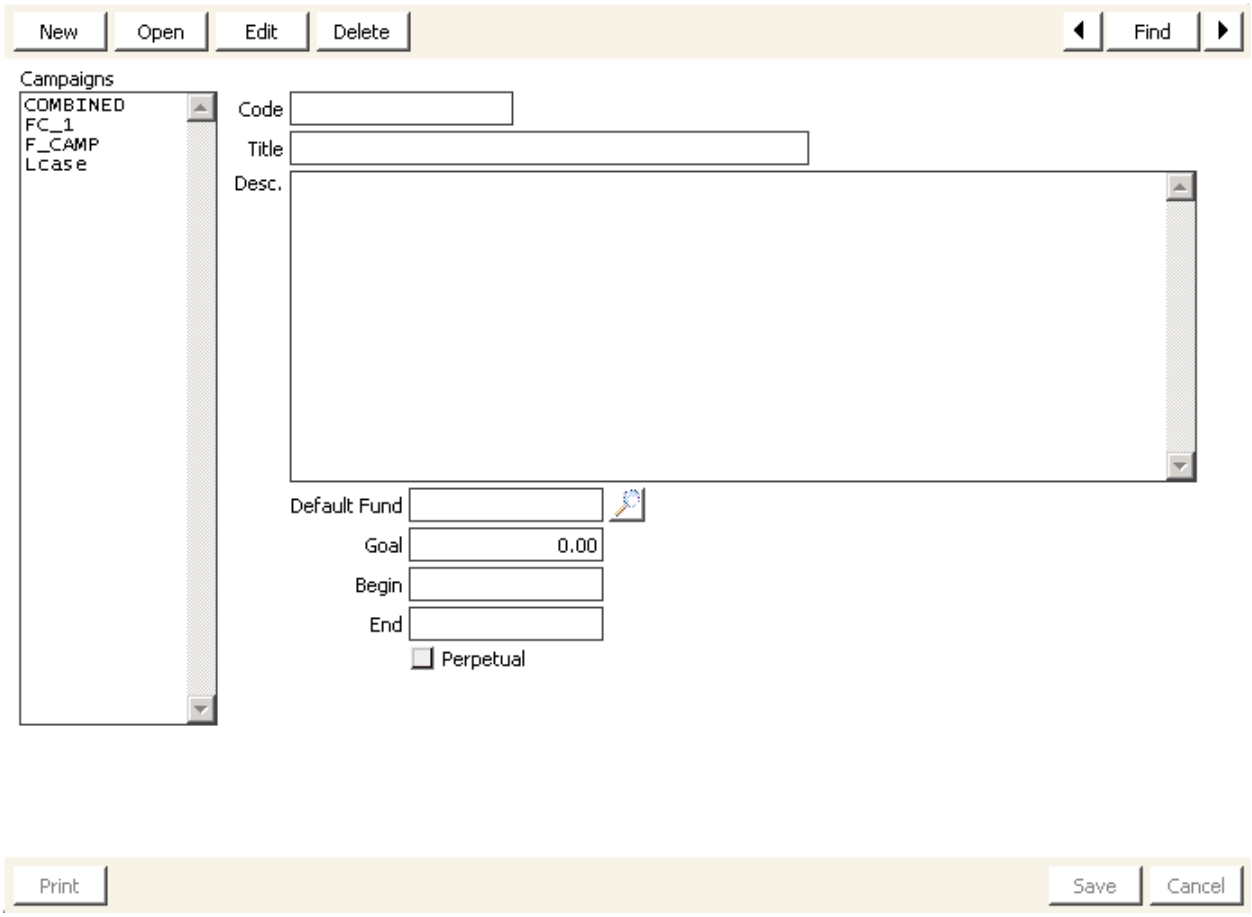
5. (optional) Paste the fund's Logo if available.
6. (optional) Enter the Letterhead like Single Line Address if applicable.
7. Select the appropriate Taxation Method option.
8. (Canadian taxation only) Enter the Tax Authority.
9. (Canadian taxation only) Enter the GST/HST Remittance #.
10. (optional) Add any interest codes to be associated with the selected fund in the Interest Code field, or press Ctrl+L to select interest codes.
11. Click Save.
12. Restart iMIS.

    Note: If you defined a fund as the default organization in the Organization Names window, the fund will have an asterisk next to it in the Org Codes scrolling list indicating that it is the default fund (and the default organization).

Defining fundraising campaigns

A campaign is a series of activities designed to generate money for a specific goal or objective. You may have a capital campaign with a goal of $1 million for a new building, or a scholarship campaign with a goal of $50,000 for a new scholarship. Campaigns are not required by iMIS, and not all organizations use them. However, campaigns are useful for generating and tracking money that is targeted for a specific goal.

Set up campaigns window



Desktop: Fundraising > Set up tables > Campaigns

Campaigns

Lists all currently defined campaigns.

Code

Designates the campaign code of the currently selected or new campaign.

Title

Designates the title of the campaign.

Desc

Describes the campaign.

Default Fund

Designates the default fund for the campaign.

Goal

Designates the campaign's financial goal.

Begin

Designates the campaign's starting date.

End

Designates the campaign's ending date.

Perpetual

When checked, indicates the campaign does not have an end date.

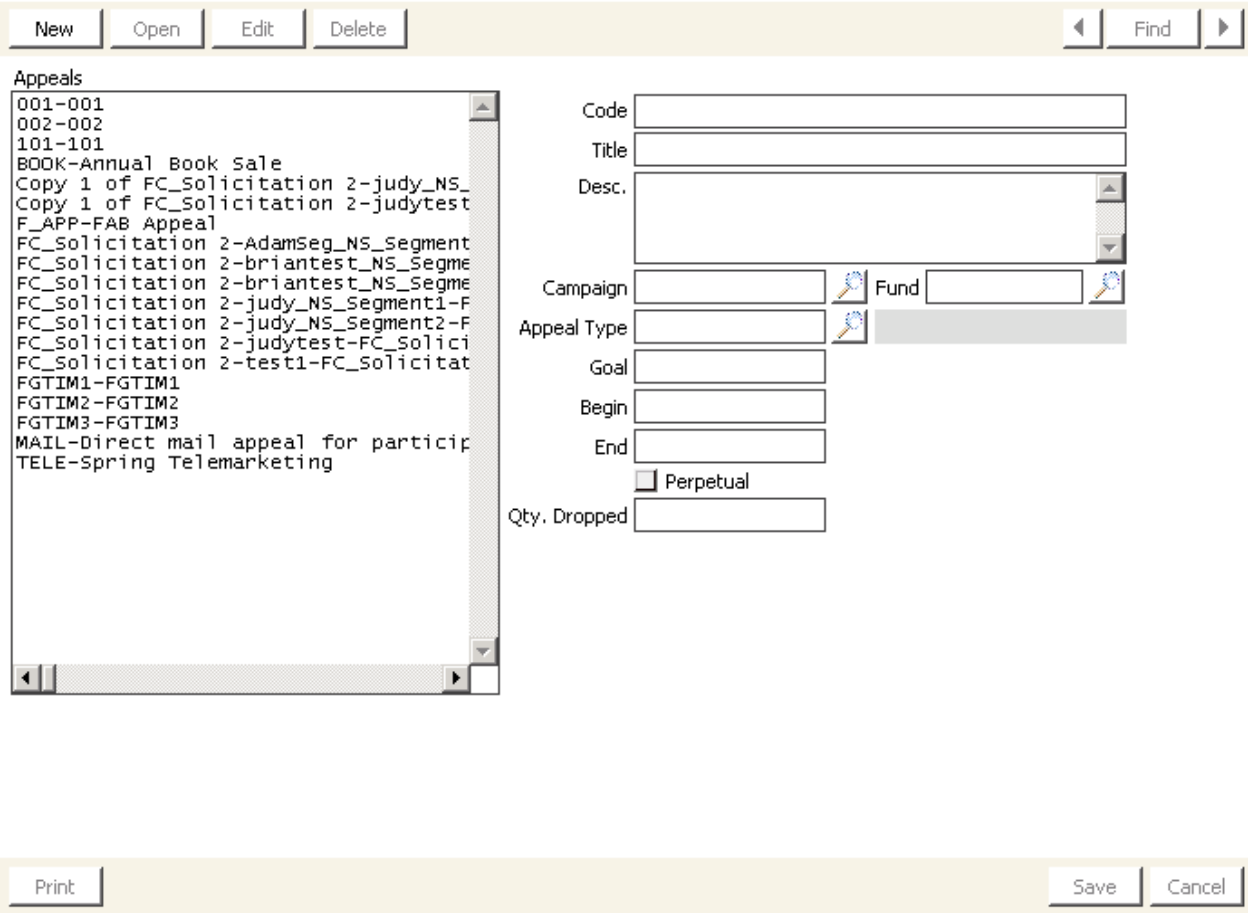
To define a campaign

1. From Set up campaigns window, click New.
2. Enter a descriptive alphanumeric Code to identify the campaign.
3. Enter the full Title of the campaign.
4. (optional) Enter a detailed description of the campaign in the Desc field.
5. (optional) Enter the Default Fund code for the campaign, or click the lookup icon to select a fund code.
6. (optional) Enter the financial Goal for the campaign.
7. Optional) Enter the starting date for the campaign in the Begin field.
8. (optional) Enter the predetermined End date for the campaign, or enable the Perpetual option if the campaign is ongoing.
9. Click Save.

Defining fundraising appeals

An appeal is a short-term activity, such as a mass mailing, a telephone solicitation, or a fax blitz, that may be connected to a particular campaign or fund. Appeals are not required in Fundraising. You can define any number of appeals, depending upon your organization's needs. Define appeals in the Set up appeals window.

Set up appeals window



Desktop: Fundraising > Set up tables > Appeals

Appeals

Lists all currently defined appeals.

Code

Enter an alphanumeric code for the selected appeal.

Title

(optional) Enter the full title of the appeal.

Desc.

(optional) Enter a detailed description of the appeal.

Campaign

(optional) Enter the campaign associated with the appeal.

Fund

(optional) Enter the fund associated with the appeal.

Appeal Type

(optional) Enter the type of appeal. Appeal types are defined in the APPEAL_TYPE lookup table (from Customers, select Set up tables > General lookup/validation, and select APPEAL_TYPE).

Goal

(optional) Enter the appeal's financial goal. When you enter a monetary value, iMIS automatically formats the value with the appropriate commas. For example, if you enter 1000000 (one million) in the Goal field, iMIS automatically formats the value as “1,000,000.00” when you tab out of the field.

Begin

(optional) Enter the appeal's begin date.

End

(optional) Enter the appeal's end date.

Perpetual

(optional) Enable to specify that the appeal is ongoing.

Note: You cannot enable the Perpetual option if the appeal is associated with a campaign that has a specific end date. You may have to update the information in the Set up appeals window more frequently than in the Set up funds window (from Fundraising, select Set up tables > Funds) or the Set up campaigns window (from Fundraising, select Set up tables > Campaigns) if you conduct several appeals during the year.

Qty Dropped

Enter the quantity dropped for the appeal. This allows you to gauge the response rate to an appeal.

Premiums

Click this button to open the Appeal Premiums dialog and apply a premium against the appeal.

To define an appeal

1. From Set up appeals window, click New.
2. Enter a unique alphanumeric Code for the appeal.
3. (optional) Enter a descriptive Title for the appeal.
4. (optional) Enter a detailed Description of the appeal. This description displays only in the Set up appeals window.
5. (optional) Enter the Campaign to which this appeal belongs, or click the lookup icon and select a campaign.
6. (optional) Enter the Fund to which this appeal belongs, or click the lookup icon and select a fund.
7. (optional) Enter the Appeal Type, or click the lookup icon and select an appeal type.
8. (optional) Enter the Goal for the appeal.
9. (optional) Enter the date that the appeal starts in the Begin field.

10. (optional) Enter the date that the appeal ends in the End field, or enable the Perpetual option if the appeal is ongoing.
11. (optional) Enter the quantity dropped for the appeal in the Qty Dropped field.
12. (optional) Click Premiums to apply a premium to the appeal.
13. Click Save.

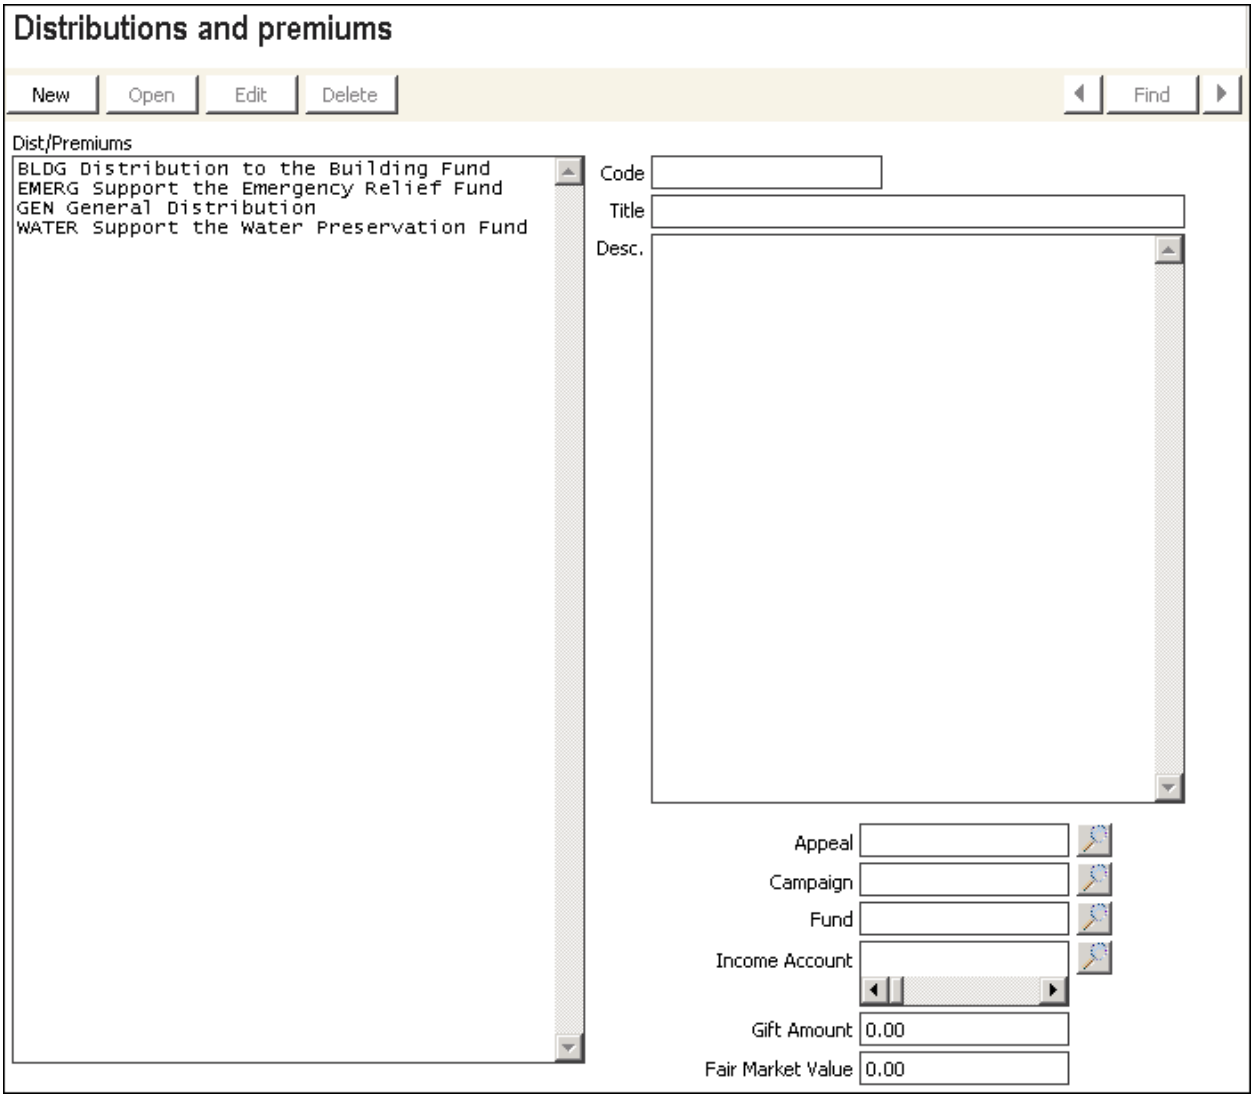
Defining distributions and premiums

Before you enter gifts and pledges, you must define the distributions or premiums that are to be credited with the contributions. Distributions allow you to predefine combinations of funds, campaigns, and appeals. When a gift is received, it is usually distributed among a fund, a campaign, and an appeal. A distribution does not have to include a campaign or an appeal, but it must include a fund. If you use a general ledger system, the distribution also determines the general ledger income account to be credited.

A premium is a complimentary gift, such as a coffee mug or T shirt, that is given to a contributor who makes a donation. A premium is a distribution with a fair market value. A premium also has a gift value. For example, the fair market value for a coffee mug may be only $4, but the donor may be required to donate at least the gift value of $25 to receive the coffee mug.

Distributions and premiums are defined in the Set up distributions and premiums window.

Set up distributions and premiums window



Desktop: Fundraising > Set up tables > Distributions and premiums

Dist/Premiums

Lists currently defined distributions and premiums.

Code

Designates an alphanumeric code for the selected distribution or premium.

Title

Designates a descriptive title for the distribution or premium.

Desc

Specifies a detailed description of the distribution or premium.

Appeal

Specifies the appeal associated with the distribution or premium.

Campaign

Specifies the campaign associated with the distribution or premium.

Fund

Specifies the fund associated with the distribution or premium.

Income Account

Specifies the general ledger income account to be credited with contributions recorded with the distribution.

Gift Amount

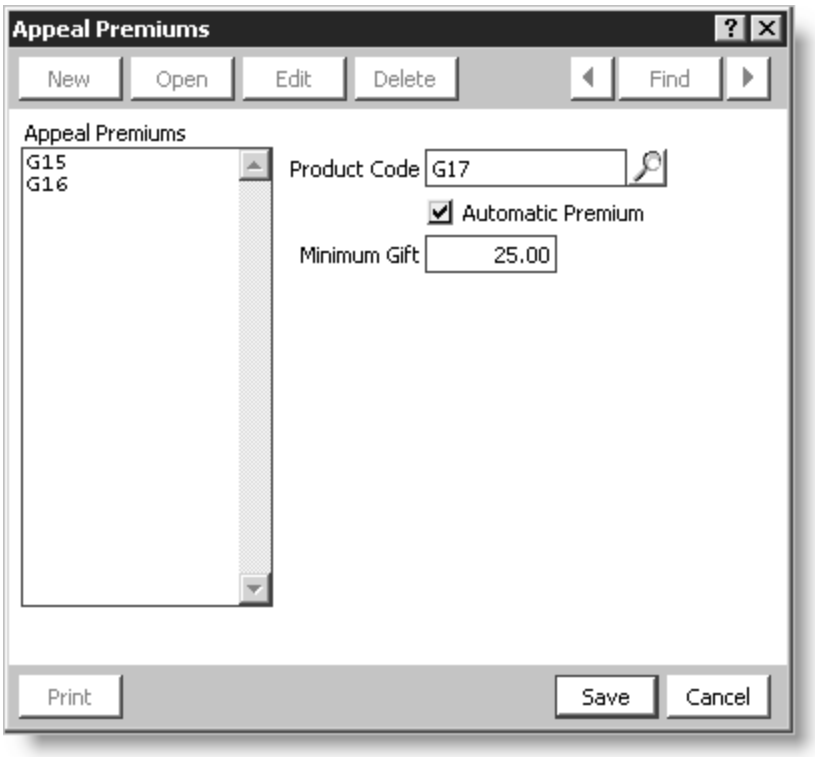
(Used only for premiums) Specifies the usual amount of the gift or pledge associated with the premium. This is the amount of money the donor must contribute to receive the premium.

Fair Market Value

(Used only for premiums) Specifies the fair market value of the premium. For example, if the premium is a coffee mug that sells for $4, but a donor receives the mug for a $20 gift, $4 is the fair market value.

Appeal Premiums window

You can apply a premium against an appeal code to establish rules about which premium is given for a specific gift amount. For example, a gift of $10 will provide a key chain, a gift of $ 25 will provide a mug. Appeal premiums are created and assigned to products on the Appeal Premiums window.



From Fundraising, select Set up tables > Appeals, highlight an Appeal and click Premiums

Note: To display the Premiums button in the Appeals window, you must enable the setup option to Allow Premiums as Products (Fundraising > Set up module).

Creating appeal premiums

Appeal Premiums is the product selected for the premium.

Product Code is the product associated with the Appeal premium. The Premium option must be enabled on the Manage Products window for the product to appear in this list (Orders > Manage inventory > Manage products).

Automatic Premium controls options on the Enter and edit gifts window.

- If enabled, the premium will automatically attach.
- If disabled, the Show all premiums option is available and you can attach a general item from inventory.

Minimum Gift sets the minimum amount required to apply the premium.

To define a distribution or premium

1. From Set up distributions and premiums window, click New.
2. Enter a unique alphanumeric Code (five characters maximum) for the distribution or premium.
3. (optional) Enter the Title of the distribution or premium.
4. (optional) Enter the description of the distribution in the Desc field.
5. (optional) Enter the Appeal associated with the distribution or premium, or click the lookup icon and select an appeal.
6. (optional) Enter the Campaign associated with the distribution or premium, or click the lookup icon and select a campaign.
7. Enter the Fund to be identified with the distribution or premium, or click the lookup icon and select a fund.
8. (optional) Enter the general ledger Income Account to be credited with contributions recorded with the distribution or premium, or click the lookup icon and select an account.
9. (Premiums only) Enter the usual amount of the gift or pledge in the Gift Amount field. This is the amount the contributor must donate in order to qualify for the premium.
10. (Premium only) Enter the fair market value of the contribution in the Fair Market Value field.
11. Click Save.

Defining donor clubs

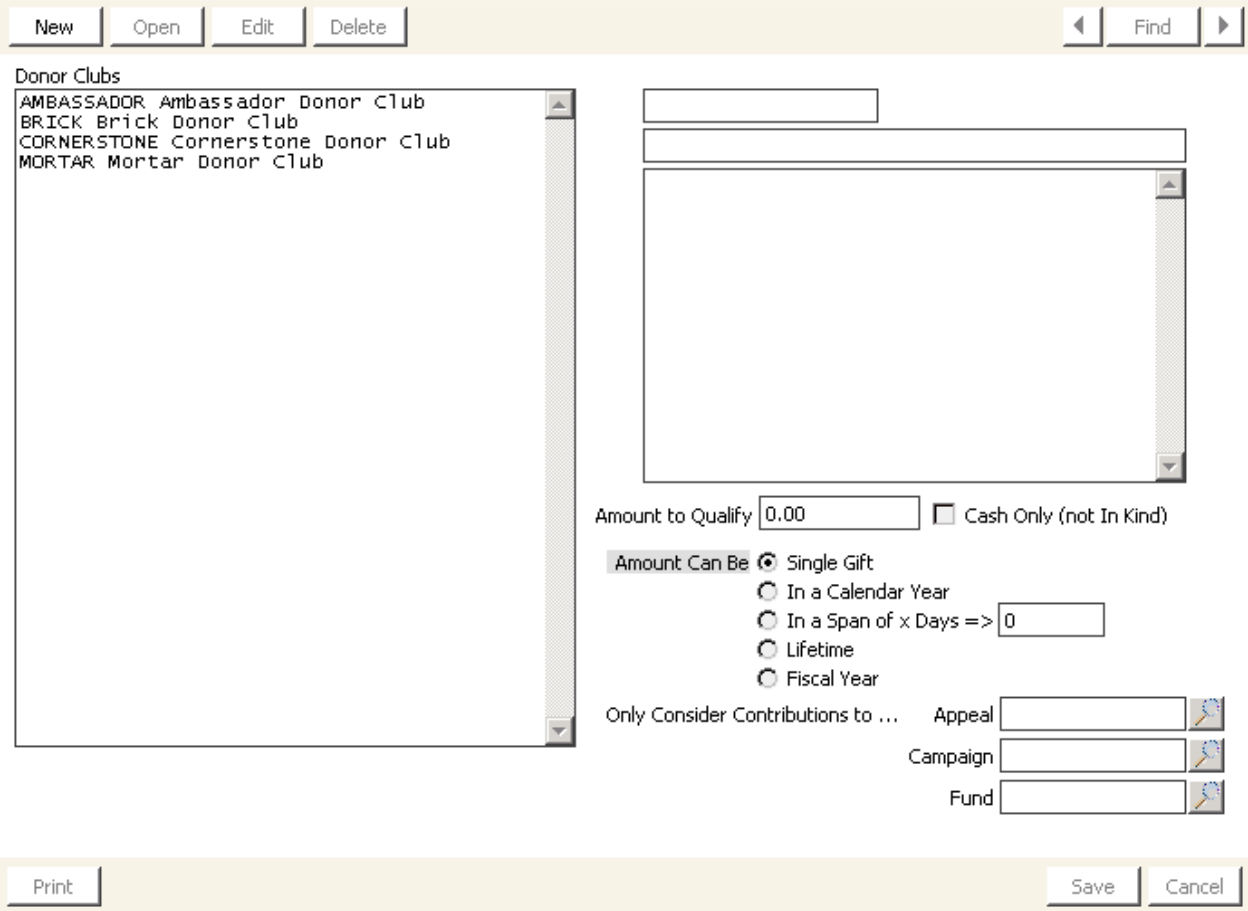
Many fundraising organizations establish donor clubs to recognize various levels of giving by donors. For example, for contributions of $10,000 or more, the organization may designate a donor as a “friend,” and for $20,000 or more, a donor may be designated as a “benefactor.” Not all organizations use donor clubs, but if your organization does, iMIS makes it easy to record and track donations and donor clubs.

iMIS automatically determines whether a donor club is attained with each gift entry. If you define a donor club at $20 for a single gift, and a contributor donates $20 or more, the contributor automatically attains the donor club.

When generating a Donor Club Detail report, the highest donor club achieved by an individual within the same criteria as defined in the Set up donor clubs window supersedes any lower donor club (if Superseded was entered in one of the user-defined fields on the Set up activity types window (from Customers, select Set up module> Activity types) when setting up the DONORCLUB activity type).

However, such a donor club does not supersede a donor club that was achieved under different parameters. For example, an individual makes a $1,000 cash contribution, which qualifies the donor for the Diamond Donor Club. The Diamond Donor Club requires a cash-only contribution of at least $1,000. The donor also qualifies for the Silver and Gold Donor Clubs, which require cash-only contributions of $100 or $500, respectively. The Diamond Donor Club supersedes the Silver and Gold, and only the Diamond Donor Club prints on the Donor Club Detail report. However, the contributor also qualifies for the Patron Donor Club, which requires a $500 gift, but does not require cash-only contributions. Both the Diamond and Patron Donor Clubs print on the Donor Club Detail report.

Set up donor clubs window



Desktop: Fundraising > Set up tables > Donor clubs

Donor Clubs

Displays all currently defined donor clubs.

Code

Designates an alphanumeric code for the current donor club.

Title

Designates a title for the donor club.

Desc

Specifies a description of the donor club.

Amount to Qualify

Specifies the monetary value of donation needed to qualify for the donor club.

Cash Only (not In Kind)

Check this box to limit qualifying gifts to cash. When this box is cleared, pledges and or in-kind gifts are also eligible.

Amount Can Be

Designates whether the total of multiple gifts is used to qualify for donor club membership, and if so, what time span is used to calculate total giving.

- Single Gift - Specifies that only single gifts can qualify donor club membership.
- In a Calendar Year - Specifies that the sum of a donor's contributions made during a calendar year is the amount used to determine donor club membership.
- In a Span of x Days=> - Specifies that the sum of a donor's contributions made during the last X days is the amount used to determine donor club membership.
- Lifetime - Specifies that the sum of all contributions a donor has ever made is the amount used to determine donor club membership.
- Fiscal Year - Specifies that the sum of a donor's contributions made during the fiscal year, as defined in the AR/Cash module, is the amount used to determine donor club membership.

Only Consider Contributions to

Specifies if donations must be associated with a particular fundraising effort in order to qualify for donor club membership. If all items are left blank, all otherwise qualified donations are eligible. If one or more of the following items is specified, only donations that are associated with all of the specified codes are considered when determining donor club membership.

- Appeal - Specifies an appeal code with which qualifying donations must be associated.
- Campaign - Specifies a campaign code with which qualifying donations must be associated.
- Fund - Specifies a fund code with which qualifying donations must be associated.

To define donor clubs

1. From Set up donor clubs window, click New.
2. Enter a unique alphanumeric Code (five characters maximum) for the donor club.
3. (optional) Enter the Title of the donor club. This is the title that will print on thank you letters to donor club members.
4. (optional) Enter a short description of the donor club in the Desc field.
5. Enter the amount needed to qualify for this particular donor club in the Amount to Qualify field.
6. (optional) Enable the Cash Only option for the donor club to be achieved only with cash gifts and not pledges or in-kind gifts.
7. Select a receipt period option for the gift or pledge in the Amount Can Be field.
8. (optional) In the Only Consider Contributions to area, enter the appropriate code or combination of codes if the donor club can only be achieved with a contribution to a specific appeal, campaign, or fund.
9. Click Save.

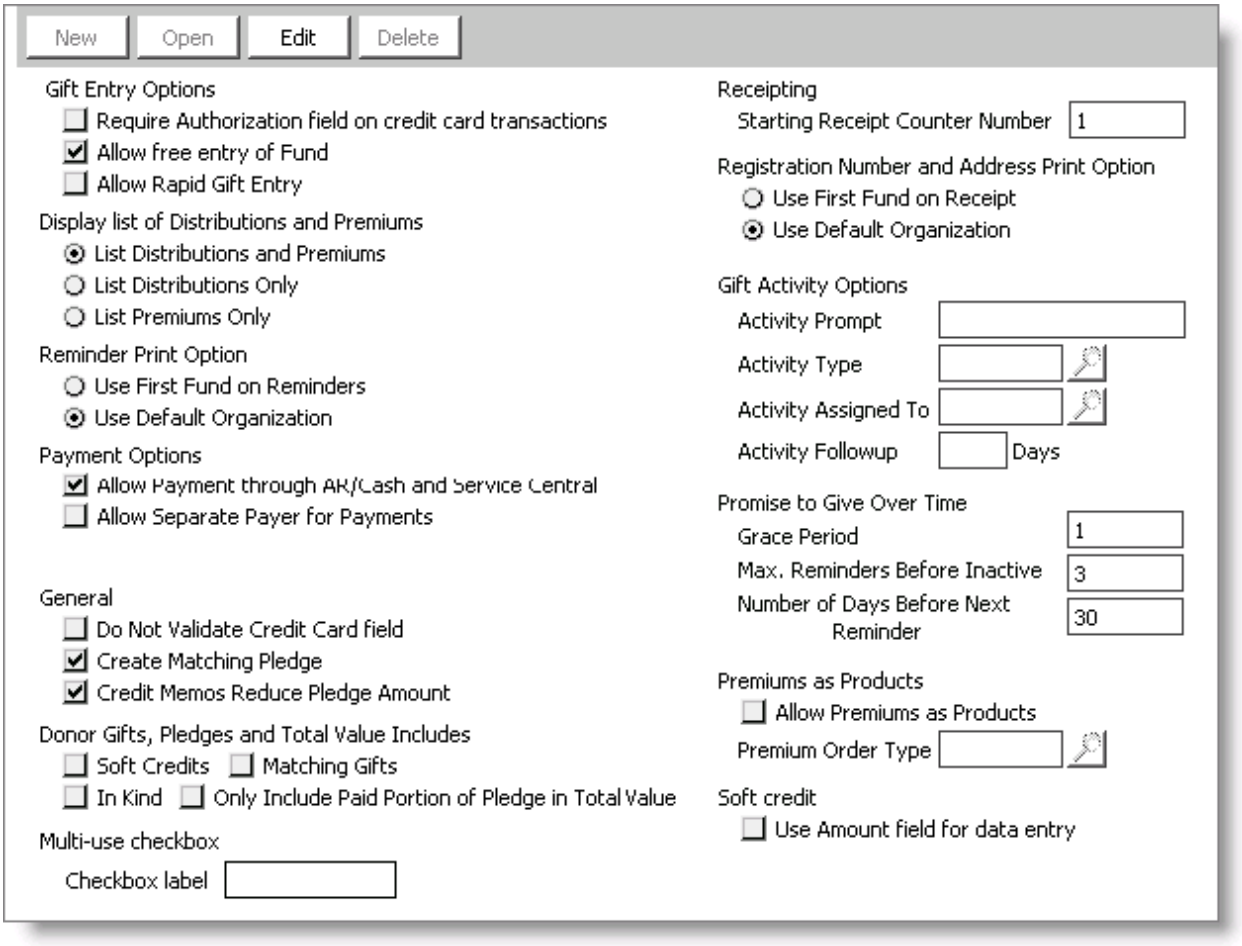
Defining fundraising setup options

Use the Fundraising Set up module window to:

- Select gift entry options
- Determine how distributions and premiums will display on the Enter and edit gifts window
- Select printing options

- Select payment options
- Set receipt printing options

Configure fundraising options window



Desktop: Fundraising > Set up module.

Gift Entry Options

You may check any of the following boxes:

- Require Authorization field on credit card transactions - Enable to make the Authorization field a required field on every credit card transaction entered in the Enter and edit gifts window or the Process payments window.

- Allow free entry of Fund - Enable to freely match distributions and funds at gift entry. This allows you to determine on a case-by-case basis how the gift should be distributed. If you do not enable this option, you must define all valid combinations of funds and distributions. Users can still overwrite the Campaign and Appeal fields even if the Allow free entry of Fund option is not enabled.
- Allow Rapid Gift Entry - Enable to give users the ability to enter Date Received, Gift Type, Gift Amount, Distribution, Appeal, Campaign, and Fund once on the Enter and edit gifts window and have these fields automatically entered in additional records. When this option is checked, the buttons Enable Rapid Gift Entry and Disable Rapid Gift Entry are available to users.

  Note: The Single Gift and Single Pledge gift types are the only gift types supported for rapid gift entry. If the gift type is Installment, an error message displays when you click Enable Rapid Gift Entry.

- Date Received
- Gift Type
- Gift Amount
- Distribution
- Appeal
- Campaign
- Fund
- Installment gifts
- Acknowledgements
- Split gifts
- Memorials/TributesNotes
- Matching plans
- Inserting or editing soft credits (you can enter an existing soft credit ID, but you cannot create a new soft credit ID or edit an existing soft credit ID)

Display list of Distributions and Premiums

You must choose one of the following options:

- List Distributions and Premiums - Enable to display distributions and premiums in the Enter and edit gifts window (from Fundraising, select Enter and edit gifts).
- List Distributions Only - Enable to display only distributions in the Enter and edit gifts window.
- List Premiums Only - Enable to display only premiums in the Enter and edit gifts window.

Reminder Print Option

You must choose one of the following options:

- Use First Fund on Reminders - Enable to print the name of the first defined fund in the title of all reminders and reports. If there is only one fund, the name of this fund prints on reminders and reports.
- Use Default Organization - Enable to print the name of the default organization in the title of all reminders and reports.

Payment Options

You may check any of the following boxes:

- Allow Payment through AR/Cash and Service Central

Enabled

Allows fundraising payments through both the Service Central Enter and edit payments window and the AR/Cash Enter and edit cash receipts window. This is helpful if you receive payments for multiple products and some of those products are not related to fundraising.

Disabled

Prevents viewing Fundraising invoices on:

- Service Central Process customer requests window
- Service Central Enter and edit payments window
- AR/Cash Cash receipts window (AR/Cash > Enter and edit transactions > Cash receipts)

Note: If disabled, staff can only make fundraising payments through the Fundraising Process payments window.

- Allow Separate Payer for Payments - Enable to allow a separate payer for payments made in the Process payments window. If this option is enabled, you can specify a different payer ID for a pledge made by another individual.
- Payer Label - Enter the label that will be displayed for the separate payer field on the Process payments window. If you leave this field blank, the default label is Payer. Displays only if the Allow Separate Payer for Payments option is enabled.

General

You may check any of the following boxes:

- Do Not Validate Credit Card field - Enable to disable the credit card format validation feature when entering gifts in the Enter and edit gifts window and when making payments in the Process payments window or the AR/Cash Enter and edit cash receipts window.

  Note: When setting up the Fundraising module for Credit Card Authorization, we recommend disabling the Do Not Validate Credit Card field option on the Fundraising Set up module window. If the Do Not Validate Credit Card field option is enabled, the credit card number will not be formatted automatically when it is entered on the Fundraising Enter and edit gifts window. If the Deferred Authorization option is enabled on the AR/Credit Card Authorization window, transactions made on the Enter and edit gifts window with unformatted credit card numbers will not display in credit card searches and will not print on the Deferred Credit Card Pre-Authorization report.
- Create Matching Pledge - Enable to record matching gifts as pledges rather than requests.
- Credit Memos Reduce Pledge Amount - Enable if you want credit memos to reduce a pledge amount. For example, if you pledge $100 and you write off $25 of the pledge, iMIS will recalculate the pledge as $75 and display $75 in the Fundraising History window if the Credit Memos Reduce Pledge Amount option is enabled. However, if this option is dis-

abled and you pledge $100 and write off $25 of the pledge, iMIS will display the pledge amount as $100 with a $25 credit in the Fundraising History window.

Donor Gifts, Pledges and Total Value Includes

You may check any of the following boxes:

- Soft Credits - Include donation amounts not made by the contact, but made because of the contact.
- Matching Gifts - Include matching gift amounts provided by someone other than the donor.
- In Kind - Include the value of non-cash contributions
- Only Include Paid Portion of Pledge in Total Value - Include the amount actually received from pledges, not the total amount promised.

Multi-use checkbox

You can create a User Defined field to flag a gift record. Use the multi-use Checkbox label field to label the generic checkbox on the Enter and edit gifts window (Fundraising > Enter and edit gifts). This field will appear on the Enter and edit gifts window only if you have entered a label for the Checkbox label field.

Note: The state of the multi-use Checkbox label field checkbox (checked or unchecked) is saved in Trans.FR_CHECKBOX table field.

Receipting

- Starting Receipt Counter Number - (optional) Enter the next receipt number to be automatically generated. The default for the initial counter number is 1. After you generate receipts, the counter increases the number incrementally by 1 for each printed receipt. You can manually change the counter value to a higher number, but not to a lower number. Automatically generated receipt numbers are not duplicated.

Registration Number and Address Print Option

You must choose one of the following options:

- Use First Fund on Receipt - Enable to print the name of the first fund the donor contributed to when donating to multiple funds on the receipt header.
- Use Default Organization - Enable to print the name and address of the default fundraising organization on all receipt headers. When this option is enabled, receipts aggregate by donor ID, even if the payments are to funds with different registration numbers.

  Gift Activity Options

  The fields in this area are used to specify a user-specified activity that can be created when a gift or pledge is entered or edited.

- Activity Prompt - Enter the prompt for the activity checkbox on the Enter and edit gifts window.
- Activity Type - Enter the activity type for the activity that is created when the activity checkbox is enabled on the Overview tab on the Enter and edit gifts window, or select the lookup icon and select the activity type from the drop-down list.
- Activity Assigned To - Enter the iMIS user who will be assigned the activity, or select the lookup icon and select the iMIS user from the drop-down list.
- Activity Followup - Enter the time (in days) between the gift or pledge entry and the follow-up action.

  Promise to Give Over Time

- Grace Period - Enter the number of days beyond the end date that requests with a status other than Active continue to display in the Manage requests window. The default grace period is 1 day.
- Max Reminders Before Inactive - Enter the number of reminders before the request status is changed to Inactive. The default value is 3.
- Number of Days Before Next Reminder - Enter the minimum number of days between the printing of reminder notices for a request. The default value is 30 days.

  Premiums as Products

- Allow Premiums as Products - When checked, products can be used as premiums. You can set up stock, non-stock, and kit products so that they can be used as premiums for gifts and pledges with the added benefit of inventory control.

  Note: You must have the Full Order Entry module, and all products that are to be used as premiums must be set up for use as premiums on the Orders Manage products window.

- Premium Order Type - Designates the order type for products used as premiums.

  Soft Credit

  Select the Use Amount field for data entry option if you want iMIS to automatically calculate the amount as a percentage of the entire donation.

  To define default Fundraising options

1. From Configure fundraising options window, click Edit.
2. Select one or more of the Gift Entry Options checkboxes.
3. Select one of the Display list of Distributions and Premiums options.
4. Select one Reminder Print Option.
5. (optional) Select one or more of the Payment Options checkboxes.

- If you checked the Allow Separate Payer for Payments box, fill in the Payer Label field.

6. (optional) Select one or more of the General checkboxes.
7. (optional) Select one or more of the Donor Gifts, Pledges and Total Value Includes checkboxes.
8. (optional) Enter the Starting Receipt Counter Number.
9. Select one of the Registration Number and Address Print Options.
10. (optional) Enter Gift Activity Options.
11. (optional) Enter Promise to Give Over Time Options.

12. (optional) Configure Premiums as Products options.
13. Click Save.

Enabling rapid gift entry in Enter and edit gifts window

Rapid gift entry field values are retained on a per-session basis. All of the field values that were retained for rapid gift entry are cleared if you disable rapid gift entry (click Disable Rapid Gift Entry), open another window, or restart iMIS. You must populate the rapid gift entry fields with the appropriate values before clicking Enable Rapid Gift Entry each time you use rapid gift entry.

Rapid Gift Entry will not be available if:

- Batch Control is disabled.
- Organization is not licensed for Fundraising.
- iBO Rapid Gift Entry is turned off via .NET security.

  A .NET Fundraising security group is created during install. Users with Fundraising security level 3-8 will be added to this group.

  Note: Since the Installments tab is disabled during rapid gift entry, the installment date for a single pledge is set to the transaction date and cannot be changed.

- Date Received
- Gift Type
- Gift Amount
- Distribution
- Appeal
- Campaign
- Installment gifts
- Acknowledgements
- Split gifts
- Memorials/Tributes notes
- Matching plans
- Inserting or editing soft credits (you can enter an existing soft credit ID,

- Fund but you cannot create a new soft credit ID or edit an existing soft credit ID)

Note:

Split gifts require a fund. Split gifts must be split between or among multiple funds or within one fund. You can designate only one appeal or campaign for each gift/pledge entry.

If Allow Free Entry of Fund is disabled in Fundraising > Setup Module, you will not be able to edit the fund.

Fundraising authorization levels

Set up authorization levels for users according to your organization's needs.

Authorization levels for pledge credit and debit memos

Fundraising authorization level of 1 or higher lets you find and view existing pledge credit or debit memos.

Fundraising authorization level of 3 or higher lets you enter new pledge credit or debit memos. You can also edit or delete pledge credit or debit memos that you have entered with a Fundraising authorization level of 3 or higher.

Fundraising authorization level of 4 or higher lets you edit or delete pledge credit or debit memos entered by other iMIS users.

Setting up fundraising accounting

To implement Fundraising, you will make a few modifications and additions to iMIS AR/Cash.

Setting up fundraising in AR/Cash

After you have defined your funds, you will set up fundraising in AR/Cash.

Tip: If you are using multiple entities, see Configuring multi-entity processing in the AR/Cash Administration section.

Implementing Fundraising requires a few modifications and additions to your existing AR/Cash system. These changes are necessary for the successful use of the Fundraising module.

Note: Before you can set up AR/Cash to accommodate Fundraising, you must first define your funds.

Determining transaction entity ownership

Each transaction generated within iMIS is made up of two or more transaction entry lines. Each individual transaction line can be one of the following:

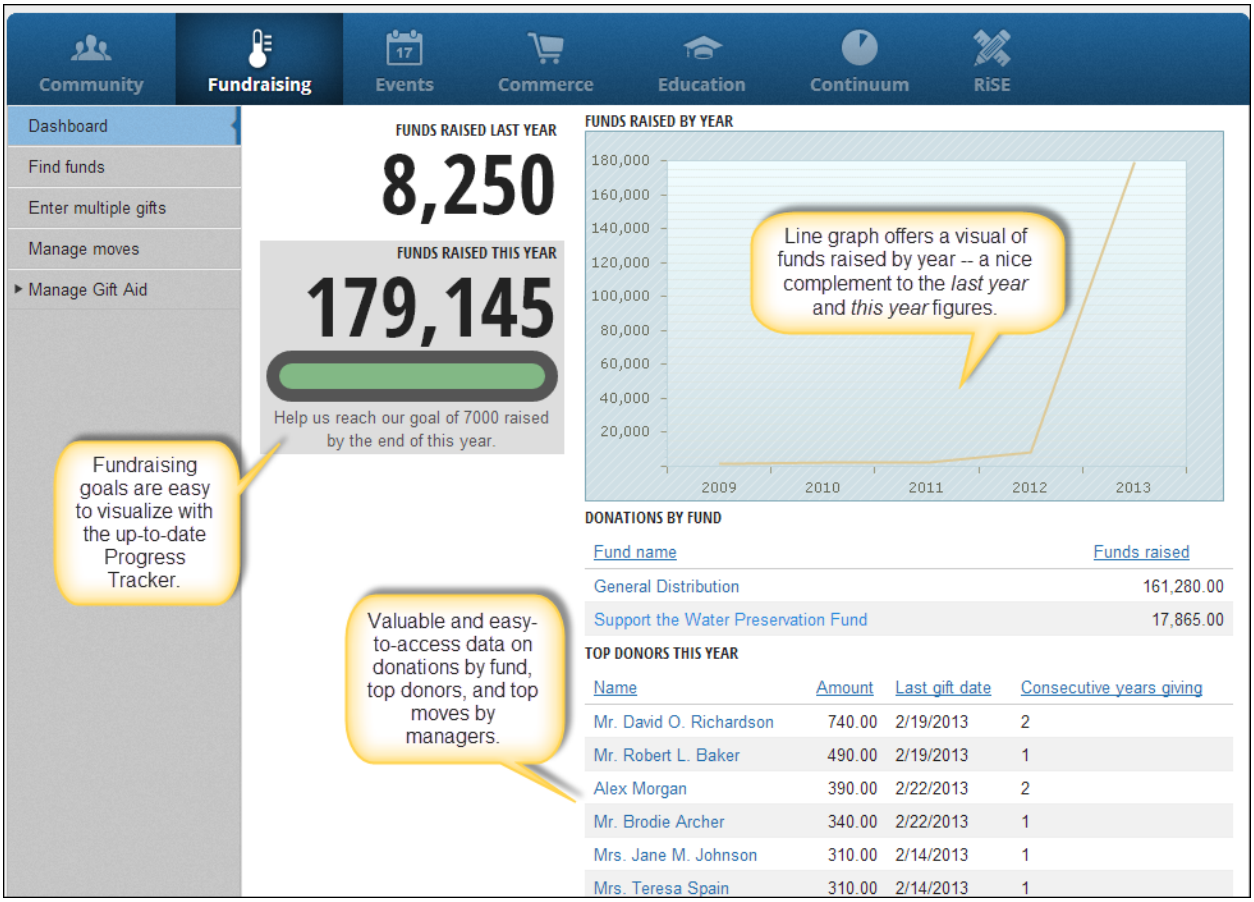
- a cash line, representing a cash payment or reversal
- a distribution line, typically representing an entry to income
- an AR line, normally representing an offset to the accounts receivable account

A due to/due from (see "DueTo/DueFrom processing") situation arises when there is a difference between the entity assigned to the cash line (for example, representing the cash account into which the funds are deposited) and the entity assigned to either a distribution/income or AR line within the same transaction.

The accounts to which transaction lines are assigned depends on the module and on configuration options.

Fundraising

Fundraising offers an easy-to-read Dashboard Overview of your fundraising activities for present and past years, as well as figures on new donors via Acquisitions.



- Overview
- Funds raised last year
- Funds raised by year
- Funds raised this year
- Donations by fund
- Top donors this year
- Top moves managers this year

Rapid Gift Entry

The Enter multiple gifts window in the iMIS Staff site lets you quickly enter new gifts or single pledges based on default values. For each session you can set the default values for a specific gift or pledge. After setting the default values, you can enter as many gifts or pledges as needed in one session.

The Enter multiple gifts window is the same in all views.

The Single Gift and Single Pledge gift types are the only gift types supported for Rapid Gift Entry. The Rapid Gift Entry table does not support the following:

- Installment gifts
- Split gifts
- Matching plans

> **Note:** Note: To use Rapid Gift Entry, your administrator must set up batch control (see Batch Control).

Enabling web-based Rapid Gift Entry

Do the following to enable the web-based Rapid Gift Entry.

To enable web access to Rapid Gift Entry

1. Grant the Full users Fundraising authorization level 3 or higher.
2. Set the system to use batches. In the Advanced Accounting Console, go to Finance > Processes > Manage batches.
3. Tell the Full users how to log on to iMIS Web View.

Setting defaults for Rapid Gift Entry

To process gifts quickly, you enter shared field values (defaults) to set up your Rapid Gift Entry table. After you submit these values, iMIS builds your pre-populated table, ready for data entry.

> **Note:** Note: In Rapid Gift Entry, you cannot enter an in-kind gift or asset.

To set defaults for Rapid Gift Entry

Go to Fundraising > Enter multiple gifts:

1. In the top half of the table, enter the required overview fields and any others that apply. Most of these fields are in the Single Gift entry form and are described in Enter and edit gifts window - Overview tab and in Enter and edit gifts window - Acknowledge tab.

- (required) Date Received
- (required) Batch – Lists existing open batches.
- Distribution
- Salutation
- Appeal
- Merge
- Campaign
- Sender
- Fund
- Pay By – Lists the available payment types associated with the selected batch type.

  The description displayed is the Title of the cash account defined by the system administrator in Accounting > Options > Set up tables > Set up cash accounts.

2. In the bottom half of the table, enter one or more gift detail fields:

- (required) Gift Type
- Gift Amount
- Description
- Notes

3. Specify the number of entries you want to pre-populate with these defaults: How many rows would you like?
4. Click Go.

Using Rapid Gift Entry

When using the Enter multiple gifts window in the iMIS Web View, gifts paid for in cash or by check cannot be entered in the same batch as gifts paid for with debit or credit cards. Instead, cash and check gifts must be entered in a batch enabled for cash. When you create a batch for a cash or check gift entry, select an account from the Cash Table field that is set up for cash (go to Accounting > Processes > Manage batches).

> **Note:** Note: If the Multi-use checkbox is labeled in Configure > Fundraising > Configure fundraising options, then the generic checkbox appears next to the Notes column in the Rapid Gift Entry table. The checkbox is the last field on each line item in the grid.

Keyboard shortcuts for Rapid Gift Entry

Once your cursor is in the table, you can complete data entry without using the mouse:

- Tab – moves from left to right
- Enter on an icon pops up the needed window (Search or Add donor information)
- Arrow Down – moves the user to the donor id field at the start of the next row
- Alt+S – submits the batch to iMIS

To use Rapid Gift Entry

Go to Fundraising > Enter multiple gifts:

1. To customize the Rapid Gift Entry table, enter the field default data.

Note: On the web, the batch selected on the Enter multiple gifts window is for Rapid Gift Entry transactions only. No other types of transactions can be entered.

2. Click Go. The Enter multiple gifts window is updated with a table for data entry.
3. In the table, enter the donation information. You can override the value in any of the rapid entry fields for any gift or pledge.

   Tip: On the web, save your entries before clicking another tab, or your work might be lost.
4. Click Save.

   To substitute a credit card holder name

   During Rapid Gift Entry, you can submit donations for a donor with a credit card under a different name by manually overriding the donor's name in the Name on Credit Card column. iMIS substitutes the correct name.

   iMIS automatically associates the Name on Credit Card with the donor based on how you searched for the donor:

- By ID number: The text [Default:Donor's Name] appears in the Name on Credit Card column. This indicates that the Name on Credit Card will be substituted with the donor's name.
- By contact name: The name of the donor appears in the Name on Credit Card column.

Moves Manager

(Major Donor Solicitation)

Major gifts fundraising requires a highly individualized and hands-on approach. "Moves Management," developed by G.T. “Buck” Smith and David Dunlop at Cornell University, is a process of relationship management that specifically cultivates major gifts. This process spans prospect identification and research through involvement, solicitation, and stewardship.

Creating a Moves Management plan can help fundraisers build relationships with donors, which improves their success in obtaining larger contributions. Whether you need to create a cultivation plan, track the moves made per donor, or check on the total amount raised, Moves Manager can help.

To designate a Moves Manager

The Moves Manager (also known as the solicitor) is responsible for defining a plan for interactions with the donor (the cultivation plan) and for keeping track of the plan's progress.

1. Find and select the staff member you want to designate as a Moves Manager.
2. From the staff member's account page, select the Donor Data tab.
3. Edit the Donor Info panel, and select the checkbox Is a moves manager.

   After saving this change, the staff member can be selected as a donor's Moves Manager.

To assign a Moves Manager to a contact

Any contact in iMIS can be assigned to a Moves Manager. Once assigned, the contact appears as a Major Donor assigned to the Moves Manager from Fundraising > Manage moves.

1. Find and select the contact.
2. From the contact's account page, select the Donor Data tab.
3. Edit the Donor Info panel, and from the Moves manager dropdown list, select the Moves Manager you want to assign.

   After saving this change, the Moves Manager can manage a cultivation plan for the contact.

To manage a prospective donor's cultivation plan

The Moves Manager can create a unique cultivation plan for each of their prospective donors, then track the plan's progress.

1. Sign in as a staff member that is designated as the contact's Moves Manager.
2. From Fundraising > Manage moves, select the contact for whom you want to manage the cultivation plan.
3. Create a cultivation plan. Edit the Cultivation Plan panel to define the following:

- Gift Type – Select the gift type you hope to acquire from the donor.
- Estimated Value – Enter the estimated value of the gift.
- Planned Ask Time – Define the timeframe for the plan.
- Note – Add any notes about the plan.
- Quality – Assign a quality level to the plan. For example, from here you can mark a plan as a high priority.

4. Add Cultivation Activities to track progress on the plan:

- Type of Move – Select the type of progress made on the plan. For example, note the type of contact made with the donor.
- Date – Enter the date the move occurred.
- Note – Enter any notes related to the move's progress.
- Follow Up Date – Select a date to follow up with the prospective donor.
- Follow Up Note – Enter any notes to keep in mind for the follow up contact.

5. Save and close the window.

Donations

With the Donation Creator content item, you can integrate an online fundraising campaign into your website seamlessly. When you use the content item alone or in combination with other content items, your supporters can either pay for the gift immediately from a donation page or add the gift to their shopping cart and pay for it along with any other items from your store.

Note: Tip: See the sample donation pages in the Member quick start site. Turn on Easy edit to inspect the content records and content item configuration settings.

Building donation pages

The Donation Creator is a flexible content item that you can use in a variety of scenarios. Following are guidelines about setting it up to work in the processing modes available:

- adding a donation to the cart
- processing the donation immediately
- processing a recurring donation

Regardless of the mode you choose, you must decide how to assign the distribution that is associated with the donations you receive. See Associating the donation with a distribution.

To build standalone donation pages

You can build donation pages that allow supporters to enter their donation and payment information from a single page, bypassing the cart. There are many ways to set up your donation process, but at a minimum, you must do the following.

Go to RiSE > Page Builder > Manage content:

1. Create a new content record or edit an existing one.

   Note: For a sample content record, see @/iCore/Fundraising/GiveNow. Make a copy of this content record if you want to use it in your website.

2. You must add multiple content items to your content record to set up a standalone donation page. It does not matter the order in which these content items are defined or displayed on the page. However, some configuration options are required so that iMIS can successfully process donations.

- Donation Creator – Allows entry of donation information.
- Processing Mode: Process donation immediately.
- Distribution: See Associating the donation with a distribution for your distribution options.
- Commit sequence: 2

- Recurring Donation Creator – (optional) Allows donors to elect whether or not their donation will repeat on a specified basis (monthly, quarterly, and annually)

  Note: This content item is only available to those with the AUTOPAY license key. For more information, please see Automatic Payments.

- Commit sequence: 3.
- 'No' radio option text – No, this is a one time gift.
- 'Yes' radio option text – Yes, please make this a recurring gift.
- Gift frequency text - Select gift frequency.

  Note: This text is configurable.

- Display Name Editor – (optional) Allows donors to specify the name to be listed in all reports and acknowledgements for their donation (for example, Bob and Sue Smith). If you use this content item, you must also create a connection to the Donation Creator.
- Commit sequence: 3
- Salutation Type: Donation List As
- Tribute Gift Editor – (optional) Allows donors to make a donation in honor, memory, or recognition of someone. If you use this content item, you must also create a connection to the Donation Creator.
- Commit sequence: 4
- Contact Account Creator – Allows unauthenticated users to create an account when they submit a donation.
- Hide for authenticated users: Enable

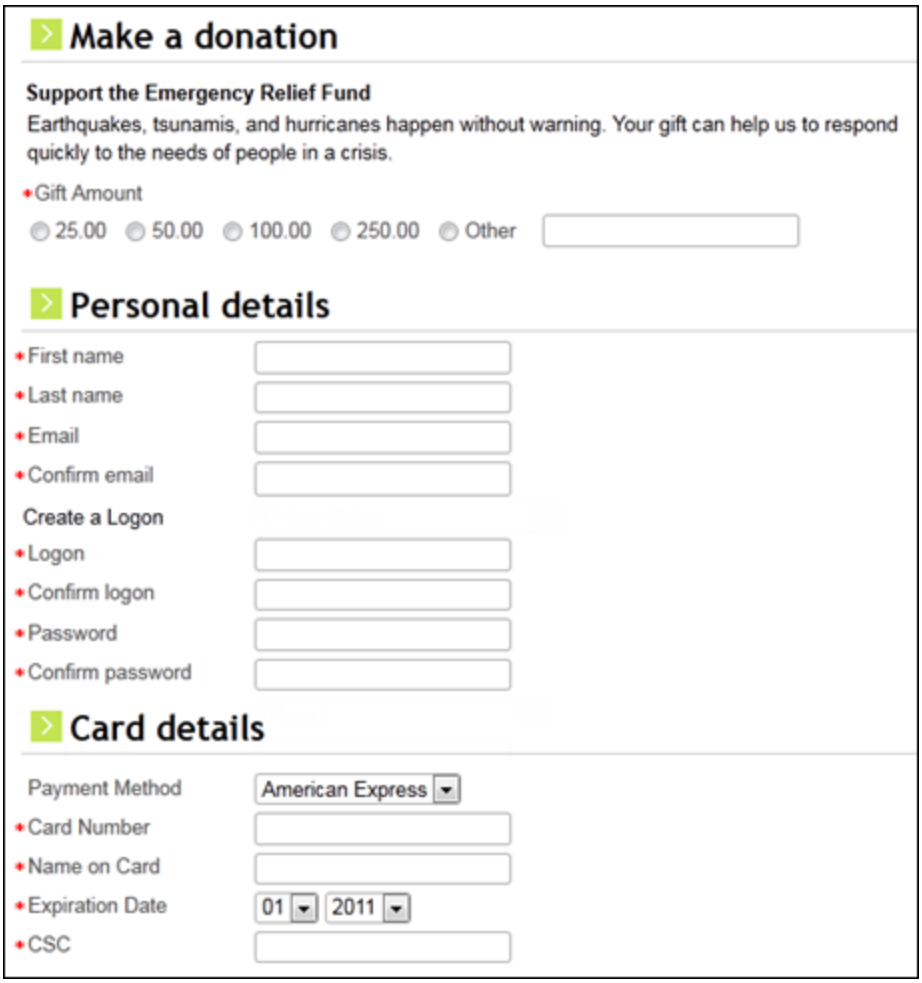
  Users must log in to make a donation, so that their contribution is recorded against an iMIS ID. Enable this option so that your supporters are only prompted to create an account if they are not logged in.

- Include option to create an account: Enable
- Require username and password: Enable
- Commit sequence: 1
- Payment Creator – Required to allow entry of payment information. For how to set up PayPal support, see PayPal Express Checkout Integration in Payment Authorization.
- Purpose: Donation
- Display Update button: Disable
- Commit sequence: 5
- Submit Order Button Link – Required to submit the donation.
- URL for order confirmation: Select a content record to display after the user has submitted a donation.

  Note: For a sample content record thanking the user for their contribution, see @/iCore/Fundraising/Donation Thank You Page. Make a copy of this content record if you want to use it in your website. It includes a link to HEP's E-Match Donor Link, which encourages donors to check if their employer has a matching gift program. Contact HEP if you want to create a custom matching gift form for your organization.
- Purpose: Donation
- Commit sequence: 6

3. Save and Publish your content record.

   When displayed in your website, the result should look something like this:

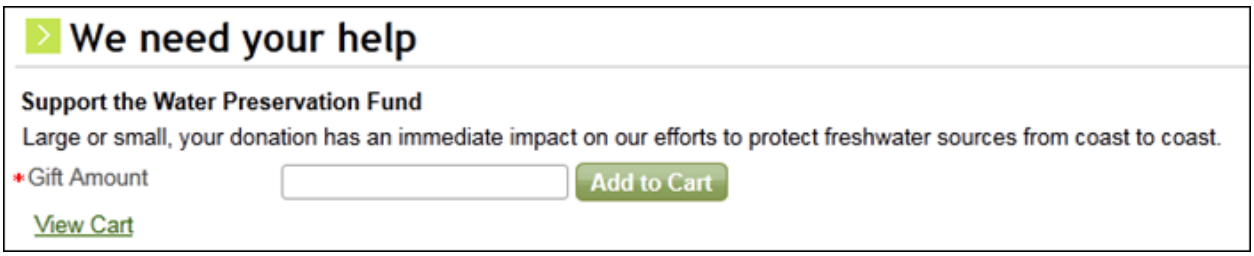


To build donation pages that use the cart

Using only the Donation Creator content item, supporters can make a donation and then pay for it separately through the cart. At that time, they must also pay for any other items in their cart.

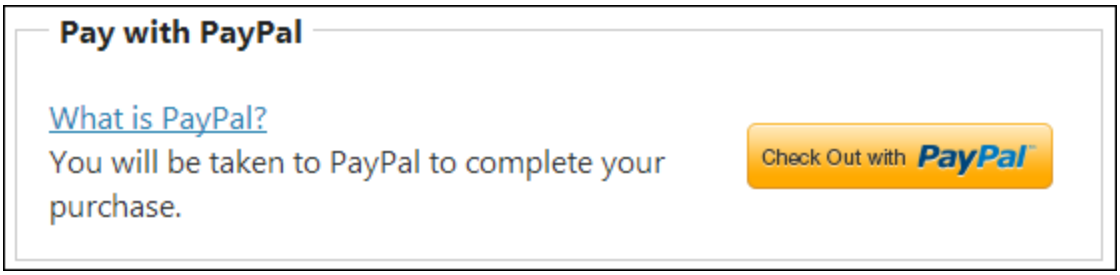
At a minimum, your content record must contain a Donation Creator content item that is configured with a Processing mode of Add donation to the cart (setting a Commit sequence is not required). You can also use it with other content items. For example, you could set up a page that features donation campaigns and products (using the General Product Display content item), each of which your users can add to their cart with a single click.

Note: Note: In this mode, you cannot connect the Donation Creator to the Display Name Editor or the Tribute Gift Editor. Those content items can only be used together when the Donation Creator is configured to Process donation immediately.



Offering Pay with PayPal

If you already accept credit cards online, you can set up Express Checkout with PayPal to integrate with your site. The PayPal option can enhance your campaign success by giving your donors the reassurance of a known and secure payment method. This option also reduces your liability for holding cardholder data, because their credit card information is stored securely at PayPal.



The Payment Creator content item supports the PayPal Express Checkout panel when it appears outside of the context of the shopping cart, on a standalone donation page.

See PayPal Express Checkout Integration in Payment Authorization for how to set up PayPal support.

Allowing donors to change the display name for the donation

To provide the option for donors to change the name listed in reports and acknowledgements for a donation (for example, The Smith Family):

1. Add the Display Name Editor to a content record that contains the Donation Creator content item configured with a Processing Mode of Process donation immediately.
2. Create a connection to the Donation Creator content item.
3. Configure the Display Name Editor Salutation Type to be Donation List As.

> **Note:** Note: When you set up a connection between the Display Name Editor and the Donation Creator, then the value entered only applies to that specific donation. When the Donation List As type is selected, and the content item is not on a donation page, then the value entered is saved for all future donations. The Donation List As salutation is synchronized with the List As field in Advanced Accounting Console > Home > Customer service > Enter and edit gifts > Overview tab. If you change one field, then the other field is also updated.

To create a connection for the Display Name Editor

1. Edit the content record that contains your donation content items.
2. Set up the connection. From the Display Name Editor content item's title-bar menu, select Connect. The Connect box that opens shows you any current connections and lets you disconnect them.
3. Click Create a new connection. The Connect box that pops up prompts you to create one of four connection types.
4. From the Object Consumer dropdown list, select your Donation Creator content item.
5. Select Connect.

6. Save and Publish the content record.

Allowing donors to make tribute donations

When you add the Tribute Gift Editor to your donation page, donors have the option to indicate if their donation is a tribute. They can choose to make their donation in honor, memory, or recognition of someone and enter a tribute message. If they choose to notify someone of their donation, the recipient information they enter creates a new contact in your database. The creation of duplicate contacts is prevented by checking to see if another contact already exists with the same name and address, or name and email address.

To allow tribute donations, add the Tribute Gift Editor to a content record that contains the Donation Creator content item configured with a Processing Mode of Process donation immediately and then create a connection to the Donation Creator content item.

To create a connection for the Tribute Gift Editor

1. Edit the content record that contains your donation content items.
2. Set up the connection:

1. From the Tribute Gift Editor content item's title-bar menu, select Connect. The Connect box that opens shows you any current connections and lets you disconnect them.
2. Click Create a new connection. The Connect box that opens prompts you to create one of four connection types.
3. From the Object Consumer dropdown list, select your Donation Creator content item.
4. Select Connect.

5. Save and Publish the content record.

Displaying gift arrays or pre-populated gift amounts

By default, the Donation Creator displays an empty gift amount field for users to enter the amount they want to donate, but you can set it up to display other gift amount formats, including:

- A pre-defined array of gift amounts from which the user can choose
- A gift amount field with a pre-populated gift amount
- An array of suggested gift amounts based on the signed-in user's prior giving history

To display a pre-defined gift array or a pre-populated gift amount in the Donation Creator

1. In the Advanced Accounting Console, go to Configure > Membership > Set up look-up/validation tables.
2. If a GIFT_AMOUNT table does not already exist, select New Table to create it.
3. Select the GIFT_AMOUNT table from the list and click New.
4. In the Code field, enter the distribution code for which you want to customize the display. For example, BLDG.
5. The values you enter in the Description field determine what is displayed on the donation webpage:

- To display an array of gift amounts, enter a comma-separated list of gift values that you want to appear in the list. For example, entering 50,100,200,500 results in a radio list of those values displayed on the page. To preselect an option, precede the number with an asterisk: 15,*25,75.

  Note: The gift array always displays an option for the user to select Other and enter any amount.

- To display a single Gift Amount field with a pre-populated gift amount, enter a single amount. For example, 25.

6. Click Save.

To display a gift array based on the donor's giving history

1. Configure the Donation Creator content item for which you want to display personalized gift arrays.
2. For the Personalized gift array query, select the query $/Fundraising/DefaultSystem/Queries/ProductFundraising/GiftArray.
3. Save and Publish the content record.

When an authenticated user visits the donation page, the donation amounts shown in the gift array are generated based on that user's prior giving history. For example, if their last donation was $50, the gift array shown for them might be 55, 110, 220, 440, and a free text entry field.

Associating the donation with a distribution

Every donation must be associated with an iMIS distribution, which is a predefined combination of a fundraising appeal, campaign, and fund. The distribution is credited with the donations you receive. It also controls the description displayed in the content item (if the configuration option Display the gift distribution description is enabled), and it controls which gift options are displayed, such as an array of gift amounts from which the user can select, a single Gift Amount field that is empty, or a pre-populated Gift Amount field.

Distributions are defined in the Advanced Accounting Console. Go to Configure > Fundraising > Set up tables > Set up distributions and premiums (see Defining distributions and premiums). For information about how to customize the Gift Amount display for iMIS distribution codes, see GIFT_AMOUNT (Lookup only).

To associate the donation with a distribution, you have two Distribution options available in configuration:

- Set the distribution by an ItemId URL parameter – Indicates that the Donation Creator content item will be dynamically populated with a distribution based on the value of an ItemId parameter in the URL (described below).

- Select a distribution– Specifies a single distribution code to be used for any donations made from the content item. If selected, this option overrides the value of an ItemId parameter in the URL.

  How to pass a URL parameter value to the Donation Creator

  Using a URL parameter allows you to set up a single donation page that is dynamically populated based on the distribution you pass to it. For example, let's say you want to provide a list of all of your current fundraising campaigns on your homepage, each of which links to a donation page for the cause. Instead of creating a custom donation page for each campaign, you can set up a single content record that contains the Donation Creator configured to Set the distribution by an ItemId URL parameter. Then you only have to add the URL parameter and distribution code to each of the links. When clicked, your content record displays the description and gift amount options associated with the distribution code.

  The link to your Donation Creator page can be built using relative links, absolute links, or navigation items.

- Relative link: To assign the URL parameter from a relative link pointing to a content record published to your website, use the Content Link content item. For example, if you have a content record with a Publish File Name of DonateNow in the @/iMIS/Fundraising content folder, and you want the link to populate the Donation Creator with the BLDG distribution, then enter the following relative URL in the Content Link content item's URL for link field: ~/iMIS/Fundraising/DonateNow.aspx?ItemId=BLDG.
- Absolute link: To assign the URL parameter through an absolute link to the page, add the URL parameter to the link's URL. For example, if you want to create a link to a donation page for the BLDG distribution, set the URL to http://mywebsite.com/donationpage.aspx?ItemId=BLDG.
- Navigation item: To assign the URL parameter from a navigation item, enter ItemId=DistributionCode in the URL Parameters field of the navigation item pointing to your content record. For example, ItemId=BLDG.

Importing Donor and Donation Data

Many organizations have third-parties, such as volunteers or telemarketers, collect donations for them. Staff users can import this donor and donation data into iMIS if it is saved in a tab-delimited file that conforms to a format recognized by iMIS. If the donor is already a contact, the import process creates and posts a donation. If the donor is a person but not a contact, the import process both creates a contact record for the donor and also creates and posts a donation. Staff users can view information in the Review log files list about both donations that post successfully and errors in the import process.

Note: Note: The import process will not update contacts or create new contacts for organization donors. It does post donations made by existing organization contacts.

Note: Note: If the data file contains information, such as address, phone number, and email information, for donors who are existing contacts (but not organizations) that differs from their saved contact information, the contacts are updated with the information from the data file. If the data file contains new address information for a contact, the import process updates the preferred mailing address. If no preferred mailing address exists, the default address is updated.

Creating the Donor and Donation Data File

In order to import donor and donation data, you must enter the data in a tab-delimited file that contains the columns listed in the table below. You must arrange the columns in the tab-delimited file in the same order as they are listed in the table.

Note: Tip: Most spreadsheet applications, including Microsoft Excel, can create tab-delimited files. The file should be saved as a text file (.txt).

You can import donor information, donation information, or both at the same time. Each row contains donor information that the import process adds as a new contact or uses to

update an existing contact if the donor is a person. It can also contain donation information that the import process adds to the contact.

Column	Notes
iMIS ID	If an iMIS ID is not present and the donor is a person, a new contact is added for the donation.
	If an iMIS ID and the required contact fields (First name and Last name for a person or Organization name for an organization) are not present, the row is not imported.
	If the IMIS ID does not match an existing iMIS ID, the data cannot be successfully processed.
Title	
First name	If a First name is not present, the donor will be considered an organization.
	If the iMIS ID, First name, and Organization Name are not present, the row is not imported.
Last name	If a Last name is not present, the donor will be considered an organization.
	If the iMIS ID, Last name, and Organization name are not present, the row is not imported.
Organization name	If an Organization name is not present, the donor will be considered a person.
	If the iMIS ID, Organization name, First name, and Last name are not present, the row is not imported.

	If an Organization name, First name, and Last name are present, a contact for the person is created or updated using the Organization name as the primary organization for the person.
Email address	
Phone	
Country	If a Country is not present, it defaults to the default country in the general finance settings. Navigate to Settings > Finance > General to change this setting. If a Country is present, it must match an iMIS country code. If it does not match a country code, the data cannot be successfully processed.
Address line 1	
Address line 2	
City / Town	
State / Province	If a State or Province is present, it must match an iMIS state or province code. If it does not match a state or province code, the data cannot be successfully processed.
Postal Code	
Gift date	The YYYY-MM-DD format is preferred, but other formats are accepted if they are valid for your web browser's language setting. If a Gift date is not present, it defaults to today's date.
Gift Amount	Do not enter a currency symbol. For example, enter 10.00 or 10 but not $10. During the import, the donation amount formats according to your web browser's language setting.
Product or Distribution code	If the Product or Distribution code does not have a match in iMIS, the data cannot be successfully processed.

Source code

To Import the Donor and Donation Data

Go to Fundraising > Import donations.

1. Confirm that Donations is selected in the File Format field.

   Note: The Import donations page uses the File Importer for Web Services content item to import donor and donation data.

2. Browse to select the tab-delimited file that contains your donor and donation data.

3. Click Upload. The file imports to an XML file that displays in the Process import files list.

   Note: Rows in the tab-delimited file that contain improperly formatted data or that do not contain required fields do not import. Error messages list the rows that do not import and explain why these rows cannot import. Even if the file contains rows that cannot import, the rows that contain all of the required information in the proper formats will still import.

4. If you want to correct errors in the data file, click Download errors to download a tab-delimited file that only contains the rows that did not import. You can correct the errors in the file and try to import again.

   Note: The Download errors button only displays if the import process found errors in the data file that prevented data rows from importing.

5. Click Process to the right of the file you imported. The donor and donation data processes, adding and updating contacts for the donors and adding and posting donations. The XML file is removed from the file list.

   Note: If the donor is a person but not a contact, processing the data creates a contact record for the donor. The process will not create new or update contacts for organization donors.

   Note: If the data file contains information, such as address, phone number, and email information, for donors who are existing contacts (but not organizations) that differs from

their saved contact information, the contacts are updated with the information from the data file.

6. View information about the processed data in the Review log files list.

- If the import succeeds, Success - [import file name].log displays in the Review log files list. Open the file to view each donation that successfully posted.
- If the import fails, because one or more donations could not be processed due to inaccurate donor or donation data , two files are created:
- Warnings - [import file name].log displays in the Review log files list. Open the file to view each donation that could not be processed and each donation that successfully posted. Review the error messages to determine how to resolve the problems.
- [import file name] - error - [timestamp].xml is created in the Process import files list. This file only lists the donor and donation data that did not process successfully. After you resolve the problems listed in the Warnings - [import file name].log file, Process this file to complete the import.

Friendraising

Friendraising adds social networking and peer-to-peer fundraising functionality to the iMIS fundraising product line. Customers who add Friendraising to their iMIS solution can empower their constituents to reach out to new members and donors. Friendraising supports campaigns and special events that rely on fundraising among peers to succeed.

This entirely web-based service empowers both the organization and its supporters. Organizations are able to communicate directly with team captains, share fundraising tips and tricks, upcoming deadlines, success stories, and other key information for the campaign. The result is dramatically increased campaign and member recruitment and fundraising revenue built upon of the strength of one-to-one relationships.

Friendraising consists of two pieces:

- The Friendraising Administration Console (a third party application) provides you with a site where you can create online fundraising events, from which your supporters can sign

up to participate, create their own personal pages, set up collection goals, raise funds, and promote their participation to their friends, family, and others.

Note: Contact your AiSP about obtaining the Friendraising Administration Console, which is separate from the iMIS Friendraising interface. The console is a required component of the Friendraising feature.

- The Friendraising Interface in iMIS provides the tools you need to import all activities from the Friendraising site into iMIS to create new contacts, event registrations, and donations. When a member clicks Sign Up on their Friendraising event home page, that transaction is considered a registration in the Friendraising system. During sign up, the member can add a Friendraising donation. iMIS uses a similar model to integrate transactions:
- A Friendraising constituent is imported as an iMIS Contact.
- A Friendraising registration is imported as an iMIS Event Registration.
- A Friendraising donation or sponsorship is imported as an iMIS Donation.

Enabling Friendraising

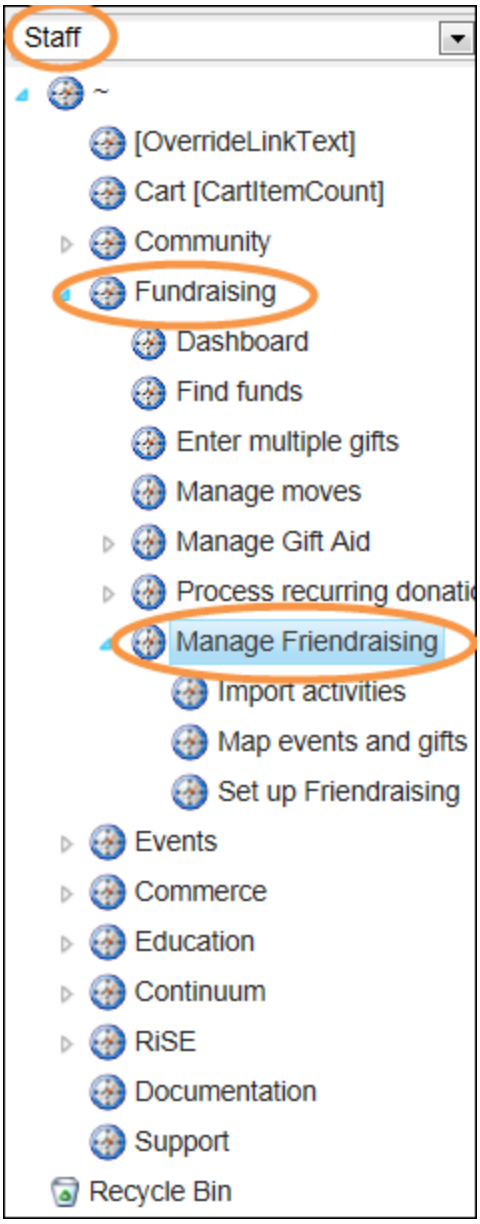
iMIS comes with the Friendraising feature pre-installed, however, by default, it is hidden and must be enabled. This is accomplished by unhiding the Manage Friendraising navigation item.

> **Note:** Note: The steps in this section are based on the default configuration of Friendraising. Your view of the product may not match these steps if your organization has implemented this feature in another way.

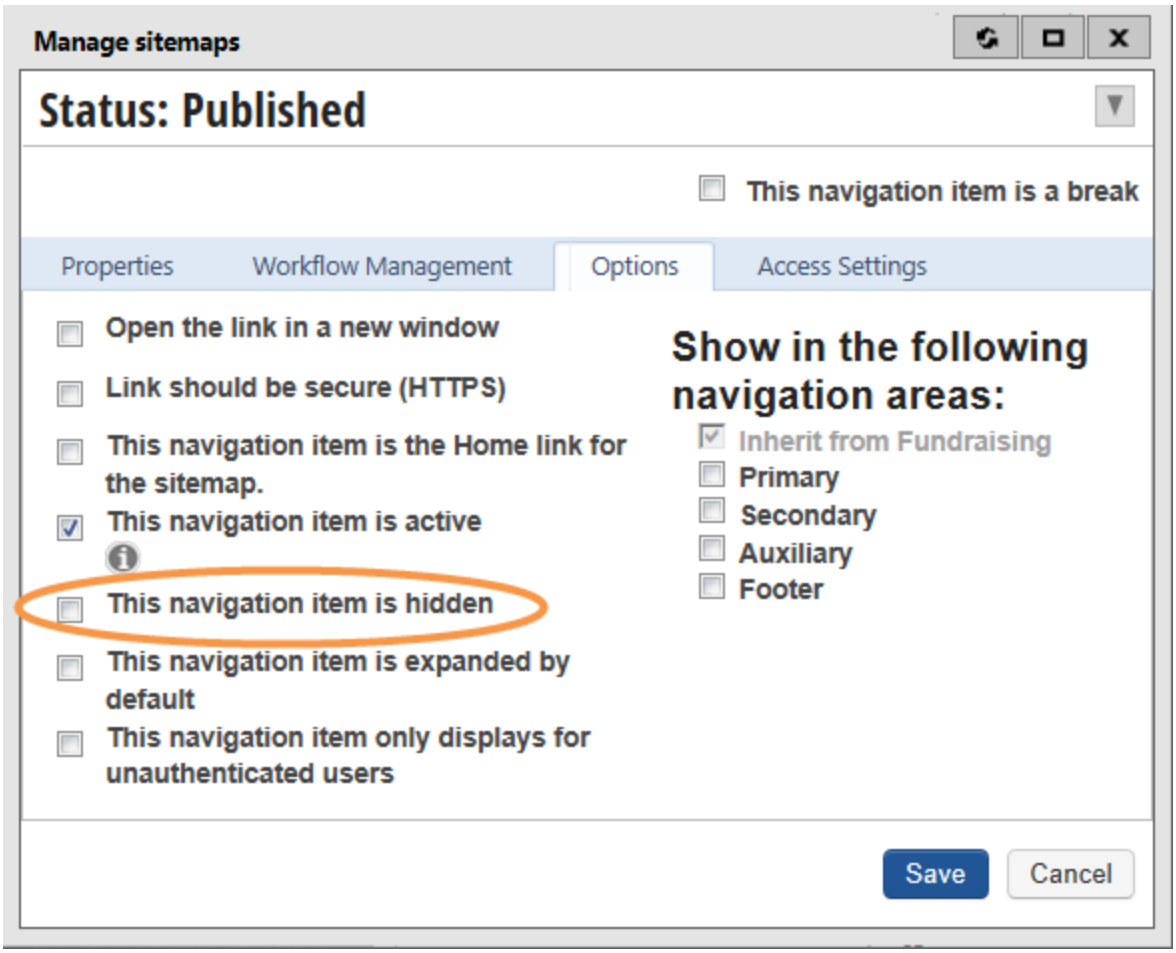
To access Friendraising on the Staff Site

Go to RiSE > Site Builder > Manage sitemaps:

1. From the drop-down menu above the sitemap tree, select Staff.
2. Reveal the Manage Friendraising navigation item.

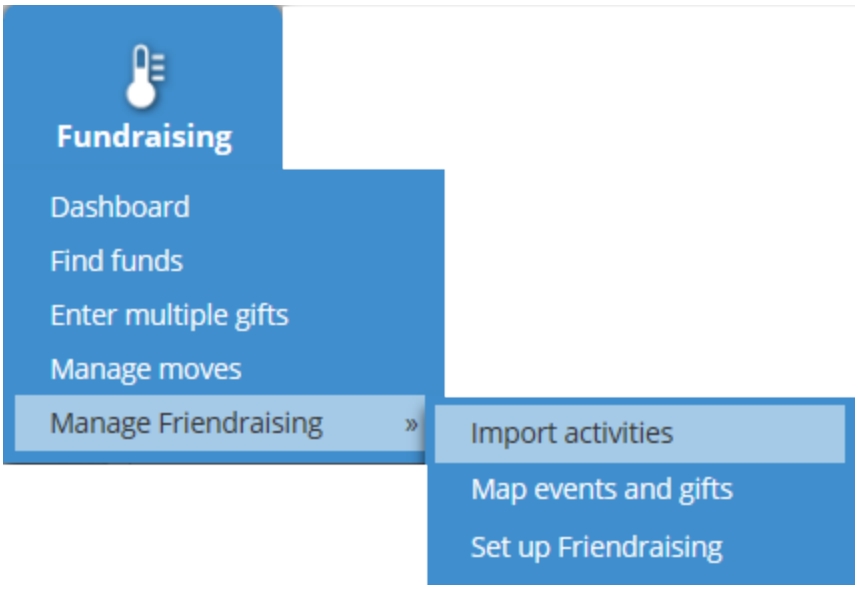


- In the sitemap tree, expand Fundraising.
- Select the Manage Friendraising navigation item.
- Click Edit.
- Under the Options tab, clear the This navigation item is hidden checkbox.
- Save, and close the window.



- From the toolbar, click Publish.

  The three Friendraising pages, Import activities, Map events and gifts, and Set up Friendraising, are displayed.



3. (optional) Set up on-demand imports using the Friendraising Importer content item.

   Note: To use this content item, your AiSP must help you set up the Friendraising Administration Console for on-demand exports.

- From RiSE > Page Builder > Manage content, edit the Friendraising Imports content record.

  Note: By default, this is available from Core Content > Tools > Friendraising Imports, However, depending on your organization's configuration selections, this content record could be elsewhere.

- Remove the File Importer For Web Services content item.
- Click add content to find and select the Friendraising Importer content item.
- Save and Publish the content record.

Setting up Friendraising

To start using iMIS Friendraising:

- Update the Staff sitemap and configure the Friendraising pages from Content Management.
- Define the settings required to use the Friendraising Bridge in iMIS.

> **Note:** Note: These settings are defined within the third party Friendraising Administrative console.

- Map the events defined in the Friendraising Administration Console to events and gifts defined in iMIS.
- (optional) Create user-defined tabs for the Friendraising tables.
- (optional) Create the Team Participation report.

> **Note:** Note: Contact your AiSP about obtaining the Friendraising Administration Console, which is separate from the iMIS Friendraising interface. The console is a required component of Friendraising.

Setting up the Friendraising pages in iMIS

To set up the default member type of imported Friendraising contacts

Your system's default member type is assigned to any new contacts created when importing Friendraising transactions. If you have not already done so, select your default member type from Settings > Organization > The default Customer Type to use when creating new customers online.

Configuring the Friendraising pages

The Friendraising pages are built in iMIS using Concept: content records, iParts, and content types that you can configure for the needs of your organization. iMIS Friendraising is comprised of the following:

Description	Default navigation	Default content records	Content items
New node on the Fundraising tab to organize the Friendraising pages.	Fundraising -> Manage Friendraising	(none)	(none)
Staff can import and process Friendraising Export Files	Fundraising > Manage	@/iCore/Tools/Friendraising_Imports	File Importer For Web Ser-

downloaded from the Administration Console. The Export File must be manually downloaded first before you can import it.	Friendraising > Imports		vices • File Viewer For Web Services • Log Viewer For Web Services
Staff can import Friendraising Export Files on demand from the third party Friendraising Administration Console, without the need to download the file first. If you prefer to use this import method, edit the Friendraising Imports content record and replace the File Importer For Web Services content item with the Friendraising Importer content item. Note: You must contact your AiSP to request that they enable your Friendraising Administration Console for exports to use this content item.	(none)	(none)	• Friendraising Importer
Staff can map the events defined in the Friendraising Administration Console to gifts and/or events defined in	Fundraising > Manage Friendraising > Map events	@/iCore/Tools/Friendraising_Mappings	• Friendraising Mapping

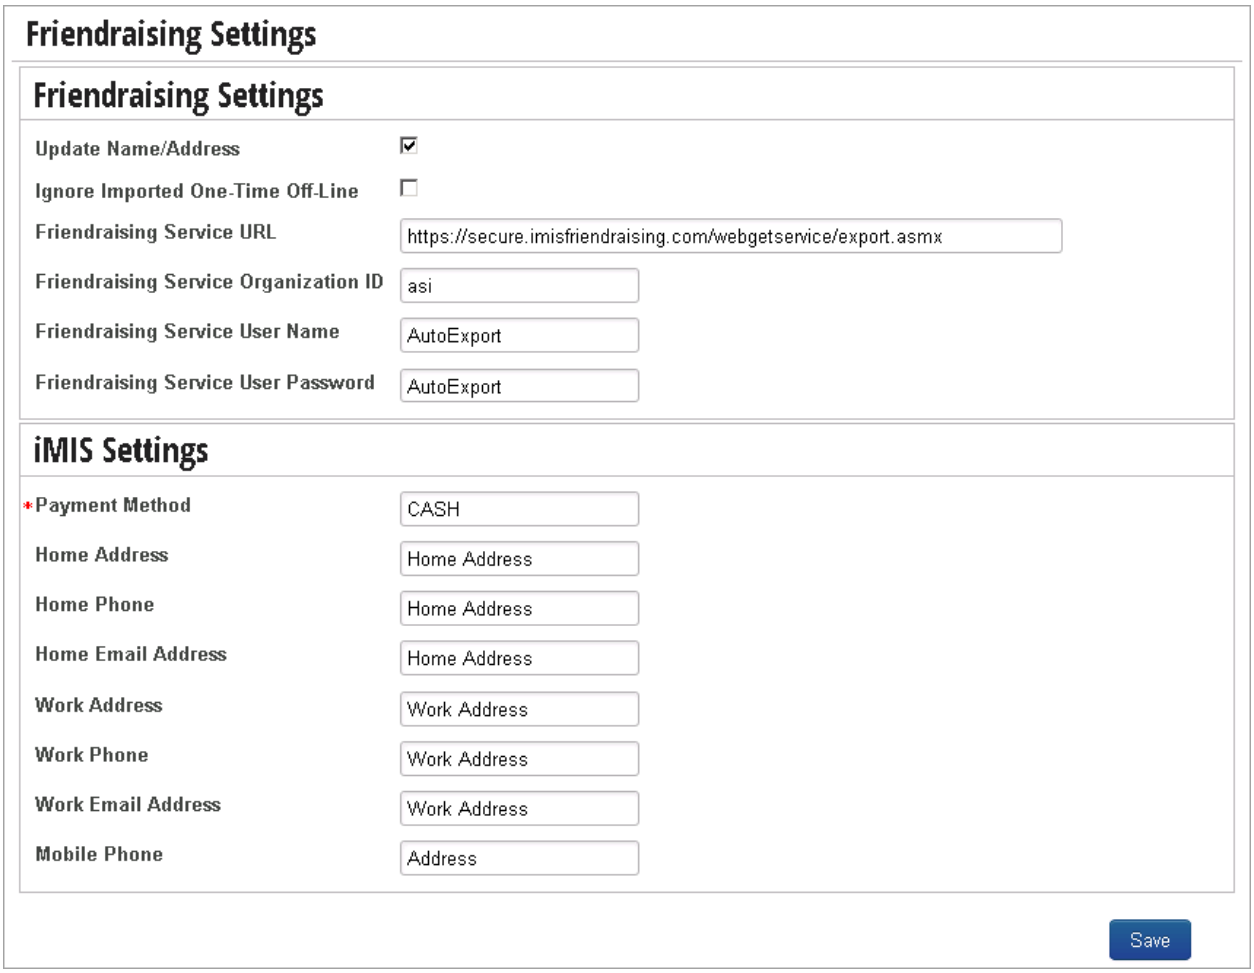
iMIS.	and gifts		
Staff can define the settings required to use the Friendraising Bridge in iMIS.	Fundraising > Manage Friendraising > Set up Friendraising	@/iCore/Tools/Friendraising_Settings	Friendraising Settings

Defining Friendraising settings

To import Friendraising contacts, event registrations, and gifts, you must define your connection settings and map the Friendraising events to iMIS events and distributions.

To define settings

Go to Fundraising > Manage Friendraising > Set up Friendraising:



1. Define the following Friendraising Settings:

- Update Name/Address: Enable this option if you want to update the name and address of Friendraising contacts in iMIS when differences are detected during an import. For example, if an existing contact registers for a Friendraising event using a new street address, their iMIS contact record is updated with the new address when you import the Friendraising transaction.

  This option does not affect new Friendraising contacts, which always generate new contact records in iMIS.

- Ignore Imported One-Time-Off-Line: Select this option if you do not want to import transactions marked as One-Time-Off-Line in Friendraising. This marker indicates that a trans-

action has been imported to the Friendraising Administration Console from an external source.

For example, when setting up a new Friendraising implementation, some users import donations into the console to maintain a historical record. These imported transactions are marked as One-Time-Off-Line in the console.

- To download your Friendraising Export Files to iMIS on demand via the Friendraising Importer content item, you must enter the following authentication information.

  Note: If you have not already done so, contact your AiSP to request that they enable your Friendraising Administration Console for on demand exports, so that you can enter the information below.

- Friendraising Service URL
- Friendraising Service Organization ID
- Friendraising Service User Name
- Friendraising Service User Password

2. Define the following iMIS Settings:

- Payment Method: Enter an iMIS Cash Account Code that is a Cash type. Incoming Friendraising transactions are associated with this code. iMIS Cash Account Codes of other types (i.e. Credit Card) cannot be used, because the incoming transactions have already been billed via the payment gateway associated with your organization's Friendraising account. We recommend that you create a distinct Cash Account of the Cash type to track Friendraising transactions, so that you can make sure these are reconciled separately from other iMIS transactions (see Setting up cash accounts).
- If you want to capture address data from your imported Friendraising transactions, you must enter an iMIS Address Usage label for each Friendraising field listed below. You can find your Address Usage labels in Desktop from Customers > Set up module > General > Address and Notes.
- Home Address

- Home Phone
- Home Email Address
- Work Address
- Work Phone
- Work Email Address
- Mobile Phone

  Note: You can only record one phone number per each iMIS Address Usage label. Therefore, you must assign a unique iMIS Address Usage label to the Friendraising Home Phone, Work Phone, and Mobile Phone settings.

  Similarly, you can only record one email address per each iMIS Address Usage label. Therefore, you must assign a unique iMIS Address Usage label to the Friendraising Home Email Address and Work Email Address settings.

3. Click Save.

   Mapping events and gifts

   To import registrations and gifts, you must first map each event defined in the Friendraising Administration Console to an event defined in iMIS. To map events, you need the Friendraising Event ID as well as the iMIS distribution, event, and function codes.

   Each Friendraising event you create in iMIS must include at least one event function. The function fees are defined in the Friendraising Administration Console.

   Each Friendraising donation is considered a single gift in iMIS. When a donor sponsors an event participant, the donation is imported as a single gift from the sponsor, but iMIS also records a soft credit in the iMIS Advanced Accounting Console on the event participant's record to show who is responsible for helping to obtain the gift.

   To map events and gifts

   Go to Fundraising > Manage Friendraising > Map events and gifts:

1. Click + Add new record.
2. Define the following Mapping elements:

- Event Id: The Friendraising event ID listed in the export file.
- Gift Item Code: The iMIS Distribution Code to be assigned to imported gifts associated with this event.
- iMIS Event Code: The iMIS Event Code to be assigned to imported registrations associated with this event.
- iMIS Event Function Code: The iMIS Event Function Code to be assigned to imported event function registrations associated with this event.

  Note: If a registration fee has been set up for the event in the Friendraising Administration Console, then you must map that event to an iMIS Event Function Code that has the same fee amount.

3. To save the event mapping, click Insert.

Setting up Friendraising user-defined tabs in iMIS Advanced Accounting Console

To record and display important information about Friendraising event participants in the iMIS Advanced Accounting Console, you must first run a SQL script that allows you to create user-defined tabs based on the Friendraising-specific tables.

To enable the Friendraising tables for user-defined tabs

1. From the ~\util folder located in your appserver's installation directory, locate the RegisterFriendraisingUDTablesV10.sql script. The ~\util path is relative to the root of your iMIS application.

2. From SQL Server Management Studio, execute the Register-FriendraisingUDTablesV10.sql script on your iMIS database.
3. From iMIS Advanced Accounting Console, create user-defined tabs for the following Friendraising tables and fields:

- To create and edit the user-defined tables, go to iMIS Advanced Accounting Console > Configure tab > Membership > Configure membership options > Additional Windows.

Description	Table	Fields
Contains information about any teams a contact has joined as part of an event registration.	Name_FRTeamInformation	ID SEQN MEETING TeamID TeamName TeamType TeamGoal TeamCaptainAlternateId
Contains information about a contact's event registrations.	Name_FREventInformation	ID SEQN MEETING LocationID RegistrationType ParticipantGoalOnline
Contains survey questions and the contact's answers.	Name_FRSurveyQuestion	ID SEQN MEETING

		QuestionID AnswerID AnswerValue
Contains the contact's mail and email opt out preferences.	Name_FRAdditionalInfo	ID HomeMailOptOut HomeEMailOptOut WorkMailOptOut WorkEMailOptOut
Contains a record of each registration or donation that has been successfully imported for a contact.	Name_FRTransactionLog	ID SEQN TransactionID TransactionType EventID ConstituentID DateImported
Contains a contact's AlternateId, which is the constituent ID in Friendraising. Note: Name_AlternateId is not a user-defined table specific to Friendraising, but does contain information useful for Friendraising purposes.	Name_AlternateId	ID SEQN IdType AlternateId

Managing Friendraising transactions

Use iMIS Friendraising to import Friendraising event registrations, donations, and contacts via Export Files downloaded from the Friendraising Administration Console.

> **Note:** Note: The steps in this section are based on the default configuration of Friendraising. Your view of the product may not match these steps if your organization has implemented this feature in another way.

To import, process, and post Friendraising data

1. Import the Friendraising export file manually.

- Manual download, using the File Importer For Web Services content item:
- Download the Friendraising export file from your Friendraising Administration Console.
- In iMIS, navigate to Fundraising >Manage Friendraising > Import activities.
- Select XML file from the File Format list.
- Browse for the export file that you just downloaded, and then click Upload.
- The file is added to the list under the File Name column and is updated with a timestamp.

2. From the file list, click Process on the line of the file you imported.

   When you click Process, iMIS uses your mappings to process the registrations and gifts in the Friendraising export file, and it removes the import file from the File list. One of two scenarios may occur:

- Import succeeds:
- Success - [import file name].log is created in the Log Viewer. The log lists each transaction that successfully posted.
- Import fails (one or more transactions could not be processed):
- Warnings - [import file name].log is created in the Log Viewer. The log lists each transaction that could not be processed and any payments that have been successfully posted. Review the error messages to determine how to resolve the problems.
- [import file name] - error - [timestamp].xml is created in the File list. This file contains only

those transactions that could not be processed. After you resolve the problems listed in the Warnings log file, Process this file to complete the import.

3. From iMIS Advanced Accounting Console, navigate to Accounting > Processes > Manage batches.

   Imported Friendraising transactions are automatically placed in system-generated batches that are created based on the date the import took place. All of the transactions from a single day are placed in a batch named Auto-Created, created by AUTOBATCH. This batch may contain other auto-created transactions. If today's Friendraising batch is closed, and a new import takes place, a new batch is created with today's date.

4. To review the imported Friendraising transactions, select the appropriate Auto-Created batch and click Print Selected.

5. To post the batch, click Post Selected.

Creating a Team Participation report

For easier querying and reporting, use the vFRParticipantTeamCaptain view, which unites team, team captain, and participant information. The view is created when you install Friendraising, and it contains the following columns:

- ID
- Meeting
- Team ID
- Team Name
- Team Type
- Team Goal
- Captain ID

To report on this information, create a Team Participation query based on a business object that uses this view.

To create the Team Participation report

1. Create the new business object.

   Go to RiSE > Business object designer:

- Select New > Design Business Definition.
- Name the object FriendraisingTeamInfo.
- Click Create Object.
- (Database tab).
- From the Tables section, click Add.
- Select the vFRParticipantTeamCaptain view and click OK.
- The Available Columns section is updated to list the view's fields.
- From the Available Columns list, select the fields you want to be listed as Properties of the business object and then click Add as Properties. The properties are added in the order you select them. Or you can Add All as Properties. If you add all fields as properties, the properties are added in alphabetical order.
- Click Save and then Publish.

2. Define a query using the new business object.
3. Create a report using the new query.

Gift Aid (UK)

iMIS Gift Aid allows UK charities to reclaim tax on Gift Aid donations. This adds significant value to a gift at no cost to the donor.

How Gift Aid works

Paul earned £1000 last month. Assuming he pays regular income tax on his earnings at the basic rate of 20%, £200 in tax was deducted from his pay, or £25 in tax for every £100 in pay.

Paul then makes a donation of £100 to your charity. If Paul completes a Gift Aid declaration, you can reclaim the £25 he paid in tax on this £100 donation. Thus, your charity receives £125 (£100 donation + £25 tax reclaim) at no extra cost to Paul.

Changes to Gift Aid beginning April 6th, 2008

Since April 6th, 2000, charities have been able to claim Gift Aid relief at the basic rate of income tax (22%) if the individual donor consented and the donation was eligible for tax relief.

On April 6th, 2008, the basic rate of income tax changed to 20%, reducing the amount of Gift Aid relief available to charities. However, the government instituted a period of transitional tax relief that will last from April 2008 to April 2011. During this time, charities can claim 20% Gift Aid relief on donations and the HMRC will make up the remaining 2%.

Charities do not need to make a special claim for transitional relief. HMRC pays it automatically along with your Gift Aid tax repayment.

For more information about Gift Aid, visit the HMRC Gift Aid site.

Managing Gift Aid (../Admin)

Use iMIS Gift Aid to manage the following tasks:

- Recording a contact's Gift Aid declaration, so that you can reclaim tax on their donations.
- Generating Gift Aid tax reclaim data so that you can track the eligible Gift Aid donations your organization has received. You can also mark these as claimed, so that those transactions do not show up in future iMIS generated reclaims.
- Creating a printable report that you can use to reclaim tax from the HMRC. Visit the HMRC for more information about how to reclaim tax on Gift Aid.

Recording Gift Aid declarations

If a donor is a UK taxpayer, they can make a Gift Aid declaration to your organization, so that you can reclaim the tax paid on their donation. Donors can make Gift Aid declarations online, by filling out a form, or by phone, but you must confirm the declaration in writing. The declarations you enter into iMIS are matched against the donations you

receive when you generate Gift Aid tax reclaims. You can only reclaim the tax if a donor has a valid Gift Aid declaration.

A donor's declaration only has to be completed once for your charity and can be valid for as long as the donor remains a taxpayer. It is the donor's responsibility to inform you when they are no longer eligible for Gift Aid. In theory, all declarations could be open-ended. However, many organizations prefer to contact donors periodically to check that they are still taxpayers, and thus use an arbitrary declaration length of four or five years.

> **Note:** Note: A 30-day cooling off period is applied to all gift aid declarations, based on the Date Received entered for the declaration. During the cooling off period, no tax can be reclaimed for the contact. Once the 30-day period is over, donations received from the contact are eligible for gift aid reclaims.

To enter a Gift Aid declaration

1. From iMIS Web View, select Community > Find contacts.
2. Search for and select a contact.
3. From Contacts > Contact management, select Gift Aid declarations.
4. Select Create new declaration.
5. Create a new declaration using the fields described in the Gift Aid declaration window section.
6. Click Save.

To generate Gift Aid tax reclaim data

1. Navigate to the Tax reclaim page in iMIS. By default, it is located on iMIS Web View under Donations > Gift Aid.
2. Enter the tax recovery information using the fields described in the Gift Aid tax reclaim window section.
3. Click Generate Claim.

The new claim appears in the Review Claim section.

4. Select Review next to the new claim.

   The Claim Details page opens.

5. Review the transactions in the claim.

   Note: iMIS does not check for missing or incomplete donor names in the claim. We recommend that you review the data and update records within iMIS as needed.

6. (optional) From the In Claim column, use the transaction checkboxes to exclude or include transactions in the claim. You can locate specific transactions using the Transaction ID or Contact ID fields.

   Changes to the transactions in the claim are automatically saved as you make your selections.

7. To ensure that the transactions in the claim do not appear in any future claims, select Mark as Claimed.

   To create a Gift Aid tax reclaim report for the HMRC

1. Navigate to the Tax reclaim report page.

   By default, it is located on iMIS Web View under Donations > Gift Aid.

2. From the list, select Gift Aid Claim Report and click Run.

3. In the Gift Aid Reference Equals field, enter the claim's Tax Reclaim Reference.

4. Click Run.

   The tax reclaim report appears.

5. To export the report to a PDF or Excel file, click the one of the export icons located in the top-left of the page.

Gift Aid declaration window

These fields define a donor's gift aid declaration. By default, these fields are found in the following location:

- From iMIS Web View, select Contacts > Find contact, and then search for and select a contact. From Contacts > Contact management, select Gift Aid declarations.

  Fields

- Prefix, First Name, Last Name – Defaults to the selected contact's prefix and name. These fields must contain the name of the individual paying tax for the gift aid declaration.
- Address, Address 2, Address 3, City, County, Postcode, Country – Defaults to the selected contact's main address in iMIS. For HMRC reporting purposes, the address fields must contain the taxpayer's correct address.
- High-rate tax payer – Indicates that the donor is a high rate tax payer. This field is for informational purposes only and does not affect the amount of tax reclaimed. You could use this information, for example, to target marketing campaigns to these donors.
- Declaration Notes – Captures notes about the declaration.
- Status – Specifies the status of the declaration.
- Declaration Method – Specifies how the declaration was made.
- Confirmation Required – Indicates that confirmation of the declaration must be obtained from the donor before any tax can be reclaimed. For example, a declaration made verbally requires confirmation. When cleared, no further confirmation is required.
- Confirmation Sent Date – Specifies the date a confirmation letter was mailed to the donor.
- Date Received – Specifies the date the donor made the declaration.

  Note: A 30-day “cooling off” period is applied to all gift aid declarations, based on the Date Received entered for the declaration. During the cooling off period, no tax can be reclaimed for the contact. Once the 30-day period is over, donations received from the contact are eligible for gift aid reclaims.
- Effective From – Specifies the date from which the declaration is valid.
- Apply 4 year rule – Sets the effective date of the declaration to a rolling four-year period that equals today minus 4 years.

- Other – Specifies a fixed date from which the declaration is valid.
- Expiry Date – Specifies the end date of the declaration. An end date is not required. However, some organizations prefer to contact donors periodically to check that they are still taxpayers, and thus use an arbitrary declaration length of four or five years.
- Related Appeal – Specifies a related appeal code associated with the receipt of the declaration.

Gift Aid tax reclaim window

These fields define a donor's gift aid declaration. By default, these fields are found in the following location:

- From iMIS Web View, select Donations > Gift Aid > Tax reclaim.

Fields

- Tax Reclaim Reference – Specifies a unique reference for the claim. The reference can be any combination of letters, numbers, or special characters. It has a maximum length of 50 characters.
- From / To – Specifies the date range of the tax reclaim. The From and To dates must not cross the end of a UK tax year which runs from 6 April to 5 April the following year.
- Tax Rate – Specifies the tax rate to be applied to the tax reclaim. Claims made for transactions before 6 April 2008 use a 22% tax rate, and transactions after that date use the prevailing tax rate.

Setting up Gift Aid (../Admin)

To set up Gift Aid in iMIS, you must:

- Edit iMIS Web View sitemap to display the Gift Aid navigation items.
- Configure the Gift Aid pages.

To display the Gift Aid navigation items

Go to RiSE > Site Builder > Manage sitemaps:

1. From the drop-down menu above the sitemap tree, select iMIS Web View.

2. Reveal the Gift Aid declarations navigation item.

1. In the sitemap tree, select Contacts > Contact management > Gift Aid declarations.
2. From the toolbar, click Edit.
3. (Options tab) Clear the This navigation item is hidden checkbox.
4. Click Save.
5. Close the window.
6. From the toolbar, click Publish.

3. Reveal the Gift Aid navigation item.

1. In the sitemap tree, select Donations > Gift Aid.
2. From the toolbar, click Edit.
3. (Options tab) Clear the This navigation item is hidden checkbox.
4. Click Save.
5. Close the window.
6. From the toolbar, click Publish.

To configure the Gift Aid pages

iMIS Gift Aid is built using content records and content items (Concept: content records, iParts, and content types) that you can configure for the needs of your organization.

By default, iMIS Gift Aid is comprised of the following:

Description	Default sitemap navigation	Default content record	Content items
Record and manage Gift Aid declarations from donors.	Contacts > Contact management > Gift Aid declarations	@/iCore/Fundraising/Gift Aid declarations	ContentTypes/Offering/Gift Aid Declaration

Generate data for Gift Aid tax reclaims.	Donations > Gift Aid > Tax reclaim	@/iCore/Fundraising/Gift Aid tax reclaim	ContentTypes/Offering/Gift Aid Reclaim
Create tax reclaim reports for the HMRC.	Donations > Gift Aid > Tax reclaim report	(none)	(none)

Standing Orders (UK)

Some donors like to give recurring, open-ended gifts by instructing their bank to pay a certain amount of money each month, quarter, or year directly to the non-profit's bank account. In the UK, these bank instructions are known as Standing Orders. Unlike a continuous credit card donation or a direct-debit bank transaction, the donor initiates the Standing Order and the bank makes regular payments on the donor's behalf.

In iMIS, Standing Orders are known as Commitments. iMIS allows charities to manage various aspects of the Standing Order process, such as:

- Handling donor commitments – Logged-in public users can make a Standing Order commitment from a simple webpage and staff can add, update, or delete commitments using specialized staff screens.
- Generating expected payments – Staff can run a monthly report that calculates the income expected from each donor so that the non-profit knows how much income is expected from Standing Orders.
- Importing bank payments – On a periodic basis, the non-profit receives or downloads the file that contains information about all of the Standing Order payments it has received from donors. Using iMIS, staff can import and process this information to match bank payments to the expected payments. iMIS gifts are created for each matched payment.

Managing Standing Orders (../Admin)

Use iMIS Standing Orders to manage the following tasks:

- Recording a contact's commitment to donate to your organization by Standing Order.
- Generating a record of the payments your organization expects to receive every month.
- Importing the Standing Order payment file you receive periodically from your organization's bank.
- Matching the payments you received from the bank to the payments you expected to receive.
- Resolving any mismatched payments.

> **Note:** Note: The following steps are based on the default Standing Order configuration shipped with iMIS. If your organization has tailored this feature, your view of the product might not match the documentation.

To record Standing Order commitments, Staff

1. From iMIS Web View, select Contacts > Find contact.
2. Search for and select the iMIS contact who has made the commitment.
3. Navigate to the Standing Order commitments page.

   By default, it is located on iMIS Web View from Contacts > Contact management > Recurring donation commitments.
4. Create a new commitment or edit an existing commitment.

> **Note:** Note: A donor can notify you of their intent to make donations by Standing Order if your organization has implemented the Recurring Donation Commitments Public View (UK) content item.

To generate expected payments

1. Navigate to the Expected payments page.

   By default, it is located on iMIS Web View under Donations > Recurring donations.
2. Select a Month/Year and click Generate Expected Payments.

To import the Standing Order payment file

1. Navigate to the Import Standing Order payment file page.

   By default, it is located on iMIS Web View under Donations > Recurring donations.

2. Select a File Format.

   The file format identifies the structure of the data within the file, so that iMIS can properly import and process the contents. Currently the Standing Order payments file - BACS format is the only supported format (see Supported Standing Order payment file format).

3. Select a file, and then click Upload.

   When you upload a file, it is prepared for processing as a common standing order payment file.

   To match imported payments to expected payments

   > **Note:** Note: The maximum import file size that can be processed depends on many factors, such as memory, processor speed, and load on the server. If you have any problems processing a large file, then we recommend that you break it up into smaller pieces of no more than 1000 transactions per file.

1. From the Files awaiting processing section of the Import Standing Order payment file page, find the file you imported in the list. The file name has been updated with a timestamp.

2. Click Process.

   When you click Process, iMIS compares the information in the imported bank file to the expected payments you have on record. For iMIS to successfully create a donation payment for the correct contact, each of the following items must match up:

- Branch Sort Code
- Bank Account Number

- Match Reference Number
- Donation Amount

  Note: An expected payment record must be generated for the month and year of the bank payment.

  After iMIS does the comparison, one of two scenarios may occur:

- If all items in the bank payment file are matched to expected payments, then:
- A Success - [import file name].log is created in the Log Viewer. The log lists each payment that has been successfully matched. An iMIS gift is created for each successful match.
- The original import file is removed from the Files awaiting processing list.
- If one or more items in the bank payment file could not be matched to expected payments, then:
- A Warnings - [import file name].log is created in the Log Viewer. The log lists each payment that could not be matched and any payments that have been successfully matched. If a Warnings log has been created, you must review the errors and take steps to resolve the payment mismatches. An iMIS gift is created for any successful matches.
- The original import file is removed from the Files awaiting processing list.
- An [import file name] - error - [timestamp].xml file is created in the Files awaiting processing list. This file contains all of the items from the original bank payment file that could not be matched. After resolving the payment mismatches, reprocess this file to complete the import.

  To resolve payment mismatches

1. From the Log Viewer section of the Import Standing Order payment file page, find the Warnings log for the file you are trying to process: Warnings - [import file name].log.
2. Click the arrow on the left to expand the log.

The log lists each payment that could not be matched and any payments that have been successfully matched.

3. Review the error entries in the list.

   The error log entry describes the problem iMIS encountered, the steps you should take to resolve the problem, and the associated payment data from the bank.

4. Resolve the payment mismatches using the information in the error messages.

5. From the Files awaiting processing section of the Import Standing Order payment file page, process the [import file name] - error - [timestamp].xml file that contains the payments that failed to match.

   If all of the problems have been resolved, a Success - [import file name].log is created in the Log Viewer. However, if there is still a problem matching payments, a new Warnings - [import file name].log is created in the Log Viewer.

6. Repeat the steps above until all payments have been matched.

Supported Standing Order payment file format

The Standing Order data file from your bank must be in the format described below for iMIS to successfully import the file and to match the payment details to the correct Standing Order commitments. Contact your bank to obtain the Standing Order data file. They should be able to provide you with the software necessary to electronically download the file in the following format.

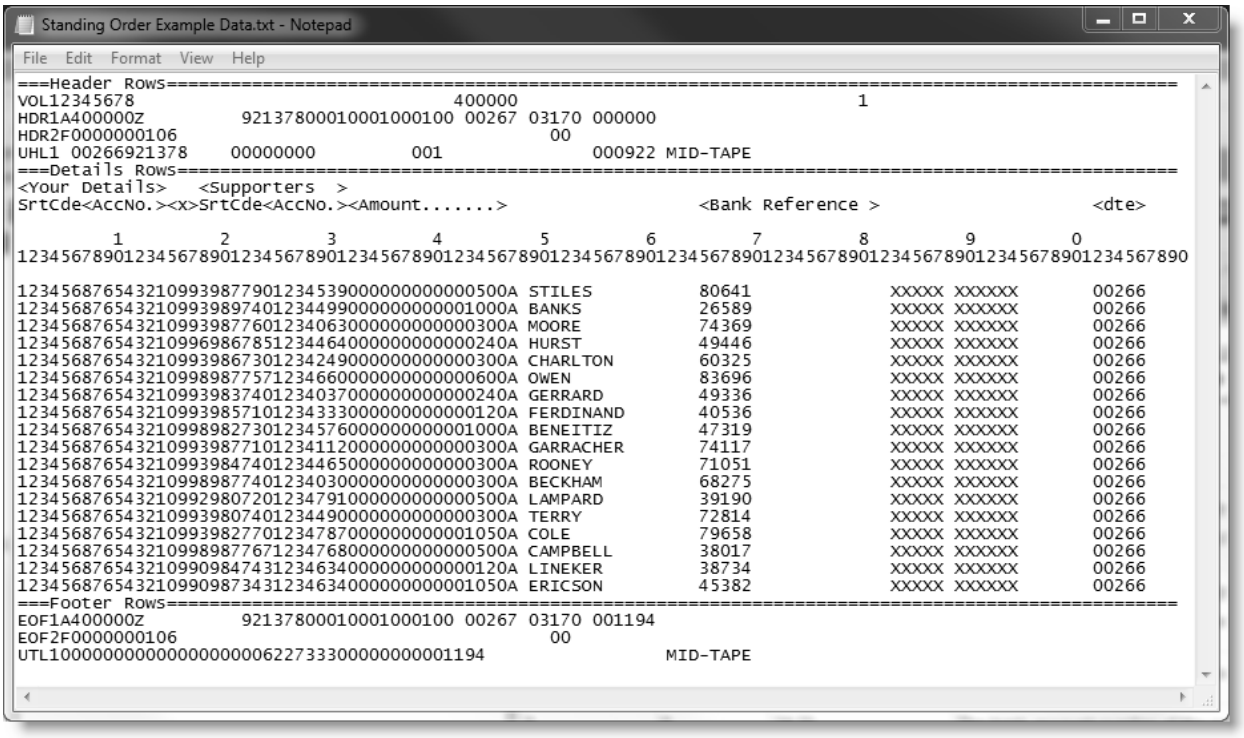
> **Note:** Note: Header and footer rows in the file are ignored during processing.

Barclays Standard Format Layout 1, 106 character data record

Field Number	Field Size	Character Position	Description
1.	6	1-6	Sort Code of your account-holding branch.
2.	8	7-14	Account Number to which the payment has been applied.
3.	1	15	Account type.

			Note: Must be 0 for the iMIS import.
4.	2	16-17	Transaction code for the entry type. Note: Must be 99 for the iMIS import.
5.	6	18-23	Sort Code of the bank from which the payment originated.
6.	8	24-31	Account Number of the originating contact.
7.	4	32-35	The mandate identifier assigned by the originating bank. If none, this field is zero-filled.
8.	11	36-46	The amount of the entry in pence, unsigned, right-justified and left zero-filled.
9.	18	47-64	The originating customer name.
10.	18	65-82	The reference number quoted by, or on behalf of, the originating customer. In iMIS, this corresponds to the Match Reference Number. If entered, normally the field is left-justified and space-filled for unused characters.
11.	18	83-100	Space-filled field.
12.	6	101-106	The date the entry was applied to the bank account, in bYYDDD format (b = blank, DDD = Julian date).

Sample Standing Order payment file



Setting up Standing Orders (../Admin)

To set up Standing Orders, you must:

- Configure iMIS batch control for Standing Orders.
- Edit your sitemap to display the Standing Order navigation items.
- Configure the Standing Orders pages.

> **Note:** Note: The steps below are based on the default Standing Order configuration shipped with iMIS. If your organization has tailored this feature, your view of the product may not match the documentation.

To configure batch control for Standing Orders

To use iMIS Standing Orders, you must set up your AR/Cash batch control to enable either Auto Sequential Batch Numbers or Auto Date Batch Numbers, if one of these options is not already selected.

After you match the Standing Order payments you receive from the bank to the payments you expected to receive, an iMIS gift is created and automatically placed in system-generated Internet batches that are created based on the date the match was made. All of the transactions from a single day are placed in a batch with the same date. If today's Internet batch is closed, and a new Standing Order transaction takes place, a new batch is created with today's date.

To display the Standing Order navigation items

Go to RiSE > Site Builder > Manage sitemaps:

1. From the drop-down menu above the sitemap tree, select iMIS Web View.
2. Reveal the Standing Order commitments navigation item. In the sitemap tree, select Contacts > Contact management > Standing Order commitments.
3. From the toolbar, click Edit.
4. (Options tab) Clear the This navigation item is hidden checkbox.
5. Click Save.
6. Close the window.
7. From the toolbar, click Publish. The Standing Order commitments page is displayed on iMIS Web View.
8. Reveal the Recurring donations navigation item. In the sitemap tree, select Donations > Recurring donations.
9. From the toolbar, click Edit.
10. (Options tab) Clear the This navigation item is hidden checkbox.
11. Click Save.
12. Close the window.
13. From the toolbar, click Publish. The Standing Order navigation items listed under Recurring donations are displayed on iMIS Web View.

To configure the Standing Order pages

iMIS Standing Orders is built using content records and content items (Concept: content records, iParts, and content types) that you can configure for the needs of your organization.

By default, iMIS Standing Orders is comprised of the following:

An authenticated public user can commit to a Standing Order donation from a simple webpage. This feature is not set up by default. You can add this content item to your public WCM website.	(none)	(none)	ContentTypes/Offering/Recurring Donation Commitments Public View
The default Thank You page that displays after a pub-	(none)	@/iCore/Fundraising/Standing Order Thank You Page	(none)

lic user makes a Standing Order commitment.			
Staff can add, update, or delete standing orders from a detailed view of the commitment. Before using this content for the first time, you must configure the content item to select a default Payment Method.	Contacts > Contact management > Standing Order commitments	@/iCore/Fundraising/Recurring donation commitments	ContentTypes/Offering/Recurring Donation Commitments
Staff can generate expected	Donations > Recurring donations >	@/iCore/Fundraising/Expected payments	ContentTypes/Commerce/Recurring Donation Expected Payments

Standing Order payments for a given month.	Expected payments		
Staff can import and process Standing Order payment files received from your organization's bank.	Donations > Recurring donations > Import Standing Order payment file	@/iCore/Fundraising/Import Standing Order payment file	ContentTypes/Utility/File Importer For Web Services ContentTypes/Utility/File Viewer For Web Services ContentTypes/Utility/Log Viewer For Web Services

General Ledger Interfaces

Implementing General Ledger Interfaces

For each GL interface, you may be required to set the general ledger options in iMIS, create a lookup validation table in iMIS, create the export file, and import the data into the general ledger. For detailed information on setting the general ledger options in the AR/Cash General Ledger Interface window in iMIS, see Configuring the general ledger interface.

List of supported and unsupported interfaces

Supported interfaces

ASI supports the following interfaces through iMIS updates by updating our exports as these products change their import requirements.

- ACCPAC for Windows
- Fundware
- Great Plains Dynamics
- Great Plains Enterprise (CS+)
- MIP Non Profit Series
- MAS90 (Sage)
- Peachtree Windows
- Quick Books Pro
- Great Plains Dynamics
- Great Plains Enterprise (CS+)
- SQL Financials
- Solomon IV

Unsupported interfaces

ASI does not support for following interfaces. These options are not removed from the iMIS menu, but iMIS is not updated to match subsequent releases of these products that change their import format requirements.

If you depend on one of these interfaces, please note the role of the Generic General Ledger Conversion Program.

Solomon IV

SQL Financials

Access Accounts

Accounting Vision

AccPac Plus (DOS)

Business Works

Deltek

Exact

Great Plains DOS

Macola

Peachtree MAC

Platinum for Windows/SQL

Sage Sterling

SBT

Solomon III

Solomon III

Accounting Vision

Great Plains DOS

Solomon III Betrieve

Generic General Ledger Conversion Program

ASI has developed numerous General Ledger (GL) interfaces to work with popular third-party accounting software packages. See ASI Support for the list of supported interfaces and the support policy.

If you are integrating to an accounting package that is not included in the list of GL Interface types supported by iMIS, you can use the Generic GL Interface and the Visual Basic (VB) Conversion Template.

The Generic GL Interface creates a standard generic export file. The VB Conversion Template reads this file and reformats the data as you specify. The advantages of using the VB Conversion Template include:

- You do not have to write a VB program to convert data; simply modify the template to meet your requirements.
- After you modify the template to meet your requirements, you can run it within iMIS during month-end procedures. No additional interface is needed to do this.

To perform a GL export with the Generic GL Interface and VB Conversion template, you must have an iMIS FSI license and you must install Microsoft Visual Basic runtime. To obtain a license, please contact your Reseller or ASI.

To use the Generic GL Interface and the VB Conversion Template

The Generic GL Interface and the VB Conversion Template are used together to create an export file that is formatted to your specifications. To use these products:

1. Create a generic export file with the Generic GL Interface.
2. Modify the VB Conversion Template for your data requirements.
3. Test the modified VB conversion program (outside iMIS).

4. Run the VB conversion program in iMIS to modify the generic export file.
5. Check the results.

To create a generic export file

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Generic or Generic 2000. The Generic type uses a 2-digit year format. The Generic 2000 type uses a 4-digit year format.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output file path/name of the export/import file to be used by the conversion program when the GL Interface runs.
6. Click Save.
7. To create the generic export file, select AR/Cash > Process month-end procedures, and click Create GL Journal. You should see one export file:

   generic.txt (standard generic layout)

   The generic export file is generated, as in the following example:

   "iMIS","8",1,04/03/2011,04032011,20110403,"1-1100",,"","000403-8","000403-8: DEMO Cash Receipt",150.00,150.00,0.00

   "iMIS","8",2,04/03/2011,04032011,20110403,"1-4000",,"","000403-8","000403-8: DEMO-MEETING-BAMS/MAIN",-150.00,0.00,150.00

To modify the VB Conversion Template

1. Launch Visual Basic.
2. Double-click the Generic GL/GenGL.exe file from the iMIS CD to the desired project folder location. Double-click the GLIntConversion.vbp file to open it in Visual Basic.
3. Make layout modifications to the ts.write line in the WriteOut() procedure.

4. (Optional) Make other modifications to the VB Conversion Template if the GL package has other requirements. For example, some GL packages require an additional header record or limit the number of transactions per file.

   To test the modified program outside of iMIS

   To make sure the modified VB conversion program is correct, test it outside of iMIS.

1. Run the standard Generic or Generic 2000 interface in iMIS to produce a test export file. Do not fill in the Conversion Program File Path/Name.
2. Create a batch file:

1. Open an editor, such as Notepad.
2. Enter the command to call the VB Conversion Template executable file and include the path of your standard generic output file. For example:

   C:\glinterface\glintconversion.exe C:\glinterface\generic.txt
3. Save the file with a .bat extension.
4. Double-click the .bat file to run the program.
5. If the program completes and the Visual Basic syntax is correct, a .bak file is created, for example: C:\glinterface\generic.bak
6. Make sure the .bak file has a more recent date or timestamp than its corresponding generic export file.
7. Compare the .bak file to the generic export file to make sure all records in the generic export file are also included in the .bak file.
8. Import the .bak file into the GL package to make sure it works correctly.

   To run the VB conversion program in iMIS

   ASI recommends that you test on a demo database within iMIS and make a backup before beginning the conversion process.

1. Note: The VB conversion program runs after the generic export file is created; therefore, all transactions included in the generic export file are marked as posted and sent to GL in iMIS before the VB conversion program executes. If the program fails, restore from a backup or use the batch file created in the previous procedure to convert the file outside iMIS.
2. Enter the conversion program file path in AR/Cash > Set up module > GL Interface > Output file path/name.
3. To create the generic export file, select AR/Cash > Process month-end procedures, and click Create GL Journal. You should see two export files:

- generic.txt (standard generic layout)
- generic.bak (VB Conversion Template layout)

To check the conversion

Check the conversion to make sure iMIS finds the correct executable program and to verify that the correct records are being exported.

1. Make sure the .bak file has a more recent date or timestamp than its corresponding generic export file.
2. Compare the .bak file to the generic export file to make sure all records in the generic export file are also included in the .bak file.

Supported Interfaces

ACCPAC for Windows

iMIS provides support to meet export requirements for ACCPAC for Windows version 2.0A or greater. This support is in place in iMIS LAN as of version 3.50b and iMIS as of version 4.01.

To set up iMIS for ACCPAC

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.

2. Click Edit.
3. From the GL interface type drop-down list, select ACCPAC for Windows.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored.
6. Click Save.

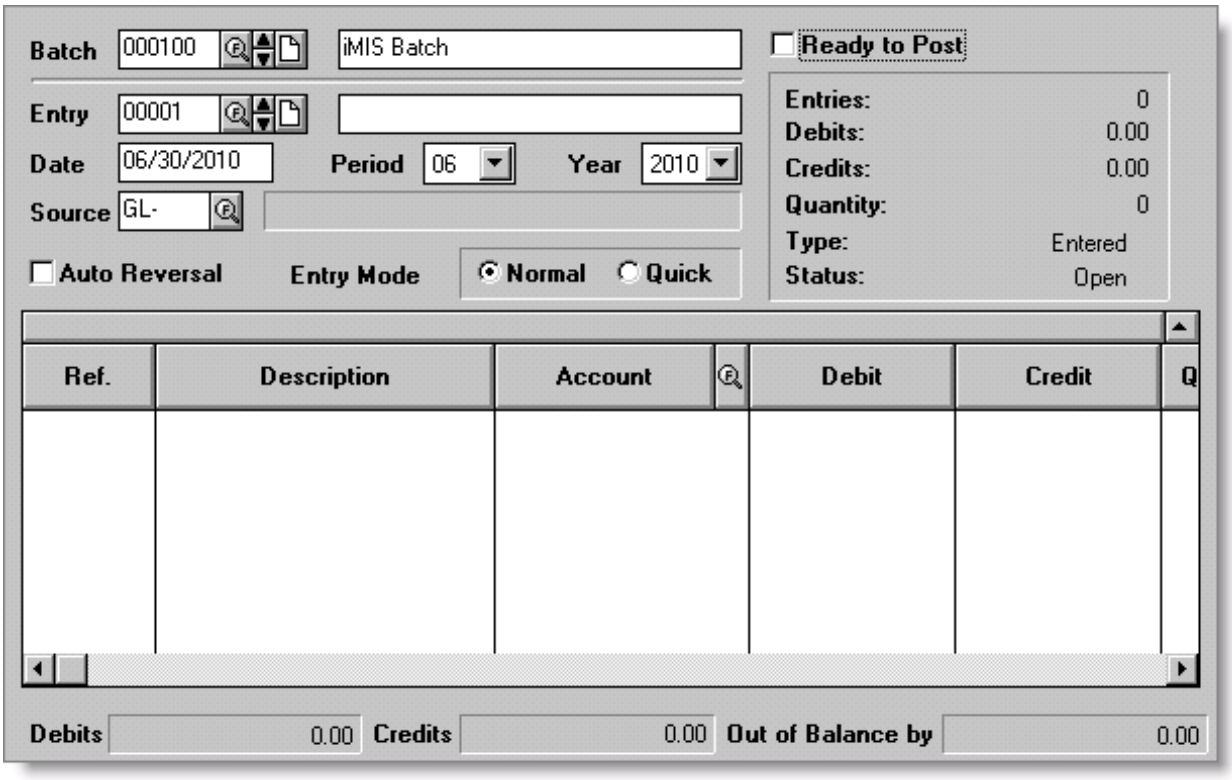
Note: No ACCPAC for Windows setup steps are required.

To create the export file from iMIS (ACCPAC)

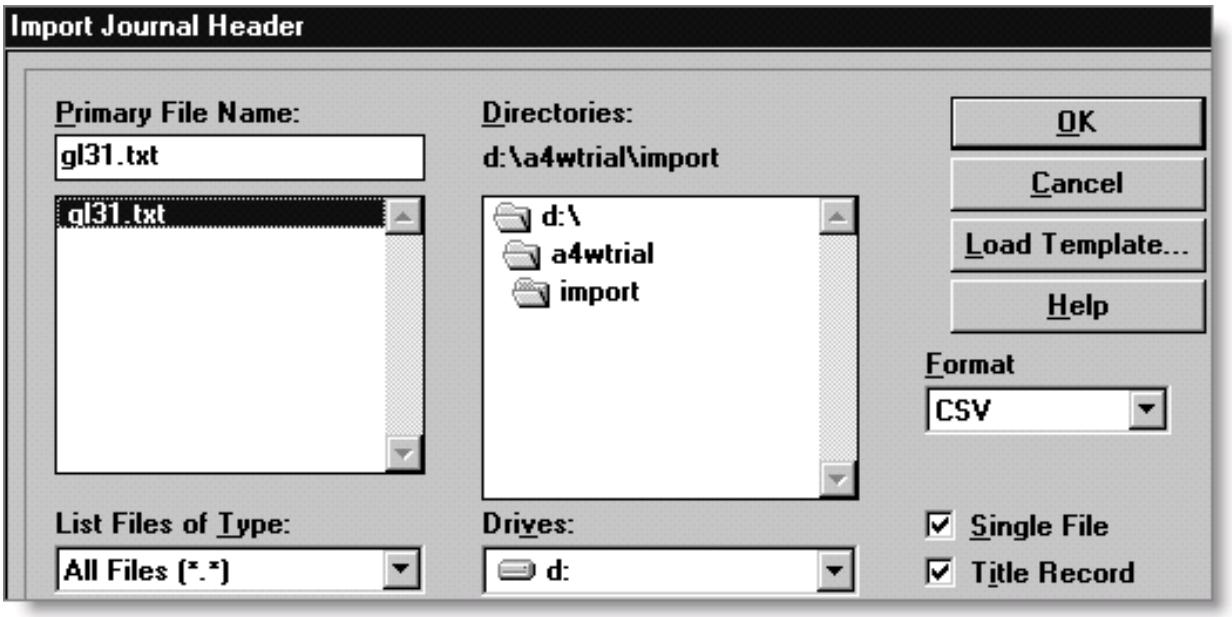
1. Select AR/Cash > Process month end procedures > Create GL Journal to generate the general ledger transaction export files.

To import data into ACCPAC

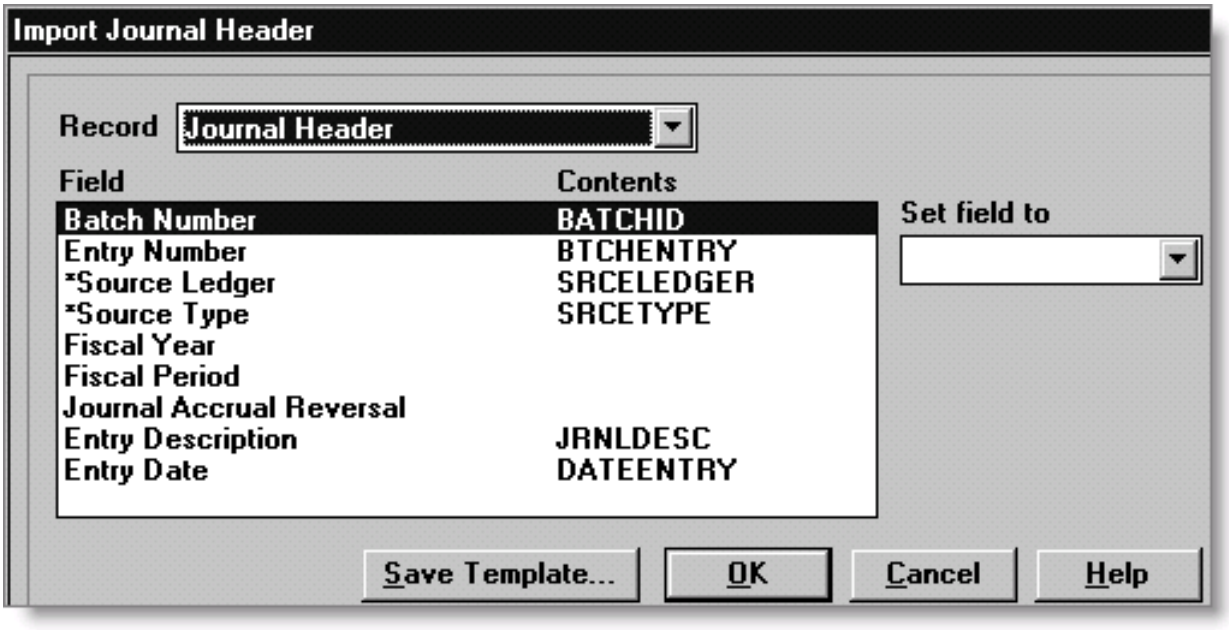
1. Open the G/L Journal Entry window.
2. Press the icon to assign a new Batch and fill in an appropriate description in the text box next to the batch number.



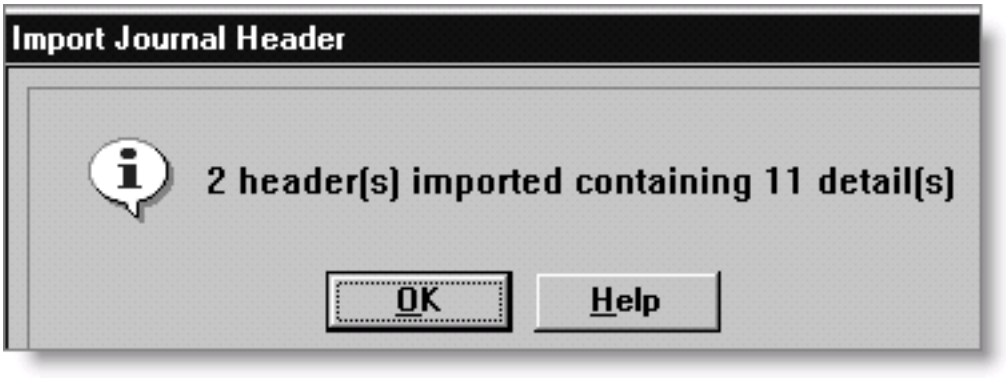
3. Select File > Import.
4. In the dialog box, navigate to and select the correct iMIS import/export file, maintaining all default options.



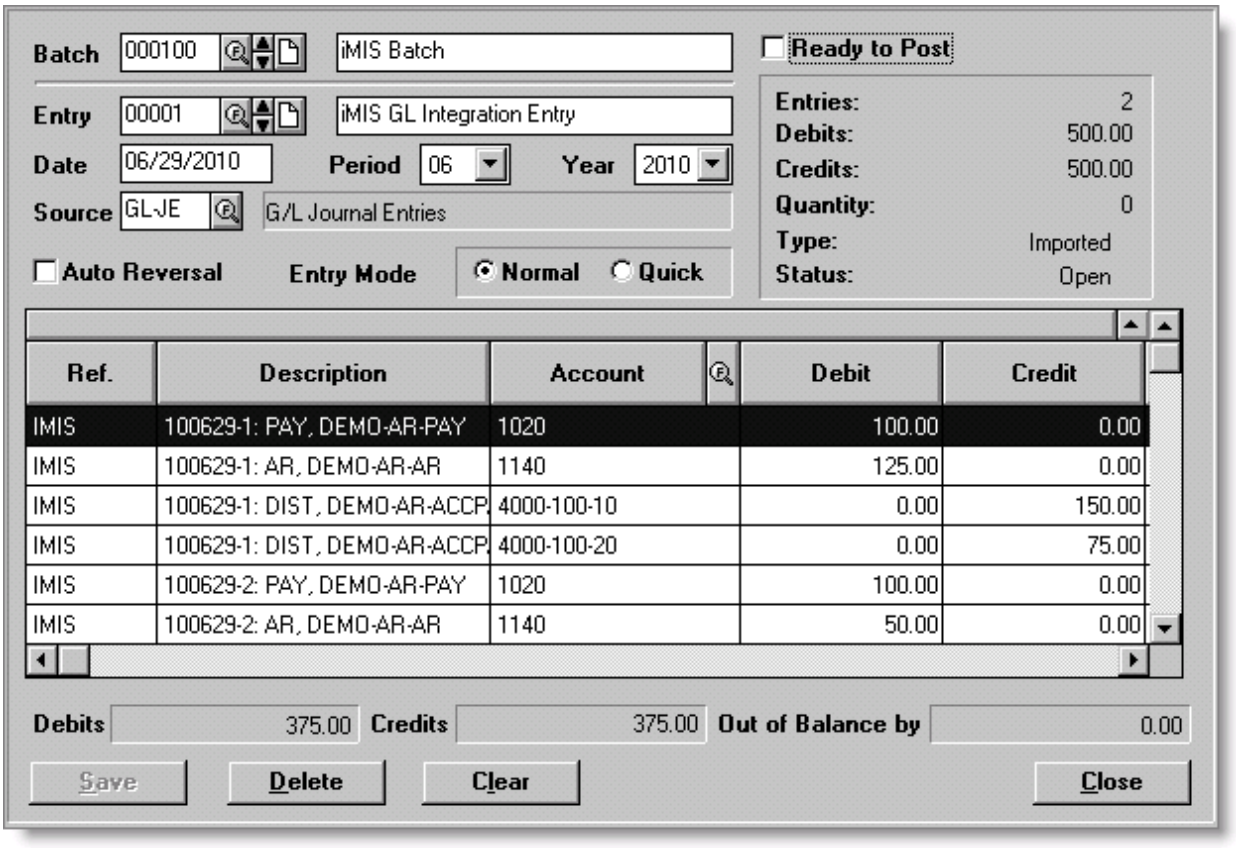
5. A second dialog box appears, based upon the field information in the import/export file (both for the Journal Header and Journal Detail portion contained in the single file).
6. Click OK to proceed with the import.



7. The import process proceeds. When it successfully finishes, a message such as the following displays.



8. Click OK to continue. The imported journal entries display in the journal entry window.



Note: Print and post the iMIS batch with normal processing procedures.

Note: Note: ACCPAC for Windows will always default the fiscal period for the imported transactions to the current or active fiscal period

Export/Import File Example

The export/import file is a two-tiered, comma-delimited file with initial title records listing the internal ACCPAC field names that correspond to the data columns. iMIS generates a separate journal entry for each transaction date that contains transaction data in the export/import file. Each exported journal entry contains a separate, single journal header record and multiple journal detail records.

The following export/import example shows a small interface file covering the period of 6/29/2010 thru 6/30/2010. The file, which was generated using the “Batch” summary

level, contains two separate journal entries, one for each day for which transactions were exported.

FundWare

iMIS Financial Systems (GL) Interface module now provides support to meet import requirements for FundWare DOS version 5.50 or greater. This support is in place in iMIS as of version 4.10.

To set up iMIS for FundWare

The setup steps from iMIS include making appropriate choices on the AR/Cash General Ledger Interface window and an optional step to establish a FUNDWARE general/lookup validation table.

The iMIS setup steps are described in detail below:

Step 1 – Change the GL Interface Type

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select FundWare.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored. FundWare specifically looks in the AFW\DATA directory for a file name of GL000X.y where X corresponds to the terminal number. For example, c:\afw\data\gl0001.y assumes a terminal number of 1.
6. Click Save.

Step 2 – Set up a special FUNDWARE General Lookup/Validation Table

This step is required if you need to map each iMIS organization code to the FundWare Division code. As the Division code is an integral part of the export file, this step is crucial unless the iMIS organization or entity code already matches the FundWare Division code. It is very possible, especially in the case of multiple funds that more than one iMIS entity (i.e., Fund) may map to a single FundWare Division code.

If the table is properly set up and the output file name contains the substitute character #, the FundWare division, not the iMIS entity, will be the key factor in determining the splitting and generation of the output files.

Note: Note: You do not have to create separate files (i.e., include a # in the output file name) if you have a single legal entity but multiple funds. iMIS treats funds as

> separate entities, but they are only handled in separate sets of books, not separate files, within FundWare. However, if iMIS transactions may cross over multiple Divisions, it is mandatory to create separate files per division (include the # separator symbol).

1. From Customers, select Set up tables > General lookup/validation to open the General lookup/validation window.
2. Select (New Table) from the list of table types. The New Table Type window opens.
3. Enter a New Table named FUNDWARE and click Save.
4. Click New and insert a record for each iMIS organization code, filling in the organization code in the Code field.
5. In the Expansion field, enter the appropriate FundWare Division code.
6. Click Save.

To set up FundWare

In FundWare, you will need to establish a special iMIS journal. The setup within FundWare includes a simple step to set up a special iMIS customer account to which all accounts receivable amounts will be linked.

1. From the General Ledger menu, choose Setup (7) > Define Journal Controls (5).
2. Enter A to Add.
3. Fill in the values as shown below.

Description: iMIS Journal Entry

Desc title: IMIS

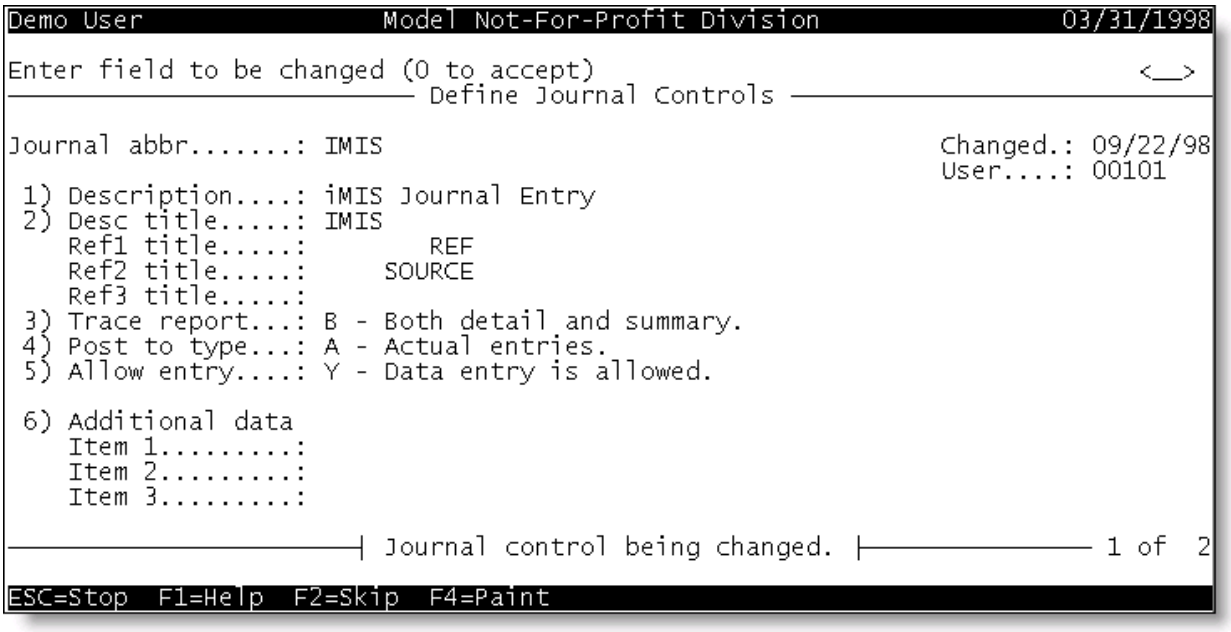
Ref1 Title: REF

Ref2: SOURCE

Trace report: B – Both detail and summary

Post to type: A – Actual entries

Allow entry: Y – Data entry is allowed.



To create the export file from iMIS (Fundware)

1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal.

To import data into Fundware

1. From the Administration menu, select Special Processing (5).
2. From the Special Processing menu, select Run Program (8)
3. Type GLS018 at the Program prompt and press Enter.
4. Type Y at the “Is above correct?” message.

The import process will begin and a message should appear giving you the assigned batch code and the filing report name. The filing report, similar to the one displayed below, should be located in the AFW\DATA directory:

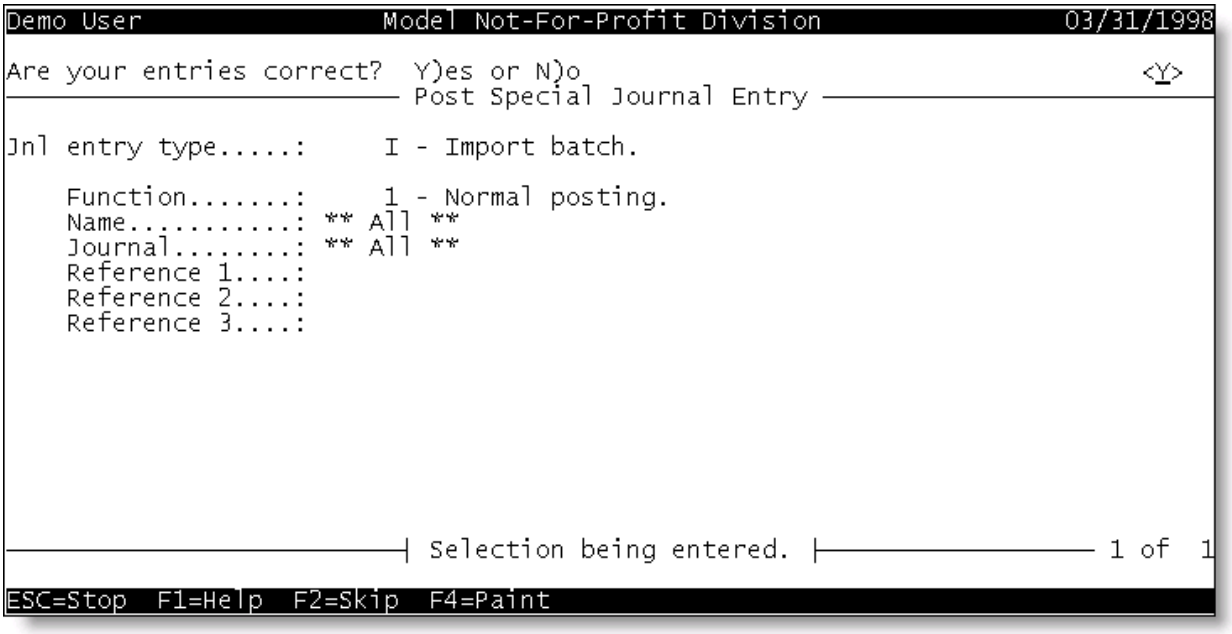
		Total for Financial Reporting System	130.00	130.00 .00

Batch 208 posted on 03/13/11 by for business date 01/14/2011

Number of lines printed = 27 *** End of report ***

The imported data is used to create unposted general journal transactions. Once imported, the data can be posted through the following steps:

1. From the General Ledger menu, choose Transaction Entry (3).
2. From the Transaction Entry menu, choose Post Special Journal Entry (8).
3. Type I for Jnl Entry Type, 1 for Function and fill in the remaining fields, as appropriate



Export/Import File Example

The export/import file is a simple fixed file export/import file that contains a single heading line for the Division (one file per Division), a document header line for each new transaction created, and detail document lines for each debit or credit entry in the document or transaction.

iMIS will generate a new journal entry and Document Number each time the following is encountered:

- A new transaction date (for Day or Detail summary methods)
- A new batch (for Batch summary methods)

The following export/import example shows a small interface file for two batches across two dates.

Great Plains Dynamics - Integration Manager

iMIS provides support to meet export requirements for Great Plains Dynamics version 5.0 or greater with the Integration Manager. This support is in place in iMIS version 4.11 and later and iMIS LAN version 3.52 and later.

Note: Address line 3, which was added in iMIS 10.6, is supported for AP refunds in iMIS 15.x export files but not in iMIS 10.6.x export files.

To set up iMIS for Dynamics

This document provides some implementation setup steps for integrating iMIS with Dynamics using the Integration Manager. Also included are the instructions for importing the iMIS export/import files into Dynamics.

On the Dynamics side, follow the steps in the Dynamics Integration Manager setup instructions.

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Dynamics 5.0. The Taylor and Taylor OIM choices remain for those users who have not upgraded from older versions of Dynamics and Taylor GL Integration Kit (GLIK). If you use Dynamics version 3.15 through 4.0, select Taylor OIM. If you use an earlier version of Dynamics, select Taylor.
4. You also may need to modify the Output file path/name to dictate the naming and placement of the output files. The Output file path/name you enter in iMIS AR/Cash GL Interface should agree with the path and file name that you enter for your Query in the Dynamics Integration Manager (DIM).
5. The Dynamics Integration Manager requires two import files: a header file and a detail transaction file. iMIS correctly exports the two needed files, but it provides a single Output file path/name data entry box for naming the General Ledger export files. iMIS assigns the name you specify as the Path/Name in setup to the detail transaction file. It names the

header file the same, except that it appends the letter H to the end of the specified name. For example, if you enter a path/file name of C:\TEMP\GLINT.TXT, iMIS creates a file named GLINT.TXT for the transaction export and a file named GLINTH.TXT for the header export file.

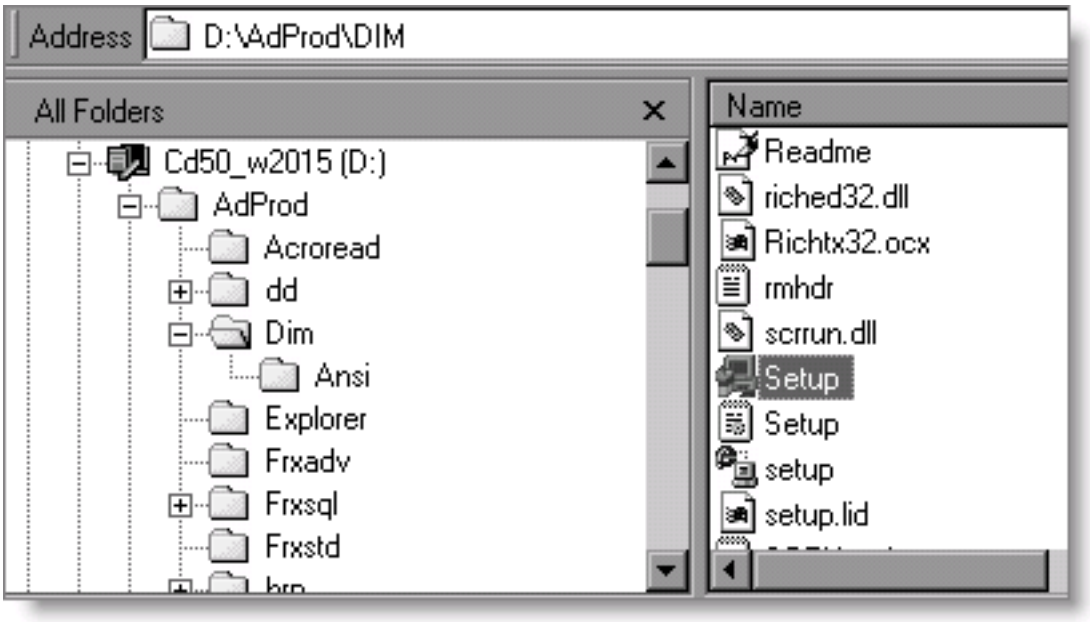
6. Click Save.

To set up Dynamics Integration Manager

The following instructions were established with the assumption that Dynamics has been fully installed/upgraded and is functioning properly. Dynamics must be installed before the following steps can be performed. Refer to the Dynamics Installation Procedures manual if you need assistance installing Dynamics.

> **Note:** Note: Be sure to enter your new or revised Dynamics registration keys at the appropriate point during the Dynamics install or upgrade. These keys make it possible for you to access the Integration Manager after it is properly installed.

Execute Setup.exe located in the AdProd\Dim directory of the Dynamics Installation CD. Follow the installation instructions in the Dynamics Integration Manager manual.



1. Launch Dynamics and answer Yes to include the new code.

2. If necessary, fine-tune the directory and/or file name for the export/import files.

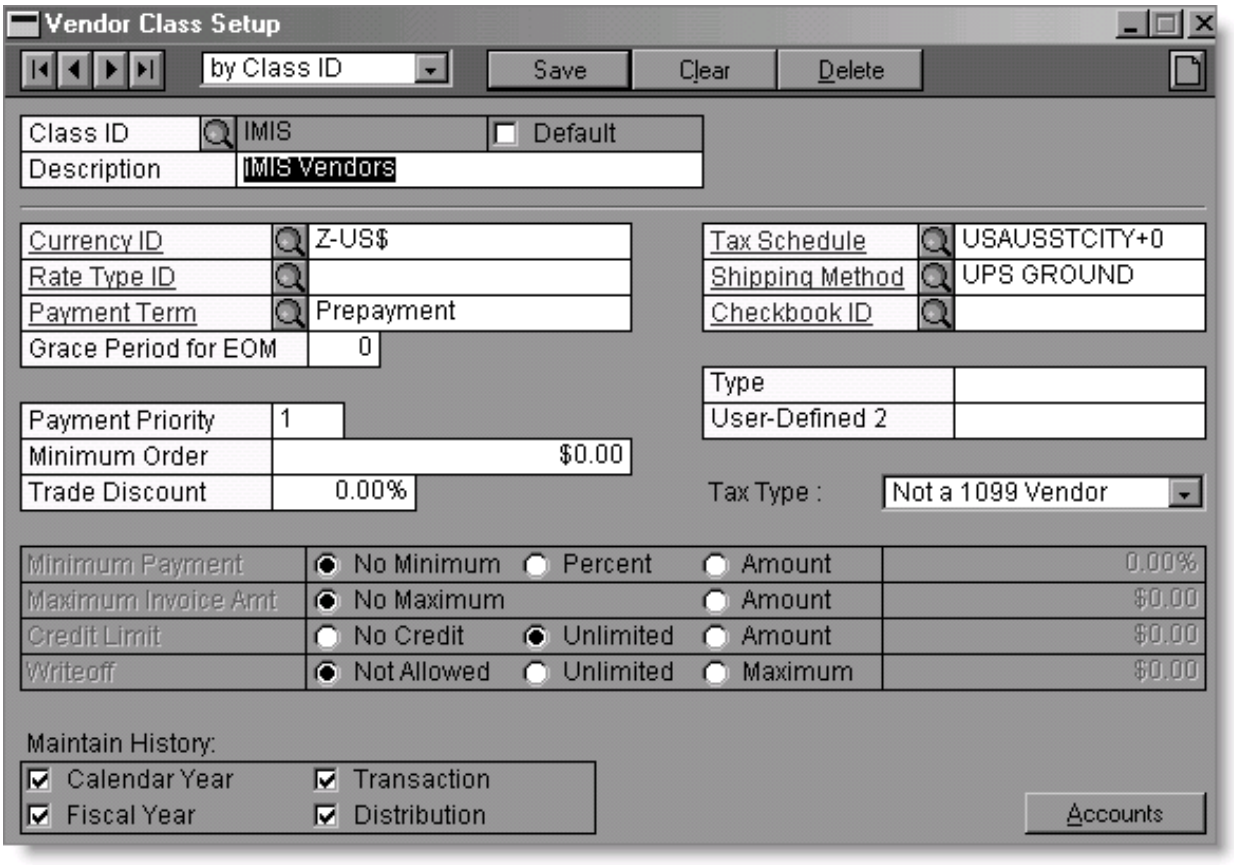
- Use an iMIS Integration to import accounting data from the export file generated by the iMIS GL Interface and AP Interface. To use an iMIS Integration, perform the following steps:
- Make a backup of your existing IM.MDB. This is an Access database that is distributed with the Dynamics Integration Manager 5.0. It contains consolidated information regarding integrations and queries for use by the DIM. It is located under the \..\Dynamics\IM\ folder of your Dynamics 5.0 installation.
- Copy and paste the IM.MDB file from the iMIS CD to \..\Dynamics\IM\.
- If your iMIS setup is complete, you are now ready to begin exporting iMIS GL and AP transactions and to run iMIS integrations in Dynamics.

3. (AP Interface only) In some circumstances, you may want to set up a special iMIS vendor classification (for example, to change the due date calculation). In this case, make a slight modification to the existing vendor interface setup.

   To change a Vendor Class (AP Interface Only)

   The iMIS-to-Dynamics setup tables are currently set so that all imported vendor records default to the default Vendor Class. If you wish, you can establish a special iMIS class (for example, to alter the payment terms) and make a minor modification so that all iMIS vendors receive this special classification.

1. Select Setup > Purchasing > Vendor Class and insert a new iMIS vendor class. The Vendor Class Setup window opens.
2. Click Insert on the left palette.
3. Enter the appropriate information in the setup fields.



To set up the Dynamics import/export files

The setup instructions are looking for specifically named export files in specific directory locations. If possible, create the specified directory and be sure to specify the same directory and file names in the iMIS setup.

The built-in external file names for the GL Interface are set as:

- GL Header Import File: C:\DYNAMICS\SYSTEM\GLINTH.TXT
- GL Transaction Line File: C:\DYNAMICS\SYSTEM\GLINT.TXT

The built-in external file names for the AP Interface are set as:

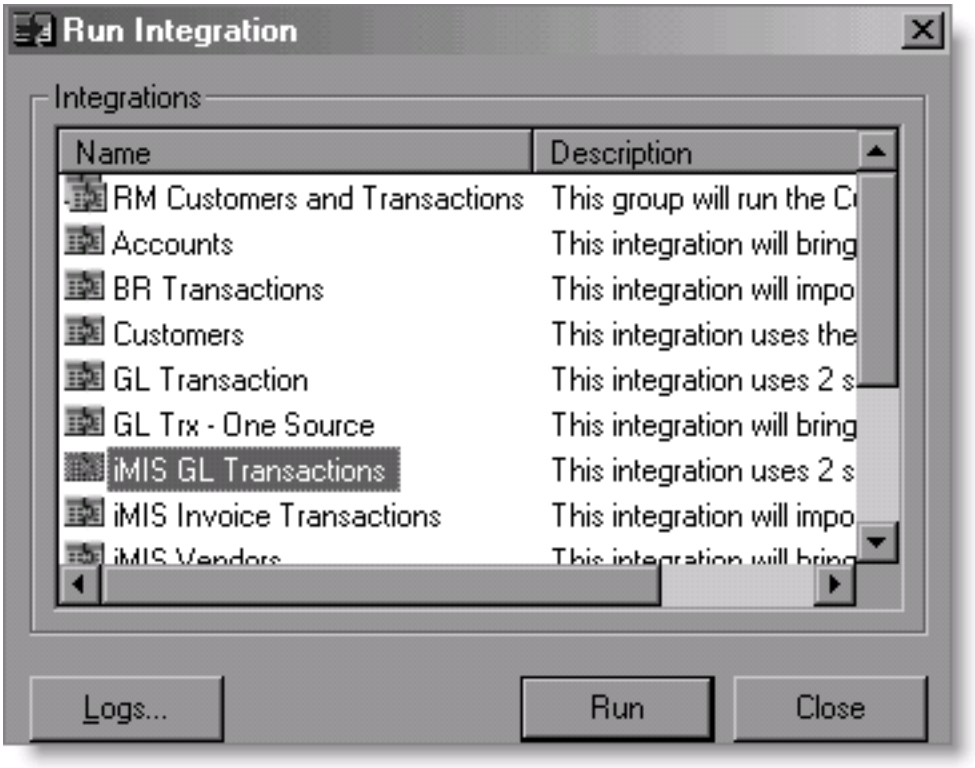
- Vendor Import File: C:\DYNAMICS\SYSTEM\VENDOR.TXT
- GL Transaction Line File: C:\DYNAMICS\SYSTEM\INVOICE.TXT

If you can maintain the file name but change the directory location, you can use the Pathname Translation tab under Tools > Options in the Dynamics Integration Manager to reroute the directory location that the iMIS Location ID points to. See the Dynamics Integration Manager manual.

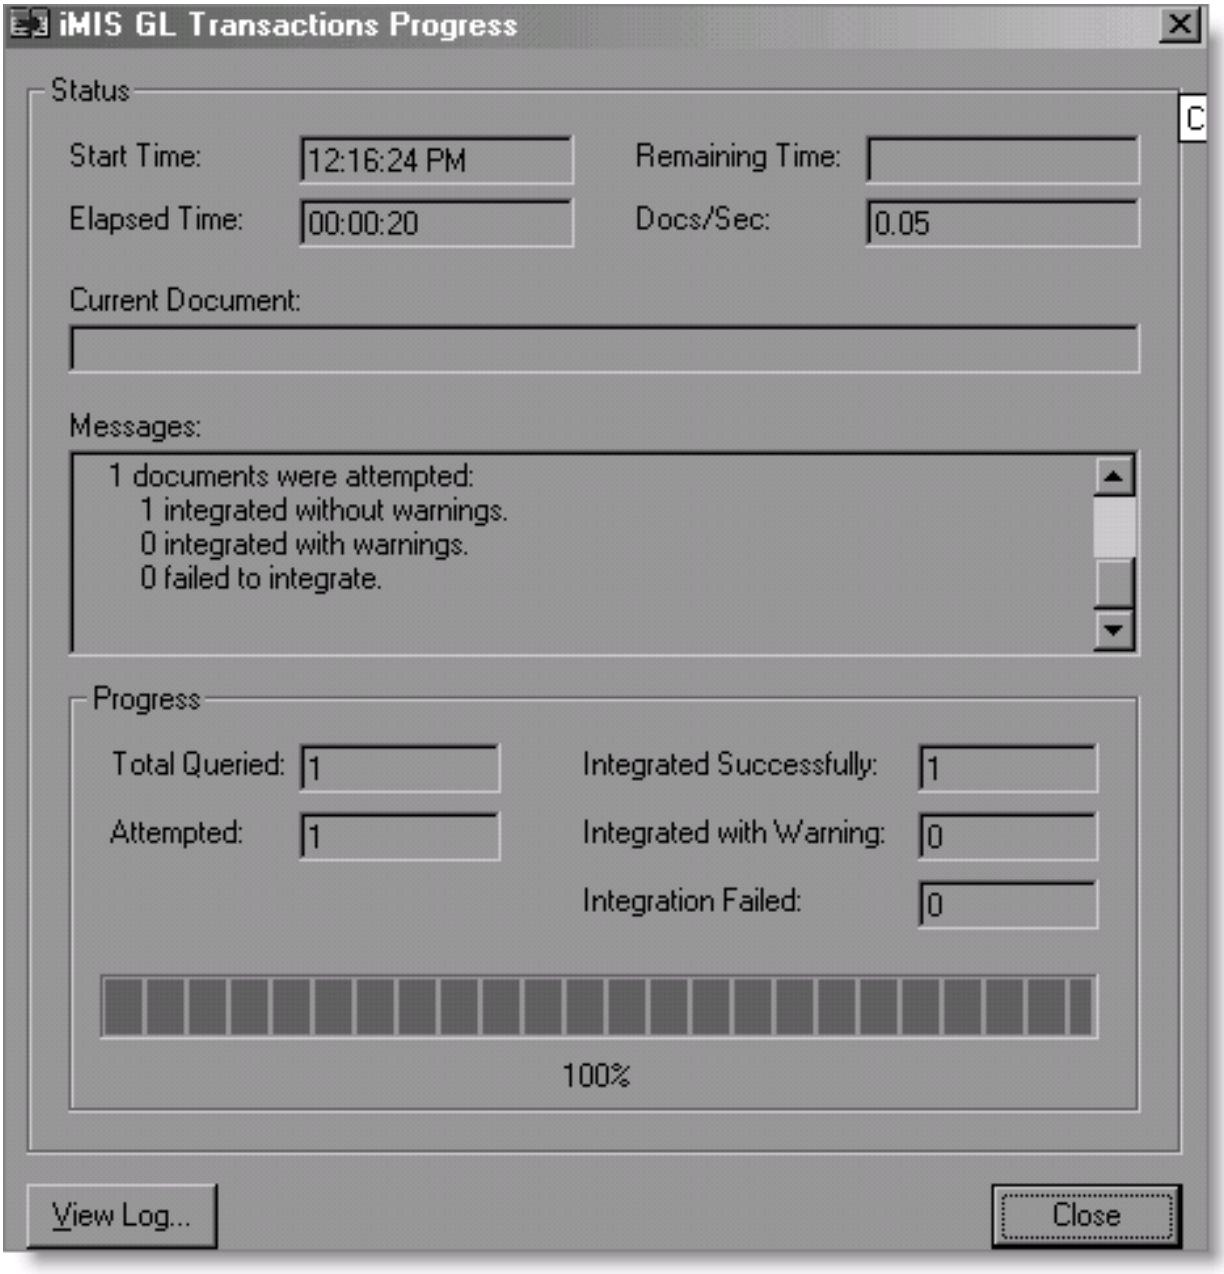
If you are operating in a multi-entity situation within iMIS (for example, the entity code becomes a part of the export file name: GL#.TXT translates to GLDEMO.TXT, etc.), you can modify the import/export file name directly and no special setup provisions are required for DIM version 5.0.

To run an iMIS GL transactions integration

1. Launch Dynamics 5.0.
2. Select Tools > Integrate > Run Integration. The Run Integration window opens.
3. Double-click iMIS GL Transactions.



As the integration runs, Dynamics 5.0 temporarily disappears, but reappears when the integration is complete. The iMIS GL Transactions Progress window opens.

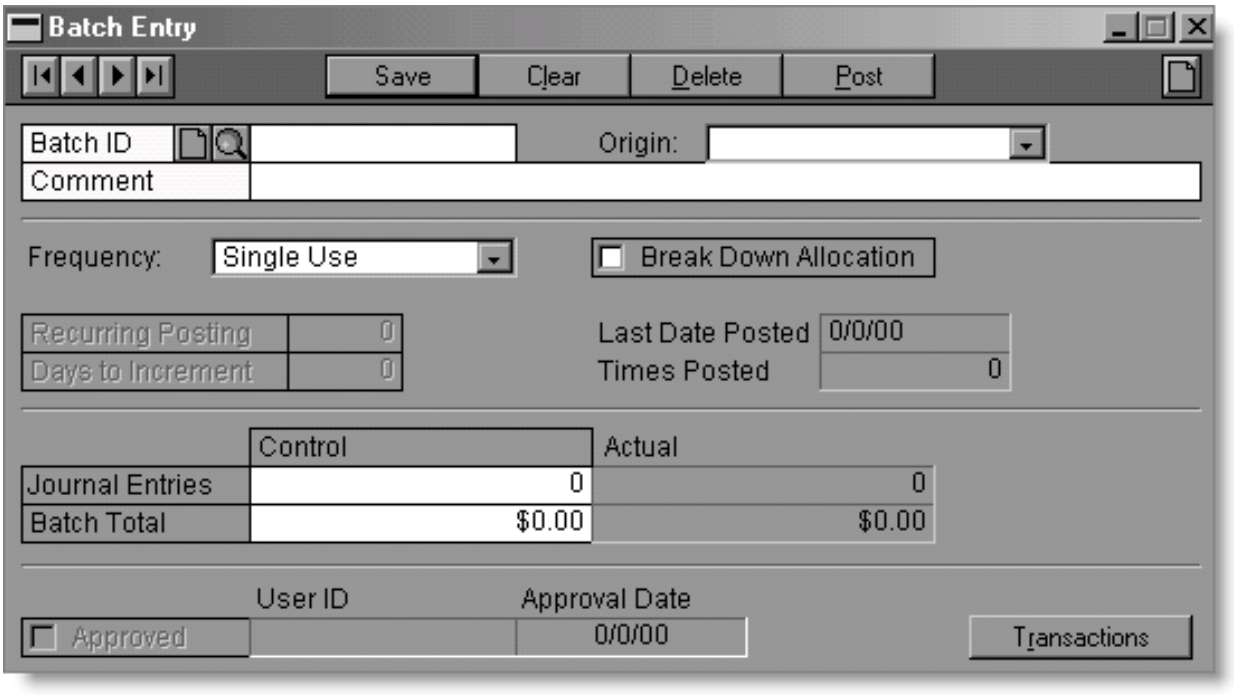


1. If the integration was successful, click Close. Otherwise, click View Log... to examine the error log.

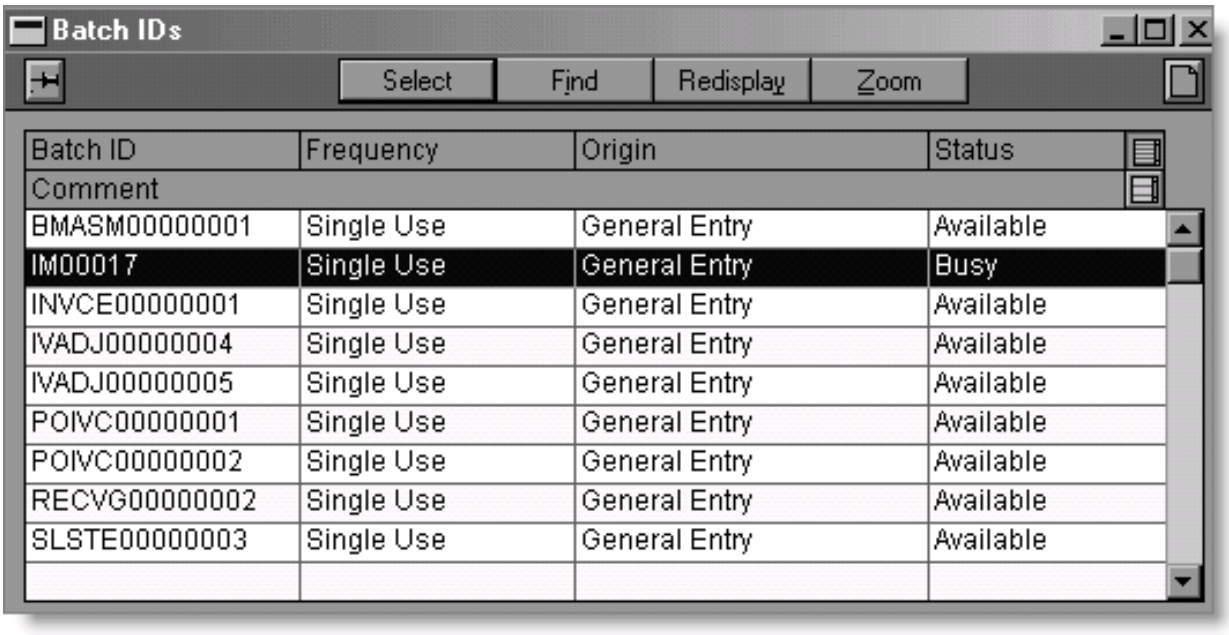
   Note: One of the most likely reasons that integration fails is invalid data (such as account numbers that do not match the required format and segmentation specified in Dynamics

5.0 during initial installation). If this is the case, review your account numbering scheme for compatibility in Dynamics and iMIS.

2. Verify that the integration of iMIS GL transactions was successful from within Dynamics 5.0: select Transactions > Financial > Batches. The Batch Entry window opens.



3. Click the magnifying glass icon for Batch ID to display a listing of Batch IDs.

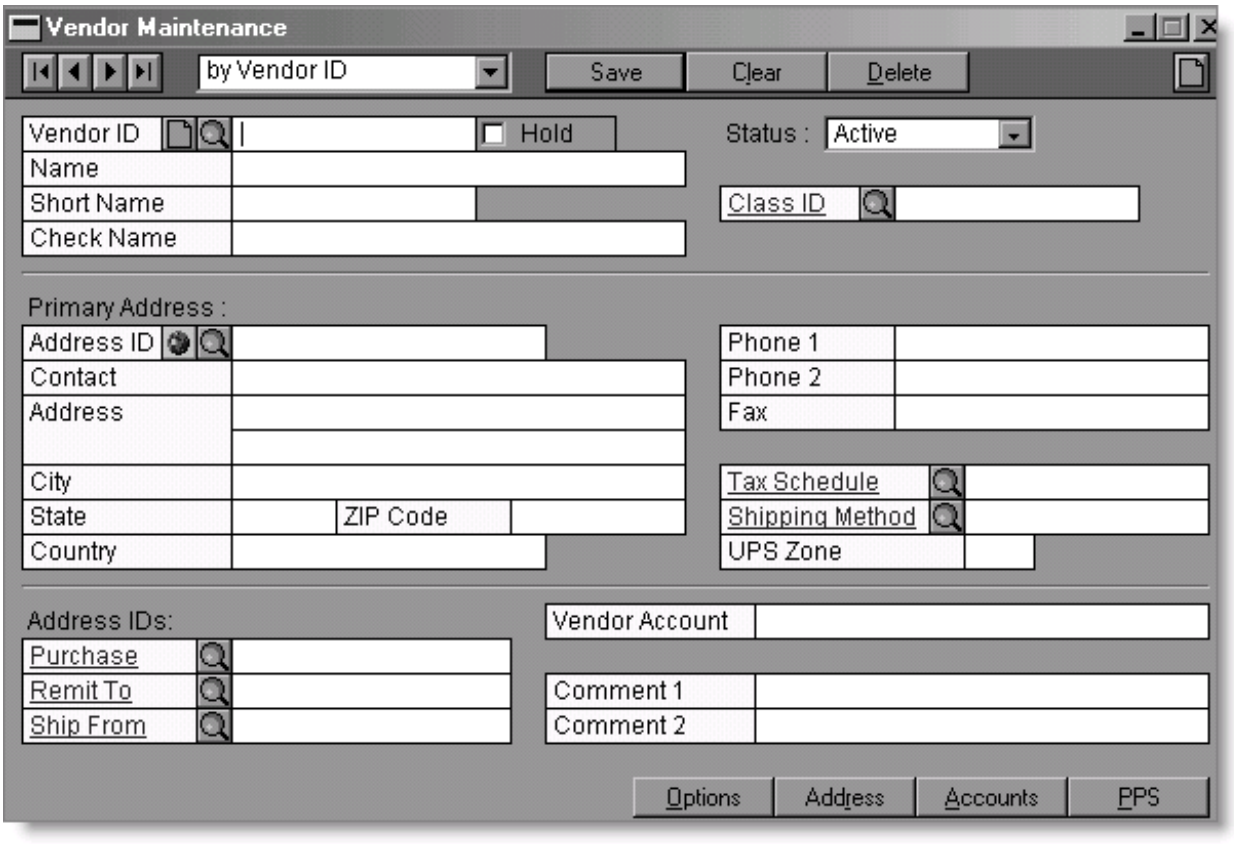


4. Locate and select the Batch ID corresponding to the integrated GLINT.TXT file. If the batch is still in a Busy Status, wait a few minutes for the Status to change to Available before viewing.

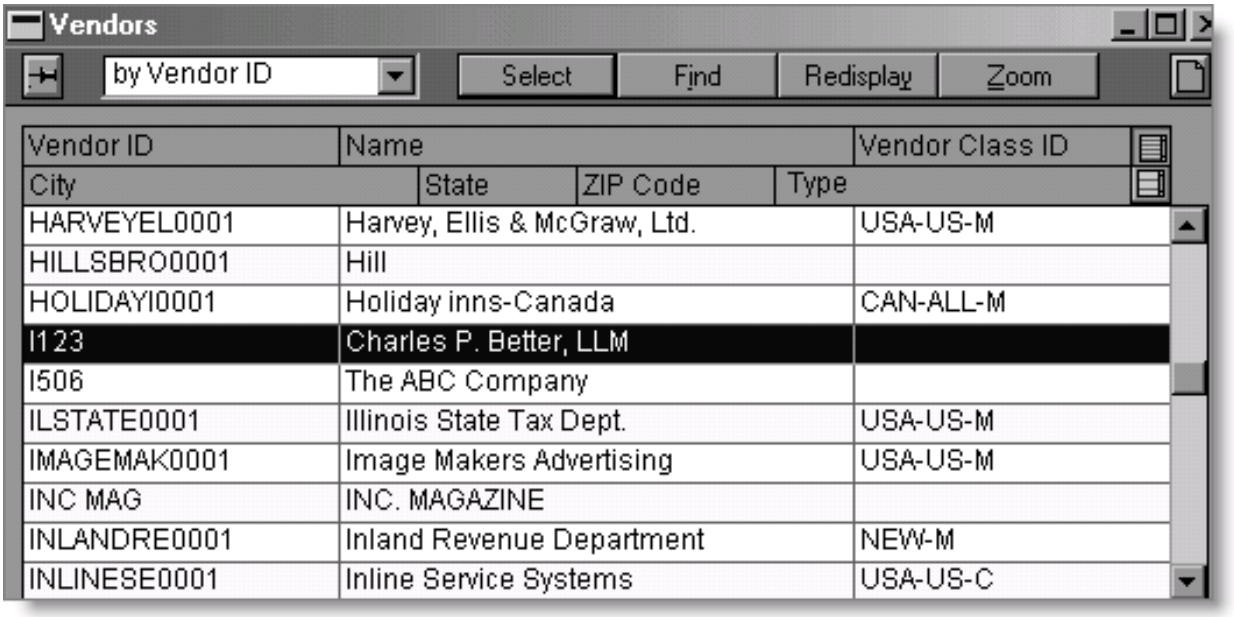
   To run an iMIS vendors integration

   This integration must be run before performing the iMIS Invoice Integration because it imports vendor data that is used later in the process. The integration steps for vendor integration are the same as in the iMIS GL transactions integration.

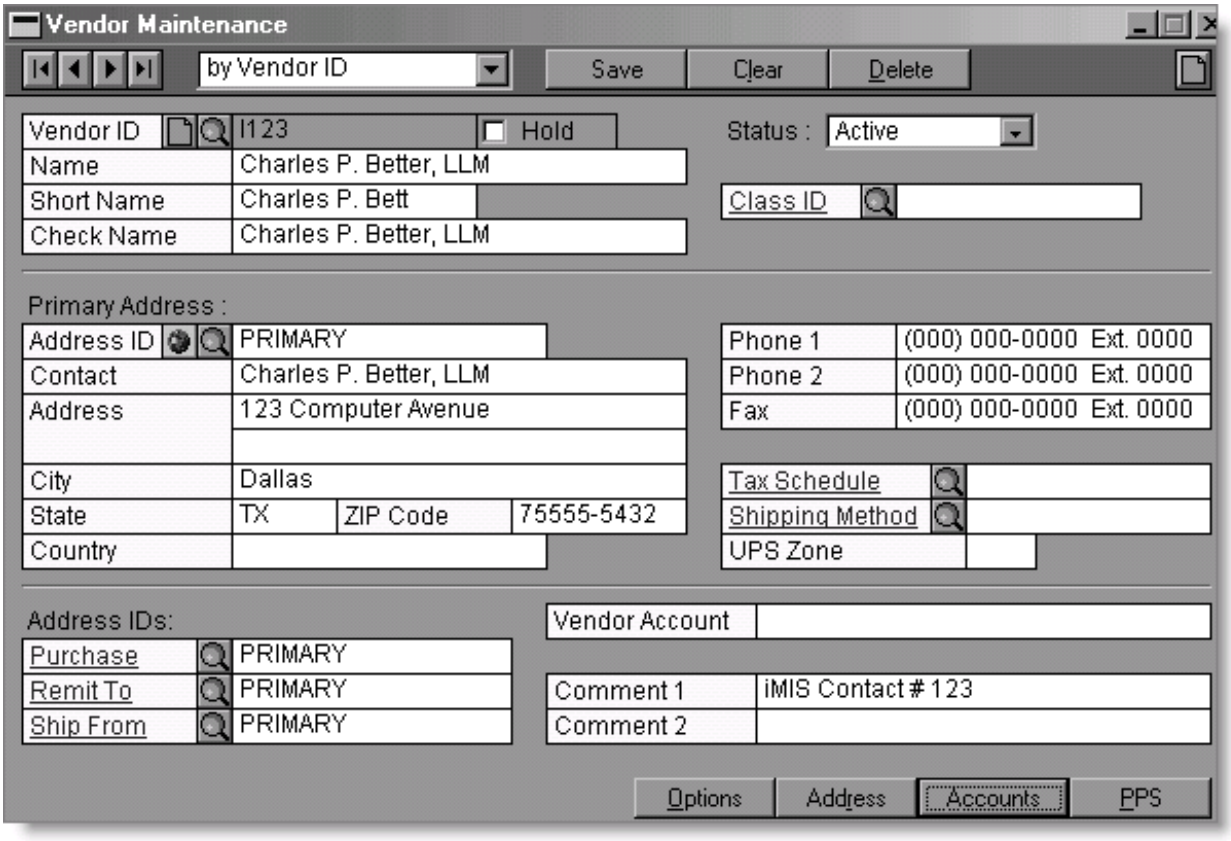
1. After successfully completing the iMIS Vendors Integration, in Dynamics, select Cards > Purchasing > Vendor. The Vendor Maintenance window opens.



2. Click the magnifying glass for Vendor ID and select the vendor(s) that corresponds to the one(s) you imported.



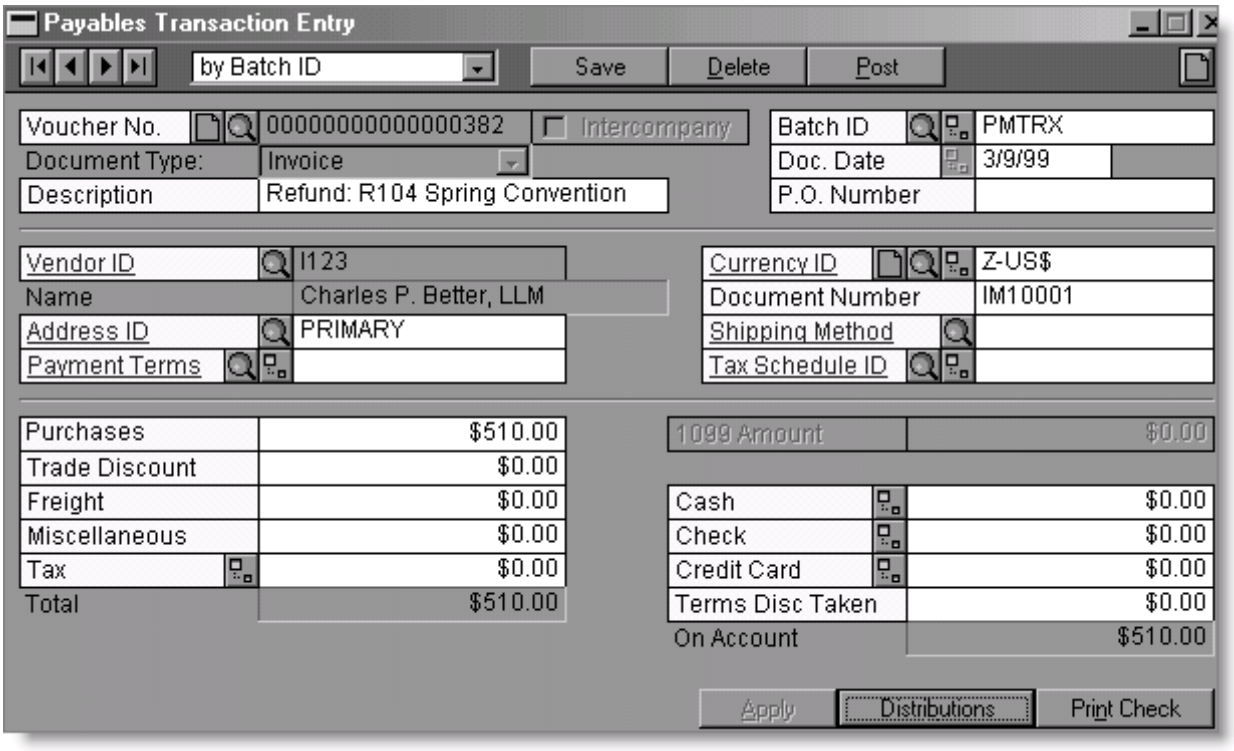
3. Review the Vendor data in the Vendor Maintenance window for accuracy.



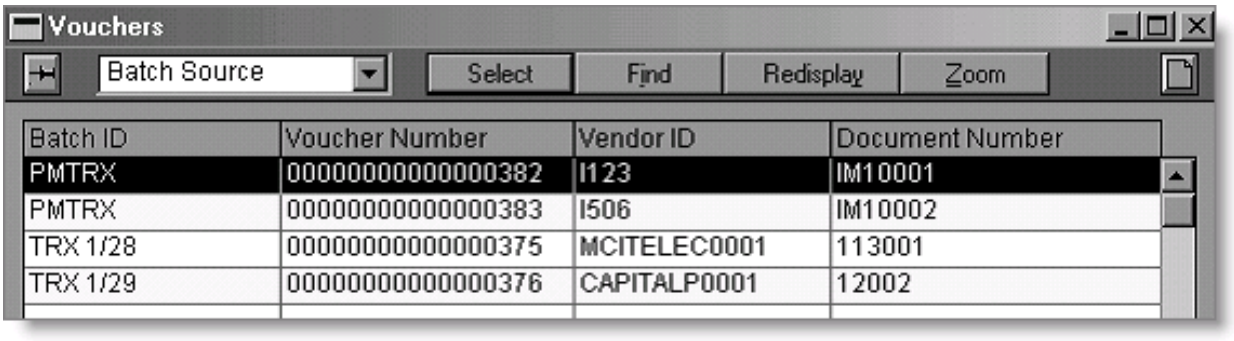
To run an iMIS invoice integration

You must run the iMIS vendor integration before iMIS invoice integration because the Vendor ID in the INVOICE.TXT file must cross-reference the Vendor ID in the VENDOR.TXT file. The integration steps for invoice integration are the same as in the iMIS GL transactions integration.

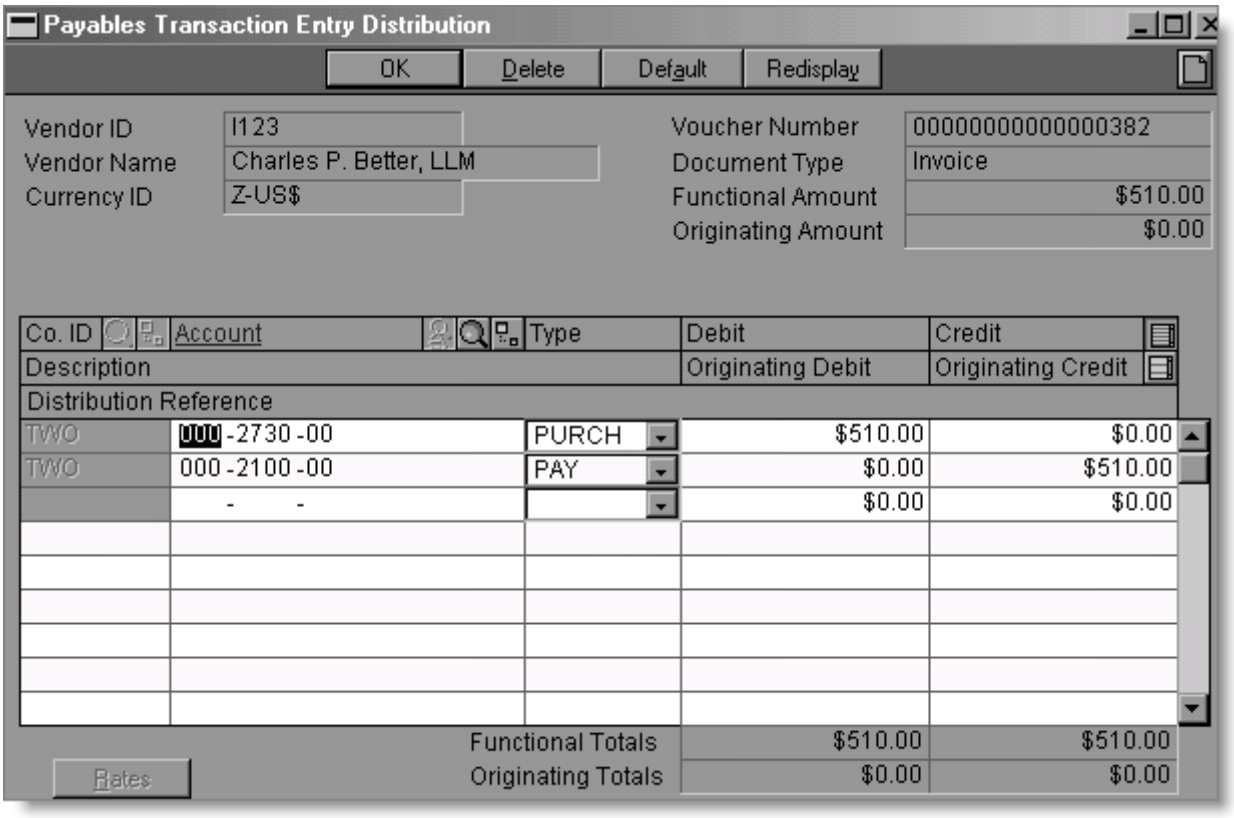
1. When the iMIS Invoice Transactions integration is complete, select Transactions > Purchasing > Transaction Entry. The Payables Transaction Entry window opens.



2. Click the magnifying glass for Voucher No. and select the voucher number that corresponds to the imported transaction.



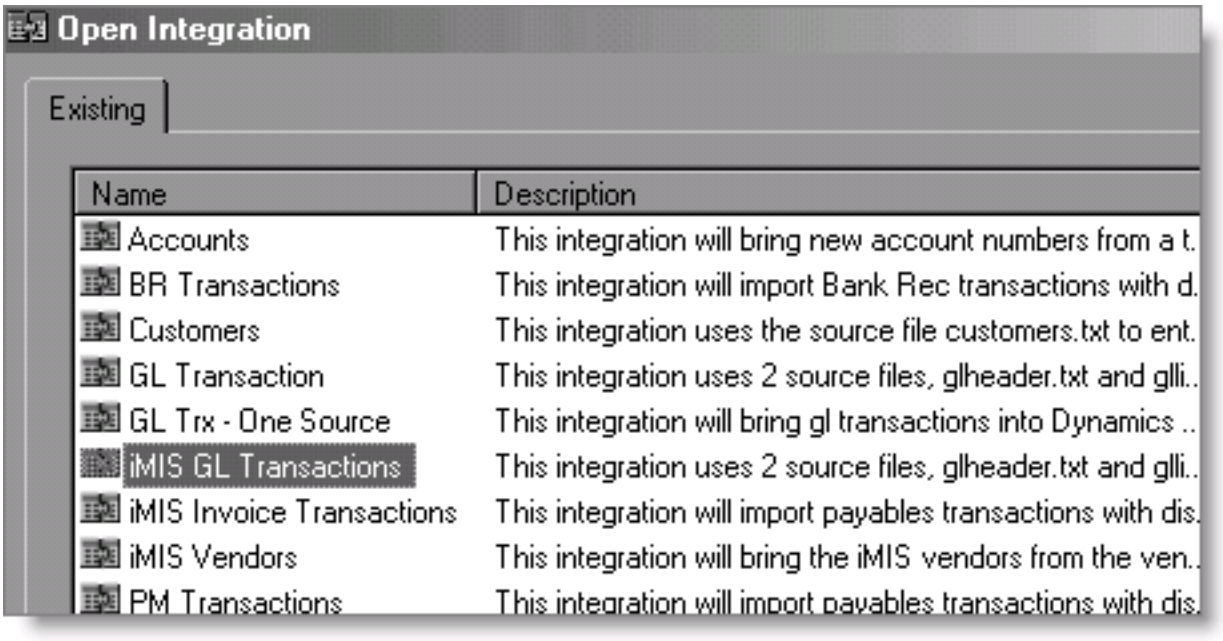
3. Click the Distributions button to display the Payables Transaction Entry Distribution window.



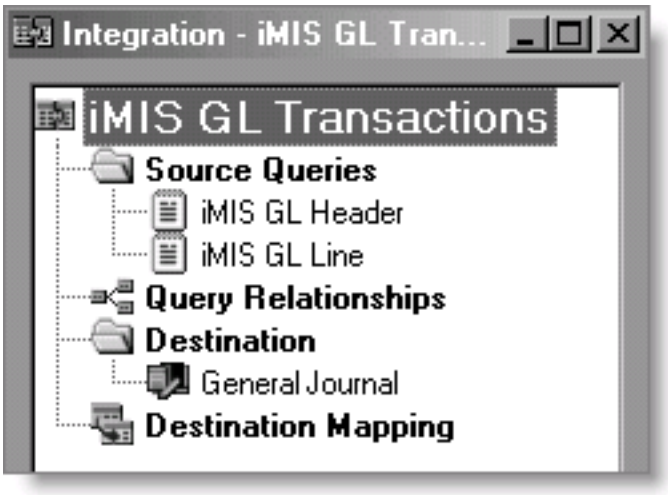
4. Confirm that the distributions are correct. Pay particular attention to the accounting entries and the Purchases account number.

To modify an iMIS integration

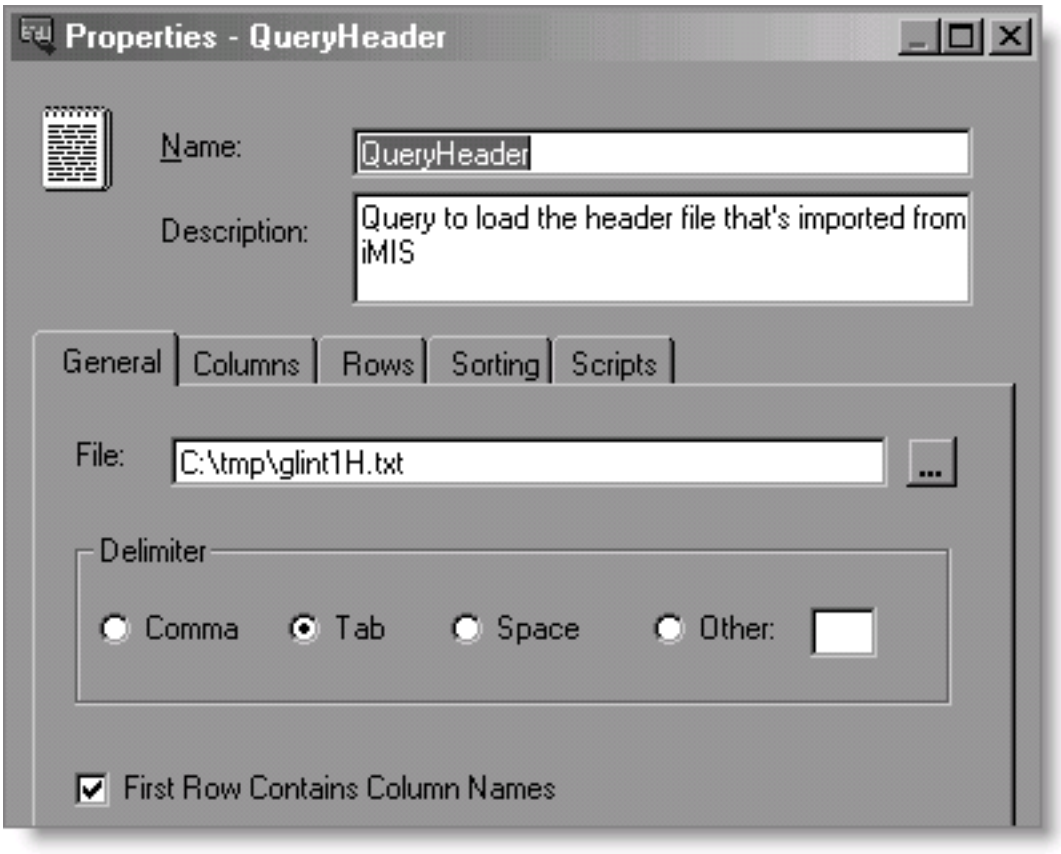
1. From Dynamics 5.0, launch the Integration Manager from Tools > Integrate > Integration Manager.
2. Click the Open button from the top row of buttons to display the available integrations.



3. Select the integration to modify (such as iMIS GL Transactions). The Integration – iMIS GL Transactions window opens.



4. Double-click the desired source query (such as iMIS GL Header). The Properties - QueryHeader window opens.



5. Modify the path and filename in the textbox under the General tab to correspond to your actual system. Note that the path/file name combination you specify here must match what you have set up for the Output file path/name under the GL Interface section in iMIS AR/Cash System Setup.
6. If you modify the path/file name combination for the iMIS vendors' integration or the iMIS invoice integration in the Dynamics Integration Manager, make the corresponding change to the Output file path/name under the AP Interface section in AR/Cash System Setup.

MAS 90 (Sage)

iMIS provides support to meet export requirements for MAS 90 version 3.21 or greater. This support is in place in iMIS LAN version 3.52 or greater and iMIS version 4.11 or greater.

To set up iMIS for MAS 90

This document provides some implementation setup steps for integrating iMIS with MAS 90. It also includes the instructions for importing the iMIS export/import files into MAS 90.

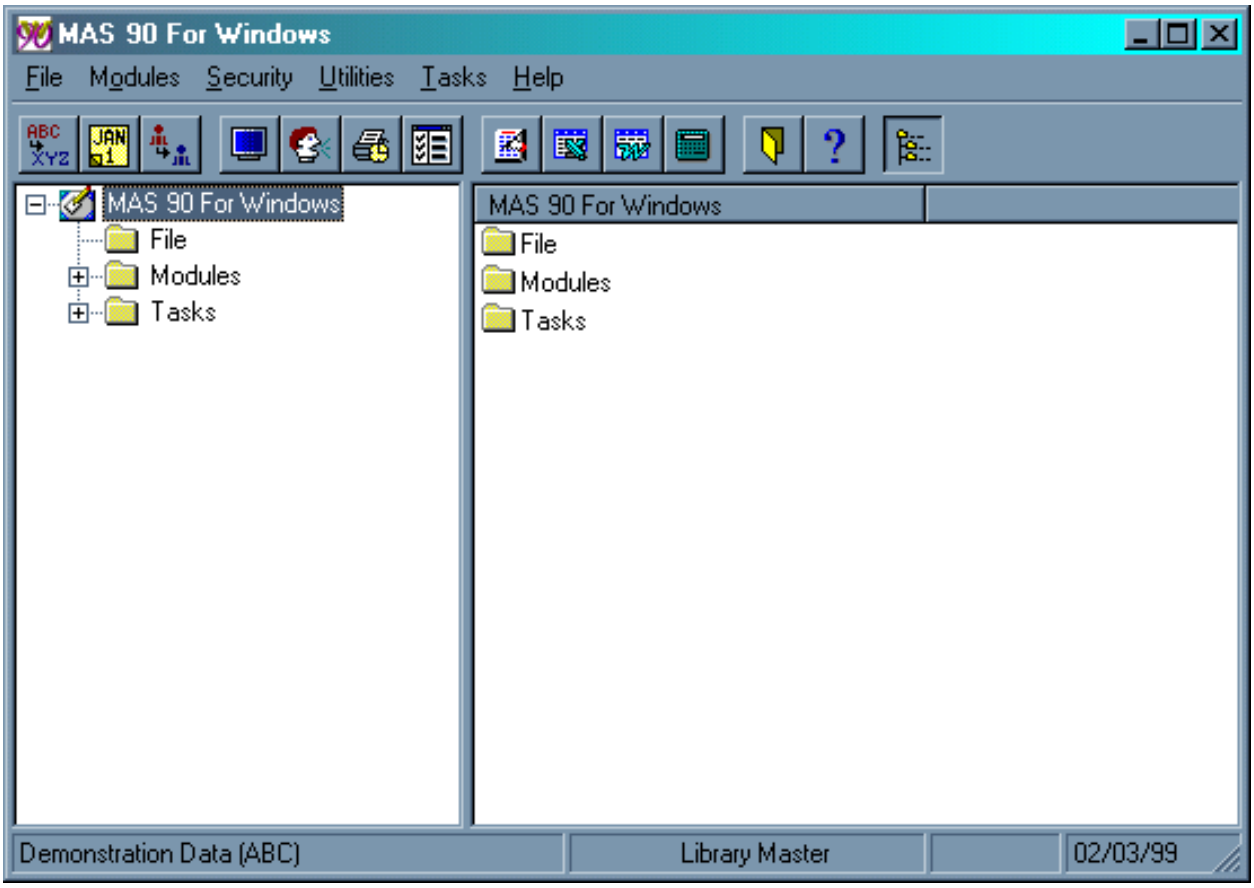
On the MAS 90 side, follow the steps outlined in MAS 90 Data Exchange Setup.

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select MAS 90 Exchange. Note that the MAS 90 choice remains for those users who have not upgraded from older versions of MAS 90.
4. You may also need to modify the Output file path/name to dictate the naming and placement of the output file. The Output file path/name you enter in iMIS AR/Cash GL Interface should agree with the path and file name that you enter for your Import Transactions in the MAS 90 General Ledger module. MAS 90 requires a single detail transaction file only; iMIS correctly exports as the filename specified above.
5. Click Save.

To set up MAS 90

The following instructions were established with the assumption that MAS 90 version 3.21 has been fully installed/upgraded and is functioning properly. The General Ledger module must be installed before the following steps can be performed. Refer to your MAS 90 Installation Guide if you need assistance installing MAS 90.

Note: Note: Be sure to enter your new or revised General Ledger module registration keys at the appropriate point during the MAS 90 install or upgrade. These keys make it possible for you to access the General Ledger module (which contains the Import Transactions feature) after it is properly installed.



MAS 90 For Windows
File
Modules
Tasks
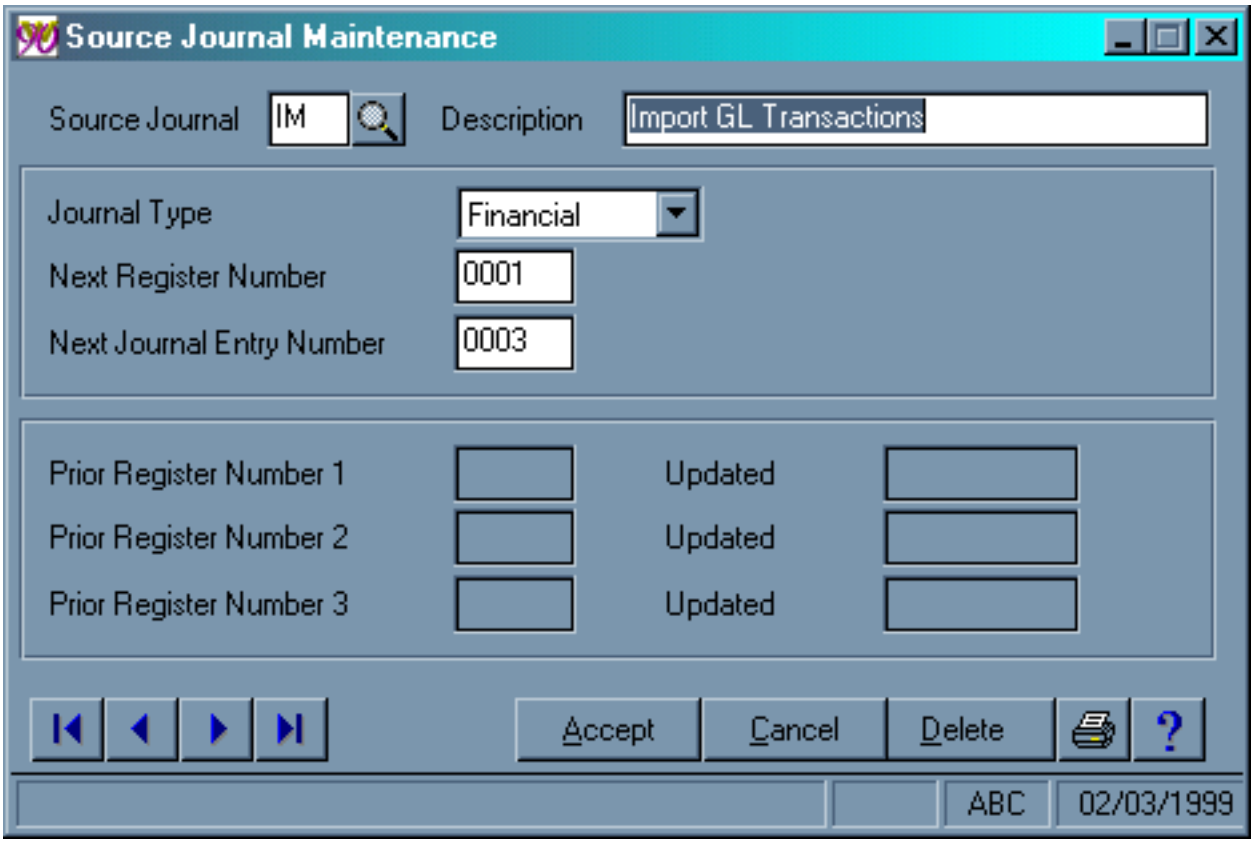
Demonstration Data (ABC)
Library Master
02/03/99



Follow these steps to set up the MAS 90 Data Exchange to import a comma-delimited detail transaction line file into MAS 90.

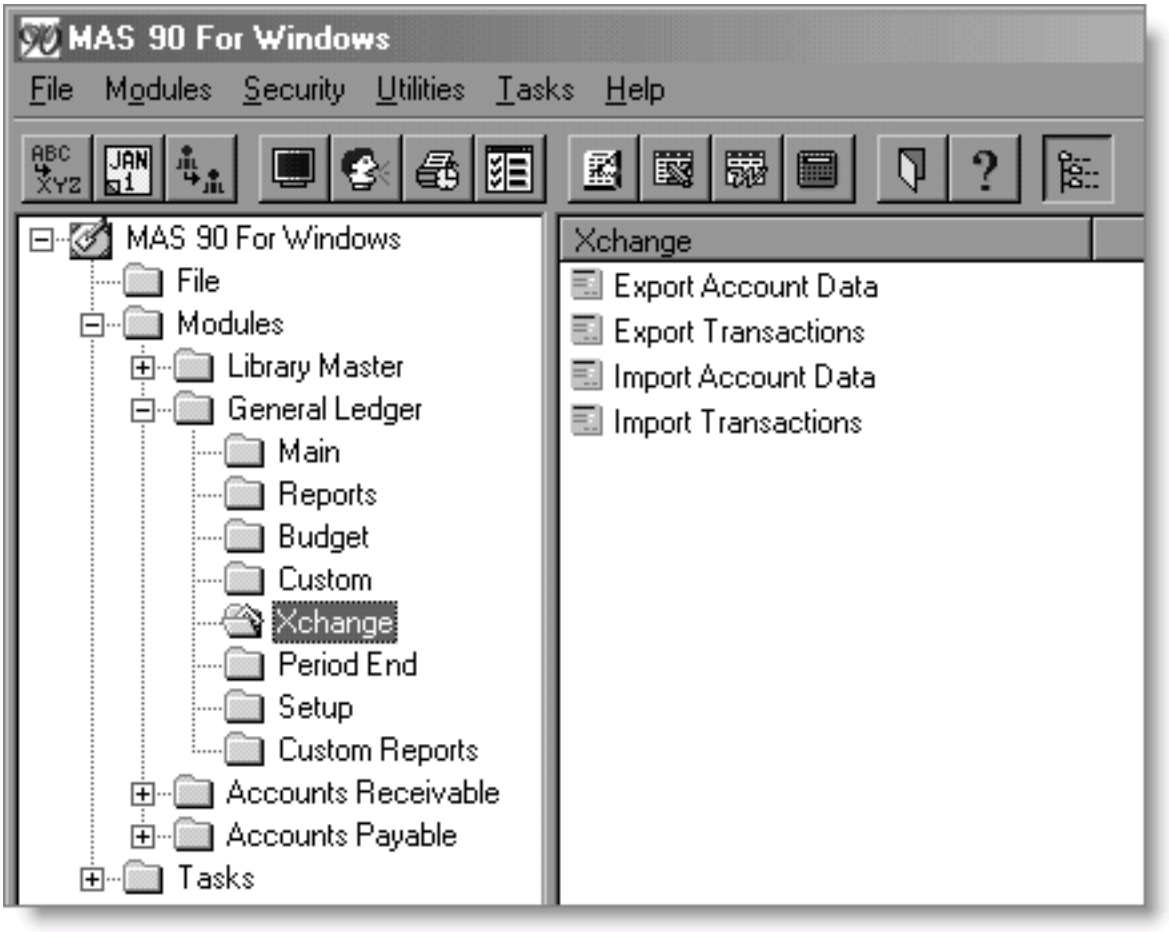
1. Launch MAS 90. The main window opens.
2. Create a Source Journal (or use an existing one) for importing transactions. In the pane on the left, select Modules > General Ledger > Setup. Double click Source Journal Maintenance in the pane on the right. The Source Journal Maintenance window opens.
3. Create a Source Journal with the following settings:

- Source Journal = IM
- Description = Import GL Transactions, or whatever is appropriate for your setup.
- Journal Type = Financial
- Next Register Number = Use the defaults or whatever is appropriate for your setup.
- Next Journal Entry Number = Use the defaults or whatever is appropriate for your setup.

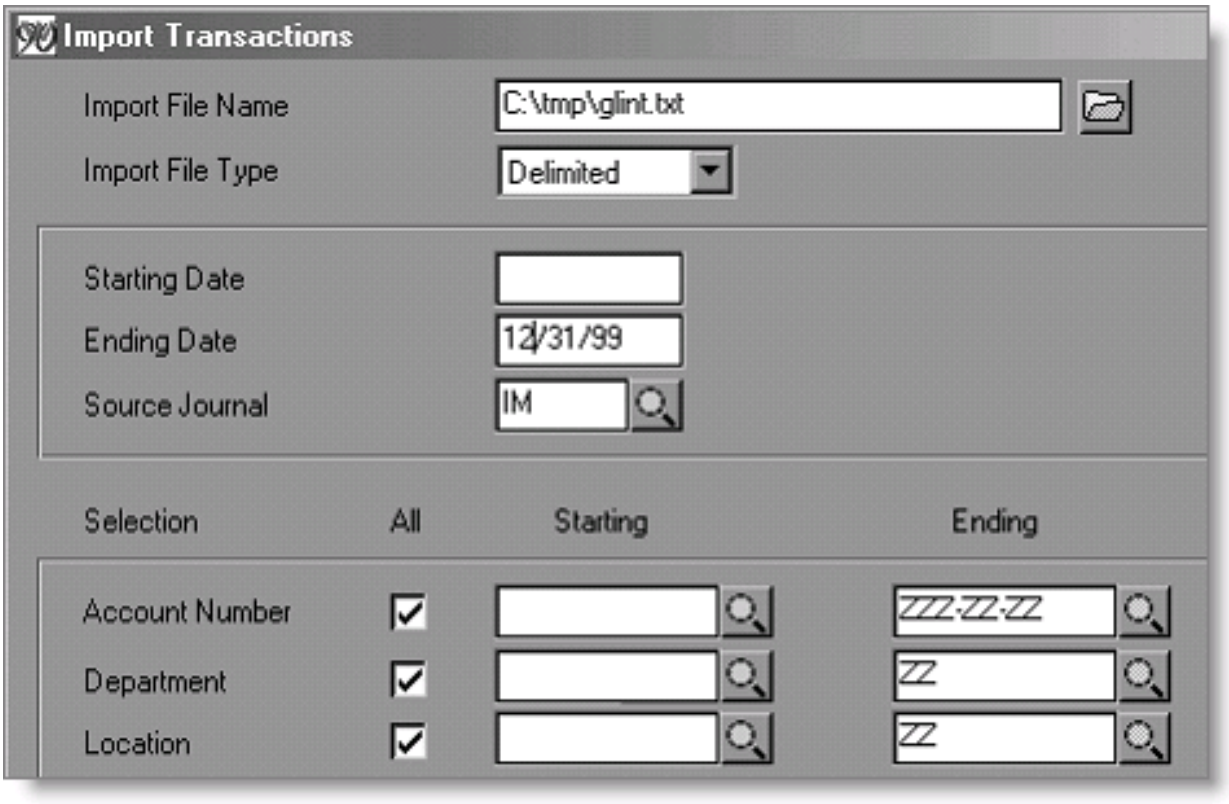
4. Click Accept.
5. Click X to close the Source Journal Maintenance window.

To import data into MAS 90

1. Open the Data Exchange area in the General Ledger module. In the pane on the left, select Module > General Ledger > Xchange.



2. Double-click on Import Transactions in the pane on the right to display the Import Transactions window.



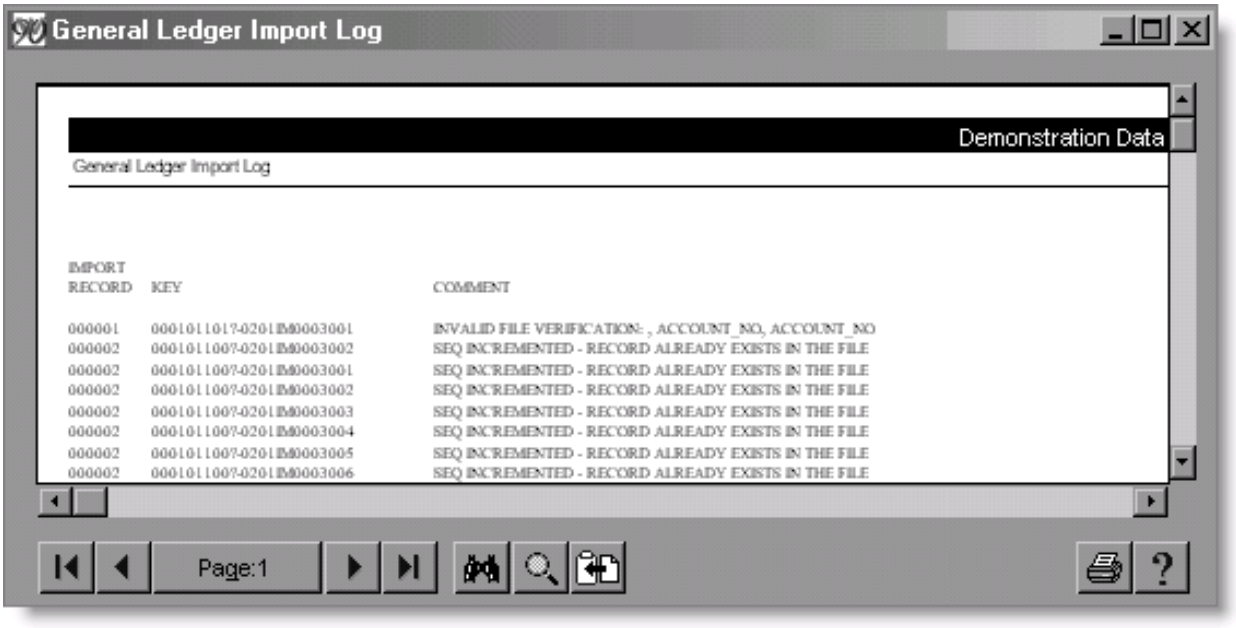
3. Enter the following settings:

- Import File Name = The default location where MAS 90 looks for import files is <root>:\MAS90\Home, but you can customize the Import File Name setting to a path and filename that is appropriate for your system. In this example, we use C:\TMP\GLINTDEMO.TXT to correspond to the setting for Output file path/name in iMIS AR/Cash GL Interface.
- Import File Type = Delimited
- Starting Date = N/A
- Ending Date = N/A
- Source Journal = IM

  Note: You must have already created a Source Journal listing of IM before you enter this setting for your import operation. See MAS 90 Data Exchange setup.

4. Click Proceed.
5. When a message box reporting the number of records imported prompts you to print the import log, click Yes. The GL Import Log window opens.

6. Click Preview and view the results to determine the possible cause for transactions that were not imported successfully.



7. Review the results as necessary and print the output as necessary with the printer icon button in the lower right portion of the window.
8. Click X to close the window.

MIP NonProfit Series

iMIS provides support to meet export requirements for MIP NonProfit Series for Windows version 3.0 or greater. This support is in place in iMIS as of version 4.10.

In order to facilitate the interface, iMIS formats the transaction data into a fixed-file format. The export/import file is then imported into a journal batch with a simple import process that works hand-in-hand with an iMIS-specific import definition file.

To set up iMIS for MIP

The setup steps from iMIS include making appropriate choices on the AR/Cash General Ledger Interface window and an optional step to establish a MIP general/lookup validation table.

The iMIS setup steps are described in detail below:

Step 1 – Change the GL Interface Type

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select MIP.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored. To avoid changing the file name with each new import, do not include the ? substitute character.
6. Click Save.

Step 2 – Set up a special MIP General Lookup/Validation Table

1. From Customers, select Set up tables > General lookup/validation to open the General lookup/validation window.

2. Select (New Table) from the list of table types. The New Table Type window opens.
3. Enter a New Table named MIP and click Save.
4. Click New.
5. Type SEGMENTS in all caps in the Code field.
6. In the Expansion field, fill in the number of segments in your GL Chart of Account structure.
7. Click Save.

To copy the IMIS_GL.def definition file

1. Copy the IMIS_GL.def file to the mipnps32\data directory. You can copy the definition file from either the iMIS_Ent\Files\GL_Int or the iMIS_Mil\Files\GL_Int directories on the CD.

To modify the export/import file path and name

1. Edit the copied IMIS_GL.def file with a text editor such as Notepad.
2. Change the path and file name on in the FILE,SESSION section to coincide with the location and naming convention you entered during the iMIS setup.

```
REM,-------------------------------------------------------------------
REM,                 SAMPLE IMIS JOURNAL VOUCHER IMPORT DEF FILE
REM,-------------------------------------------------------------------
REM, The following lines define where the text file is located that hol
REM, data to be imported. You should modify this path and filenames as
REM, appropriate.
REM,-------------------------------------------------------------------
FILE,SESSION            ,c:\program files\mipnps32\data\glint.txt
REM,-------------------------------------------------------------------
CONTEXTIDPOSITION,1,6
REM,-------------------------------------------------------------------
REM,                      Session Information Import
REM,-------------------------------------------------------------------
REM,                            Session Header Information
REM,-------------------------------------------------------------------
CONTEXT,SESSION,HEADER,HSESSN
SESSION_SESSIONNUMID,8,7
SESSION_TRANSSOURCEID,56,2
SESSION_SESSIONDATE,45,8
SESSION_DESCRIPTION,19,25
```

The path on the supplied definition is c:\program files\mipnps32\data\glint.txt

> **Note:** Note: If you are in a multi-entity situation in which you need to generate multiple output files (that is, you have a # entity substitution character within the output file), you must create a separate definition file for each entity. For example, if you had two entities, DEMO and FND, and the export/import file setup as GL#.TXT, copy the single IMIS_GL.DEF to 2 files, such as IMIS_GL_DEMO.DEF and IMIS_GL_FND.DEF. In IMIS_GL_DEMO.DEF, change the file name to GLDEMO.TXT. Likewise, the file name in IMIS_GL_FND.DEF should be changed to GLFND.TXT.

You do not need to create separate files if you have a single legal entity but multiple funds. iMIS treats funds as separate entities, but they are only handled in separate sets of books, not separate files, within MIP.

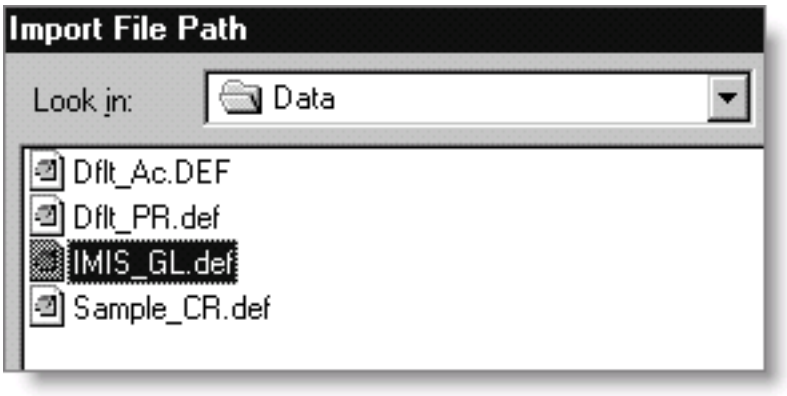
> **Note:** Caution! Do not make any other modifications to the definition file. This file contains important instructions to help MIP read and process the iMIS import.

To create the export file from iMIS (MIP)

1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal.

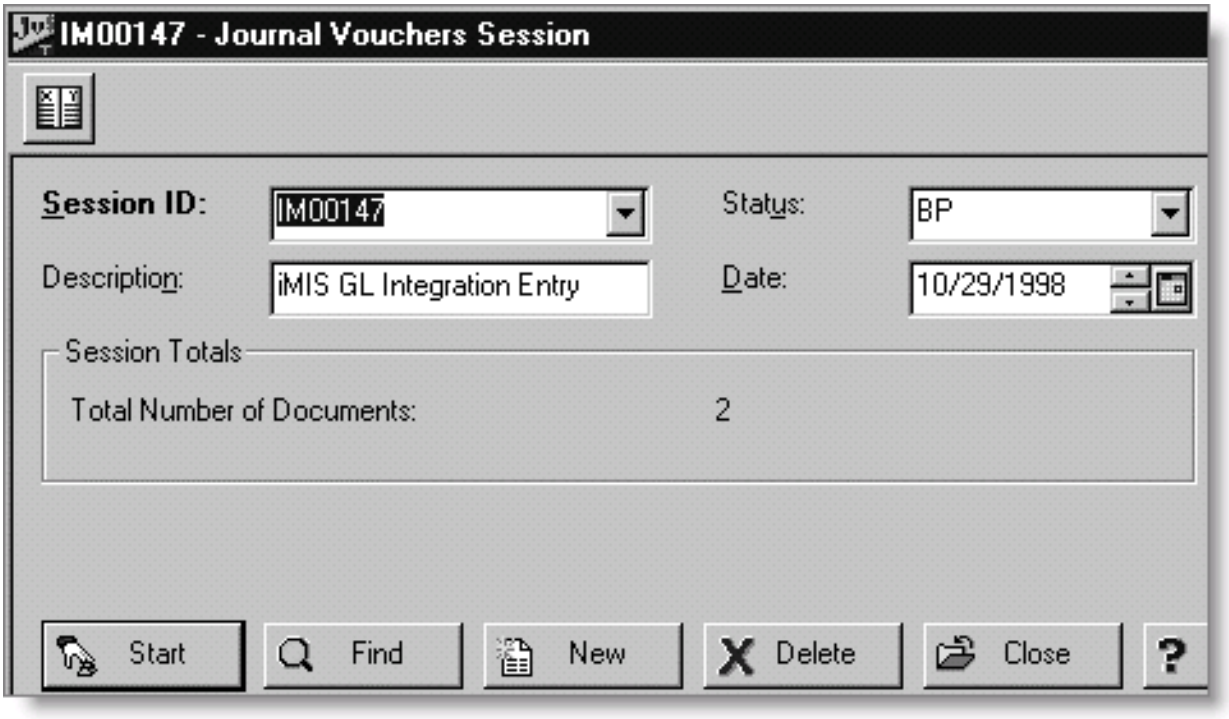
To import data into MIP

1. Select File > Import.
2. In the Import File Path window, locate and double-click the IMIS_GL.def definition file.

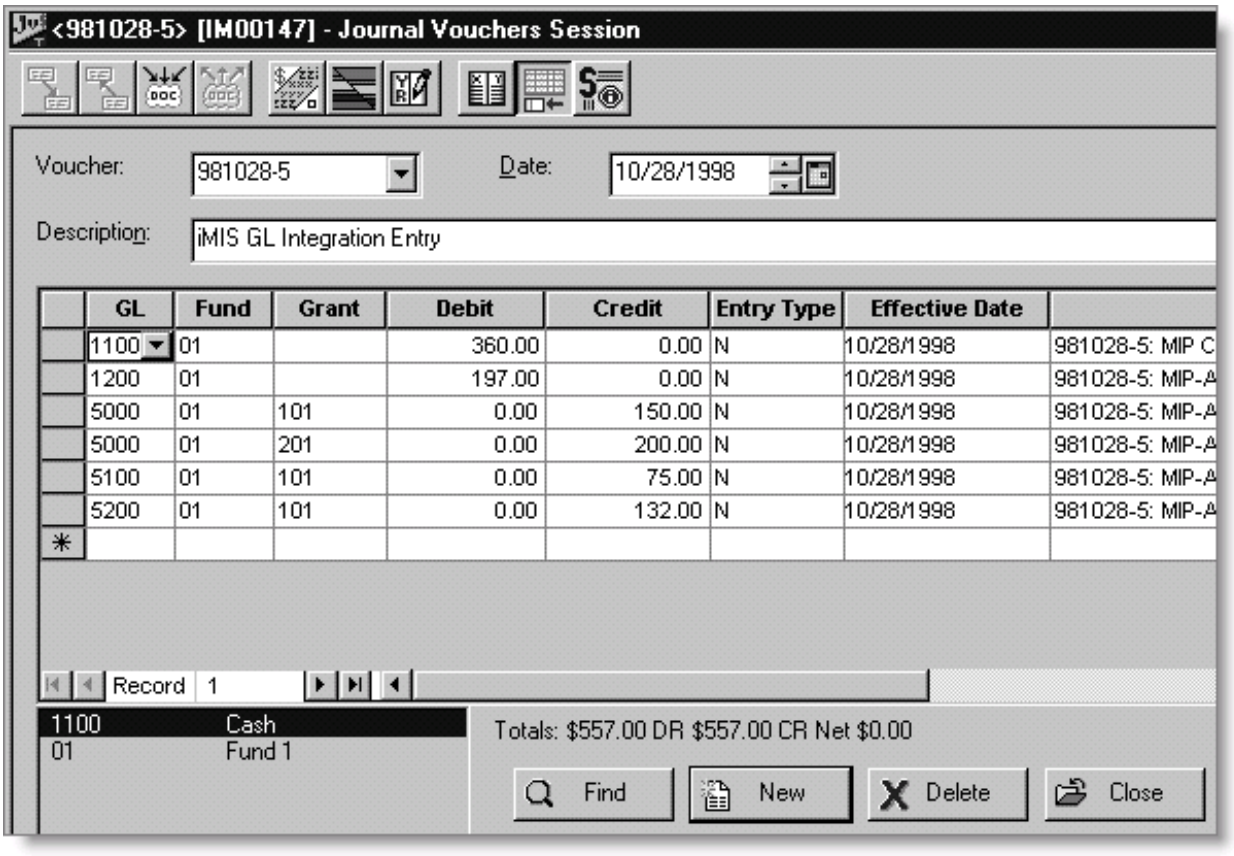


Note: In a multiple-entity, multi-file situation, select the appropriate copied and renamed definition file for the entity with which you are working.

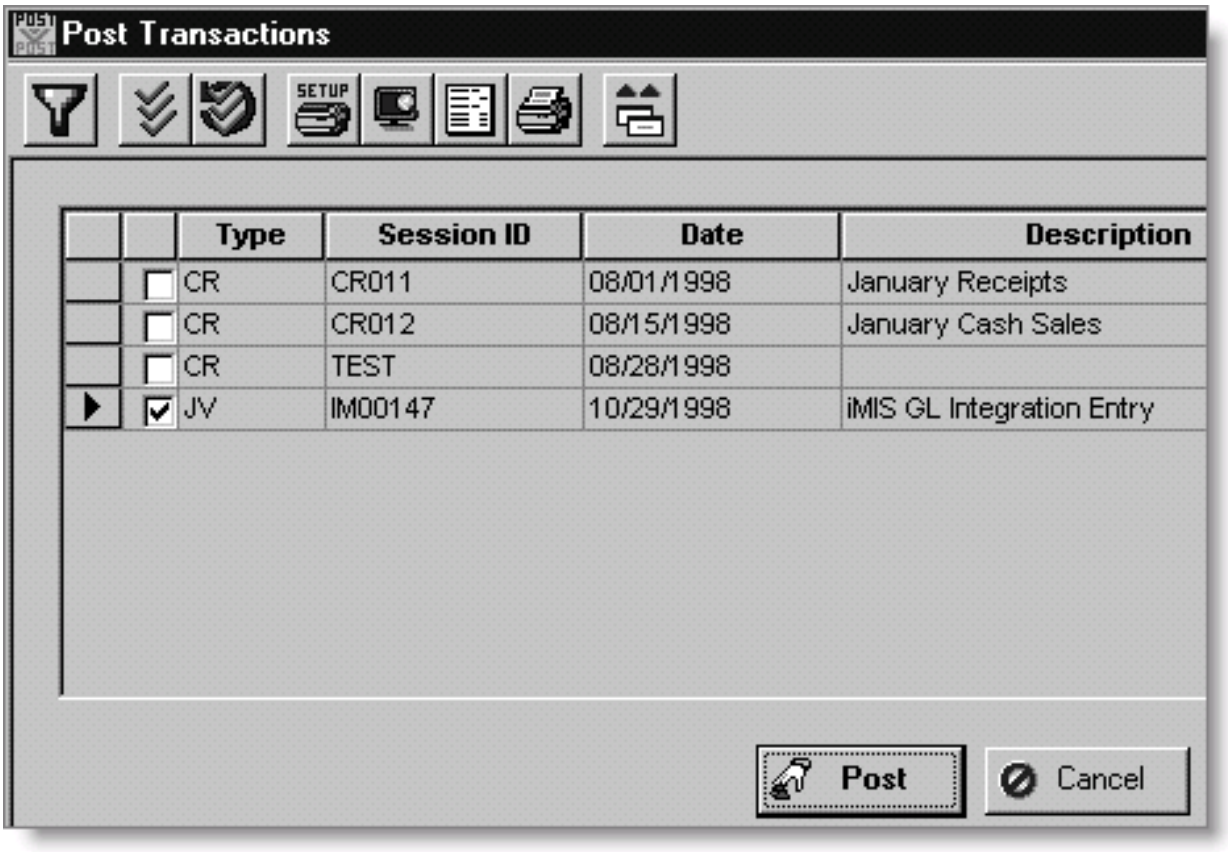
3. The data is used to create unposted general journal voucher transactions.
4. Once imported, the data can be viewed through Transactions > Enter Journal Vouchers.



5. Note that all iMIS generated Session IDs begin with “IM” so they are easy to locate.
6. To view the individual transactions imported, click the Start button and use the Voucher drop-down list to find the transaction to view.

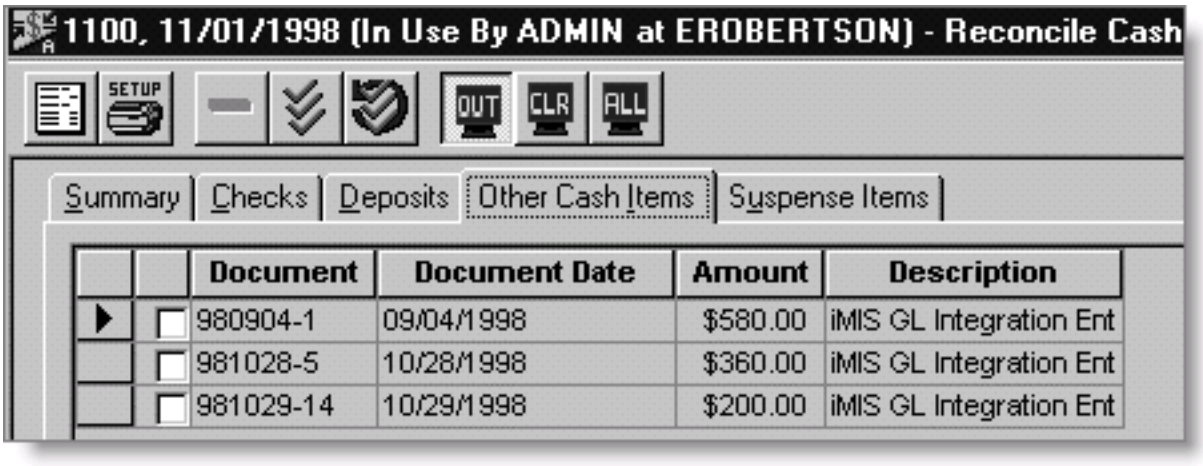


7. To post the transactions, select Activities > Manage Sessions > Post Transactions.



8. Enable the checkbox next to the iMIS GL Integration Entry session and click the Post button to post the imported entries.

   Note: iMIS-imported entries to a cash account appear under the Other Cash Items tab on the Reconcile Cash Accounts window.



Export/Import File Example

The export/import file is a simple fixed-length export/import file that contains a single heading line for the MIP session, a document header line for each new transaction created, and detail document lines for each debit or credit entry in the document or transaction.

iMIS generates a new journal entry and Document Number each time the following is encountered:

- A new transaction date (for Day or Detail summary methods).
- A new batch (for Batch summary methods).

The following export/import example shows a small interface file for two batches across two dates.

Peachtree for Windows

iMIS provides support to meet export requirements for Peachtree for Windows version 6 and greater. This support is in place in iMIS as of version 4.11.13.04.

To set up iMIS for Peachtree

The setup steps from iMIS include making appropriate choices on the AR/Cash General Ledger Interface.

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select a version of Peachtree. The version you select depends upon which version of Peachtree Windows you are using.

- Select Peachtree V6 from the drop-down list if your version is 6 or greater.
- Otherwise, select the Peachtree V3_B5 option.

4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored.

- Use a # sign in the file name to instruct iMIS to create files for each iMIS organization code, with the ORG code inserted in the file name.
- Use a ? mark in the file name to instruct iMIS to create sequentially numbered files with each subsequent file that is generated.

  For example, #glint?.csv will create ORG1glint1.csv and ORG2glint1.csv for the first export and ORG1glint2.csv and ORG2glint2.csv for the next export.

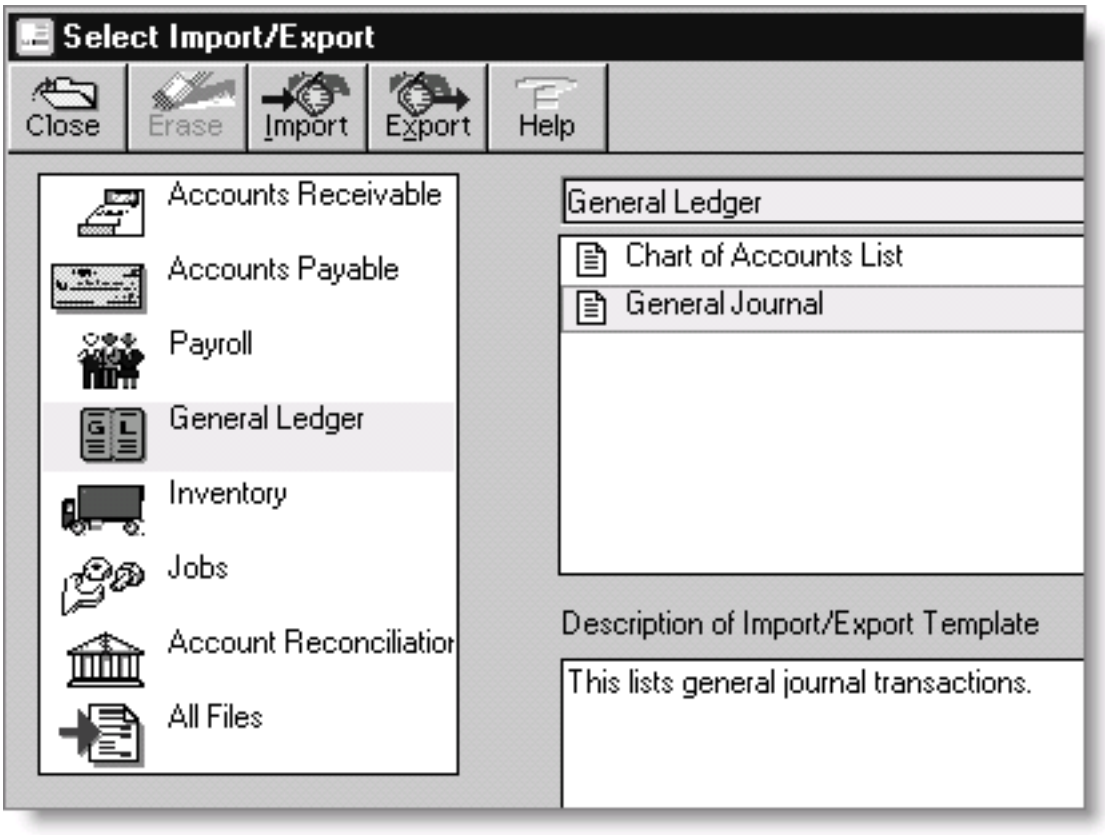
  Hint: The default extension for Peachtree import files is .CSV (Comma Separated Values). Peachtree uses the default directory bcs subfolder under the peachw folder when looking for import files. Although you can name and position Peachtree import files anything or anywhere you wish, you may wish to keep these defaults in mind when considering the name and location of the export file.

6. Click Save.

   To set up Peachtree Windows

   The setup within Peachtree Windows includes a simple step to fine-tune the General Journal Import definition.

1. Select File > Select Import/Export. The Select Import/Export window opens.

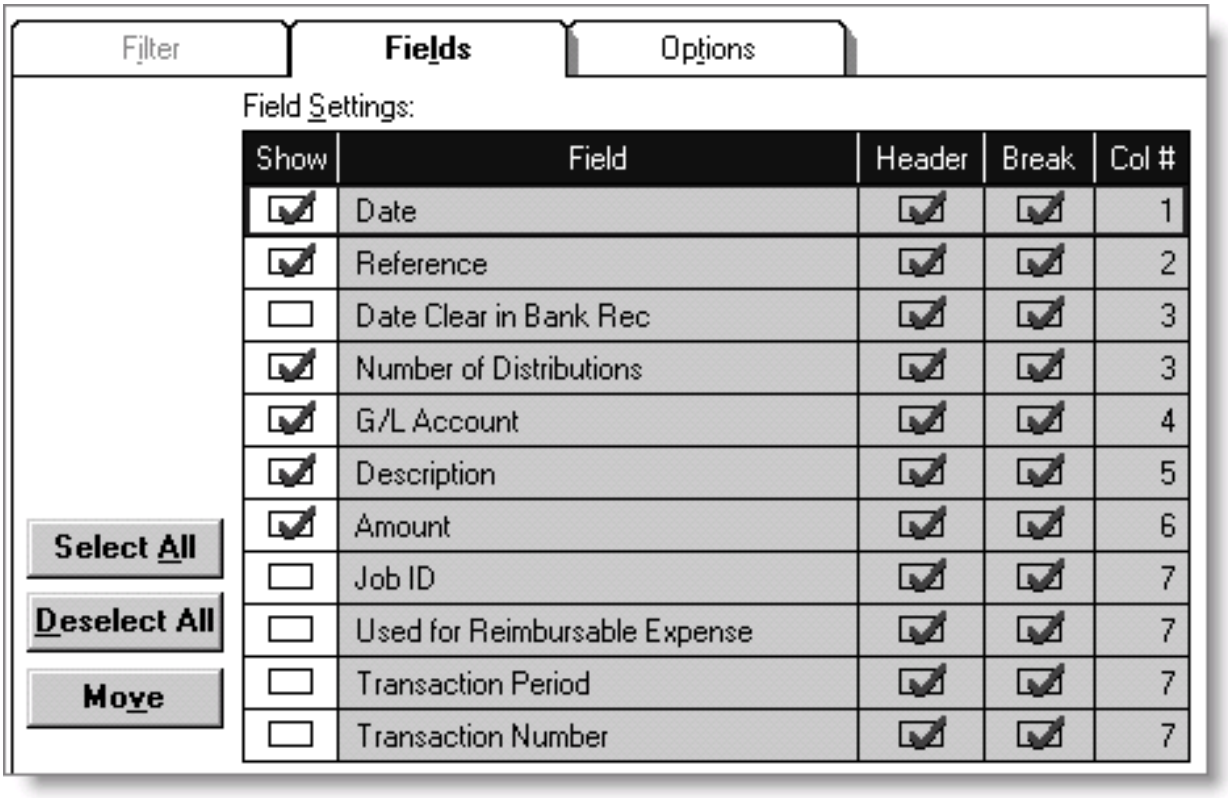


2. From the Select Import/Export window, highlight General Ledger on the left and General Journal on the right
3. Click the Import button. The General Journal window opens.
4. From the General Journal window Fields tab, uncheck the Show box for the following fields:

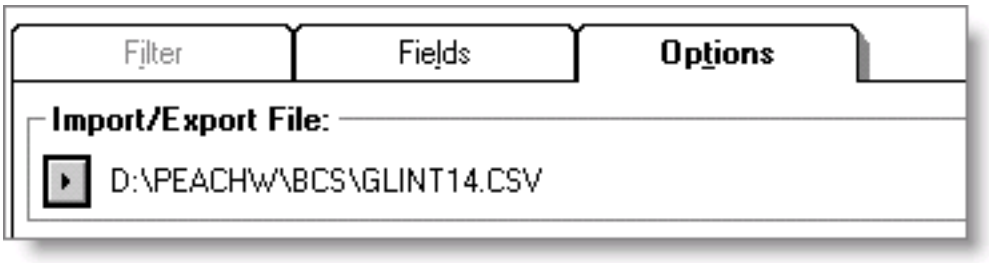
- Date Clear in Bank Rec
- Job ID
- Used for Reimbursable Expense
- Transaction Period
- Transaction Number

5. When you finish, six fields remain checked to match the iMIS Peachtree export output:

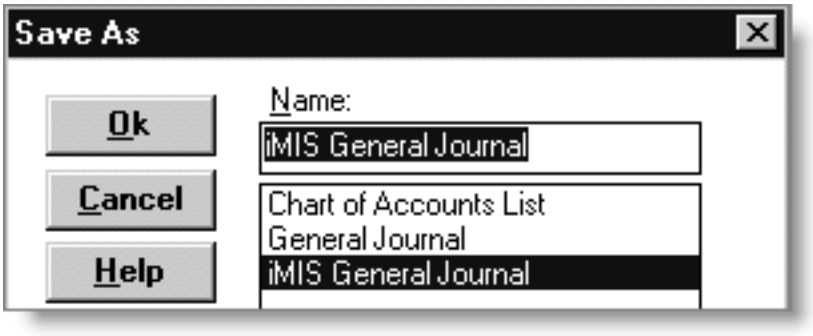
- Date
- Reference
- Number of Distributions
- G/L Account
- Description
- Amount



6. Click the Options tab.
7. Click the right arrow icon under the Import/Export File prompt and browse to the correct export/import directory and file name.



8. Click the Save button on the window.
9. Assign a new name (for example, iMIS General Journal) to the revised Import Definition in the Save As window.
10. Click OK.



If you wish to process the import, click the OK button on the Import definition window, or click the Cancel button to exit.

To create the export file from iMIS (Peachtree)

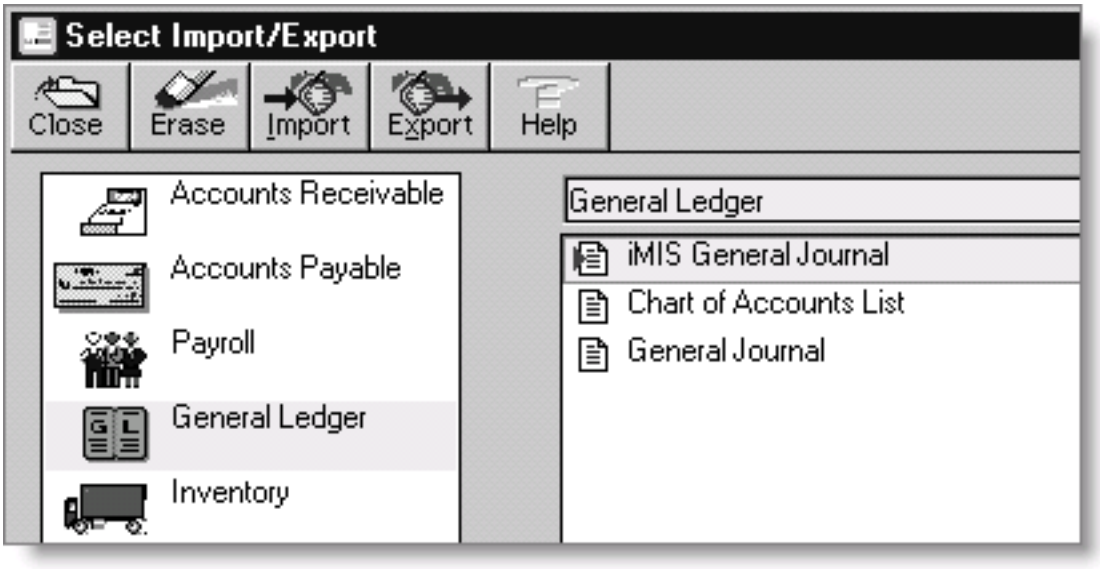
1. Select AR/Cash > Process month-end procedures > Create GL Journal to generate the general ledger transaction export files.

To import data into Peachtree Windows

Make sure you have a current backup before you begin the import process.

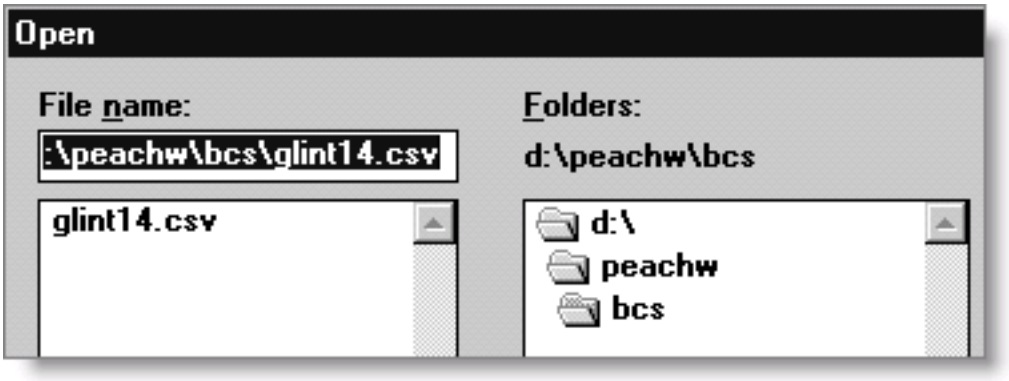
1. Select File > Select Import/Export to open the Select Import/Export window.

2. Select General Ledger on the left.
3. Select iMIS General Journal, or the name assigned in step General Ledger Interfaces above.
4. Click Import.

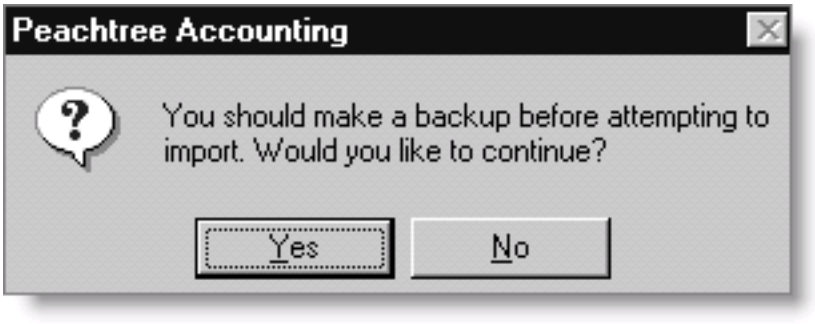


5. Click the Options tab and verify that the Path and file names are correct for the export file created by iMIS.

   Note: If your file name varies with each import, or if you have multiple files to import, click the right arrow icon under the Import/Export File prompt and select the correct export/import and file name.



6. Click OK from the Import window to proceed with importing the iMIS general journal entry. The following verification message displays.

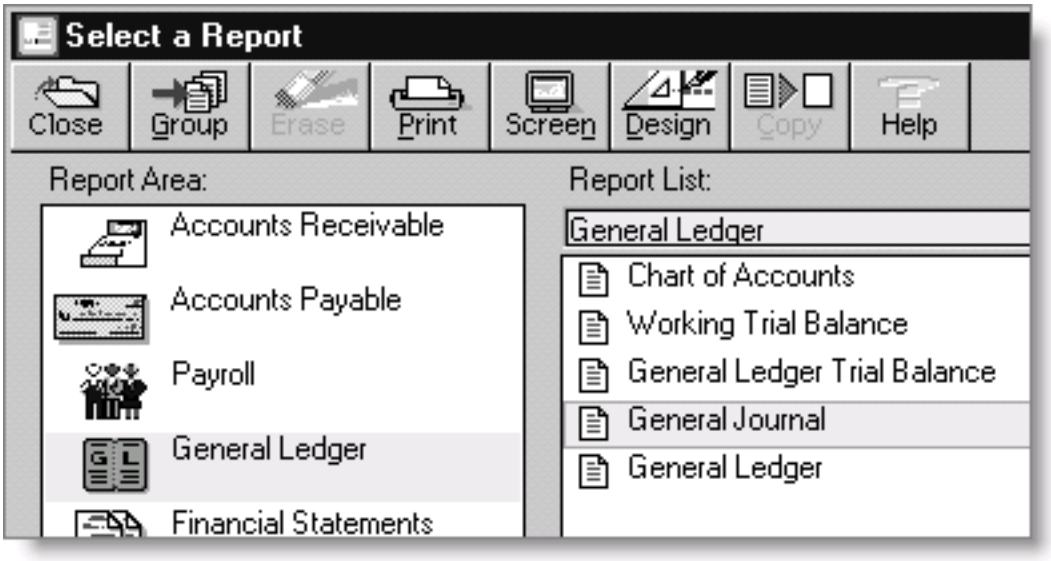


Make sure you have a current backup.

7. Click Yes to proceed with the import.

To view transactions imported from Peachtree

1. Select Reports > General Ledger. The Select a Report window opens.



2. You may need to click the Design icon and override the date range for the report.

Date	Account ID	Reference	Trans Description	Debit Amt	Credit Amt
3/12/00	10100	000312-1	000312-1: PEACH Cash Receipt	650.00	
	11000		000312-1: PEACH-AR-AR	60.00	
	11000		000312-1: PEACH-MEETING-AR	150.00	
	40000		000312-1: PEACH-AR-PEACH1		100.00
	40000-C		000312-1: PEACH-AR-PEACH2		60.00
	40000-R		000312-1: PEACH-MEETING-PEACH/M		700.00
3/12/00	10100	000312-2	000312-2: PEACH Cash Receipt	100.00	
	40000		000312-2: PEACH-AR-PEACH1		100.00
3/13/00	10100	000313-1	000313-1: PEACH Cash Receipt	210.00	
	11000		000313-1: PEACH-AR-AR		210.00
		Total		**1,170.00**	**1,170.00**

Export/Import File Example

The GL Interface process creates a single comma-delimited file containing the transactions selected for export in iMIS. The transactions are summarized based on the option selected in AR/Cash System Setup.

04/12/2011,"110412-1",6,"10100","110412-1: PEACH Cash Receipt",650.00

04/12/2011,"110412-1",6,"11000","110412-1: PEACH-AR-AR",60.00

Quickbooks Pro

iMIS provides support to meet export requirements for Quickbooks Pro version 5.0 or greater. This support is in place in iMIS LAN version 3.50d or greater and iMIS as of version 4.10.

In Quickbooks Pro, all receivable and payable accounts must be cross-referenced to a customer or vendor account, respectively. For this purpose, you must set up a special iMIS customer in Quickbooks Pro to which the accounts receivable entries are linked. If you have to charge sales tax through iMIS processing, you must map the appropriate Vendor code to the tax liability account in iMIS. These required setup steps are outlined below.

To set up iMIS for Quickbooks Pro

The setup steps from iMIS include making appropriate choices on the AR/Cash General Ledger Interface window and an optional step to establish a Quickbooks Pro general/lookup validation table.

The iMIS setup steps are described in detail below:

Step 1 – Change the GL Interface Type

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Quickbooks Pro.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored. Although you can be flexible in what name and directory you assign to the export file, Quickbooks Pro will, by default, look in the qbooksw directory for import files with an .IIF extension. If you follow these defaults, there will be fewer steps required to importing.

   For best results, set the extension of the file name to .iif (i.e., I:\IMIS\GLINT.iif).

- Use a # sign in the file name to instruct iMIS to create files for each iMIS organization code, with the ORG code inserted in the file name.
- Use a ? mark in the file name to instruct iMIS to create sequentially numbered files with each subsequent file that is generated.

  For example, #glint?.iif will create ORG1glint1.iif and ORG2glint1.iif for the first export and ORG1glint2.iif and ORG2glint2.iif for the next export.

6. Click Save.

   Step 2 – Set up a special QUICKBOOKS General Lookup/Validation Table

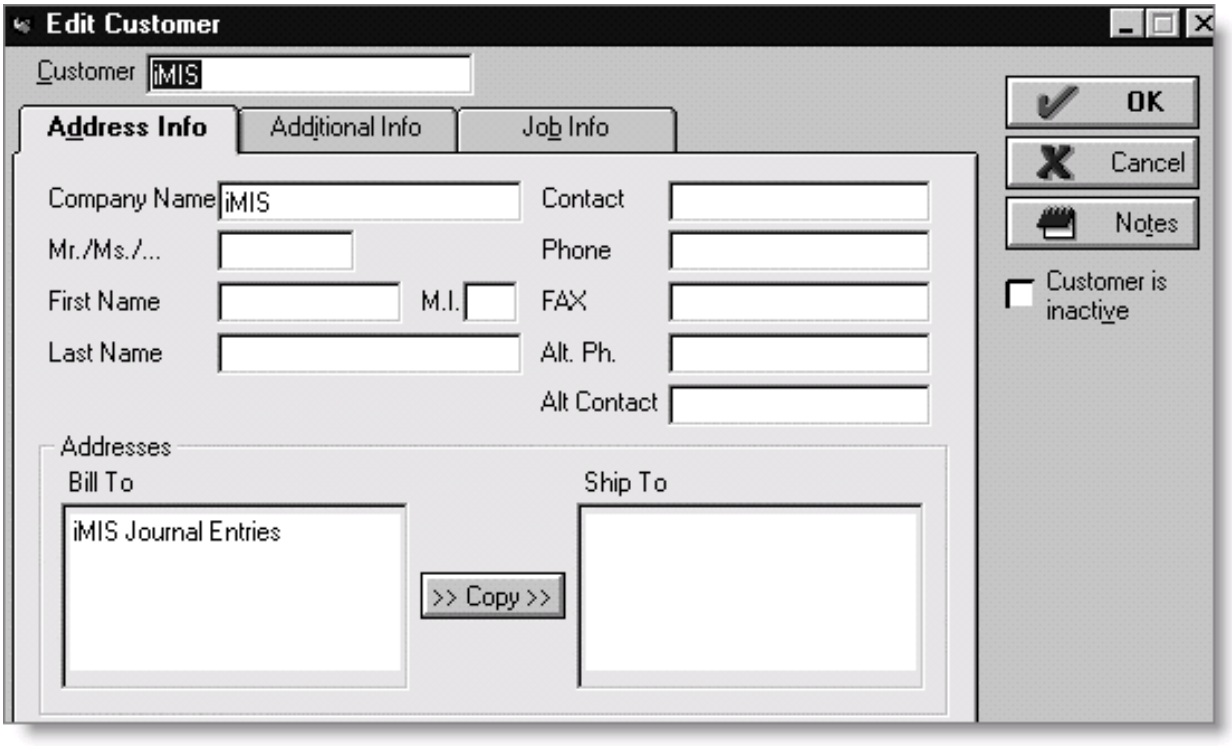
   You must follow these steps if you process sales tax through iMIS. If not, you can skip them. Creating this validation table will associate the QuickBooks vendor with your tax account in the GL_ACCOUNT table. All entries in the export file for this GL Account will be assigned to the appropriate vendor, instead of the Quickbooks customer “iMIS”.

1. From Customers, select Set up tables > General lookup/validation to open the General lookup/validation window.
2. Select (New Table) from the list of table types. The New Table Type window opens.
3. Enter a New Table named QUICKBOOKS and click Save.
4. Click New and insert a new record with the code equal to your tax liability account in the Code field.
5. In the Expansion field, fill in the Quickbooks Vendor Name associated with your tax liability account.
6. Click Save.

   To set up Quickbooks Pro

1. The setup within Quickbooks Pro includes a simple step to set up a special iMIS customer account to which all accounts receivable amounts will be linked.

2. Select Lists > Customer:Job List.
3. From the Customer:Job List window, select New from the Customer:Job List drop-down list.
4. Assign the code “iMIS” as the Customer Name and complete any other fields, as desired.
5. Click OK.

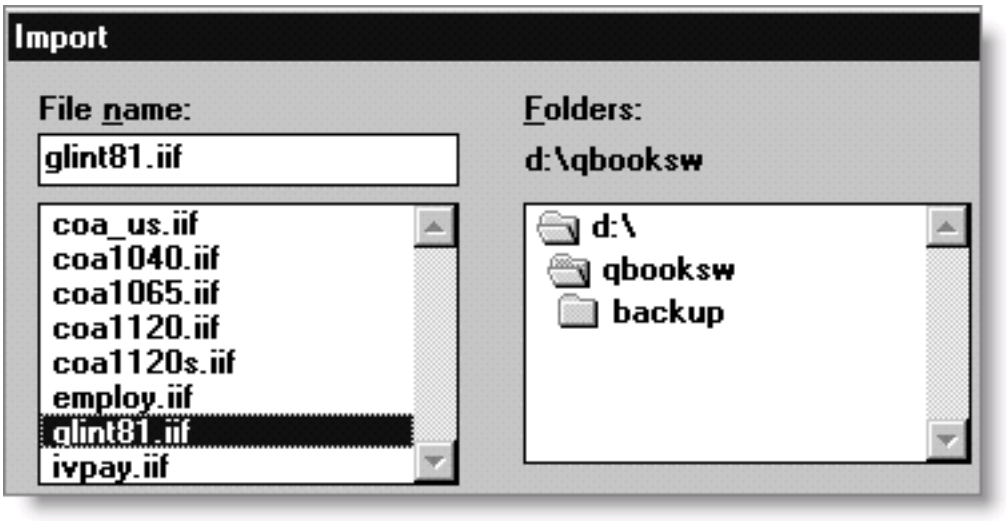


To create the export file from iMIS (Quickbooks Pro)

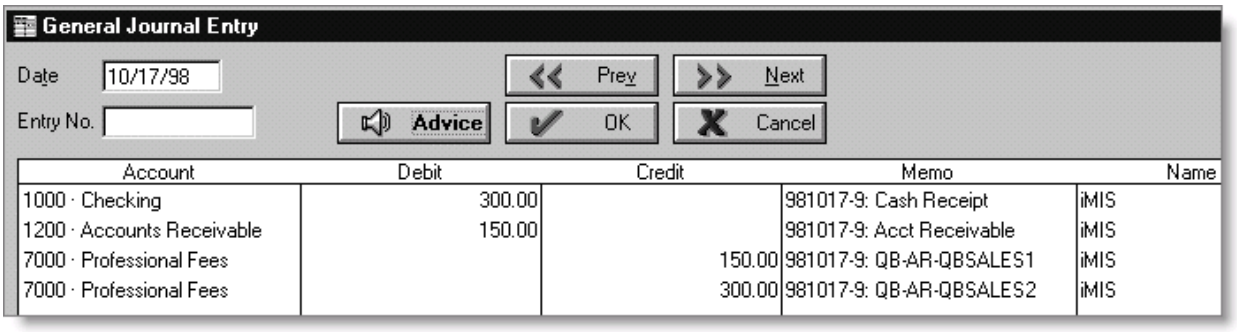
1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal.

To import data into Quickbooks Pro

1. Select File > Import.
2. In the Import window, locate and double-click the appropriate iMIS export/import file.



3. Once imported, you can view the data by selecting Activities > Make Journal Entry and choosing the Previous and/or Next buttons until the entry or entries are located.



Account	Debit	Credit	Memo	Name
1000 · Checking	300.00		981017-9: Cash Receipt	iMIS
1200 · Accounts Receivable	150.00		981017-9: Acct Receivable	iMIS
7000 · Professional Fees		150.00	981017-9: QB-AR-QBSALES1	iMIS
7000 · Professional Fees		300.00	981017-9: QB-AR-QBSALES2	iMIS

Export/Import File Example

The export/import file is a simple fixed-length export/import file that contains a heading section, a transaction header line for each journal entry to be created, and detail document lines for each additional debit or credit entry in that group (determined by the Summarize By field in iMIS). For example, if you summarize by batch, the first line of the export file for a batch containing payments and meeting registrations may show the Accounts Receivable total for the batch on the first line, followed by lines with totals for each additional GL account/pseudo-account in that batch.

Each group of entries are posted to QuickBooks under a single transaction, with transaction type of JOURNAL. iMIS generates a new journal entry each time the following is encountered:

- A new transaction date (for Day or Detail summary methods)
- A new batch (for Batch summary methods)

The following export/import example shows a small interface file for two batches across one date, summarized in iMIS by batch. Each batch is set off by a beginning line that starts with
TRNS and an ending line containing only “!ENDTRNS.” Each set of entries is recorded in QuickBooks

!TRNS TRNSTYPE DATE ACCNT NAME MEMO AMOUNT

!SPL TRNSTYPE DATE ACCNT NAME MEMO AMOUNT

!ENDTRNS

TRNS GENERAL JOURNAL 03/10/11 1-1100 iMIS PAY, DEMO-ORDER-PAY 38.00

SPL GENERAL JOURNAL 03/10/11 1-1150 iMIS DIST, DEMO-ORDER-INV -12.57

SPL GENERAL JOURNAL 03/10/11 1-5400 iMIS DIST, DEMO-ORDER-FREIGHT_2 - 5.00

ENDTRNS

TRNS GENERAL JOURNAL 03/10/11 1-1200 iMIS AR, Acct Receivable 38.00

SPL GENERAL JOURNAL 03/10/11 1-4500 iMIS DIST, DEMO-MEETING-BAMS/GOLF -38.00

ENDTRNS

Solomon IV – Read Consolidation File

iMIS provides support to meet export/import requirements for Solomon IV Read Consolidation File. This support is in place in iMIS LAN version 3.00e or greater and iMIS version 3.30d or greater.

The standard Solomon IV Interface makes use of the built-in Solomon IV general ledger consolidation option. The export file created by iMIS when the Solomon IV option is chosen from the GL Interface down drop list is formatted according to the requirements of the import file needed by the General Ledger - Read Consolidation File window (01.510.00).

Make sure all GL accounts in iMIS match the accounts in Solomon's charge of accounts (and sub-accounts, if used in Solomon). When you enter a GL account in iMIS, use the format AAAA-SSSS, where A=the account number (i.e. 1200 for AR) and SSSS=sub-account number (defined in Solomon). The length of the account or sub-account can vary, and is defined in Solomon.

Note: Note: iMIS currently supports two methods to export/import general ledger or financial data to Solomon IV. Financial transaction data can either be exported/imported using the Read Consolidation File method discussed here, or through the Transaction Import Utility. You may wish to review the import steps for both options before deciding which one you would prefer to use. For those users who are licensed for the iMIS Accounts Payable Interface, AP vendor and transaction

data can only be imported using the Transaction Import Utility.

Note: Note: Address line 3, which was added in iMIS 10.6, is not exported because the Transaction Import utility does not support it.

To set up iMIS for Solomon IV – Read Consolidation File

A Currency ID is required in the Read Consolidation import file as of Solomon IV version 4.21. A field was added to the AR/Cash General Ledger Interface window in iMIS version 4.41.

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Solomon IV.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored.

   For best results, set the extension of the file name to .txt (i.e., I:\IMIS\GLINT.TXT).

- Use a # sign in the file name to instruct iMIS to create files for each iMIS organization code, with the ORG code inserted in the file name.
- Use a ? mark in the file name to instruct iMIS to create sequentially numbered files with each subsequent file that is generated.

  For example, #glint?.dta will create ORG1glint1.txt and ORG2glint1.txt for the first export and ORG1glint2.txt and ORG2glint2.txt for the next export.

6. Enter the Currency ID from your Solomon GL Setup (Module > General Ledger > GL Setup > Currency Info tab). The Currency ID field only displays when the Solomon IV GL interface type is chosen.
7. Click Save.

To create the export file from iMIS (Solomon IV – Read Consolidation File)

1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal. If batch processing is enabled, only posted batches are included.

To import data into Solomon IV – Read Consolidation File

The steps to import data into Solomon IV using this method are:

1. Choose General Ledger > Read Consolidation.
2. At the prompt, Name of File to be Read, enter the export file name including the path name that you specified in iMIS. Notice that a Browse button is available to help you locate the file without typing it in.
3. At the prompt, Period to Post, enter the appropriate fiscal month and year for the transactions that are being imported. For example, the second fiscal period of 2002 would be entered as 02-2002.
4. Click the Begin Processing button to start the import process. A status box will appear to processing status information. When finished, it will inform you of the location of the log file to check for any errors, etc.
5. If errors occurred, the most likely problem may relate to validity errors with the GL account or the sub account. The error messages will point you to the exact error for your review.
6. If the import was successful, you can review the imported iMIS batch by choosing General Ledger > Journal Transactions. To locate the iMIS batch, you can press the F3 function key at the Batch Nbr prompt.
7. From this window, you may wish to select the Quick Print button to get a printout of the imported iMIS batch.
8. To make the batch ready for posting, select Release Now from the Batch Handling drop-down list.
9. To post the iMIS batch, choose General Ledger > Post Transactions.

File Layout Example

'1200' '1' '1200' '06/01/2001' 'AR, GEN-MEETING-AR' '1500.00' 'D' 'BAS'

'4300' '1' '4300' '06/01/2001' 'DIST, DEMO_AR_LABELS' '1500.00' 'C' 'BAS'

@

File layout definition:

Field Name , Sample Data , Comments

1 account number, '1200', iMIS account number field, up to first dash (-)

2 subaccount number, '1', from iMIS account number field, after the dash (-)

3 ref number, '1200', iMIS account number field, up to first dash (-); Solomon Ref#

4 date, '06/01/2001'

5 description, 'AR, GEN-MEETING-AR'

6 amount, '1500.00'

7 credit or debit, 'D'

8 currency, 'BAS', entered in AR/Cash GL Interface setup in iMIS

9 end of file marker, '@'

Solomon IV – Transaction Import Utility

iMIS provides support to meet export/import requirements for Solomon IV – VI Transaction Import utility. This support is in place in iMIS LAN version 3.5 or greater and iMIS version 3.31 or greater.

Make sure all GL accounts in iMIS match the accounts in Solomon's charge of accounts (and sub-accounts, if used in Solomon). When you enter a GL account in iMIS, use the format xxxx-yyyy, where xxxx=the account number (i.e. 1200 for AR) and yyyy=sub-

account number (defined in Solomon). The length of the account or sub-account can vary, and is defined in Solomon.

> **Note:** Note: iMIS currently supports two methods to export/import general ledger or financial data to Solomon IV. Financial transaction data can either be exported/imported using a Read Consolidation File option with Solomon IV, or through the Transaction Import Utility. You may wish to review the import steps for both options before deciding which one you would prefer to use. For those users who are licensed for the iMIS Accounts Payable Interface, AP vendor and transaction data can only be imported using the Transaction Import Utility. Refer to the Solomon System Manager manual for additional details on Transaction Import.

> **Note:** Note: Address line 3, which was added in iMIS 10.6, is not exported because the Transaction Import utility does not support it.

The following paragraphs provide some implementation setup tips for integrating iMIS with Solomon IV using the Transaction Import Utility.

The iMIS to Solomon IV (- TI) Interface works through the Solomon IV Transaction Import utility. The Transaction Import utility serves as the bridge to bring information from outside packages, such as iMIS, into the normal Solomon IV files. This utility provides the mechanism for bringing financial (accounts receivable/cash/income) data generated through iMIS into your Solomon IV General Ledger. If you are licensed for the iMIS AP Interface, it also provides the vehicle for imported vendor and accounts payable transaction data into Solomon IV for generating refund checks.

> **Note:** Note: The Solomon IV SQL-TI works the same as Solomon IV-TI except that the Ledger ID for the set of books that the transactions will be posted to must be specified in the export/import records.

The monthly (or more frequent) interface runs are quite straightforward.

On the Solomon IV side, the only setup required is to copy the control files supplied specifically for iMIS imports to the Solomon directory. The control files give the Solomon transaction import utility specific instructions as to how to import export data generated from iMIS. The control files for iMIS exports can be downloaded from the ASI Technical Support website. The following files should be copied into the main Solomon directory. Solomon will report an error that the file cannot be opened if the file is not in the expected directory. The control files are:

For the Financial Systems (GL) Interface:

- IMIS.CTL – Control file to support the GL transaction import for Solomon IV-TI
- IMISSQL.CTL – Control file to support the GL transaction import for Solomon IV SQL-TI

For the Accounts Payable Interface:

> **Note:** Note: Solomon only allows 10 characters for the vendor ID, which includes the letter "I" plus the iMIS member ID. Therefore, the member ID cannot exceed nine (9) characters in order to support the processing of refunds in Solomon.

- IMISVEN.CTL – Control file to support the Vendor import
- IMISAP.CTL – Control file to support the Voucher import

To set up iMIS for Solomon IV – Transaction Import Utility

The setup steps from iMIS include making appropriate choices on the AR/Cash General Ledger Interface window and a required step to establish a SOLOMON general/lookup validation table.

The iMIS setup steps are described in detail below:

Step 1 – Change the GL Interface Type

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.

2. Click Edit.
3. From the GL interface type drop-down list, select Solomon IV-TI or Solomon IV SQL-TI. If you are using Solomon VI, select a Solomon interface type.

- Select Solomon IV-TI if Ledger IDs are NOT used in Solomon.
- Select Solomon IV SQL-TI if multiple Ledger IDs are used in Solomon.

4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored.

   For best results, set the extension of the file name to .DTA (i.e., I:\IMIS\GLINT.DTA). The .DTA extension will make it easier to find the import file using the lookup window.

- Use a # sign in the file name to instruct iMIS to create files for each iMIS organization code, with the ORG code inserted in the file name.
- Use a ? mark in the file name to instruct iMIS to create sequentially numbered files with each subsequent file that is generated.

  For example, #glint?.dta will create ORG1glint1.dta and ORG2glint1.dat for the first export and ORG1glint2.dta and ORG2glint2.dta for the next export.

6. Click Save.

   Step 2 – Set up a special SOLOMON General Lookup/Validation Table

   You must follow these steps if you process sales tax through iMIS. If not, you can skip them.

1. From Customers, select Set up tables > General lookup/validation to open the General lookup/validation window.
2. Select (New Table) from the list of table types. The New Table Type window opens.
3. Enter a New Table named SOLOMON and click Save.
4. Click New and insert a new record with the code of LEDGER in all caps in the Code field.

5. In the Expansion field, fill in the correct codes for Solomon IV Ledger ID.
6. Click Save.

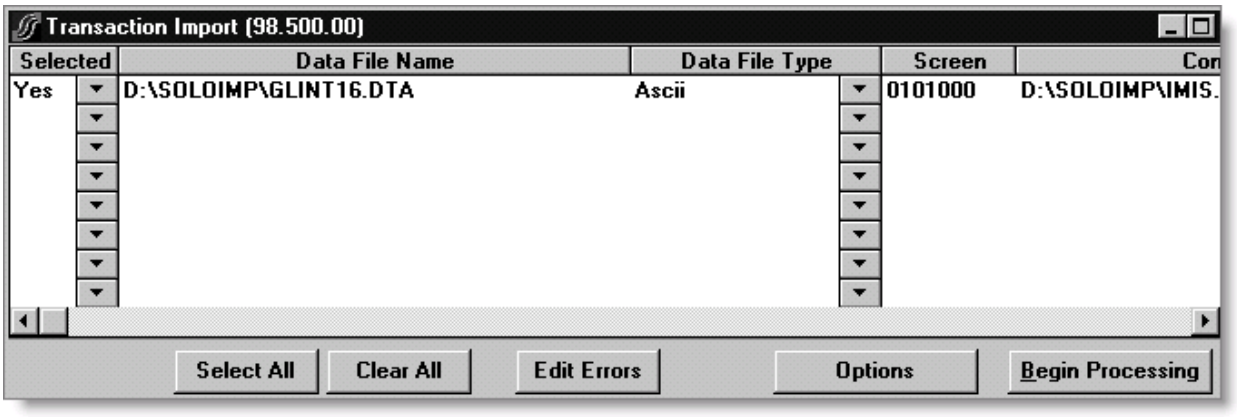
To create the export file from iMIS (Solomon IV – Transaction Import Utility)

1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal. If batch processing is enabled, only posted batches are included.

To import data into Solomon IV – Transaction Import Utility

After the new import files are created by iMIS, they can be imported into Solomon IV.

1. Select Transaction Import from the Solomon IV Utility menu.



2. Mark the first line as selected.
3. For the data file name enter the output file name including the path name that you specified in iMIS in the second column or press F3 to open a search dialog window. The third column should default to ASCII.
4. Select the screen in the fourth column by pressing F3. The following list of screens displays:

- 0101000 (Journal Transactions) for GL Import
- 0327000 (Vendor Maintenance) for Vendor Import
- 0301000 (Voucher and Adjustment Entry) for Voucher Import

5. Scroll over and enter the import control file into the fifth column. The import control file describes the import file. Select the control file from the following options:

- IMIS.CTL for GL Import without Ledger ID (Solomon IV -TI), or
  IMISSQL.CTL for GL Import with Ledger ID (Solomon IV SQL -TI)
- IMISVEN.CTL for Vendor Import
- IMISAP.CTL for Voucher Import

6. In the sixth column, enter a file name for the creation of an error or log file to be created during the import.
7. Enter the appropriate import control file name including the path name or press F3 to open a search dialog window. The seventh column should read Minimized and should not be changed.
8. Select Begin after you have filled in all columns. If you named an error file, you can review the status of the import through Edit Errors.

   This is an example of a normal error log output for a general ledger transaction import. The sample error log is configured to include “all import data”, and the Batch is out of balance message will always appear until the user enters a control and posts the batch. Make sure the number of errors near the end of the log file is zero.

   'System Message 8000: Start Processing Wed Feb 23 04:07 P.M.

   'System Message 8042: Transaction Import Processing Combine Edit and Update mode

'System Message 8001: Completed Processing Wed Feb 23 04:07 P.M.

Note: Tip: Two import files (Vendor & Invoice) are required to support the AP Interface. You can shortcut your steps by entering the import instructions for both files (Vendor First) on one Transaction Import window.

1. When the import is complete, review the general ledger import batch through the General Ledger > Journal Transactions window.
2. Select Accounts Payable > Voucher and Adjustment for the AP interface, to review the batch of transactions. If you press F3 at the Batch Nbr field, the newly imported batch should be the first batch in the list.

3. To process/post the batch, fill in the batch control amount with the amount shown as the debit or credit amount at the bottom of the window.

4. Print the iMIS GL transaction batch using the Quick Print button at the lower left corner of the window. (For the AP batch report, select Accounts Payable > Reports > AP Edit.)
5. When you are ready to post the batch, change the Batch Handling drop-down list to Release Now.
6. Select General Ledger > Post Transactions to post the iMIS batch.

4 Status "A" for Active

5 Invc Num blank

6 Invc Date "06/24/2005"

7 Vendor ID "I136" "I" plus the iMIS member ID

8 PO # blank

9 Terms blank

10 Due Date "06/24/2005"

11 Pay Date "06/24/2005"

12 Orig Doc Amt 45.00

13 Disc Bal 45.00

14 AP Acct 2100

15 AP Sub-acct 0001

Detail record ("Transaction") - this is a detail line for the preceding Document record

Field Name Sample Data Comments

1 Acct 2500

2 Sub-acct 0001

3 Trans amt 45.00

4 Trans Descr "Refund: R95 Books Are Good"

> **Note:** Note: Solomon only allows 10 characters for the vendor ID, which includes the letter “I” plus the iMIS member ID. Therefore, the member ID cannot exceed nine (9) characters in order to support the processing of refunds in Solomon.

Unsupported Interfaces

Access Accounts for Windows

iMIS provided support to meet export requirements for Access Accounts for Windows 95 version 3.41B or greater. This support was in place in iMIS LAN as of version 3.50b and iMIS as of version 4.01.

To set up iMIS for Access Accounts

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Access Accounts.
4. Select an option from the Summarize by drop-down list.
5. (Recommended) For the Output file path/name, enter the Access\Import subdirectory for the path and NOMJRNLS.TXT for the file. This is the default path location and file name where Access Accounts will use for importing general ledger transactions.

> **Note:** Note: Optionally, you can enter a different path and/or file name than the default settings, as outlined above. For example, you can enter a file name that contains the allowed special characters (for example, ? to append a sequential

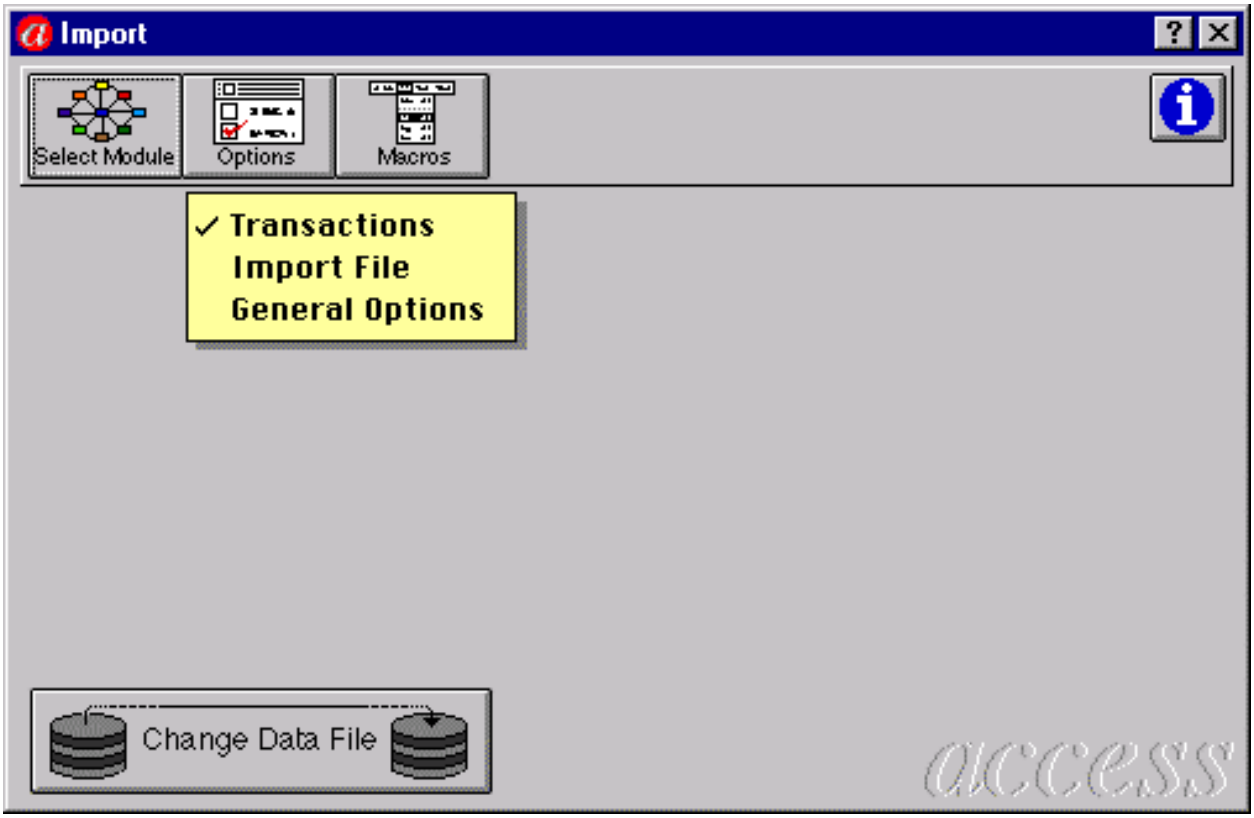
> number, # to create multiple export files for multiple entities). If you elect to use a non-default path and/or file name, be sure to choose the Always Prompt for Files option in the Access Accounts setup.

To create the export file from iMIS (Access Accounts)

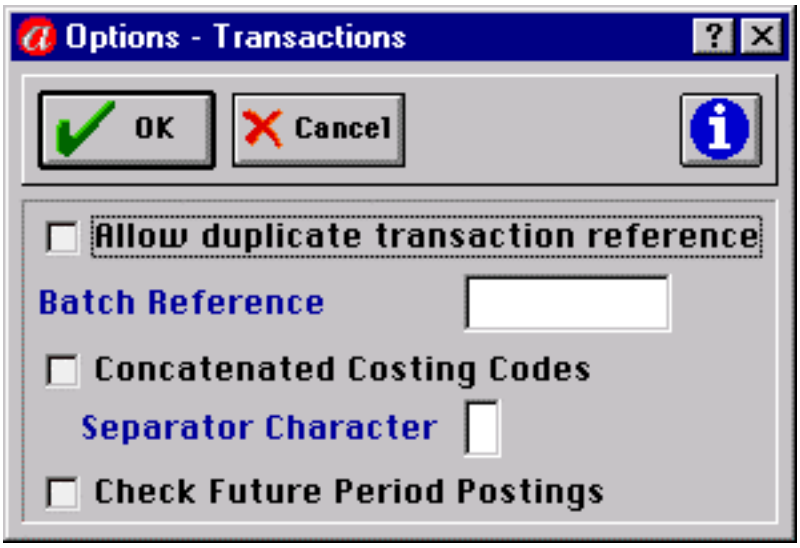
1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal.

To import data into Access Accounts

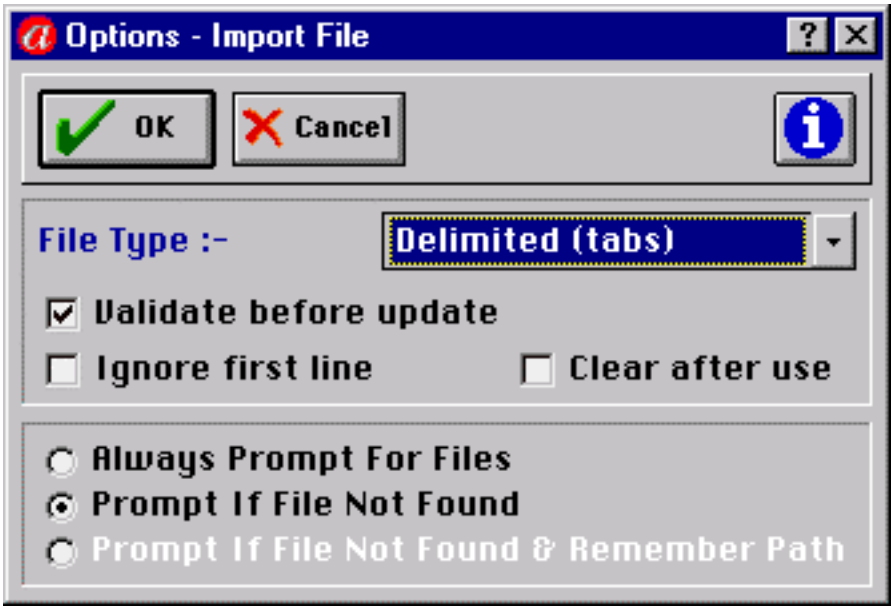
1. Open the Access Import/Export Utility.
2. Select Access Accounts > Import.
3. Select Options > Transactions.



4. (Recommended) Ensure that all options remain unchecked, as displayed below. Click OK.



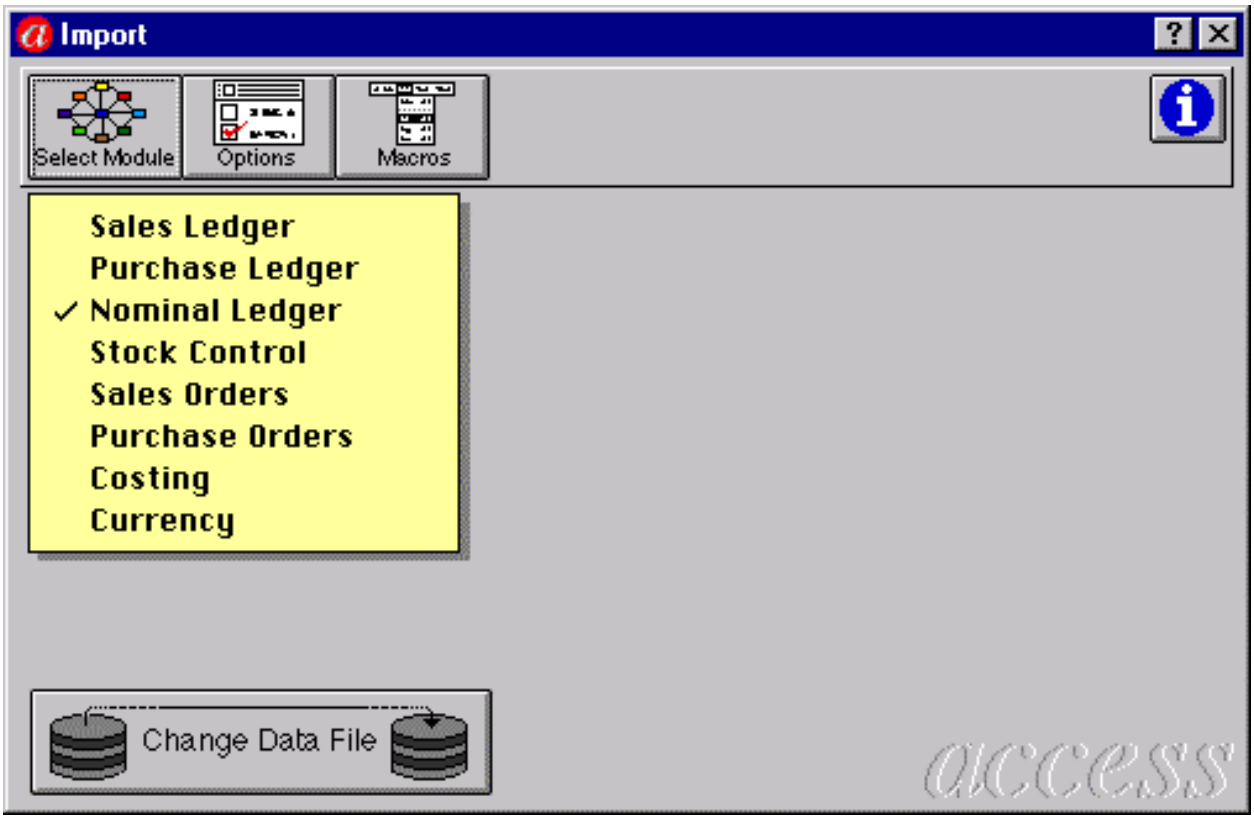
5. Click the Options button and select Import File.
6. Select Delimited (tabs) from the drop down list for the File Type.
7. Enable the Validate before update checkbox.
8. (Recommended) Select the Prompt if File Not Found radio button if the default path and file name were entered at the iMIS setup step 3 above. Otherwise, select the Always Prompt for Files options.



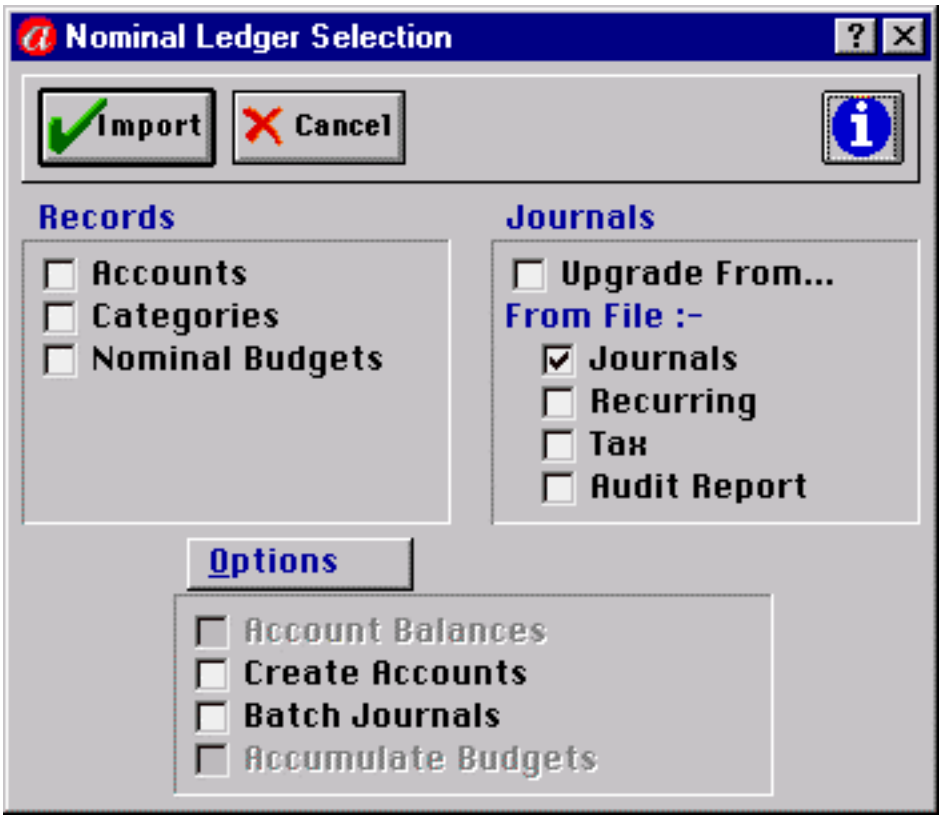
9. Click OK.

To integrate the General Ledger from Access Accounts

1. Open the Access Import/Export Utility.
2. Select Access Accounts > Import.
3. Click the Select Module button and select Nominal Ledger.



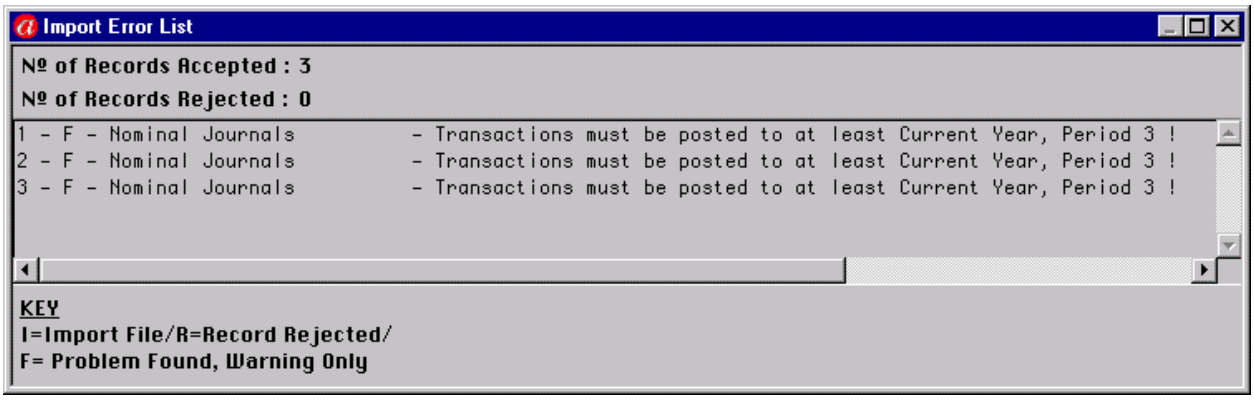
4. In the Nominal Journal Selection window, enable only the From File: - Journals checkbox only. Ensure that all other options are disabled or unchecked, as in the example below.



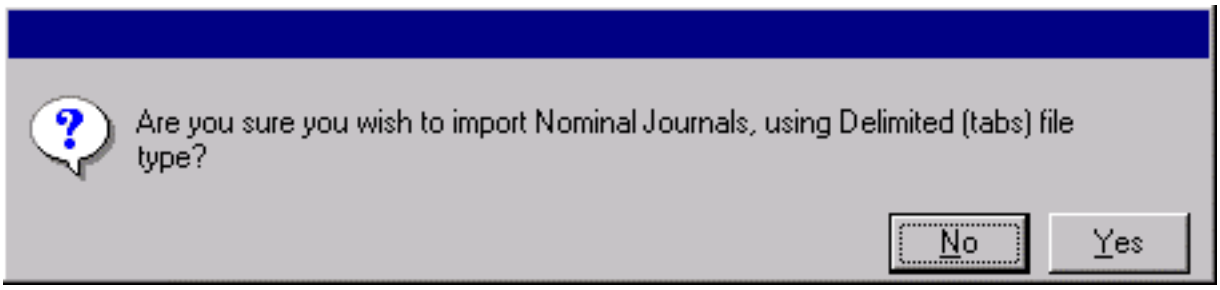
5. Click the Import button.
6. To proceed with the import validation process, answer or click Yes to the next four pop-up questions:

- Have you taken a backup of your data?
- The import routine may take a long time! Are you sure you wish to continue?
- Do you wish to validate Nominal Journals?
- Are you sure you wish to validate Nominal Journals, using Delimited (tabs) file type?

7. As the transactions are tested for validity, an error list is generated. It is normal to get Warnings concerning the fiscal period. Investigate problems if you received other types of errors (for example, the No. of Records Rejected is greater than 0).



8. Begin the actual import process by repeating steps 4 and 5 above.
9. Answer or click No to Do you wish to validate Nominal Journals?
10. Answer or click Yes to the following pop up question if you only received warning messages about the fiscal period.



11. After the import is complete, you may receive another warning message about the fiscal period. You can close the window. Your iMIS GL Integration Entry should have posted to your Nominal Accounts area.

Export/Import File Example

The export/import file is a simple tab delimited file.

A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P
363		07/16/1996					This is a test desc	C	113101	206			Detail Desc.		IMIS6
363		07/16/1996					This is a test desc	D	133700	106			Detail Desc.		IMIS6
363		07/16/1996					This is a test desc	D	133500	100			Detail Desc.		IMIS6

Business Works for Windows

iMIS provided support to meet export requirements for Business Works for Windows version 12.02 or greater. This support is was place in iMIS LAN 3.50d and in iMIS as of version 4.10.

To set up iMIS for Business Works

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Business Works.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored.

   Caution! Business Works can only accept 8-character file names.
6. Click Save.

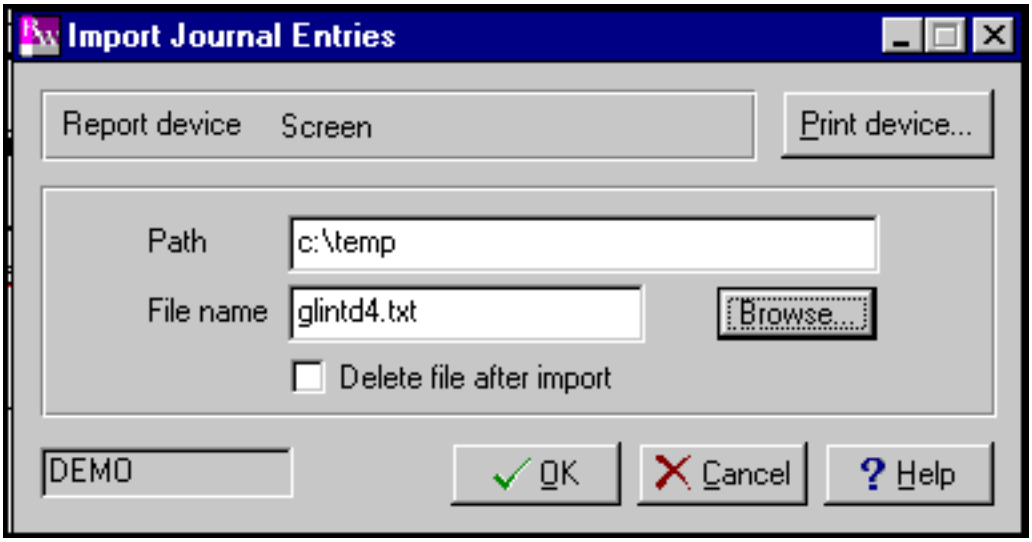
To create the export file from iMIS (Business Works)

1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal.

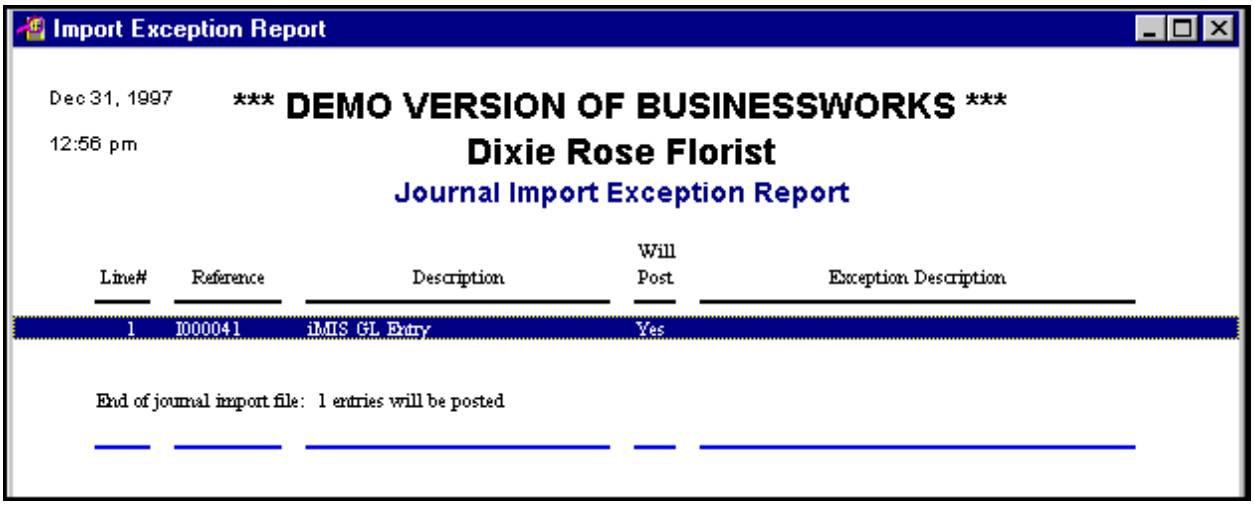
To import data into Business Works

1. Select the Transfer > Import Journal Entries from the menu bar on the main Business Works window.
2. In the Import Journal Entries window, select the location where you want the exception report to be printed. Business Works will print an exception report for each import indicating the reasons why the import cannot be completed or warning of any potential problems.

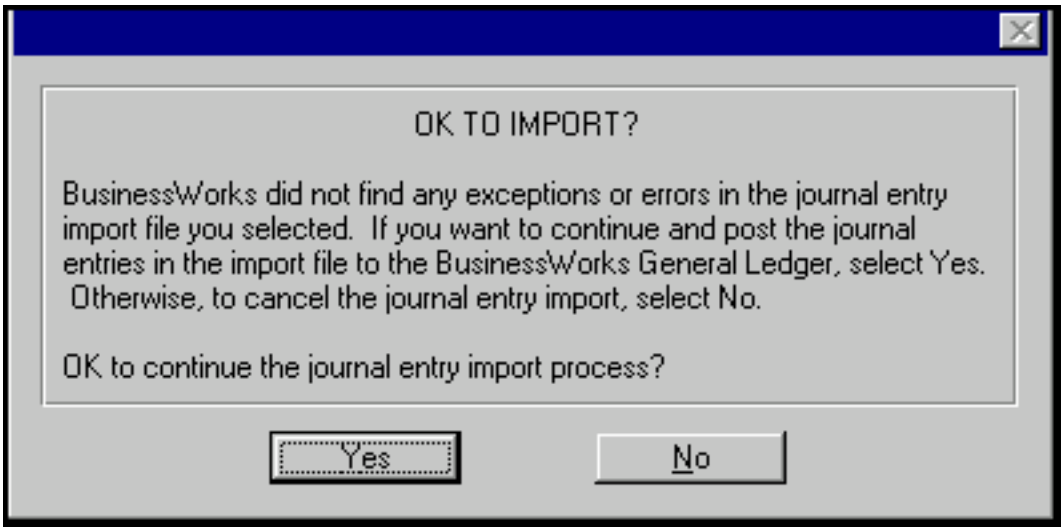
3. Enter the path and file name of the file to be imported, or use the Browse button to locate the file to be imported.



4. Once the file is selected, click OK.
5. Click OK to the Journal Import Exception Report prompt.
6. Review the Exception Report for any errors.



7. You will be prompted whether or not to continue the import.



8. If there are no errors in the import file, click Yes. If errors do exist, click No, correct the file, and re-import the data.

   Export/Import File Example

   The export/import file is a simple comma-delimited file with a record for each transaction detail or summary line. Since each journal entry is limited to 99 records, be sure that the default Transfer/Clearing account is defined, in case a journal entry would normally exceed this limitation.

   Each record consists of seven fields, separated by commas, as follows:

   Sequence Number

   The sequence number is used to differentiate journal entries. This number must be unique, and all records in one journal transaction must have the same sequence number.

   iMIS will generate a new journal entry and Sequence Number each time the following is encountered:

1. The entry exceeds 90 lines (a transfer/clearing balancing line will be created)
2. A new transaction date (for Day or Detail summary methods)
3. A new batch (for Batch summary methods)

   Date

The date in MM/DD/YY format. Dates older than 24 months before the current month or more than 12 months in the future are not accepted.

Journal Number

The number is 0, for General Journal.

Reference

The reference field, which is used to identify a transaction, is a required field and cannot be blank. This identifier is a combination of the letter I for iMIS, the sequential GL interface run number, and a sequence number from the first field.

Description

The transaction description is typically “iMIS GL Entry.” It will include the batch number, if the Batch summary level is chosen.

Account Number

The General Ledger Account Number.

Amount

The transaction amount. Credits are denoted by a preceding minus sign.

The following export/import example shows a small interface file for the date of April 20, 2011

1,04/20/11,0,"I000041","iMIS GL Entry",1050.00,40.00

1,04/20/11,0,"I000041","iMIS GL Entry",1050.00,23.00

1,04/20/11,0,"I000041","iMIS GL Entry",6010.00,-23.00

1,04/20/11,0,"I000041","iMIS GL Entry",6010.00,-40.00

Note: Note: After an export/import file is successfully imported, if you have not chosen to delete the file, the file will be flagged as imported. You will see an appropriate warning message if you attempt to reimport it.

Exact for Windows

The iMIS Financial Systems (GL) Interface module now provided support to meet import requirements for Exact for Windows version 3.11 or greater. This support was in place in iMIS version 4.11.

To set up iMIS for Exact

Step 1 – Change the GL Interface Type

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Exact.
4. Select an option from the Summarize by drop-down list.

   Note: Each import file is limited to 999 detail lines. We recommend you do not choose the Detail option.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored.
6. Click Save.

Step 2 – Set up a special EXACT General Lookup/Validation Table

Create a new General Lookup/Validation Table to setup Accounts Receivable entries for export to Exact.

1. From Customers, select Set up tables > General lookup/validation to open the General lookup/validation window.
2. Create a new General Lookup/Validation Table to setup Accounts Receivable entries for export to Exact. Go to Customers > Set up tables > General lookup/validation.
3. Select (New Table) from the list of table types. The New Table Type window opens.

4. Enter a New Table named EXACT and click Save.
5. Click New and enter the following fields:

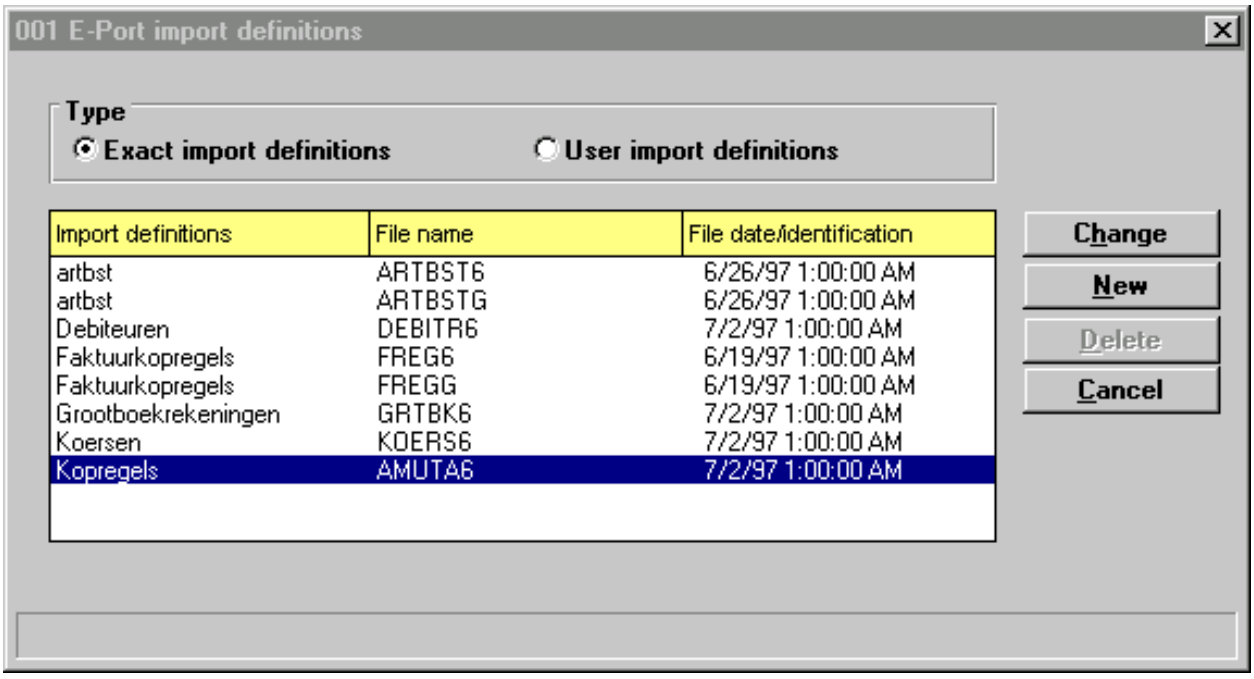
- Code: Must be a valid iMIS GL account for Accounts Receivable under Default Accounts for your Exact-compliant entity. In the example below, 1300 corresponds to the Domestic Debtors account in the demo data from Exact.
- Expansion: Must be a valid Debtor ID number from Exact (see Set up company – Financial > Debtor data > Debtors for a list of valid codes).
- Description: As appropriate.

To set up Exact

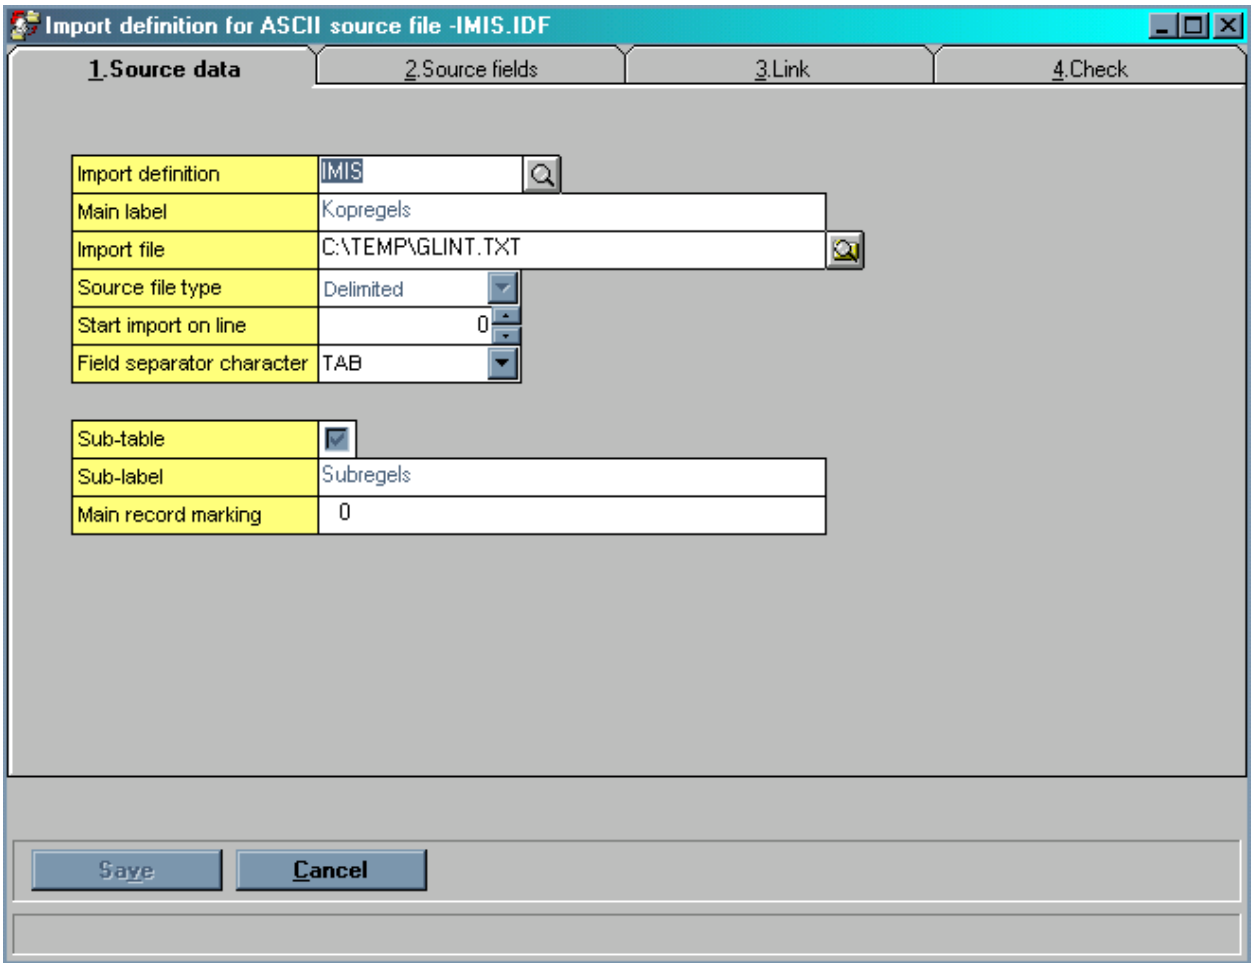
> **Note:** Note that iMIS assumes the General Journal number to be 90. If you do not have a journal 90 in place as a General Journal type, you should take the appropriate steps to enter one. Otherwise, the setup within Exact includes simple steps to modify the existing general journal import definition file, which will be used for both the Trial and Final Import processes.

> **Note:** Note: It is best to do this step with a sample or test export\import file available.

1. From Exact for Windows, select Menu > Systems Maintenance.
2. Choose File Control > Import > Definitions.
3. Select the Kopregels Import Definition (file name AMUTA6) and click the Change button.



4. From the Source Data tab, override the Import Definition name to IMIS. If appropriate, change the Import File or browse for the correct import path/file location.



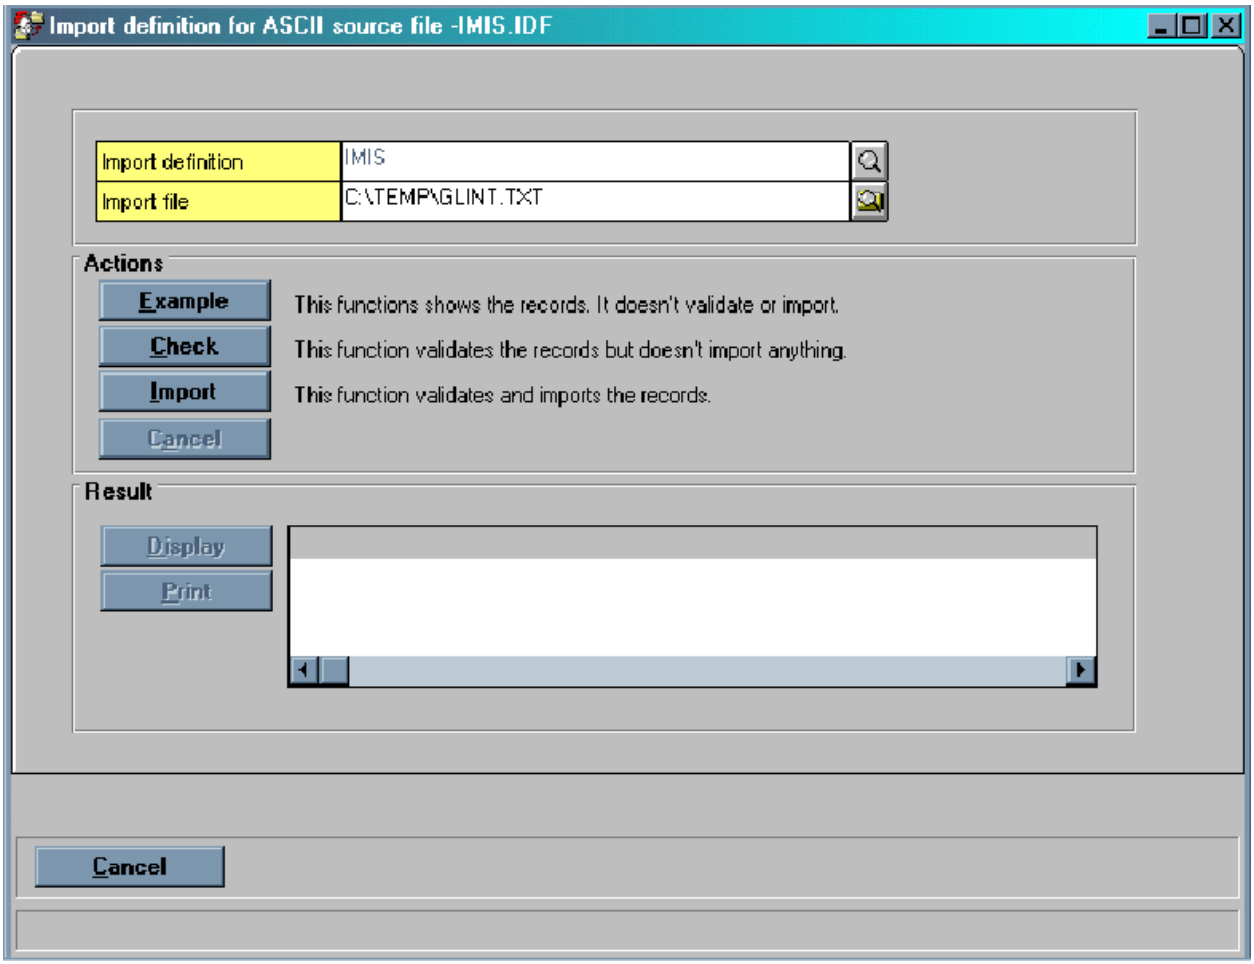
5. If you have a test import file, you can select the Check tab and click the Check button to validate the accuracy of the data.
6. Click Save.

To create the export file from iMIS (Exact)

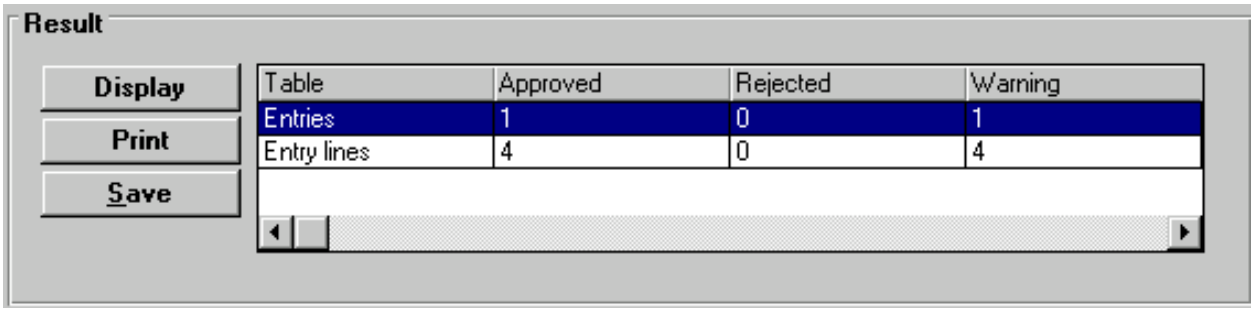
1. Generate the general ledger transaction export files using AR/Cash > Process month end procedures > Create GL Journal.

To import data into Exact

1. From Exact for Windows, select Menu > Systems Maintenance.
2. Choose File Control > Import > Import.
3. Select the User Import Definitions option.



4. Select the Kopregels/IMIS line and click the Open button.
5. Click the Check button to validate the import data. The summary results will display in the lower portion of the window. If there are any errors, you can highlight the line and click either the Display or Print buttons to review the warning or error messages.



6. If the data checked out properly, you can import the unposted batch by clicking the Import button on this window. You will be prompted about the backup status. Enter Y to proceed with the import.
7. To view the imported transaction, from the Financial menu select Enter>Enter>General Journal and do a lookup to locate the imported transactions. Note that you will not be able to edit the transactions from this window because the cash account is not normally included in a General Journal transaction.
8. To post the imported transaction, from the Financial menu select Process>Post Entries and process in the same manner as a normal posting run.

   Export/Import File Example

   The GL Interface process creates a file with a single line header and multiple detail lines (one for each debit and credit). Note that date values exported in field #8 (Date) for both the Import Header and Detail Lines are in a rearranged date format (DDMMYY). E-Port automatically rearranges the format to comply with the MM/DD/YY format in Exact for Windows.

   Import Header Line Sample

   "0" "M" "90" "04" "97" "" "iMIS GL:02/11/2011-
   02/11/2011" "110211" "" "" "" "" 0.00 "N" ""

"" "" "" 0.00 "" "" 0.00 "0" "" "N" "" 0.00 0.00 0.00 0.00 "" "" ""

When an outstanding balance exists, the entry to Accounts Receivable contains two additional fields that are required by the iMIS import definition (based on AMUTA6.IDF) in Exact. The Debtor ID (field 10) is required for successful import, and the Invoice Number (field 12) is required to successfully post the imported AR transactions to the General Ledger. See the following Import Header Line 2 and note that the Debtor ID (1510) must correspond to a valid entry in Exact.

The Invoice Number (00000001) is an arbitrary numeric constant. If necessary, you can manually modify this number from within Exact after the transactions have been imported, but before the GL entries are posted to the General Ledger.

To modify the invoice number

1. Go to the Financial menu. Select Enter > Enter > General Journal.
2. In the Jrnl field, enter the appropriate journal number (for example, 90).
3. Enter the appropriate FY.
4. Enter the appropriate Per. and Seq. for the corresponding GL entries, or click the magnifying glass icon to select the batch from a list.
5. Modify the Invoice field for the desired AR entries and click Save.

Platinum for Windows

iMIS provided support to meet export requirements for Platinum for Windows version 4.6 or greater. This support was for iMIS LAN version 3.51 and iMIS version 4.10.

In order to facilitate the interface, iMIS formats the transaction data into a Lotus spreadsheet format. The Lotus file is then imported into a journal batch using Platinum's Spreadsheet Import utility.

To set up iMIS for Platinum

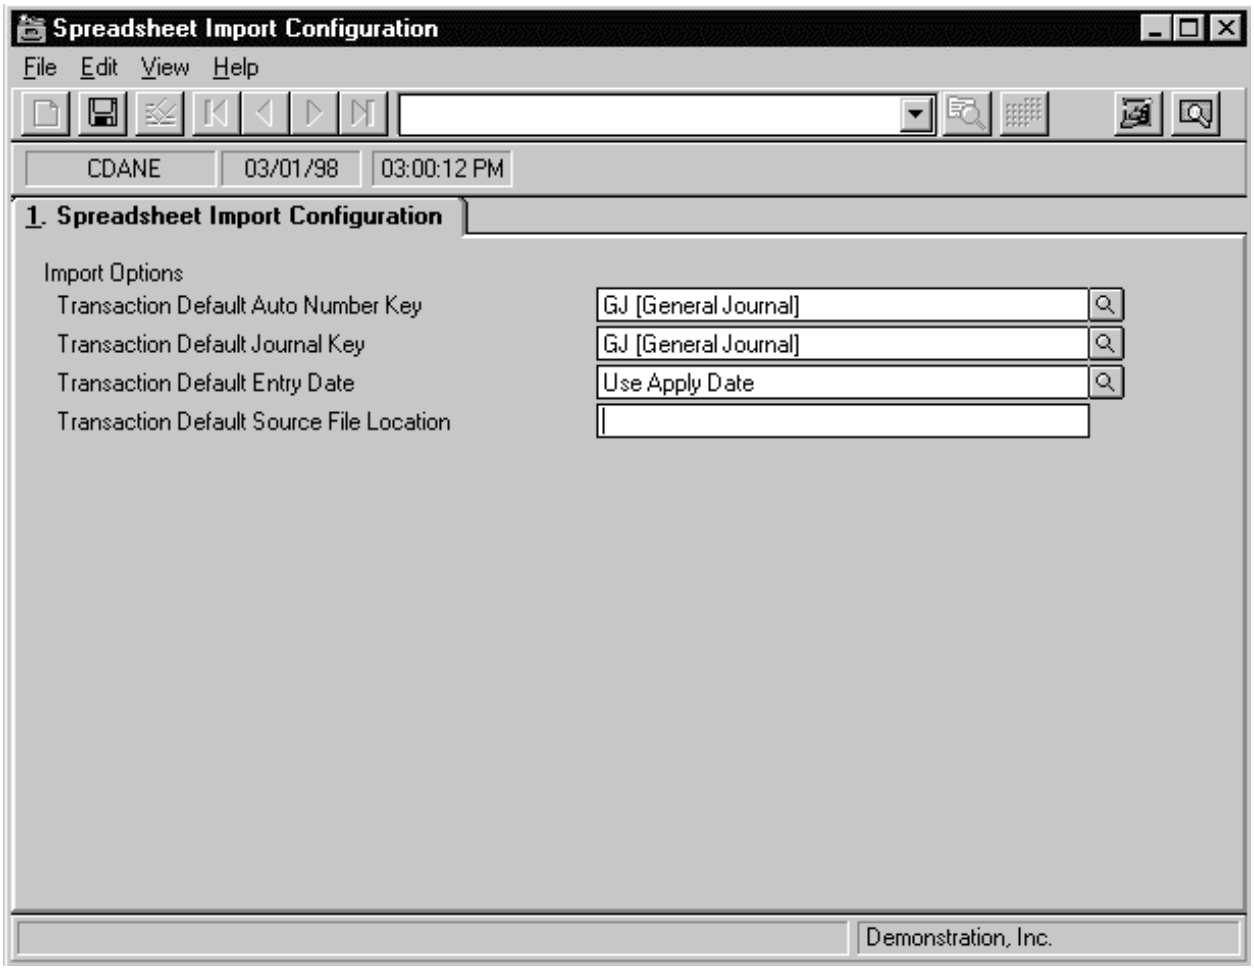
1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Platinum for Windows.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored. For best results, the path should be the Platinum\Post directory of the drive where the related Platinum Application Server (PAS) resides. Furthermore, the extension of the export/import file must be WKS, indicating a Lotus

spreadsheet file.

6. Click Save.

To set up Platinum

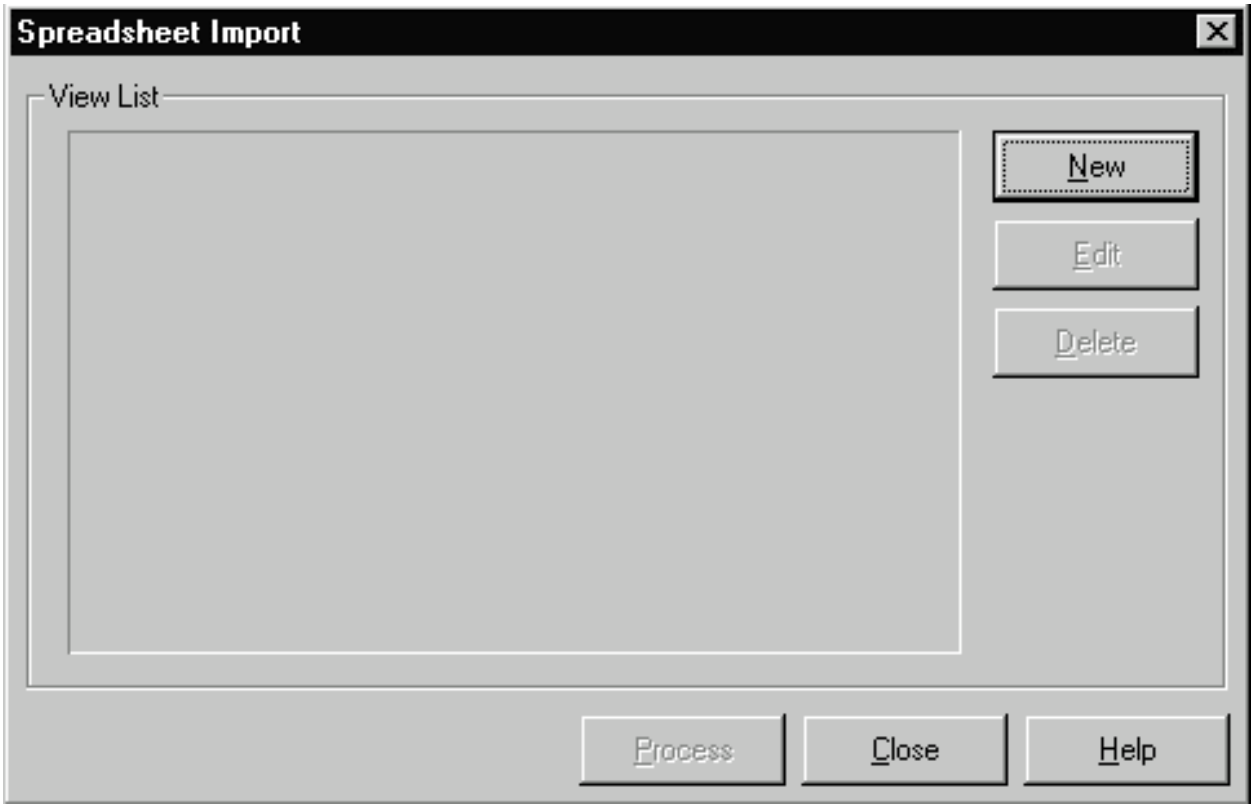
1. Select the Spreadsheet Import Configuration window from the GL menu browser.
2. Fill in the Import Options section (using the lookup button) as indicated below:
3. Transaction Default Auto Number Key: GJ (General Journal)
4. Transaction Default Journal Key: GJ (General Journal)
5. Transaction Default Entry Date: Use Apply Date
6. Click the Save (diskette) icon to finalize the import configuration settings.



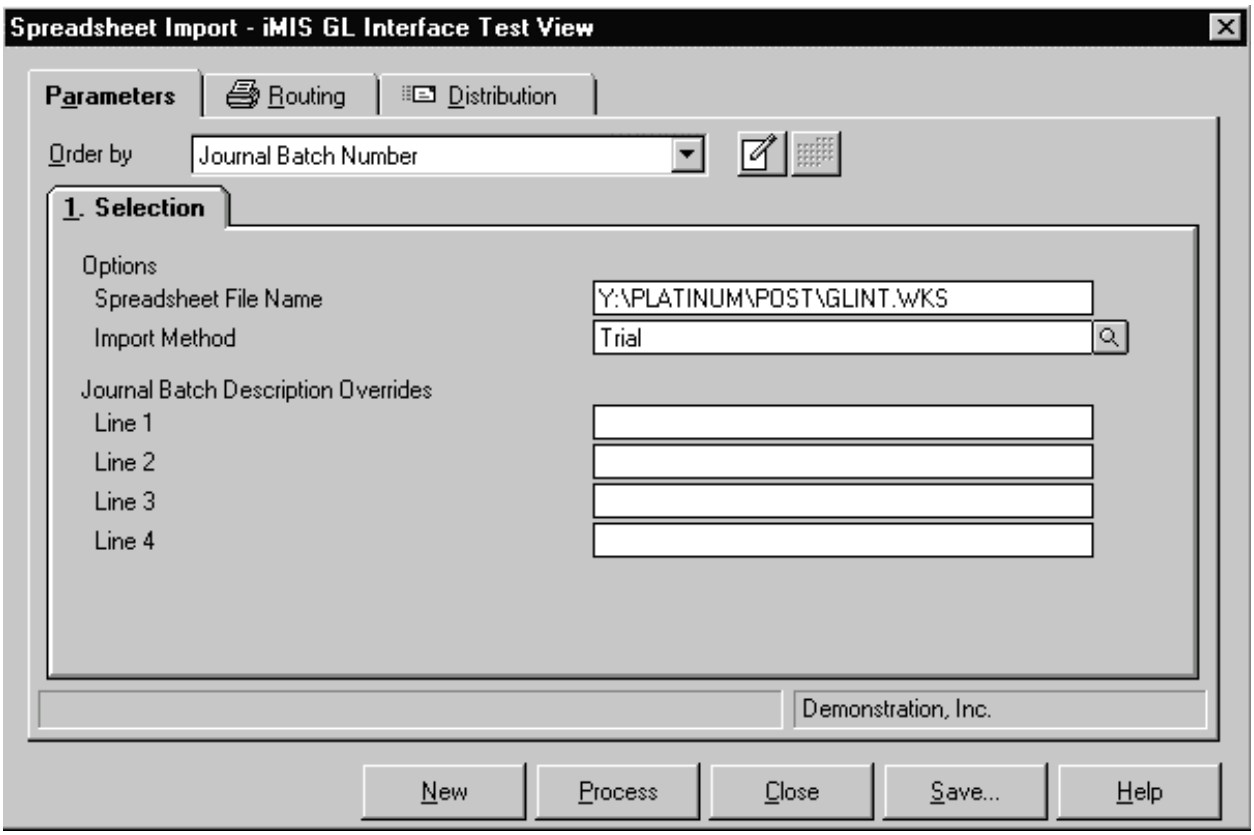
7. Continuing with the PFW setup, you may wish to set up 2 import views, one for testing the import data and process, and one for finalizing the import of the data.

   To set up the import test or trial view

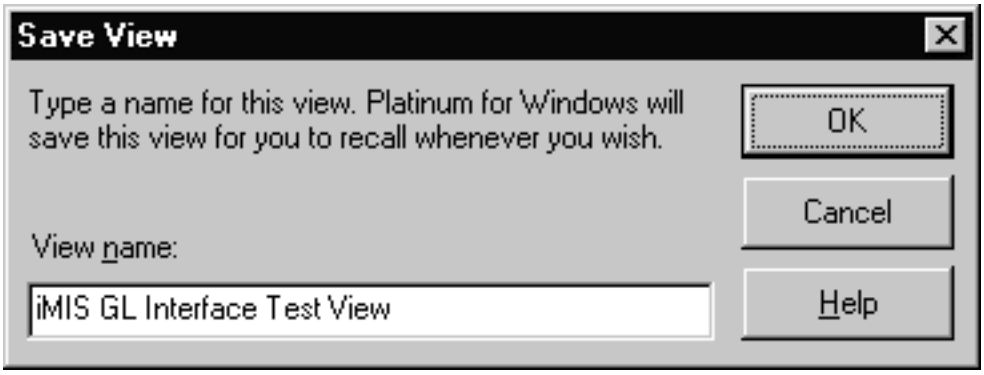
1. Select the Spreadsheet Import option from the GL menu browser.
2. In the View List window, select New.



3. On the Parameters tab, fill in the path/file name of the iMIS generated export/import file in the Spreadsheet File Name under options.
4. Select Trial as the Import Method.



5. Complete the Routing and Distribution tabs. Refer to the Platinum for Windows System Basics User's Guide for information about these tabs.
6. Click the Save button.
7. Assign a name to the view in the pop up box that appears and click OK.



8. Click the New button to begin the definition of the view to perform the final import procedure.

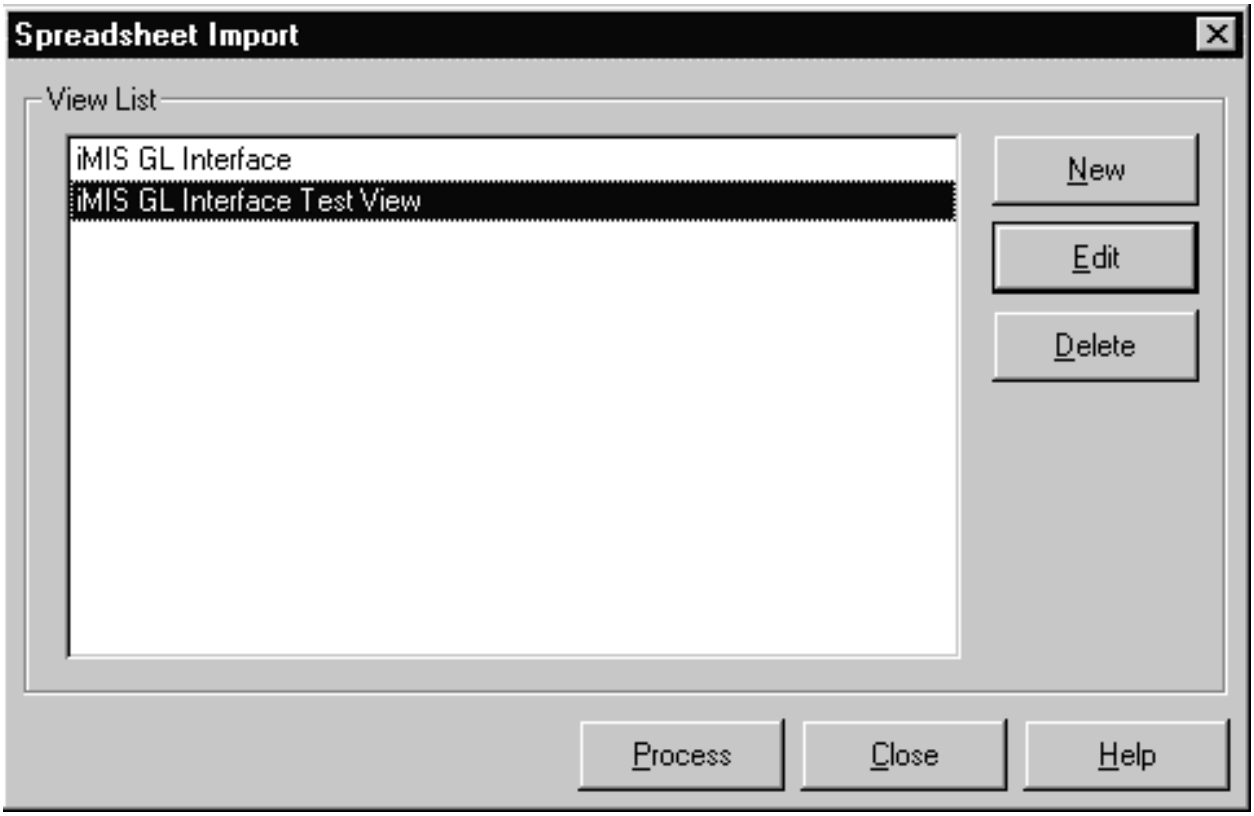
9. Repeat the steps outline for defining the Trial view (1 thru 7 above), except this time select Final as the Import Method in step 4.

To create the export file from iMIS (Platinum)

1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal.

To import data into Platinum

1. Select the Spreadsheet Import option from the GL menu browser.
2. In the View List window, highlight the Trial view if you wish to test the import data before finalizing the import.



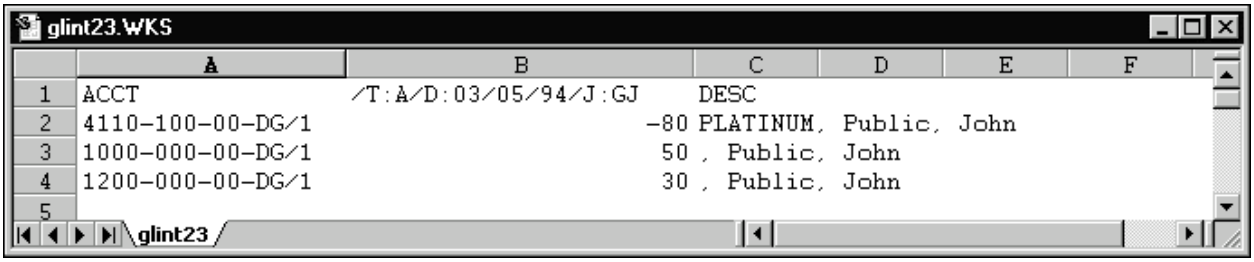
3. Click Edit and change the Spreadsheet File Name if the import file's path or name is different than the path/file originally defined in the view. Note that the file name should only be different if a unique, sequential number is appended to each newly created export/import file (i.e., if a? is imbedded in the Output file path/name name defined in iMIS).

4. Click Process to proceed with the trial run. A Spreadsheet Import Trial Report will print with the results of the test run.
5. To finalize the import procedure, highlight the View setup for the Final Import Method from the View List window.
6. Click Edit only if the Spreadsheet File Name needs to be changed (see step 3).
7. Click Process to proceed with the actual import of the journal transaction data. A Spreadsheet Import Final Report will print with the results of the import. This report will indicate the Journal Batch Number assigned to the set of iMIS transaction data.
8. You can continue normal General Ledger processing of the iMIS batch. To post the transactions, for example, print the Edit List and perform the Period Post.

   Export/Import File Example

   The export/import file is a simple Lotus spreadsheet file in which the first line contains required heading information, followed by multiple lines containing the journal transaction lines. The middle section of the heading contains the transaction date as well as the transaction type (A for Actual) and journal type (GJ for General Journal) indicators. The transaction line data includes the Account, Amount, and Description for each journal entry line.

   The following export/import example shows a small interface file for the date of March 4, 1994.



Platinum SQL

iMIS provided support to meet export requirements for Platinum SQL version 4.2 or greater. This support was in place in iMIS 4.10.

The iMIS to Platinum SQL Interface works through the Platinum SQL Import Manager. The Import Manager serves as the bridge to bring information from outside packages, such as iMIS, into the normal Platinum SQL files. The Import Manager provides the mechanism for bringing financial (accounts receivable/cash/income) data generated through iMIS into your Platinum SQL General Ledger.

To set up iMIS for Platinum SQL

The setup steps from iMIS include making appropriate choices on the AR/Cash General Ledger Interface window and an optional step to establish a PLATINUMSQL General/Lookup Validation Table.

Step 1 – Change the GL Interface Type

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Platinum SQL.
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored. The path should point to the IMDATA directory of the drive where the related Platinum SQL Server (PAS) resides. Furthermore, the export/import file must be assigned the name “glintdet.tab”.
6. Click Save.

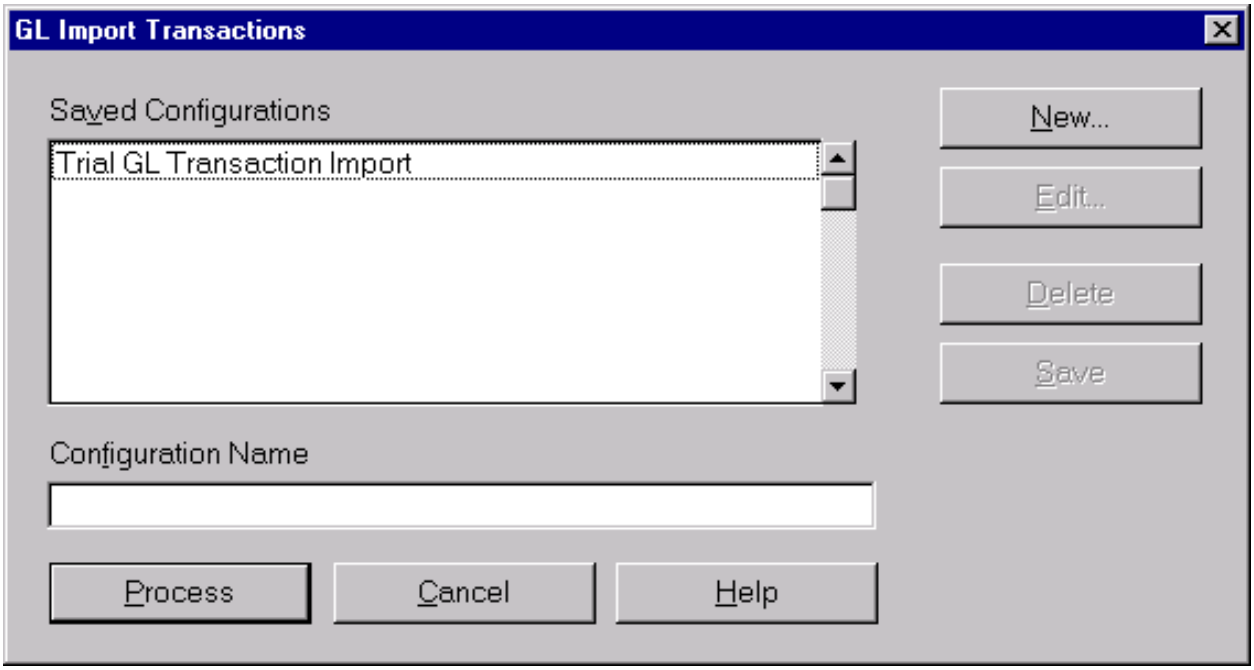
Step 2 – Set up a special PLATINUMSQL General Lookup/Validation Table

Create the Platinum lookup table. This step depends on whether you can use the iMIS default settings related to the Platinum company code and currency code. The default settings are to use the iMIS organization code for the Platinum company code and the literal “USD” for the currency code. If you need to use a different value for either the company code or the currency code, you must establish a PLATINUMSQL table and map the necessary codes to each iMIS organization code.

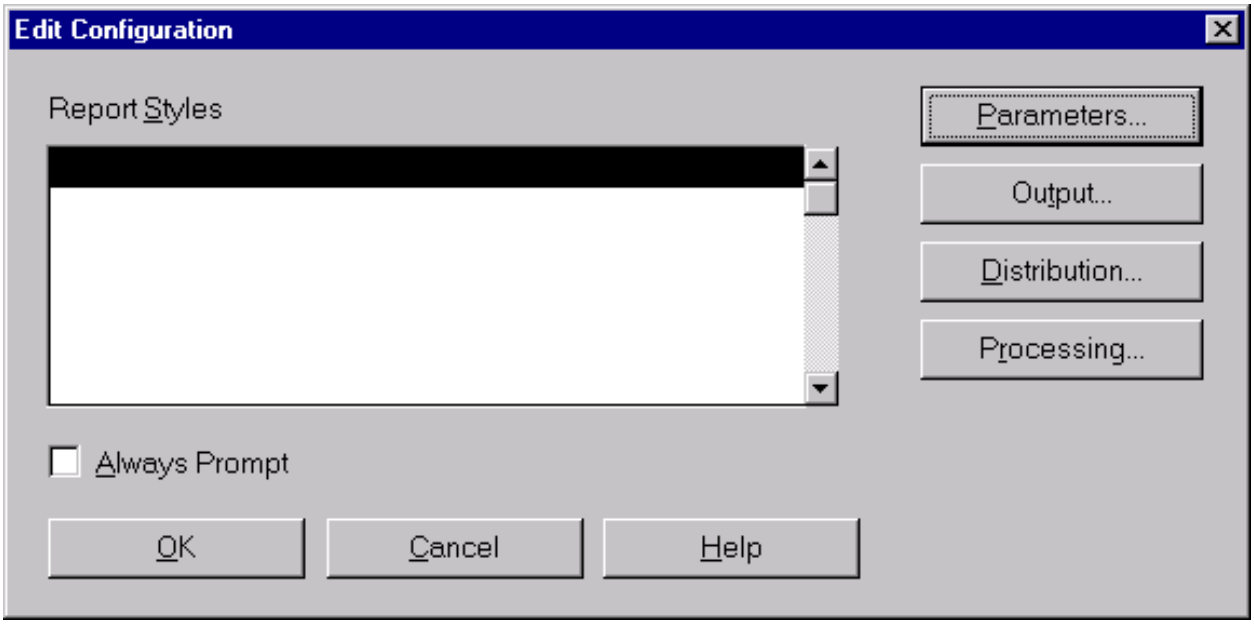
1. From Customers, select Set up tables > General lookup/validation to open the General lookup/validation window.
2. Select (New Table) from the list of table types. The New Table Type window opens.
3. Enter a New Table named PLATINUMSQL and click Save.
4. Insert a record for each iMIS organization code, filling in the organization code in the Code field.
5. Enter the appropriate Platinum company code in the Expansion field and the currency code in the Description field. Be sure to enter non-blank values for both fields.
6. Click Save.

To set up Platinum SQL

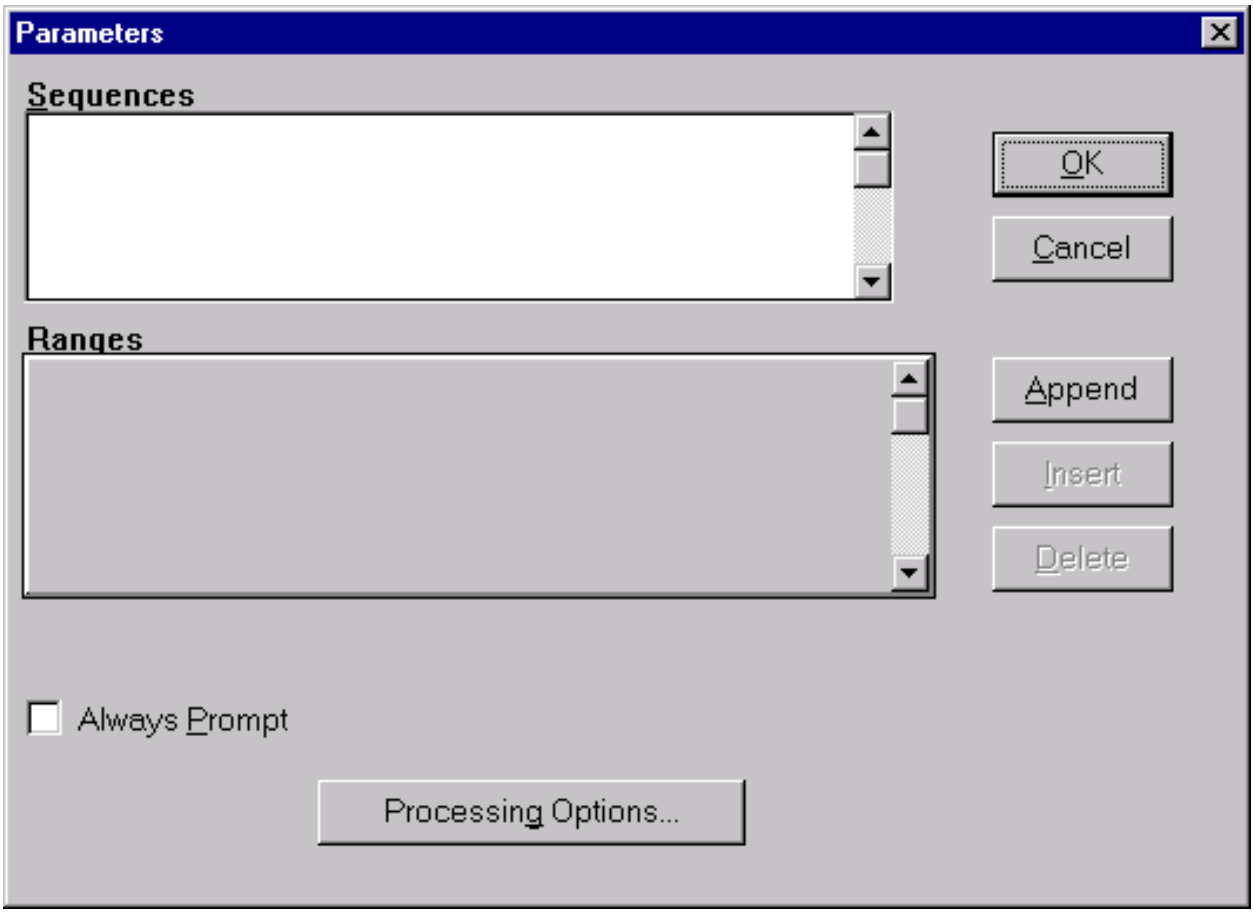
1. The setup within Platinum SQL includes simple steps to establish processing options for both the Trial and Final Import processes. These instructions are saved in Configuration files.
2. From System Manager, select Import > GL Import > GL Transactions from the System Manager menu bar to open the GL Import Transaction window.



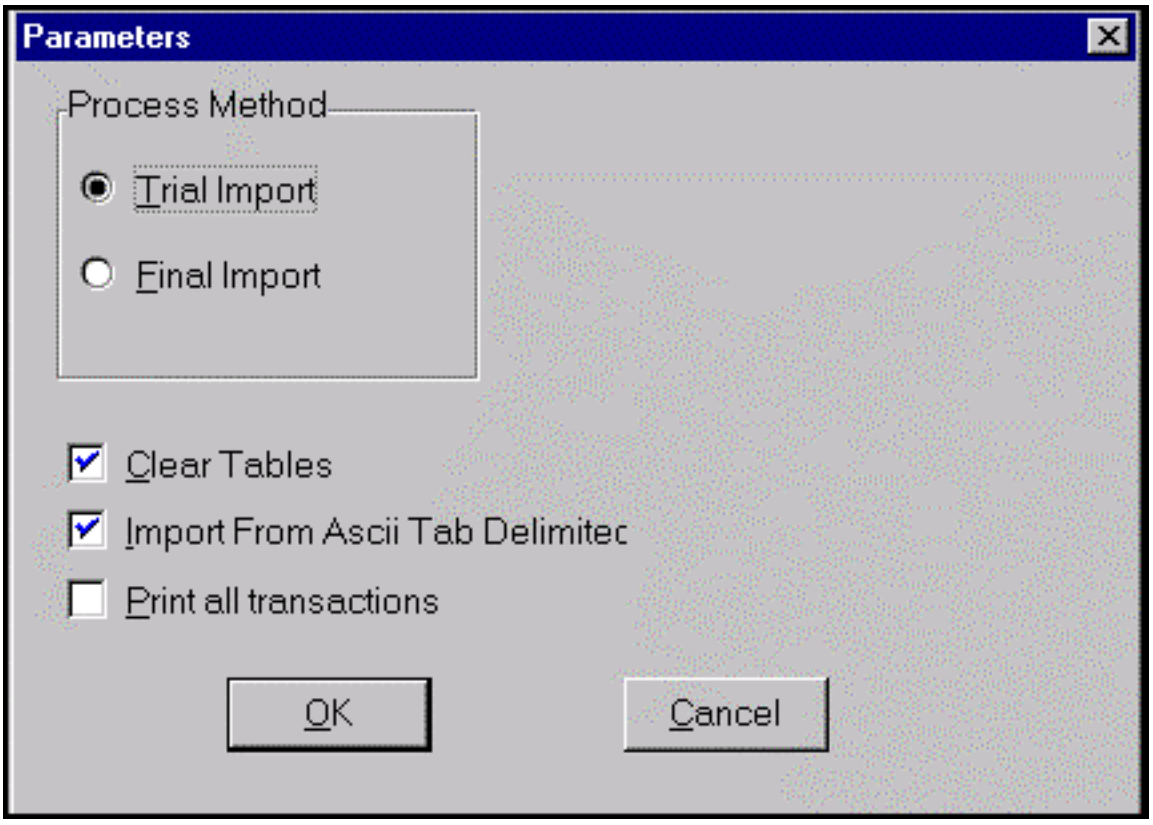
3. Click New to create the Import. An Edit Configuration window opens.
4. From the Edit Configuration window, click the Parameters button.



5. From the Parameters window, click the Processing Options window.



6. On the Options (Parameters) window, click the Processing Options button to open the Parameters window.



7. Set the Processing Method to Trial Import. This allows you to review the import report for errors prior to the final run.
8. Enable the Clear Tables and Import From Ascii Tab Delimited options.
9. Click OK.
10. Click OK to close the main Parameters window.
11. Optionally, click the Output, Distribution, and Processing buttons to change any default settings on those windows.
12. Click OK on the Edit Configuration window.
13. Enter an appropriate Configuration Name and click Save.
14. If you have a sample set of export/import files, click the Process button to test. Otherwise, click Cancel.

15. Repeat steps 1 through 9 to setup similar Configuration Instructions for the Final Import step. However, this time select the Final radio button within Processing Options in step 5.

To create the export file from iMIS (Platinum SQL)

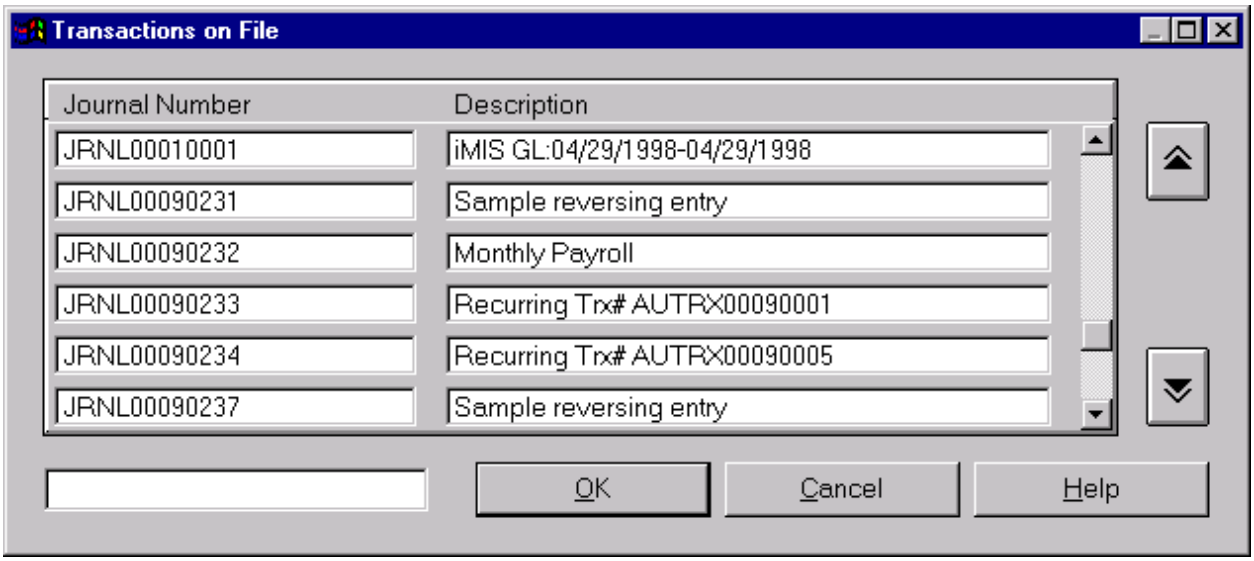
1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal.

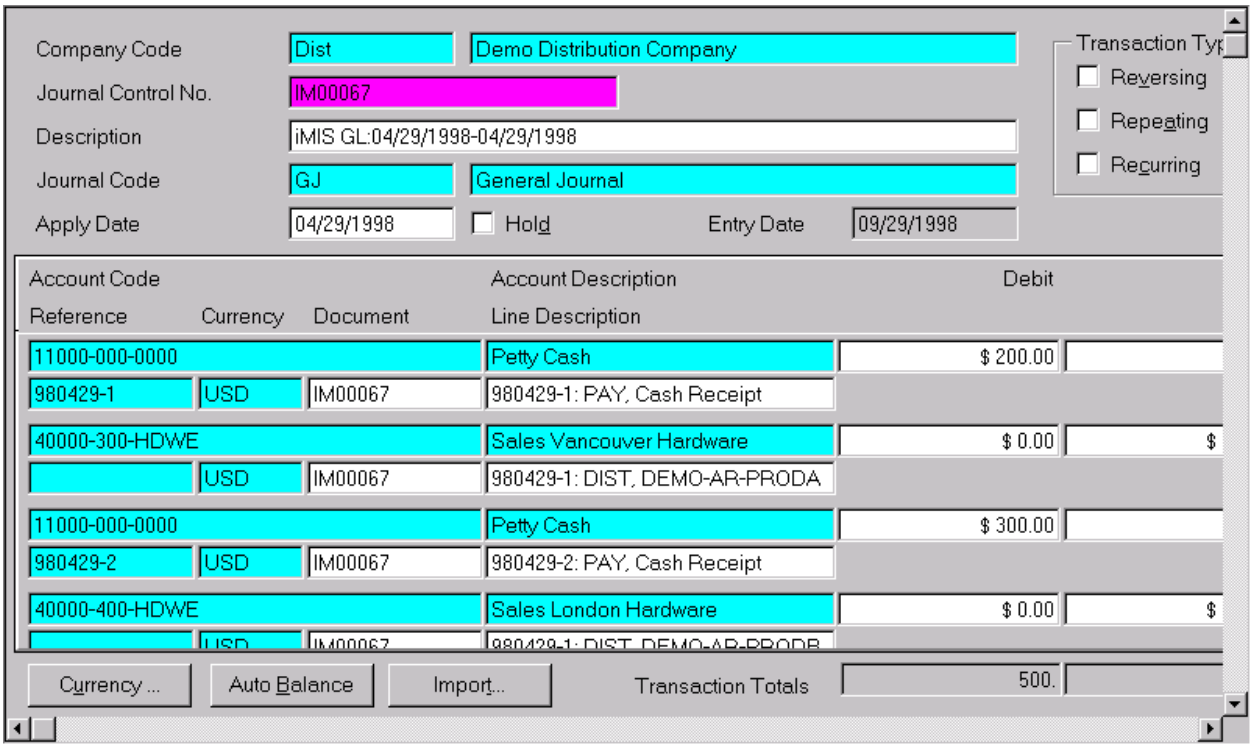
To import data into Platinum SQL

1. From System Manager, select Import > GL Import > GL Transactions from the System Manager menu bar to open the GL Import Transaction window.
2. Highlight the appropriate Trial Import Configuration Name on the list and click Process.
3. Once the import is complete, review the import report: report.out , which is located in the Winplt directory.
4. If there are no errors reported, repeat steps 1 and 2, choosing the Final Import Configuration in step 2.
5. If errors are recorded, analyze the results. In cases such as an incorrect or blank GL account, it may be easiest to correct the import file and repeat the process.

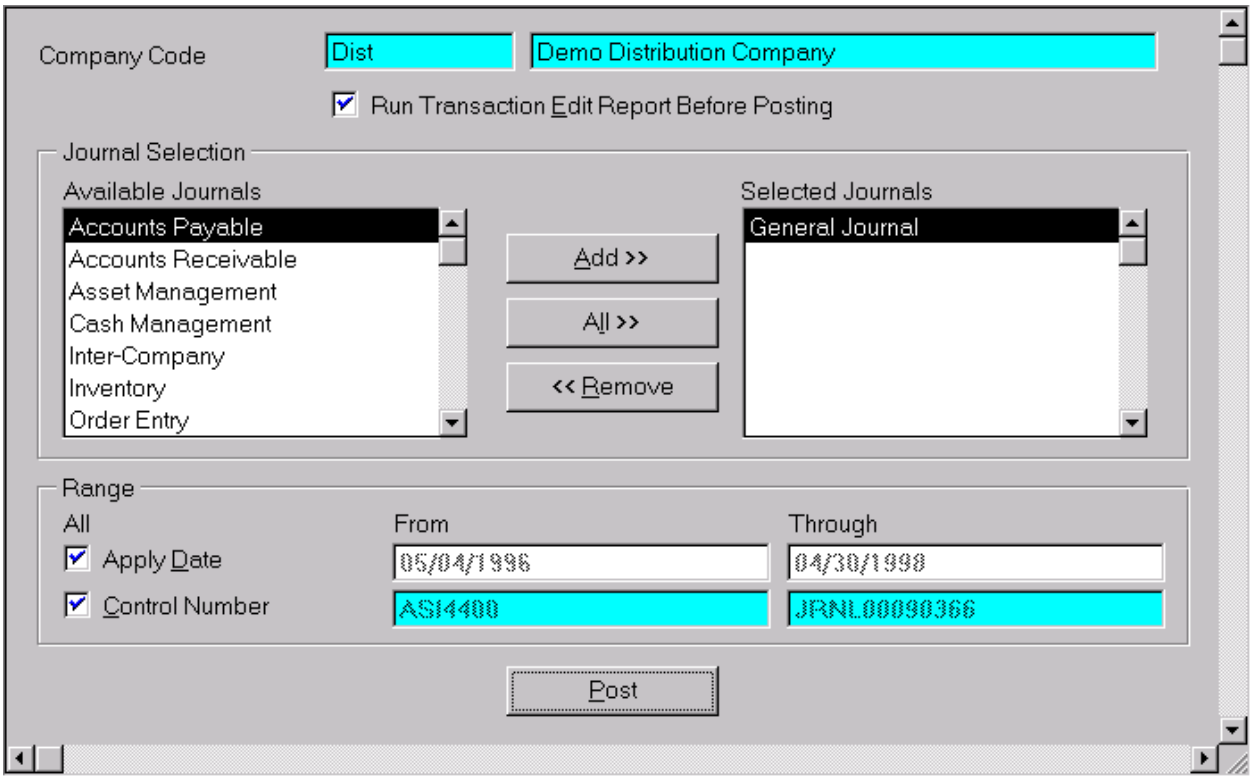
To view and post imported transactions

1. Select Applications > General Ledger.
2. View the transactions by choosing Processing > Standard Transactions > Transaction Entry.
3. Tab to the Journal Control No field and press Ctrl+Z. Double-click the line that contains the iMIS description.





4. To post the imported transaction, select Processing > Standard Transactions > Post Transactions.



5. Optionally, enable the Run Transaction Edit Report Before Posting option.
6. Click Post.

Export/Import File Example

> **Note:** The GL Interface process creates two tab-delimited files, a single line header file (GLINTHDR.TAB), and a multi-line detail file (GLINTDET.TAB). The header file contains the transaction date to be assigned to the journal entry. The begin date within the interface date range is used for this purpose. The detail file contains one line for each debit or credit entry.

> **Note:** Note: As you enter general ledger account numbers in iMIS, you can include dashes to separate the various components within the account structure (i.e., 11000-000-0000). All dashes will be dealt with properly and removed as required in the export data that is generated.

Sage Sterling

iMIS provided support to meet export requirements for Sage Sterling. This support was in place in iMIS LAN version 3.50b and in iMIS 4.10.

Minimal setup is required on the iMIS side to facilitate the interface. No setup steps are required with Sterling.

Within Sterling, there is a department designated by an integer no longer than 3 digits and a Nominal Account Reference, which is represented by a character string, no longer than 8 characters. You must construct the iMIS GL account by the department code, followed by a hyphen (-), followed by the account.

Note: Example: 1-4000 in iMIS translates to Nominal Account Reference “4000” belonging to Department “1” in Sterling.

To set up iMIS for Sage Sterling

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. From the GL interface type drop-down list, select Sage Sterling.

   Note: Note: In LAN, select Sterling.

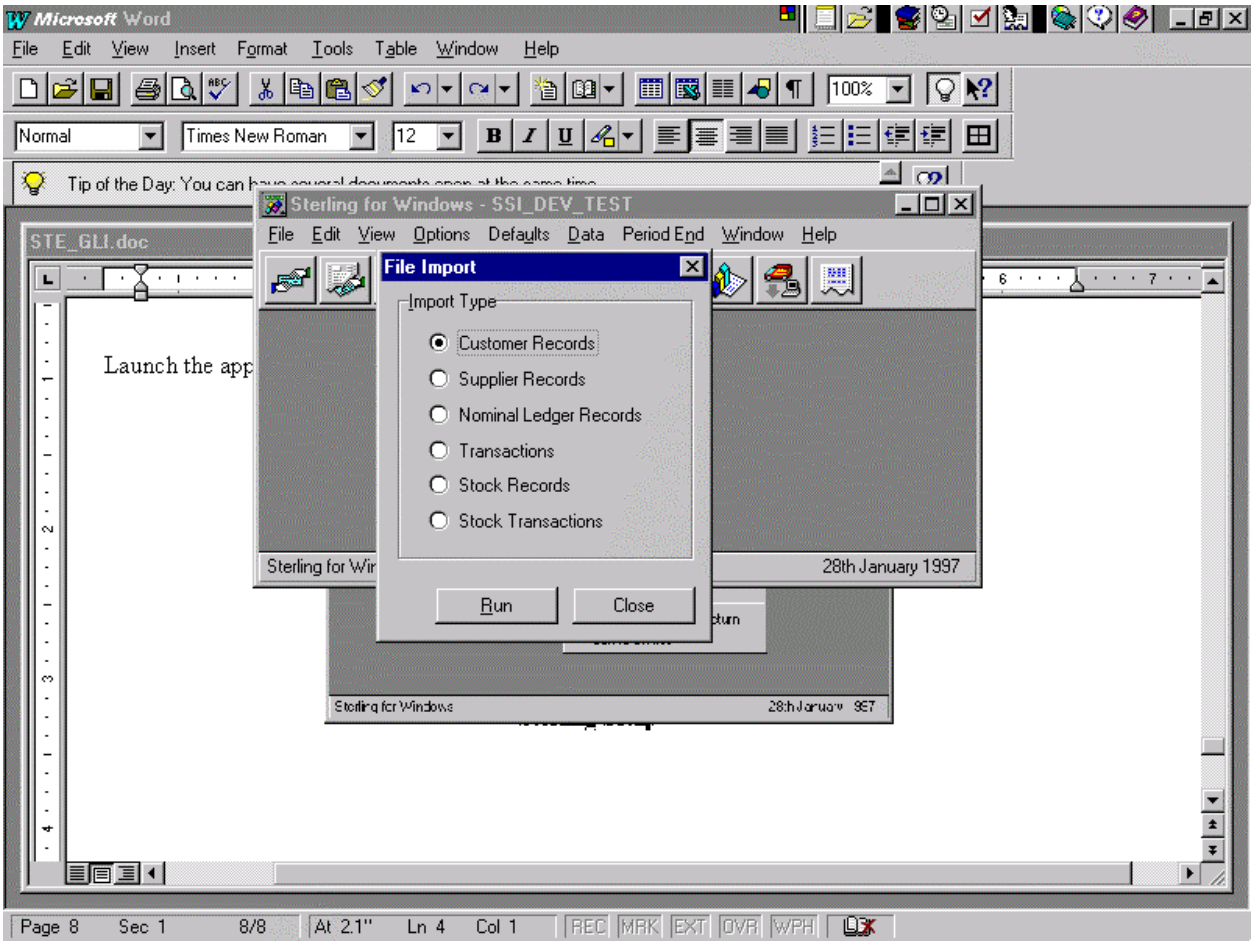
4. Select an option from the Summarize by drop-down list.
5. Enter the Output File Path/Name, which dictates how iMIS should name the export/import file and where it should be stored.
6. Click Save.

To create the export file from iMIS (Sage Sterling)

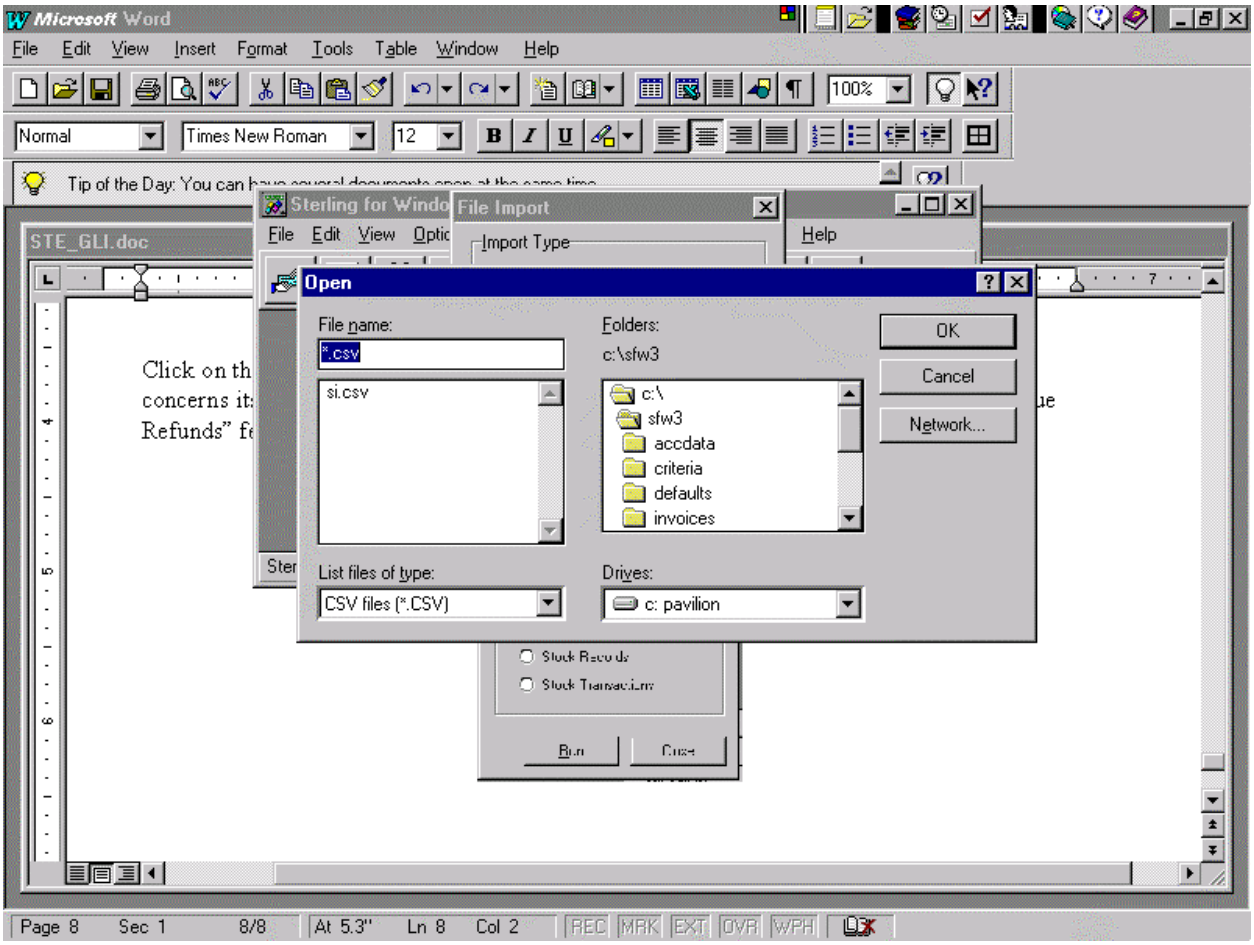
1. Generate the general ledger transaction export files using AR/Cash > Process month-end procedures > Create GL Journal.

To import data into Sage Sterling

1. Launch the application and select Data > Import.
2. Click the Transactions radio button and click Run.



3. From the selection window that appears, locate and double-click the export/import file.



4. If Sterling detects a problem with the import file, it will post an error message detailing the problem line by line and will reject the import.

> **Note:** Note: One common problem is that the Nominal Account number in Sterling does not match a GL number in iMIS.

Import Header File Sample

General lookup/validation tables

Creating general lookup/validation tables

iMIS enables you to create and add to validation and expansion tables for many fields of the iMIS interface. iMIS comes with built in links between many of the its standard fields, and you can create validation tables for any of your user-defined demographic or list-string fields.

Guidelines for populating tables

When working with lookup/validation and expansion tables, keep the following guidelines in mind:

- Do not use special characters in the Codes or Expansion fields when creating general lookup/validation tables.
- The Code field on the Set up general lookup/validation window can hold up to 60 characters. However, the general lookup/validation tables that are used for various fields in iMIS that have varying field length requirements. Before adding Code values to a general lookup/validation table, you should determine the maximum length of the field to which the general lookup/validation code is connected. If you add a Code that is longer than the field length requirement for the field to which it connects, the data will be truncated, or in the case of certain tables, the value will not be shown as an available option.
- If the length of the Code field for the following general lookup/validation tables is greater than the defined field length, the value will not display in the drop-down as an available option:
- CATEGORY
- MAIL_CODE
- MEMBER_STATUS

- SIC_CODE
- STATUS

  Note: Refer to the latest Alpha Table Layouts for field lengths.

- The value that is displayed in a drop down list or in a select window is determined in the following way:
- If a Description is defined, the Description is displayed.
- If no Description is defined, but an Expansion is defined, the Expansion is displayed.
- If neither a Description nor an Expansion are defined, the Code is displayed.
- The value that is saved after a user selects a value from a drop down list or select window is determined as follows:
- If the value in the general lookup/validation table has an Expansion value, the Expansion value is saved.
- If the value in the general lookup/validation table does not have an Expansion value, the Code value is saved.
- The Description value from the general lookup/validation table is never saved as the result of a selection from a drop down list.

  The value that is saved is the value that is displayed in the window that calls the drop down list or select window.

  The following are exceptions to the values that will display in a drop-down list:

- The SIC field on the Other tab will always display the Code field values defined in the SIC_CODE general lookup/validation table.

  Tables that provide validation

  The table validation feature enables you to assure that everyone within your organization uses the same codes to designate the same thing by either checking entered values

against a list of approved values (validation) or by providing a fixed list of values from which users must choose (lookup).

For example, the STATE_CODES table comes preloaded with state and regional two-character abbreviations, and iMIS rejects entries in the St/Prov field that fail to match those in the table. While you are entering or editing a field linked to a table, you can view a selection window of the available table values through the lookup feature.

Tables that provide expansion

Expansion tables provide input replacement for specified fields. With this keystroke-saving technique, the user enters an abbreviation for a field, and the table look-up replaces it with the associated replacement text. This feature is useful for fields that commonly contain the same text. For example, the Prefix field can expand abbreviations in data entry according to the PREFIX table: entering m expands to Mr., entering p in the Title field expands to President, entering vp expands to Vice President.

List string fields will only validate against a table if and when a general table is linked to the field. With a few fields, iMIS uses the table for expansion only (in which case the table associates abbreviations and expanded text) but does not restrict the text that users can enter. For example, the TITLE table expands vp to Vice President but it will not keep you from entering a new title that is not in the table, such as Sales Representative.

Tables that expand and validate

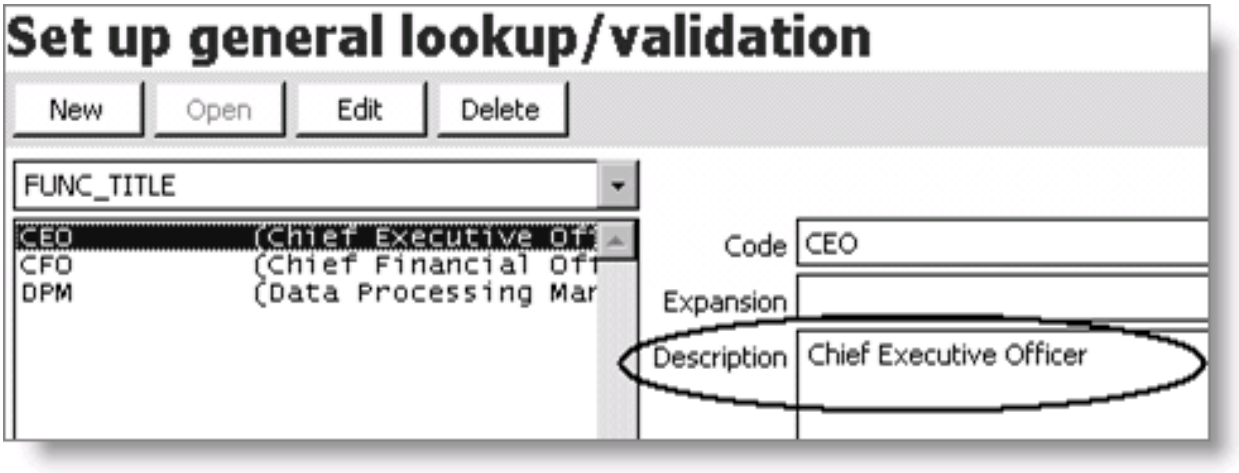
Some fields are set to use a table for both expansion and validation. For example, the PREFIX table provides abbreviated entries and restricts the text to one of the field values (or blank). When using combination tables, be sure to enter both the valid abbreviations and the full field values as codes so that both types of text entries will be accepted (validated).

When setting up tables on the Set up general lookup/validation window to provide lookup choices and validation during data entry for coded fields such as Prefix, you should enter values for Expansion or Description that are different from the specified Code to prevent duplicate values from displaying in your drop-down lists. For example, if you enter Dr. as the Code and Dr as the Expansion, you will have a duplicate in your list.

Note: Leave the Expansion values blank for lookup/validation tables that you create unless you are sure that you need expansion. Entering expansion values when they are not necessary may cause problems with some lookup/validation fields in the iMIS interface.

Note: Most lookup and validation fields limit input to values defined in their associated tables. Be sure to define all of the codes that your users will need when you set up lookup/validation tables.

Set up general lookup/validation window



From Customers, select Set up tables > General lookup/validation

New

This field creates a new value for the currently selected table.

To create a new table, scroll to the bottom of the table list and select New Table.

Tables

Displays a drop-down list of the lookup/validation tables established for your system. When you select a table, the code and description you have defined for the table display in the window below the drop-down list.

Code

Specifies the codes (up to 60 characters) for the lookup/validation tables you are defining for your system.

Expansion

Specifies the Expansion value that will be substituted for its Code.

Description

Specifies the description of the code you are defining for your system.

Print button

Used to generate and send a general lookup/validation table report to your report destination.

Import button

Used to import tab-delimited files into a general lookup/validation table.

To create a general lookup/validation table

When creating general lookup/validation tables, keep the tables as small as possible to optimize system performance on lookups.

The values or selections defined in a general lookup/validation table display in a drop-down list.

Note: In order for Prefix and Suffix data to show up in the Web view and Public view, the Expansion field must be populated. Otherwise, prefix and suffix information only displays in the iMIS Desktop view.

1. From Customers, select Set up tables > General lookup/validation to open the Set up general lookup/validation window.
2. Select New Table from the bottom of the drop-down table list.

   A window opens and prompts you for the new table name.
3. Enter the exact table name in the window.
4. Click Save to insert the new table into the table list.

5. Populate the new table:

1. Click New.
2. Enter a value in the Code field.
3. If you are creating an expansion table, enter a value in the Expansion field.

   Caution! When creating a general lookup/validation table, leave the Expansion field blank. Entering a value in the Expansion field of a lookup validation table can prevent iMIS fields tied to the table from working properly and may prevent iMIS from saving the correct data from fields populated by the table.
4. Enter a Description. The value entered in this field is displayed in lookup windows and drop down lists.
5. Click Save.
6. Repeat until you have entered all of the lookup/validation values.

To import files into a general lookup/validation table

iMIS allows you to import tab delimited files into a general lookup/validation table. The import process requires that the file be tab delimited and contain a Code, Expansion, and Description.

1. From Customers, select Set up tables > General lookup/validation to open the Set up general lookup/validation window.
2. Select New Table from the bottom of the drop-down table list. A window opens and prompts you for the name of the new table.
3. Enter the name of the new table in the window that displays.
4. Click Save.
5. Select Import to display the Importing Tab Delimited Tables... window.
6. Click Continue to display the Select import file window.

7. Navigate to your import file, and click Open.
8. When the import is complete, a dialog box will prompt you to select an additional file.

- Click No to end the import process.
- Click Yes to import another tab delimited file.

9. When complete, the Set up general lookup/validation window is displayed.

To delete a general lookup/validation table

Note: A general lookup/validation table is automatically deleted when no codes exist for the table. Follow the steps outlined below to delete each code you have defined for the table you wish to delete.

1. From Customers, select Set up tables > General lookup/validation to open the Set up general lookup/validation window.
2. Select the table to be deleted from the table name list. The table's code, expansion, and description values are displayed in their respective fields.
3. Delete all of the codes from the table:

1. Select a Code to delete.
2. Click Delete. A system message prompts you to verify the deletion of the selected record.
3. Click Yes.
4. Repeat until you have deleted all codes from the table.

Reference to general lookup/validation tables

For this reference to the general lookup/validation tables that are used in iMIS, the heading is the name of the table as it appears in the Set up general lookup/validation window, followed by indication of the table's purpose (data validation, expansion, or lookup only) and whether the table is required.

Table reference guide

- Required - Indicates that a value must be entered. Click the Lookup icon to select a value.
- Validation - Indicates that iMIS validates the data entered against the entries in the table. "Lookup" indicates that no validation is performed.
- Module - The name of the iMIS module that uses the table.
- Display field- The fields in the iMIS window where you can select from a value in the table.
- iMIS table - The specific iMIS table and column(s) whose contents are affected by the general lookup/validation table.

ACCESS_KEYWORDS (Validation)

Users must have a Customers Authorization level of 8 or higher to access this table. There is one predefined access keyword: HIDDEN. Assigning HIDDEN and another access keyword will hide a designated customized window. See Limiting User Access for more information.

Customers

Customer Setup – Access Keys (from Customers, select Set up module > General, Access Keys)	Name Financials Edit	System_Params: .Member_Control.NameFinKeys
	Name Addresses Edit	.Member_Control.NameAddressKeys
	Name Status Edit	.Member_Control.NameStatusKeys
	Import Activities	.Member_Control.ActivityImporterKeys
	Name Internet Security Data	.Member_Control.NameWebSecurityKeys

	Fundraising History View	.Member_Control.FRHistoryKeys
Set up activity types (from Customers, select Set up module > Activity types)	Keywords	Product_Type.ACCESS_KEYWORDS
Window Designer (from Customers, select Set up module > General, click Additional Windows, Define Windows)	Access Keywords	UD_WindowHeader.ACCESS_KEYWORDS

System Setup

Location	Display field	iMIS table
Users window (System Setup)	Access Keywords	Users.ACCESSKEYWORDS

ADDRESS_PURPOSE (Validation)

ADDRESS_PURPOSE enables you to have an unlimited number of addresses per customer. It includes address purposes that will be used in tracking multiple addresses. The three primary address tabs on the Manage customers window are reserved for the address types defined in Customer Setup - Address and Notes window. When the ADDRESS_PURPOSE table is created with at least one value defined, a New address tab is added to the Manage customers window (see "Customer data entry").

Note: In content item-based sites, you can create more than one address with the same custom purpose (defined in the ADDRESS_PURPOSE table), but multiples are not allowed for the standard purposes (defined in Customer Setup > Address and Notes). In the Public view and the Web view (non-content item-based sites), users will only be able to add or edit one address per ADDRESS_PURPOSE type.

1. Create the ADDRESS_PURPOSE table.
2. Enter one or more address purpose codes in the table.
3. Log out of iMIS.

Customers

Address tab (from Customers, select Manage customers, enter/edit record, and select Address tab)	Purpose	Name_ Address.PURPOSE

APPEAL_TYPE (Validation)

Appeal Types help to identify the kind of appeals used in fundraising activities.

Customers

Set up appeals (from Fundraising, select Set up tables > Appeals)	Appeal Type	Appeal.APPEAL_ TYPE

BAD_ADDRESS (Validation)

Used to indicate that an address is invalid and should not be used as mailing destination for reports. When reports are printed, a checkbox allows you to choose to include/exclude records with bad addresses.

Customers

Manage customers (from Customers, select Manage customers, enter/edit record, and select Address tab)	Bad Address	Name_ Address.BAD_ ADDRESS

BAD_ADDRESS enables you to mark address that do not pass validation with codes such as “moved”, “no_such_addr”, and so on. You can specify an address as bad (invalid) and include or exclude those customer records when generating Exports, Labels, and Letters (using the Word Integration Letter System) by selecting a bad address status from the Status drop-down list on the Address tab of the Manage customers window to associate with the customer’s address.

The values listed in the Status drop-down list are defined in the BAD_ADDRESS general lookup/validation table. If the table is not defined or there are no values specified, no values display in the drop-down list.

Note: The Status field accepts up to ten characters. Code or Expansion values defined for the BAD_ADDRESS general lookup/validation table that exceed ten characters will not display in the Status drop-down list. If the Description value exceeds ten characters, the value will display in the Status field but may display truncated (shortened), assuming the Code or Expansion associated with the Description does not exceed ten characters.

Note: To generate a report that includes or excludes addresses that have been marked with a bad address status, modify the report specification to include the Include Bad Addr option on the appropriate Selection window.

About company flowdown

If automatic flowdown of company address information is enabled on the Customer Setup – Advanced window, marking a company address as invalid will mark that address as invalid for all associated individual records with the following limitations:

- Only the data that appears in the Main address tab (the tab in the first position) for the company record will flow down to the address fields for associated individual records.
- Flowdown only occurs if the address for the individual record exactly matches the address for the company record.

BADGE_TYPES (Validation)

Exposition Management comes with two badge types predefined: FREE_PASS and PAID_PASS. Free passes are those that come with the purchase of the booth. A paid pass is a specific product defined at the exposition product level so you can purchase additional badges beyond the free passes.

Events, Exposition

Badges (from Events, select Register a customer, enter/edit	Type	Order_

record, select Badges tab OR from Exposition, select Process booth orders, enter/edit record, click Options> Badges)	Badge.BADGE_TYPE

CATEGORY (Validation)

The Category field must be enabled in Customers System Setup before it can be viewed/used on the Manage customers window.

Note: When entering a new value to the CATEGORY validation table, the CODE field must be 5 characters or less; otherwise, it will not display in the Category drop-down list under Customers.

Customers

Manage customers (from Customers, select Manage customers)	Category	Name.CATEGORY

CEU_TYPE (Required Validation)

Lists the continuing education units (CEU) type codes used for validation and lookup of CEU credit entries if you are not licensed for the Certification module.

If you are licensed for Certification, lookup and validation of CEU Type fields are performed against CEU type codes that are defined in Certification. If this CEU_TYPE table is also populated with CEU type codes, then the codes from both sources are combined and listed alphabetically when you click the CEU Type field's Lookup icon.

Note: If an identical CEU type code exists both in Certification and in the CEU_TYPE table, the code from Certification is used.

Events

Event Function Definition - CEU window (from Events, select Define an event, double-click an event, double-click an event function, click More, and select CEU)	CEU Type	Product_Function.CEU_TYPE

COMMITTEE_GROUP (Validation)

Committees

Set up committee codes (from Customers, select Set up tables > Committee codes)	Group	Product.Product_Code

To create the Committee Group general lookup/validation table

You can define committee groups to collectively organize your committees. For large associations that may have hundreds of committees, this feature allows you to group committees for easier access, maintenance, and modification.

Committee codes are tagged with a committee group on the Set up committee codes window. The Manage committees window can view all committees or committees that have been assigned to a specific group.

COMMITTEE_STS (Required Validation)

Committee Management comes with two predefined codes: A and I. These codes allow for better committee management. ‘A’ indicates that a committee is of an active status. ‘I’ indicates that a committee is of an inactive status and will display the description on the Committee Roster window. A warning message will also appear in the Set up committee codes window when changing the status from A to I.

<tCommittee>

Set up committee codes (from <Cust>, select Set up tables	Status	Product.GROUP_

> Committee codes)	3

CONFLICT_CODE (Validation)

Used to determine conflicts based on date/time or content within events at the time of registration. Registering for conflicting event functions will yield a warning message.

Events

Event Function Detail (from Events, select Define an event, enter/edit event, and edit/insert function)	Conflict Code	Product_Function.CONFLICT_CODE

CONTACT_TYPE (Validation)

Exposition Management comes with one predefined code: PRIMARY.

Exposition

Exhibitor Contacts (from Exposition, select View exhibitor information, double-click company, and click More > Contact Maintenance)	Assign Contact Type to selected contact	Exhb_Meet_Contact.CONT_TITLE

COUNTRY (Validation, Expansion)

The COUNTRY table is a combination validation/expansion table for the Country field used in customer addresses. You need to specify values, either abbreviations for expansion tables and/or full country names, for all the countries in which your customers may reside.

DESIGNATION (Expansion only)

Customers

Manage customers (from Customers, select Manage customers)	Desig	Name.DESIGNATION

EXPENSE_TYPE (Validation, Expansion)

Used to help identify the kind of expenses associated with your fundraising appeals (such as Postage and Rent).

Fundraising

Set up appeal expenses (from Fundraising, select Set up appeal expenses)	Expense Type	Expenseitem.EXPENSE_TYPE

EXPO_CAT (Validation)

User defined types depending on the type of expositions you conduct. The values in this table must be entered in Description in order to view them through Exposition.

Exposition

Expo Options (from Exposition, select Set up an exposition, select an exposition, enter/edit exposition, and click More > Options)	Historical Category	Exhb_Setup.HIST_CODE

EXPO_PROD_CAT (Validation)

Defines exposition product categories to use for grouping exposition product codes.

Exposition

Product Master File Maintenance (from Exposition, select Set up tables > Product master list)	Product Category(s)	Exhb_Prod_Mast.PROD_CAT

FUNC_TITLE (Validation)

10.5 and later - Added to Relationship tab. The Functional Title field must be enabled in Customer System Setup before it can be viewed or used on the Manage customers window. Used for additional member tracking and reporting.

Customers

Manage customers (from Customers, select Manage customers)	Func Title	Name.FUNCTIONAL_TITLE
Relationship Detail window (from Customers, select Manage Customers, select Relationships tab, click New)	Functional Title	Relationship.FUNCTIONAL_TITLE

FUNDRAISER_TYPE (Validation)

10.4 and later - Used to indicate the type of fundraiser. Helpful in differentiating between types of soft credits when using the multiple soft credit feature.

Fundraising

Soft Credit tab (from Fundraising, enter/edit a gift, and select Soft Credit tab)	Type	Trans_SoftCredit

GIFT_AMOUNT (Lookup only)

By default, the Donation Creator content item displays a single, empty Gift Amount field. However, you also have the option to display an array of gift amounts from which the user can select, or to display a single Gift Amount field that is pre-populated with a gift amount of your choice. You set these options through the GIFT_AMOUNT table and can customize the Gift Amount display for any iMIS distribution code.

Fundraising

Donation Creator content item Gift Amount	Activity.AMOUNT
	Trans.AMOUNT

To display a gift array or a pre-populated gift amount in the Donation Creator content item

1. From iMIS Desktop, go to Customers > Set up tables > General lookup/validation.
2. If a GIFT_AMOUNT table does not already exist, select New Table to create it.
3. Select the GIFT_AMOUNT table from the list and click New.
4. In the Code field, enter the distribution code for which you want to customize the display. For example, BLDG.
5. The values you enter in the Description field determine what is displayed on the donation webpage:

- To display an array of gift amounts, enter a comma-separated list of gift values that you want to appear in the list. For example, entering 50,100,200,500 results in a radio list of those values displayed on the page. To preselect an option, precede the number with an asterisk: 15,*25,75.

  Note: The gift array always displays an option for the user to select Other and enter any amount.

- To display a single Gift Amount field with a pre-populated gift amount, enter a single amount. For example, 25.

6. Save.

GL_ACCOUNT (Validation)

If the Validate G/L Accounts is enabled in AR/Cash System Setup G/L Interface, then the table will be used to validate accounting codes. If this is not enabled, you may enter codes that are not in the table.

AR/Cash

Set up cash accounts (from AR/Cash, select Set up tables > Cash accounts)	Account	Cash_Accounts.GL_ACCOUNT

Billing

Set up product codes (from Billing, select Set up mod-ule> Products)	G/L Acct	Product.INCOME_ACCOUNT

Certification

Set up components (from Certification, select Set up components)	Income Account	Product.INCOME_ACCOUNT

Events

Event Function Definition - Fees (from Events, select Define an event, select/insert event, edit/insert function, and click More> Fees)	Income Account	Product.INCOME_ACCOUNT

Exposition

Exhibition Booth & Product Fees (from Exposition, select Set up an exposition, double-click an exposition, insert/edit function, and click More> Fees)	Income Account	Product.INCOME_ ACCOUNT

Fundraising

Set up distributions and Premiums (from Fundraising, select Set up tables > Distributions and premiums)	Income Account	Product.INCOME_ ACCOUNT

Orders

Inventory System Setup (from Orders, select Set up module, and click Inventory)	Default Accounts	Order_Control.INCOME_ ACCOUNT
Set up product categories (from Orders, select Set up tables > Product categories)	Default Accounts	Product_ Cat.INCOME_ ACCOUNT
Accounting (from Orders, select Manage inventory> Manage products, enter/edit product, and click Accounting)	Income Account	Product.INCOME_ ACCOUNT

GROUP_CODE (Validation)

Used to define relationship groups.

Customers

Relationship Detail Window (from Customers, select Manage customers, select Relationships tab, click New)	Group Code	Relationship.GROUP_CODE

To create the GROUP_CODE general lookup/validation table

1. Create a general lookup/validation table (see "To create a general lookup/validation table") named GROUP_CODE.
2. Select New.
3. Enter ROLE in the Code field.
4. (optional) Enter a brief Description.
5. Click Save.

HOLD_CODES (Lookup only)

Orders

Order Entry General Information (from Orders, select Enter and edit orders, enter record, and click General)	Hold Code	Orders.HOLD_CODE

LOCATION (Lookup only)

Used to store warehouse locations in versions prior to 10.3; replaced by the Product_Location table.

Orders

Product Detail (from Orders, select Enter and edit orders, enter record, select Overview tab, and double-	Warehouse	Orders.LOCATION

click a line item)

MAIL_CODE (Lookup only)

The Use Mail Code option must be enabled in Customers System Setup before it can be viewed/used on the Manage customers window. Used to identify and sort mail.

Customers

Manage customers (from Customers, select Manage customers)	Mail Code	Name.MAIL_CODE

MEETING_TYPE (Lookup only)

Used to distinguish between types of events.

Events

Event Definition (from Events, select Define and event, and enter/edit event)	Type	Meet_Master-.MEETING_TYPE

MEM_TRIB_RELATIONSHIP (Validation)

Includes memorial/tribute relationships that are used to help identify and maintain fundraising notifications (son of, mother of, etc.).

Fundraising

Notification tab (from Customers, select Manage customers, and select Notification tab)	Relationship	Name_Notify.RELATIONSHIP

MEMBER_STATUS (Required Validation)

10.5 and later – Added to Relationship tab. If the status code is left blank, the record will not be included in dues & subscription product billing runs. Status codes other than A, I, S and D will be ignored for dues & subscription product billing runs.

Customers

Manage customers (from Customers, select Manage customers)	Status	Name.STATUS
Relationship Detail window (from Customers, select Manage Customers, select Relationships tab, click New)	Status	Relationship.STATUS

MERGE_CODE (Validation)

Used to help identify the body of the letter for each gift/pledge acknowledgement.

Fundraising

Notification tab (from Customers, select Manage customers, and select Notification tab)	Merge Code	Name_Notify.MERGE_CODE
Acknowledgement Info (from Fundraising, select Enter and edit gifts, enter/edit a gift, and click Acknowledge)	Merge Code	Trans.MERGE_CODE

NOTE_PURPOSE (Validation)

Used to track note purposes beyond the three that are defined in Customers System Setup.

Customers

Notes tab (from Customers, select Manage customers, and select Notes tab)	Purpose	Name_ Note.PURPOSE

PREFIX (Validation)

Titles or abbreviated titles that will be used before the contact's formal name (such as Mr., Ms., Dr.).

Note: A value that you enter in the PREFIX general lookup table can also be made to appear in the Name.FULL_NAME field of customer records if you add the value to the Prefixes in Full Name field in the Customer Setup - Basic Options window (Customers > Set up module > General, then click Basic Options).

Customers

Manage customers (from Customers, select Manage customers)	Prefix	Name.PREFIX

Events

Attendee (from Events, select Register a customer, enter/edit record, and select Attendee tab)	Prefix	Orders.PREFIX Order_ Badge.PREFIX

Exposition

Expo Registration - Name/Address (from Exposition, select Process booth orders, enter/edit record, and click Options>	Prefix	Orders.PREFIX

Address) Orders		
Order Entry - Name/Address (from Orders, select Enter and edit orders, enter record, and click Address)	Prefix	Orders.PREFIX

REFERRAL_AREA (Validation)

Entries in table validate against Ref_Provider.ZIP field. Multiple zip codes can make up an area.

Referrals

Manage referrals (from Referrals, select Manage referrals)	Zip	Ref_Provider.ZIP

REQUEST_STATUS (Validation)

10.3 and later - Used to indicate the status of a request. Default status values: Active and Inactive.

Fundraising

Request Entry (from Fundraising, select Manage requests)	Status	Activity.Status_Code

REQUEST_TYPE (Validation)

Used to help identify the kind of requests used in fundraising activities. The activity where this resides is REQUEST.

Fundraising

Request Entry (from Fundraising, select Manage requests)	Request Type Activity.UF_2

SALUTATION_CODE (Validation)

Used to help identify and track multiple customized salutations for gift/pledge acknowledgements and also in Customers.

iMIS allows you to create salutation codes that add salutation text to customer records. The assigned text is used for customizing acknowledgements for gifts, pledges, and letters. Before you can assign salutation codes to customers, you need to set up the Salutation Code table and enter the salutation codes and descriptions.

Note: If the Upper/Lower option is enabled in the System Setup window, then all values entered in the Salutation field convert automatically to upper/lowercase. If the Upper/Lower option is disabled, then the text is saved as it is entered.

Customers

Salutations (from Customers, select Manage customers, and select Salutations tab)	Salutation Code	Name_Salutation.SALUTATION_TYPE

Fundraising

Notification (from Customers, select Manage customers, and select Notification tab)	Salutation Code	Name_Notify.SALUTATION_CODE

Acknowledgement Info (from Fundraising, select Enter and edit gifts, enter record, and click Acknowledge)	Salutation Code	Trans.SALUTATION_CODE

Display Name Editor content item

The content item can be added to any content record	Field label is configurable	Name_Salutation.SALUTATION_TYPE

SHIP_METHOD (Required Validation)

Used to specify the shipping method for a particular order.

Orders

Set up freight (from Orders, select Set up tables > Freight)	Shipping Method	Freight_Rate.SHIP_METHOD

SIC_CODE (Validation)

Used to define Standard Industry Code (SIC) that apply to businesses.

Customers

Other (from Customers, select Manage customers, and select Other tab)	SIC	Name.SIC_CODE

SOURCE_CODE (Validation)

Used to specify the marketing program or contact type that generated this accounting transaction. Customers System Setup gives you the option of requiring a source code

throughout the system.

AR/Cash

Order Entry (from AR/Cash, select Enter and edit orders, and enter/edit record)	Source	Activity.SOURCE_CODE Invoice.SOURCE_CODE Trans.SOURCE_CODE

Billing, Customers

Dues/Subscription Payment by Individual (from Billing, select Enter and edit payments OR from Customers, select Manage customers, find a record, select Billing tab, and click Payments)	Source Code	Activity.SOURCE_CODE Invoice.SOURCE_CODE Subscription.SOURCE_CODE

Events, Exhibition

Payments (from Events, select Register a customer, enter-/edit record, and select Payments tab, OR from Exhibition, select Process orders, select Payments tab)	Source Code	Orders.SOURCE_CODE Trans.SOURCE_CODE

Exposition

Payment (from Exposition, select Process booth orders, enter/edit record, and click Payment)	Source Code	Orders.SOURCE_CODE Invoice.SOURCE_CODE Trans.SOURCE_CODE

Fundraising

• Set up Tables (from Fundraising, select Set up Tables select Appeals) • Distributions and Premiums (from Fundraising, select Set up Tables, select Distributions and Premiums) • Enter and Edit Gifts (from Fundraising, select Enter and Edit Gifts)	Appeal	Invoice.SOURCE_CODE Trans.SOURCE_CODE Activity.SOURCE_CODE

Orders

Enter and edit orders (from Orders, select Enter and edit orders, and enter/edit record)	Source	Invoice.SOURCE_CODE Orders.SOURCE_CODE Trans.SOURCE_CODE

		Activity.SOURCE_CODE

SR_AREA (Validation)

Service Central

Service - Request (from Issues, select View and enter issues, and enter/edit record)	Area	Service_Request.AREA

SR_CAT (Validation)

Service Central

Service - Request (from Issues, select View and enter issues, and enter/edit record)	Category	Service_Request.CATEGORY

SR_ENVIRON (Validation)

Service Central

Service - Request (from Issues, select View and enter issues, and enter/edit record)	Environment	Service_Request.ENVIRONMENT

SR_CATLEVEL (Validation)

Designates a category that spans across other categories. For example, you might have categories that align with product types, such as books, t-shirts, and desk accessories, but customers might inquire about the availability of these items in other languages. These inquiries might all receive an additional categorization such as "Language".

Values must be 20 characters or less.

Note: Do not define Expansion values in this validation table. Expansion values will not be saved when creating new issues and will also prevent the appropriate codes from being saved in issues.

Service Central

Resolution window (from Issues, select View and enter issues, open an issue, click Edit, and click Resolution)	Category Level	Service_ Request.CATEGORYLEVEL

SR_CNTTYPE (Validation)

Designates what kind of follow-up contact is necessary for an issue, for example, "onsite" or "callback".

Must be eight characters or fewer.

Service Central

Issue window (from Issues, select View and enter issues, and open an issue)	Contact Type	Service_ Request.CONTACTTYPE

SR_RES (Required Validation)

Service Central

Service – Resolution (from Issues, select View and enter issues, enter/edit record, and click Resolution)	Resolution	Service_ Request.RESOLUTIONCODE

SR_SRVTYPE (Required Validation)

Service Central

Service – Request (from <tIssue>, select View and enter issues, and enter/edit record)	Type	Service_ Request.SERVICETYPE

SR_SYS (Validation)

Service Central

Service – Request (from Issues, select View and enter issues, and enter/edit record)	System	Service_ Request.IMISSYSTEM

SR_VERSION (Validation)

Service Central

Service – Request (from Issues, select View and enter issues, and enter/edit record)	Version	Service_ Request.PRODUCTVERSION

STATE (Validation)

STATE is a validation-only table, which comes preloaded with all 50 two-character abbreviations of the United States (with full name descriptions). It also contains valid codes for the District of Columbia, for Canadian provinces, and for some U.S. related regions. You can add any entries you need.

SUFFIX (Validation)

Titles or abbreviated titles that will follow the contact's formal name (for example, Jr., Sr., III).

Customers

Manage customers (from Customers, select Manage customers, and enter record)	Suffix	Name.SUFFIX

Events

Attendee (from Events, select Register a customer, enter/edit record, and select Attendee tab)	Suffix	Orders.SUFFIX Order_ Badge.SUFFIX

Exposition

Expo Registration - Name/Address (from Exposition, select Process booth orders, enter/edit record, and click Options> Address)	Suffix	Orders.SUFFIX

Orders

Order Entry - Name/Address (from Orders, select Enter and edit orders, enter record, and click Address)	Suffix	Orders.SUFFIX

TITLE (Validation/Lookup)

10.5 and later – Added to Relationship tab. Professional titles or positions used in contact management.

Customers (lookup only)

Manage customers (from Customers, select Manage customers, and enter record)	Title	Name.TITLE
Relationship Detail window (from Customers, select Manage customers, select Relationships tab, click New)	Title	Relationship.TITLE

Events (validation)

Attendee (from Events, select Register a customer, enter/edit record, and select Attendee tab)	Title	Orders.TITLE Order_ Badge.TITLE

Exposition (validation)

Expo Registration - Name/Address (from Exposition, select Process booth orders, enter record, and click Options > Address)	Title	Orders.TITLE

Orders (validation)

Order Entry - Name/Address (from Orders, select Enter and edit orders, enter record, and click Address)	Title	Orders.TITLE

ZIP3 (Validation)

ZIP3 is a validation-only table comprised of three-digit ZIP codes that reference the city to which each belongs.

Glossary of Terms

Accounting

The systematic recording, reporting, and analysis of the financial transactions of an organization.

Accounting date

The Date assigned to the journal entry (or journal entries) related to the upfront recording and posting of a commerce transaction or to subsequent processing of the commerce transaction related to the change in accounting status. The accounting date should always align with the invoice date for an accrual standard invoice or an accrual adjusting invoice. For a payment, the payment deposit date should be used to record the cash receipts journal entry.

Accounting period

A regular period of time for which a financial statement is produced.

Accounting policy

A systematic routine that determines how the financial transactions of an organization are recorded and reported, such as how income (whether earned or a gift) is received and recognized, how expenses are authorized and paid, and how assets and liabilities are presented on the organization's financial statements.

Accounts receivable

Money owed to an organization by customers who have bought goods or services on credit (when income is recorded on the accrual accounting basis). Accounts receivables are current assets that continually turn into cash as customers pay their bills.

Accrual basis

The system of accounting in which the income is recognized when it is invoiced or earned instead of when the invoice is paid.

Adjusting invoice

Invoice that is cross-referenced to a standard invoice for the purposes of increasing or decreasing product charges and/or reducing the open balance of the invoice.

Adjustment transaction

A commerce transaction (or a part of a commerce transaction) that impacts the current status of an original posted transaction.

Alias

(IQA) An alternate name for a column (property).

Announcements

Items posted for information only. Announcements typically allow no replies.

Application Service Provider (ASP)

Third-party entities that manage and distribute software-based services and solutions to customers across a wide area network from a central data center. ASPs may be commercial ventures that cater to customers, or not-for-profit or government organizations, providing service and support to end-users.

Asset

Something valuable that a financial entity owns, benefits from, or has use of, in generating income. In accounting, an asset is something an entity has acquired or purchased, and which has money value (its cost, book value, market value, or residual value). An asset can be (1) something physical, such as cash, machinery, inventory, land and building, (2) an enforceable claim against others, such as accounts receivable, (3) a right, such as copyright, patent, trademark, or (4) an assumption, such as goodwill.

Authenticated user

A user who has logged in

Batch

A group or collection of transactions of the same general type. The transactions may be batched together by date or by other parameters.

Bill to contact

The party financially responsible to pay for an order. A single bill to contact is assigned to each order and to each invoice.

Billing

The processing of renewable, specified-term products for a group.

Billing address

The address to which the invoice document should be sent. For online payments, the billing address of the credit card which is used for credit card verification.

Blog

Chronological listing of entries, often created by one individual.

Book

A set of pages tied together in a hierarchical parent-child relationship. Multiple levels can exist and these can be used for manuals, FAQs, or other content groupings.

Business Object

A collection of self-contained data that represents an entity or process, and shields the physical data.

Cash accounting

The system of accounting in which income is recognized when the payment is received for an invoice.

Cash GL account

GL Account that aligns with an individual bank account that is owned by a financial entity. Traditional payments, once processed and posted, will result in an increase in the balance of a Cash GL account.

Cash receipt

Cash amount (currency and checks) received and deposited into one of the organization's bank accounts.

Cash receipt document

Document that confirms the receipt of a payment from a customer and communicates information about how the payment was applied (such as applied to a new order or an existing open invoice balance).

Cash receipts journal

Journal in which all cash receipts are recorded before they are posted to the general ledger. These entries are reconciled regularly with the bank statements as an internal auditing measure.

Chapter

Method to organize contacts by regional areas.

Chart of accounts

System of accounting records developed by every organization to be compatible with its particular financial structure and with the amount of detail required in its financial statements. The chart of accounts consists of a list of GL account names and numbers showing classifications and sub-classifications, serving as an index to locate a given account within the general ledger. A company has the flexibility to tailor its chart of accounts to best suit its needs, including adding accounts as needed.

Commerce

The trading of something of value (such as goods, services, or money) between two parties.

Commerce transaction

The data set result from the recording and processing of any or all of the following items: one or more new customer purchases one or more prepayments an ordered product the assignment of payment or billing instructions for an unpaid order balance one or more payments of an existing open invoice balance an adjustment related to a previously processed and posted transaction

Comparison Method

(IQA) Specifies the method by which data is restricted for a column.

Contact status

Method to indicate standing within the organization for specific actions, communications, and workflows. Defaults: A – Active S – Suspended I – Inactive D - Mark for Deletion

Contact type

Method to categorize a contact for specific actions, communications, and workflows.

Claim

In security, an individual right or action applicable to a particular resource. Individual rights are granted by a particular Issuer and allow a user to perform a specific operation on a specific resource or group of resources

Claims set

In security, a collection of claims granted by a particular issuer to a given user or required by a specific resource in order to perform a specific operation.

Commerce item

A representation of goods or services offered for sale. A commerce item may be a physical item, a service, a downloadable item, an event registration, a subscription, or a donation.

Complex group

A group with roles assigned to some or all members.

Components

Individual items within a kit

Content Designer

Content management tool that allows organizations to build and manage pages of text, multimedia files, and iMIS iParts.

Content page

An iMIS definition object that contains the content layout information and iParts needed to render a web page.

Content layout

An iMIS definition object that contains information for how the content zones of a content page will be arranged. A content layout defines only the arrangement of elements that will be displayed for a content page within the main content area - it does not define the over-all layout of the website (which is defined by the site's master page).

Content record

An iMIS definition object stored in the Document System that specifies all the information needed to render a web page for an iMIS-controlled website.

Content tagging

A method of categorizing website content that helps users retrieve information.

Content type

A registered iPart definition that includes the information required by WCM to configure the iPart, publish it, and display it.

Control account

General ledger account whose balance reflects the total of balances of related subsidiary ledger accounts. Accounts receivable and accounts payable are the most commonly used control accounts and their balances serve as a crosscheck (control) of the accuracy of the associated subsidiary records.

Credit

Entry on the right side of a journal entry (that is, it carries a negative accounting sign). Credit has the effect of (1) decreasing an asset or expense GL account balance or (2) increasing a capital, liability, or income GL account balance.

Credit memo invoice document

Official document sent by an organization to a customer (Bill To Contact) stating that an amount has been credited to an original invoice belonging to the customer. A credit memo invoice document is issued for a variety of situations, including when (1) an invoice amount is overstated, (2) the correct price sheet or promotion was not applied, (3) the goods spoil within the guaranty period, or (4) the goods do not meet the customer's specifications and are returned.

Date-limited group

A group with specific join and end dates for the group or for a role in the group.

Debit

Entry on the left side of a journal entry (that is, it carries a positive accounting sign). Debit has the effect of (1) decreasing a capital, liability, or income GL account balance or (2)increasing an asset or expense GL account balance.

Debit memo document

Official document sent by an organization to a customer (Bill To Contact) stating that a new amount is owed due to a change applied to an original invoice. A debit memo invoice document is issued for a variety of situations, including a product price change.

Deferred income

The principle of accounting in which the recording of income is deferred until the accounting perious when the costs are incurred realted to the generation of the income. For example, for an event, the deferred income is recorded during the month in which the event occurs. For a subscription or membership, it is typically spread evenly across the span of service.

Display Order

(IQA) The order that columns display in the results for a query.

Document System

A server-side file system containing documents and objects (business objects, query objects, and output processes).

Event

A gathering of individuals that traditionally occurs at a particular time and place. The event may occur at a particular location and be attended in person (i.e., conference, seminar), or it may occur in a virtual meeting place (i.e., webinar, teleconference).

Event coordinator

An individual who is responsible for managing the planning and/or operation of the event or some aspect of the event.

Event showcase

The detailed display of information about an event. The showcase can include images and a variety of information.

End date

Date on which an individual's group membership ends.

Expiration date

Date on which a group member's role expires. For example, the treasurer might serve one year, but the chair of a committee serves two years. The individuals are still members of the group after their specific role term expires.

Expense

Money expended or cost incurred in an organization's efforts to generate revenue. An expense is typically an event in which an asset is used up or a liability is incurred, such as cost of goods sold, damaged goods, and bad debt expense.

Facility

A location that provides a particular service, typically the venue within which an event is being held (i.e., convention center, hotel, meeting room).

Filter

(IQA) One or more column-specific search conditions.

Financial entity

A legal entity for which a separate set of balanced financial accounts (or set of books) must be maintained independently. Although accounting information from different entities may be combined for consolidated reporting purposes, all transactions and accounts must be kept in balance for each entity.

Fiscal period

A month/year combination expressed in terms of a financial entity's fiscal year (as opposed to the calendar year). For example, if the calendar date of an accounting transaction is April 15, 2009, and the fiscal year begins in April, then the fiscal period is 1/2009. Likewise, if the transaction calendar date is is March 15, 2009, the fiscal period is 12/2008.

Fiscal year

Accounting period covering 12 consecutive months over which a financial entity determines income and profits. The fiscal year does not necessarily correspond to the calendar year.

Formal event

An event for which an official registration or a fee is required as a prerequisite for event participation.

Formal registration

An official event registration for a formal event. Usually, the registrant is expected to attend (i.e., a slot or seat may be held for him/her) unless the registration is canceled.

Fulfillment

The act in which the selling organization meets its financial obligation of delivering the goods and services that have been ordered by a customer. In the case of a physical product, fulfillment occurs when the product is shipped or physically delivered to the customer.

Function (in Events)

A sub-event or session that occurs within the context of an overall parent event. For example, a conference may incorporate multiple functions or mini-meetings over the course of the conference date span. Such a conference may include multiple break-out sessions, social events, and networking sessions.

Function (IQA)

(IQA) Summarizes some characteristic of the current set of rows. The functions that are available depend on the data type of the column you selected.

GAAP (Generally Accepted Accounting Principles)

Authoritative rules, practices, and conventions meant to provide both broad guidelines and detailed procedures for preparing financial statements and handling specific accounting situations.

Gateway account

General journal

Journal used to record journal entries other than those that are recorded in the Sales and Cash Receipts journal.

General ledger

The set of financial accounts (GL accounts) which contains the balance sheet and income statement accounts that summarize the financial activity of a financial entity.

Gift item

A commerce item that has a suggested amount price, such as for a donation.

GL account

An individual account within the Chart of Accounts that is used to record a financial amount in a journal entry.

Group

Method to organize contacts according to pertinent criteria such as chapters, interest groups, industry, or subscribers.

Group member

A contact who is, has been, or will be a member of the particular group.

Group role

A classification of the way in which a group member participates in the group.

Group member status

A potential membership stage or state within a detailed group.

Group type

A method of classifying similar groups for efficiency in setup and reporting. Default information is assigned to a group type, but can usually be changed at the individual group level.

GUID (globally unique identifier)

A 32-character hexadecimal string used to provide a unique reference number. iMIS often uses a GUID to identify controls and interface objects.

Identity claim

A security function that describes a set of attributes about a user or other entity.

Income

An amount generated from the sale of goods or services, or any other use of capital or assets, associated with the main operations of an organization before any costs or expenses are deducted. (Also called revenue.)

Income account

The account number by which income amounts are recorded or recognized. The income account is maintained with the Profit and Loss set of accounts.

Inventory setup options

The accounting treatment to be used for inventory. System defaults are FIFO, LIFO, Average, and Standard.

Invoice

An official object that itemizes all of the product charges and miscellaneous fees involved in a sales transaction. The invoice contains key reference data such as the invoice number, invoice date, references to the originating order, customer information, and billing instructions.

Invoice date

The date on which the invoice was issued or created, usually the date of product fulfillment. For an accrual invoice, the invoice date is the accounting transaction date for the related sales journal entry.

Invoice distribution line

An object attached to a parent invoice line that carries related accounting information and represents the detailed invoice balance level to which all payments are applied. Individual invoice distribution lines are created for each income account that is used in booking the income for the parent invoice line.

Invoice document

The printed or electronic invoice information sent to a customer.

Invoice due date

See "Payment schedule due date".

Invoice header

The portion of the invoice that contains general information about the invoice, such as the invoice number and date, customer information, and billing instructions.

Invoice line

A sequentially numbered line in an invoice that represents the charges for an individual product line (or a partial quantity of a product line) that has been fulfilled or a miscellaneous fee (such as taxes or shipping and handling). The extended amounts of all invoice lines should equal the grand total of an invoice.

Invoice number

A unique, sequential number assigned to each invoice as the primary reference.

iPart

An ASP.NET web part control designed for integration with iMIS that allows user to view and, in some cases, create and edit content.

IQA

Intelligent Query Architect. The query-building tool used to extract data from the iMIS database.

Issuer

A trusted source for granting Claim Sets based on user authentication.

Item

Generic term for commerce objects. For example, an event item, a dues/billing item, or a gift item. Items can be grouped into item sets.

Item class

The method to assign the default GL accounts, tax schedule, standard discount percentage, and other settings to be used for a type of commerce item, such as Chapter Products or National Events.

Item set

A collection of commerce items with related options and rules. For example, and event plus required functions, a product bundle, or a collection of membership and other fees.

Item showcase

A display of information about a commerce item. The showcase can contain all information and images for the item or can link to other pages.

Item type

A general kind of simple commerce item, usually used to differentiate a gift (donation) with a suggested amount from a commerce item with a set price.

Itinerary

A list of functions a person has chosen for an event. The itinerary can contain an informal choice of functions (pre-registration itinerary) or a formal registration, if required (post-registration itinerary).

Issuer

A trusted source for granting Claim Sets based on user authentication.

Joins (IQA)

Relationships between data used in query definition. Joins specify which fields are equivalent so the data is associated correctly.

Join date

Date on which an individual became a member of a group.

Journal

Business diary in which all financial data pertaining to the day-to-day business transactions of an organization is recorded. From the journal, debit and credit changes caused by each transaction will be posted to the designated accounts in the general ledger.

Kit

A product set of two or more components (items or services) that are sold for a single price. Kits are often used to present a group of items as a bundled, discounted product. In addition, kits are a useful method to distribute the costs of individual items (components) among multiple income areas for accounting purposes.

Liability

Claim against the assets or legal obligations of a person or organization. Liabilities include amounts owed to lenders and suppliers, amounts received in advance for a future sale or for a future service to be performed (unearned or deferred income).

Method of receipt

Indicates whether purchased item will be shipped to the customer or customer carries the item out. The method of receipt effects which taxes should be applied.

Monetary application

The link between an invoice distribution line with another object (such as a payment, a payment reversal, or an adjusting invoice) that is applied towards decreasing or increasing the balance of the distribution line. In most cases, a monetary application represents the amount of a payment that is applied towards an individual invoice distribution line.

Multi-function event

An event that incorporates multiple break-out sessions, social events, networking brown bags, or other functions which a registrant can attend.

Net income

Total income in an accounting period, less all expenses during the same period. If income taxes are not deducted, it is called operating profit (or loss). Also called earnings, net earnings, or net profit.

Non-authenticated user

A user who has not logged in

Non-commerce event

An event in which there are no fees. Registrations for a non-commerce event are processed on a direct basis, not through a commerce order.

Object

(IQA) Self-contained element that consists of instructions to manipulate data; for example, a business object or query object.

On behalf of (proxy)

Performing an action in place of another person.

Open credit

The portion of any payment that is in the unrestricted, unapplied state. An open credit can be applied toward new or existing orders or open invoices.

Open invoice

An invoice with an unpaid balance.

Open order

An order that is not 100% fulfilled.

Operation

A well known system function, such as Create, Read, Update, or Delete that can be performed for a specified resource within the application.

Order

A customer request to purchase one or more products.

Organization

Name for company-type contact record.

Parameterized Query

(IQA) A query that requires a value from the user at runtime.

Payer contact

The party who actually made the payment (officially owns the bank account or credit card being used for the payment). The payer contact is normally, but not always, the same as the bill to contact.

Payment

A sum of money paid.

Payment alternative

A category of payment instructions which are provided in lieu of a traditional payment, such as Bill Me, Bill My Company, or Application of Open Credit. Payment alternatives do not create a brand new payment object when processed or posted.

Payment date

The date when a payment was deposited into the bank account. The payment date will always be assigned as the accounting transaction date for the related cash receipts journal entry.

Payment instructions

Information collected and/or derived by the system that indicates how a financial obligation will be met.

Payment method

The allowable method of payment a customer can use and the bank account into which the payment should be deposited. The payment method may specify the general type of payment (credit card, cash, check) or it may specify a specific type of payment (VISA, MasterCard).

Payment method set

The collection of pre-defined payment methods that are allowed for a particular commerce transaction process.

Payment reversal

A complete or partial reversal of an original payment stemming from a credit card refund, a bad check, or a credit card charge back.

Payment schedule

The amount due and due date for payments, in accordance with the payment terms.

Payment schedule due date

The date by which the payment for an invoice balance must be received. The due date is typically calculated as a certain number of days from the invoice date, in accordance with the payment terms.

Payment terms

The period of time allowed to pay for the goods and services that have been ordered. Payment terms may include standard terms (such as Net 30) or a specified payment schedule.

Payment type

The highest-level category of payments such as Cash, Credit Card, Debit Card, or Bill Me. The payment type defines the required information to be entered for payment instructions and how the payment transaction should be processed.

Pay Priority

(commerce) The order in which payments are applied to invoice line items.

Person/People

Name for individual contact record. Contact records contain the descriptive contact and demographic information for each iMIS100 user (and for non-users). A contact record must be created for a new user before you can create a user record to link to that contact record.

Posting (batch)

Procedure that updates accounts with specific transaction amounts or transfers temporary transactions to permanent records (appropriate accounts in the general ledger).

Prepayment

A payment that accompanies an order or is made in advance. The prepaid amount is recorded in an Unearned Income liability account until the ordered products are fulfilled and the payment is applied to the associated invoice(s).

Price sheet

A set of product prices and price calculation rules assigned to customers or orders of a certain type.

Priority

(IQA) The order in which the data for a particular column is sorted.

Proxy

See On behalf of.

Publishing server

A local service running on a web server that generates physical files representing the content defined by a content page and add related search metadata to the search index on the local web server.

Query

User-defined criteria used to retrieve a subset of data.

Registrant

A person who has formally registered for an event.

Registration

The recording of people who sign up to attend an event, typically in advance of the event occurrence (except for on-site registration).

Registration status

The current state of relationship between a person and an event or function.

Registration Type

Designation of an event's requirement for registration or fee.

Relation

(IQA) The part of a query definition that specifies a relationship between two or more sources, which effectively creates a new temporary table against which the query is run.

Relationship (Join) Operator

(IQA) The specific type of relationship between two sources.

Renewal invoice

An invoice generated by the selling organization to request that the customer repurchase or renew a subscription or membership service. The renewal invoice data is generated directly and is not connected to the fulfillment of an order.

Renewal notice

Document that is frequently sent to a customer instead of a renewal invoice. The renewal notice is typically used in cash basis accounting systems to document the renewal or continuation of a subscription or membership.

Resource

An application object that exposes properties and methods to allow users to interact. In claims-based security, such resources are assumed to be secured.

Resource group

A logical group of related resources that share a common set of claims. Such groupings simplify the need for assigning and checking for required claim sets.

Sales journal

Journal for first entry of sales invoices issued to customers for goods supplied or services rendered. Entries from this journal are posted to individual customer accounts. The totals are posted to the general ledger as a debit to accounts receivable and a credit to income.

Schema

The structure of a database.

Search index

A database (used by an index server running on a web server) that is updated by the publishing process and is used for quickly retrieving weighted results for website searches and in the compilation of output for tagged list content.

Shopping cart

A tentative commerce transaction data set that exists for any new commerce transaction until checkout and order submission. The cart may contain products added to the cart, adjustments processed, and the list of open invoices selected for payment. Items can be added, edited, or removed from the cart at any stage before submission.

Simple event

An event with no functions. A simple event can be for information only (no registration required) or can require registration.

Simple group

A group with no assigned roles or date limits.

Simple item

A commerce item that has a single price.

Site Designer

A website and navigation management tool that allows organizations to establish one or more websites, create navigation menus and connect navigation to content.

Source

(IQA) Object that is available for building query definitions. Sources include both business objects and query objects. Query definitions can be created based on one or more sources.

Standard invoice

Document issued by a seller to a buyer detailing goods and services sold. Also called a bill of sale or contract of sale, it identifies the trading parties, the assigned invoice

number, and the invoice date. It also lists, describes, and quantifies the items sold, shows the date of shipment and mode of transport, lists prices and discounts (if any), and shows delivery and payment terms.

Subsidiary ledger

A record of the details to support a general ledger account (control account). For example, the accounts receivable subsidiary ledger provides the details to support the balance in the general ledger control account Accounts Receivable.

System administrator

A user with complete access and privileges

System role

Used in claims-based security. System roles include:

- Non-authenticated user: A user who has not logged in
- Authenticated user: A user who has logged in
- System administrator: A user with complete access and privileges

Tag

Keyword or category name used to classify website information.

Tagged list

Listing of content tagged with a specific keyword and, optionally, related tags.

Tagging hierarchy

Visual means of displaying relationships between content tags.

Traditional payment

A category of payment instructions that, when processed, will create a brand new payment when the order is fulfilled. Traditional payments include Cash, Check and Credit Card.

Tag

A type of metadata that associates a content page with a defined taxonomy for searching and displaying the content page within a website. When a content author tags a content page, the tag is added to the metadata for the content page and to the website's search index. This facilitates the inclusion of the content page in website searches and tagged lists displayed on other content pages.

Tagged list

An iPart which aggregates content pages that contain specified tags and satisfy other defined criteria into a display list. The tagged list definition includes an association with a tagged list format that defines how the aggregated content will be displayed.

Tagged list format

An iMIS definition object that contains information for how a tagged list iPart should display details for each content page that is displayed by the tagged list.

Target contact

The person on whose behalf you are performing an action.

Tax authority

A jurisdiction or geographical area to which a set of specific taxing rules apply.

Tax category

General collection of items that have common taxation rules.

Tax schedule

All tax authorities that apply to particular situation (such as the purchaser, the location, the item class, or the individual item) and the order in which taxes are calculated when more than one tax applies.

Transaction

An event or condition that is recorded in asset, liability, expense, revenue, and/or equity accounts.

Unearned income

A liability that is recorded when assets are received before the order is fulfilled. Unearned income can be due to (1) a payment in advance of products or services being supplied, (2) an unidentified payment, (3) an overpayment, (4) a duplicate payment, or (5) a return or cancellation of products or services involved in an early pre-paid sale.

Unit of measure

The measurement amount for a product, such as case, each, meter, sheet, pack, or box.

Unposted transaction

Any order, invoice, or payment that has been recorded but remains in a tentative state. While in the unposted state, the transaction can be easily changed or deleted without generating an audit trail of the change.

User-defined field

A method to add metadata to content and to filter search results.

Web Content Manager (WCM)

Write-off

Removal of the outstanding value of an invoice that is deemed uncollectible or that carries a trivial positive or negative balance. The result of the write-off transaction is to bring the invoice balance to zero. In the case of an accrual invoice, the amount written off is charged against the net income by recording either a bad debt expense or an adjustment to income.

See Redux Sprint 36A for Fundraising Dictionary

Home – Common Tasks

Your Advanced Accounting Console includes a Home page with frequently used tasks presented in a Common Tasks console. These tasks also can be accessed from the top navigation items, if available. For example, finance transactions can be accessed from the Home page or by selecting Finance > Transactions. Instead of repeating the topics, you will be redirected to the topics for the main navigation area (i.e. Finance > Transactions) when you select the topic below.

Depending on your license keys, some areas may not be listed on the Common Tasks console. The license keys needed for each area are:

- Finance (CASH)
- Commerce (W_ORDERS or ORDER)
- Membership and Dues (MEMBERSHIP)
- Events (MEETINGS or WMEET)

Home > Finance	Home > Commerce
Transactions	Gifts
Processes	Orders
	Inventory

Home > Membership	Home > Events
Chapters	Register
Committees	Define an event
Payments	
Bill membership fees	

How-To Articles

Content Records and Dynamic Content Items

A content record is an iMIS definition object, stored in the Document System, which specifies all the information needed to render a web page from an iMIS content management website. Instead of hand-coding the contents of a web page for your website, you define some basic properties and tags for the content record, choose a content layout, add various content items to the content item zones in the layout, and then define the properties for each content item. After the content record has been published to an.aspx file on the website, it is available for viewing by web browsers as a complete web page.

A dynamic content item is essentially a web widget in the ASP.NET environment. As with any web widget, you choose from different types of content items to insert in the various content item zones in the content layout and then you configure each content item to populate that instance of it with the desired content. You can easily rearrange the rendered page contents by dragging a content item to a different location within the content item zones. A standard set of system-defined content items are available in iMIS, but staff or consultants who are experienced in ASP.NET development can also easily add new content items for use when authoring content.

Creating a Content Record

Go to RiSE > Page Builder > Manage content:

Select the content folder in which you want to create the content record. You can either:

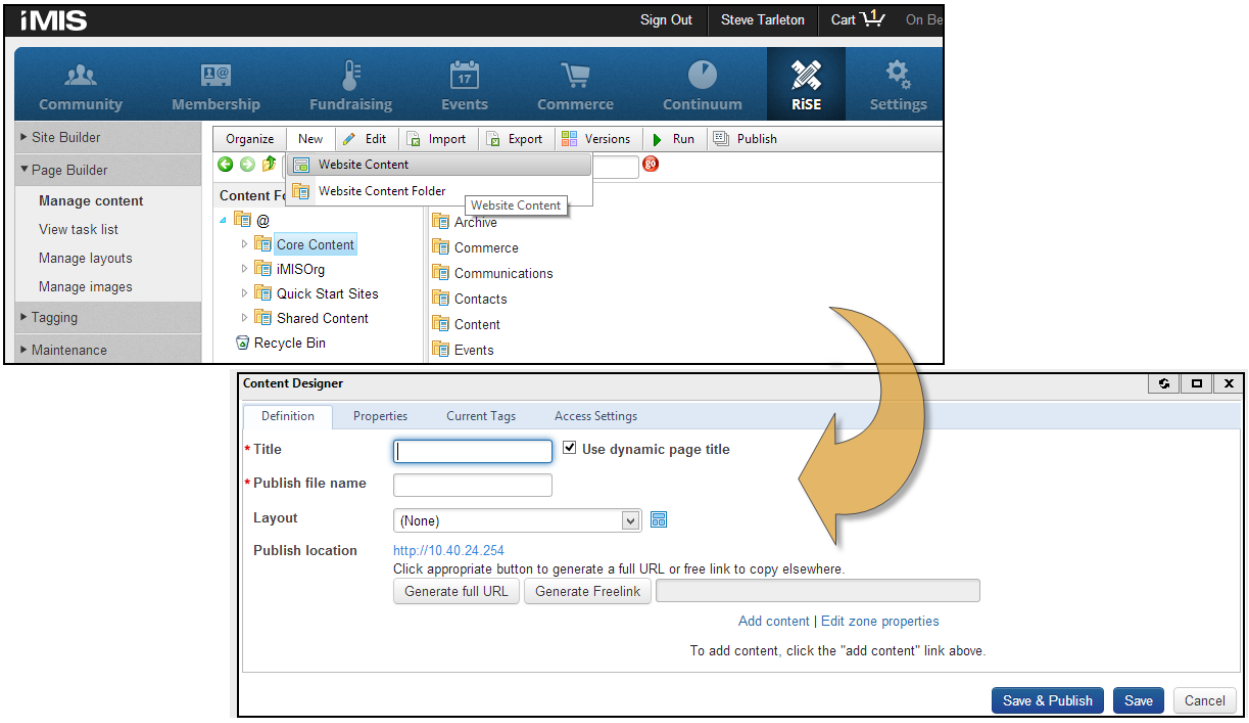
- Select New > Website Content to create a new content record.
- Click Edit to modify an existing content record.
- Select Organize > Delete to delete an existing content record.

Do the following in order to create a new content record:

1. (Definition tab) Enter a Title for the content record.

1. If you would like to include the title of a dynamic content item with the title of your content record, select the Use dynamic page title checkbox.
2. The content record supplies the name of your webpage unless you choose to override with a navigation item title.
3. If a content record contains several dynamic content items, it is recommended that you turn dynamic page titles off for the entire page in order to limit the title length.

2. Enter a Publish File Name for the content record
3. Select a layout in the Content Layout drop-down list.
4. Click Add Content to add one or more content items to each content item zone.
5. Select the content item you want to use. Click OK.



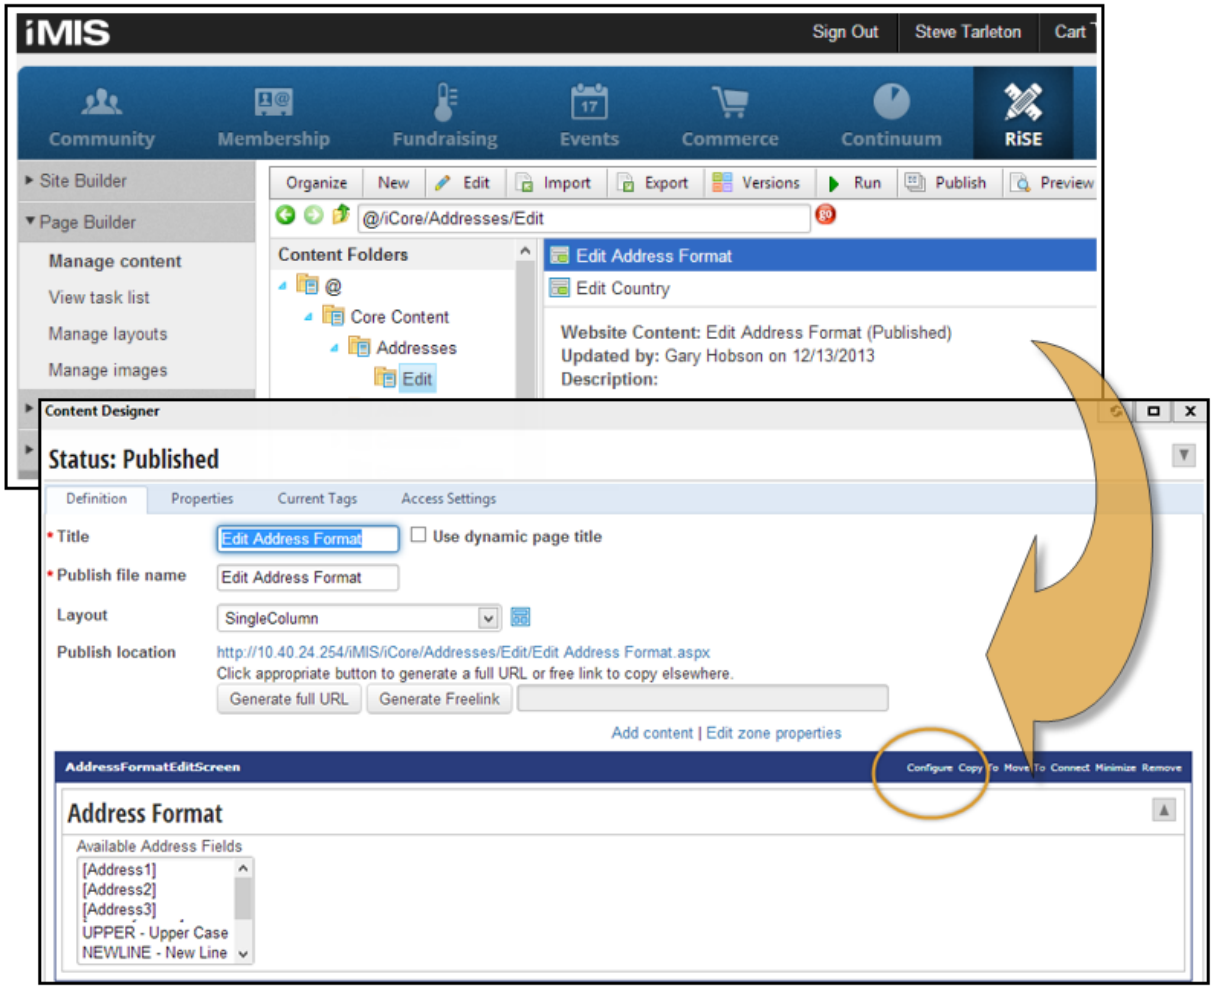
6. Configure each content item to define its individual content.

   To modify an existing content record:

1. Select the content record.
2. Click Edit.
3. Click Configure on the content item.
4. Configure the content item.

   Select the tabs in the Content Designer to provide the following for each content record:

- Definition
- Properties
- Current Tags
- Access Settings

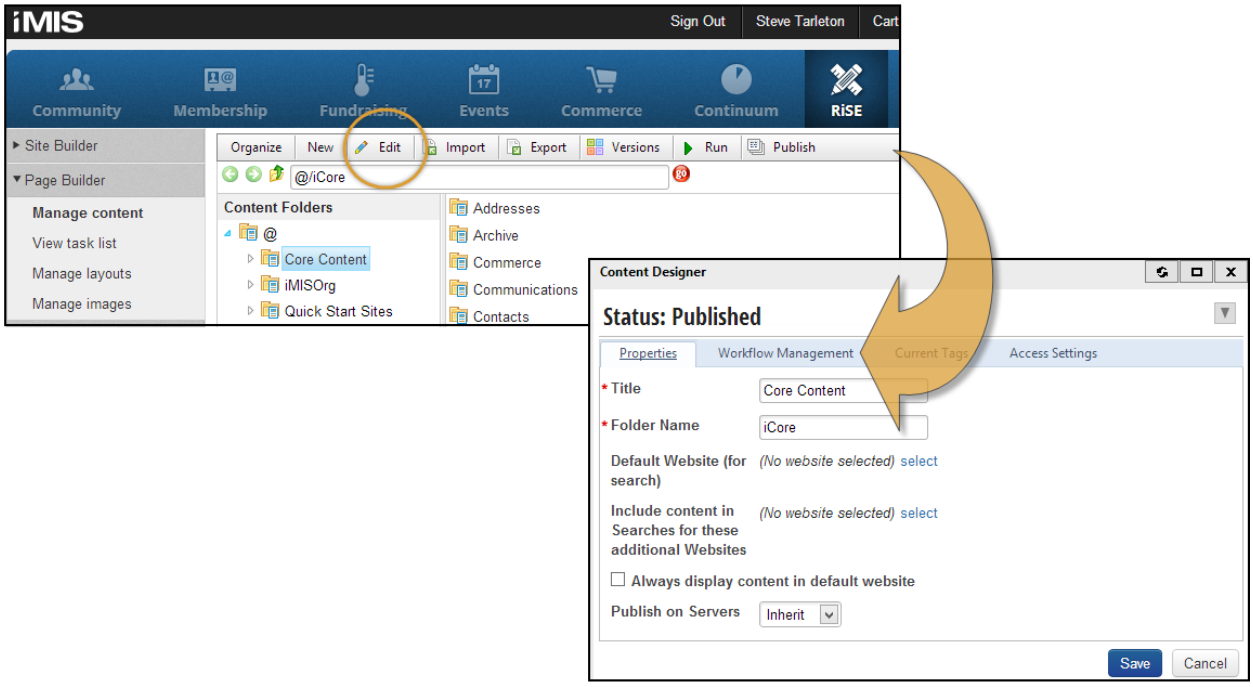


If the parent content folder has been enabled for content authoring workflow, you can optionally change the default settings:

a. Select the parent folder.

b. Click Edit.

c. (Workflow Management tab) Modify the content record.



You can also click and drag content items to rearrange them within a content item zone or between different content item zones. It's also possible to copy or move existing content items from one content record to another.

All content records in the Core Sites and Quick Start Sites content folders are protected as System content records and cannot be edited or deleted. If you want to update a System content record, create a copy of it, and then edit the copy. Be sure to also update any navigation items or shortcuts that point to that content record.

Publishing content records

When you first create a content record, or when you make changes to an existing Published content record, that particular version of the content record is not visible on any iMIS content management websites until it is published. You have two publishing options:

- Save and publish immediately: Before closing the content record, select Save and Publish to make your changes immediately visible on all websites that use the content record.
- Save, then publish later: If you Save the content record without publishing, the content record is marked with a status of Working. To publish the content record, select it and then click Publish in the Document System toolbar.

  After publishing your content record, the status changes briefly to PublishPending, and then to Published once it has been fully rendered to an .aspx file on all web servers that host the relevant iMIS content management websites.

To create a new web page containing one or more content items

Go to RiSE > Page Builder > Manage content:

1. Select New > Website Content.
2. Select Add Content and select the desired content item from the Content Gallery.
3. Enter the applicable information and select the desired options.

1. The iMIS Dynamic Content Items Reference Guide provides a detailed list of configuration options for each content item.

4. Click OK.
5. Click Preview to see how the content will be displayed to users.
6. Click Save and then Publish.
7. From RiSE > Site Builder > Manage sitemaps, create new website navigation.

2. If no owner is specified for the content block, the default organization displays as the owner.

8. Click Publish.

To add content items to an existing webgate go to RiSE > Page Builder > Manage Content , select the content record you wish to edit, and then click Edit.

Copying or moving content items to another content record

Go to RiSE > Page Builder > Manage content:

- Select the content record you want to move or copy.
- Click Edit.
- In the content item header, click Copy To or Move To. The Document Browser window is displayed.
- Select the content record to which you want to move the content item.
- Click OK.
- Click Save & Publish.

Copying or moving content records to another content folder

You can move content records into different content folders by dragging and dropping them into a different folder. Do the following to move content records into other content folders.

Go to RiSE > Page Builder > Manage content:

1. Select the content record you want to move.
2. Select Organize > Cut.
3. Select the content folder to which you want to move the content record.
4. Select Organize > Paste.

Do the following to copy content records into other content folders:

1. Select the content record you want to copy.
2. Select Organize > Copy.
3. Select the content folder to which you want to move the content record.
4. Select Organize > Paste.

When you move or copy a content record into a new content folder, you must republish it to make sure that the content record is made visible on all websites associated with the new content folder, as well as removed from all websites that were associated with the old content folder.

When you move or copy a content record that was originally in a workflow-enabled content folder (a content authority group is assigned to the content folder) into another workflow-enabled folder, the content record's assigned content owner remains unchanged if:

- The new folder's content authority group also lists the assigned content owner as a member.
- The assigned content owner has Content Editor content authority group permissions in the new content folder's content authority group.

If either of these conditions is false, then the assigned Default Owner of the new content folder’s content authority group is assigned as the new content owner for this instance of the content record.

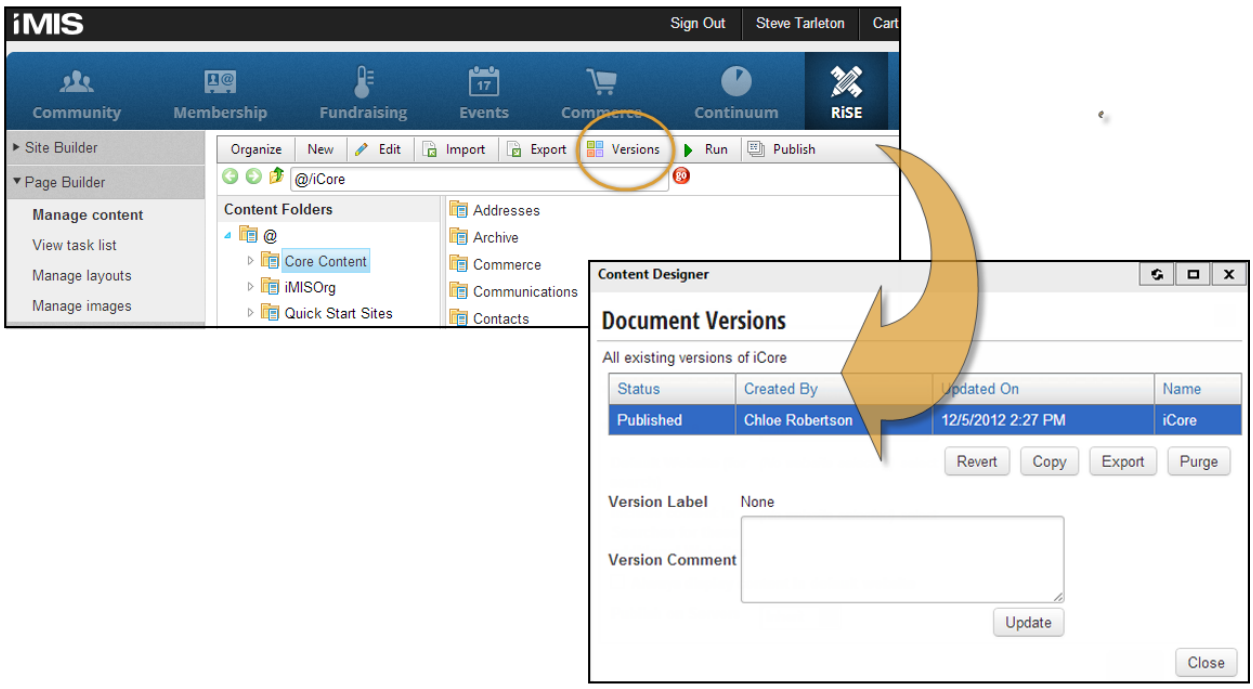
The tags inherited from ancestors in the content folder hierarchy are recalculated based on the content record's new position in the hierarchy. Although the new inherited tags are visible immediately within the Page Builder tool, website searches for these tags will not find the content records until you republish them.

Reverting to an earlier version of a content record

Every time you publish a content record, the previously published version is saved as an Archived version. Do the following to revert to an older archived version.

Go to RiSE > Page Builder > Manage content:

1. Select the content record.
2. Click Versions.
3. Select an archived version
4. Click Revert. A warning message is displayed.
5. Click OK.
6. Click Close.



The archived version you select is turned into a new Working version at the top of the list, and all previous versions remain intact. When you close the window, the archived version is the version you'll now see in the content folder. As with any Working content record,

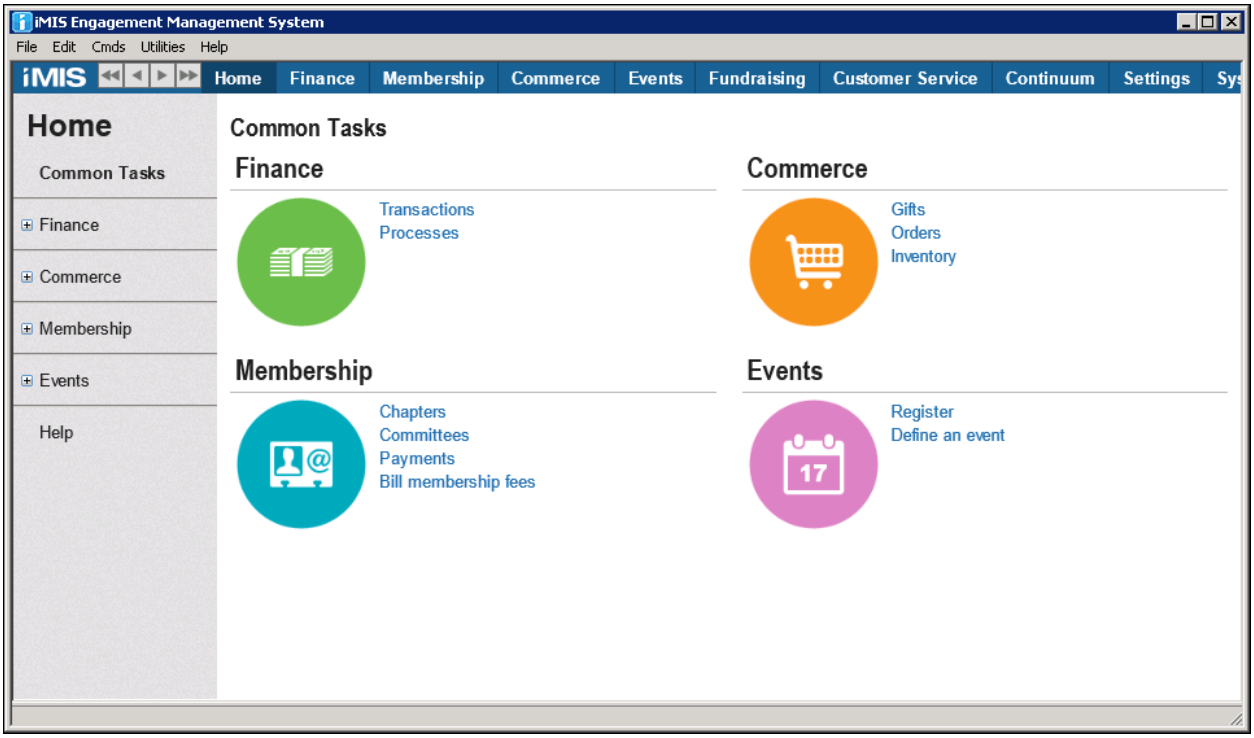
you can publish the content record when you are ready to push it to your iMIS content management websites.

iMIS Advanced Accounting Console

iMIS functionality is widely accessible and can be administered from the Staff site. However, Advanced Accounting Console is a streamlined, easy-to-use interface alternative for customer service and other staff functions.

Although the Advanced Accounting Console is a Desktop client installation, you can access the Advanced Accounting Console from the Staff site by creating a link on the Staff site that can be used to launch the Advanced Accounting Console within a separate browser window. For details, see Accessing the iMIS Advanced Accounting Console using a Web Browser.

Note: Note: For iMIS users upgrading from 15.2, Advanced Accounting Console includes numerous paths through which you can set up and administer your iMIS system – but you might need to continue using iMIS Desktop to access certain features. Please see details below.



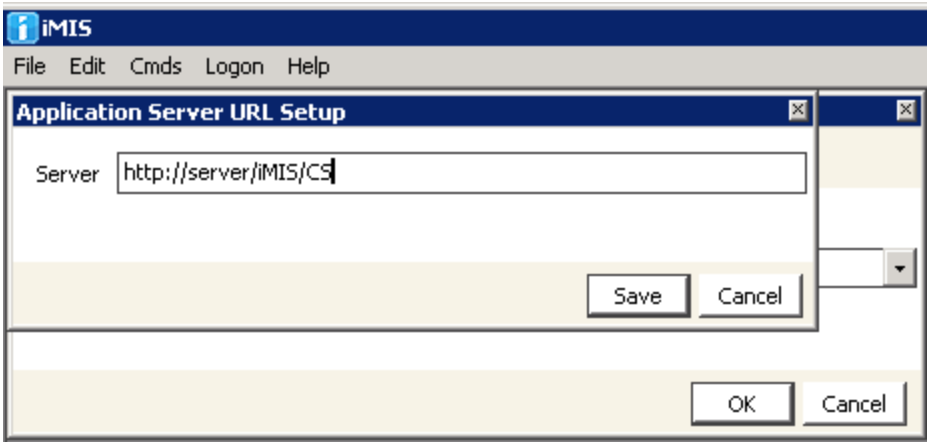
iMIS Advanced Accounting Console

The iMIS Advanced Accounting Console includes the following landing pages for efficient access to administrative areas:

- Home: Frequently used tasks
- Finance: Manage your organization's financial transactions
- Membership: Manage chapters, committees, payments, etc.
- Commerce: Manage orders and inventory
- Events: Manage events and registrations
- Fundraising: Manage gifts, pledges, appeals, premiums
- Customer Service: Process event registrations, orders, fundraising gifts, etc.
- Continuum: Run reports for membership, events, orders, fundraising, etc.
- Settings: Define and configure product options
- System Admin: Manage your organization's websites

To switch to Desktop from Advanced Accounting Console

1. From the Windows Start bar, open iMIS Desktop (ASI > iMIS > iMIS Desktop).
2. If an initial logon screen appears, click Cancel.
3. From the taskbar, select Logon > Set Host Location.
4. If you are unsure of the Desktop location, click Edit and from the Application Servers drop-down, make note of the location and click OK.
5. Click Insert.
6. Set the host location, changing CS2 (indicates Advanced Accounting Console) to CS (indicates Desktop). For example, http://server/iMIS/CS.
7. Click Save.



8. Click Edit and make certain the new location is highlighted in Application Servers.
9. Click OK and exit out (x) of Local Preferences.
10. Select Logon > Logon to Host.
11. Log on with your administrative credentials.

> **Note:** Note: After you have completed steps 4-7, you will not need to set up the new host location again. You will simply follow steps 1-3, and select your desired location from the drop-down.

The iMIS DataVault

Providing a secure method for processing payments ensures confidence when your customers visit your website. The PCI Security Standards Council has established security standards called "PCI DSS" (Payment Card Industry Data Security Standards) or PCI Compliance. PCI Compliance increases customer confidence when entering credit card or bank account information on your website and has quickly become the industry standard for merchants. If you do not meet PCI Compliance standards and your customers' payment data is compromised, the payment card brands can fine or penalize you or even revoke your right to accept their payment cards.

The iMIS DataVault provides an effective solution for securing payment information. The iMIS DataVault is a "data store" that uses a tokenization method to replace payment details. Since the payment information is not stored in iMIS, PCI compliance is only required on the iMIS DataVault. This reduces the expense of complying with PCI standards on every iMIS website.

The DataVault is used with iMIS installations licensed for AutoPay. After configuring iMIS for automatic payments, a member or donor can automatically renew their membership fees or set up recurring donations using a credit card or bank account. The DataVault is a separate utility that processes payment requests sent to it by iMIS.

Benefits to your organization

Using the DataVault to process automatic payments offers a variety of benefits for your organization.

- DataVault works seamlessly with iMIS AutoPay, making it easy for you to offer secure automatic payment options to your members and donors.
- Automatic payment processing within iMIS uses the token created by the DataVault as a surrogate for the payment information. The token cannot be associated with the credit card or bank account, ensuring the security of your members' and donors' financial information.

- The DataVault is PCI-compliant. Since the payment information is not stored in iMIS, your iMIS database is not required to be PCI-compliant, eliminating needless expense and complexity for your organization.
- Organization staff will save essential time as they will no longer need to manually enter credit card numbers for recurring payments each time the payment is due.

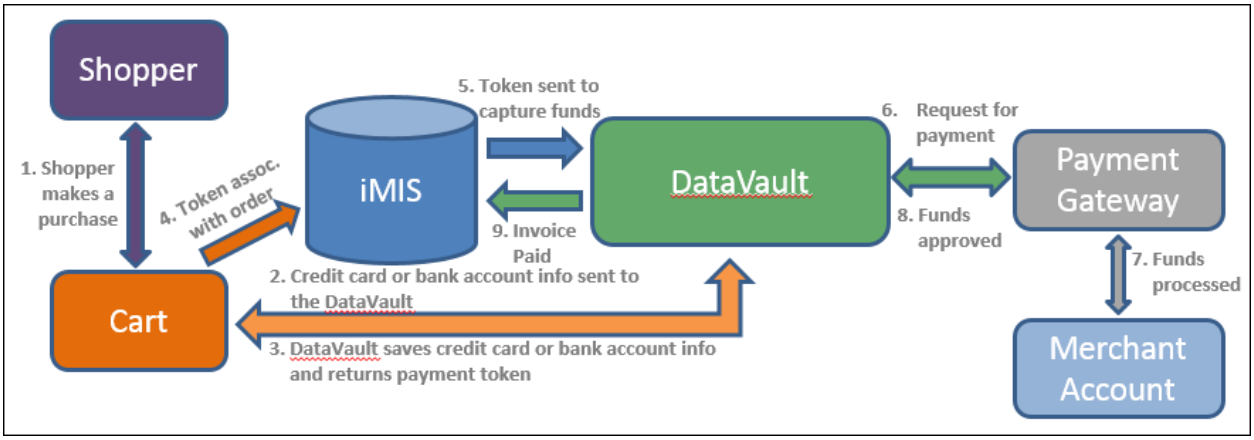
How the DataVault secures payment method

The DataVault acts as a secure pass-through between iMIS and the Payment Gateway (i.e., Payflow Pro or iATS). When a user sets up an automatic payment, the DataVault generates a token to represent the user's credit card number or bank account details. Sensitive payment information remains safely stored in the DataVault while iMIS uses the token to process the transaction.

If iMIS is licensed for AutoPay, a member or donor can set up their membership fee or donation to be automatically processed on a continual basis. iMIS and the DataVault begin to interact when a member or donor chooses to use automatic membership renewals or recurring donations:

1. The user adds the membership fee or donation item to their cart.
2. When the user submits credit card or bank account information for payment in the cart, iMIS sends the encrypted payment information to the DataVault.
3. The DataVault saves the payment information and sends a payment token to iMIS for use with future payments.
4. The token now acts as a surrogate for the payment information within iMIS.
5. The staff user sends the invoice, along with the token to be used to pay for the invoice, to the DataVault to be processed.
6. The DataVault matches the token to the payment details and sends them along with the payment request to the gateway.

7. The Payment Gateway interacts with the Merchant Account to determine if payment is approved or declined.
8. The Payment Gateway sends the Merchant Account's response to the DataVault.
9. DataVault associates the response information with the token and sends the information to iMIS. If the transaction was approved, iMIS uses the token to process the payment and shows the invoice as paid.



Hosting options for iMIS 20-300 customers

iMIS 20-300 customers can choose to self-host the DataVault, or if ASI already hosts their iMIS application server, ASI can also host the DataVault. (ASI hosts the DataVault for all iMIS 20-100 and iMIS 20-200 customers.)

Customers who self-host the DataVault will need to meet the system requirements and follow the installation instructions described in the Installing the DataVault section of this document. A number of reports are also available for self-hosted customers.

When customers choose to use the ASI-hosted DataVault, ASI provides the system requirements and installs the utility.

iMIS DataVault Installation

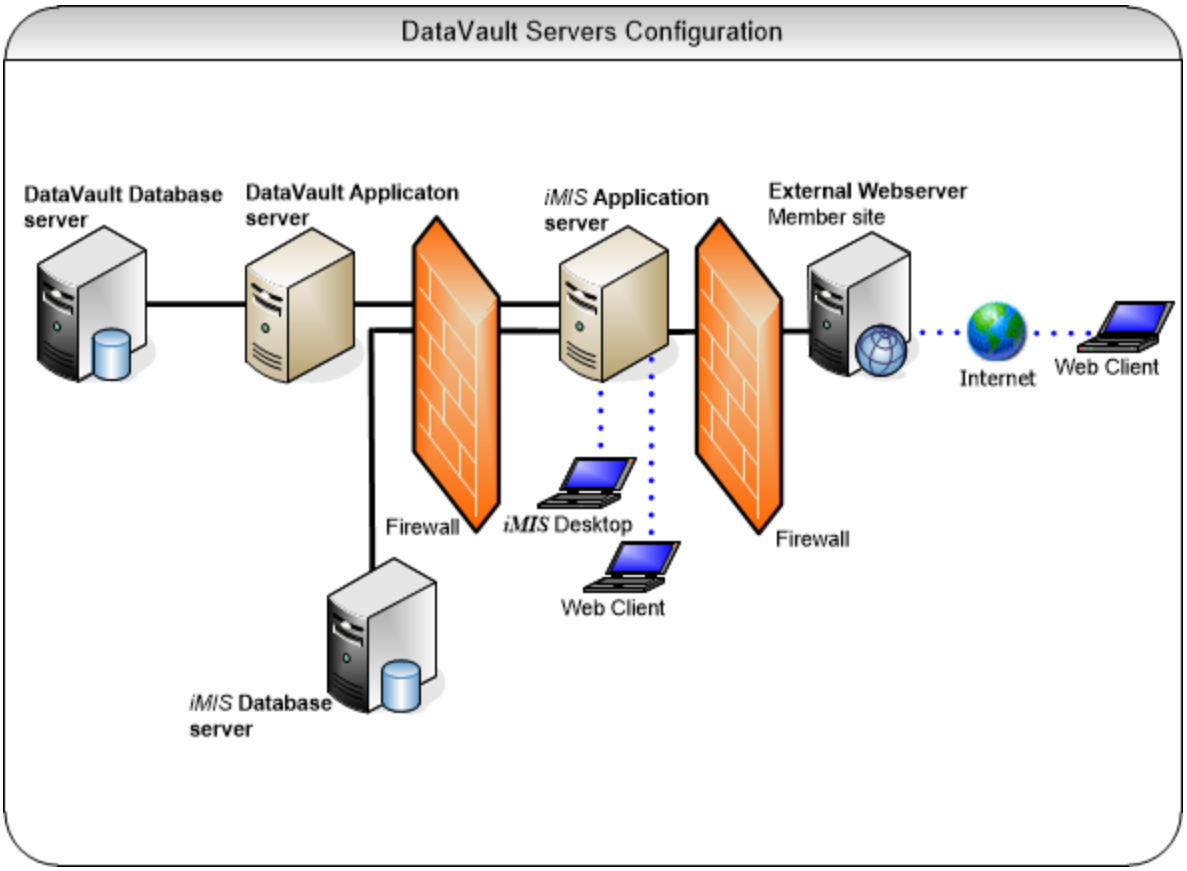
Before you Begin

iMIS architecture is made up of a single database server, one or more application servers (appservers), and two types of clients (a Windows application and a web application), which run on typical workstations. These requirements apply across database servers, appservers, and workstations. Web clients only need to meet requirements for displays and browsers. The DataVault has all of the same requirements as iMIS, and includes several additional requirements.

Important! Review the iMIS PCI Implementation Guide for details about PCI-compliance.

System Requirements

Minimum hardware (all) Operating System (for both servers)	2 machines: 1 application server and 1 database server Windows Server 2008 R2 SP1, 2012 [or] 2012 R2 (64-bit, Standard/Enterprise/Datacenter editions only)
Application Server	Microsoft .NET Framework 3.5 and 4.5 (ASP.NET) Microsoft Internet Information Services (IIS) 7.5, 8.0, [or] 8.5 Note: An SSL certificate must be installed on the application server.
Database Server	Microsoft SQL Server and Express Edition 2012 SP1 [or] Microsoft SQL Server and Express Edition 2008 R2 SP2 (32-bit and 64-bit) Note: 2008 R2 is not backwards compatible.



Installing the DataVault

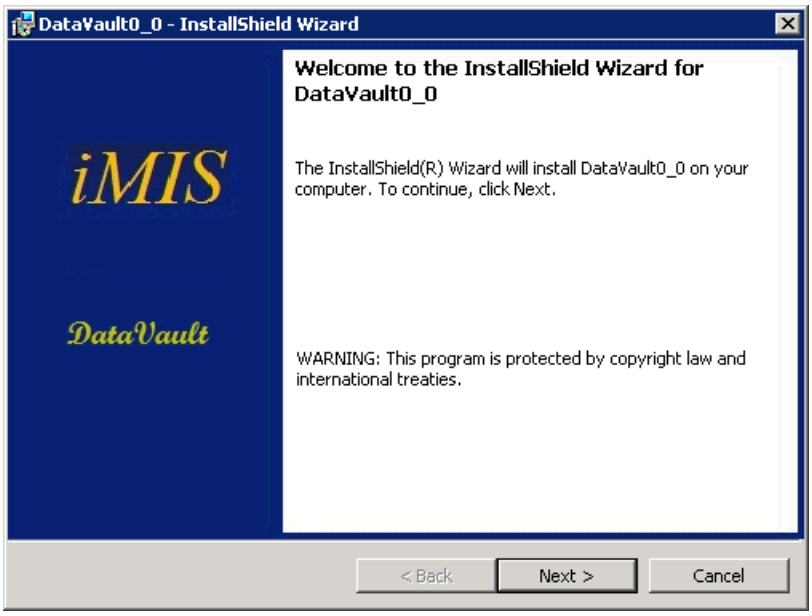
The DataVault is versioned. It is vital that you check to see if you need to update your DataVault any time you update iMIS.

To install the DataVault utility

1. Contact ASI hosting for the most recent version of the ASI DataVault Installer.

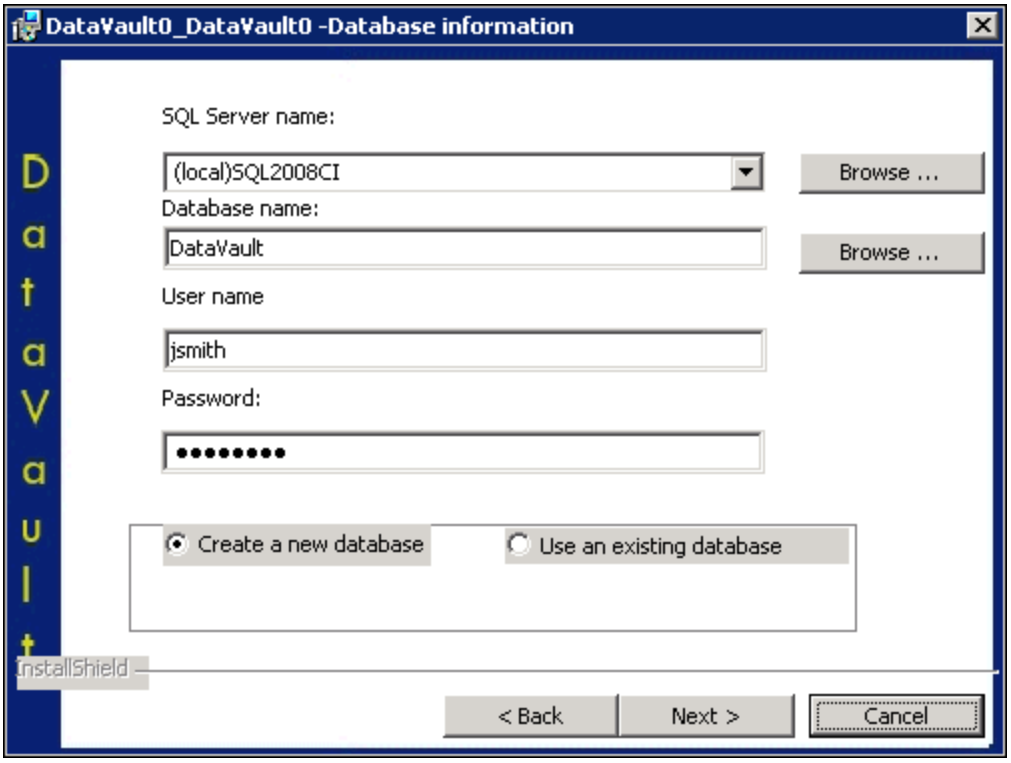
   Note: Each instance of DataVault is supported with a particular release of iMIS.

2. Run the Setup.exe to initiate the installation.
3. Follow the installation wizard.

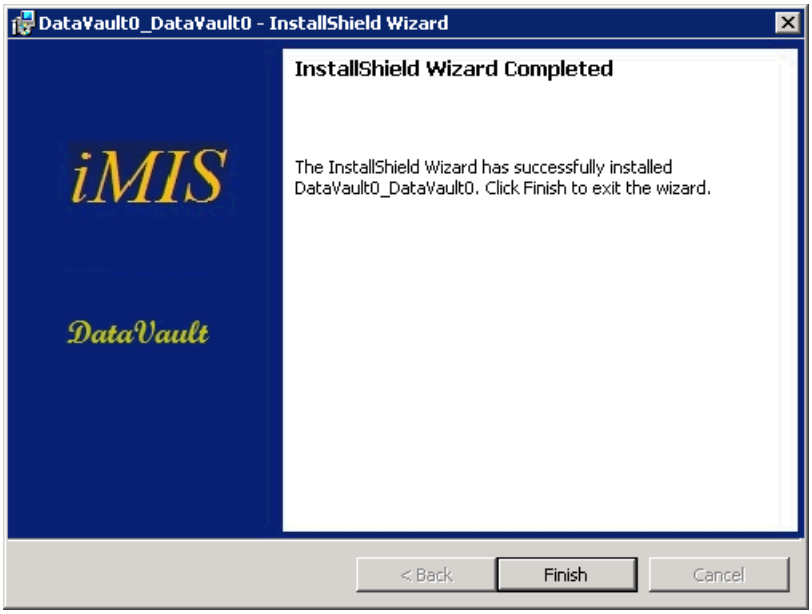


4. Select your default installation folder.

5. Provide your database information.



1. SQL Server name – To determine this information, open MS SQL Server and locate the server it is trying to connect to. Copy the server name into this field.
2. Database name – Choose a name for your DataVault database.
3. User name – Enter your SQL server login.
4. Password – Enter your SQL server password.
5. Select the Create a new database radio button.
6. Choose a location for your Appserver virtual Root.
7. Click Next, then click install.
8. Click Finish.



To test web service installation

1. Open IIS from your workstations administrative tools.
2. Locate your newly installed [Your Site Name] website.

   Note: This should be located under ~/sites/Default Web Site/[Your Site Name].
3. Right-click on [Your Site Name] and select Manage Application > Browse.

This takes you to the default [Your Site Name] webpage and provides a link to the web service.

4. Click on the link to Asi.Services.DataVaultService.DataVault.svc and you will see the DataVault web service home page.

   Important! Copy the DataVault Service address. You will use this information to connect the DataVault to iMIS.

5. Locate the new DataVault Database in MS SQL Server.

- By default, this will be located at ~/Databases/DataVault.

Configuring iMIS 20-300 for the DataVault

In order to connect the DataVault to iMIS, you must enter the service address in the iMIS web configuration. Since you have the AutoPay license, you will see the additional configuration options that are addressed below.

1. Locate the DataVault service address.

1. Open IIS.
2. Navigate to your [Your Site Name] site.
3. From the Manage Application pane, select Browse *:443 (https).
4. On the subsequent webpage, click in the .svc file.
5. Copy the .svc file address from your browser bar.

   For example, the address will look something like this:

   https://localhost/Data Vault0/Asi.Services.DataVaultService.DataVault.svc

   IMPORTANT! You will need to edit the .svc file address to replace localhost with the name of the server on which you have installed the DataVault.

   For example, if the machine where the DataVault is installed is named DVServer1, you would change the address to the following: https://DVServer1/DataVault0/Asi.Services.DataVaultService.DataVault.svc

2. From the Staff site, navigate to Settings > Commerce > General.
3. Locate AutoPay service address (DataVault.DataVaultServiceAddress) and paste in the link you copied in step 1, edited to reference the machine where the DataVault is installed.
4. Click Save.
5. Set up your Payment Gateway and Save:

   Go to Settings > Commerce > Automatic payment gateways and provide either your Payflow Account Settings or your iATS Account Settings.

- Please see the iMIS 20.1 helpsite for more information about configuring Automatic membership renewals and Recurring donations.

Reviewing DataVault Reports

DataVault has a series of reports available to self-hosted customers that provide information to help detect and troubleshoot issues with the DataVault.

- DataVault Status Summary
- Payment Gateways
- Payment Gateway Details
- Payment Accounts
- Payment Batches
- Payment Batch Details
- Audit Log
- Audit Log By iMIS Invoice Number
- Audit Log By iMIS Invoice Number - Type in Invoice Number
- Find Payment Methods - Date Range

PCI Compliance Recommendations

Please follow the following installation-related recommendations to ensure PCI-compliance.

Important! Review the iMIS PCI Implementation Guide for additional details about PCI-compliance.

- The DataVault database must not be installed on a server in the DMZ (Demilitarized Zone).
- If the DataVault's SQL server is on the same server as the IMIS SQL server, they need to be separate instances of SQL, so the SA password of the iMIS SQL instance cannot access the DataVault SQL instance.
- Access to DataVault database must not be through the SA ID. Access should be granted to a different User ID with System Administrator privileges.
- The User ID and password with System Administrator privileges in SQL must not be in plain text in the web.config file. For more information about encrypting this portion of the web.config file, see How to: Secure Connection Strings When Using Data Source Controls.

  Note: If you install a second instance of iMIS, you can set up the Multi-Instance Utility to encrypt the web.config file automatically.

iMIS Desktop

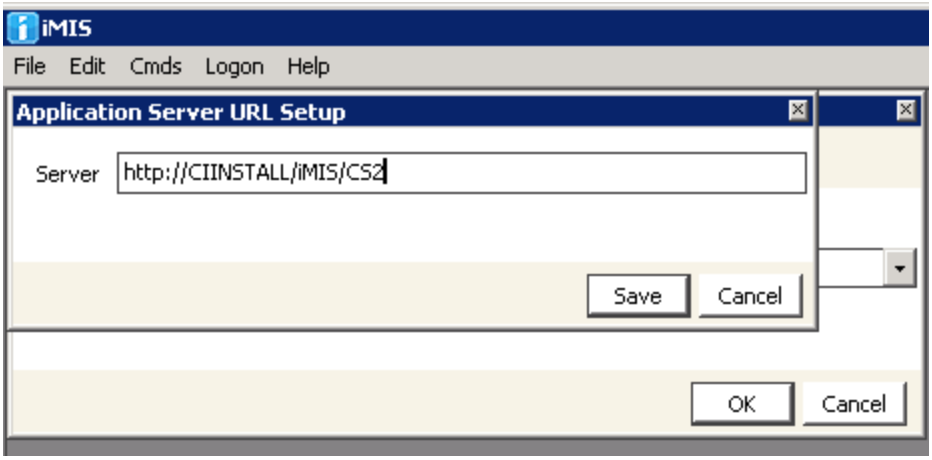
iMIS Desktop includes extensive configuration for numerous features: contact management, accounting, billing events, fundraising, and orders.

An alternative to iMIS Desktop is the iMIS Advanced Accounting Console, a streamlined, easy-to-use interface alternative for customer service and other staff functions.

> **Note:** For iMIS users upgrading from 15.2, Advanced Accounting Console includes numerous paths through which you can set up and administer your iMIS system – but you might need to continue using iMIS Desktop to access certain features.

To switch to Advanced Accounting Console from Desktop

1. From the Windows Start bar, open iMIS Desktop (ASI > iMIS > iMIS Desktop).
2. If an initial logon screen appears, click Cancel.
3. From the taskbar, select Logon > Set Host Location.
4. If you are unsure of the Advanced Accounting Console location, click Edit and from the Application Servers drop-down, make note of the location and click OK.
5. Click Insert.
6. Set the host location, changing CS (indicates Desktop) to CS2 (indicates Advanced Accounting Console). For example, http://server/iMIS/CS2.
7. Click Save.



8. Click Edit and make certain the new location is highlighted in Application Servers.
9. Click OK and exit out (x) of Local Preferences.
10. Select Logon > Logon to Host.
11. Log on with your administrative credentials.

> **Note:** Note: After you have completed steps 4-7, you will not need to set up the new host location again. You will simply follow steps 1-3, and select your desired location from the drop-down.

RiSE

Site Builder

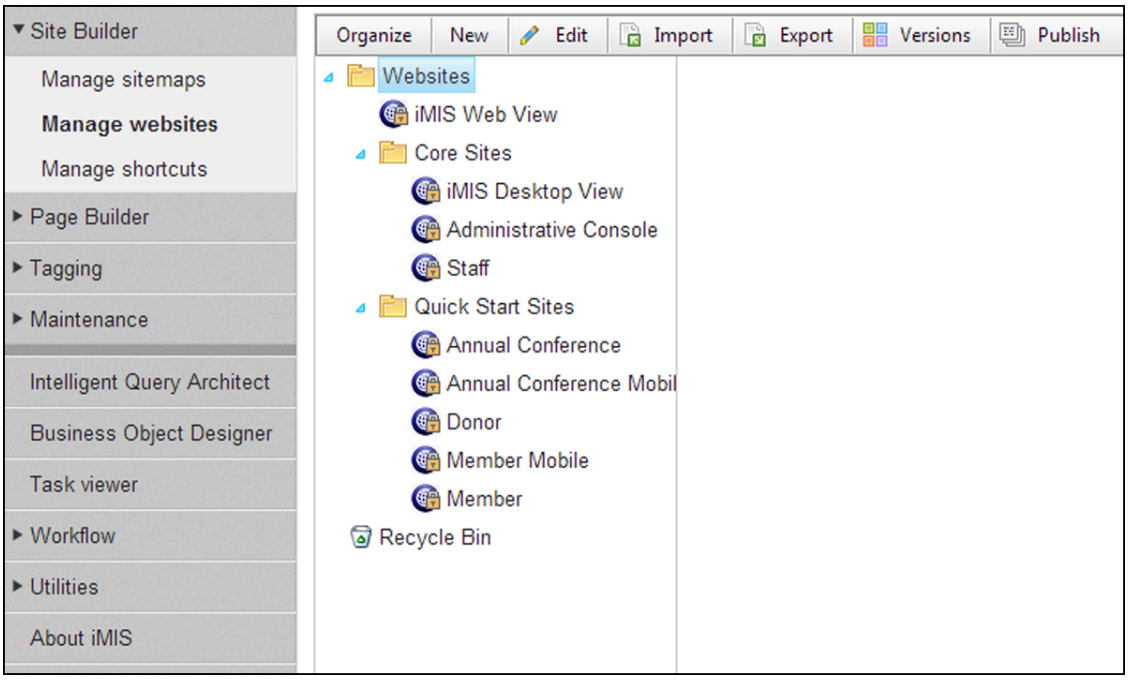
Site Builder allows you to manage sitemap navigation, websites, and URL shortcuts.

The sitemaps for Core Content and Quick Start Sites are managed by ASI and should not be modified on your system. These sitemaps currently permit editing but any changes will be overwritten by future upgrades.

The Manage websites utility organizes websites into folders that make clear their usage:

- Core Sites holds essential iMIS applications (such as Staff). Be prepared to recreate any customizations you introduce there.
- Quick Start Sites holds the growing set of sample websites (for example, Member, Member Mobile). Refer to Quick Start Sites for comparison, but make no changes.

You can copy a Quick Start Site and manage your organization's sites outside of these folders so that you can change, copy, and implement customizations, safe from overwriting by upgrades.



Note: Tip: The Access Settings security options are the same throughout iMIS (see Using Access Settings). For best performance, use Preconfigured security sets.

Defining sitemaps (navigation items)

Every iMIS content management website has a corresponding sitemap, in which you define a hierarchy of navigation items. Each navigation item defines the behavior of a single link to a web page of some sort, which can be:

The website's sitemap is automatically created when you define a new iMIS content management website, and is given the same name as the website. Currently, iMIS content management supports one sitemap per website. You cannot delete or change the name of a sitemap. Instead, you define sitemaps by adding and removing navigation items, rearranging navigation items in the sitemap hierarchy, and changing the definition of individual navigation items.

To define sitemaps

Go to RiSE > Site Builder > Manage sitemaps:

1. Select a sitemap you want to define in the drop-down list.
2. In the sitemap tree, select the navigation item beneath which you want to create the new navigation item.
3. Do one of the following:

- Click New > Website Navigation Item to create a new navigation item.
- Click Edit to modify an existing navigation item.
- Click Organize > Delete to delete a navigation item.

4. Define the navigation item’s Properties, Workflow Management, Options, and Access Settings.

To publish sitemaps

Do the following to publish this version of the navigation item and make it visible on its sitemap's associated iMIS content management website.

Go to RiSE > Site Builder > Manage sitemaps:

1. Select a navigation item.
2. Click Publish.

When you first create a navigation item, or when you make changes to an existing Published navigation item, the navigation item has a status of Working and that particular version of the navigation item is not yet visible on the associated iMIS content management website.

You reorganize the sitemap hierarchy by dragging and dropping navigation items into new positions. Do the following to reorganize navigation items within the sitemap hierarchy:

- Drop navigation item A onto navigation item B to make A subordinate to B (A becomes a child of B, and B is the parent of A).
- Drop navigation item A into the space below navigation item B (a dotted line appears below B) to make A follow B at the same level of the hierarchy (A becomes a sibling of B).

Troubleshooting

- You must have one or both of the following content authority group (CAG) permissions in at least one content authority group to which you belong:
- To create new navigation items, you must have Navigation Creator content authority group permissions.
- To modify the properties of a navigation item, you must have Navigation Editor content authority group permissions.
- To edit existing navigation items, you must have both Read and Edit Document System permissions on each navigation item. To delete existing navigation items, you must have Delete Document System permissions on each navigation item. The Document System permissions from the parent navigation item are copied into each newly created

navigation item, but can later be changed.

- If you click the rendered link from a navigation item in an iMIS content management website and you receive the following message:

  The requested content could not be loaded

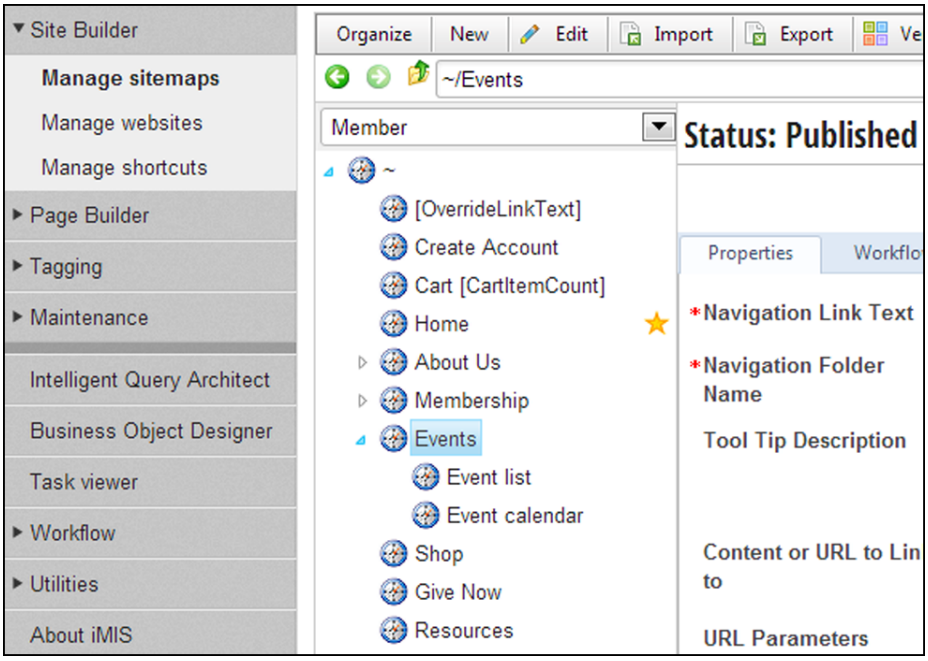
  This means that the navigation item's target content record has been deleted. To fix the navigation item, you must do one of the following:

- Point the navigation item at a different content record.
- Remove the navigation item from the sitemap.

> **Note:** Caution! The sitemaps for Core Sites and Quick Start Sites are protected for use by iMIS. The default Document System permissions for these sitemaps permit editing by SysAdmins only.

Modifying menus and task list items

Site Builder lets you quickly add, move, edit, and delete the items in your menus and task lists from your websites, without ever touching HTML or configuration files.



Site Builder manages the menus and task links for all of your websites

The structure of each website is a sitemap which you manage as a simple hierarchy of navigation items. Users see these as menus (tabs) and groups of task list items.

Editing task list items

As with most work you do in RiSE, your sitemap changes are versioned so that you can revert to a previous iteration, and you can export and import sitemaps between systems.

Go to RiSE > Site Builder > Manage sitemaps:

1. Select a site you want to reorganize in the drop-down list.
2. Drag and drop to change the order of menus and task items.

   Tip: Dropping an item on top of another item places the first item as a subordinate of the second item. To move an item up or down in a list, drop the item onto the dotted line that is temporarily displayed between items during the move.
3. At the bottom right, select Save. The Status section header reports Working.
4. Click Preview on the toolbar to check your changes. You can correct any issues before publishing.
5. Click Publish on the toolbar.
6. Click OK. A window is displayed that reports the publishing success.
7. Click Close.

Changing menus and task list items

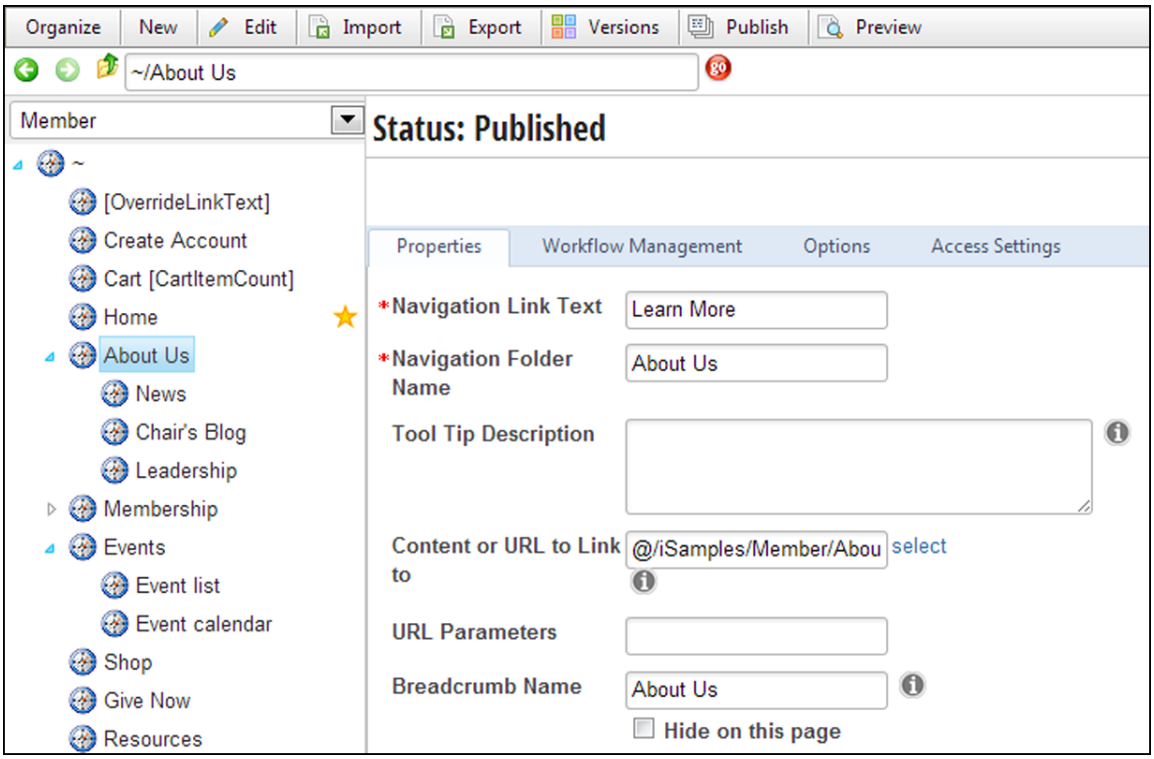
Do the following to change menus and task list items.

Go to RiSE > Site Builder > Manage sitemaps:

1. Select a site you want to modify in the drop-down list.

2. Select the navigation item you want to change.
3. In the editing window that is displayed, you can edit the navigation item and edit the Properties, Options, and Access Settings.

   For example, to rename About Us to Learn More on your site, select About Us and edit the Navigation Link Text property:



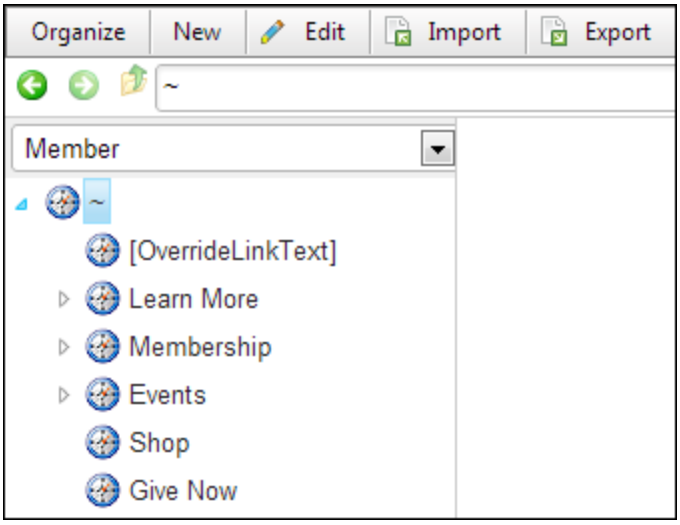
4. Click Save. The Status section header reports Working.
5. Click Preview on the toolbar to check your changes. You can correct any issues before publishing.
6. Click Publish on the toolbar.
7. Click OK. A window is displayed that reports the publishing success.
8. Click Close.

   Adding new menus and task list items

   Do the following to add new menus and task list items.

Go to RiSE > Site Builder > Manage sitemaps:

1. Select a site you want to modify in the drop-down list.
2. Select the navigation item (parent) that you want your new item (child) to appear below. To add a new Resources tab to your site, select the top node on the sitemap:



3. Click New > Website Navigation Item. Specify the new item's Properties, Options, and Access Settings.
4. Drag and drop to change the order of menus and task items, if necessary.

   Tip: Dropping an item on top of another item places the first item as a subordinate of the second item. To move an item up or down in a list, drop the item onto the dotted line that is temporarily displayed between items during the move.
5. Click Save. The Status section header reports Working.
6. Click Preview on the toolbar to check your changes. You can correct any issues before publishing.
7. Click Publish on the toolbar.
8. Click OK. A window is displayed that reports the publishing success.
9. Click Close.

10. The Status section header reports Published, and you can follow the URL link to see the changes on the live site.

Concept: sitemaps and navigation items

Every iMIS content management website has a corresponding sitemap, in which you define a hierarchy of navigation items. Each navigation item defines the behavior of a single link to a web page of some sort, which can be:

- A content record located anywhere in the Page Builder content folder hierarchy. At run time on the website, IIS provides the rendered .aspx version of the most recently Published version of that content record.
- An ASI-developed dynamic web page that is available for use on all iMIS content management websites. Some of these pages provide standard website functionality such as a dynamic Sitemap page, while others provide specific features from the Public view of iMIS.
- A manually coded .aspx or .html file located anywhere in the IIS Physical Path associated with the IIS application that is used for hosting iMIS content management websites.
- A page located on an external website completely outside of the iMIS content management environment.

You can nest navigation items inside of other navigation items, creating a hierarchical structure. The structure that you create for the sitemap hierarchy is very important for two reasons:

- This is what the system dynamically renders as the structure of a Sitemap page on iMIS content management websites.
- The position of a navigation item in the hierarchy (the root node is level 0 of the hierarchy) determines whether that navigation item is automatically displayed in the various navigation areas of website pages. This automated display can be suppressed on a per-navigation item basis, and you can force a navigation item to be displayed in specific navigation areas even if it would not normally be displayed there by the automated display handling specified in the definition of each navigation area.

The specific ASI-developed control used in the website's master page for the rendering of each navigation area also affects whether navigation items are rendered in the various navigation areas. For more information, refer to Defining navigation areas and bread-crumb areas.

The website's sitemap is automatically created when you define a new iMIS content management website, and is given the same name as the website. Currently, iMIS content management supports one sitemap per website. You cannot delete or change the name of a sitemap. Instead, you define sitemaps by adding and removing navigation items, rearranging navigation items in the sitemap hierarchy, and changing the definition of individual navigation items.

> **Note:** Note: In content records, you can also hard-code links to other content records or external content by using ContentReference and ContentLink, but unlike navigation items, these hard-coded links cannot be dynamically displayed or hidden by the system. Instead, they are static links that are always visible in rendered pages.

Configuration options: sitemaps (navigation items)

These fields control the properties of the navigation items within each sitemap defined in the system.

Go to RiSE > Site Builder > Manage sitemaps:

Select a sitemap from the drop-down list, and then do one of the following:

- Select New > Website Navigation Item.
- Click Edit.

> **Note:** Tip: The Access Settings security options are the same throughout iMIS (see Using Access Settings). For best performance, use Preconfigured security sets.

Tips

- Choose which sitemap to edit by using the drop-down list above the sitemap tree.
- | Red bars next to navigation items indicate a Working state (unpublished).
- Drag and drop navigation items in the sitemap tree to reorganize them:
- Child position: Drop navigation item A onto navigation item B to make A subordinate to B (A becomes a child of B, and B is the parent of A).
- Sibling position: Drop navigation item A into the space below navigation item B to make A follow B at the same level (A becomes a sibling of B). A dotted line appears below B.
- URL paths for navigation items map relative to the IIS website root to which this sitemap's website is mapped in the Properties section of the Manage websites window. Several websites can map to the same IIS website root, and some of the properties that you define in this window need to be unique across all sitemaps that ultimately map to the same IIS website root. Therefore, it helps to identify which other websites might share the same IIS website root when working with this window.

  > **Note:** Caution! The sitemaps for Core Sites and Quick Start Sites are protected for use by iMIS. The default Document System permissions for these sitemaps permit editing by SysAdmins only.

  This navigation item is a break

  Defines the navigation item as a special break item that:

- Is rendered as a simple horizontal line in the secondary navigation area of an iMIS content management website
- Disables all other definition fields for the navigation item
- Creates system-generated values for the Navigation Link Text and Navigation Folder Name

  When cleared, all definition fields for the navigation item are enabled.

  Status

Specifies whether this definition object is in a Working, PublishPending, Submitted, Published, Inactive, or Active state. Click the expand icon to view further details, including who created the record, who modified it last, and dates of these changes.

- Content records in a Working state have been saved within the iMIS database, but the latest changes have not been made active on the associated iMIS content management websites by the associated publishing servers and their corresponding publishing service. The Publish command on the toolbar queues the content record to the associated publishing servers, during which the content record is in a PublishPending state and can be viewed in the Pending Requests detail for the associated publishing servers. After each publishing server has successfully processed the publishing request, the latest changes become visible on the associated websites and become active within iMIS, both of which are denoted by the Published state.

  If an iMIS user does not have content authority group (CAG) Content Approver permissions, they will see a Submit command instead of a Publish command. The Submit command queues a publishing request to the Page Builder Task List of all content authority group members who have Content Approver permissions. Alternatively, if workflow is enabled for the parent content folder, only those members of the content folder's assigned content authority group who have Content Approver permissions. Only a person with Content Approver permissions in at least one content authority group can actually publish content records.

- For all other definition objects, the publishing process is less complex and does not involve content authority group permissions, publishing servers, or the iMIS publishing service. When the object is in a Working state, the latest changes have been saved within the iMIS database, but they have not yet been made active within iMIS. The Publish command makes the latest changes active within iMIS.

- Websites in an Inactive state are offline so that browsers cannot view the website content, and instead see a 503 error (Service Unavailable) from IIS. Selecting the Is this website active? checkbox in the Status section of the website's definition puts the website in an Active state, enabling browsers to view the website content. Clearing the checkbox puts the website in an Inactive state.

Configuration options: Properties tab (Manage sitemaps)

Navigation Link Text

Specifies the anchor text that will be used for the links representing this navigation item throughout the iMIS content management website. This value must be unique among all sibling navigation items in the sitemap tree.

Navigation Folder Name

Specifies the name of this navigation item within the sitemap tree. This value is automatically generated by the system to be a valid hierarchical part of a URL (the path of folder names in a long URL) when you enter the Navigation Link Text. For example, if there are spaces in the value that you specified in the Navigation Link Text field, they are automatically converted to underscore characters in this field.

If you manually change this value, you must use a value that web browsers will correctly parse as a valid hierarchical part of the URI scheme used in URL syntax. You must also ensure that this value is unique among all sibling navigation items in the sitemap tree.

Tool Tip Description

Specifies short help text that pops up when the user hovers over the link in the navigation. Leave it blank if you do not want to show a Tool tip.

Content or URL to Link to

Specifies the target of the navigation link. You can specify an absolute URL to any website, a relative URL to pages within the website associated with this sitemap, or you can click select to browse for a content record. For relative URLs, use a tilde character to represent the IIS website root where this sitemap's website is located. For example, ~/ThisWebsiteFolder/Default.aspx

Note: Note: If a navigation item is selected as the Home link for a website (Manage sitemaps, Options tab), be sure to enter Default.aspx as the Content or URL to Link to (Manage sitemaps, Properties tab). Default.aspx is the default page used when a link does not specify a page.

You can specify this value in the following ways:

- Click the select link and select any content record defined in the system.
- Specify a root-relative URL to a manually coded .aspx or .html file located anywhere below the root (~) of the physical path associated with the IIS application or IIS website that hosts your iMIS content management websites. For example, ~/handCodedPages/myPage.aspx.

  Note: Be sure to use web-style forward slashes (/) for the segment delimiters.
- Specify an absolute path to a manually coded .aspx or .html file located anywhere in the IIS folder hierarchy of the Default Web Site. This is useful for linking to files that are outside of the physical path of the IIS application or IIS website that hosts your iMIS content management websites. The root of the absolute path is the IIS Default Web Site, which must be represented by a single forward slash (/), and you must also use forward slashes to delimit the path segments. For example, the absolute path to an .aspx file located in a first-level virtual directory named SiteX would be /SiteX/externalPage.aspx.
- Specify an absolute URL to a page on an external website. For example, http://-docs.imis.com/.

  URL Parameters

  Specifies a string to append to this navigation item's URL. The string can be one or more parameters that will pass data to the parameter-collection web user control in the content type associated with a custom content item that is used in the content record to which this navigation item points. None of the standard iMIS content items use parameter-collection web user controls that accept this type of input in their associated content types. The specific control is defined in the URL to the control or page that is used to collect parameters for content items of this type field in the content item's corresponding content type.

  Each parameter must contain a name and a value. Separate multiple parameters with an ampersand. For example, name1=value1&name2=value2.

  Breadcrumb Name

Specifies the text displayed for the navigation item in a breadcrumb path, if breadcrumbs are enabled for the iMIS content management website. This text must be unique among all sibling navigation items in the sitemap tree.

Hide on this page

Prevents the Breadcrumb Name for this navigation item from being displayed in a breadcrumb path. When cleared, the Breadcrumb Name will be visible in breadcrumb paths.

Override Content Title

Specifies the text to use to override the title bar title. This title appears on the content page pointed to by this navigation item. Leave it blank to allow the content's assigned title to display.

Navigation Code

(for use by developers)

This field allows developers to hard-code links to this navigation item without worry about the text or location of the navigation changing later. It specifies a URL alias for the navigation item that will stay the same even if this navigation item is moved within the sitemap tree or if the Navigation Folder Name is later changed. Navigation codes allow you to identify navigation items without the need to refer to the full path or underlying GUID for that item. They can be used in a variety of ways, including:

- Creating links in IQA query results
- Creating links in search results for the Common Search
- Creating target links in ASPX web pages to redirect users to another page
- Creating links in the Big Button Panel

A navigation code must be unique among a given sitemap. If a navigation code is unique among all navigation items that share the same IIS website root, which is defined from Site Builder > Manage websites > Properties of a website, then it can be used in a URL without the website name (such as http://mydomain.com/StoreHome instead of http://mydomain.com/PublicSite/StoreHome).

Image URL

Enter an image URL or select an image to display next to the navigation item.

CSS Class

Specifies one or more CSS classes to apply to the navigation item. For example, class1 class2.

Folder containing template content

Defaults to Inherit from parent, which you can disable to specify a different folder, such as for content that is shared across areas or websites.

Configuration options: Workflow management tab

- Remove this navigation if it has not been published within n days – Specifies the expiration interval for this navigation item. When expired, the navigation item is no longer rendered on iMIS content management websites, but the navigation item remains in the system with a status of Expired. Manually republishing the navigation item makes it appear again on the iMIS content management websites and resets the expiration interval.

  The expiration interval can be overridden by specifying a value of 0.

- Notify this person 10 and 5 days before removing this navigation – Specifies the iMIS user that should receive email notifications before the navigation item expires. This field is enabled only when the preceding field has a non-zero value. The list comprises only those people who have Navigation Editor content authority group permissions in at least one content authority group.

Configuration options: Options tab

Specifies how the website links created by the navigation itemshould behave when rendered in a web browser.

Open the link in a new window

Link should be secure (HTTPS)

Makes the rendered version of a content record that is the target of this navigation item be displayed through a secured connection (SSL) to the web server, but only if both of the following two conditions are also met:

1. The website associated with this navigation item's sitemap has a valid https:// URL listed in the Secure URL(s) pointing to the IIS website root field in their definition.

   Important: Restart IIS whenever you change the Secure URL(s) pointing to the IIS website root setting. Note that localhost is not a valid Secure URL.

2. You have installed valid site certificates in IIS for each web server that hosts this website.

If the content record that is the target of this navigation item ends up being served by an iMIS content management website that does not meet the above criteria, the content record will be displayed through a non-secured connection (http://).

> **Note:** Note: If other navigation items point at the same content record, but those other navigation items do not have this checkbox selected, they will not display the content record through a secured connection. However, if the Content is secure (https://) checkbox is selected on the target content record itself, then it doesn't matter how this checkbox is set on any navigation items that point at the content record—the content record will always be displayed through a security connection regardless of which link is used to get to the content.

This navigation item is the Home link for the sitemap

This navigation item is active

Check this box to make this navigation functional on the website. Uncheck it to stop this navigation item from functioning on the website.

> **Note:** Important: Although active, the navigation item cannot appear on the site if it is hidden by the following option.

This navigation item is hidden

Hides the navigation item from the end user, per the automated display rules defined in each navigation area. This option does not apply to any navigation item selected to be displayed in the Auxiliary and Footer navigation areas. If you do not want a navigation item to appear in those areas, you must clear the Auxiliary and Footer checkboxes from the Show in the following navigation area options. For more information, see Fields: websites.

> **Note:** Note: The Primary Navigation ignores the sitemap order for any navigation item marked as This navigation item is hidden. To enable the sitemap order, uncheck this property.

This navigation item is expanded by default

This navigation item only displays for unauthenticated users

Hides the navigation item from authenticated users. This option is best used on public-facing iMIS-generated websites. For example, enable this option to display a Create Account link only to unauthenticated users.

Show in the following navigation areas:

Specifies in which navigation areas this navigation item is displayed. This applies to the top level of the navigation hierarchy only (the one that is always visible). The navigation item can still be used as a sub-navigation item whether this option is selected or not.

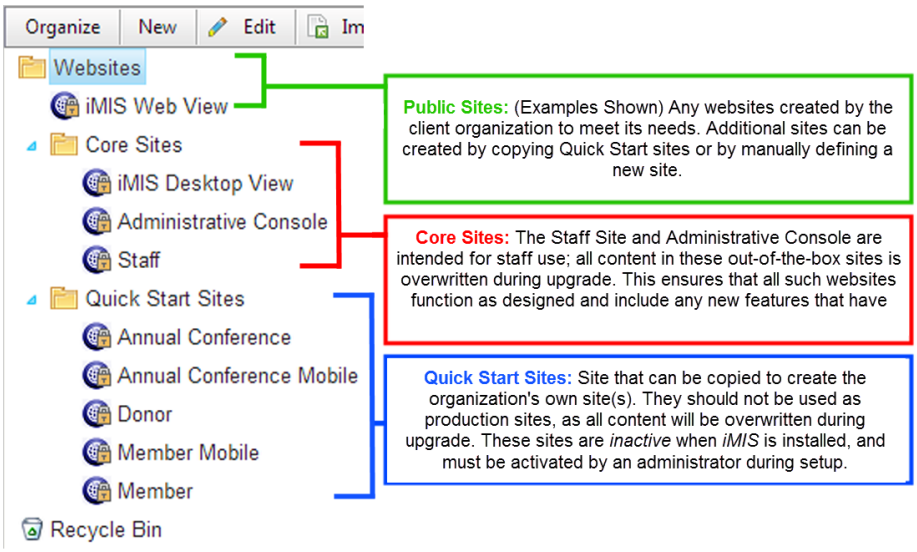
- This option is the only way that you can make a navigation item appear in the Auxiliary or Footer navigation areas. Note that if the link is flagged as a hidden navigation item, the link is still displayed in the Auxiliary and Footer navigation areas if selected here. If you do not want a navigation item to appear in those areas, you must clear the Auxiliary and Footer checkboxes.
- Remember that these navigation areas are defined in iMIS, but not all website master pages will necessarily include them.
- The Inherit from Parent checkbox shows this navigation item if the parent is also displayed.

Managing websites

Getting started: website management

Website management is the process of configuring and maintaining the appearance, navigation structure, and content authoring environment for your iMIS websites. Website management comprises the following activities:

- Defining the appearance and navigation structure of websites.
- Defining the infrastructure for the web content authoring environment.
- Performing website maintenance



The copy website functionality of *iMIS* will only copy site-specific content from a Quick Start Site. All navigation that points to shared core content will continue to point to the same shared core content in the copied website. Only when an *iMIS* client decides to modify any shared core content will they be required to save the modified content into the new Shared Content folder (or website-specific folder where appropriate).

Putting it all together

Website management comprises three general workflows:

- The process of defining the appearance and navigation structure of your iMIS content management websites entails the following actions, which should be performed in the order shown:

1. Defining website look and feel. Choose a specific mix of available master pages and themes.
2. Defining sitemaps (navigation items) to build the navigation structure of your website.
3. (optional) Defining shortcut URLs to enable the use of short, reader-friendly links to important pages of your website.

- The process of creating the infrastructure to support the people who perform web content authoring entails the following actions, which should be performed in the order shown:

1. Defining content authority groups (CAGs) to grant various content authoring permissions to the people who will perform web content authoring in your organization.
2. Defining content folders to organize the creation of content records.
3. (optional) Enabling workflow for content authoring for specific content folders to enable better coordination of web content authoring efforts among the people responsible for developing and maintaining the content records in those folders.
4. (optional) Defining content layouts to extend the basic set of content layouts provided with iMIS content management, thereby enabling new arrangements of the content items in a content record.
5. Defining tags and defining tagged list formats (see Defining tagged list formats) for use in content record properties and certain types of content items, to enable tag-filtered searches and the creation of dynamic content that changes automatically based on the tags assigned to content records in the system.
6. (optional) Defining iMIS content management user-defined fields (UDFs) to enable capturing additional properties of the content in content records, which can enable iMIS content management website visitors to perform more powerful website searches, and can provide additional filtering and sorting of the output of ContentTaggedList content items.
7. (optional) Importing content from a staging server if you choose to develop and test new content and navigation outside of your production environment.

- The process of website maintenance entails the following actions, performed as needed:
- Managing the priority of pending publication requests to speed up a publishing request that is behind many others in the publishing queue.
- Viewing CM reports to gain information about your websites and web content authoring efforts.

Website appearance and structure definition

Website appearance and structure definition is the process of defining the look and feel and the navigation of your iMIS content management websites.

Define website look and feel

The initial look and feel of an iMIS content management website is chosen when the administrator first defines iMIS content management websites. However, anyone with access to the Site Builder tool can subsequently change the look and feel of an existing website in various ways by using the Look and Feel section of the website's definition:

- You can selectively mix and match master pages and themes that are listed in their respective drop-down lists. This makes it easy, for example, to share a customized master page among several different websites.
- You can enable or disable the breadcrumb navigation on the site.

You can also use the Navigation Areas section of the website's definition to select the navigation areas that are used on the site, which can change the links that appear on the website according to the definition of each navigation area.

To customize master pages, see Integrating hand-built master pages and themes with CM.

To customize navigation areas, see Defining navigation areas and breadcrumb areas.

Configuration options: websites

These fields control the properties of websites that are defined in your system.

Go to RiSE > Site Builder > Manage websites:

Do one of the following:

- Select New > Website.
- Select an existing website.

Tips

- The Access Settings security options are the same throughout iMIS (see Using Access Settings). For best performance, use Preconfigured security sets.
- Some of the file locations described in this section are expressed as root-relative URLs based on the root (~) of the physical path for the IIS application or IIS website that hosts the iMIS content management website you are creating. For example, ~/App_Themes, which in a default installation of an iMIS application server would be C:\Program Files\ASI\iMIS\Net\App_Themes.

Status

Specifies whether this definition object is in a Working, PublishPending, Submitted, Published, Inactive, or Active state. Click the expand icon to view further details, including who created the record, who modified it last, and dates of these changes.

- Content records in a Working state have been saved within the iMIS database, but the latest changes have not been made active on the associated iMIS content management websites by the associated publishing servers and their corresponding publishing service. The Publish command on the toolbar queues the content record to the associated publishing servers, during which the content record is in a PublishPending state and can be viewed in the Pending Requests detail for the associated publishing servers. After each publishing server has successfully processed the publishing request, the latest changes become visible on the associated websites and become active within iMIS, both of which are denoted by the Published state.

  If an iMIS user does not have content authority group (CAG) Content Approver permissions, they will see a Submit command instead of a Publish command. The Submit command queues a publishing request to the Page Builder Task List of all content authority group members who have Content Approver permissions. Alternatively, if workflow is

enabled for the parent content folder, only those members of the content folder's assigned content authority group who have Content Approver permissions. Only a person with Content Approver permissions in at least one content authority group can actually publish content records.

- For all other definition objects, the publishing process is less complex and does not involve content authority group permissions, publishing servers, or the iMIS publishing service. When the object is in a Working state, the latest changes have been saved within the iMIS database, but they have not yet been made active within iMIS. The Publish command makes the latest changes active within iMIS.
- Websites in an Inactive state are offline so that browsers cannot view the website content, and instead see a 503 error (Service Unavailable) from IIS. Selecting the Is this website active? checkbox in the Status section of the website's definition puts the website in an Active state, enabling browsers to view the website content. Clearing the checkbox puts the website in an Inactive state.

Configuration options: Properties tab (Manage websites)

Name/Title of this Website

Specifies the name of this website within iMIS and iMIS content management windows and reports. This value also appears as the default browser window title when viewing the home page of the website, but you can override this default browser-facing website name in the root navigation item of the website's associated sitemap (by using the Override Content Title field).

URL Name of this Website

Specifies the unique site ID of this website as a hierarchical part of the complete URL to this website when the IIS application or IIS website used for iMIS content management is hosting more than one iMIS content management website.

This value is automatically generated when you enter the Name/Title of this Website to ensure that it will parse as a valid hierarchical part of a URL. For example, if there are

spaces in the value that you specified in the Name/Title of this Website field, they are automatically converted to underscore characters in this field.

If you manually change this value, you must use a value that web browsers will correctly parse as a valid hierarchical part of the URI scheme used in URL syntax. You must also ensure that this value is unique among all iMIS content management websites.

URL(s) pointing to the IIS website root

Specifies one or more URLs that resolve to IIS applications or IIS websites that host your iMIS content management websites. The staff or consultants who install iMIS content management on your organization's web servers should provide you with a list of URLs that correspond to each web server.

The URLs that you specify in this field determine exactly which servers will host this iMIS content management website. Use commas to delimit each URL after the first one.

For example, if you want this website to be hosted on three external web servers in different geographic locations, you would specify the three URLs that resolve to the IIS application or IIS website used for hosting iMIS content management websites on each of the three servers. This requires that iMIS content management has already been installed on each server.

Secure URL(s) pointing to the IIS website root

If you have installed security certificates in IIS on the servers that host this website, specify the secure versions of same URLs that you entered in the URL(s) pointing to the IIS website root. The number and order of this list must exactly match the URL(s) pointing to the IIS website root field.

Note: Note: In order to run your site using SSL, you must change your Secure URL to point to the IIS website root.

To Set up SSL in a RiSE website

After SSL is installed in IIS you must change the default site setup for each RiSE site you wish to enforce SSL on. To enable this:

Navigate to RiSE > Site builder > Manage websites

In the dropdown select the site you wish to require SSL for:

1. Edit.
2. Change the URL(s) pointing to the IIS website root to http://YourDomain.com or http://your external IP or http://YourMachineName.
3. Change the secure URL(s) pointing to the IIS website root to Change the URL(s) pointing to the IIS website root to https://YourDomain.com or https://your external IP or https://YourMachineName.
4. Save & Publish the entire website.

   Note: Above need to be done for each website you want to run under SSL. Using the default URL of localhost will not work by Microsoft's design.

   Note: For the Desktop and Advanced Accounting Console, an internal IP address must be used. The external IP address can be used for RiSE sites.

   The IIS website root (above) points to more than one CM website

   Appends the URL Name of this Website to each of the URLs defined in the URL(s) pointing to the IIS website root field. For example, if the URL(s) pointing to the IIS website root is http://www.example.com/, and the URL Name of this Website is xyz, then the full URL to this website would be http://www.example.com/xyz.

   When cleared, the URL(s) pointing to the IIS website root cannot be used for any other iMIS content management website except this one.

   Make this website the default

   Makes this iMIS content management website the website that is displayed when a browser requests only the URLs specified in URL(s) pointing to the IIS website root or Secure URL(s) pointing to the IIS website root without also appending the segment corresponding to the value specified in the URL Name of this Website. You cannot clear this box directly, because there must always be one such iMIS content management website that is specified as the default to display if a URL does not include the URL Name of the

website. To clear this box you must edit the definition of another website that shares the same website root URL and select this checkbox in the other website's definition.

> **Note:** Note: This checkbox does not need to be selected if the iMIS content management website is the only one being hosted by the IIS application or IIS website that is (indirectly) specified by the URL(s) pointing to the IIS website root field. However, if you later create a second iMIS content management website that will be hosted by the same IIS application or IIS website, the system will automatically select this checkbox for the original iMIS content management website.

Website-specific parent content folder

Specifies the site-specific folder that contains the content that is included when the website is copied. When a new website is created, the field is hidden until you save the website and then the path is auto-populated with the website name (@/website name). On existing websites, the field defaults to blank. If you choose to copy this website later, only the content within this site-specific folder will be copied.

Advanced

This section includes options for the integration of third-party APIs.

- Google Analytics script – If you are using Google Analytics to track website activity, paste the script provided by Google Analytics. For more information, refer to Tracking your site with Google Analytics.

Configuration options: Look and Feel tab

Folder containing template content

Specifies the relative Document System path beneath the root of the content folder hierarchy (@) to the folder that contains the content records that define the content areas of a template. Use the format @/etc/etc. You can use this field to reuse customizations you might have made to the content area files for another website that shares the same template design, which spares you maintaining multiple sets of the same customized content records.

MasterPage/Template to use for the site's layout

Specifies the ASP.NET master page to use for the layout of the entire website or special types of website pages as indicated by the field name. You can use this site's layout field to reuse a customized master page among several different websites, rather than maintain multiple versions of the same customized master page. The master pages shown in the list are the contents of the ~/Templates/MasterPages folder.

Theme (colors, fonts, etc.) to use for the site's "look and feel"

Specifies the ASP.NET theme to use for the visual look and feel of the website. You can use this field to reuse a customized theme among several different websites, rather than needing to maintain multiple sets of the same customized theme files. The themes shown in the list are the contents of the ~/App_Themes folder.

MasterPage/Template to use for "Print this page" type functionality

Specifies the layout to use to render print-friendly page views, such as called by the printer icon:

MasterPage/Template to use for Text Only requests

Specifies the layout to use to render text-only page views, such as called by the text icon:

MasterPage/Template to use for Pop-up windows

Specifies the layout to use to render pop-up windows, such as used by the Send this page icon:

Use breadcrumbs on this site

Enables breadcrumbs (the hierarchical path of links to the current content) that appear directly between the global navigation and the page contents.

Configuration options: Navigation Areas

This area lists all of the navigation areas that are defined for use in the iMIS content management environment. The Edit icon on the list ( ) enables you to add new navigation

areas to the system, delete existing navigation areas, or select existing navigation areas to change their properties.

The specific navigation areas that you select here determine which navigation areas are available for use by the navigation items that you define in the sitemap for this website. You must ensure that the master page used by this website contains elements that support all of the navigation areas that you select.

The master page of every template supports the four default navigation areas (Primary, Secondary, Auxiliary, and Footer). If you select any navigation area for use in this website besides these four defaults, you must ensure that the master page used by the website contains the elements needed to support that navigation area.

iMIS can support a maximum of 30 navigation areas, and each navigation area must have a unique Name.

> **Note:** Caution! Avoid deleting a navigation area, because doing so will remove it from the entire system, which affects all iMIS content management websites in the system. When you delete a navigation area, all navigation items that are currently defined to be displayed in that area will still appear in that navigation area in rendered website pages. The master page contains a framework for the navigation area, and published navigation items still contain the properties that make them be displayed in the deleted navigation area. The navigation area will not completely disappear from all of your rendered websites until you edit and save every navigation item in the system that currently uses it.

When defining a navigation area, the following properties are displayed. Not all of these properties are actually used by every navigation area. The specific properties that are used depend on which of the three ASI-developed controls are used in the website's master page to render the navigation area. For more information, refer to Defining navigation areas and breadcrumb areas.

- Navigation Pane Code – (read only) Specifies a unique identifier that must be used in the NavigationPaneCode attribute of various asi: and asiweb: controls used in master pages

to support navigation areas. When you add a new navigation area, this code is displayed as 0 until you click Save and then select the navigation area to view its properties. (For more information, refer to Defining navigation areas and breadcrumb areas.)

- Static Display Levels – Specifies how many levels of the sitemap hierarchy (which is zero-based) to display by default in this navigation area, based on the value of the Starting Level field. For example, if this value is set to 2 and Starting Level is set to 3, then the 3rd and 4th levels below the sitemap root are displayed in the navigation area.

  Only navigation items that are active and not hidden are displayed. Controlled respectively by the fields This navigation item is active and This navigation item is hidden, both located the Options section of the definition for a navigation item.

  If the range specified by this value comprises more than one level, the rendered list of navigation links is by default collapsed to the first level, requiring users to click one of the parent links in the range to expand that node to show the child links. This default behavior can be overridden on a per-navigation-item basis by selecting the This navigation item is expanded by default checkbox in the Options section of the navigation item's definition.

  Note: This value is ignored by the asi:PageNav and asi:PageNavR controls that (by default) render the Primary navigation area, and by the asiweb:NavigationList control that (by default) renders the Auxiliary and Footer navigation areas.

- Dynamic Display Levels – Specifies how many additional levels in the sitemap hierarchy to display when the lowest level of the range specified in Static Display Levels is expanded, either by user action or because the This navigation item is expanded by default checkbox is selected in the Options section of the definition for a navigation item.

  Only navigation items that are active and not hidden are displayed. Controlled respectively by the checkboxes This navigation item is active and This navigation item is hidden, which are both located in the Options section of the definition for a navigation item.

  Note: This value is ignored by the asi:PageSubNav control that (by default) renders the Secondary navigation area, and by the asiweb:NavigationList control that (by default) renders the Auxiliary and Footer navigation areas.

- Starting Level – Specifies the level of the sitemap hierarchy (which is zero-based) that constitutes the first (initial) level of the Static Display Levels field. The value 1 corresponds to the first level immediately beneath the sitemap root (~). For example, if this value is set to 3 and Static Display Levels is set to 2, then the 3rd and 4th levels below the sitemap root are displayed in the navigation area.

  Note: This value is currently ignored by the following ASI-developed controls for rendering content areas: asi:PageNav, asi:PageNavR, asi:PageSubNav, and asi-web:NavigationList. As a result, this field has no effect on navigation area behavior in the current release.

Defining shortcut URLs

iMIS supports the ability to define friendly URL shortcuts, so that an easy-to-remember URL redirects to a specific page. You can create these shortcuts for any of your websites and link the shortcuts to a URL or content record.

Do the following to create a new shortcut URL.

Go to RiSE > Site Builder > Manage shortcuts:

1. Click Add New.
2. Provide values for the shortcut URL:

1. Select the website you are creating a shortcut for in the For Websites drop-down list.
2. Select the shortcut you want to use in the Shortcut drop-down list, or enter a new Shortcut name. The Shortcut name should not be the same as the name of a website or a top-level folder in Page Builder.
3. Enter the URL or content record in the URL or Content Record field.
4. Enter a description of the shortcut in the Description field.

3. Click Save.
4. You can click the Shortcut to test the link.

For example, create an Events shortcut that points to the Conference List page. You can do this either by entering the URL to the page (~/Events/Conferences/ConferenceList.aspx) or by selecting the content record (@/Events/Conferences/ConferenceList). After inserting the shortcut, the link www.yourwebsite/Events automatically displays www.yourwebsite/Events/Conferences/ConferenceList.aspx.

By default, shortcuts apply to all of your websites. For example, if you define an Events shortcut for all sites, the shortcut always displays the same content record, regardless of which website the user is visiting, www.yourwebsite/events or www.otherwebsite/events. But you can also define shortcuts for a specific site. For example, you might want your mobile website to display a different content record for www.mobilesite/events. In that case, select your mobile site from the For Website dropdown list and point the Events shortcut to the content record you prefer.

Note: Note: System shortcuts used in the Quick Start Sites cannot be edited or deleted. Shortcuts included in the product for All Sites behave as defaults shortcuts. They cannot be deleted because they are used by content items, but they can be edited to point to different content.

Note: Note: Your shortcuts will not be overwritten during upgrade.

Configuration options: shortcut URLs

These fields control the properties of shortcut URLs that are defined in the system.

Go to RiSE > Site Builder > Manage shortcuts:

Do one of the following:

- Click Add New.
- Click Edit selected to an existing, selected shortcut.

For Websites

The All Sites option applies the shortcut to all websites in the system. Select a specific site to only apply the shortcut to a single website. If you enter an iMIS URL for the shortcut, it's important to ensure that all of your sites have the specified relative navigation item path in their respective sitemaps.

Shortcut

The name of the shortcut. Do not enter the name of an existing folder path for the website.

URL or Content Record

Enter a URL or select a content record to display when a user navigates to the shortcut. If you enter a URL, replace the site's root URL with ~, for example ~/Events/Conferences/ConferenceList.aspx.

Description

(optional) Enter a description for the shortcut.

URL rewriting in iMIS

When someone visits your website, iMIS uses a URL Rewriter to determine which page to display as they navigate your site. The Rewriter parses the URL and then looks for a matching definition for the following elements, which are resolved in the following order:

1. Virtual directory name.
2. Website URL:

1. Go to RiSE > Site Builder > Manage websites.
2. Select a website.
3. See the value for the URL Name of this Website field.

3. Links to a content folder that contains a content record with a Publish File Name of Default.
4. URL shortcuts for a particular website:

1. Go to RiSE > Site Builder > Manage shortcuts.
2. See the value for the Shortcut field.

5. URL shortcuts set up for All sites:

1. Go to RiSE > Site Builder > Manage shortcuts.
2. See the value for the Shortcut field.

6. Navigation path:

1. Go to RiSE > Site Builder > Manage sitemaps.
2. Select a navigation item.
3. (Properties tab) See the value for the Content or URL to Link to field.

7. Navigation codes:

1. Go to RiSE > Site Builder > Manage sitemaps.
2. Select a navigation item.
3. (Properties tab) See the value for the Navigation Code field.

   For example, consider the URL http://mysite.com/mbr/events. If you have a URL shortcut named events and a navigation code named events, the page associated with the URL shortcut is rendered, instead of the page associated with the navigation code.

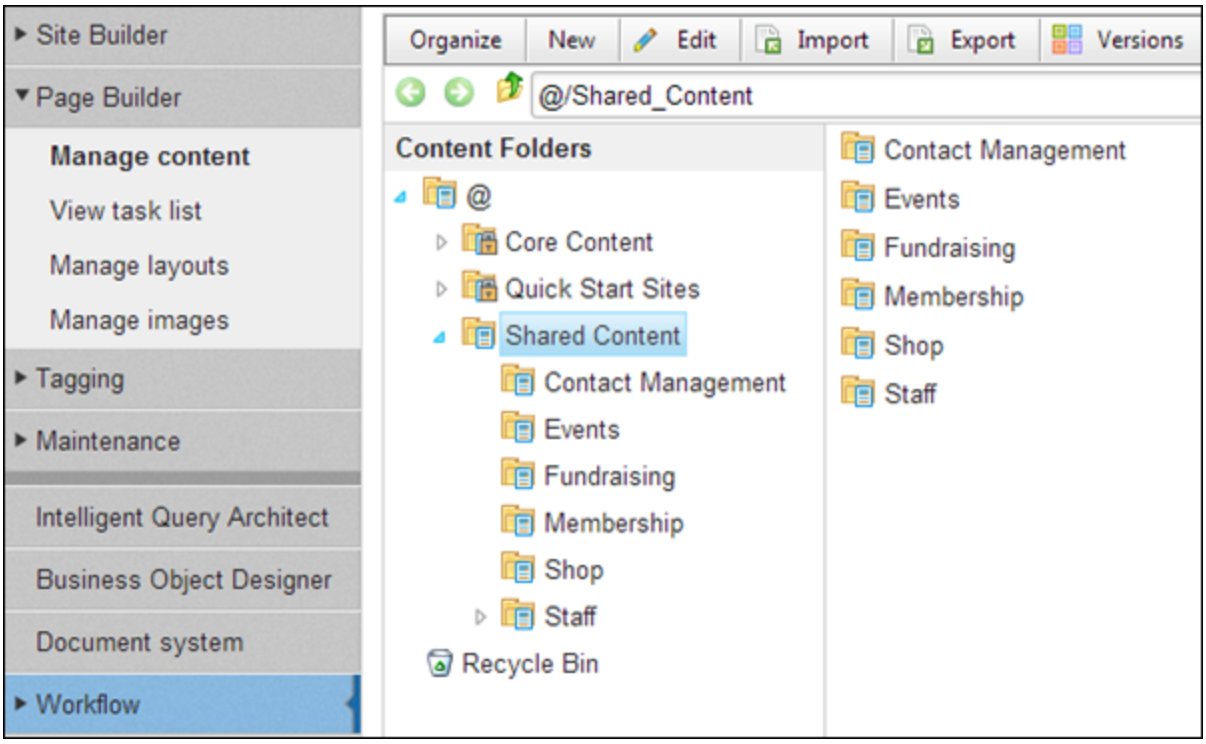
Page Builder

Content infrastructure definition is the process of defining the objects that secure, organize, and collect your content, and that assist with managing web content authoring activities.

All content records in the Core Content and Quick Start Sites content folders are protected as System content records and cannot be edited or deleted. If you want to update a System content record, create a copy of it, and then edit the copy. Be sure to also update any navigation items or shortcuts that point to that content record.

Content records are in folders that make clear their usage:

- Core Content holds essential iMIS content records. Be prepared to recreate any customizations you introduce there.
- Quick Start Sites holds sample content records. Refer to Quick Start Sites for comparison, but make no changes.



Content authoring

Web content authoring is the process of creating page-level content for your content management websites. Web content authoring comprises the following activities:

- Defining the content records that populate the content areas of your website pages, optionally using workflow and Easy Edit features to help with this task.
- Managing images that you use in your content.

Before you begin

You cannot perform web content authoring tasks until after the following tasks are performed:

- Defined content authority groups (CAGs) to control who can define/approve content records and upload images and other file types for use in content records
- Defined content folders in which to create your content records
- (optional) Assigned content authority groups to specific content folders to enable work-flow for the content records in that folder
- (optional) Defined tags and tagged list formats for use in your content records
- (optional) Defined iMIS content management user-defined fields (UDFs) for use in your content records

Putting it all together

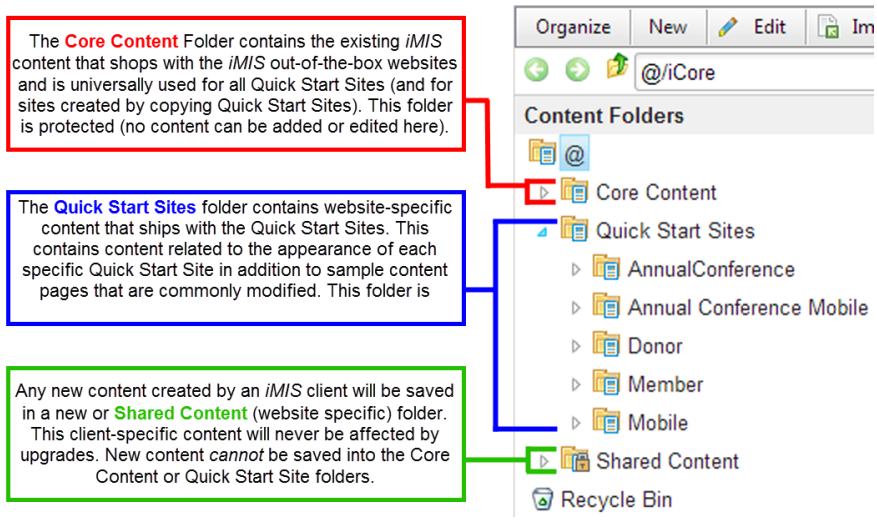
Web content authoring includes the following actions, performed as needed:

- Managing content records, each of which is the source of a content area on a rendered web page. You can define these on an ad hoc basis as needed, or by tracking your current and available authoring work in your Page Builder Task List:
- Revise pages for your website by adding one or more content items to a content record or configuring existing content items in the content record, or both. Save the changes and then publish the content record. In moments, the changes become live on all iMIS content management websites that use that content record. You might need to refresh the page in your browser to see the changes.
- If you're creating a brand new page, you must link the content record to a navigation item in the website's sitemap to add the published content record to the website. This is typically done by the person who manages the website.
- Many content items come with iMIS content management, and your iMIS implementers might have added custom content items as well. To learn about content items and what they do, see Content Item Essentials, RiSE Features, and Creating Dynamic Content Items.
- Managing images for use in content records.

- Approving content records for publication or deletion by authors who do not have Content Approver permissions.
- Browsing your website to review its content and using Easy Edit (see Revising website content with Easy Edit) to edit the underlying content records (or to log a change request for a content revision if you do not have Content Editor permissions for a given content record).

> **Note:** Note: Full users can perform all web content authoring tasks. Full, Casual, and Public users can define and revise content by using the Easy Edit feature of iMIS content management.

Managing content



Defining content records

Do the following to define content records.

Go to RiSE > Page Builder > Manage content:

Select the content folder in which you want to create the content record. Do one of the following:

- Select New > Website Content to create a new content record.
- Click Edit to modify an existing content record.

- Select Organize > Delete to delete an existing content record.

The following are the basic parts to creating a content record, which should be performed in the following order:

1. Enter a Title for the content record.

- If you would like to include the title of a dynamic content item with the title of your content record, select the Use dynamic page title checkbox.

Note: The content record supplies the name of your webpage unless a you choose to override with a navigation item title.

Note: If a content record contains several dynamic content items, it is recommended that you turn dynamic page titles off for the entire page in order to limit the title length.

2. Enter a Publish File Name for the content record.
3. (Definition tab) Select a layout in the Content Layout drop-down list.
4. Click add content to add one or more content items to each content item zone.
5. Select the content item you want to use. Click OK.
6. Configure each content item to define its individual content. To modify an existing content record:

1. Select the content record.
2. Click Edit.
3. Click Configure on the content item.
4. Configure the content item.

7. Provide the following for each content record:

- Definition
- Properties

- Current Tags
- Access Settings

8. If the parent content folder has been enabled for content authoring workflow, you can optionally change the default settings:

1. Select the parent folder.
2. Click Edit.
3. (Workflow Management tab) Modify the content record.

   You can also click and drag content items to rearrange them within a content item zone or between different content item zones. It's also possible to copy or move existing content items from one content record to another.

   > **Note:** Note: All content records in the Core Sites and Quick Start Stes content folders are protected as System content records and cannot be edited or deleted. If you want to update a System content record, create a copy of it, and then edit the copy. Be sure to also update any navigation items or shortcuts that point to that content record.

   Publishing content records

   When you first create a content record, or when you make changes to an existing Published content record, that particular version of the content record is not visible on any iMIS content management websites until it is published. You have two publishing options:

- Save and publish immediately: Before closing the content record, select Save and Publish to make your changes immediately visible on all websites that use the content record.
- Save, then publish later: If you Save the content record without publishing, the content record is marked with a status of Working. To publish the content record, select it and then click Publish in the Document System toolbar.

After publishing your content record, the status changes briefly to PublishPending, and then to Published once it has been fully rendered to an .aspx file on all web servers that host the relevant iMIS content management websites.

Copying or moving content items to another content record

Do the following to copy or move a content item to another content record.

Go to RiSE > Page Builder > Manage content:

1. Select the content record you want to move or copy.
2. Click Edit.
3. In the content item header, click Copy To or Move To. The Document Browser window is displayed.
4. Select the content record to which you want to move the content item.
5. Click OK.
6. Click Save or Save & Publish.

Copying or moving content records to another content folder

You can move content records into different content folders by dragging and dropping them into a different folder. Do the following to move content records into other content folders.

Go to RiSE > Page Builder > Manage content:

1. Select the content record you want to move.
2. Select Organize > Cut.
3. Select the content folder to which you want to move the content record.
4. Select Organize > Paste.

Do the following to copy content records into other content folders:

1. Select the content record you want to copy.
2. Select Organize > Copy.
3. Select the content folder to which you want to move the content record.
4. Select Organize > Paste.

   When you move or copy a content record into a new content folder, you must republish it to make sure that the content record is made visible on all websites associated with the new content folder, as well as removed from all websites that were associated with the old content folder.

   When you move or copy a content record that was originally in a workflow-enabled content folder (a content authority group is assigned to the content folder) into another workflow-enabled folder, the content record's assigned content owner remains unchanged if:

- The new folder's content authority group also lists the assigned content owner as a member.
- The assigned content owner has Content Editor content authority group permissions in the new content folder's content authority group.

  If either of these conditions is false, then the assigned Default Owner of the new content folder’s content authority group is assigned as the new content owner for this instance of the content record.

  The tags inherited from ancestors in the content folder hierarchy are recalculated based on the content record's new position in the hierarchy. Although the new inherited tags are visible immediately within the Page Builder tool, website searches for these tags will not find the content records until you republish them.

  Reverting to an earlier version of a content record

  Every time you publish a content record, the previously published version is saved as an Archived version. Do the following to revert to an older archived version.

  Go to RiSE > Page Builder > Manage content:

1. Select the content record.
2. Click Versions.
3. Select an archived version
4. Click Revert. A warning message is displayed.
5. Click OK.
6. Click Close.

   The archived version you select is turned into a new Working version at the top of the list, and all previous versions remain intact. When you close the window, the archived version is the version you'll now see in the content folder. As with any Working content record, you can publish the content record when you are ready to push it to your iMIS content management websites.

   Preventing content records from expiring

   Content records in a workflow-enabled content folder can be set to expire a certain number of days after they were last published. The content record's assigned content owner receives several email notifications, and corresponding entries in their Page Builder Task List:

- Before a content record is due to expire.
- When it expires.
- After it has expired, if the system has not automatically deleted the content record upon expiration. For more information, refer to Fields: setup – workflow.

   Do the following to set the content record expiration parameters.

   Go to RiSE > Page Builder > Manage Content:

1. Select the content folder in which you are setting expiration parameters on content records.
2. Click Edit.

3. Select the Workflow Management tab.
4. Select an Authority Group to assign a CAG to the content folder.
5. Click Save and Cancel.
6. Select the content record for which you are setting expiration parameters.
7. Click Edit.
8. Select the Workflow Management tab.
9. Select a content owner in the Owner of this content list.
10. Specify a time for the content to expire in the Content is considered expired [n] days after last published field, or specify a date for the content to expire in the Content set to expire field.
11. Select the Automatically remove expired content? option.

    If you receive notice of an upcoming expiration, you can do the following to prevent the content record from expiring.

    Go to RiSE > Page Builder > View task list:

1. Click the content record's title in Content that has expired or will soon expire.
2. Click Publish. This republishes the content record, which restarts the expiration clock.

    Manually deleting expired content records that were not auto-deleted

    When a content record expires and the Automatically delete expired content? checkbox is selected in the Workflow Management tab of the content record's definition, the system automatically does the following:

- Sets the content record's status to Recycled.
- Moves the content record to the Recycle Bin.
- Removes the corresponding rendered .aspx file from IIS on all web server hosts to which the content record has been published.

However, if the Automatically delete expired content? checkbox is not selected and a content record expires, nothing happens until the content owner selects the expiration notice in the Page Builder Task List and clicks Delete Selected. This does the following:

- Sets the content record's status to Recycled.
- Moves the content record to the Recycle Bin.
- Removes the corresponding .aspx file from all web servers.

Purging or restoring deleted content records

A content record that has expired and been deleted is moved to the Recycle Bin at the bottom of the content folder hierarchy.

Go to RiSE > Page Builder > Manage content:

Do the following to permanently purge specific content records:

1. Select Recycle Bin.
2. Press Ctrl and select the content you want to permanently purge.
3. Select Organize > Purge.

Do the following to permanently purge all items:

1. Select Recycle Bin.
2. Select Organize > Empty the Recycle Bin.

Do the following to restore a deleted content record:

1. Select Recycle Bin.
2. Select the deleted content record to restore.
3. Click Versions.
4. Select the first Recycled version, or the desired earlier version.
5. Click Revert. The content record is moved to its original content folder and its status

changes to Working. You must republish the content record to create a rendered version again on all associated iMIS content management websites.

> **Note:** Note: If the content record's original parent folder no longer exists or is in the Recycle Bin, the restored content record is placed in the root folder (@) of the tree. You must move it into an appropriate content folder before you can publish the content record.

Troubleshooting

- You can edit content records with the Easy Edit feature. Casual and Public users cannot perform the tasks described here because they cannot access iMIS content management. However, they can use the Easy Edit feature to revise existing content records.
- You must have some or all of the following content authority group (CAG) permissions in at least one content authority group to which you belong:
- To create or edit content records, you must have Content Editor content authority group permissions.
- To publish content records without requiring approval from another person, you must have Content Approver content authority group permissions. Without these permissions, you will see a Submit command (instead of a Publish command) in the Document System toolbar, which submits a publishing request to all Content Approvers defined in the system.
- To delete content records without requiring approval from another person, you must have Content Approver content authority group permissions, and you must have Delete Document System permissions for each content record. Without these permissions, you will see an Organize > Request Delete command in the Document System toolbar, but it will only submit a deletion request to all Content Approvers defined in the system. You must also have Content Approver content authority group permissions to use the Organize > Cut command, as this action effectively deletes the content record from its current content folder.

- You must have both Read and Edit Document System permissions on each content folder in which you create new content records. To edit existing content records, you must have both Read and Edit Document System permissions on each content record. To delete content folders, you must have Delete Document System permissions on each content folder. The Document System permissions from the parent content folder are copied into each newly created content record, but can be changed later.
- You must have Select Document System permissions on each content record to which you assign tags.
- With the help of those who perform website management, you must determine in which content folder to create the content record. Every content folder specifies important criteria that define how the system should manage content, and automatically applies these criteria to the content records created in that content folder. For example, the content folder specifies which iMIS content management websites the content records will be published to, and also specifies the content authority group that determines the default workflow for the content records, such as who is notified when a content record nears its expiration date.
- You should not create content records in the root content folder (the @ folder). It is unwise to specify system management criteria for content folders at the root level of the content folder hierarchy, as these criteria would be copied into all new content folders. By leaving the system default values intact in the root content folder, those who perform website management can design a more flexible authoring and publishing environment.
- Modifications to your master pages might be required if content items appear to overflow the boundaries of content item zones in the rendered pages. This requires modifying the template's master page and accompanying CSS files to make the Home page and interior page layouts larger than their default size.

> **Note:** Note: Membership in the SysAdmin security role effectively grants the full set of Document System permissions and the full set of content authority group permissions (you are effectively a member of a MasterAdmin content authority group

too). However, to participate in web content authoring workflow, a member of the SysAdmin role must be an explicitly-listed member of at least one content authority group.

Note: Note: The Core Content content folder and all of its descendant content folders and content records are protected for use by iMIS. The default Document System permissions for these content folders and content records permit editing only by members of the SysAdmin role.

Choosing Keywords and Description Text for a Content Record

External web-based search engines such as Google generally index the text that you specify in the Description/Summary field, and they generally ignore the keywords that you specify in the Keywords/Metatags field. The iMIS content management search engine, by contrast, looks in both of these fields for matches to the keywords specified in the search.

These two fields both generate <META> elements in the source code for a rendered content record, which are used by search engines to index pages and weight search results. The subject of <META> elements and search engines is extremely complex and has spawned its own industry of consultants, but the Search Engine Watch website includes tips for optimizing your <META> elements for search engines.

Planning for tag inheritance in AdvancedSearch and ContentTaggedList content items

When choosing the tags to include in the configuration of an AdvancedSearch or ContentTaggedList content item, you must account for the effect of implied relationships between parent and child tags in the tag hierarchy. A tag's position in the tag hierarchy creates an underlying relationship that is not specifically displayed in the Related Tags section: parent tags are implicitly related to their children tags with a more broadly defines relationship, and children tags are implicitly related to their parent tag with a further defines relationship. This means that:

- The pre-filtered result set of a basic or advanced search includes all published content records that are tagged with any descendant of the tag that is matched by the search

keywords.

- The pre-filtered result set of an advanced search includes all published content records that are tagged with any descendant of a tag that is specified in the configuration of the AdvancedSearch content item if the user selects that tag at runtime on the rendered page that contains the advanced search form.
- The pre-filtered result set of a rendered ContentTaggedList content item also includes published content records that are tagged with any descendent of a tag that is specified in the configuration of the ContentTaggedList.
- The content of the Items by Tag Report (in Continuum > Reports) does not list published content records that are tagged with any descendant of each tag in the report.

Tracking authoring work

Use the Page Builder Task List to keep track of the unpublished content records that you have been working on, and also to review content change requests that are available to be worked on.

Go to RiSE > Page Builder > View task list:

- The Content you are working on section lists the content records that are still in a Working status and for which you were the last person to make any changes to the content record's definition.
- The Content awaiting your approval section lists the content publishing requests for all people that have Content Approver CAG permissions in at least one CAG to which they belong.

- The Content deletion requests section lists the content deletion requests for all people that have Content Approver CAG permissions in at least one CAG to which they belong.
- If you are the assigned content owner for a content record that is defined to have an expiration date, expiration notices for that content record are listed in the Content that has expired or will soon expire section when that date approaches, when the date actually occurs, and at defined intervals after the date has passed.
- The Content change requests assigned to you section lists the content records for which a change request was submitted by someone using the Easy Edit feature of iMIS content management, and for which you are the assigned content owner.
- The Unassigned content change requests section lists the content records for which a change request was submitted by someone using the Easy Edit feature of iMIS content management, but for which there is no assigned content owner.

  You can perform the following actions in the Page Builder Task List:

- View the contents of a change request email message. Select the envelope icon next to the change request.

  Note: A closed envelope icon indicates that no one has looked at the contents of the change request email message. An open envelope icon indicates that somebody has looked at the contents of the change request email at least once, but this does not mean that anyone has worked on the request.

- Edit a content record's definition to incorporate the requested changes. Select the content record's title in the list.
- Mark content change requests as completed. Select the checkboxes next to the content change requests that you want to approve and click Mark as Complete. The publishing requests are removed from the Page Builder Task List of all users, but the associated content records are not submitted for publishing. If you had not already published the content records while editing their definition, you must remember to publish them.
- Ask the submitters of content change requests for more information. Select the checkboxes next to the content change requests that you want to reject, and click Respond to

Selected. A form is displayed that you can use to send an email message to the requesters with your questions or comments. No change is made to the content change requests, and they remain in the Page Builder Task List for all users.

Troubleshooting

- You must have Content Editor content authority group (CAG) permissions in at least one content authority group to which you belong.
- You must have both Read and Edit Document System permissions on each content record.

Tip: Where notification email addresses are defined

All actions related to rejection notice emails and change request notice emails use the email address listed in the Profile tab of each user's contact record (iMIS Desktop > Customers > Manage Customers). The source address used in the Profile tab is specified in Customers > Set up module > Address and Notes, in the E-mail Flow from/to E-mail at Address field.

Approving content

Approving content records for publication

When a person who does not have Content Approver content authority group permissions defines a content record, they cannot directly publish the content record, because the Publish command is not available on the Document System toolbar. Instead, they see only a Submit for Approval command. This creates an entry in the Content awaiting your approval section of the Page Builder Task List of all users who have Content Approver content authority group permissions in at least one content authority group to which they belong. The status of the content record changes to PublishRequested.

From your Page Builder Task List, you can perform the following actions:

- Review a content record's definition by clicking the content record's title in the list.
- Approve publishing requests:

1. Select the checkbox next to the request that you want to approve.
2. Click Approve Selected.

   The associated content records are submitted for publishing and the publishing requests are removed from the Page Builder Task List for all users. No publishing window is displayed.

- Reject publishing requests:

1. Select the checkbox next to the request that you want to reject.
2. Click Return Selected.

   A form appears that you can use to send an email message to the requester that explains the reason for rejecting the selected requests. After completing the form, the Status of the associated content records is set to Working, and the publishing requests are removed from the Page Builder Task List for all users.

   Approving content records for deletion

   When a person who does not have Content Approver content authority group permissions deletes a content record using the Document System Organize > Delete command, an entry is created in the Content deletion requests section of the Page Builder Task List for all users who have Content Approver content authority group permissions in at least one content authority group to which they belong. The status of the content record changes to DeleteRequested.

   From your Page Builder Task List, you can perform the following actions:

- Review a content record's definition by clicking its title in the list.
- Approve deletion requests:

1. Select the checkbox next to the requests that you want to approve.
2. Click Delete Selected.

This sets the associated content records' status to Recycled, moves the content records to the Recycle Bin, and removes the corresponding .aspx files from all web servers. The deletion requests are also removed from the Page Builder Task List for all users.

- Reject deletion requests:

1. Select the checkboxes next to the ones that you want to reject.
2. Click Respond to Selected.

   A form appears that you can use to send an email message to the requester that explains the reason for rejecting the selected requests. After completing the form, the deletion requests are removed from the Page Builder Task List for all users.

- Reject deletion requests without responding to the requestor:

1. Select the checkbox next to the request that you want to reject.
2. Click Remove from List.

   The deletion requests are removed from the Page Builder Task List for all users.

   Troubleshooting

- You must have Content Approver content authority group permissions in at least one content authority group to which you belong. You must also have Read Document System permissions on each content record.
- To delete content records, you must have Delete Document System permissions on each content record.

  Tip: Where notification email addresses are defined

  All actions related to rejection notice emails and change request notice emails use the email address listed in the Profile tab of each user's contact record (iMIS Desktop > Customers > Manage Customers). The source address used in the Profile tab is specified in Customers > Set up module > Address and Notes, in the E-mail Flow from/to E-mail at Address field.

Revising content in place

To revise an iMIS content management website page by using the Easy Edit feature, log on to the website and click the Easy Edit icon located by default near the Sign Out link on every web page of the website. This enables the Easy Edit mode until you click the Easy Edit icon again to disable it.

When Easy Edit mode is enabled, you will see a variety of different Easy Edit icons appear in different content areas of each web page. Exactly which Easy Edit icons you see will depend on which content authority group permissions and Document System permissions you have on the underlying content records in the rendered web page.

If you have both Content Editor content authority group permissions in at least one content authority group to which you belong and Edit Document System permissions on the specific content record displayed in a content area:

- If the content record is used in the Main Content Area of an interior page, you will see an Easy Edit icon for the entire content record and for each content item in the content record.
- If the content item is included in a System content record, you will see no Easy Edit icons for the content items in the content record, but you will see one Easy Edit icon for the entire content record.

The graphic used for each Easy Edit icon might look different, depending on what type of content items are used in the content record. For example, the Easy Edit icon for a Content HTML will look different from the Easy Edit icon for a ContentTaggedList content item. Moreover, the Easy Edit icon for the entire content record will look different from both of those.

If you are a member of at least one content authority group (regardless of your specific content authority group permissions) and you do not have Edit Document System permissions on the specific content record displayed in a content area, then if the content record is used in the Main Content Area of an interior page, you will see no Easy Edit icons for each content item in the content record, but you will see one Easy Edit icon for the entire content record.

In all cases where you can see at least one Easy Edit icon, you can hover your mouse pointer over an Easy Edit icon to see the name of its associated content item or content record.

The action that happens when you click on any of these Easy Edit icons depends on whether you have Edit Document System permissions to the underlying content records:

- If you have Edit permissions on the content record, you can edit the content item or content record directly:

1. Click the Easy Edit icon to open an editor that is similar to what you see in Page Builder.
2. Click Save and Publish, or click Save As if you have Edit permissions on the system content record.
3. Use your browser's Refresh button to display the changes that you have made to the web page.

- If you do not have Edit permissions on the content record, you cannot edit the associated content record. Instead, the system displays a form that you can use to enter a content change request, which is distributed as follows:
- If the content record is workflow-enabled (a content authority group is assigned to its parent content folder), an email message is sent to the content record's content owner, and a change request entry also appears in the content owner's Page Builder Task List as being assigned specifically to the content owner.
- If the content record is not workflow-enabled or simply has no assigned content owner, a change request entry appears in the Unassigned content change requests section of the Page Builder Task List for every user who has Content Editor permissions in at least one content authority group to which they belong. Even though these users do not receive an email from the system, they can view the contents of your email message by clicking the envelope icon next to the change request in their Page Builder Task List.

Using Easy Edit for a system content record

If you are modifying a system content record, your page will have a lone Easy Edit icon on the bottom of the page. Click this icon to open a modified edit page. Note the presence of a Save As button.

There are two scenarios where you will be asked to use the Save As Easy Edit approach: Shortcuts and Sitemaps.

Do the following to use Easy Edit to modify a system content record through Shortcuts (for example, an event detail, product detail, or account page):

1. Click the Easy Edit icon on your web page.
2. Make a change to your web page content.
3. Click Save As. You are prompted to save your content in the Shared Content folder.
4. Click OK.
5. Click Save & Publish.
6. Go to Manage > Web Content Management > Site Builder > Manage Shortcuts.
7. Find the shortcut that is currently pointing to the page you edited.
8. Note the values for For Website and Shortcut.
9. If the shortcut is for All Websites or your specific website, either edit the content record or create a site-specific content record using the following steps.
10. Click Add new.
11. In For Websites, select your website.
12. In Shortcut, enter the value noted in Step 8.
13. In URL or Content record, click select. Select the new content record.
14. Click Save.
15. Go back to the page you were editing. Note in the URL, the web page is accessing the Shared_Content record. You can edit as normal.

Do the following to use Easy Edit to modify a system content record that is reached through your website's sitemap (for example, clicking on a navigation link):

1. Click the Easy Edit icon on your web page.
2. Make a change to your web page content.
3. Click OK.
4. Click Save As. You are prompted to save your content in the Shared Content folder.
5. Click Save & Publish.
6. Go to Manage > Web Content Management > Site Builder > Manage Sitemaps.
7. Find the sitemap for your website.
8. Click the navigation for the page you've edited.
9. In Content or URL to Link to, click select.
10. Find your new content record.
11. Click Save.
12. Click Publish.
13. Click OK.
14. Go back to the page you were editing. Note in the URL, the web page is accessing the Shared Content record. You can edit as normal.

Troubleshooting

To edit a web page's underlying content records or content items by using the Easy Edit feature, you must have Content Editor content authority group permissions in at least one content authority group to which you belong, and you must also have Read and Edit Document System permissions for that content record. Without these permissions, you are instead presented with a form that submits a change request to the Page Builder Task List for all Content Editors defined in the system.

Tip: Why use Easy Edit?

Defining content records from within iMIS content management is a useful way to author new content, but it isn't always the most effective way to revise existing content. It can be more effective to actually browse or surf through your iMIS content management website and use the Easy Edit feature to quickly open a page's underlying content record (or even a specific content item within the content record) for editing. When you've saved your changes, you can continue browsing the website and making further content revisions as needed.

Tip: Where notification email addresses are defined

All actions related to rejection notice emails and change request notice emails use the email address listed in the Profile tab of each user's contact record (iMIS Desktop > Customers > Manage Customers). The source address used in the Profile tab is specified in Customers > Set up module > Address and Notes, in the E-mail Flow from/to E-mail at Address field.

Defining content folders

Do the following to define content folders.

Go to RiSE > Page Builder > Manage content:

1. Select the content folder in which you want to create the new content folder.
2. Select one of the following:

- Go to New > Website Content Folder to create a new content folder.
- Click Edit to modify an existing content folder.
- Go to Organize > Delete to delete a content folder.

3. Define the content folder’s Properties, Workflow Management, Current Tags, and Access Settings.

   In most cases, content folders are automatically published when you click Save. However, if you define an existing content folder that contains any content records with a status of Working, the content folder is not automatically published. You must

subsequently click Publish from the toolbar to create an active Published version. You can choose to publish the children content records at the same time, if desired.

Copying or moving content folders to another content folder

Go to RiSE > Page Builder > Manage content:

You can move content folders into different content folders by dragging and dropping them into a different folder. You can also move content folders by selecting them, then using the toolbar commands Organize > Cut and Organize > Paste.

When you move or copy a content folder into a new content folder, you must re-publish the moved content folder to make sure that the content records inside the folder that you moved are made visible on all iMIS content management websites associated with the new parent content folder. This also ensures the moved content folder is removed from all websites that were associated with the old parent content folder.

When you move or copy a content folder that is workflow-enabled, the content folder's assigned content authority group and content owner remains unchanged.

The tags inherited from ancestors in the content folder hierarchy are recalculated based on the content folder's new position in the hierarchy. Although the new inherited tags are visible immediately within the Page Builder tool, you must re-publish all descendants of the content folder to ensure that website searches for these tags will find the folder's descendant content records.

Reverting to an earlier version of a content folder

Every time you save or publish a content folder, the previous version is saved as an Archived version. Do the following to revert to an older archived version.

Go to RiSE > Page Builder > Manage content:

1. Select the content folder.
2. Click Versions.
3. Select an archived version and click Revert.

The version you selected is turned into a new Working version at the top of the list. When you close the window, this is the version you'll now see in the content folder hierarchy. As with any Working content folder, you can publish it when you are ready to make it an active Published version.

Restoring or purging deleted content folders

A content folder that has been deleted is moved to the Recycle Bin at the bottom of the content folder hierarchy.

Go to RiSE > Page Builder >Manage content:

To permanently purge specific content folders:

1. Select the content folders in the Recycle Bin. Press Ctrl as you select content folders to select more than one folder.
2. Go to Organize > Purge.

To permanently purge all items in the Recycle Bin:

1. Select the Recycle Bin.
2. Go to Organize > Empty the Recycle Bin.

To restore a deleted content folder:

1. Select the deleted content folder.
2. Click Versions.
3. In the version history that appears, select the desired Recycled version.
4. Click Revert and then OK. The content folder is moved to its original location in the content folder hierarchy and its status is changed to Working. You must re-publish the content folder to create an active Published version again.

Troubleshooting

- You must have one or both of the following content authority group permissions in at least one content authority group to which you belong:

- To create new content folders, you must have Folder Creator content authority group permissions.
- To modify the properties of a content folder, you must have Folder Editor content authority group permissions.
- You must have both Read and Edit Document System permissions on each content folder in which you create new content folders. To edit existing content folders, you must have both Read and Edit Document System permissions on each content folder. To delete existing content folders, you must have Delete Document System permissions on each content folder. The Document System permissions from the parent content folder are copied into each newly created content folder, but can later be modified.
- You must have Select Document System permissions on each content folder to which you assign tags.
- To be the content owner of a content folder, you must have Content Editor content authority group permissions in the content authority group that is assigned to the content folder.

> **Note:** Note: The iMIS content folder and all of its descendant content folders and content records are protected for use by iMIS. The default Document System permissions for these content folders and content records permit editing only by members of the SysAdmin role.

Concept: content folders

A content folder contains a set of content records and other content folders in a hierarchical tree. Each content folder specifies important criteria that define how the system should publish and manage the workflow of content records within the content folder.

Children content records and content folders inherit the tags from their parent content folder (and therefore also the tags from all ancestor content folders), but no other attributes are inherited. However, some attributes are initially copied from the parent folder at the time of creation.

- The specific Access Settings from the parent folder are copied to new content records and content folders at the time of creation, which you can subsequently change as needed.
- The Authority Group value from the parent folder is copied to new content folders at the time of creation, which you can subsequently change as needed.
- The Owner of this content value from the parent folder is copied to new content folders at the time of creation, which you can subsequently change as needed.
- The Content is considered expired n days after last published value is copied to new content records and content folders at the time of creation, which you can subsequently change as needed.

> **Note:** Note: For content folders that have a content authority group (CAG) assigned to them, the Owner of this content value is not copied to new content records that are created inside of it. Instead, content records automatically have this value set to specify the first person who created the content record, which you can subsequently change as needed.

> **Note:** Caution! A content record does not have a content owner automatically assigned if it was created by a person who is a member of the SysAdmin role, but who does not have Content Editor content authority group permissions in at least one content authority group.

Concept: content layouts and Content Item zones

A content layout is a predefined set of content item zones within a content record. Each content item zone can contain one or more content items, and you can drag and drop content items among the zones to rearrange the position in which content appears in a rendered content record.

Concept: content owners

A content owner is related to the content authority group (CAG) that is assigned to a content folder and its children content records. Content owners are specified in the Workflow Management section of the content folder or content record definition.

Only members of the content authority group assigned to a content folder who also have Content Editor permissions within that content authority group are available to be manually assigned as the content owner for the content folder or for content records within that content folder.

When you create a new content folder, it copies the currently designated content owner for the parent content folder. However, when you create a new content record, a different process is followed:

- If the person who created the content record is a person with Content Editor content authority group permissions in at least one content authority group, they are automatically assigned as the content owner for the content record. You can subsequently change this value to any person from the parent folder's content authority group who has Content Editor content authority group permissions.
- If the person who created the content folder does not have Content Editor content authority group permissions in any content authority group, for example, a person who is a member of the SysAdmin role, then no content owner is assigned.

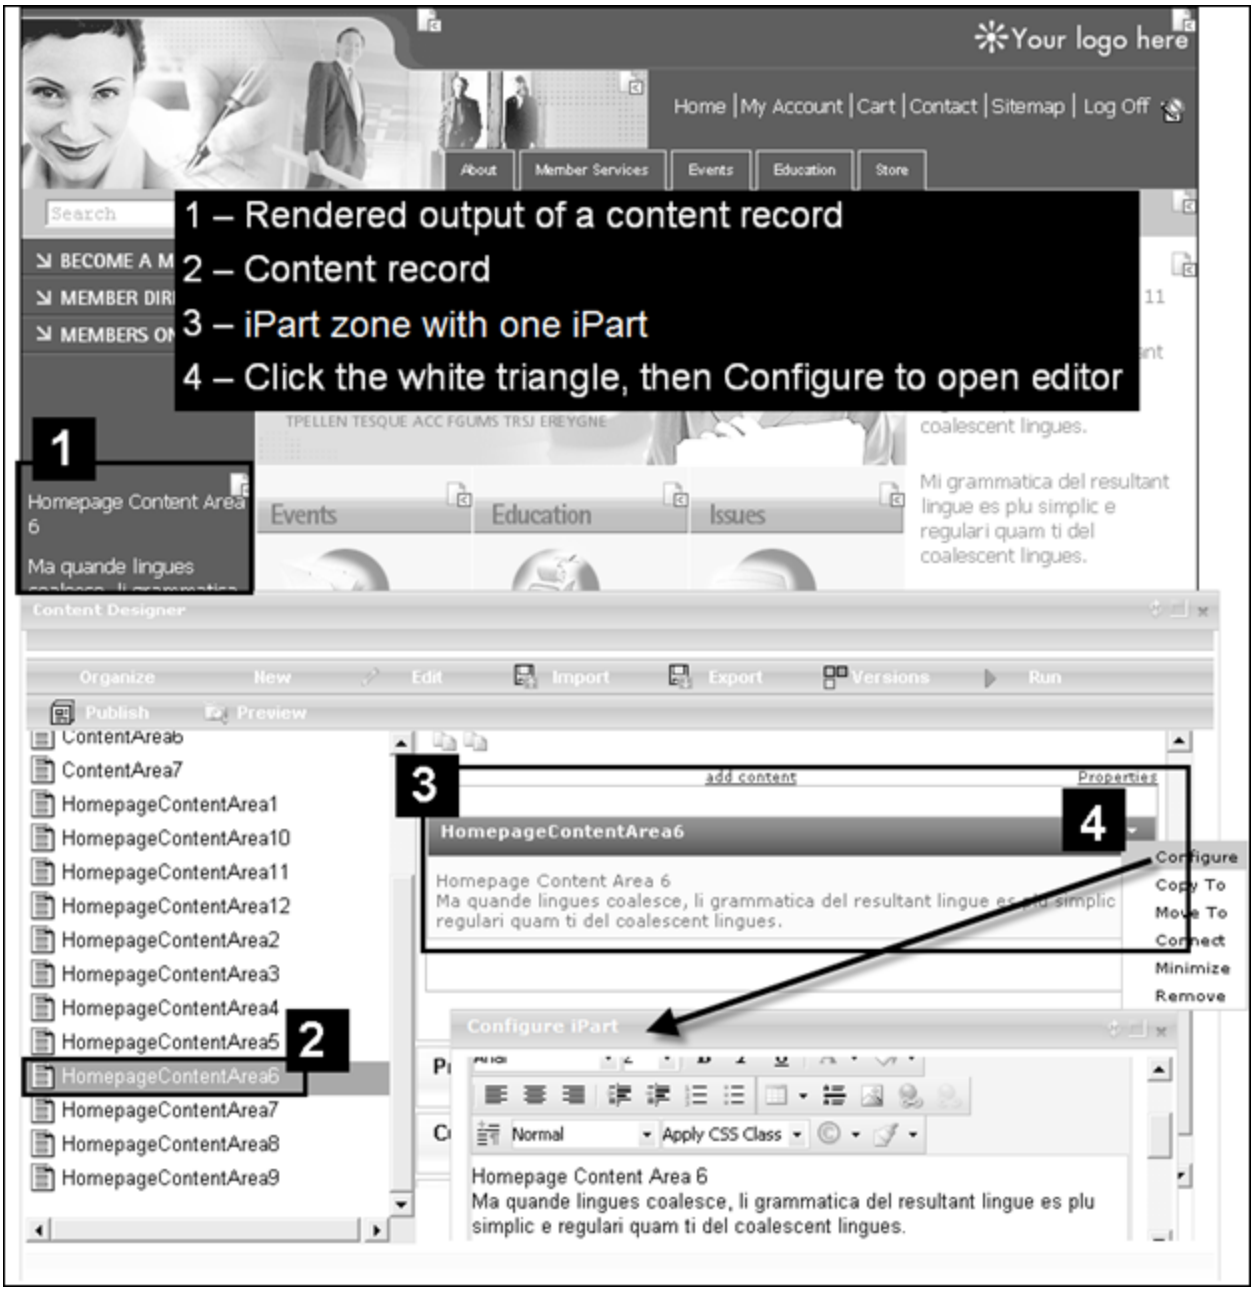
The Owner of this content field serves a different function for content records and content folders:

- For content records, the content owner:
- Receives email notification of pending expiration for the content record.
- Is assigned content change requests for the content record in the Content change requests assigned to you section of their iMIS content management Task List.
- For content folders, the content owner:

- Specifies which member of the assigned content authority group should replace the designated content owner of any child content records if the current owner assigned to a content record becomes ineligible for any reason.

Concept: content records, content items, and content types

A content record is an iMIS definition object, stored in the Document System, which specifies all the information needed to render a web page from an iMIS content management website. Instead of hand-coding the contents of a web page for your website, you define some basic properties and tags for the content record, choose a content layout, add various content items to the content item zones in the layout, and then define the properties for each content item. After the content record has been published to an .aspx file on the website, it is available for viewing by web browsers as a complete web page.



A content item is essentially a web widget in the ASP.NET environment. As with any web widget, you choose from different types of content items to insert in in the various content item zones in the content layout, then you configure each content item to populate that instance of it with the desired content. You can easily rearrange the rendered page contents by dragging a content item to a different location within the content item zones. A standard set of system-defined content items are available in iMIS, but staff or con-

sultants who are experienced in ASP.NET development can also easily add new content items for use when authoring content.

- The standard content items supplied with iMIS content management (listed in the Content Gallery) all have a corresponding content type, which tells iMIS how to create the corresponding content item within the system, how to edit it, how to display it, how to publish it, and so on.
- New complex content item that you add to your iMIS environment are also listed in the Content Gallery and must also have corresponding content types.
- A special ASI-supplied ContentWebUserControl content type is used as a generic default content type for all simple content items, or for ad-hoc web user controls that have been manually added to a content record.
- To see the Communities Content Gallery, you need a COMMUNITIES license.

Configuration options: content folders

These fields control the properties of content folders that are defined in the system.

Go to RiSE > Page Builder > Manage content:

Do one of the following:

- Select New > Website Content Folder.
- Select an existing content folder, and then click Edit.

> **Note:** Note: The Core content folder and all of its descendant content folders and content records are protected for use by iMIS. The default Document System permissions for these content folders and content records permit editing only by members of the SysAdmin role.

Status

Specifies whether this definition object is in a Working, PublishPending, Submitted, Published, Inactive, or Active state. Click the expand icon to view further details, including who created the record, who modified it last, and dates of these changes.

- Content records in a Working state have been saved within the iMIS database, but the latest changes have not been made active on the associated iMIS content management websites by the associated publishing servers and their corresponding publishing service. The Publish command on the toolbar queues the content record to the associated publishing servers, during which the content record is in a PublishPending state and can be viewed in the Pending Requests detail for the associated publishing servers. After each publishing server has successfully processed the publishing request, the latest changes become visible on the associated websites and become active within iMIS, both of which are denoted by the Published state.

  If an iMIS user does not have content authority group (CAG) Content Approver permissions, they will see a Submit command instead of a Publish command. The Submit command queues a publishing request to the Page Builder Task List of all content authority group members who have Content Approver permissions (or, if workflow is enabled for the parent content folder, only those members of the content folder's assigned content authority group who have Content Approver permissions). Only a person with Content Approver permissions in at least one content authority group can actually publish content records.

- For all other definition objects, the publishing process is less complex and does not involve content authority group permissions, publishing servers, or the iMIS publishing service. When the object is in a Working state, the latest changes have been saved within the iMIS database, but they have not yet been made active within iMIS. The Publish command makes the latest changes active within iMIS.

- Websites in an Inactive state are offline so that browsers cannot view the website content, and instead see a 503 error (Service Unavailable) from IIS. Selecting the Is this website active? checkbox in the Status section of the website's definition puts the website in an Active state, enabling browsers to view the website content. Clearing the checkbox puts the website in an Inactive state.

Folder Name

Specifies a version of the folder Title that meets the requirements for an IIS path segment to the rendered .aspx files for each content record in the folder. Every content folder created in iMIS content management has a corresponding IIS folder.

Default Website (for search)

Specifies the website for which searches will always include the content records within this content folder. This value is not inherited by any children content folders, although when you create a new content folder this field will copy the current value from its parent content folder as a default value.

> **Note:** Troubleshooting: If iMIS returns no search results, be sure to designate some content folders to list the specific website in either of these fields.

Include content in Searches for these additional Websites

Specifies additional websites, other than the one specified in Default Website (for search), for which searches will always include the content records within this content folder. These values are not inherited by any children content folders, although when you create a new content folder this field will copy the current values from its parent content folder as default values.

> **Note:** Caution! If you clear the Always display content in default website checkbox, be careful to specify only additional websites whose sitemaps include navigation items that link to all of the content records in this content folder.

> **Note:** Troubleshooting: If iMIS returns no search results, be sure to designate some content folders to list the specific website in either of these fields.

Always display content in default website

Displays the rendered version of a content record in this content folder in the context of the website specified in Default Website (for search) regardless of which website the

search was performed on. When cleared, displays the rendered content record in the context of the website in which the search was made.

Publish on Servers

Specifies the publishing servers that should manage the publishing of all content records within this content folder.

- In the simplest case where you have only one publishing server defined in your iMIS content management environment, you should set this value to All for the root content folder (@) and set this value to Inherit on all folders beneath the root.
- In more complex environments with multiple publishing servers, you should generally use the Custom option to select one or more specific publishing servers for a given content folder and then set this value to Inherit on all folders beneath the one for which you chose a custom selection of publishing servers.

Workflow Management

Specifies whether content workflow is enabled for this content folder, and by default, all of its children content records too:

- If an Authority Group is assigned to this folder, then content workflow is enabled, and only the members of that content authority group (CAG) receive workflow notifications in their Page Builder Task List when changes occur to content records in the content folder.
- If no Authority Group is assigned, then any member of any content authority group in the system receives workflow notifications in their task list when changes occur to content records in the content folder.

The following fields appear only when a content authority group is assigned to a content folder:

- Owner of this content – Specifies which member of the assigned content authority group should replace the designated content owner of any child content records or content folders if the current owner assigned to a content record becomes ineligible for any reason. The drop-down list includes only those members of the assigned content

authority group who have Content Editor permissions.

- Content is considered expired n days after last published – Specifies the default expiration interval for all content records in this folder. Expired content records are no longer rendered on iMIS content management websites, but the content record remains in the system with no change in status until it is manually deleted by selecting Organize > Delete on the Document System toolbar, or by using the Delete Selected button on a content authority group member's Page Builder Task List.

  Note: This default expiration behavior can be selectively overridden by the Automatically delete expired content? field in the definition of each content record.

  Manually republishing the content record makes it appear again on the iMIS content management websites and resets the expiration interval.

  The expiration interval can be effectively overridden for a specific content record in this folder by specifying a value smaller than the expiration interval for the Automatic Publishing Frequency field in the content record definition. This ensures that the expiration interval is never reached for that content record.

- Update this value for content in this folder and all subfolders – Automatically applies the setting for Content is considered expired n days after last published to the following when you save your changes to this content folder definition:

- all descendent content records

- descendant content folders with Workflow set up

  Current Tags

  Specifies the tags that are currently associated with this content folder. Clicking the Modify link displays a tag selection tree. Tags applied to a content folder are inherited by all descendant content records and content folders, not just the immediate children of this content folder. The Tags inherited from parent hierarchy area lists all tags that are being inherited from a content folder higher in the content folder hierarchy.

Only the inherited tags and the additional specific tags that you select here are used by the iMIS content management search engine. If you want search results to also find the descendant content records by descendant tags in the tag hierarchy, you must select the parent tag and also the specific descendant tags.

Although the iMIS content management search engine recognizes tag inheritance and finds descendant content records based on inherited tags, the Items by Tag report does not recognize tag inheritance and won't list the descendant content records and content folders for a tag that they inherit.

To choose useful tags for the dynamic handling of descendant content records, it helps to understand how tag-related functionality handles tag inheritance:

- The pre-filtered result set of a basic or advanced search includes all published content records that are tagged with any descendant of the tag that is matched by the search keywords.
- The pre-filtered result set of an advanced search includes all published content records that are tagged with any descendant of a tag that is specified in the configuration of the AdvancedSearch content item if the user selects that tag at runtime on the rendered page that contains the advanced search form.
- The pre-filtered result set of a rendered ContentTaggedList content item also includes published content records that are tagged with any descendent of a tag that is specified in the configuration of the ContentTaggedList.
- The content of the Items by Tag report (in Continuum > Content Reports) does not list published content records that are tagged with any descendant of each tag in the report.

Note: Note: Tags are always overwritten on import. For example, if you import a content folder from a staging server to a production server, the assigned tags on the production server are overwritten by whatever tags were assigned on the staging server.

Access Settings

Specifies the Document System permissions granted for this definition object to iMIS security roles, security groups, specific iMIS users, iMIS member types, or to all Full and Casual users based on their assigned authorization levels.

- Apply changes to all descendants – Changes to this section, when saved, flow automatically to all descendant definition objects. When cleared, changes to this section apply only to the current definition object. This checkbox usually appears only on Document System folder objects.
- Use a preconfigured security set – Specifies a preconfigured security configuration to use for this definition object, which can be much simpler than using the Make this available to option to specify the permissions for definition objects. The specific permissions in the preconfigured security configuration are displayed (read-only) in the Make this available to area.

  If you select a preconfigured security configuration and then switch to the Make this available to option, the permissions granted by the preconfigured security configuration are copied. This enables you to use a preconfigured security configuration as a starting point for defining custom permissions.
- Make this available to – Lists the roles, groups, users, member types, or authorization levels that have been enabled to define or view rendered output from this object. This option enables you to specify custom permissions for the definition object if none of the preconfigured security configurations meets your needs. The SysAdmin, Content Administrator, and Everyone roles are default system-defined security roles that are assigned to every definition object used by iMIS content management. The SysAdmin role is assigned in the definition of an iMIS user record, but the Content Administrator role is automatically assigned to every iMIS user who is a member of an iMIS content management content authority group (CAG) that is designated as a Master Admin content authority group.

  The permissions that can be assigned to each entry in the list are:

- Full Control – Enables all of the following permissions.
- Read – Enables users to see this object both in iMIS content management definition windows and as rendered output in iMIS content management websites, but they cannot change the object's definition.
- Add – Enables users to create new objects, or to paste or import an object into the Document System.
- Edit – Enables users to edit this object's definition, but not to delete the object.
- Delete – Enables users to delete this object.
- Select – (if displayed) Enables users to assign a tag to content folders and content records.

Configuration options: content records

These fields control the properties of content records that are defined in the system.

Go to RiSE > Page Builder > Manage content:

Do one of the following:

- Select New > Website Content.
- Select an existing content record, and then click Edit.

  You must be logged on to the website and have Content Editor permissions in at least one content authority group (CAG) in order to use the Easy Edit feature to modify a content record.

  The Save options available for a content record are:

- Save: A Working version of the content record is saved. Publish the content record to make it the active version.
- Save As: This option is available on System content records. You can rename and save the content record to a new (non-System) folder. The Save and Save & Publish options are hidden.

- Save & Publish: This option is available if you have the Content Approver content authority group permission. When you Save & Publish, your changes are immediately visible on any iMIS content management website that uses the content record.
- Save and Submit for Approval: This option is available if you do not have the Content Approver content authority group permission. When you Save and Submit for Approval, your changes are saved and a content publishing request is submitted to the content folder's Content Approver.

> **Note:** Note: Content records might also contain additional iMIS content management user-defined fields (UDFs). UDFs appear in the Properties section, beneath the Mark as important until field.

> **Note:** Note: The iMIS content folder and all of its descendant content folders and content records are protected for use by iMIS. The default Document System permissions for these content folders and content records permit editing only by members of the SysAdmin role.

> **Note:** Note: System content records cannot be edited or deleted. If you want to update a System content record, create a copy of it, and then edit the copy. Be sure to also update any navigation items or shortcuts that point to that content record.

> **Note:** Note: You cannot use Export and Import to make copies of objects within the same iMIS database. To make copies, use Organize > Copy and Organize > Paste.

Status

Specifies whether this definition object is in a Working, PublishPending, Submitted, Published, Inactive, or Active state. Click the expand icon to view further details, including who created the record, who modified it last, and dates of these changes.

- Content records in a Working state have been saved within the iMIS database, but the latest changes have not been made active on the associated iMIS content management websites by the associated publishing servers and their corresponding publishing service. The Publish command on the toolbar queues the content record to the associated publishing servers, during which the content record is in a PublishPending state and can be viewed in the Pending Requests detail for the associated publishing servers. After each publishing server has successfully processed the publishing request, the latest changes become visible on the associated websites and become active within iMIS, both of which are denoted by the Published state.

  If an iMIS user does not have content authority group (CAG) Content Approver permissions, they will see a Submit command instead of a Publish command. The Submit command queues a publishing request to the Page Builder Task List of all content authority group members who have Content Approver permissions (or, if workflow is enabled for the parent content folder, only those members of the content folder's assigned content authority group who have Content Approver permissions). Only a person with Content Approver permissions in at least one content authority group can actually publish content records.

- For all other definition objects, the publishing process is less complex and does not involve content authority group permissions, publishing servers, or the iMIS publishing service. When the object is in a Working state, the latest changes have been saved within the iMIS database, but they have not yet been made active within iMIS. The Publish command makes the latest changes active within iMIS.

- Websites in an Inactive state are offline so that browsers cannot view the website content, and instead see a 503 error (Service Unavailable) from IIS. Selecting the Is this website active? checkbox in the Status section of the website's definition puts the website in an Active state, enabling browsers to view the website content. Clearing the checkbox puts the website in an Inactive state.

  Title

Specifies what is rendered in the title of a browser window or browser tab when the rendered output of a content record is displayed. The words used in this field also factor into the relevancy weighting of search results. Go to Settings > RiSE > Search configuration.

Note: Note: This can be overridden by a navigation item title, if desired.

Use dynamic page title

When selected, enables any dynamic content item to append itself to the end of the page title as it is displayed in a browser window or tab. When a page uses multiple dynamic content items, it is recommended that you disable this feature.

Publish File Name

Specifies the name of the .aspx file to which this content record is published.

Generate full URL

Enables you to paste a full URL for this content record into the body of a content item (for example: http://10.40.10.105/iMIS/ContactManagement/ContactLayouts/Personal.aspx).

Generate Freelink

Enables you to paste a wiki-style internal link for this content record into the body of a content item (for example: [[About_Us]]). The freelink text is the defined Publish File Name of this content record. When the web page is rendered in a browser, the freelink is replaced by a standard URL link:

About_Us

(optional) You can add replacement text to the freelink using the following format: [[About_Us | Learn about our organization]], which would be rendered as:

Learn about our organization

If you have multiple content records with exactly the same Publish File Name (which is possible if the content records are in different content folders), you can assign a unique content code to each content record. The system will copy the content code instead of the name. Alternatively, you can manually add a content folder path to identify a specific content record (for example, [[@/Legal_Services/About_Us]]).

> **Note:** Caution! If you add a content folder path to a freelink, the freelink will not resolve correctly in rendered webpages if the target content record is moved to a different content folder. For this reason, it is generally best practice to ensure that all your content records are uniquely named and thereby avoid the need to add a content folder path to a freelink.

Content Layout

A content layout is a predefined set of content item zones within a content record. Each content item zone can contain one or more content items, and you can drag and drop content items among the zones to rearrange the position in which content appears in a rendered content record.

add content

Displays a Content

Content Gallery browser that lets you select from available ASP.NET content items to add to this content item zone of the content record by selecting the desired content items and clicking OK. After the content items have been added to the zone, you can drag each content item into the order you want them to appear in that zone of the rendered web page.

The Content folder contains the system-defined content items that ship with iMIS, and are meant for general-purpose content authoring. For example, the Content Html content item enables you to author a block of HTML text, and the Content Tagged List content item enables you to specify the automatic inclusion of other content records or even entire content folders that have a certain tag associated with them.

The Or, enter a path to a web user control field allows implementers to specify a path to a user control that is not defined within the Content Gallery. See Defining custom content items as content types.

To see the Communities Content Gallery, you need a COMMUNITIES license.

To work with content items that have been added to a content record, click from the following commands on the content item's title bar:

- Configure – Displays a window that enables you to define the properties of the content item. For example, performing this action for a Content Html content item displays an HTML editor. When configuring a content item, click the link for Configuration Help.
- Copy To – Copies the content item to another content record.
- Move To – Moves the content item to another content record.
- Connect – Displays a connection editor that enables staff or consultants to define content item connections. Connections allow one content item to interact with another content item on the same content record. Not all content items support connections, so when configuring a content item, open the Configuration Help to determine the content item's connection options.

  When creating a new connection, the available connection types are listed, and a drop-down list enables you to select from the other content items on the same content record. For example, to configure content item A to act upon content item B, create a connection, and set content item A to be the Object Consumer. Set content item B to be the Object Provider. Each content item can only have one Consumer and one Provider per connection type. So a content item can only act as an Object Provider for one other content item, for example, not as an Object Provider for several other content items.

  The connection editor lists all current connection points for the content item and allows you to define new connections. Each content item (consumer and provider) displays the connection once it is defined. For example, if you select content item A and connect it to content item B, and then look at the connections for B, you will see the connection there as well. Connections can also be disconnected from here.

Currently, connections can be of four types: Object, Atom Object, Uniform Key, or String Key. The type of connection to use depends on the implementation by the content item's author. Please refer to the specific content item's Configuration Help for details.

- Minimize – Collapses the content item 's preview box, instead displaying only the content item's title bar.
- Restore – Expands a collapsed content item to display its preview box.
- Remove – Removes the content item from the content record.

> **Note:** Note: The content types defined in the system determine the behavior of ASP.NET content items controls within iMIS. Each content items control must have an associated content type, which tells iMIS how to create the corresponding content item within the system, how to edit it, how to display it, how to publish it, and so on. The system-defined content items in the Content Gallery all have a corresponding content type. A special ContentWebUserControl content type is used as the default content type for all custom content items that you add to a content record. You can optionally define entirely new content types to enable more sophisticated system handling of a custom content item that has been added to a content record.

Properties (the link at upper right of each content item zone)

Specifies the displayed title and CSS classes associated with this content item zone of the content record.

- Title – Specifies a title for the zone, which is displayed in the rendered output at the top of the zone, preceding the content items in that zone.
- Title CSS Class – Specifies a CSS class attribute for the element that comprises the rendered zone title. This class must be available in the stylesheets associated with the theme used for the associated website.
- Zone CSS Class – Specifies a CSS class attribute for the <table> element that comprises

the rendered zone. This class must be available in the stylesheets associated with the theme used for the associated website.

Display within the template

Renders the content record within the content area of the website's master page. When cleared, renders the content record as a standalone web page that contains none of the navigation areas or graphic look-and-feel of the website's master page.

Content is restricted to members

Makes the rendered version of this content record non-readable unless:

- The person attempting to view the rendered content on the website is logged on to the website with a valid iMIS logon.
- The contact record that corresponds with the iMIS logon is a member type (customer type) that is defined as Is a member in Customers > Set up module > Customer types.

When cleared, the rendered version of this content record is readable by any user regardless of their member type.

Open in new browser window

Makes the rendered version of this content record open in a new browser window.

Content requires user to log in

Makes the rendered version of this content record non-readable unless the person attempting to view the rendered content on the website is logged on to the website with a valid iMIS logon. When cleared, the rendered version of this content record is readable by anonymous website visitors.

Content is secure (https://)

Makes the rendered version of this content record be displayed through a secured connection (SSL) to the web server regardless of which navigation itemsends the user to this content record, but only if both of the following two conditions are also met:

1. The websites whose sitemap navigation items point to this content record have valid https:// URLs listed in the Secure URL(s) pointing to the IIS website root field in their definition.

   Important: Restart IIS whenever you change the Secure URL(s) pointing to the IIS website root setting. Note that localhost is not a valid Secure URL.

2. You have installed valid site certificates in IIS for each web server that hosts these websites.

   Because a content record cannot know in which websites it will ultimately be used, there is no validation possible for this checkbox. If this content record ends up being served by a website that does not meet the above criteria, the content record will be displayed through a non-secured connection (http://).

   Content allows user impersonation

   This option is currently unused. Instead, use On Behalf Of.

   > **Note:** Note: In content item -based websites, enabling user impersonation is no longer required. Instead, you can use On Behalf Of, so that staff can complete transactions on behalf of your customers.

   > **Note:** Note: This option only applies to legacy sites such as Admin.master, public.master, 1501.master through 1600.master, or any custom master pages that contain pHIdImpersonation control.

   If you are not using On Behalf Of, enable this option to make the rendered version of this content record available to logged-on iMIS users who are currently changing information on behalf of another user.

   Go to Contacts > Contact management and click the Change link at the upper right of every window in this area of the product.) When cleared, the rendered version of this content record is non-readable by iMIS users who are currently changing information on behalf of another user.

For example, assume that content record X is defined such that you do not have the required Document System permissions to view its rendered web page, but user "John Doe" does have the permissions to view the rendered page. If you log on as yourself and use the above technique to impersonate user "John Doe", you will be able to navigate to the rendered page and view its contents if this checkbox is selected.

Description/Summary

Specifies a description of the content record that is oriented to the people who perform web content authoring, and which is also included in the <META> element's description attribute in the rendered page's source code for this content record. This text is not displayed in the rendered web page itself or in search results summaries, but the words used in the <META> element enable searches performed through the iMIS content management search engine,and also many external web-based search engines such as Google, to locate this content record even if the words are not actually used anywhere in the visible rendered content.

The words used in this field also factor into the relevancy weighting of search results. Go to Set up content management > Search configuration, and review the SE.SearchDescriptionHint field.

Keywords/Metatags

Specifies the keywords that should be included in the <META> element's keywords attribute in the rendered page's source code for this content record. These keywords enable searches performed through the iMIS content management search engine to locate this content record even though these keywords are not actually used anywhere in the visible rendered content.

Note: Note: External web-based search engines such as Google do not typically index the contents of this <META> element.

The keywords used in this field also factor into the relevancy weighting of search results. Go to Set up content management > Search configuration, and review the the SE.SearchKeywordHint field.

Date of Publication

Specifies the publication date for this content record, for the purpose of filtering search results or for filtering and sorting of the output from ContentTaggedList content items. For example, you could override the default (actual) date that this content record was published if you wanted searches based on a different date to find the rendered version of this content record.

> **Note:** Note: If you manually change the publication date, the date will not change with future publishing of the content when you select Publish All. If the publication date is blanked out, the date will reset to the current date when the content is published.

Publish on Future Date

Specifies a delayed and automated publication date for this content record, enabling you to embargo the content by completing the content record now but ensuring that its rendered version does not become available on any websites until later.

Automatic Publishing Frequency

Specifies how frequently to automatically republish this content record. This field can be used to prevent a content record from ever being automatically expired if a non-zero value has been specified in the Content is considered expired n days after last published field for the content folder that contains the content record. You do this by specifying a value here that is smaller than the value in the Content is considered expired… field.

Mark as important until

Specifies the date after which the New icon for an entry in the rendered version of a ContentTaggedList content item will stop being displayed.

> **Note:** Note: This field affects only content records that contain a ContentTaggedList content item, and only if the CM.UseImportantUntilDate con-

figuration option is enabled. Go to Set up content management > Page Builder configuration.

Content code

Specifies a unique identifier for this particular content record that can be used to ensure that a navigation item will always point to this content record even if the content record's location in the Document System hierarchy changes at some future date. Normally if this happens (by moving the content record to a different content folder), the Content or URL to Link to field in a navigation item must be manually changed to point to the new relative path of the content record within the Document System hierarchy.

However, if you specify this ContentCode value in the Content or URL to Link to field in a navigation item, then even if this content record is moved to another content folder or renamed, the navigation item will still point to this content record.

Cache duration

(enabled by default) You have the option to cache webpages on your server to improve website performance. This option only caches pages for unauthenticated users. A version of the page is cached for each major browser version that accesses the page (for example Firefox 14, IE9, and so forth). Pages can be cached for five seconds (Short), five minutes (Medium), one hour (Long) or Default. The Default system duration is set in Page builder configuration or Quick setup (Settings > RiSE).

When you enable this option, the first request for the content record generates and stores a cached version of the webpage on the server for the specified duration. Within that period of time, if another unauthenticated user visits the page using the same web browser type and version, then the page is loaded from the cache, instead of accessing the database again.

Consider what type of content the page displays when you choose the cache duration. For example, if the content record contains a Content Tagged List, and new data is tagged regularly, then you would likely only want to cache the page for a short or medium

period of time. However, if the data is more static, like an article, then caching for a long period of time may make more sense.

The Cache duration is ignored if the content record contains any content items that require dynamic data, because dynamic data cannot be accessed from the cache. This applies to the Payment Creator content item, Contact Account Creator content item, Contact Sign In content item, Cart Details Display content item, Submit Order Button Link content item, and any Content HTML content items that contain script tags (such as C# code or JavaScript).

Page caching can be disabled site-wide when the following value is set to false within the website's web.config file:

<add key="Content.EnablePageCaching" value="true"/>

Content Parameters

(displayed only in content records that contain a custom content item)

Specifies the parameters for a custom content item that has been added to this content record. The exact parameters cannot be described here because they are defined in the custom content item and its associated content type. Contact the staff or consultants who created the custom content item for information about what you should enter in this field.

This content is part of the site's Template design

Enables this content record to populate a named content area of a template design. When cleared, the rendered version of this content record can only be viewed if it is pointed to by a navigation item.

The available content areas that you can specify in the associated Show in content area field are the first part of the .aspx file names listed in the Content Areas folder of the iMIS content management website folders created in IIS. For example, if you want this content record to be the content displayed for the HomePageContentArea6.aspx page in a website created with the master page template, you would specify HomePageContentArea6 in this field.

Workflow Management

(displayed only when a content authority group is assigned to the parent content folder, which means that content workflow is enabled for this content record)

- Owner of this content – Specifies which person should receive email notification when this content record approaches its expiration date, and should be assigned a content change request in their Page Builder Task List when a Easy Edit user requests a change to this content record. If the person who creates a content record has Content Editor content authority group permissions in at least one content authority group, that person is automatically assigned as the content owner. You can subsequently change this value. The drop-down list includes only those members of the assigned content authority group who have Content Editor permissions.
- Content is considered expired n days after last published – Specifies the expiration interval for this content record. When expired, the content record is no longer rendered on iMIS content management websites, but the content record remains in the system with no change in status until it is manually deleted by using the Organize > Delete command on the Document System toolbar or by using the Delete Selected button on a content authority group member's Page Builder Task List. Manually republishing the content record makes it appear again on the iMIS content management websites and resets the expiration interval.

  The expiration interval can be effectively overridden by specifying a value smaller than the expiration interval for the Automatic Publishing Frequency field. This ensures that the expiration interval is never reached for that content record.
- Content set to expire – Specifies an exact expiration date for this content record. You can specify a value for this field only if the value specified for the Content is considered expired n days after last published field is 0. Otherwise, this field is read-only.
- Automatically delete expired content? – Overrides the default expiration behavior described above by automatically deleting the content record when it has passed its expiration date. The content record is moved into the Recycle Bin at the bottom of the content folder hierarchy and its status is changed to Recycled.

  Current Tags

Specifies the tags that are currently associated with this content record. The Tags inherited from parent hierarchy area lists all tags that are being inherited from a content folder higher in the content folder hierarchy. Clicking the Modify link opens a window that enables you to select the tags for this content record.

Only the inherited tags and the specific tags that you select here are used by the iMIS content management search engine. If you want search results to also find this content record by descendant tags in the tag hierarchy, you must select the parent tag and also the specific descendant tags.

Although the iMIS content management search engine recognizes tag inheritance and finds descendant content records based on inherited tags, the Items by Tag report does not recognize tag inheritance and won't list the descendant content records and content folders for a tag that they inherit.

To choose useful tags for the dynamic handling of a content record, it helps to understand how tag-related functionality handles tag inheritance.

- The pre-filtered result set of a basic or advanced search includes all published content records that are tagged with any descendant of the tag that is matched by the search keywords.
- The pre-filtered result set of an advanced search includes all published content records that are tagged with any descendant of a tag that is specified in the configuration of the AdvancedSearch content item if the user selects that tag at runtime on the rendered page that contains the advanced search form.
- The pre-filtered result set of a rendered ContentTaggedList content item also includes published content records that are tagged with any descendent of a tag that is specified in the configuration of the ContentTaggedList.
- The content of the Items by Tag report (in Content Management > Reports) does not list published content records that are tagged with any descendant of each tag in the report.

> **Note:** Note: Tags are always overwritten on import. For example, if you import a content record from a staging server to a production server, the assigned tags on the production server are overwritten by whatever tags were assigned on the staging server.

Access Settings

Specifies the Document System permissions granted for this definition object to iMIS security roles, security groups, specific iMIS users, iMIS member types, or to all Full and Casual users based on their assigned authorization levels.

- Apply changes to all descendants – Changes to this section, when saved, flow automatically to all descendant definition objects. When cleared, changes to this section apply only to the current definition object. This checkbox usually appears only on Document System folder objects.
- Use a preconfigured security set – Specifies a preconfigured security configuration to use for this definition object, which can be much simpler than using the Make this available to option to specify the permissions for definition objects. The specific permissions in the preconfigured security configuration are displayed (read-only) in the Make this available to area.

  If you select a preconfigured security configuration and then switch to the Make this available to option, the permissions granted by the preconfigured security configuration are copied. This enables you to use a preconfigured security configuration as a starting point for defining custom permissions.
- Make this available to – Lists the roles, groups, users, member types, or authorization levels that have been enabled to define or view rendered output from this object. This option enables you to specify custom permissions for the definition object if none of the preconfigured security configurations meets your needs. The SysAdmin, Content Administrator, and Everyone roles are default system-defined security roles that are assigned to every definition object used by iMIS content management. The SysAdmin role is assigned in the definition of an iMIS user record, but the Content Administrator role is

automatically assigned to every iMIS user who is a member of an iMIS content management content authority group (CAG) that is designated as a Master Admin content authority group.

The permissions that can be assigned to each entry in the list are:

- Full Control – Enables all of the following permissions.
- Read – Enables users to see this object both in iMIS content management definition windows and as rendered output in iMIS content management websites, but they cannot change the object's definition.
- Add – Enables users to create new objects, or to paste or import an object into the Document System.
- Edit – Enables users to edit this object's definition, but not to delete the object.
- Delete – Enables users to delete this object.
- Select – (iMIS content management only) Enables users to assign a tag to content folders and content records.

Configuration options: content gallery

These fields control the properties of the standard iMIS content items that are defined in the system. By default, these fields are found in the following locations:

- In a content record, click add content, click a gallery folder, and select one of the listed content items to the content record. For an existing content item, click the down triangle at the far right of the content item's title bar, and then choose Configure.
- When using the Easy Edit, click the Easy Edit icon that relates to various content items in the content records used in the content areas of the page. You must be logged on to the website and have Content Editor permissions in at least one content authority group (CAG).
- To see the Communities Content Gallery, you need a COMMUNITIES license.

When you configure a content item directly from STE, the available Save options are:

- Save: A Working version of the content record is saved. Publish the content record to make it the active version.
- Save and Publish: This option is available if you have the Content Approver content authority group permission. When you Save and Publish, your changes are immediately visible on any iMIS content management website that uses the content record.
- Save and Submit for Approval: This option is available if you do not have the Content Approver content authority group permission. When you Save and Submit for Approval, your changes are saved and a content publishing request is submitted to the content folder's Content Approver.

  When you configure a content item from a content record, you only have the option to Save or Cancel. You can publish your changes from the content record or the Document System toolbar.

  Tips

  To work with content items that have been added to a content record, click the drop-down arrow at the right of a content item's title bar and choose from the following commands:

- Configure – Displays a window that enables you to define the properties of the content item.
- Content HTML content item displays an HTML editor. In configuration, you can access Help ( ) for most content items.
- Copy To – Copies the content item to another content record.
- Move To – Moves the content item to another content record.
- Connect – Displays a connection editor that enables staff or consultants to define content item connections. Connections allow one content item to interact with another content item on the same content record. Not all content items support connections, so when configuring a content item, open the Configuration Help to determine the content item's connection options.

When creating a new connection, the available connection types are listed, and a drop-down list enables you to select from the other content items on the same content record. For example, to configure content item A to act upon content item B, create a connection, and set content item A to be the Object Consumer. Set content item B to be the Object Provider. Each content item can only have one Consumer and one Provider per connection type. So a content item can only act as an Object Provider for one other content item, for example, not as an Object Provider for several other content items.

The connection editor lists all current connection points for the content item and allows you to define new connections. Each content item (consumer and provider) displays the connection once it is defined. For example, if you select content item A and connect it to content item B, and then look at the connections for B, you will see the connection there as well. Connections can also be disconnected from here.

Currently, connections can be of four types: Object, Atom Object, Uniform Key, or String. The type of connection to use depends on the implementation by the content item's author. Please refer to the specific content item's Configuration Help for details.

- Minimize – Collapses the content item's preview box, instead displaying only the content item's title bar.
- Restore – Expands a collapsed content item to display its preview box.
- Remove – Removes the content item from the content record.

Note: Note: The content types defined in the system determine the behavior of ASP.NET content items controls within iMIS. Each content items control must have an associated content type, which tells iMIS how to create the corresponding content item within the system, how to edit it, how to display it, how to publish it, and so on. The system-defined content items in the Content Gallery all have a corresponding content type. A special ContentWebUserControl content type is used as the default content type for all custom content items that you add to a content record. You can optionally define entirely new content types to enable more soph-

isticated system handling of a custom content item that has been added to a content record.

Other tips:

- Modifications to your master pages may be required if content items appear to overflow the boundaries of content item zones in the rendered pages. In general, this requires modifying the template's master page and accompanying CSS files to make the Home page and interior page layouts larger than their default size.
- Custom ASP.NET content items are not described in this section because they are not part of the standard set of content items shipped with iMIS.
- Implementers can add an ad hoc ASP.NET web user control to a content record by entering the relative path to the content item in the Or, enter a path to a web user control field.

  Or, enter a path to a web user control

  Specifies a relative URL from the root (~) of the physical path for the IIS application or IIS website that hosts your iMIS content management websites to a web user control that you want to insert into this content record. By default, the root corresponds to C:\Program Files\ASI\iMIS\Net. For example, ~/CustomControls/myUserControl.aspx.

  Note: Note: Be sure to use forward slashes (/) for the URL segment delimiters.

Configuration options: publishing options

These fields determine how the system should process an iMIS content management definition object when you use the Publish command.

Go to RiSE > Site Builder or Page Builder:

Click Publish on the Document System toolbar for most iMIS content management definition objects.

Tips

- When you choose to Save and Publish a content record or content item, then no publishing options are displayed. Your changes to the content record or content item are automatically published and immediately visible on all websites that use it.
- You can multi-select content records (by holding Shift or Ctrl while selecting them) to publish a group of content records all in one operation.
- If you publish a content folder, the publishing process automatically includes all descendants (content records and sub folders) of that content folder too, and the publishing option you select is applied to each descendant.
- When you make changes to the definition of a content folder, the system flags only that content folder as now being in a Working state. However, changes made to a content folder usually affect the behavior of all of its descendant content records and content folders, so you generally must re-publish all of its descendants too. This is where the Publish All Items and Publish Working Items, Regenerate Published Items options become useful:
- Use Publish All Items to effectively reset the expiration countdown timer for all descendant content records that are controlled by the Content is considered expired n days after last published field.
- Use Publish Working Items, Regenerate Published Items if you do not want to affect the current expiration countdown timer for all descendant content records.

  Publish children as well?

  (displayed only for some definition object types)

  If the selected definition object or folder has children, such as a navigation item in the Manage sitemaps tree or a subfolder in the Manage websites tree, then all descendants of the definition object or folder will be published too.

  > **Note:** Note: This option is not displayed for content folders because the publishing process for a content folder always applies to all of the content folder's descendants.

Publish Working Items Only

(displayed only for some definition object types)

Publishes only the selected definition objects that currently have a status of Working. Selected objects that are in any other state are ignored.

Publish All Items

(displayed only for some definition object types)

Publishes all of the selected definition objects regardless of their status. The Updated on date will reset to the current date. Objects that are currently in a Published state have their Date of publication reset to the current date. However, if the Date of publication was manually overwritten, the date remains unchanged.

Note: Note: If the Date of publication for a content record is blanked out, the publication date will reset to the current date when the content is published.

Publish Working Items, Regenerate Published Items

(displayed only for some definition object types)

Publishes all of the selected definition objects regardless of their status. The Date of publication remains unchanged for objects that are currently in a Published state. The Updated on date will reset to the current date.

Close this window after submitting for publish?

Prevents the publishing results from being displayed, which can reduce the number of clicks you must make when publishing. This option is saved as a preference until you change it again.

Enabling workflow for content authoring

When defining a content folder, use the Workflow Management section to assign a content authority group and a content owner to a content folder. All content records created in

that content folder will subsequently progress through the content authoring workflow that is defined by the permissions assigned to each member of the content authority group:

- Any content authority group member who has Content Editor permissions can be assigned as the content owner for the content folder or for individual content records within that folder. If for any reason this member becomes ineligible to be a content owner, the member who has Default Owner permissions is automatically assigned as the new content owner for the content folder or content records that were assigned to the now-ineligible content owner. Events that can make the current content owner ineligible include:
- The content owner is removed from the content authority group assigned to this content folder.
- The content owner's Content Editor permissions are revoked within the content authority group assigned to this content folder.
- A different content authority group is assigned to the content folder and the current owner is not a member with Content Editor permissions in the newly assigned content authority group.

  Note: For content folders that have a content authority group assigned to them, the Owner of this content value is not copied to new content records that are created inside the content folder. Instead, content records automatically have this value set to specify the first person who created the content record, which you can subsequently modify as needed.

  Caution! A content record does not have a content owner automatically assigned if it was created by a person who is a member of the SysAdmin role, but who does not have Content Editor content authority group permissions in at least one content authority group.
- The Page Builder Task List for each member of the assigned content authority group lists the content records that they can take action upon.
- Content authority group members who have Content Editor permissions see content change requests and expiring content records in their Task List. They also see content

records they have been defining and which are still in Working status.

- Content authority group members who have Content Approver permissions see content publishing requests and content deletion requests in their Task List.

  The assigned content owner for the content folder must be a member of the assigned content authority group. Unlike other content authority group members, the content owner receives email notification of expiring content records. For specific content records within the folder, you can specify a different owner other than the default owner assigned to the parent content folder. This different owner must be a member of the content authority group assigned to the content folder, and must also have Content Editor content authority group permissions.

  Disabling workflow for content authoring

  If a content folder does not have an assigned content authority group, then no workflow management takes place for the content records within that folder:

- Content change requests and expiring content records appear in the Page Builder Task List for every user in the system who has been assigned Content Editor permissions in any content authority group.
- Content publishing requests and content deletion requests appear in the task list for every user in the system who has been assigned Content Approver permissions in any content authority group.
- No email notifications of expiring content records are received.

Defining layouts

Go to RiSE > Page Builder >Manage layouts:

Do the following to define content layouts:

- Go to New > Layout Definition to create a new content layout.
- Click Edit to change an existing content layout.

- Select a content layout, then go to Organize > Delete to delete the content layout. You can define content layouts with the Content Layout Editor in one of two ways:
- Use the Tool Box to create simple layouts by adding rows and specifying how many columns are in each row.
- Click Create Custom Layout to code more complex layouts:
- We recommend using the Bootstrap grid library, which is automatically included in iMIS. For more information see Creating custom layouts using Bootstrap grids. Currently only the col-sm bootstrap grids are supported. We also provide and support YUI 2 grids, but we no longer recommend using the YUI grids.
- You can create your own grids using custom CSS or another grid framework. To do so you must include the CSS for your grids in your theme. Simply add the CSS file to your theme's folder in the App_Themes folder.
- Each layout must have a single that wraps the entire layout.
- Inside each element that functions as a content item zone, insert a single <p> element with a number that identifies the content item zone. For example, if your layout comprises four content item zones, the content of each <p> element could be the numbers 1, 2, 3, and 4, respectively. These <p> elements do not appear in the rendered content record if no content item has been added to a content item zone.
- Bootstrap grids are already shaded gray in the layout preview, but to shade any other element simply add the class Shade to the element.

  Here is an example of a custom layout. It has one column on the left of 25% width, and a right column of the remaining width, which then contains two rows, one with a full-width column and one with two 50%-width columns:

  ```
  <div> <!-- this div is required for the layout to work -->
    <div class="row">
      <div class="col-sm-3"> <!-- this is the 25%-width left column -->
        <p>1</p> <!-- this paragraph indicates that this is the first zone in the layout -->
  ```

```
    </div>
    <div class="col-sm-9"> <!-- the 75%-width right column contains 3 zones -->
      <div class="row">
        <div class="col-sm-12"> <!-- this zone spans the full width of the right column
(75%) -->
          <p>2</p>
        </div>
      </div>
      <div class="row">
        <div class="col-sm-6"> <!-- this zone spans the half width of the right column -->
          <p>3</p>
        </div>
        <div class="col-sm-6"> <!-- this zone spans the half width of the right column -->
          <p>4</p>
        </div>
      </div>
    </div>
  </div>
```

Troubleshooting

- You must have Layout Editor content authority group permissions in at least content authority group to which you belong.
- If you plan to code custom content layouts, you must be familiar with CSS layout techniques.

- The default content layouts shipped with iMIS are always overwritten during upgrades, so the best practice is to create new content layouts rather than modifying the default layouts. Take care to name your user-created content layouts uniquely to prevent iMIS from treating them as standard iMIS content layouts during an upgrade. An easy technique to ensure unique naming is to prefix the name with an acronym for your organization, such as "ORG One Over Two".

  > **Note:** Note: Membership in the SysAdmin security role effectively grants the full set of Document System permissions and the full set of content authority group permissions (you are effectively a member of a MasterAdmin content authority group too). However, to participate in web content authoring workflow, even members of the SysAdmin role must be explicitly-listed members of at least one content authority group.

  Tip: Supported layout types

  Although iMIS uses DIV-based CSS layout, you can use table layout or any combination of HTML elements that you prefer. The only absolute requirements are:

- You must insert a single element with only a single number inside the element where you want each content item zone to be located in your layout. Use unique numbers for each content item zone, starting with 1. You must also have at least one of these [number] strings in your custom content layout. iMIS content management looks for these strings to determine how many content item zones are in the layout, and where they are located. Any other content inside of a element other than a single number is not considered as being a content item zone, and the content is copied directly to the rendered output of the content record.
- The HTML elements that you use must be valid in the context of a <body><form> container. For example, you cannot use a <head> element in your custom content layout.

  You can also add ASPX code and other markup to add standard elements to a layout, such as always including a search box or a logon control on a given content layout. These

elements will be available in the published output of a content record, but they will not be visible when previewing your custom content layout in the layout editor.

Creating custom layouts using Bootstrap grids

The Bootstrap grid framework provides a very powerful grid system, which is supported in iMIS. If you choose to define a custom layout, here are some basic guidelines for working with the grids.

- Wrap each row of zones in a div with the class row.
- Each column class should end with a number from 1 to 12. These numbers should add up to 12 in each row, and represent the portion of the row that column will represent.

  Layout examples

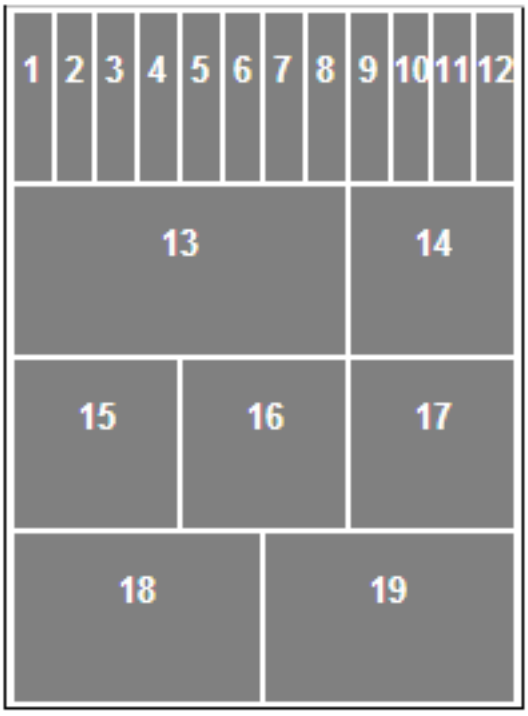
  This layout contains one row with one column that takes up the full width of the page.

```
<div>
  <div class="row">
    <div class="col-sm-12"><p>1</p></div>
  </div>
</div>
```

  For three zones in one row that will each take up one third of the row, use 3 s each with the class col-sm-4.

```
<div>
   <div class="row">
      <div class="col-sm-4"><p>1</p></div>
      <div class="col-sm-4"><p>2</p></div>
      <div class="col-sm-4"><p>3</p></div>
   </div>
</div>
```

Here’s an example of a more complex layout:



```
<div>
  <div class="row">
    <div class="col-sm-1"><p>1</p></div>
    <div class="col-sm-1"><p>2</p></div>
    <div class="col-sm-1"><p>3</p></div>
    <div class="col-sm-1"><p>4</p></div>
    <div class="col-sm-1"><p>5</p></div>
    <div class="col-sm-1"><p>6</p></div>
    <div class="col-sm-1"><p>7</p></div>
    <div class="col-sm-1"><p>8</p></div>
    <div class="col-sm-1"><p>9</p></div>
    <div class="col-sm-1"><p>10</p></div>
    <div class="col-sm-1"><p>11</p></div>
    <div class="col-sm-1"><p>12</p></div>
  </div>
  <div class="row">
    <div class="col-sm-8"><p>13</p></div>
    <div class="col-sm-4"><p>14</p></div>
  </div>
  <div class="row">
    <div class="col-sm-4"><p>15</p></div>
    <div class="col-sm-4"><p>16</p></div>
    <div class="col-sm-4"><p>17</p></div>
```

```
    </div>
    <div class="row">
      <div class="col-sm-6"><p>18</p></div>
      <div class="col-sm-6"><p>19</p></div>
    </div>
</div>
```

Note: Note: iMIS only supports column classes that begin with col-sm.

Managing images

Go to RiSE > Page Builder > Manage images:

To help you to organize your site images where they cannot be overwritten during upgrades, iMIS uses one system-defined path for all of the image files that you upload. This setting is honored by the Image Manager and by all content items that reference uploaded images, such as Content HTML, Content Block, and Contact Profile Picture.

For clarity, content items that manage images specific to a feature organize those files into subfolders below your default. Any filenames ending with _T are thumbnails that iMIS generates for you.

- Event images are stored in /Events
- Product images are stored in /Products
- Contact (individual and organization) images are stored in /Profile.

Note: Tip: Theme-related images are managed within appropriate theme folders.

Changing the upload folder for images

Go to Settings > RiSE > Page builder configuration:

To change the upload folder for your images, change the CM.ImagePath variable in your SystemConfig table. You can set this in Page Builder configuration.

For example, the following SQL command changes the path to a folder called foo in the root directory:

Update SystemConfig set ParameterValue = '~/foo' where ParameterName = 'CM.ImagePath'

For best results, choose one of the following locations for your uploaded images folder:

- On your web root: ...\ASI\iMIS\Net\
- In the SharedContent folder: ...\ASI\iMIS\Net\SharedContent\

> **Note:** Important: The path to this directory must be the same on all servers that host your iMIS sites.

Uploading images

Before you can use image files in your content items, you must upload them to the server. You can do this while configuring a Content HTML content item, or you can do this using Image Manager, which makes it easy to upload and organize a set of files.

- Using the ContentHtml editor – While defining a content record, add a Content HTML content item and configure it to display the HTML editor:

1. In the editor's toolbar, click the Image Manager button.
2. (Browse Files tab) Open the folder from which you want to upload a new image.
3. (Upload Image tab) Click Browse.
4. Select the local file that you want to upload.
5. Click OK.
6. Click Upload.

Tip: To reuse an image hosted on an external server, use the Content HTML content item and insert a standard HTML <IMG> tag to that image.

- Using Image Manager – In Page Builder, select Manage images.

  Go to RiSE > Page Builder > Manage images:

1. Open the folder in which you want to upload a new image, or click the New Folder icon to create a new folder ( ).
2. Click the Upload icon (Upload) and browse to the file on your computer that you want to upload.
3. Click OK.
4. Click the Upload link at the right of the Upload field. To cancel the upload, click the Upload icon in the toolbar.

   Both the HTML editor and the Image Manager have a built-in Image Editor that can perform some basic edits to images that you have already uploaded.

   Note: Caution: Do not use Image Editor with transparent images. The transparent background becomes black. To edit transparent images, right-click on the image and select Save Image As to save a copy locally. Edit the image with your preferred program, then upload the image to iMIS again, overwriting the original copy.

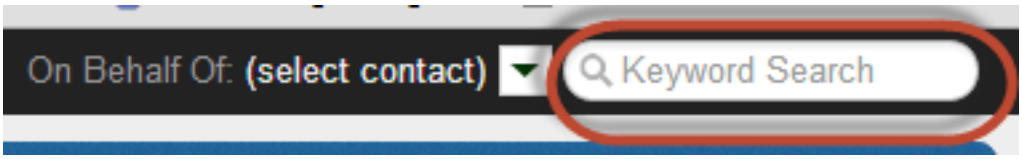
   Troubleshooting

- To upload images, you must have Content Upload content authority group permissions.
- To upload from a network location, first map that folder to a drive letter on your workstation.
- Theme images (used by Big Button Panel) do not auto-sync between servers.

Tagging

Searching for Tagged Items

You can search for content folders or content records with Tags.



Do the following to configure a content folder and content record to be searchable by Tags:

1. Go to RiSE > Page Builder > Manage content. Do one of the following:

- Create a content folder.
- Select a non-system content folder, and then click Edit.

2. Click select for the Default website (for search) field, and select a website. This enables indexing of the website for the search. You must select a default website (for search) even if you do not apply tags at the content folder level. If you do not, content records with tags applied in that content folder are not returned during searches.
3. Click select for the Include content in Searches for these additional Websites field. This allows searches for items on the default website, for example, the Staff site, to be returned when performing the search from another website, for example, the Member site.
4. (Optional) Click Always display content in default website. If this option is selected, the end-user will be redirected to the default website to view the tagged content if they perform the search in another website.
5. Click the Current Tags tab, and then click Modify to apply tags.
6. Click Save, and then click Cancel.
7. Click Publish.
8. Select Publish Working Items, Regenerate Published Items. The content folder and all content records contained therein will be searchable to any applied Tag Name.

Defining tags

Go to RiSE > Tagging > Define tags:

Do one of the following:

- Click New to create a new tag. Enter a Tag Name. Define the tag's Properties, Related Tags and Access Settings.
- Select an existing tag to edit the tag's properties. Define the tag's Properties, Related Tags and Access Settings, if necessary.
- Select an existing tag, and then click Delete to delete the tag.

When you create a child tag, it automatically copies the properties of the parent tag. Subsequent changes to the parent tag's properties do not affect the child tag.

You can reorganize the tag hierarchy by dragging and dropping tags into new positions. Drop tag A onto tag B to make A subordinate to B (A becomes a child of B, and B is the parent of A).

Troubleshooting

- You must be a member of at least one content authority group.
- Although no specific Document System permissions are required to define tags, the people who perform web content authoring must have Select Document System permissions on a tag to be able to assign that tag to a content record or content folder.
- You must plan your tag hierarchy in a manner that accounts for the effect of implied relationships between parent and child tags in the hierarchy. A tag's position in the tag hierarchy creates an underlying relationship that is not specifically displayed in the Related Tags section: Parent tags are implicitly related to their children tags with a more broadly defines relationship, and children tags are implicitly related to their parent tag with a further defines relationship. This means that:
- The pre-filtered result set of a basic or advanced search includes all published content records that are tagged with any descendant of the tag that is matched by the search keywords.
- The pre-filtered result set of an advanced search includes all published content records that are tagged with any descendant of a tag that is specified in the configuration of the

AdvancedSearch content item if the user selects that tag at runtime on the rendered page that contains the advanced search form.

- The pre-filtered result set of a rendered ContentTaggedList content item also includes published content records that are tagged with any descendent of a tag that is specified in the configuration of the ContentTaggedList.
- The content of the Items by Tag Report (in Continuum > Content Reports) does not list published content records that are tagged with any descendant of each tag in the report.

> **Note:** Note: Membership in the SysAdmin security role effectively grants the full set of Document System permissions and the full set of content authority group permissions (you are effectively a member of a MasterAdmin content authority group too). However, to participate in web content authoring workflow, even members of the SysAdmin role must be an explicitly-listed member of at least one content authority group.

Configuration options: tags

These fields control the properties of tags that are defined in the system.

Go to RiSE > Tagging > Define tags:

Do one of the following:

- Select a tag in the tag hierarchy.
- Click New.

Tips

- A tag's position in the tag hierarchy creates an underlying relationship that is not specifically displayed in the Related Tags section: Parent tags are implicitly related to their children tags with a more broadly defines relationship, and children tags are implicitly related to their parent tag with a further defines relationship. This means that:
- The pre-filtered result set of a basic or advanced search includes all published content records that are tagged with any descendant of the tag that is matched by the search

keywords.

- The pre-filtered result set of an advanced search includes all published content records that are tagged with any descendant of a tag that is specified in the configuration of the AdvancedSearch content item if the user selects that tag at runtime on the rendered page that contains the advanced search form.
- The pre-filtered result set of a rendered ContentTaggedList content item also includes published content records that are tagged with any descendent of a tag that is specified in the configuration of the ContentTaggedList.
- The content of the Items by Tag Report (in Continuum > Content Reports) does not list published content records that are tagged with any descendant of each tag in the report.

  Tag Name

  Specifies the tag name, which can comprise multiple words with spaces and even some special punctuation characters.

  Tag Description

  Specifies a description of the tag that is oriented to the people who perform web content authoring and website management. This text is not displayed anywhere except when editing the definition for a tag.

  Aliases

  Specifies a comma-delimited list of other terms that are synonymous with the Tag Name. If these alias terms are entered by the user in a basic or advanced search panel, all content tagged with the associated Tag Name will be listed in the search results, but with a lower relevancy than if the actual Tag Name had been used in a search.

  Access Settings

  Specifies the Document System permissions granted for this definition object to iMIS security roles, security groups, specific iMIS users, iMIS member types, or to all Full and Casual users based on their assigned authorization levels.

- Apply changes to all descendants – Changes to this section, when saved, flow automatically to all descendant definition objects. When cleared, changes to this section apply only to the current definition object. This checkbox usually appears only on Document System folder objects.
- Use a preconfigured security set – Specifies a preconfigured security configuration to use for this definition object, which can be much simpler than using the Make this available to option to specify the permissions for definition objects. The specific permissions in the preconfigured security configuration are displayed (read-only) in the Make this available to area.

  If you select a preconfigured security configuration and then switch to the Make this available to option, the permissions granted by the preconfigured security configuration are copied. This enables you to use a preconfigured security configuration as a starting point for defining custom permissions.
- Make this available to – Lists the roles, groups, users, member types, or authorization levels that have been enabled to define or view rendered output from this object. This option enables you to specify custom permissions for the definition object if none of the preconfigured security configurations meets your needs. The SysAdmin, Content Administrator, and Everyone roles are default system-defined security roles that are assigned to every definition object. The SysAdmin role is assigned in the definition of an iMIS user record, but the Content Administrator role is automatically assigned to every iMIS user who is a member of a content authority group (CAG) that is designated as a Master Admin content authority group.

  The permissions that can be assigned to each entry in the list are:
- Full Control – Enables all of the following permissions.
- Read – Enables users to see this object both in definition windows and as rendered output in websites, but they cannot change the object's definition.
- Add – Enables users to create new objects, or to paste or import an object into the Document System.
- Edit – Enables users to edit this object's definition, but not to delete the object.

- Delete – Enables users to delete this object.
- Select – Enables users to assign a tag to content folders and content records.

  Related Tags

- Automatically create reciprocal relationships – (Displayed when you click Add in the Related Tags section of the tag definition)

  Creates an appropriate reciprocal version of the relationship type specified for this tag in the target related tag. For example, if you specify a more broadly defines relationship in the Choose a relationship type drop-down list for this tag, the target tag will have an explicit further defines relationship created that points back to this tag.

  If this checkbox is subsequently cleared on either side of a reciprocal relationship, the corresponding checkbox will automatically be cleared on the other side too.

- Choose a relationship type – (Displayed when you click Add in the Related Tags section of the tag definition)

  Specifies an explicit type of relationship from this tag to another tag.

  Explicit tag relationships currently affect only search results. If these related tags are entered by the user in a basic or advanced search panel, all content tagged with the associated Tag Name will be listed in the search results, but with a lower relevancy than if the actual Tag Name had been used in a search.

  Explicit tag relationships currently have no effect on the dynamically rendered list of content records from a ContentTaggedList content item, nor in the content of the Items by Tag Report (in Continuum > Content Reports).

  Explicit tag relationships are not transitive. If A is related to B, and B is related to C, there is no relationship between A and C. Neither are these relationships implicitly reciprocal. You must manually create the reciprocal relationship or select the Automatically create reciprocal relationships checkbox when defining an explicit relationship to other tags.

Note: The specific type of relationship has no particular functionality. Future releases might make use of specific relationship types, but currently all types of explicit tag relationships yield the same search results as a term specified in the Tag Alias List field.

Defining tagged list formats

Do the following to define tagged list formats.

Go to RiSE > Tagging > Define tagged list formats:

Do one of the following:

- Select New > Tagged List Format to create a new tagged list format.
- Select an existing tagged list format. Click Edit to modify that list format.
- Select an existing tagged list format. Select Organize > Delete to delete that tagged list format.

Verify a tagged list format's behavior by using it in a ContentTaggedList content item, then previewing a content record that contains the content item.

Troubleshooting

- The default tagged list formats shipped with iMIS are always overwritten during upgrades, so the best practice is to create new tagged list formats rather than modifying the default ones. Take care to name your user-created tagged list formats uniquely to prevent iMIS from treating them as standard iMIS tagged list formats during an upgrade. An easy technique to ensure unique naming is to prefix the name with an acronym for your organization, such as "ORGSimpleWithHTML".

Concept: tags and tagged list formats

Tags are a special type of keyword that you can associate with content records to searches that are more powerful and the automatic population of content based on tags. All descendants of a content folder inherit the tags defined for the folder. You can tell which tags are being inherited from a content folder higher in the content folder hierarchy by viewing the Current Tags section of a content folder's or content record's definition.

- AdvancedSearch content items specify various tags that your iMIS content management website users can select to narrow their search to a smaller set of tagged content records.
- ContentTaggedList content items specify various tags that are used to generate a real-time list of links to tagged content records when the content record containing the ContentTaggedList is viewed.

  Tagged list formats are used by ContentTaggedList content items to format the rendered display of the list of links. The chosen tagged list format is applied as a display mask to each item in the list. For example, one tagged list format might display only a simple list of links, while another tagged list format might display a link followed by an HTML fragment from the target content record.

  Unlike some other content authoring systems and web applications, you cannot create ad hoc tags while defining content records. Instead, you must choose from a list of pre-defined tags that are usually defined by the people who perform website management. This restriction ensures that your content is tagged with a centrally designed taxonomy, which provides more consistent and predictable search results from ContentTaggedList content items.

  Tags are defined in a hierarchical structure, with every parent tag having an implicit more broadly defines relationship to its children tags, and every child tag having an implicit further defines relationship to its parent tag. In general, this means that if you use a parent tag in an AdvancedSearch or ContentTaggedList content item, all descendant tags are automatically included as well.

Configuration options: tagged list formats

These fields control the properties of tagged list formats that are defined in the system.

Go to RiSE > Tagging > Define tagged list formats:

Do one of the following:

- Select New > Tagged List Format.
- Select an existing tagged list format, and then click Edit.

Tips

- Tagged list formats are used by ContentTaggedList content items to format the rendered display of the content item. You specify the tagged list format to use in the List Format field of the ContentTaggedList configuration.
- The default tagged list formats shipped with iMIS are always overwritten during upgrades, so the best practice is to create new tagged list formats rather than modifying the default ones. Take care to name your user-created tagged list formats uniquely to prevent iMIS from treating them as standard iMIS tagged list formats during an upgrade. An easy technique to ensure unique naming is to prefix the name with an acronym for your organization, such as ORGSimpleWithHTML.
- The format you define here is applied as a display mask to a single item in a ContentTaggedList content item. This format is repeated once for each item content record in the list rendered from the content item. The basic elements of a tagged list format are:
- One or more content record property labels to explain a following content record property value.
- One or more content record property values.
- A single link to the content record itself.
- HTML fragments.

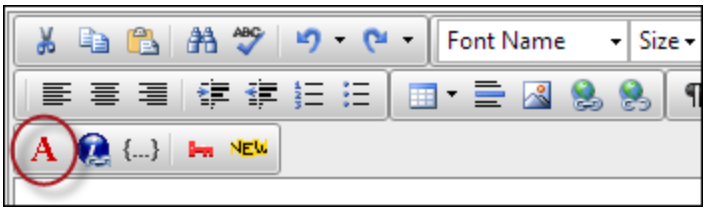
  While none of these elements is actually required by the system, at a minimum you should at least insert the link to the content record itself.
- The content record property values are all read-only values.
- The tagged list format editor is essentially the HTML editor used for Content HTML content items, with some iMIS-specific toolbar buttons at the right of the bottom toolbar, and a list of embeddable content record properties at the right of the editor.

  If you find some features of the HTML editor confusing, you can download the RadEditor user manual from the Telerik Documentation site.

> **Note:** Note: Some features described in this external document have not been enabled for use when defining Content HTML content items or tagged list formats.

> **Note:** Caution! If you use the HTML editor's built-in Image Editor to modify an image that has a transparent background, the transparent background will be replaced by solid black pixels. If you need to edit images that have a transparent background, you should save a copy of the image to your local computer and use your preferred image editing program to modify it. Then upload the new version to iMIS again, overwriting the old version if desired. The easiest way to save a copy of the image to your local computer is to right-click the image shown the Preview area of the Image Editor, and choose Save Picture As.

iMIS Label Manager (toolbar button - red "A")



Edits a content record property value that has been inserted in the editing area in the following possible ways:

- Changes an existing content record property value in the editing area to a different property. You must place your cursor somewhere inside the existing property value before clicking this button.
- Enables you to define a display mask for date-oriented and numeric property values.

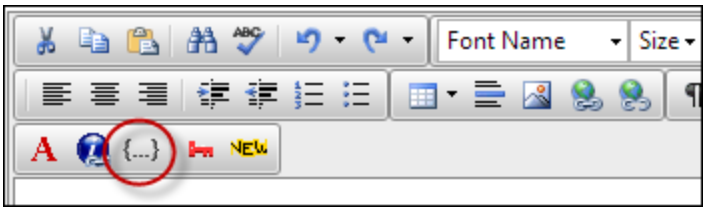
> **Note:** Tip: While you can use this toolbar button to insert a new property value, it's much easier to insert new values by clicking the red A icons in the Content - Properties list.

- Display Value – Has no effect.
- Property – Specifies the property value in which the editing cursor is positioned. If you select a different property value from the list, it will replace the property value in which the editing cursor is positioned.
- Display Format – Specifies a display mask for date-oriented and numeric property values. To view a list of the syntax you can use for the display mask, click View complete list of Date/Time and Number formats.

  iMIS Hyperlink Manager (toolbar button - globe and chain)

  
  Creates a link to the content record itself, enabling you to define the anchor text for the link in various ways.
- Dynamically based on Property – Specifies anchor text that is different for every content record in the rendered ContentTaggedList content item. The anchor text will be the selected content record property value.
- Static text – Specifies anchor text that will be the same for every content record in the rendered ContentTaggedList content item.
- Display Format – Specifies a display mask for date-oriented and numeric property values if you specify the anchor text to be Dynamically based on Property. To view a list of the syntax you can use for the display mask, click View complete list of Date/Time and Number formats.

  iMIS Conditional Display Manager (toolbar button - {…})

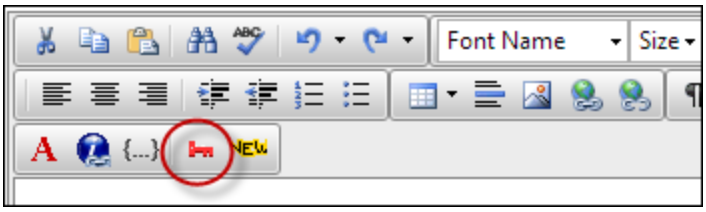


Specifies a single conditional display parameter for any element of the tagged list format (property label, property value, link, or HTML fragment). You must select the entire element before clicking this button. When you insert the conditional parameter, the element is surrounded by braces { } to indicate that it is a conditional display block.

To simulate ELSE arguments for the conditional display of an element, you can copy and paste the element inside a conditional display block to a position immediately following the existing display block, then select the copied element and click this button to create a new conditional display block with a different parameter.

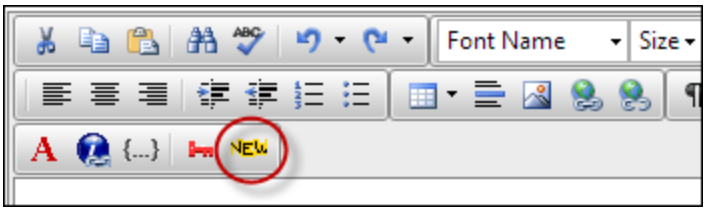
> **Note:** Note: The iMIS Conditional Display Manager is a generic conditional display control shared among several iMIS features. Therefore, you should be careful to choose values that make sense in the context of conditional display of an element in a tagged list format. As a rule, you should use the default values for Data type, Comparison type, and Source. The only value you should change is for the Value drop-down list, to specify the content record property value that you want to ensure is not empty before displaying this element.

Insert 'Members Only' Marker (toolbar button - red key)



Inserts a graphic icon that is conditionally displayed for an item in a rendered ContentTaggedList content item if the Content is restricted to members checkbox is selected in the Properties section of the corresponding content record.

Insert 'New' Marker (toolbar button - NEW)



Inserts a graphic icon that is conditionally displayed for an item in a rendered ContentTaggedList content item if the Mark as important until field in the Properties section of the corresponding content record contains a value and that date has not yet passed.

Content - Properties

Lists the content record properties that can be used as elements in the tagged list format. The list of available properties includes all iMIS content management user-defined fields (UDFs) that are defined in the system.

- P icon – Inserts a pre-defined label for the corresponding content record property. You can modify this label after it has been inserted into the editing area.
- A icon – Inserts a string variable, delimited by brackets [ ], that will display the actual value of the content record property for each item in the rendered ContentTaggedList content item. You should not directly edit this string, but you can safely delete it or change it by putting the cursor inside the string and clicking the iMIS Label Manager button on the toolbar.

> **Note:** Note: The string variable created by the A icon is not a link. To make the rendered replacement text of a string variable be a link (such as making the Title property a link to the actual content record), you must use the iMIS Hyperlink Manager.

> **Note:** Note: If you insert an HTML property value, the rendered ContentTaggedList content item displays the full content of all Content HTML content items in the content record, concatenated together with no visible divisions between them.

Maintenance

Website maintenance comprises the ongoing tasks that you periodically perform to help you troubleshoot your iMIS content management websites and manage the publishing queue for each publishing server.

Defining publishing servers

To define publishing servers

Go to RiSE > Maintenance > Publishing servers:

Select an existing publishing server to change its properties, or you can add or delete a publishing server.

Tips

- All references to "the publishing service" refer to a specific instance of AsiScheduler. You can install multiple instances of this service to any web server on which iMIS content management navigation items and content should be published, but each instance must have a unique single-letter identifier.
- If you need to create multiple publishing servers, you must manually create a new publishing server for each IIS application and IIS website. When you define a new publishing server, the Frequency and Publishing Speed values default to zero. You should set them to Frequency=10 and Publishing Speed=100.

  Note: You must associate no more than one publishing server with each publishing service. If your environment has more than one IIS application or IIS website that is hosting iMIS content management websites on a given server, you must install one publishing service for each such IIS application and IIS website, and you must define a single corresponding publishing server for each publishing service. For more information, refer to Installing CM on web servers.

  To verify/change a publishing service code

  Do the following to verify or change the Publishing Server Code assigned to an installed publishing service:

1. Open the PublishService.exe.config file in a text editor on the appserver or external web server. Default location is C:\Program Files (x86)\ASI\iMIS\Net\bin
2. In the <SystemParams> declaration, verify or change the value of the PublishServerCode key. The value must be a single uppercase letter from A to Z, and must be unique among all publishing services used by a given instance (database) of iMIS.

   To manually define additional publishing servers

   The iMIS installer automatically defines a corresponding publishing server for the default instance of the publishing service installed by iMIS. However, in some iMIS content management installation scenarios, you must manually install one or more additional instances of the publishing service at a command line.

1. Manually create a single corresponding publishing server for every publishing service that you have manually installed.
2. When you add a new publishing server, review the Publish on Servers property for all existing content folders to specify whether the rendered files from content records in those folders should be made available to the iMIS sites that are associated with these manually-created publishing servers.

   To define sets of publishing service codes

   When you install iMIS content management on a web server (or install an additional publishing service for each manually created IIS application or IIS website), you are prompted to specify a Publishing Server Code to uniquely identify the publishing service that is created during installation (it always defaults to the value A). When you define a publishing server in the iMIS content management environment to control the behavior of a specific publishing service, you use this code to link the publishing service to its corresponding publishing server.

   The Publishing Server Code must be unique among all publishing services used by a given instance of iMIS. For example, your production iMIS server might use the code A to identify its instance of the publishing service, and you might also have three other

external web servers located in different geographic locations whose Publishing Server Codes might be B, C, and D, respectively.

> **Note:** Tip: You can duplicate codes across test and production instances, since they're still unique within their specific databases.

> **Note:** Caution! The publishing server associated with the base iMIS installation must always be defined as the only Default (the one PublishServerRef row set with the IsDefault flag). Unless this one instance is set as the default, the Multi-Instance Utility will not work as expected.

Troubleshooting

- You must be a member of at least one Master Admin content authority group (CAG).
- You must already have installed iMIS content management on one or more web servers and noted the Publish Server Code that you specified to use for the iMIS publishing service that was installed during that process.

> **Note:** Note: You must associate no more than one publishing server with each publishing service. If your environment has more than one IIS application or IIS website that is hosting iMIS sites on a given server, you must install one publishing service for each such IIS application and IIS website, and you must define a single corresponding publishing server for each publishing service. See Installing iMIS content management on web servers.

> **Note:** Note: Membership in the SysAdmin security role effectively grants the full set of Document System permissions and the full set of CAG permissions (you are effectively a member of a MasterAdmin CAG as well). However, to participate in web content authoring workflow, even members of the SysAdmin role must be an explicitly-listed member of at least one CAG.

- Multiple publishing services – Do the following to update the publishing servers dashboard when multiple publishing services are installed:

1. Publish some content.
2. Go to RiSE > Maintenance > Publishing servers. Note that one of the services will show in progress while the other service shows done. The content is published to both sites, but the dashboard is not updated correctly.
3. Stop the ASIScheduler pool on the system that shows that the service is still in progress.
4. Restart the ASIScheduler pool. The dashboard is updated.

- Single instance of a publishing service – Do the following if a single instance of the publishing service does not start or does not complete:

1. Reenable asiScheduler. Go to Start > Administrative Tools > Internet Information Services (IIS) Manager.
2. Go to Sites > Default Web Site.
3. Select the asiScheduler_ [your instance] application for the instance you installed, then right-click and select Manage Application > Browse. An ASP.Net page will open.
4. Close the browser. The asiScheduler_ [your instance] is now enabled.

Managing the priority of pending publication requests

Go to RiSE > Maintenance > Publishing Servers:

1. If the Number of Pending Requests for a publishing server is a non-zero value, click detail to view the current publishing requests queue.
2. Change a request's priority in the queue by using the Priority drop-down list.
3. Click Save to process these changes.

Viewing iMIS content management reports

Go to Continuum > Content Reports:

1. Select a report.
2. Click Run.
3. If a query parameters window appears, specify the additional required parameters that you are asked for, and then click Run.

Creating new iMIS content management reports

All iMIS content management reports are standard Document System report definition objects that are based on Intelligent Query Architect (IQA) queries. Some default reports are included with iMIS content management, and you can define additional reports using the techniques described in Reporting Essentials.

Concept: publishing servers versus publishing services

The publishing service is used by Site Builder when publishing new websites and when adding pages to an already existing website:

- iMIS uses publishing services to render and place files into the local file system of web servers that have been prepared to host iMIS content management websites. Currently, these files are:
- Rendered output of a content record (browser-readable .aspx files)
- Downloadable file attachments that are defined in a ContentFile content item
- iMIS does not push files to a publishing service when an iMIS user performs an action that publishes a content record. Instead, every publishing service regularly polls the iMIS database to check whether any publishing requests have been queued up for the corresponding publishing server.

  An iMIS content management publishing server is an added control layer to a specific instance of an iMIS publishing service that provides important configuration information and enables sophisticated publishing control for content records developed with the Page Builder tool.
- Through the publishing server's assignment to the Publish on Servers field in content folders, the publishing service can determine which content records it should render

when it finds publishing requests during each polling interval.

- Through the Local Protected Path and Local Publish Path fields in the publishing server definition, the publishing service can determine where to place specific types of files in the file system of web servers that have been prepared to host iMIS content management websites.

  When you install iMIS on a server host, the installer automatically defines a corresponding publishing service/publishing server pair:

- A single default instance of the publishing service is placed on the server host, identified by a unique code string that you specify during installation.
- Connection information to the iMIS database is automatically defined by the installer.
- A corresponding publishing server is defined in the iMIS database and given a default configuration. Go to Maintenance > Publishing servers to change the default configuration.

Configuration options: publishing servers

These fields control the properties of publishing servers that are defined in the system.

detail

(displayed only in the main list of defined publishing servers)

Lists the currently pending and recently completed publishing requests for the associated publishing server. You can cancel pending requests or change their priority in the publishing queue. Changes to pending requests are processed when you click Save.

error log

(displayed only in the main list of defined publishing servers)

Lists the errors reported by the publishing server. You can remove errors from the list by selecting the corresponding checkbox and clicking Delete Selected.

Description

Specifies the name of the publishing server that is displayed in the list of publishing servers in your iMIS content management environment.

Publish Server Code

Specifies the unique single-letter identifier of the publishing service that this publishing server controls. This must be a single uppercase letter from A-Z, which means that you can define at most 26 different iMIS publishing services in your iMIS content management environment (one publishing service per IIS application or IIS website that hosts iMIS content management websites, with one corresponding publishing server per publishing service defined in iMIS content management to control each publishing service).

Local Publish Path

Specifies the root directory where the rendered .aspx files from published content records should be written on the server where the publishing service is running. This directory must be within the physical path of the IIS application or IIS website that hosts iMIS content management websites.

By default, this path is C:\Program Files\ASI\iMIS\Net.

For 64-bit systems, the path must be changed to reflect the installation path default of C:\Program Files (x86)\ASI\iMIS\Net.

The uploaded files are written to system-created directories below the one that you specify here. Each directory corresponds to a content folder in the iMIS content management content folder hierarchy. Uploaded files are placed into the directory that corresponds to the parent content folder of the content record in which the ContentFile content item is defined.

Local Protected Path

Specifies the root directory where the uploaded files defined in a ContentFile content item (for example, Word, Excel, PowerPoint, PDF, and so forth) should be written on the server where the publishing service is running. For security reasons, this directory must not be in the IIS Physical Path of any website, virtual directory, or application in IIS. In other words, the files in this directory must not be able to be linked to directly by web

browsers. Instead, they are served to the client only after security permissions are verified.

By default, this path is C:\Program Files\ASI\iMIS\indexServiceProtected.

The uploaded files are written to system-created directories below the one that you specify here. Each directory corresponds to a content folder in the iMIS content management content folder hierarchy. Uploaded files are placed into the directory that corresponds to the parent content folder of the content record in which the ContentFile content item is defined.

IP Address

Specifies the IP address of the computer that is running the publishing service for this publishing server. This is usually the IP address of the iMIS application server. You can run this service on a different computer than the iMIS application server, but there is no real benefit in doing so because the publishing service is not resource-intensive.

Alternate Server IP Address

Specifies an additional IP address of the computer that is running the publishing service for this publishing server, used for web servers that associate themselves with more than one IP address. You cannot specify a value for this field unless you have already specified the Server IP Address.

Frequency

Specifies the interval, in seconds, at which the publishing server should check for new PublishPending requests.

IIS Security

Specifies the authentication credentials for a Windows account that has permission to create, update, and delete content in the Local Publish Path that is specified in the Publishing Server Properties area.

These fields are required only when IIS security is used to protect IIS website content.

- IIS Security User Name – Specifies a windows user name.
- IIS Security Password – Specifies the password associated with the windows user name.
- IIS Security Domain – Specifies the Windows domain name if the Windows account being used is a domain account instead of a local account.

Defining user-defined fields

Do the following to define user-defined fields (UDFs).

Go to RiSE > Maintenance > User Defined Fields:

1. Select an existing iMIS content management user-defined field to change its properties. You can also add or delete a user-defined field.
2. Verify an iMIS content management user-defined field's appearance and behavior. Edit a content record. Review the Properties tab, between the Mark as important until field and the Help URL field.

> **Note:** Note: When you add, change, or delete an iMIS content management user-defined field, existing content records and their rendered .aspx files will not reflect the changes until you edit the content record, specify the desired value for the user-defined field, then re-publish the content record.

Concept: user-defined fields (UDFs)

User-defined fields (UDFs) in iMIS content management are created differently, and serve a very different purpose, than user-defined fields in iMIS contact records:

- The UDFs found in iMIS contact records enable you to collect custom information about a contact. These contact UDFs are not available for use in iMIS content management.
- The UDFs found in iMIS content management are primarily useful as a way to capture additional properties of the content in content records, and to provide a controlled list of search criteria for use in iMIS content management only. These iMIS content management UDFs can be used in three ways:

- As a value added to the keywords <META> element in the rendered page for the content record, which enables searches performed through the iMIS content management search engine (but not by typical external web-based search engines) to locate the content record by searching for this value. This behavior is controlled by the Use in Search? property of an iMIS content management UDF.
- As a search filter in AdvancedSearch content items, applied to the initial result set based on the tags and keywords specified in the search.
- As both filtering criteria and sorting criteria in ContentTaggedList content items. A date-oriented UDF can be used to filter the initial result set based on the chosen tags, and a different UDF of any type can be used to sort the the final result set.

  Every UDF defined in iMIS content management is added as a new custom property to every content record, and can be displayed in a wide variety of formats, from a simple text field to a drop-down list, to a calendar control, to a set of radio buttons, and so on. In the advanced search panel rendered from an AdvancedSearch content item, the user-defined field appears exactly the same way that it does in content records. This enables iMIS content management website users to specify UDF values for advanced searches in the same manner that the UDF values are chosen when authoring content. For example, a date-oriented UDF will have a calendar control that makes it easy to select a date.

Configuration options: User defined fields

Use In Search?

The value specified in the corresponding UDF in a content record is added to the keywords <META> element in the rendered page for the content record, which enables searches performed through the iMIS content management search engine (but not by typical external web-based search engines) to locate the content record by searching for this value. When cleared, the value specified in the corresponding UDF is not added to the keywords <META> element in rendered pages.

Because this value is added to the keywords <META> element, the relevancy weighting of search results is affected by the SE.SearchKeywordHint field Set up content management > Search configuration.

Sort Order?

Specifies the order in which this UDF appears in the total set of UDFs in the Properties section of content records. The value you specify must be in the range 1 to n, where n is the total number of iMIS content management UDFs defined in the system.

If you delete an iMIS content management UDF or change this value for any iMIS content management UDF, the system automatically recalculates this value on all other UDFs to ensure that this value in all iMIS content management UDFs stays within the range 1 to n. Therefore, it's generally a good idea to double-check this value on all iMIS content management UDFs when you make these types of changes, because the automatic recalculation might change the original order.

Is Required?

All content records that are defined after this UDF definition is saved will require a non-blank value to be specified in the corresponding UDF in the content record. When cleared, the corresponding UDF in content records will be an optional field.

Label

Specifies the label for this UDF that will appear in content records.

Display Width

Specifies the unit measurement, in pixels, of the width allotted to variable-entry Display Controls such as Text Field or Text Area.

Display Height

Specifies the unit measurement, in pixels, of the height allotted to variable-entry Display Controls such as Text Field or Text Area.

Allow Multiple Selection?

Specifies that items in a list-based Display Control can be multi-selected. When cleared, only one list item can be selected at a time. This checkbox does not become active until after you select a list-based Display Control and click Save.

Display Orientation

Specifies the orientation of certain multiple-object Display Control types, such as Check Box(es) or Radio Buttons.

- Horizontal – Arranges the display controls in left-to-right order.
- Vertical – Arranges the display controls in a top-to-bottom order.

Display Columns

Specifies how many columns a multiple-object Display Control such as Check Box(es) or Radio Buttons should span if the selected Display Orientation is Horizontal. For example, if the Values section creates four checkboxes and the Display Columns value is 2, the UDF will be rendered with two rows of checkboxes, with two in each row.

References Object

Specifies the name of the iMIS business object that has the source properties used to populate the values for list-oriented Display Control types, such as Drop Down List or Radio Buttons. Use this field only in conjunction with the Value List option in the Values Come From area.

Default Value

Specifies a value that should be pre-filled or pre-selected in this UDF when a new content record is created.

Values Come From

Specifies the source of the values for the UDF. The available choices depend on the type of Display Control.

- Freeform data entry – Requires users to enter the value manually, such as for a Text Field or Text Area.
- Finder – Requires users to interact with a finder dialog before the values are populated for the UDF. This is automatically selected when the Display Control is a Finder. No other Values Come From option is available in this case.

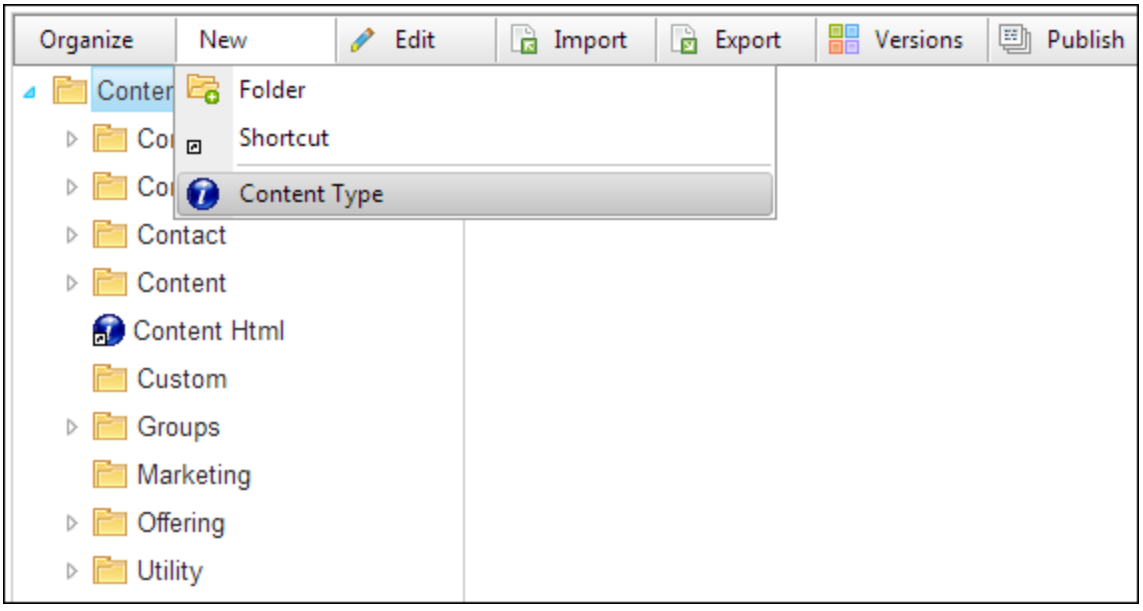
- Query Object – Produces a discrete list of possible values for the UDF in a content record, based on the results of the IQA query that you select here. This choice is available only if the Display Control allows for list-oriented data entry, such as Drop Down List or Radio Buttons.
- Data Value – Specifies which property/field of the Query Object is stored when you make a selection.
- Display Value – Specifies which property/field of the Query Object appears as the list-oriented labels in the user-defined field in content records.
- Value List – Produces a discrete list of possible values based on the contents of the Designer tab of the business object specified in References Object. This choice is available only if the Display Control allows for list-oriented data entry, such as Drop Down List or Radio Buttons.

Configuration options: content types

These fields control the properties of content types that are defined in the system.

Go to RiSE > Maintenance > Content Types:

- Select New > Content Type.
- Select an existing content type, then from the toolbar click Edit.



To place your control into the Content Gallery for easy sharing and reuse, create a content type.

Tips

- The class libraries and user controls that you specify must be manually copied to a file path that resolves to the same root-relative URL on all servers that host iMIS content management websites.
- The class libraries must be placed in the bin folder below the root of the physical path for the IIS application or IIS website that hosts your iMIS content management websites.
- The user controls can be placed in any folder below the root of the physical path.
- When specifying paths to controls, be sure to use forward slashes (/) for the segment delimiters.

Name of the Content Type, Description of the Content Type

Specifies the name and description of the associated content item. If you are publishing this content item in the Content Gallery, be sure this text is as you want it to appear to users in the Gallery when they select content items for use in content records, and do not duplicate any content item names already appearing in the Gallery.

URL to the control or page that is used to display items of this type at runtime

Specifies a relative URL from the root (~) of the physical path for the IIS application or IIS website that hosts your iMIS content management websites to the web user control that should be used to display instances of the content item associated with this content type. By default, the root corresponds to C:\Program Files\ASI\iMIS\Net. For example, ~/CustomControls/myUserControl.aspx.

If you have not created a custom IContentType class (you entered Asi.Business.ContentManagement.ContentType.ContentTypeBase in the Name of the IContentType class within the assembly field), a declaration to this control is embedded in published pages that use the content item, and the control will be dynamically loaded and inserted into the page when rendering the control (for preview or for search). If you've

implemented a custom IContentType class, you can change this behavior to match your own requirements.

Configuration options: Advanced Properties (optional)

Name of the .NET assembly that contains the class that implements this content type

Specifies the name of the class library that contains the compiled serializable class.

Name of the serializable class within the assembly that implements this content type

Specifies the name of the class that implements the content item in Page Builder (which must inherit the base class Asi.Business.ContentManagement.ContentItem). You must enter the fully qualified class name, including the namespace.

Name of the .NET assembly that contains the IContentType class used to publish this content type

Specifies the name of the class library that contains the compiled IContentType class.

- If you are using the base IContentType class provided with iMIS content management for this content type, enter Asi.Business.ContentManagement.
- If you are using a custom-developed IContentType class, enter the name of the class library that contains the compiled class.

  Name of the IContentType class within the assembly

  Specifies the name of the class that implements the IContentType interface that iMIS content management uses to render and publish the content item.
- To use the default rendering and publishing behavior provided by the base IContentType class provided with iMIS content management, enter Asi.Business.ContentManagement.ContentType.ContentTypeBase.
- To perform custom actions when a content item is published or rendered, you can instead create a custom IContentType class (which must inherit the base class (Asi.Business.ContentManagement.ContentType.ContentTypeBase). You must enter the fully qualified class name, including the namespace.

URL to the control or page that is used to collect the properties of a new item of this type

Specifies a relative URL from the root (~) of the physical path for the IIS application or IIS website that hosts your iMIS content management websites to the web user control that should be used to collect properties when creating new instances of the content item associated with this content type. By default, the root corresponds to C:\Program Files\ASI\iMIS\Net. For example, ~/CustomControls/myUserControl.aspx.

In most cases, you should specify the same control here as for the URL to the control page that is used to edit the properties of an existing item of this type.

> **Note:** Note: This control is currently unused in this version of iMIS content management. Instead the control specified in URL to the control page that is used to edit the properties of an existing item of this type is used for collecting the properties for newly created content items and for existing content items that are being edited.

URL to the control or page that is used to edit the properties of an existing item of this type

Specifies a relative URL from the root (~) of the physical path for the IIS application or IIS website that hosts your iMIS content management websites to the web user control that should be used to collect properties when editing the configuration of an existing content item associated with this content type. By default, the root corresponds to C:\Program Files\ASI\iMIS\Net. For example, ~/CustomControls/myUserControl.aspx.

In most cases, you should specify the same control here as for the URL to the control page that is used to collect the properties of a new item of this type.

URL to the control or page that is used to collect parameters for content items of this type

Specifies a relative URL from the root (~) of the physical path for the IIS application or IIS website that hosts your iMIS content management websites to the web user control that should be used to collect parameter overrides for the content item associated with this

content type. By default, the root corresponds to C:\Program Files\ASI\iMIS\Net. For example, ~/CustomControls/myUserControl.aspx.

You use this type of control to override the configuration of a content item on a per-navigation-item basis. The parameter overrides can be specified in two different ways in a navigation item, depending on what type of input this control is written to accept:

- The URL parameters field can pass parameters in an ampersand-delimited string that is appended to the URL that fetches the associated content record.
- The Content parameters field can actually display selected properties from the control that defines the configuration page for the associated content item. In other words, a subset of the properties defined in the control specified in the URL to the control or page that is used to edit the properties of an existing item of this type field.

  Only one of the content types shipped with iMIS content management uses this field (ContentTaggedList), and the corresponding control is written to collect parameters from the Content parameters section of a navigation item.

  URL to the icon graphic that represents items of this type

  Specifies a relative URL from the root (~) of the physical path for the IIS application or IIS website that hosts your iMIS content management websites to an image file that should be displayed on rendered web pages as the Easy Edit icon for content items associated with this content type. By default, the root corresponds to C:\Program Files\ASI\iMIS\Net. For example, ~/CustomControls/mySurfToEditIcon.gif.

  The image file must be 16x16 pixels in size. If this field is left blank, a default Easy Edit icon is used (~/AsiCommon/icon_con_usercontrol.gif).

  URL to the configuration help page

  Specifies a relative URL from the root (~) of the physical path for the IIS application or IIS website that hosts your iMIS content management websites to the Configuration Help for the content item associated with this content type. This Help page displays when you click the link when configuring a content item. By default, the root corresponds to

C:\Program Files\ASI\iMIS\Net. For example, ~/i-parts/Common/QueryMenu/QueryMenuHelp.htm.

The visual look and feel of the Help page is based on the iMIS theme you have selected. To be consistent with the rest of iMIS, we recommend that you only use basic HTML and allow iMIS to style the page. However, if needed, you can tailor the page using internal CSS.

Defining content authority groups

Do the following to define content authority groups (CAG).

Go to RiSE > Maintenance > Content Authority Groups:

1. Click select for an existing content authority group to modify its properties. You can also add or delete a content authority group:

- Click add to add a new content authority group:

1. Enter a Group Name for the new content authority group.
2. Select MasterAdmin if applicable.
3. You can also select to Copy an existing iMIS Group.

- Click delete to delete an existing content authority group.

2. Expand the Group Membership section to add new group members. Once members have been added, you can edit content authority group permissions for each member.

When defining a content authority group, you can designate that it is a Master Admin content authority group. This assigns all members of this content authority group to the Content Administrator Document System security role, which gives all members of this content authority group full Document System permissions to all iMIS content management definition objects in the system. This is useful when you want to ensure that members of this content authority group are never limited in any way by the Access Control settings of iMIS content management definition objects.

Creating content authority groups based on iMIS security groups

To enable the people who perform web content authoring to view and define content folders and content records, you must grant Document System Read, Edit, and Delete permissions to these people in the Access Settings section of every content folder definition. It can be too permissive to grant these permissions to the security role Everyone, and it can be too tedious to add every person as an individual user just so you can grant them the appropriate permissions.

A much easier method is to define content authority groups that are based on your preexisting iMIS security groups, with each content authority group having the same members as the corresponding security group. Then, when defining content folders, you can assign the content authority group in the Workflow Management section, and in the Access Settings section you can grant Document System Read, Edit, or Delete permissions as needed to the corresponding security group, or Full Control permissions to confer Read, Edit, and Delete permissions.

Create a content authority group that is based on an iMIS security group.

Go to RiSE > Maintenance > Content Authority Groups:

1. Click add to add a new content authority group.
2. Select Copy an existing iMIS Group.
3. Click select.
4. Find the name of the iMIS security group you want to copy.
5. Click the name of the iMIS security group.
6. Click Save.

This creates a content authority group that has the following:

- The same name as the selected iMIS security group, followed by CAG.
- The same members as the selected iMIS security group, which are copied at the time of creation. If additional members are later added to the security group, they are not automatically added to the content authority group.

- One of the members has Content Editor and Default Owner content authority group permissions assigned by default. All other members have no content authority group permissions at all. You must edit the permissions for each member.

  > **Note:** Note: After you create a content authority group in this manner, the content authority group and the original iMIS security group do not automatically stay in sync. They are two different groups at this point and each must be updated separately.

  Troubleshooting

- You must be a member of at least one Master Admin content authority group.
- You must have planned the content authoring workflow that you want for your organization.
- Optionally, you should have a list, prepared with the assistance of the person who performs iMIS administration, of the standard iMIS security groups for which you want to create corresponding content authority groups.

Managing the content block content item's security using content authority groups

Runtime access to the Content Block content item is controlled using permissions in Content Authority Groups. Only users with administrative access or the Content Editor permission can add content or posts, or a child, if applicable. Authenticated users without the Content Editor permission can reply to posts if replies are enabled, as well as edit or delete their own replies.

Giving a user content editor permissions

Go to RiSE > Maintenance > Content Authority Groups:

1. Click select for an existing content authority group to modify its properties. You can also click add to add a content authority group. In the Select New Group Members area, add the new user to the content authority group if they are not already a member:

1. Select Last Name in the Select a Query drop-down.
2. Find the new user based on their last name.
3. Click Add for the new user you want to add. The user is added to the content authority group.

   The Content Editor Permission can be added to a user in any content authority group.
2. In the Current Group Members area, click edit permissions next to the user's name.
3. Select the Content Editor checkbox. No other permissions are required to use Content Block, nor will additional permissions impact the use of Content Block.
4. Click Update to update the permissions.
5. Click Save to update the content authority group. The next time the user logs in to iMIS and navigates to a page containing a Content Block, they will see options to Add, Edit, and Delete HTML Posts and Child Posts, if enabled.

   Note: Note: This permission also gives the user Easy Edit permissions which can be used to edit the content item configuration in iMIS content management. Editing content using Content Block or using iMIS content management is considered comparable from a security stand point. Also, System Administrators have full access regardless of any content authority group permissions.

   Adding a reply or editing an existing reply

   Authenticated Users, such as logged-in users, are allowed to create replies to posts if this function is enabled in the content item configuration. These users can also edit and delete their own replies, but not those of other users. System Administrators and Content Editors have full edit access to all replies.

   Reading content block posts

   All users are allowed read access to the Content Block content item. However, all other iMIS security still applies. Pages containing a Content Block can still be public or secure just like any other page on your website.

Concept: content authority groups (CAGs) and content authoring workflow

A content authority group (CAG) is a special type of iMIS security group whose members have permissions that are specific only to iMIS content management functionality. Content authority groups are also used to enable content authoring workflow.

content authority group permissions

Content authority group permissions are specified for each member of a content authority group. These permissions determine whether that member can create, edit, publish, and delete navigation items, content records, and content folders. They also determine whether that member can define content layouts, upload graphics for use in Content HTML content items, and upload files when defining a ContentFile content item.

Content authority group permissions are globally applied throughout iMIS content management. For example, if a specific iMIS user is granted permission to edit content records in any content authority group to which they belong, then that user has global permission to edit content records in any content folder.

Content authority groups can be designated as a Master Admin content authority group. Members of a Master Admin content authority group are automatically assigned to a special iMIS Content Administrator security role. iMIS users who belong to the Content Administrator role always have full Document System security permissions for all iMIS content management definition objects in the system.

Content authoring workflow

Content authoring workflow is enabled for a content folder by assigning a content authority group to the content folder. All content records created in that content folder will subsequently progress through the workflow that is defined by the permissions assigned to each member of the content authority group.

When new sub-folders are created, the content authority group assigned to the parent folder is copied into the definition of the new sub-folder by default (thus inheriting the parent folder's workflow), but any content authority group member with Folder Editor per-

missions can change or remove the assigned content authority group of the new sub-folder.

Content authoring workflow revolves around messages that appear in the Page Builder Task List for every person who is a member of at least one content authority group. Any person with access to Content Management can view anyone's Page Builder Task List. The Page Builder Task List is divided into the following categories:

- Content you are working on – Content records that you were the last person to define and save, and which are still in a Working state, are listed here. It does not matter whether you are a member of the content authority group assigned to the content record's parent content folder, or whether the parent content folder has a content authority group assigned to it.
- Content awaiting your approval – People who do not have Content Approver content authority group permissions cannot publish content records. Instead of seeing a Publish command, they see a Submit for Approval command, which submits a content publishing request. These content publishing requests are listed here for all people that have Content Approver content authority group permissions in at least one content authority group to which they belong. It does not matter whether you are a member of the content authority group assigned to the content record's parent content folder, or whether the parent content folder has a content authority group assigned to it.
- Content deletion requests – People who do not have Content Approver content authority group permissions cannot delete content records. They see the Organize > Delete command, but using it does not actually delete the content record from its parent content folder. Instead, this action submits a content deletion request. These content deletion requests are listed here for all people that have Content Approver content authority group permissions in at least one content authority group to which they belong. It does not matter whether you are a member of the content authority group assigned to the content record's parent content folder, or whether the parent content folder has a content authority group assigned to it.

- Content that has expired or will soon expire – If you are the assigned content owner for a content record that is defined to have an expiration date, expiration notices for that content record are listed here when that date approaches, when the date actually occurs, and at defined intervals after the date has passed.
- Content change requests assigned to you – When people who do not have Content Editor content authority group permissions use the Easy Edit feature of iMIS content management to edit a content item or content record on a rendered web page, they see a content change request form instead of the content record editor or content item editor. Such content change requests on content records for which you are the assigned content owner are listed here.

  Note: The person who creates a new content record is automatically assigned as the content owner for that content record (this assignment can be manually changed after creation). It does not matter who the content owner assigned to the parent content folder might be.

  Caution! A content record does not have a content owner automatically assigned if it was created by a person who is a member of the SysAdmin role, but who does not have Content Editor content authority group permissions in at least one content authority group.
- Unassigned content change requests – Similar to the preceding bullet, except that content change requests for content records that have no specified content owner are listed here in the Page Builder Task List of every person who has Content Editor content authority group permissions in at least one content authority group to which they belong.

> **Note:** Note: You must be a Full user and you must belong to at least one content authority group to see the Content Management tab. Casual and Public users who are members of a content authority group cannot see the Content Management tab, but they can interact with content records by using the Easy Edit feature.

Concept: content authority group permissions versus Document System permissions

Content authority group (CAG) permissions are specified for each member of a content authority group in the definition of each content authority group. Document System security permissions are defined in the Access Settings section in the definition of most iMIS content management definition objects.

Both types of permissions affect your ability to view and define iMIS content management definition objects. The interaction between these two different sets of permissions enables some sophisticated structuring of security access and content authoring workflow.

- Document System Read permissions for iMIS content management definition objects such as a content record or a navigation item determine not only which iMIS users can view the properties of that definition object within Content Management, but also determine who can see the rendered version of that object on a website.

  For example, if a content record is assigned to the system role Everyone with Read permissions, then even anonymous visitors to an iMIS content management website will be able to view that content record's rendered web page. However, if only a specific security group such as "Board Members" is given Read permissions for that content record, then only members of that security group who have logged on to the iMIS content management website will be able to view that content record's rendered page. If they do not log on to the website with their iMIS logon name, they are treated as anonymous users and unable to view the rendered page.

- Document System Edit permissions are required to edit the properties of iMIS content management definition objects and Delete permissions are required to delete iMIS content management definition objects. However, these permissions are not sufficient by themselves. You must also have the corresponding content authority group permissions. For example:

- If you have Document System Read and Edit permissions on a content record but you do not also have the content authority group Content Editor permission, then when you

attempt to view the properties of that content record, you will see only a rendered preview of that content record. You might want a mixture of permissions like this, plus the content authority group Content Approver permission, for the staff in your content authoring workflow who you want to give the ability to approve or reject content, but not the ability to create or revise content.

- If you have Document System Read, Edit, and Delete permissions on a content record and you have the content authority group Content Editor permission, then you will be able to view and edit the properties of that content record, but you will not be able to delete that content record. If you also have the content authority group Content Approver permission, then you will also be able to delete that content record.

Configuration options: content authority groups

These fields control the properties of content authority groups (CAGs) that are defined in the system.

Go to RiSE > Maintenance > Content Authority Groups:

You can click add to add a new content authority group, or select an existing content authority group.

Master Admin (Is Master Admin)

Assigns all members of this content authority group to the Content Administrator Document System security role, which gives the members full Document System permissions to all iMIS content management definition objects in the system. This is useful when you want to ensure that members of this content authority group are never limited in any way by the Access Control settings of iMIS content management definition objects.

Copy an existing iMIS Group

(displayed only when you click add from the main list of defined content authority groups)

Creates a content authority group that is based on an existing iMIS security group that you choose when you click select. This content authority group:

- Has the same name as the selected iMIS security group, followed by CAG.
- Has the same members as the selected iMIS security group (copied at the time of creation. If additional members are later added to the security group, they are not automatically added to the content authority group).
- One of the members has Content Editor and Default Owner content authority group permissions assigned by default. All other members have no content authority group permissions at all. You must edit the permissions for each member.

  edit permissions

  (displayed only after at least one member has already been added to the content authority group)

  > **Note:** Note: The following content authority group permissions are additive with the standard Document System permissions used for all iMIS definition objects. For example, even if you have Content Editor content authority group permissions, you will not be permitted to edit the properties of a specific content record unless you also have Read and Edit Document System permissions on that content record. And even if you have Content Approver content authority group permissions, you are not permitted to delete content records unless you also have Delete Document System permissions on each content record.

- Content Editor – Grants the ability to create new content records and edit the properties of existing content records. Also enables you to be designated as the content owner of a content folder or content record. The following workflow events appear in your Page Builder Task List:
- Content record expiration notices
- Content record change requests

  Clear this checkbox to revoke these permissions and prevent these workflow event notifications.

Note: If you do not also have Content Approver content authority group permissions, you will not be able to publish or delete content records. Instead of a Publish command on the toolbar, you will see only a Submit command, which notifies every person with Content Approver content authority group permissions that you have requested to publish the content record. Likewise, although you'll see a Delete command, the content record is not actually deleted. Instead, all content approvers receive notice that you have requested to delete the content record.

- Default Owner – Designates a single member of the content authority group as the default content owner to automatically assign to a content folder or content record if the current content owner becomes ineligible for any reason. For example, if you change the content authority group assigned to a content folder and the previous content owner does not have Content Editor content authority group permissions in the newly assigned content authority group (or isn't even a member of the new content authority group), then the Default Owner of the newly assigned content authority group is automatically assigned by the system as the new content owner for the content folder.
- When you define a new content authority group, the first member that you add to the content authority group is automatically assigned both Default Owner and Content Editor content authority group permissions.
- You cannot remove Default Owner permissions from a content authority group member. Instead, you must assign Default Owner permissions to a different member (which also automatically assigns Content Editor permissions to that member if they do not already have them).

  Note: For content folders that have a content authority group (CAG) assigned to them, the Owner of this content value is not copied to new content records that are created inside of it. Instead, content records automatically have this value set to specify the first person who created the content record, which you can subsequently change as needed.

  Caution! A content record does not have a content owner automatically assigned if it was created by a person who is a member of the SysAdmin role, but who does not have Content Editor content authority group permissions in at least one content authority group.

- Content Upload – Grants the ability to upload images for use in Content HTML content items and to upload other types of files for use in ContentFile content items. Clear this checkbox to revoke these permissions.
- Content Approver – Grants the ability to approve content records that have been submitted for publishing or for deletion. The following workflow events appear in your Page Builder Task List. By default, publishing requests are also emailed to you, but the person who performs iMIS content management implementation can disable these emails in RiSE > Set up content management > Page Builder configuration.
- Content record publishing requests
- Content record deletion requests

  Clear this checkbox to revoke these permissions and prevent these workflow event notifications.
- Folder Creator – Grants the ability to create new and edit existing content folders. Clear this checkbox to revoke these permissions.
- Folder Editor – Grants the ability to edit the properties of existing content folders. Clear this checkbox to revoke these permissions.
- Navigation Creator – Grants the ability to create new and edit existing navigation items. Clear this checkbox to revoke these permissions.
- Navigation Editor – Grants the ability to edit the properties of existing navigation items. Clear this checkbox to revoke these permissions.
- Layout Editor – Grants the ability to create new content layouts and edit the properties of existing content layouts. Clear this checkbox to revoke these permissions.

Intelligent Query Architect (IQA)

The Intelligent Query Architect is the foundation for searches, lists, and data for reporting throughout iMIS.

Understanding IQA

Intelligent Query Architect (IQA) is a query-building tool that extracts data from the iMIS database. IQA simplifies query-building tasks by providing a user-friendly interface that makes it easy for a user with limited SQL experience to build queries and reports.

Use IQA to:

- Display targeted information to users, such as a list of committee members, participation lists on contact account pages, and lists of payments and invoices
- Create reports with the Microsoft SQL Server Reporting Service (SSRS)
- Present queries to users with runtime prompts
- Allow users to create ad hoc, dynamic reports
- Organize data for mailings and letter merges
- Gather data for business analysis

To increase efficiency, you can copy and combine existing queries to define new ones. Users can access IQA queries through various locations within iMIS, but role-based security settings control access to queries and the underlying data.

Key Features: IQA

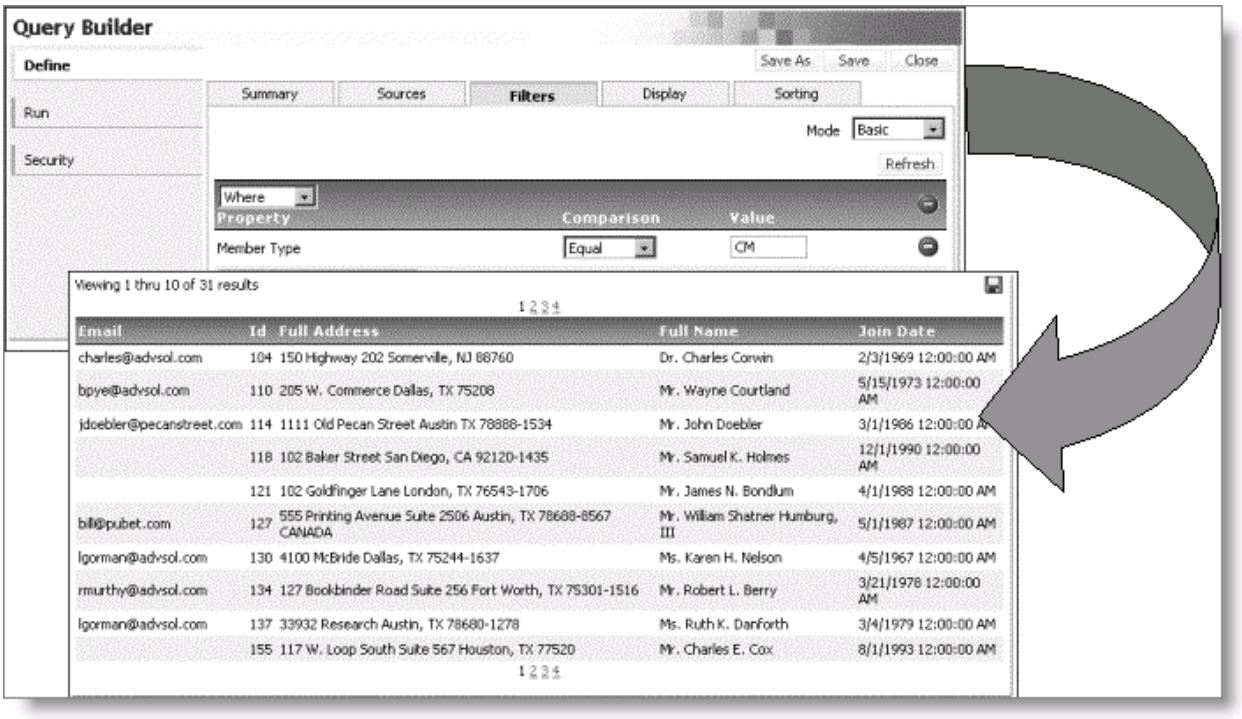
IQA allows you to specify many data display options, including:

- Fields displayed from one or more business objects, including the ability to display concatenated or calculated fields.
- The sort order for displaying rows in a list.
- The selection criteria to locate rows to display, including the ability to prompt the user for runtime criteria. For example, you can specify that the user can enter an invoice number to locate an invoice.
- Which page to display if it is appropriate to show additional information for the record being viewed. For example, you can specify that the Invoice Detail window should open if a user clicks on an invoice number link in the list.

  And you can design a query once and use it in many locations throughout the system.

Task by role: IQA

The tasks a user performs depend on their security authorization, which is role-based. Use the security controls and display options to make sure the correct query results and the access to them are appropriate for each type of user. Typically, an administrator would set permissions and security, an authorized user would define the query, and a lower-level user would run and export the available queries.



Example of a query definition and its results

Understanding iMIS queries

Queries are a central concept in iMIS. They are used to extract data from the database, but they also drive many application elements. For example, queries are used as the source for many user interface elements, especially for the display of data to users. Queries are also used as sources for reports.

The data sources for queries can be other queries or iMIS Business Objects. Queries can be simple, using a single source; or they can be complex, with multiple sources and different types of joins. For example, a simple query can gather and display all contacts from the province of Ontario. A complex query might organize donors by giving levels and frequency of gifts to generate a detailed report.

Query definitions are stored in the Document System. Access to queries are granted through security settings.

Outputs

You can generate a variety of outputs from IQA:

- Webpage display – Queries can deliver results in a quick list view (Run) or in a formatted webpage that enhances your organization's website.
- Mail merge file
- Reports – Combine query results with report formats in Microsoft SQL Server Reporting Services (SSRS) to create, access, modify, and share reports.
- File

Tour: Intelligent Query Architect

You must be have the SysAdmin role to perform this quick tour.

1. Select Tools > Intelligent Query Architect.

   The Intelligent query architect page appears displaying the full Document System folder tree, filtered to display only query objects.

2. Navigate to Common > Examples > Query Example.
3. In the Query Example folder contents area, select Example Query. Click Edit.

   The IQA page appears.

4. Click the Sources tab. Use the Mode dropdown list to toggle between Advanced mode and Basic mode.

   Notice how the Advanced mode exposes more functionality.

5. Explore the remaining tabs and task list items.

Concepts and Terms: IQA

Business objects are collections of self-contained data that represents an entity or process, and shields the physical data. You can use business objects to build the query definition, or you can base the query on an existing query.

Use joins to specify which fields are equivalent so the files can relate to each other correctly. The most common joins in iMIS center on member ID numbers.

Store the query in the Document System, iMIS's server-side file system.

Define the results display with iParts, web part controls that allow you to create and edit website content.

Administering IQA

Getting Started with IQA

The steps to set up and use IQA include:

1. Administrator defines security permissions and global settings for queries.
2. An authorized user builds the query definition using Business Object data and/or other queries, with appropriate joins between the data. The user defines the results display or report format and stores the query in the Document System.
3. An end user selects a query and supplies any required parameters. The user runs the query and views the results in a webpage or a report.

Accessing IQA

If you are an administrator or a user who is allowed to set up queries, the Tools tab displays. Select Tools > Intelligent query architect.

Building a library of queries

Best practices for building your library

- Plan for a folder structure and naming convention for queries because multiple users will create queries and it may become difficult for a user to find the query they need.
- Establish a review of all queries to delete incorrect or unused queries. Consider a policy of allowing the user to copy or borrow another user's query but not to modify the original query.
- Use the Summary tab to track the author (based on the user's iMIS username) and created/update dates.
- Make sure that any user defined tables have been previously published.

- If your query is for a merge output process and you want your query to be accessible to users via Home > Generate Reports, you must create your query in the Tools> Common> Reports View folder. You can navigate to that folder from Tools > Intelligent query architect, or from Home> Generate reports.

Queries in the Document System

The Document System (Tools> Document System) offers a complete administrative tool for managing folders, security, and storage of queries. You can implement an entire library of queries that can be used in iMIS modules to best meet your users' needs.

Creating links to reports in the Document System

You can create links in the Document System that place the queries in the Generate Reports menu for certain areas.

Each area's DefaultSystem folder contains three sub-folders:

- Queries
- Reports
- ReportsView – link to these queries to display them in the Generate Reports menu for each area.

To create a custom folder in the Document System

1. Select Tools> Document System.
2. Select a folder from the document system directories.
3. Click New Folder.
4. Enter a folder name, for example Custom Queries.
5. (Optional) Select Allow only the following type(s) of objects in this folder and select the type of objects from the list.
6. Click Save.

Integrating queries throughout iMIS

Before you begin

You must have sufficient authority to create, edit, and delete queries in the listed Document System folders.

Enabling queries on user-defined tables

To build a business object for a user-defined table

You must build a business object for each new user-defined table you create; until you do, the table cannot be used as a source in a query definition.

1. Create the user-defined table.
2. From Tools > User defined tables, click Build All.
3. If you need binary data types (such as a character field greater than 255 characters) to display in the field list, add each type manually.

   To add a binary field to the View list

   When the business object is built, any character fields with a length greater than 255 characters are converted to binary data type. Fields with binary data type do not display when you select All from the View list on the Display tab in IQA. You must manually add fields of this type to the list.

1. Make sure you are in Advanced mode.
2. On the Display tab, select All from the View list.
3. Scroll to the bottom of the Display page.
4. In the SQL Expression field, enter the name of the field.
5. (optional) Enter an Alias for the field.
6. Select Add.

Building Queries

IQA provides two modes for query definition: Basic and Advanced. The general steps for defining a query are the same in either mode, but additional functionality is available in Advanced mode. Use Basic mode for querying and displaying simple lists of results from one or more sources with optional filters to narrow the results. Use Advanced mode for more complex queries and displays.

The default selection is Basic mode and a query writer will always be in Basic mode until they select Advanced mode. After selecting Advanced mode, they will always be in Advanced mode (even after signing out and signing back in) until they select Basic mode.

Basic Mode	Advanced Mode
Define sources and (optional) filters	Use calculations, such as sums and averages
Specify display details	Use queries in iMIS searches
	Use SQL expressions in queries
	Use complex filters, such as displaying only unique results
	Allow or require end user to supply parameters at run time
	Aggregate data and display
	Assign aliases to field names for display
	Link a display property to another page

See Reporting in IQA for information about using queries for reports.

Essentials of query definition

Define the query mode

Define the query as Basic or Advanced, depending on complexity. Use Basic mode for simple queries without calculations like sums and averages or SQL expressions.

Name the query

Follow a structured naming convention to make queries easier to locate. See Building a library of queries for guidelines.

Add source(s) for the query

Add one or more sources (business objects and/or queries) for the query. For example, you could set up a query based on the Contacts business object alone, or on both Contacts and Activities, or on a previous query with an additional source.

Use existing relationships between sources or create new ones.

If you have chosen more than one source for your query, there must be relationships among them. The most common relationships are used by default. However, you might need to create new ones. You can associate business objects and queries through fields that contain the same data.

To make user-defined tables available as sources in IQA, have your system administrator publish them in Tools> User Defined Tables. Whenever a new custom table is added or updated, the system administrator should re-publish the tables.

Set filters to narrow query results

Use logical operators (such as equal, not equal, and between) to refine query results.

Select the columns to display

You can select the columns you want to display from the sources you have selected and the order in which you want the columns to appear.

Define the sorting order of the columns

You can order and prioritize the properties in each column in ascending or descending order.

Test the query

It is important to test the query and edit it, if necessary, to make sure the desired results are returned.

Modify security access to the query

You can modify the security on a filter to assign read, write, and run privileges.

Save the query to an appropriate folder

To save a valid query, you must select at least one source and one column. If you select more than one source, the relationship between them must be defined. In most cases, a default relationship is inherited from your sources.

Tips for building queries

- Review information on Business Objects to help select the appropriate objects for your query.
- Base the structure and location for your query file/folder on the needs and access levels of your users. See Building a library of queries for information and hints.
- Start with a single source object and add additional objects as needed.
- Some attributes (relations, default columns, default column order) are inherited from the sources you select. You can modify these default settings during query definition/editing.

Creating or editing a query (Basic mode)

The following procedure shows how to define a new, simple query. To edit an existing query, you can follow the same procedure. In some cases, a system administrator can navigate to the webpage where the results are displayed and click Edit Source Query. See Editing a query-generated list in iMIS for more information.

To create or edit a query in Basic mode

If you have been granted access to an IQA folder, you can edit or create queries in that folder.

1. From Tools > Intelligent Query Architect, select Edit> Query or New> Query.
2. Make sure Basic mode is selected.
3. Enter a Name and (optional) a Description for the query.

   Tips:

Do not use an apostrophe (') in the query name.

Make sure the query has a unique name. The system does not check the name for uniqueness.

4. Click the Sources tab and click Add Source. Navigate to find a business object or query to use as a source for the query. (Most business objects are located in the Common folder.) Select the desired source and click OK.

   Note: When you add a source more than once, the system automatically appends a numeric value (beginning with the number 1) to the second and subsequent sources to distinguish between the sources. For example, if you add the Contact business object three times in order to set up a variety of relationships, the instances would be labeled Contact, Contact1, and Contact2.

5. (optional) Select an additional source and click OK. Use the up and down arrows to reorder the data sources as needed.

   If you select more than one source, you must define the relationships among the sources. Most sources have a common relationship as a default. Use the default, choose the desired relation from the list, or select Custom from the drop-down list to define a new one.

6. (optional) Click the Filters tab and define the filtering rules:

- Select the Property to be compared.
- Select the type of Comparison, such as Equal, Between, or Empty. Enter the Value or select a date for comparison.
- Click the + icon to add the filter.

  Tips:

  When you select Between, the Value column changes to display two fields with the word "and" between them. The specified values are inclusive.

The pattern comparisons (Contains, Not Contains, Starts With, and Ends With) use a simple text field even for a Property that normally contains a discrete drop-down list of values.

The Contains comparison type performs a string comparison to find one string within another string. A partial match (for example, only a portion of a word) is required.

Enter multiple values for a pattern comparison (Contains, Not Contains, Starts With, and Ends With) by separating each value with a comma.

Click the calendar icon next to any Date field to select a date. If you need to specify a specific time on the selected date, first enter the time in the Date field, using 24-hour format (for example, enter 23:00 for 11:00 p.m.) then click the calendar icon to select the date.

When entering numbers for a comparison on a date field (Within Days, Within Months, Within Years), be aware that such comparisons are zero-based. For example, if you select the Last Updated column and select Within Days, you must enter zero in the Value field to get all records that were updated within one day or enter 1 to get records that were updated within two days.

7. Click the Display tab and define how results columns will be displayed:

- Select the columns you want to work with (Selected, Defaults, or All) from the View list.
- Select the Only display unique results option to prevent duplicate results from displaying. When the query includes a property with a display function such as Count, that property is used to determine unique results. If the query includes more than one display function, only the first function property displayed (defined by the display order) is used.
- Select the results columns to Display to users. Select the Order in which you want the columns to display to users (from left to right). The order is based on the Order column, not the order in which they were chosen. Subsequent sorting selections go at the end of the sort order list (per session) by order listed within each session.

  Tip: If you are defining a query for a merge output process, make sure you select all columns needed for the merge.

8. (optional) Click the Sorting tab and specify the sort order for each column:

- Select the Property to sort by.
- Select the sort Priority for each Property.
- Select the Direction of data in each column: Ascending or Descending.
- Click the + icon to add the sort.

  The user can sort columns in the output by clicking on a column header. A carat symbol (^) will display in the column header, indicating that the column is now a sort column. The user-selected sort overrides any sorting defined on the Sorting page and will change the sort definition in the query to reflect the current column sort.

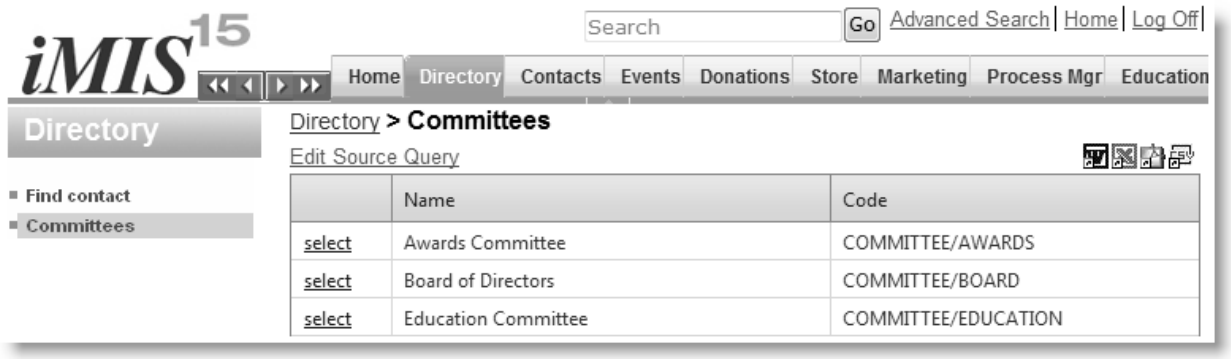
9. Select Run to test the query. If necessary, select Define to edit the query.
10. Select Security and select the Access Mode option to assign access and privileges for the query and its results display. The names of authorized users are listed in the Current Access List.
11. Click Save. Select the folder in which to save the query.
12. (optional) Click Report to save this query as a report definition. You can customize these reports and export them to .PDF or .XLS format. See Reporting in IQA for more information.

Editing query-generated lists in iMIS

Authorized users can edit an existing query that drives an IQA-generated list directly from the pages on which they appear. When you see a link called Edit Source Query above such a list, you can click the link and change the query in place, without leaving the page or navigating the Document System. This ability means that you can make quick and easy changes to query filters, column display, and sorting.

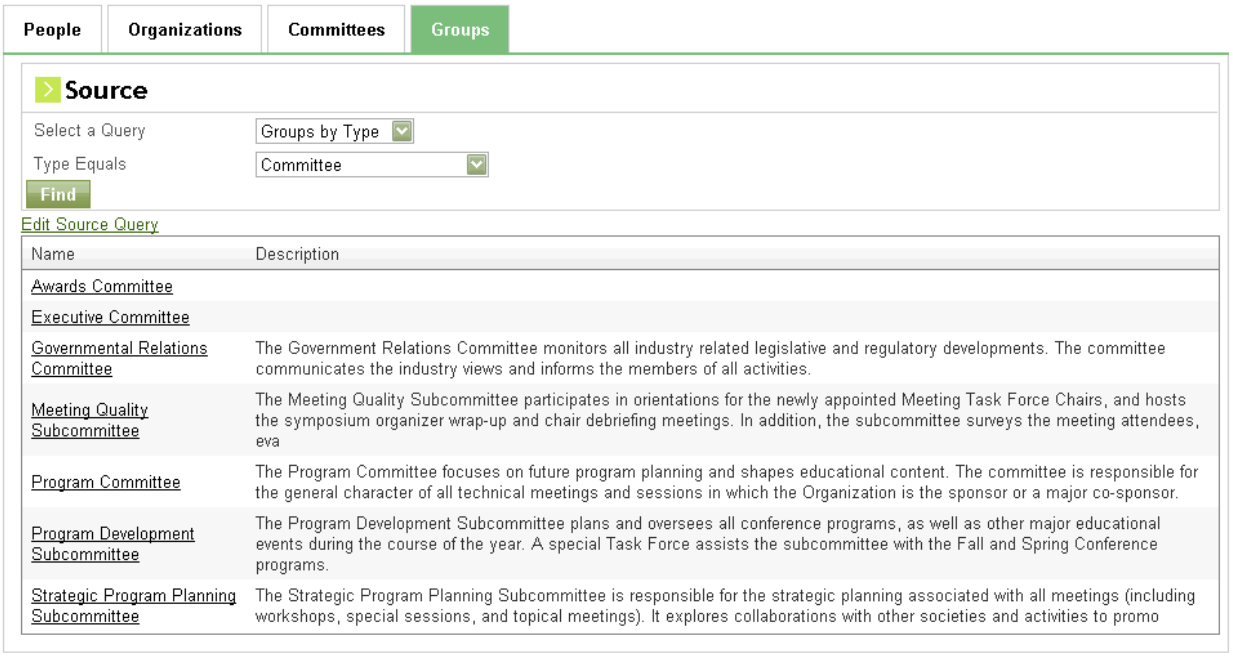
If the link does not appear above a query-generated list, then you must navigate to IQA to edit the query. For example, you cannot edit query-generated lists from many iParts. Some IQA features are disabled from this view of the query: you cannot rename the query or Save As. Depending upon the list's implementation in iMIS, a list's Edit Source Query link may be hidden until the query is run for the first time.

> **Note:** Caution! Queries are not versioned in iMIS. If you are unsure about the changes you are about to make, consider navigating to IQA instead so that you can create a copy of the original query before making any edits.



To modify a query from a webpage

1. Navigate to the desired page.
2. Click Edit Source Query.
3. Modify the information for the query, including:
   - Renaming the query
   - Adding sources
   - Defining filters
   - Specifying columns and links to display
   - Selecting column sort order for display
   - Editing security settings
4. Click Save.
5. Run the query to check the results and the display.
6. (optional) Select Report and save this report definition to your workstation or to the Document System. Click Save.



Defining displays for users

The Display options in query definitions specify which columns and fields to display, and in what order. You can use iParts to define where and how you want to display the query results for your users. These iParts allow you to:

- Display query results in a simple form view: Summary Display iPart
- Merge query results into your site with whatever title, parameters, columns, labels, and sorting you need: Query Menu iPart
- Enable exports to Word, Excel, PDF, and CSV (comma-separated values): Query Menu iPart
- Allow users to select which query they want to view: Query Menu iPart
- Display query results in a chart, such as a pie chart or a bar graph: Query Chart Viewer iPart
- Display a group of product or profile images based on the results of an IQA query: Related Items iPart.

For an example of using the Query Menu iPart for a results display, see Example: Display completed orders.

Defining a query (Advanced mode)

The Advanced mode gives you powerful methods to query, filter, display, and report your results. The steps to build a query in Advanced mode are the same as in Basic mode, with additional options described in the following sections.

Use Advanced mode to define queries with calculations and/or SQL expressions, and to aggregate data. You can set up complex filters and assign aliases to field names for display.

Advanced options for Summary

In Advanced mode, the Summary page provides a field to define any SQL statement for your query.

Advanced options for Sources

In Advanced mode, the following options are available on the Sources page:

- Use FORCE ORDER option: Require SQL Server to join the tables in a query in the order you specify.
- Use NOLOCK locking hint: Require SQL Server to ignore record locks.
- Use join method for security enforcement: If enabled, when users run the query, iMIS checks to make sure they have permission to read every source within the query before displaying the results, whether the source is a business object, another query, or both. When disabled, iMIS does not check the security for every source and instead only enforces the security setting for the main query.

Advanced options for Filters

Filters refine a query. You can limit your results by eliminating duplicates, using comparisons, setting parameters, and using logical operators.

Tips for adding filters

- If iMIS is installed on a case-sensitive SQL server, the filters you define in IQA are case-sensitive. You will not be able to define case-insensitive filters on queries when iMIS is running against a case-sensitive SQL Server.
- Select the Require user to provide at least one value option when you want to require a value for every filter you define for a query.
- Selecting the Remove icon for a filter set removes the filter set and all related filters from the query.

Advanced mode options for Display

In Advanced mode, the following options are available on the Display page:

- Function: Allows the user to find Count and Min or Max on a field.
- Alias: Creates a label name for the field to be displayed to users. The alias entered can contain special characters.

  Use key_ or code_ as a prefix in the Alias field to hide columns under certain conditions:
- If you use code_ as a prefix, this field will always be hidden from the initial result set.
- If you use key_ as a prefix, this field will be hidden if the current column is not a GUID.
- Link: You can add a link for each column listed in the Display tab so that the user can click on the link to go to a specified page for more details. See Linking IQA results for more information.
- Subtotal: Specify whether the property should be subtotaled in the display. You can display query results in a hierarchical grid of summary rows and detail rows by using the Subtotal option. See Hierarchical grid display for more information.

Developing filters

In Advanced mode, the following options are available on the Filters page:

- If you have selected multiple sources, you can select Add Filter to define additional filter rules using the And, And Not, Or, and Or Not connectors. Use the up and down arrows to specify the order in which to apply a filter.

Controlling joins between filters

Tip: When you define more than one filter, by default the join uses And, which narrows the results. However, if you add multiple filters on the same object Property (such as StateProvince), by default the filters join with an Or connective, which broadens the results. Therefore, to use the same object Property in an And join, create those filters separately.

For example, to define a filter to obtain customer records in Texas and in Virginia, first create one filter (where StateProvince = TX) and then select Add Filter to define the second part (where StateProvince = VA).

- A Multiple checkbox is visible when the filter Property contains a discrete drop-down list of values. Selecting this checkbox changes the Value selector from a simple drop-down list that enables you to select only one specific value to a multi-select control that enables you to select multiple values. The selected values are used as an Or comparison. See Defining a filter property with several values for more information.

  Tip: Even if the Multiple checkbox is not visible, you can still manually specify multiple values for any filter property by entering a comma-delimited list of quoted values. For example, you could specify the following multiple values for a City property: "Toronto","Montreal","Calgary"

- Require the user to provide at least one valid value: User must enter a valid filter value before the query can be run.

Adding runtime parameters

In Advanced mode, you can create a parameterized query, which allows (or requires) users to specify a value (such as "state = FL") to narrow their search. This lets other staff members run a standard query, changing a runtime parameter value each time to get the results they need. Such queries are useful for organizations where limited number of users may create the actual queries.

Limiting the rows returned by a query

You can set an advanced filter on a query to set a hard limit or a default value for the number of returned rows.

To limit the number of rows returned by a query

1. Create or edit a query. (See Building Queries.)
2. Select the Filters tab.
3. Select Advanced mode.
4. Select the Limit the number of results returned option.
5. Enter the Value for the maximum number of rows to display
6. (optional) Enter a Prompt for the user and specify the behavior:

- No: Enforces a hard limit on the specified number of returned rows, which a user cannot change.
- Required: Makes the specified number of returned rows a default value. The user can change the value up to the maximum defined in the web.config file. If the user specifies zero or a blank value, the query returns the maximum defined in the web.config file.
- Optional: Makes the specified number of returned rows a default value. The user can change the value up to the maximum defined in the web.config file. If the user does not enter a value, filtering does not occur and the query returns all values.

7. (optional) Enter custom text for the prompt (default is Maximum number of rows to display).

> **Note:** Tip: To create a "top n records" query result, specify at least one property on the Sorting tab.

Defining a filter property with several values

When a filter Property contains a drop-down list of values, you can select a single value from the list or you can select more than one. The selected values are used as an Or comparison.

To define multiple values for a filter property

1. Create or edit a query. (See Building Queries.)
2. Select the Filters tab.
3. Select Advanced mode.
4. A Multiple column displays between the Comparison and Value columns. For properties that have a discrete list of values, a checkbox displays in the Multiple column.
5. Select a property that has a discrete drop-down list of values, such as State Province.
6. Select the Multiple option.
7. A default Value displays. Browse to select another value.
8. From the Available Values list, select the values that you want to use in the filter. You can multi-select values by holding Shift or Ctrl while selecting values with your mouse.
9. Click OK.

The selected values appear in the Value column.

Adding dynamic filters to queries

You can dynamically filter your query results using the variables described below.

> **Note:** Note: You must enter the quotation marks where indicated when using the following variables.

- Filter by ContactKey and UserKey properties:
- “@LoggedInUser” and “@Me”: Both filter by the currently signed in user.

- “@SelectedUser” and “@SubjectContact”: Filters by a selected contact, such as contacts selected through On-Behalf-Of or user impersonation. These variables also honor ContactKeys sent via URL parameters. For example, set Contact.ContactKey equal to "@SelectedUser".
- Filter by date properties:
- @Date: Filters by the current date.
- @Now: Filters by the current date and time.

Linking IQA results

IQA lets you design search results that contain live hyperlinks within the items that are returned. Using the Link feature on the Display tab, you can create hyperlinks for one or more columns in your query results. These links let users immediately click through to the records and content that they are seeking. In the example below, users can click links to contact profile and product pages.

Recent Orders

Transaction Date	Full Name	Product Name	Quantity
1/5/2011	Mr. Charles P. Better, LLM	Waterbottle	9
5/6/2010	John Waitts	Video - Creating a New Business	1
5/6/2010	Sam Self	Video - Is Fast Food Franchising for YOU!	1
5/6/2010	Isaac Wilder	Video - Excelling through Service	1
5/6/2010	Fran Ramos	Video - Creating a New Business	1

You can add this linking while you are editing a query: in Advanced mode on the Display tab, populate the Link field with parameters to generate the custom link. The link must have one of these forms:

a shortcut	~/MyShortcut
a content record	ContentCode=MyContentCode
a navigation item	NavigationCode=MyNavigationCode&URLParameter1Name=[PropertyName]
an ASPX page in your	~/Webpage.aspx&URLParameterName=[AliasName]

site	
a page dynamically populated based on the value of one or more URL parameters	~/MyShortcut&URLParameter1Name=[Alias Name]&URLParameter2Name=URLParam2Value

Guidelines for creating query links

- To build a link, you must indicate whether it is for a content record (ContentCode) or a navigation item (NavigationCode). Content record links display the published content record within an iMIS website, regardless of the sitemap definition. Links to a navigation item take the user to a particular page within an iMIS sitemap.
- ~/MyShortcut – For the given property, a link is established to the shortcut specified (shortcuts are defined in Site designer > Manage shortcuts). For example, if you want to link query results to a Products shortcut you have defined, then enter ~/Products.
- ContentCode=MyContentCode – For the given property, a link is established to the content identified by the ContentCode value. For example, if you want to link query results to a product page content record that has a Content Code of Specials, then enter ContentCode=Specials. To define or edit a Content Code, go to Content designer > Manage content, edit a content record, and expand the Properties pane.

  Note: If the Link includes both a ContentCode and NavigationCode, only the ContentCode is used to build the link.
- NavigationCode=MyNavigationCode – For the given property, a link is established to the navigation item identified by the NavigationCode value. For example, if you want to link query results to a profile page's navigation item that has a Navigation Code of ProfilePage, enter NavigationCode=ProfilePage. To define or edit a Navigation Code, go to Site designer > Manage sitemaps, edit a navigation item, and expand the Properties pane.
- Using URL parameters, you can control the data displayed on the target page if it contains an iPart that accepts such a value. The URL parameter can either be hardcoded to a

specific value or it can be dynamically generated based on the value of a particular Property or Alias of the query. You can add multiple URL parameters to the Link, separated by ampersands (&). URL parameters should be in this form:

- &URLParameter1Name=[PropertyName] – Dynamically builds the link based on the value of the specified query property. When referencing a query property, do not include any spaces. For example, if you want to set the URL Parameter iProductID to the Product Key property value, enter &iProductID=[ProductKey] (no space between Product and Key). By combining this example with the Shortcut example above, you can build a link that opens the shortcut populated with the product in the query results. The full Link would look like this:

  ~/Products&iProductID=[ProductKey]

- &URLParameter1Name=[Alias Name] – Dynamically builds the link based on the value of the specified Alias. If you want to create a link for a query property and you have given it an Alias, then you must reference the Alias name in the Link, not the Property name. For example, if you want to set the URL Parameter ID to the Id property value in the query results, and you have given that property an Alias name of iMIS Id, enter &ID=[iMIS Id] (include the space between iMIS and Id). By combining this example with the NavigationCode example above, you can build a link that opens a particular user's profile page. The full link would look like this:

  NavigationCode=ProfilePage&ID=[iMIS Id]

- &URLParameter1Name=URLParameter1Value – Sets the URL parameter to the same value in all of the results.

- If you want to use a property in a link's URL parameter, that property must be selected on the Display tab. However, you may not want a user to see values for all of the properties required to build a link. You can hide columns from a user by giving the property an Alias prefaced with code_. In the example screenshot above, the Full Name column uses the value of an ID property to build the link, but the ID property is hidden by giving it an Alias of code_ID.

- It does not matter the order in which you specify the parameters.

Troubleshooting tips

- If you get an error message after clicking a link in your query results, check your link entry for the following:
- If you have an opening bracket, you must also have a closing one [ ].
- If you provide an Alias for a property, then the original property name is no longer usable in the Link field. The Alias always overrides the original field name and will be the only column name available for reference in the results.
- If your query result links do not work as expected, try the following troubleshooting techniques:
- If possible, find a place in iMIS where the target page is correctly displayed and compare the URL parameters that appear for that page to the ones you have identified in the Link text field. Are there additional parameters required that you have not provided?
- Add the query to a content record in your website, so that you can view the query results like an end user would. After clicking a linked query result, examine the URL in your browser. Compare it to the Link you have built in IQA to determine if the URL is incomplete and if it contains everything you intended.

Hierarchical grid display

You can display query results in a hierarchical grid of summary rows and detail rows by using the Subtotal option. Subtotaled columns display as high-level items. Expanding one of these items displays the detailed (non-subtotaled) items.

Tips for creating a query displayed in a hierarchical grid

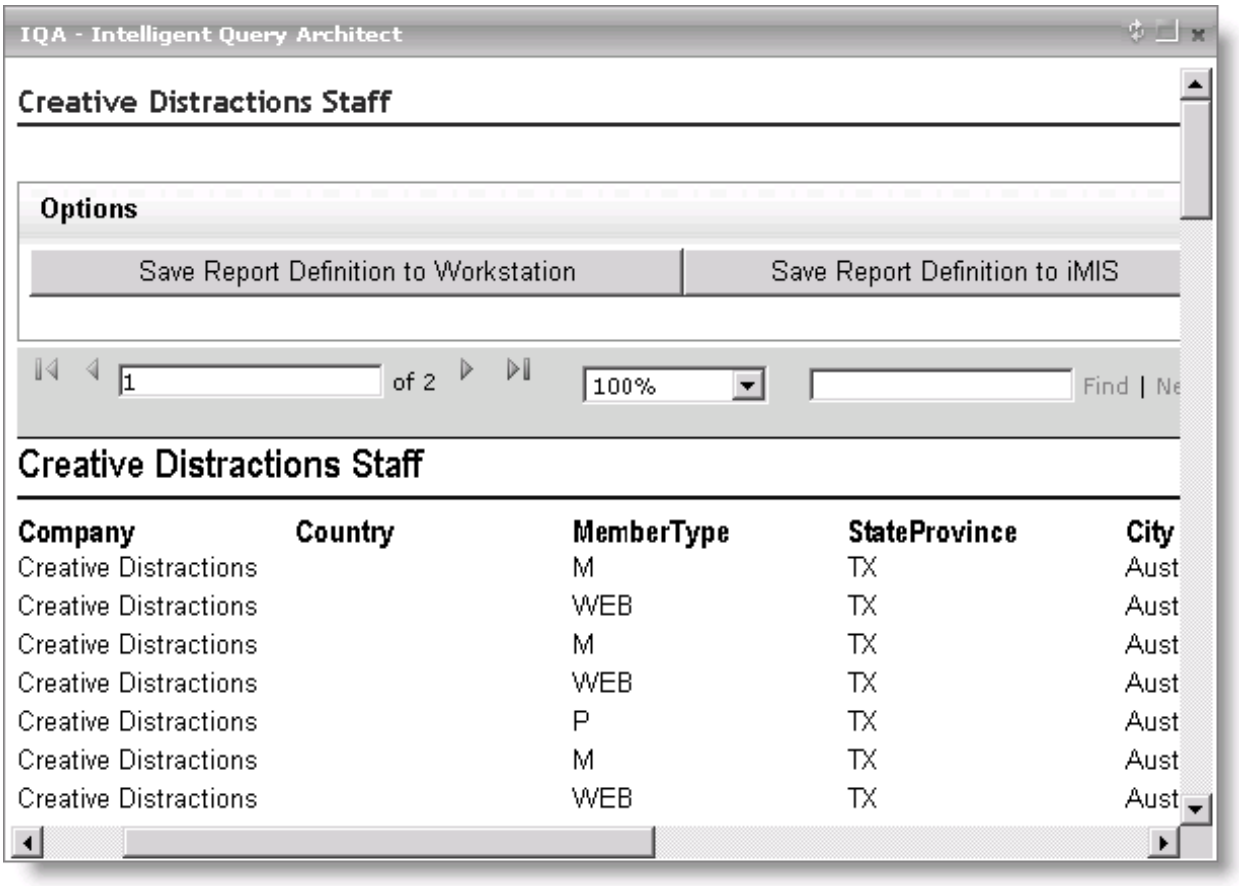
- The fields that are subtotaled are one query, and the fields that are not subtotaled are a separate query. Because of this, make sure that if you create a link for a column which contains a parameter that is a hidden field, the subtotal option for both of those fields must be the same – that is, both must be subtotaled or both must not be subtotaled.

For example, if you want to display a list of committees as a summary and the members of each committee as details, you would specify a link for the column Committee with a hidden group key field and select the Subtotal option.

- If you select the Subtotal option for all properties in a query, the results will not be displayed in a hierarchical grid.
- Any properties that are not subtotaled are displayed in the detail rows only.
- To display a non-numeric property in the summary rows, select the Subtotal option.
- Numeric, decimal properties (such as Donations.Amount, Orders.Balance, and DuesHistory.Amount) are automatically summed and displayed in the summary rows and also displayed in the detail rows. To display these properties in the summary rows only, select the Subtotal option.
- Non-decimal numeric properties such as Contact.Date of Birth, Contact.iMIS Id, and Contact.Home Phone are not automatically summed.
- If you select the Subtotal option for custom SQL expressions in your query, they will display in the summary rows. The subtotaled expression would not have any other effect on the query results.
- If the custom SQL expression is the only property subtotaled in your query, the query will not be displayed in a hierarchical grid. You must select the Subtotal option for at least one property that is not a custom SQL expression to display a hierarchical grid.

Reporting in IQA

This Report view is a fast and easy way to create and print new iMIS reports and to generate starter reports for later development. SSRS reports are always bound to a single query.



IQA reporting lets you:

- Export rendered reports to .PDF format, for archiving, sharing, and printing, and to .XLS format, for spreadsheet usage
- Customize the generated reports: totals, subtotals, summaries (Total Only), parameters (associated in the query)
- Save the reports into the Document System, which automatically adds the new template (.RDL) and its matching output process (binding query, template, and security to a report name you choose)
- Save the generated template file (.RDL) locally, to customize later in SQL Server Business Intelligence Studio

iMIS

Quick facts: IQA reporting

- iMIS integrates with the Microsoft SQL Server Reporting Service (SSRS)
- iMIS also harnesses it to bring dynamic reporting capability to iMIS queries.
- IQA reporting makes it possible to turn any query into an SSRS report:
- Filtered and auto-formatted
- Customized with sub-totals and layout settings
- Easily saved back into the Document System
- Easily saved to your workstation as an .RDL
- Free report customization in Business Intelligence Studio

Report from every query

- Every working query in iMIS can render a report in one click, without any modification
- Create reports on the fly without having to learn a report designer
- Reports inherit whatever filters the query contains
- Changes to the query show up in IQA reports immediately
- Built-in report navigation: start, end, next/previous page, jump to page

Auto-formatting

- Query result columns become report columns
- Formatting adjusts to fit the number of columns
- Change column order just by reordering them in the query

Simple saving

- No garbage: if you just create, view, and close a report, no files save or accumulate
- You save your query changes separately from the report

- Save to iMIS creates the report and template pair wherever you choose in the Document System
- Saved reports can be exposed and shared throughout iMIS as any other report
- Save to Workstation creates the report template (.RDL) on your file system, for offline editing
- Exports report data to Excel (XLS) format
- Exports formatted report to Adobe PDF

Subtotaling

- On the Display tab of queries, columns can be subtotaled and totaled
- Sort order controls order of subtotaling
- Use Totals Only to create a summary view, of subtotals without data lines

Customizable layout

- SystemConfig table holds SSRS parameters that set layout and formatting of all IQA reports
- Control page size (such as A4 versus Letter) and lay out headers and footers
- Control fonts, background and foreground colors, shading and separator lines
- Set report language and unit of measure

Creating and saving IQA reports

For all of your queries, the Report option in the IQA Editor lets you generate formatted reports on demand, as well as reusable objects: SSRS template files and matching output processes. Your queries from prior releases can leverage the Report command: no upgrading is needed to make them compatible.

To save reports from IQA

1. Select Save Report Definition to iMIS to save the reports to the Document System, which automatically adds the new template (.RDL) and its matching output process:

   The output process binds query, template, and security to a report name you choose.

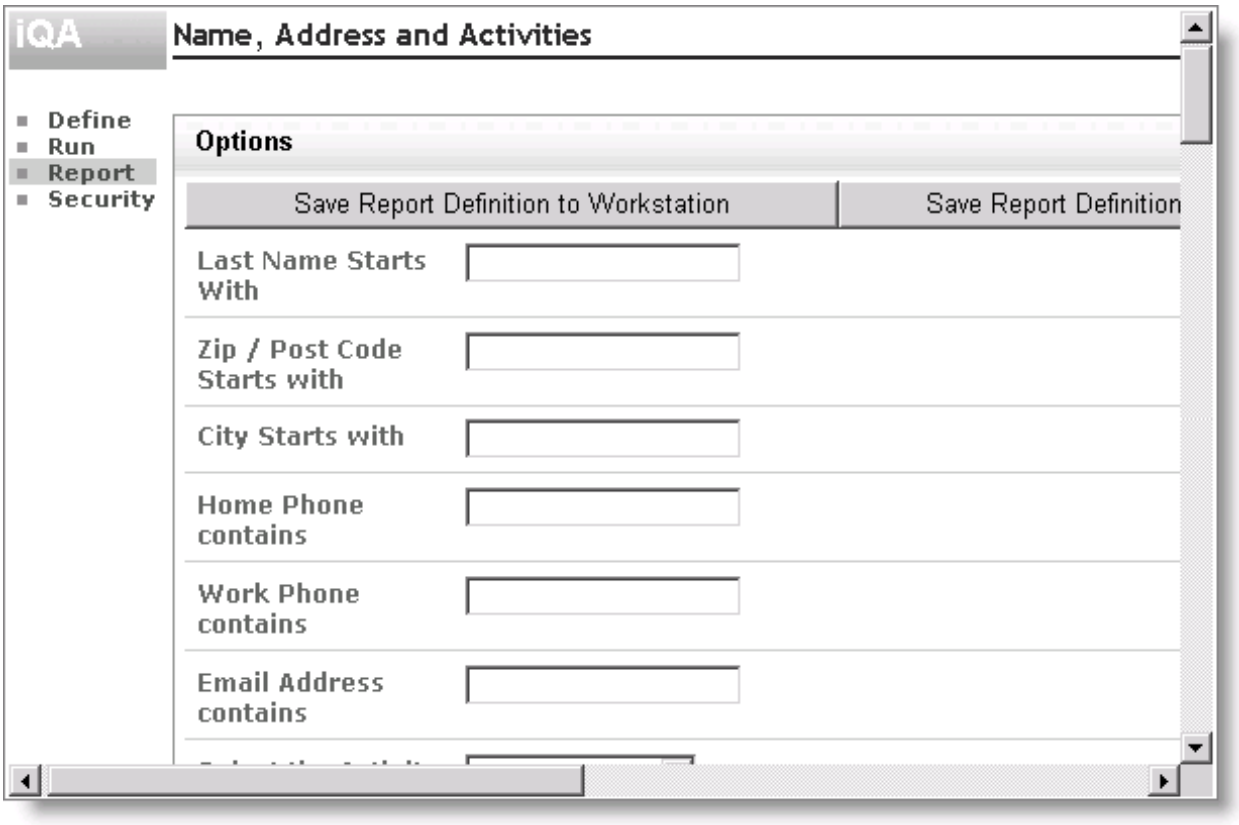
2. Select Save Report Definition to Workstation to export the generated template file (.RDL).
3. You can customize the RDL in SQL Server Business Intelligence Development Studio.
4. Select the Acrobat and Excel icons to export the report to standalone PDF or Excel files.
5. You can Open these exports directly in the application or Save them to your file system.

   To create a report from a query

1. Edit a query and click the Report link in the IQA navigation.
2. The report generates in memory and displays, fully formatted, immediately.
3. Reports default to the actual page size specified by your global parameters (see Changing the default layout for SSRS reports), so use the scroll bars to preview the entire area.

   Note: If the report is too large to fit in portrait orientation, it renders in landscape. If it is too large for landscape, the columns are narrowed to fit.

4. If your query includes filters (which appear in the Options area above the report display itself), enter a value in any or all of the filters, as needed, and click Refresh.



The report regenerates based on the filter.

13. Adust the filters and Refresh as needed.

Printing IQA reports

IQA handles printing with printer-ready layout through its facility to export to .PDF. You must have Acrobat Reader (see Adobe - http://www.adobe.com) installed on your workstation to support this. When you export by clicking one of the output icons, you're prompted to Open or Save.

When you select Open (or you later open the .PDF file from Windows Explorer after saving it), the exported .PDF displays in Acrobat Reader.

To print PDF reports

1. Verify that Acrobat Reader is installed on your workstation.
2. Open the PDF report, from either IQA or the file system on your workstation.

3. In Acrobat Reader, open the Print dialog, using the toolbar icon or File > Print.
4. Select the printer you want, and click Properties if you need to change the paper or orientation.
5. Select the print range, page handling, and advanced settings you want.
6. Click OK.

Subtotaling and ordering IQA reports

You can apply one or more subtotals in your query definition. In Reporting Services terms, subtotals are “groups”. When you enable Subtotal for a Display enabled field, a group is added. The groups nest in the Order you specify after Subtotal.

In the output, group headers appear for the first group only; group footers, with a count and the value being grouped, print for all groups.

Global layout control

IQA reporting layout is driven by global parameters that you control.

The Report view uses layout parameters stored in the iMIS SystemConfig table, so you can change parameters once (such as to assign corporate colors or A4 paper size) and have all IQA reports conform to your standards across the organization.

Requirements

This IQA-based reporting works with all of your queries, old and new. Everything you need for IQA reporting is distributed with iMIS. No additional licensing is needed for the ReportViewer control, which is a Microsoft redistributable component. Nor do you need to install Reporting Services on SQL Server, since the Report Viewer does all the needed processing.

> **Note:** Troubleshooting tip: If you see ReportViewer errors, you might have an old ReportViewer control. To get the newer version, search the web for Microsoft Report Viewer Redistributable 2005 SP1 (Full Installation), which is available for free download from several sites.

The optional applications are also free:

- Adobe Acrobat Reader, for opening and printing PDFs (install on workstations)
- SQL Server Business Intelligence Studio, for customizing RDL files externally, if needed

Creating links to reports in the Document System

You can access the Document System from Tools > Document System. You can further drill down into areas by following the hyperlink on the folder. Area folders contain a DefaultSystem folder.

The module's DefaultSystem contains three folders:

- Queries
- Reports
- ReportsView

The ReportsView folder for each module is represented by the Generate Reports menu in each area. You can manipulate what appears in those menus by creating links to queries in these folders.

To create a custom folder in the Document System

1. From Tools, select Document System.
2. Select a folder from the document system directories.
3. Click New Folder from the tool bar.
4. Enter a folder name, for example "Custom Queries".
5. (Optional) Select Allow only the following type(s) of objects in this folder and select the type of objects from the list.
6. Click Save.

Using IQA

General users with authorization can click the Select source query link located on many pages to access queries. They can also run reports based on queries from the appropriate pages.

Icons

The following icons are used in IQA:

Delete – Remove a field, filter, source, or other objects from a panel or query.

Add – Add a field, filter, source, or other objects from a panel or query. You must click this icon to apply the changes after creating the object.

Query – Distinguishes queries from other definition object types in the Document System.

International Taxation

International taxation changes how shopping carts appear to users in different regions.

This is how iMIS shows the same product across various taxation methods:

Canadian Taxation (GST and HST)

iMIS supports calculation for Canadian federal taxes (GST and HST). This allows you to tailor your organization's taxation method for both Canada and specific Canadian provinces. Applicable taxes are calculated automatically based on the default Canadian tax authority and customer province.

The tax codes for the GST/HST calculation method need to be set up in iMIS before they can be used. If these tax codes are not defined on the Product_Tax table, any taxes calculated equal zero.

To implement GST/HST calculation, you perform the following tasks in iMIS:

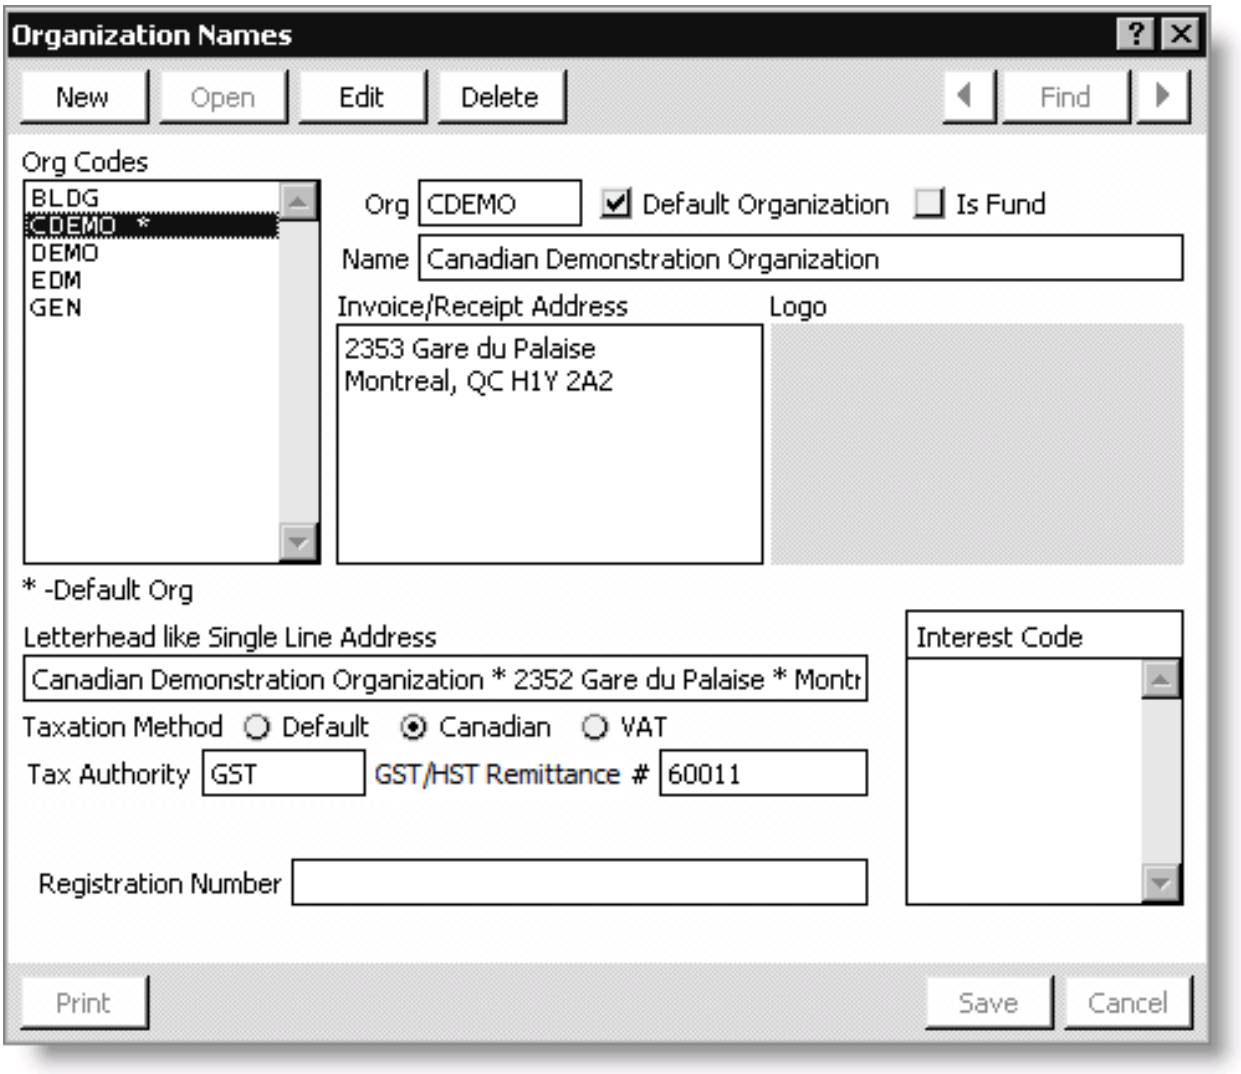
- Enable the Canadian taxation method for the Default Organization.
- Define the tax codes.
- Define the default tax authority.

> **Note:** Note: When you enable the Canadian taxation method, the VAT or Default taxation method is disabled automatically for an organization. Canadian and VAT taxation methods are mutually exclusive.

Enabling Canadian taxation for the Default Organization

The Canadian taxation method must be enabled for the Default Organization on the Organization Names window before establishing the specific tax codes used by the different modules of iMIS. After enabling the Canadian taxation method, exit and restart iMIS to implement GST or HST calculations for the Default Organization.

Organization Names window



- Org Codes - Lists the codes for the available organizations.
- Org - (required) Enter an abbreviated, descriptive code for an organization.
- Default Organization - (required) Enable to identify the organization using Canadian taxation as the default organization. If the organization using Canadian taxation is not designated as the Default Organization, the Canadian taxation method will not be implemented. An asterisk displays to the right of the default organization in the Org Codes drop-down list.
- Is Fund - (optional) Enable to indicate that an organization is also a fund.

- Name - (optional) Enter the full name of an organization. A maximum of 60 alphanumeric characters can be entered.
- Invoice/Receipt Address - (optional) Enter an organization's complete address. This address is the receipt address for invoices and other correspondences. It is also used on reports where the name and address display as a block.
- Logo - (optional) Paste an organization's logo into this area of the window.
- Letterhead like Single Line Address - (optional) If an organization's letterhead is a single line address, enter it in this field. The letterhead is used on reports where the address appears in a single line, such as event confirmations.
- Taxation Method: Canadian – Enable to use the Canadian taxation method. The following fields display when the Canadian taxation method is enabled:
- Tax Authority – Enter an organization's default tax authority. When defining a default tax authority for a Canadian organization, enter the Primary GST for the default tax authority.
- For non-Canadian organizations that use Canadian taxation and include the GST tax in the advertised price of all products (some organizations in Australia and New Zealand), enter GSTINC for the default tax authority.
- Press Ctrl+L to look up the tax authority codes defined on the Set up tax codes window (from AR/Cash, select Set up tables > Tax codes).
- GST/HST Remittance # – (optional) Enter the Canadian GST (Goods and Services Tax) number. The Canadian GST can be printed on invoices.
- Interest Code - (optional, Fundraising) Enter the interest code associated with each fund. Press Ctrl+L to find the interest codes defined on the Set up interest codes window (from Customers, select Set up Fundraising > Interest codes). This field appears only if you are licensed for Fundraising.
- Registration Number - (optional) Enter the registration number associated with an organization or fund. Fundraising organizations must have a registration number (Canada) or tax identification number (United States) to claim and verify tax-exempt status. This field

is applicable for the Fundraising module.

To enable GST for the Default Organization

1. In iMIS, select File > System Setup to open the System Setup window.
2. Click Organization Names to open the Organization Names window.
3. Add or update an organization.

   If adding a new organization, click New and enter a code for the organization in the Org field.

   If updating an organization, select one from the Org Codes list and click Edit.
4. Enable the Default Organization option.
5. Enable the Canadian taxation method option.
6. Enter the GST/HST Remittance number in the GST/HST Remittance # field.
7. If licensed for Fundraising, enter the registration number in the Registration Number field.
8. Click Save, close all windows, and restart iMIS for changes to take effect.

Defining Canadian tax codes

Canada has several types of taxes: a Harmonized Sales Tax (HST), a national Goods and Services Tax (GST), and a Provincial Sales Tax (PST). Because provincial taxes sometimes include a tax on the base national tax (a tax on a tax) in addition to taxes calculated for goods and services, set up base and primary tax authorities that allow for this extra calculation.

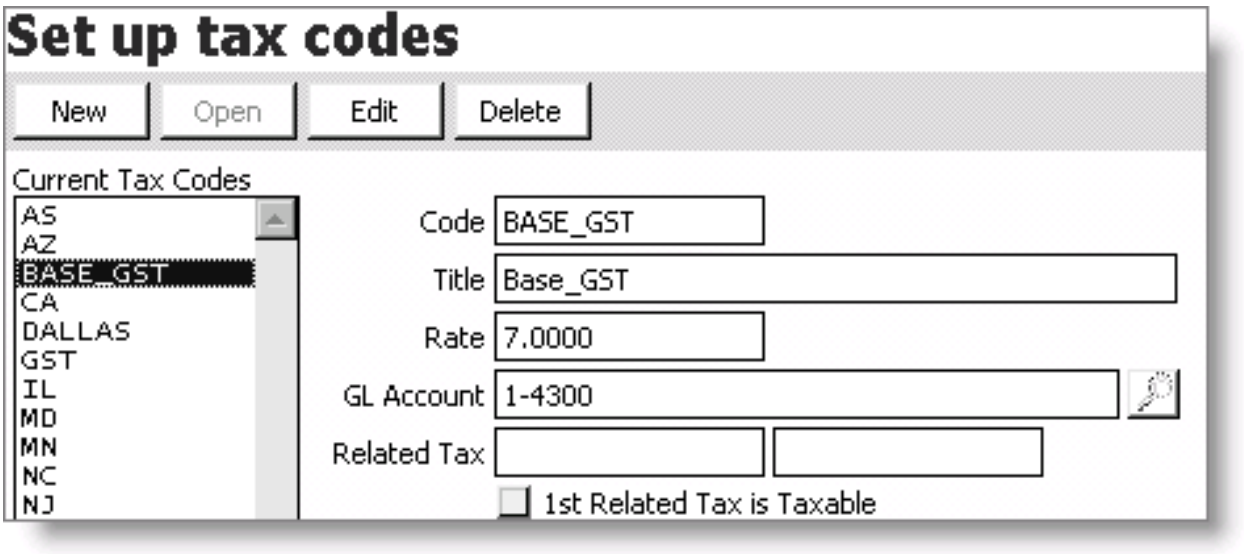
These are the roles of the various tax authorities:

- BASE_GST - Specifies the GL account for national tax and tax rate.
- BASE_HST - Specifies the GL account for harmonized tax and tax rate. For multiple rates, create codes for each: BASE_HST12, BASE_HST13, BASE_HST15 (for 12%, 13%, and 15% respectively).

- Primary GST - (required) Primary GST entry, which relates back to the BASE_GST (no GL account or tax rate should be entered).
- Primary PST - Specifies the GL account. This is related to BASE_GST and may indicate that PST tax is also applied to the GST tax amount. Use the province abbreviation.

> **Note:** Caution! Never use the BASE_GST as the primary taxation authority; rather, use BASE_GST as the related taxation authority to calculate the primary PST and GST. As the basis for tax calculation and tracking, the BASE_GST must contain the correct rate and GL account.

Set up tax codes window



- Current Tax Codes - Lists the current tax codes.
- Code - Enter an abbreviation you want to assign to a tax code.
- Title - Enter the title of the current tax code.
- Rate - Enter the tax rate of the current tax code.
- GL Account - Enter the General Ledger account number assigned to the tax code. Select the lookup icon to search for an account number.

- Related Tax - Use these fields to enter multiple tax codes. Enter the codes for any other taxes you want to relate to the tax defined in the Code field.
- 1st Related Tax is Taxable - Enable to make the first Related Tax field taxable. The option displays only if the Canadian taxation method is enabled for the Default Organization.
- Print button - Lets you print the Tax Table Listing report of the defined tax codes, descriptions, rates, and GL accounts.

  To define BASE_GST

  You will need to define a code for the base national Goods and Services Tax (GST). The BASE_GST is used as the related taxation authority when calculating the primary GST and PST. Because it is the basis for tax calculation and tracking, the BASE_GST must contain the correct rate and GL account number.

1. From AR/Cash, select Set up tables > Tax codes to open the Set up tax codes window.
2. Click New.
3. Define a Code, Title, and tax Rate for the BASE_GST tax code.
4. Enter the GL Account number (select the lookup icon to look up the account). Do not enter a Related Tax because this is the base tax.
5. Click Save.

   To define BASE_HST

   You will need to define a code for the base Harmonized Services Tax (HST). The BASE_HST is used as the related taxation authority when calculating tax for provinces using HST. Because it is the basis for tax calculation and tracking, the code must contain the correct rate and GL account number. For multiple rates, create additional codes: BASE_HST12, BASE_HST13, BASE_HST15 (for 12%, 13%, and 15% respectively).

1. From AR/Cash, select Set up tables > Tax codes to open the Set up tax codes window.

2. Click New.
3. Define a Code, Title, and tax Rate for the BASE_HST tax code.
4. Enter the GL Account number (select the lookup icon to look up the account). Do not enter a Related Tax because this is the base tax.
5. Click Save.

To define Primary GST

Enter a code for the Primary GST. Since the Primary GST relates to the BASE_GST, no GL account number or rate should be entered.

1. From AR/Cash, select Set up tables > Tax codes to open the Set up tax codes window.
2. Click New.
3. Enter a Code and a Title for the provincial tax code.

   Note: Leave the Rate and GL Account fields blank.
4. Enter the BASE_GST in the first Related Tax field.
5. Click Save.

To define a provincial tax code (PST)

Enter a code for each province for which taxes will be calculated. A provincial tax code is cross-referenced as the primary taxation authority for an organization, so you will need to enter both a rate and a GL account number. In addition, the base national GST will need to be entered as a related tax.

For provinces for which the base national GST is taxable, enable the 1st Related Tax is Taxable option. Provincial Sales Tax (PST) then will apply to the base national GST.

Some organizations may require provincial tax codes for multiple provinces:

- Organizations using Multi-Warehousing (Orders only)
- Organizations with offices in multiple provinces

Note: Organizations that do not charge provincial taxes, such as Australian and New Zealand organizations and PST exempt Canadian organizations, do not need to define provincial tax codes.

1. From AR/Cash, select Set up tables > Tax codes to open the Set up tax codes window.
2. Click New.
3. Define a Code, Title, and tax Rate for the provincial tax code.
4. Enter a GL Account number (select the lookup icon to look up an account).
5. Enter the BASE_GST tax code in the first Related Tax field.
6. (optional) For provinces for which the base national GST is taxable, enable the 1st Related Tax is Taxable option.
7. Click Save.

Defining the default tax authority

After the Canadian tax codes have been defined, enter the default tax authority that will be used by the default organization using Canadian taxation.

To define the default tax authority

1. From Customers, select Set up tables > Country names to open the Country names window.
2. If adding a new country:

- Click New.
- Enter the name of the Country.
- Enter the country's Mail Group.
- Accept the default Address Format.

If updating an existing country:

- Click Edit.

3. Enable the Use Taxation option.
4. Click Save.
5. (optional) To change the address format, click Address Layouts to open the Country Address Layouts window and set up the format.
6. Close all windows, and restart iMIS for the changes to take effect.

Defining the GSTINC tax authority (Asia-Pacific)

The GSTINC tax code is a special tax authority for clients in countries other than Canada (notably countries located in the Asia-Pacific region) that use the Canadian taxation method for calculating taxes and also include the GST tax in the advertised unit price of products and events.

The GSTINC tax authority assumes a product's advertised price already includes applicable taxes. When the GSTINC tax authority is applied, taxes are extracted from a product's advertised price when an order is entered. For example, a product with an advertised purchase price of 150.00 that includes a 12.5% GST tax will have a unit price of 133.33 with a sales tax of 16.67.

Both the GSTINC and Primary GST tax codes have similar functionality, and both tax codes are set up exactly the same way. The difference between the two is that GSTINC extracts calculated taxes from advertised product prices rather than calculating and adding taxes to product prices.

To define the GSTINC tax code

1. From AR/Cash, select Set up tables > Tax codes to open the Set up tax codes window.
2. Click New.
3. Enter GSTINC for the tax Code.
4. Enter a Title for the GSTINC tax code.

   Note: Leave the Rate and GL Account fields blank.

5. Enter the BASE_GST in the first Related Tax field.
6. Click Save.

Which tax code to use as the default?

How you define the prices and taxes for your individual products determines which tax code you define as the default tax authority. Organizations within some countries calculate taxes for product prices and then add the taxes into the advertised price of the products; advertised product prices include any applicable taxes.

- If your organization's policy is to include GST tax in the advertised product price (inclusive), then set GSTINC as the Tax Authority for the Default Organization on the Organization Names window (select File > System Setup, and click Organization Names).
- If your organization's policy is to not include GST tax in the advertised product price (exclusive), then set GST as the Tax Authority defined for the Default Organization on the Organization Names window.

Note: An organization should be defined as using either GST or GSTINC. It is recommended that all Asia-Pacific pricing use the GSTINC model exclusively.

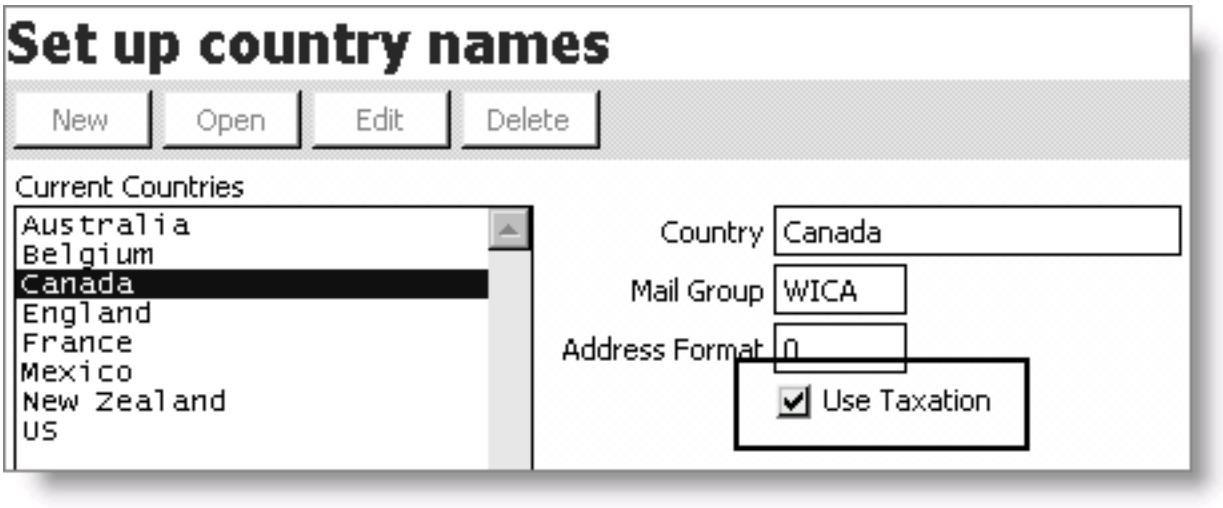
Enabling Canadian taxation for countries

When setting up GST and PST calculations for Orders, you must enable Use Taxation for each country for which taxes are collected. To enable GST taxation for individual countries, enable the Use Taxation option on the Country names window.

When the Use Taxation option is enabled for a country, GST and PST taxes (Canadian) are calculated for orders that ship to customers within that country. If you ship orders to customers in multiple countries that use the Canadian taxation method, enable the Use Taxation option for each of those countries.

To enable taxation for a country

1. From Customers, select Set up tables > Country names to open the Country names window.



2. If adding a new country:

- Click New.
- Enter the name of the Country.
- Enter the country's Mail Group.
- Accept the default Address Format.

If updating an existing country:

- Click Edit.

3. Enable the Use Taxation option.
4. Click Save.

Note: If you want to use or set up a different address format, click Address Layouts after completing this procedure to open the Country Address Layouts window and set up the format.

5. Exit and restart iMIS.

Applying Canadian taxation to Events

Canadian taxation for Events involves applying appropriate taxes to individual events and event functions. After defining GST/HST tax codes using the Canadian taxation selection

in the Organization Names window, you can enter the tax codes for your individual events and event functions.

Because services are consumed in the country in which they are delivered, all customers are considered taxable. Only customers with a nontaxable status are exempt.

> **Note:** Note: Once you register a customer for event functions designated as GSTINC, you cannot change that registrant's Tax Authority on the Register a customer - Attendee tab until you un-register the customer from the GSTINC functions.

To assign taxation to an event

1. Ensure that the following setup tasks are complete:

- Enable the Canadian taxation method for the default organization.
- Define the GST, HST, and PST tax codes as needed.
- Define the default tax authority.

2. From Events, select Define an event to open the Define an event window.
3. Double-click the event to open it in the Define an event window.
4. Click Edit.
5. Enter the default tax authority code in the Tax Authority field, or select the field's lookup icon to search for a tax code.
6. If appropriate (such as for a virtual event), enable Tax by address.

   Tax by address causes the appropriate tax to be charged based on the province specified in the registrant's Preferred Shipping Address. If that is unavailable, iMIS defaults to the tax authority of the event. Registrants see the HST amounts itemized in their carts and receipts.

   Note: Events not using Tax by Address still charge tax using the event's tax authority, and iMIS respects the Tax Exempt designation on the Name Fin tab.
7. Click Save.

To assign taxation to an event function

1. From Events, select Define an event to open the Define an event window.
2. Double-click the event that uses GST taxation to open the event in the Define an event window.
3. Double-click the function to open the Event Function Detail window.
4. Click Edit.
5. Enable the GST/HST and/or PST taxable option(s).
6. Click Save.

When a customer registers for an event function, the system will automatically calculate the tax based upon the tax options you have defined for the specific function.

Applying Canadian taxation to Orders

GST calculation for Orders involves enabling Canadian taxation method option for countries and applying GST taxes to product categories, individual products, and freight and handling charges.

Freight and handling taxes are charged in addition to any other taxes that are applied to products sold in the country using GST calculation, and freight and handling taxes are calculated on both taxable and nontaxable product purchases.

Which tax authority to use?

When processing orders using Canadian taxation, the Ship to Address's country and state/province determine which tax authority is used for calculating taxes:

- If the Use Taxation option is enabled for the Ship to Address's country on the Country names window, verify whether the Ship to Address's state/province code matches a tax code defined on the Set up tax codes window:
- If a match exists, select the Ship to Address's state/province code for the order's Tax Authority on the Enter and edit orders window.

- If a match does not exist, set the order's Tax Authority on the Enter and edit orders window to equal the Tax Authority defined for the Default Organization on the Organization Names window (normally, this is the tax code defined for the Primary GST).
- If the Use Taxation option is not enabled for the Ship to Address's country on the Country names window, leave the order's Tax Authority field blank on the Enter and edit orders window. No taxes will be charged.
- For orders for which no country is defined for the Ship to Address, the assumption is that the Ship to customer shares the same home country as the organization and therefore is taxable. For a Ship to Address for which no country is defined, verify whether the Ship to Address's state/province code matches a tax code defined on the Set up tax codes window:
- If a match exists, select the Ship to Address's state/province code for the order's Tax Authority on the Enter and edit orders window.
- If a match does not exist, set the order's Tax Authority on the Enter and edit orders window to equal the Tax Authority defined for the Default Organization on the Organization Names window (normally, this is the tax code defined for the Primary GST).

Before you begin

Ensure that the following setup tasks are complete:

1. Enable the Canadian taxation method for the default organization.
2. Define the GST and PST tax codes.
3. Define the default tax authority.

To apply taxation to a product in AR/Cash

1. From AR/Cash, select Set up tables > Products to open the Set up products window.
2. Select a product code from the list of Current Products.
3. Click Edit.

4. Enable the Taxable (GST) and/or Taxable (PST) options.
5. Click Save.

To apply taxation to a product category

> **Note:** Caution! Tax settings at the product level override those at the category level. That is, if you enable taxes for a category but not for a product in that category, no taxes are calculated; if you disable taxes for a category but enable them for a product in that category, taxes are calculated.

1. From Orders, select Set up tables > Product categories to open the Set up product categories window.
2. Select a product category from the list of Current Categories.
3. Click Edit.
4. Enable the Taxable (GST) and/or Taxable (PST) options.
5. Click Save.

To apply taxation to a single product

1. From Orders, select Manage inventory> Manage products to open the Manage products window.
2. Select a product code from the list of Current Products.
3. Click Edit.
4. Enable the Taxable (GST) and/or Taxable (PST) options.
5. Click Save.

To apply taxation to freight and handling charges

1. From Orders, select Set up module to open the Set up module window.
2. Click Add-on Charges to open the Add-on Charges window.
3. Click Edit.

4. Enable the Apply Sales Tax to Freight Charges and Apply Sales Tax to Handling Charges options.
5. Click Save.

Modifying reports for Canadian taxation

Certain standard reports and invoices must be edited so that Canadian taxation information (such as GST and HST) displays on a report. For Orders or Events invoices, you must clone the invoices and modify the parameters to show the Canadian tax rates on the invoice.

To modify reports and invoices

1. In iMIS, select Utilities > Report Specs to open the Report Specifications window to clone and change the following reports:

- MEETING – Confirmations – Confirmation Letter (Omnis only)
- MEETING – Invoices – Print Invoices (both)
- (Simple Order Entry only) SIMPLEOE – Invoices – Print New Invoices (both)
- Order-Invoices-Activity Menu Items (both)

2. Scroll and select the report.
3. Click Clone.
4. Tab to the Title field.
5. Add a period (.) in front of the title.

   Note: Putting a period at the beginning of the title places the report first in the alphabetical report category, making it the default report used.
6. In the Title field, modify the title to distinguish it from the original.
7. Click Parameters to open the Detail Report Parameters window.
8. In the Parameters text box, enter the text and field contents (press Enter after each line).

The information you enter in the Parameters text box will depend on your organization's specific tax setup. The following text and field contents are examples of the PST as the tax authority and the GST as the first related tax:

Total PST:[Orders.TAX_1]

Total GST/HST:[Orders.TAX_2]

GST/HST Remittance Number:[Org_Control.GSTRemitNumber]

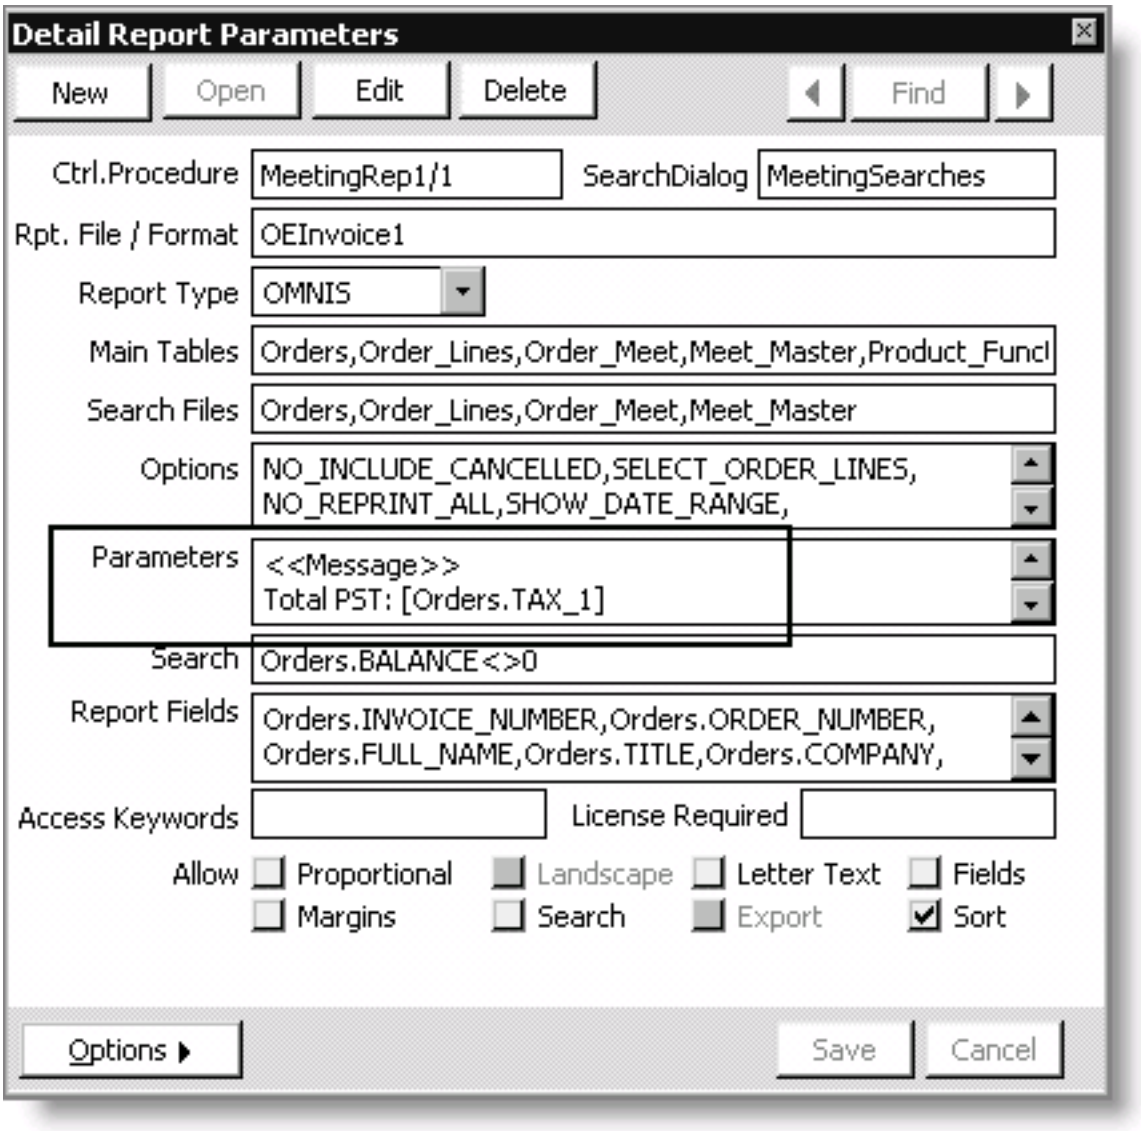
Note: If the <<Message>> line displays in the Parameters text box, do not delete it: doing so prevents the lines below it from printing on the invoice.

Note: Tax_1 will print the tax calculated for the tax authority entered. Tax_2 will print the first Related Tax. Tax_3 will print the second Related Tax from the Tax Codes table for the Tax Auth used on the order. Org_Control.GSTRemitNumber will display the GST Remittance # on the Organization Names window.

9. Click Save.

For invoice reports, the following information displays at the bottom of the invoice:

- Total PST
- Total GST/HST
- GST/HST Remittance



European Taxation (VAT)

Value-Added Tax (VAT) is a tax levied on goods and services sold within the European Union (EU). iMIS supports VAT, so you can tailor your organization's taxation method for the EU member countries in which you have operations. Applicable taxes then will be calculated automatically based on a customer's country.

Including and showing VAT

To charge VAT, you multiply the net price by the VAT rate (to calculate how much VAT to charge) and then add that amount to the net price to give the 'gross' (inclusive) price:

Net price = £100

+ VAT due at 20% = £20

= Gross price = £120

When is VAT included in the price? – Almost always. By law, the prices advertised in retail shops must include VAT, so no additional tax is charged at checkout. Products advertised in magazines, catalogs, websites, price lists, and other literature may be aimed at the public, businesses, or both. By law, if they are meant only for the public, then prices must include VAT. If they are meant for both public and business, then VAT-inclusive prices are usually given.

Exception: Prices quoted between organizations (companies) are often VAT exclusive, because VAT might be claimed back by a company and so should not affect the budget.

When is VAT shown on bills and receipts? – Most retail prices on bills and receipts include VAT, so it is not shown separately. However, some may list the VAT as a separate line, just to report how much tax is included in the price. Invoices from VAT-registered suppliers (like builders) must show a separate amount for VAT, as well as the VAT Registration Number of the business.

To specify whether you want VAT-inclusive or VAT-exclusive pricing, you enable a setup option in AR/Cash. See Configuring VAT options in AR/Cash.

Configuring iMIS for VAT

Note: Note: VAT has a separate license key. You must be licensed for VAT to enable it as a taxation method.

Implement your VAT configuration in the order documented below:

1. Enabling VAT for the default organization – gives you access to the VAT options in iMIS.

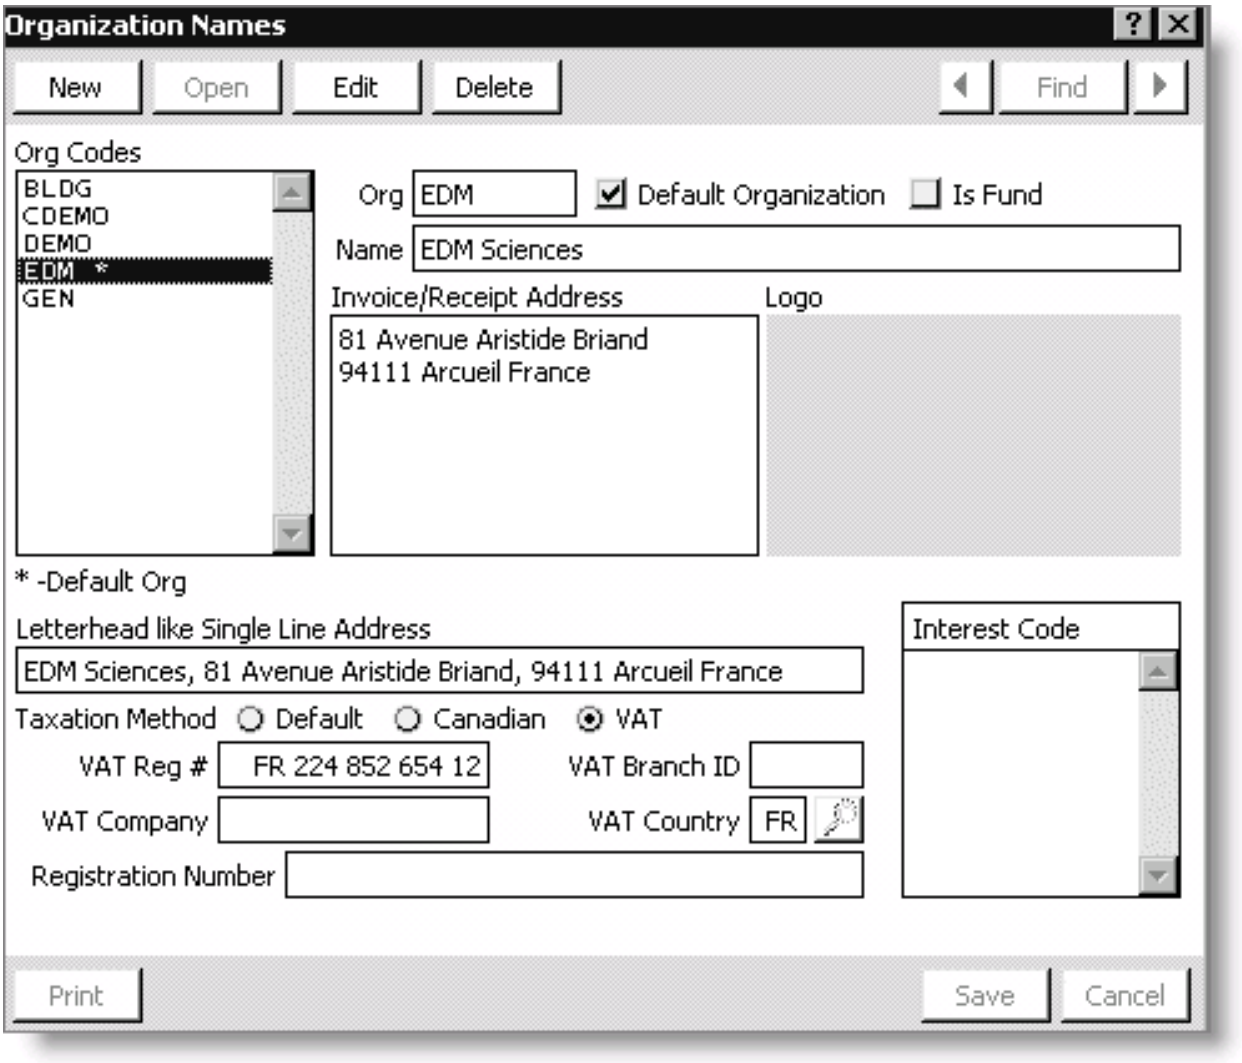
   Note: Enabling VAT automatically disables the Default or Canadian taxation method for an organization. The VAT and Canadian taxation methods are mutually exclusive.

2. Defining VAT and intrastate country codes – lets you verify that the codes are correct for your needs before you do any configuration based on this table.
3. Defining VAT tax codes – lets you set up the tax codes that you need iMIS to use. If these tax codes are missing from the Product_Tax table, any taxes calculated equal zero.
4. Configuring financial entities for VAT – lets you set company information (such as registration codes and numbers) for each organization that will collect VAT.
5. Setting up Company Flow Down for VAT – so that VAT tab data for the company contact flows down to company members.
6. Configuring VAT options in AR/Cash – lets you select options for calculating taxability and including VAT in pricing and fees.
7. Defining VAT Rules for Events – lets you add special rules for your virtual and other-country events.
8. Finally, verify that the Default country for your website (RiSE > Set up web components > General configuration) matches the VAT Country you selected for your Default Organization in Desktop System Setup.

Enabling VAT for the default organization

Before you can configure iMIS to handle VAT for your organization, you must select VAT as a Taxation Method for your Default Organization on the Organization Names window. After that, you can create the specific VAT tax codes used by the different areas of iMIS. After enabling the VAT taxation method, be sure to restart iMIS for the change to take effect.

> **Note:** Note: VAT has a separate license key. You must be licensed for VAT to enable it as a taxation method.

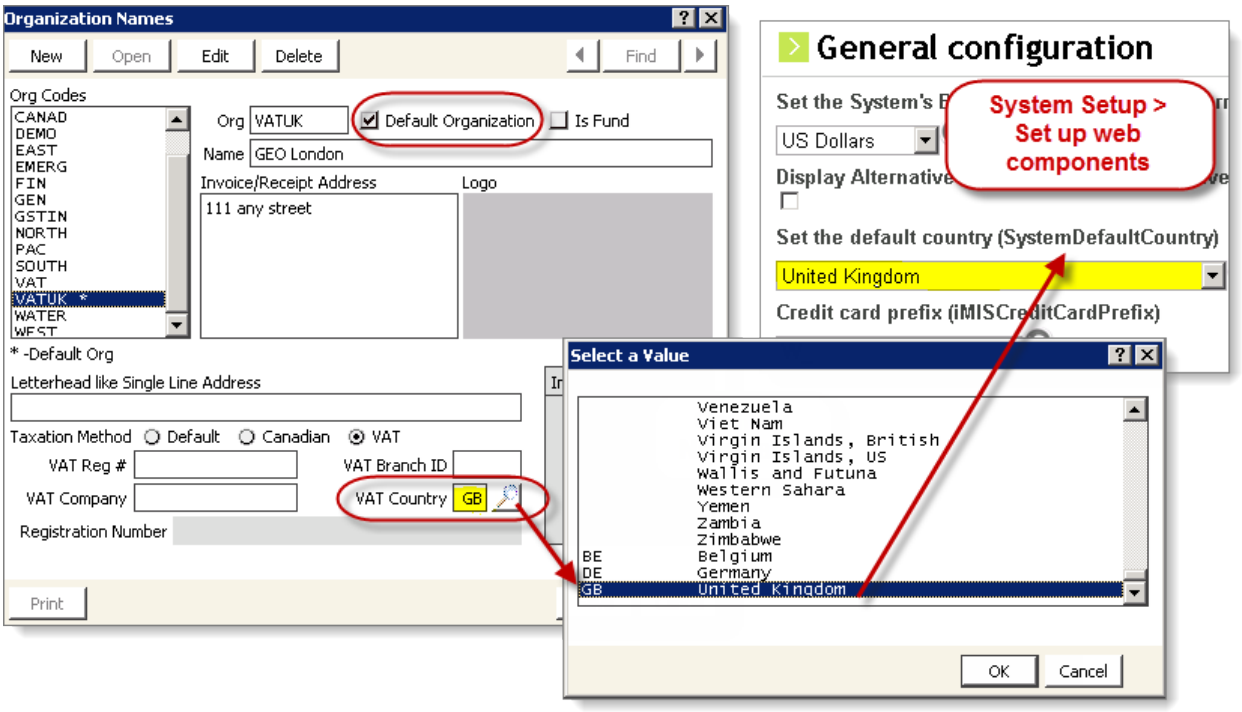


- Default Organization - (required) Enable to identify the organization using VAT as the default organization. If the organization using VAT is not designated as the Default Organization, the VAT taxation method will not be implemented. An asterisk displays to the right of the default organization in the Org Codes list.
- Taxation Method: VAT – (Displays only if you are licensed for VAT) Enable to use the VAT taxation method. The following fields display when the VAT taxation method is enabled:
- VAT Reg # – Enter the numeric part of an alphanumeric VAT number. Length and structure will vary depending on country. For example, FR 224 852 654 12 is used in France and BE 422 544 865 is used in Belgium.
- VAT Branch ID – (optional) Enter the VAT branch ID for an organization.

- VAT Company – (optional) Enter the VAT company for an organization.
- VAT Country – Enter the alphabetic part of an alphanumeric VAT number that corresponds to the EU member country of the organization. Select the lookup icon to look up a country from those defined in the Country Names table.

  Important: If the lookup populates the wrong VAT Country code, you first need to fix the entries in your Country Names table and then update the entry here.

  Troubleshooting tip: The country that you set for your Default Org must match the System Default Country that you specify for your website:



- Registration Number - (optional, Fundraising) Enter the registration number associated with an organization or fund. Fundraising organizations must have a registration number (Canada) or tax identification number (United States) to claim and verify tax-exempt status.

  To enable VAT for the Default Organization

1. In Desktop, select File > System Setup, Organization Names to open the Organization Names window.

2. If adding a new organization:

- Click New, and enter a code for the organization in the Org field.

If updating an existing organization:

- Select an organization from the Org Codes drop-down list and click Edit.

3. Enable the Default Organization option.
4. Enable the VAT taxation method option.
5. Click Save, close all windows, and restart iMIS for the changes to take effect.

Defining VAT and intrastate country codes

The VAT country code is a two-character code assigned to each European member country. The intrastate code is a country code that is used on intrastate reports. These reports list the transactions between an organization and customers from EU member countries.

> **Note:** Note: Both the VAT country code and the intrastate code must be defined in iMIS for EU member countries.

To define a country code

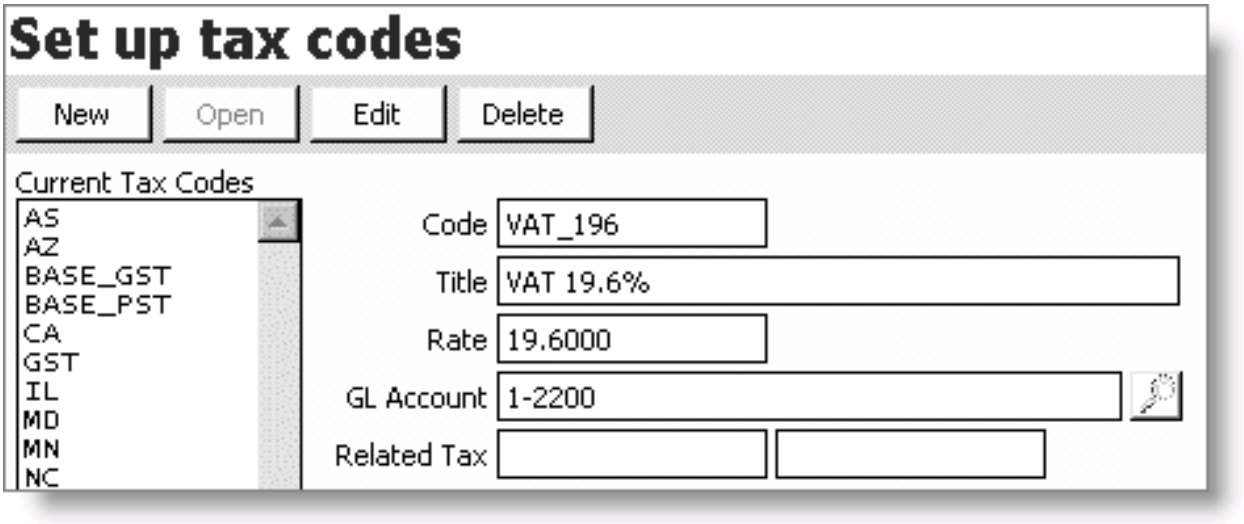
1. From Customers, select Set up tables > Country names to open the Country names window.
2. Click New.
3. Enter the name of the country in the Country field.
4. Enter the country's Mail Group.
5. Accept the default Address Format.

   Tip: To set up a different address format, click Address Layouts after completing this procedure to open the Country Address Layouts window and set up the format.

6. Enter the country code in the Country Code field. This code is used for VAT.
7. Enter the country code in the ISO 3 Digit Code field. This code is used for reporting purposes.
8. Click Save, close all windows, and restart iMIS for the changes to take effect.

Defining VAT tax codes

If you are using different VAT tax rates, you must define the different rates in iMIS before you can apply them to any type of event, product, or order. You do so in the Set up tax codes window. The following sections include examples of various VAT tax codes.



- Current Tax Codes - Lists the current tax codes.
- Code - Enter the abbreviation you want to assign to the tax code.
- Title - Enter the title of the current tax code.
- Rate - Enter the tax rate of the current tax code.
- GL Account - Enter the General Ledger account number assigned to the tax code. Select the lookup icon to search for an account number from the GL Account general look-up/validation table.
- Related Tax - Use these two fields to enter multiple tax codes. Enter the codes for any other taxes you want to relate to the tax defined in the Code field.

To define VAT-exempt tax codes

Different events and products may require defining different VAT rates.

1. From AR/Cash, select Set up tables > Tax codes to open the Set up tax codes window.
2. Click New.
3. Enter VAT_EXEMPT in the Code field.
4. Enter a Title for the VAT_EXEMPT tax code.
5. Enter the GL Account number (select the lookup icon to look up the account).
6. Click Save.

To define VAT zero-percent tax codes

1. From AR/Cash, select Set up tables > Tax codes to open the Set up tax codes window.
2. Click New.
3. Enter a Code for VAT zero-percent.
4. Enter a Title for the VAT zero-percent tax code.
5. Enter the GL Account number (select the find icon to look up the account).
6. Click Save.

To define VAT percentage tax codes

1. From AR/Cash, select Set up tables > Tax codes to open the Set up tax codes window.
2. Click New.
3. Enter a Code for the VAT tax code.
4. Enter a Title for the VAT tax code.
5. Enter a tax Rate for the VAT tax code.
6. Enter the GL Account number (select the find icon to look up the account).
7. Click Save.

Configuring financial entities for VAT

After defining the country codes, enter the country code and additional VAT information for one or more financial entities (organizations) on the Organization Names window.

To enter VAT information

1. In Desktop, select File > System Setup, Organization Names to open the Organization Names window.
2. Select an organization enabled for VAT taxation from the Org Codes list.
3. Click Edit.
4. Enter the VAT Reg # to be used to collect VAT.
5. (optional) Enter a value in the VAT Company field.
6. (optional) Enter the VAT Branch ID.
7. Enter the EU Country Code, or select the lookup icon to look up the country on the Country_Names table.

   Note: The VAT country code must be set up on the Country names window to select it at this time.
8. Repeat for any additional financial entities (organizations) as needed.
9. Click Save, close all windows, and restart iMIS for the changes to take effect.

Setting up Company Flow Down for VAT

You can enable User Defined Company Flow Down in iMIS Desktop for the VAT Reg Number, VAT Country, and VAT Exempt fields on the VAT tab if:

1. Your iMIS database includes both Company and Individual customer types, and
2. The customers of a company are linked to the company record in Customer Management.

Company flow down is useful for pre-populating related entries with common information (such as Main Address, County, and Telephone) and other additional user-defined company flow down fields.

To set up company flow down for VAT

1. From Customers, select Set up module > General.
2. Click Advanced to open the Customer Setup – Advanced window.
3. Click Edit.
4. In the User Defined Company Flow Down field, enter the fields to display. For example, to display all VAT fields, enter:

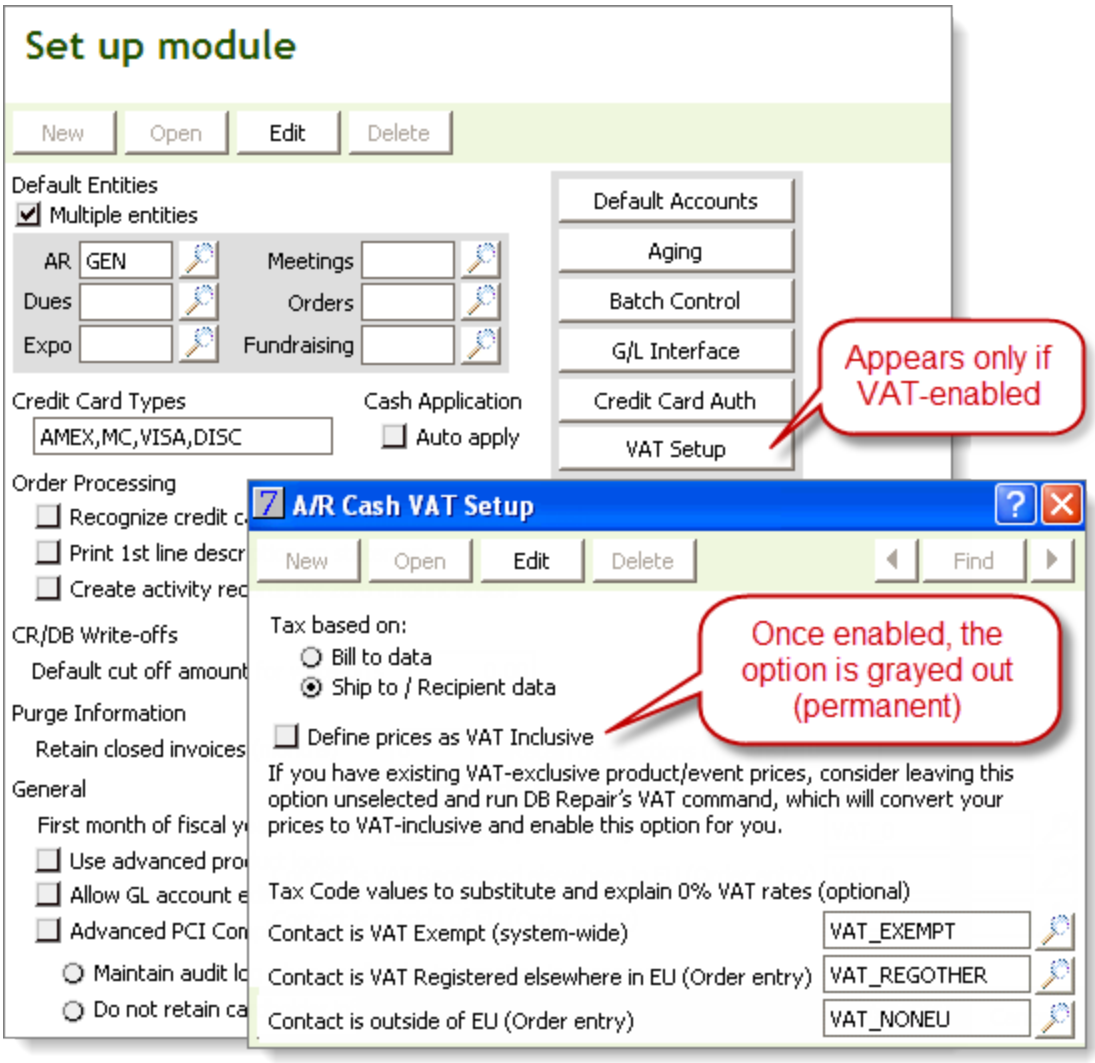
   Name_Fin.VAT_REG_NUMBER,Name_Fin.VAT_COUNTRY,Name_Fin.USE_VAT_TAXATION
5. Click Save.

Configuring VAT options in AR/Cash

Because organizations differ in how they need to charge VAT and handle pricing, iMIS gives you several global options that affect tax calculation and pricing of your order processing and events, across Desktop and the web views. These global options are set in AR/Cash.

> **Note:** Tip: For technical discussions and examples of VAT issues and scenarios, sign in to iMIS Community.

If your default organization is configured for VAT, then you see a VAT Setup button to the right of the AR/Cash > Set up module options:



- Tax based on: – lets you change the method for evaluating taxation.
- Bill to data – Applies VAT based on the Bill to contact's location and VAT tab settings.
- Ship to / Recipient data – (default) Applies VAT based on the Ship to location and the recipient's VAT tab settings. This supports point-of-sale requirements for which contacts have different Ship to addresses or make purchases intended for others, such as a manager registering an employee at a different site.
- Define prices as VAT Inclusive – (non-reversible) When enabled, all system-defined prices for taxable products, events, shipping, and handling are considered VAT Inclusive. This means that you can define products and registration fees with the gross (tax-

included) amounts that you will advertise to your members and the public. Once you enable VAT-inclusive pricing, the option appears grayed out, because the setting is permanent.

Tip: To upgrade quickly to VAT Inclusive pricing, back up your database and run the DB Maintenance standalone utility, whose VAT tab performs a one-time conversion of your VAT-exclusive product prices and registration fees to be VAT-inclusive. Once your data is converted, the command enables the Define prices as VAT Inclusive setting for you.

Remaining VAT Exclusive: Because some organizations need to handle order and registration prices as VAT-exclusive (such as for B2B sales), iMIS allows you to remain VAT exclusive. In this mode, all of the prices you define or override for events, products, freight, and handling are net amounts that exclude the VAT component, and iMIS adds the VAT separately during product ordering and event registration in Desktop.

Understanding VAT Exclusive:

- VAT-inclusive under the hood: Even though VAT-exclusive pricing appears the same as before, all order and registration pricing is now saved as VAT-inclusive. That is, being configured to remain VAT Exclusive just controls how you see and enter the data, converting your net amounts to and from the underlying VAT-inclusive amounts dynamically.
- Upgrading VAT-exclusive order data: Because iMIS now stores all order and order line amounts as VAT-inclusive, DB Upgrader takes care of updating all of your existing order data to be consistent with your new order data. Flags on the record ensure that the update occurs only once, and your original data is backed up (Orders_BAK and Order_Lines_BAK). This universal change to storing order amounts as VAT-inclusive is unrelated to whether you enable Define prices as VAT Inclusive.
- VAT-inclusive public prices: Even if you use VAT-exclusive pricing, the cart on your website will show your shoppers VAT-inclusive product prices and shipping/handling fees (if you enable taxing when defining add-on charges), to comply with sales tax rules. Order data is always stored VAT-inclusive.
- Tax Code values to substitute and explain 0% VAT rates (optional) – If you populate them, these optional fields help you document the reason for VAT exemptions. The look-up lets

you select from your existing zero-rated VAT tax codes to specify ones to globally substitute as "reason" codes for each of three situations: the contact is VAT Exempt, is registered in a different EU country, or is outside of the EU altogether. In the same way, Event VAT Rules also let you select a Substitute Tax Code for any rule that prevents taxation (see Defining VAT Rules for Events). These codes allow you to report and document tax exemptions as required.

Taxation based on Bill To versus Ship To

The Tax based on: options determine when iMIS does not charge VAT:

Bill to data	Ship to / Recipient data
• Billing address is outside of the EU • Billing contact is VAT Exempt • Billing contact is VAT registered in a different EU country from the order's financial entity	• Shipping address is outside of the EU • Recipient contact is VAT Exempt • Recipient contact is VAT registered in the same country as the shipping address, and the shipping address is a different EU country from the order's financial entity

Definitions:

- All orders have an associated financial entity, defined through System Setup > Organization Names. Each financial entity specifies a VAT Country.
- VAT Exempt means having the VAT Exempt option enabled on the contact's VAT tab (Customers > Manage customers).
- VAT registered requires having a VAT Registration Number specified on the contact's VAT tab. If so, whether a contact is VAT registered then depends on the tax method and the value in VAT Country:
- Bill to Data: if VAT Country is blank, the contact is VAT registered in the VAT Country of the order’s financial entity. (Exception: Web orders honor the original iMIS VAT

implementation by first trying to establish the order's financial entity from product lines.)

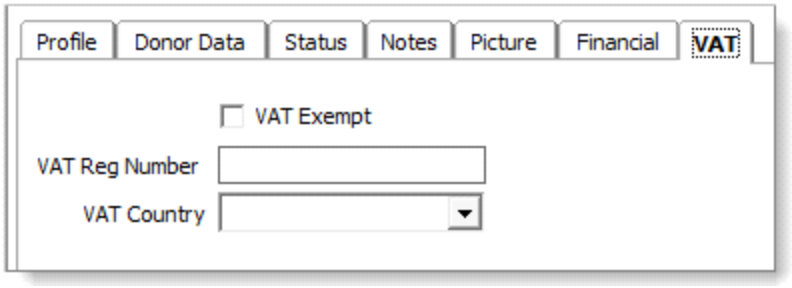
- Ship to / Recipient data: if VAT Country is blank, the contact is not VAT registered.

Here is a table that shows how VAT taxes apply to orders according to each Tax based on setting. You can substitute your EU countries for the ones used here (GB - Great Britain, BE - Belgium).

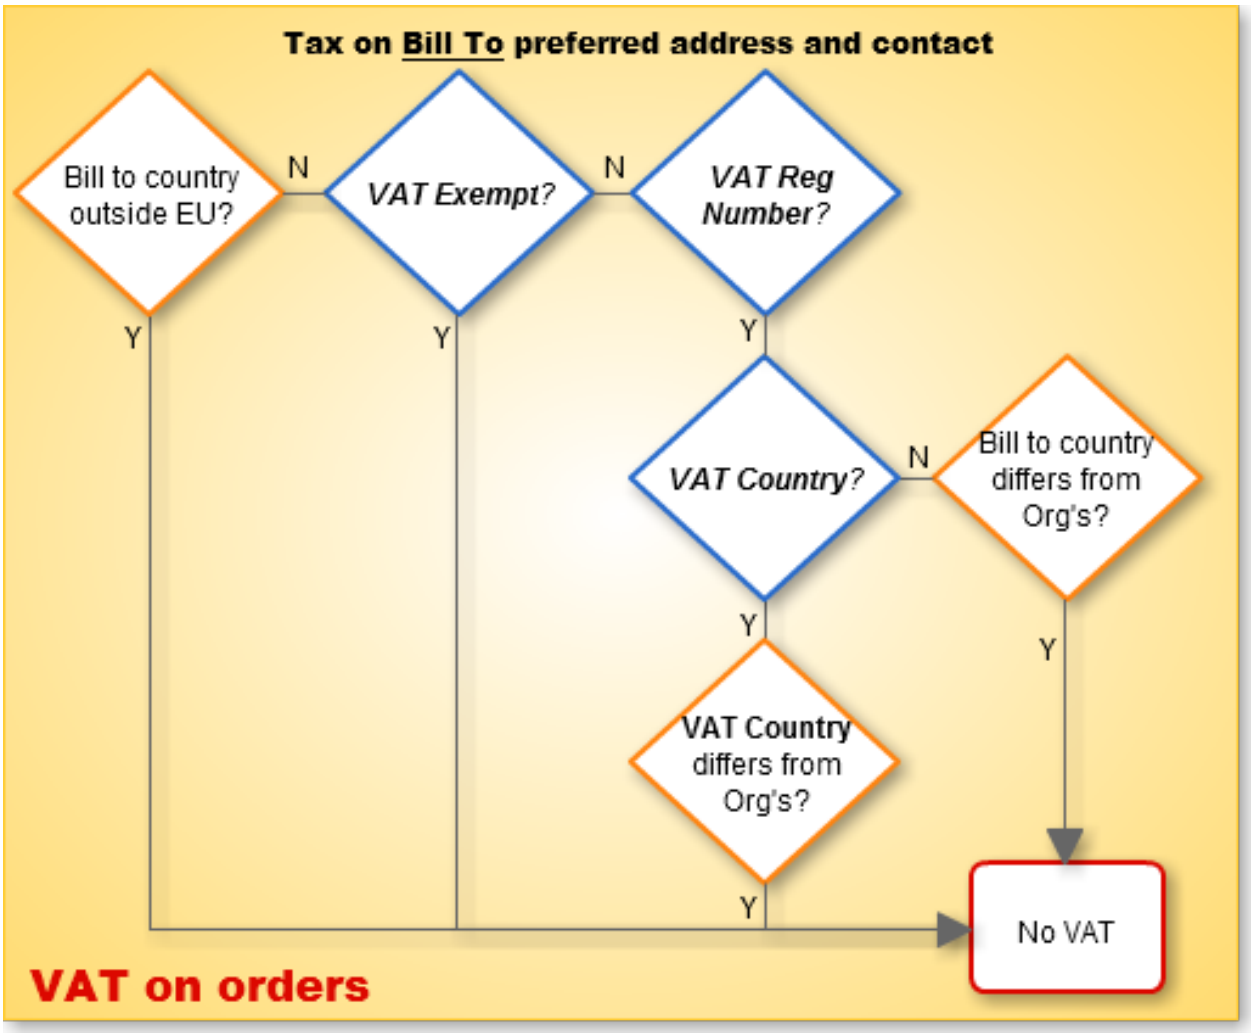
VAT Country of (*VCO*):					**Taxability tests:**							
Default Org	BillTo	ShipTo	Contact		Shipping outside EU?	Contact is VAT Exempt?	Contact has Registration Number?	VCO Contact differs from Default org?	VCO Contact matches Ship To?		**Bill To method**	**Ship To method**
*	*	*	*		**Yes**	–	–	–	–		No Tax	No Tax
*	*	*	*		No	**Yes**	–	–	–		No Tax	No Tax
*	*	*	*		No	No	**No**	–	–		Tax	Tax
*	*	*	*		No	No	Yes	**No**	–		Tax	Tax
GB	GB	BE	BE		No	No	Yes	Yes	**Yes**		No Tax	No Tax
GB	BE	BE	BE		No	No	Yes	Yes	**Yes**		No Tax	No Tax
GB	GB	GB	BE		No	No	Yes	Yes	**No**		No Tax	Tax
GB	BE	GB	BE		No	No	Yes	Yes	**No**		No Tax	Tax

How taxation methods use the VAT tab

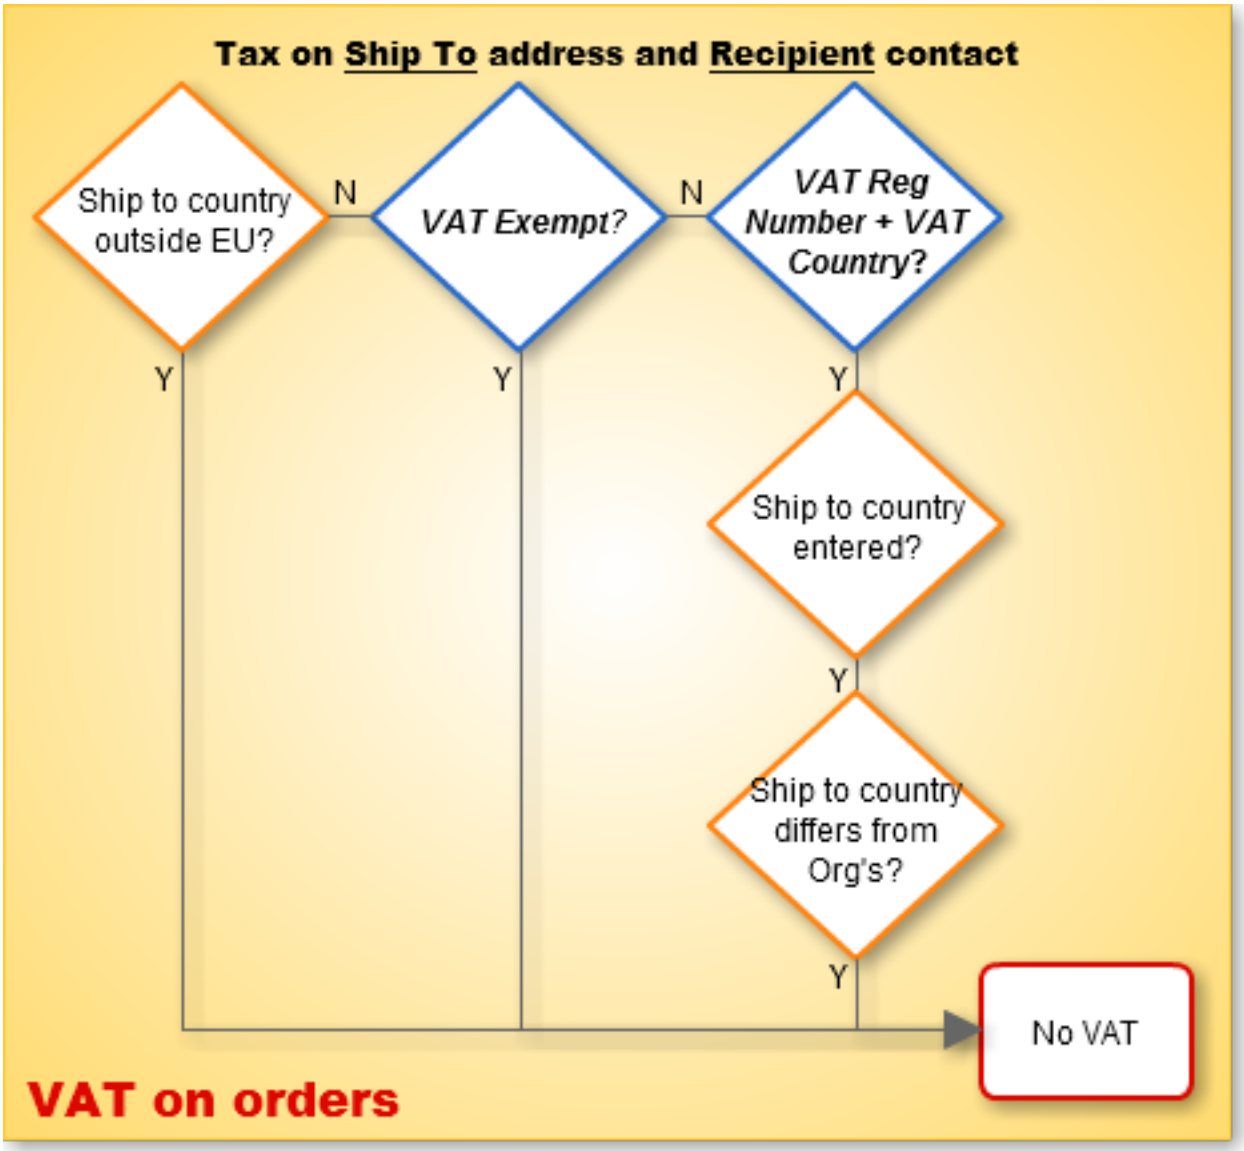
The VAT tab settings on each contact's record affect when VAT is applied:



In AR/Cash > Set up module, the Taxation section lets you choose to calculate taxes by Ship to (see Taxation based on Bill To versus Ship To). These diagrams show the essential differences in how the two methods use the values on each contact's VAT tab:



If the Bill to contact has no Preferred Billing country, iMIS assumes it is the country of the order's financial entity.



If the order has no shipping country, iMIS assumes it is the country of the order's financial entity.

iMIS calculates VAT based on Ship to just as Amazon.co.uk does, with two exceptions:

- iMIS allows each customer to supply VAT registration for one country only.
- iMIS cannot change rates based on the country to which an item is shipped.

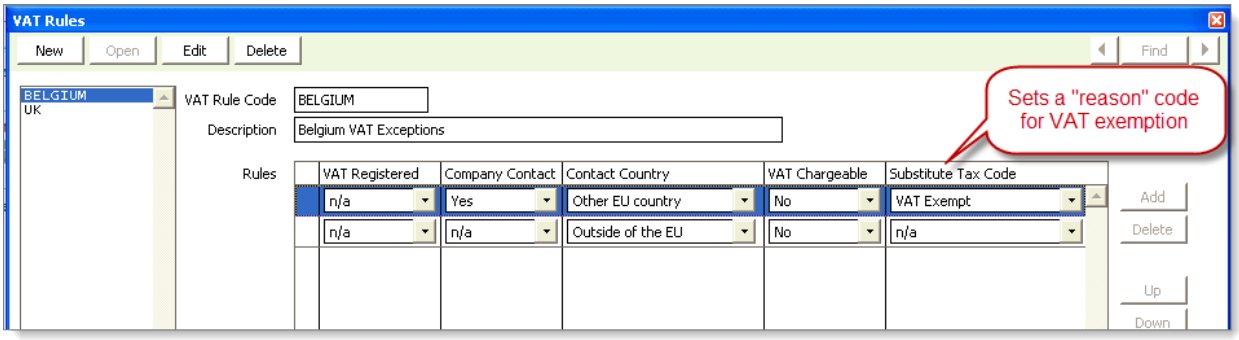
Defining VAT Rules for Events

To comply with Place of Supply requirements, you can use the VAT Rules table to define when not to charge VAT tax on taxable functions. These rules have limited scope: they only apply to taxable functions of VAT-enabled events that have a VAT Rule specified in the event's definition. These special rules are optional, and you do not need these rules at all unless your organization faces one of these situations:

- You hold online (virtual) events. The new Place of Supply rules have requirements that apply to online events, as these specifically fall into the new "General Rules" (under Article 44 and 45).
- You hold in-person events in another EU country. If you hold an event in another EU country that has different guidelines for when to charge VAT, then you need to define a new rule set.
- Your tax advisor determines that the default approach of charging VAT to all non-exempt registrants is insufficient.

> **Note:** Important: Consult your tax advisor or audit firm for questions and validation of your rule sets.

You can create as many rule sets as you need to handle the situations you must support, if any. In all cases, your registrants – whether registered in Desktop, Web, or Public views – see only confirmation that their fees include the required VAT taxes.



Select Events > Set up module, VAT Rules

- VAT Registered – whether the registrant has a VAT Registration number entered.

Required: Include both Name_Fin.VAT_REG_NUMBER and Name_Fin.USE_VAT_TAXATION in the User Defined Company Flow Down list, in Customers > Set up module, Advanced.

- Company Contact – a registrant whose own record or whose parent record has a member type that is defined as a Company Record in the Member_Types table.
- Contact Country – refers to the country specified in the registrant's address (regardless of parent record) as determined using the VAT country codes you defined.
- Same as place of supplier – the registrant is in the same VAT country as the event's entity.
- Other EU Country – the registrant is in a different EU country from the event's entity.
- Outside of the EU – the registrant is outside of the EU.
- VAT Chargeable – The Yes option exists for rare cases in which you need to insert a Yes rule to ensure a correct VAT charging situation isn't overridden by a more general No rule below it.
- Substitute Tax Code – This optional field is available only when VAT Chargeable is No. It lets you select one of your zero-rated VAT tax codes as the "reason" for why the situation is not taxable. Examples: the contact is VAT Exempt, is registered in a different EU country, or is outside of the EU altogether. These codes allow you to report and document tax exemptions as required.

  Where do VAT rules apply? If an event function is marked Taxable, VAT taxes can be charged. If the event itself also specifies use of a VAT Rule, iMIS determines whether to charge VAT according to your rules of exclusion.

  How do rule sets work? When a VAT event specifies a rule set, iMIS determines whether to charge the registrant VAT by testing each rule for a match. Starting with the top rule, iMIS stops only when all three conditions (whether VAT Registered, whether a Company Contact, and location) are met. If no rules are satisfied, VAT is charged as usual.

  Example rule set: Online Events

VAT Registered	Company Contact	Contact Country	VAT Chargeable
Yes	n/a	Other EU country	No

Example rule set: Belgium events in France

VAT Registered	Company Contact	Contact Country	VAT Chargeable
Yes	n/a	Same as place of supplier	No
No	Yes	Same as place of supplier	No

To set up entities for other EU countries

If you hold events within the EU but outside of your EU country, you may need to set up multiple entity processing for each country involved in order to keep your financial records separate. The issue is [1] whether you hold an event in another EU country (say, a Paris conference for your Brussels-based association) and [2] whether that country has different guidelines for when to charge VAT.

1. Define the entities (see Defining an organizational entity) for which you need to keep separate financial records.
   - Select File > System Setup, Organization Names.
   - Select New and create organizations for each additional EU country, ensuring the Taxation Method is VAT and completing the VAT fields that appear.
2. Enable multi-entity processing (see Enabling multi-entity processing).
   - From AR/Cash > Set up module, select Edit and enable Multiple Entities.
   - If needed, change the default entity for Events.
3. Define default accounts (see Defining default general ledger accounts) for your entities.
4. Set up cash accounts (see Setting up cash accounts) for your entities.
5. Set up Due To/Due From processing (see DueTo/DueFrom processing).
6. Verify the Default country for the website (RiSE > Set up web components > General configuration).

7. When defining events that need this special VAT tracking, select your new entity codes as needed.

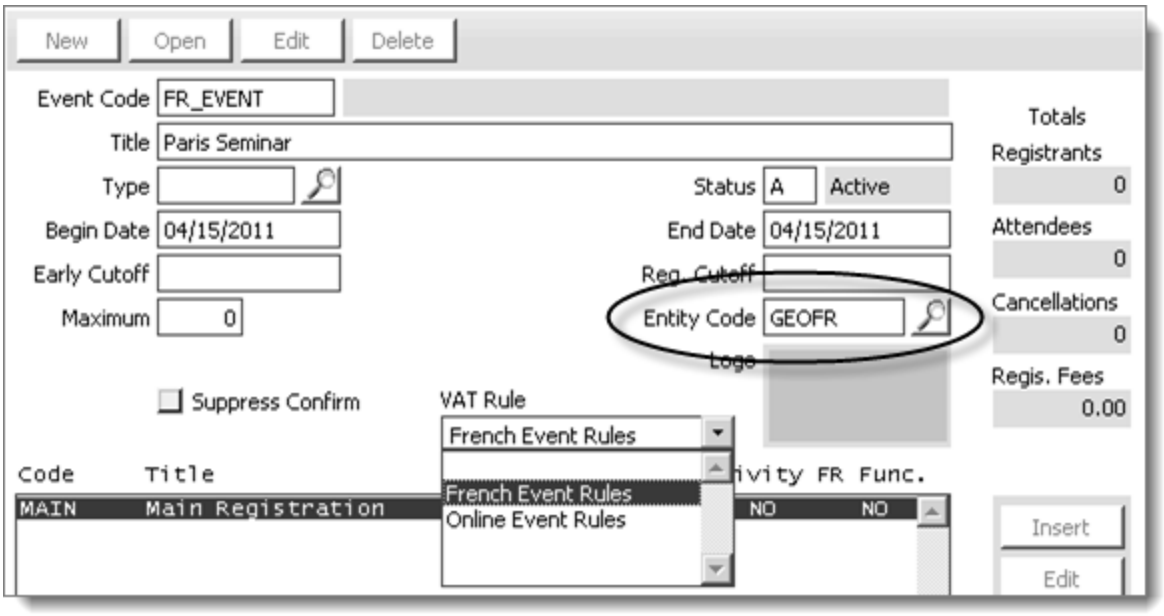
To define a set of VAT Rules

1. Open Events > Set up module, VAT Rules and select New.
2. Create a VAT Rule Code; add a Description (optional) to explain the rule set and to display in the drop-down list during Event definition.
3. Change the n/a (not applicable) defaults to Yes and No as needed to define the test for evaluating the taxability. The n/a values behave as “either Yes or No” in the evaluation.
4. Select Add to activate rows for any additional rules you need; note that Delete removes only the row that is currently highlighted.
5. Use Up and Down to arrange the rules in the order you want them to evaluate, from the top.
6. Select Save, then close the window or select New to create another rule set.

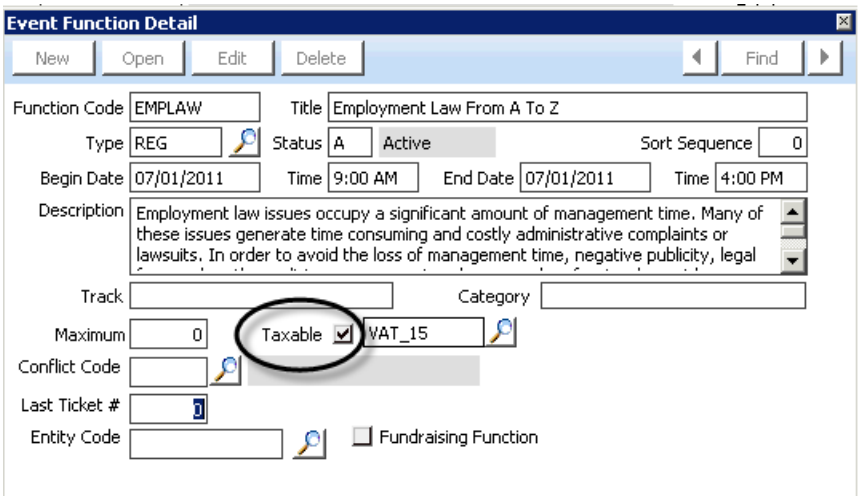
To apply VAT Rules

Each event can use one set of rules that you defined for its taxable functions, but the registration process still lets you override function-level tax codes.

1. Select Events > Define an event, select New or Edit, and select the correct VAT Entity Code for the accounting of these transactions.
2. Apply a VAT rule set to your VAT event: select a VAT Rule from the drop-down list.



3. When defining each event function, enable the Taxable option as appropriate.



4. During registration, be aware that in some cases (such as when a registrant's company is VAT Exempt), enabling Add to master during registration causes taxes to be recalculated on functions, changing their cost.

   If this happens, you are prompted to click OK, confirm the registration details, adjust the payment amount as needed, then click Save.

How VAT Rules test Contact Country

The tests for Contact Country are the most involved part of VAT Rules. Unless the selection is n/a, the country of the registrant's address evaluates as follows:

- Which address is evaluated? The test uses the country associated with the registrant's address, which appears on the Attendee tab of Event registration (Desktop) or on the Registrant page (Web), on the first step of the registration process. This address defaults to the registrant's preferred mail address, but the criteria evaluation always uses the address as it appears in the user interface, including any manual address overrides.
- Is the registrant outside the EU? If the registrant's country is not assigned a VAT Country Code in the Country Names table, then the country is considered to be outside the EU.
- Is the country blank? If the registrant's country is not populated, then it is assumed to be the same as the country of the "default organization". The default organization's country is established according to the VAT Country Code assigned to it.
- Is the registrant within the EU? The registrant's country is considered in the EU if either:
- The registrant's country is populated and the country is assigned a VAT Country Code in the Country Names table, or
- The registrant's country is not populated and the registrant's location is assumed to be the same as that of the default organization.
- What is the supplier country? If the registrant's country is determined to be within the EU, then the registrant's country is either the same as the supplier country or a different country. For this evaluation, iMIS must know what the supplier location is (i.e., which normally means the location from which the event is hosted). The following logic derives the EU Country to be used as the supplier location:
- If the event is assigned an entity (which should be the case if the event is being held in a country other than the home country of the organization), the supplier location is set to the VAT country code for that entity.
- If the event is not assigned an entity, then the supplier location is set to the VAT country code of the "Default Organization".

- Is the Registrant's country the same as place of supplier or elsewhere in EU? Once the registrant's country is determined to be in the EU and the supplier country location is known, then this test is simple. If the VAT Country Code associated with the registrant's address matches the VAT Country Code associated with the event supplier location, then the registrant location is considered "Same as place of supplier". If the VAT Country Codes do not match, then the registrant location is considered in an "Other EU country".

Examples of VAT Rules

> **Note:** Important: These examples show how to define and use VAT rules; do not take this as tax advice.

For these examples, assume you have a home base in the United Kingdom (default org has VAT enabled and VAT Country is GB) and you have three upcoming events where your tax advisor has given three different VAT treatments:

- In-person event in UK – All registrants (except those flagged as VAT Exempt), regardless of location, should pay VAT. No VAT Rule is needed; let the default VAT treatment apply.

  Rule: None; the VAT Rule drop-down should remain blank when the event is defined.

- Online event –Following the "General Rule" under Articles 44 and 45, the tax advisor has said that, in addition to those flagged as VAT Exempt (who are never charged VAT under any circumstance), all registrants who are VAT Registered and in an EU country other than that of the default organization should be excluded from VAT. All others, including those in the same country and those outside of the EU, should be charged VAT.

  Rule: Create a rule with a single criteria line only:

VAT Registered	Company Contact	Contact Country	VAT Chargeable
Yes	n/a	Other EU country	No

- Event in France – The French guidelines for this event state that all companies as well as those who are VAT registered and who have a French address should not be charged VAT. All others, except for those flagged as VAT Exempt, should be charged VAT.

Rule: Since the guidelines allow for either a Company Contact or a contact whose VAT Registration Number is populated to be excluded, create a rule with two rows:

Yes	n/a	Same as place of supplier No
n/a	Yes	Same as place of supplier No

- Event in Italy – The Italian guidelines and tax advice for this event state that all company contacts in either a different EU Country or one outside the EU should be exempt from VAT. The VAT registration status connected to the registrant has no bearing.

  Rule: Since the guidelines specify only company contacts in a country other than Italy, create a rule with two rows:

VAT Registered	Company Contact	Contact Country	VAT Chargeable
n/a	Yes	Other EU country	No
n/a	Yes	Outside the EU	No

  Reminder: When defining events that are held in a country other than the home location of the organization, you must assign an entity code to the event.

Setting up VAT for Events

VAT taxation for an event involves applying VAT to event functions and hotel rooms. After defining VAT tax codes, you can enter the tax codes for individual event functions and hotel rooms.

> **Note:** Note: Because services are consumed in the country in which they are delivered, all customers are considered taxable.

Before you begin

1. Enable the VAT method.

2. Define the VAT codes.
3. Verify the Default country for the website (RiSE > Set up web components > General configuration).

To apply VAT to an event function

1. From Events, select Define an event to open the Define an event window.
2. Double-click the event that uses VAT to open it in the Define an event window.
3. Double-click an event function to open the Event Function Detail window.
4. Click Edit.
5. Enable the Taxable option to display the Tax Code field.
6. Enter the VAT code in the Tax Code field (next to the Taxable option), or select the lookup icon to search for a tax code.
7. Click Save.

To apply VAT to a hotel room

If you are licensed for Hotel Room Block Management, you can apply VAT to the cost of a hotel room.

1. From Events, select Define an event to open the Define an event window.
2. Double-click the event that uses VAT to open it in the Define an event window.
3. Click Hotels to open the Hotels window.
4. Select a Hotel Code.
5. Click Rooms to open the Room Types window.
6. Select a room from the list of Room Types.
7. Click Edit.
8. Enable the Taxable option to display the Tax Code field.

9. Enter the VAT code in the Tax Code field, or place your cursor in the Tax Code field and press Tab to select a tax code.
10. Click Save.

Setting up VAT for Orders

VAT taxation for Orders involves applying VAT to product categories, individual products, and freight and handling charges. Unless a customer has a nontaxable status, VAT freight and handling taxes are calculated on both taxable and nontaxable product purchases. Whether tax applies depends on the location of the customer relative to the organization; if the customer is:

- in the same EU country, VAT applies
- in a different EU country but has no VAT number (private person, some types of organizations), VAT applies
- in a different EU and has a VAT number, VAT does not apply
- outside the EU, VAT does not apply

> **Note:** Caution! Tax settings at the product level override those at the category level. That is, if you enable taxes for a category but not for a product in that category, no taxes are calculated; if you disable taxes for a category but enable them for a product in that category, taxes are calculated.

Best practice: Before applying VAT tax codes to products and product categories, consult with an expert on VAT rules and regulations.

> **Note:** Tip: You can override any applied VAT taxes at order entry.

Before you begin

1. Enable the VAT method.

2. Define the VAT codes.
3. Verify the Default country for the website (RiSE > Set up web components > General configuration).

To apply taxation to a product in AR/Cash

1. From AR/Cash, select Set up tables > Products to open the Set up products window.
2. Select a product code from the list of Current Products.
3. Click Edit.
4. Enable the Taxable option. The Tax Code field displays when the Taxable option is enabled.
5. Enter a VAT Tax Code for the product, or select the find icon to look up a tax code.
6. Click Save.

To apply taxation to a product category

1. From Orders, select Set up tables > Product categories to open the Set up product categories window.
2. Select a product category from the list of Current Categories.
3. Click Edit.
4. Enable the Taxable category option. The Tax Code field displays when the Taxable option is enabled.
5. Enter a VAT Tax Code for the product, or select the find icon to look up a tax code.
6. Click Save.

To apply taxation to a single product

1. From Orders, select Manage inventory > Manage products to open the Manage products window.

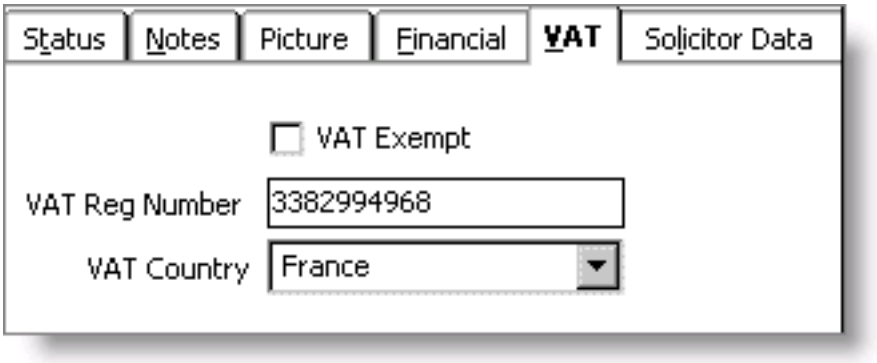
2. Select a product code from the list of Current Products.
3. Click Edit.
4. Enable the Taxable option. The Tax Code field displays when the Taxable option is enabled.
5. Enter a VAT Tax Code for the product, or select the find icon to look up a tax code.
6. Click Save.

To apply taxation to freight and handling charges

1. From Orders, select Set up module to open the Set up module window.
2. Click Add-On Charges to open the Add-on Charges window.
3. Click Edit.
4. Enable the Apply Sales Tax to Freight Charges and Apply Sales Tax to Handling Charges options. The Freight and Handling Tax field displays.
5. Enter a VAT tax code in the Freight and Handling Tax field, or select the find icon to look up a tax code.
6. Click Save.

Setting VAT tab data for a contact

Before entering an order for a customer, you need to enter the VAT details for the customer on the Manage customers window's VAT tab. This ensures that these details print on invoices.



Manage customers window - VAT tab

- VAT Exempt - Enable if this customer is exempt from VAT in all cases, regardless of VAT Rules.
- VAT Reg Number - Enter the VAT Registration Number for the customer. The VAT Registration Number on the VAT tab corresponds with a customer's VAT exempt status. If a value is entered in the VAT Reg Number field, a customer will be considered exempt and will not be charged VAT.

  The information entered in the VAT Reg Number field displays on the Enter and edit orders window (from AR/Cash, select Process orders > Enter and edit orders).

  Note: iMIS only processes VAT Registration Numbers issued by countries within the EU. If you enter a VAT Registration Number for a country outside the EU, VAT processing will be incorrect.
- VAT Country - Select the VAT country from the drop-down list. This information displays on the AR/Cash Enter and edit orders window.

  To enter VAT information for an individual

  If User Defined Company Flow Down has been set up for VAT, you only need to enter the following information for [1] company records or [2] those with no company affiliation.

1. From Customers, select Manage customers to open the Manage customers window.
2. Click Find to locate the customer's record.
3. Select the VAT tab.
4. (optional) If a customer is exempt from all VAT taxes, enable the VAT Exempt option.
5. (optional) Enter a customer's VAT Registration Number in the VAT Reg Number field. If a value is entered here, a customer is considered exempt.
6. Enter a customer's country code in the VAT Country field.
7. Click Save.

Overriding VAT for a registrant (event attendee)

When entering an event registration, a customer's VAT details will display on the Register a customer window's Overview tab, allowing you to decide whether or not to keep the VAT defaults which you defined at the function level. This is especially useful for international events with registrants from different countries.

1. From Events, select Register a customer to open the Register a customer window.
2. Select the Overview tab.
3. Click New.
4. Enter an Event code (select the lookup icon to look up an event code).
5. Enter the registrant's ID (select the lookup icon to look up an ID). The registrant's name and address information will display on the Register a customer window's data area.

   If the registrant has no record, click Add to go to the Attendee tab:

- Enter the registrant's First and Last name.
- (optional) To add the registrant to your iMIS database, enable the Add to Master option, which creates an ID.
- Complete the registrant's information, including company, address, and phone.
- Select the Overview tab.

6. Enter the Date. The date defaults to the batch date if Batch Control is used; otherwise, the date defaults to the system date.
7. If needed, override the Class code.
8. Enter the Bill To ID if it is different from the registrant's ID (select the find icon to look up an ID).
9. If needed, override the VAT code on the event functions the registrant selected:

- Double-click an event function.
- Enter the number of registrants in the Qty field.

- Enter the VAT code in the Tax Code field (select the lookup icon to look up a tax code). The tax calculated for the function displays in the VAT field.

10. Click Save.

Overriding VAT on an order

When entering an order, a customer's VAT details will display on the Overview tab of the Enter and edit orders window, allowing you to decide whether to keep the VAT defaults which you defined at the product or product category level. This is especially useful for international organizations with customers from different countries. In addition, transaction records are not created for a zero-dollar line item.

When entering orders, VAT is charged to a customer even if the 'Ship to' address's Country field is blank on the Ship to Info tab as long as the following are set on the Organization Names window:

- VAT is enabled for the Default Organization.
- VAT Country is set to a valid European country code.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click New.
3. Enter the Order Type (select the find icon to look up an order type).
4. Enter the Bill to ID (select the find icon to look up an ID). The VAT Summary information displays after entering the Bill to ID.
5. If needed, override the Order Date. The Order Date defaults to the batch date if batch control is used; otherwise, the date defaults to the system date.
6. If applicable, enter a Purchase Order.
7. Enter an order Source code (select the find icon to look up a code).
8. If needed, override the default Shipping Method.
9. If needed, override the default payment Terms.

10. If applicable, enter a percentage discount for the order in the % Discount field.
11. If applicable, enter a backorder Priority for the order.
12. Enter and modify each product:
    - Enter a Product code (select the find icon to open the Product Find window and look up a product), and press Tab. The Description field populates automatically.
    - If you need to override any of the product's defaults, double-click the product line-item to open its Product Detail window:
    - Enter/override the VAT Tax Code for the product (select the lookup icon to look up a code).
    - Override the default Net or Gross unit prices. As you change either price, the other price and the tax recalculate automatically.
    - (Multi-warehouse) If needed, override the product's default Warehouse.
    - Enter the product's specific order information in the available user-defined fields.
    - Enter the number of products ordered in the Quantity field.
    - If applicable, enter a percentage discount for the product in the % Disc field.

      Note: Entering a product-level discount in the % Disc field overrides any order-level discount entered in the % Discount field. However, product-level discounts are applicable for a given product only and do not affect entire order-level discounts.
    - Press Tab to add the product to the order. The product will display in the list of Product Line Items, and your cursor will be in the Product field.
13. Click Save to enter the order, and process the order through the stages appropriate for the order type.

Modifying reports and invoices for VAT

To help with VAT reporting, key reports include details about the VAT being collected for the order:

- The new ORDER-Order Status- Order Detail Report VAT (Crystal) report includes the customer's VAT details, such as VAT Exempt status or a VAT registration number and country. The charges at the bottom include explanation of the VAT portion, if any, including the percentage that applies and the net amount being collected.
- The MEETING-Confirmations- Confirmation Letter (Crystal) report shows the amount of VAT tax included in the registration fee.

  iMIS ships with an invoice standard report that includes an analysis of the VAT. In order to use this report, you need to modify the invoices in iMIS.

  To modify standard reports for VAT

1. Select Utilities > Report Specs to open the Report Specifications window.
2. Scroll and select the specific report you wish to modify (Omnis only):

- Select MEETING-Invoices-Print Invoices to modify Event Invoices
- Select ORDER-Invoices-Activity Menu Items to modify Order Invoices
- Select a standard Omnis report

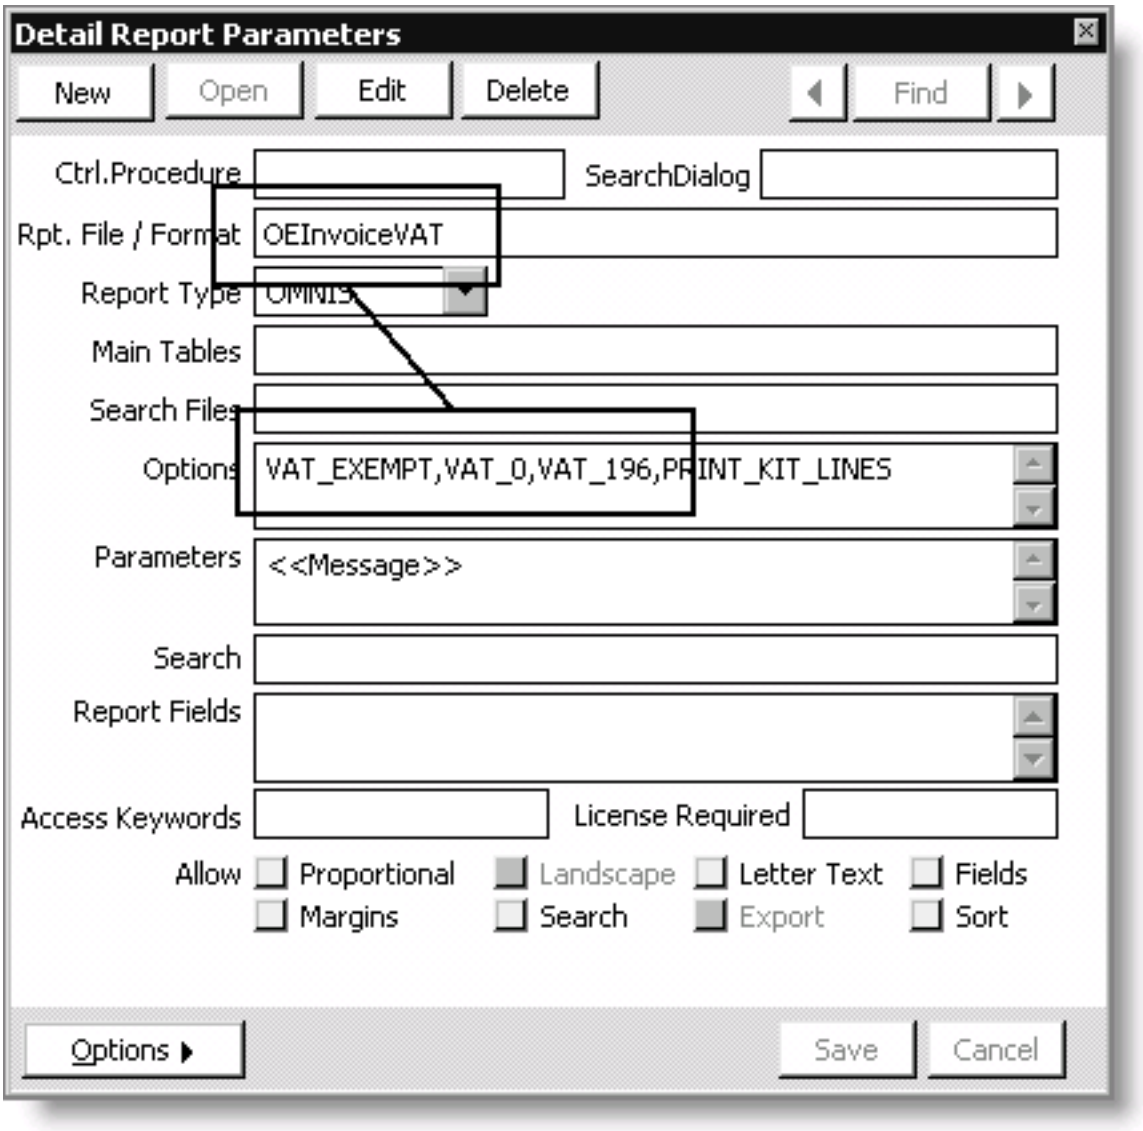
3. Click Clone.
4. Tab to the Title field, and place a period (.) at the beginning of the title.

   Tip: Putting a period at the beginning of the title places the report first in the alphabetical report category, making it the default.

5. Click Parameters to open the Detail Report Parameters window.
6. Change the Rep File / Format to OEInvoiceVAT.
7. For standard reports and Order Invoices:

- Enter the VAT tax codes in the Options field. Precede each tax code by VAT_, such as VAT_EXEMPT, VAT_0, and VAT_196.
- For Event Invoices, do not change the Options.

8. Click Save.



Example of a report modified for VAT

Validating VAT

iMIS does not automatically validate VAT Codes, but there are several validation options you can configure:

To set VAT validation options

You can decide whether to validate VAT codes, and whether to force a user to enter a valid VAT code before proceeding.

1. From Customers, select Set up Module > General.

2. Select Advanced, Edit.
3. Under VAT Validation Options, select one of the following:

- None – Disable the VAT validation options
- Allow User to Override Validation – The user can proceed even with a code the VAT validation process finds invalid
- Enforce Validation – The user cannot proceed with a code that the VAT validation process finds invalid

To hyperlink to VAT validation websites

You can hyperlink to the EU website that provides VAT validation (or any other VAT validation site). The hyperlink you set up will appear on the VAT tab on the Manage Customers window.

1. From Customers, select Set up module > General.
2. Select Advanced, Edit.
3. Under VAT Validation Hyperlink Options, select Show. Default values appear in the Text and URL fields, which you can override.

- If Text is blank but Show is selected, iMIS uses the default text VAT Country Validation.
- If URL is blank, iMIS uses the default value: http://europa.eu.int/comm/taxation_customs/vies/en/vieshome.htm.

4. Select Save, close all windows, and restart iMIS for the changes to take effect.

To validate VAT codes with a stored procedure

To automatically validate VAT codes, you can write a VAT validation stored procedure and attach it. Sample VAT validation stored procedures can be found in the Files\VAT_Validation folder on the iMIS 10.6 installation CD.

1. Go to Customers > Set up tables.

2. Select Country Names.
3. In Current Countries, select the target Country for the stored VAT validation procedure.
4. Select Edit.
5. In VAT Country, enter the desired country code.
6. In VAT Validation Procedure, enter the name of the stored procedure to run against any VAT codes entered into the system.
7. Select Save, close all windows, and restart iMIS for the changes to take effect.

To validate the number of VAT code characters

To automatically validate the number of characters in VAT codes entered (since code lengths vary by country), you can specify VAT code length parameters:

1. Go to Customers > Set up tables.
2. Select Country Names.
3. In Current Countries, select the country for which you want to set parameters.
4. Select Edit.
5. In VAT Country, enter the country code.
6. In the VAT Validation area of the open window, enter a Minimum Size of VAT Number and/or a Maximum Size of VAT Number.
7. To test the limits you specified, enter a value in the Test Value field and select Test.

   Note: If you set up a stored procedure, this will also test the value against that procedure.
8. Select Save, close all windows, and restart iMIS for the changes to take effect.

To display the VAT tab

1. Go to Customers > Manage Customers.
2. Display the Customer Portfolio Tab.
3. Open the Edit Tab Preferences options:

- Right-click the tab label area at the top of the Detail or History pane and select Edit Tab Preferences or
- Click any field and select Ctrl+T.

4. From the Other available Detail Tabs list, select VAT and add it to the Visible Details Tabs list.
5. Select Save, close all windows, and restart iMIS for the changes to take effect.

Issue Management

Issues Overview

Issues allows you to efficiently track multiple issues of various types and their status. The Issues module allows you to create and implement a comprehensive system for managing customer issue functions, enabling you to track multiple issues and their status efficiently. E-mail status updates can be sent upon request to keep customers informed of issue status.

The Issues module can be used successfully by all sizes and types of organizations—from small associations needing to track member-satisfaction issues to large organizations handling customer complaints, product/service feedback, and more complex issues.

You can set up the Issues general lookup/validation tables and configure many of the Issues field labels to match your organization's specific needs, configure the e-mail profile and timer interval to use for sending status updates, and link associated issues.

With the flexibility iMIS is known for, the Issues module integrates with the Customers module to allow current users to seamlessly integrate customer issue management into their systems.

Issues Capabilities

The iMIS Issues module allows you to perform the following tasks:

- Enter new issues
- Update details and status of existing issues
- Track issue status
- Enter and modify issue resolution information
- Maintain issue history
- Maintain issue resolution notes

- Send issue status updates via e-mail
- Generate issue statistics reports

Navigation for Issues

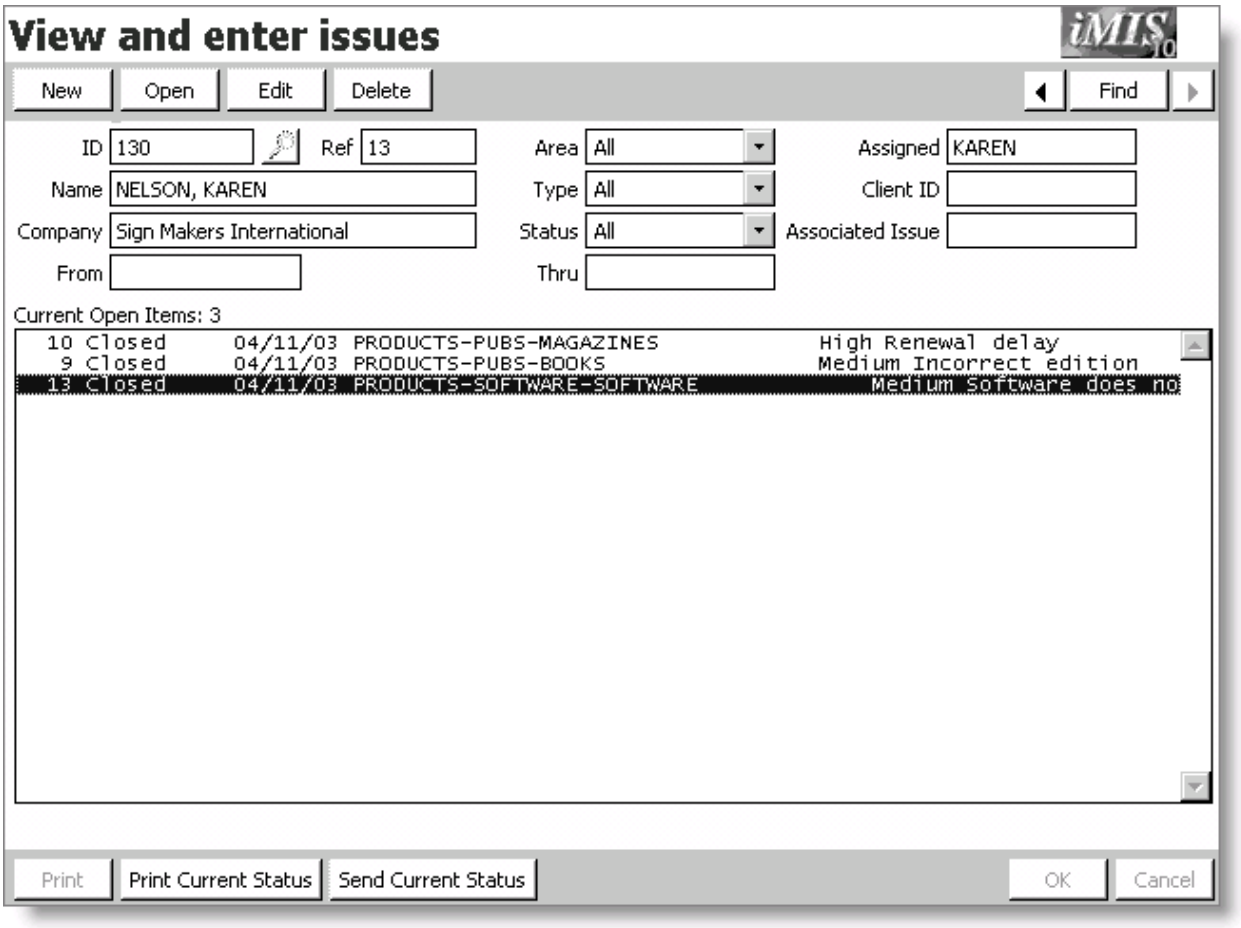
- View and enter issues - Select this item to display the View and enter issues window.
- Generate reports - Select this item to display the Generate reports window.
- Start e-mail server - Select this item to start the Issues e-mail server to send any queued issue status update messages.
- Set up module - Select this item to display the Issues Set up module window.

Entering and Editing Issues in iMIS

Viewing and Deleting Issues

Issues are entered and edited in the View and enter issues, Issue, and Resolution windows. The View and enter issues window displays by default when you select Issues from the Navigation bar.

View and enter issues window



From Issues, select View and enter issues

The View and enter issues window includes the following fields:

> **Note:** Note: The following descriptions reference the configurable prompts on the View and enter issues window (Client ID and Company) by their default names. Your administrator can customize the names of these prompts to suit your organization.

ID

Displays the customer ID of the person who submitted the issue. When searching for issues, you can enter the customer ID or click the lookup icon to look up an ID.

Ref

Displays the issue reference number. When searching for an issue, you can enter the issue reference number.

Area

Displays the area to which the issue is related. You can select the area from the drop-down list when searching for issues. Valid entries for this field are defined by your administrator.

Assigned

Displays the name of the user to whom the issue is assigned. When searching for issues, you can enter the name of the user to whom the issue is assigned.

Name

Displays the name of the person for whom the issue was entered. This field is automatically populated after entering a valid customer ID in the ID field. When searching for issues, you can enter a name.

Type

Displays the issue type. When searching for issues, you can select the issue type from the drop-down list. Valid entries for this field are defined by your administrator.

Client ID

Displays the client ID when an issue is reported on behalf of a third party (the client). When searching for issues, you can enter the client ID.

Company

Displays the name of the company associated with the customer ID. You can enter a company name when searching for issues.

Status

Displays the issue status. When searching for issues, you can select the issue status from the drop-down list.

Associated Issue

Displays the reference number of an issue associated with this issue. When searching for issues, you can enter the associated issue's reference number.

From

Enter the beginning date to use when searching for issues entered on or after a specific date.

Thru

Enter the ending date to use when searching for issues entered before or on a specific date.

Issue list

Displays the issues that met the last issue search criteria.

Print Current Status button

Used to print the current issue status.

Send Current Status button

Used to e-mail the current issue status to any customer(s) specified in an existing ISSUEREQ activity.

To search for issues

You do not have to specify any search criteria in the following procedure. However, if you do not specify a value for at least one of the fields, the search will return all issues.

> **Note:** Note: If you search for all issues and there are a large number of issues in the iMIS database, it may take some time to display all of the issues.

1. From Issues, select View and enter issues.
2. Click Open.
3. (optional) Enter or select the search criteria.

4. Click OK. All issues that meet all of the specified selection criteria display in the issue list on the View and enter issues window and the number of current open issues displays above the issue list.

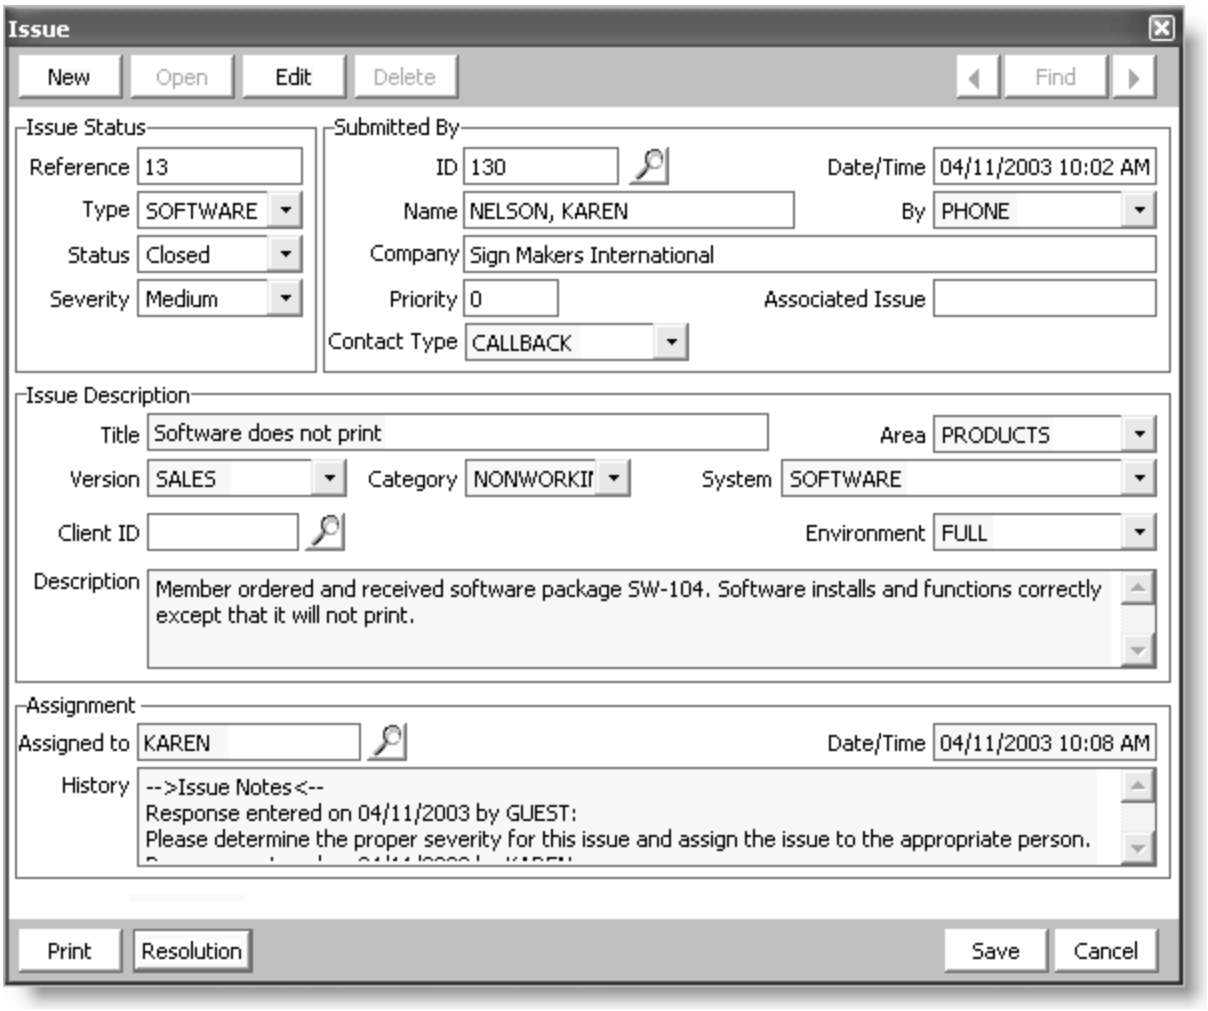
To delete an issue

1. From Issues, select View and enter issues to display the View and enter issues window.
2. Find the issue. See To search for issues for information on searching for issues.
3. Select the issue and click Delete. A confirmation message displays.
4. Click Yes to delete the issue.

Entering and Editing Issues

Issues are entered and edited on the Issue window.

Issue window



From Issues, select View and enter issues, then click New

The Issue window includes the following fields.

> **Note:** Note: The following descriptions reference the configurable prompts on the Issue window (Company, Priority, Version, System, Client ID, and Environment) by their default names. Your administrator can customize the names of these prompts to suit your organization.

Issue Status area

This area includes the following fields:

Reference

(read only) Displays the issue reference number.

Type

(required) Displays the issue type. Valid entries for this field are defined by your administrator.

Status

Displays the issue status. The default status is Unassigned.

Severity

Displays the issue severity. The default issue severity is Unassigned.

Submitted By area

This area includes the following fields:

ID

Displays the ID of the customer who submitted the issue.

Date/Time

(required) Displays the date and time that the issue was entered. This field is automatically populated with the current system date and time when you click New on the View and enter issues or Issue window. You can override the date and time if needed.

Name

Displays the name of the customer who submitted the issue. The Name field is automatically populated with the customer name when the customer ID is entered in the ID field. You can override the name if needed.

By

(required) Displays the method used to submit the issue. Valid entries for this field are defined by your administrator.

Company

Displays the company name. The Company field is automatically populated with the company name associated with the customer ID in the ID field. You can override the company name if needed.

Priority

Displays the issue priority. You can specify a numeric priority between 0 and 255. The default issue priority is 0.

Associated Issue

(optional) Displays the reference of an issue associated with this issue. This can be used to link subsequent issues to the original issue so that you can view all associated issues when the original issue is displayed.

Contact Type

Displays the required method of follow-up contact with the customer who submitted the issue. Valid entries for this field are defined by your administrator.

Issue Description area

This area includes the following fields:

Title

(required) Enter a brief title for the issue.

Area

Select the area related to the issue from the drop-down list. Valid entries for this field are defined by your administrator.

Version

Select the version related to the issue from the drop-down list. Valid entries for this field are defined by your administrator.

Category

Select the issue category from the drop-down list. Valid entries for this field are defined by your administrator.

System

Select the system related to the issue from the drop-down list. Valid entries for this field are defined by your administrator.

Client ID

(optional) Enter the customer ID of a secondary record to be associated with the issue. This must be a record with a type designated as a company record. This is often a company involved in resolving the issue (for example, a service vendor).

Environment

Select the environment related to the issue from the drop-down list. Valid entries for this field are defined by your administrator.

Description

Enter a detailed description of the issue.

> **Note:** Note: You can enlarge the view of the Description field by pressing Ctrl+Z. Click OK to close the enlarged view of the Description field.

Assignment area

This area includes the following fields:

Assigned to

Assign the issue to the appropriate user by entering a valid iMIS user name, or click the lookup icon to look up a user name.

Date/Time

The date and time the issue was assigned. This field is automatically populated with the current system date and time when a valid iMIS user name is entered in the Assigned to field. You can override the date and time if needed.

History

Displays details about the issue history. When a change is made to the Response field on the Resolution window and the issue is saved (by clicking Save on the Issue or Resolution window), the contents of the Response field are appended to the History field. Each time the contents of the Response field are appended to the History field, the contents are prefaced with a line indicating who entered the response and the date the response was entered.

> **Note:** Note: The default text on the first line of the History field is -->Issue Notes<--. This line is reserved for use in a future release and should not be deleted.

When you are in edit mode on the Issue window and click Resolution, any text contained in the Response field on the Resolution window the last time the issue was saved is selected. When you enter new text, the new text replaces the previous text. If you deselect the old text, both the old text and the new text are appended to the History field on the Issue window when the issue is saved. Since this results in duplicated information displaying in the History field, you should normally leave the previous Response text selected so that the previous text is replaced by the new text.

> **Note:** Note: You can enlarge the view of the History field by pressing Ctrl+Z. Click OK to close the enlarged view of the History field.

Resolution button

Used to display the Resolution window for the currently displayed issue.

To enter a new issue

> **Note:** Note: The following procedure references the configurable prompts on the Issue window (Company, Priority, Version, System, Client ID, and Environment) by their default names. Your administrator can customize the names of these prompts to suit your organization.

1. From Issues, select View and enter issues to display the View and enter issues window.

2. Click New to display the Issue window.
3. Select the Issue Status information (Type, Status, and Severity).
4. Enter or select the Submitted By information (ID, Name, Company, Date/Time, By, Priority, and Associated Issue).
5. Enter or select the Issue Description information (Title, Area, Version, Category, System, Client ID, Environment, and Description).
6. Enter or select the Assignment information (Assigned to, Date/Time, and History).
7. Click Save.

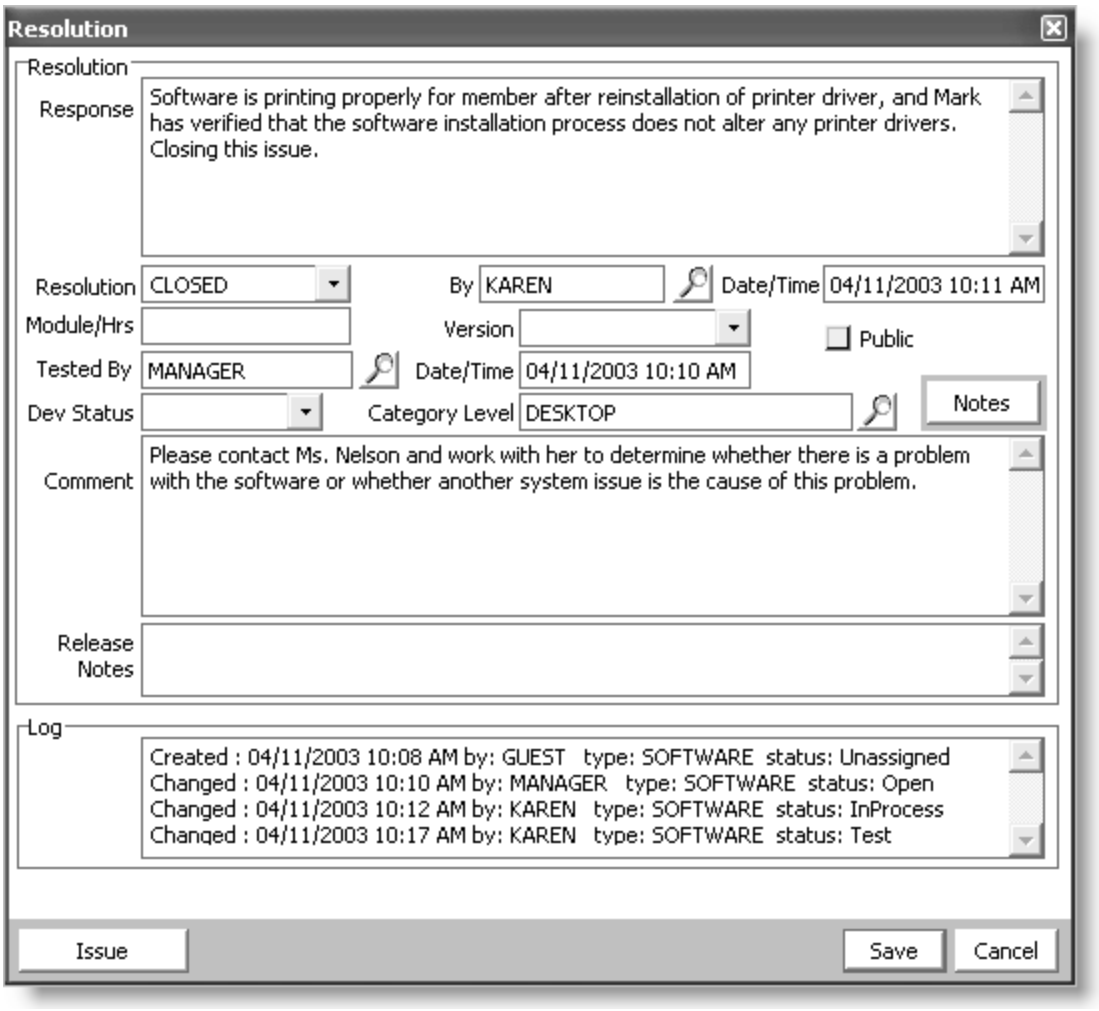
To edit an issue

1. From Issues, select View and enter issues to display the View and enter issues window.
2. Find the issue. See To search for issues for information on searching for issues.
3. Select the issue and click Edit to edit the issue in the Issue window, or double-click the issue to display the Issue window and then click Edit.
4. (optional) Make your changes to the issue on the Issue window.
5. (optional) Click Resolution to display the Resolution window and enter issue resolution and follow-up details.
6. Click Save.

Entering and Editing Issue Resolution Information

Issue resolution information is entered and edited on the Resolution window.

Resolution window



From Issues, select View and enter issues, open an issue, click Edit, and click Resolution.

The Resolution window includes the following fields:

> **Note:** Note: The following descriptions reference the configurable prompts (Module/Hrs, Version, Dev Status, and Release Notes) by their default names.

Resolution area

The resolution area includes the following fields:

Response

Enter the response information. When a change is made to the Response field on the Resolution window and the issue is saved (by clicking Save on the Issue or Resolution window), the contents of the Response field are appended to the History field. Each time these contents are appended to the History field, the contents are prefaced with a line indicating when the response was entered and by whom.

When you are in edit mode on the Issue window and click Resolution, any text entered in the Response field on the Resolution window the last time the issue was saved is selected. The text that is in this field when you click Save is appended to the History field on the Issue window. To prevent duplicate information from displaying in the History field, you should replace the selected text with your new text.

Note: Note: You can enlarge the view of the Response field by pressing Ctrl+Z. Click OK to close the enlarged view of the Response field.

Resolution

Select the issue resolution from the drop-down list. Valid entries for this field are defined by your administrator.

By

Enter the name of the iMIS user who resolved the issue, or click the lookup icon to select an iMIS user name. iMIS user names are defined on the User window (System Setup > Security administration > Users).

Date/Time

The Date/Time field is automatically populated with the current system date and time when a valid iMIS user name is entered in the By field displayed to the left of the Date/Time field. You can override the date and time if needed.

Module/Hrs

Enter the number of hours required to resolve the issue.

Version

Select the version related to the resolution from the drop-down list. Valid entries for this field are defined by your administrator.

Public

(optional) Marks this issue as searchable by all customers. Clear this checkbox to prevent customers from finding this issue in a search.

Verification area

Tested By

Enter the name of the iMIS user who verified the issue resolution, or click the lookup icon to select a customer ID.

Date/Time

The Date/Time field is automatically populated with the current system date and time when a valid iMIS user name is entered in the By field displayed to the left of the Date/Time field. You can override the date and time if needed.

Dev Status

Select the development status of the issue resolution from the drop-down list. Valid entries for this field are defined by your administrator.

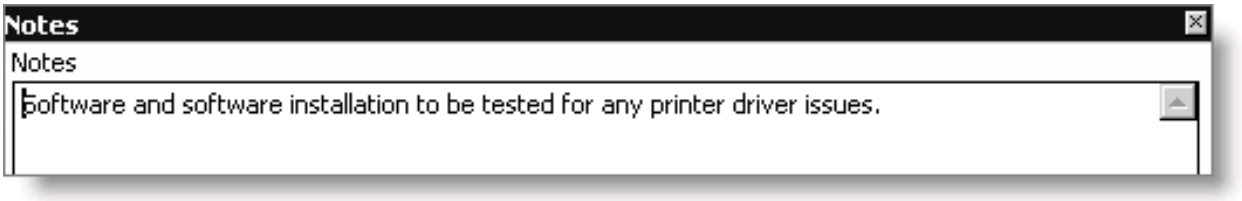
Category Level

(optional) Specifies the category level of the issue resolution. Valid entries for this field are defined by your administrator, and you can select multiple values from a list if you click the Lookup icon.

A category level is a meta category that spans across other categories. For example, you might have categories that align with product types, such as books, t-shirts, and desk accessories, but customers might inquire about the availability of these items in other languages. These inquiries might all be grouped under a category level such as "Language".

Notes

Used to display the Notes window, where you can enter or view any notes related to the issue resolution.



From Issues, select View and enter issues, open an issue, click Edit, click Resolution, and click Notes

Note: Note: You can enlarge the view of the Notes field of the Notes window by pressing Ctrl+Z. Click OK to close the enlarged view of the Notes field.

Comment

Enter any comments related to the verification of the issue resolution.

Note: Note: You can enlarge the view of the Comment field by pressing Ctrl+Z. Click OK to close the enlarged view of the Comment field.

Release Notes

Enter any release notes.

Note: Note: You can enlarge the view of the Release Notes field by pressing Ctrl+Z. Click OK to close the enlarged view of the Release Notes field.

Log

(read only) Each time you create or save an issue, the system automatically enters a record in this field. Each record includes the date, time, the name of the user who saved the issue or resolution, the issue type, and the issue status.

> **Note:** Note: You can enlarge the view of the Log field by pressing Ctrl+Z. Click OK to close the enlarged view of the Log field.

Issue

Used to display the issue in the Issue window.

> **Note:** Note: After displaying the issue in the Issue window, click Resolution on the Issue window to display the Resolution window again.

To enter issue resolution information

1. From Issues, select View and enter issues to display the View and enter issues window.
2. Find the issue. See To search for issues for information on searching for issues.
3. Select the issue and click Edit to edit the issue in the Issue window, or double-click the issue and click Edit on the Issue window.
4. Click Resolution to display the Resolution window.
5. Enter or select the issue resolution information.
6. Click Save.

To edit issue resolution information

1. From Issues, select View and enter issues to display the View and enter issues window.
2. Find the issue. See To search for issues for information on searching for issues.
3. Select the issue and click Edit, or double-click the issue to display the Issue window and click Edit.
4. Click Resolution to display the Resolution window.
5. Make your changes to the issue resolution information.
6. Click Save.

Sending Issue Status Updates

Informing Customers of Issue Status

The Issues module enables your organization to send messages concerning issue status via e-mail to keep your customers informed about the status of important issues.

> **Note:** Note: Your administrator must configure iMIS to send Issues module e-mails.

Sending Issue Status Update Messages via E-mail

You can send Issue status update e-mails to customers about the issues they have submitted.

When you select an issue from the View and enter issues window, the issue status update message is put in the issue update queue.

> **Note:** Note: If there is no Customer Profile e-mail address specified for the submitting customer, a message indicating that an e-mail address could not be found is displayed below the issue list.

When you select Start E-mail server from the navigation task bar in the Issues module, issue status update messages are queued to the e-mail client using the profile specified by your administrator.

> **Note:** Note: If an error message is displayed when trying to send status updates, confirm that your administrator has defined an E-Mail Overlay report.

> **Note:** Note: Your administrator must assign you a Sys mgmt authorization level of two (2) or higher to start the e-mail server.

When the issue status update message is queued to the e-mail client, a log entry indicating this is made automatically.

> **Note:** Note: If the issue status update message was successfully queued to the e-mail client but was not sent, you should check your e-mail client to determine the cause of the problem.

To queue an issue status update e-mail

1. From Issues, select View and enter issues to display the View and enter issues window.
2. Find the issue. See To search for issues for information on searching for issues.
3. Select the issue.
4. Click Send Current Status. A message indicating that the reply request was queued displays below the issue list if the issue was successfully queued. If an error message displays, refer to Troubleshooting E-mail Problems.

To send queued issue status updates

1. From Issues, select Start e-mail server on the Issues task list. The Start E-mail Server window opens.

   If the Timer Interval field on the Issues Set up module window is blank, an error message displays when you select Start e-mail server from the Issues task list.

   After you select Start e-mail server, the timer continues to run as long as the Start E-mail Server window is open. If you close the Start E-mail Server window, the timer stops and no additional issue status e-mail messages will be sent until you select Start e-mail server again.
2. Click Send Now to send queued issue status updates immediately.

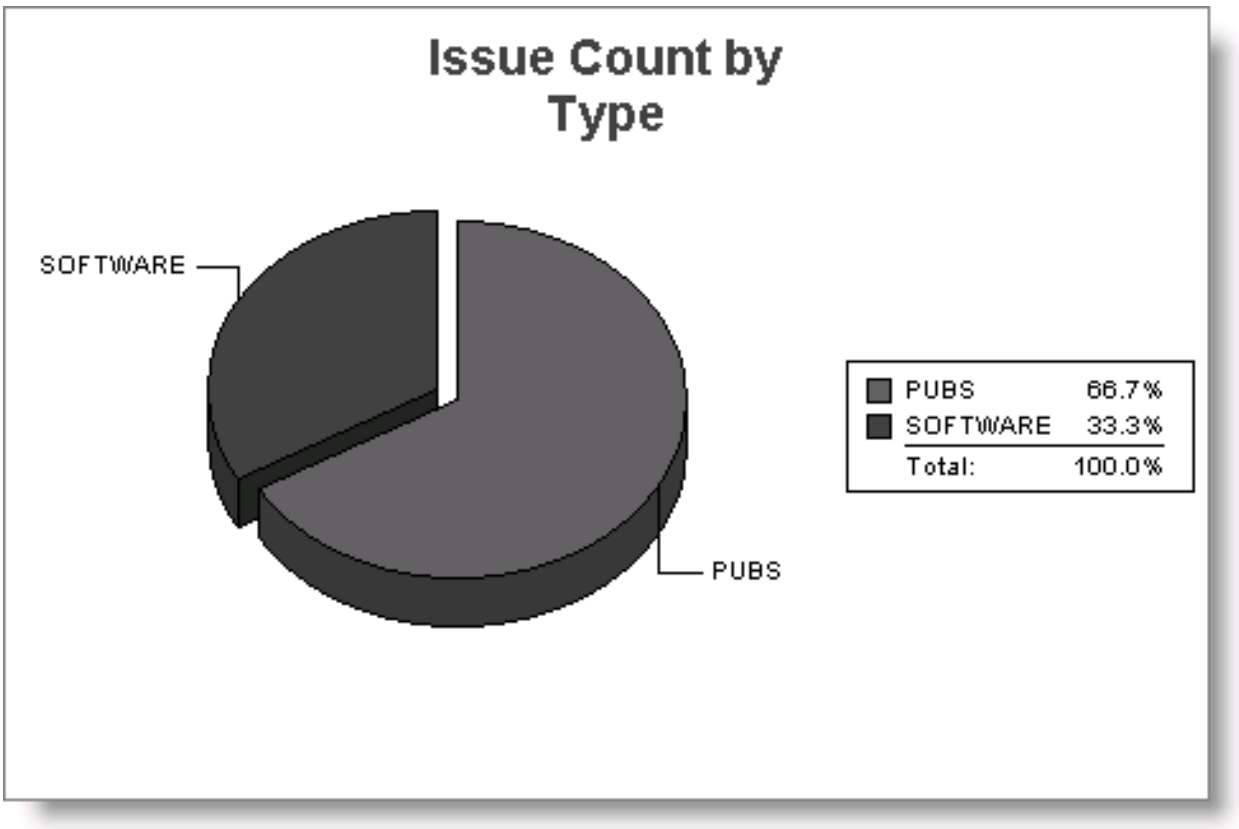
   Note: If you do not click Send Now, any queued issue status update messages will be sent after the time period specified by your administrator.

Generating Issues Reports

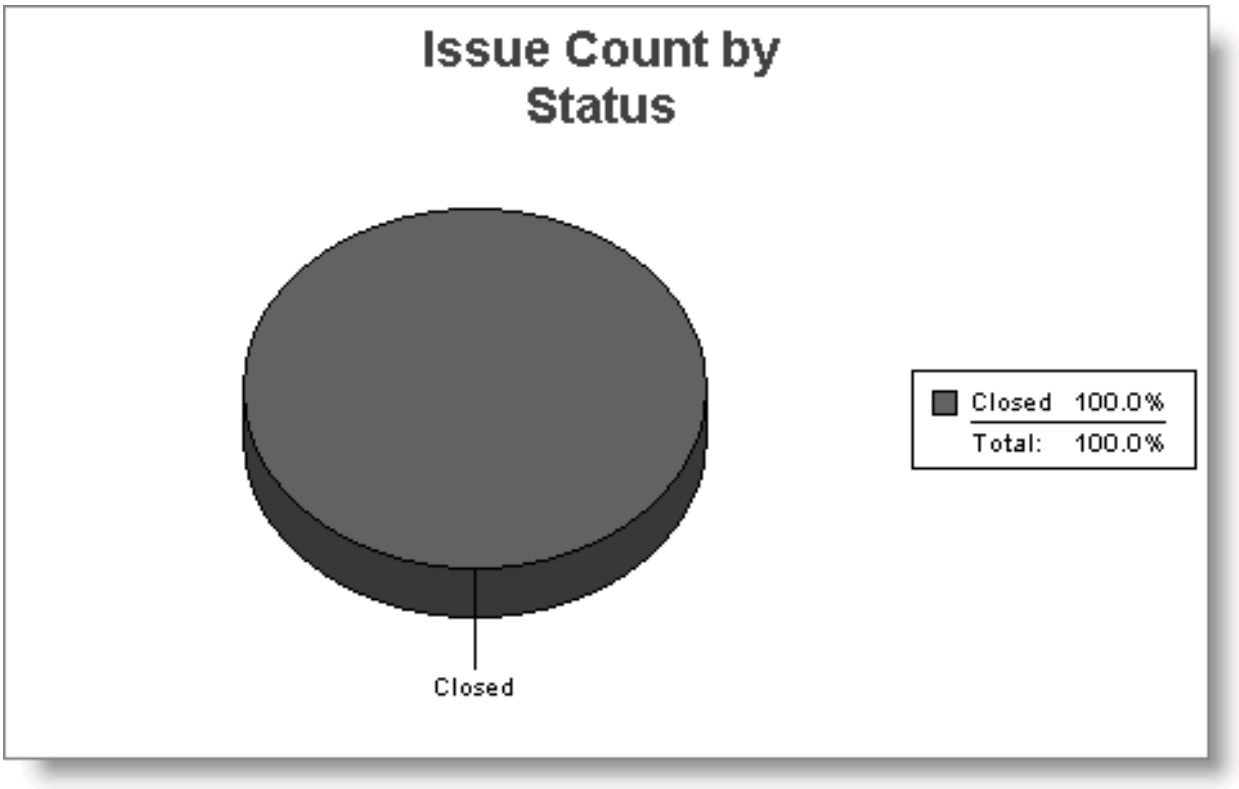
To run the Issue Statistics report

1. From Issues, select Generate reports.
2. From Report Types, select Statistics
3. From Available Reports, select Issue Statistics.
4. Click Run.
5. Specify the Begin Date.
6. Specify the End Date.
7. Click Run.

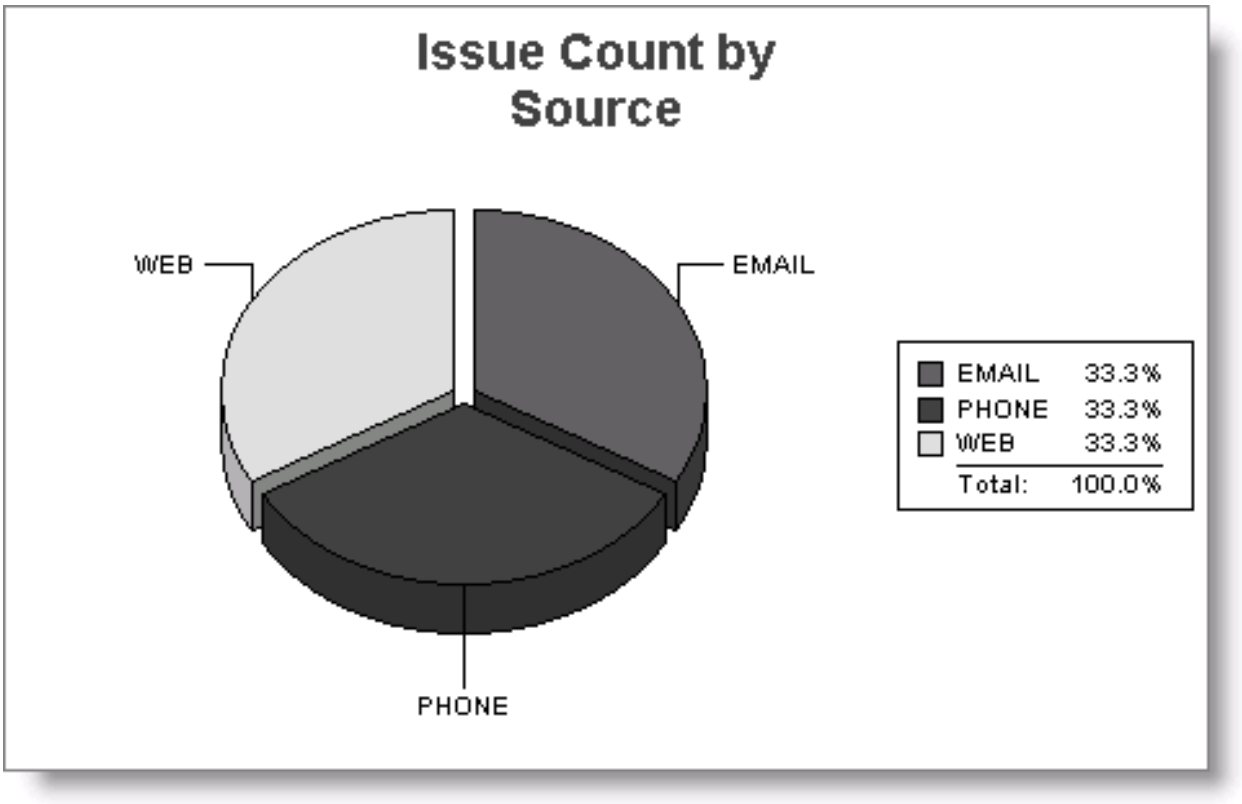
   The Issue Statistics report displays. There are four charts, similar to the following, on the Issue Statistics report.



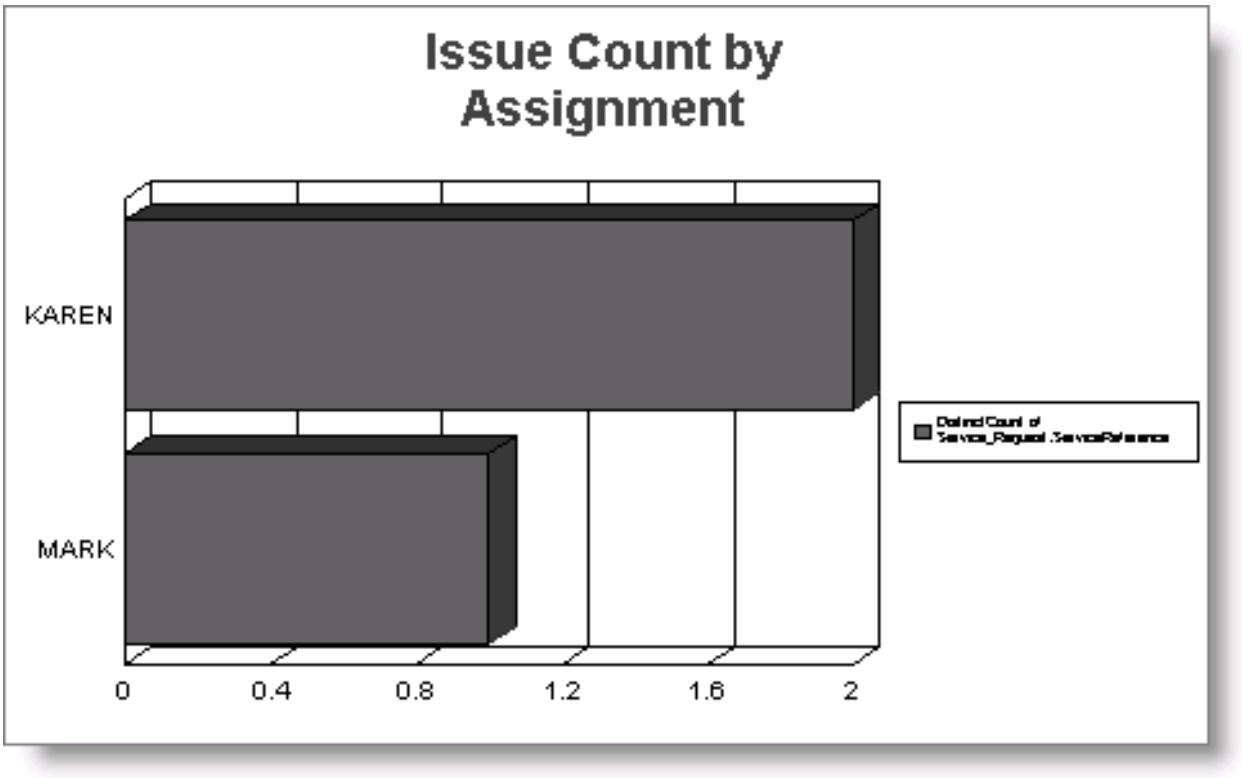
Example of Issue Count by Type chart on Issue Statistics report



Example of Issue Count by Status chart on Issue Statistics report



Example of Issue Count by Source chart on Issue Statistics report



Example of Issue Count by Assignment chart on Issue Statistic report

Setting up the Issues Module

> **Note:** Note: For detailed instructions for creating and using general look-up/validation and expansion tables, see the system reference General Look-up/Validation Tables.

You must create the following general lookup/validation tables and the appropriate codes for each table for the Issues module :

- SR_AREA – The codes used for the Area drop-down list in the Issue window are defined in this table.
- SR_CAT – The codes used for the Category drop-down list in the Issue window are defined in this table.

- SR_CATLEVEL – The codes used for the Category Level drop-down list in the Resolution window are defined in this table.
- SR_CNTTYPE – The codes used for the Contact Type drop-down list in the Issue window are defined in this table.
- SR_DEVSTATUS – The codes used for the Dev Status drop-down list in the Resolution window are defined in this table.
- SR_ENVIRON – The codes used for the Environment drop-down list in the Issue window are defined in this table.
- SR_RECORDEDBY – The codes used for the By drop-down list in the Issue window are defined in this table.
- SR_RES – The codes used for the Resolution drop-down list in the Resolution window are defined in this table.
- SR_SRVTYPE – The codes used for the Type drop-down list in the Issue window are defined in this table.
- SR_SYS – The codes used for the System drop-down list in the Issue window are defined in this table.
- SR_VERSION – The codes used for the Version drop-down lists in the Issue and Resolution windows are defined in this table.

Sample Scenario general lookup/validation tables

SR_AREA general lookup/validation table

Some organizations classify issues as product-related, services-related, or other. In this scenario, the SR_AREA general lookup/validation table contains the following issue relation codes.

Note: Note: The code is listed first, followed by the description in parentheses.

- OTHER (Other)
- PRODUCTS (Products)
- SERVICES (Services)

  SR_CAT general lookup/validation table

  Some organizations classify issues according to category. In this scenario, the SR_CAT general lookup/validation table contains the following category codes.

  > **Note:** Note: The code is listed first, followed by the description in parentheses.

- BILLING (Billing)
- INCORRECT (Incorrect)
- MISSING (Missing)
- NONCURRENT (Noncurrent)
- NONWORKING (Not working)
- OTHER (Other)

  SR_DEVSTATUS general lookup/validation table

  Some organizations use issue resolution codes that require manager approval. In this scenario, the SR_DEVSTATUS general lookup/validation table contains the following issue resolution codes.

  > **Note:** Note: The code is listed first, followed by the description in parentheses.

- APPROVE (Approved)
- DECLINE (Declined)
- PENDING (Pending approval)

  SR_ENVIRON general lookup/validation table

Some organizations classify issues by the member type of the person reporting the issue. In this scenario, the SR_ENVIRON general lookup/validation table contains the following member type codes.

> **Note:** Note: The code is listed first, followed by the description in parentheses.

- ASSOCIATE (Associate)
- FAMILY (Family)
- FULL (Full)
- NONMEMBER (Nonmember)
- SENIOR (Senior)

SR_RECORDEDBY general lookup/validation table

Some organizations have several methods by which they are notified of issues. In this scenario, the SR_RECORDEDBY general lookup/validation table contains the following issue notification method codes.

> **Note:** Note: The code is listed first, followed by the description in parentheses.

- E-MAIL (E-mail)
- FAX (Fax)
- LETTER (Letter)
- OTHER (Other)
- PHONE (Phone)
- WEB (Web)

SR_RES general lookup/validation table

Some organizations specify the current resolution status of issues. In this scenario, the SR_RES general lookup/validation table contains the following issue resolution status codes.

> **Note:** Note: The code is listed first, followed by the description in parentheses.

- CLOSED (Closed)
- CONFIRM (Confirm)
- INPROG (In progress)
- OPEN (Open)

SR_SRVTYPE general lookup/validation table

Some organizations provide several types of services. In this scenario, the SR_SRVTYPE general lookup/validation table contains the following service type codes.

> **Note:** Note: The code is listed first, followed by the description in parentheses.

- MEMBERSHIP (Membership)
- PUBS (Publications)
- SOFTWARE (Software)
- TOURS (Tours)
- VIDEOS (Videos)

SR_SYS general lookup/validation table

Some organizations manage issues by their relation to products and services. In this scenario, the SR_SYS general lookup/validation table contains the following product and service codes.

> **Note:** Note: The code is listed first, followed by the description in parentheses.

- BOOKS (Books)
- CARDS (Cards)
- DVD (DVD video)
- MAGAZINES (Magazines)
- MEMBERSHIP (Membership)
- OTHER (Other)
- SERVICES (Services)
- SOFTWARE (Software)
- TOURS (Tours)
- VHS (VHS video)

  SR_VERSION general lookup/validation table

  Some organizations resolve issues within specific departments. In this scenario, the SR_VERSION general lookup/validation table contains the following department codes.

  > **Note:** Note: The code is listed first, followed by the description in parentheses.

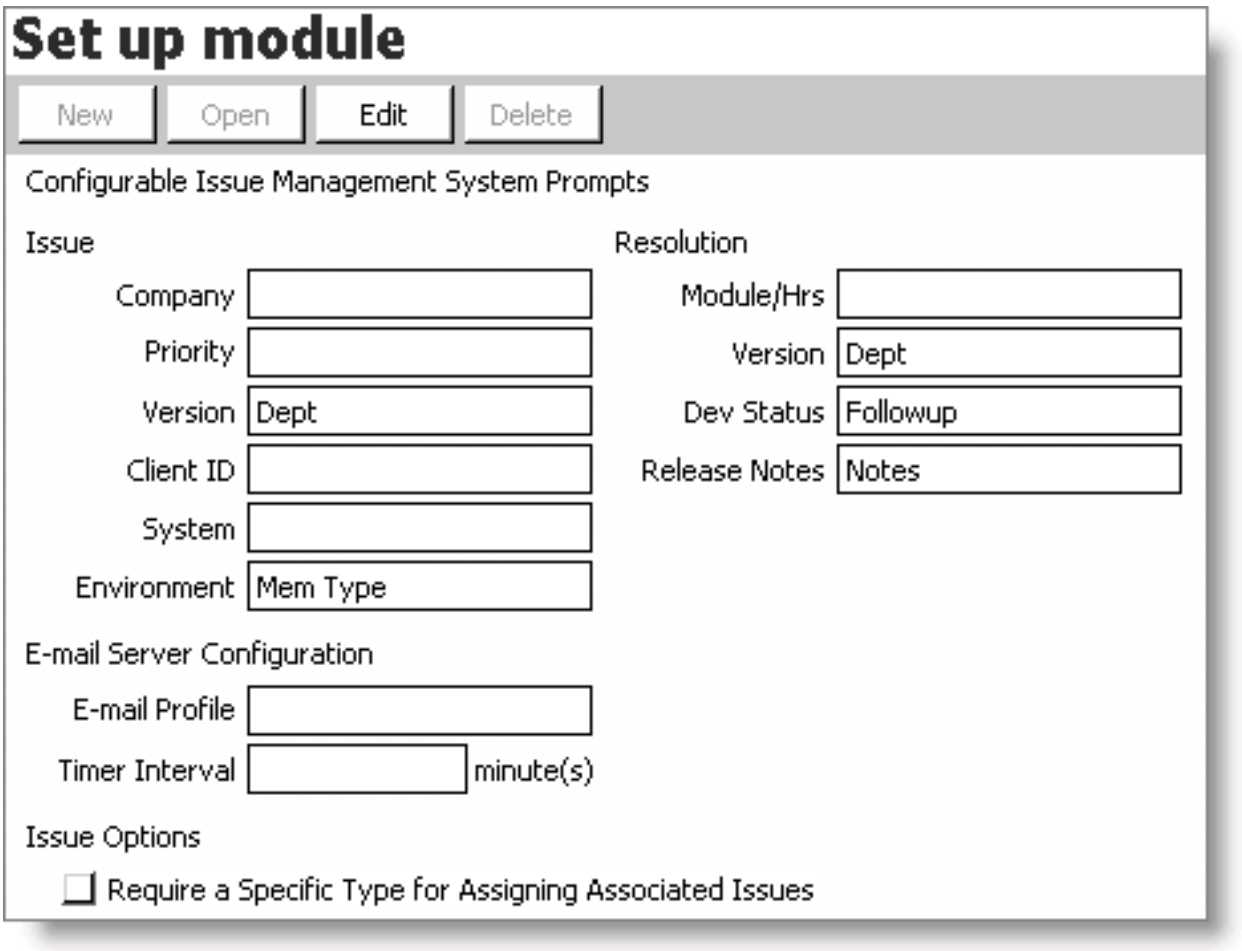
- MEMBERSHIP (Membership)
- SALES (Sales)
- TOURS (Tours)
- VOLUNTEER (Volunteer Services)

Configuring Options for Issues

You can configure several of the prompts on the View and enter issues, Issue, and Resolution windows to suit your organization's specific needs. You can also specify the e-mail profile and the time interval to use for sending issue status e-mail messages. You can configure these settings on the Issues Set up module window. You must have a Sys

mgmt authorization level of two (2) or higher to configure the Issues module on the Issues Set up module window.

Set up module window



From Issues, select Set up module

Issue area

You can use the fields in this area to configure the following prompts on the Issue window:

Company

Enter the prompt name for the Company field. If you do not specify a prompt, the default prompt is Company.

> **Note:** Note: If you configure the prompt for the Company field on the Issue window, the same prompt is also used for the Company field on the View and enter issues window.

Priority

Enter the prompt name for the Priority field. If you do not specify a prompt, the default prompt is Priority.

Version

- Enter the prompt name for the Version field. If you do not specify a prompt, the default prompt is Version.

Client ID

Enter the prompt name for the Client ID field. If you do not specify a prompt, the default prompt is Client ID.

> **Note:** Note: If you configure the prompt for the Client ID field on the Issue window, the same prompt is also used for the Client ID field on the View and enter issues window.

System

Enter the prompt name for the System field. If you do not specify a prompt, the default prompt is System.

Environment

Enter the prompt name for the Environment field. If you do not specify a prompt, the default prompt is Environment.

Resolution area

You can use the fields in this area to configure the following prompts on the Resolution window:

Module/Hrs

Enter the prompt name for the Modules/Hrs field. If you do not specify a prompt, the default prompt is Module/Hrs.

Version

Enter the prompt name for the Version field. If you do not specify a prompt, the default prompt is Version.

Dev Status

Enter the prompt name for the Dev Status field. If you do not specify a prompt, the default prompt is Dev Status.

Release Notes

Enter the prompt name for the Release Notes field. If you do not specify a prompt, the default prompt is Release Notes.

E-mail Server Configuration area

This area includes the following fields:

E-mail Profile

Enter the name of the e-mail profile to use for sending issue status e-mail messages.

Note: Note: The e-mail client must be MAPI-compliant (for example, Microsoft Outlook, Eudora, or Groupwise).

Timer Interval

Enter the time interval (in minutes) at which the system should check for and send any automatic issue status e-mail messages that need to be sent.

Note: Note: You must specify the timer interval (in minutes) for the Issues e-mail server or an error message displays when you select Start e-mail server from the Issues task list.

Issue Options area

Require a Specific Type for Assigning Associated Issues

Select to require that associated issues have a specific type in order to be assigned as associated issues. When this option is enabled, a field displays to the right of this option. Select the required type for assigning associated issues from the drop-down list.

Configuring user prompts

> **Note:** Note: Users must have a Sys mgmt authorization level of 2 or higher to access the Issues Set up module window. The Set up module item does not display on the Issues task navigation list if the current user does not have access. See Limiting user access.

The prompts for the following fields on the Issue window can be configured:

- Company (affects both Issues and View and enter issues windows)
- Priority
- Version
- Client ID (affects both Issues and View and enter issues windows)
- System
- Environment

The prompts for the following fields on the Resolution window can be configured:

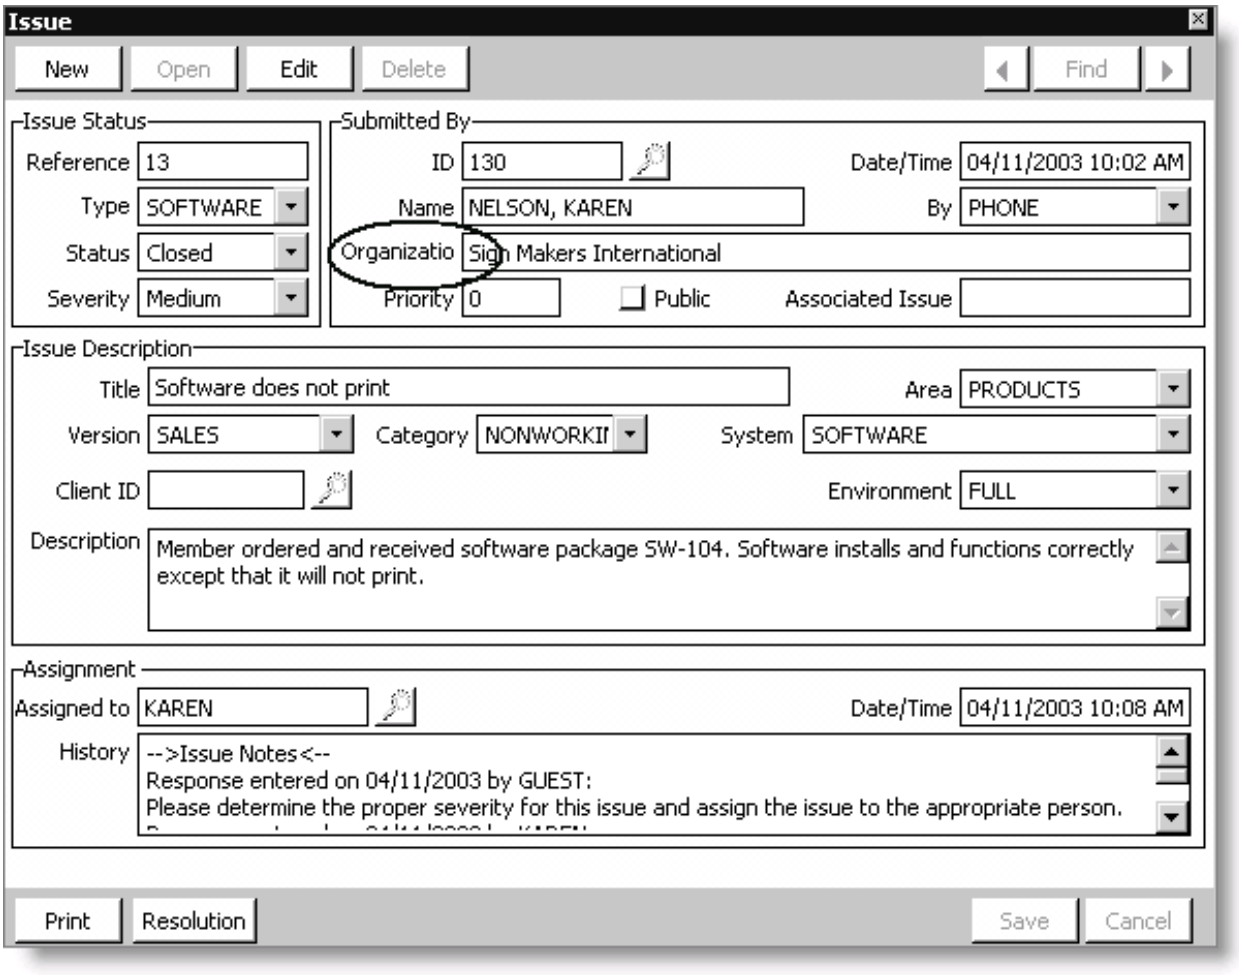
- Module/Hrs
- Version
- Dev Status
- Release Notes

The field names for configurable field prompts can contain a maximum of 15 characters, including any spaces. Due to display limitations, the number of characters that can be displayed in a field prompt without being truncated by the field itself varies. Uppercase

characters and special characters require more display space than lowercase characters, and the amount of space available varies depending on the specific prompt that is being configured. To maximize the number of characters that can be displayed without the prompt characters being truncated by the field itself, use lowercase characters. If all uppercase characters are used for a prompt, the maximum number of characters per line that can be displayed is nine. Depending on the specific field and the actual characters used for the prompt, the maximum number of uppercase characters that can be displayed may be less than nine.

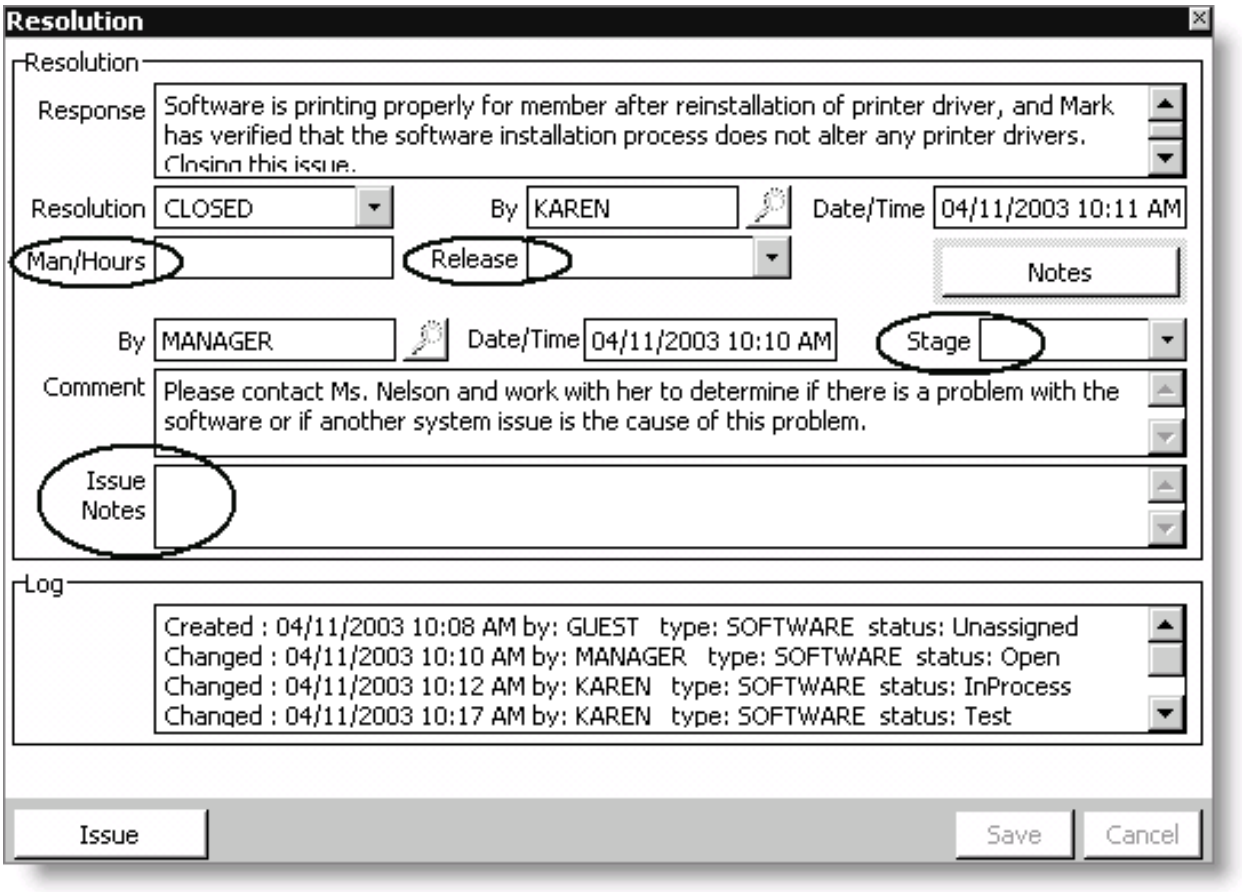
The prompt for the Release Notes field on the Resolution window can be displayed in two lines by including a space in the prompt that is specified in the Release Notes field on the Issues Set up module window. If the prompt includes a space so that the prompt is displayed in two lines, the prompt is displayed centered vertically with the field.

In the following example, the Company prompt on the Issue window has been configured to display Organization, but the modified prompt contains too many characters to display and the prompt is truncated by the field itself.



Example of Issue window with a truncated prompt

The following example illustrates the effective use of configurable prompts in the Resolution window (from Issues, select View and enter issues, open an issue, and then click Resolution).



Example of Resolution window with configured prompts

After configuring any prompts on the Issues Set up module window, be sure to view the prompts on the View and enter issues, Issue, and Resolution windows to be sure that the modified prompts display acceptably.

Configuring Issues e-mail

You can configure how the Issues module sends issue status e-mail messages. You can specify the time intervals at which iMIS checks for and sends issue status e-mail messages to specified customers regarding existing issues.

Selecting Start e-mail server on the Issues navigation task bar starts a timer and displays the Start E-mail Server window. iMIS then periodically checks for and sends (at the specified interval) any unsent issue status e-mail messages that have been queued by the Issues module.

After you select Start e-mail server, the timer continues to run as long as the Start E-mail Server window is open. If you close the Start E-mail Server window, the timer stops and no additional issue status e-mail is sent until you select Start e-mail server again.

If your organization uses a dial-up connection to send e-mail or prefers to send issue status e-mails at specific times of day, you should select Start e-mail server as needed. You can then close the Start E-mail Server window after allowing enough time for all messages to be queued to the e-mail server. The amount of time needed to queue all messages to the e-mail server varies depending on the number of issue status updates that need to be queued.

If your organization needs to send issue status e-mail messages on a continuous basis (for example, for a 24-hour customer support center), leave the Start E-mail Server window open on a dedicated workstation. iMIS and your e-mail client software must be installed on this workstation.

You must create the E-Mail Overlay report specification before you can send issue status updates via e-mail. The text that is included in issue status e-mail messages is contained in this report specification.

In order to start the Issues e-mail server, you must specify the local e-mail profile that the Issues module uses to send issue status e-mail messages and the timer interval at which the Issues module e-mail server checks for any queued issue status update messages. You can specify any existing e-mail profile on the local machine where the e-mail client is running. The e-mail client must be MAPI-compliant (for example, Microsoft Outlook, Eudora, or Groupwise). Local e-mail profiles should be set up using the normal procedure for setting up e-mail profiles for your specific e-mail client. You must specify the timer interval (in minutes) for the Issues e-mail server or an error message displays when you select Start e-mail server from the Issues task list.

Note: Note: Issue status e-mail messages are limited to 2,147,483,647 characters.

An ISSUEREQ activity record is created when an issue status message needs to be sent, either as a result of an automatic status update or when the user clicks Send Current

Status on the View and enter issues window. The ISSUEREQ activity records are checked at the interval specified in the Timer Interval field on the Issues Set up module window. If an issue status message needs to be sent and an e-mail address for the issue status message is found in the e-mail profile specified in the E-mail Profile field on the Issues Set up module window, the issue status e-mail is queued on the e-mail server.

> **Note:** Note: You do not need to manually create the ISSUEREQ activity type in order to send issue status e-mail messages. You may wish to create the ISSUEREQ activity type in order to view unsent issue status update items. For information on manually creating the ISSUEREQ activity type, see Creating the ISSUEREQ activity type.

When you click Send Current Status, a message displays if there is no e-mail address specified in the E-mail field on the Profile tab of the Manage customers window for the ID associated with the issue; the ISSUEREQ activity record is not created.

When the e-mail request is queued by the e-mail client, the ISSUEREQ activity record is deleted and an entry indicating that the e-mail request was queued by the e-mail client is automatically added to the Log field on the Resolution window.

Once the issue status e-mail has been queued by the e-mail client, any errors should be logged by the e-mail system and you should follow the normal troubleshooting procedures for your e-mail system if messages are not being sent.

To configure Issues prompts and e-mail settings

> **Note:** Note: After configuring any Issues prompts, be sure to view the prompts in the View and enter issues, Issue, and Resolution windows to be sure that the modified prompts display acceptably.

1. From Issues, select Set up module to display the Set up module window.
2. Click Edit.
3. Enter any prompts needed for the Issue window in the Issue area.

Note: If you configure the prompts for the Company or Client ID fields on the Issue window, the same prompts are also used for the Company and Client ID fields on the View and enter issues window.

4. Enter any prompts needed for the Resolution window in the Resolution area.
5. Enter the e-mail profile to use when sending issue status e-mail messages in the E-mail Profile field. You can specify any existing e-mail profile on the local machine where the e-mail client is running.

   Note: The e-mail client must be MAPI-compliant (for example, Microsoft Outlook, Eudora, or Groupwise).
6. Enter the time interval (in minutes) at which the system should check for and send any issue status e-mail messages in the Timer Interval field.

   Note: You must specify the timer interval (in minutes) for the Issue Management e-mail server or an error message displays when you select Start e-mail server from the Issues task list.
7. Select the Require a Specific Type for Assigning Associated Issues option and select a type from the drop-down list (displays when you select the option) to require that associated issues have a specific type in order to be assigned as associated issues.
8. Click Save.

E-Mail Overlay report specification

The subject and message body of issue status update e-mail messages are defined in the E-Mail Overlay report specification. The message body is specified in the Parameters field on the Detail Report Parameters window. The following parameters can be entered in the Parameters field:

- [Service_Request.ServiceReference] - This parameter is replaced by the issue reference in the e-mail message body.
- [Service_Request.Title] – This parameter is replaced by the issue title in the e-mail message body.

- [Service_Request.Status] – This parameter is replaced by the issue status in the e-mail message body.

  The issue status update e-mail subject header is prefaced with Re: your Issue followed by the issue reference and issue title.

  The following is an example of the contents of the Parameters field on the Detail Report Parameters window:

  QLWA Foundation

  Issue Management Notification

  Your Issue (Ref. # [Service_Request.ServiceReference]) [Service_Request.Title] has been submitted and has been assigned a status of [Service_Request.Status].

  Thank you,

  QLWA Foundation

  This will result in an issue status update e-mail message body similar to the following:

  QLWA Foundation

  Issue Management Notification

  Your Issue (Ref. # 14) Test has been submitted and has been assigned a status of InProcess.

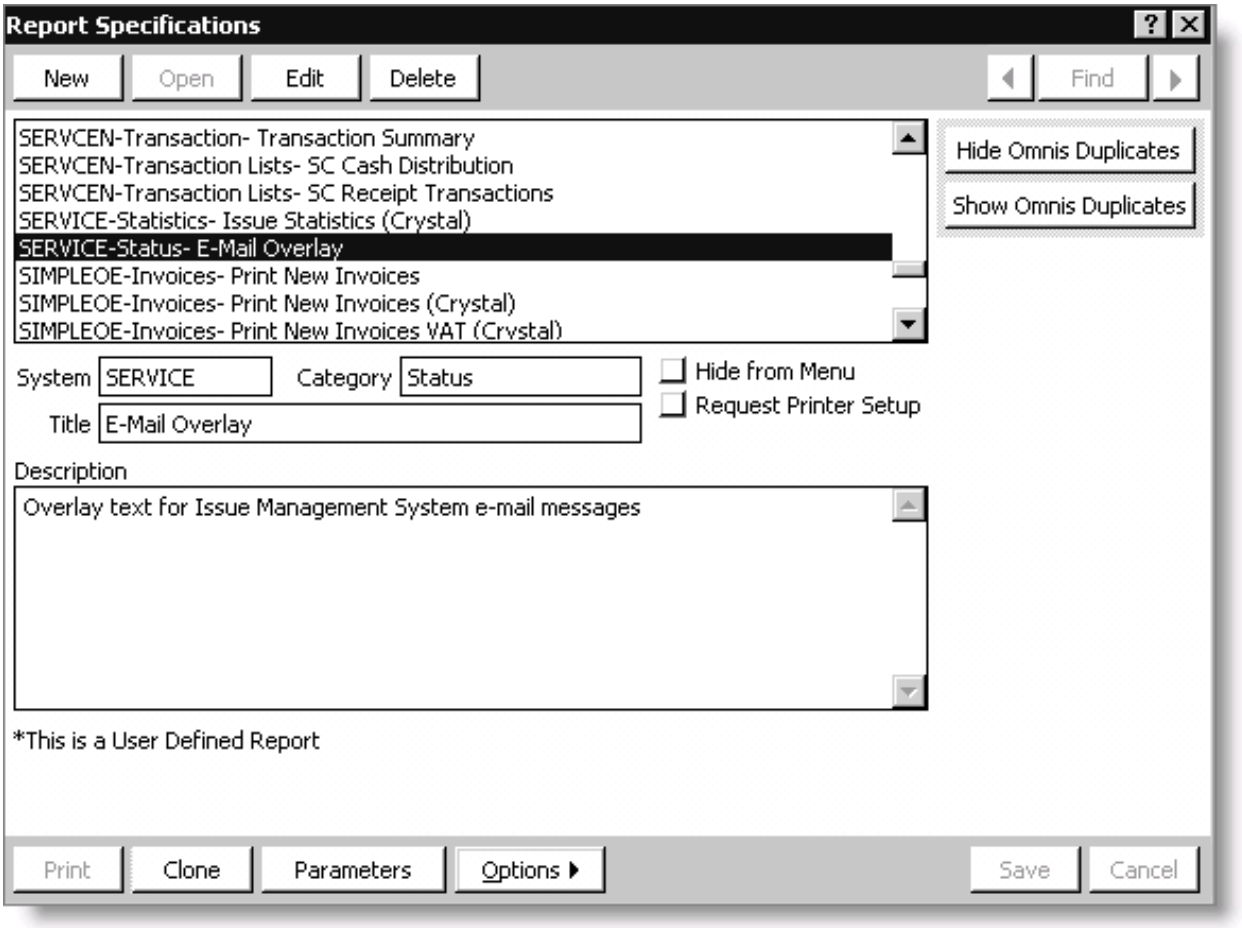
  Thank you,

  QLWA Foundation

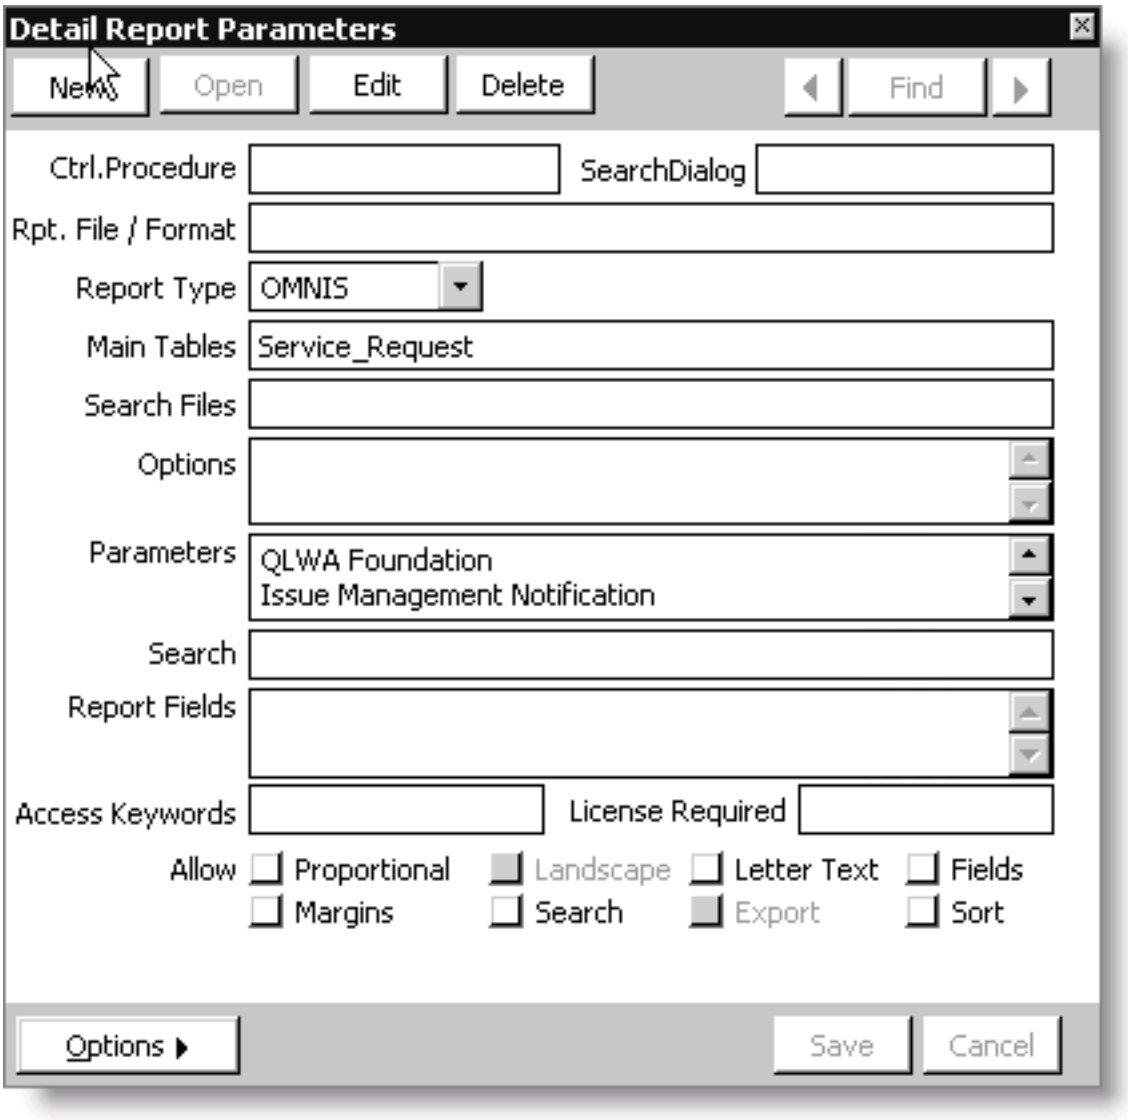
  To create the E-Mail Overlay report specification

1. Select Utilities> Report Specs to display the Report Specifications window.
2. Click New.
3. Enter SERVICE in the System field.
4. Enter Status in the Category field.

5. Enter E-Mail Overlay in the Title field.
6. Enter Overlay text for Issue Management System E-mail messages in the Description field.
7. Click Parameters to display the Detail Report Parameters window.
8. Enter Service_Request in the Main Tables field.
9. Enter the text, including the desired issue parameters ([Service_Request.ServiceReference], [Service_Request.Title], and [Service_Request.Status]), to include in issue status update e-mail messages in the Parameters field.
10. Click Save.



Report Specifications window for E-Mail Overlay report specification



Example of Detail Report Parameters window for E-Mail Overlay report specification

Creating the ISSUEREQ activity type

An ISSUEREQ activity record is created when an issue status update message needs to be sent. You do not need to manually create the ISSUEREQ activity type in order to send issue status update messages, but you can manually create the ISSUEREQ activity type so that you can view unsent issue status update messages.

To create the ISSUEREQ activity type

1. From Customers, select Set up module> Activity types to display the Set up activity types window.
2. Click New.
3. Enter ISSUEREQ in the Type field.
4. Enter ISSUEREQ in the Description field.
5. Click Save.

Sample Scenarios

You can configure Issues for your organization's needs, whatever these may be. The sample scenarios provide some examples of how the Issues module might be used in one membership organization.

This organization needs to manage customer issues related to to the following products and services:

- Membership
- Publications (books, magazines, and information reference cards)
- Software
- Videos (DVD and VHS)
- Tours

Configuring Issues for this organization includes configuring several of the prompts that display on the Issue and Resolution windows, and creating the necessary general look-up/validation tables.

Scenario Field Labels

The labels for the following Issues fields are configured specifically for this organization. These labels are configured on the Issues Set up module window.

Issue area

Version

Used to specify the department to which the issue is related, so the label for this field is changed to Dept. This department is normally the department that should resolve the issue.

Environment

Used to specify the member type of the person reporting the issue, so the label for this field is changed to Mem Type.

Resolution area

Version

Used to specify the department which resolved the issue, so the label for this field is changed to Dept. This department is normally the department that should resolve the issue.

Dev Status

Used to specify the current status of the issue, so the label for this field is changed to Followup.

Release Notes

Used to maintain notes on the issue resolution, so the label for this field is changed to Notes.

Scenario Predefined Drop-Down List Values

The issue status choices are predefined and display in the Status drop-down list on the Issue window. The available issue status choices include the following:

- Unassigned – This is the default for all new issues
- Open
- InProcess
- Test
- ReDo

- Hold
- Pending
- Closed

The issue severity choices are predefined and display in the Severity drop-down list on the Issue window (from Issues, select View and enter issues, then click New). The available issue severity choices include the following:

- Unassigned – This is the default for all new issues
- Low
- Medium
- High
- Urgent

Issue Entry without Manager Approval

The following workflow provides an example of entering an issue that does not require manager approval for this organization.

1. A member ordered a book, but received an outdated edition. The member sent an e-mail to the organization, and the following issue was entered and saved in the Issue window.

- Type drop-down list – PUBS
- Status drop-down list – Open
- Severity drop-down list – Medium
- ID field – 105
- By drop-down list – E-MAIL
- Title field – Incorrect edition
- Area drop-down list – PRODUCTS
- Dept drop-down list – SALES

- Category drop-down list – INCORRECT
- System drop-down list – BOOKS
- Mem Type drop-down list – FULL
- Description field – Received previous edition of publication HB-1045.
- Assigned to field – MARK

2. When Mark searches his assigned issues, this issue displays. He opens the issue for editing, determines the actions needed to resolve the issue, and makes the following change on the Issue window.

- Status drop-down list – InProcess

3. Mark makes the following change on the Resolution window and saves the issue.

- Response field – Will ship current edition and arrange for return shipping of previous edition.
- Resolution drop-down list – INPROG
- By field – MARK
- Dept drop-down list – SALES

4. After the current edition has been shipped and return shipping has been arranged for the previous edition, Mark opens the issue for editing, makes the following change on the Resolution window, and saves the issue.

- Response field – Shipped current edition and arranged for return shipping of previous edition. Awaiting confirmation from member of receipt of current edition and return of previous edition.

5. After the member has called to confirm receipt of the current edition of the book and placed the incorrect edition in the mail for return, Mark opens the issue for editing, makes the following change on the Resolution window, and saves the issue.

- Response field – Confirmed member receipt of current edition. Member has return shipped previous edition.

6. After the previous edition has been confirmed as returned, Mark opens the issue for editing and makes the following change on the Issue window.

- Status drop-down list – Closed

7. Mark then makes the following changes on the Resolution window and saves the issue.

- Response field – Return of previous edition has been confirmed.
- Resolution drop-down list – CLOSED
- By field – MARK (to indicate that the issue resolution was confirmed by Mark)

8. All Status changes made on the Issue and Resolution windows display in the Log field on the Resolution window.

Issue Entry with Manager Approval

The following workflow provides an example of entering an issue requiring manager approval for this organization.

1. A member renewed a subscription to one of the organization's magazines, but there was a processing delay and the member missed two issues during this time. The member submitted a complaint via the organization's web site and the following issue was entered and saved in the Issue window.

- Type drop-down list – PUBS
- Status drop-down list – Open
- Severity drop-down list – Medium
- ID field – 107
- By drop-down list – WEB
- Title field – Renewal delay
- Area drop-down list– PRODUCTS

- Dept drop-down list – SALES
- Category drop-down list – MISSING
- System drop-down list – MAGAZINES
- Mem Type drop-down list – FULL
- Description field – Member renewed annual subscription to MAG-003 before the renewal deadline, but did not receive the March and April 2003 issues.
- Assigned to field – KAREN

2. When Karen searches her assigned issues, this issue displays. She opens the issue and determines the actions needed to resolve the issue. She searches for previous issues submitted by this member and finds that this member had previously submitted two issues regarding missing publications. In accordance with organization policy, the member should receive the two missing issues and a free publication, subject to manager approval. She opens the issue and makes the following changes on the Issue window.

- Status drop-down list – InProcess
- Severity drop-down list – High
- Assigned to field – MANAGER

3. Karen makes the following changes on the Resolution window and saves the issue.

- Response field – Ms. Caller previously submitted two issues regarding missing publications and is therefore eligible for a free publication (SB-1031) in accordance with organization policy. Please approve this and return the issue to me with your approval.
- Resolution drop-down list – INPROG
- By field – KAREN
- Dept drop-down list – SALES

4. When the manager searches her assigned issues, this issue displays. The manager confirms that this member did previously submit two issues regarding missing publications,

then makes the following change on the Issue window.

- Assigned to field – KAREN

5. The manager makes the following changes on the Resolution window and saves the issue.

- Comment field – Free publication (SB-1031) approved, approval code 0423B.
- By field – MANAGER
- Followup - APPROVE

6. The next time Karen searches her assigned issues, this issue displays. She opens the issue, makes the following changes on the Resolution window, and saves the issue.

- Response field – Ensured that MAG-003 renewal for this member is in effect. Sent March and April 2003 issues and free publication (SB-1031) to member. Will confirm member receipt of March, April, and May 2003 issues and receipt of SB-1031.
- By field – KAREN

7. Karen later verifies that the member received the missing March and April 2003 issues, the new May 2003 issue, and the free publication. She then opens the issue and makes the following change on the Issue window.

- Status drop-down list – Closed

8. Karen then makes the following changes on the Resolution window and saves the issue.

- Response field – Confirmed that member received March, April, and May 2003 issues and free publication (SB-1031).
- Resolution drop-down list – CLOSED
- By field - KAREN

Issue Entry with Analysis and Testing

The following workflow provides an example of entering an issue requiring some analysis and testing for this organization.

1. A member ordered and received software from the organization. After installing and using the software, the member is unable to print from the software and calls to report this issue. The following issue is entered on the Issue window.

- Type drop-down list – SOFTWARE
- Status drop-down list – Unassigned
- Severity drop-down list – Unassigned
- ID field – 130
- By drop-down list – PHONE
- Title field – Software does not print
- Area drop-down list – PRODUCTS
- Dept drop-down list – SALES
- Category drop-down list – NONWORKING
- System drop-down list – SOFTWARE
- Mem Type drop-down list – FULL
- Description field – Member ordered and received software package SW-104. Software installs and functions correctly except that it will not print.
- Assigned to field – MANAGER

2. The following information is entered on the Resolution window and the issue is saved.

- Response field – Please determine the proper severity for this issue and assign the issue to the appropriate person.
- By field - Bill

3. Since the person entering the issue is not sure of the proper severity or the person to whom the issue should be assigned, the issue is assigned to the manager. The manager can then determine the appropriate severity, assign the issue to the proper person, and

place a note to this effect in the Resolution field on the Resolution window.

4. When the manager searches her assigned issues, this issue displays. The manager determines that the issue should be assigned to Karen with a medium priority. The manager makes the following changes on the Issue window.

- Status drop-down list – Open
- Severity drop-down list – Medium
- Assigned to field – KAREN

5. The manager makes the following changes on the Resolution window and saves the issue.

- Comment field – Please contact Ms. Nelson and work with her to determine if there is a problem with the software or if another system issue is the cause of this problem.
- By field – MANAGER

6. When Karen searches her assigned issues, this issue displays. She makes the following changes on the Issue window.

- Status drop-down list – InProcess

7. Karen makes the following change on the Resolution window and saves the issue.

- Response field – Will contact Ms. Nelson to determine cause of the printing problem.
- Resolution drop-down list – INPROG
- By field – KAREN

8. She contacts Ms. Nelson to discuss the printing problem. She determines that Ms. Nelson's printer driver is not properly installed and assists her in reinstalling the printer driver. Ms. Nelson confirms that the software prints properly after reinstalling the printer driver. Karen makes the following changes on the Issue window.

- Status drop-down list – Test
- Assigned to field – MARK

9. Karen makes the following changes on the Resolution window and saves the issue.
   - Resolution field – Contacted Ms. Nelson and determined that her printer driver was not properly installed. Assisted her with reinstallation of printer driver and Ms. Nelson confirmed that the software is now printing properly. Mark, please confirm that the software installation process does not affect any installed printer drivers and then return this issue to me.
   - Resolution drop-down list – CONFIRM
   - By field - KAREN
10. When Mark searches his assigned issues, this issue displays. He tests the software and verifies that the installation process does not alter any printer drivers. He makes the following change on the Issue window.
   - Assigned to field – KAREN
11. Mark makes the following changes on the Resolution window and saves the issue.
   - Response field – Tested software and verified that the installation process does not alter any printer drivers.
   - By field – MARK
12. When Karen searches her assigned issues, the issue displays. Mark's note that the software installation process does not alter any printer drivers displays in the History field on the Issue window. Karen makes the following changes on the Issue window.
   - Status drop-down list – CLOSED
13. Karen makes the following changes on the Resolution window and saves the issue.
   - Response field – Software is printing properly for member after reinstallation of printer driver, and Mark has verified that the software installation process does not alter any printer drivers. Closing this issue.
   - Resolution drop-down list – NOPROB
   - By field – KAREN

Troubleshooting Issues

Troubleshooting E-mail Problems

- If there is no e-mail address for the ID associated with the issue status update message, a message displays and the ISSUEREQ activity record is not deleted.
- When the Issues module is set to send issue status messages via e-mail, the ISSUEREQ activity records are checked at the interval specified by the Timer Interval field on the Issues Set up module window. An entry is automatically added to the Log field on the issue's Resolution window and the ISSUEREQ activity record is deleted if the issue status e-mail was successfully queued to the e-mail client.

  Note: You must specify the timer interval (in minutes) for the Issues e-mail server or an error message displays when you select Start e-mail server from the Issues task list.
- If the Log field on the issue's Resolution window indicates that the issue status e-mail was successfully queued to the e-mail client, you should check the e-mail profile's Sent folder to see if the issue status e-mail was sent. If the issue status e-mail was not sent, you should check your e-mail client to determine why the e-mail was not sent.

  To troubleshoot e-mail problems

1. Check the Log field on the issue's Resolution window to see if there is an entry indicating that the issue status e-mail was successfully queued to the e-mail client.

- If the issue status e-mail was not successfully queued to the e-mail client, ensure that the proper e-mail profile is specified in the E-mail Profile field on the Issues Set up module window, and ensure that the e-mail client is running on the local machine where iMIS is running.

  Note: After you select Start e-mail server, the timer continues to run as long as the Start E-mail Server window is open. If you close the Start E-mail Server window, the timer stops and no additional issue status e-mail is sent until you select Start e-mail server again.

2. If the issue status e-mail was successfully queued to the e-mail client, check the e-mail client's Sent folder to see if the message was sent.

- If the message was sent, see if a delivery failure message was received. If a delivery failure message was received, attempt to determine the cause of the delivery failure (for example, a bad e-mail address or an unavailable host).

3. If the issue status e-mail was successfully queued to the e-mail client but was not sent, check the e-mail client to determine why the issue status e-mail was not sent.

Legislative Bill Tracking

Legislative Tracking Overview

iMIS Legislative Tracking is an extensive detail-tracking system for all types of legislative bills, including Senate, House, State, and Local. Its capabilities offer powerful support to your legislative affairs staffer, from making it possible to find out which companies are in a legislator's district to analyzing the effect of pending legislation on your industry.

iMIS Legislative Tracking is the first entry in a suite of Government Relations packages. The system facilitates the tracking of important bills and the communication of significant bill information to key contacts. This system is a powerful notetaking tool to allow Legislative Affairs staff to capture, analyze, and report information about important pending legislation affecting your industry or profession.

If you do not have the staff available to research and enter information on pertinent bills in a timely manner, you can connect iMIS to an outside service that provides legislative information through a modem hookup. Your reseller can talk with you about the hardware, software, and services required to effectively utilize such a service.

Legislative Tracking offers the following features:

Key Bill Tracking Information

- Bill Number
- Title Author and Sponsor
- Subject and Category
- Status
- Large, word processing style areas for Synopsis, Analysis, and Notes
- Up to eight additional user defined alphabetic and date tracking fields that can be assigned and used according to your own needs
- A cumulative history of all legislative and related actions

Legislative Reports

- Full profiles of individual bills
- Exports to major word processors for special mailings to key individuals (i.e., committee members, key contacts)

Optional Automated Inputs (local availability varies)

- Regular downloading of bill descriptive and action history data from certain on-line legislative service companies

The download procedure would create new bill records, when appropriate, and update action history on existing bills.

Bill Tracking works with Customer

By making full use of Customer Management, you will find many ways to access and make use of the information you collect in Legislative Tracking:

Legislator Tracking

By taking advantage of the rich and flexible demographic capability of the iMIS central database you can maintain detailed information on each legislator. Once the legislators are in Customer Management, you can produce labels, letters, standard reports, and custom reports.

Call Tracking

iMIS makes it easy to keep track of who you have called, what you talked about, and who and when you are to call back. Activities such as letters you have written or information you have sent out are recorded in a history file you can easily review or report on whenever you have need.

Districting your (Company) Members

You can identify the district each of your members is in and record this data in the member's record in the US Congress and St Congress fields on the demographic screen of iMIS. You can load the congressional districts into these fields from outside sources

initially and on an on-going basis to avoid data entry and ongoing maintenance. Your reseller can refer you to companies who offer such services.

Once this information is in the member/contact records, you can produce member labels, standard letters, and standard or ad hoc reports by districts through the iMIS Search and Select facilities or the Ad Hoc Report Writer.

Configuring Legislative Bill Tracking

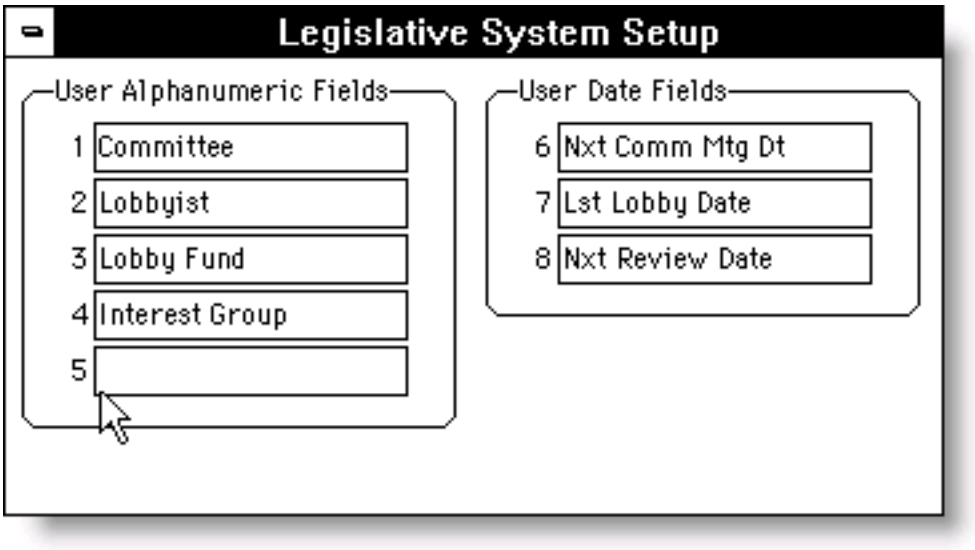
As with all iMIS modules, you need to take steps on the iMIS System Setup level to enable the module and provide secured authorization for each iMIS user.

- If needed, select File > System Menus > System Setup and edit your iMIS Licensing to enable iMIS Legislative Tracking.
- To display the Legislative module in iMIS, select File > Applications > Legislative Tracking. If it does not appear in this list, return to the previous step.
- Provide an Authorization Level for each user of Legislative: select System Setup > Security administration > Users. This security scheme works as it does with all other iMIS modules.

  Bill Tracking Options

  The only configuration you need to complete before entering your legislative bills is defining custom text and date fields to appear on each bill's Notes window.

- Select Leg/Track> System Setup.



Legislative System Setup window

These optional fields include five alphanumeric and three date fields. Each field is available only if you assign it a label (title) on this window.

> **Note:** Note: You can place white space between your optional fields to group them visually: do this by skipping fields, such as by using fields 1, 2, 4, and 5 but not 3.

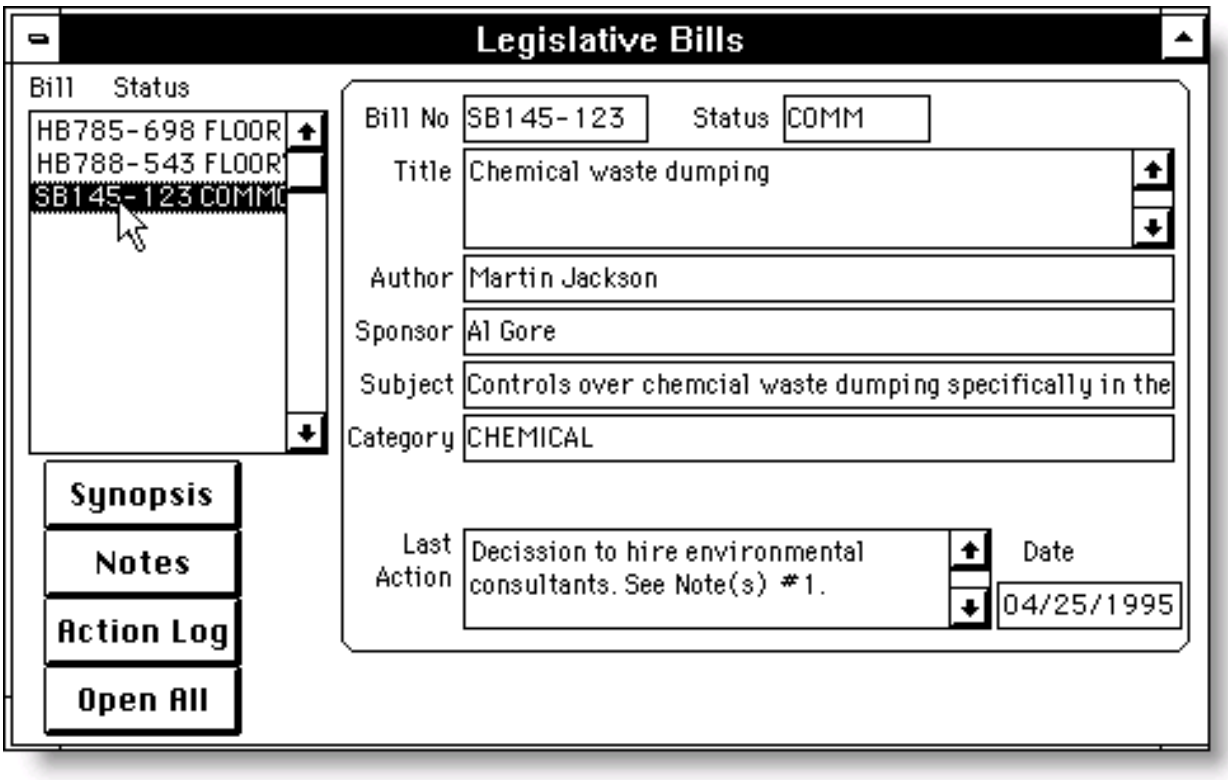
Entering Legislative Bills

Creating Legislative Bill Records

Assume you need to enter Senate bill SB145-123.

1. Select Leg/Track> Bills.
2. Enter the bill Number.
3. Enter the Status of the bill. The status is user-defined; examples would be Open, Closed, or Floor.
4. Enter the bill Title. While iMIS supports an extensive entry area, titles are usually relatively short.
5. Enter the bill's Author or multiple authors, separated by commas.

6. Enter the bill's Sponsor or multiple sponsors, separated by commas.
7. Enter the Subject relating to the bill.
8. Enter the bill's Category. This is user-defined and can be used as selection criteria for reporting purposes.
9. Enter the Last Action occurring with this bill, and accept or override the Date.



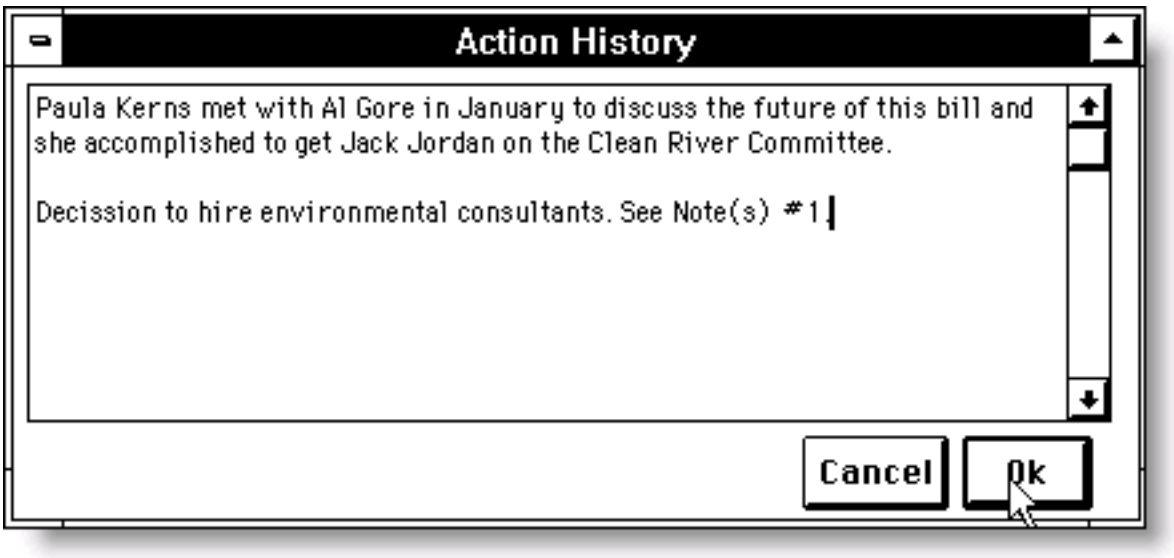
Legislative Bills window

Keeping the Action Log

Until this procedure is automated, you can populate the action log using the text from the Last Action section along with the date can be moved to the action log for history:

1. Select Edit, and select (highlight) the text to be moved.

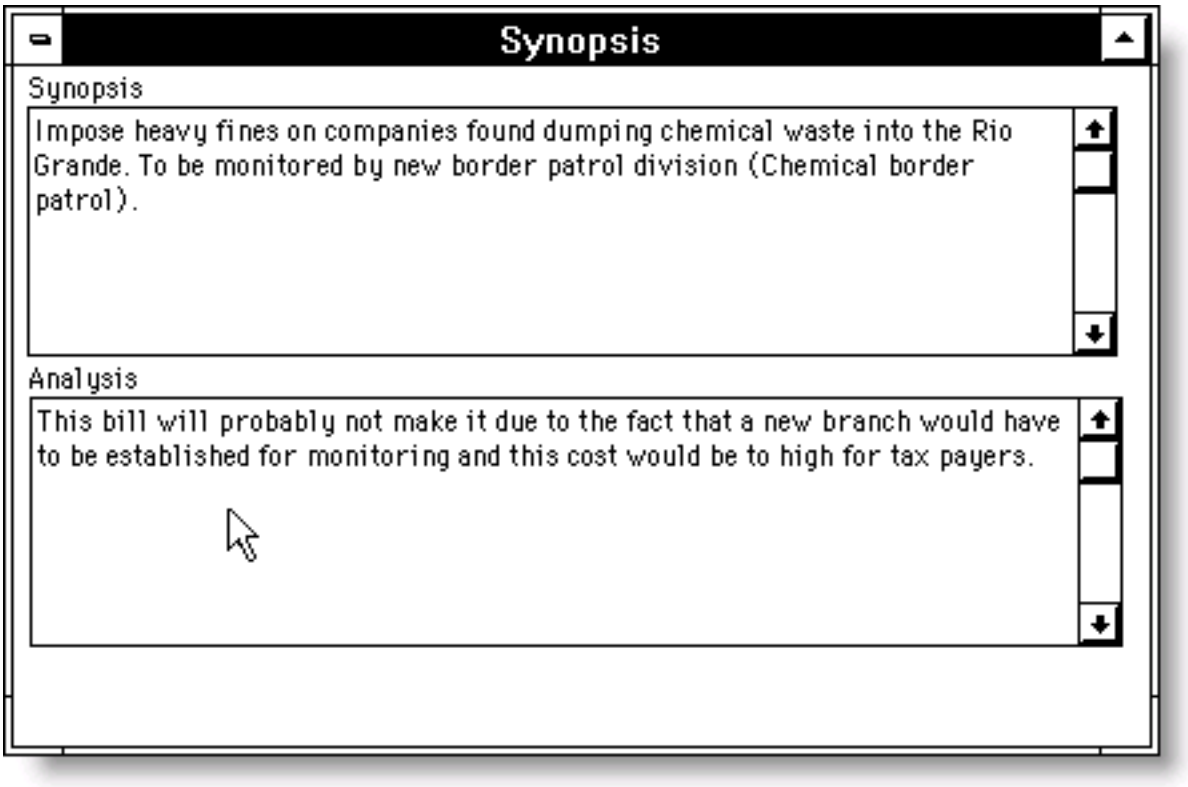
2. Select Edit> Cut.
3. Click on the Action Log button, and move the cursor to the location where you want to place the new text.
4. Select Edit> Paste.
5. Press OK to accept.



Action History window

Summarizing the Bill (Synopsis)

- Select the Synopsis button in the top section.



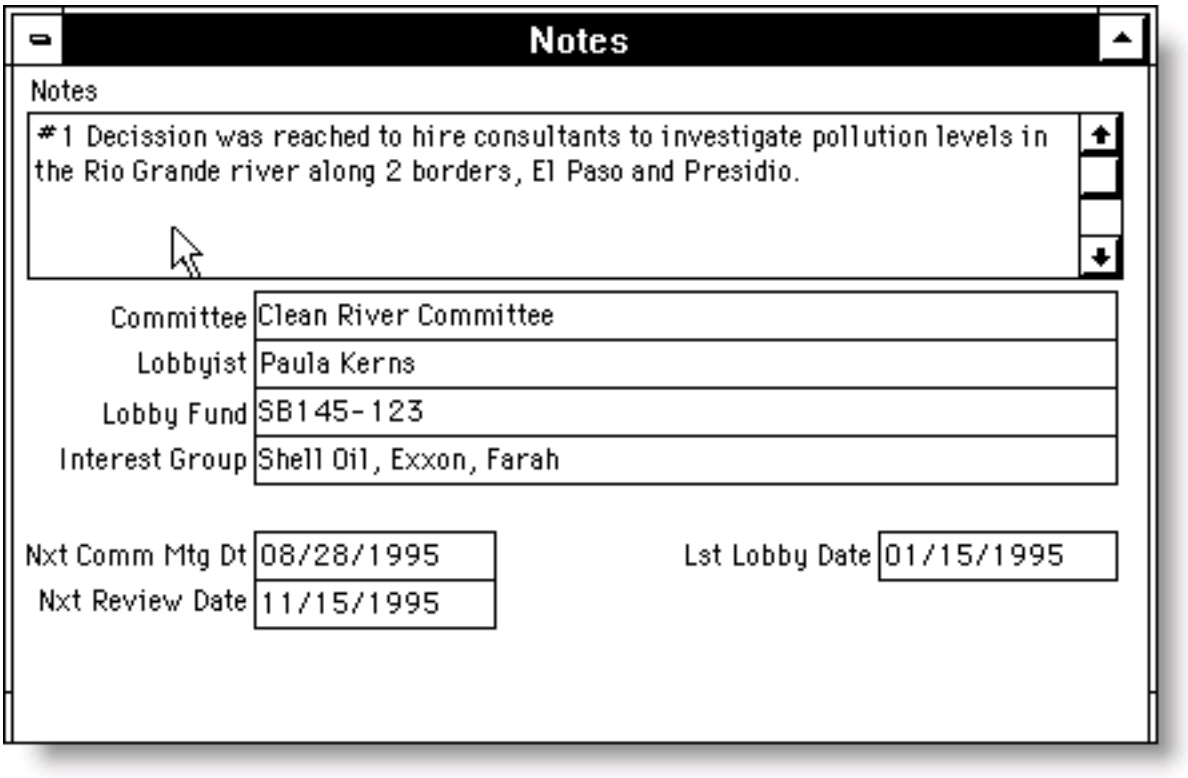
Action History window

A Synopsis of the bill is entered and this section can contain an extensive amount of text. The bottom section, Analysis, is used for your organization's analysis of the bill; again, this section can contain an extensive amount of text.

Tracking Legislative Bills

Entering Notes and Actions

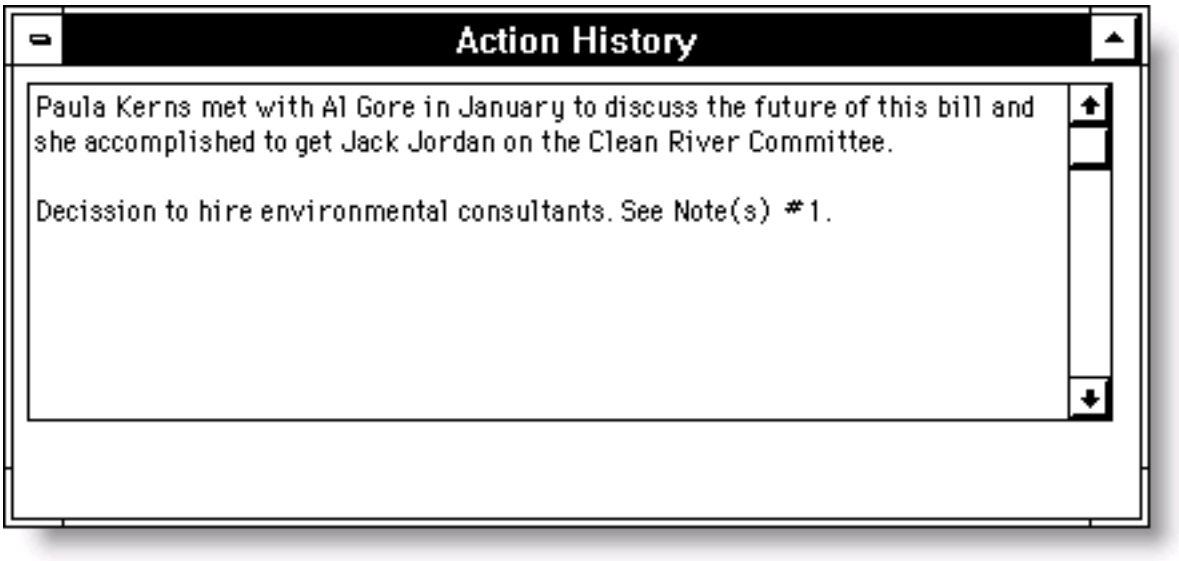
- On the Legislative Bills window, select the Notes button.



This extensive Notes section is available for free format entry and importing. It has cut and paste capability.

The bottom half of this window contains user-defined fields (configured in Legislative System Setup). These optional fields include 5 alphanumeric and 3 date fields.

- Return to the Legislative Bills window; select the Action Log button:



As in the Notes section, this is a free format area for entry, import, or cut and paste operations.

Marketing

Understanding Marketing Suite

iMIS Marketing Suite gives your organization the flexibility to support any marketing need, from basic to complex. The Marketing Suite helps you manage:

- Fundraising campaigns, such as donor activation, reactivation, and/or renewal
- Membership campaigns, such as membership recruitment, reactivation, and/or retention
- Events and conferences
- Lead generation projects
- Publications marketing
- Public awareness campaigns
- Legislative action initiatives

With the Marketing Suite, you can define and manage a coordinated series of marketing tactics, manage the responses, and analyze the results. Use the Marketing Suite to:

- Plan and create campaigns that follow your organization's goals and requirements
- Match the message to the target
- Simplify campaign execution
- Link packages to customer segments
- Automate response follow-up tasks and move contacts to the appropriate stage in a multi-stage campaign
- Track budgets at a high level or at a detailed level
- Use analysis tools to monitor campaign success at each level

The Marketing Suite offers three areas that can work together to help you achieve your marketing objectives:

- Campaign Management – Plan, create, and track single or multiple campaigns
- Segmentation – Segment contacts and prospects according to demographic and behavioral patterns
- RFM Analytics – Rank a contact's past transactions with your organization

You can use Campaign Management alone or you can use the three solutions together to take advantage of data analytics and advanced segmentation capabilities. This will help your organization target the efforts in the most cost-effective and customer-focused manner.

Campaign Management

Use Campaign Management to plan, create, and track your marketing campaigns. You can manage basic campaigns with a single customer mailing or complex campaigns with multiple appeals and solicitations.

Depending on your organization's needs, you can choose to:

- Define campaigns and categorize them by type
- Define specific goals and measure campaign performance against those goals
- Communicate with targeted prospects through a series of personalized solicitations
- Track and analyze responses

Campaign Management hierarchy

Campaign Management uses a four-tier campaign structure, so you can plan actions and monitor results to the detail level you need. A default hierarchy is supplied with the system. However, you can rename the hierarchy to reflect your organization's or industry's terminology.

Campaign Management tiers

Campaign

A strategy to accomplish a single marketing goal, such as a membership drive, a fund-draising campaign, an annual convention, or a legislative initiative. Campaigns are the highest level of measurement and are typically project-driven.

Appeal

Each major marketing effort of a campaign, usually associated with a drop date. An appeal can be:

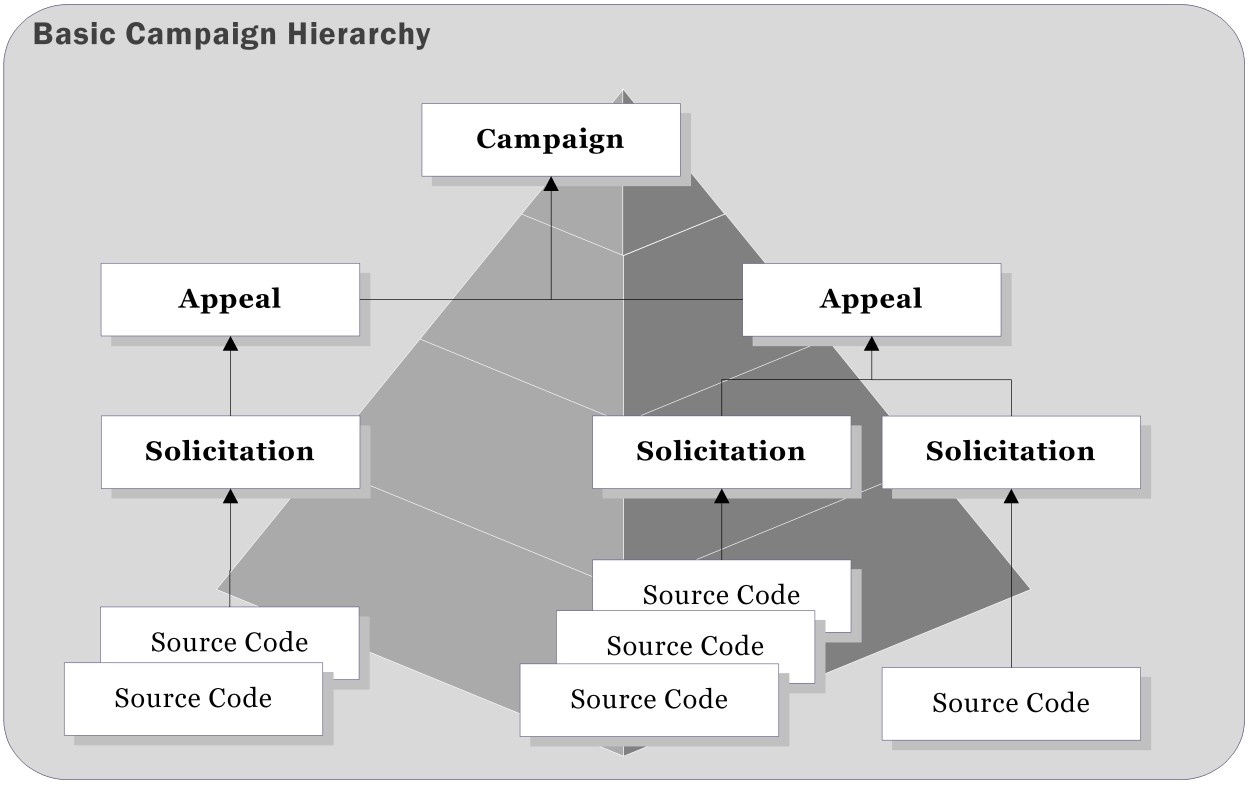
- A phase of the project, such as "First Request" or "Airwaves Blitz"
- A portion of the campaign targeted to a specific group of contacts or prospects
- A portion of the campaign assigned to an internal group (generating mailing lists, designing artwork, managing responses)

Solicitation

A series of communication pieces for an appeal. For example, a "First Request" appeal might direct different messages to previous donors/customers than to prospects.

Source codes

Numbers assigned to each communication piece to track responses. These numbers are associated with reply devices (postcard, website checkbox) so your organization can measure the effectiveness of each solicitation. Source codes are the most granular level of measurement.



Default campaign hierarchy

Basic and complex campaigns

Generally, basic campaigns are sufficient for small events, simple marketing campaigns, limited public awareness campaigns, and similar goals. For the purposes of this discussion, basic campaigns:

- Contain few appeals and related solicitations
- Probably use only one or two source codes per appeal

More complex campaigns require efficient management and tracking of multiple, multi-tiered campaigns. For the purposes of this discussion, complex campaigns:

- Contain many appeals and related solicitations
- Use many source codes
- Often build on the targeting and analytical data generated by Segmentation and RFM Analytics

Segmentation

Use Segmentation with Campaign Management to group contacts and prospects into targeted audiences. With Segmentation, you can:

- Create targeted contact and prospect lists according to demographic and behavioral patterns or other include/exclude criteria
- Split segments into multiple lists and prioritize the segments
- Eliminate duplicates in lists
- Create n-select or random select segments for message or delivery testing
- Get counts for communications collateral before production
- Assign unique source codes to segments to effectively analyze an effort's success

RFM Analytics

Research proves that a contact's past transactions with an organization indicate the likelihood of future responses. The more money a contact spends with an organization and the greater the frequency of the transactions, the more likely the contact will respond to future campaigns.

Use RFM Analytics with Segmentation to rank and organize your contacts and prospects into specific groups according to the relative recency, frequency, and monetary value (RFM) scores of their transactions. RFM Analytics gives you the ability to:

- Rank and organize your contacts into specific groups
- Record a contact's first, last, and highest transaction amounts and the dates of the first and last communication
- Generate segments that divide the population into categories based on RFM criteria
- Create groups, such as quintiles, that reflect the relative ranking of customers according to all RFM measurements

All statistics can be calculated for the source code, solicitation, appeal and/or campaign to provide the amount of summarization your organization requires. The available statistics include:

- Response rate
- Average, highest, and lowest transaction amount
- Dates of first response and last response
- Costs (actual cost, cost per thousand, estimated cost, overhead cost, total cost)
- Revenue (total revenue, net revenue, revenue per thousand, ROI)

Communications and reporting

iMIS communications tools help you to efficiently build customized messages for your contacts and prospects. You can gain valuable information about the effectiveness of your campaign with reports about the campaign or a portion of the campaign. These messages and reports can be generated at any level of a campaign.

Default templates for messages and reports are provided and are easily tailored to your organization's specific needs. In addition, the following communications tools give you the power to construct custom communications pieces:

- MS Word merge
- Email merge
- Crystal Reports
- Broadcast fax

Many iMIS communications features help you perform efficiently:

- Use saved report selections from other iMIS functionality for merge lists
- Preview merged messages and edit them before sending
- Combine email merge and fax merge into one mass mailing with timed delivery
- Combine multiple queries into one mailing

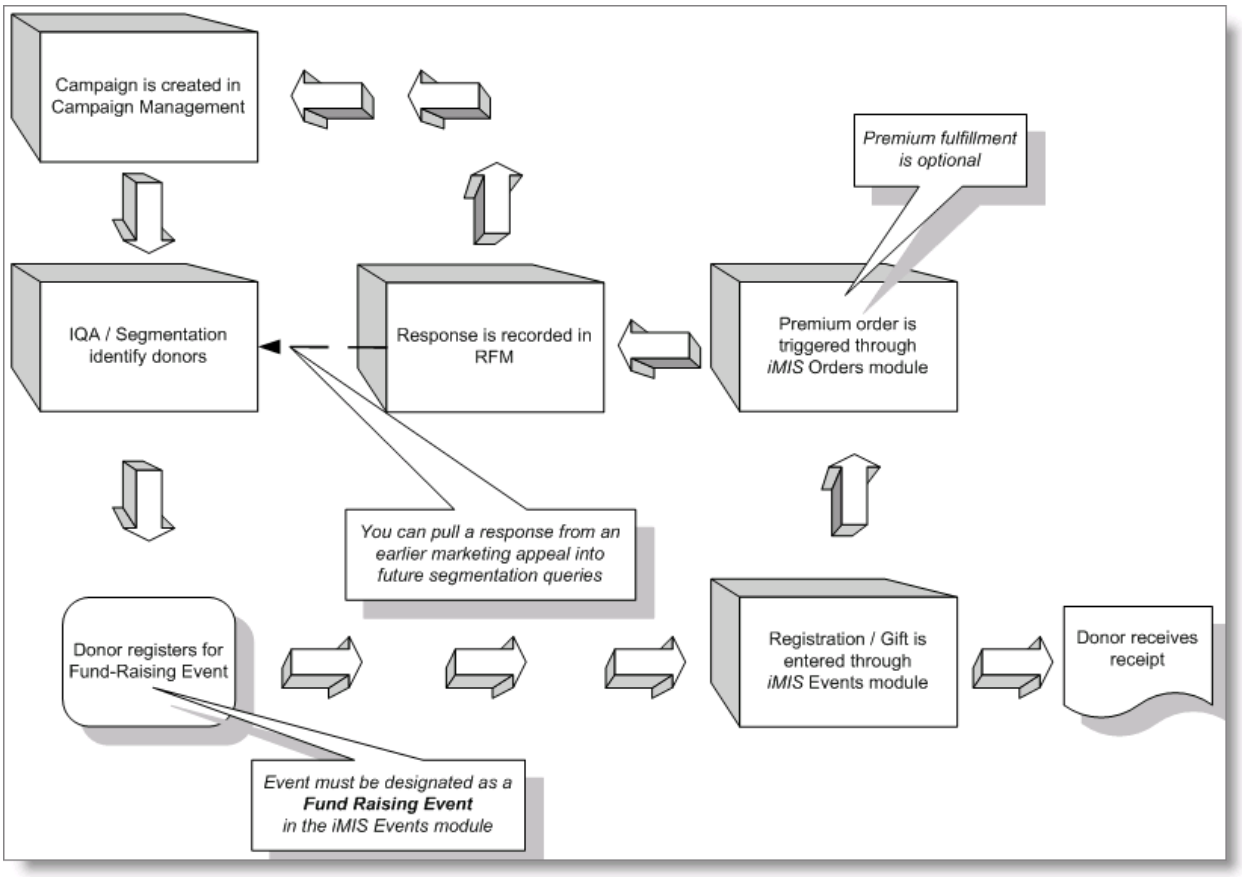
- Send merged event confirmations for a single event or for all events
- Export source lists to external vendors, fulfillment providers, or listservs
- Reprint event confirmations as needed
- Send updates to the activity history display
- Collect email bounce-backs
- Ensure that broadcast email messages are not blocked as spam
- Generate projects based on complex business rules or in response to a campaign

Marketing Suite integration across iMIS

The most powerful feature of Marketing Suite is its integration throughout the iMIS system. If you choose, you can:

- Designate appropriate orders and donations as responses to the campaign
- Send personalized acknowledgements to the contact via their preferred method of communication
- Use responses to previous solicitations for future targeting and list segmentation

The following diagram illustrates the advanced integration that is possible between Campaign Management and other iMIS features.



Example of Marketing Suite interaction throughout iMIS

Marketing Concepts and Terms

Basic and closed-loop marketing principles

There are many different types of marketing efforts used by a variety of different sectors, such as:

- Retail marketing
- Fund raising
- Brand marketing
- Membership
- Issue awareness

- Event marketing
- Calls to action

Each of these forms of marketing uses a series of principles and practices to meet their goals. The principles discussed in the following topics reference database marketing practices for the not-for-profit sector. These are general, high-level concepts, but each organization performs marketing in a unique manner.

Customer-focused marketing

Being customer-focused means that marketing efforts need to balance the goals of the organization with the needs of their "customers" (contacts, members, donors, prospects, legislators).

Customer-focused organizations integrate their customer service department and website content with current marketing efforts to offer choices. By offering choices, they open opportunities for customers to respond to the call to action. That way, the customer chooses when and how they want to hear from the organization.

For years, these organizations have used focus groups and other consumer index information to help determine what their product offering should be. More and more, focus groups and customer surveys are being used to determine how an organization is perceived by its supporters. After the questions are asked and the numbers are in, organizations are changing how they speak to their supporters.

Customer satisfaction is a relatively new key metric that organizations seek to determine. Ways to measure customer satisfaction include:

- Conducting a survey – Extract a list from your database, develop customer satisfaction questions, call or send the survey to your customers, record the responses, and analyze the results.
- Integrating short surveys into your customer service activities – Add questions to a donor reply device or a membership renewal package.
- Offering a survey on your website.

- Encouraging your customer service staff to ask questions when they are on the phone with your customer and to record the answers.

  A key component to being customer-focused is responding to supporters when they take the time to ask a question or express a concern. Respect for the customer is the key to maintaining high customer satisfaction ratings.

  Measuring customer satisfaction is integrally tied to managing your key business processes well, particularly your customer service processes.

Closed-loop marketing

The closed-loop marketing approach measures the results of marketing and communication initiatives by tracking the response of targeted groups. The results of responses, such as completed surveys, promotional entries, coupon redemptions and purchase behavior, are added to a database for tracking and evaluation to improve future marketing decisions. Marketing campaigns can then continuously adapt to the customers' wants and needs, creating a true relationship. Simply put, marketers can develop and monitor targeted strategic campaigns based on a wide variety of customer histories and behaviors.

Closed-loop marketing process

Organizations do not leap into target marketing. Organizations that are working towards a targeted closed-loop approach plan the introduction carefully and over some time, beginning with developing a segmentation strategy.

Closed-loop marketing involves a never-ending cycle of ongoing analysis, ongoing marketing, and ongoing response management. As we market, we learn. As we learn, we develop new marketing strategies. New marketing strategies lead to changes in how we manage responses.

New market opportunities are identified through trend analysis. A new opportunity may address a weak area within a marketing plan or may identify a new group.

Closed-loop marketing refers to the cycle of:

1. Developing metrics and benchmarks for the desired transactional behavior
2. Ensuring that business processes are in place to maximize the customer's experience and to build loyalty.

In essence, once a customer is introduced into our loop, we ensure that they never want to leave.

The role of segmentation

Segmentation is the science of dividing up all of the records in an organization's database into small groups that can be marketed to and measured over time. It is the way in which we apply demographic, mood, and transactional data to our marketing activities.

Most organizations that have a segmentation model are able to provide detailed descriptions of what those segments are and when they approach them. Organizations without a segmentation model need to plan one carefully. Segmentation strategies change from organization to organization. This is because the mission of each organization is unique and the characteristics that make up its supporter base are equally unique.

Segmentation usually begins by defining broad audience groups. However, audiences should not be considered as isolated groups; they may support the organization in a

variety of ways. By recognizing that these relationships exist, an organization can offer personalized targeted marketing.

Types of data

A variety of data can be used for targeted marketing:

- Demographics
- Psychographics
- Transactional data

In order to be customer-focused, an organization's data segmentation strategy must include customer communication preferences and can include individual customer satisfaction rankings.

Demographics

Demographic data helps identify groups based on information like age, gender, geographic location and marital status. Demographic data is core to understanding what groups may be likely to perform in what way.

Acquiring demographic data about customers may or may not be easy to do. Some associations require that date of birth and other demographic information be provided. Other associations may be bound by privacy rules that may make it harder to capture this information.

Demographic data can be acquired from outside sources. For instance, you can recruit the services of a vendor who has access to income tax data and other filed information.

Psychographics

Psychographics refers to how someone behaves: their likes, dislikes, interests, and key values. Although demographic data generally remains consistent, psychographics change. A key measurement of psychographics is customer mood. Customer moods change based upon how an organization interacts with a customer.

Psychographic data is usually gathered through polls and surveys.

Transactional Data

Analyzing transactional data is critical to measuring customer satisfaction and loyalty.

RFM (Recency, Frequency, Monetary Value) is a common way of scoring transactions and determining loyalty and value. By establishing a matrix of values, you can measure where a customer ranks within the matrix and the direction they are migrating.

RFM is the science of developing this matrix of scores based on values we associate with the scores. In the end, records are grouped together based on their rankings. They share their support in common. Because the rankings are standardized, it is a very statistically valid way of building a standardized segmentation model. The RFM scoring process inherently converts flat data files into three dimensional data files.

Other ways of looking at transactional data are available but they are one dimensional in nature:

- Last Year But Unfortunately Not This (LYBUNT)
- Second-to-Last Year But Unfortunately Not This (SYBUNT)
- Third-to-Last Year But Unfortunately Not This (TYBUNT)

This data measures only one RFM characteristic: Recency. You cannot use a LYBUNT, SYBUNT, TYBUNT report for identifying your best customers; its purpose is to identify the erratic donor.

High-value customer reports are also common for measuring value, but judgments made solely upon value can be misleading in determining customer strategies. For example, should you spend time building a relationship with a customer who has given you a lot of money but not for the past five years? Or, should you spend time building a relationship with a customer who has given less financial support but given it very recently? Or, very loyally every year for the past ten years?

Reports and analytics that focus on only one element of the transaction can be mis-leading. The RFM approach is preferred because of its ability to slice data three ways.

RFM is also ideal because it can be implemented easily and regularly within a database. Ideally, data should be reviewed with a vendor/partner who specializes in understanding marketing statistics and segmentation, but this is not always necessary. Other more advanced data analytic services are also available, but can be expensive and difficult to implement and are best used to develop a predictive model.

A predictive model is used to consolidate all of the demographic, psychographic, and transactional data available to the organization into a data algorithm that can be used to target records that appear to be becoming a target market. For example, a "lapsing customer" model can identify customers whose loyalty is waning before they disappear. Or, a "planned giving" model can identify the point at which we've learned the two or three key criteria that we need to gather to qualify a planned giving prospect.

Predictive models generate leads for a different marketing strategy. Marketing campaigns/appeals follow through on those leads. Data underlies the success of these marketing efforts.

Using Different Types of Data to Enhance Marketing Efforts

Source Code assignments fall into three basic categories:

- Codes assigned to outgoing marketing efforts to track the incoming responses to the effort that recruited the support
- Generic codes that are assigned to ongoing 'passive' ways in which a customer can support an organization, such as web transactions, general acknowledgement responses, pass-to-a-friend, catalogs, or cards
- Unknown codes that are assigned to capture responses when the actual source code is not known

Assign source codes to outgoing marketing efforts to be able to track how contacts respond. A source code is assigned to each segment within an outgoing marketing effort and is printed on a reply device (the form the customer returns to the organization). Printing the source code on the information the contact receives allows for it to be data entered easily when an incoming transaction is received. Essentially, source codes

should exist at any time that a contact is presented with a project to support. This opportunity is a call to action.

Source code tracking is important. To maintain the highest possible accuracy in recording the actual source code assigned to a contact's response, key processes have to be highlighted. Data entry staff need to know the importance of accurate data entry and, in a customer-focused closed-loop model, quick and accurate acknowledgements should be sent to the contact, thanking them for their response.

Entering the correct source code on incoming transactions is important for thanking the contact properly. An error might result in a complaint to your customer service staff or it might convince the contact to stop supporting your organization.

What feeds source codes into Campaign Management?

Campaign Management: The 'source' for the Campaign is your source code. The source code is your list of members/prospects that a campaign/appeal/solicitation is targeted to and the output is generated for. This list of members for a specific source code comes from a segmentation job or definition, a query or a group of solicitation responses.

Segmentation: When you generate a segmentation job consisting of 1 or more segment definitions you are creating a source list for your campaign/appeal/solicitation. A source code in Campaign Management can pull from the whole job or just one of the segment definitions.

RFM Analytics: You can use RFM analysis to generate queries to use in Segmentation to help create the segments. In this way, RFM helps create the segment definition that is used as a source list for a source code in Campaign Management.

Process Management: When you create a new opportunity, on the Definition you can select a Source Code. This is more informational than functional in that it lets you record which Source Code for a specific campaign/appeal/solicitation may have generated the opportunity.

Testing the marketing plan

The move from mass marketing to targeted closed-loop marketing is usually accomplished through testing. Best practices for testing include:

- Test one thing at a time.
- Determine a goal/objective for your test. It is important to know that you are doing what you set out to do.
- Understand what makes for a statistically valid result. The simple rule of thumb is to include enough records in your test to ensure that you receive at least 100 responses.

  Market testing within your own database requires that you use random segmentation selections. This means that you establish a group that you would expect to perform in a particular way and then randomly select the number of records you want to test against.

  Statistical validity is measured not just by having test groups of the right size, but also by the use of control groups. Test groups must be measured against a control group. The control group will receive the same package as usual or be the same group as usual. This group will receive the usual expected result unless an outside phenomenon changes the outcome. The test group will perform differently than the control group.

  If the objective is to “recruit more donors”, then you can not say that the test failed because the return on investment is lower than the control group. Return on Investment is a different metric than percentage return. The percentage return better measures if this objective was met.

  To accurately determine whether a test is successful, it should be repeated. Future campaigns should repeat the test on new groups of randomly selected records. After the test has produced similar results three or four times, consider increasing the size of your test groups and introducing your new tactic on a permanent basis. Again, vendors can work with you in developing tests, measuring their effectiveness, and deciding when the test has finished successfully.

Terms to know: Campaign Management

actual cost

Calculated as follows when Budget Level is set to Source Code:

(total insert costs x actual number of contacts solicited) + (overhead costs of source codes for which output has been generated)

appeal

Each major marketing effort of a campaign, usually associated with a drop date. An appeal can be:

- A phase of the project, such as "First Request" or "Airwaves Blitz"
- A portion of the campaign targeted to a specific group of contacts or prospects
- A portion of the campaign assigned to an internal group (generating mailing lists, designing artwork, managing responses)

average transaction amount

Total Revenue divided by the total number of all orders, gifts, and pledges attributed to one of the following:

- Source code
- All source codes within a campaign, an appeal, or a solicitation

campaign

A strategy to accomplish a single marketing goal, such as a membership drive, a fundraising campaign, an annual convention, or a legislative initiative. Campaigns are the highest level of measurement and are typically project-driven.

campaign type

Object for organizing and grouping specific and similar campaigns. The following campaign types are available by default:

- None
- Annual - Campaign that occurs every year
- Designated - Funds generated by the campaign are committed to a specific entity

- Undesignated - Funds generated by the campaign are not committed to a specific entity. The organization decides how to allocate the funds, unless specified by the donor.

cost per thousand

Equal to the following:

- For each campaign, appeal, and solicitation:

(Actual Cost x 1000) / number of pieces mailed

- For each source code when Budget Level is set to Source Code:

(Total Cost x 1000) / number of pieces mailed

count

Total records in an external list

current response rate

Equal to the following for each campaign, appeal, solicitation, and source code:

number of responses received / number of pieces mailed

date of first response

Date a contact first responds for each campaign, appeal, solicitation, and source code

date of last response

Date a contact last responded for each campaign, appeal, solicitation, and source code

drop date

The definition of drop date depends on the media involved:

- Direct mail – Date delivery begins
- Telemarketing – Date calls begin
- Media spots (TV, radio, webcast) – Air date

- Newsletters – Date of issue mailing
- Online campaigns – Date email messages are sent

Drop dates for other efforts can include:

- Date the mailing list is generated
- Date the creative concepts/artwork is complete
- Date the response management process is set up

dummy/test selects

Practise run to verify counts. Many organizations run dummy or test selects prior to their anticipated mail date to see the final counts and to modify the criteria if the numbers are not what they anticipate.

During the production process, counts are usually required for:

- Accurately determining postage costs (usually pre-paid)
- Determining print quantities
- Determining print quantities by package

estimated cost

Calculated as follows when Budget Level is set to Source Code:

(total insert costs x estimated number of contacts solicited) + (source code overhead costs)

external filename

Name of an external list

highest transaction amount

Maximum of all orders, gifts, and pledges attributed to one of the following:

- Source code
- All source codes within a campaign, an appeal, or a solicitation

insert

Physical item sent to a contact such as a merge letter, pre-printed collateral, or envelope

insert type

Object for organizing and grouping specific and similar inserts. The following insert types are available by default:

- None
- Brochure
- Envelope
- Form
- Postage

kill file

Files from an external source that have been checked for duplications and merged/purged with an organization's iMIS database and rented lists

last drop date

Date of the last output generation

list member type

Method of grouping list members into general types. The default list member types are Contact and Prospect.

list type

Method of organizing source lists by type. The default List Types are Query, Segment Definition, and Solicitation Response.

lowest transaction amount

Minimum of all orders, gifts, and pledges attributed to one of the following:

- Source code
- All source codes within a campaign, an appeal, or a solicitation

net revenue

Calculated at the campaign, appeal, solicitation, and source code levels as:

Total Revenue – Actual Cost

operational costs

Costs for anything that is applies to the marketing effort as a whole, such as:

- Lettershopping
- Printing
- Paper

output process

A process-oriented task, for example, a Crystal report, MS Word merge, or query

overhead cost

The sum of expenses entered for each appeal (when Budget Level is set to Appeal) or source code (when Budget Level is set to Source Code)

package costs

Costs for anything applied to the package, such as:

- Postage
- Outer envelope
- BRE
- BRD
- Telemarketing costs

predicted response rate

Percentage estimate of contacts responding to each appeal (when Budget Level is set to Appeal) or source code (when Budget Level is set to Source Code)

response media

The origin of an opportunity, such as email, web, telephone, or postal mail

response stage

Pre-defined stages in the source code so that a contact moves through campaign stages as they respond to solicitations

response state

The configuration setting for including contacts in specific campaign stages based on response history:

Solicited – Contact has been solicited but has not responded.

SolicitedResponse – Contact has responded to a solicitation.

UnsolicitedResponse – Contact has responded but was never solicited.

OptOut – Contact has opted out of the solicitation.

revenue per thousand

Equal to the following for each campaign, appeal, solicitation, and source code:

(Total Revenue x 1000) / number of pieces mailed

ROI percentage

Equal to the following for each campaign, appeal, solicitation (Budget Level set to Source Code), or source code (Budget Level set to Source Code):

(Total Revenue – Actual Cost) / Actual Cost

seed lists

Lists of individuals within the organization sending the campaign. These lists are often included to confirm the mail date and to distribute samples internally.

solicitation

A series of communication pieces for an appeal. For example, a "First Request" appeal might direct different messages to previous donors/customers than to prospects.

source code

Numbers assigned to each communication piece to track responses. These numbers are associated with reply devices (postcard, website checkbox) so your organization can measure the effectiveness of each solicitation. Source codes are the most granular level of measurement in a campaign.

source code ID mode

Configuration setting to generate source codes manually or automatically

source code type

Indicates whether source code list sources are defined by internal data or by an external file. Default source code types are Run Once, Run Many, and External List.

source list

List specifying contacts to be solicited

synchronize responses

Option that triggers the response recognition process

target revenue

Monetary goal for each campaign and appeal (when Budget Level is set to Appeal) or for each solicitation and source code (when Budget Level is set to Source Code)

total cost

Calculated according to budget level:

- Budget Level is set to Appeal – equals the sum of all overhead costs for an appeal and for all appeals within a campaign. Insert costs are ignore). The displayed Total Cost is always up-to-date with the current cost of all sub-items. Because Total Cost calculation relies solely on overhead costs, Total Cost is never estimated.
- Budget Level is set to Source Code – Total Cost (Actual or Estimated) displays for each campaign, appeal, solicitation, and source code

  total revenue

  The sum of all orders, gifts, and pledges attributed to all source codes within a campaign, an appeal, or a solicitation

Terms to know: Segmentation

n-Select segments

A portion of the entire population that is the target for a campaign. The results returned by a selection filter are divided into a number (n) of segments, with the same number of contacts or prospects in each segment.

segment

Portion of the entire population that is the target for a particular marketing campaign. A segment organizes customers and prospects according to demographic and behavioral patterns.

segment definition

Specifications for an individual segment within a segmentation job. A segment definition can be a query segment or an n-Select segment.

segmentation job

A mechanism for establishing all of the segments in a marketing campaign. This allows segments to be added, deleted, and tested. The segments can then be assigned to individual source codes and created in one process rather than individually creating each segment.

Terms to know: RFM Analytics

frequency

Number of times a contact has transacted with an organization

monetary

Individual or cumulative value of a contact's transactions with an organization

population query

Defines the population (contacts) used for RFM analyses. The population query references an IQA query that extracts users from an existing set.

quintile

Any of the four values that divide the items of a frequency distribution into five classes with each containing one-fifth of the total population

recency

Period of time (in days or months) that has elapsed since the last transaction between a contact and an organization

transaction query

Defines the transactions considered for RFM analysis. The transaction query references an IQA query.

Setting up Basic Campaigns

Campaign Management helps your campaign staff set up and manage "basic" campaigns easily. For the purposes of this document, basic campaigns:

- Contain few appeals and related solicitations
- Generally use only one or two source codes per appeal
- Use the Select and Send model – Select the target audience from the iMIS database or an external list, send communications to that audience, and track incoming responses

With Campaign Management, campaign staffers can:

- Plan and define basic campaigns
- Create and send appropriate communications material
- Monitor campaign performance

What must be done before you can start?

You cannot set up a basic campaign until the following setup tasks are complete:

- Define setup options for all campaigns
- Set up security groups for campaigns

Putting it all together

The process of basic campaign management includes the following actions:

- Plan the campaign
- Define the campaign
- Define the appeals and solicitations in the campaign
- Specify communications efforts
- Monitor and measure performance

Campaign hierarchy

Campaign Management uses a hierarchical system to give you the flexibility to manage campaigns at the level of detail you require. The four levels are:

1. Campaign – A strategy to accomplish a single marketing goal. The campaign is the highest level of organization and measurement.
2. Appeal – Each major marketing effort of a campaign, usually associated with a drop date (the date the effort is sent out). Appeals are the building blocks of your campaign.
3. Solicitation – A communication effort sent to a targeted group. Solicitations can be sent as letters, email messages, phone calls, or other means.

4. Source Codes – Numbers assigned to each possible response for a specific solicitation (such as reply cards, phone calls, donations, or purchases). Your organization tracks responses with these numbers to measure the effectiveness of each solicitation. Source codes are the most granular level of measurement in a campaign.

   The following diagram illustrates an example hierarchy for a basic member retention campaign.

   Example membership campaign

Viewing campaigns

Campaign Management provides you the flexibility to view campaign information in a variety of ways. You can choose to:

- Filter campaigns by desired criteria
- Sort campaign lists by name or date

- Change the default sort order
- View the campaign structure to the level of detail you need

To filter campaigns by criteria

1. From Marketing, select Campaign definition.

   By default, iMIS displays all Active campaigns for which you have security access privileges.
2. Choose a filter, if desired.
3. Select the campaign you want to view. The campaign overview displays.

The tabs along the top of the campaign display information about the campaign:

- The Summary tab displays general information about the campaign.
- The Profile tab displays general information for editing.
- The Appeals tab displays the appeals associated with the campaign.
- The Security tab displays access levels for defined security roles.

To sort the campaign list

1. From Marketing, select Campaign definition.
2. Click a column header to sort by that column.

   Note: To change the default sort order when appeals are listed, edit the query named "(Default)" in CampaignManagement/DefaultSystem/Queries/CampaignAppealsList/. However, you cannot edit the query to change sort order if solicitations or source codes are displayed.

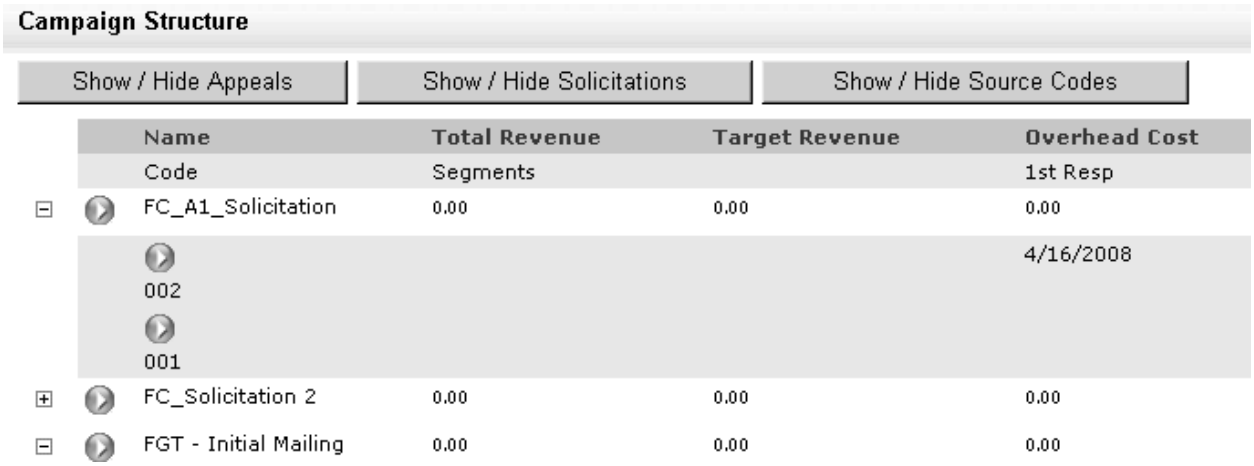
To view campaign details

1. From Marketing, select Campaign management.
2. Choose the level of detail to view:

- Show / Hide Appeals
- Show / Hide Solicitations
- Show / Hide Source Codes

Campaign Structure page

The Campaign Structure page displays a clear picture of campaign structure in a single display.



From Marketing, select Campaign management

Buttons across the top of the window (Show / Hide Appeals, Show / Hide Solicitations, Show / Hide Source Codes) enable you to collapse or expand the list to show the appeals, solicitations, and source codes for each campaign. Select links at the left of each row enable you to go directly to definition windows for solicitations and source codes.

Planning the campaign

By planning your campaign carefully, you and your staff can perform efficiently and effectively. The planning process includes:

1. Setting goals for the campaign
2. Defining campaign components and hierarchy
3. Defining the budget and cost tracking, if any

4. Identifying targets
5. Specifying marketing efforts
6. Defining campaign performance measurement

Your campaign might be an isolated, one-time-only campaign, or part of an annual or multiple-year strategic plan. Factor this into your planning.

Setting goals for the campaign

The goals and objectives for your campaign are unique to your organization. A goal is a simple statement that expresses what you want to do, such as:

- Increase the number of new donors
- Enroll new members
- Sell a new product
- Solicit advertisers for your periodicals
- Get a message out

An objective then states a measurable amount, such as:

- Increase new donor count by 5%
- Enroll 150 people
- Sell 2,000 units
- Increase ads placed by 15%
- Contact 15,000 prospects

You might set response rate goals, enrollment goals, sales goals, or budget goals. Knowing this information in advance can help you determine how best to set up your campaign.

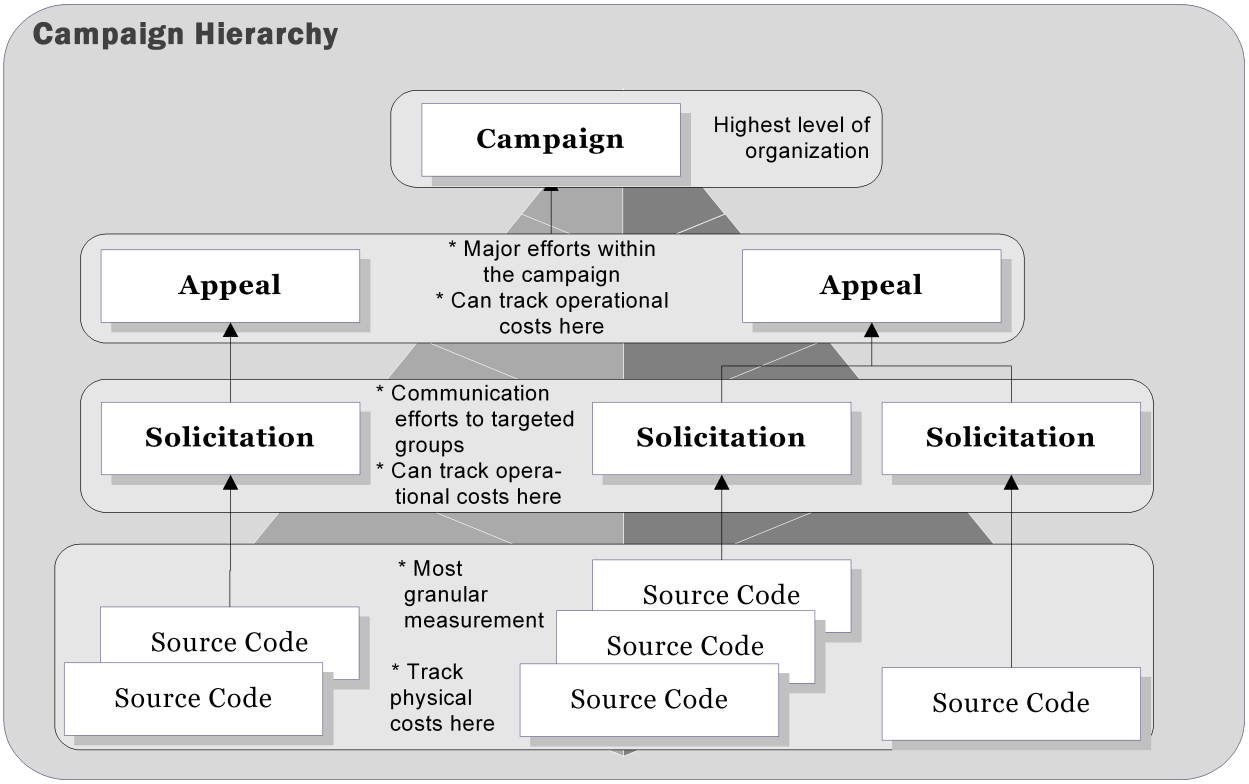
Defining campaign components and hierarchy

A campaign is an organized set of appeals that you create to accomplish your marketing goal. The campaign can consist of one or many appeals and solicitations.

Tips on defining campaign hierarchy

- Use appeals to split your campaign into major efforts.
- Define one or more solicitations for each appeal by target group, message, or delivery method.
- Assign one or more source codes to each solicitation to track responses.
- Create unique names at all levels: each campaign, each appeal within a campaign, each solicitation within an appeal, and each source code within a solicitation. The naming convention might be by department, type of campaign, year or quarter, or other meaningful methods.

It might be useful to sketch your campaign hierarchy in advance, for example:



Description of campaign hierarchy

Defining cost tracking data

In marketing campaigns, costs are tracked to calculate metrics such as Net Revenue, Cost per Thousand, Revenue per Thousand and Return on Investment. The cost of a campaign includes the overall operational costs of the campaign and the individual costs of each "package" that is sent.

Operational costs

Operational costs include any items that are applied to the entire marketing effort, such as:

- Paper
- Printing
- Letter shopping

You can track these costs at the appeal or source code level. In a basic campaign, you will probably define few source codes. In this case, it is effective to track operational costs at the source code level.

However, you may choose to track operational costs at the appeal level if you are managing a complex campaign with dozens or hundreds of source codes.

Package costs

Package costs include any items that are applied to the actual insert or package, such as:

- Postage
- Outer envelope
- Business reply envelope
- Business reply device
- Telemarketing costs

These costs are tracked at the source code level.

Identifying targets

Getting the right message to the right person at the right time is critical to the success of your campaign. With Marketing Suite, you can target prospects with simple or sophisticated tools. By precisely defining target markets, you can refine campaign messages with great accuracy. And you can measure the response rate to the messages for specific groups of people.

Think about which factors should be included and which should be excluded for each targeted group. You will use these factors to define the segment of prospects that you will be targeting for each solicitation.

Plan for the cases where customers 'opt-in' and 'opt-out' of different marketing activities. After the targeted message is delivered, the prospect will or will not respond. Marketing Suite gives you the power to define and manage processes for either case.

Using external lists

Some organizations use external lists to identify targets for their campaigns. External lists are brokered with individual list agreements that govern how the list can be used and for how long. Sometimes lists are given to the organization with all names and contact information attached. Other times, lists are used once and the organization only sees the contact information when the customer responds.

Planning communications efforts

Plan the efforts you will use to communicate with contacts or prospects. Each effort can be a combination of brochures, email messages, promotional goods, or whatever items you deem necessary. Define the contents and drop date for each package.

In addition, plan how you will communicate among the team and among your organization. Are there specific reports that will be useful for staff? Will you need to send email messages to the team upon completion of certain tasks?

Defining campaign performance

Measuring the success of your campaign helps you improve your next marketing effort. Each time the cycle repeats itself, you become more efficient at honing your message

and delivering the right message to the right person at the right time. As a result, you are able to set ever higher goals for your organization.

iMIS provides you with analysis, workflow design, and communications tools to optimize the marketing cycle throughout your organization. Effective analysis allows you to target your time, energy, and budget to those pursuits which are most likely to be profitable.

The iMIS database stores all of your important transactional, historic, and demographic data, giving you the power to prioritize the data and present it to stakeholders in a meaningful manner.

Make sure you define how you will track data to determine performance. Some suggestions:

- Run counts and statistics on your database before you start the campaign to define your starting point.
- Specify your predicted response rate.
- Determine the metric you will use to show success.
- Synchronize responses regularly. This helps you stay up-to-date with metrics.

Defining marketing campaigns

After you plan the campaign, you are able to set up the campaign structure efficiently.

Business Goals

To define a campaign:

1. Enter basic information such as name, status, and start date.
2. Designate the general type of campaign. Use the defaults or custom types designed for your organization.
3. (optional) Enter predicted information, such as end date and predicted response rate.

   If there is an existing campaign in place, you can create a new campaign quickly by copying it (cloning it) and editing it. See To clone a campaign.

If you delete a campaign, appeal, solicitation, or source code, all the lower levels of the hierarchy will also be deleted, regardless of status.

To create a campaign

1. Select Marketing > Campaign definition.
2. Click Add a Campaign.
3. Define the campaign:

- Enter a Name and Campaign Code.
- (optional) Enter a Status (Active or Inactive).

  If the status is changed from Active to Inactive, the status of all child entities is set to Inactive.

  If the status is changed from Inactive to Active, the status of child entities is not affected.

  The status of a child entity cannot be changed to Active if any parent entities have an Inactive status.
- Enter a campaign Type:
- None
- Annual – A campaign that occurs every year
- Designated – Funds generated by the campaign that are committed to a specific entity
- (optional) Enter a Start Date and an End Date.
- (optional) Enter a Predicted Response Rate (the estimated percentage of contacts that will respond to the appeal) and the Last Response Date.
- (optional) Enter a Description.

4. Click Save.

To clone a campaign

A cloned campaign is an exact duplicate of the original campaign with the following exceptions:

- The Name and Campaign Code are different.
- The Created Date equals the copy date.
- The Created By field equals the user who copied the campaign.
- The Start Date, End Date, and Reminder Date are adjusted automatically for the copied campaign.
- The copy has the same structure as the original campaign, including all appeals, solicitations, and source codes.
- All copied source codes contain the same inserts and messages as the original campaign.
- Source lists are not copied.
- If Campaign Management is configured to assign source codes automatically, all new source codes are regenerated automatically.
- If Campaign Management is configured to assign source codes manually, all new source codes are formatted as 'Copy of (original code).' If this code already exists, the code is copied until a unique code is found: 'Copy (sequence #) of (original code).'

To create a new campaign quickly, you can clone an existing one and edit it.

1. Select Marketing > Campaign definition.
2. Select a campaign.
3. Click Save As.
4. Enter the new campaign Name, Campaign Code, and Type.
5. Click Save.

To edit campaign security settings

Default campaign security settings are set up when the Marketing Suite is set up. However, if you are authorized, you can grant specific users and/or groups access to a campaign.

1. Select Marketing > Campaign definition.
2. Create a campaign.
3. Click the Security tab.
4. Select an Access Mode:

- Share (Everyone) – Grants everyone full control.
- Private – Grants full access to those assigned to the project.
- Advanced – Enables the Access Mode drop-down list and allows you to edit the access list. You can select one of the listed access areas or select Custom to choose from a list of defined security roles.

5. Click Save.

Tracking costs for campaigns

To track costs at the Appeal level

1. Select Marketing > Campaign management.
2. Click Show / Hide Appeals and open an appeal.
3. (optional) Click the Profile tab and click the plus sign next to the Overhead Cost field.
4. Add an additional cost and click Save.

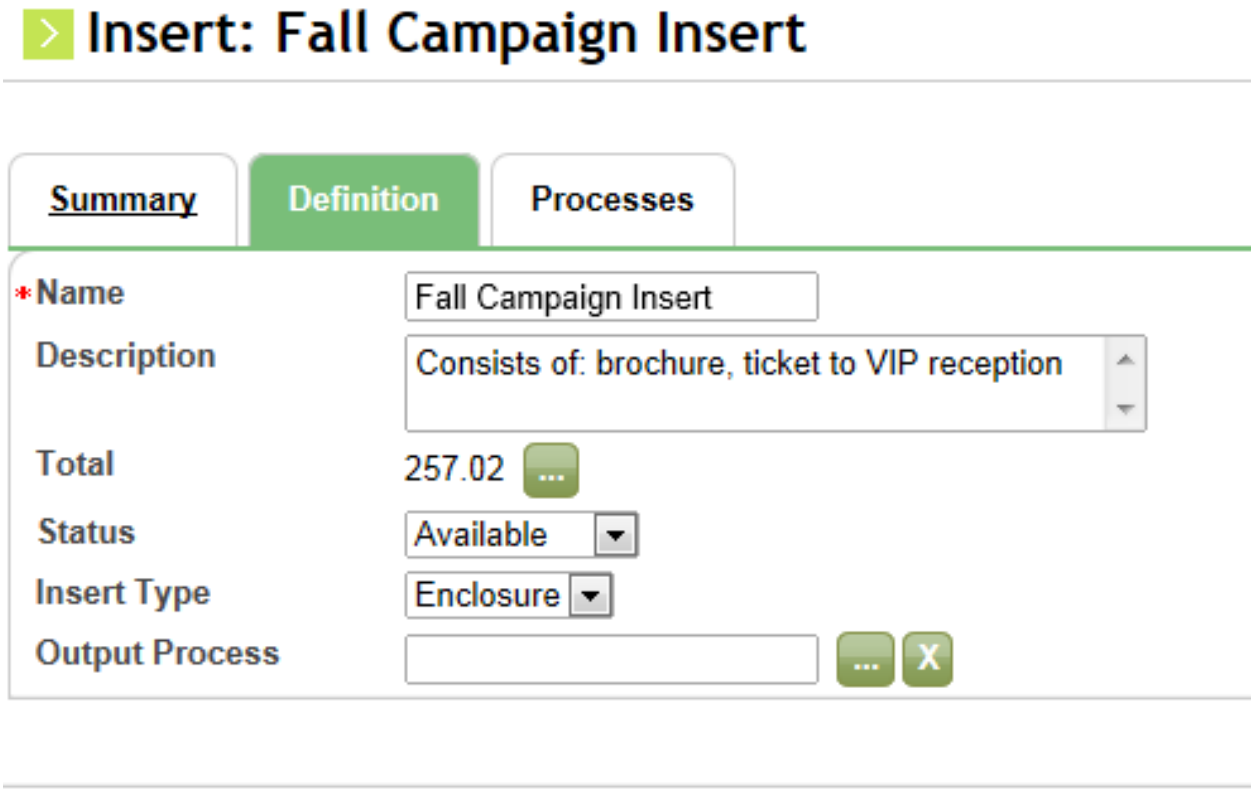
To track costs for an insert

1. Select Marketing > Inserts.
2. Select an insert.
3. Click the browse icon next to Total.

4. Enter a value in the Cost Code and a cost per piece in the Amount.
5. Click add.

6. Click OK to save the values.

   Confirm that the Total on the Insert window now shows the sum of the values entered on the Costs pop-up.



Sum of inserts

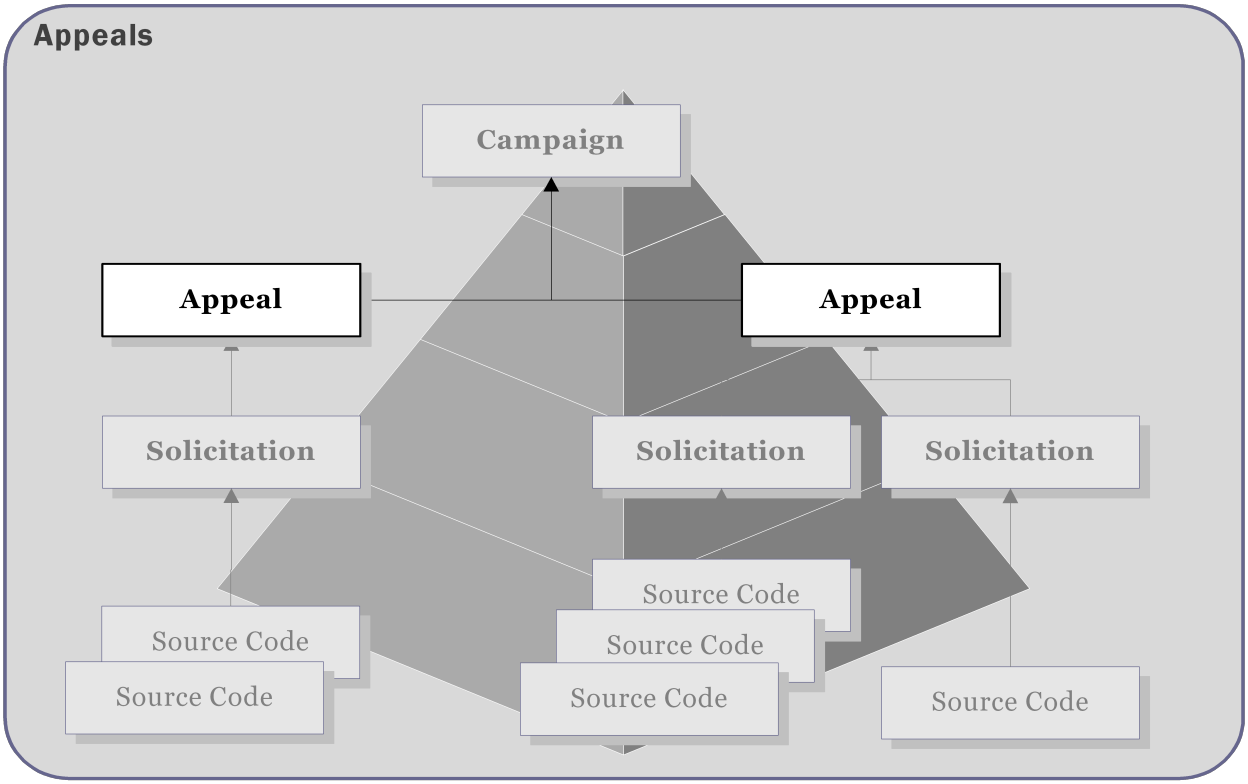
Tips

- Operational costs should be tracked at the Appeal or Source Code. The choice of tracking overhead costs at the Appeal or Source Code level is made in Campaign Management > Set Up Module.
- Package costs include any items that are applied to the actual insert or package: Those are tracked with the insert costs.
- Overhead Costs refer to any cost that is applied to the mailing or marketing effort as a whole. These costs tend to be difficult to break down on an item by item or cost per piece basis. You want to be able to track the costs against the appeal as a whole rather than trying to break out the costs against different source codes. This is especially true when you have multiple source codes within a marketing effort.
- Some costs apply only to a particular Source Code or part of a marketing effort, such as list rental costs or the difference between different packages sent. Even if you choose to

track overhead costs at the Appeal level in your Campaign Management > System Setup options, you still have the option to be able track those additional costs. They are tracked as part of the package attached to the source code.

Defining campaign appeals

The appeal level is the anchor that binds the different elements of a marketing campaign.



Appeal level in campaign hierarchy

An appeal is the level of a campaign where you:

- Link specific products to the campaign
- Assign drop dates for media and other efforts
- Track costs, if desired

Important prerequisites to defining appeals

- You must have a campaign set up before you can add an appeal.
- Make sure that all products are created before you link them to an appeal. The purchase of these products will be tracked to help you measure the campaign's success.

Business goals

To define appeals for your campaign, you will:

1. Link specific products to the campaign. Your campaign might include physical products such as apparel, books, and documents or non-physical products such as event functions, gifts, and pledges.

- Set up the products in the appropriate area before assigning them to the campaign.
- Fundraising events: Events > Define an event
- Gifts and pledges: Fundraising > Set up Tables > Appeals or Distributions and premiums
- Physical products: Orders > Manage inventory > Manage products
- Add the products to the appeal(s) in the campaign.
- (optional) Set up minimum required gift amount to receive each product.

2. Assign drop dates.

The definition of drop date depends on the media involved:

- Direct mail – Date the post office starts to deliver the mailing
- Telemarketing – Date the calls begin
- Media spots (TV, radio, webcast) – Date of airing
- Newsletters – Date of mailing, by issue
- Online campaigns – Date the email messages are sent

Drop dates for other efforts can include:

- Mailing list generation
- Creative concepts/artwork complete

- Response management process set up

3. Track costs (optional).

   If your organization tracks operational costs at the appeal level, you will need to enter cost information when you set up the appeal.

   Next step

   You will define solicitations as the different messages or groups of responses.

   To create an appeal

1. Select Marketing > Campaign definition.
2. Select the appropriate campaign.
3. Click the Appeals tab.
4. Click Add an Appeal.
5. Define the appeal:

- Enter a Name.
- Select a Status (Active or Inactive).
- If the status is changed from Active to Inactive, the status of all child entities is set to Inactive.
- If the status is changed from Inactive to Active, the status of child entities is not affected.
- The status of a child entity cannot be changed to Active if any parent entities have an Inactive status.
- (optional) Enter an Overhead Cost, or click the plus icon to add multiple costs.
- (optional) Enter a Start Date and an End Date.
- (optional) Enter a response rate next to Predicted Response Rate (the estimated percentage of contacts that will respond to the appeal) and the Last Response Date.

- (optional) Enter a dollar amount for a Target Revenue value.
- (optional) Enter a Description.

6. Click Save.

   The system displays the status on the Summary tab. Click on the link for more details.

   To assign a product to an appeal

1. Open a campaign.
2. Click the Appeals tab and select an appeal.
3. Click the Products tab.
4. Select a Query to view:

- All Products
- Products By Code

5. Select the desired products.

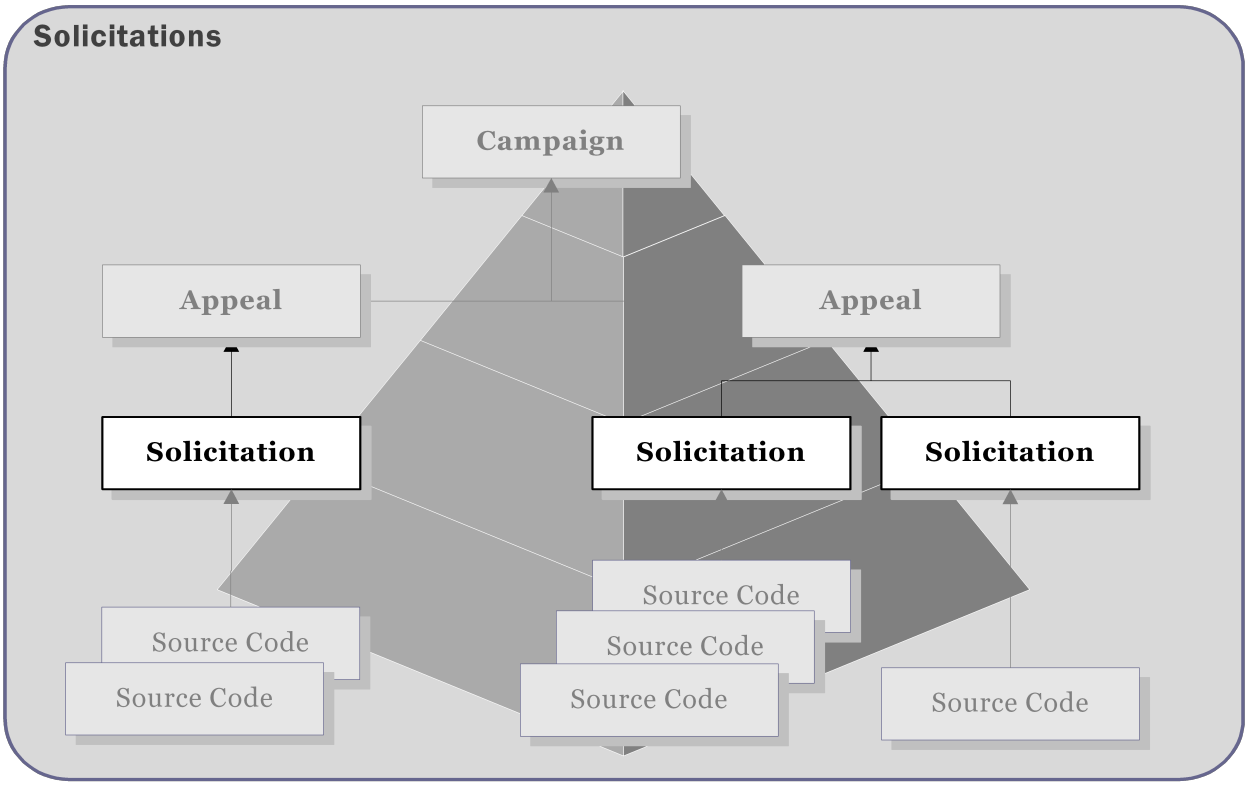
   The added products display in the list of Selected Products.

6. Click Save.

   Note: When you delete a product after it has been assigned to an appeal, the Products tab displays only the product code of the deleted product.

Defining solicitations

A solicitation is an organizing function that allows you to track responses by targeted groups. The solicitation is a series of source codes that requests a response from contacts and prospects (such as a reply, donation, or purchase). Using source codes, you create solicitations to target a specific marketing appeal for different groups of contacts and prospects. Solicitations can be in the form of letters, phone calls, personal conversations, or other methods of contact.



Solicitation level in campaign hierarchy

Solicitations can be:

- Message-based – The message is divided into different letter contents or package concepts. For example, if a mailing has an inexpensive package that will be sent to contacts who are least likely to respond, you can set up one solicitation for the less expensive package and a separate one for the more expensive package.
- External group-based – Different messages are sent to targeted groups of contacts.
- Internal group-based – Different messages are sent by different groups within your organization.

Organizations with multiple source codes within their organization probably need to measure responses in groups of source codes as well as at the source code level itself. See Setting up complex campaigns.

To create a solicitation

Before you begin

You must define one or more appeals before you define solicitations.

1. Select Marketing > Campaign management.
2. Select a campaign and then select an appeal.
3. Click the Solicitations tab.
4. Click Add a Solicitation.
5. Define the solicitation:

- Enter a Name.
- Select a Status (Active or Inactive).
- If the status is changed from Active to Inactive, the status of all child entities is set to Inactive.
- If the status is changed from Inactive to Active, the status of child entities is not affected.
- The status of a child entity cannot be changed to Active if any parent entities have an Inactive status.

6. (optional) Enter a Start Date and an End Date.
7. (optional) Enter a Display Predicted Response Rate (the estimated percentage of contacts that will respond to the appeal), Description, Reminder Date, and Last Response Date.
8. Click Save.

   The system displays the status on the Summary tab. Click on the link for more details.

   Tips

- Combine multiple source codes and list sources into a single solicitation.
- Use consistent naming conventions when creating solicitations.

Specifying communication efforts

Business goals

To define a communications effort for a campaign, you will:

1. Define source codes.
2. Create inserts.
3. Create or select target groups (source list).
4. Select a source list (who is selected to receive the message) and an insert (what will be sent) for each source code.
5. Generate output.

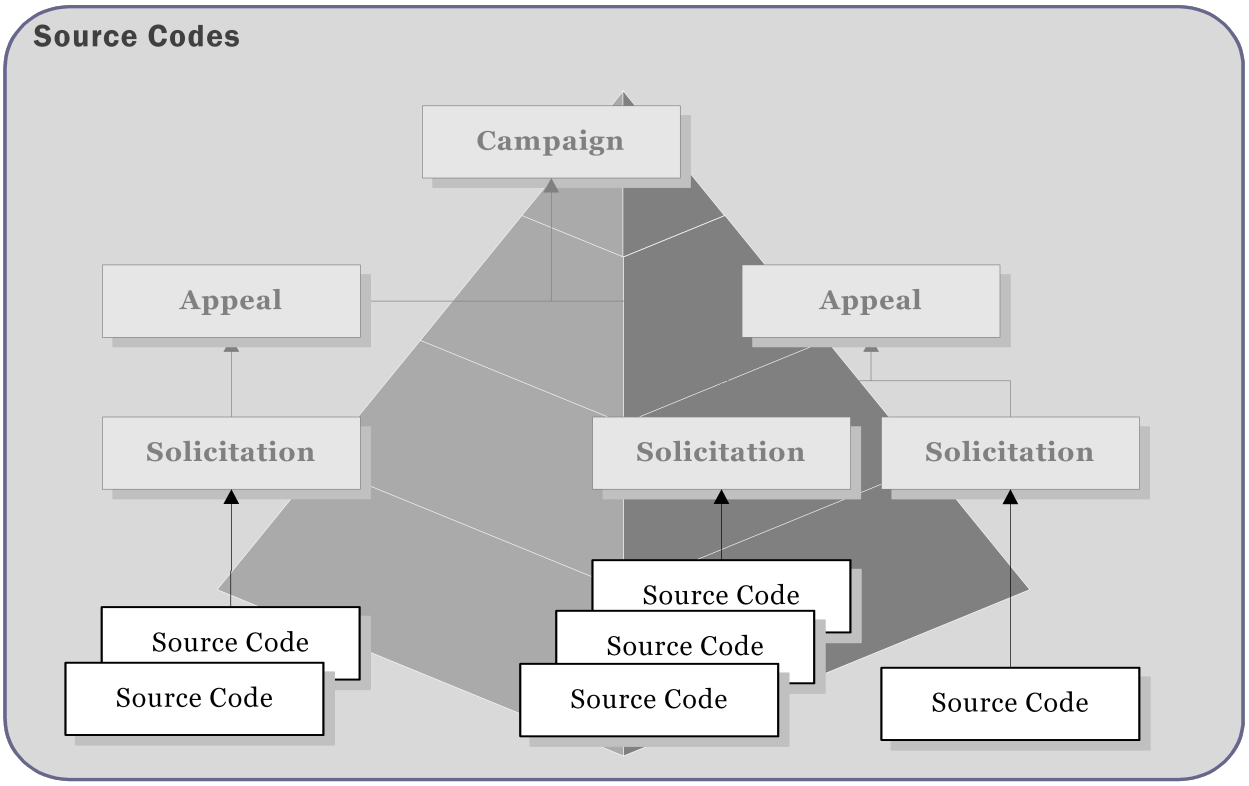
Defining source codes

Source codes are the most granular level of measurement in Campaign Management. These codes are used to identify messages you send out and track the responses to these messages. Source codes are linked to reply devices such as postcards, website links, donations, and purchases.

Use sources codes to:

- Tag the marketing message for each targeted group and to track the responses.
- Use questions such as "How did you hear about us?" to identify the message or call to action that prompted the response.
- Set up codes for bounce-backs and responses that cannot be linked to a specific message.

For a basic campaign you might define only a few (or even one) source code.



Source code level in campaign hierarchy

There are three general kinds of source codes:

- Codes assigned to outgoing marketing efforts to track the incoming responses to the effort. Sometimes a contact receives more than one solicitation from your organization in a certain timeframe.
- Generic codes that are assigned to ongoing passive ways in which a customer can support your organization, such as web transactions, word-of-mouth, or calls to action.
- Codes that are assigned to capture responses when the actual source code is not known.

Important prerequisites for defining source codes

Before you can define source codes:

- Define one or more solicitations.
- Set up source lists.
- Create an insert for the source code.

Tips for defining a source code

- Use consistent naming conventions when creating source codes. Your administrator can set up automatically generated source codes that follow your organization's standards.
- To ensure accurate response data, do not edit a source code after the responses are processed.

To create a source code

1. Open a campaign, appeal, and solicitation.
2. Click the Source Codes tab.
3. Click Add a Source Code.
4. Define the source code:

- Enter a Code (if not automatically generated).
- Select the Source Code Status (Active or Inactive).
- (optional) Enter a Description.
- Select the List Member Type:
- Contact – Queries contain the NetContact business object.
- Prospect – Queries contain the Prospect business object.
- (optional) Enter the Predicted Response Rate, Last Response Date, and Last Drop Date.
- (optional)Select the Source Code Type:
- RunOnce – The source code will be used only once.
- RunMany – The source code will be used more than once.
- ExternalList – The source list is an external file. Enter the External File Name and External List Count.

5. Click Save.

Defining inserts

Inserts are the physical items you send to contacts and prospects, such as letters, pre-printed collateral, and envelopes. After you create an insert, you can reuse it in other campaigns.

Typically, a source code is linked to each insert item. Multiple inserts (such as letter, brochure and envelope) are combined into a single package for delivery. All responses to the solicitation are then tracked by the source code. This is a useful way to perform market testing because you can choose the most effective creative package or target a test group to receive the package.

In addition, you can track the cost of each insert to determine the return on investment and to monitor budget amounts.

Output processes

To further customize an insert, you can assign queries and output processes that generate customized letters, email messages, faxes, labels, rosters, and physical file formats in a specific order.

To create an insert

Before you begin

Make sure all applicable queries and output processes are set up.

1. Select Marketing > Inserts.
2. Click Add an Insert.
3. Define the insert:

- Enter a Name.
- (optional) Enter a Description.
- Click the Browse icon for Total cost information.
- (optional) Select the Status (Available or Unavailable) and Insert Type:

- None
- Brochure
- Envelope
- Form
- Postage

4. Browse to select an Output Process.
5. Click Save.

   Tips

- Merges used for inserts must use either the Contact or the Prospect business object as a source.

  Note: You can also create a new insert for a solicitation by clicking the New Insert button while viewing the solicitation.

  Note: When output is generated from Campaign Management using a project process engine, the query and source code specified in the campaign automatically override the query and source code specified in the project process engine definition.

Selecting target groups

Use one or more source lists to identify a targeted group for your message. Basic campaigns typically use one or more of the following types of source lists:

- Lists from previous campaigns – Stagnant lists for repeat audiences. You could use lists of all contacts who were solicited in a previous campaign or only those who responded.
- Queries – Dynamic lists that can change with criteria that you specify. You can choose from queries that are set up in your system or you can create new ones.
- External lists – Purchased prospect lists from other businesses or organizations.

  Complex campaigns often use Segmentation to compile lists of contacts. See About Segmentation.

To create a source list

Before you begin

- Make sure all applicable queries are defined.
- Create all applicable segmentation jobs and definitions.
- Create multiple source lists for use with single source codes.

1. Open the campaign.
2. Select a source code.
3. Click the Source Lists tab. (If the source code uses an external list, the Source Lists tab is not available.)
4. Under Add Source List, choose the Select Type:

- Segment Definition – Select a segmentation job.
- Solicitation Response – Select a campaign.
- Query – Select a stored query.

5. Click Save.

Note: Throughout Marketing, NetContact is a required business object. Make sure that you include NetContact when you create source lists using queries.

Generating marketing output

Run output processes to generate customized letters, email messages, faxes, labels, rosters, and physical file formats in a specific order. Running the output process also calculates the non-responses for each appeal. The following output processes are available:

- MS Word merge – Print letters, acknowledgements, and other MS Word documents.
- Email merge – Send email messages to contacts.
- Campaign list export – Generate a list of contacts for an external service or for mass email output.

- RFM definition – Rank records based on Recency, Frequency, and Monetary value.
- Project process outputs – Generate projects for further relationship building.

Important prerequisites for generating output

Before you run output processes:

- Make sure valid output process types are set up.
- We recommend you generate and check a test output to make sure the message and target group is correct.

Business goal

To run output processes, you will:

1. Select the type of output process for the insert.
2. Define the specific output process.
3. Generate output.
4. View the results.

To generate output

1. Open a campaign, appeal, and solicitation.
2. Click the Source Codes tab.
3. Select a source code or create a new one.
4. Click Save.
5. Click the Inserts tab.
6. Select an insert or create a new one.
7. Click Save.
8. Click the Source Lists tab.
9. Select a source list or create a new one.

10. Click Save.
11. Click Generate Output.

    The system displays the status on the Summary tab. Click on the link for more details.

    Note: If the output is generated at a level higher than source code, output can be generated only once. If the output is generated at the source code level, output can be generated repeatedly.

Monitoring and measuring performance

Measuring the success of your campaign helps you improve your next marketing effort. Each time the cycle repeats itself, you become more efficient at honing your message and delivering the right message to the right person at the right time. As a result, you are able to set ever higher goals for your organization, such as acquiring more members, logging more donations, selling more products, or getting your message to a larger audience.

Marketing Suite provides progress and performance feedback at many levels of the campaign. You can view a real-time summary of the campaign's performance, including:

- The progress of each solicitation, source codes that have been generated, and source codes that have been dropped
- The number and type of responses resulting from each solicitation
- The progress, response, and accumulated revenues/costs for each source code
- The actual revenues and costs compared to the target figures for each source code and appeal
- Performance information to guide future actions and campaigns

These powerful performance monitoring features are usually sufficiently rigorous for basic campaigns. For more complex campaigns, use RFM Analytics.

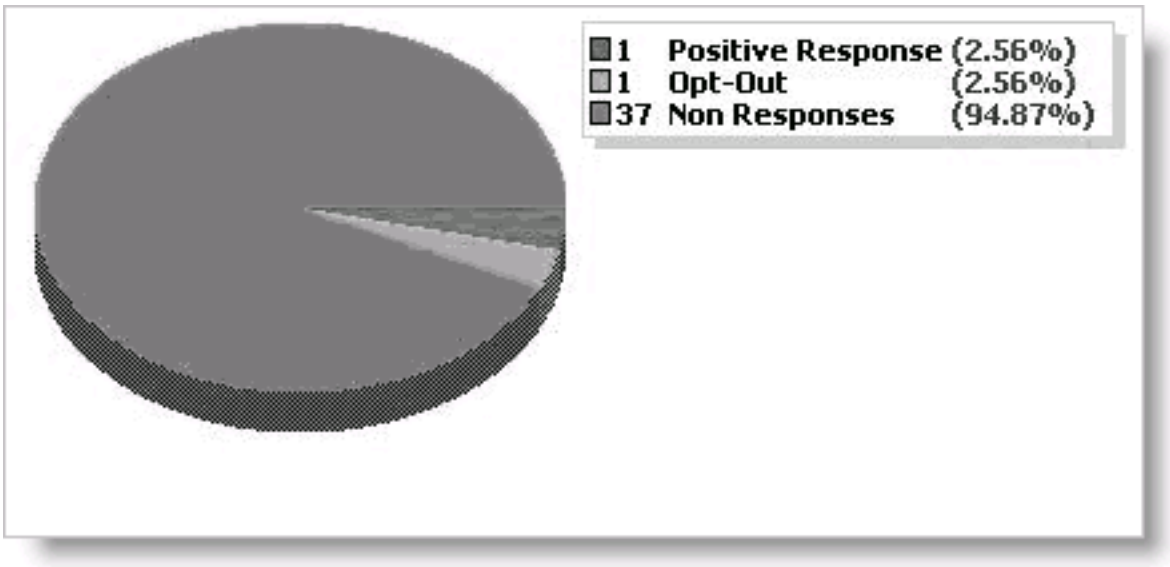
Tracking responses

Campaign Management gives you the power to track different types of responses to a campaign. This allows your organization to:

- Maintain a history of all customer responses to marketing efforts and every message that was sent
- Define specific tasks that execute automatically when prospects respond or do not respond to solicitations
- Generate personalized emails, faxes, and letters based on user-defined settings

Responses to solicitations are captured automatically. All tracking areas are synchronized, upon command, to consolidate responses. This tracking information includes:

- Contacts associated with the source code
- Non-responses and opt-outs
- (optional) Financial transactions associated with the campaign (orders, events, gifts, pledges, billings)



Example display of responses to a solicitation

Tips for tracking responses

- If you plan to track product orders associated with the campaign, make sure all appropriate products are set up.

  Business goals

  To track the responses to your campaign, you will:

1. Enter orders and associate them with a source code.
2. Synchronize responses.
3. View the results file or the summary pie chart of each level of the campaign.
4. (optional) Use communications tools to generate messages automatically when a response is received.
5. (optional) Use Process Manager to kick off projects or processes associated with each type of response or target group.

   Events responses

   You can associate events with your campaign and track responses:

- Event responses are tracked through registration data, not through payment data.
- Registration for multiple event functions that have the same source code are counted as one response. Registrations for multiple event functions that have different source codes are counted as multiple responses.

  Adding an event function to an event registration is counted as a response and affects all revenue and response attributes, such as response dates, response amounts, and response count.

  Removing an event function from an event registration affects total revenue but does not affect other revenue and response attributes such as response dates, response amounts, and response count. Removing an entire event registration decreases response count and revenue.

  Dues responses

  You can associate payments with your campaign and track responses:

- Payments for multiple products that have the same source code are counted as one response. Payments for multiple products that have different source codes are counted as multiple responses.
- Cancelling a billing fundraising item decrements total revenue, but does not affect other campaign statistics.

  If you change the source code for a payment after running response synchronization, the response is not updated.

  Synchronizing campaign responses
  Each time you synchronize responses, only those product sales that have occurred since the last time the process was run are processed.

  If you synchronize responses for an inactive campaign, no responses are generated. If you change a campaign status to Active and then synchronize responses, only those responses entered after activating the campaign are recorded. iMIS ignores the responses entered when the campaign was inactive.

  To synchronize responses

1. From Marketing, select Campaign definition.
2. Click Sync. Responses.

   A status message displays noting that the responses are being synchronized.
3. Go to System Setup > Workflow Monitor (on desktop) or Tools > Workflow (on your iMIS-enabled website) to observe the synchronization's status.

   Caution! Do not edit a campaign source code after processing responses for the source code.

Creating projects from Campaign Management

You can easily create projects that correspond to your campaign and manage them in Process Mgr. Create these projects by defining, editing, or selecting the following information for the new projects:

- A query
- A project process output
- A source code

To create projects from a campaign

1. From Marketing, select Inserts.
2. Select an insert that already contains a project output process, or create a new one.
3. Click the browse icon to select the Output Process or click the Processes tab and select New to define a new process.
4. For a new process, click the Sources tab and browse for the Source Data Query and Template Name. Click Save.
5. Click OK.
6. Click Generate Output.

The system displays the status on the Summary tab. Click on the link for more details.

Note: When output is generated from Campaign Management using a project process output, the query and source code specified in the campaign automatically override the query and source code specified in the project process output definition.

Acting on responses

You can easily set up your campaign so that specific tasks are generated when a prospect responds or fails to respond to a solicitation. This helps you to:

- Acknowledge positive responses
- Send a cross-promotional solicitation to positive responders
- Initiate reminders to prospects who do not respond to initial solicitations
- Make sure that prospects who opt out of the campaign do not receive further solicitations

To create a response stage

You can define response stages in the source code so a contact moves through campaign stages (solicitations) as they respond to solicitations.

1. Open the source code.
2. Click the Source Lists tab.
3. In the Add Source List area, Select Type of Solicitation Response.
4. Select a campaign.
5. For each campaign response stage:

- Select an Appeal.
- Select a Solicitation.
- Select a Source Code.
- Select a Comparison value (Equal or Not Equal).
- Select a response State:
- Solicited – Contact has been solicited but has not responded.
- SolicitedResponse – Contact has responded to a solicitation.
- UnsolicitedResponse – Contact has responded but was never solicited.
- OptOut – Contact has opted out of the solicitation and will be excluded from any future lists for this campaign, appeal, and source code.

  Note: If a source code is provided with the response, the system assumes the contact was solicited.
- Click add.
- Select a Global Operator that applies to all solicitation state expressions (AND or OR).

6. Click Save.

   The solicitation response displays in the Source Lists.

Note: You can choose to automatically assign source codes to responses in Set up campaign module.

To view responses

Before you begin

Before you can view responses, you must:

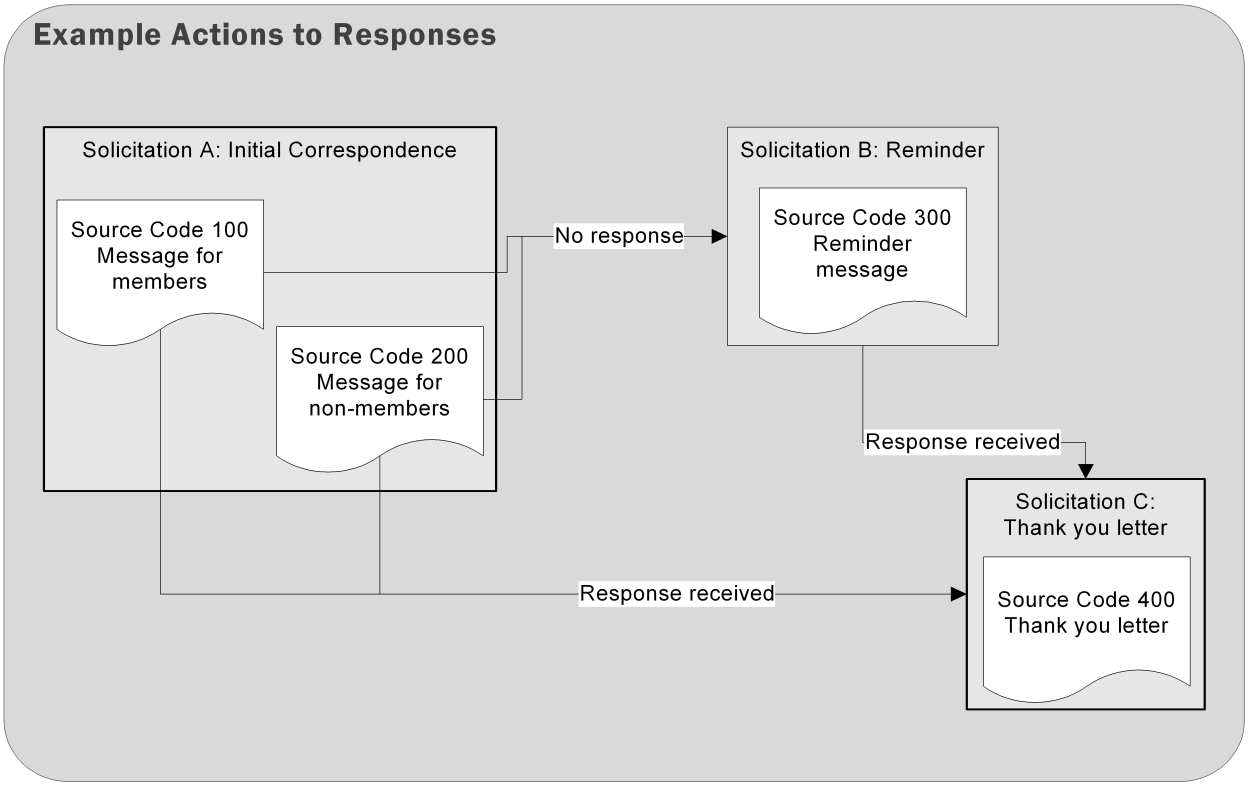
- Create response stages
- Synchronize the responses

1. Select Marketing > Record responses.
2. Find the desired contact.

   The system displays a list of responses for that contact by source code, appeal, and campaign.

   Example: Response actions

   The following campaign is defined so that a response to Solicitation A (initial correspondence) automatically moves the contact into Solicitation C (thank you letter). After a period of time (or a non-response to Solicitation A), the contact automatically moves into Solicitation B (reminder). A response to Solicitation B automatically moves the contact into Solicitation C.



Response process example

Basic campaign example: Professional conference

The following is an example of a basic campaign for a professional conference. This example follows the business goals for Campaign Management:

1. Plan the campaign.
2. Define the campaign.
3. Define the appeals and solicitations for the campaign.
4. Specify communication efforts.
5. Tracking responses
6. Monitor and measure performance.

Planning the campaign

The ABBA professional society hosts a major conference each year. The goal of the Annual Conference Campaign is to recruit 20% more attendees than last year.

Overhead costs are tracked at the appeal level. For the first appeal, the first two solicitations have different creative concepts to test effectiveness. The more successful concept will be used for the brochure and conference signage. One source code is assigned to each solicitation.

The hierarchy for this appeal is simple:

Campaign = Annual Conference

Appeal = Save the Date postcard

Solicitations = Creative A to Segment 1 (source code 000134), Creative B to Segment 2 (source code 000135)

First Mailing

The first mailing is a Save the Date post card. The goal is to get people to put the conference date on their calendar and to plan to attend. Because there is not a true call to action associated with this mailing, it is an ideal situation for testing a creative concept. There will be inquiries from:

- People who want to register right away
- Companies looking for sponsorship opportunities
- Companies looking for exhibitor opportunities

These inquiries indicate the more successful concept to be used throughout the campaign.

Second Mailing

After determining the more successful concept, ABBA incorporates the concept into the full conference brochure. The brochure contains sections on schedule, tracks, speakers, and entertainment options and is the most important mailing in the campaign.

The basic structure for this appeal is:

Annual Conference	Full Conference Brochure	Past Attendees	000234: Attended last year 000235: Attended year before 000236: Attended earlier
		People who have never attended	000334: Members 000335: Non-members

So far, ABBA has a sound plan:

- The appeals help them separate out invoices for each mailing to determine the true return on investment for each one.
- Solicitations break down the mailings into logical and broad groups of records with varying estimated response rates. It is likely there will be a higher response rate from past attendees than from people who have never attended.
- Source codes further break down the groups for customized mailings and different estimated response rates. The source codes can be seen as declining levels of expected positive responses.

Defining the campaign

Campaign definition is straightforward:

- Name = Annual Conference
- Status = Active
- Start date = today's date
- Campaign type = Event
- Predicted end date = today's date + three months

Defining the appeals

Define each appeal:

- Name = Save the date postcard
- Status = Active
- Start Date = today's date
- End Date = today's date + three weeks
- Predicted Response Rate = 10%
- Name = Conference brochure
- Status = Active
- Start Date = today's date + 6 weeks
- End Date = today's date + 3 months
- Predicted Response Rate = 30%

Defining the solicitations

Define each solicitation similarly to the first one:

- Name = Conference Save the Date Postcard Creative A
- Status = Active
- Start Date = today's date + 1 week
- End Date = today's date + 1 month
- Predicted Response Rate = 5%

Specifying communication efforts

This is the point at which the target groups, inserts, source codes, and packages are defined.

Select target groups

ABBA will use the same lists as last year: Segment 1 and Segment 2.

Create inserts

Create inserts for each mailing similarly to the first one:

- Name = Annual Conference Template_NS_Segment1
- Status = Active
- Insert Type = None

Define source codes

The inserts will be attached to a source code and combined as packages for each mailing.

Set up source codes similarly to the first one:

- Code = 000134
- Description = Segment 1
- Status = Active
- Predicted Response Rate = 7.5%
- Target Revenue = $7500 (from attendees who want to register immediately)
- Source Code Type = Run Once
- List Member Type = Contact
- List Type = Segment Definition
- Add Segment 1
- Attach insert to a package: Add Conference Save the Date Postcard Creative A.

Generate output

Generate output for the first appeal to produce labels for the postcards and to ensure that responses will be tracked:

- Open the appeal and generate output.
- Output process = Postcard labels (from list of available choices)

  Repeat for the second appeal when appropriate.

  Example display

  This example campaign will display similarly to:

	Name	Total Revenue	Target Revenue	Overhead Cost	ROI %	Start Date	End Date	Status
	Code	Segments		1st Resp	Last Drop	Type	Member Type	Status
⊟	Annual conference - Full Conference brochure							
⊞ select	Past attendees	0.00	0.00	0.00	0	1/3/2009	3/31/2009	Active
⊞ select	People who have never attended	0.00	0.00	0.00	0	1/3/2009	3/31/2009	Active
⊟	Annual conference - Save the Date postcard							
⊟ select	Creative B with green to Segment 2	0.00	0.00	0.00	0	1/3/2009	2/21/2009	Active
	select 000135					RunOnce	Contact	Active
⊟ select	Creative A with blue to Segment 1	0.00	0.00	0.00	0	1/3/2009	2/21/2009	Active
	select 000134					RunOnce	Contact	Active

  Example: Professional conference display

Getting Started: Complex Campaigns

Complex campaigns for the purposes of this document:

- Contain many appeals and related solicitations
- Use many source codes
- Often build on the targeting and analytical data generated by Segmentation and RFM Analytics

Setting up complex campaigns

To set up a complex campaign, follow this process for best efficiency.

In Segmentation

1. Write the universe query that defines who receives the marketing effort.

2. Create the segmentation job or optionally, attach the universe query to the job.
3. Write the segment queries that will separate your universe into smaller target groups, such as by membership category or by transaction types or by event.
4. Create the segment(s) by attaching segment queries to each segment.
5. Populate the segments.

In Campaigns

1. Create the insert(s).
2. Set up the campaign, appeals, solicitations and source codes (one source code per segment).
3. Attach the segments and inserts to the source codes.
4. Generate output.

Tips for setting up complex campaigns

- Plan first. Building a spreadsheet of the basic structure early makes it easier to test and train users.
- Think about data criteria. Most marketing efforts use inclusion and exclusion criteria to generate their list within their system. In fundraising organizations, this is particularly so. How are you going to determine what that criteria is and how are you going to manage the information as customers 'opt-in' and 'opt-out' of different marketing activities?
- Think end-to-end marketing. Many marketing efforts are not isolated campaigns but are part of a broader, cyclical plan. Be prepared for that and factor it into your planning.
- You can track budgets at the appeal level or the source code level. This tracking allows you to define overhead costs and the cost of individual inserts. The method you use to track budgets also determines how costs are entered, recorded, and calculated within the Campaign Management module.
- If your organization does not use complex segmentation, set the budget level to Appeal.

- If your organization uses complex segmentation, especially with insert testing, set the budget level to Source Code.
- Decide whether you need a single source code or several:
- Newsletters and similar mailings are rarely personalized beyond the mailing label attached to the piece. For this reason, although a template segmentation job is probably going to be used, a single source code will be assigned for each issue. This may be printed on the newsletter or mailing but it may not be. The issue number or cover article may be enough to be able to track the source code at the customer level.

  In this case, multiple segments = a single source code.
- Marketing efforts that are less informational and more "call-to-action oriented" (targeted marketing campaigns) require a high level of personalization. For these types of campaigns, each segment should be assigned a unique source code.

  In this case, individual segments = distinct source codes.
- If you want each RFM score to be a segment, assign a source code to each segment.

  If your campaign has only one source code, you can:
- Add one or more inserts (including more than one of the same insert).
- Generate customized lists of contacts and prospects using any combination of multiple source lists.
- Create all applicable inserts, queries, and segmentation jobs before you create a source code.
