About Segmentation

Use Segmentation with Campaign Management to group contacts and prospects into targeted audiences. With Segmentation, you can:

- Create targeted contact and prospect lists according to demographic and behavioral patterns or other include/exclude criteria.
- Split segments into multiple lists and prioritize the segments.

- Eliminate duplicates in lists.
- Perform controlled and repeatable list pulls.
- Create n-Select or random select segments for message or delivery testing.
- Get counts for communications collateral before production.
- Assign unique source codes to segments to effectively analyze an effort's success.
- Copy segmentation jobs and purge inactive jobs.
- Reuse query definitions for multiple campaigns.

Segmentation drives the criteria that will be used to select and segment those customers who will receive our marketing efforts. A segmentation job is a set of queries that are run in a specific order and result in the selection of the first occurrence of each matching record.

Segmentation data is prepared and run before it is attached to its source code and the final output is generated. This allows for data criteria testing, test or dummy selects, or to get counts before the final list is prepared. And, because the data can be purged and lists can be run again, you can continue to target your message.

Segmentation jobs have two levels of hierarchy:

- The job: the job can have a 'universe query' attached to it. It's not essential that a universe query be attached to a job.
- The segment: the segment definition also has a query associated with it. This query is called the 'population' query and contains the minute criteria we need to define who falls into which segment.

Business goals

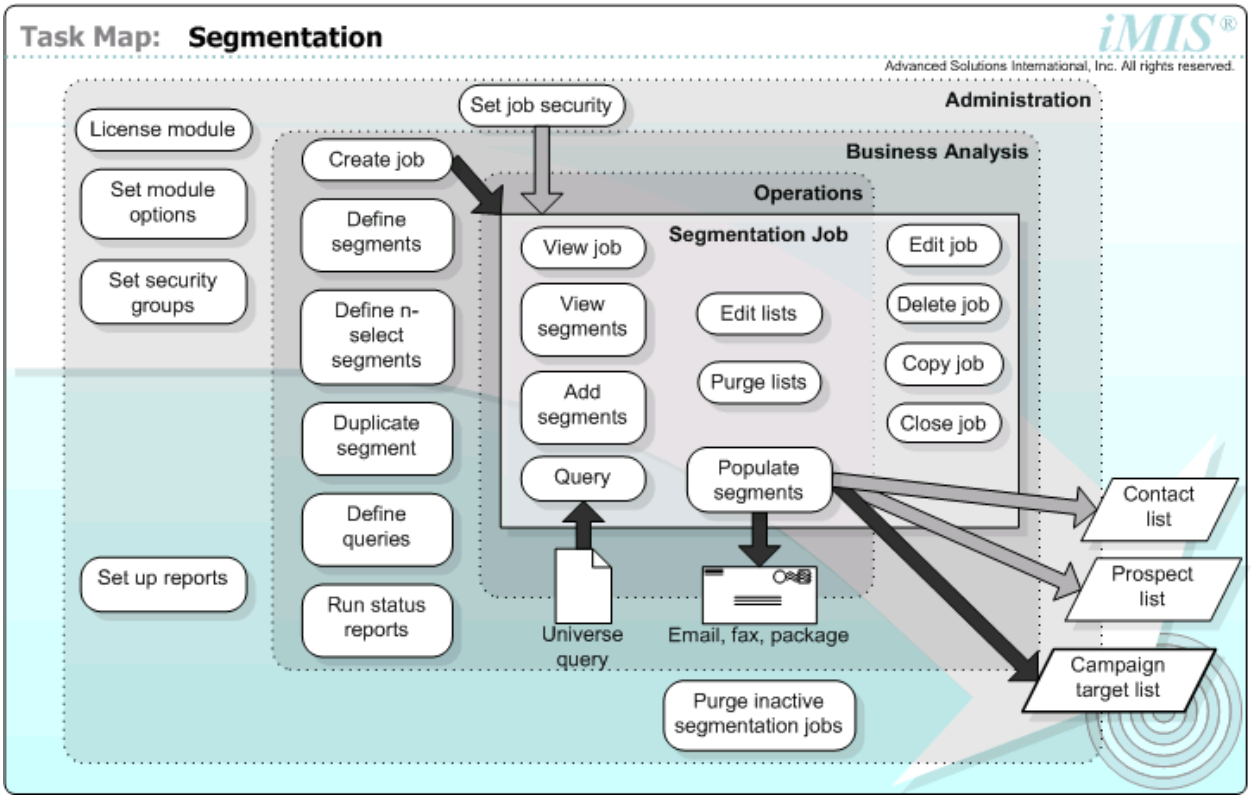
The steps to create segmented lists are:

1. Create a segmentation job.

2. Add, split, and/or delete segments.
3. Populate the segments to create lists.

Task Map: Segmentation

This diagram maps out the core tasks in Segmentation by the approximate order they occur (top-left to bottom-right) and by the organizational area that usually performs them.



Task map: Segmentation

Viewing segmentation jobs

You can view all segmentation jobs or you can filter your view of segmentation jobs by creation date, creator, description, name, or by active jobs.

If you filter the segmentation jobs view by description, all segmentation jobs with matching description fields display.

If you filter the segmentation job view by creation date, you can view segmentation jobs created on a specified date or during a specified date range:

- To view segmentation jobs created on a specified date, enter the date.
- To view segmentation jobs created during a specified date range, enclose each date in double quotes and separate the dates with a comma (for example, “1/4/2008”,”1/8/2008” specifies jobs created January 4, 2008 through January 8, 2008, inclusive).

Creating a segmentation job

A segmentation job contains the job definition, security settings, and segment definitions used to generate contact or prospect lists.

There are two types of segmentation jobs:

- Contact jobs – All queries for a Contact segmentation job must contain the Contact business object as a source.
- Prospect jobs – All queries for a Prospect segmentation job must contain the Prospect business object as a source.

  Note: When you set the type as Contact or Prospect, the system automatically defaults to the correct business object.

  Each segment is assigned an execution order to make sure duplicates are not generated. What is often different from appeal to appeal is the exclusion criteria you apply.

  Note: After selecting an additional source table, you must define a Custom relationship between the tables; in most cases, you can use the ID field for the join.

  Universe queries

  A "universe" query defines the entire population of contacts for a segmentation job. When a universe query is present, a contact must be a member of the universe query for the contact to be included in any of the segments within the segmentation job.

  If a universe query is defined for the segmentation job, it must be included as a source for any segment-level queries. The system automatically populates this. Universe queries are required only when defining n-Select segments.

Note: When adding a pre-existing universe query, check the source to make sure that the Contact business object is one of the sources. If Contact is not a declared source, the query will fail.

n-Select segments

n-Select segments list contact/prospect records returned by a selection filter in a number (n) of segments, with an equal number of contacts or prospects in each segment.

To create n-Select segments, you must include a universe query in the segmentation job. The universe query can include the results of a previous segmentation job as a source.

Note: If you have defined n-Select segments for a segmentation job, you must create these segments before you can populate the lists.

To ensure that your n-Select segments are successfully populated, make sure you do not exceed the total number of records returned by the universe query when you define the n-Select segments. For example, if the query returns 500 records, you can define n number of segments, each consisting of x number of contacts or prospects per segment, as long as n times x is less than or equal to 500.

Exclusion segments

Exclusion segments are any segments in the segmentation job that are not linked to a source code. Since each record can only be retrieved once, creating an exclusion segment in the segmentation job results in any records retrieved by an exclusion segment not being retrieved by later segments. For example, if two appeals are being dropped in a short period of time, you may want to include one or more segments in one appeal but not in the other.

Exclusions are applied at the segment level, and they can appear anywhere within a list of included segments, with these exceptions:

- Universal exclusions (No Mail Flag or Bad Address) should be the first segments entered in the segmentation job.

- Include segments have a link to a defined source code and should be defined after any universal exclusion segments.

  If you specify a number of random records to return for a segment, the resulting list may contain fewer than the specified number of records. The segments are first populated and then checked for duplicate contacts or prospects. If duplicates are found, they are removed, and the segments from which they were removed will contain fewer than the specified number of records.

  To create a segmentation job

1. From Marketing, select Segmentation.
2. Select Add a Job and enter the job definition.
3. From the drop-down menu, select the Type.
4. (optional) Apply a filter (universe) query to the job. You can create a new query or use an existing query. These queries can be added later.
5. (optional) To define and create n-Select segments, click the n-Select tab. Enter the number of segments and the number of contacts per segment.
6. (optional) To modify the security settings for the job, click the Security tab.
7. (optional) To define explicit segments, click Segments:

- Enter segment definitions.
- Select an existing query or create a new query.
- (optional) Select the number of random records to use to populate the segments.
- (optional) Modify the Priority.

8. Select Save.

   Note: Add or edit segments before closing the job.

Creating source codes based on segment definitions

Before you begin

- Create the source lists for which you want to create source codes.
- Create the segmentation job and add segments to the job.
- Generate output so that the lists are populated.

To automatically create source codes based on segment definitions

1. From Marketing, select Campaign Management.
2. Open a campaign and view the Summary tab.
3. Click Create Source Codes from List.
4. Create the source codes:

- If you want to build source codes based on solicitation lists, click an available solicitation to add it to the Current Solicitations list and then click Create Source Codes.
- If you want to build source codes based on segments, click the Create from Segments tab, and then click an available populated segmentation job to add it to the Select Segmentation Definition list. If you select Job Name, you automatically select all the segments in the job, or you can pick and choose among the segments by selecting just the segments from which you want to create source codes. Click Create Source Codes.

5. To view the automatically created source codes, click the Source Codes tab on the campaign.

Reusing and copying segmentation jobs

By reusing segmentation jobs or copying and editing them, you can work efficiently. After a targeted list pull, you can save the job and refresh the list to run it again. As the campaign progresses, you can copy the job, rename it, and adjust the segments to be included.

Consider creating segmentation templates that can be copied and reused with minimal manipulation. If you build a template with the core of the segmentation requirements, the user can copy it and modify it at any time.

Tips for copying a segmentation job

- All segments in a segmentation job are copied when the segmentation job is copied. However, any contacts or prospects contained in a segment are not copied. You must populate the segments in the copied segmentation job to generate contacts or prospects to fill the segments.
- When you copy an existing segmentation job, for convenience the new segmentation job is named "Copy of OriginalJobName" (for example, "Copy of Contacts"). Rename the copied segmentation job and edit it as desired.
- If any segment editor pages from the original job were open when the job was copied, these windows will still reference the original job. To edit the segments in the copied segmentation job, you must select the Segments tab after copying the segmentation job and open the segments individually.

To copy a segmentation job

1. From Marketing, select Segmentation.
2. Open an existing job. Click Save As and rename it.
3. Open the new job.
4. Edit, add, and/or remove segments.
5. Adjust query filters.
6. Click Populate Segments.

Example: Creating a segmentation job

In this example, we want to mail catalogues to individuals who have not yet registered for conference and exclude those who have registered.

Exclude: Already Registered for the Conference

Include:

- Last attended 2008
- Last attended 2007
- Last attended in 2006 or earlier

- Never attended - Members
- Never attended - Non-members

  Execution order is important. We want to first exclude those who have registered, and then populate the list with contacts in each segment who have not registered.

  This example displays as:

  Example: Segmentation job

Managing segments in a job

Viewing segments

You can view all segments or filter your view of segments by creation date, description, or name.

To view segments

1. From Marketing, select Segmentation.
2. Open the segmentation job.
3. Select the Segments tab.
4. (optional) Select a filter (by creation date, description, or name) if needed. By default, all segments display.

5. Select the segment to view. The segment definition displays.
6. If the segments have been populated, select the Results tab to view the segment contents.

Adding and editing segments

A segment definition is used to generate contacts or prospects based on demographic behaviors (for example, gender, location, age) and/or transactional behaviors (for example, attending events, purchasing books, or making donations).

Note: After selecting an additional source table, you must define a Custom relationship between the tables; in most cases, you can use the ID field for the join.

Note: Add or edit segments before closing the job.

To add or edit a segment

1. From Marketing, select Segmentation.
2. Open the segmentation job.
3. Select the Segments tab and add a new segment.
4. Enter the segment definition.
5. Using the Population buttons, select an existing query or create a new query.
6. (optional) Select the number of random records to use to populate the segments.
7. (optional) Modify the Priority.
8. Click Save.

Copying segments

If there is an existing segment definition that is similar to the segment definition you need to create, you can duplicate the existing segment definition and modify it as needed.The new (duplicated) segment appears in the same segmentation job as the original.

If you add or insert a new segment in an existing segment, you must manually change the order numbers of all the segments within the segmentation job.

To duplicate a segment

1. From Marketing, select Segmentation.
2. Open the segmentation job.
3. Select the Segments tab.
4. (optional) Select a filter (by creation date, description, or name). By default, all segments display.
5. Select the segment to view.

   The segment definition displays. The Duplicate Segment button does not display until the segment definition has been saved and the segment has been reopened in the Segment Definition Editor window. The Duplicate Segment button does not display when a segment definition is initially created and saved.

   If you do not see the Duplicate Segment button enabled when you open an existing segment definition, either you lack permissions to edit the definition or the lists have not been generated for the segmentation job.
6. Click Duplicate Segment.

   The Segment Definition Editor page closes and the new (duplicated) segment displays in the segments list directly above the segment that was duplicated. Both segments will have the same name.
7. Open the new (duplicated) segment.
8. Edit the segment definition.
9. Click Save.

Splitting segments

You can split a segment into multiple segments (A/B split) by creating additional segments that use the same query.

1. Define the segments in sequence (using the same query).

2. Run the query to determine the segmentation count.
3. After deciding how many records should be retrieved for each segment, retrieve each segment and specify the count for each segment.

   Note: Do not specify a count for the last segment; the last one will return all of the unretrieved records.

Deleting segments

You can delete a segment from a segmentation job if the segments have not yet been populated. To delete a segment from a job after the segments have been populated, you must first purge the lists (see "Purging lists").

Caution! Deleting a segment that is referenced in a campaign source code renders that source code unusable.

Populating segments

After you create a segmentation job and add segments, populate the segments in the job to create contact or prospect lists.

When segments are populated, iMIS ensures that segments are not populated with any record that would be a duplicate of a record in another segment that is defined for the same segmentation job.

Populating segments can be a very lengthy operation. Segments are populated as a workflow task; you can continue using iMIS for other tasks while segments are being populated.

You cannot view the results in the populated segments until the segment population workflow task has been completed.

To repopulate segments that have already been populated, you must first purge the lists and then populate the segments.

After the segments have been populated, you cannot edit the segment definitions. To edit a segment definition after the segments have been populated, you must first purge the lists.

To populate segments

1. From Marketing, select Segmentation.
2. Open the segmentation job.
3. Click Populate Segments.

   If no segments are defined, an error message displays.

   If the segments have already been populated, Populate Segments is disabled.
4. Select the segment to view.
5. Select the Results tab to view the segment contents.

Managing segmentation lists

Editing lists

After lists have been populated, you can add contacts or prospects as well as disable any that are already listed (contacts and prospects are enabled by default).

Before you begin

Verify that contacts or prospects to be added are not already in the list. No duplicate checking runs for manually added contacts/prospects.

To edit a contact or prospect list

1. From Marketing, select Segmentation.
2. Open the segmentation job.
3. Select Segments.
4. Select the segment that contains the list to be edited.
5. Select the Results tab.
6. (optional) To add a contact or prospect, click Add Contact.
7. (optional) To enable or disable a contact or prospect, select or deselect the checkbox dis-

played to the left of the contact or prospect.

8. Select Save.

Purging lists

Purge lists to remove those that you no longer need or to repopulate segments.

Note: The Purge Lists button is available only if the segments are populated.

To purge segmentation lists

1. From Marketing, select Segmentation.
2. Select the segmentation job.
3. Click Purge Lists.

Using external lists

Organizations may use external lists. External lists are brokered with individual list agreements that govern how long and how the use can be used.

Sometimes lists are given to the organization with all names and contact information attached. Other times, lists are used once with the organization only seeing the names of the contacts within it when the customer responds.

Lists with Names

Lists with names can be imported into the iMIS Acquisition Management tool. Campaigns and Segmentation can query this list and generate lists from it. One of the most important segmentation considerations is being able to test against different list rentals, therefore, it's important to have a testing model.

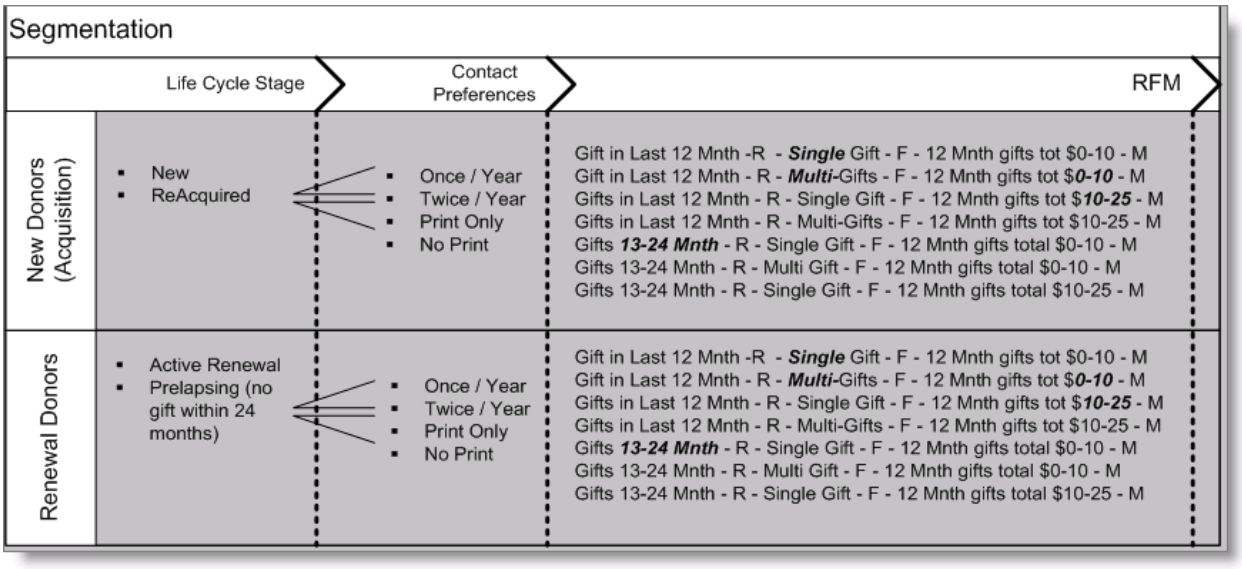
Lists without Names

Lists without names can still be tracked in Campaigns. At the source code level, assign the quantities included in the list rental. Track the list rental/purchase cost at the package level. Remember that the package gets attached to the source code. Different packages have different list costs so it's important to apply the cost to the package to properly calculate the ROI.

Example: Donor Segmentation

The following is an example of how a segmentation strategy can appear or be mapped during implementation. This example shows one audience that is separated into "life stages". It relies upon keeping track of customer contact preferences and uses RFM as the fundamental segmentation strategy.

For this example, Life Cycle Stage and Contact Preferences are the include/exclude selection criteria. RFM segment definitions will apply to everyone who has who has been selected during core criteria segmentation.



Example: Life cycle stages

Example: Event marketing

Association XYZ is preparing to market its annual conference. The venue is booked and sponsors and expo sales are under way. It's time to start raising awareness for the event and getting event registrations through the door.

In this example,there are two different marketing efforts that the association runs to meet these goals. The first is one tests a creative concept for the event. They want to understand which creative concept is more likely to get people to register.

After the creative concept is finalized and 80% of the speakers have been set, the organization is ready to recruit attendees by mailing the event brochure.

Marketing Goal

To recruit attendees for the annual conference.

Marketing Objective

To recruit 500 full conference attendees, 200 partial attendees.

The goals and objectives for this campaign are fairly straight forward. But accomplishing these goals is more complex.

First Mailing: Post Cards

First, XYZ does an A/B Split of the file to understand which creative concept is the better one to use for the rest of the conference marketing series.

Second Mailing: Full Brochure

The second mailing is where we apply some value ranks to our mailing. Full conference brochures are expensive and our goal is to cut numbers to save costs from groups who are least likely to respond.

Planning the campaign

Segmentation will be used in two different ways:

- Mailing 1 = Simple Split
- Mailing 2 = Ordered from most to least likely to respond

Annual Conference	Save the Date Postcard Mailing	Fountain Creative A	Source Code
		Dessert Creative B	Source Code
	Full Brochure Mailing	Past Attendees	Last Attended 08
			Last Attended 07

	Last Attended 06 or earlier
Non-Attendees	Active Members
	Non-Members

Business Goals

The process to accomplish this scenario is:

1. Create a segmentation job with an A/B split.
2. Build the campaign structure for the event.
3. Generate output and pickup file for the solicitation.
4. Review responses to choose most successful concept.
5. Create a segmentation job with all segment definitions.
6. Mail brochure to list.

Creating a segmentation job with an A/B split

Add a new segmentation job:

- Name = Annual Conference

Create a new query:

- Source – NetContact.
- Filter – Is A Company = No.

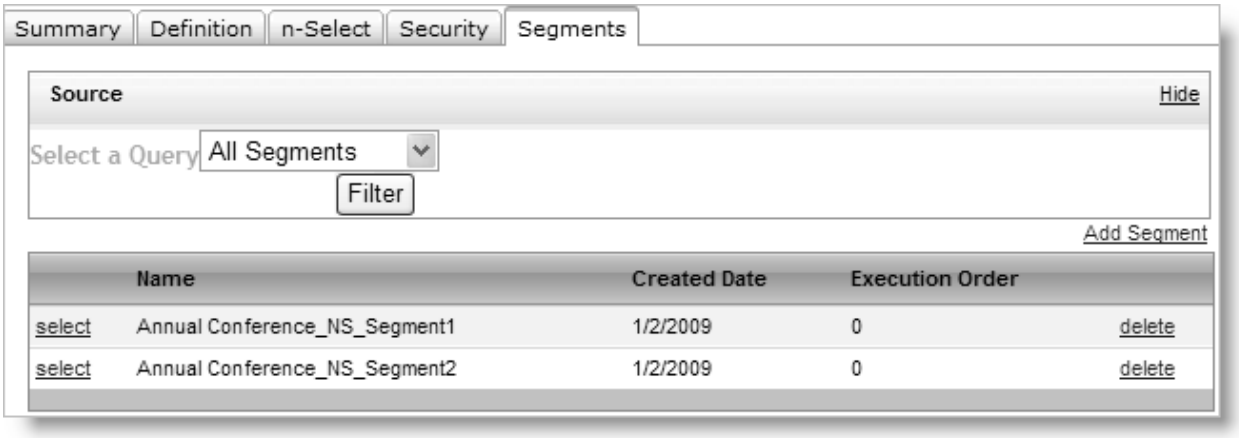
Define the n-Select segments:

- Number of Segments = 2
- Use all query results = selected
- Contacts per Segment: Enter the number of records at which you want to cap your seg-

ments. If you want two random groups with no cap, leave the 'Use All query Results' checked and enter the number of segments as two.

Populate the segments.

Two segments are created; both have an Execution Order of zero.



Example: Conference post card list with A/B split

Building the campaign structure for the event

Define the campaign structure:

- Name = Annual Conference
- Appeal = Save the Date postcard
- Solicitations = Creative A and Creative B

Attach the populated segments to the campaign:

- Select the job that contains the A/B split.
- Select a source code. The source code is attached automatically as the source list for the query.
- Select an insert and attach it to the source code.

Generating the output and the pick-up file

After the list and insert are attached, generate the output on the source code. This process will:

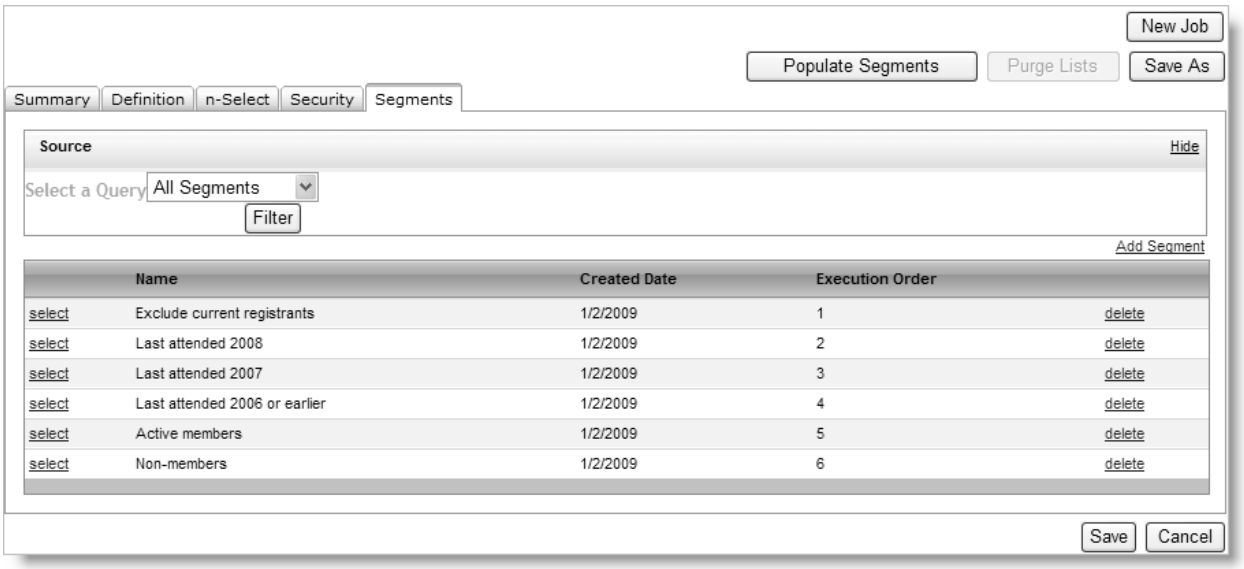
- Update the pie chart and metrics for non-responders
- Produce the output defined in the insert

Setting up the brochure mailing

The brochure mailing will use many different segments. Each segment will become a source code.

Annual Conference Full Brochure Mailing Past Attendees Last Attended 08
Last Attended 07
Last Attended 06 or earlier
Non-attendees Active Members
Non-members

Open the segmentation job for this mailing and click the Segments tab. Your display may look like the following example:



Example: Segments list

Set up six segments.

The first segment is called Exclude - Current Registrants. It includes a query that produces a list of people who are already registered for the conference. By creating this first segment, XYZ will be able to use this job repeatedly.

The Execution Order determines the order in which records will be selected. A loyal member has probably:

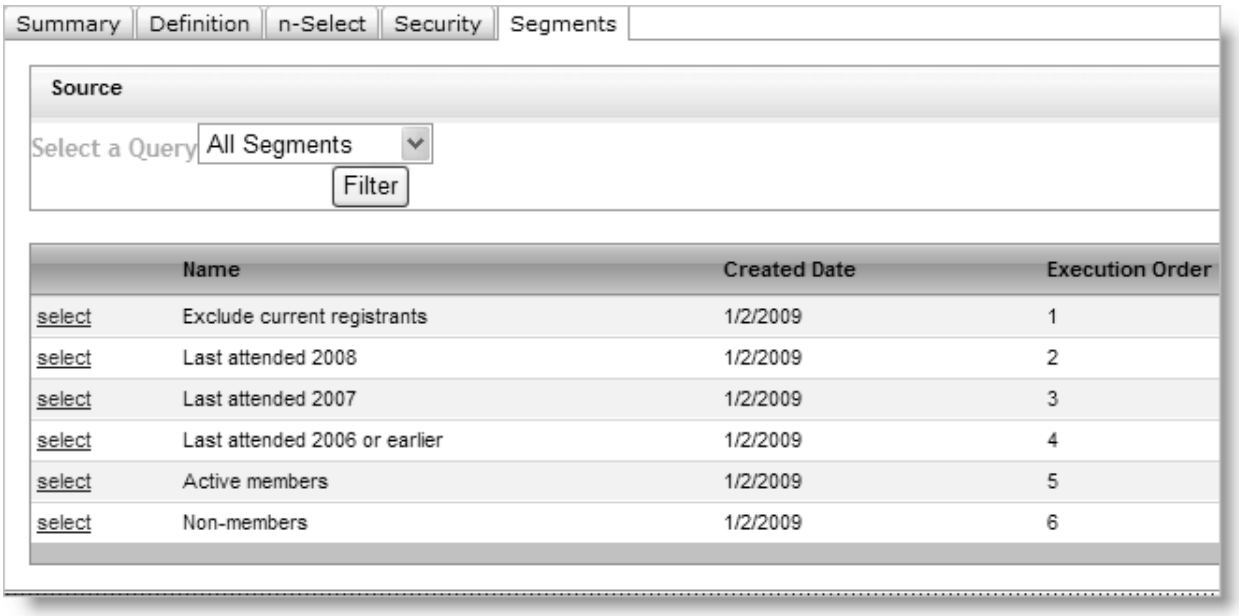
- Registered for this year's event
- Attended last year's and prior years
- Renewed their membership so they're an active member

Therefore, attach all of the segments to the job except the first. Duplicates in the file will be checked automatically to make sure that a record is only selected once.

- Select everyone who has registered for the event (don't mail them).
- Of the records left in the database, select everyone who registered last year. That segment is the first source code and are also the most likely people to respond this year
- Of the records left in the database, select everyone who registered the year before last. That segment is the second source code and are the second-most likely to respond this year
- Of the records left in the database, select everyone who attended two years ago. That segment is the third source code.
- Continue with the remaining segments.

Creating a segmentation job with all segment definitions

1. Add a new segmentation job.
2. Define the first segment by writing a simple query that defines who should be selected.
3. Define the remaining segments.
4. Assign each segment an execution order that determines the order in which to execute the duplicate checking process.
5. Populate the segments.



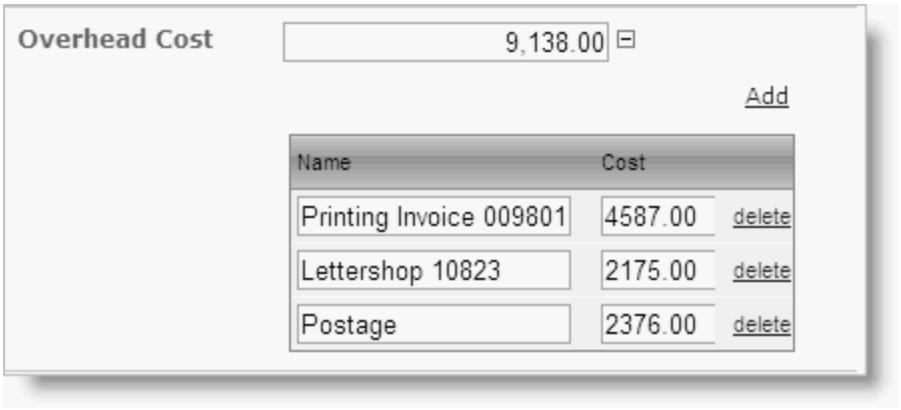
Adding to the campaign structure

- Campaign = Annual Conference
- Appeal = Full Conference Brochure
- Solicitations:
- Past attendees
- People who have never attended
- Source Codes (first mailing):
- Last attended last year
- Last attended two years ago
- Last attended three or more years ago
- Source Codes (second mailing):
- Never attended (members)
- Never attended (non-members)

Tracking costs for campaigns

To track costs at Appeal or Source Code level

1. Go to Campaign Management.
2. Click Show / Hide Appeals and open an appeal.
3. Go to the Profile tab and open the Overhead Cost panel.

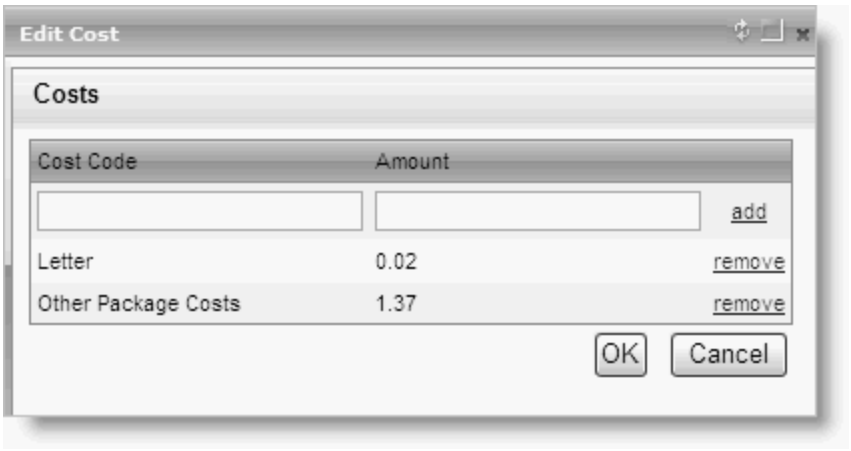


4. Add an additional cost and click Save.

   The overhead cost calculation increases.

To add cost to an insert

1. Go to Marketing > Inserts.
2. Open an Insert.
3. Click the … button next to Total.
4. Enter a value in the Cost Code and a cost per piece in the Amount.
5. Click add.



6. Click OK to save the values.

   Confirm that the Total on the Insert window now shows the sum of the values entered on the Costs pop-up.

   Sum of inserts

   Tips

- Operational costs should be tracked at the Appeal or Source Code. The choice of tracking overhead costs at the Appeal or Source Code level is made in Campaign Management > Set Up Module.
- Package costs include any items that are applied to the actual insert or package: Those are tracked with the insert costs.
- Overhead Costs refer to any cost that is applied to the mailing or marketing effort as a whole. These costs tend to be difficult to break down on an item by item or cost per piece basis. You want to be able to track the costs against the appeal as a whole rather than trying to break out the costs against different source codes. This is especially true when you have multiple source codes within a marketing effort.
- Some costs apply only to a particular Source Code or part of a marketing effort, such as list rental costs or the difference between different packages sent. Even if you choose to track overhead costs at the Appeal level in your Campaign Management > System Setup options, you still have the option to be able track those additional costs. They are tracked as part of the package attached to the source code.

About RFM Analytics

RFM Analytics is an analytical tool that provides rankings for your contacts based upon their financial participation with the organization. It is a very commonly used tool for fundraising, but its applications are not limited to the fundraising marketplace. Any organization that targets contacts based on past participation can benefit from RFM Analytics.

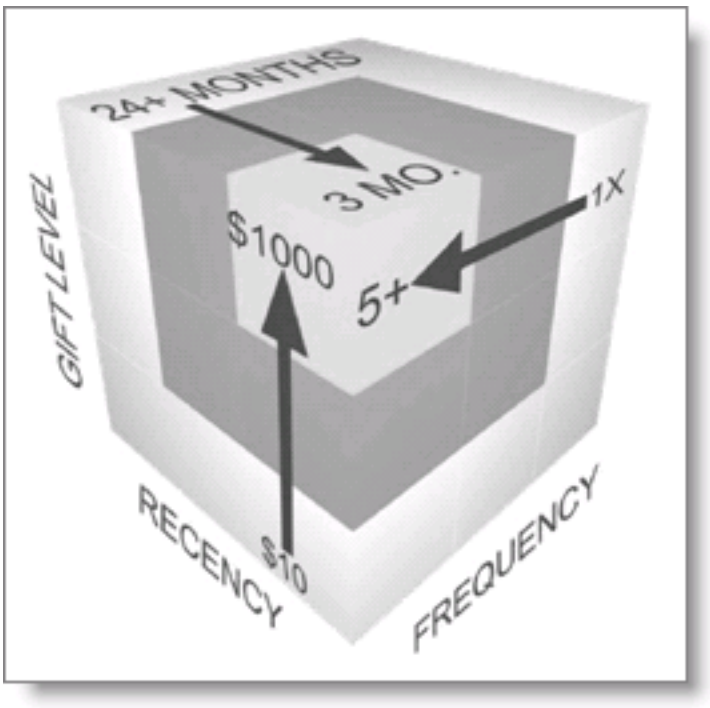
With RFM Analytics, you can:

- Rank and organize your customer population into specific groups manually or automatically.
- Define ranking scores for recency, frequency, monetary, combined (calculated), and total (calculated) values.
- Create groups, such as quintiles, that reflect the relative ranking of customers according to all RFM measurements.

- Analyze transaction patterns to accurately predict future behavior.
- Define different customer population and transaction queries to include in each analysis.

RFM Analytics relies upon three core elements that turn transactional data into a three-dimensional score based on:

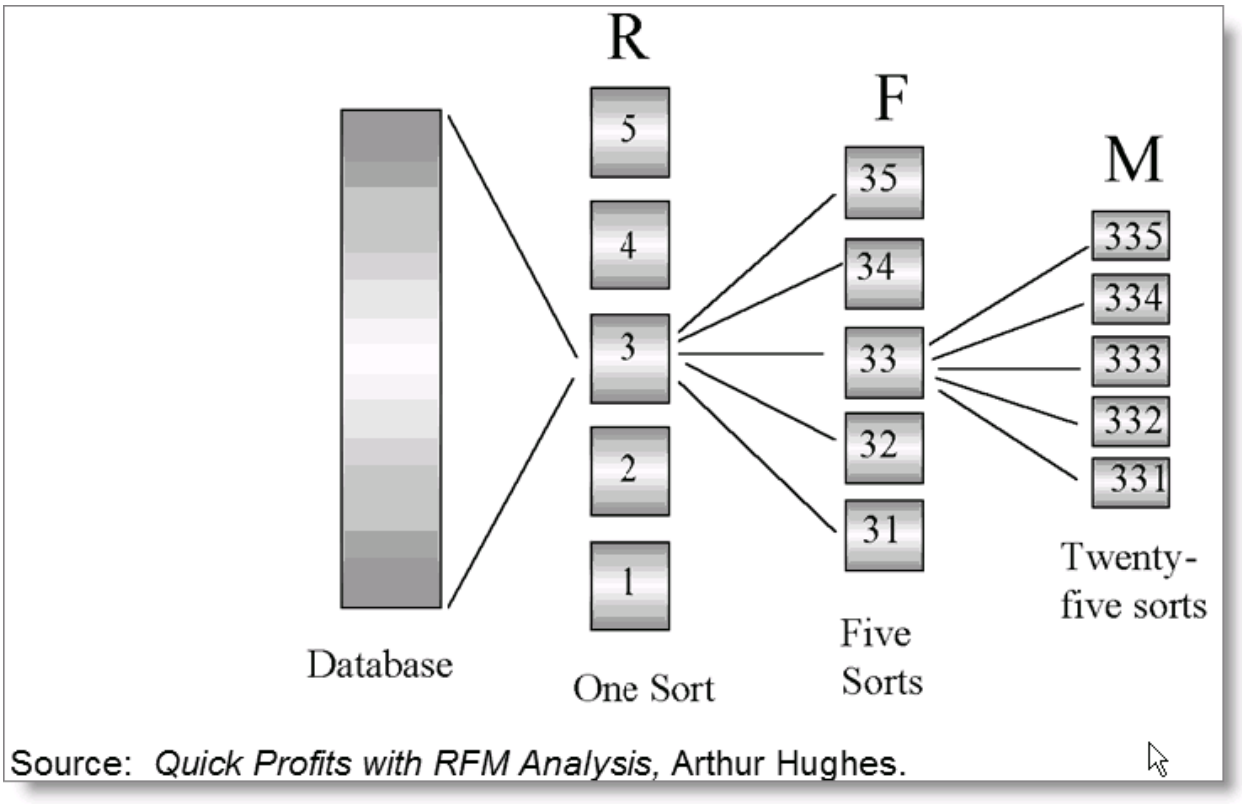
- Recency – How long since the last transaction?
- Frequency – How often does this transaction occur?
- Monetary Value – How much are these transactions worth?



RFM Analytics scoring

Rankings, once run, result in a score being assigned to each record. This score is important because ranks contacts/prospects within a matrix of highest to lowest values.

There are different schools of thought about how to use RFM scores. Some organizations use the total score (1+1+1 = 3). Others use the product of the score (1*1*1 = 1) and others use a concatenation of the scores (111).



Example RFM ranking

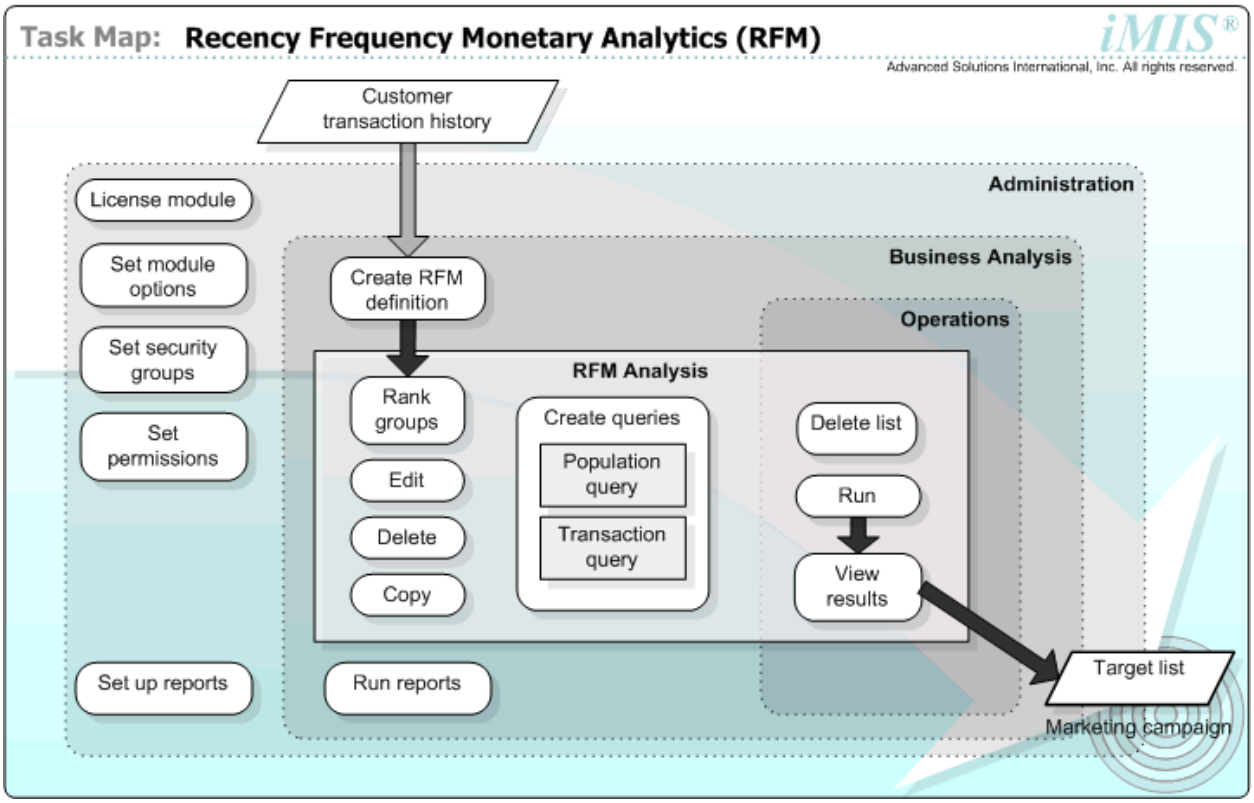
Tips for implementing RFM Analytics

- If you are running an RFM ranking for the first time, the automatic ranking might be able to help establish a first pass at quartiles or quintiles. However, make sure to review the results to see whether these rankings are correct for your organization. There is a danger in using and re-using automatic rankings for target marketing purposes. Automatic rankings will always produce equal buckets rather than telling you who is falling where based on typical transactional behaviors. After determining some basic highs and lows for each category, use the manual ranking to define those buckets and continue to evaluate the results.
- The key to successfully using RFM Analytics in any organization is having the patience to watch how people perform over a long period of time. Remember that anything can impact behavior and do not react immediately to changes. RFM buckets tend to remain stable.

- Build your queries separately. Do not use Save As to copy queries. There may be some unwanted criteria carried over from the original query.
- Make sure the transaction query Includes Quantity, Amount, and Transaction Date. These properties are used for the ranking. You can alias other properties if you wish, such as aliasing Date Received or Effective Date as the Transaction Date.

Task Map: RFM Analytics

This diagram illustrates RFM Analytics core tasks by the approximate order they occur (top-left to bottom-right) and by the organizational area that performs them.



Task Map: RFM Analytics

Example: Interpreting RFM rankings

The following example uses RFM rankings to identify prospects for a specific campaign.

Interpreting recency rankings

In this case, low values correspond to the most recent transactions.

Interpret these rankings as:

- 1 – Received within the last day
- 13 – Received from 2 to 13 days ago
- 25 – Received from 14 to 25 days ago
- 37 – Received from 26 to 37 days ago
- 49 – Received from 38 to 49 days ago
- 61 – Received from 50 to 61 days ago

Interpreting frequency rankings

Interpret these rankings as:

- 1 – Donated once
- 5 – Donated from 2 to 5 times
- 10 – Donated from 6 to 10 times
- 15 – Donated from 11 to 15 times
- 20 – Donated from 16 to 20 times
- 25 – Donated from 21 to 25 times

Interpreting monetary value rankings

Interpret these rankings as:

- 250 – Amount donated is 250 or less
- 500 – Amount donated is 251 to 500
- 750 – Amount donated is 501 to 750
- 1500 – Amount donated is 751 to 1500
- 2000 – Amount donated is 1501 to 2000

- 2500 – Amount donated is 2001 to 2500
- 3000 – Amount donated is 2501 to 3000

Creating RFM analysis definitions

RFM Analytics requires that two queries work together:

- Population query – Determines who will be analyzed
- Transaction query – Determines what will be analyzed (for example, date, quantity, amount)

Tips for creating RFM Analytics definitions

- You can copy and edit existing RFM definitions for efficiency.
- After you define the RFM analysis, you can run it repeatedly to create or update the list of segments generated.

Before you begin

Make sure the population query and transaction query are set up.

To create an analysis definition

1. From Marketing, select RFM Analytics.
2. From the New drop-down list, select RFM Definition.
3. Identify each RFM model with a unique name (duplicate names are allowed).
4. Determine whether ranges should be set automatically or manually:

- When setting ranges automatically, enter a value greater than zero for at least one range.
- When setting ranges manually, specify the Recency, Frequency, and Monetary ranges.

The query is saved to the default RFM Process Engine folder unless specified otherwise.

Ranking groups automatically

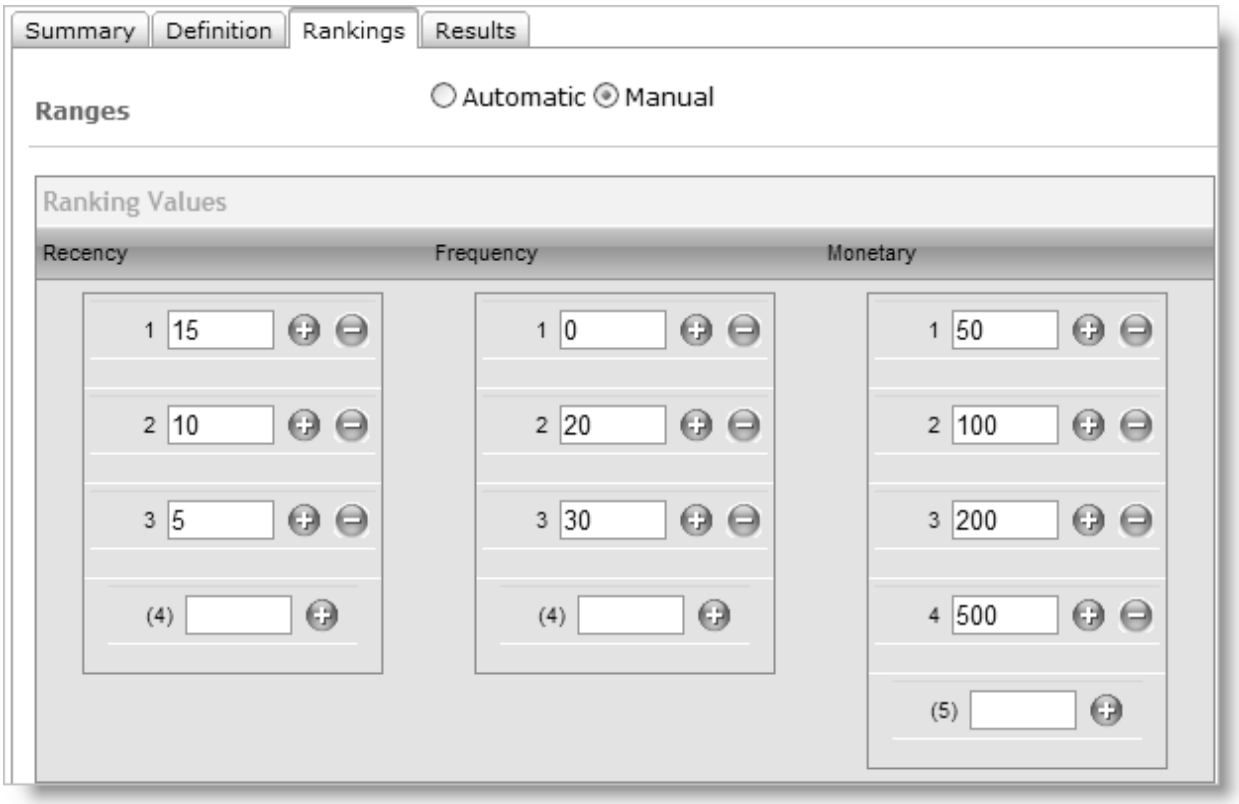
RFM Analytics divides the number of groups specified using the following procedure when groups are ranked automatically:

- Sorts lists based on criteria (Recency, Frequency, and Monetary)
- Divides the population equally into the specified number of groups
- Starts at the top of the list and ranks each contact based on the group
- Creates an equal number of contacts for each group:
- The lowest-numbered group corresponds to the least desirable ranking.
- The highest-numbered group corresponds to the most desirable ranking.
- The last group may contain a different number of contacts than the other groups depending on the population and number of groups.
- Some groups will be empty if the number of contacts is less than the number of groups.
- Two contacts with the same score may be placed in different groups.

Ranking groups manually

When ranking groups manually, you must enter criteria for each ranking group.

Note: When defining your manual rankings, you should use higher numbers for more desirable rankings and lower numbers for less desirable rankings to conform to industry standards for RFM rankings.



Example: Manually ranking RFM values

Recency

The criteria for ranking Recency is based on the last time the individual had contact with the organization. The date used is based on the Transaction Date specified in the Transaction Query. The following example illustrates how Recency is ranked:

- Group 1: >10 days and <=15 days, value = 15
- Group 2: >5 days and <=10 days, value = 10
- Group 3: <=5 days

Frequency

The criteria for ranking Frequency is based on the number of times the individual had contact with the organization. The value is calculated by the number of records for an individual in the Transaction Query. The following example illustrates how Frequency is ranked:

- Group 1: <20 times and >=0 times, value = 0
- Group 2: <30 times and >=20 times, value = 20
- Group 3: <50 times and >=30 times, value = 30
- Group 4: >=50 times, value = 50

Monetary

The criteria for ranking Monetary is based on the amount of money the individual has spent with the organization. The amount is based on the total amount from the Transaction Query. The following example illustrates how Monetary is ranked:

- Group 1: <0 and >=50, value = 50
- Group 2: <50 and >=100, value = 100
- Group 3: <100 and >=200, value = 200
- Group 4: >200 and >=500, value = 500

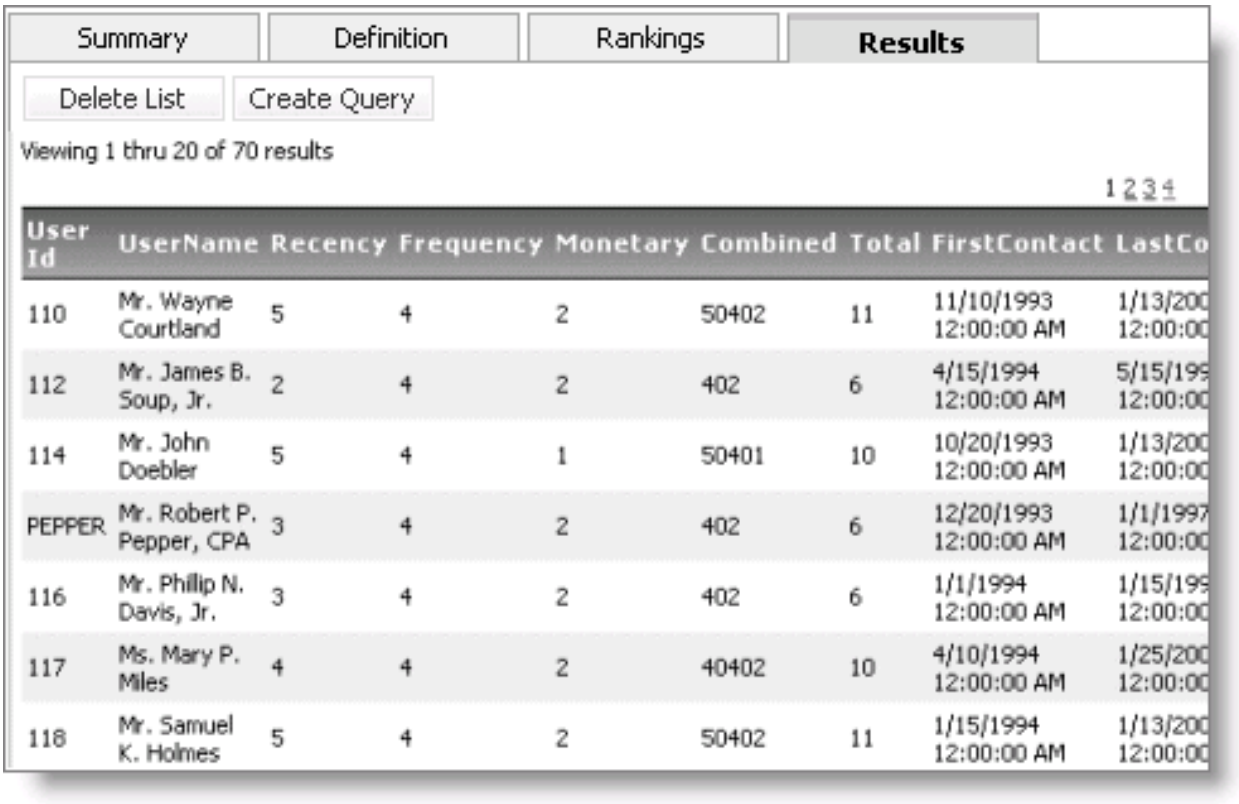
Generating and querying RFM analysis results

To generate and query RFM results

1. From Marketing, select RFM Analytics and open the RFM analysis definition.
2. Click Run.

   A status message displays on the Summary tab. If an error message such as "An error has occurred while generating Lists" appears, click on the message to see more details.
3. View the results on the Results tab.

   Your results may look similar to the following example:



User Id	UserName	Recency	Frequency	Monetary	Combined	Total	FirstContact	LastCo
110	Mr. Wayne Courtland	5	4	2	50402	11	11/10/1993 12:00:00 AM	1/13/200 12:00:00

To query the results of an RFM analysis

1. From Marketing, select RFM Analytics and open the RFM analysis definition.
2. Select contacts from the following RFM criteria:

- Recency ranking
- Frequency ranking
- Monetary ranking
- Combined ranking
- Total ranking
- First amount
- First amount date
- Last amount

- Last amount date
- Highest amount
- Highest amount date

3. To purge the results, select Delete List.
4. To create a query for use in Campaigns, select Create Query.

Using RFM Analytics with Segmentation

RFM rankings can be used as the basis for segmentation. Segmentation assists with targeting the market or the segment of the database who is most likely to respond to the marketing effort. For example, if your marketing department is trying to mail the company contact of their best conference attendees, they might look for:

- Recency going back 5 years
- Frequency of attendance being greater than ten times attending (because this would imply that at least two attendees from that company attended within those 5 years)

  and

- Value = to increments of conference registration because that's the value of their attendance (anyone with a value higher than that might have purchased books at the conference or made a donation above and beyond the registration fee).

  You can use the same ranking model against different groups or populations within your database to be able to make predictions and better target who is most likely to respond to a particular marketing effort. The RFM rankings may look the same, but the numbers within each rank may be quite different.

Example: Creating a fundraising campaign

In this example, the campaign manager for the Research Foundation wants to create a fundraising campaign. The Research Foundation, which researches human diseases and develops vaccines, is preparing for its annual Ride for Research fundraising event.

The Ride for Research event is a weekend-long bicycle ride that has been very successful in generating revenue and awareness for the foundation's research. To attract riders for this year's event, the foundation will conduct a direct-mail marketing campaign that targets past and potential riders.

Create the campaign

Define the campaign:

- Name: Ride for Research
- Campaign Code: 05RR
- Description: Our annual series of events that serve as our major outreach and awareness campaign. The series culminates in our annual bicycle ride.
- Campaign Type: Annual
- Status: Active
- Start Date: 03/01/2006
- End Date: 02/27/2007
- Predicted Response Rate: 14.00

Create the direct mail appeal

Define the direct mail appeal:

- Name: Direct Mail Appeal
- Description: Direct mail appeal to attract riders for the Ride for Research event.
- Status: Active
- Start Date: 04/01/2006
- End Date: 04/30/2006
- Predicted Response Rate: 11.00

Create the products monitored by the campaign

When a monitored product (product linked to the campaign at the appeal level) is purchased (or a donation is made), the response management feature of Campaign Management automatically captures the product sale, which then is used for monitoring and measuring the campaign's performance.

In the iMIS Events module, define the event:

- Event Code: 05RR
- Title: 2005 Ride for Research
- Status: A
- Begin Date: 02/26/2006
- End Date: 02/27/2006
- Maximum: 25000
- Fundraising Event: Enabled
- Entity Code: General Fund
- Campaign: 05RR

Define the Event Registration function:

- Function Code: REG
- Title: Event Registration
- Type: REG
- Status: A
- Begin Date: 02/26/2006
- Time: 7:00 AM
- End Date: 02/27/2006
- Time: 5:00 PM
- Description: Registration for the Ride for Research fundraising event.

- Maximum: 25000
- Automatic Option: Enabled
- Fees: 100.00 Regular
- Income Account: General Income

In the iMIS Orders module, create the Product category:

- Category: Product
- Description: Order Products
- Stock Item: Enabled
- Taxable: Enabled

Create the Ride for Research coffee mug product:

- Code: RR-MUG
- Category: Product
- Status: Active
- Title: 2005 Ride for Research Coffee Mug
- Pricing: 8.00 Regular
- Unit of Measure: Each
- Weight: .5
- Stock Item: Enabled
- Taxable: Enabled

Add the products to the direct mail appeal

Assign the monitored products (05RR and RR-MUG) to the campaign's Direct Mail Appeal.

Create the solicitation for riders

The marketing plan is to solicit all Research Foundation members to ride in the Ride for Research event.

Define the Solicitation for Riders:

- Name: Solicitation for Riders
- Description: Core solicitation with specific requests for participating in and sponsoring the Ride for Research event.
- Status: Active
- Reminder Date: 04/09/2006
- Start Date: 04/10/2006
- End Date: 04/17/2006
- Predicted Response Rate: 14.00

Create the source code package for potential riders

This source code package will be sent to all potential riders in the Ride for Research event.

Define the Riders source code:

- Code: Riders
- Description: Package to contacts for riding in the Ride for Research event.
- Status: Active
- Overhead Cost: CC_01 = Cost Code, 500 = Amount
- Predicted Response Rate: 14.00
- Target Revenue: 75000
- Source Code Type: Run Many
- List Member Type: Contact

Create the source list: All Contacts query

Create the inserts

Create the following inserts:

- 10" x 15" envelope
- Brochure
- Business return envelope
- Postage
- Registration form

Add the inserts to the source code

Add the following inserts to the Riders source code:

- ENV10X15
- BRCHR
- RTNENV
- POSTAGE
- RegForm

Communications and Reporting

Communications tools help you build messages to be sent to targeted contacts. In addition, you can run reports about a campaign or a portion of a campaign. These messages and reports are considered “output” and can be generated at any of the four campaign levels:

- Campaign
- Appeal
- Solicitation
- Source code

In addition, you can import and export source lists.

Lists with names can be imported into iMIS Acquisition Management. Campaign Management and Segmentation can query this list and generate lists from it. One of the most important considerations is being able to test against different list rentals. Therefore, it is important to have a testing model.

Lists without names can still be tracked in Campaign Management. At the source code level, assign the quantities included in the list rental. Track the list rental/purchase cost at the package level. Remember that the package will be attached to the source code. Different packages have different list costs, so it is important to apply the cost to the package to properly calculate the ROI.

Kill files

Kill files may be prepared to accompany marketing campaigns, particularly acquisition campaigns. To prevent redundancy, an organization should run a de-duping or merge/purge of their house file (the active names) within their iMIS database and the lists that they rent.

If your organization is using these files, prepare both a segmentation job and output file specific to kill files.

Setting up output processes

Output processes are the means to generate collateral for your campaign:

- Word Merge – Print a mail merge document
- Email Merge – Send an email message
- Campaign List Export – Generate a list to be sent to an external vendor for letter shopping or to contacts via listserv
- RFM Analytics – Rank records based on Recency, Frequency and Monetary Value
- Opportunity Process Engine – Generate projects/opportunities based on complex business rules or in response to a campaign.

You can generate output from a campaign, appeal, solicitation or source code. When you generate output from one level, such as an appeal, output for all of the components beneath it generates. For example:

- Appeal – generates output for all solicitations and source codes beneath it
- Solicitation – generates output for all source codes linked to it
- Source Code – generates output for that one source code only

Word merges and campaign list export files are stored inside Campaign Management after running. Use the View Output menu to see the results.

Tips for setting up output processes

- Throughout the Marketing Suite, NetContact is a required business object. Make sure that you include it in all of your queries, regardless of whether they are used as source lists for source codes or as output queries for an output process attached to a source code.
- Use templates for best efficiency. Some templates are designed through third-party packages which integrate with iMIS; for example, Microsoft Word documents, emails, and report files. Most output processes allow you to define and save the template while you build the process itself.
- Process Manager must be set up before running the opportunity output process.

Business goals

The process for generating output is:

1. Build the campaign structure first and define the source list (query, a previous solicitation, or a segmentation job).
2. Define an insert.
3. Customize the insert template, if necessary, for this specific need.
4. Attach the output process insert to one or more source codes.
5. Generate the output.

Seed lists for campaigns

A seed list is a list of the individuals within your organization concerned with the campaign. Seed lists are often used to confirm the mail date and to distribute samples internally.

Seed lists are often attached to campaigns but usually not to source codes so that the seed list is not included in the return on investment (ROI) calculations.

Queries for output processes

Using queries to generate output

When a process is run independently of Campaign Management, the process uses the query in its definition to determine the set of generated records. When the same process is executed as part of a campaign's output generation process, the set of records is determined by joining the query with the campaign's target list to form a subset of records. If the process's query does not have records in common with the target list, no output will be generated for that source code.

The source that you should use for the query depends on how you will use the output process.You must typically define two separate output processes for marketing inserts because source codes and job segments differentiate between contacts and prospects.

- Job segments are defined as a contact job or as a prospect job.
- Source codes are designated as a contact source codes or as a prospect source code.

So, to send marketing inserts to both your contacts and your prospects, you would need to create two different inserts:

- One insert must use an output process whose query source is the NetContact business object
- The other insert must use an output process whose query source is the Prospect business object.

Note: You should not use CSContact or CSProspect as the query source for any output process associated with marketing inserts. Use only the NetContact or the Prospect

business object as appropriate, depending on the associated source codes and job segments.

Setting up Marketing Suite

Licensing and installing

Follow standard iMIS procedures for licensing and installing Campaign Management.

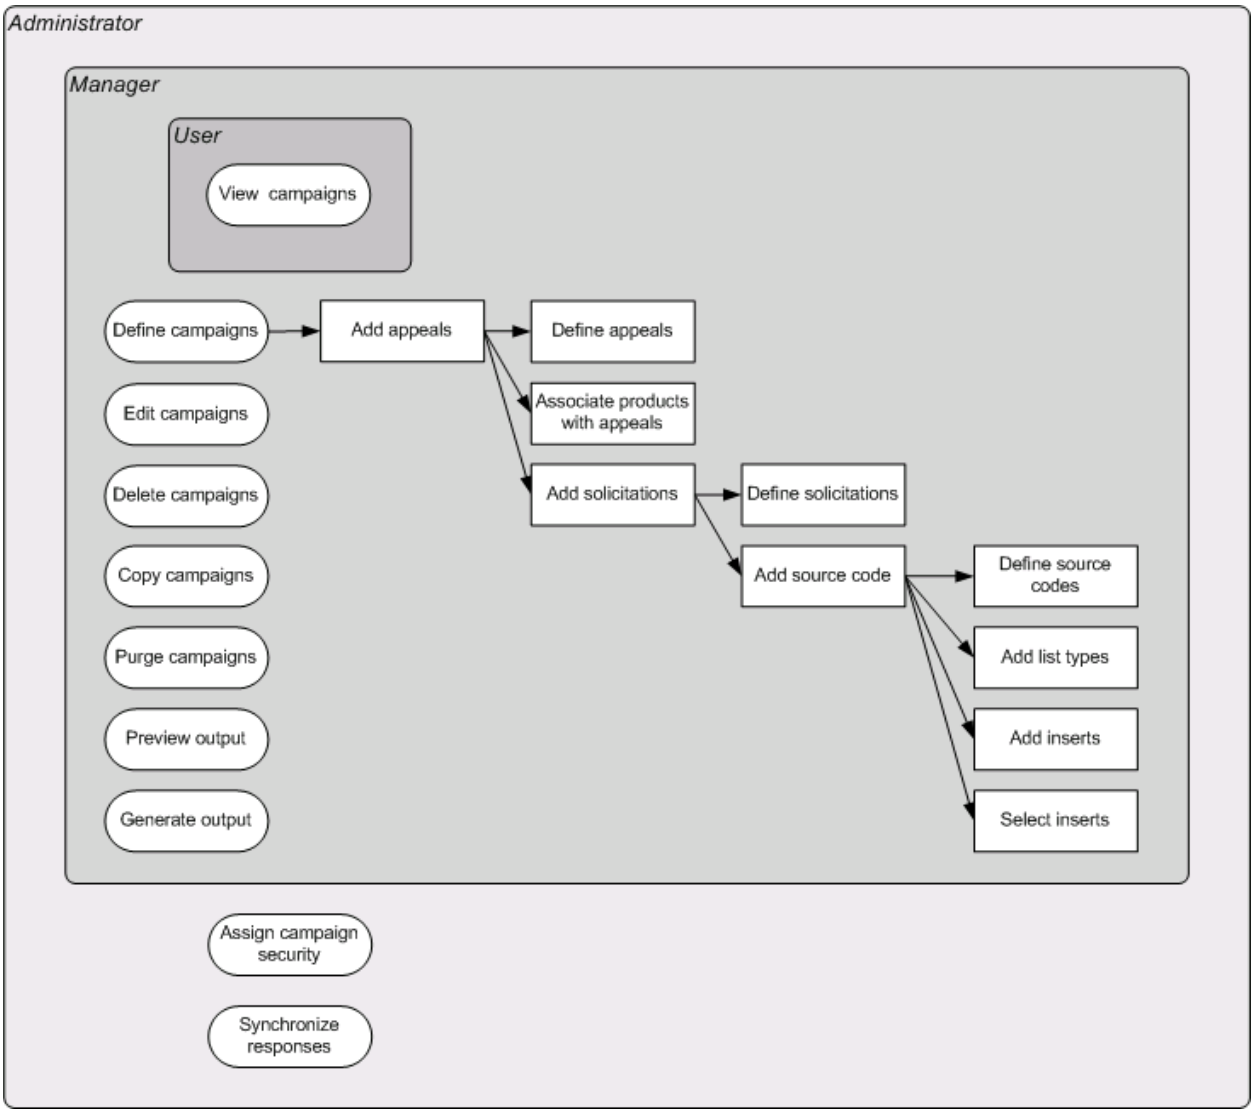
After installation, you must synchronize responses before other setup tasks. This initializes the database to recognize new product sales only so that the response reporting does not include previous sales.

Setting up security groups for campaigns

Security groups specify levels of access and control for users. Each user must have a record in the database before you can add them to a security group.

Campaign Management security groups

- CampaignAdmin: Has full control access for all campaigns.
- CampaignMgr: Has read, add, edit, and delete access for the module and read and edit access for all campaigns.
- CampaignUser: Has read-only access for campaigns.



Campaign tasks by security group

Segmentation security groups

- SegAdmin: Has full control access for all segment setup and segmentation jobs.
- SegMgr: Has read, add, edit, and delete access for all segments and jobs.
- SegUser: Has read-only access for segmentation jobs.

RFM Analytics security groups

- RFMAdmin: Has full control access for RFM Analysis setup and processes.
- RFMMgr: Has read, add, edit, and delete access for all analysis and reports.

- RFMUser: Has read-only access for reports.

To add users to security groups

1. From Marketing, select Set up campaign module > Security Groups tab, or Set up segmentation, or Set up RFM.
2. Select a security group.
3. Under Select New Members, search for and select the additional users.
4. Click Save.

Setting up reports and output processes

iMIS communications tools give you the power to optimize communications within your organization and with outside contacts. By using templates and pre-built reports, your staff can be productive immediately. They can generate reports and email messages, send Microsoft Word letters, and export data to Excel spreadsheets or other analysis tools without detailed knowledge of database structure or report configuration. See Communications and reporting for more information.

Setting up Campaign Management

Set up Campaign Management according to the method your organization uses to track and process data. These options apply to all campaigns. Use the Business Object Designer to track additional information that is important to your organization's marketing success.

Source code ID mode

This setting determines whether source codes will be generated manually or automatically.

- Manually – When enabled, the Manually-Assigned option governs the Set up module page's Source Code Name Format field and the source code Definition tab's Code field:
- The Source Code Name Format field is disabled.

- The Code field is editable until the source code is saved; once saved, the Code field cannot be edited.
- The Code field is blank when first creating a source code.
- You must enter a unique value in the Code field to save a source code.
- Automatically – When enabled, the Auto-Assigned option governs the Set up module page's Source Code Name Format field and the source code Definition tab's Code field:
- The Source Code Name Format field is enabled.
- The Code field is read-only.
- The Code field populates automatically with a unique value when saving a source code.

Tracking costs

You can track campaign costs by appeal or by source code.

Tracking by appeal – If the budget and costs are tracked at the appeal level:

- Total costs display at the campaign and appeal levels only.
- Users can view the Total Cost, Target Revenue, Predicted Response Rate, and ROI for a campaign.
- Users can enter and edit the Overhead Cost, Target Revenue, and Predicted Response Rate for an appeal.
- Users cannot view or edit costs for a solicitation or source code.
- Users can enter costs for an insert, but these costs are ignored in the campaign and appeal cost calculations.

Tracking by source code – If the budget and costs are tracked at the source code level:

- Users can view the Total Cost (estimated or actual), Target Revenue, Predicted Response Rate, and ROI for a campaign, appeal, or solicitation.
- Users can edit the Overhead Cost, Target Revenue, and Predicted Response Rate for a source code.

- Users can view the Total Cost (estimated or actual) for a source code.
- Users can enter costs for inserts, which are used for cost calculations.
- The Summary tab for a campaign, appeal, solicitation, and source code display Estimated Cost until output is generated. After generating output, Actual Cost displays. (For a campaign, appeal, or solicitation, the Summary tab displays the Actual Cost if output has been generated for any child source codes; otherwise, Estimated Cost displays.)
- The Calculate Estimated Costs button displays on the campaign, appeal, solicitation, and source code portfolio pages.

  About auto-map source codes when retrieving responses

  If selected, this setting automatically maps source codes to orders, gifts, and pledges if a source code is not provided when synchronizing responses. The source code is obtained from iMIS Events, Orders, or Fundraising.

  If the setting is not selected, iMIS does not recognize responses if an order, gift, or pledge does not have an associated source code.

  Note: This feature applies only if one or more products are associated with an appeal.

  To set Campaign Management options

1. From Marketing, select Set up campaign module > Options tab.
2. Enable the desired options:

- Choose the Source Code ID Mode: Manually-Assigned or Auto-Assigned.
- If Auto-Assigned is enabled, enter the Source Code Name Format.
- Choose the Budget Level: Appeal or Source Code.
- Check to select Auto-map source codes when retrieving responses.

3. (optional) Enter the Opt Out URL and the Opt Out Key which can be used when editing an email template (see "Defining output processes") for customers who want to be removed

from a mailing list.

4. Click Save.

Understanding opt-out configuration

Sometimes people want to be removed from a campaign mailing list. This action is called opting out. Campaign managers want to know the number of people who opt out of a campaign and which source code is related to the opt-out action.

Understanding the tracking of opt-outs helps you analyze the campaign's effectiveness. Opt-outs are tracked from the originating source code so that your campaign manager knows the source code that caused the opt-out action.

Two settings and inserting code into an email template control the opt out configuration:

- Marketing > Set up module > Opt Out Url field points to a special opt out page, such as http://www.domainname.org/iMIS/OptOut.aspx. When the person clicks on the link in the email containing the Opt Out code, they are taken to this page. The page can contain instructions for choosing to be removed from the list, or request further information for why the message caused the email recipient to choose to be removed.
- Marketing > Set up module> Opt Out Key field contains %OPTOUTURL% by default. This field contains the code that you insert into the email template in the HTML code. You could change it to %REMOVEME% or another variable name, but you must be sure to change the code in the email templates that use the Opt Out Key in them.

  When you create an email merge template, use HTML, not plain text, and use %OPTOUTURL% for the URL for the link. For example, add the text, "If you want to be removed from our campaign, click here." Highlight "click here" and insert a link. Enter %OPTOUTURL% as the URL and choose Other as the Type.

  Using this email merge, generate output from a source code. The email messages are generated and sent.

  When an email recipient clicks the "click here" link in the campaign email, they go to the URL for the Opt Out Url page configured in iMIS Marketing > Set up module.

If you have more than one source code in one campaign that solicits the same prospect, opting-out for any one source code should opt-out all source codes in the campaign that have solicited that prospect. In addition, iMIS discontinues all further campaign appeals, solicitations, and source codes for that prospect, even those that are created after the opt-out. In short, any future lists automatically exclude that contact from being selected again.

For example, when you look at the Record Responses area and look up an ID, you see every source code the person with that ID is being solicited for. If a member is solicited by two different source codes within the same campaign, they are shown as opted-out of both campaigns.

Solicited and unsolicited responses

The definition of a solicited response is twofold. One definition is an order (product, event, fundraising) or opportunity that has a source code associated with it and the primary contact (or BT_ID) has been solicited for the source code. The other definition is associated with an order that contains no source code but does contain a product that is associated with an appeal and the primary contact (BT_ID) has been solicited for a source code within the appeal. For the second definition to be recognized as a response, automatic source code mapping must be enabled. Opportunities that do not reference a source code are not calculated as a response.

The definition of an unsolicited response is also twofold. One definition is an order (product, event, fundraising) that has a source code associated with it and the primary contact (BT_ID) was not solicited for the course code. The second definition is an order that contains no source code but does contain a product that is associated with an appeal, but the primary contact (BT_ID) has not been solicited for any source codes within the appeal. For the second definition to be recognized as a response, automatic mapping of source codes must be enabled. Auto-mapping of unsolicited responses is not a perfect implementation.

The begin and end dates of the source code, solicitation, appeal, and campaign are ignored when recognizing responses for both explicit or indirect responses. This design

means that an order generated past the campaign end date still generates a response to the campaign.

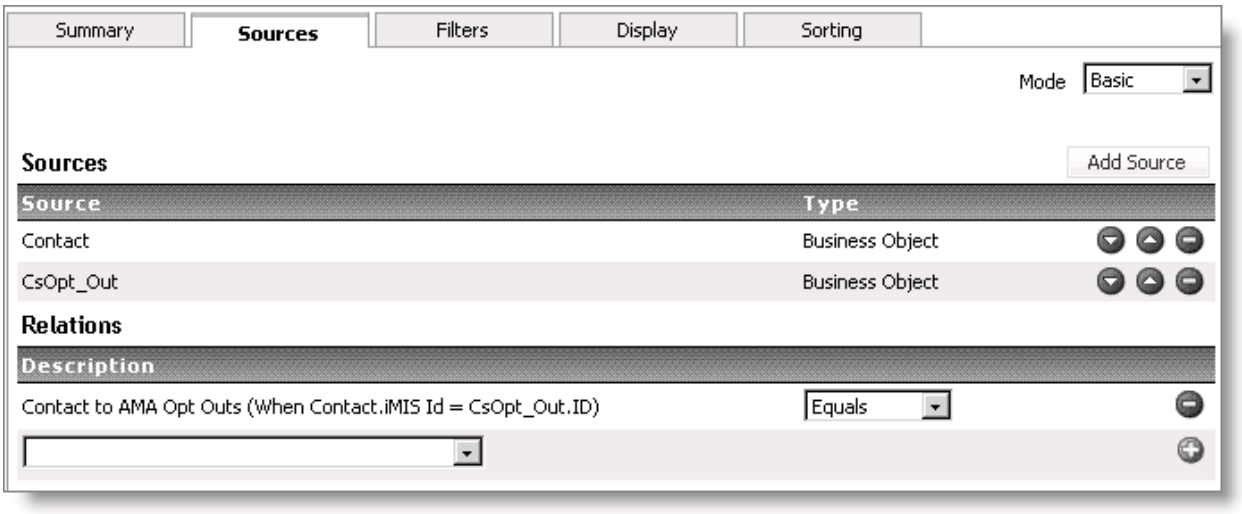
Events and responses

Responses are created as one response per order or event registration. A single event registration for ten contacts would be recorded as a single response.

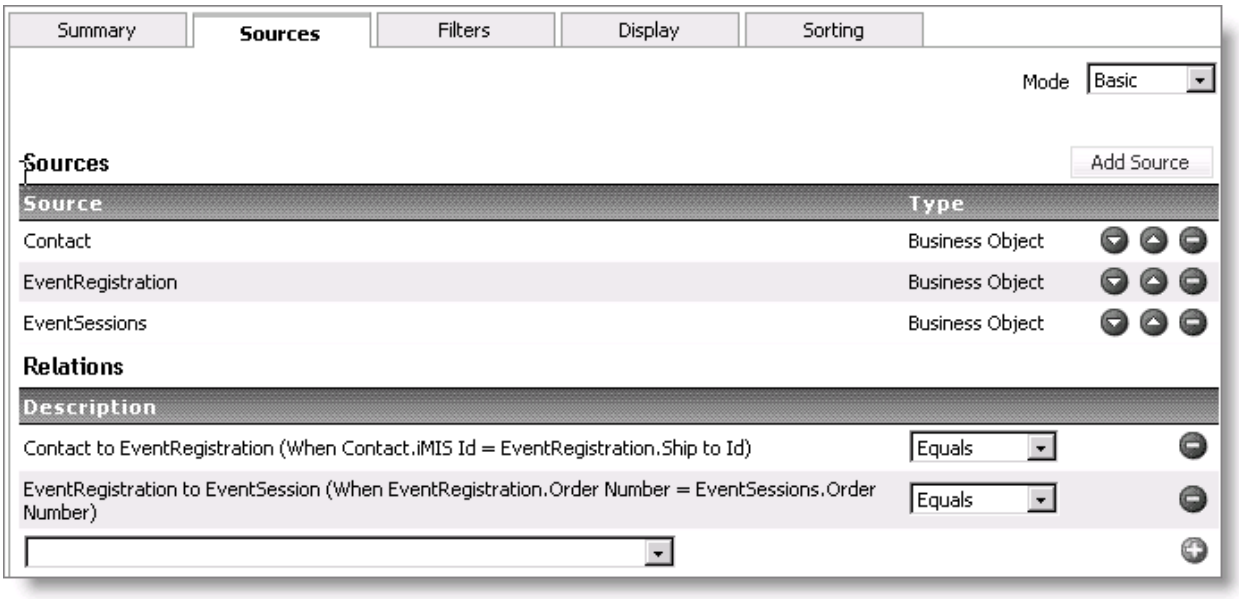
Example: Segmentation queries for RFM analysis

The following example illustrates queries for segmentation and RFM analysis.

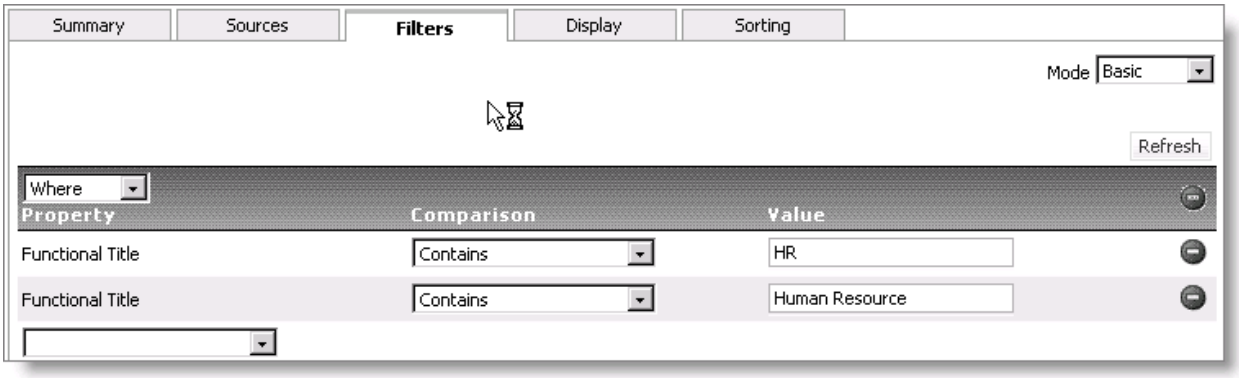
1. In IQA, create the segment queries.
2. Write a query to suppress Opt Out responses. For example:



3. Write the query for a Segment Definition 1. This segment includes anyone who has purchased seminar 6515 this year.



4. Write the query for Segment Definition 2. This segment includes HR Professionals.



5. Create the job. The job is a container for all of the segments to be run.

- Create the first segment: Suppress query - Catalog opt outs
- Add the remaining segments.

6. Populate the segments.

Membership

Your Advanced Accounting Console includes a Membership page with quick access to often-used features. Membership and dues are vital to your organization. From here, you can manage your chapters and committees, bill membership fees, managed expired members, manage accrual dues, and enter and edit payments.

The license key needed for this area is:

- Membership (MEMBERSHIP)

Managing chapters

From the Chapters window you have full access to all chapter data maintenance, inquiry, and reporting functions. This access enables you to do the following:

- Activate and view chapter rosters of current, past, or future enrollees
- Maintain a list of enrollees and their terms
- Print a detailed roster of current, future, or past chapter enrollees
- Maintain the tables of chapter codes

To assign a member to a chapter

To add a member to a chapter, you need their customer ID and the code for the chapter to which you are adding the member. Before you can enter lists of chapter enrollees, you must define chapter codes on the Chapters window.

1. From Chapters window, select the chapter from the Chapters scrolling list to which you want to add the member.
2. Click New.
3. Enter the member's Id, or click the lookup icon to select an ID.
4. Select the appropriate enrollment Term.
5. (optional) Enter the From and Thru dates of the enrollment period.

Note: When you enter the From date and press Tab, iMIS automatically populates the Thru field with a date one full year from the From date. You can override this value.

6. Click Save.

To edit a chapter enrollment

After a member has been assigned to a chapter, you can only change the From and Thru date of the members' enrollment term.

1. From Chapters window, select the chapter from the Chapters list and the enrollment Term option to which the member was assigned. The members listed in the roster area will change based on the enrollment Term option selected.
2. Select the record from the roster.
3. Click Edit.
4. Make your changes.
5. Click Save.

To delete a chapter enrollment

1. From Chapters window, select the chapter from the Chapters scrolling list and a term selection that includes the record.
2. Select the record from the roster.
3. Click Delete. A message displays prompting you to confirm the deletion.
4. Click Yes.

Running Chapter reports

When you click the Print button on the Chapters window, the Chapter Reports window opens. From this window, you can access five Chapter Management subsystem report types:

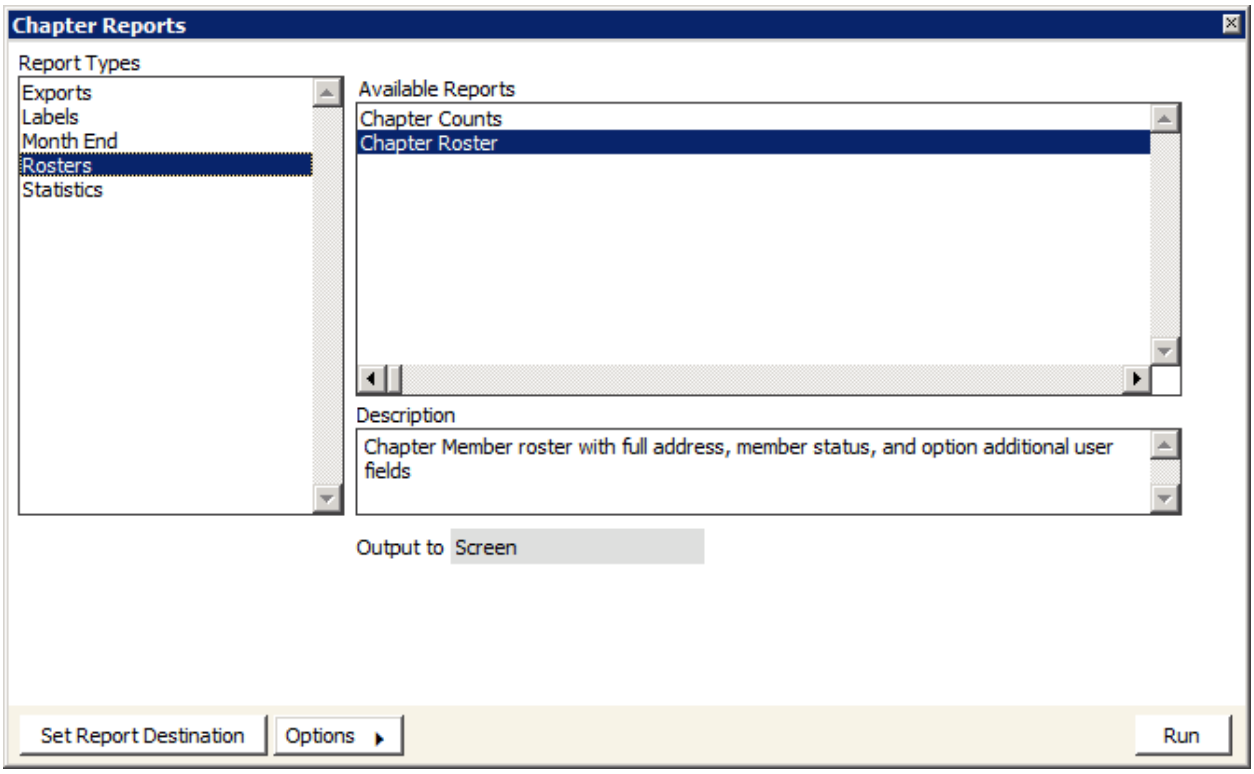
- Exports
- Labels

- Month End
- Rosters
- Statistics

To run a chapter report

Before running a standard report, check your printer destination.

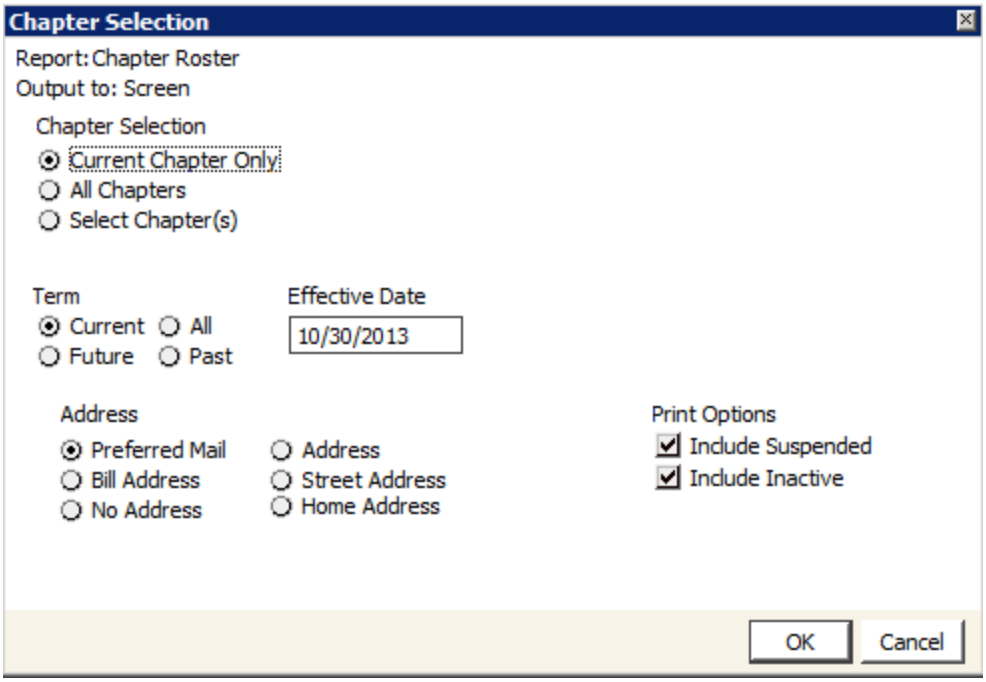
1. From the Chapters window, click Print to open the Chapter Reports window.



2. From Report Types, select a report type.
3. From Available Reports, select a report.

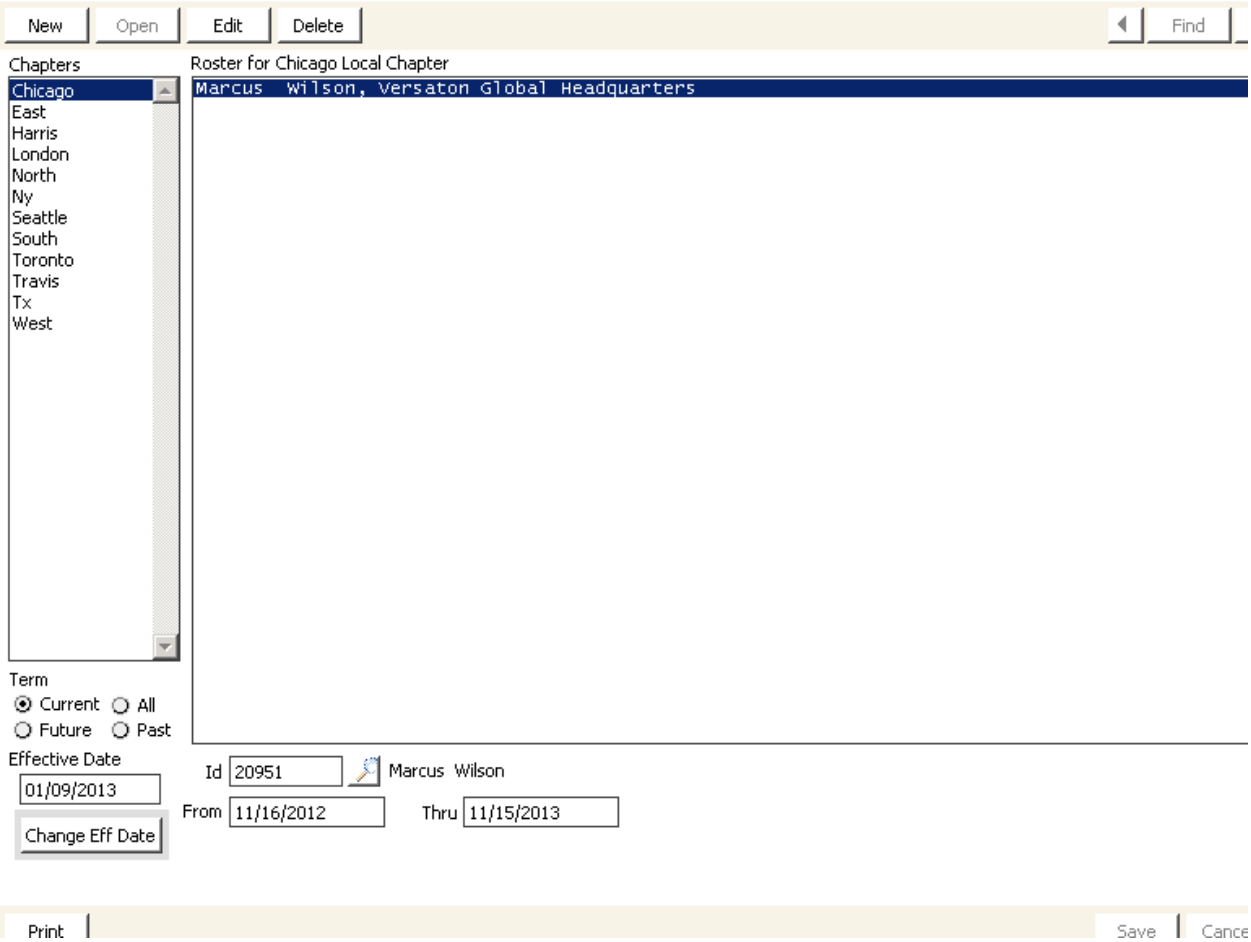
   Note: Check the description of the report in the Description field at the bottom of the window.

4. Click Run. The Chapter Selection window opens.



5. (optional) Select your print options.
6. Click OK.

Chapters window



Membership > Chapters

Chapters

Lists the chapters.

Roster for

Displays the members enrolled in the selected chapter for the selected term.

Term

- Current – Enable to display only those members who have terms that include the date displayed in the Effective Date field. The From date must be on or before this date and the Thru date must be on or after this date.

- All – Enable to display in the roster, all members who have served, are serving, or will be a member of the chapter.
- Future – Enable to display only those members whose term beings in the future (the From date is after the Effective Date).
- Past – Enable to display only those members whose terms have expired (the Thru date is before the Effective Date).

  Effective Date

  Displays the date upon which the radio button selections are based. Defaults to the current system date.

  Change Eff Date

  Enables edit of the Effective Date field.

  Id

  Specifies the member's ID number, or click the lookup icon to select an ID. When you enter the ID, the member's full name displays to the right of the field.

  From

  Specifies the start date of the enrollment term.

  Thru

  Specifies the end date of the enrollment term.

  Print

  Opens the Chapter Reports window where you can export chapter membership data as well as print rosters and a month-end report based on chapter enrollments, statistical reports, and labels.

Managing committees

The Committees window enables you to assign customers to a committee, edit their assignments, delete assignees, and report this information to other committee members.

This window also enables you to enter and track applicants and proposed committee members in advance of actual appointments being made. You can also track committee members, their respective terms, and the positions they have held.

The Committees window gives you full access to all committee data maintenance, inquiry, and reporting functions, enabling you to do the following:

- View committee rosters of past, current, and future members
- Maintain a list of members and their positions and terms
- Maintain a list of committee applicants and proposed members
- Create and store minutes on any committee meeting or activity
- Print a detailed roster of past, current, and future committee members and applicants
- Print personalized letters to any committee grouping
- Print labels for any committee list
- Maintain the tables of committee codes and positions

To assign a member to a committee

To add a member to a committee, you need the following information:

- Customer ID
- Code for the position in which the member will serve
- Date range for the appointed term

1. From the Committees window, select the committee from the Group list that you want the member to join.
2. Select the appropriate committee Type by enabling one of the following options:

- Committee
- Proposed

- Applicants
- Show All

  For example, if you want to add applicants instead of actual committee members, enable the Applicants option before entering the applicant. Otherwise, iMIS assumes you want to enter an appointee.

3. Click New. Your insertion point moves to the ID field.
4. Enter the customer ID of the appointee, or click the lookup icon to select an available value.
5. (optional) Enable the No Mail option to exclude the given appointee from committee-specific label runs.
6. Enter the appointee's position code in the Position field or click the lookup icon to select an available value.
7. Enter the start date of the appointee's committee term in the From field.
8. (optional) Enter the ending date of the appointee's committee term. If the default committee duration has been defined by your administrator, you can keep or override this value.
9. Enter any additional information you want to record for the appointee in the Notes field.
10. Click Save.

    To edit a committee appointment

    In the Committees window, you can edit any information on a particular appointee except:

- The committee to which the member record is assigned
- The ID associated with the record

  If either the committee or the customer ID is wrong, delete the existing record and insert a new record containing the correct information.

1. From the Committees window, select the committee from the Group list (including any necessary filtering selections). Make sure you include an enrollment Term that includes the member's record.
2. Highlight the customer record in the list of committee appointees.
3. Click Edit.
4. Make any necessary changes.
5. Click Save.

To delete an appointee from a committee

1. From the Committees window, select the committee from the Group list. Make sure you include an enrollment Term selection that includes the customer's record.
2. Highlight the customer record in the list of committee appointees.
3. Click Delete. A system message prompts you to verify the deletion of the selected record.
4. Click Yes.

To change a committee appointment type

After preliminary or final appointment selections have been made, you can change the appointee's status as necessary.

1. From the Committees window, select the committee from the Group list (including any necessary filtering selections). Make sure you include an enrollment Term that includes the customer's record.
2. Highlight the customer record in the list of committee appointees.
3. Select More on the Committees window to display a menu of maintenance choices.
4. Select one of the following options:

- Move to Committee to change the member to a permanent appointee
- Move to Proposed to change the member to a proposed appointee

- Move to Applicant to reassign a member to an applicant

  A warning message box is displayed.

5. Click Yes.

   To insert committee minutes

1. From the Committees window, select the committee from the Group list.
2. Click More, and select Minutes.
3. Click New.

   Note: The cursor moves to the Date field and automatically populates it with the current date.

4. Enter the date for which you want the minutes to be recorded in the Date field.
5. Enter the minutes of the committee meeting in the Minutes field.
6. Click Save.

   Note: Recorded minutes are listed by date.

   To print committee minutes

1. From the Committees window, select the committee from the Group list.
2. Click More, and select Minutes.
3. Select the minutes to be printed from the list of minutes.
4. Click Print.

Running Committee reports

There are three Committee report types:

- Committee
- Proposed
- Applicant

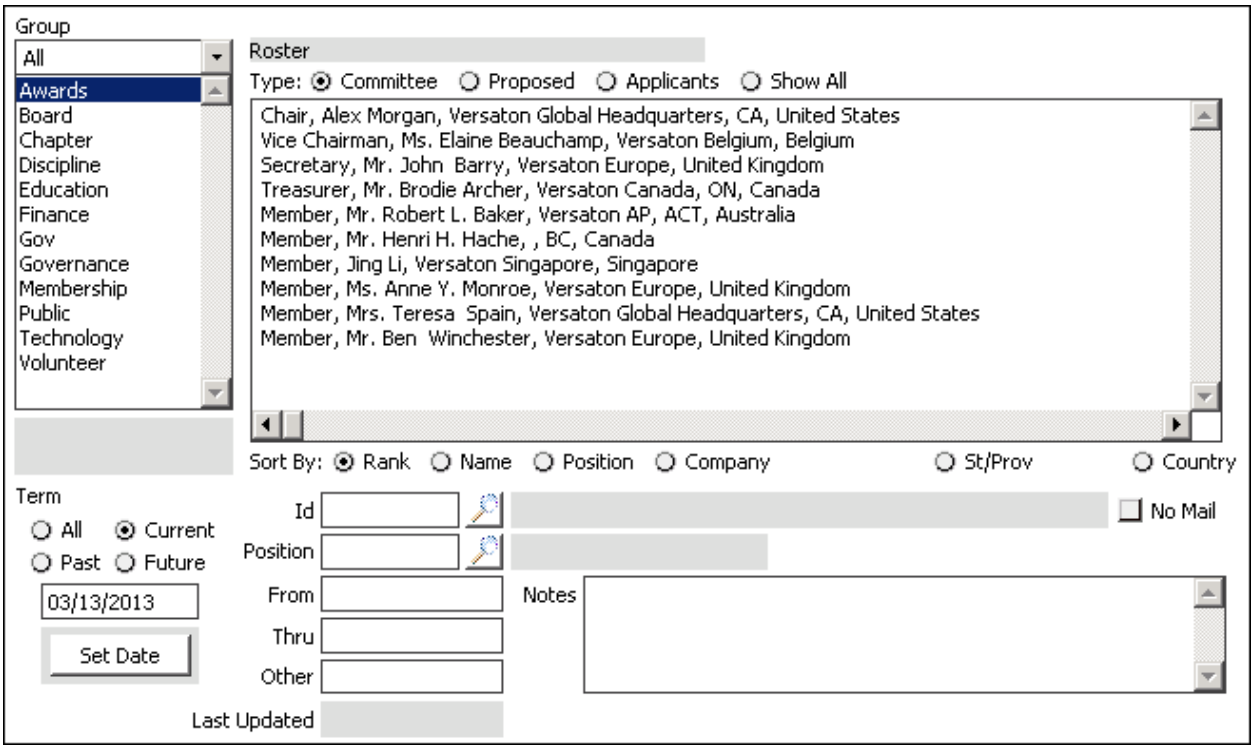
The print dialog box lets you customize your reports by selecting various committees, positions, and terms in the search.

To print committee reports

1. From the Committees window, select the committee, and click Print to open the Committee Reports window.
2. From Report Types, select a report type.
3. From Available Reports, select a report format.
4. Click Run to open the Committee Selection window.
5. Select the committee options that you want your report to contain.

   Note: The options available vary depending on the type of report selected.
6. Click OK.

Committees window



Membership > Committees

Filter by Co ID

The Filter by Co ID option is visible only if enabled during system setup. Although rarely used, this feature enables you to link a committee to the ID of a company record. For example, if you have set up a committee named Awards, and a company has 25 branches and each branch has an Awards committee, you normally would need to create 25 separate Awards committees with each having a slightly different name. Instead, you create 25 company name records that represent your branches.

With Filter by Co ID enabled, you can open the Awards committee and set the filter to work with only one of the 25 branches. A Find window will open so you can locate the company ID to filter by.

Group

The Group field is a drop-down list that enables you to view either all committees or committees that have been assigned to a specific group.

Committees

The Committees field displays the current list of the committee codes that have been defined in the Committee Codes window.

Type

Designates one of the following display filters:

- Committee – All committee members are displayed.
- Proposed – Proposed committee members are displayed.
- Applicants – Committee applicants are displayed.
- Show All – Committee members, proposed members, and applicants are displayed.

Roster

The Roster field displays the currently selected committee's member list (affected by Type and Term choices).

Sort By

Designates one of the following sort orders:

- Rank – Sorts members by the rank assigned to their positions in the Committee Positions window.
- Name – Sorts members alphabetically by last name.
- Position – Sorts members alphabetically by position title.
- Company – Sorts members alphabetically by company name.
- St/Prov – Sorts by the member's Name.STATE_PROVINCE, then Name.LAST_FIRST, both in alphabetic ascending order (A-Z, a-z).

  Note: The State/Province radio button will be labeled according to the value set up in Customer Setup – Address and Notes > State/Province.
- Country – Sorts by the member's Name.COUNTRY, then Name.STATE_PROVINCE, then Name.LAST_FIRST, all three in alphabetic ascending order (A-Z, a-z).

  Term

  Designates on of the following term filters:
- All – Displays all members who have served, are serving, or will be serving on the committee.
- Current – Displays only those members who are currently serving on the committee.
- Past – Displays only those members whose terms have concluded.
- Future – Displays only those members whose terms begin in the future.

  Set Date

  Activates the date field by which member terms are evaluated (date defaults to the current system date).

  ID

  Designates the ID of the currently selected or added member.

  No Mail

Exempts the committee member from committee-specific label runs.

Position

Designates the position the member holds in the selected committee.

From

(required) Designates the start of the member's committee term.

Thru

Designates the end of the committee member's term. It defaults to the specified Default Duration (usually 12 months) after the From date.

Other

Designates a user-defined value corresponding to the type or category of educational credit awarded the member, if applicable. The value specified is displayed in the bottom of the member's Activity Detail window if your administrator has defined a prompt for the CEU Type field for the COMMITTEE activity type.

Last Updated

(read only) Shows the last date the record was updated.

Preference

Indicates an order of preference expressed by applicants for more than one committee position. For example, if an applicant wants to be President of a committee but has a second choice of Vice President, create two committee records for the applicant. The first record would have a position of President and a preference of 1. The second record would have a position of Treasurer and a preference of 2. This field is only displayed when Proposed or Applicants is enabled.

Notes

Specifies notes about the individual.

Print

Opens the Committee Reports window from which you can print committee reports.

More

Opens a menu of maintenance choices:

- Minutes – Opens the Minutes window where you can maintain minutes for the active committee. Minutes are accessed by the date that they were stored. You can open the minutes for any meeting and view or transfer them to a letter, report, or other area for printing. You can open an existing minute's entry to work from or to insert a new set of minutes. Each entry consists of the date and the text of the minutes. All standard data maintenance procedures apply.
- Committee Codes – Opens the Committee Codes window where you can add, edit, and delete committee codes.
- Committee Positions – Opens the Committee Positions window where you add, edit, delete, and assign the rank for committee positions.
- Move to 'Committee' – Assigns the currently selected individual to the currently selected committee as a member.
- Move to 'Proposed' – Assigns the currently selected individual to the currently selected committee as a proposed member.
- Move to 'Applicant' – Assigns the currently selected individual to the currently selected committee as an applicant.
- Check 'Paid Thru' – Checks the currently selected individual's name and linked chapter or area with that chapter's paid thru date. If the selected individual is not linked to any chapter or area, iMIS displays a prompt to notify you.

Entering payments

As you enter a payment, iMIS automatically completes the following tasks:

- Updates the product open item (if any)
- Moves the Paid Thru date forward by a preset period (when paid in full)
- Creates the proper activity/history records

> **Note:** Note: For more on batch control, see Accounts Receivable and Cash Receipts Overview.

Entering a full payment

You can apply full payments to the open balance line items in product payment priority order.

To enter a billing payment

1. From the Payments window, click New.
2. (optional) If batch control is enabled, select or create a new batch for the payment transaction. Close the Open Batches window.
3. Enter the customer ID. If you do not know the customer ID, select the lookup icon in the ID field to look up the customer in the database. The window displays any line items associated with the customer ID and the total outstanding balance.
4. Enter the Source Code that prompted this payment and press Tab.
5. Enter the check number or credit/debit card code and press Tab. For credit/debit cards, enter the required card information.
6. Enter the amount of the payment in the Pay Amount field and press Tab.

   The payment amount is applied automatically to each open line item, beginning with the main customer dues product. As full payment is applied to a line item, the Paid Thru date field advances to the end of the bill term or beyond.

   Note: Complimentary or zero dollar items can be denoted by an asterisk (*) on the Payments window. The Paid Thru date advancement for complimentary billing items billed through Create Invoice follows the rule established by the billing cycle that is selected on the Bill membership fees window. To update the Paid Thru date for zero dollar items, double-click the line item.
7. Click Save. Verify that the payment information is updated on the Billing tab.

   To apply payment to a different line item

The Payments window automatically applies the lump sum amount paid to the open balance line items in product payment priority order. Occasionally, the payment may need to be applied to line items other than the ones the payment window automatically selects. To apply a dues payment to a different line item, perform the following:

1. From the Payments window, click New.
2. Enter the customer ID and press Tab.
3. Enter the payment information. The payment amount is applied automatically to the open (positive) line items according to the payment priority rankings assigned to each product code (from lowest to highest). In the following example, iMIS applied $20 to the Journal Subscription.
4. Double-click the line item to remove the amount paid (in this example, the Journal Subscription line item). You can manually override the amount applied to a line item by selecting the line and entering the desired amount in the Amt Paid field.
5. Double-click the line item where the payment should be applied (for example, PAC Contribution).
6. Click Save.

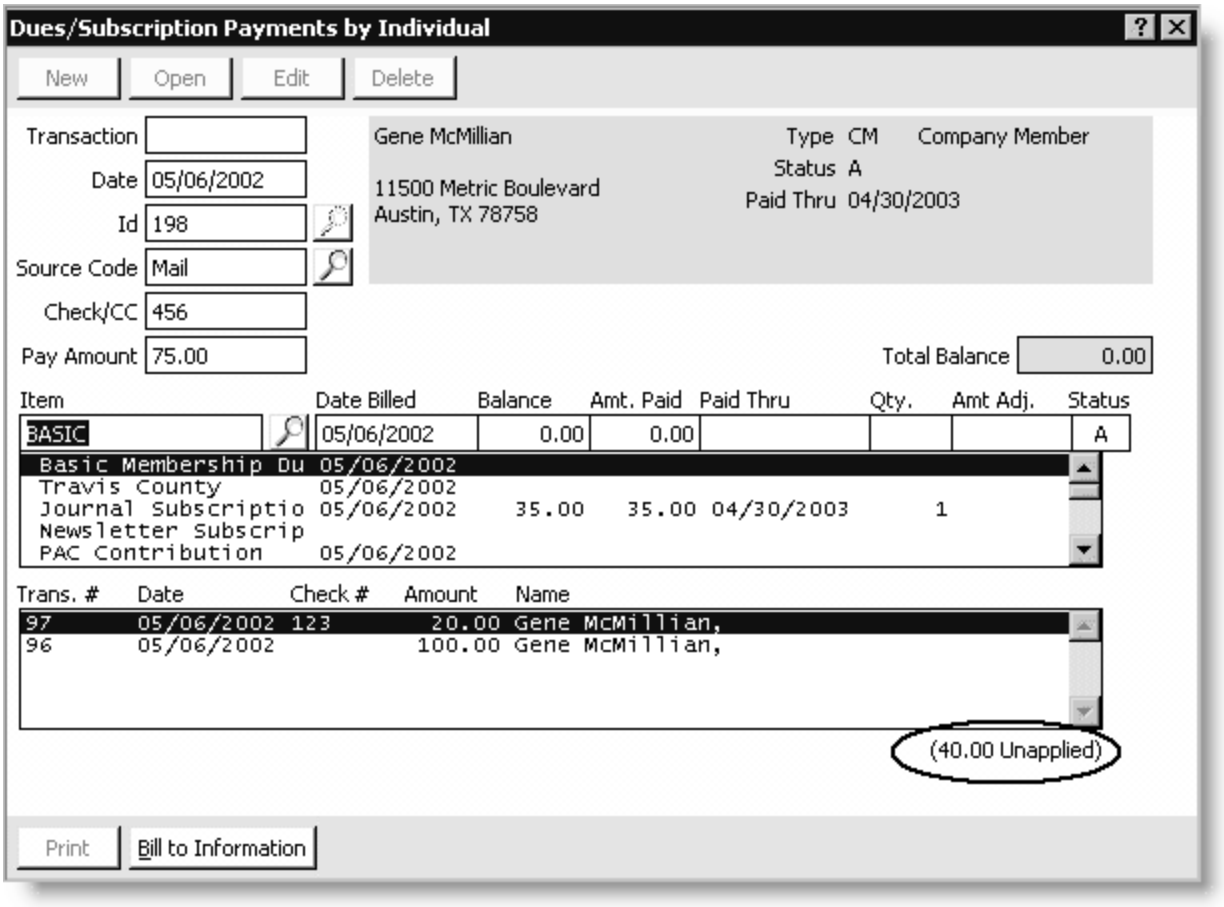
Entering an overpayment

Overpayments can be processed in one of three ways:

- Transfer open credit to AR/Cash so you can refund the overpayment or apply the credit to current or future sales items
- Apply overpayment to offset next year's dues by using AVAIL_CREDIT
- Apply overpayment to another product credit by using _CREDIT

If an overpayment for dues is received, process the payment as described in To enter a billing payment. Enter the amount of the actual payment in the Pay Amount field. The amount that is needed to pay the dues items (for example, the remaining balance) will be

applied. The overpayment amount (amount not applied) displays in parentheses at the bottom of the window.



Dues/Subscription Payments by Individual window showing overpayment

To transfer open credit to AR/Cash

If you transfer an open credit to AR/Cash, you can refund the over-payment or apply the credit to current or future sales items (such as an order or an event registration).

> **Note:** Note: You cannot create an open AR credit unless the Cash Dues Over-/Under Payments Create AR option is selected on the Set up general options window.

1. From the Payments window, click New.

2. Tab to the ID field and enter the customer ID, or click the lookup icon to select a value.
3. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
4. Enter the check number or credit/debit card code in the Check/CC field, and press Tab. For credit/debit cards, enter the required card information.
5. Enter the amount of the actual payment in the Pay Amount field. The amount needed to pay the billing items (for example, the remaining balance) is applied. The amount of the overpayment (amount not applied) displays in parentheses at the bottom of the window.
6. Click Save. A system message is displayed asking you to confirm the creation of an AR item for the overpayment.
7. Click Yes. This overpayment can be refunded on the Credit Invoices window (from AR/Cash, select Process month-end procedures, and click Credit Invoices), or applied to other open balances such as meeting registrations or orders by using the *TAB feature.

   Note: For more on refunding an overpayment, see Accounts Receivable.

   To apply overpayment to offset next year's billing

   Overpayments can be applied to a special credit product by using the _CREDIT product code. The _CREDIT product code retains credit balances and prints the billed amounts and credits separately.

1. Set up a credit product. The following steps are required to process credits that print as separate line items on subsequent bills:

1. Insert a product code that ends in _CREDIT on the Set up billing products window (in Advanced Accounting Console, go to Settings > Billing > Set up billing products). Do not use AVAIL_CREDIT.
2. Select the credit product on the scrolling list on the Set up billing cycles window (in Advanced Accounting Console, go to Settings > Billing > Set up billing cycles) so it will print on the renewal notice when an overpayment balance exists for a renewing customer.

3. Enable the Maintain Prev Balance option on the Set up general options window (in Advanced Accounting Console, go to Settings > Billing).

   Note: If your billing cycle sort method is by product rank, assign a large number to the credit product if you want the credit listed at the bottom of the line items.

2. From the Payments window, click New.
3. Tab to the ID field and enter the customer ID, and press Tab.
4. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
5. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.
6. Enter the amount of the actual payment in the Pay Amount field. The amount that is needed to pay the dues items (for example, the remaining balance) will be applied. The amount of the overpayment (amount not applied) displays in parentheses at the bottom of the window.
7. Apply the overpayment to the special credit product code. For this example, we have inserted a product code of BILLING_CREDIT.

1. Select the empty space immediately below the last line item displayed.
2. Select the Item field.
3. Enter the product code for the special credit line (for example, BILLING_CREDIT), or select the lookup icon and double-click the DUES_CREDIT product code.
4. Tab to the Amt Paid field and enter the overpayment.

8. Click Save.

   The overpayment credit should appear as a separate, negative line item on the next bill generated for this customer. Credit line items must then be offset against positive line items manually on the Payments window. If the overall balance of the bill is positive, this manual offset process can occur when the payment is received and entered.

Entering a partial payment

Underpayments can be processed in one of three ways:

- By leaving underpayment balances in Billing;
- By transferring underpayment balances to AR; or
- By adjusting residual balances.

> **Note:** Note: If Maintain Prev. Balance was selected on the Billing window (Settings > Billing), you can leave underpayments in Billing or you can adjust the balance.

If the Cash Dues Over/Under Payments Create AR option was selected on the Billing window (Settings > Billing), you can transfer underpayment balances to AR.

If both of these options are selected, the underpayment balances can be transferred to AR, left in Billing, or you can adjust the balance.

To leave underpayment balances in Billing

If a partial payment is received, the unpaid balance appears in the Total Balance field, the Paid Thru date is not advanced, and the residual balance continues to be tracked as an open item in the Billing module. Since the Paid Thru date is not advanced, the remaining balance will print on subsequent Reminder Notices until full payment is received.

> **Note:** Note: The remaining balances that print on Reminder Notices for billings with partial payments do not include VOL products.

1. From the Payments window, click New.
2. Tab to the ID field and enter the customer ID.
3. Press Tab.
4. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.

5. Enter the amount of the actual payment in the Pay Amount field. iMIS automatically applies the amount paid to the open line items until the amount paid has been fully applied. In the following example, the balance due was $115 and we entered a $50 payment.
6. Click Save.

For more information on Paid Thru dates, see Overriding the Paid Thru Date.

To transfer underpayment balances to AR

Use the following steps to enter a partial payment, transfer the underpayment balance to AR, and show dues as paid in full.

1. From the Payments window, click New.
2. Tab to the ID field and enter the customer ID, and press Tab.
3. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
4. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.
5. Enter the amount of the actual payment in the Pay Amount field. In the following example, the balance due was $95 and we entered a single payment of $55.
6. Select each line item and enter the full amount due in the Amt Paid field.

   As you override the Amt Paid, the difference between the payment entered and the amount applied displays as over applied at the bottom of the window.
7. Click Save. A message is displayed asking you to confirm the creation of an AR item for the over applied payment.
8. Click Yes.

The remaining balance transfers to AR/Cash as an open receivable. The balance will appear on the AR statements instead of future Dues Billing Reminder Notices.

To adjust residual balances

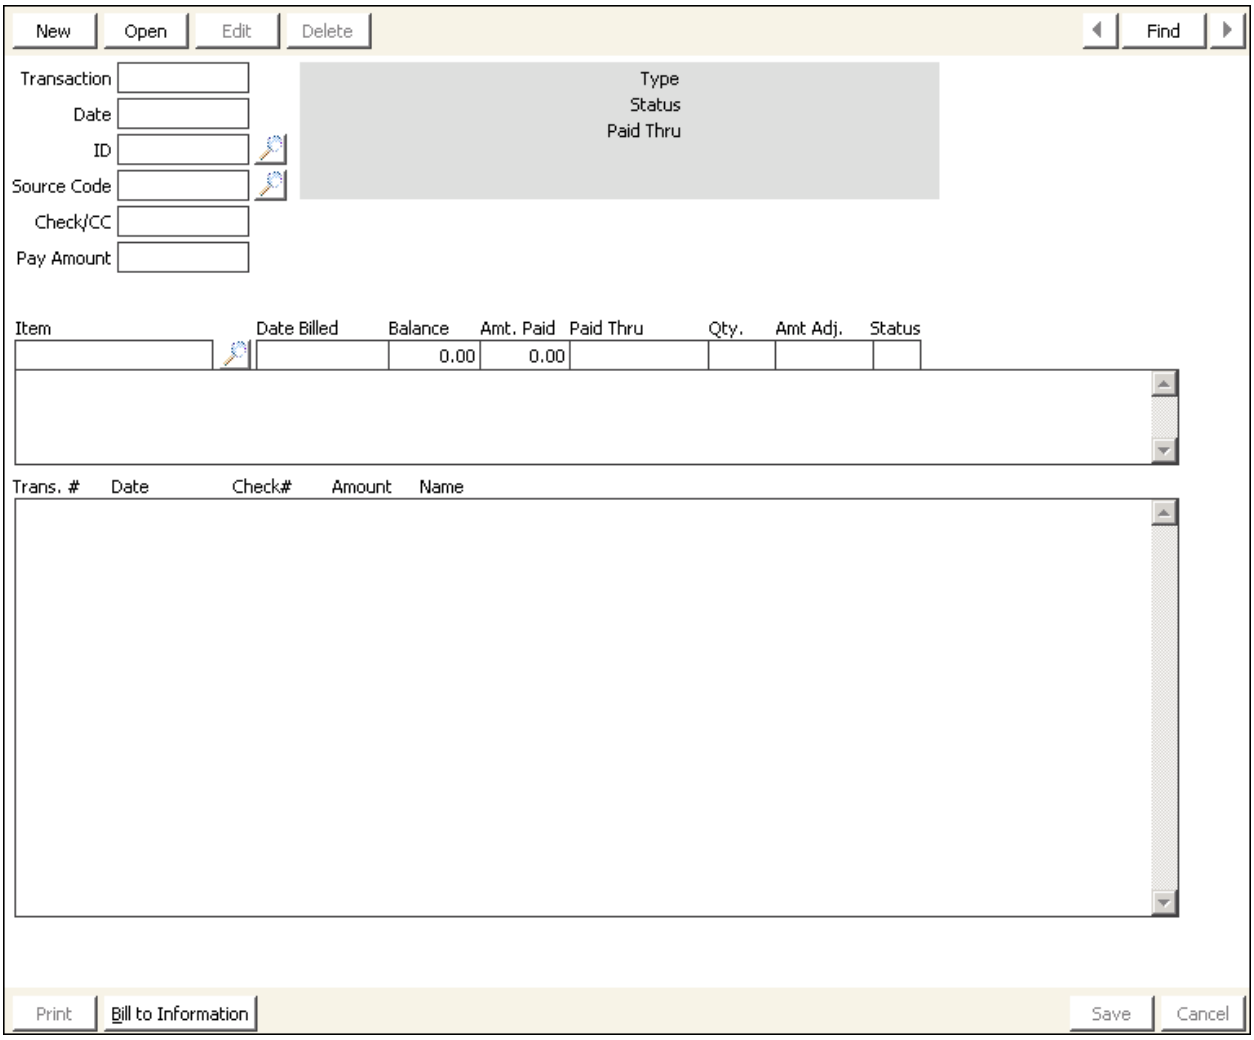
In certain cases, you may want to write off or reduce the residual balance left from an underpayment, particularly if the remaining balance is insignificant. You also may want to use the adjustment method to officially record decisions to award a post-billing discount for a line item.

> **Note:** Note: Entering this adjustment makes no credit or debit entries into any accounts, including the write-off account.

1. From the Payments window, click New.
2. Tab to the ID field and enter the customer ID, and press Tab.
3. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
4. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.
5. Enter the amount of the actual payment in the Pay Amount field. In the following example, the balance was $75 and the payment was $60.
6. Select the line item for which the Amt Paid (applied) is less than the balance.
7. Enter the positive difference between the Balance and Amt Paid in the Amt Adj field.
8. Click Save.

   Note: An activity tracking record will be generated even when no payment is applied (for example, when a full complimentary discount is being applied).

Payments window



Membership > Payments

Transaction

When you complete a payment transaction, iMIS assigns a sequential number in this field. This field cannot be changed.

Date

The transaction date defaults to the current system date and can be overwritten. If Batch Control is used, this date defaults to the batch date and cannot be overwritten.

ID

Specifies a customer ID or select the lookup icon to select a value.

Source Code

Specifies a user-defined code, often used for marketing purposes, or select the lookup icon to select a value. Validates from the SOURCE_CODE table and is required if the Force Source Coding option is enabled on the Customer Setup - Basic Options window.

Check/CC

Specifies the payment's check number or credit/debit card abbreviation (for example, VISA, MC, DISC, or AMEX). To enter a credit/debit card payment, the credit/debit card code must be defined on the Set up cash accounts window. When a credit/debit card code is entered, iMIS displays the following additional fields where you can enter specific card information.

- CC # – Enter the credit/debit card number.

  Note: For credit cards only, if you enter the credit card number incorrectly, a message is displayed informing you that the credit card did not pass validation and asking you if you want to override the validation check. Make sure to reenter the card number correctly.

- CSC – (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code (CSC). You can make the CSC a required value for specific credit/debit card cash accounts. See Accounts Receivable for more on making the CSC a required value.
- Exp – Enter the card's expiration date (mm/yy).
- Authorize – Enter any authorization code here.
- Name on CC – Enter the name as it appears on the card.
- Issue # – (Displays only when the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date – (Displays only when the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).

> **Note:** Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Pay Amount

Specifies the amount paid. The payment amount is applied automatically to each open line item, beginning with the main customer dues.

Total Balance

This field is automatically populated with the outstanding balance for all product items.

Item

Specifies a line item, or click the lookup icon to select a value. To enter a new line item, highlight a new line and enter the new product.

Date Billed

This field is automatically populated with the date the line item was billed.

Balance

This field is automatically populated with the outstanding balance for the line item.

Amt. Paid

Displays the payment amount for the line item selected. You can also use this field to manually override amount paid for an individual line item.

Paid Thru

Specifies the date through which payments have been applied for the line item. As full payment is applied to a line item, the Paid Thru date field advances to the end of the bill term or beyond.

Qty.

Specifies the number of the line items purchased.

Amt Adj.

Specifies the dollar amount to be adjusted from this line item.

Status

(Defaults to current status) Specifies the product's billing status. The status code field relates to whether the subscription line item is active or inactive. This field determines if this product will be billed again, but does not relate to the Amt Adj field.

Updated information list

Displays the Trans #, Date, Check#, Amount, and Name fields.

New Bill From

(Displays when processing bills for new customers) This option works the same way as the Effective Date on the Bill membership fees window. If billing is based on an annual schedule, the New Bill From date must be set to the first day of the first month of the annual term even if the customer has a Join Date subsequent to that date. (For example, if the annual term starts on 01/01/2001 and the customer joined 07/15/2001, the New Bill From date must be 01/01/2001.)

For anniversary billing, the date is set to the first day of the month in which you are processing the billing payment or to the value entered on the Advance Start Month as of field.

Bill New Mem Type Items

(Displays when processing bills for new customers) Enable to automatically select all Dues products that are listed in the Set up customer types window for that customer type.

Bill to Information

Opens the Bill to Information window where you can enter the Bill to ID, as well as the name and address of the entity being billed.

Bill New

Automatically generates and displays billing data for the line item. (Is displayed when the main dues product has never been billed or a new line item is added)

Billing membership fees

The billing process involves entering payments, updating billing expiration (Paid Thru) dates in each customer's record, creating history (activity) records for each customer and line item paid, and generating cash/income accounting transactions that produce reports and then post to the GL interface.

The billing procedure is designed to be as automatic as possible, minimizing extra steps and user intervention. Within one window, you can generate initial and reminder notices, produce bills for a large group of customers, perform individual and mass billing, and run bills for specific selection criteria such as customer type, Paid Thru date, and Renewed Thru date.

iMIS allows multiple line items for each dues bill-up to ten standard items per customer type and optional subscription, section, and chapter lines. The billing periods can be set up at a system-wide default interval and overridden at the individual customer or product level. Intervals can be controlled to affect the billing amounts and the expiration (Paid Thru) dates.

> **Note:** Caution! Billing affects critical data throughout the database. Never generate Renewal Notices without first creating a backup copy of your iMIS data!

Running mass dues billing

Mass billing enables you to process a billing cycle for all customers who match the parameters defined in the selected billing cycle. The system decides which customers to bill by comparing the Paid Thru dates to the renewal Effective Date. iMIS also decides what and how much to bill based on your settings. (See Defining Special Pricing, Setting up Customer Types, and Defining Product Codes). You can run a mass billing cycle to print initial bills, first or second reminders, or run a billing cycle for all print options concurrently.

For example, you enter a Run Date of 9/26/2013 for all print options and the billing reminders that were set as:

- Initial Bill Cut Off = 3
- First Reminder Start = -2 and Cut Off = -1
- Second Reminder Start = -3 and Cut Off = -2

iMIS searches the database for customers who match the billing cycle parameters. An initial billing is generated for all customers who have a Paid Thru date before 12/01/2013 (applies to anniversary only). iMIS runs first reminders for unpaid customers whose initial billing was sent between 7/01/2013 and 8/01/2013 and second reminders for those who were initially billed between 6/01/2013 and 7/01/2013.

> **Note:** Caution! Before initial billing is run, print a test-billing run and verify the results.

To run initial mass dues billings

> **Note:** Caution! If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

1. From the Bill membership fees window, click New.
2. Select the Renewals option under Billing Options process new renewals. The default Effective Date field automatically displays.
3. Select a billing cycle to process that was previously created in the Set up billing cycles window.
4. Select Printing Options.
5. (optional) Override the Run Date.
6. (optional) Override the Effective Date.

7. (optional) Select the Additional Options.
8. Click Run to process the billing run.

To rebill to correct a mass dues billing

iMIS provides a Rebill feature that enables you to correct a previous mass billing. Rebill a mass run if:

- The pricing table originally used for the renewal bill run was incorrect; or
- The original dues billing did not include a line item.

For example, rebill the sample initial dues bill discussed in To run initial mass dues billings.

> **Note:** Note: A renewal billing can be combined with a rebilling.

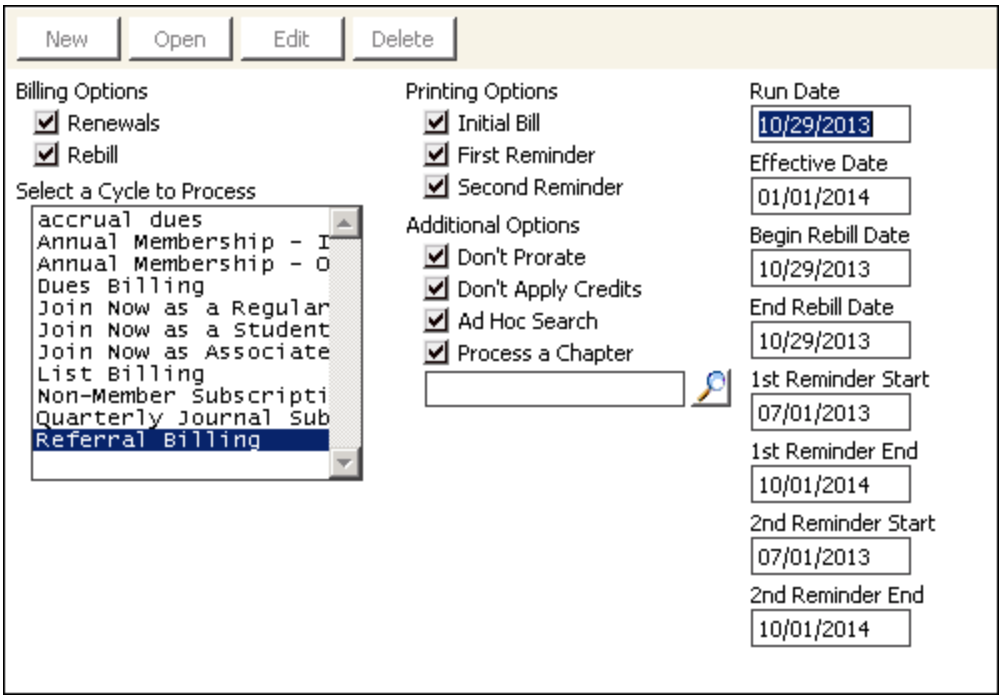
1. Correct the reason for the rebill.

- If you need to add a product to the Billing Cycle, see Creating billing cycles.
- If you need to change the pricing of a product, see Setting up Customer Types, or Defining Special Pricing.

2. From the Bill membership fees window, click New.
3. Select Rebill to change or correct a billing run generated previously.
4. Select a billing cycle to process.
5. Select the Printing Options.
6. Enter the original Run Date range in the Begin Rebill Date and End Rebill Date fields.
7. Click Run to process the billing run.

> **Note:** Tip: See Billing run troubleshooting.

Bill membership fees window



Membership > Bill membership fees

Billing Options

Use the options in this section to specify the type of billing process to run.

Renewals – Select this option to generate new billing data for customers who match the billing cycle parameters. When this option is selected, the Effective Date field displays.

Rebill – Select this option to generate an invoice to correct a billing run generated previously. The Rebill option recalculates the billing data only if it finds a customer who was originally billed within the Begin Rebill Date and End Rebill Date range.

> **Note:** Note: Both the Renewals and Rebill options can be selected to bill other renewal candidates who fit the cycle and Effective Date criteria and who did not get billed earlier (for example, if an earlier bill run was canceled).

Printing Options

Use this section to indicate which notices are to be printed.

Initial Bill – Selecting this option prints an invoice when a customer's Paid Thru date expires before the Effective Date and the customer has not been billed previously for the term currently being billed. Select Initial Bill to print Renewal Notices for those customers whose billing dates are generated through the Billing Options selection.

First Reminder –When selected, this option displays the 1st Reminder Start and 1st Reminder End date fields. This option prints a first reminder for those customers whose Initial Bill was run between the 1st Reminder Start and 1st Reminder End dates and who are currently not paid.

Second Reminder –When selected, this option displays the 2nd Reminder Start and 2nd Reminder End date fields. This option prints a second reminder for those customers who were sent first reminders between the 2nd Reminder Start and 2nd Reminder End dates and who are currently not paid.

A reminder will be printed if the following criteria are met:

- The original run date falls within the reminder Start and End date range, inclusive,
- There is still at least one non-voluntary line item open, and
- The Paid Thru date has not been advanced.

Run Date

(Defaults to the current system date) Specifies when the billing run is processed. This date can be overwritten.

Effective Date

> **Note:** Note: The Effective Date is available on the Bill membership fees window only when Renewals or Rebill options are selected.

Specifies the first date of the new customer term for individuals to be included in the billing cycle. The Effective Date is a very important factor in determining who gets billed.

All customers who meet the other selection criteria and have a Paid Thru date before the Effective Date will be billed if a renewal has not already been generated. For example, if

you enter 9/1/2001 in the Effective Date field, iMIS will bill renewals to individuals who have a Paid Thru date of 8/31/2001 or earlier and have not been billed previously.

For anniversary billing cycles, the Effective Date is calculated based on the Initial Bill Cut Off parameters set on the Billing and Reminder Notices window (from Settings, select Billing > Set up billing cycles, select Bills/Reminders).

For annual billing cycles, the Effective Date is set to the first day of the current fiscal year based on the First Month of Fiscal Year field set on the Finance Configure accounting options window (from Finance, select Options > Configure accounting options).

> **Note:** Caution! If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

Begin Rebill Date

Use to indicate the beginning date of a billing run to correct a billing run previously processed.

End Rebill Date

Use to indicate the ending date of a billing run to correct a billing run previously processed.

1st Reminder Start

Default date is based on the First Reminder Start parameter set on the Billing and Reminder Notices window. This date can be overwritten.

1st Reminder End

Default date is based on the First Reminder Cut Off parameter set on the Billing and Reminder Notices window. This date can be overwritten.

2nd Reminder Start

Default date is based on the Second Reminder Start parameter set on the Billing and Reminder Notices window. This date can be overwritten.

2nd Reminder End

Default date is based on the Second Reminder Cut Off parameter set on the Billing and Reminder Notices window. This date can be overwritten.

Select a Cycle to Process

This section contains a list of billing cycles created on the Set up billing cycles window. To define a new billing cycle, see Set up billing cycles.

Additional Options

Use this section to specify additional billing options.

Don't Prorate – Enable this checkbox to override prorating options set on the Set up general options window (from Settings, select Billing > Configure billing options) or the Set up products window (from Settings, select Billing > Set up billing products). This option bills full-term amounts in all cases.

Don't Apply Credits – Enable this checkbox if you do not want to apply any outstanding AVAIL_CREDIT credit amounts to the renewal calculation run.

Ad Hoc Search – Enable this checkbox to generate additional restriction of the billing cycle based on the Name table.

Process a Chapter – Enable this checkbox to allow the selection of a specific chapter for dues product billing run. If a chapter is selected, only those records selected in the billing cycle whose main chapter code matches the selected chapter will be billed.

Run button

Used to generate and print invoices to your report destination (select File> Report Destination).

Printing Renewal Notices

Printing Renewal Notices at the same time as billing is recommended to ensure that the only items that print on the renewal notices are the items that get billed. To do this, select both the Renewals and Initial Bill options on the Bill membership fees window on the same billing run.

If you print the initial bill separately from billing, you must perform an ad hoc search to print only the items that were last billed. See the next section, "To print Renewal Notices separately" for more information on performing an ad hoc search to verify bill date.

> **Note:** Note: With accrual dues, the posting and finalization of mass billing data occurs after the renewal billing step, therefore, you need to print renewal notices (Initial Bill) independently after the batch posting is complete.

When you print Renewal Notices, the following field conditions are evaluated to determine if a Renewal Notice will print for a customer:

- The Paid Thru date field on the Status tab (Name.PAID_THRU) contains a date that is earlier than the Renewed Thru field on the Financial tab (Name.Fin.RENEWED_THRU) located on the Manage customers window (from Customers, select Manage customers).
- The Status field (Name.STATUS) on the Manage customers window is not set to S (Suspended), I (Inactive), or D (Marked for deletion).
- The balance for the dues product (Subscriptions.BALANCE) is greater than zero.
- Subscriptions.REMINDER_COUNT is equal to zero.

To print Renewal Notices Separately

When you print Renewal Notices separately from billing, you must perform an ad hoc search so that you don't print duplicate notices.

When you print an initial bill, the system looks for records with REMINDER_COUNT = 0 (renewal hasn't been printed). It is possible, however, that a record has a REMINDER_

COUNT = 0 and you may not want to print the Renewal Notice, as in the following examples:

- You generate a billing run by selecting the Rebill option on the Set up general options window. In this case the REMINDER_COUNT is reset to zero.
- You manually print an individual Renewal Notice by clicking Create Invoice from the Billing tab. In this case, REMINDER_COUNT never increments.

1. From the Bill membership fees window, click New.

   Note: Do not select either option in the Billing Options area.
2. Select a billing cycle from Select a Cycle to Process.
3. (optional) Override the Run Date.
4. Select Initial Bill under Printing Options.
5. Select Ad Hoc Search under Additional Options.
6. Click Run. The Select Search Instructions window opens.
7. Click New to display the Search Instructions window.
8. Enter a Search Name.
9. Enter the new search instructions.

   Note: Press Ctrl + Z to expand the Comparison Value field.
10. Click Save on the Search Instructions window.
11. Click OK on the Select Search Instructions window.

    Note: If you print Renewal Notices to the screen prior to sending them to the printer, they may not be aligned exactly as they appear on the screen. To achieve the correct formatting, always print reports directly to the printer rather than from the screen.

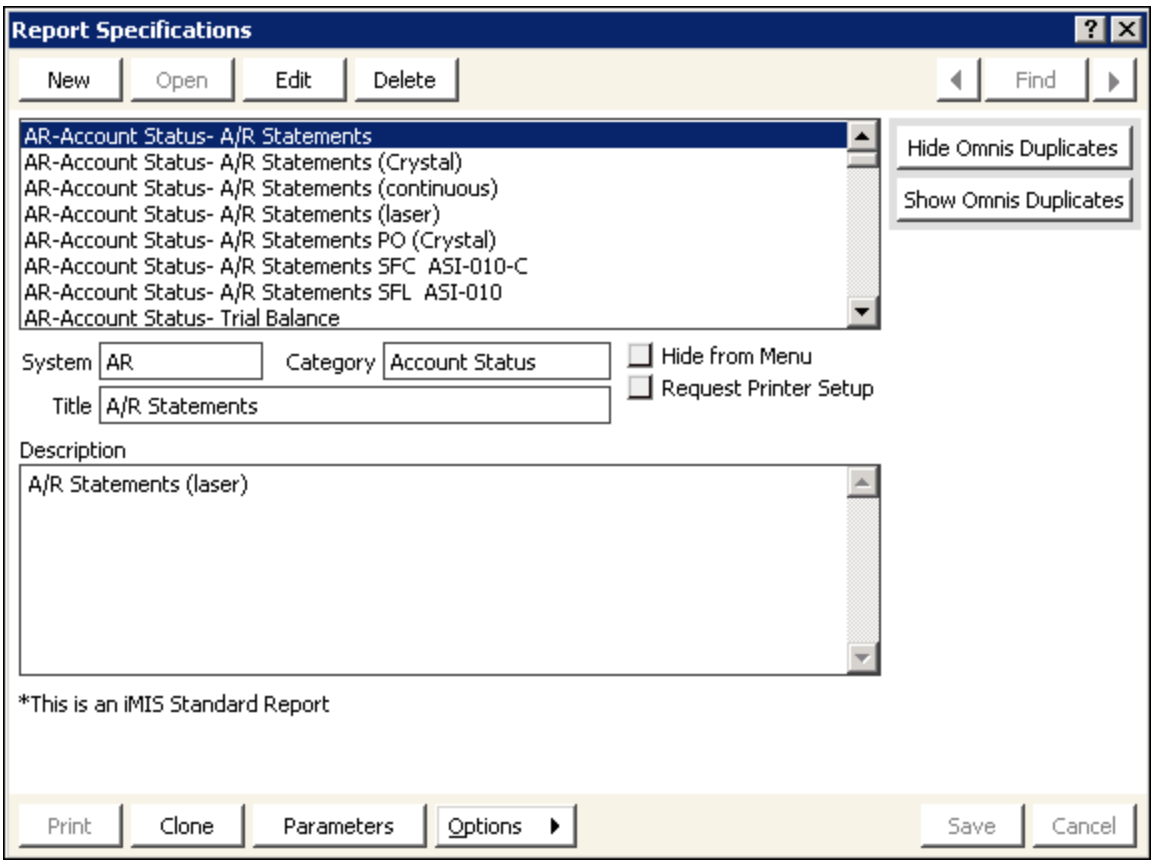
Customizing the Renewal Notice Formats

A variety of standard renewal notice options are available. Although the presentation of most billing-related data is predetermined, many aspects can be customized.

For many of the available formats, the enlarged, bold title that appears at the top of the notice is user-defined within the Billing and Reminder Notices window (go to Settings > Billing > Billing Cycles, select a Cycle Name, and click Bills/Reminders). You can also define a limited size (notice-specific) text area.

In addition to the Billing and Reminder Notice title and text options, you can customize other aspects of the renewal notice by entering instructions on the Report Specifications window (on the menu bar, go to Utilities> Report Specs).

> **Note:** Note: If changes are made on the Report Specifications window, you must make the changes on a cloned copy of the standard report. This step is required to make the changes permanent.



The types of changes that can be made on the Report Specifications window include the following:

- The entry of larger user-defined text areas
- The addition of merge fields from the customer/subscriber-specific data. Up to five merge fields can be included in the overlay text

  Note: There is no provision for merge fields in the Billing and Reminder Notices text.
- The modification or addition of a few available printing options that affect the output
- The modification of top and/or left margins, which may be required to align the printed output with an iMIS-authorized preprinted form.

  Note: Crystal Report parameters should not be deleted from a report as the majority of them are necessary to run the report. The preferred method for building reports is to clone your existing report specifications, which automatically copies the report parameters.

  To generate a custom Renewal Notice

  To enter user-defined overlay text, you may need to customize a renewal format to print merge fields from a customer's demographic data or to modify or add an available printing option. User-defined text that exceeds 255 alphanumeric characters must be specified here.

  Follow these steps to generate a custom Renewal Notice for your organization:

1. Select Utilities > Report Specs. The Report Specifications window opens.
2. Select the Dues Renewal Notice to customize.

   Note: If you are cloning one of the DUES-Renewal Notices-Std. Form ASI-### reports, you may need to adjust the top and left margins to print the renewal notice correctly on your printer. To change the margins, select Options > Margins.
3. Click Clone.
4. Tab to the Title field and enter a unique name.

5. Click Parameters. The Detail Report Parameters window displays the current parameters for the report you cloned.
6. Tab to the Options field and add or remove available options. Available options vary from format to format. The two primary renewal notice options include the following:

- SUPPRESS_ZERO_ITEMS - Suppresses printing line items that have been paid off or that have a zero balance. This option suppresses individual zero balance line items when the grand total of the renewal notice is nonzero.
- PRINT_CHECKBOX - Displays checkboxes on the renewal form stub in which a customer/subscriber can choose items to pay (an optional addition that is not part of the standard option set).

7. Tab to the Parameters field and enter the text to be printed on the renewal notices. To print your organization's name and address, enter the name and address in the Parameters field. The organization name and address will not automatically print as they do on some invoices and bills from other iMIS modules.

   The entered text overlays the standard report elements. Therefore, add hard returns (by pressing Enter) to shift text down the page far enough to avoid the preset report elements on the form.

   In the following example, three additional merge fields [Temp.Item1], [Temp.Item2], and [Temp.Item3] have been included in the overlay text. Use the following instructions to define merge fields.

   Example of parameters changed on customized renewal format

1. Click Options and select Additional Fields to open the Additional Fields window.
2. Enter a formula or field name that corresponds to the merge fields entered in the Parameters field on the Detail Report Parameters window. Tab to each Field Name row and continue entering the data that will be merged with the overlay text entered in the Parameters field. A field can reference data contained in the Name, Name_Fin, Subscriptions.BILL_DATE, or any user-defined table. You can enter up to five additional fields in the notice by selecting Options> Additional Fields. Field names must be entered

in the Filename.FIELDNAME format. For example, Name.INFORMAL brings in the informal nickname from the Name file.

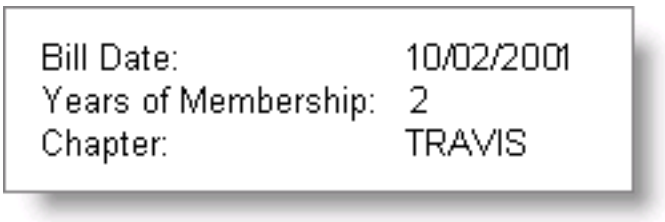
Example of text entry area expanded. This formula calculates the years of membership.

Note: The formula or field name entered in the first row must correspond to the [Temp.Item1] overlay text entered in the Parameters field on the Detail Report Parameters window.

Note: All calculations must be prefixed with @# where # represents the number of the field (1-5). Field names do not need to be prefixed.

Note: If you enter an SQL calculation for a field, you might be prompted: Invalid Omnis calculation: proceed anyhow? Click Yes and ignore the warning.

3. Click OK to close the Additional Fields window.
4. Click Save to close the Detail Report Parameters window.
5. Click Save to close the Report Specifications window.
6. Select the cloned report title from the Forms drop-down menu on the appropriate billing cycle.
7. Test the renewal notice.



A portion of the text entered in the Parameters area with merge data from the resulting renewal notice.

To add user-defined text to the Dues Renewal Notice

The Dues Renewal Notice is a standard laser printer renewal notice format that prints the line items in the upper right corner and at the bottom in the remittance stub area. The middle of the renewal format is reserved for user-defined text.

1. Select Utilities > Reports Specs to display the Report Specifications window.
2. Clone the format.
3. Click Parameters.

   The Detail Report Parameters window opens. User-defined text can be entered in the Parameters field.

   Note: The title, Renewal Notice, cannot be changed. Billing and reminder notices text, entered in the Set up billing cycles window, is ignored with this renewal notice format.

   Note: The standard options set in the Options field of the Detail Report Parameters window includes SUPPRESS_ZERO_ITEMS, but PRINT_CHECKBOX is an optional setting that is not included in the standard options set.

   To add user-defined text to the Dues Renewal Notice - List Bill

   The Dues Renewal Notice - List Bill is a plain-paper laser printer format designed for printing list bills in which the line items for multiple individuals or branches are all listed and totaled on one continuous bill to the BT_ID (bill to ID) or main company. This format may be used when individual or branch billing is billed to the parent company or for agency subscription billings.

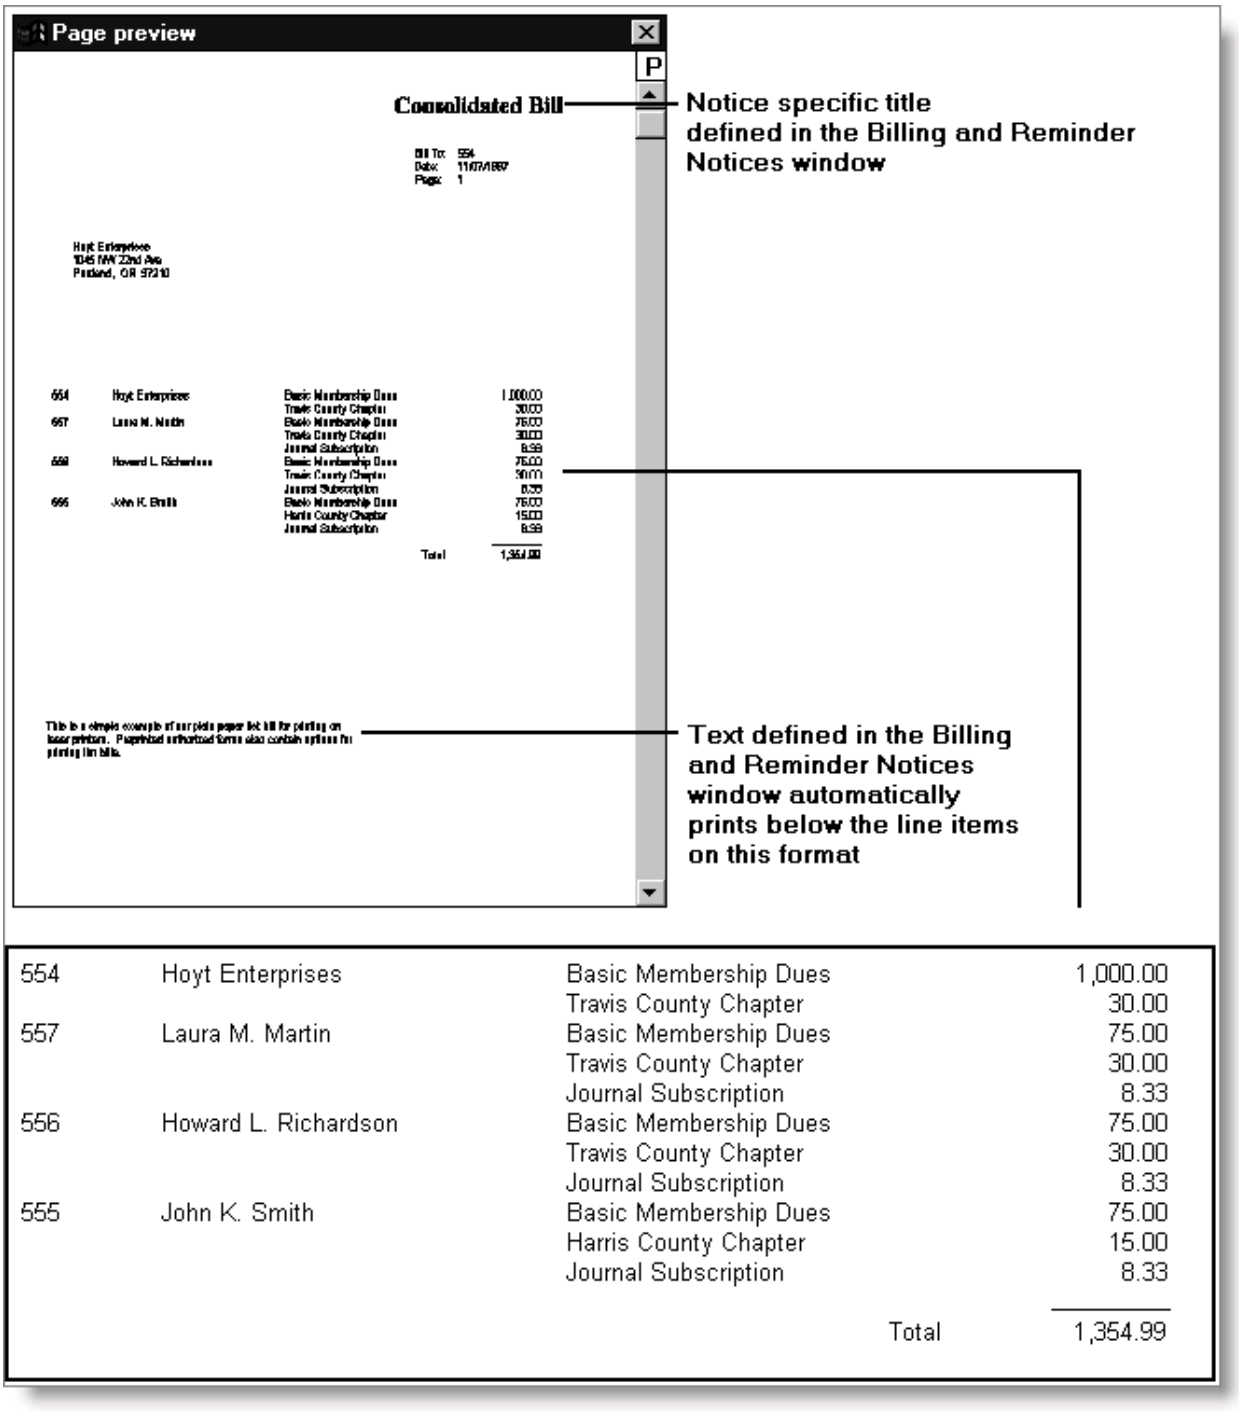
1. Select Utilities > Reports Specs to display the Report Specifications window.
2. Clone the format.
3. Click Parameters.

The Detail Report Parameters window opens so that user-defined text can be entered in the Parameters field.

Billing and reminder notices text is formatted to print immediately below the last line item printed. The bolded title prints in the upper right corner.

The following illustration shows a simple list bill example where the billing line items for the main company, as well as for the individual customers who work for that company, appear on a single combined bill addressed to the company. In a combination bill like this, the line items that belong directly to the billed company will sort to the top of the list, as shown in the example.

Note: Note: The standard options set in the Options field of the Detail Report Parameters window are SUPPRESS_ZERO_ITEMS and SUPPRESS_CHECKBOX.

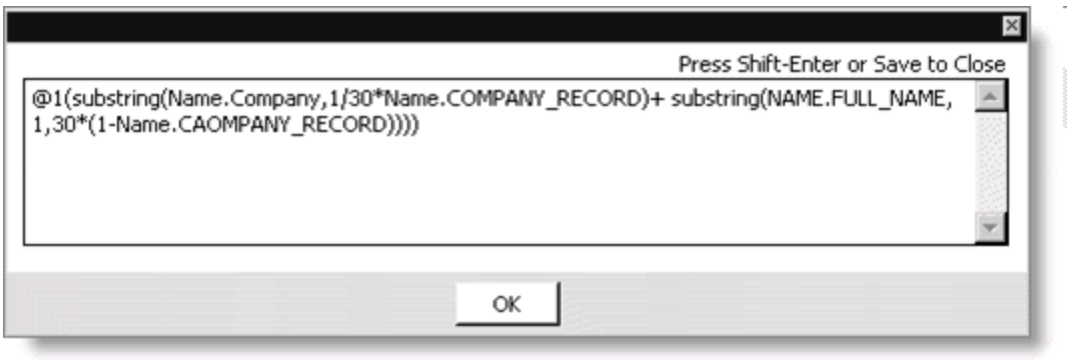


Expanded view of customers and products billed with a Dues Renewal Notice List Bill

The first Additional Fields area, which can be modified, controls the printing of the individual or branch name. The default is set to print the full name for an individual or the company name for a branch.

Note: Note: You can access the Additional Fields window by selecting Utilities> Reports Specs, cloning the format, clicking Parameters, and selecting Additional Fields from the Options drop-down menu.

This default formula is designed to print the company name if the customer or subscriber is a company. If the customer is an individual, the individual's full name prints.



Expanded view of the additional fields area

The following is an example of how to modify the above formula to add the city next to the customer's name.

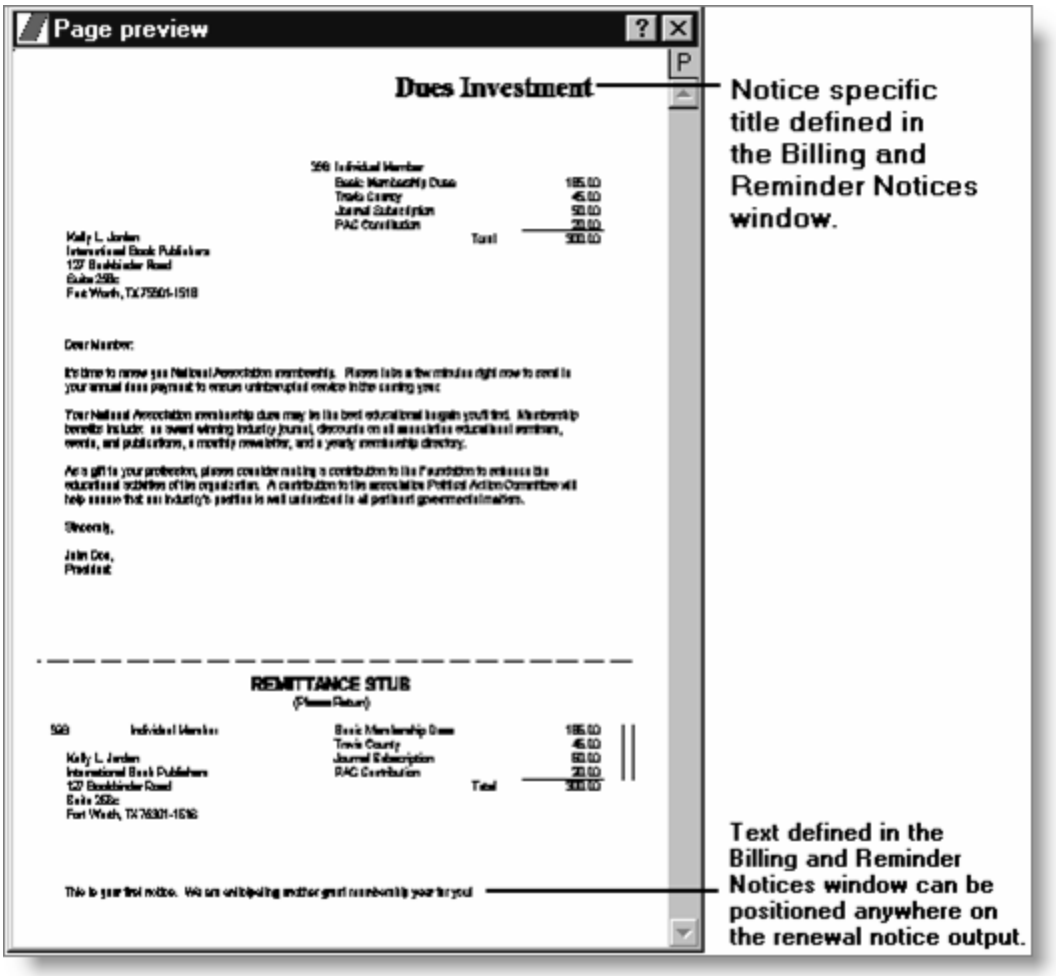
Example of the Dues Renewal Notice with Reminder Text

This format is identical to the Dues Renewal Notice format, except that it uses the Title and Text entered on the Billing and Reminder Notices window (from Billing, select Set up module> Billing cycles, select a Cycle Name, and click Bills/Reminders). You can define

the bold title and reminder text by selecting Utilities> Report Specs, and clicking Parameters.

Fundraising items are flagged (**) and the report includes a note that specifies how much of dues subscriptions are donation, and how much is taxable or receiptable. The report also includes Total FR Donations.

> **Note:** Note: The standard options set in the Options field of the Detail Report Parameters window are SUPPRESS_ZERO_ITEMS and PRINT_CHECKBOX.



Dues Renewal Notice with reminder text

Example of the Dues Renewal Notice - No Remittance Stub

The printing and customizing options in this example are identical to the Dues Renewal Notice with Reminder Text, but a remittance stub area is not printed.

> **Note:** Note: The standard option set in the Options field of the Detail Report Parameters window is SUPPRESS_ZERO_ITEMS.

Dear Member:

It's time to renew your National Association membership. Please take a few minutes right now to send in your annual dues payment to ensure uninterrupted service in the coming year.

Your National Association membership dues may be the best educational bargain you'll find. Membership benefits include: an award winning industry journal, discounts on all association educational seminars, events, and publications, a monthly newsletter, and a yearly membership directory.

As a gift to your profession, please consider making a contribution to the Foundation to advance the educational activities of the organization. A contribution to the association Political Action Committee will help ensure that our industry's position is well understood in all pertinent governmental matters.

Sincerely,

John Doe,
President

This is your last notice. We are anticipating another great membership year for you!

Dues Renewal Notice - no remittance stub

iMIS-authorized Renewal Notice formats

The iMIS-authorized Dues Renewal Notice form allows you to generate renewal notices on either dot matrix (continuous) or laser printers. Several of the Standard Renewal Notice formats are designed to print on forms provided in the Authorized Forms Catalog included with iMIS. The Authorized Forms Catalog is a joint effort by ASI and Versient.

In the iMIS Authorized Forms Catalog, there are six preprinted forms (four laser and two continuous) available for printing Billing renewal notices.

> **Note:** Note: For forms that include the credit card payment box (ASI-016, ASI-018, ASI-020-C), you must enter your list of available credit card choices in the Credit Card Types field on the AR/Cash Set up module window.

On certain preprinted forms, there may be optional choices for the iMIS report output (for example, the placement of the line items may be different, or one form could be used for a standard renewal notice or a list bill). The variations of all possible forms and iMIS output choices are represented in the following list of iMIS standard reports:

Std. Form ASI-016 - Line Items at Top	A laser-printer format that includes a bottom stub for payment and a credit card payment box. Line items are printed in the upper, right corner of the form. Clone the report specification entry to enter user text. Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Overlay text prints in the middle shaded area of the form. Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD
Std. Form ASI-016 - Line	A laser-printer format that includes a bottom stub for payment and a credit card payment box. Line items are printed in the middle shaded area of the form.

Items in Middle	Clone the report specification entry to enter user text. Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Overlay text prints on the left half of the middle shaded area of the form (for example, to the left of the line items). Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD
Std. Form ASI-017 - Line Items at Top	Identical in form and output to Std. Form ASI-016 except line items are printed at the top of the form and the credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS
Std. Form ASI-017 - Line Items in Middle	Identical in form and output to Std. Form ASI-016 except line items are printed in the middle of the form and the credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS
Std. Form ASI-018 - Dbl Column List Bill	A laser-printer list-bill format designed to print a consolidated list of line items for multiple individuals and/or branches whose line items are to be billed to a single parent company or other Bill_To_ID. This particular format is designed with a tear-off stub along the right side of the form, which also contains a credit card payment box. Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Text entered in the Billing and Reminder Notices window (from Billing, select Set up module> Billing cycles, select a Cycle Name, and click Bills/Reminders) is formatted to print immediately below the last line item printed, to the left of the tear-off stub.

	The first Additional Fields area, which can be modified, controls the printing of the individual or branch name. The default is set to print the full name for an individual or the company name for a branch. Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD Optional add on: PRINT_CHECKBOX
Std. Form ASI-019 - Dbl Column List Bill	Identical in form and output to Std. Form ASI-018 except it includes a double-column list bill and the credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS Optional add on: PRINT_CHECKBOX
Std. Form ASI-020-C - Full Page List Bill	A continuous-format (dot-matrix) form designed for printing list bills in which the line items for multiple individuals/branches are all listed and totaled on one continuous bill to the Bill_To_ID or main company. This list bill, with no stub on the right, provides full-page width to list the individual/branch names and line items. This form also contains a credit card payment box. Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Text entered in the Billing and Reminder Notices window (from Billing, select Set up module> Billing cycles, select a Cycle Name, and click Bills/Reminders) is formatted to print immediately below the line items and totals. The first Additional Fields area, which can be modified, controls the printing of the individual or branch name. The default is set to print the full name for an individual or the company name for a branch. Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD
Std.	A continuous-format (dot matrix) form with line items listed in the body of the form (traditional invoice format).

Form ASI-020-C - Full Page Standard	Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD Optional add on: DUESDAT appends the printing of the renewal period onto the end of the line item description for any billing type product lines. (For example, FOR 01/01/1999 THRU 12/31/1999.)
Std. Form ASI-021-C - Full Page List Bill	Identical in form and output to Std. Form ASI-020-C. Includes a full-page list bill. The credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS
Std. Form ASI-021-C - Full Page Standard	Identical in form and output to Std. Form ASI-020-C except it includes a full-page standard billing and the credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS

Sample Billing reports

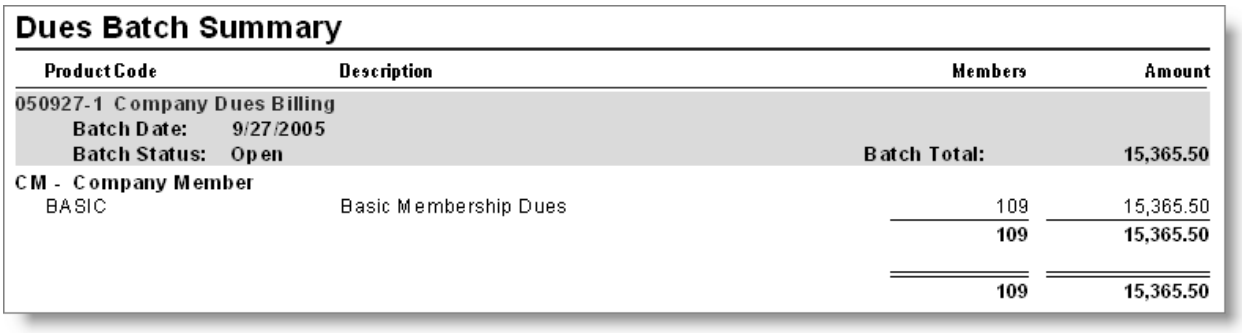
Dues Batch Summary report (Crystal)

The Dues Batch Summary report lists batches that contain Accrual Dues product transactions. The report is grouped by Batch Number, Member Type, and Product Code.

To run this report, go to Membership > Accrual dues > Manage accrual dues, and click Print Summary.

Note: Note: This report includes the following Product Types: DUES, CHAPT, SEC, SUB, VOL, MISC.

This report cannot be filtered for Distribution. Adding Report Spec parameters for Distribution will produce an error.



Dues Batch Summary

Product Code	Description	Members	Amount
050927-1 Company Dues Billing			
Batch Date: 9/27/2005			
Batch Status: Open		Batch Total:	15,365.50
CM - Company Member			
BASIC	Basic Membership Dues	109	15,365.50
		109	15,365.50
		109	15,365.50

Dues Batch Report (Combined) report

The Dues Batch Report (Combined) is a combination of the Dues Batch Summary and the Dues Batch Detail reports.

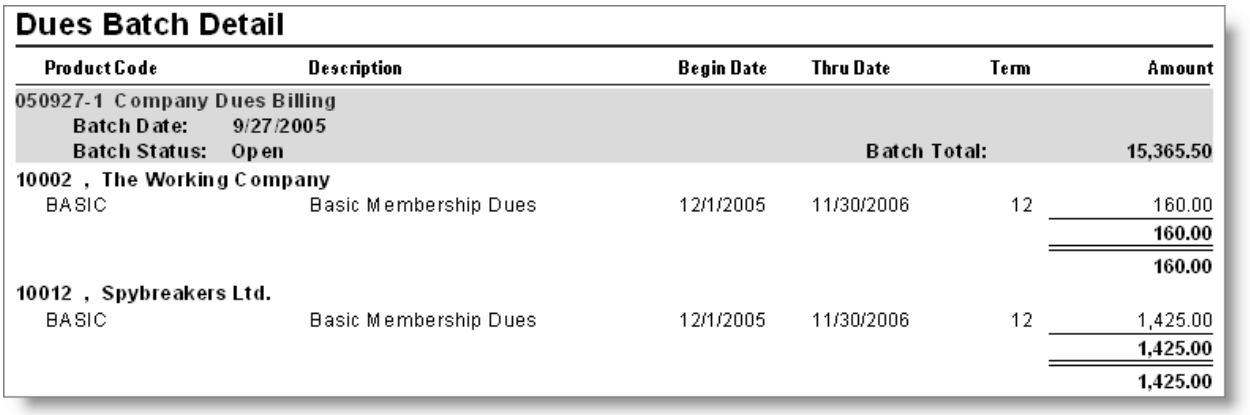
Dues Batch Detail report (Crystal)

The Dues Batch Detail report lists batches that contain Dues product transactions. The report is grouped by Batch_Num and by Bill To ID.

To run this report, go to Membership > Accrual dues > Manage accrual dues, and click Print Detail.

Note: Note: This report includes the following Product Types: DUES, CHAPT, SEC, SUB, VOL, MISC.

This report cannot be filtered for Distribution. Adding Report Spec parameters for Distribution will produce an error.



Dues Batch Detail

Product Code	Description	Begin Date	Thru Date	Term	Amount

					1,425.00
					1,425.00

Dues Batch Detail

Managing expired members

An important maintenance step is dealing with member status and type of those who fail to renew. If member statuses or types are not changed, they may retain unwarranted access to organizational privileges, and you won't have current records on the overall status of your members. From the Expired members window you can process expired memberships throughout your database.

Note that this method makes use of the Paid Thru date in the member's record to perform the status and/or member type conversion. Most users will be set up with cash-based accounting (in Billing system setup), so this utility will work fine. If, however, you are set up for accrual-based accounting, and the Paid Thru dates are updated automatically at each billing, you'll have to convert expired member' statuses by hand, as needed because in some cases accrual updated Paid Thru at payment time.

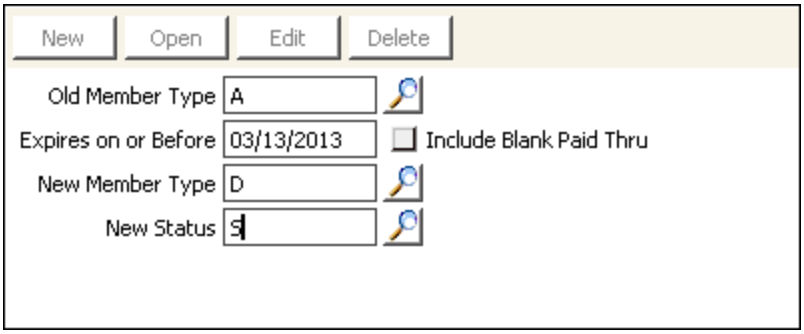
To modify a member type or status

> **Note:** Note: Perform the following procedure for a single member type you want to modify. If you have more than one member type to modify, perform the procedure as many times as necessary.

1. From the Expired members window, click Edit.

2. Enter the member type you want to modify in the Old Member Type field or click the lookup icon to select a value.
3. Enter the old expiration date to use as the basis of the conversion in the Expires on or Before field. The system finds all of those member types who have a Paid Thru date that matches or precedes the date you enter in this field.
4. (optional) Enable the Include Blank Paid Thru option if you want the system to find those customers from whom no payment was ever received.
5. (optional) Enter the member type you want to assign to delinquent or expired members or select the lookup icon and select a value. You can retain the existing member type designations and simply change their status. To retain the member type, leave the New Member Type field blank.
6. (optional) Enter the New Status or select the lookup icon to select a value. To retain the status, delete the default status of S (Suspended).
7. Click OK.

Expired members window



Membership > Expired members

Old Member Type

Enter an existing member type that you want to convert or select the lookup icon to select a value.

Expires on or Before

Enter the customer's Paid Thru date.

Include Blank Paid Thru

Check this field if you want the system to find those customers from whom no payment was ever received (resulting in a blank Paid Thru field).

> **Note:** Note: Selecting the Include Blank Paid Thru option may include your newly joined as well as your delinquent customers.

New Member Type

Enter the non-customer type that you want to assign to delinquent or expired customers or select the lookup icon and select a value. You can retain the existing member type designations and simply change their status. To retain the member type, leave the New Member Type field blank.

New Status

(Defaults to S, for Suspended) Enter a status or select the lookup icon to select a value.

Accrual dues

This section describes the following accrual dues topics:

- Manage accrual dues
- Credit memos
- Debit memos

Managing accrual dues

The Process accrual dues task item displays only if Accrual is enabled as the default accounting method on the Set up general options window (Settings, select Billing > Configure billing options).

Using the accrual method for managing your dues products, you can book income or deferred income, and create open accounts receivable items whenever you generate bills. The accrual dues method provides the following:

- Creation of unposted transaction records – Option to review, reject, and rerun billing results prior to batch posting
- Two accrual basis dues billing run reports – Dues Batch Summary and Dues Batch Detail reports
- AR Payment Application option – Distribute partial payments by priority or proportionally
- Paid Thru Date Update option – Update Paid Thru date when the invoice is paid in full or at billing time
- Cash/Accrual Option at the Billing Cycle level – Process a mixture of accrual- and cash-based billings

Generating a mass accrual dues billing

When an accrual method billing cycle is selected, certain areas of the Bill membership fees window might be disabled or grayed out. For example, the rebill and available credit options are not allowed for accrual dues items.

> **Note:** Note: A new batch will be generated for each mass dues billing run even if you do not have Batch Control enabled on the AR/Cash Batch Control window.

To generate a mass accrual dues billing

1. From the Bill membership fees window, click New.
2. Select the Renewals option.

   Note: The Rebill option is not allowed for accrual dues items. Adjustments must be made using debits or credits (see Processing Adjustments).

   Note: Printing of renewal notices under accrual dues is not allowed with the generation of the billing. You must post the batch and then print the renewal notices separately.
3. (optional) Override the Run Date.
4. Select an accrual billing cycle.

5. (optional) Override the Effective Date.
6. (optional) Select any Additional Options.

   Note: The AVAIL_CREDIT feature is currently not supported by accrual dues cycles. All accrual dues cycles will operate as if the Don't Apply Credits option on the Bill membership fees window is enabled.
7. Click Run to process the billing run.

   Note: A new batch will be generated for each mass dues billing run even if you do not have Batch Control enabled on the AR/Cash Batch Control window. If you have selected Operator Assigned Batch Numbers, iMIS will prompt you for a batch number (maximum of ten characters) when the billing process is started. Otherwise, the system will assign a batch number automatically according to the selection made for batch numbering on the AR/Cash Batch Control window.

Posting mass accrual dues batches

After you have generated a mass accrual dues billing, review and post the batch. The Manage accrual dues window allows you to review, post, or cancel individual batches prior to posting the batches to the Transaction table.

To print an accrual dues batch

Before posting an accrual dues batch, click Print Summary or Print Detail to review the results of the accrual dues billing run.

1. From the Manage accrual dues window, select the batch to be printed.
2. Select File > Report Destination and select the print destination.
3. Click Print Summary to print the Dues Batch Summary report, or click Print Detail to print the Dues Batch Detail report.

   The Dues Batch Summary report summarizes the transaction records for each customer type. It provides subtotals for the number of records and amounts for each product code for that customer type. It also provides a subtotal for each customer type and a grand total for the accrual dues billing run at the end of the report.

For each customer billed, the Dues Batch Detail report lists the line items billed (including term dates and amounts) with a subtotal by ID. On a list bill, you can use the Bill to ID to further group and subtotal the details for multiple customers.

To post a mass accrual dues batch

If the billing transaction data is accurate, you can finalize the transaction by posting the batch.

From the Manage accrual dues window:

- (Single batch) Select the batch you want to post and click Post Selected.
- (Multiple batches) Double-click each open batch to mark it as ready, select the Ready option to view the ready list, and click Post Ready.

iMIS processes the batch and prints the Dues Batch Detail Report and the Batch Posting Listing report. The batch status changes to Posted.

To delete an unposted batch

If any of the billing transactions are incorrect (such as wrong customers or line items billed, or incorrect term dates or amounts), simply delete the billing results; correct the causes of the errors, and run the billing process again.

> **Note:** Note: You must delete an unposted batch if you want to rerun the billing cycle.

1. From the Manage accrual dues window, select the batch you want to delete.
2. Click Delete. A message is displayed asking you to confirm the deletion.
3. Click Yes to delete the batch.

Entering accrual dues credit memos

Use credit memos to perform the following tasks:

- Write off an open item that cannot be collected
- Reduce or reverse a line item charge

- Reverse a previously entered transaction
- Record product returns and credit the customer

You can process reversals of open accrual dues items on a line-by-line basis on the Credit memos window (go to Membership > Accrual dues > Credit memos). After the credit memo is processed, the balance reduction is reflected appropriately in the various inquiry windows.

For example, if a customer cancels a single line item on a bill and pays for the remaining items, you should reverse the charge of the canceled item.

Authorization levels for credit memos

The Credit memos window adheres to the same security rules as the Payments window:

- To find and view an existing credit memo, you must have a Billing authorization level of one (1) or greater.
- To enter new accrual dues credit memos, you must have a Billing authorization level of three (3) or greater. A Billing authorization level of three (3) will allow you to edit or delete credit or debit memos you have entered.
- If the View Batch by User option is enabled on the AR/Cash Batch Control window (go to Finance > Options > Batch Control), to edit or delete another user's accrual dues credit memo, you must have a Billing authorization level of four (4) or greater.

To process an accrual dues credit memo

You can process reversals of accrual dues items on a line-by-line basis through the Credit memos window. For example, if a customer cancels a single line item, you can reverse that one line.

Note: Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any income recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

1. From the Credit memos window, click New. The Date field defaults to:

- Batch date if Batch Control is used.

  If Batch Control is enabled and an active open batch is not selected, the Batch Control List is displayed. Select or create a batch and click New.

  If Batch Control is enabled and an active open batch is selected, the Date field is populated with the date of the batch.

- System date, if Batch Control is not used

  If the system date is overridden, the new date becomes the default value for inserts until the window is closed and reopened.

  The Open Batches screen will open.

2. Enter an ID or select the lookup icon to find a customer's record. After the ID field is populated, an address block for the customer displays at the top of the window and the fields labeled Type, Status, Paid Thru, and Category populate. The calculated address block contains a concatenation of the full name, title, company, and full address.

   Note: The CATEGORY field displays prefixed with the label Category if your administrator has enabled the Use Bill Categories option. If this option is not enabled, neither the category value nor the category label will display.

3. Tab to the Invoice # field.

- Enter the accrual billing invoice number and press Enter, or
- Select the lookup icon to select an invoice.

  Invoice or reference numbers are validated for the following:

- Invoice.SOURCE_SYSTEM is equal to DUES and at least one Invoice_Lines row is linked to the invoice.
- The Invoice.BT_ID is equal to the ID entered for the credit memo.

4. After a valid invoice number is entered, select from the following options:

- Click Adjust All to select all line items to credit.

  The balance amount displays in the Amt Adj field and the Credit option is selected for each line item.

- Select the Credit option to credit specific line items. For example, select this option for Line 2.

  The balance amount displays in the Amt Adj field.

- Enter an amount to credit in a line item's Amt Adj field. For example, enter 100.00 in the Amt Adj field for Line 1.

  This will automatically enable the Credit option.

  If an invoice number is invalid, these options are not enabled.

5. Click Save to update the record.

   The Total Adjustment field displays the total amount of the credit memo. Line items not adjusted are no longer displayed on the window.

   To find an accrual dues credit memo using a transaction number

1. From the Credit memos window, click Find or Open.
2. Enter the transaction number and press Enter.

   iMIS verifies that the transaction number is the correct type based on whether Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM. If the transaction number is not correct, a message is displayed informing you that the transaction could not be located.

   To find an accrual dues credit memo using a transaction date

1. From the Credit memos window, click Find or Open.

   Note: Do not enter a Transaction number.

2. Tab to the Date field and enter a valid date, for example, 04152001, and press Enter.

iMIS builds a list of potential matches, looking for a match with that date and of the correct type (Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM). If no transactions are found, a message is displayed informing you that no transactions match your criteria.

The most recent transaction to meet the criteria is displayed. If there is more than one transaction that meets the criteria, the most recent transaction is displayed and the Left arrow is activated. After viewing the previous transaction, the Right arrow is activated, allowing you to scroll through all transactions based on the date entered (Trans.SOURCE_SYSTEM equal to DUES and Trans.JOURNAL_TYPE equal to CM).

To find an accrual dues credit memo using the customer ID

1. From the Credit memos window, click Find or Open.
2. Tab to the ID field, enter a valid ID, and press Enter.

iMIS will build a list of potential matches, looking for a match with that ID and of the correct type (Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM). If the ID is not correct, a message is displayed informing you the transaction could not be located.

The most recent transaction to meet the criteria is displayed. If there is more than one transaction that meets the criteria, the most recent transaction is displayed and the Left arrow is activated. After you have viewed the previous transaction, the Right arrow is activated, allowing you to scroll through all valid transactions (Trans.SOURCE_SYSTEM equal to DUES and Trans.JOURNAL_TYPE equal to CM) based on the date entered.

If more than one Find criteria is entered, iMIS will search on the following:

- Transaction number first, if populated, and ignore the other search criteria.
- Date second, if populated, and ignore the ID.
- ID third, if both Transaction and Date are blank.

To edit an accrual dues credit memo with Batch Control enabled

You can edit an accrual dues credit memo only if it has not been exported through a General Ledger interface. After this occurs, Trans.POSTED is equal to 4, and you will not be able to edit the credit memo.

1. From the Credit memos window, find an accrual dues credit memo.
2. Click Edit.

   Note: If a batch is not selected, iMIS will ensure that the batch containing the credit memo is still in an open state and then open the Batch window.

   If a batch is selected, but is not the batch containing the credit memo, a message is displayed asking you to confirm loading a batch other than the one selected. Click No to cancel the edit or click Yes to proceed. Before changing the batch, iMIS will ensure that the batch is still in an open state. If the batch is not open, a message is displayed informing you that the batch is not open and cannot be edited.
3. Tab to the Amt Adj field to edit the amount.
4. Click Save.

   To cancel an accrual dues credit memo with Batch Control enabled

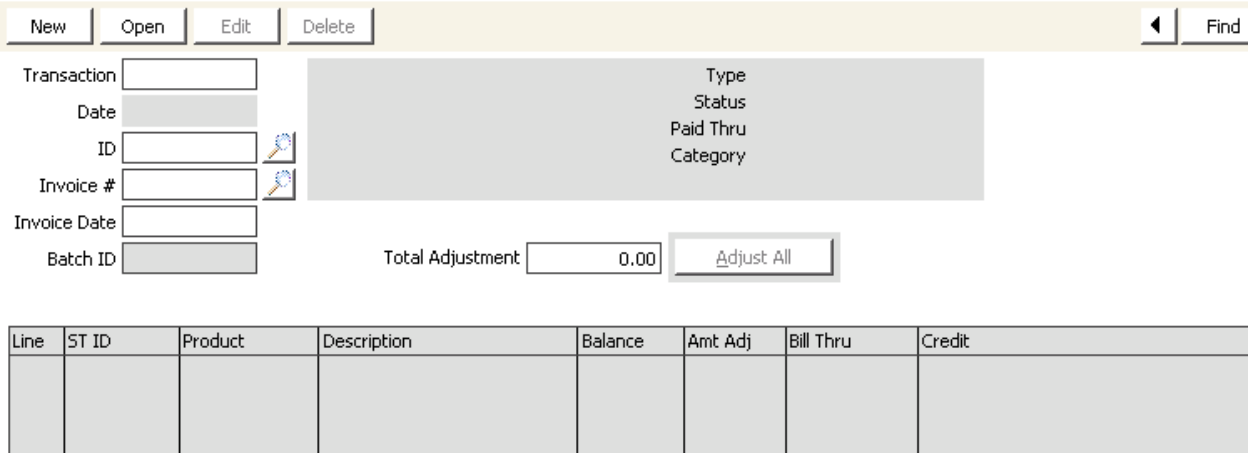
   You can cancel an accrual dues credit memo only if it has not been exported through a General Ledger interface. After this occurs and the Trans.POSTED_FLAG is equal to four, you will not be able to edit the credit memo.

1. From the Credit memos window, find an accrual dues credit memo.
2. Click Delete.

- If a batch is not selected, iMIS will ensure that the batch containing the credit memo is still in an open state, open the Batch window, and ask you to confirm the deletion. Click Yes to delete the transaction or click No to cancel the deletion.
- If a batch is selected, but is not the batch containing the credit memo, a message is displayed asking you to confirm loading a batch other than the one selected. Click Yes to proceed. Before changing the batch, iMIS will ensure that the batch is in an open state. If the

batch is open, a message is displayed asking you to confirm the deletion. Click No to cancel the delete or click Yes to delete the transaction. If the batch is not open, a message is displayed informing you that the batch is not open and cannot be edited.

Credit memos window



Membership > Accrual dues > Credit memos

Transaction

This field can be automatically populated with the transaction number. You can also enter a Transaction number to search for a specific transaction.

Date

Defaults to the current system date, or the batch date if you are using the batch control option.

ID

Specifies the billed customer identification number or. You can also select the lookup icon to select a value.

Invoice #

Specifies the invoice number assigned to the billing transaction or select the lookup icon to select a value.

Invoice Date

This field is automatically populated with the invoice date when you enter a value in the Invoice# field.

Batch ID

This field is automatically populated with the batch number of the current, open batch if batch control is enabled on the AR/Cash Batch Control window.

Original Invoice Balance

Displays the total balance due from the original billing invoice. This option displays when a record is entered.

Total Adjustment

Displays the total amount to be adjusted for the line items as you select them.

Adjusted Invoice Balance

Displays the difference between the Original Invoice Balance and Total Adjustment fields. This option is displayed when a record is entered.

Adjust All button

Used to automatically mark the credit checkbox for all line items.

Line

This column displays all the Invoice_Lines.LINE_NUM fields associated with the Invoice Number.

ST ID

This column displays all the Invoice_Lines.ST_ID fields associated with the Invoice Number.

Product

This column displays all the Invoice_Lines.PRODUCT_CODE fields associated with the Invoice Number.

Description

This column displays the description of the product code. If the invoice is a List Bill, the name of the ST_ID will be concatenated with the product title (for example, Bill Smith, Basic Dues).

Balance

This column displays all Invoice_Lines.BALANCE fields associated with the Invoice Number.

Amt Adj

This column displays the dollar amount to be adjusted from this line item. Entering an amount in this field then tabbing automatically marks the Credit checkbox.

Bill Thru

This column displays all Invoice_Lines.BILL_THRU fields associated with the Invoice Number.

Credit

Select to select a line item to be credited in full.

Entering accrual dues debit memos

Use debit memos to perform the following tasks:

- Increase a line item charge
- Bring a credit balance to zero due to an overpayment, credit memo, or cancellation transaction

Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

Authorization levels for debit memos

The Debit memos window adheres to the same security rules as the Payments window:

- To find and view an existing debit memo, you must have a Billing authorization level of one (1) or greater.
- To enter new accrual dues debit memos, you must have a Billing authorization level of three (3) or greater. A Billing authorization level of three (3) will allow you to edit or delete credit or debit memos you have entered.
- If the View Batch by User option is enabled on the AR/Cash Batch Control window (go to Finance > Options > Batch Control), to edit or delete another user's accrual dues debit memo, you must have a Billing authorization level of four (4) or greater.

  To process an accrual dues debit memo

  You can process reversals of accrual dues items with a credit balance on a line-by-line basis through the Debit memos window (go to Membership > Accrual dues > Debit memos). For example, if a customer overpays an invoice and you do not intend to refund the overpayment, you should process a debit memo for that amount.

  > **Note:** Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any income recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

1. From the Debit memos window, click New.

   The Date field defaults to:

- Batch date if Batch Control is used.

  If Batch Control is enabled and an active open batch is not selected, the Batch Control List is displayed. Select or create a batch and click New.

  If Batch Control is enabled and an active open batch is selected, the Date field is populated with the date of the batch.

- System date, if Batch Control is not used

If the system date is overridden, the new date becomes the default value for inserts until the window is closed and reopened.

The Open Batches screen will open.

2. Press Tab and enter an ID or select the lookup icon to find a customer's record.

   After the ID field is populated, an address block for the customer displays in the upper right-hand corner and the fields labeled Type, Status, Paid Thru, and Category are populated.

   The calculated address block contains a concatenation of Name.FULL_NAME, Name.TITLE (if Use Title is enabled for the preferred mailing address type), Name.COMPANY (if Use Company is enabled for the preferred mailing address type), and Name.FULL_ADDRESS.

   Note: Name.CATEGORY displays prefixed with the label Category: as long as the Use Bill Categories option is enabled on the Customer Setup - Basic Options window. If this option is not enabled, neither the category value nor the category label will display.

3. Tab to the Invoice Number field.

- Enter the invoice number and press Enter, or
- Select the lookup icon and select an invoice:

  Invoice or reference numbers are validated for the following:

- Invoice.SOURCE_SYSTEM is equal to DUES and at least one Invoice_Lines row is linked to the invoice.
- The Invoice.BT_ID is equal to the ID entered for the credit memo.

4. After the invoice number is entered, select from the following options:

- Select Adjust All to select all line items to debit.

  The balance amount times -1 displays in the Amt Adj field and the Debit option is selected for each line item.

  Note: Adjust All is available only when the overall balance is negative.

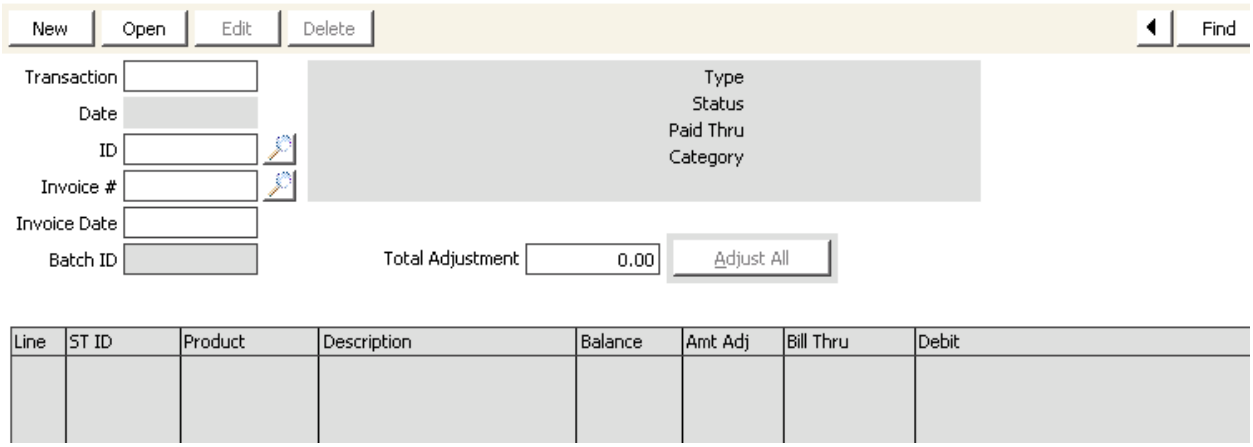
- Select the Debit option to debit specific line items.
- Enter an amount to debit in the line item's Amt Adj field.

5. Click Save to update the record.

   The Total Adjustment field displays the total amount of the debit memo and line items not adjusted are no longer displayed on the window.

   After an accrual dues debit memo is applied to an invoice, the Transaction Ledger displays the detail for each amount adjusted.

Debit memos window



Membership > Debit memos

Transaction

This field is automatically populated with a transaction number.

Date

Defaults to the current system date, or the batch date if you are using the batch control option.

ID

Enter the customer identification number or, if a company is responsible for the payment, enter the company ID in this field. You can also select the lookup icon to select a value.

Invoice Number

Specifies the invoice number assigned to the transaction or select the lookup icon to select a value.

Invoice Date

The current date automatically displays in this field when a record is entered.

Batch ID

Displays the batch number of the current open batch if batch control is enabled on the AR/Cash Batch Control window.

Original Invoice Balance

Displays the total current balance of the original invoice.

Total Adjustment

Displays the total amount to be adjusted for the selected line items.

Adjusted Invoice Balance

Displays the Original Invoice Balance plus the Total Adjustment field. The value in the Total Adjustment field is typically a negative amount and is therefore deducted from Original Invoice Balance. If Total Adjustment is a positive amount, it is added to Original Invoice Balance.

Adjust All

Used to automatically debit all line items. This button can be used if the overall balance is negative.

Line

This column displays all Invoice_Lines.LINE_NUM fields associated with the Invoice Number.

ST ID

This column displays all the Invoice_Lines.ST_ID fields associated with the Invoice Number.

Product

This column displays all the Invoice_Lines.PRODUCT_CODE fields associated with the Invoice Number.

Description

This column displays the description of the product code. If the invoice is a List Bill the name of the ST_ID will be concatenated with the product title, for example, Bill Smith, Basic Dues.

Balance

This column displays all Invoice_Lines.BALANCE fields associated with the Invoice Number.

Amt Adj

This column displays the dollar amount to be adjusted from the specified line item. Entering an amount in this field automatically enables the Debit option.

Bill Thru

This column displays all Invoice_Lines.BILL_THRU fields associated with the Invoice Number

Debit

Select to have the line item debited.

New Features iMIS20 EMS

iMIS 20 is an Engagement Management System (EMS) that enables organizations to engage members, donors, and other constituents – as well as staff – anytime, anywhere, and from any device. It includes constituent management, constituent self-service, online fundraising, social engagement, private communities, mobile access, and website management in one seamless system.

Advanced Solutions International, Inc. is pleased to announce the release of iMIS 20. This section offers an overview of the exciting developments iMIS customers have come to expect with every new product release.

With iMIS 20, ASI added to the strengths of iMIS 15.2 by making improvements, enhancements, offering new expansions and developing exciting, first-time features.

To our current customers and organizations new to the world of iMIS, welcome to the power of iMIS 20!

Engagement is paramount: iMIS 20 breaks ground as the premier Engagement Management System with deep functionality – including Fundraising, Managing Contacts and relationships, Events, Communities, and International Commerce – spanning a record number of self-service-based interfaces and devices.

No more missed connections: iMIS 20 is a complete site-building platform, making it possible for organizations to support staff in the way they need to work – and to reach constituents in the way they want to connect. With Give Now, Renew Now and Join Now, Promotions and Discounts, Mobile sites, self service-based Event registration engagement with iMIS 20 is for today's organizations.

The strength of RiSE: Powering all of these sites, the iMIS RiSE platform combines a full-featured web content management system with a gallery of site-building web parts,

letting you construct robust and easily upgradable sites.

With RiSE Tools, you can create queries, reports, business objects, workflow, and content tags. In addition, with the exciting benefit of no programming or hand customization requirements, you control the elements that make for dynamic and engaging user interfaces.

Think of it as your control panel: Administrative Console offers a streamlined interface for staff to perform day-to-day and occasional activities for organizations in the areas of Finance, Membership, Events, Fundraising, Continuum, Settings, and System Admin.

Enhancements in iMIS 20

This release includes enhancements you will find throughout iMIS.

Enhancements in iMIS 20.1.19

Accounting enhancements

Paying open invoices from the Staff site

Users can pay standard invoices listed in the Open Invoices section on the individual and organization account pages. Company Administrators can pay invoices billed to the organization and invoices billed to a member of the organization. Staff users with On Behalf Of privileges can pay invoices billed to any contact. The staff user is transitioned automatically to act On Behalf Of the invoiced contact.

Editable amounts for Voluntary items

Customers can now edit the amount of their Voluntary Contributions, and specify an exact amount they want to contribute.

TNSPay Gateway

Customers now have the option of using the TNSPay gateway for transactions.

Enhanced online credit card validation

This enhancement validates that the credit card number entered by a customer when making an online purchase matches the selected payment method. If a customer enters a credit card number that does not match their selected card type, the customer will be required to correct the card type or the credit card number.

Staff users now have the ability to define fair market value for an event or product

The Item Creator content item now provides a field for Fair Market Value when setting up gift events and products. This option allows people to take a tax deduction for the amount that exceeds the Fair Market Value.

Manage taxation through the Staff site

While defining or editing products through the Staff site, users can conveniently manage taxation for products.

Donor donation data can be imported

When third-parties, such as volunteers, collect donations for an organization, staff users can import donor and donation data into iMIS.

Viewing and printing contact account statements

Account statements provide a useful summary of contacts' open invoices. Staff users can conveniently view and print a single contact's account statement

from the contact's profile page on the Staff and Member sites. They can also easily print account statements for all contacts in iMIS that have outstanding balances.

Easier auditing of staff web transactions via batches

By default, one batch is created for both staff and public users' web transactions per day. System administrators, however, can configure iMIS to create separate batches for staff and public users' transactions to allow easier auditing of staff web transactions. They can further specify that a separate batch be created for each staff user per day.

Change a cash or check transaction date to reflect the true date of payment

Staff users can adjust the transaction date for their own and On Behalf Of transactions that use non-gateway payment methods, such as checking accounts. These transactions are placed in an open batch for the specified transaction date.

Billing enhancements

Online joins now support annually billed memberships and standard and special pro-rating

The billing type (Annual or Anniversary) set for the billing cycle in iMIS Desktop or the Advanced Accounting Console is now honored for an online join. Since online joins now support annually billed memberships, standard and special prorating can be applied to membership fees when members join online. This allows an organization to prorate an annual membership fee based on the date the member joins within the billing year. When special prorating is defined, user-defined prorating rules are now applied to online joins. Future credits can also be applied, enabling members to receive a discounted membership rate for concurrent membership renewals.

Fundraising enhancements

Staff users now have the ability to define fair market value for an event or product

The Item Creator content item now provides a field for Fair Market Value when setting up gift events and products.

Manage taxation through the Staff site

Staff users can now conveniently manage taxation for products and events through the Staff site.

Donor donation data can be imported

When third-parties, such as volunteers, collect donations for an organization, staff users can import donor and donation data into iMIS.

Certification enhancements

iMIS Certification is a highly organized and integrated tool for managing your organization's certification programs! iMIS Certification assists your organization in giving

credits to members for activities or achievements defined by your organization. Providing a certification program on your site keeps your members well-informed and coming back to your site to check on the status of their certification as they complete each program requirement.

iMIS Certification is a self-service feature that gives your members the ability to:

- Stay informed and up-to-date with training and certification programs
- Manage and view their certification progress
- Stay engaged with your organization and your website

iMIS Certification allows your staff to:

- Define and manage a certification program
- Add component requirements
- Offer a variety of ways to complete the requirement
- Link offerings to iMIS products and events as well as HTML links

Communications enhancements

Attachments saved with email drafts

You can now include attachments (in RDL or PDF format) with email drafts.

Communication Creator enhancement

When you use a query to create a list of contacts to email with Communication Creator, you no longer need to display a PartyId column to users on your website in the Query Menu content item.

Setting email preferences through Communication Types

Staff users can define the types of communications that organization members can receive. This enables users to set personal preferences to opt in or out of different types of emails.

Users can manage communication subscriptions directly

Recipients of your emails can now manage their subscription preferences directly from the emails they receive from your organization without logging into the site.

Contact mailing labels

You can print contact mailing labels directly from the Staff site using two new contact reports. The 2 Up Labels.rdl report prints labels on letter-size (8.5 x 11 inches) Avery 5162 or 5262 stock. The 2 Up Labels A4.rdl report prints labels on A4-size (210 x 297 mm) Avery L7162 stock.

New Users can manage their communication preferences

iMIS now enables users to manage their opt in and opt out preferences for email communications both through their account pages and directly from emails.

View a log of contacts' communication opt-outs and opt-ins

Staff users can run the Communication Preferences Log query to view a log of contacts' updates to their communication preferences.

Events enhancements

Specify a Date Range for Event Visibility

A new event setup option has been added that allows event planners to define a date and time range through which events are displayed to the public in the search results and the event calendar.

Staff users can still view inactive events by selecting the new Show Inactive checkbox.

Staff users can restrict when public users can register for events

Staff users can specify a date and time range when public users are allowed to register for an event. Staff users and system administrators can register themselves and other contacts at any time, regardless of the date range.

Event reports

Users can now access two reports on the Event-Specific Console that make managing your events easier. The Registrant Directory report allows you to view a listing of all event

registrants. The Print Badges report allows you to print badges on Avery 5392 badge stock for all event registrants.

Renamed buttons on the Events Console Dashboard

The Registration Option Registrants report is now accessed through the Registration Option Registrants button on the Event-Specific Console. This button opens a report that displays a list of registrants for each registration option. The All reports button has been replaced. Instead, there is now a Program Item Registrants button. This button opens a report that displays a list of registrants for each program item.

Badges formatted to Avery 5392 badge stock can be run from the Print Badges report.

Events listed on the Event Calendar are now color-coded to indicate visibility and availability for registration

Users can now easily tell if an event on the event calendar is available for registration!

Events listed on the Event Calendar are now color-coded

- Green indicates that the event is visible to all users and open to registration.
- Yellow indicates that the event is visible to all users but not open to registration.
- Orange indicates that the event is visible only to staff users.

Manage taxation through the Staff site

Staff users can now conveniently manage taxation for events through the Staff site.

New Customer Types for event guests added by members

Specifies the default Customer Type to use when creating new iMIS contact records for event guests of registered members. If you do not define the type, these new contacts will be assigned as the system default as defined above.

Search enhancements

Common Search Content Item

Staff can now search for people and organizations!

The Common Search Content Item has two new search areas. People and Organizations search areas now allow staff users to easily search for a person or organization from a single location.

Search results now include attachments

The content of attachments is used during a general search. When an unsecured PDF, TXT, RTF, DOC/DOCX, or HTML file is attached to a Community post, the results will link back to the parent document where the attached document is located.

Product search can be limited by dates

A new product setup option allows administrative users to define a date and time range for when products are available to the public by search.

iMIS Dynamic Content Item enhancements

Enhanced Search (Common Search)

The Search (Common Search) has added two new search areas to the display search drop down box. People and Organizations search areas now allow staff users to easily search for a person or organization from one easy place.

Improved Address Mapper Configuration

The Address Mapper now includes a drop down box that will list any preferred addresses or address purposes. The selected address purpose determines what address is shown.

Improved Panel Editor Configuration

The Panel Editor will now be able to hide the panel if the current user is viewing data for another contact and when none of the fields have value. An option has been added into the configuration that limits users who can view the data for another contact.

New: Open Invoice List Display

The Open Invoice List Display allows users to pay listed open invoices on the individual and organization account pages.

Enhanced Invoice Payment Link

The Invoice Payment Link now includes an option to add standard invoices to the cart.

New: Recent History

The Recent History content item allows users to quickly review and access items that have been recently viewed such as events, contacts, and groups.

Contact Sign In Configuration Update

The Contact Sign In content item now includes a configuration option that enables you to customize the message that appears when a user encounters a failed sign in.

Hiding content items for different screen sizes

Your website might have content that is not appropriate to display on certain devices. With the introduction of responsive themes to iMIS, you can configure your content to be displayed only on the devices that you want.

Users can configure any of their websites that use a responsive theme to selectively show or hide various content based on the screen size of the device used to visit the site. The configuration can be performed with options in many of the content items, or through utility classes through any content item that supports HTML editing.

Staff users now have the ability to define fair market value for a product

The Item Creator content item now provides a field for Fair Market Value when setting up gift products.

Additional gateway for the EFT Gateway Account Administrator content item

Staff users can now select one of two gateways in the EFT Gateway Administrator content item: Payflow or iATS.

Users can link to content from the HTML Editor

You can now link to iMIS content or shortcuts in the document system from the HTML editor.

New configuration options for Query Chart Viewer

Charts are now more dynamic, more appealing, and allow for some level of drilldown to isolate measures in the chart.

There are three new configuration options added to the Query Chart Viewer content item: Chart series position, Enable Tooltips and Display chart labels.

Panel Editor and Panel Collection Editor enhancements

Panel Editor and Panel Collection Editor now allow easier editing of data in single-instance panels. When users choose to edit a panel, the panel displays in edit mode inline with the page instead of in a separate window. Staff users can also configure the content items to open in edit mode by default for users who have permission to edit the panel data.

New: Social Profile List Creator

The Social Profile List Creator content item displays social network profiles for a contact as an icon link list. Clicking on the contact's social network icon will open the contact's profile page for that network in another browser window.

New Group List Editor configuration option

You can show or hide multiple levels of groups. For example, if you have a committee, your Group List Editor list for the committee shows all the people. Expanding the Group List Editor for the person shows all of their other committees and other groups, which can also be expanded.

When selected, the Allow expanding lists configuration option provides a nested group list. When deselected, the new configuration option provides a flat list of groups or people that belong to a group.

EFT Gateway Administrator configuration update

You can now put the Gateway into test more.

The EFT Gateway Administrator content item now includes a configuration option that allows users to change the PayflowPro Gateway Host Address for testing purposes.

New: Confirmation Display

The Donation Thank You Page is updated to send an email to donors. A new content item, Confirmation Display, automatically sends Thank You emails to donors.

New config option in Report Display content item

Under Toolbar, the option none is changed to read Display full toolbar.

New configuration option for File Importer for Web Services

A new configuration option, Use custom file formats, is added to the File Importer for Web Services content item. At run time, the content item displays the available import modules instead of file types.

New configuration options in the Query Chart Viewer content item

There are new configuration options for the Query Chart Viewer content item: Series data column and Series data format. These new options will allow users to view multiple values of data, for example, compare yearly sales or meeting attendance year-to-year. These new configurations allow for multiple values to be displayed in one chart driven by IQA queries. The data points are animated when the user first sees the chart.

There is also an option to Enable stacked series. This option allows related data to be stacked on the same data-point bar.

Defining redirection on the Finish button in a Content Collection Organizer wizard

Staff users can now define how the Finish button in a Content Collection Organizer wizard can redirect a user to specific content in iMIS. By defining the behavior of the Finish button, Staff users can direct a customer's path through content and websites.

Installation enhancements

Multi-Instance Utility

The Multi-Instance Utility has been refactored to accommodate the new AsiScheduler.

Enhancing the Multi-Instance Utility to enable reconfiguring existing copied instances of iMIS

Users can now reconfigure a copied instance of a server with multiple iMIS instances configured, and use the copied server instance to set up new instances. Using the Multi-Instance Utility, you can provide new virtual application root names, host names, database coordinates, and more on the copied server instance.

AsiScheduler

AsiScheduler provides an optimized PUSH publishing infrastructure. AsiScheduler takes the place of two previous iMIS services: AsiPublisher and AsiWorkflow. AsiScheduler provides a more stable publishing service and offers increased performance.

Convenient access to the appropriate version of the Workbook Converter tool

The corresponding version of the Workbook Converter tool for use with your version of iMIS is now placed in the Net\bin folder during the iMIS installation (under the location where iMIS is installed). The default location is C:\Program Files (x86)\ASI\iMIS\Net\bin. If your iMIS 20-300 is ASI-hosted, contact ASI Hosting or your AiSP to access the Workbook Converter.

New Settings section in the Staff site

A new Settings navigation has been added to the Staff site to keep common security, organization, contact, commerce, RiSE, and utility configurations in a single, easy to navigate location.

Look and feel enhancements

Enhanced Search (Common Search)

The Search (Common Search) has added two new search areas to the display search drop down box. People and Organizations search areas now allow staff users to easily search for a person or organization from one easy place

New Look for The Intelligent Query Architect (IQA)

The Intelligent Query Architect now displays the Define, Run, Report, and Security tabs above the Summery, Sources, Filters, Display, and Sorting tabs.

New grid system for website layouts

The grid system in iMIS has been enhanced to include the Bootstrap grid framework to allow for more modern and complex layouts. Up to 12 columns with simple nesting ability are now allowed.

Search results now include attachments

When an unsecured PDF, TXT, RTF, or HTML is attached to a post the content of that file will be searched when a general search is performed. The results will link back to the parent document where the attached document is located.

Staff and security enhancements

User-level based security settings for searching for and viewing contact profiles

iMIS now has 3 user-level oriented security settings for visitors to your public-facing sites to search for and view contacts. These settings are powered by the queries you place in the following fields:

- AllUsersAccessQuery: All website visitors can view the contacts included in the query populating this field.
- AuthenticatedUsersAccessQuery: All logged-in visitors can view the contacts included in the query populating this field.
- MemberAccessQuery: All logged-in members of your organization can view the contacts included in the query populating this field.

Online directory access based on queries

System administrators can configure iMIS so that any users, including unauthenticated users (visitors), can view profiles for contacts that are returned by a selected query.

New Sign in system setting

A new system setting provides an option to create a site-wide default failed sign in message.

Adding HTML to Certification component and offering descriptions

Staff users can now use an HTML editor to add HTML content to the descriptions of Program components and Program component offerings. There is no support for adding images through HTML.

Linking products to Certification program component offerings

Products can now be linked to Program component offerings. When program component offerings are defined as Product types, Staff users can define the product they want to link to the offering.

Purchasing products can satisfy Certification requirements

Purchasing products that are linked to Program component offerings can satisfy the requirements for program components.

Running self-contained reports in the Document System

Staff users can now run SSRS reports in the Document Browser using a Run button. This will open a new window in which the report is displayed. These reports can be exported as either PDF or Excel files.

Organizations can now define the default currency to use in iMIS

The Staff site has a new configuration option that allows users to specify the default currency code in iMIS with PayPal Express and Payflow Pro.

Manage taxation through the Staff site

Staff users can now conveniently manage taxation for products and events through the Staff site.

Add Organization Goals and Industry Standards to the Guided Performance Scorecard

Staff users can update the Guided Performance Scorecard, adding yearly association goals and industry standards.

Use the Workbook Converter to import data

You can now import data from an Excel workbook into a new iMIS 20-300 database using the Workbook Converter Tool. The original data is exported to an Excel workbook, and

the Workbook Converter runs a one-time import of this data and uses it to populate the new database.

Committee management through the staff site

You can now manage committee membership, assign committee roles, and define term dates through the iMIS Staff site.

Contact mailing labels

You can print contact mailing labels directly from the Staff site using two new contact reports. The 2 Up Labels.rdl report prints labels on letter-size (8.5 x 11 inches) Avery 5162 or 5262 stock. The 2 Up Labels A4.rdl report prints labels on A4-size (210 x 297 mm) Avery L7162 stock.

Remote Advanced Accounting Console

In the Staff site, a navigation link is added that directly connects to the Advanced Accounting Console, remotely. This link provides Staff users the ability to access all of the powerful features of the Advanced Accounting Console from the convenience of the Staff website.

New Settings section in the Staff site

A new Settings navigation has been added to the Staff site to keep common security, organization, contact, commerce, RiSE, and utility configurations in a single, easy to navigate location.

Sign in to your website using Facebook

After a Staff user completes a simple set up procedure on the Staff site, your users can sign in to your website using their Facebook credentials. Existing iMIS accounts are linked to the Facebook accounts, and new users will automatically create iMIS accounts. A user can even choose to use their Facebook profile picture as their profile picture on your website. If desired, you can configure iMIS to prompt users to link their iMIS and Facebook accounts and to prompt users who create a new account during the linking process to enter additional information in a Contact Account Creator content item. Users

have the option to disconnect their iMIS account from their Facebook account at any time. Eliminating the need for users to keep track of multiple usernames and passwords will result in more visits to the essential content on your website!

Expanded BIDS compatibility increases convenience when creating and editing SSRS reports

SQL Server Reporting Services (SSRS) reports in iMIS are now compatible with all versions of Business Intelligence Development Studio (BIDS) that install with SQL Server versions supported by iMIS. iMIS currently supports Microsoft SQL Server and Express Edition 2012 SP1 and Microsoft SQL Server and Express Edition 2008 SP3 and 2008 R2 SP2 (32-bit and 64-bit). You can now easily create and edit SSRS reports in any of these versions of BIDS.

Enhancements in iMIS 20.1.1

Creating Communications in iMIS

New for this release is the ability to design and send email communications to designated contacts. This enables users to create a new message template and open a saved message template message templates and customize recipients using an IQA query. This will enable staff users to use an already-designed message for future communications without having to design the message again.

Staff users can also add attachments to communications. The attachments can be static documents chosen through the Document System, or they can be templates.

Staff users can review the full results of the primary query for Communication recipients and select or deselect recipient checkboxes from the list before sending the email. Users can also see the data source in the communication creator, and switch back and forth between the data source and message composition.

Staff users can run an IQA query and then, by clicking a newly provided Email button, use the Communication Creator content item to write and send a new or pre-defined email to the resulting PartyID members and constituents.

Events enhancements

When a user selects an event to view, iMIS displays an event console page. The event console provides a detailed display of information about an event. The console can include images and a variety of information, including:

- Showcase tab – The Event Showcase offers a detailed display of information about an event. The showcase allows users to edit an event, register, and add program items for an event.
- Dashboard tab – This is the landing page for the Events tab. It provides a quick view of important, up-to-date registration figures for a specific event. The dashboard information is configurable.
- Registrants tab – The Registrants tab presents a listing of all the registrants for a selected event.
- Questions tab – The Questions tab displays answers to the questions that were posed to registrants when they registered for an event.

Registering

iMIS Events has been enhanced to provide more robust registration options. Event planners can now easily associate specific program items with particular registration options. This feature offers flexibility to event planners and clarity for members about what is offered with their registrations.

Users can add a guest for themselves or others whom they have already registered. These guests are linked to the primary registrant. Users can select the guests from the Registrants carousel in the Event Showcase, update their registration details, and edit their registrant (badge) information. Also, when registering someone else, users can search for an existing company contact to register, or add a new contact from a single screen.

Users can set a maximum number of registrations per registrant for a Program Items.

Managing

Staff users can also manually override set fees for registration options and program items for individual members, making personalized, one-time discounts possible. This provides flexibility in event pricing. Entered the wrong price or changed your mind? Before checking out, simply revert back to the original price by clicking the Revert to original price link.

Users can view and edit the registration of anyone they have previously registered by returning to the Event Showcase. This includes registrants added by staff users using On Behalf Of. For each existing registration, you can add and remove program items if the event allows it, add a guest for any registrants that are not already guests, and edit registrant information.

iMIS now fully supports questions during the registration process. Staff users are now able to define questions for registration options, as well as for a full event and individual program items. Staff users can also select drop-down lists as an answer type for questions. These lists can be defined explicitly or by query.

Questions can be edited and hidden in events, registration options, and program items. Staff users can reorder questions after they have been defined for an event, an event registration option, or an event program item.

A reminder message now appears in the shopping cart if a user has forgotten to answer a required question.

Accessibility enhancements

Page Builder now has a checkbox that enables certain content items to include more detail in the title of the webpage. The General Product Display, Event Display, Contact Name, Contact Mini Profile, Communities, and Donation Creator content items can now contribute to the dynamic page title. This feature must be enabled manually for custom content.

You can also now specify a summary attribute in the IQA definition interface to describe the type of information contained in the results table. This summary helps users who are using screen readers or other assistive technology get a quick indication of the type of information included in the table, without forcing users to read the entire table.

Accounting enhancements

Renewals

Two new checkbox fields, Use for web joins and Use to display itemized web renewals, have been added to the Set up billing cycles window on the Administrative Console and in Desktop:

- Use for web joins –When selected, the billing cycle can be used to allow new members to join on the web.
- Use to display itemized web renewals – If selected, each individual item is displayed when a cash-based renewal is viewed on the web. Optional items may be added and removed. If not selected, or if the renewal is accrual-based, the individual items are not visible on the web.

Promotion Codes

A previously defined discount code can be used by a shopper to receive a discount on a specific event program item.

Staff users can create promotions (discount codes) that apply to specific products, and these discounts can be either percentages or fixed amounts.

Overrides

Before adding simple items to the cart for checkout, staff users now have the added convenience of overriding simple item pricing. Switching back to the original price is as easy as clicking Revert to original price. This option cannot be used in conjunction with promotional codes or other discounts.

Staff users can also manually override set fees for registration options and program items for individual members, making personalized, one-time discounts possible. Before checking out, click Revert to original price to revert back to the original price.

Staff users can override alerts indicating items are out of stock. Simply enter the desired quantity, and proceed through the checkout process.

Moneris payment gateway available in the Administrative Console

You can now authorize Moneris as a credit card payment gateway in the Administrative Console.

Moneris is also available as a supported payment authorization gateway, along with PayPal and TNSPay (formerly SafePay).

Join Now Page allows chapter selection

New members are able to select a single chapter when they elect to use Join Now. When a member renews a membership, the chapter fee is now included.

Deferred Income option when setting up program items

Staff users with a DEFINC license for iMIS can now choose a deferred income account when setting up program items.

iMIS Dynamic Content Item enhancements

Panel Editor now allows Required data fields

The Panel Editor content item now allows you to define fields as required. If the required data, such as a name or date, is not populated, the panel cannot be saved by the user.

Enhanced functionality of Invoice Payment Link (Renew Now)

The Invoice Payment Link content item now allows users with On Behalf Of permissions to select the Renew Now button. This will automatically enable On Behalf Of, and add the invoice for the selected user to the cart. For users without On Behalf Of permissions, the renewal invoice is added to the logged-in user's cart where they can pay for the invoice themselves. This applies to staff without the On Behalf Of role and Company Administrators who can see their employee's account pages.

Percentage and fixed-amount promotions for specific products and product categories

The Promotion Creator content item now allows users to create promotion (discount codes) that apply to specific products or product categories. These promotions can be a percentage or a fixed amount.

New content item – Administrative Console content item

Staff users can use a new Administrative Console content item to create a link on the Staff site that can be used to launch the Administrative Console (Desktop client) within a separate browser window. The staff user can automatically be logged in. The content item works with Internet Explorer, Firefox, and Chrome browsers.

New content item – Payment Method Set Creator

Within an organization, website-to-website payment needs can vary. With the Payment Method Set Creator, accounting staff working through Administrative Console (Finance) can now easily create a unique payment method set, and conveniently associate that payment method set with a specific website.

Look and feel enhancements

Easy edit now has color-shaded bars and borders

Easy edit now features shaded bars and borders in blue tones, so users can easily click on areas for content editing and content item configuration.

Style guide now available for reference

A style guide (found under Manage in the Member Quick Start site) is now available for web developers to reference when designing or editing an iMIS theme. This first iteration includes a page that describes and displays some of the basic HTML elements that commonly appear within an iMIS site. You can see at a glance exactly which styles need to be updated for a theme.

Renamed RiSE terms and navigation items in Staff site

The following terms and navigation items have been renamed:

Previous term	New term
Site designer	Site Builder
Content designer	Page Builder
Manage content layouts	Manage layouts
Set up content management	Set up RiSE
Site designer configuration	Site Builder configuration

Content designer configuration	Page Builder configuration
Sample Sites	Quick Start Sites

Improved website performance

The default for caching website content is now set to one hour for unauthenticated users. This allows for a cached version of the page to be stored on the server without having to access the database if the same page is accessed within one hour.

Administrative Console improvements

The look and feel of the Administrative Console has been streamlined and improved, and common tasks are easier to find. Bold icons have been added to the console page. The Home page has been updated to include frequently used tasks, and new navigation items were added for Membership, Commerce, Events, Fundraising, and Customer Service. The Accounting navigation item was renamed Finance and Configure was renamed Settings.

Users only see CCO tabs they have permission to view

Website users accessing content records with Content Collection Organizer (CCO) will now only see tabs if they have permission to view the content in the tab. Tabs will be hidden if the user does not have permission to access the content in the tab or if the content is unavailable for any other reason.

Account page improvements

The Participation tab for staff, Authenticated and Organization account pages has been updated to include a new Open Invoices query, which shows the invoices due for payments for which the target is the Bill To contact. A new Recent Transactions query was added to show any transaction for which the target contact is the Ship To contact. The Billing History query was removed from the non-staff account page.

Installation enhancements

During a new iMIS install, several core components are selected by default and automatically installed. The following changes are made to the iMIS installation wizard:

- The iMISPublic application will not be selected during a new install. If you want to install iMISPublic, be sure to select the iMISPublic application during a Custom install.
- Although the iMIS Web View (legacy Administrative site) is installed with RiSE, it will not be marked as an active site.
- The new Staff site will be installed as your default site.
- iMIS offers support for Windows 8.

  These changes do not affect upgrades. You can continue using iMISPublic and the iMIS Web View will be marked as active, if previously active.

  Alternative sites to use: With the focus provided on feature enhancements to our RiSE websites, the legacy Administrative site (iMIS Web View) has been replaced with the RiSE Staff site. The new Member site can be copied and used as your organization's public-facing website.

Automatic Payments

AutoPay enables the automatic renewal of membership fees and recurring donations using a member or donor credit card. AutoPay is available in the Join Now and Give Now pages of your website. You can set your website to invite the member and donor to opt in or out of automated renewals, or even have the option switched on for all new members and donations.

Members can opt in at any time - when they join or when they renew. Members who have opted in to automated renewals still have the option to pay by alternative means of payment at renewal time, or opt out altogether.

When making a donation online, donors are invited to make a recurring gift – offering weekly, monthly, quarterly and annual payments. Your staff can suspend or cancel the payment at the donor's request.

Key Features & Benefits:

- Offer members and donors the choice of easy, automated payments.
- Maximize member and donor retention with automated renewals and recurring donations.
- Enable members to discontinue automatic payments at any time.
- Set automatic payment options in the join or renewal process as either off, opt-in, opt-out or always on.
- Set recurring donation options in the online give now pages as either off, opt-in, opt-out or always on.
- Differentiate between automatic and non-automatic renewals so your members are billed accurately.
- Staff manually add members to the automatic membership renewal program.
- Staff preview membership fees and donations to be collected, and submit for collection.
- Securely store member credit card details in a PCI-compliant manner.

Staff and security enhancements

Company Administrator role extended and enhanced

Members with the Company Administrator Role role can now add new contacts to their company roster, edit their contact information, and assign a member from the roster to the Company Administrator role.

System configuration to control how users link to their organization

A new configuration option has been added to control whether users can link to an organization when they create an account or update their account information. There is also a new option to allow either all users or only company administrators and staff to bill their organization when paying for items in the cart. These configuration options are located on the Staff site.

A designated Company Administrator can select their organization as the Bill To contact for the organization for transactions entered through the web. The Company Administrator can also pay dues for the company or for others in their company.

Upgrading the On Behalf Of role

Security was added to the On Behalf Of role to allow only Full users to be assigned to this role. After upgrade, all Casual or Public users previously assigned to the On Behalf Of role are removed from this role. To add this role back to contacts, change the contact to a Full user.

Global password requirements message

A new system settings field was added allowing you to customize the password requirements message when an account is created or when a password is changed. The message can include two variables to specify the minimum password length and the minimum non-alphanumeric characters allowed.

Overriding prices on simple items and events

Staff users now have the added convenience of overriding simple item pricing before adding simple items to the cart for checkout. Switch back to the original price by clicking Revert to original price. This option cannot be used in conjunction with promotional codes or other discounts.

Staff users can also manually override set fees for registration options and program items for individual members, making personalized, one-time discounts possible. Before checking out, click Revert to original price to revert to the original price.

Customizable Staff account pages

iMIS provides a Staff Account Page with content records displayed in a tabbed format. These content records are stored in a system-protected folder and are subject to being overwritten during an upgrade. To display custom content records on the Staff Account Page, a staff user can place those content records in a shared folder that will not be overwritten during an upgrade. You can also copy an existing content record from a system-protected folder to the shared folder.

Staff can complete event registrations despite alerts and warnings

Staff users can now override messages and alerts during registration and in the cart, and complete the registrations.

NRDS

With the NRDS bridge for data synchronization, National Association of REALTORS® clients can better manage the information shared between iMIS and NRDS through an automatic synchronization of changes made in either database. This process runs in the background as a scheduled task. You also have the option to manually synchronize specific records at any time.

How it works

iMIS polls NRDS on a regular basis to see if there have been any data changes. If a change is found, it is placed in a queue for processing. The queue is processed every time the NRDS scheduled task is run, according to the frequency and batch size you define. This same process also looks for changes in iMIS and sends that information back to NRDS. If three timeout errors occur in a row during this exchange, the process stops, but all remaining records stay in the queue. These are processed the next time the scheduled task is run. If any other problems occur during this transfer, the item is removed from the queue and an error message is added to the NRDS log. By default, NRDS changes are brought into iMIS first, before iMIS changes are pushed to NRDS.

In addition to the automatic updates, you also have the option to synchronize data for a specific member or office on-demand using the NRDS Sync Buttons and NRDS Sync By ID content items. These content items are helpful when you need to synchronize data immediately, instead of waiting for your scheduled task to run.

Data shared between NRDS and iMIS

All of the data shared between NRDS and iMIS can be accessed through content items, user-defined windows, queries, and reports. The following table defines the data types shared between NRDS and iMIS.

Note: Note: If you have any custom NRDS tables that you use for iMIS queries, reports, special pricing, or billing, update those items to use the new AsiNrds tables described below.

NRDS tables	iMIS user-defined tables	iMIS business objects
Member	Broken up into AsiNrdsMember and AsiNrdsMemberDesignation	CsAsiNrdsMember and CsAsiNrdsMemberDesignation
Member Supplemental	AsiNrdsMemberSupplemental	CsAsiNrdsMemberSupplemental
Member Demographic	AsiNrdsMemberDemographic	CsAsiNrdsMemberDemographic
Member Education	AsiNrdsMemberEducation	CsAsiNrdsMemberEducation
Member Financial	AsiNrdsMemberFinancial	CsAsiNrdsMemberFinancial
Office	AsiNrdsOffice	CsAsiNrdsOffice
Office Supplemental	AsiNrdsOfficeSupplemental	CsAsiNrdsOfficeSupplemental
Association	AsiNrdsAssociation	CsAsiNrdsAssociation

Data restrictions

Multi-instance tables: When you make changes to the NRDS data stored in iMIS, keep in mind that NRDS does not allow you to add, update, and delete all data. So while it might be possible to update something in iMIS, changes that NAR does not allow will be reverted the next time the record changes in NRDS. NAR has rules for the following multi-instance tables:

- You can add, update, and delete data from the Education and Demographic tables.
- You can add and update (but not delete) from the Supplemental tables.
- You can only add to the Financial table.

Point of Entry status: There are also restrictions on what you can update based on your Point of Entry status for a member or office. If you make changes to a record you are not authorized to edit, this will be overwritten when you synchronize from NRDS. You may

also get a partial success error in your log after a synch. Contact NAR if you have questions about your Point of Entry status for a particular record.

Field length: If you notice that certain iMIS fields are truncated after synchronizing from NRDS, it is possible that the iMIS field has a different maximum field length than the NRDS field it is mapped to.

New NRDS contacts: If you manually create a new NRDS member or office in iMIS, you must fill out the required fields in the NRDS tables according to the NRDS requirements before synchronizing the new record to NRDS. Contact NAR if you have questions about the required fields. For more information, see Adding new NRDS contacts and supplemental memberships from iMIS.

Associations: Association panels are read-only in iMIS, because association records are only allowed to be updated from NRDS. Any changes you make to an association in iMIS are overwritten during a regular synchronization.

NRDS bridge setup and configuration

To start using the NRDS bridge, you must do the following:

- Install the WebSphere MQ Client and use the iMIS DB Maintenance Utility tabs to create the required NRDS pieces.
- Configure the NRDS Bridge with the NRDS host credentials and map the NRDS fields to iMIS fields.
- Set up windows to view and edit the NRDS data.

> **Note:** Important: You must set up and configure the NRDS bridge before you can synchronize any data.

> **Note:** Note: If you plan to set up a test database before implementing NRDS in your live system, contact NAR first to obtain connection information for their test database, so that you do not update any live data while testing.

To install the NRDS foundation

1. Download and install the free IBM WebSphere MQ Client on your iMIS application server.

   Tip: After unzipping the WebSphere MQ Client zip file, open the Windows folder and run setup.exe.

2. Restart your application server.
3. From the Start menu, go to the iMIS program group and run the iMIS DB Maintenance Utility tool.
4. Enter your database connection information.
5. From the Options tab, click Add NRDS Items.
6. Check the Output section below the button to verify that no errors occurred.

   To configure the NRDS feature

1. Add the NRDS configuration page to your website.

- From RiSE > Page Builder > Manage content, create a new content record and add the NRDS Configuration content item (located in the Utility folder of Content Gallery).
- Configure the content item as desired, then Save & Publish the content record.
- From RiSE >Site Builder > Manage sitemaps, select a website from the dropdown list.

  Note: You can select any WCM website or your staff site.

- Create a new Website Navigation Item.
- For the Content or URL to Link to, select the NRDS configuration content record you created.
- Save, and then Publish the navigation item.

2. From the configuration page, enter your NRDS host credentials and map the NRDS fields to iMIS fields. The mapped fields are automatically updated when iMIS and NRDS are synchronized.

Note: The following fields are automatically mapped and cannot be edited from the configuration page: name fields (including Prefix, First, Middle, Last, and Informal/Nickname), Gender, Birthdate, Title, Join Date, and CO_ID (for members if the primary office record is in iMIS or for offices if the parent office or association record is in iMIS).

- Navigate to the NRDS configuration page you created.
- Click the edit icon.
- In the NAR Host Credentials section, enter the NRDS host credentials provided to you from NAR, so that iMIS can connect to NRDS.
- For each NRDS field listed in the Member, Office, and Association field mappings sections, specify which iMIS field you want to map it to, or leave it blank if you do not want to synchronize the data with a standard iMIS field.
- Member type fields: Enter the iMIS customer types that you want to map to the NRDS member types. You can map the NRDS member types to a single iMIS customer type or to multiple types using a comma-separated list (e.g. M,IM). In addition, note the following about the Member, Office, and Association member type sections:
- Member type mappings: For each NRDS type listed, you can specify one or more member types or member type-category combinations. For example, to map the NRDS Realtor type to the iMIS Member type (M), enter M. If you would also like to map that member type to a category (for example, Cat1), enter M-Cat1. In this case, when a new realtor is synchronized from NRDS, it will be marked as a Member in Cat1.

  Multiple NRDS types can be mapped to the same iMIS type if needed. For example, if you do not use customer types to keep track of whether or not a member is a Realtor or a Designated Realtor, then you can map both of those NRDS fields to the same iMIS customer type.

  You can map a NRDS member type to multiple iMIS customer types and categories using a comma-delimited list. If multiple types and/or categories are listed, then all of the listed values are considered a valid mapping and are not overwritten in iMIS when a record is

updated from NRDS. For example, you may have three types of Designated Realtors defined in iMIS (DR, DR2 and DR3) and two related categories (Cat2 and Cat3). For the Designated Realtor type in this case, enter DR,DR2-Cat2,DR3-Cat3. When a new Designated Realtor is added to iMIS from NRDS, they are assigned to the first item in the list: DR. If you then change that person in iMIS to DR2 instead and add them to Cat2, those changes will not be overwritten when the record is updated from NRDS.

- Office member type: This field is required and must be unique. None of the other NRDS member types can be mapped to the iMIS customer type listed here.
- Association member type: This field is required and must be unique. None of the other NRDS member types can be mapped to the iMIS customer type listed here. If you do not synchronize association records, you can enter text that is not a valid iMIS customer type, such as N/A or XYZ.

  Note: Customer types are set up in iMIS. Go to Desktop > Customers > Set up module > Customer types. Categories are defined in the CATEGORY table. Go to Desktop > Customers > Set up tables > General lookup/validation.
- Member, Office, and Association status mappings: Enter the iMIS statuses that you want to map to the NRDS statuses. You can leave a status field blank, if you do not want to automatically map a NRDS status to an iMIS status. For example, you may not want to mark a record for deletion in iMIS if it is terminated in NRDS.

  While not required, we do recommend mapping each NRDS status within an area (member, office, or association) to a unique iMIS status. By default, the available iMIS statuses are A (Active), D (Marked for deletion), I (Inactive), and S (Suspended). You can define additional values in the MEMBER_STATUS table. Go to Desktop > Customers > Set up tables > General lookup/validation.
- Branch to category mappings: (for Office records only) Enter the iMIS categories that you want to map to the NRDS categories. The categories available in iMIS are defined in the CATEGORY table. Go to Desktop > Customers > Set up tables > General lookup/validation.

- NRDS ID: You have two options for mapping the NRDS ID. The option you select for the Member NRDS ID is also applied to
- ImisId: Select this option if you want to use the ID sent from NRDS as the iMIS ID. If you select this option, you must disable the Auto Assign Member Numbers option. Go to Desktop > Set up module > General > Basic Options).
- MajorKey: Select this option if you want to save the NRDS ID in the contact record's Major key field. This allows you to maintain your iMIS ID numbering scheme and provides an alternative way to find NRDS contact records. The Major key field is displayed in Desktop > Customers > Manage customers > Profile tab. You can also display this value in any query or report. To change the label displayed for this field, edit the Major Key Prompt. Go to Desktop > Customers > Set up module > General > Basic Options.
- NRDS ID prefix: Enter a value if you want to add a prefix to NRDS member and office IDs. For example, you might want to add different prefixes to the member and office IDs so that you can easily distinguish between them, such as M and O.
- Addresses/phones/fax/email fields: Select the iMIS address type that will store the corresponding NRDS data. The iMIS options available in the dropdown lists are drawn from two places: the three main iMIS address types (labels are defined in Desktop > Customers > Set up module > General > Address and Notes) and any additional address types defined in the ADDRESS_PURPOSE table (Desktop > Customers > Set up tables > General lookup/validation). For phone numbers and email address, you have an additional option to save the value in the Name Table, which displays as part of the contact's main record.

  Note: You can only record one phone number and address per each iMIS address type available in the dropdown lists. For example, you cannot map both the Home phone and Cell phone to the Home Address type. Each must be mapped to a unique address type.

  Caution: You can set up iMIS so that changes to a company address flow down to employee records; their primary address is automatically updated to match the parent company's address. In this case, a change to the address of a NRDS office triggers an update to the address of each NRDS member on the office's roster, which is then sent to

NRDS during the next scheduled synchronization. If you are concerned about that automatic update, you can turn this feature off. Go to Desktop > Customers > Set up module > General > Advanced. Select the checkbox for the option Disable Auto Flow Down of company address Information.

Caution: If you have set up iMIS so that the phone numbers, fax number, or email entered on the main contact record (the Name Table) flow down to an address type (the target), then you should not map a NRDS phone, fax, or email field to that target address type. For example, if the iMIS Home Phone is set up to flow to the Home Address, then you should map the NRDS Home Phone to the Name Table, and not to the Home Address. Otherwise, it is possible that changes synchronized from NRDS will be overwritten in iMIS. This setting is defined in Desktop > Customers > Set up module > General > Address and Notes > Synchronize Phone Numbers & Email section.

- Post sync stored procedure: If your organization needs to apply any special business rules after a member or office is refreshed from NRDS, then you can specify the name of the iMIS stored procedure to run after each synchronization from NRDS in this field. Only one stored procedure can be entered.

  Tip: Write the stored procedure to take a single parameter of @imisId, so that it can be run for each member and office after a synch from NRDS.

Setting up iMIS to view and edit NRDS data

You can view and edit the NRDS data in two ways: from content items added to a website or from Desktop. However, the ability to synchronize data for a specific office or member on-demand is only available in an iMIS content management website or your staff site, where you can add the NRDS Sync Buttons and NRDS Sync By ID content items.

To view and edit NRDS data from an iMIS website

Because content items, content records, and navigation items are so flexible, there are numerous ways that you can set up your NRDS pages. We recommend the following setup, but you can adjust any of these steps as needed for your organization.

Go to RiSE > Page Builder > Manage content:

1. Create the NRDS content records:

1. Create a new Website Content Folder named NRDS.
2. Inside the NRDS folder, create the following four content records:

- Member Profile

  Add three content items:

- Contact Name
- NRDS Sync Buttons
- Panel Collection Editor

  In the content item configuration, enable the option to Select individual panels and then select the following panels:

- NRDS Member
- NRDS Member Designation
- NRDS Member Demographic
- NRDS Member Education
- NRDS Member Financial
- NRDS Member Supplemental
- Office Profile

  Add three content items:

- Contact Name
- NRDS Sync Buttons
- Panel Collection Editor

  In Configuration, enable the option to Select individual panels and then select the following panels:

- NRDS Office
- NRDS Office Supplemental
- Sync By ID

  Add one content item: NRDS Sync By ID
- Sync Log

  Add one content item: Query Menu

  In the Source query or folder field, click select. Select the $/NRDS/NrdsLog query. If you want to make changes to this query, we recommend that you make a copy of the query and use the copy instead.

2. Edit the Member Profile and Office Profile content records to create the following connections in both:

- Create a connection from the NRDS Sync Buttons content item to the Panel Collection Editor:

1. Click Connect in the NRDS Sync Buttons content item title-bar menu.
2. Click Create a new connection in the Connect New NrdsSyncButtonsCommon box.
3. In the Object Consumer dropdown list, select the Panel Collection Editor content item.
4. Click Connect.

- Create a connection from the Panel Collection Editor content item to the NRDS Sync Buttons content item:

1. Click Connect in the Panel Collection Editor’s title-bar menu.
2. Click Create a new connection in the Connect New PanelCollectionEditorCommon box.
3. In the Object Consumer dropdown list, select the NRDS Sync Buttons.
4. Click Connect.

3. Add the NRDS navigation items.

Go to RiSE > Site Builder > Manage sitemaps:

- Select your website from the dropdown list.
- Select New > Website Navigation Item to create a new navigation item at the root of your site titled NRDS.
- (Access Settings tab) Choose how you want to restrict access to the NRDS area, so that it never shows up to public users. For example, you can restrict access only to Staff (a Member Type).
- With the NRDS navigation item selected, create four navigation items linked to the NRDS content records (Member Profile, Office Profile, Sync By ID, and Sync Log). You can also restrict access to these pages from the Access Settings.
- Move the NRDS Configuration navigation item under the NRDS node.

4. Edit the Member and Office panels, if needed.

- From NRDS > Member Profile and NRDS > Office Profile, select the tab you want to edit.
- From the dropdown list, choose Design.
- In the Design window, you can change the Panel name and edit the fields displayed. For more information about working with panels, see Panels and custom data.

5. From the new NRDS pages, verify that you can view NRDS members and offices. Use On-Behalf-Of to select a contact.

   Tip: The member or office data displayed in the NRDS panels is based on the value of the ID URL parameter or the On-Behalf-Of selection.

   To view and edit NRDS data from Desktop

1. Open Desktop > Customers > Manage customers.
2. Right-click the Detail tab area (top-right) and select Edit Tab Preferences.
3. From the Other available Detail tabs list, select the eight NRDS tabs.

4. Click the left-arrow icon to move those tabs to the Visible Detail tabs list.
5. Click Save and then restart iMIS for the changes to take effect.

Synchronizing data between NRDS and iMIS

You can synchronize data between NRDS and iMIS in the following ways:

- Initial: Run the initial synchronization to pull over NRDS data for offices and members into the iMIS tables.
- Scheduled: Create a scheduled task to regularly synchronize updated office and member data.
- Command line: Synchronize data for offices and members using a command line if you need to update NRDS data immediately.
- On-demand: Synchronize data for a particular office or member as needed using content items.

This section describes how you can set up these synchronization types.

Note: Important: For an iMIS contact to sync to NRDS, it must have a NRDS ID.

Note: Note: Before synchronizing NRDS data, you must set up and configure the NRDS bridge in iMIS. Also verify that you have defined the default Customer Type to use when creating new customers and organizations online (defined in RiSE > Set up web components > Quick setup).

To run the initial synchronization between NRDS and iMIS

Before scheduling your routine data synchronization between NRDS and iMIS, you must run the initial synchronization that pulls all of your NRDS members and offices into the new iMIS tables. This process can take several hours, depending on the number of records you bring over. We recommend that you run the initial synchronization at night or over the weekend to limit potential performance problems on your application server while it runs. After the initial process completes, only members and offices that have been

modified are synchronized when you run the scheduled task or the command line application.

> **Note:** Tip: Be sure to run your index maintenance plan regularly first to get the best possible performance during the initial synchronization.

1. If you used the old NRDS system in iMIS, use the legacy NRDS Importer to do a final batch upload so that everything is up to date in NRDS.
2. Select the batch files to be used for the initial synchronization:

- From NAR, select Batch Refresh to create a set of batch files that contain all of your NRDS records. Choose the option to create tab-delimited files. When complete, NAR will email a zip file of these records to the association Point of Entry.
- (optional) If you need to manage state and local associations in iMIS, then download that file also. From NRDS, select Batch Refresh, answer the delimiter question, then click Create File of State and Local Association Directory.
- Unzip the NRDS batch files onto your iMIS application server. Each file is named with your association ID followed by the word FULL (i.e. 0123FULL), but they all have different file extensions followed by a couple numbers. You must have seven [ID]Full files:
- [ID]FULL.m00 – Members
- [ID]FULL.n00 – Member supplemental
- [ID]FULL.o00 – Offices
- [ID]FULL.p00 – Office supplemental
- [ID]FULL.e00 – Education
- [ID]FULL.d00 – Demographic
- [ID]FULL.f00 – Financial

  Note: If you downloaded the optional state and local association directory, then unzip that file in the same location: [ID]ASSN.a00.

- Using a text editor, find and edit the Asi.NrdsSync XML configuration file. By default it is located on your application server in C:\Program Files\ASI\iMIS\Net\bin.
- Find the BatchRefreshFileLocation property.
- Edit the value to specify the location of the unzipped NRDS batch files. For example C:\NRDS.

  Note: If you leave this value blank, the NRDS records will be requested directly from NRDS one-by-one. If you have a large database, this process could take several days. We highly recommend that you use the NRDS batch files for your initial synchronization.

3. Run the initial synchronization to pull your members and offices into the new tables:

- Open a command prompt on your application server.
- Change the directory to the iMIS\Net\bin directory:

  cd C:\Program Files\ASI\iMIS\Net\bin

  Note: This path may vary depending on your install location.

- Run the Asi.NrdsSync application with the initialsync command. You have the option to run this process silently in the background, but we recommend that you use the verbose command so that you can monitor the progress and view log details as the process runs.

  Asi.NrdsSync.exe initialsync Verbose

  After this process completes, set up a scheduled task to regularly synchronize data between NRDS and iMIS (described below).

  Note: If you do not use the NRDS batch files for the initial synchronization and encounter a network interruption during the initial synchronization, do not run the initialsync process again. Instead, run an Inbound synchronization only: Asi.NrdsSync.exe In Verbose

  To run a synchronization from the command line

1. Open a command prompt on your application server.
2. Change the directory to the iMIS\Net\bin directory:

cd C:\Program Files\ASI\iMIS\Net\bin

Note: This path may vary depending on your install location.

3. Run the Asi.NrdsSync application.

   Asi.NrdsSync.exe

   Note that you can override the default behavior using the following arguments:

- <type> – Specifies the type of the synchronization. Enter In if you want to synch from NRDS to iMIS. Enter Out if you want to synch from iMIS to NRDS. Enter Initialsync to run the initial synchronization.

  Values: In | Out | Initialsync

- <verbose> – Displays log information while the Asi.NrdsSync task is run. By default, this session is hidden.

  Value: Verbose

  For example, the following command synchronizes members and offices from NRDS into iMIS and displays the command line session, so that you can monitor progress:

  Asi.NrdsSync.exe In Verbose

  To create a scheduled task that regularly synchronizes data between NRDS and iMIS

  The NRDS scheduled task runs in the background and synchronizes data in the following order:

1. Office records inbound from NRDS.
2. Member records inbound from NRDS.
3. Office and Member records outbound from iMIS.

   This synchronization runs in batches. The default number of records included in each batch is 50. Depending on your requirements, you might want to adjust the batch size. For example, a smaller batch size puts a smaller load on your application server's memory. To change this value, edit the Asi.NrdsSync XML configuration file. By default it

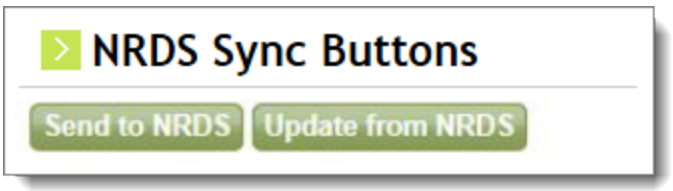
is located in C:\Program Files\ASI\iMIS\Net\bin. Find the NrdsBatchSize property and adjust the value as needed.

1. From your application server, open the Windows Task Scheduler.
2. Select Action > Create Task.
3. (General tab) Enter a Name and a Description, and select the Security options you prefer.
4. (Triggers tab) Click New.
5. Make your frequency selections based on how often you want to synchronize data between NRDS and iMIS. Click OK.
6. (Actions tab) Click New.
7. For the Action, select Start a program.
8. Browse to and select the Asi.NrdsSync application. By default it is located in C:\Program Files\ASI\iMIS\Net\bin.
9. Click OK to save the task.

To set up on-demand synchronization

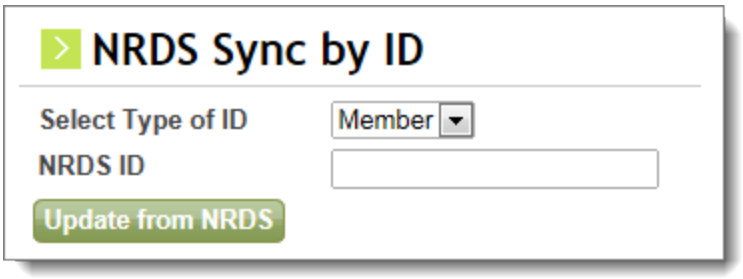
Two content items are available that you can use to synchronize data on-demand:

- Use the NRDS Sync Buttons content item to synchronize the currently selected iMIS record. It contains two buttons. Send to NRDS sends iMIS changes to NRDS. Update from NRDS pulls in NRDS changes to iMIS. The buttons are disabled if the selected contact does not have a valid NRDS ID.



Note: The Send to NRDS button is disabled when an association record is selected. Association records can only be updated from NRDS.

- Use the NRDS Sync By ID content item to update iMIS with NRDS data for a particular NRDS ID. If an iMIS record does not yet exist for the NRDS ID, then a new contact is created.



If you want to set up on-demand synchronization, we recommend that you add the NRDS Sync Buttons to your NRDS Profile content records, so that the content item can synchronize data for the currently selected contact. You can add the NRDS Sync By ID content item to any content record.

Adding new NRDS contacts and supplemental memberships from iMIS

To add a new NRDS contact from iMIS

1. Create a new iMIS contact.
2. From your NRDS pages (in either your website or Desktop, depending on where you set them up), add the contact's NRDS data. For iMIS to send this information to NRDS, at a minimum you must enter an office ID for members, or an association ID for offices. In addition, you must also fill out the required fields in the NRDS tables according to the NRDS requirements. If any of the required fields are missing, an error will be added to the NRDS log when the record is synchronized to NRDS. Contact NAR if you have questions about the required fields.

   The record will be sent during your next scheduled synchronization.

   Note: You cannot use the NRDS Sync Buttons content item to send new contacts to NRDS.

To add a supplemental membership

1. From an instance of the NRDS Sync by ID content item, enter the record's NRDS ID and choose whether it is a member or an office, then click Update from NRDS.

   A partial record for the member or office is added to iMIS.

2. From your NRDS pages (in either your website or Desktop, depending on where you set them up), select the Member Supplemental or Office Supplemental data panel.

3. Add a new supplemental record, and enter the supplemental information.

   Note: You must enter all required supplemental NRDS fields. Contact NAR if you have questions about the required fields.

4. If you want to immediately update iMIS with the new supplemental record, use the NRDS Sync Buttons content item to Send to NRDS. Alternatively, you can wait for the record to be updated during your next scheduled synchronization.

Troubleshooting tips

- In some cases, you might get several errors after running the initial synchronization. These show up in your NRDS log. We recommend that you resolve these errors before setting up your regularly scheduled synchronization task. There are a few steps you can take:

- Run the following SQL on your iMIS database after the initial import to prepare iMIS to access the records directly from NRDS, instead of using the Batch Refresh files:

  INSERT INTO [dbo].[AsiNrdsQueue]

  ([ID], [Direction], [NrdsId], [RecordType], [QueuedDateTime])

  SELECT DISTINCT '', 'Inbound', [NrdsId], [RecordType], GETDATE() FROM [dbo].[AsiNrdsLog] WHERE [Direction] = 'Inbound' AND [Status] = 'Failed' AND [NrdsId] != '' AND [RecordType] != ''

- Run an Inbound synchronization from the command line:

  Asi.NrdsSync.exe In Verbose

- Once the Inbound process completes, check your log. You will have to address any remaining errors individually. These might include validation table errors, date format errors, or other problems. The details of the errors are noted in your log. After resolving the errors for a contact, use the NRDS Sync By ID content item or the NRDS Sync Buttons content item to update from NRDS for the member, office, or association.
- If you get a parsing error, then use the NRDS Sync by ID content item to try to import the record using the NRDS ID.
- If you get an error indicating that a Prefix value is not valid, you might need to add the missing prefix to the iMIS PREFIX validation table. You can do that from Desktop > Customers > Set up tables > General lookup/validation.
- If you get a database connection error when you try to run a synchronization, there might be a problem with your connection credentials. To investigate, open the Asi.NrdsSync XML configuration file. By default it is located in C:\Program Files\ASI\iMIS\Net\bin. Find the DataSource.iMIS.Connection section and verify that the following values are correct for your iMIS database: Data Source (your server), Initial Catalog (your database), User ID and Password (the database credentials).
- If you get an error for a particular record after it is synchronized with NRDS, or if you notice that changes which you made in iMIS are not being successfully saved to NRDS, check the following in the record's data:
- Ensure that you are the Point of Entry or have the proper authority to make changes to the record in NRDS.
- Ensure the record has a status of Active. Changes to Inactive records are not synchronized to NRDS.
- Ensure the data fields meet the NRDS requirements for format, length, and required fields.

Orders Administration

Product Management for Orders

Before using Orders, you first must define product categories and the various products you are going to offer for sale. Product categories must be defined before defining individual products.

If your system is licensed for product kitting, you also can create and offer product kits for sale. Product kits are groups of individual items sold as a single unit.

When defining your products, you will create product codes and enter pricing, accounting, and inventory information. Products and product inventory are managed through the Manage inventory sub-task list, which has three primary functions:

- Defining and managing products
- Entering and editing product inventory receipts, adjustments, and transfers
- Posting product inventory receipts, adjustments, and transfers

Manage inventory sub-task list

Manage products

Select to open the Manage products window used for defining and managing individual products including product codes, titles, descriptions, prices, and other options.

Several other windows important in setting up your individual products are accessed through the Manage products window:

- Special Pricing - Click Pricing on the Manage products window.
- Upsell/Replace - Click Upsell/Replace on the Manage products window.
- Accounting - Click Accounting on the Manage products window.
- Inventory / Warehouses

Inventory - Click Inventory on the Manage products window. The Inventory button displays and replaces the Warehouses button when Multi-Warehouses is disabled.

Warehouses - Click Warehouses on the Manage products window. The Warehouses button displays and replaces the Inventory button when Multi-Warehouses is enabled.

- Publication Demographics - Click Publication on the Manage products window. The Publication button displays only if the Use Publication Demographics option is enabled on the Set up product categories window for a category to which a product is assigned.
- Web Options - Click Web on the Manage products window.

Enter and edit receipts and adjustments

Select to open the Enter and edit receipts and adjustments window used for managing product inventory.

Post receipts

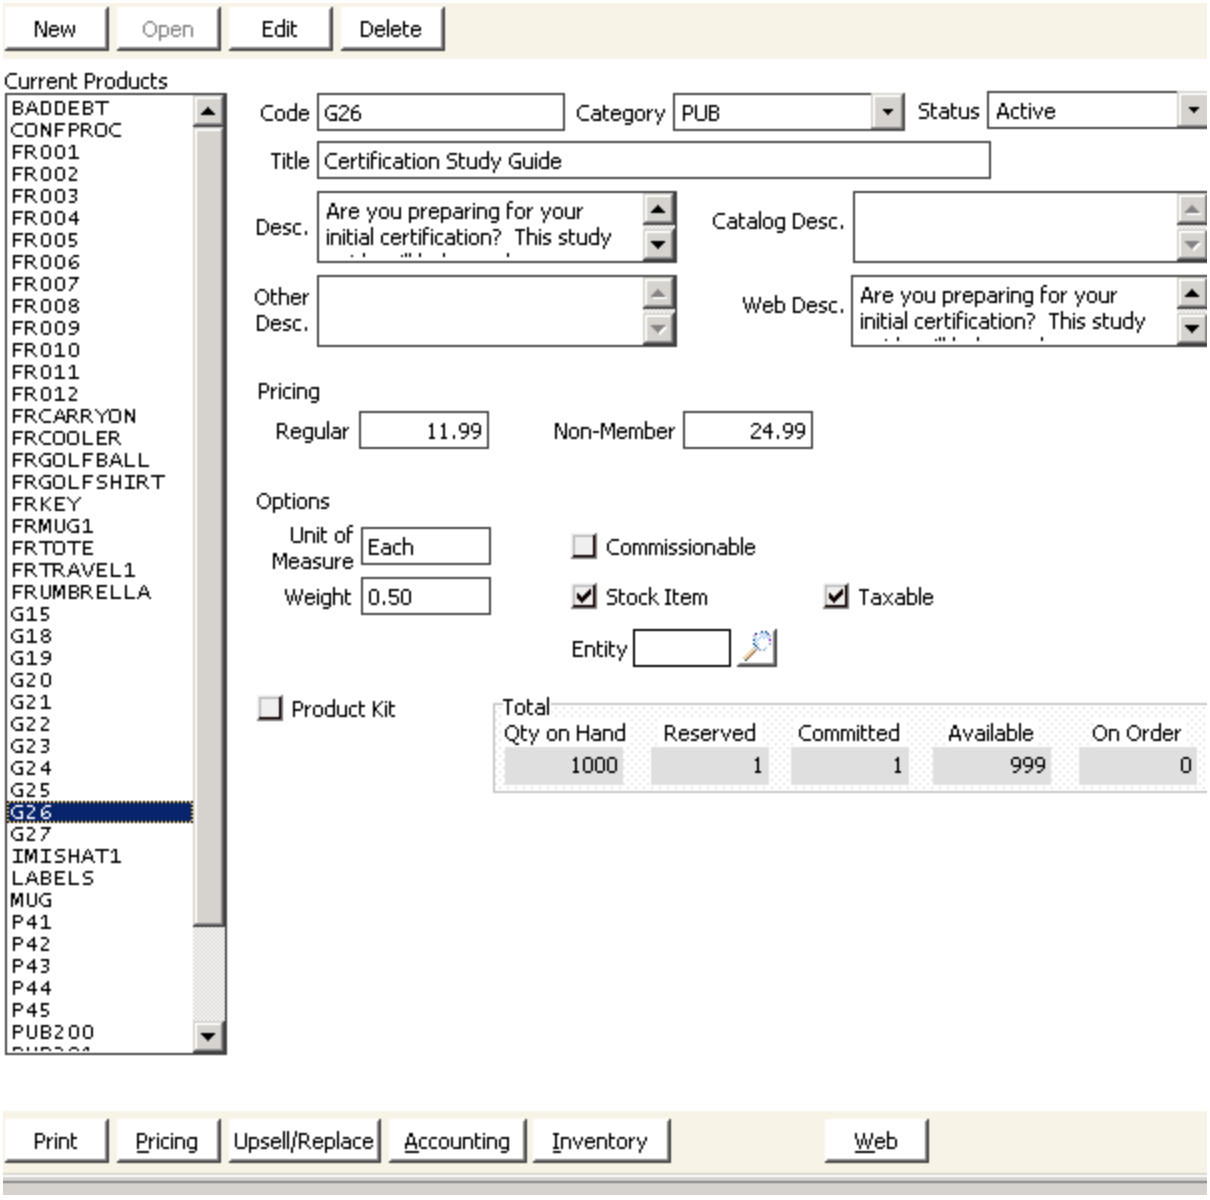
Select to open the Post receipts window used for posting inventory transactions.

Defining products

Before defining your individual products, you first must define your product categories. Product categories are defined on the Set up product categories window (from Orders, select Set up tables > Product categories).

After defining your product categories, you can define your individual products. Products are defined and managed on the Manage products window, which allows you to enter and access product codes, titles, descriptions, prices, accounting information, and other specific product options. The Manage products window also is used for accessing and displaying product inventory information and for designating a product's Process Manager items.

Manage products window



Desktop: Orders > Manage inventory > Manage products

Current Products

Lists all of the defined product codes. Select a product code from the drop-down list to view the product's details on the Manage products window.

Code

(required) Enter a specific code for an individual product.

Category

(required) Select a product's category from the drop-down list. Product categories are defined on the Set up product categories window (from Orders, select Set up tables > Product categories).

Status

Select a product's status from the drop-down list. The default status for all new products is Active, and you can assign the following status codes to your products at any time during a product's life cycle:

- Active (A)
- Inactive (I)
- Mark for Deletion (D)
- Not Available (N)
- Out of Production (O)

See Product Status Codes for more on product status code functionality.

Title

Enter a brief, descriptive product title. A product's title displays next to the product's code on windows and reports; product titles can be edited when entering orders.

If the Print 1st Line Desc on Statement option is enabled on the AR/Cash Set up module window (from AR/Cash, select Set up module), the product title entered in the Description field on the Overview tab of the Enter and edit orders window prints on invoices and statements. The product title entered in the Description field also displays on the AR/Cash tab on the Manage customers window and on the AR/Cash Enter and edit cash receipts window. If the Print 1st Line Desc on Statement option is disabled on the AR/Cash Set up module window, only the order number prints on statements and displays on windows.

Description Fields

All description fields hold product descriptions, to a maximum of 5000 characters:

- Desc

  Enter the product description to be seen by staff. The text entered in the Desc field does not appear on printouts, but it will appear on the product's web description if none exists in Web Desc.

- Catalog Desc

  Unused.

- Other Desc

  Unused.

- Web Desc

  Enter the description to display on the Product Detail page; otherwise, the web page uses the Desc text, if any.

  Note: Place key search terms within the first 300 characters of the description. In the Public view, search truncates the description to 300 characters, so only text within that range yields search results for users.

  Pricing

- Regular - Enter a product's default unit price. The price entered in the Regular field will apply for all customers unless you enter a different price in the Non-Member field. You can override a product's default price at order entry.

  The Use Member Pricing option on the Overview tab of the Enter and edit orders window allows you to apply Regular product pricing for non-member customers.

- Non-Member (optional) - Enter a product price for non-member customers. This price applies automatically when you sell a product to any customer with Non-Member status, allowing you to avoid most manual price overrides.

  If the Non-Member field is blank, a product's price defaults to the value entered in the Regular field for non-member customers. You can override a product's default price at

order entry, and the Use Member Pricing option on the Overview tab of the Enter and edit orders window allows you to apply Regular product pricing for non-member customers.

- Fair Market Value (Displays only when the Premium option is enabled) - Enter a fair market value for a product used as a premium. You must enter a value in this field, which can be 0.00. The default value is 0.00.

Options

- Unit of Measure - Enter a product's unit of measure, such as individually, each, foot, yard, sheet, book, or pack.
- Commissionable - Enable if a product's sale generates a commission.
- Comm % - (Displays only when the Commissionable option is enabled) Enter the commission percentage a product's sale will generate.
- Weight - Enter a product's weight. When defining product kits, be sure to enter a Weight. Freight by weight charges will not calculate for a product kit unless a weight has been defined, regardless of whether weight has been defined for the individual kit components.
- Stock Item - Enable to indicate that a product is stored in inventory. When the Stock Item option is enabled, both products in inventory and backorders are tracked in the Qty on Hand, Reserved, Committed, Available, and On Order fields on the Manage products window.
- Taxable - Enable if a product is taxable. When the Taxable option is enabled, iMIS automatically calculates any applicable taxes for a product according to the tax code entered for an order. When defining a new product, the Taxable option on the Manage products window enables by default if the Taxable option on the Set up product categories window is enabled for the new product's category.
- Premium - Enable this option to use a product as a premium for gifts and pledges. This option only displays only if Allow Premiums as Products is enabled on the Fundraising Set up module page.

When an order is generated for a product used as a Fundraising premium, the Notes field on the Order Details tab of the Enter and edit orders window displays the text “Premium order for Transaction TransNum, Batch BatchNum” (for example, Premium order for Transaction 1438, Batch 08062004). See Fundraising Management (see "Fundraising") for details about using premium products.

- Default Warehouse - (Required/Displays only if using Multi-Warehouses) Enter a stock item's default warehouse location. Select the Find icon to look up a warehouse; warehouse locations are defined in the Set up warehouses window (from Orders, select Set up warehouses).

  The Default Warehouse field displays only if a product is a stock item and the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory). If a default warehouse is defined on the Inventory System Setup window, the Default Warehouse field defaults to the warehouse defined on the Inventory System Setup window. A product's default warehouse can be overridden at order entry on the Product Detail window with a warehouse that is pre-defined for the product.

  Individual warehouses are set up for products on the Warehouses window (from Orders, select Manage inventory > Manage products, select a product from the list of Current Products, and click Warehouses).

- Entity - (Optional/displays only if Multiple Entities is enabled on the AR/Cash Set up module window) Enter an owner entity for an individual product. Select the Find icon to look up an entity; entities are defined in the Org Codes field on the Organization Names window (select File > System Setup, and click Organization Names).

  An Entity value can be left blank if the entity owner is the same as the default Orders entity assigned on the AR/Cash Set up module window.

  Product Kit

  Enable if a product is a kit. A kit is a group of individual products sold as a single unit. The Product Kit option displays only if your system is licensed for product kitting.

  Kit button

(displays only when the Product Kit option is enabled) Opens the Kitting window used for defining product kits.

Total

The totals are display only:

- Qty on Hand - the total number of products in inventory. If using Multi-Warehouses, Qty on Hand includes the total number of products in inventory across all warehouses.
- Reserved - the number of products that are in “open order” status, including backorders. If using Multi-Warehouses, Reserved includes the total number of products reserved across all warehouses.
- Committed - the number of shippable products in inventory excluding backorders. If using Multi-Warehouses, Committed includes the total number of products committed across all warehouses.
- Available - the number of products on hand excluding reserved products. If using Multi-Warehouses, Available includes the total number of products available across all warehouses.
- On Order - the number of products on order from suppliers. If using Multi-Warehouses, On Order includes the total number of products on order across all warehouses.

  The number of products displayed depends on the number of products entered in the On Order field on the Inventory / Warehouses window (click Inventory / Warehouses on the Manage products window).

  Pricing button

  Opens the Special Pricing window used for setting up specific product price calculations.

  Upsell/Replace button

  Opens the Upsell/Replace window used for designating Upsell, Cross-sell, and Replacement items for products.

  Accounting button

Opens the Accounting window used for entering product account information.

Inventory / Warehouses button

- Inventory button - (Disabled for non-stock items) Opens the Inventory window used for entering product inventory information. The Inventory button displays and replaces the Warehouses button when Multi-Warehouses is disabled.
- Warehouses button - (Disabled for non-stock items) Opens the Warehouses window used for entering inventory information for a product's individual warehouses. The Warehouses button displays and replaces the Inventory button when Multi-Warehouses is enabled.

Publication button

Opens the Publication Demographics window used for defining additional information for publications. The Publication button displays only if the Use Publication Demographics option is enabled for a product's category on the Set up product categories window (from Orders, select Set up tables > Product categories).

Web button

Opens the Web Options window to display a product on the Web.

To edit a product

When editing a product that is a stock item, you cannot disable the Stock Item option if the product has inventory in stock. A product's inventory must be reduced to zero if you want to indicate the product is no longer a Stock Item. For additional information, see To enter inventory adjustments.

1. From Manage products window, select the product you want to edit from the list of Current Products.
2. Click Edit.
3. Make any necessary changes.
4. Click Save.

Note: If you want to change pricing for a product that has been published on the web with pricing, we recommend making changes in the Staff site. When you make pricing changes in the Desktop, the cache is only refreshed based on the Cache duration configuration value. When you make pricing changes through the Staff site, the changes are published immediately.

Note: This does not apply when you initially create the product or initially define pricing for the product using the Desktop.

To delete a product

You can delete a stock item only if all inventory quantities are zero. When you delete a product, all of the product's Upsell/Cross-sell/Replacement records also are deleted.

1. From Manage products window, select the product you want to delete from the list of Current Products.
2. Click Delete. You are prompted to verify deleting the product.
3. Click Yes to delete the product.

To define a product

1. From Manage products window, click New.
2. Define the product:

- Enter a Code for the product. The product code should not contain any spaces or special characters other than an underscore.
- Select a product Category from the drop-down list of available categories.
- Enter a Title for the product.

3. Enter any applicable product descriptions:

- Enter a general product description in the Desc field.
- Enter a product description for a product catalog in the Catalog Desc field.
- Enter any other product description in the Other Desc field.

4. Enter the product's Pricing information:

- Enter a default price for the product in the Regular field.
- (optional) Enter a Non-Member price for the product if applicable.

  Note: If products are used only as kit components, you do not need to enter prices for the individual products that make up the kit. Only the kit itself requires product pricing information.

5. Enter the product's Options:

- Enter the product's Unit of Measure, such as each or sheet.
- (optional) Enable the Commissionable option if a product's sale generates a commission (enter a commission percentage in the Comm % field if you enable the Commissionable option).
- Enter the product's Weight.
- Enable the Stock Item option.
- (optional) Enable the Taxable option if the product is taxable.
- (Optional/For use with Fundraising) Enable the Premium option to use the product as a premium for gifts and pledges, and enter a Fair Market Value.
- (Multi-Warehouses only) Enter the product's Default Warehouse location if you are using Multi-Warehouses. Select the Find icon to look up a warehouse.
- (Multi-Entities only) Enter an Entity for the product.

6. Click Save.

Defining Product Kits

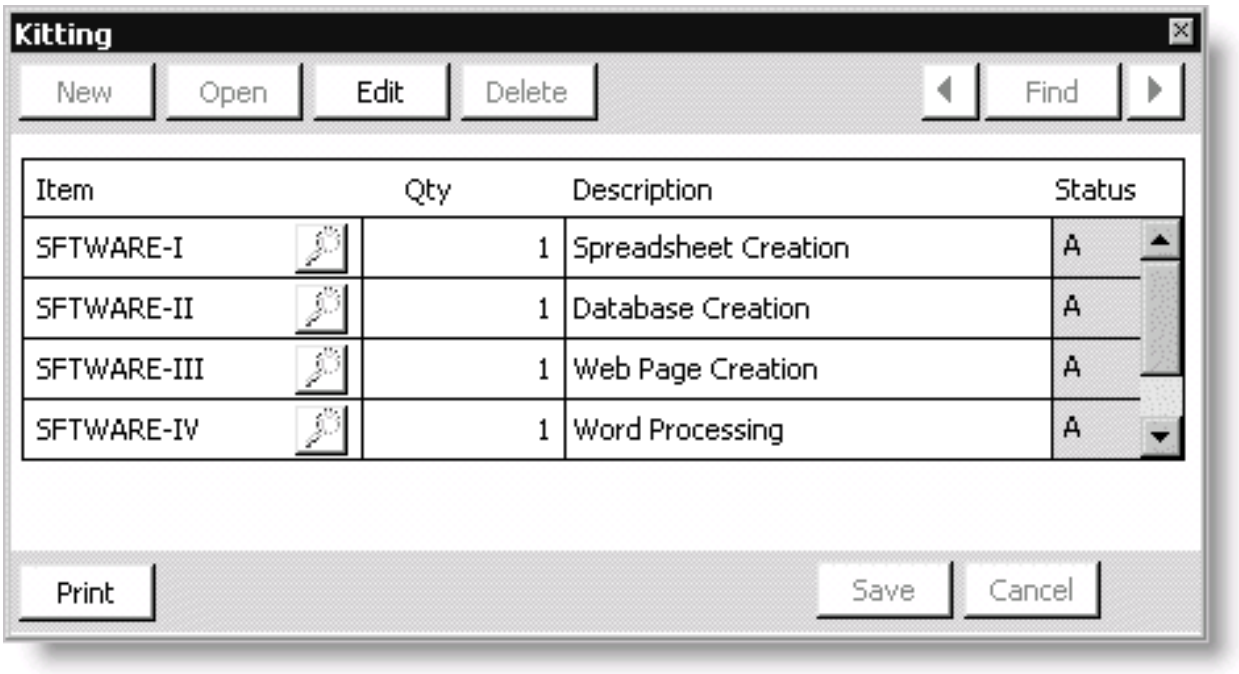
If your system is licensed for Kitting, iMIS Orders allows you to create and maintain product kits. Product kits are groups of individual products sold as a single unit for a single price.

A product kit cannot consist of other product kits or be a stock item. However, a product kit can consist of both individual stock and non-stock items. Just as with individual products, you must define a product category before you can define a product kit. In addition, each individual product first must be defined on the Manage products window before it can be sold as part of a kit.

Note: When defining product kits, be sure to enter a Weight. Freight by weight charges will not calculate for a product kit unless a weight has been defined, regardless of whether weight has been defined for the individual kit components.

Once you define the product kit on the Manage products window, you can assign the individual products to the kit using the Kitting window.

Kitting window



From Orders, select Manage inventory > Manage products, select a product kit, and click Kit

Item

Enter the codes of the products you want to include in the kit. Select the Find icon to look up products.

Qty

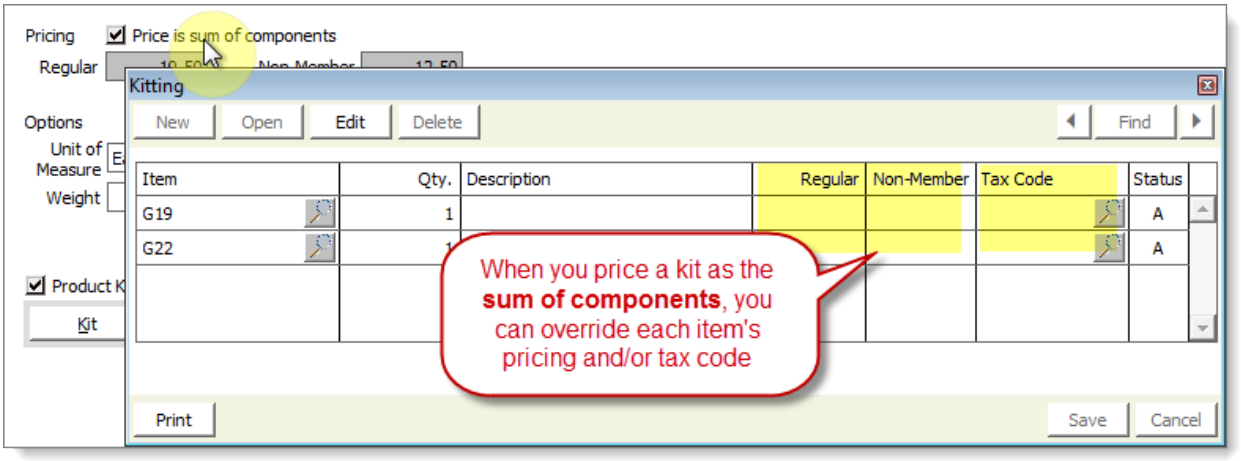
(required) Enter the number of individual products included in the kit. Enter quantities as whole numbers or as partial quantities, such as “1.5.”

Description

Enter a description of the individual products included in the kit. This product description will print on invoices and orders. If you leave the Description field blank, each individual product's Title from the Manage products window will print.

Regular | Non-Member | Tax Code

(VAT feature; requires Price is sum of components) When you create a "sum of components" product kit, all pricing and tax calculations are based on the sum of the individual components of the kit, rather than the kit itself. You can override the pricing of one or more items within the kit, and you can override the tax code of individual items as well. To make a kit item non-taxable, for example, you can override the item's tax code to one that you have set to a zero rate. This flexibility supports complex tax situations, which can help you to meet VAT requirements. These overrides work for kit products across all views of iMIS.



Status

Displays the product's status.

To define a product kit

When defining product kits, remember the following:

- Your system must be licensed for Kitting.
- A product kit cannot consist of other kits or be a stock item; however, a kit can consist of both individual stock and non-stock items.
- Each individual product must be defined before being sold as part of a kit.

1. From Manage products window, click New.
2. Define the kit:

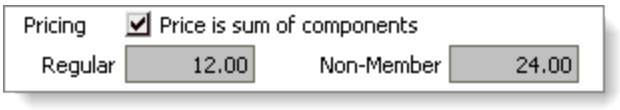
- (required) Enter a Code for the product kit.
- (required) Select a product Category from the drop-down list. The Product Kit option enables and the Kit button displays if the Product Kit option is enabled for the Category on the Set up product categories window.
- Enter a Title for the kit.

3. Enter any applicable product kit descriptions:

- Enter a general kit description in the Desc field.
- Enter a kit description for a product catalog in the Catalog Desc field.
- Enter any other kit description in the Other Desc field.

4. Enter the product kit's Pricing information:

- Price is sum of components – causes the price to be calculated from the sum of its components and so grays out the Regular/Non-Member price fields. The tax for kits is calculated from the Taxable amount of each component, honoring the taxation rules for each.



VAT friendly: A "sum of components" product kit calculates pricing and taxes on the parts of the kit, rather than the kit itself. This supports a mixture of tax rates, which can be required for VAT.

- Regular/Non-Member price fields – Enter a default price for the product kit in the Regular field. This manual kit pricing does not reflect the individual products that make up the kit. Enter a Non-Member price for the kit as well, if applicable.

5. Enter the product kit's Options:

- Enter the kit's Unit of Measure, such as package or group.
- (optional) Enable the Commissionable option if the product kit's sale generates a commission (enter a commission percentage in the Comm % field if you enable the Commissionable option).
- Enter the product kit's Weight if automatic freight charges are calculated by weight. Freight-by-weight charges will not calculate for a product kit unless a weight has been defined.
- (optional) Enable the Taxable option if the kit is taxable.
- (Multi-Entities only) Enter an Entity for the kit.

6. Click Save.

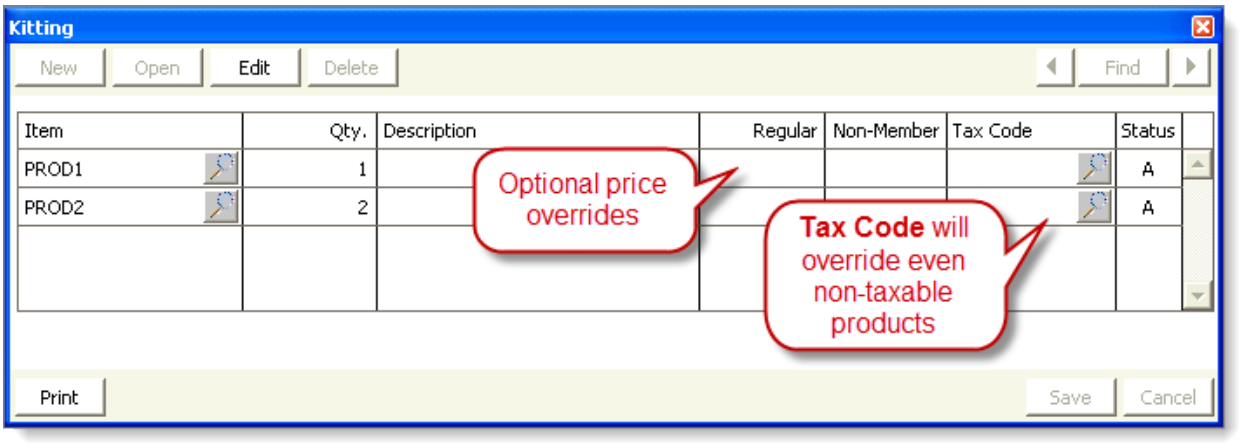
To define a kit's components

To define a component for a kit, the kit component must have either an Active (A) status or the same status as the parent kit.

1. From Orders, select Manage inventory > Manage products to open the Manage products window.
2. Enter or edit a product.
3. While in the edit mode, click Kit to open the Kitting window.
4. Define the kit's components:

- Enter a component's code in the Item field (select the Find icon to look up a product code).
- Enter the number of components in the Qty field that you are including in the kit.
- Enter a Description of the component you are including in the kit. If you leave the Description field blank, the product Title from the Manage products window will print on invoices and orders.
- (VAT only) To override the default product price, you can enter values in the Regular and Non-Member columns. If you leave these fields blank or enter a zero (0) for any component, its pricing will default to the product pricing defined in the Manage products window. You can Find and override the Tax Code as well, but keep in mind that doing so could force a non-taxable product to become taxable.

  Note: The Regular, Non-Member, and Tax Code columns will not appear unless the option, Price is sum of components, is enabled on the Manage Products windows for the kit product.



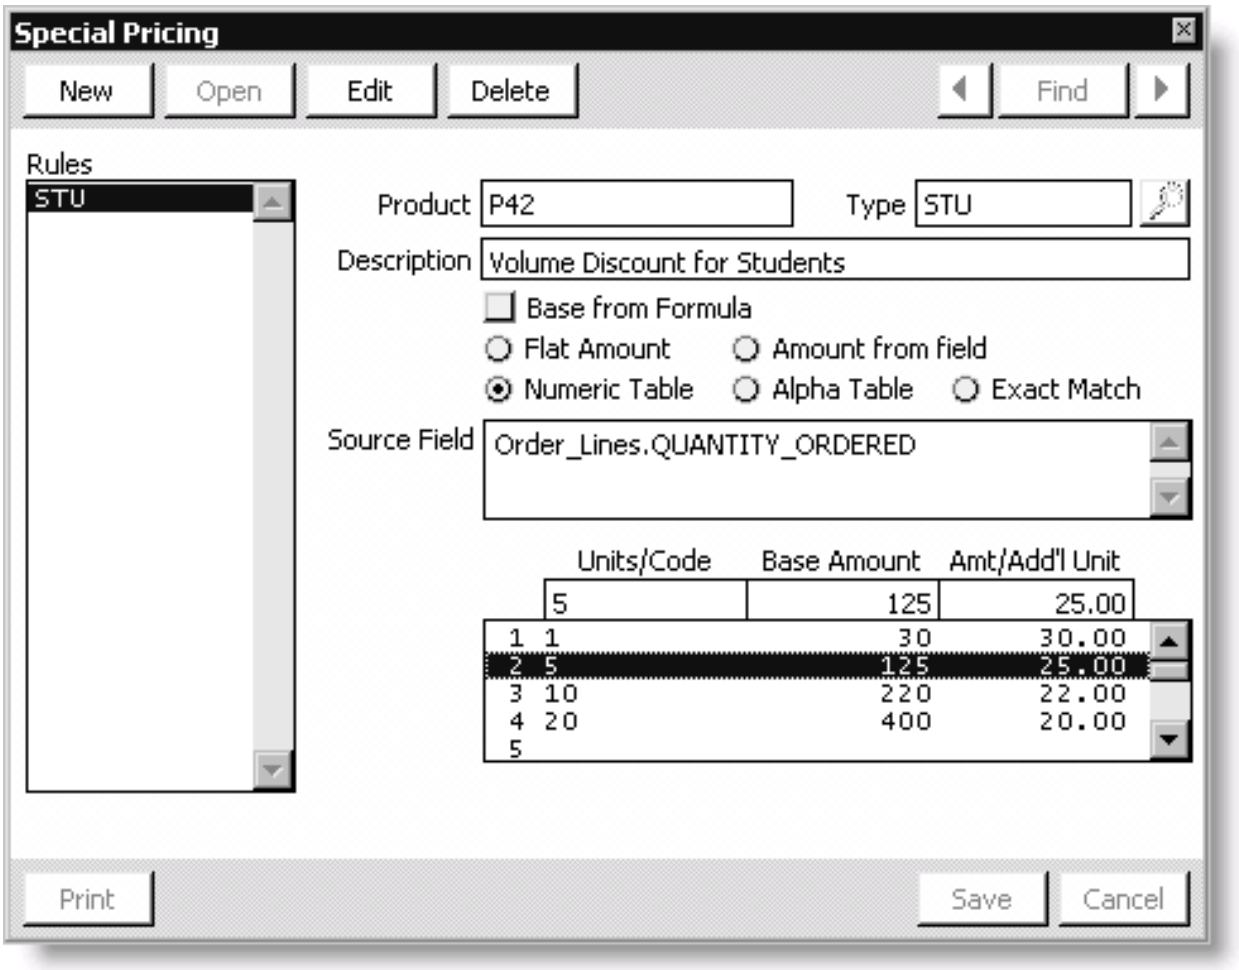
5. Press Tab to generate another line item, and repeat this process for each additional kit component.
6. Click Save.

Defining product special pricing

iMIS Orders allows you to set special pricing discounts that override a product's price as defined on the Manage products window. Special pricing discounts are set up according to customer type.

You also can set up special pricing discounts according to product quantity purchased for specific customer types. For example, you may want to give your customers a discount when they order more than 10 or 20 items of a particular product. Product special pricing is defined on the Special Pricing window.

Special Pricing window for Orders



From Orders, select Manage inventory > Manage products, select a product from the list of Current Products, and click Pricing

Rules

Lists a product's special pricing rules according to customer type.

Product

Displays the product code to which the special pricing applies.

Type

Enter the customer type to which the product special pricing will apply. Select the Find icon to look up a customer type.

Description

Enter a description of the special pricing rule. This field is for reference only and does not display on any bills or reports.

Base from Formula

(Applicable only for a Numeric Table, Alpha Table, or Exact Match) Enable when you enter a formula (calculation) and not a flat amount in the Base Amount field.

Flat Amount

Enable when defining a single, set price for a specific customer type. If you enable this option, you must enter the price for the specific customer type in the Base Amount field.

Amount from field

Enable to reference an exact cost based on a specific field value or to enter a formula to calculate a cost based on a specific field value. If you enable this option, the Orders and Order_Lines tables are the only tables you can reference in the Source Field.

Numeric Table

Enable to vary costs according to numeric values, such as special rates based on volume. The Numeric Table supports a maximum of 20 rows and calculates unit costs according to the quantity range defined in the table, such as reduced price rates based on quantity ordered.

When setting up each row (each special price break) in the Numeric Table, the value in the Base Amount field must equal the value in the Units/Code field multiplied by the value in the Amt/Addl Unit field.

Alpha Table

Unused.

Exact Match

Unused.

Source Field

Enter the field from the Orders or Order_Lines table you are referencing when you enable the Amount from field, Numeric Table, Alpha Table, or Exact Match option.

Units/Code

(Applicable only for a Numeric Table, Alpha Table, or Exact Match) Enter the minimum number of units purchased that will receive the special pricing discount defined in the Amt/Addl Unit field. The value in the Units/Code field multiplied by the value in the Amt/Addl Unit field must equal the value in the Base Amount field for each row in a Numeric Table.

Base Amount

Enter the amount you are charging for product(s). The amount you enter in the Base Amount field depends on the special pricing option you are using:

- Flat Amount - If you enable the Flat Amount option, the amount entered in the Base Amount field determines the actual amount a specific customer type is charged for a product. For example, if you charge student customers a reduced amount, such as $20 for a magazine subscription, you would enter 20 in the Base Amount field.
- Numeric Table - If you enable the Numeric Table option, the value in the Base Amount field must equal the value in the Units/Code field multiplied by the value in the Amt/Addl Unit field.

For example, say you want to define a price break of $5.00 on a $25.00 product for customers when they purchase 10 or more products. You would enter 10 in the Units/Code field, 200 in the Base Amount field, and 20 in the Amt/Addl Unit field. Customers then would be charged $20.00 per product for each product order of 10 or more units.

Amt/Addl Unit

(Applicable only for a Numeric Table) Enter the unit cost of the special price break; the unit cost entered determines the unit cost for the quantity range. The value entered in the Amt/Addl Unit field multiplied by the value in the Units/Code field must equal the value in the Base Amount field.

To define product special pricing

Some pricing rules require an understanding of iMIS tables and fields.

1. From Orders, select Manage inventory > Manage products to open the Manage products window.
2. From the list of Current Products, select the product for which you want to define special pricing.
3. Click Pricing to open the Special Pricing window.
4. Click New.
5. Enter a customer type in the Type field (select the Find icon to look up a customer type).
6. Enter a Description of the special pricing rule.
7. Define your special pricing rule.
8. Click Save.

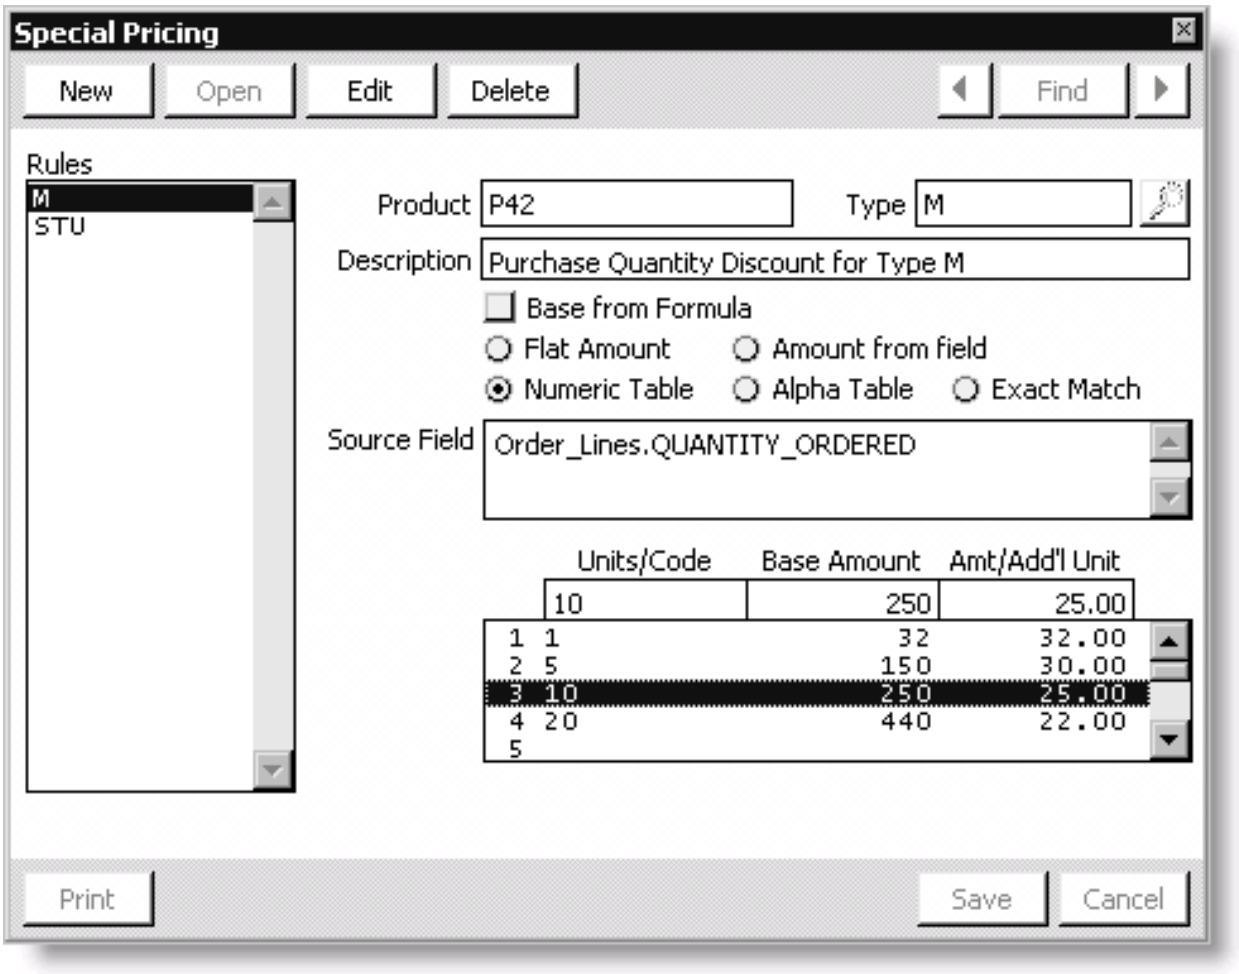
To generate purchase quantity discounts

iMIS allows you to generate discounts according to the number of products a customer purchases (excluding freight and handling charges and any applicable taxes). The more products a customer purchases, the greater the discount.

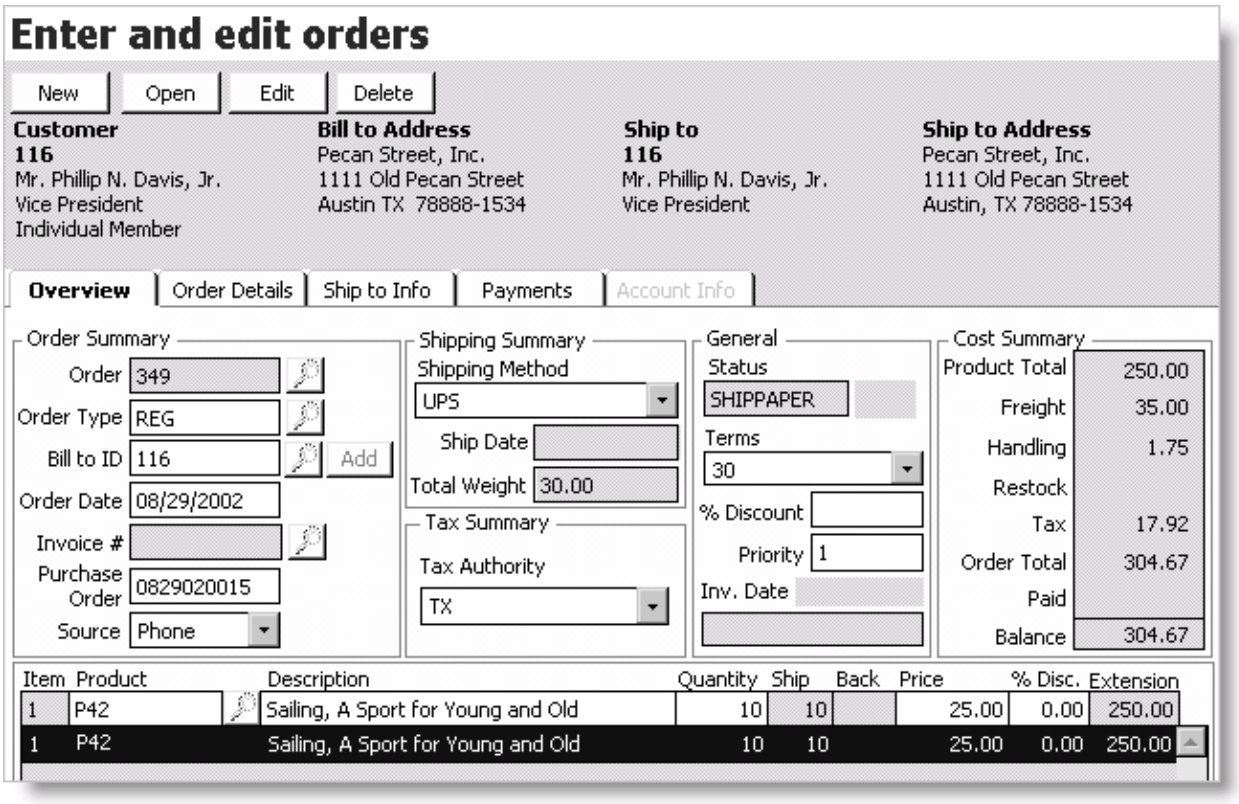
1. From Orders, select Manage inventory > Manage products to open the Manage products window.
2. From the list of Current Products, select the product for which you want to define special pricing.
3. Click Pricing to open the Special Pricing window.
4. Click New.
5. (required) Enter a customer type in the Type field (select the Find icon to look up a customer type).
6. Enter a Description of the special pricing rule.
7. Enable the Numeric Table option to display the Base from Formula option and the Source Field, Units/Code, Base Amount, and Amt/Addl Unit fields.
8. Enter Order_Lines.QUANTITY_ORDERED in the Source Field field.
9. Define a price break based on order quantity:
   - In the Units/Code field, enter the minimum number of units to be charged the value defined in the Amt/Addl Unit field.
   - Enter the correct value in the Base Amount field; the amount entered must equal the number of units in the Units/Code field multiplied by the unit price in the Amt/Addl Unit field.
   - In the Amt/Addl Unit field, enter the unit cost. The unit cost entered determines the unit cost for the quantity range.
10. Press Tab, and repeat this process until you have set up all price breaks for the customer type. Each line will represent a different price break based on order quantity.
11. Click Save.
12. Repeat this process for each customer type for which you want to generate purchase quantity discounts.

    Procedure reference

In the following example of purchase quantity discounts, units 1 - 4 cost $32.00 per unit, units 5 - 9 cost $30.00 per unit, units 10 - 19 cost $25.00 per unit, and units 20 and above cost $22.00 per unit.



Example of a purchase quantity discount defined on the Special Pricing window



Example of the purchase quantity discount defined in the example above as generated for an M type customer

To generate discounts based on total quantity ordered

iMIS Orders allows you to set up price discounts according to customer type and total quantity ordered. Unlike purchase quantity discounts, total quantity discounts apply to all products ordered and not just to one specific type of product. For example, you could set up and apply a 10% discount to an order (excluding freight and handling charges and any applicable taxes) for specific customers who purchase 10 or more products.

Defining a total quantity discount is a two part process:

- Assign a DISCOUNT product to a specific product category.
- Define the parameters for the DISCOUNT product for each customer type on the Special Pricing window.

Once you define the parameters for the DISCOUNT product, you can apply the discount to orders placed by specific customer types. A total quantity DISCOUNT is applied to an order by entering the DISCOUNT just as a product is entered.

1. From Orders, select Manage inventory > Manage products to open the Manage products window.
2. Define a DISCOUNT product:

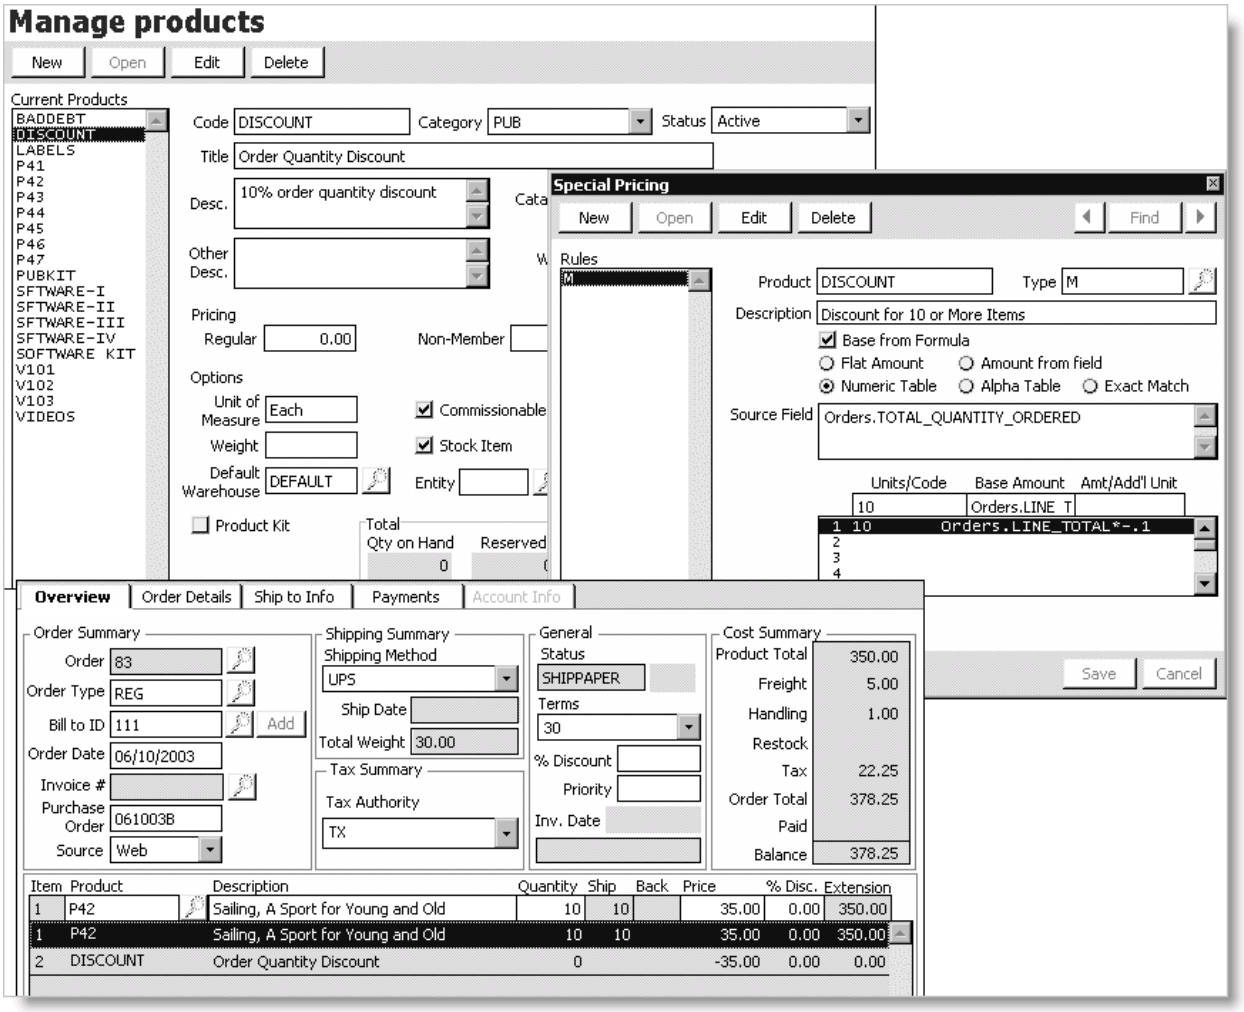
- Click New.
- Enter DISCOUNT for the product Code.
- Select the product Category for which you want to define the discount, such as PUB.
- Enter a Title for the DISCOUNT product.
- Enter a description of the DISCOUNT product in the Desc field.
- Click Save.

3. Select DISCOUNT from the list of Current Products.
4. Define the quantity discount for the DISCOUNT product:

- Click Pricing to open the Special Pricing window.
- Click New.
- Enter a customer Type (select the Find icon to look up a type).
- Enter a Description of the discount.
- Enable the Numeric Table option to display the Base from Formula option and the Source Field, Units/Code, Base Amount, and Amt/Addl Unit fields.
- In the Source Field, enter Orders.TOTAL_QUANTITY_ORDERED.
- In the Units/Code field, enter the minimum number of units for which you want the discount to generate.

- In the Base Amount field, enter Orders.LINE_TOTAL*-.1 (press Ctrl+Z to expand the field to enter the information).

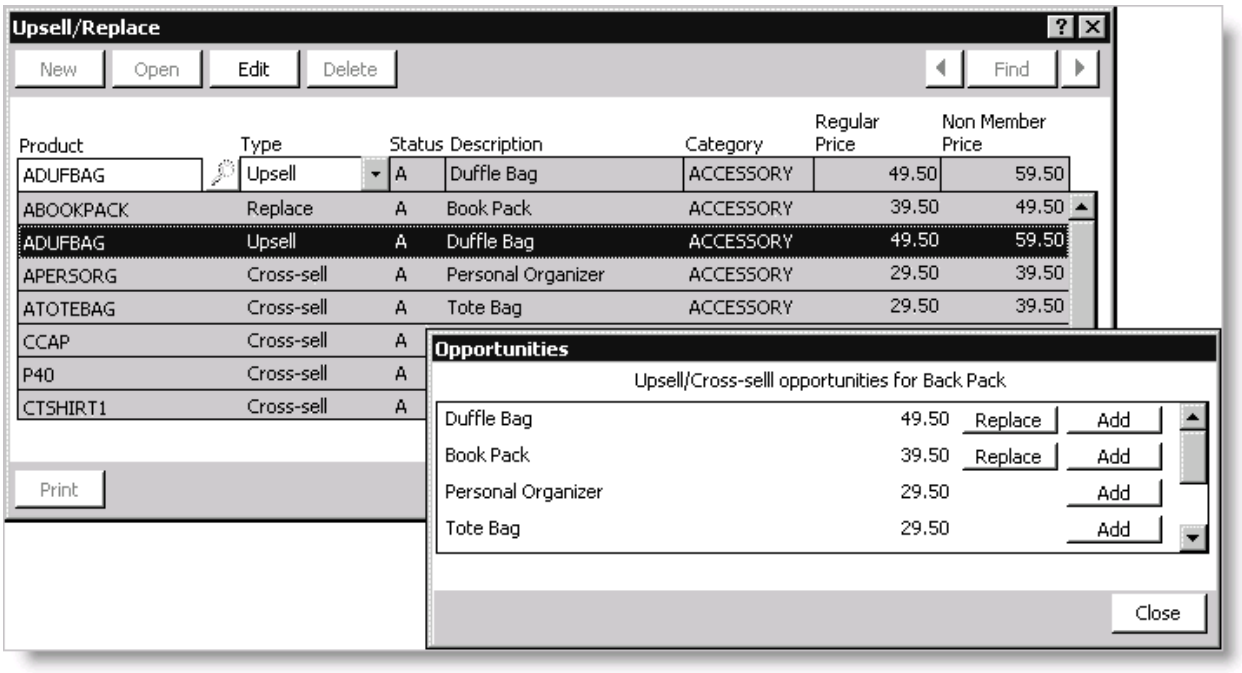
5. Click Save.



Example of a total quantity discount that has been defined and applied to an order

Designating upsell, cross-sell, and replacement items for products

Upsell, Cross-sell, and Replacement items are designated for products on the Upsell/Replace window, which is accessible by clicking Upsell/Replace on the Manage products window. The Product_Substitute table stores the relationships defined for products on the Upsell/Replace window.



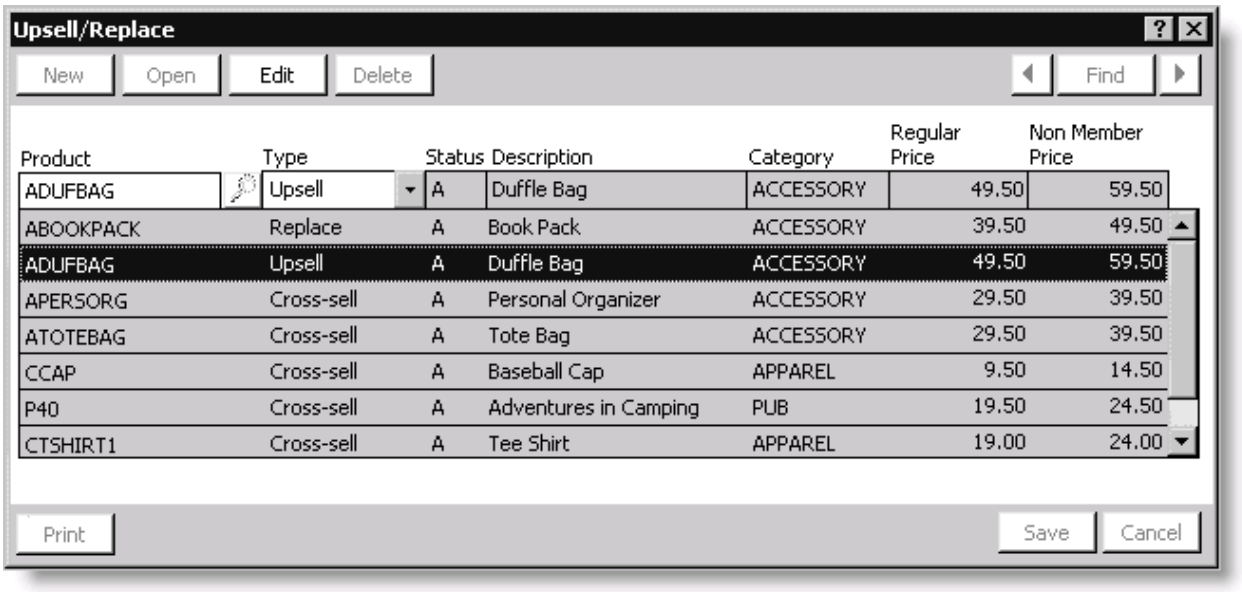
Examples of the Upsell/Replace and Opportunities windows

Both stock and non-stock items can have designated Upsell, Cross-sell, and Replacement opportunities. Upsell, Cross-sell, and Replacement opportunity items can be either stock or non-stock items.

Once you designate Upsell, Cross-sell, or Replacement items for a product, the items are easily accessible during order entry from the Opportunities window. When entering orders, you then can replace a product with an Upsell or Replacement item, or you can add Upsell, Cross-sell, and Replacement items to the order.

Note: When you delete a product from the Manage products window, iMIS also deletes all of the product's Upsell/Cross-sell/Replacement records from the Product_Substitute table.

Upsell/Replace window



From Orders, select Manage inventory > Manage products, select a product from the list of Current Products, and click Upsell/Replace

Product

Enter a product code for an item you want to designate as an Upsell, Cross-sell, or Replacement item for another product. Select the Find icon to look up a product code.

Type

Designate an item's linked product type by making a selection from the drop-down list:

- Upsell - (To persuade a customer to purchase a product that may have a greater value than the product initially chosen.) Upsell items allow you to replace an available product or add an item as an additional product. No pricing rules exist for products designated as Upsell items, and Upsell items do not have to cost more than the products they replace.
- Cross-sell - (To persuade a customer to purchase one or more similar items that complement the product initially chosen.) Cross-sell items allow you to add products to an order that, based on a marketing-defined relationship, are similar to (or complement) the product originally ordered.

- Replace - (To offer a customer an alternative item to take the place of the product initially chosen.) Replacement items allow you to replace a product or add an item to an order as an additional product.

  Status

  (read only) Displays a product's status.

  Description

  (read only) Displays a product's description.

  Category

  (read only) Displays a product's category.

  Regular Price

  (read only) Displays a product's regular price.

  Non Member Price

  (read only) Displays a product's non-member price.

  To designate opportunity items for a product

  When designating a product's Upsell, Cross-sell, and Replacement opportunity items, iMIS does not allow the following:

- Designating a product as an Upsell, Cross-sell, or Replacement opportunity for itself
- Entering duplicate Upsell, Cross-sell, or Replacement opportunities (a duplicate is defined as two lines having the same Product and Type field values)

  Note: If you are adding opportunity items for a product, and opportunity items already exist on the product's Upsell/Replace window, select the last opportunity item listed before clicking Edit. This will save you from having to scroll through the entire list to add a new item.

1. From Orders, select Manage inventory > Manage products to open the Manage products window.

2. Select a product from the list of Current Products.
3. Click Upsell/Replace to open the Upsell/Replace window.
4. Click Edit. If opportunity items are listed on the window, Tab through the Product and Type fields (without deleting any designated opportunities) until the Product field is blank.
5. Enter a Product code (select the Find icon to look up a product).
6. Select the linked Type for the product you are designating as an opportunity item: Upsell, Cross-sell, or Replace.
7. Click Save.
8. Repeat this process for each additional opportunity item you are designating.

To edit, replace, or delete a product's opportunity items

When editing or replacing a product's Upsell, Cross-sell, and Replacement opportunity items, iMIS does not allow the following:

- Designating a product as an Upsell, Cross-sell, or Replacement opportunity for itself
- Entering duplicate Upsell, Cross-sell, or Replacement opportunities (a duplicate is defined as two lines having the same Product and Type field values)

Note: If you are adding opportunity items for a product, and opportunity items already exist on the product's Upsell/Replace window, select the last opportunity item listed before clicking Edit. This will save you from having to scroll through the entire list to add a new item.

1. From Orders, select Manage inventory > Manage products to open the Manage products window.
2. Select a product from the list of Current Products.
3. Click Upsell/Replace to open the Upsell/Replace window.
4. Select the opportunity item you want to edit, replace, or delete.
5. (optional) To edit an opportunity item:

- Click Edit.
- Select the appropriate Type.
- Click Save.

6. (optional) To replace an opportunity item:

- Click Edit.
- Replace the opportunity item's Product code.
- Select the appropriate Type.
- Click Save.

7. (optional) To delete an opportunity item:

- Click Edit.
- Delete the opportunity item's Product code by pressing Delete.
- Click Save.

To designate opportunity items for kits

When an order is entered for a kit, only Upsell, Cross-sell, and Replacement items designated for the kit parent display on the Opportunities window. Upsell, Cross-sell, and Replacement items designated for kit components will not display on the Opportunities window unless they are also designated for the kit parent.

Opportunity items are designated for kits just as opportunity items are designated for individual products.

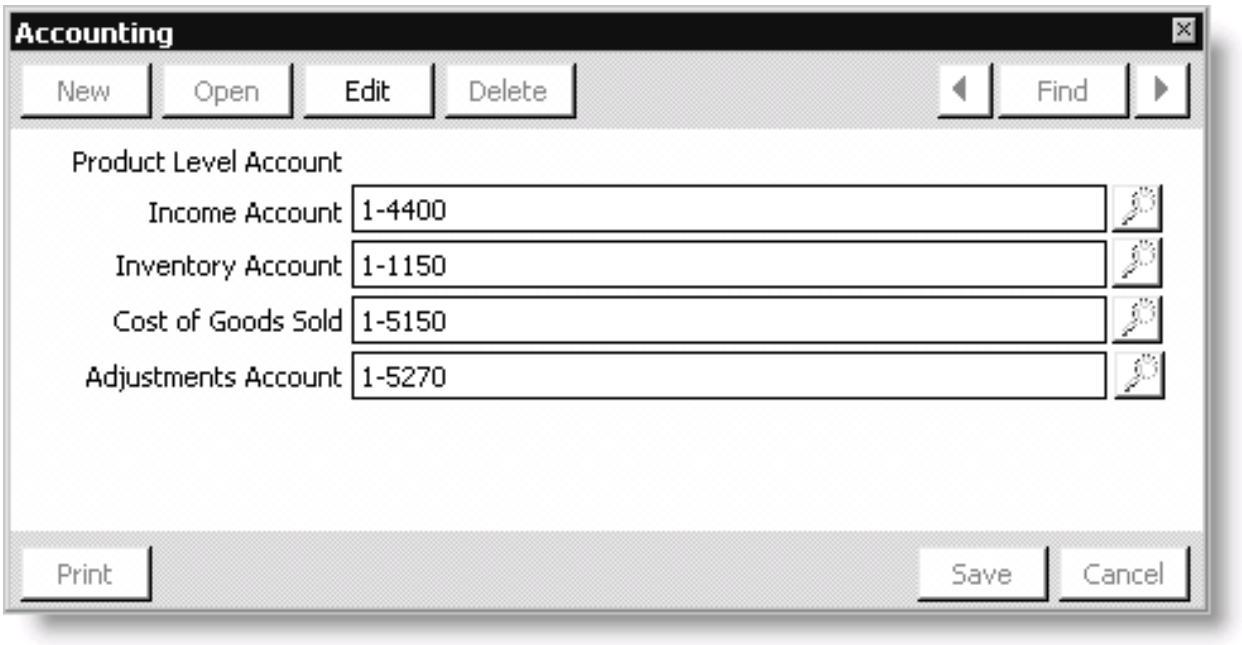
Defining product account information

iMIS Orders allows you to define specific account numbers for products on the Accounting window. The accounts defined on the Accounting window are used for recording credits and debits for products when orders are invoiced and inventory adjustments are posted.

Accounts can be defined for products at several levels, and which accounts are used depend on product account hierarchy. Accounts defined for a product on the Accounting window may not be used. See Understanding Product Account Hierarchy for more.

Before you can define accounts for products, you first must define the individual accounts. Individual accounts are defined on the GL_ACCOUNT table through the Set up general lookup/validation window (from Customers, select Set up tables > General look-up/validation).

Accounting window



From Orders, select Manage inventory> Manage products, select a product from the list of Current Products, and click Accounting

Income Account

Enter the income account number for a product. Select the Find icon to look up an account number.

The Income Account field displays for all products.

Inventory Account

Enter the inventory account number for a product. Select the Find icon to look up an account number.

The Inventory Account field displays only if the Generate Cost of Goods Sold option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

Cost of Goods Sold

Enter the cost of goods sold account number for a product. Select the Find icon to look up an account number. If product adjustments use the same inventory account, leave the Cost of Goods Sold field blank.

The Cost of Goods Sold field displays only if the Generate Cost of Goods Sold option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

Adjustments Account

Enter the adjustment account number for a product. Select the Find icon to look up an account number.

The Adjustments Account field displays only if the Generate Cost of Goods Sold option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

To define product account information

1. From Orders, select Manage inventory> Manage products to open the Manage products window.
2. Select a product for which you want to define product-specific account information from the list of Current Products.
3. Click Accounting to open the Accounting window.
4. Enter the correct Income Account number (select the Find icon to look up an account).

5. (optional) Enter the correct account numbers in the following fields. These account fields display only if the Generate Cost of Goods Sold option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory):

- Inventory Account (select the Find icon to look up an account)
- Cost of Goods Sold (select the Find icon to look up an account)
- Adjustments Account (select the Find icon to look up an account)

6. Click Save.

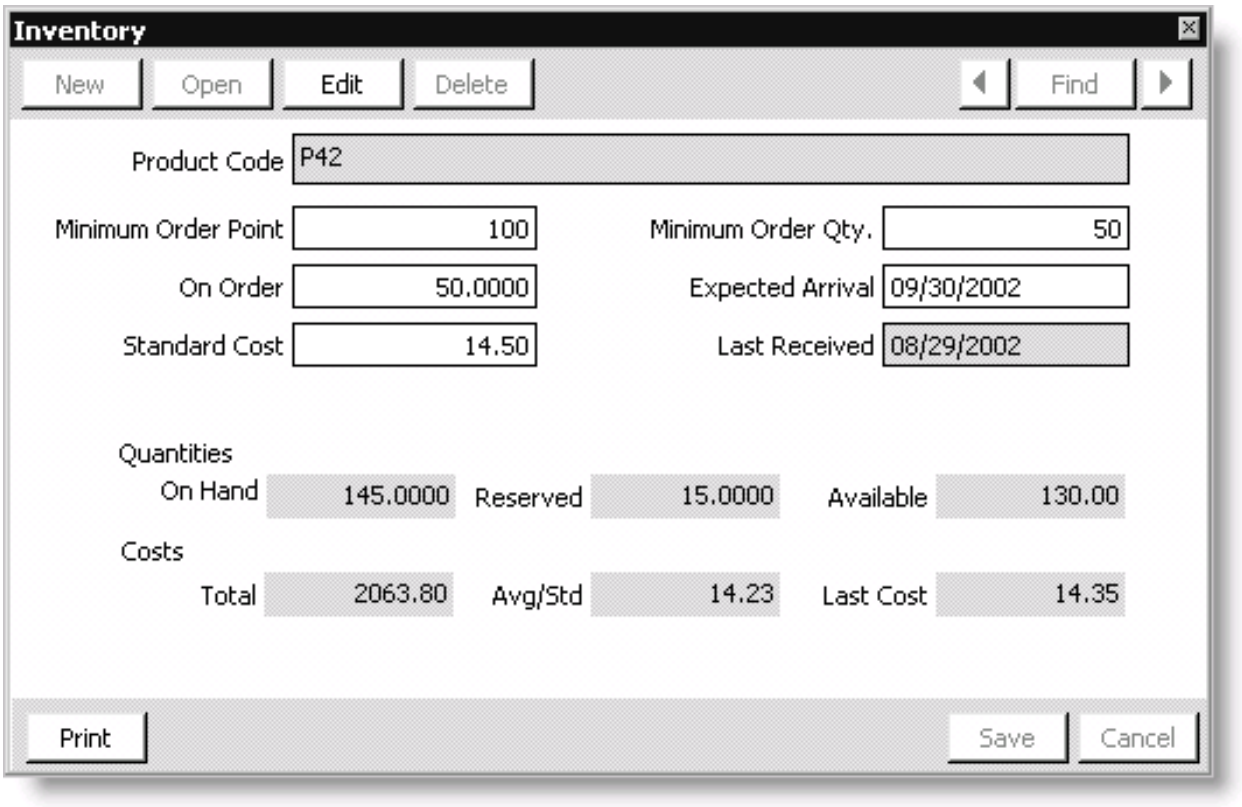
Defining standard inventory parameters

iMIS Orders allows you to define parameters that assist you in managing your product inventory. Inventory can be managed only for stock items, and how you manage your product inventory depends on whether your inventory is stored in a single location or in multiple warehouses. See Defining Inventory Parameters for Multiple Warehouses for more on multiple warehouses.

If you do not store single products in multiple warehouse locations, then you will need to define standard inventory parameters for managing your stock items. Standard inventory parameters are defined on the Inventory window and include reorder points, order quantities, inventory arrival and receipt dates, and product costs. The Inventory window is accessed by clicking the Inventory button on the Manage products window.

In order to access the Inventory window and define inventory parameters for a product, the Stock Item option must be enabled for the product on the Manage products window. If a product is designated as a stock item, the Inventory button will be enabled. If a product is not designated as a stock item, the Inventory button will be visible but disabled.

Inventory window



From Orders, select Manage inventory> Manage products, select a product from the list of Current Products, and click Inventory

Product Code

(read only) Displays the code of the product for which you are defining standard inventory parameters.

Minimum Order Point

Enter a reorder point for a product's inventory. When a product's inventory drops to the reorder point, iMIS informs you that you need to reorder the product when you print the Product Reorder List report (from Orders, select Generate reports, select the Product report type, and select Product Reorder List). iMIS compares the products in inventory to the Minimum Order Point to determine if the product should print on the report.

Minimum Order Qty

Enter a minimum amount of a product to reorder. Often, the quantity entered depends on the order quantity required for receiving a vendor discount. When the inventory level drops below the Minimum Order Point, the suggested Minimum Order Qty prints on the Product Reorder List report (from Orders, select Generate reports, select the Product report type, and select Product Reorder List).

On Order

Enter the number of products currently on order. The value entered in the On Order field is the value that displays in the On Order field on the Manage products window.

iMIS automatically decreases the number of products entered in the On Order field on both the Inventory and Manage products windows when you post product receipts.

Expected Arrival

Enter the date a reordered product is expected to arrive.

Standard Cost

Enter the standard cost of a reordered product. You only need to enter a Standard Cost if you selected Standard Cost as the Valuation Method on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

Last Received

(read only) Displays the last date a product receipt was posted to inventory. Only inventory receipts, and not inventory adjustments, update the Last Received field.

Quantities

- On Hand - (read only) Displays the total number of products currently in inventory.
- Reserved - (read only) Displays the number of reserved products (pre-invoiced products in open order status) in inventory. Reserved products include backorders.
- Available - (read only) Displays the number of products currently available in inventory (On Hand products minus Reserved products).

Costs

- Total - (read only) Displays the total cost of the products in inventory. The total cost is a cumulative running balance of receipts minus the cost of goods sold and/or inventory adjustments.
- Avg/Std - (read only) Displays the average or standard product cost on a per unit basis, depending on the option selected to determine the cost of goods sold.
- Last Cost - (read only) Displays the last amount paid for a product on a per unit basis. Only inventory receipts, and not inventory adjustments, update the Last Cost field.

  The value that displays in the Last Cost field is the value entered in the Unit Cost field on the Enter and edit receipts and adjustments window (from Orders, select Manage inventory> Enter and edit receipts and adjustments).

  To define standard inventory parameters

1. From Orders, select Manage inventory> Manage products to open the Manage products window.
2. Select a product from the list of Current Products.
3. Click Edit.
4. Click Inventory to open the Inventory window.
5. Enter the product's Minimum Order Point.
6. Enter the product's Minimum Order Qty.
7. Enter the number of products On Order.
8. Enter the product's Expected Arrival date.
9. (optional) Enter the product's Standard Cost if you selected the Standard Cost valuation method on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).
10. Click Save.

Defining inventory parameters for multiple warehouses

If you store single products in multiple warehouse locations, then you can define inventory parameters for each warehouse in which single products are stored. You also have the ability to define a specific bin within a warehouse where a product is stored. Inventory parameters for multiple warehouses include reorder points, order quantities, inventory arrival and receipt dates, product costs, and account numbers.

To use multiple warehouses for storing single products, the Enable Multi-Warehouses option must be enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

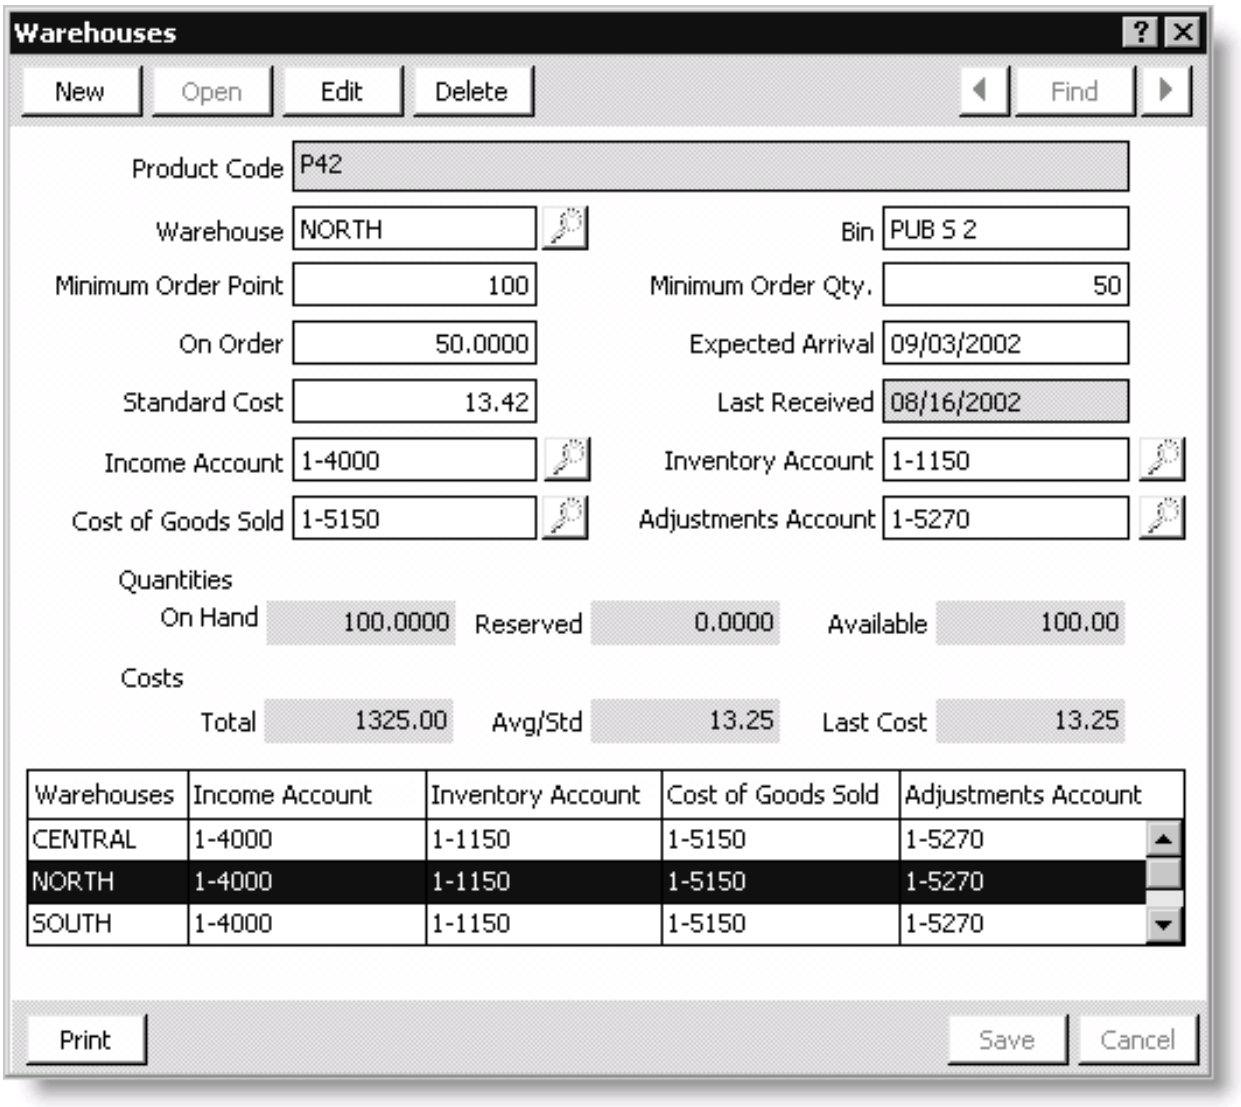
If the Enable Multi-Warehouses option is enabled, the Warehouses button displays in place of the Inventory button on the Manage products window. The Warehouses window is used for setting up multiple warehouses for single products and is accessed by clicking the Warehouse button.

To access the Warehouses window and define inventory parameters for a product's warehouses, the Stock Item option must be enabled for a product on the Manage products window. If a product is designated as a stock item, the Warehouses button will be enabled. If a product is not designated as a stock item, the Warehouses button will be visible but disabled.

Each product can be assigned a default warehouse on the Manage products window. If a product has a default warehouse, iMIS verifies that the default warehouse has sufficient inventory in stock when an order for the product is entered. If insufficient inventory is in stock at the default warehouse, you have the ability to order the product from another warehouse. If necessary, you also have the ability to override a product's default warehouse at order entry.

To define inventory parameters for multiple warehouses on the Warehouses window, the warehouses first must be defined on the Set up warehouses window (from Orders, select Set up warehouses). See Defining Warehouse Locations (see "Set up warehouses") for more.

Warehouses window



From Orders, select Manage inventory> Manage products, select a product from the list of Current Products, and click Warehouses

Delete button

Click to delete a product's warehouse. The following conditions exist for deleting a product's warehouse:

- The warehouse must be empty of all inventory.
- The warehouse cannot be the product's Default warehouse.

- No orders can be open for the product stored in the warehouse.

  Product Code

  (read only) Displays the code of the product for which you are setting up warehouses and defining inventory parameters.

  Warehouse

  Enter a warehouse location for a product. Select the Find icon to look up a warehouse location; warehouse locations are defined on the Set up warehouses window (from Orders, select Set up warehouses).

  Bin

  (optional) Use this field to define a specific bin where a product is stored in a warehouse.

  Minimum Order Point

  Enter a reorder point for a product's inventory. When a product's inventory at a warehouse drops to the reorder point, iMIS informs you that you need to reorder the product when you print the Product Reorder List report (from Orders, select Generate reports, select the Product report type, and select Product Reorder List). iMIS compares the products in inventory to the Minimum Order Point to determine if the product should print on the report.

  Minimum Order Qty

  Enter a minimum amount of a product to reorder for a warehouse. Often, the quantity entered depends on the order quantity required for receiving a vendor discount. When the inventory level drops below the Minimum Order Point, the suggested Minimum Order Qty prints on the Product Reorder List report (from Orders, select Generate reports, select the Product report type, and select Product Reorder List).

  On Order

  Enter the number of products currently on order for a warehouse.

The value entered in the On Order field is the value that displays in the On Order field on the Manage products window. If you store a single product's inventory in multiple warehouses, the On Order field on the Manage products window displays the combined total product quantity on order for all the warehouses.

iMIS automatically decreases the number of products entered in the On Order field on both the Inventory and Manage products windows when you post product receipts.

Expected Arrival

Enter the date a reordered product is expected to arrive at a warehouse.

Standard Cost

Enter the standard cost of a reordered product for a warehouse. You only need to enter a Standard Cost if you selected Standard Cost as the Valuation Method on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

Last Received

(read only) Displays the last date a product receipt was posted to inventory for a warehouse. Only inventory receipts, and not inventory adjustments, update the Last Received field.

Income Account

Enter the income account number for a product stored in a warehouse. Select the Find icon to look up an account number; individual accounts are defined for the GL_ ACCOUNT table on the Set up general lookup/validation window (from Customers, select Set up tables > General lookup/validation).

Inventory Account

Enter the inventory account number for a product stored in a warehouse. Select the Find icon to look up an account number; individual accounts are defined for the GL_ ACCOUNT table on the Set up general lookup/validation window (from Customers, select Set up tables > General lookup/validation).

Cost of Goods Sold

Enter the cost of goods sold account number for a product stored in a warehouse. Select the Find icon to look up an account number; individual accounts are defined for the GL_ ACCOUNT table on the Set up general lookup/validation window (from Customers, select Set up tables > General lookup/validation).

Adjustments Account

Enter the adjustment account number for a product stored in a warehouse. Select the Find icon to look up an account number; individual accounts are defined for the GL_ ACCOUNT table on the Set up general lookup/validation window (from Customers, select Set up tables > General lookup/validation).

Quantities

On Hand - (read only) Displays the total quantity of a product currently in inventory at a warehouse.

Reserved - (read only) Displays the reserved quantity of a product (pre-invoiced products in open order status) in inventory at a warehouse. Reserved products include backorders.

Available - (read only) Displays the quantity of a product currently available in inventory at a warehouse (On Hand products minus Reserved products).

Costs

Total - (read only) Displays the total cost of a product in inventory at a warehouse. The total cost is a cumulative running balance of receipts minus the cost of goods sold and/or inventory adjustments.

Avg/Std - (read only) Displays the average or standard cost of a product at a warehouse on a per unit basis, depending on the option selected to determine the cost of goods sold.

Last Cost - (read only) Displays the last amount paid for a product in inventory at a warehouse. The cost is calculated on a per unit basis. Only inventory receipts, and not inventory adjustments, update the Last Cost field.

The value that displays in the Last Cost field is the value entered in the Unit Cost field on the Enter and edit receipts and adjustments window (from Orders, select Manage inventory> Enter and edit receipts and adjustments).

Warehouses

Displays all of the warehouses set up for a product. Each warehouse line item displays a warehouse's code and account information.

To define warehouse parameters

Before defining warehouse parameters, make sure that you have defined the individual warehouses on the Set up warehouses window (from Orders, select Set up warehouses).

1. From Orders, select Manage inventory> Manage products to open the Manage products window.
2. Select a product from the list of Current Products.
3. Click Warehouses to open the Warehouses window.
4. Click New.
5. Enter the location of the Warehouse (select the Find icon to look up a warehouse location).
6. (optional) Enter the Bin in which the product is stored in the warehouse.
7. Enter the product information.

- Enter the product's Minimum Order Point.
- Enter the product's Minimum Order Qty.
- Enter the number of products On Order.
- Enter the product's Expected Arrival date.
- (optional) Enter the product's Standard Cost if you selected the Standard Cost valuation method on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

8. Enter the warehouse's Income Account (select the Find icon to look up an account).
9. (optional) Enter the warehouse's remaining account numbers. These account fields display only if the Generate Cost of Goods Sold option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory):

- Inventory Account (select the Find icon to look up an account)
- Cost of Goods Sold (select the Find icon to look up an account)
- Adjustments Account (select the Find icon to look up an account)

10. Click Save.

To edit warehouse parameters

1. From Orders, select Manage inventory> Manage products to open the Manage products window.
2. Select a product from the list of Current Products.
3. Click Warehouses to open the Warehouses window.
4. Click Edit.
5. Select a warehouse line item from the list of Warehouses.
6. Make any necessary changes.
7. Click Save.

To delete a product's warehouse

Once you remove a product's warehouse, you cannot post any outstanding, non-posted inventory transactions for that warehouse. If you post inventory transactions manually (recommended) and remove a product's warehouse, all non-posted inventory transactions will be removed from the Post receipts window (from Orders, select Manage inventory> Post receipts).

However, non-posted inventory transactions will still display on the Enter and edit receipts and adjustments window (from Orders, select Enter and edit receipts and adjustments).

1. From Orders, select Manage inventory> Manage products to open the Manage products window.
2. Select a product from the list of Current Products.
3. Click Warehouses to open the Warehouses window.
4. Select the warehouse you want to delete from the list of Warehouses:

- The warehouse must be empty of all inventory.
- The warehouse cannot be the product's Default warehouse.
- No orders can be open for the product stored in the warehouse.

5. Click Delete. A message displays prompting you to confirm deleting the selected warehouse.
6. Click Yes to delete the warehouse.

Defining publication demographics

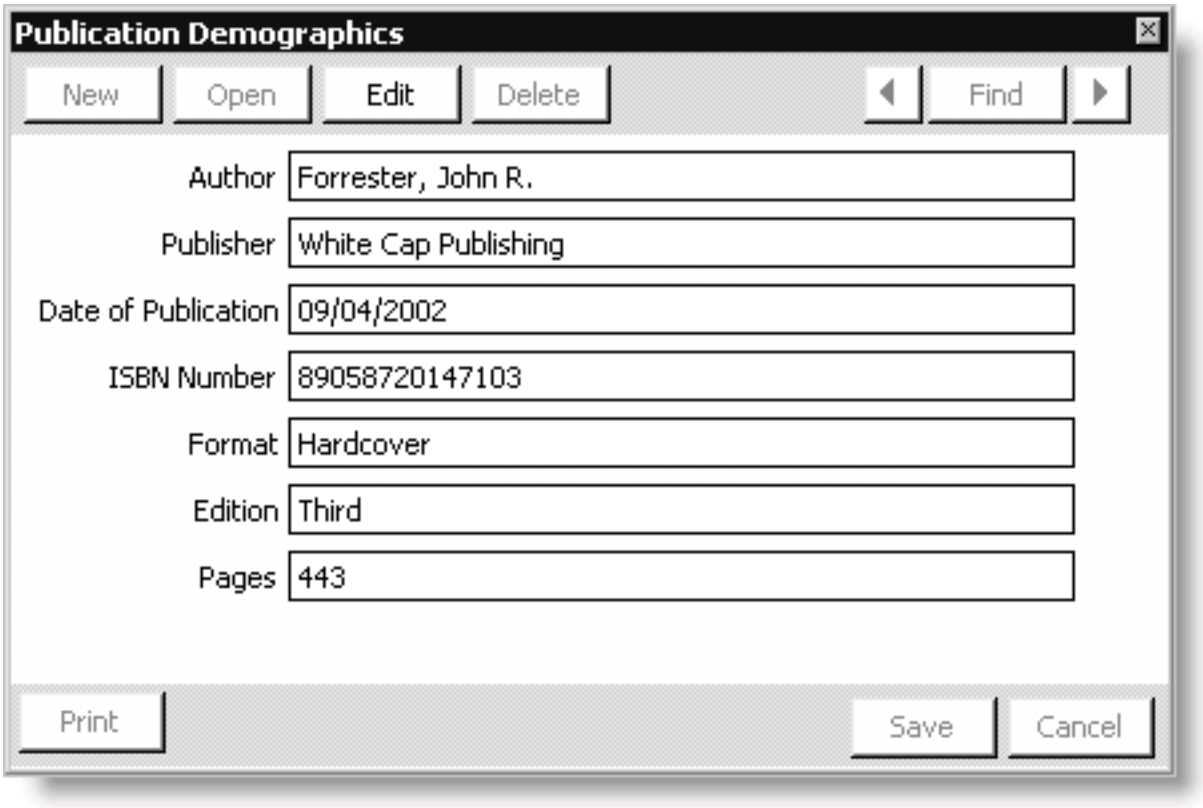
iMIS Orders allows you to define and store specific information about the various publications you offer for sale to your customers. Detailed publication information is defined on the Publication Demographics window, and the information that you define displays as read-only data on the Publication Detail window. The Publication Detail window is accessible by clicking the Publication Detail button on the Product Detail window.

If the Use Publication Demographics option is enabled for a product category on the Set up product categories window, then the Publication button will display on the Manage products window for products belonging to that category. Clicking the Publication button opens the Publication Demographics window.

For the Publication Detail button to display and/or enable on the Product Detail window, the following conditions must be true:

- The Use Publication Demographics option must be enabled for the product's category on the Manage products window. The Publication Detail button only displays when the option is enabled for a product's category.
- Data must be entered in at least one field on a product's Publication Demographics window. If data is not entered in at least one field, the Publication Detail button will not enable on the Product Detail window.

Publication Demographics window



From Orders, select Manage inventory> Manage products, select a product from the list of Current Products, and click Publication

Author

Enter a publication's author.

Publisher

Enter a publication's publisher.

Date of Publication

Enter a publication date. You can enter any date in the mm/dd/yyyy format, or you can let iMIS format a date automatically. If iMIS automatically formats a date, the date formats to mm/dd/yyyy, and the applicable date range is from 1980 to 2079.

For example, if you enter 092698 for the publication date, the date automatically formats to 09/26/1998. If you enter 092602, the date automatically formats to 09/26/2003.

ISBN Number

Enter a publication's International Standard Book Number.

Format

Enter a publication's binding format, such as softbound or hardcover.

Edition

Enter a publication's edition number.

Pages

Enter a publication's number of pages.

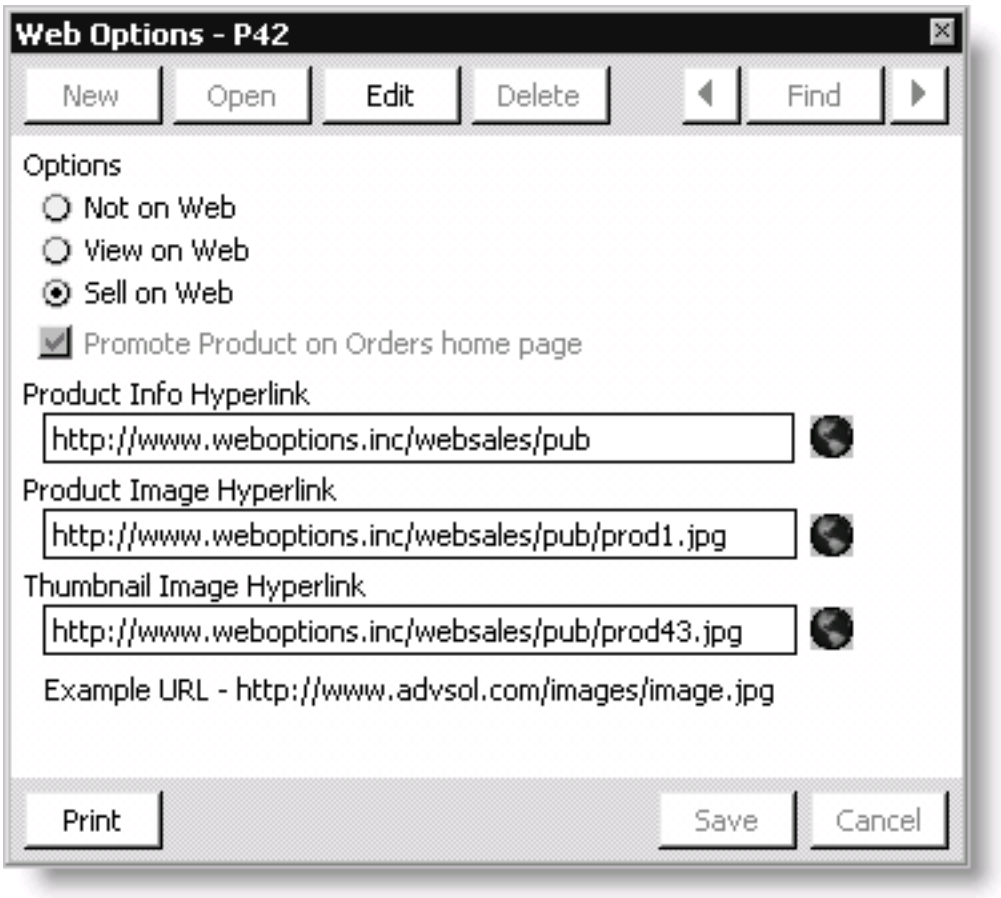
To enter or edit publication demographic information

1. Make sure the Use Publication Demographics option is enabled for a product's category on the Set up product categories window. See "Product categories setup" for details.
2. From Orders, select Manage inventory> Manage products to open the Manage products window.
3. Select a product from the list of Current Products for which you want to define publication demographics. The Publication button will display.
4. Click Publication to open the Publication Demographics window.
5. Click Edit.
6. Enter or edit the product's publication demographic information.
7. Click Save.

Enabling products for the web

You can enable products to be viewed or sold on the web using the Web Options window (Orders > Manage inventory > Manage products, select a product and click Web). The options set here affect products sold through the web views of iMIS.

Web Options window for products



From Orders, select Manage inventory > Manage products, select a product from the list of Current Products, and click Web

Options

- Not on Web - Prevents the product from being viewed or sold on the web.
- View on Web - Allows the product to be viewed, but not sold, on the web.
- Sell on Web - Allows the product to be viewed and sold on the web.

Note: The viewing option selected at the product level can be overridden at the product category level for web view products (Orders > Set up tables > Product categories, select a category, and click Web Options).

Promote Product on Orders home page

Enable to promote the product as a Featured Product on the Orders main page and on every search results page.

Product Info Hyperlink

Enter a URL to information about the product category. Click the Web icon to view the product category's information on the web.

By default, this field populates with the value entered for the product's category in the Product Info Hyperlink field on the Web Options window (from Orders, select Set up tables > Product categories, select a category, and click Web Options).

Product Image Hyperlink

Enter a URL to an image representing the product category. Click the Web icon to view the product category on the web.

By default, this field populates with the value entered for the product's category in the Product Image Hyperlink field on the Web Options window (from Orders, select Set up tables > Product categories, select a category, and click Web Options).

Thumbnail Image Hyperlink

Enter a URL to an image of the product. Click the Web icon to view the product on the web.

To enable a product for the Web

1. From Orders, select Manage inventory > Manage products to open the Manage products window.
2. Select a product from the list of Current Products.
3. Click Edit.

4. Click Web to open the Web Options window.
5. Enable the product for the Web:

- Not on Web - prevents it from being viewed or sold on the web.
- View on Web - allows it to be viewed, but not sold, on the web.
- Sell on Web - allows it to be viewed and sold on the web.

6. Enable Promote Product on Orders home page option if you want to promote the product as a Featured Product on your main page and on every search results page.
7. Enter the Product Info Hyperlink.
8. Enter the Product Image Hyperlink.
9. Enter the Thumbnail Image Hyperlink.
10. Click Save.

Product Inventory

The flexibility of Orders simplifies managing product inventory and ensures inventory transactions are recorded efficiently and accurately. How you manage product inventory and process inventory transactions depends on whether your inventory is stored in a single location or in multiple warehouses.

After entering a product inventory transaction, the transaction must be posted. Inventory transactions can be posted either automatically or manually. Manually posting inventory transactions is recommended because it provides an opportunity to review a transaction for errors. Automatic transaction posting does not offer this opportunity.

Product inventory transactions are separated into three distinct tasks:

- Receipts - Record and track your physical product inventory.
- Adjustments - Adjust your product inventory records in the event of loss or damage.
- Transfers - If you are using multiple warehouses, record product inventory transfers from warehouse to warehouse.

Product inventory transactions can be entered only for products that have Active, Inactive, or Out of Production status. Changes to product status codes are not retroactive, and existing inventory receipts, adjustments, and transfers are not affected by product status changes.

Enter and post product inventory transactions using the windows accessed through the Manage inventory sub-task list.

Manage inventory sub-task list

Note: From Orders, select Manage inventory.

Manage products

Select to open the Manage products window used for defining and managing individual products.

Enter and edit receipts and adjustments

Select to open the Enter and edit receipts and adjustments window used for entering product inventory transactions.

Post receipts

Select to open the Post receipts window used for manually posting inventory transactions.

Entering and posting inventory transactions

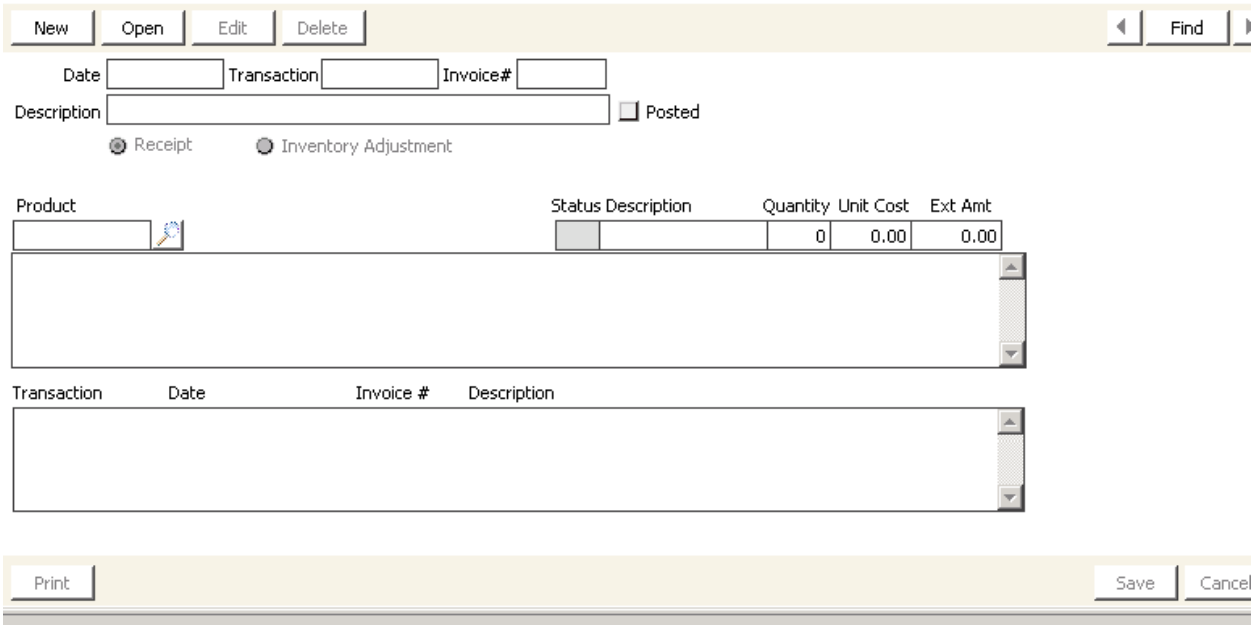
Product inventory transactions include inventory receipts, adjustments, and transfers. Automatically posting inventory transactions is not recommended because it does not allow you to review your transactions or make any necessary corrections before the transactions are posted.

By posting transactions manually, you can verify and correct any errors before a transaction is posted. This helps protect product inventory, backorder, and cost of goods sold information from inadvertent updates and changes.

To post inventory receipts and adjustments manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

All inventory transactions are entered using the Enter and edit receipts and adjustments window (from Orders, select Manage inventory > Enter and edit receipts and adjustments).

Enter and edit receipts and adjustments window



Desktop: Manage inventory > Enter and edit receipts and adjustments

Date

Enter the date of a product inventory transaction. The Date field defaults to the current system date but can be overridden.

Transaction

Enter a transaction number when opening or editing a product inventory transaction. Transaction numbers are system generated when an inventory transaction is entered.

Invoice #

Enter an invoice number for a product inventory transaction. Using an invoice number from a vendor's invoice is recommended.

Description

Enter a brief description of the product inventory transaction.

Posted

This option enables automatically when the selected inventory transaction has been posted.

Receipt

Enable to record an inventory receipt.

Inventory Adjustment

Enable to record an inventory adjustment rather than an inventory receipt. An inventory adjustment will affect a product's Qty on Hand as displayed on the Manage products window (from Orders, select Manage inventory> Manage products).

Transfer

(Multi-Warehouses only) Enable to transfer product inventory from one warehouse to another. The Transfer option displays only if the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

The following fields display when the Transfer option is enabled:

- From Warehouse - Replaces the Warehouse field
- Bin (From Warehouse)
- To Warehouse
- Bin (To Warehouse)

Product

Enter the product code for which you are entering an inventory transaction (select the Find icon to look up a product code). Inventory transactions can be entered only for products that have an Active, Inactive, or Out of Production status.

Warehouse

(Required/Displays for Multi-Warehouses only) Enter the warehouse for which you are entering a product inventory receipt or adjustment. The Warehouse field is a required field and defaults to a product's Default Warehouse on the Manage products window, but it can be overridden.

Select the Find icon to look up a warehouse; warehouses are defined on the LOCATION general lookup/validation table.

From Warehouse

(Replaces the Warehouse field when the Transfer option is enabled) Enter the warehouse from which you are transferring a product's inventory. The From Warehouse field is a required field and defaults to a product's Default Warehouse on the Manage products window, but it can be overridden to another warehouse that has the same product in stock.

Select the Find icon to look up a warehouse; warehouses are defined on the LOCATION general lookup/validation table.

Bin

(Displays for Multi-Warehouses only) Enter the warehouse bin for which you are entering a product inventory receipt or adjustment, or enter the warehouse bin from where you are transferring a product's inventory. The Bin field defaults to the bin defined for the Default Warehouse, but it can be overridden for any bin (the bin does not have to be pre-defined) when recording inventory transactions.

To Warehouse

(Displays only when the Transfer option is enabled) Enter the warehouse to which you are transferring a product's inventory (this warehouse must be pre-defined for the product). The To Warehouse field is a required field for inventory transfers.

Select the Find icon to look up a warehouse; warehouses are defined on a product's Warehouses window.

Bin

(Displays only when the Transfer option is enabled) Enter the warehouse bin to which you are transferring a product's inventory. The Bin field defaults to the bin defined for a warehouse on the Warehouses window, but it can be overridden.

If you update a To Warehouse's Bin field, the Bin field on the Warehouses window will be updated for that particular warehouse.

Status

(read only) Displays the product's status. Product inventory receipts, adjustments, and transfers can be entered only for products that have an Active, Inactive, or Out of Production status. See Product Status Codes for more on product status codes.

Description

(read only) Displays a description of the product entered in the Product field. The value that displays in the Description field is the value entered in the Title field on the Manage products window.

Quantity

Enter the number of products involved in the inventory transaction. The following stipulations exist depending on transaction type:

- Receipt - A negative value cannot be entered for an inventory receipt.
- Inventory Adjustment - No stipulations.
- Transfer - A negative value cannot be entered for an inventory transfer, and the value

entered in the Quantity field cannot exceed a From Warehouse's available inventory quantity.

Unit Cost

Enter the per-unit cost of a product. For inventory receipts and adjustments, the Unit Cost field defaults to the value displayed in the Last Cost field on a product's Inventory window. You can override a product's unit cost as necessary.

For inventory transfers, the Unit Cost field is display only and cannot be edited. The value that displays in the Unit Cost field depends on the Valuation Method selected on the Inventory System Setup window:

- Standard Cost valuation method
- If the From Warehouse's total product cost equals zero, then the value displayed in the Unit Cost field will be zero.
- If both the From Warehouse's total product cost and standard product cost are greater than zero, then the value displayed in the Unit Cost field will equal a product's standard cost.
- If none of the above are true, then the value displayed in the Unit Cost field will equal a product's average cost.
- Average valuation method
- If the From Warehouse's total product cost equals zero, then the value displayed in the Unit Cost field will equal zero.
- If the From Warehouse's total product cost does not equal zero, then the value displayed in the Unit Cost field will equal the average product cost.

Ext Amt

(read only) Displays the system-generated extended amount of a product's cost, which is the product Quantity times the product Unit Cost.

Product Inventory

(read only) Displays all of the product line-items for which you entered inventory transactions.

Inventory Transactions

(read only) Displays all of the product inventory transactions processed during the current session.

Entering inventory receipts

Product inventory receipts allow iMIS Orders to record and track your physical product inventory accurately and efficiently. Inventory receipts are recorded when a product is received in inventory, and receipts can be entered only for stock items that have an Active, Inactive, or Out of Production status.

When entering product inventory receipts, enter the transaction date, invoice number, description, and quantity received in inventory for a specific product. When an inventory receipt is entered, a transaction number is generated automatically as a reference for the receipt. When inventory receipts are posted, iMIS automatically updates and adjusts your product inventory records.

To ensure accurate inventory records, manually posting inventory receipts is recommended because it provides an opportunity to review the receipts before they are posted. This helps prevent entering any inadvertent updates or changes. To post inventory receipts manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

Your method of storage determines how inventory receipts are entered. If an individual product is stored in a single storage facility, you only need to enter a single inventory receipt for a product. If an individual product is stored in multiple warehouses, you have the ability to enter inventory receipts for each warehouse in which a product is stored. In order to record inventory receipts for products stored in multiple warehouses, the Enable Multi-Warehouses option must be enabled on the Inventory System Setup window.

To enter inventory receipts

Follow this procedure if the Enable Multi-Warehouses option on the Inventory System Setup window is disabled.

1. From Enter and edit receipts and adjustments window, click New.
2. (optional) Enter the Date of the inventory receipt, or accept the default system date.
3. Enter an Invoice #, such as the invoice number of the vendor's invoice.
4. Enter a brief Description of the product inventory receipt.
5. Enter the code of the Product received in inventory (select the Find icon to look up a product code). Receipts can be entered only for products that have an Active, Inactive, or Out of Production status.
6. Press Tab. The product's Description and Unit Cost display by default. The Description can be overridden if necessary.
7. Enter the Quantity of the product received in inventory.
8. (optional) Enter the Unit Cost of the product, or accept the default unit cost.
9. Press Tab, and repeat this process for each additional product inventory receipt you want to enter.
10. Click Save.

To enter inventory receipts for multiple warehouses

Follow this procedure if the Enable Multi-Warehouses option on the Inventory System Setup window is enabled.

1. From Enter and edit receipts and adjustments window, click New. The Receipt option is enabled by default.
2. (optional) Enter the Date of the product inventory receipt, or accept the default system date.
3. Enter an Invoice #, such as the invoice number of the vendor's invoice.
4. Enter a brief Description of the product inventory receipt.

5. Enter the Product code of the product received in inventory (select the Find icon to look up a product code). Receipts can be entered only for products that have an Active, Inactive, or Out of Production status.
6. Press Tab. The product's default Warehouse, Bin (if applicable), Description, and Unit Cost display by default.
7. Enter the Warehouse for which you are entering the inventory receipt (select the Find icon to look up a warehouse), or accept the product's default warehouse. You also can enter a warehouse that has not been pre-defined for the product:

   Entering a warehouse that has not been pre-defined creates a new warehouse record for that product.
8. Enter the warehouse Bin in which the product is stored, or accept the default bin.
9. (optional) Enter the product's Description, or accept the default product description.
10. Enter the Quantity of the product received in inventory at the warehouse.
11. Enter the Unit Cost of the product, or accept the default unit cost.
12. Press Tab, and repeat this process for each additional product inventory receipt you want to enter.
13. Click Save.

Entering inventory adjustments

Product inventory adjustments allow you to adjust your inventory records for stock items when you need to make corrections. For example, you may need to enter a product inventory adjustment after taking inventory of all products and discovering loss or damage that has decreased a product's physical inventory.

Inventory adjustments are entered just as inventory receipts are entered, and the only difference between the two is that negative quantities can be entered for inventory adjustments. Adjustments can be entered only for products with an Active, Inactive, or Out of

Producton status, and iMIS automatically updates and adjusts your product inventory records when adjustments are posted.

As with all inventory transactions, manually posting inventory adjustments is recommended. To post inventory adjustments manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

As with inventory receipts, your method of storage determines how inventory adjustments are entered. In order to record inventory adjustments for a product stored in multiple warehouses, the Enable Multi-Warehouses option must be enabled on the Inventory System Setup window.

To enter inventory adjustments

1. From Enter and edit receipts and adjustments window, click New.
2. (optional) Enter the Date of the inventory adjustment, or accept the default system date.
3. Enter an Invoice # for the inventory adjustment.
4. Enter a brief Description of the product inventory adjustment.
5. Enable the Inventory Adjustment option.
6. Enter the code of the Product for which you are entering an inventory adjustment (select the Find icon to look up a product code). Adjustments can be entered only for products that have an Active, Inactive, or Out of Production status.
7. Press Tab. The product's Description and Unit Cost display by default. The Description can be overridden if necessary.
8. Enter the quantity of the inventory adjustment:

- Enter a positive amount in the Quantity field to increase a product's inventory.
- Enter a negative amount in the Quantity field to decrease a product's inventory.

9. Enter the Unit Cost of the product, or accept the default unit cost.
10. Press Tab, and repeat this process for each additional product adjustment.

11. Click Save to enter the inventory adjustment.

To enter inventory adjustments for multiple warehouses

1. From Enter and edit receipts and adjustments window, click New.
2. (optional) Enter the Date of the inventory adjustment, or accept the default system date.
3. Enter an Invoice # for the inventory adjustment.
4. Enter a brief Description of the product inventory adjustment.
5. Enable the Inventory Adjustment option.
6. Enter the code of the Product for which you are entering an inventory adjustment (select the Find icon to look up a product code). Adjustments can be entered only for products that have an Active, Inactive, or Out of Production status.
7. Press Tab. The product's Warehouse, Bin (if applicable), Description, and Unit Cost display by default.
8. Enter the Warehouse for which you are entering the inventory adjustment (select the Find icon to look up a warehouse), or accept the product's default warehouse.
9. Enter the warehouse Bin in which the product is stored, or accept the default bin.
10. (optional) Enter the product's Description, or accept the default product description.
11. Enter the quantity of the inventory adjustment:
    - Enter a positive amount in the Quantity field to increase a product's inventory.
    - Enter a negative amount in the Quantity field to decrease a product's inventory.
12. Enter the Unit Cost of the product, or accept the default unit cost.
13. Press Tab, and this process for each additional product adjustment.
14. Click Save to enter the inventory adjustment.

Entering inventory transfers

If you store individual products in multiple warehouses, iMIS Orders gives you the ability to record product inventory transfers from warehouse to warehouse.

Product inventory transfers may be necessary under a variety of circumstances. For example, a product's inventory at one warehouse may be insufficient to meet immediate customer demand. If another warehouse has excess inventory in stock, you may decide to transfer the excess inventory to the warehouse with insufficient inventory.

When product inventory transfers are posted, iMIS automatically updates and adjusts a product's inventory record for each warehouse involved in the transfer. As with all inventory transactions, manually posting inventory transfers is recommended. To post inventory transfers manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

To record inventory transfers for a product stored in multiple warehouses, the Enable Multi-Warehouses option must be enabled on the Inventory System Setup window.

To enter inventory transfers

Transfers can be entered only for products that have an Active, Inactive, or Out of Production status. If you select a To Warehouse that is not already assigned to the product, iMIS automatically assigns the warehouse once you save the inventory transfer and adds it to the product's Warehouses window. Entering or editing a Bin value on the Enter and edit receipts and adjustments window updates a product's Warehouses window for that To Warehouse.

1. From Enter and edit receipts and adjustments window, click New.
2. (optional) Enter the Date of the inventory transfer, or accept the default system date.
3. Enter an Invoice # for the inventory transfer.
4. Enter a brief Description of the product inventory transfer.

5. Enable the Transfer option. The From Warehouse, To Warehouse, and Bin (To Warehouse) fields display.
6. Enter the code of the Product that you are transferring (select the Find icon to look up a product code). Transfers can be entered only for products that have an Active, Inactive, or Out of Production status.
7. Press Tab. The product's From Warehouse, Bin ('From Warehouse'), Description, and Unit Cost display by default.
8. Enter the product's From Warehouse. This is the warehouse from which inventory is transferred. Select the Find icon to look up a warehouse, or accept the product's default warehouse.
9. Enter the 'From Warehouse' Bin, or accept the default bin.
10. Enter the product's To Warehouse. This is the warehouse to which inventory is transferred. Select the Find icon to look up a warehouse.
11. Enter the product's To Warehouse Bin if applicable.
12. (optional) Enter the product's Description, or accept the default product description.
13. Enter the Quantity of the inventory transfer. The quantity entered cannot be a negative value or exceed the From Warehouse's total available inventory.
14. Click Save.

Opening and finding inventory transactions

Several options are available for opening and finding inventory transactions. If you know either the transaction number or transaction invoice number of the transaction you want to open, you can open the transaction directly on the Enter and edit receipts and adjustments window.

If you do not know the transaction number or transaction invoice number, you will have to search for the transaction.

To open inventory transactions

Follow this procedure if you know either the transaction number or transaction invoice number of the transaction you want to open.

1. From Enter and edit receipts and adjustments window, click Open or Find.
2. You have two options when opening inventory transactions:

- Enter the transaction number in the Transaction field, or
- Enter the transaction invoice number in the Invoice # field.

3. Click OK to display the transaction in the Enter and edit receipts and adjustments window.

To find inventory transactions using the Inventory Transaction list

Follow this procedure if you entered the inventory transaction during the current iMIS session, and the transaction still displays in the Inventory Transaction list.

1. From Enter and edit receipts and adjustments window, select the transaction you want to open from the Inventory Transaction list. The transaction displays on the Enter and edit receipts and adjustments window.

To find inventory transactions by date

Follow this procedure if you know the date the inventory transaction was entered.

1. From Orders, select Manage inventory> Enter and edit receipts and adjustments to open the Enter and edit receipts and adjustments window.
2. Click Open or Find.
3. Enter the transaction date in the Date field.
4. Click OK to display all inventory transactions entered on that date in the Inventory Transaction list.
5. Select the inventory transaction from the Inventory Transaction list.

To find product inventory transactions using the Post receipts window

If you do not know the transaction date or number of an inventory transaction, you can open the Post receipts window to display a list of all open, non-posted transactions.

1. From Orders, select Manage inventory> Post receipts to open the Post receipts window.
2. Find the inventory transaction number of the transaction you want to open.
3. From Orders, select Manage inventory> Enter and edit receipts and adjustments to open the Enter and edit receipts and adjustments window.
4. Enter the transaction number in the Transaction field.
5. Click OK to display the transaction in the Enter and edit receipts and adjustments window.

Editing and deleting inventory transactions

You have the ability to review, edit, and delete inventory receipts, adjustments, and transfers that have not been posted. Because posted inventory transactions cannot be edited, automatically posting inventory transactions is not recommended.

To post inventory transactions manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

To edit product inventory transactions

1. From Orders, select Manage inventory> Enter and edit receipts and adjustments to open the Enter and edit receipts and adjustments window.
2. Open the product inventory transaction.
3. Click Edit.
4. Make any necessary changes.
5. Click Save.

To delete product inventory transactions

1. From Orders, select Manage inventory> Enter and edit receipts and adjustments to open the Enter and edit receipts and adjustments window.
2. Open the product inventory transaction you want to delete.
3. Click Delete. A message displays prompting you to verify deleting the transaction.
4. Click Yes to delete the inventory transaction.

Posting inventory transactions

Upon entering a product inventory transaction and verifying that the transaction information is correct, a transaction can be posted. When an inventory transaction is posted, a product's inventory records are updated with the transaction information.

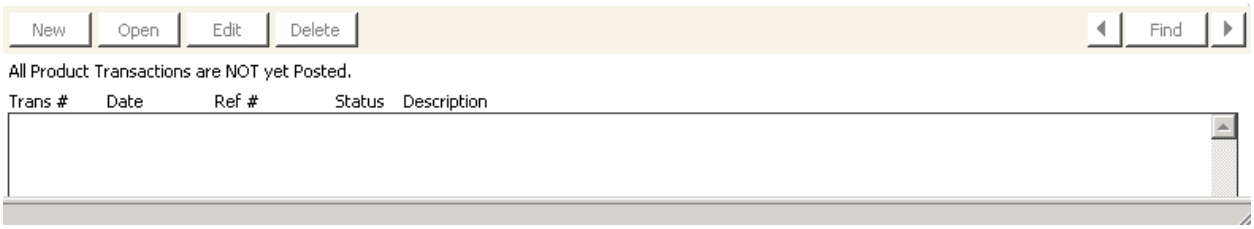
If you elect to post inventory transactions automatically (not recommended), all transactions are posted when they are entered and saved on the Enter and edit receipts and adjustments window. Automatically posting inventory transactions is not recommended because it does not allow you to review your transactions and make any necessary corrections before posting the transactions.

By posting transactions manually, you can verify and correct any errors before posting a transaction. This helps protect product inventory, backorder, and cost of goods sold information from inadvertent updates or changes. Inventory transactions are posted manually as long as the Automatically Post Inventory Receipts/Adjustments option is disabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

After verifying that your transaction information is correct, you can post your inventory transactions individually, in groups, or all at once using the Post receipts window (from Orders, select Manage inventory> Post receipts).

Caution! Product inventory receipts, adjustments, and transfers can be posted only for products that have an Active, Inactive, or Out of Production status. If a product's status is changed to a status other than Active, Inactive, or Out of Production after a transaction has been entered for the product, the transaction will not display on the Post receipts window and cannot be posted.

Post receipts window



Desktop: Orders > Manage inventory > Post Receipts

Trans #

This column displays the transaction number for the product inventory transaction. iMIS generates the transaction number after the inventory transaction is entered.

Date

This column displays the date of the product inventory transaction.

Ref #

This column displays the number entered in the Invoice # field on the Enter and edit receipts and adjustments window.

Status

(read only) Displays the product's status. Inventory transactions can be posted only for products that have an Active, Inactive, or Out of Production status.

Description

This column displays the description entered in the Description field on the Enter and edit receipts and adjustments window.

Sort

(Not shown in example) Use this drop-down list to sort the product inventory transactions on the Post receipts window. The following sorting options are available:

- Trans # - Sorts by transaction number.
- Trans Date - Sorts by transaction date.

- Ref # - Sorts by invoice number.
- Description - Sorts by description.
- Entered By - Sorts according to transaction entry.

Post button

(Not shown in example) Click to post the selected product inventory transaction(s).

Posting transactions for multiple warehouses

While the process of posting inventory transactions for multiple warehouses and standard inventory is the same, you need to be aware of the following when posting transactions for multiple warehouses:

Removing warehouses

Once you remove a product's warehouse, you cannot post any outstanding, non-posted inventory transactions for that warehouse. If you post inventory transactions manually and remove a product's warehouse, all non-posted inventory transactions will be removed from the Post receipts window. However, non-posted inventory transactions will still display on the Enter and edit receipts and adjustments window (from Orders, select Enter and edit receipts and adjustments).

Inventory transfers

Transferring inventory from one warehouse to another affects both product cost and inventory field values when a transfer is posted.

Cost of Goods Sold - Regardless of whether the Average or Standard Cost valuation method is selected when the Cost of Goods Sold option is enabled on the Inventory System Setup window, the following rule applies when posting inventory transfers:

Caution! The extended amount of the transferred product cannot exceed the current total cost of the From Warehouse.

If the extended amount of the transferred product exceeds the current total cost of the From Warehouse, then iMIS will perform the following calculations:

1. The average cost of the From Warehouse will be multiplied by the quantity transferred in determining that the average cost does not exceed the total cost:
2. If the average cost does not exceed the total cost, then the extended amount will be recalculated by multiplying the average cost by the quantity transferred. The unit cost of the transferred product then will be updated by dividing the extended amount by the quantity transferred.
3. If the average cost does exceed the total cost, then the extended amount will equal the total cost of the product inventory. The unit cost of the transferred product then will be updated by dividing the extended amount by the quantity transferred.

   Field recalculation

   The following fields will be recalculated when transferring inventory from one warehouse to another:

- From Warehouse

  Qty on Hand (Manage products window) will be reduced by the Quantity (Enter and edit receipts and adjustments window) transferred.

  Total cost (Warehouses window) will be reduced by the Ext Amt (Enter and edit receipts and adjustments window) of the product transferred.

  Avg/Std cost (Warehouses window) will be updated by dividing the Total cost (Warehouses window) by the Qty on Hand (Manage products window).

- To Warehouse

  Qty on Hand (Manage products window) will be increased by the Quantity (Enter and edit receipts and adjustments window) transferred.

  Total cost (Warehouses window) will be increased by the Ext Amt (Enter and edit receipts and adjustments window) of the product transferred.

  Avg/Std cost (Warehouses window) will be updated by dividing the Total cost (Warehouses window) by the Qty on Hand (Manage products window).

  To post inventory transactions

1. From Orders, select Manage inventory> Post receipts to open the Post receipts window.
2. (optional) Sort the inventory transactions using the drop-down list.
3. Select the transaction(s) you want to post.
4. Click Post. A message displays prompting you to verify posting the selected transaction (s).
5. Click Yes to post the transaction(s). A Product Posting report generates automatically.

Viewing product inventory

After posting product inventory transactions, you can view your updated product inventory on the Manage products window.

To view product inventory

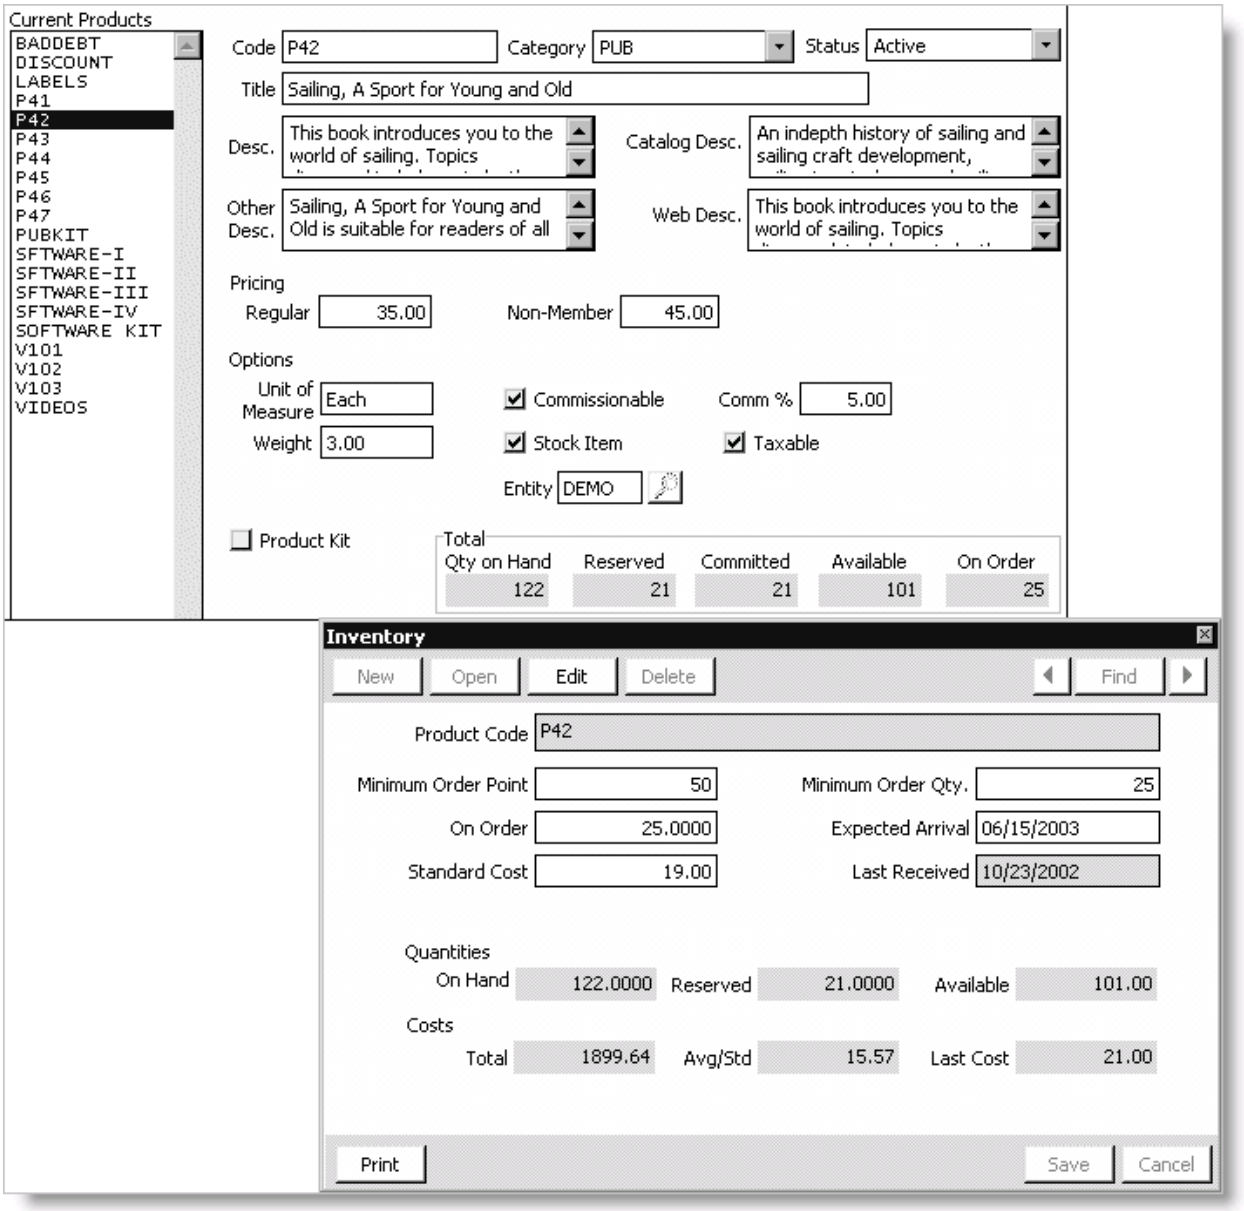
1. From Orders, select Manage inventory> Manage products to open the Manage products window.
2. Select a product to view its current inventory:

- The Qty on Hand field displays the total number of products in inventory.
- The Reserved field displays the number of products that are in “open order” status including backorders.
- The Committed field displays the number of shippable products in inventory excluding backorders.
- The Available field displays the number of products on hand minus reserved products.
- The On Order field displays the number of products on order from suppliers.

3. Click Inventory to open the Inventory window. The inventory data on the Inventory window will match the inventory data on the Manage products window for a product's inventory:

- The On Order field displays the number of products on order from suppliers.
- The Expected Arrival field displays the date the order is expected to arrive.

- The Last Received field displays the date an inventory receipt was posted.
- The On Hand field displays the total inventory transactions entered.
- The Reserved field displays the number of products that are in “open order” status including backorders.
- The Available field displays the number of products on hand minus reserved products.



Example of a product's inventory displayed on both the Manage products and Inventory windows

To view product inventory for multiple warehouses

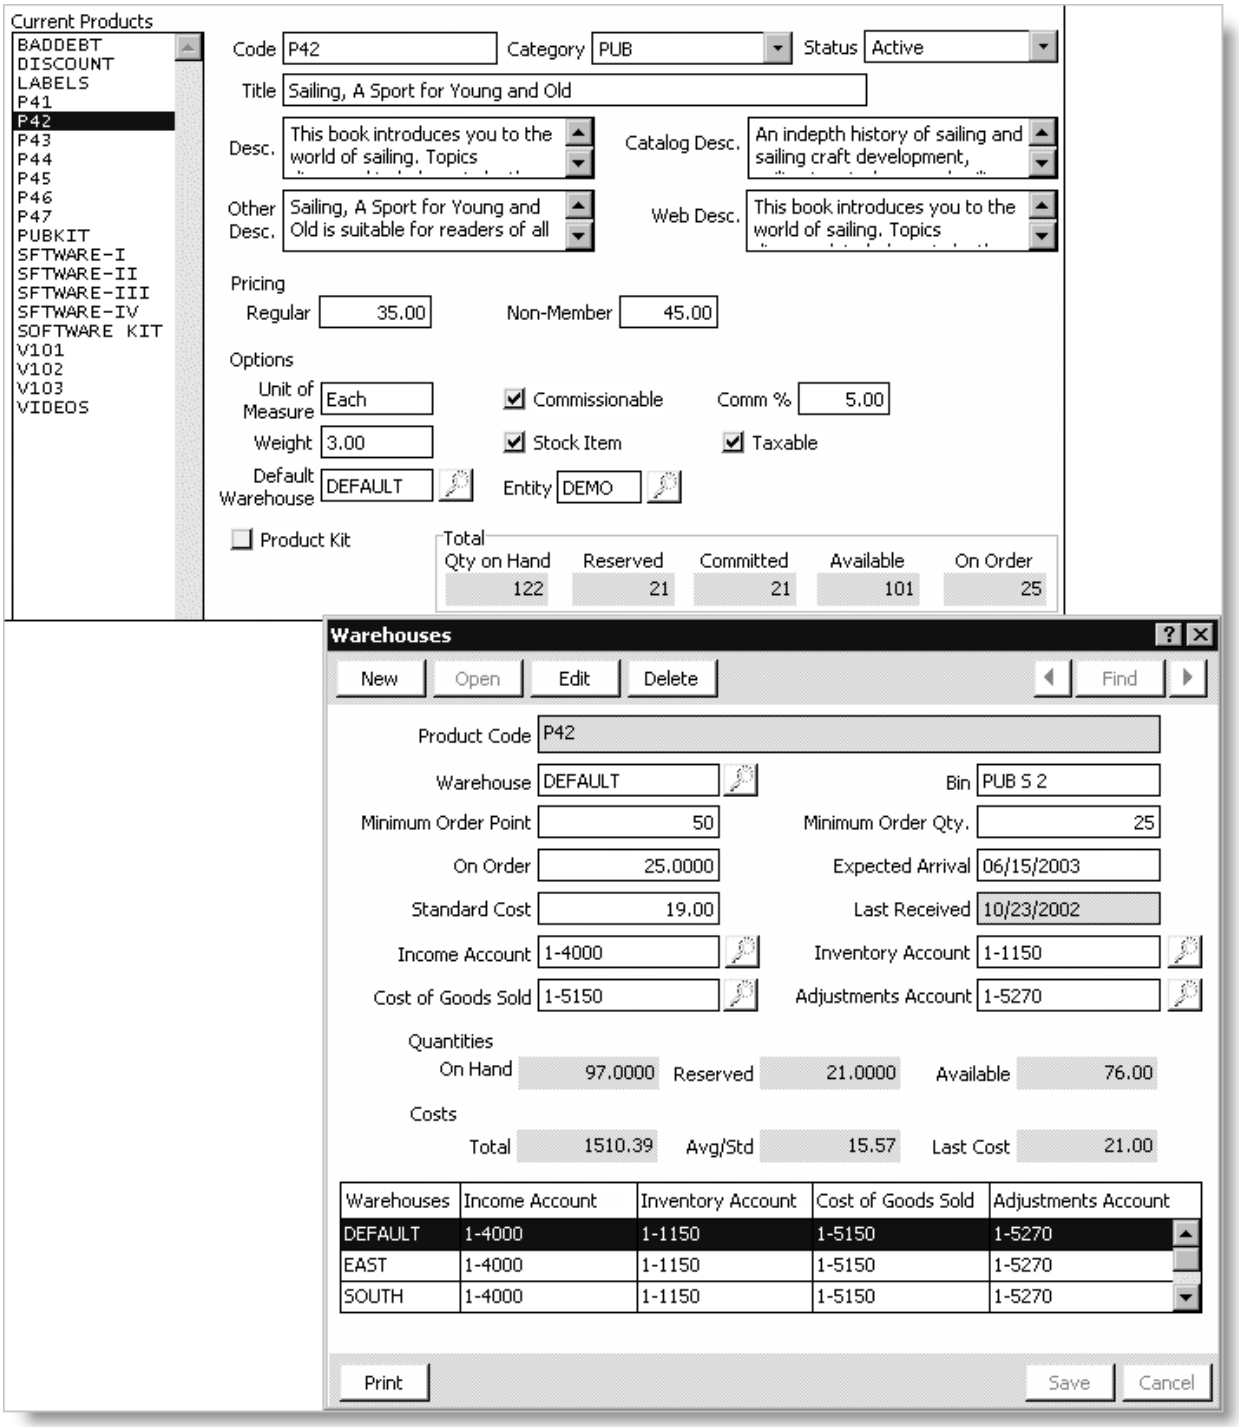
1. From Orders, select Manage inventory> Manage products to open the Manage products window.
2. Select a product to view its current inventory:

- The Qty on Hand field displays the total number of products in inventory across all warehouses.
- The Reserved field displays the total number of products that are in “open order” status across all warehouses including backorders.
- The Committed field displays the number of shippable products in inventory across all warehouses excluding backorders.
- The Available field displays the total number of products on hand across all warehouses excluding reserved products.
- The On Order field displays the total number of products on order from suppliers across all warehouses.

3. Click Warehouses to open the Warehouses window. The combined inventory data on the Warehouses window will match the total inventory data on the Manage products window for a product's inventory.

- The On Order field displays the number of products on order from suppliers for a warehouse.
- The Expected Arrival field displays the date the order is expected to arrive for a warehouse.
- The Last Received field displays the date an inventory receipt was posted for a warehouse.
- The On Hand field displays the total inventory transactions entered for a warehouse.

- The Reserved field displays the number of products that are in “open order” status for a warehouse including backorders.
- The Available field displays the number of products on hand for a warehouse excluding reserved products.



Example of a product's inventory displayed on both the Manage products and Warehouses windows

Backorders

The backorder feature of iMIS Orders allows you to place products with insufficient inventory in backorder status. When you enter an order for a product with insufficient inventory to fill the order, the unavailable items are placed on backorder. For example, if a customer orders 15 products but only 10 are available, you can place the five that are unavailable on backorder.

You can release backorders automatically if you enable the Automatic Backorder Processing option on the Backorder Processing window (from Orders, select Set up module, and click Backorders). When this option is enabled, backordered products are released automatically when you enter and post inventory receipts. However, you still have the ability to release backorders manually. For example, when you have an open order with a backordered product, you can release the backorder to print the shipping papers listing the quantity you project to ship with the order.

As long as the shipping papers have not been printed, products on backorder are released automatically to their next order processing stage when you post inventory receipts. Released orders are listed on the Product Posting report.

Processing backorders automatically

iMIS projects an order's shippable status based on product inventories when the Automatic Backorder Processing option is enabled on the Backorder Processing window (from Orders, select Set up module, and click Backorders).

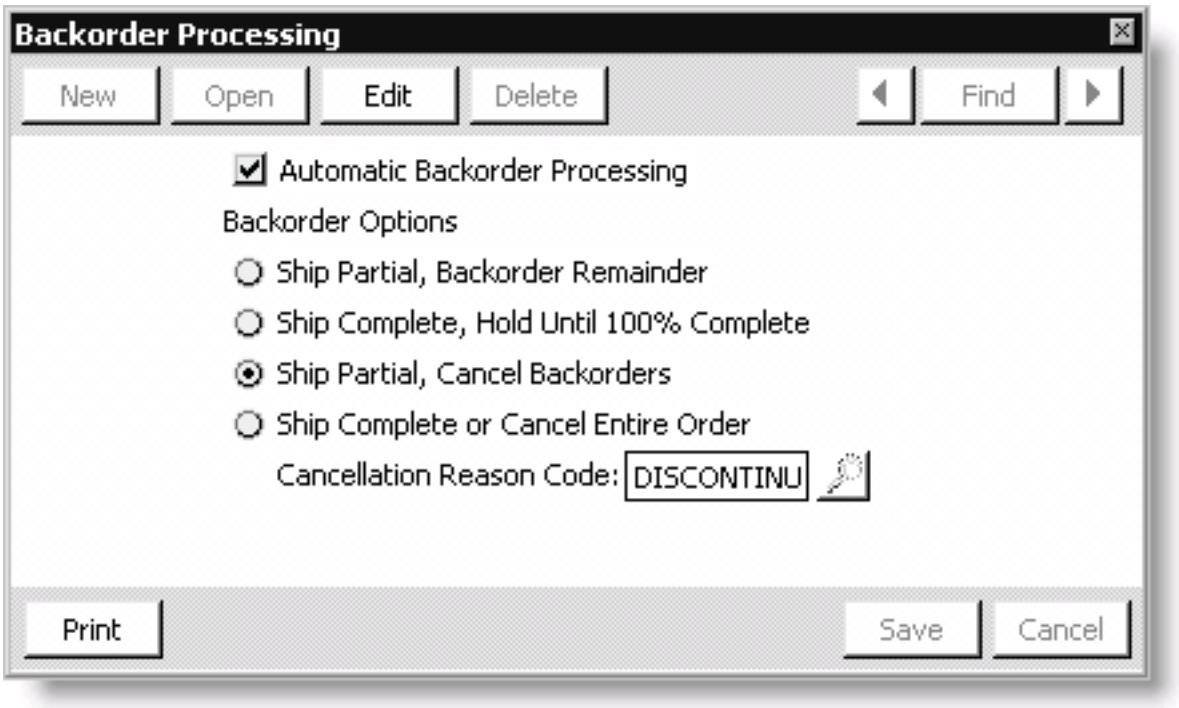
When you enable the Automatic Backorder Processing option, iMIS compares a product's available inventory to its ordered inventory. If the quantity available is equal to or greater than the quantity ordered, the Ship field displays the quantity entered in the Order field on the Enter and edit orders window.

If the quantity available is not equal to or greater than the quantity ordered, the Ship field displays the product quantity available, if any, and the Back field displays the calculated difference between the Order and Ship fields.

A product's available inventory determines its projected ship and backorder quantities. The Available inventory equals the difference between the Qty on Hand and the Reserved inventory as displayed on the Manage products window (from Orders, select Manage inventory > Manage products).

A backorder is an order of which 100 percent of the products ordered are not available for shipping. A partially shippable order is one of which at least one unit of any product line-item is available for shipping while at least one unit is out of stock and cannot be shipped.

Backorder Processing window



From Orders, select Set up module, and click Backorders

Automatic Backorder Processing

Enable to release backorders automatically when you enter and post product inventory receipts.

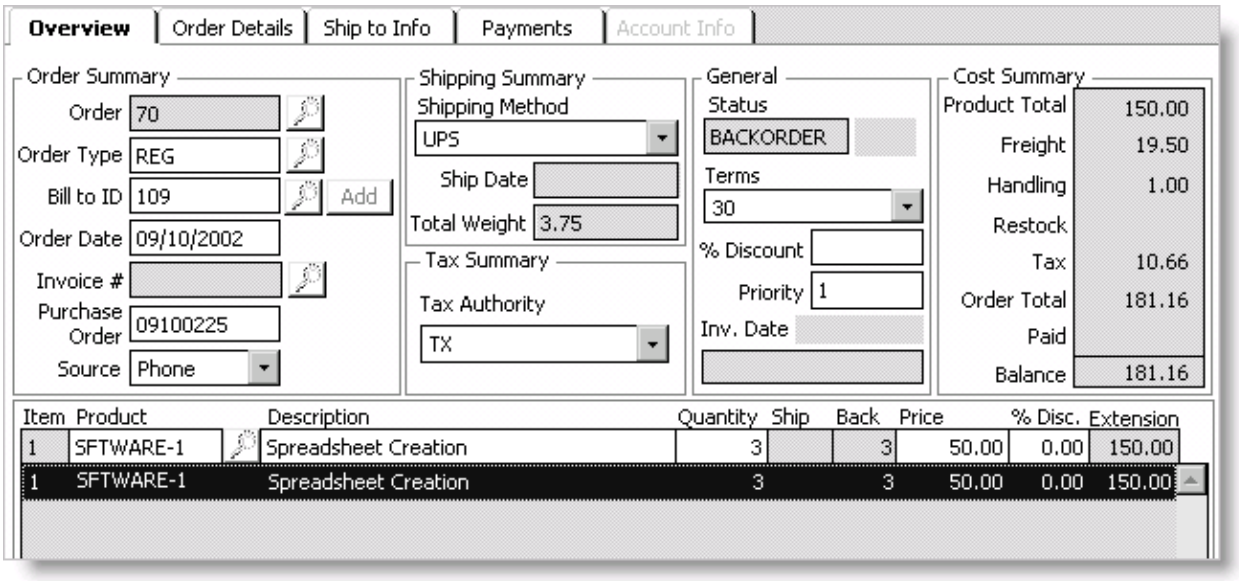
Backorder Options

When you enable Automatic Backorder Processing, you have several Backorder Options that you can enable on the Backorder Processing window. The Backorder Options allow you to define specific parameters for how iMIS processes backorders:

Ship Partial, Backorder Remainder

The Ship Partial, Backorder Remainder option enables by default when you use Automatic Backorder Processing and is the most widely used backorder processing option. The Ship Partial, Backorder Remainder option performs the following backorder processing tasks when enabled:

- Backorder Entire Order - When all of the products ordered are on backorder, iMIS automatically places the order in backorder status. When any ordered products become available through posted inventory receipts, the order is released from backorder status to the first processing stage for the given order type. If any of the ordered products remain on backorder, the order follows the processing steps for a partially shippable order.



Example of a backorder

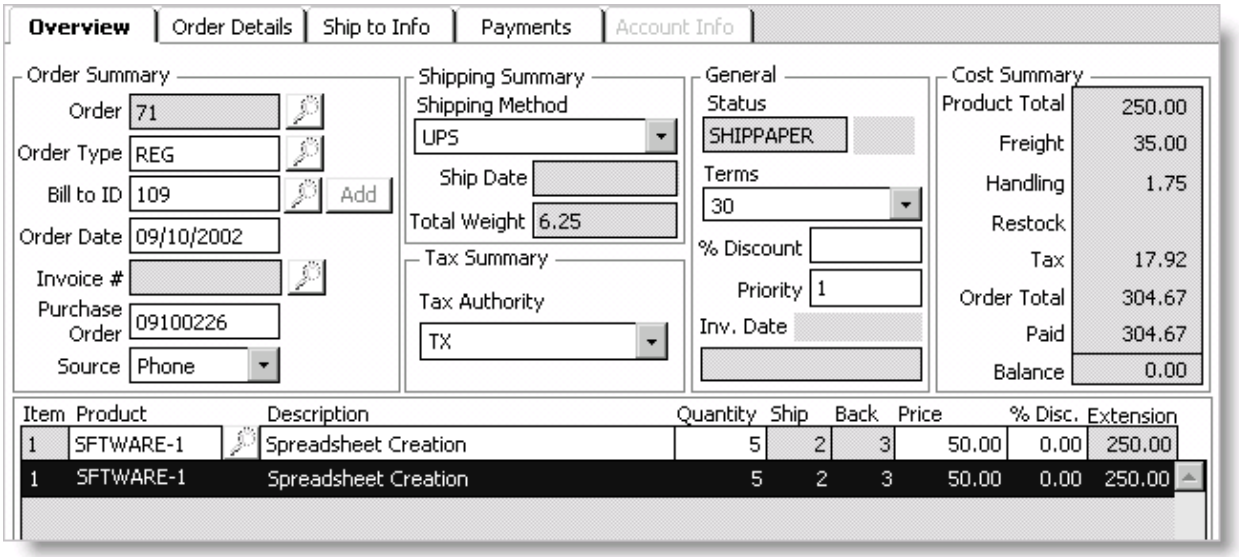
- Ship Partial Order - When some of the products ordered are on backorder, iMIS automatically places the order in the first processing stage for the given order type, such as

PICKLIST, SHIPPAPER, or INVOICE, as with complete orders.

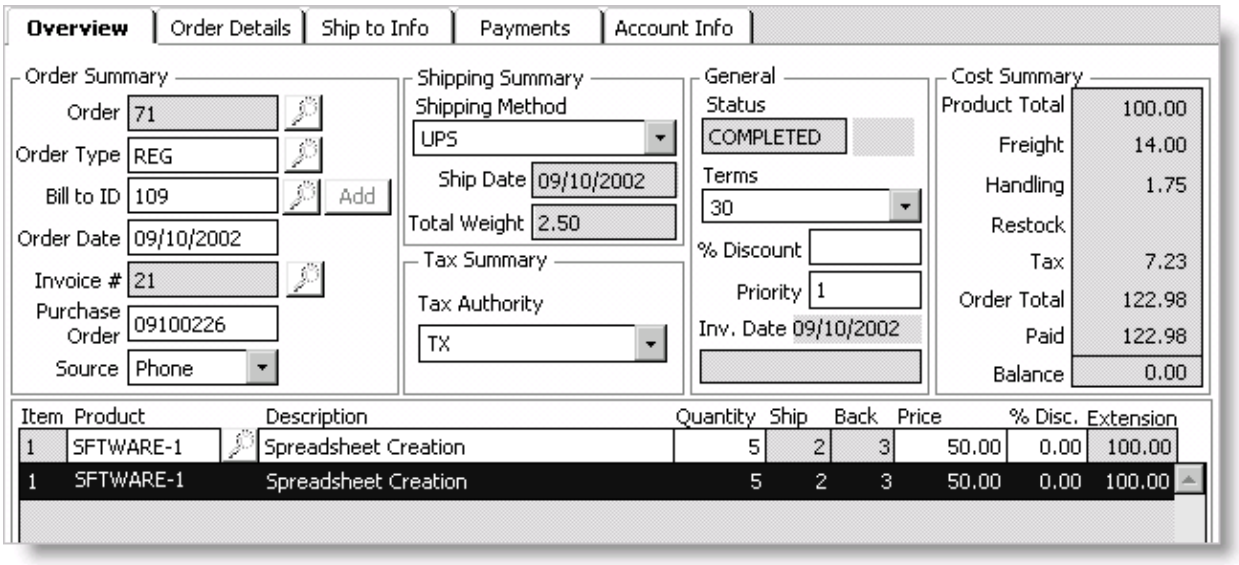
If one or more of the ordered products remain backordered when the order is invoiced, iMIS proceeds with the following steps during the invoicing stage:

- iMIS recalculates the original order's product totals to include only the quantities actually shipped.
- iMIS generates an extended suborder, which is assigned the original order transaction number plus .01, such as 208.01. The extended suborder consists only of the back-ordered products remaining when the original order was invoiced. The original order retains the backordered product's product code with an Extension price of 0.00 as displayed on the Enter and edit orders window.
- Any prepaid cash amounts are split appropriately between the original order and the extended suborder. The original order's cash amount equals the lesser of the full cash amount or the invoiced total. All remaining cash applies to the extended suborder.

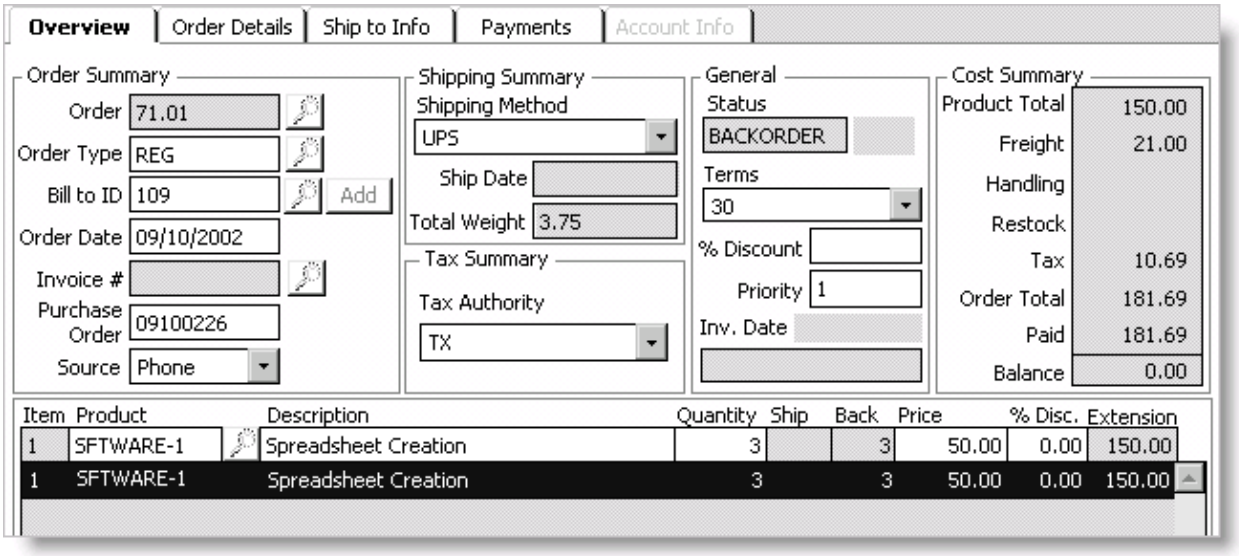
  Note: An extended suborder can continue to generate additional extended suborders for products that remain on backorder.



Example of a partially shippable order with full payment before invoicing



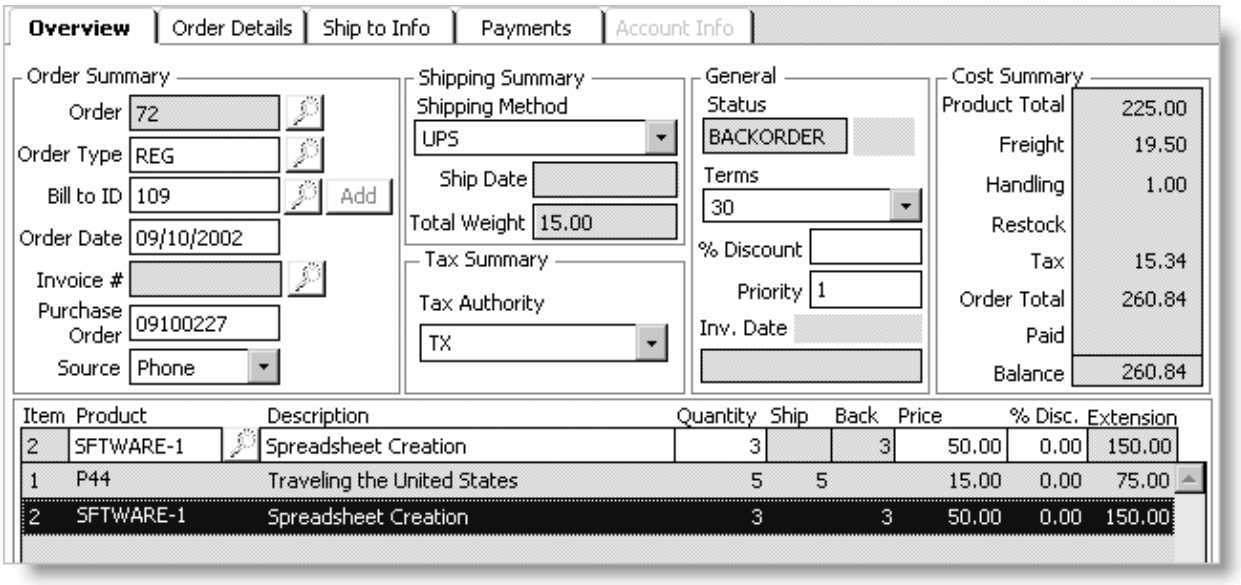
Example of a partially shipped order after invoicing. Note that the Extension price does not reflect the backordered products. Taxes were recalculated for the shipped products, and only the cash relevant to the shipped total is applicable for the order.



Example of an extended suborder, Order # 208.01, generated for Order # 208. Note that the remaining prepaid cash has been applied to suborder 208.01. Handling fees are charged on original orders and not on extended suborders.

Ship Complete, Hold Until 100% Complete

If you enable the Ship Complete, Hold Until 100% Complete option, iMIS does not ship an order until all ordered products are available in inventory. Orders for products with insufficient inventory are placed on backorder whether or not the products are fully backordered or partially shippable. No extended suborders are generated because the order does not have any backordered quantities remaining when it is shipped and invoiced.

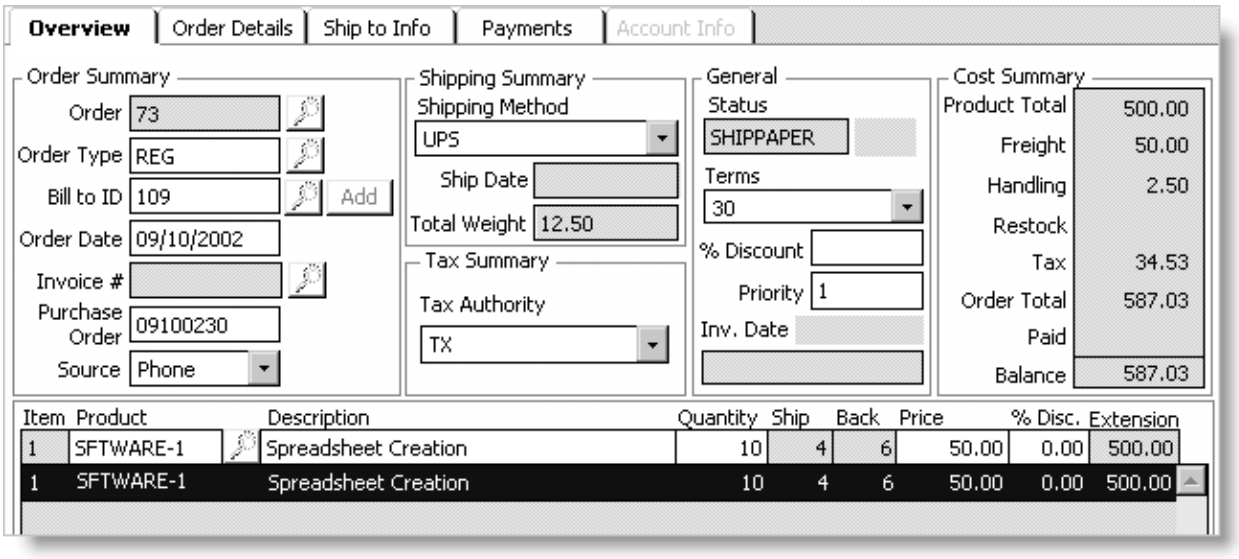


Example of a partially shippable order in backorder status when the Ship Complete, Hold Until 100% Complete option is enabled

Ship Partial, Cancel Backorders

If you enable the Ship Partial, Cancel Backorders option, iMIS treats backorders as normal orders upon data entry. However, unlike complete and ship partial orders, you are prompted to cancel the backordered products (or the entire order if it is completely backordered) at the Invoice orders processing stage.

If you do not cancel the backordered products when invoicing the order, an extended suborder is generated for the backordered products. The original order then goes automatically to the first processing stage for the given order type, such as PICKLIST, SHIPPAPER, or INVOICE.



Example of a partially shippable order before invoicing when the Ship Partial, Cancel Backorders option is enabled

Ship Complete or Cancel Entire Order

If you enable the Ship Complete or Cancel Entire Order option, you can cancel partial or completely backordered orders at order entry. When an order is entered for any product on backorder, a message displays prompting you to cancel the order instead of generating a backorder. If you elect not to cancel the order, the order does not ship until all products are available in inventory just as if the Ship Complete, Hold Until 100% Complete option were enabled.

Cancellation Reason Code

(Displays when the Ship Partial, Cancel Backorders option is enabled) Enter a reason code for canceling orders. Select the Find icon to look up a cancellation reason code.

Cancellation reason codes are defined on the CANCELLATION general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

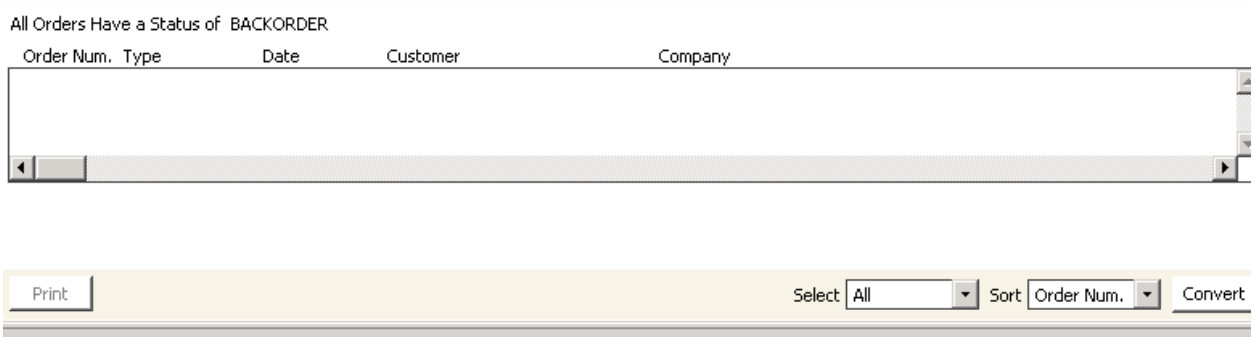
Releasing backorders

When you release backorders, iMIS applies the product received in stock to items with a backorder status based on the Priority entered for the order. This is displayed in both the

Back and Ship fields on the Overview tab of the Enter and edit orders window. You have several methods that you can use to release backorders:

- Release backorders by posting product receipts
- Release backorders after printing shipping papers
- Release backorders by editing open orders
- Release backorders manually

Release backorders window



Desktop: Orders > Process Orders > Manually release backorders

Releasing backorders by posting product receipts

The primary method for releasing backorders is to post product receipts. If a product's quantity on hand is less than its reserved quantity (a product's total open order quantity) at the time the product's receipts are posted, iMIS checks for backorders and commits products to them.

If a product's inventory remains insufficient for filling all backorders after posting receipts, the receipts are applied to orders in priority order, such as the oldest orders receiving priority over the newest orders for the given priority. Priority 1 is the highest priority as defined in the Priority field on the Enter and edit orders window. Orders with no priority assigned (the Priority field is left blank) are the last orders filled and sort in date order, oldest to newest.

All orders with committed receipts print on the receipts posting report, indicating the quantity committed to them and the stage or status of the order when the receipts are posted.

If shipping papers have been printed for a partially shippable order, iMIS commits the appropriate quantity to the order. However, iMIS does not move the committed quantity from the Back field to the Ship field as displayed on the Enter and edit orders window.

Partially shippable orders for which shipping papers have been printed are handled differently than other partially shippable orders because the shipping personnel dictate the product quantity that actually ships. For example, the shipping personnel may decide to ship the actual quantities indicated, or they may decide to override the shipped quantities and ship a different amount.

In either case, iMIS must wait for specific shipping instructions for processing the order. The best alternative in this situation is to enter the revised shipped quantities when the shipment entry is recorded if a manual override is processed. If the quantities are not revised, iMIS generates a shippable order when the order is invoiced.

To release backorders after printing shipping papers

When the Automatic Backorder Processing option is enabled, backorders move to the appropriate order processing stage for the given order type when the backordered product's inventory transaction is posted. The only time this does not happen automatically is if the order has been converted through the Print shipping papers processing stage.

After you print the shipping papers for an order with backordered products, you must edit the shipped and backordered products on the Ship Order window. For example, if you place an order for 25 products but only 20 are in stock, and then you print the shipping papers for the order, you will need to edit the Ship and Back quantities on the Ship Order window at the Ship orders processing stage.

1. From Orders, select Process orders > Print shipping papers to open the Print shipping papers window.

2. Select the order with products on backorder.
3. Click Convert, and move the order to the Ship orders processing stage.
4. Enter and post a receipt for the backordered product (see "Posting inventory transactions").
5. Review the effect of the inventory receipt on the product's inventory (see "Viewing product inventory").
6. From Orders, select Process orders > Ship orders to open the Ship orders window.
7. Double-click the order to open the Ship Order window.
8. Edit the number of products that you are shipping in the Ship field.
9. Press Tab to update the number of products on backorder as displayed in the Back field.
10. Click OK.

To release backorders by editing open orders

If necessary, you can edit the ship quantities and, by default, backorder quantities of any open order before invoicing the order. For example, if you forgot to release an order's backorders before reaching the Invoice orders processing stage, you still can edit the ship quantities as long as you do not invoice the order.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order for which you want to release backordered products.
3. Click Edit.
4. Select the product you want to release from backorder from the Product List field.
5. While pressing Shift, edit the quantity in the Ship field.
6. Press Tab to update the quantity in the Back field.
7. Click Save.

Note: Select a product line-item in the Product List field to display a product's available inventory at the bottom of the Overview tab. If you are using multiple warehouses, a product's total available inventory and warehouse inventory display.

Releasing backorders manually

Backorders can be converted to shippable orders using the Manually release backorders processing stage (from Orders, select Process orders > Manually release backorders). Released backorders are removed from the holding stage for orders awaiting inventory and are returned to the appropriate order processing stages for the given order types.

You would use the Manually release backorders processing stage only in rare instances. For example, you would use this function if you did not have the opportunity to enter and post product inventory receipts before processing an order or if a difference existed between perpetual and physical inventory.

You can release backorders manually even if you enable Automatic Backorder Processing.

Backordering product kits

Product kit inventory must be complete before an order for a product kit can move to the next order processing stage. For example, if a kit consists of three videos and only two are available in inventory, the entire kit will be on backorder.

Regardless of any Automatic Backorder Processing options enabled, backordered kits override the selected options. For example, if you enable the Ship Partial, Backorder Remainder option, the backordered kit overrides the option because you cannot ship partial kits.

If an order contains a product kit as well as one of the kit components, the order will be processed, but the inventory count will be inaccurate. This can result in a backorder not generating. See Preventing duplicate product line-items for more information.

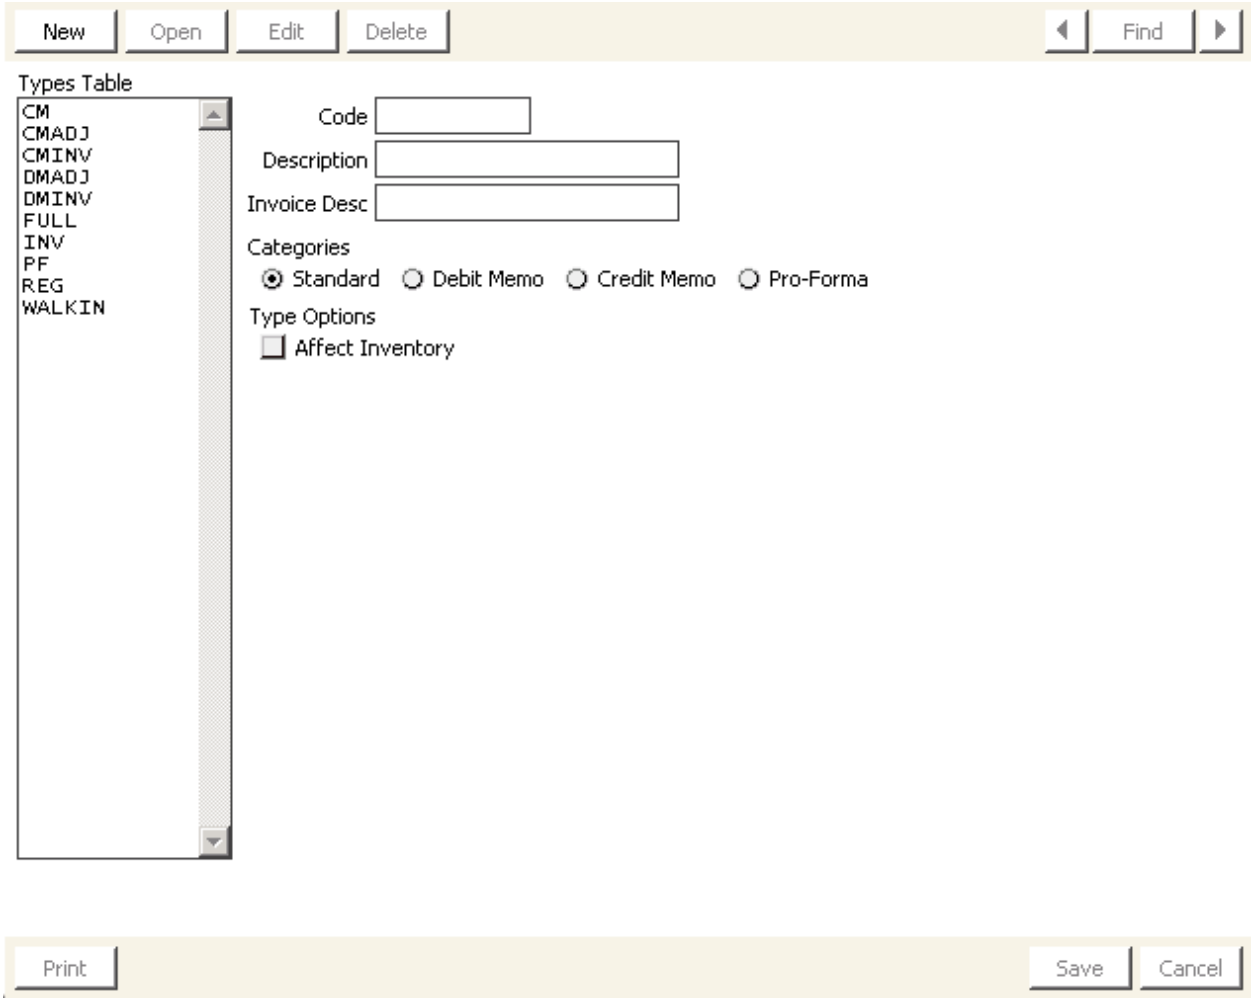
Orders: Set up tables

Order types determine the processing stages for orders, and you must define your order types before you can enter and process orders. Each time you enter a product order, you must select a defined order type. Order types that have been assigned orders cannot be deleted.

Order types fall into one of four system-defined order type categories: Standard, Debit Memo, Credit Memo, or Pro-Forma. You can define an unlimited number of order types for each order type category.

The category selected for an order type determines the available Type Options, or order processing stages, for the order type. Of the available Type Options, you select which are required, and you determine if an order type affects inventory. Order types are defined on the Set up order types window.

Set up order types window



Desktop: Orders > Set up tables > Order types

Types Table

This list displays the defined order types.

Code

Enter the code for an order type.

Description

Enter a description of the order type.

Invoice Desc

Enter a description of the invoice generated for the order type. The description entered in the Invoice Desc field prints on invoices.

Categories

Order types are classified according to one of the following four system-defined categories. You must enable one of the categories for each order type you define. The category selected determines which Type Options display when defining an order type.

- Standard - Enable to classify an order type as a standard order.
- Debit Memo - Enable to classify an order type as a debit memo order.
- Credit Memo - Enable to classify an order type as a credit memo order.
- Pro-Forma - Enable to classify an order type as a pro forma order. Create pro forma order types only after defining standard order types. This allows you to specify a valid standard order type in the Convert to Order Type field on the Order Status Defaults window (from Orders, select Set up module, and click Order Staging) for converting pro forma orders to standard orders.

Type Options

These options allow you to define the order processing stages for an order type. An order type's category determines the Type Options that display on the Set up order types window:

- Affect Inventory - Enable if you want the order type to affect product inventory. For example, a standard order would reduce a product's physical inventory, and a credit memo order would increase a product's physical inventory if the Affect Inventory option were enabled.
- Print an Invoice - Enable if you want the order type to generate a printed invoice for invoiced orders.
- Pick List - (Displays for standard orders only) Enable to process the order type through the Print pick list order processing stage. A Pick List will print for the order type.

- Shipping Paper - (Displays for standard orders only) Enable to process the order type through the Print shipping papers order processing stage. Shipping papers (Packing Slips) will print for the order type.
- Print a Quote - (Displays for pro forma orders only) Enable to process the order type through the Print quotes order processing stage. An order Quotation will print for the order type.
- Convert to Order Type - (Displays for pro forma orders only) Enter the default order type for converted pro forma orders.

To define order types

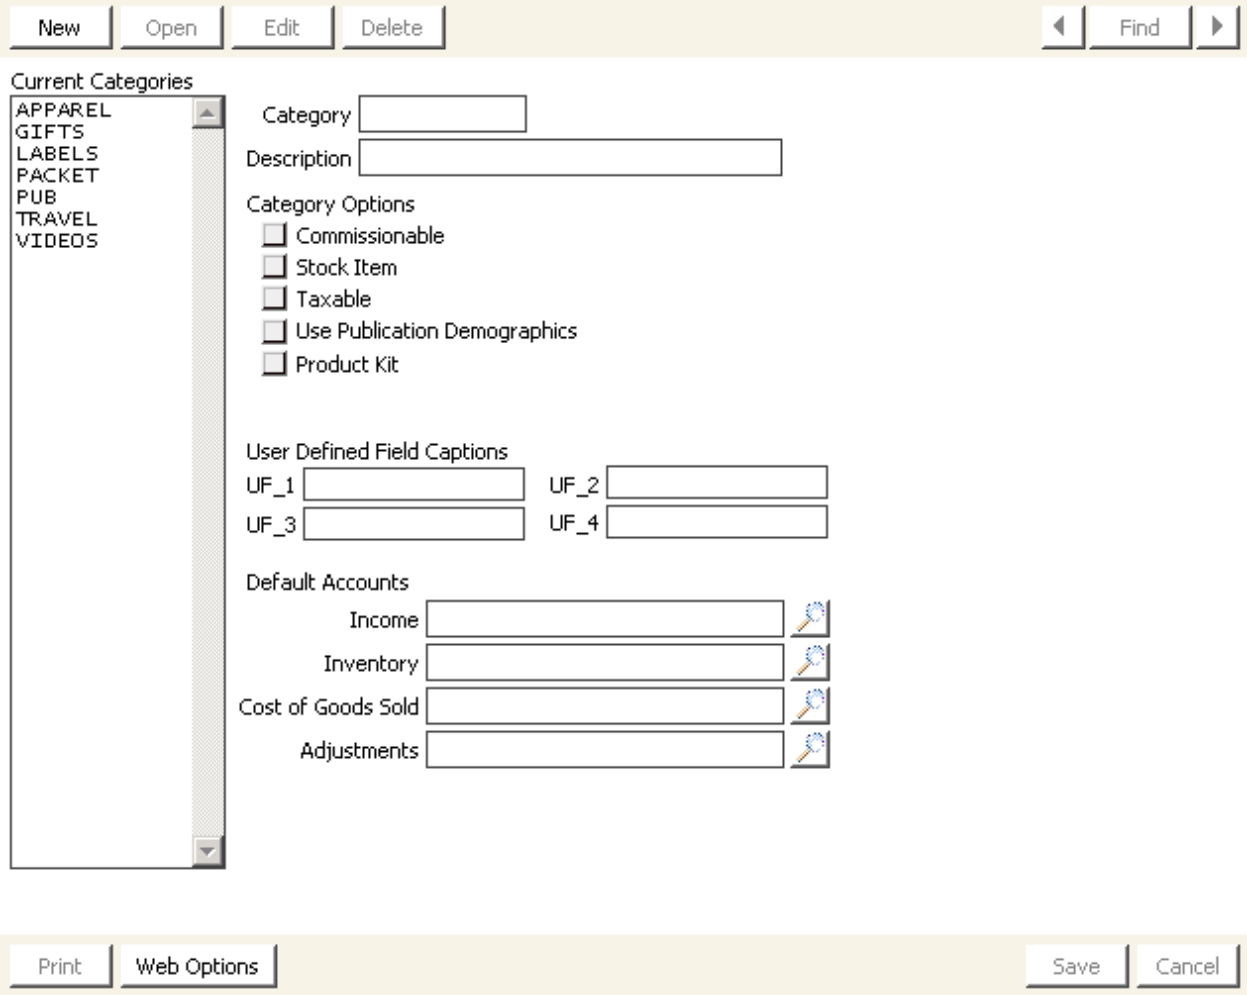
1. From Set up order types window, click New.
2. Enter a Code for the order type.
3. Enter a Description for the order type.
4. Enter a description of the invoice in the Invoice Desc field.
5. Select a category for the order type from the list of Categories.
6. Enable the applicable Type Options.
7. Click Save.

Product categories setup

Product categories allow you to classify your products, and you must define your product categories before defining your individual products. Each time you define a product, you must assign it to one of your product categories.

Product categories are used to assign default accounts and to enable category options for groups of products.

Set up product categories window



Desktop: Orders > Set up tables > Product categories

Current Categories

This list displays the defined product categories.

Category

Enter a code for the product category.

Description

Enter a description of the product category.

Category Options

Enable the options that you want enabled by default when defining new products on the Manage products window (from Orders, select Manage inventory> Manage products). You can override all settings at the product level.

- Commissionable - Enable if you want the sale of a product within a category to generate a commission. The Comm % field displays when you enable the Commissionable option.
- Comm % - (Displays only when the Commissionable option is enabled) Enter the default commission rate generated by the sale of a product in this category. For example, a 5.00 % commission rate would generate a $5.00 commission on a $100.00 sale. Make sure to enter the rate as a percentage and not as a decimal.
- Stock Item - Enable to indicate that products within this category have physical inventory. You can track inventory only for items stocked in inventory.
- Taxable - Enable to indicate that the product category is taxable.
- Use Publication Demographics - Enable to define publication demographic information for a category's products. If the option is enabled, the Publication button displays and enables on the Manage products window for products belonging to that category. Clicking the Publication button on the Manage products window opens the Publication Demographics window used for defining demographic information for publications.
- Product Kit - Enable to indicate that the product category consists of product kits.

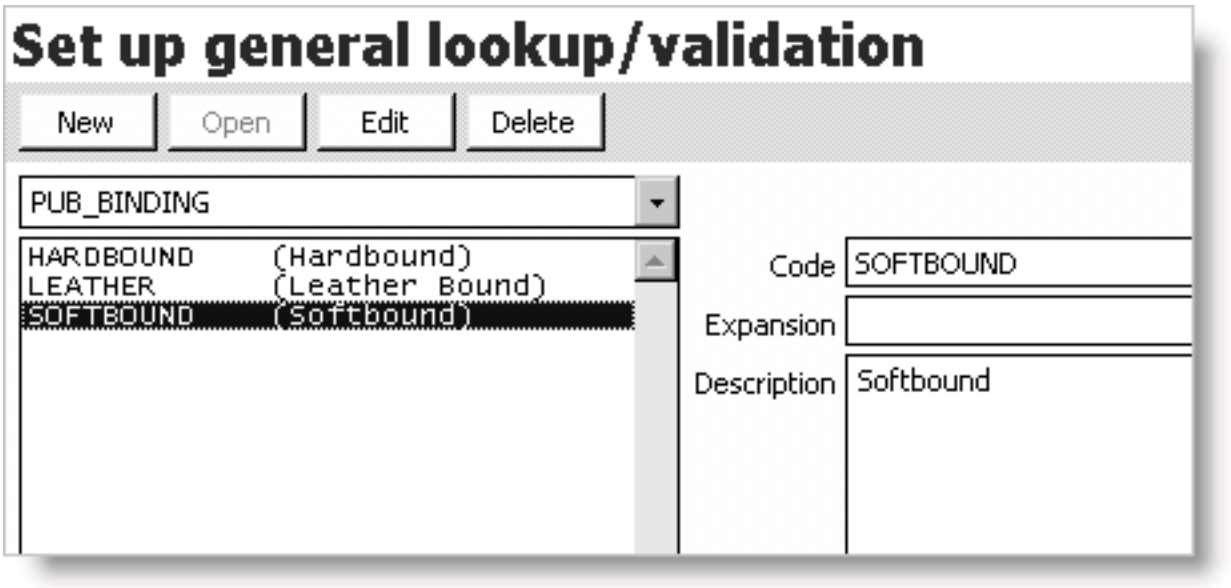
User Defined Field Captions

(optional) Enter captions in the UF_1, UF_2, UF_3, and UF_4 fields that will display on the Product Detail window. Each caption that you define generates a text box on the Product Detail window for products belonging to that category. You can define the same or different captions for any product category.

When entering or editing an order, some products may require additional order information before an order can be shipped. The user-defined fields on the Product Detail window allow you to record this additional information.

You also have the ability to define general lookup/validation tables for each of the user-defined fields, and any predefined data can be accessed by selecting each field's Find icon on the Product Detail window. Regardless of whether general lookup/validation tables have been set up, you always have the ability to enter any necessary order information.

General lookup/validation tables are set up for product category user-defined fields by combining the product category codes and field labels defined on the Set up product categories window. When setting up a table for a user-defined field, the product category code and field label must be separated by an underscore. For example, if the product category code is PUB and the field label is Binding, the general lookup/validation table for the user-defined field would be PUB_BINDING as displayed in the following example:



Example of a general lookup/validation table set up for a user-defined field

Default Accounts

These accounts allow you to define the default accounts for products within this category. You can override the accounts at the product level on the Accounting window and at the warehouse level on the Warehouses window if Multi-Warehouses is enabled.

When defining product-level accounts, the most specific accounting information takes precedence. For example, iMIS first looks for warehouse level accounts. iMIS then looks for product level accounts. If you have not defined product-level accounts, iMIS uses the default product category accounts. If you have not defined default product category accounts, iMIS uses the accounts defined on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

- Income - Enter a product category's default income account number.
- Inventory - Enter a product category's default inventory account number.
- Cost of Goods Sold - Enter a product category's default cost of goods sold account number.
- Adjustments - Enter a product category's default adjustments account number.

Web Options button

Opens the Web Options window for the selected product category. The Web Options window is used for enabling products either for sale or for viewing on the Web.

To define product categories

1. From Orders, select Set up tables > Product categories to open the Set up product categories window.
2. Click New.
3. Enter a code for the product category in the Category field.
4. Enter a Description of the product category.
5. Enable the applicable Category Options.
6. Enter the User Defined Field Captions that will display and generate text boxes on the Product Detail window.
7. Enter any applicable Default Accounts.
8. Click Save.

To define product categories for kits

If you are licensed for product kitting, iMIS Orders allows you to sell product kits. A kit consists of multiple products sold as a single unit for a single price.

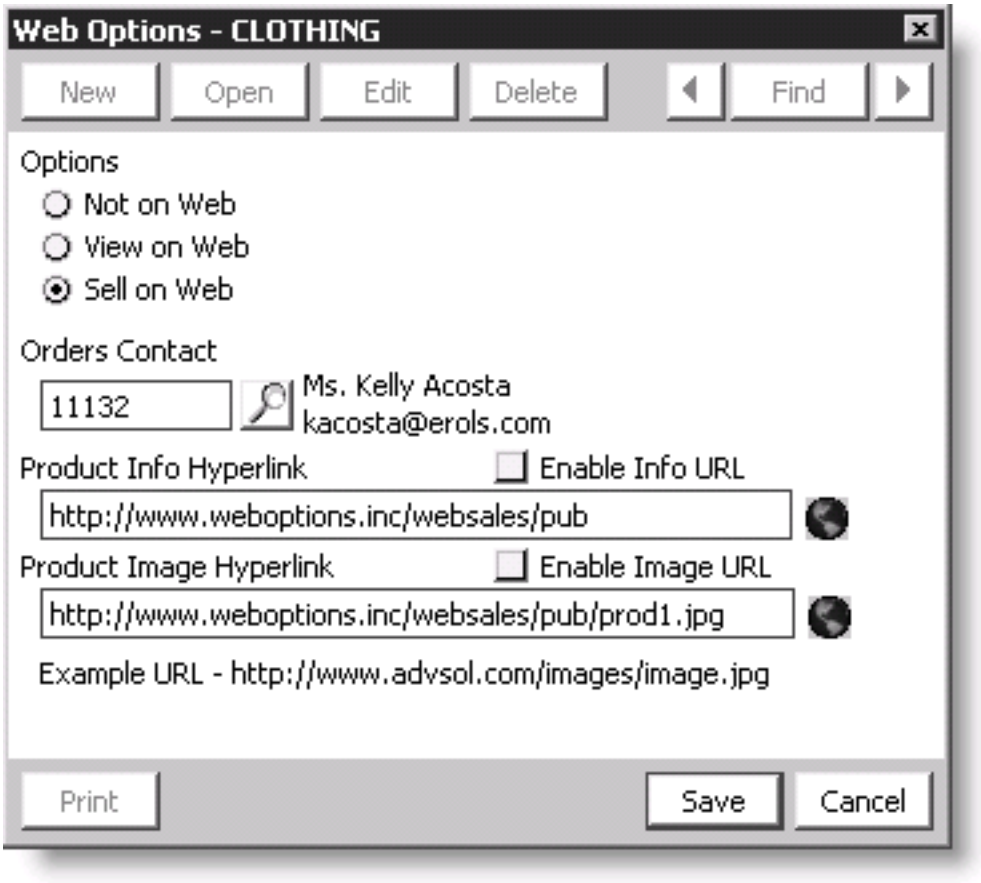
If you plan to sell product kits, you can define product categories that set default options on the Manage products window, such as Commissionable, Taxable, and Product Kit. After defining your product kit categories, you can define your product kits.

1. From Orders, select Set up tables > Product categories to open the Set up product categories window.
2. Click New.
3. Enter a code for the product category in the Category field.
4. Enter a Description of the product category.
5. Enable the applicable Category Options.
6. Enable the Product Kit option.
7. Enter any applicable Default Accounts.
8. Click Save.

Enabling product categories for the web

You can enable product categories to be viewed or sold on the web using the Web Options window (Orders > Set up tables > Product categories, select a category, and click Web Options). Individual products can also be enabled for the web (see "Enabling products for the web").

Web Options window for product categories



From Orders, select Set up tables > Product categories, select a category, and click Web Options

Options

The viewing option selected at the product category level overrides the viewing option selected at the product level for web products (Orders > Manage inventory > Manage products, select a product and click Web).

- Not on Web - Prevents the category from being viewed or sold on the Web.
- View on Web - Allows the category to be viewed, but not sold, on the Web.
- Sell on Web - Allows the category to be viewed and sold on the Web.

Orders Contact

Specifies the contact to notify when purchases from this category are made.

Note: You can specify a contact to notify about web purchases in the E-mail address to notify when a product is sold field on the Organization Configuration window (System Setup > Set up web components > Organization Configuration).

Product Info Hyperlink

Enter a URL to information about the product category. Click the web icon to view the product category's information on the web.

Enable Info URL

Enable to enable the hyperlink to the product category's information.

Product Image Hyperlink

Enter a URL to an image representing the product category. Click the web icon to view the product category image on the web.

Enable Image URL

Enable to enable the hyperlink to the product category's image.

To enable a product category for the Public view

1. From Orders, select Set up tables > Product categories to open the Set up product categories window.
2. Select a product category from the list of Current Categories.
3. Click Edit.
4. Click Web Options to open the Web Options window.
5. Enable the product for the Web:

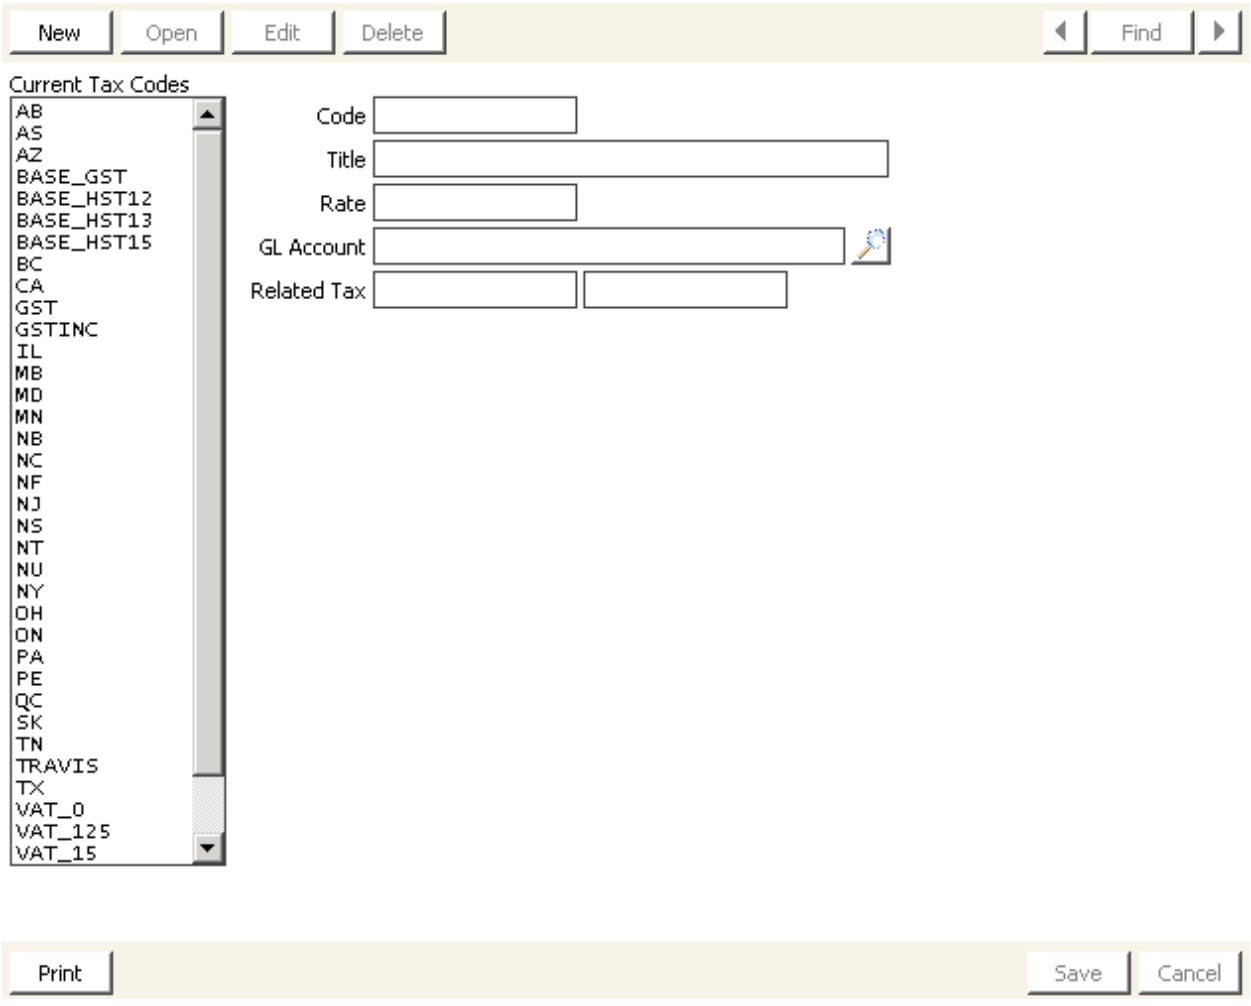
- Enable the View on Web option if you want the product category to be viewed, but not sold, on the Web.
- Enable the Sell on Web option if you want the product category to be viewed and sold on the Web.

6. Enter the Product Info Hyperlink.
7. Enable the Enable Info URL option.
8. Enter the Product Image Hyperlink.
9. Enable the Enable Image URL option.
10. Click Save.

Tax codes setup

You must define the appropriate tax codes before you can enter orders with applicable sales taxes. The Tax Codes window is used for defining tax codes and is the same window that is accessed through the AR/Cash module.

Set up tax codes window



Desktop: Orders > Set up tables > Tax codes

Current Tax Codes

Lists defined tax codes.

Code

Enter a code for the tax.

When defining state or province tax codes, use the standard two-character postal abbreviation for the state or province. This allows the Tax Auth field on the Enter and edit orders window to default to the customer's state tax code.

Title

Enter a title for the tax code.

Rate

Enter the percentage rate assigned to the tax code. Make sure to enter the rate as a percentage and not as a decimal. For example, enter 6.0 and not .06 for a tax rate of 6%.

G/L Account

Enter the general ledger account number assigned to the tax code, or use the lookup icon to select a value.

If you leave the G/L Account field blank, iMIS records the value entered in the Sales Tax field on the AR/Cash Default Accounts window (from AR/Cash, select Set up module, and click Default Accounts).

Related Tax

These two fields allow you to enter multiple tax codes. Enter the codes for any other taxes you want to relate to the tax defined in the Code field.

To define tax codes

1. From Set up tax codes window, click New.

2. Enter a Code for the tax.
3. Enter a Title for the tax code.
4. Enter the percentage Rate you are assigning to the tax code.
5. (optional) Enter the G/L Account number.
6. (optional) Enter any applicable Related Tax.
7. Click Save.

Freight setup

iMIS Orders has the ability to calculate an order's freight charges automatically. To calculate freight charges automatically, you must enable the Automatic Calculation of Freight Charge option on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges). You then must select the freight calculation method you want to use from the options on the Add-on Charges window:

- Freight by Weight
- Freight by Total Value Ordered
- Freight by Total Quantity Ordered

Freight by weight

When calculating freight charges by weight, an order's shipping method, shipping postal code, and weight are factors in calculating freight charges.

Before Orders will calculate an order's freight charges by weight automatically, you must perform the following actions:

- Define shipping methods
- Define shipping zones
- Define weight tables

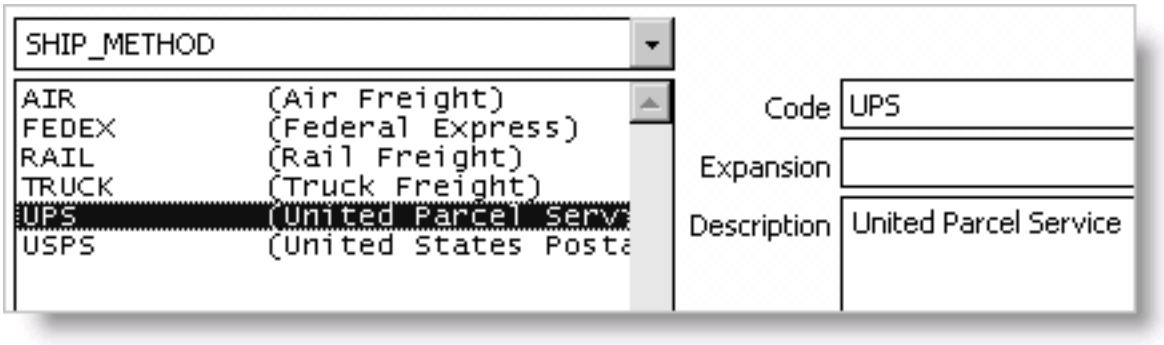
- Enable the Automatic Calculation of Freight Charge option
- Enable the Freight by Weight option

  Note: The only shipping calculation supported in the iMIS Public View is Freight by Weight.

  Defining shipping methods

  You can define shipping methods for any form of transport or for any specific carrier that you use to ship your orders. Examples of shipping methods include Truck, Air, and Rail Freight as well as conventional carriers such as UPS, FEDEX, and USPS.

  To define shipping methods, you first must create the SHIP_METHOD general look-up/validation table (from Customers, select Set up tables > General lookup/validation). After creating the SHIP_METHOD table, you can create shipping zone and freight tables.



Example of the SHIP_METHOD general lookup/validation table

Defining weight tables

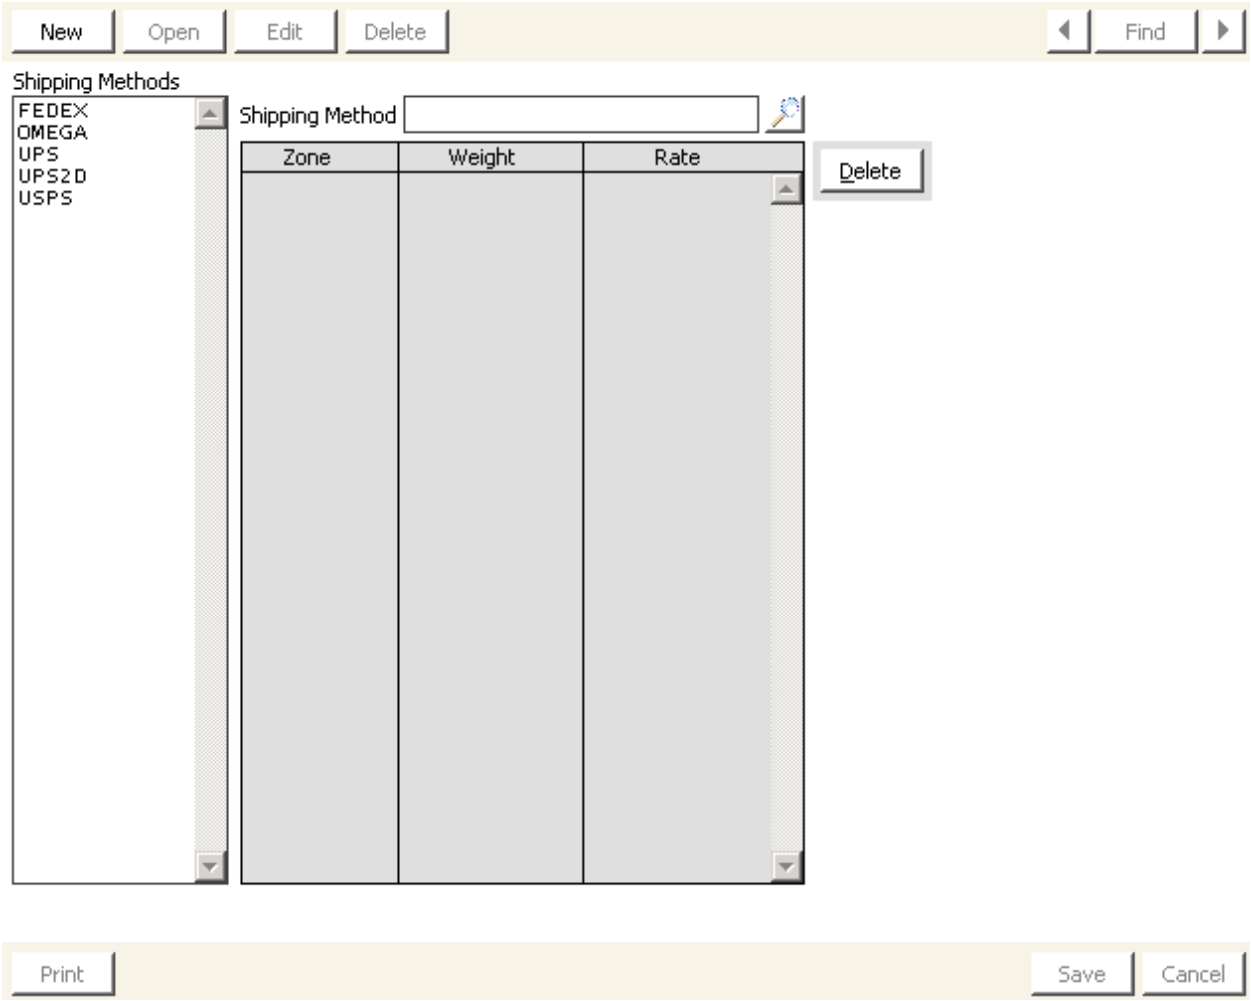
After defining your shipping zone tables, you can define weight tables on the Freight by Weight window for your user-defined shipping zones. Weight tables allow you to calculate shipping rates for individual shipping methods, and rates are calculated according to an order's shipping weight and shipping zone. When defining rates, high value determines the weight break for each rate.

After defining your weight tables, make sure you enable the Automatic Calculation of Freight Charge and Freight by Weight options on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges). When you enable these

options, freight charges are automatically calculated by order weight when you enter an order.

Remember that you always can override automatic freight charges on the Order Details tab of the Enter and edit orders window if necessary. See "Entering order details information"for more.

Set up freight by weight window



Desktop: Orders > Setup tables > Freight by Weight

Shipping Methods

Displays the shipping methods for which you have defined weight tables.

Shipping Method

Enter the shipping method for which you are defining a weight table. Select the Find icon to look up a shipping method.

Shipping methods are defined on the SHIP_METHOD general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

Zone

Enter the designation for a shipping zone. The zone designation follows the postal code as defined in the Default Zone field and the Table list on the Set up zones window (from Orders, select Set up tables > Zones).

Weight

Enter the weight break for a shipping zone, which is the maximum weight.

For example, in the previous image of the Set up freight by weight window, any weight greater than 1.00 and less than or equal to 1.50 will be charged $2.50 for Zone 1. Any weight greater than 1.50 and less than or equal to 2.00 will be charged $2.75 for Zone 1.

Rate

Enter the freight rate for orders of the defined weight that are shipping to the specified zone.

To define weight tables

1. From Set up freight by weight window, click New to create a new weight table, or select an existing Shipping Method and click Edit to modify the table (or click Delete in the top row of buttons to remove the table).
2. Specify the weight table information.

- To create new rows in the table for zone-weight-rate sets, position your cursor in the Rate cell of the last row in the table and press Tab.
- To delete rows from the table, position your cursor in the Rate cell of the row to be deleted and click Delete at the right of the table.

Be sure to define at least one entry for every zone designator that is used in the various shipping zone tables that use this shipping method. (These designators are used in the Default Zone and Table fields of the Zones window.)

For example, assume you have defined a UPS zone table and a UPS-USA zone table, and you have used zone designators A, 1, 2, and 3 in those two UPS-based zone tables. In this example, you would define weight-rate sets for those four zone designators.

3. Click Save.

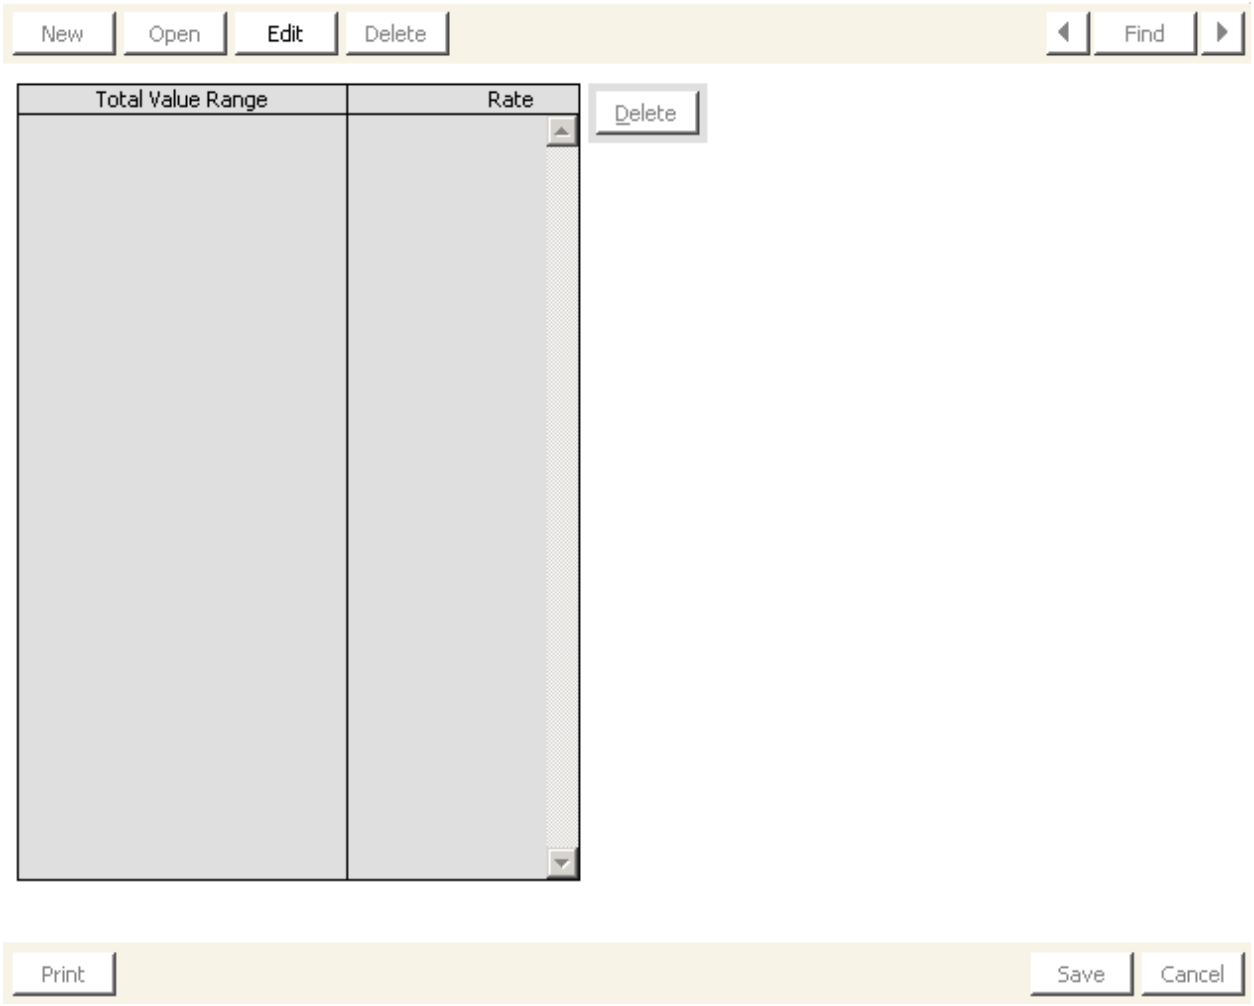
Freight by total value

When calculating freight charges by total value, iMIS uses an order's total pre-tax value excluding handling and restocking charges. To calculate freight charges by total order value, you must define freight rates for ranges of order values. Value ranges are defined on the Set up freight by total value window.

Before iMIS Orders automatically will calculate freight charges by total order value, you must perform the following actions:

- Set up value range tables
- Enable the Automatic Calculation of Freight Charge option
- Enable the Freight by Total Value Ordered option

Set up freight by total value window



Desktop: Orders > Set up tables > Freight by total value

Total Value Range

Enter the low value of a range. Each range's high value is determined by each succeeding range's low value; a range's high value equals the low value of the succeeding range minus .01.

Rate

Enter a freight rate for a value range.

Defining value ranges

Freight rates can be defined for any range of order values, and no limit exists to the number of value ranges and rates that can be defined. When defining a rate's value range, only the low value of the range is entered in the Total Value Range field. The high value of the range is not entered; it is calculated upon completing and saving the table.

When defining a value range's low value, the low value must be greater than $0.00, such as $0.01; $0.00 cannot be the beginning range. In addition, if your beginning range's lowest value is $5.00 for example, then freight will not be calculated for any orders valued less than $5.00.

Each range's high value is determined by each succeeding range's low value; a range's high value equals the low value of the succeeding range minus .01.

To define a single value range

1. Enter the low value in the Total Value Range field. (Low values must be greater than $0.00; $0.00 cannot be the beginning range.)
2. Enter the Rate for the order value range.
3. Enter the low value of the succeeding range in the Total Value Range field.

For example, say you need to define rates for the following three order value ranges:

- Orders with a value greater than $0.00 and less than $10.00 will cost $2.50 to ship.
- Orders valued between $10.00 and less than $25.00 will cost $5.00 to ship.
- Orders valued above $25.00 will cost $7.50 to ship.

To set up value ranges for required rates

1. Define the first value range:
   - Enter 0.01 in the Total Value Range field for the first range's low value.
   - Enter 2.50 for the Rate of the first range.
   - Press Tab.
2. Define the second value range:

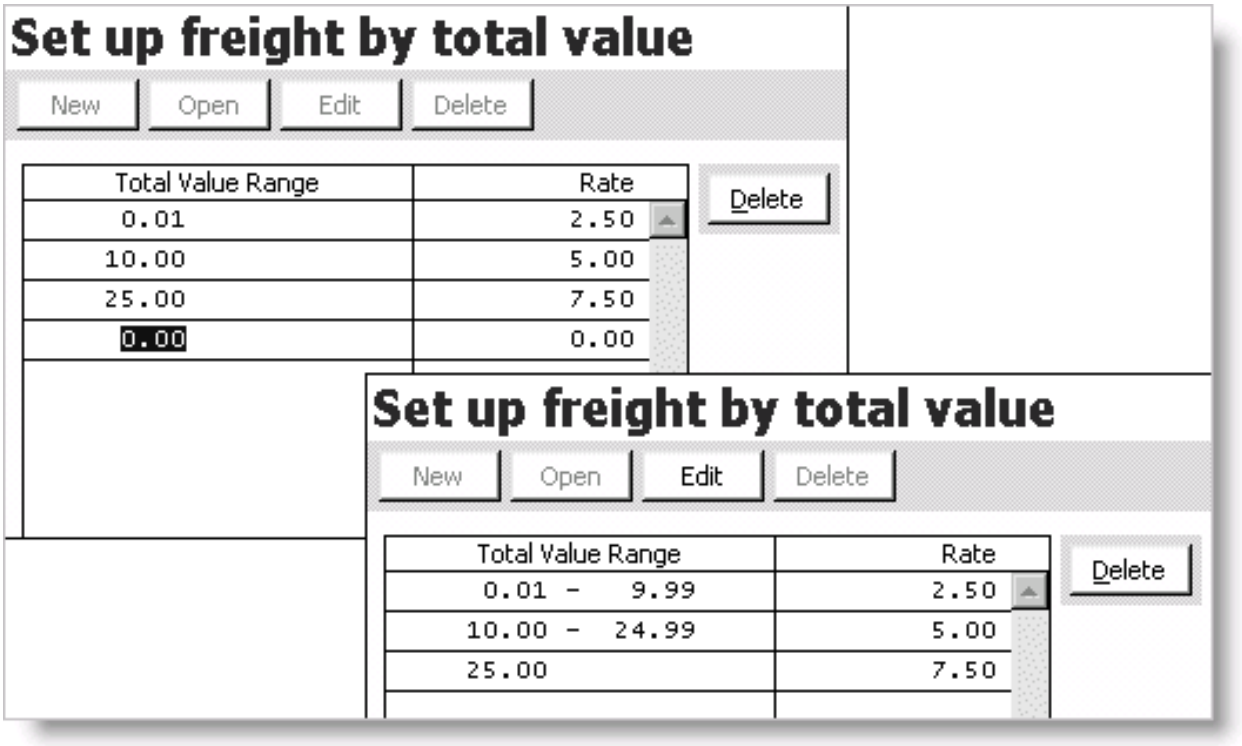
- Enter 10.00 in the Total Value Range field for the second range's low value. By entering 10 for the second range's low value, the first range's high value will equal 9.99 when the entire table is completed and saved.
- Enter 5.00 for the Rate of the second range.
- Press Tab.

3. Define the third value range:

- Enter 25.00 in the Total Value Range field for the third range's low value. By entering 25.00 for the third range's low value, the second range's high value will equal 24.99 when the entire table is completed and saved.
- Enter 7.50 for the Rate of the third range.

4. Click Save.

   The Total Value Range field will calculate and display the low and high values for each range.



Example of rates defined for three value ranges (before and after being saved)

To define a value range

1. From Set up freight by total value window, click Edit.
2. Enter the first range's low value in the Total Value Range field. (Low values must be greater than $0.00; $0.00 cannot be the beginning range.)
3. Enter a Rate for the first value range, and press Tab.
4. Enter a value in the Total Value Range field. The value entered determines the following:

- The high value of the preceding range.
- The low value of the current range you are defining.

5. (optional) Repeat this process for each additional value range you are defining.
6. Click Save.

To add a value range

When adding value ranges, you can add additional, expanded ranges as well as ranges that fall between other ranges.

1. From Set up freight by total value window, click Edit.
2. Place your cursor on the Rate of the last value range, and press Tab to display a new line (0.00).
3. Define the new range:

- Enter the new range's low value in the Total Value Range field.
- Enter a Rate for the new range.

4. Click Save. When you save the new range, it will be inserted in the table, and the high value will be calculated.

To edit or delete a value range

1. From Set up freight by total value window, click Edit.

2. Select the total value range you want to edit (you only can edit the low value of a range and the Rate). To delete a total value range:

- Select the row of the range you want to delete.
- Click the Delete button to the right of the table.

3. Click Save.

   The ranges are recalculated.

Calculating order values that fall outside defined ranges

If an order's pre-tax value exceeds the highest defined value range, the order's freight charges will be calculated at the rate defined for the highest value range. If an order's pre-tax value is below the lowest defined value range, no freight charges will be calculated, and no freight will be charged.

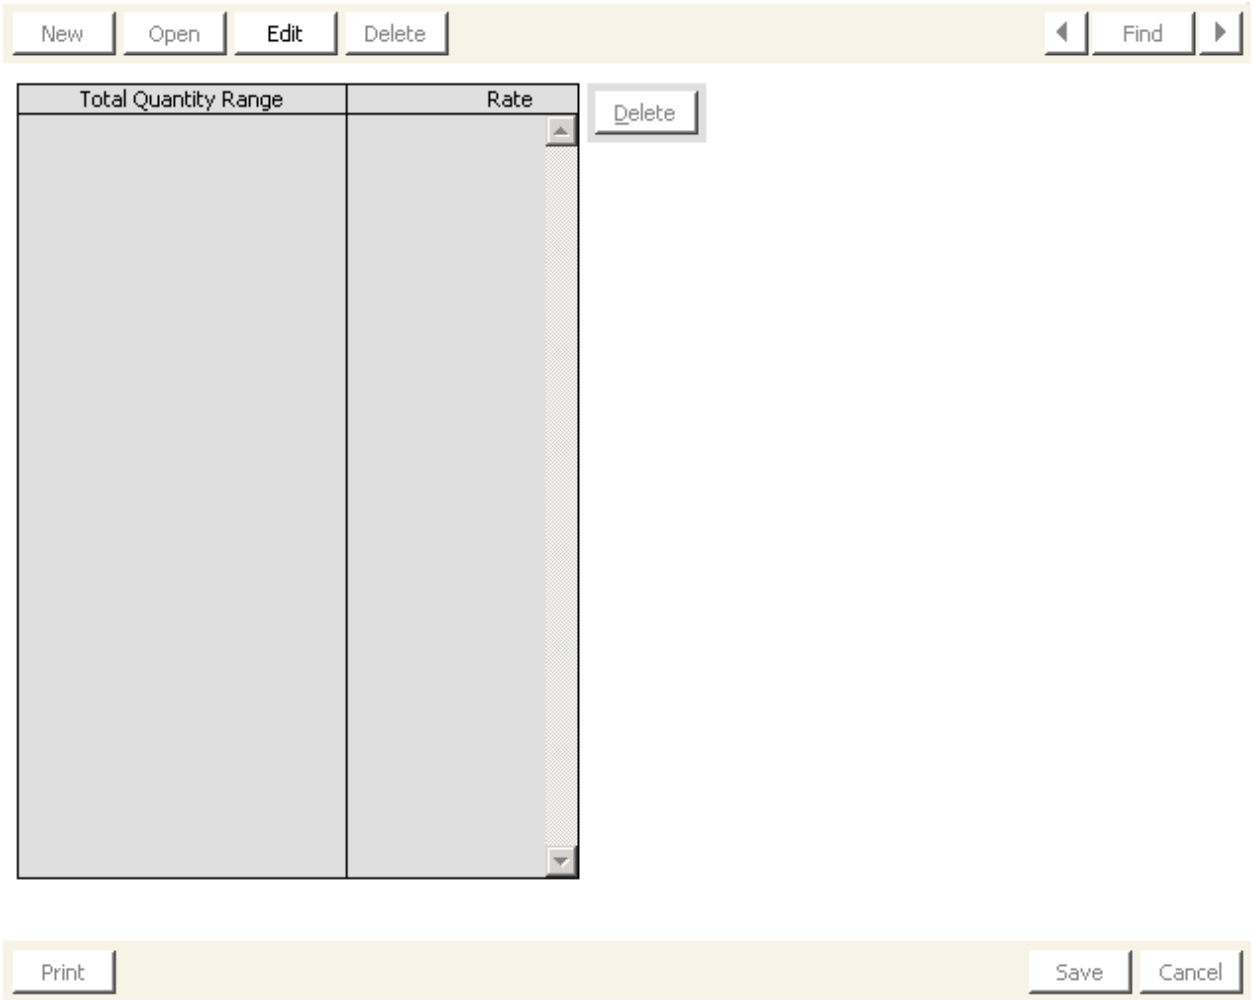
Freight by total quantity

When calculating freight charges by quantity, the total product quantity ordered determines an order's freight charges. To calculate freight rates by order quantity, you must define rates for ranges of product quantities. Quantity ranges are defined on the Set up freight by total quantity window.

Before iMIS Orders automatically calculates freight charges by order quantity, you must perform the following actions:

- Set up quantity range tables
- Enable the Automatic Calculation of Freight Charge option
- Enable the Freight by Total Quantity Ordered option

Set up freight by total quantity window



Desktop: Orders > Set up tables > Freight by total quantity

Total Quantity Range

Enter the minimum quantity of a range. Each range's maximum quantity is determined by each succeeding range's minimum quantity; a range's maximum quantity equals the minimum quantity of the succeeding range minus .01.

Rate

Enter a freight rate for a quantity range.

Defining quantity ranges

Freight rates can be defined for any range of product quantities, and no limit exists to the number of quantity ranges and rates that can be defined. When defining a rate's quantity range, only the minimum quantity of the range is entered in the Total Quantity Range field. The maximum quantity of the range is not entered; it is calculated upon completing and saving the table.

When defining a quantity range's minimum quantity, the minimum quantity must be greater than 0.00, such as 0.01; 0.00 cannot be the beginning range. In addition, if your beginning range's minimum quantity is 5.00 for example, then freight will not be calculated for any orders for quantities of less than 5.00.

Each range's maximum quantity is determined by each succeeding range's minimum quantity; a range's maximum quantity equals the minimum quantity of the succeeding range minus .01. Thus, defining a single value range is a three step process:

1. Enter the minimum quantity in the Total Quantity Range field. (Minimum quantities must be greater than 0.00; 0.00 cannot be the beginning range.)
2. Enter the Rate for the product quantity range.
3. Enter the minimum quantity of the succeeding range in the Total Quantity Range field.

For example, say you need to define rates for the following three product quantity ranges:

- Orders for quantities of more than 0 and less than 5 products will cost $7.50 to ship.
- Orders for quantities of between 5 and less than 10 products will cost $10.00 to ship.
- Orders for quantities of 10 or more products will cost $20.00 to ship.

To set up value ranges for the required rates, you would do the following:

1. Define the first quantity range:

- Enter 0.01 in the Total Quantity Range field for the first range's minimum quantity.
- Enter 7.50 for the Rate of the first range.
- Press Tab.

2. Define the second quantity range:

- Enter 5.00 in the Total Quantity Range field for the second range's minimum quantity. By entering 5.00 for the second range's minimum quantity, the first range's maximum quantity will equal 4.99 when the entire table is completed and saved.
- Enter 10.00 for the Rate of the second range.
- Press Tab.

3. Define the third quantity range:

- Enter 10.00 in the Total Quantity Range field for the third range's minimum quantity. By entering 10.00 for the third range's minimum quantity, the second range's maximum quantity will equal 9.99 when the entire table is completed and saved.
- Enter 20.00 for the Rate of the third range.

4. Click Save.

   The Total Quantity Range field will populate with the maximum quantity for each range.

Example of rates defined for three quantity ranges (before and after being saved)

To define a quantity range

1. From Set up freight by total quantity window, click Edit.
2. Enter the first range's minimum quantity in the Total Quantity Range field. (Minimum quantities must be greater than 0.00; 0.00 cannot be the beginning range.)
3. Enter a Rate for the first quantity range, and press Tab.
4. Enter a quantity in the Total Quantity Range field. The quantity entered determines the following:

- The maximum quantity of the preceding range.
- The minimum quantity of the current range you are defining.

5. (optional) Repeat this process for each additional quantity range you are defining.
6. Click Save.

To add a quantity range

When adding quantity ranges, you can add additional, expanded ranges as well as ranges that fall between other ranges.

1. From Set up freight by total quantity window, click Edit.
2. Place your cursor on the Rate of the last quantity range, and press Tab to display a new line (0.00).
3. Define the new range:

- Enter the new range's low value in the Total Quantity Range field.
- Enter a Rate for the new range.

4. Click Save.

The new range is inserted in the table, and the high value is calculated.

To edit or delete a quantity range

1. From Set up freight by total quantity window, click Edit.
2. Select the total quantity range you want to edit (you only can edit the low value of a range and the Rate). To delete a total quantity range:

- Select the row of the range you want to delete.
- Click the Delete button to the right of the table.

3. Click Save.

   The ranges are recalculated.

   Calculating freight charges that fall outside defined ranges
   If an order's product quantity exceeds the maximum defined quantity, the order's freight charges will be calculated at the rate defined for the maximum quantity. If an order's product quantity is less than the minimum defined quantity, no freight charges will be calculated, and no freight will be charged.

Zones setup

After creating the SHIP_METHOD general lookup/validation table and defining your shipping methods, you can set up your shipping zone tables. Zone tables are based upon shipping method, country (if applicable), and zip or postal codes. You can set up zone tables both for multiple shipping methods and for countries that use these shipping methods.

To define a default zone table for a shipping method, do not designate a country for a shipping method when setting up shipping zones. Orders that do not list a country will use the default zone table for a given shipping method.

Shipping zones are defined according to postal code. Depending on your organization's needs, you can define single postal codes as shipping zones or divide groups of postal codes into shipping zones.

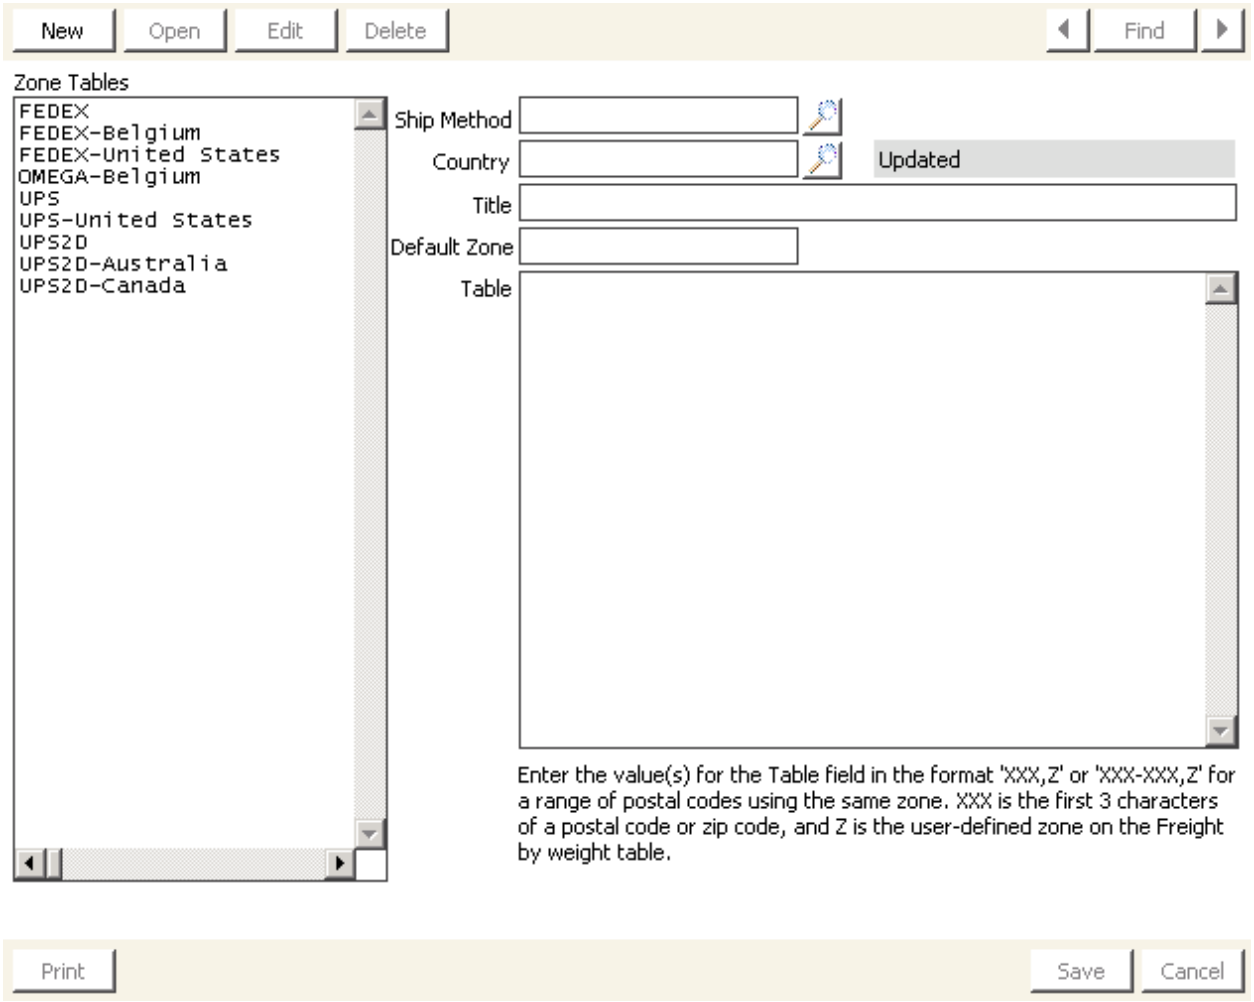
Shipping zones use the first three characters of a postal code, and the table format for defining zones is XXX,Z where XXX represents the first three characters of a postal code, and Z represents the zone designation defined by the user. You also can enter a postal

code in the format XXX-XXX,Z where XXX represents the first three characters of the beginning postal code, XXX represents the first three characters of the ending postal code, and Z represents the zone designation. These zone designations are used when setting up weight tables on the Freight by Weight window.

For example, if you define a shipping zone for a single postal code, such as 75208, you would enter 752 followed by a comma. You then would enter either a numeric or alphabetic value for the zone designation, such as a 1. The shipping zone would display as 752,1. A shipping zone defined for a group of postal codes could be entered as 900-999,2.

As long as you follow the correct table format, you can define as many zone codes as necessary. You must define shipping zone tables before defining freight tables. Zone tables are defined on the Zones window.

Set up shipping zones window



Desktop: Orders > Set up tables > Zones

Zone Tables

Lists the defined shipping zone tables. Zone table names are concatenations of the Ship Method and Country fields.

Ship Method

Specifies the shipping method for the selected zone table. Select the Find icon to look up a shipping method; shipping methods are defined on the SHIP_METHOD general look-up/validation table (from Customers, select Set up tables > General lookup/validation).

Country

(optional) Specifies the country for the selected zone table. Select the Find icon to look up a country; countries are defined on the Set up country names window (from Customers, select Set up tables > Country names).

If you are updating an existing zone table and the Country field is not populated, you can enter a country for the zone table. However, once the Country field is populated and saved, it no longer can be edited.

To define a default zone table for a shipping method, leave the Country field blank. Default zone tables are used for orders that do not list a country.

Updated

(read only) Displays the last date and time that the selected zone table was modified.

Title

Specifies a descriptive title for the selected zone table.

Default Zone

(optional) Specifies the default shipping zone designation for the selected zone table, which must have a matching value in the Zone field of the Freight by Weight window.

This default zone is used only when an order's 'Ship to' address specifies a country for which a zone table exists and when any of the following conditions exists:

- The 'Ship to' address:
- Does not specify a postal code, or
- Specifies a postal code that does not match any of the entries in the Table list for the zone table.
- The 'Ship to' address of an order specifies a postal code, but the Table list for the zone table does not contain any entries.

For example, if a UPS zone table and a UPS-USA zone table both exist, the UPS zone table is used if an order does not specify a country name in the 'Ship to' address. However, if USA is specified in the order's 'Ship to' address, the UPS-USA zone table is

used instead. If the 'Ship to' address in this second case does not specify a postal code, or it specifies a postal code that isn't listed in the UPS-USA zone table, then the specified Default Zone designation would be used to determine the appropriate freight charges by looking for a matching value from Zone field of the Freight by Weight window.

Table

Specifies the shipping zones for the table. The table format for defining zones is XXX,Z or XXX-XXX,Z where XXX is the first three characters of a postal code, and Z is a shipping zone designation specified in the Zone field of the Freight by Weight table.

Table format

(read only) Displays the correct format for defining shipping zones in the Table list.

To define shipping zone tables

1. From Set up shipping zones window, click New to create a new zone table, or select an existing Zone Table and click Edit to modify the table (or click Delete to remove the table).
2. Specify the shipping zone information.
3. Click Save.

Verifying shipping zones for orders

When entering orders, the following rules determine which zone table is used:

- A country is defined for the Ship to address - The zone table used is the one for which the Ship Method and Country combination matches an order's Ship to address Country and Shipping Method.
- A country is not defined for the Ship to address - The zone table used is the one for which the Ship Method matches an order's Shipping Method. The zone table has a blank Country field.

After the correct zone table has been determined, the following rules determine whether the Default Zone defined in that zone table is used:

- The Ship to address:
- Does not specify a postal code, or
- Specifies a postal code that does not match any of the entries in the Table list for the zone table.
- The Ship to address of an order specifies a postal code, but the Table list for the zone table does not contain any entries.

Overview or Orders set up tasks

Set up Orders tables first and then set up:

- Order types
- Product categories
- Tax codes
- Freight information

Set up tables sub-task list (Orders)

Orders has its own tables that must be set up first. You access these tables through the Set up tables sub-task list (from Orders, select Set up tables).

Order types

Select to open the Set up order types window used for defining order types. All orders are classified according to one of the defined order types, and the order types must be defined before you can enter and process orders.

Product categories

Select to open the Set up product categories window used for defining product categories. All products that you define are classified according to one of the defined product categories, and you must define the product categories before you can define your products.

Tax codes

Select to open the Set up tax codes window used for defining tax codes. You must define the appropriate tax codes in order to apply sales taxes to product orders.

Freight by weight

Select to open the Set up freight by weight window used for defining zones for shipping methods based on weight.

Freight by total value

Select to open the Set up freight by total value window used for defining value tables. Value tables allow you to calculate order shipping rates based on total order value ranges.

Freight by total quantity

Select to open the Set up freight by total quantity window used for defining quantity tables. Quantity tables allow you to calculate order shipping rates based on product quantity ordered.

Zones

Select to open the Set up zones window used for defining shipping zone tables. You must define zone tables for each of your shipping methods when calculating shipping charges by order weight; zone tables can be set up both for multiple shipping methods and for countries that use these shipping methods.

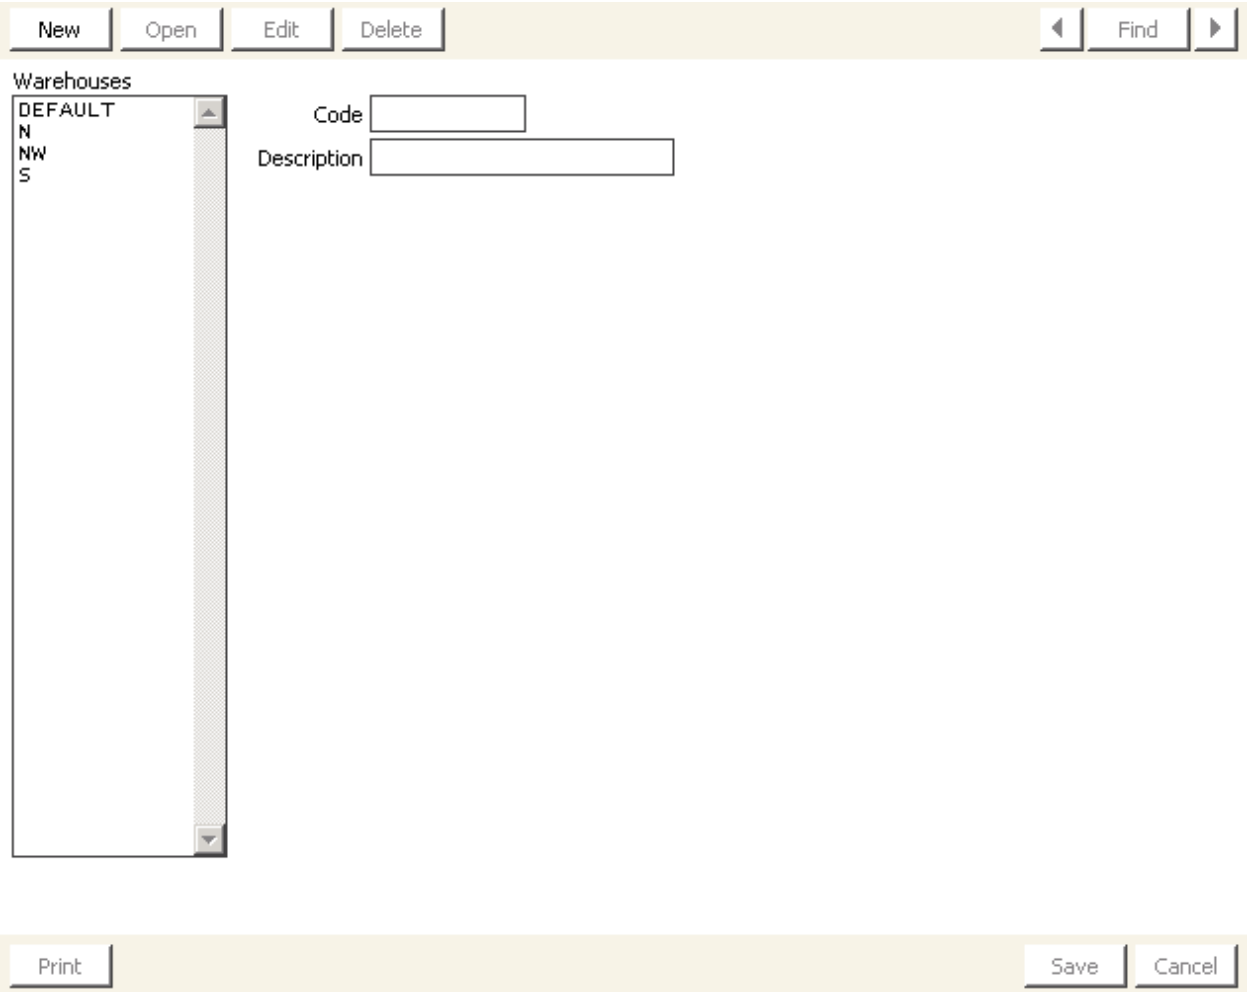
Orders: Set up warehouses

To define inventory parameters for multiple warehouses on the Warehouses window, the warehouses first must be defined on the Set up warehouses window (from Orders, select Set up warehouses). If the warehouses are not defined on the Set up warehouses window, you will not be able to define inventory parameters for them.

The Set up warehouses window is accessed from the Set up warehouses task-list item. The Set up warehouses item displays under the Orders task list only if the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (from Orders,

select Set up module, and click Inventory). Warehouse locations and descriptions defined on the Set up warehouses window are stored in the Product_Location table.

Set up warehouses window



Desktop: Orders > Set up warehouses

Delete button

Click to delete a selected warehouse. Warehouses that are still used by the Manage products window cannot be deleted. See To delete a warehouse for more.

Warehouses

Lists all defined warehouse codes.

Code

(required) Enter a warehouse code or location. The Code field is disabled during Edit mode.

Description

Enter a warehouse description.

To define a warehouse

1. From Set up warehouses window, click New.
2. Enter a warehouse Code.
3. Enter a Description for the warehouse.
4. Click Save.

To edit a warehouse description

1. From Set up warehouses window, select a warehouse code from the list of Warehouses.
2. Click Edit.
3. Edit the warehouse's Description.
4. Click Save.

To delete a warehouse

You can delete a warehouse from the Set up warehouses window only if the following conditions are true:

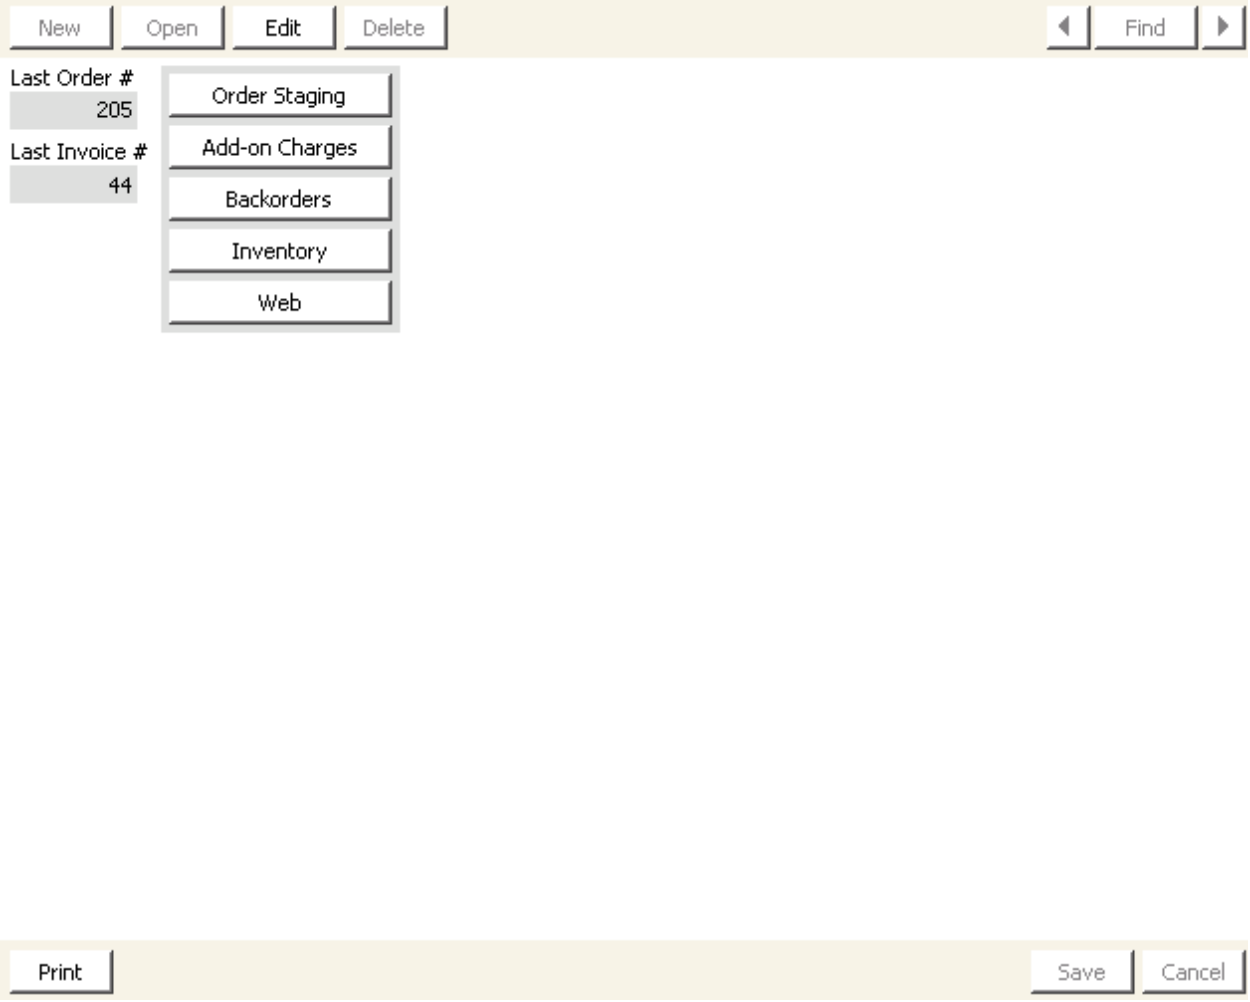
- The warehouse is not the Default warehouse for any product.
- No orders are open for products stored in the warehouse.
- The warehouse is empty of all inventory.

1. From Set up warehouses window, select the warehouse you want to delete from the list of Warehouses.
2. Click Delete.

Orders: Set up module

The iMIS Orders feature has its own system setup used for setting the defaults and parameters needed for managing and processing order transactions and product inventory. You set up your Orders module through the Configure commerce options window.

Configure commerce options window



Desktop: Orders > Set up module

Last Order #

(read only) Displays the order number of the last order entered.

Last Invoice #

(read only) Displays the invoice number of the last order invoiced.

Order Staging button

Opens the Order Status Defaults window used for defining the defaults for the system-defined order type categories.

Add-on Charges button

Opens the Add-on Charges window used for enabling sales tax for freight and handling charges, for selecting a default shipping method, and for defining freight, handling, and restocking charges.

Backorders button

Opens the Backorder Processing window used for enabling and defining Automatic Back-order Processing.

Inventory button

Opens the Inventory System Setup window used for defining default inventory options and default accounts.

Web button

Opens the Web Order Options window used for defining options for sales transactions over the Web.

Defining order status defaults

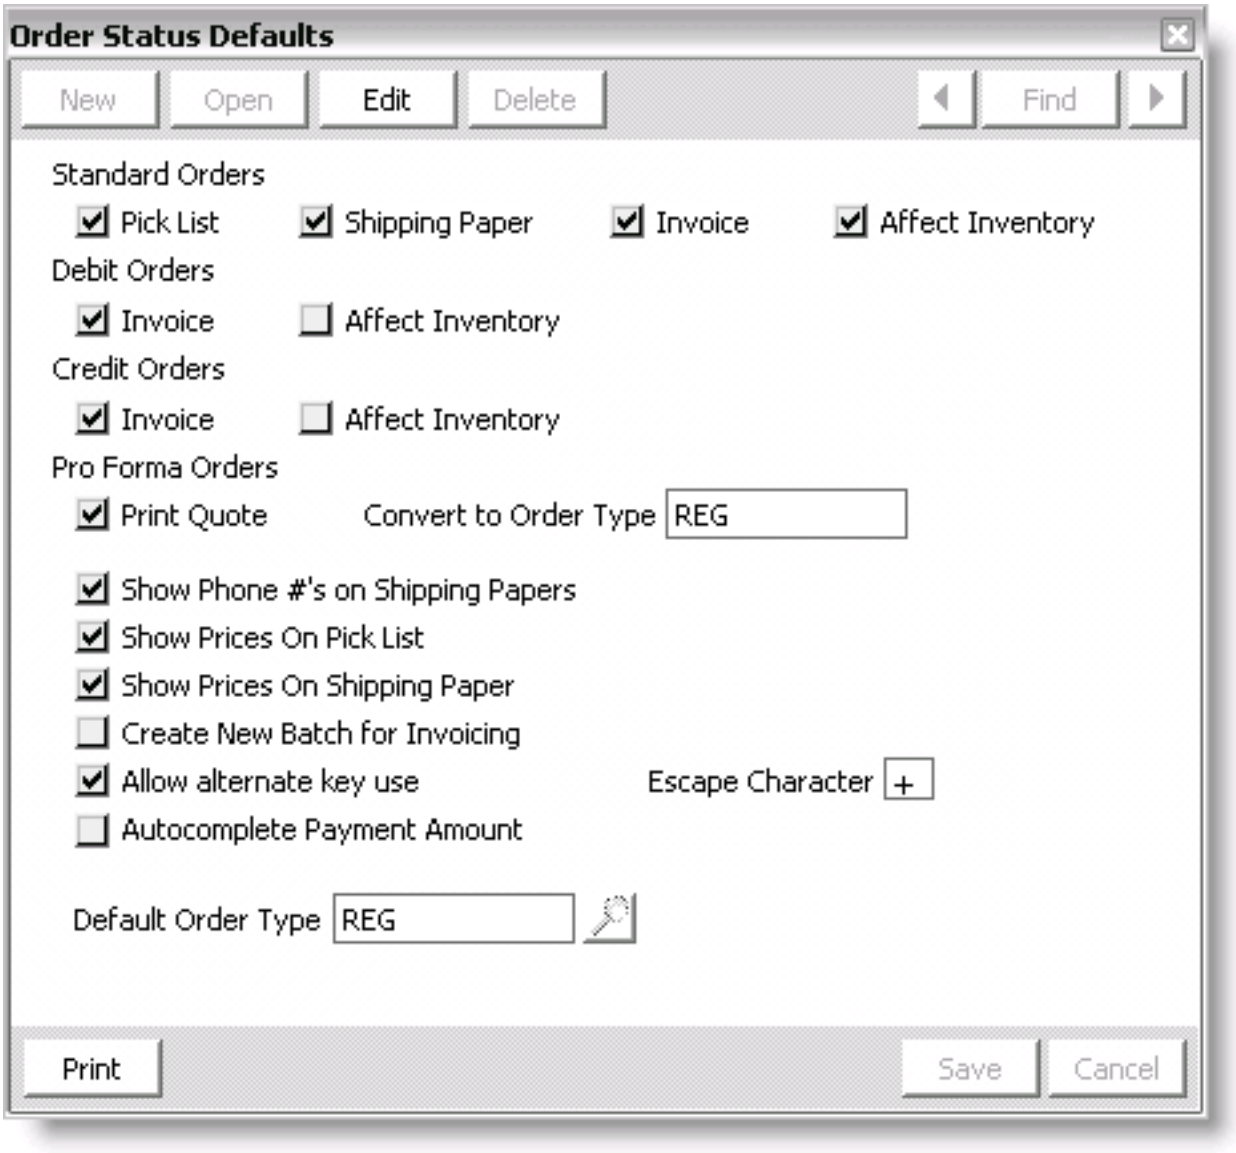
iMIS Orders has four system-defined order type categories: Standard Orders, Debit Orders, Credit Orders, and Pro Forma Orders. Each order type that you define on the Set up order types window (from Orders, select Set up tables > Order types) falls into one of these four order type categories.

The Order Status Defaults window allows you to define the default order processing and inventory options for each order type category as well as several order processing stage options. When you define a new order type on the Set up order types window, the order

processing and inventory options enable automatically according to the defaults set on the Order Status Defaults window.

Regardless of the default options enabled on the Order Status Defaults window, you always can override order processing and inventory options on the Set up order types window for any order type.

Order Status Defaults window



From Orders, select Set up module, and click Order Staging

Standard Orders

The Standard Orders options that you enable are the default options that enable on the Set up order types window (from Orders, select Set up tables > Order types) when you define a standard order type:

- Pick List - Enable to process standard orders through the Print pick list processing stage. If you enable this option, a Pick List sorted by product code prints for each standard order. Pick Lists show the total number of products needed for each order and are useful if you have an intermediate staging area where products are gathered for filling orders.
- Shipping Paper - Enable to process standard orders through the Print shipping paper order processing stage. If you enable this option, shipping papers (Packing Slips) print for each order.
- Invoice - Enable to process standard orders through the Invoice orders order processing stage. If you enable this option, an invoice prints for each order.
- Affect Inventory - Enable to reduce product inventory automatically when you invoice an order.

Debit Orders

A debit order is a special order type category used for entering adjustments for invoiced orders, such as increasing the number of products purchased. Debit orders are entered against an original order's invoice; however, they do not update the original, invoiced order. Any order type created as a debit order can generate an invoice and affect inventory levels only.

The Debit Orders options that you enable are the default options that enable on the Set up order types window (from Orders, select Set up tables > Order types) when you define a debit order type:

- Invoice - Enable to process debit orders through the Invoice orders order processing stage. If you enable this option, an invoice prints for each debit order.
- Affect Inventory - Enable to reduce product inventory automatically when you invoice a debit order.

Credit Orders

A credit order is a special order type category used for reversing invoiced orders. Since invoiced orders cannot be canceled, credit orders are used to reverse invoiced orders. Credit orders are entered against an original order's invoice; however, they do not update the original, invoiced order.

The Credit Orders options that you enable are the default options that enable on the Set up order types window (from Orders, select Set up tables > Order Types) when you define a credit order type:

- Invoice - Enable to process credit orders through the Invoice orders order processing stage. If you enable this option, an invoice prints for each credit order.
- Affect Inventory - Enable to increase product inventory automatically when you enter a credit order.

Pro Forma Orders

A pro forma order is a price quote that you can convert to a standard order. The Pro Forma Orders options that you enable are the default options that enable on the Set up order types window (from Orders, select Set up tables > Order Types) when you define a debit order type:

- Print Quote - Enable to process pro forma orders through the Print quotes order processing stage. If you enable this option, a quote prints for each pro forma order.
- Convert to Order Type - Enter the default order type for converted pro forma orders. The order type you enter is the default order type for pro forma orders when they are converted.

Show Phone #'s on Shipping Papers

Enable to print customer phone numbers on shipping papers (packing slips) below the 'Ship to' Address. This is a requirement for some international businesses.

Show Prices On Pick List

Enable to print extended price amounts on pick lists.

Show Prices On Shipping Paper

Enable to print extended price amounts on shipping papers.

Create New Batch for Invoicing

Enable to create a new batch each time you generate invoices (recommended). If you do not enable this option, the transactions created when you invoice orders are included in the original batch in which payment was entered.

Note: There is one exception to the standard behavior when this option is not enabled. If the invoicing run includes items whose original order batch has a status of Ready or Posted (closed), a new batch is created automatically and iMIS displays a message informing you that a new batch was created for transactions whose original batch is no longer available.

When processing invoices individually using the Print button, the transactions created when you invoice orders are subject to the following rules:

- If Create New Batch for Invoicing is enabled, the following rules apply:
- If you have an open batch selected in your current session, invoices will be generated into that open batch.
- If you have no open batch selected in your current session, the system will prompt you to select or create an open batch into which the invoice entry will be generated.
- If Create New Batch for Invoicing is not enabled, the following rules apply:
- If the original batch in which the order was generated is open, the invoice entry will be generated into that same batch.
- If the original batch in which the order was created is closed, but another batch is selected and open in your current session, the invoice entry will be created into that batch.
- If the original batch is closed, and there is no batch selected and open in your current session, the system will prompt you to select or create an open batch into which the invoice entry will be generated.

Caution! Enable the Create New Batch for Invoicing option if you are using the iMIS Orders backorder feature. For example, with the Create New Batch for Invoicing option

enabled, an order that is invoiced in April that has a backorder that is filled in June will be in the June batch. Without the Create New Batch for Invoicing option enabled, the invoice for the backorder will be in the original April batch. The invoice will reflect the current date, but the AR statement will reflect the old batch date, which is incorrect for aging.

Allow alternate key use

Enable to use identifying numbers for customers other than customer IDs. For example, you may want to use a Social Security number, which is derived from the Major Key field. If you enable this option, the Escape Character field displays.

Escape Character

(Displays when the Allow alternate key use option is enabled) Enter an appropriate character, such as a forward slash, to differentiate the entry of the major key. Prefix the major key in the BT_ID field with this character (forward slash, as an example).

Autocomplete Payment Amount

Enable to automatically populate the Payment Amount field with the order amount after the order is invoiced if you enter credit card information on the Payments tab on the Enter and edit orders window but do not enter a payment amount (or if the payment amount is zero).

If this option is disabled and the Payment Amount field on the Payments tab on the Enter and edit orders window is blank or the payment amount is zero, a message displays to confirm that the Payment Amount field is blank. If you select Yes, the credit card information is saved and the credit card is not charged when the order is invoiced. If you select No, all of the information in the credit card fields is deleted.

This option is disabled by default.

Default Order Type

Enter the default order type that populates the Order Type field on the Overview tab of the Enter and edit orders window each time you enter a new order. The default order type is in effect each time you open iMIS. If you enter an order with a different order type, the

Order Type field on the Overview tab defaults to the last order type entered until you restart iMIS.

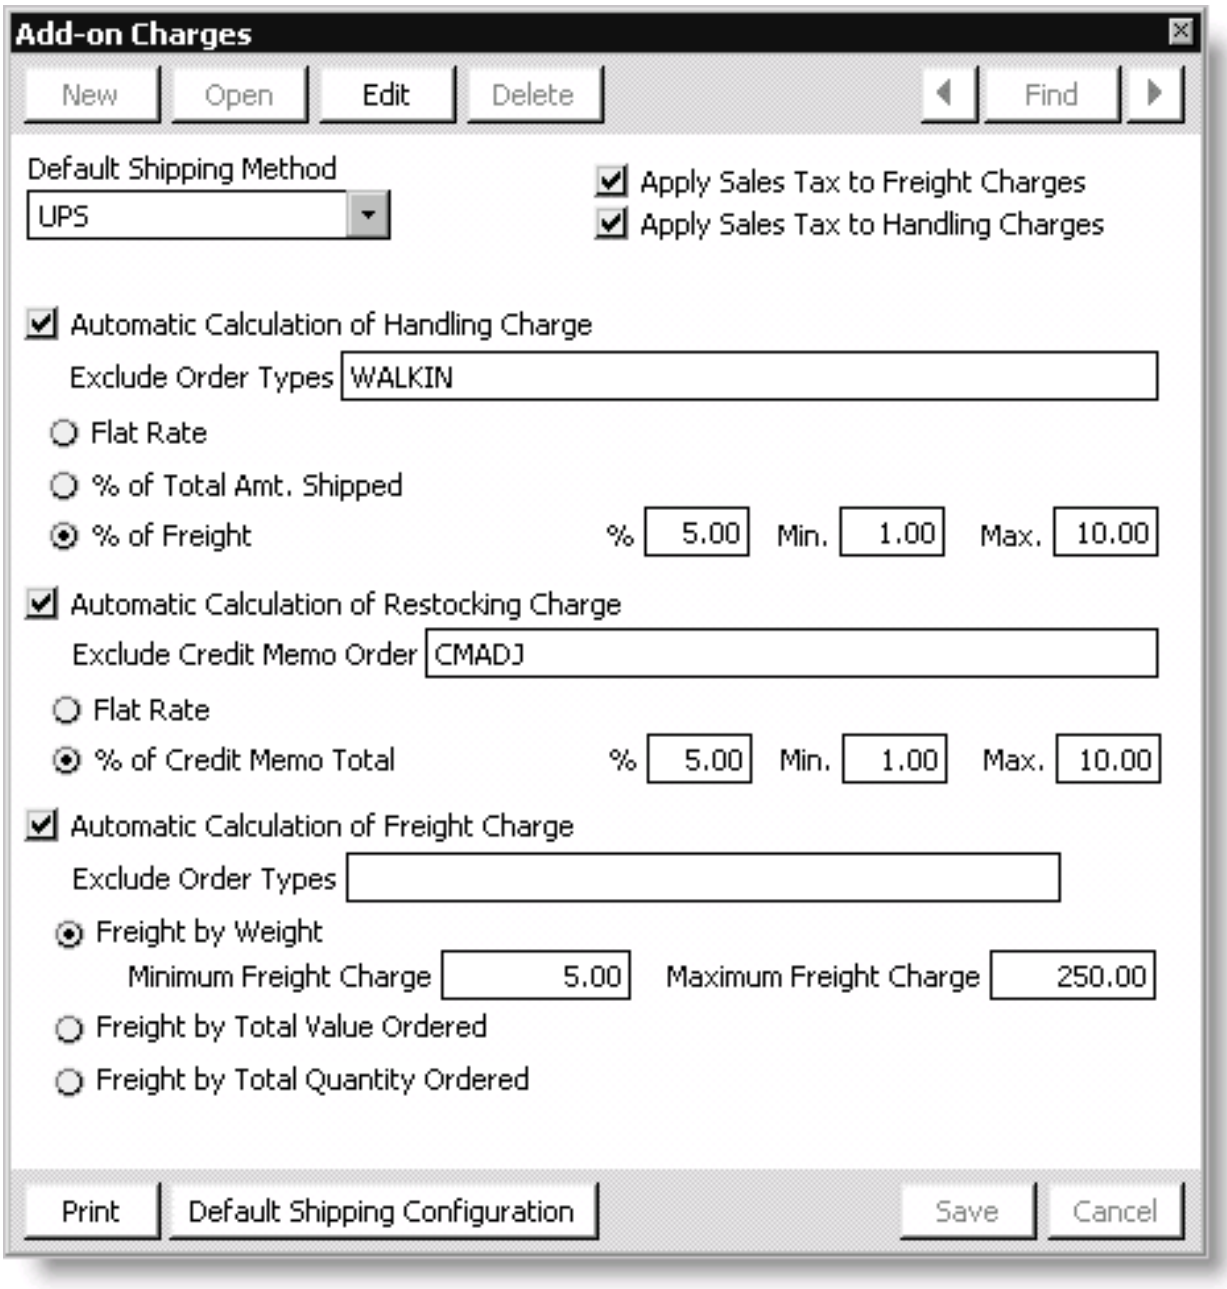
To define order status defaults

1. From Orders, select Set up module to open the Set up module window.
2. Click Order Staging to open the Order Status Defaults window.
3. Click Edit.
4. Enable the default options for each order type category.
5. Enter the order type to which you want pro forma orders to convert in the Convert to Order Type field.
6. Enable any other default order status options.
7. (optional) Enter the Default Order Type.
8. Click Save.

Defining add-on charges

iMIS Orders allows you to define a default shipping method for your orders. You also can calculate freight, handling, and restocking charges, as well as apply sales tax to the calculated freight and handling charges. All of the default charges can be overridden at order entry.

Add-on Charges window



From Orders, select Set up module, and click Add-on Charges

Default Shipping Method

Enter the default shipping method you want to use when shipping your orders. The value entered displays in the Shipping Method field on the Overview tab of the Enter and edit orders window. Select the Find icon to look up a shipping method.

Note: A Shipping Method is required for your Member site.

Shipping methods are defined on the SHIP_METHOD general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

Apply Sales Tax to Freight Charges

Apply Sales Tax to Handling Charges

Enable if you want iMIS automatically to apply sales taxes to freight and/or handling charges for taxable products.

VAT only: Even if you configure iMIS to do VAT-exclusive pricing, the cart on your web-site will show your shoppers VAT-inclusive product prices and shipping/handling fees, to comply with sales tax rules. See "Configuring VAT options in AR/Cash" in International Taxation.

Automatic Calculation of Handling Charge

Enable if you want iMIS to calculate handling charges automatically. Handling charges can be overridden on the Order Details tab at order entry.

The following fields display when you enable the Automatic Calculation of Handling Charge option:

Exclude Order Types - Enter the order types that you want to exclude from automatic handling charges. For example, you may want to exclude on-site or walk-in customer orders from any handling charges. Separate multiple order types by commas.

Flat Rate - Enable to define a single, flat handling charge for orders. When you enable this option, the following fields display for defining your flat handling charge:

- Rate - Enter the default, fixed dollar amount of the handling charge.
- Minimum Order - Enter the minimum dollar amount for which handling charges will apply. For example, no handling charges will apply to orders under $20.00 if you enter 20.00 for the Minimum Order. Entering a zero means that no orders are excluded from handling charges.

  % of Total Amt Shipped - Enable to calculate a one-time handling charge as a percentage of an order's total cost, regardless of what products from the order actually ship at the time of the original order. For example, due to backorder, if two of five products ship with the original order, the entire handling charge is included in the original invoice. When you enable this option, the following fields display for calculating your handling charge:

- % - Enter a percentage to calculate handling charges. For example, if you enter 5.00, an order that costs $100.00 would have handling charges of $5.00.
- Min - Enter a minimum dollar amount for handling charges. For example, entering 1.00 would charge a minimum handling charge of $1.00 regardless of the percentage defined in the % field. Entering a zero means no minimum exists for handling charges.
- Max - Enter a maximum dollar amount for handling charges. For example, entering 100 would charge a maximum handling charge of $100.00 regardless of the percentage defined in the % field. Entering a zero means no maximum exists for handling charges.

  % of Freight - Enable to calculate handling charges as a percentage of freight costs. When you enable this option, the following fields display for calculating your handling charge:

- % - Enter a percentage to calculate handling charges. For example, if you enter 5.00, an order with freight costs of $100.00 would have handling charges of $5.00.
- Min - Enter a minimum dollar amount for handling charges. For example, entering 1.00 would charge a minimum handling charge of $1.00 regardless of the percentage defined in the % field. Entering a zero means no minimum exists for handling charges.
- Max - Enter a maximum dollar amount for handling charges. For example, entering 100

would charge a maximum handling charge of $100.00 regardless of the percentage defined in the % field. Entering a zero means no maximum exists for handling charges.

Automatic Calculation of Restocking Charge

Enable if you want iMIS to calculate restocking charges automatically for credit memo orders. The following fields display when you enable the Automatic Calculation of Restocking Charge option:

Exclude Credit Memo Order - Enter the credit memo order types you want to exclude from automatic restocking charges. Separate multiple credit memo order types by commas.

Flat Rate - Enable to define a single, flat restocking charge for credit memo orders. When you enable this option, the following fields display for defining your flat restocking charge:

- Rate - Enter the default, fixed dollar amount of the restocking charge.
- Min Credit Memo Amount - Enter the minimum dollar amount for which restocking charges will apply. For example, no restocking charges will apply to credit memo orders under $20.00 if you enter 20.00 for the Minimum Order. Entering a zero means no credit memo orders are excluded from restocking charges.

% of Credit Memo Total - Enable to calculate restocking charges as a percentage of a total credit memo order. When you enable this option, the following fields display for calculating your restocking charge:

- % - Enter a percentage to calculate restocking charges. For example, if you enter 5.00, a credit memo order for $100.00 would have restocking charges of $5.00.
- Min - Enter a minimum dollar amount for restocking charges. For example, entering 1.00 would charge a minimum restocking charge of $1.00 regardless of the percentage defined in the % field. Entering a zero means no minimum exists for restocking charges.
- Max - Enter a maximum dollar amount for restocking charges. For example, entering 100 would charge a maximum restocking charge of $100.00 regardless of the percentage defined in the % field. Entering a zero means no maximum exists for restocking charges.

Automatic Calculation of Freight Charge

Enable if you want iMIS to calculate freight charges automatically. When you enable the Automatic Calculation of Freight Charge option, freight charges are calculated automatically based on which of the following calculation methods is enabled. Regardless of which calculation method is used, freight charges can be overridden on the Order Details tab of the Enter and edit orders window.

Exclude Order Types - (Displays only when the Automatic Calculation of Freight Charge option is enabled) Enter the order types that you want to exclude from automatic freight charges. Separate multiple order types by commas.

Freight by Weight - Enable to calculate freight charges based on order weight. When you enable the Freight by Weight option, freight charges are calculated based on the weight tables defined on the Set up freight by weight window (from Orders, select Set up tables > Freight by weight).

The following fields display when the Freight by Weight option is enabled:

- Minimum Freight Charge - Enter a minimum dollar amount for freight charges. For example, entering 5.00 would charge a minimum freight charge of $5.00 regardless of an order's shipping weight or destination. Entering a zero means no minimum exists for freight charges.
- Maximum Freight Charge - Enter a maximum dollar amount for freight charges. For example, entering 250.00 would charge a maximum freight charge of $250.00 regardless of an order's shipping weight or destination. Entering a zero means no limit exists for freight charges.

Freight by Total Value Ordered - Enable to calculate freight charges based on total pre-tax order value, excluding handling and restocking charges. When you enable the Freight by Total Value Ordered option, freight charges are calculated based on the value ranges defined on the Set up freight by total value window (from Orders, select Set up tables > Freight by total value).

Freight by Total Quantity Ordered - Enable to calculate freight charges based on total product quantity ordered. When you enable the Freight by Total Quantity Ordered option, freight charges are calculated based on the quantity ranges defined on the Set up freight by total quantity window (from Orders, select Set up tables > Freight by total quantity).

Default Shipping Configuration button

Click to open the Default Shipping Configuration window used for defining default shipping methods for individual countries.

To define add-on charges

1. From Orders, select Set up module to open the Set up module window.
2. Click Add-on Charges to open the Add-on Charges window.
3. Click Edit.
4. Enter the Default Shipping Method for your orders.
5. (optional) Enable the options to add sales tax to freight and handling charges.
6. (optional) Enable the default options for handling charges.
7. (optional) Enable the default options for restocking charges.
8. (optional) Enable the default options for freight charges.
9. Click Save.

Defining default shipping methods for individual countries

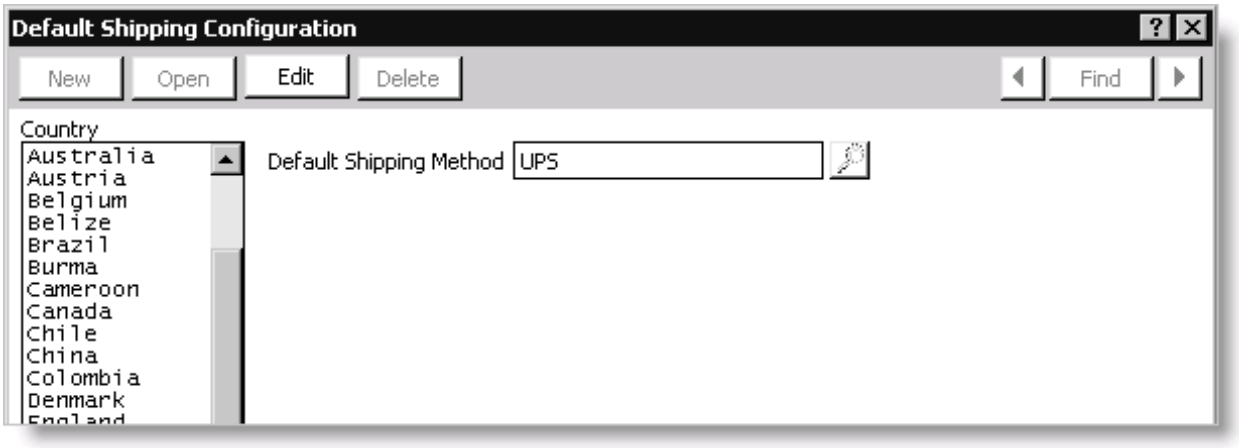
Default shipping methods are defined for individual countries on the Default Shipping Configuration window, which is accessed by clicking Default Shipping Configuration on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

A different default shipping method can be assigned to each individual country defined on the Set up country names window. This is a useful feature for organizations frequently

shipping to international customers. The ability to assign a default shipping method to individual countries streamlines and automates the order-entry process.

You always have the ability to override an order's Shipping Method during order entry.

Default Shipping Configuration window



From Orders, select Set up module, click Add-on Charges, and click Default Shipping Configuration

Country

Displays the countries defined on the Set up country names window (from Customers, select Set up tables > Country names).

Default Shipping Method

Enter a default shipping method for a country. Select the Find icon to look up a shipping method.

Shipping methods are defined on the SHIP_METHOD general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

To assign a default shipping method to a country

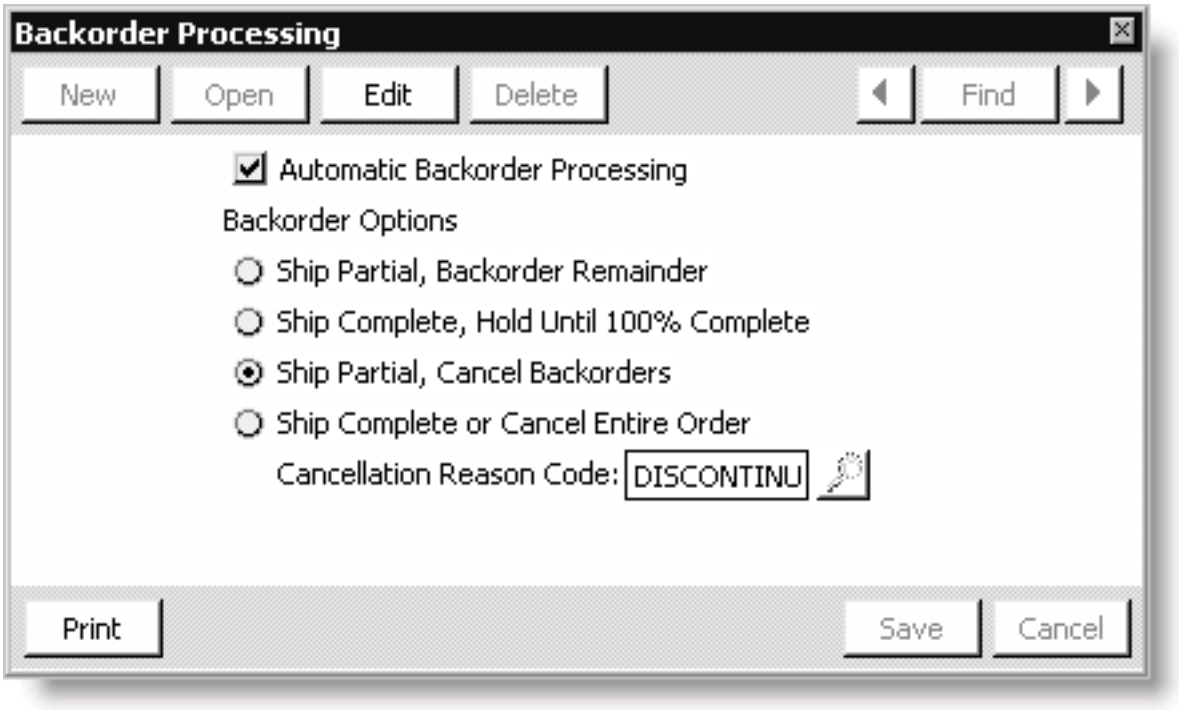
1. From Orders, select Set up module to open the Set up module window.
2. Click Add-on Charges to open the Add-on Charges window.
3. Click Default Shipping Configuration to open the Default Shipping Configuration window.

4. Select a Country for which you want to assign a default shipping method.
5. Click Edit.
6. Enter a Default Shipping Method, or select the Find icon to look up a shipping method.
7. Click Save.

Defining backorder options

iMIS Orders offers several options when processing backorders. Backorder options are defined on the Backorder Processing window.

Backorder Processing window



From Orders, select Set up module, and click Backorders

Automatic Backorder Processing

Enable to release backorders automatically when you enter and post product inventory receipts.

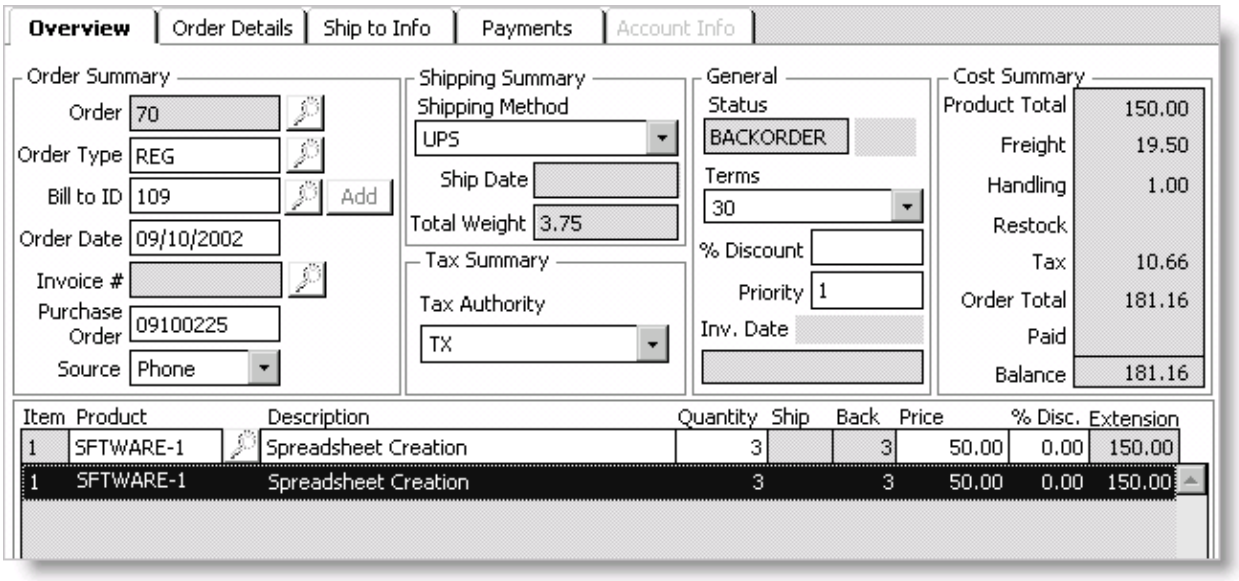
Backorder Options

When you enable Automatic Backorder Processing, you have several Backorder Options that you can enable on the Backorder Processing window. The Backorder Options allow you to define specific parameters for how iMIS processes backorders:

Ship Partial, Backorder Remainder

The Ship Partial, Backorder Remainder option enables by default when you use Automatic Backorder Processing and is the most widely used backorder processing option. The Ship Partial, Backorder Remainder option performs the following backorder processing tasks when enabled:

- Backorder Entire Order - When all of the products ordered are on backorder, iMIS automatically places the order in backorder status. When any ordered products become available through posted inventory receipts, the order is released from backorder status to the first processing stage for the given order type. If any of the ordered products remain on backorder, the order follows the processing steps for a partially shippable order.



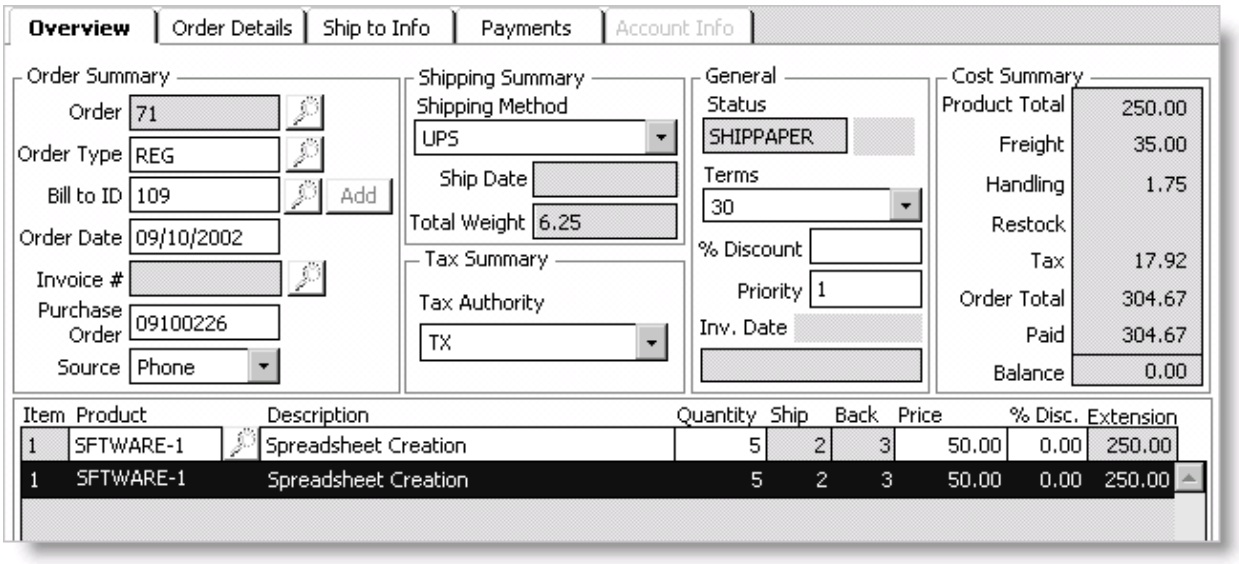
Example of a backorder

- Ship Partial Order - When some of the products ordered are on backorder, iMIS automatically places the order in the first processing stage for the given order type, such as PICKLIST, SHIPPAPER, or INVOICE, as with complete orders.

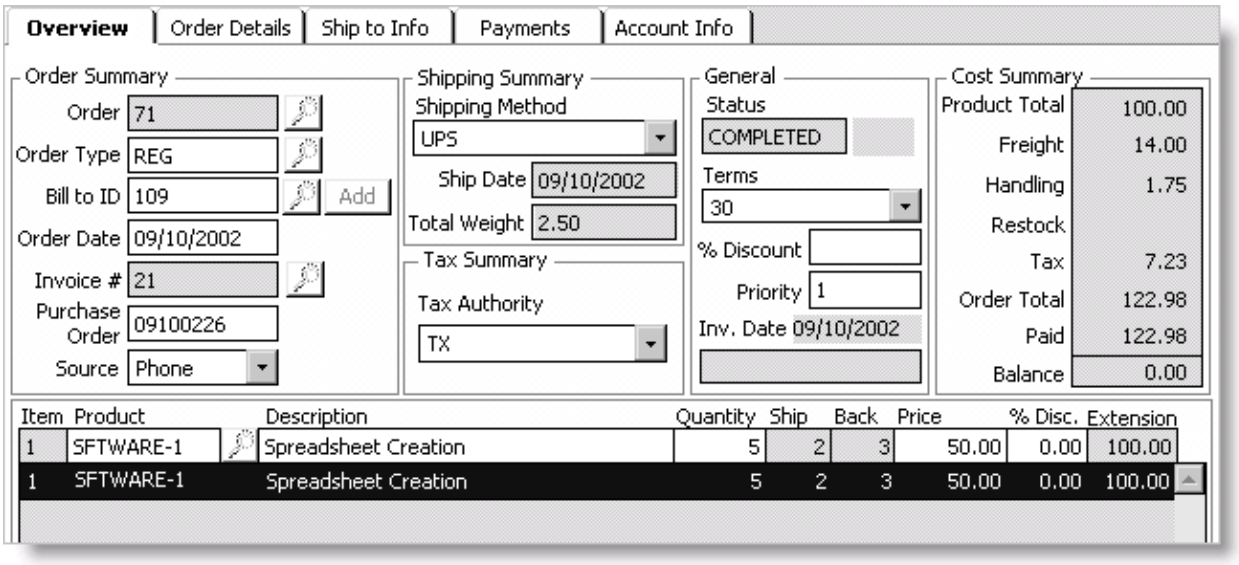
If one or more of the ordered products remain backordered when the order is invoiced, iMIS proceeds with the following steps during the invoicing stage:

- iMIS recalculates the original order's product totals to include only the quantities actually shipped.
- iMIS generates an extended suborder, which is assigned the original order transaction number plus .01, such as 208.01. The extended suborder consists only of the back-ordered products remaining when the original order was invoiced. The original order retains the backordered product's product code with an Extension price of 0.00 as displayed on the Enter and edit orders window.
- Any prepaid cash amounts are split appropriately between the original order and the extended suborder. The original order's cash amount equals the lesser of the full cash amount or the invoiced total. All remaining cash applies to the extended suborder.

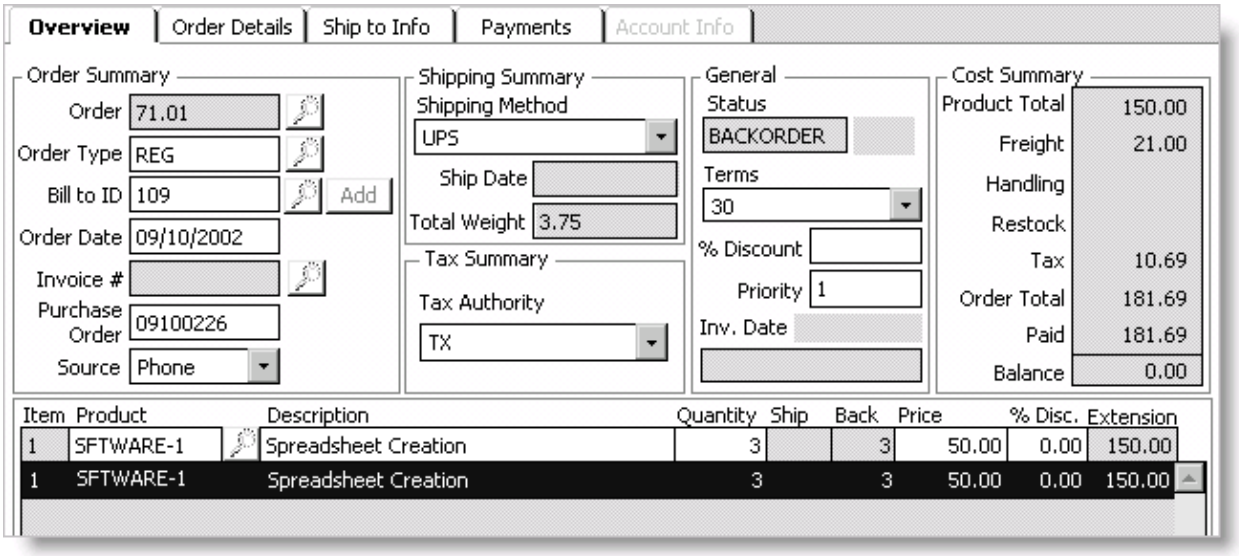
  Note: An extended suborder can continue to generate additional extended suborders for products that remain on backorder.



Example of a partially shippable order with full payment before invoicing



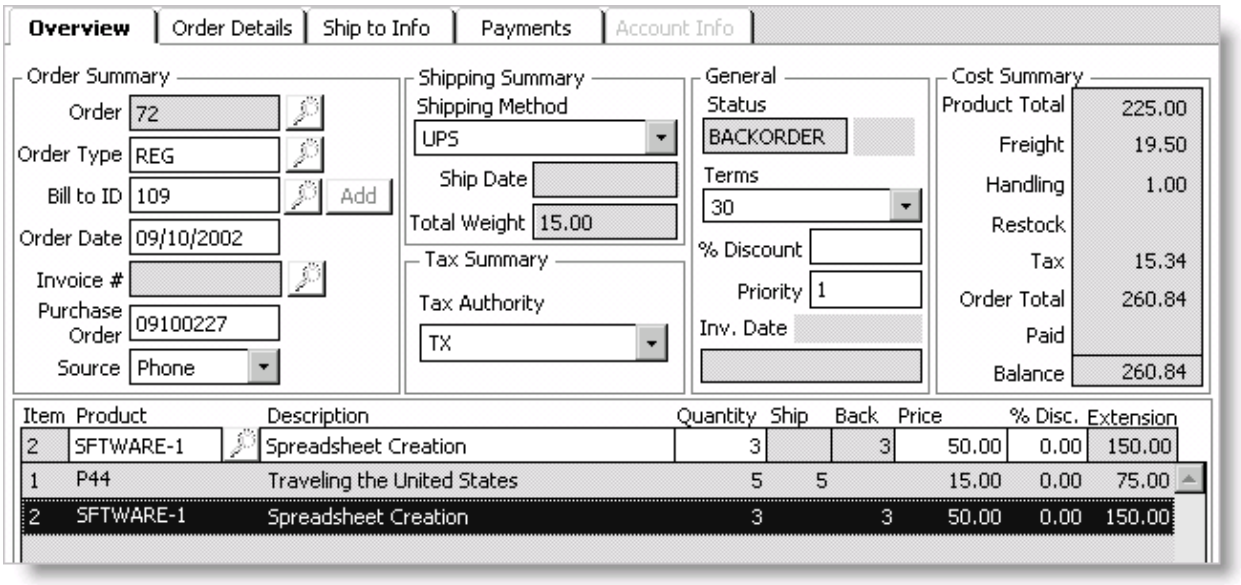
Example of a partially shipped order after invoicing. Note that the Extension price does not reflect the backordered products. Taxes were recalculated for the shipped products, and only the cash relevant to the shipped total is applicable for the order.



Example of an extended suborder, Order # 208.01, generated for Order # 208. Note that the remaining prepaid cash has been applied to suborder 208.01. Handling fees are charged on original orders and not on extended suborders.

Ship Complete, Hold Until 100% Complete

If you enable the Ship Complete, Hold Until 100% Complete option, iMIS does not ship an order until all ordered products are available in inventory. Orders for products with insufficient inventory are placed on backorder whether or not the products are fully backordered or partially shippable. No extended suborders are generated because the order does not have any backordered quantities remaining when it is shipped and invoiced.

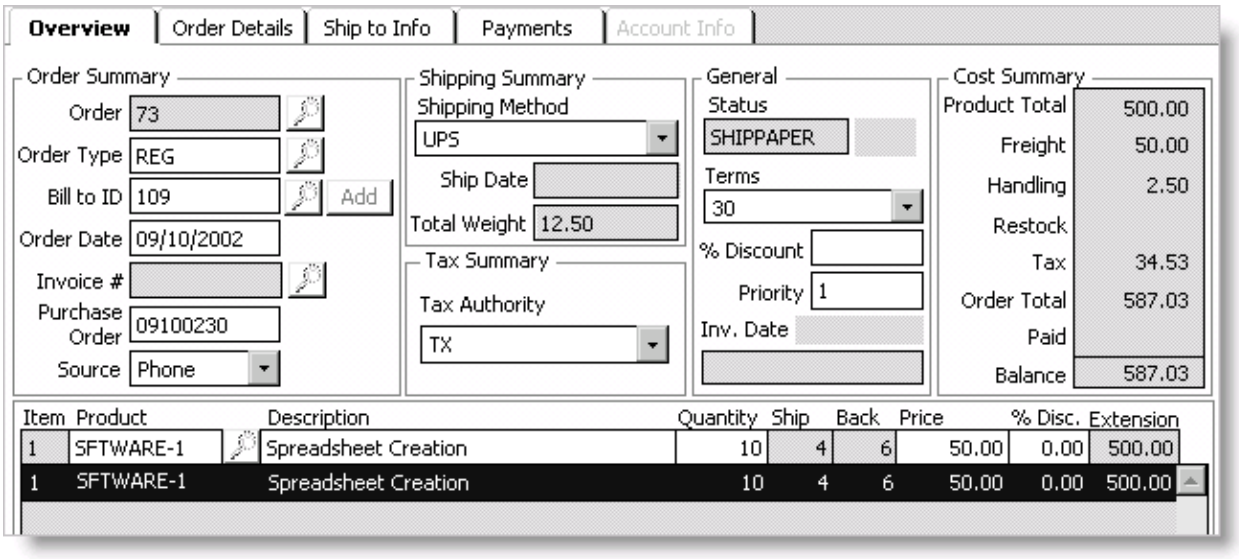


Example of a partially shippable order in backorder status when the Ship Complete, Hold Until 100% Complete option is enabled

Ship Partial, Cancel Backorders

If you enable the Ship Partial, Cancel Backorders option, iMIS treats backorders as normal orders upon data entry. However, unlike complete and ship partial orders, you are prompted to cancel the backordered products (or the entire order if it is completely backordered) at the Invoice orders processing stage.

If you do not cancel the backordered products when invoicing the order, an extended suborder is generated for the backordered products. The original order then goes automatically to the first processing stage for the given order type, such as PICKLIST, SHIPPAPER, or INVOICE.



Example of a partially shippable order before invoicing when the Ship Partial, Cancel Backorders option is enabled

Ship Complete or Cancel Entire Order

If you enable the Ship Complete or Cancel Entire Order option, you can cancel partial or completely backordered orders at order entry. When an order is entered for any product on backorder, a message displays prompting you to cancel the order instead of generating a backorder. If you elect not to cancel the order, the order does not ship until all products are available in inventory just as if the Ship Complete, Hold Until 100% Complete option were enabled.

Cancellation Reason Code

(Displays when the Ship Partial, Cancel Backorders option is enabled) Enter a reason code for canceling orders. Select the Find icon to look up a cancellation reason code.

Cancellation reason codes are defined on the CANCELLATION general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

To define backorder options

1. From Orders, select Set up module to open the Set up module window.

2. Click Backorders to open the Backorder Processing window.
3. Click Edit.
4. Enable the appropriate backorder options.
5. Click Save.

Enabling backordering on the web

To allow out-of-stock items to be purchased in the web views, enable the Allow purchase of out-of-stock items checkbox (System Setup > Set up commerce web components > Store configuration).

The backordered purchase is processed as a pro forma order and created as if the item is in stock and will be shipped. However, the product inventory is not affected at the time of the order.

When an out-of-stock item is in the cart during checkout, the cart issues a message about the backordered state. The backorder quantity displayed is based on the product availability at the time the order is placed.

You can customize the out-of-stock and backorder messages that appear during the order process. The out-of-stock message appears on the Product Detail page. The backorder message appears on the My Cart, Review, and Order Summary pages, and in the Order Confirmation sent by email.

If the Allow purchase of out-of-stock items checkbox is cleared, orders containing out-of-stock items can not be processed in the web views.

To enable backorders in the web views

1. From System Setup, select Set up commerce web components > Store configuration.
2. Select the Allow purchase of out-of-stock items checkbox.
3. (Optional) Customize the out-of-stock and backorder messages.

Only one backorder message displays in the web views. The backorder message displayed is based on the backorder option selected on the Backorder Processing window (from Orders, select Set up module, and click Backorders).

4. Click Save.

Disabling multiple warehouses

The following rules apply for disabling the Enable Multi-Warehouses option after posting inventory transactions and entering orders with the option enabled:

- Each stock item can have only one warehouse defined on the Warehouses window, and the warehouse must equal the default system warehouse defined on the Inventory System Setup window.
- A stock item's total product inventory must equal the total inventory in the product's default warehouse on the Manage products window.
- Each default warehouse defined for a stock item on the Manage products window must equal the default warehouse defined on the Inventory System Setup window.
- For all open orders for stock items, all of the products must be ordered from the default warehouse as defined on the Manage products window.

If one of the previous rules is not true, you will not be able to disable the Enable Multi-Warehouses option. To disable the option, you will have to do the following:

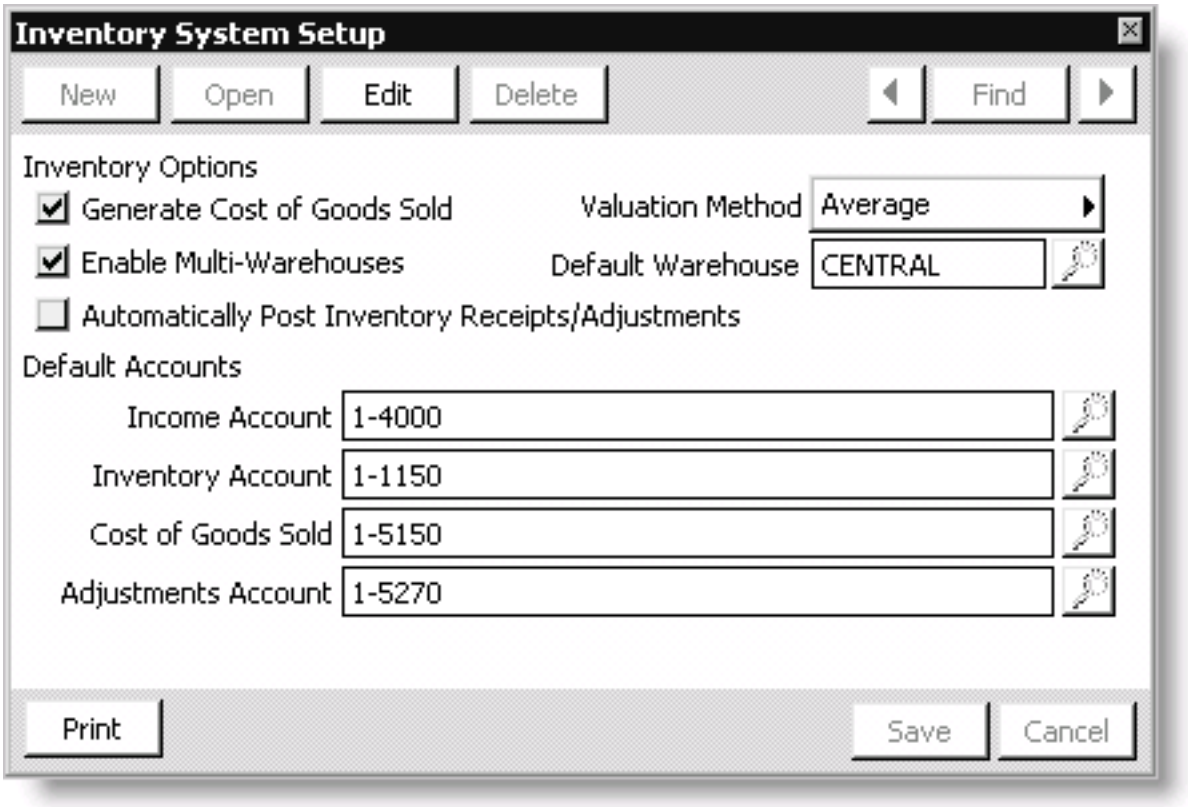
1. Close all open orders.
2. Change each stock item's default warehouse on the Manage products window to equal the default warehouse defined on the Inventory System Setup window.
3. Move all of a product's inventory to the default warehouse (you can do this by entering and posting inventory adjustments and warehouse transfers).
4. Delete all warehouses defined for a product on the Warehouses window except the default warehouse.

Defining inventory options

iMIS Orders allows you to define the following options that are useful in managing your product inventory:

- Generate cost of goods sold
- Use multiple warehouses
- Define a default warehouse
- Post inventory receipts and adjustments automatically
- Determine the valuation method for your inventory

Inventory System Setup window



From Orders, select Set up module, and click Inventory

Inventory Options

Generate Cost of Goods Sold - Enable to track the cost of the products you sell. The cost of the products sold posts to the Inventory and Cost of Goods Sold accounts during the Invoice orders process. The Valuation Method field displays when you enable the Generate Cost of Goods Sold option.

Valuation Method - (Displays when the Generate Cost of Goods Sold option is enabled) Select the method you want to use to value your product inventory:

- Average - Select this method to determine the cost of goods sold as averaged over time.

Average unit cost is calculated by dividing average total inventory cost by inventory on hand. Average total inventory cost is calculated using a two-step process:

- The total average unit cost of all invoiced products is subtracted from the average total inventory cost.
- The average total inventory cost then is divided by the updated product inventory on hand.

A product's inventory on hand is recalculated each time products are invoiced. A product's average unit cost and average total inventory cost are recalculated each time inventory transactions are posted. The Product_Inventory.AVERAGE_COST field updates upon invoicing.

When you invoice a product order, the product's average unit cost is calculated according to the product quantity on hand and the average total product inventory cost. This average total inventory cost can change every time you post an inventory transaction.

For example, if you post inventory receipts for an individual product at a cost of $10 and $15 per unit, the total inventory on hand is two units, the average total inventory cost is $25, and the average product cost is $12.50. If you then sell one product and invoice the order, the total inventory on hand is one unit, the average total inventory cost is $25, and the average product cost is $12.50.

However, if you then post another single product receipt for $15, the total inventory on hand is again two units, but the average total inventory cost and average product cost will

be different: The average total product inventory cost will be $27.50 and the average product cost will be $13.75.

To calculate the average total product inventory cost, subtract the total average product cost of the invoiced products ($12.50) from the average total product inventory cost ($40 - $12.50 = $27.5). To calculate the average product cost, divide the new average total product inventory cost ($27.5) by the current product inventory on hand ($27.5 / 2 = $13.75).

- Standard Cost - Select this method to use a fixed cost to determine the cost of goods sold. Depending on whether Multi-Warehouses is enabled, the Standard Cost is entered manually on either the Inventory or the Warehouses window, allowing you to build overhead costs into your cost of goods sold.

  Enable Multi-Warehouses - Enable if individual products are stored in multiple warehouse locations. Warehouse locations are defined on the LOCATION general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

  Enabling the Enable Multi-Warehouses option after posting products to inventory does not directly affect product inventory. As with all system setup changes throughout iMIS, changes do not update existing records. You simply need to enter your products' warehouses and inventory information on the Warehouses window (from Orders, select Manage inventory > Manage products, select a product from the list of Current Products, and click Warehouses).

  Default Warehouse - (Enables only if the Enable Multi-Warehouses option is enabled) Enter the default warehouse you want to use when defining new products. Select the Find icon to look up a warehouse; warehouse locations are defined in the Set up warehouses window (from Orders, select Set up warehouses).

  The warehouse entered displays by default in the Default Warehouse field on the Manage products window when defining new products. You can override a product's default warehouse on the Manage products window at any time.

Automatically Post Inventory Receipts/Adjustments - (Most users should not enable this option) Enable to post inventory transactions automatically. If you do not enable this option, you still can verify and edit your inventory transactions before posting them.

Since posted inventory transactions cannot be edited, automatically posting inventory receipts, adjustments, and transfers is not recommended. Also, if you automatically post inventory receipts, iMIS automatically commits the products in inventory and releases backorders.

Default Accounts

Income Account - Enter the default income account to which income posts. This account is used when an income account is not defined at the warehouse, product, or category level. If you leave this field blank, the income account will not be populated.

Inventory Account - Enter the default inventory account used for recording inventory reductions. This account is used when an inventory account is not defined at the warehouse, product, or category level. If you do not track your product inventory, you do not need to enter an account number.

Note: iMIS does not create an accounting entry when inventory is received. The system assumes that the entry is made to the General Ledger or Accounts Payable when receiving or paying for inventory.

Cost of Goods Sold - Enter the default account used for recording inventory costs when invoicing orders. This account is used if you do not define a cost of goods sold account at the warehouse, product, or category level.

Adjustments Account - Enter the default account used for posting inventory adjustments. This account is used if you do not define an inventory account at the warehouse, product, or category level. The Adjustments Account offsets inventory when you post inventory adjustments, for example, when inventory cost and quantity are adjusted for loss or damage.

Enabling multiple warehouses

How you manage your product inventory depends on whether you store each individual product in a single warehouse or in multiple warehouses. If you store individual products in a single warehouse, then you will be using standard inventory, and the Enable Multi-Warehouses option does not need to be enabled. However, if you store individual products in multiple warehouses, then you do need to enable the option.

Enabling the Enable Multi-Warehouses option allows you to define multiple warehouse locations for each of your individual products; you have the ability to record and manage a product's inventory for each individual warehouse location. You also have the ability to define a specific bin where products are stored within each individual warehouse.

Enabling the option after products have been posted to inventory does not affect product inventory directly. However, once you enable the Enable Multi-Warehouses option, you completely alter the way iMIS Orders records your product inventory. In turn, this affects how you manage your products and product inventory.

The following summarizes the effects enabling the Enable Multi-Warehouses option has on windows:

- Enter and edit receipts and adjustments window

  Transfer option - Displays for transferring products from warehouse to warehouse.

  Warehouse field(s) and Bin field(s) - Display for entering inventory receipts, adjustments, and transfers for specific products' warehouses.

- Manage products window

  Default Warehouse field - Displays for entering a product's default warehouse.

  Warehouses button - Replaces the Inventory button and opens the Warehouses window. The Warehouses window replaces the Inventory window and is used for entering warehouses and defining inventory parameters for individual products.

- Product Detail window

Warehouse field - Displays for overriding a product's default warehouse when entering or editing an order.

Bin field - Displays the location in the warehouse where a product is stored.

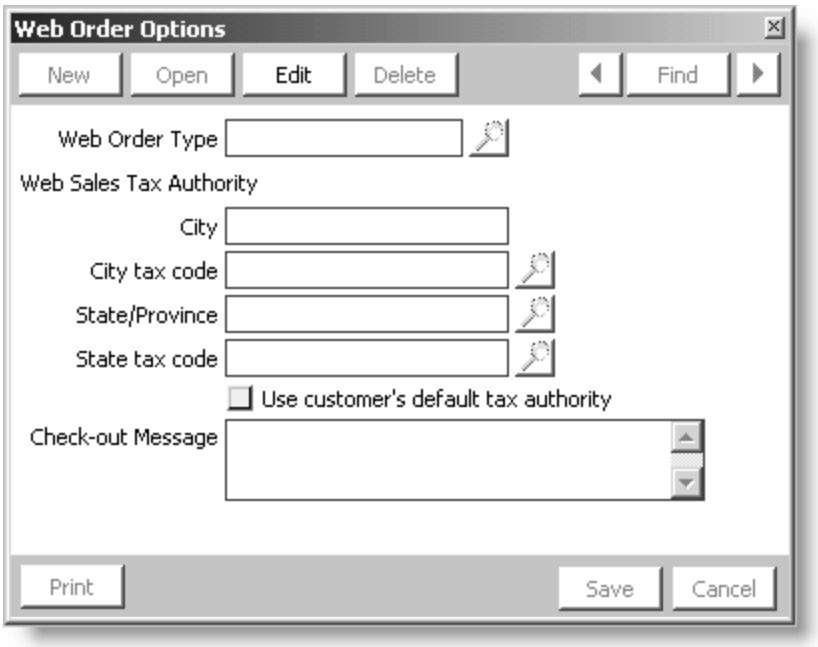
To define inventory options

1. From Orders, select Set up module to open the Set up module window.
2. Click Inventory to open the Inventory System Setup window.
3. Click Edit.
4. Enable the applicable Inventory Options.
5. Enter the Default Accounts.
6. Click Save.

Defining web order options

iMIS allows you to define default order types, tax authority, and tax codes for orders placed over the Web.

Web Order Options window



From Orders, select Set up module, and click Web

Web Order Type

Enter the default order type for orders placed over the Web. Select the Find icon to look up an order type; order types are defined on the Set up order types window (from Orders, select Set up tables > Order types).

All orders placed over the Web are entered initially as pro forma (PF) orders, allowing you to verify both customer and order information. After verification, you can convert and process an order through its appropriate order processing stages.

Web Sales Tax Authority

The Web Sales Tax Authority options allow you to define the tax codes for orders placed over the Web. If the customer's ship to address (city and/or state) match the ones entered in the Web Sales Tax Authority or the State's tax authority in the Web setup in iMIS, the web view shows the calculated taxes. If these settings do not match, no taxes are assessed. The logic behind this is that you are assessed taxes if the organization you are ordering from is located in the same city and/or state.

- City - Enter the city from where you want to generate your Web orders.
- City tax code - Enter the tax code for the city or municipality entered in the City field if taxes are applicable. Tax codes are defined on the Set up tax codes window (from Orders, select Set up tables > Tax codes).
- State/Province - Enter the state from where you want to generate your Web orders. State/Province codes are defined on the State/province codes window (from Customers, select Set up tables > State/province codes).
- State tax code - Enter the tax code for the state or province entered in the State/Province field. Tax codes are defined on the Set up tax codes window (from Orders, select Set up tables > Tax codes).

Note: You must enter a tax authority and a tax code for taxes to be calculated and applied. For example, if you specify a State/Province but no State tax code, no tax is calculated.

Use customer's default tax authority

The Use customer's default tax authority option displays on the Web Order Options window only when the selected Taxation Method is set to Default on the Organization Names window.

Note: If the Canadian or VAT taxation method is enabled, the Use customer's default tax authority option is not displayed.

Check-out Message

Enter the message you want to display on your order checkout page.

To define web order options

1. From Orders, select Set up module to open the Set up module window.
2. Click Web to open the Web Order Options window.
3. Enter PF for the default Web Order Type.

   Note: The pro forma order type (PF) is required.
4. Define your Web Sales Tax Authority options by entering both a tax authority and a tax code.
5. (optional) Enable the Use customer's default tax authority option.
6. Enter the Check-out Message you want to display on your order checkout page.
7. Click Save.

Using a customer's default tax authority

The Use customer's default tax authority option is on the Web order options window (Orders > Set up module > Web). A tax authority and a tax code must be specified in the Web order options window for taxes to be calculated and applied.

When Enabled

When Use customer's default tax authority is enabled, iMIS automatically calculates taxes, for product orders placed over the web, based on the customer's Default Tax code. The Default Tax code is defined on the Financial tab of the Manage customers window (Customers > Manage customers > Financial tab).

If a Default Tax code is not defined for the customer, the Public view uses the city's tax authority when the Ship to city and state match, or the state's tax authority when only the Ship to state matches.

When Disabled

When Use customer's default tax authority is disabled, the Public view uses the city's tax authority when the Ship to city and state match, or the state's tax authority when only the Ship to state matches.

Note: If there is no match for Ship to city or Ship to state and/or the tax authority is unassigned, no tax is applied.

When using Canadian or VAT taxation methods

The Use customer's default tax authority option displays on the Web order options window only when the Taxation Method is set to Default on the Organization Names window (File > System Setup > Organization Names).

If the Taxation Method is set to Canadian or VAT, the Use customer's default tax authority option will not display.

Orders References

In the iMIS Importers and Exporters section, see Orders Importer.

Product status codes

You can assign status codes to your products that provide additional flexibility for managing, maintaining, and controlling your products and product availability. In addition,

Upsell/Cross-sell/Replacement product functionality is dependent on the status codes you define for your products.

When you save an order, iMIS verifies each ordered product's status and available inventory to ensure fulfillment of the order. Only orders for products with an Active status (or an Out of Production status with sufficient inventory) can be saved.

Assigning status codes to products

The default status for all new products is Active, and you can assign the following status codes to your products at any time during a product's life cycle:

- Active (A)
- Inactive (I)
- Mark for Deletion (D)
- Not Available (N)
- Out of Production (O)

Active products

The default status for all new products is Active. Active products are always available for sale to your customers except during periodic fluctuations in inventory. When an Active product has insufficient inventory in stock to fill an order, the product is backordered until sufficient inventory exists for delivery.

Order Entry Cases - During order entry, Active products have the following functional characteristics:

- Can be ordered when the number of products in inventory is greater than or equal to zero.
- Cause the creation of backorders when the order quantity exceeds the number of products in inventory.
- Display on the Product Find window when returned from a product search.
- Cause the Opportunities window to open when you Tab out of the Product field (if Upsell and/or Cross-sell items are designated for the product):

- Allow the substitution of Upsell items (if designated).
- Allow the addition of Upsell and Cross-sell items (if designated).

Inactive products

Products that have an Inactive status are temporarily unavailable for sale to your customers. However, you still can maintain inventory for an Inactive product.

Possible reasons for assigning an Inactive status to a product include an interruption of supply (for example, a supplier has gone out of business, or the product is part of an embargoed shipment), you are awaiting regulatory approval to sell the product, or the product is a seasonal item.

Order Entry Cases - During order entry, Inactive products have the following functional characteristics:

- Cannot be ordered regardless of the inventory level.
- Do not display on the Product Find window when searching for products.
- Cause the Product field to clear and the Product Find window to open when you Tab out of the Product field.
- Do not allow the Opportunities window to open (regardless of whether Upsell/Cross-sell/Replacement items are designated for the product):
- Do not allow the substitution of Upsell/Replacement items (if designated).
- Do not allow the addition of Cross-sell items (if designated).

Products marked for deletion

Products that have a status of Mark for Deletion are no longer available for sale to your customers, and the inventory has been sold, returned, or destroyed. Reasons to keep products that have a Mark for Deletion status in your system are for historical reporting and to prevent reusing a previously assigned product code.

Products with a Mark for Deletion status have the same functional characteristics as Inactive products. No Replacement item should be designated for a product that has a status of Mark for Deletion.

Products that are Not Available

Products that have a status of Not Available are no longer available for sale to your customers and can include discontinued and recalled items. The entire product inventory has been sold, returned, or destroyed.

The primary reason to keep Not Available products in your system is for identifying Replacement items when customers request an unavailable or discontinued product (requires designating at least one Replacement item for the product). You cannot save orders for products that have a status of Not Available, but customers can order Replacement items.

Order Entry Cases - During order entry, Not Available products have the following functional characteristics:

- Cannot be ordered regardless of inventory level.
- Display on the Product Find window when searching for products.
- Cause the Product field to clear when you Tab out of the Product field.
- Cause the Opportunities window to open when you Tab out of the Product field (if Upsell and/or Replacement items are designated for the product). You then are required to do one of the following:
- Select an Upsell or Replacement item (if designated) to replace the entire number of units ordered.
- Enter another Product code.

Products that are Out of Production

Products that have an Out of Production status cannot be reordered from suppliers and are available for sale to your customers only up to the current inventory level. You can sell an Out of Production product only if the product's quantity-on-hand is greater than zero.

Once you deplete an Out of Production product's current inventory, iMIS treats any additional sales of the product as if the product's status is Not Available.

Order Entry Cases - During order entry, Out of Production products have the following functional characteristics:

- Can be ordered only when the number of products in inventory is greater than zero.
- Display on the Product Find window when returned from a product search.
- Can be replaced with Upsell items (if designated).
- Allow the addition of Upsell and Cross-sell items (if designated).
- Cause the Opportunities window to open when you Tab out of the Product field (if Upsell and/or Cross-sell items are designated for the product):
- Allow the substitution of Upsell items (if designated).
- Allow the addition of Upsell and Cross-sell items (if designated).
- Cause the Opportunities window to open if the order Quantity exceeds the quantity available in inventory. You then must do one of the following:
- Select an Upsell or Replacement item for the entire number of units ordered (the order Quantity remains unchanged).
- Select an Upsell or Replacement item to replace the units ordered in excess of the available inventory:
- The Out of Production product's order Quantity updates to reflect the maximum quantity available in inventory.
- A new line item is added for the Upsell or Replacement item, and the new item's order Quantity equals the difference between the Out of Production product's original order Quantity and the available inventory.
- The Opportunities window closes.
- Click Close on the Opportunities window to update the Out of Production product's order Quantity to equal the number of units available in inventory.

Changing product status codes

Changes to product status codes are not retroactive, and existing orders are not affected by product status changes. When editing an order on the Overview tab of the Enter and edit orders window, if you tab out of the Product field without changing the product code, iMIS does not re-verify the status of the product code. However, if a product code is changed, iMIS does verify the new product's status according to the verification requirements for entering orders.

Changing an active product's status

The default status code for all products is Active, and you can change a product's status code any time during the product's life cycle. Changes to product status codes are not retroactive and do not affect existing orders.

Depending on a product's original status, additional restrictions may apply when changing status codes if the product also is one of the following:

- Kit
- Kit component
- Upsell/Cross-sell item for another product
- Replacement item for another product

Note: Kit components are required to have an Active status if the parent kit product's status also is Active, and you must remove a product from all Active kits before changing its status.

Note: Changing the status of a kit component does not flow down to the component's parent kit. However, when a parent kit product's status is changed, you can change the status of all of the kit components as long as the components do not belong to other kits.

Active >> Inactive

Once you change a product's status from Active >> Inactive, the product is no longer available for sale to customers, and iMIS does not return the product from searches during order entry.

Additional restrictions apply when changing a product's status from Active >> Inactive if the product also is a kit, kit component, Upsell/Cross-sell item, or Replacement item.

Active >> Mark for Deletion

Once you change a product's status from Active >> Mark for Deletion, the product is no longer available for sale to customers, and iMIS does not return the product from searches during order entry.

If any of the following conditions are true when changing a product's status from Active >> Mark for Deletion, an error will display, the status change will fail, and iMIS will reset the product's status to Active:

- The product has pending inventory transactions.
- The product has inventory in stock.
- The product has entries in the Product_Price table.

Additional restrictions apply when changing a product's status from Active >> Mark for Deletion if the product also is a kit, kit component, Upsell/Cross-sell item, or Replacement item.

Active >> Not Available

To change a product's status from Active >> Not Available, you first must designate a Replacement item for the product on the Upsell/Replace window. Only if you designate a Replacement item for the product can you change the product's status from Active >> Not Available.

Additional restrictions apply when changing a product's status from Active >> Not Available if the product also is a kit, kit component, Upsell/Cross-sell item, or Replacement item.

Active >> Out of Production

To change a product's status from Active >> Out of Production, you first must designate a Replacement item for the product on the Upsell/Replace window. Only if you designate a

Replacement item for the product can you change the product's status from Active >> Out of Production.

Once you change a product's status from Active >> Out of Production and deplete the product's current inventory, iMIS treats additional sales of the product as if the product's status is Not Available.

Additional restrictions apply when changing a product's status from Active >> Out of Production if the product also is a kit, kit component, Upsell/Cross-sell item, or Replacement item.

Additional Restrictions

Additional restrictions apply when changing a product's status from Active >> Inactive, Mark for Deletion, Not Available, or Out of Production if the product also is one of the following:

Kit (Active >> All) - If a product with an Active status is a kit, iMIS prompts you to select either Yes or No to change the status of all kit components:

- Yes - iMIS verifies whether each component is part of another kit:
- True - If a component is part of another kit, then iMIS does not change that component's status.
- False - If a component is not part of another kit, then iMIS changes that component's status.
- No - iMIS changes only the product kit's status and does not change the status of the kit components.

Kit component (Active >> All) - Only products with an Active status can be components of kits with an Active status. To change an Active component's status when the parent kit's status is Active, you first must remove the component from the kit.

Upsell/Cross-sell item (Active >> All) - If a product with an Active status is an Upsell/Cross-sell item for other products (or has Upsell/Cross-sell items assigned to it),

iMIS deletes the relationships from the appropriate tables when you change the product's status.

Replacement item (Active >> Inactive, Not Available, and Out of Production) - If a product with an Active status is a Replacement item for other products, iMIS deletes the relationships from the appropriate tables when you change the product's status. Relationships for this product's Replacement items are not affected.

Replacement item (Active >> Mark for Deletion) - If a product with an Active status is a Replacement item for other products (or has a Replacement item designated for it), iMIS deletes the relationships from the appropriate tables when you change the product's status from Active to Mark for Deletion.

Changing an Inactive, Not Available, or Out of Production product's status

The following rules apply when changing an Inactive, Not Available, or Out of Production product's status:

Inactive, Not Available, or Out of Production >> Active, Not Available, or Out of Production

Unless the product is a kit, no restrictions exist for changing a product's status from Inactive, Not Available, or Out of Production to Active, Not Available, or Out of Production.

Not Available or Out of Production >> Inactive

Once you change a product's status from Not Available or Out of Production to Inactive, the product is no longer available for sale to customers, and iMIS does not return the product from searches during order entry.

Additional restrictions apply if the product also is a kit.

Inactive, Not Available, or Out of Production >> Mark for Deletion

Once you change a product's status from Inactive, Not Available, or Out of Production >> Mark for Deletion, the product is no longer available for sale to customers, and iMIS does not return the product from searches during order entry.

If any of the following conditions are true when changing a product's status from Inactive, Not Available, or Out of Production >> Mark for Deletion, an error will display, the status change will fail, and iMIS will reset the product to its original status:

- The product has pending inventory transactions.
- The product has inventory in stock.
- The product has entries in the Product_Price table.

Additional restrictions apply if the product also is a kit or Replacement item.

Additional restrictions

Additional restrictions apply when changing an Inactive, Not Available, or Out of Production product's status if the product also is one of the following:

Kit (Inactive, Not Available, or Out of Production >> Active) - If a product with an Inactive, Not Available, or Out of Production status is a kit, iMIS prompts you to select either Yes or No to change the status of all kit components:

- Yes - The status of the kit and all kit components changes.
- No - The status change fails; all kit components must have an Active status.

Kit (Inactive, Not Available, or Out of Production >> Inactive, Mark for Deletion, Not Available, or Out of Production) - If a product with an Inactive, Not Available, or Out of Production status is a kit, iMIS prompts you to select either Yes or No to change the status of all kit components:

- Yes - iMIS verifies whether each component's status equals the original, unchanged status of the parent kit:
- True - iMIS then verifies whether the component also is a component of another kit:
- True - iMIS does not change the component's status.

False - iMIS changes the component's status to equal the status of the parent kit.

- False - iMIS does not change the component's status.
- No - iMIS changes only the product kit's status and does not change the status of the kit components.

  Replacement Item (Inactive, Not Available, or Out of Production >> Mark for Deletion) - If a product with an Inactive, Not Available, or Out of Production status has a Replacement item designated for it, iMIS deletes the relationship from the appropriate table when you change the product's status to Mark for Deletion.

Verifying a product's status during order entry

When entering and editing orders, iMIS verifies a product's status each time you Tab out of the Product field. Whether iMIS opens the Opportunities window at this stage of the order entry process depends on the product's status.

Inactive or Mark for Deletion

If a product's status is Inactive or Mark for Deletion, iMIS does the following:

- Clears the Product field.
- Displays a message at the bottom of the screen, “Product-code is not available”.
- Opens the Product Find window.

Not Available or Out of Production (no inventory is available)

If a product's status is Not Available or Out of Production, and no inventory is available, the availability of Upsell and Replacement items determines whether iMIS opens the Opportunities window:

No Upsell or Replacement items are available - If no Upsell or Replacement items are available for the product, iMIS does the following:

- Clears the Product field (cursor remains in the field)
- Displays a message at the bottom of the screen (the message displayed depends on the product's status):
- Out of Production - “Product-code is out of production and no replacement product is

available."

- Not Available - "Product-code is not available and no Replacement Product is available."

  Upsell or Replacement items are available - If Upsell or Replacement items are available for the product, iMIS does the following:

- Clears the Product field (cursor remains in the field).
- Opens the Opportunities window listing all available Upsell and Replacement opportunities (the Replace button enables).
- Displays a message at the bottom of the Opportunities window, "Product-code is not available. Please select a replacement product, or click Close."

  If you click Replace, iMIS does the following:

- Updates the original product's line item with the Upsell or Replacement item's data.
- Recalculates the order's discounts, taxes, and prices to reflect the Upsell or Replacement item's data.
- Refreshes the Opportunities window with the Upsell or Replacement item's available opportunities.
- Refreshes each line item's Opportunities indicator.

Active or Out of Production (inventory is available)

If inventory is available for an Active or Out of Production product, and Upsell, Cross-sell, or Replacement opportunities exist, iMIS opens the Opportunities window, listing all available Upsell, Cross-sell, and Replacement opportunities.

The Replace and Add buttons enable for Upsell and Replacement opportunities, and the Add button enables for Cross-sell opportunities:

If you click Add, iMIS does the following:

- Adds a new line item for the selected Upsell, Cross-sell, or Replacement item with the Qty set to zero.

- Refreshes the Opportunities window (the item added to the order is removed from the window).
- Refreshes each line item's Opportunities indicator.
- Maintains focus on the first line item (the initial product ordered) until all Upsell, Cross-sell, and Replacement opportunities have been exhausted.

If you click Replace, iMIS does the following:

- Updates the original product's line item with the Upsell or Replacement item's data.
- Refreshes the Opportunities window with the Upsell or Replacement item's existing opportunities.
- Recalculates the order's discounts, taxes, and prices to reflect the Upsell or Replacement item's data.
- Refreshes each line item's Opportunities indicator.
- Maintains focus on the first line item (the original Replacement item) until all Upsell, Cross-sell, and Replacement opportunities have been exhausted.

Verifying a Product's Available Inventory during Order Entry

When entering and editing orders, iMIS verifies a product's available inventory each time you Tab out of the Qty field. Whether iMIS opens the Opportunities window at this stage of the order entry process depends on the product's status.

Active

If a product's status is Active, and you enter a Qty that is greater than the quantity available in inventory, backorder processing occurs as in previous versions of iMIS.

Out of Production

If a product's status is Out of Production, and you enter a Qty that is greater than the product quantity available in inventory, iMIS does the following:

- Resets the Qty field to equal the product's total quantity available in inventory.
- Verifies whether Upsell or Replacement items are available for the product:

No Upsell or Replacement items are available - iMIS displays a message at the bottom of the Overview tab, “Only x remaining and no Replacement Product is available.”

Upsell or Replacement items are available - iMIS opens the Opportunities window listing all available Upsell and Replacement opportunities (the Add and Replace buttons enable), and a message displays at the bottom of the Opportunities window, “Insufficient inventory. Replace the item, or click Add to replace the unavailable x units.”

If you click Add, iMIS does the following:

- Adds a new line item for the Upsell, Cross-sell, or Replacement item with the Qty equal to the difference between the original quantity ordered and the quantity available in inventory.
- Refreshes the Opportunities window (the added item is removed from the window).
- Refreshes each line item's Opportunities indicator.

If you click Replace, iMIS does the following:

- Updates the original product's line item data with the Upsell or Replacement item's data.
- Resets the Qty ordered to equal the quantity originally ordered.
- Recalculates the order's discounts, taxes, and prices to reflect the Upsell or Replacement item's data.
- Refreshes the Opportunities window with the Upsell or Replacement item's existing opportunities.
- Refreshes each line item's Opportunities indicator.

Summarizing product status codes and upsell/cross-sell/replacement items

The combination of product status codes, available inventory, and linked product type designations affect the behavior of the Enter and edit orders window when you tab away from the Product field or when you enter an order Qty that is greater than the available inventory. The behavior of the Opportunities window is also affected.

- product status codes are set at the Manage products window.
- available inventory is set at various windows:
- stock item quantities are set at inventory or warehouse windows.
- non-stock items are designated at the Manage products window.
- linked product type designations are set at the Upsell/Replace window.

After entering a product code and tabbing away from the Product field

If the product status = Not Available (N) and the available inventory = none/any/non-stock:

- If there are no linked Upsell or Replacement items, nothing happens.
- If there are linked Upsell or Replacement items:
- The Product field is cleared.
- The Opportunities window opens:
- A message informs you that the specified product code is not available, advising you to instead select an alternative product.
- The Replace button is enabled.
- The linked Upsell and Replacement items are listed.

If the product status = Out of Production (O) and the available inventory = none:

- If there are no linked Upsell or Replacement items, nothing happens.
- If there are linked Upsell or Replacement items:
- The Product field is cleared.
- The Opportunities window opens:
- A message informs you that the specified product code is not available, advising you to instead select an alternative product.

- The Replace button is enabled.
- The linked Upsell and Replacement items are listed.

If the product status = Out of Production (O) and the available inventory = any/non-stock:

- If there are no linked Upsell or Cross-sell items, nothing happens.
- If there are linked Upsell or Cross-sell items:
- The Opportunities window opens:
- The Add button is enabled.
- The Replace button is enabled if there are linked Upsell items.
- The linked Upsell and Cross-sell items are listed.

If the product status = Active (A) and the available inventory = none/any/non-stock:

- If there are no linked Upsell or Cross-sell items, nothing happens.
- If there are linked Upsell or Cross-sell items:
- The Opportunities window opens:
- The Add button is enabled.
- The Replace button is enabled if there are linked Upsell items.
- The linked Upsell and Cross-sell items are listed.

Note: Linked Replacement items are ignored for products with an Active status because these products generate backorders.

After entering an order Qty that is greater than the available inventory

If the product status = Out of Production (O) and the available inventory = partial:

- If there are no linked Upsell or Replacement items, nothing happens.
- If there are linked Upsell or Replacement items:
- The Qty field resets from the value ordered to the value available.

- The Opportunities window opens:
- A message informs you that there is insufficient inventory for the specified product code, advising you to instead select an alternative product or to click Add to replace the unavailable number of units.
- The Add button is enabled.
- The Replace button is enabled.
- The linked Upsell and Replacement items are listed.

Product search results filter by status

Be aware that the products returned from searches vary according to product status and the window from which the search is performed. That is, windows only locate products of status appropriate to the window's purpose:

Enter and edit orders window	>>	A, O, and N
Enter and edit receipts and adjustments window	>>	A, O, and I
Kitting window	>>	A and Status of parent kit
Upsell/Replace window	>>	A
Upsell/Cross-sell window	>>	A

Orders accounting business rules

Understanding cash handling in orders

iMIS Orders processes order payments in different ways. How Orders processes an order payment depends on whether the payment is by check/cash or credit card and on which options you have enabled through the AR/Cash Set up module window.

Cash and check payments

When you apply a payment of cash or check to an order, iMIS immediately recognizes the payment when the order is entered. A debit to the appropriate cash account is created, and a credit is made to the Prepaid account defined on the AR/Cash Default Accounts

window (from AR/Cash, select Set up module, and click Default Accounts). Cash and check payments usually are deposited promptly and are considered “Cash on Hand.” When you subsequently invoice the order, the prepaid account is debited, and the income account specified for the product is credited.

Credit card payments

How iMIS processes orders with credit card payments depends on whether the Recognize Credit Card Order Payments as Prepaid Cash option on the AR/Cash Set up module window is enabled or disabled:

Option disabled

When you apply a credit card payment to an order, iMIS follows the policy dictated by most credit card companies, which is not to submit payment until the order has been shipped. In compliance with this policy, iMIS recognizes a credit card payment at the time an order is invoiced. If you are using batch control, this payment is recognized in the batch that was open during order entry.

To prevent credit card payments from posting to previously closed batches, enable the Create New Batch for Invoicing option on the Order Status Defaults window. When you enable this option, a new batch is created automatically for the entries generated by the invoicing process. This new batch will be numbered using the date method, such as 020726-1, and will be marked as ready for posting. It will appear on the Manage batches window (from AR/Cash, select Manage batches), and you must post the batch from there.

When processing orders with credit card payments on the Payments tab of the Enter and edit orders window, you can enter a payment amount in the Payment Amount field or leave the field blank. If you enter a credit card code in the Check #/CC field and leave the Payment Amount field blank, iMIS will make the cash amount equal to the invoice amount at the time the order is invoiced. If a payment amount is entered in the Payment Amount field, iMIS will apply this payment against the invoiced amount. In the event of over- or underpayments, iMIS will create the appropriate accounts receivable entries.

Option enabled

When you apply a credit card payment to an order, iMIS treats the payment as a cash payment and immediately recognizes the payment when the order is entered. A debit to the appropriate cash account is created, and a credit is applied to the Prepaid account defined on the AR/Cash Default Accounts window (from AR/Cash, select Set up module, and click Default Accounts). When you subsequently invoice the order, the prepaid account is debited, and the income account specified for the product is credited.

Note: If you are processing orders in iMIS, you must populate the default Transfer/Clearing and Prepaid accounts on the AR/Cash Default Accounts window.

Back orders and batch control

When you enable the Create New Batch for Invoicing option on the Order Status Defaults window, a new batch is created automatically for each invoicing run. If you do not enable this option, transactions that are created when you invoice will be included in the batch in which the order was originally entered.

Note: Invoices are not added to batches that have a status of Ready or Posted. Instead, a new batch is created automatically and iMIS displays a message informing you that a new batch was created for those invoices whose original order batch is no longer available.

One of the most common reasons for enabling the Create New Batch for Invoicing option is managing backorders. For example, if you enter and invoice an order in January that includes a backordered product that will not be available until March, the March invoice transaction for the backorder will be in the original January batch. However, if you enable the Create New Batch for Invoicing option, the new transaction generated by the backorder will be included in a new batch that is created when the backorder is invoiced in March.

Understanding order accounting entries

The following is a list of typical order transactions with explanations of how they affect accounting entries throughout iMIS.

If Enable Multi-Warehouses is enabled on the Inventory System Setup window, warehouse will be an applicable GL account level for some entries.

Note: Orders does not look to AR/Cash for an Income account. If an Income account is not defined within the product's account hierarchy, then no Income account exists, and no Income account will be credited when an order for the product is invoiced.

Enter an order for a stock item without a payment	No transactions created	No transactions created
Invoice an order for a stock item without payment	The Accounts Receivable account defined on the AR/Cash Default Accounts window	The first non-blank Income account defined at the warehouse, product, category, or inventory system setup level
	The Cost of Goods Sold account specified at the warehouse, product, category, or inventory system setup level	The Inventory account specified at the warehouse, product, category, or inventory system setup level
Enter an order for a non- stock product with a non- credit card cash payment	The cash account defined for the batch, or the default cash account if no account is defined for the batch	The Prepaid account defined on the AR/Cash Default Accounts window
Invoice an order for a non-stock product with a non-credit card cash payment	The Prepaid account defined on the AR/Cash Default Accounts window	The Transfer/Clearing account defined on the AR/Cash Default Accounts window
	The Transfer/Clearing account defined on the AR/Cash Default Accounts window	The Income account specified at the warehouse, product, category, or inventory system setup level
Enter an order for a stock item	No transaction created	No transaction created

with a credit card payment (Recognize Credit Card Order Payments as Prepaid Cash option disabled)		
Invoice an order for a stock item with a credit card payment (Recognize Credit Card Order Payments as Prepaid Cash option disabled)	The cash account specified for the credit card or, if blank, the cash account associated with the original order entry batch	The Income account specified at the warehouse, product, category, or inventory system setup level
	The Cost of Goods Sold account specified at the warehouse, product, category, or inventory system setup level	The Inventory account specified at the warehouse, product, category, or inventory system setup level
Enter an order for a stock item with a credit card payment (Recognize Credit Card Order Payments as Prepaid Cash option enabled)	The cash account specified for the credit card or, if blank, the cash account associated with the batch	The Prepaid account defined on the AR/Cash Default Accounts window
Invoice an order for a stock item with a credit card payment (Recognize Credit Card Order Payments as Prepaid Cash enabled)	The Prepaid account defined on the AR/Cash Default Accounts window	The Transfer/Clearing account defined on the AR/Cash Default Accounts window
	The Transfer/Clearing account defined on the AR/Cash Default Accounts window	The Income account specified at the warehouse, product, category, or inventory system setup level
	The Cost of Goods Sold	The Inventory account spe-

	account specified at the warehouse, product, category, or inventory system setup level	cified at the warehouse, product, category, or inventory system setup level
Post a receipt for a stock inventory item	No transaction recorded	No transaction recorded
Post an inventory adjustment to reduce inventory	The Adjustments account specified at the warehouse, product, category, or inventory system setup level	The Inventory account specified at the warehouse, product, category, or inventory system setup level
Post an inventory adjustment to increase inventory	The Inventory account specified at the warehouse, product, category, or inventory system setup level	The Adjustments account specified at the warehouse, product, category, or inventory system setup level
Cancel an order that contains a recognized cash payment	The Prepaid account defined on the AR/Cash Default Accounts window	The Accounts Receivable account defined on the AR/Cash Default Accounts window
Cancel an order without payment	No transactions	No transactions
Enter a credit memo against an order for a previously invoiced non-stock item (or a credit memo that does not affect inventory)	No transaction	No transaction
Invoice a credit memo against an order for a previously invoiced non-stock item (or a	The Income account specified at the warehouse, product, category, or invent-	The Accounts Receivable account defined on the AR/Cash Default

credit memo that does not affect inventory)	ory system setup level	Accounts window
Enter a credit memo against an order for a previously invoiced stock item	No transaction	No transaction
Invoice a credit memo against an order for a previously invoiced stock item	The Income account specified at the warehouse, product, category, or inventory system setup level	The Accounts Receivable account defined on the AR/Cash Default Accounts window
	The Inventory account specified at the warehouse, product, category, or inventory system setup level	The Cost of Goods Sold account specified at the warehouse, product, category, or inventory system setup level

Understanding order inventory transactions

The following is a list of order entry transactions and how they affect inventory. This sample assumes that all transactions are processed one at a time for the same product.

If the Enable Multi-Warehouses option is enabled on the Inventory System Setup window, each transaction affects a product's inventory at each individual warehouse location.

Receive 10 items into inventory	10			10
Enter an order for 2 items	10	2	2	8
Invoice an order for 2 items	8	0	0	8
Enter an order for 10 items	8	10	8	-2
Invoice the partially shippable order prior to receiving more inventory	0	2	0	-2

Receive 5 items into inventory (which will release the backorder)	5	2	2	3
Invoice the backorder	3	0	0	3
Enter a credit memo (which affects inventory) for 1 returned item	3	0	0	3
Invoice the credit memo for the 1 returned item	4	0	0	4
Enter a positive inventory adjustment for 1 item, and post	5	0	0	5
Enter a negative inventory adjustment for 1 item, and post	4	0	0	4

Understanding product account hierarchy

When an order is invoiced, the transaction credits the appropriate Income account. If the Generate Cost of Goods Sold option is enabled on the Inventory System Setup window, the transaction also credits the Inventory account and debits the Cost of Goods Sold account. However, which accounts actually are affected by a transaction depend on product account hierarchy.

Note: Orders does not look to AR/Cash for an Income account. If an Income account is not defined within the product's account hierarchy, then no Income account exists, and no Income account will be credited when an order for the product is invoiced.

Factors determining a product's account hierarchy

- Product Type - Is a product a stock item, non-stock item, or product kit?
- Inventory Method - Is standard product inventory used, or are products stored in multiple warehouses?
- Account Data - Accounts can be defined for products on the following windows:

- Warehouses window - Multi-Warehouses only - (from Orders, select Manage inventory > Manage products, select from Current Products, and click Warehouses)
- Accounting window (from Orders, select Manage inventory > Manage products, select from Current Products, and click Accounting)
- Set up product categories window (from Orders, select Set up tables > Product categories)
- Inventory System Setup window (from Orders, select Set up module, and click Inventory)

Standard inventory

The following tables display the product account hierarchy that determines which account information is used when orders are invoiced. In determining account hierarchy, specific accounts take precedent over general accounts; accounts at the product level supersede accounts at the category and system level.

For example, if accounts are defined for a stock item at the product level, those accounts will be used when orders are invoiced. If no accounts are defined at the product level, iMIS will use the accounts defined at the category or system level.

In the following tables, order of significance is indicated numerically, the lower the number, the greater the significance. Depending on whether a product is a stock item, non-stock item, or product kit, some accounts may not be applicable; an X indicates a non-applicable account.

Note: iMIS Orders does not look to AR/Cash for an Income account. If an Income account is not defined within the product's account hierarchy, then no Income account exists, and no Income account will be credited when an order for the product is invoiced.

Stock item

Income	1	2	3
Inventory	1	2	3
Cost of Goods Sold	1	2	3

Non-stock item

Income	1	2	3
Inventory	X	X	X
Cost of Goods Sold	X	X	X

Product kit

Since product kits consist of multiple products and are treated as single, non-stock units, iMIS uses the inventory account numbers for the individual products that make up a kit.

Income	1	2	3
Inventory	X	X	X
Cost of Goods Sold	X	1	2

Multiple warehouses

The following tables display the product account hierarchy that determines which account information is used when orders are invoiced. In determining account hierarchy, specific accounts take precedent over general accounts; accounts at the warehouse level supersede accounts at the product, category, and system levels.

For example, if accounts are defined for a stock item at the warehouse level, those accounts will be used when orders are invoiced. If no accounts are defined at the warehouse level, iMIS will use the accounts defined at the product level. If no accounts are defined at the product level, iMIS will use the accounts defined at the category or system level.

In the following tables, order of significance is indicated numerically, the lower the number, the greater the significance. Depending on whether a product is a stock item, non-stock item, or product kit, some accounts may not be applicable; an X indicates a non-applicable account.

Note: iMIS Orders does not look to AR/Cash for an Income account. If an Income account is not defined within the product's account hierarchy, then no Income account exists, and no Income account will be credited when an order for the product is invoiced.

Stock item

Income	1	2	3	4
Inventory	1	2	3	4
Cost of Goods Sold	1	2	3	4

Non-stock item

Income	X	1	2	3
Inventory	X	X	X	X
Cost of Goods Sold	X	X	X	X

Product kit

Since product kits consist of multiple products and are treated as single units, iMIS uses the inventory account numbers for the individual products that make up a kit.

Income	X	1	2	3
Inventory	X	X	X	X
Cost of Goods Sold	X	1	2	3

Understanding inventory accounting transactions

Accounting transactions are dependent on your method of inventory storage.

Standard inventory transactions

The following accounting transactions are created when an inventory transaction is posted:

Receipt

Accounting transactions are not created in iMIS when product inventory receipts are posted. Typically, accounting transactions occur when inventory invoices are processed through your accounting software, which affects the General Ledger account.

Inventory adjustment

Unlike product inventory receipts, product inventory adjustments create accounting transactions if the Cost of Goods Sold option is enabled on the Inventory System Setup window. Inventory adjustments create accounting transactions that affect both Inventory and Adjustments accounts. For example, an inventory adjustment that reduces a product's inventory will credit the Income account and debit the Adjustments account.

Account hierarchy determines which specific Income and Adjustments accounts are affected by inventory adjustments.

Note: If you are using batch control, be sure to open the appropriate batch before posting inventory adjustments.

Multiple warehouse inventory transactions

The following accounting transactions are created when a multiple warehouse inventory transaction is posted:

Receipt

Accounting transactions are not created when inventory receipts are posted for a product's warehouse. However, accounting transactions are created for a warehouse's inventory receipts when inventory invoices are processed through AR/Cash or a check is written that affects the General Ledger account.

Inventory adjustment

Unlike product inventory receipts, inventory adjustments for product warehouses create accounting transactions if the Cost of Goods Sold option is enabled on the Inventory System Setup window.

If accounts are defined at the warehouse level, inventory adjustments create accounting transactions that affect a warehouse's Inventory and Adjustments accounts. For example, an inventory adjustment that reduces a warehouse's inventory will credit the warehouse's Inventory account and debit the warehouse's Adjustments account.

Account hierarchy determines which specific Income and Adjustments accounts are affected by inventory adjustments.

Note: If you are using batch control, be sure to open the appropriate batch before posting inventory adjustments.

Transfer

Warehouse transfers generate accounting transactions if the Cost of Goods Sold option is enabled on the Inventory System Setup window.

If Inventory accounts are defined at the warehouse level, inventory transfers create accounting transactions that affect both warehouses' Inventory accounts. For example, an inventory transfer credits the Inventory account of the From Warehouse and debits the Inventory account of the To Warehouse.

If Inventory accounts are not defined at the warehouse level, inventory transfers do not generate noticeable accounting transactions.

Account hierarchy for inventory adjustments

Since accounts can be defined on multiple windows for both Standard Inventory and Multiple Warehouses, account hierarchy determines which specific accounts are affected by inventory adjustments.

In determining account hierarchy, specific accounts take precedent over general accounts; accounts at the warehouse and product level supersede accounts at the category and system level. For example, if accounts are defined for a stock item at the product level, those accounts will be used when adjustments are posted. If no accounts

are defined at the product level, iMIS will use the accounts defined at the category or system level.

Inventory and Adjustments accounts can be defined on the following windows:

- Warehouses window - Multi-Warehouses only - (from Orders, select Manage inventory > Manage products, select from Current Products, and click Warehouses)
- Accounting window (from Orders, select Manage inventory > Manage products, select from Current Products, and click Accounting)
- Set up product categories window (from Orders, select Set up tables > Product categories)
- Inventory System Setup window (from Orders, select Set up module, and click Inventory)

Standard inventory

The following table summarizes the account hierarchy iMIS uses for Standard Inventory. Order of significance is indicated numerically, the lower the number, the greater the significance.

Inventory	1	2	3
Adjustments	1	2	3

Multiple warehouses

The following table summarizes the account hierarchy iMIS uses for Multiple Warehouses. Order of significance is indicated numerically, the lower the number, the greater the significance.

Inventory	1	2	3	4
Adjustments	1	2	3	4

Understanding multiple entities and orders

When Multiple Entities is enabled on the AR/Cash Set up module window, Orders supports multiple entities at the product level. Entities are individual organizations, and iMIS can separate and process transactions for multiple entities (and multiple sets of books) even if the entities share a common customer database.

When an organization has multiple accounting entities, such as different subsidiaries and foundations, revenue from the sale of specific products often needs to be allocated to specific entities. You can define entity owners for individual products. These product-level entities then are assigned to orders, order transactions, and product-specific transactions processed through the Orders module.

Individual entities are defined in the Org Codes field on the Organization Names window (select File > System Setup, and click Organization Names).

Summary of product-level entities

- A specific hierarchy determines each product's owner entity.
- The Batch cash entity is applicable only as the cash entry owner and is not assigned as the owner entity of order or income transactions.
- The entity associated with an order's first product determines the overall owner entity of the order.
- Product-level entities are assigned to product-related accounting transactions such as income transactions, cost of goods sold transactions, and inventory transfer and adjusting entries.
- The overall order entity is assigned to invoice summary transaction lines, such as entries for Accounts Receivable and miscellaneous charges.
- Due To/Due From entries generate when an order for multiple products with differing entities is invoiced, regardless of whether the order is prepaid.
- Due To/Due From entries generate when invoicing a prepaid order for which the cash entity differs from the overall order's entity.

Determining a product's owner entity

The following hierarchy determines the entity assigned to a product and the transactions related to that product:

Multiple Entities (enabled)

- If an Entity is assigned to the product, then the entity assigned to the product-related transaction line equals the product's Entity.
- If an Entity is not assigned to the product, then the entity assigned to the product-related transaction line equals the default Orders entity assigned on the AR/Cash Set up module window.
- If the default Orders entity is not assigned, then the entity assigned to the product-related transaction line equals the default system entity (Org Code) defined on the Organization Names window.

Multiple Entities (disabled)

The entity assigned to the product-related transaction line equals the default system entity (Org Code) defined on the Organization Names window.

Assigning entities to standard orders

When a standard order is created, iMIS sets the order's overall entity equal to the entity of the first product entered in the order. Because entering a comment-only line without a product code is possible, the first line item containing a product code represents an order's first product.

This overall order's entity is referenced when processing standard orders for the following purposes:

- The order's entity determines which entity's organization name and address print on invoices when the PRINT_MULTI_ENTITY option is enabled on the Detail Report Parameters window.
- The order's entity is passed on as the overall order entity to any backorders generated after partial order fulfillment (even if the first order line has been fulfilled and is not included in the backorder).

- The order's entity is assigned as the entity to the Accounts Receivable entry when a non-prepaid (or partially prepaid) order is invoiced.
- The order's entity is assigned as the owner of the Invoice line that is created when the invoicing transaction is generated and/or its batch is posted.
- The order's entity is assigned as the entity to various miscellaneous charges connected to the invoiced order, including freight, handling, and tax.
- For a prepaid order for which the cash entity differs from the overall order's entity, the order's entity plays the role of the “Owner Entity,” resulting in a debit equal to the pre-payment to the Due From inter-company receivable account.
- When an order for multiple products with differing entities is invoiced, the order's entity takes on the liability role (similar to that of the “Cash Entity”), incurring an inter-company liability for the income amount of each secondary product that is assigned a different entity.

Assigning entities to credit memo orders and debit memo orders

The following are the rules for assigning entities to credit memo orders and debit memo orders:

- If a credit memo or debit memo order has a linked invoice number (the Invoice # field is populated on the Overview tab of the Enter and edit orders window), the order's entity always equals the entity of the original order's invoice.

  For example, A is the original order's entity, and B is the entity of the credit memo's first product line. If you populate the Invoice # field with the original order's Invoice number, the credit memo's entity will still be A (the entity of the original invoice) even though B is the entity of the first product line.

- If the order does not have a linked invoice number, the order's entity calculates according to the hierarchy defined in Assigning Entities to Standard Orders.

  As in the previous example, where B is the entity of the credit memo's first product line, the credit memo's entity will still be B.

Assigning entities during transaction generation

If Multiple Entities is enabled on the AR/Cash Set up module window, the product entity is used when generating the following accounting transactions:

- Income transactions generated by the order invoicing process
- Cost of Goods Sold and Inventory reduction transactions generated by the order invoicing process (if Generate Cost of Goods Sold is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory))
- Income adjusting transactions generated by processing credit and debit memo orders
- Inventory transfer and adjusting transactions generated by recording inventory transfers and quantity adjustments

The overall order's entity is used when generating the following accounting transactions:

- Accounts Receivable entries when non-prepaid (or partially prepaid) orders are invoiced
- Miscellaneous charge entries connected to the invoiced order, including freight, handling, and tax charges

Due To/Due From scenarios

In the following scenarios, a Due To/Due From adjusting transaction may be created automatically when an order is invoiced:

- An invoiced order contains multiple product lines with multiple entity owners

  Since an overall order or invoice must have a single entity owner, the entity owner of the first line item is designated as the order's overall owner. In this scenario, a Due To/Due From adjusting transaction generates between the main order's owner and the secondary product's owner entity.

- A prepaid order's payment is deposited to a cash account owned by an entity other than the order's overall entity

  In this scenario, a Due To/Due From adjusting transaction generates between the cash entity owner and the overall order's entity owner.

Examples of Due To/Due From scenarios

The following examples outline several Due To/Due From scenarios for entities A, B, and C. For simplicity, each entity's alphabetic designation indicates the entity's corresponding GL account numbers.

The GL accounts used in the examples are as follows:

Cash	A-1100	B-1100	C-1100
Accounts Receivable	A-1200	B-1200	C-1200
Inventory	A-1300	B-1300	C-1300
Income	A-4000	B-4000	C-4000
Cost of Goods Sold	A-5200	B-5200	C-5200

The inter-company Due To/Due From accounts are as follows:

Due From Entity A	N/A	B-1501	C-1501
Due From Entity B	A-1502	N/A	C-1502
Due From Entity C	A-1503	B-1503	N/A
Due To Entity A	N/A	B-2501	C-2501
Due To Entity B	A-2502	N/A	C-2502
Due To Entity C	A-2503	B-2503	N/A

The products and their entities are as follows:

- Product A - Unit Price of 50.00, assigned to Entity A
- Product B - Unit Price of 100.00, assigned to Entity B

Example 1

Non-prepaid order for Product A and Product B - The invoice sales transaction is as follows:

A-1200 - Accounts Receivable (Entity A) 150.00

A-4000 - Product A Sales (Entity A)		50.00
B-4000 - Product B Sales (Entity B)		100.00

Because Entity A (assigned to the first line item, Product A) receives the full debit to Accounts Receivable, Entity A incurs an inter-company liability to Entity B, which receives a credit to Income of 100.00. This sales transaction generates the following Due To/Due From entry:

B-1501 - Due From Entity A (Entity B)	100.00	
A-2502 - Due To Entity B (Entity A)		100.00

Example 2

Prepaid order for Product A for which the funds are deposited into Entity C's bank account - If the payment is processed and recorded when the order is shipped, the invoice sales transaction is as follows:

C-1100 - Cash (Entity C)	50.00	
A-4000 - Product A Sales (Entity A)		50.00

In this example, Entity A receives a credit to Income of 50.00 for the sale of Product A, while Entity C receives the debit to Cash. The inter-company Due To/Due From balancing transaction that results is as follows:

A-1503 - Due From Entity C (Entity A)	50.00	
C-2501 - Due To Entity A (Entity C)		50.00

Example 3

(This example combines the scenarios for Examples 1 and 2)

Prepaid order for Product A and Product B for which the funds are deposited into Entity C's bank account - If the payment is processed and recorded when the order is shipped, the invoice sales transaction is as follows:

C-1100 - Cash (Entity C)	150.00	
A-4000 - Product A Sales (Entity A)		50.00
B-4000 - Product B Sales (Entity B)		100.00

The Due To/Due From transaction generated from this example is similar to a combination of the two inter-company transactions generated in the earlier examples:

A-1503 - Due From Entity C (Entity A)	150.00	
A-2502 - Due To Entity B (Entity A)		100.00
C-2501 - Due To Entity A (Entity C)		150.00

Orders

Orders Overview

Orders expands on the simple order entry functionality found in AR/Cash. Orders provides you with an established and integrated tool for recording, processing, and tracking your organization's product orders. In addition to order processing, you have unprecedented control in managing your organization's products and kits, product inventory, backorders, and accounting information.

Orders allows you to perform the following tasks effectively and efficiently:

- Enter, edit, and process orders
- Find and track orders
- Define products and product prices
- Designate Upsell, Cross-sell, and Replacement items for products
- Assign entities and status codes to individual products
- Manage product inventory for either standard inventory or multiple warehouses
- Manage backorders
- Generate specific inquiries and reports
- Define order types, product categories, and tax codes
- Calculate freight charges by weight, value, and quantity
- Define default shipping methods for individual countries
- Define and configure the setup options used for customizing Orders
- Import orders from external sources
- Enable, apply, and use VAT and Canadian taxation
- Access accounting information

iMIS Orders system capabilities

iMIS Orders is easy to use and integrates with the other iMIS features, allowing you to maintain and save all of your organizational information in one database. As with all iMIS features, standard lookup is available for important fields, such as customer IDs, product codes, and tax authorities.

Order entry and processing features

iMIS Orders provides for all aspects of order processing:

- Entering and modifying data
- Ordering replacements for out-of-stock items
- Adding Upsell and Cross-sell items to orders
- Ordering products from multiple warehouses
- Canceling orders
- Conducting pre- and post-inventory inquiries
- Entering credit and debit memos
- Applying flexible pricing and both customer and product discounts
- Applying freight and handling charges
- Calculating taxes automatically, including provisions for VAT and Canadian taxes
- Processing both full and partial payments by cash, check, and credit card
- Customizing and determining the processing flow of orders through your system:
- Some orders may require generating packing slips and shipping papers
- Some orders may require only invoices

Inventory control features

iMIS Orders adds key inventory control features in several areas:

- Full Inventory Status and Reporting
- Perpetual inventory
- Reorder reports
- Inventory storage in single and multiple warehouse locations
- Receiving functions, inventory adjustments, warehouse transfers, and reporting
- Inventory Costs and Valuations - Provides two options for valuing your inventory and determining costs:
- Weighted average
- Standard cost
- Backorder Processing
- Includes an option to generate and track backorders when only partial or no shipments are available because of insufficient inventory
- Includes an option to release backorders manually or automatically when shipments arrive

Order inquiry and reporting

iMIS Orders features many built-in display and reporting capabilities:

- Shipping labels can be printed for orders having a SHIPMENT status
- Order Status reports display summaries and details of all open orders within the system
- Product reports listing orders by product, product inventory, product prices, and product sales are available
- Posted and un-posted transactions can be printed by date

Orders system integration

Orders integrates completely with the other iMIS modules:

- Customer Management
- The database maintained in Customer also serves as the database for Orders
- Individual customer activity records are created for each detailed line item, simplifying future system reporting and analysis
- Accounts Receivable and Cash Receipts
- Automatically processes, tracks, and generates accounting entries, including sales, accounts receivables, and cash receipts, when an order is entered
- Tracks and records balances owed
- Generates invoices
- General Ledger Interface

  Transactions are passed to your General Ledger package if you are licensed for the General Ledger Interface.

Benefits of order processing

The iMIS Orders feature offers many benefits when processing orders.

Cash prepayments

Cash and check prepayments are recorded immediately at order entry. These prepayments offset a prepaid order's unearned or deferred income account. Credit card prepayments, however, may or may not be recognized as prepaid cash.

If you do not enable the Recognize Credit Card Order Payments as Prepaid Cash option on the AR/Cash Set up module window (from AR/Cash, select Set up module), credit card payments are not recorded until an order is invoiced.

When you ship and generate an invoice for a prepaid order, the prepaid order entry is reversed, and the income is recognized.

Product-level entities

When Multiple Entities is enabled on the AR/Cash Set up module window, you can define an owner entity for an individual product. These product-level entities then are assigned to orders, order transactions, and product-specific transactions processed through the Orders module.

Entities are individual organizations, and iMIS can separate and process transactions for multiple entities (and multiple sets of books) even if the entities share a common customer database. Organizations having multiple accounting entities, such as different subsidiaries or foundations, then can allocate revenue to specific entities.

Upsell, cross-sell, and replacement items

When customers order products, additional items often are available that can replace, that complement, or that are superior to the products ordered initially. However, customers sometimes miss these purchasing opportunities because they are unaware that additional items are available.

With Orders, you can designate upsell, cross-sell, and replacement items for products that are readily accessible and available during order entry.

Special pricing

Special pricing allows you to set up product quantity discounts. These discounts are based on customer type and establish price breaks for a predefined number of products. For example, a single product may sell for $25, but you may drop the price to $20 if the customer purchases 10 or more items. This is similar to calculating sliding-scale rates in iMIS Billing.

You can set up special pricing for each of your products. The special pricing rules and formulas you define for your products determine a product's special price and override the product's default price. Define product special pricing on the Special Pricing window (from Orders, select Manage inventory > Manage products, select a current product, and click Pricing).

Automatic handling calculation

When the Automatic Calculation of Handling Charge option is enabled on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges), iMIS automatically computes handling charges when you enter an order.

Handling charges are calculated automatically for each order based on a number of variables, such as the percentage of the total amount shipped, the percentage of freight, and the minimum order. The option also allows you to exclude specific order types from the automatic handling calculation. You can override the automatic handling calculation at order entry.

Automatic freight calculation

When the Automatic Calculation of Freight Charge option is enabled on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges), iMIS automatically computes freight charges when you enter an order.

Freight charges compute each time an order is totaled based upon the calculation method enabled on the Add-on Charges window:

- Freight by Weight
- Freight by Total Value Ordered
- Freight by Total Quantity Ordered

You can override automatic freight calculation at order entry.

Note: Automatic calculation of Freight charges applies to all web views of iMIS.

Inventory valuation

Two methods exist for valuing your inventory: Average and Standard.

The Average inventory valuation method calculates the cost of goods sold as averaged over time. A product's average unit cost and average total inventory cost are recalculated each time you post inventory receipts, adjustments, and transfers. The average cost of an invoiced product is used when recalculating average unit and average total inventory costs.

The Standard inventory valuation method is calculated based on a fixed amount. This method gives you the ability to factor in a fixed amount for adding overhead costs to your calculation.

Order processing terms

The following terms are used frequently in iMIS Orders.

Available

Product quantity on hand less the product quantity reserved.

Backorder

Indicates that insufficient inventory is available to fill an order. Orders that cannot be filled are held in a backorder status until inventory is received.

Bin

Specific location within a warehouse where a product is stored.

Committed

Actual number of products committed to fill open orders or the number of products in inventory that are awaiting shipping. Committed products do not include backorders.

Cross-sell

To persuade a customer to purchase one or more similar items that complement the product initially chosen.

Entity

Individual organization that may have multiple subsidiaries or foundations (and multiple sets of books).

Kit

Group of products sold as an individual item.

Multi-Warehouses

Option that allows you to record and store a stock item's inventory in several different warehouse locations.

On Order

Quantity of a product on order from a vendor or supplier.

Order

Request to purchase products.

Order Processing Stages

Steps orders must go through until the orders are complete. The number and type of order processing stages an order goes through depends on the order type. Different order types require different order processing stages. Examples of order processing stages include Convert quotes, Print shipping papers, Ship orders, and Invoice orders.

Order Types

Determine how orders are processed. All orders are entered as a specific order type.

Product

Item or service that your organization offers for sale to its customers.

Product Adjustments

Include inventory adjustments due to breakage, pilferage, giveaways, or physical inventory count differences.

Product Receipts

Record products received in inventory.

Product Transfers

Transfer a product's inventory from warehouse to warehouse.

Quantity on Hand

Specifies how many products are currently in stock. These are products that have been received but not shipped.

Replace

To substitute an item for the product that was initially chosen.

Reserved

Indicates how many products are in open order status. Reserved orders include both shippable and backordered items.

Stock Item

Product that physically is stocked in inventory.

Upsell

To persuade a customer to purchase a product that may have a greater value than the product initially chosen.

Warehouse

Facility where stock items are stored in inventory. Stock items can be stored in multiple warehouses.

Navigation for Orders

The Orders task list consists of seven items that launch your Orders windows: Enter and edit orders, Process orders, Manage inventory, Generate reports, Set up tables, Set up warehouses, and Set up module.

Enter and edit orders

Opens the Enter and edit orders window used for entering and editing customer orders. This window utilizes the Portfolio concept and is organized into the following tabs:

- Overview - (Default tab) Use this tab to enter and edit product orders.
- Order Details - Use this tab to add and edit specific order information such as hold codes, commission rates, order notes, and shipping and handling information.

- Ship to Info - Use this tab to enter and edit an order's 'Ship to' information. The Ship to Info tab allows you to edit a customer's name and address information for a single order, or you can enter the 'Ship to' customer's information if the order is being shipped to someone other than the 'Bill to' customer.
- Payments - Use this tab to enter an order's payment information.
- Account Info - (read only) This tab allows you to view an order's specific accounting information.

  Process orders

  Opens a sub-menu of tasks used for processing orders. Order processing is a series of logical stages that move an order through the system from order entry to order invoicing. Different order types require processing through different stages, and the processing stages allow you to keep track of an order and its status. Each processing stage lists the orders that are at that stage in the order lifecycle.
- Print quotes - Select to open the Print quotes window used for generating printed copies of selected sales quotes.
- Convert quotes - Select to open the Convert quotes window used for converting pro forma orders to the default standard order type.
- Print pick list - Select to open the Print pick list window used for generating itemized product lists.
- Print shipping papers - Select to open the Print shipping papers window used for generating shipping papers (Packing Slip) for selected orders.
- Ship orders - Select to open the Ship orders window used for recording shipping dates, shipping methods, and shipped quantities.
- Invoice orders - Select to open the Invoice orders window used for posting selected product sales transactions to AR/Cash.
- Close orders - Select to open the Close orders window used for marking completed orders as closed.

- Manually release backorders - Select to open the Manually release backorders window used for reversing an order's backorder status and returning the order to the appropriate order processing stage.

  Manage inventory

  Opens a sub-menu of tasks used for inventory control functions. These functions represent the progression of inventory tasks, which include setting up product inventory and managing and posting inventory receipts, adjustments, and transfers.

- Manage products - Select to open the Manage products window used for defining products and product information, such as product codes, descriptions, pricing, and accounting information. The Manage products window displays current inventory information by product.
- Enter and edit receipts and adjustments - Select to open the Enter and edit receipts and adjustments window used for entering product inventory receipts, adjustments, and transfers.
- Post receipts - Select to open the Post receipts window used for posting product receipts, adjustments, and transfers.

  Generate reports

  Opens the Generate reports window used for generating order inquiries, standard reports, and internal reports, such as order status, order transaction postings, and lists and details of your product inventory. The printed materials that you send to customers, such as price quotes, shipping papers, and invoices, are generated either through the Process orders sub-task list or from the Print button on the Overview tab when an order is open on the tab.

  IQA

  This functionality is no longer available from this location. You can access it from the Staff site..

  Set up tables

Opens a sub-menu of tasks for configuring and maintaining the tables used by the Orders module.

- Order types - Select to open the Set up order types window used for defining order types.
- Product categories - Select to open the Set up product categories window used for defining product categories.
- Tax codes - Select to open the Set up tax codes window used for defining tax codes.
- Freight by weight - Select to open the Set up freight by weight window used for defining shipping rates according to order weight and shipping zone.
- Freight by total value - Select to open the Set up freight by total value window used for defining shipping rates according to order value.
- Freight by total quantity - Select to open the Set up freight by total quantity window used for defining shipping rates according to order quantity.
- Zones - Select to open the Set up zones window used for defining the shipping zones for each country's shipping methods.

  Set up warehouses

  (visible only if multi-warehouses are enabled) - Opens the Set up warehouses window used for defining warehouse locations and descriptions.

  Set up module

  Opens the Set up module window used for configuring the behavior of the Orders module.

- Order Status Defaults window - Click Order Staging on the Set up module window.
- Add-on Charges window - Click Add-on Charges on the Set up module window.
- Backorder Processing window - Click Backorders on the Set up module window.
- Inventory System Setup window - Click Inventory on the Set up module window.
- Web Order Options window - Click Web on the Set up module window.

Order Entry

The iMIS Orders feature utilizes the Portfolio concept, which organizes the windows used for entering orders into a series of tabs. The efficient tab design influences user workflow and simplifies the process of entering and managing customer orders.

Entering product orders is a simple process that you can perform by entering a minimum amount of data in the following four fields:

- Order Type
- Bill to ID
- Product code
- Order Quantity

However, iMIS Orders provides the capability and flexibility to enter and manage much more complex orders. If you are entering an order for a new customer, Orders allows you to add the customer to your organization's file when entering their order.

As long as an order has not been invoiced, you have the ability to edit an order's information such as the type and number of products ordered, the 'Ship to' information, and any applicable add-on charges and prepayments. For orders that already have been invoiced, you have the ability to enter credit and debit memo orders.

Entering orders

This section documents the steps for entering a basic order. The following sections of this chapter document the procedures for entering detailed and specific order information.

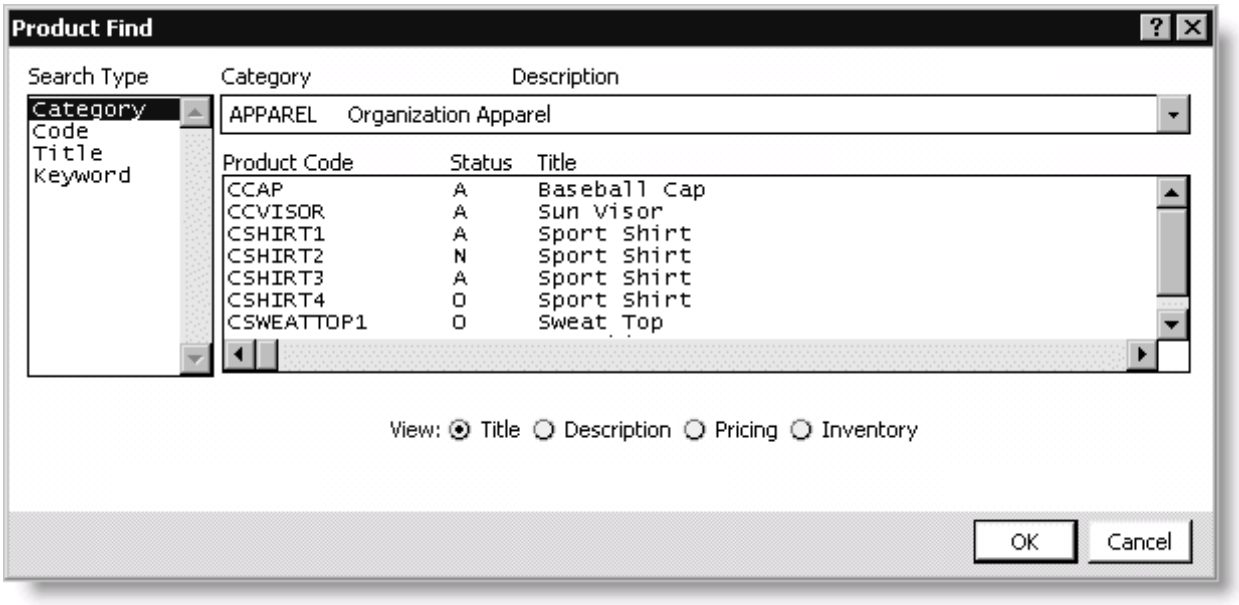
Orders are entered on the Enter and edit orders window. Organized into a series of tabs, this window provides a useful and intuitive format for efficiently entering your customers' product orders.

Searching for products

When entering orders, the Product Find window is a useful tool when searching for specific products and product codes. Accessed through the Product field's Find icon, the

Product Find window allows you to search for products by product category, product code, product title, and keyword.

Product Find window



From Orders, select Enter and edit orders, enter or edit an order, and select the Product field's Find icon

Search Type

Select from the list of iMIS-specified search types: Category, Code, Title, and Keyword. The Product Find window's format is dependent on which Search Type is selected:

- Category - Select to search by product category. The Category drop-down list displays above the Product Code drop-down list when the Category search type is selected.
- Code - Select to search by product code.
- Title - Select to search by product title.
- Keyword - Select to search by keyword in the product title and/or description. The Title and Description options and the Search For field display at the bottom of the Product Find window when the Keyword search type is selected.

Category

(Displays when the Category search type is selected) Select from a list of product categories. Both the Category code and Description display for each defined product category.

Product Code

Select from a list of products. This field always displays a product's Product Code. The other product data that displays is dependent on the search type selected and the View option enabled.

Status

Displays a product's status code.

View

- Title - (default) Displays a product's title in the Product Code field.
- Description - Displays a product's description in the Product Code field.
- Pricing - Displays a product's pricing information in the Product Code field. Both Regular and Non-Member pricing appear.
- Inventory - Displays a product's inventory information in the Product Code field. A product's On Hand, Reserved, Commttd, Avail, and On Order quantity appears.

Title

(Not shown in example, displays when the Keyword search type is selected) Enables keyword searching on a product's title.

Description

(Not shown in example, displays when the Keyword search type is selected) Enables keyword searching on a product's description.

Search For

(Not shown in example, displays when the Keyword search type is selected) Enter the keyword for which you want to search.

Enter and edit orders window - Full Order Entry

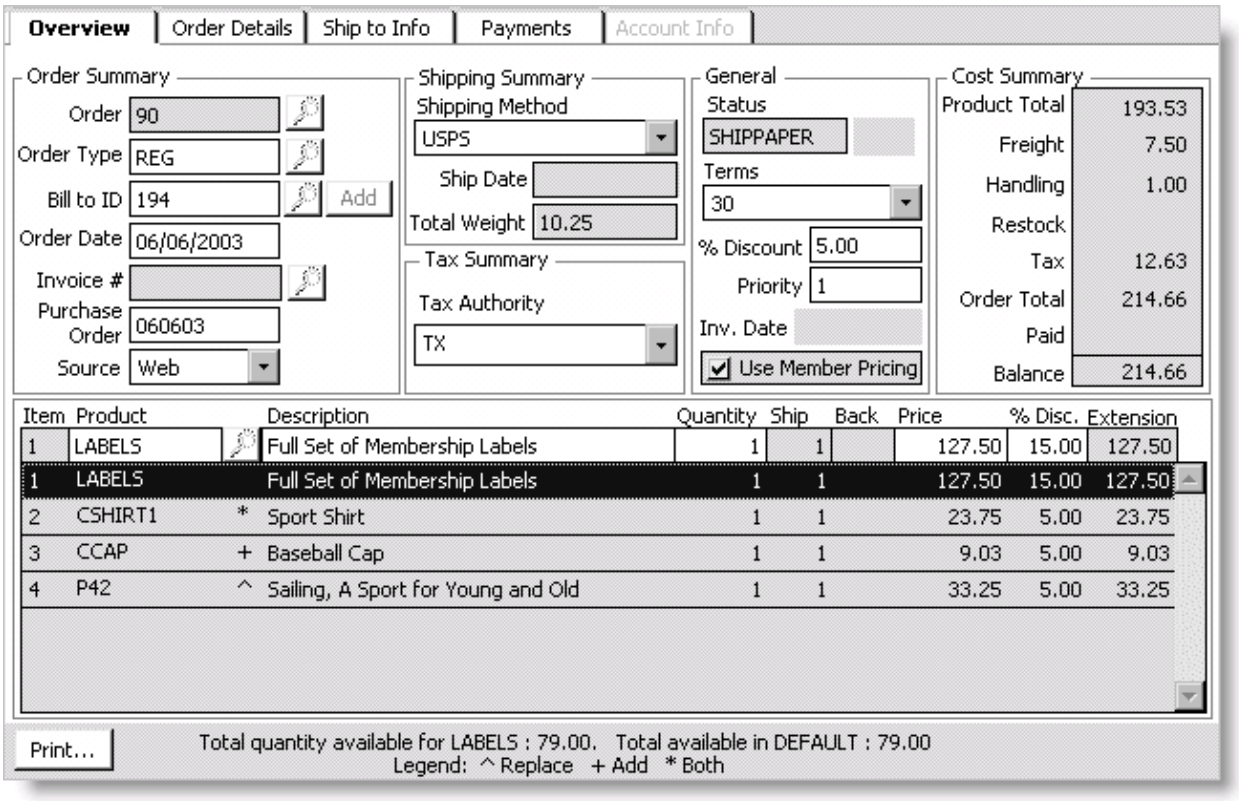
The Enter and edit orders window enables you to enter sales orders, and to record payment, shipping, and account info. It has five tabs that separate order information:

- Overview -(Default tab) Select to enter, edit, and view a customer's general order information.
- Order Details -Select to enter, edit, and view a customer's specific order information such as hold codes, order notes, shipping, and handling information.
- Ship to Info -Select to enter, edit, and view the 'Ship to' customer's name, address, and phone information.
- Payments tab -Select to enter, edit, and view an order's payment information.
- Account Info -(read only) Select to view an order's specific accounting information. The Account Info tab is disabled for orders that have not been invoiced.

Print opens the Select Report window used for generating specific reports such as Order Detail, Quotation, Pick List, Packing Slip, and Invoice. For Full Order Entry orders (order type Full) you can also use the Print button to convert the current order to the next processing stage.

Enter and edit orders window - Overview tab

The Overview tab appears when you select Orders > Enter and edit orders.



Order Summary

- Order - This field remains blank until you enter an order. After you enter an order, iMIS automatically generates a sequential number for the order. When searching for an existing order, use the Order field to enter the order number for which you are searching. Select the Order field's Find icon to look up an order number.
- Order Type - (Defaults to the last order type used) Enter an order type defined on the Set up order types window (from Orders, select Set up tables > Order types). Select the Find icon to look up an order type.
- Bill to ID - Enter the ID of the customer to be billed for an order. Select the Find icon to look up an ID.
- Add button - Opens the Add New Customer window. The Add New Customer window allows you to add new customers to your organization's database when entering orders.
- Order Date - The system automatically enters the current system date for the Order Date. You can override this date by entering a new value. If you are using batch control, the

Order Date field defaults to the active batch date; you can override the batch date if the order date is different.

- Invoice # - For all orders except credit and debit memo orders, this field remains blank until you invoice an order. Once you invoice an order, iMIS automatically generates a sequential invoice number that displays in the field.
- When searching for an invoiced order, enter the invoiced order's invoice number in the Invoice # field. Select the Find icon to look up an invoice number.
- When entering a credit or debit memo order for an invoiced order, enter the invoiced order's invoice number in the Invoice # field.
- Purchase Order - Enter a purchase order number or other reference number. Purchase order numbers display on order invoices.
- Source - Select a source code from the drop-down list, such as WEB, MAIL, or PHONE; source codes are defined on the SOURCE_CODE general lookup/validation table (from Customers, select Set up tables > General lookup/validation). Source codes are required when entering orders if the Force Source Coding option is enabled on the Customer Setup - Basic Options window (from Customers, select Set up module> General, and click Basic Options).

Shipping Summary

- Shipping Method - Select a shipping method for the order from the drop-down list; shipping methods are defined on the SHIP_METHOD general lookup/validation table (from Customers, select Set up tables > General lookup/validation). If you do not select a shipping method, the Shipping Method list defaults to the Default Shipping Method defined on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).
- Ship Date - (read only) Displays the system date an order is processed through the Ship orders processing stage. If an order type does not process through the Ship orders processing stage, the ship date defaults to the invoice date.
- Total Weight - (read only) Displays an order's total shipping weight.

Tax Summary

- Tax Authority - Select a tax authority for the order from the drop-down list; tax authorities and their corresponding tax codes are defined on the Set up tax codes window (from Orders, select Set up tables > Tax codes). If a state code has been defined for the 'Ship to' customer's address, the Tax Authority defaults to the 'Ship to' customer's state code.
- VAT Summary - (Not shown in example, displays only if you are licensed for VAT) The VAT Summary area summarizes a customer's VAT information:
- Reg Number - (Not shown in example, display/VAT only) Displays a customer's VAT registration number.
- Country - (Not shown in example, display/VAT only) Displays a customer's VAT member country.

  Note: You can enable the Canadian Taxation (see "Canadian Taxation (GST and HST)") or the Value-Added Tax (VAT) (see "European Taxation (VAT)") method.

  General
- Status - (read only) Displays an order's current status. An order's status changes as the order is converted from one processing stage to another.
- Hold - (read only) Indicates an order has been placed on hold. Orders are placed on hold by selecting a Hold Code on the Order Details tab. Placing an order on hold prevents the order from displaying on the order processing windows. When you remove an order's Hold Code, the order is released to go through the appropriate order processing stages.
- Terms - Select a payment term that applies to an order, such as 30, 60, or 90 days; payment terms are defined on the Set up terms window (from AR/Cash, select Set up tables > Terms). The selected term prints on an order's invoice. If you entered a Default Terms Code on the AR/Cash Aging window (from AR/Cash, select Set up module, and click Aging), the code displays by default on each new sales order.
- % Discount - (optional) Enter a percentage discount (0 to 100) to apply to an order's price. For example, entering 25 in the % Discount field reduces a $400 order by 25 percent, or

$100, to $300. A discount entered in the % Discount field applies to all of the products ordered. However, if a product's price is changed after applying an order-level discount, the discount does not extend to the product line-item's new price. In addition, individual product line-item discounts override order-level discounts.

Changing the order-level % Discount changes all line-item discounts if they matched the order-level % Discount prior to the change.

Exception: If the product price has been overridden and the % Disc had been reset to zero, that line item does not change. The Price remains overridden and the % Disc remains set to zero.

- Priority - (optional) Specify the priority that will be assigned to any backordered portion of an order. For example, a “1” has the highest priority. A backorder with a higher priority will be processed before a backorder with a lower priority.
- Inv Date - (Display/Invoiced orders only) Displays an order's invoice date.
- Use Member Pricing - (Displays only for non-member customers) Enable to charge member prices for products ordered by non-member customers. The Use Member Pricing option displays only for non-member customers under the following conditions:
- The Is a Member option is not enabled for the customer's type on the Set up customer types window.
- The Is a Member option is enabled for the customer's type on the Set up customer types window, but the customer's status is D, S, or I.

  If Use Parent Company Pricing is enabled on the Customer Setup - Advanced window (from Customers, select Set up module > General, and click Advanced), the Use Member Pricing option displays under these conditions:

- The Is a Member option is not enabled for the parent company's customer type on the Set up customer types window.
- The Is a Member option is enabled for the parent company's customer type on the Set up customer types window, but the company's status is D, S, or I.

Cost Summary (read only)

VAT Tip: To see how VAT taxes apply to the prices you see in the Cost Summary pane, press the Ctrl key as you click on various charges. The pop-up shows what iMIS is calculating the applicable VAT to be.

- Product Total - Displays an order's total product cost excluding any applicable add-on charges such as freight, handling, and taxes.
- Freight - Displays an order's applicable freight charge.
- Handling - Displays an order's applicable handling charge.
- Restock - Displays an order's applicable restocking charge.
- Tax - Displays an order's applicable sales tax.
- Order Total - Displays an order's total cost.
- Paid - Displays any amount paid on an order.
- Balance - Displays any outstanding payment balance for an order.

Product Line Items

- Item - (read only) Displays a product's line number on an order. Item numbers are system generated as products are added to orders.
- Product - Enter a product code for an order. Select the Find icon to open the Product Find window and look up a product; products are defined on the Manage products window (from Orders, select Manage inventory > Manage products).
- Description - Displays the product description defined in the Title field on the Manage products window. The text in the Description field is editable. If you leave the Product code field empty, you can enter printable comments in the Description field.
- Quantity - Specify the number of individual products ordered. Enter quantities as whole numbers unless you are designating partial quantities. If you are designating partial quantities, enter fractions as decimals, such as “1.5.” If you are entering a credit memo order, enter a negative value, such as “-2.” When you invoice a customer's order, an activity

record is created for the customer. The quantity of each individual product ordered populates the Activity.QUANTITY field when an activity record is created.

- Ship - (read only) Displays the number of products ordered that are available to ship at the time of order entry. If you are entering a credit memo, the Ship field displays a negative value, indicating the number of products being returned.
- Back - (read only) Displays the number of products ordered that are on backorder at the time of order entry.
- Price - Enter a product's price. The Price field defaults to the value defined for a product on the Manage products window, but it can be overridden at order entry. If a price has not been defined for a product, you can enter a price at order entry. If a discount has been applied at either the product or the order level, the Price field reflects the discount. Overriding a product's price after a product line-item discount has been applied resets the product line-item discount to zero. In addition, if a product's price is changed after applying an order-level discount, the discount will not extend to the product line-item's new price.
- % Disc - (optional) Enter a percentage discount (0 to 100) that will be applied to a product's price. For example, entering 10 in the % Disc field reduces a $100 product's price by 10 percent, or $10, to $90.

  Product line-item discounts entered in the % Disc field override order-level discounts for product line-items. If an order-level discount has been applied to an order, the discount percentage displays in the % Disc field until it is overridden with a product line-item discount. The discount entered in the % Disc field applies only to a product line-item; product line-item discounts do not affect an entire order. Overriding a product's price after a product line-item discount has been applied resets the product line-item discount to zero.

  If someone previously modified the unit price by entering price manually, iMIS calculates the newly discounted price for the line item as line-item % Disc multiplied by the previously entered manual price.

If the unit price has not been modified, iMIS calculates the newly discounted price as line-item % Disc multiplied by the original price at the value that the price was originally set, regardless of member pricing or other special pricing.

- Extension - (read only) Displays a product line-item's total price. A product's Extension price is determined by multiplying the value in the Quantity field by a product's unit Price. If a price discount has been applied at either the product or the order level, the Extension field reflects the discount. If you are entering a credit memo order, the Extension price reflects a negative value since products are being returned.
- Total quantity available - (read only) Displays a product's total number of units in inventory. To display the Total quantity available field, select a product line-item.

  If the Enable Multi-Warehouses option is enabled on the Inventory System Setup window, the Total quantity available field displays a product's total number of units in inventory across all warehouses.
- Total available - (Display/Multi-Warehouses only) Displays a product's total number of units in inventory at a selected warehouse. To display the Total available field, select a product line-item.
- Opportunities Legend - (read only) Displays as long as one of the order's line items has unrealized opportunities. Each line item that has unrealized opportunities is indicated by one of the following characters displaying next to the Product code:

  '+' - Indicates an item has cross-sell opportunities

  '^' - Indicates an item has upsell opportunities

  '*' - Indicates an item has both upsell and cross-sell opportunities

  Display of VAT tax code and amount for each line

  The VAT tax code and VAT tax amount for a line item subject to VAT taxation now display at the bottom of the Orders portfolio when the line item is being entered, edited, or is selected.

Preventing duplicate product line-items

When entering orders, be careful not to duplicate product line-items. Available quantities are not updated until an order is saved, and entering duplicate product line-items can result in backorders not generating when insufficient inventory exists to fill an order. For example, if an order contains a product kit as well as one of the kit components, the order will be processed, but the inventory count will be inaccurate. This can result in a backorder not generating.

If Multi-Warehouses is disabled, backorders will generate only for a product's first line-item if insufficient inventory exists to fill an order. For example, Product X has 10 units in stock, and a line-item is entered for 10 units of Product X. If a second line-item is entered for additional units of Product X, regardless of the number of units, a backorder will not generate for the second line-item.

If Multi-Warehouses is enabled, and duplicate line-items are entered for a product ordered from the same warehouse, backorders will generate only for the first product line-item ordered from the warehouse. For example, Product X has 10 units in the Default warehouse and 5 units in the East warehouse. If a line-item is entered for 10 units of Product X at the Default warehouse, and a second line-item is entered for another 10 units of Product X at the Default warehouse, a backorder will not generate for the second line-item. However, if the second line-item was entered for 10 units of Product X at the East warehouse, a backorder will generate for the second line-item.

To enter an order

Follow this procedure to enter a basic order.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click New.
3. Enter the Order Summary information:

- Enter an Order Type (select the Find icon to look up an order type).
- Enter a Bill to ID (select the Find icon to look up an ID).

- (optional) Override the Order Date if necessary. The Order Date defaults to the batch date if batch control is used; otherwise, the date defaults to the system date.
- (optional) Enter a Purchase Order if applicable.
- Select an order Source code from the drop-down list.

4. (optional) Override the default Shipping Method if necessary.
5. (optional) Override the default Tax Authority if necessary.
6. Enter the General order information:

- (optional) Override the default payment Terms if necessary.
- (optional) Enter a percentage discount for the order in the % Discount field.
- (optional) Enter a backorder Priority for the order.

7. Enter the product line-item information:

- Enter a Product code (select the Find icon to open the Product Find window and look up a product), and press Tab. The Description field populates automatically.
- Enter the number of products ordered in the Quantity field.
- (optional) Edit the product Price if necessary.
- (optional) Enter a percentage discount for the product in the % Disc field. Entering a line-item discount in the % Disc field recalculates the price for that one product line regardless of any order-level discount entered in the % Discount field. Entering a line-item discount does not affect other line items or the order-level discount.

  Note: If you override a line-item unit price at any time, the new price is considered to be the price after discount. The assumption is that you are not using any discount percentage (% Discount or % Disc) and iMIS sets the % Disc field to zero for that line item.

  Note: Changing the line-item discount (% Disc) causes iMIS to recalculate the price.

1. If someone previously modified the unit price by entering a price manually, iMIS calculates the newly discounted price for the line item as line-item % Disc) multiplied by the

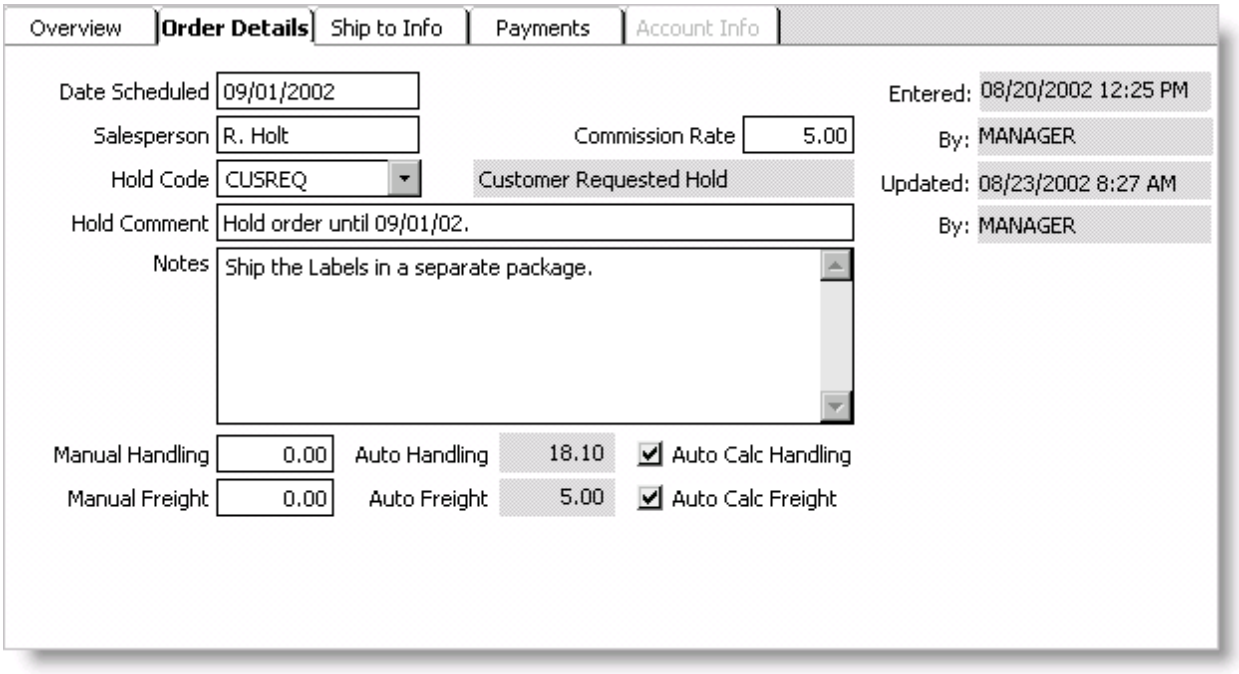
previously entered manual price. You can see a manual price by placing your mouse over the line in the order and looking for the price in the bottom left corner.

2. If the unit price has not been modified, iMIS calculates the newly discounted price as line-item % Disc) multiplied by the original price at the value that the price was originally set, regardless of member pricing or other special pricing.
3. Press Tab to add the product to the order. The product displays in the list of Product Line Items, and your cursor will be in the Product field.
4. Repeat this process for each additional product ordered.
5. Click Save to enter the order.

Entering order details information

The Order Details tab allows you to enter, edit, and record specific order information, such as scheduled shipping dates, salespeople, commission rates, order hold codes, notes, and freight and handling charges.

Enter and edit orders window - Order Details tab



From Orders, select Enter and edit orders, enter or open an order, and select the Order Details tab

Date Scheduled

Enter an order's scheduled delivery date. The date you enter is for information only and is not used for processing an order.

Salesperson

Enter the name of the salesperson who took the order. The name you enter is for information only and is not used for processing an order.

Commission Rate

Enter a salesperson's commission rate for an order. The commission rate you enter is for information only and is not used for processing an order.

Hold Code

Select an order hold code from the drop-down list; hold codes are defined on the HOLD_CODES general lookup/validation table.

A Hold Code prevents an order from being processed, and orders on hold do not display on processing windows. As an indication that an order has been placed on hold, Hold displays next to the Status field on the Overview tab. Once you remove an order's Hold Code, the order is released to its appropriate order processing stage and displays on the order processing window.

To view all orders on hold, run the Orders On Hold report from the Generate reports window (from Orders, select Generate reports, select Order Status, and select Orders On Hold).

Hold Code Description

(read only) Displays a description of the selected order hold code.

Hold Comment

Enter a comment about why an order is on hold.

Notes

Enter any additional comments about an order.

Note: Do not enter special characters (such as square brackets) in the Notes field. Entering special characters generates an error message and does not allow an order to be completed.

Manual Handling

Add a handling charge or override the automatic handling charges generated for an order. You must disable the Auto Calc Handling option to enter a manual handling charge.

Auto Handling

(read only) Displays an order's automatic handling charge when the Auto Calc Handling option is enabled. The amount that displays in the Auto Handling field is dependent on the parameters defined for the Automatic Calculation of Handling Charge option on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

You can override an automatic handling charge in the Manual Handling field once the Auto Calc Handling option is disabled.

Auto Calc Handling

This option enables automatically if the Automatic Calculation of Handling Charge option is enabled on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

Disable the Auto Calc Handling option if you want to enter a manual handling charge in the Manual Handling field.

Manual Freight

Add a freight charge or override the automatic freight charges generated for an order. You must disable the Auto Calc Freight option to enter a manual freight charge.

Auto Freight

(read only) Displays an order's automatic freight charge when the Auto Calc Freight option is enabled. The amount that displays in the Auto Freight field is dependent on the parameters defined for the Automatic Calculation of Freight Charge option on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

You can override the automatic freight charge in the Manual Freight field once the Auto Calc Freight option is disabled.

Auto Calc Freight

This option enables automatically if the Automatic Calculation of Freight Charge option is enabled on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

Disable the Auto Calc Freight option if you want to enter a manual freight charge in the Manual Freight field.

Restocking

(Not shown in example, applies only to Credit Memo type orders) Add a restocking charge or override the automatic restocking charges generated for an order. The amount that displays in the Restocking field is dependent on the parameters defined for the Automatic Calculation of Restocking Charge option on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

You can override the automatic restocking charge in the Restocking field once the Auto Calc Restocking option is disabled.

Auto Calc Restocking

(Not shown in example, applies only to Credit Memo type orders) This option enables automatically if the Automatic Calculation of Restocking Charge option is enabled on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

Disable the Auto Calc Restocking option if you want to enter a manual restocking charge in the Restocking field.

Entered

(Display only, system generated) Displays the date and time an order was entered.

By

(Display only, system generated) Displays who entered an order.

Updated

(Display only, system generated) Displays the last date and time an order was updated.

By

(Display only, system generated) Displays who last updated an order.

Understanding order hold codes

When you select a hold code from the Hold Code drop-down list on the Order Details tab, an order is prevented from being processed through the order processing stages. An order on hold does not display on the order processing windows, and Hold displays next to the Status field on the Overview tab as an indication that the order is on hold. When you remove an order's Hold Code, the order is released to its appropriate order processing stage.

To place an order on hold, you first must define the hold codes on the HOLD_CODES general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

To view all of the orders on hold, run the Orders On Hold report from the Generate reports window (from Orders, select Generate reports, select Order Status, and select Orders On Hold).

When Orders may require hold codes

- A customer has an outstanding balance on a previous order
- An order is incomplete, and specific questions need to be answered before the order can be shipped
- The customer does not want the order shipped until a certain date

To place an order on hold

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order.
3. Select the Order Details tab.
4. Click Edit.
5. (optional) Enter the date the order is scheduled to ship in the Date Scheduled field.
6. Select an order Hold Code from the drop-down list.
7. Enter a Hold Comment.
8. Enter any applicable Notes.
9. Click Save to place the order on hold. Hold will display next to the Status field on the Overview tab.

To release orders placed on hold

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order.
3. Select the Order Details tab.
4. Click Edit.
5. Select the Hold Code drop-down list to display all of the defined hold codes.
6. Select the blank area at the top of the Hold Code drop-down list. This will remove the previously selected hold code.
7. Delete any comments entered in the Hold Comment field.
8. Click Save. Hold will no longer display next to the Status field on the Overview tab, and the order will be released to its appropriate order processing stage.

To edit an order's freight and handling charges

If you enable the Automatic Calculation of Freight Charge or the Automatic Calculation of Handling Charge option on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges), freight and/or handling charges will be calculated automatically for all orders.

You can disable the automatic calculation options and override an order's freight and handling charges on the Order Details tab. If the automatic calculation options are not enabled, you can enter freight and handling charges for an order manually.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order.
3. Select the Order Details tab.
4. Click Edit.
5. (optional) Enter the date the order is scheduled to ship in the Date Scheduled field.
6. (optional) Enter a Salesperson.
7. (optional) Enter a Commission Rate for the salesperson.
8. Enter any applicable Notes.
9. If enabled, disable the Auto Calc Handling option.
10. Enter a handling charge in the Manual Handling field.
11. If enabled, disable the Auto Calc Freight option.
12. Enter a freight charge in the Manual Freight field.
13. Click Save to update the freight and handling charges.

To edit a credit memo order's restocking charge

If you are entering credit memo orders and the Automatic Calculation of Restocking Charge option is enabled on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges), restocking charges are calculated automatically.

You have the option of disabling the automatic calculation option and overriding the calculated restocking charges on the Order Details tab. If the Automatic Calculation of Restocking Charge option is not enabled, you can enter a restocking charge for a credit memo order manually.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Enter or open the credit memo order for which you are entering or editing restocking charges.
3. Select the Order Details tab.
4. Click Edit.
5. (optional) Enter an applicable date for the restocking charge in the Scheduled Date field.
6. (optional) Enter a Salesperson.
7. (optional) Enter a Commission Rate for the salesperson.
8. Enter any applicable Notes.
9. Enter any applicable Manual Handling charge.
10. Enter any applicable Manual Freight charge.
11. If enabled, disable the Auto Calc Restocking option.
12. Enter a Restocking charge.
13. Click Save to update the restocking charge.

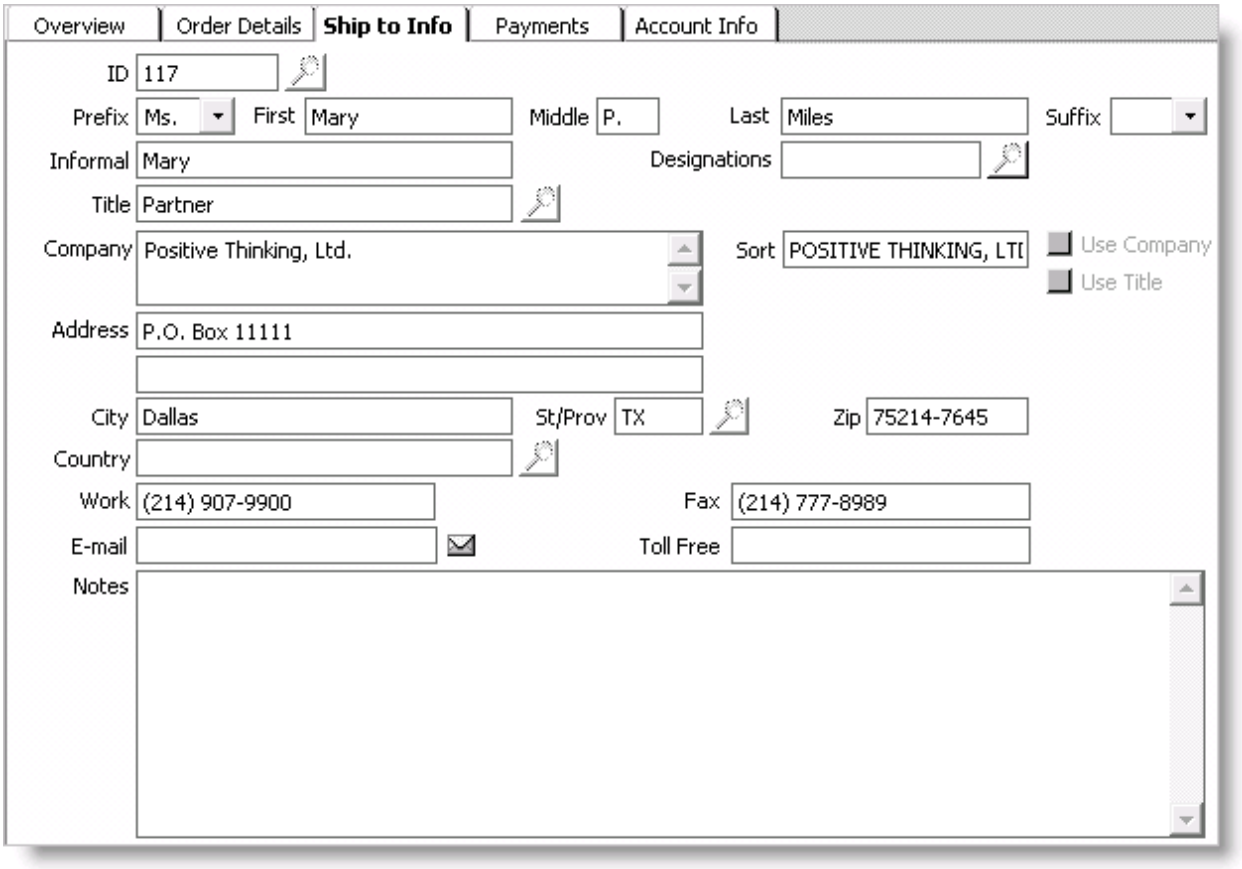
Entering shipping information

The Ship to Info tab is used to designate a Ship to customer when an order's Ship to and Bill to customer differ. You also can use the Ship to Info tab to edit a customer's name and address information for an individual order.

By default, the Ship to Info tab displays the Bill to customer's name and address information. When an ID other than the Bill to customer's ID is entered in the ID field, the Ship to customer's name and address information automatically populate the tab.

If necessary, a customer's name and address information can be edited for an order regardless of whether the Bill to and Ship to customer are the same. Changes made to a Ship to customer's name and address information on the Ship to Info tab affect only the order you are editing; updates made on the Ship to Info tab do not affect a customer's record.

Enter and edit orders window - Ship to Info tab



From Orders, select Enter and edit orders, enter or open an order, and select the Ship to Info tab

ID

Enter a 'Ship to' customer's ID; select the Find icon to look up an ID. By default, the ID field displays the 'Bill to' customer's ID, and the Ship to Info tab displays the 'Bill to' customer's name and address information. When an ID other than the 'Bill to' customer's ID is entered in the ID field, the new 'Ship to' customer's name and address information populate the tab.

Prefix

Select a 'Ship to' customer's prefix from the drop-down list, such as Mr., Ms., or Dr.; prefixes are defined on the PREFIX general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

First

Enter a 'Ship to' customer's first name.

Middle

Enter a 'Ship to' customer's middle name.

Last

Enter a 'Ship to' customer's last name.

Suffix

Select a 'Ship to' customer's suffix from the drop-down list, such as Jr., Sr., or III; suffixes are defined on the SUFFIX general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

Informal

(Defaults to the 'Ship to' customer's First name) Enter a 'Ship to' customer's informal name or nickname.

Designations

Enter a 'Ship to' customer's professional designations, such as CPA or MD. Select the Find icon to look up a designation; designations are defined on the DESIGNATION gen-

eral lookup/validation table (from Customers, select Set up tables > General look-up/validation).

Title

Enter a 'Ship to' customer's professional title. Select the Find icon to look up a title; titles are defined on the TITLE general lookup/validation table (from Customers, select Set up tables > General lookup/validation).

Company

Enter a 'Ship to' customer's company name. Depending on the length of the name entered, iMIS may truncate the company name in the Ship to Address area of the Enter and edit orders window.

Sort

Specify a value by which you want to sort a company record (Name.COMPANY_SORT). iMIS automatically removes the first instance of the word “The” from a company name.

Use Company

Enable to include the company name with the Ship To address on reports. This affects only the Ship To address that prints on reports and does not apply to the Bill To address. The Bill To (preferred billing) address's Use Company option is defined on the Customer Setup - Address and Notes window.

When entering product orders, iMIS automatically sets this option to equal the settings on the Customer Setup - Address and Notes window for the customer's preferred billing address (designated on the Manage customers window). You can override the setting on the Ship to Info tab as necessary for the customer's Ship To address (does not affect the Bill To address).

Note: The label for the Use Company option is customizable, so your system may display another label for this option. The value entered in the Institute Type field on the Customer Setup - Basic Options window defines the option's label.

Use Title

Enable to include the customer title with the Ship To address on reports. This affects only the Ship To address that prints on reports and does not apply to the Bill To address. The Bill To (preferred billing) address's Use Title option is defined on the Customer Setup - Address and Notes window.

When entering product orders, iMIS automatically sets this option to equal the settings on the Customer Setup - Address and Notes window for the customer's preferred billing address (designated on the Manage customers window). You can override the setting on the Ship to Info tab as necessary for the customer's Ship To address (does not affect the Bill To address).

Address

Enter a 'Ship to' customer's street address in one or both of the fields. Depending on the length of the address entered, iMIS may truncate the address in the Ship to Address area of the Enter and edit orders window.

City

Enter a 'Ship to' customer's city.

St/Prov

Enter a 'Ship to' customer's state or province. Select the Find icon to look up a state or province.

Zip

(Accepts up to nine characters) Enter a 'Ship to' customer's ZIP code.

Country

(Leave blank to accept the default) Enter a 'Ship to' customer's country. Select the Find icon to look up a country.

Work

Enter a 'Ship to' customer's work telephone number.

Fax

Enter a 'Ship to' customer's fax number.

E-mail

Enter a 'Ship to' customer's e-mail address.

Toll Free

Enter a 'Ship to' customer's toll free telephone number.

Notes

Enter any specific notes about an order.

Note: Do not enter special characters (such as square brackets) in the Notes field. Entering special characters generates an error message and does not allow an order to be completed.

To enter 'Ship to' customer information

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order for which you want to edit the 'Ship to' customer's information.
3. Select the Ship to Info tab.
4. Click Edit:
5. (optional) If you are shipping an order to a customer other than the 'Bill to' customer:

- Enter the 'Ship to' customer's ID in the ID field.
- Press Tab to populate the window with the 'Ship to' customer's name and address information.
- Make any necessary changes to the 'Ship to' customer's name and address information. Any changes made affect only the current order and not the customer's record.
- Skip the following step.

6. (optional) Edit the 'Ship to' customer's name and address information. Any changes made affect only the current order and not the customer's record.
7. Click Save.

   The 'Ship to' customer's information displays in the Ship to and Ship to Address fields on the Enter and edit orders window.

About assigning default shipping methods during order entry

When you select a 'Ship to' country during order entry, the Shipping Method field on the Overview tab populates automatically with the Default Shipping Method assigned to that country on the Default Shipping Configuration window (from Orders, select Set up module, click Add-on Charges, and click Default Shipping Configuration).

If no Default Shipping Method is assigned to the 'Ship to' country on the Default Shipping Configuration window, then the order's Shipping Method defaults to the Default Shipping Method defined on the Add-on Charges window (if the appropriate zone and freight-by-weight tables are set up for the Default Shipping Method and 'Ship to' country combination). See Calculating Freight Charges for more on setting up the appropriate zone and freight tables.

If the appropriate zone and freight-by-weight tables are not set up for the Default Shipping Method and 'Ship to' country combination, no freight charges will calculate. For example, if the Default Shipping Method is UPS, and the 'Ship to' country is England, you must define a zone table for UPS - England and a freight-by-weight table for the 'Ship to' address's zone for freight charges to calculate.

If no Default Shipping Method is defined for the Orders module on the Add-on Charges window, then you will have to select a Shipping Method from the drop-down list on the Overview tab during order entry. You always have the option of overriding an order's default shipping method when entering or editing orders.

Entering order payments

You have several options when entering order payments:

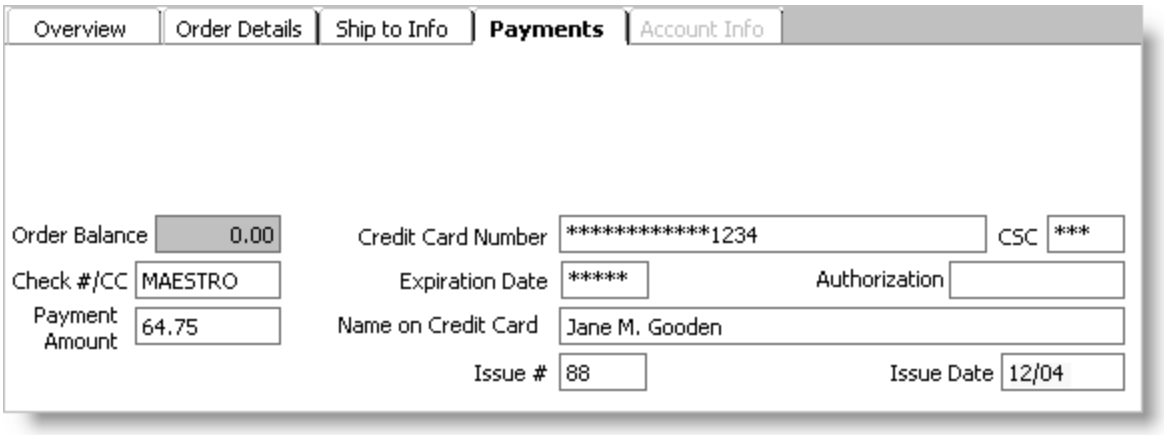
- You can enter a payment when entering an order.
- You can enter a payment after an order is entered but before an order is invoiced.
- You can enter a payment after an order is invoiced.

  Note: To authorize credit card payments for Events, Exhibition, Exposition, and Orders, enter them through Service Central > Enter and edit payments (if licensed for SERVCEN) or AR/Cash > Cash receipts (if licensed for CCAUTH (see "Credit Card Authorization")).

  Prepayments are entered on the Payments tab. A prepayment is a payment that is entered before an order is invoiced. Post-invoice payments are entered in AR/Cash on the Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions > Cash receipts). You also can use the Enter and edit cash receipts window to enter payments after an order has been entered.

  Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Enter and edit orders window - Payments tab



From Orders, select Enter and edit orders, enter or open an order, and select the Payments tab

Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Order Balance

(read only) Displays an order's outstanding payment balance. The Order Balance is recalculated each time the Payment Amount is changed.

Credit Card Number

(Required for credit/debit card payments) Enter a credit/debit card number. When a payment is saved, all but the last four digits of the card number are masked.

Note: If you are using credit card authorization, do not enter credit card payments on the Orders Payments tab. See Credit Card Authorization (see "Authorizing Credit Cards in iMIS") for more information.

CSC

(Optional/Displays only if a European debit card code is entered in the Check #/CC field and the associated card authorization account uses the Other gateway and accepts a CSC number for deferred authorization) Enter the European debit card CSC number. When a payment is saved, the CSC number will be masked.

Check # / CC

Enter a check number or credit/debit card code. Credit/debit card codes are defined on the Set up cash accounts window (from AR/Cash, select Set up tables > Cash accounts).

Expiration Date

(Required for credit/debit card payments) Enter a card's expiration date (mm/yy). When a payment is saved, the card's expiration date is masked.

Authorization

(Optional for credit card payments) Enter an authorization code when a credit/debit card payment is processed.

Payment Amount

Enter the amount of a check or credit/debit card payment. You can enter payments in one of the following amounts:

- Full - No open accounts receivable item is tracked through the system.
- Partial - Offsets or reduces the accounts receivable amount.
- None - Sales order amount remains an open receivable. If a customer is paying by credit/debit card, you can enter a credit/debit card code and leave the Payment Amount field blank. If you leave the Payment Amount field blank for a credit/debit card payment, the payment amount will equal the invoiced total when an order is invoiced. If you select this option, a cash entry is generated when you invoice an order.

Name on Credit Card

(Required for credit/debit card payments) Enter the name of the customer whose credit/debit card is used when making a payment. The 'Bill to' customer's full name displays by default.

Issue #

(Optional/Displays when a European debit card code is entered in the Check #/CC field and the associated cash account accepts an issue number) Enter the European debit card issue number.

Issue Date

(Optional/Displays when a European debit card code is entered in the Check #/CC field and the associated cash account accepts an issue date) Enter the European debit card issue date (mm/yy).

To enter a prepayment

When you enter a payment during order entry or before an order is invoiced, the payment is considered a prepayment. Prepayments are entered on the Payments tab.

When you record check prepayments, the payment is applied to the prepaid orders account. Credit/debit card payments are applied immediately to the prepaid orders account when a nonzero payment amount is entered and the Recognize Credit Card Order Payments as Prepaid Cash option is enabled on the AR/Cash Set up module window (from AR/Cash, select Set up module).

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Enter a new orderor open an existing order.
3. While in edit mode, select the Payments tab.
4. If entering a payment by check:

- Enter a check number in the Check #/CC field.
- Enter the amount in the Payment Amount field.

5. If entering a payment by credit card:

- Enter a credit card code, such as VISA or AMEX, in the Check #/CC field. When you enter a credit card code, additional fields display which validate the credit card number, expiration date, authorization code, and name on the credit card.
- Enter the credit card number in the Credit Card Number field. All but the last four digits of the number will be masked when the payment is saved.
- Enter the credit card expiration date in the Expiration Date field. The expiration date will be masked when the payment is saved.
- Enter the name on the credit card in the Name on Credit Card field. Defaults to the 'Bill to' customer's name.
- (optional) Enter a code in the Authorization field.
- Enter the amount in the Payment Amount field.

6. If entering a payment by European debit card:

- Enter a European debit card code, such as MAESTRO, in the Check #/CC field. When you enter a European debit card code, additional fields display which enable you to enter the card number, expiration date, authorization code and name on the card. Depending on the card authorization account used for the European debit card, fields might also display which enable you to enter the card's CSC number, issue number, and issue date.
- Enter the card number in the Credit Card Number field. All but the last four digits of the number will be masked when the payment is saved.
- Enter the card expiration date in the Expiration Date field (mm/yy). The expiration date will be masked when the payment is saved.
- (optional) Enter the card CSC number in the CSC field. The CSC number will be masked when the payment is saved.
- Enter the name on the card in the Name on Credit Card field.
- (optional) Enter a code in the Authorization field.
- Enter the amount in the Payment Amount field.
- (optional) Enter the card issue number in the Issue # field.
- (optional) Enter the card issue date in the Issue Date field (mm/yy).

7. Click OK.

To edit a prepayment

Follow this procedure to edit an order's payment amount only. To edit an order's payment type, see Editing Payment Types.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order for which you want to edit a prepayment.
3. Select the Payments tab.

4. Click Edit.
5. Edit the amount in the Payment Amount field.
6. Click OK.

To enter a post-invoice payment

After an order has been invoiced, it no longer can be edited. You must make payments on invoiced orders in AR/Cash on the Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions > Cash receipts).

See Entering Cash Receipts in AR/Cash for details about entering such payments.

Viewing account information

After an order is invoiced, you can view an order's account information on the Enter and edit orders window's Account Info tab. The Account Info tab displays a running, itemized transaction log for an order or invoice, such as fees charged, payments received, adjustments, and canceled items. Individual lines display for each transaction and include payment amounts.

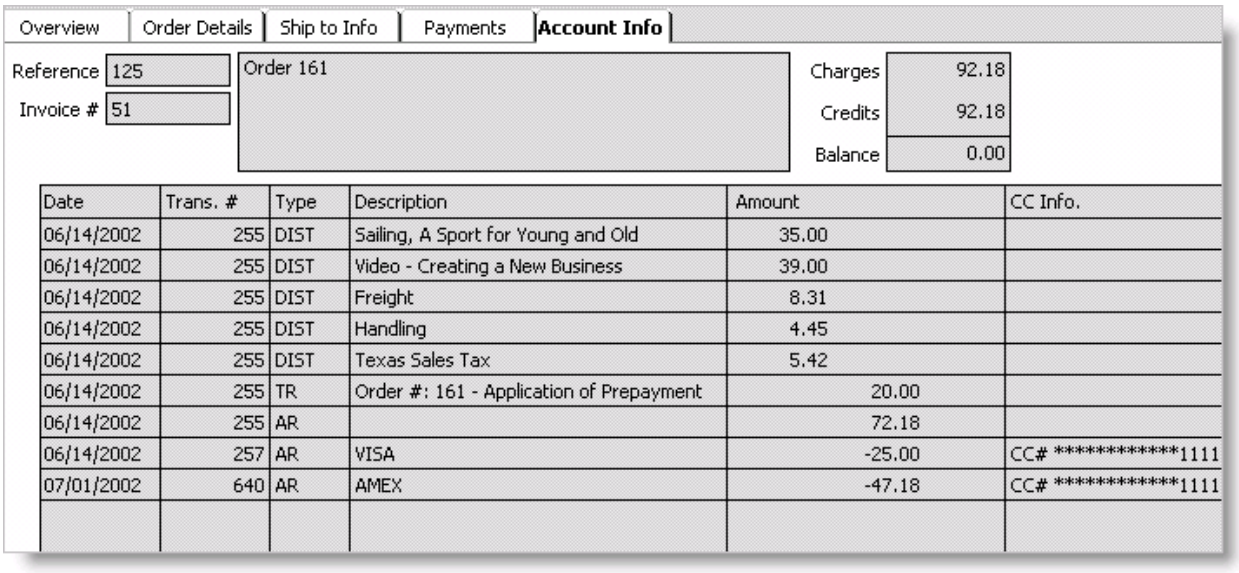
For each transaction line, the Account Info tab displays the date, the transaction number, the transaction type, a description of the transaction, the transaction amount, and any applicable credit card information.

The Enter and edit orders window's Account Info tab is disabled until an order is invoiced. Once you invoice an order, the Account Info tab enables. Invoiced orders cannot be edited on the Enter and edit orders window.

Note: Prepayments generate transaction records even though the Account Info tab is inaccessible until an order is invoiced.

Enter and edit orders window - Account Info tab

The information on this tab is read-only. The ledger (table) view displays each transaction for an order and includes the following transaction information: date, number, type, description, amount, and any applicable credit card information such as the credit card number, credit card expiration date, and the name on the credit card.



Date	Trans. #	Type	Description	Amount	CC Info.
06/14/2002	255	DIST	Sailing, A Sport for Young and Old	35.00	
06/14/2002	255	DIST	Video - Creating a New Business	39.00	
06/14/2002	255	DIST	Freight	8.31	
06/14/2002	255	DIST	Handling	4.45	
06/14/2002	255	DIST	Texas Sales Tax	5.42	
06/14/2002	255	TR	Order #: 161 - Application of Prepayment	20.00	
06/14/2002	255	AR		72.18	
06/14/2002	257	AR	VISA	-25.00	CC# **********1111
07/01/2002	640	AR	AMEX	-47.18	CC# **********1111

From Orders, select Enter and edit orders, open an invoiced order, and select the Account Info tab

PBI_1626, PBI_1628 Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

To view account information

You can select the Account Info tab for invoiced orders only.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the invoiced order for which you want to open the transaction ledger.
3. Select the Account Info tab to view the order's account information.

Ordering upsell, cross-sell, and replacement items

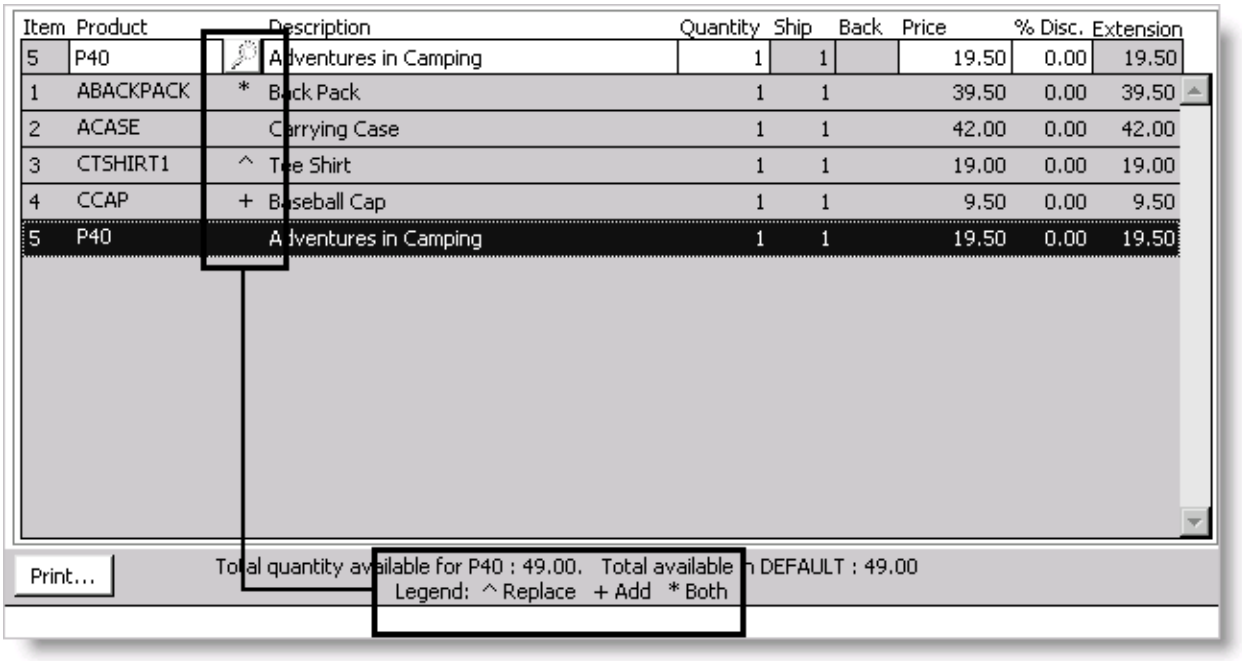
When customers order products, additional items often are available that can replace, that complement, or that are superior to the products initially ordered. However, customers sometimes miss these purchasing opportunities because they are unaware that additional items are available.

If you designate Upsell, Cross-sell, or Replacement items for a product on the Upsell/Replace window (accessible by clicking Upsell/Replace on the Manage products window), the items are easily accessible during order entry from the Opportunities window, which opens from the Overview tab. You then can replace a product with an Upsell or Replacement item, or you can add Upsell, Cross-sell, and Replacement items to the order.

Direct access to Upsell, Cross-sell, and Replacement items during order entry significantly helps organizations to increase revenue from the sale of additional items and higher-margin products:

- Upsell - To persuade a customer to purchase a product that may have a greater value than the product initially chosen. Upsell items can replace products or can be added to orders as additional items. No pricing rules exist for products designated as Upsell items, and Upsell items do not have to cost more than the products they replace.
- Cross-sell - To persuade a customer to purchase one or more similar items that complement the product initially chosen. Cross-sell items are added to orders in addition to initial product selections.
- Replace - To offer a customer an alternative item to take the place of the product initially chosen. Replacement items can replace products or can be added to orders as additional items.

Using the Opportunities Legend



Example of the Opportunities Legend on the Overview tab

As an indicator of a product's available opportunities, an Opportunities Legend displays at the bottom of the Overview tab as long as one line item has unrealized opportunities. Each line item that has unrealized opportunities is indicated by one of the following characters displaying next to the Product code:

'+' - Indicates an item has Cross-sell opportunities

'^' - Indicates an item has Upsell opportunities

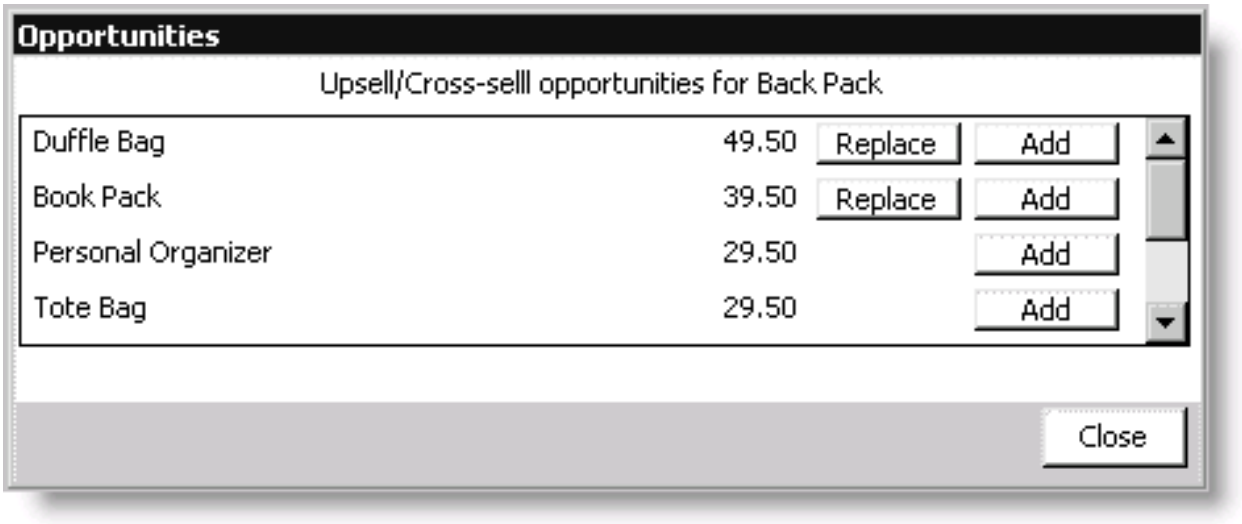
'*' - Indicates an item has both Upsell and Cross-sell opportunities

Opportunities window

Both stock and non-stock items display on the Opportunities window. Items sort with Upsell items listed before Cross-sell items. Within each group of opportunity items, items then sort by price in descending order.

For an Upsell/Cross-sell/Replacement item to display on the Opportunities window, it must meet the following criteria:

- The item must not be part of the current order
- The item's status must be Active
- For a stock item, inventory must be available in the item's Default warehouse



From Orders, select Enter and edit orders, and select a line item

Title

Displays the product's title as defined on the Manage products window. If a product does not have a title, its product code displays. The title displays as follows:

“Upsell/Cross-sell opportunities for product title”

Opportunity Items

Displays all Upsell, Cross-sell, and Replacement opportunity items that currently exist for a product:

- Description - Displays the Upsell/Cross-sell/Replacement item's title as defined on the Manage products window. If an item does not have a title, its product code displays.
- Price - Displays the Upsell/Cross-sell/Replacement item's price as defined on the Manage products window. Use Member Pricing is honored, but Special Pricing is not.

- Replace button - Click to replace a product with an Upsell/Replacement item.
- Add button - Click to add an Upsell/Cross-sell/Replacement item to an order.

To open the Opportunities window

When you open the Opportunities window, whether you open the window in read-only mode or in enter-and-edit mode determines how the window functions:

Read-only mode

Open an order in read-only mode, and select a line item that has designated Upsell, Cross-sell, or Replacement items. The Opportunities window opens, and all existing Upsell, Cross-sell, and Replacement opportunities designated for the selected product display:

- Upsell and Replacement opportunities display with Add and Replace buttons (disabled)
- Cross-sell opportunities display with Add buttons (disabled)

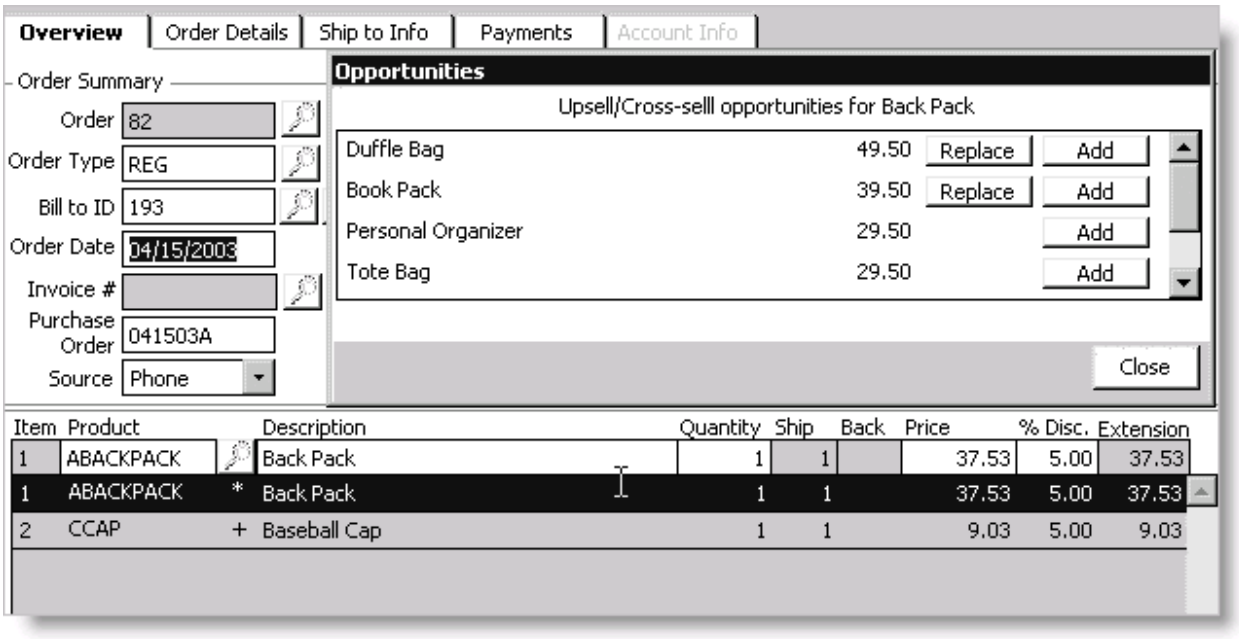
If you select another line item that has Upsell, Cross-sell, or Replacement opportunities, the Opportunities window remains open, and the data on the window refreshes.

Enter-and-edit mode

Enter or edit an order, and enter or select a line item that has Upsell, Cross-sell, or Replacement opportunities. The Opportunities window opens automatically, and all existing Upsell, Cross-sell, and Replacement opportunities designated for the product display:

- Upsell and Replacement opportunities display with Add and Replace buttons (enabled)
- Cross-sell opportunities display with Add buttons (enabled)

If you select another line item that has Upsell, Cross-sell, or Replacement opportunities, the Opportunities window remains open, and the data on the window refreshes. If you Tab to or select a blank line item, the Opportunities window disappears until you enter or select another line item that has Upsell, Cross-sell, or Replacement opportunities.



Example of the Opportunities window and Overview tab during order entry

To close the Opportunities window

To close the Opportunities window, do one of the following:

- Select a line item that does not have existing Upsell, Cross-sell, or Replacement opportunities
- Click an area outside the order line grid of the Overview tab
- Click Close on the Opportunities window

To add opportunity items to an order

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Enter a new order, or open an existing order (see Entering Orders or Finding Orders). Opportunity indicators designate which products have available opportunities.
3. While in the edit mode, click on the line item for which you want to add opportunity items. The Opportunities window opens.

4. Select an opportunity item, and click Add to add a new line item to the order for the Upsell, Cross-sell, or Replacement item:

   The Qty is set to zero, the Opportunities window refreshes (the added item is removed from the window), and each line item's Opportunity indicator refreshes.

5. Enter a Qty for the added item.

6. Click Save.

   To replace products with opportunity items

1. From Orders, select Enter and edit orders to open the Enter an edit orders window. The Overview tab displays by default.

2. Enter a new order or open an existing order. Opportunity indicators designate which products have available Replacement opportunities.

3. While in the edit mode, click on the line item you want to replace. The Opportunities window will open.

4. Select an opportunity item, and click Replace to update the original product's line item data with the Upsell or Replacement item's data.

   The Qty changes to the quantity originally ordered. The order's discounts, taxes, and prices recalculate to reflect the Upsell or Replacement item's data. The Opportunities window refreshes with the Upsell or Replacement item's available opportunities. Each line item's Opportunity indicator refreshes.

5. Click Save.

   To replace out of production products that have no inventory available

   The functionality for replacing Out of Production products that do not have inventory available is different from replacing products for which inventory is available. When you replace a product, the Overview tab's focus remains on the first line item as long as you do not Tab out of the Qty field.

By keeping the focus on the first line item, you see all products (on the refreshed Opportunities window) linked to the Replacement item. As items are added from the Opportunities window, each additional item's Qty is set to zero, and the Overview tab's focus remains on the first line item (the original Replacement item) as long as you do not Tab out of the Qty field.

For each item added from the Opportunities window (for the original Replacement item), you must manually enter the Qty ordered by either Tabbing to or selecting each newly added line item.

Ordering products from multiple warehouses

The multi-warehouses functionality of iMIS allows you to order individual products from multiple warehouse locations using the Product Detail window. This is a useful feature when the default warehouse has insufficient inventory to fill product orders.

The following are the requirements for ordering from multiple warehouse locations:

- The Enable Multi-Warehouses option must be enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).
- Multiple warehouse locations must be defined for the product on the Warehouses window (from Orders, select Manage inventory> Manage products, select from the list of Current Products, and click Warehouses).
- Each warehouse location must have sufficient inventory to fill an order.

To order a product from a non-default warehouse

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click New.
3. Enter the order information:

- Order Summary information
- Shipping Summary information

- Tax Summary information
- General information

4. Enter the product line-item information, and press Tab to add the product to the order. The product will display in the list of Product Line Items, and your cursor will be in the Product field.
5. Double-click the product line-item to open the Product Detail window.
6. Enter the Warehouse from which you want to ship the product:

- Enter a warehouse with sufficient inventory in the Warehouse field; or
- Select the Warehouse field's Find icon, select a warehouse with sufficient inventory, and click OK.

7. Click OK to close the Product Detail window.
8. Click Save.

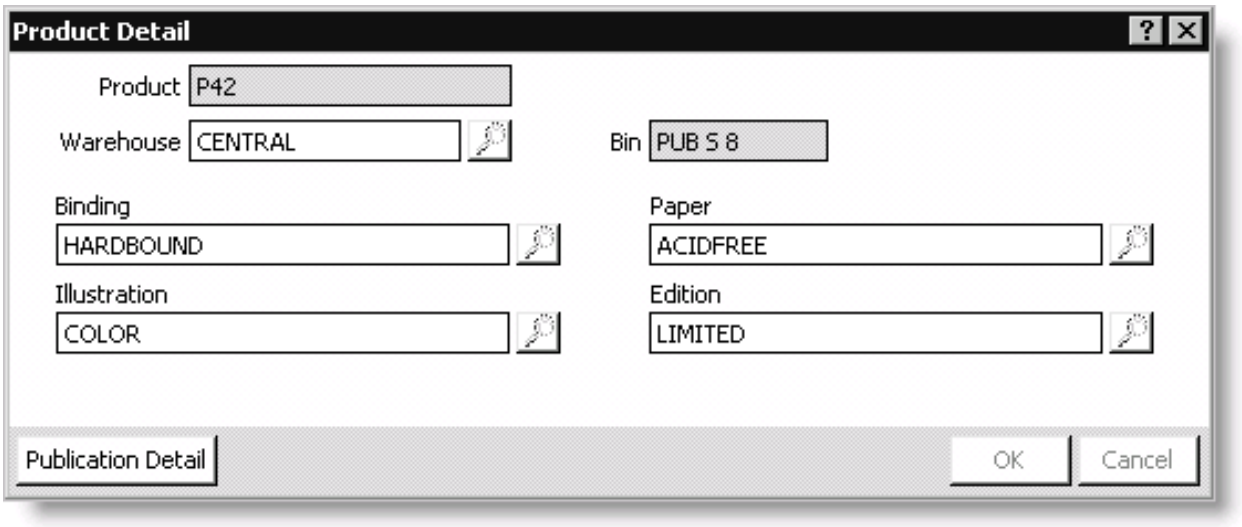
Entering detailed product information

Detailed and specific order information is entered for products on the Product Detail window. The Product Detail window is accessible by double-clicking a product line-item on the Overview tab.

When entering or editing orders, some products may require entering specific information before an order can be completed or shipped. For example, if an ordered product is an article of clothing, you may need to specify size or color. If an ordered product is a publication, you may need to specify a specific binding or paper type. Regardless of the product or product type, iMIS Orders incorporates the flexibility needed for entering detailed order information for products.

If you are using Multi-Warehouses, the Product Detail window also allows you to order individual products from other than a default warehouse. This is useful if a product's default warehouse does not have sufficient inventory to fill an order.

Product Detail window



From Orders, select Enter and edit orders, enter or edit an order, and double-click a product line-item

Product

(read only) Displays a selected product's code.

Tax Code

(Not shown in example, VAT only) Use this field to override the default tax code assigned to a product.

VAT

(Not shown in example, display/VAT only) Displays the tax amount based on the product price and tax rate.

Warehouse

(Multi-Warehouses only) Use this field to override the default warehouse from which a product will ship. A product's default warehouse can be overridden only with a warehouse that is pre-defined for the product.

Bin

(Display/Multi-Warehouses only) Displays the specific warehouse bin in which a product is stored.

User-Defined fields

(UF_1 through UF_4) Enter specific order information for a product, or select the Find icon to look up any predefined data.

Publication Detail button

(optional) Opens the Publication Detail window. The Publication button displays only if the following two conditions are true:

- The Use Publication Demographics option is enabled on the Set up product categories window (from Orders, select Set up tables > Product categories).
- At least one field is populated with data on a product's Publication Demographics window.

To enter detailed product information

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Enter a new order, or open an existing order.
3. While in the edit mode, double-click the product line-item for which you want to enter specific order information. The Product Detail window will open.
4. (Optional, only if using Multi-Warehouses) Override the product's default Warehouse if necessary:
   - Enter a Warehouse; or
   - Select the Warehouse fields Find icon, and select a warehouse with sufficient inventory to fill the order.
5. Enter the product's specific order information in the available user-defined fields, or select the user-defined fields' Find icons to look up any predefined general lookup/validation data.

Note: The user-defined field labels are set up according to product category on the Set up product categories window (from Orders, select Set up tables > Product categories).

6. Click OK to close the Product Detail window.
7. Click Save to save the order information.

Viewing publication details

The Publication Detail window allows you to view specific, predefined publication information about a product. The Publication Detail window is accessible by clicking the Publication button on the Product Detail window.

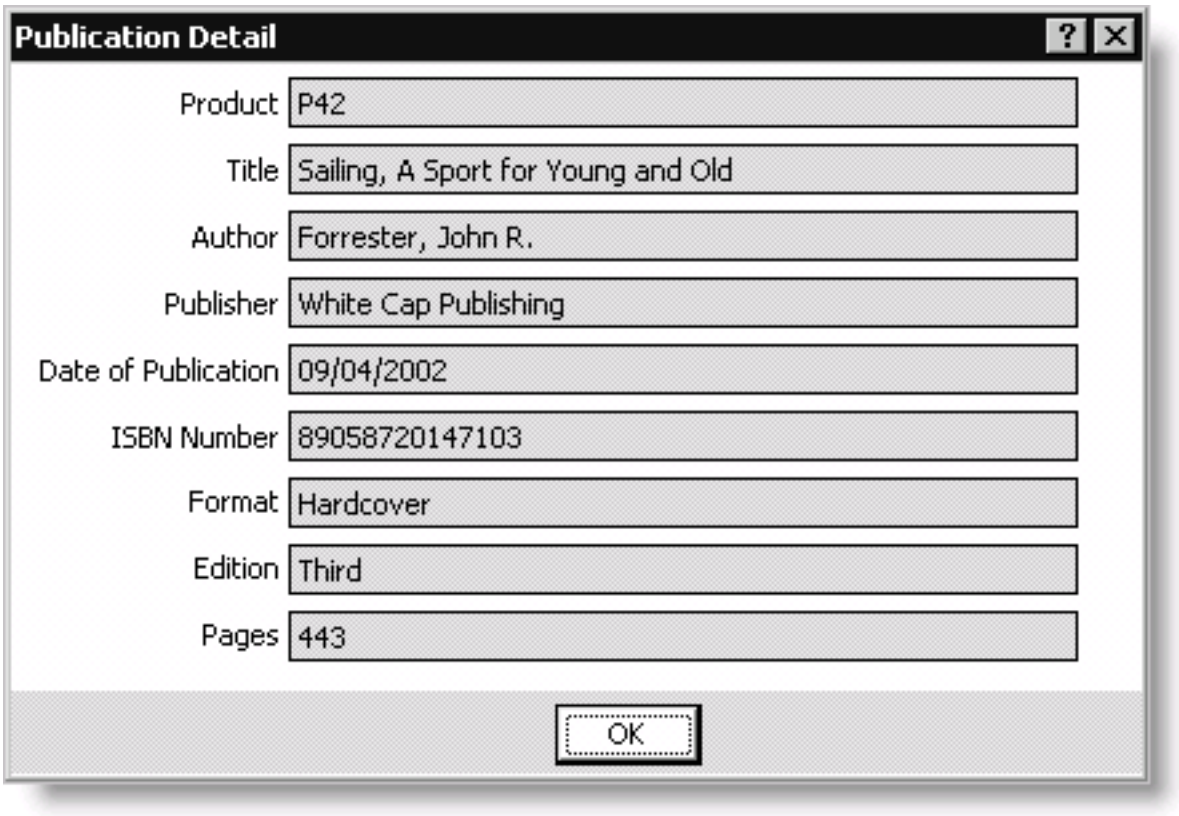
Publication information is defined for products on the Publication Demographics window (from Orders, select Manage inventory> Manage products, select a product from the list of Current Products, and click Publication).

The Publication button is available on the Product Detail window only if the following two conditions are true:

- The Use Publication Demographics option is enabled for a product's category on the Set up product categories window.
- At least one field is populated with data on a product's Publication Demographics window.

Publication Detail window

The information on this window is read-only.



From Orders, select Enter and edit orders, enter or edit an order, double-click a product line-item, and click Publication

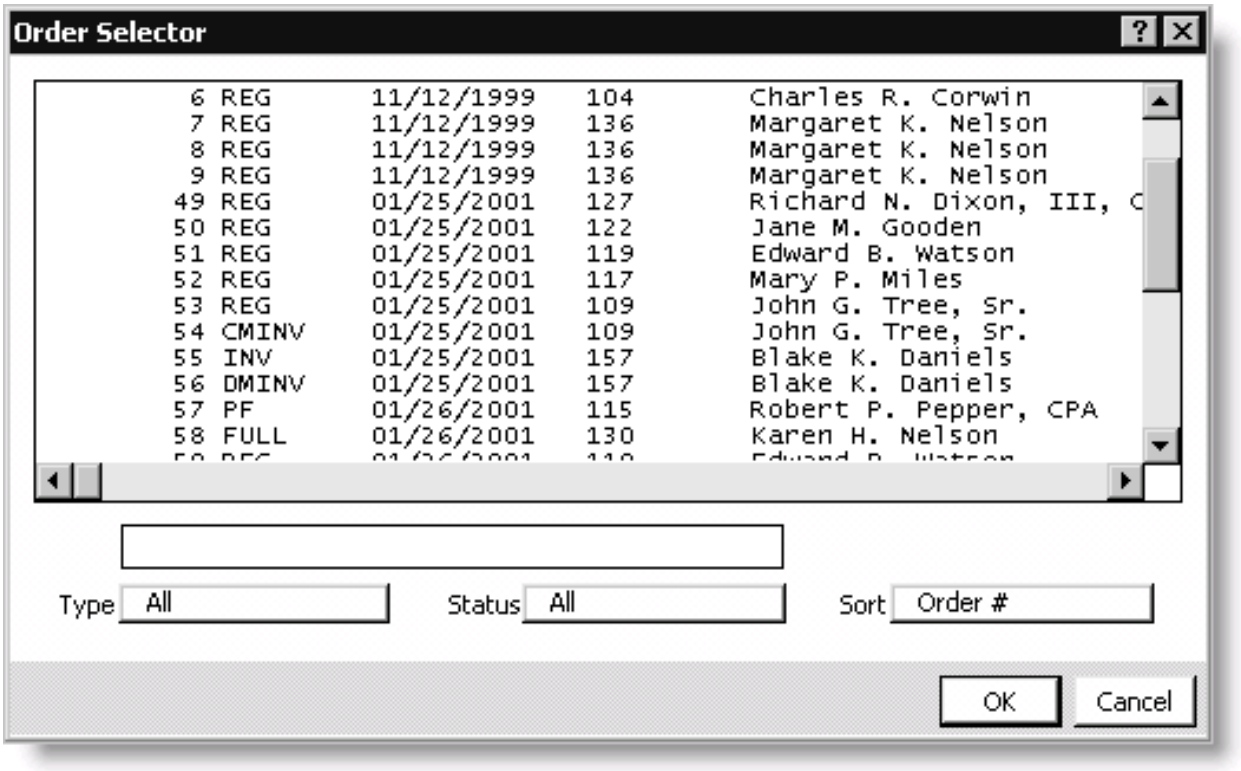
To view publication details

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Enter a new order, or open an existing order.
3. While in edit mode, double-click the product line-item for which you want to view publication details. The Product Detail window will open.
4. Click Publication Detail to open the Publication Detail window and view the product's detailed publication information.

Finding orders

When opening orders, the Order Selector window is a useful search tool if specific order information is not available. If the order number or 'Bill to' ID is not known, you can use the Order Selector window to view a group of orders based on a specific order type and/or order status. This makes finding specific orders a simple and efficient process.

Order Selector window



From Orders, select Enter and edit orders, click Open or Find, select the Order field's Find icon, and click OK

Orders

Lists all of the orders entered in the system.

Search

Enter the 'Ship to' customer's complete or partial last name.

Type button

(Defaults to All) Click to display a drop-down list of order types defined on the Set up order types window (from Orders, select Set up tables > Order types). Select the order type by which you want to search.

Status button

(Defaults to All) Click to display a drop-down list of each system-defined order status. Select the order status by which you want to search.

Sort button

Click to sort the orders returned by your search. Select from one of the following sort options:

- Order # - (default) Sorts all orders by order number.
- Order Date - Sorts all orders by order date.
- Type - Sorts all orders by order type.
- Customer - Sorts all orders alphabetically by last name.
- Company - Sorts all orders by company name.
- Status - Sorts all orders by order status.
- Entered By - Sorts all orders by operator name or number.

To open an order

Follow this procedure to open an existing order if you know the order number.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click Open or Find.
3. Enter the order number in the Order field.
4. Click OK.

To find an order using an invoice number

Follow this procedure to open an invoiced order if you know the order's invoice number.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click Open or Find.
3. Enter the invoice number in the Invoice # field (select the Find icon to look up the invoice number).
4. Click OK to open the order on the Enter and edit orders window.

To find an order using the 'Bill to' customer's ID

Follow this procedure to open an existing order if you know the 'Bill to' customer's ID.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click Open or Find.
3. Press Tab to go to the Bill to ID field, and enter the 'Bill to' customer's ID (select the Find icon to look up an ID).
4. Click OK. The Order Selector window opens and displays a list of orders for the 'Bill to' customer's ID.
5. Select the order you want to open from the Orders field.
6. Click OK to open the order on the Enter and edit orders window.

To search for an order

Follow this procedure to search for and open an existing order for which specific order information is not available.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click Open or Find.
3. Select the Order field's Find icon to open the Order Selector window.

4. Search for an order using one of the search methods.
5. Select the order you want to open from the Orders field.
6. Click OK to open the order on the Enter and edit orders window.

Procedure reference

There are three different methods that you can use to search for an order:

- Search from a list of all existing orders by clicking OK on the Order Selector window to display a list of all existing orders.
- Narrow your search according to the 'Ship to' customer's last name:
- Enter the 'Ship to' customer's complete or partial last name in the Search field. If you enter a complete last name, all orders display for anyone having that last name. If you enter a partial last name or the first letters of a last name, all orders display for anyone whose last name begins with those letters.
- Click OK.
- Narrow your search according to a specific order type and/or order status:
- Click Type or Status to narrow your search to a specific order type or status, respectively.
- Click Sort to sort the search results.
- Click OK.

Editing orders

iMIS Orders allows you to edit orders that have not been invoiced. Editing may be required for different situations. For example, a customer may decide to change either the products or product quantity ordered, or the wrong shipping information may have been entered for an order.

Whatever the reason, you have the ability to edit orders that have not been invoiced. Once an order is invoiced, it can no longer be edited or canceled. Debit memo orders are

used to increase the number of products purchased for an original invoiced order, and credit memo orders are used to reverse an invoiced order.

To edit the product quantity ordered

Follow this procedure to edit the products ordered, to edit the quantity ordered, or to delete a product from an order.

Note: You cannot edit an order that has been invoiced.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order from which you want to delete a product.
3. Click Edit.
4. From the list of Product Line Items, select the product that you are going to edit.
5. Place your cursor in the line-item's Quantity field, and update the product quantity. If you are deleting a product from an order, enter a zero (0).
6. Click Save to update the order. The Price field will continue to display the product price, but the Extension field will display the updated total product price for the order. The Order Total and Balance fields will update accordingly.

To add a product to an existing order

Follow this procedure to add a product to an existing order. To add a product to an existing order, the order must not have been invoiced. If additional products need to be added to an invoiced order, you must enter a debit memo order.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order to which you want to add a product.
3. Click Edit.

4. Without deleting any applicable discount, place your cursor in the% Disc field of the last line item of the order, and press Tab. Your cursor now will be in the Product field.
5. Enter the product code in the Product field, or select the Find icon to open the Product Find window and search for a product (see "Searching for products").
6. Enter the number of new products ordered in the Quantity field.
7. (optional) Edit the product Price if necessary.
8. (optional) Enter a percentage discount for the product in the % Disc field.

   Entering a product-level discount in the % Disc field overrides any order-level discount entered in the % Discount field. However, product-level discounts are applicable only for a given product and do not affect entire order-level discounts.
9. Press Tab to add the product to the order. The product will display in the list of Product Line Items, and your cursor will be in the Product field.
10. Repeat this process for each additional product to be purchased.
11. Click Save to update the order.

    To override a product's default warehouse

    If you are using Multi-Warehouses, follow this procedure to override a product's default warehouse. To override a product's default warehouse, multiple warehouses must be defined for the product on the Warehouses window.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Enter a new order, or open an existing order.
3. While in the edit mode, double-click the product line-item for which you want to enter specific order information. The Product Detail window will open.
4. (Optional, only if using Multi-Warehouses) Override the product's default Warehouse if necessary:

- Enter a Warehouse; or
- Select the Warehouse field's Find icon, and select a warehouse with sufficient inventory to fill the order.

5. Click OK to close the Product Detail window.
6. Click Save to save the order information.

To place a product on backorder

If a customer orders a product that incorrectly shows to be in inventory, you can edit the order and place the product on backorder if the order has not been invoiced.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order for the product you need to place on backorder.
3. Click Edit.
4. Select the product that you are going to place on backorder from the list of Product Line Items.
5. While pressing Shift, place your cursor in the Ship field. The Ship field enables and becomes editable.
6. Enter a zero in the Ship field, and press Tab. This will update the Back field with the original product quantity ordered, and the Ship field will be cleared.
7. Click Save. The Committed field on the Manage products window will decrease by the number of products placed on backorder.

Canceling orders

You can cancel an un-invoiced order with or without a credited payment (prepayment). Canceling an order without a prepayment reverses an order. Canceling an order with a prepayment creates a credit balance. You can apply a credit balance to another order or issue a refund to a customer.

To cancel an order

Follow this procedure to cancel an un-invoiced order without a prepayment. A canceled, un-invoiced order without a prepayment does not generate invoice or transaction line items. Therefore, the Enter and edit orders window's Account Info tab will not reflect any record of either the order or the cancellation of the order.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order you want to cancel.
3. Click Delete. A system message prompts you to verify the cancellation of the order.
4. Click Yes to cancel the order. CANCELED displays in the Status field.

To cancel an order with a cash prepayment

Follow this procedure to cancel an un-invoiced order with a cash prepayment. A canceled, un-invoiced order with a cash prepayment will generate a credit balance on the Customer Management Transaction Ledger window (from Customers, select Manage customers, select the AR/Cash tab on the History section, and double-click the order). However, a canceled, un-invoiced order will not generate any transactions on the Enter and edit orders window's Account Info tab.

When canceling an order with a cash prepayment, you can apply a credit balance to another order or issue a refund to the customer.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order you want to cancel.
3. Click Delete. A system message prompts you to verify the cancellation of the order.
4. Click Yes to cancel the order.

To cancel an order with a credit card prepayment

Follow this procedure to cancel an un-invoiced order with a credit card prepayment. The following steps will cancel both an order and a credit card prepayment.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order you want to cancel.
3. Select the Payments tab.
4. Click Edit.
5. Delete the amount in the Payment Amount field, but do not alter any data in the other fields:

- Do not delete the data in the Check # / CC, Credit Card Number, Expiration Date, or Name on Credit Card fields. In order to apply a reversal to the correct cash account and for a payment method to reflect the correct reverse entry, the original, correct data must be entered in these fields.
- If the Recognize Credit Card Order Payments as Prepaid Cash option is enabled on the AR/Cash Set up module window (from AR/Cash, select Set up module), deleting a payment removes the value from the following fields: Orders.RECOGNIZED_CASH_AMOUNT, Invoice.CREDITS, and Invoice.BALANCE.
- If the Recognize Credit Card Order Payments as Prepaid Cash option is not enabled, Orders.RECOGNIZED_CASH_AMOUNT is not populated, and an invoice transaction is not created.

6. Click OK to delete the credit card prepayment.
7. Click Delete. The Enter and edit orders window defaults to the Overview tab, and a system message prompts you to verify the cancellation of the order.
8. Click Yes to cancel the order.

To restore a canceled order

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.

2. Open the order you want to restore.
3. Click Edit. A message displays prompting you to restore the order.
4. Click Yes. A message displays prompting you to proceed with the order edit.
5. Click OK to restore the order, and make any necessary edits.
6. Click Save.

Editing payment types

If a payment type is applied to an order in error, you can edit the payment type. However, you need to be aware of several possible error scenarios related to whether the Recognize Credit Card Order Payments as Prepaid Cash option on the AR/Cash Set up module window (from AR/Cash, select Set up module) is enabled or disabled.

Recognize Credit Card Order Payments as Prepaid Cash - option enabled

When the Recognize Credit Card Order Payments as Prepaid Cash option is enabled, the following scenarios will cause an error if you try to edit the Check # / CC field on the Enter and edit orders window's Payments tab:

- Changing the payment type from cash/check to credit/debit card when the Orders.RECOGNIZED_CASH_AMOUNT field is populated
- Changing the payment type from credit/debit card to cash/check when the Orders.RECOGNIZED_CASH_AMOUNT field is populated
- Changing the payment type from one credit/debit card to another when the credit/debit card cash accounts are different and the Orders.RECOGNIZED_CASH_AMOUNT field is populated

To edit a payment type recognized as prepaid cash

Follow this procedure to edit a payment type when the Recognize Credit Card Order Payments as Prepaid Cash option is enabled.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.

2. Open the order for which you want to edit the payment type.
3. Select the Payments tab.
4. Click Edit.
5. Delete the amount in the Payment Amount field, but do not alter any data in the other fields. If you try to edit the Check # / CC field on the Payments tab without first deleting the amount in the Payment Amount field, you will receive an error message.
6. Click OK on the Payments tab.
7. Click Edit.
8. If you are entering a payment by cash or check, enter the cash payment type or check number in the Check # / CC field.
9. If you are entering a payment by credit card, enter the credit card payment type in the Check # / CC field and any other required data in the following fields:
   - Enter a Credit Card Number.
   - Enter a credit card Expiration Date.
   - (optional) Enter a credit card Authorization code.
   - Enter the name on the credit card in the Name on Credit Card field.
10. If you are entering a payment by European debit card, enter the European debit card payment type in the Check # / CC field and any other required data in the following fields:
    - Enter the card number in the Credit Card Number field.
    - (optional) Enter the card's CSC number.
    - Enter a card Expiration Date (mm/yy).
    - (optional) Enter an Authorization code.
    - Enter the name on the card in the Name on Credit Card field.

- (optional) Enter the card's issue number in the Issue # field.
- (optional) Enter the card's Issue Date (mm/yy).

11. Enter the correct Payment Amount.
12. Click OK to update the payment information.

Recognize Credit Card Order Payments as Prepaid Cash - option disabled

When the Recognize Credit Card Order Payments as Prepaid Cash option is disabled, the following scenario will cause an error if you try to edit the Check # / CC field on the Payments tab:

- Changing the payment type from credit/debit card to cash/check when the Orders.RECOGNIZED_CASH_AMOUNT field is populated.

To edit a payment type not recognized as prepaid cash

Follow this procedure to edit a payment type when the Recognize Credit Card Order Payments as Prepaid Cash option is disabled.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open the order for which you want to edit the payment type.
3. Select the Payments tab.
4. Click Edit.
5. If you are entering a payment by cash or check, enter the cash payment type or check number in the Check # / CC field.
6. If you are entering a payment by credit card, enter the credit card payment type in the Check # / CC field and any other required data in the following fields:

- Enter a Credit Card Number.
- Enter a credit card Expiration Date.

- (optional) Enter a credit card Authorization code.
- Enter the name on the credit card in the Name on Credit Card field.

7. If you are entering a payment by European debit card, enter the European debit card payment type in the Check # / CC field and any other required data in the following fields:

- Enter the card number in the Credit Card Number field.
- (optional) Enter the card's CSC number.
- Enter a card Expiration Date (mm/yy).
- (optional) Enter an Authorization code.
- Enter the name on the card in the Name on Credit Card field.
- (optional) Enter the card's issue number in the Issue # field.
- (optional) Enter the card's Issue Date (mm/yy).

8. Enter the correct Payment Amount if necessary.
9. Click OK to update the payment information.

Applying credit balances as orders payment

If a customer has an open credit balance, you can apply this credit balance as payment for either an existing order or a new order. You can apply all or part of a credit balance as payment. If you attempt to apply an amount in excess of the credit balance, an error message will be generated. Credit balances are applied as payment by using the *Tab command.

Selecting open payments for orders: *Tab

When you enter an asterisk (*) in the Check # / CC field on the Enter and edit orders window's Payments tab and then press Tab, the Select Open Payments window opens. This window is used for applying open credit balances as payment for new and existing orders.

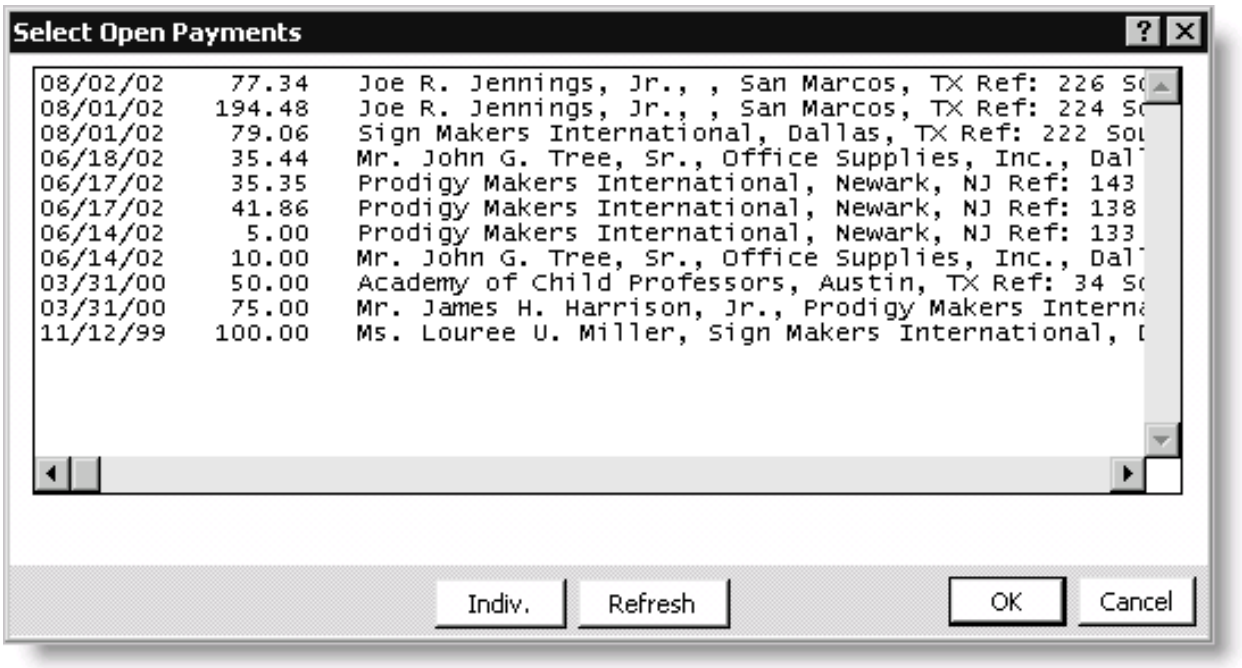
When you first open the Select Open Payments window for a given customer, any open credit balances the customer has display on the window. If a customer has generated several credit balances on different occasions, each individual open credit balance displays. However, you can select only one credit balance at a time on the Select Open Payments window when applying credit balances as payment.

Applying credit balances to other customers

When in the All view, any open credit balance can be applied to a customer's account for which you are entering payment. For example, if a customer is an employee of the XYZ Corporation and XYZ has an open credit balance, you can apply XYZ's credit balance as payment for the customer's order.

After applying a credit, the Trans.INVOICE_REFERENCE_NUMBER will be the same for both the customer who generated the credit balance and the customer for whom the credit balance was applied.

Select Open Payments window (Orders)



From Orders, select Enter and edit orders, open an order, select the Payments tab, click Edit, and use the * Tab command

Credit Balances

Displays the credit balances for either a single customer or all of your customers depending on which view is enabled. Each line indicates an individual credit balance and includes the following information:

- The date the credit balance was generated
- The amount of the credit balance
- The name of the customer
- The customer's city and state
- The reference number of the credit balance transaction
- The iMIS system module in which the credit balance was generated

All/Indiv button

Click to toggle between the All and Individual views. The Individual view displays all of the open credit balances for a given customer. The All view displays all of the open credit balances for all of your customers.

Refresh button

Click to refresh the data on the window.

To apply a credit balance as Orders payment

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Enter or open an order. (See Entering Orders or Finding Orders.)
3. While in the Edit mode, select the Payments tab.
4. Enter an asterisk (*) in the Check # / CC field.
5. Press Tab to open the Select Open Payments window.
6. Select the open credit balance you want to apply as payment from either the Individual or All view.

- Click Indiv to display all of the open credit balances for a given customer.
- Click All to display all of the open credit balances for all of your customers.

7. Click OK to close the Select Open Payments window.
8. Enter the amount of the credit balance you are applying as payment in the Payment Amount field. The credit balance's reference number will display next to the asterisk in the Check # / CC field.
9. Click OK to apply the credit balance as payment. The amount of the credit balance you entered in the Payment Amount field will display in the Paid field on the Overview tab.

Entering credit memo orders

Invoiced orders cannot be canceled; therefore, you reverse an invoiced order by entering a credit memo order against an original order's invoice number. Because the audit trail would be lost, entering a credit memo order does not update an original, invoiced order.

To enter a credit memo order (cancel an invoiced order)

1. View the original order details and note the information you need to enter a credit memo:

- The Bill to ID
- The Invoice #
- The Source code
- The Product code
- The Quantity
- The Freight and Handling charges, if any

2. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
3. Click New. The Order Date defaults to the batch date if batch control is used; otherwise, the date defaults to the system date.

4. Enter the credit memo (CM) order type in the Order Type field (select the Find icon to look up the order type).
5. Press Tab to go to the Bill to ID field. The Invoice # field enables.
6. Enter the Bill to ID.
7. Override the Order Date if necessary.
8. Enter the original order's invoice number in the Invoice # field (select the Find icon to look up the invoice number).
9. Enter a source code in the Source field.
10. Enter the product code from the original order in the Product field.
11. Enter the product Quantity from the original order and press Tab.

    When you tab out of the Quantity field, the Quantity, Ship, Extension, Product Total, Tax, Order Total, and Balance fields are updated automatically to a negative number.
12. Enter the freight and handling charges to be refunded.

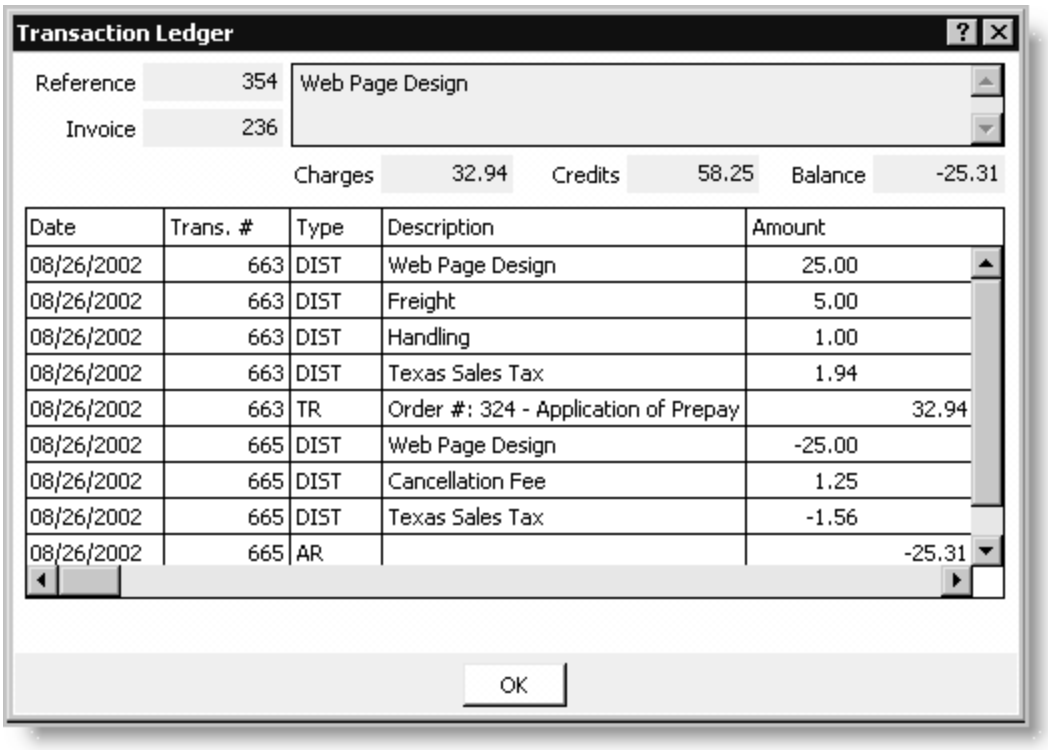
- Select the Order Details tab.
- In the Manual Handling field, enter the handling charge from the original order and press Tab.
- In the Manual Freight field, enter the freight charge from the original order and press Tab.

13. Repeat this process for each of the products on the original order.
14. Click Save.
15. Invoice the order.

    To view credit transactions

    Because the audit trail would be lost, entering a credit memo order does not update an original, invoiced order. However, you can view all transactions attached to an original invoice number through the AR/Cash Transaction Ledger window.

1. From AR/Cash, select Process month-end procedures to open the Process month-end procedures window.
2. Click Credit Invoices to open the Credit Invoices window.
3. Double-click the invoice for which you want to view all transactions to open the Transaction Ledger window.



Date	Trans. #	Type	Description	Amount
08/26/2002	663	DIST	Web Page Design	25.00
08/26/2002	663	DIST	Freight	5.00
08/26/2002	663	DIST	Handling	1.00
08/26/2002	663	DIST	Texas Sales Tax	1.94
08/26/2002	663	TR	Order #: 324 - Application of Prepay	32.94
08/26/2002	665	DIST	Web Page Design	-25.00
08/26/2002	665	DIST	Cancellation Fee	1.25
08/26/2002	665	DIST	Texas Sales Tax	-1.56
08/26/2002	665	AR		-25.31

Example of the AR/Cash Transaction Ledger window reflecting all transactions for Invoice # 236

Entering debit memo orders

Invoiced orders cannot be edited, so the quantity of products purchased cannot be increased for an invoiced order. Debit memo orders are used to increase the number of products purchased for an original invoiced order. As with a credit memo order, a debit memo order also is entered against an original order's invoice number. However, because the audit trail would be lost, entering a debit memo order does not update an original, invoiced order.

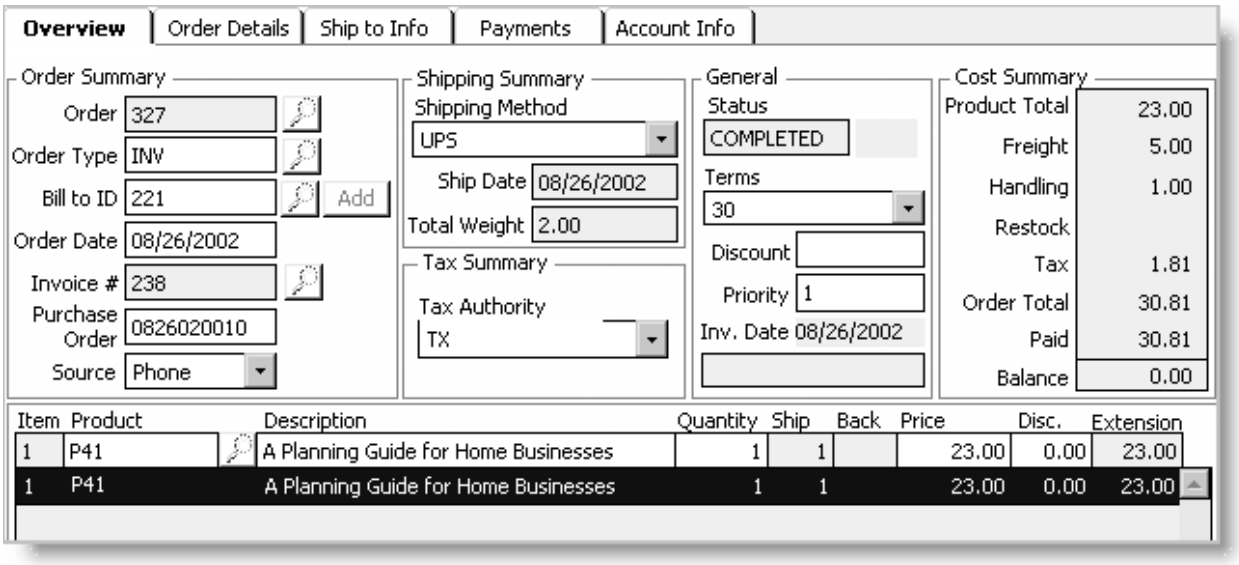
All transactions attached to an original invoice number can be viewed through the AR/Cash Transaction Ledger window. A Trial Balance report can be printed from the AR/Cash Generate reports window, showing all transactions associated with an order.

If entering a debit memo for a bad check or credit card payment, setting up an order type specifically for this situation is recommended.

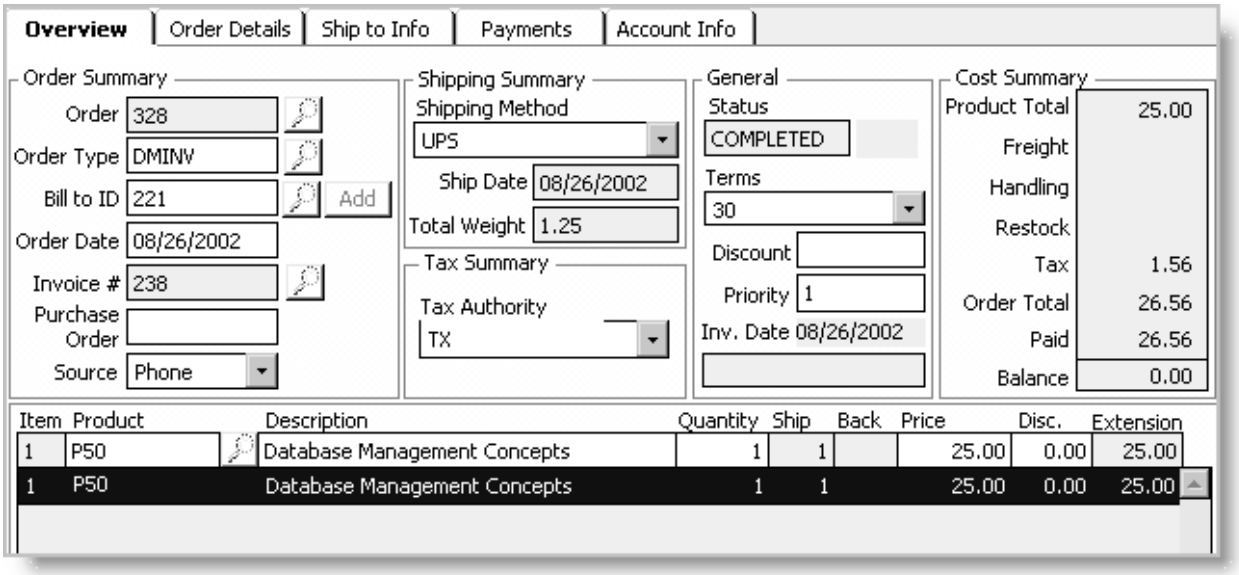
To enter a debit memo order

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click New. The Order Date defaults to the batch date if batch control is used; otherwise, the Order Date defaults to the system date.
3. Enter the debit memo (DMINV) order type in the Order Type field (select the Find icon to look up the order type).
4. Press Tab to go to the Bill to ID field. The Invoice # field enables.
5. Enter the Bill to ID.
6. Override the Order Date if necessary.
7. Enter the original order's invoice number in the Invoice # field (select the Find icon to look up the invoice number).
8. Enter a source code in the Source field.
9. Enter the Product code of the product you want to add to the order.

   If entering a debit memo for a bad check or credit card payment, set up a product code specifically for the bad check or credit card payment.
10. Enter the Quantity of the product you are adding to the order, and press Tab.
11. Repeat this process for each additional product you want to add to the order.
12. Click Save.
13. Invoice the order.



Example of an original invoiced order - Invoice # 238



Example of the invoiced debit memo order for Invoice # 238

To view debit transactions

Because the audit trail would be lost, entering a debit memo order does not update an original, invoiced order. However, you can view all transactions attached to an original invoice number through the Enter and edit orders window's Account Info tab.

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Open either the original order or the debit memo order with the same invoice number.
3. Select the Account Info tab listing all transactions for the same invoice number.

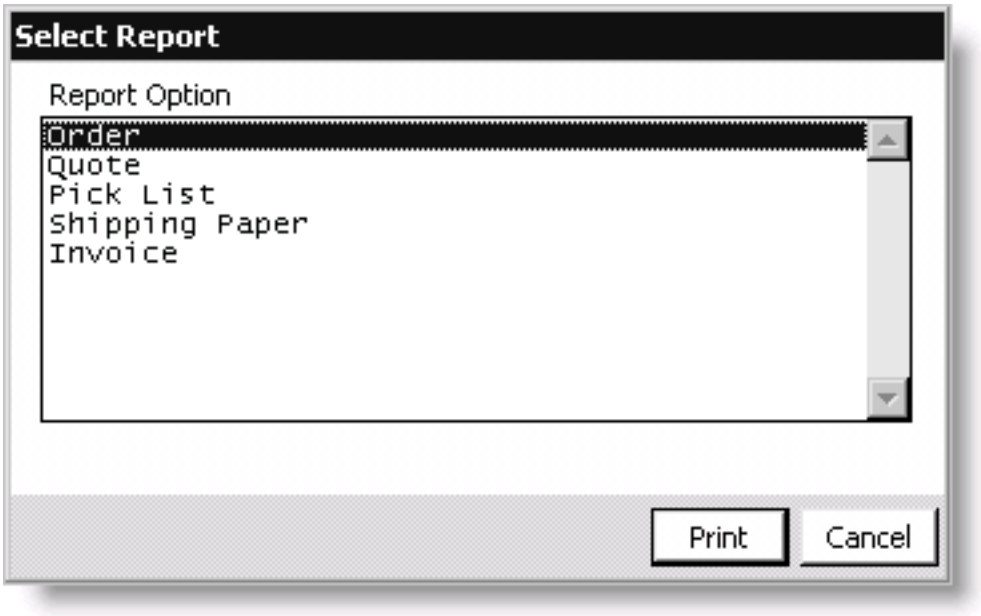
Printing order-specific reports

iMIS allows you to print reports for specific orders. Depending on the stage of the order process, you can print a copy of the order as well as quotes, pick lists, shipping papers, and invoices. These reports are accessed through the Select Report window, which opens when you click Print.

In addition, you can move orders through the order processing stages using the Print button.

Select Report window for Orders



From Orders, select Enter and edit orders, open or enter an order, and click Print

Report Option

Lists the reports or processing options that you can select for the current order depending on its processing stage. For example, you cannot print a shipping paper until you process an order through the shipping paper stage.

- Order - Select this option to print an Order Detail report.
- Quote - Select this option to print an order's Quotation. Optional: Convert the order to QUOTEREADY status.

- Convert Quote - Select this option to convert a quote to an order.
- Pick List - Select this option to print an order's Pick List. Optional: Convert the order to SHIPPAPER status.
- Shipping Paper - Select this option to print an order's Packing Slip. Optional: Convert the order to SHIPMENT status.
- Ship Order - Select this option to convert an order to INVOICE status.
- Invoice - Select this option to print an order's Invoice and convert order status to COMPLETED.

Print button

Click to print the selected report.

To print an order-specific report

1. Select File > Report Destination, and select the destination for the report.
2. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
3. Open the order for which you want to print a report.
4. Click Print to open the Select Report window.
5. Select the report you want to print from the Report Option list.
6. Click Print to print the report.

Accessing the Orders feature from Customers

You can access the Orders feature from the Manage customers window's Orders tab. The Orders tab allows you to find and view customers' open and invoiced orders. You can open the Enter and edit orders window for a customer directly from the Orders tab by clicking New Order.

The Orders tab's Current view displays a list of all open orders. Double-clicking an open order while in the Current view opens the order on the Enter and edit orders window

where you can edit and view the selected order. The History view displays a list of all invoiced orders. Double-clicking an invoiced order while in the History view opens the Activity Detail window.

From Customers, select Manage customers, open a customer record, select the Orders tab, and click History

Transaction Date

Displays the date of the transaction.

Product Code

Displays the code for the purchased product.

Description

Displays a description of the product.

Amount

Displays the amount of the order.

New Order button

Opens the Enter and edit orders window and enter an order.

Current button

(Not shown in example) Click to toggle between viewing historical invoiced orders and current open orders.

To access the Orders module from Customer Portfolio

1. From Customers, select Manage customers to open the Customer Portfolio.
2. Open a customer record.
3. Select the Orders tab. The Current view displays by default.
4. To access the Orders module, do one of the following:

- Click New Order to open the Enter and edit orders window for the customer. When you click New on the Enter and edit orders window, the customer's ID automatically populates the Bill to ID field.
- Double-click the gray box to the left of the Date field to open the customer's selected order in Enter and edit orders window. You then can view or edit the customer's order.

To access the Customer Portfolio from the Orders module

You can go directly to a customer's Customer Portfolio record from that customer's order in the Orders module.

1. Open a customer order.
2. Click Customers.

The customer record is displayed in the Customer Portfolio.

Viewing order activities

Order activity records are created each time you invoice a customer's order. When an order is invoiced and the activity record is created, the quantity of each individual product ordered populates the Activity.QUANTITY field. The total product quantity of the order populates the Orders.TOTAL_QUANTITY_ORDERED field.

If you enable the Create Activity Records for Zero Dollar Orders option on the AR/Cash Set up module window, activity records also will be created for zero dollar orders. If you are using batch control and the Separate Posting Cycle Required option is enabled on the AR/Cash Batch Control window, order activity records will be created when you post a batch.

You can view a customer's order activities through the Manage customers window's Activities-All tab. Double-clicking an order activity opens the Activity Detail window.

Tip: For details about the Activities-All tab fields, see Manage customers window - Activities-All tab in the Customers section.

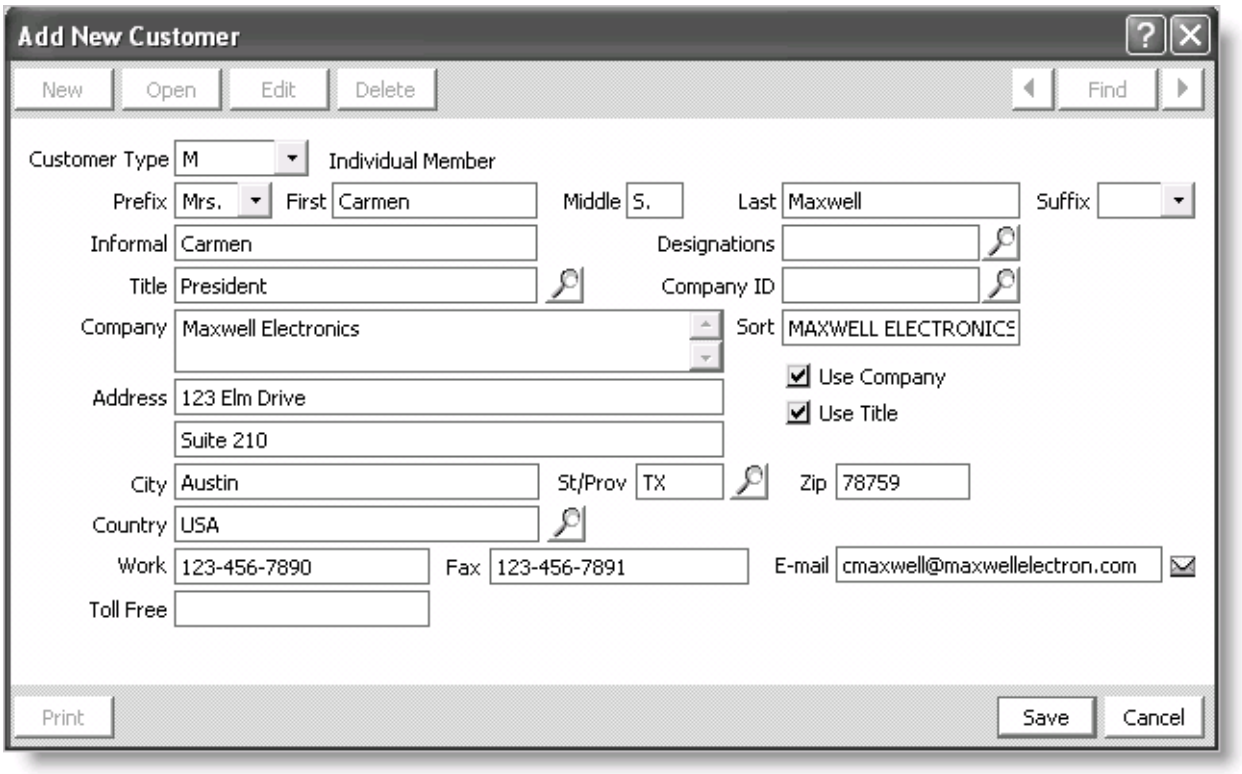
To view customer order activities

1. From Customers, select Manage customers to open the Manage customers window.
2. Open a customer record.
3. Select the Activities-All tab.
4. Select Order from the Activities drop-down list. All of the customer's order activities display on the tab.
5. Double-click an order activity to open it in the Activity Detail window.

Adding new customers during order entry

iMIS Orders allows you to add a new customer to your database during order entry. Enter name and address information on the Add New Customer window, and then continue to process the order.

Add New Customer window



From Orders, select Enter and edit orders, enter an order, and click Add

Customer Type

(required) Select a customer type for the new customer's record. The Customer Type field requires population before any other fields on the Add New Customer window can be populated.

Type

(Read only) Displays the customer type selected.

Prefix

Select a prefix for a customer, such as Mr., Ms., or Dr.

First

Enter a customer's first name.

Middle

Enter a customer's middle name.

Last

Enter a customer's last name.

Suffix

Select a suffix for a customer, such as Jr., Sr., or III.

Informal

(Defaults to the name entered in the First field) Enter a customer's informal name or nick-name.

Designations

Enter a customer's professional designations, such as CPA, Ph.D., or MD; select the Find icon to look up a designation.

Title

Enter a customer's professional title or position; select the Find icon to look up a title.

Company ID

Enter a customer's company ID; select the Find icon to look up an ID.

Company

Enter a customer's company name; select the Find icon to look up a company.

Sort

Specify a value by which you want to sort a company record (Name.COMPANY_SORT). iMIS automatically removes the first instance of the word “The” from a company name.

Use Company

Select to print the company name on reports.

When adding new records during product orders, iMIS automatically sets this option to equal the Main address field's settings on the Customer Setup - Address and Notes

window. If you override the settings on the Add New Customer window while adding a new customer record, these changes are copied to the Ship to Info tab, which affects the Ship To address but does not affect the Bill To address.

Note: The label for the Use Company option is customizable, so your system may display another label for this option. The value entered in the Institute Type field on the Customer Setup - Basic Options window defines the option's label.

Use Title

Select to print the customer title on reports.

When adding new records during product orders, iMIS automatically sets this option to equal the Main address field's settings on the Customer Setup - Address and Notes window. If you override the settings on the Add New Customer window while adding a new customer record, these changes are copied to the Ship to Info tab, which affects the Ship To address but does not affect the Bill To address.

Address

Use these two fields to enter a customer's street address.

City

Enter a customer's city.

St/Prov

Enter a customer's state or province; select the Find icon to look up a state or province.

Zip

(Accepts up to nine characters) Enter a customer's ZIP code.

Country

(Leave blank to accept the default) Enter a customer's country; select the Find icon to look up a country.

Work

Enter a customer's work telephone number.

Fax

Enter a customer's fax number.

E-mail

Enter a customer's e-mail address.

Print button

Disabled.

To add a new customer during order entry

1. From Orders, select Enter and edit orders to open the Enter and edit orders window. The Overview tab displays by default.
2. Click New.
3. Enter an Order Type (select the Find icon to look up an order type), and press Tab to go to the Bill to ID field.
4. Click Add to open the Add New Customer window.
5. Enter the relevant customer information.
6. Click Save to add the customer to the database, and continue entering the customer's order.

Order Processing

In iMIS Orders, you process each order through stages to completion. There are several possible order stages, but the number and type of stages through which an order is processed depends on the order's type. Different order types require different processing stages. For example, a pro forma order (quote) is processed through a maximum of two stages after being entered: Print quotes and, if requested, Convert quotes which converts a pro forma order quote to an actual product order.

Using order processing

The order processing stages are accessed from the Process orders sub-task list (from Orders, select Process orders). Each sub-task list item opens a window used in processing an order to completion. Each processing window lists the orders that are at that stage of the order process. If an order processing window is empty, it means only that no orders are at that processing stage, not that active orders are not in the system.

Regardless of an order's status, orders placed on hold do not appear on the order processing windows. For more information about orders placed on hold, see Entering Order Details Tab Information.

Process orders sub-task list

Note: From Orders, select Process orders.

All order processing stages except Ship orders generate printed output, and this generated data is separate from Orders reports. Regardless of whether you generate printed data, each order must proceed through the stages defined for its specific order type.

These are the order processing stages:

Print quotes

(Used only with pro forma orders) Select to open the Print quotes window used for generating selected sales quotes. The Print quotes option is for printing only; it does not affect product inventory or account status. You can generate sales quotes and then e-mail, fax, or mail the quotes to customers requesting them.

Convert quotes

(Used only with pro forma orders) Select to open the Convert quotes window used for converting pro forma order quotes to actual product orders. The Convert quotes order stage is the second order stage following Print quotes for pro forma orders.

The Convert quotes stage automatically converts pro forma orders to an actual order with the appropriate order type. You specify which order type pro forma orders convert to in the Convert to Order Type field on the Order Status Defaults window (from Orders, select

Set up module, and click Order Staging). A converted order then reenters the staging process at the correct order stage defined for that order type.

Print pick list

Select to open the Print pick list window used for generating an itemized product list known as a Pick List. A Pick List sorts items by warehouse location and product. Separate print lists print per bin if you are using bins.

Print shipping papers

Select to open the Print shipping papers window used for generating a shipping paper known as a Packing Slip. These shipping papers, which detail an order's contents and 'Ship to' information, are packaged with each product shipment.

Ship orders

Select to open the Ship orders window used for recording actual shipping dates, shipping methods, and shipped quantities of orders. The Ship orders processing stage is the only order processing stage that does not generate printed output.

Invoice orders

Select to open the Invoice orders window used for posting (invoicing) selected order sales transactions to AR/Cash. Invoicing an order generates an order Invoice. You cannot edit or delete orders once you invoice them.

Close orders

(optional) Select to open the Close orders window used for marking COMPLETED orders as CLOSED.

Manually release backorders

Select this option to open the Manually release backorders window used for releasing orders with a BACKORDER status. This reverses the BACKORDER status and removes the backorder from the queue of orders awaiting inventory. The order is returned to the appropriate order processing stage automatically unless shipping papers have been generated.

You can release backorders manually even if the Automatic Backorder Processing option is enabled on the Backorder Processing window (from Orders, select Set up module, and click Backorders).

Converting orders

Each order processing window lists any orders currently at that order processing stage. Each conversion process moves an order to its next succeeding order processing stage, and you convert each order through its appropriate stages until the order is complete.

Order type determines the number and type of stages an order goes through in processing. Different order types require different processing stages.

All Orders Have a Status of

(read only) Displays the order processing stage.

Order #

(read only) Displays the order number.

Batch #

(read only) Displays an order's batch number if batch control was enabled on the AR/Cash Batch Control window (from AR/Cash, select Set up module, and click Batch Control) when the order was entered.

Type

(read only) Displays the order type.

Date

(read only) Displays the order date. If batch control is enabled, the batch date displays.

Customer

(read only) Displays the name of the 'Ship to' customer.

Company

(read only) Displays the name of the 'Ship to' company. If necessary, scroll to the right to view this information.

Entered By

(Not shown in example, display only) Displays the individual who entered the order. If necessary, scroll to the right to view this information.

Select

Select from a list of conversion options:

- All - Converts all of the orders at this processing stage.
- None - Converts none of the orders at this processing stage.
- Order # - Converts a specific order number at this processing stage. Selecting this option opens a window used for entering specific order numbers.
- Order Type - Converts all orders of a specific type at this processing stage. Selecting this option opens a window used for selecting a specific order type.
- Batch # - Converts orders with a specific batch number at this processing stage. Selecting this option opens a window used for entering specific batch numbers. The Batch # option does not display for the Invoice orders processing stage.

  Note: To process a group of orders within an order processing window, you can use the traditional GUI bulk selection methods (for example, pressing the Shift or Ctrl keys while selecting an order), or you can choose one of the Select options.

Sort

Select from a list of order sorting options to sort the orders in the window:

- Order # - Sorts by order number.
- Batch Number - Sorts by batch number. The Batch Number option does not display for the Invoice orders processing stage.
- Order Date - Sorts by order date.
- Order Type - Sorts by order type.

- Customer - Sorts by customer last name.
- Company - Sorts by company name.
- Entered By - Sorts by who entered the orders.

Convert button

Click to complete the processing stage for the selected order(s) and to generate the appropriate printout. Each conversion process moves an order to the next succeeding order processing stage configured for the order type.

To convert an order

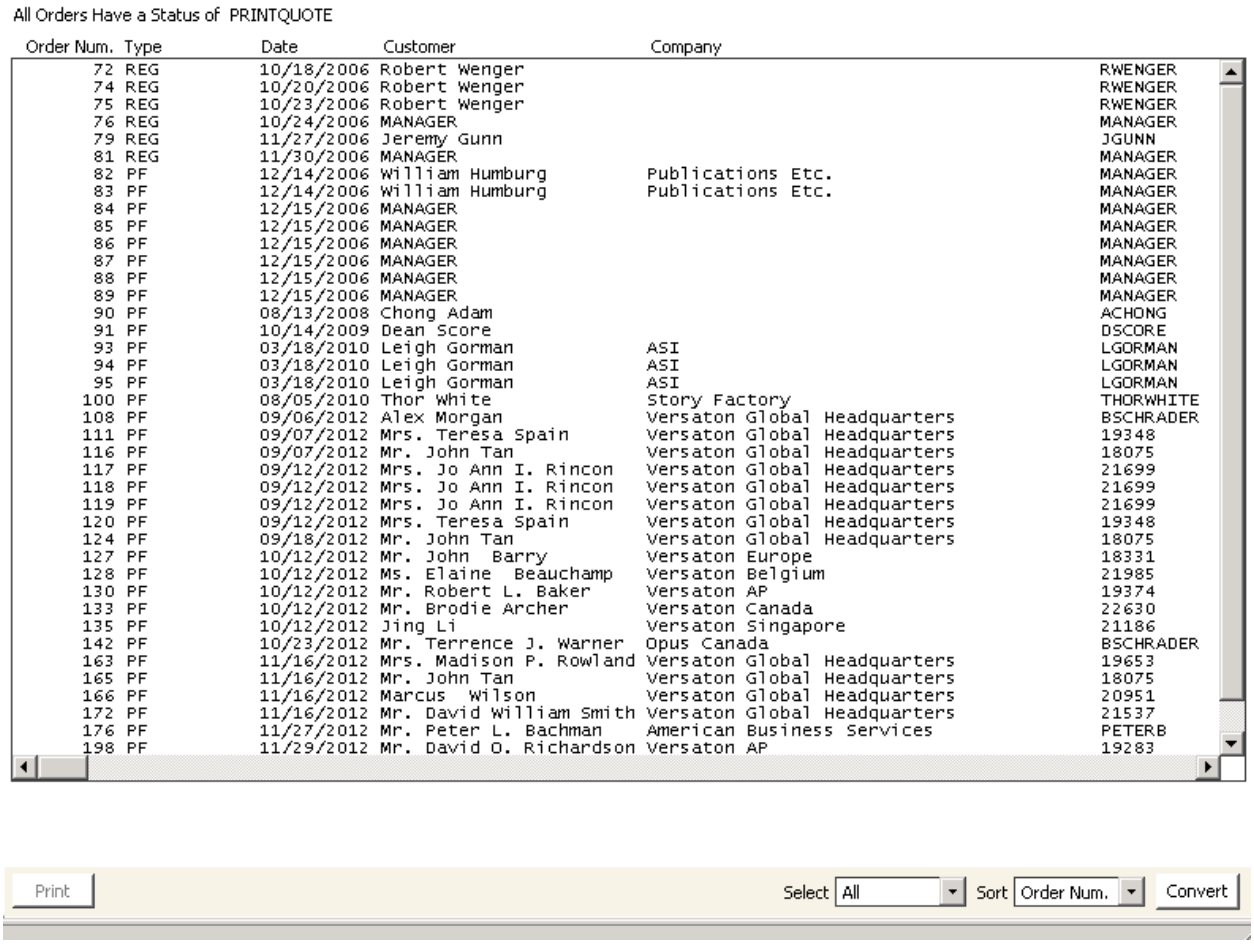
1. Enter an order.
2. From Orders, select Process orders to view the Process orders sub-task list.
3. Select the appropriate order processing stage to open that stage's order processing window.
4. Select the order(s) you want to convert to the next stage.
5. Click Convert. A message displays prompting you to confirm converting to the appropriate order type.
6. Click Yes to convert the order.

Printing sales quotes

The Print quotes option is used for printing sales quotes. Used only for pro forma orders, the Print quotes option allows you to print sales quotes without affecting product inventory or account status. You can generate sales quotes and then e-mail, fax, or mail the quotes to customers requesting them.

Sales quotes sort by order number and line item number, and any user defined fields populated for an order line item on the Product Detail window will print below each line item on a sales quote.

Print quotes window



Desktop: Orders > Process orders > Print quotes

To print sales quotes

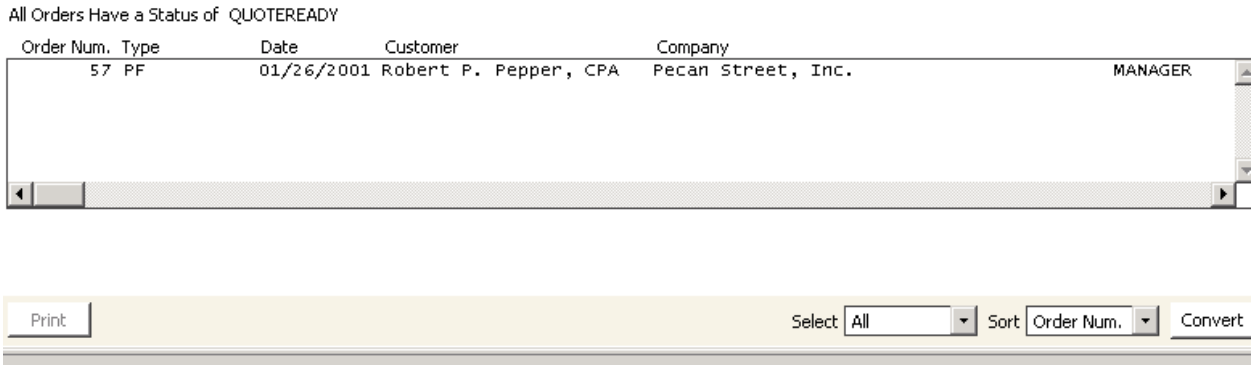
1. Enter a pro forma order.
2. From Print quotes window, select the order(s) for which you want to generate sales quotes. To edit an order, double-click it to open it on the Order Entry window.
3. Click Convert. A message displays prompting you to confirm moving the pro forma order (s) to the next stage.
4. Click Yes to convert the order(s) and print the sales quote(s).

Converting quotes

The Convert quotes option is used only with pro forma orders. It is the second order processing stage for pro forma orders following the Print quotes stage and automatically converts pro forma orders to actual orders.

You determine which order type pro forma orders convert to in the Convert to Order Type field on the Order Status Defaults window (from Orders, select Set up module, and click Order Staging). A converted order then enters the staging process at the correct order processing stage defined for that order type. The Convert quotes option does not generate printed data.

Convert quotes window



Desktop: Orders > Process orders > Convert quotes

To convert quotes

1. Complete the Print quotes order processing stage for the pro forma order you want to convert. See Printing Sales Quotes.
2. From Convert quotes window, select the order(s) you want to convert. To edit an order before converting it, double-click the order to open it on the Order Entry window.
3. Click Convert. A message displays prompting you to confirm converting to the appropriate order type.
4. Click Yes to convert the quote(s) to the appropriate order type. The Convert quotes option does not generate printed data.

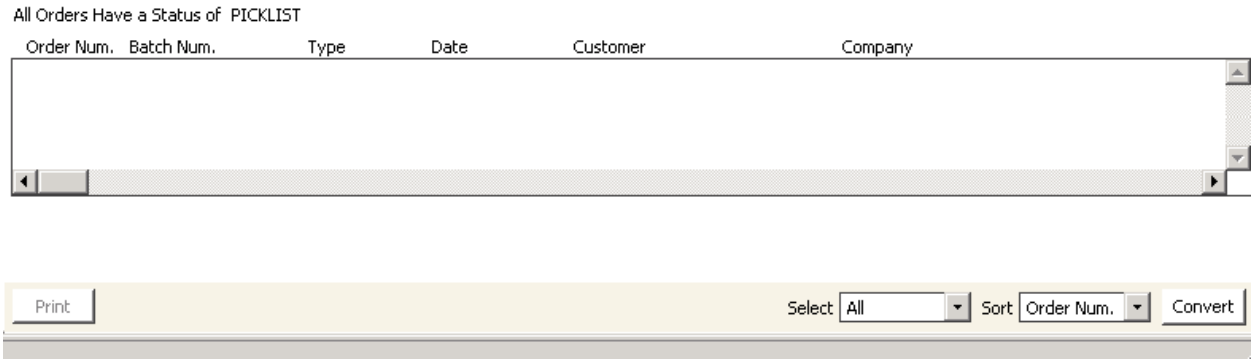
Printing pick lists

The Print pick list option is used for generating an itemized product list known as a Pick List. Pick lists sort products by product code, order number, and line number, and each product code prints on a separate page. Any user defined fields populated for an order line item on the Product Detail window will print below each line item on a pick list.

If the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory), products also sort by warehouse and bin. Each product code prints on a separate page, and if a product is ordered from multiple warehouses, a pick list then will sort each product code by warehouse; a separate page will print for each warehouse.

A product's warehouse Location Code prints at the top of a pick list. If a bin is defined for a warehouse, the Bin location prints next to a product line-item on a pick list.

Print pick list window



Desktop: Orders > Process orders > Print pick list

To print a pick list

1. From Print pick list window, select the order(s) for which you want to generate pick lists. To edit an order, double-click it to open the order on the Order Entry window.
2. Click Convert. A message displays prompting you to confirm printing the pick lists.
3. Click Yes to print the pick lists. A pick list will print for each individual item.

Example of a Pick List for item P42 - Multi-Warehouses disabled

Printing shipping papers

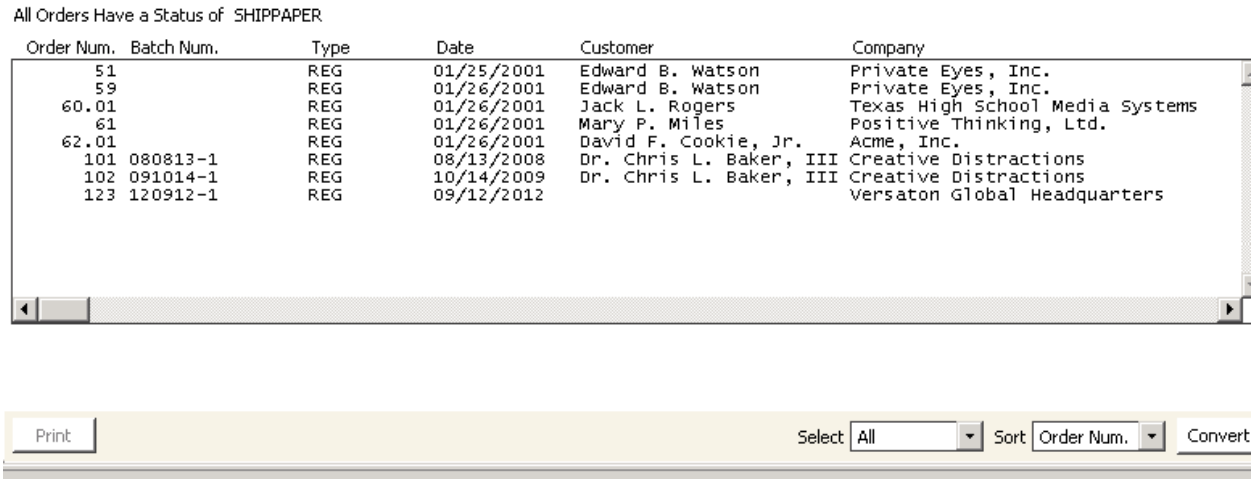
The Print shipping papers option is used for generating a shipping paper known as a Packing Slip. Shipping papers generate for individual orders and detail order 'Ship to', Sold To, and content information; each order should ship with shipping papers.

Any user defined fields populated for an order line item on the Product Detail window will print below each line item on a shipping paper. If the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (from Orders, select Set up module, and click Inventory), shipping papers sort by order number, warehouse, and line number.

If the warehouse location changes for an individual product, that product's order information prints on a separate page. The Warehouse location prints at the top of a shipping paper, and, if a bin is defined for a warehouse, the Bin location prints next to the product line-item. In addition, order quantity totals will not print on shipping papers when the Enable Multi-Warehouses option is enabled.

Shipping papers also sort product kits by warehouse location when the Enable Multi-Warehouses option is enabled. A product kit will print on one page, and the kit's items will sort and print on separate pages depending on warehouse location. For example, a product kit consists of four items. Three items are from the Default warehouse, and the fourth item is from the North warehouse. The three items from the Default warehouse will print on one page, and the fourth item from the North warehouse will print on a separate page.

Print shipping papers window



Desktop: Orders > Process orders > Print shipping papers

To print shipping papers

1. From Print shipping papers window, select the order(s) for which you want to print shipping papers. To edit an order, double-click it to open the order on the Order Entry window.
2. Click Convert. A message displays prompting you to confirm printing the shipping papers.
3. Click Yes to print the shipping papers. The following is a sample shipping paper:

   Note: If you are converting multiple shipping papers and screen is the report destination, canceling the job before all shipping papers are processed will cause errors. These errors will occur for every shipping paper that was not processed, and the unprocessed shipping papers will not print. However, each order still will proceed to the Ship orders stage.

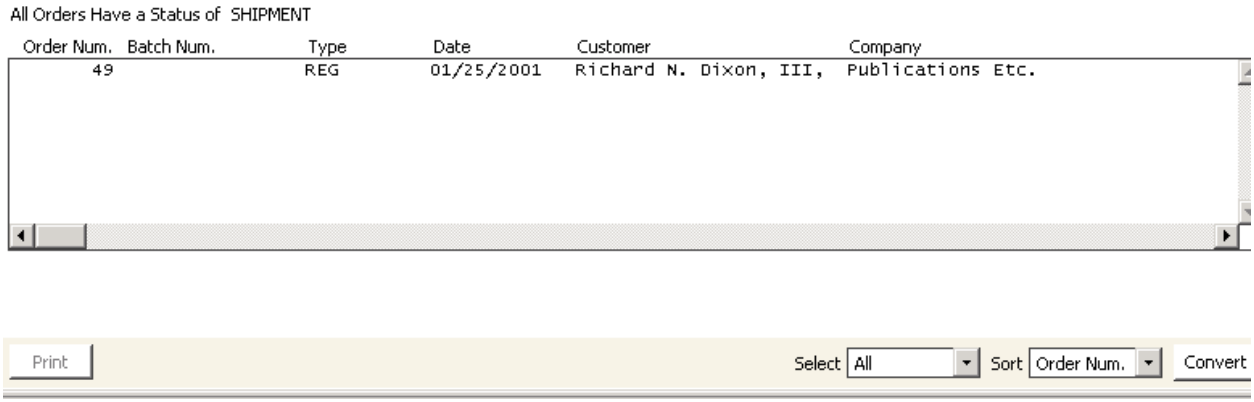
98.90	5.00	1.00	0.00	6.56	111.46		111.46

Example of a Packing Slip - Multi-Warehouses disabled; pricing information displays only if the Show Prices On Shipping Paper option is enabled on the Order Status Defaults window (from Orders, select Set up module, and click Order Staging)

Shipping orders

The Ship orders option is used for shipping orders and is the only order processing stage that does not generate printed output. At this order processing stage, you can open the Ship Order window to record an order's actual shipping date and shipping method. The Ship Order window also allows you to edit freight and handling charges and the quantity of items shipped.

Ship orders window



Desktop: Orders > Process orders > Ship orders

Order Number

(read only) Displays the number assigned to an order.

Order Date

(read only) Displays the date of an order.

PO

(read only) Displays the purchase order number of an order, if any.

Ship To

(read only) Displays the name and address of the customer to whom an order is shipping.

Ship Date

(Defaults to the system date and time) Enter an order's shipping date and time.

Ship Method

Enter an order's shipping method. Select the Find icon to look up a shipping method.

Shipping methods are defined on the SHIP_METHOD lookup/validation tables (from Customers, select Set up tables > lookup/validation).

Freight

Add a freight charge or override the automatic freight charges generated for an order. You can override a Freight amount by entering a value and pressing Tab; the Auto Calc Freight option will disable.

Auto Calc Freight

This option enables automatically if the Automatic Calculation of Freight Charge option is enabled on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

Handling

Add a handling charge or override the automatic handling charges generated for an order. You can override a Handling amount by entering a value and pressing Tab; the Auto Calc Handling option will disable.

Auto Calc Handling

This option enables automatically if the Automatic Calculation of Handling Charge option is enabled on the Add-on Charges window (from Orders, select Set up module, and click Add-on Charges).

Line

(read only) Displays the line number of an order.

Product

(read only) Displays the product codes of the items ordered.

Description

(read only) Displays the product descriptions of the items ordered.

Order

(read only) Displays the quantity of the items ordered.

Ship

Enter the quantity of items shipped.

Back

Enter the quantity of items on back order.

To ship an order

1. From Ship orders window, select the order(s) you want to ship.
2. Click Convert. A message displays prompting you to confirm marking the selected order (s) as shipped.
3. Click Yes. The Shipment Express window opens.
4. If you want to cancel shipping the order, use the following steps:

- Click Cancel. A message displays stating that express shipping was canceled.
- Click OK to cancel shipping the order and return to the Ship orders window.

5. (optional) Edit the Ship Date and/or Ship Method, if necessary.
6. Click OK. A message displays prompting you to remove any previously specified shipping methods.
7. Click No to ship the order, or click Yes to remove any previously specified shipping methods and ship the order.

To edit an order's shipping information

You can view and edit an order's shipping information using the Ship Order window.

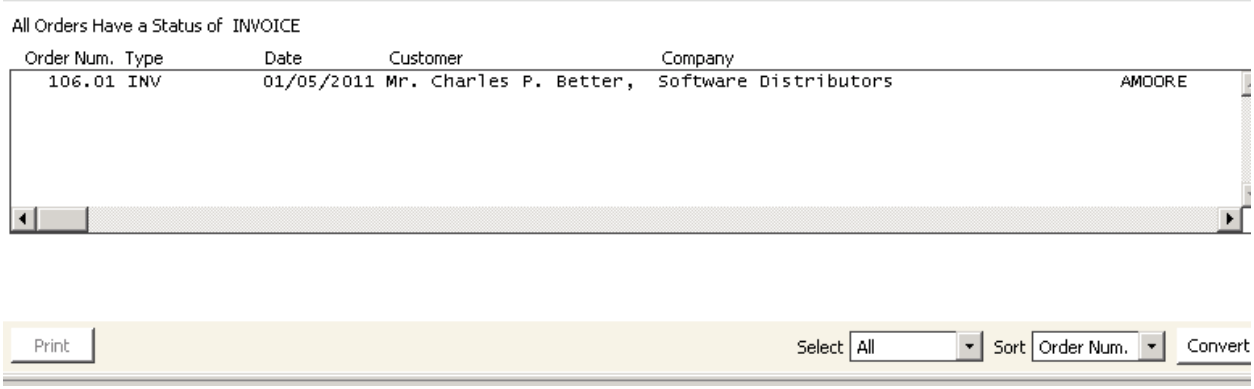
1. From Ship orders window, double-click an order to open the Ship Order window. Detailed information about the selected order displays on the window.
2. Edit the shipping information, if necessary. For example, edit the Ship Date, select a new Ship Method, or override the freight and handling information.
3. Click OK to mark the order as shipped. The order will ship just as if you had selected it and clicked Convert on the Ship orders window.

Generating an order invoice

The Invoice orders option is used for posting selected sales transactions to iMIS AR/Cash. Once you have invoiced an order, the order cannot be edited or deleted.

Generating an order invoice also creates an accounting entry, affects product inventory, and generates an activity record for a customer. If you enable the Create Activity Records for Zero Dollar Orders option on the AR/Cash Set up module window (from AR/Cash, select Set up module), activity records are generated for zero-dollar orders as well.

Invoice orders window



Desktop: Orders > Process orders > Invoice orders

To invoice orders

1. From Invoice orders window, select the order(s) you want to invoice. To edit an order, double-click it to open the order on the Order Entry window.

2. Click Convert. A message displays asking if you want to invoice the order(s) and mark them as completed.
3. Click Yes to invoice the order(s). The Enter Invoice Date window opens.
4. (optional) Edit the invoice date, if necessary.
5. Click OK to invoice the order(s).
6. (optional) If you are using batch control and have enabled the Create New Batch for Invoicing option on the Order Status Defaults window, a message displays stating that a new batch for order invoicing is going to be created by the system.

- Click Yes to continue.

  The Batch # has been created for invoicing message displays with the specified batch number.

- Click OK.

Advanced Solutions International, Inc.

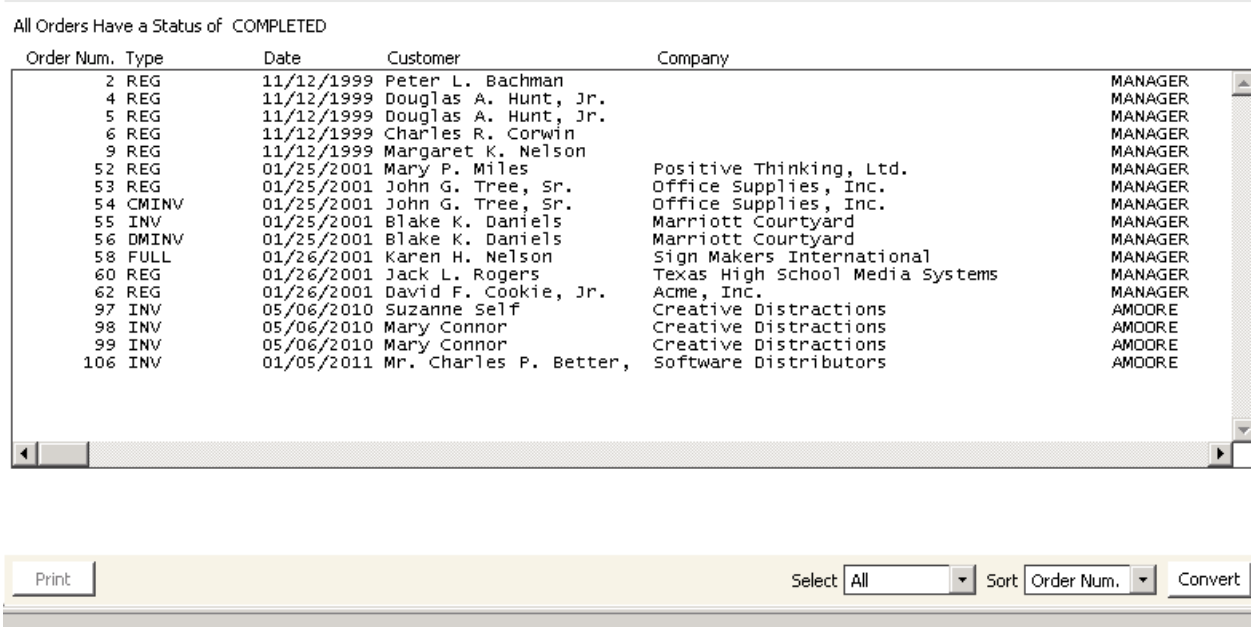
Example of an order Invoice; note the user defined fields

Closing orders

The Close orders option is used for closing orders that have a COMPLETED status. Only orders with a COMPLETED status can be closed.

The Close orders option is not a required step, and closing an order changes only the Orders.STAGE field from COMPLETED to CLOSED. It is available as an option for customers who may want to purge or archive order records; you can use the Closed status to indicate which orders are ready for purging or archiving.

Close orders window



Desktop: Orders > Process orders > Close orders

To close an order

1. From Close orders window, select the order(s) you want to close.
2. Click Convert. A message displays prompting you to confirm closing the selected order(s).
3. Click Yes to the close the order(s).

Manually release backorders

The Manually release backorders option is used to reverse an order's BACKORDER status. A released backorder is removed from the holding stage for orders awaiting inventory and is returned to its appropriate order processing stage.

The Manually release backorders option is available even if the Automatic Backorder Processing option is enabled on the Backorder Processing window (from Orders, select Set up module, and click Backorders).

To release backorders manually

1. From Orders, select Process orders > Manually release backorders to open the Manually release backorders window.

   All of the orders with a BACKORDER status display on the window.

2. Select the order(s) you want to release from BACKORDER status.

3. Click Convert.

   A message displays prompting you to confirm returning the selected order(s) to the appropriate order processing stage.

4. Click Yes to release the backorder(s).

Package Installer Utility

Go to RiSE > Utilities > Package installer:

Use Package Installer Utility to select packages for installation, view currently installed packages, and view failed installations. Although making iParts deployable is the most common use for packages, they can also include:

- iMIS document system objects, such as queries, business objects, and content types
- SQL Scripts, which run against the iMIS database during installation
- Files, such as ASCX pages, images, and Word templates

To install a package

You can use the Package Installer to update the iParts on a system and to revert them. When you run the installer multiple times on the same package, it installs only one iPart. When you run the installer with multiple packages that install the same iPart, only one iPart is created, using the data in the last package you installed.

> **Note:** Note: Where you see local paths specified, be sure to use the path appropriate for your system, such as C:\Program Files (x86)\ for C:\Program Files\.

1. Stop the ASI Publishing Service.
2. Save the .ipackage file to the C:\Program Files\ASI\iMIS\Net\package\pending folder. Create the pending folder if it does not exist yet.

   Go to RiSE > Utilities > Package installer:
3. Select Packages to be Installed from the Show dropdown list.
4. Click Install.
5. Restart the Publishing Service.
6. If you installed any ActiveX controls, register the OCX files.

7. If your package includes a control (iPart or ActiveX), repeat this process on each additional application server that needs to host it. For example, if you host your staff site on your production iMIS application server and your Public view on an external webserver, add the Package Installer iPart to a content record that displays in both websites. Make sure you set up the correct security permissions to the iPart's page so that only authorized users are able to access it.

   Since iMIS runs with a single database, you do not have to install a package on multiple servers if it only includes database-related objects. But a control is an application component, so you need to deploy it on each server that hosts it. A package can install multiple times on the same database.

   To create a package

1. From the command line, change the directory to the following folder:

   cd C:\Program Files\ASI\iMIS\Net\bin

2. Execute the command to create the manifest: PackageBuilder.exe -create <packageFolder>

- Replace <packageFolder> with a path to the folder that contains the source files to be included in the package. For example:

  PackageBuilder.exe -create C:\MyNewiPart

- A package.manifest file is created for you in the <packageFolder> location.

  Note: If a package.manifest file already exists in that folder, it is overwritten when you run this command.

3. In a text editor, edit package.manifest to specify the package description and the install path for each of the package's files.

   Note: The install path is relative to the Net directory, which defaults to C:\Program Files\ASI\iMIS\Net

- ASCX files (iParts) usually install to: <InstallPath>iparts/Custom</InstallPath>
- DLL files usually install to: <InstallPath>bin</InstallPath>

- For <Type>Document</Type>, the <InstallPath> refers to a path in the document system. You can either enter a file system path or a document system path, such as $/Folder-/SubFolder.
- For <Type>Sql</Type>, the <InstallPath> is not required, because the SQL in the file specified by <Name> is executed. If the <InstallPath> is specified, then the corresponding SQL file is saved to that path. Additionally, the file extension for an SQL file must be .sql, or it will be treated as the File type during the PackageBuilder -create step.

4. Execute the command to build the package: PackageBuild.exe -build <packageFolder> <packageFileName>:

- packageFolder is the path to the folder that contains the source files to be included in the package, such as: C:\MyNewiPart
- packageFileName is the pathname of the package file to be generated (which must have the extension .ipackage), such as: C:\Program Files\ASI\iMIS\Net\package\pending\ASIEUGiftAidWebPart.ipackage

  The following is a sample package.manifest file:

```
<Package xmlns="http://schemas.imis.com/2008/01/DataContracts/iParts/PackageInstaller"
xmlns:i="http://www.w3.org/2001/XMLSchema-instance">

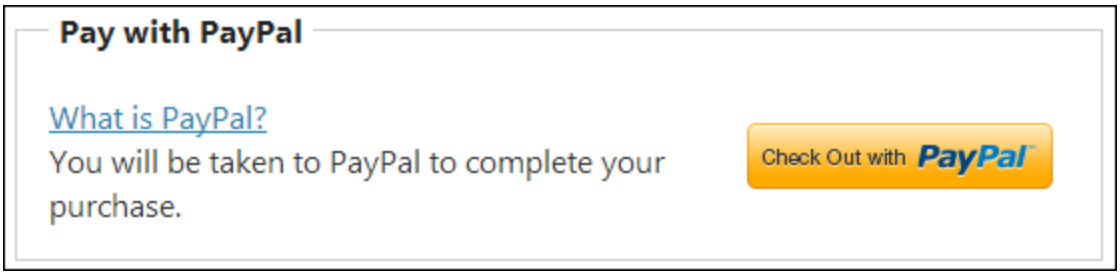
```

Payment Authorization

PayPal Express Checkout Integration

If you already accept credit cards online, you can set up Express Checkout with PayPal to integrate with your content item-based sites. This additional payment option is a convenience for your members, customers, registrants, and donors, which means more revenue for your organization. This option also reduces your liability for holding cardholder data, because their credit card information is stored securely at PayPal.



The Pay with PayPal block appears in the Payment Creator content item if you set up a cash account as a PayPal service.

PayPal payments can apply to a full range of items offered in iMIS sites:

- Products and product kits
- Event registrations
- Renewal invoices, for both accrual and cash dues
- Donations

iMIS handles PayPal Express Checkout differently for products that are not shipped:

- Shippable items (products and kits) require a deliverable address, which both iMIS and PayPal verify. iMIS sends the contact's name and address to PayPal, which displays the information on its site for the payer to verify.
- Non-shippable items (renewals, registrations, donations) require no delivery address, so

none is sent to PayPal. Because of this, PayPal displays the name and address of the payer that it has on file, which may differ from the name and address stored in iMIS.

Your site visitors can complete transactions quickly and easily without entering credit card information:

1. After adding all items to their cart (or completing a standalone donation), users click Check out with PayPal.
2. They redirect to PayPal and sign in, where they complete their payment:

- see their payment item details
- review their shipping info
- select their method and complete payment

3. PayPal automatically returns the necessary information needed to confirm and fulfill the order. Your customer is returned to your website to view their confirmation.

   You can set up style elements in your PayPal account so that customers will feel comfortable that it is a continuation of their shopping experience from your site.

> **Note:** Note: The Pay with PayPal option is hidden whenever the signed-in user works On Behalf Of another.

Setting up PayPal Express Checkout

Once your organization establishes a PayPal Business or Premiere account, you can integrate PayPal Express into iMIS to offer a preferred payment option to your site visitors. Setting this up involves creating your sandbox account with PayPal, creating the PayPal service in iMIS, and testing transactions between iMIS and PayPal.

These resources on the PayPal Developer site (developer.paypal.com) will help your organization implement the service:

- Products > Express Checkout
- Getting Started Guides > Express Checkout API

To enable the service with PayPal

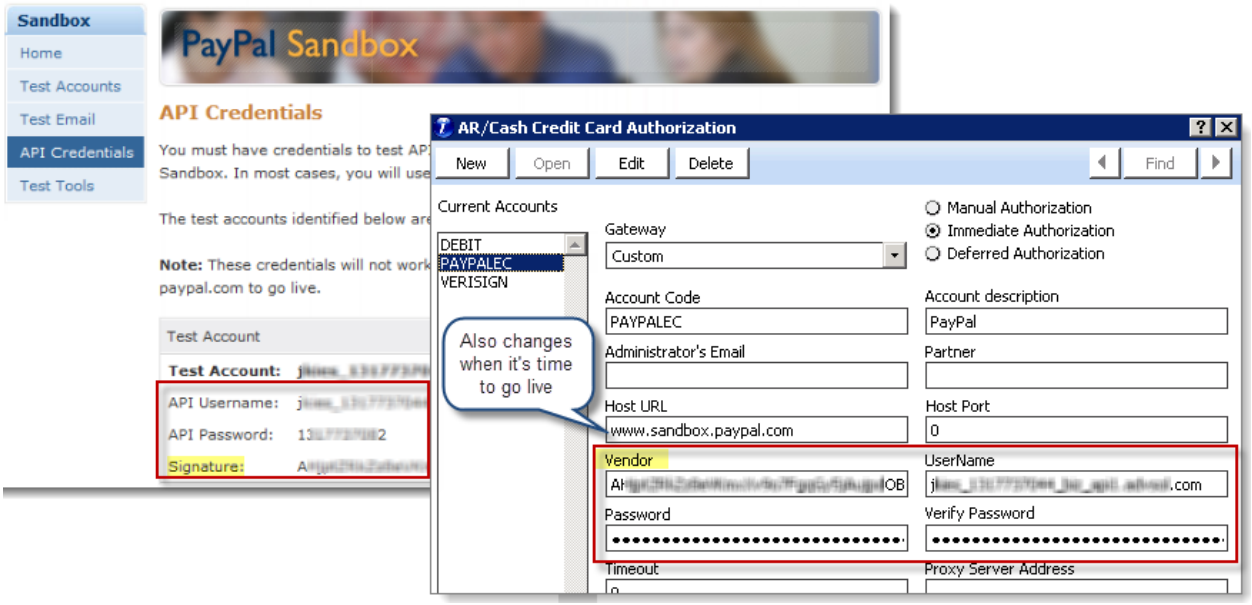
1. Sign up for Express Checkout. Log in, or select Create New Account.

   Important: Express Checkout requires a Business or Premier account.

2. Set up a PayPal Sandbox account to use for testing, with at least two test accounts:

- A merchant account to represent your organization
- A personal account to represent your buyer

3. Sign into your sandbox account, click API Credentials to collect the information you need to enter into iMIS to begin your setup and testing:



To set up PayPal authorization in iMIS

Keep in mind that you will be moving between test (sandbox) mode and live mode, which requires a different Host URL and set of PayPal API Credentials. Before you begin your iMIS testing, remember that you must be signed in on the PayPal sandbox site.

> **Note:** Tip: Keep a separate instance of iMIS configured to use your sandbox settings, for ongoing testing.

1. In Desktop, select AR/Cash > Set up module, Credit Card Auth. Under Current Accounts, choose PAYPALEC.

   If the PayPal account does not exist, create it: click New and add a Custom gateway with an Account Code of PAYPALEC, set for Immediate Authorization.

2. Set the PAYPALEC account values for your organization, and Save.

- In Host URL, enter the appropriate PayPal URL: www.sandbox.paypal.com (test) or www.paypal.com (live)
- Enter your organization's values for Vendor (the API Signature for your PayPal account), UserName, and Password.

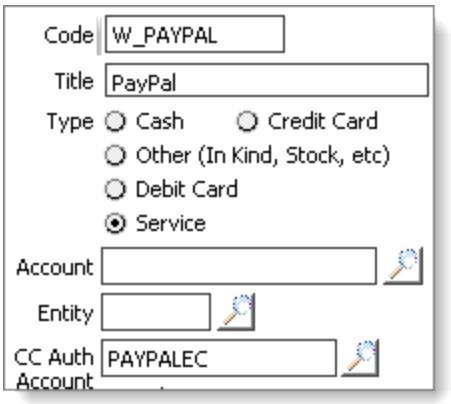
  Troubleshooting: If you get an error, verify that all of the cases match and remove any trailing spaces from these fields.

3. In AR/Cash > Set up tables > Cash accounts, add a cash account with these features:

- Code: PAYPAL

  Important: The code must begin with the prefix defined in System Setup > Set up web components > General configuration > Credit card prefix, which defaults to W_. This makes the account available to public users on the web.

- Title: PayPal (exact-case-sensitive)
- Type: Service
- CC Auth Account: PAYPALEC



4. From the Advanced Accounting Console, add the PayPal method to the Payment Method Set. See Set up payment method sets.

   > **Note:** Important: Your payment method set Display Name for PayPal must exactly match the title: PayPal. If there are any variations, PayPal will not display in the cart.

5. Verify that your web.config includes PayPal as a payment gateway provider, and that the authorization account code matches what you defined above:

   <add name="PayPalPaymentGatewayProvider" type-e="Asi.PaymentGateway.PayPalPaymentGatewayProvider, PayPalPaymentGatewayProvider" authorizationAccounts="PAYPALEC" />

6. If you are designing your own checkout pages, be sure that the Payment Creator and Sub-mit Order Button content items are on same page.

   To test the PayPal service

1. Important: Open your PayPal sandbox test site.

- Browse to developer.paypal.com and log in to your Business or Premier account.
- From the navigation at left, select Test Accounts.
- Choose a test account (such as the Business test acct) and click to Enter Sandbox Test Site.

2. On your iMIS site, complete a PayPal transaction.

- Put an item in your cart.

  When configured correctly, the Pay with PayPal panel appears directly above the pay-ment methods drop-down in the Cart and on the Give & Go page.

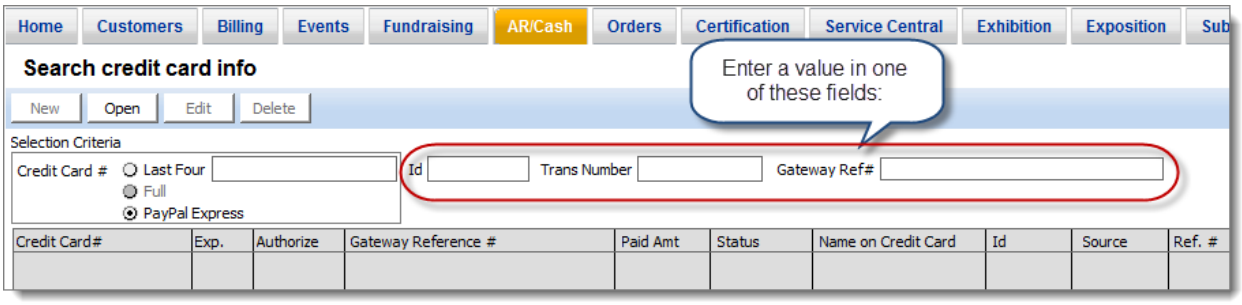
- Click Pay with PayPal, which redirects to the PayPal site.
- Log into PayPal with your personal test account, not your business account.

- Verify that your order details appear on the PayPal site, and click on Pay Now to complete the transaction.

  PayPal redirects you to the confirmation page in iMIS.

3. Verify that the transaction information was stored correctly in iMIS.

- In Desktop, go to AR/Cash > Credit Card Reporting > Search CC Info.
- To find the transaction, specify PayPal Express, enter the iMIS Id, Trans Number, or Gateway Ref#, which contains the Transaction ID that PayPal assigned.



Restricting payment methods to PayPal only

If you want to switch to accepting payment through PayPal Checkout Express only for public users, you can easily reconfigure iMIS so that the Payment Creator allows payment through PayPal alone.

> **Note:** Note: These steps will restrict payment methods to PayPal alone only for public users. Staff users will still see other payment methods as defined in AR/Cash > Set up tables > Cash accounts.

To change cash accounts to support PayPal only

To achieve PayPal-only payments, you need to configure iMIS so that PayPal is the only web-enabled cash account. Here is a quick way to achieve this for public users without deleting any existing credit card accounts:

1. Go to System Setup > Set up web components > General configuration.
2. For Credit card prefix, change the default value PAYPAL to another, such as Z_PAYPAL.

This has the effect of hiding all of your existing cash accounts from the Payment Creator.

3. In Desktop, go to AR/Cash > Set up tables > Cash accounts.
4. Add a cash account that is a copy of your PAYPAL account, named Z_PAYPAL.

   This new account must point to your existing PAYPALEC authorization account.
5. View your site and add an item to the cart to verify that Payment Creator is hiding the credit card options.

> **Note:** Tip: To re-enable credit card processing, simply repeat the first two steps and restore the value.

Using PayPal for standalone donations

The Payment Creator content item supports the PayPal Express Checkout panel when it appears outside of the context of the shopping cart, on a standalone donation page. The PayPal integration preserves any entries in the Display Name Editor (List As) and Tribute Gift Editor content items. The PayPal option can enhance your campaign success by giving your site visitors the reassurance of a known and secure payment method.

> **Note:** Note: On contact account pages, the Giving History content item lists donations paid using PayPal as having a Type of Cash.

Auditing PayPal payments

To reconcile transactions in your iMIS database with the PayPal Express entries, use the transactions report to obtain the Transaction IDs, Gross and Net amounts, dates, and PayerIDs. On the PayPal site, you can look up a PayerID to identify the purchaser.

To reconcile transactions in your iMIS database with the reports in PayPal, look at the Transaction ID that appears in the Details for an entry on the Overview page.

> **Note:** Tip: Keep in mind that it is possible for addresses and even names to differ between iMIS and PayPal for a single Transaction ID. The Transaction ID in the merchant account listing is what pairs the two.

To retrieve audit details from PayPal

1. Log on to paypal.com using your seller account.
2. Select your account and enter the site.
3. Locate the most recent transaction, verifying that the amount matches the order.
4. Click the Details link for that line.
5. View Unique Transaction ID # that appears next to the text Express Checkout Payment Received.
6. In iMIS Desktop, look up the values as appropriate:

- Orders > Open an order > Payments tab, Gateway Ref#
- Events > Register a customer > Open a registration > Payments tab, Gateway Ref#
- AR/Cash > Credit card reporting > Search CC Info, any combination of iMIS ID, iMIS Trans ID, and Gateway Ref#
- (for future release) AR/Cash > Generate Reports > Credit Card > Credit Card Post Authorization Report (Crystal) returns the results for CC Auth Acct of PayPal (which is tied to cash accounts with a type of Service).

Refunding PayPal payments

Refunding customer payments always involves iMIS Desktop, where you cancel out the payments and issue refunds. When PayPal is the payment method, refunds must be made via PayPal as well.

> **Note:** Important: The only time that both iMIS and PayPal process payments automatically is when they are first entered by customers on your site. Any subsequent

transactions affecting that payment must be entered manually into both PayPal and iMIS Desktop.

Reversing a PayPal payment (such as to remove payment for a registration) takes two steps:

1. PayPal: Log into PayPal and process the refund using PayPal's standard procedures.
2. Desktop: Open AR/Cash and create a new payment to cancel the prior one:

- Enter the appropriate ID, the PayPal cash account (typically PayPal) in the Check/CC field, and a negative payment amount.
- Apply the (negative) payment to the original transaction: Edit the transaction, and enter a negative amount in the Amt Paid box, so that it has a balance due.

  If the transaction will not be paid by another method and you need to reverse the original purchase, use the normal procedures to cancel a registration/order/donation.

Authorizing Credit Cards in iMIS

Card authorization is the process of obtaining payment authorization when a credit/debit card transaction is entered. Credit/debit card transactions can be authorized across these areas of iMIS:

- AR/Cash: Sales transactions and cash receipts windows
- Billing: Dues and subscriptions payments
- Fundraising: Gifts, pledges, and fundraising payments
- Service Central: Payment entries
- Public view: Events registration and order entry

  Card Authorization allows you to search by card number or customer ID to find credit/debit card transactions throughout iMIS.

> **Note:** Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Card authorization requirements

iMIS ships with the card authorization and Service Central modules. To use card authorization in iMIS, you need the CCAUTH license key. You also need a high-speed Internet connection to handle a high volume of transactions.

To use card authorization, you must:

1. Set up a merchant account at your bank or another financial institution.
2. Set up a payment processing account. Your payment processor must be supported by your payment gateway service. If you are doing business outside of the United States, use a payment processor that handles international currencies.
3. Register with a payment gateway service and install additional gateway software as required. iMIS natively supports Payflow Pro, offered by PayPal, (previously Verisign), and SafePay, offered by TNS), which handles international sales, and Moneris, offered by Moneris Solutions, based in Canada and focused on Canadian sales.

   Note: European debit card transactions in iMIS cannot be processed with either gateway. Instead, your AiSP must implement a custom gateway interface.

Before you take any of these steps, you should understand what card authorization is and how it works.

The card authorization process

Card authorization allows you to accept a credit/debit card payment from a customer and, within a matter of seconds, have the card transaction approved over the Internet by your bank. You also have the option of having transactions deferred for authorization at a later time.

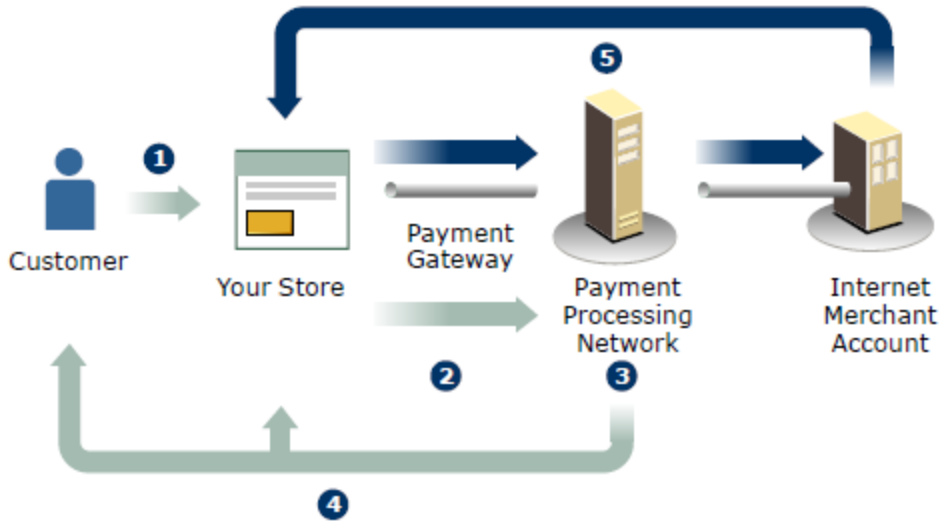


Diagram and steps from PayPal

Credit card authorization includes these steps:

1. A customer purchases a product or service from your store.
2. The payment gateway encrypts data and securely sends it through the payment processing network.
3. The transaction is reviewed for authorization or decline, and the results are sent back through the Payflow payment gateway.
4. Your customer receives a confirmation receipt and you fulfill the order.
5. Once the transaction is processed, funds are transferred from the customer's bank account to your merchant bank account.

Card authorization terms

Before you get started, it is a good idea to become familiar with some of the terms that are used throughout this section. The following is a list of some of the most commonly used terms.

Acquiring financial institution

An acquiring financial institution is a bank or other financial organization that contracts with banks and merchants to allow merchants to accept card transactions. Some financial institutions perform merchant services; others outsource these services to a third-party processor.

Authorization

An authorization is an electronic request for approval of the sale that is sent to the financial institution that issued the customer's credit/debit card. Authorization options in iMIS include Manual, Immediate, and Deferred. Manual is the default authorization setting.

Batch (CC Auth)

A batch is an accumulation of card transaction authorizations that are awaiting settlement.

Capture

A capture is the process of submitting a credit/debit card sale for financial settlement. When a transaction is captured, the sale amount is credited to your deposit account through your acquiring financial institution and posted to the cardholder's credit/debit card account. This transaction usually occurs after midnight when authorizations for the previous day are batched.

Card authorization gateway

A card authorization gateway is a third-party credit/debit card interface, similar to an automated point-of-sale system that provides a front end to financial networks, financial institutions, and payment processors, which allows merchants to provide credit/debit card authorization to their clients.

Card Security Code (CSC)

The 3- or 4-digit, unembossed number that displays on the front or back of a credit/debit card; often used as an added measure of verification for card transactions. The Card Security Code (CSC) is not part of the actual card number.

DBA name

(Doing Business As) A DBA name is the name used to identify the business, as opposed to the business' legal name.

Deferred authorization

Deferred authorization is transaction information that is saved for later processing.

Manual authorization

Manual authorization option enables a system licensed for card authorization to turn off automatic authorization.

Editing

Editing is the process of changing the payment information for a transaction in the Trans database table in iMIS.

Flag

To flag is to mark a transaction to be processed later.

Immediate authorization

With immediate authorization, the payment information is sent immediately to the gate-way for authorization (and for later capture) when a credit/debit card transaction is entered.

Issue date

The 5-character date (mm/yy format) date of issue that is printed on certain European debit cards, used for authentication.

Issue number

The 1- or 2-digit number that is printed on certain European debit cards, which indicate how many versions of the card have been issued to the cardholder. This value is used for authentication.

Issuing financial institution

An issuing financial institution extends credit to a customer through credit card accounts or provides electronic account debits through debit cards. The issuing financial institution issues a credit card and bills the consumer against the credit card account. An issuing financial institution is also referred to as the cardholder's financial institution or issuer.

Merchant account

The account that collects the funds from a credit/debit card transaction. The merchant account receives the funds after the capture is complete.

Submit

Submit is the process of sending deferred credit/debit card transactions to a gateway for authorization.

Settlement

Settlement is the process in which an electronic credit card transaction is settled between your acquiring financial institution and the customer's credit card issuing financial institution. Your acquiring financial institution credits your account for the credit card sale and the sale is posted to the customer's credit card account.

User account

The account that is debited after an authorized credit/debit card transaction is captured.

Void

A void is a deleted payment transaction. The transaction can then be replaced with a new transaction.

Setting up card authorization

Installing iMIS and adding license keys

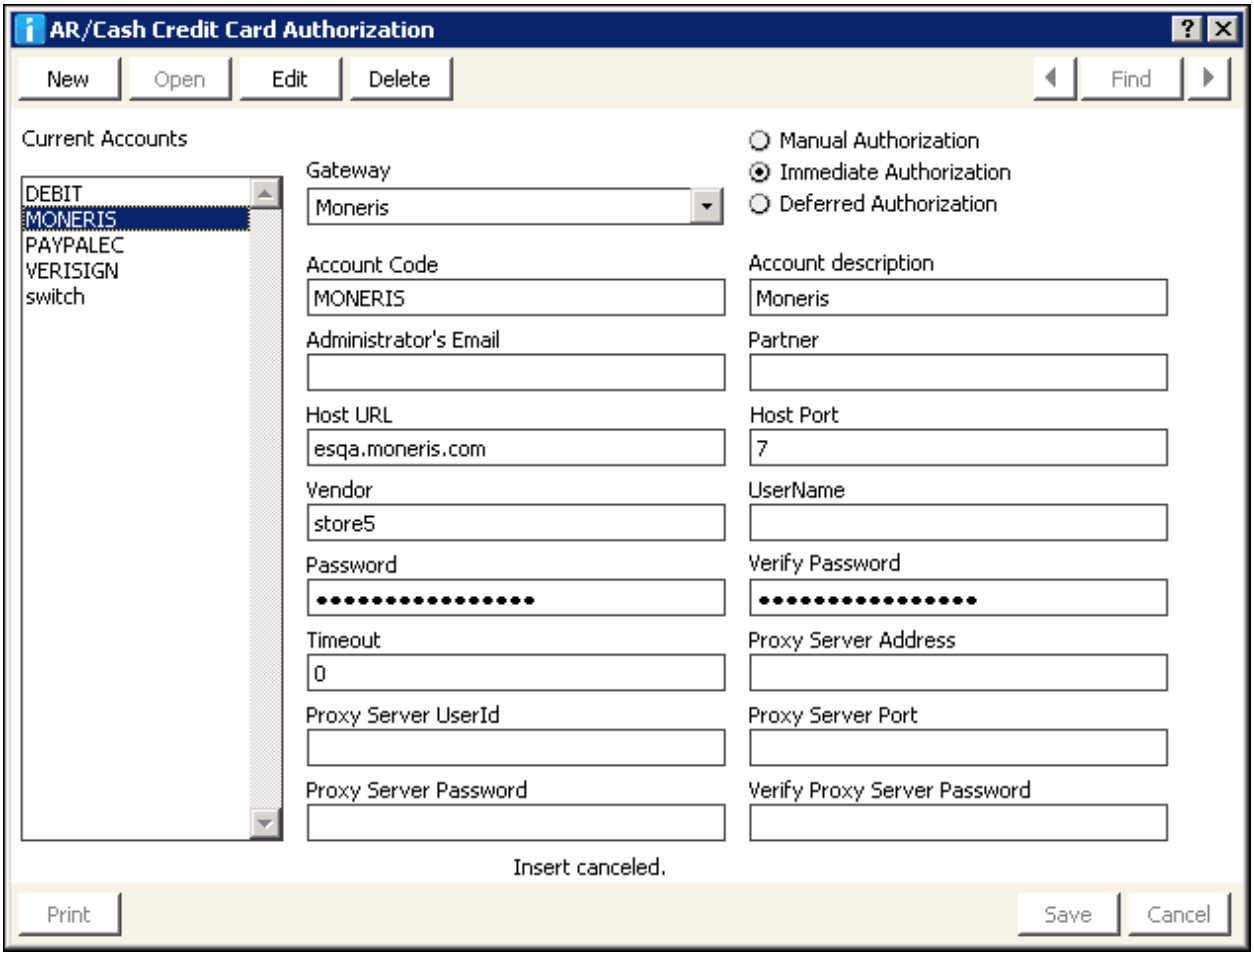
The first step in getting started is to install iMIS, which includes the components needed to run card authorization. However, you must have the CCAUTH license key in your system before you can use this function.

Note: Note: To set up card authorization, you need a relevant license, such as CCAuth or Service Central.

AR/Cash Credit Card Authorization window

This window specifies authorization options for credit cards and European debit cards.

In Desktop, go to AR/Cash > Set up module, and click Credit Card Auth.



Current Accounts

Lists the currently defined card authorization accounts.

Gateway

Lists the authorization gateways supported by iMIS:

- SafePay – authorizes international credit cards.
- Payflow Pro – authorizes domestic credit cards.
- Moneris – authorizes Canadian credit cards.
- Other – for European debit cards, enables storage of encrypted CSC values and unencrypted issue number and issue date values so that a custom gateway for deferred authorization of European debit card transactions can be implemented.
- Custom – custom gateways you can write and install on your system.

  Authorization options

  Specifies the type of authorization that will be performed for all credit/debit card cash accounts that use this card authorization account.

- Manual Authorization – Disables automated authorization through a gateway. The payment information can be edited or deleted at any time until invoiced.
- Immediate Authorization (Payflow Pro andSafePay gateways only) – Performs automated authorization through a gateway. Payment information can be edited or deleted the same day only. Because the Other gateway is not supported, immediate authorization cannot be used for European debit card transactions. The following authorization process is used:

1. Credit card payment is entered.
2. Credit card information is immediately sent for authorization.
3. Authorization is returned and transaction is saved for later capture.
4. Transaction is saved and completed.

- Deferred Authorization – Performs automated authorization through a gateway. Payment information can be edited or deleted until the transaction is captured. The following authorization process is used:

1. Credit/debit card payment is entered.

2. Transaction information is saved for later batch processing.
3. Transactions are periodically sent in a batch for authorization and capture.
4. Transactions in the batch are saved and completed.

Save CSC Prior to Authorization

(only for Deferred Authorization) Saves the card security code (CSC) value in an encrypted format in the iMIS database, so that the CSC information can be sent with all other transaction information in the batch for deferred authorization.

If the associated Gateway is Payflow Pro or SafePay, iMIS automatically deletes the saved CSC information after successful deferred authorization. If the associated gateway is Other, however, the custom gateway implemented by your AiSP for European debit card authorization is responsible for ensuring that the saved CSC information is deleted from your iMIS database.

Account Code

Specifies a short name for the account.

Account description

(optional) Specifies a description for the account.

Administrator's Email

(Payflow Pro and SafePay gateways only) Specifies the email address of your iMIS administrator so that the gateway service can contact the administrator if necessary.

Partner

(Payflow Pro gateway only) Specifies the Payflow Pro partner name that was obtained when you created your account.

Host URL

(Payflow Pro gateway only) Specifies the web address of the Payflow Pro gateway.

Host Port

(Payflow Pro gateway only) Specifies the port number of the Payflow Pro gateway.

Vendor

(Payflow Pro and SafePay gateways only) Specifies your Payflow Pro user name or your SafePay merchant administration login (username) that was obtained when you created your account.

UserName

(Payflow Pro and SafePay gateways only) Specifies your Payflow Pro user name or your SafePay merchant ID that was obtained when you created your account.

Password, Verify Password

(Payflow Pro and SafePay gateways only) Specifies your Payflow Pro password or your SafePay merchant administration login password.

Timeout

(Payflow Pro gateway only) Specifies the gateway connection timeout value, in seconds. ASI recommends a timeout value of 30 seconds.

Proxy Server Address

(optional, Payflow Pro gateway only) Specifies the IP address of your organization's proxy server.

Proxy Server UserId

(optional, Payflow Pro gateway only) Specifies the user ID of your organization's proxy server.

Proxy Server Port

(optional, Payflow Pro gateway only) Specifies the port number of your organization's proxy server.

Proxy Server Password

(optional, Payflow Pro gateway only) Specifies the password required by your organization's proxy server.

Verify Proxy Server Password

(optional, Payflow Pro gateway only) Specifies the password required by your organization's proxy server.

Setting up credit/debit card cash accounts in AR/Cash

You must set up credit/debit card cash accounts on the Set up cash accounts window in AR/Cash before you can use card authorization. When you select a cash account of type Credit Card or Debit Card, the CC Auth Account field displays, enabling you to associate a card authorization account with a credit/debit card cash account. The system automatically generates a read-only description under the CC Auth Account field. The CC Auth Account field requires a value when you select a cash account of type Credit Card or Debit Card.

To define a new credit/debit card cash account code

> **Note:** Note: Before defining new credit/debit card cash accounts, set up your card authorization accounts on the AR/Cash Credit Card Authorization window (AR/Cash > Set up module, Credit Card Auth).

1. Select AR/Cash > Set up tables > Cash accounts.
2. Click New.
3. In the Code field, enter the abbreviation you want to assign to the cash account you are creating.

   Note: You can use any code you prefer for a credit/debit card. However, for a credit card number to be validated by iMIS, the value, in addition to being a cash account of type Credit Card, must contain one of the credit card types iMIS supports: AMEX, VISA, MC, DISC, DINERS, CB.

4. In the Title field, enter the full name you want to assign to the account.
5. Under Type, enable either the Credit Card or Debit Card option.
6. (optional) In the Account field, enter the GL chart of accounts number for the cash account assigned to this table entry, or click the Find icon to select a value.
7. (optional) For multiple entities, enter the Entity code, or click the Find icon to select a value.
8. Enter the CC Auth Account, or click the Find icon to select a value.
9. (optional) Select the appropriate CSC Required option:

- Web Entry – in all web-based views of iMIS, makes the Card Security Code field required for the specified credit card.
- Workstation Entry – in iMIS Desktop, makes the CSC field required for the specified credit card.

  Note: When making the CSC value required, ensure the card authorization account to which the credit/debit card cash account is associated is set to Immediate Authorization or Deferred Authorization.

10. (optional) Select the appropriate Display Issue option(s):

- Number - Select this option to display a field for the entry of a European debit card's issue number.
- Date - Select this option to display a field for the entry of a European debit card's issue date.

11. Click Save.

To modify a credit/debit card cash account

Card authorization accounts are limited in how they can be modified; you may need to create new ones.

1. Select AR/Cash > Set up tables > Cash accounts.

2. Select a code to edit from the Current Cash Accounts list.
3. Modify the credit/debit card cash account:

- Click Edit to make any necessary changes to the cash account.
- Click Delete to delete the cash account.

Note: When editing card authorization accounts, you cannot modify the values for the Gateway or Account Code field.

Note: You cannot delete a card authorization account that has been assigned a cash account.

4. Click Save.

Requiring a Card Security Code (CSC) for credit/debit card transactions

As an additional verification for iMIS Desktop credit card transactions, you can make the Card Security Code (CSC) a required value for specific credit/debit card cash accounts. A CSC is the 3- or 4-digit unembossed number that displays on the front or back of a credit/debit card. The CSC is not part of the actual card number and is useful in situations where the card holder is not present when the payment is being made.

To make the CSC required, select the CSC Required option for Web Entry, Workstation Entry, or both for the specified credit/debit card cash account(s) on the Set up cash accounts window (from AR/Cash, select Set up tables > Cash accounts). Selecting the CSC Required option for Web Entry makes the CSC required for the specified cash account in the web views. Selecting the CSC Required option for Workstation Entry makes the CSC required for the specified cash account in iMIS Desktop. When the CSC Required option is selected (for either Web Entry or Workstation Entry), a CSC value is required before you can complete the credit/debit card transaction using the specified cash account(s).

A CSC is not required when processing a reversal payment transaction (for example, entering a credit transaction) or when editing a payment transaction.

Note

- For transactions associated with card authorization accounts that use Immediate Authorization, the CSC value is not stored in the database. The value that displays in the Card Security Code or CSC field is deleted once the transaction is submitted for processing.
- For transactions associated with card authorization accounts that use Deferred Authorization and for which the Save CSC Prior to Authorization option has been selected, the CSC value is temporarily stored in an encrypted format in the iMIS database. For Payflow Pro and SafePay gateways, iMIS then deletes the stored CSC information after successful authorization. If a saved payment is viewed prior to successful authorization, the CSC number appears as three asterisks regardless of the security level of the iMIS user.
- For Other gateways, which are used only for European debit cards, the CSC information stored in the iMIS database is not automatically deleted by iMIS after successful deferred authorization. You should ensure that the custom gateway interface implemented by your Solution Provider deletes the stored CSC information after being successfully authorized.

  iMIS Desktop only validates that a CSC value is present (if required) and that the value is a 3- or 4-digit alphanumeric character. CSC validation depends on various factors that go beyond the scope of iMIS (for example, whether the credit card processor supports CSC). For specific information regarding CSC validation, contact your authorization gateway, merchant bank, credit/debit card processor, or any other third-party involved in validating your credit card transactions.

  Location of CSC fields

  CSC values can be entered in many locations throughout iMIS. For iMIS payment windows, the CSC field appears only when you enter a credit/debit card cash account that is associated with a card authorization account that uses Immediate Authorization, or that uses Deferred Authorization with the Save CSC Prior to Authorization option selected.

- AR/Cash
- Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions> Cash receipts)

- Enter and edit sales transactions window (from AR/Cash, select Enter and edit transactions> Sales transactions)
- Billings
- Enter and edit payments window (from Billing, select Enter and edit payments)
- Certification (European debit cards only)
- Order Payment window (from Certification, register a student and create an order)
- Events (European debit cards only)
- Payments tab on the Register a customer window (from Events, select Register a customer, and select the Payments tab)
- Payments window (from Events, select Register a customer, select the Payments tab, and click More Payments)
- Exhibition (European debit cards only)
- Payments tab on the Process orders window (from Exhibition, select Process orders, and select the Payments tab)
- Payments window (from Exhibition, select Process orders, select the Payments tab, and click More Payments)
- Exposition (European debit cards only)
- Payments window from Process booth orders (from Exposition, select Process booth orders and click Payment)
- More Payments window from the Payments window (from Exposition, select Process booth orders, click Payment, and click More Payments)
- Fundraising
- Overview tab on the Enter and edit gifts window (from Fundraising, select Enter and edit gifts)
- Process payments window (from Fundraising, select Process payments)

- Orders (European debit cards only)
- Payments tab of the Enter and edit orders window (select Orders, select Enter and edit orders, enter or open an order, and select the Payments tab)
- Service Central
- Enter and edit payments window (from Service Central, select Enter and edit payments)
- Payment Entry window (from Service Central, select Process customer requests, and select Payment)

Accepting and validating Diners Club and Carte Blanche credit cards

iMIS accepts and validates Diners Club and Carte Blanche credit cards. To use Diners Club and Carte Blanche credit cards to process payment transactions, you must set up the following two new credit card type values on the Set up cash accounts window (from AR/Cash, select Set up tables > Cash accounts):

- DINERS (Diners Club)
- CB (Carte Blanche)

The following credit card number is available for testing Diners Club and Carte Blanche credit card transactions:

3056 9309 0259 04

> **Note:** Note: For testing purposes, transactions must be under $100.00.

You can process transactions using credit card types with variations of the supported credit card types (for example, DINERS1, DINERS2).

You can enter any credit card value in the Check/CC field on the Enter and edit sales transactions window (from AR/Cash, select Enter and edit transactions > Sales transactions) and the Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions > Cash receipts). However, for a credit card number to be validated by iMIS, the value entered in the Check/CC field, in addition to being a cash account of type

Credit Card, must contain one of the supported credit card types: AMEX, VISA, MC, DISC, DINERS, CB (for example, MY-AMEX).

Setting up multiple card authorization accounts

Organizations that use iMIS to process accounting transactions may have multiple credit/debit card cash accounts and may want to control how funds are allocated to financial institutions.

For example, an organization that has domestic and international accounts may not want the international accounts processed, but may want to store the information in iMIS. The organization could create a new card authorization account for the international accounts, set the account to Manual Authorization, and create a corresponding cash account and set its CC Auth Account value to the new card authorization account.

Setting up authorization options in Fundraising

When setting up the Fundraising module for card authorization, we recommend disabling the Do Not Validate Credit Card field on the Fundraising Set up module window (from Fundraising, select Set up module).

If you enable this option, the credit/debit card number will not automatically format when it is entered on the Fundraising Enter and edit gifts window. If Deferred Authorization is enabled on the AR/Cash Credit Card Authorization window, transactions made on the Overview tab on the Enter and edit gifts window with unformatted credit/debit card numbers will not display in credit/debit card searches and will not print on the Deferred Credit Card Pre-Authorization report.

Setting up European debit card authorization

You can set up a card authorization account that can be used either for manual authorization or deferred authorization of European debit cards through a custom gateway interface.

To set up European debit card authorization

1. From AR/Cash, select Set up module.

   The Set up module window appears.

2. Click Credit Card Auth.

   The AR/Cash Credit Card Authorization window appears.

3. Click New.
4. From the Gateway drop-down list, select Other.
5. In the Account Code field, specify a short label for this card authorization account.
6. (optional) In the Account description field, specify a description for this card authorization account.
7. Select either Manual Authorization or Deferred Authorization for this card authorization account.
8. If you have selected Deferred Authorization and your authorization service requires CSC information for European debit card transactions, select the Save CSC Prior to Authorization checkbox.

   Note: You should ensure that the custom gateway interface implemented by your AiSP deletes the stored CSC information after being successfully authorized.

9. Click Save.

Setting up an authorization account for non-iMIS supported gateway

You must assign a card authorization account to each credit/debit card cash account you create in iMIS.

To set up an account for non-iMIS supported gateways

1. Select AR/Cash > Set up module, Credit Card Auth.

   Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.

2. Click New and select Other from the Gateway from the drop-down list.
3. Select Manual Authorization.
4. Enter NOPROCESS as the Account Code.

Caution! NOPROCESS has been associated in the web.config file as a no processing payment gateway. If you enter a different code, you will have to modify your web.config files for that code to be recognized.

This value displays in the Select a Value window that opens when you use the lookup icon on the CC Auth Account field on the Set up cash accounts window. This value cannot be changed once the record is saved.

5. Enter a meaningful description for the authorization account in the Account description field.

   This information displays as read-only data under the CC Auth Account field on the Set up cash accounts window.

6. Click Save.

Database schema for authorization and cash accounts

Card authorization account information and cash account information is kept in the following iMIS tables.

Payflow Pro credit card authorization accounts

The following columns in the CCAuthAcct table are used for each Payflow Pro (PayPay, previously Verisign) card authorization account:

CCAuthAcctCode	varchar (20)	The code for the card authorization account
CCAuthAcctDescription	varchar (255)	Description associated with an account code
CCAuthMode	tinyint	Authorization mode: 0 (manual), 1 (immediate), or 3 (deferred)
CCAuthAdminEmail	varchar (255)	E-mail address of the system administrator responsible for setting up the accounts
CCAuthUrl	varchar	URL of the test or live site

	(255)	
CCAuthGateway	varchar (255)	Gateway interface through which card authorization occurs
CCAuthPort	int	Port address used for transaction processing
CCAuthUser	varchar (255)	Username created during setup process
CCAuthPassword	varchar (255)	Password created during sign-up process
CCAuthVerisignPartner	varchar (255)	Partner name supplied
CCAuthVerisignVendor	varchar (255)	Vendor name supplied
CCAuthTimeout	int	Timeout period supplied
CCAuthVerisignProxyServer	varchar (255)	Proxy server supplied by network administrator
CCAuthVerisignProxyPort	varchar (255)	Proxy port supplied by network administrator
CCAuthVerisignProxyUser	varchar (255)	Proxy user ID supplied by network administrator
CCAuthVerisignProxyPassword	varchar (255)	Proxy password supplied by network administrator
CCAuthSaveCscBeforeAuth	tinyint	Handling of CSC value for deferred authorization: 0 (do not save CSC in iMIS) or 1 (save encrypted CSC in iMIS then delete after successful authorization)

SafePay credit card authorization accounts

The following columns in the CCAuthAcct table are used for each SafePay (TNS, previously Dialect and QSI) card authorization account:

CCAuthAcctCode	varchar (20)	The code for the card authorization account
CCAuthAcctDescription	varchar (255)	Description associated with an account code
CCAuthMode	tinyint	Authorization mode: 0 (manual), 1 (immediate), or 3 (deferred)
CCAuthAdminEmail	varchar (255)	E-mail address of the system administrator responsible for setting up the accounts
CCAuthGateway	varchar (255)	Gateway interface through which card authorization occurs
CCAuthUser	varchar (255)	Merchant ID created during setup process
CCAuthVerisignPartner	varchar (255)	Merchant Administration login (username) obtained from QSI/Dialect during setup process
CCAuthPassword	varchar (255)	Merchant Administration login (username) password obtained from TNS during setup process
CCAuthSaveCscBeforeAuth	tinyint	Handling of CSC value for deferred authorization: 0 (do not save CSC in iMIS) or 1 (save encrypted CSC in iMIS then delete after successful authorization)

Other gateway credit card authorization accounts

The following columns in the CCAuthAcct table are used for each Other card authorization account:

CCAuthAcctCode	varchar (20)	The code for the card authorization account
CCAuthAcctDescription	varchar (255)	Description associated with an account code
CCAuthMode	tinyint	Authorization mode: 0 (manual), 1 (immediate), or 3 (deferred)
CCAuthGateway	varchar (255)	Gateway interface through which card authorization occurs
CCAuthSaveCscBeforeAuth	tinyint	Handling of CSC value for deferred authorization: 0 (do not save CSC in iMIS) or 1 (save encrypted CSC in iMIS)

Credit/debit cards cash accounts

The following columns in the Cash_Accounts table are used for each credit/debit card cash account:

CCAuthAcctCode	varchar (20)	The code for the card authorization account
CSC_ REQUIRED_ WEB	bit	Indicates whether the CSC value is required on the web: 0 (not required) or 1 (required)
CSC_ REQUIRED_CS	bit	Indicates whether the CSC value is required in iMIS: 0 (not required) or 1 (required)
ISSUE_NO_ FLAG	tinyint	Indicates whether the Issue Number field should be displayed in iMIS payment entry windows: 0 (not displayed) or 1 (displayed)

ISSUE_DATE_FLAG	tinyint	Indicates whether the Issue Date field should be displayed in iMIS payment entry windows: 0 (not displayed) or 1 (displayed)

Setting up credit card authorization for the Public view

Use the following steps to accept credit card payments in iMIS Public view:

1. Set up credit card authentication (AR/Cash > Set up module > Credit Card Auth).
2. Set up cash accounts for online registration credit cards (AR/Cash > Set up tables > Cash accounts).

   Note: The cash account codes must be prefixed with "W_" (such as "W_VISA") to accept credit card payments via the Public view.
3. Modify the web.config file to include the Gateway Account Code.

Modifying the web.config file with the credit card gateway

In order to accept credit card payments in the Public view or any content items website, you must add the Gateway Account Code to your web.config file. This must be updated in the iMIS_Public folder if you are using the iMIS Public view or the NET folder if you are using any website containing content items. If you do not make this change, you will receive the error message, “An error occurred while processing a payment. Payment gateway was not found to match the associated authorized account” Here are the steps you need to follow:

1. Select AR/Cash > Set up module > Credit Card Auth.
2. Take note of your Account Code for the gateway you are using.
3. On your webserver, open the web.config file located in your iMIS_Public folder if you are using the iMIS Public view or the NET folder if you are using RiSE sites.
4. Search for AuthorizationAccounts. The code should look similar to the following:

<add name="PayFlowProPaymentGatewayProvider" type-e="Asi.PaymentGateway.PayflowProPaymentGatewayProvider, Pay-flowProPaymentGatewayProvider" authorizationAccounts="VERISIGN,PaymentTech,PAYFLOWPRO" />

5. Place a comma after PAYFLOWPRO and add the Account Code for your credit card gate-way and save. For example, if your credit card gateway Account Code was labeled CREDITCARDS, then your code should read similar to the following:

   <add name="PayFlowProPaymentGatewayProvider" type-e="Asi.PaymentGateway.PayflowProPaymentGatewayProvider, Pay-flowProPaymentGatewayProvider" authorizationAccounts="VERISIGN,PaymentTech,PAYFLOWPRO,CREDITCARDS" />

6. Restart IIS and your credit cards should work in iMIS Public view or any content items website.

Customizing credit card fields for the Public view

When configuring the Public view for card authorization, go to these locations to adjust your settings:

1. System Setup > Set up commerce web components > Credit card label configuration
2. System Setup > Set up commerce web components > Checkout configuration
3. AR/Cash > Set up tables > Cash accounts - Enable the CSC Required Web Entry option if the CSC code is required for Public view transactions.

Using card authorization

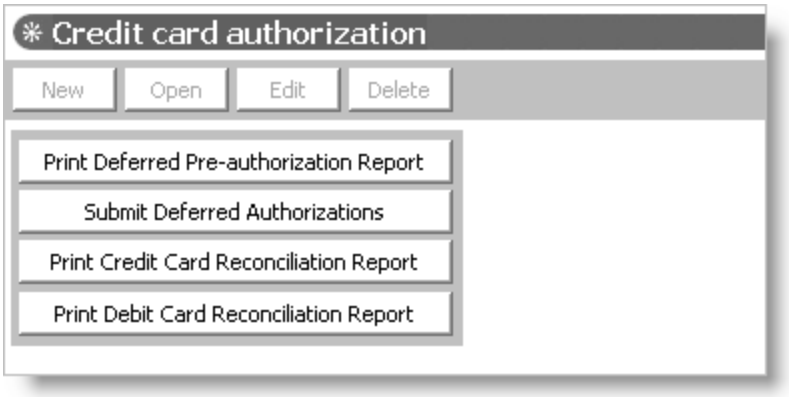
Once you have set up the AR/Cash options and tested your credit/debit card gateway, you are ready to use card authorization.

- Credit card transactions can be processed in iMIS with either deferred or immediate authorization, as defined by the associated card authorization account.
- European debit cards, however, can be processed only with deferred authorization, and

only if your Solution Provider has implemented a custom gateway interface for European debit card authorization.

Credit card authorization window

> **Note:** Note: If you have not set up credit card cash accounts in the AR/Cash module, the Credit card reporting menu item is disabled.



From AR/Cash, select Credit card reporting > Credit card reports

To generate credit/debit card reports, from AR/Cash, select Credit card reporting > Credit card reports. The following report options display on the Credit card authorization window:

- Print Deferred Pre-authorization Report – Prints a report of deferred credit/debit card transactions. The report parameters include Date Range and Org Code.
- Submit Deferred Authorizations – Sends transactions flagged for deferred authorization. All flagged transactions are submitted immediately. This applies only to deferred credit/debit card authorizations.
- Print Credit Card Reconciliation Report – Prints a credit card reconciliation report.
- Print Debit Card Reconciliation Report – Prints a European debit card reconciliation report.

Note: If you have not set up European debit card cash accounts in the AR/Cash module, the Print Debit Card Reconciliation Report button is not available.

Immediate card authorization

If you have enabled the Immediate Authorization option, and then entered a credit card payment, the transaction information is sent immediately through the gateway to the financial institution for authorization. After the payment is authorized, the funds are captured at midnight of the transaction date.

> **Note:** Note: European debit card authorization accounts cannot be configured to use the Immediate Authorization option.

To enter a credit card payment using immediate authorization

1. From AR/Cash, select Enter and edit transactions > Sales transactions to open the Enter and edit sales transactions window.

   Note: For this example, we are using the Enter and edit sales transactions window. You can enter the credit card payments in any of the windows available for credit card authorization.

2. Click New.
3. Enter the customer ID in the Id field.
4. Enter a product in the Product field, or click the Find icon to select a value.
5. Enter the product quantity in the Quantity field.
6. Enter the credit card code in the Check/CC field. Several additional credit card fields display when you press Tab.
7. Enter the credit card number in the CC # field.
8. If required, enter the Card Security Code in the CSC field.
9. Enter the expiration date in the Exp field.

10. Enter the name on the credit card in the Name on CC field. This does not have to be the same as the customer name.
11. Enter an amount in the Payment Amount field.
12. Click Save.

- If the transaction was authorized, the Authorize field on the payment transaction window populates with the authorization code and the transaction is saved. In addition, if you entered a value in the CSC field, the field is now blank because the system automatically deleted the value once the transaction has been submitted.
- If the authorization was declined, an error message displays indicating that the transaction was declined.Select OK to exit the Results window and return to the transaction window. If the transaction was declined, DECLINED displays in the Authorize field in the payment window.

  Note:

- There could be several reasons for a declined authorization, such as bad card, invalid data, or invalid credit card number.
- At this point, you are not able to save the transaction. You can edit the payment date, amount, name, credit card number, and expiration date, and then resubmit the transaction for authorization.

Deferred authorization of payments

Deferred credit/debit card payments are entered in the same manner as if you were using immediate authorization. When a deferred transaction is saved (by clicking OK), the word DEFER displays in the Authorize field. If you select the Deferred Authorization option, credit/debit card transactions are deferred until you submit them.

Note: Caution! Do not accidentally enter any data in the Authorize field. When entering payment information, the Authorize field is empty. It remains empty until you save the transaction, then it populates with the word DEFER to indicate that it is batched for authorization. However, you might need to authorize a payment

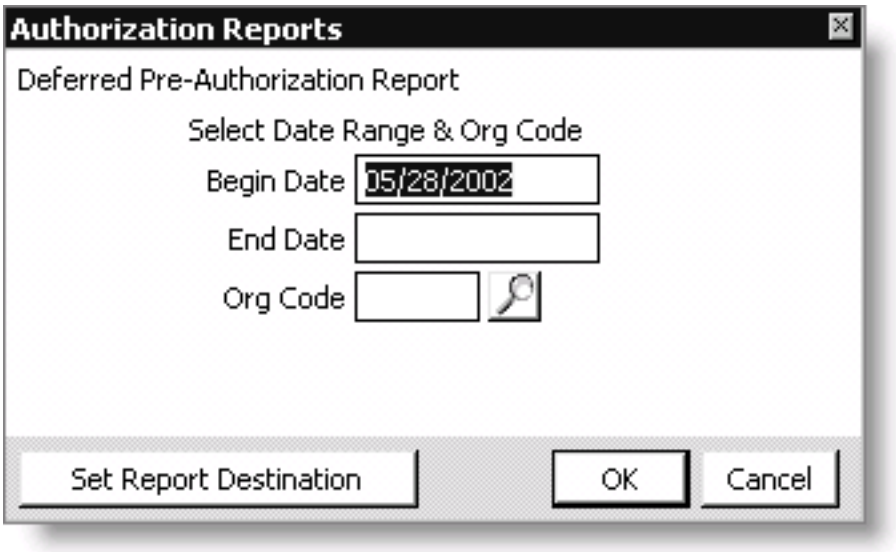
through a credit card machine or by calling the merchant bank, so iMIS allows you to manually enter authorization codes for these circumstances. However, keep in mind that if you do enter information in this field, iMIS assumes that it is a manually entered authorization code.

Running a Deferred Pre-Authorization report

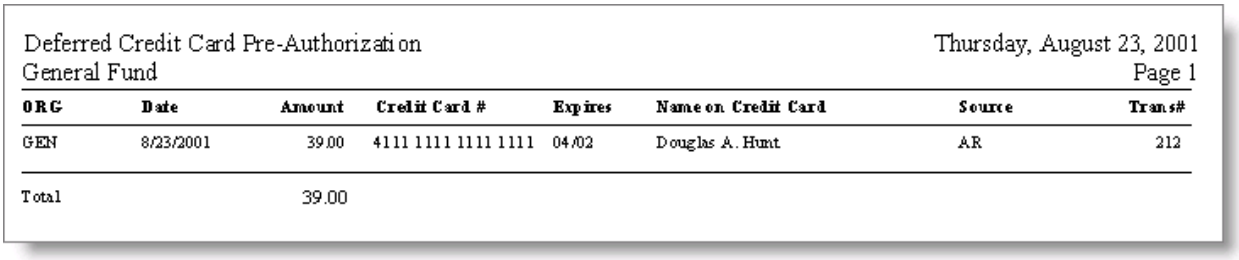
If you are using Deferred Authorization, you can view a Pre-Authorization report of credit/debit card transactions before you transmit them to be authorized. This allows you to check and edit transactions before submitting them.

To run the Deferred Pre-Authorization report

1. From AR/Cash, select Credit card reporting> Credit card reports, and click Print Deferred Pre-authorization Report. The Authorization Reports: Deferred Pre-Authorization Report window opens.
2. Enter the Begin Date and the End Date for the date range you are evaluating. The Begin Date defaults to the current system date.
3. (optional) Enter the Org Code, or click the Find icon to select a value. If you do not enter an Org Code, the report prints for every Org Code.
4. Click Set Report Destination and select the output for the report.
5. Click OK. A Deferred Credit Card Pre-Authorization report prints based upon the specified date range and Org Code.



Selecting a Date Range & Org Code



Deferred Credit Card Pre-Authorization — Thursday, August 23, 2001
General Fund — Page 1

ORG	Date	Amount	Credit Card #	Expires	Name on Credit Card	Source	Trans#
GEN	8/23/2001	39.00	4111 1111 1111 1111	04/02	Douglas A. Hunt	AR	212
Total		39.00					

Sample Deferred Credit Card Pre-Authorization report

Submitting deferred credit card payments

Before deferred credit/debit card payments can be authorized, they must be submitted.

To submit deferred credit/debit card payments for authorization

1. From AR/Cash, select Credit card reporting> Credit card reports, and click Submit Deferred Authorizations. The Authorization Reports: Submit Deferred Authorizations window displays.
2. Enter the Begin Date and End Date of the deferred authorizations. The Begin Date defaults to the current system date, which you can override.
3. Enter the Org Code, or click the Find icon to select a value. If you do not enter an Org

Code, the report prints for every Org Code.

4. Click OK.

Searching credit/debit card transactions

After you enter credit/debit card transactions, search iMIS for transactions using the Card #, the customer Id, the Trans Number, or any combination of these criteria. Credit/debit card searches are conducted through the Search credit card info window.

Unencrypted card information can be viewed in this window only if a user has an AR/Cash authorization level of 8 or higher.

> **Note:** Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

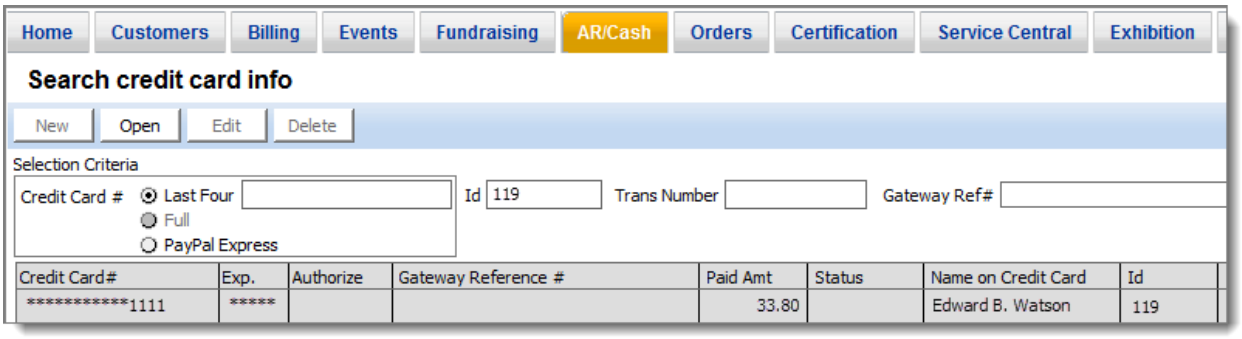
Search credit card info window

To search for credit/debit card information, from AR/Cash, select Credit card reporting > Search CC info. The Search credit card info window displays, where you can search in iMIS for credit/debit card payments by Credit Card #, customer Id, or Trans Number, or any combination of these criteria.

> **Note:** Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Troubleshooting

- The Status field is populated by Trans.STATUS for transactions entered through Service Central and iBO.
- When entering an order and paying by credit card over the web, the order must be processed to the invoice stage before it will display in the Search credit card info window.
- When viewing credit card transaction status, the details of the transaction are shown, not the details of the actual order payment or the event payment.



From AR/Cash, select Credit card reporting > Search CC info

Credit Card #

The credit/debit card number associated with the search

Id

The customer or company ID whose credit/debit card transactions are associated with the search

Display fields

- Credit Card # – The card numbers associated with the search
- Exp – The expiration date for each card number
- Authorize – The authorization code for the card transaction
- Paid Amt – The amount paid with the card transaction
- Status – This field indicates the authorization status of the transaction. The status options are: A (authorized), D (deferred), and C (captured). If this field is blank, it is either a manual transaction or the transaction was denied.
- Name on Credit Card – The name on the card associated with the transaction.
- Id – The ID associated with the card transaction
- Source – This field indicates the module source for the card transaction. For example, if the payment were a fundraising gift, FR would display in this field.

- Ref # – A transaction number or order ID that is generated by the authorization gateway. This information is stored in the Description field of the transaction entry, and must be referenced in order to delete any transactions.
- Ref Date – Specifies the date the transaction was entered in iMIS

To search credit/debit card transactions

1. From AR/Cash, select Credit card reporting > Search credit card info to open the Search credit card info window.
2. Enable the Last Four option to search on the last four numbers of the credit/debit card or the Full option to search on the full card number.

   Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields. Therefore, the Full option is disabled, because only the last four credit card digits are saved.
3. Enter the card number in the Credit Card # field to search for a specific card number.
4. Enter the customer or company ID in the Id field to search by record. You search by both the card number and ID, or by one field only.
5. Enter the transaction number in the Trans Number field to search by transaction number.
6. Press Enter.

   A list of transactions for the selected card and/or customer record displays in the window.
7. To view an individual transaction through the Search credit card info window, double-click the line item. The original transaction window opens.

Authorization Gateways

iMIS supports these gateway options for credit card authorization:

- Payflow Pro, offered by PayPal, (previously Verisign), based in the United States
- SafePay, offered by TNS, based in Australia and focused on international sales

- Moneris, offered by Moneris Solutions, based in Canada and focused on Canadian sales
- Custom gateways, which you can create using ASI-supplied code and documentation

All gateway options work with the PCI Compliance options.

> **Note:** Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Applying for a merchant bank account

You must apply for a merchant bank account. The merchant bank is where all the credit card transactions are verified. You can find a list of financial institutions using the authorization gateway website. However, before contacting a merchant bank, check with your bank to see if it is compatible with the authorization gateway.

Every organization accepting online credit card transactions must have a merchant account with an acquiring financial institution.

The acquiring financial institution deposits the daily credit card sales into the merchant's account after deducting applicable fees. Some acquiring financial institutions perform merchant services in-house; others outsource these functions to a third-party processor. These services may include billing, customer service, reporting, authorization, and settlement services for merchants. A third-party processor is a company that provides credit card services to merchants on behalf of acquiring financial institutions.

Implementing Payflow Pro as an authorization gateway

> **Note:** Note: Payflow Pro authorizes credit card transactions up to $9,999.00.

Before you go live with card authorization using Payflow Pro (from PayPal, previously VeriSign), you must take several steps:

1. Ensure you have set up card authorization in iMIS.

2. Register with the Payflow Pro card authorization gateway.
3. Verify your registration setup.
4. Apply for a merchant bank account at a financial institution.
5. Submit and review test transactions.
6. The acquiring financial institution approves the application and notifies the authorization gateway.
7. Switch from test mode to live mode.

   This process generally takes 2 to 4 weeks to complete.

   To register for a Payflow Pro gateway

   You must set up an account with PayPal (previously, VeriSign) for your Payflow Pro card authorization gateway.

1. Go to the PayPal website at www.paypal.com.
2. Select Business from the menu.
3. Under Merchant Services, select Payflow Gateway > Get Started.
4. From the Solution options, select Payflow Pro.
5. From the Country drop-down list, select your country.
6. Click Go.
7. Complete the registration.

   Note: Please make a note of your user login and password. You will need it to configure iMIS and to view reports on the PayPal website. ASI Technical Support does not have access to this information.

   To set up a Payflow Pro card authorization account

1. Select AR/Cash, Set up module, Credit Card Auth.

Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.

2. Click New and select Payflow Pro from the Gateway drop-down list.

   Note: Once you save a card authorization account, you cannot change the Gateway field.

3. Specify the authorization type: Manual, Immediate, or Deferred.
4. Enter an Account Code, which will appear in the Select a Value window that opens for lookup on the CC Auth Account field on the Set up cash accounts window.

   Note: Once you save a card authorization account, you cannot change the Account Code field.

5. Enter an Account description, which will appear under the CC Auth Account field on the Set up cash accounts window.
6. Enter the Administrator's Email.
7. Enter the Partner value supplied in your account information.
8. In the Host URL field, enter the test or live mode:

   - Test mode: pilot-payflowpro.paypal.com
   - Live mode: payflowpro.paypal.com

   Caution! Do not go live without first setting the Host URL to test mode to verify the registration.

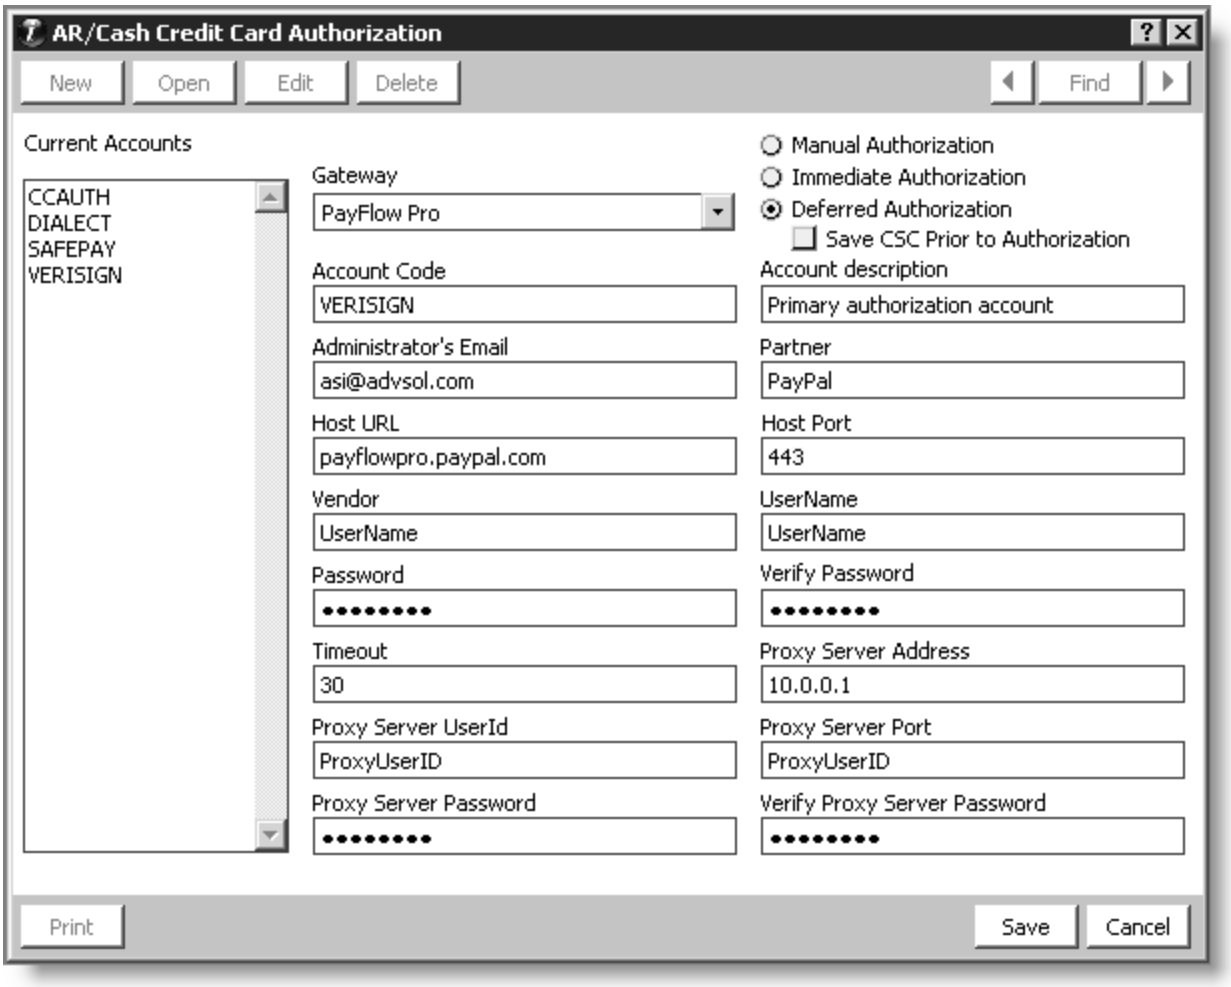
9. Enter 443 in the Host Port field.
10. Enter the values created during the Payflow Pro sign-up process:

    - Enter the UserName in the Vendor field.
    - Enter the UserName in the UserName field.
    - Enter the Password in the Password field and in the Verify Password field.

11. Enter 30 in the Timeout field. (This is a recommended value.)
12. If you are using a proxy server, enter the values as supplied by your network administrator:
    - Proxy Server Address
    - Proxy Server UserId
    - Proxy Server Port
    - Proxy Server Password
    - Verify Proxy Server Password
13. Click Save.
14. Repeat the steps for each account.
15. Restart iMIS.

Troubleshooting

- If you do not restart iMIS after creating a new account, all transactions will have an authorize code of “DEFER” even if you enabled the Immediate Authorization option.
- You cannot delete a card authorization account that has been assigned a cash account.
- If you change the CC Auth account for a cash account (from one gateway to another or to a different account on the same gateway) and attempt to edit or delete transactions that were created earlier in the day before the change of the CC Auth account, there may be undesirable results, particularly if the CC Auth account was changed to a Payflow Pro account.



To associate an authorization account with a credit card cash account code

Before you can use card authorization you must set up credit card cash accounts on the Set up cash accounts window (from AR/Cash, select Set up tables > Cash accounts).

1. From AR/Cash, select Set up tables > Cash accounts to open the Set up cash accounts window.
2. Select a code to edit from the Current Cash Accounts list.
3. Click Edit.
4. Enter a CC Auth Account or click the Find icon to select a value.
5. Click Save.

Editing and deleting credit card payments

PayPal transaction entries are generated with a captured status. You can edit or delete payment transactions if the changes are made on the same day. If the transaction has already been charged to the credit card, an error will be reported.

iMIS assumes that authorizations are captured every night, so the changes are only allowed if it is done on the same system date as the authorization. However, the system date may not be the same as the batch date or the transaction date.

Note: Note: Deferred payments have not been authorized and can be edited without restriction.

UNKNOWN and DECLINED Payflow Pro transactions

If you encounter an UNKNOWN status, check the Payflow Pro website to verify the transaction exists there. If the transaction does not exist there, delete the transaction from iMIS. If the transaction does exist there, run the following statement:

Update Trans

Set CC_STATUS=' ', CC_AUTHORIZE=' ',DESCRIPTION=' '

Where TRANS_NUMBER = XXXX and

TRANSACTION_TYPE = 'PAY'

To select UNKNOWN or DECLINED transactions, run the following statement:

Select BT_ID,AMOUNT,TRANSACTION_TYPE,CC_STATUS,CC_AUTHORIZE,DESCRIPTION

From Trans

Where TRANSACTION_TYPE = 'PAY' and CC_STATUS <> '' and DESCRIPTION <> ' ' and CC_AUTHORIZE in ('DECLINED','UNKNOWN')

For additional information on Payflow Pro integration, see the Payflow Pro developer's site.

Implementing SafePay as an authorization gateway

Before you go live with card authorization, you must complete these implementation steps and checks.

> **Note:** Tip: Allow two to four weeks to complete this process.

To implement a SafePay authorization gateway

1. Ensure you have set up card authorization in iMIS.
2. Apply for a merchant bank account at a financial institution. The acquiring financial institution approves the application and notifies the SafePay authorization gateway.
3. Register with SafePay and obtain a test account with a payment server, Merchant ID, certificate files, payment host URL, and login/password for the payment administration web interface.
4. Verify your registration setup.
5. Install Java Virtual Machine and Java Runtime Environment.
6. Set up a SafePay Payment Client.
7. (iMIS Desktop only) Submit and review test transactions in iMIS.
8. Test PaymentClientoutside of the iMIS environment.
9. Set up a SafePay card authorization account.
10. Associate a credit card cash account code.
11. Switch from test mode to live mode.

> **Note:** Caution! Transactions processed through SafePay cannot be edited or deleted.

> **Note:** Note: For SafePay-based accounts, the authorization and capture scheme is configured on the payment server, based on the requirements of the merchant bank. This means that transactions may not be captured automatically, depending on the configuration of the account. For accounts that are not set up for automatic capture, in order to perform the captures for transactions submitted for the account, you must log in to the SafePay administration interface and perform the captures manually.

Registering with SafePay

You must register with SafePay (TNS/QSI/Dialect) to obtain the account information you need.

1. Contact SafePay for the Service Agreement and Registration form.
2. Contact your bank for Internet Merchant ID (Terminal ID) for the SafePay (Dialect) Internet Credit Card Gateway.
3. Complete the registration form and contact the SafePay HelpDesk. They will set up the account for you and provide you with a merchant key.
4. Via email, SafePay will send you your account information:

- Merchant ID
- certificate files
- login/password
- payment host
- payment host URL

Installing Java Runtime Environment for SafePay

SafePay (TNS/Dialect) requires the Java Runtime Environment (JRE) to be installed:

- To run the Payment Server, install JRE 1.3.1 or higher on your iMIS application server.
- Before setting up the PaymentClient, install JRE 1.3.1 or higher.

You can download the current JRE version from java.com.

To set up a SafePay payment client

To accept SafePay payments through iMIS Web or Public views, you must install the SafePay client software on the appserver itself, which does the processing for the gateway. Perform the following steps on iMIS Desktop:

1. Obtain the setup files from SafePay or ASI Technical Support and copy them to a temporary local directory.
2. (Windows 2008) To install the client on Windows 2008, disable Data Execution Prevention (DEP) for everything except System Processes.
3. (Windows 2003) Change the setup file's properties to run as compatible with Windows 2000 (right-click the file, select Properties, and select the Compatibility tab).
4. Run the setup as directed by SafePay.
5. Restart your machine when the installation successfully completes.
6. Verify the settings in your setup.properties file, as directed by SafePay.
7. (optional) To test PaymentClient outside of iMIS, in the CardNumbers.profile file, ensure that any expiryDate values match the expiration dates of any test credit card numbers provided to you by SafePay.

To test the SafePay client outside of iMIS

You can test the SafePay client, PaymentClient, outside of the iMIS Desktop environment. Be sure to adjust your PaymentClient settings so that the test card numbers will be authorized:

1. Locate the \config directory within the \PaymentClient installation directory.
2. Edit the CardNumbers.profile file.
3. Ensure that any expiryDate values match the expiration dates of any test credit card numbers provided to you by SafePay.

To test immediate SafePay authorization

1. Before you test, make sure that you are licensed in iMIS for credit card authorization (CCAUTH) and that the Immediate Authorization option is selected on the AR/Cash Credit Card Authorization window (in Desktop, go to AR/Cash > Set up module. Click Credit Card Auth).

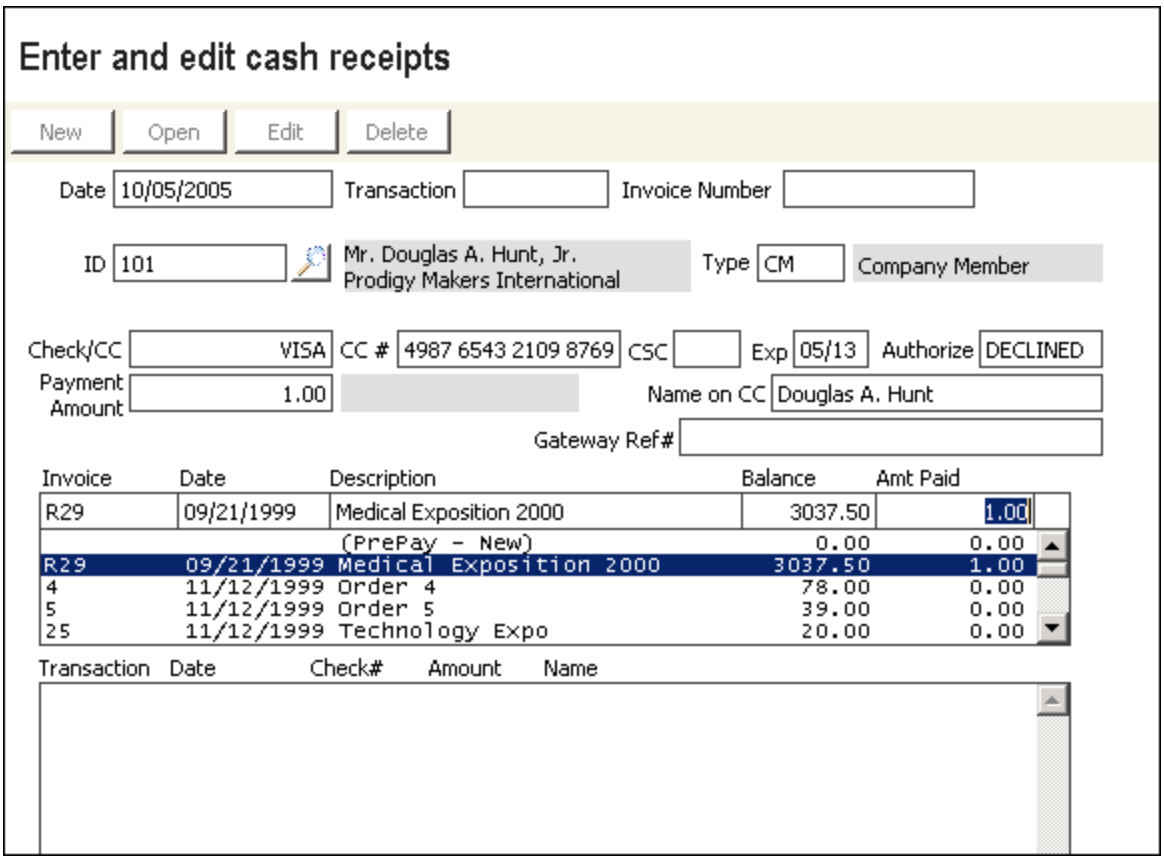
   Use the following credit card numbers for testing purposes:

- Master Card: 5123 4567 8901 2346 (05/13)
- VISA: 4987 6543 2109 8769 (05/13)
- American Express: 3456 7890 1234 564 (05/13)
- Diners Club 3012 3456 7890 19 (05/13)

2. In Desktop, go to AR/Cash > Enter and edit transactions > Cash receipts.
3. Click New.
4. When entering a payment, enter one of the test credit card codes in the Check/CC field. A CC # and additional data entry fields display.
5. Enter the test credit card number in the CC # field.
6. If required, enter a Card Security Code in the CSC field.
7. Enter an expiration date in the Exp field.
8. Enter the name on the credit card in the Name on CC field. This need not be the same as the customer name.
9. Enter a dollar amount in the Payment Amount field.
10. Click Save. The Authorize field displays a status code of either a deferred status (DEFER), a unique authorization code (if your financial institution returns an authorization code), or DECLINED or UNKNOWN if the credit card is not authorized by SafePay. In addition, if you entered a value in the CSC field, the field is now blank because iMIS automatically deletes the value once the transaction has been submitted.

    Notes

- If your financial institution does not return unique authorization codes, the Authorize field will contain null.
- The criteria for authorization depend upon the policy of the acquiring financial institution.



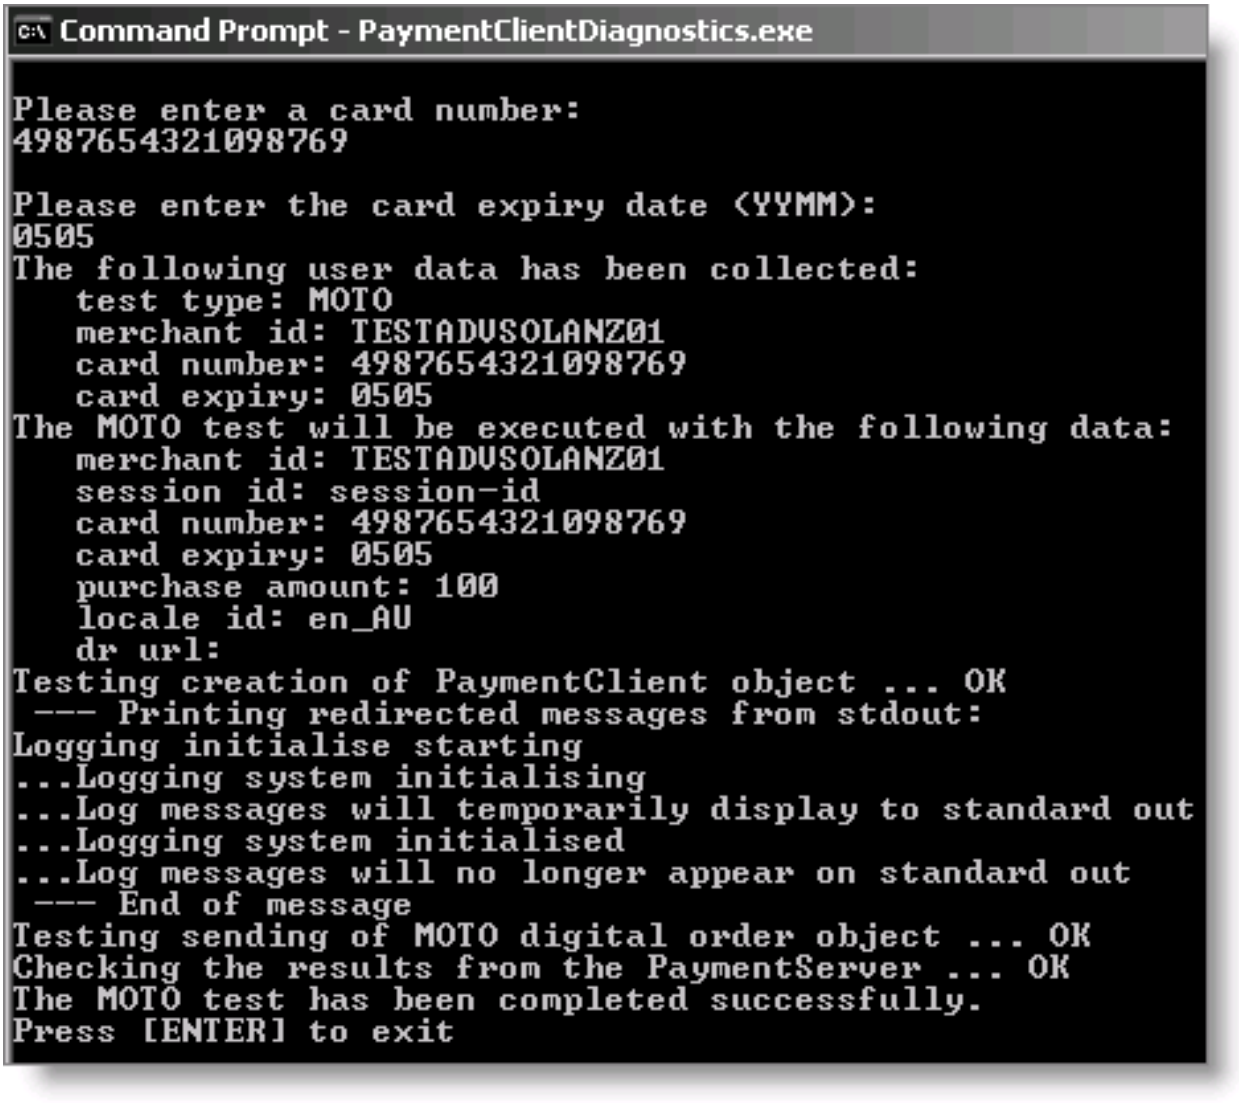
Testing immediate credit card authorization with CCAuth

Example: Testing immediate authorization

This example tests SafePay connections using the command line test tool provided with the payment client. Check with your gateway provider for the latest testing tools and procedures.

1. Ensure the service is running. Go to Start > Control Panel > Administrative Tools > Services.
2. Look for Dialect PCService in the Service Console, and ensure that it is Started.

3. Test connectivity by selecting Start > Programs > Dialect > PaymentClient > Test Payment Client. The Payment Client Diagnostics program retrieves and displays client configuration information and prompts you to enter transaction information.
4. Select 1 for MOTO.
5. Enter the Merchant ID provided with your account information.
6. Select a credit card number or enter Z to enter another credit card number.
7. Enter the credit card expiration date (format: YYMM). The diagnostic program tests the PaymentClient configuration and displays test results on the screen.



Example of a successful test transaction

To set up a SafePay card authorization account

1. In Desktop, go to AR/Cash > Set up module, and click Credit Card Auth. Click Credit Card Auth.

   Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.

2. Click New and select SafePay from the Gateway drop-down list.

   Note: When editing card authorization accounts, you cannot modify the values for the Gateway or Account Code field.

3. Enable the Manual Authorization, Immediate Authorization, or Deferred Authorization option.

4. Enter an Account Code. This value displays in the Select a Value window that opens when you click the lookup icon on the CC Auth Account field on the Set up cash accounts window. This value cannot be changed once the record is saved.

   Note: When editing card authorization accounts, you cannot modify the values for the Gateway or Account Code field.

5. Enter a description for the account in the Account description field. If you enter a value in this field, it displays as read-only data under the CC Auth Account field on the Set up cash accounts window.

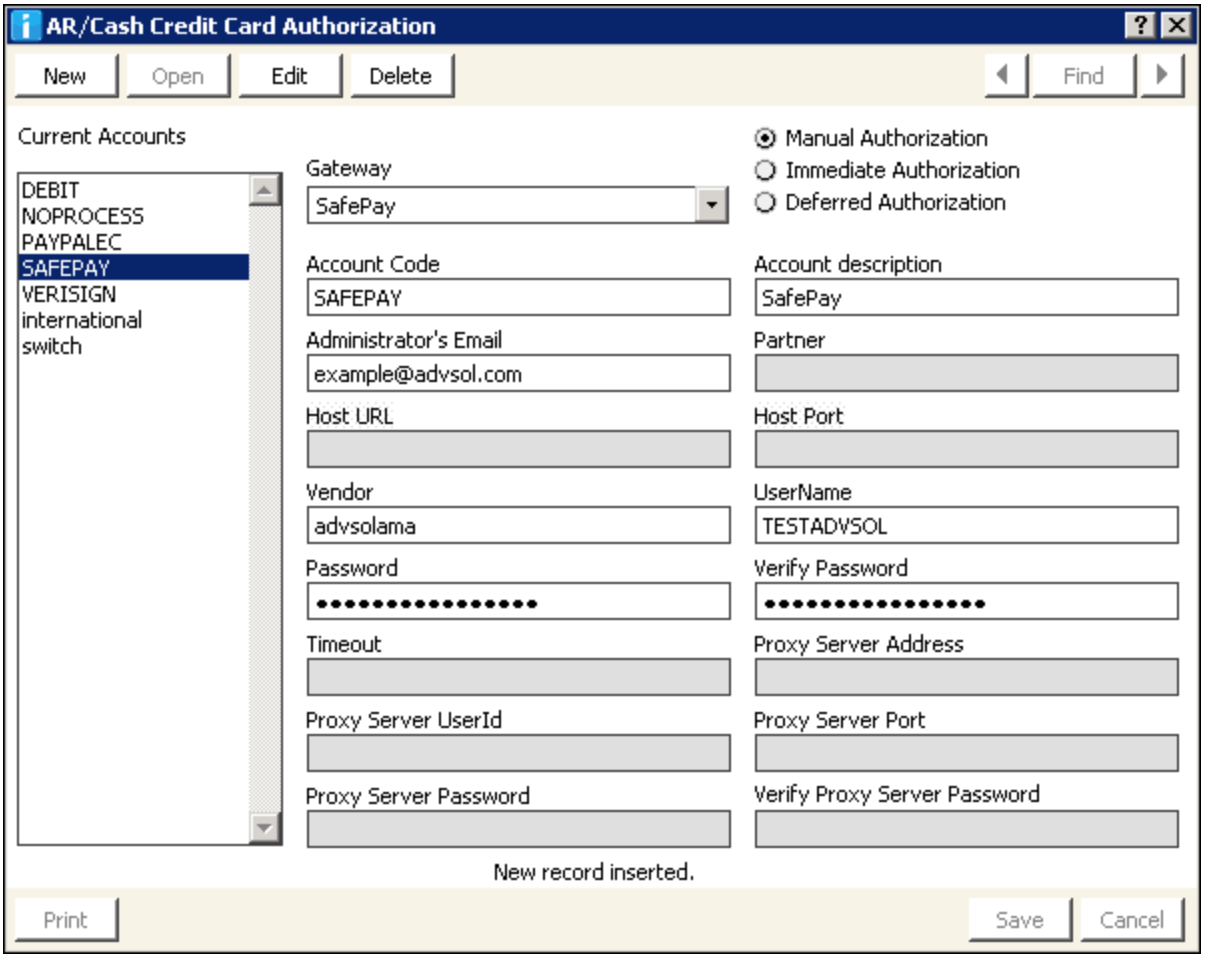
6. Enter the Administrator's Email.

7. (optional) Enter the Merchant Administration login (username) you were given in the Vendor field.

8. Enter the Merchant ID obtained during set up in the UserName field.

9. Enter the Merchant Administration password you were given in the Password and Verify Password fields.

10. Click Save.
11. Restart iMIS.



Configuring QSI Authorization

Note: If you do not restart iMIS after creating a new account, all transactions will have an authorize code of DEFER even if you enabled the Immediate Authorization option.

Note: You cannot delete a card authorization account that has been assigned a cash account.

Note: Transactions processed through QSI cannot be edited or deleted.

Note: If you change the CC Auth account for a cash account (from one gateway to another or to a different account on the same gateway) and attempt to edit or delete

transactions that were created earlier in the day before the change of the CC Auth account, there may be undesirable results, particularly if the CC Auth account was changed to a VeriSign account.

To associate a card authorization account with a credit card cash account code

Before you can use card authorization you must set up credit card accounts on the Set up cash accounts window:

1. In Desktop, go to AR/Cash > Set up tables > Cash accounts.
2. Select a code to edit from the Current Cash Accounts list.
3. Click Edit.
4. Enter a CC Auth Account or click the lookup icon to select a value.
5. Click Save.

Managing SafePay transactions

With SafePay, you cannot edit or delete existing transactions or enter refunds (enter payments with negative amounts).

The authorization and capture schema is configured on the payment server, based on the requirements of the merchant bank. This means that transactions might not be captured automatically, as it depends on the configuration of the account.

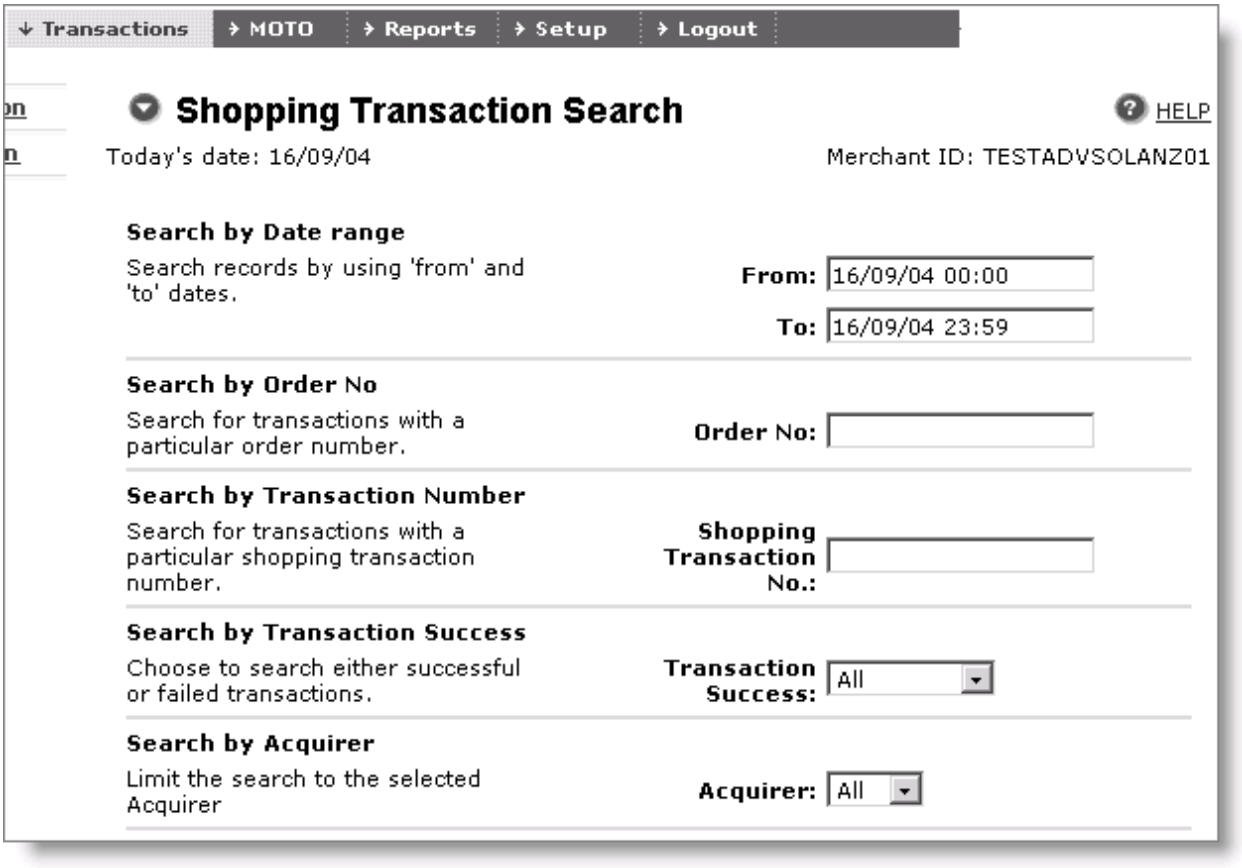
For accounts that are set up for automatic capture, you must log in to the administration interface and capture the transactions manually in order to perform the captures for transactions submitted for the account.

> **Note:** Note: Regardless of the authorization/capture schema, iMIS creates all Trans entries for SafePay-based transactions with the Trans.CC_Status column value = 'C' (in the same manner as Payflow Pro).

To view submitted transactions

1. Go to the merchant account site.

2. Enter your merchant ID, login, and password.
3. Select the Transactions menu. A window similar to the following is displayed:



Go to https://secure.dialectsolutions.com/DPS/MA

Creating a custom credit card gateway

If you choose not to use Payflow Pro or SafePay, you can create a custom credit card gateway. The same connection parameters that are available for a Payflow Pro gateway are also available for a custom gateway. This includes all of the authorization modes and settings on the AR/Cash Credit Card Authorization window.

iMIS Web views

A .NET developer can write a custom gateway for the web views of iMIS. Templates and documentation are available from iMIS Community's SDK Center.

iMIS Desktop

An Xtender developer can use Visual Basic to write a custom gateway for iMIS Desktop. Templates and documentation are available from the iMIS Support community under Extension Products. Instructions for customizing the gateway are in the documentation and the control files. The Xtender developer must define and carefully document which of the fields should be populated, if any, and for what purpose.

Installing a custom credit card authorization gateway

Before implementing a custom gateway, the developer must install the new application in a test environment. The application must be installed on each iMIS Desktop workstation from which payments are entered.

After the custom gateway application is installed you must:

1. Create a new Credit Card Authorization account (AR/Cash > Set up module > Credit card authorization).
2. Set up a Cash Account (AR/Cash > Set up table > Tables > Cash Accounts) for a Type, Credit Card or Debit Card, that uses the newly defined Credit Card Authorization account.

Setting up a custom credit card authorization account

To configure iMIS to use an Xtender application that a developer has created for a custom credit card gateway.

> **Note:** Note: Only two fields are required for the custom gateway: Account Code and Account Description. The remaining fields are available for connection parameters. Your developer can use the data entered to these fields for other purposes, or not at all.

> **Note:** Caution! The labels on the fields may not correspond to the data you need to enter. Check with your developer to find out whether these fields require special data for the custom gateway.

1. Select AR/Cash > Set up module, Credit Card Auth.

Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.

2. Click New and select Custom from the Gateway drop-down list.
3. Enable the Immediate Authorization, or Deferred Authorization option.
4. Enter an Account Code. This value displays in the Select a Value window that opens when you click the Find icon in the CC Auth Account field on the Set up cash accounts window. This value cannot be changed once the record is saved.
5. Enter a description for the account in the Account description field. If you enter a value in this field, it displays as read-only data under the CC Auth Account field on the Set up cash accounts window.

Troubleshooting the installation for custom gateway

If the custom gateway application is not installed or is installed incorrectly on iMIS Desktop, the transaction will fail. When a user attempts to save a payment transaction that is dependent on the custom gateway, the authorization process will time out for that transaction. iMIS informs the user that the payment cannot be authorized because the gateway application is not installed correctly.

- This message is presented first.

  Custom Gateway not properly installed

  The payment type entered for this transaction requires a Custom Gateway for credit card authorizations. The custom gateway is not properly installed on this workstation.

  The authorization for this payment transaction will time out.

  Please contact your system administrator or the developer of your custom gateway application before processing payments using the specified payment type.

  Note: An error message identifier, nCCAuthOnly_Custom, at the bottom of this message informs Technical Support that this is not an iMIS issue.

- After the user clicks OK in the Custom Gateway not properly installed message box, a standard iMIS warning is provided.

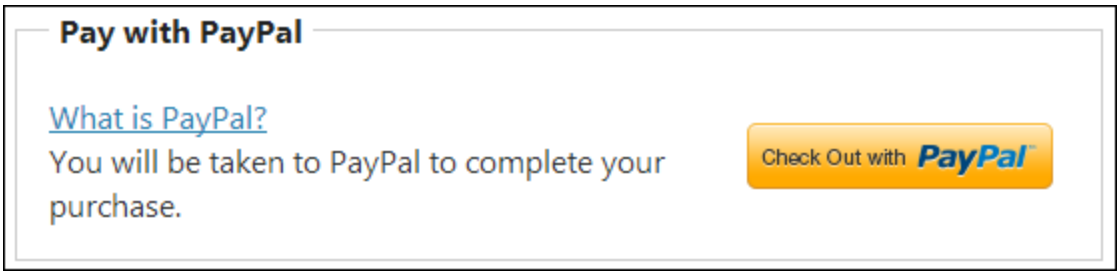
  The authorization process timed out. Please contact your system administrator.

Payments in iMIS

Note: Note: This document will ask the user to use the iMIS Staff site and the iMIS Advanced Accounting Console to configure and administer payment functionality for iMIS. Also, the user may be asked to access locations outside of both the iMIS Staff site and the iMIS Advanced Accounting Console.

PayPal Express Checkout Integration

If you already accept credit cards online, you can set up Express Checkout with PayPal to integrate with your content item-based sites. This additional payment option is a convenience for your members, customers, registrants, and donors, which means more revenue for your organization. This option also reduces your liability for holding cardholder data, because their credit card information is stored securely at PayPal.



The Pay with PayPal block appears in the Payment Creator content item if you set up a cash account as a PayPal service.

PayPal payments can apply to a full range of items offered in iMIS sites:

- Products and product kits
- Event registrations
- Renewal invoices, for both accrual and cash dues
- Donations

iMIS handles PayPal Express Checkout differently for products that are not shipped:

- Shippable items (products and kits) require a deliverable address, which both iMIS and PayPal verify. iMIS sends the contact's name and address to PayPal, which displays the information on its site for the payer to verify.
- Non-shippable items (renewals, registrations, donations) require no delivery address, so none is sent to PayPal. Because of this, PayPal displays the name and address of the payer that it has on file, which may differ from the name and address stored in iMIS.

  Your site visitors can complete transactions quickly and easily without entering credit card information:

1. After adding all items to their cart (or completing a standalone donation), users click Check out with PayPal.
2. They redirect to PayPal and sign in, where they complete their payment:

- see their payment item details
- review their shipping info
- select their method and complete payment

3. PayPal automatically returns the necessary information needed to confirm and fulfill the order. Your customer is returned to your website to view their confirmation.

   You can set up style elements in your PayPal account so that customers will feel comfortable that it is a continuation of their shopping experience from your site.

> **Note:** Note: The Pay with PayPal option is hidden whenever the signed-in user works On Behalf Of another.

Setting up PayPal Express Checkout

Once your organization establishes a PayPal Business or Premiere account, you can integrate PayPal Express into iMIS to offer a preferred payment option to your site vis-

itors. Setting this up involves creating your sandbox account with PayPal, creating the PayPal service in iMIS, and testing transactions between iMIS and PayPal.

These resources on the PayPal Developer site (developer.paypal.com) will help your organization implement the service:

- Products > Express Checkout
- Getting Started Guides > Express Checkout API

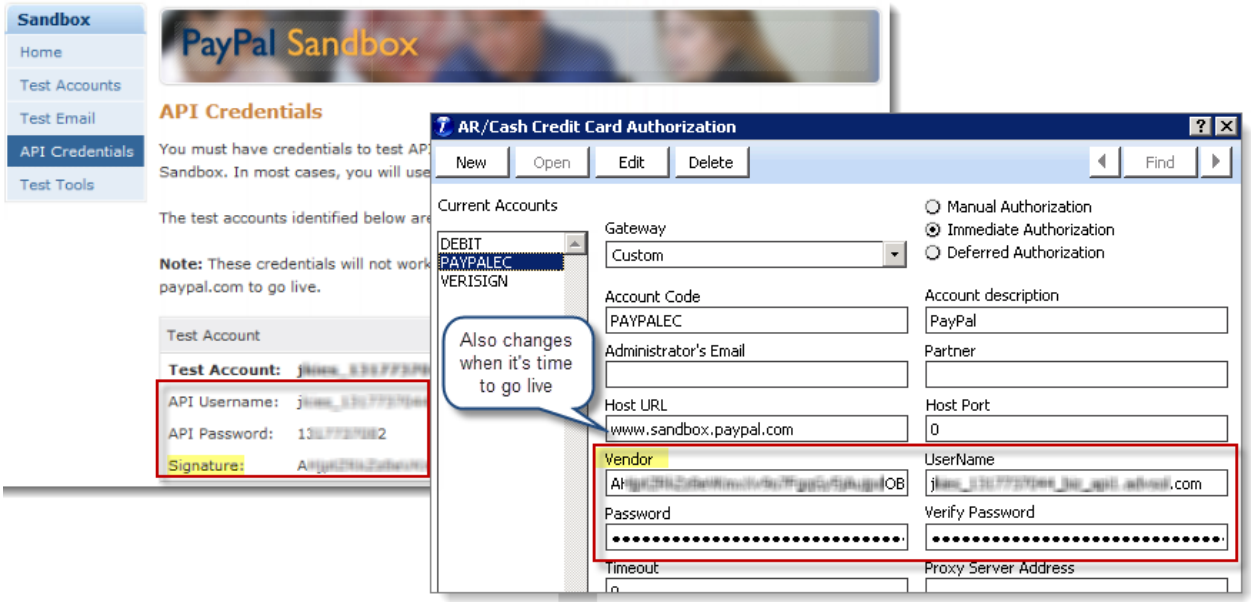
> **Note:** Important! The specified default currency symbol will not be displayed on your iMIS site. If the customer's merchant account is set to a different currency than the default currency set on the iMIS site, then the total that appears on the customer's PayPal site will correspond with the currency that they have set in their merchant account.

To enable the service with PayPal

1. Sign up for Express Checkout. Log in, or select Create New Account.

   Important: Express Checkout requires a Business or Premier account.

2. Set up a PayPal Sandbox account to use for testing, with at least two test accounts:
   - A merchant account to represent your organization
   - A personal account to represent your buyer
3. Sign into your sandbox account, click API Credentials to collect the information you need to enter into iMIS to begin your setup and testing:



To set up PayPal authorization in iMIS

Keep in mind that you will be moving between test (sandbox) mode and live mode, which requires a different Host URL and set of PayPal API Credentials. Before you begin your iMIS testing, remember that you must be signed in on the PayPal sandbox site.

> **Note:** Tip: Keep a separate instance of iMIS configured to use your sandbox settings, for ongoing testing.

1. From Advanced Accounting Console, select Finance > Options > Configure accounting options.
2. Click Credit Card Auth. Under Current Accounts, select PAYPALEC.

   If the PayPal account does not exist, create it:

1. Click New.
2. Add a Custom gateway with an Account Code of PAYPALEC, set for Immediate Authorization.
3. Set the PAYPALEC account values for your organization, and click Save.

- In Host URL, enter the appropriate PayPal URL: www.sandbox.paypal.com (test) or www.paypal.com (live)
- Enter your organization's values for Vendor (the API Signature for your PayPal account), UserName, and Password.

  Troubleshooting: These values are case-sensitive. Also, remove any trailing spaces from these fields.

4. In Finance > Options > Set up table > Cash accounts, add a cash account with these features:

- Code: PAYPAL
- Title: PayPal (exact-case-sensitive)
- Type: Service
- CC Auth Account: PAYPALEC

5. Add the PayPal method to the Payment Method Set. See Set up payment method sets.

> **Note:** Important: Your payment method set Display Name for PayPal must exactly match the title: PayPal. If there are any variations, PayPal will not display in the cart.

6. Verify that your web.config includes PayPal as a payment gateway provider, and that the authorization account code matches what you defined above:

   <add name="PayPalPaymentGatewayProvider" type-e="Asi.PaymentGateway.PayPalPaymentGatewayProvider, PayPalPaymentGatewayProvider" authorizationAccounts="PAYPALEC" />

7. If you are designing your own checkout pages, be sure that the Payment Creator and Submit Order Button content items are on same page.

   To test the PayPal service

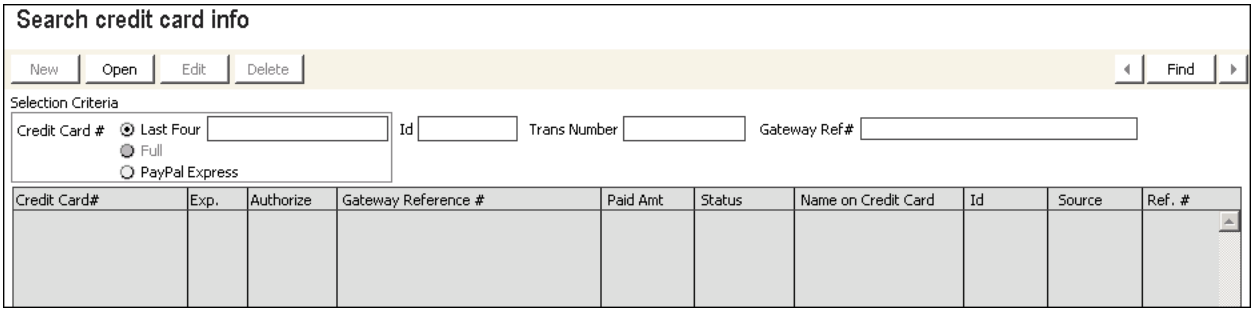
> **Note:** Important: Open your PayPal sandbox test site.

1. Browse to developer.paypal.com and log in to your Business or Premier account.
2. On your iMIS site, complete a PayPal transaction:

1. Put an item in your cart. When configured correctly, the Pay with PayPal panel appears directly above the payment methods drop-down in the Cart and on the Give & Go page.
2. Click Pay with PayPal, which redirects to the PayPal site.
3. Log into PayPal with your personal test account, not your business account.
4. Verify that your order details appear on the PayPal site, and click on Pay Now to complete the transaction. PayPal redirects you to the confirmation page in iMIS.

3. Verify that the transaction information was stored correctly in iMIS:

1. In Advanced Accounting Console, go to Finance > Transactions > Search credit card info.
2. To find the transaction, specify PayPal Express.
3. Enter the iMIS Id, Trans Number, or Gateway Ref#, which contains the Transaction ID that PayPal assigned.



Restricting payment methods to PayPal only

If you want to switch to accepting payment through PayPal Checkout Express only for public users, you can easily reconfigure iMIS so that the Payment Creator allows payment through PayPal alone.

> **Note:** Note: These steps will restrict payment methods to PayPal alone only for public users. Staff users will still see other payment methods as defined in Finance > Options > Set up tables > Cash accounts.

To change cash accounts to support PayPal only

To achieve PayPal-only payments, you need to configure iMIS so that PayPal is the only web-enabled cash account. The following is a quick way to achieve this for public users without deleting any existing credit card accounts:

Go to Settings > Commerce > General:

1. In Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts.
2. Add a cash account that is a copy of your PAYPAL account, named Z_PAYPAL. This new account must point to your existing PAYPALEC authorization account.
3. View your site and add an item to the cart to verify that Payment Creator is hiding the credit card options.

> **Note:** Tip: To re-enable credit card processing, simply repeat the first two steps and restore the value.

Using PayPal for standalone donations

The Payment Creator content item supports the PayPal Express Checkout panel when it appears outside of the context of the shopping cart, on a standalone donation page. The PayPal integration preserves any entries in the Display Name Editor (List As) and Tribute Gift Editor content items. The PayPal option can enhance your campaign success by giving your site visitors the reassurance of a known and secure payment method.

> **Note:** Note: On contact account pages, the Giving History content item lists donations paid using PayPal as having a Type of Cash.

Auditing PayPal payments

To reconcile transactions in your iMIS database with the PayPal Express entries, use the transactions report to obtain the Transaction IDs, Gross and Net amounts, dates, and PayerIDs. On the PayPal site, you can look up a PayerID to identify the purchaser.

To reconcile transactions in your iMIS database with the reports in PayPal, look at the Transaction ID that appears in the Details for an entry on the Overview page.

> **Note:** Tip: Keep in mind that it is possible for addresses and even names to differ between iMIS and PayPal for a single Transaction ID. The Transaction ID in the merchant account listing is what pairs the two.

To retrieve audit details from PayPal

1. Log on to paypal.com using your seller account.
2. Select your account and enter the site.
3. Locate the most recent transaction, verifying that the amount matches the order.
4. Click the Details link for that line.
5. Click Unique Transaction ID # that appears next to the text Express Checkout Payment Received.
6. In Advanced Accounting Console, look up the values as appropriate:

- Go to Orders > Open an order > Payments tab, Gateway Ref#
- Events > Register a customer > Open a registration > Payments tab, Gateway Ref#
- AR/Cash > Credit card reporting > Search CC Info, any combination of iMIS ID, iMIS Trans ID, and Gateway Ref#
- (for future release) AR/Cash > Generate Reports > Credit Card > Credit Card Post Authorization Report (Crystal) returns the results for CC Auth Acct of PayPal (which is tied to cash accounts with a type of Service).

Refunding PayPal payments

Refunding customer payments always involves iMIS Advanced Accounting Console, where you cancel out the payments and issue refunds. When PayPal is the payment method, refunds must be made using PayPal as well.

> **Note:** Important: The only time that both iMIS and PayPal process payments automatically is when they are first entered by customers on your site. Any subsequent transactions affecting that payment must be entered manually into both PayPal and iMIS Advanced Accounting Console.

Reversing a PayPal payment (such as to remove payment for a registration) require the following two steps:

1. PayPal: Log in to PayPal and process the refund using PayPal's standard procedures.
2. Advanced Accounting Console: Go to Finance > Transactions > Cash receipts and create a new payment to cancel the prior one:

- Enter the following:
- ID
- PayPal cash account (typically PayPal) in the Check/CC field
- negative payment amount
- Apply the negative payment to the original transaction:
- Edit the transaction.
- Enter a negative amount in the Amt Paid field, so that it has a balance due.

If the transaction will not be paid by another method and you need to reverse the original purchase, use the normal procedures to cancel a registration/order/donation.

Authorizing Credit Cards in iMIS

Card authorization is the process of obtaining payment authorization when a credit/debit card transaction is entered. Credit/debit card transactions can be authorized across these areas of iMIS:

- AR/Cash: Sales transactions and cash receipts windows
- Billing: Dues and subscriptions payments
- Fundraising: Gifts, pledges, and fundraising payments
- Service Central: Payment entries
- Public view: Events registration and order entry

Card Authorization allows you to search by card number or customer ID to find credit/debit card transactions throughout iMIS.

> **Note:** Note: If Advanced PCI Compliance|Implementing Advanced PCI Compliance options > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Card authorization requirements

iMIS ships with the card authorization and Service Central modules. To use card authorization in iMIS, you need the CCAUTH license key. You also need a high-speed Internet connection to handle a high volume of transactions.

To use card authorization, you must:

1. Set up a merchant account at your bank or another financial institution.
2. Set up a payment processing account. Your payment processor must be supported by your payment gateway service. If you are doing business outside of the United States, use a payment processor that handles international currencies.

3. Register with a payment gateway service and install additional gateway software as required. iMIS natively supports Payflow Pro (see "Implementing Payflow Pro as an authorization gateway"), offered by PayPal, (previously Verisign), and SafePay, offered by TNS), which handles international sales, and TNSPay, offered by TNS), which handles international sales, and Moneris), offered by Moneris Solutions, based in Canada and focused on Canadian sales.

   Note: European debit card transactions in iMIS cannot be processed with either gateway. Instead, your AiSP must implement a custom gateway interface.

   Note: iMIS Payment gateways are compatible with all cards that can be processed as credit.

   Before you take any of these steps, you should understand what card authorization is and how it works.

The card authorization process

Card authorization allows you to accept a credit/debit card payment from a customer and, within a matter of seconds, have the card transaction approved over the Internet by your bank. You also have the option of having transactions deferred for authorization at a later time.

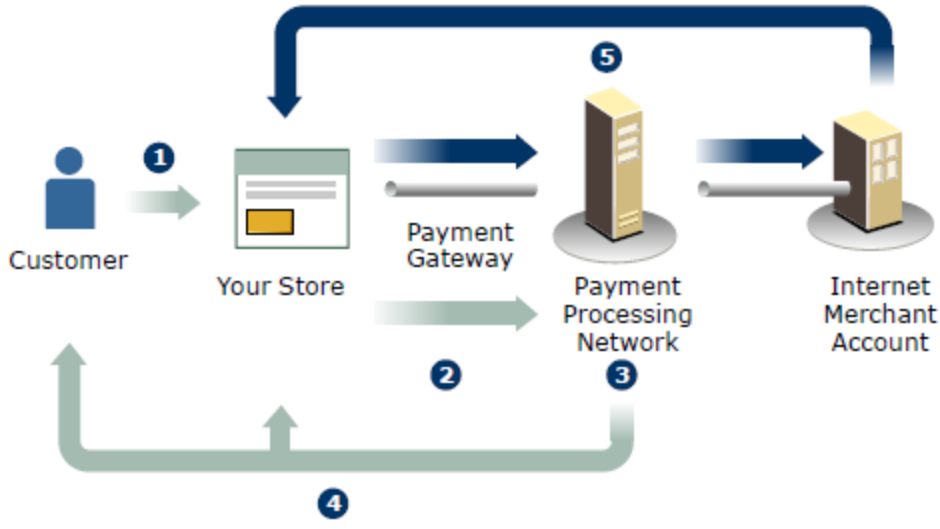


Diagram and steps from PayPal

Credit card authorization includes the following steps:

1. A customer purchases a product or service from a store.
2. The payment gateway encrypts data and securely sends it through the payment processing network.
3. The transaction is reviewed for authorization or decline, and the results are sent back through the payment gateway.
4. The customer receives a confirmation receipt and the order is fulfilled.
5. Once the transaction is processed, funds are transferred from the customer's bank account to the merchant bank account.

Card authorization terms

Before you get started, it is a good idea to become familiar with some of the terms that are used throughout this section. The following is a list of some of the most commonly used terms.

Acquiring financial institution

An acquiring financial institution is a bank or other financial organization that contracts with banks and merchants to allow merchants to accept card transactions. Some financial institutions perform merchant services; others outsource these services to a third-party processor.

Authorization

An authorization is an electronic request for approval of the sale that is sent to the financial institution that issued the customer's credit/debit card. Authorization options in iMIS include Manual, Immediate, and Deferred. Manual is the default authorization setting.

Batch (CC Auth)

A batch is an accumulation of card transaction authorizations that are awaiting settlement.

Capture

A capture is the process of submitting a credit/debit card sale for financial settlement. When a transaction is captured, the sale amount is credited to your deposit account through your acquiring financial institution and posted to the cardholder's credit/debit card account. This transaction usually occurs after midnight when authorizations for the previous day are batched.

Card authorization gateway

A card authorization gateway is a third-party credit/debit card interface, similar to an automated point-of-sale system that provides a front end to financial networks, financial institutions, and payment processors, which allows merchants to provide credit/debit card authorization to their clients.

Card Security Code (CSC)

The 3- or 4-digit, unembossed number that displays on the front or back of a credit/debit card; often used as an added measure of verification for card transactions. The Card Security Code (CSC) is not part of the actual card number.

DBA name

(Doing Business As) A DBA name is the name used to identify the business, as opposed to the business' legal name.

Deferred authorization

Deferred authorization is transaction information that is saved for later processing.

Manual authorization

Manual authorization option enables a system licensed for card authorization to turn off automatic authorization.

Editing

Editing is the process of changing the payment information for a transaction in the Trans database table in iMIS.

Flag

To flag is to mark a transaction to be processed later.

Immediate authorization

With immediate authorization, the payment information is sent immediately to the gateway for authorization (and for later capture) when a credit/debit card transaction is entered.

Issue date

The 5-character date (mm/yy format) date of issue that is printed on certain European debit cards, used for authentication.

Issue number

The 1- or 2-digit number that is printed on certain European debit cards, which indicate how many versions of the card have been issued to the cardholder. This value is used for authentication.

Issuing financial institution

An issuing financial institution extends credit to a customer through credit card accounts or provides electronic account debits through debit cards. The issuing financial institution issues a credit card and bills the consumer against the credit card account. An issuing financial institution is also referred to as the cardholder's financial institution or issuer.

Merchant account

The account that collects the funds from a credit/debit card transaction. The merchant account receives the funds after the capture is complete.

Submit

Submit is the process of sending deferred credit/debit card transactions to a gateway for authorization.

Settlement

Settlement is the process in which an electronic credit card transaction is settled between your acquiring financial institution and the customer's credit card issuing financial institution. Your acquiring financial institution credits your account for the credit card sale and the sale is posted to the customer's credit card account.

User account

The account that is debited after an authorized credit/debit card transaction is captured.

Void

A void is a deleted payment transaction. The transaction can then be replaced with a new transaction.

Setting up card authorization

Note: Note: If you are creating a custom gateway, see Creating a custom credit card gateway.

Installing iMIS and adding license keys

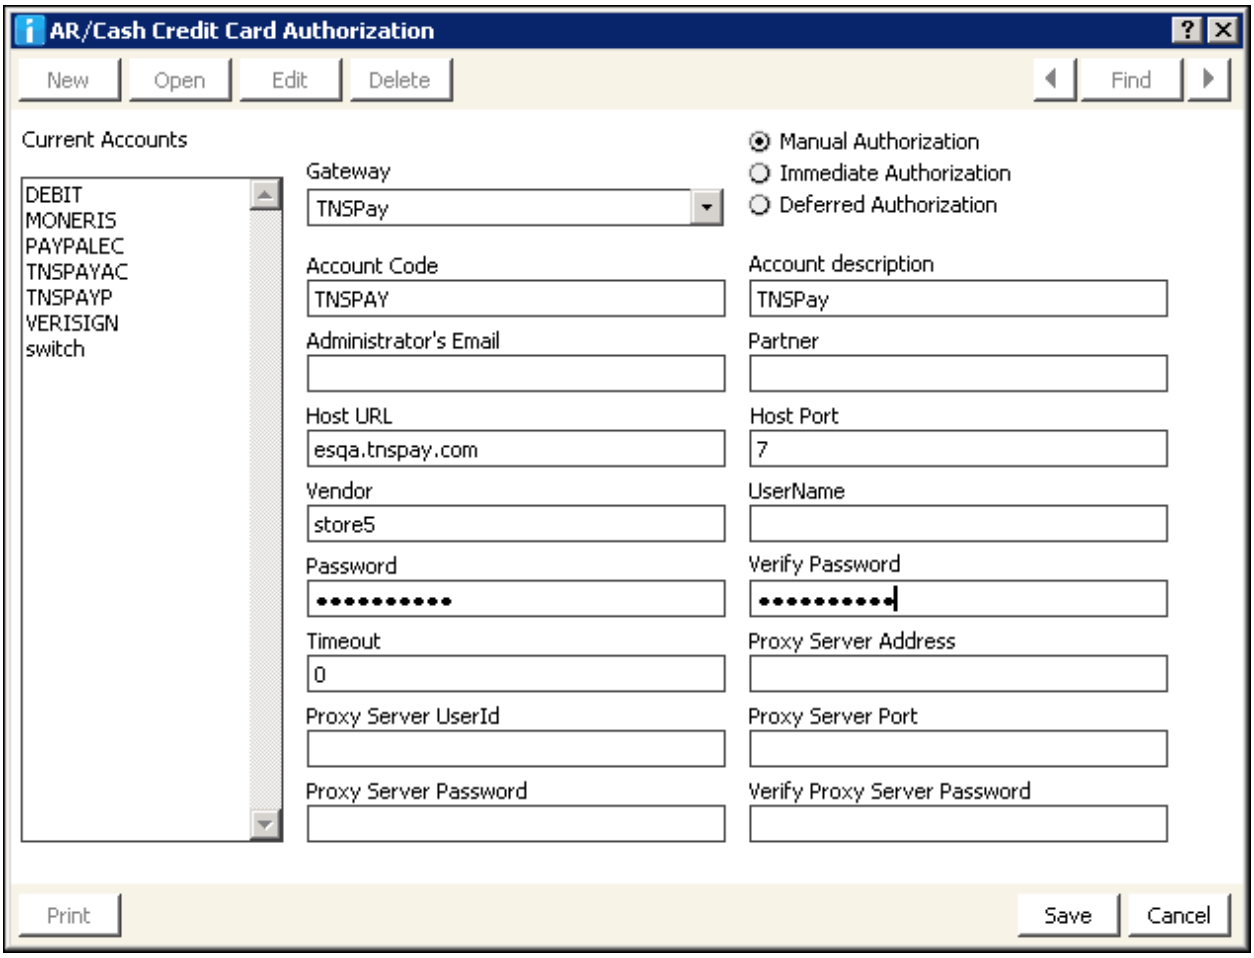
The first step in getting started is to install iMIS, which includes the components needed to run card authorization.

Note: Note: To set up card authorization, you need a relevant license, such as CCAuth or Service Central.

AR/Cash Credit Card Authorization window

This window specifies authorization options for credit cards and European debit cards.

In Advanced Accounting Console, go to Finance > Options > Configure accounting options, and click Credit Card Auth.



Current Accounts

Lists the currently defined card authorization accounts.

Gateway

Lists the authorization gateways supported by iMIS:

- SafePay – authorizes international credit cards.
- Payflow Pro – authorizes domestic credit cards.
- Moneris – authorizes Canadian and US currency credit cards using the eSelect service.
- TNSPay – authorizes international credit cards.
- Other – for European debit cards, enables storage of encrypted CSC values and unencrypted issue number and issue date values so that a custom gateway for deferred

authorization of European debit card transactions can be implemented.

- Custom – custom gateways you can write and install on your system.

  Authorization options

  Specifies the type of authorization that will be performed for all credit/debit card cash accounts that use this card authorization account.

- Manual Authorization – Disables automated authorization through a gateway. The payment information can be edited or deleted at any time until invoiced.
- Immediate Authorization (Payflow Pro, SafePay, TNSPay and Moneris gateways only) – Performs automated authorization through a gateway. Payment information can be edited or deleted the same day only. Because the Other gateway is not supported, immediate authorization cannot be used for European debit card transactions. The following authorization process is used:

1. Credit card payment is entered.
2. Credit card information is immediately sent for authorization.
3. Authorization is returned and transaction is saved for later capture.
4. Transaction is saved and completed.

- Deferred Authorization – Performs automated authorization through a gateway. Payment information can be edited or deleted until the transaction is captured. The following authorization process is used:

1. Credit/debit card payment is entered.
2. Transaction information is saved for later batch processing.
3. Transactions are periodically sent in a batch for authorization and capture.
4. Transactions in the batch are saved and completed.

   Save CSC Prior to Authorization

(only for Deferred Authorization) Saves the card security code (CSC) value in an encrypted format in the iMIS database, so that the CSC information can be sent with all other transaction information in the batch for deferred authorization.

If the associated Gateway is Payflow Pro, or SafePay, iMIS automatically deletes the saved CSC information after successful deferred authorization. If the associated gateway is Other, however, the custom gateway implemented by your AiSP for European debit card authorization is responsible for ensuring that the saved CSC information is deleted from your iMIS database.

Account Code

Specifies a short name for the account which must match the value in the web.config file.

Account description

(optional) Specifies a description for the account.

Administrator's Email

(Payflow Pro and SafePay gateways only) Specifies the email address of your iMIS administrator so that the gateway service can contact the administrator if necessary.

Partner

(Payflow Pro gateway only) Specifies the Payflow Pro partner name that was obtained when you created your account.

Host URL

Specifies the web address of the Payflow Pro, TNSPay or Moneris gateways.

Host Port

(Payflow Pro gateway only) Specifies the port number of the Payflow Pro gateway.

Vendor

(Payflow Pro, SafePay, TNSPay and Moneris gateways only) Specifies your Payflow Pro user name, your SafePay merchant administration login (username), TNSPay Merchant

ID or Moneris online account name (monxxnnnnn) that was obtained when you created your account.

UserName

(Payflow Pro and SafePay gateways only) Specifies your Payflow Pro user name, your SafePay merchant ID that was obtained when you created your account.

(TNSPay gateway only) Specifies the payment model of your merchant account. For the Authorize + Capture model enter AC. For the Pay (also known as Purchase) model enter P. If no value is specified then P is assumed.

Password, Verify Password

(Payflow Pro and SafePay gateways only) Specifies your Payflow Pro password or your SafePay merchant administration login password.

(Moneris gateway only) Specifies your API Token provided via your Moneris eSelect Store Settings. You must have access to this feature to generate an API Token.

(TNSPay gateway only) Specifies your Integration Authentication password.

Timeout

(Payflow Pro gateway only) Specifies the gateway connection timeout value, in seconds. ASI recommends a timeout value of 30 seconds.

Proxy Server Address

(optional, Payflow Pro gateway only) Specifies the IP address of your organization's proxy server.

Proxy Server UserId

(optional, Payflow Pro gateway only) Specifies the user ID of your organization's proxy server.

Proxy Server Port

(optional, Payflow Pro gateway only) Specifies the port number of your organization's proxy server.

Proxy Server Password

(optional, Payflow Pro gateway only) Specifies the password required by your organization's proxy server.

Verify Proxy Server Password

(optional, Payflow Pro gateway only) Specifies the password required by your organization's proxy server.

Setting up credit/debit card cash accounts in the Finance module

You must set up credit/debit card cash accounts on the Set up cash accounts window in the Finance module in the Advanced Accounting Console before you can use card authorization. When you select a cash account of type Credit Card or Debit Card, the CC Auth Account field displays, enabling you to associate a card authorization account with a credit/debit card cash account. The system automatically generates a read-only description under the CC Auth Account field. The CC Auth Account field requires a value when you select a cash account of type Credit Card or Debit Card.

To define a new credit/debit card cash account code

> **Note:** Note: Before defining new credit/debit card cash accounts, set up your card authorization accounts on the AR/Cash Credit Card Authorization window. In Advanced Accounting Console, go to Finance > Options > Configure accounting options, and click Credit Card Auth.

1. In Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts.
2. Click New.
3. In the Code field, enter the abbreviation you want to assign to the cash account you are creating.

   Note: You can use any code you prefer for a credit/debit card. However, for a credit card number to be validated by iMIS, the value, in addition to being a cash account of type

Credit Card, must contain one of the credit card types iMIS supports: AMEX, VISA, MC, DISC, DINERS, CB.

4. In the Title field, enter the full name you want to assign to the account.
5. For Type, enable either the Credit Card or Debit Card option.
6. (optional) In the Account field, enter the GL chart of accounts number for the cash account assigned to this table entry, or click the lookup icon to select a value.
7. (optional) For multiple entities, enter the Entity code, or click the lookup icon to select a value.
8. Enter the CC Auth Account, or click the lookup icon to select a value.
9. (optional) Select the appropriate CSC Required option:

- CSC Required Web Entry – In all web-based views of iMIS, marks the Card Security Code field as required for the specified credit card.
- CSC Required Workstation Entry – In Advanced Accounting Console, marks the CSC field as required for the specified credit card.

  Note: When making the CSC value required, ensure the card authorization account to which the credit/debit card cash account is associated is set to Immediate Authorization or Deferred Authorization.

10. (optional) Select the appropriate Display Issue options:

- Number – Select this option to display a field for the entry of a European debit card's issue number.
- Date – Select this option to display a field for the entry of a European debit card's issue date.

11. Click Save.

To modify a credit/debit card cash account

Card authorization accounts are limited in how they can be modified. You might need to create new ones.

1. In Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts.
2. Select a code to edit from the Current Cash Accounts list.
3. Modify the credit/debit card cash account:

- Click Edit to make any necessary changes to the cash account.
- Click Delete to delete the cash account.

Note: When editing card authorization accounts, you cannot modify the values for the Gateway or Account Code field.

Note: You cannot delete a card authorization account that has been assigned a cash account.

4. Click Save.

Requiring a Card Security Code (CSC) for credit/debit card transactions

As an additional verification for Advanced Accounting Console credit card transactions, you can make the Card Security Code (CSC) a required value for specific credit/debit card cash accounts. A CSC is the 3- or 4-digit unembossed number that displays on the front or back of a credit/debit card. The CSC is not part of the actual card number and is useful in situations where the card holder is not present when the payment is being made.

Do the following to make the CSC required:

1. In Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts.
2. Select one of the following options for the specified credit/debit card cash accounts:

- CSC Required Web Entry
- CSC Required Workstation Entry

- Both CSC Required Web Entry and CSC Required Workstation Entry

  Selecting CSC Required Web Entry makes the CSC required for the specified cash account in the web views. Selecting CSC Required Workstation Entry makes the CSC required for the specified cash account in Advanced Accounting Console. When either CSC Required Web Entry or CSC Required Workstation Entry is selected, a CSC value is required before you can complete the credit/debit card transaction using the specified cash accounts.

  A CSC is not required when processing a reversal payment transaction (for example, entering a credit transaction) or when editing a payment transaction.

  Note

- For transactions associated with card authorization accounts that use Immediate Authorization, the CSC value is not stored in the database. The value that displays in the Card Security Code or CSC field is deleted once the transaction is submitted for processing.
- For transactions associated with card authorization accounts that use Deferred Authorization and for which the Save CSC Prior to Authorization option has been selected, the CSC value is temporarily stored in an encrypted format in the iMIS database. For Payflow Pro and SafePay gateways, iMIS then deletes the stored CSC information after successful authorization. If a saved payment is viewed prior to successful authorization, the CSC number appears as three asterisks regardless of the security level of the iMIS user.
- For Other gateways, which are used only for European debit cards, the CSC information stored in the iMIS database is not automatically deleted by iMIS after successful deferred authorization. You should ensure that the custom gateway interface implemented by your Solution Provider deletes the stored CSC information after being successfully authorized.

  Advanced Accounting Console only validates that a CSC value is present (if required) and that the value is a 3- or 4-digit alphanumeric character. CSC validation depends on various factors that go beyond the scope of iMIS (for example, whether the credit card processor supports CSC). For specific information regarding CSC validation, contact your authorization gateway, merchant bank, credit/debit card processor, or any other third-party involved in validating your credit card transactions.

Location of CSC fields

CSC values can be entered in many locations throughout iMIS. For iMIS payment windows, the CSC field appears only when you enter a credit/debit card cash account that is associated with a card authorization account that uses Immediate Authorization, or that uses Deferred Authorization with the Save CSC Prior to Authorization option selected.

- AR/Cash
- Cash receipts window. In Advanced Accounting Console, go to Finance > Transactions > Cash receipts.
- Sales transactions window. In Advanced Accounting Console, go to Finance > Transactions > Sales transactions.
- Billings
- Enter and edit payments window. In Advanced Accounting Console, go to Home > Membership and Dues > Enter and edit payments.
- Certification (European debit cards only)
- Order Payment window (from Certification, register a student and create an order)
- Events (European debit cards only)
- Payments tab on the Register for an event window. In Advanced Accounting Console, go to Home > Events > Register for an event. Select the Payments tab.
- Payments window. In Advanced Accounting Console, go to Home > Events > Register for an event. Select the Payments tab, and then click More Payments.
- Fundraising
- Overview tab on the Enter and edit gifts window. In Advanced Accounting Console, go to Home > Fundraising > Enter and edit gifts. Select the Overview tab.
- Process gift payments window. In Advanced Accounting Console, go to Home > Fundraising > Process gift payments.
- Orders (European debit cards only)

- Payments tab on the Enter and edit orders window. In Advanced Accounting Console, go to Home > Customer Service > Enter and edit orders. Select the Payments tab.
- Customer Service
- Enter and edit payments window. In Advanced Accounting Console, go to Home > Customer Service > Enter and edit payments.
- Payment Entry window. In Advanced Accounting Console, go to Home > Customer Service > Process customer requests. Select the Payment tab.

Accepting and validating Diners Club and Carte Blanche credit cards

iMIS accepts and validates Diners Club and Carte Blanche credit cards. To use Diners Club and Carte Blanche credit cards to process payment transactions, you must set up the following two new credit card type values on the Set up cash accounts window (in Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts:

- DINERS (Diners Club)
- CB (Carte Blanche)

The following credit card number is available for testing Diners Club and Carte Blanche credit card transactions:

3056 9309 0259 04

> **Note:** Note: For testing purposes, transactions must be under $100.00.

You can process transactions using credit card types with variations of the supported credit card types (for example, DINERS1, DINERS2).

You can enter any credit card value in the Check/CC field on the Sales transactions window (from Advanced Accounting Console, go to Finance > Transactions > Sales transactions) and the Cash receipts window (from Advanced Accounting Console, go to Finance > Transactions > Cash receipts). However, for a credit card number to be validated by iMIS, the value entered in the Check/CC field, in addition to being a cash

account of type Credit Card, must contain one of the supported credit card types: AMEX, VISA, MC, DISC, DINERS, CB (for example, MY-AMEX).

Setting up multiple card authorization accounts

Organizations that use iMIS to process accounting transactions may have multiple credit/debit card cash accounts and may want to control how funds are allocated to financial institutions.

For example, an organization that has domestic and international accounts might not want the international accounts processed, but may want to store the information in iMIS. The organization could create a new card authorization account for the international accounts, set the account to Manual Authorization, and create a corresponding cash account and set its CC Auth Account value to the new card authorization account.

Setting up authorization options in Fundraising

When setting up the Fundraising module for card authorization, we recommend disabling the Do Not Validate Credit Card field option.

1. In the Advanced Accounting Console, go to Configure > Fundraising > Configure fundraising options.
2. Disable the Do Not Validate Credit Card field option.

   If you enable this option, the credit/debit card number will not automatically format when it is entered on the Fundraising Enter and edit gifts window. If Deferred Authorization is enabled on the AR/Cash Credit Card Authorization window, then transactions made on the Overview tab on the Enter and edit gifts window with unformatted credit/debit card numbers will not display in credit/debit card searches and will not print on the Deferred Credit Card Pre-Authorization report.

Setting up European debit card authorization

You can set up a card authorization account that can be used either for manual authorization or deferred authorization of European debit cards through a custom gateway interface.

To set up European debit card authorization

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options.
2. Click Credit Card Auth. The AR/Cash Credit Card Authorization window is displayed.
3. Click New.
4. From the Gateway drop-down list, select Other.
5. In the Account Code field, specify a short label for this card authorization account.
6. (optional) In the Account description field, specify a description for this card authorization account.
7. Select either Manual Authorization or Deferred Authorization for this card authorization account.
8. If you have selected Deferred Authorization and your authorization service requires CSC information for European debit card transactions, select the Save CSC Prior to Authorization checkbox.

   Note: You should ensure that the custom gateway interface implemented by your AiSP deletes the stored CSC information after being successfully authorized.
9. Click Save.

Setting up an authorization account for non-iMIS supported gateway

You must assign a card authorization account to each credit/debit card cash account you create in iMIS.

To set up an account for non-iMIS supported gateways

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options.
2. Click Credit Card Auth. The AR/Cash Credit Card Authorization window is displayed.

   Note: For AR/Cash Credit Card Authorization window to display, you need a relevant license, such as CCAuth or Service Central.

3. Click New.
4. From the Gateway drop-down list, select Other.
5. Select Manual Authorization.
6. Enter NOPROCESS as the Account Code.

   Caution! NOPROCESS has been associated in the web.config file as a no processing payment gateway. If you enter a different code, you will have to modify your web.config files for that code to be recognized.

   This value displays in the Select a Value window that opens when you use the lookup icon on the CC Auth Account field on the Set up cash accounts window. This value cannot be changed once the record is saved.
7. Enter a meaningful description for the authorization account in the Account description field.

   This information displays as read-only data under the CC Auth Account field on the Set up cash accounts window.
8. Click Save.

Database schema for authorization and cash accounts

Card authorization account information and cash account information is kept in the following iMIS tables:

Payflow Pro credit card authorization accounts

The following columns in the CCAuthAcct table are used for each Payflow Pro (PayPay, previously Verisign) card authorization account:

CCAuthAcctCode	varchar (20)	The code for the card authorization account
CCAuthAcctDescription	varchar	Description associated with an account code

	(255)	
CCAuthMode	tinyint	Authorization mode: 0 (manual), 1 (immediate), or 3 (deferred)
CCAuthAdminEmail	varchar (255)	E-mail address of the system administrator responsible for setting up the accounts
CCAuthUrl	varchar (255)	URL of the test or live site
CCAuthGateway	varchar (255)	Gateway interface through which card authorization occurs
CCAuthPort	int	Port address used for transaction processing
CCAuthUser	varchar (255)	Username created during setup process
CCAuthPassword	varchar (255)	Password created during sign-up process
CCAuthVerisignPartner	varchar (255)	Partner name supplied
CCAuthVerisignVendor	varchar (255)	Vendor name supplied
CCAuthTimeout	int	Timeout period supplied
CCAuthVerisignProxyServer	varchar (255)	Proxy server supplied by network administrator
CCAuthVerisignProxyPort	varchar (255)	Proxy port supplied by network administrator
CCAuthVerisignProxyUser	varchar (255)	Proxy user ID supplied by network administrator
CCAuthVerisignProxyPassword	varchar (255)	Proxy password supplied by network administrator
CCAuthSaveCscBeforeAuth	tinyint	Handling of CSC value for deferred author-

		ization: 0 (do not save CSC in iMIS) or 1 (save encrypted CSC in iMIS then delete after successful authorization)

SafePay credit card authorization accounts

The following columns in the CCAuthAcct table are used for each SafePay (TNS, previously Dialect and QSI) card authorization account:

CCAuthAcctCode	varchar (20)	The code for the card authorization account
CCAuthAcctDescription	varchar (255)	Description associated with an account code
CCAuthMode	tinyint	Authorization mode: 0 (manual), 1 (immediate), or 3 (deferred)
CCAuthAdminEmail	varchar (255)	E-mail address of the system administrator responsible for setting up the accounts
CCAuthGateway	varchar (255)	Gateway interface through which card authorization occurs
CCAuthUser	varchar (255)	Merchant ID created during setup process
CCAuthVerisignPartner	varchar (255)	Merchant Administration login (username) obtained from QSI/Dialect during setup process
CCAuthPassword	varchar (255)	Merchant Administration login (username) password obtained from TNS during setup process
CCAuthSaveCscBeforeAuth	tinyint	Handling of CSC value for deferred authorization: 0 (do not save CSC in iMIS) or 1 (save encrypted CSC in iMIS then delete after successful author-

ization)

Other gateway credit card authorization accounts

The following columns in the CCAuthAcct table are used for each Other card authorization account:

CCAuthAcctCode	varchar (20)	The code for the card authorization account
CCAuthAcctDescription	varchar (255)	Description associated with an account code
CCAuthMode	tinyint	Authorization mode: 0 (manual), 1 (immediate), or 3 (deferred)
CCAuthGateway	varchar (255)	Gateway interface through which card authorization occurs
CCAuthSaveCscBeforeAuth	tinyint	Handling of CSC value for deferred authorization: 0 (do not save CSC in iMIS) or 1 (save encrypted CSC in iMIS)

Credit/debit cards cash accounts

The following columns in the Cash_Accounts table are used for each credit/debit card cash account:

CCAuthAcctCode	varchar (20)	The code for the card authorization account
CSC_ REQUIRED_	bit	Indicates whether the CSC value is required on the web: 0 (not required) or 1 (required)

WEB

CSC_REQUIRED_CS	bit	Indicates whether the CSC value is required in iMIS: 0 (not required) or 1 (required)
ISSUE_NO_FLAG	tinyint	Indicates whether the Issue Number field should be displayed in iMIS payment entry windows: 0 (not displayed) or 1 (displayed)
ISSUE_DATE_FLAG	tinyint	Indicates whether the Issue Date field should be displayed in iMIS payment entry windows: 0 (not displayed) or 1 (displayed)

Setting up credit card authorization for the Public view

Use the following steps to accept credit card payments in iMIS Public view:

1. Set up credit card authentication (in Advanced Accounting Console, go to Finance > Options > Configure accounting options and click Credit Card Auth.
2. Set up cash accounts for online registration credit cards (in Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts).

   Note: The cash account codes must be prefixed with W_ (such as W_VISA) to accept credit card payments using the Public view.
3. Modify the web.config file to include the Gateway Account Code.

Modifying the PayFlowPro web.config file with the credit card gateway

In order to accept credit card payments in the Public view or any content items website, you must add the Gateway Account Code to your web.config file. This must be updated in the iMIS_Public folder if you are using the iMIS Public view, or the NET folder if you are using any website containing content items. If you do not make this change, you will receive the error message:

An error occurred while processing a payment. Payment gateway was not found to match the associated authorized account

Do the following:

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options.
2. Click Credit Card Auth.
3. Take note of your Account Code for the gateway you are using.
4. On your webserver, open the web.config file located in your iMIS_Public folder if you are using the iMIS Public view, or the NET folder if you are using RiSE sites.
5. Search for AuthorizationAccounts. The code should look similar to the following:

   <add name="PayFlowProPaymentGatewayProvider" type-e="Asi.PaymentGateway.PayflowProPaymentGatewayProvider, Pay-flowProPaymentGatewayProvider" authorizationAccounts="VERISIGN,PaymentTech,PAYFLOWPRO" />
6. Place a comma after PAYFLOWPRO and add the Account Code for your credit card gate-way and save. For example, if your credit card gateway Account Code was labeled CREDITCARDS, then your code should look similar to the following:

   <add name="PayFlowProPaymentGatewayProvider" type-e="Asi.PaymentGateway.PayflowProPaymentGatewayProvider, Pay-flowProPaymentGatewayProvider" authorizationAccounts="VERISIGN,PaymentTech,PAYFLOWPRO,CREDITCARDS" />
7. Restart IIS. Your credit cards should work in iMIS Public view or any content items web-site.

Customizing credit card fields for the Public view

When configuring the Public view for card authorization, go to these locations to adjust your settings:

1. System Setup > Set up commerce web components > Credit card label configuration

2. System Setup > Set up commerce web components > Checkout configuration
3. AR/Cash > Set up tables > Cash accounts - Enable the CSC Required Web Entry option if the CSC code is required for Public view transactions.

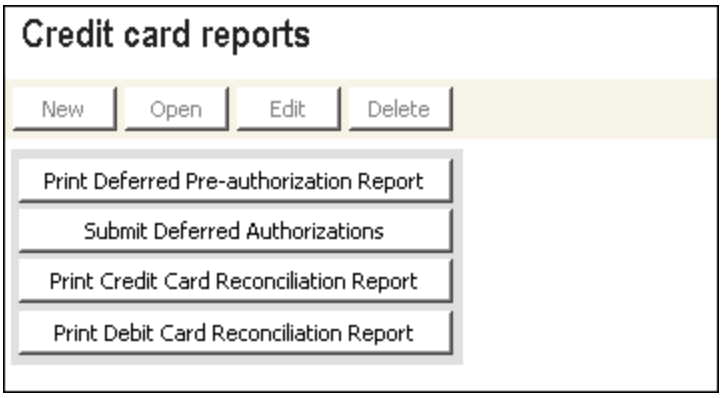
Using card authorization

Once you have set up the AR/Cash options and tested your credit/debit card gateway, you are ready to use card authorization.

- Credit card transactions can be processed in iMIS with either deferred or immediate authorization, as defined by the associated card authorization account.
- European debit cards, however, can be processed only with deferred authorization, and only if your Solution Provider has implemented a custom gateway interface for European debit card authorization.

Credit card authorization window

Note: Note: If you have not set up credit card cash accounts in the Finance module, the Credit card reports menu item is disabled.



In Advanced Accounting Console, go to Continuum > Commerce and Customer Service Reports > Credit card reports

To generate credit/debit card reports, in Advanced Accounting Console, go to Continuum > Commerce and Customer Service Reports > Credit card reports. The following report options display on the Credit card reports window:

- Print Deferred Pre-authorization Report – Prints a report of deferred credit/debit card transactions. The report parameters include Date Range and Org Code.
- Submit Deferred Authorizations – Sends transactions flagged for deferred authorization. All flagged transactions are submitted immediately. This applies only to deferred credit/debit card authorizations.
- Print Credit Card Reconciliation Report – Prints a credit card reconciliation report.
- Print Debit Card Reconciliation Report – Prints a European debit card reconciliation report.

  Note: If you have not set up European debit card cash accounts in the Finance module, the Print Debit Card Reconciliation Report button is not available.

Immediate card authorization

If you have enabled the Immediate Authorization option, and then entered a credit card payment, the transaction information is sent immediately through the gateway to the financial institution for authorization. After the payment is authorized, the funds are captured at midnight of the transaction date.

> **Note:** Note: European debit card authorization accounts cannot be configured to use the Immediate Authorization option.

To enter a credit card payment using immediate authorization

1. In Advanced Accounting Console, go to Finance > Transactions > Sales transactions.

   Note: For this example, we are using the Enter and edit sales transactions window. You can enter the credit card payments in any of the windows available for credit card authorization.
2. Click New.
3. Enter the customer ID in the Id field.
4. Enter a product in the Product field, or click the Find icon to select a value.

5. Enter the product quantity in the Quantity field.
6. Enter the credit card code in the Check/CC field. Several additional credit card fields display when you press Tab.
7. Enter the credit card number in the CC # field.
8. If required, enter the Card Security Code in the CSC field.
9. Enter the expiration date in the Exp field.
10. Enter the name on the credit card in the Name on CC field. This does not have to be the same as the customer name.
11. Enter an amount in the Payment Amount field.
12. Click Save:

- If the transaction was authorized, the Authorize field on the payment transaction window populates with the authorization code and the transaction is saved. In addition, if you entered a value in the CSC field, the field is now blank because the system automatically deleted the value once the transaction has been submitted.
- If the authorization was declined, an error message displays indicating that the transaction was declined.Select OK to exit the Results window and return to the transaction window. If the transaction was declined, DECLINED displays in the Authorize field in the payment window.

  Note:

- There could be several reasons for a declined authorization, such as bad card, invalid data, or invalid credit card number.
- At this point, you are not able to save the transaction. You can edit the payment date, amount, name, credit card number, and expiration date, and then resubmit the transaction for authorization.

Deferred authorization of payments

Deferred credit/debit card payments are entered in the same manner as if you were using immediate authorization. When a deferred transaction is saved (by clicking OK), the word DEFER displays in the Authorize field. If you select the Deferred Authorization option, credit/debit card transactions are deferred until you submit them.

> **Note:** Caution! Do not accidentally enter any data in the Authorize field. When entering payment information, the Authorize field is empty. It remains empty until you save the transaction, then it populates with the word DEFER to indicate that it is batched for authorization. However, you might need to authorize a payment through a credit card machine or by calling the merchant bank, so iMIS allows you to manually enter authorization codes for these circumstances. However, keep in mind that if you do enter information in this field, iMIS assumes that it is a manually entered authorization code.

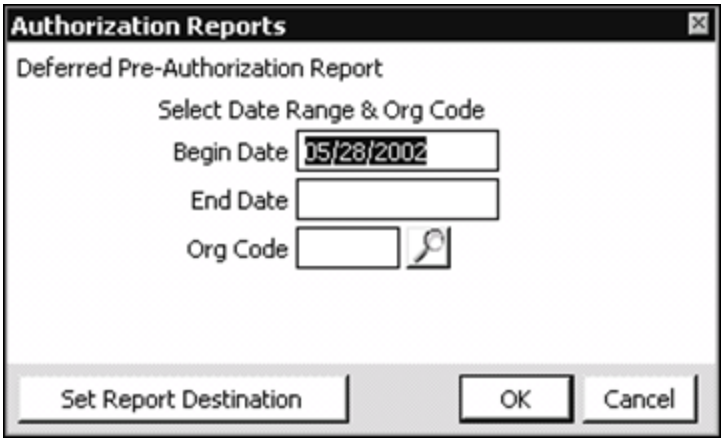
Running a Deferred Pre-Authorization report

If you are using Deferred Authorization, you can view a Pre-Authorization report of credit/debit card transactions before you transmit them to be authorized. This allows you to check and edit transactions before submitting them.

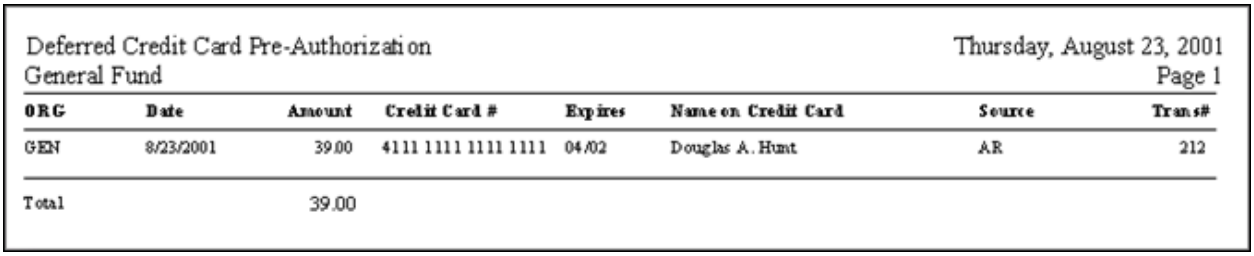
To run the Deferred Pre-Authorization report

1. In Advanced Accounting Console, go to Continuum > Commerce and Customer Service Reports > Credit card reports, and click Print Deferred Pre-authorization Report. The Authorization Reports: Deferred Pre-Authorization Report window opens.
2. Enter the Begin Date and the End Date for the date range you are evaluating. The Begin Date defaults to the current system date.
3. (optional) Enter the Org Code, or click the lookup icon to select a value. If you do not enter an Org Code, the report prints for every Org Code.
4. Click Set Report Destination and select the output for the report.

5. Click OK. A Deferred Credit Card Pre-Authorization report prints based upon the specified date range and Org Code.



Selecting a Date Range & Org Code



Deferred Credit Card Pre-Authorization — Thursday, August 23, 2001
General Fund — Page 1

ORG	Date	Amount	Credit Card #	Expires	Name on Credit Card	Source	Trans#
GEN	8/23/2001	39.00	4111 1111 1111 1111	04/02	Douglas A. Hunt	AR	212
Total		39.00					

Sample Deferred Credit Card Pre-Authorization report

Submitting deferred credit card payments

Before deferred credit/debit card payments can be authorized, they must be submitted.

To submit deferred credit/debit card payments for authorization

1. In Advanced Accounting Console, go to Continuum > Commerce and Customer Service Reports > Credit card reports, and click Submit Deferred Authorizations. The Authorization Reports: Submit Deferred Authorizations window displays.
2. Enter the Begin Date and End Date of the deferred authorizations. The Begin Date defaults to the current system date, which you can override.
3. Enter the Org Code, or click the Find icon to select a value. If you do not enter an Org

Code, the report prints for every Org Code.

4. Click OK.

Searching credit/debit card transactions

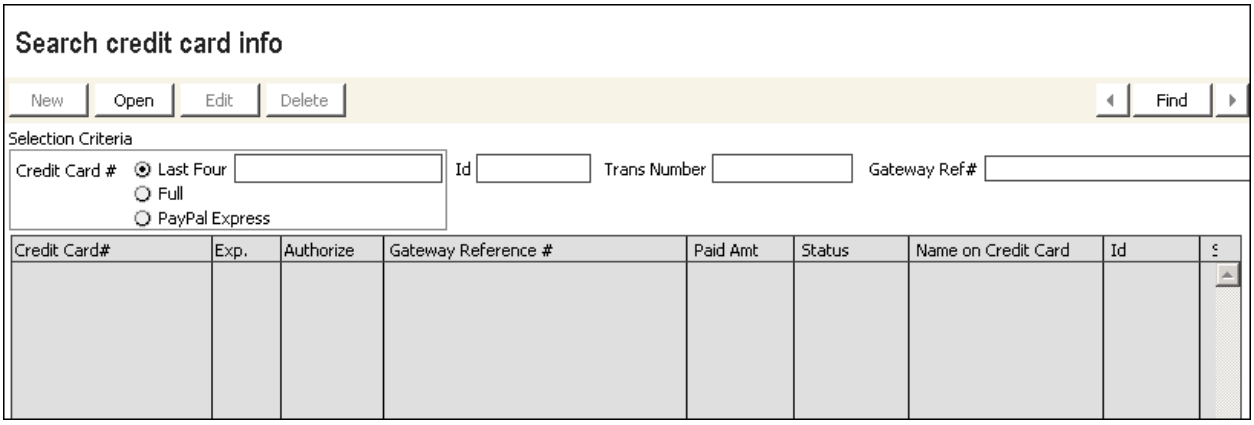
After you enter credit/debit card transactions, you can search iMIS for transactions:

1. In Advanced Accounting Console, go to Finance > Transactions > Search credit card info.
2. Enable the Last Four option to search on the last four numbers of the credit/debit card or the Full option to search on the full card number.

   Note: If Advanced PCI Compliance| > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields. Therefore, the Full option is disabled, because only the last four credit card digits are saved.
3. Enter the card number in the Credit Card # field to search for a specific card number.
4. Enter the customer or company ID in the Id field to search by record. You search by both the card number and ID, or by one field only.
5. Enter the transaction number in the Trans Number field to search by transaction number.
6. Press Enter. A list of transactions for the selected card and/or customer record displays in the window. Unencrypted card information can be viewed in this window only if a user has an AR/Cash authorization level of 8 or higher.
7. To view an individual transaction through the Search credit card info window, double-click the line item. The original transaction window opens.

> **Note:** Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Search credit card info window



Troubleshooting

- The Status field is populated by Trans.STATUS for transactions entered through Service Central and iBO.
- When entering an order and paying by credit card over the web, the order must be processed to the invoice stage before it will display in the Search credit card info window.
- When viewing credit card transaction status, the details of the transaction are shown, not the details of the actual order payment or the event payment.

Credit Card #

The credit/debit card number associated with the search

Id

The customer or company ID whose credit/debit card transactions are associated with the search

Display fields

- Credit Card # – The card numbers associated with the search.
- Exp. – The expiration date for each card number.
- Authorize – The authorization code for the card transaction.
- Paid Amt – The amount paid with the card transaction.

- Status – This field indicates the authorization status of the transaction. The status options are: A (authorized), D (deferred), and C (captured). If this field is blank, it is either a manual transaction or the transaction was denied.
- Name on Credit Card – The name on the card associated with the transaction.
- Id – The ID associated with the card transaction.
- Source – This field indicates the module source for the card transaction. For example, if the payment were a fundraising gift, FR would display in this field.
- Ref. # – A transaction number or order ID that is generated by the authorization gateway. This information is stored in the Description field of the transaction entry, and must be referenced in order to delete any transactions.
- Ref. Date – Specifies the date the transaction was entered in iMIS

Authorization Gateways

iMIS supports these gateway options for credit card authorization:

- Payflow Pro, offered by PayPal, (previously Verisign), based in the United States
- SafePay, offered by TNS, based in Australia and focused on international sales
- TNSPay, offered by TNS, focused on international sales
- Moneris, offered by Moneris Solutions, based in Canada and focused on Canadian sales
- Custom gateways), which you can create using ASI-supplied code and documentation

All gateway options work with the PCI Compliance options (see "Implementing Advanced PCI Compliance options") available in AR/Cash Setup.

> **Note:** Note: If Advanced PCI Compliance| > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Applying for a merchant bank account

You must apply for a merchant bank account. The merchant bank is where all the credit card transactions are verified. You can find a list of financial institutions using the authorization gateway website. However, before contacting a merchant bank, check with your bank to see if it is compatible with the authorization gateway.

Every organization accepting online credit card transactions must have a merchant account with an acquiring financial institution.

The acquiring financial institution deposits the daily credit card sales into the merchant's account after deducting applicable fees. Some acquiring financial institutions perform merchant services in-house; others outsource these functions to a third-party processor. These services may include billing, customer service, reporting, authorization, and settlement services for merchants. A third-party processor is a company that provides credit card services to merchants on behalf of acquiring financial institutions.

Implementing Payflow Pro as an authorization gateway

> **Note:** Note: Payflow Pro authorizes credit card transactions up to $9,999.00.

Before you go live with card authorization using Payflow Pro (from PayPal, previously VeriSign), you must take several steps:

1. Ensure you have set up card authorization in iMIS.
2. Register with the Payflow Pro card authorization gateway.
3. Verify your registration setup.
4. Apply for a merchant bank account at a financial institution.
5. Submit and review test transactions.
6. The acquiring financial institution approves the application and notifies the authorization gateway.
7. Switch from test mode to live mode.

8. The default currency code must be specified in order for iMIS to pass the correct currency values to Payflow Pro. See quick setup.

   This process generally takes 2 to 4 weeks to complete.

   To register for a Payflow Pro gateway

   You must set up an account with PayPal (previously, VeriSign) for your Payflow Pro card authorization gateway. Set up your account by going to the PayPal website at www.paypal.com.

   Note: Please make a note of your user login and password. You will need it to configure iMIS and to view reports on the PayPal website. ASI Technical Support does not have access to this information.

   Note: When setting up an account for a non-US currency, you may encounter some errors when testing your transaction. In that case, create a support ticket by going to https://paypal.com/mts.

   Note: When opening an Australian Dollar account, go here.

   To set up a Payflow Pro card authorization account

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options. Click Credit Card Auth.

   Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.

2. Click New.

3. Select Payflow Pro from the Gateway drop-down list.

   Note: Once you save a card authorization account, you cannot change the Gateway field.

4. Specify the authorization type: Manual, Immediate, or Deferred.

5. Enter an Account Code, which will appear in the Select a Value window that opens for lookup on the CC Auth Account field on the Set up cash accounts window.

Note: Once you save a card authorization account, you cannot change the Account Code field.

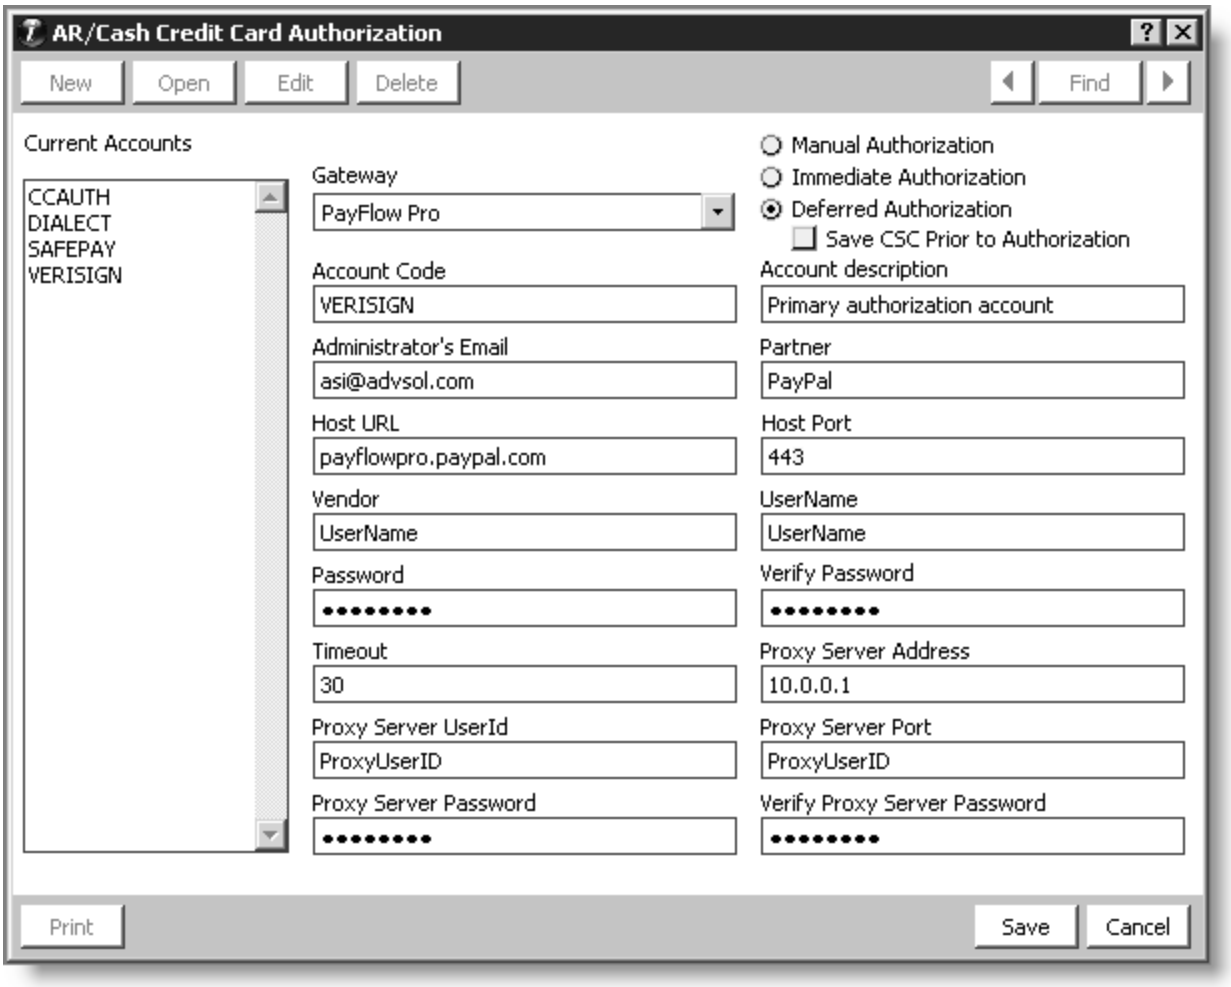
6. Enter an Account description, which will appear under the CC Auth Account field on the Set up cash accounts window.
7. Enter the Administrator's Email.
8. Enter the Partner value supplied in your account information.
9. In the Host URL field, enter the test or live mode:
   - Test mode: pilot-payflowpro.paypal.com
   - Live mode: payflowpro.paypal.com

   Caution! Do not go live without first setting the Host URL to test mode to verify the registration.
10. Enter 443 in the Host Port field.
11. Enter the values created during the Payflow Pro sign-up process:
    - Enter the UserName in the Vendor field.
    - Enter the UserName in the UserName field.
    - Enter the Password in the Password field and in the Verify Password field.
12. Enter 30 in the Timeout field. This is a recommended value.
13. If you are using a proxy server, enter the values as supplied by your network administrator:
    - Proxy Server Address
    - Proxy Server UserId
    - Proxy Server Port
    - Proxy Server Password
    - Verify Proxy Server Password

14. Click Save.
15. Repeat the steps for each account.
16. Restart iMIS.

Troubleshooting

- If you do not restart iMIS after creating a new account, all transactions will have an authorize code of DEFER even if you enabled the Immediate Authorization option.
- You cannot delete a card authorization account that has been assigned a cash account.
- If you change the CC Auth account for a cash account (from one gateway to another or to a different account on the same gateway) and attempt to edit or delete transactions that were created earlier in the day before the change of the CC Auth account, there may be undesirable results, particularly if the CC Auth account was changed to a Payflow Pro account.



To associate an authorization account with a credit card cash account code

Before you can use card authorization you must set up credit card cash accounts on the Set up cash accounts window:

1. In Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts.
2. Select a code to edit from the Current Cash Accounts list.
3. Click Edit.
4. Enter a CC Auth Account or click the lookup icon to select a value.
5. Click Save.

Editing and deleting credit card payments

PayPal transaction entries are generated with a captured status. You can edit or delete payment transactions if the changes are made on the same day. If the transaction has already been charged to the credit card, an error will be reported.

iMIS assumes that authorizations are captured every night, so the changes are only allowed if it is done on the same system date as the authorization. However, the system date may not be the same as the batch date or the transaction date.

Note: Note: Deferred payments have not been authorized and can be edited without restriction.

UNKNOWN and DECLINED Payflow Pro transactions

If you encounter an UNKNOWN status, check the Payflow Pro website to verify the transaction exists there. If the transaction does not exist there, delete the transaction from iMIS. If the transaction does exist there, run the following statement:

Update Trans

Set CC_STATUS=' ', CC_AUTHORIZE=' ',DESCRIPTION=' '

Where TRANS_NUMBER = XXXX and

TRANSACTION_TYPE = 'PAY'

To select UNKNOWN or DECLINED transactions, run the following statement:

Select BT_ID,AMOUNT,TRANSACTION_TYPE,CC_STATUS,CC_AUTHORIZE,DESCRIPTION

From Trans

Where TRANSACTION_TYPE = 'PAY' and CC_STATUS <> '' and DESCRIPTION <> ' ' and CC_AUTHORIZE in ('DECLINED','UNKNOWN')

For additional information on Payflow Pro integration, see the Payflow Pro developer's site.

Implementing SafePay as an authorization gateway

Before you go live with card authorization, you must complete these implementation steps and checks.

> **Note:** Tip: Allow two to four weeks to complete this process.

To implement a SafePay authorization gateway

1. Ensure you have set up card authorization in iMIS.
2. Apply for a merchant bank account at a financial institution. The acquiring financial institution approves the application and notifies the SafePay authorization gateway.
3. Register with SafePay and obtain a test account with a payment server, Merchant ID, certificate files, payment host URL, and login/password for the payment administration web interface.
4. Verify your registration setup.
5. Install Java Virtual Machine and Java Runtime Environment.
6. Set up a SafePay Payment Client.
7. (iMIS Desktop only) Submit and review test transactions in iMIS.
8. Test PaymentClient outside of the iMIS environment.
9. Set up a SafePay card authorization account.
10. Associate a credit card cash account code.
11. Switch from test mode to live mode.

> **Note:** Caution! Transactions processed through SafePay cannot be edited or deleted.

> **Note:** Note: For SafePay-based accounts, the authorization and capture scheme is configured on the payment server, based on the requirements of the merchant bank. This means that transactions may not be captured automatically, depending on the configuration of the account. For accounts that are not set up for automatic capture, in order to perform the captures for transactions submitted for the account, you must log in to the SafePay administration interface and perform the captures manually.

Registering with SafePay

You must register with SafePay (TNS/QSI/Dialect) to obtain the account information you need.

1. Contact SafePay for the Service Agreement and Registration form.
2. Contact your bank for Internet Merchant ID (Terminal ID) for the SafePay (Dialect) Internet Credit Card Gateway.
3. Complete the registration form and contact the SafePay HelpDesk. They will set up the account for you and provide you with a merchant key.
4. Via email, SafePay will send you your account information:

- Merchant ID
- certificate files
- login/password
- payment host
- payment host URL

Installing Java Runtime Environment for SafePay

SafePay (TNS/Dialect) requires the Java Runtime Environment (JRE) to be installed:

- To run the Payment Server, install JRE 1.3.1 or higher on your iMIS application server.
- Before setting up the PaymentClient, install JRE 1.3.1 or higher.

You can download the current JRE version from java.com.

To set up a SafePay payment client

To accept SafePay payments through iMIS Web or Public views, you must install the SafePay client software on the appserver itself, which does the processing for the gateway. Perform the following steps on Advanced Accounting Console:

1. Obtain the setup files from SafePay or ASI Technical Support and copy them to a temporary local directory.
2. (Windows 2008) To install the client on Windows 2008, disable Data Execution Prevention (DEP) for everything except System Processes.
3. (Windows 2003) Change the setup file's properties to run as compatible with Windows 2000 (right-click the file, select Properties, and select the Compatibility tab).
4. Run the setup as directed by SafePay.
5. Restart your machine when the installation successfully completes.
6. Verify the settings in your setup.properties file, as directed by SafePay.
7. (optional) To test PaymentClient outside of iMIS, in the CardNumbers.profile file, ensure that any expiryDate values match the expiration dates of any test credit card numbers provided to you by SafePay.

To test the SafePay client outside of iMIS

You can test the SafePay client, PaymentClient, outside of the Advanced Accounting Console environment. Be sure to adjust your PaymentClient settings so that the test card numbers will be authorized:

1. Locate the \config directory within the \PaymentClient installation directory.
2. Edit the CardNumbers.profile file.
3. Ensure that any expiryDate values match the expiration dates of any test credit card numbers provided to you by SafePay.

To test immediate SafePay authorization

1. Before you test, make sure that you are licensed in iMIS for credit card authorization (CCAUTH) and that the Immediate Authorization option is selected on the AR/Cash Credit Card Authorization window (in Advanced Accounting Console, go to Finance > Options > Configure accounting options. Click Credit Card Auth).

   Use the following credit card numbers for testing purposes:

- Master Card: 5123 4567 8901 2346 (05/13)
- VISA: 4987 6543 2109 8769 (05/13)
- American Express: 3456 7890 1234 564 (05/13)
- Diners Club 3012 3456 7890 19 (05/13)

2. In Advanced Accounting Console, go to Finance > Transactions > Cash receipts.
3. Click New.
4. When entering a payment, enter one of the test credit card codes in the Check/CC field. A CC # and additional data entry fields display.
5. Enter the test credit card number in the CC # field.
6. If required, enter a Card Security Code in the CSC field.
7. Enter an expiration date in the Exp field.
8. Enter the name on the credit card in the Name on CC field. This need not be the same as the customer name.
9. Enter a dollar amount in the Payment Amount field.
10. Click Save. The Authorize field displays a status code of either a deferred status (DEFER), a unique authorization code (if your financial institution returns an authorization code), or DECLINED or UNKNOWN if the credit card is not authorized by SafePay. In addition, if you entered a value in the CSC field, the field is now blank because iMIS automatically deletes the value once the transaction has been submitted.

   Installing for SafePay and document attachment publishing

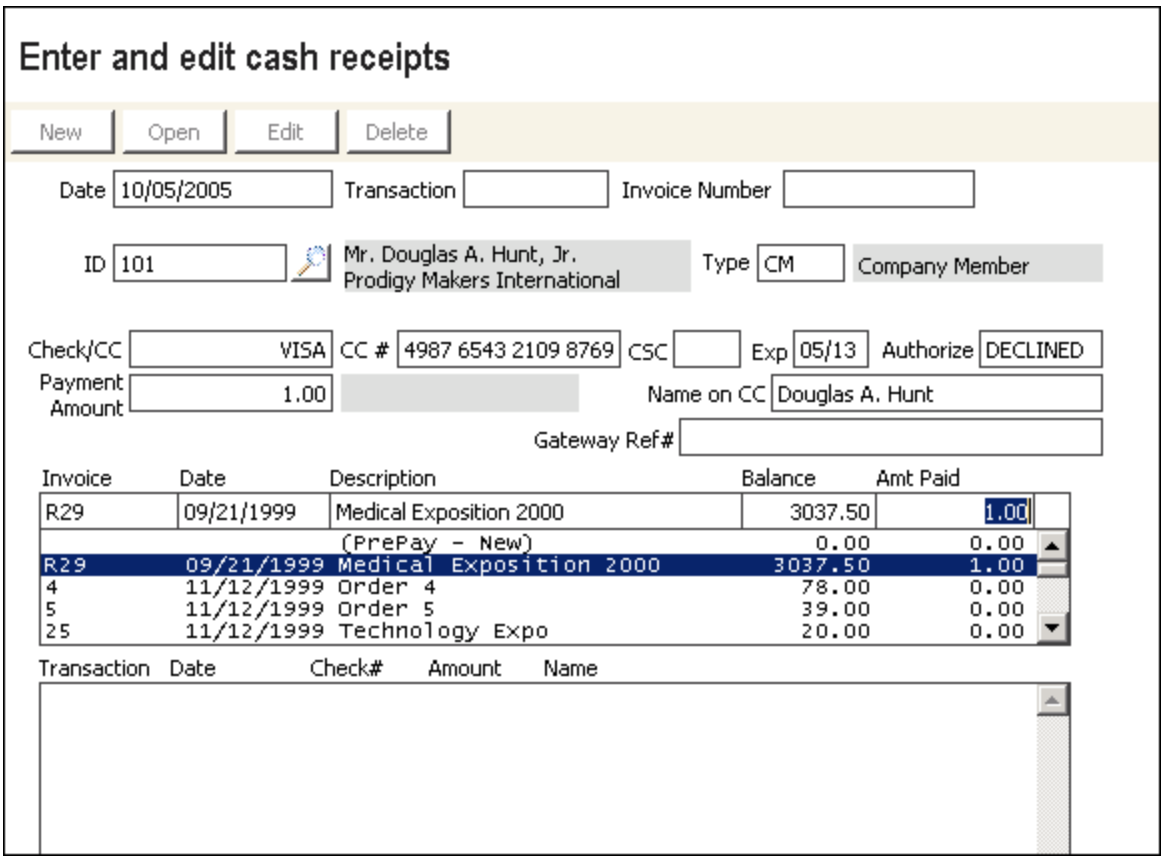
When an unsecured PDF, DOC, TXT, RTF, or HTML is attached to a post the content of that file will be searched when a general search is performed. The results will link back to the parent document where the attached document is located.

Java Runtime Environment (JRE) must be installed in order for document attachments to be searchable.

Notes:

If your financial institution does not return unique authorization codes, the Authorize field will contain null.

The criteria for authorization depend upon the policy of the acquiring financial institution.

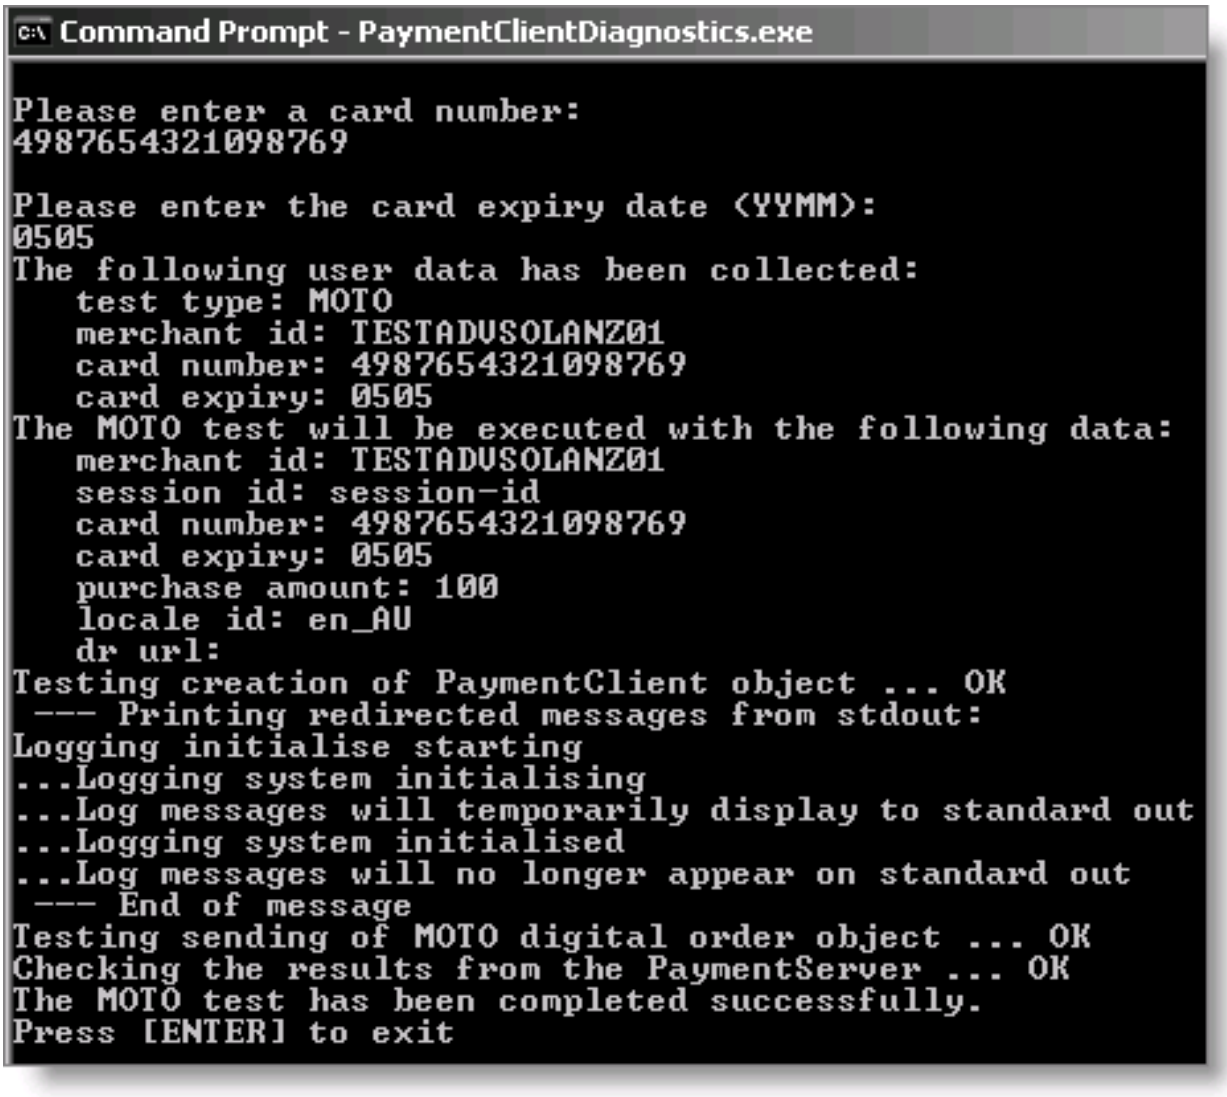


Testing immediate credit card authorization with CCAuth

Example: Testing immediate authorization

This example tests SafePay connections using the command line test tool provided with the payment client. Check with your gateway provider for the latest testing tools and procedures.

1. Ensure the service is running. Go to Start > Control Panel > Administrative Tools > Services.
2. Look for Dialect PCService in the Service Console, and ensure that it is Started.
3. Test connectivity by selecting Start > Programs > Dialect > PaymentClient > Test Payment Client. The Payment Client Diagnostics program retrieves and displays client configuration information and prompts you to enter transaction information.
4. Select 1 for MOTO.
5. Enter the Merchant ID provided with your account information.
6. Select a credit card number or enter Z to enter another credit card number.
7. Enter the credit card expiration date (format: YYMM). The diagnostic program tests the PaymentClient configuration and displays test results on the screen.



Example of a successful test transaction

To set up a SafePay card authorization account

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options. Click Credit Card Auth.

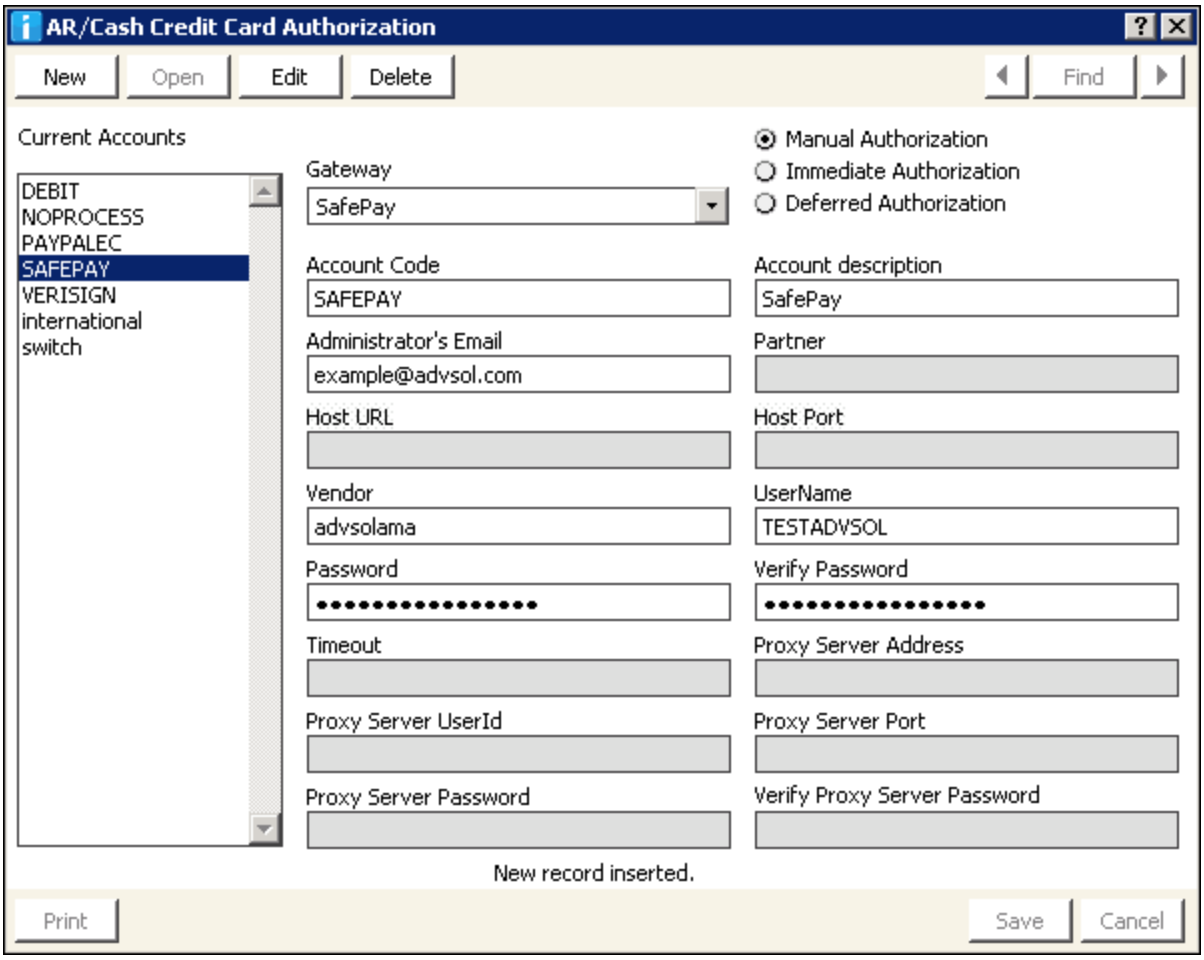
   Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.

2. Click New and select SafePay from the Gateway drop-down list.

Note: When editing card authorization accounts, you cannot modify the values for the Gateway or Account Code field.

3. Enable the Manual Authorization, Immediate Authorization, or Deferred Authorization option.
4. Enter an Account Code. This value displays in the Select a Value window that opens when you click the lookup icon on the CC Auth Account field on the Set up cash accounts window. This value cannot be changed once the record is saved.

   Note: When editing card authorization accounts, you cannot modify the values for the Gateway or Account Code field.
5. Enter a description for the account in the Account description field. If you enter a value in this field, it displays as read-only data under the CC Auth Account field on the Set up cash accounts window.
6. Enter the Administrator's Email.
7. (optional) Enter the Merchant Administration login (username) you were given in the Vendor field.
8. Enter the Merchant ID obtained during set up in the UserName field.
9. Enter the Merchant Administration password you were given in the Password and Verify Password fields.
10. Click Save.
11. Restart iMIS.



Configuring QSI Authorization

Note: If you do not restart iMIS after creating a new account, all transactions will have an authorize code of DEFER even if you enabled the Immediate Authorization option.

Note: You cannot delete a card authorization account that has been assigned a cash account.

Note: Transactions processed through QSI cannot be edited or deleted.

Note: If you change the CC Auth account for a cash account (from one gateway to another or to a different account on the same gateway) and attempt to edit or delete transactions that were created earlier in the day before the change of the CC Auth account, there may be undesirable results, particularly if the CC Auth account was changed to a VeriSign account.

To associate a card authorization account with a credit card cash account code

Before you can use card authorization you must set up credit card accounts on the Set up cash accounts window:

1. In Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts.
2. Select a code to edit from the Current Cash Accounts list.
3. Click Edit.
4. Enter a CC Auth Account or click the lookup icon to select a value.
5. Click Save.

Managing SafePay transactions

With SafePay, you cannot edit or delete existing transactions or enter refunds (enter payments with negative amounts).

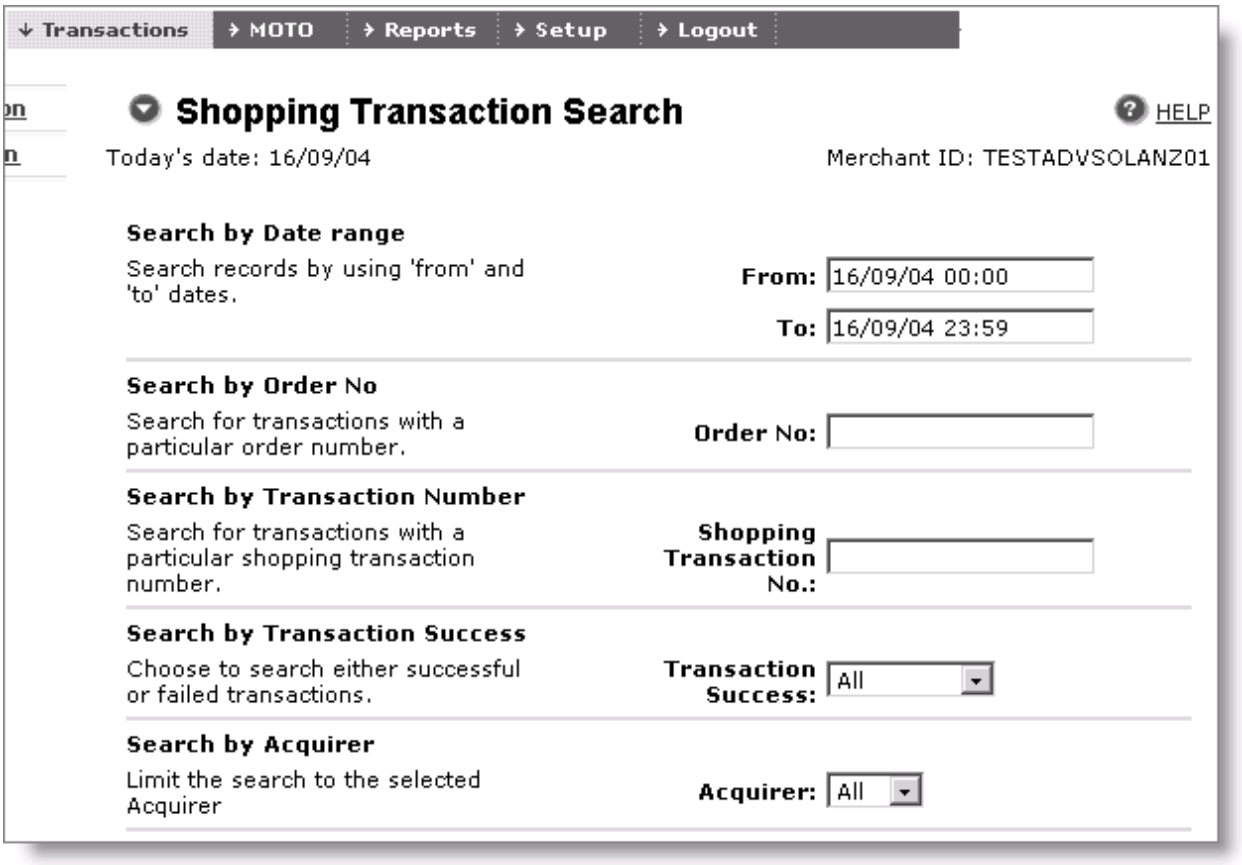
The authorization and capture schema is configured on the payment server, based on the requirements of the merchant bank. This means that transactions might not be captured automatically, as it depends on the configuration of the account.

For accounts that are set up for automatic capture, you must log in to the administration interface and capture the transactions manually in order to perform the captures for transactions submitted for the account.

> **Note:** Note: Regardless of the authorization/capture schema, iMIS creates all Trans entries for SafePay-based transactions with the Trans.CC_Status column value = 'C' (in the same manner as Payflow Pro).

To view submitted transactions

1. Go to the merchant account site.
2. Enter your merchant ID, login, and password.
3. Select the Transactions menu. A window similar to the following is displayed:



Go to https://secure.dialectsolutions.com/DPS/MA

Implementing Moneris as an authorization gateway

Before you go live with card authorization, you must complete these implementation steps and checks. You will need a merchant account with Moneris. As a developer, you will also need a copy of the Moneris SDK, documentation, tools, and a test account with test card numbers. Make sure your test account credentials work properly.

To implement a Moneris authorization gateway

1. Ensure you have set up card authorization in iMIS.
2. Apply for a merchant bank account at a financial institution. The acquiring financial institution approves the application and notifies the Moneris authorization gateway.
3. Register with Moneris and obtain a test account with a payment server, Merchant ID, certificate files, payment host URL, and login/password for the payment administration web

interface.

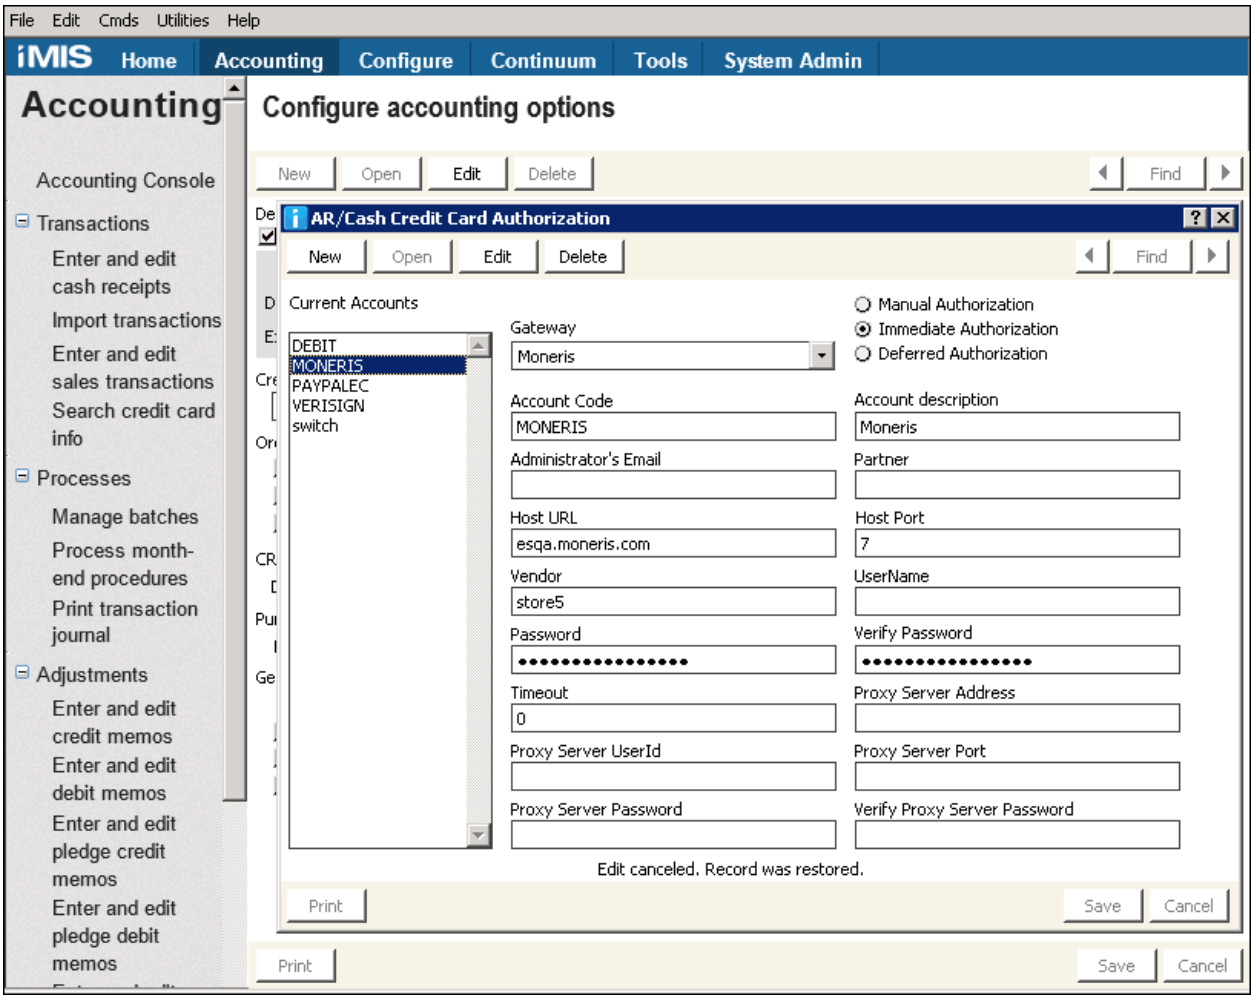
4. Verify your registration setup.
5. Set up a Moneris card authorization account.
6. Associate a credit card cash account code.

To set up a Moneris credit card authorization account

To configure iMIS to work with Moneris, you must setup a credit card authorization account.

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options.
2. Click Credit Card Auth.

   Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.
3. Click New.



4. Select Moneris from the Gateway drop-down.
5. Select the Immediate Authorization option.
6. Enter an Account Code. This value displays in the Select a Value window that opens when you click the Find icon in the CC Auth Account field on the Set up cash accounts window. This value cannot be changed once the record is saved. Your values may vary depending on your account info with Moneris.
7. Enter a description for the account in the Account description field. If you enter a value in this field, it displays as read-only data under the CC Auth Account field on the Set up cash accounts window.
8. (optional) Enter the Administrator's Email.

9. In the Vendor field, enter the Store ID you were provided by Moneris.
10. In the Password and Verify Password fields, enter the API token (password) you were provided by Moneris.
11. Click Save.
12. Restart iMIS.

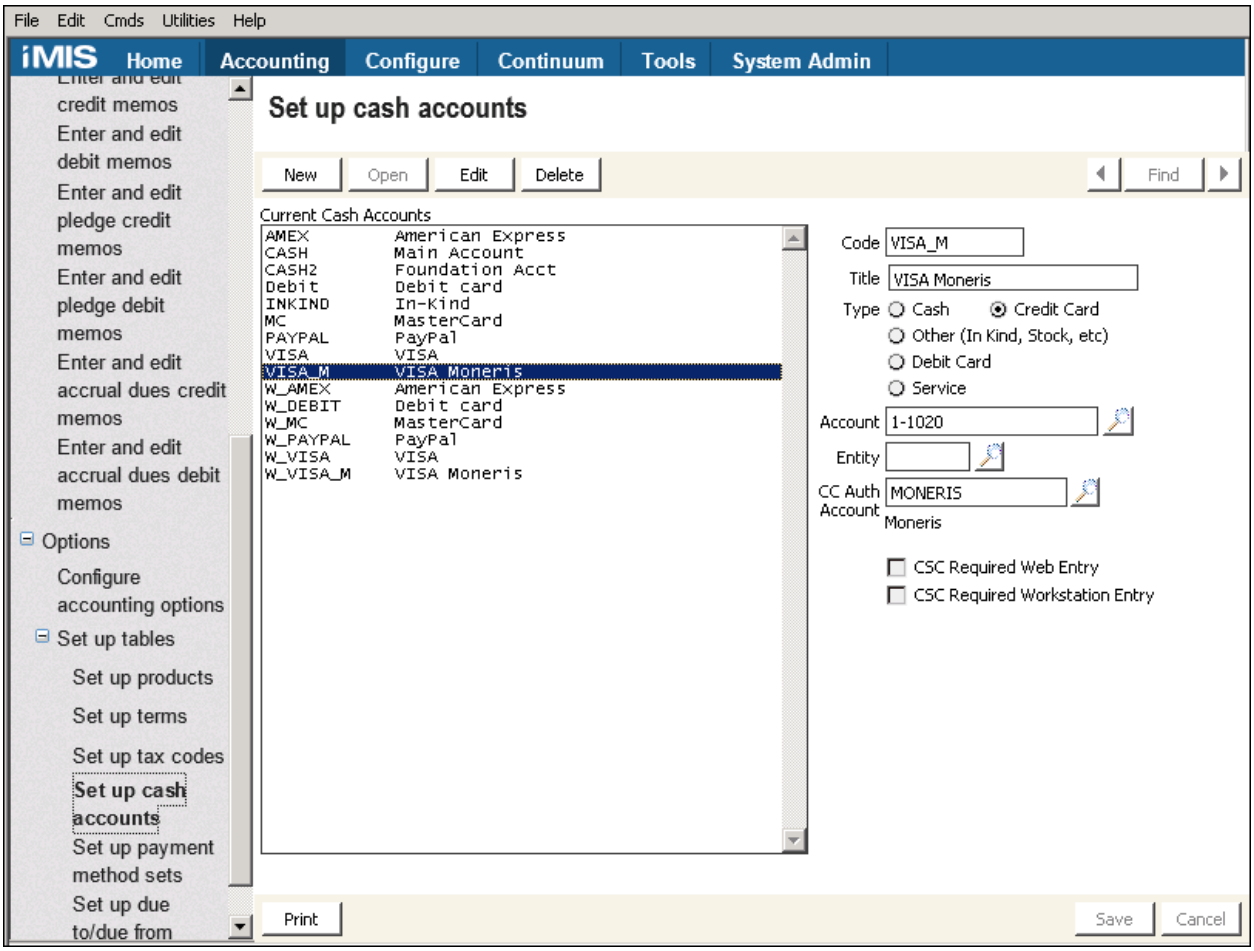
To associate a card authorization account with a credit card cash account code

Before you can use card authorization with Moneris, you must set up credit card accounts on the Set up cash accounts window:

1. In Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts.
2. Add credit cards as needed for use with Moneris to Current Cash Accounts:

- Click New to add a new card.
- Click Edit to edit an existing card.

3. Select Moneris from the CC Auth Account dropdown for the card.



4. Click Save.

To modify the web.config file for Moneris with the credit card gateway

In order to accept credit card payments in the Public view or any content items website, you must add the Gateway Account Code to your web.config file. This must be updated in the iMIS_Public folder if you are using the iMIS Public view, or the NET folder if you are using any website containing content items. If you do not make this change, you will receive the following error message:

An error occurred while processing a payment. Payment gateway was not found to match the associated authorized account

Do the following:

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options.
2. Click Credit Card Auth.
3. Take note of the Account Code for Moneris.
4. On your application server, open the web.config file located in your iMIS_Public folder if you are using the iMIS Public view, or the Net folder if you are using any website containing content items.
5. Search for AuthorizationAccounts. The code should look similar to the following:

   <add name="PayFlowProPaymentGatewayProvider" type-e="Asi.PaymentGateway.PayflowProPaymentGatewayProvider, Pay-flowProPaymentGatewayProvider" authorizationAccounts="VERISIGN,PaymentTech,PAYFLOWPRO" />
6. Place the following snippet in the web.config file before the closing </providers> tag. Note that the MONERIS authorization account matches the MONERIS CC auth account:

   <add name="MonerisPaymentGatewayProvider" type-e="Asi.PaymentGateway.MonerisPaymentGatewayProvider, Mon-erisPaymentGatewayProvider" authorizationAccounts="MONERIS"/>
7. Restart IIS. Your credit cards should work in iMIS Public view or any content items website.

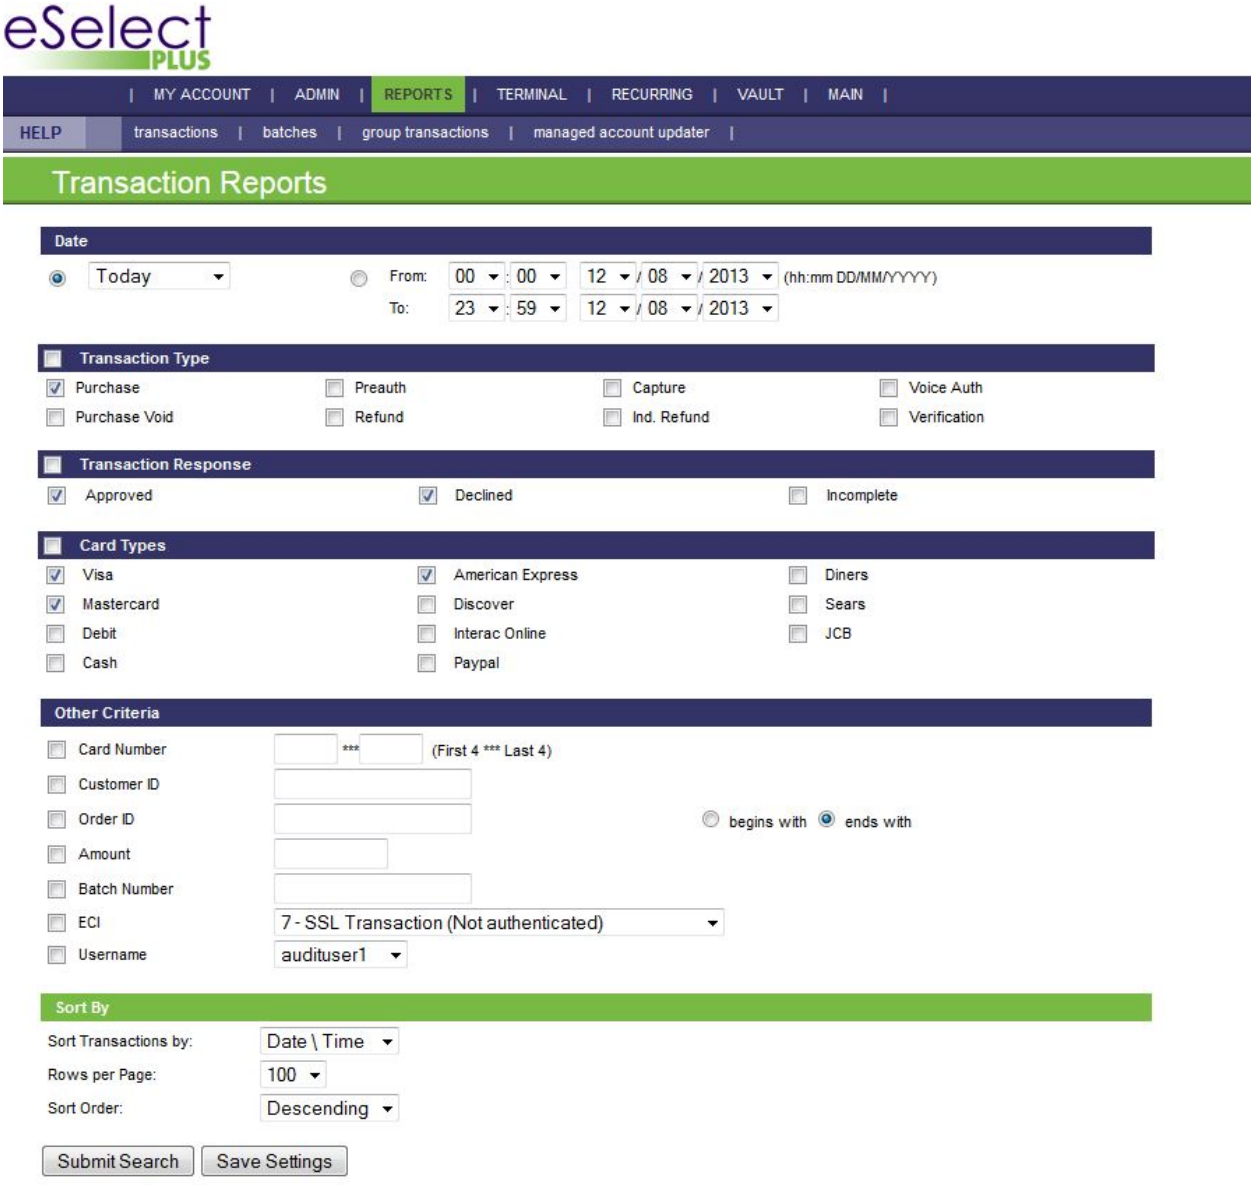
Managing Moneris transactions

Note: Note: Regardless of the authorization/capture schema, iMIS creates all transaction entries for Moneris-based transactions with the Trans.CC_Status column value = ‘C’ (in the same manner as SafePay and Payflow Pro).

To view submitted transactions

1. Go to the merchant account site.
2. Click Login.

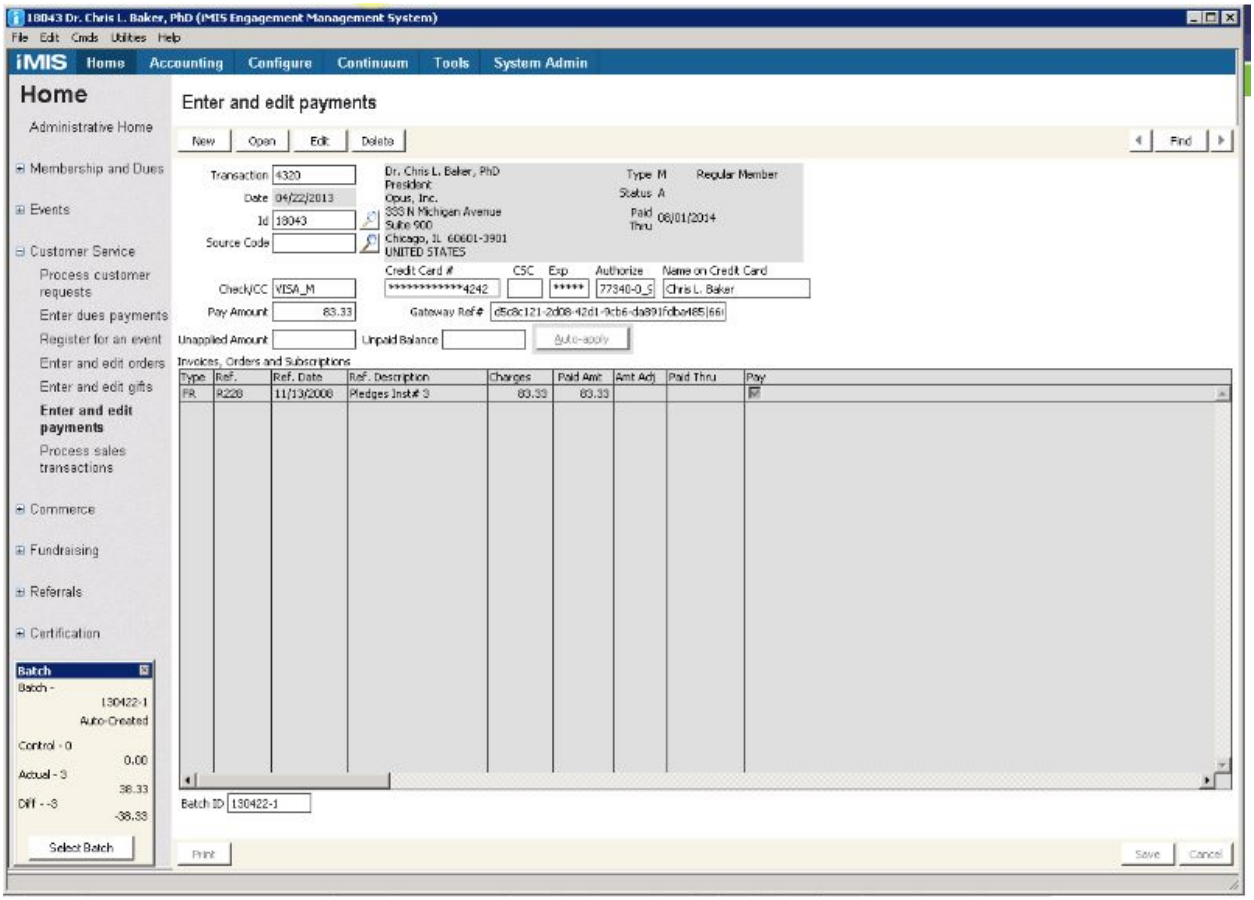
3. Enter your Username, Store ID, and Password.
4. Click Submit.
5. Go to REPORTS > Transactions. A window similar to the following is displayed:



From this window, you can run and view reports for recent transactions.

Troubleshooting the installation for Moneris

- Moneris returns Authorization codes and Gateway Reference numbers as shown in the following image. The Gateway Reference can be used to match up against the Order Number on the Moneris admin site.



- If Moneris is not installed or is installed incorrectly (for example, if there is no CCAuthAcct row or Cash_Account row in the database), you will not see it as an available option in the Gateway drop-down.
- Other kinds of misconfigurations, such as using the wrong URL or vendor, will result in the following message:

If Moneris transactions are failing to process, it may be helpful for you to create a log file

of them to test and debug:

1. Create an ASIMonerisOCX.log file in the ASI/iMIS directory where the client is deployed. This log file will capture debugging information for Moneris payment transactions.
2. Process some additional transactions and reopen the log. Examine the log file for information about why the transactions failed.

   Caution: Once you've determined the reasons for the failure, remove the log file. If you don't remove it, the log file will continue to grow in size with each transaction processed.

- You cannot delete a card authorization account that has been assigned a cash account.
- If you change the CC Auth account for a cash account (from one gateway to another, or to a different account on the same gateway) and attempt to edit or delete transactions that were created earlier in the day before the change of the CC Auth account, there may be undesirable results, particularly if the CC Auth account was changed to a Payflow Pro account.

Implementing TNSPay as an authorization gateway

Before you go live with card authorization, you must complete these implementation steps and checks. You will need a merchant account with TNSPay. As a developer, you will also need access to the TNSPay documentation and a test account with test card numbers. Make sure your test account credentials work properly.

A TNSPay Merchant account is configured for a specific payment processing model, either Authorization+Capture, or Purchase. You will need to know which payment model your Merchant account supports. iMIS supports the use of multiple TNSPay Merchant accounts in a single installation.

To implement a TNSPay authorization gateway

1. Ensure you have set up card authorization in iMIS.
2. Apply for a merchant bank account at a financial institution. The acquiring financial institution approves the application and notifies the TNSPay authorization gateway.

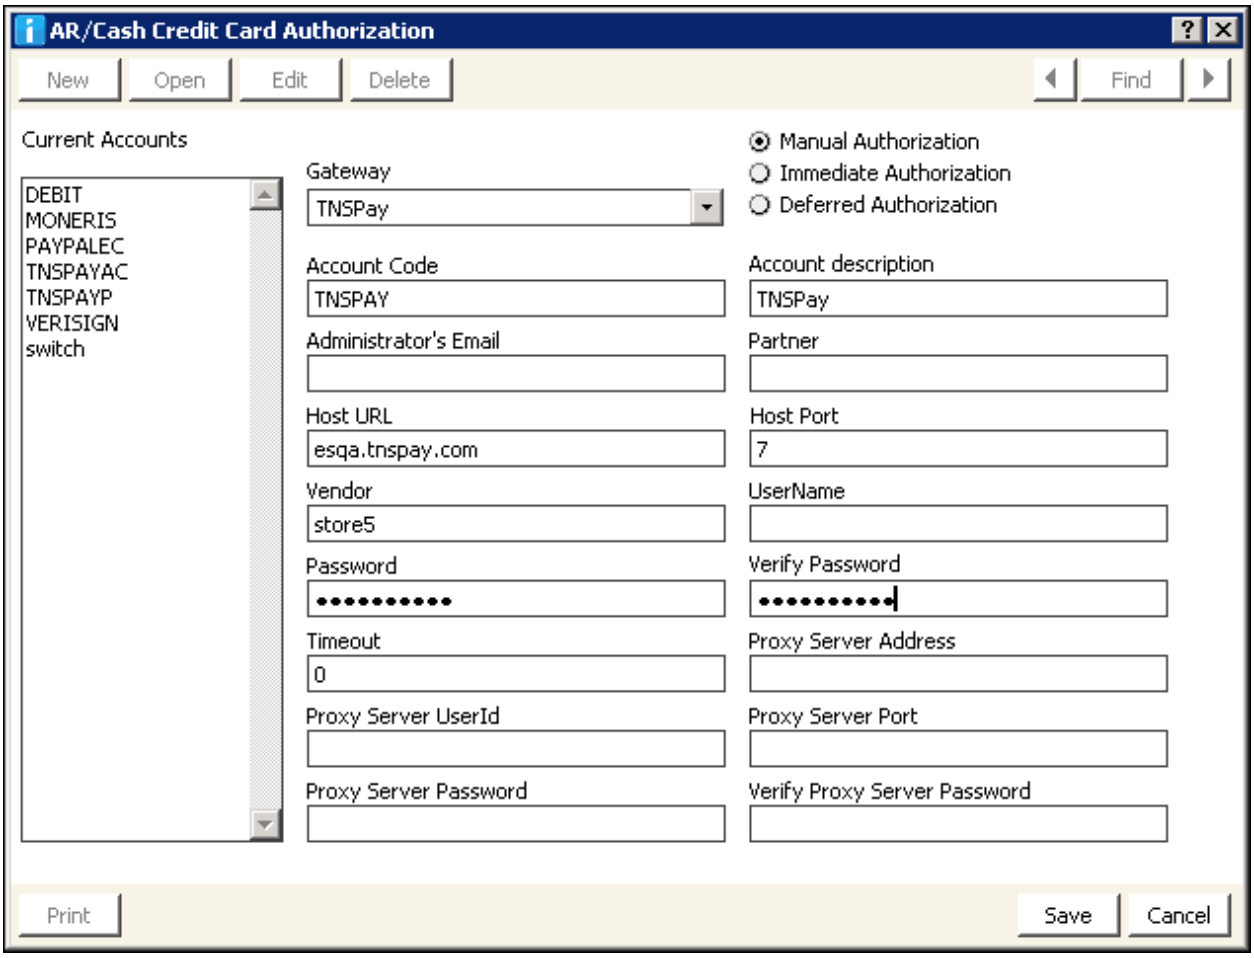
3. Register with TNSPay and obtain a test account with a payment server URL, Merchant ID, Integration password, and login/password for the payment administration web interface.
4. Verify your registration setup.
5. Set up a TNSPay card authorization account.
6. Associate a credit card cash account code.

To set up a TNSPay credit card authorization account

To configure iMIS to work with TNSPay, you must setup a credit card authorization account.

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options.
2. Click Credit Card Auth.

   Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.
3. Click New.



4. Select TNSPay from the Gateway drop-down.
5. Select the Immediate Authorization option.
6. Enter an Account Code. This value displays in the Select a Value window that opens when you click the Find icon in the CC Auth Account field on the Set up cash accounts window. This value cannot be changed once the record is saved. Your values may vary depending on your account info with TNSPay.
7. Enter a description for the account in the Account description field. If you enter a value in this field, it displays as read-only data under the CC Auth Account field on the Set up cash accounts window.
8. (optional) Enter the Administrator's Email.

9. In Host URL field, enter the URL of the payment gateway service, for example, secure.n-a.tnspayments.com.
10. In the Vendor field, enter the Merchant ID you were provided by TNSPay.
11. In the UserName field, enter a code to specify the payment model of the merchant account. For Authorize+Capture, enter AC. For Pay (also known as Purchase), enter P. If no value is entered or the value is not recognized, then P is assumed.
12. In the Password and Verify Password fields, enter the Integration authentication password you were provided by TNSPay.
13. Click Save.
14. Restart iMIS.

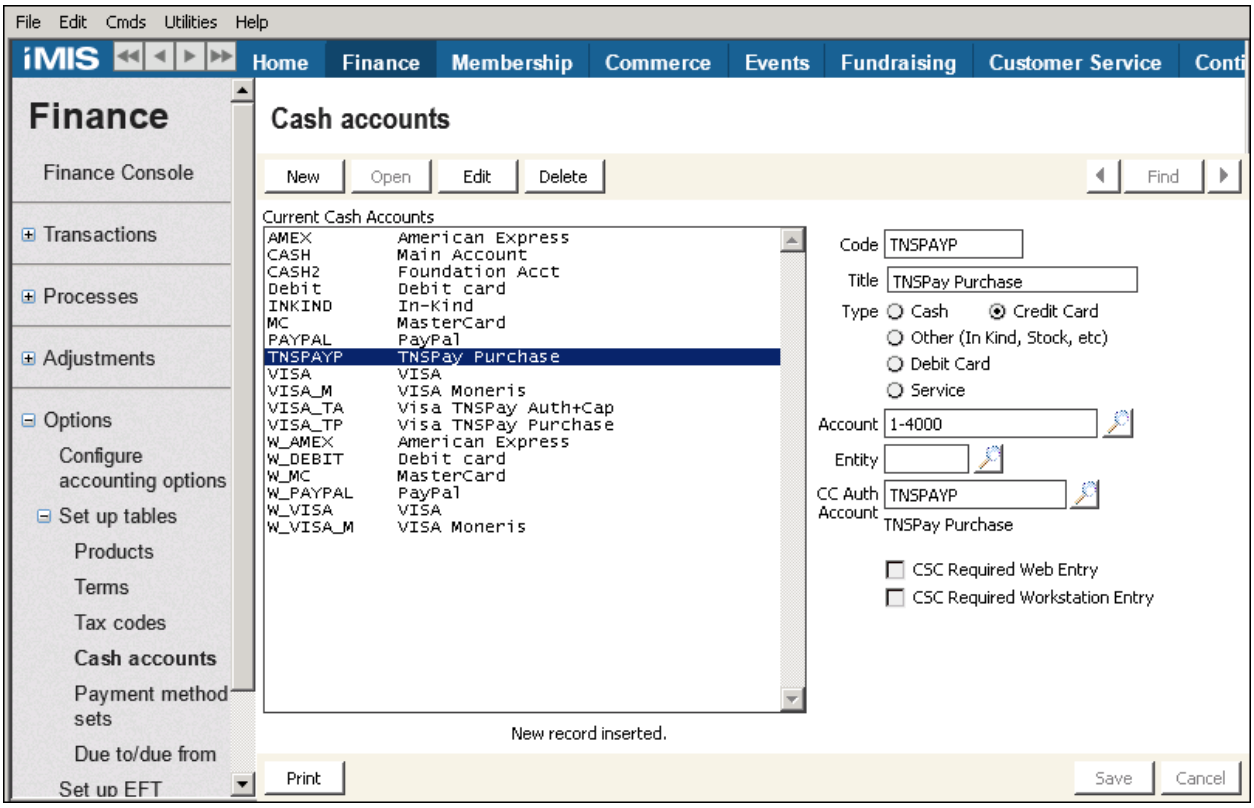
To associate a card authorization account with a credit card cash account code

Before you can use card authorization with TNSPay, you must set up credit card accounts on the Set up cash accounts window:

1. In Advanced Accounting Console, go to Finance > Options > Set up tables > Cash accounts.
2. Add credit cards as needed for use with TNSPay to Current Cash Accounts:

- Click New to add a new card.
- Click Edit to edit an existing card.

3. Select the relevant TNSPay Authorization account from the CC Auth Account dropdown for the card.



4. Click Save.

To modify the web.config file for TNSPay with the credit card gateway

In order to accept credit card payments in the website, you must add the Gateway Account Code to your web.config file. This must be updated in the NET folder if you are using any website containing content items. If you do not make this change, you will receive the following error message:

An error occurred while processing a payment. Payment gateway was not found to match the associated authorized account

Do the following:

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options.
2. Click Credit Card Auth.

3. Take note of the Account Code for TNSPay.
4. On your application server, open the web.config file located in the Net folder if you are using any website containing content items.
5. Search for AuthorizationAccounts. The code should look similar to the following:

   <add name="PayFlowProPaymentGatewayProvider" type-e="Asi.PaymentGateway.PayflowProPaymentGatewayProvider, Pay-flowProPaymentGatewayProvider" authorizationAccounts="VERISIGN,PaymentTech,PAYFLOWPRO" />
6. Place the following snippet in the web.config file before the closing </providers> tag. Set the value in the authorizationAccounts attribute to the Account Code of the credit card authorization account you created earlier. You can specify multiple authorization accounts delimited by commas:

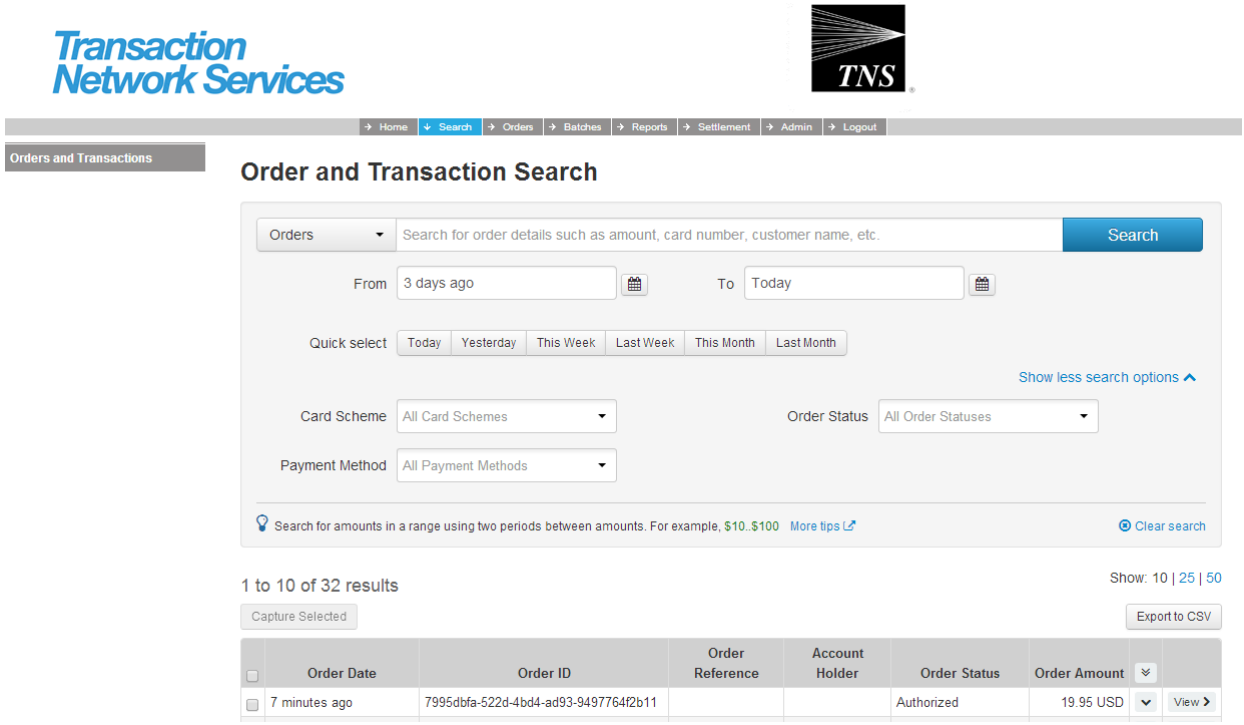
   < add name="TnsPayPaymentGatewayProvider" type-e="Asi.PaymentGateway.TnsPayPaymentGatewayProvider, TnsPayPay-mentGatewayProvider" authorizationAccounts="TNSPAY"/>
7. Restart IIS. Your credit cards should work in your content items website.

Managing TNSPay transactions

> **Note:** Note: Regardless of the authorization/capture schema, iMIS creates all trans-action entries for TNSPay-based transactions with the Trans.CC_Status column value = 'C' (in the same manner as SafePay and Payflow Pro).

To view submitted transactions

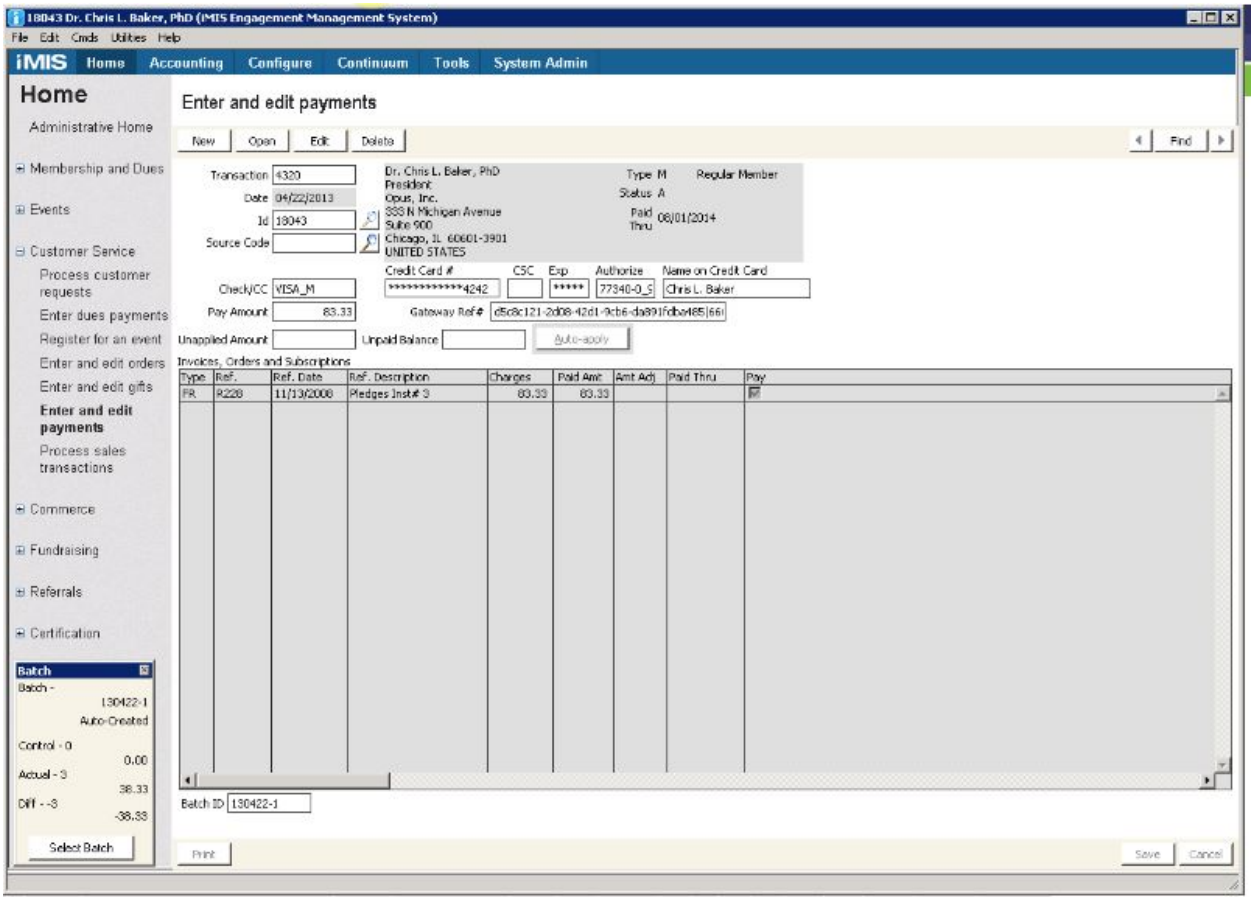
1. Go to the merchant admin portal https://secure.na.tnspayments.com/ma.
2. Enter your Merchant ID, Operator ID, and Password.
3. Click Log In.
4. Go to Search. A window similar to the following is displayed:



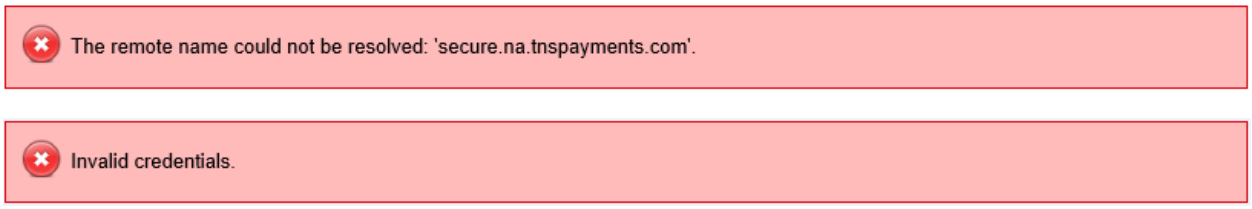
From this window, you can run and view reports for recent transactions.

Troubleshooting the installation for TNSPay

- TNSPay returns Authorization codes and Gateway Reference numbers as shown in the following image. The Gateway Reference can be used to match up against the Order Number on the TNSPay admin site.



- If TNSPay is not installed or is installed incorrectly (for example, if there is no CCAuthAcct row or Cash_Account row in the database), you will not see it as an available option in the Gateway drop-down.
- Other kinds of misconfigurations, such as using the wrong URL, will result in the following message:



If TNSPay transactions are failing to process, it may be helpful for you to create a log file of them to test and debug:

1. Create an ASITnsPayOCX.log file in the ASI/iMIS directory where the client is deployed. This log file will capture debugging information for TNSPay payment transactions.
2. Process some additional transactions and reopen the log. Examine the log file for information about why the transactions failed.

   Caution: Once you've determined the reasons for the failure, remove the log file. If you don't remove it, the log file will continue to grow in size with each transaction processed.

- You cannot delete a card authorization account that has been assigned a cash account.
- If you change the CC Auth account for a cash account (from one gateway to another, or to a different account on the same gateway) and attempt to edit or delete transactions that were created earlier in the day before the change of the CC Auth account, there may be undesirable results, particularly if the CC Auth account was changed to a Payflow Pro account.

Creating a custom credit card gateway

If you choose not to use Payflow Pro, Moneris, TNSPay or SafePay, you can create a custom credit card gateway. The same connection parameters that are available for a Payflow Pro gateway are also available for a custom gateway. This includes all of the authorization modes and settings on the AR/Cash Credit Card Authorization window.

iMIS Web views

A .NET developer can write a custom gateway for the web views of iMIS. Templates and documentation are available from iMIS Community's SDK Center.

Advanced Accounting Console

An Xtender developer can use Visual Basic to write a custom gateway for Advanced Accounting Console. Templates and documentation are available from the iMIS Support community under Extension Products. Instructions for customizing the gateway are in the documentation and the control files. The Xtender developer must define and carefully document which of the fields should be populated, if any, and for what purpose.

Installing a custom credit card authorization gateway

Before implementing a custom gateway, the developer must install the new application in a test environment. The application must be installed on each Advanced Accounting Console workstation from which payments are entered.

After the custom gateway application is installed you must:

1. Create a new Credit Card Authorization account (AR/Cash > Set up module > Credit card authorization).
2. Set up a Cash Account (AR/Cash > Set up table > Tables > Cash Accounts) for a Type, Credit Card or Debit Card, that uses the newly defined Credit Card Authorization account.

Setting up a custom credit card authorization account

To configure iMIS to use an Xtender application that a developer has created for a custom credit card gateway (see "Creating a custom credit card gateway"), you must setup a credit card authorization account.

> **Note:** Note: Only two fields are required for the custom gateway: Account Code and Account Description. The remaining fields are available for connection parameters. Your developer can use the data entered to these fields for other purposes, or not at all.

> **Note:** Caution! The labels on the fields may not correspond to the data you need to enter. Check with your developer to find out whether these fields require special data for the custom gateway.

1. In Advanced Accounting Console, go to Finance > Options > Configure accounting options. Click Credit Card Auth.

   Note: For Credit Card Auth to display, you need a relevant license, such as CCAuth or Service Central.
2. Click New.
3. Select Custom from the Gateway drop-down list.

4. Enable the Immediate Authorization, or Deferred Authorization option.
5. Enter an Account Code. This value displays in the Select a Value window that opens when you click the Find icon in the CC Auth Account field on the Set up cash accounts window. This value cannot be changed once the record is saved.
6. Enter a description for the account in the Account description field. If you enter a value in this field, it displays as read-only data under the CC Auth Account field on the Set up cash accounts window.
7. Click Save.

Troubleshooting the installation for custom gateway

If the custom gateway application is not installed or is installed incorrectly on Advanced Accounting Console, the transaction will fail. When a user attempts to save a payment transaction that is dependent on the custom gateway, the authorization process will time out for that transaction. iMIS informs the user that the payment cannot be authorized because the gateway application is not installed correctly.

- This message is presented first.

  Custom Gateway not properly installed

  The payment type entered for this transaction requires a Custom Gateway for credit card authorizations. The custom gateway is not properly installed on this workstation.

  The authorization for this payment transaction will time out.

  Please contact your system administrator or the developer of your custom gateway application before processing payments using the specified payment type.

  Note: An error message identifier, nCCAuthOnly_Custom, at the bottom of this message informs Technical Support that this is not an iMIS issue.

- After the user clicks OK in the Custom Gateway not properly installed message box, a standard iMIS warning is provided.

  The authorization process timed out. Please contact your system administrator.

PHP Examples

Add a Person

```
<?php

require_once 'iMISClasses.php';

require_once 'iMISEntityService.php';

$baseURL = 'http://www.imiscommunity.net/iMISSOA';

$username = 'username';

$password = 'password';

$verbose = false;

// get an EntityService client

echo "Get an EntityService client.\n";

try { $client = new iMISEntityService($baseURL, $username, $password); }

catch( Exception $e )

  {

  echo "Exception: $e->faultstring\n";

  exit();

  }

// Add a person

echo "Add a Person.\n";

try
```

```
{
    $party = new PersonData();
    $party->PersonName->LastName = "Smith";
    $party->PersonName->NamePrefix = "Mr.";
    $fa = new FullAddressData();
    $fa->AddressPurpose = 'Work Address';
    $fa->Phone = '(555) 555-5555';
    $addr = new AddressData();
    $addr->AddressLines->string[] = '123 Main Street';
    $addr->CityName = "Boston";
    $addr->CountrySubEntityCode = 'MA';
    $fa->Address = $addr;
    $party->Addresses->FullAddress[] = $fa;
    $sal = new PartySalutationData();
    $sal->SalutationType = 'test';
    $sal->Text = 'Mr. John Smith';
    $party->Salutations->PartySalutation[] = $sal;
    $result = $client->Add($party);
    if ($result->IsValid) {
        $party = $result->Entity;
        echo "Added a person: $party\n";
    }
    else {
```

```
      echo "Error adding person: " . $result->getErrorSummary() . "\n";
   }
}
catch (Exception $e)
{
   echo "Exception: " . $e->getMessage() . "\n";
   echo $client->getLastRequest();
}
?>
```

Find Party by PartyId

```
<?php
require_once 'iMISClasses.php';
require_once 'iMISEntityService.php';

$baseURL = 'http://www.imiscommunity.net/iMISSOS';
$username = 'username';
$password = 'password';
$verbose = false;

// get an EntityService client
echo "Get an EntityService client.\n";
try { $client = new iMISEntityService($baseURL, $username, $password); }
catch( Exception $e )
   {
   echo "Exception: $e->faultstring\n";
   exit();
   }
```

```
// Find party by PartyId
echo "Find a Party.\n";
try
   {
   $query=new QueryData('Party');
   $query->addCriteria(new CriteriaData('PartyId', CRITERIA_EQUAL, '101'));
   $findResults=$client->Find($query);
   if (count($findResults->Result) == 0)
      {
      echo "Party not found.\n";
      exit();
      }
   $party=$findResults->Result[0];
   echo "Find Party: $party \n";

   if (is_a($party, "PersonData")) { echo "FirstName: " . $party->PersonName->FirstName
. "\n"; }
   else { echo "Organization: $party->OrganizationName\n"; }

   echo "City: " . $party->Addresses->FullAddressData[0]->Address->CityName . "\n";

   if ($verbose) { print_r ($party); }
   }
catch( Exception $e )
   {
   echo "Exception: $e->faultstring\n";
   echo $client->getLastRequest();
```

```
   }
?>
```

Find Party (summaries) by Last Name, with pagination

```
<?php
require_once 'iMISClasses.php';
require_once 'iMISEntityService.php';

$baseURL = 'http://www.imiscommunity.net/iMISSOA';
$username = 'username';
$password = 'password';
$verbose = false;

// get an EntityService client
echo "Get an EntityService client.\n";
try { $client = new iMISEntityService($baseURL, $username, $password); }
catch( Exception $e )
   {
   echo "Exception: $e->faultstring\n";
   exit();
   }

// Find Parties by last name
echo "Find Parties by last name.\n";
try
   {
```

```
   $query=new QueryData('PartySummary');
   $query->addCriteria(new CriteriaData('LastName', CRITERIA_STARTSWITH, 'Hunt'));
   // $query->addCriteria(new CriteriaData('UpdateInformation.UpdatedOn', CRITERIA_
GREATERTHAN, '2008-6-1'));
   $pager=new PagerData();
   $pager->PageSize=5;
   $query->Pager=$pager;
   $query->SortFields=Array
      (
      new SortFieldData("FirstName", "Descending"),
      new SortFieldData("LastName")
      );
   echo "Parties: \n";
   do
      {
      $findResults=$client->Find($query);
      echo $findResults->Query->Pager . "\n";
      foreach ($findResults->Result as $party) { echo "$party\n"; }
      $query=$findResults->Query;
      $query->Pager->PageNumber=$query->Pager->PageNumber + 1;
      } while ($query->Pager->PageNumber < $query->Pager->PageCount);
   echo "\n";
   }
catch( Exception $e )
   {
   echo "Exception: $e->faultstring\n";
   echo $client->getLastRequest();
   }
?>
```

Process Manager

For your convenience, Process Manager can be accessed from the iMIS Staff Site (select Community> Process Manager).

Professional Referrals

Referrals Overview

Professional Referral gives you several important tools that enable you to generate and manage professional referral requests.

- You can narrow your selection criteria of professionals with preferences like location or gender.
- You can view only relevant provider candidates based on the criteria you enter, and who is currently subscribed to the service. The candidates with the fewest referrals display at the top of the list.
- You can select candidates returned by your search and dynamically view their complete record of information including name, address, office location, specialties, and insurance.
- When you select candidates for referral, you can then enter contact information about the client requesting the service. This information is available for generating reports for your providers which detail the referral requests received and fulfilled.

Professional Referral Features

The iMIS Professional Referral module is integrated into the iMIS system such that it capitalizes on data and systems existing elsewhere in your database.

- Professional Referrals works with the Customer Management and Billing modules to coordinate subscriptions with the referral service and to determine current eligibility for participation.
- Specifying your search criteria lets you customize the referral for your client's needs. You can specify up to four additional customer fields to serve as search criteria.
- A zip/area option lets iMIS preferentially locate a zone or area based on the client's zip code. iMIS can search for a specific zip code, a zip code area (all zip codes beginning with a set of three digits), or no zip code restriction.

- By editing the text in your formal letters, you can customize your policy statements and insert merge fields for seamless, personalized output.

  Navigation for Referrals

  The Referrals task list displays when you select Referrals from the navigation bar.

- Manage referrals - Select this task list item to open the Manage referrals window that allows you to enter and manage professional referral requests.
- Generate reports - Select this task list item to open the Generate reports window that allows you to print detailed rosters, overall status summaries, and letters.
- Set up module - Select this task list item to open the Set up module window that allows you to define your Referrals system preferences.
- Create referral orders - Select this task list item to create referral orders.
- Delete expired - Select this task list item to open the Deleted expired window that allows you to delete expired referrals, customers, and providers.
- Rebuild search indexes - Select this task list item to rebuild your list of referrals.

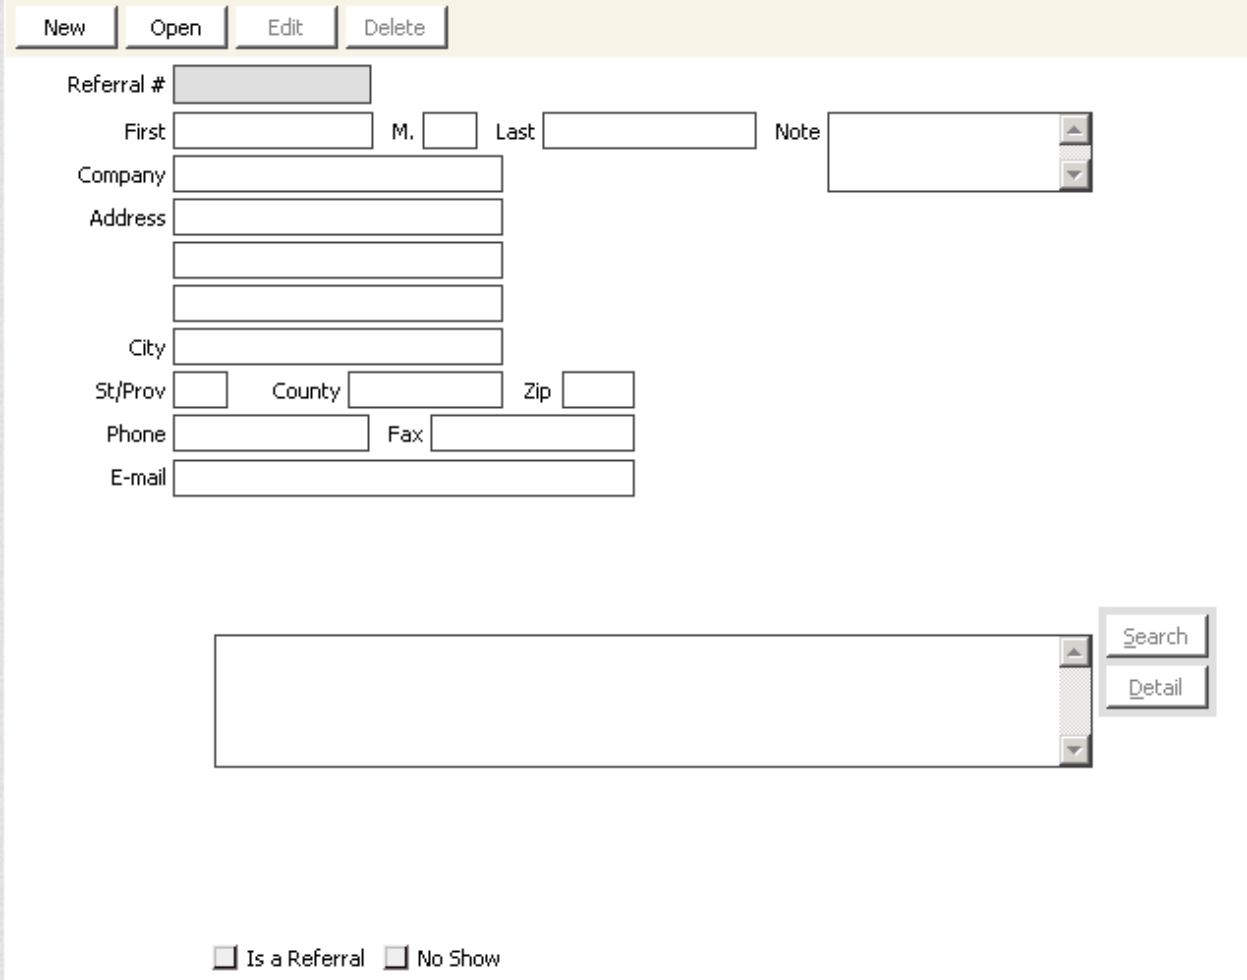
Referral Management

Referral information is entered on the Manage referrals window. Data relating to the request for a referral is entered in the top half of the window. The bottom half of the window displays the results of the search, and the marking of the candidates that were actually referred.

Entering Referrals

Entering a referral involves entering the referral client's information, and selecting a provider. Use the Manage referrals window to enter referrals.

Manage referrals window



Desktop: Referrals > Manage referrals

Referral #

(read only) Displays the referral number. When you enter a new referral, this field is blank until you click Save. After you click Save, iMIS automatically generates a sequential number for the referral.

You can search for referrals by entering the Referral # in the Ref ID on the Find Referrals window.

First

Specifies the first name of the client requesting the referral, or use standard lookup (Ctrl+L) to retrieve an existing client.

> **Note:** Note: When you search for clients, you are not able to lookup individuals in the Name table, only Ref_Client. You will need to manually enter existing customers as clients.

> **Note:** Note: If you enter information for an existing client you will create a duplicate record.

> **Note:** Note: If you do not enter a name for the client, iMIS prompts you to confirm you entered the referral correctly.

M

Specifies the middle name of the client making the referral request, or use standard lookup (Ctrl+L) to retrieve an existing client.

Last

Specifies the last name of the client making the referral request, or use standard lookup (Ctrl+L) to retrieve an existing client.

> **Note:** Note: If you do not enter a Last name for the client, iMIS prompts you verify that you want to create a transaction without the Last name.

Company

Specifies the company name of the client making the referral request.

Address

Specifies the street address of the client making the referral request.

City

Specifies the city of the client making the referral request

St/Prov

Specifies the state or providence of the client making the referral request.

zip

Specifies the Zip code of the client making the referral request.

Phone

Specifies the telephone number of the client making the referral request.

Fax

Specifies the fax number of the client making the referral request.

E-mail

Specifies the e-mail address of the client making the referral request.

Note

Specifies any information related to the referral transaction.

Optional Fields

Specifies the codes for the client's responses, such as the source of the marketing program or contact type that generated their order. Standard lookup (Ctrl+L) is available.

> **Note:** Note: These optional fields are validated from the lookup tables you create on the Set up general lookup/validation window (from Customers, select Set up tables > General lookup/validation) and referenced on the Referrals Set up module window. Do not to enter data into the Expansion field for these validation tables.

Zip/Area

Optional search field. If you enable the Use Zip Areas option on the Set up module window, iMIS autofills this field with the client's zip code to restrict search to local providers. You can override the code or enter a 3-digit zip such as "787," which locates 78727,

78759, and 78702. You can also enter any zip code areas you defined in the REFERRAL_AREA table.

> **Note:** Note: At any time, you can override or clear the default value.

User-Defined Search Fields (Up to 5)

According to the Optional Search Fields you specify on the Set up module window, labeled text boxes display for the entry of match/search values to find candidates that meet the specified criteria. Depending upon the nature of the search field, it may be appropriate to enter multiple search values, separated by commas. For example, a client looking for a CPA may specify a company/individual with expertise in both individual tax preparation and personal financial planning. In this case, it would find records with both areas indicated.

Provider List

A scrolling list of providers. The providers that display in the list depend on your search criteria.

As you choose referrals from the candidates listed, double-click on the lines in the scrolling list to mark them. When you double-click, an indicator (>) marks the line (left of the ID). This marking works as a toggle: double-click an unmarked line to mark it for referral; double-click a marked line to unmark (deselect) it.

Typically, you will mark the first three candidates in the returned list for a referral. However, you control which lines are marked, so you can select any number of records from any location in the list.

Search button

Used to search for providers according to your criteria.

Detail button

Opens the Provider Detail window where you can view details about a provider including contact information, overall status, and current referral status.

Is a Referral

Select this option to indicate that you are making a referral. The referral count for the selected provider will automatically be decreased, but any orders or invoices must be manually adjusted.

If you select a provider and do not select the Is a Referral option, iMIS displays a message informing you that to count your selection as a true referral, you must select the Is Referral option. If you do not select the option, iMIS saves the record as a non-referral.

> **Note:** Note: Whether or not you select Is A Referral will determine whether or not the referral count of the provider is affected.

No Show

Select this option to indicate that a client did not show up as scheduled. iMIS automatically does the following when you mark a referral as a no show:

- Decreases the provider's count
- Sets the LAST_REFERRED date in the Ref_Provider table to the date of the last referral if that date is earlier than the creation date of the referral at hand. If the date of the last referral is later than the referral at hand, it remains the LAST_REFERRED date.

  In either case, the referral record is maintained in the Referrals table. No shows are labeled as such in relevant reports such as the Daily Summary of Referrals.

Ready to Invoice

Select this option to indicate that reference fees can be processed for the specified referral.

Ref Fee

When you set up a sales product for referrals, you can specify default fee amounts. These values display in this field. You can override this value as long as the referral has not been invoiced.

To enter a referral

1. From Manage referrals, click New.
2. Enter the client's full name, or if the client is already in the database, press Ctrl+L in one of the name fields to open the Find Referrals window, and find the client.
3. Enter the address, phone, and fax information (if not already populated by a Find).
4. Enter a Note if desired.
5. Enter information into the custom additional fields as needed. Use lookup (press Ctrl+L) in the fields for a list of available selections. If you do not alter the fields, they will simply populate with the default value you specified on the Set up module window.
6. If the Use Zip Areas option is enabled on the Set up module window, when you enter a value in the Zip field and press Tab, the City, St/Prov, and County fields are automatically populated with the appropriate value. Make changes to these values, if necessary.
7. Enter information in the other custom search fields where needed.
8. Click Search.
9. A list of providers displays in the lower half of the Manage referrals window. Select providers from this list as desired by double-clicking on them; an indicator (>) displays to the left of the provider record. To deselect providers, just double-click on them again to remove the indicator.

   If the list of providers is not satisfactory, narrow or broaden your search to receive the desired list. You are able to search as many times as you want before clicking Save.
10. (optional) Mark the referral as Ready to Invoice or Is A Referral. Depending on your organization, you may want to perform this step later.
11. Click Save to enter the transaction and have the system update the providers' referral records with the most recent referral date and time. The transaction data will be used when you generate letters to clients and providers, and it will be retained for your detail and summary reports.

> **Note:** Note: If any of the providers you select do not meet the requirements of a provider (according to set up options), a message displays and iMIS will not allow you to select the provider.

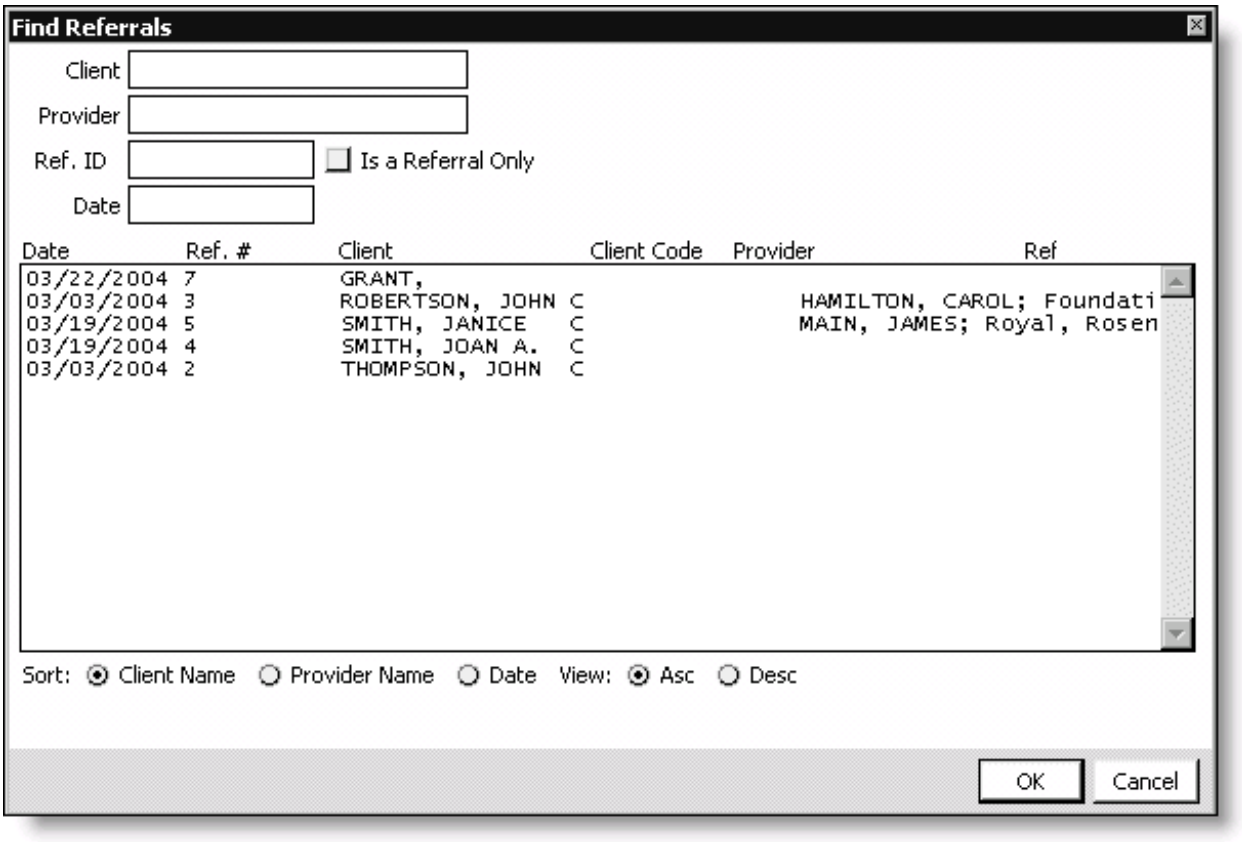
Finding Referral Records

The Find Referrals window displays the calls referred to an individual provider, as well as the referrals provided to an individual caller, depending on your search criteria. The default information provided includes date, referral number, client's name, client type ("Special Code"), provider's name, and any custom search criteria.

> **Note:** Note: You can specify what displays on the Find Referrals window on the Referral Advanced Setup window. See To set advanced options for more information.

You can open the Find Referrals window one of two ways:

- From Referrals, select Manage referrals, and click Find.
- When entering or editing a referral, press Ctrl+L in any of the name fields (First, M, or Last).



The Find Referrals window scrolls horizontally and vertically. The value in the provider list Maximum field on the Referral Advanced Setup window determines the maximum number of records displayed at one time on the Find Referrals window. A concatenated list of search criteria used for the referral (fields SEARCH_1 through SEARCH_5 in the Referrals table) displays with each record when you scroll to the right.

You can search for specific clients and/or providers by entering a text string in the Client or Provider fields.

When you select the Is a Referral Only option, iMIS displays only those records marked Is a Referral.

According to the criteria you enter in the top-half of the Find Referrals window, iMIS uses the following search logic to find and return a list of applicable referral records:

- CONTAINS – Add a comma after your search value for the system to use CONTAINS logic. For example, if you enter the beginning character of a search code followed by a

comma, all records containing a code beginning with that character will be returned by the search.

- EQUAL TO – Enter a search value that does not contain a comma for the system to use EQUALS logic (searches for the exact value you entered).
- OR – Add the percent symbol (%) between values to have the system search using OR logic with a list string field. For example, if the search is A, B, and you want the members returned that have A or B in the field, you will search using A%B.
- AND – Add a forward slash (/) between values to have the system search using AND search logic with a list string field.

  To find all existing referrals

  View all existing referrals by clicking in the Client field and clicking OK.

  To find referrals by client name

  You can select referrals for a particular client by providing the complete or partial name.

  To find referrals by provider

  You can select referrals for a particular provider by providing the complete or partial name.

  To find referrals by client and provider

  You can narrow your search for referrals by using a combination of a client and a provider names.

Viewing Provider Information

The provider list on the Manage referrals window displays according to the options you select on the Referral Advanced Setup window. The information that displays in the scrolling list for each provider includes ID, individual name (if any), company name, phone number, total number of referrals and date last referred.

To view information for a particular provider, just select a provider in the list.

> **Note:** Note: Selecting a provider broadcasts the ID to any other customer windows that you may also have open; giving you quick access to information related to that candidate.

To view additional information about a provider

1. From Referrals, select Manage referrals.
2. Enter or edit a referral record.
3. Select the provider for which you want more information, and click Detail. The Provider Detail window displays.

Modifying Referral Records

You can modify referral records that you enter on the Manage referrals window.

To edit a referral record

1. From Referrals, select Manage referrals.
2. Open a referral record.
3. Click Edit.
4. Make your changes.
5. Click Save.

To delete a referral record

> **Note:** Note: If you have already invoiced a referral, you are not able to edit the referral.

1. From Referrals, select Manage referrals.
2. Open a referral record.
3. Select the provider you want to remove.

4. Click Delete.
5. A message displays asking you to perform your deletion. Click Yes.

To mark a referral as a no show

> **Note:** Note: When you mark a referral record as a no show, the referral count for that provider automatically decreases, but you must manually adjust any orders or invoices.

1. From Referrals, select Manage referrals.
2. Click Find.
3. Find the referral.
4. Click OK.
5. Double-click the appropriate referral. The system returns you to Manage referrals window with the referral information populated.
6. Click Edit.
7. Select the provider.
8. Select the No Show option at the bottom of the screen.

Processing Referral Orders

If you specify an additional fee product on the Referral Advanced Setup window, the Ref Fee and Ready to Invoice options display on the Manage referrals window to allow you to process reference fees that apply to successful referrals beyond the base referral sub-scription fee.

Perform the following tasks to process referral orders:

- Create referral orders
- Invoice open referral orders
- Enter payments for referral orders

To create a referral order

1. Advanced Accounting Console: Home > Referrals, select Create referral orders.
2. Find the referral.
3. Select the Ready to Invoice option.
4. From Referrals, select Create referral orders to create orders for all referrals marked Ready to Invoice.

To invoice referral orders

Generating additional fee invoices occurs as a batch process that you handle through the Generate reports window. You invoice the referral fees for your subscribers directly from the iMIS Professional Referrals system.

> **Note:** Note: You cannot edit a referral order once it has been invoiced.

1. From Referrals, select Generate reports.
2. Select the Invoice report type.
3. Select the Print New Invoices report.
4. Click Run.

To enter payments for referrals

When you receive payments for referral services, you can enter them through AR/Cash as you would any other order.

1. From AR/Cash, select Enter and edit transactions> Cash receipts.
2. Click New.
3. Enter the customer Id, or click the Find icon to select a value. You can also enter the Invoice Number.
4. In the Check/CC field, enter the check number or credit card type, and press Tab.

5. Enter the Payment Amount, and press Tab.
6. Select one of the following transaction options:

- To apply cash to an item, double-click on the item in the list and enter the amount to apply to the item in the Amt Paid field.
- To partially apply cash to an item, select the line and enter the amount to apply to the item in the Amt Paid field.

7. Click Save.

Referral Lists

The section discusses building and maintaining your referral list, which is the list of current referral candidates from your customer database.

To build the referral list, the system creates and later updates, a list of referral candidates, which consists of the active REFERRAL subscription records that matched the Provider List User Search Filter (or the iMIS default).

To build a referral List

1. Add the REFERRAL subscription to all provider candidates and invoice them. If you use the default search filter, iMIS verifies that the Paid_Thru date is greater than the current date. In this case, the customer must pay the REFERRAL product before they will process when you rebuild search indexes.
2. Make sure all provider candidates have records in all Customer tables referenced in the Optional Search Fields area of the Set up module window.
3. From Referrals, select Rebuild search indexes. The system prompts you to confirm your choice before running the procedure, which can be lengthy.
4. Click Yes. As iMIS builds the list, it pulls the data maintained in the search fields you specified.

Troubleshooting Provider List Problems

If after running the rebuild indexes utility the provider list does not include all of the providers you expect, narrow the list down to one provider candidate that is not being added and check for the following:

- Does the provider candidate have a REFERRAL subscription?
- If you are using the default Search Filter, has the provider candidate paid for REFERRAL, and is the Paid Thru date greater than today's date?
- If you are using the default Search Filter, do the candidate and the subscription record both have a status of "A"?
- If you are using your own Search Filter, does the provider candidate meet all of the prerequisites, as well as Name.STATUS='A%'?
- Does the provider candidate have records in all of the Custom Tables specified as Search Field Names on the Set up module window?

Updating Referral List

Run the Rebuild search indexes procedure periodically to update it with new subscribers and to refresh the specified fields from the master file. Note that the time required to update your referrals list depends on how many records and fields are involved.

In general, be sure to update your referrals list whenever your provider data changes significantly.

Even if providers are listed, they may not be available for referrals. iMIS will check the search filter options before allowing you to select them. iMIS displays a message informing you that the provider is not eligible for reference if you select a provider who is not available for referrals.

Desktop: Referrals > Rebuild search indexes

Note: Note: iMIS will not delete expired providers from the Ref_Provider table until their subscription to REFERRAL has been removed from their Dues/Subscription

Item Detail window (from Customers, select Manage customers, find the customer record, select the Billing tab, and double-click the Referral activity). Thus, inactive providers may be listed as providers, although you cannot select them.

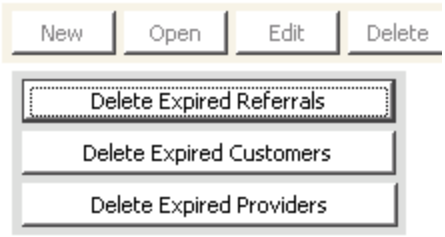
Expired Records

Professional Referrals makes deleting your old referrals, providers, and clients an automated process that you can perform for large groups at once. From the Delete expired window you can select to delete referral, provider, and client records that are older than a specific date.

Deleting Expired Referral Records

To determine whether a referral record should be deleted, iMIS compares the date you enter in the Older Than field on the Delete Old Referrals Referral Dialog window to the Referral.DATE_CREATED, Ref_Provider.LAST_REFERRED, and Ref_Client.DATE_CREATED values for each referral record.

Delete expired items window



Desktop: Referrals > Delete expired

To delete expired items

1. From Delete expired items, click Delete Expired Referrals.
2. Enter the date before which you want to remove the transactions of completed referrals. The Older Than date defaults to the current system date. You can override this value.

3. Click OK.
4. A message displays asking you to confirm the deletion. Click Yes.

Deleting Expired Provider Records

To determine whether a provider should be deleted, iMIS compares the date you enter in the Older Than field on the Delete Old Providers Referral Dialog window to the Ref_Provider.LAST_REFERRED value for each provider record.

To delete expired provider records

1. From Delete expired items, click Delete Expired Providers.
2. Enter the date before which you want to remove providers. The Older Than date defaults to the current system date. You can override this value.
3. Click OK.

Deleting Expired Client Contact Records

To determine whether a client should be deleted, iMIS compares the date you enter in the Older Than field on the Delete Old Clients Referral Dialog window to the Ref_Client.DATE_CREATED value for each client record.

To delete expired client records

1. From Delete expired items, click Delete Expired Customers.
2. Enter the date before which you want to remove client records. The Older Than date defaults to the current system date. You can override this value.

Configuring Referrals

Setting up Referrals to enter and manage professional referrals involves the following multipart process:

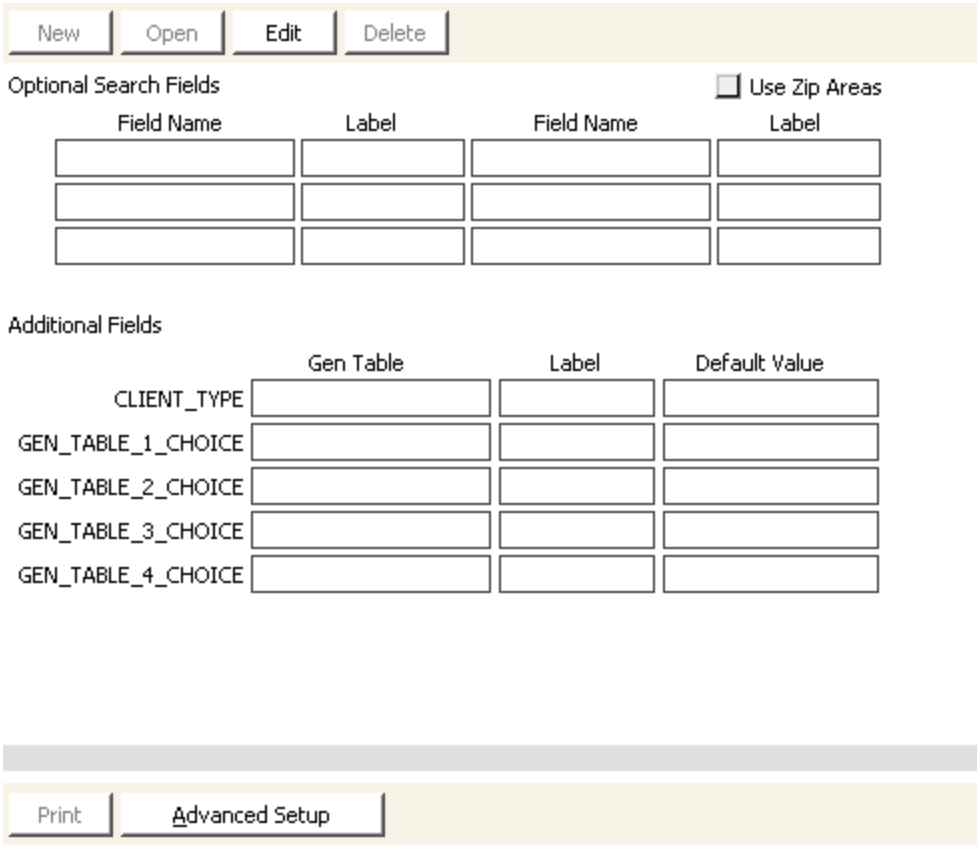
1. On the Billing Set up products window (from Billing, select Set up module> Products), you must set up a subscription-billing item (of type REFERRAL) in order to enroll your providers in the referral program.

2. On the Customers Set up general lookup/validation window (from Customers, select Set up tables > General lookup/validation), you must create your referral tables (REFERRAL_AREA, and up to four additional tables) and enter your organization's preferences.
3. Build a list of providers.
4. Set the options available on the Referral Advanced Setup window.
5. In Customers, establish any additional demographics (user-defined fields (see "Creating a user-defined table")) you need for searching for referrals.
6. (optional) On the AR/Cash Set up product codes window, create a product code (such as SALES-REFERRAL_FEE) for your referral service sales item. This code must begin with SALES and must match the code named on the Referrals Set up module window (from Referrals, select Set up module).

Setting basic Referrals options

The settings you enter on the Referrals Set up module window dictate certain variables to the system that it will use as guidelines in performing the daily operations.

Configure referrals options window



Desktop: Referrals > Set up module

Optional Search Fields

Use this area to specify your optional search fields:

Use Zip Areas – Select this option if you are maintaining zip code areas (zones) and want iMIS to locate providers based on the client's zip code.

If you disable this option, you can use the first field for an additional (sixth) search field, such as Name.COUNTY.

Note: Note: Refer to Enabling Zip Code Search for instructions on setting up the Use Zip Areas feature.

Field Name – You can specify up to five character fields from the Name table and custom (except multi-instance) tables to be available for searching. You can also specify six fields if you deselect the Use Zip Areas option. In most cases, these fields will point to either a user-defined demographic field or a list string field.

Note: Note: When using these fields to search, iMIS will process the query on a CONTAINS basis - meaning it will return all values that contain the search term. For example, if you search for "600", the values 600, 1600, 2600, 6001, 6006 would all be returned. The search will also insert ANDs between each search field you use.

Note: Each provider you expect to use must have a record in all custom Tables referenced in Field Name. Otherwise, they will not be added when you run the Rebuild Search Indexes utility.

iMIS validates the Field Name entry to ensure that it refers to appropriate Name fields; it also autoformats the field's capitalization. iMIS rejects a field name in two cases: 1) If the field is not in the Name table or any custom tables, or 2) if the field is not a character field (for example, PAID_THRU).

The fields you specify will be used to create search indexes for providers and are populated by the Rebuild search indexes utility. The Referral module will reference these indexes when building lists of available providers for each client. These fields are stored in Ref_Provider.INDEX. The first thru sixth fields and have a length of 100 characters.

Each Field Name field has a limit of 30 characters.

Note: Note: Any field over 255 characters long is considered a text field, and iMIS will not accept that entry.

Note: The first search field (top left) is available only when the Use Zip Areas is not selected.

Label – Specifies the prompt (label) that you want to display in the Manage referrals window to represent the search field. Label 1 refers to Field Name 1 (30-character limit).

Additional Fields

Use this area to specify your additional fields:

- Gen Table – Specifies up to five general lookup/validation tables. For each specified table, a corresponding field displays on the Manage referrals window and the values are saved in the Referral table.

  Note: You must have already created your general lookup/validation tables to reference them in this area. If your table name does not match an existing table, iMIS prompts you to correct the entry.

- Label – Specifies a label you want to appear on the Manage referrals window to represent the table.

- Default Value – The value you enter in this field is the default general lookup/validation table value to be used for a new transaction. You can select this value by using the lookup feature (Ctrl+L). The values will display in the Manage referrals window.

  Note: The Gen Table fields can be edited throughout the life of the referral record to maintain an ongoing status. For example, you can use one of these to track the referral status based on the information received from the provider.

Advanced Setup button

Opens the Referral Advanced Setup window where you can specify your advanced setup options.

To set basic referral options

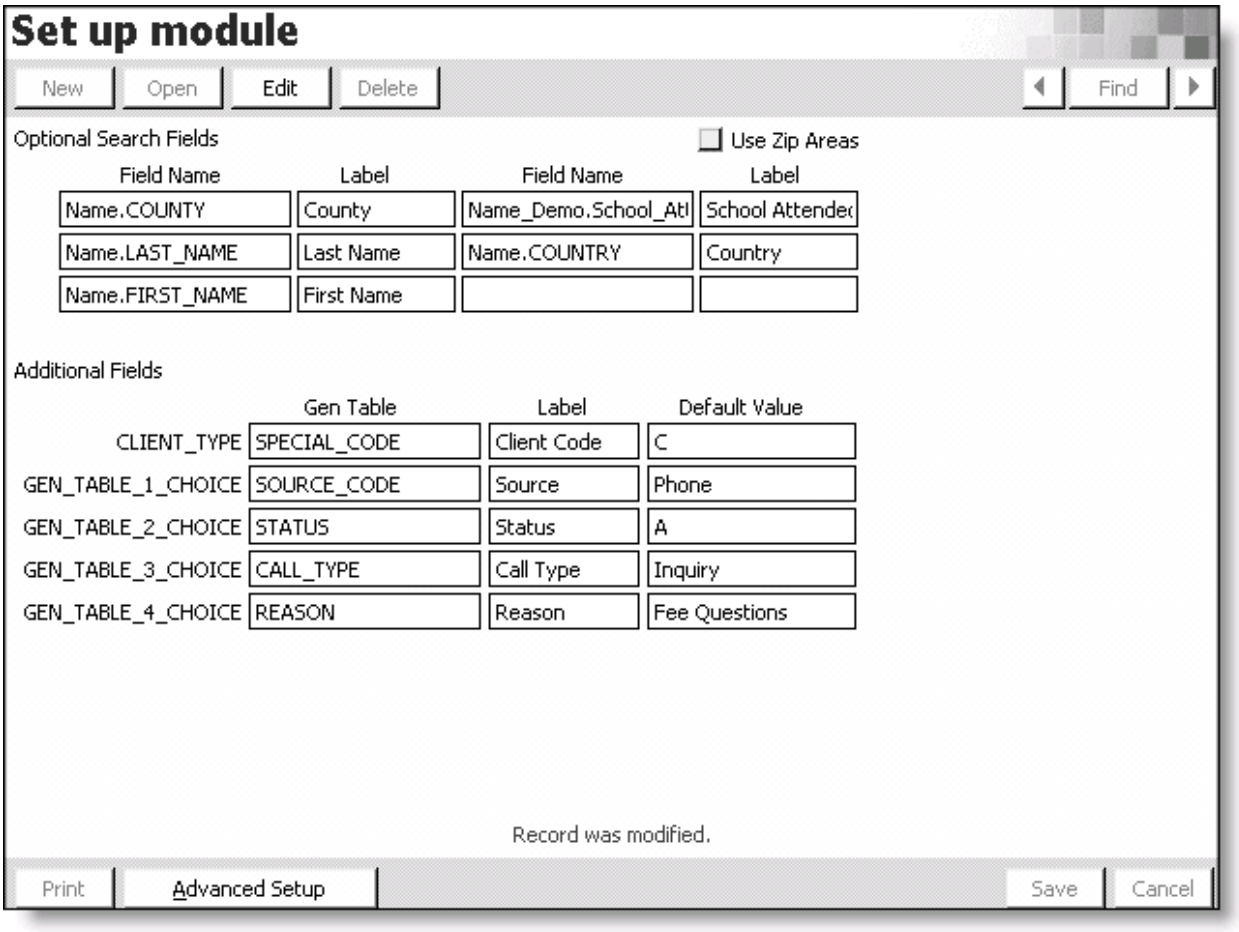
1. From Configure referrals options, click Edit.
2. Specify your desired optional search fields. Once you enter the desired fields and labels, they will display at the bottom half of the Manage referrals window.

3. (optional) In the Additional Fields area of the window, define up to four fields to categorize your incoming referrals, plus one field to categorize the client. The general lookup tables you specify provide lookup, validation, and expansion for the fields.

   The data iMIS gathers for referrals is recorded in the following fields in the Referral and Ref_Client tables:

- Ref_Client.CLIENT_TYPE
- Referral.GEN_TABLE_1_CHOICE
- Referral.GEN_TABLE_2_CHOICE
- Referral.GEN_TABLE_3_CHOICE
- Referral.GEN_TABLE_4_CHOICE

   After you enter the fields, they display in the top half of the Manage referrals window. The following example categorizes calls by Client Code, Source, Status, Call Type, and Reason.



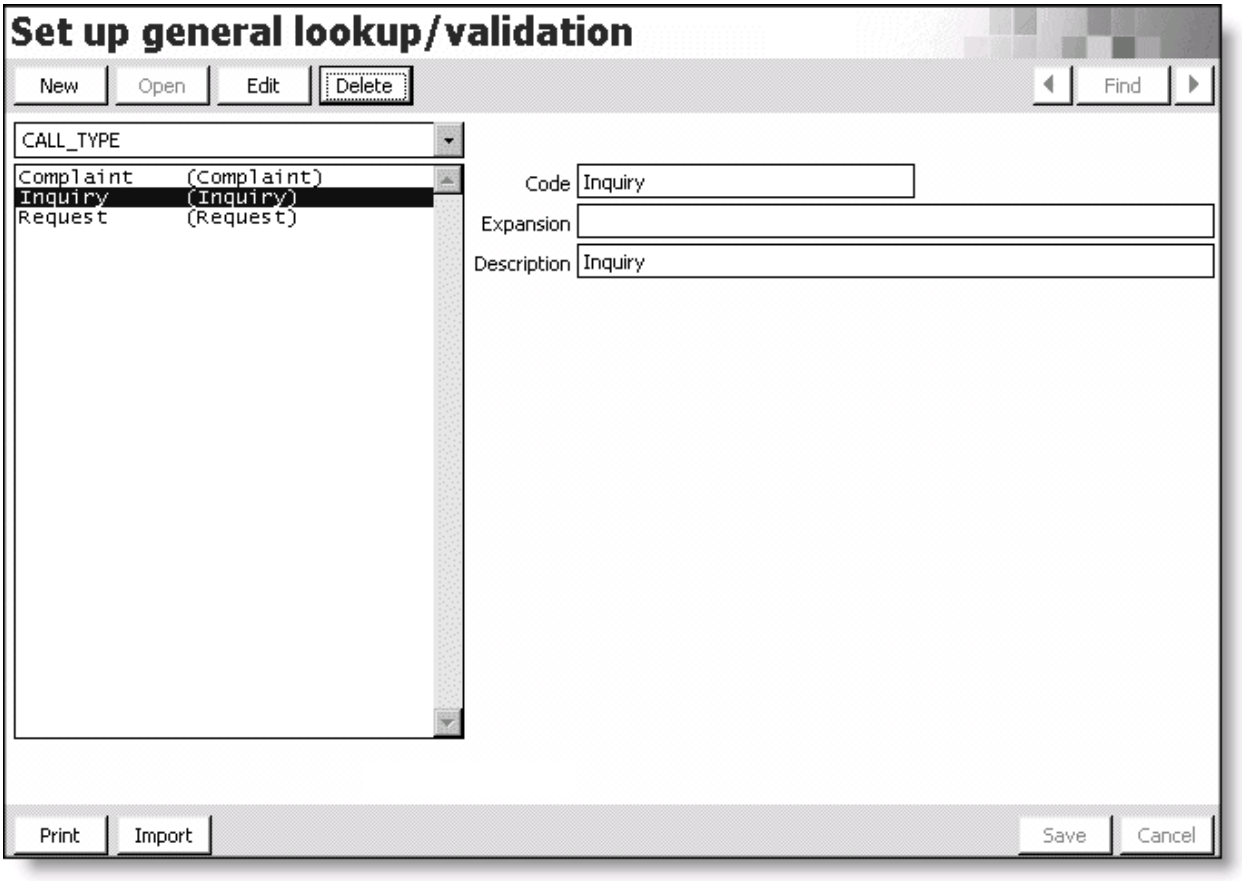
Example Set up module window displaying basic setup settings

To create a lookup for a search field

In the Professional Referral module, general lookup/validation tables provide the lookup, validation, and expansion for Additional Fields when you specify an existing general look-up/validation table on the Set up module window.

1. From Customers, select Set up tables > General lookup.validation. The Set up general lookup/validation window appears.
2. Click the drop-down list and select (New Table).
3. Enter the name of the table in the space provided. For example, CALL_TYPE.
4. Click Save. The new table name displays in the table list.

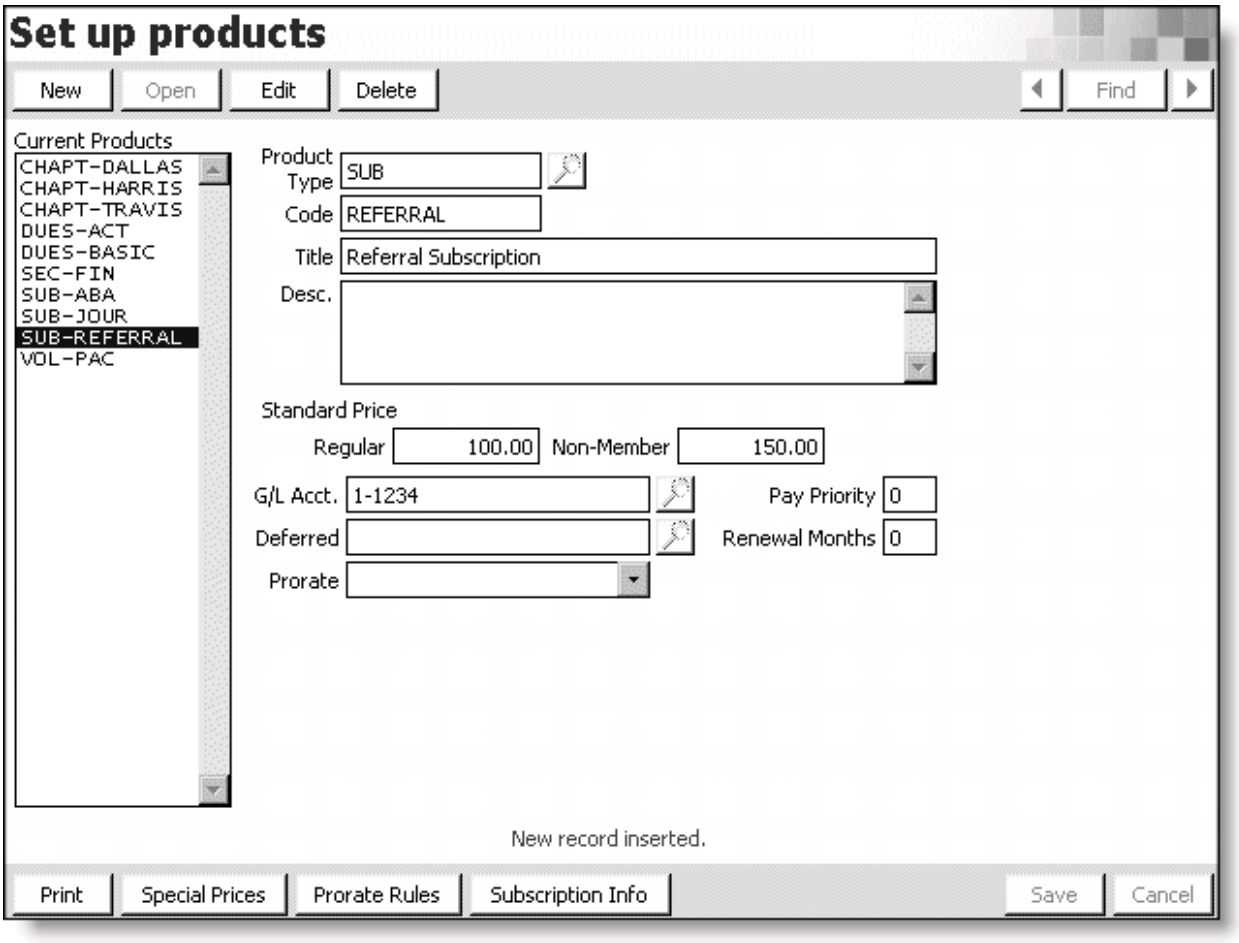
5. Click New and enter (as desired) the Code, Expansion, and/or Description values for all valid selections.
6. Click Save.
7. From Referrals, select Set up module. Enter the name of the general lookup/validation table as one of the Additional Fields. Enter a corresponding label that displays in the Manage referrals window.



Defining Referral Subscription Product Code

You need to create a subscription-billing item for your referral service. This is the item for which customers will be charged to start or extend their participation in the referral program.

Billing Set up products window



From Billing, select Set up module> Products

Current Products

A list of current products.

Product Type

Specifies a system-maintained code that lets Billing manage the relationships between the files and modules affected by the billing items. You can also use the lookup icon to select a Product Type. Use SUB for subscription.

Code

Use this field to assign a primary abbreviation to the product, which will be your code identifying this billing item type. This code must be REFERRAL.

Title

Enter a descriptive title for the Dues billing item type. When this billing item is referenced on most related data entry screens and renewal notices, this title will appear next to or in place of the billing code.

Desc

(optional) Enter a longer, descriptive explanation for the billing item type. This description displays only in this window for later reference.

Standard Price

Regular – Enter any default fee that you want to apply automatically when you generate a bill or enter a cash receipt for this item when no other amounts apply (from Standard Pricing or the Member Type Table). As you process Dues cash receipts, you can override this default fee on a case-by-case basis. If you leave the Standard Price field empty, there is no charge.

Non-Member – If you need to vary the fees for this item according to Member, Non-Member, or Member Type designations, specify these designations in the Member Types table. If you leave the Standard Price field empty, there is no charge.

G/L Acct

(Required for iMIS Financial Interface users) Identify the general ledger income account you want to credit for income relating to this item. The schedule for entries being posted to this account depends on which accounting method you selected in the Dues module.

Cash-Based – An entry posts to this income account when you process a cash receipt.

Accrual-Based – An entry posts to this income account when you generate a Dues bill.

Note: Note: This step is not optional. To add providers correctly, they must have the REFERRAL product as a Subscription. If your organization does not charge for referrals, you can make this product free by not entering a price, but providers must have a Subscription.

To create the Referral subscription code

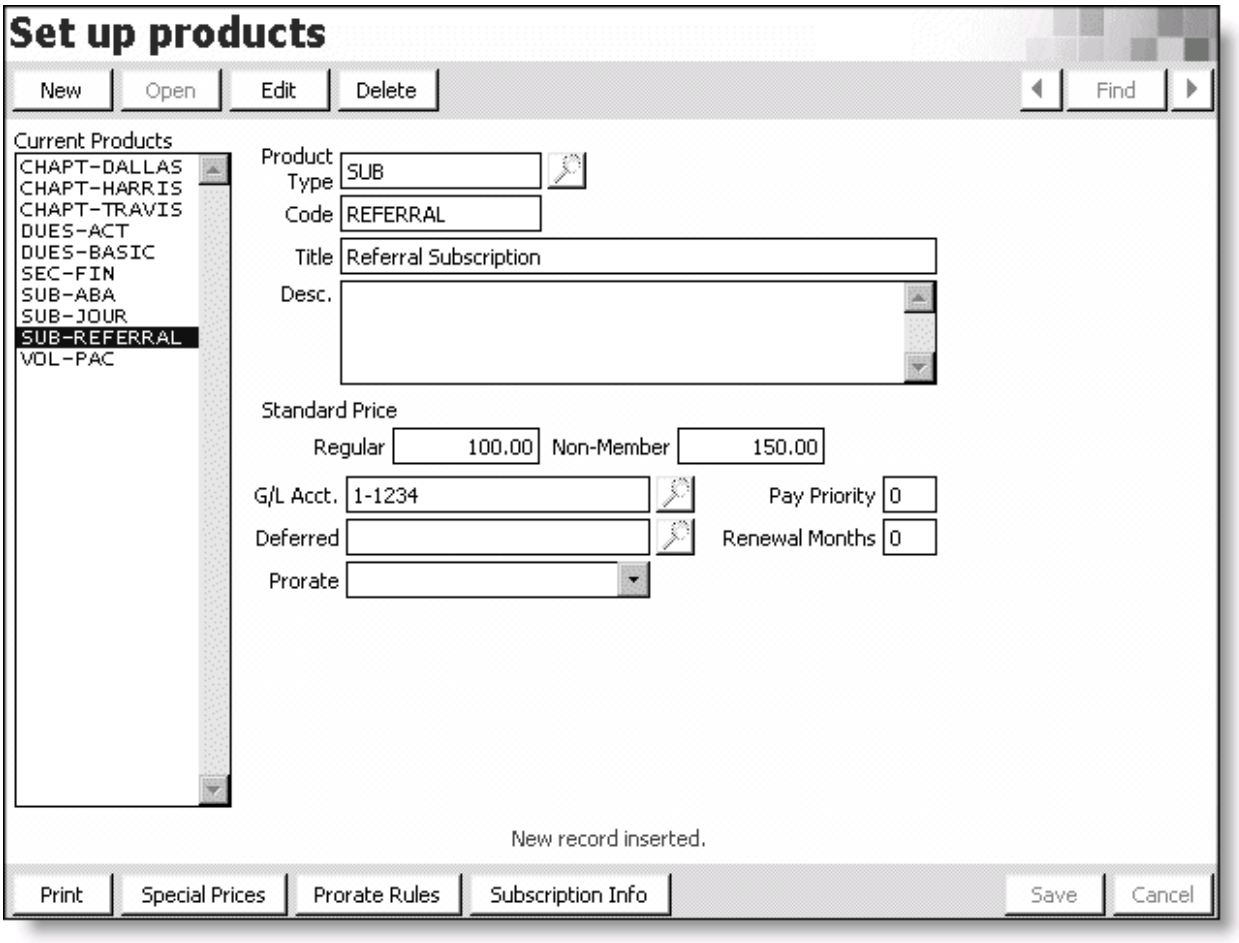
1. From Billing, select Set up module> Products. The Set up products window opens.
2. Click New.
3. Enter information for a new product. The Product Type and Product Code fields are required.
4. Click Save.

Defining Referral Fee Product Code

If you want to collect fees for referrals, create a sales product for this professional referral fee (Referrals Fee Product, Product Code) so that you can process referral transactions and invoices as you would any other order.

For each referral, iMIS makes a provision for this optional referrals fee. To activate this feature, set up a product for the referral fee in the AR/Cash module and then enter the product in the Referral Fee Product field on the Referral Advanced Setup window. You can specify a default amount for the product, or manually supply the amount on the Manage referrals window. You can change the amount anytime until the referral is invoiced.

AR/Cash Set up products window



From AR/Cash, select Set up products

Product Type

Specifies a system-maintained code that lets the AR/Cash module manage the relationships between the files and modules. Use SALES for sales item.

Code

Assign a primary abbreviation, which will be the identifying code for this sales item type. Use a custom code and remember it for future use. For example, REFFERAL_FEE.

Title

Enter a descriptive title for the sales item. When this item is referenced on most related data entry screens, this title displays next to or in place of the product code.

Description

(optional) Enter a longer, descriptive explanation for the sales item. This description displays only in this window, for later reference.

Standard Price

Regular – Enter any default fee that you want to apply automatically when you generate a bill or enter a cash receipt for this item when no other amounts apply. As you process cash receipts, you can override this default fee on a case-by-case basis.

Non-Member – If you need to vary the fees for this item according to Member, Non-Member, or Member Type designations, specify these designations in the Member Types table.

G/L Acct

(Required for iMIS Financial Interface users) Identify the general ledger income account you want to credit for income relating to this item.

To create the Referral fee code

1. From AR/Cash, select Set up tables > Products.
2. Click New and enter a new product code to be used for the referral fee.
3. Enter information for the product. The Product Type, Product Code, and G/L Acct fields are required.
4. Click Save.

> **Note:** Note: You must specify a G/L account number for this product for iMIS to process it correctly.

Enabling Zip Code Search

The zip code search feature allows you to restrict your search of providers to a specific zip code.

To enable zip code search feature

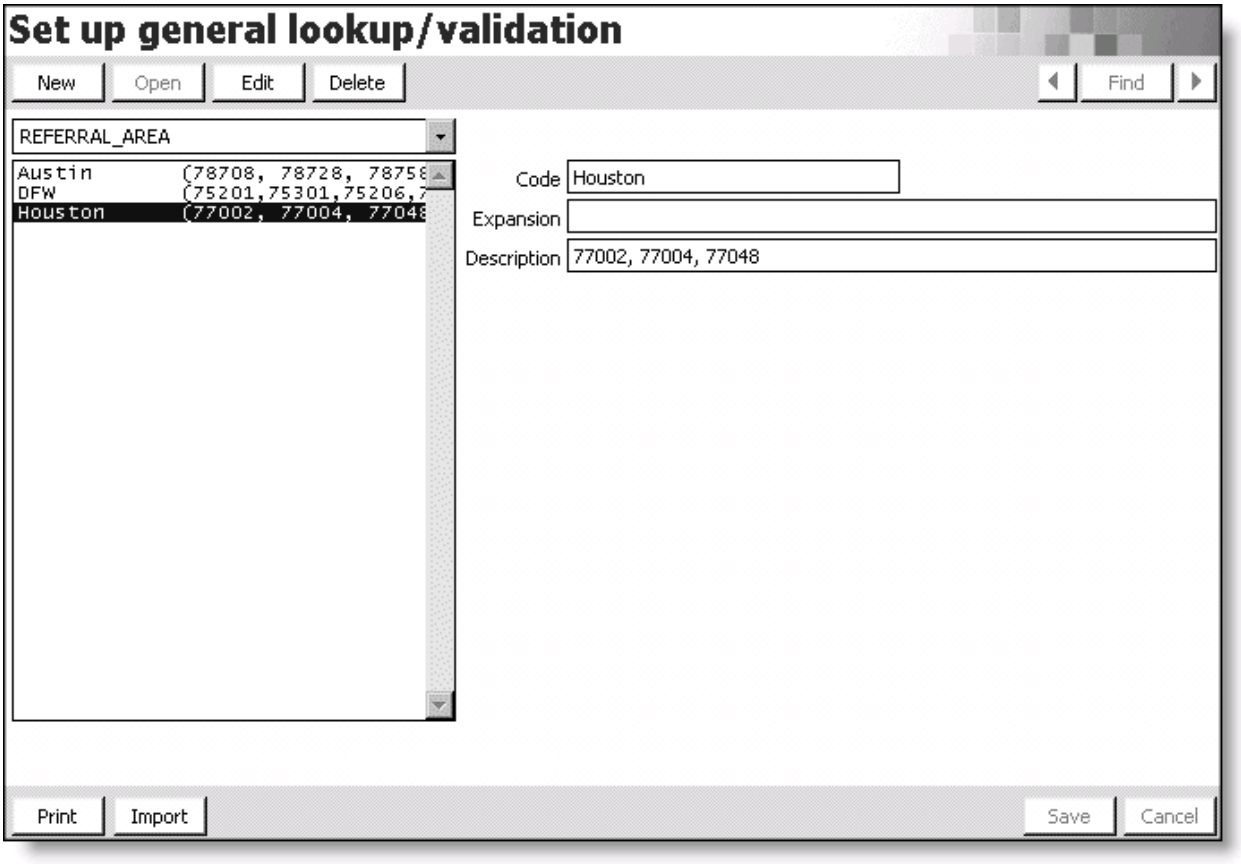
1. From Referrals, select Set up module to open the Set up module window.

2. Click Edit.
3. Select the Use Zip Areas option.
4. Click Save.
5. You will need to create the REFERRAL_AREA general lookup/validation table.

- From Customers, select Set up tables > General lookup/validation to open the Set up general lookup/validation window.
- Select New Table from the scrolling list.
- Enter REFERRAL_AREA in the space provided and click Save.
- Click New.
- Enter a Code and Description a zip code area. The Code should contain the name of the area (for example, the city's name or the first three numbers of the zip code). The Description should contain a list of all possible zip codes in that area separated by commas and no spaces.

  Note: If you want the search to be based on the first three numbers of the client's zip code compared to the first three numbers of all providers' zip codes, enter the Code normally, but enter the Description as the three digits only.
- Click Save.
- Repeat the process to enter additional codes.
- Run the Rebuild search indexes utility (from Referrals, select Rebuild search indexes).
- Restart iMIS. You must restart iMIS any time you change values in the REFERRAL_ AREA table.
- From Referrals, select Manage referrals.
- Enter a test client with a zip code that you defined in the REFERRAL_AREA table.
- When you tab past the client's zip code field, ensure the Zip/Area Search Field auto-populates with the correct code from REFERRAL_AREA.

- Click Search.
- Make sure the correct providers displays.



Verifying Zip/Area Search Feature

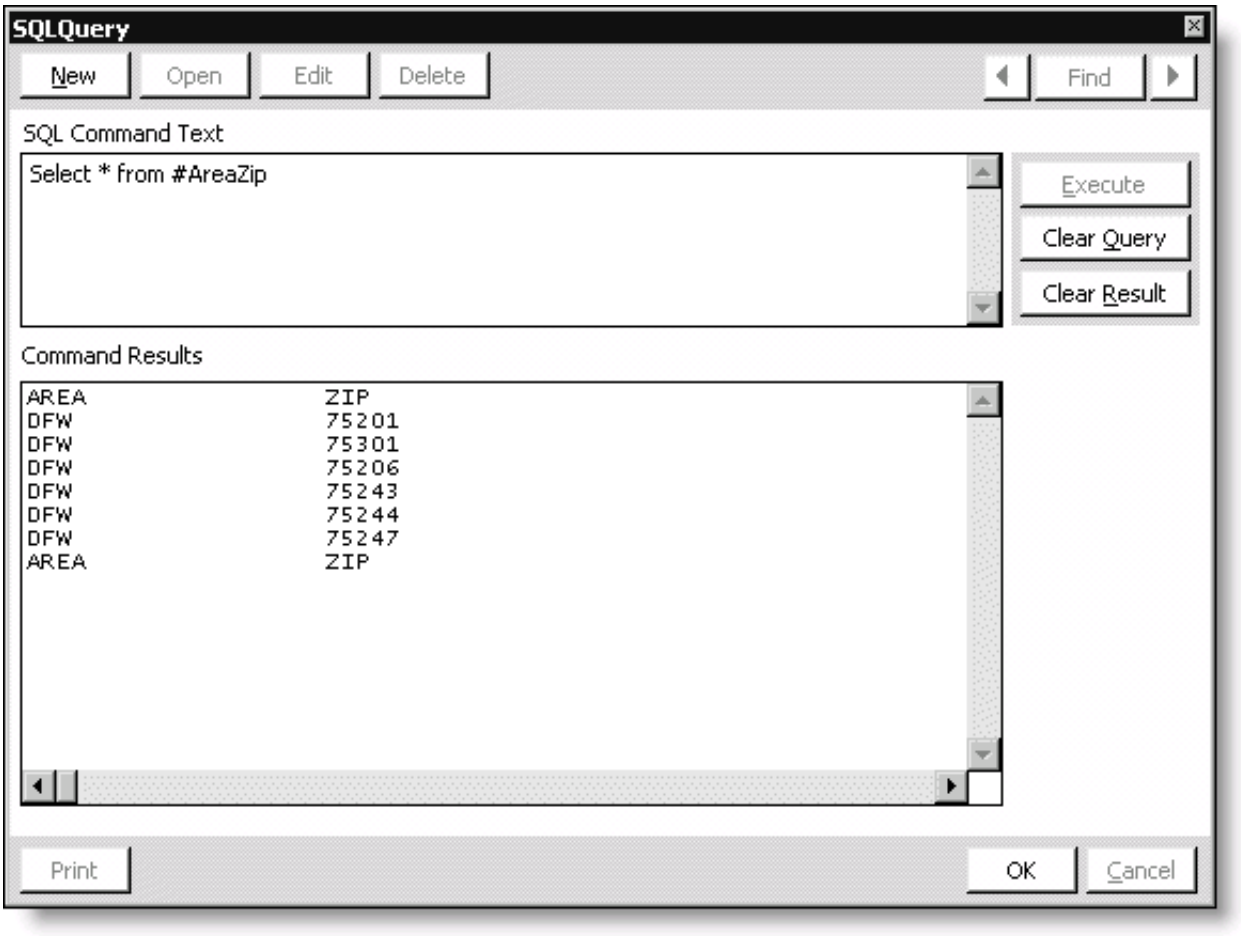
A temporary table is created in iMIS to handle the interaction between the REFERRAL_AREA general lookup/validation table and the Professional Referral module. The table is named #AreaZip. You can query this table, after an initial search to ensure the Zip/Area Search will be working properly.

To verify Zip/Area search feature is working properly

1. Select Utilities> SQL Query.
2. Enter the following query in the SQL Command Text area:

   Select * from #AreaZip

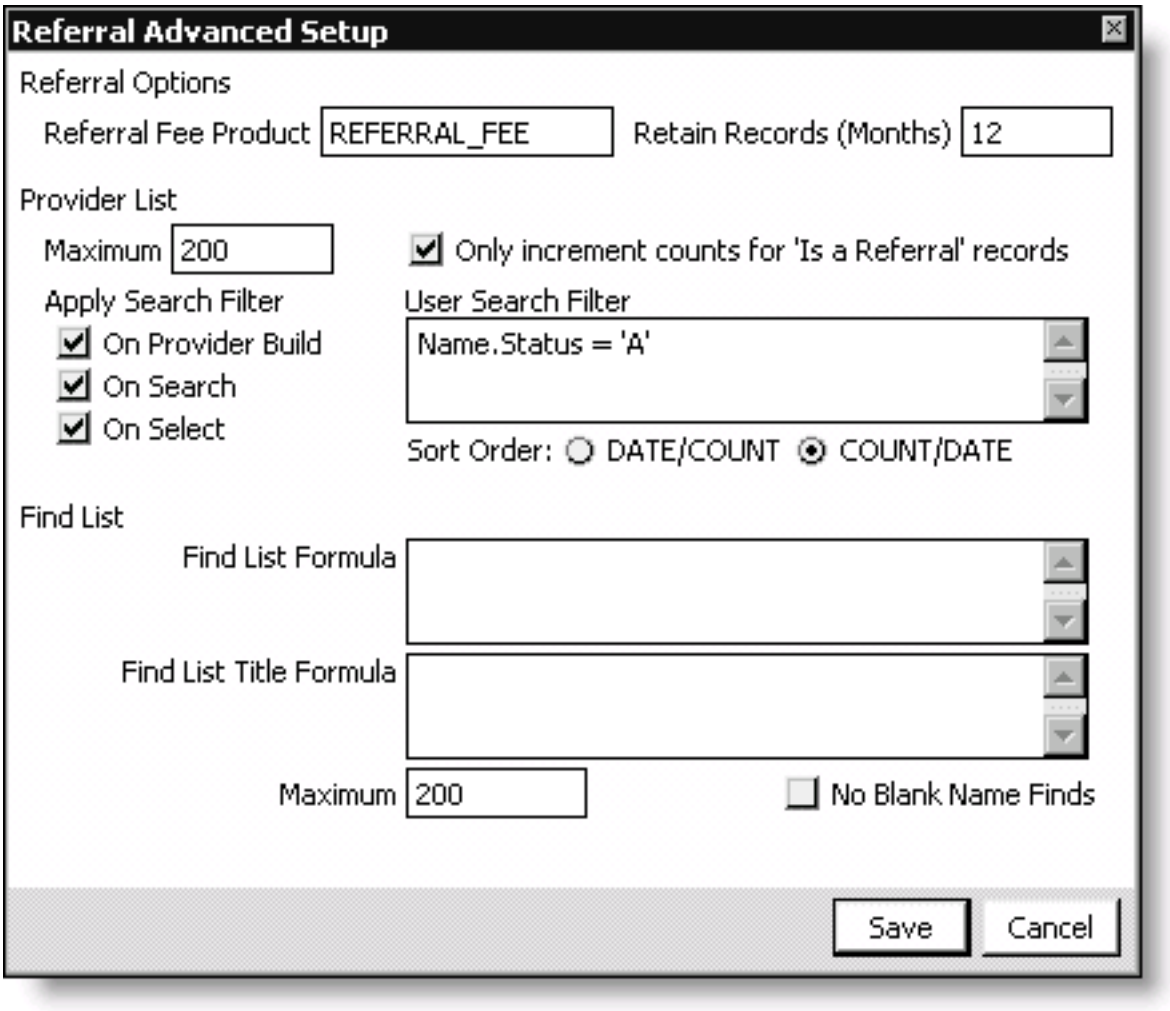
The AREA column in the Command Results area should contain the codes you defined in the REFERRAL_AREA table. Each zip code from the Description field should display in the ZIP column individually.



Setting Advanced Referral Options

Use the Referral Advanced Setup window to specify your referral search options, a Referral fee product, and display options for the Manage referrals and Find windows.

Referral Advanced Setup window



From Referrals, select Set up module, and click Advanced Setup

Referral Options

Referral Fee Product – (optional) Enter the product code (such as REFERRAL_FEE), if any, that you created for the referral service sales item. You will invoice providers for this item when you enter referral orders on their behalf, mark them as ready to invoice, and run invoices. Note that these are not the iMIS Professional Referral defaults.

Note: Note: You must first create your Additional Fee product code on the AR/Cash Set up products window (from AR/Cash, select Set up tables > Products) to reference it here. If your entry does not match an existing product code, iMIS prompts you to correct it.

Retain Records (Months) – Enter the number of months to retain the transactions. Records will be deleted when the time elapsed is greater than this specified period of time, but you must run the Delete Expired Referrals utility to delete the records. iMIS will not do it automatically.

Provider List

Maximum – Enter the greatest number of records iMIS can return as a search result in the Manage referrals window. This feature helps avoid lengthy searching and provides a manageable results list.

Only increment counts for 'Is a Referral' records – When this option is enabled, iMIS increases the referral counts for providers when the Is a Referral option is checked for each referral. This option will have an impact on the sort order of the providers and reports.

When this option is disabled, all Referral records created will be counted in the provider's counts, whether or not Is a Referral is selected.

Apply Search Filter

- On Provider Build – Applies the search filter when running the Rebuild Provider Indexes utility, so all new providers will meet the custom criteria.
- On Search – Applies the search filter when searching for providers. The list will reflect the User Defined Formula.
- On Select – Applies the search filter when selecting providers for a referral. An error message displays when you select providers that do not meet the search criteria.

User Search Filter

(optional) iMIS uses the Provider List User Search Filter (or the iMIS default) each time it performs a search. This eliminates the possibility of referring a provider that does not meet the specified search criteria at the time of referral.

The following is the iMIS default search criteria for building the Provider List:

SUBSTRING(Name.STATUS,1,1)='A' AND SUBSTRING(Subscriptions.STATUS,1,1)='A'

AND Subscriptions.PAID_THRU>=DATEADD(day,-1,getdate())

When you leave the User Search Filter field blank, iMIS uses this default.

When different criteria are required, enter a SQL statement in the User Search Filter area of the Referral Advanced Setup window. The Name and Subscription tables are the only ones that work properly in the User Search Filter.

Note: Note: iMIS will insert the Select…Where part of the SQL statement. When creating the filter, add criteria as you would at the end of a SQL query.

Note: Note: If you make a change to the User Search Filter, the new conditions will override the iMIS default, making it possible that providers who are not current in their SUB-REFERRAL payments would be included in the Provider List. Make sure you have all necessary criteria included in the customized search filter.

Sort Order

Specifies the sort order of providers in the Provider List. Choose between DATE/COUNT (default) and COUNT/DATE orientation for your application.

The DATE/COUNT option sorts by providers whose Last Referred date is the oldest, then by the number of references.

The COUNT/DATE option sorts providers with the fewest number of referrals to the top of the eligibility list. When more than one provider has received the same number of referrals, they are sorted by the date of the last referral.

Find List Formula

(optional) You can specify an OMNIS calculation that will be used to display the list of referrals resulting from a Find. If this field is blank, iMIS will use a default formula.

The default formula will change with the different options selected, but is always similar to the following formula:

con("jst(",nam(Referral.DATE_CREATED),",'11:M/D/CY',",nam(Referral.REFERRAL_ID),",'11X',", nam(Ref_Client.LAST_FIRST),",'15X',","' ','1',"," pick(len(Ref_Provider.LAST_FIRST)>0,Ref_Provider.COMPANY,con(Ref_Provider.LAST_FIRST,pick(len(Ref_Provider.COMPANY)>0, ',' '),Ref_Provider.COMPANY))","'40X',' ','2'," con(Referral.SEARCH_1,' ',Referral.SEARCH_2,' ',Referral.SEARCH_3,' ',Referral.SEARCH_4,' ',Referral.SEARCH_5,' ',Referral.SEARCH_6)","'100')")

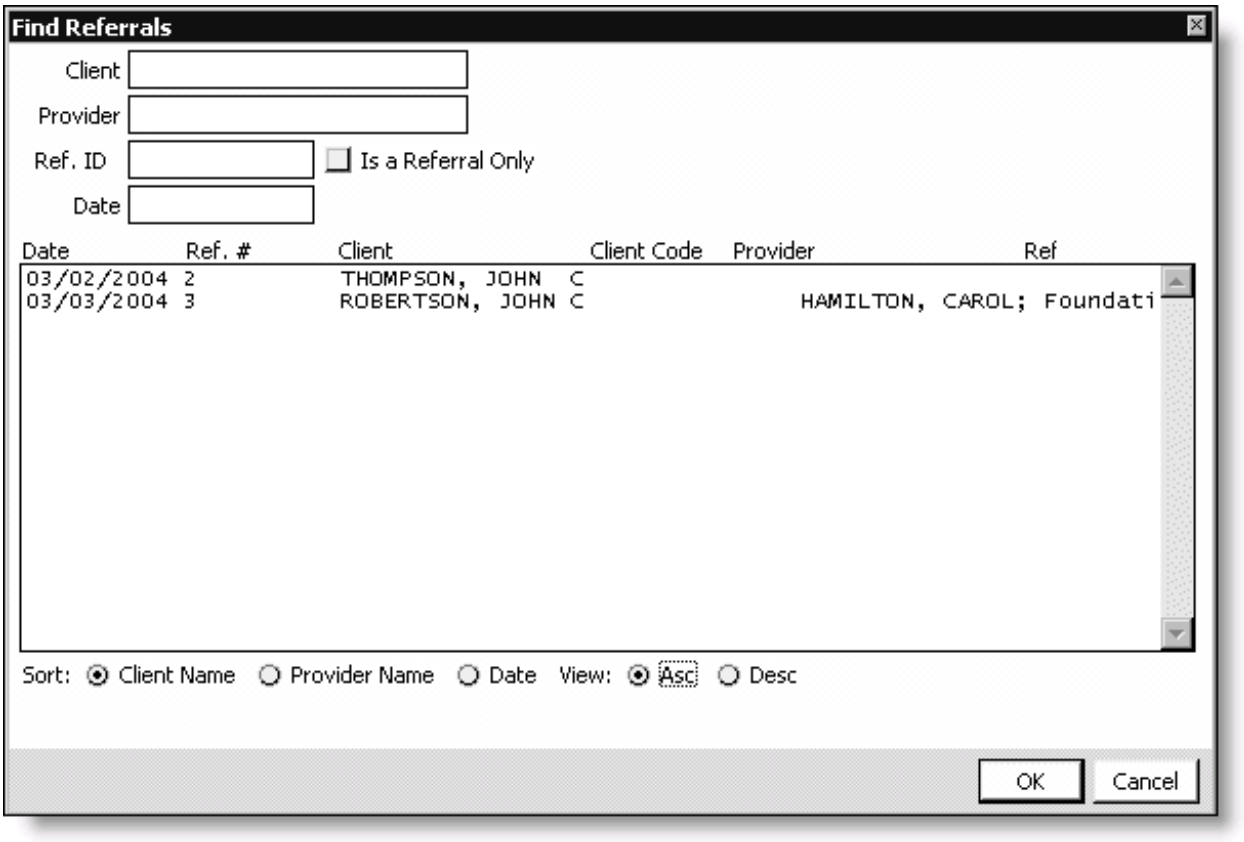
> **Note:** Note: To avoid incorrect results, use only the Ref_Client, Ref_Provider, and Referral tables when creating your formula.

Find List Title Formula

(optional) You can specify an OMNIS calculation that will be used to display the Find List Title in the Find Referrals window. It should coincide with the Find List Formula as described in the previous item. If this field is blank, iMIS will use a default formula.

The default Find List Title formula is:

con(jst("Date",11,"Ref. #",11,"Client",16, Referral_Control.ClientTypeLabel,16,"Provider",42,"Ref. Search Values",25))



Maximum

Enter the greatest number of records iMIS can return as a search result in the Find Referrals window. This feature helps avoid lengthy searching and provides a manageable result list.

No Blank Name Finds

Select this option to make sure every record entered has a value in one of the Name fields on the Manage referrals window.

To set advanced options

1. From Referrals, select Set up module.
2. Click Edit.
3. Click Advanced Setup to open the Referral Advanced Setup window.
4. Enter the desired Referral Options.

5. Enable the desired Provider List options.
6. Enable the desired Find List options.
7. Click Save.

Reports for Referrals

When you select Generate reports from the Referrals task list, the standard iMIS report window displays.

The Generate reports window offers you a variety of printed output, including detailed rosters, overall status summaries, and letters. The initial Generate reports window is identical to that of every iMIS module. It gives you access to many categories of reports and options, from which you select specific formats and output. It also lets you choose the printer or other output device, and you can often vary the sort order and control the inclusion of providers and records, as well as other report-related items.

Print Invoice report

The Print Invoice report prints an invoice listing additional referral fees charged to clients.

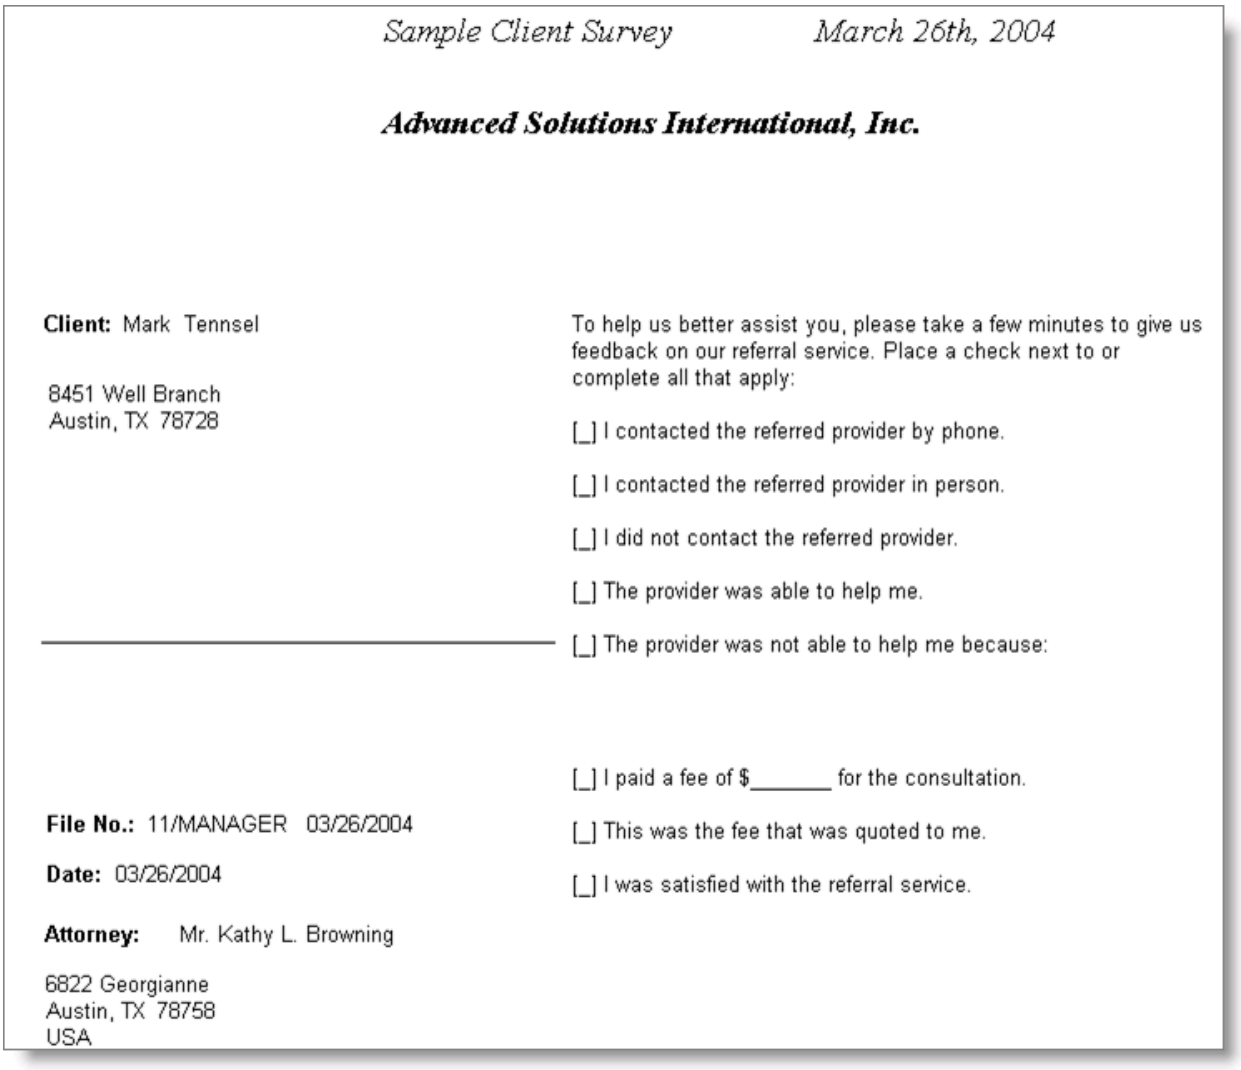
Survey Reports

Client and provider survey reports are available to allow you to obtain and track feedback associated with the referral.



Sample Client Survey *March 26th, 2004*

Advanced Solutions International, Inc.

Client: Mark Tennsel

8451 Well Branch
Austin, TX 78728

To help us better assist you, please take a few minutes to give us feedback on our referral service. Place a check next to or complete all that apply:

[_] I contacted the referred provider by phone.

[_] I contacted the referred provider in person.

[_] I did not contact the referred provider.

[_] The provider was able to help me.

[_] The provider was not able to help me because:

[_] I paid a fee of $_____ for the consultation.

File No.: 11/MANAGER 03/26/2004

Date: 03/26/2004

[_] This was the fee that was quoted to me.

[_] I was satisfied with the referral service.

Reporting in iMIS

Reporting Essentials

The Reporting tools in iMIS can be used for a wide range of tasks. Reports span a broad range of outputs for all of the iMIS modules, including rosters, status summaries, letters, badges, and statistical reports. This section covers essentials such as:

- Creating reports from IQA
- Using and running reports
- The Generate reports window and its options
- Secondary reports windows with field definitions
- Output categories and Report Destination options
- Overriding report margins and sort orders
- Cloning reports

Using Standard iMIS Reporting Tools

The standard reporting functions available across all iMIS modules include the following:

- Run a report
- Modify a standard report
- Enter search selections, including adhoc searches
- Clone report specifications
- Run daily and month-end financial reports
- Export report data
- Generate and manage mass report activity records
- Generate letter reports with both Quickletter and the MS Letter System

The reporting features all require knowledge of some basic aspects of iMIS. You will need familiarity with these associated parts of the system:

- The report and output categories
- The Report Destination options
- The process for overriding report margins and sort orders
- The process for cloning a report
- The record selection options for various output types

Authorization Levels for Reports

What users can see and do in reporting depends on which authorization level they have set on the Users window for the module being used (select System Setup > Security administration > Users):

- Accessing the Generate reports task list item requires level two (2) authorization.
- Updating the report specifications requires a system management level eight (8) authorization.
- Viewing a complete list of reports available (Utilities > Report Specs) requires level eight (8) authorization.

iMIS Report Terms

Key concepts for determining the required report options include the following:

Format

The report format is the physical layout (appearance) of the report, which involves both the design and the content (what fields or data elements appear on the report). In a columnar detail report, each line contains certain data elements, such as a contact name, company name, city, state, and join date. The format also specifies column headings, the order in which data elements display on the line, the space allowed for printing and between elements, and so on. The format does not control which records are queried (selected) in the report.

Selection/Search

Some reports allow the selection of customer records to be used to generate the report. Selecting records does not control the format or the sort order. In a columnar detail report, the record selection controls the lines that print on the report, not the columns; each line typically corresponds to a specific record, while a column relates to a field in a record. Selections are generally based on field values; records are included in a report run if its contents match the selection criteria. Search criteria may be simple, such as “All Members,” or complex, as in an ad hoc search.

Sort Order

Dictates the order in which the details print on the report. Like the selection criteria, it is normally based on field values. However, it applies only to the records that were selected based on the search criteria, so you can specify a different field set for sorting the output. For example, you can first select records by customer type and then sort the results by ZIP code.

Standard Report

Includes preset iMIS report formats, which include rosters, labels, letters, and statistical reports. Most standard reports give you significant control in selecting the records and allow sort order overrides. However, pre-built standard reports have more limitations on the format or layout of the report.

Ad Hoc Report

Omnis facility used to build custom reports. The Ad Hoc Report Writer gives you total control over the entire report, including the format, record selection criteria, and sort order. Any customized report can be added to the Available Reports selection lists of any iMIS module.

To run a standard report

Before running any preset iMIS standard reports, check your report destination:

Running a Standard Report

1. From the reports window, select a report type from the Report Types list.
2. Select an available report from the Available Reports list.
3. Click Run. Depending on the report type, the report will run or a window will open, prompting you to select the date range for the report.
4. Enter or select the date range.
5. Click OK.

Modifying a Standard Report

You can make certain changes to the appearance or the order of the report output by making selections from the Options drop-down list on the Generate reports window. The list contains several options, and their availability varies from report to report.

To view report options

1. From the reports window, select a report type from the Report Types list.
2. Select an available report from the Available Reports list.
3. Click Options. The options available for selection will appear bolded. Use the Options list to make a one-time change at runtime, or you can save the report under a new name with the same parameters.
4. Click Run.

To adjust margins

The Margins option allows you to control the layout of your report or other output. You can perform the following tasks:

- Adjust margin settings to suit your printer.
- Top, Bot, Left Margin - The actual print area and built-in margins vary among laser printers, so these settings may need to be adjusted. Margins are critical for output that must fit in a target area, such as labels.

- Specify a repeat factor to generate multiple reports for each address.
- Enter measurement settings (widths, space between, and margins) in decimal fractions of inches (for example, if you want 1-1/2 inches, enter 1.5 without units).

To make adjustments to the margins:

1. From the reports window, select a report type from the Report Types list.
2. Select an available report from the Available Reports list.
3. Click Options and select Margins. Use the Options list to make a one-time change at runtime, or you can save the report under a new name with the same parameters.
4. Change the margins and click OK.
5. Click Run.

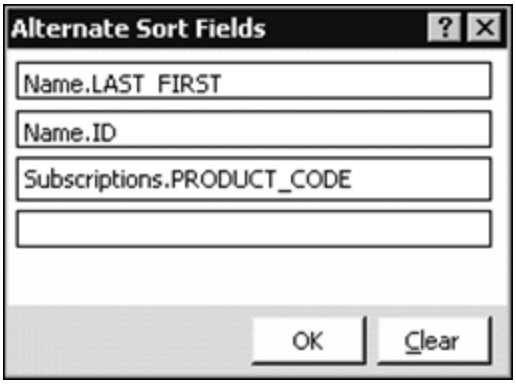
To change the sort fields

The field format for entering data is Table.FIELD. The table name appears first in title case, followed by a period separator and the field name in all caps, for example, Name.FULL_NAME. The Alternate Sort Fields window allows you to enter the Table.FIELD name for a maximum of four sort fields. To specify a multiple-field sort, enter the first-order sort field in the first text box, working down to the lowest-level sort field in the fourth text box. The sort fields you enter must be selected from the tables used for the report.

> **Note:** Note: For some report types, the Sort option is grayed out (unavailable) on the Options list.

1. From the reports window, select a report type from the Report Types list.
2. Select a report from the Available Reports list.
3. Click Options and select Sort Fields. The areas you can change appear bolded. For example, using the data in the following window, your report sorts in the following order: last name, ID, and product code.

4. Change the alternate sort fields to new sort fields selected from the tables to be included in the report.
5. Click OK to change the sort order.



Example of an Alternate Sort Fields window.

Using Ad Hoc Searches

Ad hoc searches allow refinement of the standard report search criteria used to select specific records needed for a report. After the search is defined, the search instructions are saved in a list of predefined search formats for future use. Depending upon the selected report, you can define your search by using multiple tables.

You can specify selections based on multiple-field comparisons from one or more files. The files that are available for selection depend on the module and the menu function you choose.

Ad hoc searches can be as simple as one line searches that look for an exact match on values in a single field or as complex as a multiple-line item or multiple-group search. You can have up to 50 criteria for each selection. This search function supports extremely complicated queries, and supports Boolean logic statements as well as AND and OR connections.

> **Note:** Note: For selection between values, such as dates, combine the Greater than and Less than conditions.

To create an ad hoc search

Ad hoc searches allow refinement of the standard report search criteria used to select specific records needed for a report. After the search is defined, the search instructions are saved in a list of predefined search formats for future use. Depending upon the selected report, you can define your search by using multiple tables.

1. From the reports window, select a Report Type and related Available Report.
2. Click Options and select Search Format to display the Select Search Instructions window, where you can perform the following tasks:

- Create a new ad hoc search.
- Edit an existing ad hoc search.

3. Click New or select an existing search format and click Edit on the Select Search Instructions window. The Search Instructions window displays.
4. Enter a descriptive name for the ad hoc search in the Search Name field.
5. Select the ad hoc search criteria.
6. Click Save to accept the search instructions and close the Search Instructions window.
7. Click OK on the Select Search Instructions window.
8. Click Run to generate the report.

Modifying an Existing Ad hoc Search

1. From the reports window, select a Report Type and related Available Report.
2. Click Options and select Search Format to display the Select Search Instructions window.
3. Select the name of the search and click Edit. The Search Instructions window displays, allowing you to make changes to the search criteria.
4. Click Save.

Examples of Ad Hoc Searches

When you run the Open Items by Product report, you can enter search selection (search format) criteria to specify which line items will be listed. Any field contained in the

Subscription, Name, or Product files can be used in the search criteria. Refer to the following examples from the Billing module for more information.

Example 1: To search by bill date

1. Go to Continuum, select Membership Reports > Billing reports.
2. Select Open Invoices from the Report Types list.
3. Select Open Items by Product from the Available Reports list.
4. Click Options and select Search Format to display the Select Search Instructions window.
5. Click New to display the Search Instructions window.
6. Enter the new search instructions. For example, enter the following data to search for bills with a non-zero balance run on 10/1/01:

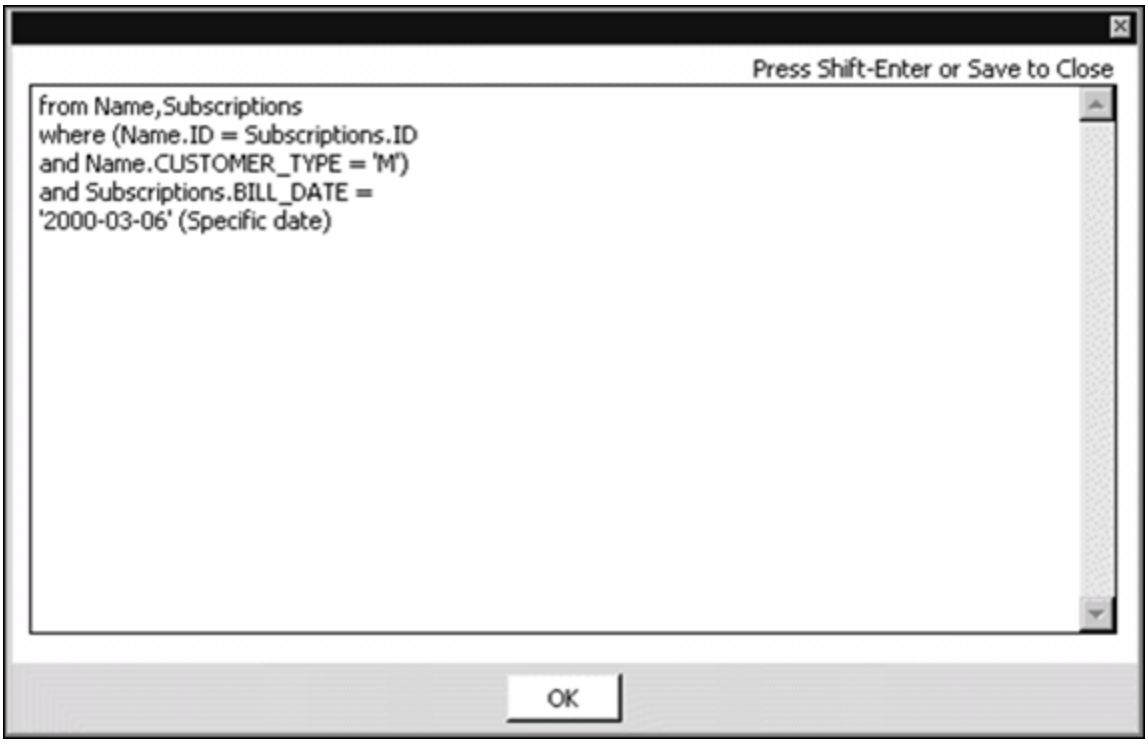
   Subscriptions.BILL_DATE = 10/01/2001

   Subscriptions.BALANCE <> 0

   Note: BILL_DATE corresponds to the Run Date field on the Process billing window (from Billing, select Process billing). Make sure to consider whether the Run Date was overwritten.
7. Click Save to accept the search instructions and close the Search Instructions window.
8. Click OK to close the Select Search Selections window.
9. Click Run to generate the report.

   If you select the Calculation mode, entering the following calculation expression on the Comparison Value window verifies that the Bill Date matches today's date.

   from Name,Subscriptions
   where (Name.ID = Subscriptions.ID
   and Name.MEMBER_TYPE = 'M')
   and Subscriptions.BILL_DATE =
   '2000-03-06'(Specific date)



Example of the Comparison Value window.

If searching for multiple customer types, use the following command sequence:

From Name,Subscriptions.ID
and Name.CUSTOMER_TYPE = 'M'
or Name.CUSTOMER_TYPE = 'CM'
and Subscriptions.BILL_DATE =
'2000-03-06' (Specific date)

Note: Caution! Any ad hoc search instruction must also include any filter that would already be inherent within the cycle and renewal printing process (for example, specific customer type and/or categories, printing flags, and specific products).

Example 2: To search for specific products

You can create meaningful searches to look at the status of open billing balances. For example, if you want to see the balances for specific products, set the PRODUCT_CODE equal to those codes only:

1. Go to Continuum, select Membership Reports > Billing reports.
2. Select Open Invoices and select Open Items by Product.
3. Click Options and select Search Format to display the Select Search Instructions window.
4. Click New to display the Search Instructions window.
5. Enter the new search instructions:

- To search for product codes with a balance:
  Subscription.PRODUCT_CODE = BASIC,JOUR
  Subscription.BALANCE <> 0
- To specify comparisons for the codes to be excluded:
  Subscription.PRODUCT_CODE <> PAC,SCHOL
  Subscription.BALANCE <> 0p
- To print open items for an entire group or type of product, such as all open subscription lines:
  Product.PROD_TYP = SUB
  Subscription.BALANCE <> 0

6. Click Save to accept the search instructions, and close the Search Instructions window.
7. Click OK to close the Select Search Selections window.
8. Click Run to generate the report.

Example 3: To search by customer type

Any field in the Name table can also be used for searching. Customer type is a common search option.

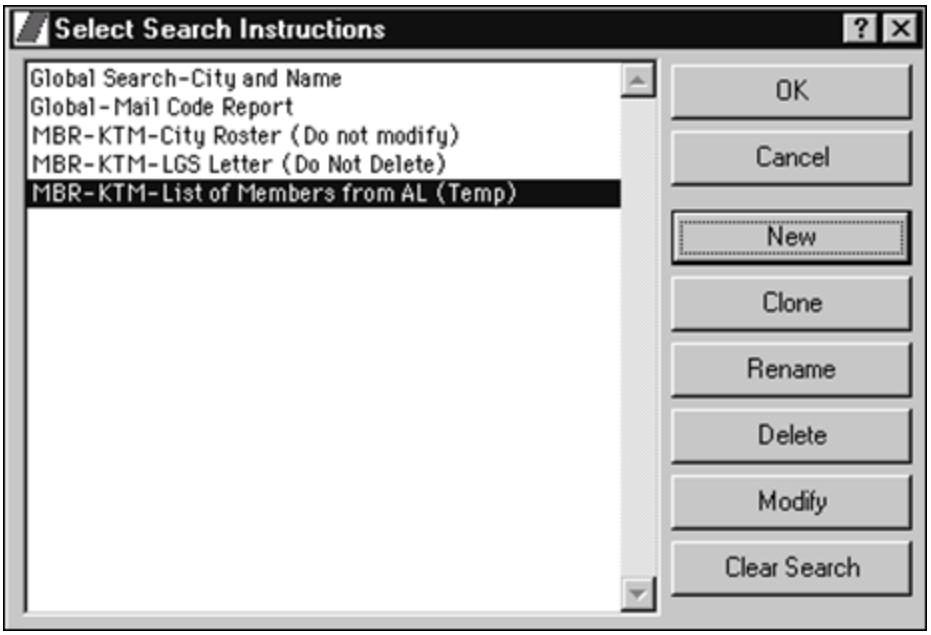
1. Go to Continuum, select Membership Reports > Billing reports.
2. Select Open Invoices and select Open Items by Product.
3. Click Options and select Search Format to display the Select Search Instructions window.
4. Click New to display the Search Instructions window.

5. Enter the new search instructions with this criteria:
   Name.CUSTOMER_TYPE = M
   Name.STATUS Begins with A
   Subscription.BALANCE <> 0
6. Click Save to accept the search instructions, and close the Search Instructions window.
7. Click OK to close the Select Search Selections window.
8. Click Run to generate the report.

Managing Ad Hoc Searches

Since Ad Hoc searches are created globally in the system, there is the potential to build up a long list of ad hoc searches. When you create and use searches, consider these suggestions (based on client experience) to help manage them:

1. Create a naming convention that will assist in identifying the creator/owner of the ad hoc search. This could include the individual's initials or last name information, for example, KTM - List of Members by State.
2. Group the searches in a manner that will make them easy to find on the search list. For example, group them by organization department or search category, MBR – KTM – List of Members by State.
3. Include a note in the title not to modify or delete the ad hoc search if you do not want other's to change or update the search selection criteria. (For example, MBR – KTM – List of Members by State Do Not Modify).
4. Include a note in the title if the search is temporary with instructions when it can be removed. For example, MBR – List of Members from AL (TEMP-delete After 2/1/01).
5. Create a group of general searches that are commonly used by all staff members. (General – List of Members from the same Organization).
6. Review the list of Ad Hoc Searches every six months to remove duplicates or temporary searches.



Manage Ad Hoc searches in Select Search Instructions window

Cloning a Report (Permanent Report Modifications)

Cloning allows copying of the specifications from an existing report and modification of the cloned version. Cloning avoids duplication of effort when two similar reports are being run.

> **Note:** Note: To access the Report Specifications window (select Utilities> Report Specs), you must have an authorization level of eight (8) or higher set on the Users window.

Typical reasons for making modifications to report specifications include modifying sort orders and margins, adding additional fields, or adding message text.

Setting Report Print Options

The report Options field communicates various instructions to the dialog box and/or report that can affect the contents or appearance of the output or, in some cases, change the processing steps during the running of the report. The options fall into three main categories:

- Yes/No type options that may appear as checkboxes on the secondary selection dialog box. Typically, these are used to print or suppress the printing of certain types of information. These options typically appear as strings that are prefixed with “PRINT_” (option checkbox will default to on) or “NO_” (option checkbox will default to off). For example, PRINT_HOME_PHONE would set the default to print the home phone number while NO_HOME_PHONE would set the default to not print the phone number.
- Options that will enable a specific selection prompt to appear on the related report dialog box.
- Options that will force certain data updates to occur as the data is printed on a report.

Report Options by System/Category

There are many report options available for frequently used reports. For Yes/No type options, a positive option is prefixed with PRINT_ and a negative option is prefixed with NO_.

Below, options are grouped by system module and report category. Be aware that certain report options may not apply to all reports within the category and that obscure/specialty options (not embedded in the standard report specification table) can be added when cloning a report.

AR - Account Status (Trial Balance & Statements)

- PRINT_PAID_INVOICES: Option to print closed or zero balance invoice items.
- PRINT_DEBIT_BALANCES: Option to include customers who have an overall positive or debit account balance.
- PRINT_CREDIT_BALANCES: Option to include customers who have an overall negative or credit account balance.
- PRINT_EXCLUDE_FUTURE: Option to exclude transactions dated in advance of the Aging Date.
- PRINT_SUMMARY: Option to print only total balances per each customer as opposed to individual open items.

COMMITTEES/MEMBERSHIP - Various Report Options that print address data

- ADDRESS_BUTTONS: Enables the radio button address selection section to appear on the report's dialog box at run time. This lets the user select to print no address, preferred bill or preferred mail, or a specific address on the labels.
- PRINT_BARCODE: Option to print the USPS barcode at the top of each label.

COMMITTEES/MEMBERSHIP - Letters

- EMAIL: Send the letters by email as opposed to normal printing of the letters.
- WORDOUT: Produce normal, printed output.

COMMITTEES/MEMBERSHIP - Exports

- PRINT_HEADER: Print a header record with the output field names at the top of the export file (standard for Microsoft Word merge files).
- PRINT_QUOTATIONS: Print quotations around each output field (for example, comma delimited output).
- EXPORT: Create the output as an export file.

COMMITTEES - Rosters

- PRINT_HOME_PHONE: Print home phone number.
- PRINT_EMAIL (Crystal Only): Print e-mail address.
- PRINT_WEBSITE (Crystal Only): Print Web site address.
- PRINT_DATE_APPOINTED: Print date appointed to committee.
- PRINT_TOTALS: Print total number of people in roster.

COMMITTEES - Labels

- ADDRESS_BUTTONS: Enables the radio button address selection section to appear on the report's dialog box at run time. This lets the user select to print no address, preferred bill or preferred mail, or a specific address on the labels.
- PRINT_BARCODE: Option to print the USPS barcode at the top of each label.

COMMITTEES - Exports

- PRINT_HEADER: Print a header record with the output field names at the top of the export file (standard for Microsoft Word merge files).
- PRINT_QUOTATIONS: Print quotations around each output field (for example, comma delimited output).
- EXPORT: Create the output as an export file.

DUES - Renewal Notices

- SUPPRESS_ZERO_ITEMS: Suppresses zero balance line items from printing on the renewal or reminder notice.
- PRINT_CHECKBOX: The option to print a checkbox next to the line item so the customer can indicate for which items he is submitting payment.
- PRINT_CARD: For iMIS Authorized forms only, this option will cause the credit card string to print in the credit card area on the form.

MEETING - Registrations

- PRINT_INCLUDE_CANCELLED: Option to print the cancelled registrants (those with a status that begins with C) as well as the active registrants.
- FORCE_MASTER: Forces the registrant to print even if he/she has not registered for any functions. (Does not apply to Crystal Reports.)
- REGISTRANT_TYPE: Permit dialog box selection by Registrant Class.
- FUNCTION_BUTTON: Permit dialog box selection of a specific function within an event.

MEETING - Badges

- PRINT_DESIGNATION: Option to print the designation in the registrant's full name that prints on the badge.
- PRINT_TITLE: Option to print the registrant's title on the badge.
- PRINT_COMPANY: Option to print the registrant's company name on the badge.

- NO_FULL_ADDRESS: Option to print the full address, including the street address, on the badge.
- PRINT_STATE: Option to print the state as well as the city on the badge. When this option is not enabled only the city prints.
- PRINT_ORG_NAME: Option to print the organization or association's name at the bottom of the badge.
- PRINT_REG_CLASS: Option to print the registrant class code in very small letters in the lower right corner of the badge. This encoding is intended to indicate which color-coded badge cover to use with the badge (for example, blue for customers, green for exhibitors).

MEETING - Confirmations

- MARK_CONFIRMED: This option marks the registration data with the date and time of the confirmation printing, thereby preventing the confirmation from being printed in future print runs.
- PRINT_REPRINT_ALL: Option to print all confirmations, including the registrations that have already been confirmed.
- PRINT_SHOW_DATE_RANGE: Option to print the date or date range of the overall event in the top portion of the confirmation.
- PRINT_DAY_FIRST: (Crystal Report Only): Option to print the formal event date in non-US, day month year format when PRINT_SHOW_DATE_RANGE is enabled. (for example, Wednesday, 09 February, 2000)
- PRINT_SHOW_FUNCTION_DATES: Option to print the date & time range of each function. If enabled, the date/time range appears in a separate line underneath the respective function.
- PRINT_HOTEL_LINE_ITEMS: (Applicable to sites licensed for Hotel Block Management): Option to print (PRINT_) or suppress (NO_) the zero balance hotel registration lines from the confirmation. If printed, the hotel registration lines will appear at the bottom of the function section.

- PRINT_NOTE: Option to print the Notes field from the individual registration in the bottom section of the confirmation.
- PRINT_ORG_LOGO: Option to print the Organization's Name & Letterhead Style Address at the top of the Confirmation.
- PRINT_MULTI_ENTITY: (Crystal Report Only) In a multiple entity situation, option to print the name and letterhead style address of the specific entity that owns the event at the top of the Confirmation.
- PRINT_CANDADIAN_INFO: (Crystal Report Only): Option to print the breakdown of PST, GST, and the GST Remit Number at the bottom of the notice. This information will print if the tax is non-zero and this option is enabled.

  MEETING - Invoices

- PRINT_REPRINT_ALL: Option to print all Invoices for selected event(s), even those that have been previously printed.
- INVOICE_REGISTRATION: This option will assign a sequential Invoice number and the appropriate Invoice date to each registration order for which an invoice has not already been printed.
- PRINT_ADDL_MEETING_INFO: Option to print the event title, date range and location immediately above the function details.

  MEETING - Rosters - Preregistration List and Formal Meeting Roster

- PRINT_FULL_ADDRESS: Print full address.
- PRINT_PHONE: Print phone number.
- PRINT_EMAIL (Crystal Only): Print e-mail address.
- PRINT_DESIGNATION: Print designation.

  MEETING - Tickets

- MARK_TICKET: Marks each ticket as being printed so that it will not be reprinted in future print runs unless reprinting is specifically requested.

- PRINT_ALL_TICKETS: Option to print all tickets for selected event(s), even those that have been previously printed.
- PRINT_MEETING_NAME: Option to print the event title on the ticket.
- PRINT_TICKET_NUM: Option that assigns a sequential number to tickets and prints the number on the ticket.
- PRINT_ORG_LOGO: Option to print the organization name on the ticket.

  ORDERS - Shipping Papers and Invoices

- PRINT_KIT_LINES: Option to print the individual kit components as well as the main kit product on the documents.

  To clone a report

  Any new report you create displays with the other Standard Reports on the Reports menu. Before you begin cloning reports, create or find out your organization's naming convention that distinguishes the cloned report from the original.

1. Select Utilities> Report Specs to display the Report Specifications window, which contains a list of all iMIS standard reports, sorted by module and type.

   Note: To access the Utilities> Report Specs option, you must have an authorization access code of eight (8) or higher.

2. Select a report to clone, and click Clone.
3. Change the System name if you cloned a report from another module.

   Note: If you clone a standard report and put a period (“.”) at the beginning of the name of the cloned report, such as .Badge, it becomes the default for that report type and places the report at the top of the Systems list.

4. Click Parameters and make the necessary changes. These changes may include changes to the Rpt File/Format, the Options list string, or a message text in the Parameters text field. When changing an option, remember that most of the report options are already in the Options list. To enable an option that is disabled, change the first word of

the option from NO to PRINT. For example, change NO_FULL_ADDRESS to PRINT_FULL_ADDRESS.

5. Click Save.

Hands-on exercise: Clone a report

In this exercise, you will create a new report by cloning it from an existing report.

1. Select Utilities> Report Specs to open the Report Specifications window.
2. Select the REFERRAL - Invoice - Print New Invoices report from the drop-down list.
3. Click Clone.
4. Change the name of the Title to Print New Invoices - 032604.
5. Click Save on the Report Specifications window to display the report you created with the other Standard Reports on the Reports menu.

Printing Bar Codes

The U.S. Postal Service (USPS) uses the POSTNET bar-coding scheme to sort letters at high speeds. The USPS high-speed scanners read the bar code during the sorting process.

iMIS allows you to pre-print the POSTNET bar codes on reports such as labels, badges, billing reminders, and accounts receivable notices so you can take full advantage of the large discounts offered by the USPS for mailings with pre-printed bar codes. Refer to the following example.

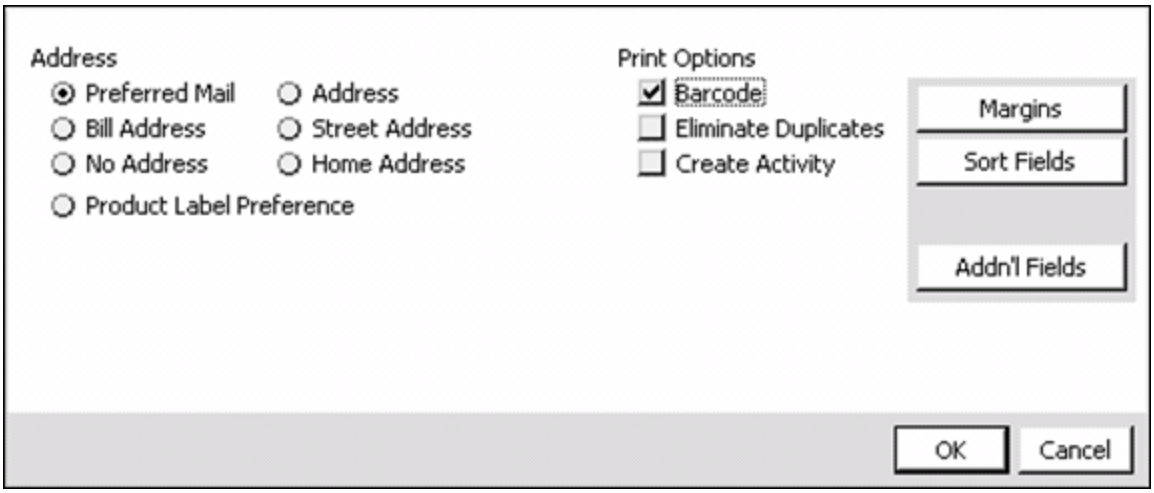
Current USPS regulations allow bar codes to be printed with the address, instead of requiring the bar code to be printed on the envelope. The iMIS bar code is compatible with both laser and dot-matrix printers.

Note: Note: You must be licensed to use the iMIS postal bar code feature.

To include bar coding on a report

1. Include the ZIP code (ZIP + 4) in your iMIS customer records along with the address.

2. When you are generating a report that can use bar coding, such as most labels, you will see an option labeled Barcode on the bottom half of the Selections window under Print Options. Select the Barcode print option.
3. Click OK.



The bottom half of the Selections window.

> **Note:** Note: If Barcode does not appear under Print Options, it is not available for the current report.

When the bar codes print on the output, they automatically appear flush left above the mailing address and, by default, all of the output sorts by ZIP code.

Example of a properly aligned barcode.

If your bar code font appears wrong, check that the correct font is installed. Postal BarCode v.1.02 is located in a \FONTS directory in your \iMIS directory.

> **Note:** Note: To change the default setting for the Barcode option for a report you use frequently, change NO_BARCODE to PRINT_BARCODE (or the reverse) in the Report Specification Parameters field for that report format.

Exporting Report Data

You can export your iMIS data so that it can be read and used by outside applications, such as word processors, spreadsheets, and database packages. Most report windows throughout iMIS offer export formats for creating these files. Some formats automatically create files for popular word processing applications, filtering names, addresses, phone, date, and additional fields you specify. For these reports, you do not need to specify the export format because the format specifications are already built into the report.

To export a report to either MS Word or WordPerfect

1. From the reports window, select Exports from the Report Types list if this report type is available. A list of Available Reports displays in the area on the right.
2. Select a report from the Available Reports list.
3. (optional) Click Options and select Export Format to open the Export Format window.
4. Select a Format Type, enter a file name, and click OK.
5. Click Run.
6. Enter or select report information and click OK. The Set print file name window displays.
7. Enter the file name.
8. Click Save to save the exported data in a file report.

You can select from several other export formats for your report, such as spreadsheet, dBase, and so forth. Select the additional formats from the Export Format window.

To export a report in other formats

1. From the reports window, select Exports from the Report Types list if this report type is available. A list of Available Reports displays in the area on the right.
2. Select a report from the Available Reports list.
3. (optional) Click Options and select Export Format to display the Export Format window.
4. Choose one of the nine Format Type options to specify how iMIS should format the output file.
5. Enter the file name.
6. Click OK.
7. Click Run.
8. Enter or select report information and click OK.
9. The Set print file name window displays.
10. Enter the file name.
11. Click Save to save the exported data in a file report.

The QuickLetter System

To create a new letter template (QuickLetter)

1. From the reports window, select Letters from the Report Types list.
2. Select a letter from the list of Available Reports.
3. Click Options> Letter Text to open the Letter Text window.
4. Place your cursor in the Title field, and enter a title for your new letter template.
5. Place your cursor in the letter text area, and modify the letter template as necessary.
6. Click Save as Standard to open the Letter Name window.
7. Enter a name for your new letter template.

8. Click Save to save the letter template.
9. Click Close to close the Letter Text window.

To edit a letter template (QuickLetter)

If you modify a template that was previously used to create activity records and you create new activity records based on the modified template, the letter text in the new activity records will show the original letter text before it was modified. If you want the new activity records to reflect the new text, create a new template.

1. From the reports window, select Letters from the Report Types column.
2. Select a letter from the list of Available Reports.
3. Click Options> Letter Text to open the Letter Text window.
4. Modify the letter as necessary.
5. Click Save as Standard. The Letter Name window opens.
6. Click Save. A message prompts you to replace the current letter.
7. Click Yes.
8. Click Close to close the Letter Text window.

To add additional fields to a template (QuickLetter)

Additional fields can be added to templates created in QuickLetter.

1. Select Utilities> Report Specs to open the Report Specifications window.
2. Select a QuickLetter template to edit (e.g., MEMBERSHIP-Letters-Sample New Member Letter (QuickLetter)).
3. Click Parameters to open the Detail Report Parameters window. The template name you chose displays in the Rpt File / Format field, and the Report Type is shown as OMNIS.
4. Click Edit.
5. (optional) Enter the table name in the Main Tables field.

6. (optional) Enter the table name in the Search Files field.
7. Enter the field name in the Report Fields, for example, Orders.INFORMAL.

   Note: The table name is entered in upper/lower case while the field name is in all upper case.
8. Click Save.

   To mass merge a letter (QuickLetter)

1. From the reports window, select Letters from the Report Types column.
2. Select a letter from the Available Reports column.

   Note: Sample MS Word templates cannot be used with QuickLetter.
3. Click Run to open the Member/Contact Selections window.
4. Click OK on the Member/Contact Selections window. The template opens with the text displayed.

   To mass merge an e-mail (QuickLetter)

   To ensure all letters are delivered by e-mail, verify that the E-mail field is populated on the Manage customers window's Profile tab for each customer.

   > **Note:** Note: The subject line of e-mail letters created using QuickLetter defaults to "E-mail Letter." To modify the text that displays in the subject line of your e-mail letters, select Utilities> Report Specs, clone the report, click Parameters, modify the text that appears after "<Subject>" in the Parameters field, save your changes, close the Report Specifications window, and run the report.

1. Open your e-mail program.
2. From the reports window, select Letters from the Report Types window.
3. Select the e-mail to merge.
4. Click Run to open the Member/Contact Selections window.

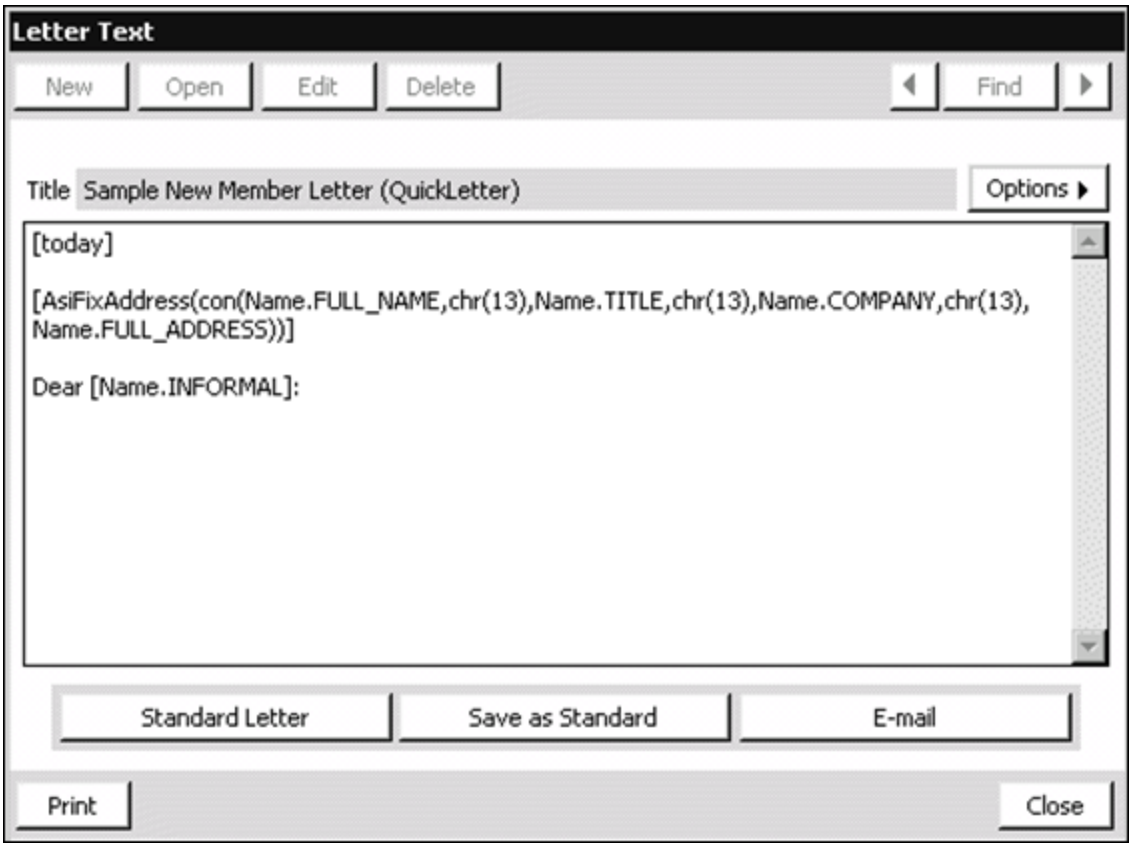
5. Enable the specific Member/Nonmember options.
6. Click OK to send the e-mail. The View E-mail Results window displays.
7. Verify that the information is correct, and click Close.

To delete a letter (QuickLetter)

1. Select Utilities> Report Specs to open the Report Specifications window.
2. Highlight the letter you want to delete.
3. Click Delete.
4. A message displays asking you confirm the deletion. Click Yes.

Note: When a report specification is deleted on the Report Specifications window, the template will not appear in the Available Reports column on the Generate reports window.

Letter Text window



From the reports window, select Letters from the Report Types list, select a letter, and click Options > Letter Text

Title

Enter the name of the Standard Letter.

Options button

Opens a list of options for the selected letter:

Letter Format - Available letter formats. Corresponds to the six available letter report formats defined in the Report Specifications window.

> **Note:** Note: When you change the format for a letter, the selected format is written to the report description so that the next time the report is selected from the Letter Text window, the most recently selected format will be used.

Margins - Opens the Margins/Page Layout window that allows you to specify the layout settings for your letter.

Standard Letter button

Opens the Find window and select from the available letter reports.

Save as Standard button

Used to save a letter.

E-mail button

Used to send an e-mail directly to a customer (requires MAPI32-compliant e-mail application software and Internet access).

Print button

Used to generate a letter and send it to your report destination.

Standard Letters window

This window shows the list of Letter System templates that are available for a module, and provides options for managing the templates.

Note: Note: The name of the window varies by module.

From the reports window, select Letters, and click Letter System

This window shows the following information for each template.

- Title - The iMIS database name of the template.
- Status - The status of the MS Word files associated with the template.
- OK - The template files are available in the template folder.
- Unavailable - The template files are not available in the template folder, or the folder is not available.
- Report file (.doc) - The unique portion of the names of the template files.

This window provides the following buttons.

- New - Creates a template that can use the iMIS fields that are currently available for a module.
- Edit - Opens the selected template with MS Word.
- Save As - Creates a template by copying the existing, selected template. The new template can use the fields that were available for the module when the existing template was created.
- Setup - (if enabled) Opens the Setup Standard Letters window.
- Merge - Initiates the process of combining iMIS data with the selected template.

Setup Standard Letters window

This window defines the iMIS database fields that become columns in the data source table for this MS Word letter template, and the order in which the columns appear in the data source table.

Note: Note: Your login must have authorization level 8 to use this window.

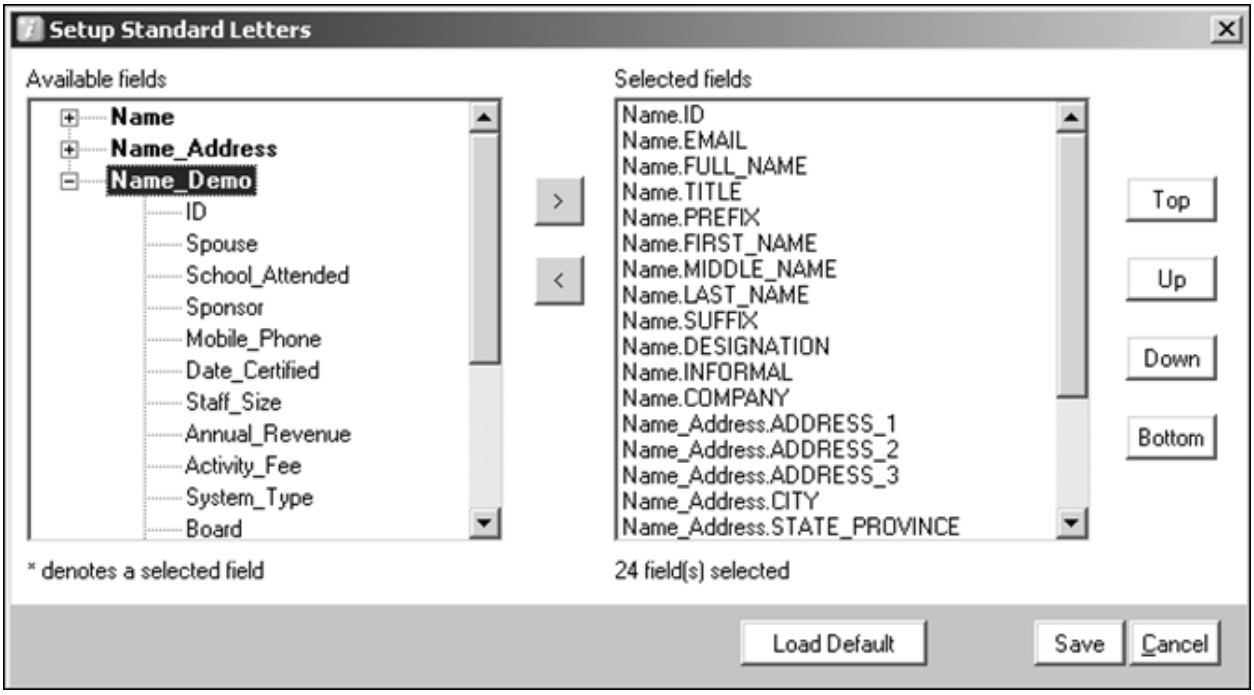


Figure 1: Setup Standard Letters

Setup Standard Letters window

Available fields

This area shows the iMIS tables and fields that are available for use as columns in the data source table for this letter.

To add a field to this letter's data source, select the field name, and then click >.

> **Note:** Note: Users with authorization level 8 can add fields from any iMIS table to the list of available fields, except fields that contain image data.

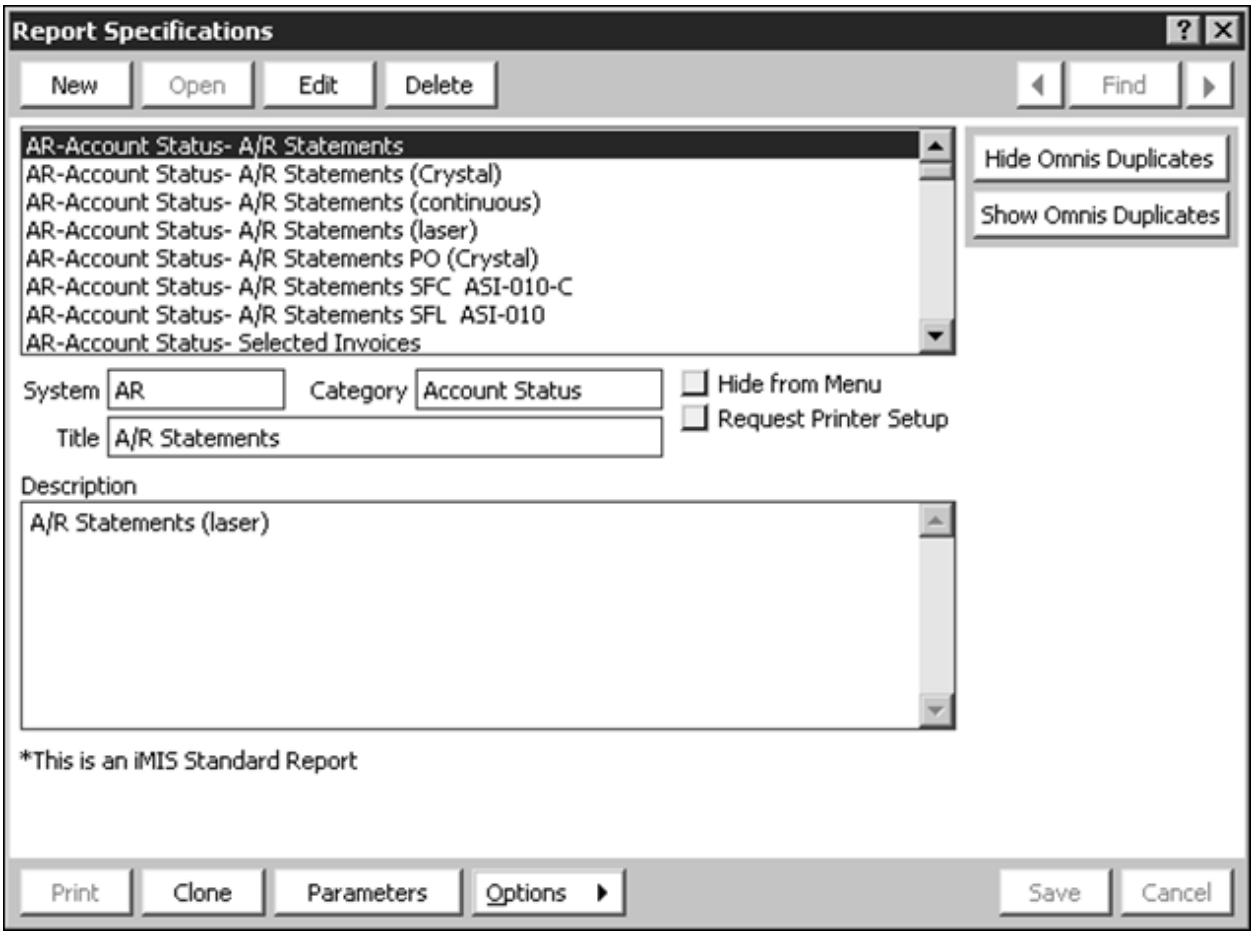
Selected fields

This area shows the iMIS fields that become columns in the data source table for this letter.

To remove a field from this letter's data source table, select the field name, and then click <.

- Top - Moves the selected field to the beginning of the list.
- Up - Moves the selected field one entry towards the beginning of the list.
- Down - Moves the selected field one entry towards the end of the list.
- Bottom - Moves the selected field to the end of the list.
- Load Default - Populates the list with the fields defined by ASI for this letter's iMIS module.

Report Specifications window



From the menu bar, select Utilities > Report Specs

Report scrolling area

This area contains a list of all iMIS reports.

Hide Omnis Duplicates button

Used to display Crystal-type reports for the specified System in the report scrolling area and hide the same reports that were created using Omnis.

Show Omnis Duplicates button

Used to display Crystal and Omnis report types for the specified System in the report scrolling area.

System

This field indicates where the report resides in the iMIS module, for example, Expo.

Category

This field indicates the report group/type, for example, Product.

Title

Displays the name of the report in this window and in the Generate reports window.

Hide from Menu

Enable to hide the report title on the Generate reports window.

Request Printer Setup

Enable for the system to automatically display a Set Report Destination window.

Description

This field contains a detailed description of the report.

Print button

Used to generate and send the selected report to your report destination.

Clone button

Used to produce an exact copy of the selected report.

Parameters button

Used to display the Detail Report Parameters window, where you can specify additional report specifications.

Options button

Used to display a drop-down list of report options available for printing, exporting, saving, and sorting the selected report format. Report options vary by report type.

Run-time report selection windows

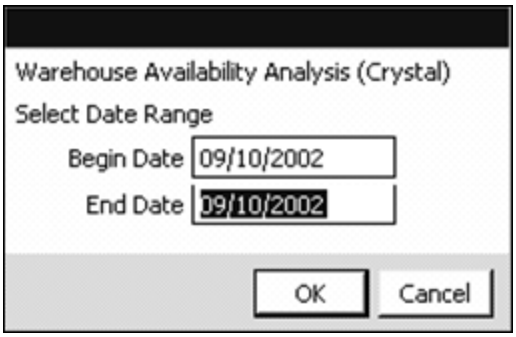
A run time window is a secondary selection window that allows you to specify the date range and data to be included in your output results. Only open items with a Bill Date or

Run Date within the specified date range will print. Run time windows display when you click Run on the Generate reports window (from Billing, select Generate reports).

The window that displays depends on the search parameters entered for the selected report in the SearchDialog field on the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters):

- If DateRangeDia or CRTransDia is entered in the SearchDialog field, then the Select Date Range window displays when you click Run on the Generate reports window.
- If DuesPrintDia is entered in the SearchDialog field, then the Select Member Type window displays when you click Run on the Generate reports window. The DuesPrintDia parameter generally is used when generating Renewal Notices.

Select Date Range window



An example of a Select Date Range run time window from the Orders module

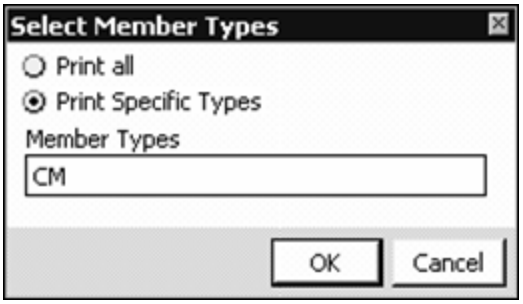
Begin Date

Specifies the beginning date of the reporting period.

End Date

Specifies the ending date of the reporting period.

Select Member Types window



An example of the Select Member Types window

Print all

Enable to print all of the customer types.

Print Specific Types

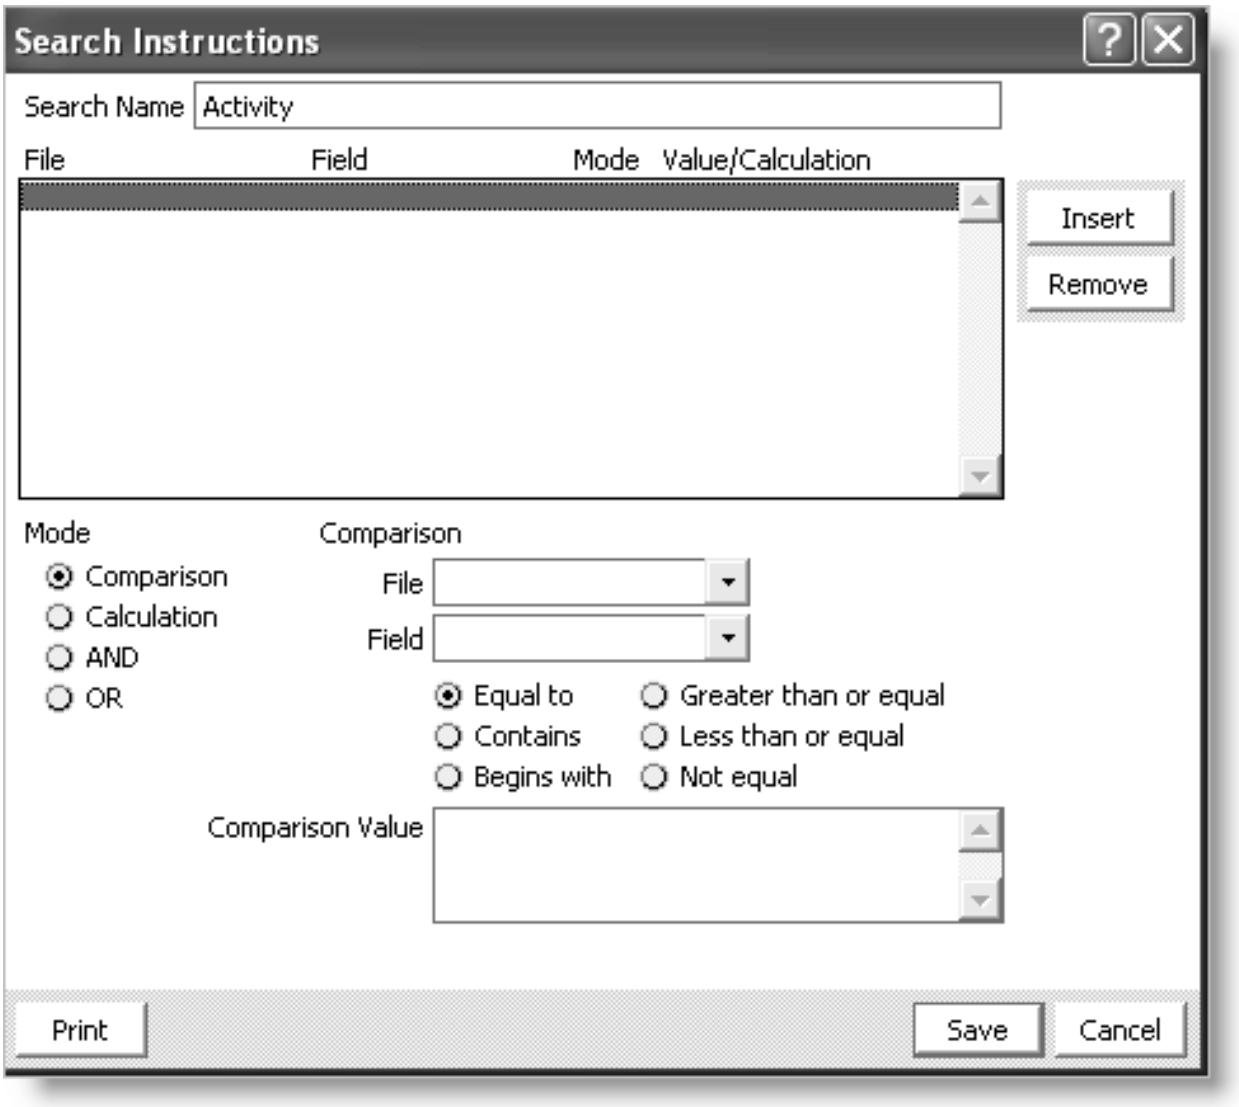
Enable to print specific customer types.

Member Types

(Displays when Print Specific Types is enabled) Specifies the specific customer types you want to print on your report.

Note: Note: Set your Report Destination to Screen, and then enable all printing options you would like to try. Selectively disable the options, and observe their effect until you achieve the output you want to print.

Search Instructions window



From the Select Search Instructions window, select an existing search instruction, and click Edit

When you select the New, Clone, or Edit button, the Search Instructions window displays. In the Search Name field, you enter the name for the search instruction set. In the scrolling list, you can view the individual lines that make up the search instruction. In the Comparison Value field, you enter data to define those individual lines.

Search Name

Enter a unique name for search instructions so that they can be retrieved at a later date.

Search Instruction scrolling area

This section contains a list of the search instructions for the specified Search Name.

Insert button

Used to enter a new instruction.

Remove button

Used to delete an instruction.

Mode selection options

The mode specifies the calculation you will be performing for your search criteria. The following options can be specified:

Comparison - Compares a specified field to a given value. For example, you can specify that a field value equal the given value, be greater than, less than, and so forth. Comparison is the most commonly used string.

The fields in the Comparison area include the following:

- File - Name of the file (table) that contains the field you are comparing. Comparison lines only.
- Field - Name of the data field whose contents or value is being searched for the comparison. Comparison lines only.
- Equal to - (Default) Dictates that the field value must precisely match the value (or one of multiple values) specified in the Comparison Value field.

  Note: For an Equal to comparison, you can enter multiple values separated by commas (no spaces) in the Comparison Value field. With multiple values, a record passes the comparison test if the field data matches any one of the comparison values (iMIS assumes a logical OR).
- Contains - Similar to Equal To, but instead of requiring an exact match of the entire field value, it requires that a continuous character string anywhere in the field match the comparison value. This option is typically used to find values in a list string field.

- Begins with - Looks for a continuous character string at the beginning of the field contents. It tries to match that string with the comparison value. For example, use Begins with to search for records whose last names begin with “W.”
- Greater than or equal - Requires that the field value be greater than or equal to the comparison value. This type is used as one side of a two-part specification for a range of values. A typical use is for date fields.
- Less than or equal - Requires that a field's value be less than or equal to comparison value. This type also serves as the second half of a range specification. A typical use is for date fields.
- Not equal - Searches for records in which the contents of the named field do not match the specified comparison value (or any of the multiple values, separated by commas).

  Note: For a Not equal comparison, you can enter multiple values if you separate them with commas (no spaces). With multiple values, a record passes the comparison test only if the field's data does not match any of the values (iMIS assumes AND).
- Comparison Value - For Comparison lines, this text box contains the value or character string you are comparing to the field contents. For Calculation lines, this area contains the full formula for the True/False evaluation.

  Calculation - Allows you to enter a formula to compute. The calculation results are a true or false condition. A true condition result includes the record in the search results.

  AND - Use between two search lines to require a record to pass both conditions before it is included in your search results. By default, AND is assumed between adjoining lines, except when the same field is specified in adjoining comparison lines and the mode is Equal to, Begins with, or Contains. In this case, OR is assumed.

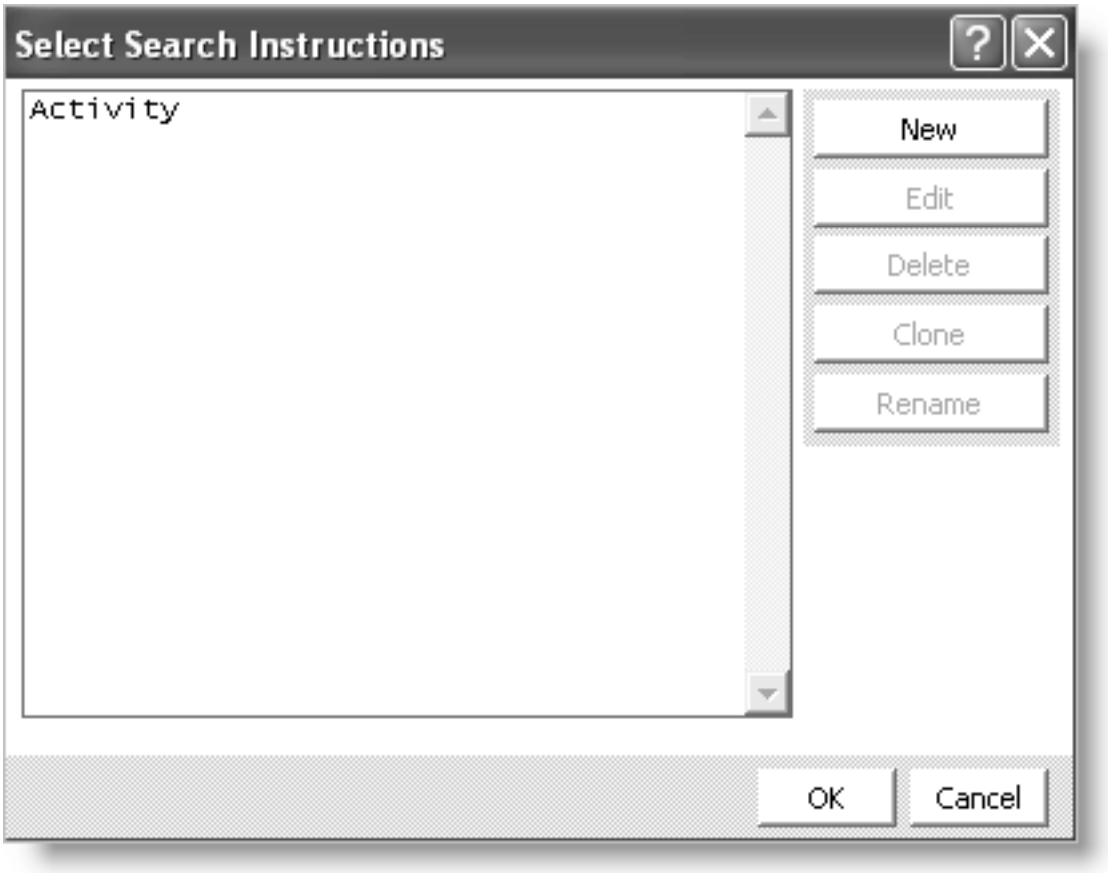
  OR - Use between two search lines to require a record to pass only one of the two conditions. OR must be entered to specify anything other than AND. The exception is when the same field is specified in adjoining comparison lines and the mode is Equal to, Begins with, or Contains. In this case, OR is assumed.

> **Note:** Note: When you are entering a character string, you must enclose the string in single quotes.

Print button

Used to generate and send a search instruction report to your report destination.

Select Search Instructions window



From the module that you're in, select Generate Reports, select a report type from the Report Types list, select a report from the Available Reports list, and select Search Format from the Options drop-down list

When you first request an ad hoc search, an initial Select Search Instructions window displays. This window lists the titles of any preexisting search instructions.

> **Note:** Note: iMIS only displays the search definitions that relate to the active module or task list item.

The following command options display on the Select Search Instructions window:

Search instructions scrolling list

This list displays the current search instructions.

Clone button

Used to create a new set of instructions based on an existing set.

Rename button

Used to change the name of a search definition.

Advanced Reporting

Managing Crystal Reports in iMIS

Section Goal

The goal of this section is to give you an understanding of how to incorporate Crystal reports into iMIS.

After completing this section, you will be able to do the following:

1. Add a custom Crystal report to the iMIS menu.
2. Clone an ASI standard Crystal report specification.
3. Use the Crystal Print Manager.
4. Add security to your reports.

Adding Crystal reports to the menu

You can insert new Crystal reports or clone existing ASI standard Crystal reports so that the customized reports can be accessed from the iMIS Reports menu.

When you insert reports into the iMIS Reports menu, it is important to determine where the report is stored. If you enter a report name with no path shown, iMIS assumes the report is stored in the stdrpts folder or the custrpts folder. iMIS will look for the stdrpts folder or the custrpts folder in either:

- Your local workstation, if the iMIS libraries were installed locally
- A server, if the iMIS libraries were installed on a server

> **Note:** Note: Make sure to place custom or cloned reports in the custrpts folder. Make sure to rename cloned reports. The iMIS standard reports are kept in the stdrpts folder and are overwritten during an install or upgrade.

To clone an ASI standard Crystal report

> **Note:** Note: Make sure to place custom or cloned reports in the custrpts folder. Make sure to rename cloned reports. The iMIS standard reports are kept in the stdrpts folder and are overwritten during an install or upgrade.

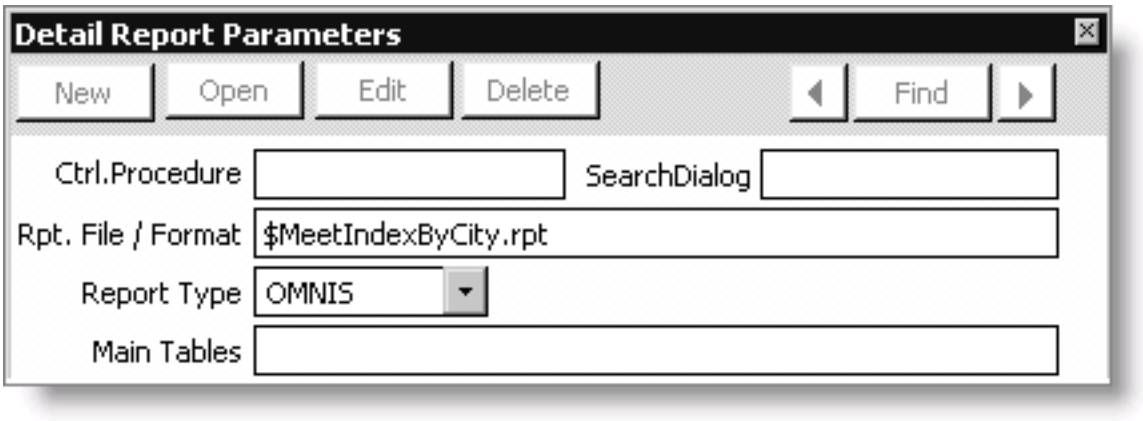
Cloning allows you to copy the specifications from an existing report and modify the cloned version. Cloning saves time compared to creating a new report from scratch.

1. Copy the ASI Crystal report to the custrpts directory, and rename the report.
2. Select Utilities> Report Specs to open the Report Specifications window, which contains a list of all standard reports sorted by module (System) and type (Category).
3. Highlight the report to be cloned, and click Clone at the bottom of the window.
4. Enter the System and Category in which you want the report to appear, or leave the report in the same module and as the same report type.
5. Enter a name for the cloned report in the Title field. If you are creating a Crystal report based on a cloned Omnis report, add “Crystal” in parentheses (Crystal). Adding “Crystal” to the report name helps to identify the Crystal reports.
6. Enter a Description for the cloned report.

7. Click Parameters to open the Detail Report Parameters window.
8. Delete the displayed Ctrl Procedure.

   Note: Prompts for search parameters will no longer be passed through iMIS if they were set up in the Crystal report unless the report file name is preceded by a “$.” Otherwise, all search parameters must be set in iMIS.
9. To use Crystal parameters (or to prompt for values):

- Tab to the Rpt File / Format field.
- Enter the report name preceded by the $ sign ($ReportName).



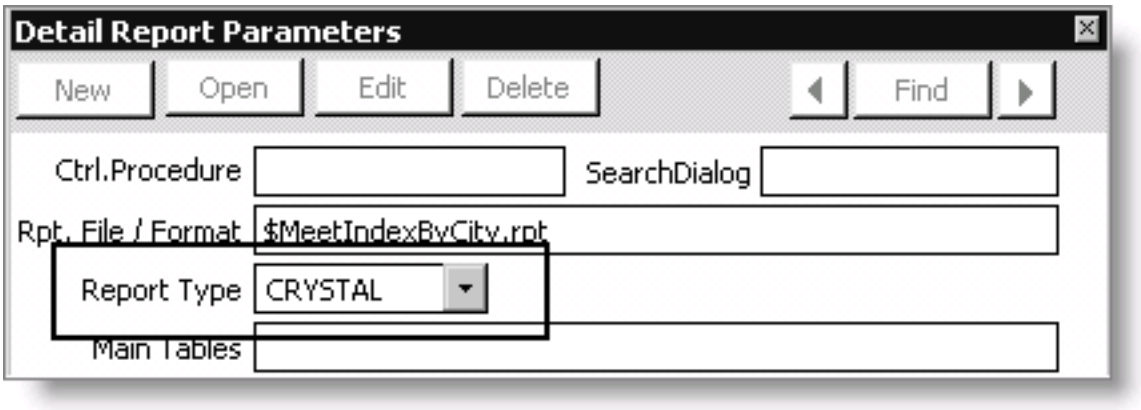
- Click Save on the Detail Report Parameters window to save the report specifications.

10. To map Crystal parameters to iMIS variables:

- Enter the report name in the Rpt File / Format field. The Crystal report should have an .rpt extension.
- Enter the complete directory path if the report does not reside in the stdrpts or custrpts folder.

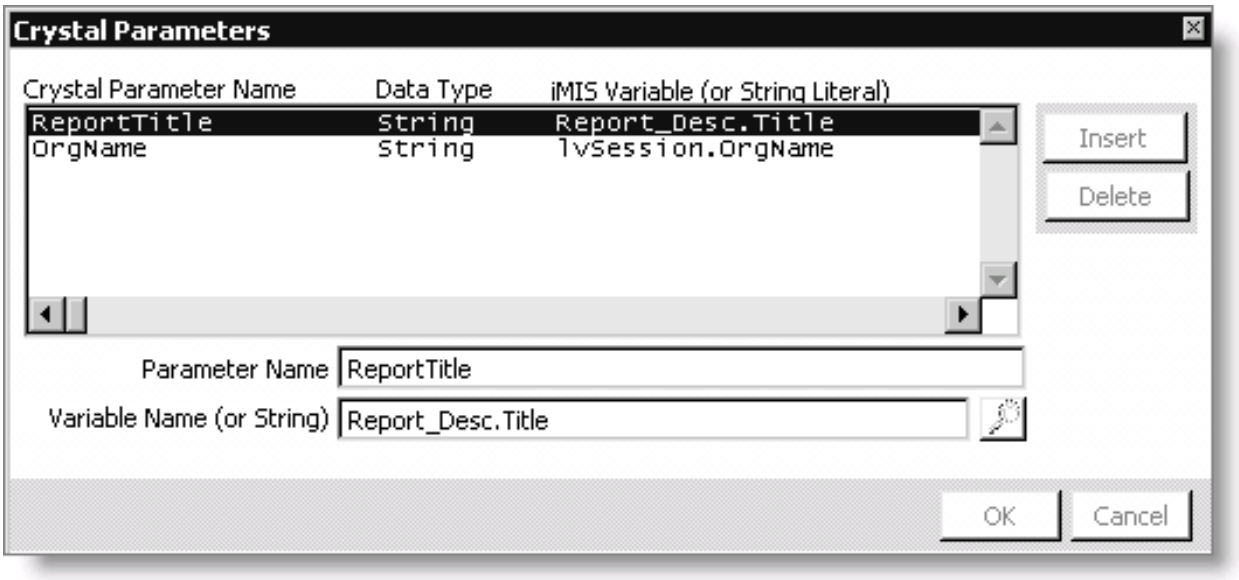
  Optionally, you can press Ctrl+L to browse to the report directory and select the file. This lookup option is available only when a CRYSTAL report type is selected. The report name displays without the directory path shown.

- Click the Report Type drop-down list, and select CRYSTAL. The Report Type names the tool in which the report was developed. The tools currently supported are the Omnis Report Writer and the Crystal Report Writer.



- If you have set parameters in the Crystal report:
- Click Crystal Params to open the Crystal Parameters window.

  The Crystal Parameters window allows you to map Crystal parameters to iMIS variables or to a string literal. You must map Crystal parameters to a corresponding iMIS variable for the data to pass into iMIS and to display in the report.



- Click OK to save the parameters and return to the Detail Report Parameters window.
- Click Save on the Detail Report Parameters window to save the report specifications.

To convert an older Crystal report

Convert older Crystal reports so they can use Crystal report functionality.

1. Prompts for search parameters will no longer be passed through to iMIS if they were set up in the Crystal report. All search parameters should be set up in iMIS.
2. In iMIS, select Utilities> Report Specs.
3. Select the report, and click Edit.
4. Click Parameters to open the Detail Report Parameters window.
5. Remove the $ character from the report file name.
6. Click the Report Type drop-down menu, and select CRYSTAL.
7. If the following parameters are used in the Crystal report, click Crystal Params, click Insert on the Crystal Parameters window, and map the parameters to an iMIS variable. Click OK to save the parameters and return to the Detail Report Parameters window.

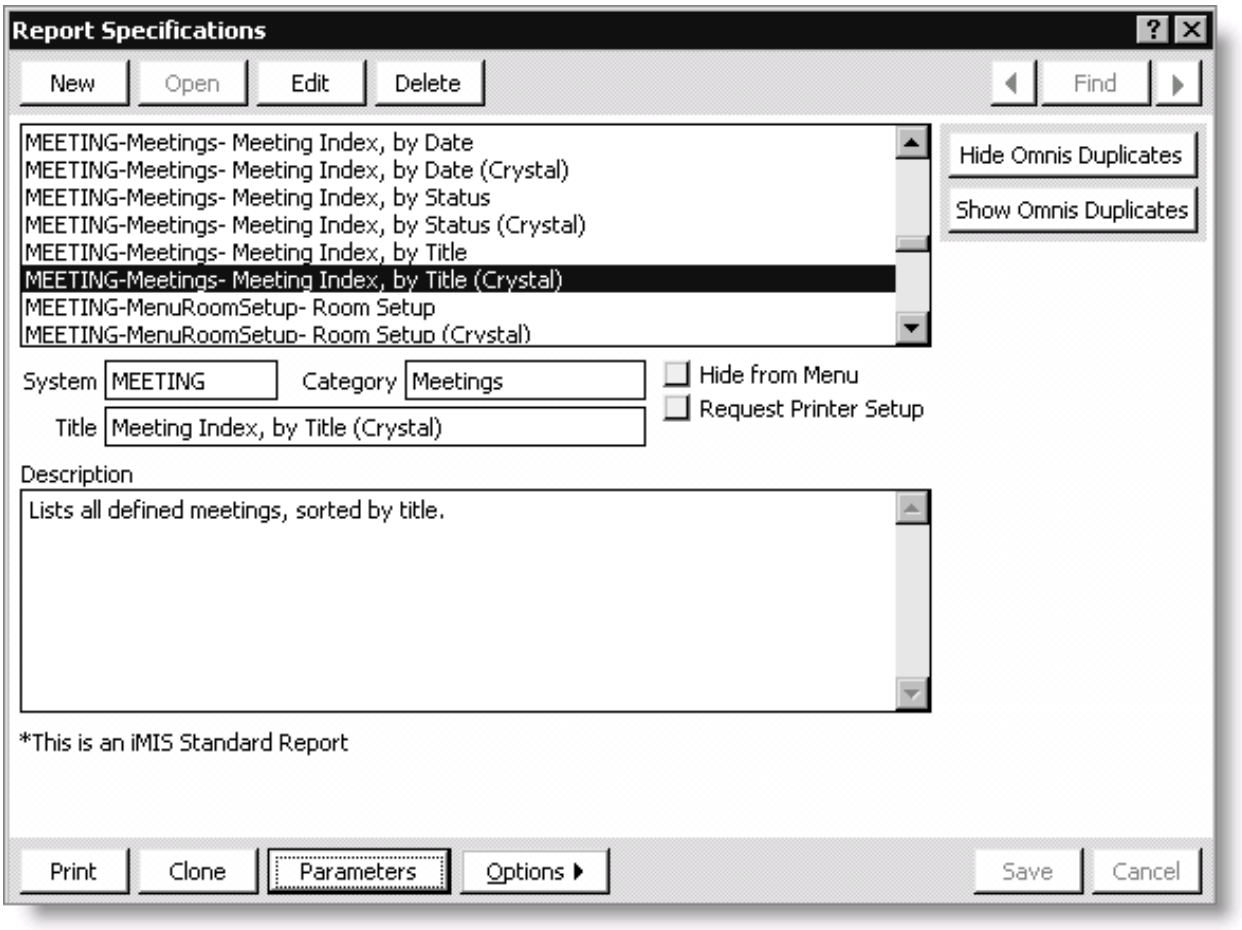
- If the OrgCode or OrgName parameters are used, map OrgCode to the iMIS lvSession.OrgCode variable, and map OrgName to the iMIS lvSession.OrgName variable.
- If the report uses the automatic Report Title Set feature, create a new Crystal parameter (for example, ReportTitle), place the parameter in the report layout, and map the Crystal parameter to the iMIS Report_Desc.Title variable.
- If a formula was entered in the Parameters field on the Detail Report Parameters window, the formula must be migrated to Crystal using the Crystal formula editor. If the formula used a runtime iMIS variable value, the iMIS variable value must be passed in as a parameter.

8. Enable the Save Report option to store the Crystal report in the Print Manager so that it can be accessed or printed later.

9. When the Save Report option is enabled, the For __ Days field displays with the default number of days that was set on the System Setup window (File> System Setup). This is the number of days the report will be stored and displayed on the Print Manager window. Override the default days, if necessary.
10. Tab to the Parameters field. You can enter overlay text or a Message parameter. In general, parameters to be passed to Crystal reports must be specified on the Crystal Parameters window.
    - If a message parameter is used, a Message formula in the Crystal report must be created and placed into the report layout appropriately.
    - If the report uses OrgCode or OrgName, click Crystal Params, map OrgCode to the iMIS lvSession.OrgCode variable, and map OrgName to the iMIS lvSession.OrgName variable.
11. Click OK.

To add custom Crystal reports to the menu

1. Create the Crystal report.
2. (optional) Copy the Crystal report to the custrpts subdirectory.
3. Select Utilities> Report Specs to open the Report Specifications window, which contains a list of all standard reports sorted by module (System) and type (Category).

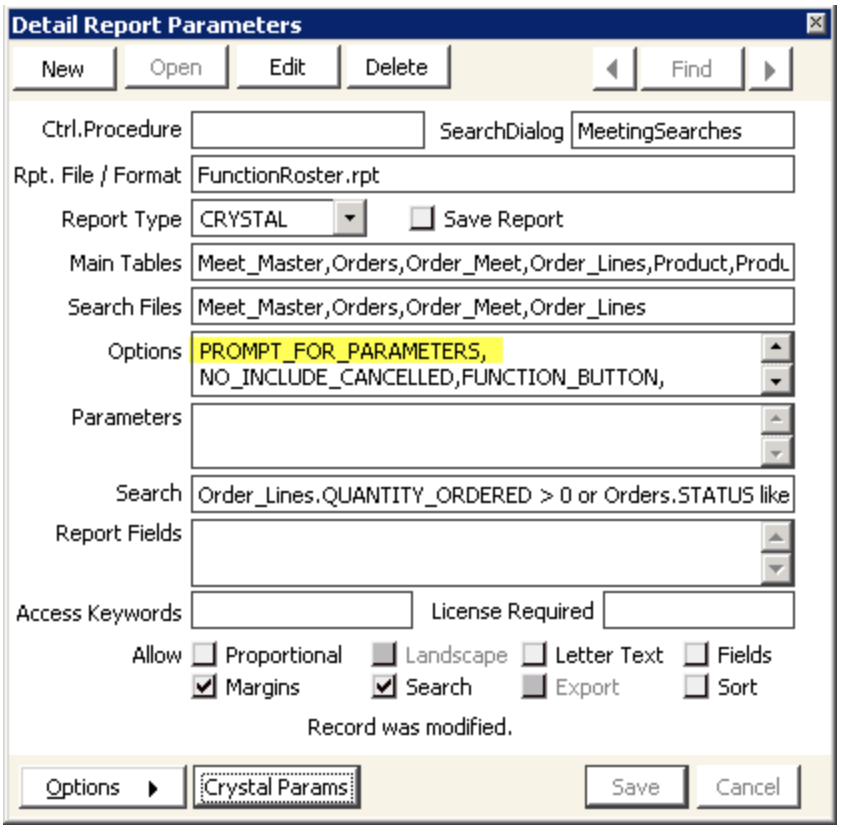


4. Click New.
5. Enter the name of the system module in which the report is to appear. For example, if the report is based on the Events module, enter EVENTS in the System field.
6. Enter the category in which you want the report to display on the module-specific Reports window. The category displays as Report Types on the module-specific Reports window. For example, if the report appears in the Events module, you could enter Badges in the Category field.
7. Enter a descriptive Title for the new report followed by “Crystal” in parentheses (Crystal). Adding “Crystal” to the report name helps to identify the Crystal reports.
8. Enter a Description of the report.
9. Click Parameters to open the Detail Report Parameters window.

- To use Crystal parameters (or to prompt for values):
- Tab to the Rpt File / Format field.

10. In the Options field enter PROMPT_FOR_PARAMETERS.

    Note: If the report includes other pre-entered options, separate each using a comma.



- Click Save on the Detail Report Parameters window.
- To map Crystal parameters to iMIS variables:

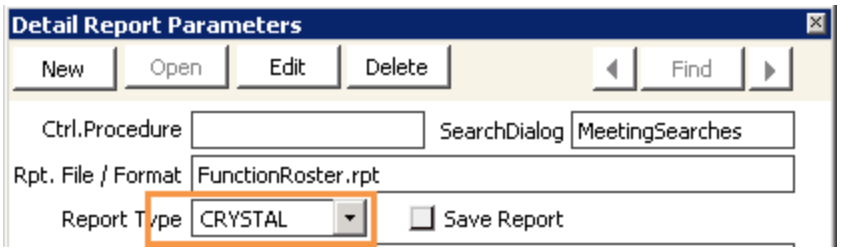
1. Enter the report name in the Rpt File / Format field. The Crystal report should have an .rpt extension.
2. Enter the complete directory path if the report does not reside in the stdrpts or custrpts folder.

Optionally, you can press Ctrl+L to browse to the report directory and select the file. This lookup option is available only when a CRYSTAL report type is selected. The report name displays without the directory path.

3. Select the Report Type drop-down list.

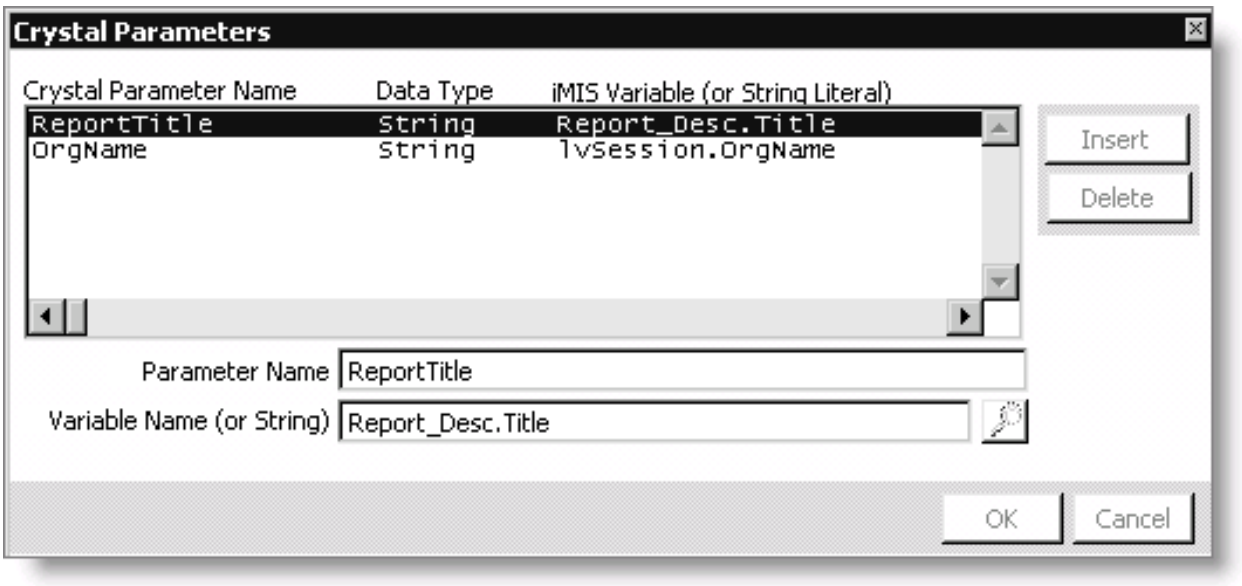
   Select CRYSTAL, the Report Type names the tool in which the report was developed.

   The tools currently supported are the Omnis Report Writer and the Crystal Report Writer.



- If you have set parameters in the Crystal report, click Crystal Params to open the Crystal Parameters window.

  The Crystal Parameters window allows you to map Crystal parameters to iMIS variables or to a string literal. You must map Crystal parameters to a corresponding iMIS variable for the data to pass into iMIS and to display in the report.



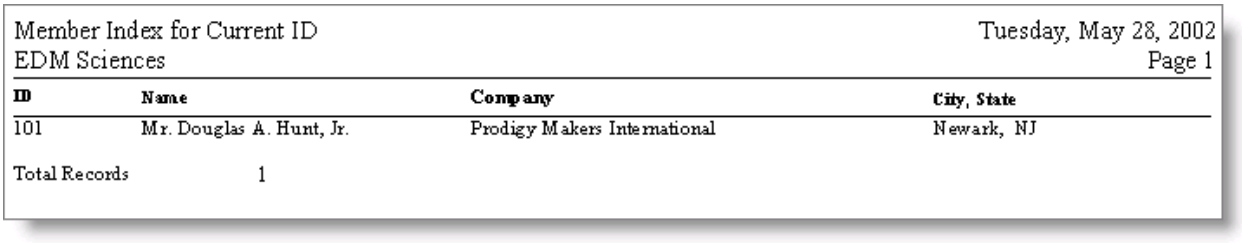
- Click OK to save the parameters and return to the Detail Report Parameters window.
- Click Save on the Detail Report Parameters window to save the report specifications.

Hands-on exercise: Clone a Crystal report

In this exercise, you will clone the Member Index report and modify it so the report prints the Member Index information for the displayed customer's record.

1. Copy the MemberIndex.rpt file from the iMIS stdrpts directory to the \...\custrpts directory.
2. Open the \...\custrpts\MemberIndex.rpt in Crystal.
3. Rename the report as MemberIndexforCurrentID.
4. Select the Field Explorer icon.
5. Select the Parameter tab.
6. Click New to open the Create Parameter Field window.
7. Enter CurrentID in the Name field, and click OK.
8. Close the Field Explorer window.
9. Select the Select Expert icon.
10. Select Name.ID, and click OK.
11. Select the drop-down list, and select is equal to.
12. Select the second drop-down list, select the {?CurrentID} parameter, and click OK.
13. Open iMIS.
14. Select Utilities> Report Specs to open the Report Specifications window.
15. Scroll down, and select the Membership-Rosters-Member Index (Crystal) report.
16. Click Clone.
17. Enter Member Index for Current ID (Crystal) as the report Title.
18. Click Parameters to open the Detail Report Parameters window.

19. Tab to the Rpt File / Format field, and press Ctrl+L.
20. Navigate to the \imis\custrpts directory, select the MemberIndexforCurrentID.rpt file, and click OK.
21. Click Crystal Params to open the Crystal Parameters window.
22. Click Insert.
23. Enter CurrentID in the Parameter Name field, and press Tab.
24. Enter lvSession.CurrentId in the Variable Name (or String) field, and press Tab. Click OK.
25. Click Save on the Detail Report Parameters window to save the report changes.
26. Close the Detail Report Parameters window and the Report Specifications window.
27. Select Customers> Manage customers to open the Manage customers window.
28. Click Find to open the Search window.
29. Select ID from the drop-down list, enter 101 as the customer Id, and click Go.
30. Select Customers> Generate reports to open the Generate reports window.
31. Click Set Report Destination, and choose to print the report to Screen.
32. Select the Rosters report type, and then select the Member Index for Current ID (Crystal) report.
33. Click Run to open the Member/Contact Selections window.
34. Click OK. The report displays the information for customer 101.

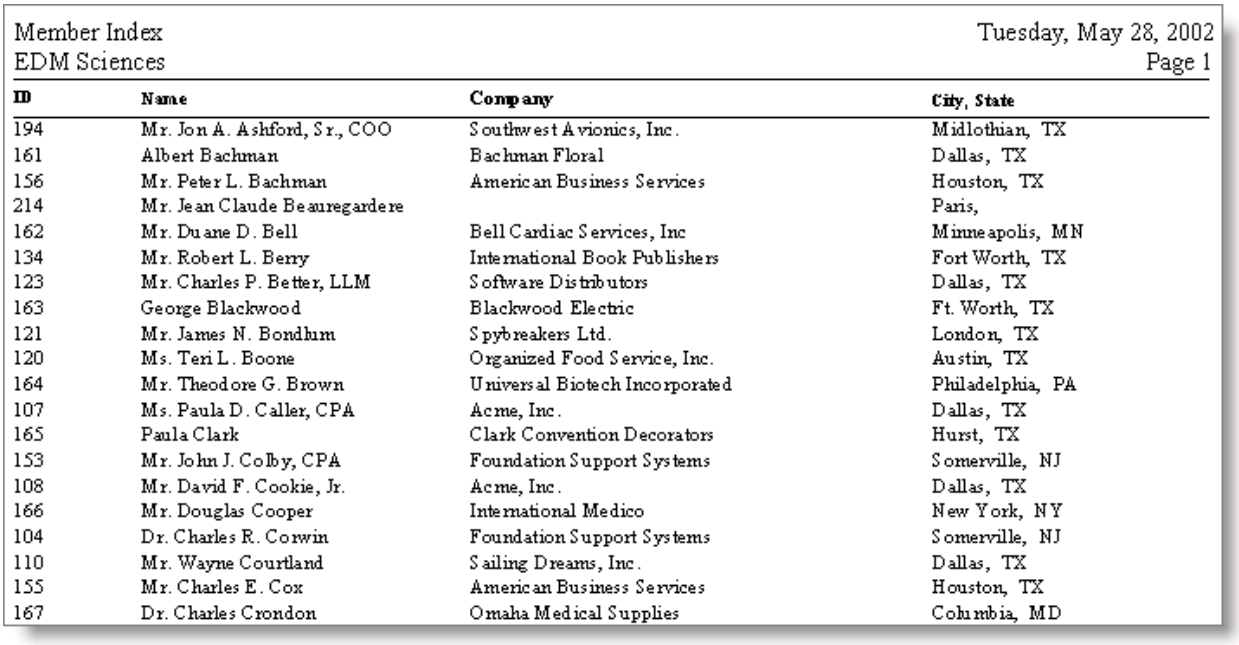


Member Index for Current ID — Tuesday, May 28, 2002
EDM Sciences — Page 1

ID	Name	Company	City, State
101	Mr. Douglas A. Hunt, Jr.	Prodigy Makers International	Newark, NJ

Total Records 1

35. Run the original report, Member Index (Crystal), to compare the original report to the modified report. Notice the original report shows the address for each customer selected while the report we modified only shows the address for the customer's record we have displayed.



Member Index
EDM Sciences

167	Dr. Charles Crondon	Omaha Medical Supplies	Columbia, MD

Using the Crystal Print Manager

The Print Manager allows you to save a report for a specified period and to reprint the stored report.

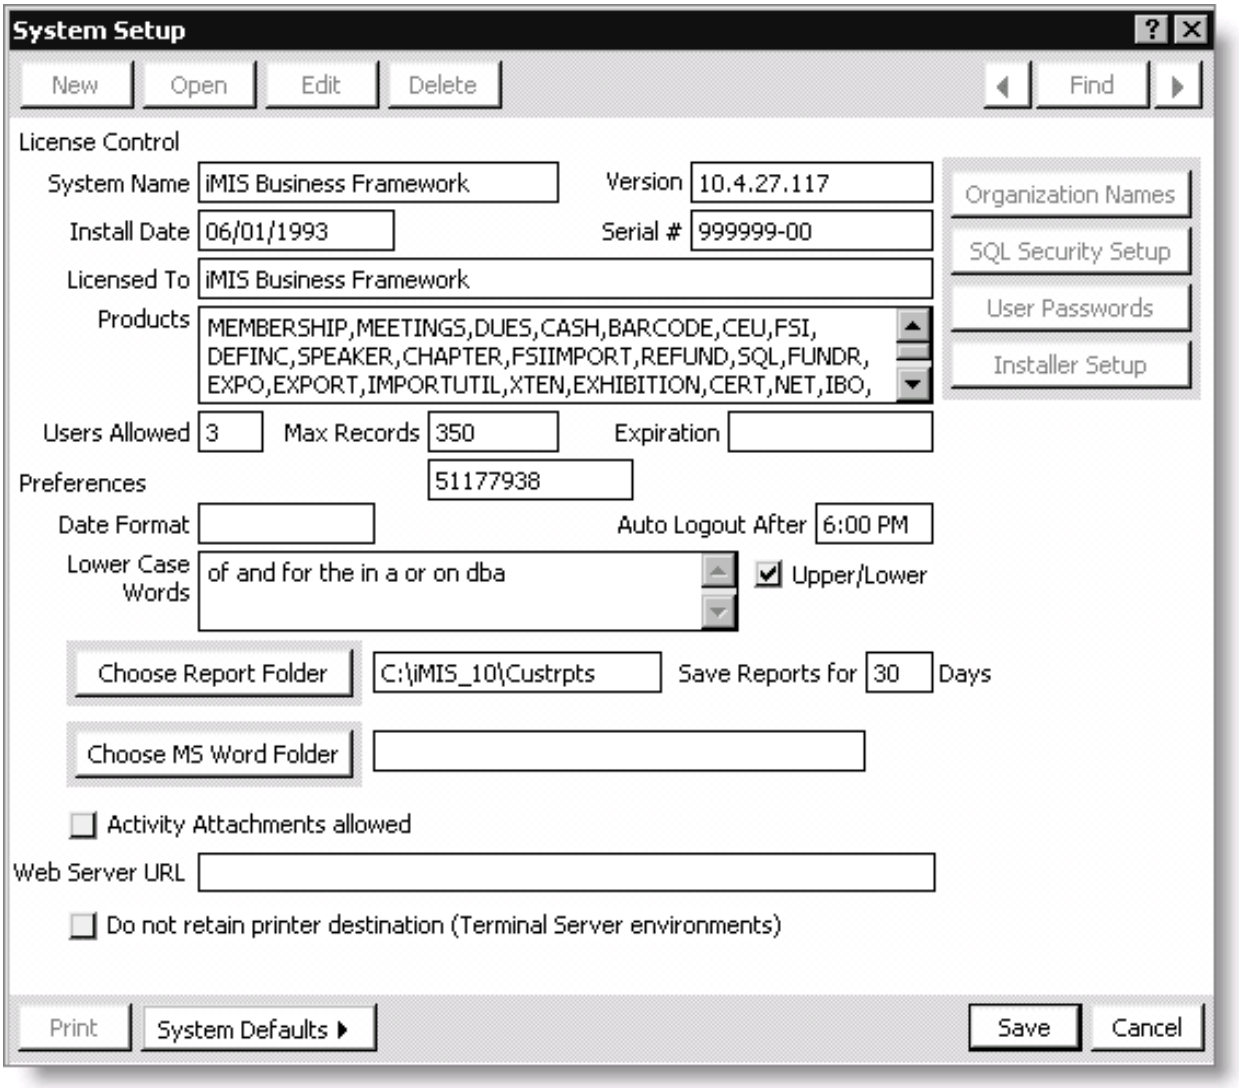
To set the Print Manager system defaults

On the System Setup window, specify the location and default number of days for storing the report.

1. Open iMIS.
2. Select File> System Setup to open the System Setup window.
3. Click Edit.
4. Click Choose Report Directory to open the Browse for Folder window.

Note: Select a network drive that is mapped on all iMIS clients. If a local drive is selected, users on the network are not able to print the reports from the Print Manager.

5. Select the directory where the report will be stored, and click OK.
6. In the Save Reports for _ Days field, enter the default number of days to store the reports. If a different period is set on the Detail Report Parameters window for the report, the days set for the report override the System Setup.

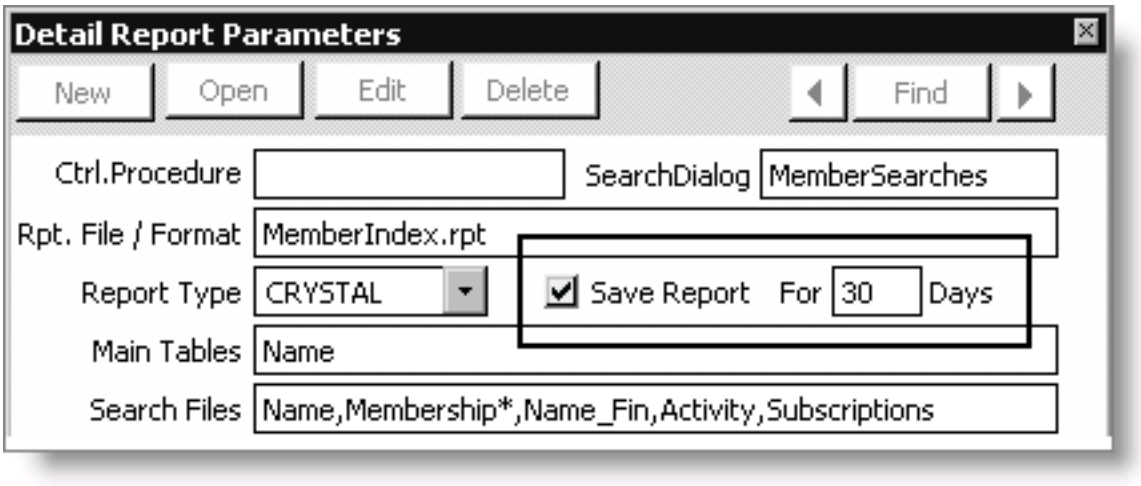


7. Click Save.

To save a Crystal report

To save a report to the Print Manager to be accessed or printed later, you must enable the Save Report option on the Detail Report Parameters window.

1. Open iMIS.
2. Select Utilities> Report Specs to open the Report Specifications window.
3. Select the Crystal report.
4. Click Edit.
5. Click Parameters to open the Detail Report Parameters window.
6. Enable the Save Report option. When this option is enabled, a new field displays.
7. When the Save Report option is enabled, the For __ Days field displays with the default number of days that was set on the System Setup window (select File> System Setup). This is the number of days the report will be stored and displayed in the Print Manager window. Override the default days if necessary.



8. Click Save.

Hands-on exercise: Set the number of days to save a report

In this exercise, you will set the number of days to save the Member Index report in the Print Manager.

1. Open iMIS.

2. Select Utilities> Report Specs to open the Report Specifications window.
3. Select MEMBERSHIP-Rosters-Member Index (Crystal).
4. Click Edit.
5. Click Parameters to open the Detail Report Parameters window.
6. Enable the Save Report option. When this option is enabled, a new field displays.
7. Enter 30 as the number of days for the Print Manager to store the report.
8. Click Save, and close the Detail Report Parameters window.

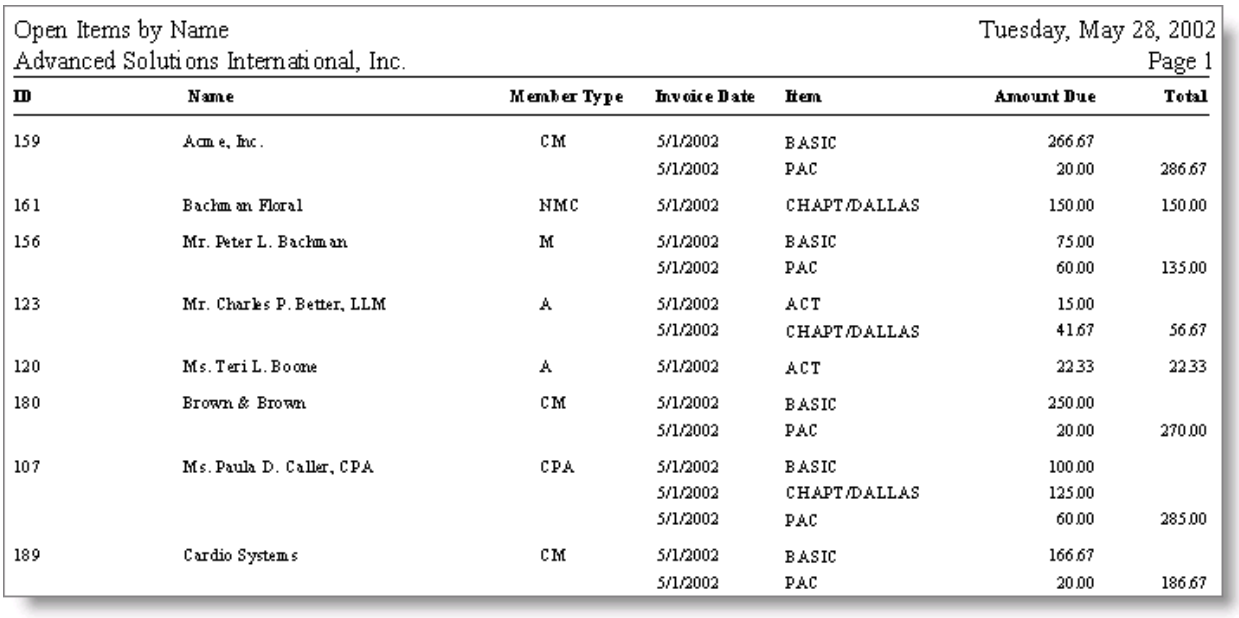
To run a saved Crystal report

When you run a Crystal report with the Save Report option enabled, the report displays on the Crystal Preview window, and the data is exported and stored to a file labeled asi#.rpt. The location of the stored report file (asi#.rpt) is designated on the System Setup window (select File> System Setup). All stored reports are kept in the Job_Record table.

1. Open iMIS.
2. Select the report. For this example, we selected Billing> Generate reports to open the Generate reports window. We then selected the Open Invoices report type, and selected Open Items by Name (Crystal) from the Available Reports area.
3. Click Set Report Destination, select the appropriate destination, and click OK.
4. Click Run.
5. Select a date range.

The Crystal Preview window opens with the data displayed. While the data is exported to the asi#.rpt file, the system displays an Exporting Records window.

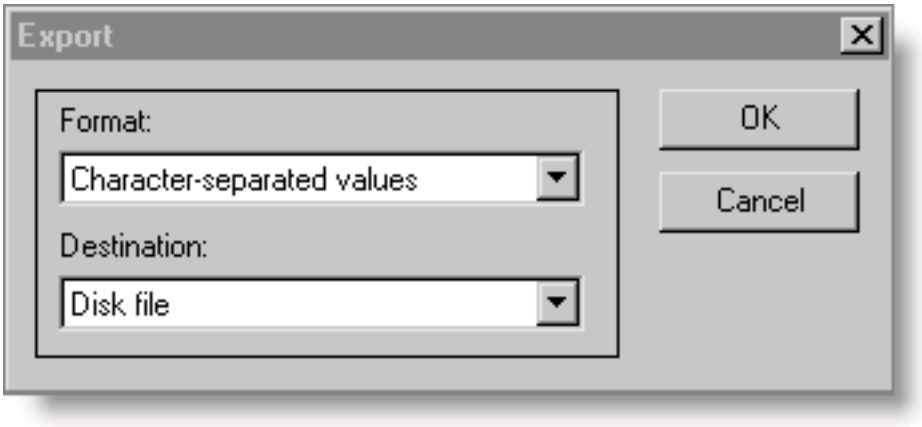
Brief descriptions of the buttons, menus, and items shown on the Crystal Preview window are shown in the following example.



Open Items by Name — Tuesday, May 28, 2002
Advanced Solutions International, Inc. — Page 1

ID	Name	Member Type	Invoice Date	Item	Amount Due	Total
159	Acme, Inc.	CM	5/1/2002	BASIC	266.67	
			5/1/2002	PAC	20.00	286.67
161	Bachman Floral	NMC	5/1/2002	CHAPT/DALLAS	150.00	150.00
156	Mr. Peter L. Bachman	M	5/1/2002	BASIC	75.00	
			5/1/2002	PAC	60.00	135.00
123	Mr. Charles P. Better, LLM	A	5/1/2002	ACT	15.00	
			5/1/2002	CHAPT/DALLAS	41.67	56.67
120	Ms. Teri L. Boone	A	5/1/2002	ACT	22.33	22.33
180	Brown & Brown	CM	5/1/2002	BASIC	250.00	
			5/1/2002	PAC	20.00	270.00
107	Ms. Paula D. Caller, CPA	CPA	5/1/2002	BASIC	100.00	
			5/1/2002	CHAPT/DALLAS	125.00	
			5/1/2002	PAC	60.00	285.00
189	Cardio Systems	CM	5/1/2002	BASIC	166.67	
			5/1/2002	PAC	20.00	186.67

- To print the report, click Print.
- To export the data to a specific format, click Export. The Export window opens to allow you to select the Format and Destination of the export file.



6. Close the Crystal Preview window.

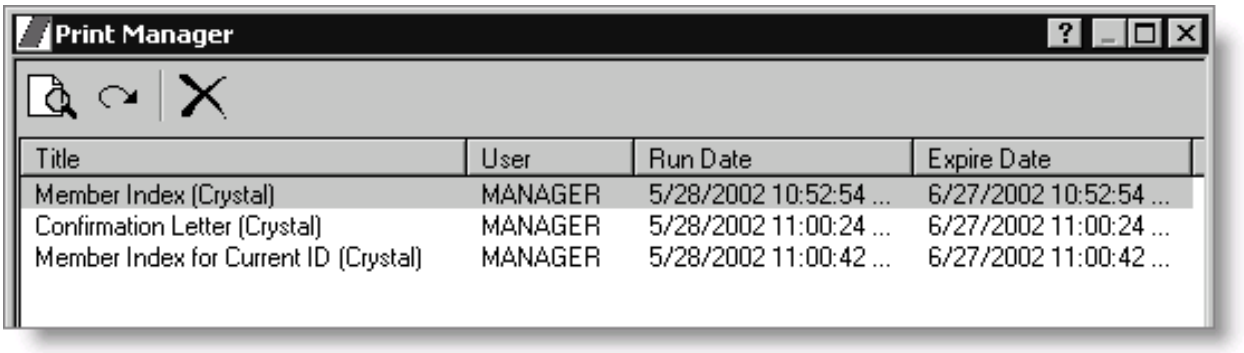
   To view a report from Print Manager

   All stored reports are kept in the Job_Record table and are assigned sequential numbers. The reports are saved in the directory designated in the System Setup window (select File> System Setup) and are stored in files labeled asi#.rpt. The Print Manager displays

only those reports that the current user has run. Only users with a system management access level of eight or higher can view all reports.

1. Open iMIS.
2. Select File> Print Manager. The Print Manager displays a list of stored reports with the following columns:

- Title (report title)
- User (the user who ran the report)
- Run Date (the date the report was run)
- Expire Date (the date the report will be purged from the Print Manager)



3. To view the report, double-click the report title, or select the report title, and click View the report. The Crystal Preview window opens. Print the complete report or select a range of pages to print.
4. To update the list, click Refresh report list.
5. To delete a report from the Print Manager, select the report, and click Delete the report(s). To select multiple reports, hold down the Shift key (to select a range) or the Ctrl key (to select individually) on your keyboard.

Hands-on exercise: Run a report from the Print Manager

In this exercise, you will run a saved report from the Print Manager in iMIS.

1. Select File> Print Manager. The Print Manager window opens with a list of the current stored reports.

2. Double-click the Member Index (Crystal) report. The report opens in the Crystal Preview window.

Troubleshooting when reports are not being stored

1. Make sure the report directory where the reports are to be stored has been designated (select File> System Setup).
2. Make sure the Save Report option is enabled (select Utilities> Report Specs, select the report, click Edit, and click Parameters).
3. Check the Install CD to make sure the Launch Data Access Setup was selected during installation.

Implementing report security

The Access Keywords field on the Detail Report Parameters window allows you to set up global security measures to prevent users from running or printing a report.

1. You must perform the following steps to implement the iMIS report security measures:
2. Create the ACCESS_KEYWORDS lookup table.
3. Assign an access keyword(s) to reports.
4. Assign an access keyword(s) to users.

To create the ACCESS_KEYWORDS lookup table

The first step in implementing security measures is to create the ACCESS_KEYWORDS lookup table for the reports.

1. Go to Configure, select Membership > Set up tables > Set up lookup/validation tables.

Note: Unlike other General Lookup/Validation Tables, users must have an authorization level of 8 or higher to edit ACCESS_KEYWORDS.

2. Select the drop-down list, and select ACCESS_KEYWORDS or, if the ACCESS_ KEYWORDS table does not exist:

- Select (New Table) from the list of table types. The Please Enter a New Table Type window opens.

- Enter ACCESS_KEYWORDS in the data entry field.

3. Click New.
4. Type the Code and Description for the access keyword.
5. Click Save.
6. Click New for each table entry you create, and click Save to save each entry.
7. Restart iMIS.

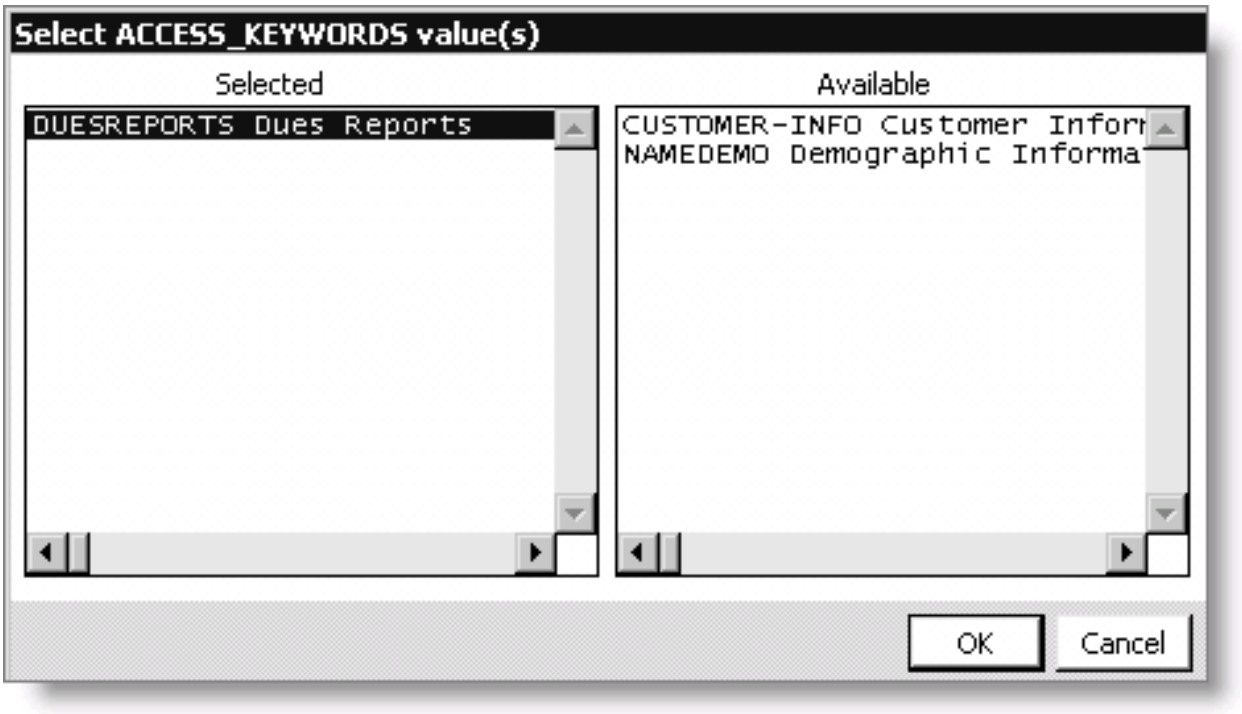
   Note: If an access keyword is deleted from the General Lookup/Validation lookup table, the keyword must be removed manually from the Detail Report Parameters window and the User Names window where it is used.

   To assign access keywords to reports

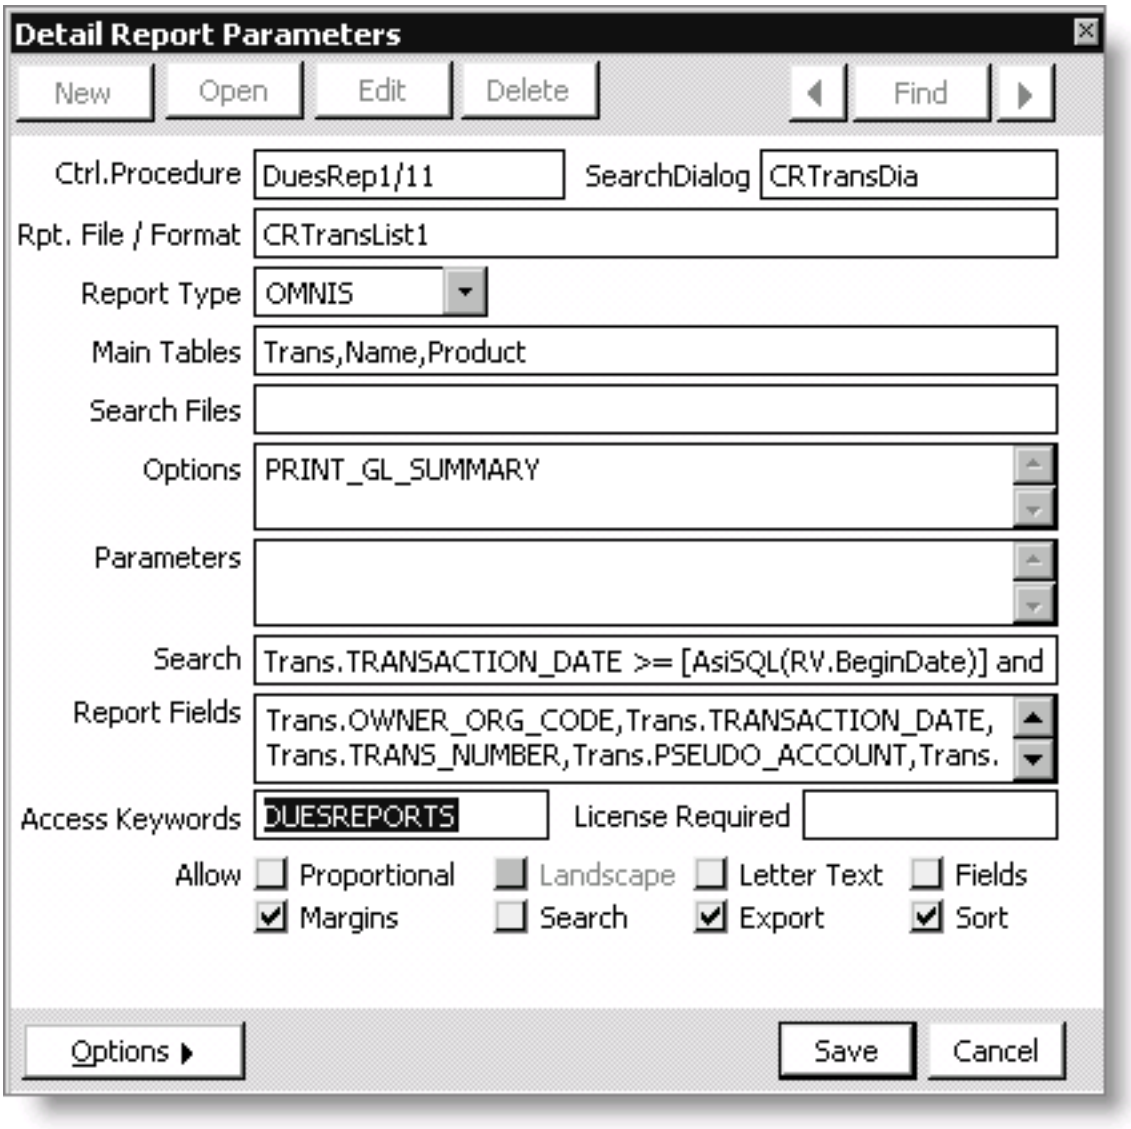
   iMIS allows you to enter and assign access keywords that allow only certain users to see or to print a report. You can apply the access keywords to any report.

1. Create the access keywords in the ACCESS_KEYWORDS lookup table.
2. Select Utilities> Report Specs.
3. Select the report.
4. Click Edit.

5. Click Parameters to open the Detail Report Parameters window.
6. Place your cursor in the Access Keywords field, and press Ctrl+L to select from the available access keywords.
7. Double-click the keyword to move the keyword from the Available area to the Selected area.



8. Click OK. The selected keyword displays in the Access Keywords field.



9. Click Save to save the information.
10. If you have assigned access keywords to a report, give the appropriate users permission to view and print the report.

    To assign access keywords to users

    Now that you have defined the ACCESS_KEYWORDS values and assigned the keywords to reports, you are ready to assign access keywords to the individuals who will be using the reports.

1. Log on to iMIS as MANAGER.
2. From System Setup, select Security administration > Users.
3. Find a Full or Casual user and open their user record.
4. Enter an authorization level for each module in which the user has access.
5. Enter the access keywords, if any, for this user in the Access Keywords field. The access keywords grant the user access to areas of functionality associated with the designated keyword.
6. Click Save to save the information.
7. Restart iMIS.

Tips and Tricks: Crystal reports

Printing

- To print Crystal reports (which includes both Print to Screen and Print PDF file to Screen), you must have the free Adobe® Reader® installed on both the server and your work-station.
- If you are experiencing problems with your margins, you might want to check your print driver's default margins. The print driver's default margins will override all other margins.
- To cancel a print job, you must have permissions to the print server.

Can Grow Fields

- Crystal has an option that prevents data fields from being truncated. This prevents longer names from being cut off. This option should be set on all fields except date fields and numeric fields.
- To set the Can Grow option globally: Select File> Options, select the Fields tab, click String, select the Common tab, and enable the Can Grow option.
- To set the Can Grow option on a field: Highlight the field, right-click, select Format Editor, select the Common tab, and enable the Can Grow option.

Dates

Do not hard code date formats in the report. Instead, use the system default.

Suppress blank sections

Use different detail sections for fields that you wish to suppress based on selection criteria or, if there will be no data in those fields, for some records.

Report access

To access a module's reports, you must be assigned either to the module's group or to the Reporting group. You will see only folders and documents that match your permissions.

To see the Generate reports link on the iMIS Home page, you must be assigned to the Reporting group.

Runtime parameters

- An asterisk (*) next to a parameter name shows that it is required.
- With an optional parameter, either enter a parameter to narrow the search or leave it blank to obtain all records.
- In addition to default parameters (OrgName, ReportTitle, OperatorName, and DateTimeSubmitted), Crystal reports might use others: refer to the Crystal Report Specifications for report-specific parameters.
- If you see no default value (the field is empty), you can enter your own value. However, if a default value appears, you must select from among the values in the drop-down list.
- If you change the original parameters in preview mode, be sure to select Change Parameters before generating the report.
- If you expect parameters but see none, ask the creator of the output process to enable the Show Parameters at Runtime option.

Troubleshooting: Crystal reports

Validation errors

The following conditions will produce a validation error when creating a Crystal report output process:

- A required field has not been populated. The message will state which required field was not supplied.
- A parameter required for the template or query has not been supplied. The message will state which parameter was not supplied.
- The query assigned to the output process does not contain the business object driver object type as a source.

Printing errors

Problem: The error message "Could not open print engine" displays when trying to run a custom Crystal report from the iMIS Generate reports window.

Solution 1: Make sure the full version of Crystal is installed on your workstation. The error message may display if you are accessing the runtime dlls from the network instead of your workstation.

Solution 2: Check the printer setup.

1. Make sure all printers are set up in Windows with the actual PORT listed in front of the printer path. For example, LPT1:\\SERVERNAME\\PRINTER instead of \\SERVERNAME\\PRINTER. It is better to capture the printer port as shown in the following steps instead of manually entering the port in front of the printer path.

- Double-check your printer setup. From the Windows Taskbar, select Start> Settings> Printers. Right click on the printer, select Properties, and select the Details tab.
- Click Capture Printer Port. The first available port displays. Enter the path to the printer you wish to use, and select OK.
- After the port has been selected, the Details tab displays. Select the Print to the following port drop-down menu, and select the new destination that was set up on the previous screen.

2. Also, some print drivers will cause this error. It usually is caused unexpectedly when you install new software. When this occurs, reinstall the original print drivers.
3. Also, note the following for general printing issues:

   iMIS requires temporary storage on the local hard drive when sending reports to the screen. If you are unable to print reports to the screen, review the following:

- The TEMP environment variable listed in your autoexec.bat file may be pointing to an invalid location. Check to make sure this variable is valid.
- There may be no free space available on the local drive. Check to make sure you have at least a few megabytes available.
- The TEMP environment variable may be pointing to a valid directory, but the directory may be filled. Check to see if the temporary directory is full. If so, delete unwanted files.

On Your Own

1. In which directory are the iMIS standard reports kept?
2. What is the purpose of the Print Manager?
3. Which iMIS table stores reports?
4. What are the three steps required to implement report security?

Advanced Report Customization

See International Taxation for details about customizing reports for Canadian and VAT taxation needs.

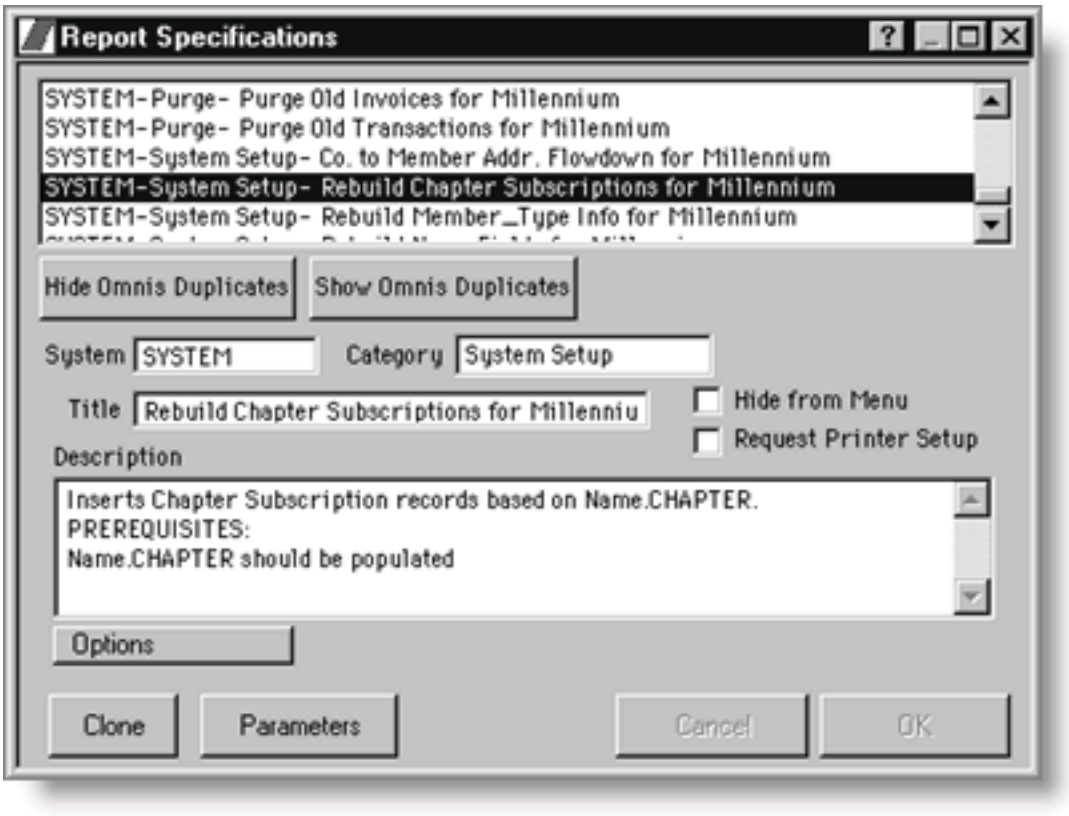
Adding Custom Scripts to System Reports/Queries

System administrators can execute custom SQL scripts by first setting up report specifications. The benefit of executing a SQL script in this method is that the script can be automated from the iMIS front-end and report driven.

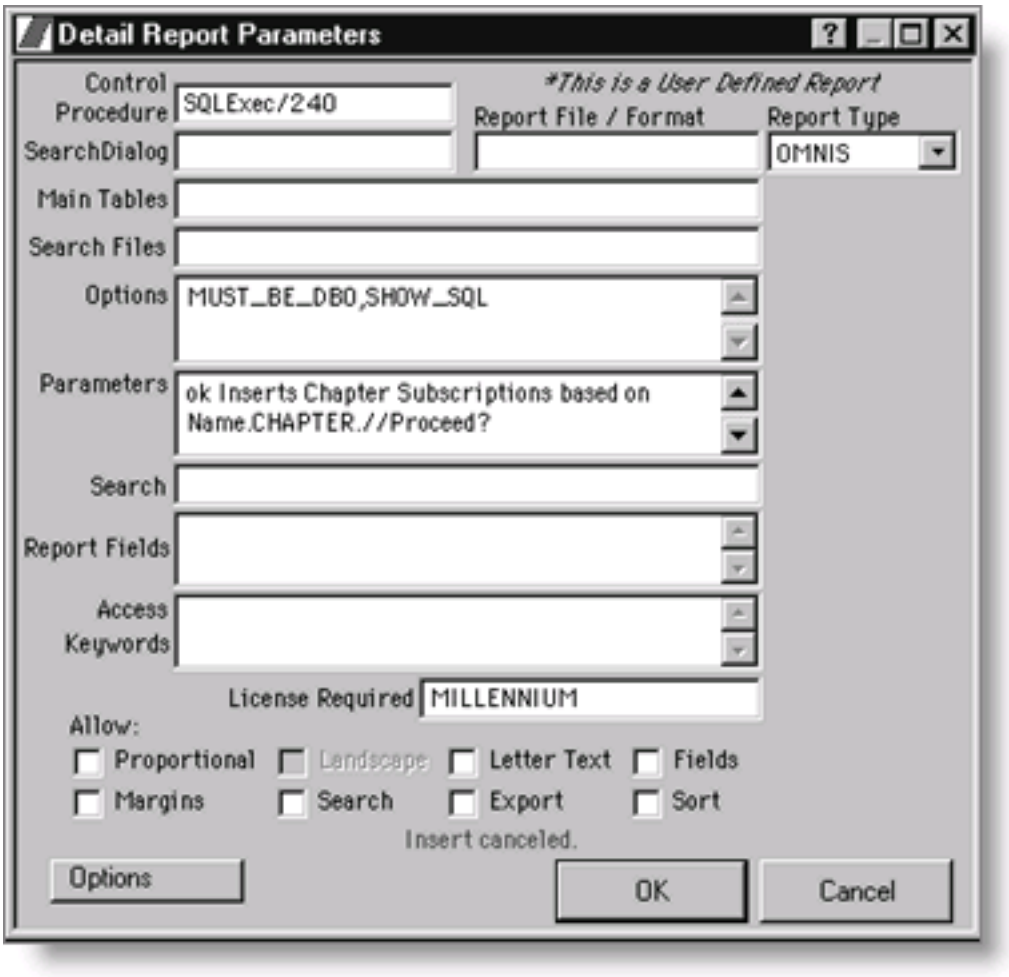
1. Select Utilities> Report Specs.

2. Select a report from the SYSTEM-System Setup group to clone.
3. Click the Clone button.
4. Enter a System, Category, Title and Description.
5. Click the Parameters button.
6. Enter SQLExec/240 in the Control Procedure box.
7. Enter MUST_BE_DBO,SHOW_SQL in the Options box.
8. Substitute the script in the Parameters box on the Detail Report Parameters window

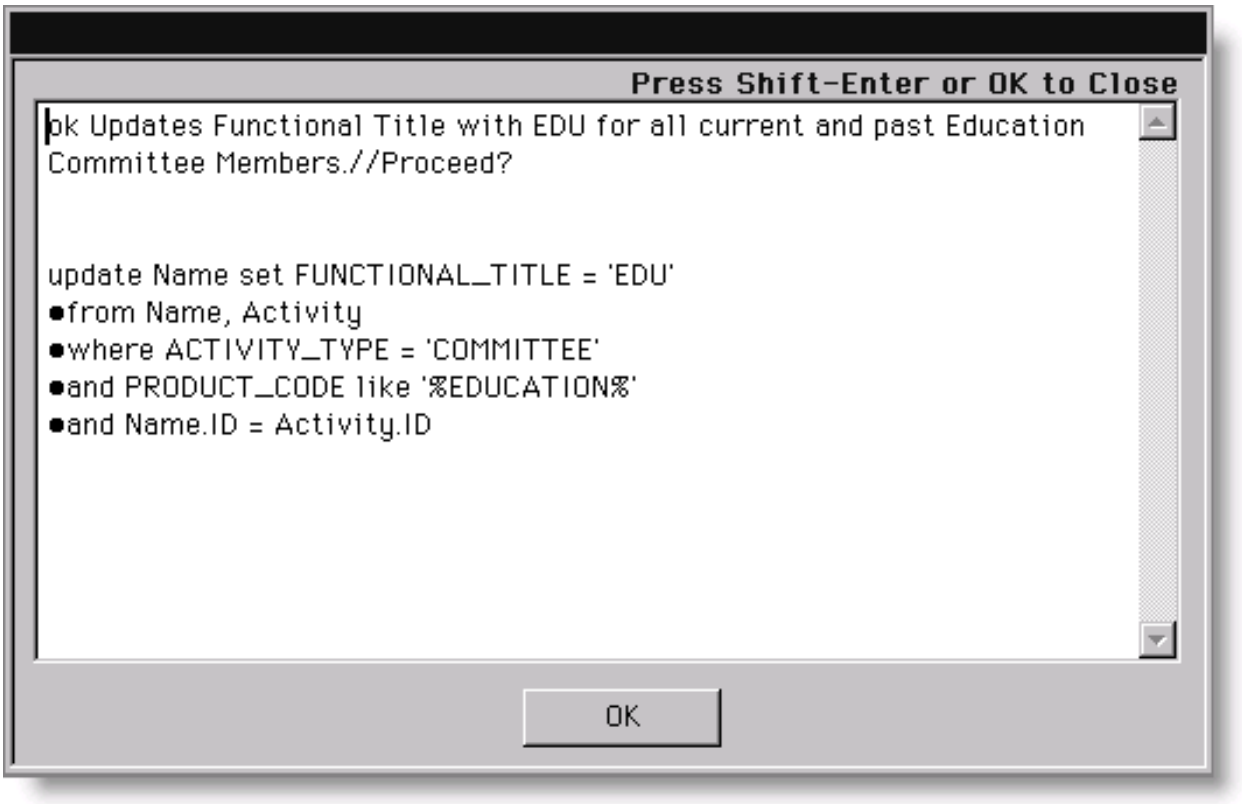
   Note: Place your cursor in the Parameters box and press CTRL+Z or click the Zoom button to open the parameters window.
9. Click OK to accept the changes. You can now execute the script from the Utilities> Reports & Queries window from within iMIS.
10. Click Run to execute the command. iMIS prompts you to confirm the action Updates Functional Title.
11. Click Yes to execute the script.



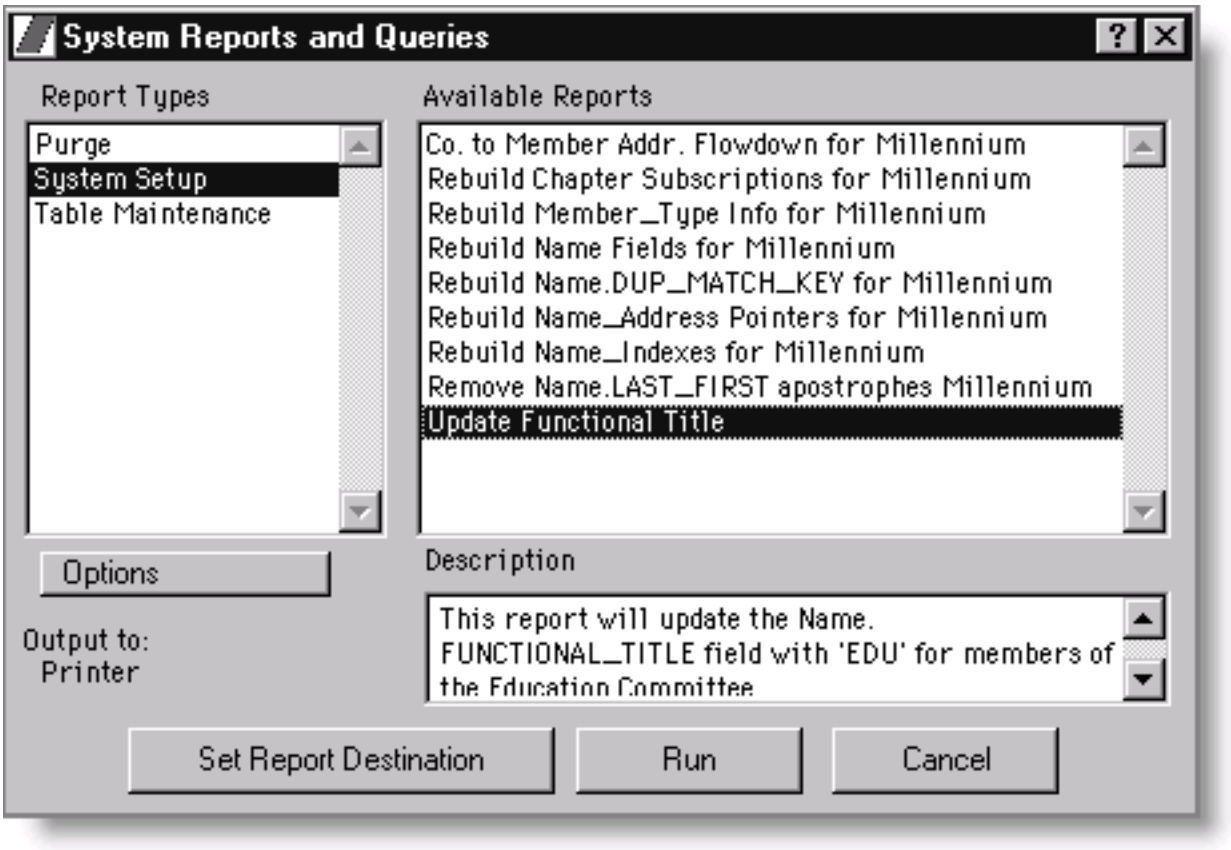
Example: Select a Report from the SYSTEM-System Setup.



Example: Enter MUST_BE_DBO,SHOW_SQL in the Options box.



Example: Substitute the script in the Parameters box.



Example: You can now execute the script.

Creating a Report Role with Restricted Rights

Some users will only need to perform certain functions for iMIS data. They should not be able to perform other tasks on the system. This prevents the user from viewing data that does not pertain to their reporting responsibilities.

You can create a role restricting users to specific tables, used in running reports, with SQL Server Enterprise Manager. All dbo owned tables and views except Users, System_Params, Security_Filters, Security_Groups, Security_Modes, Security_Tables are used in reporting.

For more information refer to the Microsoft SQL Server Enterprise Manager user documentation.

To add Access reports to the menu

1. Create the Access report.

2. Select Utilities> Report Specs to open the Report Specifications window.
3. Click Insert to enter a new report specification.
4. Enter the System and Category where you want the Access report to appear.
5. Enter a unique Title for the new report.
6. Click Parameters to open the Detail Report Parameters window.
7. Enter RunCommand in the Control Procedure field.
8. Enter the following data in the Parameters field to point to the sample report NameMailAddressLabels in the iMIS database:

   (Enterprise database)

   <<Command>> “c:\Program Files\Microsoft

   office\Office\MsAccess.exe”

   “c:\imis_ent\access\imis_ent.mdb”;Report;NameMailA

   ddressLabels;Screen (or Printer)

   To add one of your reports in your Access database, enter:

   <<Command>> “c:\Program Files\Microsoft

   office\Office\MsAccess.exe” “full-path-to-yourdatabase-

   file”;Report;your-report-name;Screen (or

   Printer).

   Note: The << >> symbols are less-than and greater-than symbols, not chevrons.
9. Click OK on the Detail Report Parameters window.
10. Click OK on the Report Specifications window.

Generating and Managing Mass Report Activity Records

This standard feature allows the user to create mass activity records when running system-generated Omnis and Crystal reports. To enable this feature, the PRINT_CREATE_ACTIVITY option will need to be entered in the Options field on the Detail Report Parameters window. The default value for this field is NO_CREATE_ACTIVITY.

When PRINT_CREATE_ACTIVITY is entered in the Options field on the Detail Report Parameters window, the Create Activity option will be enabled on the Selections window. You can choose to not create activity records by disabling the option.

The NO_CREATE_ACTIVITY option should display in the Options field for the following report specifications:

- Certification - Labels, letters, and exports
- Fundraising - Exports, reminder notices, and letters
- Events - Badges, certificates, confirmations, exports, labels, letters, and tickets
- Customers - CEU Detail report, certificates, exports, labels, and letters
- Orders - Labels

To update report specifications

To update additional report specifications, edit the Detail Report Parameters window to add either PRINT_CREATE_ACTIVITY or NO_CREATE_ACTIVITY to the Options field.

1. Select Utilities> Report Specs to open the Report Specifications window.
2. Select a report.
3. Click Edit.
4. Click Parameters to open the Detail Report Parameters window.
5. Enter one of the following commands in the Options field:

- Enter PRINT_CREATE_ACTIVITY to enable a Create Activity checkbox on the report request screen; or

- Enter NO_CREATE_ACTIVITY to display a disabled Create Activity checkbox on the report request screen.

6. Click Save.

The Options field in the Detail Report Parameters window.

To create a report-specific activity type

Activities used as report activities must have the Allow user Edit option enabled.

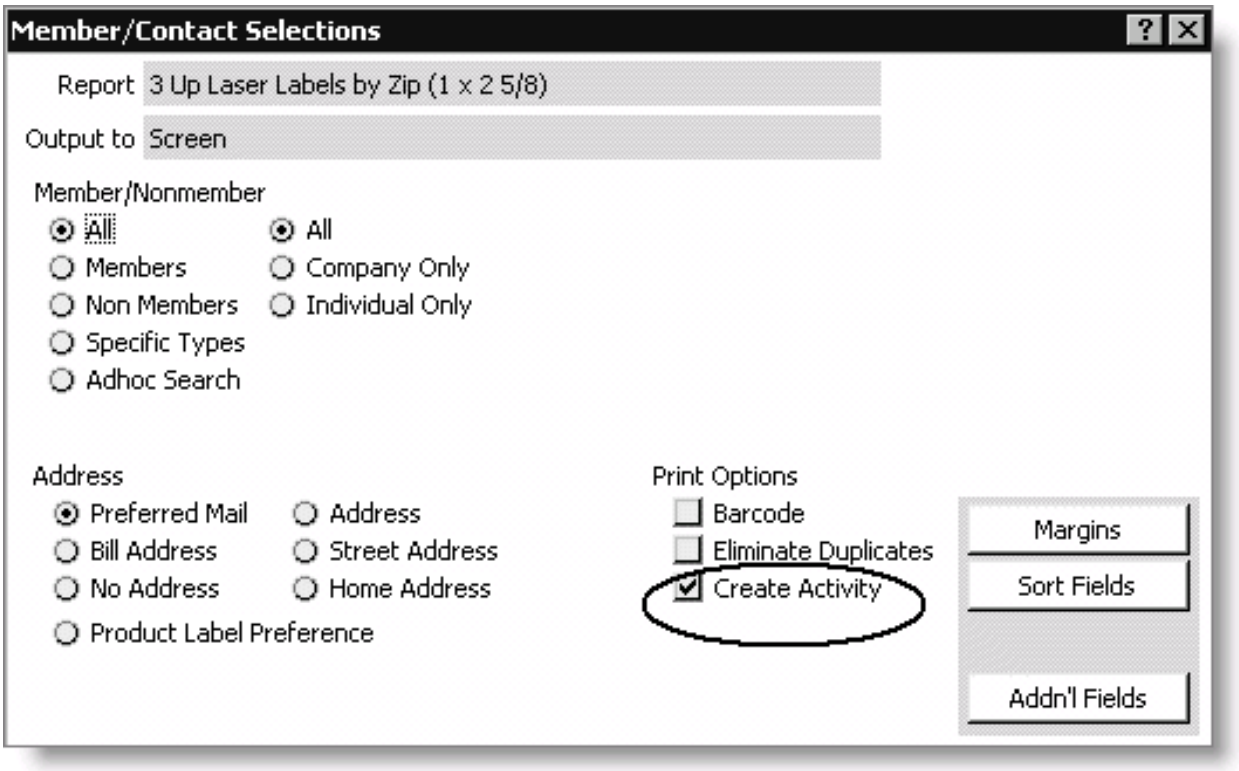
1. Go to Configure, select Membership > Set up tables > Set up activity types.
2. Click New.
3. Enter an activity name, for example, REPORT.
4. Tab to Description, and enter a description, for example, Report Generation Activity.
5. Tab to the Description prompt field, and enter a prompt, for example, Report Desc. This field will store the description of the report.
6. Tab to the Source prompt field, and enter a prompt, for example, Promotion Code.
7. Enable the Allow user Edit option.
8. Click Save.

To request a report and generate activities

1. From Customers, select Generate reports.
2. Select your Report Type and the desired report from the Available Reports list.
3. Select the appropriate Report Destination.
4. Click Run. The Member/Contact Selections screen appears.

5. Enable your desired member/contact selections for your report, making sure the Create Activity box is selected. Click OK to open the Activity Detail window.
6. Enter an Activity Type, or press Ctrl+L to select a value.
7. Enter a Source Code, or press Ctrl+L to select a value.
8. The Date field will default to the system date and can be changed if necessary.
9. The Description field will default to the report title on the Report Selection window.

   Note: Clicking Cancel will cancel the activities, but the report will process.
10. Click Save to process the report.
11. A dialog box shows the number of activities to be inserted and asks if you want to run the procedures. Select Yes.



The Member/Contact Selections Window

To view activities after report processing

After the report processing is complete, activity records can be viewed.

1. From Customers, select Manage customers.
2. Find a customer record for which a previous report was processed, for example, 105.
3. Select the Activities-All tab.
4. Select the activity created to open the Activity Detail window.

The Letter System (Word Merge)

iMIS uses the Merge feature of Microsoft Word™ to let Word be your organization's word processor for bulk mailings and 1-off letters, using the data in your iMIS database.

Word templates

Default templates are used as a starting point when creating a Word merge. When a user sets up a Word merge, the default template structure is copied to a new Word document. The default template contains a set of merge fields which come configured with iMIS but may be customized by an administrator.

Merged documents

Users can make changes to the the Word document that is used for a particular merge, but these changes will not affect the template on which the document was based.

Custom merge fields

Administrators chose the fields that are available to users for their Word merges. Users can add fields to their Word merge document, but these fields must be chosen from the fields that you make available to them when configuring Word merge for the module in question.

Reverting changes

If you have made modifications to the default template that no longer meet your needs, you can revert to the default template and available fields.

Implementing the Letter System

Authorizing access to the Letter System

To use the Letter System from the Generate reports window, users must have authorization level 2 or greater, except for these places where level 1 suffices:

- In Customers, the Letters tab (select Manage customers, find a customer record, select the Letters tab, and then click New Letter).
- In Events, select Register a customer, find a registrant, and then click Letter

To add fields to the list of available fields in the Letter System, and to define the fields that are available in the Letter System, you must have authorization level 8.

Enabling the Letter System

No license key is required to use the Letter System.

To enable the Letter System

1. In System Setup, specify a folder (see below) for the Letter System's templates.
2. Grant user logons authorization level 2 or greater, which is generally required to use the Letter System.
3. Ensure that those client computers have Microsoft Word installed.
4. When installing iMIS Desktop on client computers, select the Letter System option.

To enable the Letter System, you must specify a folder its template files. All iMIS users must specify the same folder path, whether it's local or remote. The path you specify is stored in the iMIS System_Params table, as the ParameterName value of System_Control.MSWordStoreDirectory.

> **Note:** Note: Truncating the Report Specs table deletes the Microsoft Word template report specifications.

To specify a folder for Letter System template files

1. Log on to iMIS.

2. Select File > System Setup.

   The System Setup window opens.

3. Click Edit.
4. Click Choose MS Word Folder (or enter a folder path in the field next to that button).

   The Browse for Folder dialog box appears.

- Select a local or remote folder.

  If you specify a remote folder, make sure that all users have permissions to access to the folder.

- Click OK.

5. In the System Setup window, click Save.
6. Log out of iMIS, and then log on again.

   Related information

- To disable the Letter System
- Authorization for the Letter System (see "Authorizing access to the Letter System")
- Troubleshooting the Letter System

  To disable the Letter System

1. Open a command prompt.
2. Navigate to your local system directory (for example, the \WINNT\system32 directory).
3. Unregister the ASIWordInt.ocx Active X control by typing:

   regsvr32 ASIWordIntocx /u

4. Delete the ASIWordInt.ocx file.

Defining the fields available in letter templates

You can change and reorder the fields that are available in the Letter System.

> **Note:** Note: The changes you make with this procedure affects only new templates. Templates that you create by copying an existing template are not affected.

Related information

- Creating a letter template
- To add fields to the list of available fields in a template (see "Adding a field to a Letter System template")
- Fields Available in the Letter System

To define the fields that are available in letter templates

> **Note:** Note: You must have authorization level 8 for the module in which you wish to perform this procedure.

1. Log on to iMIS, and open the window of a module that includes the Letter System.
2. From the reports window, select a Letters report type.
3. Click Letter System.

   The (module name) Standard Letters window opens.
4. Click Setup.

   The Setup Standard Letters window opens.
5. Specify field properties for this module.
6. Click Save.

Fields available in the Letter System

The following iMIS fields are available in the Letter System, and display for each MS Word template in the Report Fields field on the Detail Report Parameters window (select Utilities > Report Specs, select a template, click Edit, and click Parameters):

Note: Note: You can add other fields to your MS Word templates (see "Adding a field to a Letter System template").

Creating Letter System templates

The Letter System allows you to create and edit letter templates for use with Word's Merge feature. The Letter System integrates Microsoft Word with many areas of iMIS:

- Customers
- Events
- Exposition
- Fundraising
- Certification
- Referrals
- Committees

For best results, customize the templates for your organization. An iMIS administrator can change which iMIS fields are available for use in letter templates. Create the content for each letter template, including the common text, styles, layout, and the fields that best suit each letter or email.

> **Note:** Tip: Customers can track Letter System communications as Activity records.

Creating a letter template

The fields that are available in the template depend upon whether you create a new template or copy an existing template.

- A new template can use the fields that are currently available for this module.
- A copy of an existing template can use the fields that were available when the existing template was created.

Related information

- Defining the fields that are available in letter templates

Before you begin

- Close other instances of MS Word, if any are running.
- Complete any edits in iMIS, if any records are open.
- Log on to iMIS, and open the window of a module that includes the Letter System.

To create a letter template

1. From the reports window, select a Letters report type.

   Note: The Available Reports list is empty. Letter reports are selected on the (module name) Standard Letters window.

2. Click Letter System.

   The (module name) Standard Letters window opens.

3. Create a new template or copy an existing template.

- To create a new template, click New.
- To copy an existing template, select the name of the template to copy, and then click Save As.

The New Standard Letters window opens.

4. In the Report Title field, enter a name for this letter template. For example, Established Member Letter.
5. In the Report File field, enter a file name for this letter template. For example, est_mem.
6. Click OK.

   iMIS displays the new template information in the (module name) Standard Letters window, and starts MS Word with the new template file. You can edit the template and add iMIS database fields now or later.

7. Save the template file and exit MS Word.

Adding a field to a Letter System template

You can add fields from any iMIS table to the list of available fields in a Letter System template, within these limits:

- Images: You cannot add a field containing image data, such as Name_Picture.PICTURE_LOGO.
- UDTs: You cannot override the restrictions that are built into user-defined tables. For example, if you add a field to a template from a user-defined table that is restricted to a specific member type, the merge results can include only those records that match the member type. This is true even when the template does not use any of the fields from the table that is the source of the restriction.

To add a field to a report specification

> **Note:** Note: You must have authorization level 8 to perform this procedure.

1. Select Utilities > Report Specs to open the Report Specifications window.
2. Select a Word template to edit.
3. Click Edit.
4. Click Parameters to open the Detail Report Parameters window. The template file name displays in the Rpt File / Format field, and the Report Type is shown as MSWORD.
5. Edit the report properties.

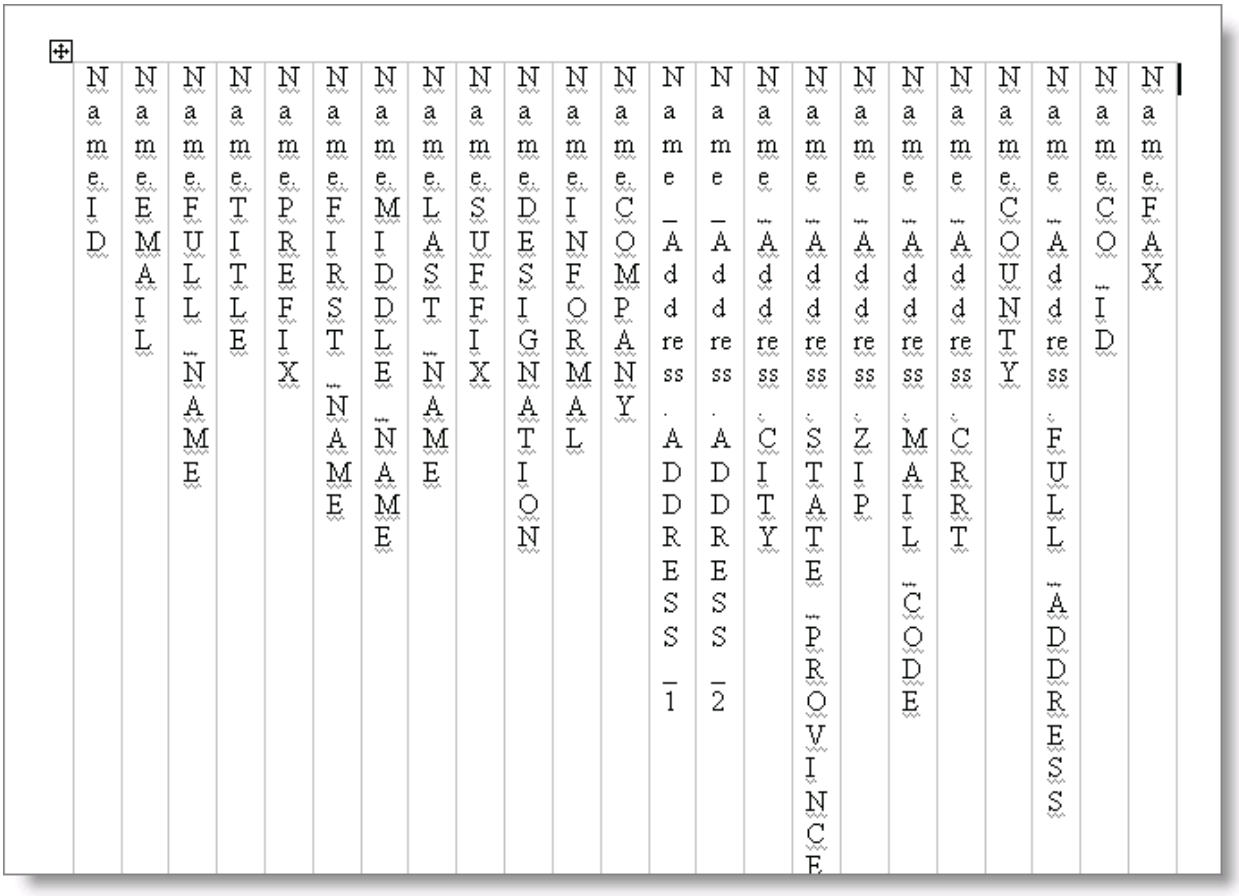
- (optional) In the Main Tables and Search Files fields, enter the table name.
- In Report Fields, enter new field names after the existing field names. For example, Name.FAX.

6. Select and copy the new field name to the clipboard.
7. Select Save.
8. Now add the field to the header file (below).

To add a field to the Word template header file

1. Browse to the folder in which Letter System template files are stored.
2. Open the header file for the template you are editing. The file name for header files end in _header.doc.
3. At the end of the table, insert a new column.
4. Paste the new field name that you copied from the Detailed Report Parameters window into the new column.
5. Important: Verify that the new field appears in the same order as it does in its report specification.
6. Save and close the document.

   When this template is used, the new field appears at the end of the list in Word.



Sample of a _header.doc

Using Word field switches in Letter System templates

You can apply the switches available in Microsoft Word to the merge fields in your Letter System templates. These switches let you modify the format of the data that results from the merge fields you add to your letter. Refer to Microsoft Word documentation for more on using switches to change the format of merged data.

> **Note:** Note: The switch must be placed after the “MERGEFIELD” but before the curly bracket }. For example { MERGEFIELD Name * Caps }.

The numeric picture (\#) and format (*) switches are the two most common types of switches used in merging letters. The following are options available when using these two switches to modify your merge data:

\# - Numeric Picture

Use this switch to specify the display of a numeric result, including the number of decimal places and the use of currency symbols.

0 - (zero) Indicates the number of decimal places to display

- Indicates the number of spaces to display

$ - Indicates to include the specified character in the result

. - (decimal point) Indicates the decimal point position

, - (comma, digit grouping symbol) Indicates where to separates a series of three digits

For example, if the Annual Review merge field has a value of 100, changing the field to
{MERGEFIELD "Name_DemoANNUAL_REVIEW \#$#,0.00}
displays $100.00 for the result.

* - Formats

Use this switch to specify number formats, capitalization, and character formatting; prevents changes to the format of the field results when a field is updated.

* Charformat - Apply the formatting of the first letter of the field type to the entire result

* Caps - Indicates the first letter of each word should display as a capital letter

* FirstCap - Indicates the first letter of only the first word should display as a capital letter

* Upper - Indicates all the letters should be capitalized

* Lower - Indicates all the letters should be lowercase

For example, if the {NameFULL_NAME} merge field results in a value of Ms. Jean D. Smythe, changing the field to {NameFULL_NAME * Upper} results in a value of MS. JEAN D. SMYTHE.

Converting checkbox values to text

When you add a checkbox field to a letter template, iMIS inserts the database value of the field, which is either 0, for no (not selected), or -1, for yes (selected). To substitute text for the database values, use an If-Then-Else field in MS Word. For example, { IF {MERGEFIELD Checkbox } = "0" "No" "Yes" }.

Troubleshooting the Letter System

Following are some examples of problems that may occur with the Letter System.

Blank lines in a MS Word letter or an e-mail message

Reason: A limitation in MS Word may allow blank lines to print even with the Don't print blank lines when data fields are empty option enabled on the Merge window.

Solution: Verify fields are populated.

Unable to activate Merge in MS Word

Reason 1: MS Word is open in another session.

Solution 1: Close all sessions of MS Word before performing a merge.

Reason 2: You have not chosen at least one merge field.

Solution 2: Make sure to select at least one merge field.

Problems while creating multiple templates and running merges within iMIS

Solution: Close MS Word and iMIS, then restart your iMIS application.

Message: “A field calculation error occurred in record 1.”

Reason: This error may occur in MS Word during a mass merge due to additions and deletions of the Normal.DOT template in MS Word.

Solution: Refresh the Normal.DOT originally supplied with MS Word, or regenerate it by deleting it and allowing Word to recreate it.

Message: “GetMergeData - [Sybase][ODBC Driver][Adaptive Server Anywhere]Syntax error or access violation: near “I” in …ADDRESS,Name.CO_ID[I]from Name,Name_...”

Reason: This error may occur during a single customer merge. Our testing has shown this may be due to additions and deletions of the NORMAL.DOT template in MS Word.

Solution: Refresh the NORMAL.DOT originally supplied with MS Word.

Message: “The messaging interface has returned an unknown error. If the problem persists, restart Outlook.”

Reason: This message may occur when the Letter System in iMIS is open and you are trying to send an e-mail.

Solution: Close Outlook.

Message: “This template does not exist in the MS Word folder."

Reason: The template folder is invalid or unavailable.

Solution: If the template folder is located on the client computer, check the complete path to the folder. If the template folder is located on a remote computer, check your network connection.

Letter System is not working

Reason: The Letter System is not fully enabled. Follow these steps to perform additional troubleshooting:

1. Log on to iMIS.
2. Select Help > About iMIS.

   The About iMIS window opens.

3. Click System Info.

   The iMIS System Info window opens.

4. Check the value of the ASIWordInt.ocx property.

- If the value is not loaded, the Letter System option was not selected when iMIS was installed on your client computer.
- If the value is not loaded (no MS Word), the Letter System option was selected when iMIS was installed on your client computer, but Microsoft Word is not installed.
- If the value is not loaded (no path), the Letter System option was selected when iMIS was installed on your client computer, and Microsoft Word is installed, but no folder was specified for template files.
- If the value is not loaded (path error), the Letter System option was selected when iMIS was installed on your client computer, and Microsoft Word is installed, but the folder that was specified for template files is invalid or unavailable.
- If the value is a number, the Letter System is fully enabled. Contact Support.

Tables and fields used by the Letter System

The following tables and fields are used with the Letter System:

Activity_Attach

(stores merged MS Word documents as attachments)

ATTACH_SEQN	long integer	Primary key
TEMPLATE	varchar (255)	Name of the template used
ATTACH_TEXT	text	Text of the MS Word document as sent by the merge process

Activity

ATTACH_	long	Used to store a reference to an associated record in the Activ-

SEQN	integer	ity_Attach table

Report_Desc

REPORT_ OPTIONS	text	PRINT_CREATE_ACTIVITY (default) - The checkbox on the Report Selection window is enabled by default. NO_CREATE_ACTIVITY - The checkbox on the Report Selection window is disabled by default

Reports and Output Processes

Understanding reports and output processes

iMIS Reports and Output Processes help you customize and manage reports, Microsoft Word merges, and email merges. These output processes use current iMIS database information and can be exported to a variety of output formats for maximum flexibility. With Reports and Output Processes, you can:

- Create and manage custom business data
- Use queries and business objects to generate output
- Customize report output
- Assign folder and document security
- Use templates to ensure consistency
- Export data to a variety of formats
- Use pre-built reports to assist non-technical users

Process

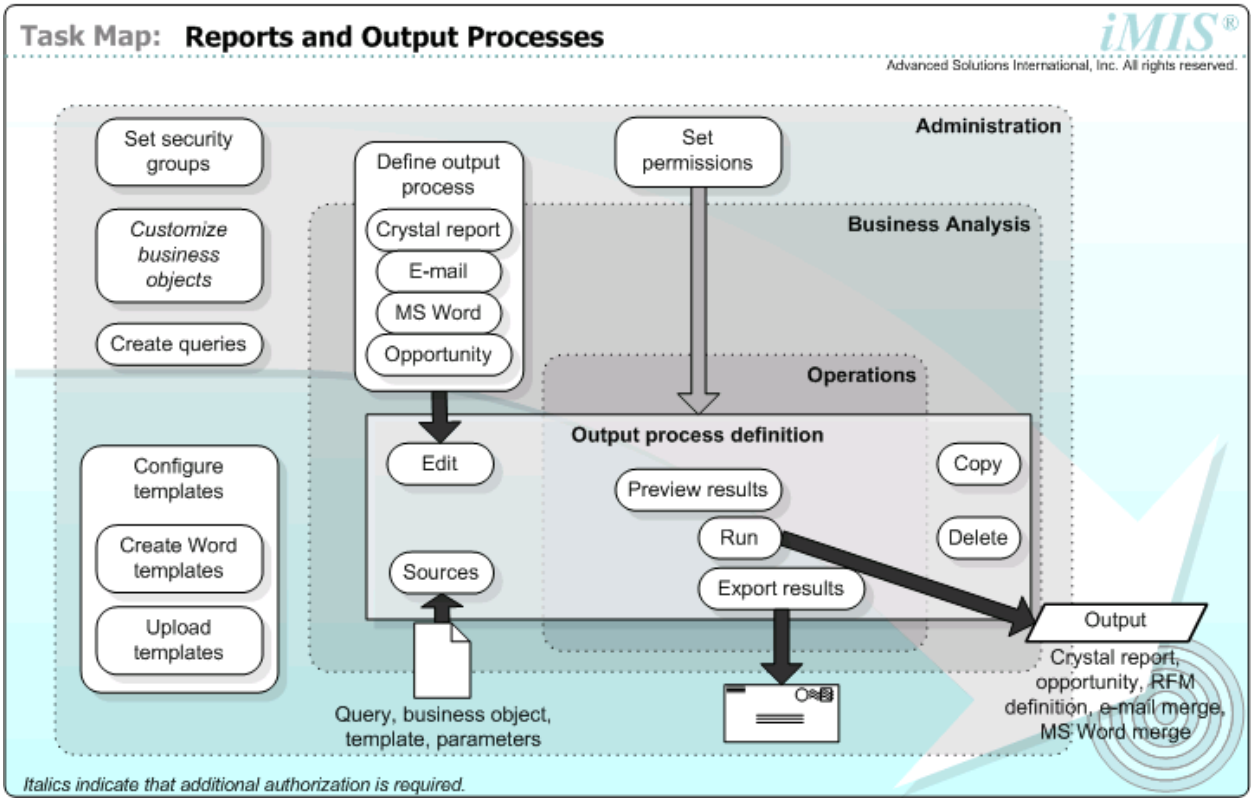
By using the flexible features, your staff can efficiently manage your organization's communications needs to meet your business goals. The process to set up and use Reports and Output Processes is:

- In Tools, administrators modify default output processes/reports or create new ones.
- When using an application, managers can modify items in the output processes/reports folders, within limits set by the administrators, and run reports and output processes.
- Users can run reports and output processes through a simple interface, inputting any required information specified the administrators.

  In this tiered approach, managers and users do not have to know report setup or database schema to modify and run reports. Security settings determine the information each user can view.

Task Map: Reports and Output Processes

This diagram maps tasks for reporting and output processes, both by the approximate order they occur (top-left to bottom-right) and by the organizational area that performs them.



Task Map: Reports and Output Processes

Concepts and Terms: Reports and Output Processes

Asynchronous Process

A process that runs independently (in the background) of other processes. Other processes may be started before the asynchronous process has finished.

Bound Query

A query that is connected to an output process definition and cannot be overridden at runtime.

Driver Business Object

A business object that validates, at runtime, that a selected query will be able to drive an output process; for example, a driver business object for a report would create the required index.

Object

Self-contained element that consists of instructions to manipulate data; for example, a business object or query object.

Output Device

Method through which a user views the results of an output process; for example, a computer screen, printer, or PDF file.

Output Format

Format in which the data resulting from an output process displays; for example, comma-delimited, tab-delimited, Excel, HTML, MS Word, or XML.

Output Process

Process-oriented task; for example, a report, MS Word merge, or query.

Parameter

User-supplied value that dynamically customizes output. A parameter can be hard-coded or specified at runtime.

For example, a query that outputs the registrants for a closed event could require the user to supply the event code at runtime.

Process Definition

Set of runtime-specific instructions used to execute an output process.

For example, to create a report process definition you must specify a report template, associate a data source (query), determine the output destination, and specify any parameters necessary to guide the process execution.

Synchronous Process

A process that runs as a result of another process being completed.

Template

A document that dictates the format and/or style of the output of a process definition. Many templates are designed through third-party packages, which are tightly integrated with the iMIS output processing system to produce high-quality output; for example, Microsoft Word documents, email text files, and report file formats.

Creating output processes

Tips for creating output processes

Use output process templates for best efficiency. Some templates are designed through third-party packages which integrate with iMIS, such as Microsoft Word documents. Most output processes allow you to define and save the template while you build the process itself.

Before you begin

Before you create an opportunity output process, make sure Process Mgr is set up to receive it.

Process

The process to create an output process is:

1. Set up security groups.

2. Create queries and customize business objects, if not using existing queries.
3. Create templates, if not using existing templates.
4. Define output processes and set permissions.

Setting up security groups

Security groups are hard-coded in iMIS. You cannot create new security groups. You can only add one or more system-defined security groups to a user record to define general reporting access. See Security Administration.

After you create an output process, you can set permissions for that specific process. See To set user permissions for an output process.

Creating queries for output processes

The source that you should use for the query depends on the context in which the output process will be used.

Location of queries in the Document System

When defining an output process, users must browse to the appropriate query to use for the process. You should create all such queries in the $ > Common > Shared Documents folder (or one of its sub-folders) of the Document System to ensure that it will be easy to find the query when defining an output process.

Query source for Marketing output processes

You must typically define two separate output processes for marketing inserts because source codes and job segments differentiate between contacts and prospects.

- Job segments are defined as a Contact Job or as a Prospect job.
- Source codes are designated as either Contact source codes or as Prospect source codes.

To send marketing inserts to both contacts and prospects, create two different inserts:

- One insert must use an output process whose query source is the NetContact business object.

- The other insert must use an output process whose query source is the Prospect business object.

  > **Note:** Note: You should not use CSContact or CSProspect as the query source for any output process associated with marketing inserts. Use only the NetContact or the Prospect business object as appropriate, depending on the associated source codes and job segments.

  Query source for action plans in Process Mgr

  In Process Mgr, the appropriate query source for an output process depends on whether the process is being used in an action plan.

- If the output process is being used in an action plan, you must use the following query sources:
- Donor action plans must use the OppDonorContact business object.
- Sales action plans must use the OppSalesContact business object.
- Member action plans must use the OppMemberContact business object.
- If the output process is not being used in an action plan, you can use any of the preceding three business objects for the query source, or you can use the NetContact business object.

  Query source for other applications

  If you are not using the query source for anything related to Marketing or Process Mgr, use the CsContact business object as a query source.

Customizing business objects

To validate that the query selected for the output process will indeed drive the process as you expect, you may need to customize a driver business object (usually the Contact business object). See Editing an existing business object.

Using templates for output processes

Use output process templates for MS Word merges or email merges for greater efficiency.

To create a Microsoft Word template

Create the basic template in Microsoft Word. Upload it and add any iMIS-based merge fields when you create the output process.

1. Open Microsoft Word.
2. Create the base text and graphics for your template.
3. Save your template to a local or network drive.
4. Close Microsoft Word.

Defining output processes

The process for defining the types of output processes (MS Word merge, email merge, opportunity) are similar. After you define the process, you can set user permissions for that process.

To define a Microsoft Word mail merge output process

Before you begin

- Ensure that you have created an appropriate query, using the appropriate business object, to use as the query for this type of output process.
- If you are creating a query through Tools > Intelligent query architect, and you want it to be visible to users through Home> Generate Reports, you must save it to Common > Reports View folder.
- Templates from iMIS 10 versions may be incompatible. If you are using new search criteria for your Microsoft Word mail merge that includes something other than date criteria, you will need to recreate your template.

1. From Tools, select Document system.

2. Navigate to (or create) the folder in which you want to create the MS Word merge process.
3. Select Organize > New > MS Word Mail Merge.
4. Define the output process:

- In the Summary tab, enter general information.
- In the Sources tab, browse to select the Source Data Query.
- Leave the Template Name field blank.

  Note: If you upload an existing template or browse to a template that has been uploaded, the template will not be saved as part of the Word mail merge process and you will need to add the merge fields. It is simpler to create a new template during the output process.

5. Create a new template in Microsoft Word (these instructions are for Word 2003):

- Select Edit Template. A new Microsoft Word document appears.
- Click Word's Mail Merge toolbar or consider using the Mail Merge wizard to create the template.
- Create the letter and add merge fields using the Insert Merge Fields icon. (The merge fields are the fields from the query that is associated to the output process display.)
- Select Save, which commits the changes to the Word template.

  Note: Note: The MS word template is embedded within the output process itself.

- (optional) Save a copy of this template outside of iMIS by selecting Save As.

6. Close Word.

   The Template Name field remains blank because the template is embedded within the process itself.

7. Execute your merge:

- From the Process Engine Portfolio, select Run.
- Select Execute Merge.

  Note: You may need to click twice to activate this control.
- View the Merge Details.
- Open Microsoft Word to review, print, or save the output.
- Close Microsoft Word.

8. Save the output process to the appropriate folder location.

   To define an email merge output process for email notifications

   You can define an email merge process in which a query provides the merge data to be combined with an email template to create the output.

   Notes

- Email merge processes should generally be stored in the $ > Common > Shared Documents > Processes folder (or one of its sub-folders) of the Document System to provide for easy access by all users working with Marketing or Process Mgr. If they are stored in any other folder, users need to navigate through the Document System folder hierarchy to locate the process.
- You must associate a query that contains a field with the email addresses of the recipients and the sources for any fields you use in the email.
- The From address must be a valid email address.
- You can also define email merge processes directly from the Processes tab of any Insert definition window in Marketing.

  Before you begin

  Ensure that you have created an appropriate query, using the appropriate business object, to use as the query for this type of output process. See Creating queries for output processes in iMIS Reference Reporting and Sample Reports for more information.

1. From Tools, select Document system.
2. Navigate to (or create) the folder in which you want to create the email merge process.
3. Select New > Email Merge.

   The Define window appears.
4. On the Security page, enter access information.
5. On the Define page, specify the email template:

- On the Summary tab, define general attributes.
- On the Sources tab, In the Associated Query area, choose whether the associated query should be:
- Bound – a specific query is always used with the process. For email messages to be sent automatically when a stage is passed during a certification program, you want to choose Bound.
- Select at Runtime – user selects the query each time the process runs.

6. In the Query area, click … , then use the Document System browser to select the bound or default Query. The query results determine the email addresses of the recipients and the variables that are allowed in the body of the email template.

- In the Recipient List area, click Edit to specify which column in the query results contains the email address for the recipients.

  Note: This area is disabled until a query is chosen. If you specify the Select at runtime option for the Associated Query, you will not be able to specify the column for the recipient email address information until the email merge process is run.
- (optional) Enter the text for the From and Subject fields and specify whether they can be modified at runtime.
- Select the Email Format.

Note: You must specify HTML if the body of the Email Template will contain an opt-out code. Opt-out codes in a PlainText or Multi_Part_Mime email will not direct recipients to the proper URL.

- In the Email Template area, enter the body of the message, using the following techniques:
- Insert text variables in the format [businessObjectName.columnName]. Only columns that are present in the query results will be properly substituted at runtime.
- To insert an opt-out code, insert a link to %OPTOUTURL%. From the Type drop-down list, select Other and click OK.
- (optional) Browse to import an email template from another folder within the Document System, or click Upload to import an existing email template from outside the Document System.

  Note: If you find some features of the HTML editor confusing, you can download user documentation for the editor. Some features described in this external document have not been enabled for use when defining email merge output processes.
- (optional) In the Attachment area, click … , then use the Document System browser to choose an attachment to the email message.

7. Click Save.

> **Note:** Note: If your merge produces any email address duplicates, they result from the query specified in the merge.

To define an opportunity output process

Create an opportunity output process to generate projects or opportunities from a marketing campaign or other project. The generated opportunities are stored in the Process Manager document system.

1. From Tools, select Document system.

2. Navigate to (or create) the folder in which you want to create the email merge process.
3. Select Organize > New > Opportunity.
4. Define the opportunity:

- In the Summary tab, enter general information.
- In the Sources tab, choose whether the associated query should be:
- Bound – a specific query is always used with the process
- Select at Runtime – user selects the query each time the process is run
- Browse to select the bound or default query.

5. Click Save.

To set user permissions for an output process

You can grant specific users and/or groups access to an individual output process from the Security tab.

1. Define an output process.
2. Select Security.
3. Select an Access option:

- Share (Everyone) – Grants everyone full control.
- Private – Grants full access to the query owner only.
- Advanced – Enables the Access Mode drop-down list and allows you to edit the access list. You can select one of the listed access areas or select Custom to select from a pre-defined list of security settings in which one or more roles and/or specific users have been granted access permissions.

4. Click Save.

Troubleshooting output processes

Email merges

The following validation errors will prevent the merge from completing correctly:

- A required field has not been populated. The message will state which required field was not supplied.
- A parameter required for the query has not been supplied. The message will state which parameter was not supplied.
- The query assigned to the output process does not contain the business objects referred to in the template.
- The template uses field names that do not correspond to a column on any of the query's sources.

A warning displays for each record for which no email address can be found (by searching through the To field).

MS Word merges

Error messages about missing components can prevent the merge from completing correctly, so ensure that all of these components are installed on the web server or workstation:

- Microsoft Word (or Office)
- Microsoft .NET Framework
- Microsoft interop assemblies

Creating and modifying reports

Two reporting applications are available to help you create, manage, and deliver reports:

- Crystal Reports
- SQL Server Reporting Services

Default report templates are supplied with iMIS. The administrator or manager can modify these reports to meet your organization's needs.

To create a custom report

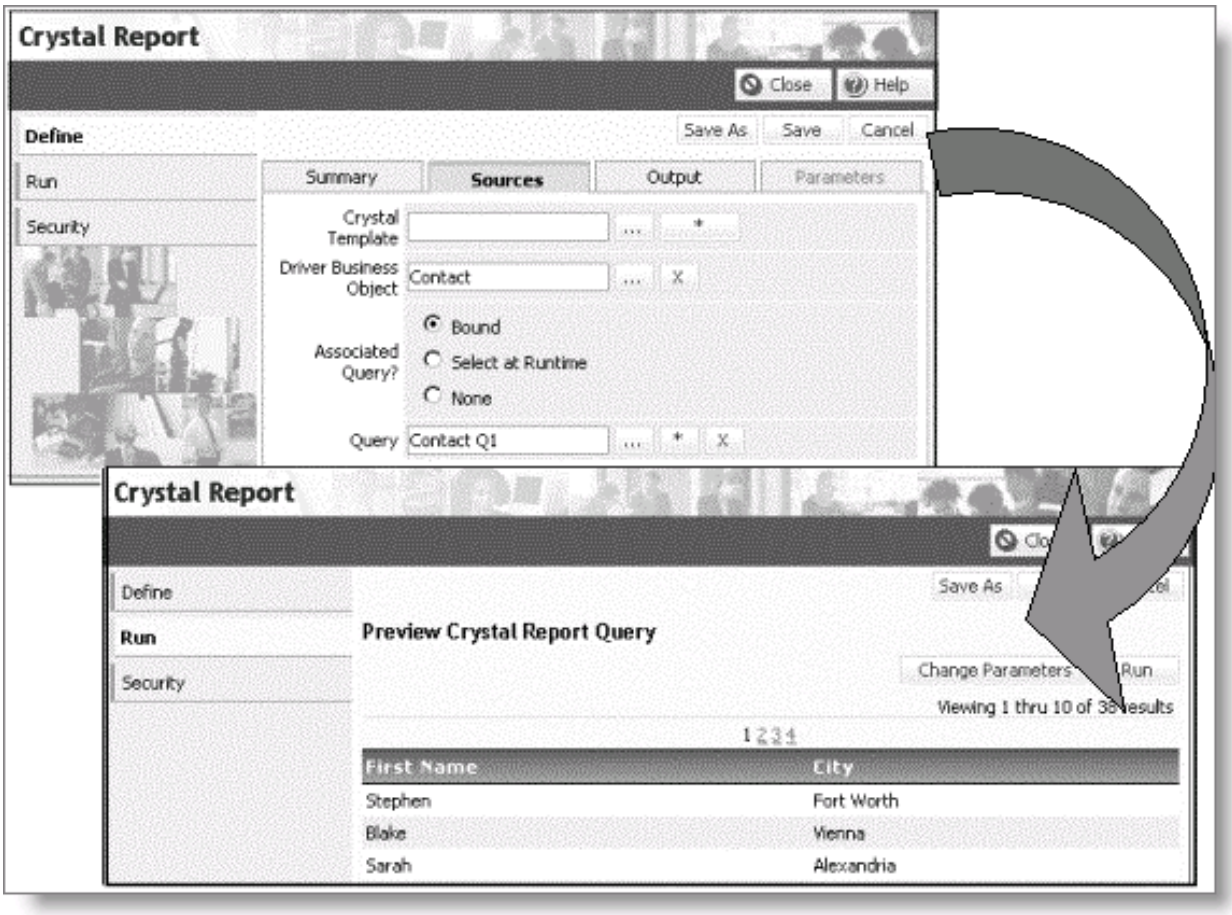
If you need custom reports that are not similar to the default reports, have your administrator:

1. Create a custom report.
2. Specify an associated query, as needed.
3. Define runtime information (such as adding parameters), as needed.
4. Store the report in an appropriate location in the Document System.

The manager, if granted access, has the ability to modify the report.

About Crystal Reports

Standard Crystal reports are supplied with iMIS. The administrator or manager can modify these reports to meet your organization's needs.



Example of a Crystal report definition and its output

If you need custom reports that are not similar to the standard reports, the administrator creates the custom report. The manager, if granted access, still has the ability to modify the report.

Process

The process to set up a Crystal report is:

1. Create or modify a Crystal report template.
2. Create a Crystal report output process.

To modify an individual Crystal report, change the associated output process.

Crystal Report Templates

The following default report templates can often be modified to meet your organization's needs:

- Mailing labels
- Invoices
- Badges
- Rosters
- AR/Cash Batch report
- AR/Cash Trial Balance
- Customer Profile
- Dues Renewal Notice
- Event Registration Confirmation
- Order Status
- Donor Profile
- Gift Receipt
- Campaign Performance

- Process Management Action report
- Process Forecast

To create a Crystal report template

1. From Tools, select Document System.
2. Navigate to (or create) the folder in which you want to create the report template.
3. Select Organize > New > Crystal Report Template.
4. Browse to the Crystal report (.rpt file) you want to save as a template.
5. (optional) Enter a Description.
6. Click Upload.

To create a Crystal report output process

Before you begin

Before you create a Crystal report output process, set up a Crystal report template (.rpt file). See To create a Crystal report template.

To create a Crystal report output process

1. From Tools, select Document System.
2. Select Organize> New> Crystal Report.
3. The Process Engine Portfolio displays.
4. Set up the report:

- In the Summary tab, enter general information.
- In the Sources tab, upload or browse to the desired Crystal Template.
- (optional) In the Sources tab, define or select the query, if any, to be associated with the report and select the type:
- Bound – The specific query is always associated with this report.

- Select at runtime – User accepts the default query or selects another one when ready to run the report.
- None
- If you select an associated query for the report, browse to the desired Driver Business Object.
- In the Output tab, specify the output options, such as print location and settings. Specify whether these options can be changed by the user at runtime.
- (optional) In the Parameters tab, select the Show Parameters at Runtime option to request or require user input at runtime.

  Note: If you do not select the Show Parameters at Runtime option, you must provide default values for the report to execute successfully.

5. (optional) Select Security and modify the security settings for the report.
6. Click Save.

   Note: The business objects that start with a "Cs" prefix (such as CsContact, CsDonations, and so on) sometimes return more information in a Crystal report than they do in a query. For example, a report that is sourced from the CsPledges object, and which is defined to show information for only one specific fund might show the expected results when you preview the query results, but then display information for multiple funds when you run the report.

   This behavior is caused because the Cs-prefixed objects might not have primary keys in their original data source, and in one-to-many relationships the query results can differ from report results because of the way that filters are currently implemented in reports.

Running reports and output processes

Managers and users can run reports and output processes from the related iMIS area, as designated in the Document System.

Users can also start the Word merge output process from Home > Generate Reports if the lefthome.htm file has been customized to include MS Word Mail Merge.

Clearing old query results

Periodically, the interim tables used by iMIS reports and queries should be cleared of old data. You can accomplish this by running the sp_asi_ClearOldQueryResults script.

To clear old data from the query results tables

1. From Tools, select Utilities> Modify system tables.
2. A message window opens and asks you to confirm that you want to run the script, and the Run ClearOldQueryResults script window opens. Click Yes.

   The script is run and the number of rows fitting the deletion criteria is reported in Run ClearOldQueryResults script window.

iMIS

RiSE

iMIS 20 is built on the RiSE web-engagement platform, a key industry differentiator that empowers you to easily create and personalize constituent self-service, community, and mobile web pages – with no programming necessary.

- Manage member data and web content together
- Tailor all web pages for staff and members
- Customize mobile websites
- Dynamic content translates into website engagement
- Personalized engagement experience

RiSE is the flexible and powerful DNA of iMIS 20.

- Customize your web pages with dozens of dynamic items from the Content Gallery.
- Share content on Facebook, Twitter, YouTube, LinkedIn, and more
- Easy edit keeps content up-to-date – with a simple click
- Quickly and easily position information anyplace on your website

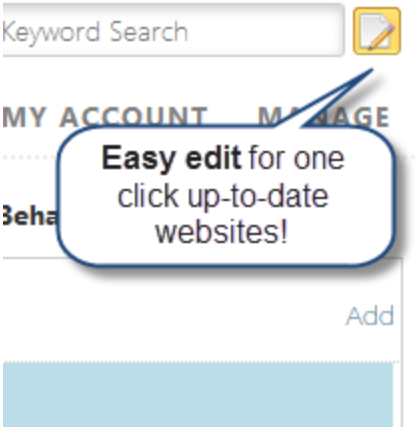
  Quick Start Sites

  RiSE includes plenty of out-of-the-box website templates full of features for quickly launching your websites – or microsites for your branches, committees, and events. With RiSE mobile sites, relatable and relevant info is at your members' fingertips. See Creating a site.

- Staff
- Member
- Member Responsive

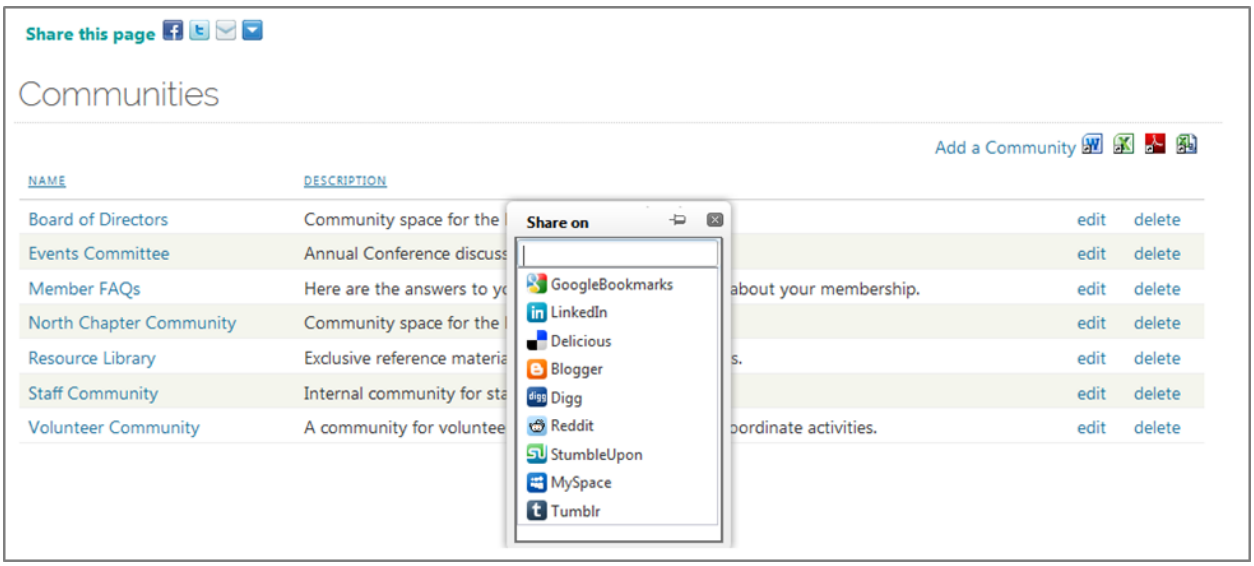
- Member Mobile
- Donor
- Annual Conference
- Annual Conference Mobile

All of your content can be quickly refreshed and updated with Easy edit. And with RiSE, power users and non-technical staff can easily maintain your web pages.



Support for social networks

With ready to use building blocks for online Communities, RiSE contributes to significant peer-to-peer relationships.

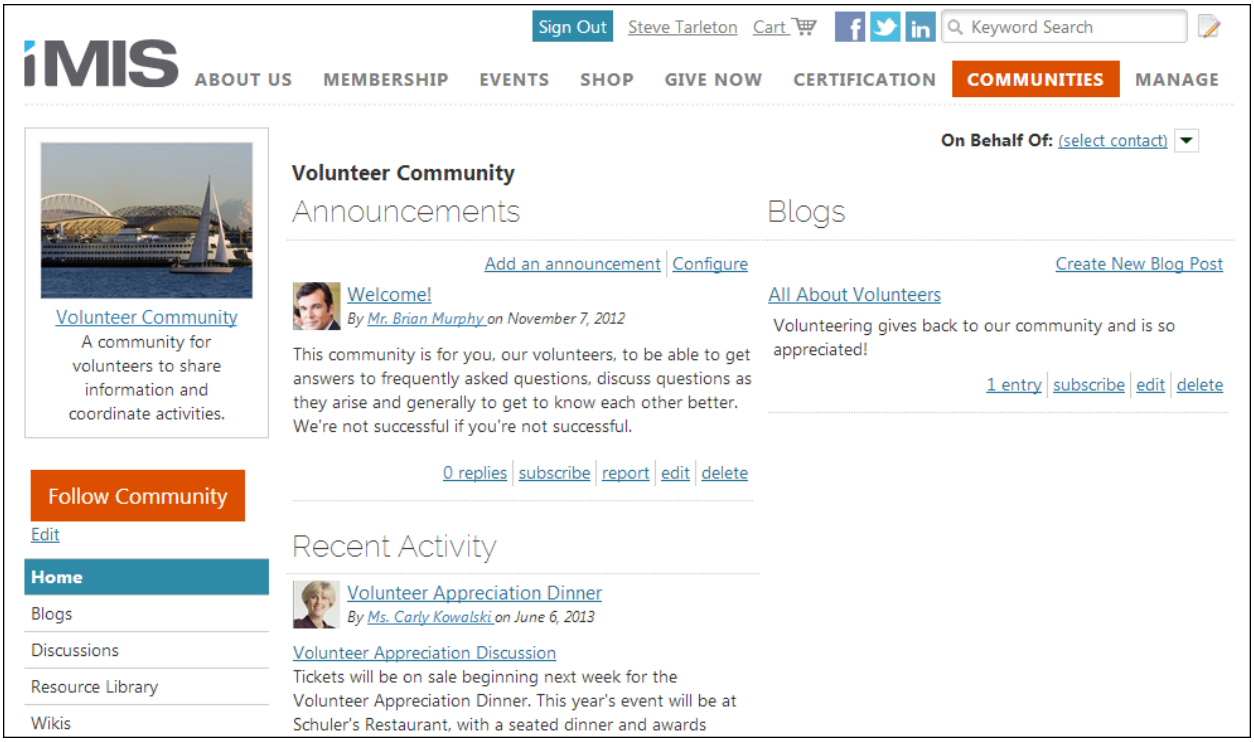


- Convenient discussions to discuss best practices and other valuable member topics
- Members can easily connect organization info to other popular sites
- Private network features
- Social engagement is content for your websites – place it anywhere, anytime

Content Gallery

The RiSE platform includes a gallery of widgets and savvy (easy-to-use) tools to customize existing iMIS self-service pages, as well as create entirely new personalized web pages to meet the rapidly-changing expectations of your members.

Members share products, events, fundraising, campaigns, and content from your website with popular social media sites.

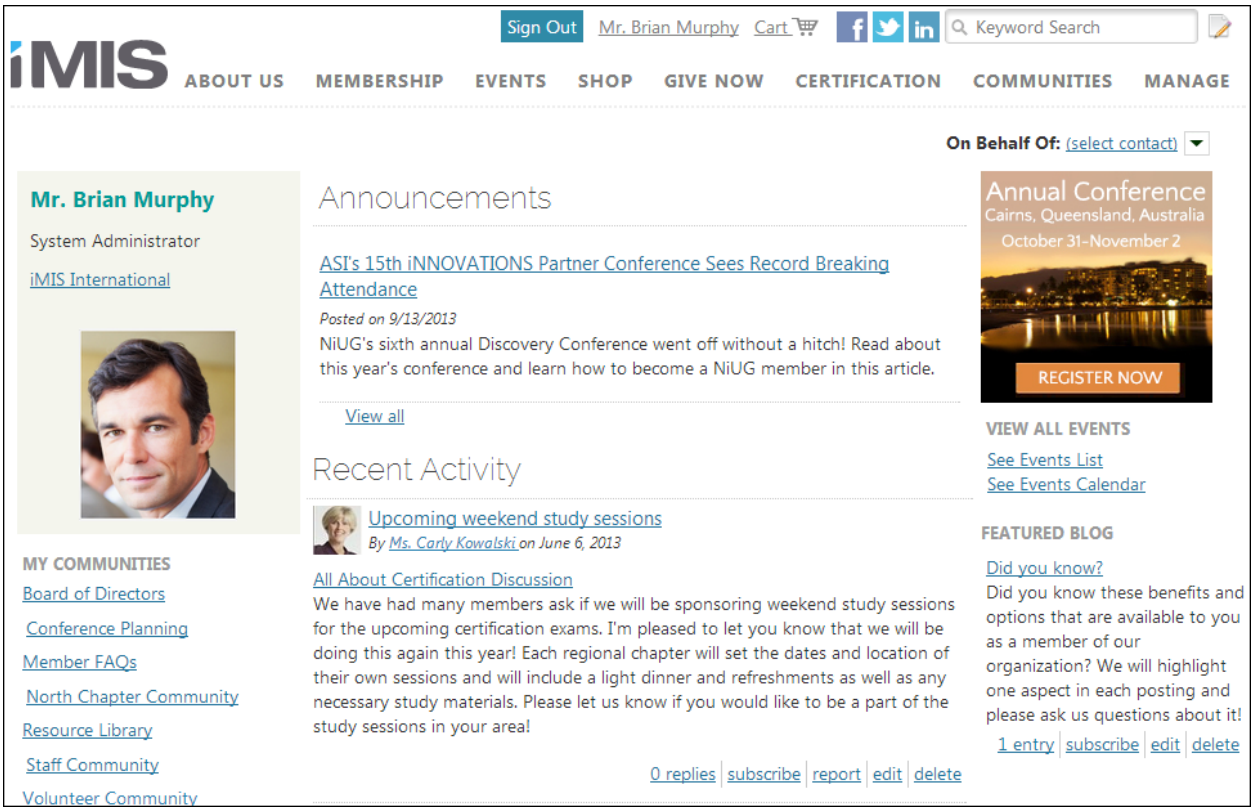


- Tailor promotions to individual members and constituents
- Up-to-date progress on fundraising efforts – right on the donations page

- Up-to-date info about your membership base
- Create personalized, self-service experiences for your members on the cloud

Member content transformed

Your constituents have preferences – one member likes white papers, another is a fan of multiple communities. With RiSE, those preferences translate into personalized, engaging visits to your websites.



- Communities organized by audience
- Private communities inspire engagement between members
- Previous interest delivers tailored content on subsequent visits
- Blogging enhances familiarity and sense of community

RiSE plugs in!

- Maintain your current CMS while leveraging the power of RiSE
- Easily publish dynamic content from iMIS and content from other sources

  More on RiSE

  Organization websites
- Quick Start Sites, tailored, or newly created, organizations use RiSE for creating their web and micro sites. Tie in themes, or keep them unique; it is the organization's choice with RiSE on where and how content is displayed.
- Non-technical staff can edit web page content with browser-based editing tools; targeted according to an organization's terms, audiences, and concepts.
- Ease in use and navigation
- Users can subscribe to communities
- Community members can share documents
- Create communities by member type
- Users can create titles for documents and set documents as hot or normal
- New documents automatically tag as new
- Creates folders to store documents
- Ability to create an unlimited number of discussions per community
- Users can respond to discussion threads by username – or anonymously
- Administrators can monitor and delete unwanted posts
- Users can choose when to receive discussion posts from communities

  Fundraising

- Dashboard of up-to-date fundraising efforts
- Easily process recurring donations
- Seamlessly manage Gift Aid
- Enter multiple gifts
- Highly visible Give Now option
- Convenient Automatic recurring donations

Events

- Intuitive online registration
- Allow members to register others in their organization
- Displays calendar of events
- Organizations can define type and number of guests a registrant can sign up
- Ability to change each type of guest to a different rate
- Registrant can create badges for guests
- Special pricing
- Multiple forms of payment
- Automatically update Events module
- Automatically verify funds via authorized gateway
- Staff can configure online event information
- Provides HTML-based e-mail notifications

Commerce

- Amazon-like online shopping experience
- Displays quick view of current items in shopping cart
- Accepts multiple forms of payment

- Asks customers to authenticate credit card
- Automatically updates iMIS Orders
- Verifies funds via authorized gateway
- Unified checkout basket so that all transactions (dues, events, products) can be purchased at one time
- Offers multiple pricing strategies (member/non-member, quantity discounts, and flat rates)

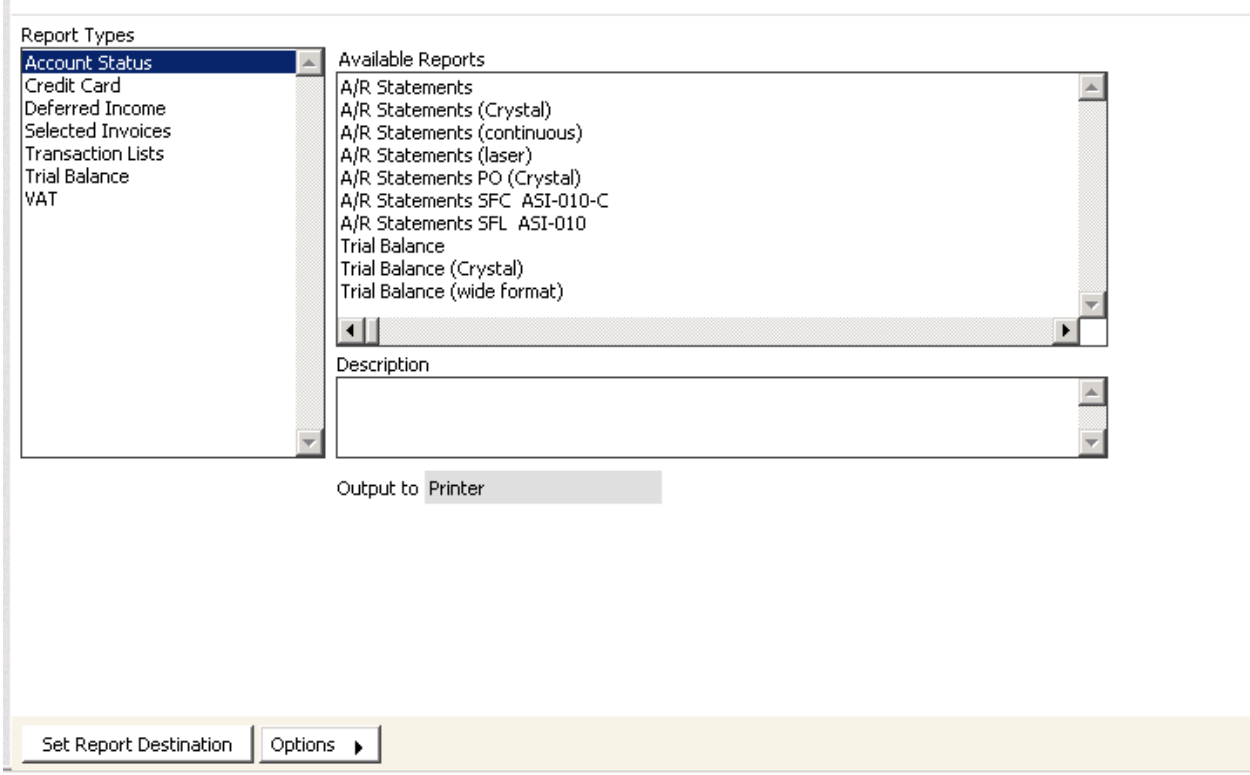
  Continuum
- Multiple report options provide valuable content for your website
- Charts and graphs; query and query displays

  Content Manager
- Allows non-technical users to post content and maintain websites
- Assigns roles for contributors and approvers
- Automatically sets data to post, archive, or remove
- Ability to publish website once content is approved
- Allows one piece of content to be displayed in multiple places by using categories/tags
- Consistent look and feel of websites through the use of templates
- Allows contributors to assign additional attributes to content
- Creates security keys to make data available by login only

Sample Reports

Reports for Accounting

Accounting reports window



Desktop: AR/Cash > Generate reports

The following reports are the most frequently used in Accounting, and are often used on a daily basis:

- On-screen account inquires
- Accounting Transaction reports
- Accounting Transaction journal
- Accounting Statements reports
- Trial Balance reports
- Deferred Income reports

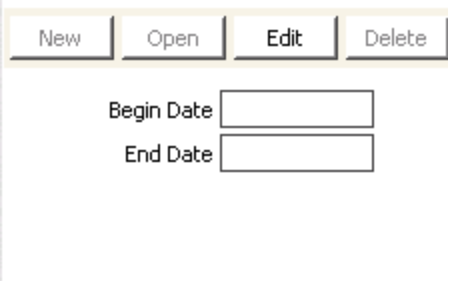
- Selected Invoices reports
- Credit/Debit Card Authorization reports

To view on-screen account inquiries

Perhaps the most important inquiry tool you will use is located in the customer's record. For example, if a customer asks for instant information on the status of an account item, you can immediately open screens that show overall and detailed data on open items.

1. From Customers, find a customer's record.
2. The name and address data for the selected customer displays on the Manage customers window.
3. Select the AR/Cash tab.
4. Double-click on a line item to display the transaction details on the Transaction Ledger window.
5. Click OK.
6. Click Print Trial Balance on the AR/Cash tab. The system automatically generates a Trial Balance report for the specified customer ID.

Print transaction journal window



Desktop: AR/Cash > Print Transaction Journal

The Print Transaction Journal window includes the following fields:

Begin Date

Enter the beginning date for the AR transactions to be printed.

End Date

Enter the ending date for the AR transactions to be printed.

Print button

Click to print the AR transactions for the specified date range.

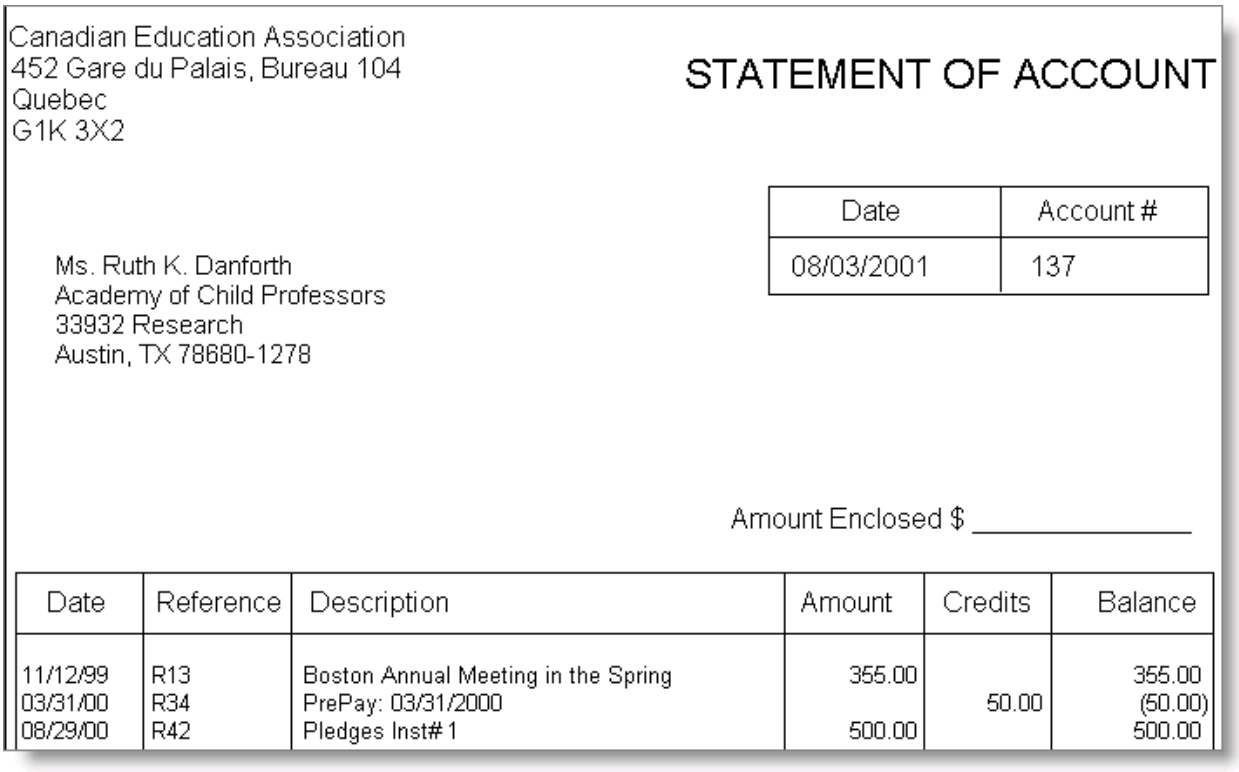
After specifying a date range and clicking Print, the Transaction Recap, Debit Memo Journal, Revenue-Sales Journal, and Payments Journal reports are printed.

Sample Accounting Reports

Account Status - AR Statements report

The AR Statements report produces a Statement of Account for any customer that has an outstanding balance. The search features on the A/R Statements dialog window determine the range of information printed on the report.

The statements print on plain paper designed for laser printers. The statements list all open items in the body and provide an aged summary at the bottom of the report. Depending on the age of an open account, you have the option of a pre-configured message at the bottom of the report that lines up with text entered on the AR/Cash Aging window (from AR/Cash, select Set up module > Aging). The AR Statements reports are primarily used for sending reminders out to customers who are overdue in paying one or more invoices.



Canadian Education Association
452 Gare du Palais, Bureau 104

Desktop: AR/Cash > Generate reports > Account Status > A/R Statements (Crystal)

Account Status - Selected Invoices report

Invoice reports are frequently used to verify the accuracy of a billing run and to see which customers or subscribers have not paid.

The invoice printing process prints the invoice and generates the related accounting transactions to record the sales. Because orders cannot be modified after they are invoiced, the printing process represents the final step in the order processing cycle.

Selected Invoices

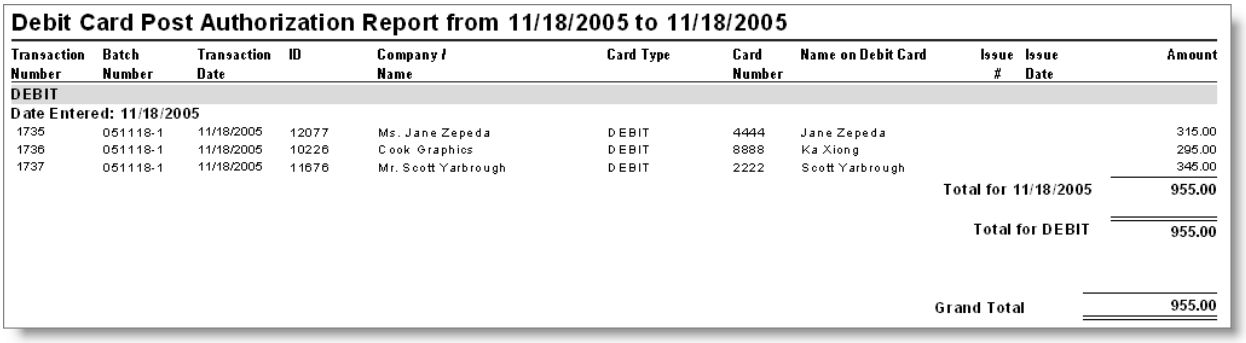
Credit Card - Debit Card Post Authorization report

The Debit Card Post Authorization report shows a list of all European debit card transactions for the selected date range. Run this report from:

Desktop: AR/Cash > Generate Reports > Credit Card > Debit Card Post Authorization Report (Crystal)

Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.



Debit Card Post Authorization Report from 11/18/2005 to 11/18/2005

Debit Card Post Authorization Report

Debit Reconciliation - Debit Card Reconciliation report

The Debit Card Reconciliation report shows a list of all European debit card transactions for the selected time frame, sorted by batch and transaction number. Run this report from:

Desktop: AR/Cash > Credit Card Reporting > Credit Card Reports > Print Debit Card Reconciliation Report

Troubleshooting

- The Print Debit Card Reconciliation Report button is only available if you have defined a credit card authorization gateway and a cash account for debit cards.
- To return results, you need to select a batch with at least one debit card transaction. Otherwise, the report is empty.

Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Debit Card Reconciliation report

Deferred income reports

Several summary and detail level reports let you review the status of deferred income. Go to AR/Cash > Generate reports > Deferred Income:

- Deferred Income Analysis/Spread
- Deferred Income Audit Trail (Crystal)
- Deferred Income Detail (Crystal)
- Deferred Income Matrix Summary (Crystal)

Deferred Income Analysis/Spread

Provides a projection of how the current balances in deferred income will be recognized in each future period. This is an important management report.

Deferred Income Audit Trail (Crystal)

Provides a report on the income that was recognized, as well as the deferred income balance that remains at the end of the reporting period. This report is designed to run for a specific monthly period (any month for which the GL interface has already been run). The report is designed as an audit trail report to simulate the income that was recognized, as well as the deferred income balances that remain at the end of the reporting period.

Note: This report is generated using the specified End Date. Only transactions equal to or less than the report's End Date are included. It is important to always enter the last day of the month.

This report is based on deferred income transactions for which the deferral/recognition timeframe is still in effect as of the beginning of the month being reported on (residual income is yet to be recognized either during the report month and/or in a future month).

This report simulates the process that iMIS uses to generate the deferral to income transfer entries with one exception. It depicts the income recognition at the individual detail transaction level, as opposed to the matrix summary level that iMIS uses to generate the actual entries. As a result, the reported income amounts will most likely be different from the actual amounts by small rounding differences. Nonetheless, the report should give a close approximation of the actual transfer amounts per month as well as the residual balance at the end.

This report is structured as follows:

- The report is based on all transactions dated on or before the reporting end date that have been posted to the deferred income matrix.
- The transactions are grouped, sorted, and subtotaled by the four key deferral matrix elements (deferral account, income account, begin date, and term).
- For identification and cross reference, the Trans #, Trans Date, Bill To ID, Bill To Name, and Product code are listed.
- The transaction amount is listed and subtotaled at the matrix summary level. This subtotal should agree with the original amount on the Deferred Income Matrix Summary report as of the end date of the report (the sign is shown as positive instead of the normal credit balance for easier use of the report).
- For each detail line, the monthly transfer column will show the portion of the income that should have been transferred during the reporting month. In most cases, if the begin date is equal to or less than the reporting period, this will be the transaction amount divided by the term, with appropriate rounding. In some cases, the amount may be more if the

transaction date falls within the reporting date and the deferral begin date was within an earlier period. In this case, iMIS works in a catch-up mode on income that needs to be recognized by the reporting date. If the reporting period is the last period within the deferral term, the amount may be smaller or larger to account for any cumulative rounding differential. The transfer amount is summarized at the matrix level and is also subtotaled for each income account. The actual transfer amount can be compared to the total income from transfer for the reporting period.

Note: If the actual transfer amount differs substantially from the report amount, this may be due to timing issues where the income for certain transactions was not recognized because a future month's GL interface was processed before the affected transactions were processed through an interface cycle.

- The Months Remaining in the deferral term beyond the reporting month is shown for each transaction.
- The deferred income Amount Remaining is shown at the individual transaction level, matrix summary level, and the Total amount by the deferred GL account. It can be compared to the GL balance and/or the Deferred Income Matrix Summary report as of the end of the reporting month. Again, due to the detail basis of the report, this balance will only be an approximation, which may be off by a rounding difference.

  Deferred Income Detail (Crystal)

  Provides a report of transactions to be posted to deferred income. Transactions are sorted by deferred income account, regular income account, beginning date, and term. This report should be printed prior to running the GL interface procedure. Verify the accuracy of the data and make modifications as needed before running the GL interface.

  Deferred Income Matrix Summary (Crystal)

  Provides a current status of the deferred income matrix table and shows the totals that were originally posted to deferred income, how much has been recognized to date, and the amount that remains to be recognized in future months. This report should be printed after each GL interface. The remaining amounts should tie to the deferred income bal-

ances in the General Ledger. Save this report and use it as a backup for deferred income transfer entries.

Deferred Income - Deferred Income Analysis/Spread report (Crystal)

The Deferred Income Analysis/Spread report (Crystal) provides a projection, sorted by deferral account, of how the current balances in deferred income will be recognized over the next twelve months. It also summarizes all amounts projected beyond one year in the Future column, and shows the total of all deferred amounts in the Total column.

Note: The total deferred amount equals Original Amount - Amount Transferred - Amount already realized.

MenuTransJournal - AR/Cash Transactions report

The AR/Cash Transactions report runs the following reports:

- Credit Memo Journal - This report groups together adjusting transactions that typically reduce or reverse income, such as credit memo transactions entered in AR/Cash, Billing (from adjusting accrual dues invoices), Fundraising, and Order Entry (from invoicing Credit Memo type orders).
- Debit Memo Journal - This report groups together adjusting transactions that typically increase income, such as debit memo/adjustment transactions entered in AR/Cash, Billing (from adjusting accrual dues invoices), Fundraising, and Order Entry (from invoicing debit memo type orders).
- Payments Journal - This report focuses primarily on cash receipt transactions, such as those entered in the (AR/Cash) Enter and edit cash receipts, (Billing) Enter and edit payments, (Fundraising) Process payments, and (Service Central) Enter and edit payments windows.
- Refund Journal - This reported provides information on transactions generated as a result of refunds issued from AR/Cash (from AR/Cash, select Process month-end procedures, click Credit Invoices, select one or more credit invoices, and click Issue Refunds).
- Revenue-Sales Journal - This report provides a detailed audit trail of all AR/Cash transactions entered through AR/Cash.
- Transaction Recap - This report provides an accounting summary showing the net effect of the transactions.

  These documents do not include transactions generated through other modules, such as Events.

  Note: If you have batch control enabled (from AR/Cash, select Set up module, and click Batch Control) print your transaction journal from the Manage batches window (from AR/Cash, select Manage batches). You can also select batch-specific printing options on the Manage batches window.

  The detail journal separates transactions by type. Transactions entered on the Enter and edit sales transactions window (from AR/Cash, select Enter and edit transactions> Sales transactions) print with summary totals followed by a page break before printing

transactions entered on the Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions> Cash receipts).

Note: Remember to select the output destination (printer, screen, file, and so on) before you generate this journal.

The Transaction Journal - Transaction Recap

Note: The AR Cash Transactions (Crystal) report prints as two different pages on the same report. Use the scroll feature on the Print window to view Transaction Recap.

Reconciliation - Credit Card Reconciliation report

The Credit Card Reconciliation report shows a list of all credit card transactions for the selected batch, sorted by BT ID and Org code. Run this report from:

Desktop: AR/Cash > Credit Card Reporting > Credit Card Reports > Print Credit Card Reconciliation Report.

Troubleshooting

- The Print Credit Card Reconciliation Report button is only available if you have defined a credit card authorization gateway and a cash account for credit cards.
- To return results, you need to select a batch with at least one credit card transaction. Otherwise, the report is empty.

Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Trial Balance - Trial Balance report

The Trial Balance report lists customer accounts with an open balance, and provides contact name, company name, telephone number, a line for each open item, a summary aging for each account, and a total.

The Trial Balance report is used as a collection report to locate and call overdue customers and is also a month-end accounting report used to balance the iMIS AR subsidiary ledger against the general ledger AR control account.

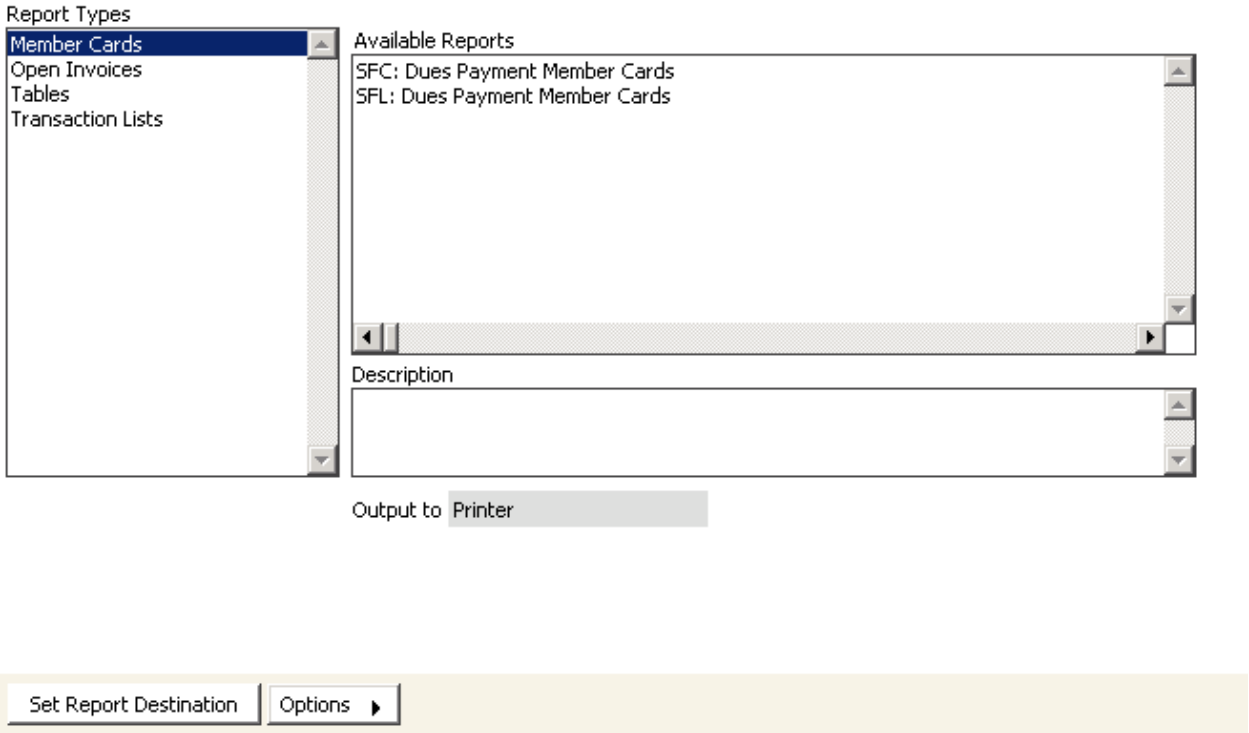
Reports for Billing

Billing reports window



Desktop: Billing > Generate reports

Printing Renewal Notices

Printing Renewal Notices at the same time as billing is recommended to ensure that the only items that print on the renewal notices are the items that get billed. To do this, select both the Renewals and Initial Bill options on the Process billing window on the same billing run.

If you print the initial bill separately from billing, you must perform an ad hoc search to print only the items that were last billed. See the next section, "To print Renewal Notices separately" for more information on performing an ad hoc search to verify bill date.

Note: With accrual dues, the posting and finalization of mass billing data occurs after the renewal billing step, therefore, you need to print renewal notices (Initial Bill) independently after the batch posting is complete.

When you print Renewal Notices, the following field conditions are evaluated to determine if a Renewal Notice will print for a customer:

- The Paid Thru date field on the Status tab (Name.PAID_THRU) contains a date that is earlier than the Renewed Thru field on the Financial tab (Name.Fin.RENEWED_THRU) located on the Manage customers window (from Customers, select Manage customers).
- The Status field (Name.STATUS) on the Manage customers window is not set to S (Suspended), I (Inactive), or D (Marked for deletion).
- The balance for the dues product (Subscriptions.BALANCE) is greater than zero.
- Subscriptions.REMINDER_COUNT is equal to zero.

To print renewal notices separately

When you print Renewal Notices separately from billing, you must perform an ad hoc search so that you don't print duplicate notices.

When you print an initial bill, the system looks for records with REMINDER_COUNT = 0 (renewal hasn't been printed). It is possible, however, that a record has a REMINDER_COUNT = 0 and you may not want to print the Renewal Notice, as in the following examples:

- You generate a billing run by selecting the Rebill option on the Process billing window. In this case the REMINDER_COUNT is reset to zero.
- You manually print an individual Renewal Notice by clicking Create Invoice from a contact's the Billing tab in Customers. In this case, REMINDER_COUNT never increments.

1. From Billing, select Process billing to display the Process billing window.

   Note: Do not select either option in the Billing Options area.

2. Click New.
3. Select a billing cycle from Select a Cycle to Process.
4. (optional) Override the Run Date.
5. Select Initial Bill under Printing Options.

6. Select Ad Hoc Search under Additional Options.
7. Click Run. The Select Search Instructions window opens.
8. Click New to display the Search Instructions window.
9. Enter a Search Name.
10. Enter the new search instructions.

    Note: Press Ctrl + Z to expand the Comparison Value field.
11. Click Save on the Search Instructions window.
12. Click OK on the Select Search Instructions window.

    Note: If you print Renewal Notices to the screen prior to sending them to the printer, they may not be aligned exactly as they appear on the screen. To achieve the correct formatting, always print reports directly to the printer rather than from the screen.

Customizing the Renewal Notice Formats

A variety of standard renewal notice options are available. Although the presentation of most billing-related data is predetermined, many aspects can be customized.

For many of the available formats, the enlarged, bold title that appears at the top of the notice is user-defined within the Billing and Reminder Notices window (from Billing, select Set up module> Billing cycles, select a Cycle Name, and click Bills/Reminders). You can also define a limited size (notice-specific) text area.

In addition to the Billing and Reminder Notice title and text options, you can customize other aspects of the renewal notice by entering instructions on the Report Specifications window (select Utilities> Report Specs).

Note: If changes are made on the Report Specifications window, you must make the changes on a cloned copy of the standard report. This step is required to make the changes permanent.

The types of changes that can be made on the Report Specifications window include the following:

- The entry of larger user-defined text areas
- The addition of merge fields from the customer/subscriber-specific data. Up to five merge fields can be included in the overlay text

  Note: There is no provision for merge fields in the Billing and Reminder Notices text.
- The modification or addition of a few available printing options that affect the output
- The modification of top and/or left margins, which may be required to align the printed output with an iMIS-authorized preprinted form.

  Note: Crystal Report parameters should not be deleted from a report as the majority of them are necessary to run the report. The preferred method for building reports is to clone your existing report specifications, which automatically copies the report parameters.

  To generate a custom Renewal Notice

  To enter user-defined overlay text, you may need to customize a renewal format to print merge fields from a customer's demographic data or to modify or add an available printing option. User-defined text that exceeds 255 alphanumeric characters must be specified here.

  Follow these steps to generate a custom Renewal Notice for your organization:

1. Select Utilities > Report Specs.

   The Report Specifications window opens.
2. Select the Dues Renewal Notice to customize.

   Note: If you are cloning one of the DUES-Renewal Notices-Std. Form ASI-### reports, you may need to adjust the top and left margins to print the renewal notice correctly on your printer. To change the margins, select Options> Margins.
3. Click Clone.
4. Tab to the Title field and enter a unique name.
5. Click Parameters.

The Detail Report Parameters window displays the current parameters for the report you cloned.

6. Tab to the Options field and add or remove available options. Available options vary from format to format. The two primary renewal notice options include the following:

- SUPPRESS_ZERO_ITEMS - Suppresses printing line items that have been paid off or that have a zero balance. This option suppresses individual zero balance line items when the grand total of the renewal notice is nonzero.
- PRINT_CHECKBOX - Displays checkboxes on the renewal form stub in which a customer/subscriber can choose items to pay (an optional addition that is not part of the standard option set).

7. Tab to the Parameters field and enter the text to be printed on the renewal notices. To print your organization's name and address, enter the name and address in the Parameters field. The organization name and address will not automatically print as they do on some invoices and bills from other iMIS modules.

   The entered text overlays the standard report elements. Therefore, add hard returns (by pressing Enter) to shift text down the page far enough to avoid the preset report elements on the form.

   In the following example, three additional merge fields [Temp.Item1], [Temp.Item2], and [Temp.Item3] have been included in the overlay text. Use the following instructions to define merge fields.

   Example of parameters changed on customized renewal format

1. Click Options and select Additional Fields to open the Additional Fields window.
2. Enter a formula or field name that corresponds to the merge fields entered in the Parameters field on the Detail Report Parameters window. Tab to each Field Name row and continue entering the data that will be merged with the overlay text entered in the Parameters field. A field can reference data contained in the Name, Name_Fin, Subscriptions.BILL_DATE, or any user-defined table. You can enter up to five additional fields in the notice by selecting Options> Additional Fields. Field names must be entered

in the Filename.FIELDNAME format. For example, Name.INFORMAL brings in the informal nickname from the Name file.

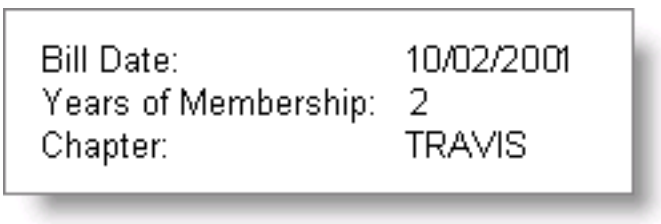
Note: The formula or field name entered in the first row must correspond to the [Temp.Item1] overlay text entered in the Parameters field on the Detail Report Parameters window.

Note: All calculations must be prefixed with @# where # represents the number of the field (1-5). Field names do not need to be prefixed.

Note: If you enter an SQL calculation for a field, you might be prompted: Invalid Omnis calculation: proceed anyhow? Click Yes and ignore the warning.

3. Click OK to close the Additional Fields window.
4. Click Save to close the Detail Report Parameters window.
5. Click Save to close the Report Specifications window.
6. Select the cloned report title from the Forms drop-down menu on the appropriate billing cycle.
7. Test the renewal notice.

Example of text entry area expanded. This formula calculates the years of membership.



A portion of the text entered in the Parameters area with merge data from the resulting renewal notice.

To add user-defined text to the Dues Renewal Notice

The Dues Renewal Notice is a standard laser printer renewal notice format that prints the line items in the upper right corner and at the bottom in the remittance stub area. The middle of the renewal format is reserved for user-defined text.

1. Select Utilities > Reports Specs to display the Report Specifications window.
2. Clone the format.
3. Click Parameters.

   The Detail Report Parameters window opens. User-defined text can be entered in the Parameters field.

   Note: The title, Renewal Notice, cannot be changed. Billing and reminder notices text, entered in the Set up billing cycles window, is ignored with this renewal notice format.

   Note: The standard options set in the Options field of the Detail Report Parameters window includes SUPPRESS_ZERO_ITEMS, but PRINT_CHECKBOX is an optional setting that is not included in the standard options set.

   To add user-defined text to the Dues Renewal Notice - List Bill

   The Dues Renewal Notice - List Bill is a plain-paper laser printer format designed for printing list bills in which the line items for multiple individuals or branches are all listed and totaled on one continuous bill to the BT_ID (bill to ID) or main company. This format may be used when individual or branch billing is billed to the parent company or for agency subscription billings.

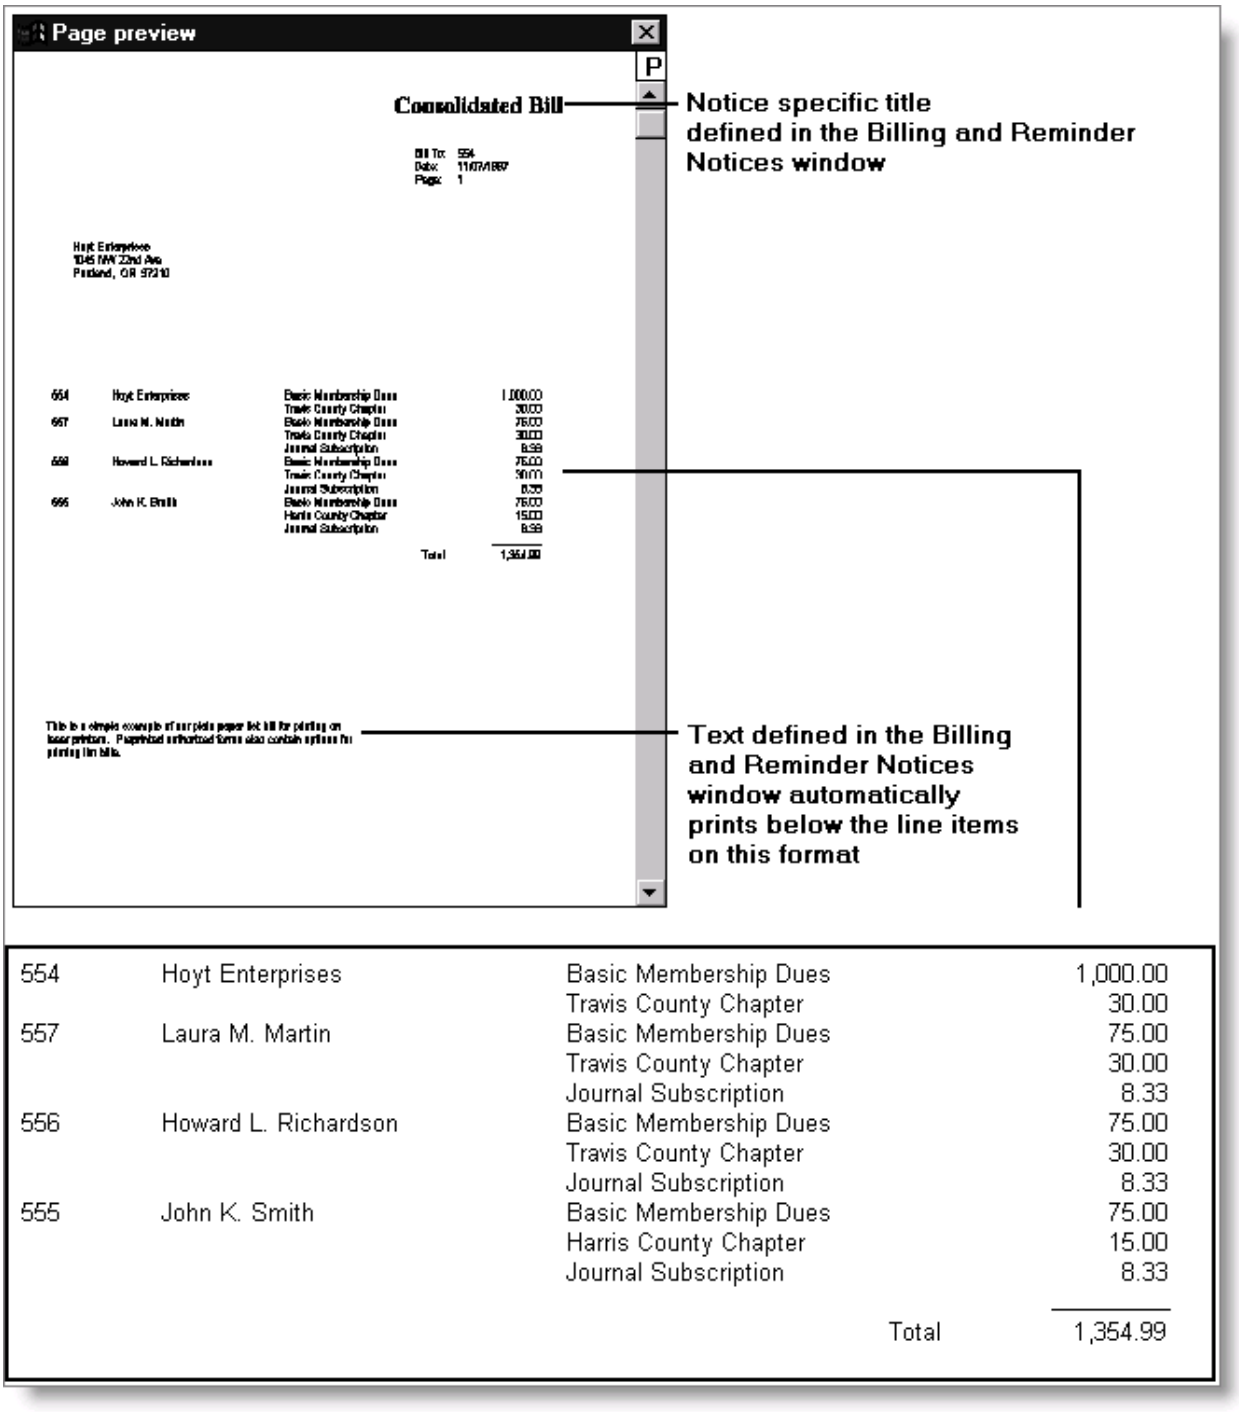
1. Select Utilities > Reports Specs to display the Report Specifications window.
2. Clone the format.
3. Click Parameters.

The Detail Report Parameters window opens so that user-defined text can be entered in the Parameters field.

Billing and reminder notices text is formatted to print immediately below the last line item printed. The bolded title prints in the upper right corner.

The following illustration shows a simple list bill example where the billing line items for the main company, as well as for the individual customers who work for that company, appear on a single combined bill addressed to the company. In a combination bill like this, the line items that belong directly to the billed company will sort to the top of the list, as shown in the example.

Note: The standard options set in the Options field of the Detail Report Parameters window are SUPPRESS_ZERO_ITEMS and SUPPRESS_CHECKBOX.

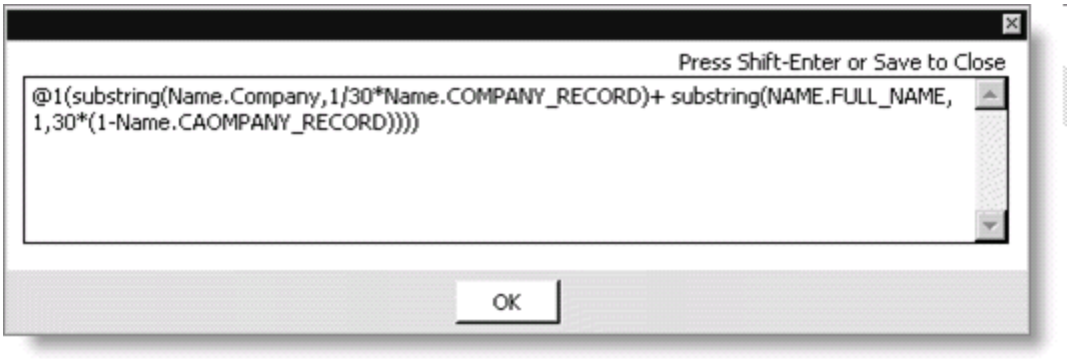


Expanded view of customers and products billed with a Dues Renewal Notice List Bill

The first Additional Fields area, which can be modified, controls the printing of the individual or branch name. The default is set to print the full name for an individual or the company name for a branch.

Note: You can access the Additional Fields window by selecting Utilities> Reports Specs, cloning the format, clicking Parameters, and selecting Additional Fields from the Options drop-down menu.

This default formula is designed to print the company name if the customer or subscriber is a company. If the customer is an individual, the individual's full name prints.



Expanded view of the additional fields area

The following is an example of how to modify the above formula to add the city next to the customer's name.

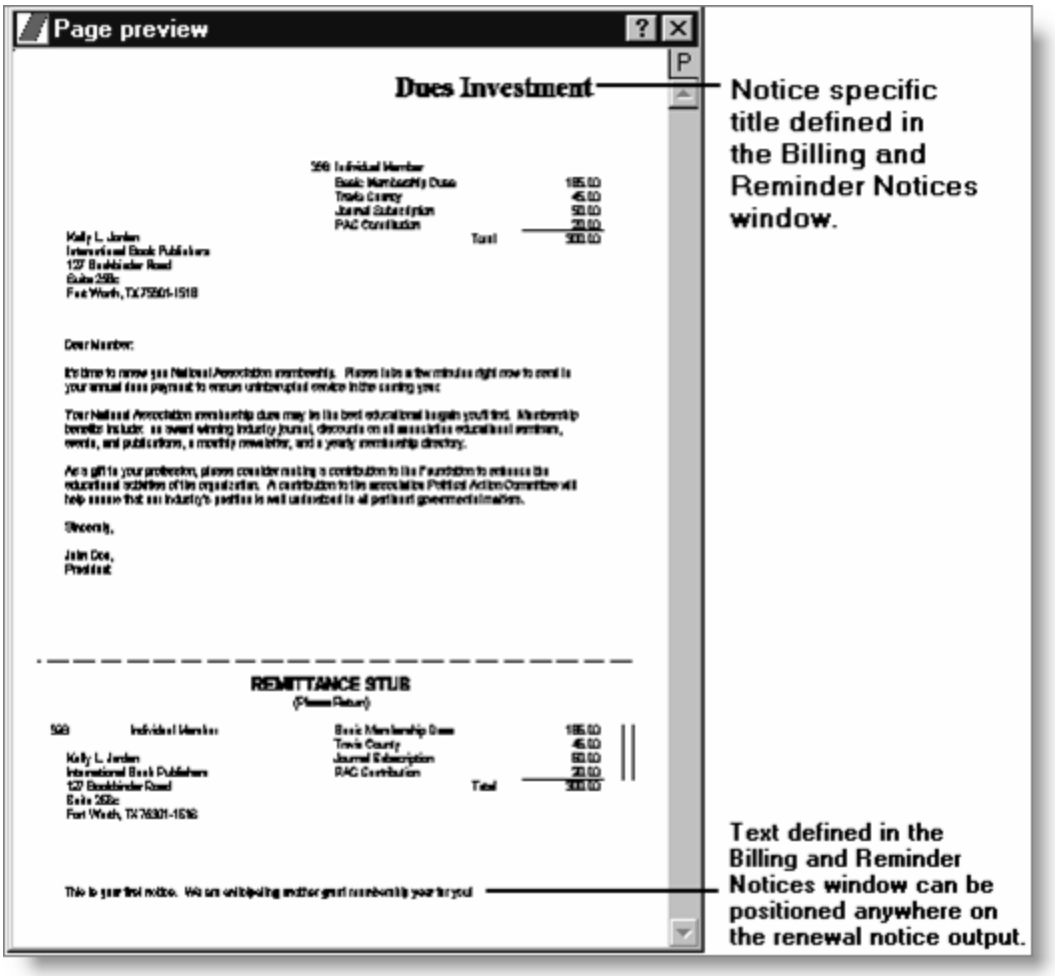
Example of the Dues Renewal Notice with Reminder Text

This format is identical to the Dues Renewal Notice format, except that it uses the Title and Text entered on the Billing and Reminder Notices window (from Billing, select Set up module> Billing cycles, select a Cycle Name, and click Bills/Reminders). You can define

the bold title and reminder text by selecting Utilities> Report Specs, and clicking Parameters.

Fundraising items are flagged (**) and the report includes a note that specifies how much of dues subscriptions are donation, and how much is taxable or receiptable. The report also includes Total FR Donations.

Note: The standard options set in the Options field of the Detail Report Parameters window are SUPPRESS_ZERO_ITEMS and PRINT_CHECKBOX.



Dues Renewal Notice with reminder text

Example of the Dues Renewal Notice - No Remittance Stub

The printing and customizing options in this example are identical to the Dues Renewal Notice with Reminder Text, but a remittance stub area is not printed.

Note: The standard option set in the Options field of the Detail Report Parameters window is SUPPRESS_ZERO_ITEMS.

Dear Member:

It's time to renew your National Association membership. Please take a few minutes right now to send in your annual dues payment to ensure uninterrupted service in the coming year.

Your National Association membership dues may be the best educational bargain you'll find. Membership benefits include: an award winning industry journal, discounts on all association educational seminars, events, and publications, a monthly newsletter, and a yearly membership directory.

As a gift to your profession, please consider making a contribution to the Foundation to enhance the educational activities of the organization. A contribution to the association Political Action Committee will help ensure that our industry's position is well understood in all pertinent governmental matters.

Sincerely,

John Doe,
President

This is your last notice. We are anticipating another great membership year for you!

Dues Renewal Notice - no remittance stub

iMIS-authorized Renewal Notice formats

The iMIS-authorized Dues Renewal Notice form allows you to generate renewal notices on either dot matrix (continuous) or laser printers. Several of the Standard Renewal Notice formats are designed to print on forms provided in the Authorized Forms Catalog included with iMIS. The Authorized Forms Catalog is a joint effort by ASI and Versient.

In the iMIS Authorized Forms Catalog, there are six preprinted forms (four laser and two continuous) available for printing Billing renewal notices.

Note: For forms that include the credit card payment box (ASI-016, ASI-018, ASI-020-C), you must enter your list of available credit card choices in the Credit Card Types field on the AR/Cash Set up module window.

On certain preprinted forms, there may be optional choices for the iMIS report output (for example, the placement of the line items may be different, or one form could be used for a standard renewal notice or a list bill). The variations of all possible forms and iMIS output choices are represented in the following list of iMIS standard reports:

Std. Form ASI-016 - Line Items at Top	A laser-printer format that includes a bottom stub for payment and a credit card payment box. Line items are printed in the upper, right corner of the form. Clone the report specification entry to enter user text. Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Overlay text prints in the middle shaded area of the form. Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD
Std. Form ASI-016 - Line Items in	A laser-printer format that includes a bottom stub for payment and a credit card payment box. Line items are printed in the middle shaded area of the form. Clone the report specification entry to enter user text. Enter overlay text in the

Middle	Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Overlay text prints on the left half of the middle shaded area of the form (for example, to the left of the line items). Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD
Std. Form ASI-017 - Line Items at Top	Identical in form and output to Std. Form ASI-016 except line items are printed at the top of the form and the credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS
Std. Form ASI-017 - Line Items in Middle	Identical in form and output to Std. Form ASI-016 except line items are printed in the middle of the form and the credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS
Std. Form ASI-018 - Dbl Column List Bill	A laser-printer list-bill format designed to print a consolidated list of line items for multiple individuals and/or branches whose line items are to be billed to a single parent company or other Bill_To_ID. This particular format is designed with a tear-off stub along the right side of the form, which also contains a credit card payment box. Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Text entered in the Billing and Reminder Notices window (from Billing, select Set up module> Billing cycles, select a Cycle Name, and click Bills/Reminders) is formatted to print immediately below the last line item printed, to the left of the tear-off stub. The first Additional Fields area, which can be modified, controls the printing of

	the individual or branch name. The default is set to print the full name for an individual or the company name for a branch. Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD Optional add on: PRINT_CHECKBOX
Std. Form ASI-019 - Dbl Column List Bill	Identical in form and output to Std. Form ASI-018 except it includes a double-column list bill and the credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS Optional add on: PRINT_CHECKBOX
Std. Form ASI-020-C - Full Page List Bill	A continuous-format (dot-matrix) form designed for printing list bills in which the line items for multiple individuals/branches are all listed and totaled on one continuous bill to the Bill_To_ID or main company. This list bill, with no stub on the right, provides full-page width to list the individual/branch names and line items. This form also contains a credit card payment box. Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Text entered in the Billing and Reminder Notices window (from Billing, select Set up module> Billing cycles, select a Cycle Name, and click Bills/Reminders) is formatted to print immediately below the line items and totals. The first Additional Fields area, which can be modified, controls the printing of the individual or branch name. The default is set to print the full name for an individual or the company name for a branch. Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD
Std. Form ASI-020-	A continuous-format (dot matrix) form with line items listed in the body of the form (traditional invoice format).

C - Full Page Standard	Enter overlay text in the Parameters field of the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters). Standard Options: SUPPRESS_ZERO_ITEMS, PRINT_CARD Optional add on: DUESDAT appends the printing of the renewal period onto the end of the line item description for any billing type product lines. (For example, FOR 01/01/1999 THRU 12/31/1999.)
Std. Form ASI-021-C - Full Page List Bill	Identical in form and output to Std. Form ASI-020-C. Includes a full-page list bill. The credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS
Std. Form ASI-021-C - Full Page Standard	Identical in form and output to Std. Form ASI-020-C except it includes a full-page standard billing and the credit card payment box and string are omitted. Standard Options: SUPPRESS_ZERO_ITEMS

Sample Billing Reports

Dues Batch Summary report (Crystal)

The Dues Batch Summary report lists batches that contain Accrual Dues product transactions. The report is grouped by Batch Number, Member Type, and Product Code. Run this report from:

Run this report from: Billing > Process Accrual Dues > Post Batches > click Print Summary

Note: This report includes the following Product Types: DUES, CHAPT, SEC, SUB, VOL, MISC.

This report cannot be filtered for Distribution. Adding Report Spec parameters for Distribution will produce an error.

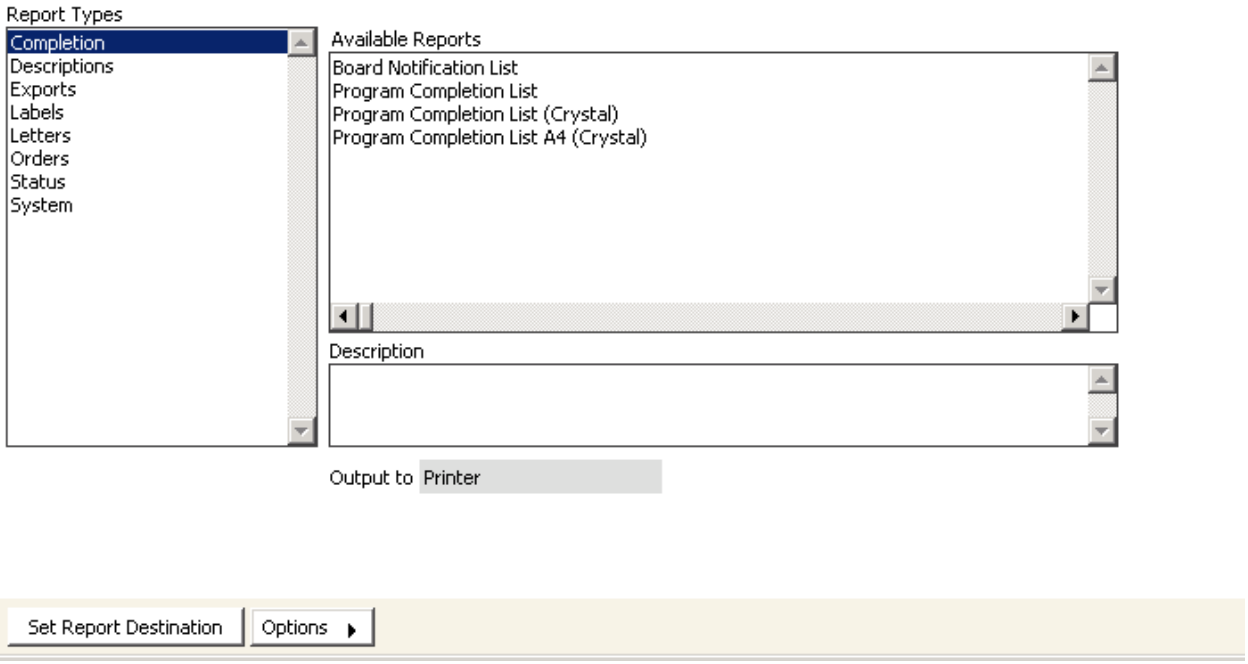
Reports for Certification

Certification reports window



Desktop: Certification > Generate reports

There are several Certification reports. Some are necessary for updating student records, such as the Board Notification List report or the Program Completion List report (which also tests for program completion).

You will run all certification reports from the Certification reports window.

Generating Completion Reports

Completion reports update program information for students who have completed a certification program. For example, when you run the Board Notification List report, which contains a list of students who have completed the requirements for the selected program, student records are updated as well as fields on the Register a student by program window.

To generate a completion report

1. From Certification, select Generate reports to open the Generate reports window.

2. From Report Types, select Completion.
3. From Available Reports, select a report.
4. Click Set Report Destination and select an output option.
5. Click Run.

   The Certification Selections window opens.
6. Select a search option:

- Single Program - Enter a program code, or click the lookup icon to select a program. Processes a report for the single program.
- All Active Programs - Processes a report for all active programs
- Adhoc Search - Create the search criteria to use to process the report.

7. Click OK to run the report.

   To view program status after the completion report is run

1. From Certification, select Register a student > By program to open the Register a student by program window.
2. Click Open.
3. Enter an ID in the Registrant field.
4. Press Tab.

   The student's record is displayed. The Board Notified? field is checked and the When? field contains today's date.

Generating Export Reports

You can run special export reports for generating form letters in your word processing software, for example, a letter from the executive director or president to students when they earn their certification. The Certification module exports files to both Microsoft Word and WordPerfect.

To generate an export file

1. From Certification, select Generate reports to open the Generate reports window.
2. From Report Types, select Exports.
3. From Available Reports, select Export Name and Address to Microsoft Word.
4. Click Run to open the Certification Selections window.
5. Enable the appropriate Certification Items option.
6. Select the appropriate Print Options.
7. Enable the appropriate Address option.
8. Click OK to open the Set print file name window.
9. Enter a file name and click Save.
10. Open a blank document in Microsoft Word.
11. Select Tools > Mail Merge.

    The Mail Merge Helper window opens.
12. Click Create > Form Letters under the Main document area.

    A message asks you to choose either Active Window or New Main Document.
13. Click Active Window.
14. Click Get Data > Open Data Source under the Data source section, and browse to the file you saved.

    A message alerts you that Word found no merge fields in your main document and displays an Edit Main Document button.
15. Click Edit Main Document and enter the appropriate merge fields in the document.
16. Click OK to save the document.
17. Merge the information and print the form letter.

Generating Description Reports

Description reports allow you to view the details of a specific category or component, as well as lists of categories or components. For example, the Category Description report displays all the components that make up the category and the number of units required to complete the category. In addition, you can generate reports listing all available certification categories, components, and programs.

To generate a description detail report

1. From Certification, select Generate reports to open the Generate reports window.
2. From Report Types, select Descriptions.
3. From Available Reports, select the Category Description report .
4. Click Run.

   The Certification Selections window opens.
5. Enable the appropriate Certification Items options.
6. Click OK to generate the Category Description report.

Sample Description Detail report

Generating Certification Letter Reports

With the Certification module, you can generate letters to specific students.

To generate letter reports

1. From Certification, select Generate reports to open the Generate reports window.
2. From Report Types, select Letters.
3. From Available Reports, select Student Notification Letters.
4. Click Run to open the Certification Selections window.
5. Enable the appropriate Certification Items options.
6. Enter an ID in the Student ID field.

7. Enable the Notify Student option.
8. Click OK to generate the Student Notification Letter report.

Generating Status Reports

With the Certification module, you can generate several reports that allow you to view the status of program components, as well as the status of students enrolled in either one or multiple programs.

To run the Component Registration List report

With the Certification module, you can see how many people are registered for any component and generate a list of their names.

1. From Certification, select Generate reports to open the Generate reports window.
2. From Report Types, select Status.
3. From Available Reports, select a report.
4. Click Run.

   The Certification Selections window displays.
5. Enable the appropriate Single Component and enter the component code in the data entry field.
6. Click OK.

Running Committee Reports

There are three Committee Management subsystem report types:

- Committee
- Proposed
- Applicant

The print dialog box lets you customize your reports by selecting various committees, positions, and terms in the search.

To print committee reports

1. From Customers, select Manage committees to open the Manage committees window.
2. From Committees, select the committee code.
3. Click Print to open the Committee Reports window.
4. From Report Types, select a report type.
5. From Available Reports, select a report format.
6. Click Run to open the Committee Selection window.
7. Select the committee options that you want your report to contain.

   Note: The options available vary depending on the type of report selected.
8. Click OK.

Running Chapter Reports

When you click the Print button on the Manage chapter rosters window, the Chapter Reports window opens. From this window, you can access five Chapter Management subsystem report types:

- Exports
- Labels

- Month End
- Rosters
- Statistics

To run a chapter report

Before running a standard report, check your printer destination.

1. From Customers, select Manage chapter rosters to open the Manage chapter rosters window.
2. Click Print.
3. From Report Types, select a report type.
4. From Available Reports, select a report.

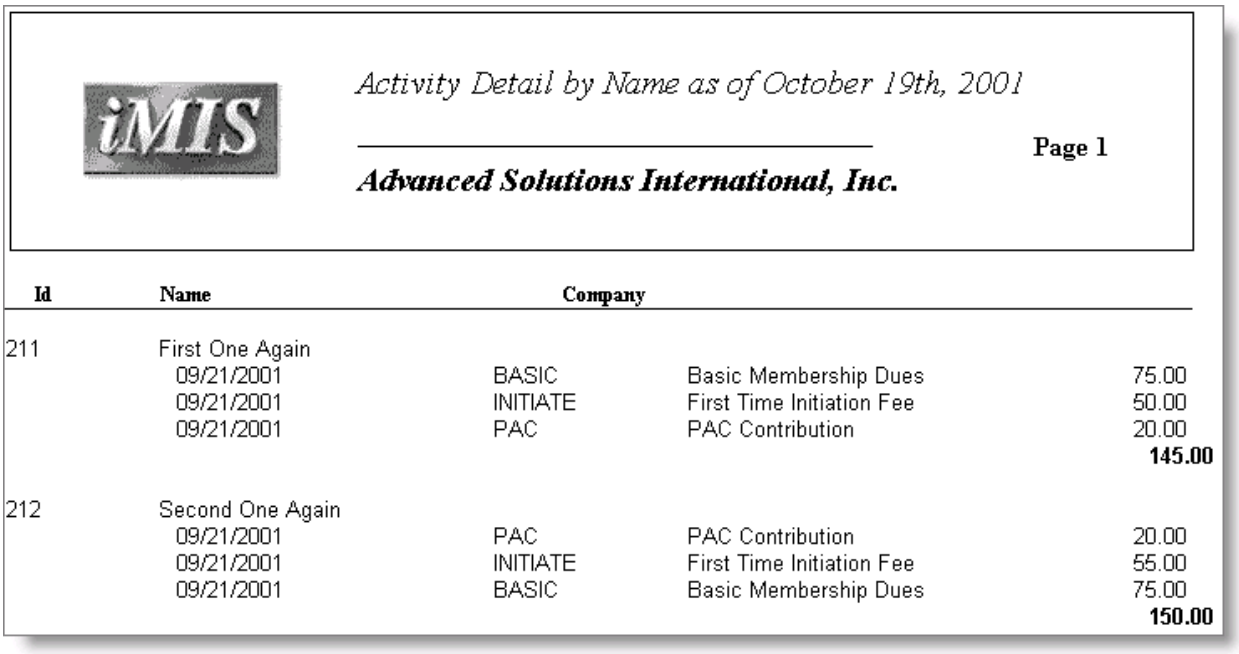
   Note:Check the description of the report in the Description field at the bottom of the window.
5. Click Run.

   The Chapter Selection window opens.
6. (optional) Select your print options.
7. Click OK.

Sample Customer Reports

Activity Detail report

The Activity Detail reports can provide information by name or by type. The Activity Detail by Name report lists activities by individual with dates and totals. The Activity Detail by Type report lists activities by type and product with totals.



Activity Detail by Name as of October 19th, 2001

Page 1

Advanced Solutions International, Inc.

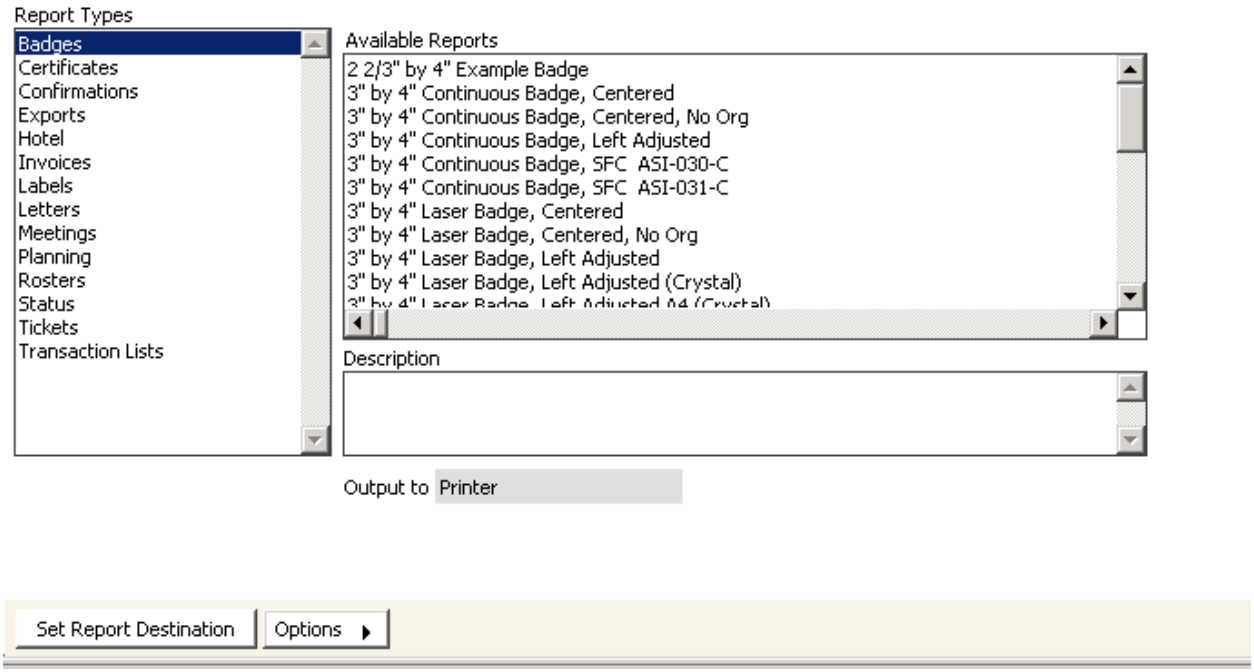
Hands-on exercise: Clone a report

In this exercise, you will create a new report by cloning it from an existing report.

1. Select Utilities > Report Specs to open the Report Specifications window.
2. Select the MEMBERSHIP - Activity - Activity Detail by Name report from the drop-down list.
3. Click Clone.
4. Change the name of the Title to Activity Detail by Name - New.
5. Click Save on the Report Specifications window to display the report you created with the other Standard Reports on the Reports menu.

Event Reports

Event reports window



Desktop: Events > Generate reports

Events-Specific Report Options

The report options Print_Guest and Print_Additional_Badges enable you to include Event badge holders other than conference registrants in several Events reports. The check-boxes for these options, Guest and Additional Badges, are included under the Print Options area of the Event Selections window.

Note: Badge holder information is entered on the Event Registration > Badge Information window.

Print_Guest affects Events badge holders whose BADGE_TYPE is GUEST.

Note: The GUEST type must be defined in the BADGE_TYPE General Lookup/Validation table for the report option to work correctly.

Print_Additional_Badges affects Events badge holders whose BADGE_TYPE is any type other than PRIMARY.

The following reports accommodate the use of Print_Guest and Print_Additional_Badges:

- Formal Meeting Roster, Alpha by Name (Crystal) - the report format groups and sorts by the primary registrant's last name, with associated badge holders, sorted by their last names, directly following the primary registrant.
- Formal Meeting Roster, by Company (Crystal) - the report format groups and sorts primary registrants by their company names, with associated badge holders, sorted by their last names, directly following the primary registrant. Company names are not listed for non-primary badge holders.
- Preregistration List (Crystal) - the report format groups and sorts by Meeting Title, Order Number, Primary Registrant, and associated badge holders.

The following reports offer the Print_Guest and Print_Additional_Badges options but have not been specially formatted to use them:

- Formal Meeting Roster, by Company/Institute (Crystal) - no change to report format
- Preregistration List
- Export Registrants to Microsoft Word
- All Labels by Zip
- All Badges reports except Combination Badge and Ticket reports

Note: Combination Badge and Ticket reports automatically print a badge for the Registrant and a badge for the next badge holder listed in that registrant's Badges tab. This feature cannot be turned off.

Modifying invoice reports for zero balance and payment details

The following reports, when the search condition is modified in the report specification, can print invoices for registrants with a zero balance:

- MeetingInvoicesOE4
- MeetingInvoicesOE4_VAT
- MeetingInvoicesOE1
- MeetingInvoicesOE1_VAT

These changes are intended only for customized and cloned reports. The standard reports will not differ from their previous versions. You can clone any of the above reports or customized versions of these reports and manually modify the relevant report specification to achieve the intended results.

To modify an invoice to print zero-balance invoices

1. Clone the desired Meeting Invoices report.
2. Click Parameters to display the Detail Report Parameters window.
3. In the Search field, remove the Orders.BALANCE <> 0 criteria.
4. Click Save.

You can now run the cloned report.

The Multi Payments option enables you to print payment details for event registrations. The description field for each payment indicates the type of payment (check or credit card name) and the check number or credit card name (the credit card number is masked).

To print payment lines from Events > Generate reports, enable the Multi Payments option. If you want to print payment details on invoices generated from the Register a customer window, you must modify the invoice's report specification.

To modify an invoice to print payment details

1. Clone the desired Meeting Invoices report.
2. Click Parameters to display the Detail Report Parameters window.
3. Click Edit.

4. Change NO_MULTI_PAYMENTS to PRINT_MULTI_PAYMENTS in the Options field.
5. Click Save.

Sample Events Reports

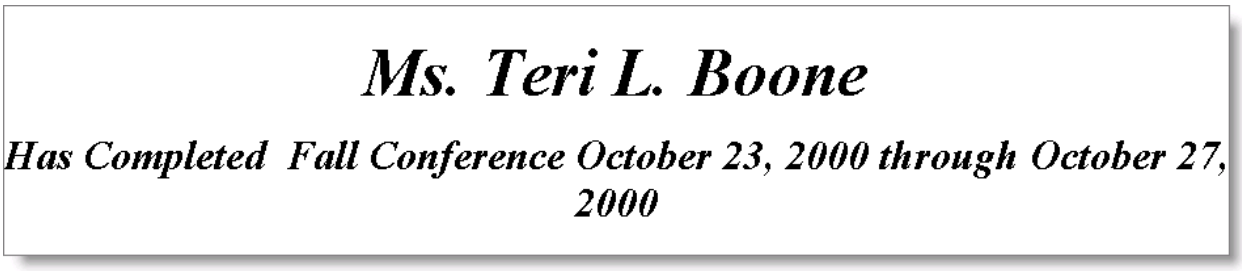
Badges report

There are several different formats available for printing badges.

Desktop: Events > Generate reports > Badges

CEU Certificates report

The CEU Certificates report prints a Function/Meeting Certificate (Form ASI-038).



Desktop: Events > Generate reports > Certificates > Function/Meeting Certificate SFL

Meeting Registration Invoice report

The Print Invoices report (MeetingInvoicesOE1.rpt) and Print New Invoices report (MeetingInvoicesOE4.rpt) allow the printing of the correct entity on the invoices by entering PRINT_MULTI_ENTITY in the Print options field on the Report Parameters window. It also includes a legend for cancelled and wait-listed functions.

While the event is open, use the Room Setup report to view function-level speaker data (evaluation criteria, scores, and comments recorded).

Using Hotel Room Reports

The three hotel room reports together provide a comprehensive packet to give to hotel personnel. They itemize the room assignments, the room sharing requested, and the changes that occurred throughout the event registration. These reports are:

- Hotel Room Bookings/Availability
- Hotel Room Change Roster
- Hotel Room Roster

The Hotel Room Roster has an option for including phone numbers, which adds the telephone number of the person with whom to confirm the reservation.

To report on sharing of multiple rooms

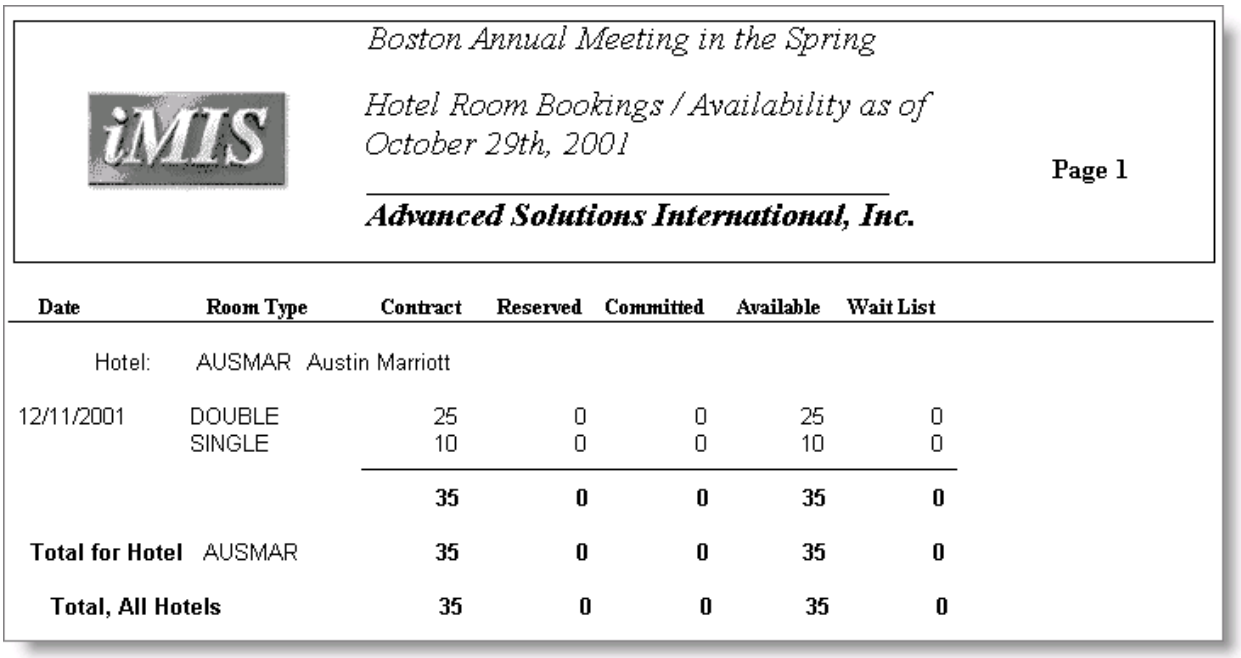
If a primary room holder registers multiple rooms and then shares these rooms, each room appears as a separate event function with the appropriate pricing, and all people sharing with the primary room holder appear under both functions in the report.

Therefore, individuals can appear twice in the Hotel Room Roster report and be shown as sharing both of these functions. The primary room holder is responsible for allocating those rooms within hotel regulations.

Sample Hotel Room reports

Hotel Room Bookings/Availability report

This report shows the number of rooms contracted for the event, and the number of rooms that are currently shown as reserved, committed, available, or on a wait list.



Boston Annual Meeting in the Spring

Hotel Room Bookings / Availability as of October 29th, 2001

Desktop: Events > Generate reports > Hotel > Hotel Room Bookings/Availability

Hotel Room Roster report

If you have entered Arrival and Departure dates for all individuals, you can generate the Hotel Room Roster report to get a complete breakdown of who is sharing a room at any one time. Notice that the arrival and departure dates are mandatory only if registering for a room.

iMIS does not warn or control how many people share a room because every hotel has its own rules and capabilities to accommodate this. Instead, generate a Hotel Room Roster report, which allows a hotel auditor to see who is sharing a room and when. As the report indicates, pricing is not split between sharing registrants; billing for the room goes to the primary registrant.

Desktop: Events > Generate reports > Hotel > Hotel Room Roster

Hotel Room Change Roster report

The Hotel Room Change Roster report records housing cancellations. This report sorts registrations by their Added, Changed, or Dropped status.

If a couple is in the Dropped section, you also see them in the Added section, because they had to register for a room to be able to cancel that room. They will also be listed in the Changed section if they had a change before they dropped.

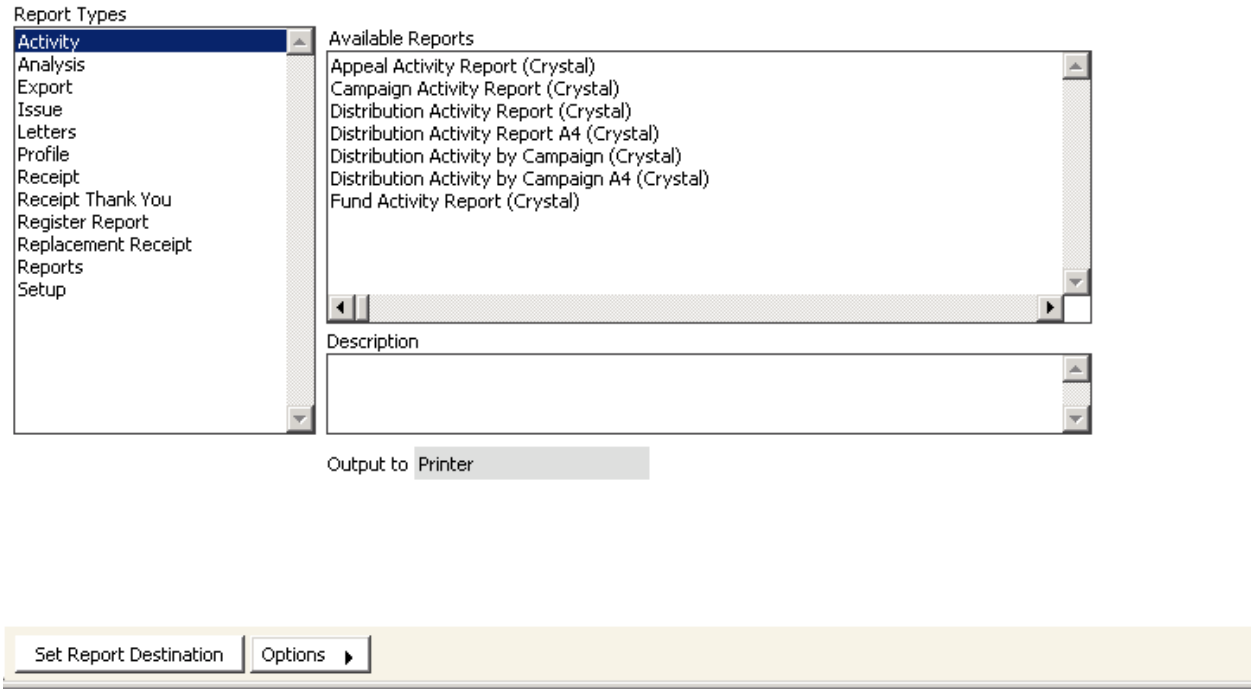
Reports for Fundraising

Fundraising reports window



Desktop: Fundraising > Generate reports

Report Types

The reports and outputs available through the iMIS Customer Management, Events, and Fundraising modules are generated from information gathered during customer entry, registration entry, gift entry, order entry, and planning processes. The following standard reports are available:

- Activity - Generates a list of activities for individuals.
- Badges - Prints groups of badges using a variety of formats for both continuous-fed and laser printers. (Events only)
- Certificates - Formats and produces continuing education, appreciation, and customer certificates at the event, function, or committee level. (Customer Management and Events)

- Confirmations - Prints confirmation letters or postcards for event registrations. Each printing run consists of the new registrants entered since the last printing run. (Events only)
- Export - Exports a variety of field and file data.
- Hotel - Prints hotel booking/availability, rosters, and transfer information. (Events only)
- Invoices - Prints invoices for event registrations and orders. (Events and Orders only)
- Issue - Prints reminders for donors who have made pledges or who have committed to new gifts on a certain date. (Fundraising only)
- Labels - Prints groups of labels using a variety of sizes and layouts. (Customer Management and Events)
- Letters - Selects letter formats for printing mass mailings for event registrations and other customer activities. (Customer Management, Events, and Fundraising)
- Meetings - Generates event reports from a group of indexes that list the events and related functions. (Events only)
- Order Status - Generates a variety of detailed summary reports on open orders.
- Planning - Generates room setup and general planning reports. (Events only)
- Product - Prints product and product inventory reports.
- Product Transactions - Generates reports on both posted and unposted product inventory transactions.
- Profiles - Prints customer profile information.
- Receipt - Prints receipts. (Fundraising only)
- Receipt Thank You - Prints thank you letters. (Fundraising only)
- Register Report - Prints detailed and summarized reports of receipts printed. (Fundraising only)
- Replacement Receipt - Prints replacement receipts. (Fundraising only)
- Reports - Prints detailed and summarized reports and analyses. (Fundraising only)

- Rosters - Generates a variety of detailed rosters that list registrants or committee members for events or functions.
- Statistics - Generates statistical analysis of data including event registrations and customer participation. (Customer Management only)
- Status - Prints summary reports that recap registration and cancellation counts and fees. (Events only)
- Tickets - Prints personalized tickets for functions. Each printing consists of new registrants entered since the last printing run. (Events only)
- Transaction Lists - Generates accounting audit trail details and recaps reports that list activities based on the transactions generated through AR/Cash, Billing, and Events.

Generating Letters from the Fundraising Overview Tab

To streamline fundraising processes, you can generate thank-you letters directly from the Overview tab of Fundraising, while the donor's record is open.

To generate a Fundraising letter

To generate a letter, the donor record opened must display a valid gift transaction. To access this feature, you must have Word Integration installed on the iMIS system.

1. From Fundraising > Enter and edit gifts, open the gift record for the contact for whom you are generating a letter.

   Note: To generate a letter, the record opened must display a valid gift transaction.

2. Click Letter at the bottom.

   The Fundraising Standard Letters window opens.

3. Choose the letter you want you use from the Fundraising Standard Letters window.

   Note: If you are creating a new letter or editing an existing letter, see To create a new letter or To edit an existing letter.

4. Click Merge.
5. Choose one or both of the following options: Create Activity Records with Merge and/or Create EMAIL Activities Records with Merge.
6. Click Continue.
7. A dialog box prompts: The System has X Activities to insert. Do you wish to write these activities? Click Yes or No. Microsoft Word opens and displays the Template.
8. To create the merged output, select Merge to New Document from the Word toolbar.
9. To print the letter, select File > Print.
10. Select File > Save As to save the letter to a folder on your computer.

To create a new letter

1. Click New.

   The New Standard Letter window opens.
2. Complete the Report Title and Report File fields.
3. Click OK.

   Microsoft Word opens.
4. Create the letter by selecting merge fields and entering text.
5. When you finish, click the Save icon or select File> Save.
6. To save the letter to another location outside of iMIS, select File> Save As and save a copy in another location.
7. Close Microsoft Word.

To edit an existing letter

1. Select the title of the letter you wish to edit and click OK.

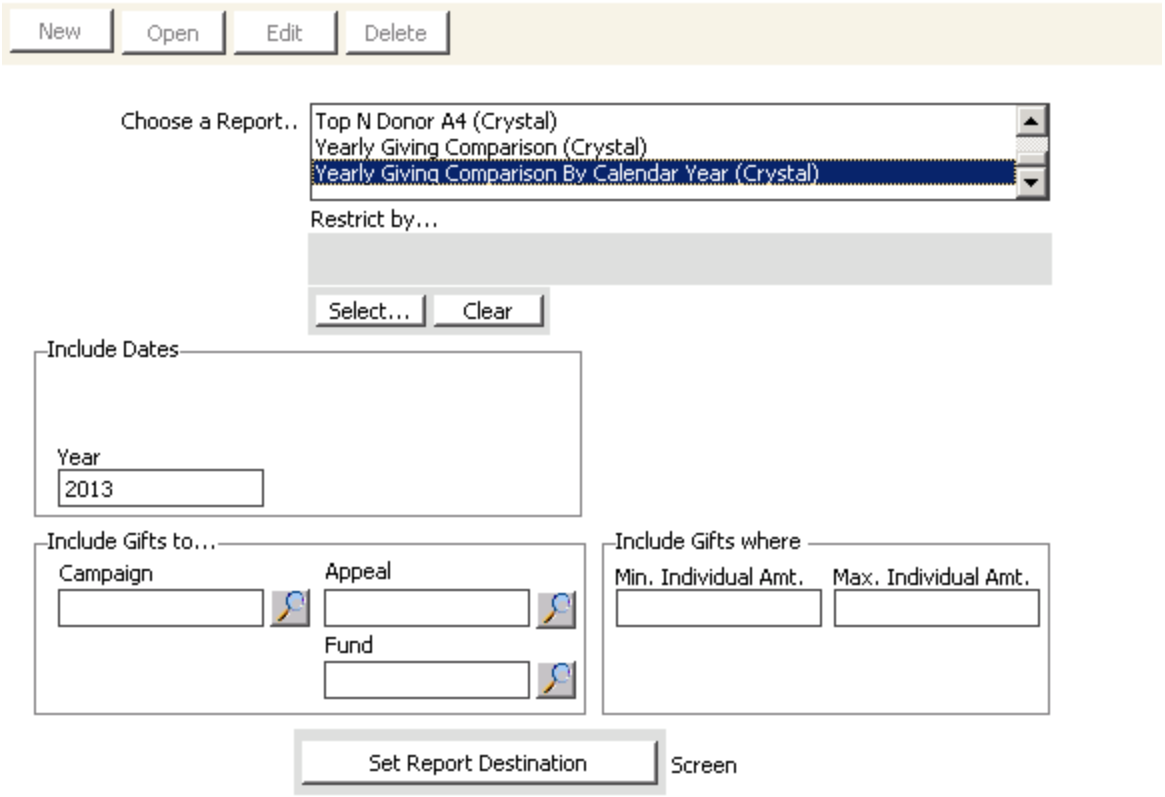
2. Once the letter opens in Microsoft Word, edit it.
3. When you finish, select File> Save.
4. If you also want to save the letter to another location outside of iMIS, you can select File> Save As and save a copy in another location.
5. Close Microsoft Word.

Generating executive reports in Fundraising

The Generate executive reports window is an abbreviated version of the Fundraising Generate reports window. The Generate executive reports window allows you to generate several of the detail and summary reports that are available in the Fundraising Generate reports window. The Generate executive reports window is just that - a window designed to allow the fundraising executive to view or print detail or summary reports of gifts, pledges, and donor clubs, and to view or print comparisons between current and previous time periods - all without having to go to the Generate reports window.

The Generate executive reports window has some limitations. You cannot rename reports in the Generate executive reports window, nor can you export, issue, or run letters reports as you can in the Generate reports window.

Executive reports window



Desktop: Fundraising > Generate executive reports

Choose a Report

This area contains a scrolling list of all reports available from the Generate executive reports window. For each available report displayed in this area, you can select either a detail or summary report by enabling either the Detail or Summary option.

- Pledge - Select this report to generate either a detail or summary report of all pledges entered. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Donor Club and Meeting. The report lists the amounts pledged and paid as well as balances remaining. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.

- Giving - Select this report to generate either a detail or summary report of all gifts and pledge/installment payments. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Donor Club and Meeting. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.
- Prev/Curr Period - Select this report to generate a detail or summary list of gifts given per user-selected sort, comparing these amounts between two defined time periods. These reports show the difference in amounts and the percentage of change, with single gifts and pledges broken down by fund. To run the Prev/Curr Period report, you must enter values in the Comparison to Previous Period From and Thru date fields.
- Donor Club - The Donor Club Detail (lndscape) report allows you to generate a list of all individuals who have attained a donor club, subtotaled by individual donor clubs with a total of all donor clubs achieved. The report displays the date the donor club was achieved and the Solicitor, Donor, List As, Fund, Campaign, and Appeal associated with each donor club. Subtotal the report by sorting on any of the options in the Sort and Summarize by area except Meeting and Donor Club. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date. The solicitor is determined by the solicitor specified in the Solicitor field on the Donor Data tab on the Manage customers window (from Customers, select Manage customers, open a customer record, and select the Donor Data tab) rather than the solicitor specified in the Solicitor field on the Enter and edit gifts window (from Fundraising, select Enter and edit gifts).
- The Donor Club Summary report lists only the fund, campaign, and appeal codes for each specified donor club. The solicitor is determined by the solicitor specified in the Solicitor field on the Donor Data tab on the Manage customers window rather than the solicitor specified in the Solicitor field on the Enter and edit gifts window. Selecting the Summary option allows you to generate a list of all donor clubs achieved. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Meeting and Donor Club. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.

Sort & Summarize by

Select from the following options to sort and summarize your report:

- Date - Subtotal your report by sorting by date or date range. The date cannot be selected for Prev/Curr Period reports.
- Fund - Subtotal your report by sorting on Fund. This sorting option is available for all applicable reports.
- Campaign - Subtotal your report by sorting on Campaign. This sorting option is available for all applicable reports.
- Appeal - Subtotal your report by sorting on Appeal. This sorting option is available for all applicable reports.
- Member Number - Subtotal your report by sorting on the donor's customer ID. This sorting option is available for all applicable reports.
- Solicitor - Subtotal your report by sorting on solicitor. This sorting option is available for all applicable reports. In all reports except for the Donor Club reports, the solicitor entered in the Solicitor field on the Enter and edit gifts window restricts each report. The Donor Club reports search on the solicitor entered in the Solicitor field on the Donor Data tab on the Manage customers window.
- Donor Club - Subtotal your report by sorting on donor club. This sorting option works only for Donor Club Detail and Donor Club Summary reports.
- Meeting - Subtotals report by sorting on events. This sorting option is available only for Donor Club reports.

Restrict by

There are several options in this area of the window for restricting report output.

Member - Enter the customer ID for the report, or click the lookup icon to select an ID.

Select - (optional) Lets you open the Member/Contact Selections window to select customer type options for setting your report parameters. All is the default. You can select from one of the following options:

- All (all customer types)
- Members
- Non Members
- Specific Types
- All (all company and individual customers)
- Company Only
- Individual Only

Note: If you select the Specific Types field, a blank field displays where you can enter one or more customer types (to enter multiple customer types, enter a comma (but no space) between customer types).

Clear - Lets you clear the values entered on the Member/Contact Selections window.

Solicitor

(optional) Enter the customer ID of the solicitor associated with the report, or click the lookup icon to select an ID.

Gifts To

Enter an Appeal, Campaign, and Fund for your report in these fields. You can click the lookup icon to select an appeal, campaign, or fund code. For all reports except Donor Club reports, the Appeal, Campaign, and Fund are determined by the information that was entered in the Appeal, Campaign, and Fund fields on the Enter and edit gifts window (from Fundraising, select Enter and edit gifts).

Date

Enter the beginning date for the reporting period. The system searches on the actual transaction date for all reports except for Prev/Curr Period reports.

Thru

Enter the report ending date.

Comparison to Previous Period

The following fields and options are used in conjunction with the Prev/Curr Period reports:

- From - Enter the beginning date of the previous comparison period.
- Thru - Enter the ending date of the previous comparison period.
- All - Enable to print all records for the specified time period. This is the default value.
- Lapsed - Enable to print a record with subtotals that have previous amounts and zero current period amounts.
- Decreased by - Enable to print records with a specified subtotal where the percentage change is equal to (=) or less than (<) the percentage specified in the Percent field.
- New - Enable to print only records with subtotals in the current period and zero amounts in previous time periods.
- Increased by - Enable to print only records with a specified subtotal where the percentage change is equal to (=) or greater than (>) the percentage specified in the Percent field.
- Percent - Enter the percentage for a Decreased by or Increased by comparison.

Detail

Enable to specify a detail report.

Summary

Enable to specify a summary report.

Set Report Destination

Opens the Set report destination window to set the report output destination. The initial default output device is Printer. You can change the default output device and save this setting (select File> Report Destination, select the desired default output device, and click Save) so that the desired default output device is selected each time you start iMIS.

Note: Set the report destination to Screen to avoid the unnecessary printing of reports.

Note: To print the report, from the Report Destination window select the Printer option rather than printing the report from the screen. The printed reports will not align exactly as they appear on the screen if you print them from the screen; printing from the Printer option will prevent this problem.

To generate reports in the Generate executive reports window

1. From Executive reports, click New.
2. From Choose a Report, select a report.
3. Select the search options for the report. The options available vary based on the report selected.
4. Click Run.

To upgrade a cloned Fundraising Profile Crystal report

If you cloned a Fundraising Profile Crystal report for use in a previous iMIS release, make sure you add the date range parameters to the cloned report description, or the report will not print - from the Fundraising History window or any location in iMIS. (The standard Fundraising Profile Crystal report specification file is updated automatically when you upgrade to iMIS 10.5. You need to manually update this type of report specification file only if you created a clone and saved it with a customized name or location.)

To add date range parameters manually to a cloned Fundraising Profile Crystal report specification file, use the following steps.

1. Select Utilities > Report Specs.
2. In the Report Specifications window, select the cloned Fundraising Profile Crystal report from the list, then click Parameters.

3. In the Detail Report Parameters window, click Edit, then click Crystal Params.
4. In the Crystal Parameters window, add the new parameters:

- BeginDate

  Select Insert. In Parameter Name, enter BeginDate. In Variable Name (or String), enter RV.BeginDate.

- EndDate

  Select Insert. In Parameter Name, enter EndDate. In Variable Name (or String), enter RV.EndDate.

5. Click OK in the Crystal Parameters window.
6. Click Save in the Detail Report Parameters window.
7. Close the Detail Report Parameters and the Report Specifications windows.

Fundraising Receipts

Receipt Reports

The Fundraising module offers several receipting reports. All of these reports are Crystal reports, which can be customized.

Receipt (Conforms to the Canadian tax publication IT-110R3 Interpretation Bulletin for Gifts and Official Donation Receipts)	Sample Auto Receipt	Generates a receipt that includes the following fields: Registration Number, Receipt Number, Issued Date, Amount, and Original Receipt Number
Receipt Thank You	Sample Thank You	Sample receipting thank you letter that includes receipt amount and breakdown of gifts received
Register Report	Sample Register Report 1	Sample register report that includes a detail report of receipts printed

Register Report	Sample Register Report 2	Sample register report that includes a summary of receipts printed
Replacement Receipt (Conforms to the Canadian tax publication IT-110R3 Interpretation Bulletin for Gifts and Official Donation Receipts)	Duplicate Receipt	Generates a duplicate receipt that includes the following fields: Registration Number, Receipt Number, Issued Date, Amount, and Original Receipt Number

Assigning Receipting Intervals to Customer Records

One of the benefits of the Fundraising receipting function is the ability to assign receipting intervals to donors. For example, if you set the receipting interval to annual, the donor receives one receipt per year.

Other donors may have a monthly donation schedule and receive a receipt every 30 days. By enabling a receipting interval option, the donor's receipts are filtered out from the rest of the auto-generated receipts until the desired receipting interval has passed.

The Last Receipt Date field on the Donor Data tab of the Manage customers window is updated when a receipt is issued. The last date that a receipt was printed for the donor is displayed on the Donor Data tab.

Receipts are printed when the interval preference is greater than or equal to the difference between the current receipts issued date (system date) and the donor's Last Receipt Date. For example, a donor's receipt interval is set to Monthly and the donor makes a new gift (with payment) within 30 days after their last receipt was printed. If an auto-receipt run is initiated on the 31st day after the last receipt was printed, a receipt prints for the gift. However, a receipt does not print if a receipt run is initiated within 30 days after the donor's last receipt was printed.

Receipting intervals for customers are selected in the customer's Donor Data tab on the Manage customers window. See Adding Fundraising Information to a Customer Record.

Generating Receipts

Gift receipts are not generated until you run the auto-receipting batch query report. You can also generate receipts if batch control is not enabled. You cannot edit a gift after a receipt has been issued for the gift because an accounting record has been generated. With the Fundraising module, you can print receipts, thank you letters, and register reports in one linear process or you can print each separately.

Note: If you use multiple entities, batch control should be enabled.

Printing receipts uses the same batch logic that is used in AR/Cash and Billing. A batch is used to select and group receipts. It also can be used as part of the selection criteria for other receipting reports. You can select an AR/Cash batch that has been used to record payments, or you can use a receipt batch created for receipting purposes only.

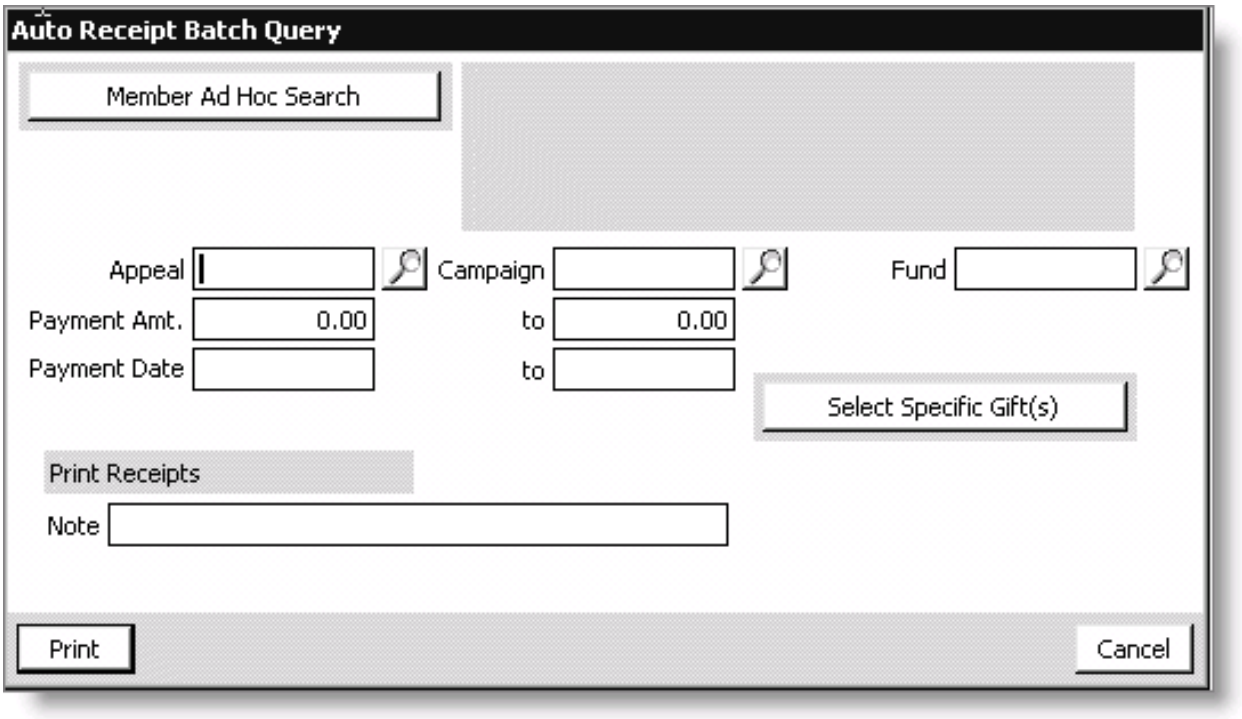
Note: If you use a mixed batch (one that contains receipts and payments) and post the batch, you cannot open the batch to print thank you letters or register reports unless you change the batch's status to open. However, you can enter the closed batch name or number as selection criteria for thank you letters, register reports, or replacement receipts.

Auto Receipt Selection Criteria

You can select from several methods for printing receipts:

- Set a Receipting Interval at the donor level.
- Use selection criteria from the Auto Receipt Batch Query window.
- Conduct an ad hoc search from the Select Search Instructions window.
- Use selection criteria from the Select Specific Gift(s) window.
- You can generate receipts from the Auto Receipt Batch Query window.

Auto Receipt Batch Query window



Desktop: Fundraising > Generate reports > Receipt from the Report Types list > Sample Auto Receipt (Crystal)

Member Ad Hoc Search

(optional) Enables you to display the Select Search Instructions window for options to conduct an ad hoc search.

Appeal

(optional) Enter the appeal to be included in the search criteria for the auto receipt report.

Campaign

(optional) Enter the campaign to be included in the search criteria for the auto receipt report.

Fund

(optional) Enter the fund to be included in the search criteria for the auto receipt report.

Payment Amt

(optional) Enter the minimum payment amount for the payment amount range criteria for issuing the receipts.

to

(optional) Enter the maximum payment amount for the payment amount range criteria for issuing the receipts.

Payment Date

(optional) Enter the beginning payment date range criteria for issuing the receipts.

to

(optional) Enter the ending payment date range criteria for issuing the receipts.

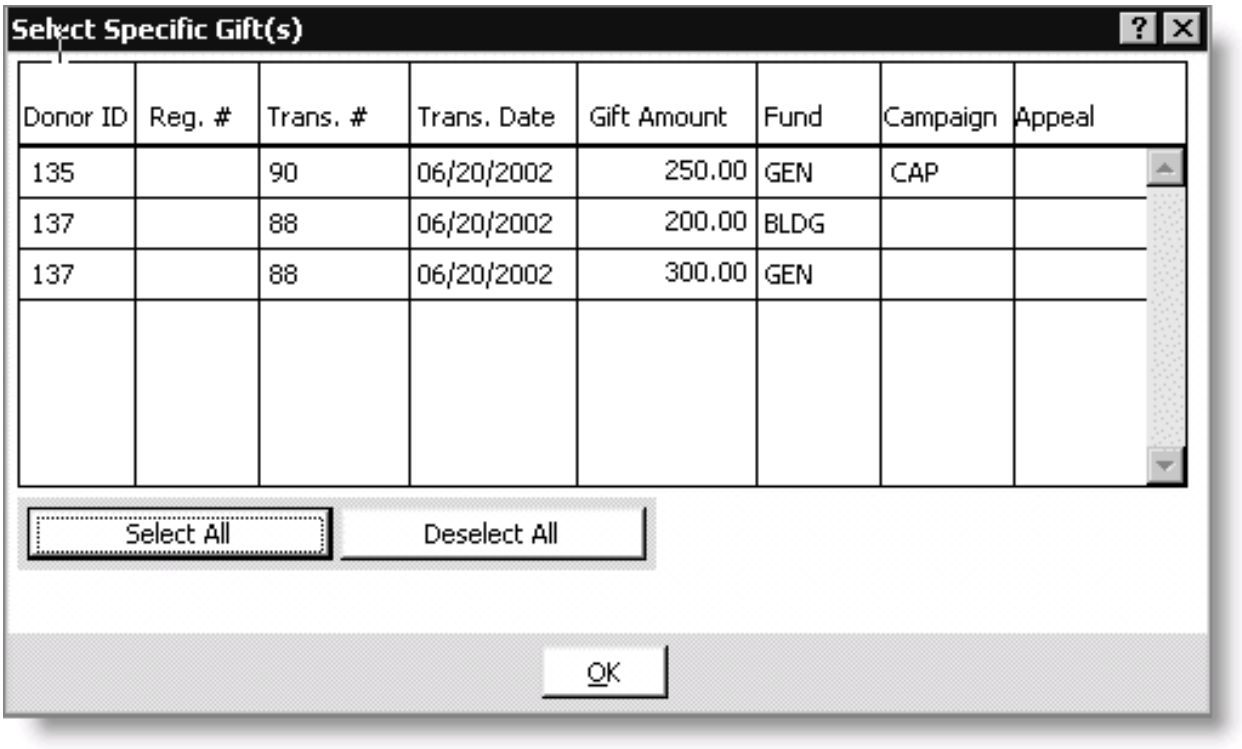
Select Specific Gift(s)

(required) Enables you to display the Select Specific Gift(s) window to select from a list of gifts. You cannot print receipts unless you click this button and select at least one gift in the Select Specific Gift(s) window.

Note

Enter additional information to be printed on the receipt.

Select Specific Gift(s) window



Use the Select Specific Gift(s) window to select specific gifts for donation receipts after the search criteria have been entered on the Auto Receipt Batch Query window. You may also use the Select Specific Gift(s) window as the sole selection of gifts for donation receipts.

Donor ID

Displays the customer ID number of the donor associated with the gift.

Reg #

Displays the registration number of the fund or organization associated with the gift.

Trans #

Displays the transaction number associated with the gift.

Trans Date

Displays the date of the transaction associated with the gift.

Gift Amount

Displays the amount of the gift.

Fund

Displays the fund associated with the gift.

Campaign

Displays the campaign associated with the gift.

Appeal

Displays the appeal associated with the gift.

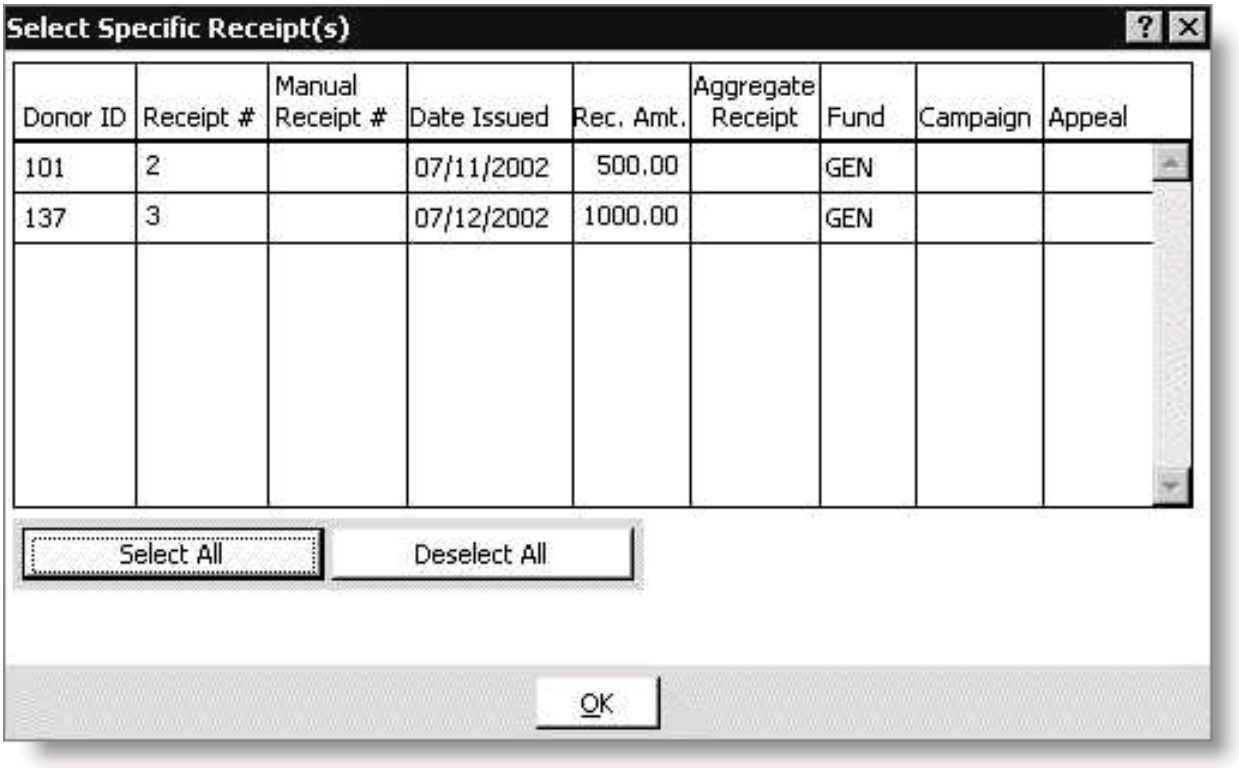
Select All

Enables you to select all the gifts in the window.

Deselect All

Enables you to deselect all selected gifts in the window.

Select Specific Receipt(s) window



Desktop: Generate reports > Receipt Thank You from the Report Types list > Sample Thank You (Crystal)

Use the Select Specific Receipts(s) window to select specific receipts for thank you receipts after the search criteria have been entered on the Auto Receipt Batch Query window. You may also use the Select Specific Receipts(s) window as the sole selection of receipts for thank you receipts.

Donor ID

Displays the customer ID number of the donor associated with the receipt.

Receipt #

Displays the automatically generated receipt number.

Manual Receipt #

Displays the manual receipt number.

Date Issued

Displays the date the receipt was issued.

Rec Amt

Displays the receipt amount.

Aggregate Receipt

Displays Yes if the receipt is an aggregate receipt.

Fund

Displays the fund associated with the receipt.

Campaign

Displays the campaign associated with the receipt.

Appeal

Displays the appeal associated with the receipt.

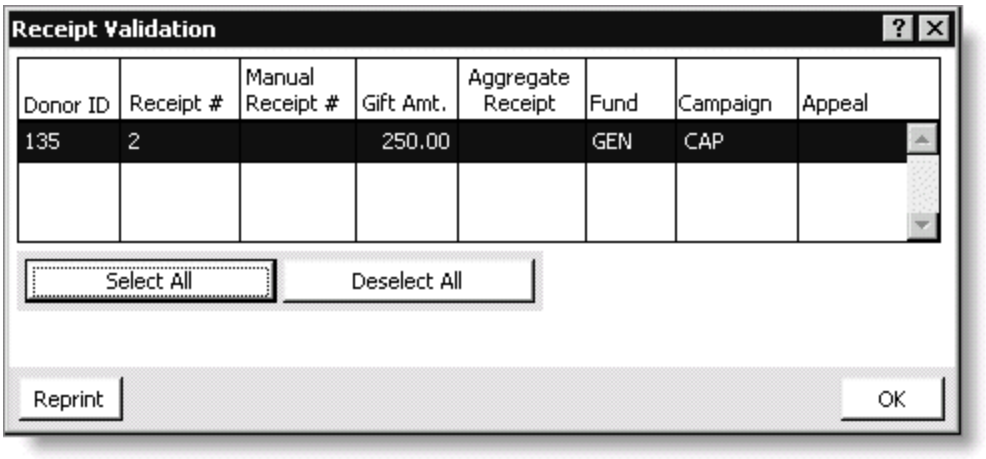
Select All

Enables you to select all the gifts in the window.

Deselect All

Enables you to deselect all selected gifts in the window.

Receipt Validation window



Desktop: Fundraising > Generate reports > Receipt > Sample Auto Receipt (Crystal)

After you print receipts, you can either validate or reprint the receipts. All receipt numbers in the current batch that have been printed are listed in the Receipt Validation window.

Donor ID

Lists donors by ID number.

Receipt #

Lists receipt numbers for recently printed receipts.

Manual Receipt #

Lists manual receipt numbers for recently issued receipts.

Gift Amt

Lists gift amounts for the recently issued receipts.

Aggregate Receipt

Displays Yes if the receipt is an aggregate receipt.

Fund

Displays the fund associated with the printed receipt(s).

Campaign

Displays the campaign associated with the printed receipt(s).

Appeal

Displays the appeal associated with the printed receipt(s).

Select All

Enables you to select all the receipts in the window.

Deselect All

Enables you to deselect all the receipts in the window.

Reprint

Enables you to reprint all selected receipts in the window.

Note: When you click the OK button, you are prompted to print a thank you letter report and a register report. Before you click OK, verify that the receipts printed correctly. After you click OK, the receipts cannot be reprinted. However, the original receipts can be canceled and you can issue replacement receipts with new receipt numbers.

To generate auto receipts

When issuing receipts, you are prompted to issue thank you letters and register reports during the process. You can issue these additional reports at this time or to postpone printing them.

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.

4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Auto Receipt Batch Query window opens.
6. Enter the search parameters for finding the receipts.
7. Click Select Specific Gift(s).

   The Select Specific Gift(s) window opens.

- If you did not enter specific search criteria in the Auto Receipt Batch Query window and only clicked Select Specific Receipt(s), a confirmation message is shown before the list of receipts is built. Click Yes to proceed.

  The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a thank you receipt was printed or not.

8. Select the gifts for which to generate receipts, or click Select All to select all of the gifts.
9. Click OK to return to the Auto Batch Receipt Query window.
10. (optional) Add a note of up to 30 characters in the Note field. This information is printed on all receipts generated in this batch.
11. Click Print.
12. Click OK to print the receipts.
13. (optional) To reprint the receipt, click Reprint.
14. Click OK after you have checked the receipts and verified that they have printed correctly.

    A message asks if you want to print the thank you letter now.

    To print the thank you letter:

- Click Yes.
- Click OK.
- The Fundraising Reports window opens.

- Select the Sample Thank You (Crystal) report.
- Click OK.

  A message asks if you want to print the Register Report.

15. To print the Register Report, click Yes.
16. Click OK.

    The Fundraising Reports window opens.

17. Select the Register Report to print and click OK.

    To print a thank you letter after auto receipting

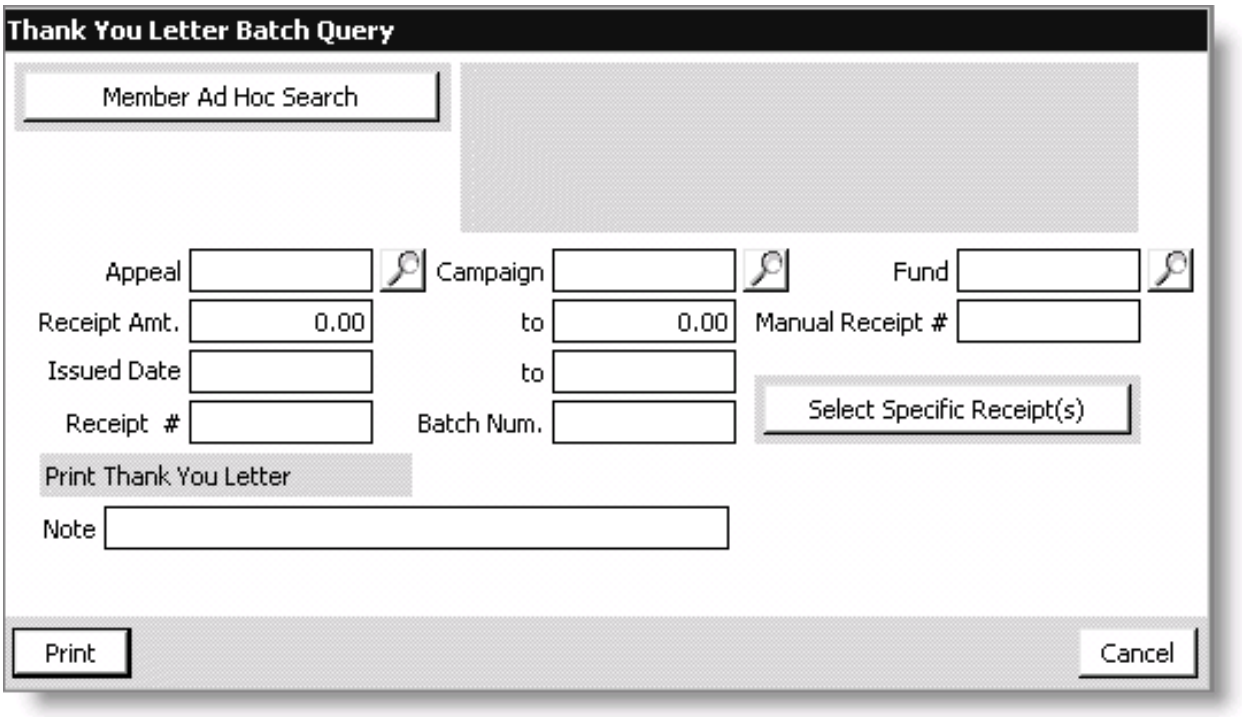
1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt Thank You from the list of Report Types.
3. Select Sample Thank You (Crystal) from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Thank You Letter Batch Query window opens.
6. Enter the search parameters.
7. Click Select Specific Receipt(s).

   - If you did not enter specific search criteria in the Thank You Letter Batch Query window and only clicked Select Specific Receipt(s), a confirmation message is displayed before the list of receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a thank you receipt was printed or not.

8. Select the receipts to be generated, or click Select All to select all of the receipts.
9. Click OK to return to the Thank You Letter Batch Query window.
10. (optional) Add a note of up to 30 characters in the Note field. This information displays on

all receipts generated in this batch.

11. Click Print to generate the report and close the Thank You Letter Batch Query window.



Thank You Letter Batch Query window

To print a Register Report after auto receipting

1. From Fundraising, select Generate reports to open the Generate reports window.
2. Select Register Report from the list of Report Types.
3. Select one of the register reports from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Batch Receipt Query window opens.
6. Enter the search parameters.
7. Click Select Specific Receipt(s).

- If you did not enter specific search criteria in the Batch Receipt Query window and only selected Select Specific Receipt(s), a confirmation message displays before the list of

receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a register report was printed or not.

8. Select the receipts to be generated, or click Select All to select all of the receipts.
9. Click OK to return to the Batch Receipt Query window.
10. (optional) Add a note of up to 30 characters in the Note field. This information displays on all receipts generated in this batch.
11. Click Print to generate the report and close the Batch Receipt Query window.

Trans.#	Date	Appeal	Campaign	Fund	Amount
90	6/20/2002		CAP	GEN	250.00

Grand Total $250.00

Sample Register Report

Generating Receipts Using Special Search Criteria

You can conduct specific searches using a wide range of options when generating donation receipts and receipt reports. For example, you can narrow your search to a specific appeal, campaign, or fund, or you can specify a date or amount range. In addition, you can conduct ad hoc searches on the Name table, the Name_FR table, or both.

To generate receipts using a date and amount range

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
4. Click Run. The Auto Receipt Batch Query window opens.

5. Enter the Campaign.
6. Enter the Fund.
7. Enter an amount range in the Payment Amt and to fields.
8. Enter a date range in the Payment Date and to fields.
9. Click Select Specific Gift(s) and select records for which receipts will be issued.
10. Click OK to return to the Auto Receipt Batch Query window.
11. Click Print to run the report.

To generate receipts using an ad hoc search

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
4. Click Run. The Auto Receipt Batch Query window opens.
5. Click Member Ad Hoc Search. The Select Search Instructions window opens.
6. Click New. The Search Instructions window opens.
7. Enter the name of the search in the Search Name field.
8. Select a Mode.
9. Select a Comparison File from the drop-down list.
10. Select a Comparison Field from the drop-down list.
11. Select a comparison operator from the list of comparison options.
12. Enter the desired value in the Comparison Value data entry area.
13. Click Save to save the search instructions and return to the Select Search Instructions window.

14. Click OK to return to the Auto Receipt Batch Query window. The search parameters display to the right of the Member Ad Hoc Search button.
15. Click Select Specific Gift(s). The Select Specific Gift(s) window opens.
16. Select the receipt to be generated, or click Select All to select all of the receipts.
17. Click OK.
18. Click Print to generate the report.

Generating Replacement Receipts

You can generate replacement receipts with the receipting function. Replacement receipts are issued to replace previously issued receipts. To provide an audit trail, the original receipt number is canceled and a new replacement receipt number is issued. Only receipts that have not been canceled can be selected to print replacements. When the receipt is selected, the original receipt number is canceled and the next available auto-generated receipt number is assigned.

Note: When printing replacement receipts, if you do not enter information in the Note field on the Replacement Receipt Batch Query window, the receipt prints the note from the original receipt. For example, if the original note was January 99 receipts and a replacement receipt is issued in July, the note on the receipt will still read January 99 receipts if you do not enter a new note in the Note field. If a new entry is made in the Note field, this entry overrides the original note text.

To generate replacement receipts

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Replacement Receipt from the list of Report Types.
3. Select Sample Replacement Receipt (Crystal) from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Replacement Receipt Batch Query window opens. This window is similar to the Auto Receipt Batch Query window in that it also allows you to specify search

criteria to generate receipts.

6. (optional) Enter the search criteria.
7. Click Select Specific Receipt(s) to display the Select Specific Receipts window.

- If you did not enter selection criteria on the Replacement Receipt Batch Query window and only clicked Select Specific Receipt(s), a confirmation message displays before the list of receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a register report was printed or not.

8. Select the receipts for which to generate replacements, or click Select All to select all of the receipts.
9. Click OK to return to the Replacement Receipt Batch Query window.
10. Click Print to generate the replacement receipts. You are prompted to change the printer settings if necessary.

- To change the printer selection, select the destination from File> Report Destination.

11. Click OK.

- A message is printed on the receipt indicating that it is a replacement receipt. The original receipt number is also printed on the receipt. The Receipt Validation window opens after the receipt prints.

12. Click OK. A message displays asking if you want to print a thank you letter for this receipt.
13. Click Yes to print the letter, or No to skip printing the letter. After you print the thank you letter or click No, a second message displays asking if you want to print a register report for this receipt.
14. Click Yes to print the register report, or No to skip printing the register report.

Generating Aggregate Receipts

The receipting feature allows you to generate aggregate receipts. An aggregate receipt can be a single receipt for multiple payments or for one payment split among multiple

funds.

An aggregate receipt prints under the following conditions:

- A donor made multiple payments to one fund (one registration number)
- A donor made one payment distributed to multiple funds that meet the specified selection criteria, but the funds have the same registration number
- A donor made a payment to a fund that does not have a registration number (receipts for payments to funds without registration numbers are aggregate receipts by default)

To generate an aggregate receipt

1. From Fundraising, select Enter and edit gifts to display the Overview tab on the Enter and edit gifts window.
2. Enter a gift. See To enter a single gift or single pledge for information on entering a single gift.
3. Click New and enter a second gift using the same donor ID, but to a different fund, and click Save.
4. From Fundraising, select Generate reports to display the Generate reports window.
5. Select Receipt from the list of Report Types.
6. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
7. Click Run to display the Auto Receipt Batch Query window.
8. Click Select Specific Gift(s) to display the Select Specific Gifts window. Select the two gifts you just entered.
9. Click OK to return to the Auto Receipt Batch Query window.
10. Click Print.
11. Click OK when the system prompts you to change printers.

- In this example, a single receipt was issued for both gifts. The gift amount of $500 displays in the Gift Amt. field in the Receipt Validation window. This is the total of the two

gifts. Yes displays in the Receipt Validation window to indicate that this is an aggregate receipt. Because this is an aggregate receipt, only one receipt number displays.

12. Click OK. A message displays asking if you want to print a thank you letter for this receipt.
13. Click Yes to print the letter, or No to skip printing the letter. After you print the thank you letter or click No, a second message displays asking if you want to print a register report for this receipt.
14. Click Yes to print the register report, or No to skip printing the register report.

Manual Receipting

Although the Fundraising module provides a robust auto-receipting feature, you can use the user-generated manual receipting function when necessary. Because manual receipting and auto receipting are mutually exclusive, if you enter a manual receipt for a gift, a receipt is not auto-generated for the gift. Manual receipts are never printed; they are stored with the gift. Manual receipt numbers cannot be entered for single pledges or installment pledges. If you select a Gift Type of Single Pledge or Installment, the Receipt Number field and the Do not Print Receipt option are disabled on the Enter and edit gifts window.

To issue manual receipts

1. From Fundraising, select Enter and edit gifts to display the Overview tab on the Enter and edit gifts window.
2. Enter a gift.
3. Enter a manual receipt number in the Receipt Number field.
4. Click Save.

Note: When you enter a receipt number, the Do not Print Receipt option is automatically selected and cannot be cleared. You cannot edit a gift associated with a manual receipt after the gift has been saved.

Sample Fundraising Reports

Fundraising reports are used to generate detail and summary reports on many aspects of fundraising.

Donor Club Summary as of July 23rd, 2002

Page 1

Sorted by Date

Advanced Solutions International, Inc.

Date	Donor Clubs Awarded	Donor Clubs	Donor Club Title
08/29/2000	1	BRICK	Brick Donor Club
07/15/2002	2	AMBASSADOR	Ambassador Donor Club

Desktop: Fundraising > Generate reports > Reports, select a report from the Available Reports

Appeal Activity Report (Crystal)

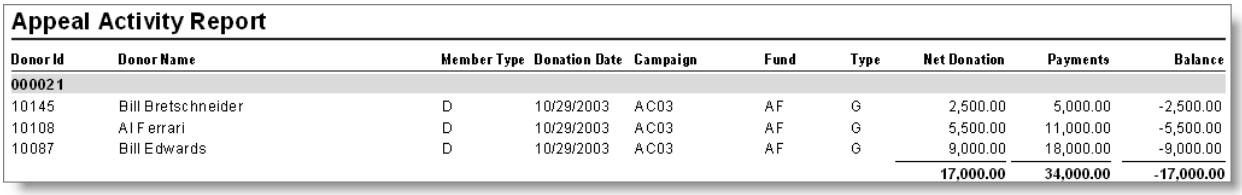
The Appeal Activity Report is a detailed listing of all of the Donation (Gifts and Pledges) Activities, listed by Appeal for a given period of time. Run this report from:

Desktop: Fundraising > Generate Reports > Activity

Notes

- Donations include Gifts and Pledges, including unpaid pledges.
- The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.
- In this report, Donations include Fundraising, Events, and Dues donations.
- Split donations will be displayed on two or more shaded lines.

- If the donor is a company, company name is displayed. If the donor is a person, Full Name is displayed.



Appeal Activity Report

Donor Id	Donor Name	Member Type	Donation Date	Campaign	Fund	Type	Net Donation	Payments	Balance
000021									
10145	Bill Bretschneider	D	10/29/2003	AC03	AF	G	2,500.00	5,000.00	-2,500.00
10108	Al Ferrari	D	10/29/2003	AC03	AF	G	5,500.00	11,000.00	-5,500.00

Split donations are shown on consecutive shaded lines

Appeal Performance Analysis (Crystal)

The Appeal Performance Analysis is a comprehensive summary of appeal results and statistics. The report provides a snapshot of each appeal. It lists the total number and total amount of gifts, pledges, and donations; the number of donors; the appeal goal and the amount and percentage difference between the goal and the actual proceeds. Run this report from:

Desktop: Fundraising > Generate Reports > Analysis or Fundraising > Generate executive reports

Note: In this report, Donations include Fundraising, Events, and Dues donations.

The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

This report cannot be filtered for Distribution. Adding Report Spec parameters for Distribution will produce an error.

Appeal Performance Analysis report

Appeal Expense report

You can enter these search criteria when printing an Appeal Expense report (Fundraising > Generate reports > Reports > Appeal Expense):

- Appeal code
- Campaign code
- Fund code
- Date range
- Amount range

The system searches for the expense items with exact match on Appeal, Campaign, or Fund if any of these fields are populated.

Date searches

Date searches work with these conditions:

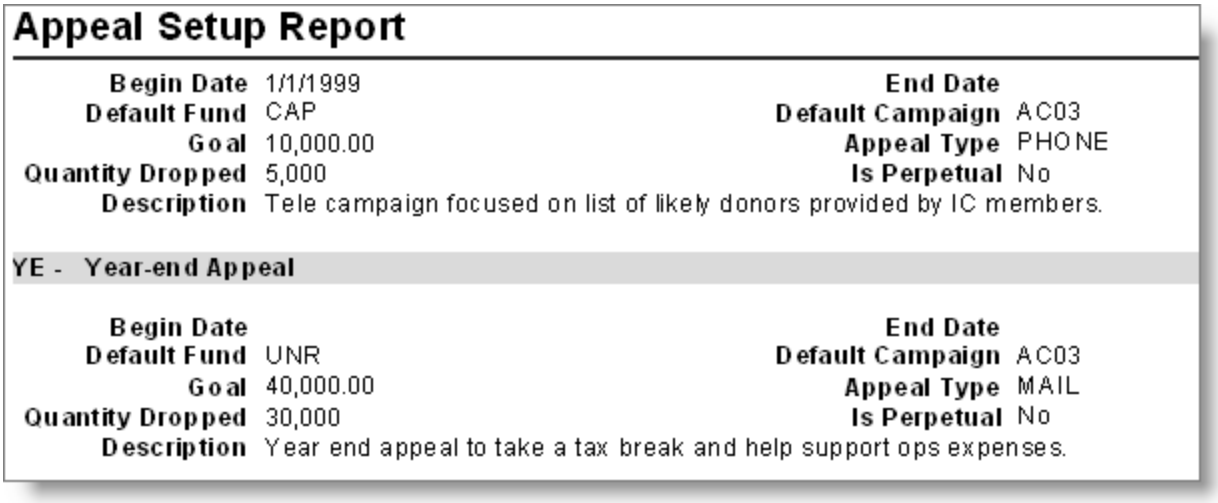
- If only the minimum date is populated, the system searches for any expense items that are equal to or greater than the minimum date.
- If only maximum date is populated, the system searches for any expense items that are equal to or less than the maximum date.
- If both minimum and maximum date are populated, the system finds the expense items that are greater than or equal to minimum date but less than or equal to maximum date.

The rules applied to the amount range are the same as for the date range.

Appeal Setup Report (Crystal)

The Appeal Setup Report lists each Fundraising Appeal and its current configuration in iMIS. Run this report from:

Desktop: Fundraising > Generate Reports > Setup



Appeal Setup Report

Begin Date	1/1/1999	**End Date**	
Default Fund	CAP	**Default Campaign**	AC03
Goal	10,000.00	**Appeal Type**	PHONE
Quantity Dropped	5,000	**Is Perpetual**	No
Description	Tele campaign focused on list of likely donors provided by IC members.		

YE - Year-end Appeal

Begin Date		**End Date**	
Default Fund	UNR	**Default Campaign**	AC03
Goal	40,000.00	**Appeal Type**	MAIL
Quantity Dropped	30,000	**Is Perpetual**	No
Description	Year end appeal to take a tax break and help support ops expenses.

Solicitor Performance Analysis

Solicitor Profile (Crystal)

The Solicitor Profile report shows solicitor performance summaries by Gift and Pledge, by Campaign, by Fiscal Year, and by Distribution and also lists donation information for Donors associated with the solicitor. The report can be run for one solicitor or for all solicitors.

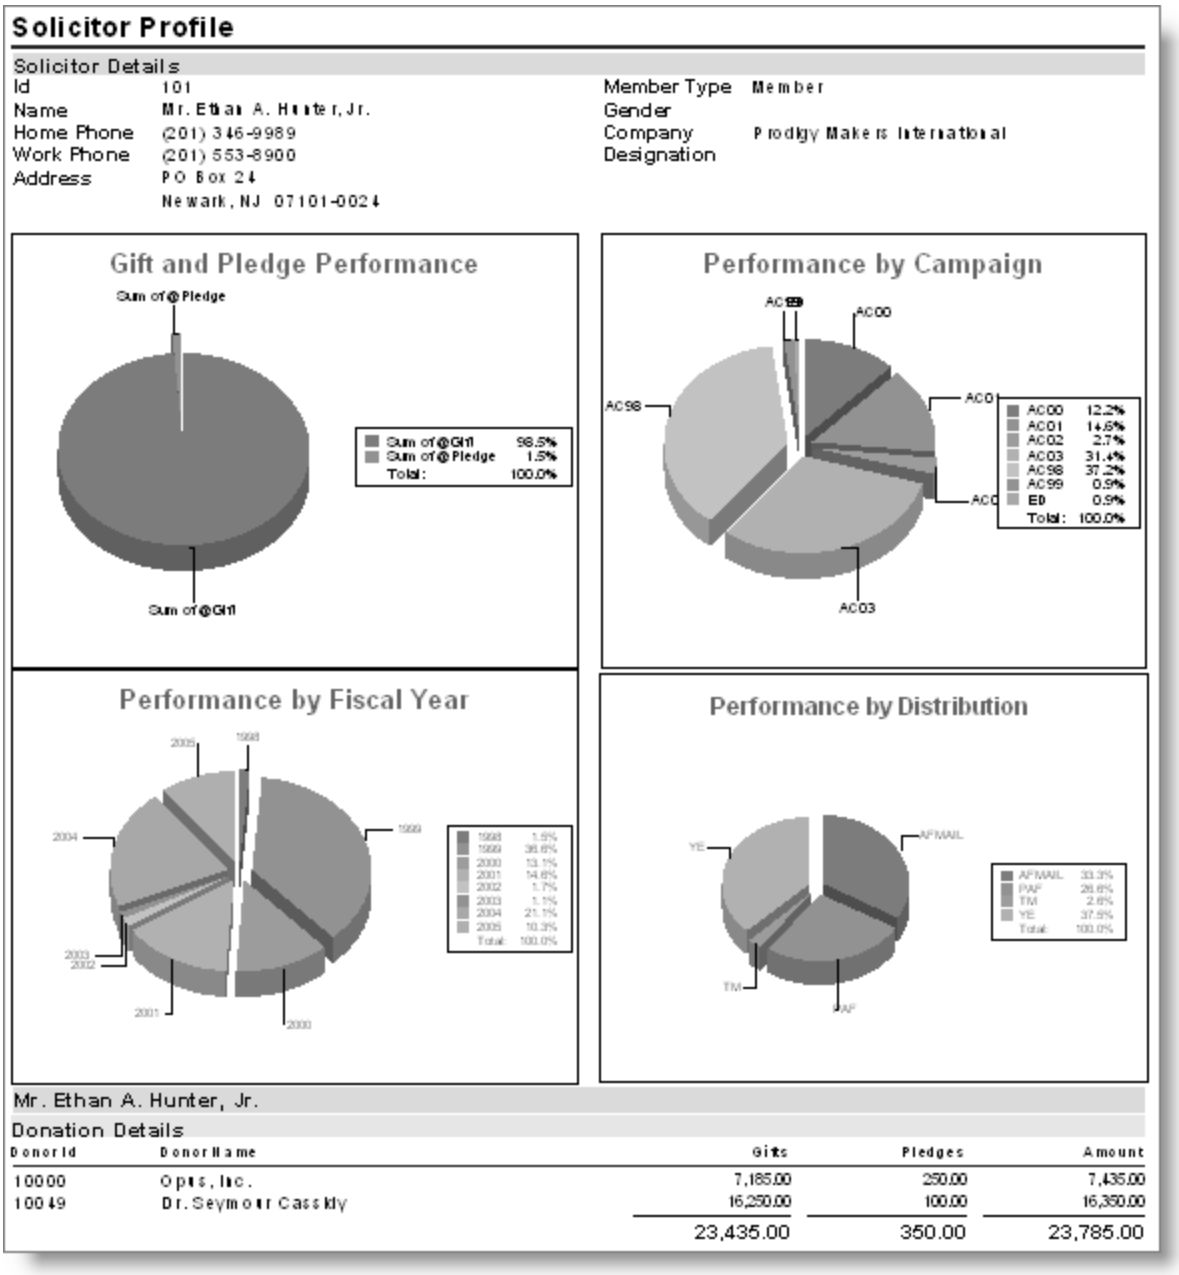
Desktop: Fundraising > Generate Reports > Reports, Fundraising > Generate executive reports

Note: In this report, Donations include Fundraising, Events, and Dues donations.

Donations include Gifts and Pledges, including unpaid pledges.

The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

This report cannot be filtered for Distribution. Adding Report Spec parameters for Distribution will produce an error.



Solicitor Profile

SYBUNT Report (Crystal)

The SYBUNT (some year but unfortunately not this year) report lists past collected funds (either gifts or payments) for all Donors who have contributed in two or more calendar years before the current year but who have not contributed this year or last year.

Note: To see which donors have donated last year but not this year, run the LYBUNT report.

Run this report from:

Desktop: Fundraising > Generate Reports > Reports, Fundraising > Generate executive reports

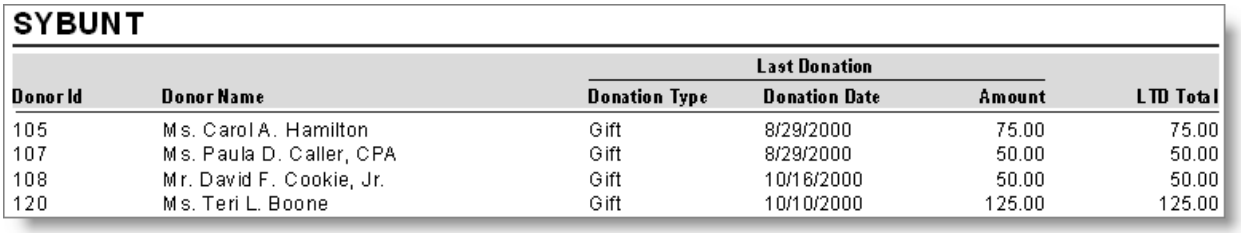
Note:

In this report, Donations include Fundraising, Events, and Dues donations.

This report includes Gifts and Pledge Payments. It does not include pledge income that has not been collected.

The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

This report includes Gifts and Pledge Payments. It does not include pledge income that has not been collected.



SYBUNT

		Last Donation

Yearly Giving Comparison by Calendar Year

Reporting performance for large Fundraising data sets

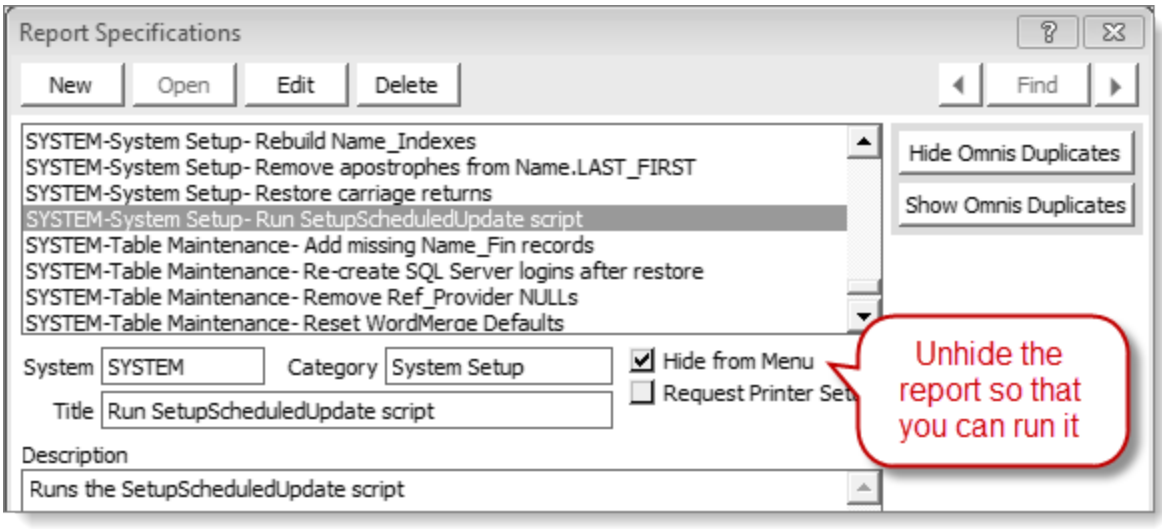
If you have a large amount of Fundraising data, you can enhance the performance of your Fundraising reports by periodically updating the Fundraising report summary tables. These tables act as a cache of pre-calculated data, so that when a report runs, only the data collected since the last time you updated the summary files must be combined, filtered, and calculated.

Note: Do not use these tables to create customizations. Instead, use the views that support Fundraising. These views are optimized each time you run the update procedure.

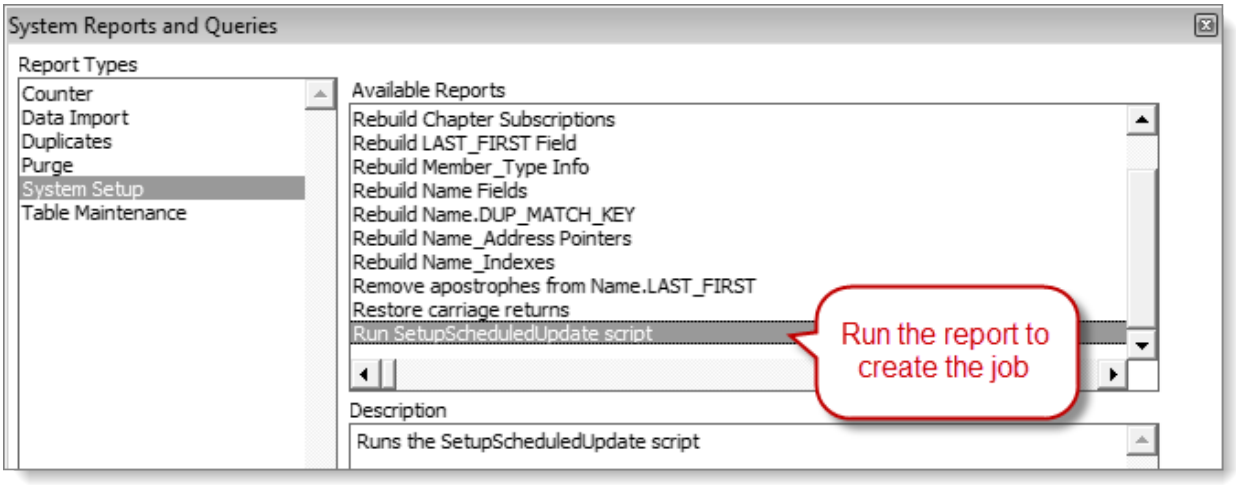
To create the job that updates FR report data

To create the job that updates these fundraising tables, unhide and then run a special report within Desktop. Once the job exists, you can run the update manually as needed.

1. From the Desktop menu, select Utilities > Report Specs.
2. Select the item titled SYSTEM-System Setup-Run SetupScheduledUpdate script.
3. Select Edit, uncheck Hide from Menu, and Save.



4. To run the script, select Utilities > Reports and Queries.
5. From Report Types, select System Setup.
6. From Available Reports, select Run SetupScheduledUpdate script.
7. Click Run.



To automate the job that updates FR report data

In SQL Server Agent, configure the update job to run automatically.

1. Enable the job titled ASI Update Fundraising Views.
2. As needed, change the job's scheduled run time, which defaults to 2:00 AM daily.

Tip: Avoid running updates during hours when iMIS usage is heavy to avoid affecting performance.

3. After you enable the ASI Update Fundraising Views job, configure SQL Server Agent to start whenever the operating system restarts.

Hands-on exercise: Generate reports

1. From Fundraising, select Generate reports to open the Generate reports window.
2. Export a report in Microsoft Word for all gifts made during August 2009:

- Report Types: Export
- Available Reports: All Gifts to Microsoft Word
- Click Run to display the Select Date Range window.
- Enter 08/01/2009 in the Begin Date field.
- Enter 08/31/2009 in the End Date field.
- Click OK to display the Set print file name window.
- Browse to the desired folder for the file.
- Enter August 2009 in the File name: field.
- Click Save.

3. Issue a reminder for installments due during August 2009:

- Report Types: Issue
- Available Reports: Reminder for Installments Due
- Click Run to display the Select Date Range window.
- Enter 08/01/2009 in the Begin Date field.
- Enter 08/31/2009 in the End Date field.

- Click OK. The Set report destination window opens.
- Select Screen and click OK.

4. Generate a summary of all gifts made during August 2009, sorted by campaign:

- Report Types: Reports
- Available Reports: Giving Summary
- Click Run to display the Reports window.
- Enter ANNUAL in the Campaign field.
- Enter 08/01/2009 in the Date field.
- Enter 08/31/2009 in the Thru field.
- Click Run.

5. Generate a detailed list of all pledges made to the General (GEN) fund from August 1, 2009 through November 1, 2009, sorted by customer ID:

- Report Types: Reports
- Available Reports: Pledge Summary
- Click Run to display the Reports window.
- Select Member Number from the Sort & Summarize by scrolling list.
- Delete ANNUAL from the Campaign field (if still displayed from the last report run).
- Enter GEN in the Fund field.
- Enter 08/01/2009 in the Date field.
- Enter 11/01/2009 in the Thru field.
- Click Run.

Hands-on exercise: Generate reports from the Generate executive reports window

1. From Fundraising, select Generate executive reports to open the Generate executive reports window.
2. Click New.
3. Select Pledge from the Choose a Report.. scrolling list.
4. In the Comparison to Previous Period area, enter 08/01/2009 in the From field and 11/01/2009 in the Thru field.
5. Click Run.

Reports for Issues

Issue Statistics Report

The iMIS Issues module includes the Issue Statistics (IssueStatistics.rpt) report.

The Issue Statistics report provides four charts detailing statistics about the number of issues for a specified time period. The following charts are provided:

- Issue Count by Type
- Issue Count by Status
- Issue Count by Source
- Issue Count by Assignment

You can specify the date range for the issues to be included.

Reports for Legislative Tracking

Reporting Full Bill Details

iMIS Legislative Tracking includes a report called “Full Bill Detail”. This report prints all of the information available for each bill. You can create numerous user-defined search criteria to fit your reporting needs.

iMIS Legislative Tracking also offers exports of Bill details to Word Perfect and Microsoft Word, so that you can use this material in other word processing.

To report full bill details

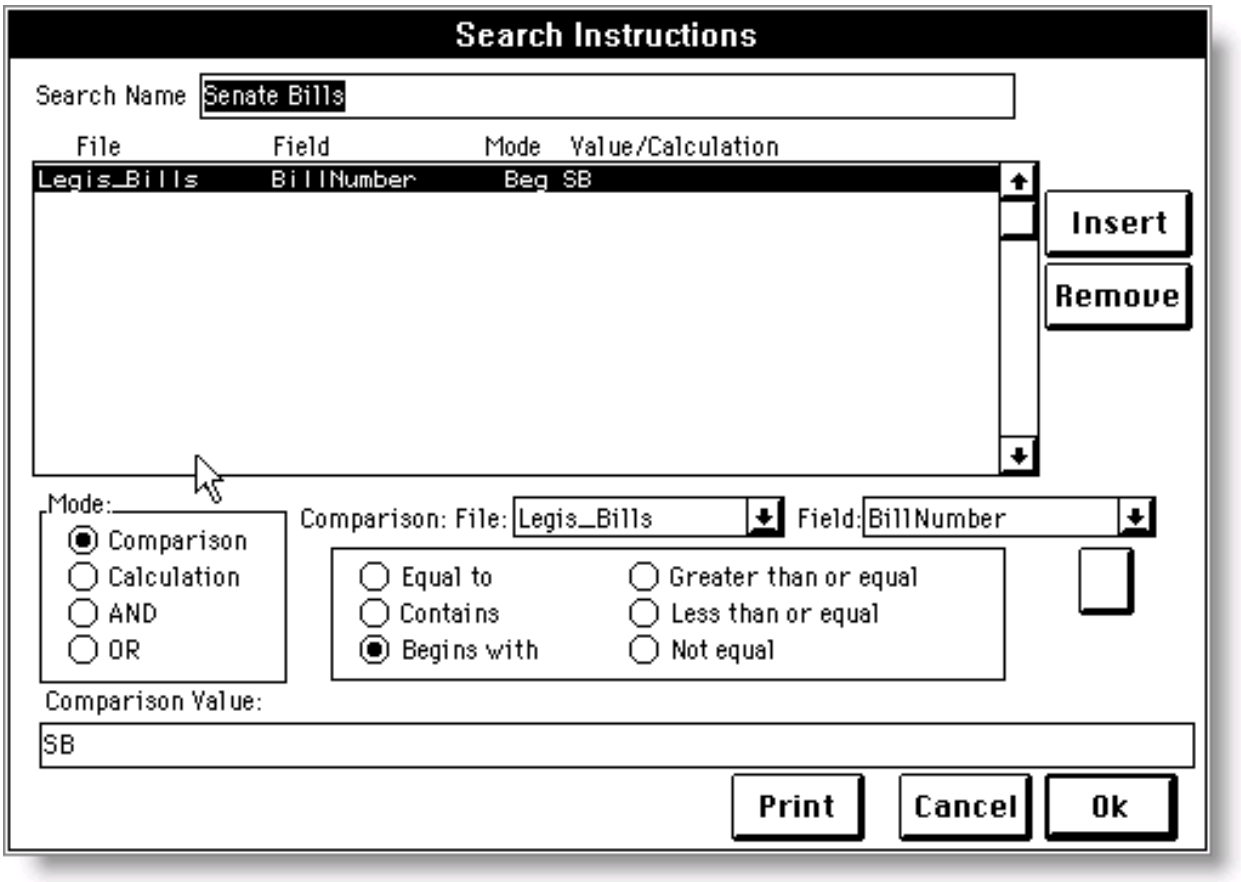
1. Select Leg/Track> Reports.
2. Highlight the report type Bills.
3. Highlight a report format, such as Full Bill Detail.
4. Click the Run button.

Selecting Specific Bills

The report format Full Bill Detail allows you to create report selection criteria to filter your bill records.

To select specific bills

1. On the Select Search Instructions window, select New, Clone, or Modify at left to open the Search Instructions window.
2. Define the comparison to use the iMIS File “Legis_Bills”.
3. Set the Field comparison to one that will allow you to make a useful search, such as “BillNumber”.
4. Press OK to generate the report.



In this example, the comparison on the field BillNumber finds all Senate Bills, which always begin with the letters “SB”.

iMIS

Bill: SB145-123 **Title:** Chemical waste dumping

Author: Martin Jackson
Sponsor: Al Gore

Subject: Controls over chemcial waste dumping specifically in the Rio Grande river.
Category: CHEMICAL

Synopsis: Impose heavy fines on companies found dumping chemical waste into the Rio Gra monitored by new border patrol division (Chemical border patrol).

Analysis: This bill will probably not make it due to the fact that a new branch would have to monitoring and this cost would be to high for tax payers.

Notes: #1 Decission was reached to hire consultants to investigate pollution levels in the along 2 borders, El Paso and Presidio.

Action History: Paula Kerns met with Al Gore in January to discuss the future of this bill and she Jack Jordan on the Clean River Committee.

Decission to hire environmental consultants. See Note(s) #1.

Last Action Date: 04/25/1995

Warehouse Availability Analysis report

The Warehouse Availability Analysis report generates a list of order line items for back-ordered products. Separated by products on backorder, each line item lists specific order information including order number, order date, order priority, and product quantity. The product quantity information lists the number of products Ordered, Shipped, Backordered, and Fillable. If you are using multiple warehouses, the report also lists a product's availability at each warehouse.

If a product's default warehouse does not have sufficient inventory in stock, you can run the report to view a product's availability at other warehouses. If another warehouse has available inventory, you can edit an order to ship a product from a warehouse with sufficient inventory.

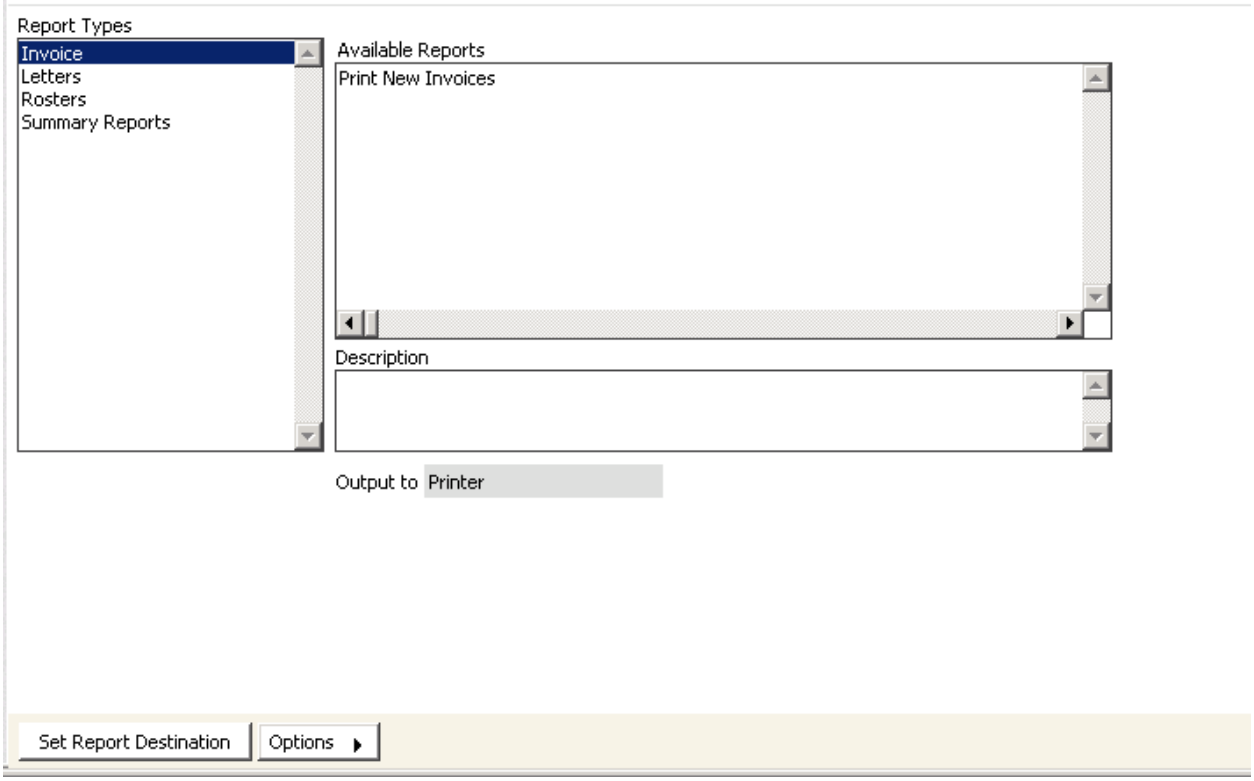
Reports for Referrals

Referral reports window



Desktop: Referrals > Generate reports

When you select Membership Reports, the standard iMIS report window displays. The window offers you a variety of printed output, including Rosters, Statistics, and Activity reports. The window is identical to that of every iMIS module. It gives you access to many categories of reports and options, from which you select specific formats and output. It also lets you choose the printer with Set Report Destination or other output device, and you can often vary the sort order and control the inclusion of providers and records, as well as other report-related items.

Print Invoice report

The Print Invoice report prints an invoice listing additional referral fees charged to clients.

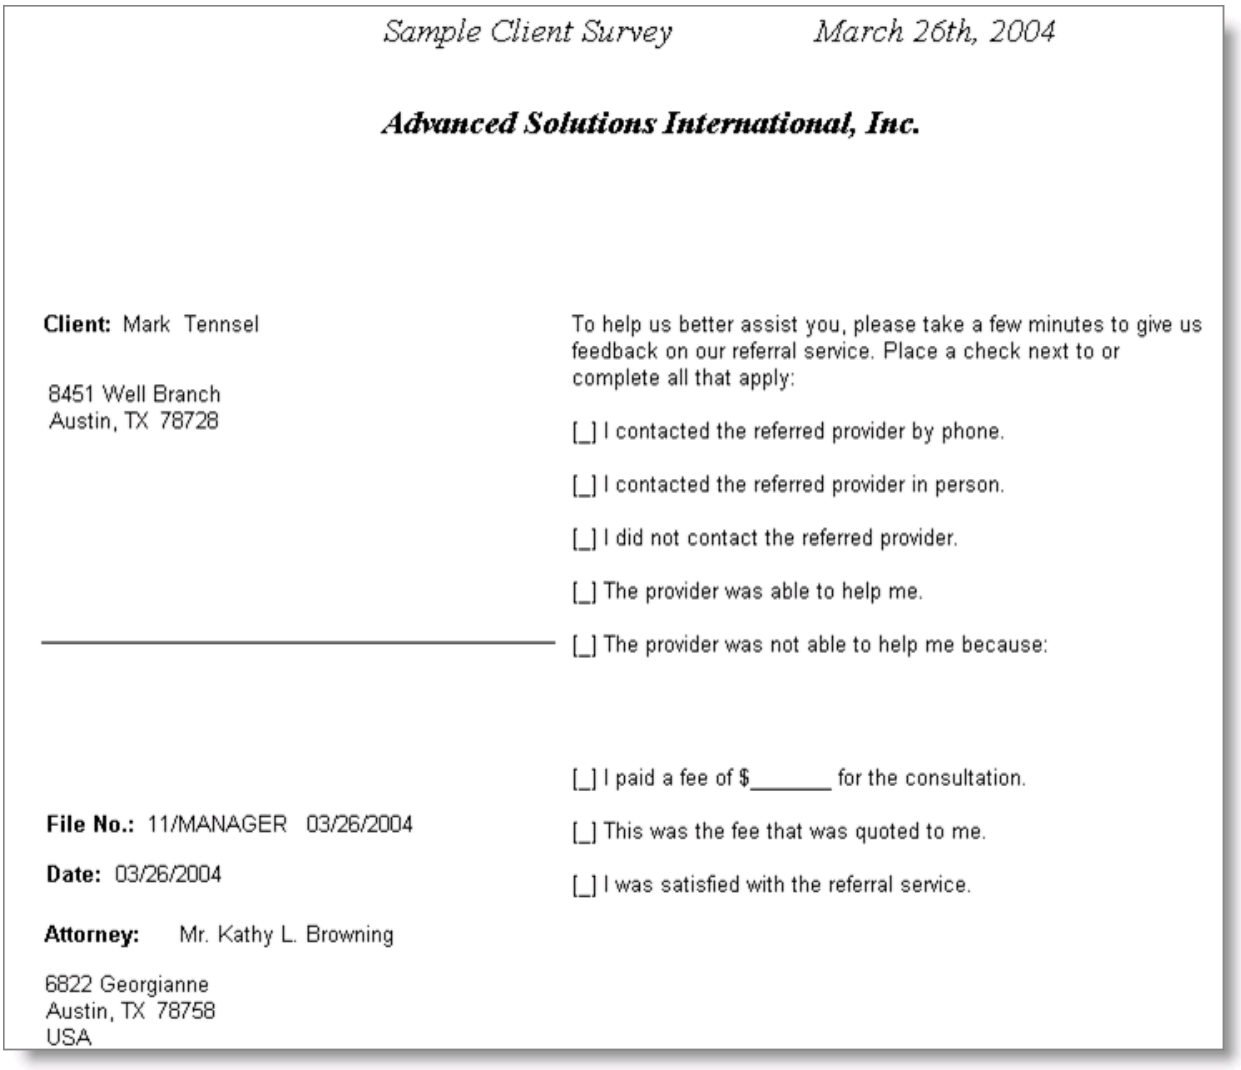
Survey Reports

Client and provider survey reports are available to allow you to obtain and track feedback associated with the referral.



Sample Client Survey *March 26th, 2004*

Advanced Solutions International, Inc.

Client: Mark Tennsel

8451 Well Branch
Austin, TX 78728

To help us better assist you, please take a few minutes to give us feedback on our referral service. Place a check next to or complete all that apply:

[_] I contacted the referred provider by phone.

[_] I contacted the referred provider in person.

[_] I did not contact the referred provider.

[_] The provider was able to help me.

[_] The provider was not able to help me because:

[_] I paid a fee of $_____ for the consultation.

File No.: 11/MANAGER 03/26/2004

Date: 03/26/2004

[_] This was the fee that was quoted to me.

[_] I was satisfied with the referral service.

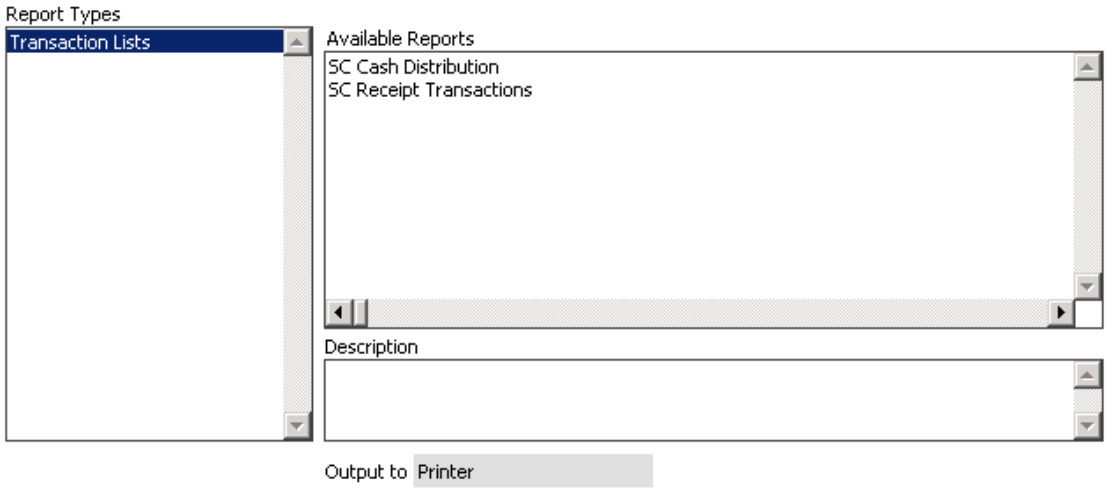
Summary By Category report

Reports for Service Central

Service Central reports window



Desktop: Service Central > Generate reports

You can generate two reports through Service Central: SC Cash Distribution and SC Receipt.

Transaction. The SC Cash Distribution report is a monthly transaction detail report, sorted by income and account number. The SC Receipt Transaction report is a daily receipts detail report showing all payment details, including a recap by income account.

Printing Service Central Reports

You can print Service Central reports in the same manner as other iMIS modules.

To print Service Central reports

1. From Service Central > Generate reports > Transaction Lists, select a report.

2. Click the Set Report Destination button and select where you want the view the output.
3. Click Run. The Date Range window opens.
4. Enter a Begin Date and End Date for the report.

   Note: Enter a date range that is not greater than 30 days. If you enter a date range that exceeds 30 days.
5. Click OK to run the report.

Receipt Transaction - Payments Journal

Transaction Summary

The Transaction Summary report is available from the Print Transaction button on the Process customer requests page when the item being paid and the payment are both in

the current batch (or if not using batch control, entered on the current date and the Today view is selected).

Run this report from: Service Central > Process customer requests > Print Transaction button

Service Central

Service Central Overview

Service Central allows you to offer one-stop shopping to your customers. This module provides a central location for processing event registrations, orders, fundraising gifts and pledges, and payment(s). In addition, Service Central provides your organization with the ability to sell products and services from various areas and apply payment for the products or service with a single check or credit card transaction.

Service Central Capabilities

The Service Central module has many unique and useful capabilities. The following list is an overview of Service Central module capabilities:

- Apply events and orders payments using a single point of entry
- Pay and view cash dues and subscription list payments for both the company and the individual
- Apply fundraising gift/pledge payments
- Authorize or validate credit card payments
- Apply payment for any open balance for any module within iMIS
- Create a Transaction Summary report for customers of dues/subscriptions, events, fundraising gifts/pledges and orders activity
- Print and distribute a Transaction Summary report of all Service Central transactions using e-mail or regular mail
- Calculate and display a Total Amount due as you enter items on the Process customer requests window
- Option to Auto-apply payment to the oldest items or to apply payment to individual outstanding items in the Payment Entry window by selecting or deselecting the line item
- Display Fundraising items with a Balance Due on the Payment window

- Option to search by customer ID, date, or transaction number from the Payment Entry window
- Easy access to all iMIS modules
- Display All, Outstanding, and Current batch transactions
- Display All, Outstanding, and Today non-batch transactions

Module Restrictions

- Open credit balance line items and Fundraising items are not selected for Auto-apply on the Payment Entry window when you open it from the Process customer requests window.
- Do not apply overpayments to Fundraising items, which results in a credit balance. Instead, apply overpayments to the Pre-Pay line.
- Separate Posting Required, an AR/Cash function is not compatible with Service Central.
- Accrual Dues Billing is not compatible with Service Central.
- Do not create credit and debit memos using the Service Central module; create credit and debit Memos only in the AR/Cash module.

> **Note:** Note: Processing customer credit card authorization and batch control transactions in Service Central is optional. These features must be set up by your administrator.

Navigation for Service Central

To gain access to the Service Central task list, select Service Central from the navigation bar.

- Process customer requests - Select this task list item to open the Process customer request window that interfaces with other iMIS modules to allow you to process customer requests.

- Process billing - Select this task list item to open the Process billing window where you can create a dues billing and place a subscription for an individual or a company customer.
- Register a customer - Select this task list item to open the Register a customer window where you can enter registration information for a customer.
- Enter and edit gifts - Select this task list item to open the Enter and edit gifts window where you can enter and edit gifts and pledges.
- Process sales transactions - Select this task list item to open the Process sales transactions window where you can process sales transactions that are tracked through AR/Cash.
- Process orders - Select this task list item to open the Process orders window where you can process orders.
- Enter and edit payments - Select this task list item to open the Enter and edit payments window where you can enter payments received from customers. By default, the Pay Amount field is not auto-populated and the Pay option is not auto-selected.
- Generate reports - Select this task list item to open the Service Central Generate reports window where you can generate a report of detailed daily receipts or a monthly cash distribution report.

Service Central Windows

This section contains detailed information about Service Central windows and a brief description of other iMIS module windows that interface with Service Central.

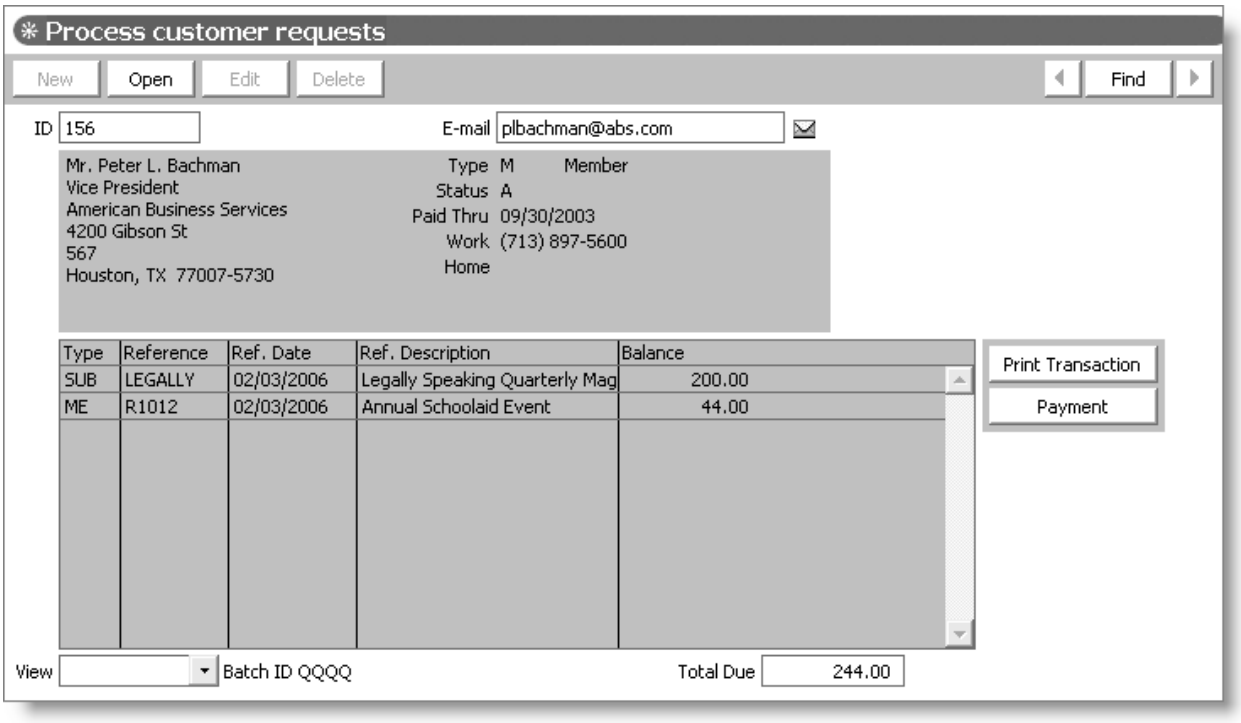
The Service Central module has three primary windows:

- Process customer requests window
- Payment entry window
- Generate reports

Several task list items on the Service Central task list are linked to other iMIS modules. This saves you time and effort when opening different modules to complete a single transaction. These links enable you to use related module windows:

- Process billing (Billing)
- Register a customer(Events)
- Enter and edit gifts (Fundraising).
- Process orders (either AR/Cash Simple Order Entry or Full Order Entry

Process customer requests window



Desktop: Service Central > Process customer requests

ID

This field specifies the customer identification number.

E-mail

Displays customer's e-mail address.

Message (envelope)

This icon opens the Confirmation of Transaction – Summary – Message (e-mail) window where you can send a Transaction Summary. You must select Current Batch from the View drop-down list.

Print Transaction

This button sends the Transaction Summary report to the user's designated location (for example, Screen or Printer). It is available in the Current Batch view if you are using the Batch Control option. You must select the batch that contains transactions for the selected customer.

Payment

This button opens the Payment Entry window. By default, the Pay Amount field auto-populates with the total amount due for any unpaid open item(s) and each open item displays with the order type, date, description, and balance due with the Pay option auto-selected for each item.

Type

Displays the source module or the transaction type.

Reference

Displays a number the system assigns to the transaction.

Ref Date

Displays the date the referenced transaction occurred.

Ref Description

Displays a description of the referenced transaction.

Note: Note: A detailed description displays for Orders (OE) if your administrator has enabled 1st Line Desc. on Statement in the AR/Cash module. If this option is not enabled, only the transaction name, Order displays in this field.

Balance

Displays the amount the customer owes for the referenced transaction.

View

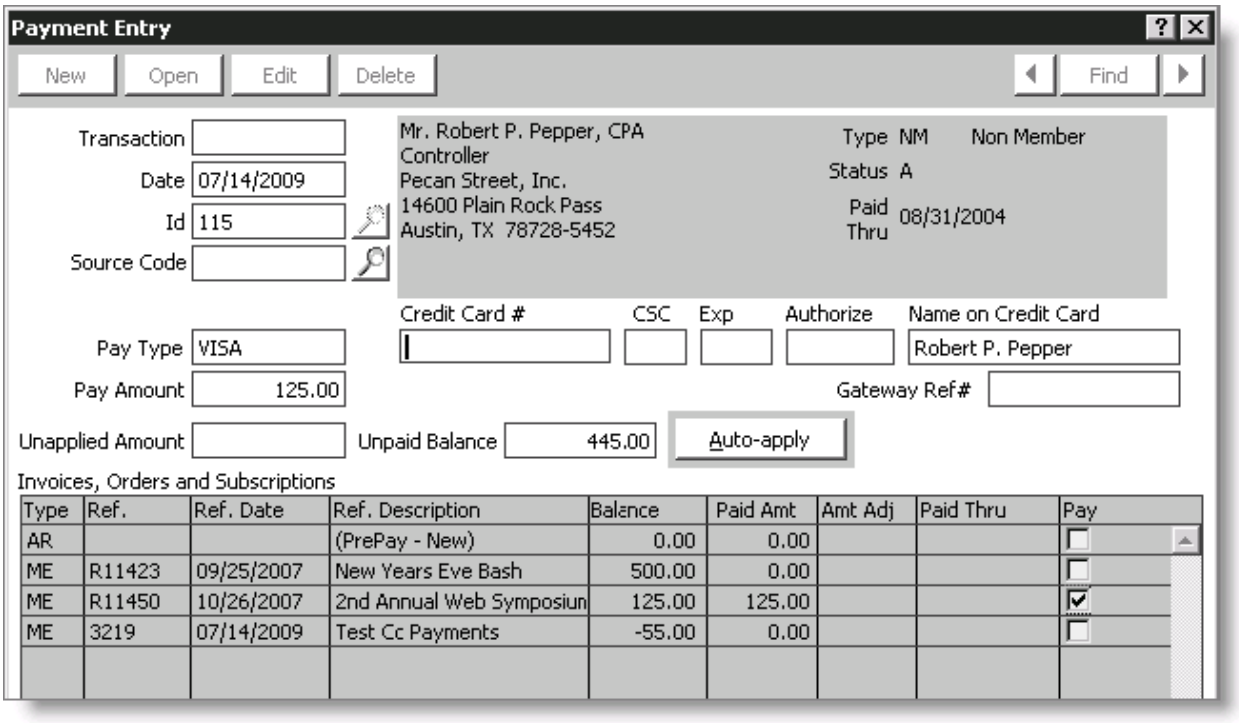
Specifies which requests are shown for the current customer ID:

- All – Shows all customer requests for the specified customer ID.
- Outstanding – Shows only outstanding customer requests for the customer ID.
- Current Batch – Shows only requests in the current batch for the customer ID.

Total Due

Displays the total amount (balance) of all line items displayed.

Payment Entry window



From Service Central, select Process customer requests, and click Payment

Transaction

Displays the transaction number.

Date

Defaults to the current system date or the batch date if you are using the Batch Control option.

Id

Specifies the customer identification number or if the company is responsible for the payment, this is the company ID. You can click the lookup icon to select a value.

Source Code

(optional) Use to indicate how the payment was made (for example, phone or mail).

Check/CC

Specifies a check number or a credit/debit card code (for example, MC, VISA, AMEX, and DISC). If you enter a valid credit/debit card code, additional payment fields display:

- CC # - Enter the credit/debit card number.
- CSC - (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code. CSC can be a required value (see "Requiring a Card Security Code (CSC) for credit/debit card transactions") for specific cash accounts.
- Exp - Enter the card's expiration month and year (mm/yy).
- Authorize - Enter any authorization code here. (If credit card authorization is enabled, this field populates when the payment is approved.)
- Name on CC - Enter the name as it appears on the payment card.
- Issue # - (Displays only if the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date - (Displays only if the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).

- Gateway Ref # - Read only: Populates when the gateway provider returns the reference number for the transaction.

  > **Note:** Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

  Pay Amount

  The system populates this field with the customer's current session balance due (except Fundraising and credit balance line items) when a customer's record is opened in the Process customer requests window. This field can be overridden if the customer wants to pay a different amount.

  Unapplied Amount

  Displays the amount of the current payment that has not yet been applied.

  Unpaid Balance

  Displays the total of balance due for items not selected (checkbox enabled) for payment.

  Auto-apply

  Used to enable the system to automatically apply a payment.

  Type

  Displays the source module or the transaction type.

  Ref

  Displays a number the system assigns to the transaction.

  Ref Date

  Displays the invoice reference date.

  Ref Description

Displays a description of the referenced transaction. A detailed description displays for Orders (OE) if you enable 1st Line Desc. on Statement on the AR/Cash System Setup window. If you do not enable 1st Line Desc. on Statement, only the transaction name, Order displays in this field.

Balance

Displays the balance for a specific transaction.

Paid Amt

Displays the dollar amount the customer designated to be applied to the specific line item.

Amt Adj

Displays the positive difference between the Balance and Paid Amt used for cash Dues/Subscription billing only.

Paid Thru

Displays the Paid Thru date associated with the specific cash-basis Dues/Subscription line item. This field is populated only if the item has been paid in full.

Pay

Use this checkbox to select or deselect a line item for payment.

Batch Id

Displays the batch number of the current open batch if you are using Batch Control.

Using Service Central

Request and Payment Processing

Most of the tasks you perform in Service Central will take place in the Process customer requests and Payment Entry windows. However, iMIS Service Central contains several windows to allow you to enter records and transactions.

- The Register a customer window allows you to register a customer for an event function.
- From the Enter and edit gifts window you can process customer gifts and pledges.
- You can process orders using the Process orders window.
- The Enter and edit payments window is available to allow you to record miscellaneous sales and cash receipts.
- You can use the Process billing window to bill new customers for cash-only dues or subscription.
- The Process customer requests window allows you to process orders and transactions to completion.

Processing Orders and Event Registrations

Scenario: A current customer calls to purchase two sets of customer labels and would like to register for an annual event. The customer is paying by credit card and needs a receipt. This requires you to:

- Use the Process customer requests window to place an order and register a customer for an event,
- Apply a single payment for two open items using a credit card,
- Print and/or electronically mail a receipt, called a Transaction Summary.

To enter an order

1. From Service Central, select Process orders. The Overview tab is displayed by default.
2. Click New.
3. Enter the Order Summary information.

- Order Type - use the lookup icon to select a value, type an entry, or leave the default entry (if any) as it is. Press Tab to accept the value and move to the next field.
- Bill to ID - type in or use the lookup icon to select an ID.
- Order Date - accept the default or override if necessary.

Note: The Order Date defaults to the batch date if you use batch control; otherwise, the date defaults to the system date.

- Purchase Order - enter a purchase order number if necessary.
- Source - Enter a code or click the lookup icon to select a value.
- Shipping Method - (optional) Override the default shipping if necessary.
- Tax Authority - (optional) Override the default tax authority if necessary.

4. Enter General order information.

- Terms - (optional) Override the default payment Terms if necessary.
- Discount - (optional) Enter a percentage discount for the order in the % Discount field.
- Priority - (optional) Enter a backorder Priority for the order.

5. Enter a Product.

- Product - Enter a code and press Tab.

  Note: Click the lookup icon to open the Product Find window where you can look up and select a product.

- Description - the field is populated automatically.
- Quantity - (optional) Enter the Quantity.
- Price - (optional) Edit the product Price if necessary.
- % Disc - (optional) Enter a percentage discount for the product in the % Disc field.

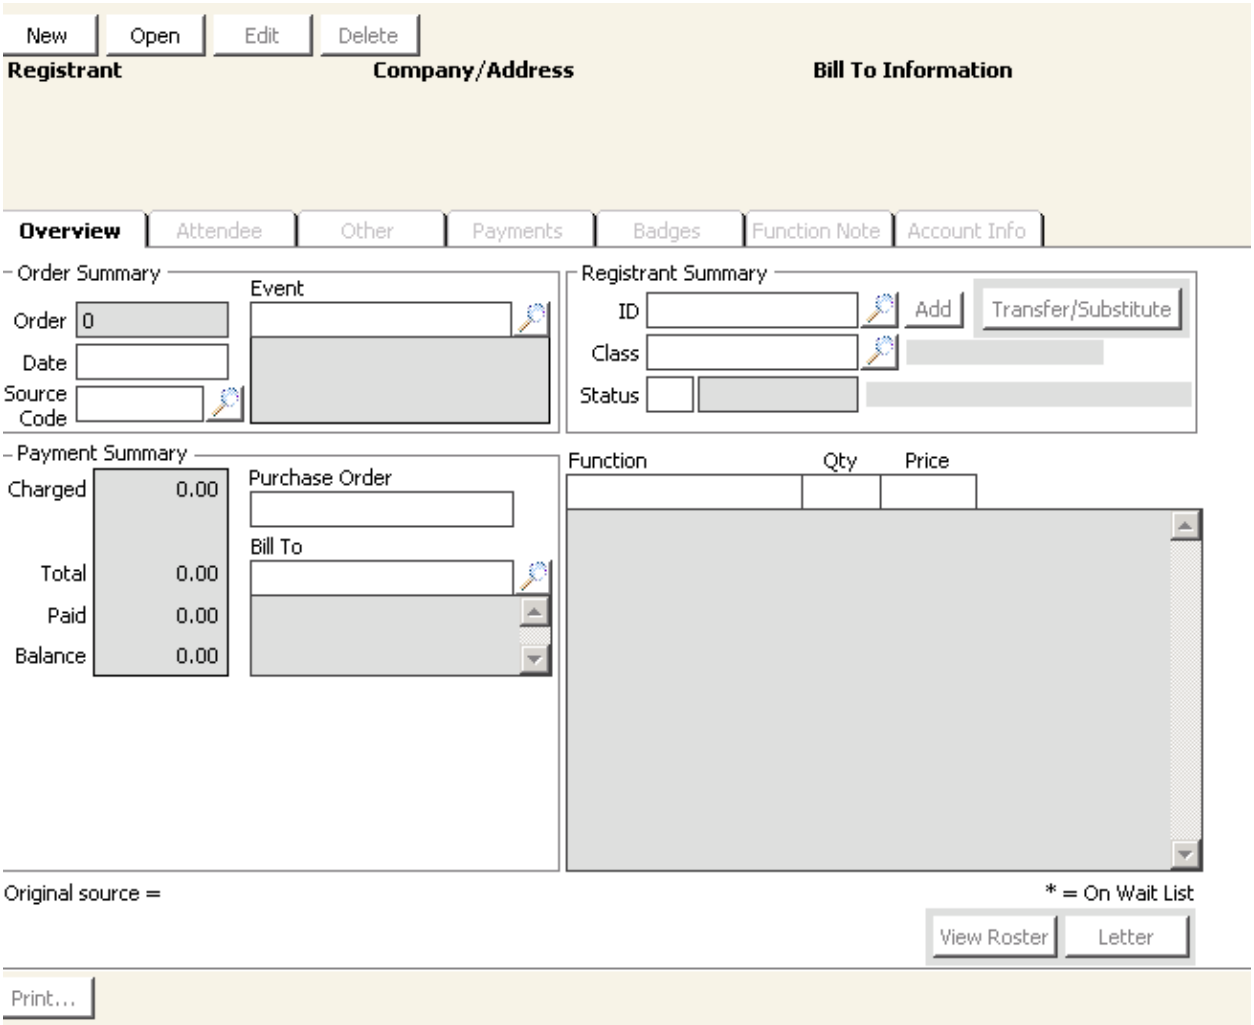
  Note: Entering a product-level discount in the % Disc field overrides any order-level discount entered in the % Discount field. However, product-level discounts are applicable only for a given product and do not affect entire order-level discounts.

- Press Tab to add the product to the order. The product is displayed in the list of Product Line Items, and your cursor is moved to the Product field.

6. Enter additional products.
7. Click Save.
8. From Service Central, select Process customer requests. Notice that the order (OE) you just processed is now a line item on the Process customer requests window.

   Note: You can click and drag the vertical lines between items on the Process customer requests window so that you can see all the information in a column.

Register for an event window



Desktop: Service Central > Register a customer

To register a customer for an event

1. From Register window, click New.

- If you already have an ID selected, it automatically populates the ID field.
- Otherwise, enter or look up a customer ID.

2. Register the customer for an event. For more information about registering customers, see the iMIS Events guide.
3. Click Save.
4. Select Process customer requests.

   The event registration (ME) is a new line item on the Process customer requests window. The system keeps a running total of the Balance field in the Total Due field.

   Note: You can double-click on any line item on the Process customer requests window to view and edit data specific to that item. For example, if you double-click the ME (event) Type line item, the Register a customer window displays with the event the customer requested. You can also edit the registration by deleting a line item or adding another function.

   Example: To pay for an order and a registration with one credit card payment

   If you have added an event registration (ME) and placed an order (OE) for the active contact, you need to process only one credit card payment for the two open line items (ME and OE).

1. Select Enter and edit payments to open the Enter and edit payments window.

- All transactions processed for this customer display when All is the View on the Process customer requests window.
- The line items listed on the Process customer requests window are listed on the Enter and edit payments window for the Current Batch, if any.
- By default, items entered during the current session (except Fundraising and credit balance line items) are checked for payment when you open the Payment Entry window

from the Process customer requests window. You can deselect any item and apply a partial payment.

2. Enter a credit/debit card code in the Check/CC field and complete the customer's card information.
3. Click Save to apply the Pay Amount to the checked items.
4. Close the window to return to the Process customer requests window, which now shows the line items with a zero balance.

After you apply the payment, you can view the items and transaction history:

- Open the customer's event registration record in the Process customer requests window by double-clicking on the event line item.
- Select AR/Cash > Credit card reporting > Search credit card info and enter the customer ID or Credit Card # to search for and review the customer's credit card payment history window.

Sending a Summary Transaction Report

The Summary Transaction report serves as a receipt for the customer. The report shows all services and payments transacted for the customer during the current (or today's) session. If you have an e-mail address listed for the customer (Manage customers window), you can mail a printed report to the customer or send the report using e-mail.

To send a receipt by e-mail

1. Verify that the customer has an e-mail address.

Note: If a customer does not have an e-mail address on record, you can add one using the Manage customers window. If you add an email address, or one is already on file, it is shown automatically in the e-mail field on the Process customer requests window.

2. Select Current Batch from the View drop-down list.
3. Click the e-mail (small envelope) icon. The Confirmation of Transaction – Summary e-mail message opens displaying a Transaction Summary report.

4. Enclose an attachment or perform any other required e-mail functions.
5. Click Send.

Creating an Open Cash Dues Item for a New Customer

You can apply a payment to both cash and cash accrual dues, but the two types of payments display differently on the Service Central windows.

- Only cash dues subscriptions invoke the Paid Thru dates and display as individual line items on the Payment Entry window
- You can bill a customer for cash dues, but not accrual dues through the Service Central module
- You can only bill the customer once using Service Central for dues products from the Member Type table.
- Accrual billings are included in one line item, as in the Cash Receipts window. After the initial billing, only additional dues and non-dues items may be processed for a customer in Service Central.

Scenario: A customer calls to join the association in order to receive a price break on an order. This requires you to:

- Enter new customer information
- Create an open dues item
- Process an order
- Apply a credit card payment for both Dues and Orders

To add a new customer

1. Enter information for the new customer on the Manage customers window.
2. Click Save.
3. From Service Central, select Process customer requests to open the Process customer requests window populated with the new customer information.

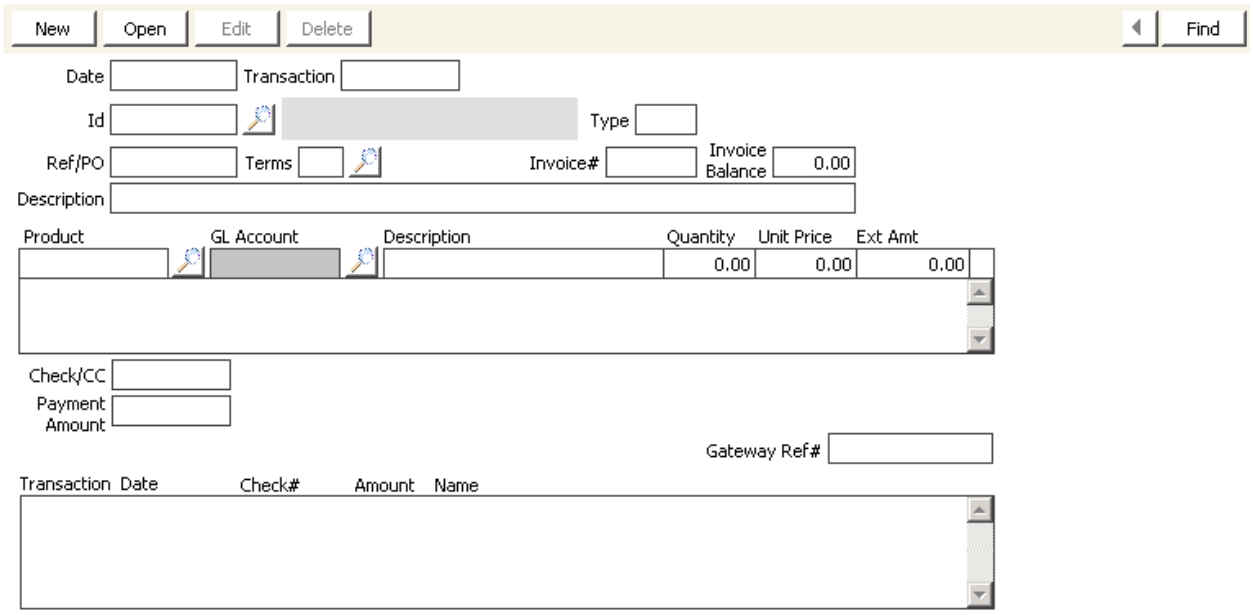
To create an open dues item

1. From Service Central, select Process billing to open the Process billing window.
2. Click New to populate the window with the customer information.
3. Click the checkbox to enable the Bill New Mem. Type Items feature. New fields display when you process a dues item that has not been billed.
4. Click Bill New on the Process billing window to create a cash dues open line item.
5. Click Save.
6. From Service Central, select Process customer requests to open the Process customer requests window with the new dues/subscription line item (SUB).

To process an order

1. From Service Central, select Process orders to open the Process orders window.
2. Click New.
3. Accept the default Order Type, or change it by clicking the lookup icon to select a type or by entering a value.
4. Press Tab and continue to enter the order information.
5. Click Save.

Process sales transactions window



Desktop: Service Central > Process sales transactions

To apply a credit card payment to outstanding items

Note: Note: You are still processing request(s) for the same customer.

1. From Service Central, select Process customer requests.
2. The order you entered displays in the Process customer requests window. Click Payment to open the Payment Entry window with the customer's outstanding (unpaid) items.

   Note: All line item checkboxes are selected (check in Pay column) for payment except Fundraising (FR) and credit balance line items.
3. Enter payment information.
4. Click Save to apply the Pay Amount to all selected items.
5. From Service Central, select Process customer requests.

   Notice that the Balance for the OE line item you entered has a Total Due of $0.

Processing Fundraising Gifts and Pledges

Where you process fundraising gifts and pledges depends on their type. You must pay Single Gifts through the Fundraising Enter and edit gifts window, but you can pay Single Pledge and Installment pledges through the Service Central Payment Entry window.

A pledge is a contribution that will be paid at a later date. A pledge can be either a single pledge or an installment pledge. For example, a customer might pledge $1,000, which they agree to pay at a particular date in the future, either in one payment (single pledge) or in a series of predefined payments (installments). You can customize the amount and the payment schedule.

You can also process acknowledgements, member tributes, split gifts, and setup an installment pay plan for pledges.

To enter a single gift or pledge (Service Central)

Payments for single gifts must be made at the time the gift is entered. You can pay for a single gift by entering a check number, credit card number, an in-kind non-cash asset account (if you are entering an in-kind or asset contribution), or by applying an open credit.

A pledge is a donation to be paid at a later date and can be a single pledge or an installment pledge.

Note: In-kind contributions can only be made for gifts. iMIS Fundraising does not track single in-kind pledges or installment in-kind pledges.

1. From Fundraising, select Enter and edit gifts to display the Overview tab on the Enter and edit gifts window.
2. Click New.
3. Enter the donor ID, or click the lookup icon to select an ID. The donor's name and address information display in the Donor and Address areas.
4. Enter the date the gift was received in the Date Received field. The default is the batch date if batch control is enabled, or the current system date if batch control is not enabled.

5. Select Single Pledge or Single Gift from the Gift Type drop-down list.
6. Enter the total amount of the donation in the Gift Amount field.
7. Enter the Request, Distribution, Appeal, Campaign, and Fund information as necessary.
8. (optional) Enter the List as name.
9. (optional) Enter the Solicitor ID, or click the lookup icon to select a solicitor ID.
10. (optional) If there is an individual partially responsible for this donation who is not the donor, enter the Soft Credit ID, or click the lookup icon to select a soft credit ID.
11. For Single Gifts only:
    - Enter the payment information in the Check #/CC/In-kind/Asset field and its related fields as appropriate.
    - (optional) Enter a manual receipt number in the Receipt Number field.
    - (optional) Enable the Do not Print Receipt option to skip the printing of a receipt for this gift.
12. Click Save.
13. From Service Central, select Process customer requests. The gift or pledge you just entered will be shown.

    To process an installment pledge

    Scenario: A customer wants to make an installment pledge for $1000 to be paid in monthly installments.

    Note: Note: If you select an installment pledge; select a down payment; and the customer is paying by credit card, only the installment down payment is charged to the credit card. The remaining installments populate on the Process customer requests and Payment Entry windows for payment at a later date.

    Note: The credit card is not automatically billed monthly.

> **Note:** You do not have to click the down payment option, if the customer is paying with cash or check at a later date. Individual installments for a pledge populate on the Central Processing and Payment Entry windows until paid.

1. Find the donor from the Manage customers window.
2. From Fundraising, select Enter and edit gifts to open the Enter and edit gifts window.
3. Click New.
4. Select Installment from the Gift Type drop-down list. The Payment Info area of the window is grayed out because a pledge means that the money will be paid at a later date.
5. Enter the Total Amount of the installment pledge.
6. Enter the Distribution or income account where the pledge will be credited or, click the lookup icon to select a value.

   Note: Although you predefined the Distribution, you can override the value by manually entering a different combination of a fund, appeal, or campaign if your setup allows.
7. (optional) Enter the Appeal code and Campaign code if there is one associated with the pledge, or click the lookup icon to select a value.
8. Enter the Fund code associated with this pledge, or click the lookup icon to select a value.
9. Enter a credit card code in the Check #/CC/In-Kind/Asset field and complete the credit card information.
10. Click the Installments tab and specify the installment details:
11. Click the Installment Frequency from the drop-down list.
12. Click to enable Pay a downpayment. The down payment amount displays under the Prepay column.

    Note: If the customer is making a credit card payment, you must select Pay a downpayment or when you return to the Enter and edit gifts window and you click Save, a message informs you that you must first select the Pay a downpayment option.

13. Click Save.
14. From Service Central, select Process customer requests window.

Processing Payments in Service Central

In this section, you will apply payments for outstanding items using the Enter and edit payments window directly from the Service Central menu. There are three different payment scenarios:

- Applying a specified Pay Amount to all unpaid line items (full payment)
- Applying a payment toward specific unpaid line items
- Applying a payment to multiple unpaid line items using the Auto-apply button

To apply a specified payment amount to all unpaid items

1. From Manage customers, find a customer record.
2. From Service Central, select Process customer requests, and click Payment to open the Payment Entry window.
3. Click New.
4. Enter an Id and press Tab to populate the Payment Entry window, or click the lookup icon on the Id field to select a customer record.
5. Enter a check number or credit/debit card code in the Check/CC field and enter the required card information.
6. Enter a dollar amount equal to the Unpaid Balance and press Tab in the Pay Amount field. Notice the Pay Amount, Unapplied Amount, and Unpaid Balance fields are equal because no line items have been selected for payment.
7. Click the checkbox in the Pay column to select the line item(s) where payment will be applied.
8. Click Save to update the customer's record with the payment.

To select open items for a payment

1. From Manage customers, find a customer record.
2. From Service Central, select Process customer requests, and click Payment to open the Payment Entry window.
3. Click New.
4. Enter an Id, or click the lookup icon on the Id field.
5. Enter a check number or credit/debit card code in the Check/CC field and enter the required card information. Do not enter any information in the Pay Amount field.
6. Click the checkbox in the Pay column for each line item that you want to select for payment.

   Note: The Pay Amount field increases by the line item amount as you select each line item. If you select the wrong line item, click to deselect (uncheck) the checkbox.
7. Click Save.

To apply a payment to multiple items using Auto-apply

1. From Manage customers, find a customer record.
2. From Service Central, select Process customer requests, and click Payment to open the Payment Entry window.
3. Click New.
4. Enter an Id and press Tab to populate the Payment Entry window, or click the lookup icon on the Id field to select an ID.
5. Enter a check number or credit/debit card code in the Check/CC field and enter the required card information.
6. Enter the amount of the check in the Pay Amount field.
7. Click Auto-apply. The Pay Amount is applied to the oldest line items first. Open Dues (SUB) items have the highest priority.

Note: Auto-apply does not automatically select Fundraising items for payment, you must manually select them.

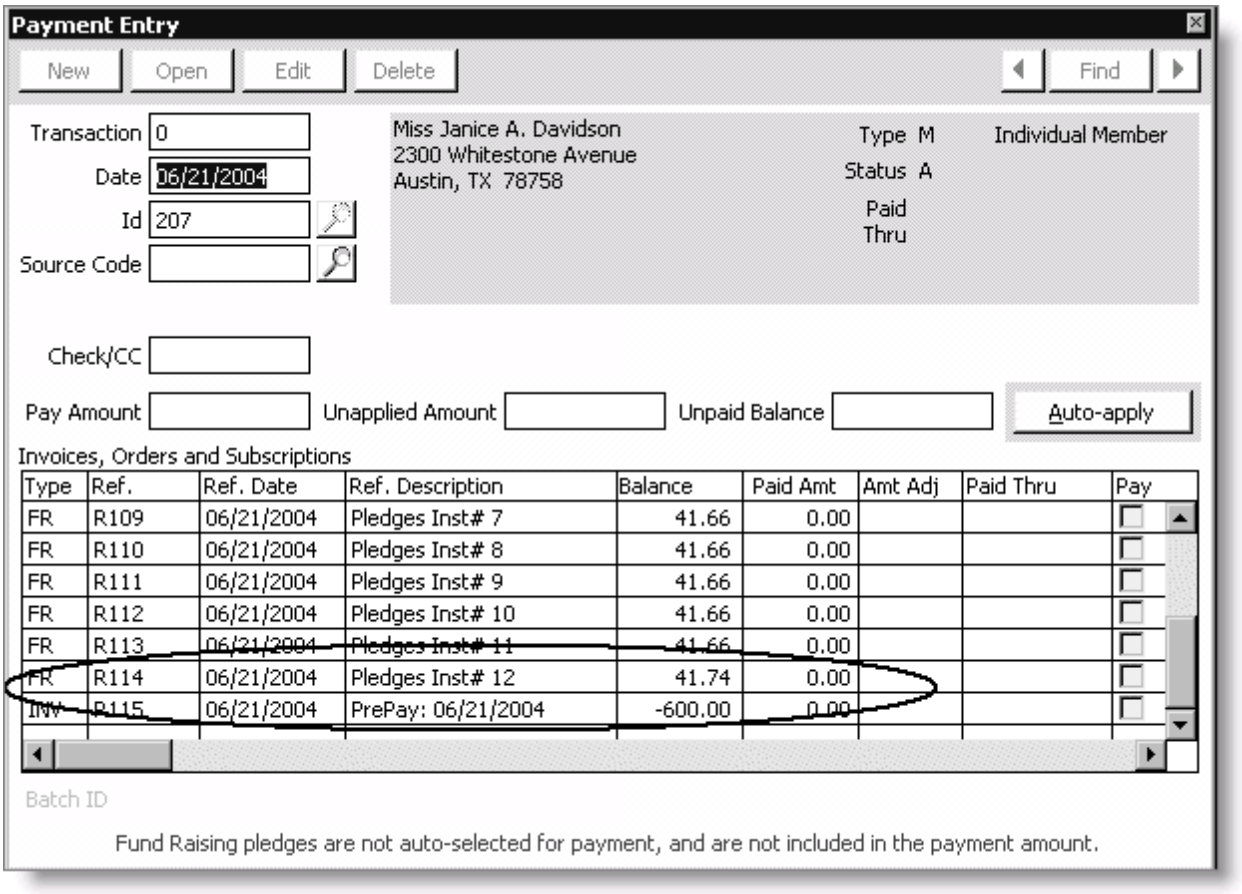
8. Click Save.

Applying a Credit Balance to a Specific Item

A credit balance is an overpayment that occurs when a customer unknowingly sends in too much money to pay an Unpaid Balance. You can apply an open credit balance in Service Central by selecting Process customer requests, and clicking Payment.

> **Note:** Note: Do not create credit and debit memos using the Service Central module; perform credit and debit memos only in the AR/Cash module.

Note: Overpayments (credit balances) to Fundraising items are not recommended. Apply these overpayments to the Pre-Pay line. A message stating this appears at the bottom of the Payment Entry window.



Example of a credit balance line item

Scenario: A customer calls and places an order that is processed through the Process customer requests window. Now the customer wants to pay the Unpaid Balance. The customer has an open credit balance. When you open the Payment Entry window from the Process customer requests window, all items except the credit balance are automatically selected (checked) for payment. The Pay Amount has been generated to equal the amount of all selected line items (except Fundraising line items).

To apply a credit balance through the Process customer requests window

1. From Service Central, select Process customer requests to open the Process customer requests window.
2. Open the customer's record and select Outstanding from the View drop-down list.
3. Click Payment to open the Payment Entry window.

4. Select the credit item by clicking the Pay checkbox. This applies the credit to all items that were automatically selected for payment.
5. If you do not want to apply the entire balance of the credit item to the payment, enter the amount you want to apply in the Paid Amt. for the credit item.

   Note: If you do not enter the Paid Amt. for the credit item, the entire credit item balance is applied to the payment. The credit item balance zeros out even if it is greater than the amount of the payment.
6. Click Save.

   Note: If you only select the open credit line item for payment or multiple open credit line items, when you click Save to apply the credit, a message displays informing you that you have only selected credit items for payment. Click No to select more unpaid items for payment, or click Yes to have the system apply the credit.

   To apply a credit balance using Auto-apply

   A customer sends a check to make a partial payment on an unpaid balance. The customer has an open credit balance. In this scenario, you would open the Payment Entry window from the Service Central menu.

   When you open the customer record, no line items are selected for payment. You will enter a check number and the amount of the check. To apply the open credit, select the credit line item by checking the box in the Pay column.

   The amount of the credit is added to the Unapplied Amount and the Pay Amount is not affected. If you press the Auto-apply button, the entire Unapplied Amount (including the Pay Amount and credit) is auto-applied to the Unpaid Balance in order of priority.

   Note: Note: Fundraising line items (FR) are not paid using Auto-apply.

   Note: From Manage customers, find a customer record.

1. From Service Central, select Process customer requests, and click Payment to open the Payment Entry window.
2. Click New.
3. Enter an Id and press Tab to populate the Payment Entry window, or click the lookup icon on the Id field to select an Id.
4. Enter a check number in the Check/CC field.
5. Enter the amount of the check in the Pay Amount field.
6. Select the credit line item by clicking the checkbox in the Pay column.
7. If you do not want to apply the entire balance of the credit item to the payment, enter the amount you want to apply in the Paid Amt. for the credit item.

   Note: If you do not enter the Paid Amt. for the credit item, the entire credit item balance is applied to the payment. The credit item balance zeros out even if it is greater than the amount of the payment.
8. Click Auto-apply to apply the credit line item and check payment.
9. Click Save.
10. Close the window.

    Note: If you reopen the Payment Entry window or the Process customer requests window with the same record, the credit does not display in either window.

Applying a Credit Balance Using *TAB

The *TAB feature allows you to apply a credit to a customer record. A credit balance is a result of an overpayment that occurs when a customer sends in too much money to pay an Unpaid Balance. You can use *TAB in Service Central for dues/subscriptions (including cash and accrual methods (SUB)), Meeting (ME), Orders (OE), Fundraising (FR) and AR/Cash (INV) transactions.

The *TAB feature works through the Process customer requests window and directly through the Payment Entry window. There are some differences in how payment information is presented depending on which process you choose to use.

The following procedures address using *TAB through the Process customer requests window then accessing the Payment Entry window and directly through the Payment Entry window only.

To apply a credit balance from Process customer requests

1. From Service Central, select Process customer requests to open the Process customer requests window.
2. Click Find to locate the customer's record.
3. Click Payment to open the Payment Entry window.

   Note: The Pay Amount field is the total of the line items checked for payment in the Pay column. Line items are automatically checked for payment except, Fundraising (FR) and credit balances. If you go directly to the Enter and edit payments window (from Service Central, select Enter and edit payments), checkboxes in the Pay column are not automatically checked for payment.
4. Place your cursor in the Check/CC field and enter an asterisk (*), and press Tab to open the Select Open Payments window.

   The view defaults to an individual view. If you press All, all customer records with an open credit balance displays.

   Note: All credit balances from overpayments to Fundraising or Accrual Dues items are filtered out and will not display on the Select Open Payments window.
5. Make a mental or written note of the available credit balance. Double-click on the line item or, select the line item and click OK. The system returns to the Payment Entry window.
6. Enter the amount of the available credit balance you wish to apply in the Pay Amount field. Do not enter more than the amount of the available credit balance.

7. Click Save. The system populates the Check/CC field with the invoice reference number of the original transaction that resulted in a credit balance.

To apply a credit balance from Enter and edit payments

1. From Service Central, select Enter and edit payments to open the Enter and edit payments window.
2. Click New.
3. Press Tab and enter an Id, or click the lookup icon to select an Id.
4. Press Tab. The system populates the Enter and edit payments window with the individual's payment information.
5. Place your cursor in the Check/CC field and enter an asterisk (*), and press Tab to open the Select Open Payments window.

   The view defaults to an individual view. If you press All, all customer records with an open credit balance displays. The above view is All.

   Note: All credit balances from overpayments to Fundraising or Accrual Dues items will be filtered out and will not display on the following window.
6. Double-click on the line item or, highlight the line item and click OK. The system populates the Check/CC field with the invoice reference number of the original transaction that resulted in a credit balance. Make a mental or written note of the available credit balance.
7. Enter the amount of the available credit balance you wish to apply in the Pay Amount field. Do not enter more than the amount of available credit balance.
8. Select line item(s) by clicking the checkbox in the Pay column that you wish to pay with the credit balance.
9. Click Save.

Processing List Payments

The list payments feature allows you to apply a payment for dues products (membership dues and subscriptions) to a list of individuals that share a Bill To contact. For example, if a company sends in a dues payment billed for their employees that are members of your organization, you can apply that payment to each individual record from a single page.

Dues products billed to the company will appear in the list based on the following criteria:

- The company record is assigned the company member (CM) Member Type
- The company's ID is either:
- Entered in the Bill To ID field on the individual's Financial tab (from Customers, select Manage customers, find the customer record, and select the Financial tab)
- Entered in the individual's subscription Bill To field (from Customers, select Manage customers, find the customer record, select the Billing tab, and create or open a subscription)

To process list payments

1. From Service Central, select Enter and edit payments.
2. Click New.
3. Accept the default date or enter another value.
4. Enter an Id or click the Find icon to select a company ID.
5. Press Tab to populate the Enter and edit payments window.

   Note: The items in the list vary depending on whether they are billed as cash dues or accrual dues. A cash dues billing list includes the balances for each individual. An accrual dues billing list only displays a single balance and line per billing type, regardless of how many individual records were billed against the company ID.
6. Enter the Pay Amount.
7. Apply the payment in one of two ways:

- Select Auto-apply to automatically apply the Pay Amount
- Select the Pay checkboxes to choose line items to be paid

8. Click Save.

   The window is updated to only display the paid items.

Service Oriented Architecture (SOA)

iMIS SOA provides a secure set of web services for accessing the iMIS platform, across the organization, across different physical locations, and even across organizational boundaries.

This documentation contains the following sections:

Section	Description
Getting Started	Provides general information about iMIS SOA and iMIS Web Services
Working with iMIS SOA	Describes important concepts for developing with SOA, including a list of the addressable primary entities
Extending iMIS SOA	Describes how to build a new SOA module
Glossary	Describes some terminology used in ASI web services
.NET Examples	Provides C# examples pulled directly from ASI's automated test suite
PHP Examples	Provides examples showing how to use SOA with PHP
Namespace references	Provides reference information about the SOA namespaces available

Settings Console

Your Advanced Accounting Console includes a Settings console with quick access to tools for configuring and setting up your organization's websites.

Membership is where you set up membership information for your websites, including customer and activity types, area and state/province codes, country names and addresses, as well as lookup/validation tables. You can also set up chapters, committee positions, relationship types, and committee codes.

Billing allows you to set up billing cycles, including whom and what to bill, arrange billing for your products, and configure billing options - including intervals, accrual, billing time, and prorating.

Events allows you to easily configure registrant classes and event resources, including facilities, refreshments, furniture, and supplies.

Commerce is a helpful area for setting up tax codes, freight options – by weight, total value, or total quantity – as well as shipping zones, warehouses, and order types.

Key to any organization, Fundraising is where you configure fundraising options such as 'promises' and 'gifts,' set up sender and interest codes, memorial and tribute codes, arrange campaigns, appeals, and donor funds, and also set up your distributions and premiums. From Fundraising, you can also easily set up donor clubs.

Depending on your license keys, some areas might not be listed in your Administrative Configure. The license keys needed for each area are:

- Membership (MEMBERSHIP)
- Billing (DUES or EDUES)
- Events (MEETING or WMEET)
- Commerce (W_ORDERS or ORDER)
- Fundraising (FUNDR or FUNDRAISING)

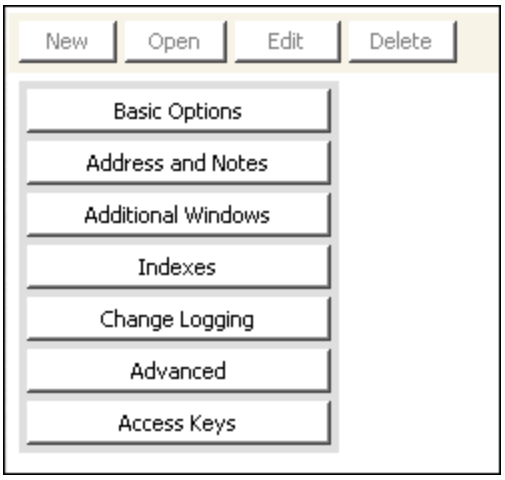
Membership

Configuring membership options

> **Note:** Note: Several configuration options on the Configure membership options window are documented within the iMIS Desktop. Links in this section might display iMIS Desktop documentation. This saves you time and effort when configuring membership options.

Customer Management is usable out-of-the-box but is designed to be customized to your specific organization's structure and operation. For this reason, you must work with your System Administrator to set up and configure it to meet the needs of your organization. This area outlines the steps required in setting up iMIS for maintaining your customer data according to organizational requirements for:

- Basic customer options.
- Customer addresses and notes.
- Lookup information for searching with the Find window.
- Fields in the Change Log.
- Advanced customer options.



Advanced Accounting Console: Settings > Membership

Basic Options

Opens the Customer Setup - Basic Options window.

Address and Notes

Opens the Customer Setup - Address and Notes window.

Additional Windows

Opens the Customer Setup - Additional Windows window.

Indexes

Opens the Customer Setup - Indexes window.

Change Logging

Opens the Customer Setup - Change Logging window.

Advanced

Opens the Customer Setup - Advanced window.

Access Keys

Opens the Customer Setup - Access Keys window.

Print

Used to generate and send a system settings report to your report destination.

Defining customer types

The Customer types window defines the categories to which you assign each customer record. These types designate the broad classification of customer categories. Assign a different type to each major customer class (Individual Member, Associate Member, Student Member, Hotel, etc.) and at least one type to the Nonmember category.

When you define a type through the table, be sure to indicate whether the type represents a customer and whether the type defines a company/entity or an individual. This helps iMIS differentiate between the different records.

To define customer types

1. From the Customer types window, click New.
2. Enter a meaningful, unique code to represent a specific grouping in the Type field.
3. In the Description field, enter the descriptive, full name of the customer group that corresponds to the code you assigned in the Type field.
4. (optional) If the customer type you are defining represents a company or entity other than an individual, enable the Is a Company option.
5. (optional) If the customer type you are defining represents a member rather than a non-member category, enable the Is a Member option.
6. Click Save.
7. Exit iMIS.

To add billing codes to customer types

1. From the Customer types window, click New.
2. Enter a meaningful, unique code to represent a specific grouping in the Type field.
3. In the Description field, enter the descriptive, full name of the customer group that corresponds to the code you assigned in the Type field.
4. (optional) If the customer type you are defining represents a company or entity other than an individual, enable the Is a Company option.
5. (optional) If the customer type you are defining represents a member rather than a non-member category, enable the Is a Member option.
6. (optional) Enter the Billing Codes that were set on the Set up products window (go to Settings > Billing > Billing products). These entries dictate the dues products that will be automatically billed for each customer type. Only link dues products that should be billed to all customers within the type. Do not enter add-on products that are optional or that vary from customer to customer.

   Caution! Unless all line items for the type are complimentary or are to be billed zero dollars, do not insert a product in the first line that will have a zero price amount, such as a

complimentary product. When a product line item is billed and a zero amount has been set, the Paid Thru date will automatically advance.

1. Enable the Comp option if the dues product will be provided at no charge (complimentary) for this customer type.
2. Enter a Fixed Amount if a fixed rate applies to all or most customers of this type.
3. Enable the Bill Company option if the parent company is to receive the bill for customers of this customer type that are linked to it.
7. Click Save.
8. Exit iMIS.

To use wildcard product codes to update PAID_THRU date

A special wildcard option enables you to control the overall customer term Paid Thru date when there is not a single main dues product (the product that is listed first on the Customer types window) to be billed for the customer type. In order to use the wildcard feature, all potential products, which may be used to control the customer term Paid Thru date, must be established with the same initial string of characters in their product codes. A partial product code string followed by % designates a wildcard in the first product code slot on the customer types table. This option allows different products to be the main dues product for one customer type. This feature enables ties to use dues product billing and to control the customer Paid Thru date even when there is not a consistent dues product billed to all customers.

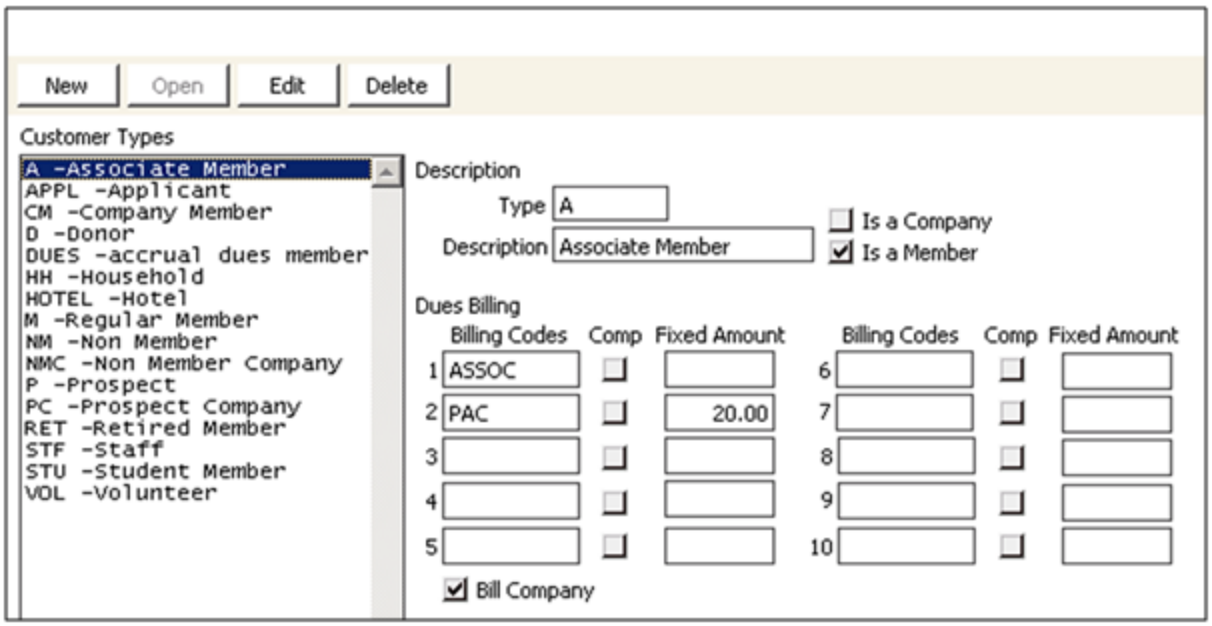
Example

An organization bills only chapter dues products and the chapter codes vary from customer to customer. In this case, CHAPT% would be entered in the first Billing Codes field on the Customer types window because all chapter product codes automatically begin with CHAPT (for example, CHAPT-HARRIS, CHAPT-TRAVIS). Payment of the first product whose code begins with the wildcard string will update the overall customer term or name PAID_THRU date. An example of a wildcard used on the Set up customer types is shown in the following picture with the corresponding product code defined on the Set

up products window (see Defining Product Codes) In this case, only chapter dues products are billed. Customers can join from a group of chapters. In this example, the wild-card option is used for all chapters that begin with CHAPT.

Note: Note: The customer's overall Paid Thru date will be advanced the first time a payment is fully applied to a line item whose product code begins with CHAPT.

Customer types window



Advanced Accounting Console: Settings > Membership > Customer types

Customer Types

Lists the codes and descriptions for the defined customer types.

Type

Specifies a unique code to represent a specific grouping (Max. characters 5). This code corresponds to the Type field in the Manage customers window.

Description

Specifies the descriptive, full name of the customer or nonmember group that corresponds to the abbreviated type code you assigned. This description displays in the

drop-down list on the Manage customers window. If the Description field does not contain a value, the value in the Type field is used.

> **Note:** Note: You cannot add a customer type description that is the same as an existing customer type code when adding a new customer type.

Is a Company

Enable to indicate that the customer type you are defining represents companies or other entities rather than individuals. By enabling this option, iMIS will be able to maintain relationships between companies and individuals for the purpose of maintaining current company rosters and other related lists.

Is a Member

Enable to indicate that the group represents a customer category rather than a non-member. By enabling this option, iMIS can distinguish between members and non-members regardless of how many types or categories you maintain. This provision lets you produce quick lists, reports, and counts by members or nonmembers.

Billing Codes

Use these fields to enter up to 10 product codes for each customer type. These entries dictate the dues products that automatically will be billed for each customer type. Only link dues products that should be billed to all members within the type. Do not enter add-on products that are optional or vary from member to member.

All codes entered here display on dues bills for this customer type unless the line item bills at zero dollars and the renewal notice option to suppress the printing of zero balance line items is active.

The first product cross-referenced is the key product because it controls the advancing of the overall membership paid thru date. For best results, enter the primary dues product code in the first Billing Codes field.

> **Note:** Note: Unless all line items for the type are complimentary or are to be billed zero dollars, do not insert a product in the first line that will have a zero price amount such as a complimentary product. When a product line item is billed and a zero amount has been set, the paid thru date will automatically advance.

Comp

Enable if the dues item will be provided at no charge for this customer type.

Fixed Amount

Specifies a fixed rate that applies to all or most customers of this type.

Bill Company

Enable if the parent company is to receive the bill for customers of this customer type that are linked to it; for example, if a List Bill requirement exists.

Print

Used to generate and send a customer type table report to your report destination.

Creating activity types

To create an activity type

1. From the Activity types window, click New.
2. Enter the activity category or code in the Type field.
3. Enter a Description of the activity type.
4. Enter additional prompts, if needed.
5. Save the activity type.

To edit an activity type

1. From the Activity types window, select an activity from the Product Types column.

2. Select the activity to open it in the Set up activity types window.
3. Click Edit.
4. Make any necessary edits.

   Note: The Type field cannot be edited.
5. Save the activity type.

   To delete an activity type

1. From the Activity types window, select an activity from the Product Types column.
2. Select the activity to open it in the Set up activity types window.
3. Click Delete. A system message prompts you to verify the deletion of the selected record.
4. Click Yes.

   To create the LETTER activity type

1. Create a new activity type using the following settings:

- Type: LETTER
- Prompts for Description, Note, and Source.
- Additional prompts, if needed.

  Note: The prompts entered in the Activity types window dictate which fields are enabled and visible in the Activity Detail and Activity Importer windows.

2. Save the activity type.

   To display activity records in customer profiles

   You can configure an activity type to be displayed in customer profiles. If a customer does not have an activity record for a particular activity type, then that activity type will not be displayed in the customer's profile. Activity records are grouped according to type, and you can specify the order in which the activity types display.

1. From the Activity types window, select an activity type from the Product Types list.

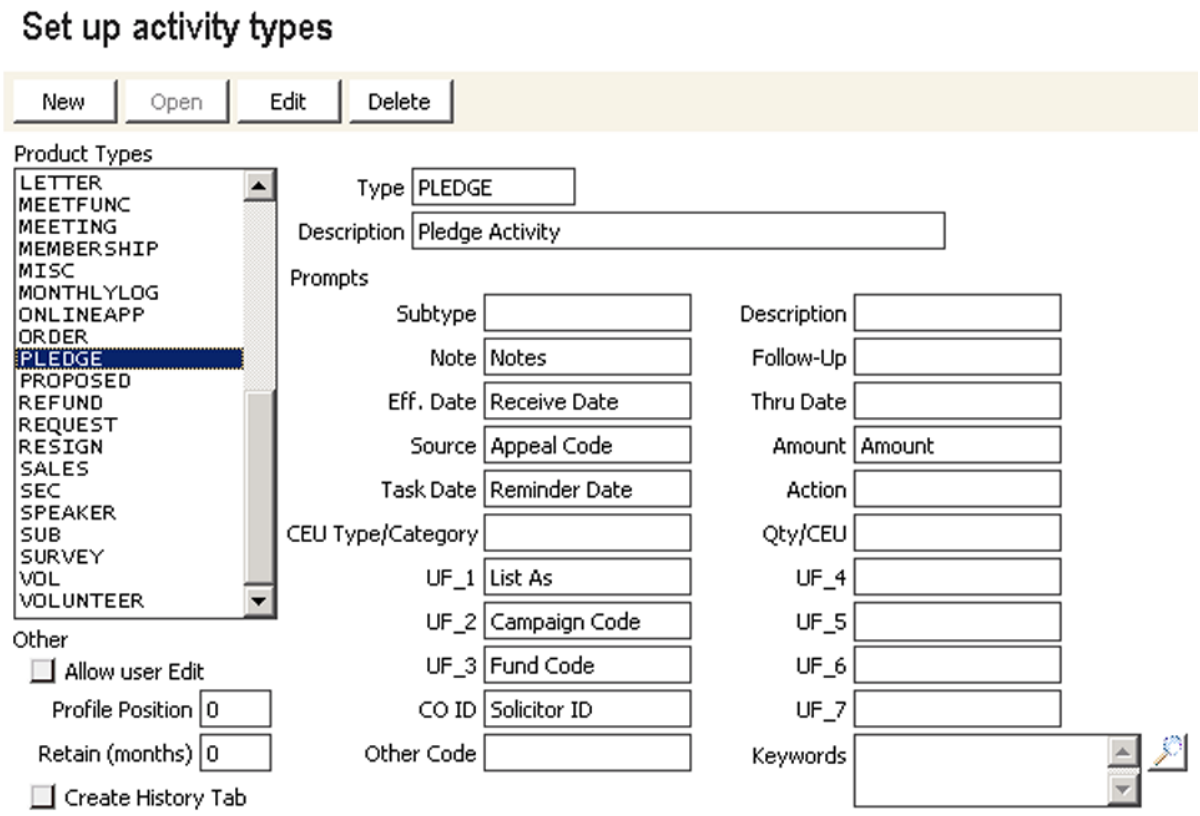
2. Click Edit.
3. Enter a Profile Position to display the activity type and related activity records. You have several options:

- To not display an activity type and its related activity records, enter a Profile Position of zero. The default Profile Position is zero.
- To display an activity type and its related activity records in the customer's profile, assign a number greater than zero to the Profile Position to display the activity type. For example, enter a 1 for the Email activity type.
- To sort the order in which the activity types display, enter numbers in succeeding order for each activity type. An activity type with a Profile Position of 1 will display ahead of an activity type with a Profile Position of 2, and an activity type with a Profile Position of 2 will display ahead of an activity type with a Profile Position of 3.

  For example, if you want the customer's Call Log activity records to display first in the customer's profile and the customer's Award activity records to display second, enter a 1 for the Call activity's Profile Position and a 2 for the Award activity's Profile Position.
- To order the activity types alphabetically, assign the same Profile Position to each activity type. For example, enter a 1 for each activity type's Profile Position.

4. Click Save.

Activity types window



Advanced Accounting Console: Settings > Membership > Activity types

Product Types

Lists all of the defined activity types.

Type

Specifies an activity type prompt.

Description

Specifies a description prompt for the activity type.

Subtype

Specifies a subtype prompt.

Description

Specifies a description prompt for the subtype.

Note

Specifies a note prompt.

Follow-Up

Specifies a follow-up prompt.

Eff. Date

Specifies an effective date prompt.

Thru Date

Specifies a thru date prompt.

Source

Specifies a source prompt.

Amount

Specifies an amount prompt.

Task Date

Specifies a task date prompt.

Action

Specifies an action prompt.

CEU Type/Category

Specifies a CEU type prompt.

Qty/CEU

Specifies a CEU quantity prompt.

UF1 - UF3

Use these fields to enter prompts for the values entered in the Char 1 - Char 3 fields on the Event System Preferences window.

UF4 - UF5

Use these fields to enter prompts for the values entered in the Number 1 - Number 2 fields on the Event System Preferences window.

UF6 - UF7

Use these fields to enter prompts for the values entered in the Date 1 - Date 3 fields on the Event System Preferences window.

CO ID

Specifies the company ID prompt.

Other Code

Specifies another code prompt.

Keywords

Specifies keywords (use the lookup icon to open the Select ACCESS_KEYWORDS value(s) window and search for defined keywords.

Allow user Edit

Enable to allow users to edit activity records.

Profile Position

Specifies the profile position.

Retain (months)

Specifies the number of months the activity record will be retained.

Updating area codes

The Update area codes procedure automates the mass changes that are required when a new area code has been added in an area containing many of your existing

member/contact records.

Advanced Accounting Console: Settings > Membership > Update area codes

To update area codes

To initiate the mass change of area codes:

1. From the Update area codes window, click New.
2. Enter the Old Area Code.
3. Enter the New Area Code.
4. In Exchanges Affected, enter the 3-digit telephone exchanges of the affected telephone numbers; separate by commas and without spaces.
5. Click OK.

iMIS will look for a match in the Old Area Code and one of the Exchanges Affected listed in all telephone numbers for business, fax, and home in the profile tab in Membership.

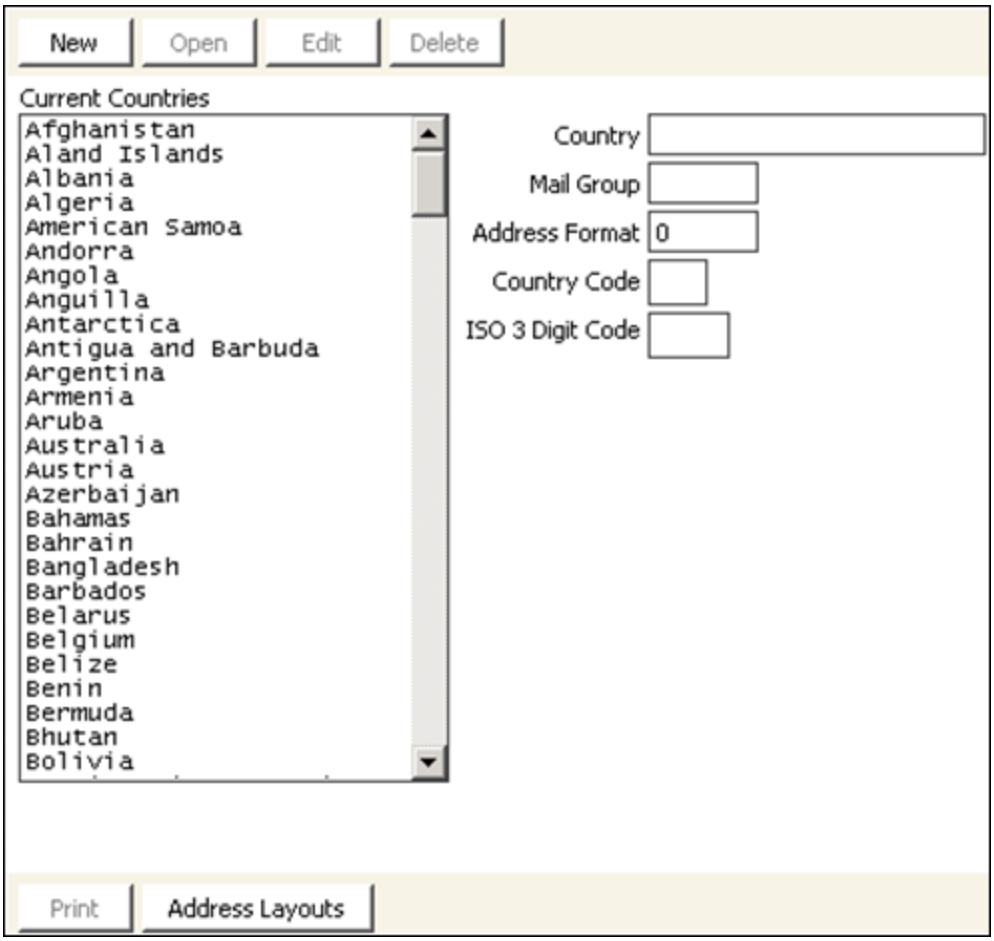
Set up tables – Membership

This area describes the following set up options for the Membership area of the Settings Console:

- Country names
- Country address layouts
- State/province codes
- Lookup/validation tables
- Chapters
- Committee codes
- Committee positions
- Relationship type

Defining country names

The Country names window is used to add country records to the Country_Names table. The records entered in the Country_Names table then are linked with the appropriate address formats that are stored in the Country_Addr_Layouts table.



Advanced Accounting Console: Settings > Membership > Set up tables > Country names

Current Countries

Lists the current countries.

Country

(required) Enter the country name in this field (Country_Names.COUNTRY).

Mail Group

This field is reserved for future use (Country_Names.MAIL_GROUP).

> **Note:** Note: The Mail Group field is used in the Advanced Subscriptions module for reporting purposes. You do not need to enter anything in the Mail Group field if you do not intend to separate by mail group in the Advanced Subscriptions module.

Address Format

Displays the Address Format assigned to the country (Country_Names.ADDRESS_FORMAT).

Country Code

Designates the two letter code that stands for this country.

ISO 3 Digit Code

Designates the ISO 3 digit code that stands for this country.

Address Layouts

Opens the Country Address Layouts window to view the address format that is assigned to the country.

The Country table is a combination validation/expansion table for the Country field used for customer addresses. You need to specify values, either abbreviations for expansion and/or for full country names, for all the countries in which your customers may maintain a residence, a mailing address, or a billing address.

Formatting country address layouts

iMIS ships with the following address formats predefined for specific countries. For example, format 12 is applied to Bulgaria, format 13 is applied to Japan, and format 14 is applied to Korea. We recommend that you review these formats to be sure that they fit your business needs. If necessary, you can modify the formats, for example, change the format that applies to a country. For countries that have not had address formats applied to them, you will need to format address layouts and apply them to the countries.

0	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[C][S]STATE_PROVINCE[S][S]ZIP[N][U]COUNTRY
3	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[N][U]ZIP[N][U]COUNTRY
4	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N]

	[U]ZIP[S][U]CITY[N][U]COUNTRY
5	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[N]STATE_PROVINCE[N][U]COUNTRY
6	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[S]STATE_PROVINCE[N][U]COUNTRY
7	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[S][U]ZIP[N][U]COUNTRY
8	CITY[N]ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] ZIP[N]STATE_PROVINCE[N][U]COUNTRY
9	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] CITY[N]ZIP[S][U]COUNTRY
10	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] ZIP[S]CITY[N]STATE_PROVINCE[S]COUNTRY
11	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[N][U]COUNTRY
12	COUNTRY[N]STATE_PROVINCE[N]ZIP[S]CITY[N] ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N]
13	COUNTRY[N]ZIP[S]STATE_PROVINCE[S]CITY[N] ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N]
14	COUNTRY[N]ZIP[N]STATE_PROVINCE[S]CITY[S] ADDRESS_1[S]ADDRESS_2[N]ADDRESS_3[N]

To enter an address format

1. From the Country address layouts window, click New. The Format field automatically populates with the next succeeding format code. For example, if the last format code created was 15, then format code 16 will be entered automatically in the Format field.
2. Enter a Description for the country address format.
3. Arrange the component fields in the area located below the Address Fields field to suit the desired address layout. For example, if you want the country name to display on the

first line in the address layout, press Enter before ADDRESS_1[N] to move it to the second line, highlight COUNTRY and press Ctrl+X, then press Ctrl+V.

4. Enter the formatting codes in the Address Layouts field to format the address.
5. Click Save.

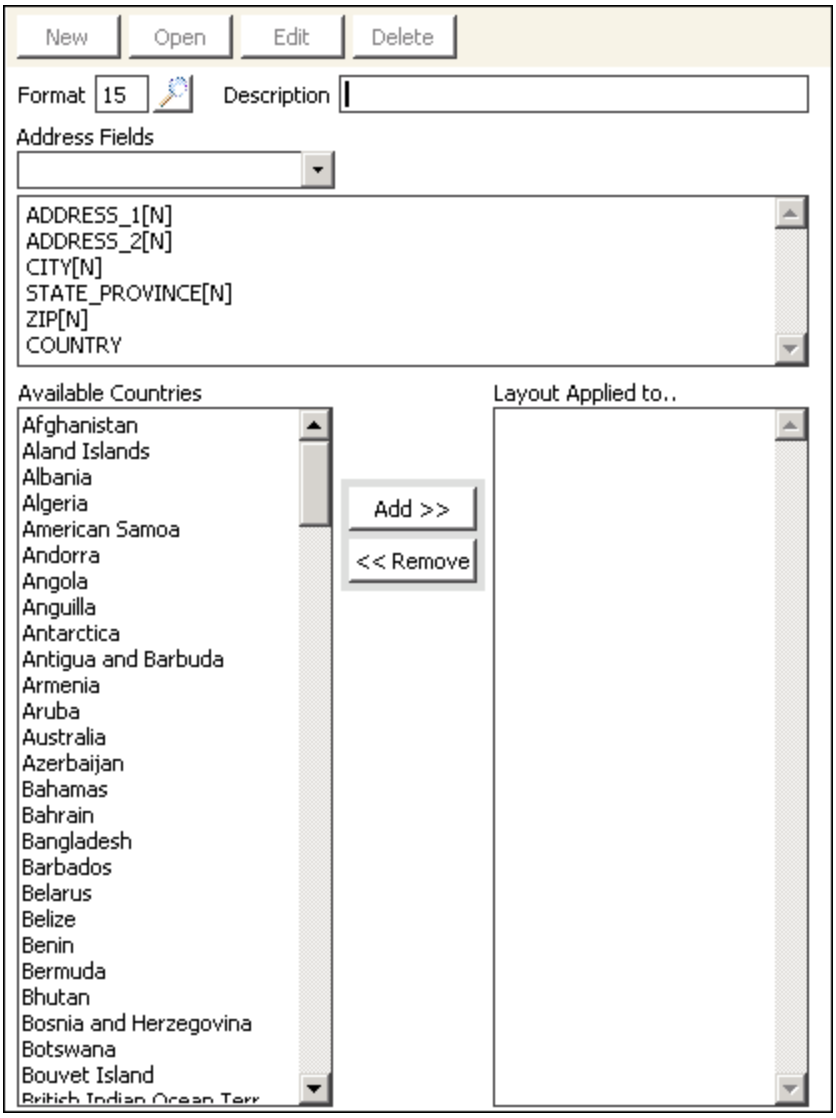
To apply an address format to a country

Make sure the country that you want to apply an address format to has been added to the Country_Names table.

1. From the Country address layouts window, click Find.
2. Click the lookup icon in the Format field to choose the format code for the address format that you want to modify.
3. Click OK. The address format assigned to that code opens in the window. The countries for which no address formatting has been applied display in the Available Countries drop-down list.
4. Click Edit.
5. Select the country (or countries) from the Available Countries list for which you want to apply address formatting.
6. Click Add to move the selected country from the Available Countries list to the Layout Applied to list.
7. Click Save to apply the address format to the country.
8. (optional) Select Test Layout to verify that the formatted address layout produces the desired result.

The Country address layouts window is used to enter format codes, to modify existing format codes, to format address layouts, and to apply formatted addresses to specific countries defined in the Country_Names table. This address format information is stored in the Country_Addr_Layouts table.

Country address layouts window



Advanced Accounting Console: Settings > Membership > Set up tables > Country address layouts

Format

This field contains an address format code that will be auto-assigned to an address format (Country_Addr_Layouts.ADDRESS_FORMAT).

Description

Specifies a description for the address format (Country_Addr_Layouts.DESCRIPTION).

Address Fields

Use this drop-down list to select the fields that you want to use in the address format.

Use the area located below the Address Fields field to format the address layout (Country_Addr_Layouts.ADDRESS_LAYOUT). The formatted address layout combines the component fields of the address with four formatting codes:

- [U] – Uppercase. Enter [U] before a component field to make the data in the field all uppercase. For example, [U]CITY would generate all capital letters for a city such as NEW YORK or LONDON.
- [N] – New line. Enter [N] after a component field to insert a carriage return. For example, ADDRESS_1[N] would generate a carriage return and place the next component field on a different line in the address.
- [S] – Space. Enter [S] after a component field to insert a space between component fields. For example, [U]STATE_PROVINCES[S][U]ZIP would display as TEXAS 75208 when generated in an address.
- [C] – Comma. Enter [C] after a component field to insert a comma between component fields. For example, CITY[C][S][U]STATE[S][U]ZIP would display as Dallas, TEXAS 75208 when generated in an address.

Available Countries

Lists the countries that have not had address formats applied to them.

> **Note:** Note: Countries must be entered on the Country names window before they will be available for address formatting.

Add

Used to move selected countries from the Available Countries list to the Format Applied to list. This action is part of the process of applying an address format to a country.

Remove

Used to move selected countries from the Format Applied to list to the Available Countries list. This action is part of the process of removing an address format from a country.

Layout Applied to

Lists the countries for which address formatting has been applied.

Test Layout

Opens the Address Layout Tester window that is used to verify that an address is formatted correctly.

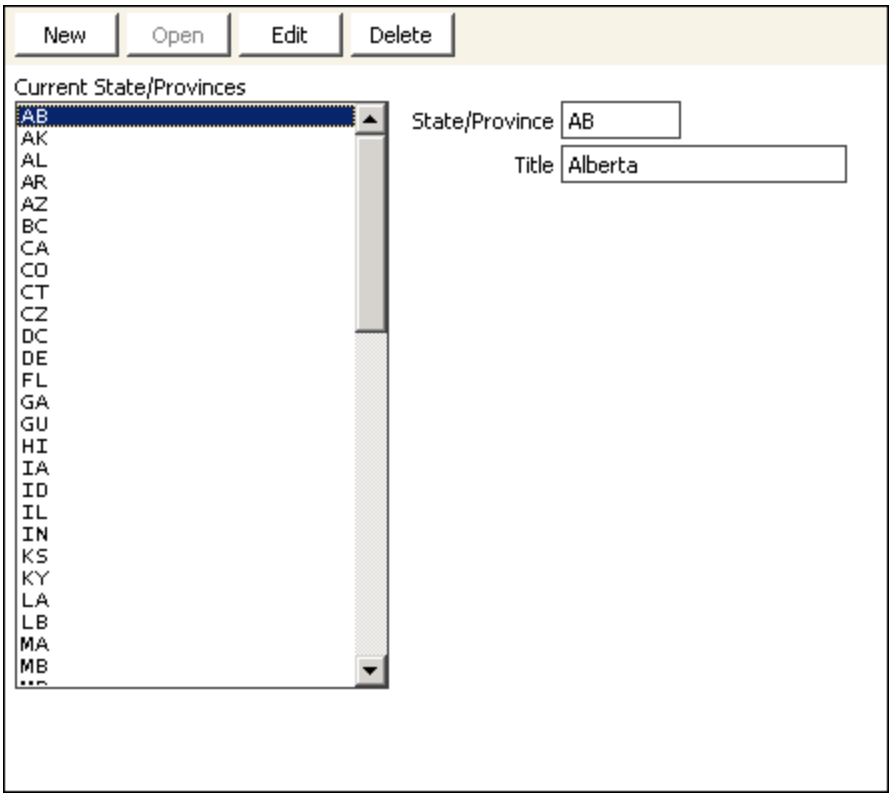
Defining state/province codes

The State_Code table is a combination validation/expansion table for the St/Prov field used for customer addresses. This table is preloaded with all 50 two-character state abbreviations and full name descriptions. It also contains valid codes for the District of Columbia, other related U.S. regions, and Canadian provinces. You can add any entries you need.

To define state/province codes

1. From the State/province codes window, click New.
2. Enter the code for the state/province you want to add to your validation/expansion table in the State/Province field.
3. Enter the full name of the state/province in the Title field.
4. Click Save.

State/province codes window



Advanced Accounting Console: Settings > Membership > Set up tables > State/province codes

Current State/Provinces

This field contains a list of defined state/province codes.

State/Province

Enter the state/province code in this field.

Title

Enter the full name of the state/province in this field.

Creating lookup/validation tables

iMIS enables you to create and add to validation and expansion tables for many fields of the iMIS interface. iMIS comes with built in links between many of its standard fields, and

you can create validation tables for any of your user-defined demographic or list-string fields.

Guidelines for populating tables

When working with lookup/validation and expansion tables, keep the following guidelines in mind:

- Do not use special characters in the Code or Expansion fields when creating general look-up/validation tables.
- The Code field on the Lookup/validation tables window can hold up to 60 characters. However, the general lookup/validation tables used for various fields in iMIS have varying field length requirements. Before adding Code values to a general lookup/validation table, you should determine the maximum length of the field to which the general look-up/validation code is connected. If you add a Code that is longer than the field length requirement for the field to which it connects, the data will be truncated, or in the case of certain tables, the value will not be shown as an available option.
- If the length of the Code field for the following general lookup/validation tables is greater than the defined field length, the value will not display in the drop-down as an available option:
- CATEGORY
- MAIL_CODE
- MEMBER_STATUS
- SIC_CODE
- STATUS

  Note: Refer to the latest Alpha Table Layouts for field lengths.
- The value that is displayed in a drop down list or in a select window is determined in the following way:
- If a Description is defined, the Description is displayed.

- If no Description is defined, but an Expansion is defined, the Expansion is displayed.
- If neither a Description nor an Expansion are defined, the Code is displayed.
- The value that is saved after a user selects a value from a drop down list or select window is determined as follows:
- If the value in the general lookup/validation table has an Expansion value, the Expansion value is saved.
- If the value in the general lookup/validation table does not have an Expansion value, the Code value is saved.
- The Description value from the general lookup/validation table is never saved as the result of a selection from a drop down list.

  The value that is saved is the value that is displayed in the window that calls the drop down list or select window.

  The following are exceptions to the values that will display in a drop-down list:
- The SIC field on the Other tab will always display the Code field values defined in the SIC_CODE general lookup/validation table.

  Tables that provide validation

  The table validation feature enables you to assure that everyone within your organization uses the same codes to designate the same thing by either checking entered values against a list of approved values (validation) or by providing a fixed list of values from which users must choose (lookup).

  For example, the STATE_CODES table comes preloaded with state and regional two-character abbreviations, and iMIS rejects entries in the St/Prov field that fail to match those in the table. While you are entering or editing a field linked to a table, you can view a selection window of the available table values through the lookup feature.

  Tables that provide expansion

Expansion tables provide input replacement for specified fields. With this keystroke-saving technique, the user enters an abbreviation for a field, and the table look-up replaces it with the associated replacement text. This feature is useful for fields that commonly contain the same text. For example, the Prefix field can expand abbreviations in data entry according to the PREFIX table: entering m expands to Mr., entering p in the Title field expands to President, entering vp expands to Vice President.

List string fields will only validate against a table if and when a general table is linked to the field. With a few fields, iMIS uses the table for expansion only (in which case the table associates abbreviations and expanded text) but does not restrict the text that users can enter. For example, the TITLE table expands vp to Vice President but it will not keep you from entering a new title that is not in the table, such as Sales Representative.

Tables that expand and validate

Some fields are set to use a table for both expansion and validation. For example, the PREFIX table provides abbreviated entries and restricts the text to one of the field values (or blank). When using combination tables, be sure to enter both the valid abbreviations and the full field values as codes so that both types of text entries will be accepted (validated).

When setting up tables on the Set up general lookup/validation window to provide lookup choices and validation during data entry for coded fields such as Prefix, you should enter values for Expansion or Description that are different from the specified Code to prevent duplicate values from displaying in your drop-down lists. For example, if you enter Dr. as the Code and Dr as the Expansion, you will have a duplicate in your list.

Note: Note: Leave the Expansion values blank for lookup/validation tables that you create unless you are sure that you need expansion. Entering expansion values when they are not necessary may cause problems with some lookup/validation fields in the iMIS interface.

> **Note:** Note: Most lookup and validation fields limit input to values defined in their associated tables. Be sure to define all of the codes that your users will need when you set up lookup/validation tables.

To create a general lookup/validation table

When creating general lookup/validation tables, keep the tables as small as possible to optimize system performance on lookups.

The values or selections defined in a lookup/validation table display in a drop-down list.

> **Note:** Note: In order for Prefix and Suffix data to show up in the Web view and Public view, the Expansion field must be populated. Otherwise, prefix and suffix information only displays in the iMIS Desktop view.

1. From the Lookup/validation tables window, select (New Table) from the list. A window opens and prompts you for the new table name.
2. Enter the exact table name in the window.
3. Click Save to insert the new table into the table list.
4. Populate the new table:

1. Click New.
2. Enter a value in the Code field.
3. If you are creating an expansion table, enter a value in the Expansion field.

   Caution! When creating a general lookup/validation table, leave the Expansion field blank. Entering a value in the Expansion field of a lookup validation table can prevent iMIS fields tied to the table from working properly and may prevent iMIS from saving the correct data from fields populated by the table.
4. Enter a Description. The value entered in this field is displayed in lookup windows and drop down lists.

5. Click Save.
6. Repeat until you have entered all of the lookup/validation values.

   To import files into a general lookup/validation table

   iMIS allows you to import tab delimited files into a general lookup/validation table. The import process requires that the file be tab delimited and contain a Code, Expansion, and Description.

1. From the Lookup/validation tables window, select (New Table) from the list. A window opens and prompts you for the name of the new table.
2. Enter the name of the new table in the window that displays.
3. Click Save.
4. Select Import to display the Importing Tab Delimited Tables window.
5. Click Continue to display the Select import file window.
6. Navigate to your import file, and click Open.
7. When the import is complete, a dialog box will prompt you to select an additional file.

- Click No to end the import process.
- Click Yes to import another tab delimited file.

8. When complete, the Set up lookup/validation window is displayed.

   To delete a general lookup/validation table

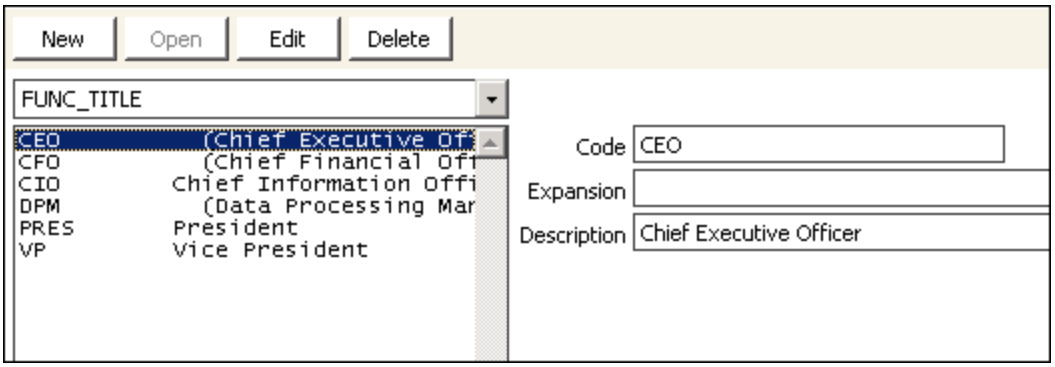
   > **Note:** Note: A general lookup/validation table is automatically deleted when no codes exist for the table. Follow the steps outlined below to delete each code you have defined for the table you wish to delete.

1. From the Lookup/validation tables window, select the table to be deleted from the table name list. The table's code, expansion, and description values are displayed in their respective fields.

2. Delete all of the codes from the table:

1. Select a Code to delete.
2. Click Delete. A system message prompts you to verify the deletion of the selected record.
3. Click Yes.
4. Repeat until you have deleted all codes from the table.

Lookup/validation tables window



Advanced Accounting Console: Settings > Membership > Set up tables > Look-up/validation tables

New

This field creates a new value for the currently selected table.

To create a new table, scroll to the bottom of the table list and select New Table.

Tables

Displays a drop-down list of the lookup/validation tables established for your system. When you select a table, the code and description you have defined for the table display in the window below the drop-down list.

Code

Specifies the codes (up to 60 characters) for the lookup/validation tables you are defining for your system.

Expansion

Specifies the Expansion value that will be substituted for its Code.

Description

Specifies the description of the code you are defining for your system.

Print

Used to generate and send a general lookup/validation table report to your report destination.

Import

Used to import tab-delimited files into a general lookup/validation table.

Setting up chapters

Setting up Chapter Management consists of the following:

- Setting field prompts
- Defining chapter codes

Once setup is complete, you can enter the chapter enrollments for anyone maintained in your customer database.

To use the chapter-tracking feature, your administrator must specify a Chapter Prompt field on the Customer Setup - Basic Options window.

If needed your administrator can also establish a hierarchical structure of up to three levels for your chapters by specifying group prompts on the Customer Setup - Basic Options window. For example, if your chapters are grouped by region, the proper region for the chapter can be designated. This will let you group customers by region on reports, searches, and so forth. With this added capability, you can produce detail or summary reports by region with the information sorted by region overall, and by chapter under that.

To set chapter prompts

1. Go to Settings > Membership > Configure member options.
2. Click Basic Options to open the Customer Setup - Basic Options window.

3. Click Edit.
4. Enter a Chapter Prompt for tracking customers who belong to a particular chapter.
5. (optional) Enter a prompt in the Group 1 Prompt, Group 2 Prompt, and Group 3 Prompt fields. The prompts you define display between the Name and Short Note/Address fields on the Chapters window (go to Settings > Membership > Set up tables > Chapters). These groups allow you to specify and maintain hierarchies among your chapters, which facilitates targeted mailings and reporting. Examples of groupings include countries or regions, states, and counties and cities.
6. Click Save.

Defining chapter codes

With the Chapter Codes table, you can easily track chapter members through iMIS. To maintain chapter designations, you only have to set up a table of chapters and enter a chapter code for relevant customers in your file. The chapter table entry can be as simple as a chapter code and a chapter name, but you can add additional information such as an address or a note.

To define a chapter code

1. From the Chapters window, click New.
2. Enter an abbreviation for the chapter in the Code field.
3. Enter the full name of the chapter in the Name field.
4. (optional) Enter a code in the three fields between the Name and Short Note/Address fields.
5. (optional) Enter a note or address for the chapter in the Short Note/Address field.
6. (optional) Enter a note for the chapter in the Notes field.
7. Click Save.

To modify a chapter code

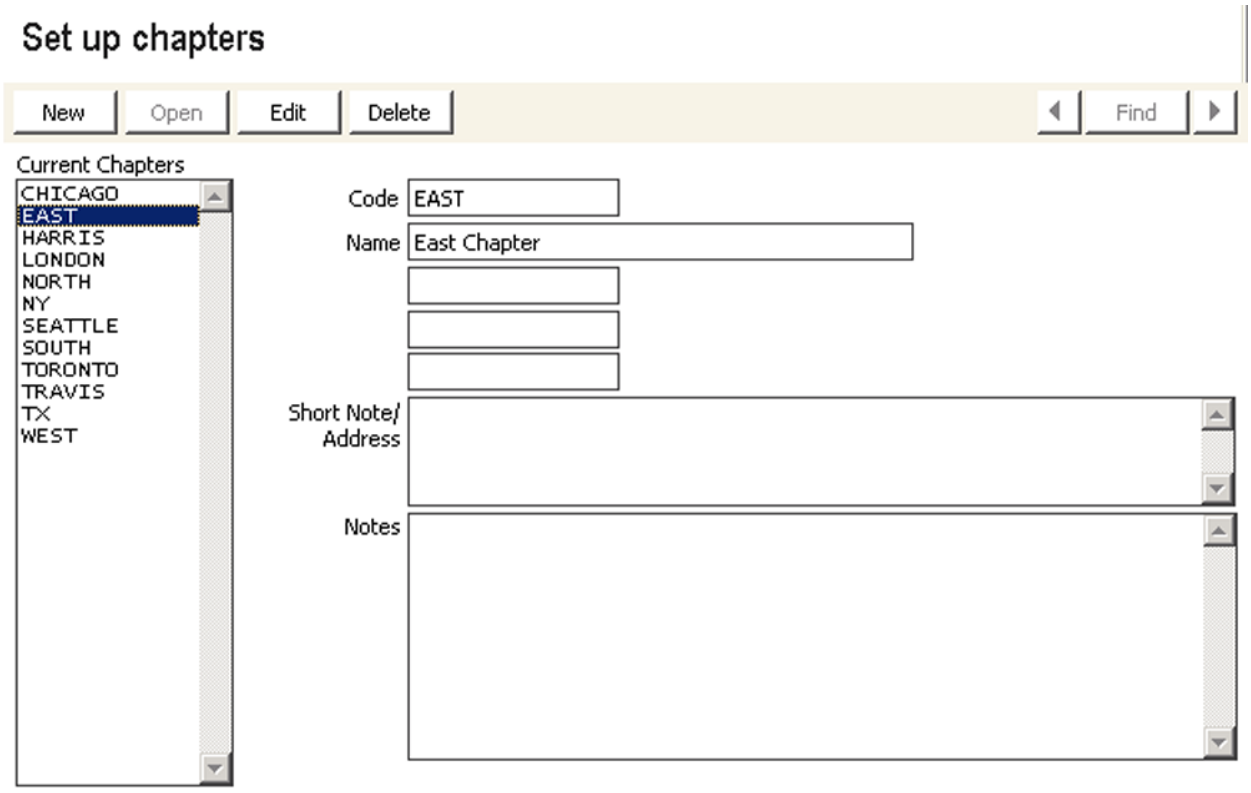
1. From the Chapters window, select the Chapter code you wish to modify.

2. Click Edit.
3. Edit the fields you wish to change.
4. Click Save.

To delete a chapter code

1. From the Chapters window, select the chapter code you wish to delete.
2. Click Delete.

Chapters window



Advanced Accounting Console: Settings > Membership > Set up tables > Chapters

Current Chapters

Lists the codes assigned to each chapter.

Code

(required) Use this field to assign a unique code to each chapter. This field holds a maximum of 15 characters.

Name

Use this field to assign a name to each chapter.

Chapter prompts

Specify codes for three groups that correspond to the chapter hierarchy. You define the labels that display for these fields on the Customer Setup - Basic Options window

- Use the first field to enter a code for the highest level grouping of your chapter hierarchy (if applicable). For example, if you have a chapter organizational structure containing several sub-groupings, the Region code could represent the highest level.
- Use the second field to enter a code for the second-highest level grouping of your chapter hierarchy (if applicable).
- Use the third field to enter a code for the third-highest level grouping of your chapter hierarchy (if applicable).

Short Note/Address

Specifies miscellaneous notes about a chapter, as well as an address for the chapter.

Print

Prints information stored in the Chapter Description table.

Defining committee codes

To define committee codes

For each committee in your customer system, you must define an alphabetic committee code and a title for the committee that you are setting up in the Committee Codes table. Define committee codes and assign committees to groups after defining the committee groups.

1. From the Committee codes window, click New to create a new committee code, or select an existing committee code from the Current Committees list and do the following:

- Click Edit to modify the committee code.
- Click Delete to remove the committee code.

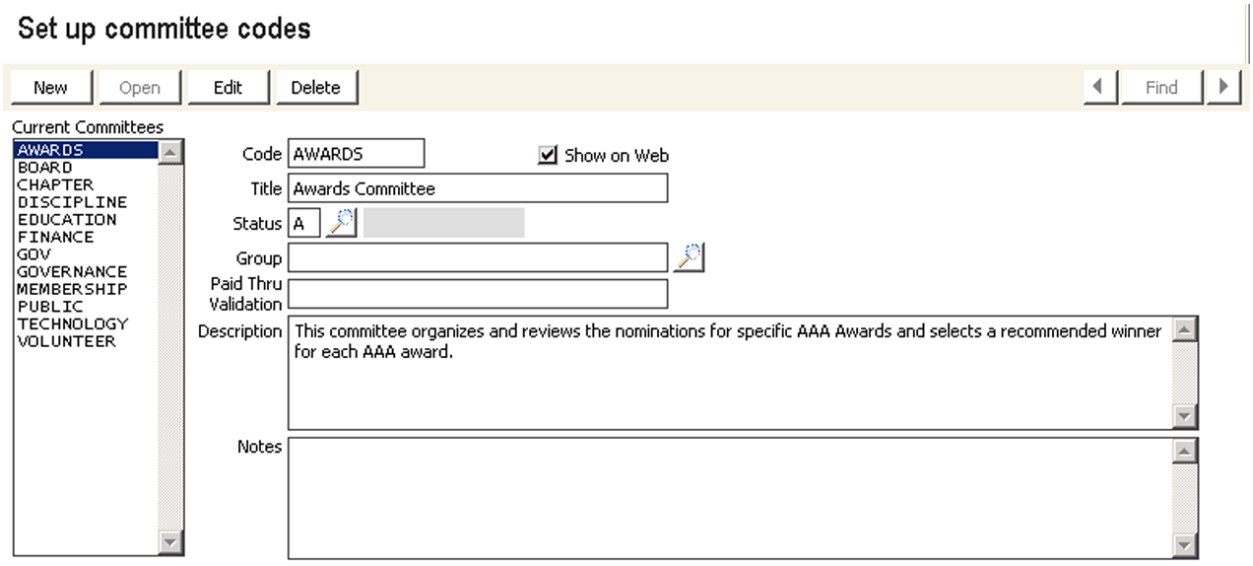
2. Specify the committee code information.
3. Click Save.

To change a committee status

1. From the Committee codes window, select the committee from the Current Committees list whose status you want to change.
2. Click Edit.
3. Enter I for Inactive in the Status field.
4. Click Save. A warning message box displays.

   Note: When you change a committee to inactive, iMIS searches the Activity table for any committee members with a Thru date greater than today. If any are found, iMIS will notify you and ask if you want those Thru dates automatically changed to yesterday's date. If you answer yes, iMIS will set those activities' Thru dates back to the previous day's date.
5. Click Yes.
6. Click Save on the Committee codes window.

Committee codes window



Advanced Accounting Console: Settings > Membership > Set up tables > Committee codes

Current Committees

Lists the codes assigned to each committee.

Code

Specifies a unique code for each member. The maximum length is 15 characters.

Show on Web

Enables all committees and committee members associated with this committee code to be listed on the Committees page of the Public view components site. Clear this check-box to prevent the associated committees and committee members from being listed.

Title

Specifies a descriptive name for the committee. The maximum length is 60 characters.

Status

Use this field to identify the status of the committee as A for active or I for inactive. If you wish to discharge a committee, set its status to I for inactive. Click the lookup icon to select an available value.

> **Note:** Note: To use the search feature, the COMMITTEE_STS general look-up/validation table must be set up.

Group

Use to collectively group related committees together. Click the lookup icon and select an available value.

> **Note:** Note: To use the search feature, the COMMITTEE_GROUP general look-up/validation table must be set up.

Paid Thru Validation

Specifies a validation code that links a committee to a dues-product code for a given chapter or area. This field is used to verify that a potential committee member has purchased the required chapter or area dues-product. Click Edit to see a drop-down list of available chapters.

Description

Describes the purpose of the committee. This description is displayed in the committee roster and is available for printing on other reports. The maximum length is 255 characters.

Notes

Stores miscellaneous notes that are printed on reports and directories. The maximum length is 32,000 characters.

Print

Prints information stored in the Committee Codes tables.

Defining committee positions

To define committee positions

After setting up the Committee Codes table, you must set up the Committee Positions table before you can enter committee appointments. In the Set up committee positions window, you assign a code, a description, and a rank (order indicator) for each position that might be held within any committee.

1. From the Committee positions window, click New.
2. Enter a code in the Code field that represents the position you are defining.
3. Enter the descriptive name for the committee position in the Title field.
4. (optional) Enter a unique number that represents the order of importance in the Rank field.
5. Click Save.

To set committee options and membership duration

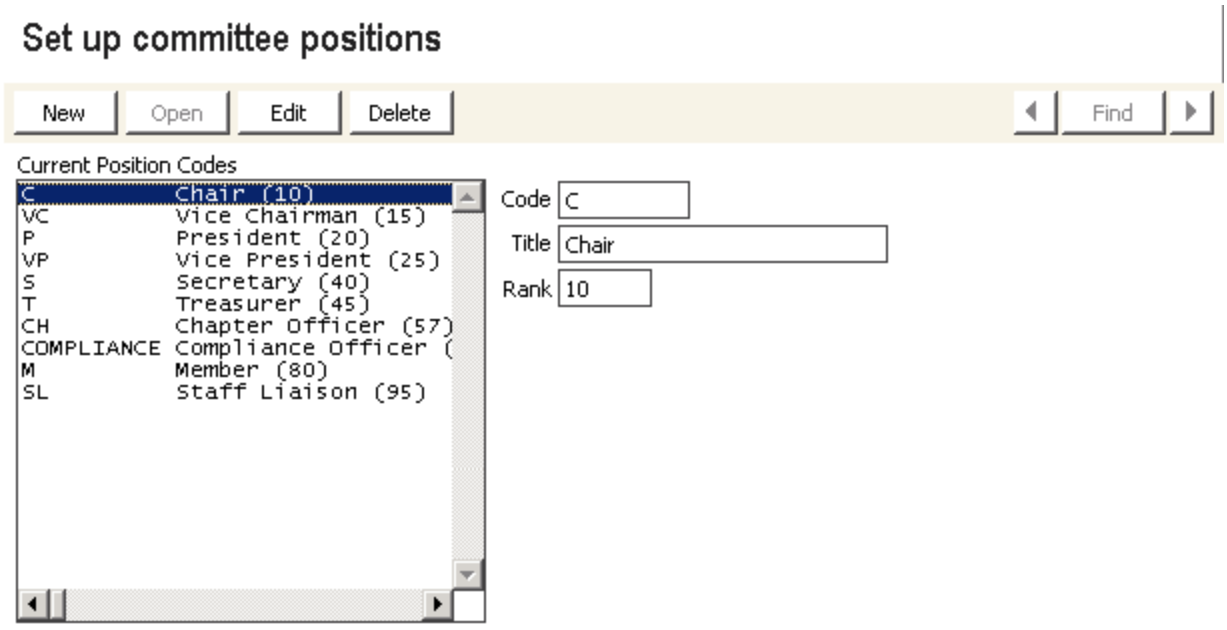
By default, iMIS sets the membership duration (the date represented in the Thru field in the Manage committees window) to 12. For example, when you type a date in the From field, the Thru date will default to 12 months from that date.

1. Go to Settings > Membership > Configure membership options and click Advanced to open the Customer Setup - Advanced window.
2. Click Edit.
3. Set up the options and customer duration for your committees.
4. (optional) Enter labels in the Minutes 1, 2, 3, and 4 Prompts for options that activate in the Minutes window. The option(s) activate in the Minutes window only when a label is entered in a Minutes Prompt field in the Customer Setup - Advanced window.
5. (optional) Enter the number of months in the Default Duration (months) field that you want iMIS to use when calculating the default Thru date in the Manage committees window. To indicate that the committee appointment does not expire, leave this field blank or set it to

0.

6. (optional) Enable the Use Co ID Hierarchy option to link a committee to the ID of a company record. A sub-set of customers associated with the company branch of the committee is created.
7. Click Save.

Committee positions window



Advanced Accounting Console: Settings > Membership > Set up tables > Committee positions

Current Position Codes

Displays the various positions that can be held within any committee.

Code

Specifies a code that represents each position that can be held within any committee. Create codes to represent all committee appointees, even those who do not hold officer-level positions. Characters entered in this field are capitalized automatically.

Title

Specifies the descriptive name for the committee position.

Rank

Specifies a unique number that corresponds to the order in which you want committee members who hold this position to display on committee rosters and other related reports. For example, enter 1 for the Chair (to display first on the roster), enter 2 for the next most important position, and so on. Assign the highest number to the lowest position such as a regular committee member.

You can reassign these ranks at any point, but in order to more easily add new positions in the future, you may wish to skip numbers between ranks. For example, if Chair is ranked as a 1, enter a 3 for the second most important position. If you do not enter a rank, iMIS sorts the members in alphabetic order.

Print

Used to print information stored in the Committee Position tables.

Adding relationship types

Use the Relationship types window to add, edit, and delete relationship types.

Configuring Relationships

In order to use the Relationships module, you must set up a GROUP_CODE general look-up/validation table.

To add a new relationship type

1. From the Relationship types window, click New.
2. In the Code field, enter a value that you want to use to represent the relationship.
3. In the Description field, enter information that describes the relationship. The description displays on the Relationship Detail window for this code.
4. (optional) If desired, enter the code for the relationship you want linked to your new relationship type in the Reciprocal Code field.

Note: If you leave the Reciprocal Code field blank for relationship type, two contacts connected with that relationship type will be displayed with that same type.

5. (optional) Enable the Use Title option if you want to display the Title and Functional Title fields in the Relationship Detail window.
6. (optional) Enable the Use Dates option if you want to display fields for beginning (From) and ending (Thru) dates of the relationship in the Relationship Detail window.
7. Click Save.

To edit a relationship type

You can change the Description, Reciprocal Code, and the Use Title or Use Dates options for any of the standard relationship types that are shipped with iMIS, and you can edit any customized relationship types that you created.

1. From the Relationship types window, select a code from the list of relationship types.
2. Click Edit.
3. Enter the new information.
4. Click Save to save the changes, or click Cancel to cancel your changes.

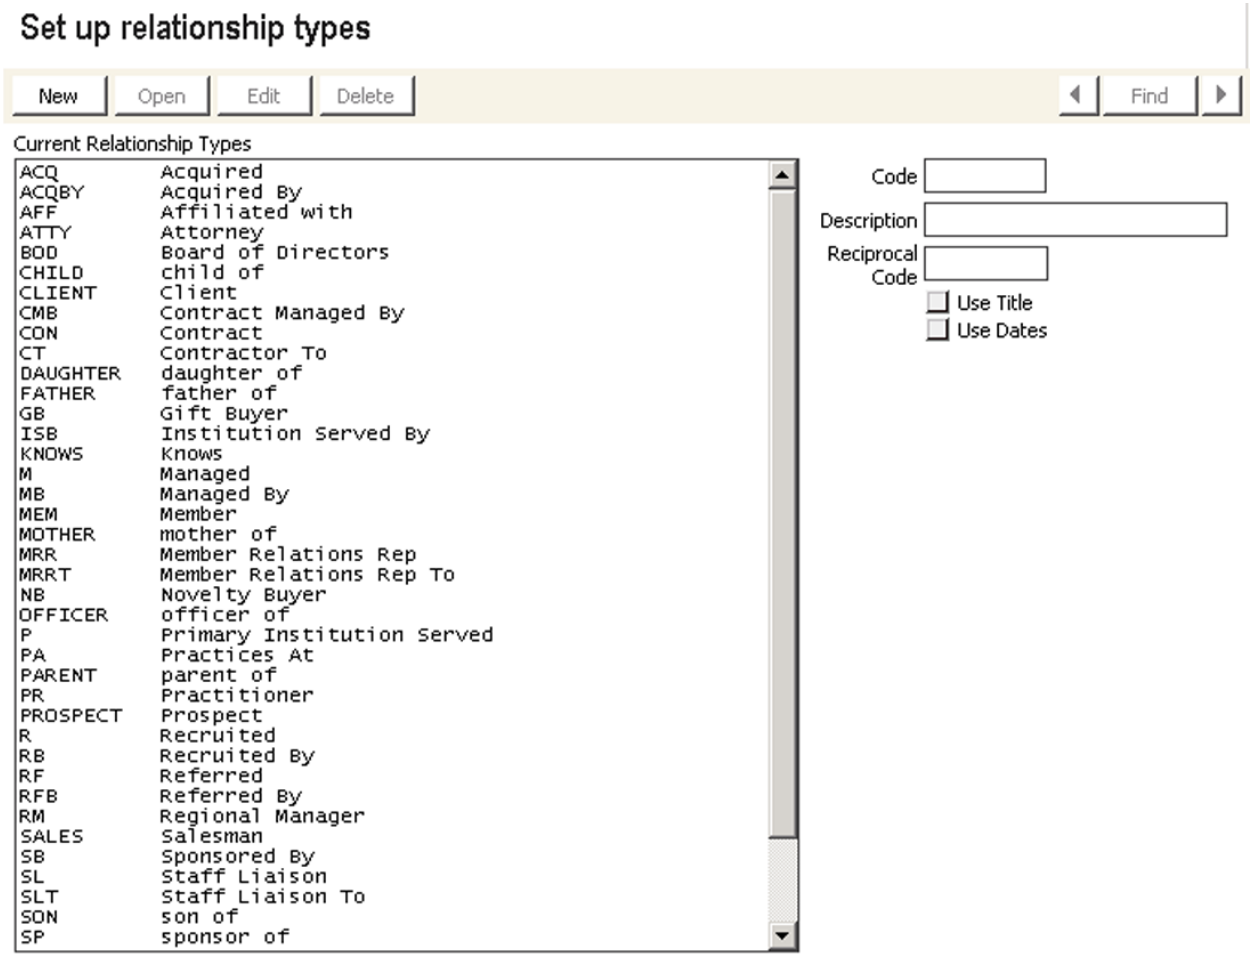
To delete a relationship type

1. In the Relationship types window, select a code from the list of relationship types.
2. Click Delete. A message displays asking you to confirm the deletion:

- Click Yes to remove the type.
- Click No to cancel the deletion.

Note: Note: Before deleting a relationship type, check to be sure that your system does not have any relationships set up that use that relationship type.

Relationship types window



Advanced Accounting Console: Settings > Membership > Set up tables > Relationship types

Code

Specifies a code that you want to represent the relationship.

Description

Use this field to describe the relationship code. Code descriptions display next to their corresponding code on the Relationship Detail window when you select the lookup icons for the Relationship and Reciprocal fields.

Reciprocal Code

(optional) Enter the code (existing or yet to be defined) for the relationship you want to link to this code to in order to create paired relationship records (for example, you can make MOTHER the reciprocal code for the relationship type DAUGHTER).

Use Title

(optional) Enable if you want the Title and Functional Title fields to display in the Relationship Detail window.

Use Dates

(optional) Enable if you want to display fields for the beginning (From) and ending (Thru) dates of the relationship in the Relationship Detail window. Use this option for time-bound activities such as appointments.

Billing

Configuring billing options

To set up general billing options

1. From the Configure billing options window, click Edit.
2. Enter the Standard Billing Interval in months.
3. Select an Accounting Method. If Accrual is selected, additional options display in the Paid Thru Date Update section and the AR Payment Application section displays. You must make selections in these areas.
4. Select a Billing Time.
5. Select an appropriate Prorating option.

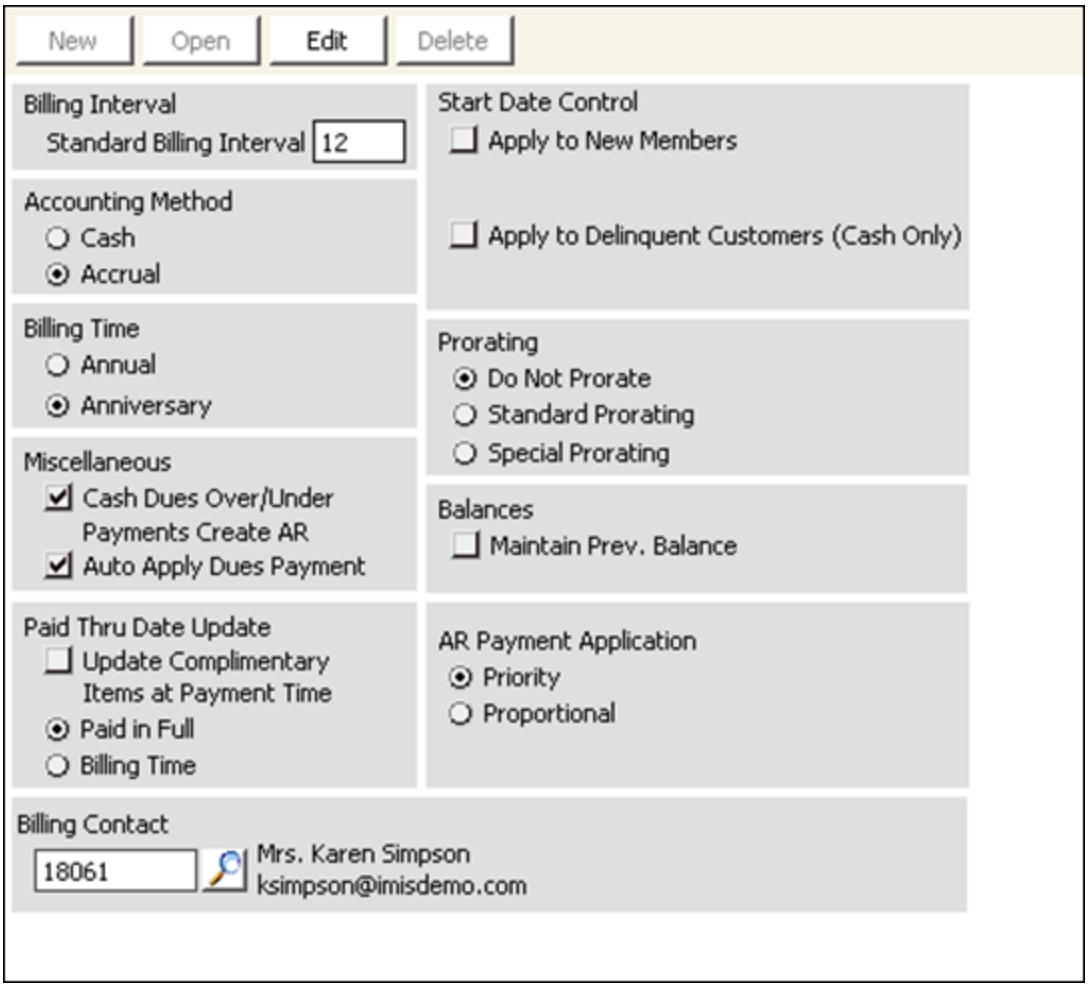
   Note: Prorating applies only when you want to bill on an annual or fixed-term basis, as opposed to an anniversary or rotating term basis. If billing is done for all products (for example, all fees and product billings) on an anniversary basis, you must enable the Do Not Prorate option.

6. (optional) Enable the Update Complimentary Items at Payment Time option if you want to advance the Paid Thru date of complimentary products at payment time instead of at billing time.
7. (optional) Select the Start Date Control options to advance the Bill Begin day by one month and create a new billing term.
8. Enable or disable the Cash Dues Over/Under Payments Create AR option.
9. Enable or disable the Maintain Prev. Balance option.
10. Click Save.

    Caution! If Annual is chosen as the Billing Time, be sure to open the Configure accounting options window (go to Finance > Options > Configure accounting options) and enter the calendar month (numeric) that represents either your fixed-term or fiscal year in the First month of fiscal year (number) field.

    Caution! If Special Prorating is selected, define the product codes as discussed previously and then see Defining Prorating Rules to establish the special prorating table rules.

Configure billing options window



Advanced Accounting Console: Settings > Billing > Configure billing options

Billing Interval

Standard Billing Interval – The billing interval controls the frequency with which you will normally generate bills. You can override the billing interval at the individual customer level, at the product level, or at the individual subscription level. Choose the billing interval as a number of months from 1(monthly), 2(bimonthly), 3(quarterly), 6 (semi-annual), 12 (yearly), or 24 (every 2 years).

Note: Note: The number entered in the Standard Billing Interval field affects billing rates. Unless the billing interval is overridden at the product level, the dollar

amounts entered for the products should be in accordance with the Standard Billing Interval.

Start Date Control

Note: Note: If there are no Start Date Control options implemented, the New Bill From field on the Dues/Subscription Payments window defaults to the first day of the current month. See Date Usage in iMIS.

Determines whether the Bill Begin date should be advanced by one month. Start Date Control can be used to advance the start date of newly billed items or to specify a grace period for delinquent customer products. If implemented, the Bill Begin date will be controlled according to the following options:

- Apply to New Members – This option enables you to automatically advance the subscription begin date for new customers according to the parameter set in the Advance Start Month as of field.
- Advance Start Month as of – (Displays once you enable the Apply to New Members or Apply to Delinquent Customers option.) This option is a user-defined parameter used with the Apply to New Members option to allow you to set a specific day of the month on which to advance the begin date for new customers. Valid entries range from 0-28. If the value is 0 or 1, the Bill Begin date will always advance to the beginning of the next month.

  For example, if the Advance Start Month as of field is set to 15 and the Apply to New Members option is enabled, all new customers joining on August 15 will have their billing Begin Date set to 09/01.
- Apply to Delinquent Customers – (Applies to Cash basis and Anniversary items only.) This option allows for the calculation of a new billing term when payment is posted to an existing billing record after the Bill Begin date. The new term begin date is determined by the value of the Advance Start Month as of field. If the value is 0 or 1, the new term will always advance to the beginning of the next month.

- Grace Period in Months – (Applies to Cash basis and Anniversary items only and displays only when the Apply to Delinquent Customers option is enabled.) This option refers to the grace period that is allowed for payment after the Bill Begin date.

  For example, the Advance Start Month as of field is set to 15, the Apply to Delinquent Member option is enabled, and the Grace Period in Months is set to 3. A customer with a Paid Thru date of 12/31/2001 is billed for a renewal term of 01/01/2002 to 12/31/2002. The customer does not pay until 04/15/2002. The payment transaction date of 04/15/2002 exceeds the Bill Begin date of 01/01/02, and it also exceeds the three-month grace period from the Bill Begin date of 01/01/2002. Therefore, a new product term will be calculated by comparing the payment transaction date to the value of the Advance Start Month as of field. In this example, the payment transaction date of 15 is equal to the value set in the Advance Start Month as of field, and the new term will be calculated as 05/01/2002 to 04/30/2003.

  Accounting Method

- Cash – Enable this accounting method to set up the billing system to recognize income when payment (cash) is received regardless of when bills or invoices were generated. The cash method is preferred for the Billing module.
- Accrual – Enable this accounting method to recognize income by creating open accounts receivable items when bills and invoices are generated.

  > **Note:** Note: After you change the accounting method, you must restart iMIS Desktop and ensure that your iMIS Administrator stops and restarts all websites that contain your iMIS 15 applications in order to see the changes in the left navigation area.

  > **Note:** If restarting the websites is problematic, you can wait for the cache to refresh (default is 15 minutes wait time, designated by the refresh cache interval), and then your changes appear.

  Billing Time

The billing time is a method selected to control the start and end time of a customer or product term.

- Annual – Fixed annual customer term. All customers have the same billing term. The customer term coincides with the fiscal year (begin in any month). Annual fees are commonly prorated for new customers. Different prorating rules apply depending on when a customer joins. For example, if new customers join in July and you renew annually on the calendar year, you might want to prorate their fees by 50 percent.

  Note: If you select Annual as the billing time, you will need to set up the first month of the fixed term or fiscal year on the Configure accounting options window (go to Finance > Options > Configure accounting options). Enter the calendar month (numeric) that represents either your fixed term or fiscal year in the First Month of Fiscal Year (Number) field. The value in the First month of the fiscal year (number) field auto-populates the Effective Date. If this field does not have a value greater than zero, then the Effective Date must be manually entered on the Process billing window (go to Home > Membership > Bill membership dues).

- Anniversary – Individual renewal date that fluctuates based on each customer's Join Date. For example, if a customer joins on July 1, his or her term would be from July 1-June 30 of the following year. If you select an anniversary billing time, terms will initially default to a year (or other specified billing interval) from the Join Date, if it exists, or the Effective Date you specified during billing.

  Prorating

  Prorating applies only to organizations that bill on an annual or fixed-term basis, as opposed to an anniversary or rotating-term basis.

- Do Not Prorate – Enable to specify that fees are the same regardless of when a customer joins the organization.

- Standard Prorating – Enable to specify a global setting that prorates all products for the current year (depends on the billing interval). The following example relates to a billing interval of 12. If a customer joins during a term, iMIS reduces the initial fees based on a standard 12-month calculation. For example, if a customer joins in month 7 and the

annual fees are $200, the calculated fees would be 6/12 of the total fees, or $100.

- Special Prorating – Enable to specify user-defined prorating rules according to the needs of your organization. This rule is a per product setting and must be defined and assigned to individual products. Specify prorating rules on the Prorating window (go to Settings > Billing > Billing products, and click Prorate Rules). See Defining Prorating Rules for detailed information.

  Note: When a former member, who is still marked as active in the system, rejoins your organization, the rejoin is processed as a renewal and prorating does not apply. See Defining Prorating Rules for more detailed information about how prorating is applied to rejoins.

  Miscellaneous

  Cash Dues Over/Under Payments Create AR – When you enable this option, over-payments are tracked in the AR/Cash system to allow the credit to appear on the Credit Invoices window (go to Finance > Processes > Month-end procedures, and click Credit Invoices). Underpayments are also tracked in AR by considering the item fully paid and maintaining an outstanding balance. Overpayment or underpayment to AR creates an open credit or debit item for that customer. For example, if the customer paid $150 and had been billed $100, a payment of $150 can be entered but only $100 applied. iMIS would create an open credit of $50 for that customer in AR. A full payment of line items advances the Paid Thru date on those items. Credit (overpayments) and outstanding debit (underpayments) balances are maintained by the AR system. In Billing, the item will be treated as fully paid.

  Auto Apply Dues Payment – This option is enabled by default. When you disable this option, dues payments are not applied automatically.

  Balances

  Maintain Prev. Balance – If this option is enabled, iMIS maintains the previous balances on customers who have made a partial payment or no payment. Previous balances are usually maintained in conjunction with a low Standard Billing Interval. For example, if annual fees were $100 and the customer paid only $80, iMIS would retain a balance of

$20. When the customer is billed next year, iMIS would add the previous balance of $20 to the customer's total balance.

> **Note:** Note: The Maintain Prev. Balance option applies only to cash-based dues. For accrual-based fees, previous fee balances can be viewed in the individual's AR window because accrual fees billings create invoice records. The PREVIOUS_ BALANCE field in the Subscriptions table will not be populated for an accrual fees billing even if the Maintain Prev. Balance option has been checked.

> **Note:** Note: The Maintain Prev. Balance option must be enabled for a _CREDIT (user-defined credit) to display on a Renewal Notice.

> **Note:** Note: This option does not apply to voluntary contributions (VOL).

Paid Thru Date Update

The options set in this section set the preference for when the Paid Thru date information is to be updated. The Paid Thru date for the cash accounting method is updated with payment in full.

- Update Complimentary Items at Payment Time – Enable to specify that the Paid Thru date for complimentary items (no charge products) be updated at payment time instead of billing time.
- Paid in Full – (This option displays when the Accrual accounting method is enabled.) Enable to specify that the Paid Thru date be updated when full payment of the associated line item is received.
- Billing Time – (This option displays when the Accrual accounting method is enabled.) Enable to specify that the Paid Thru date will be updated when the initial accrual fees billing is performed.

AR Payment Application

(This option displays when the Accrual accounting method is enabled.) Enable to sets the preference for distribution of partial payments across multiple-fee line items on the Enter and edit cash receipts window (go to Finance > Transactions > Enter and edit cash receipts). This option allows the choice of whether a partial payment will be applied based on priority established at the product code level or evenly distributed across each fee-based product billed.

- Priority – (default) Enable to apply payments to each open line item in payment priority order until all open line items are paid. If no pay Priority has been set for the products defined on the Set up products window (go to Finance > Options > Set up tables > Products), partial payment will be applied to products in alphabetical order.
- Proportional – Enable to apply payments across all the open line items in direct proportion to each line's amount.

Billing Contact

Enter the iMIS ID for the person who would like to receive an email message each time someone makes a Billing-related purchase. The email messages is similar to the one the Event Contact receives for an Event purchase.

Setting up billing cycles

The final step for Billing setup is to define the necessary billing cycles. The steps for defining billing cycles include the following:

1. Create a new cycle name/edit a current cycle.
2. Select whom to bill.
3. Select what to bill.
4. Define how to present the bill.
5. Select how and when to bill.

A billing cycle is another name for a billing run. Define a billing cycle to bill a particular group of people for a particular set of products. Two general groups of billing cycles can be set up:

Customers dues billing

A billing run used to collect dues for a given set of customers sorted by type, category, or both.

- The Add Member Type Items option on the Billing cycles window must be checked. Selecting this checkbox indicates the billing cycle is a dues product billing.
- The overall customer Paid Thru dates and Renewed Thru dates are used to determine who should be billed.
- The customer Join Date month is used to determine the customer term beginning date (anniversary date) for new customers.
- This billing run will automatically bill all items cross-referenced on the Set up customer types to all customers who are selected for billing. Do not select the same dues products that are listed on the Set up customer types window from the scrolling product list on the Billing cycles window.
- This billing run will bill only non-customer type products selected on the cycle if an active subscription record already exists for the customer. For example, Include all sections, Include all chapters, and any items selected on the scrolling product list.
- All line items will bill uniformly for the same customer term (for example, beginning date and number of months) based on the value in the Renewal Months field on the Financial tab on the Manage customers window if non-zero, the value in the Renewal Months field on the Set up products window, or the overall system setup Standard Billing Interval setting.
- Can bill for all chapters and/or all sections.

Note: Note: To set up a Join Now billing cycle, name the cycle Join Now with one space and no special characters, followed by any identifying characteristics. For

> instance, if you plan to add a Join Now membership option for students, associates, and regular members, you would enter Join Now as a Student Member, or Join Now as an Associate Member, and so on.

Non-dues billing

A separate billing run used to collect payments for optional subscriptions for customers or non-customers.

- The Add Member Type Items option on the Billing cycles window must not be enabled (checked).
- Evaluates individual subscription line items' Paid Thru and Billed Thru dates in determining whom/what to bill.
- The Subscription Date Added is used to determine the subscription term beginning date for new subscribers.
- This billing run will bill only items chosen on the cycle if an active subscription record already exists for the subscriber. For example, Include all sections, Include all chapters, and any items selected on the scrolling product list.
- Each item's term (number of months) will be calculated independently based on the first nonzero setting of the individual's subscription Billing Period, the product Renewal Months, the subscriber Renew Months (Financial tab), and the overall system setup Standard Billing Interval.

To create a new billing cycle

1. From the Billing cycles window, click New.
2. Enter the name of the billing cycle in the Cycle Name field.
3. Select whom to bill:

1. Select the customer types to bill from the Member Types column.
2. Select the Categories to include for this billing cycle.

4. Enable the Other Billing Instructions options, if any.
5. Select a Web Option, if necessary:

1. Select Use for web joins to enable the billing cycle to be available for joining online.
2. Select Use to display itemized web renewals to enable use of the billing cycle as a template to display itemized details of a renewal invoice. Customer types must be selected to determine which customers will have their invoices displayed using the billing cycle template. If a corresponding billing cycle cannot be located, the user will be unable to view the contents of the invoice. Any number of billing cycles can have this Web Option set.

   Note: If the Use to display itemized web renewals option is selected, and the selected customer type matches the customer type for the SoldToParty of the renewal invoice, users will be redirected to a Renewal Detail screen when they add a renewal product to the shopping cart. The user will see all the billing products that are selected in the billing cycle as well as any other products that might be present in the invoice.

   Note: A cash based renewal invoice can be modified on the web. A user can add or remove optional items, but the user cannot remove dues items or chapter items.

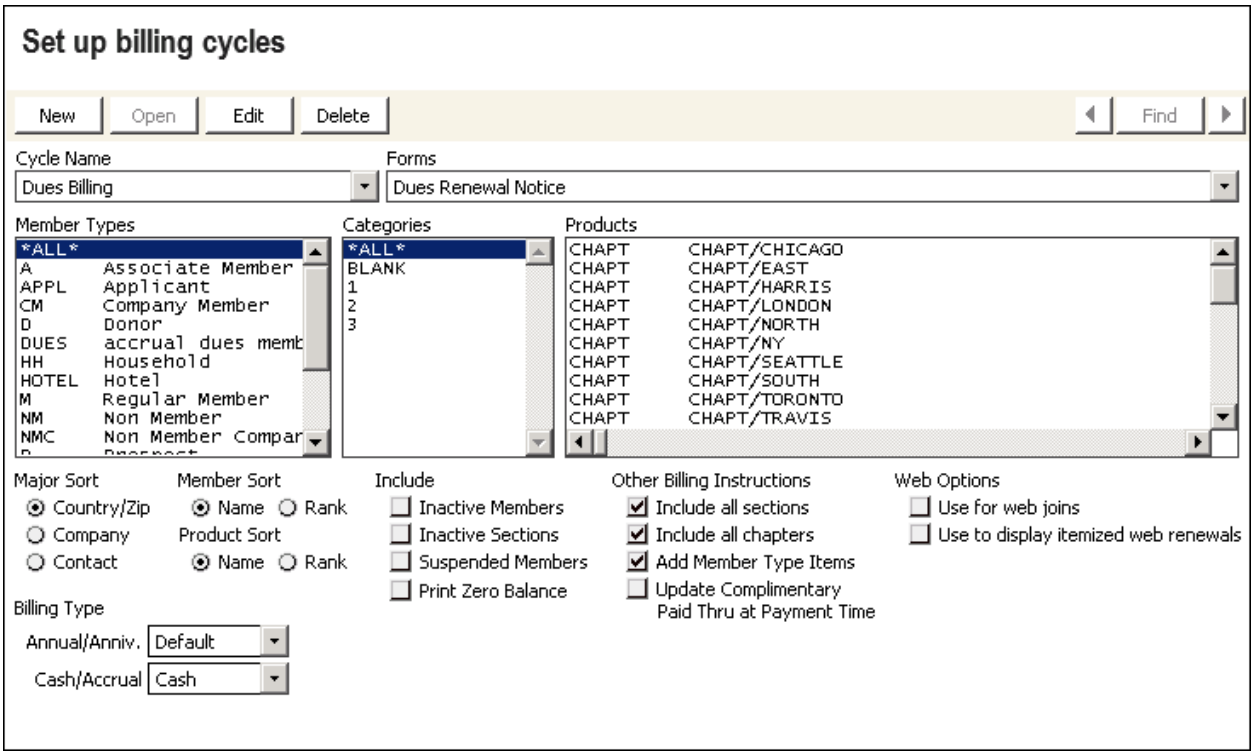
6. Select the Products to be included in the bill. If you enable the Add Member Type Items option, do not select any customer type-referenced products from the scrolling list.
7. Define how to present the bill:

1. Select the renewal notice format for this billing cycle from the Forms list.
2. Select the Major Sort option to be used to sort the order in which the bills are printed.
3. Select the Member Sort option to be used to order the individuals (Ship to) on the list bill.
4. Select the Product Sort option to be used to order the line items on the dues bill.
5. Enable the appropriate Include options, if any, that also need to be billed.

8. In the Annual/Anniv. list, select when the billing cycle should be billed: Annual, Anniversary, or retain the default setting. iMIS defaults to the setting specified on the Set up general options window.

9. In the Cash/Accrual list, select the Cash or Accrual accounting method, or retain the default setting. iMIS defaults to the setting specified on the Set up general options window.
10. Click Save.

Billing cycles window



Advanced Accounting Console: Settings > Billing > Billing cycles

Cycle Name

Indicates the designated name for the group of records from which renewal notices will be generated. This name displays on the Process billing window with a list of available cycles.

Forms

Drop-down list of renewal notice formats

Member Types

A list of available customer types available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (selects range) while you select your selections. To bill all customer types, select *ALL* at the top of the scrolling list. For example, for a subscription cycle where the subscription can be purchased by any customer, select *ALL*.

Categories

A list of categories available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (sequential range) while you select your selections. To bill all categories of customers or subscribers, select *ALL* at the top of the scrolling list. If BLANK is selected, only customers or subscribers with a blank or empty category will be selected.

Products

A list of products available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (sequential range) while selecting other selections. Products selected in this list will be billed only if an active subscription line item already exists for the customer.

For dues product billing, only select products that are optional add-on items to the mandatory or regular dues products. The Add Member Type Items option must enabled. If the Add Member Type Items option is enabled, all products listed on the Set up customer types window for the customer types selected will be billed automatically during this billing cycle. These customer type-referenced products should not be selected on the scrolling list.

Shortcut – To select all chapters (CHAPT) and sections (SEC), enable the Include all sections and Include all chapters options located in the Other Billing Instructions section.

Major Sort

This option specifies the order in which the bills are sorted for printing. The choices include Country/Zip (postal code), Company (company sort), and Contact (individual's last name, first name).

Member Sort

This is used only for list bills (where the dues and/or subscription products for several individuals or branches are itemized on a single bill and sent to a single parent company or a third party). It establishes the order in which the individuals (Ship to) are listed on the list bill. You can sort by Name (last, first) or Rank (under development for a future release).

Product Sort

This option controls the order of the line items on the dues bill. Select Name (to sort alphabetically by product code) or Rank (to sort by the payment priority shown on the Billing products window).

Include

Specific options that are included in the billing cycle, when enabled.

- Inactive Members – Enable to bill customers whose status begins with I (inactive).
- Inactive Sections – Enable to force the billing of SEC-type subscription in which the subscription's status begins with I (inactive).
- Suspended Members – Enable to bill customers whose status begins with S (suspended).
- Print Zero Balance – Enable to print bills with zero balances. For example, if you enable this option, iMIS will generate a bill for a customer who receives a complimentary (zero dollar amount) membership. Not enabling this option causes iMIS to bypass all zero balance bills during the printing process.

  Note: This option applies only to bills with a total balance of zero. To suppress the printing of individual zero balance line items when the grand total is nonzero, see the SUPPRESS_ZERO_ITEMS print options.

Other Billing Instructions

Include all sections – Bills all active subscription records of the product type SEC for the customer types selected. If multiple sections exist, all sections will be included.

Include all chapters – Bills active subscription records of the type CHAPT for the customer types selected. If multiple chapters exist, all chapters will be included.

Add Member Type Items – Use for dues billing. This option bills customers for all product codes defined on the Set up customer types window. If this option is enabled, select only those items in the Products list not covered on the Customer types window or by the options Include All Sections and Include All Chapters.

> **Note:** Note: When Add Member Type Items is selected, new subscription records will be created only for items included on the Ccustomer types window. All other products selected for the dues billing cycle will be billed only if an existing active subscription record already exists for that customer. The Add Member Type Items option must be enabled for dues billing and should not be enabled for non-dues product billing.

Update Complimentary Paid Thru at Payment Time – When enabled, allows the Paid Thru date for complimentary items (no charge products) for this billing cycle to be updated at payment time instead of billing time. During dues billing, iMIS checks the billing cycle to determine how to handle complimentary item Paid Thru dates.

Web Options

Use for web joins – This option determines whether the billing cycle can be used to allow new members to join on the Web. If this option is selected, the billing cycle is available to be used to join online.

Use to display itemized web renewals – If selected, each individual item in the renewal product is displayed. If not selected, you will see one product that contains the individual items.

> **Note:** Note: To avoid errors in displaying renewal invoices, do not select Add Member Type Items when Use to display itemized web renewals is selected.

Note: Also, do not select *ALL* in the Member Types list. Select each member type individually to view itemized dues renewal options.

Note: Note: If the Use to display itemized web renewals option is selected, users will in some cases be redirected to a Renewal Detail screen when they add a renewal product to the shopping cart. The user will see all the billing products that are selected in the billing cycle as well as any other products that might be present in the invoice, and can add/remove products that are optional. Products of type DUES, CHAPT and MISC are mandatory. The renewal detail page appears only if the following are all true:

-- The user was billed using only cash dues. If any dues were billed on a real/accrual invoice, then there will not be a link in the cart entry for the renewal fees, and any adjustments must be performed by Staff users in the Advanced Accounting Console.

--The billed amount and the current balance are the same. If they are not, then the user can pay the full amount due through the web-based sites, but cannot make adjustments. This can happen if the dues item is partially paid, has been manually adjusted by staff, or has a balance forward from a prior billing period.

--The Use to display itemized web renewals option is selected.

For accrual dues, only the most recent billing period's dues are represented in the Renew Now process. For example, if a member has not paid dues for the last two years, then when they click Renew Now they will be charged only for this year's dues. After paying this year's dues they can see that they have a balance due in their Open Invoices list, but cannot use the Renew Now button to pay them. For cash dues, if the Maintain Prev. Balance option has been enabled (go to Settings > Billing), and if a member has carried forward a balance, then the full amount due will be charged.

> **Note:** Note: Make sure that there are no dues products with a code that ends with _CREDIT selected in the Products area of the billing cycle when selecting the Use to display itemized web renewals option.

For more information, see To set up a "Join Now" billing cycle.

Billing Type

Annual/Anniv. – List used to select when the billing cycle should be billed: Annual, Anniversary, or retain the default setting. iMIS defaults to the setting specified on the Set up general options window. You may want to change the setting if you bill dues products annually and subscriptions by anniversary.

Cash/Accrual – List used to s select the Cash or Accrual accounting method, or retain the default setting. iMIS defaults to the setting specified on the Configure billing options window. You can select Cash or Accrual if the default accounting method on the Set up general options window is set to Accrual. If you try to set the billing cycle accounting method to Accrual when the dues product accounting method system default is Cash, iMIS displays a message informing you that the accounting method system setup must be changed to Accrual.

Bills/Reminders

Opens the Billing and Reminder Notices window where you can specify when iMIS should send first and second reminder notices to the customers included in the billing run.

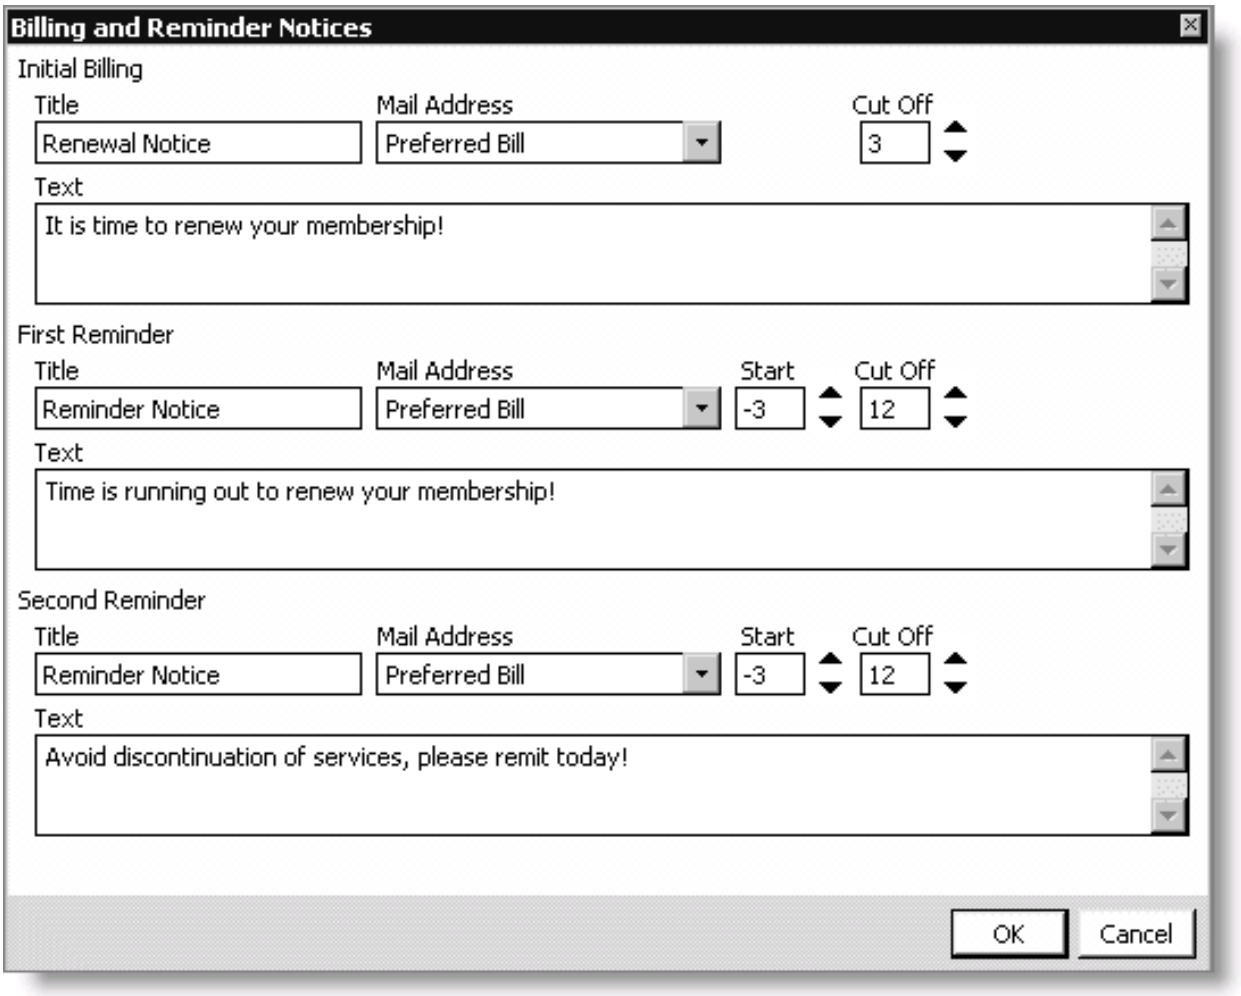
On the Billing and Reminder Notices window, you can enter a title to display at the top of the Billing and Reminder Notice, add overlay text, select a different mail address, and set the default initial and reminder date parameters for each Reminder Notice.

To set the billing and Reminder Notices

1. From the Billing and Reminder Notices window, enter the Title information.
2. Select the Mail Address.
3. Enter the customized Text to be added to the billing notice.

4. Select the Initial Billing Cut Off month.
5. Select the First and Second Reminder Start and Cut Off months.
6. Click Save.

Billing and Reminder Notices window



Initial Billing, First Reminder, and Second Reminder

Title – Specifies the title to appear on the renewal or reminder notice. For example, Initial Billing, First Reminder, and Second Reminder. You can specify a title for the following renewal notice formats only: Dues Renewal Notice with Reminder Text, Dues Renewal Notice List Bill, and Dues Renewal Notice - No Remittance Stub

Mail Address – Drop-down list for selecting an address option. Options include Preferred Mail, Preferred Bill, or one of the three address purposes defined on the Customer Setup - Address and Notes window (go to Settings > Membership> Configure membership options, and click Address and Notes).

Text – Customized text to be added to the billing notice. Up to 255 alphanumeric characters can be entered. For most renewal notice formats, the text entered overlays or prints on the preset renewal notice elements. Therefore, press Enter to shift text down the page far enough to avoid the preset report elements on the form. Full overlay text for all renewal notice formats can be set on the Detail Report Parameters window (go to Utilities> Report Specs, and click Parameters).

Examples of notice-specific text:

- Initial Billing – It is time to renew your membership!
- First Reminder – Time is running out to renew your membership!
- Second Reminder – Avoid a discontinuation of services, please remit today!

Note: This feature is available on the following renewal notice formats only: Dues Renewal Notice with Reminder Text, Dues Renewal Notice List Bill, Dues Renewal Notice - No Remittance Stub, Std. Form ASI-018 DBL Column List Bill, Std. Form ASI-019 Dbl Column List Bill, Std. Form ASI-020-Full Page List Bill, and Std. Form ASI-021-Full Page List Bill.

Initial Billing – Cut Off

Use this option to set the default number of months for calculating the billing Effective Date for anniversary billing cycles. For example, if you typically send out your initial billing three months before the renewal or Paid Thru date expires, set the first Cut Off field to 3 on the Initial Billing. If your current run date is 7/25/2001, iMIS will set the default Effective Date to 10/01/2001 for the initial billing, and will bill all customers whose Paid Thru date expires before that date and who have not been billed previously.

On an annual cycle, the Effective Date should always coincide with the first day of the fixed term. iMIS will calculate the Effective Date based upon the First Month of Fiscal Year set on the AR Cash
Set up module window. The default always assumes the billing applies to the current fiscal or fixed year. Override the year when you run next year's renewal cycle in advance.

> **Note:** Note: The default Effective Date can be overridden as needed at dues product billing time. If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

First and Second Reminder Start and Cut Off

Use this option to set the Start and Cut Off parameters used to calculate a date range for selecting outstanding billings. The date range, which should include the outstanding bill's original date or Run Date, is determined by subtracting the number of months set in the Start and Cut Off month field from the run date.

For example, if first reminders are typically sent one month after the Initial Billing, specify -2 for the Start field and -1 for the corresponding Cut Off field. In the following example, the current run date is 7/25/2001. iMIS will set a default begin and end date range and print First Reminder renewal notices for those customers whose initial billing was run between 5/01/2001 and 6/01/2001 inclusive and who are currently not paid.

If you want to remind your customers more than twice, set up an additional billing cycle for printing Reminder Notices 3, 4, and so forth to make processing your additional Reminder Notices easier. When you use the Third, Fourth, and Fifth Reminder Notices from a second billing cycle, iMIS will automatically calculate the reminder start and end dates based on the Start Month set up on the Billing and Reminder Notices window. After the initial bill is printed, the Subscriptions.REMINDER_COUNT field changes from 0 to 1. After the first Reminder Notices is printed, it changes to 2 and will stay at 2 even after you run a 3rd, 4th, or 5th Reminder Notice.

Defining billing products

The Billing products window is used to define or create product codes for products that will be billed or for which your organization collects money. The Billing products window defines product line items, default pricing, and entity and General Ledger account information.

Only products with defined product codes can be billed. One product code should be created for each potential dues or subscription-type product or service that will be billed. Unless General Ledger account numbers vary by Customer type, a single, primary membership dues product can be established.

> **Note:** Note: To determine a price for a given product, iMIS first looks to see if a price is set on the Special Pricing window. If no price is set on the Special Pricing window, iMIS then checks the Set up customer types window. If no price is set or the Comp option is not enabled on the Set up customer types window, iMIS then looks on the Billing products window.

To define a new product code

1. From the Billing products window, click New.
2. Enter a Product Type.
3. Enter a Code that identifies the product.
4. Enter a descriptive Title for the billing product. This title will display on the customer's bill and on other windows.
5. (optional) Enter a detailed description in the Desc. field.
6. (optional) Set the Standard Price information. As a rule of thumb, if the product will be cross-referenced to a customer type through the Set up customer types window, do not enter an amount in the Standard Price area.

1. Enter the default standard customer pricing, if any, in the Regular field.
2. Enter the default non-customer pricing, if any, in the Non-Member field. Even if the same rate for customers applies to non-customers, enter the rate again in the Non-Member price field.
7. Enter the G/L Acct. number. (Required for iMIS G/L interface users)
8. (optional) Enter the Deferred account number. This field is available only when iMIS is licensed for the Deferred Income module.
9. (optional) Select the appropriate prorating rule. See Defining Prorating Rules.

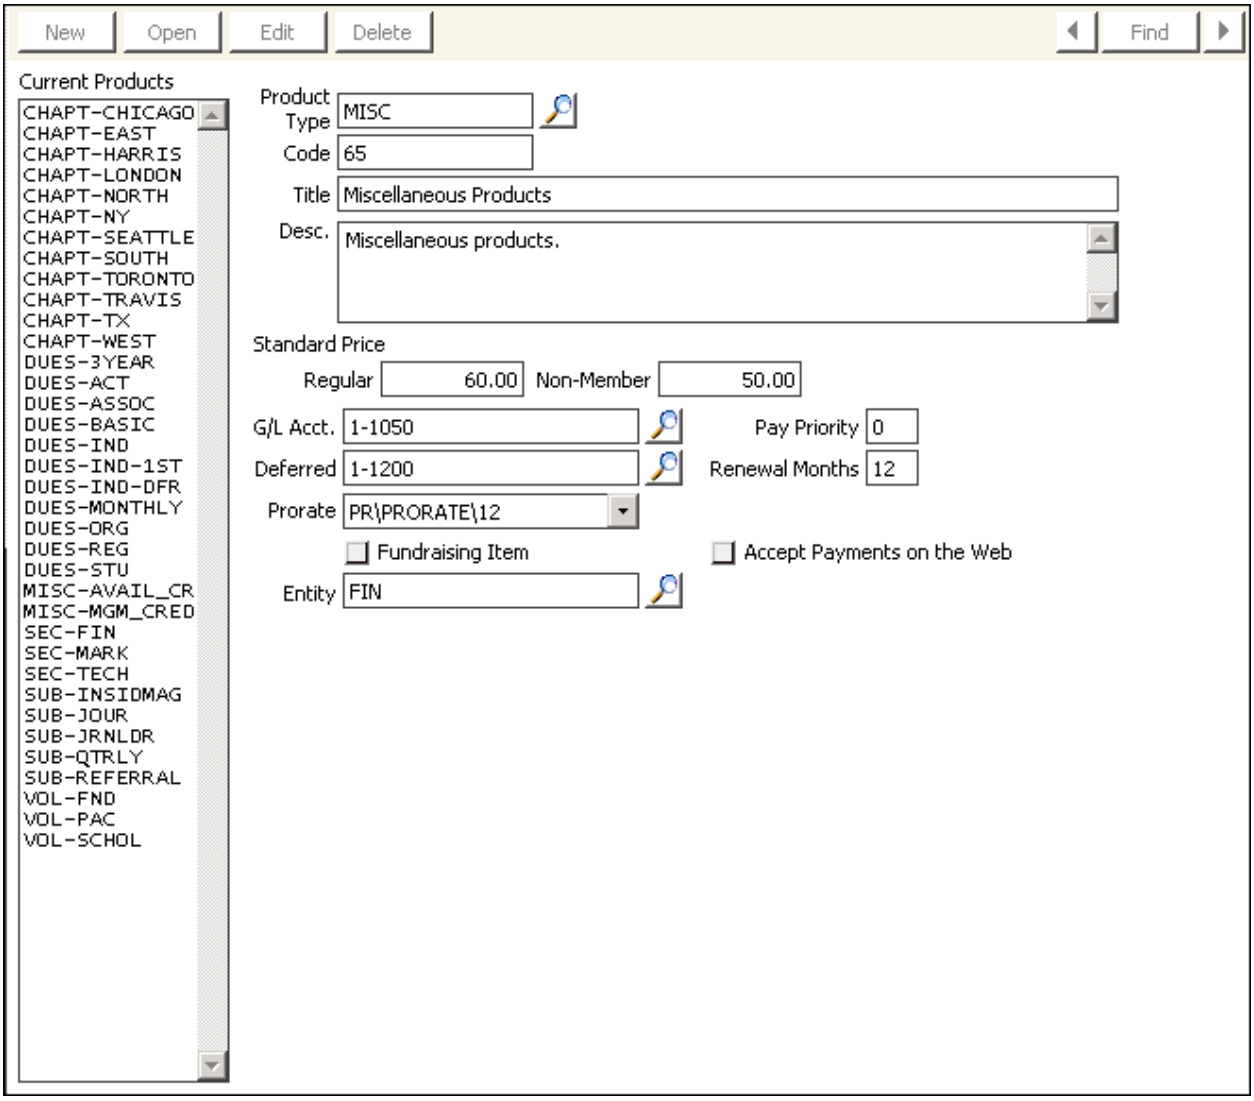
   Caution! Do not select a prorating rule if the Do Not Prorate option or the Standard Prorating option is selected on the Configure billing options window (see Configure billing options).
10. (optional) Select the Fundraising Item checkbox if the product is a fundraising product. When the Fundraising Item checkbox is selected, the Fair Market Value, Appeal, and Campaign fields are activated, and the Entity field is changed to the Fund field.
11. (optional) Choose the financial Entity or Fund.
12. (optional) For fundraising products, enter fundraising information (Appeal, Campaign, and Fair Market Value).
13. (optional) Enter the Pay Priority.
14. Enter the Renewal Months if you want to override the Standard Billing Interval set on the Set up general options window.
15. Click Save.

    Note: Chapter product codes are usually added on the Chapters window (go to Settings > Membership > Set up tables > Chapters). Pricing for CHAPT type products can be set on the Billing products window.

    Note: If a product code will be linked to a customer types, the pricing for the product code should be set in the Dues Billing section on the Set up customer types window or on the

Special Pricing window. Do not set the pricing for a mandatory product item on the Billing products window.

Billing products window



Advanced Accounting Console: Settings > Billing > Billing products

Current Products

List of defined products.

Product Type

The product type is a system-maintained code that allows iMIS Billing to manage the relationships among files and other modules that are affected by billing.

- CHAPT – Separate dues for chapter or local groups – Use this code for separate chapter membership dues. Chapter products are created automatically when you insert entries on the Chapters window (go to Settings > Membership > Set up tables > Chapters) or when you populate the Chapter field on the Status tab in the Manage customers window. To allow chapter billing, a dollar amount must be assigned to the chapter product, either at the product level or at the special pricing level. If CHAPT is entered in the Product Type field, CHAPT is automatically populated in the Code field and a chapter can be entered in the Chapter field, which displays next to the Code field.
- DUES – Regular membership dues – Use this code for all normal membership dues items. This code normally is used for standard non-optional dues line items that are cross-referenced on the Customer types window.
- MISC – Reserved for miscellaneous charges. Normally, special pricing rules dictate the conditions for charging for a miscellaneous item.
  For example, special pricing rules that are based on the Join Date.
- SEC – Sections and specialty groups – Use this code for optional add-on section memberships such as professional specialty groups. Generally, this type would not be put on the Customer types window because SEC normally represents groups that are joined only by request. After a customer has subscribed to this product type, iMIS enables you to automatically bill for initial billing and renewals through cycle definition rules.
- SUB – Magazine/journal subscriptions – Use this code for optional subscriptions such as journals and magazines. This product type would not be put on the Customer types window because SUB items are optional. After a customer has subscribed to this product type, iMIS enables you to automatically bill for initial billing and renewals through cycle definition rules.
- VOL – Voluntary contributions – Use this code for non-mandatory contributions such as PACs or foundations. VOL typically will be cross-referenced on the Customer types window. However, open items of this product type will not appear on Reminder Notices

unless non-voluntary items within the same cycle still have open balances. Voluntary contributions are editable; customers can edit the Amount of voluntary contributions before going to the cart.

Label Preference

Displays when Use Product Label Preferences is enabled on the Customer Setup - Address and Notes window.

Code

Specifies a key word that identifies the Product. The code entered should not contain any spaces or special characters other than an underscore (_), and should contain no more than 15 alphanumeric characters. This code is used in the Billing Codes field on the Customer types window. Select the lookup icon to search field values.

> **Note:** Note: Product codes that end in _Credit can bill and retain negative or credit balances. For example, the code AVAIL_CREDIT can be used to apply overpayments to offset next year's dues.

Title

Enter a descriptive title of the Product Type in this field. When a billing item is referenced on data entry screens and Renewals Notices, the title will appear next to, or in place of, the billing code.

Desc.

(optional) Enter a detailed description of the product in this field.

Standard Price

Enter the default price for customers and non-customers. Unless the billing interval is overridden in the Renewal Months field, the dollar amounts entered for the products should be in agreement with the Standard Billing Interval set on the Set up general options window. For example, the rate for a product is $120 per year. Enter the flat rate of $120 when the Standard Billing Interval is 12 (every 12 months or annual), $10 when the

interval is 1 (once per month), and $240 when the interval is 24 (every 24 months or 2 years).

Different rates for customers and non-customers can be entered.

- Regular – Default standard customer pricing. An entry in the Customer types window will override the Standard Price, and an entry in Special Pricing will override both customer-type pricing and Standard Price.
- Non-Member – Default non-customer pricing if there is no entry in Special Pricing or in the Customer types window.

> **Note:** Note: A dollar amount specified on the Customer types window will override the Standard Price for that particular customer type. Special pricing rules will override fee amounts defined on the Customer types window or in the Standard Price section.

G/L Acct

Enter the general ledger account that will be credited when the payment is received or when the income is recognized. Select the lookup icon to search for values.

Pay Priority

Enter the order in which payments are applied to multiple billing product lines. This can be used to sort the line items during a product billing or on Renewal Notices. A lower number has a higher priority than a larger number. For example, a product with priority 1 will appear on the payment and renewal list before a product with a priority of 2.

Deferred

Enter the deferred income balance sheet account that should receive the credited amount. This option is available only when the system is licensed for the add-on Deferred Income module. A deferred income account should be entered if your system is licensed for the Deferred Income module and the income for this product type should be deferred and recognized during the customer or product term. Select the lookup icon to search for values.

Renewal Months

(optional) Indicates the number of months that the dues product type will be renewed for when payment is received. This number will override the Standard Billing Interval set on the Billing window if the product is being billed on a non-dues cycle. The product's Standard Billing Interval will be used only for pricing determination on the dues billing cycle.

For example, an individual purchases a journal subscription as of 9/1/2001. The journal is set as a product with a rate of $45 for both customers and non-customers, with Renewal Months set at 60 months (five years). On a non-dues billing cycle, the journal line item will be billed for $45 with a Paid Thru date of 8/31/2006.

Prorate

Use this drop-down list to identify the Special Proration table for this specific product. These rules were defined through the Special Pricing window (see Defining Prorating Rules). This feature allows reduced rates for new customers who join after the annual customer term.

Note: Caution! Do not select a prorating rule if the Do Not Prorate or the Standard Prorating option is selected on the Set up general options window.

Fundraising Item

When selected, designates a fundraising product. Checking this box activates the Appeal, Campaign, and Fair Market Value fields and changes the Entity field to the Fund field.

Accept Payments on the Web

(optional) Enable this option if you want line items billed for this product using the Cash accounting method to appear in the Public view under Contacts > Contact Management > Billing. See Billing setup for Public view for more information.

Entity/Fund

(optional) Specifies the financial entity to which income from this product is assigned. When the product is a standard product, the field is labeled Entity and the lookup list contains all org codes defined on the system. When the product is a fundraising product, the field is named Fund and the lookup list contains only those org codes that are defined as funds.

Appeal

(Fundraising products only) Specifies the Fundraising appeal (if any) to which this product is tied.

Campaign

(Fundraising products only) Specifies the Fun Raising campaign (if any) to which this product is tied.

Fair Market Value

The fair market value, for tax purposes, of a fundraising product.

Subscription Info

(Displays only if you have the Advanced Subscription module installed and the product code is SUB). Opens the Publication Information window where you can enter Zone Table and Postal Sort information.

Special Prices

Opens the Special Pricing window where you can define pricing rules for products.

To define special pricing

1. Go to Finance > Options > Set up tables > Products.
2. Select a value from the Current Products list to which special pricing will apply (for example, DUES-BASIC).
3. Click Special Prices to open the Special Pricing window. The product code selected from the Set up products window automatically displays in the Product field on the Special Pri-

cing window.

4. Click New. The Base Amount field displays.

   Note: To modify an existing rule, select the rule and click Edit.

5. Define a special pricing rule by entering the Type, Description, and Base Amount. Other options may also be selected such as Flat Amount, Exact Match, and so forth.

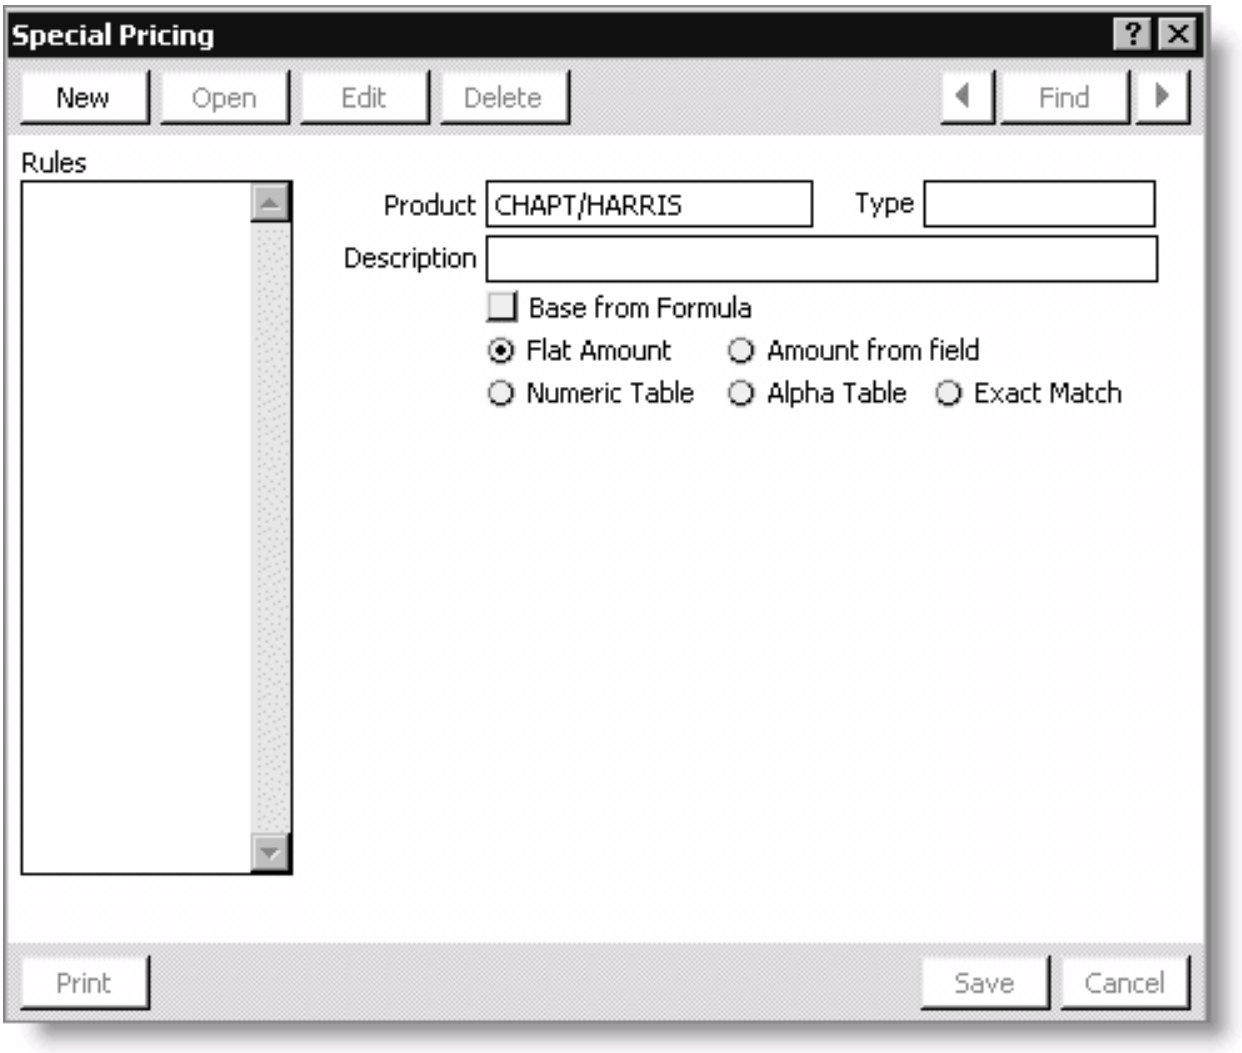
   Note: Some pricing rules require a basic understanding of SQL and user-defined fields. See a SQL manual for information about entering SQL commands.

6. Click Save.

   To create a new billing category

1. Go to Settings > Membership > Configure membership options.
2. Click Basic Options to open the Customers Setup - Basic Options window.
3. Click Edit.
4. Enable the Use Bill Categories option.
5. Click Save.
6. Go to Settings > Membership > Set up tables > Lookup/validation tables.
7. Select CATEGORY from the tables list.
8. Click New.
9. Enter the billing Code. The Code field must be 5 characters or less; otherwise, it will not display in the Category drop-down list under Customers.
10. Enter a Description that will help identify the billing code.
11. Click Save.

    Special Pricing window



Rules

A list of defined special pricing rules.

Product

Displays the product type that was selected on the Set up products window.

Type

Specifies the customer type or the customer type/optional category combination (customer type and category codes are separated by a forward (/) slash.)

To define special prices for a predefined category, open the Set up general look-up/validation window to check for the correct category. To create a new category, see Setting Up Customer Type Categories for Special Pricing.

Description

Enter a detailed description of the billing rule for the specified customer type. This field is for reference only and is not displayed on any bill or report.

Base from Formula

Enable when a formula is to be added to the base amount. This option is available only when the Numeric Table, Alpha Table, or Exact Match option is enabled.

Flat Amount

Use this setting for assigning customer type fees that vary by billing category or rates for non-customer type products whose fees vary by customer type. If you select this option, enter a Base Amount value.

Amount from field

Use this setting to reference an exact rate or to enter a formula that calculates a rate based upon a field. If you select this option, enter
a user-defined field in the Source Field. For example, Name_All.ACTIVITY_FEE, or an SQL calculation that references such fields.

Numeric Table

Use this setting to vary rates according to numeric values. You can establish sliding rates based on income/volume, or rates based on length of certification. This option supports a maximum of 20 rows and prompts you to enter numeric values (units/code) and rates (base amount) that serve as starting levels for applying pricing guidelines. An optional additional per-unit charge can be entered in the Amt/Add'l Unit field.

Alpha Table

This field prompts you to complete a table of alphanumeric values. Like the Numeric Table option, this option looks for a range rather than an exact match. Use this setting to create sliding rates based on values matched to alphanumeric or character fields.

Exact Match

Use this field to restrict a character field to an exact match. Enter a setting to create exact rates based on values exactly matched to character fields.

Source Field

Specifies a user-defined field that references the value entered in the Amount from field field. This option is available only when the Amount from field, Numeric Table, Alpha Table, or Exact Match option is enabled.

Units/Code

Specifies the numeric values that serve as starting levels for applying pricing guidelines. This option is available only when the Numeric Table, Alpha Table, or Exact Match option is enabled.

Base Amount

Specifies a rate that serve as a starting level for applying pricing guidelines. This option is available only when the Flat Amount, Numeric Table, Alpha Table, or Exact Match option is enabled.

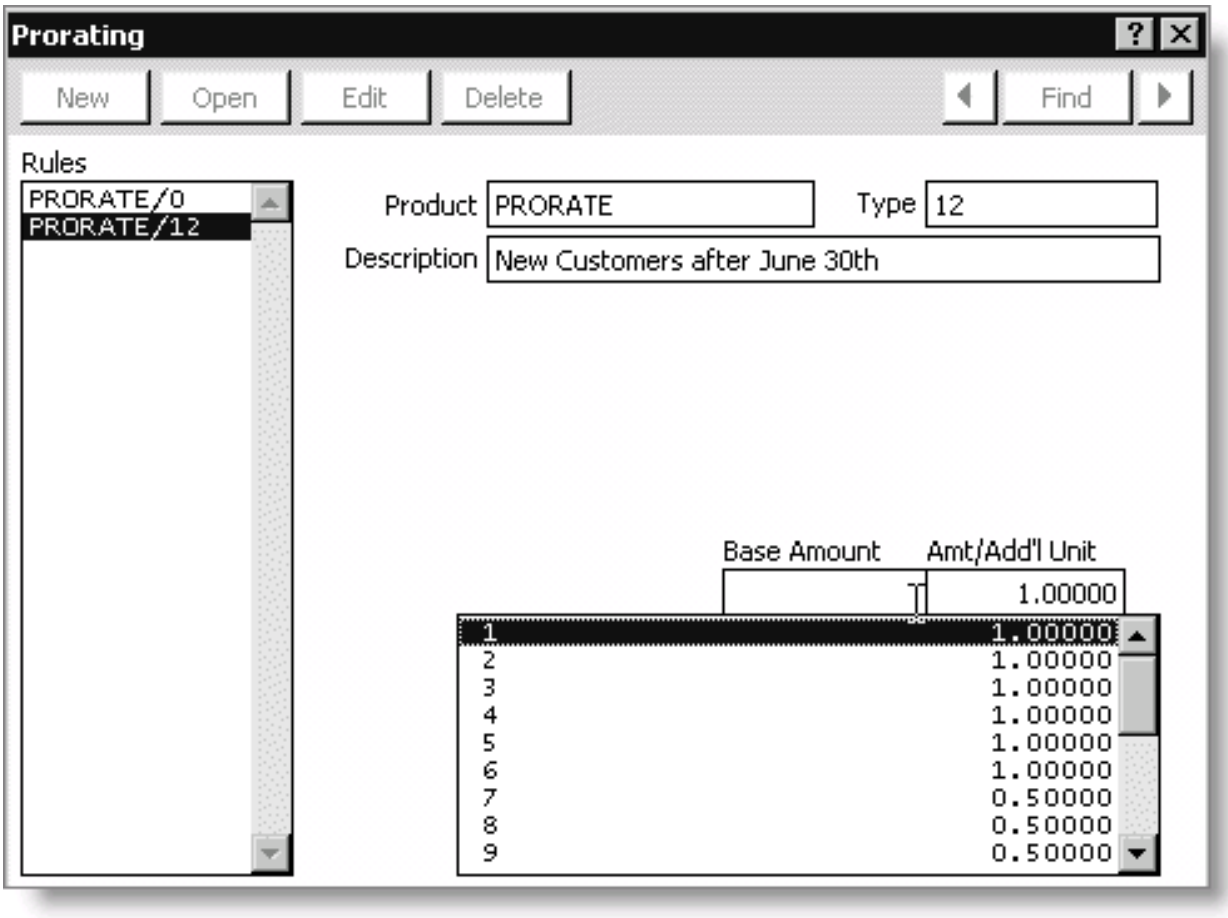
Amt/Add'l Unit

Specifies an optional additional per-unit charge. This option is available only when the Numeric Table option is enabled.

Prorate Rules

Opens the Prorating window where you can specify an amount to an activity or product that is proportional to some base.

Prorating window



Rules

List of defined prorating rules.

Product

This field is automatically populated with PRORATE. You can edit this value.

Type

Indicates the number of months in the billing period. This number must agree with either the Product Renewal Months, on the Set up products window or the Standard Billing Interval on the Billing Set up general options window.

Description

Specifies a detailed description of the prorating rule.

Prorating Table Entries

The entries in the prorating table specify the amount that a customer is charged. For example, if month 1 represents an on time payment, for which a customer is charged a full fee (100%), the Amt/Add'l Unit field will contain a 1. There must be one table entry for each month in the renewal cycle as defined in the Type field.

Base Amount

Specifies refinements (if any) to the prorating rule. The following codes can be entered in this field:

- F (Future Credit) - Postpones the prorating discount to the second billing year.
- B (Bump Date) - Advances the end of the billing term to the end of the next term. The amount charged depends on the multiplier entered in the Amt/Add'll Unit field.

Amt/Add'l Unit

Indicates the percentage of the full price to charge customers.

Events

Configuring event options

You must perform basic system setup activities before you can begin using the Events module. System setup information is entered on the Configure event options window.

The Configure event options window contains options grouped into three areas: Event Description Fields, Registration Fields, and the Exhibition - Years Exhibited Field. By entering user-defined information in these fields, you customize the information that appears on the Event Description window and the Register a customer window's Other tab.

Information you define in the Event Description Fields appears as labels on the Event Description window. For example, you may want to have fields that specify the location of the event, who the event contact is, or other pertinent event information. These fields will not appear on the Event Description window unless they are given labels on the Configure event options window.

Information added in the Registration Fields appears as fields on the Register a customer window's Other tab. This is helpful if you want to track information about registrants, such as first-time attendee status, the registrant has special room needs, or other information that might be helpful for analysis and future planning.

To add user-defined Event Description Fields

1. From the Configure event options window, click Edit.
2. Enter the field names in the Event Description Fields that you want to display on the Event Description window. The user-defined fields entered on the Configure event options window display as data entry fields on the Event Description window.
3. Click Save.

To add user-defined event Registration Fields

1. From the Configure event options window, click Edit.
2. Enter the field names in the Registration Fields that you want to display on the Register a customer window's Other tab. The user-defined fields entered on the Configure event options window display as data entry fields on the Other tab.
3. Click Save.

To add field names to the Exhibition - Years Exhibited Field

1. From the Configure event options window, click Edit.
2. Enter the field name in the Exhibition - Years Exhibited Field that will store the calculated number of years exhibited.
3. Click Save.

Configure event options window

Settings > Events > Configure event options

Event Description Fields

These user-defined description fields display on the Event Description window.

Registration Fields

These user-defined registration fields display on the Register a customer window's Other tab.

Exhibition - Years Exhibited Field

This custom field stores the number of years exhibited. You must be licensed for Exhibition in order to use this field.

Preferences

Opens the Event System Preferences window where you can enable several options.

To delete an event definition on close

1. From the Event System Preferences window, click Edit.
2. Enable the Delete Event Definition on Close option.
3. Click Save.

To copy customer type codes to registrant class codes

1. From the Event System Preferences window, click Edit.
2. Enable the Copy Membership Type to Registrant Class option.
3. Click Save.

Note: You must have the same information on both the Set up registration classes and Set up customer types windows for the customer types to display in the Event Function Definition - Fees window.

To enable Duplicate Registration/Registrant checking

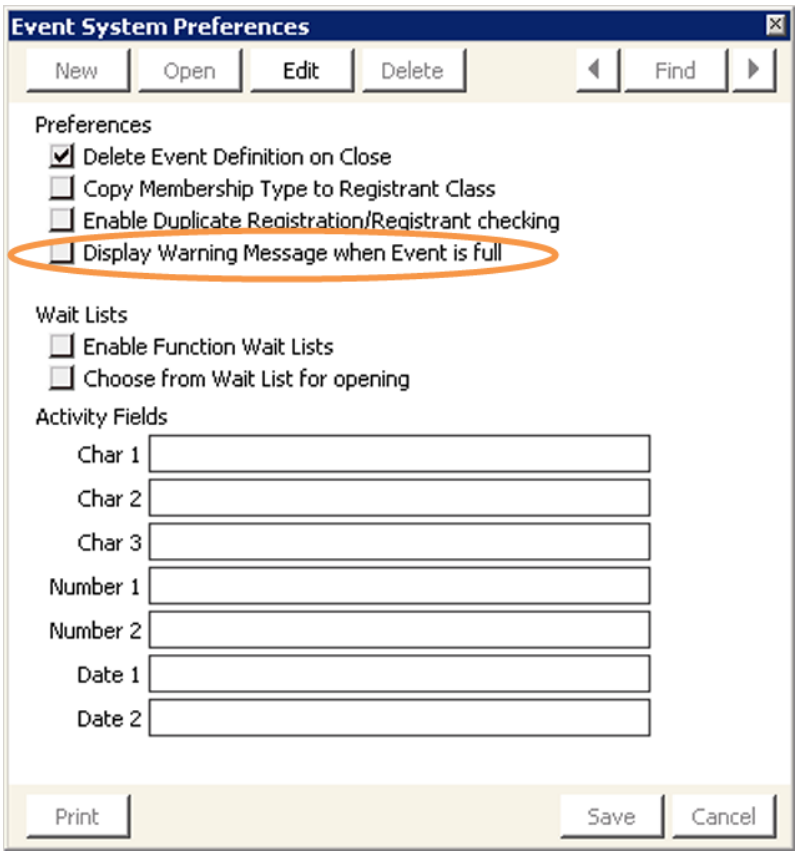
The Enable Duplicate Registration/Registrant checking option on the Event System Preferences window turns on duplicate checking for registrants. It might be useful if you routinely register customers who do not have records in the customer database. When this option is enabled and a suspected duplicate registrant is entered, a message appears on the Register a customer window stating that the customer is already registered for the event.

1. From the Event System Preferences window, click Edit.
2. Enable the Enable Duplicate Registration/Registrant checking option.
3. Click Save.

To display a warning message when an event is full

1. From the Event System Preferences window, click Edit.
2. Enable the Display Warning Message when Event is full option.
3. Click Save.

Event System Preferences window



Preferences

Delete Event Definition on Close – Enabling this option has significant implications. If enabled, all event definition records and function definition records are deleted when you close the event.

If you do not enable this option, you can retain the event definition and summary records, which may be important to you when cloning events. The event remains listed on the Define an event window with a status of C for closed.

Copy Membership Type to Registrant Class – iMIS can copy the customer type code directly to the registrant class code if you need to assign fees or group registrants at the customer type level. All non-represented types map to the basic Member (M) or Non Member (NM) classes. You can directly override any system-assigned class on the Event Registration window. If you want to use customer types to define your registrant classes, you can copy the existing customer types from the Set up customer types window to the Set up registration classes window. For example, if you have a student type (customer type =

STU) that you need to assign different product fees to, enter the same customer type code on the Set up registration classes window. You can select the customer types that you want to use only by entering matching codes for those types.

Enable Duplicate Registration/Registrant checking – This option compares registrants without customer IDs to the customer database. When this option is enabled and iMIS finds a customer with the same first and last name as the registrant, a warning message displays informing you that the person may already exist in the database.

Display Warning Message when Event is full – This option enables a warning message when the maximum event registration limit has been reached. This option is not related to the Wait Lists options.

Create Separate Invoices for Events Adjustments – (option only available for organizations whose Taxation Method is set to VAT) To comply with regulations related to VAT invoicing, enable this option so that new invoices are generated for financial adjustments made to event registrations. Once the original invoice is printed, then the line items, quantities, and amounts in that document will not change. With this option, every adjustment generates a new invoice document (credit note or positive adjustment), which uses the date of the adjustment, lists any credits or debits, and references the original invoice. These invoices can be viewed and printed from Events > Register a customer > Account Info tab.

Note: Note: Enabling this option affects new event registrations only; existing registrations retain their consolidated, single invoice.

Wait Lists

Enable Function Wait Lists – This option enables the wait list for all event functions that have an entry in the Maximum field.

Choose from Wait List for opening – When this option is enabled, you can select from the wait list which registrant you want to register for a function when it becomes available.

Activity Fields

These seven mapped fields can be defined to capture and store order information in the registrant's activity records.

Advanced

Opens the Events Advanced Features window.

To create a stored procedure

1. Go to Utilities > SQL Query to open the SQLQuery window.
2. Click New.
3. Enter the SQL command in the SQL Command Text field. For example, the following SQL command will create a stored procedure to generate unique, consistent event codes that include the year and event number count:

```
CREATE PROCEDURE Meeting_Calc @MeetingCounterName varchar (30) AS

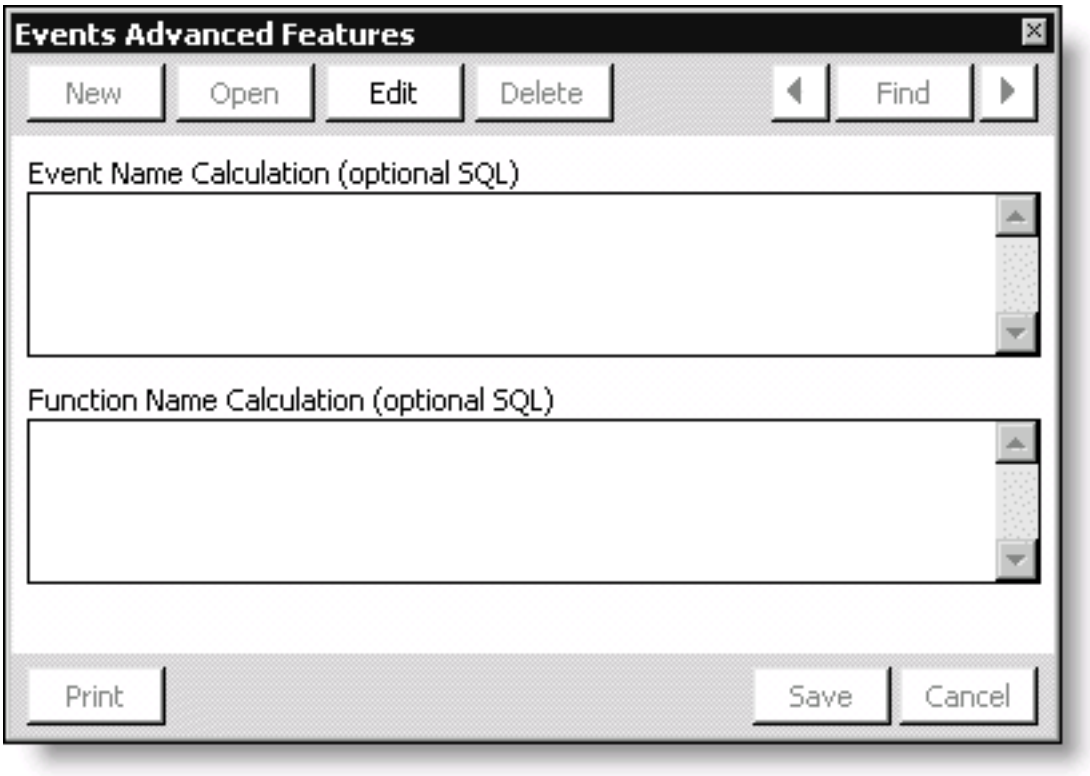
Declare @MeetingCounter int, @Count int
select @Count=Count(*) from Counter
where COUNTER_NAME=@MeetingCounterName
if @Count=0
begin
insert into Counter (COUNTER_NAME,LAST_VALUE)
values (@MeetingCounterName,1)
select @MeetingCounter=1
end
else
begin
update Counter set LAST_VALUE=LAST_VALUE+1
where COUNTER_NAME=@MeetingCounterName
select @MeetingCounter=LAST_VALUE from Counter
where COUNTER_NAME=@MeetingCounterName
end
select convert(varchar,datepart(yy,getdate()))+convert(varchar,@MeetingCounter)
```

4. Click Execute.

To set up event and function name calculations

1. From the Events Advanced Features window, click Edit.
2. Enter the SQL string that executes the stored procedure in the Event Name Calculation field or the Function Name Calculation field. For example, enter Meeting_Calc 'MeetingCounterName' in the Event Name Calculation field.
3. Click Save.

Events Advanced Features window



Event Name Calculation (optional SQL)

Specifies the name of the SQL string used to store the procedure that automatically assigns event codes.

Function Name Calculation (optional SQL)

Specifies the name of the SQL string used to store the procedure that automatically assigns function codes.

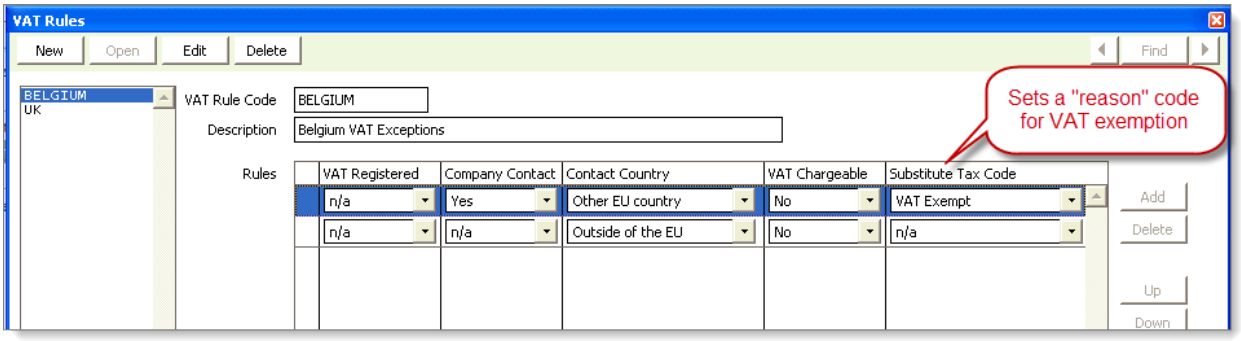
VAT Rules

(if licensed and enabled at the organization level) Opens the VAT Rules window, for optionally defining rule sets for “place of supply” requirements.

To define a set of VAT Rules

1. From the VAT Rules window, select New.
2. Create a VAT Rule Code.
3. Add a Description (optional) to explain the rule set and to display in the drop-down list during Event definition.
4. Change the n/a (not applicable) defaults to Yes and No as needed to define the test for evaluating the taxability. The n/a values behave as “either Yes or No” in the evaluation.
5. Click Add to activate rows for any additional rules you need. Note that Delete removes only the row that is currently highlighted.
6. Use Up and Down to arrange the rules in the order you want them to evaluate, from the top.
7. Select Save, then close the window.

VAT Rules window



- VAT Registered – whether the registrant has a VAT Registration number entered.

Required: Include both Name_Fin.VAT_REG_NUMBER and Name_Fin.USE_VAT_TAXATION in the User Defined Company Flow Down list.

- Company Contact – a registrant whose own record or whose parent record has a member type that is defined as a Company Record in the Member_Types table.
- Contact Country – refers to the country specified in the registrant's address (regardless of parent record) as determined using the VAT country codes you defined.
- Same as place of supplier – the registrant is in the same VAT country as the event's entity.
- Other EU country - the registrant is in a different EU country from the event's entity.
- Outside of the EU - the registrant is outside of the EU.
- VAT Chargeable – The Yes option exists for rare cases in which you need to insert a Yes rule to ensure a correct VAT charging situation isn't overridden by a more general No rule below it.
- Substitute Tax Code – This optional field is available only when VAT Chargeable is No. It lets you select one of your zero-rated VAT tax codes as the "reason" for why the situation is not taxable. Examples: the contact is VAT Exempt, is registered in a different EU country, or is outside of the EU altogether. These codes allow you to report and document tax exemptions as required.

Set up tables - Events

This area describes the following set up options for the Events area of the Settings Console:

- Registrant classes
- Event resources

Setting up registrant classes

The Registrant classes window lets you manage the categories for customers that you plan to register for an event.

You should create categories for all groups for which you need to do the following:

- Charge different fees
- Track
- Print badges
- Report on separately

A set of registrant classes can include member, non-member, exhibitor, speaker, staff, student, and volunteer. When you set up your categories, include all of the classes that you will need for tracking and differentiating the registrants attending the largest events that you will process through iMIS.

At its basic level, iMIS Events will categorize each event registrant into either the member (M) or non-member (NM) class because most organizations commonly assign registration fees at those levels. This determination is made based upon the registrant's customer type and whether or not the registrant's record is on file in the database.

> **Note:** Note: A non-member class will be assigned if the customer's status is set to suspended, inactive, or deleted (begins with S, I, or D).

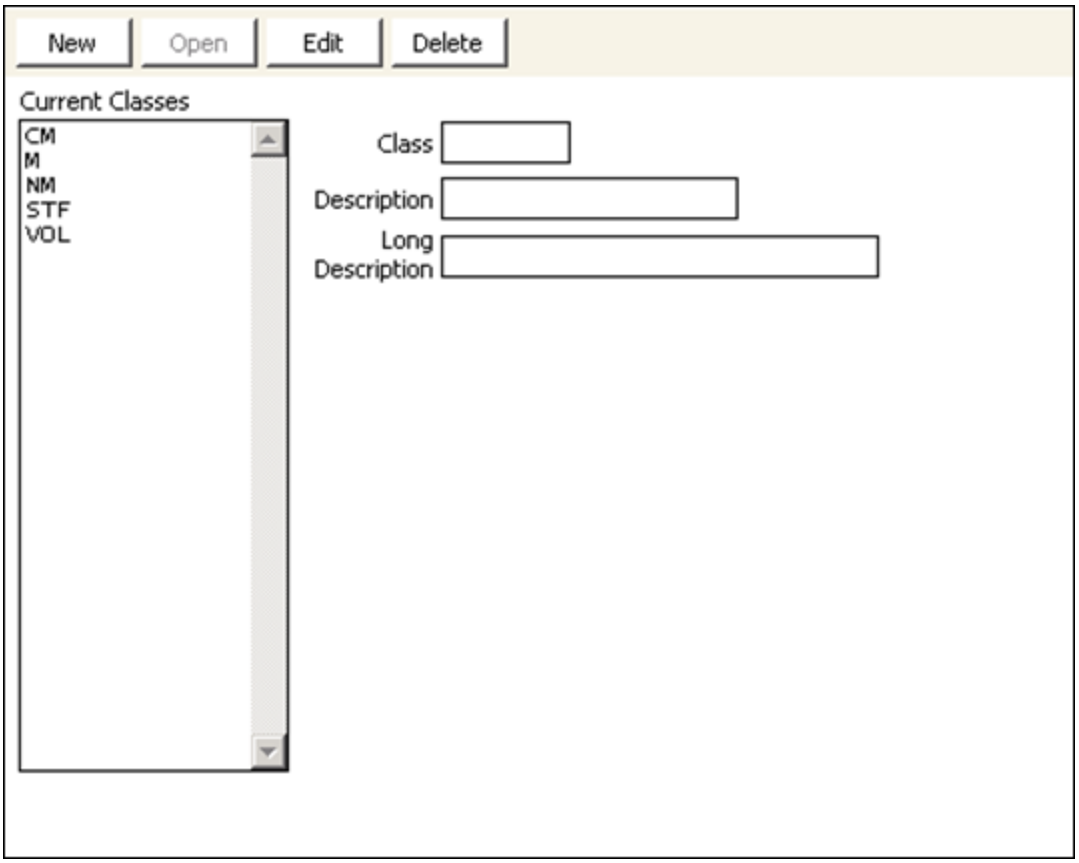
These are three possible scenarios for defining event classes:

- Let the registrant class default to the M = Member or NM = Non-member type in the Member Type table. Using this scenario, all registrants are either members or non-members based upon their customer record.
- Map customer types to registrant classes. Using this scenario, you may or may not want to map all customer types. For example, you may want to map only M = Member, NM = Non-member, and CM = Company Member.
- Define your own registrant classes without using customer types. Using this scenario, you must override the M = Member and/or NM = Non-member status during the event registration process by entering the appropriate registrant class.

To define event registration classes

1. From the Registrant classes window, click New.
2. Enter the Class, Description, and Long Description.
3. Click Save.

Registrant classes window



Settings > Events > Set up tables > Registrant classes

Current Classes

Lists all of the defined registrant classes.

Class

Specifies an abbreviation or alphanumeric code that represents a specific class or category of registrants.

Description

Specifies a description of the registrant class. The description entered displays in the Event Function Definition - Fees window.

Long Description

(optional) Specifies a detailed description of the registrant class.

Defining event resources

The Event resources window enables you to define all of the potential room/function resource groups and items.

Standard resources define the elements you need in preparing the physical setting for an event function:

- Facilities
- Tools
- Refreshments
- Furniture
- Supplies

On the Set up event resources window, you can outline major planning resource groups and detail items (indented from the group heading). After you establish the groups and detail items, including assigning codes, descriptions, and the order in which they appear on the planning report, those resource groups and items are available when you activate any room setup/planning sheet.

Keep in mind that you can define any number of resource groups and detail items so you can cover the anticipated needs of any particular event or function. Extra resources will not clutter your planning reports; while you may have defined many resource areas on the window, only the ones that you need and activate for a particular event function appear on its planning report.

The Set up event resources window has three purposes and enables you to do the following:

- Define a full range of event planning resources (both groups and detail items) to accommodate and plan for any size and type of event
- Establish a print/display order for resource groups and items on the planning report (and related windows)
- Dictate the type of information that you can enter for a resource item when you define a plan, such as quantity, time, and notes

  iMIS Events includes a sample set of resource entries. You are free to use and build on this skeleton sample or discard it. You can add, delete, and edit resource table records as needed.

  When you define a resource group (such as Audio-Visual), you name, describe, and set the order in which each group should appear on reports and windows. Similarly, if a resource group has multiple detail items such as projectors and microphones, assign a ranking for these items as well.

  Depending on the resources you select for a function, iMIS may prompt you for a quantity (of the resource needed) or a time (for which the resource is needed), or require you to verify that the resource applies. A large text area may appear for you to enter notes in the resource area. When you define a resource group or item, you also can specify which kinds of information it will accept.

  Sometimes a group may not have any detail items. Conversely, planning data may use only detail-level items (such as Audio-Visual: Microphone). In this case, the group entry provides a heading for its detail items included in the plan. When a group has no detail items, you enter planning information directly at the group level (as with Floor Plan and Notes above).

  The Set up event resources window enables you to define the options that appear in the function/room setup and planning facility. If your license includes iMIS Speaker Evaluation, this window also lets you define the event/speaker evaluation areas you want to track.

The Room Setup facility provides planning reports and inquiry tools to help you organize the setup requirements for any function. Within iMIS Events, the room setup categories and items that you can specify for any function are referred to as resources. You determine the type of resource groups and items to have available for a planning facility. Overall resource groups include Audio-Visual (A/V) Equipment and Food and Beverage; items within the A/V group include microphones and overhead projectors.

When you plan your available resource groups and items, list all of the items that you may want to include for complex events in a planning sheet that you can give to hotel or other setup personnel.

To define event resource groups

1. From the Event resources window, click New.
2. Enter a resource Type (press Ctrl+L to select a value).
3. Enter a Group code, for example, A/V.
4. Enter a Title for the group, for example, Audio Visual Requirements.
5. Enter the Group Sort Order, for example, 10.
6. (optional) Enable the Text option under Field 2 Usage.
7. Click Save.

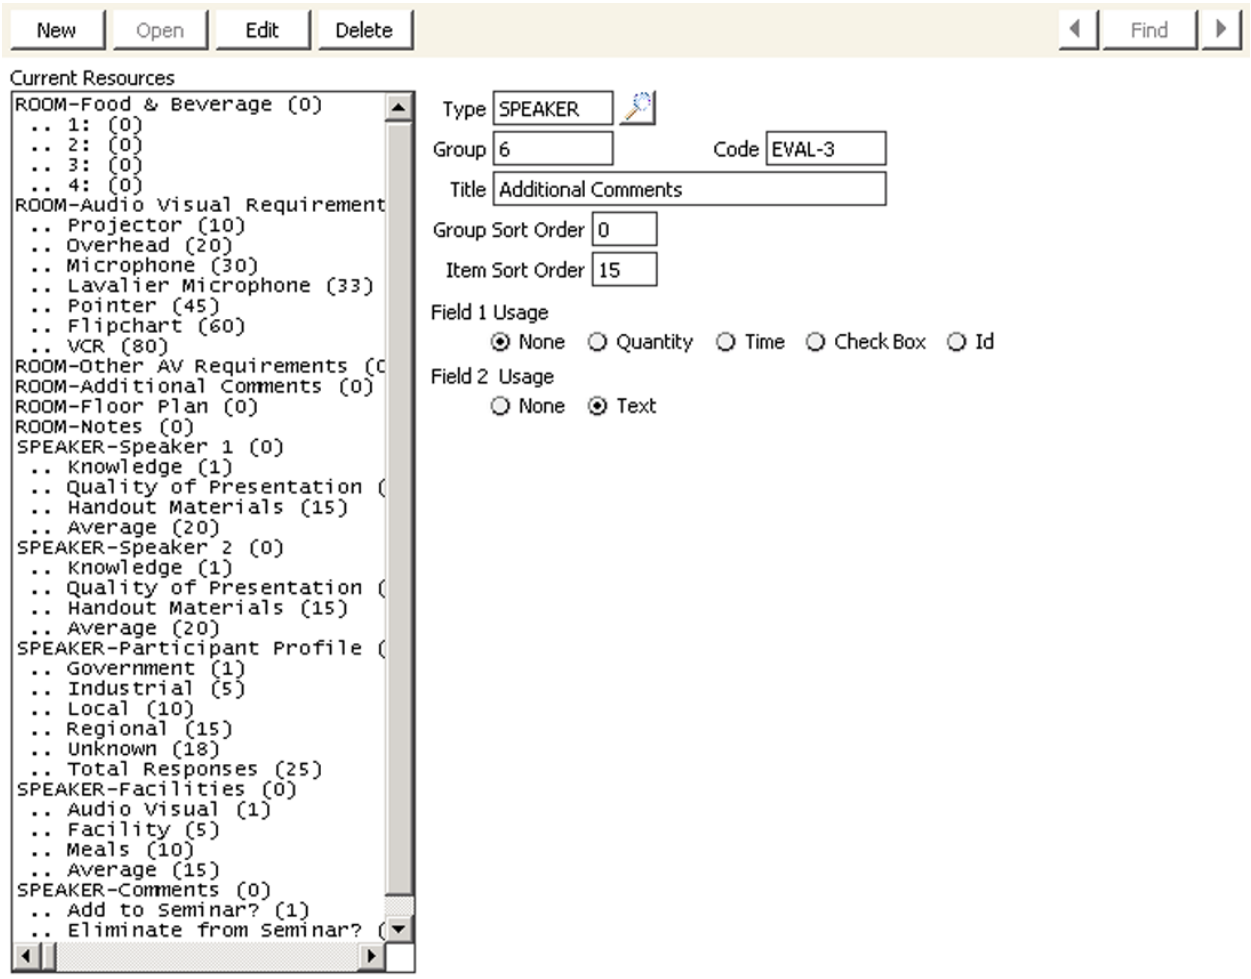
To define resources for a group

After defining an event resource group, you will need to define the resources for the group.

1. From the Set up event resources window, click New.
2. Enter a resource Type (press Ctrl+L to select a value).
3. Enter the Group code established in the above procedure, for example, A/V.
4. Enter a resource Code for the group.
5. Enter a Title for the resource code.

6. Enter the Group Sort Order defined in the above procedure.
7. Enter an Item Sort Order.
8. (optional) Enable a Field 1 Usage option.
9. (optional) Enable the Text option under Field 2 Usage.
10. Click Save.

Event resources window



Settings > Events > Set up tables > Event resources

Current Resources

Lists the defined current resources and their detail items. Resource groups, such as ROOM-Audio Visual Requirements and Room-Other AV Requirements, sort according to the order you define. Detailed group items, such as Projector, Overhead, and Microphone, are indented and sorted under their respective groups.

Type

Specifies the event resource type. The type defaults to ROOM for the Room Setup event resource. Standard Ctrl+L lookup is available, and the codes listed in the lookup window are hard coded in iMIS.

Group

Specifies a subgroup if you want the event resource divided into groups. For example, F&B and A/V are subgroups of ROOM.

Code

Specifies a unique code for a specific resource or item in a group. For example, PROJ and OVER are items in the A/V group.

Title

Specifies a description of the resource group or code, depending on which you are currently defining. For example, the title for A/V is Audio Visual Requirements; the title for PROJ is Projector. This title appears on planning reports.

Group Sort Order

Specifies the sort order of the resources on lists and reports. Enter a number indicating the sequence of this group in relation to other groups.

Item Sort Order

Specifies the sort order of the resources on lists and reports. Enter a number indicating the sequence of this item in relation to other items in the same group.

Field 1 Usage

Select one of these options for each type/group/code combination. Data is entered on the Event Function Definition - Plan window during the setup of the event:

- None (default) – When defining a group, enable this default option when the following options are not required.
- Quantity – Enable when you need to enter a quantity for a specific item, such as 2 microphones.
- Time – Enable to enter a specific time the item is required. For example, coffee will be needed at 7:00 am.
- Check Box – Enable if a specific item is required (the resource does not require quantity or time indications).
- Id – Enable when the Type is SPEAKER to link the speaker's customer record to ratings data. The ratings data will be transferred to an activity record at the close of the event.

Field 2 Usage

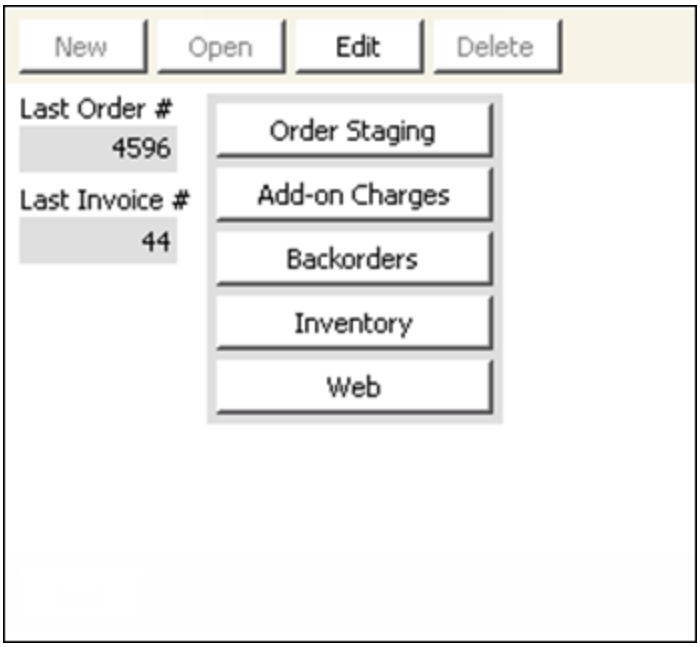
Select one of these options for each type/group/code combination. Data is entered on the Event Planning Definition - Plan window during the setup of the event:

- None (default) – Enable when text is not required.
- Text – Enable to enter text notes or comments for groups or specific items.

Commerce

Configuring commerce options

The iMIS Orders feature has its own system setup used for setting the defaults and parameters needed for managing and processing order transactions and product inventory. You set up your Orders module through the Configure commerce options window.



Advanced Accounting Console: Settings > Commerce > Configure commerce options

Last Order #

(read only) Displays the order number of the last order entered.

Last Invoice #

(read only) Displays the invoice number of the last order invoiced.

> **Note:** Note: Several configuration options on the Configure commerce options window are documented within the iMIS Desktop. The following links will display iMIS Desktop documentation. This saves you time and effort when configuring commerce options.

Order Staging

The Order Staging button opens the Order Status Defaults window used for defining the defaults for the system-defined order type categories.

Add-on Charges

The Add-on Charges button opens the Add-on Charges window used for enabling sales tax for freight and handling charges, for selecting a default shipping method, and for defining freight, handling, and restocking charges.

Backorders

The Backorders button opens the Backorder Processing window used for enabling and defining Automatic Backorder Processing.

Inventory

The Inventory button opens the Inventory System Setup window used for defining default inventory options and default accounts.

Web

The Web button opens the Web Order Options window used for defining options for sales transactions over the Web.

Defining warehouses

To define inventory parameters for multiple warehouses on the Warehouses window, the warehouses first must be defined on the Set up warehouses window (from Orders, select Set up warehouses). If the warehouses are not defined on the Set up warehouses window, you will not be able to define inventory parameters for them.

The Set up warehouses window is accessed from the Set up warehouses task-list item. The Set up warehouses item displays under the Orders task list only if the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (go to Settings > Commerce > Configure commerce options). Warehouse locations and descriptions defined on the Set up warehouses window are stored in the Product_Location table.

To define a warehouse

1. From the Warehouses window, click New.
2. Enter a warehouse Code.
3. Enter a Description for the warehouse.

4. Click Save.

To edit a warehouse description

1. From the Warehouses window, select a warehouse code from the list of Warehouses.
2. Click Edit.
3. Edit the warehouse's Description.
4. Click Save.

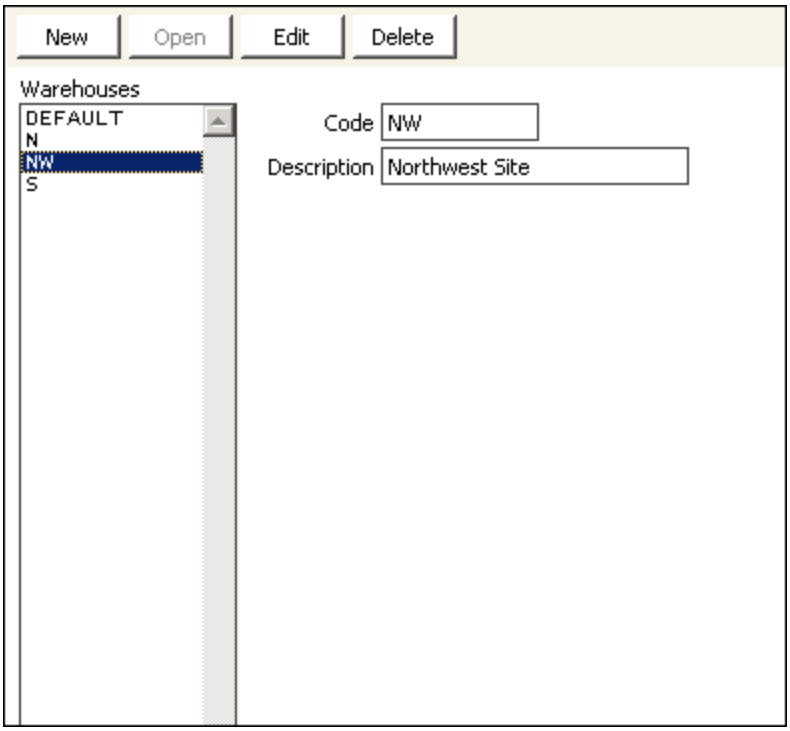
To delete a warehouse

You can delete a warehouse from the Set up warehouses window only if the following conditions are true:

- The warehouse is not the Default warehouse for any product.
- No orders are open for products stored in the warehouse.
- The warehouse is empty of all inventory.

1. From the Warehouses window, select the warehouse you want to delete from the list of Warehouses.
2. Click Delete.

Warehouses window



Advanced Accounting Console: Settings > Commerce > Warehouses

Warehouses

Lists all defined warehouse codes.

Code

(required) Enter a warehouse code or location. The Code field is disabled during Edit mode.

Description

Enter a warehouse description.

Set up tables – Commerce

This area describes the following set up options for the Commerce area of the Settings Console:

- Order types
- Product categories
- Tax codes
- Freight by weight
- Freight by total value
- Freight by total quantity
- Shipping zones

Defining order types

Order types determine the processing stages for orders, and you must define your order types before you can enter and process orders. Each time you enter a product order, you must select a defined order type. Order types that have been assigned orders cannot be deleted.

Order types fall into one of four system-defined order type categories: Standard, Debit Memo, Credit Memo, or Pro-Forma. You can define an unlimited number of order types for each order type category.

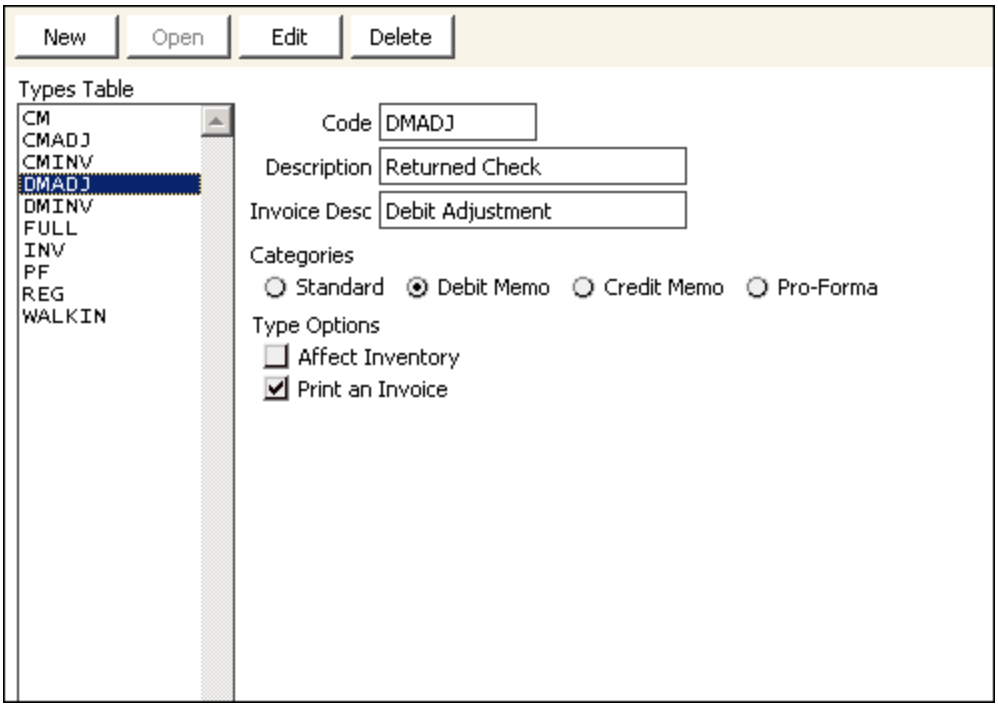
The category selected for an order type determines the available Type Options, or order processing stages, for the order type. Of the available Type Options, you select which are required, and you determine if an order type affects inventory. Order types are defined on the Order types window.

To define order types

1. From the Order types window, click New.
2. Enter a Code for the order type.
3. Enter a Description for the order type.
4. Enter a description of the invoice in the Invoice Desc field.
5. Select a category for the order type from the list of Categories.

6. Enable the applicable Type Options.
7. Click Save.

Order types window



Advanced Accounting Console: Settings > Commerce > Set up tables > Order types

Types Table

This list displays the defined order types.

Code

Enter the code for an order type.

Description

Enter a description of the order type.

Invoice Desc

Enter a description of the invoice generated for the order type. The description entered in the Invoice Desc field prints on invoices.

Categories

Order types are classified according to one of the following four system-defined categories. You must enable one of the categories for each order type you define. The category selected determines which Type Options display when defining an order type.

- Standard – Enable to classify an order type as a standard order.
- Debit Memo – Enable to classify an order type as a debit memo order.
- Credit Memo – Enable to classify an order type as a credit memo order.
- Pro-Forma – Enable to classify an order type as a pro forma order. Create pro forma order types only after defining standard order types. This allows you to specify a valid standard order type in the Convert to Order Type field on the Order Status Defaults window (go to Settings > Commerce > Configure commerce options and click Order Staging) for converting pro-forma orders to standard orders.

Type Options

These options allow you to define the order processing stages for an order type. An order type's category determines the Type Options that display on the Set up order types window:

- Affect Inventory – Enable if you want the order type to affect product inventory. For example, a standard order would reduce a product's physical inventory, and a credit memo order would increase a product's physical inventory if the Affect Inventory option were enabled.
- Print an Invoice – Enable if you want the order type to generate a printed invoice for invoiced orders.
- Pick List – (Displays for standard orders only) Enable to process the order type through the Print pick list order processing stage. A Pick List will print for the order type.
- Shipping Paper – (Displays for standard orders only) Enable to process the order type through the Print shipping papers order processing stage. Shipping papers (Packing Slips) will print for the order type.

- Print a Quote – (Displays for pro forma orders only) Enable to process the order type through the Print quotes order processing stage. An order Quotation will print for the order type.
- Convert to Order Type – (Displays for pro forma orders only) Enter the default order type for converted pro forma orders.

Defining product categories

Product categories allow you to classify your products, and you must define your product categories before defining your individual products. Each time you define a product, you must assign it to one of your product categories.

Product categories are used to assign default accounts and to enable category options for groups of products.

To define product categories

1. From the Product categories window, click New.
2. Enter a code for the product category in the Category field.
3. Enter a Description of the product category.
4. Enable the applicable Category Options.
5. Enter the User Defined Field Captions that will display and generate text boxes on the Product Detail window.
6. Enter any applicable Default Accounts.
7. Click Save.

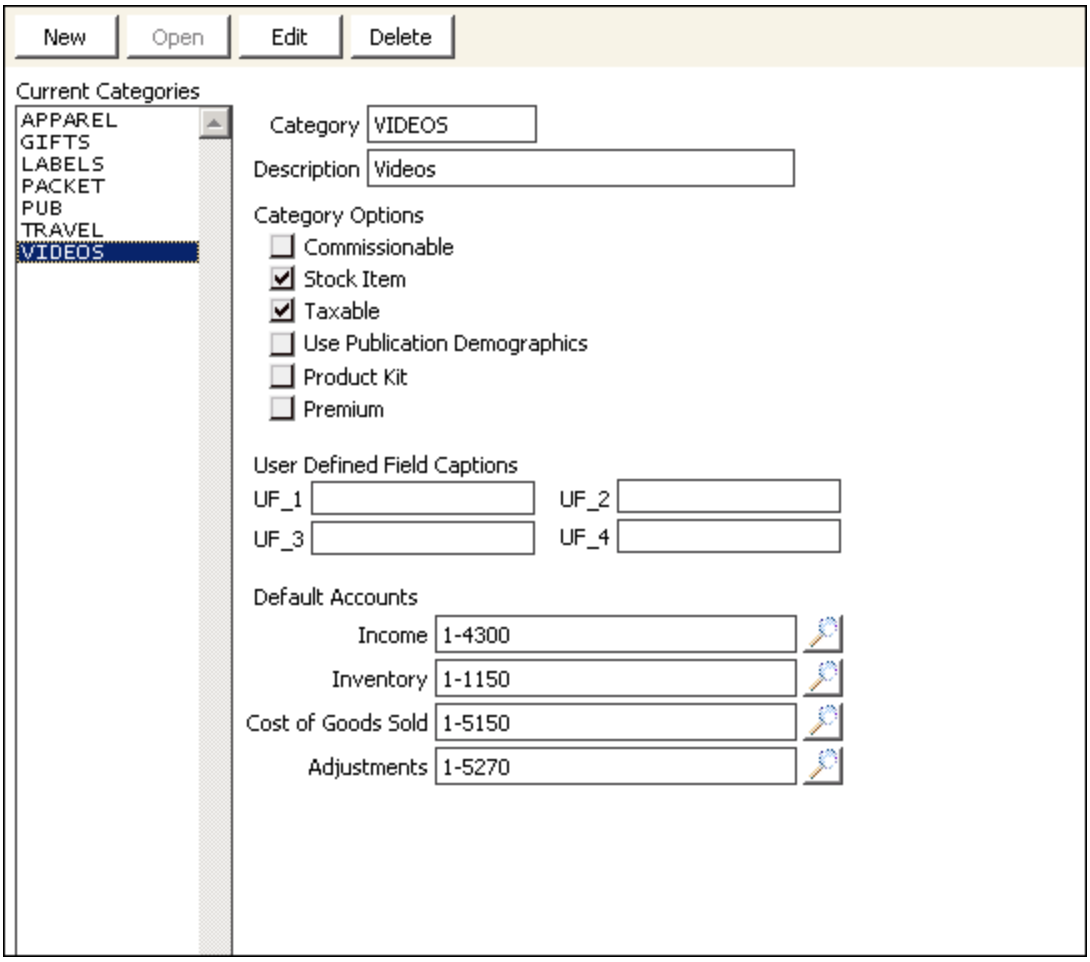
To define product categories for kits

If you are licensed for product kitting, iMIS Orders allows you to sell product kits. A kit consists of multiple products sold as a single unit for a single price.

If you plan to sell product kits, you can define product categories that set default options on the Manage products window, such as Commissionable, Taxable, and Product Kit. After defining your product kit categories, you can define your product kits:

1. From the Product categories window, click New.
2. Enter a code for the product category in the Category field.
3. Enter a Description of the product category.
4. Enable the applicable Category Options.
5. Enable the Product Kit option.
6. Enter any applicable Default Accounts.
7. Click Save.

Product categories window



Advanced Accounting Console: Settings > Commerce > Set up tables > Product categories

Current Categories

This list displays the defined product categories.

Category

Enter a code for the product category.

Description

Enter a description of the product category.

Category Options

Enable the options that you want enabled by default when defining new products on the Manage products window (go to Home > Commerce > Enter and edit products). You can override all settings at the product level.

- Commissionable – Enable if you want the sale of a product within a category to generate a commission. The Comm % field displays when you enable the Commissionable option.
- Comm % – (Displays only when the Commissionable option is enabled) Enter the default commission rate generated by the sale of a product in this category. For example, a 5.00 % commission rate would generate a $5.00 commission on a $100.00 sale. Make sure to enter the rate as a percentage and not as a decimal.
- Stock Item – Enable to indicate that products within this category have physical inventory. You can track inventory only for items stocked in inventory.
- Taxable – Enable to indicate that the product category is taxable.
- Use Publication Demographics – Enable to define publication demographic information for a category's products. If the option is enabled, the Publication button displays and enables on the Manage products window for products belonging to that category. Clicking the Publication button on the Manage products window opens the Publication Demographics window used for defining demographic information for publications.
- Product Kit – Enable to indicate that the product category consists of product kits.

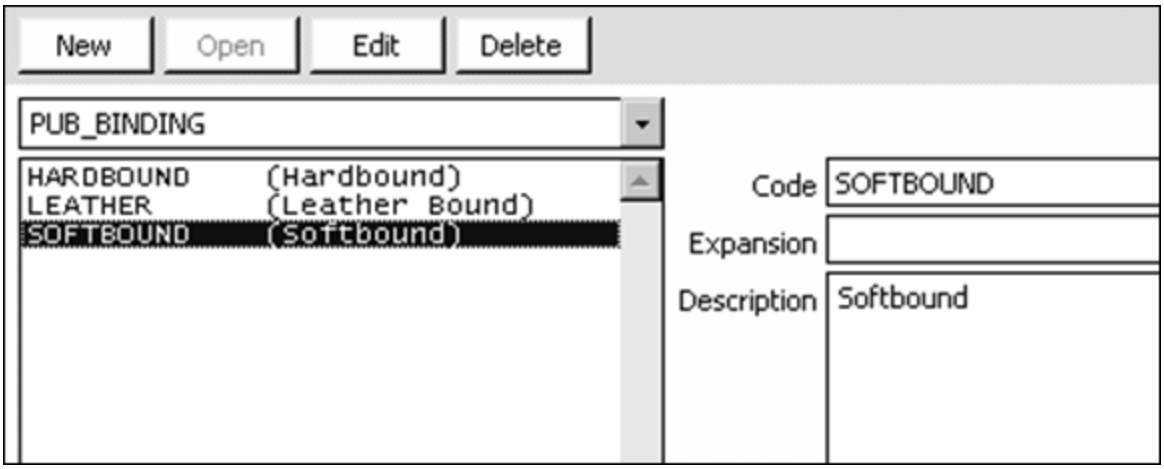
User Defined Field Captions

(optional) Enter captions in the UF_1, UF_2, UF_3, and UF_4 fields that will display on the Product Detail window. Each caption that you define generates a text box on the Product Detail window for products belonging to that category. You can define the same or different captions for any product category.

When entering or editing an order, some products may require additional order information before an order can be shipped. The user-defined fields on the Product Detail window allow you to record this additional information.

You also have the ability to define general lookup/validation tables for each of the user-defined fields, and any predefined data can be accessed by selecting each field's Find icon on the Product Detail window. Regardless of whether general lookup/validation tables have been set up, you always have the ability to enter any necessary order information.

General lookup/validation tables are set up for product category user-defined fields by combining the product category codes and field labels defined on the Set up product categories window. When setting up a table for a user-defined field, the product category code and field label must be separated by an underscore. For example, if the product category code is PUB and the field label is Binding, the general lookup/validation table for the user-defined field would be PUB_BINDING as displayed in the following example:



Example of a general lookup/validation table set up for a user-defined field

Default Accounts

These accounts allow you to define the default accounts for products within this category. You can override the accounts at the product level on the Accounting window and at the warehouse level on the Warehouses window if Multi-Warehouses is enabled.

When defining product-level accounts, the most specific accounting information takes precedence. For example, iMIS first looks for warehouse level accounts. iMIS then looks for product level accounts. If you have not defined product-level accounts, iMIS uses the default product category accounts. If you have not defined default product category

accounts, iMIS uses the accounts defined on the Inventory System Setup window (from Orders, select Set up module, and click Inventory).

- Income – Enter a product category's default income account number.
- Inventory – Enter a product category's default inventory account number.
- Cost of Goods Sold – Enter a product category's default cost of goods sold account number.
- Adjustments – Enter a product category's default adjustments account number.

Web Options

Opens the Web Options window for the selected product category. The Web Options window is used for enabling products either for sale or for viewing on the Web.

You can enable product categories to be viewed or sold on the web using the Web Options window. Individual products can also be enabled for the web (see "Enabling products for the web").

To enable a product category for the Public view

1. Go to Settings > Commerce > Set up tables > Product categories.
2. Select a product category from the list of Current Categories.
3. Click Edit.
4. Click Web Options to open the Web Options window.
5. Enable the product for the Web:

- Enable the View on Web option if you want the product category to be viewed, but not sold, on the Web.
- Enable the Sell on Web option if you want the product category to be viewed and sold on the Web.

6. Enter the Product Info Hyperlink.
7. Select the Enable Info URL option.

8. Enter the Product Image Hyperlink.
9. Select the Enable Image URL option.
10. Click Save.

Web Options window for product categories

Options

The viewing option selected at the product category level overrides the viewing option selected at the product level for web products.

- Not on Web – Prevents the category from being viewed or sold on the Web.
- View on Web – Allows the category to be viewed, but not sold, on the Web.
- Sell on Web – Allows the category to be viewed and sold on the Web.

Orders Contact

Specifies the contact to notify when purchases from this category are made.

> **Note:** Note: You can specify a contact to notify about web purchases in the E-mail address to notify when a product is sold field on the Organization Configuration window (System Setup > Set up web components > Organization Configuration).

Product Info Hyperlink

Enter a URL to information about the product category. Click the web icon to view the product category's information on the web.

Enable Info URL

Enable to enable the hyperlink to the product category's information.

Product Image Hyperlink

Enter a URL to an image representing the product category. Click the web icon to view the product category image on the web.

Enable Image URL

Enable to enable the hyperlink to the product category's image.

Defining tax codes

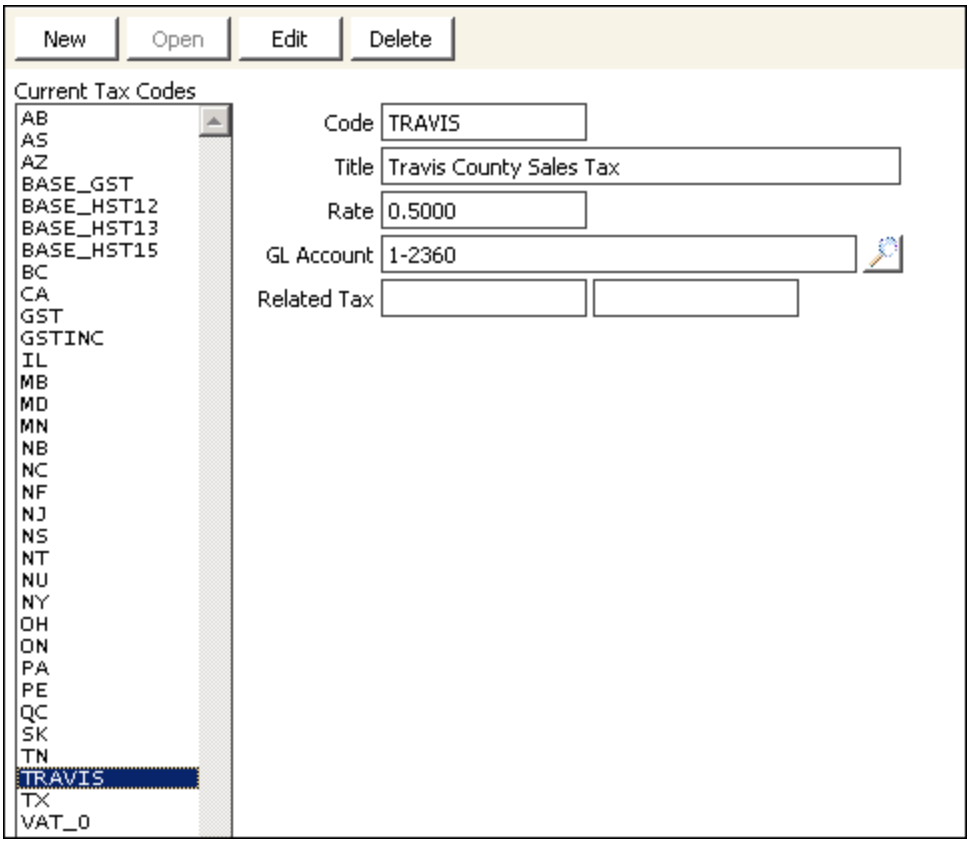
You must define the appropriate tax codes before you can enter orders with applicable sales taxes. The Tax Codes window is used for defining tax codes.

To define tax codes

1. From the Tax codes window, click New.
2. Enter a Code for the tax.
3. Enter a Title for the tax code.
4. Enter the percentage Rate you are assigning to the tax code.
5. (optional) Enter the GL Account number.

6. (optional) Enter any applicable Related Tax.
7. Click Save.

Tax codes window



Advanced Accounting Console: Settings > Commerce > Set up tables > Tax codes

Current Tax Codes

Lists defined tax codes.

Code

Enter a code for the tax.

When defining state or province tax codes, use the standard two-character postal abbreviation for the state or province. This allows the Tax Auth field on the Enter and edit orders window to default to the customer's state tax code.

Title

Enter a title for the tax code.

Rate

Enter the percentage rate assigned to the tax code. Make sure to enter the rate as a percentage and not as a decimal. For example, enter 6.0 and not .06 for a tax rate of 6%.

GL Account

Enter the general ledger account number assigned to the tax code, or use the lookup icon to select a value.

If you leave the G/L Account field blank, iMIS records the value entered in the Sales Tax field on the AR/Cash Default Accounts window (go to Finance > Options > Configure accounting options, and click Default Accounts).

Related Tax

These two fields allow you to enter multiple tax codes. Enter the codes for any other taxes you want to relate to the tax defined in the Code field.

Setting up freight by weight

When calculating freight charges by weight, an order's shipping method, shipping postal code, and weight are factors in calculating freight charges.

Before an order's freight charges can be calculated by weight automatically, you must perform the following actions:

- Define shipping methods
- Define shipping zones
- Define weight tables
- Enable the Automatic Calculation of Freight Charge option
- Enable the Freight by Weight option

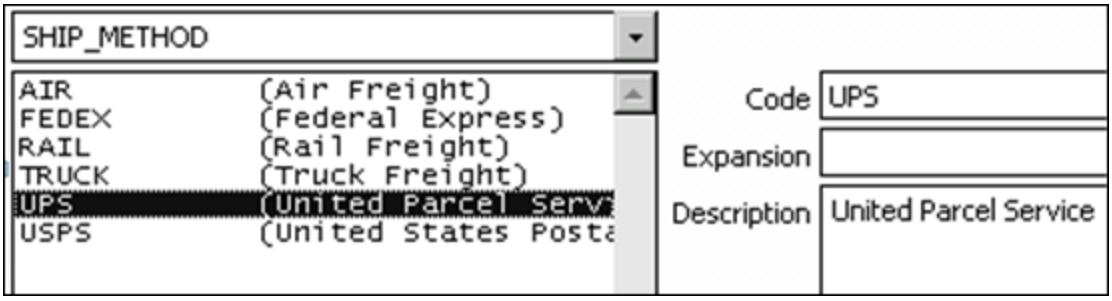
Note: The only shipping calculation supported in the iMIS Public View is Freight by Weight.

Defining shipping methods

You can define shipping methods for any form of transport or for any specific carrier that you use to ship your orders. Examples of shipping methods include Truck Freight, Air Freight, and Rail Freight as well as conventional carriers such as UPS, FEDEX, and USPS.

To define shipping methods, you first must create the SHIP_METHOD general look-up/validation table (go to Settings > Membership > Set up tables > Set up look-up/validation tables). After creating the SHIP_METHOD table, you can create shipping zone and freight tables.

See "About assigning default shipping methods during order entry" for more.



Example of the SHIP_METHOD general lookup/validation table

Defining weight tables

After defining your shipping zone tables, you can define weight tables on the Set up freight by weight window for your user-defined shipping zones. Weight tables allow you to calculate shipping rates for individual shipping methods, and rates are calculated according to an order's shipping weight and shipping zone. When defining rates, high value determines the weight break for each rate.

After defining your weight tables, make sure you enable the Automatic Calculation of Freight Charge and Freight by Weight options on the Add-on Charges window (go to Settings > Commerce > Configure commerce options, and click Add-on Charges). When you enable these options, freight charges are automatically calculated by order weight when you enter an order.

Remember that you always can override automatic freight charges on the Order Details tab of the Enter and edit orders window if necessary. See Enter and edit orders window - Order Details tab for more.

To define weight tables

1. From the Freight by weight window:

- Click New to create a new weight table.
- Select an existing Shipping Method and click Edit to modify the table.
- Select an existing Shipping Method and click Delete to remove the table.

2. Specify the weight table information:

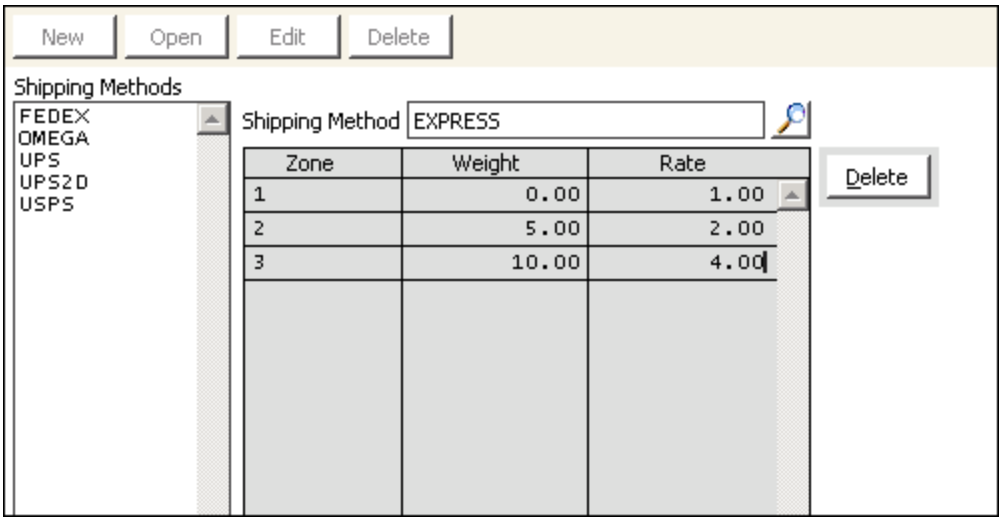
- To create new rows in the table for zone-weight-rate sets, position your cursor in the Rate cell of the last row in the table and press Tab.
- To delete rows from the table, position your cursor in the Rate cell of the row to be deleted and click Delete at the right of the table.

  Be sure to define at least one entry for every zone designator that is used in the various shipping zone tables that use this shipping method. (These designators are used in the Default Zone and Table fields of the Zones window.)

  For example, assume you have defined a UPS zone table and a UPS-USA zone table, and you have used zone designators A, 1, 2, and 3 in those two UPS-based zone tables. In this example, you would define weight-rate sets for those four zone designators.

3. Click Save.

Freight by weight window



Advanced Accounting Console: Settings > Commerce > Set up tables > Freight by weight

Shipping Methods

Displays the shipping methods for which you have defined weight tables.

Shipping Method

Enter the shipping method for which you are defining a weight table. Select the Find icon to look up a shipping method.

Shipping methods are defined on the SHIP_METHOD general lookup/validation table (go to
Settings > Membership > Set up tables > Lookup/validation tables).

Zone

Enter the designation for a shipping zone. The zone designation follows the postal code as defined in the Default Zone field and the Table list on the Set up shipping zones window (go to Settings > Commerce > Set up tables > Shipping zones).

Weight

Enter the weight break for a shipping zone, which is the maximum weight.

For example, in the previous image of the Set up freight by weight window, any weight greater than 1.00 and less than or equal to 1.50 will be charged $2.50 for Zone 1. Any weight greater than 1.50 and less than or equal to 2.00 will be charged $2.75 for Zone 1.

Rate

Enter the freight rate for orders of the defined weight that are shipping to the specified zone.

Setting up freight by total value

When calculating freight charges by total value, iMIS uses an order's total pre-tax value excluding handling and restocking charges. To calculate freight charges by total order value, you must define freight rates for ranges of order values. Value ranges are defined on the Set up freight by total value window.

Before freight charges by total order value can be automatically calculated, you must perform the following actions:

- Set up value range tables
- Enable the Automatic Calculation of Freight Charge option
- Enable the Freight by Total Value Ordered option

To define a single value range

1. Enter the low value in the Total Value Range field. Low values must be greater than $0.00. $0.00 cannot be the beginning range.
2. Enter the Rate for the order value range.
3. Enter the low value of the succeeding range in the Total Value Range field.

For example, define rates for the following three order value ranges:

- Orders with a value greater than $0.00 and less than $10.00 will cost $2.50 to ship.
- Orders valued between $10.00 and less than $25.00 will cost $5.00 to ship.
- Orders valued above $25.00 will cost $7.50 to ship.

To set up value ranges for required rates

1. Define the first value range:

- Enter 0.01 in the Total Value Range field for the first range's low value.
- Enter 2.50 for the Rate of the first range.
- Press Tab.

2. Define the second value range:

- Enter 10.00 in the Total Value Range field for the second range's low value. By entering 10 for the second range's low value, the first range's high value will equal 9.99 when the entire table is completed and saved.
- Enter 5.00 for the Rate of the second range.
- Press Tab.

3. Define the third value range:

- Enter 25.00 in the Total Value Range field for the third range's low value. By entering 25.00 for the third range's low value, the second range's high value will equal 24.99 when the entire table is completed and saved.
- Enter 7.50 for the Rate of the third range.

4. Click Save. The Total Value Range field will calculate and display the low and high values for each range.

To define a value range

1. From the Freight by total value window, click Edit.
2. Enter the first range's low value in the Total Value Range field. Low values must be greater than $0.00. $0.00 cannot be the beginning range.
3. Enter a Rate for the first value range, and press Tab.
4. Enter a value in the Total Value Range field. The value entered determines the following:

- The high value of the preceding range.
- The low value of the current range you are defining.

5. (optional) Repeat this process for each additional value range you are defining.
6. Click Save.

To add a value range

When adding value ranges, you can add additional, expanded ranges as well as ranges that fall between other ranges.

1. From the Freight by total value window, click Edit.
2. Place your cursor on the Rate of the last value range, and press Tab to display a new line (0.00).
3. Define the new range:

- Enter the new range's low value in the Total Value Range field.
- Enter a Rate for the new range.

4. Click Save. When you save the new range, it will be inserted in the table, and the high value will be calculated.

To edit or delete a value range

1. From the Freight by total value window, click Edit.
2. Select the total value range you want to edit. You only can edit the low value of a range and the Rate. To delete a total value range:

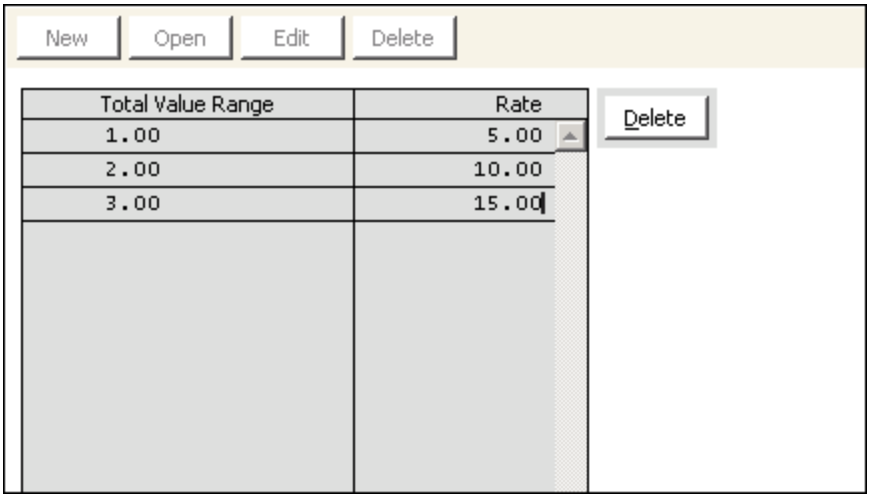
- Select the row of the range you want to delete.
- Click the Delete button to the right of the table.

3. Click Save. The ranges are recalculated.

Calculating order values that fall outside defined ranges

If an order's pre-tax value exceeds the highest defined value range, the order's freight charges will be calculated at the rate defined for the highest value range. If an order's pre-tax value is below the lowest defined value range, no freight charges will be calculated, and no freight will be charged.

Freight by total value window



Advanced Accounting Console: Settings > Commerce > Set up tables > Freight by total value

Total Value Range

Enter the low value of a range. Each range's high value is determined by each succeeding range's low value; a range's high value equals the low value of the succeeding range minus .01.

Rate

Enter a freight rate for a value range.

Defining value ranges

Freight rates can be defined for any range of order values, and no limit exists to the number of value ranges and rates that can be defined. When defining a rate's value range, only the low value of the range is entered in the Total Value Range field. The high value of the range is not entered. It is calculated upon completing and saving the table.

When defining a value range's low value, the low value must be greater than $0.00, such as $0.01; $0.00 cannot be the beginning range. In addition, if your beginning range's lowest value is $5.00 for example, then freight will not be calculated for any orders valued less than $5.00.

Each range's high value is determined by each succeeding range's low value; a range's high value equals the low value of the succeeding range minus .01.

Setting up freight by total quantity

When calculating freight charges by quantity, the total product quantity ordered determines an order's freight charges. To calculate freight rates by order quantity, you must define rates for ranges of product quantities. Quantity ranges are defined on the Set up freight by total quantity window.

Before freight charges can be automatically calculated by order quantity, you must perform the following actions:

- Set up quantity range tables
- Enable the Automatic Calculation of Freight Charge option
- Enable the Freight by Total Quantity Ordered option

To define a quantity range

1. From the Freight by total quantity window, click Edit.
2. Enter the first range's minimum quantity in the Total Quantity Range field. Minimum quantities must be greater than 0.00 (0.00 cannot be the beginning range).
3. Enter a Rate for the first quantity range, and press Tab.
4. Enter a quantity in the Total Quantity Range field. The quantity entered determines the following:

- The maximum quantity of the preceding range
- The minimum quantity of the current range you are defining

5. (optional) Repeat this process for each additional quantity range you are defining.
6. Click Save.

To add a quantity range

When adding quantity ranges, you can add additional, expanded ranges as well as ranges that fall between other ranges.

1. From the Freight by total quantity window, click Edit.
2. Place your cursor on the Rate of the last quantity range, and press Tab to display a new line (0.00).
3. Define the new range:

- Enter the new range's low value in the Total Quantity Range field.
- Enter a Rate for the new range.

4. Click Save. The new range is inserted in the table, and the high value is calculated.

To edit or delete a quantity range

1. From the Freight by total quantity window, click Edit.
2. Select the total quantity range you want to edit. You only can edit the low value of a range and the Rate. To delete a total quantity range:

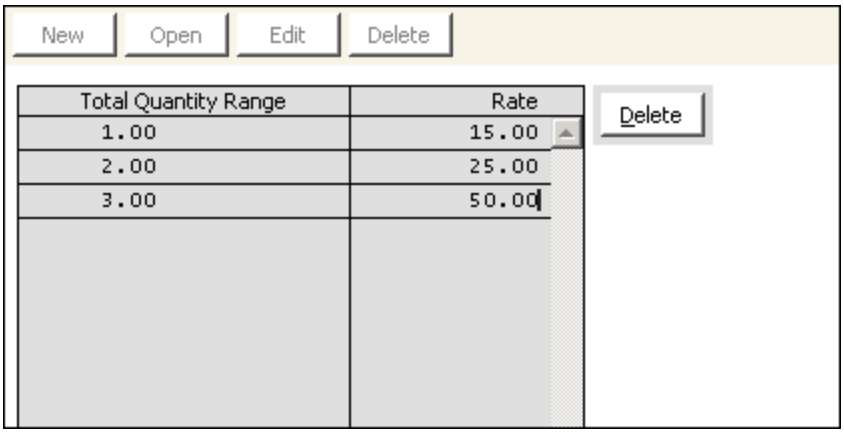
- Select the row of the range you want to delete.
- Click the Delete button to the right of the table.

3. Click Save. The ranges are recalculated.

Calculating freight charges that fall outside defined ranges

If an order's product quantity exceeds the maximum defined quantity, the order's freight charges will be calculated at the rate defined for the maximum quantity. If an order's product quantity is less than the minimum defined quantity, no freight charges will be calculated, and no freight will be charged.

Set up freight by total quantity window



Advanced Accounting Console: Settings > Commerce > Set up tables > Freight by total quantity

Total Quantity Range

Enter the minimum quantity of a range. Each range's maximum quantity is determined by each succeeding range's minimum quantity. A range's maximum quantity equals the minimum quantity of the succeeding range minus .01.

Rate

Enter a freight rate for a quantity range.

Defining quantity ranges

Freight rates can be defined for any range of product quantities, and no limit exists to the number of quantity ranges and rates that can be defined. When defining a rate's quantity range, only the minimum quantity of the range is entered in the Total Quantity Range field. The maximum quantity of the range is not entered; it is calculated upon completing and saving the table.

When defining a quantity range's minimum quantity, the minimum quantity must be greater than 0.00, such as 0.01 (0.00 cannot be the beginning range). In addition, if your beginning range's minimum quantity is 5.00 for example, then freight will not be calculated for any orders for quantities of less than 5.00.

Each range's maximum quantity is determined by each succeeding range's minimum quantity; a range's maximum quantity equals the minimum quantity of the succeeding range minus .01

The Total Quantity Range field will populate with the maximum quantity for each range.

Defining shipping zones

After creating the SHIP_METHOD general lookup/validation table and defining your shipping methods, you can set up your shipping zone tables. Zone tables are based upon shipping method, country (if applicable), and zip or postal codes. You can set up zone tables both for multiple shipping methods and for countries that use these shipping methods.

To define a default zone table for a shipping method, do not designate a country for a shipping method when setting up shipping zones. Orders that do not list a country will use the default zone table for a given shipping method.

Shipping zones are defined according to postal code. Depending on your organization's needs, you can define single postal codes as shipping zones or divide groups of postal codes into shipping zones.

Shipping zones use the first three characters of a postal code, and the table format for defining zones is XXX,Z where XXX represents the first three characters of a postal code, and Z represents the zone designation defined by the user. You also can enter a postal code in the format XXX-XXX,Z where XXX represents the first three characters of the beginning postal code, XXX represents the first three characters of the ending postal code, and Z represents the zone designation. These zone designations are used when setting up weight tables on the Set up freight by weight window.

For example, if you define a shipping zone for a single postal code, such as 75208, you would enter 752 followed by a comma. You then would enter either a numeric or alphabetic value for the zone designation, such as a 1. The shipping zone would display as 752,1. A shipping zone defined for a group of postal codes could be entered as 900-999,2.

As long as you follow the correct table format, you can define as many zone codes as necessary. You must define shipping zone tables before defining freight tables.

To define shipping zone tables

1. From the Shipping zones window:

- Click New to create a new zone table.
- Select an existing Zone Table and click Edit to modify the table.
- Select an existing Zone Table and click Delete to remove the table.

2. Specify the shipping zone information.
3. Click Save.

Verifying shipping zones for orders

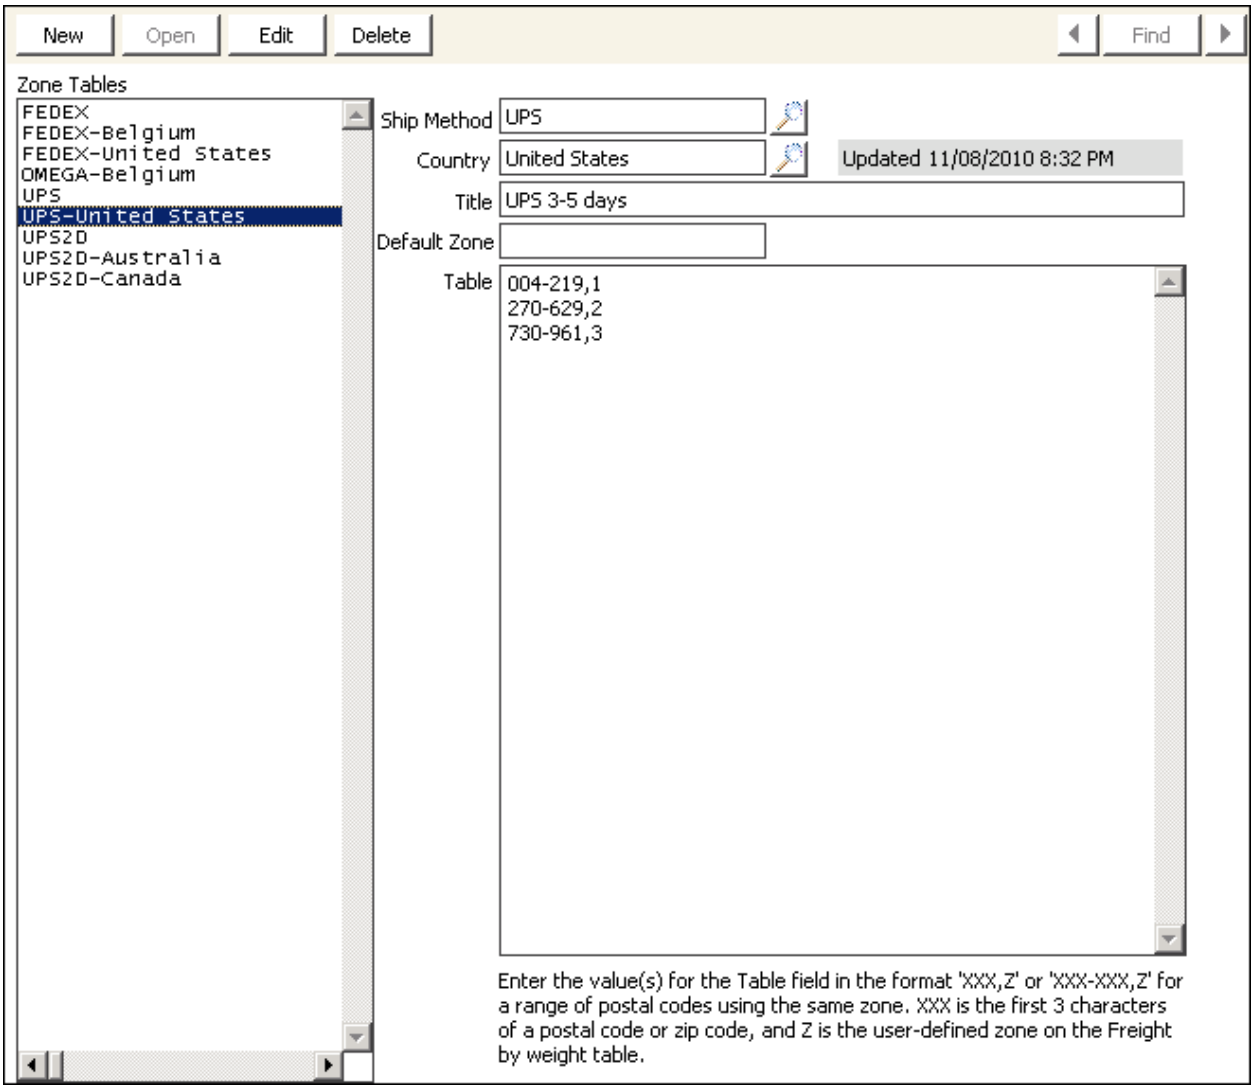
When entering orders, the following rules determine which zone table is used:

- A country is defined for the Ship to address – The zone table used is the one for which the Ship Method and Country combination matches an order's Ship to address Country and Shipping Method.
- A country is not defined for the Ship to address – The zone table used is the one for which the Ship Method matches an order's Shipping Method. The zone table has a blank Country field.

After the correct zone table has been determined, the following rules determine whether the Default Zone defined in that zone table is used:

- The Ship to address:
- Does not specify a postal code, or
- Specifies a postal code that does not match any of the entries in the Table list for the zone table.
- The Ship to address of an order specifies a postal code, but the Table list for the zone table does not contain any entries.

Shipping zones window



Advanced Accounting Console: Settings > Commerce > Set up tables > Shipping zones

Zone Tables

Lists the defined shipping zone tables. Zone table names are concatenations of the Ship Method and Country fields.

Ship Method

Specifies the shipping method for the selected zone table. Select the lookup icon to look up a shipping method. Shipping methods are defined on the SHIP_METHOD general

lookup/validation table (go to Settings > Membership > Set up tables > Set up look-up/validation tables).

Country

(optional) Specifies the country for the selected zone table. Select the lookup icon to look up a country. Countries are defined on the Set up country names window (go to Settings > Membership > Set up tables > Set up country names).

If you are updating an existing zone table and the Country field is not populated, you can enter a country for the zone table. However, once the Country field is populated and saved, it no longer can be edited.

To define a default zone table for a shipping method, leave the Country field blank. Default zone tables are used for orders that do not list a country.

Updated

(read only) Displays the last date and time that the selected zone table was modified.

Title

Specifies a descriptive title for the selected zone table.

Default Zone

(optional) Specifies the default shipping zone designation for the selected zone table, which must have a matching value in the Zone field of the Set up freight by weight window.

This default zone is used only when an order's Ship to address specifies a country for which a zone table exists and when any of the following conditions exists:

- The Ship to address:
- Does not specify a postal code.
- Specifies a postal code that does not match any of the entries in the Table list for the zone table.

- The Ship to address of an order specifies a postal code, but the Table list for the zone table does not contain any entries.

  For example, if a UPS zone table and a UPS-USA zone table both exist, the UPS zone table is used if an order does not specify a country name in the Ship to address. However, if USA is specified in the order's Ship to address, the UPS-USA zone table is used instead. If the Ship to address in this second case does not specify a postal code, or it specifies a postal code that isn't listed in the UPS-USA zone table, then the specified Default Zone designation would be used to determine the appropriate freight charges by looking for a matching value from Zone field of the Set up freight by weight window.

  Table

  Specifies the shipping zones for the table. The table format for defining zones is XXX,Z or XXX-XXX,Z where XXX is the first three characters of a postal code, and Z is a shipping zone designation specified in the Zone field of the Freight by weight table.

  Table format

  (read only) Displays the correct format for defining shipping zones in the Table list.

Fundraising

Configuring fundraising options

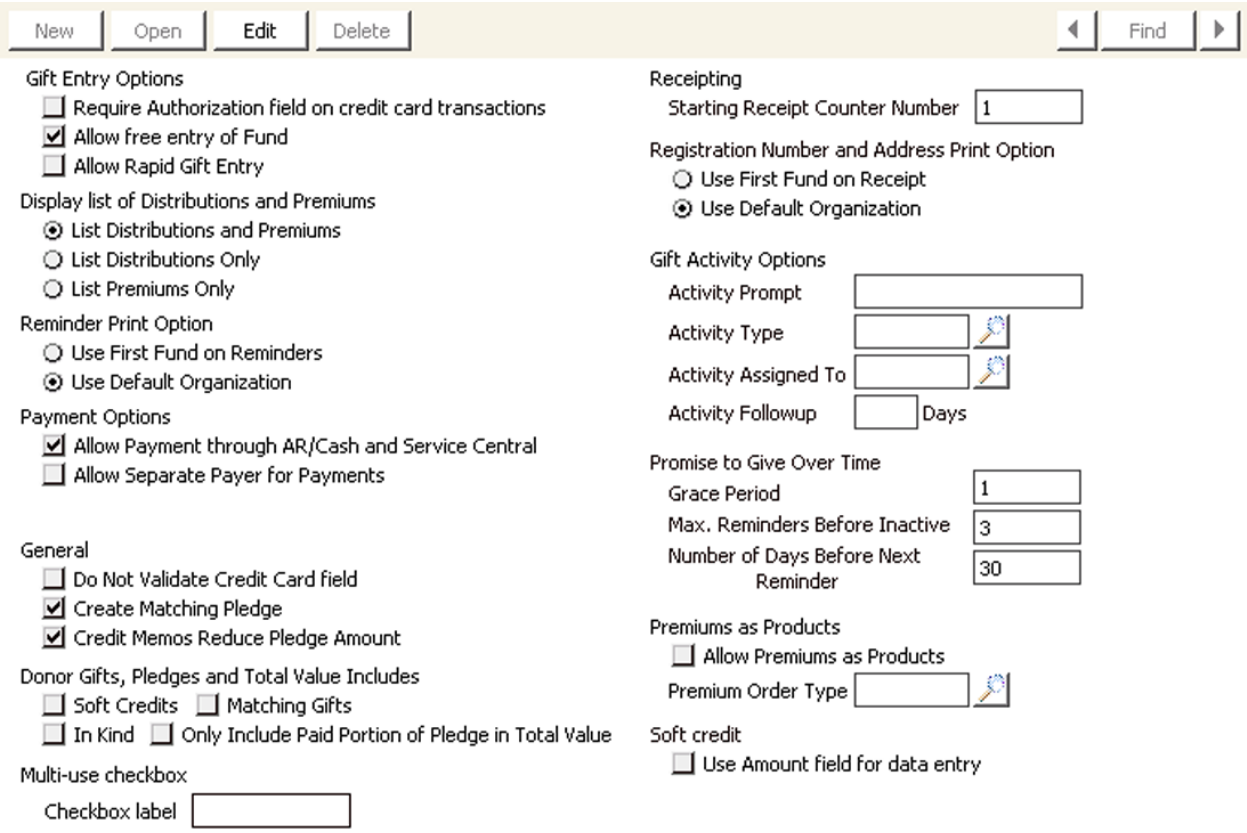
To define default fundraising options

1. From the Configure fundraising options window, click Edit.
2. Select one or more of the Gift Entry Options checkboxes.
3. Select one of the Display list of Distributions and Premiums options.
4. Select one Reminder Print Option.
5. (optional) Select one or more of the Payment Options checkboxes.

   Note: If you checked the Allow Separate Payer for Payments box, fill in the Payer Label field.

6. (optional) Select one or more of the General checkboxes.
7. (optional) Select one or more of the Donor Gifts, Pledges and Total Value Includes check-boxes.
8. (optional) Enter the Starting Receipt Counter Number.
9. Select one of the Registration Number and Address Print Options.
10. (optional) Enter Gift Activity Options.
11. (optional) Enter Promise to Give Over Time options.
12. (optional) Configure Premiums as Products options.
13. Click Save.

Configure fundraising options window



Advanced Accounting Console: Settings > Fundraising > Configure fundraising options

Gift Entry Options

You may check any of the following boxes:

- Require Authorization field on credit card transactions – Enable to make the Authorization field a required field on every credit card transaction entered in the Enter and edit gifts window or the Process payments window.
- Allow free entry of Fund – Enable to freely match distributions and funds at gift entry. This allows you to determine on a case-by-case basis how the gift should be distributed. If you do not enable this option, you must define all valid combinations of funds and distributions. Users can still overwrite the Campaign and Appeal fields even if the Allow free entry of Fund option is not enabled.
- Allow Rapid Gift Entry – Enable to give users the ability to enter Date Received, Gift Type, Gift Amount, Distribution, Appeal, Campaign, and Fund once on the Enter and edit gifts window and have these fields automatically entered in additional records. When this option is checked, the buttons Enable Rapid Gift Entry and Disable Rapid Gift Entry are available to users.

> **Note:** Note: The Single Gift and Single Pledge gift types are the only gift types supported for rapid gift entry. If the gift type is Installment, an error message displays when you click Enable Rapid Gift Entry.

- Date Received
- Gift Type
- Gift Amount
- Distribution
- Appeal
- Campaign
- Fund
- Installment gifts
- Acknowledgements
- Split gifts
- Memorials/TributesNotes
- Matching plans
- Inserting or editing soft credits (you can enter an existing soft credit ID, but you cannot create a new soft credit ID or edit an existing soft credit ID)

Display list of Distributions and Premiums

You must choose one of the following options:

- List Distributions and Premiums – Enable to display distributions and premiums in the Enter and edit gifts window (from Fundraising, select Enter and edit gifts).
- List Distributions Only – Enable to display only distributions in the Enter and edit gifts window.
- List Premiums Only – Enable to display only premiums in the Enter and edit gifts window.

Reminder Print Option

You must choose one of the following options:

- Use First Fund on Reminders – Enable to print the name of the first defined fund in the title of all reminders and reports. If there is only one fund, the name of this fund prints on reminders and reports.
- Use Default Organization – Enable to print the name of the default organization in the title of all reminders and reports.

Payment Options

You may check any of the following boxes:

- Allow Payment through AR/Cash and Service Central
- Enabled

  Allows fundraising payments through both the Service Central Enter and edit payments window and the AR/Cash Enter and edit cash receipts window. This is helpful if you receive payments for multiple products and some of those products are not related to fundraising.
- Disabled

  Prevents viewing Fundraising invoices on:
- Service Central Process customer requests window
- Service Central Enter and edit payments window
- AR/Cash Enter and edit cash receipts window (go to Finance > Transactions > Cash receipts)

  Note: If disabled, staff can only make fundraising payments through the Fundraising Process payments window.
- Allow Separate Payer for Payments – Enable to allow a separate payer for payments made in the Process payments window. If this option is enabled, you can specify a different payer ID for a pledge made by another individual.
- Payer Label – Enter the label that will be displayed for the separate payer field on the Process payments window. If you leave this field blank, the default label is Payer. Displays only if the Allow Separate Payer for Payments option is enabled.

  General

  You may check any of the following boxes:
- Do Not Validate Credit Card field – Enable to disable the credit card format validation feature when entering gifts in the Enter and edit gifts window and when making payments in the Process payments window or the AR/Cash Enter and edit cash receipts window.

Note: When setting up the Fundraising module for Credit Card Authorization, we recommend disabling the Do Not Validate Credit Card field option on the Fundraising Set up module window. If the Do Not Validate Credit Card field option is enabled, the credit card number will not be formatted automatically when it is entered on the Fundraising Enter and edit gifts window. If the Deferred Authorization option is enabled on the AR/Credit Card Authorization window, transactions made on the Enter and edit gifts window with unformatted credit card numbers will not display in credit card searches and will not print on the Deferred Credit Card Pre-Authorization report.

- Create Matching Pledge – Enable to record matching gifts as pledges rather than requests.
- Credit Memos Reduce Pledge Amount – Enable if you want credit memos to reduce a pledge amount. For example, if you pledge $100 and you write off $25 of the pledge, iMIS will recalculate the pledge as $75 and display $75 in the Fundraising History window if the Credit Memos Reduce Pledge Amount option is enabled. However, if this option is disabled and you pledge $100 and write off $25 of the pledge, iMIS will display the pledge amount as $100 with a $25 credit in the Fundraising History window.

Donor Gifts, Pledges and Total Value Includes

You may check any of the following boxes:

- Soft Credits – Include donation amounts not made by the contact, but made because of the contact.
- Matching Gifts – Include matching gift amounts provided by someone other than the donor.
- In Kind – Include the value of non-cash contributions
- Only Include Paid Portion of Pledge in Total Value – Include the amount actually received from pledges, not the total amount promised.

Multi-use checkbox

You can create a User Defined field to flag a gift record. Use the multi-use Checkbox label field to label the generic checkbox on the Enter and edit gifts window (go to Home > Fundraising > Enter and edit gifts). This field will appear on the Enter and edit gifts window only if you have entered a label for the Checkbox label field.

> **Note:** Note: The state of the multi-use Checkbox label field checkbox (checked or unchecked) is saved in Trans.FR_CHECKBOX table field.

Receipting

Starting Receipt Counter Number – (optional) Enter the next receipt number to be automatically generated. The default for the initial counter number is 1. After you generate receipts, the counter increases the number incrementally by 1 for each printed receipt. You can manually change the counter value to a higher number, but not to a lower number. Automatically generated receipt numbers are not duplicated.

Registration Number and Address Print Option

You must choose one of the following options:

- Use First Fund on Receipt – Enable to print the name of the first fund the donor contributed to when donating to multiple funds on the receipt header.
- Use Default Organization – Enable to print the name and address of the default fundraising organization on all receipt headers. When this option is enabled, receipts aggregate by donor ID, even if the payments are to funds with different registration numbers.

Gift Activity Options

The fields in this area are used to specify a user-specified activity that can be created when a gift or pledge is entered or edited.

- Activity Prompt – Enter the prompt for the activity checkbox on the Enter and edit gifts window.
- Activity Type – Enter the activity type for the activity that is created when the activity checkbox is enabled on the Overview tab on the Enter and edit gifts window, or select the

lookup icon and select the activity type from the drop-down list.

- Activity Assigned To – Enter the iMIS user who will be assigned the activity, or select the lookup icon and select the iMIS user from the drop-down list.
- Activity Followup – Enter the time (in days) between the gift or pledge entry and the follow-up action.

Promise to Give Over Time

- Grace Period – Enter the number of days beyond the end date that requests with a status other than Active continue to display in the Manage requests window. The default grace period is 1 day.
- Max. Reminders Before Inactive – Enter the number of reminders before the request status is changed to Inactive. The default value is 3.
- Number of Days Before Next Reminder – Enter the minimum number of days between the printing of reminder notices for a request. The default value is 30 days.

Premiums as Products

- Allow Premiums as Products – When checked, products can be used as premiums. You can set up stock, non-stock, and kit products so that they can be used as premiums for gifts and pledges with the added benefit of inventory control.

  Note: You must have the Full Order Entry module, and all products that are to be used as premiums must be set up for use as premiums on the Orders Manage products window.
- Premium Order Type – Designates the order type for products used as premiums.

Soft credit

Select the Use Amount field for data entry option if you want iMIS to automatically calculate the amount as a percentage of the entire donation.

Creating sender codes

Sender codes enable you to assign a signature line to requests, acknowledgements, and other correspondence that iMIS generates.

For example, different letters can be signed by the head of your organization, a committee chairperson, or a customer support representative.

You must define one sender code for each different signature line that you wish to include in correspondence. When a new gift is entered, the sender code can be assigned by clicking Acknowledge on the Enter and edit gifts window.

To create sender codes

1. From the Sender codes window, click New.
2. Enter the Sender Code.
3. Enter the Sender Description, which specifies the exact name and title to be used for the sender code. You can include a carriage return in the Sender Description.
4. Click Save.

Defining interest codes

Interest codes indicate specific areas that an organization or fund supports (for example, education, health, or literacy). These codes can be assigned to your organization, to funds, and to company matching plans. Specifying interest codes is optional, but if an interest code is specified in a company matching plan, matching donations can only be made to funds that have that same code.

For example, if the ED interest code is specified for the matching plan, but the GEN fund only has the CHILD code, you cannot enter a matching donation to the GEN fund.

To define interest codes

1. From the Interest codes window, click New.
2. Enter the Interest Code.
3. Enter a brief Interest Description for the interest code.
4. Click Save.

Creating memorial/tribute codes

Provides memorial/tribute codes to identify the type of memorial gift or pledge (for example, In Memory of, In Tribute to, and In Honor of).

Memorial/tribute codes help you track memorial and tribute donations and help to generate correspondence related to these donations. Memorial/tribute codes designate how a donation is dedicated. For example, the code MEMOR could stand for In memory of, the code HONOR could stand for In honor of. When a memorial/tribute donation is made, the iMIS user who records the donation chooses from pre-defined memorial/tribute codes.

To create memorial/tribute codes

1. From the Memorial/tribute codes window, click New.
2. Enter the Memorial/Tribute Code.
3. Enter the Description of the memorial or tribute. This description is printed or included on the letters sent to the Notify ID and to the donor.
4. Click Save.

Set up tables – Fundraising

This area describes the following set up options for the Fundraising area of the Settings Console:

- Funds
- Campaigns
- Appeals
- Distributions and premiums
- Donor clubs

Defining funds

Funds are the entities within your organization that serve as asset accounts for your fundraising activities. Frequently, for legal and accounting reasons, an organization must maintain separate accounting records for each fund.

In iMIS, a fund is an organization. Gifts and pledges are directed to a fund (for example, a capital fund, a fixed asset fund, or a general unrestricted fund).

Information that is entered in the Set up funds window is displayed in the Organization Names window. Entities that have the Is Fund option enabled in the Organization Names window are also displayed in the Set up funds window.

> **Note:** Note: If you add a fund, restart iMIS to enable access to the new fund information.

> **Note:** Caution! Do not delete funds after you have completed fundraising transactions. Deleting funds affects the completed transactions. If you delete a fund, you must manually delete the fund from the appeals, campaigns, distributions, and donor levels associated with the fund.

To define a fund

1. From the Funds window, click New.
2. Enter the Fund code.
3. Enter the Name of the fund.
4. (optional) Enter the fund's Invoice/Receipt Address.
5. (optional) Paste the fund's Logo if available.
6. (optional) Enter the Letterhead like Single Line Address if applicable.
7. Select the appropriate Taxation Method option.
8. (Canadian taxation only) Enter the Tax Authority.

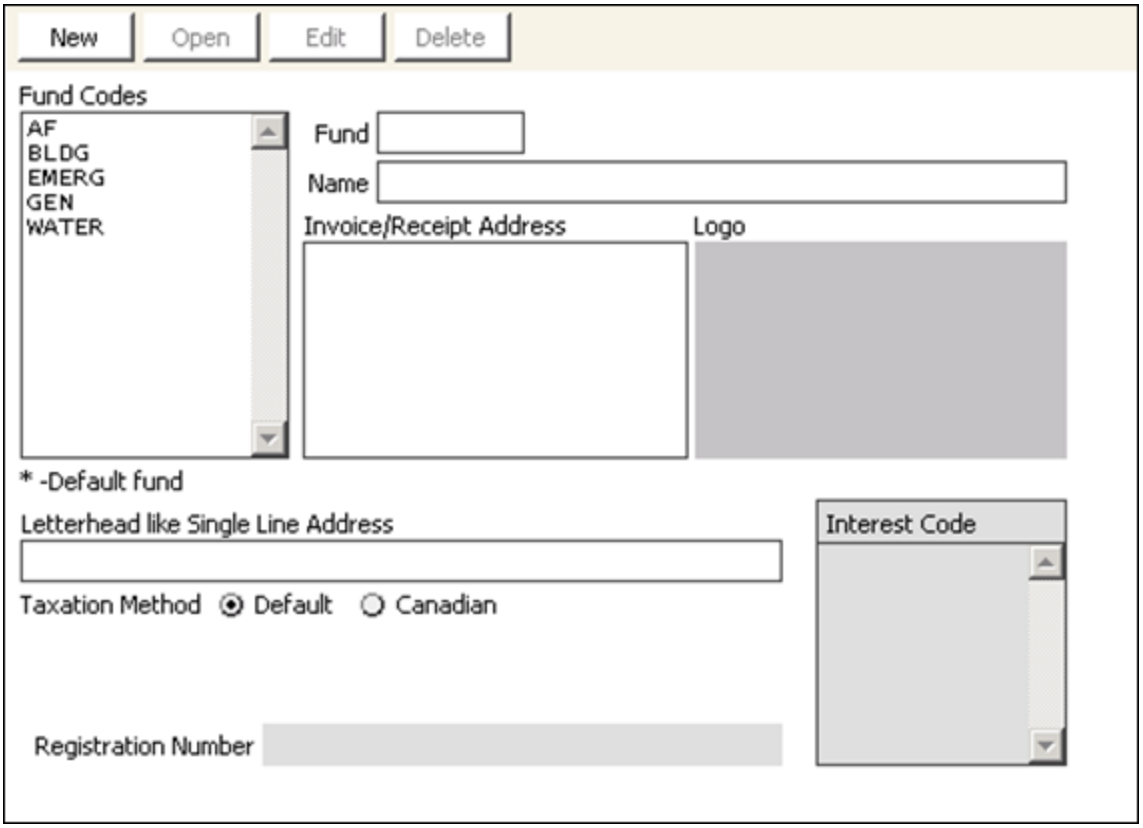
9. (Canadian taxation only) Enter the GST/HST Remittance #.
10. (optional) Add any interest codes to be associated with the selected fund in the Interest Code field, or press Ctrl+L to select interest codes.
11. Click Save.
12. Restart iMIS.

> **Note:** Note: If you defined a fund as the default organization in the Organization Names window, the fund will have an asterisk next to it in the Org Codes scrolling list indicating that it is the default fund (and the default organization).

To designate your organization as a fund

1. Go to File > System Setup to open the System Setup window.
2. Click Organization Names to open the Organization Names window.
3. Select an item from the Org Codes list.
4. Click Edit.
5. Check the Is Fund checkbox.
6. Enter the Registration Number associated with the organization if applicable.
7. Click Save.

Funds window



Advanced Accounting Console: Settings > Fundraising > Set up tables > Funds

Fund Codes

Lists all currently defined fund codes.

Fund

Designates the currently selected or the new fund code.

Name

Designates the full name of the organization or fund.

Invoice/Receipt Address

Designates the mailing address of the fund.

Logo

Designates the fund's logo that will be used on reports that include the logo.

Letterhead like Single Line Address

Designates the fund's letterhead if it is a single line address line.

Interest Code

(optional) Enter the interest codes associated with the fund.

Taxation Method

Designates the taxation method used for this organization/fund. Choose one of the following options:

- Default – Uses the default taxation method defined in system setup.
- Canadian – Uses the Canadian taxation method. This method requires the following additional fields:
- Tax Authority – The Canadian tax authority.
- GST/HST Remittance # – The GST/HST Remittance number.

> **Note:** Note: Canadian taxation (see "Canadian Taxation (GST and HST)") requires additional configuration.

Registration Number

(optional) Designates the registration number associated with the fund. The registration number is used with the Fundraising receipting function.

Defining campaigns

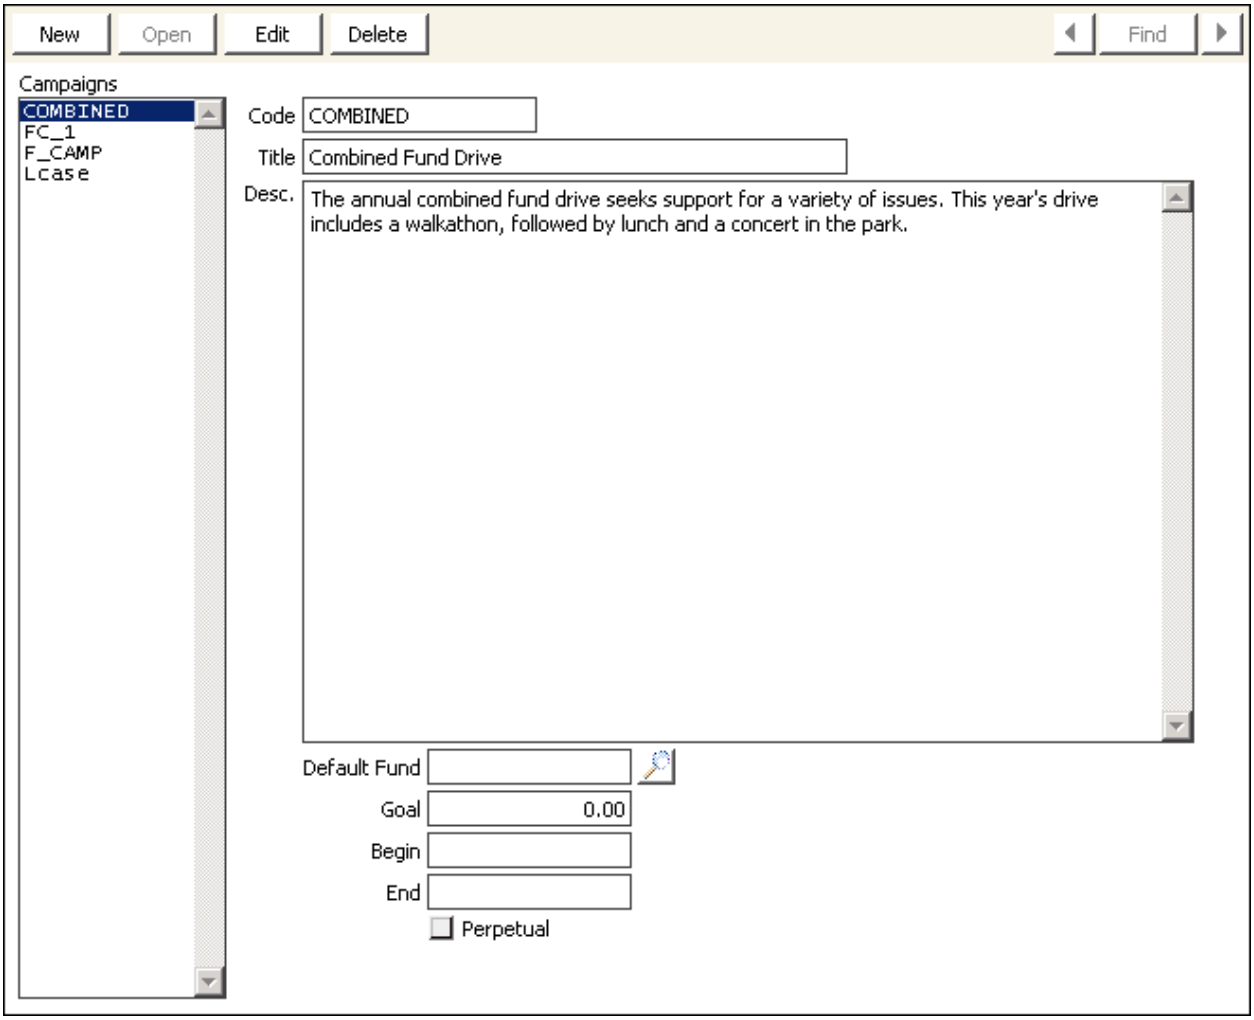
A campaign is a series of activities designed to generate money for a specific goal or objective. You may have a capital campaign with a goal of $1 million for a new building, or a scholarship campaign with a goal of $50,000 for a new scholarship. Campaigns are not required by iMIS, and not all organizations use them. However, campaigns are useful for generating and tracking money that is targeted for a specific goal.

To define a campaign

1. From the Campaigns window, click New.

2. Enter a descriptive alphanumeric Code to identify the campaign.
3. Enter the full Title of the campaign.
4. (optional) Enter a detailed description of the campaign in the Desc. field.
5. (optional) Enter the Default Fund code for the campaign, or click the lookup icon to select a fund code.
6. (optional) Enter the financial Goal for the campaign.
7. Optional) Enter the starting date for the campaign in the Begin field.
8. (optional) Enter the predetermined End date for the campaign, or enable the Perpetual option if the campaign is ongoing.
9. Click Save.

Campaigns window



Advanced Accounting Console: Settings > Fundraising > Set up tables > Campaigns

Campaigns

Lists all currently defined campaigns.

Code

Designates the campaign code of the currently selected or new campaign.

Title

Designates the title of the campaign.

Desc.

Describes the campaign.

Default Fund

Designates the default fund for the campaign.

Goal

Designates the campaign's financial goal.

Begin

Designates the campaign's starting date.

End

Designates the campaign's ending date.

Perpetual

When checked, indicates the campaign does not have an end date.

Defining an appeal

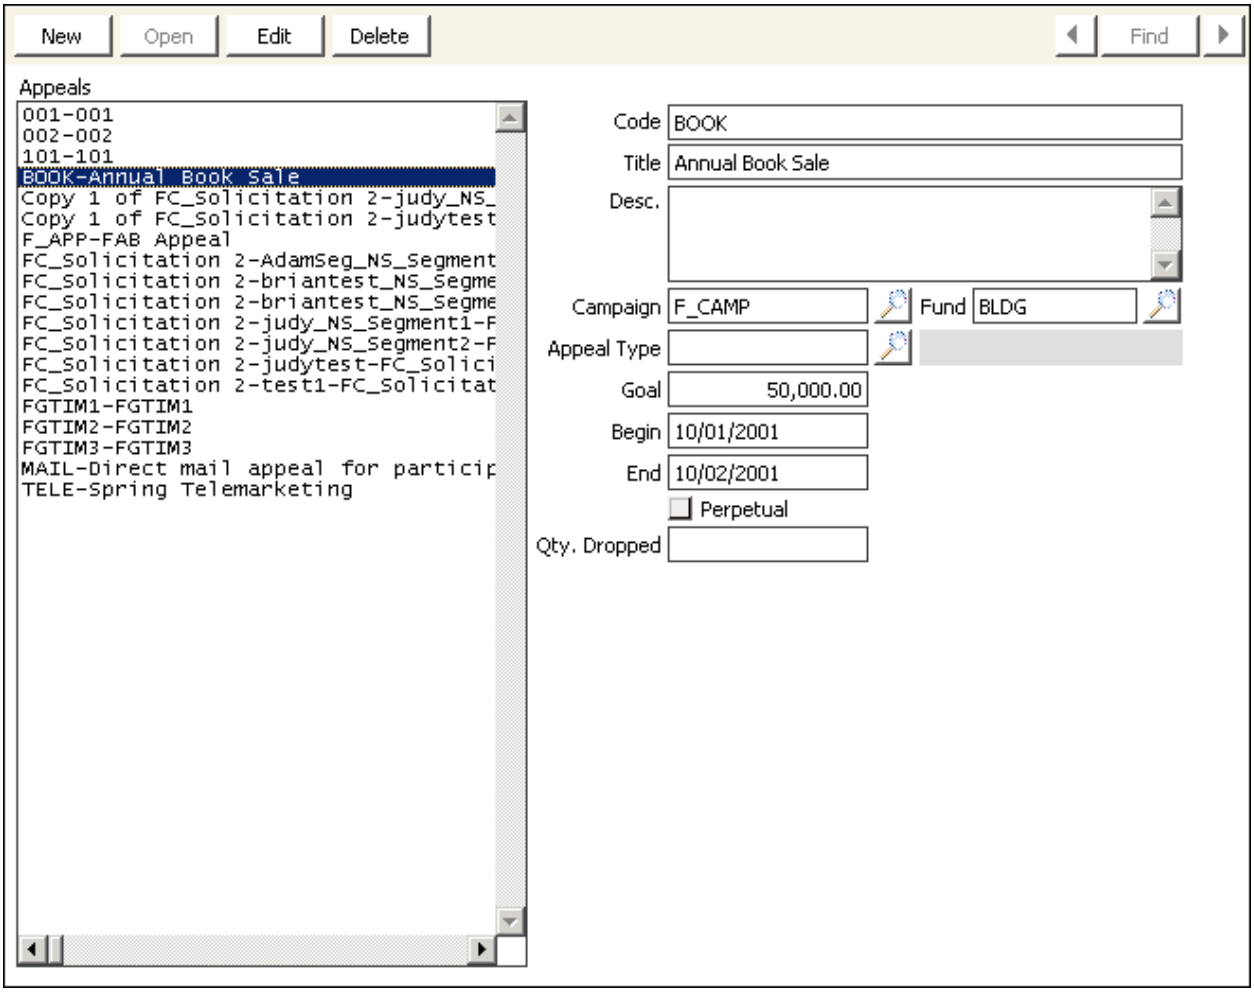
An appeal is a short-term activity, such as a mass mailing, a telephone solicitation, or a fax blitz, that may be connected to a particular campaign or fund. Appeals are not required in Fundraising. You can define any number of appeals, depending upon your organization's needs.

To define an appeal

1. From the Appeals window, click New.
2. Enter a unique alphanumeric Code for the appeal.
3. (optional) Enter a descriptive Title for the appeal.
4. (optional) Enter a detailed Description of the appeal. This description displays only in the Set up appeals window.
5. (optional) Enter the Campaign to which this appeal belongs, or click the lookup icon and select a campaign.

6. (optional) Enter the Fund to which this appeal belongs, or click the lookup icon and select a fund.
7. (optional) Enter the Appeal Type, or click the lookup icon and select an appeal type.
8. (optional) Enter the Goal for the appeal.
9. (optional) Enter the date that the appeal starts in the Begin field.
10. (optional) Enter the date that the appeal ends in the End field, or enable the Perpetual option if the appeal is ongoing.
11. (optional) Enter the quantity dropped for the appeal in the Qty Dropped field.
12. (optional) Click Premiums to apply a premium to the appeal.
13. Click Save.

Appeals window



Advanced Accounting Console: Settings > Fundraising > Set up tables > Appeals

Appeals

Lists all currently defined appeals.

Code

Enter an alphanumeric code for the selected appeal.

Title

(optional) Enter the full title of the appeal.

Desc.

(optional) Enter a detailed description of the appeal.

Campaign

(optional) Enter the campaign associated with the appeal.

Fund

(optional) Enter the fund associated with the appeal.

Appeal Type

(optional) Enter the type of appeal. Appeal types are defined in the APPEAL_TYPE lookup table (from Customers, select Set up tables > General lookup/validation, and select APPEAL_TYPE).

Goal

(optional) Enter the appeal's financial goal. When you enter a monetary value, iMIS automatically formats the value with the appropriate commas. For example, if you enter 1000000 (one million) in the Goal field, iMIS automatically formats the value as “1,000,000.00” when you tab out of the field.

Begin

(optional) Enter the appeal's begin date.

End

(optional) Enter the appeal's end date.

Perpetual

(optional) Enable to specify that the appeal is ongoing.

Note: Note: You cannot enable the Perpetual option if the appeal is associated with a campaign that has a specific end date. You may have to update the information in the Set up appeals window more frequently than in the Set up funds window (from Fundraising, select Set up tables > Funds) or the Set up campaigns window (from Fundraising, select Set up tables > Campaigns) if you conduct several appeals during the year.

Qty Dropped

Enter the quantity dropped for the appeal. This allows you to gauge the response rate to an appeal.

Premiums

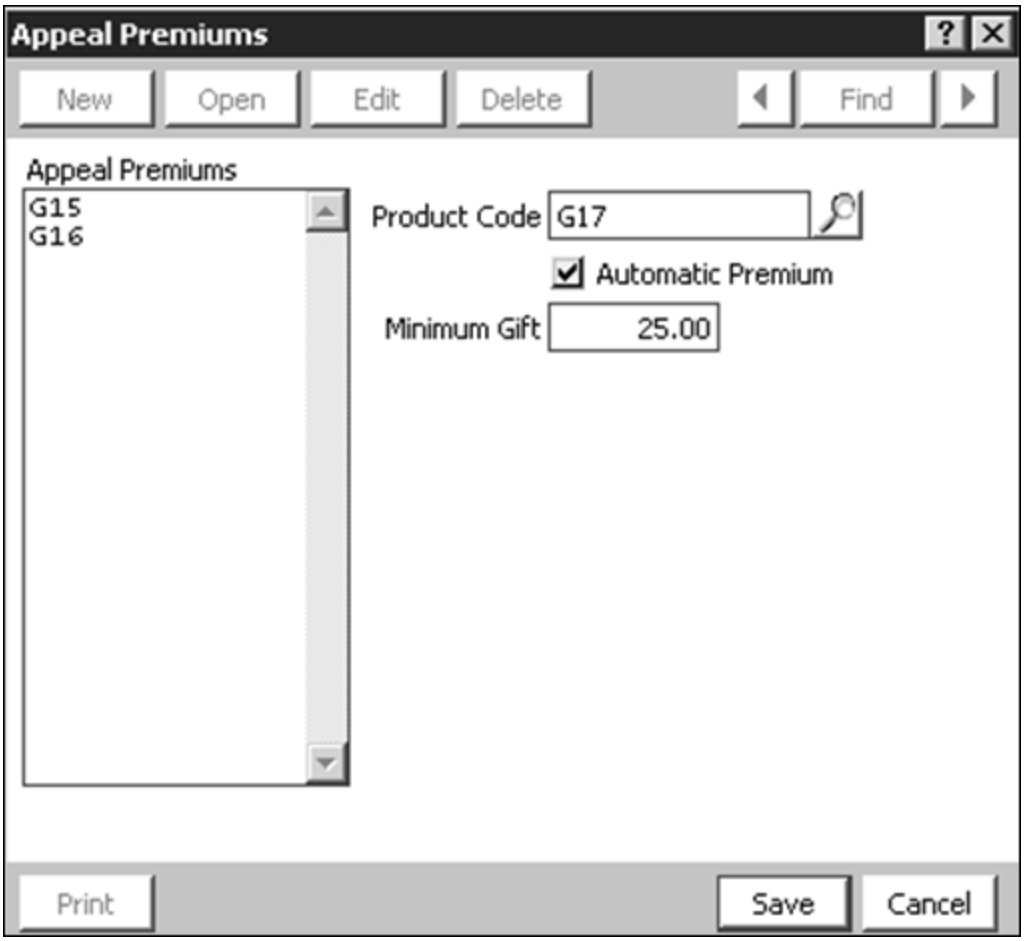
Click this button to open the Appeal Premiums window and apply a premium against the appeal.

Appeal Premiums window

You can apply a premium against an appeal code to establish rules about which premium is given for a specific gift amount. For example, a gift of $10 will provide a key chain, a gift of $ 25 will provide a mug. Appeal premiums are created and assigned to products on the Appeal Premiums window.

1. Select Set up appeals.
2. Highlight an appeal.
3. Click Premiums.

> **Note:** Note: To display the Premiums button in the Appeals window, you must enable the setup option to Allow Premiums as Products (Settings > Fundraising > Configure fundraising options).



Appeal Premiums

The product selected for the premium.

Product Code

The product associated with the Appeal premium. The Premium option must be enabled on the Manage Products window for the product to appear in this list (Home > Commerce > Enter and edit products).

Automatic Premium

Controls options on the Enter and edit gifts window.

- If enabled, the premium will automatically attach.
- If disabled, the Show all premiums option is available and you can attach a general item from inventory.

Minimum Gift

Sets the minimum amount required to apply the premium.

Setting up distributions and premiums

Before you enter gifts and pledges, you must define the distributions or premiums that are to be credited with the contributions. Distributions allow you to predefine combinations of funds, campaigns, and appeals. When a gift is received, it is usually distributed among a fund, a campaign, and an appeal. A distribution does not have to include a campaign or an appeal, but it must include a fund. If you use a general ledger system, the distribution also determines the general ledger income account to be credited.

A premium is a complimentary gift, such as a coffee mug or T-shirt that is given to a contributor who makes a donation. A premium is a distribution with a fair market value. A premium also has a gift value. For example, the fair market value for a coffee mug may be only $4, but the donor may be required to donate at least the gift value of $25 to receive the coffee mug.

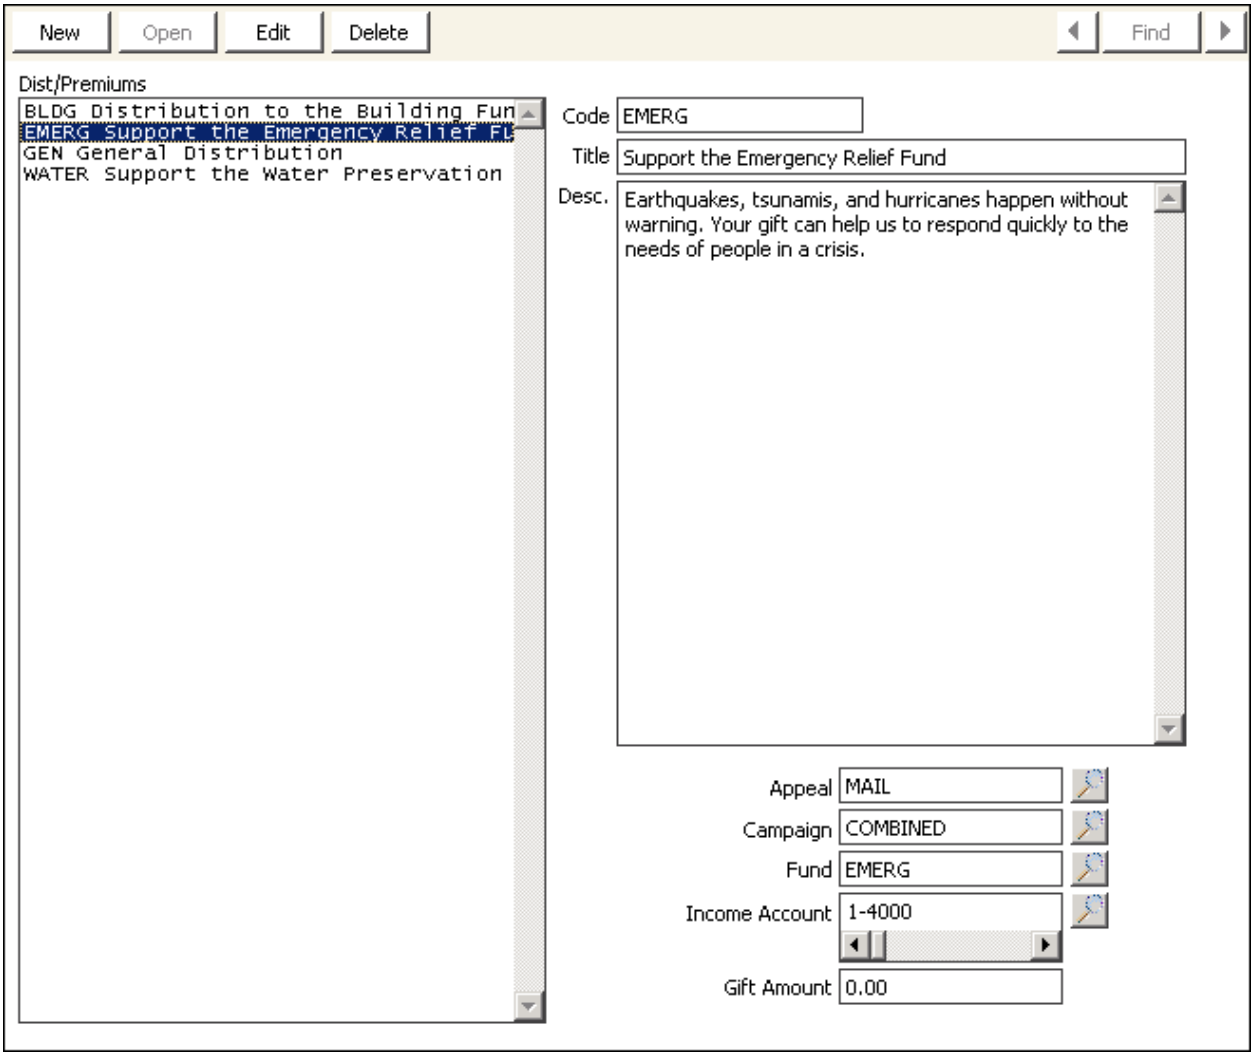
Distributions and premiums are defined in the Set up distributions and premiums window.

To define a distribution or premium

1. From the Distributions and premiums window, click New.
2. Enter a unique alphanumeric Code (five characters maximum) for the distribution or premium.
3. (optional) Enter the Title of the distribution or premium.
4. (optional) Enter the description of the distribution in the Desc. field.
5. (optional) Enter the Appeal associated with the distribution or premium, or click the lookup icon and select an appeal.

6. (optional) Enter the Campaign associated with the distribution or premium, or click the lookup icon and select a campaign.
7. Enter the Fund to be identified with the distribution or premium, or click the lookup icon and select a fund.
8. (optional) Enter the general ledger Income Account to be credited with contributions recorded with the distribution or premium, or click the lookup icon and select an account.
9. (Premiums only) Enter the usual amount of the gift or pledge in the Gift Amount field. This is the amount the contributor must donate in order to qualify for the premium.
10. (Premium only) Enter the fair market value of the contribution in the Fair Market Value field.
11. Click Save.

Distributions and premiums window



Advanced Accounting Console: Settings > Fundraising > Set up tables > Distributions and premiums

Dist/Premiums

Lists currently defined distributions and premiums.

Code

Designates an alphanumeric code for the selected distribution or premium.

Title

Designates a descriptive title for the distribution or premium.

Desc.

Specifies a detailed description of the distribution or premium.

Appeal

Specifies the appeal associated with the distribution or premium.

Campaign

Specifies the campaign associated with the distribution or premium.

Fund

Specifies the fund associated with the distribution or premium.

Income Account

Specifies the general ledger income account to be credited with contributions recorded with the distribution.

Gift Amount

(Used only for premiums) Specifies the usual amount of the gift or pledge associated with the premium. This is the amount of money the donor must contribute to receive the premium.

Fair Market Value

(Used only for premiums) Specifies the fair market value of the premium. For example, if the premium is a coffee mug that sells for $4, but a donor receives the mug for a $20 gift, $4 is the fair market value.

Defining donor clubs

Many fundraising organizations establish donor clubs to recognize various levels of giving by donors. For example, for contributions of $10,000 or more, the organization may designate a donor as a “friend,” and for $20,000 or more, a donor may be designated as a “benefactor.” Not all organizations use donor clubs, but if your organization does, iMIS makes it easy to record and track donations and donor clubs.

iMIS automatically determines whether a donor club is attained with each gift entry. If you define a donor club at $20 for a single gift, and a contributor donates $20 or more, the contributor automatically attains the donor club.

When generating a Donor Club Detail report, the highest donor club achieved by an individual within the same criteria as defined in the Set up donor clubs window supersedes any lower donor club (if Superseded was entered in one of the user-defined fields on the Set up activity types window (from Customers, select Set up module> Activity types) when setting up the DONORCLUB activity type).

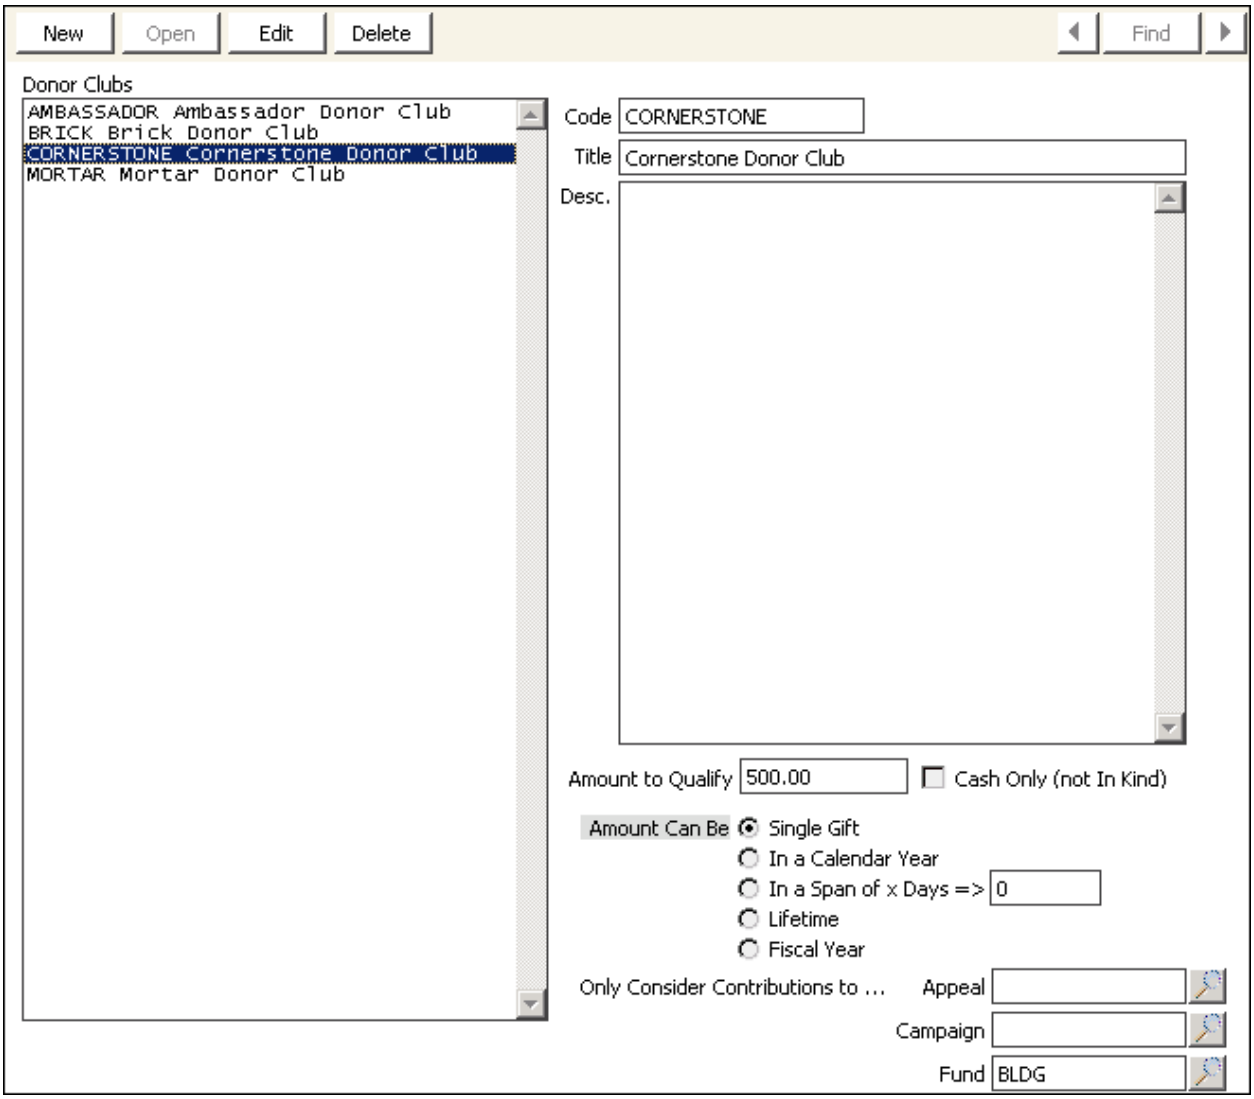
However, such a donor club does not supersede a donor club that was achieved under different parameters. For example, an individual makes a $1,000 cash contribution, which qualifies the donor for the Diamond Donor Club. The Diamond Donor Club requires a cash-only contribution of at least $1,000. The donor also qualifies for the Silver and Gold Donor Clubs, which require cash-only contributions of $100 or $500, respectively. The Diamond Donor Club supersedes the Silver and Gold, and only the Diamond Donor Club prints on the Donor Club Detail report. However, the contributor also qualifies for the Patron Donor Club, which requires a $500 gift, but does not require cash-only contributions. Both the Diamond and Patron Donor Clubs print on the Donor Club Detail report.

To define donor clubs

1. From the Donor clubs window, click New.
2. Enter a unique alphanumeric Code (five characters maximum) for the donor club.
3. (optional) Enter the Title of the donor club. This title will print on thank you letters to donor club members.
4. (optional) Enter a short description of the donor club in the Desc. field.
5. Enter the amount needed to qualify for this particular donor club in the Amount to Qualify field.
6. (optional) Enable the Cash Only option for the donor club to be achieved only with cash gifts and not pledges or in-kind gifts.
7. Select a receipt period option for the gift or pledge in the Amount Can Be field.

8. (optional) In the Only Consider Contributions to area, enter the appropriate code or combination of codes if the donor club can only be achieved with a contribution to a specific appeal, campaign, or fund.
9. Click Save.

Donor clubs window



Advanced Accounting Console: Settings > Fundraising > Set up tables > Donor clubs

Donor Clubs

Displays all currently defined donor clubs.

Code

Designates an alphanumeric code for the current donor club.

Title

Designates a title for the donor club.

Desc.

Specifies a description of the donor club.

Amount to Qualify

Specifies the monetary value of donation needed to qualify for the donor club.

Cash Only (not In Kind)

Check this box to limit qualifying gifts to cash. When this box is cleared, pledges and or in-kind gifts are also eligible.

Amount Can Be

Designates whether the total of multiple gifts is used to qualify for donor club membership, and if so, what time span is used to calculate total giving.

- Single Gift – Specifies that only single gifts can qualify donor club membership.
- In a Calendar Year – Specifies that the sum of a donor's contributions made during a calendar year is the amount used to determine donor club membership.
- In a Span of x Days=> – Specifies that the sum of a donor's contributions made during the last X days is the amount used to determine donor club membership.
- Lifetime – Specifies that the sum of all contributions a donor has ever made is the amount used to determine donor club membership.
- Fiscal Year – Specifies that the sum of a donor's contributions made during the fiscal year, as defined in the AR/Cash module, is the amount used to determine donor club membership.

Only Consider Contributions to

Specifies if donations must be associated with a particular fundraising effort in order to qualify for donor club membership. If all items are left blank, all otherwise qualified donations are eligible. If one or more of the following items is specified, only donations that are associated with all of the specified codes are considered when determining donor club membership.

- Appeal – Specifies an appeal code with which qualifying donations must be associated.
- Campaign – Specifies a campaign code with which qualifying donations must be associated.
- Fund – Specifies a fund code with which qualifying donations must be associated.

Subscription Fulfillment

Subscription Fulfillment works with Customer Management to facilitate subscription processing for customers who distribute multiple periodicals. Subscription Fulfillment allows you to create mailing labels and provides the appropriate audit trails that conform to USPS second-class mailing standards.

Accessing Subscription Fulfillment

Subscription Fulfillment exists as a separate module with its own task menu items:

- Generate reports - Select this task list item to open the Generate reports window that allows you to print mailing labels.
- Set up tables - Select this task list item to open a sub-task list of the following items:
- Subscriptions – Select this item to open the Set up subscriptions window that allows you to set up and maintain subscription products.
- Maintain zones – Select this item to open the Maintain zones window that allows you to define and manage the transports or carriers that you use to ship your subscription orders.

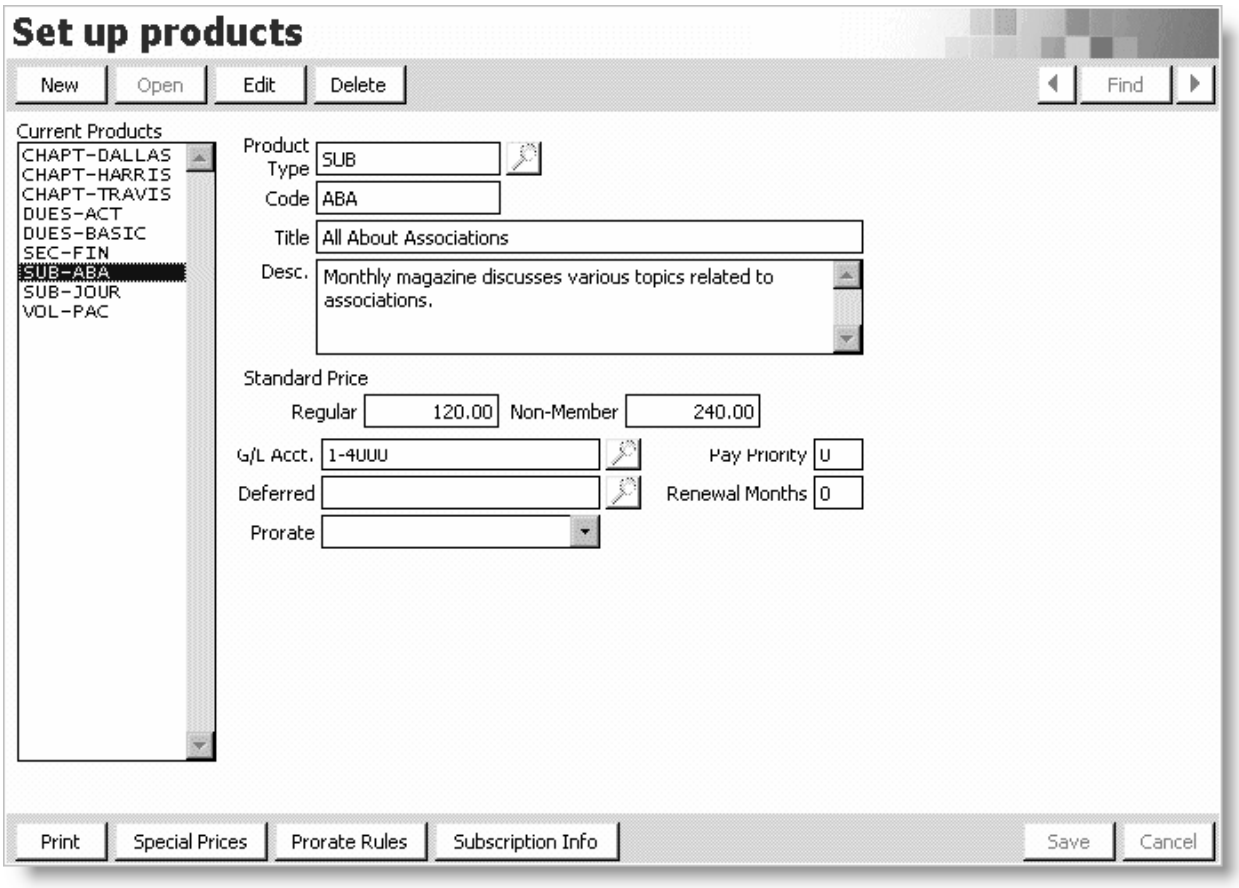
Subscription Product Management

Managing subscriptions involves setting up subscriptions, including journals and other publications for customers.

Creating SUB (subscription) products

The first step in managing subscriptions is to create product codes of type SUB on the Set up products window for each potential subscription-type product for which you intend to bill, or for products for which your organization collects money.

Set up products window



Subscription Fulfillment - Set up products window

From Billing, select Set up module> Products

Current Products

List of all available products

Product Type

A specific code for an individual product.

SUB –This product is used for optional subscriptions such as journals and magazines. This product type would not appear in the Set up customer types window, because SUB items are optional. After a member has subscribed to this product type, iMIS allows you to automatically bill for initial fees and renewals through cycle-definition rules. A SUB product type in Dues is used with the PUB product type in Advanced Subscriptions.

Code

Specifies a unique code that identifies the Product Type. The code entered should not contain any spaces or special characters other than an underscore (_), and should contain no more than 15 alphanumeric characters. This code can be used in the Billing Codes field on the Set up customer types window.

Title

Specifies a descriptive title of the Code. This title displays on the member's dues bill and other data entry windows.

Desc

(optional) Specifies a detailed description of the product.

Standard Price

(optional) Unless the billing interval is overridden in the Renewal Months field, the dollar amounts entered for the products should be in agreement with the standard billing interval set in the Set up general options window. For example, the rate for a product is $120.00 per year. Enter the flat rate of $120.00 when the standard billing interval is 12 (every 12 months or annual), $10 when the interval is 1 (once per month), and $240.00 when the interval is 24 (every 24 months or 2 years).

You can enter different rates for members and nonmembers.

- Regular – Default standard customer pricing. An entry in the Set up customer types window will override the Standard Price, and an entry in Special Pricing will override both customer-type pricing and Standard Price.
- Non-Member – Default nonmember pricing if there is no entry in Special Pricing or in the Set up customer types window.

G/L Acct

(optional) Displays the General Ledger account that will be credited when the payment is received or when the income is recognized.

Pay Priority

(optional) Determines the order in which payments are applied to multiple dues product lines. This can be used to sort the line items on a dues billing notice or renewal. A lower number has a higher priority than a larger number. For example, a product with priority 1 will appear on the payment and renewal list before a product with a priority of 2.

Deferred

(optional) Specifies the deferred income balance sheet account that should receive the credited amount. This features is available only when the system is licensed for the add-on Deferred Income module. A deferred income account should be entered if the income for this product type should be deferred and recognized during the membership or subscription term.

Renewal Months

(optional) Indicates the number of months the dues product type will be renewed for when payment is received. This number will override the Standard Billing Interval set in the Dues General Setup window if the product is being billed on a non-dues cycle. The product's standard billing interval will be used only for pricing determination on the dues billing cycle.

For example, an individual purchases a journal subscription as of 9/01/1999. The journal is set as a product with a rate of $45.00 for both members and nonmembers, with Renewal Months set at 60 months (five years). On a non-dues billing cycle, the journal line item will be billed for $45.00 with a paid thru date of 8/31/2004.

Prorate

(optional) This feature provides a drop-down list of prorate rules that were defined through the Special Pricing window. Prorating allows reduced rates for new members/subscribers who join during the annual membership term.

Subscription Info button

Opens the Subscription Information window where you can enter zone and postal sort information. This button displays only when you are licensed for Advanced Subscriptions and the Product Type is SUB.

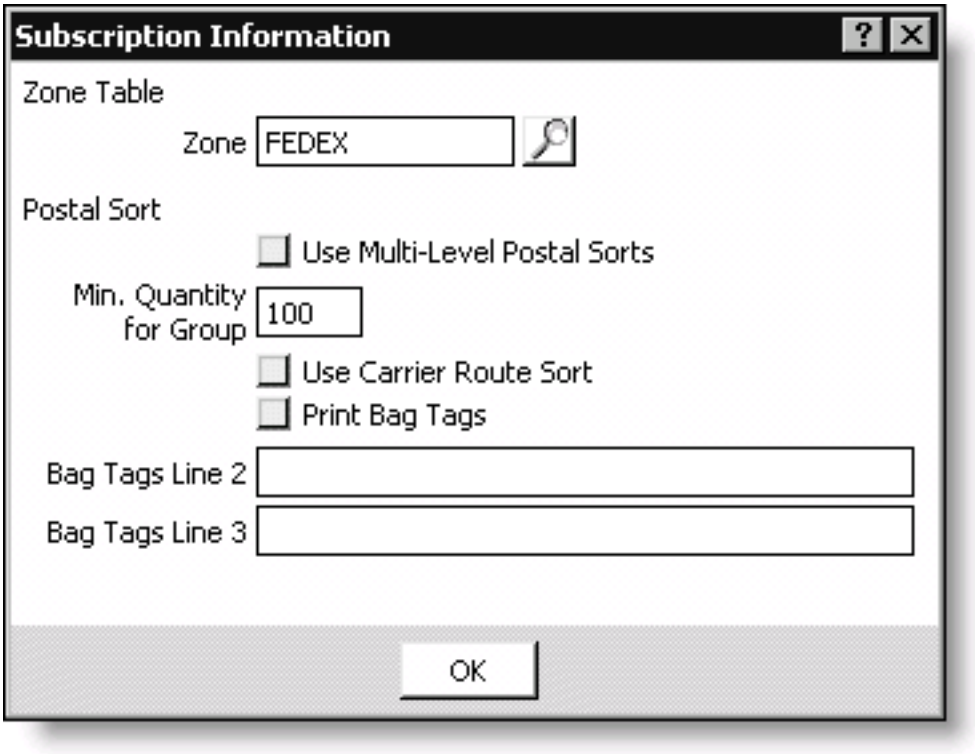
Special Prices button

Opens the Special Pricing window where you can define pricing rules for products.

Prorate Rules button

Opens the Prorating window where you can specify an amount to an activity or product that is proportional to some base.

Subscription Information window



Subscription Fulfillment – Subscription Information window

From Billing, select Set up module> Products, select a SUB product, and click Subscription Info

Zone Table

Zone – Specifies the code for the zone table used for this publication. The Edition Size report will report the Zone.

Postal Sort

Use Multi-Level Postal Sorts – Enable if the Single Mail Code or Multiple Mail Codes option have been activated on the Customer Setup – Address and Notes window (from Customers, select Set up module> General, and click Address and Notes).

Min Quantity for Group – Specifies the minimum number of labels that must print.

Use Carrier Route Sort – Enable if you are using Accumail and populating Name_ Address.CRRT.

Print Bag Tags – Select to print bag tags.

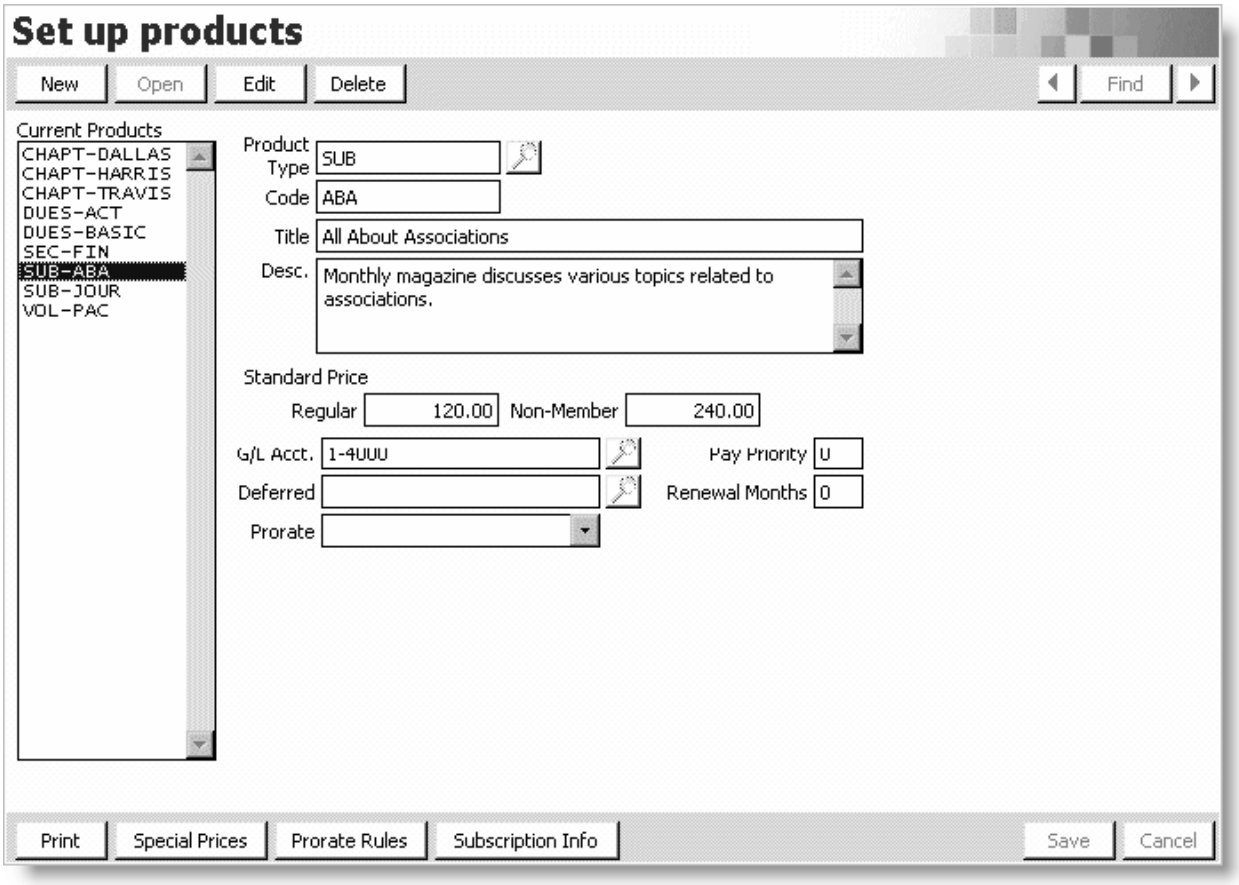
Bag Tags Line 2 – Specifies the information you want printed on the bag tag.

Bag Tags Line 3 – Specifies the information you want printed on the bag tag.

To define a SUB product

1. From Billing, select Set up module> Products to open the Set up products window:
2. Click New.
3. Enter SUB for the Product Type.
4. Enter the product Code. The code entered should not contain any spaces or special characters other than an underscore.
5. Enter the product Title.
6. (optional) Enter the product Description.
7. (optional) Enter the Regular pricing information.
8. (optional) Enter the Non-Member pricing information.
9. (optional) Enter the G/L Account.
10. (optional) Enter the Pay Priority.
11. (optional) Enter the Deferred account number.
12. (optional) Select the Prorate rule from the drop-down list.
13. Click Save.

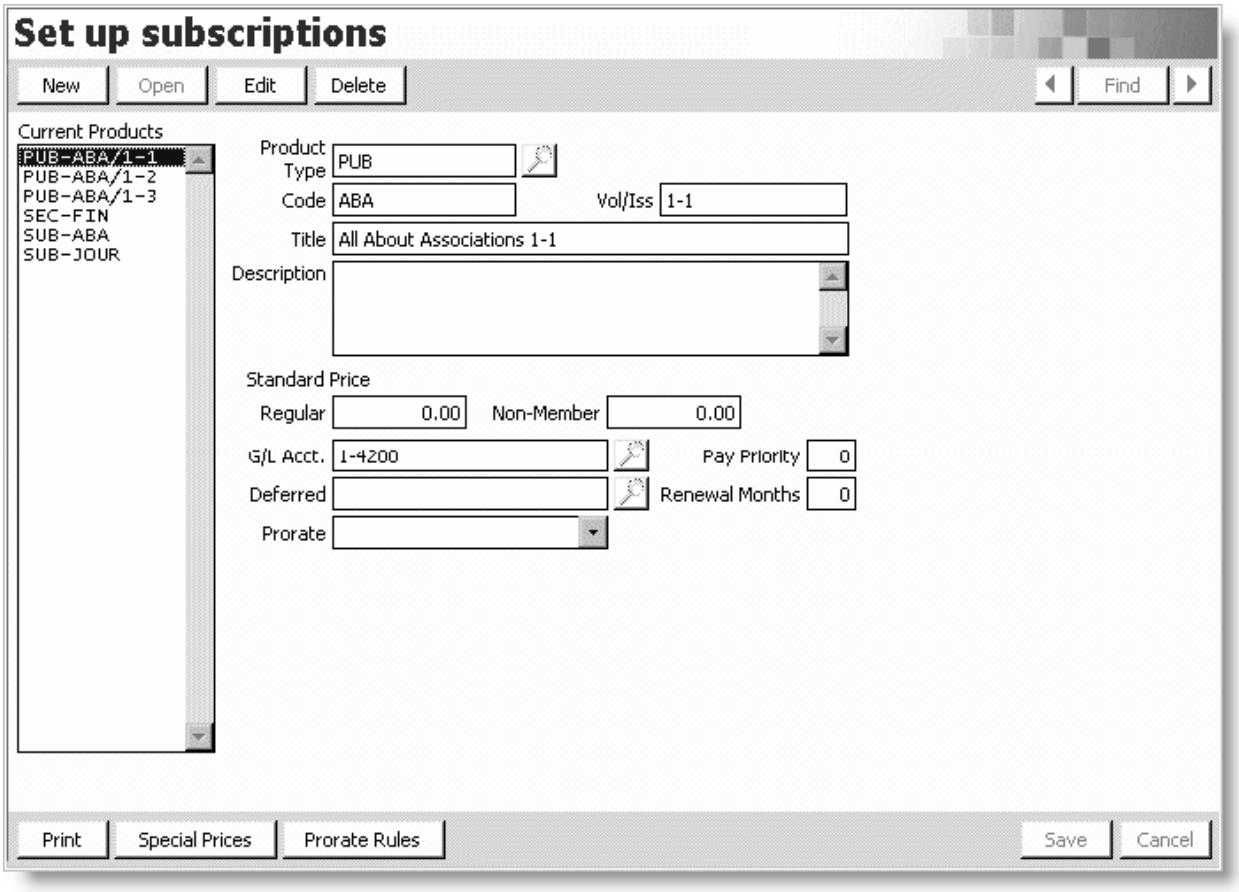
14. Click Subscription Info to open the Subscription Information window.
15. (optional) Enter a Zone Table.
16. (optional) Enable the Multi-Level Postal Sorts option.
17. (optional) Enter a Min Quantity for Group.
18. (optional) Enable the Carrier Route Sort option.
19. (optional) Enable the Print Bag Tags option.
20. (optional) Enter text for Bag Tags Line 2.
21. (optional) Enter text for Bag Tags Line 3.
22. Click Save.



Defining Publication Product Codes

You maintain individual publications belonging to a subscription (volumes or issues) on the Set up subscriptions window.

Set up subscriptions window



From Subscriptions, select Set up tables > Subscriptions

To define a subscription product

1. From Subscriptions, select Set up tables > Subscriptions to open the Set up subscriptions window.
2. Click New.
3. Enter PUB for the Product Type. The Vol/Iss field displays.

4. Enter the product Code. The code entered should not contain any spaces or special characters other than an underscore.
5. Enter the Vol/Iss number for this publication. Slashes are not allowed in the product code. Separate the Vol/Iss number with a dash.
6. Enter the product Title.
7. (optional) Enter the product Description.
8. (optional) Enter the Regular pricing information.
9. (optional) Enter the Non-Member pricing information.
10. (optional) Enter the G/L Account.
11. (optional) Enter the Pay Priority.
12. (optional) Enter the Deferred account number.
13. (optional) Select the Prorate rule from the drop-down list.
14. Click Save.
15. Repeat steps to enter each publication code for each volume/issue of this subscription.

Subscription Product Billing

Billing for a subscription product involves adding the subscription item to customer records, setting up a billing cycle, and running the billing. You will use the Customer Management and Billing modules to perform these tasks.

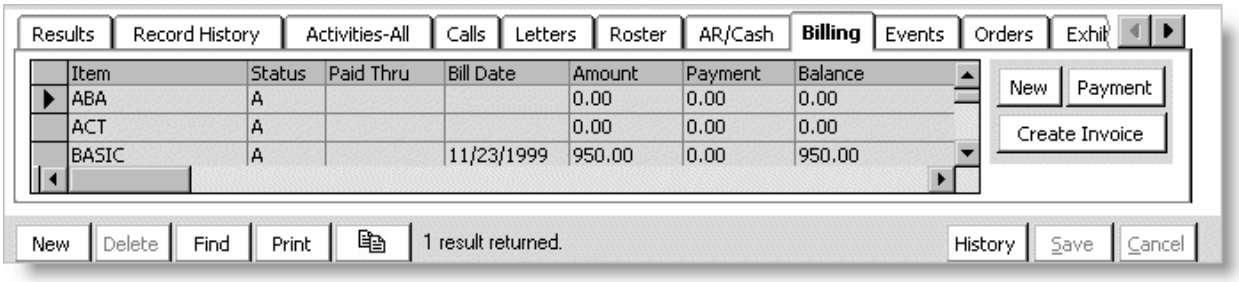
See AR/Cash: Deferred Income for how to defer dues/subscriptions income and events/exhibition/exposition income.

Adding a Subscription Item

Before printing labels for a subscription, you must add the subscription item to the customer's Dues/Subscriptions window and bill the customer for the subscription.

To add a subscription item to a customer record

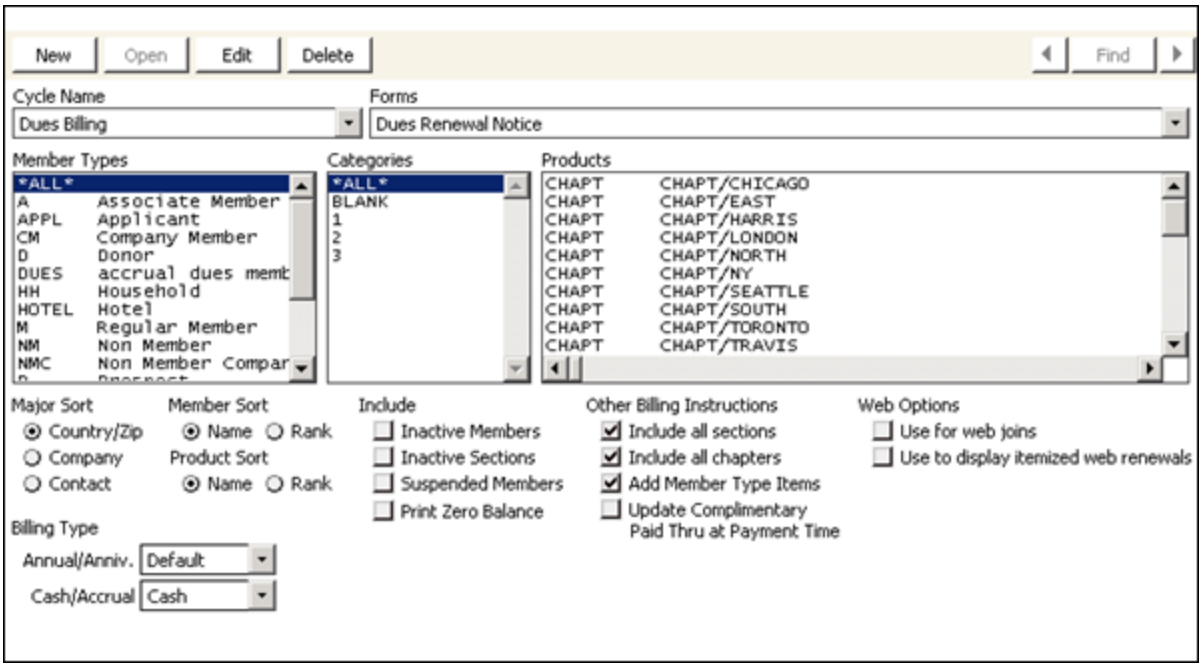
1. From Customers, select Manage customers and find the customer requesting the subscription.
2. Select the Billing tab.
3. Click New to open the Dues/Subscription Item Detail window.
4. Enter the subscription code in the Item field, or click the Find icon to select the code.
5. Enter the Begin Date.
6. Click Save to return to the Billing tab.



Billing for a Subscription Product

You can bill a customer for a subscription product once you add the item to the customer's Billing tab. The billing cycle does not add records for a customer; it only bills the records that you have added previously.

Billing cycles window



From Billing, select Set up module> Billing cycles

Cycle Name

Indicates the designated name for the group of records from which renewal notices will be generated. This name displays on the Process billing window with a list of available cycles.

Forms

Drop-down list of renewal notice formats.

Member Types

A list of available customer types available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (selects range) while you select your selections. To bill all customer types, select *ALL* at the top of the scrolling list. For example, for a sub-scription cycle where the subscription can be purchased by any customer, select *ALL*.

Categories

A list of categories available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (sequential range) while you select your selections. To bill all

categories of customers or subscribers, select *ALL* at the top of the scrolling list. If BLANK is selected, only customers or subscribers with a blank or empty category will be selected.

Products

A list of products available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (sequential range) while selecting other selections. Products selected in this list will be billed only if an active subscription line item already exists for the customer.

For dues product billing, only select products that are optional add-on items to the mandatory or regular dues products. The Add Member Type Items option must enabled. If the Add Member Type Items option is enabled, all products listed on the Set up customer types window for the customer types selected will be billed automatically during this billing cycle. These customer type-referenced products should not be selected on the scrolling list.

Shortcut - To select all chapters (CHAPT) and sections (SEC), enable the Include all sections and Include all chapters options located in the Other Billing Instructions section.

Major Sort

This option specifies the order in which the bills are sorted for printing. The choices include Country/Zip (postal code), Company (company sort), and Contact (individual's last name, first name).

Member Sort

This is used only for list bills (where the dues and/or subscription products for several individuals or branches are itemized on a single bill and sent to a single parent company or a third party). It establishes the order in which the individuals (Ship to) are listed on the list bill. You can sort by Name (last, first) or Rank (under development for a future release).

Product Sort

This option controls the order of the line items on the dues bill. Select Name (to sort alphabetically by product code) or Rank (to sort by the payment priority shown on the Set up products window).

Include

Specific options that are included in the billing cycle, when enabled.

- Inactive Members - Enable to bill customers whose status begins with I (inactive).
- Inactive Sections - Enable to force the billing of SEC-type subscription in which the subscription's status begins with I (inactive).
- Suspended Members -Enable to bill customers whose status begins with S (suspended).
- Print Zero Balance -Enable to print bills with zero balances. For example, if you enable this option, iMIS will generate a bill for a customer who receives a complimentary (zero dollar amount) membership. Not enabling this option causes iMIS to bypass all zero balance bills during the printing process.

  Note: This option applies only to bills with a total balance of zero. To suppress the printing of individual zero balance line items when the grand total is nonzero, see the SUPPRESS_ZERO_ITEMS print options.

Other Billing Instructions

Include all sections -Bills all active subscription records of the product type SEC for the customer types selected. If multiple sections exist, all sections will be included.

Include all chapters -Bills active subscription records of the type CHAPT for the customer types selected. If multiple chapters exist, all chapters will be included.

Add Member Type Items -Use for dues billing. This option bills customers for all product codes defined on the Set up customer types window. If this option is enabled, select only those items in the Products list not covered on the Set up customer types window or by the options Include All Sections and Include All Chapters.

Note: Note: When Add Member Type Items is selected, new subscription records will be created only for items included on the Set up customer types window. All other products selected for the dues billing cycle will be billed only if an existing active subscription record already exists for that customer. The Add Member Type Items option must be enabled for dues billing and should not be enabled for non-dues product billing.

Update Complimentary Paid Thru at Payment Time - When enabled, allows the Paid Thru date for complimentary items (no charge products) for this billing cycle to be updated at payment time instead of billing time. During dues billing, iMIS checks the billing cycle to determine how to handle complimentary item Paid Thru dates.

Web Options

Use for web joins – This option determines whether the billing cycle can be used to allow new members to join on the Web. If this option is selected, the billing cycle is available to be used to join online.

Use to display itemized web renewals – If selected, each individual item in the renewal product is displayed. If not selected, you will see one product that contains the individual items.

For accrual dues, only the most recent billing period's dues are represented in the Renew Now process. If a member has not paid dues for the last two years, then when they click Renew Now they are charged only for this year's dues. After paying this year's dues they will not see that they have a balance due. For cash dues, if the Maintain Prev. Balance option has been enabled (go to Billing > Set up module > General options), and if a member has carried forward a balance, then the full amount due will be charged.

Note: Note: The Renew Now button will allow a user to modify the renewal invoice only if the following are all true:

--The user is using cash dues. If dues were billed on a real/accrual invoice, then there will not be a link in the cart entry for the renewal fees, and adjustments must be performed by Staff users in the Desktop.

--The billed amount and the current balance are the same. If they are not, then the user can pay the full amount due through the web-based sites, but cannot make adjustments. This can happen if the dues item is partially paid, has been manually adjusted by Staff, or has a balance forward from a prior billing period.

--The Use to display itemized web renewals option is selected.

Note: Note: These Web Options apply to RiSE sites. These selections will not affect your Web View or Public View sites.

Note: Note: Make sure that are no dues products with a code that ends with _ CREDIT selected when selecting the Use to display itemized web renewals option.

Billing Type

Annual/Anniv - Drop-down list used to select when the billing cycle should be billed (Annual or Anniversary) or to retain the default setting. iMIS defaults to the setting specified on the Set up general options window. You may want to change the setting if you bill dues products annually and subscriptions by anniversary.

Cash/Accrual - Drop-down list used to select the accounting method of Cash or Accrual or to retain the default setting. iMIS defaults to the setting specified on the Set up general options window. You can select Cash or Accrual if the default accounting method on the Set up general options window is set to Accrual. If you try to set the billing cycle accounting method to Accrual when the dues product accounting method system default is Cash, iMIS displays a message informing you that the accounting method system setup must be changed to Accrual.

Bills/Reminders button

Opens the Billing and Reminder Notices window where you can specify when iMIS should send first and second reminder notices to the customers included in the billing run.

To set up a subscription billing cycle

1. From Billing, select Set up module> Billing cycles to open the Set up billing cycles window.
2. Click New.
3. Enter the name of the billing cycle in the Cycle Name field.
4. Select a form from the Forms drop-down list.
5. Select whom to bill:

- Select the customer types to bill from the Member Types column.
- Select the Categories to include for this billing cycle.

6. Select a SUB product from the Products scrolling list.
7. Click Save.

To run a non-dues billing

You can bill an individual member or run a mass billing based on a billing cycle.

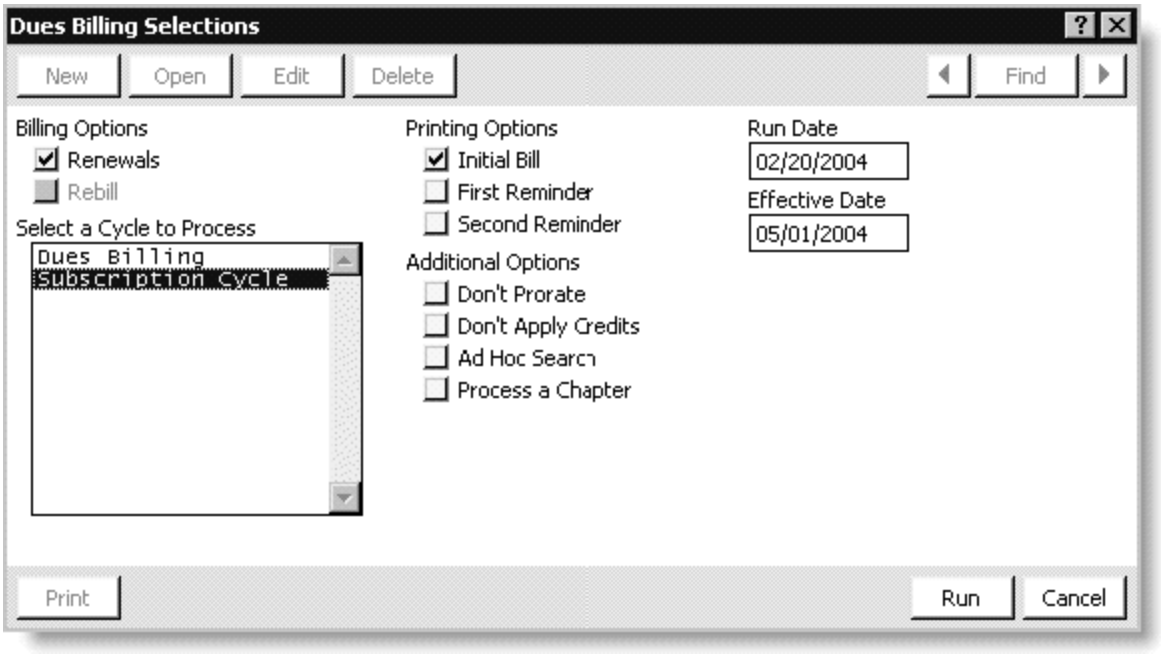
1. If billing a customer:

- From Customers, select Manage customers, find a customer, and then select the Billing tab, and then
- Click Create Invoice to display the Dues Billing Selections window and continue with the next step.

2. If billing for the cycle:

- From Billing, select Process billing to open the Process billing window. Continue with the next step.

3. Click New.
4. Select the Renewals options under Billing Options. The Effective Date field displays.
5. Select the Initial Bill option under Printing Options.
6. Select the cycle in the Select a Cycle to Process field.
7. Verify that the Effective Date is correct for the date range you are going to process.
8. Click Run to process the cycle and print the invoices.
9. From Customers, select Manage customers, find the customer record, and select the Billing tab.



Back Issues

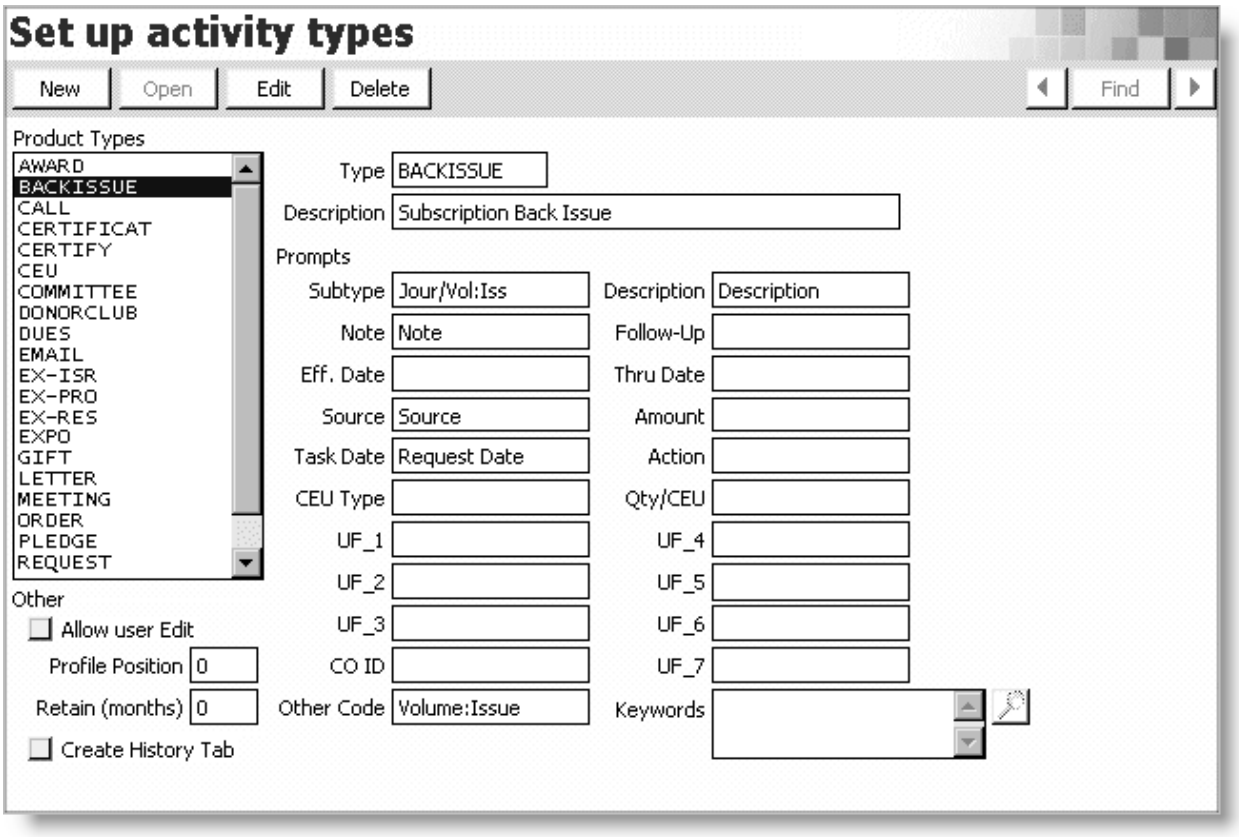
Managing back issue requests involves setting up the BACKISSUE activity type on the Customer Management Set up activity types window, and entering and editing the back issue request using the Issues/Back Issue Requests window.

Defining the BACKISSUE Activity Type

Before you can enter a back issue request for a publication, you must create the BACKISSUE activity type on the Set up activity types window.

To define the BACKISSUE activity type

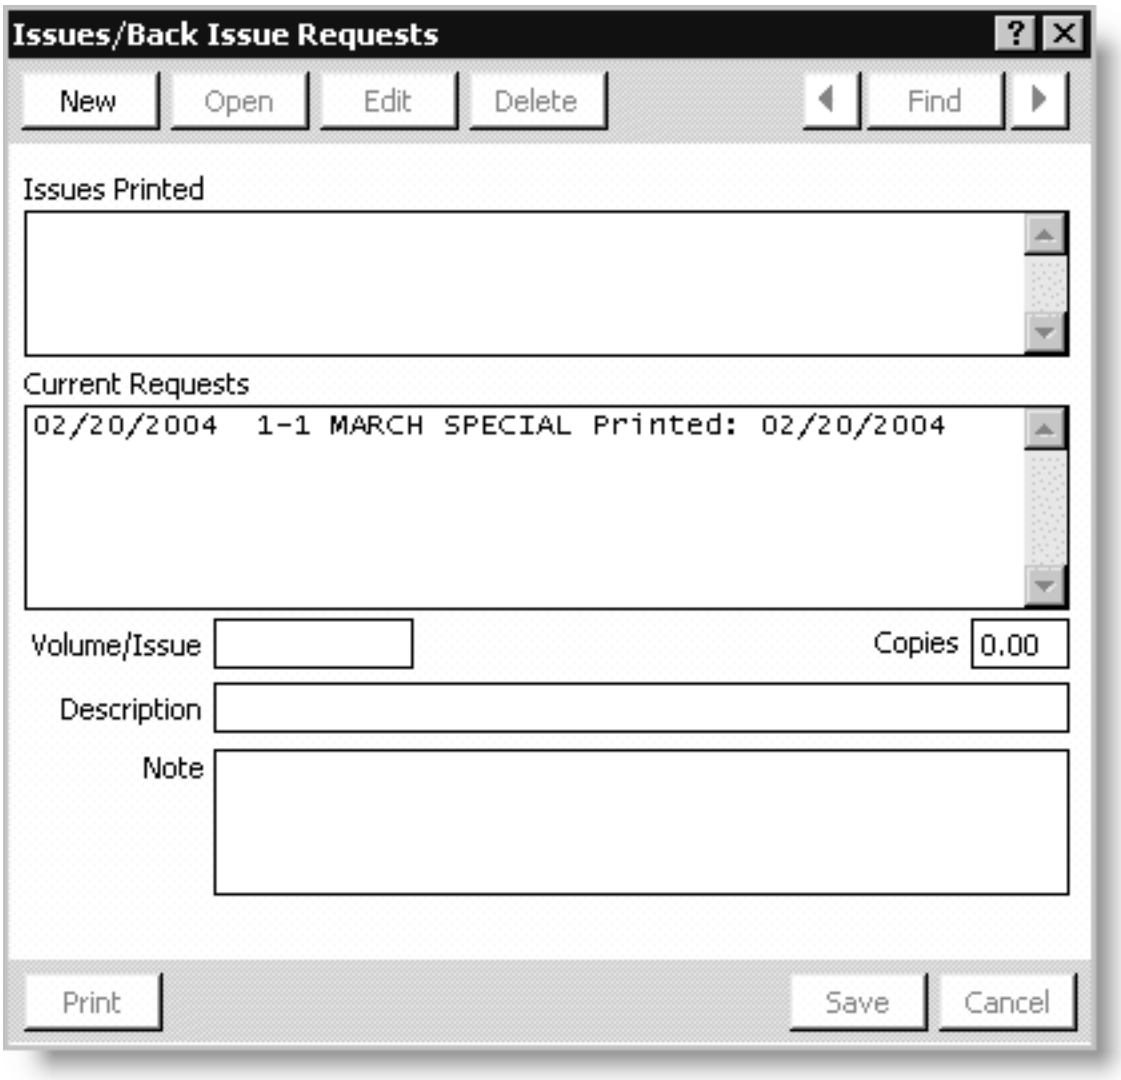
1. From Customers, select Set up module> Activity types to display the Set up activity types window.
2. Click New.
3. Enter BACKISSUE in the Type field.
4. Enter a Description for the activity.
5. Enter a prompt for Subtype.
6. Enter a prompt for Description.
7. Enter a prompt for Note.
8. Enter a prompt for Source.
9. Enter a prompt for Task Date.
10. Enter a prompt for Other Code.
11. Click Save to display the Set up activity types window.



Managing Back Issue Requests

Once you have created the BACKISSUE activity type, you can enter and manage back issue requests.

Issues/Back Issue Requests window



From Customers, select Manage customers, find customer record, select the Billing tab, double-click SUB item, and click Back Issues

Issues Printed

List of requests for which Issue Labels have been printed

Current Requests

List of requests for Back Issue Labels (updated with Printed: MM/DD/YYY after labels have been printed)

Volume/Issue

Specifies the PUB volume/issue number requested

Copies

Specifies the number of copies requested

Description

(optional) Specifies a description.

Note

(optional) Specifies a note.

To enter a back issue request

1. From Customers, select Manage customers, find a customer record, and select the Billing tab.
2. Double-click the subscription item to open the Dues/Subscription Item Detail window.
3. Click Back Issues to open the Issues/Back Issue Requests window.
4. Click New.
5. Place the cursor in the Volume/Issue field and enter the volume and issue the member is requesting.
6. Enter the number of Copies.
7. (optional) Enter a Description.
8. (optional) Enter a Note.
9. Click Save to update the record
10. Click New to continue to enter back issue requests.

To edit a back issue request

1. From Customers, select Manage customers, find a customer record, and select the Billing tab.

2. Double-click the subscription item to open the Dues/Subscription Item Detail window.
3. Click Back Issues to open the Issues/Back Issue Requests window.
4. Select the line item to edit from the Current Requests list.
5. Click Edit.
6. Make your changes.
7. Click Save to update the record.
8. Edit additional requests as necessary.

To delete a back issue request

1. From Customers, select Manage customers, find a customer record, and select the Billing tab.
2. Double-click the subscription item to open the Dues/Subscription Item Detail window.
3. Click Back Issues to open the Issues/Back Issue Requests window.
4. Select the line item to delete from the Current Requests list.
5. Click Delete.
6. A message displays asking you to confirm the deletion. Click Yes.

Label Generation

The main purpose of iMIS Subscription Fulfillment is to create mailing labels and appropriate audit trail for large mailings (usually 5,000 or more pieces) similar to the USPS second-class mailing standards.

The Subscription Fulfillment system is capable of printing mailing labels in several different sort orders:

- Carrier route sorts
- 5-digit direct
- 3-digit direct

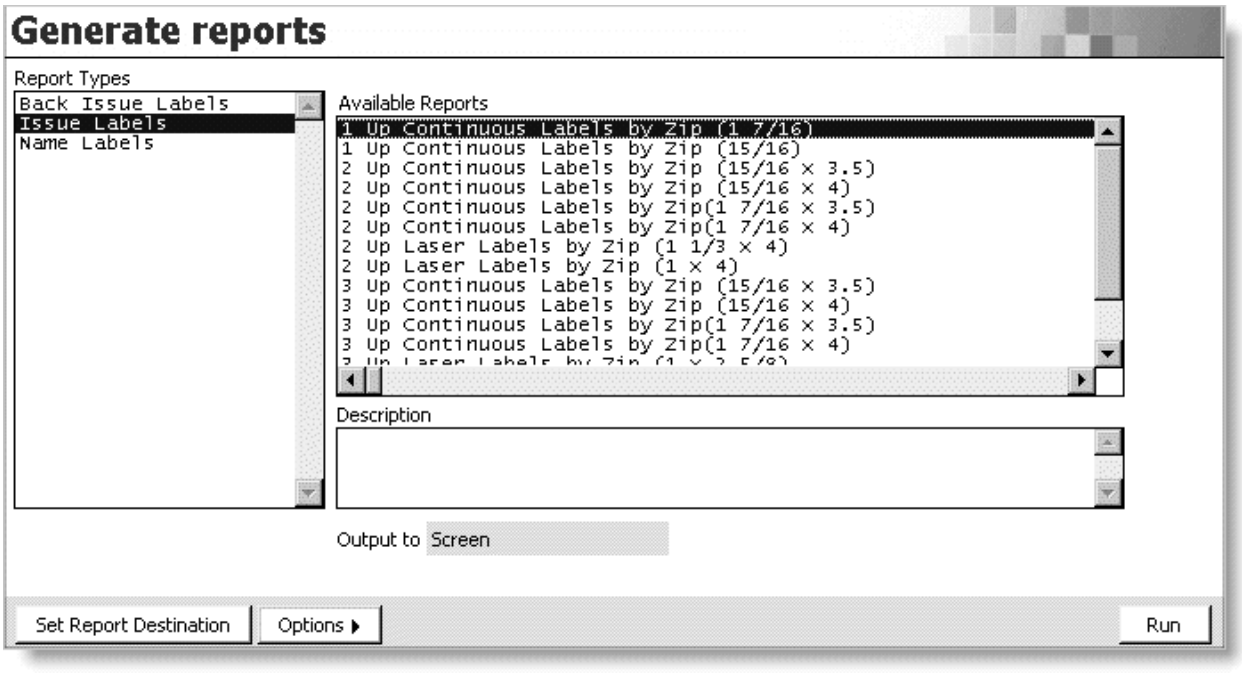
- State
- Mixed state
- Foreign
- Special mail codes
- Multi-copy
- Other reports include:
- Edition analysis
- 5-digit summary
- 3-digit summary
- Zone analysis

Using the Generate reports Window

This section describes the Generate reports window and other secondary report windows. For all report types, the Subscription Selection window opens when you run the report. This selection window allows you to specify the subset of data that you want to include in the output results. Depending on the options you select, a secondary window allows you to select subscribers.

> **Note:** Note: The settings that determine the features of the label print runs are based on the Subscriptions table.

Generate reports window



From Subscriptions, select Generate reports

Report Types

Lists the available report types.

> **Note:** Note: For printing 1 Up labels from a locally installed printer, iMIS supports the Crystal label format, 1 Up Continuous Labels - 1 1/8 by 3 1/2 (Crystal) for the Dymo 400 Turbo Label number 30572.

Available Reports

Lists the reports available for each report type.

Description

Provides a description of the selected report.

Set Report Destination button

Used to select the output device for your report, and to select a device for printing individual address labels. Printer is the default destination option. However, once you select another destination option and click Save, that option becomes the default report

destination. The report destination defaults to the last destination selected and saved each time iMIS is launched.

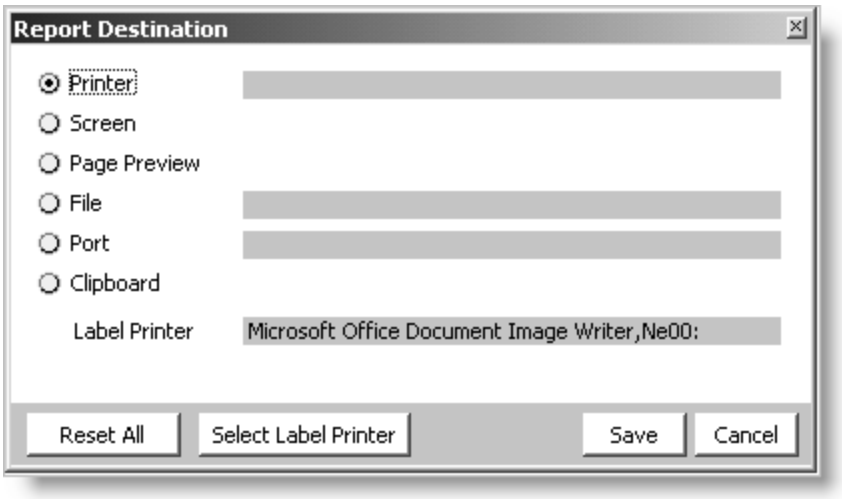
When you select Printer as your default destination, iMIS stores the path to your default printer in the database. If you do not want iMIS to store this information (for example, if you access iMIS through a Terminal Server or Citrix connection that may append a network identifier to the path to your default printer, causing iMIS to designate your printer setting as invalid), you can select the Do not retain printer destination (Terminal Server environments) option on the System Setup window (select File> System Setup). When you enable this option, iMIS does not save the path to your default printer destination to the database. You will still be able to print to your default printer when you select the Printer option on the Report Destination window. If when starting a subsequent session iMIS detects a conflict with your printer setting (for example, if you select a different default printer), an error message will display and you will be able to select a valid printer. You can also click the Reset All button to clear any existing report destination values.

Note: Note: You must have a default printer specified on your workstation to access the Print Setup (select File> Print Setup) and Report Destination window.

If you select the File report destination option, every time you restart iMIS the system recreates that file. If you have a previously existing instance of that file still in the path location, then a message displays asking if you want to overwrite the file. Click Yes to overwrite the file, or click No to rename the file. If you have moved or deleted the file from the previous export, then it creates the file again as a 0 KB file in preparation for the next export.

Note: Note: Set the report destination to Screen to avoid the unnecessary printing of reports.

Note: Note: The label printer destination is for printing individual address labels only, and is independent of the overall report destination. this note for DT_16632



Note: Note: To print the report, select the Printer option rather than printing the report from the screen. The printed reports will not align exactly as they appear on the screen if you print them from the screen; printing from the Printer option will prevent this problem.

Note: Note: The label printer destination only works from the address section of the manage customers window.

Options button

Opens a list of options for the selected report. This list includes report output formats for printing, exporting, saving, and sorting. Some options may not be available for all Available Reports.

Run button

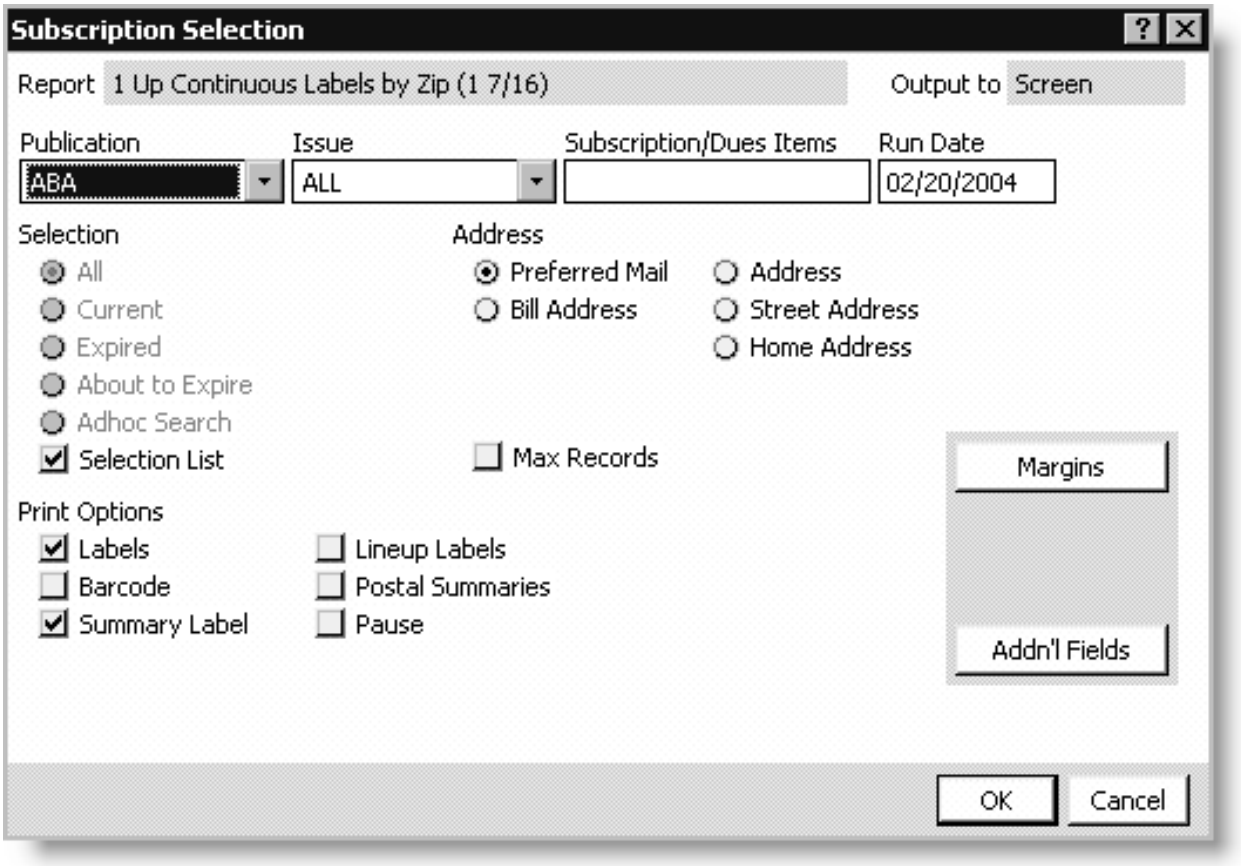
Used to generate the output produced from your search, format, and content choices.

Selection windows for subscriptions and subscribers

The Subscription Selection window opens when you select a report and click Run. From this window you can select a specific issue, created in the Set up subscriptions window (from Subscriptions, select Set up tables > Subscriptions), or select Subscription/Dues items that will be associated with the publication specified. For example, you could

specify a magazine, JOUR, that no one subscribes to directly and then enter the name of the Dues/Subscription product that will be associated with users who will receive the JOUR publication, for example, BASIC. You can enter multiple subscriptions by separating them with commas (no spaces).

Subscription Selection window



From Subscriptions, select Generate reports, select the Issue Labels report type, select the label report, and click Run

Publication

(required) Drop-down list of available SUB items

Issues

(optional) Drop-down list of available PUB items associated with the SUB item

Subscription/Dues Items

(optional) Specifies the subscription code to be associated with the publication.

Run Date

Defaults to system date.

Selection

All – Enable to select all records with the current Publication dues item

Current – Opens an Effective Date field

Expired – Opens an Effective Date field

About to Expire – Opens an Effective Date field

Adhoc Search – Opens the Select Search Instructions window

Selection List – Opens the Subscriber Selection window

Address

Preferred Mail – Enable to create labels with the preferred mailing address

Preferred Bill – Enable to create labels with the preferred billing address

Address – Enable to create labels with the first address in the Name_Address table

Street Address – Enable to create labels with the second address in the Name_Address table

Home Address – Enable to create labels with the third address in the Name_Address table

Max Records

Select this option to open a field that allows you to enter the maximum number of records to be created for this label run

Print Options

Labels –Must be enabled to print labels

Barcode – Enable to print a bar code on the label. (Name.BAR_CODE must be populated)

Summary Labels – Enable to display an End Label Run summary with the name of the label processed, date, time, user name, and total labels printed for total records selected.

Lineup Labels – Enable to display Begin Label Run line up labels used to align the label with the printer.

Postal Summaries – Enable to display postal reports. The reports displayed are dependent on the options chosen in the Subscription Information window.

Pause - Enable to display the message “Label printing complete. Press OK to continue.” This option is used in conjunction with Postal Summaries and will pause the printing of the Postal Summaries until you press OK.

Margins button

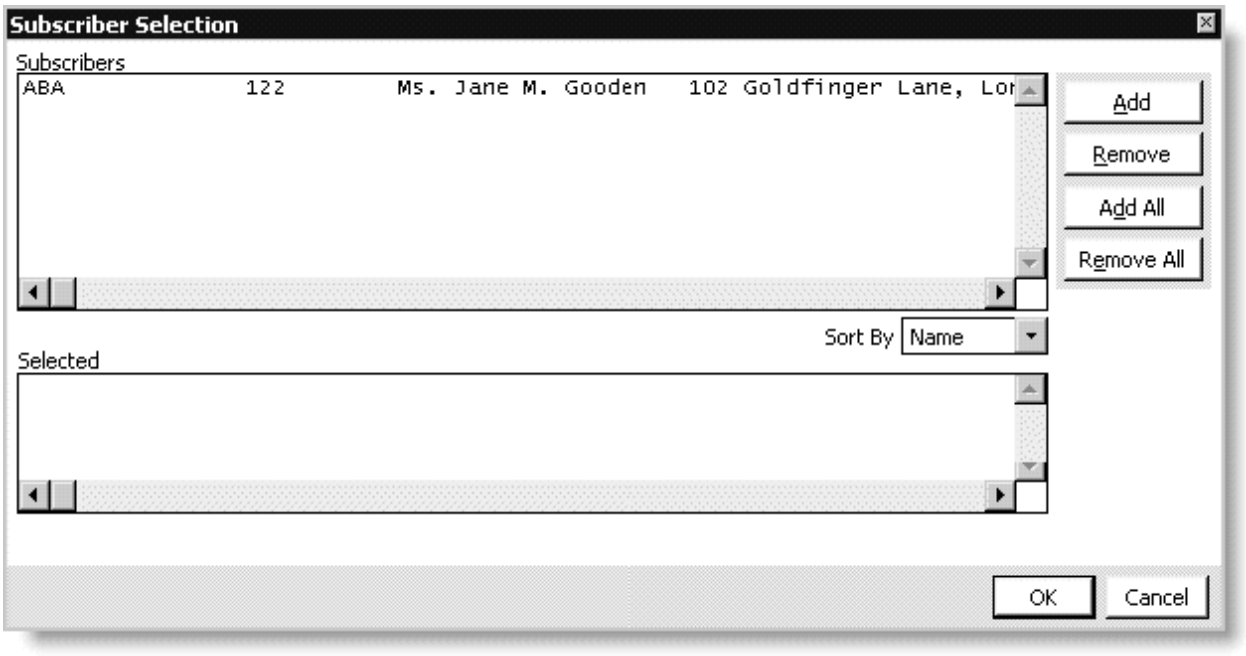
Opens the Margins/Page Layout window that allows you to specify the layout settings for your labels.

Addn’l Fields button

Opens the Additional Fields window where you can select additional fields to print on the labels. The additional fields will print for this label run only.

The Subscriber Selection window displays when you select the Selection List option on the Subscription Selection window. This window allows you to specify the subscribers to be included in the output results.

Subscriber Selection window



From Subscriptions, select Generate reports, choose report, click Run, enable Selection List, and click OK

Subscribers

Displays subscribers based on the selection criteria, for example, ALL Issues

Add button

Used to move Subscribers to Selected

Remove button

Used to remove line items selected under Selected to Subscribers

Add All button

Used to adds all line items under Subscribers to Selected

Remove All button

Used to remove all line items under Selected to Subscribers

Sort by

Name – Select this value to sort subscribers by last name

ID – Select this value to sort subscribers by ID

Sub – Select this value to sort subscribers by subscription when more than one subscription item is entered in Subscription/Dues Items field on the Subscription Selection window

Selected

Lists subscribers for which labels will be printed

To run a subscription label report

1. From Subscriptions, select Generate repots,
2. Select a report type, choose a label report, and click Run to display the Subscription Selection window.
3. If running labels for:

- A current publication and issue, select the Publication and Issue from the appropriate drop-down list.
- A group of members based on a particular Subscription/Dues item, enter the product code(s) in Subscription/Dues Items.

4. Select the Selection List option as needed.

- When processing Back Issue Labels, the Selection List option is automatically enabled and the only one available.
- When processing Issue Labels, all options are available.

5. Enable the appropriate Address option.
6. (optional) Select the Max Records option and enter the maximum number of labels to print.
7. Select the appropriate Print Options.
8. If you selected the Selection List option, click OK to open the Subscriber Selection window. Otherwise, continue to the next step.

- Select the subscriber(s) for whom you want to print labels by selecting the appropriate button to move the subscriber(s) from the Subscribers list to the Selected list.

9. Click OK to run the label report.

Modifying Subscription Label Reports

You can copy and make certain changes to the appearance of the report output. For example, you can customize the top line in the label run. In the following example, you need to select both the Use Multi-Level Postal Sorts and Use Carrier Route Sort fields on the Subscription Information window (from Billing, select Set up module> Products, select a product of type SUB, and click Subscription Info).

To modify subscription labels

1. Select Utilities > Report Specs to open the Report Specifications window.
2. Select the label report to modify.
3. Click Clone.
4. Tab to the Title field and modify the name of the report.
5. Click Parameters. The Detail Report Parameters window opens.
6. Click Options.
7. Select Additional Fields.
8. Press Ctrl-Z to open the window and add the following:

   jst(Name.ID,10,RV.SubCRRT,8,RV.SubLabelMark,1)

9. Click OK on the Additional Fields window.
10. Click Save on the Detail Report Parameters window.
11. Close the windows.
12. The following will print on the labels:

- ID, left-adjusted for 10 positions
- CRRT, from Name_Address for 8 positions
- ###, which is hard-coded as the SubLabelMark

  Note. The format spacing can be changed, but be sure to use the field names RV.SubCRRT and RV.SubLabelMark exactly as spelled.

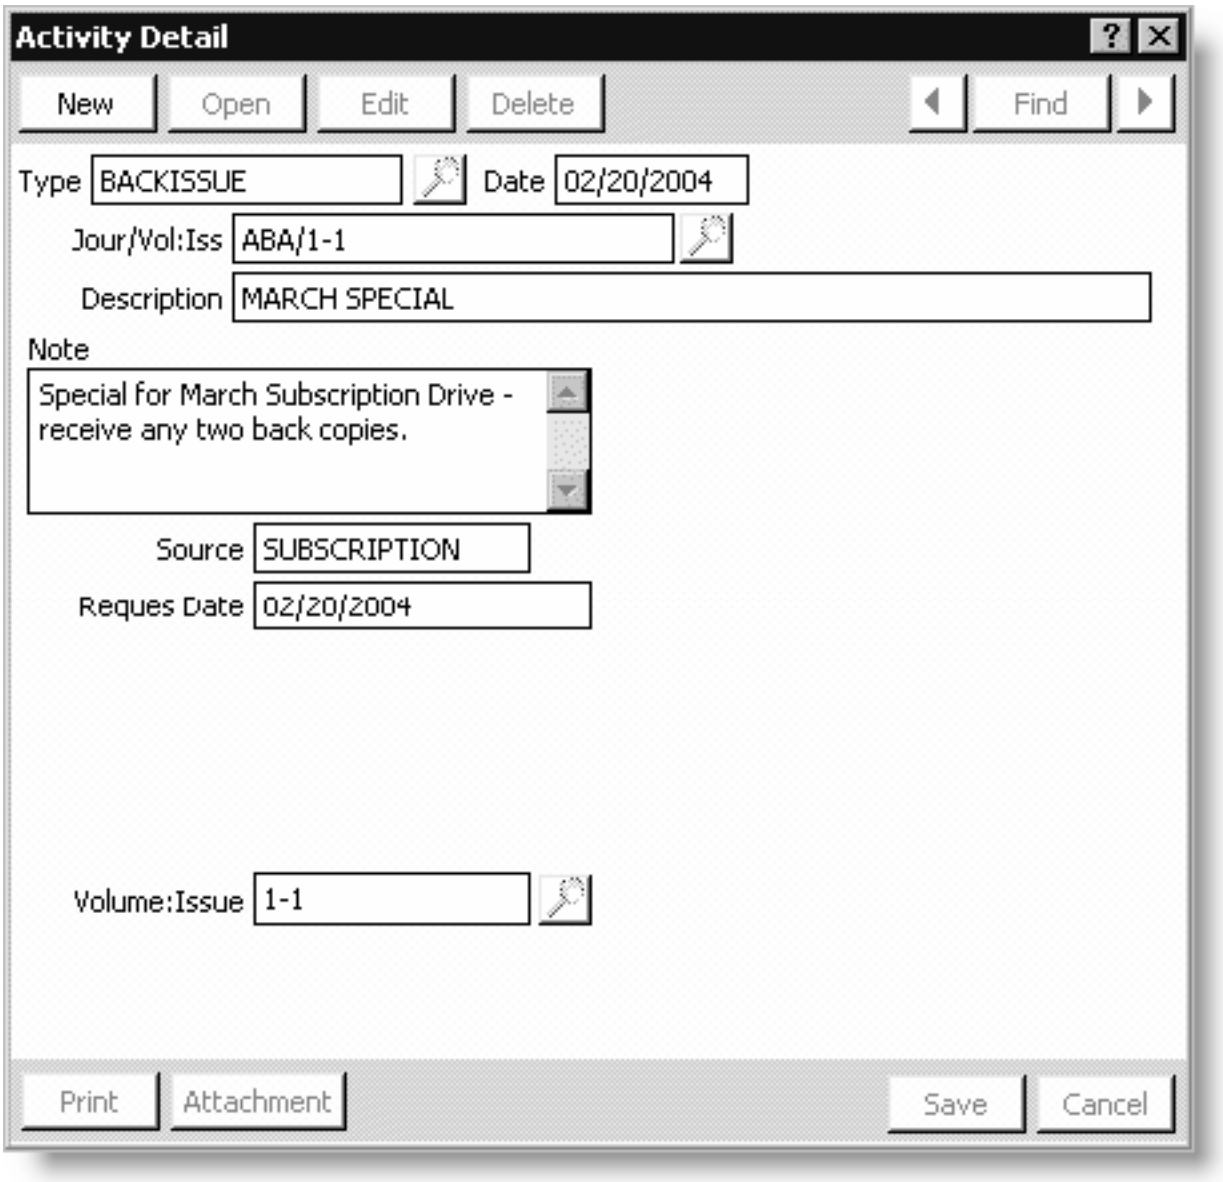
  Note: RV stands for report variable.

Printing Back Issue Labels

You can only print back issue labels once for each journal, volume, or issue. When requesting back issues, you must use the Subscriber Selection window.

The Subscriber Selection window is populated based on the BACKISSUE activity. The field TICKLER_DATE in the Activity table is populated when a back issue is requested (from the Billing tab, double-click the SUB item, and click Back Issues). After back labels are requested, the field is cleared.

Activity Detail window – BACKISSUE



From Customers, select Manage customers, find a customer record, select the Activity tab, and double-click BACKISSUE activity

To issue back labels

1. From Subscriptions, select Generate reports to open the Generate reports window.
2. Select Back Issue Labels from the Report Types area.
3. Select a label report.
4. Click Run to display the Subscription Selection window.

5. Select the Publication.
6. Select the Issue.
7. Select the Selection List option.
8. Enable the Address option.
9. Select the appropriate Print Options.
10. Click OK to display the Subscriber Selection window:

    Note: If using the Selection List option, and there are no customers with an active BACKISSUE activity, a message displays informing you that no subscribers found using the current selection options.
11. Click Add All to add all the customers under Subscribers to Selected.
12. Click OK to display a message that states that the label printing is complete.
13. Click OK to display the 3 Digit Zip Code Analysis report:
14. Close this report to display the 5 Digit Zip Code Analysis report:
15. Close this report to display the Edition Size report. This report will show the number of copies requested, as well as the Zone Code and Mail Code, if specified.
16. Close this report to display the labels. The Begin Label Run labels are the Lineup Labels. The label has a Barcode. The subscription code and issue number print above the name. The End Label Run is the Summary Label.

The BACKISSUE activity record updates after you perform a label run.

- The Description field updates with Printed: MM/DD/YYYY.
- The Request Date (task date) field will become blank.

The Issues/Back Issue Requests window updates with the Printed: MM/DD/YYYY information.

Printing Issue Labels

Use the Issue Labels reports to print labels for current issue requests or to create labels for a publication that has not been billed to each member. All of the selections are available when printing issue labels.

The Subscriber Selection window is populated based on either the publication chosen or the Subscription/Dues items entered.

To print issue labels

1. From Subscriptions, select Generate reports, select the Issue Labels report type, choose a label report, and click Run to display the Subscription Selection window.
2. If running labels for:

- A current publication and issue, select the Publication and Issue from the appropriate drop-down list.
- A group of members based on a particular Subscription/Dues item, enter the product code(s) in Subscription/Dues Items.

3. Select the Selection List option.
4. Enable the Address option.
5. Select the appropriate Print Options.
6. Click OK to display the Subscriber Selection window.
7. Click Add All to add all the members under Subscribers to Selected
8. Click OK to display a message that states that the label printing is complete.

9. Click OK to display the 3 Digit Zip Code Analysis report.
10. Close this report to display the 5 Digit Zip Code Anaylsis report.
11. Close this report to display the Edition Size report. This report will show the number of copies requested as well as the Zone Code and Mail Code, if specified.
12. Close this report to display the labels. The Begin Label Run labels are the Lineup Labels. The label has a Barcode. The End Label Run is the Summary Label.

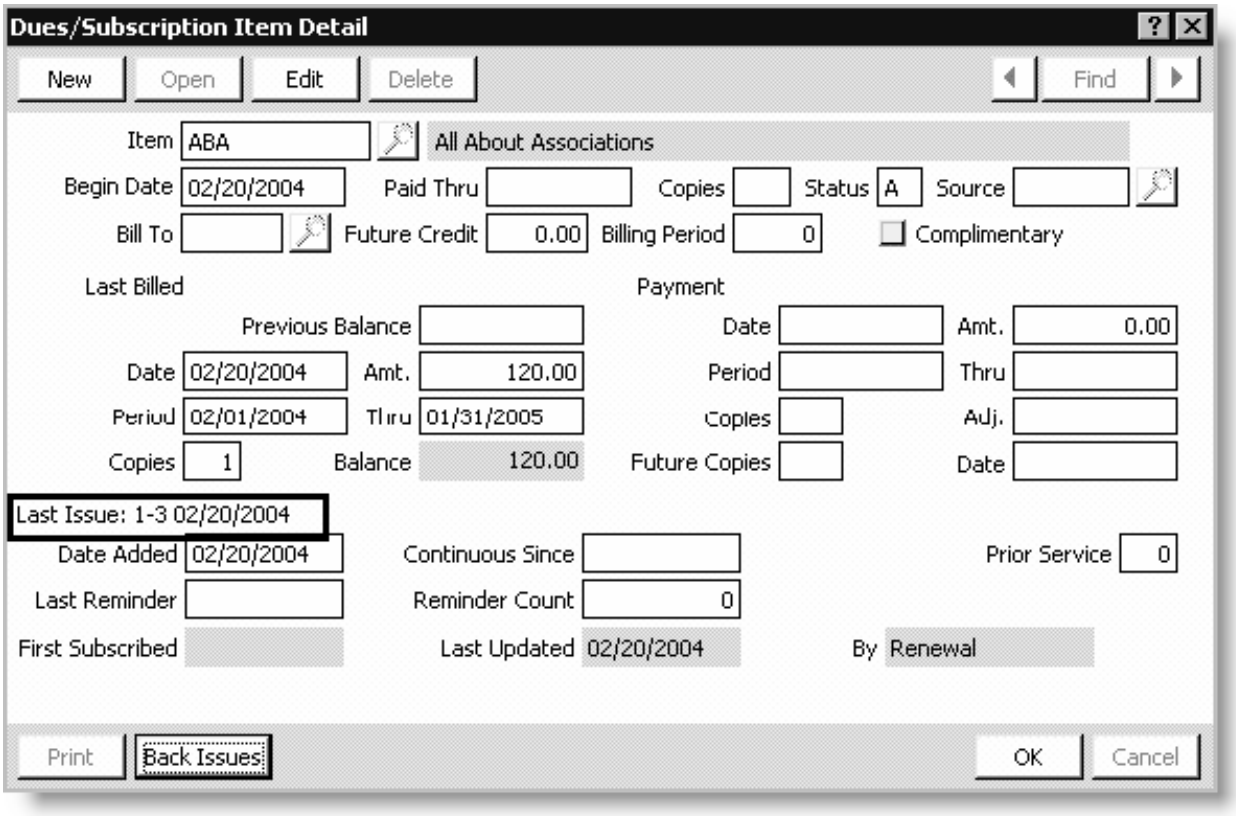
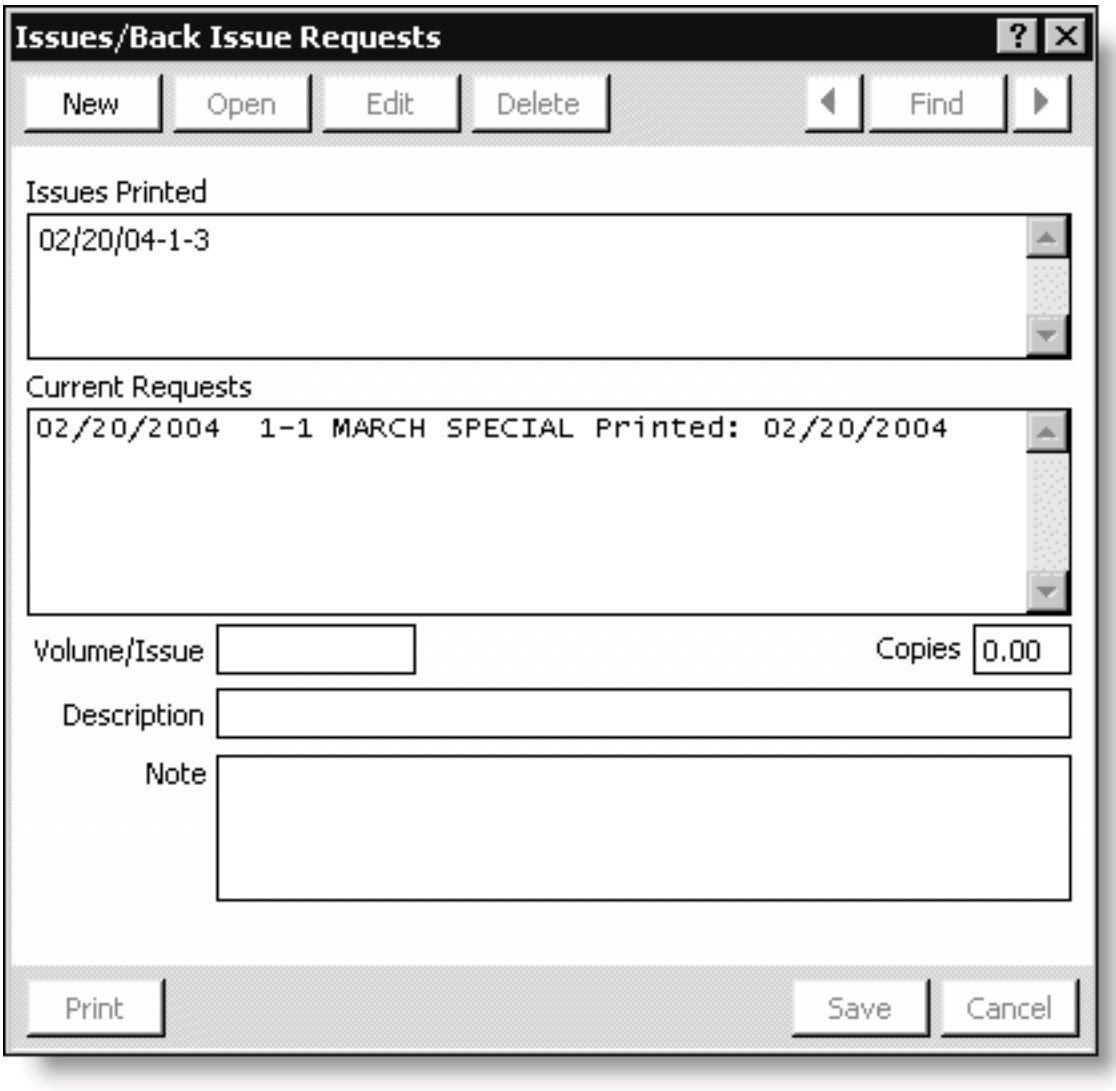
The Dues/Subscription Item Detail window displays the Last Issue: number and print date. (This field is stored in Activity.ISSUE_PRINT).



The Issues/Back Issue Requests window Issues Printed field will be updated with MM/DD/YY-Volume/Issue.



Printing Bag Tags

You can use any of the Issue Labels reports to print bag tags. Before you can print labels for a bag tag, you must define the ZIP3 general lookup/validation table and import 3-digit ZIP code values, and specify your publication on the Subscription Selection window. See Importing Values into the Zip3 Table for information about how to defining the ZIP3 general lookup/validation table.

To print a bag tag

1. From Billing, select Set up module> Products to open the Set up products window.

2. Select a product of type SUB. The Subscription Info button displays.
3. Click Edit.
4. Click Subscription Info.
5. Select the Carrier Route Sort and Print Bag Tags options.
6. Enter free form text in Bag Tags Line 2 and Bag Tags Line 3.
7. Click Save.
8. From Subscriptions, select Generate reports to open the Generate reports window.
9. Select the Issue Labels report type.
10. Select a label report.
11. Click Run.
12. Select the Publication and click OK.

Subscriptions Table Maintenance

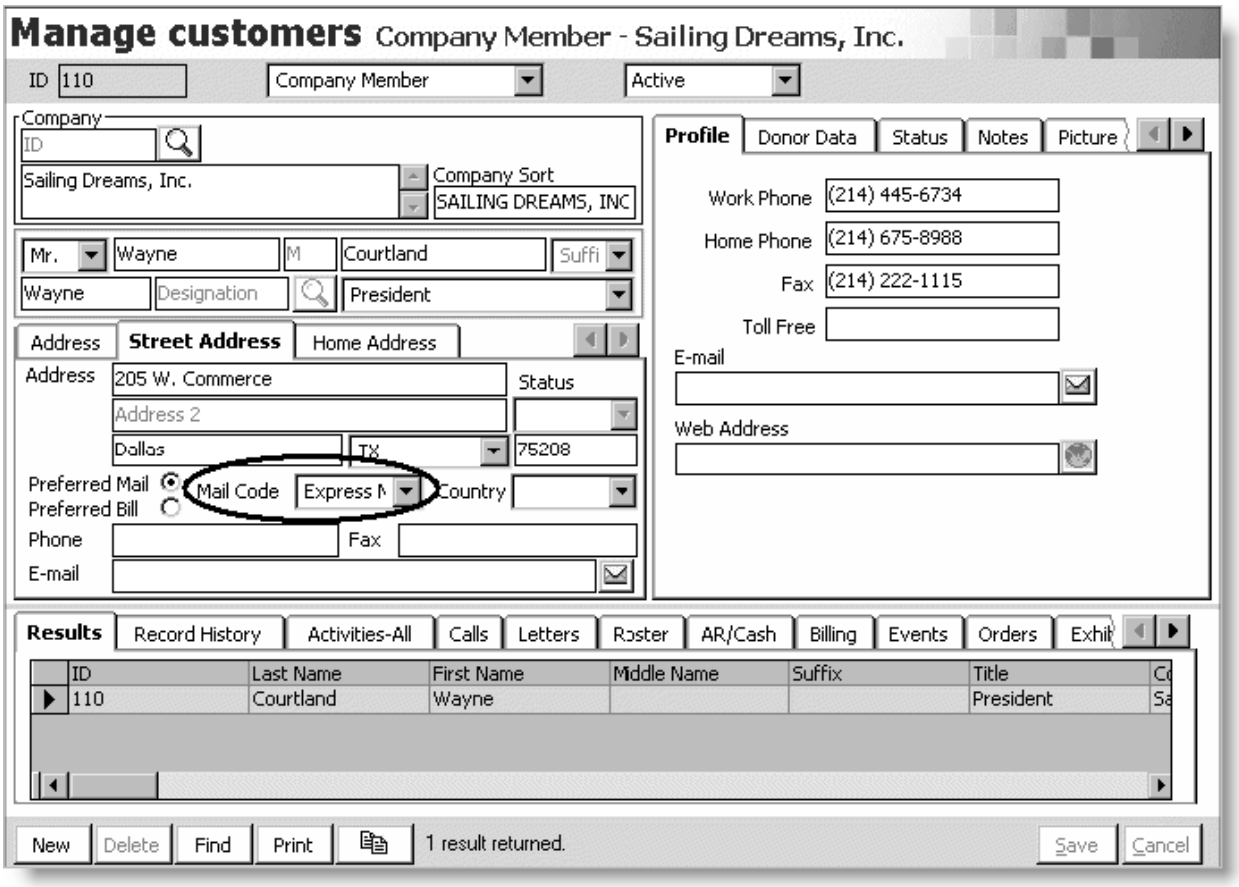
For iMIS Subscription Fulfillment, you need to set up the following tables:

- MAIL_CODE table
- Zone table
- 3-digit ZIP table (ZIP3)

Defining Mail Codes

On the Manage customers window you can associate a mail code with a customer's address. The Mail Code field is an optional, special-purpose field that comes into play for bulk mailings, such as subscription mailing. The field provides special groupings within a mailing. The Mail Code field allows a higher-level sort for ZIP-sorted labels and printouts. With this feature, you can segregate all first-class mail recipients at the end of a label run by giving the first-class records a consistent mail code, while leaving the regular mail records uncoded.

The Mail Code field displays on the Manage customers window once you create the MAIL_CODE general lookup/validation table. You can specify how the field displays by enabling an Address Code on the Customer Setup – Address and Notes window (from Customers, select Set up module> General, and click Address and Notes). The Mail Code field displays on the main address tab only when you enable the Single Mail Code option and on all three primary address tabs when you enable the Multiple Mail Codes option.



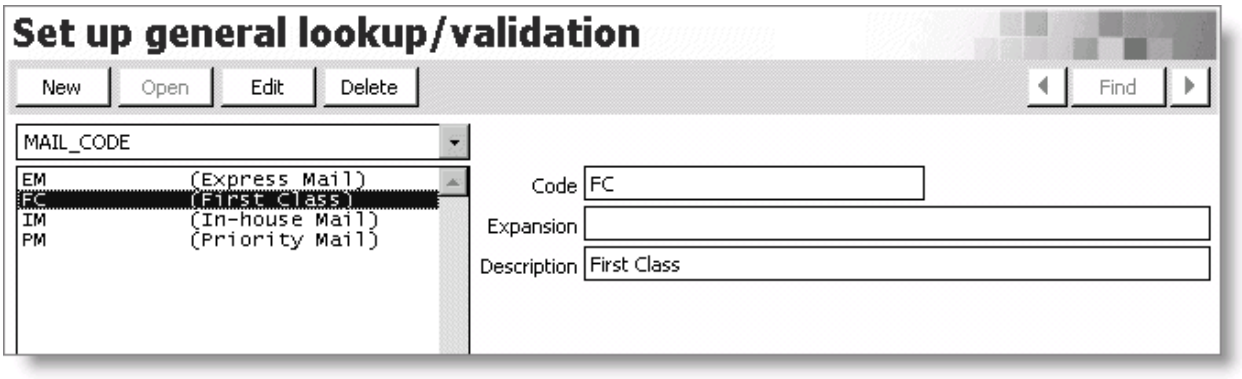
Sample customer record with Mail Code field

To define the MAIL_CODE lookup table

Before you can associate a mail code with a customer's address, you need to create the MAIL_CODE general lookup/validation table.

1. From Customers, select Set up tables > General lookup/validation to open the Set up general lookup/validation window.
2. Select (New Table) from the list of available tables.
3. Enter the name of the new table in the space provided.
4. Click Save.
5. Click New.
6. Enter a Code.

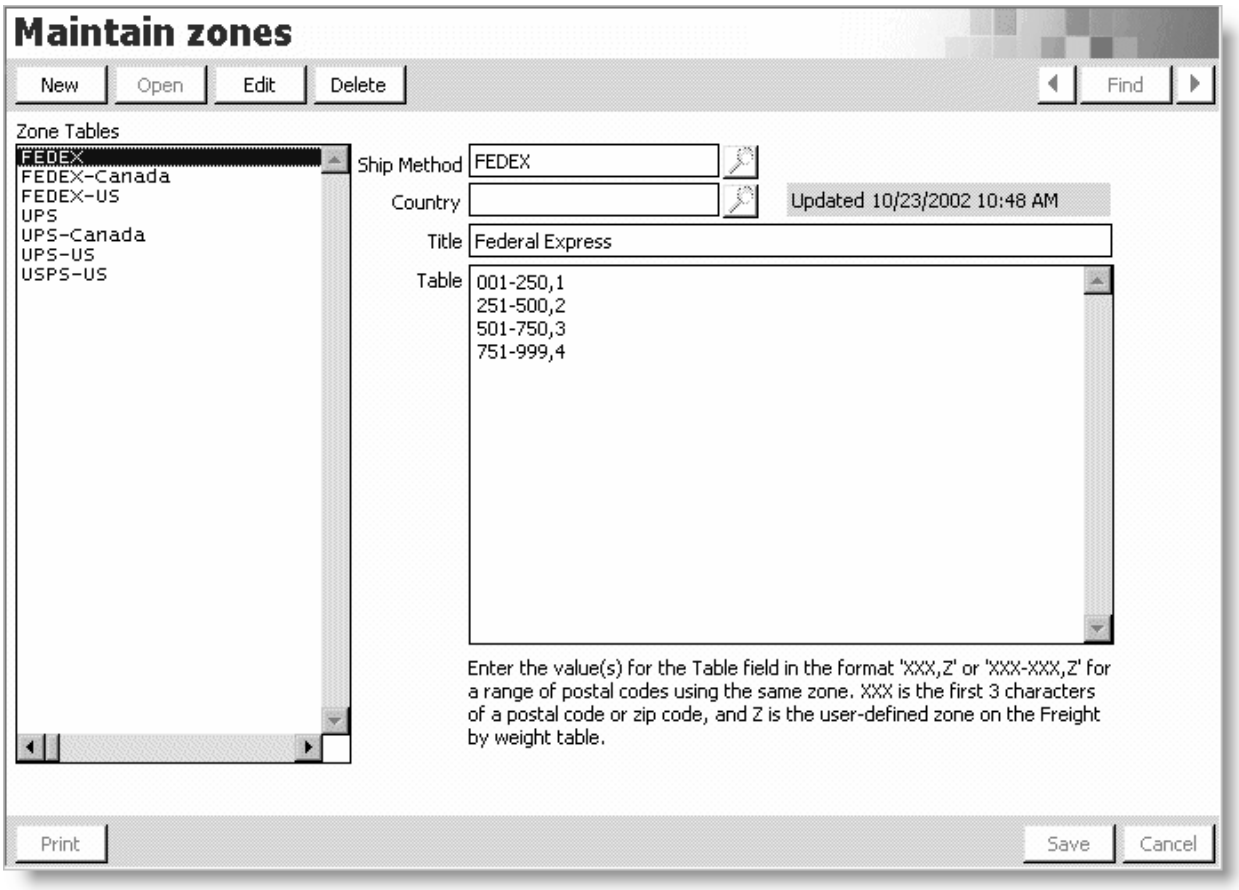
   Note: Make sure the Code you specify for a mail code does not exceed the maximum field length for the MAIL_CODE field (5 characters). If the length of the Code field is greater than the defined field length, the value will not display in the drop-down as an available option.
7. (optional) Enter a Description.
8. Click Save.
9. Repeat the process to enter additional codes.



Defining Zone Tables

You can use zone tables to measure the distance from the shipping location to the destination. If the client ships from multiple locations, you will need to define a zone table for each location.

Maintain zones window



From Subscriptions, select Set up tables > Maintain zones

Zone Tables

List of available Zone tables

Ship Method

Specifies a form of transport or any carrier that you use to ship your orders. You can use the lookup icon to select a shipping method when you have created the SHIP_METHOD general lookup/validation table and defined shipping zones.

Country

Specifies a country for the zone, or use the lookup icon to select a country. You define countries on the Set up country names window (from Customers, select Set up tables > Country names).

Title

Specifies a descriptive title of the zone table.

Table

Specifies the ZIP code and zone information the zone table contains.

To define a zone table

1. From Subscriptions, select Set up tables > Maintain zones to open the Maintain zones window.
2. Click New.
3. Enter the Ship Method of the zone table you are defining, or click the Find icon to select a value.
4. Enter the Country for the zone, or click the Find icon to select a country.
5. Enter the Title of the zone table.
6. Enter the shipping zone information for the zone table in the Table field. The table format for defining zones is XXX,Z or XXX-XXX,Z, where XXX is the first three characters of a postal code, and Z is a user-defined zone.
7. Click Save.

Importing Values into the Zip3 Table

ZIP3 is an optional table used to create bag tags. ASI supplies a ZIP3 tab-delimited file to import into the ZIP3 table along with the BCP commands, but you are free to use your own. The only requirements are that the file be tab delimited and contain a Code, Expansion, and Description.

To import a file into the ZIP3 general lookup/validation table

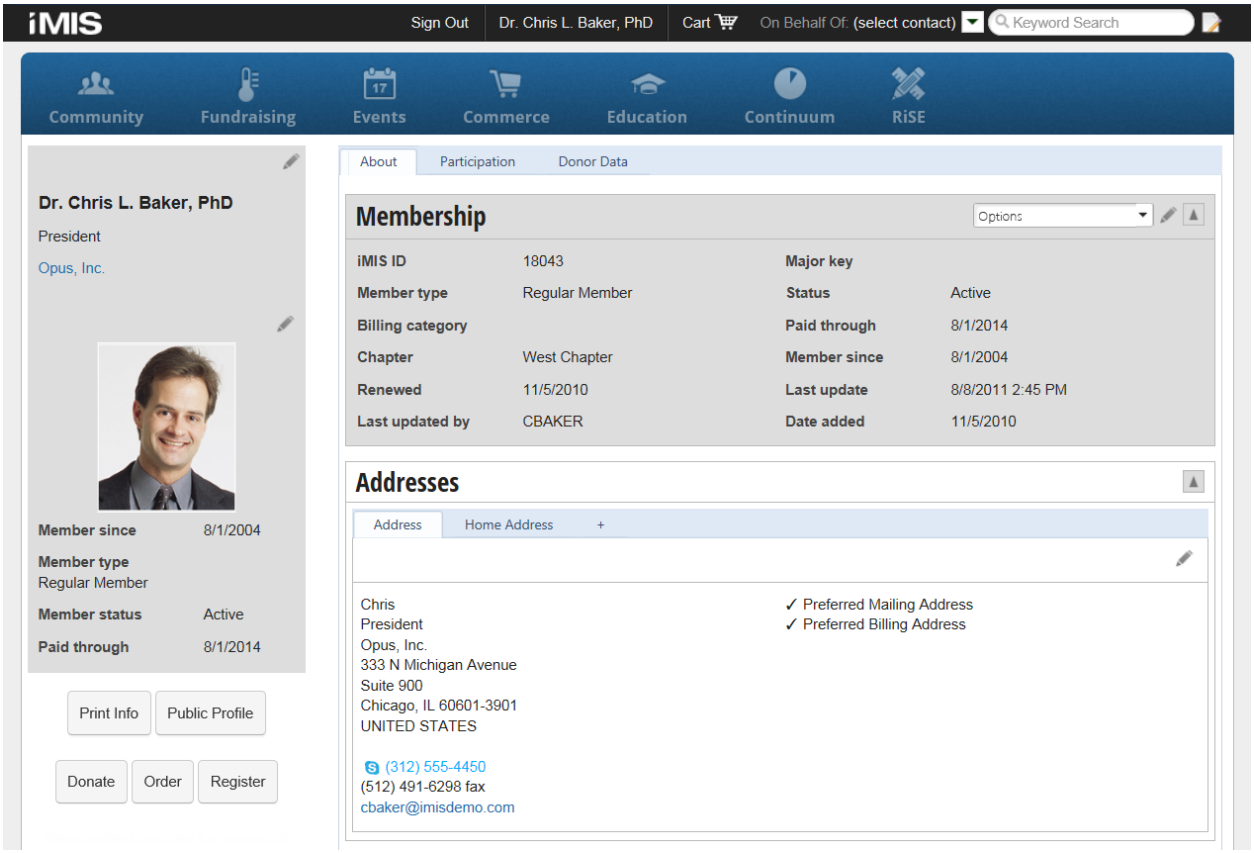
1. From Customers, select Set up tables > General lookup/validation to open the Set up general lookup/validation window.
2. Select New Table from the bottom of the drop-down table list.
3. Enter ZIP3 in the space provided.

4. Click Save.
5. Select Import to display the Importing Tab Delimited Tables... window.
6. Click Continue to display the Select import file box.
7. Navigate to your import file, and click Open.
8. When the import is complete, a message displays asking if you want to select an additional file.

- Click No to end the import process.
- Click Yes to import another tab file.

elbaSupport Services

iMIS is software that runs organizations and their websites, managing the day-to-day information needs of organizations other non-profit businesses. You use it to not only store data but also maintain relationships, run events, raise funds or awareness, and communicate with the members of your group.



iMIS is an end-to-end tool that lets you and your members complete organizational tasks from the web

iMIS streamlines organization management and the business aspects of managing data. It unifies how staff members conduct daily business with how visitors to your website take care of their own needs: joining, registering, donating, subscribing, learning, ordering, and participating.

Where to go next

Technical Support

ASI's Technical Support team is a three-time winner of Service and Support Professionals Association's (SSPA) Software Technical Assistance Recognition (STAR) Award and Support Center Practices (SCP) Certification. SCP Certification measures the effectiveness of customer support based on a stringent set of performance standards and represents best practices for the industry.

Technical Support is available to all iMIS customers who are current on their iMIS Software Update Plan (SUP).

You can receive live technical support via the web or telephone, Monday through Friday, during standard business hours. You can submit, monitor, review, and update a technical support request via the web 24 hours a day, 7 days a week. You can also search a database of previously resolved technical issues.

Hours of Operation

North America

Technical Support is available Monday through Thursday from 8:00 a.m. to 7:00 p.m. (CST) and on Friday from 8:00 a.m. to 5:00 p.m. (CST). (512) 491-0550 ext 2

Online resources are available 24 hours a day. Questions submitted after end of business will be addressed during working hours the next business day. Service is not available during company holidays:

- New Year's Day, 1 January
- Memorial Day
- Independence Day, 4 July
- Labor Day
- Thanksgiving Day
- Day after Thanksgiving Day

- Christmas Eve, 24 December
- Christmas Day, 25 December

Also, service is not available one day per quarter to accommodate internal planning sessions; specific dates and times of these sessions are announced in the monthly newsletter available on the Tech Support Community and posted on the Technical Support web page prior to the date of the session.

Asia-Pacific

Technical Support is available Monday through Friday from 9:00 to 17:00. (Australian Eastern Standard Time) Dial extension 2 for Customer Support. +61 3 9869 7500

Online resources are available 24 hours a day.

Holidays for Asia-Pacific include:

- New Year's Day, 1 January
- Australia Day
- Labour Day (VIC)
- Good Friday
- Easter Monday
- Anzac Day
- Queen's Birthday
- Bank Holiday (NSW)
- Labour Day (NSW)
- Melbourne Cup Day (VIC)
- Christmas Day, 25 December
- Boxing Day, 26 December

Europe

Online resources are available 24 hours a day. Technical Support is available Monday through Thursday from 9:15 to 24:00 (BST) and Friday from 9:00 to 23:00. +44 (0)2032 670067

Holidays for Europe include:

- New Year's Day, 1 January
- 2nd January (Scotland), 2 January
- Good Friday
- Easter Monday (England/Wales)
- Early May Bank Holiday
- Spring Bank Holiday
- Summer Bank Holiday (Scotland)
- Summer Bank Holiday (England/Wales)
- St. Andrew Day (Scotland)
- Christmas Day, 25 December
- Boxing Day, 26 December

Call Response Times

ASI prioritizes all calls as follows:

- System Down. All resources applied. Immediate initial response, with same to next-day targeted resolution for most issues.
- Inability to Perform a Critical Business Process. All scheduled resources applied. Immediate to ten-minute initial response, with same to next day targeted resolution for most issues.
- General how-to questions and techniques, installation questions and minor product bugs. All scheduled resources applied. Immediate to two-hour targeted initial response.

Requesting Support

To request technical support, browse to advsol.com/support and select Tech Support > Request Technical Support.

Once you submit a technical request support form, you will be given an SMR (Software Maintenance Request) case number and a time frame within which you will receive an e-mail response.

To check the status of or make updates to technical support requests, browse to advsol.-com/support and select Tech Support > Check Support Status.

To initially request technical support, you must submit your request online. However, you may call Technical Support for the following:

- To discuss an existing technical support request with an analyst
- To ask questions about services available through Technical Support
- To learn how to submit a technical support request online
- To get assistance with ASI website access issues

Please provide your name, organization name, and SMR (Software Maintenance Request) case number when contacting us.

- TechSupport@advsol.com
- advsol.com/support

Submitting Product Defects and Requests

- Product defects or enhancements are reported and documented by iMIS users. Defects are prioritized and a note on its priority is sent to the call initiator. High-priority items are scheduled for future maintenance releases; however, we cannot guarantee that a particular defect will be addressed in the next release.
- Requests for Enhancements and lower priority defects are reviewed on a periodic basis. Prior to work on each release, all open defects and enhancements are reviewed and pri-

oritized based on potential benefits. Not all reviewed program changes can be chosen for inclusion.

Additional Support Services

- Problem Escalation procedure for calls outstanding over one week are escalated to a senior analyst for concentrated research
- Known problem documentation, workaround procedures, and updates when product defects are prioritized and fixed
- Monthly Technical Newsletter available on the Tech Support community
- Product notification and availability of web releases
- Current product release maintenance on website
- Database search availability of reported incidents via website
- Tech Alert notification for serious and urgent product problems

Services Not Covered by Technical Support

- Live or phone-based training, business analysis, and system setup – please contact your Authorized iMIS Solution Provider or ASI Consulting
- Implementation and conversion – please contact your Authorized iMIS Solution Provider or ASI Consulting
- Programming of enhancements – please contact your Authorized iMIS Solution Provider or ASI Consulting
- Weekend or after hours support – please contact your Authorized iMIS Solution Provider or ASI Consulting
- Questions about non-iMIS software, hardware or peripheral problems, or database administration – please contact product vendor
- Product pricing and pre-sales questions – please contact your Authorized iMIS Solution Provider or ASI Sales

- Unsupported versions of iMIS – supported versions include the current release and one major release back – please contact your Authorized iMIS Solution Provider or ASI Consulting
- ASI beta products – please contact ASI Product Management
- Specialized query or report writing – please contact your Authorized iMIS Solution Provider or ASI Consulting
- Data corruption analysis and repair that has occurred with prior releases – please contact your Authorized iMIS Solution Provider or ASI Consulting
- Support for third-party add-on and unsupported products – contact product vendor. Supported products include: iMIS LAN, iMIS for Microsoft SQL databases, and iMIS for MSDE

  For client security, ASI does not grant logon access to the password protected areas of any ASI website, including ASI Technical Support websites or iMIS Community websites, to individuals serving as outside third-party consultants or outside third-party technical support service providers for our clients. These restrictions also apply to individuals working for ASI's client organizations temporarily or on a contract basis. These restrictions also apply to volunteers and non-staff Board members.

  ASI policy allows access to Technical Support services, including web-based services, to permanent staff members of ASI's client organizations and Authorized iMIS Solution Providers only. All communications regarding support requests or submitted issues may only occur between ASI Technical Support and ASI customer contacts or Authorized iMIS Solution Providers. Additionally, ASI's Terms of Use does not allow for the transfer or sharing of logon user names and/or passwords.

Non-Plan Services

The following services are available to all iMIS customers regardless of their iMIS Software Update Plan status.

Training

ASI offers a wide range of training courses designed for new and experienced users. Classes are held on a regular schedule at ASI offices worldwide, and at other locations based on demand. Training can also be customized to your specific needs. To register for any iMIS course, choose from these options, according to your location:

North America

- Register online.
- Fax your registration form to (703) 739-3218 or mail to ASI Training, 901 North Pitt St., Suite 200, Alexandria, VA 22301
- E-mail your registration information to training@advsol.com.
- If you do not see a class that you wish to attend listed in the timeframe or location that you desire, please e-mail training@advsol.com.

Asia-Pacific

- Download a full schedule and registration form.
- Fax your registration form to ASI at +61 3 9629 5919 or mail to ASI at Level 22, 459 Collins St, Melbourne, 3000, Australia.
- E-mail your registration information to training@advsol.com.
- If you do not see a class that you wish to attend listed in the timeframe or location that you desire, please contact your Customer Care Manager or e-mail training@advsol.com.

Europe

- ASI Europe can provide training on demand, customized to your specific needs. To learn more, e-mail training@advsol.com.

Consulting

ASI and its AiSPs all deliver a comprehensive array of consulting services to existing iMIS customers. These include iMIS system audits, custom report creation, website design, and more.

To learn more about consulting services in North America, contact your AiSP or ASI; in Europe and Asia-Pacific, contact ASI.

User Groups

NiUG, the International iMIS User Group, is the largest independent, not-for-profit, volunteer-run user group. Consisting of hundreds of company members, NiUG sponsors an independent, non-commercial list serve for all iMIS users, solution providers, vendors and ASI employees, which is a forum for discussing iMIS and iMIS-related issues. Regular (Organization) membership dues are based on how many licensed users the organization has for iMIS; Associate and Vendor member companies may join, but they are not able to vote; moreover, vendors do not have access to the NiUG listserve.

In addition to the ability to acquire abundant free technical advice via its list serve in a peer-to-peer format, members can get a discount on a number of iMIS-related products and services. NiUG also holds conferences three times a year at various locations throughout North America.

For more information, visit NiUG: niug.org

Webcasts

ASI offers a variety of product-related webcasts on a regular basis. To participate, all you need is access to a phone and a dedicated internet connection. You view the presentation through the internet and call a special toll-free number to hear the audio presentation and participate.

To view the latest schedule, visit Webcasts: advsol.com/webcasts

Discovery Conference

The Discovery Conference is an annual event bringing together the entire iMIS community of customers, AiSPs, ASI staff, and ASI business partners. Separate Conferences are held in North America, Europe, and Asia-Pacific.

This conference is a great opportunity to learn about the latest advances in iMIS, collaborate with fellow users of iMIS, and give feedback directly to the producers of the iMIS

solutions. In addition, it is an excellent opportunity to learn about complementary solutions offered by ASI's business partners.

For more information, visit NiUG: niug.org

Software Updates

All production and maintenance releases of iMIS are made available to SUP members.

iMIS production releases take advantage of technological advances as well as incorporate new features based on feedback from the entire iMIS community of users. The iMIS community is comprised of more than 30,000 people, from over 10 countries, representing a wide variety of non-profit organizations as well as AiSPs and ASI staff.

iMIS production releases are available for download. iMIS maintenance releases address important product issues between production releases; they are available for download.

To access the latest iMIS releases, visit Product Releases: advsol.com/productreleases.

Contacting ASI

Contacting Customer Support

To submit general questions, provide feedback, or voice concerns, please contact the Customer Contact Center. All requests receive a response within one business day.

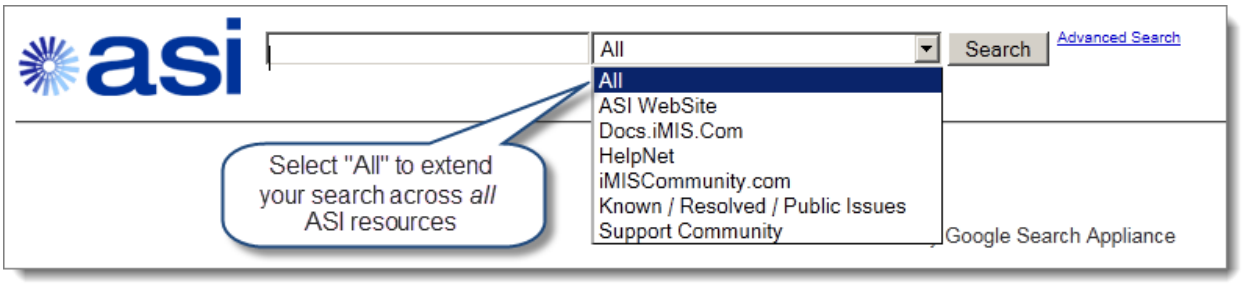
  Google search for iMIS

  ASI offers powerful information searching through a custom Google Search Appliance. Google Search gives you a single place from which to access information from one or all of ASI's sources: user documentation, developer postings, support issues, and community areas.



- Browse to advsol.com/support and select Tech Support > Google Search.

  Support Issues Search

  You can view real-time listings of software issues for each release. You can search resolved issues and known issues, by release version.

- Browse to advsol.com/support and select Tech Support > Search Issues.

  Knowledgebase Search

  You can access the powerful iMIS Knowledgebase online. This tool allows you to search the entire library of online resources, including HelpNet discussions, previously resolved technical issues, and other product and technical information.

- Browse to advsol.com/support and select Tech Support > Search Knowledgebase.

  Help and Documentation

  You have unrestricted access to the iMIS Helpsite, which provides the latest documentation for online browsing and searching; corrections and additions become available immediately.

  The Helpsite also includes downloadable, print-ready references that pull together comprehensive information and appendices on each feature set; they remain available on the Helpsite, so you do not have to log in to HelpNet for documentation.

- Browse to advsol.com/support and select Documentation, and follow the ordering link that appears under iMIS 20 Documentation.

  HelpNet Community

iMIS HelpNet is an online self-service community devoted to empowering you to solve your own issues and develop application expertise. iMIS HelpNet hosts a discussion forum where you can post questions to the entire iMIS community of users, Authorized iMIS Solution Providers (AiSPs), and ASI Staff as well as search previous discussion threads.

HelpNet also contains archives of iMIS 10 and 15 documentation, including user manuals, release notes, and installation instructions.

- Browse to advsol.com/support and select Tech Support > HelpNet Community.

Customer Support

Software Update Plan Services

Advanced Solutions International (ASI) values lifelong customer relationships. This is why we focus on providing customers with all the tools and resources necessary to keep iMIS forever. The decision to purchase iMIS is an investment in your organization's future, and the iMIS Software Update Plan lets you maximize and protect that investment.

Plan members receive access to industry-leading online resources, award-winning and certified technical support, and regular software updates.

For more information on the iMIS Software Update Plan (SUP):

- Browse to advsol.com/sup
- Contact: softwareupdateplan@advsol.com

iMIS Training – Learning iMIS

Advanced Solutions International provides a vast range of iMIS training courses. They are offered both as at-your-desk, web-based seminars, and face-to-face, in a classroom setting with an instructor.

The list of available courses is constantly expanding, and the existing training seminars are updated regularly to match the ever-improving iMIS product.

iMIS

System Admin Console

Your Advanced Accounting Console includes System Admin, an area of easily accessible, widely used tools, for administering your organization's websites:

With Workflow, you can view workflow queue items that are running, or that are waiting to run. You can also view failed workflow queue items and delete or reschedule any failed workflow items. Also within Workflow, you can use the Task View to view, edit, delete, and add tasks.

iMIS Management includes a summary of information, including your iMIS version, database server, whether or not workflow service is running, active user information, and, among other data, the web server file path. In addition, iMIS Management includes the opportunity to find contacts and users, and create and modify iMIS user records. From iMIS Management, you may also grant specific administrative privileges to users.

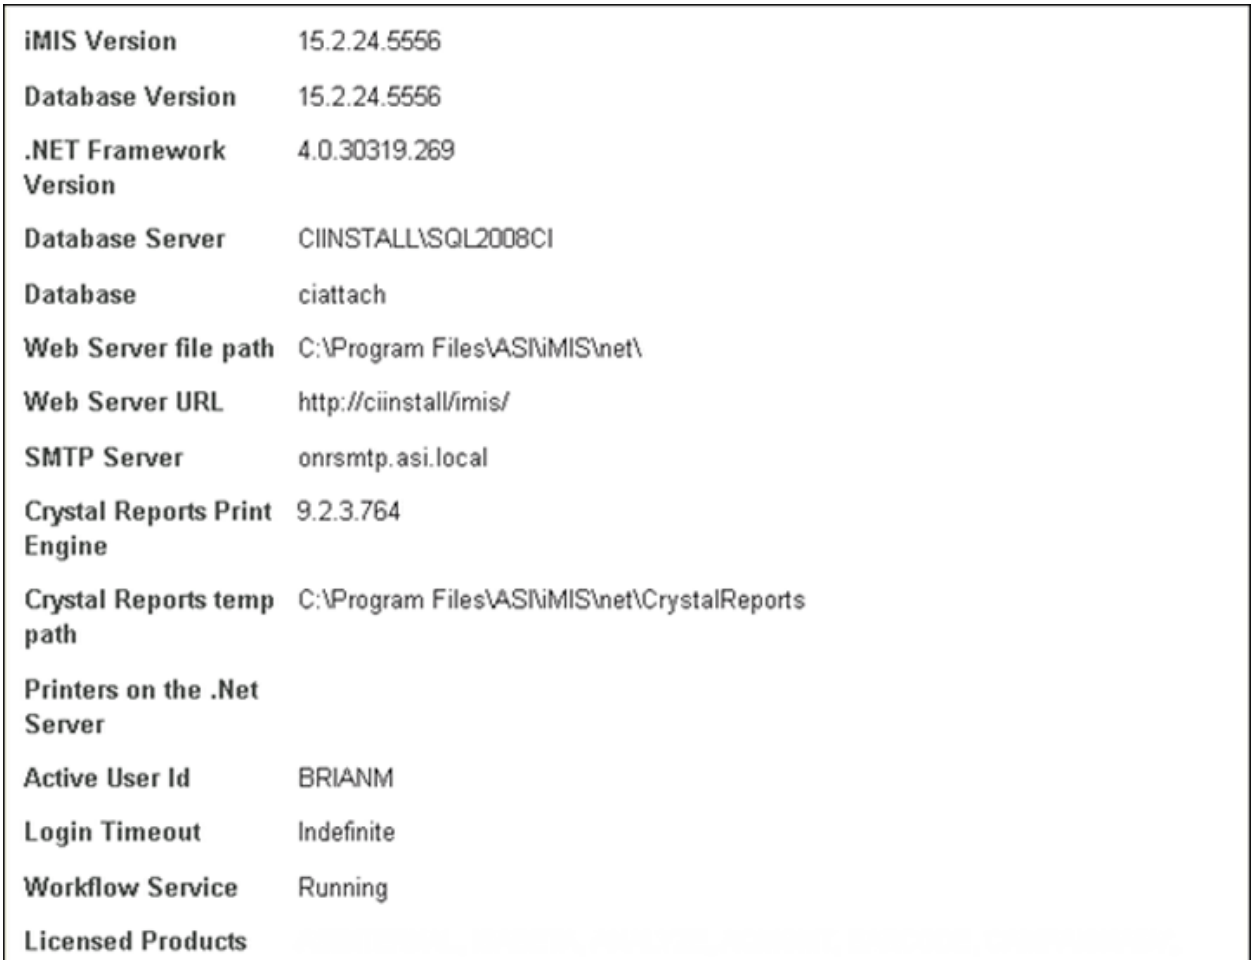
From Utilities you can also create business objects for user-defined-tables, upgrade iMIS, use the Package Installer Utility to select packages for installation, view currently installed packages (and view failed installations), and with Import Activities you can also import request activities – particularly useful if you have a large number of identical requests that you need to enter and track.

Site Builder	Workflow
Defining sitemaps (navigation items)	Monitor workflow
Managing websites	Work item console
Manage shortcuts	Monitor processes
	View tasks
iMIS Management	Utilities
System summary	Document system
Printers	User defined tables
Security administration - users	Update iMIS
Security administration - roles	Package installer
	Import activities

iMIS Management

System summary

The iMIS System Summary window displays system information.



iMIS Version	15.2.24.5556
Database Version	15.2.24.5556
.NET Framework Version	4.0.30319.269
Database Server	CIINSTALL\SQL2008CI
Database	ciattach
Web Server file path	C:\Program Files\ASI\iMIS\net\
Web Server URL	http://ciinstall/imis/
SMTP Server	onrsmtp.asi.local
Crystal Reports Print Engine	9.2.3.764
Crystal Reports temp path	C:\Program Files\ASI\iMIS\net\CrystalReports
Printers on the .Net Server	
Active User Id	BRIANM
Login Timeout	Indefinite
Workflow Service	Running
Licensed Products	

Example of iMIS system information

Printers

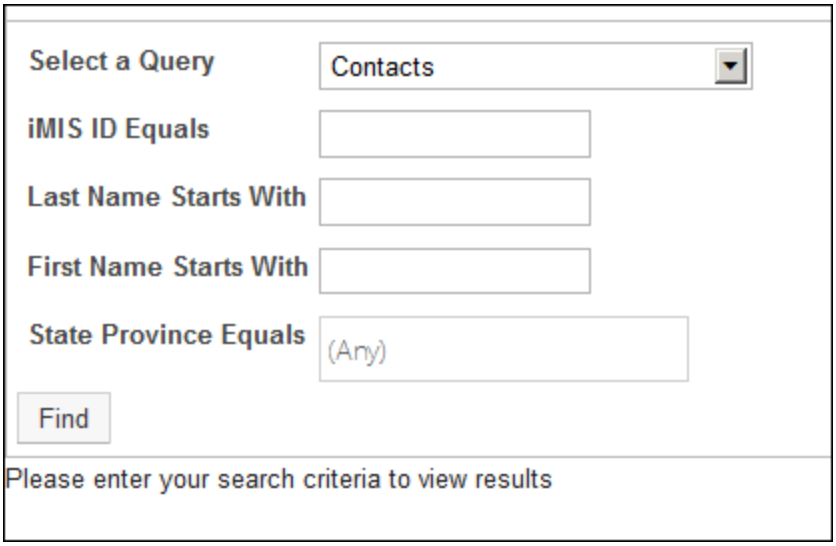
- You must enter the printer server name and printer name (for example, \\PRNTSRV\HP4650). You can copy this from the printer information and paste it in the printer field.
- iMIS does not perform any printer validation checking when you add a printer. Be sure

that you enter the printer server and printer information correctly.

- You must have permissions on the printer server to cancel an iMIS print job.

Security administration - Users

This window provides options for finding contacts or users, and creating and modifying iMIS user records.

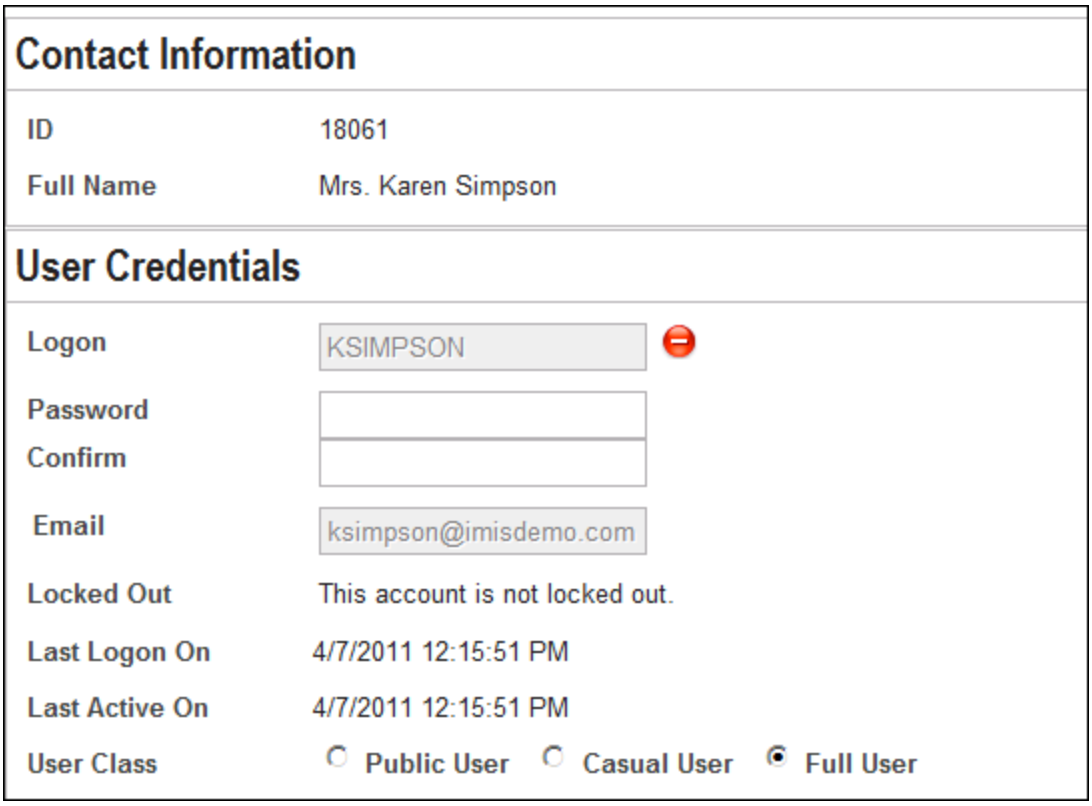


1. From the query drop-down, you can choose to find Contacts, All Full and Casual users, or Users. Depending on the query you select, additional search filters are provided to help you narrow the search results.
2. After you click Find, you can select the record from the search results.

   The contact information displays with three main sections: User Credentials, User Information, and Staff Access.

   User Credentials

   The credentials shown are retrieved from the ASP.NET authentication store. If the contact listed in the Contact Information area is not an iMIS user, the fields in the User Credentials area are empty. To change the logon information, click the red minus (-) icon.



- Logon - Displays this authentication record's logon name, or No User Selected when the authentication record is not linked to a user record.
- Password/Confirm - Input fields for changing an existing password.

  Tip: By default, passwords must contain at least 6 characters. You can change the default password complexity requirements by editing the Web.config file for the iMIS application.
- Email - When you create a new authentication record, if the iMIS contact record includes an email address, iMIS populates the Create User Logon window with that address. However, the value that is displayed in this area of the Users window is always the value that is stored in the ASP.NET authentication store.
- Locked Out - Indicates whether this authentication record is temporarily blocked from gaining access to iMIS.

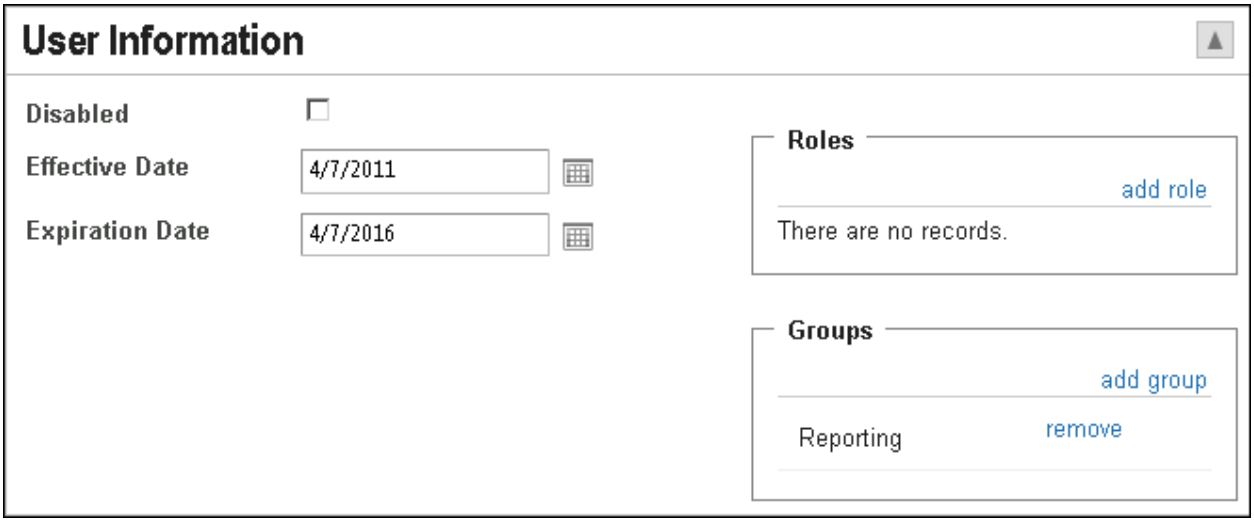
  Tip: By default, iMIS locks out an authentication record after 5 failed attempts to log on. You can change the default by editing the Web.config file for the iMIS application.

- User Class - Specifies the license to apply to this user, which controls all subsequent authorization.

  Note: Only those contacts with the user class of Full User are able to see the Staff Access areas and be assigned to the On Behalf Of role.

  User Information

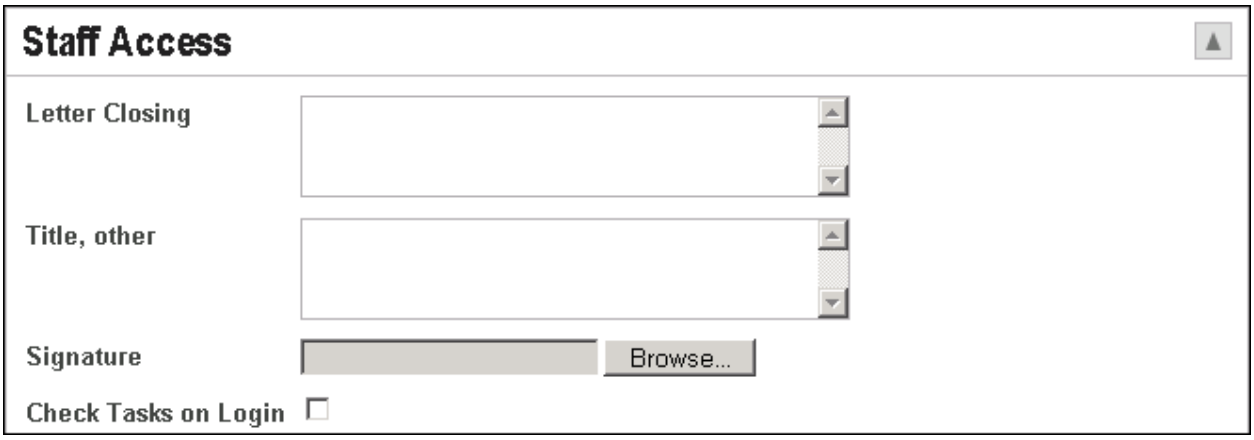
  You can sets the membership dates and assign the user to specific roles and group (see "User-level security: Roles and Groups").



> **Note:** Caution! Do not remove a user's SysAdmin role without also lowering the Sys Mgmt level see About authorization levels parts of the system that consider them an administrator will conflict with the parts that do not. Make sure they have both or neither.

  Staff Access

  The Staff Access area includes the user information to include on letters sent by the user and authorization levels to functional in iMIS:

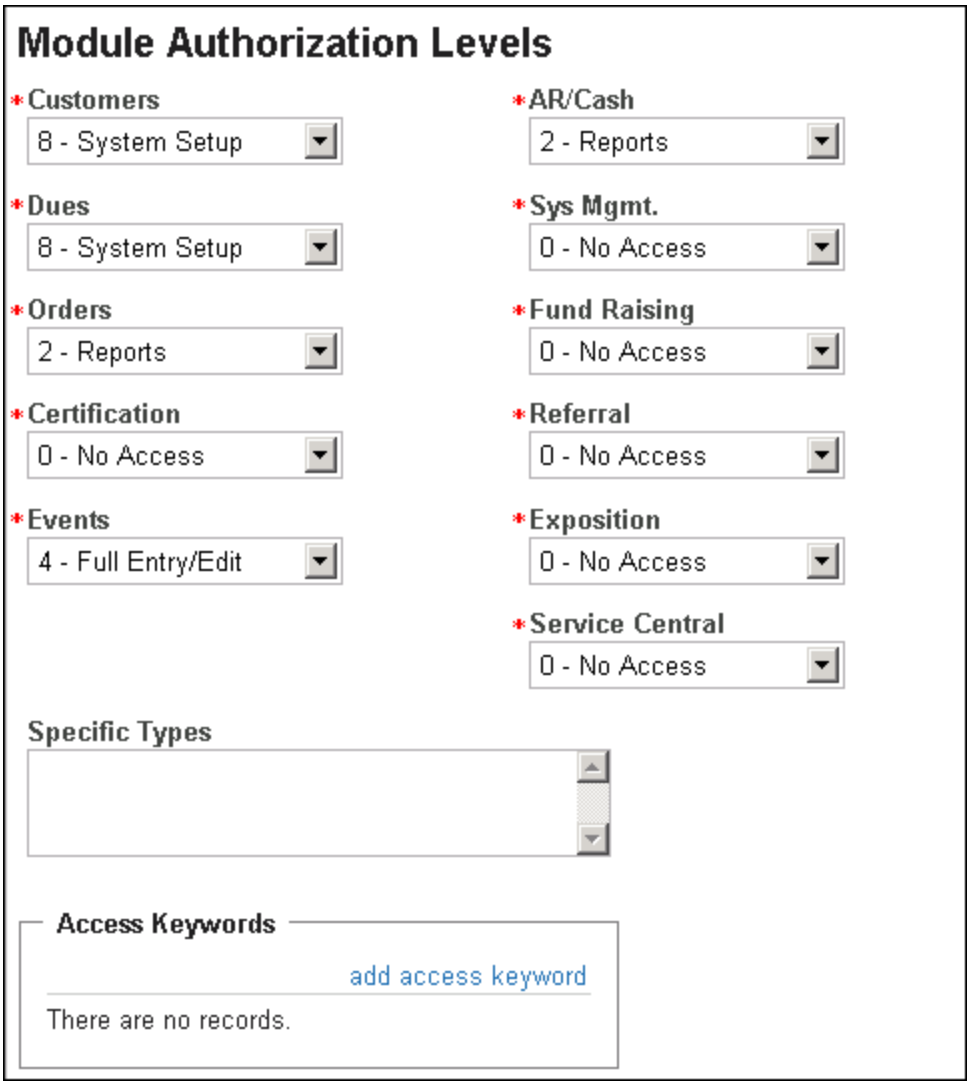


- Letter Closing - The text that closes letters sent by the user. For example, Sincerely.
- Title, other - The user's role, to use in letters. For example, Certification Specialist.
- Signature - An image of the user's signature, to use in letters. The image may be in one of the following formats:
- Microsoft Bitmap (BMP)
- Windows Meta File (WMF)
- Graphics Interchange Format (GIF)
- Portable Network Graphics (PNG)
- JPEG Interchange Format (JPG)

  iMIS converts the image into a BMP file before storing it in the database.
- Check Tasks On Login - Displays the user's View activity tasks window when they first log on. When cleared, displays the standard administrative view instead.

  Module Authorization Levels

  The authorization levels set will determine what functionality the contact will see in iMIS Advanced Accounting Console, which also affects some web features. See About authorization levels for details.



- Specific Types - Controls the customer types that the user can edit in Customers. The types listed in this field can be edited by this user. For example, if you only want the user to be able to edit records with customer type CM, add CM to the Specific Types field. The user will have read-only access to all other records. Separate customer types with spaces or commas.
- Access Keywords - The Access Keywords in Customers that restrict the user from viewing secured windows, tabs, reports, or windows. Separate access keywords with spaces or commas.

Authorization levels: Advanced Accounting Console (../CS2)

Full and Casual users can access the System Admin Console based on their authorization levels.

Authorization levels: Home (../CS2)

The functionality available to a user is limited based on the user's authorization levels, user class, and licensing. The highest authority level a Casual user can have here is 2, but they are still forbidden from accessing payment transactions in Customer Service.

What each user type can do

Finance:

- Full users with AR/Cash auth level 1 can find and view transactions
- Full users with AR/Cash auth level 4 can create transactions, and can edit or delete the transactions that they have created, but not transactions created by other iMIS users - Full users with can edit or delete any transaction

Commerce:

- Full and Casual users with Orders auth level 1 can find and view orders
- Full users with Orders auth level 3 can create and edit orders
- Full users with Orders auth level 4 can delete orders

Membership:

- Full and Casual users with Dues auth level 1 can find and view billing records
- Full users with Dues auth level 3 can create and edit billing records
- Full users with Dues auth level 4 can delete billing records

Events:

- Full and Casual users with Events auth level 1 can find and view event records
- Full users with Events auth level 3 can create and edit event records

- Full users with Events auth level 4 can delete event records

Customer Service:

- Full and Casual users with Service Central auth level 1 can find and view customer requests
- Full and Casual users with Service Central auth level 2 can find and view payments
- Full users with Service Central auth level 3 can create and edit customer requests and payments
- Full users with Service Central auth level 4 can delete customer requests and payments

What navigation items appear

Set up tables (all except Payment method sets)	Full user + AR/Cash auth level 8 + CASH license
Set up tables > Payment method sets	Full user + AR/Cash auth level 5
Set up Payment Gateway	Full user + AR/Cash auth level 5

How authorization affects batches

The AR/Cash authorization level determines your privileges in working with batches that appear across iMIS.

> **Note:** Note: The following descriptions concerning batch management features assume that AR/Cash batch control is enabled. See "AR/Cash Batch Control window".

> **Note:** Note: For authorization levels 3 through 7, if batch management is configured to hide batches created by other users, the only batches that you can view and work with in the Manage Batches and Open Batches windows are your own.

- AR/Cash auth level 0

  If batch management is configured to hide batches created by other users, no batches are visible in the Open Batches window that appears in other features of iMIS. Otherwise, the following batch management privileges are globally available in the Open Batches window:

- View, select, and print batches that are open or ready.
- Filter batches by date.
- Switch to a different batch, if the batch is open.
- AR/Cash auth level 2

  If batch management is configured to hide batches created by other users, no batches are visible in the Open Batches window. Otherwise, you can view, select, and print closed batches in the Open Batches window.

- AR/Cash auth level 3

  Manage batches becomes available in the task list for AR/Cash, and you can perform the following batch management tasks from the Manage batches and Open Batches windows:

- You can create batches and change only your open/ready batches as follows:
- Edit the Descr field.
- Change the state from open to ready, or from ready to open, with Set Ready/Open.
- Additionally, if a batch is yours, is open/ready, and contains no transactions, you can:
- Delete the batch.
- Select a new value from the Cash Table list (which updates the Cash Account field).

- Edit the following fields: Date, Control Count, Control Amount
- AR/Cash auth level 4

  You can perform the following batch management tasks from the Manage batches and Open Batches windows:
- You can change any open/ready batch as follows:
- Post the batch.
- Edit the following fields: Date, Descr, Control Count, Control Amount
- Change the state from open to ready, or from ready to open, with Set Ready/Open.
- Additionally, if a batch is open/ready and contains no transactions, you can:
- Delete the batch.
- Select a new value from the Cash Table list (which updates the Cash Account field).
- AR/Cash auth level 8

  You can perform the following batch management tasks from the Manage batches and Open Batches windows:
- View, select, and print any batch, even when batch management is configured to hide batches created by other users.
- Change the status of any batch from open or ready to posted/closed with the Posted/Closed option.
- Change the status of any batch from posted/closed to open or ready with the Open or Ready options.
- Delete any closed batch that contains transactions.

  Note: (if General Ledger is enabled) Before deleting a batch that contains transactions, you must export it to the General Ledger.

Authorization levels: Membership (../CS2)

The functionality available to a user is based on the user's Dues authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view billing records

  Note: Level 1 users select Enter and edit payments to find and view those records.

- Full and Casual users with auth level 1 auth level 1process accrual dues
- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit billing records
- Full users with auth level 4 can delete billing records

What navigation items appear

Receipts and adjustments	Full user + Orders auth level 4 + ORDER license

Authorization levels: Events (../CS2)

The functionality available to a user is based on the user's Events authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view event registrations

  Note: Level 1 users select Register a customer to find and view those registrations.
- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit event registrations
- Full users with auth level 4 can delete event registrations

What navigation items appear

Register for an event	Full or Casual user + Events auth level 1 + MEET license
Define an event	Full user + Events auth level 5 + MEET license

Authorization levels: Fundraising (../CS2)

The functionality available to a user is based on the user's Fundraising authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view gifts, payments, adjustments, and requests

  Note: Level 1 users select Enter and edit gifts, Process payments, Enter and edit adjustments, and Manage requests to find and view those records.

- Full and Casual users with auth level 2 can run reports and executive reports
- Full users with auth level 3 can create and edit fundraising records
- Full users with auth level 4 can delete fundraising records

What navigation items each user type can see

Process gift payments	Full or Casual user + Fundraising auth level 1 + FUNDR license
Pledge credit memos	Full or Casual user + Fundraising auth level 1 + FUNDR license
Pledge debit memos	Full or Casual user + Fundraising auth level 1 + FUNDR license
Manage requests	Full or Casual user + Fundraising auth level 1 + FUNDR license
Appeal expenses	Full or Casual user + Fundraising auth level 1 + FUNDR license
Process premiums	Full user + Fundraising auth level 4 + FUNDR and ORDER license
Generate recurring donations	Full or Casual user + Fundraising auth level 1 + FUNDR license
Process automatic payments	Full or Casual user + Fundraising auth level 1 + FUNDR license

Authorization levels: Customer Service (../CS2)

The functionality available to a user is based on the user's authorization levels, user class, and licensing. The highest authority level a Casual user can have here is 2, but they are still forbidden from accessing AR/Cash transactions in Customer Service.

What each user type can do

Customer Service:

- Full and Casual users with auth level 1 can find and view customer requests
- Full and Casual users with auth level 2 can find and view payments
- Full users with auth level 3 can create and edit customer requests and payments
- Full users with auth level 4 can delete customer requests and payments

Dues:

- Full and Casual users with auth level 1 can find and view billing records
- Full users with auth level 3 can create and edit billing records
- Full users with auth level 4 can delete billing records
- AR/Cash:
- Full users with auth level 1 can find and view transactions
- Full users with auth level 3 can create transactions, and can edit or delete the transactions that they have created, but not transactions created by other iMIS users
- Full users with auth level 4 can edit or delete any transaction

Orders:

- Full and Casual users with auth level 1 can find and view orders
- Full users with auth level 3 can create and edit orders
- Full users with auth level 4 can delete orders

Fundraising:

- Full and Casual users with auth level 1 can find and view fundraising records
- Full users with auth level 3 can create and edit fundraising records
- Full users with auth level 4 can delete fundraising records

Events:

- Full and Casual users with auth level 1 can find and view event records
- Full users with auth level 3 can create and edit event records
- Full users with auth level 4 can delete event records

What navigation items each user type can see

Customer requests	Full or Casual user + Service Central auth level 1 + SERVCEN license
Billing	Full or Casual user + Dues auth level 1 + SERVCEN and Dues license
Register	Full or Casual user + Events auth level 1 + SERVCEN and MEET license
Gifts	Full or Casual user + Fundraising auth level 1 + SERVCEN and FUNDR license
Sales trans-actions	Full or Casual user + A/R Cash auth level 1 + SERVCEN and CASH license
Orders	Full or Casual user + Orders auth level 1 + SERVCEN and ORDER license
Payments	Full or Casual user + Service Central auth level 2 + SERVCEN license

Security administration - Roles

Security roles grant specific administrative privileges to user records. In iMIS, there are five system roles that you cannot delete: SysAdmin, CompanyAdministrator, OnBehalfOf, Everyone, and Content Administrator. Additional security roles can be added (Settings > Security administration > Roles > Add a Role).

Note: Note: The On Behalf Of role can only be assigned to a Full User.

Two roles are dynamically assigned to users, Everyone and Content Administrator. These roles are hidden and cannot be added to a users' role. The role, Everyone, is

assigned to authenticated and guest users. While the role, Content Administrator, is assigned to members of any Master Admin Content Authority Group.

> **Note:** Caution! Do not remove a user's SysAdmin role without also lowering the Sys Mgmt level parts of the system that consider them an administrator will conflict with the parts that do not. Make sure they have both or neither.

	Name	Description	IsSystem	UpdatedOn
select	CompanyAdministrator	Members of this role can administer the records of all contacts associated with the same company.	True	8/28/2007 9:59:54 AM
select	Content Administrator	Member of a Master Admin Content Authority Group	True	9/29/2008 2:27:02 PM
select	Everyone	Everyone	True	2/9/2005 3:40:27 PM
select	OnBehalfOf	Members of this role can perform commerce transactions on behalf of other contacts	True	10/13/2011 2:29:33 PM
select	SysAdmin	Administrators	True	2/9/2005 3:40:27 PM

From System Setup, select Security administration > Roles

Utilities

Update iMIS

Provides a link to the ASI support page to enable you to update iMIS.

Import activities

You can import request activities. This is particularly useful if you have a large number of identical requests that you must enter and track.

> **Note:** Note: Your administrator must set up request activities.

To import activities

1. Choose your ID input method from one of the following:

   Input from file

- Click Browse. A browse dialog opens.
- Browse to and select the text file containing ID numbers, one ID per line.

  Input from Query

- Enter a SQL query to run against the Name table. A message shows how many IDs have been selected.
- Click OK to close the message.

2. Click Step 1 - Load IDs to load the IDs and enable the Activity Type field, Trans. Date field, and Step 2 - Set Values option. The remaining fields and buttons remain disabled and grayed-out until an Activity Type is selected from the drop-down list.
3. Select an Activity Type from the drop-down list.

   When an Activity Type is selected from the drop-down list, the user-defined fields and prompts that are set up for that activity type become available in the Import activities window.

   Note: The fields from the Activity Type field thru and including the User Field 7 field in the Import activities window are defined in the Activity types window by your administrator. The remaining fields in the Import activities window are available whenever an Activity Type is selected from the drop-down list. These are not user-defined fields, and knowledge of iMIS business processes is required to use them successfully.
4. Enter values in the fields defined for the activity type.
5. Click Step 2 - Set Values.

When the step is complete, the Transformation Query field, and the options Optional Step 3 - Transform, Preview, and Step 4 - Generate Activity are activated.

6. Click Preview to display a grid-view of the records in the Activity Importer table.

   Note: At this point, nothing has been written to the Activity table.

7. Use the side and bottom scroll bars to check the data entered.
8. Click Hide Preview to return to the Import activities window.
9. (optional) Enter a SQL statement in the Transformation Query field to make any necessary modifications. For example, modify the Committee from Award Selection to Awards Presentation.
10. (optional) Click Optional Step 3 - Transform to update the ActivityImporter table and display a Transformation Complete message.
11. Click OK to continue.
12. (optional) Click Preview to display the grid-view and verify your modifications.

    At this point, you can click Hide Preview and continue with transformation queries. For example, you could update the Activity.CO_ID field by using the following query:

    ```
    Update ActivityImporter
    Set CO_ID = Name.CO_ID
    From Name where Name.CO_ID = ActivityImporter.CO_ID
    ```

    You can also use the transformation query to delete records from the ActivityImporter table before generating activities as in the following example:

    ```
    Delete from ActivityImporter
    Where ID = 140
    ```

13. After verifying that the values entered in the activity fields are correct, click Step 4 - Generate Activity.

    A system message informs you that activity records will be created.

14. Click Yes to create the activity records.

After the activities have been created, the product displays a “Process is complete” message.

15. Click OK.

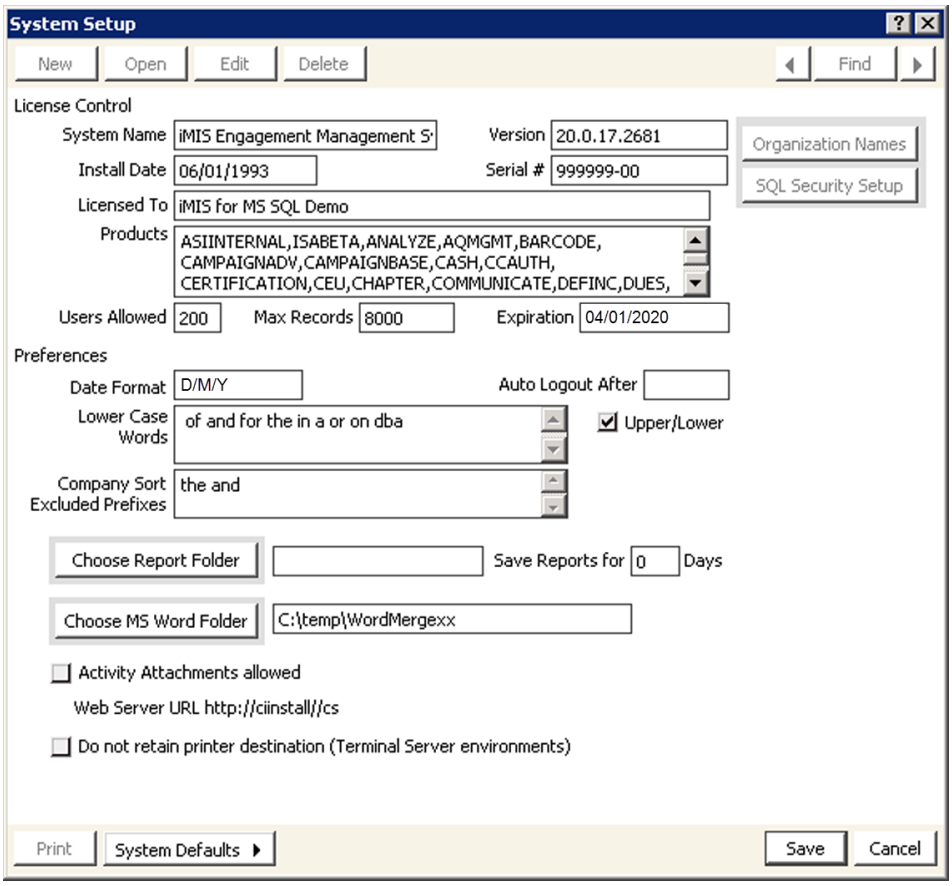
System Setup (File menu)

The System Setup provides configuration options for a variety of iMIS features. You enter the license information here when you install iMIS for the first time, and you may need to modify the license information if you purchase additional iMIS modules or upgrades.

In addition to modifying the license control, the System Setup window is where you set Organization Names and SQL Security.

System Setup window

From File, select System Setup



License Control

The following information should be entered from the data on the license sheet that accompanies an order.

- System Name – The title you want displayed on the main iMIS window
- Version – The current version of iMIS installed
- Install Date – The date the current version was installed
- Serial # – The iMIS serial number provided on your System Setup sheet
- Licensed To – Company name in which iMIS is licensed
- Products – The list of current features installed
- Users Allowed – The number of users allowed to access iMIS at one time
- Max Records – The maximum number records allowed for the license
- Expiration – The license expiration date

Organization Names

Opens the Organization Names window where you can enter logos and addresses for each organization. This is also where the taxation method for the organization is selected.

SQL Security Setup

Opens the SQL Security Setup window where you can set database passwords.

Preferences

- Date Format – (defaults to D/M/CY) If needed, override the default date format.
- Auto Logout After – Specifies a time, such as the end of your normal business hours, when you want iMIS to automatically log out any logged-in but inactive users. The logout will not interfere with users in the middle of actions or procedures in iMIS; rather, it waits for a period of inactivity (no keystrokes, mouse movements) before logging off the user. Those wanting to work later that this “auto logout” hour can log back in and work undisturbed.

- Lower Case Words – Specifies a list of words that you do not want capitalized
- Company Sort Excluded Prefixes - The list of prefixes to ignore when sorting company names, which can include prefixes in foreign languages.
- Upper/Lower – Select this option to allow iMIS to automatically apply capitalization rules to name and address fields so that the text appears in Title (upper and lower) case. When you enter text into these fields, iMIS will capitalize the first letter of each word, except for the words listed in the Lower Case Words field. For example, if you entered “the university of texas at austin,” iMIS would format it as The University of Texas at Austin.
- Choose Report Folder – Used to enter the location where stored Crystal reports are saved and accessed through the Print Manager (File > Print Manager).
- Save Reports for __ Days – Specifies the default number of days to store Crystal reports in the Print Manager. If a different period is specified in the Detail Report Parameters window of the report, the days set in the report overrides the System Setup.
- Choose MS Word Folder – Used to enter the location where MS Word templates are stored and accessed.
- Activity Attachments allowed – Select this option to enable the activity attachment feature that enables you to attach a file to an activity record and save it to the iMIS database. For example, you can attach a Microsoft Word document, PowerPoint slide presentation, spreadsheet, graphic, e-mail file, or HTML page. Once the file is saved to the iMIS database, you can open it on your system using the associated application and view, modify, or delete it from within iMIS.
- Web Server URL – Specifies the URL of your iMIS application server.
- Do not retain printer destination (Terminal Server environment) – Select this option if you do not want iMIS to store the path to your default printer in the database (for example, if you access iMIS through a Terminal Server or Citrix connection that may append a network identifier to the path to your default printer, causing iMIS to designate your printer setting as invalid), you can select the Do not retain printer destination (Terminal Server environments) option on the System Setup window (select File > System Setup). When

you enable this option, iMIS does not save the path to your default printer destination to the database. You will still be able to print to your default printer when you select the Printer option on the Report Destination window. If when starting a subsequent session iMIS detects a conflict with your printer setting (for example, if you select a different default printer), an error message will display and you will be able to select a valid printer. You can also click the Reset All button to clear any existing report destination values.

> **Note:** Note: You must have a default printer specified on your workstation to access the Print Setup (select File > Print Setup) and Report Destination window.

System Defaults button

Used to Change Font Tables and access Help Options menu items.

When the Help Options menu item is selected, the Help Options window opens where you can select (enable) or deselect (disable) the following options:

- Help bar on – A dynamic, field-specific help line in the status bar at the bottom of the iMIS main window displays. This option must be enabled for the status bar to display. For example, when the cursor is positioned over the Joined Date field of the Name Maintenance window, the status bar displays Date membership began as additional information to help you know what to enter in the field.
- Show help codes – Internal help codes display the associated iMIS table and columns. For example, when the cursor is positioned over the Join Date field in the Name Maintenance window, the status bar displays the Name.JOIN_DATE.

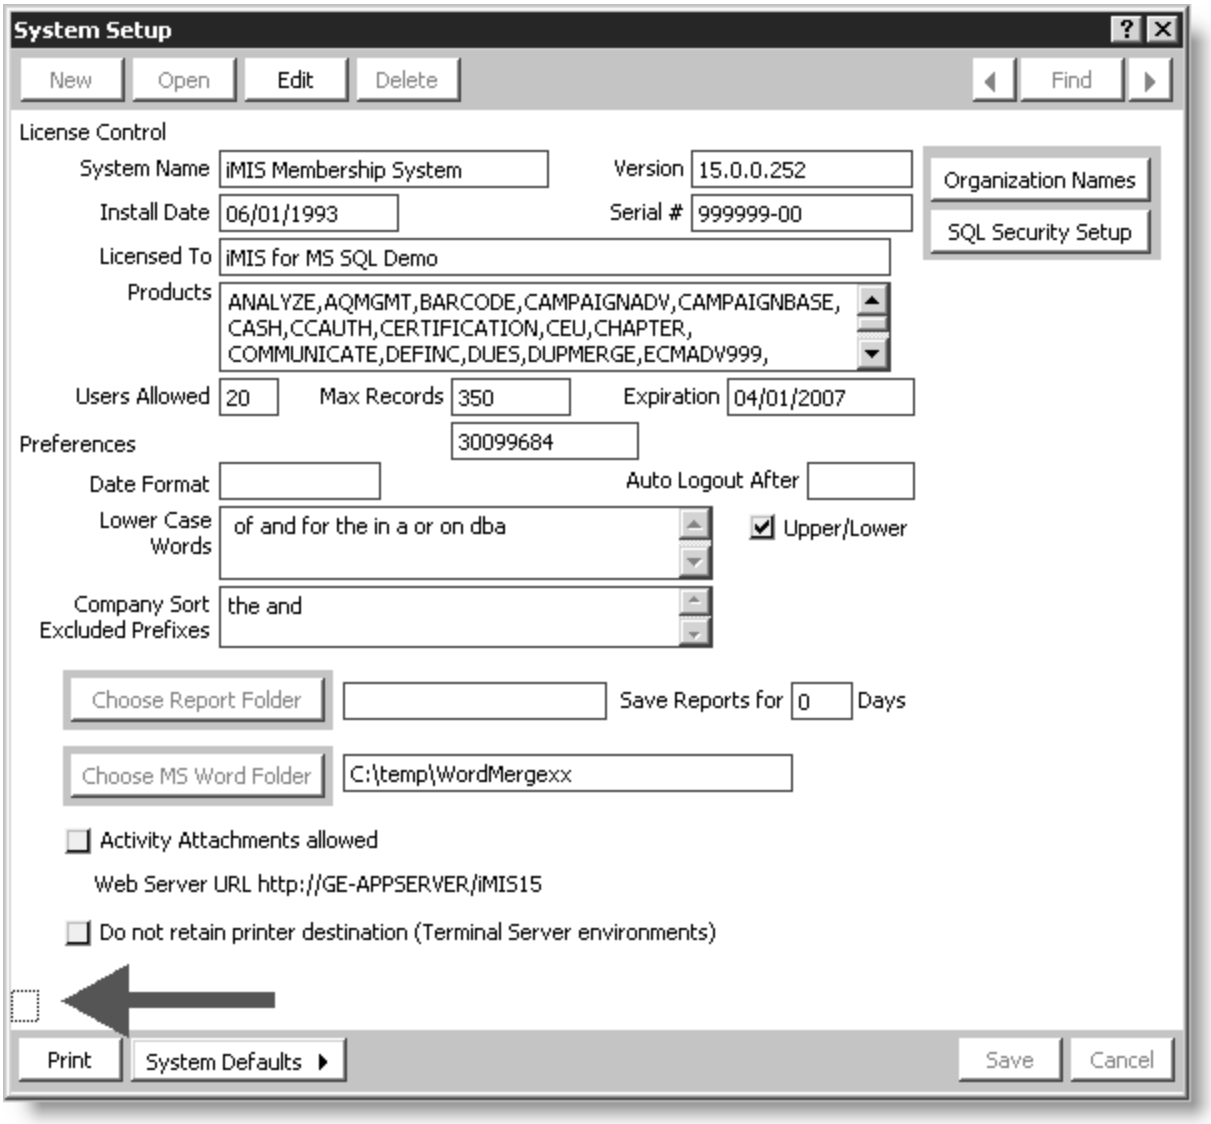
Modifying license configuration

You must modify your license configuration whenever you purchase new iMIS features or add users to an existing license. Have your updated license sheet (license key information) handy.

To modify the license configuration

1. Select File > System Setup to open the System Setup window.

2. Click in the lower left corner of the window until the hidden control button appears.
3. Click Edit.
4. Enter the license information exactly as shown on the license key.
5. Click Save.



Defining the date/time format for iMIS

The Date Format field in the System Setup window is blank by default, which causes iMIS to use the U.S. English short date and time formats used in most U.S.-based computers.

For example:

- 11/16/2007 is the short date format that represents November 16, 2007
- 2:16:26 PM is the time format that represents 14:16:26

> **Note:** Tip: Use a format that displays the entire four-digit year so that users can verify the correct century. iMIS typically assumes a year of 29 or less to refer to the 21st century (30/3/22 = 30 March 2022) and 30 or higher as the 20th century (30/3/30 = 30 March 1930).

Formatting date/time outside the United States

Whenever you have the operating system of an iMIS server set for a region other than U.S. English, be sure to specify a matching Date Format in iMIS. The region is set through Control Panel > Regional and Language Options, Regional Options.

For example, if the server specifies English (United Kingdom) for the regional language, 16/11/2007 for the Short date format, and 14:16:26 for the Time format, you must make iMIS match by specifying D/M/CY H:N:S in iMIS.

To define the date/time format for iMIS

6. Log on to iMIS Desktop with the MANAGER logon.
7. Choose File > System Setup.
8. Click Edit.
9. In the Date Format field, specify a combination of variables that represents the Short date and Time formats used by the operating system of the iMIS application server. Examples:

- m D CY H:N.S.s returns "JUN 12 2008 15:45.00.00"
- D m Y H:N A returns "12 JUN 08 3:45 PM"
- M/D/Y H.N returns "06/12/08 15.45"
- YMD returns "080612"

Refer to the table below for details.

10. Click Save.
11. Restart iMIS.

Y	Year, 2-digit	99
y	Year with Century, 4-digit	1999
C	Century, 2-digit	19
M	Month, numeric	06
m	Month, 3-character abbr. In caps	JUN
D	Day of month, cardinal	12
d	Day of month, ordinal	12th
W	Day of week, numeric, Sunday=0, Saturday=6	5
w	Day of week, full name	Friday
H	Hour of day, 24-hour format	0-23
h	Hour of day, 12-hour format	1-12
N	Minutes, 2-digit, with leading zero	07
S	Seconds, 2-digit, with leading zero	02
s	Hundredths of seconds, 2-digit	37
A	AM/PM, all caps	AM

Changing the font table

The font table controls the fonts that are used for reports in iMIS. The type and size of the font determines how the report will print both on the screen and on the printer. If the fonts are not properly set, the output may cause a reduction in printing speed, loss of quality, or missing components.

View the font table to make sure that it is properly set up and that all of the necessary fonts are installed.

Support for foreign language characters

iMIS runs a customizable stored procedure that replaces foreign characters (ASCII 128 to 256) with standard equivalents (ASCII 0 to 127) before it adds a name or address to a search index. Likewise, when you search for a name or address, iMIS runs the same stored procedure on the search text before it performs the search. The stored procedure works with all Microsoft SQL Server code page settings.

iMIS supports foreign language prefixes such as l' and d'.

- The lower-case word list accepts prefixes that contain an apostrophe.
- A customizable list (the Company Sort Excluded Prefixes list) can exclude prefixes that contain an apostrophe from the Name.COMPANY_SORT field.

  Both lists are available on the System Setup window (in iMIS Desktop, select File > System Setup).

Foreign language character replacement map

This is how iMIS replaces foreign (high ASCII) characters before it adds a name or address to a search index:

Š	S	È	E	ä	a
€	E	É	E	å	a
Œ	C	Ê	E	Æ	a
Ž	Z	Ë	E	ç	c
™	T	Ì	I	è	e
š	s	Í	I	é	e

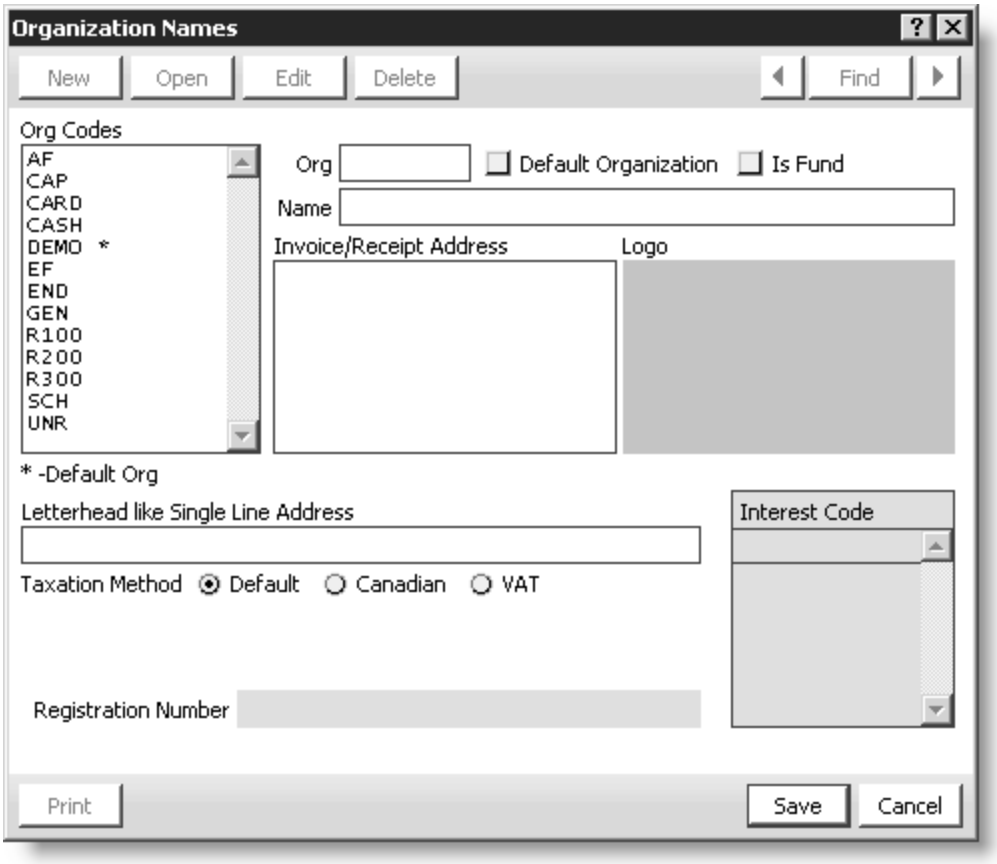
Ä	A	à	a	ý	y
Å	A	á	a	þ	b
Æ	A	â	a	ÿ	Y
Ç	C				

Organization Names window



Select File > System Setup, and click Organization Names

Org Codes

List of codes for the available organizations

Org

(required) Specifies a code for the selected organization

Default Organization

(optional) Select this option to identify the default organization. An asterisk displays to the right of the default organization in the Org Codes list.

Is Fund

(optional) Select this option to indicate that the organization is also a fund

Name

(optional) Specifies the full name of the organization. A maximum of 60 alphanumeric characters can be entered.

Invoice Mail Address

(optional) Specifies the organization's complete address where invoices and other correspondence are to be mailed. Used on reports where the name and address display as a block, such as invoices.

Logo

(optional) Use this field to paste the organization's logo, which must be a 256-color BMP. The preferred image size is 130 pixels by 125 pixels.

Letterhead like Single Line Address

(optional) Specifies the organization's letterhead is in a single line address. This information is used on reports where the address appears in single line, such as event confirmations.

Interest Code

(optional) This list contains the fields for entering the interest codes associated with each fund. The interest codes that display are defined on the Set up interest codes window (from Customers, select Set up Fundraising > Interest codes). The Set up Fundraising task list only displays if you are licensed for Fundraising.

Taxation Method

- Default -Enables the default taxation method set up in the AR/Cash module
- Canadian - Enables the Canadian taxation method which includes Goods and Services Tax (GST)/Harmonized Sales Tax (HST) and Provincial Sales Tax (PST) and may be used for other countries that calculate GST
- VAT - Enables taxation method for the European Union

Registration Number

Specifies the registration number associated with the organization or fund. Fundraising organizations must have a registration number (Canada) or tax identification number (United States) in order to claim and verify their tax-exempt status. This field only displays if you are licensed for Fundraising.

Setting Up Organization Names

You can enter your organization's logo to appear on your standard report headings. The company address you enter in the Organization Names window appears on standard invoices, confirmations, and other reports.

If you have multiple financial entities within your organization, you can define multiple entities within iMIS to track their financial records separately.

> **Note:** Note: Although you can have several organizations (entities) defined, you can have only one Default Organization. The default organization is used through-out the product and on printed standard reports.

Defining an organizational entity

Organization, Fund, and Entity, in the context of iMIS accounting, all refer to a business unit that maintains separate financial books. A "fund" is specific type of organization or entity whose purpose is to solicit donations.

To define an entity/organization/fund

12. Select File > System Setup to open the System Setup window.
13. Click Organization Names to open the Organization Names window.
14. Click New.
15. Enter a unique alphanumeric Org Code to represent the organization.

    Note: If you plan to create separate GL interface files for each financial entity, be sure to use as few characters as possible when defining your org codes.
16. Select the Default Organization option if this is the default organization.

Note: You can set only one entity as the default entity for non-accounting reports and other standard uses. The default organization name and address data is used for all non-accounting oriented reports. It also becomes the accounting default in cases where no module-level or other override entity is provided.

17. Select the Is Fund option if this organization is also a Fund.

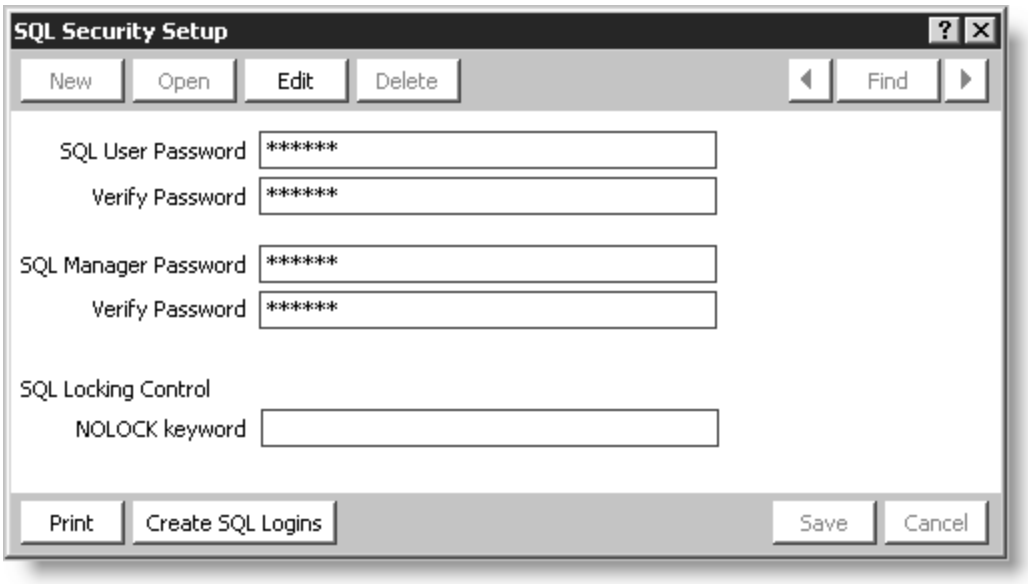
    Note: You must identify the organization as a fund for it to serve as a fund in the Fundraising module.

18. Enter the full Name of the organization.
19. Enter the organization's Invoice/Receipt Address. Include the full mailing address.
20. In the Logo area, paste the graphic, which must be a 256-color BMP. The preferred image size is 130 pixels by 125 pixels.
21. Enter the Letterhead like Single Line Address.
22. Select the Taxation Method.
23. Select as many Interest Codes as applicable.
24. Enter the organization's Registration Number.
25. Click Save.

SQL Security Setup window

This window allows you to change the passwords of the SQL Server login accounts that perform transactions on behalf of iMIS Desktop users, and to enable iMIS to prevent data modification while reports are running.

> **Note:** Note: See Resetting the system-level SQL authentication passwords in the Maintaining iMIS section of Installation.



File > System Setup, then click SQL Security Setup

This window includes the following fields.

- SQL User Password - (optional) Enter text here to generate a new password for the IMISUSER_[dbName] SQL Server login. Enter the text again in the Verify Password field.

  Note: iMIS uses the password text to generate an SHA-1 hash, so enter a reasonably complex string. For example, a text string of 6-10 characters, including 1 or more digits and 1 or more non-alphanumeric characters, will result in a hash that should prevent dictionary-based attacks.

- SQL Manager Password - (optional) Enter text here to generate a new password for the MANAGER_[dbName] SQL Server login. Enter the text again in the Verify Password field.

- SQL Locking Control - (optional) Enter nolock here to enable iMIS to prevent data modification while a report is running.

  Note: To prevent data modification while a report is running, enter NOLOCK in the report's Parameters field.

- Create SQL Logins - Resets the SQL Server passwords for the IMISUSER_[dbName] and MANAGER_[dbName] logins. iMIS prompts you to enter the password for the SQL

Server sa login.

- Save - For the SQL password fields, this button generates password hashes and then stores them in the System_Params table. For the NOLOCK keyword field, this button saves the keyword in the System_Params table.

Specifying a folder for Letter System templates

To enable the Letter System, you must specify a folder its template files. All iMIS users must specify the same folder path, whether it's local or remote. The path you specify is stored in the iMIS System_Params table, as the ParameterName value of System_Control.MSWordStoreDirectory.

> **Note:** Note: Truncating the Report Specs table deletes the Microsoft Word template report specifications.

To specify a folder for Letter System template files

26. Log on to iMIS.
27. Select File > System Setup.

    The System Setup window opens.
28. Click Edit.
29. Click Choose MS Word Folder (or enter a folder path in the field next to that button).

    The Browse for Folder dialog box appears.

- Select a local or remote folder.

  If you specify a remote folder, make sure that all users have permissions to access to the folder.

- Click OK.

30. In the System Setup window, click Save.
31. Log out of iMIS, and then log on again.

Activity record file attachments

When you open an activity record and click the Attachment button on the Activity Detail window, you can attach a file to the activity record and save it to the iMIS database. For example, you can attach a Microsoft Word document, PowerPoint slide presentation, spreadsheet, graphic, email file, or HTML page.

Once the file is saved to the iMIS database, you can open it on your system using the associated application and view, modify, or delete it from within iMIS.

Enabling attachments on activity records

To enable the activity attachment feature, you must do the following:

- Enable the Activity Attachments allowed option on the System Setup window (select File > System Setup).
- Enter a value in the Maximum file size (KB) field on the System Setup window (displays when you enable the Activity Attachments allowed option). See Specifying maximum size of activity attachments for more information.
- Enable the Allow user Edit option on the Set up activity types window (from Customers, select Set up module > Activity types) for the activity for which you want to add an attachment.

> **Note:** Note: Some activity types are system-generated (for example, Order) and are not intended for editing. However, if you want to attach a file to one of these activity types, you must enable the Allow user Edit option.

To enable the Activity attachments

32. Select File > System Setup to open the System Setup window.
33. Click Edit.
34. Enable the Activity Attachments allowed option.

35. Enter a value in the Maximum file size (KB) field. (Displays when you enable the Activity Attachments allowed option.)
36. A message warns you that the maximum you specified may have adverse effects on performance. Click OK.
37. Click Save.

Specifying maximum size of activity attachments

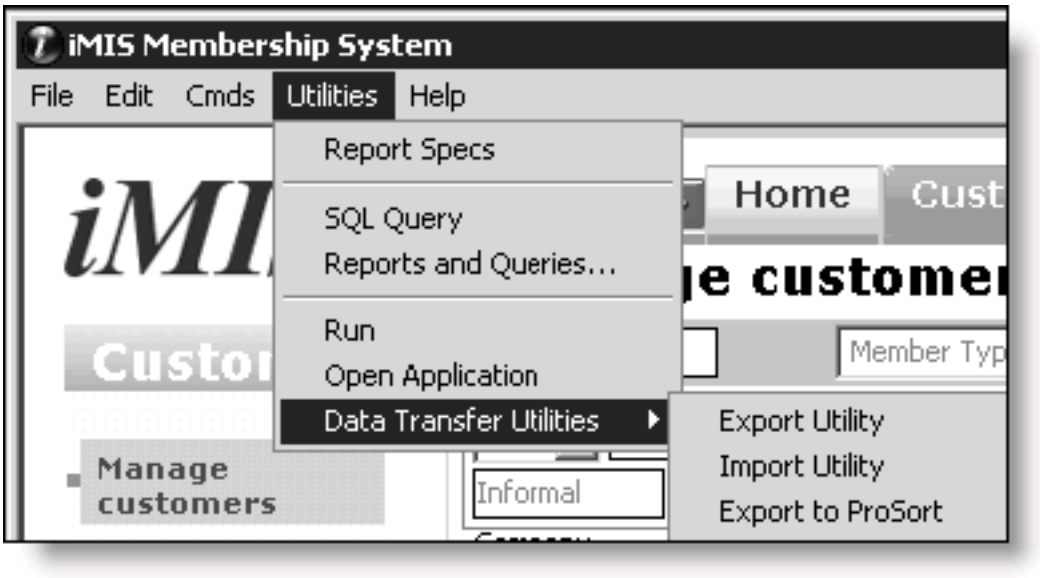
Although you can specify the maximum file size of activity attachments that can be stored in the database, the absolute maximum size is determined by many factors (for example, the maximum size of your database server). In most cases, specifying a small activity attachment size limit (for example, 500 for a 500 KB file) should be large enough. The maximum file size for a Word document, for example, is 32 MB.

> **Note:** Caution! Do not increase this value until you have verified through testing that performance of your system remains acceptable at the new value. Storing a large number of attachments will increase the size of your database very rapidly, affecting backup requirements and the available disk space on your database server.

Utilities (Utilities menu)

The commands on the Utilities menu help you maintain and monitor reports, tables, and data that are used throughout iMIS.

> **Note:** Note: As functionality moves to .NET, many of these utilities are being replaced by and incorporated into DB Maintenance and DB Upgrader, which are available from your iMIS program group.



The Utilities menu is only available from the administrative views.

Report Specs

Opens the Report Specifications window, where you can copy and modify standard reports.

SQL Query

Opens the SQLQuery window, where you can enter and execute SQL commands.

Reports and Queries…

Opens the System Reports and Queries window, where you have access to SQL scripts that can be run to manipulate your iMIS data.

Run

For developers: Executes an iMIS procedure.

Open Application

For developers: Opens a different Omnis library.

Data Transfer Utility

Opens a sub-menu of the following items, which appear only if licensed:

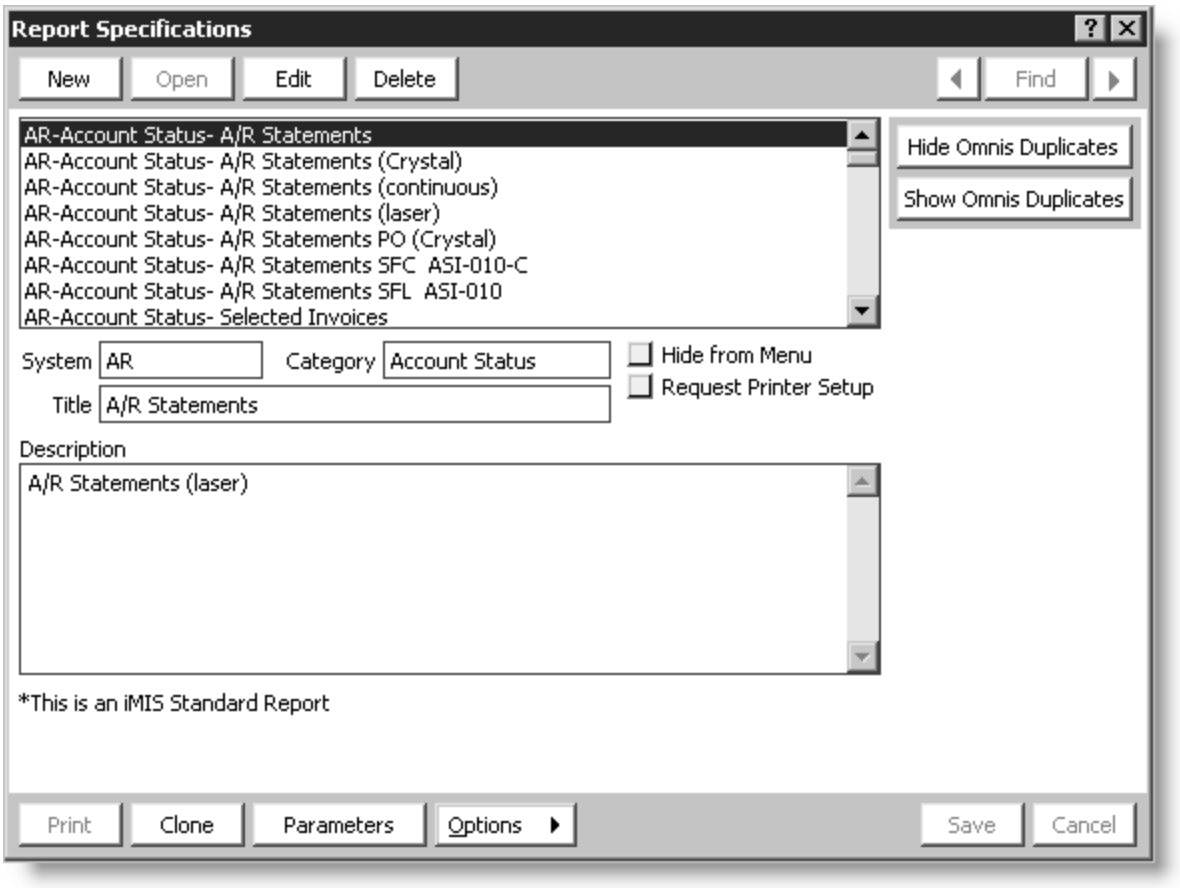
- Export Utility – opens the Export Utility window
- Import Utility – opens the Import Utility window
- Export to ProSort – opens the ProSort Exports window

Report Specifications

Each iMIS module contains a Reports menu item through which module-specific reports can be run. The specifications or details of all the iMIS standard reports can be modified or cloned (copied and renamed) through the Report Specifications window (select Utilities > Report Specs) and the Detail Report Parameters window (select Utilities > Report Specs and click Parameters). This is a powerful tool when used in conjunction with the Ad Hoc Search feature to create customized end-user reports with a minimum of time, energy, and expertise.

Note: Note: To run a Crystal or Access report in iMIS, the report must be added to the list of reports in the Report Specifications window.

Report Specifications window



From the menu bar, select Utilities > Report Specs

Report scrolling area

List of all iMIS reports.

System

Indicates the iMIS system or module where the report resides. For example, if a report is listed in the AR system, you would access the AR system report by selecting AR/Cash, and selecting Generate reports.

Category

Refers to the report type. For example, if you access the AR/Cash Generate reports window (from AR/Cash, select Generate reports), there would be three report type categories: Account Status, Deferred Income, and Transaction Lists. Each category contains reports that are specific to the category.

Title

Indicates the report name that will display on the report and in the Available Reports area of the report window. For example, you would access the A/R Statements report by selecting AR/Cash, and selecting Generate reports, and selecting the Account Status report type.

Hide from Menu

If enabled, hides the report from displaying on the report window.

Request for Printer Setup

If enabled, the system automatically displays the Set Report Destination window so you can select the appropriate print destination.

Description

This is a detailed description of the report.

Options button

Drop-down menu items of current report format options that can be modified for the selected report. Options range from adjusting the margins, modifying the search criteria, changing the sorting option, exporting report records to another application, adding additional fields that are mapped to the specific parameters, and adding text to letter formats. Report options vary by report type.

Clone button

Used to create an exact copy of the selected report. Modify the title and some of the report properties to create a new report on the report menu.

Parameter button

Opens the Detail Report Parameters window. This window contains a detailed list of the report parameters.

Cloning reports

To avoid losing report specifications, it is best to clone a report and make the changes to the cloned version.

To clone a report

38. From the menu bar, select Utilities > Report Specs to display the Report Specifications window that contains a list of all standard reports, sorted by module and type.
39. Select the report you want to clone and then click Clone.
40. Enter in the System and Category where you want the report to appear.
41. Enter a name for the cloned report in the Title field and a new description in the Description field.

    Note: If you use the cloned report as the standard report within its Category and the original report chosen for printing at the individual level, make sure the report name is first in the alphabetical report category. To simplify this task further, put a period "." at the beginning of the name, such as .Badge, so it becomes the default for the report type. Not all options are available for all reports.
42. Click Parameters and make changes, if necessary.
    This may include a change in the Report Format used to print the report, an addition or change of an option in the Options list string, or an addition of message text (for certain invoice and confirmation formats) in the Parameters text field.

    Note: When changing an option, remember that most of the options available for a report are already in the Options list. However, you may need to either enable or disable the option depending upon the setting. To enable an option that is disabled, change the first word of the option from NO to PRINT For example, NO_FULL_ADDRESS to PRINT_FULL_ADDRESS.
43. Click OK. You have created a new report that appears with the other Standard Reports.

Common report tables and joins

These are the most common table and field layouts and joins that are used in iMIS reports:

Activity Reports

Tables
- Name
- Name_Address
- Activity
- Name_Fin
- Org_Control
- Product
- Subscriptions

Join Examples
- Name.ID=Activity.ID
- Name.ID=Name_Fin.ID
- Name.ORG_CODE=Org_Control.ORG_CODE
- Activity.PRODUCT_CODE=Product.PRODUCT_CODE
- Name.ID=Subscriptions.ID
- Activity.PRODUCT_CODE=Subscriptions.PRODUCT_CODE

See Common Address Joins

AR/Cash Reports

Tables
- Name
- Invoice
- Trans

Join Examples
- Name.ID=Invoice.BT_ID

- Trans.BT_ID=Invoice.BT_ID
- Trans.BATCH_NUM=Invoice.BATCH_NUM

Committee Reports

Tables
- Name
- Activity
- Committee_Minutes
- Committee_Position
- Gen_Tables

Join Examples
- Name.ID=Activity.ID
- Activity.PRODUCT_CODE=Committee_Minutes.PRODUCT_CODE
- Name.TITLE=Committee_Position.TITLE
- Activity.DESCRIPTION=Gen_Tables.DESCRIPTION

Dues Reports-Invoices (Cash Method)

Tables
- Name
- Name_Address
- Subscriptions

Join Examples
- Name.ID=Subscriptions.ID
- Name.BILL_ADDRESS_NUM=Name_Address.ADDRESS_NUM

Dues Reports-Invoices (Accrual Method)

Tables
- Name
- Name_Address
- Invoice

- Invoice_Lines
- Trans
- Subscriptions

Join Examples
- Name.ID=Trans.BT_ID
- Name.BILL_ADDRESS_NUM=Name_Address.ADDRESS_NUM
- Invoice.REFERENCE_NUM=Trans.INVOICE_REF_NUM

Meeting Reports

Consist of Rosters, Badges, Confirmation Letters, and Invoices

Tables
- Orders
- Order_Badge
- Order_Lines
- Order_Meet
- Order_Payments
- Meet_Master

Join Examples
- Orders.ORDER_NUMBER=Order_Lines.ORDER_NUMBER
- Orders.ORDER_NUMBER=Order_Badge.ORDER_NUMBER
- Orders.ORDER_NUMBER=Order_Payments.ORDER_NUMBER
- Orders.ORDER_NUMBER=Order_Meet.ORDER_NUMBER
- Order_Meet.MEETING=Meet_Master.MEETING

Membership Reports

Tables
- Name
- Name_Address
- Name_Note

	• Name_Fin • Any User-Defined Custom Table
Join Examples	• Name.ID=Name_Note.ID • Name.ID=Name_Fin.ID • Name.BT_ID=Name_Fin.BT_ID See Common Address Joins

Orders Reports

Tables	• Orders • Order_Lines • Order_Payments
Join Examples	• Orders.ORDER_NUMBER=Order_Payments.ORDER_NUMBER • Orders.ORDER_NUMBER=Order_Lines.ORDER_NUMBER • Orders.PAY_TYPE=Order_Payments.PAY_TYPE • Orders.PAY_NUMBER=Order_Payments.PAY_NUMBER • Orders.CREDIT_CARD_EXPIRES= Order_Payments.CREDIT_CARD_EXPIRES • Orders.AUTHORIZE=Order_Payments.AUTHORIZE • Orders.CREDIT_CARD_NAME= Order_Payments.CREDIT_CARD_NAME • Orders.CASH_GL_ACCT=Order_Payments.CASH_GL_ACCT

Common address joins

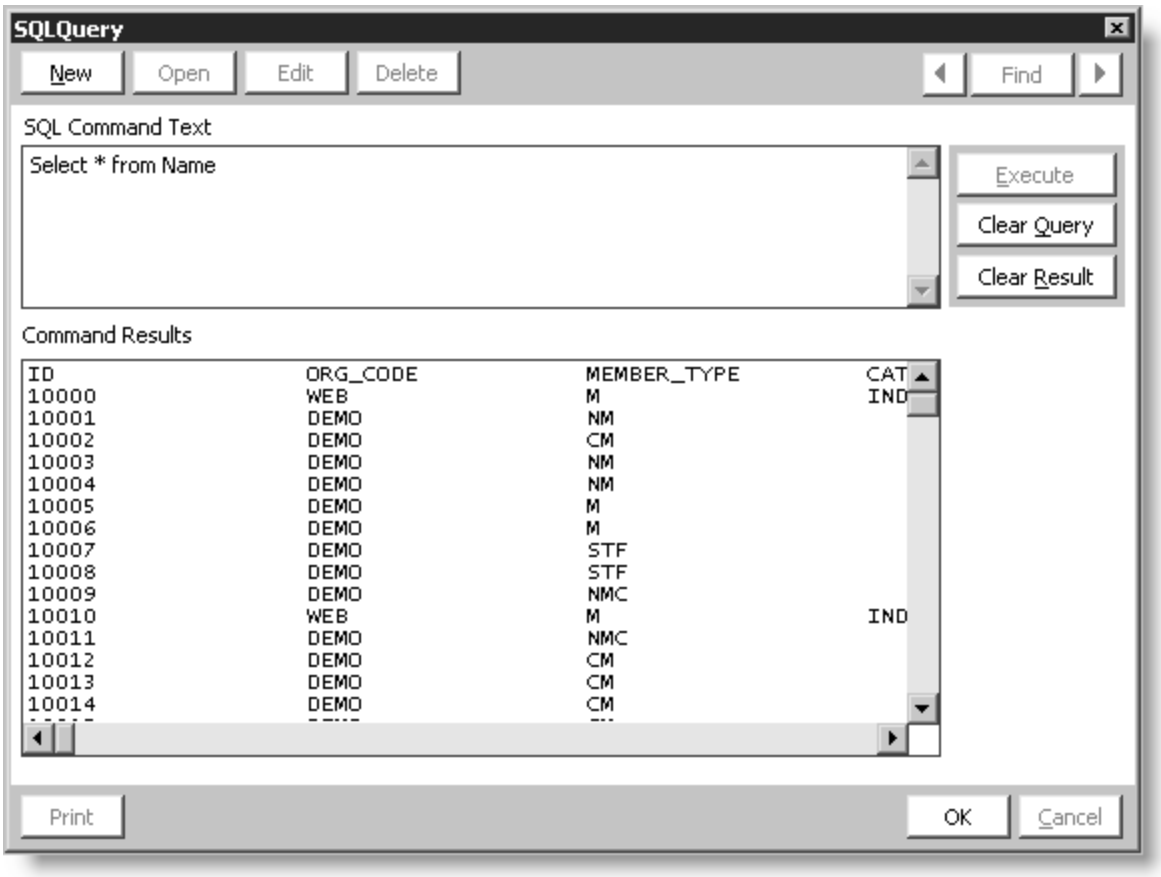
Reports using Address 1	Name.ADDRESS_NUM_1= Name_Address.ADDRESS_NUM
Reports using Address 2	Name.ADDRESS_NUM_2= Name_

	Address.ADDRESS_NUM
Reports using Address 3	Name.ADDRESS_NUM_3= Name_ Address.ADDRESS_NUM
Reports using Preferred Bill Address	Name.BILL_ADDRESS_NUM= Name_ Address.ADDRESS_NUM
Reports using Preferred Mail Address	Name.MAIL_ADDRESS_NUM= Name_ Address.ADDRESS_NUM
Other Alternate Addresses	For example, if you have more than three purposes: Name.ID=Name_Address.ID where PURPOSE=' ' (List purpose in between single quotes.)

SQL Query

In iMIS you can run SQL queries to view the data in the tables.

44. From the menu bar, select Utilities > SQL Query to open the SQL Query window.
45. Click New.
46. Enter the SQL query in the SQL Command Text box. In the following example, we are selecting all the data from the Name table.
47. Click Execute. iMIS displays the results of the query in the Command Result box.
48. To clear the screen:
49. Click Clear Query to clear the SQL command.
50. Clear Clear Result to clear the results.

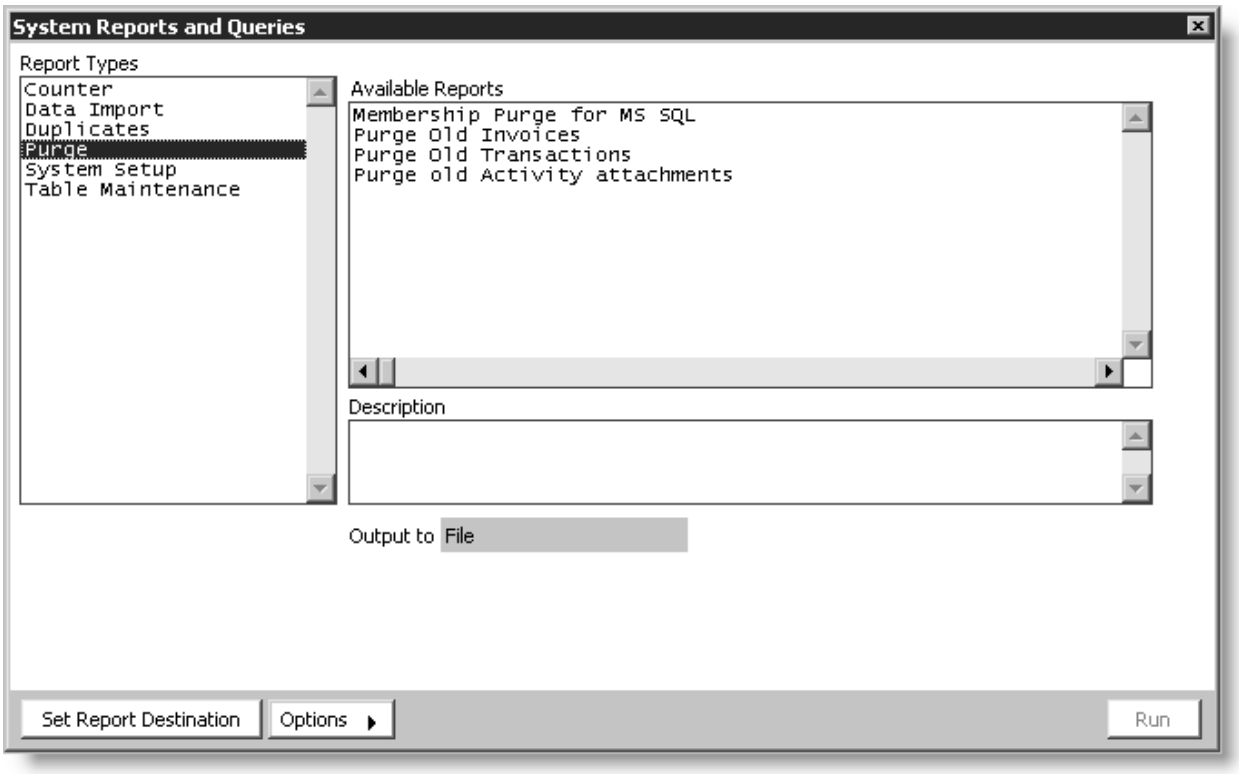


From the menu bar, select Utilities > SQL Query

Reports and Queries

iMIS provides several SQL scripts that can can add or change data in the tables. The SQL scripts are stored as standard iMIS reports that you can clone and customize.

System Reports and Queries window



From the menu bar, select Utilities > Reports and Queries

> **Note:** Note: Run the System Setup routines only after the prerequisite conditions are met.

The following Data Import, Purge, System Setup, and Table Maintenance report types display with a brief description.

Data Import

Import Data into the Prospect Table: Imports prospect records from a tab-delimited file into iMIS.

Purge

Membership Purge for MS SQL: Deletes customer records with a status of “D.”

Purge Old Invoices: Deletes records in the Invoice and Invoice_Lines tables which have a zero balance, are dated before the retention months and in which there are no linked and unposted transactions remaining.

Purge Old Transactions: Deletes records in the Trans table where TRANSACTION_DATE is less than Trans retention months and are no longer associated with its corresponding invoice record.

Purge Old Activity attachments: Deletes activity attachments with a timestamp before a specified date.

System Setup

Co. to Member Addr. Flowdown: Populates a member's first Name_Address record (the required one where PURPOSE = Membership Address1 Prompt) from the corresponding Name_Address record of the company ID (CO_ID). Only member records where ADDRESS_1 is blank are updated.

Prerequisite: This procedure requires that Name_Address.ADDRESS_NUM be populated and Name_Address.PURPOSE be populated to match the address prompts in Customers > Set up module > General > Address and Notes button.

Note: This script updates only the Name_Address record; it does not update user-defined fields within Advanced Flow Down.

Rebuild Chapter Subscriptions: (for optional Chapter Management) Inserts Chapter Subscription records based on Name.CHAPTER.

Prerequisite: Requires that Name.CHAPTER be populated.

Rebuild Member_Type Info: Populates Name.MEMBER_RECORD, COMPANY_RECORD, and CO_MEMBER_TYPE.

Prerequisite: Requires that you first complete Member_Type setup and create the Company_Index view.

Rebuild Name Fields: Rebuilds the index fields Name.LAST_FIRST, COMPANY_SORT, and FULL_NAME. To speed processing, select Drop Indexes first.

Prerequisites: (1) Requires that you first upload the Name table, (2) populate elements of member name (at least LAST and FIRST), and (3) populate Name.COMPANY.

Rebuild Name.DUP_MATCH_KEY: Rebuilds the Name.DUP_MATCH_KEY according to the following iMIS default formula. This formula checks for duplicates: the first five digits of the ZIP (postal code) field, the first four characters of the last name, and the first initial.

con (mid(Name.ZIP,1,5),mid(Name.LAST,1,4),

mid(Name.FIRST,1,1))

The standard formula is used unless a custom formula has been entered in the Duplicate Record Check Formula field on the Customer Setup – Advanced window (from Customers, select Set up module > General, and click Advanced). If the Duplicate Record Check Formula field is blank, the default formula will be used.

Prerequisite: Requires that you first run Rebuild Name_Address Pointers (to populate ZIP in Name) and populate any other fields used in the dupmatch formula.

Caution! If you customize your dupmatch formula, you must populate the parameters of the report specification (select Utilities > Report Specs).

Rebuild Name_Address Pointers: Populates Name_Address.FULL_ADDRESS and Name's address fields, including MAIL_ADDRESS_NUM, BILL_ADDRESS_NUM, ADDRESS_NUM_1, ADDRESS_NUM_2, ADDRESS_NUM_3, and FULL_ADDRESS.

Prerequisite: Requires that you first populate the Name table with unique ID's, populate the Name_Address table with unique ID's that correspond to the Name table and populate the Name_Address.ADDRESS_NUM field with unique sequential numbers. From Customers, select Set up module > General and click Address and Notes, populate the Address Usage fields (Name_Address.PURPOSE) to match your setup, and make sure that you have at least one Name_Address record for each member, with a PURPOSE matching the first address prompt.

Post Processing: (1) Select Utilities > Table Analysis (2) Select Name table record, and (3) Click Make Indexes.

Rebuild Name_Indexes: Name_Indexes can be used to define auxiliary indexes on the Name table that will appear in the Name Find window's list of find criteria. These additional indexes are set up on the Customer Setup – Indexes window (from Customers, select Set up module > General, and click Indexes). This example script shows how to populate the Name_Indexes table when Name.STATE_PROVINCE is set up as additional index 1.

Prerequisites: (1) A column or Omnis expression using columns from the Name table must be defined as an additional index on the Customer Setup – Indexes window. In this example, Name.STATE_PROVINCE is defined as additional index 1. (2) To modify this script, clone it and substitute a SQL expression equivalent to the Omnis expression used in System Setup and the corresponding index number (1, 2, 3, or 4) where this script has Name.STATE_PROVINCE and 1, respectively. (3) This script truncates and rebuilds the whole Name_Indexes table, so if you have several additional indexes you should put all the updates in one script.

Remove Name.LAST_FIRST apostrophes: Removes apostrophes from the Name.LAST_FIRST field. It will run faster if it is done before Name indexes are added.

Prerequisites: (1) Name table is uploaded (2) Elements of member name are populated: at least LAST and FIRST (3) Rebuild Name script has been run to populate LAST_ FIRST.

Table Maintenance

Remove Ref_Provided NULLs: Replaces NULLs in the Ref_Provider table with either a blank (' ') or a zero (0) depending on the datatype of the field being updated.

Set Activity type donor club: Updates Activity.ACTIVITY_TYPE = 'DONORCLUB'.

Set Activity.ORIGINATING_TRANS_NUM: Updatse Activity.ORIGINATING_TRANS_ NUM with its matching Trans.TRANS_NUMBER.

Set Product type donor club: Updates Product.PROD_TYPE = 'DONORCLUB'.

Set Product FR type donor club: Updates Product_FR.FR_TYPE = 'DONORCLUB'.

Set Product_Type type donor club: Updates Product_Type.PROD_TYPE = 'DONORCLUB'.

Customizing system reports

The System Reports can be customized to fit your company's needs.

To clone and customize a system report

1. From the menu bar, select Utilities > Report Specs to open the Report Specifications window that contains a list of all standard reports, sorted by module and category.
2. Scroll down to the SYSTEM module. The categories under SYSTEM are Data Import, Purge, System Setup and Table Maintenance.
3. Select the report you want to clone and then click Clone.

   Note: Do not change the System and Category fields if you want the cloned report to display with the other reports.
4. Type a name for the cloned report in the Title field and a new description in the Description field.

   Note: If you use the cloned report as the standard report within its Category, make sure the report name is first in the alphabetical report category. To simplify this task further, put a period "." at the beginning of the name, such as .Badge, so it becomes the default for that report type. Not all options are available for all reports.
5. Click Parameters to open the Detail Report Parameters window.
6. If you are entering an SQL command in the Parameters field, make sure that SQLExec/240 is shown in the Control Procedure field.
7. Make the necessary changes to the report. This may include a change in the Report Format used to print the report, an addition or change of an option in the Options list string, or an addition of message text (for certain invoice and confirmation formats) in the Parameters text field.

Note: When changing an option, remember that most of the options available for a report are already in the Options list. However, you may need to either enable or disable the option depending upon the setting. To enable an option that is disabled, change the first word of the option from NO to PRINT, for example, NO_FULL_ADDRESS to PRINT_ FULL_ADDRESS.

8. Click OK. You have created a new report that appears with the other Standard Reports.

Adding SQL queries to custom reports

You can add a new System Report with an SQL query.

To add an SQL query to a custom report

1. From the menu bar, select Utilities > Report Specs to open the Report Specifications window.
2. Click New.
3. Enter the System, Category, and Title.
4. Click Parameters to open the Detail Report Parameters window.
5. Enter SQLExec/240 in the Control Procedure field.
6. Add GO after your SQL statement.
7. Click OK.

Run iMIS Procedure Utility

Occasionally, ASI will develop procedures to fix iMIS data. The Run procedure utility is used to run an ASI procedure that the technical support department has determined is required.

To run an iMIS procedure

1. From the menu bar, select Utilities > Run.

   The Run Procedure window opens.
2. Enter the procedure name and click OK.

Open Application Utility

The Open application utility allows you to open an Omnis-based library in iMIS.

To open a different library

1. From the menu bar, select Utilities > Open Application.

   The Select library window opens.

2. Select the library you wish to use and click Open.

Data Transfer Utilities

The Import Utility can be used by customers who are new to iMIS. By making use of templates and SQL scripts to make their existing data meet the mapping requirements of the iMIS database tables, the new customers can use the Import Utility to load their existing data into the iMIS database.

Existing customers can also use the Import Utility to import data from a third-party source that does not match iMIS database formats.

iMIS customers can use the Export Utility to create customized layouts of exported information that is easier for third parties to consume and use.

Import Utility

This document provides an example designed to walk users through the process of importing records into the Name table in the iMIS database.

There are several steps in the record import process:

1. Create an import template.
2. Load an import template to the Import Utility.
3. Disable the Name table trigger.
4. Import a records file.
5. Enable the Name table trigger.

This document will also identify NRDS-specific steps, which are performed only when conducting NRDS-specific imports. NRDS is an acronym for National Realtors Database System. NRDS was designed as a single database residing on the Internet to store the member and office records for the Realtor organization.

iMIS import templates

A template file is a comma-delimited text file that defines the format of the data imported into the Name table in the iMIS database. The template file acts as an interpreter,

defining for the database the data that is imported, and enables the iMIS database to consume the data accurately.

The import template is a guide only and must be created based on the data being imported.

Create the template file in a flat editor. The rows in the template file correspond to the columns in your .csv (comma-separated values) file that contains the data you are importing.

> **Note:** Note: The template file and the corresponding .csv file must be in agreement on the order of the columns to ensure the data is imported accurately.

Do the following to import a file with five records. There will be six items that will be imported for each record:

- First name
- Last name
- Company
- Email
- Home phone
- Work phone

1. Create a template file. The template file for this import will look like the following:

   Name.FIRST_NAME,0,0,C

   Name.LAST_NAME,0,0,C

   Name.COMPANY,0,0,C

   Name.EMAIL,0,0,

   Name.HOME_PHONE,0,0,

   Name.WORK_PHONE,0,0,

Note: In the template file, the values 0,0,C correspond to the Position, Length, and Processing Code in the Import Utility. These are explained later in this document.

Each row in the template file represents an entry in the header row of a .csv file, and corresponds to a column name in the iMIS database. For example, data entered through the Import Utility as Name.LAST_NAME,0,0,C and Name.FIRST_NAME,0,0,C is placed under the Name (Last, First) column in the iMIS database.

2. Give the template file a name, for example, template.txt. The corresponding rows in the .csv file must match the order of the items in the template file.
3. Create a .csv file to import. Give it a name, for example, Contacts.csv. Include the following information in the Contacts.csv file:

   ALAN,ADAMS,ADANAC ELECTRIC,AADAMS@YAHOO.COM,512-334-7834,512-222-5389

   MICHAEL,BAKER,ADANAC ELECTRIC,MICHAEL99@GMAIL.COM,512-672-8302,512-332-7378

   JENNIFER,CARSON,ADANAC ELECTRIC,CARS212@HOTMAIL.COM,512-373-2383,512-564-9765

   GENE,DARRENS,ADANAC ELECTRIC,GD_555@DARRENS.COM,512-254-9492,512-759-8545

   LISA,EBERSOL,ADANAC ELECTRIC,EBERS73@GMAIL.COM,512-998-7259,512-213-2596

Loading import template files

To load import template files in the Import Utility

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Import Utility to open the Import Utility window.
2. Click New.

3. Enter the Import Name (description of the import task). For this example, use CONTACT.
4. Select an Import Type:

- Select (C)omma for comma-delimited (.csv) files.
- (NRDS only) Select (F)ixed Field for Import Type when working with NRDS imports.

5. Select Name for the File to Modify.
6. (NRDS only) Select the NRDS Import (Skip Header Records) checkbox when performing a NRDS import. This instructs the import utility to skip the header records.
7. (NRDS only) Select the Member Import or the Office Import checkbox to specify whether you are importing the NRDS Member file or the NRDS Office file.
8. Click Save.
9. Click Edit.
10. Click Load and select the template.txt file.
11. Edit the template as needed, if necessary:

1. In the template area, click Add to append a record row to the end of the template, or click Insert to add a row within the template. You can highlight a record row and click Delete to remove the record row.
2. Click Ctrl+Z to open an edit window.
3. Specify the fields to be edited:

1. Enter the Field Name in the conversion table.
2. (NRDS only) Enter the record Position from the NRDS file for that field.
3. (NRDS only) Enter the Length of the field.
4. Enter the Processing Code option, if used. This code identifies which record to update. The Processing Codes table on the window lists the options and their descriptions.

If the field is a Name_Address field, for example, ADDRESS_1, CITY, STATE_PROVINCE, and so forth, you will need to specify which address purpose to use. The #1, #2, #3 processing codes specify the first, second or third address purpose. When importing address information, you need only specify the ADDRESS_1, CITY, STATE_PROVINCE, COUNTRY, and ZIP fields in Name_Address. iMIS will build the FULL_ADDRESS field and populate the corresponding fields in the Name table. The same is true for Name information. If you populate the LAST_NAME and FIRST_NAME, iMIS will automatically build the FULL_NAME field.

(NRDS only) The following table defines some NRDS-related processing codes used in the import templates:

#1, #2, #3	Address format. Used with one of the three PURPOSEs used in iMIS. Note: This must match the address exported to the National Association of REALTORS® (NAR). • #1 – Updates the member's current main address • #2 – Updates the member's second address • #3 – Updates the member's third address
N	Numeric format, removes leading zeroes. Do not use N for importing international phone numbers.
P	Phone format.
L	Instructs the import utility to insert a new Name.ID or Name.MAJOR_KEY if no match is found for that field.
D	Date format. Note: The NRDS import file contains two fields for zip code. To convert these fields to the iMIS zip code format, enter two zip code fields in the table. Specify Length = 5 for the first field. For the second code, specify Length = 4 and specify A- processing code (Append Data to Field, followed by a hyphen). Tip: Use the A- processing code (Append Data to Field, followed by a hyphen) for

importing Social Security numbers in the standard format (999-99-9999).

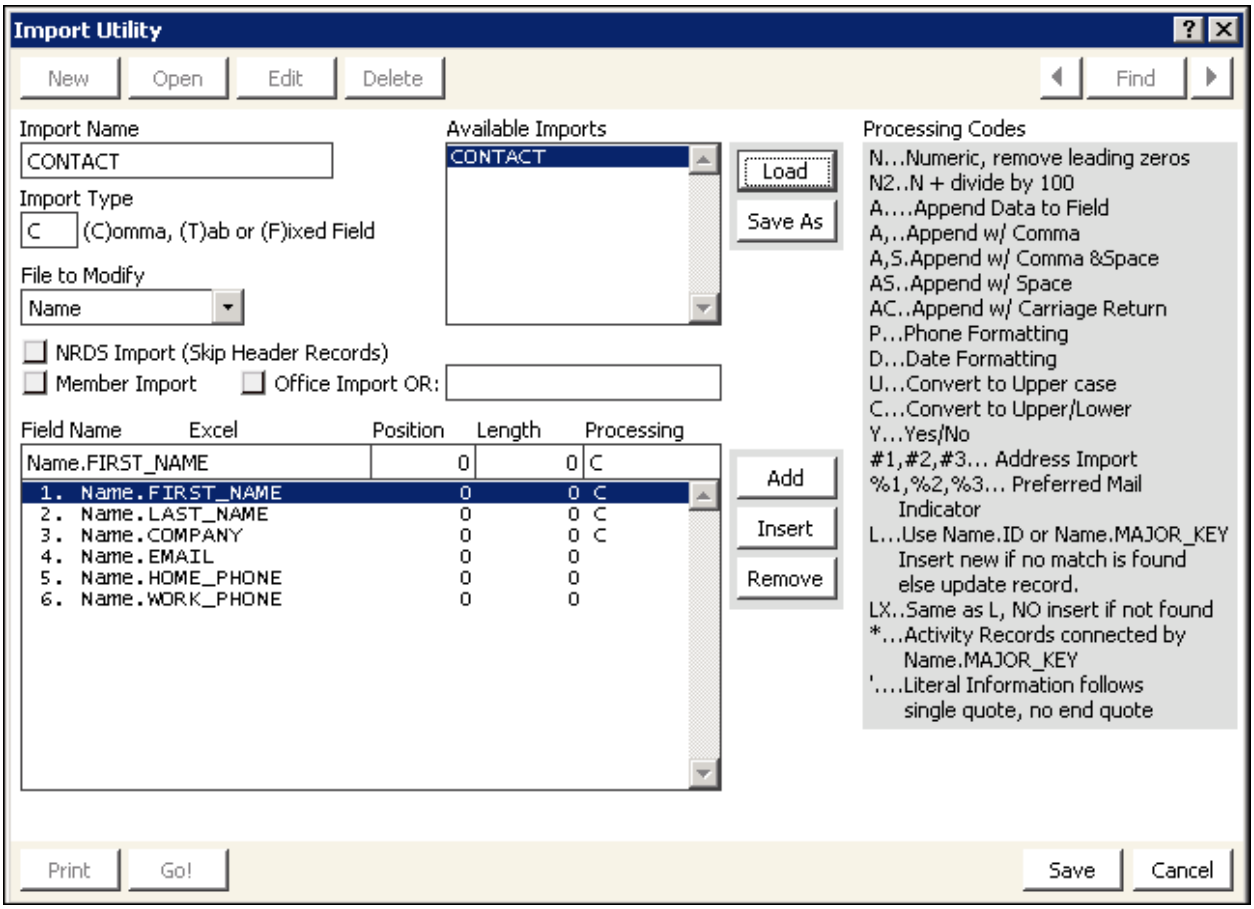
The Member import template uses the following additional Processing Codes:

@ Takes the NRDS ID number in the import file and finds the Name record in iMIS where this number is populated in the MAJOR_KEY field to get the iMIS ID. The utility then populates the Name.CO_ID field with this iMIS ID for the member record to be imported. Any necessary company information flowdown is then processed.

% Used to populate the preferred mail checkbox. The import file contains a field consisting of H, M, or O. The Import Utility maps each letter to a specific address.

- H = 1 – Main Address in the Name Maintenance window
- M = 2 – Second Address in the Address window
- O = 3 – Third Address in the Address window

In the Name_Address.PREFERRED_MAIL field, enter a % processing code with a 3-digit code representing each of your three iMIS addresses. For example, using %312 means the third address in iMIS corresponds to the Home Address, the Main Address corresponds to the mailing address, and the Second Address corresponds to the office address.



12. Click Save to save the changes to the template.

Disabling a trigger before an import

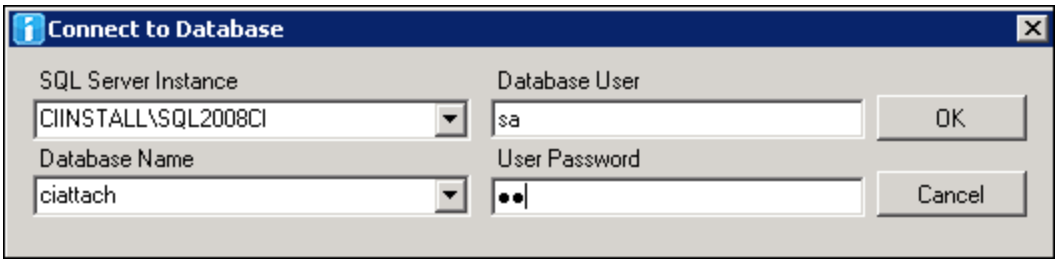
The Name Table Trigger is a trigger on the Name table that runs every time there is a change to the Name table. The trigger initiates procedures that keep contacts information synchronized.

Disable the Name Table Trigger to enable quicker data imports.

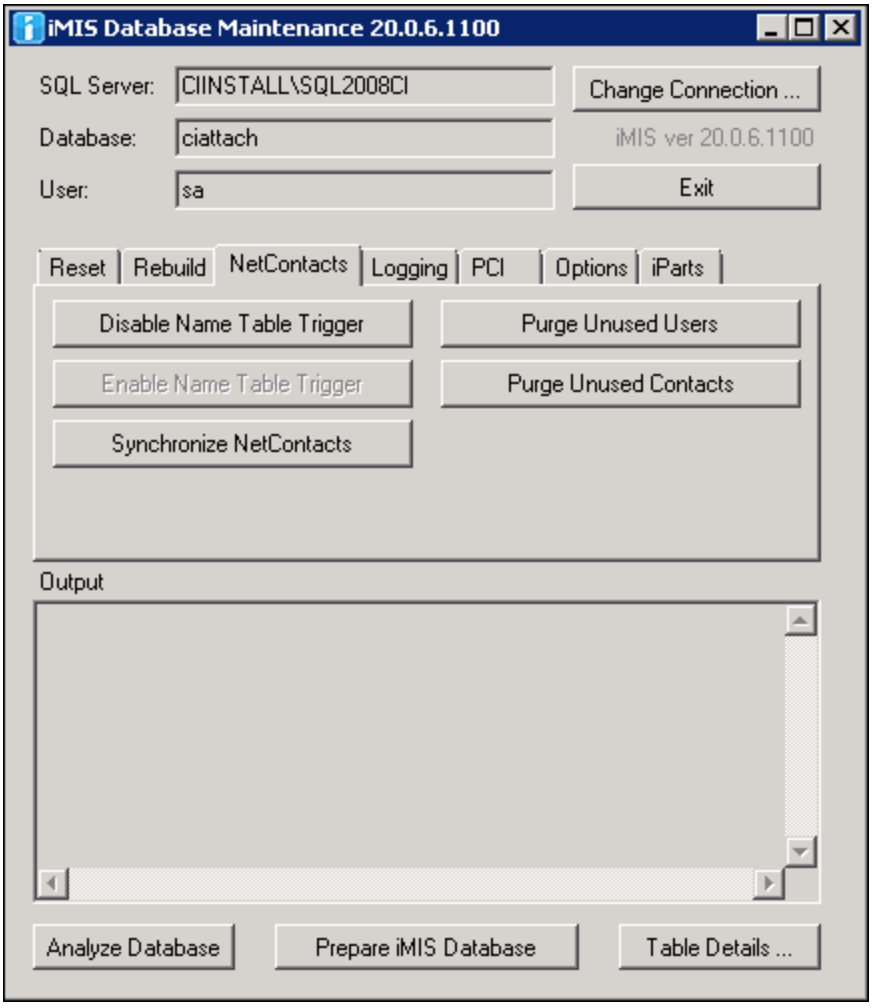
Before importing the Contacts.csv file, you must use the iMIS DB Maintenance Utility tool to disable the Name Table Trigger. This step should be completed immediately prior to running the import.

To disable a Name Table Trigger

1. Go to Start > All Programs > ASI > iMIS > Tools > iMIS DB Maintenance Utility.



2. You must enter the User Password before you can select the Database Name from the drop-down list.
3. Click OK.
4. Click the NetContacts tab.



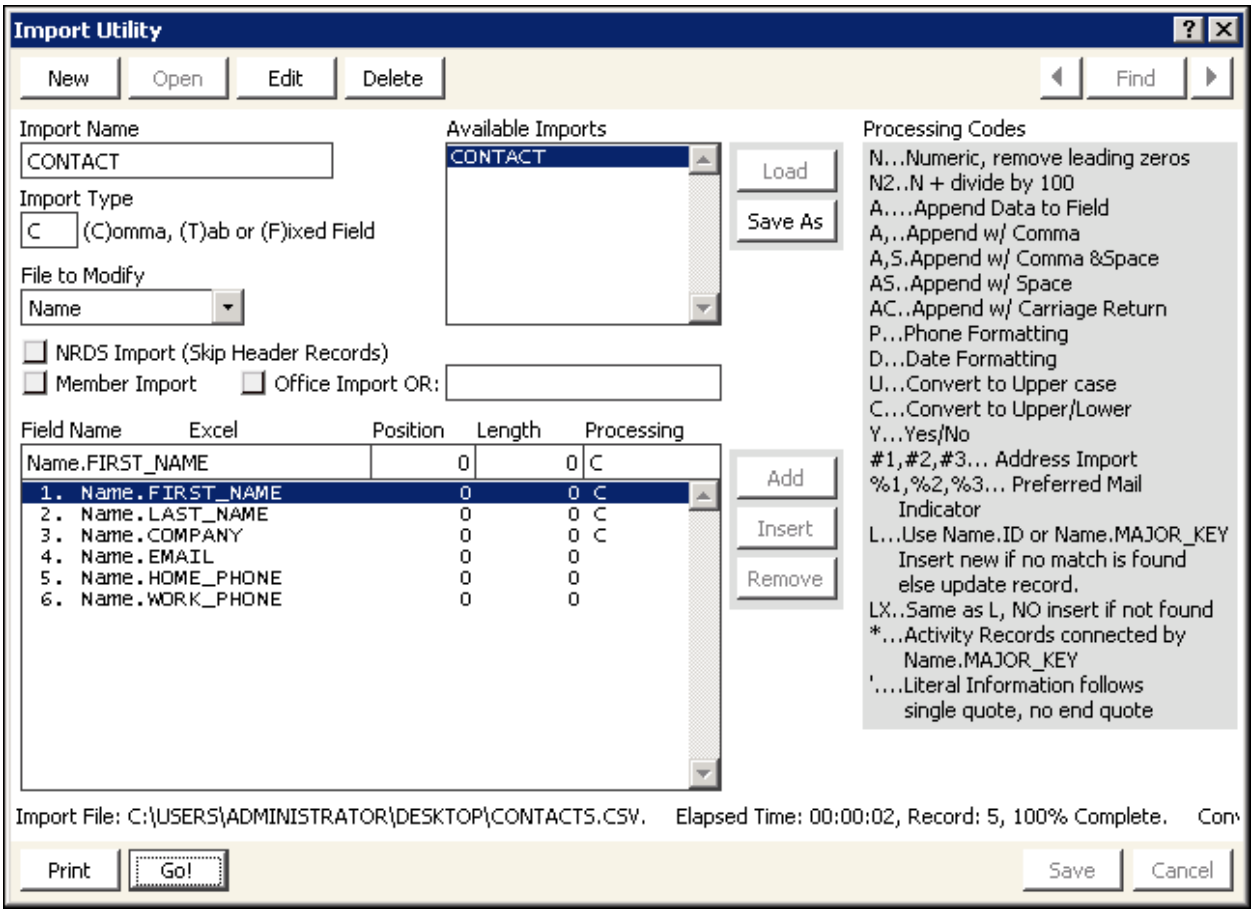
5. Click Disable Name Table Trigger to disable the Name table trigger while you run the import.

Importing a file

Before importing the Contacts.csv file, you must ensure that the data in the file is accurate and correct. Review all the fields in the Contacts.csv file, as iMIS will import exactly what is in each field.

To import the Contacts.csv file

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Import Utility to open the Import Utility window.
2. Under Available Imports, highlight the CONTACT import.
3. Click Go!
4. Browse to find the Contacts.csv file.
5. Select the Contacts.csv file.
6. Click Open.



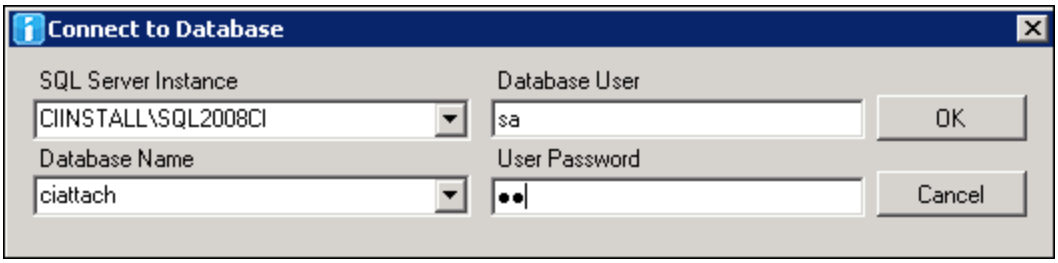
7. On the Import Utility window, the number of records imported will display, along with 100% Complete once the import is complete.
8. Ensure the number of records imported matches the number of records in your Contact-s.csv file.

Enabling triggers after an import

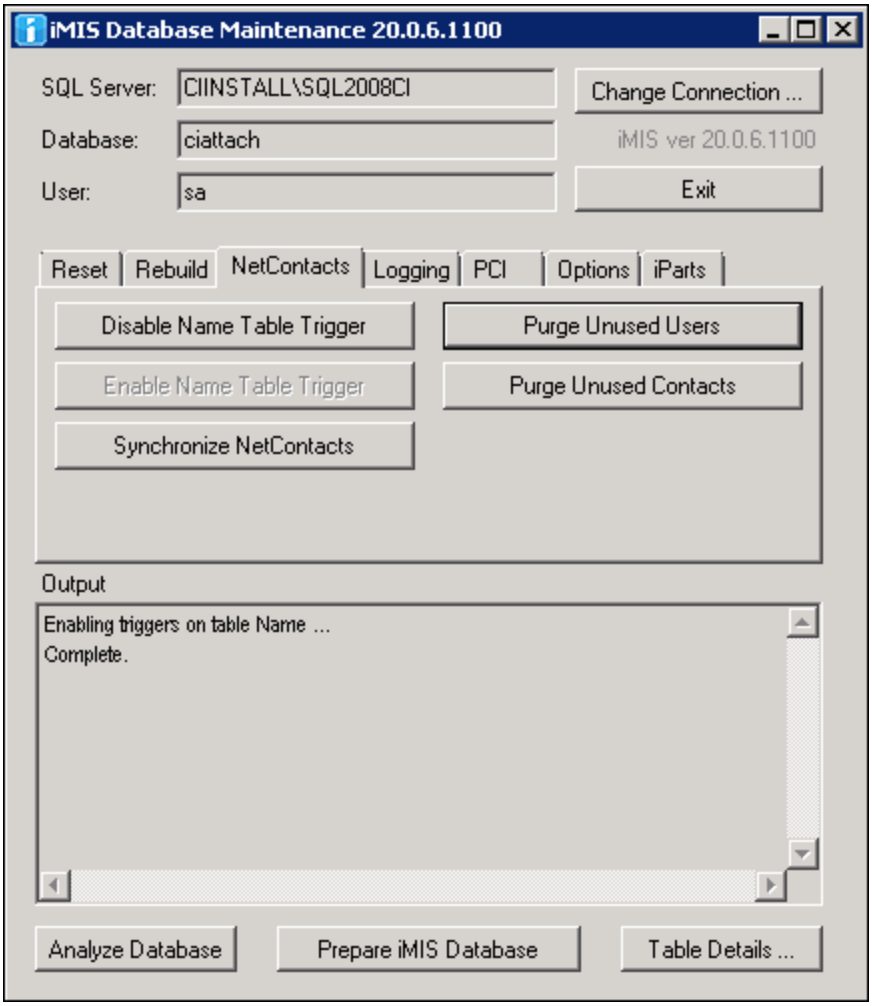
Use the iMIS DB Maintenance Utility tool to enable the Name Table Trigger. This step must be completed immediately after running the import.

To enable a Name Table Trigger

1. Go to Start > All Programs > ASI > iMIS > Tools > iMIS DB Maintenance Utility.



2. You must enter the User Password before you can select the Database Name from the drop-down list.
3. Click OK.
4. Click the NetContacts tab.
5. Click Enable Name Table Trigger to enable the Name Table Trigger.

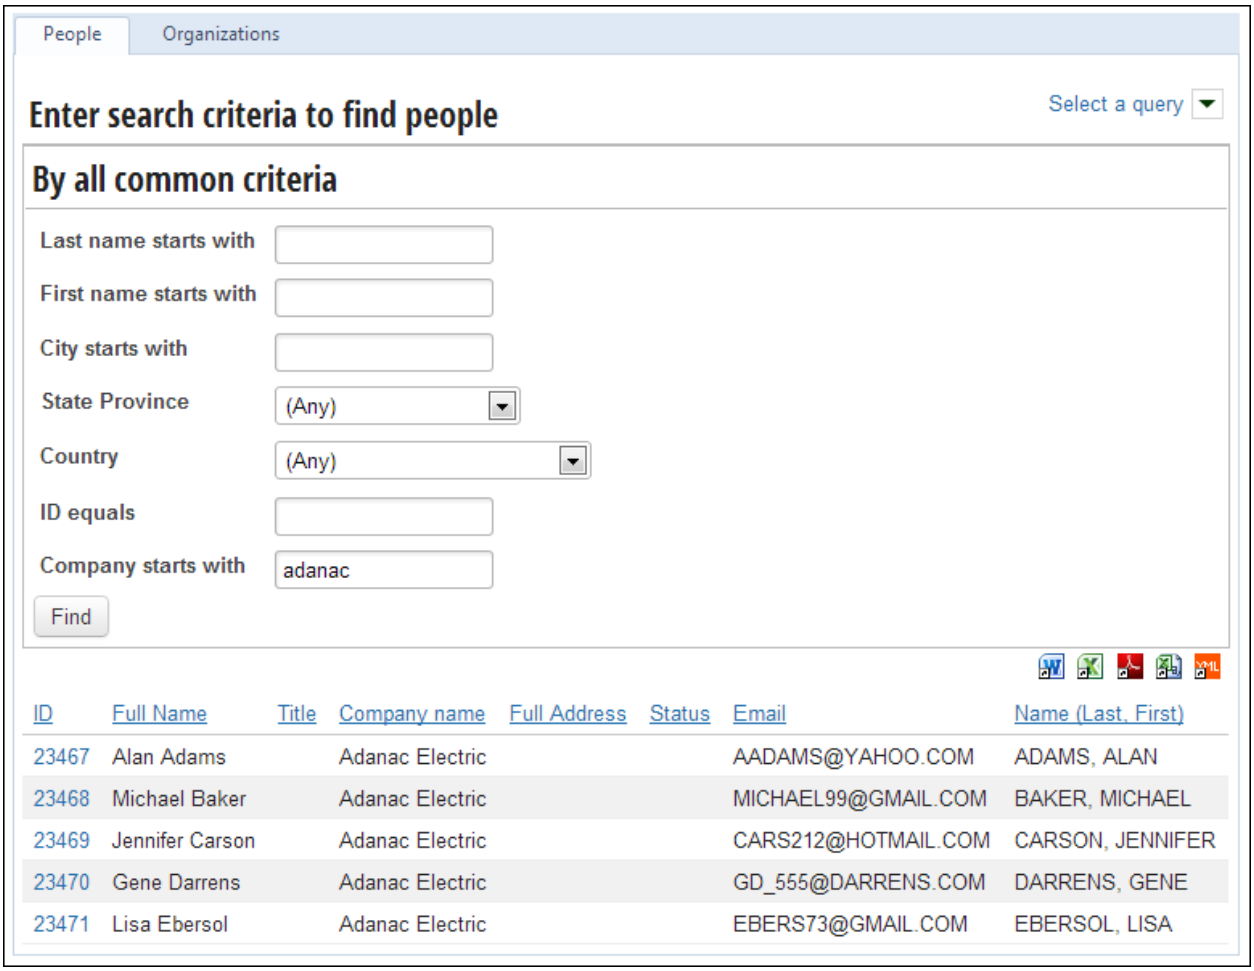


6. Click Synchronize NetContacts. The number of contacts synced should equal the number of records you imported.

Verify the import

To verify the import was successful

1. In the staff site, go to Community > Find Contacts.
2. Perform a search By all common criteria.
3. Enter adanac in the Company starts with field.
4. Verify that you can see the records you imported into the Name table in the iMIS database.



Export Utility

The Export Utility lets you export information from the iMIS system to another location or to a third-party software application, such as a word processor, spreadsheet program, or compatible database application. The Export Utility lets you:

- Include information from multiple records of the same file on one export record.
- Update fields in the iMIS database when the export is run.
- Specify if/then processing of the output.
- Create an activity record that records the date the export record was created and includes a copy of each member's export record.
- Schedule the export execution time.

To use the iMIS Export Utility, you must have the EXPORT license code in your system control file. Contact your authorized iMIS reseller to obtain an updated system control file.

iMIS table/field formats

The primary table (file) in iMIS is the Name table, which is the internal system label for the member/contact file. It contains name, address, categorization, and demographic information for each member/contact that you track through iMIS. All iMIS modules interact with and retrieve information from this table.

The other main table that supports membership processing is the general purpose Activity table. It contains records that track historical and participation details, such as meetings attendance, committee service, dues payments, product purchases, correspondence sent, and calls logged. The information in this table is commonly accessed for analysis or marketing reasons.

Another table you may want to use is the Subscription table, which tracks all dues and subscription line items billed and collected.

Referencing the fields

When you want to access or reference a field in iMIS, you can often select from a field list. To export iMIS fields, format the field names exactly, including precise capitalization and punctuation. Table (file) names appear with initial capitals (with underscores as needed), field names appear in all capitals (with underscores as needed), and the two parts are connected with a period.

iMIS files to use for export

The following are the recommended iMIS tables to use to export data:

- Name
- Activity
- Subscription
- Orders
- Order_Lines
- Trans
- Invoice
- Invoice_Lines

Avoid using other iMIS tables for export, because data in the other tables might not be easily linked to the primary tables.

Using the iMIS Export Utility

To export data using the iMIS Export Utility:

1. Create the export definition.
2. Select the iMIS tables and fields to be exported.
3. Specify the search criteria to be used.

4. Specify the export field formats.
5. Run the export.

Creating an export definition

The first step to export data with the Export Utility is to create the basic export definition. The export definition specifies and formats the data to be exported.

To create the export definition

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Click New.
3. Type a name for the export definition in the Name field.
4. Select a Delimiter (character to be placed between fields):

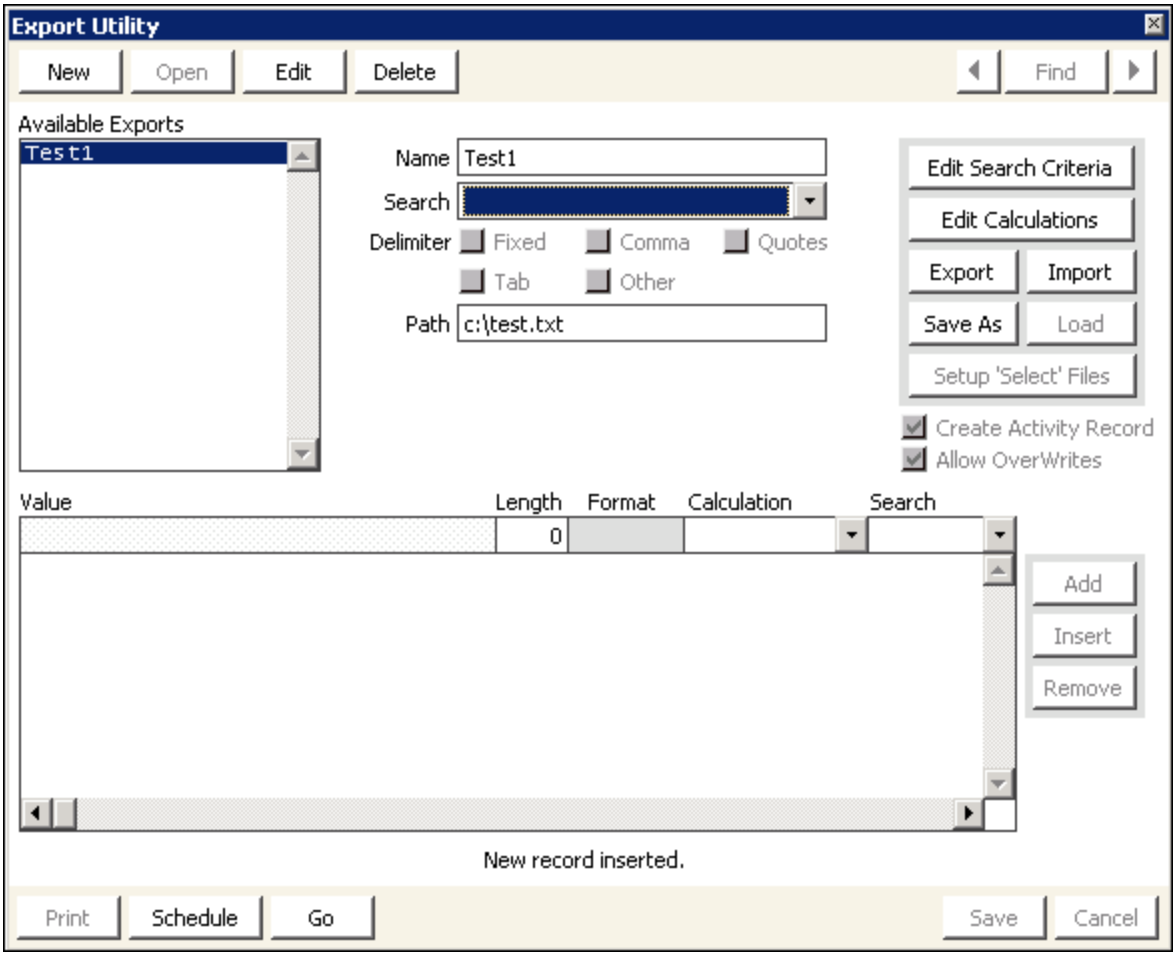
- Fixed – no delimiter.
- Tab
- Comma
- Other – specifies other delimiter in a field that is displayed.
- Quotes – encloses text in double quotes. This is helpful if a comma delimiter is required and some text fields contain commas.

  Note: The Quotes field displays only when a delimiter other than Fixed is selected.

5. (Optional) Select the Create Activity Record option to record each export record as a member activity in the iMIS database.
6. Define the Path for the export file.

   Tip: You can include an incremental sequence number in the name of the file by including a question mark in the name of the file. For example, if you enter c:\Temp\national?.txt, the file c:\Temp\national1.txt is created the first time you run the export, c:\Temp\national2.txt is created the second time you run the export, and so forth.

7. (Optional) Select the Allow OverWrites option to allow the file to be overwritten each time the export is run.
8. Click Save.



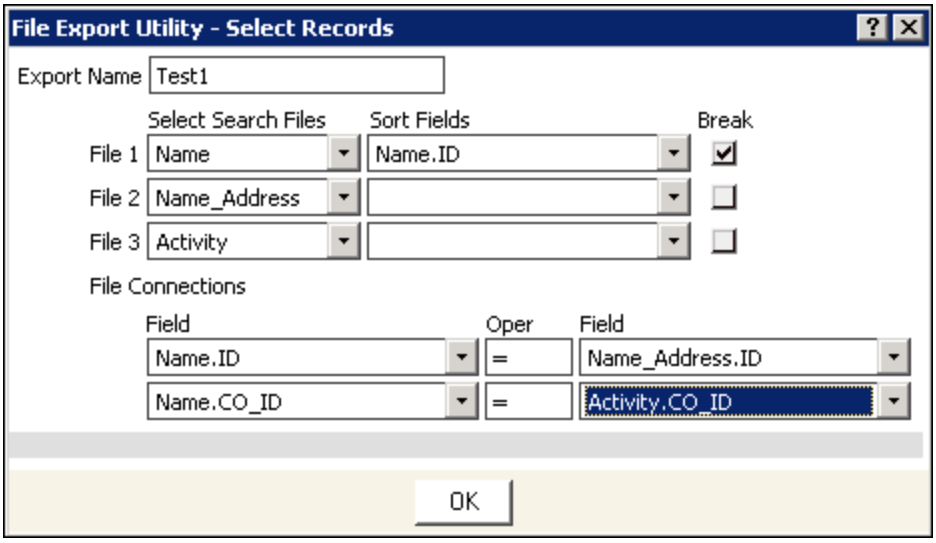
Selecting iMIS tables and fields to be exported

After you create the export definition, select the iMIS tables and fields to be included in the export definition. These Select Files are the basis for the export. You can sort the export records based on a file or field value in the Select Files and you can define search criteria to designate data in the Select Files to be exported.

To select the iMIS tables and fields to be exported

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.

2. Select an export definition from the Available Exports.
3. Click Edit.
4. Click Setup 'Select' Files to open the File Export Utility – Select Records window.



5. Select up to three iMIS tables as Select Search Files.
6. (Optional) Select the Sort Fields for these files. This determines the order the records are exported.
7. (Optional) Select the Break option if you want to create an export record each time the value in Sort Fields changes.

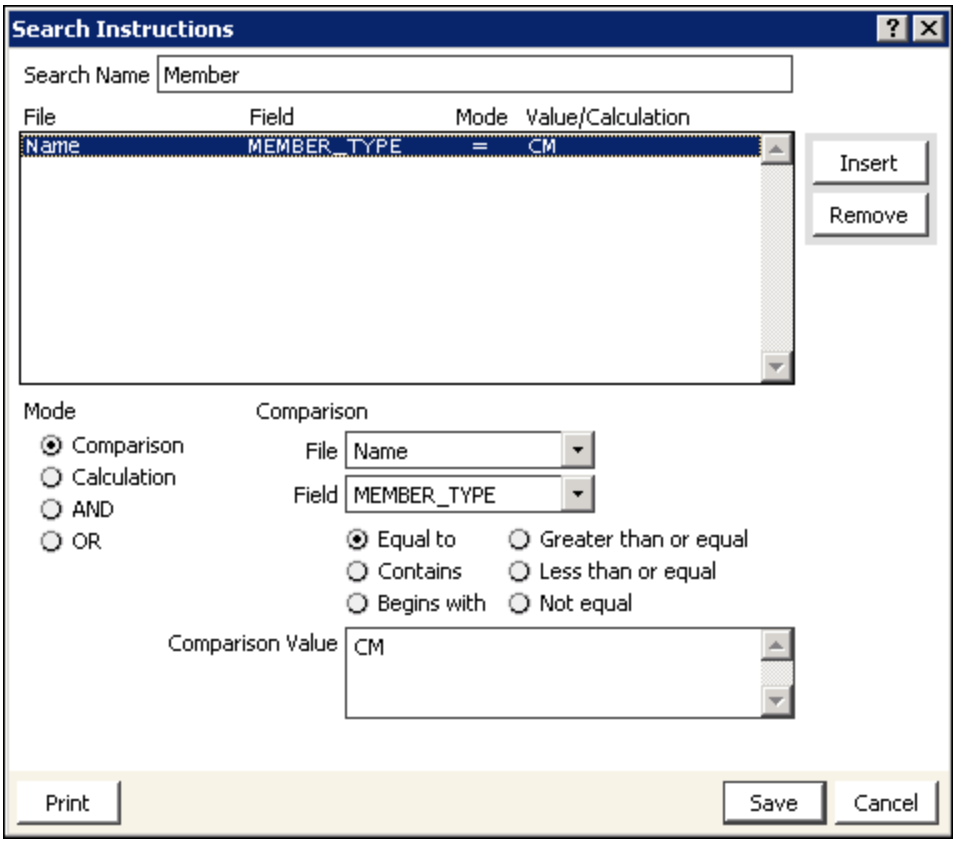
   Tip: To eliminate duplicate member export records, specify the Name.ID field as a Break field. The Export Utility will create only one export record for each unique Name.ID.
8. Define the joins for the Select Search Files in the File Connections fields. For more information, see Defining joins for select files.
9. Click OK to return to the Export Utility window.
10. Click Save.

Specifying search criteria

Specify the general search criteria for the export. The export will contain only the information in the Select Search Files that meets the search criteria.

To specify search criteria

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Click Edit Search Criteria to open the Select Search Instructions window.
3. Click New to open the Search Instructions window.

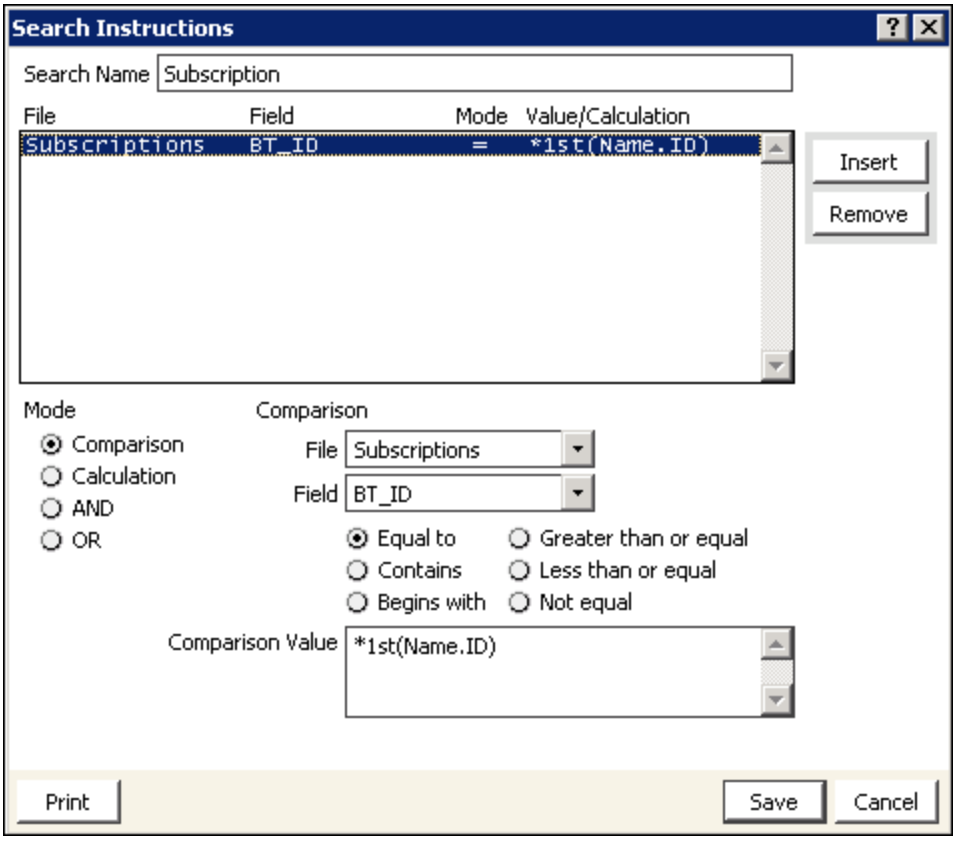


4. Enter the Search Name.
5. (Optional) Select the Mode. This option allows you to export only the files or fields that meet defined criteria such as Comparison, Calculation, AND, and OR.

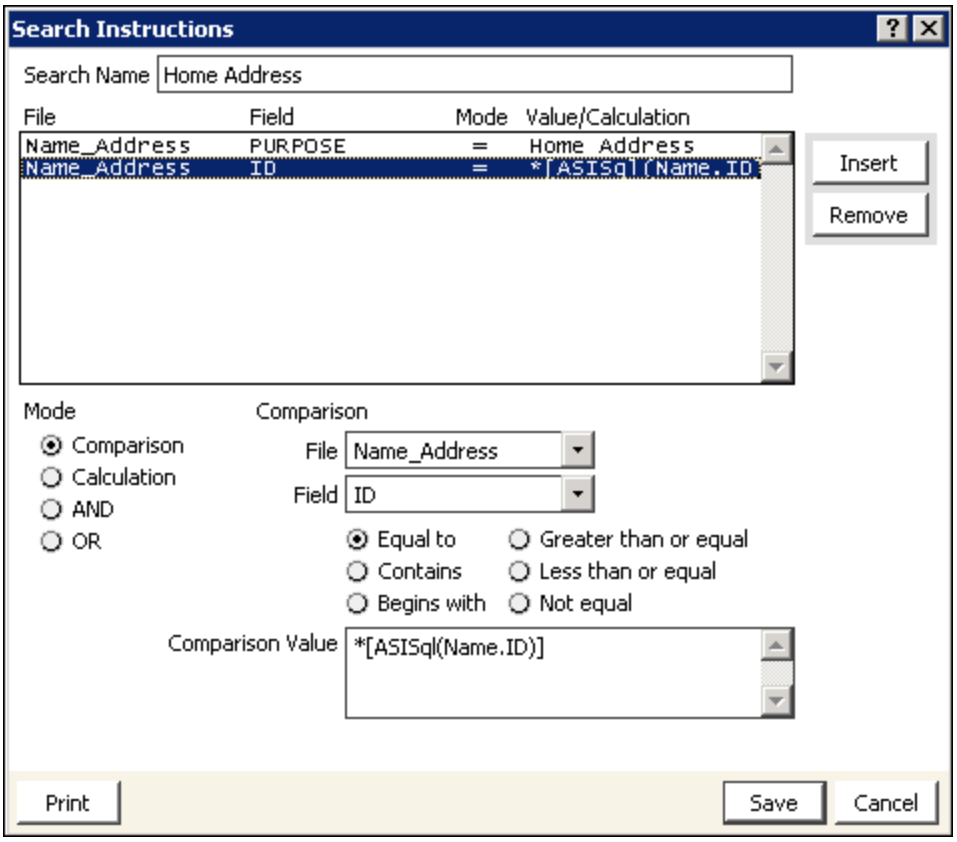
   Note: If the Comparison Value is a field value, enter an asterisk (*) before the field name.

6. Click Save.
7. Click OK to return to the Export Utility window.

   Tip: You can specify search criteria from a record in a file that is not one of the three Select Search Files, or from another record within a Select File. If you are pulling information from a file other than a Select File, you must relate the file to one of the Select Search Files in the search criteria.



You can use SQL statements to specify the Comparison Value. For example, if Name is a Select File and you want to bring in the Home Address record, enter Name_Address.ID to search for a specific address. Enter *[ASISql(Name.ID)] for the Comparison Value, as shown in the following example.



Specifying export field formats

Export field formatting is entered in the Comparison Value section of the Export Utility window. You can specify formatting for constants, iMIS field values, and Omnis calculations. You can also specify if/then processing of the output by formatting the export output with condition statements. This step narrows the general search criteria for specific fields.

To format export fields

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an Available Export.
3. Click Edit. There are three types of values that can be exported: a constant, a value contained in an iMIS field, and an Omnis calculation. Enter the formatting in the Value field.

- To specify the format for a constant (literal) value, type a double-quotation mark followed by the value. For example, if the first four characters of the export record must contain the

value 0001, enter "0001 in the Comparison Value field.

- To specify the format for an iMIS field value, type the field name, for example, Name.MEMBER_TYPE.
- To specify the format for an Omnis calculation, type an equal sign followed by the calculation.
  For example, if you want to export the area code of the home telephone number field, type =mid(Name.HOME_PHONE,2,3). This statement exports the second, third, and fourth characters from the Name.HOME_PHONE field.

4. (Optional) Specify the desired Length of the field. This allows you to truncate or extend the field length.
5. (Optional) Enter a code in the Format field (see below).
6. Click Add to save the format.
7. After all formatting instructions are added, click Save to save the formats.

   The following table lists the available Format codes.

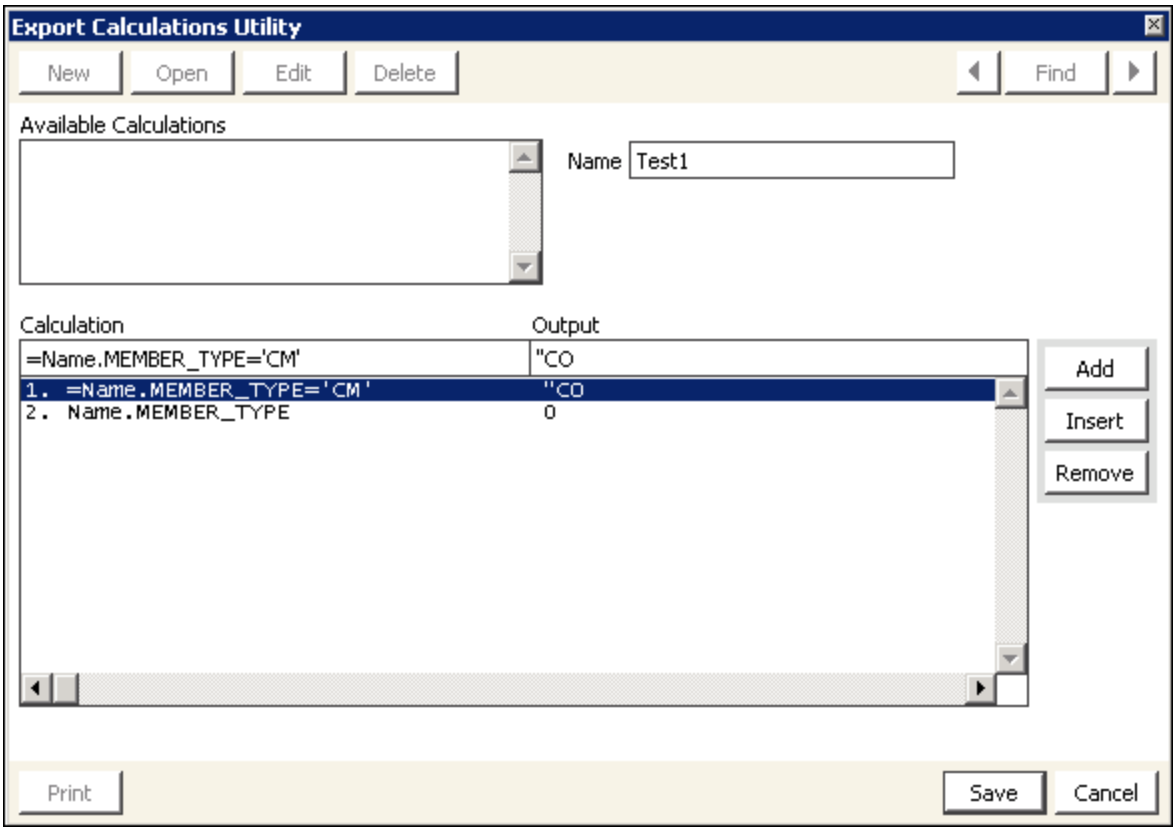
1	Exports the value on the first record only (useful for header records). Must be in the first position of the Format field.
C	Formats the output to initial capital letters.
D6	Exports the value as a date in the MMDDYY format.
D6/	Exports the value as a date in the MM/DD/YY format.
D8	Exports the value as a date in the MMDDYYYY format.
D8/	Exports the value as a date in the MM/DD/YYYY format.
F	Appends a LF (line feed) return to the end of the field.
L	Formats the output to all lowercase letters.
P	Pads the field to the length specified in the Length field with the character immediately following the P.
P0	Pads the field without zeros.

N	Specifies all blank or zero field values to be output as 'Null'.
N2	Same as N except that the characters. , - $ ( ) are saved.
R	Appends a CR (carriage return) feed at the end of the field. Note: This code should be used with the last field of each format.
U	Converts the output to all uppercase letters.
S	Skips the delimiter and concatenates with the next export column.
X	Updates data in the iMIS database. Note: You must include search criteria and a calculation with this format. The search criterion identifies the specific record to be updated. The calculation determines the value that is output in the export record.
6X	Indicates which record will be selected when searching extra records. For example, the code 62 will take the field value from the second record that matches the search criteria.
Y	Outputs a YES or NO. If the field value or calculation in the Value field evaluates True, a YES is exported. Otherwise a NO is exported.
y	Same as Y, except outputs a Y or N.

To format output with condition statements

You can format the export output with condition statements by creating a series of IF statements with corresponding output values.

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an Available Export.
3. Click Search. Highlight an export Value.
4. Click Edit Calculations to display the Export Calculations Utility window.
5. Click New to create a new calculation.



6. Click Insert at the bottom of the window and click in the Name field to add a new name for the calculation.
7. Click Add to add a calculation or condition statement. In the Calculation field, type an equals sign followed by the calculation, for example, =Name.MEMBER_TYPE='CM'.
8. In the Output field, type a double quotation mark followed by the desired output value, for example "CO. In this example, every CM Member Type is exported as a CO value.

   You can add as many calculations as you need. The utility exports the result of the last True calculation. The result can be an iMIS field name, a constant, or an Omnis calculation.
9. Click Save to save the calculation. The calculation is now listed as an Available Calculation on the Export Calculations Utility window.

   To load record formats from other compatible software

To load records from compatible third-party software applications, the records must be comma- delimited or tab-delimited. Each record to be loaded must contain the following fields in this exact sequence: Value, Length, Format, Calculation, and Search.

Do the following:

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an Available Export.
3. Click Edit.
4. Click Load to select the file to load into the export definition.
5. Click Open to start the load process.
6. Click Save to save.

Running an export

You can run an export on demand.

To run an export on demand

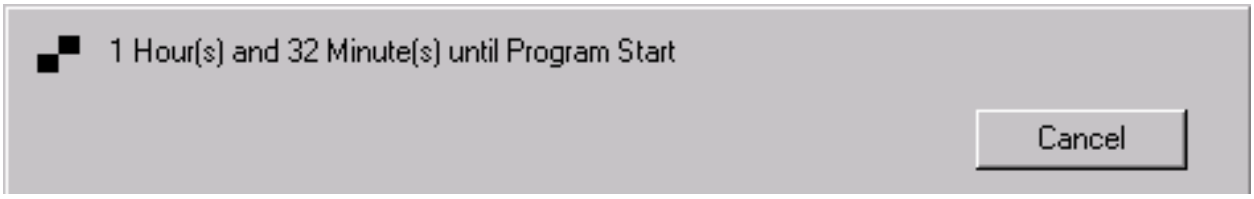
1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select the Available Export to run.
3. Click Go.
4. When prompted to confirm running the export, select Yes.

To schedule an export

The export should be scheduled after you have finished work for the day.

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.

2. Click Schedule to open the Schedule Program window.
3. Select the time to start the export by using the up and down arrows.
4. Click OK. The <remaining time> until Program Start message is displayed.



Cloning an export definition

You can clone an existing export definition and make changes to create a new export definition.

To clone an export definition

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an Available Export.
3. Click Save As on the Export Utility window to display the Export Definition Save As window.
4. Type the New Name for the export definition.
5. Click Save to save the file with a new name.
6. Make changes in the new file and save.

Viewing the Activity Record

If the Create Activity Record option is selected in the Export Utility window, iMIS records the date the export record was created and saves a copy of each member's export record.

To view the activity record

1. Make sure the Name file is one of the Select Files in the export definition.

2. In the Advanced Accounting Console, go to Configure > Membership > Set up activity types.
3. Create an activity type named EXPORT.

   Note: When creating an EXPORT activity type, be sure to define some columns. For example:

   UF1 - UF3 – Use these fields to enter prompts for the values entered in the Char 1 - Char 3 fields on the Event System Preferences window.

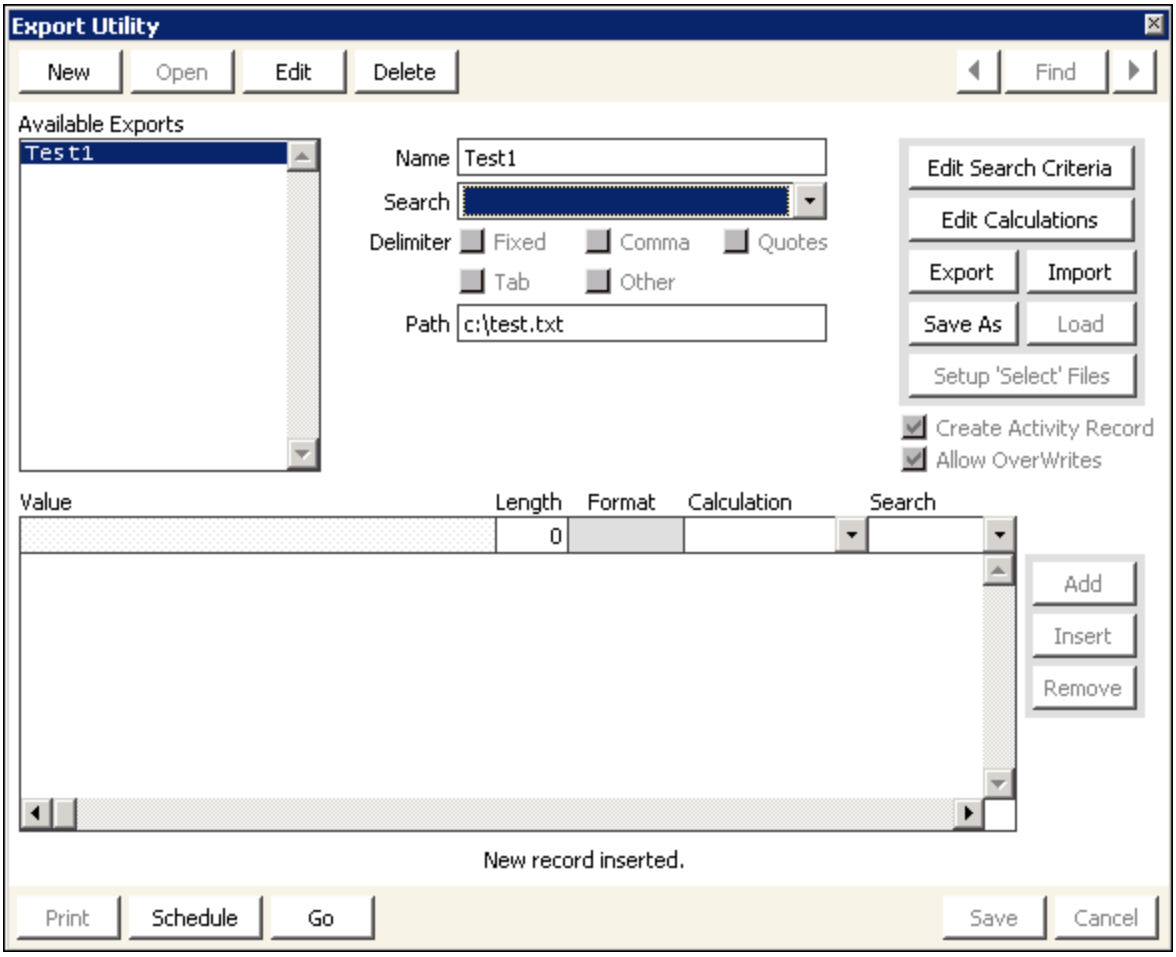
   UF4 - UF5 – Use these fields to enter prompts for the values entered in the Number 1 - Number 2 fields on the Event System Preferences window.

   UF6 - UF7 – Use these fields to enter prompts for the values entered in the Date 1 - Date 3 fields on the Event System Preferences window.

   These columns will generate data that will be visible in the Panel Editor content item that you will create in order to view the activity records.
4. Click Save.
5. Go to the Staff site.
6. Go to RiSE > Page Builder > Manage content.
7. Select a Content Folder.
8. Go to New > Website Content.
9. Enter a Title and a Publish File Name.
10. Click add content.
11. In the Content Gallery, go to Content Types > Content > Panel Editor.
12. Click OK.
13. In the Panel list, select (New Panel).
14. Name the panel.

15. Select the Show data sources that allow multiple entries per object instance radio button.
16. Double-click Activity-EXPORT. The columns available for the EXPORT activity record are displayed.
17. Click Save & Close.
18. Click OK.
19. Click Save & Publish.

Export Utility window



Utilities > Data Transfer Utilities > Export Utility

Available Exports

List of user-defined export definitions.

Name

Name of selected export definition.

Search

Name of user-defined search criteria.

Delimiter

Character placed between fields:

- Fixed – no delimiter.
- Tab
- Comma
- Other – specifies other delimiter in the field that appears.
- Quotes – encloses text in double quotes. This is helpful if a comma delimiter is required and some text fields contain commas.

Note: This field displays only when a delimiter other than Fixed is selected.

Path

Directory and file name for the export file.

Edit Search Criteria

Opens the Select Search Instructions window.

Edit Calculations

Opens the Export Calculations Utility window.

Export

Opens the Set print file name window to save the selected export definition to a file.

Import

Opens the Select import file window to import a file containing export data formatting information.

Save As

Saves a copy of the export definition with a different name.

Load

Opens the Select import file window where you can select and insert a record template from compatible third-party software applications such as Excel. Each record template loaded must contain the following fields in this exact sequence: Value, Length, Format, Calculation, and Search.

Setup ‘Select’ Files

Opens the File Export Utility - Select Records window.

Create Activity Record

Option to record each export record as a member activity in the iMIS database.

Allow OverWrites

Option to allow the file to be overwritten each time you run the export definition.

Value section

Specific formatting information is entered here.

Value

The constant value, iMIS field value, or Omnis calculation to be formatted.

Length

User-defined length of the Value field.

Format

Code to specify data format.

Calculation

List of available calculations.

Search

List of available search names.

Add

Adds a new line in the Value text box.

Insert

Inserts a line between existing lines in the Value text box.

Remove

Removes the selected line in the Value text box.

Print

Prints the export.

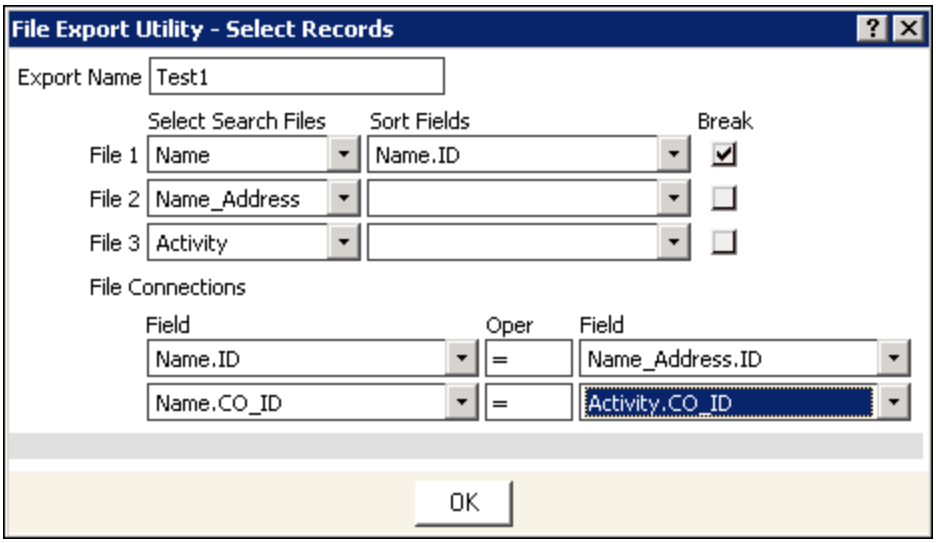
Schedule

Opens the Schedule Program window.

Go

Runs the export.

File Export Utility – Select Records window



Utilities > Data Transfer Utilities > Export Utility > Setup 'Select' Files

Export Name

User-defined export definition name.

Select Search Files

Select Files for the export definition.

Sort Fields

Defines sort order.

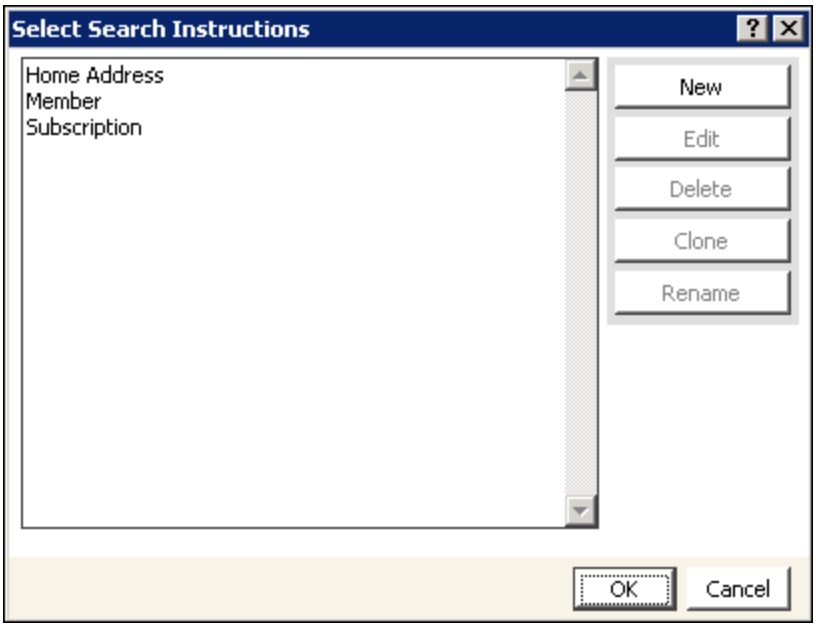
Break

Creates an export record whenever the value in the Sort field changes.

File Connections

User-defined file/table joins.

Select Search Instructions window



Utilities > Data Transfer Utilities > Export Utility > Edit Search Criteria

New

Opens the Search Instructions window to create search instructions.

Edit

Opens the Search Instructions window to modify the search instructions.

Delete

Deletes the selected search instructions.

Clone

Makes a copy of the selected search instruction.

Rename

Allows you to rename the selected search instruction.

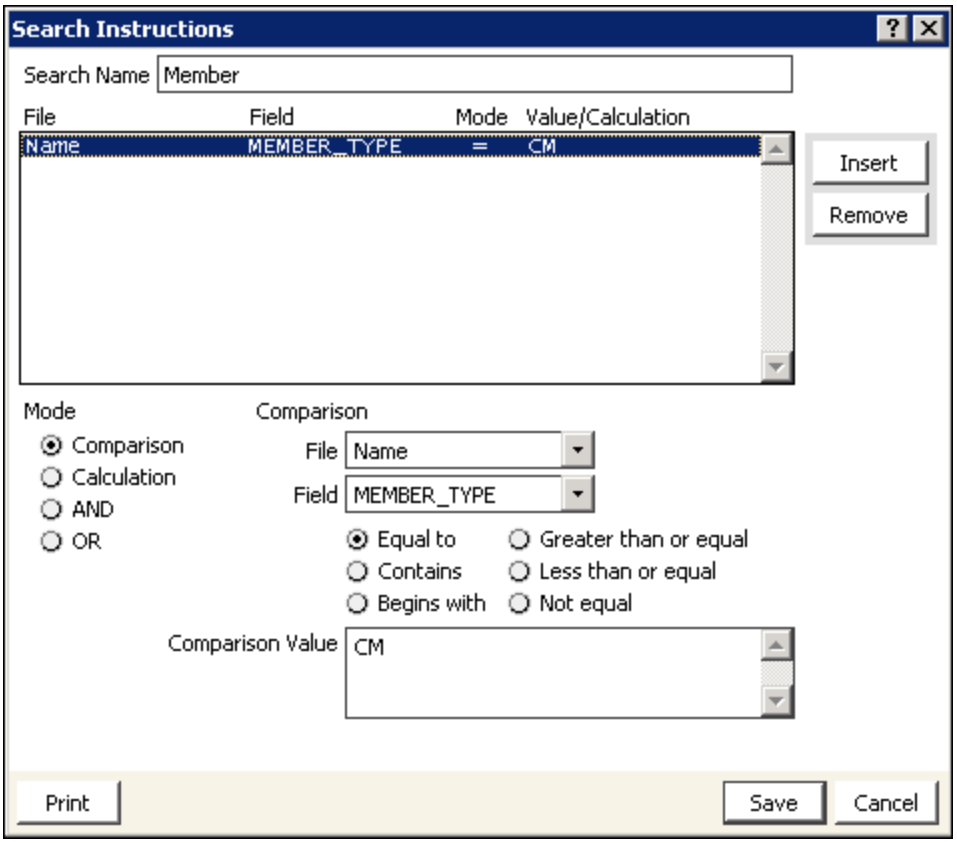
OK

Saves changes made to the search record.

Cancel

Closes the Select Search Instructions window and returns to the Export Utility window.

Search Instructions window



Utilities > Data Transfer Utilities > Export Utility > Edit Search Criteria > New

Search Name

User-defined name for search criteria.

Insert

Inserts a line in the Comparison Value text box.

Remove

Deletes the selected line in the Comparison Value text box.

Mode

Allows you to export only the files/fields that meet defined criteria (Comparison, Calculation, AND, OR).

File

File (iMIS table) to be used for comparison.

Field

Drop-down list of available fields in the selected file.

Comparison Value

Value to be compared with selected field value.

Print

Prints a report of the comparison instructions.

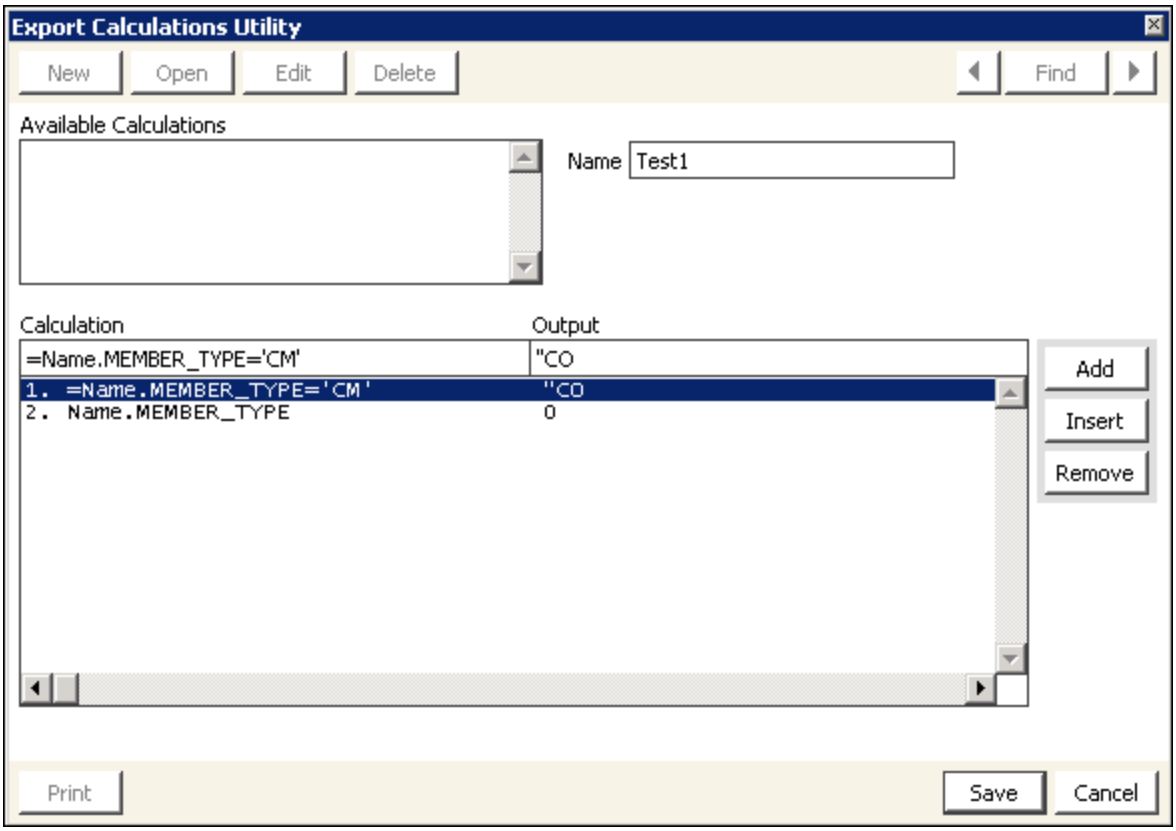
Save

Saves the search instructions.

Cancel

Closes the window without saving new search instructions.

Export Calculations Utility window



Utilities > Data Transfer Utilities > Export Utility > Edit Calculations

Available Calculations

List of user-defined calculations.

Name

Name of selected calculation.

Calculation

Calculation or condition statement.

Output

Desired output value when Calculation evaluates True.

Add

Adds a line in the Calculation text box.

Insert

Inserts a line between existing lines in the Calculation text box.

Remove

Deletes the selected line in the Calculation text box.

Print

Prints a report of the calculations.

Save

Saves the calculation.

Cancel

Cancels editing of the calculation.

Defining joins for select files

You might require data from more than one iMIS table for export. For example, you might need FULL_NAME and COMPANY from the Name table and TYPE='DUES' and BALANCE from the Subscription table. Since there is no membership data in the Subscription table, you must access the Name table. To use data from two or more tables, you must join them.

To join files (tables) is to specify which fields are equivalent so the files can relate to each other correctly, record-by-record. In effect, joining glues the files together for the export process. The most common joins in iMIS center on member ID numbers. A join across three tables might look like the following:

Name.ID = Activity.ID

Name.ID = Subscription.ID

Ordering the joins

The order of your table joins can impact performance. Although the optimal order depends on the report, the key iMIS joins are:

Name.ID = Activity.ID

Name.ID = Subscription.ID

Name.ID = Invoice.BT_ID

Orders.ORDER_NUMBER = Order_Lines.ORDER_NUMBER

Product.PRODUCT_CODE = Order_Lines.PRODUCT_CODE

Name.ID = Orders.BT_ID

Troubleshooting joins

If you experience problems such as too much data being returned, multiple records being returned, or endless data retrieval, you may not have joined the files correctly.

If you are experiencing performance problems with a report that uses a join, try switching the order of the files.

Make sure that the files included in the join are Select Files in the export definition.

System Setup

This section describes the administration and security options in System Setup, as well as the options available through the administrative views:

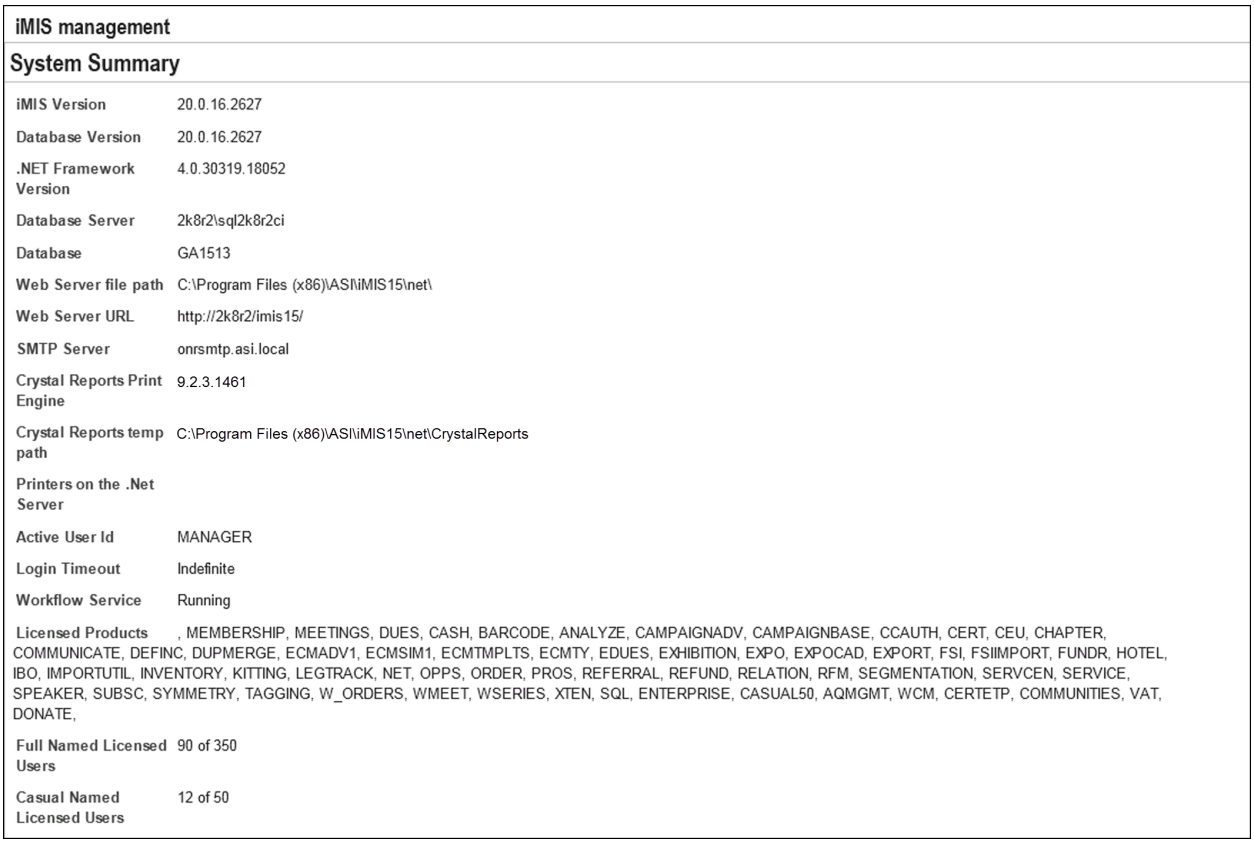
- The File > System Setup window
- The Utilities menu
- The Multi-instance Utility, available in the iMIS \bin folder

> **Note:** Note: To view and use this area, you must log on as a system administrator (the SysAdmin role).

System Setup

iMIS Management

The default window of iMIS System Setup displays system information.



iMIS management

System Summary

iMIS Version	20.0.16.2627
Database Version	20.0.16.2627
.NET Framework Version	4.0.30319.18052
Database Server	2k8r2\sql2k8r2ci
Database	GA1513
Web Server file path	C:\Program Files (x86)\ASI\iMIS15\net\
Web Server URL	http://2k8r2/imis15/
SMTP Server	onrsmtp.asi.local
Crystal Reports Print Engine	9.2.3.1461
Crystal Reports temp path	C:\Program Files (x86)\ASI\iMIS15\net\CrystalReports
Printers on the .Net Server	
Active User Id	MANAGER
Login Timeout	Indefinite
Workflow Service	Running
Licensed Products	, MEMBERSHIP, MEETINGS, DUES, CASH, BARCODE, ANALYZE, CAMPAIGNADV, CAMPAIGNBASE, CCAUTH, CERT, CEU, CHAPTER, COMMUNICATE, DEFINC, DUPMERGE, ECMADV1, ECMSIM1, ECMTMPLTS, ECMTY, EDUES, EXHIBITION, EXPO, EXPOCAD, EXPORT, FSI, FSIIMPORT, FUNDR, HOTEL, IBO, IMPORTUTIL, INVENTORY, KITTING, LEGTRACK, NET, OPPS, ORDER, PROS, REFERRAL, REFUND, RELATION, RFM, SEGMENTATION, SERVCEN, SERVICE, SPEAKER, SUBSC, SYMMETRY, TAGGING, W_ORDERS, WMEET, WSERIES, XTEN, SQL, ENTERPRISE, CASUAL50, AQMGMT, WCM, CERTETP, COMMUNITIES, VAT, DONATE,
Full Named Licensed Users	90 of 350
Casual Named Licensed Users	12 of 50

Example of iMIS system information

Set up printers

You can configure printers for iMIS from System Setup.

Tips for configuring printers

- You must enter the printer server name and printer name (for example, \\PRNTSRV\HP4650). You can copy this from the printer information and paste it in the printer field.
- iMIS does not perform any printer validation checking when you add a printer. Be sure that you enter the printer server and printer information correctly.
- You must have permissions on the printer server to cancel an iMIS print job.

Task Viewer

You can use iMIS System Setup to view, edit, delete, and add tasks.

Tips for managing tasks

- You can access the Task Viewer from your Home page or iMIS System Setup. To access tasks from your Home page, select Home and select View tasks.
- Any user can modify the status of any task at any time, even if the task has already been completed.
- By default, a task can only be seen by its creator, an administrator, or a user who has been assigned the task.
- By default, only tasks that are currently in progress display. You can view completed tasks if needed.
- When adding more than one task, you must save and close the window after adding each task.

Module Setup

The Module Setup pages for Marketing and Process Manager display in iMIS System Setup even if your system is not licensed for these features. These pages include links to the iMIS Staff site, where you can complete setup tasks that include configuring and administering security groups, as well as additional setup tasks for some features, such as setting options for Campaigns and creating types and action plans for Process Manager.

Security Administration

Security Administration provides options for administering user records and the roles you can associate with user records.

> **Note:** Note: To administer user records and roles, your User Credentials must include the SysAdmin role.

Creating iMIS user records

iMIS user records control what users can see and do in every view of iMIS. Each user record is linked to two others: a contact record (defined in Customers) and an ASP.NET authentication record.

- First, you create a contact record for a new user, with descriptive, address, and demographic information.

  Caution! Never create contact records for Administrator or Manager: iMIS automates this for you.

- Next, you create a user record and link it to the new contact record, matching logon/-password to that of the contact record under Name_Security.
- Lastly, creating the user record triggers iMIS to create the needed authentication record in the ASP.NET authentication store, to authenticate users when they log on to iMIS. (Because other ASP.NET applications share the authentication store, iMIS cannot delete authentication records.)

  > **Note:** Troubleshooting tip: Remember that everything in iMIS that uses the keyword logon relates to the user records in the ASP.NET authentication store.

  To create user records

  You generally need to create user records only for Full and Casual users.

  > **Note:** Tip: To create multiple user records faster, use the User Credentials button in the Manage Customers window; this lets you create a new contact record and jump directly User Credentials without leaving Customers.

1. If you are creating a set of user records, back up your iMIS database.
2. Launch iMIS Desktop and log on as MANAGER.
3. From Customers > Manage Customers, define (or find) a contact record for the user.

   When you click Save, the new contact record appears in the history area.

4. Click User Credentials to jump directly to User Credentials setup (System Setup > Security Administration > Users).
5. On the Users window, find the contact.

- In the View drop-down list, select Contacts:

  Select Users only to change an existing user record.

- Enter search criteria and click go.

  In the results list, the check in the Public User, Casual User, or Full User column marks which user class is currently assigned.

  Upgrades from 10.6: Records are set to Disabled because you need to allocate your named licenses before enabling them.

- Select the record from the results list, and click the Select icon.

6. If you are creating a new user record, add logon information.

- In the Logon field, click the Add icon.
- In the Create User Logon window, define a Logon Name, Password (minimum: 6 chars and one non-alpha), and E-mail address.
- Click Create User.

  An authentication record for this logon is created in the ASP.NET authentication store.

7. In the User Class field, choose the user class (Public, Casual, or Full).

   (Full or Casual) iMIS opens the User Access area (for web permissions) and prompts you to save before continuing.

   Note: Any Full user can see the User Credentials area if they have been granted Authorization level 4 or higher for Sys Mgmt., and if they have been granted any relevant access keyword for Name Internet Security Data (iMIS Customers > Set up module > General > Access Keys). However, only Full users who are members of the SysAdmin role can see the User Access section.

8. Scroll to the bottom of the window and click Save.
   - Success: If the user class is not maxed out for named licenses, the user record is created and the User Credentials area expands.
   - Failure (error message): If the user class is maxed out, no user record is created. When you recreate a user record for this contact record (by picking a different class or increasing your license counts), be sure to click the Link this contact… icon in the Logon field and specify the logon that you created during the first attempt.
9. (Full or Casual only) Add role, group, module authorization, and access keywords as needed.
   - In the User Information area, add the user to a role or group.
   - In the Staff Access area, set authorizations, customer type restrictions, and any access keywords.
   - Set authorization levels for each listed feature. (See Authorization levels: Desktop views.)
   - (optional) In the Specific Types field, restrict the user's access by specifying a comma-delimited list of the only customer types that this user can edit in Customers. (See "Defining Customer Types" in Customer Features.)
   - (optional) Click … next to the Access Keywords field and enter access keywords, if any. (See "iMIS Desktop Access Keywords (see "Access Keywords in Customers")" in System Setup.)
   - Click Save.

     Note: How or whether user-specific authorization levels apply might differ between staff and administrative views. For more, see Security Administration.
10. Test the ability of this user to log on with the associated authentication record.
    - Staff view: browse to iMIS and log on.
    - Administrative view: choose File > User Id and log on.

User-level security: Roles and Groups

Together, security roles and security groups let you control access to the ASP.NET-based features of iMIS; in contrast, older features of iMIS are secured using authorization levels (see Authorization levels: Desktop views. Security role and group assignments are defined in user records.

- Security roles grant specific administrative privileges to user records. For example, one security role might let you use and edit an iMIS definition object in the Document System, while another role might let you use that object but not edit (or even see) its properties.
- Security groups control which iMIS features group members see and which capabilities within each feature they can use.

> **Note:** Tip: User-level security is separate from object-level security (see "Pre-configured security sets"), which restricts objects (folders, queries, reports) in the Document System.

Roles: SysAdmin

The default SysAdmin role grants privileges much like those of the MANAGER user record. Only a Full user can be a SysAdmin. Each SysAdmin can:

- Edit user records, including logon names (unless that privilege is disabled in the web.-config file for iMIS)
- Use System Setup
- Use Tools (if licensed)
- Administer Issues (if licensed)
- Start e-mail server
- Set up module

Groups

The following table describes the security groups that affect user privileges.

CampaignAdmin	Enables full-control access to the Campaign functionality and its objects	Marketing
CampaignMgr	Enables read/add/edit/delete access to the Campaign functionality, and read/edit access to its objects	Marketing
CampaignUser	Enables read-only access to the Campaign functionality and its objects	Marketing
Certification Admin	Enables full-control access to the Certification functionality and its objects	Certification
Certification Manager	Enables read/add/edit/delete access to the Certification functionality, and read/edit access to its objects	Certification
Certification User	Enables read-only access to the Certification functionality and its objects	Certification
EventUser	Controls security for IQA integration	Events
FRUser	Controls security for IQA integration	Fundraising
OpportunityAdmin	Enables full-control access to Process Manager and its objects	Process Manager
OpportunityCreator	In Process Manager, enables add privileges for projects, and read/edit/delete access to created projects, but read-only access to projects created by others	Process Manager
OpportunityMgr	Enables read/add/edit/delete access to Process Manager, and read/edit access to its objects	Process Manager
OpportunityOwners	Enables addition to a project's Owner or Contact group	Process Manager
OpportunityUser	Enables read-only access to Process Manager and its objects	Process Manager
OrderUser	Controls security for IQA integration	Orders
Reporting	Enables access to IQA query links	IQA

RFMAdmin	Enables full-control access to the RFM application and its objects	Marketing
RFMMgr	Enables read/add/edit/delete access to the RFM application, and read/edit access to its objects	Marketing
RFMUser	Enables read-only access to the RFM functionality and its objects	Marketing
SegAdmin	Enables full-control access to the Segmentation functionality and its objects	Marketing
SegMgr	Enables read/add/edit/delete access to the Segmentation functionality, and read/edit access to its objects	Marketing
SegUser	Enables read-only access to the Segmentation functionality and its objects	Marketing

Group membership controls web access

Group membership determines whether a user sees Marketing and/or Process Manager from a web client.

- To grant access to Marketing, place users in one of these groups:
- CampaignAdmin
- CampaignMgr
- CampaignUser
- RFMAdmin
- RFMMgr
- RFMUser
- SegAdmin
- SegMgr

- SegUser
- To grant access to Process Manager, place users in one of these groups:
- OpportunityAdmin
- OpportunityCreator
- OpportunityMgr
- OpportunityOwners
- OpportunityUser

> **Note:** Note: Casual licensing prevents access Marketing or Process Manager, regardless of group assignments.

Securing logons and authorization persistence

Following is information to help you control user logon behavior and troubleshoot logon issues.

Conflicts from shared Windows logins

iMIS employs the ASP.NET login controls and uses HTTP cookies for state information. If two different iMIS users share the same Microsoft Windows login on the same client system, iMIS features that use cookie data may appear to confuse one user with the other. To avoid this problem, always ensure that every iMIS user has a unique Windows login.

Authorization persistence: web clients

By default, web client users can make their authentication record authorization persistent. To disable this option, edit the Web.config file used for the iMIS application. iMIS Desktop users, by contrast, must always log on and be reauthorized each time.

Authorization changes: locating and disabling

By default, users are allowed to change their own logon name and password. To disable the option to change their logon, edit the Web.config file used for the iMIS application and

change the AllowUsernameChange system parameter to false. The option to change their password cannot be disabled.

- iMIS Desktop users can change their own logon name and password through the File > Change Password option, which displays the Enter new Logon or Password window.
- Full and Casual users can change their own logon name and password through the Contacts tab.
- Public users can change their own logon name and password through the My Account tab in the Public view.
- Full users who belong to the SysAdmin role can change the logon name and password for other users through the System Setup feature of iMIS (From System Setup, select Security administration > Users).

  About ODBC connections

  The iMIS Desktop client uses information returned by an iMIS application server's ASP.NET authentication store to create an ODBC DSN for the database associated with that application server. So, iMIS Desktop users only need the URL of an application server with an instance of the iMIS application to ensure that they are using the correct iMIS database.

  Removing user logon names

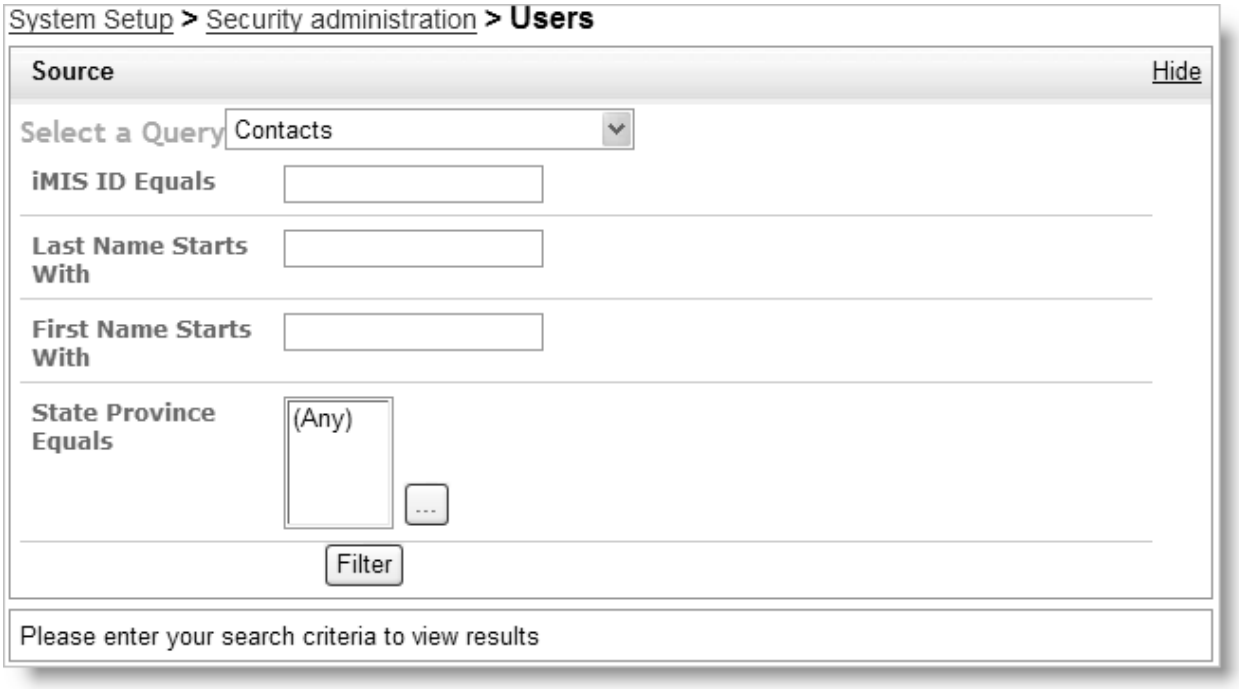
  When you remove a logon under User Credentials by selecting the "-" button, then attempt to add the same login back using the "+" button, the contact gets two security records in iMIS. You can verify this problem by searching by username. When a contact has more than one record then they can not log on. If this happens, you must find the original username for the user and then select the play button for that user, then save the user record. This action deletes the records that need to be cleaned up and allows the user to logon again.

Users window

This window provides options for finding contacts or users, and creating and modifying iMIS user records.

Source (select a contact record)

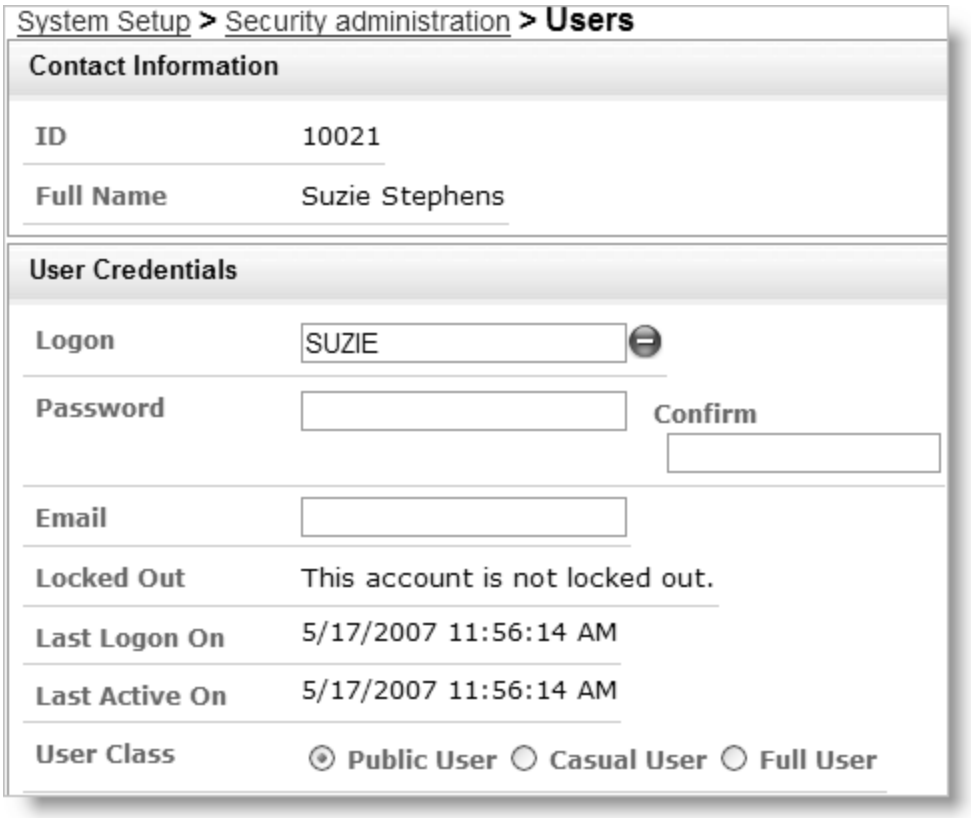
Prompts you to select a contact, so that you can create or edit its user record.



Once you select a contact record, which sections appear depends on whether you are editing its user record or creating it for the first time. Some sections are not available for certain User Classes, such as Public User.

User Credentials

Displays authentication record data from the ASP.NET authentication store. If the contact listed in the Contact Information area is not an iMIS user, the fields in the User Credentials area are empty.



- Logon - Displays this authentication record's logon name, or No User Selected when the authentication record is not linked to a user record.
- Password/Confirm - Input fields for changing an existing password.

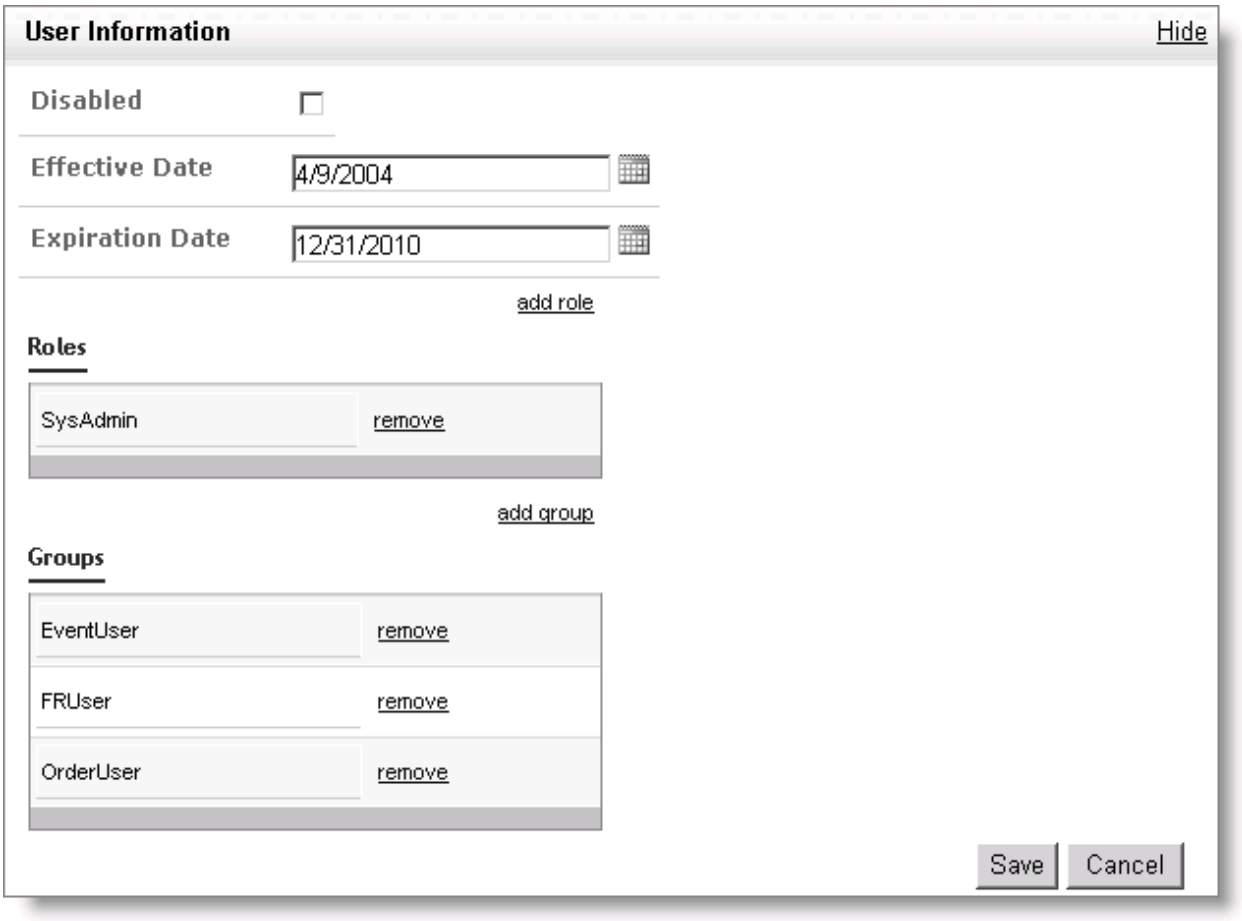
  Tip: By default, passwords must contain at least 6 characters. You can change the default password complexity requirements by editing the Web.config file for the iMIS application.
- Email - When you create a new authentication record, if the iMIS contact record includes an email address, iMIS populates the Create User Logon window with that address. However, the value that is displayed in this area of the Users window is always the value that is stored in the ASP.NET authentication store.
- Locked Out - Indicates whether this authentication record is temporarily blocked from gaining access to iMIS.

  Tip: By default, iMIS locks out an authentication record after 5 failed attempts to log on. You can change the default by editing the Web.config file for the iMIS application.

- User Class - Specifies the license to apply to this user, which controls all subsequent authorization.

  User Information

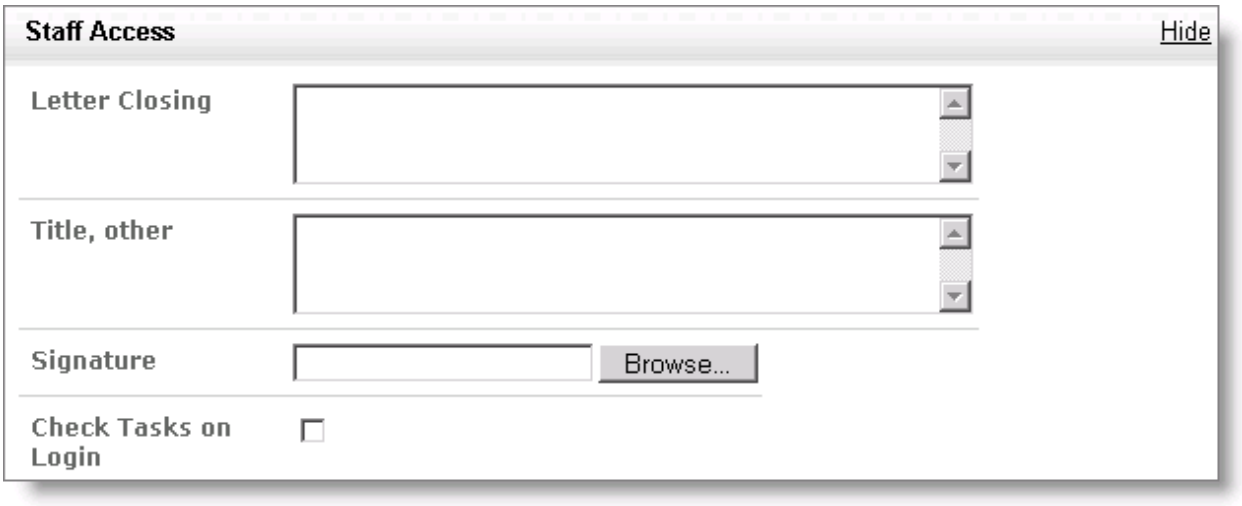
  Sets membership dates and assigns ASP.NET roles and groups (see "User-level security: Roles and Groups") to the user record.



> **Note:** Caution! Do not remove a user's SysAdmin role without also lowering the Sys Mgmt level (see Authorization levels: Desktop views) parts of the system that consider them an administrator will conflict with the parts that do not. Make sure they have both or neither.

  Staff Access

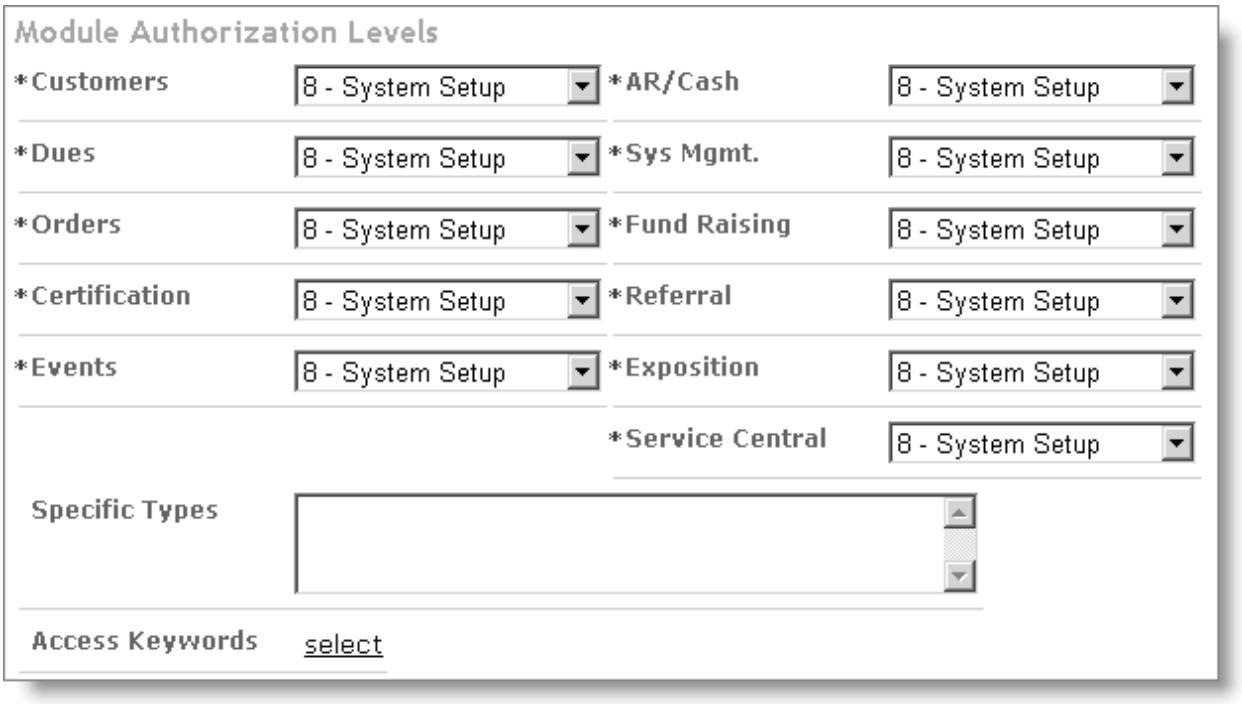
  Sets options for iMIS Desktop client users:



- Letter Closing - The text that closes letters sent by the user. For example, Sincerely.
- Title, other - The user's role, to use in letters. For example, Certification Specialist.
- Signature - An image of the user's signature, to use in letters. The image may be in one of the following formats:
- Microsoft Bitmap (BMP)
- Windows Meta File (WMF)
- Graphics Interchange Format (GIF)
- Portable Network Graphics (PNG)
- JPEG Interchange Format (JPG)

  iMIS converts the image into a BMP file before storing it in the database.
- Check Tasks On Login - Displays the user's View activity tasks window when they first log on. When cleared, displays the standard administrative view instead.

  Sets module authorization levels for iMIS Desktop client users, which also affects some web client behaviors (see Authorization levels: Desktop views.)



- Specific Types - Controls the customer types that the user can edit in Customers. The types listed in this field can be edited by this user. For example, if you only want the user to be able to edit records with customer type CM, add CM to the Specific Types field. The user will have read-only access to all other records. Separate customer types with spaces or commas.
- Sys mgmt. - Controls the availability of the Utilities menu on the iMIS Desktop menu bar, and the ability to define access keywords. The Utilities menu provides database maintenance and query commands. To enable iMIS Desktop system management privileges (see Authorization levels: Desktop views.
- Access Keywords - The access keywords (see "Access Keywords in Customers") that restrict the user from viewing secured windows, tabs, reports, or windows. Separate access keywords with spaces or commas.

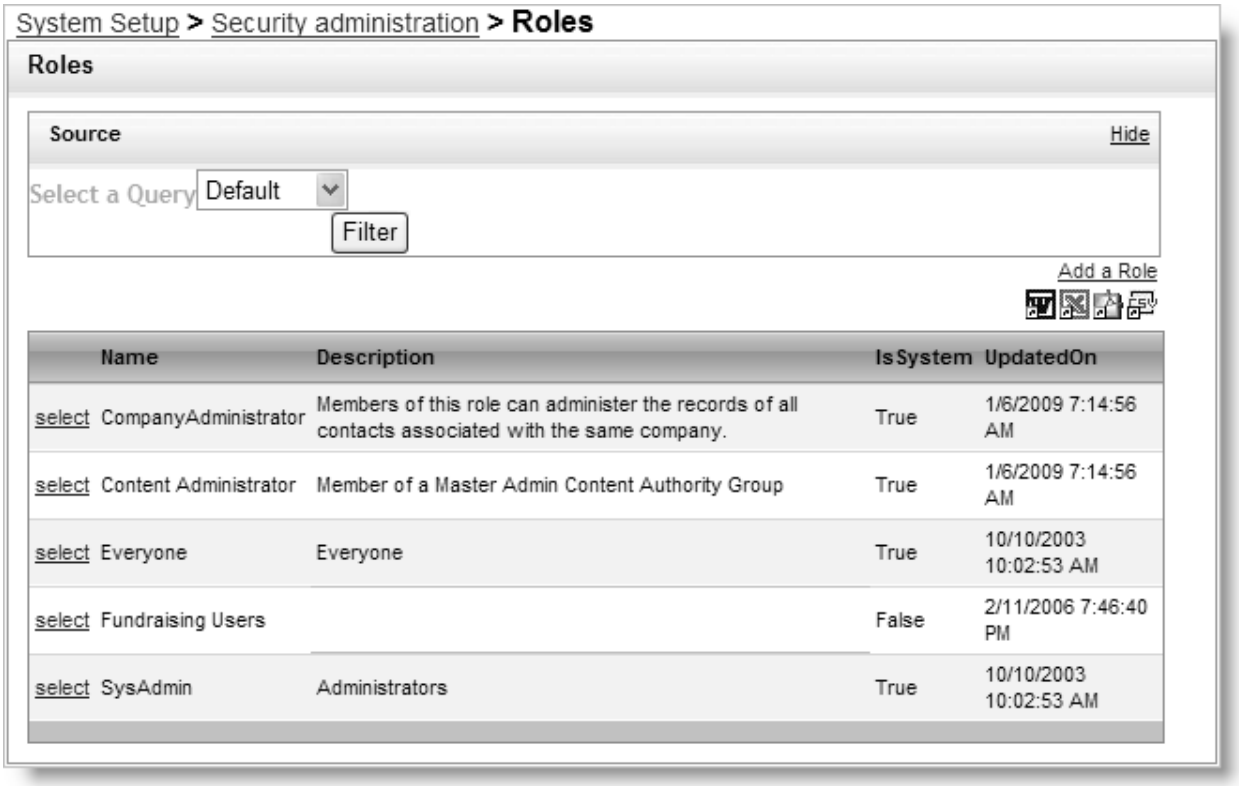
Roles window

The Roles window provides options for creating new security roles.

- iMIS uses the Everyone and SysAdmin roles.

Caution! SysAdmin is linked to Sys Mgmt. authorization (see Authorization levels: Desktop views) do not remove one and not the other.

- Applications that integrate with iMIS may use additional roles.



From System Setup, select Security administration > Roles

Enabling CAPTCHA security

iMIS uses CAPTCHAs for security when users create a new account and when users have forgotten their username or password. CAPTCHA is a program that can generate and grade tests that humans can pass but current computer programs cannot. For example, humans can read the distorted text below, but computers can't.

To enable CAPTCHA security

1. Create an account with reCAPTCHA.
2. Follow reCAPTCHA's instructions to create your Public and Private keys.
3. On your production iMIS appserver host, open the web.config files for each iMIS application.

- iMIS default location: C:\Program Files\ASI\iMIS\net
- iMISpublic default location: C:\Program Files\ASI\iMIS\iMIS_public

4. If you have a license for Web Content Management and have the WCM application installed on one or more external web servers, open the web.config file for the WCM application on each external web server.

- WCM default location: C:\Program Files\ASI\WCM\Net

5. In each web.config file, add the Public and Private keys generated by reCAPTCHA to the values of the following entries:

   <add key="RecaptchaPublicKey" value=""/>

   <add key="RecaptchaPrivateKey" value=""/>

6. Save the files.

   CAPTCHA security is now enabled.

Authorization levels: iMIS Web View site (../Admin)

Full and Casual users can access the staff iMIS Web View site based on their authorization levels.

Authorization levels: Home page (../Admin)

All content	Full or Casual user

Authorization levels: Directory (../Admin)

All content	Full or Casual user + MEMBERSHIP license

Authorization levels: Contacts (../Admin)

The functionality available to a user is based on the user's Customers authorization level, user class, and licensing.

- Full and Casual users with auth level 1 can only view contact records
- Full and Casual users with auth level 3 can create and edit contact records
- (if enabled) Full and Casual users with auth level 4 can delete contact records
- A maximum of auth level 4 can be granted to Casual users.

> **Note:** Note: To enable the ability to delete contact records, use the Customer Setup - Basic Options window. (From Customers, select Set up module > General and click Basic Options.)

The functionality available to a user is based on the user's Dues authorization level, user class, and licensing.

- Full and Casual users with auth level 1 can only view billing records
- Full users with auth level 3 can create and edit billing records
- Full users with auth level 4 can delete billing records
- A maximum of auth level 2 can be granted to Casual users.

The functionality available to a user is based on the user's Orders authorization level, user class, and licensing.

- Full and Casual users with auth level 1 can only view orders
- Full users with auth level 3 can create and edit orders

- Full users with auth level 4 can delete orders
- A maximum of auth level 2 can be granted to Casual users.

  The functionality available to a user is based on the user's Events authorization level, user class, and licensing.
- Full and Casual users with auth level 1 can only view event registrations
- Full users with auth level 3 can create and edit event registrations
- Full users with auth level 4 can delete event registrations
- A maximum of auth level 2 can be granted to Casual users.

Find contact	Full or Casual user + Customers auth level 1 + MEMBERSHIP license
Create account	Full or Casual user + Customers auth level 3 + MEMBERSHIP license
Contact management > Personal	Full or Casual user + Customers auth level 1 + MEMBERSHIP license Read-only for all user classes unless: • The customer type of the contact record is not one of customer types listed in the Specific Types field of your user record (if any) • You are viewing your own contact record Name Status Edit access keyword (see "Access Keywords in Customers") might be required in your user record to specify a Member Type If your user record contains a list of Specific Types, you can choose only among those types when specifying a Member Type Name Address Edit access keyword (see "Access Keywords in Customers") might be required in your user record to specify E-mail, Work phone, Home Phone, Toll free phone, Fax, and Web site information

Contact management > Address	Full or Casual user + Customers auth level 3 + MEMBERSHIP license Read-only for all user classes unless at least one condition met from both of the following lists: • The customer type of the contact record is not one of customer types listed in the Specific Types field of your user record (if any) • You are viewing your own contact record AND • Name Address Edit access keyword (see "Access Keywords in Customers") might be required in your user record • You are viewing your own contact record
Contact management > Logon & password	Full or Casual user + Customers auth level 4 + MEMBERSHIP license Name Internet Security Data access keyword (see "Access Keywords in Customers") might be required in your user record Full users who belong to the SysAdmin role can always see this task list item
Contact management > Orders	Full or Casual user + Customers auth level 1 + Orders auth level 1 + MEMBERSHIP and ORDER licenses
Contact management > Billing	Full or Casual user + Customers auth level 1 + Dues auth level 1 + MEMBERSHIP and DUES licenses
Contact management > Activities	Full or Casual user + Customers auth level 1 + MEMBERSHIP license Read-only for all user classes regardless of auth level An activity type access keyword (see "Access Keywords in Customers") for each product type might be required in your user record
Contact man-	Full or Casual user + Customers auth level 1 + MEMBERSHIP license

agement > Call logs	An activity type access keyword (see "Access Keywords in Customers") for the CALL product type might be required in your user record
Contact management > Change logs	Full or Casual user + Customers auth level 1 + MEMBERSHIP license Read-only for all user classes regardless of auth level
Contact management > Fundraising	Full or Casual user + Customers auth level 1 + Fund Raising auth level 1 + MEMBERSHIP and FUNDR licenses Read-only for all user classes regardless of auth level Fundraising History View access keyword (see "Access Keywords in Customers") might be required in your user record
Contact management > User defined fields	Full or Casual user + Customers auth level 1 + MEMBERSHIP license
Register for event	Full or Casual user + Customers auth level 1 + Events auth level 1 + MEMBERSHIP and MEET licenses The Register button is available on an event's detail page only if the event's status is Active and one of the following conditions are met: • You are the currently selected Contact • You have the same Company (Organization) name as the selected Contact • You are a Full user
Make a purchase	Full or Casual user + Customers auth level 1 + Orders auth level 1 + MEMBERSHIP and ORDER licenses Read-only for Casual users regardless of Customers auth level
Make a purchase > Cart	Full user + Customers auth level 1 + Orders auth level 1 + MEMBERSHIP and ORDER licenses

Authorization levels: Events (../Admin)

The functionality available to a user is based on the user's Events authorization level, user class, and licensing.

- Full and Casual users with auth level 1 can only view event registrations
- Full users with auth level 3 can create and edit event registrations
- Full users with auth level 4 can delete event registrations
- A maximum of auth level 2 can be granted to Casual users.

All content	Full or Casual user + Events auth level 1 + MEET license The Register button is available on an event's detail page only if the event's status is Active and one of the following conditions are met: • You are the currently selected Contact • You have the same Company (Organization) name as the selected Contact • You are a Full user

Authorization levels: Donations (../Admin)

The functionality available to a user is based on the user's Fund Raising authorization level, user class, and licensing.

- Full users with auth level 3 can create and edit fundraising records
- Full users with auth level 4 can delete fundraising records
- A maximum of auth level 2 can be granted to Casual users, which effectively forbids Casual users from accessing Donations

All content	Full user + Fund Raising auth level 3 + FUNDR license

Authorization levels: Store (../Admin)

The functionality available to a user is based on the user's Orders authorization level, user class, and licensing.

- Full and Casual users with auth level 1 can only view orders
- Full users with auth level 3 can create and edit orders
- Full users with auth level 4 can delete orders
- A maximum of auth level 2 can be granted to Casual users.

Maintenance	Full user + (SysAdmin role) + WCM license
All other content	Beta customers only

Authorization levels: Desktop views (../CS)

Both Full and Casual users can use administrative views. Exactly what each user can subsequently see and do there can vary greatly depending on a combination of the following factors:

- The product license keys registered in the iMIS database
- The user class, roles, groups, authorization levels, and access keywords defined in each person's user record

Special restrictions for Casual users

Each iMIS feature has a maximum authorization level that may be granted to a Casual user:

- For Customers, a maximum authorization level of 4 enables Casual users to insert/edit/delete committee participants, tasks, and activity records.
- For AR/Cash, the maximum authorization level of 0 forbids all access to Casual users.
- For all other features of iMIS, the maximum authorization level of 2 enables Casual users to access reports but not financial transactions.
- You cannot assign the SysAdmin role to a Casual user record.

An authorization level of zero is the default for every Casual user that you create.

Existing Casual users that might have been granted higher authorization levels in early releases of iMIS 15 that allowed higher authorization levels will have their authorization levels adjusted down to the new maximum defaults during an upgrade to this release, but those pre-existing Casual users that had authorization levels lower than these maximum levels will remain unchanged.

Conditions required to expose each major feature and its task list items

This list summarizes the conditions needed to display each major iMIS feature and its task list items to a specific user; the details are described in About authorization levels

(see Authorization levels: Desktop views. Access keywords also play a large role in what a user can see and do in iMIS: see "Access Keywords in Customers".

Note: Note: At authorization levels 1 through 3, both Full and Casual users have restricted ability to modify information in most iMIS features.

Authorization level privileges

Authorization levels let you precisely control the iMIS Desktop privileges of individual users. A standard type of privilege (such as Run reports) is associated with each level, but specific windows and fields also become available at certain levels. Note that Casual records are limited: you cannot assign them authorization level 8 or the SysAdmin role.

All authorization level privileges are additive. For example, authorization level 3 automatically gets all of the privileges available at levels 0, 1, and 2.

Note: Note: Access Keywords (see "Access Keywords in Customers") defined in various areas of iMIS constrain these authorizations. For example, one user's authorization level enables her to edit a particular window, but one sensitive field on that window might be read-only or even hidden from her unless her record also contains the specific access keyword that exposes it.

These are the general privileges associated with each authorization level:

0	No access
1	View information
2	Run reports
3	Create and edit records
4	Delete records
5	Maintain tables
6	Change reports
8	Configure features - SysAdmin (see Authorization levels: Desktop views.)

About authorization levels

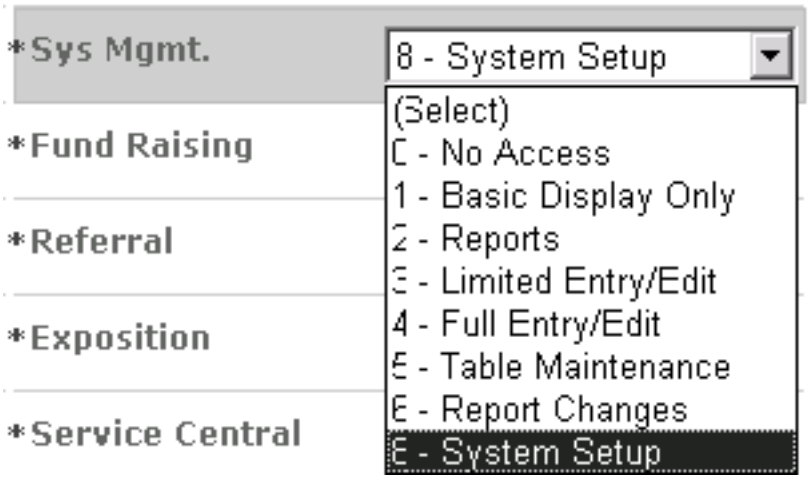
The Sys Mgmt. authorization level grants system administration on iMIS Desktop, as the SysAdmin role (see "User-level security: Roles and Groups") does across the other views. In fact, they are intrinsically paired: If you give a user Level 8 authorization for Sys Mgmt., they automatically join the SysAdmin role; if you remove that Level 8, they automatically drop the SysAdmin role.

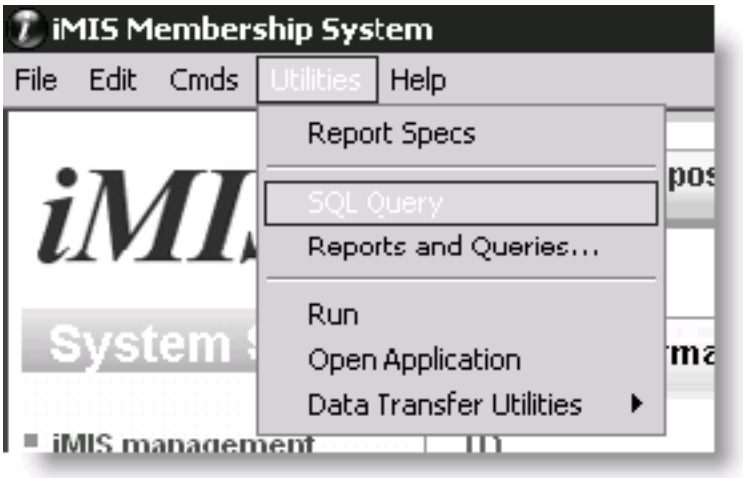
> **Note:** Caution! Do not remove a user's SysAdmin role without also lowering the Sys Mgmt level: parts of the system that consider them an administrator will conflict with the parts that do not. Make sure they have both or neither.

All users who had authorization level 8 in Sys Mgmt. are granted the SysAdmin role.

How Sys Mgmt. levels affect iMIS Desktop access

The Sys Mgmt. authorization level controls what appears on iMIS Desktop menus:





The Sys Mgmt. authorization controls menu access

These are the menu bar privileges associated with each level:

0	No iMIS features appear
1	Licensed features of iMIS appear File > System Setup appears (Full users only)
2	No changes
3	No changes
4	No changes
5	On the File > System Setup window, Organization Names appears (Full users only)
6	No changes
8	Utilities appears (Full users only)

Casual access in iMIS Desktop and staff views

These are the areas across iMIS available for use by Casual users. See the authorization levels topic for each iMIS Desktop area for complete details. The greatest possible access a Casual user can hold is authorization level 2 for all modules (except AR/Cash) and level 4 for Customer.

Note: Note: Assume authorization level [1] except where noted.

Contacts and Committees	Customers (see "Authorization levels: Customers")
Find contact or committee	Find and view contact records
Name maintenance [3]	Create and edit contact records [3]
Address maintenance [3]	Delete contact records [4, if enabled]
Call Log activity creation [3]	Manage committees

View activities	Manage chapter rosters
User-defined maintenance	View activity tasks

IQA > Fundraising	Full user + Fund Raising auth level 2 + Reporting group + FUNDR license

Authorization levels: Customers (../CS)

The functionality available to a user is based on the user's Customers authorization level, user class, and licensing. Casual users have extended capabilities in Customers, so the highest authority level they can have here is 4.

> **Note:** Note: The Specific Types field in the Staff Access area of the Users window affects what can be seen and done in the Customers feature, by limiting which customer types the user can edit.

What each user type can do

- Full and Casual users with auth level 1 can find and view contact records

  Note: Level 1 users select Manage customers to find and view those records.
- Full and Casual users with auth level 1 can manage committees and chapter rosters
- Full and Casual users with auth level 2 can run reports
- Full and Casual users with auth level 3 can create and edit contact records
- Full and Casual users with auth level 4 can delete contact records

  Note: To disable contact record deletion, go to Set up module > General, Basic Options.

- Full and Casual users with auth level 4 can find and print duplicate records
- Full and Casual users with auth level 4 can import activities (requires keyword)
- Full users with auth level 8 can merge duplicate records

What navigation items appear

Manage customers	Full or Casual user + Customers auth level 1 + MEMBERSHIP license
Manage committees	Full or Casual user + Customers auth level 1 + MEMBERSHIP license
Manage chapter rosters	Full or Casual user + Customers auth level 1 + MEMBERSHIP and CHAPTER license
View activity tasks	Full or Casual user + Customers auth level 1 + MEMBERSHIP license
Manage Accumail	Full user + Customers auth level 8 + MEMBERSHIP and ACCU license
Manage QAS	Full user + Customers auth level 8 + MEMBERSHIP and QAS license
Manage duplicates	Full or Casual user + Customers auth level 4 + MEMBERSHIP and DMM license
Generate reports	Full or Casual user + Customers auth level 2 + MEMBERSHIP license
Import activities	Full or Casual user + Customers auth level 4 + MEMBERSHIP license An access keyword (see "Access Keywords in Customers") might be required in your user record

Set up fundraising	Full user + Customers auth level 5 + MEMBERSHIP and FUNDR license
Set up product label preferences	Full user + Customers auth level 5 + MEMBERSHIP license Use Product Label Preferences must be selected in the Customer Setup - Address and Notes window

Authorization levels: Events (../CS)

The functionality available to a user is based on the user's Events authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view event registrations

  Note: Level 1 users select Register a customer to find and view those registrations.

- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit event registrations
- Full users with auth level 4 can delete event registrations

What navigation items appear

Register a customer	Full or Casual user + Events auth level 1 + MEET license
Define an event	Full user + Events auth level 5 + MEET license
Generate reports	Full or Casual user + Events auth level 2 + MEET license
IQA	Full user + Events auth level 2 + Reporting group + MEET license
Set up tables	Full user + Events auth level 5 + MEET license

Authorization levels: Billing (../CS)

The functionality available to a user is based on the user's Dues authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view billing records

  Note: Level 1 users select Enter and edit payments to find and view those records.
- Full and Casual users with auth level 1 can process accrual dues
- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit billing records
- Full users with auth level 4 can delete billing records

What navigation items appear

Process billing	Full user + Dues auth level 4 + DUES license
Process accrual dues	Full or Casual user + Dues auth level 1 + DUES license + Accrual setup
Process automatic payments	Full user + Dues auth level 4 + DUES license
Generate reports	Full or Casual user + Dues auth level 2 + DUES license
Manage expired members	Full user + Dues auth level 8 + DUES license
Set up module	Full user + Dues auth level 5 + DUES license

Authorization levels: Fundraising (../CS)

The functionality available to a user is based on the user's Fund Raising authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view gifts, payments, adjustments, and requests

  Note: Level 1 users select Enter and edit gifts, Process payments, Enter and edit adjustments, and Manage requests to find and view those records.
- Full and Casual users with auth level 2 can run reports and executive reports
- Full users with auth level 3 can create and edit fundraising records
- Full users with auth level 4 can delete fundraising records

What navigation items each user type can see

Enter and edit gifts	Full or Casual user + Fundraising auth level 1 + FUNDR license
Rapid gift entry	Full user + Fundraising auth level 3 + FUNDR license Available only if Fundraising is configured to use rapid gift entry
Process payments	Full or Casual user + Fundraising auth level 1 + FUNDR license
Enter and edit adjustments	Full or Casual user + Fundraising auth level 1 + FUNDR license
Process premiums	Full user + Fundraising auth level 4 + FUNDR and ORDER license
Set up appeal expenses	Full or Casual user + Fundraising auth level 1 + FUNDR license
Manage requests	Full or Casual user + Fundraising auth level 1 + FUNDR license
Generate reports	Full or Casual user + Fundraising auth level 2 + FUNDR license
Generate executive reports	Full or Casual user + Fundraising auth level 2 + FUNDR license

IQA	Full user + Fundraising auth level 2 + Reporting group + FUNDR license
Set up tables	Full user + Fundraising auth level 5 + FUNDR license
Set up module	Full user + Fundraising auth level 5 + FUNDR license

Authorization levels: AR/Cash (../CS)

The functionality available to a user is based on the user's AR/Cash authorization level, user class, and licensing. The highest authority level a Casual user can have here is 0 (none).

What each user type can do

- Full users with auth level 1 can only view transactions
- Full users with auth level 3 can create transactions, and can edit or delete the transactions that they have created, but not transactions created by other iMIS users
- Full users with auth level 4 can edit or delete any transaction
- Full users with AR/Cash auth level 1 + Orders auth level 3 can enter orders

What navigation items each user type can see

Enter and edit transactions	Full user + AR/Cash auth level 1 + CASH license
Enter and edit transactions > Import transactions	Full user + AR/Cash auth level 1 + CASH and FSIIMPORT license
Manage batches	Full user + AR/Cash auth level 3 + CASH license Batch management has many complex restrictions; see below.
Credit card reporting	Full user + AR/Cash auth level 8 + CASH and CCAUTH license
Generate reports	Full user + AR/Cash auth level 2 + CASH license
Process month-end procedures	Full user + AR/Cash auth level 4 + CASH license

Print Transaction Journal	Full user + AR/Cash auth level 2 + CASH license
Set up tables	Full user + AR/Cash auth level 5 + CASH license
Set up module	Full user + AR/Cash auth level 8 + CASH license
Enter and edit Orders	Full user + AR/Cash auth level 1 + CASH license and not licensed for ORDER
Generate order reports	Full user + AR/Cash auth level 1 + CASH license and not licensed for ORDER

How authorization affects batches

The AR/Cash authorization level determines your privileges in working with batches that appear across iMIS.

> **Note:** Note: The following descriptions concerning batch management features assume that AR/Cash batch control is enabled.

> **Note:** Note: For authorization levels 3 through 7, if batch management is configured to hide batches created by other users, the only batches that you can view and work with in the Manage Batches and Open Batches windows are your own.

- AR/Cash auth level 0

  If batch management is configured to hide batches created by other users, no batches are visible in the Open Batches window that appears in other features of iMIS. Otherwise, the following batch management privileges are globally available in the Open Batches window:

- View, select, and print batches that are open or ready.
- Filter batches by date.
- Switch to a different batch, if the batch is open.
- AR/Cash auth level 2

If batch management is configured to hide batches created by other users, no batches are visible in the Open Batches window. Otherwise, you can view, select, and print closed batches in the Open Batches window.

- AR/Cash auth level 3

  Manage batches becomes available in the task list for AR/Cash, and you can perform the following batch management tasks from the Manage batches and Open Batches windows:

- You can create batches and change only your open/ready batches as follows:
- Edit the Descr field.
- Change the state from open to ready, or from ready to open, with Set Ready/Open.
- Additionally, if a batch is yours, is open/ready, and contains no transactions, you can:
- Delete the batch.
- Select a new value from the Cash Table list (which updates the Cash Account field).
- Edit the following fields: Date, Control Count, Control Amount
- AR/Cash auth level 4

  You can perform the following batch management tasks from the Manage batches and Open Batches windows:

- You can change any open/ready batch as follows:
- Post the batch.
- Edit the following fields: Date, Descr, Control Count, Control Amount
- Change the state from open to ready, or from ready to open, with Set Ready/Open.
- Additionally, if a batch is open/ready and contains no transactions, you can:
- Delete the batch.

- Select a new value from the Cash Table list (which updates the Cash Account field).
- AR/Cash auth level 8

  You can perform the following batch management tasks from the Manage batches and Open Batches windows:

- View, select, and print any batch, even when batch management is configured to hide batches created by other users.
- Change the status of any batch from open or ready to posted/closed with the Posted/Closed option.
- Change the status of any batch from posted/closed to open or ready with the Open or Ready options.
- Delete any closed batch that contains transactions.

  Note: (if General Ledger is enabled) Before deleting a batch that contains transactions, you must export it to the General Ledger.

Authorization levels: Orders (../CS)

The functionality available to a user is based on the user's Orders authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view orders

  Note: Level 1 users select Enter and edit orders to find and view those records.

- Full and Casual users with auth level 1 can set up warehouses
- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit orders
- Full users with auth level 4 can delete orders

  What navigation items appear

Enter and edit orders	Full or Casual user + Orders auth level 1 + ORDER license
Process orders	Full user + Orders auth level 4 + ORDER license
Manage inventory	Full user + Orders auth level 4 + ORDER license
Generate reports	Full or Casual user + Orders auth level 2 + ORDER license

Set up tables	Full user + Orders auth level 5 + ORDER license
Set up warehouses	Full or Casual user + Orders auth level 1 + ORDER license + set up for multiple warehouses
Set up module	Full user + Orders auth level 8 + ORDER license

Authorization levels: Certification (../CS)

The functionality available to a user is based on the user's Certification authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit certification records
- Full users with auth level 4 can delete certification records

What navigation items appear

Register a student	Full user + Certification auth level 3 + CERT license
Set up programs	Full user + Certification auth level 4 + CERT license
Set up Components	Full user + Certification auth level 3 + CERT license
Generate reports	Full or Casual user + Certification auth level 2 + CERT license

Set up tables	Full user + Certification auth level 5 + CERT license
Set up module	Full user + Certification auth level 8 + CERT license

Authorization levels: Service Central (../CS)

The functionality available to a user is based on the user's authorization levels, user class, and licensing.The highest authority level a Casual user can have here is 2, but they are still forbidden from accessing AR/Cash transactions in Service Central.

What each user type can do

Service Central:

- Full and Casual users with auth level 1 can find and view customer requests
- Full and Casual users with auth level 2 can find and view payments
- Full users with auth level 3 can create and edit customer requests and payments
- Full users with auth level 4 can delete customer requests and payments

Dues:

- Full and Casual users with auth level 1 can find and view billing records
- Full users with auth level 3 can create and edit billing records
- Full users with auth level 4 can delete billing records

AR/Cash:

- Full users with auth level 1 can find and view transactions
- Full users with auth level 3 can create transactions, and can edit or delete the transactions that they have created, but not transactions created by other iMIS users
- Full users with auth level 4 can edit or delete any transaction

Orders:

- Full and Casual users with auth level 1 can find and view orders
- Full users with auth level 3 can create and edit orders
- Full users with auth level 4 can delete orders

Fundraising:

- Full and Casual users with auth level 1 can find and view fundraising records
- Full users with auth level 3 can create and edit fundraising records
- Full users with auth level 4 can delete fundraising records

Events:

- Full and Casual users with auth level 1 can find and view event records
- Full users with auth level 3 can create and edit event records
- Full users with auth level 4 can delete event records

What navigation items appear

Process customer requests	Full or Casual user + Service Central auth level 1 + SERVCEN license
Process billing	Full or Casual user + Service Central auth level 1 + Dues auth level 1 + SERVCEN and DUES license
Register a customer	Full or Casual user + Service Central auth level 1 + Events auth level 1 + SERVCEN and MEET license
Enter and edit gifts	Full or Casual user + Service Central auth level 1 + Fund Raising auth level 1 + SERVCEN and FUNDR license
Process sales transactions	Full user + Service Central auth level 1 + AR/Cash auth level 1 + SERVCEN and CASH license

payments	
Generate reports	Full or Casual user + Service Central auth level 2 + SERVCEN license

Authorization levels: Exhibition (../CS)

The functionality available to a user is based on the user's Events authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can only view event records

  Note: Level 1 users select Process orders to find and view those records.
- Full and Casual users with auth level 1 can calculate years exhibited
- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit event records
- Full users with auth level 4 can delete event records

What navigation items appear

Process orders	Full or Casual user + Events auth level 1 + EXHIBITION license
Manage prospect list	Full user + Events auth level 4 + EXHIBITION license
Generate reports	Full or Casual user + Events auth level 2 + EXHIBITION license
Calculate years exhibited	Full or Casual user + Events auth level 1 + EXHIBITION license

Authorization levels: Exposition (../CS)

The functionality available to a user is based on the user's Exposition authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view exposition records

  Note: Level 1 users select Process booth orders to find and view those records.
- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit exposition records
- Full users with auth level 4 can delete exposition records

What navigation items appear

Process booth orders	Full or Casual user + Exposition auth level 1 + EXPO license
Set up an exposition	Full user + Exposition auth level 5 + EXPO license
Manage prospect lists	Full user + Exposition auth level 4 + EXPO license
View exhibitor information	Full user + Exposition auth level 4 + EXPO license
Manage wait lists	Full user + Exposition auth level 4 + EXPO license
Manage booth preferences	Full user + Exposition auth level 4 + EXPO license
Process EXPOCAD	Full user + Exposition auth level 4 + EXPO and EXPOCAD license
Generate reports	Full or Casual user + Exposition auth level 2 + EXPO license
Set up tables	Full user + Exposition auth level 5 + EXPO license
Set up module	Full user + Exposition auth level 8 + EXPO license

Authorization levels: Subscriptions (../CS)

All content	Full or Casual user + SUBSC license

Authorization levels: Referrals (../CS)

The functionality available to a user is based on the user's Referral authorization level, user class, and licensing. The highest authority level a Casual user can have here is 2.

What each user type can do

- Full and Casual users with auth level 1 can find and view referrals

  Note: Level 1 users select Manage referrals to find and view those records.

- Full and Casual users with auth level 2 can run reports
- Full users with auth level 3 can create and edit referrals
- Full users with auth level 4 can delete referrals

What navigation items appear

Manage referrals	Full or Casual user + Referral auth level 1 + REFERRAL license
Generate reports	Full or Casual user + Referral auth level 2 + REFERRAL license
Set up module	Full user + Referral auth level 8 + REFERRAL license
Create referral orders	Full user + Referral auth level 5 + REFERRAL license

Rebuild search indexes	Full user + Referral auth level 5 + REFERRAL license

Authorization levels: Leg. Tracking (../CS)

All content	Full or Casual user + LEGTRACK license

Authorization levels: Issues (../CS)

User class combined with licensing determines what users can see and do within Issues.

> **Note:** Note: No specific authorization codes apply to this module.

What each user type can do

- Full and Casual users can view and enter issues
- Full and Casual users can run reports
- Sysadmin roles can start the email server and set up the module

What navigation items appear

View and enter issues	Full or Casual user + SERVICE license
Generate reports	Full or Casual user + SERVICE license
Start e-mail server	Full user + SysAdmin role + SERVICE license
Set up module	Full user + SysAdmin role + SERVICE license

Authorization levels: Xtender (../CS)

All content	Full or Casual user + XTEND license

Access Keywords in Customers

Many organizations want to limit the information their users can access. Customers allows you to define and establish parameters that limit the entering, editing, and viewing of confidential information to authorized users only.

User access and authorization are established using authorization levels, security models, and access keywords. Authorization levels provide general, module-wide access controls. Access keywords provide additional levels of security within modules and allow you either to hide information completely or to make information read-only, so that only authorized users are allowed to change information.

Creating Access Keywords

You implement access keyword security in three stages:

1. Create and populate the ACCESS_KEYWORDS general lookup/validation table.

2. Assign the access keywords to the customer information areas you wish to secure. The customer information areas to which access keywords can be assigned include:

- Custom windows
- Reports
- Activity records
- Financial tab within Customers
- Fundraising tab within Customers
- Customer address information
- Customer status information

3. Assign one or more access keywords to each user to enable access to the protected information.

> **Note:** Note: You need a Sys mgmt authorization level of 8 and database owner privileges to assign access keywords.

To create access keywords

1. Create a general lookup/validation table named ACCESS_KEYWORDS.
2. Enter access keywords according to these restrictions:

- Do not enter an Expansion for access keywords.
- To hide custom windows from certain users, add the keyword HIDDEN.

3. Restart iMIS Desktop after creating the access keywords.

Limiting access to or hiding custom windows

Custom (user-defined) windows can store detailed information about your customers such as annual salary, major gifts, and political affiliations. However, you might not want all system users to view this information or to enter or edit information in the custom window.

The iMIS Desktop client allows you to assign access keywords that allow only certain users to view or to enter and edit information on custom windows. You can apply the access keywords to custom windows on a tab-by-tab basis.

How access can be limited

- For single-instance user-defined tabs, if an access keyword has been set up for that tab (other than HIDDEN), and the user has no access keywords assigned, then the tab will display but will not allow editing or inserting.
- If the HIDDEN access keyword is setup for the tab, and the user has no access keywords assigned, then the tab will not display.
- If a multi-instance window has an access keyword associated with it, only users that have the matching access keyword and a Customers authorization level of three or higher will be permitted to edit the tab; the tab will display in read-only mode for users who do not have the matching access keyword. If the tab has more than one access keyword associated with it, the user must have at least one matching access keyword for the tab to display in enter/edit mode.
- If a multi-instance window has one or more access keywords associated with it, including the HIDDEN keyword, the tab will only be visible to users who have at least one of the access keywords. The tab will not display for users who do not have one of the assigned keywords in their profile.
- If a multi-instance window does not have any access keywords associated with it, any user is permitted to view the tab. If there are customer type restrictions on the underlying table, these will be honored as usual; the tab will be disabled if the current customer type does not have permissions to access the tab.

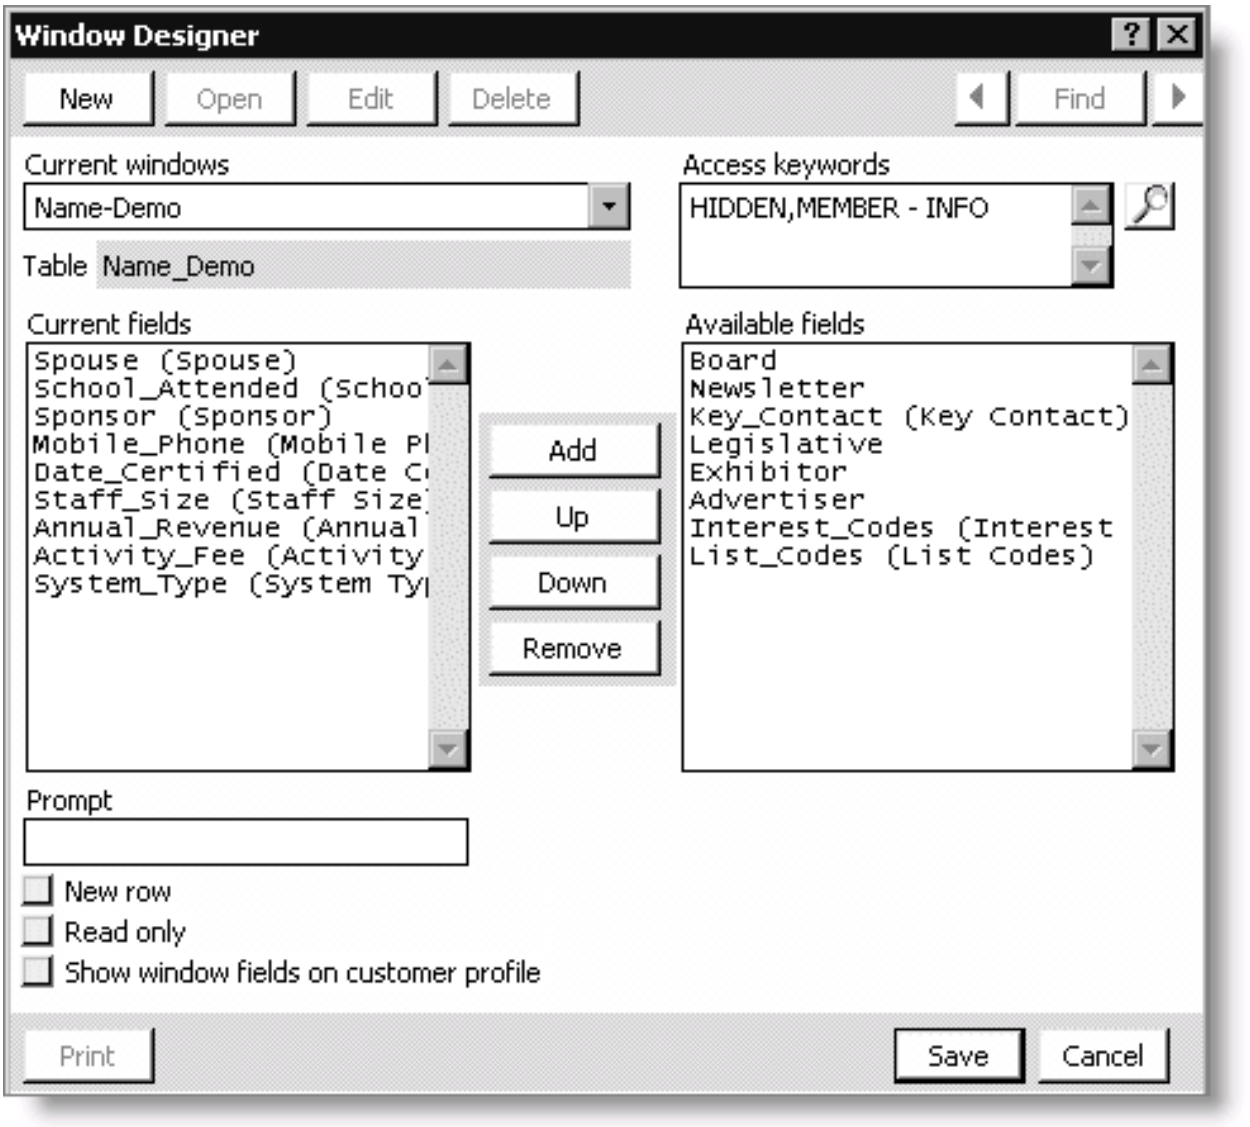
To limit access to or hide custom windows

1. Create keywords (see "Creating Access Keywords") in the ACCESS_KEYWORDS lookup table.
2. From Customers, select Set up module > General, and click Additional Windows to open the Customer Setup – Additional Windows window.

3. Click Define Windows to open the Window Designer window.
4. Select the desired user-defined window from the Current windows drop-down list.
5. Click the Find icon to the right of the Access keywords field to select from the available access keywords. You can assign access keywords to user-defined windows in three ways:

- Assign one or more access keywords to the window, but not the reserved keyword HIDDEN. All users will be able to see the window, but only those with one of the access keywords will be able to enter and edit information in the window.
- Assign both the reserved keyword HIDDEN and one or more access keywords to the window. The window will be hidden from all users except those who have one of the access keywords for the window.
- Do not assign the reserved keyword HIDDEN or any access keywords to the window. Everyone will be able to see the window, and everyone will be able to enter and edit information in the window.

6. Double-click the selected keyword(s) to move the keyword(s) from the Available field to the Selected field.
7. Click OK. The selected keywords display in the Access Keywords field.
8. Click Save.
9. Assign the keywords to the user (see "Assigning Access Keywords to users").



Limiting access to reports

The iMIS Desktop client allows you to assign access keywords that allow only authorized users to see or print a report. A report that is assigned an access keyword will not display in the window unless you assign the user the same keyword.

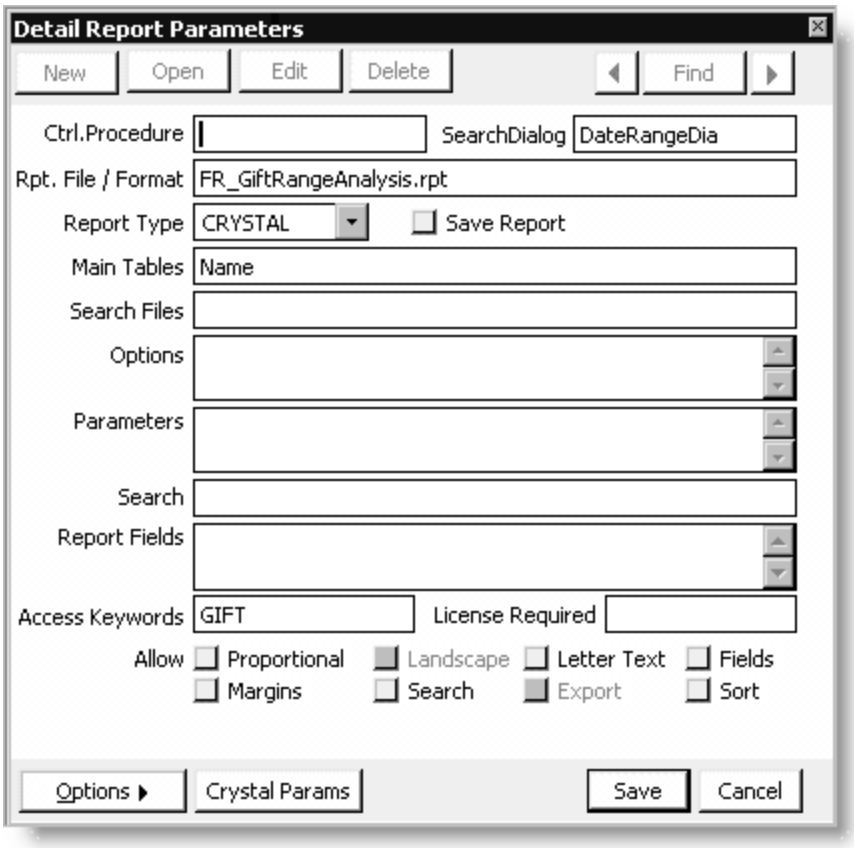
> **Note:** Note: You must have a Sys mgmt authorization level of 8 or greater to assign keywords to reports.

To limit access to reports

1. Create the keywords in the ACCESS_KEYWORDS lookup table.

2. Select Utilities > Report Specs to open the Report Specifications window.
3. Select the report to which you want to assign an access keyword from the list of available reports.
4. Click Edit.
5. Click Parameters on the Report Specifications window to open the Detail Report Parameters window.
6. Place your cursor in the Access Keywords field on the Detail Report Parameters window. Press Ctrl+L to open the Select ACCESS_KEYWORDS value(s) window.
7. Select each keyword that you want to assign to the report in the Available field and double-click to move the keyword to the Selected field.
8. Click OK. The selected keyword(s) displays in the Access Keywords field on the Detail Report Parameters window.
9. Click Save.
10. Assign keywords to the user (see "Assigning Access Keywords to users").

> **Note:** Note: Make sure to assign the same keyword(s) to the users who will be authorized to access the report(s).



Example of a keyword assigned to a report

Limiting access to activity records

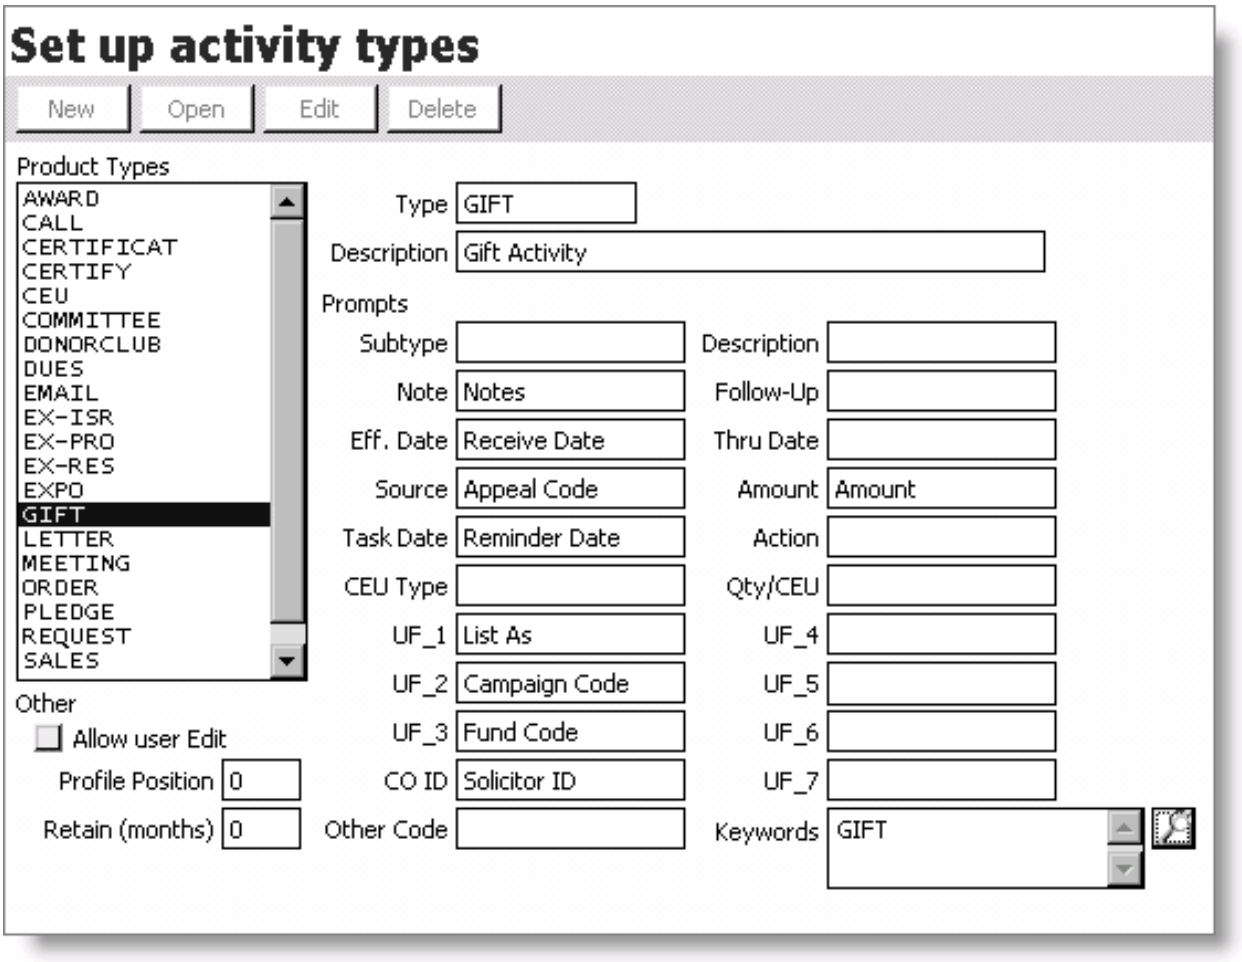
iMIS Desktop allows you to assign access keywords to activity records. Only authorized users are allowed to enter, edit, and view customers' activity records. Access keywords are assigned to activity records on the Set up activity types window.

To limit access to activity records

1. Create the keywords (see "Creating Access Keywords") in the ACCESS_KEYWORDS lookup table.
2. From Customers, select Set up module > Activity types to open the Set up activity types window.
3. Select the activity type that you want to assign an access keyword from the Product Types list.

4. Click Edit.
5. Click the Find icon displayed to the right of the Keywords field to open the Select ACCESS_KEYWORDS value(s) window.
6. Select each keyword that you want to assign in the Available field and double-click to move the keyword to the Selected field.
7. Click OK. The selected keyword(s) displays in the Keywords field on the Set up activity types window.
8. Click Save.
9. Assign keywords to the user (see "Assigning Access Keywords to users").

> **Note:** Note: After the access keywords are assigned on the Set up activity types window, the activity will not display in a customer's activity window unless the user has been assigned at least one of the access keywords.



Limiting access to customer data

The Access Keys window provides the ability to configure access to the following customer data areas:

- Activity Importer functionality
- Financial data
- Address data
- Status data
- Fundraising History data

To assign access keywords to customer data

1. From Customers, select Set up module > General to open the Set up general options window.
2. Click Access Keys to open the Customer Setup – Access Keys window.
3. Click Edit.
4. Place your cursor in the field you want to modify.
5. Click the Find icon to open the Select ACCESS_KEYWORDS value(s) window.
6. Double-click the keyword in the Available field to move it to the Selected field.
7. Click OK to save the information and return to the Customer Setup –Access Keys window.

   The keyword now displays in the field you selected.
8. Click Save to update the record.

   To limit access to the Activity Importer

   Unlike the other areas that you can control from the Access Keys window, access to Activity Importer functionality is controlled by a combination of three controls:

- Authorization level
- User-defined access keywords - Users who have one of the access keywords allowing access to the Activity Importer but who do not have the SQLQuery access keyword will have access to the Activity Importer, but will not be able to access its advanced features.
- The SQLQuery access keyword – an iMIS reserved word that controls whether the Input from Query and Transformation Query fields on the Import activities window are enabled.

> **Note:** Note: If a user has the SQL Query keyword and the appropriate authorization level, the Transformation Query field is automatically populated with SQL text and the current user's identifier (the UserID_Date value). This information must be present when the user clicks the Optional Step 3 –Transform button. If any part of the default information is missing, an error displays informing the user which part of the SQL script is missing.

Access to Activity Importer by Keyword and Authorization Level

0 – 3	Import activities task list item not enabled; user cannot use Activity Importer			
4 – 7	Import activities task list item displays but user cannot access Activity Importer	Import activities task list item displays and user can access Activity Importer	Import activities task list item displays; user can access Activity Importer but cannot use advanced query features	User can access and use all Activity Importer features
8	Import activities task list item displays and user can access Activity Importer		Import activities task list item displays; user can access Activity Importer but cannot use advanced query features	User can access and use all Activity Importer features

To limit user access to the Activity Importer, you must perform the following steps:

1. Create or add keywords to the ACCESS_KEYWORDS general lookup/validation table (see "Creating Access Keywords").
2. Assign access keywords to Activity Importer (see "Limiting access to customer data").
3. Assign access keywords to users (see "Assigning Access Keywords to users").

> **Note:** Note: You must have a Sys mgmt authorization level of eight (8) or higher and database privileges to assign access keywords.

To limit access to customer financial data

The iMIS Desktop client allows you to assign access keywords that allow only authorized users to edit the customer financial information found on the Financial tab.

1. Create or add keywords to the ACCESS_KEYWORDS general lookup/validation table (see "Creating Access Keywords").
2. Assign access keywords to Financial data (see "Limiting access to customer data").
3. Assign access keywords to users (see "Assigning Access Keywords to users").

> **Note:** Note: After the access keywords are assigned on the Customer Setup – Access Keys window, customer financial information cannot be edited unless the user has been assigned at least one of the access keywords. The financial information is read-only for users with Customers authorization level of 1 or higher.

To limit access to the Fundraising tab

iMIS Desktop allows you to assign access keywords that allow only authorized users to view and edit customer fundraising information. The Fundraising Access keyword does not control viewing of Fundraising invoices in Service Central.

1. Create or add keywords to the ACCESS_KEYWORDS general lookup/validation table (see "Creating Access Keywords").
2. Assign access keywords to fundraising data (see "Limiting access to customer data").
3. Assign access keywords to users (see "Assigning Access Keywords to users").

> **Note:** Note: After the access keywords are assigned on the Customer Setup – Access Keys window, customer fundraising data cannot be edited unless the user has been assigned at least one of the access keywords.

To limit access to customer address information

iMIS Desktop allows you to assign access keywords so that only authorized users can enter and edit customer address information.

The authorization limits entry and editing of customer addresses in the Customers feature.

The limitations also extend to the Address, City, St/Prov, Zip, Home, Work, Fax, and E-mail fields on the Donor tab of the Enter and edit gifts window and on the Gift – Name/Address – Soft Credit window and the customer congressional district information (US Congress, St Senate, St House) found in the Other tab (from Customers, select Manage customers, find the customer record, and select the Other tab).

The address access key prevents entry on the address fields on both the Customers and Fundraising tabs when entering or editing a gift. If the user does not have the address access keyword, the customer address is never updated even if the user has the update option set in Customers.

1. Create or add keywords to the ACCESS_KEYWORDS general lookup/validation table (see "Creating Access Keywords").
2. Assign access keywords to Address (see "Limiting access to customer data").
3. Assign access keywords to users (see "Assigning Access Keywords to users").

> **Note:** Note: After Name Addresses Edit access keywords are assigned on the Customer Setup – Access Keys window, customer address information cannot be entered or edited unless the user has been assigned the appropriate access keyword.

To limit access to customer status information

iMIS Desktop allows you to assign access keywords so that only authorized users can enter new donors and soft credits and edit the following:

- Customer Type field on the Manage customers window, Donor tab of the Enter and edit gifts window, and on the Gift - Name/Address – Soft Credit window (from Fundraising, select Enter and edit gifts, open an existing gift or pledge, and click the Edit button displayed to the right of the Soft Credit field).
- Status and Category fields on the Manage customers window

- Join Date and Paid Through Date fields on the Status tab on the Manage customers window

1. Create or add keywords to the ACCESS_KEYWORDS general lookup/validation table (see "Creating Access Keywords").
2. Assign access keywords to Financial data (see "Limiting access to customer data").
3. Assign access keywords to users (see "Assigning Access Keywords to users").

> **Note:** Note: After a Name Status Edit access keyword is assigned on the Customer Setup – Access Keys window, new donors and soft credits cannot be entered and the Customer Type, Status, Category, Join Date, and Paid Through Date fields cannot be edited unless the user has been assigned the appropriate access keyword.

Assigning Access Keywords to users

After the ACCESS_KEYWORDS table has been created and you have assigned access keywords for the windows and data to which you want to limit access, you can assign access keywords to the users that you want to allow to access customer information. Access keywords are assigned to users through iMIS System Setup.

To assign access keywords to users

You may limit user access (see "Access Keywords in Customers") to information in the Customers feature of the administrative view.

> **Note:** Note: You must create access keywords before you assign them to user records.

1. Log on to iMIS as MANAGER.
2. From System Setup, select Security administration > Users.
3. Find a Full or Casual user and open their user record.
4. In the bottom half of the User Access area of the Users window, enter one or more access keywords in the Access Keywords field, or click the Find icon to select keywords.

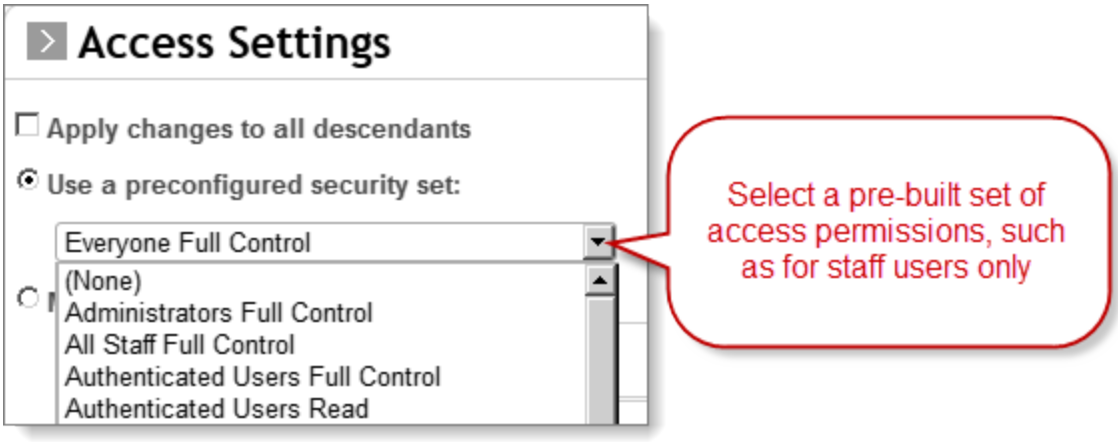
Note: If you create access keywords and apply them to specific areas in Customers, but do not specify the keywords in a user record, that user cannot enter or edit information in those areas of Customers.

5. Click Save.

   Exit and restart iMIS Desktop.

Preconfigured security sets

Throughout iMIS, whenever you configure Access Settings, you see a drop-down list of available security settings that you can apply to individual folders and objects. These security sets offer you easier control and faster iMIS performance than defining custom ones.



These are the key security sets you should use, from most permissive to least:

- Everyone * – no restrictions, including the public (if they can access this level/context).
- Authenticated Users * – restricts access to users who are signed in (both staff and public members).
- * Staff * – restricts access to users by licensing: Full Staff Full Control limits to Full users, Casual Staff Full Control limits to Casual users, and All Staff Full Control limits to Full and Casual users.
- Administrators * – restricts access to users with the SysAdmin role.

> **Note:** Tip: If you do not have the feature named in the security set (such as Certification), do not use the set.

iMIS ships with these pre-built security sets to cut down on the customization you need, for objects that should be neither unsecured (Share) nor locked for you alone (Private). Each security set contains a predefined Access List and permissions (Full Control, Read, Add, Delete, Edit) that are constant for all objects that use it. A Select permission is also available for tagged objects.

When you choose a set, the Current Access List below it updates to show the settings it includes. Look at those details to decide if the selected security set has the permissions you need.

Feature-specific default security

Most feature-specific security sets have three levels (Admin, Manager, User), each of which allows access for any level above it. For example, "Certification Users" grants access for Managers and Admins as well. Note that you can define your own access settings based on User-level security: Roles and Groups.

For example, applying Segmentation Job Default Access security means that

- users in the "SegAdmin" group get control privileges
- users in the "SegMgr" group get Read+Add+Edit+Delete privileges
- users in the "SegUser" group get Read-only privileges
- users in the "SysAdmin" role get control privileges

Setting access for folders and objects

iMIS SysAdmins have Full Control access to all folders and objects in the Document System, so they can also define security privileges for every folder and object.

To access the Document System, you must use the Staff site.

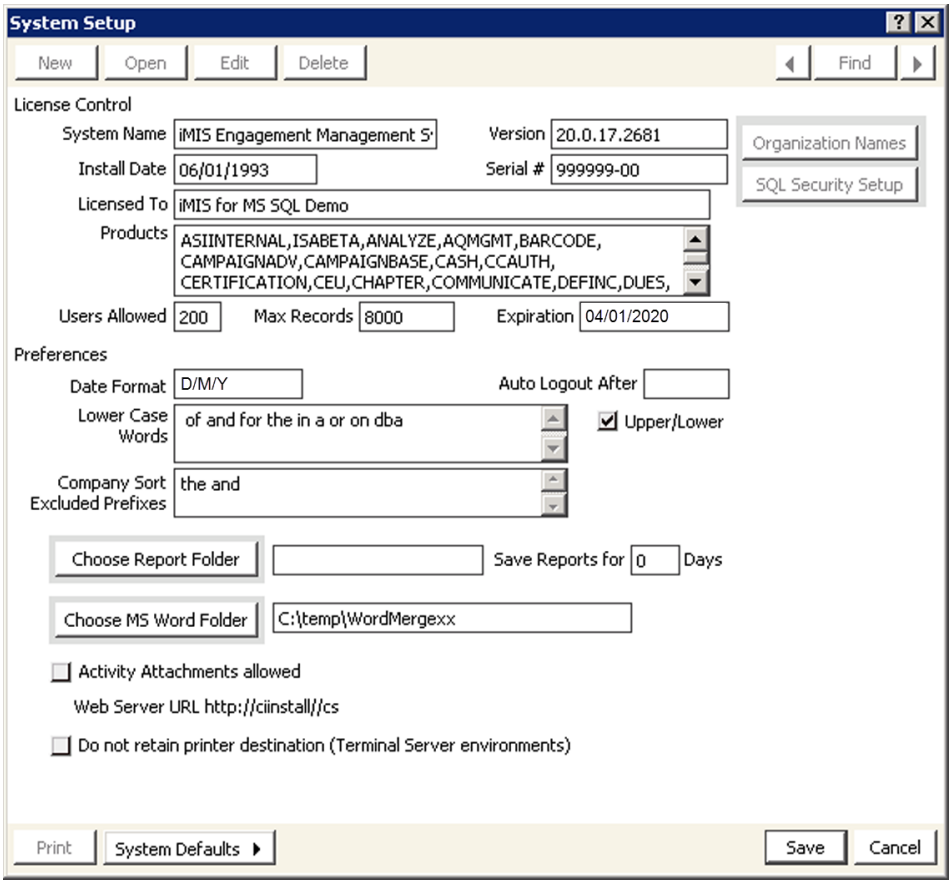
System Setup (File menu)

The System Setup provides configuration options for a variety of iMIS features. You enter the license information here when you install iMIS for the first time, and you may need to modify the license information if you purchase additional iMIS modules or upgrades.

In addition to modifying the license control, the System Setup window is where you set Organization Names and SQL Security.

System Setup window

From File, select System Setup



License Control

The following information should be entered from the data on the license sheet that accompanies an order.

- System Name – The title you want displayed on the main iMIS window
- Version – The current version of iMIS installed
- Install Date – The date the current version was installed
- Serial # – The iMIS serial number provided on your System Setup sheet
- Licensed To – Company name in which iMIS is licensed
- Products – The list of current features installed
- Users Allowed – The number of users allowed to access iMIS at one time
- Max Records – The maximum number records allowed for the license
- Expiration – The license expiration date

  Organization Names

  Opens the Organization Names window where you can enter logos and addresses for each organization. This is also where the taxation method for the organization is selected.

  SQL Security Setup

  Opens the SQL Security Setup window where you can set database passwords.

  Preferences

- Date Format – (defaults to D/M/CY) If needed, override the default date format.
- Auto Logout After – Specifies a time, such as the end of your normal business hours, when you want iMIS to automatically log out any logged-in but inactive users. The logout will not interfere with users in the middle of actions or procedures in iMIS; rather, it waits for a period of inactivity (no keystrokes, mouse movements) before logging off the user. Those wanting to work later that this “auto logout” hour can log back in and work undisturbed.
- Lower Case Words – Specifies a list of words that you do not want capitalized

- Company Sort Excluded Prefixes - The list of prefixes to ignore when sorting company names, which can include prefixes in foreign languages.
- Upper/Lower – Select this option to allow iMIS to automatically apply capitalization rules to name and address fields so that the text appears in Title (upper and lower) case. When you enter text into these fields, iMIS will capitalize the first letter of each word, except for the words listed in the Lower Case Words field. For example, if you entered “the university of texas at austin,” iMIS would format it as The University of Texas at Austin.
- Choose Report Folder – Used to enter the location where stored Crystal reports are saved and accessed through the Print Manager (File > Print Manager).
- Save Reports for __ Days – Specifies the default number of days to store Crystal reports in the Print Manager. If a different period is specified in the Detail Report Parameters window of the report, the days set in the report overrides the System Setup.
- Choose MS Word Folder – Used to enter the location where MS Word templates are stored and accessed.
- Activity Attachments allowed – Select this option to enable the activity attachment feature that enables you to attach a file to an activity record and save it to the iMIS database. For example, you can attach a Microsoft Word document, PowerPoint slide presentation, spreadsheet, graphic, e-mail file, or HTML page. Once the file is saved to the iMIS database, you can open it on your system using the associated application and view, modify, or delete it from within iMIS.
- Web Server URL – Specifies the URL of your iMIS application server.
- Do not retain printer destination (Terminal Server environment) – Select this option if you do not want iMIS to store the path to your default printer in the database (for example, if you access iMIS through a Terminal Server or Citrix connection that may append a network identifier to the path to your default printer, causing iMIS to designate your printer setting as invalid), you can select the Do not retain printer destination (Terminal Server environments) option on the System Setup window (select File > System Setup). When you enable this option, iMIS does not save the path to your default printer destination to the database. You will still be able to print to your default printer when you select the

Printer option on the Report Destination window. If when starting a subsequent session iMIS detects a conflict with your printer setting (for example, if you select a different default printer), an error message will display and you will be able to select a valid printer. You can also click the Reset All button to clear any existing report destination values.

> **Note:** Note: You must have a default printer specified on your workstation to access the Print Setup (select File > Print Setup) and Report Destination window.

System Defaults button

Used to Change Font Tables and access Help Options menu items.

When the Help Options menu item is selected, the Help Options window opens where you can select (enable) or deselect (disable) the following options:

- Help bar on – A dynamic, field-specific help line in the status bar at the bottom of the iMIS main window displays. This option must be enabled for the status bar to display. For example, when the cursor is positioned over the Joined Date field of the Name Maintenance window, the status bar displays Date membership began as additional information to help you know what to enter in the field.
- Show help codes – Internal help codes display the associated iMIS table and columns. For example, when the cursor is positioned over the Join Date field in the Name Maintenance window, the status bar displays the Name.JOIN_DATE.

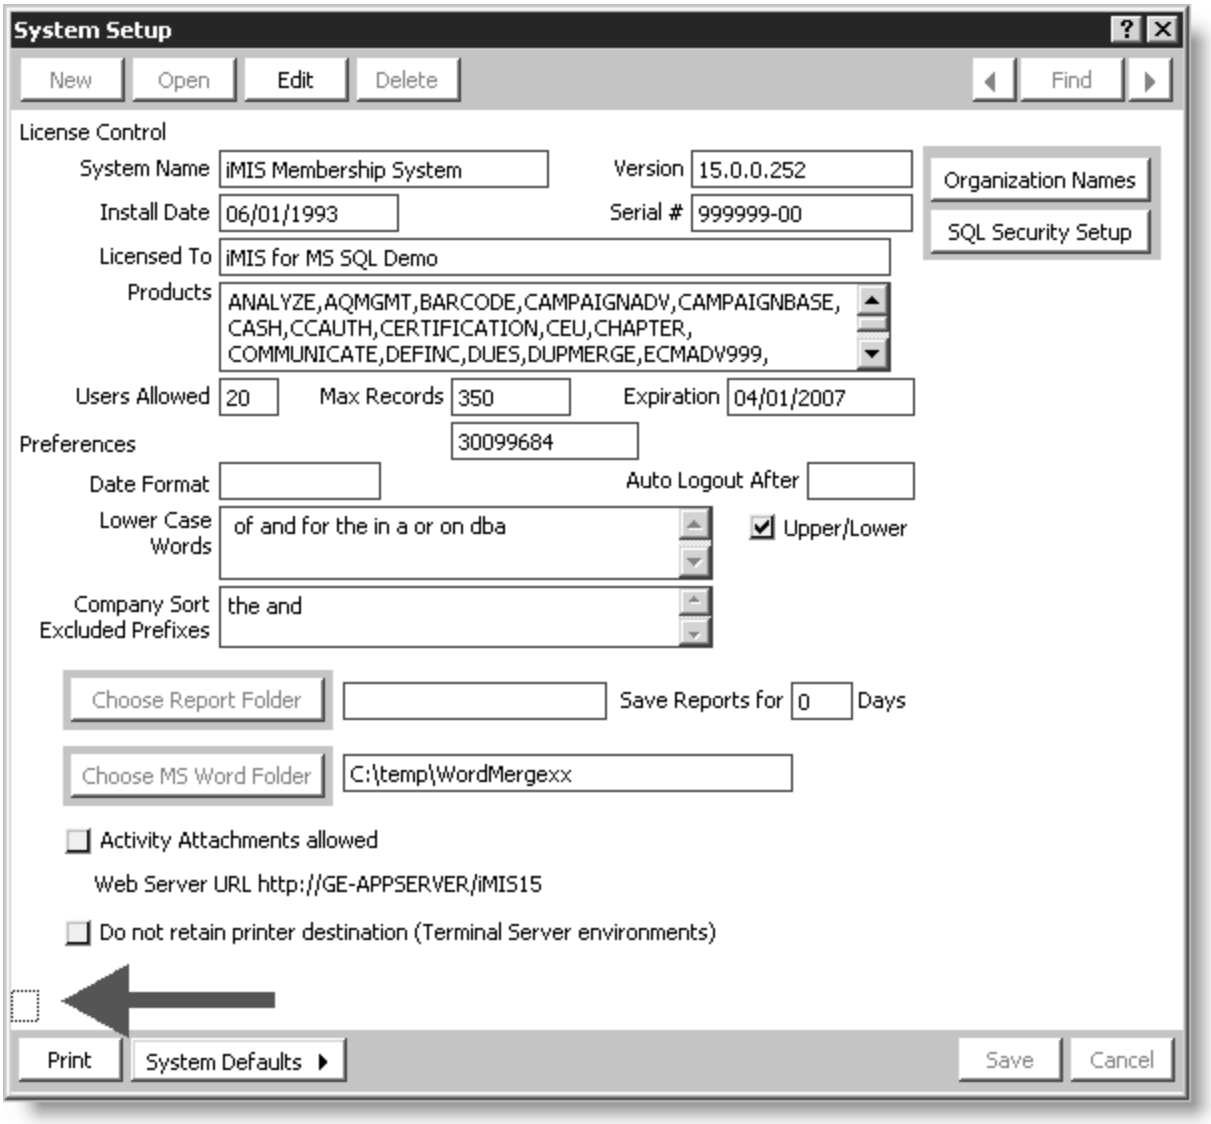
Modifying license configuration

You must modify your license configuration whenever you purchase new iMIS features or add users to an existing license. Have your updated license sheet (license key information) handy.

To modify the license configuration

1. Select File > System Setup to open the System Setup window.
2. Click in the lower left corner of the window until the hidden control button appears.
3. Click Edit.

4. Enter the license information exactly as shown on the license key.
5. Click Save.



Defining the date/time format for iMIS

The Date Format field in the System Setup window is blank by default, which causes iMIS to use the U.S. English short date and time formats used in most U.S.-based computers. For example:

- 11/16/2007 is the short date format that represents November 16, 2007
- 2:16:26 PM is the time format that represents 14:16:26

> **Note:** Tip: Use a format that displays the entire four-digit year so that users can verify the correct century. iMIS typically assumes a year of 29 or less to refer to the 21st century (30/3/22 = 30 March 2022) and 30 or higher as the 20th century (30/3/30 = 30 March 1930).

Formatting date/time outside the United States

Whenever you have the operating system of an iMIS server set for a region other than U.S. English, be sure to specify a matching Date Format in iMIS. The region is set through Control Panel > Regional and Language Options, Regional Options.

For example, if the server specifies English (United Kingdom) for the regional language, 16/11/2007 for the Short date format, and 14:16:26 for the Time format, you must make iMIS match by specifying D/M/CY H:N:S in iMIS.

To define the date/time format for iMIS

1. Log on to iMIS Desktop with the MANAGER logon.
2. Choose File > System Setup.
3. Click Edit.
4. In the Date Format field, specify a combination of variables that represents the Short date and Time formats used by the operating system of the iMIS application server. Examples:

- m D CY H:N.S.s returns "JUN 12 2008 15:45.00.00"
- D m Y H:N A returns "12 JUN 08 3:45 PM"
- M/D/Y H.N returns "06/12/08 15.45"
- YMD returns "080612"

Refer to the table below for details.

5. Click Save.
6. Restart iMIS.

Y	Year, 2-digit	99
y	Year with Century, 4-digit	1999
C	Century, 2-digit	19
M	Month, numeric	06
m	Month, 3-character abbr. In caps	JUN
D	Day of month, cardinal	12
d	Day of month, ordinal	12th
W	Day of week, numeric, Sunday=0, Saturday=6	5
w	Day of week, full name	Friday
H	Hour of day, 24-hour format	0-23
h	Hour of day, 12-hour format	1-12
N	Minutes, 2-digit, with leading zero	07
S	Seconds, 2-digit, with leading zero	02
s	Hundredths of seconds, 2-digit	37
A	AM/PM, all caps	AM

Changing the font table

The font table controls the fonts that are used for reports in iMIS. The type and size of the font determines how the report will print both on the screen and on the printer. If the fonts are not properly set, the output may cause a reduction in printing speed, loss of quality, or missing components.

View the font table to make sure that it is properly set up and that all of the necessary fonts are installed.

Support for foreign language characters

iMIS runs a customizable stored procedure that replaces foreign characters (ASCII 128 to 256) with standard equivalents (ASCII 0 to 127) before it adds a name or address to a search index. Likewise, when you search for a name or address, iMIS runs the same

stored procedure on the search text before it performs the search. The stored procedure works with all Microsoft SQL Server code page settings.

iMIS supports foreign language prefixes such as l' and d'.

- The lower-case word list accepts prefixes that contain an apostrophe.
- A customizable list (the Company Sort Excluded Prefixes list) can exclude prefixes that contain an apostrophe from the Name.COMPANY_SORT field.

  Both lists are available on the System Setup window (in iMIS Desktop, select File > System Setup).

Foreign language character replacement map

This is how iMIS replaces foreign (high ASCII) characters before it adds a name or address to a search index:

Š	S	È	E	ä	a
€	E	É	E	å	a
Œ	C	Ê	E	Æ	a
Ž	Z	Ë	E	ç	c
™	T	Ì	I	è	e
š	s	Í	I	é	e

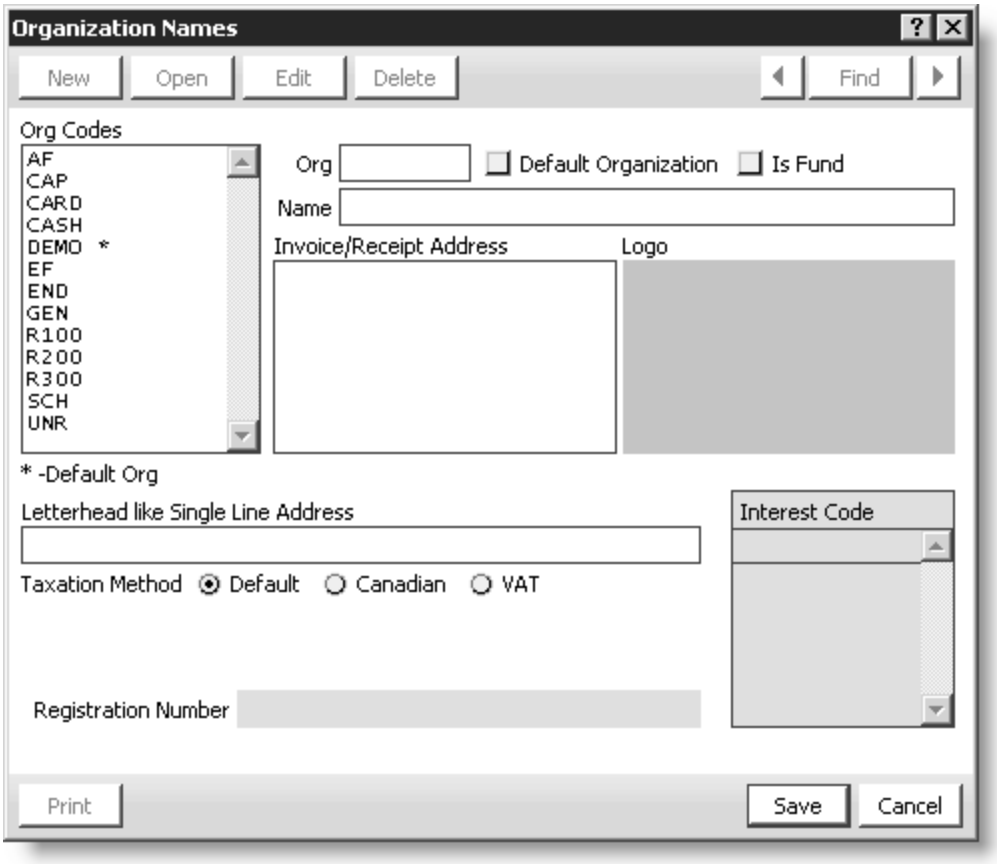
Å	A	á	a	þ	b
Æ	A	â	a	ÿ	Y
Ç	C				

Organization Names window



Select File > System Setup, and click Organization Names

Org Codes

List of codes for the available organizations

Org

(required) Specifies a code for the selected organization

Default Organization

(optional) Select this option to identify the default organization. An asterisk displays to the right of the default organization in the Org Codes list.

Is Fund

(optional) Select this option to indicate that the organization is also a fund

Name

(optional) Specifies the full name of the organization. A maximum of 60 alphanumeric characters can be entered.

Invoice Mail Address

(optional) Specifies the organization's complete address where invoices and other correspondence are to be mailed. Used on reports where the name and address display as a block, such as invoices.

Logo

(optional) Use this field to paste the organization's logo, which must be a 256-color BMP. The preferred image size is 130 pixels by 125 pixels.

Letterhead like Single Line Address

(optional) Specifies the organization's letterhead is in a single line address. This information is used on reports where the address appears in single line, such as event confirmations.

Interest Code

(optional) This list contains the fields for entering the interest codes associated with each fund. The interest codes that display are defined on the Set up interest codes window (from Customers, select Set up Fundraising > Interest codes). The Set up Fundraising task list only displays if you are licensed for Fundraising.

Taxation Method

- Default -Enables the default taxation method set up in the AR/Cash module
- Canadian - Enables the Canadian taxation method which includes Goods and Services Tax (GST)/Harmonized Sales Tax (HST) and Provincial Sales Tax (PST) and may be used for other countries that calculate GST
- VAT - Enables taxation method for the European Union

Registration Number

Specifies the registration number associated with the organization or fund. Fundraising organizations must have a registration number (Canada) or tax identification number (United States) in order to claim and verify their tax-exempt status. This field only displays if you are licensed for Fundraising.

Setting Up Organization Names

You can enter your organization's logo to appear on your standard report headings. The company address you enter in the Organization Names window appears on standard invoices, confirmations, and other reports.

If you have multiple financial entities within your organization, you can define multiple entities within iMIS to track their financial records separately.

> **Note:** Note: Although you can have several organizations (entities) defined, you can have only one Default Organization. The default organization is used throughout the product and on printed standard reports.

Defining an organizational entity

Organization, Fund, and Entity, in the context of iMIS accounting, all refer to a business unit that maintains separate financial books. A "fund" is specific type of organization or entity whose purpose is to solicit donations.

To define an entity/organization/fund

1. Select File > System Setup to open the System Setup window.
2. Click Organization Names to open the Organization Names window.
3. Click New.
4. Enter a unique alphanumeric Org Code to represent the organization.

   Note: If you plan to create separate GL interface files for each financial entity, be sure to use as few characters as possible when defining your org codes.
5. Select the Default Organization option if this is the default organization.

Note: You can set only one entity as the default entity for non-accounting reports and other standard uses. The default organization name and address data is used for all non-accounting oriented reports. It also becomes the accounting default in cases where no module-level or other override entity is provided.

6. Select the Is Fund option if this organization is also a Fund.

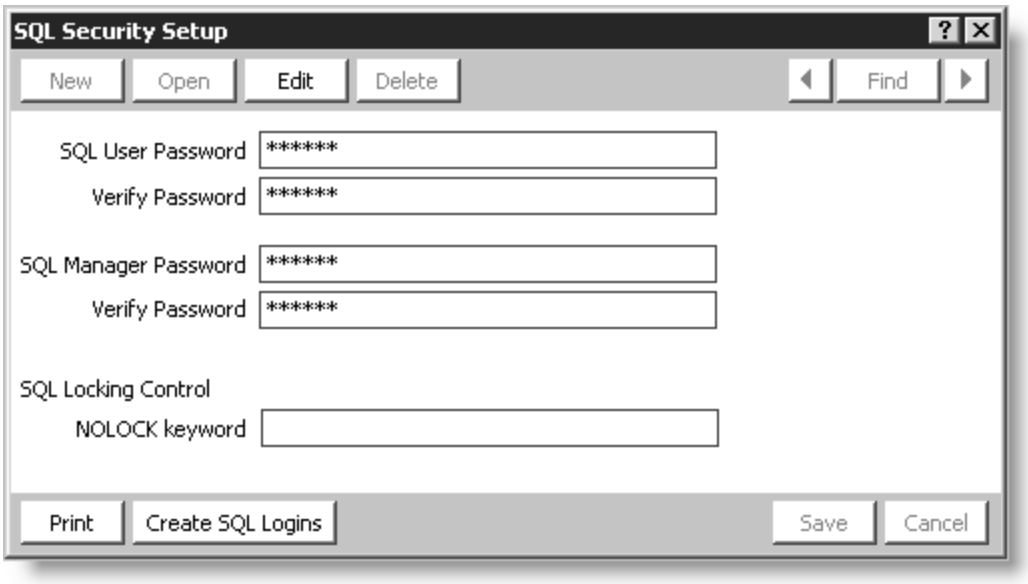
   Note: You must identify the organization as a fund for it to serve as a fund in the Fundraising module.

7. Enter the full Name of the organization.
8. Enter the organization's Invoice/Receipt Address. Include the full mailing address.
9. In the Logo area, paste the graphic, which must be a 256-color BMP. The preferred image size is 130 pixels by 125 pixels.
10. Enter the Letterhead like Single Line Address.
11. Select the Taxation Method.
12. Select as many Interest Codes as applicable.
13. Enter the organization's Registration Number.
14. Click Save.

SQL Security Setup window

This window allows you to change the passwords of the SQL Server login accounts that perform transactions on behalf of iMIS Desktop users, and to enable iMIS to prevent data modification while reports are running.

> **Note:** Note: See Resetting the system-level SQL authentication passwords in the Maintaining iMIS section of Installation.



File > System Setup, then click SQL Security Setup

This window includes the following fields.

- SQL User Password - (optional) Enter text here to generate a new password for the IMISUSER_[dbName] SQL Server login. Enter the text again in the Verify Password field.

  Note: iMIS uses the password text to generate an SHA-1 hash, so enter a reasonably complex string. For example, a text string of 6-10 characters, including 1 or more digits and 1 or more non-alphanumeric characters, will result in a hash that should prevent dictionary-based attacks.

- SQL Manager Password - (optional) Enter text here to generate a new password for the MANAGER_[dbName] SQL Server login. Enter the text again in the Verify Password field.

- SQL Locking Control - (optional) Enter nolock here to enable iMIS to prevent data modification while a report is running.

  Note: To prevent data modification while a report is running, enter NOLOCK in the report's Parameters field.

- Create SQL Logins - Resets the SQL Server passwords for the IMISUSER_[dbName] and MANAGER_[dbName] logins. iMIS prompts you to enter the password for the SQL

Server sa login.

- Save - For the SQL password fields, this button generates password hashes and then stores them in the System_Params table. For the NOLOCK keyword field, this button saves the keyword in the System_Params table.

Specifying a folder for Letter System templates

To enable the Letter System, you must specify a folder its template files. All iMIS users must specify the same folder path, whether it's local or remote. The path you specify is stored in the iMIS System_Params table, as the ParameterName value of System_Control.MSWordStoreDirectory.

> **Note:** Note: Truncating the Report Specs table deletes the Microsoft Word template report specifications.

To specify a folder for Letter System template files

1. Log on to iMIS.
2. Select File > System Setup.

   The System Setup window opens.
3. Click Edit.
4. Click Choose MS Word Folder (or enter a folder path in the field next to that button).

   The Browse for Folder dialog box appears.

- Select a local or remote folder.

  If you specify a remote folder, make sure that all users have permissions to access to the folder.

- Click OK.

5. In the System Setup window, click Save.
6. Log out of iMIS, and then log on again.

Activity record file attachments

When you open an activity record and click the Attachment button on the Activity Detail window, you can attach a file to the activity record and save it to the iMIS database. For example, you can attach a Microsoft Word document, PowerPoint slide presentation, spreadsheet, graphic, email file, or HTML page.

Once the file is saved to the iMIS database, you can open it on your system using the associated application and view, modify, or delete it from within iMIS.

Enabling attachments on activity records

To enable the activity attachment feature, you must do the following:

- Enable the Activity Attachments allowed option on the System Setup window (select File > System Setup).
- Enter a value in the Maximum file size (KB) field on the System Setup window (displays when you enable the Activity Attachments allowed option). See Specifying maximum size of activity attachments for more information.
- Enable the Allow user Edit option on the Set up activity types window (from Customers, select Set up module > Activity types) for the activity for which you want to add an attachment.

> **Note:** Note: Some activity types are system-generated (for example, Order) and are not intended for editing. However, if you want to attach a file to one of these activity types, you must enable the Allow user Edit option.

To enable the Activity attachments

1. Select File > System Setup to open the System Setup window.
2. Click Edit.
3. Enable the Activity Attachments allowed option.

4. Enter a value in the Maximum file size (KB) field. (Displays when you enable the Activity Attachments allowed option.)
5. A message warns you that the maximum you specified may have adverse effects on performance. Click OK.
6. Click Save.

Specifying maximum size of activity attachments

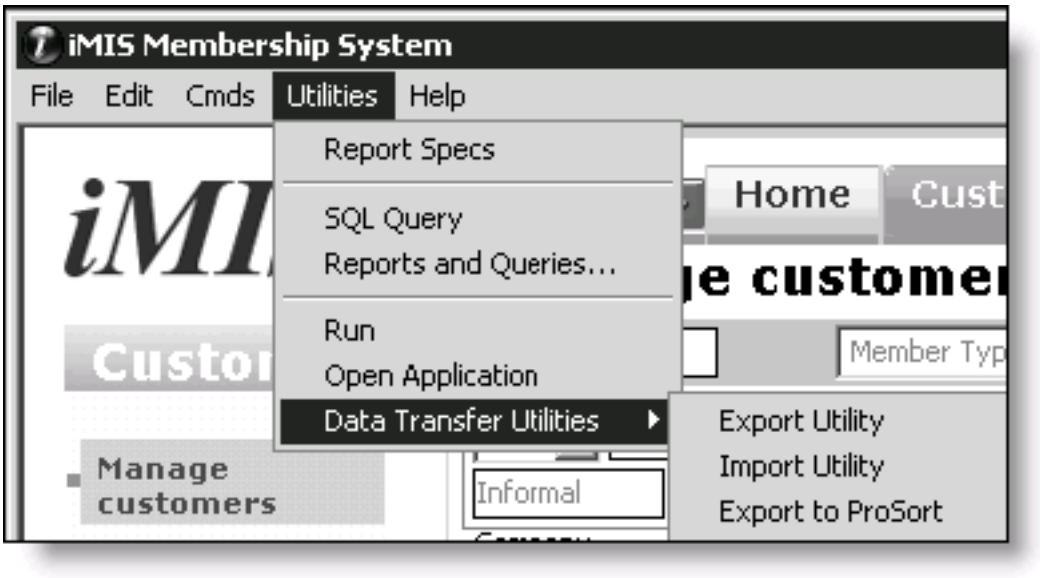
Although you can specify the maximum file size of activity attachments that can be stored in the database, the absolute maximum size is determined by many factors (for example, the maximum size of your database server). In most cases, specifying a small activity attachment size limit (for example, 500 for a 500 KB file) should be large enough. The maximum file size for a Word document, for example, is 32 MB.

> **Note:** Caution! Do not increase this value until you have verified through testing that performance of your system remains acceptable at the new value. Storing a large number of attachments will increase the size of your database very rapidly, affecting backup requirements and the available disk space on your database server.

Utilities (Utilities menu)

The commands on the Utilities menu help you maintain and monitor reports, tables, and data that are used throughout iMIS.

> **Note:** Note: As functionality moves to .NET, many of these utilities are being replaced by and incorporated into DB Maintenance and DB Upgrader, which are available from your iMIS program group.



The Utilities menu is only available from the administrative views.

Report Specs

Opens the Report Specifications window, where you can copy and modify standard reports.

SQL Query

Opens the SQLQuery window, where you can enter and execute SQL commands.

Reports and Queries…

Opens the System Reports and Queries window, where you have access to SQL scripts that can be run to manipulate your iMIS data.

Run

For developers: Executes an iMIS procedure.

Open Application

For developers: Opens a different Omnis library.

Data Transfer Utility

Opens a sub-menu of the following items, which appear only if licensed:

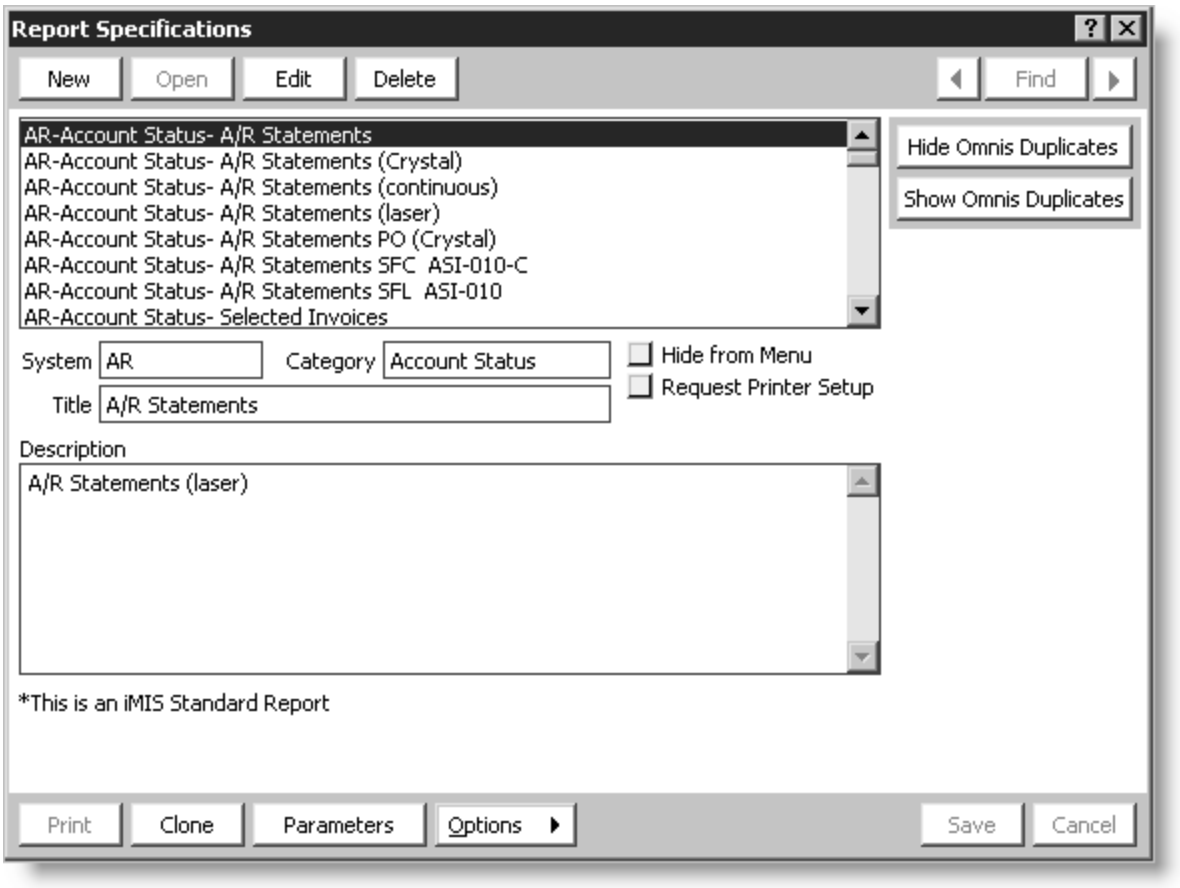
- Export Utility – opens the Export Utility window
- Import Utility – opens the Import Utility window
- Export to ProSort – opens the ProSort Exports window

Report Specifications

Each iMIS module contains a Reports menu item through which module-specific reports can be run. The specifications or details of all the iMIS standard reports can be modified or cloned (copied and renamed) through the Report Specifications window (select Utilities > Report Specs) and the Detail Report Parameters window (select Utilities > Report Specs and click Parameters). This is a powerful tool when used in conjunction with the Ad Hoc Search feature to create customized end-user reports with a minimum of time, energy, and expertise.

Note: Note: To run a Crystal or Access report in iMIS, the report must be added to the list of reports in the Report Specifications window.

Report Specifications window



From the menu bar, select Utilities > Report Specs

Report scrolling area

List of all iMIS reports.

System

Indicates the iMIS system or module where the report resides. For example, if a report is listed in the AR system, you would access the AR system report by selecting AR/Cash, and selecting Generate reports.

Category

Refers to the report type. For example, if you access the AR/Cash Generate reports window (from AR/Cash, select Generate reports), there would be three report type categories: Account Status, Deferred Income, and Transaction Lists. Each category contains reports that are specific to the category.

Title

Indicates the report name that will display on the report and in the Available Reports area of the report window. For example, you would access the A/R Statements report by selecting AR/Cash, and selecting Generate reports, and selecting the Account Status report type.

Hide from Menu

If enabled, hides the report from displaying on the report window.

Request for Printer Setup

If enabled, the system automatically displays the Set Report Destination window so you can select the appropriate print destination.

Description

This is a detailed description of the report.

Options button

Drop-down menu items of current report format options that can be modified for the selected report. Options range from adjusting the margins, modifying the search criteria, changing the sorting option, exporting report records to another application, adding additional fields that are mapped to the specific parameters, and adding text to letter formats. Report options vary by report type.

Clone button

Used to create an exact copy of the selected report. Modify the title and some of the report properties to create a new report on the report menu.

Parameter button

Opens the Detail Report Parameters window. This window contains a detailed list of the report parameters.

Cloning reports

To avoid losing report specifications, it is best to clone a report and make the changes to the cloned version.

To clone a report

1. From the menu bar, select Utilities > Report Specs to display the Report Specifications window that contains a list of all standard reports, sorted by module and type.
2. Select the report you want to clone and then click Clone.
3. Enter in the System and Category where you want the report to appear.
4. Enter a name for the cloned report in the Title field and a new description in the Description field.

   Note: If you use the cloned report as the standard report within its Category and the original report chosen for printing at the individual level, make sure the report name is first in the alphabetical report category. To simplify this task further, put a period "." at the beginning of the name, such as .Badge, so it becomes the default for the report type. Not all options are available for all reports.
5. Click Parameters and make changes, if necessary.
   This may include a change in the Report Format used to print the report, an addition or change of an option in the Options list string, or an addition of message text (for certain invoice and confirmation formats) in the Parameters text field.

   Note: When changing an option, remember that most of the options available for a report are already in the Options list. However, you may need to either enable or disable the option depending upon the setting. To enable an option that is disabled, change the first word of the option from NO to PRINT For example, NO_FULL_ADDRESS to PRINT_FULL_ADDRESS.
6. Click OK. You have created a new report that appears with the other Standard Reports.

Common report tables and joins

These are the most common table and field layouts and joins that are used in iMIS reports:

Activity Reports

Tables
- Name
- Name_Address
- Activity
- Name_Fin
- Org_Control
- Product
- Subscriptions

Join Examples
- Name.ID=Activity.ID
- Name.ID=Name_Fin.ID
- Name.ORG_CODE=Org_Control.ORG_CODE
- Activity.PRODUCT_CODE=Product.PRODUCT_CODE
- Name.ID=Subscriptions.ID
- Activity.PRODUCT_CODE=Subscriptions.PRODUCT_CODE

See Common Address Joins

AR/Cash Reports

Tables
- Name
- Invoice
- Trans

Join Examples
- Name.ID=Invoice.BT_ID

- Trans.BT_ID=Invoice.BT_ID
- Trans.BATCH_NUM=Invoice.BATCH_NUM

Committee Reports

Tables
- Name
- Activity
- Committee_Minutes
- Committee_Position
- Gen_Tables

Join Examples
- Name.ID=Activity.ID
- Activity.PRODUCT_CODE=Committee_Minutes.PRODUCT_CODE
- Name.TITLE=Committee_Position.TITLE
- Activity.DESCRIPTION=Gen_Tables.DESCRIPTION

Dues Reports-Invoices (Cash Method)

Tables
- Name
- Name_Address
- Subscriptions

Join Examples
- Name.ID=Subscriptions.ID
- Name.BILL_ADDRESS_NUM=Name_Address.ADDRESS_NUM

Dues Reports-Invoices (Accrual Method)

Tables
- Name
- Name_Address
- Invoice

- Invoice_Lines
- Trans
- Subscriptions

Join Examples
- Name.ID=Trans.BT_ID
- Name.BILL_ADDRESS_NUM=Name_Address.ADDRESS_NUM
- Invoice.REFERENCE_NUM=Trans.INVOICE_REF_NUM

Meeting Reports

Consist of Rosters, Badges, Confirmation Letters, and Invoices

Tables
- Orders
- Order_Badge
- Order_Lines
- Order_Meet
- Order_Payments
- Meet_Master

Join Examples
- Orders.ORDER_NUMBER=Order_Lines.ORDER_NUMBER
- Orders.ORDER_NUMBER=Order_Badge.ORDER_NUMBER
- Orders.ORDER_NUMBER=Order_Payments.ORDER_NUMBER
- Orders.ORDER_NUMBER=Order_Meet.ORDER_NUMBER
- Order_Meet.MEETING=Meet_Master.MEETING

Membership Reports

Tables
- Name
- Name_Address
- Name_Note

	• Name_Fin • Any User-Defined Custom Table
Join Examples	• Name.ID=Name_Note.ID • Name.ID=Name_Fin.ID • Name.BT_ID=Name_Fin.BT_ID See Common Address Joins

Orders Reports

Tables	• Orders • Order_Lines • Order_Payments
Join Examples	• Orders.ORDER_NUMBER=Order_Payments.ORDER_NUMBER • Orders.ORDER_NUMBER=Order_Lines.ORDER_NUMBER • Orders.PAY_TYPE=Order_Payments.PAY_TYPE • Orders.PAY_NUMBER=Order_Payments.PAY_NUMBER • Orders.CREDIT_CARD_EXPIRES= Order_Payments.CREDIT_CARD_EXPIRES • Orders.AUTHORIZE=Order_Payments.AUTHORIZE • Orders.CREDIT_CARD_NAME= Order_Payments.CREDIT_CARD_NAME • Orders.CASH_GL_ACCT=Order_Payments.CASH_GL_ACCT

Common address joins

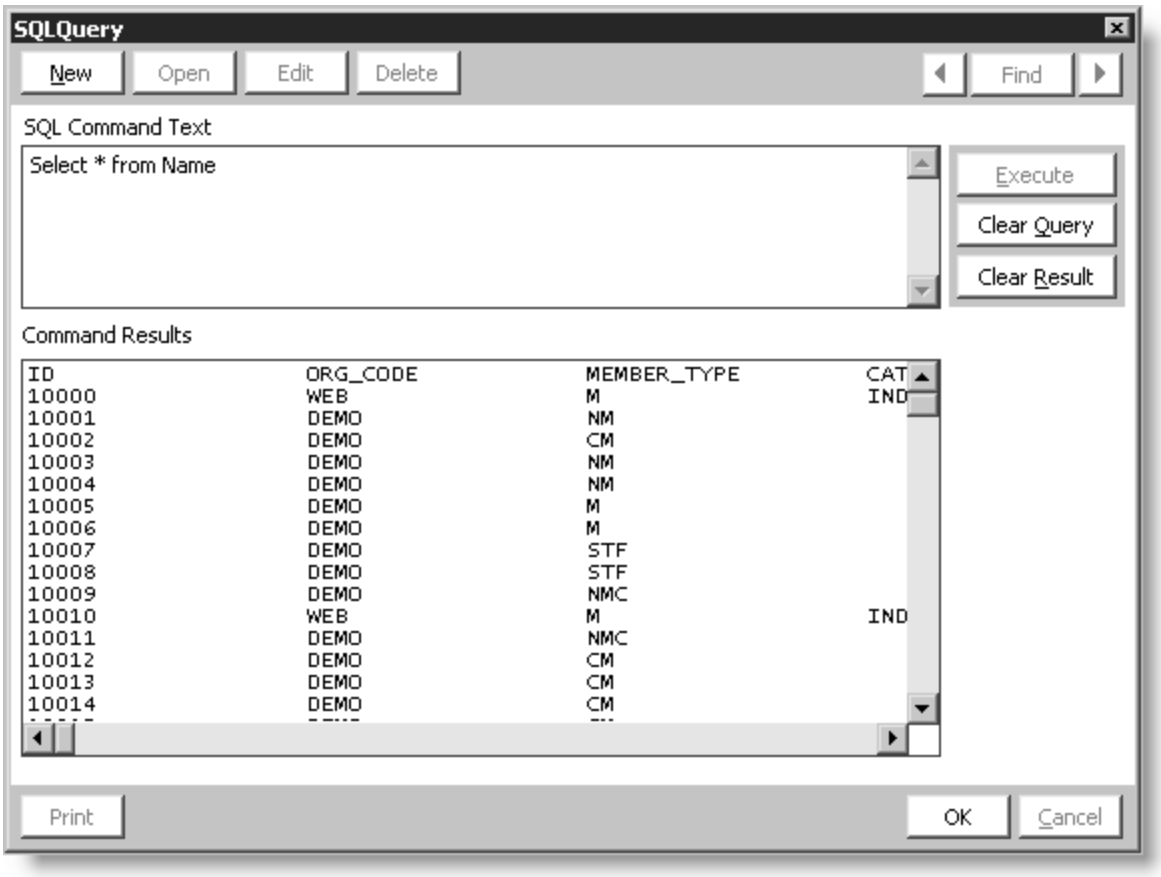
Reports using Address 1	Name.ADDRESS_NUM_1= Name_Address.ADDRESS_NUM
Reports using Address 2	Name.ADDRESS_NUM_2= Name_

	Address.ADDRESS_NUM
Reports using Address 3	Name.ADDRESS_NUM_3= Name_ Address.ADDRESS_NUM
Reports using Preferred Bill Address	Name.BILL_ADDRESS_NUM= Name_ Address.ADDRESS_NUM
Reports using Preferred Mail Address	Name.MAIL_ADDRESS_NUM= Name_ Address.ADDRESS_NUM
Other Alternate Addresses	For example, if you have more than three purposes: Name.ID=Name_Address.ID where PURPOSE=' ' (List purpose in between single quotes.)

SQL Query

In iMIS you can run SQL queries to view the data in the tables.

1. From the menu bar, select Utilities > SQL Query to open the SQL Query window.
2. Click New.
3. Enter the SQL query in the SQL Command Text box. In the following example, we are selecting all the data from the Name table.
4. Click Execute. iMIS displays the results of the query in the Command Result box.
5. To clear the screen:
6. Click Clear Query to clear the SQL command.
7. Clear Clear Result to clear the results.

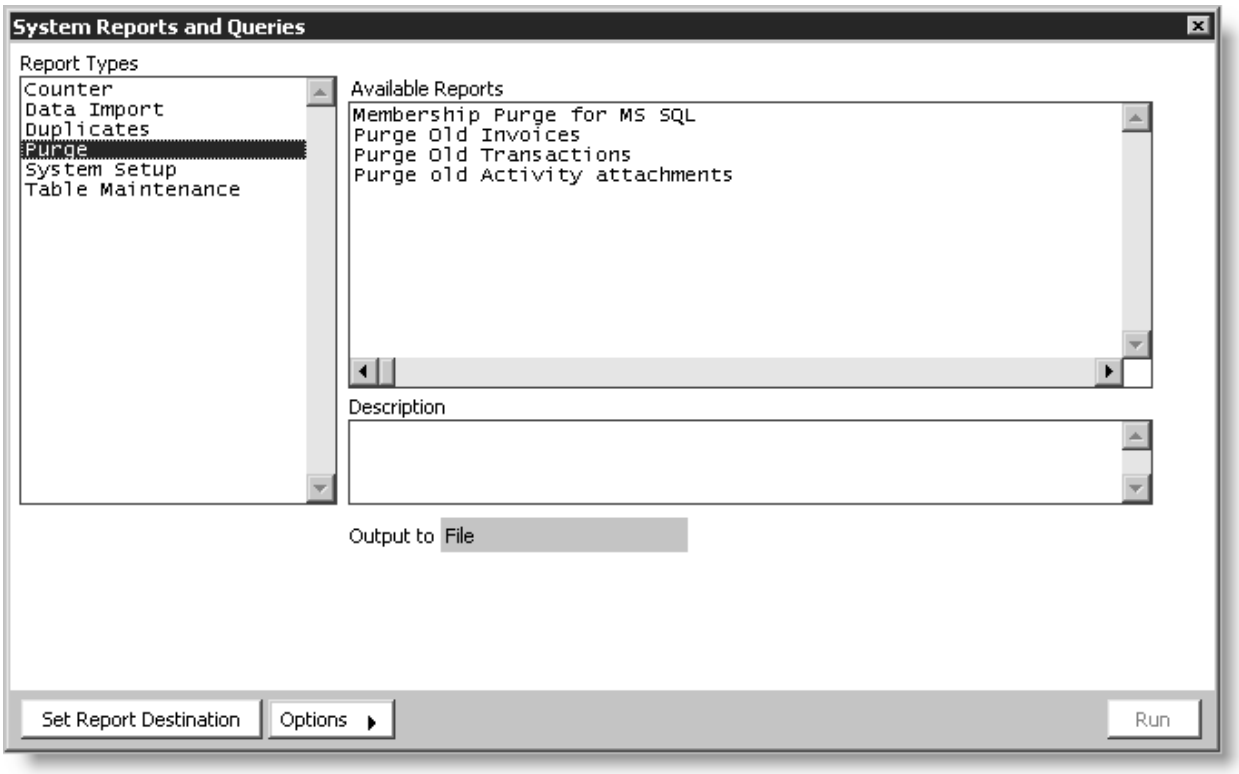


From the menu bar, select Utilities > SQL Query

Reports and Queries

iMIS provides several SQL scripts that can can add or change data in the tables. The SQL scripts are stored as standard iMIS reports that you can clone and customize.

System Reports and Queries window



From the menu bar, select Utilities > Reports and Queries

> **Note:** Note: Run the System Setup routines only after the prerequisite conditions are met.

The following Data Import, Purge, System Setup, and Table Maintenance report types display with a brief description.

Data Import

Import Data into the Prospect Table: Imports prospect records from a tab-delimited file into iMIS.

Purge

Membership Purge for MS SQL: Deletes customer records with a status of “D.”

Purge Old Invoices: Deletes records in the Invoice and Invoice_Lines tables which have a zero balance, are dated before the retention months and in which there are no linked and unposted transactions remaining.

Purge Old Transactions: Deletes records in the Trans table where TRANSACTION_DATE is less than Trans retention months and are no longer associated with its corresponding invoice record.

Purge Old Activity attachments: Deletes activity attachments with a timestamp before a specified date.

System Setup

Co. to Member Addr. Flowdown: Populates a member's first Name_Address record (the required one where PURPOSE = Membership Address1 Prompt) from the corresponding Name_Address record of the company ID (CO_ID). Only member records where ADDRESS_1 is blank are updated.

Prerequisite: This procedure requires that Name_Address.ADDRESS_NUM be populated and Name_Address.PURPOSE be populated to match the address prompts in Customers > Set up module > General > Address and Notes button.

Note: This script updates only the Name_Address record; it does not update user-defined fields within Advanced Flow Down.

Rebuild Chapter Subscriptions: (for optional Chapter Management) Inserts Chapter Subscription records based on Name.CHAPTER.

Prerequisite: Requires that Name.CHAPTER be populated.

Rebuild Member_Type Info: Populates Name.MEMBER_RECORD, COMPANY_RECORD, and CO_MEMBER_TYPE.

Prerequisite: Requires that you first complete Member_Type setup and create the Company_Index view.

Rebuild Name Fields: Rebuilds the index fields Name.LAST_FIRST, COMPANY_SORT, and FULL_NAME. To speed processing, select Drop Indexes first.

Prerequisites: (1) Requires that you first upload the Name table, (2) populate elements of member name (at least LAST and FIRST), and (3) populate Name.COMPANY.

Rebuild Name.DUP_MATCH_KEY: Rebuilds the Name.DUP_MATCH_KEY according to the following iMIS default formula. This formula checks for duplicates: the first five digits of the ZIP (postal code) field, the first four characters of the last name, and the first initial.

con (mid(Name.ZIP,1,5),mid(Name.LAST,1,4),

mid(Name.FIRST,1,1))

The standard formula is used unless a custom formula has been entered in the Duplicate Record Check Formula field on the Customer Setup – Advanced window (from Customers, select Set up module > General, and click Advanced). If the Duplicate Record Check Formula field is blank, the default formula will be used.

Prerequisite: Requires that you first run Rebuild Name_Address Pointers (to populate ZIP in Name) and populate any other fields used in the dupmatch formula.

Caution! If you customize your dupmatch formula, you must populate the parameters of the report specification (select Utilities > Report Specs).

Rebuild Name_Address Pointers: Populates Name_Address.FULL_ADDRESS and Name's address fields, including MAIL_ADDRESS_NUM, BILL_ADDRESS_NUM, ADDRESS_NUM_1, ADDRESS_NUM_2, ADDRESS_NUM_3, and FULL_ADDRESS.

Prerequisite: Requires that you first populate the Name table with unique ID's, populate the Name_Address table with unique ID's that correspond to the Name table and populate the Name_Address.ADDRESS_NUM field with unique sequential numbers. From Customers, select Set up module > General and click Address and Notes, populate the Address Usage fields (Name_Address.PURPOSE) to match your setup, and make sure that you have at least one Name_Address record for each member, with a PURPOSE matching the first address prompt.

Post Processing: (1) Select Utilities > Table Analysis (2) Select Name table record, and (3) Click Make Indexes.

Rebuild Name_Indexes: Name_Indexes can be used to define auxiliary indexes on the Name table that will appear in the Name Find window's list of find criteria. These additional indexes are set up on the Customer Setup – Indexes window (from Customers, select Set up module > General, and click Indexes). This example script shows how to populate the Name_Indexes table when Name.STATE_PROVINCE is set up as additional index 1.

Prerequisites: (1) A column or Omnis expression using columns from the Name table must be defined as an additional index on the Customer Setup – Indexes window. In this example, Name.STATE_PROVINCE is defined as additional index 1. (2) To modify this script, clone it and substitute a SQL expression equivalent to the Omnis expression used in System Setup and the corresponding index number (1, 2, 3, or 4) where this script has Name.STATE_PROVINCE and 1, respectively. (3) This script truncates and rebuilds the whole Name_Indexes table, so if you have several additional indexes you should put all the updates in one script.

Remove Name.LAST_FIRST apostrophes: Removes apostrophes from the Name.LAST_FIRST field. It will run faster if it is done before Name indexes are added.

Prerequisites: (1) Name table is uploaded (2) Elements of member name are populated: at least LAST and FIRST (3) Rebuild Name script has been run to populate LAST_ FIRST.

Table Maintenance

Remove Ref_Provided NULLs: Replaces NULLs in the Ref_Provider table with either a blank (' ') or a zero (0) depending on the datatype of the field being updated.

Set Activity type donor club: Updates Activity.ACTIVITY_TYPE = 'DONORCLUB'.

Set Activity.ORIGINATING_TRANS_NUM: Updatse Activity.ORIGINATING_TRANS_ NUM with its matching Trans.TRANS_NUMBER.

Set Product type donor club: Updates Product.PROD_TYPE = 'DONORCLUB'.

Set Product FR type donor club: Updates Product_FR.FR_TYPE = 'DONORCLUB'.

Set Product_Type type donor club: Updates Product_Type.PROD_TYPE = 'DONORCLUB'.

Customizing system reports

The System Reports can be customized to fit your company's needs.

To clone and customize a system report

1. From the menu bar, select Utilities > Report Specs to open the Report Specifications window that contains a list of all standard reports, sorted by module and category.
2. Scroll down to the SYSTEM module. The categories under SYSTEM are Data Import, Purge, System Setup and Table Maintenance.
3. Select the report you want to clone and then click Clone.

   Note: Do not change the System and Category fields if you want the cloned report to display with the other reports.
4. Type a name for the cloned report in the Title field and a new description in the Description field.

   Note: If you use the cloned report as the standard report within its Category, make sure the report name is first in the alphabetical report category. To simplify this task further, put a period "." at the beginning of the name, such as .Badge, so it becomes the default for that report type. Not all options are available for all reports.
5. Click Parameters to open the Detail Report Parameters window.
6. If you are entering an SQL command in the Parameters field, make sure that SQLExec/240 is shown in the Control Procedure field.
7. Make the necessary changes to the report. This may include a change in the Report Format used to print the report, an addition or change of an option in the Options list string, or an addition of message text (for certain invoice and confirmation formats) in the Parameters text field.

Note: When changing an option, remember that most of the options available for a report are already in the Options list. However, you may need to either enable or disable the option depending upon the setting. To enable an option that is disabled, change the first word of the option from NO to PRINT, for example, NO_FULL_ADDRESS to PRINT_FULL_ADDRESS.

8. Click OK. You have created a new report that appears with the other Standard Reports.

Adding SQL queries to custom reports

You can add a new System Report with an SQL query.

To add an SQL query to a custom report

1. From the menu bar, select Utilities > Report Specs to open the Report Specifications window.
2. Click New.
3. Enter the System, Category, and Title.
4. Click Parameters to open the Detail Report Parameters window.
5. Enter SQLExec/240 in the Control Procedure field.
6. Add GO after your SQL statement.
7. Click OK.

Run iMIS Procedure Utility

Occasionally, ASI will develop procedures to fix iMIS data. The Run procedure utility is used to run an ASI procedure that the technical support department has determined is required.

To run an iMIS procedure

1. From the menu bar, select Utilities > Run.

   The Run Procedure window opens.

2. Enter the procedure name and click OK.

Open Application Utility

The Open application utility allows you to open an Omnis-based library in iMIS.

To open a different library

1. From the menu bar, select Utilities > Open Application.

   The Select library window opens.

2. Select the library you wish to use and click Open.

Data Transfer Utilities

The Import Utility can be used by customers who are new to iMIS. By making use of templates and SQL scripts to make their existing data meet the mapping requirements of the iMIS database tables, the new customers can use the Import Utility to load their existing data into the iMIS database.

Existing customers can also use the Import Utility to import data from a third-party source that does not match iMIS database formats.

iMIS customers can use the Export Utility to create customized layouts of exported information that is easier for third parties to consume and use.

Import Utility

This document provides an example designed to walk users through the process of importing records into the Name table in the iMIS database.

There are several steps in the record import process:

1. Create an import template.
2. Load an import template to the Import Utility.
3. Disable the Name table trigger.
4. Import a records file.
5. Enable the Name table trigger.

This document will also identify NRDS-specific steps, which are performed only when conducting NRDS-specific imports. NRDS is an acronym for National Realtors Database System. NRDS was designed as a single database residing on the Internet to store the member and office records for the Realtor organization.

iMIS import templates

A template file is a comma-delimited text file that defines the format of the data imported into the Name table in the iMIS database. The template file acts as an interpreter, defining for the database the data that is imported, and enables the iMIS database to consume the data accurately.

The import template is a guide only and must be created based on the data being imported.

Create the template file in a flat editor. The rows in the template file correspond to the columns in your .csv (comma-separated values) file that contains the data you are importing.

> **Note:** Note: The template file and the corresponding .csv file must be in agreement on the order of the columns to ensure the data is imported accurately.

Do the following to import a file with five records. There will be six items that will be imported for each record:

- First name
- Last name
- Company
- Email
- Home phone
- Work phone

1. Create a template file. The template file for this import will look like the following:

   Name.FIRST_NAME,0,0,C

Name.LAST_NAME,0,0,C

Name.COMPANY,0,0,C

Name.EMAIL,0,0,

Name.HOME_PHONE,0,0,

Name.WORK_PHONE,0,0,

Note: In the template file, the values 0,0,C correspond to the Position, Length, and Processing Code in the Import Utility. These are explained later in this document.

Each row in the template file represents an entry in the header row of a .csv file, and corresponds to a column name in the iMIS database. For example, data entered through the Import Utility as Name.LAST_NAME,0,0,C and Name.FIRST_NAME,0,0,C is placed under the Name (Last, First) column in the iMIS database.

2. Give the template file a name, for example, template.txt. The corresponding rows in the .csv file must match the order of the items in the template file.
3. Create a .csv file to import. Give it a name, for example, Contacts.csv. Include the following information in the Contacts.csv file:

   ALAN,ADAMS,ADANAC ELECTRIC,AADAMS@YAHOO.COM,512-334-7834,512-222-5389

   MICHAEL,BAKER,ADANAC ELECTRIC,MICHAEL99@GMAIL.COM,512-672-8302,512-332-7378

   JENNIFER,CARSON,ADANAC ELECTRIC,CARS212@HOTMAIL.COM,512-373-2383,512-564-9765

   GENE,DARRENS,ADANAC ELECTRIC,GD_555@DARRENS.COM,512-254-9492,512-759-8545

   LISA,EBERSOL,ADANAC ELECTRIC,EBERS73@GMAIL.COM,512-998-7259,512-213-2596

Loading import template files

To load import template files in the Import Utility

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Import Utility to open the Import Utility window.
2. Click New.
3. Enter the Import Name (description of the import task). For this example, use CONTACT.
4. Select an Import Type:

- Select (C)omma for comma-delimited (.csv) files.
- (NRDS only) Select (F)ixed Field for Import Type when working with NRDS imports.

5. Select Name for the File to Modify.
6. (NRDS only) Select the NRDS Import (Skip Header Records) checkbox when performing a NRDS import. This instructs the import utility to skip the header records.
7. (NRDS only) Select the Member Import or the Office Import checkbox to specify whether you are importing the NRDS Member file or the NRDS Office file.
8. Click Save.
9. Click Edit.
10. Click Load and select the template.txt file.
11. Edit the template as needed, if necessary:

1. In the template area, click Add to append a record row to the end of the template, or click Insert to add a row within the template. You can highlight a record row and click Delete to remove the record row.
2. Click Ctrl+Z to open an edit window.
3. Specify the fields to be edited:

1. Enter the Field Name in the conversion table.
2. (NRDS only) Enter the record Position from the NRDS file for that field.
3. (NRDS only) Enter the Length of the field.

4. Enter the Processing Code option, if used. This code identifies which record to update. The Processing Codes table on the window lists the options and their descriptions.

   If the field is a Name_Address field, for example, ADDRESS_1, CITY, STATE_PROVINCE, and so forth, you will need to specify which address purpose to use. The #1, #2, #3 processing codes specify the first, second or third address purpose. When importing address information, you need only specify the ADDRESS_1, CITY, STATE_PROVINCE, COUNTRY, and ZIP fields in Name_Address. iMIS will build the FULL_ADDRESS field and populate the corresponding fields in the Name table. The same is true for Name information. If you populate the LAST_NAME and FIRST_NAME, iMIS will automatically build the FULL_NAME field.

   (NRDS only) The following table defines some NRDS-related processing codes used in the import templates:

#1, #2, #3	Address format. Used with one of the three PURPOSEs used in iMIS. Note: This must match the address exported to the National Association of REALTORS® (NAR). • #1 – Updates the member's current main address • #2 – Updates the member's second address • #3 – Updates the member's third address
N	Numeric format, removes leading zeroes. Do not use N for importing international phone numbers.
P	Phone format.
L	Instructs the import utility to insert a new Name.ID or Name.MAJOR_KEY if no match is found for that field.
D	Date format. Note: The NRDS import file contains two fields for zip code. To convert these fields to the iMIS zip code format, enter two zip code fields in the table. Specify Length = 5 for the first field. For the second code, specify Length = 4 and specify

A- processing code (Append Data to Field, followed by a hyphen).

Tip: Use the A- processing code (Append Data to Field, followed by a hyphen) for importing Social Security numbers in the standard format (999-99-9999).

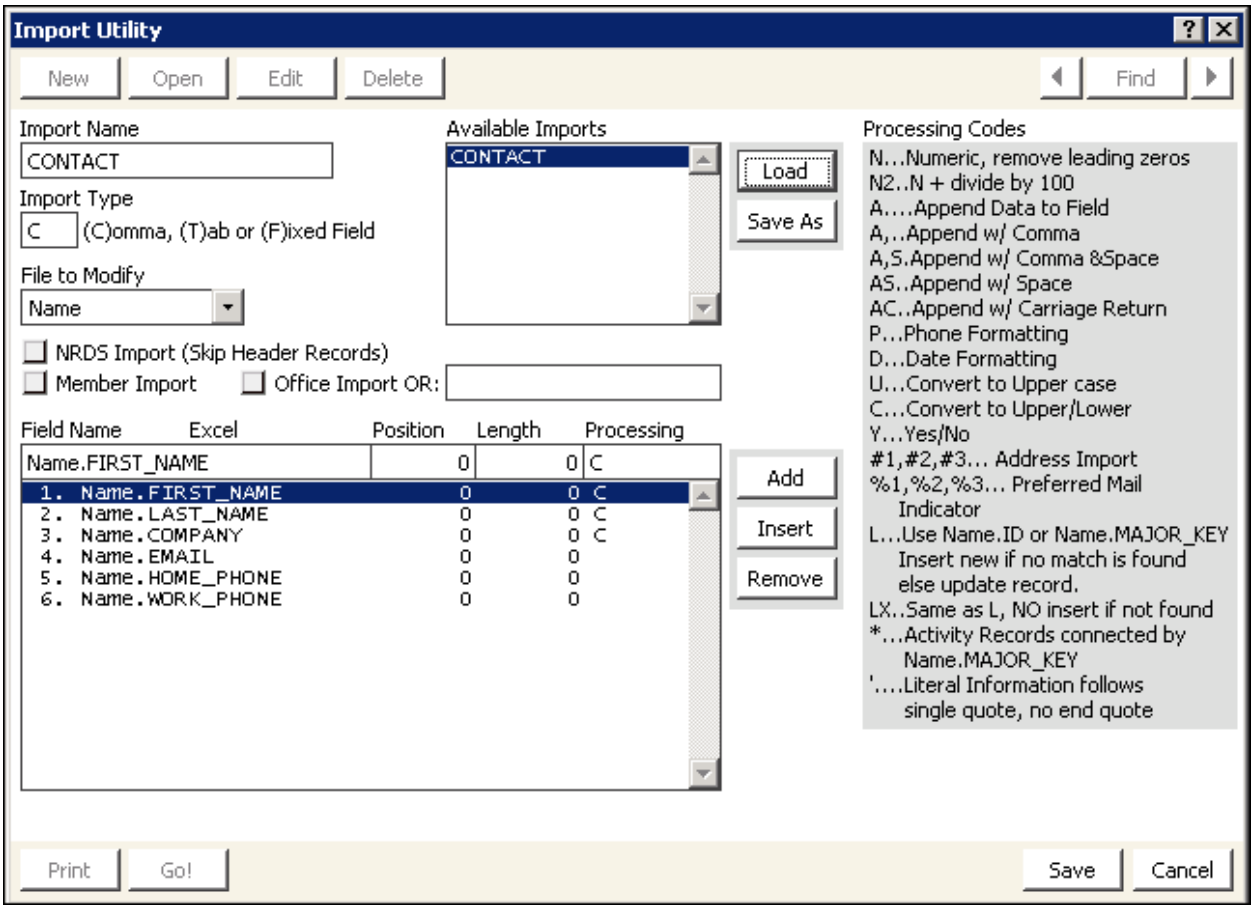
The Member import template uses the following additional Processing Codes:

@ Takes the NRDS ID number in the import file and finds the Name record in iMIS where this number is populated in the MAJOR_KEY field to get the iMIS ID. The utility then populates the Name.CO_ID field with this iMIS ID for the member record to be imported. Any necessary company information flowdown is then processed.

% Used to populate the preferred mail checkbox. The import file contains a field consisting of H, M, or O. The Import Utility maps each letter to a specific address.

- H = 1 – Main Address in the Name Maintenance window
- M = 2 – Second Address in the Address window
- O = 3 – Third Address in the Address window

In the Name_Address.PREFERRED_MAIL field, enter a % processing code with a 3-digit code representing each of your three iMIS addresses. For example, using %312 means the third address in iMIS corresponds to the Home Address, the Main Address corresponds to the mailing address, and the Second Address corresponds to the office address.



12. Click Save to save the changes to the template.

Disabling a trigger before an import

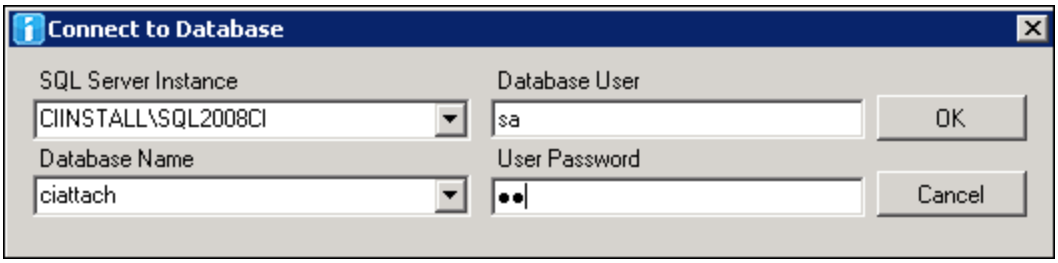
The Name Table Trigger is a trigger on the Name table that runs every time there is a change to the Name table. The trigger initiates procedures that keep contacts information synchronized.

Disable the Name Table Trigger to enable quicker data imports.

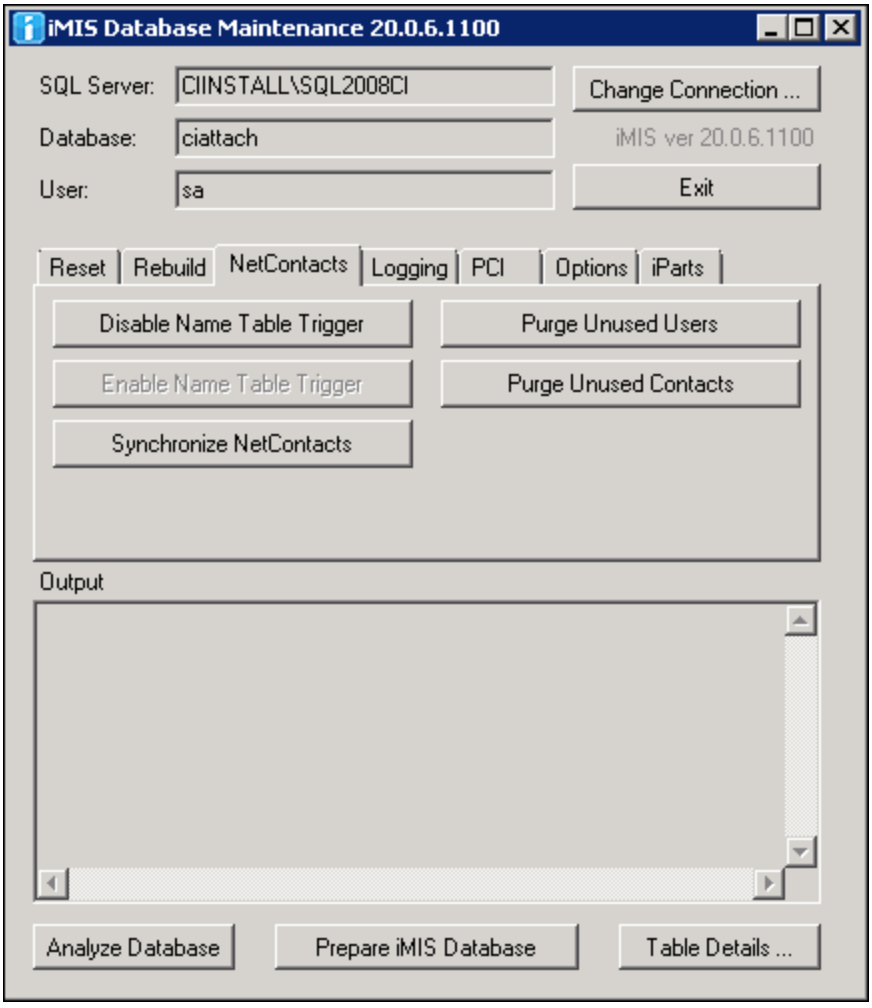
Before importing the Contacts.csv file, you must use the iMIS DB Maintenance Utility tool to disable the Name Table Trigger. This step should be completed immediately prior to running the import.

To disable a Name Table Trigger

1. Go to Start > All Programs > ASI > iMIS > Tools > iMIS DB Maintenance Utility.



2. You must enter the User Password before you can select the Database Name from the drop-down list.
3. Click OK.
4. Click the NetContacts tab.



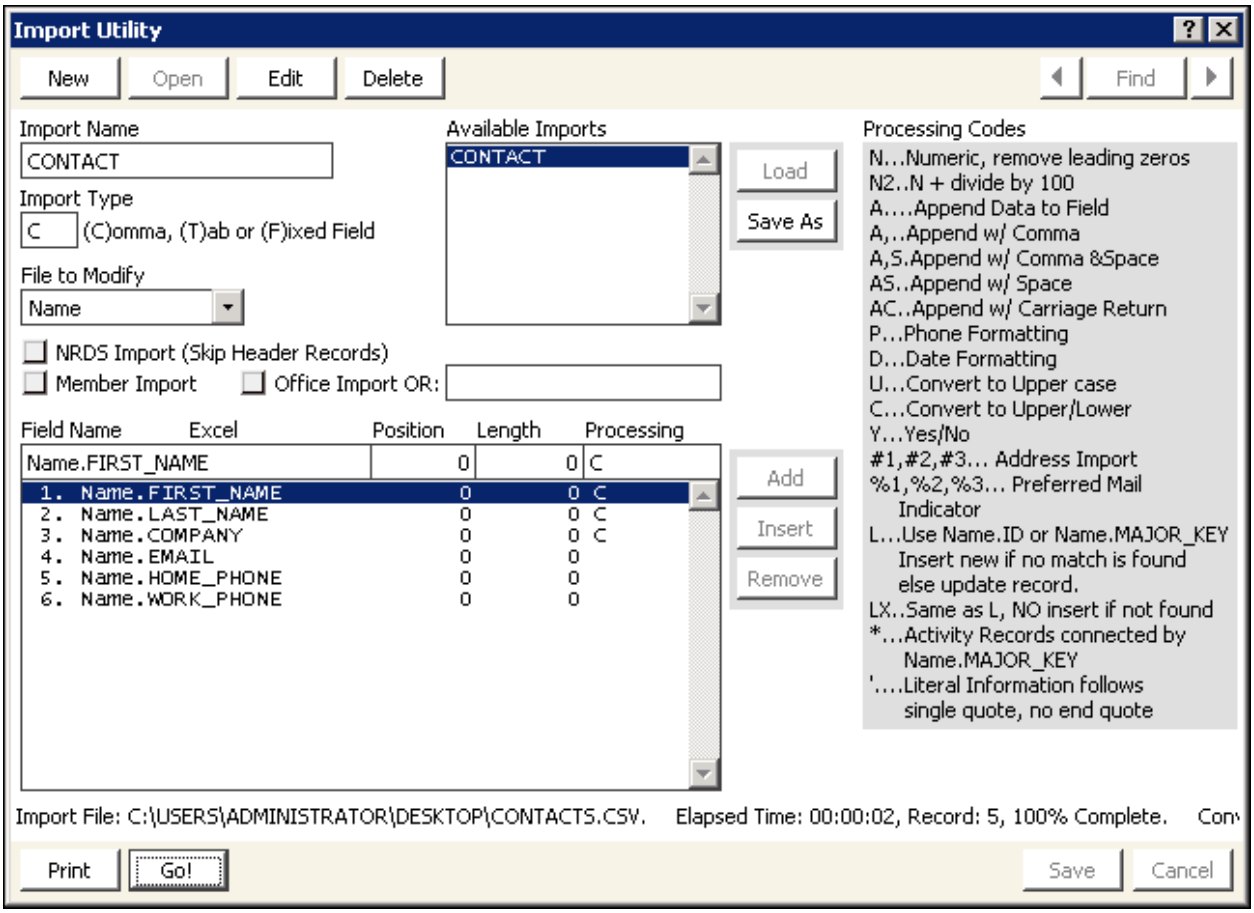
5. Click Disable Name Table Trigger to disable the Name table trigger while you run the import.

Importing a file

Before importing the Contacts.csv file, you must ensure that the data in the file is accurate and correct. Review all the fields in the Contacts.csv file, as iMIS will import exactly what is in each field.

To import the Contacts.csv file

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Import Utility to open the Import Utility window.
2. Under Available Imports, highlight the CONTACT import.
3. Click Go!
4. Browse to find the Contacts.csv file.
5. Select the Contacts.csv file.
6. Click Open.



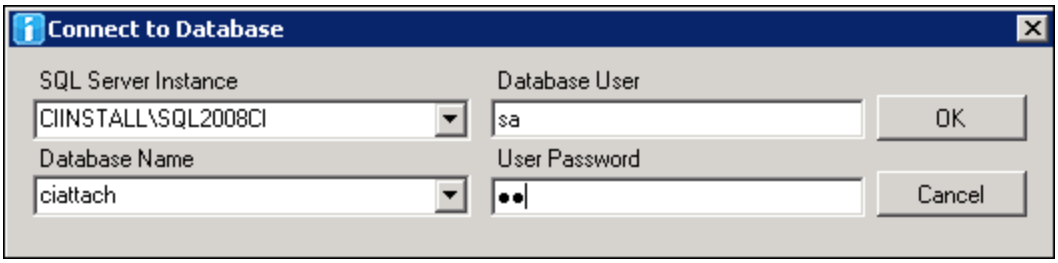
7. On the Import Utility window, the number of records imported will display, along with 100% Complete once the import is complete.
8. Ensure the number of records imported matches the number of records in your Contact-s.csv file.

Enabling triggers after an import

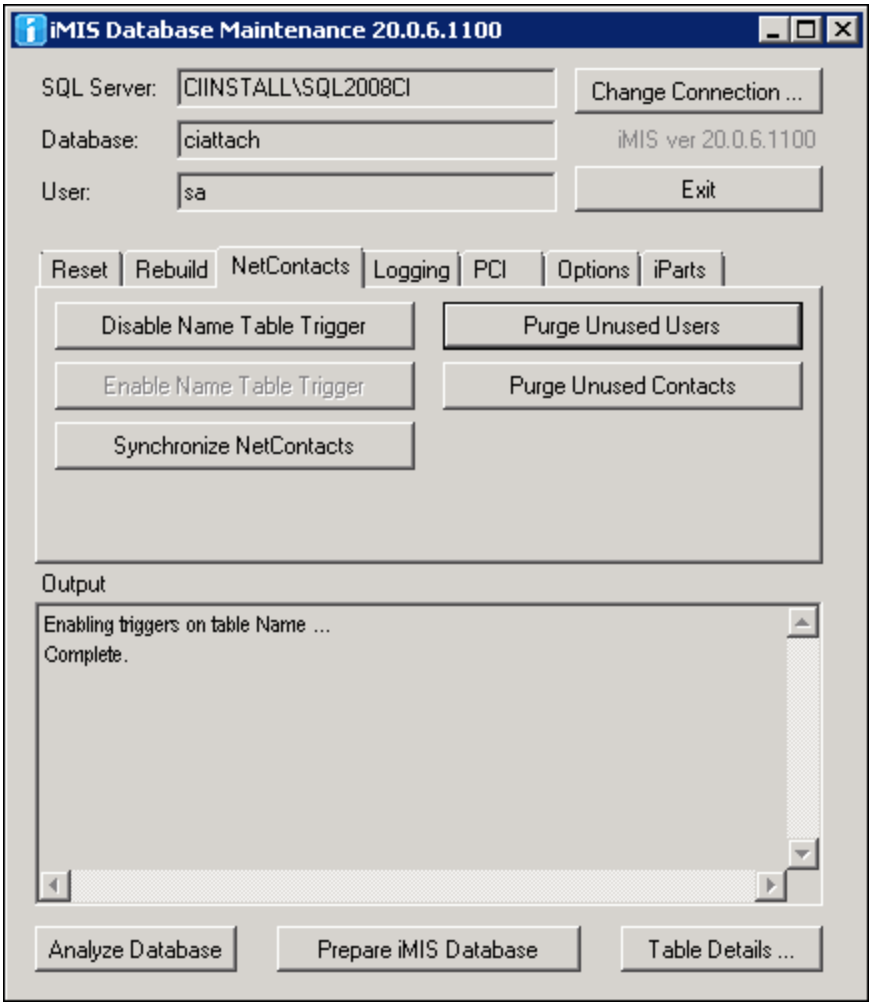
Use the iMIS DB Maintenance Utility tool to enable the Name Table Trigger. This step must be completed immediately after running the import.

To enable a Name Table Trigger

1. Go to Start > All Programs > ASI > iMIS > Tools > iMIS DB Maintenance Utility.



2. You must enter the User Password before you can select the Database Name from the drop-down list.
3. Click OK.
4. Click the NetContacts tab.
5. Click Enable Name Table Trigger to enable the Name Table Trigger.

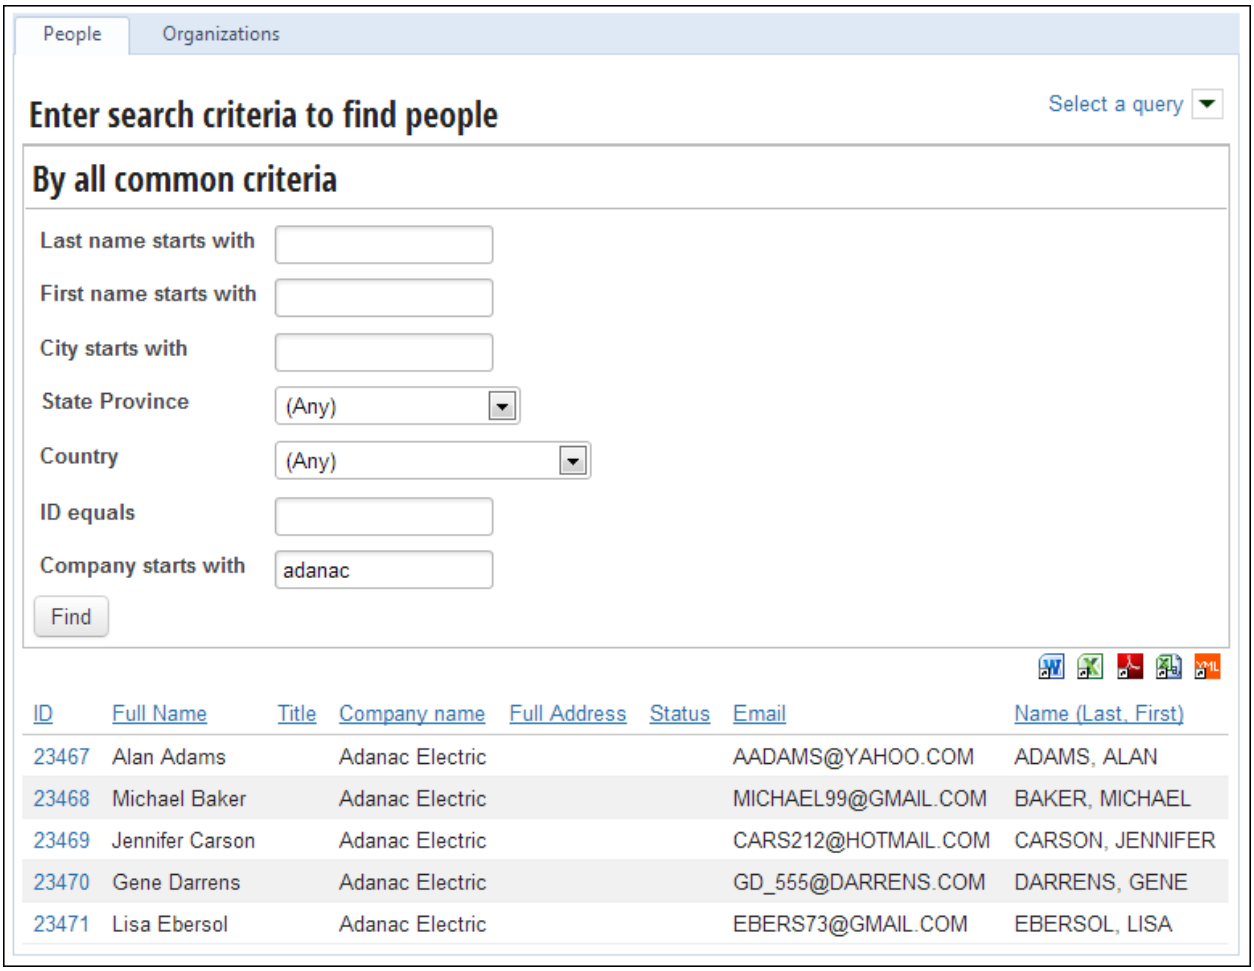


6. Click Synchronize NetContacts. The number of contacts synced should equal the number of records you imported.

Verify the import

To verify the import was successful

1. In the staff site, go to Community > Find Contacts.
2. Perform a search By all common criteria.
3. Enter adanac in the Company starts with field.
4. Verify that you can see the records you imported into the Name table in the iMIS database.



Export Utility

The Export Utility lets you export information from the iMIS system to another location or to a third-party software application, such as a word processor, spreadsheet program, or compatible database application. The Export Utility lets you:

- Include information from multiple records of the same file on one export record.
- Update fields in the iMIS database when the export is run.
- Specify if/then processing of the output.
- Create an activity record that records the date the export record was created and includes a copy of each member's export record.
- Schedule the export execution time.

To use the iMIS Export Utility, you must have the EXPORT license code in your system control file. Contact your authorized iMIS reseller to obtain an updated system control file.

iMIS table/field formats

The primary table (file) in iMIS is the Name table, which is the internal system label for the member/contact file. It contains name, address, categorization, and demographic information for each member/contact that you track through iMIS. All iMIS modules interact with and retrieve information from this table.

The other main table that supports membership processing is the general purpose Activity table. It contains records that track historical and participation details, such as meetings attendance, committee service, dues payments, product purchases, correspondence sent, and calls logged. The information in this table is commonly accessed for analysis or marketing reasons.

Another table you may want to use is the Subscription table, which tracks all dues and subscription line items billed and collected.

Referencing the fields

When you want to access or reference a field in iMIS, you can often select from a field list. To export iMIS fields, format the field names exactly, including precise capitalization and

punctuation. Table (file) names appear with initial capitals (with underscores as needed), field names appear in all capitals (with underscores as needed), and the two parts are connected with a period.

iMIS files to use for export

The following are the recommended iMIS tables to use to export data:

- Name
- Activity
- Subscription
- Orders
- Order_Lines
- Trans
- Invoice
- Invoice_Lines

Avoid using other iMIS tables for export, because data in the other tables might not be easily linked to the primary tables.

Using the iMIS Export Utility

To export data using the iMIS Export Utility:

1. Create the export definition.
2. Select the iMIS tables and fields to be exported.
3. Specify the search criteria to be used.
4. Specify the export field formats.
5. Run the export.

Creating an export definition

The first step to export data with the Export Utility is to create the basic export definition. The export definition specifies and formats the data to be exported.

To create the export definition

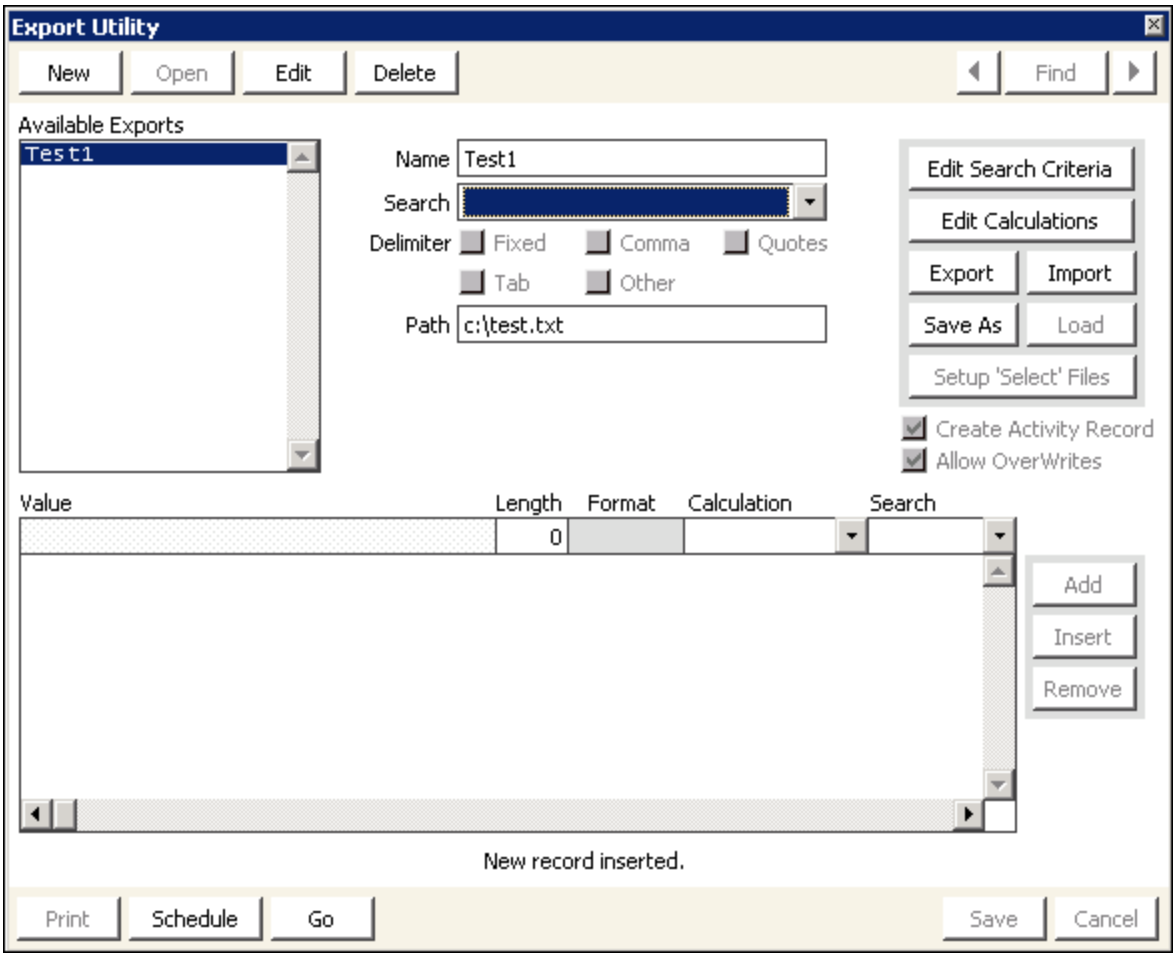
1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Click New.
3. Type a name for the export definition in the Name field.
4. Select a Delimiter (character to be placed between fields):

- Fixed – no delimiter.
- Tab
- Comma
- Other – specifies other delimiter in a field that is displayed.
- Quotes – encloses text in double quotes. This is helpful if a comma delimiter is required and some text fields contain commas.

  Note: The Quotes field displays only when a delimiter other than Fixed is selected.

5. (Optional) Select the Create Activity Record option to record each export record as a member activity in the iMIS database.
6. Define the Path for the export file.

   Tip: You can include an incremental sequence number in the name of the file by including a question mark in the name of the file. For example, if you enter c:\Temp\national?.txt, the file c:\Temp\national1.txt is created the first time you run the export, c:\Temp\national2.txt is created the second time you run the export, and so forth.
7. (Optional) Select the Allow OverWrites option to allow the file to be overwritten each time the export is run.
8. Click Save.

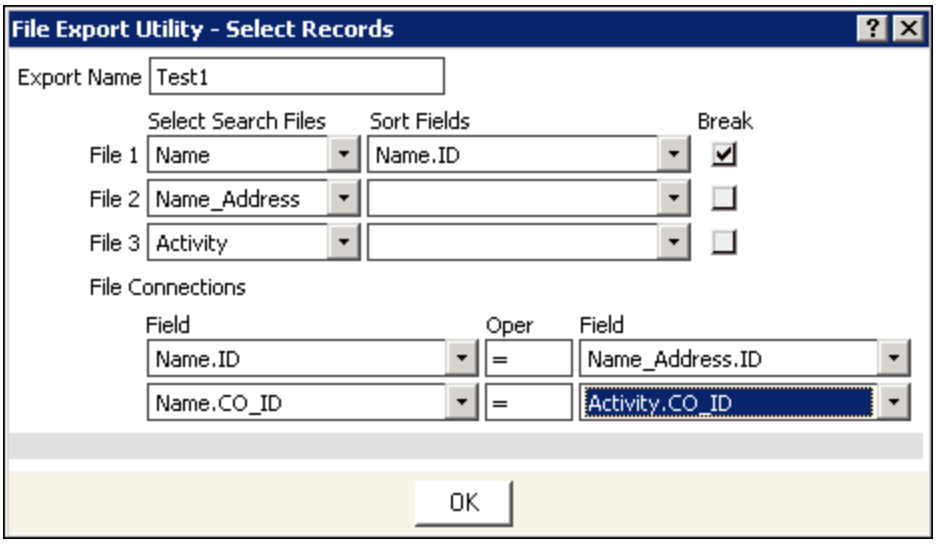


Selecting iMIS tables and fields to be exported

After you create the export definition, select the iMIS tables and fields to be included in the export definition. These Select Files are the basis for the export. You can sort the export records based on a file or field value in the Select Files and you can define search criteria to designate data in the Select Files to be exported.

To select the iMIS tables and fields to be exported

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an export definition from the Available Exports.
3. Click Edit.
4. Click Setup ‘Select’ Files to open the File Export Utility – Select Records window.



5. Select up to three iMIS tables as Select Search Files.
6. (Optional) Select the Sort Fields for these files. This determines the order the records are exported.
7. (Optional) Select the Break option if you want to create an export record each time the value in Sort Fields changes.

   Tip: To eliminate duplicate member export records, specify the Name.ID field as a Break field. The Export Utility will create only one export record for each unique Name.ID.
8. Define the joins for the Select Search Files in the File Connections fields. For more information, see Defining joins for select files.
9. Click OK to return to the Export Utility window.
10. Click Save.

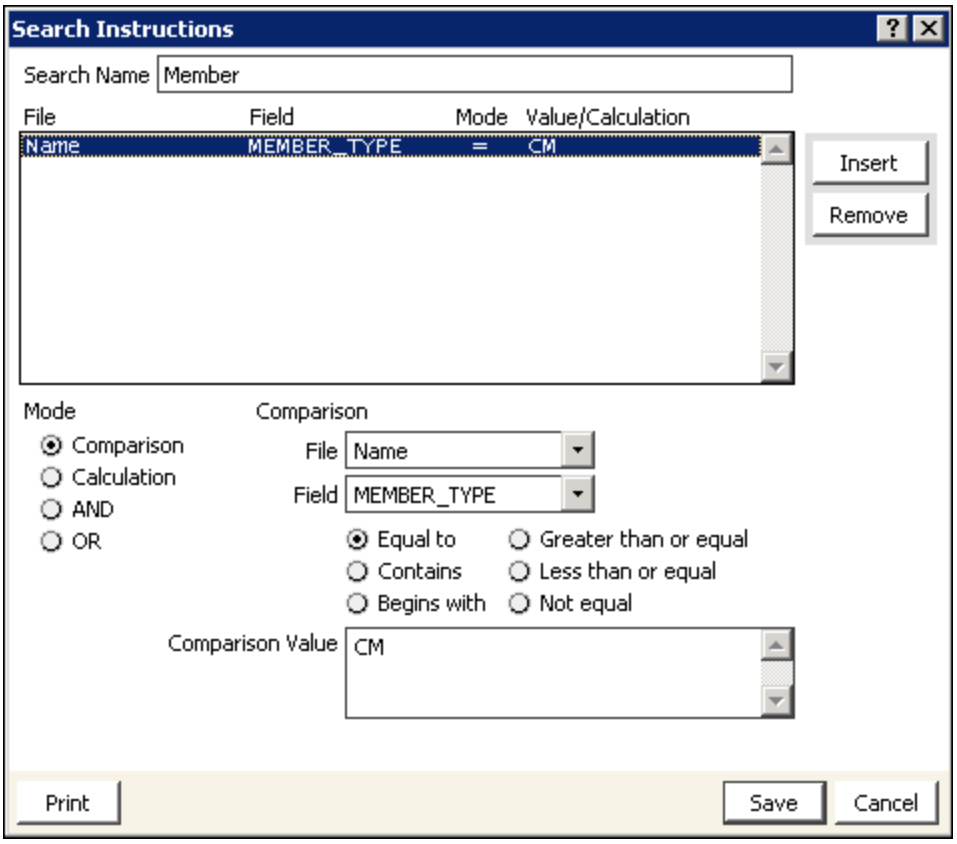
Specifying search criteria

Specify the general search criteria for the export. The export will contain only the information in the Select Search Files that meets the search criteria.

To specify search criteria

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.

2. Click Edit Search Criteria to open the Select Search Instructions window.
3. Click New to open the Search Instructions window.

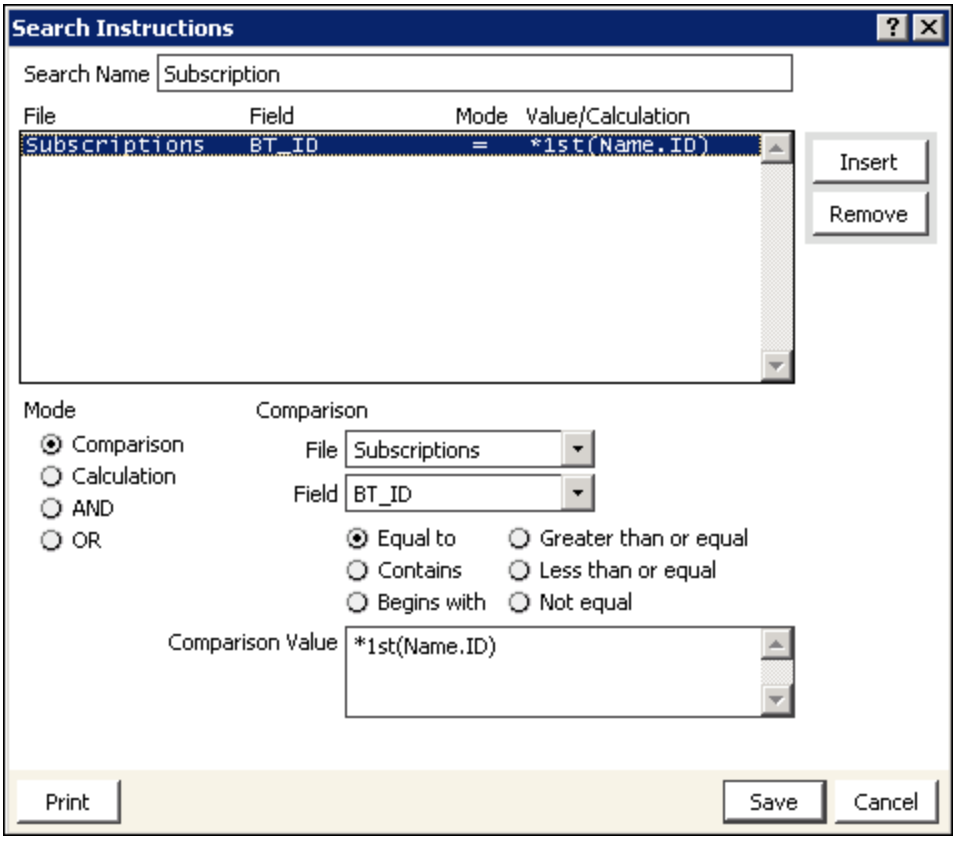


4. Enter the Search Name.
5. (Optional) Select the Mode. This option allows you to export only the files or fields that meet defined criteria such as Comparison, Calculation, AND, and OR.

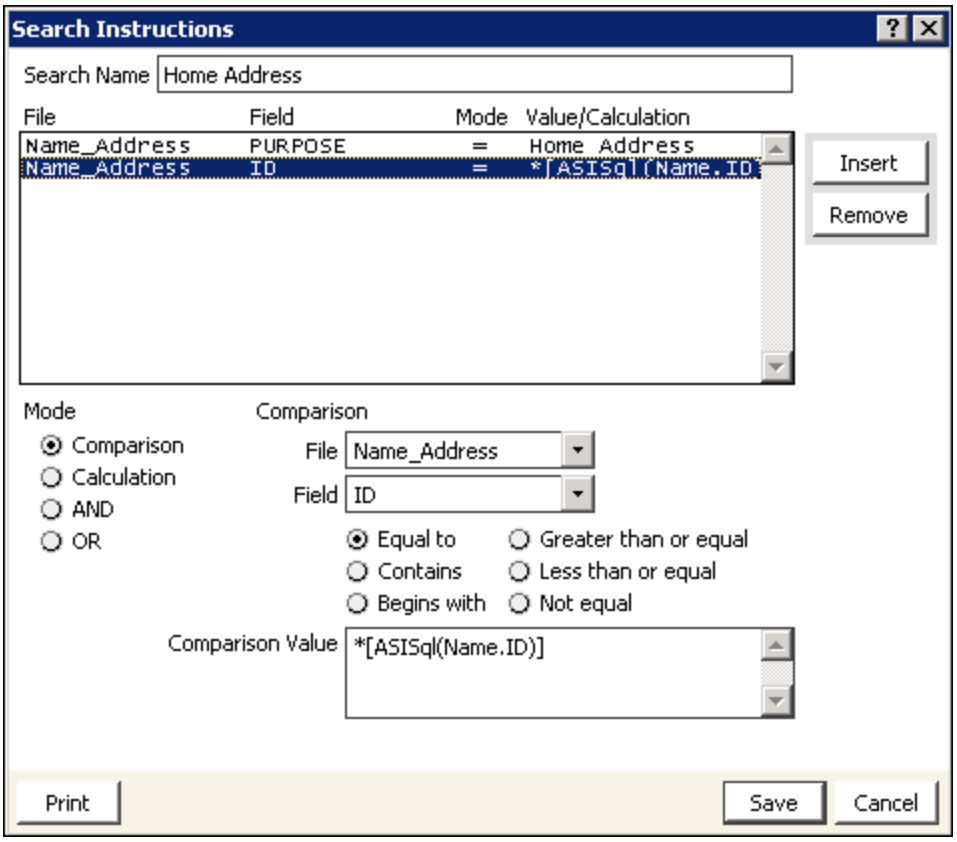
   Note: If the Comparison Value is a field value, enter an asterisk (*) before the field name.
6. Click Save.
7. Click OK to return to the Export Utility window.

   Tip: You can specify search criteria from a record in a file that is not one of the three Select Search Files, or from another record within a Select File. If you are pulling inform-

ation from a file other than a Select File, you must relate the file to one of the Select Search Files in the search criteria.



You can use SQL statements to specify the Comparison Value. For example, if Name is a Select File and you want to bring in the Home Address record, enter Name_Address.ID to search for a specific address. Enter *[ASISql(Name.ID)] for the Comparison Value, as shown in the following example.



Specifying export field formats

Export field formatting is entered in the Comparison Value section of the Export Utility window. You can specify formatting for constants, iMIS field values, and Omnis calculations. You can also specify if/then processing of the output by formatting the export output with condition statements. This step narrows the general search criteria for specific fields.

To format export fields

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an Available Export.
3. Click Edit. There are three types of values that can be exported: a constant, a value contained in an iMIS field, and an Omnis calculation. Enter the formatting in the Value field.

- To specify the format for a constant (literal) value, type a double-quotation mark followed by the value. For example, if the first four characters of the export record must contain the

value 0001, enter "0001 in the Comparison Value field.

- To specify the format for an iMIS field value, type the field name, for example, Name.MEMBER_TYPE.
- To specify the format for an Omnis calculation, type an equal sign followed by the calculation.
  For example, if you want to export the area code of the home telephone number field, type =mid(Name.HOME_PHONE,2,3). This statement exports the second, third, and fourth characters from the Name.HOME_PHONE field.

4. (Optional) Specify the desired Length of the field. This allows you to truncate or extend the field length.
5. (Optional) Enter a code in the Format field (see below).
6. Click Add to save the format.
7. After all formatting instructions are added, click Save to save the formats.

   The following table lists the available Format codes.

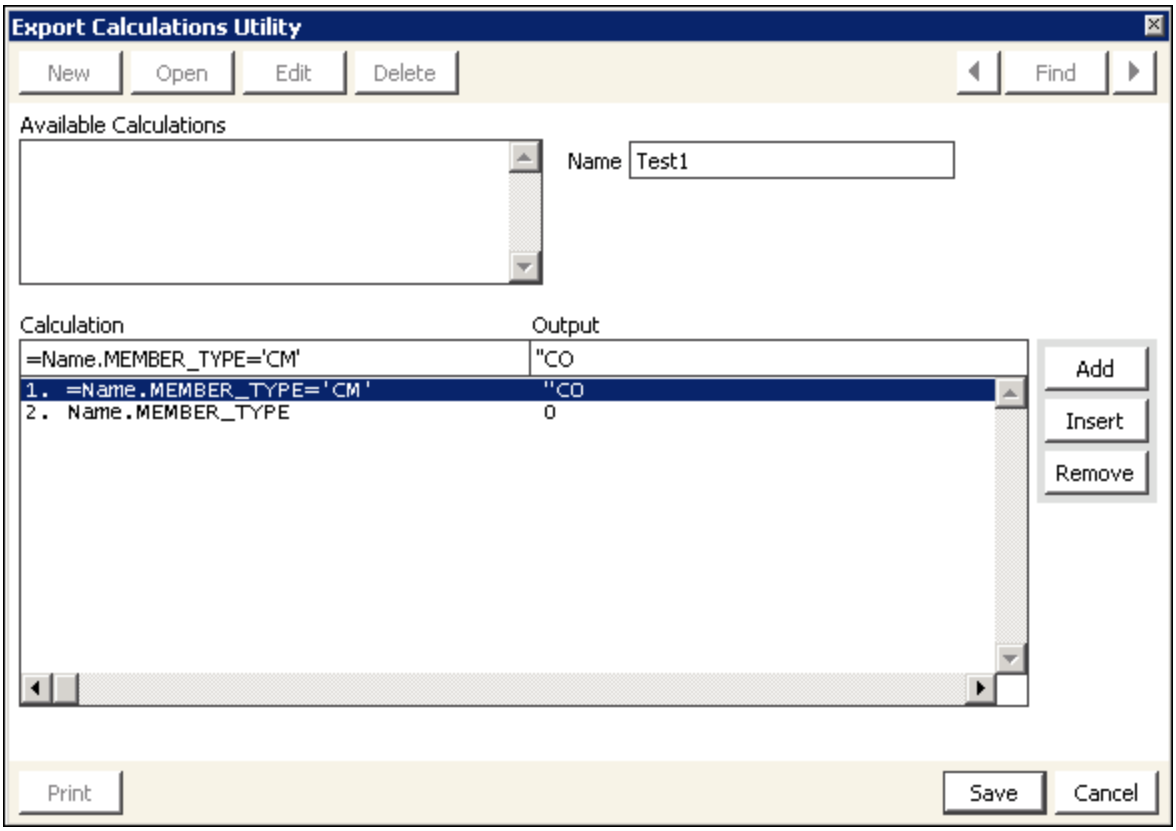
1	Exports the value on the first record only (useful for header records). Must be in the first position of the Format field.
C	Formats the output to initial capital letters.
D6	Exports the value as a date in the MMDDYY format.
D6/	Exports the value as a date in the MM/DD/YY format.
D8	Exports the value as a date in the MMDDYYYY format.
D8/	Exports the value as a date in the MM/DD/YYYY format.
F	Appends a LF (line feed) return to the end of the field.
L	Formats the output to all lowercase letters.
P	Pads the field to the length specified in the Length field with the character immediately following the P.
P0	Pads the field without zeros.

N	Specifies all blank or zero field values to be output as 'Null'.
N2	Same as N except that the characters. , - $ ( ) are saved.
R	Appends a CR (carriage return) feed at the end of the field. Note: This code should be used with the last field of each format.
U	Converts the output to all uppercase letters.
S	Skips the delimiter and concatenates with the next export column.
X	Updates data in the iMIS database. Note: You must include search criteria and a calculation with this format. The search criterion identifies the specific record to be updated. The calculation determines the value that is output in the export record.
6X	Indicates which record will be selected when searching extra records. For example, the code 62 will take the field value from the second record that matches the search criteria.
Y	Outputs a YES or NO. If the field value or calculation in the Value field evaluates True, a YES is exported. Otherwise a NO is exported.
y	Same as Y, except outputs a Y or N.

To format output with condition statements

You can format the export output with condition statements by creating a series of IF statements with corresponding output values.

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an Available Export.
3. Click Search. Highlight an export Value.
4. Click Edit Calculations to display the Export Calculations Utility window.
5. Click New to create a new calculation.



6. Click Insert at the bottom of the window and click in the Name field to add a new name for the calculation.
7. Click Add to add a calculation or condition statement. In the Calculation field, type an equals sign followed by the calculation, for example, =Name.MEMBER_TYPE='CM'.
8. In the Output field, type a double quotation mark followed by the desired output value, for example "CO. In this example, every CM Member Type is exported as a CO value.

   You can add as many calculations as you need. The utility exports the result of the last True calculation. The result can be an iMIS field name, a constant, or an Omnis calculation.
9. Click Save to save the calculation. The calculation is now listed as an Available Calculation on the Export Calculations Utility window.

   To load record formats from other compatible software

To load records from compatible third-party software applications, the records must be comma- delimited or tab-delimited. Each record to be loaded must contain the following fields in this exact sequence: Value, Length, Format, Calculation, and Search.

Do the following:

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an Available Export.
3. Click Edit.
4. Click Load to select the file to load into the export definition.
5. Click Open to start the load process.
6. Click Save to save.

Running an export

You can run an export on demand.

To run an export on demand

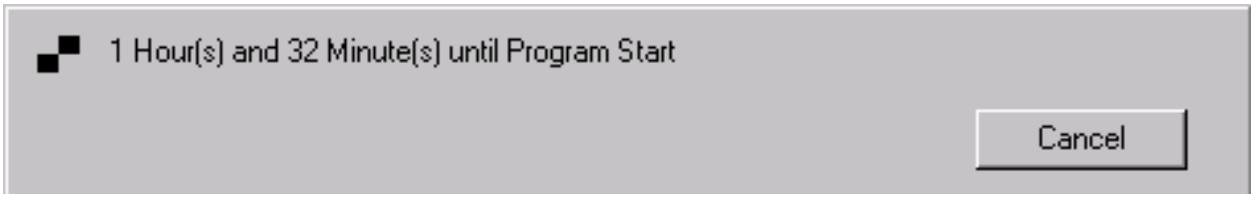
1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select the Available Export to run.
3. Click Go.
4. When prompted to confirm running the export, select Yes.

To schedule an export

The export should be scheduled after you have finished work for the day.

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Click Schedule to open the Schedule Program window.
3. Select the time to start the export by using the up and down arrows.

4. Click OK. The <remaining time> until Program Start message is displayed.



Cloning an export definition

You can clone an existing export definition and make changes to create a new export definition.

To clone an export definition

1. In the Advanced Accounting Console tool bar, go to Utilities > Data Transfer Utilities > Export Utility.
2. Select an Available Export.
3. Click Save As on the Export Utility window to display the Export Definition Save As window.
4. Type the New Name for the export definition.
5. Click Save to save the file with a new name.
6. Make changes in the new file and save.

Viewing the Activity Record

If the Create Activity Record option is selected in the Export Utility window, iMIS records the date the export record was created and saves a copy of each member's export record.

To view the activity record

1. Make sure the Name file is one of the Select Files in the export definition.
2. In the Advanced Accounting Console, go to Configure > Membership > Set up activity types.
3. Create an activity type named EXPORT.

Note: When creating an EXPORT activity type, be sure to define some columns. For example:

UF1 - UF3 – Use these fields to enter prompts for the values entered in the Char 1 - Char 3 fields on the Event System Preferences window.

UF4 - UF5 – Use these fields to enter prompts for the values entered in the Number 1 - Number 2 fields on the Event System Preferences window.

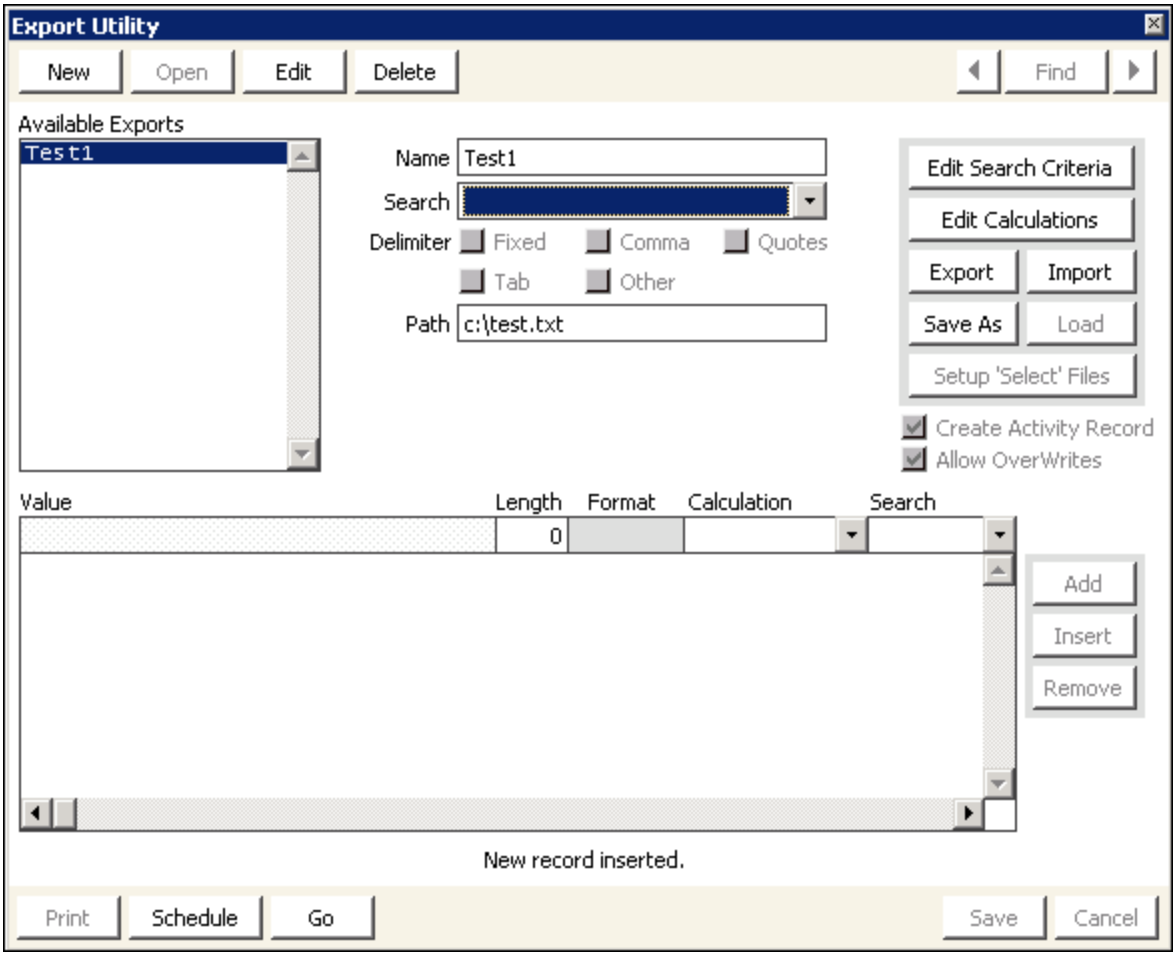
UF6 - UF7 – Use these fields to enter prompts for the values entered in the Date 1 - Date 3 fields on the Event System Preferences window.

These columns will generate data that will be visible in the Panel Editor content item that you will create in order to view the activity records.

4. Click Save.
5. Go to the Staff site.
6. Go to RiSE > Page Builder > Manage content.
7. Select a Content Folder.
8. Go to New > Website Content.
9. Enter a Title and a Publish File Name.
10. Click add content.
11. In the Content Gallery, go to Content Types > Content > Panel Editor.
12. Click OK.
13. In the Panel list, select (New Panel).
14. Name the panel.
15. Select the Show data sources that allow multiple entries per object instance radio button.
16. Double-click Activity-EXPORT. The columns available for the EXPORT activity record are displayed.

17. Click Save & Close.
18. Click OK.
19. Click Save & Publish.

Export Utility window



Utilities > Data Transfer Utilities > Export Utility

Available Exports

List of user-defined export definitions.

Name

Name of selected export definition.

Search

Name of user-defined search criteria.

Delimiter

Character placed between fields:

- Fixed – no delimiter.
- Tab
- Comma
- Other – specifies other delimiter in the field that appears.
- Quotes – encloses text in double quotes. This is helpful if a comma delimiter is required and some text fields contain commas.

Note: This field displays only when a delimiter other than Fixed is selected.

Path

Directory and file name for the export file.

Edit Search Criteria

Opens the Select Search Instructions window.

Edit Calculations

Opens the Export Calculations Utility window.

Export

Opens the Set print file name window to save the selected export definition to a file.

Import

Opens the Select import file window to import a file containing export data formatting information.

Save As

Saves a copy of the export definition with a different name.

Load

Opens the Select import file window where you can select and insert a record template from compatible third-party software applications such as Excel. Each record template loaded must contain the following fields in this exact sequence: Value, Length, Format, Calculation, and Search.

Setup ‘Select’ Files

Opens the File Export Utility - Select Records window.

Create Activity Record

Option to record each export record as a member activity in the iMIS database.

Allow OverWrites

Option to allow the file to be overwritten each time you run the export definition.

Value section

Specific formatting information is entered here.

Value

The constant value, iMIS field value, or Omnis calculation to be formatted.

Length

User-defined length of the Value field.

Format

Code to specify data format.

Calculation

List of available calculations.

Search

List of available search names.

Add

Adds a new line in the Value text box.

Insert

Inserts a line between existing lines in the Value text box.

Remove

Removes the selected line in the Value text box.

Print

Prints the export.

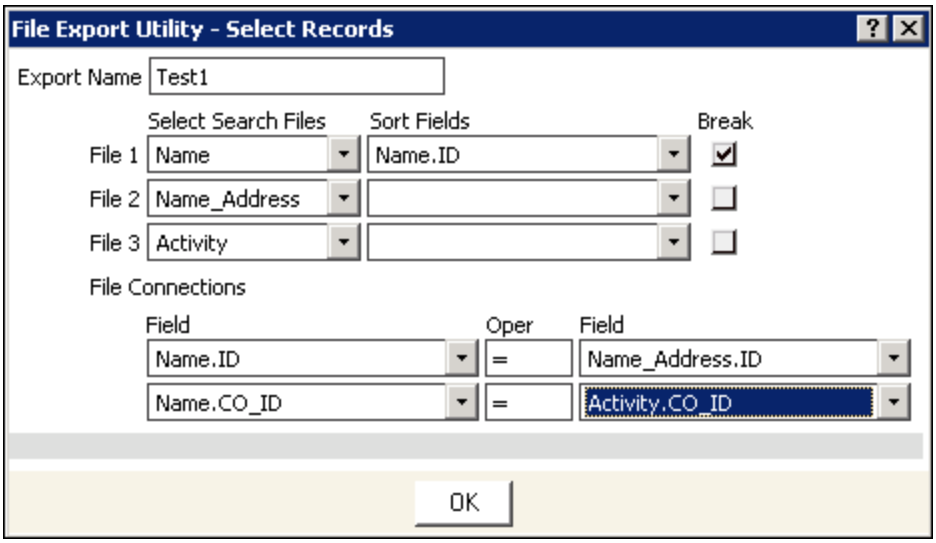
Schedule

Opens the Schedule Program window.

Go

Runs the export.

File Export Utility - Select Records window



Utilities > Data Transfer Utilities > Export Utility > Setup 'Select' Files

Export Name

User-defined export definition name.

Select Search Files

Select Files for the export definition.

Sort Fields

Defines sort order.

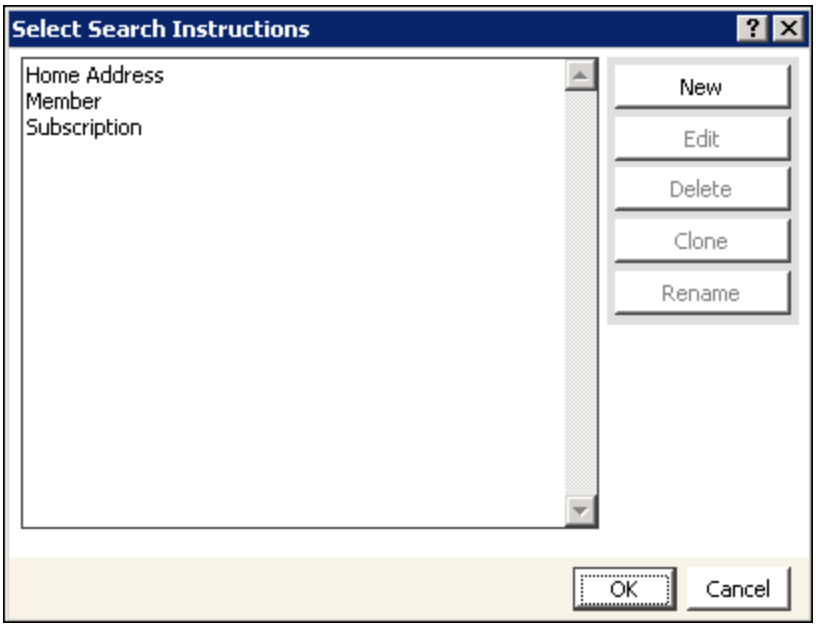
Break

Creates an export record whenever the value in the Sort field changes.

File Connections

User-defined file/table joins.

Select Search Instructions window



Utilities > Data Transfer Utilities > Export Utility > Edit Search Criteria

New

Opens the Search Instructions window to create search instructions.

Edit

Opens the Search Instructions window to modify the search instructions.

Delete

Deletes the selected search instructions.

Clone

Makes a copy of the selected search instruction.

Rename

Allows you to rename the selected search instruction.

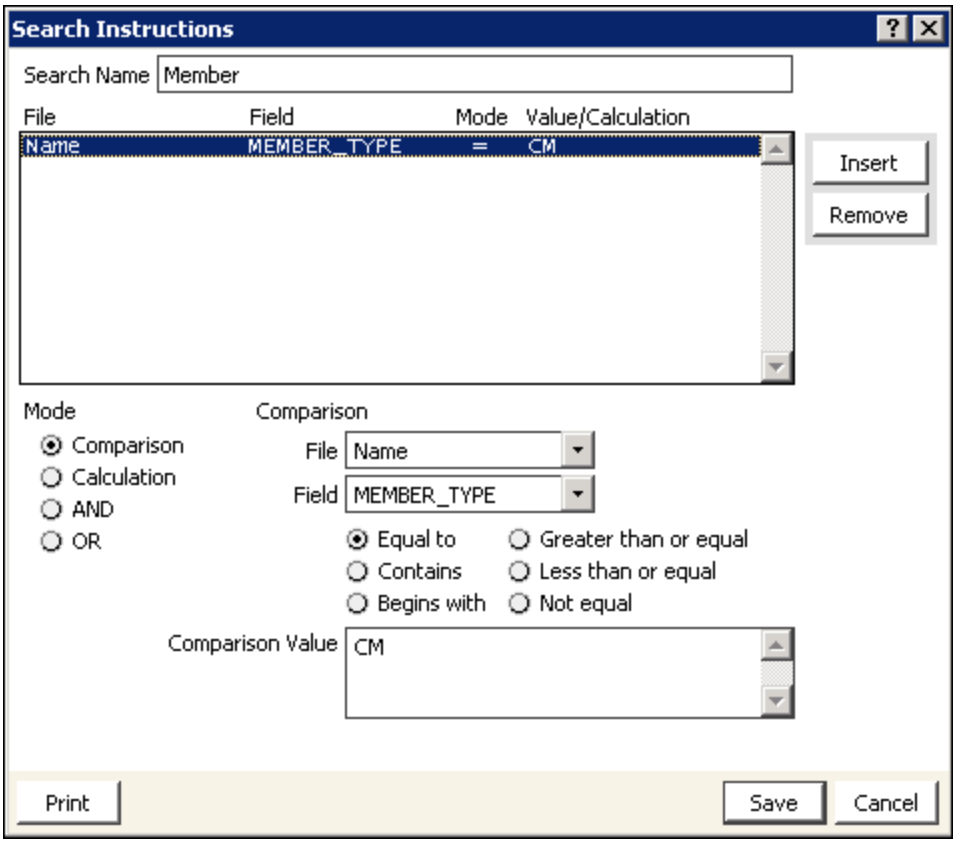
OK

Saves changes made to the search record.

Cancel

Closes the Select Search Instructions window and returns to the Export Utility window.

Search Instructions window



Utilities > Data Transfer Utilities > Export Utility > Edit Search Criteria > New

Search Name

User-defined name for search criteria.

Insert

Inserts a line in the Comparison Value text box.

Remove

Deletes the selected line in the Comparison Value text box.

Mode

Allows you to export only the files/fields that meet defined criteria (Comparison, Calculation, AND, OR).

File

File (iMIS table) to be used for comparison.

Field

Drop-down list of available fields in the selected file.

Comparison Value

Value to be compared with selected field value.

Print

Prints a report of the comparison instructions.

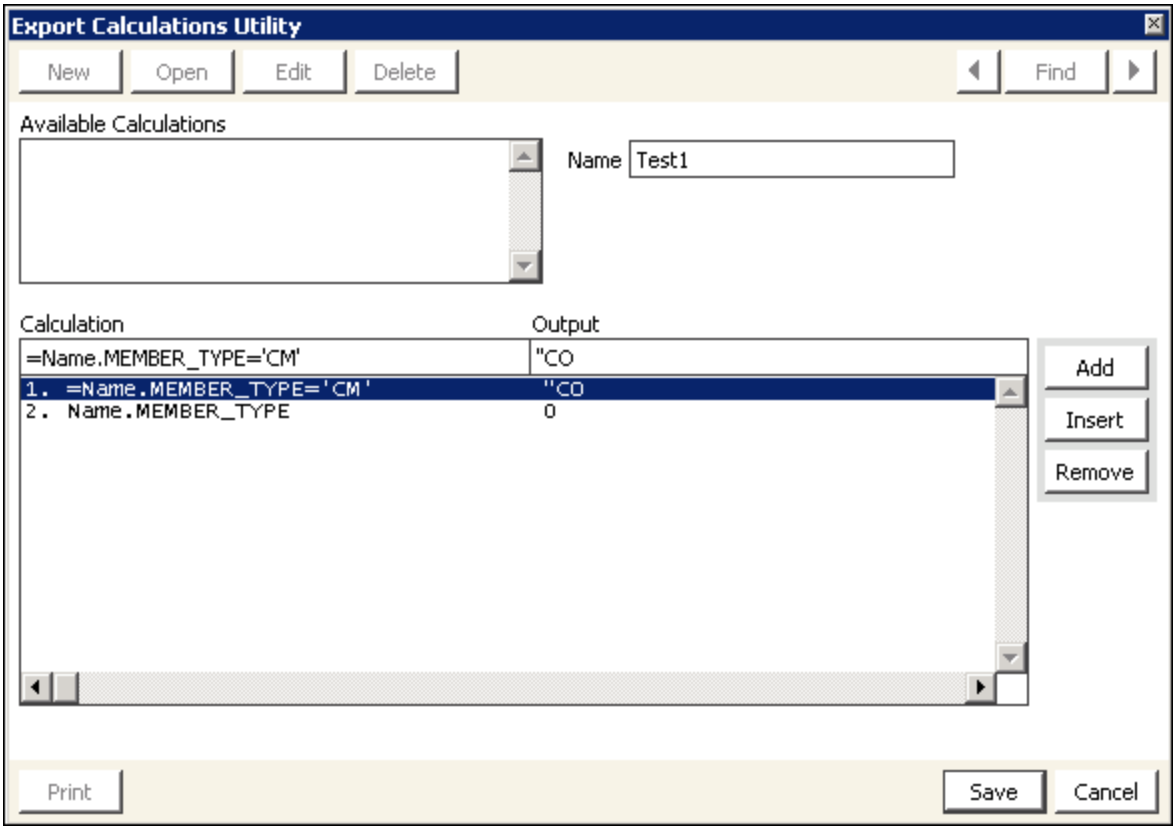
Save

Saves the search instructions.

Cancel

Closes the window without saving new search instructions.

Export Calculations Utility window



Utilities > Data Transfer Utilities > Export Utility > Edit Calculations

Available Calculations

List of user-defined calculations.

Name

Name of selected calculation.

Calculation

Calculation or condition statement.

Output

Desired output value when Calculation evaluates True.

Add

Adds a line in the Calculation text box.

Insert

Inserts a line between existing lines in the Calculation text box.

Remove

Deletes the selected line in the Calculation text box.

Print

Prints a report of the calculations.

Save

Saves the calculation.

Cancel

Cancels editing of the calculation.

Defining joins for select files

You might require data from more than one iMIS table for export. For example, you might need FULL_NAME and COMPANY from the Name table and TYPE='DUES' and BALANCE from the Subscription table. Since there is no membership data in the Subscription table, you must access the Name table. To use data from two or more tables, you must join them.

To join files (tables) is to specify which fields are equivalent so the files can relate to each other correctly, record-by-record. In effect, joining glues the files together for the export process. The most common joins in iMIS center on member ID numbers. A join across three tables might look like the following:

Name.ID = Activity.ID

Name.ID = Subscription.ID

Ordering the joins

The order of your table joins can impact performance. Although the optimal order depends on the report, the key iMIS joins are:

Name.ID = Activity.ID

Name.ID = Subscription.ID

Name.ID = Invoice.BT_ID

Orders.ORDER_NUMBER = Order_Lines.ORDER_NUMBER

Product.PRODUCT_CODE = Order_Lines.PRODUCT_CODE

Name.ID = Orders.BT_ID

Troubleshooting joins

If you experience problems such as too much data being returned, multiple records being returned, or endless data retrieval, you may not have joined the files correctly.

If you are experiencing performance problems with a report that uses a join, try switching the order of the files.

Make sure that the files included in the join are Select Files in the export definition.

Tools Console

Your Advanced Accounting Console includes Tools – convenient implements for managing your organization's websites through Site Builder.

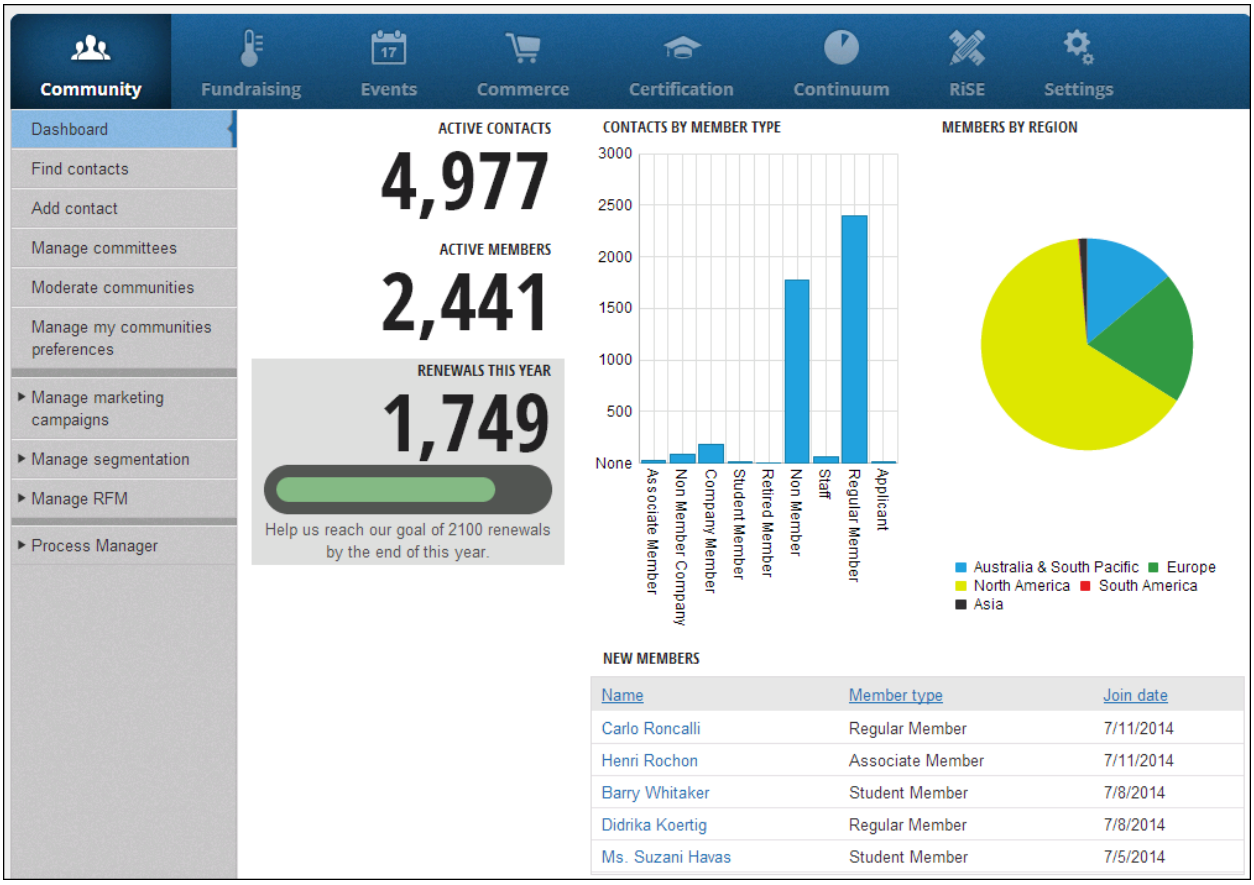
Manage Sitemaps is where you will define and publish your sitemaps, including hierarchy and navigation items.

From Manage Websites you can define the appearance and navigation structure of your websites, define the infrastructure for the web content authoring environment, and perform website maintenance. In addition to navigation areas, you can configure look and feel, properties, appearance and structure, and, last but not least, create your own websites from iMIS Core and Quick Start sites.

Manage Shortcuts is for defining friendly URL shortcuts – so that an easy-to-remember URL redirects to a specific page. As an example, you might want to create an event shortcut that points to a conference list page.

Using the iMIS Staff Site

The Staff site is a core site available with iMIS 20. The site offers your staff members an easy, convenient way to manage your organization's business from a browser. In addition, utilizing the powerful security features of iMIS organizations can control which areas and content staff can access.



Community

From the Staff site, Community offers a quick-view of up-to-date contact and membership figures that are important to your organization. You can also find and add contacts, view and moderate communities, manage your community preferences, as well as manage segmentation and RFM.

Fundraising

Fundraising via the Staff site offers an easy-to-read overview of fundraising activities for present and past years; as well as figures on new donors via Acquisitions. Fundraising also offers Rapid Gift Entry, Donations, Friendraising, and Gift Aid and Standing Orders (UK).

Events

From your Staff site, Events offers a quick-view Dashboard of your organization's event progress and figures. In addition, organizations create events, define registration options and event pricing, add program items, allow itinerary changes, and can also choose to allow itinerary changes and registrations 'on behalf of' other users.

Commerce

From the Staff site, Commerce offers a quick-view, up-to-date look at key product revenue for your organization. In addition, organizations are easily able to add and edit products, bill membership dues, arrange confirmation e-mails, and more.

Certification

Certification allows your organization to setup and manage certification programs for your members, including enrollment and approval of completion of certification requirements.

Continuum – Reporting

For organization's reporting needs, including Commerce, Contacts, Fundraising, Campaigns, RFM, Segmentation, Content, Process Manager, and a Guided Performance Scorecard (GPS). In addition, with Continuum's standard executive dashboard, organizations can monitor the performance of membership, fundraising, events, financials, and other program areas.

RiSE

The cloud-based web engagement platform of iMIS 20 is self-service driven with multiple theme-based, Quick Start websites. These allow organizations to launch quickly, tailor, and create beautiful and functional new sites. RiSE includes powerful tools such as Site Builder, iMIS Dynamic Content, Page Builder, and Content Gallery.

Settings

The Settings area is where you can administer user records and roles, define default organization and commerce settings, define contact specific settings (including communication preferences), define RiSE website configurations, and configure language translation. In addition, you can generate business objects and select packages for installation by selecting Utilities.

Using the Workbook Converter

The iMIS Workbook Converter lets you easily import contact data from Excel spreadsheets within a workbook into iMIS 20-300. Most of the documentation for this tool is embedded within the workbook, on the Instructions tab or as a note that appears when you hover over the column headers in each worksheet. Implementation instructions are included here. Be sure to read the Before you begin section in order to ensure a smooth conversion process.

Before you begin

Before you get started with your iMIS 20-300 conversion, please take a moment to read this document.

1. Contact ASI or your AiSP to obtain Workbook Converter tool.
2. (If iMIS 20-300 is ASI-hosted) Review & complete the Pre-Conversion Checklist.
   - Prepare iMIS 300 and scrub the source data.
3. (If iMIS 20-300 is ASI-hosted) Contact/coordinate with ASI Hosting.
   - Hosting will back up the database once it is ready for conversion.
   - You provide the IP address you will be connecting from (this can be a single IP or a range of IPs). Hosting will have to edit the web.config to allow conversion from the remote IP address.
4. (If iMIS 20-300 is self-hosted) Prepare the database into which you want to convert.
   - It is recommended that you start with an empty database from the iMIS installer.
   - Review and complete the Pre-Conversion Checklist.
   - Back up the final prepared database.

- If the customer anticipates using the https protocol to communicate with iMIS, a valid SSL certificate must be installed for the website.

5. Run conversions in test mode.
6. Identify & fix errors.
7. Run conversion and update your iMIS 300 database.

1. Save all logs.
2. Deal with non-test-mode errors that occur.
3. Contact Hosting to restore db and clear metadata between update runs.

8. Review & complete post-conversion checklist.
9. Contact ASI Hosting to make final backup & secure the database.

Pre-Conversion Checklist

These in-product tasks help you ensure the quality of your data conversion to iMIS:

Ensure iMIS is ready:

> **Note:** IMPORTANT: Complete this setup in the *new site* (with fresh, empty database) provided by ASI (if you were previously provided with a test site/database and any setup was done there for testing, this setup/configuration will need to be re-applied to the new site).

From the Advanced Accounting Console:

1. Set up the organization name (Settings > Membership > Address and Notes).
2. Set the financial entity (File > System Setup > Organization Names).
3. Set up the default organization (File > System Setup > Organization Names).

1. Add a new Org Code.
2. Select Default Organization for the new Org Code.

4. Set up any new member types you will be importing (Settings > Membership > Customer types). Customer types should correspond to values in the MemberType column in the Contact worksheet type.
5. Configure the appropriate membership options (Settings > Membership > Configuring membership options).

1. Click Additional Windows to set up user-defined tables if you are not using dynamic user-defined tables.

   Note: If you use the Workbook Converter tool to create data in a single-instance, user-defined table, you must deselect Always create in the table definition (located in the User Defined Tables window) before beginning the conversion. You can re-select Always create after the conversion has successfully completed. See Creating a user-defined table for more information on user-defined tables.
2. Click Address and Notes to define address purposes and specify communication flow preferences. (Select the appropriate options to Synchronize Phone Numbers & Email.)
3. Click Basic Options to review your phone number masking policy before running the conversion. If existing phone numbers are already formatted, you may wish to Disable automatic phone number formatting. For sites with a high volume of international numbers, it is recommended to disable masking, so that numbers are brought in exactly as they appear in the source data.

6. Review lookup/validation table information (Settings > Membership > Set up tables > Lookup/validation tables):

1. Review default prefixes and suffixes and add new prefixes and suffixes if needed. Select the Prefix or Suffix table from the drop-down list.
2. Set up customer categories if used. Select the CATEGORY table from the drop-down list.
3. Define additional address purposes if used. Select the ADDRESS_PURPOSE table from the drop-down list.

4. Define default roles. These are assigned to members without roles defined in the source data. Select MEMBER_STATUS from the drop-down list.
7. Set up activity types (Settings > Membership > Activity types).
8. Define the format and starting number for generating the ID for new contacts (Settings > Membership > Configure membership options > Basic Options > ID Assignment). Auto Assign Member Numbers is required.
9. Review system lists for countries and state/provinces (Settings > Membership > Set up tables> Country names & State/province codes).

   From the Staff site:

10. In the Staff site, set the default country and default currency (RiSE > Set up web components > General configuration).

Workbook Converter

The Workbook Converter is a tool that reads data from an Excel workbook into iMIS300. The data is populated by exporting data to Excel, and then manually revising data if/as needed.

The tool converts data from an Excel workbook (which can in turn be populated with data from an iMIS LAN site or any non-iMIS data source), based on the assumptions/logic outlined below and in the detailed pages for the tool.

The conversion can be used to populate the iMIS 20-300 database with the following information:

- Contacts (people and organizations)
- Historical activity
- User-defined data

The following are some of the areas that are not included in the conversion process:

- Open orders/invoices/accounts receivable
- Setup (products, events, dues cycles, etc.)

- Notes
- Subscriptions – billing detail on open items
- Lookup/validation tables
- Relationships
- Change log
- Passwords (but you can generate new ones based on email addresses)
- Adhoc searches & Reports/letter templates
- Pictures
- Transactions (such as fill event, donations, orders, and membership fees)

  Creation of Contacts

  The Workbook conversion allows you to specify details for each contact, defining which contacts are created as persons or organizations, and redirecting activity/history/user-defined data to the appropriate ID.

  Phone numbers, email addresses, fax numbers, etc are stored in their associated address records.

  Contacts whose status is either Inactive or Marked for Deletion should be reviewed. The Workbook conversion only converts information for Active contacts.

  User-Defined Data

  The Workbook conversion allows you to define multiple objects with all their properties, and they convert to iMIS 300 as virtual objects that are accessible to IQA and the Panel Editor.

Using the Workbook Conversion tool

The Workbook Converter lets you easily import contact data from Excel spreadsheets within a workbook into iMIS 20-300.

> **Note:** Note: Most of the documentation for this tool is embedded within the workbook either on the Instructions tab or as a note that appears when you hover over the column headers in each worksheet.

Before you begin, read through this article. Once you have read the Before you Begin article, make sure that you have completed the Pre-Conversion Checklist.

Preparing the Workbook Data

1. See recommended Pre-Conversion Checklist.
2. (If iMIS 20-300 is self-hosted):

1. Navigate to the Net\bin folder (under the location where iMIS is installed) to obtain the iMIS20-300WorkbookConverter.zip file. The default location is C:\Program Files (x86)\ASI\iMIS\Net\bin.
2. Copy the file to a local folder and extract its contents.
3. (If iMIS 20-300 is ASI-hosted) Contact ASI Hosting or your AiSP to obtain the Workbook Converter ZIP file.
4. Copy the Excel workbook file from that folder to a backed-up location for editing, and rename the file. Note that the sample workbook is designated as read-only, so you should save changes into a new file.

   Note: This must be in the .xlsx format- older versions are not supported.
5. Complete the spreadsheet with the organization's data, following the instructions provided in the workbook.

   Tip: Hover over column headers in each spreadsheet for tips/help on that column.
6. Enter/prepare your data:

- Contents worksheet: Be sure that each worksheet tab that contains data is listed here, and that there is an entry for all appropriate Worksheet Types. For example, if you have a worksheet called Individuals, which contains both contact and address information, be

sure that there are two entries for that worksheet, one with type Contact, and another with type Address.

List the worksheets in the Contents page in the order listed on the Instructions tab, that is, all Contact type sheets first, then Address type, and so forth.

- Remove any trailing spaces from all entries in the Contents tab.
- Contact worksheet type: Create one or more worksheets with type Contact. The sample workbook instructions show which fields apply to each type of contact. Fields at the top of the worksheet that are in bold apply to that worksheet's PartyType. You must have at least one worksheet of type Contact. Follow the instructions provided in the worksheet comments.

  Important: To create a new worksheet, copy the entire first row containing the column headers from one of the provided examples with a matching WorksheetType into the first row of your new worksheet. The column headers must be on the first row, and all column headers must appear. You do not have to fill out every column, but do not delete or rename any column headers.
- Address worksheet type: Enter all of the addresses for each contact - individual or organization - into the appropriate columns of the contact worksheets. If a contact has more than one address, you may enter additional addresses into any worksheet with worksheet type of Address (as defined on the Contents page). Be sure to list all of the worksheets that contain address information in the Contents page, with a worksheet type of Address.

  Note: The very first address for each ID must be marked as the default address. All other addresses can be flagged to override that default with a specific value for various communication reasons (preferred mail, bill, and ship).
- RelatedDataDefinition worksheet type: You can use this worksheet type to define the structure of an associated worksheet of the RelatedData type. The example workbook contains the following worksheets as examples of this type:
- Education Info Definition: Defines the fields used in the associated Education Info Data worksheet. Follow the instructions provided in the worksheet comments.

- Personal Info Definition: Defines the fields used in the associated Personal Info Data worksheet. Follow the instructions provided in the worksheet comments.
- RelatedData worksheet type: Worksheets of this type are user-defined. Their structure can be defined by an associated worksheet of the RelatedDataDefinition type or by a table that already exists in iMIS. The example workbook contains the following worksheets as examples of this type:
- Education Info Data: This worksheet's structure is defined by the associated Education Info Definition worksheet of the RelatedDataDefinition type. Enter the educational information for each contact into the appropriate columns.
- Personal Info Data: This worksheet's structure is defined by the associated Personal Info Definition worksheet of the RelatedDataDefinition type. Enter the personal information for each contact into the appropriate column.
- Activities: This worksheet is an example of a RelatedData worksheet type that does not have an associated RelatedDataDefinition worksheet type. The table referenced by the worksheet already exists in iMIS. Enter information about the activities, such as sales, for each contact in the appropriate column. In order to import the data, the activity type must be valid in iMIS. If the activity type is valid, but not fully set up in the Advanced Accounting Console, the data imports, but you cannot view it. Follow the instructions provided in the worksheet comments.

  When all entries are complete, save and close the workbook. The workbook must be closed when running the conversion.

  Note: Note: The workbook must be saved with an extension of .xlsx. You will receive an error if you attempt to convert using an .xls extension.

  Note: Note: If you have a column of data in a spreadsheet that should be empty, but instead contains a blank or space character (whitespace), then you will get an error during the TestOnly run. To clear a space from a cell in Excel, right-click the cell, and select Delete. To clear an entire column, it may be easier to copy the

column header to the clipboard, then highlight the entire column and delete it, and then copy the column header into the first available cell at the end of line 1.

Importing the Data

1. Locate the WorkbookConverter.exe file. Double-click the file to launch the converter.

   Note: The conversion utility now requires .NET 4.5. If not present, you will be prompted to update.

2. Fill out the Workbook Conversion utility fields as follows:

- Source Workbook: Configure the converter to use the correct spreadsheet file. You can use the folder icon to browse to your workbook file.
- Max Contacts: Leave at zero.
- Test Only: Keep this checked until you have run a successful test conversion that reports no errors.
- Destination website and Protocol fields: There are two protocols that can be used; you can use an https protocol to access the conversion utility from outside the ASI firewall (which applies to all except ASI staff, who have the additional option of operating within the firewall using NetTcp protocol).
- If using https protocol, select https://[DomainName]/[VirtualRoot] as the Destination WebSite.

  Note: ASI Hosting or your AiSP will set up the target iMIS 20-300 website with a valid SSL certificate.

- If using the NetTcp protocol, select net.tcp://[DomainName]:808/[VirtualRoot]/NetTcp as the Destination WebSite.

  Replace [Domain Name] with localhost, the IP address, or the proper name of the destination website.

Replace [VirtualRoot] with the name given to the virtual root during the installation of iMIS.

Note: Workbook Converter saves the modified website name, so when you next run the conversion, the modified name automatically displays as the Destination WebSite.

- Create User Accounts is only available when the Test Only box is unchecked. Select this checkbox if you want to generate usernames based on the preferred mailing address email addresses:
- Duplicates: If the email address already exists in the iMIS database, the duplicate is flagged in your error log.
- No email: If the contact has no email address, no username is created for them.
- Passwords: The password is a random value, so the user will go through the Forgot my password route to reset it to a password of their choosing
- Username and Password: Hosting will provide credentials for running the conversion.

3. Run the conversion in Test Only mode.

1. Verify that the spreadsheet file is closed.
2. Click Convert to run the import test. It can take several minutes for the initial connection to succeed, and no information appears on the conversion update window until after that is complete.

   Note: If you get a timeout error after 60 seconds, try resetting IIS and re-starting.
3. After conversion completes, click Export Log to save the import information and any errors.

   Tip: Exported logs include additional details on any Service Errors encountered.
4. Click Update Workbook to allow the converter to update the spreadsheet and flag any errors in red.
4. Open the spreadsheet and fix any problems identified, such as duplicate records.
5. Re-run the converter in Test Only mode until it returns no errors.

6. Back up the iMIS database. Run the converter with Test Only mode disabled. Some additional errors may be reported at this point. You must examine the conversion log to identify all Errors and Warnings, and either correct them in the workbook and initiate a new conversion with a fresh 20-300 database, or in a few cases, you may correct them directly in 20-300.
7. Verify the conversion by logging into iMIS and locating records that should have been imported.

   Once you have completed the conversion process, proceed to the Post-Conversion Checklist to ensure that your conversion process concludes seamlessly.

   Tips and Tricks

- If you re-run the Workbook Converter tool immediately after a data import, you may receive errors. To avoid these errors, follow these instruction before re-running the tool:

  Close the WorkbookConverter.exe file.

  Stop Internet Information Services (IIS).

  Restore the database.

  Start IIS.

  Open the WorkbookConverter.exe file and begin the import.

- If you use the Workbook Converter tool to create data in a single-instance, user-defined table, you must deselect Always create in the table definition before beginning the conversion. You can re-select Always create after the conversion has successfully completed. (Settings > Membership > Configuring membership options. Click Additional Windows, and then click Define Tables.)

Post-conversion tasks

These tasks can help you ensure the quality of your data conversion to iMIS 20-300, and some are required in order to ensure proper 20-300 processing:

After you convert:

Confirmation emails will be sent. It is important for staff accounts to be used for all post-conversion testing of orders/event registrations/etc. If this is not feasible, another option is to reset the preferred email address for selected contacts.

1. Ensure expected numbers of Individual and Organization records were created.
2. Review your committees, chapters, etc. and compare rosters. Review roles that were assigned to members.
3. Secure the database.

Queries can be used to check for issues:

- Committees: Run this query on source database to get a list of all the committees and their members, and check resulting data in 20-300 (search for the committee & check against the roster there). Compare names, roles, and in cases where the membership is date-limited, the effective & expiration dates of membership:

  SELECT Activity.Product_Code, Committee_Position.TITLE, Name.FULL_NAME, Name.COMPANY, Activity.ACTION_CODES, Activity.EFFECTIVE_DATE, Activity.THRU_DATE, Committee_Position.RANK, Activity.TRANSACTION_DATE

  from Activity INNER JOIN Name on Name.ID = Activity.ID LEFT OUTER JOIN Committee_Position on Committee_Position.POSITION_CODE = Activity.ACTION_CODES

  Where Activity.ACTIVITY_TYPE = 'COMMITTEE' AND Activity.PRODUCT_CODE LIKE 'COMMITTEE/%'

  order by Product_Code

- Duplicate organizations: Run this query to see any duplicate Organizations that got created in 20-300 (multiple companies were created having the same name) – and investigate the cause.

  select COUNT(i.ContactKey) as CompanyRecords, InstituteName as CompanyName

  from Institute i, ContactMain cm where i.ContactKey = cm.ContactKey

  group by InstituteName having COUNT(i.contactkey)>1

Web component setup (Public view)

Where to set up Public view page options

Because there are so many configuration pages in System Setup that control the Public view, this section maps specific pages in the Public view to the many configuration pages that affect them.

Use the tables below to locate the System Setup areas that control the Public view pages you want to change.

Tip: Keep in mind that when Full users access the Public view, they see what a Public user sees.

Configuring Public view - Log on

To customize this area of the public view, go to System Setup and choose the menu items indicated for each public page.

Log On	• General configuration • Organization configuration	• Logon configuration

	• SSL configuration	
	• Misc label configuration	
Forgot my ID	• Organization configuration	• Forgot logon or password configuration
	• Misc label configuration	• Reset password configuration
Contact us	• Contact us configuration	(none)
	• Organization configuration	
	• Misc label configuration	

Note: To allow contacts to pay their bills (dues, subscriptions) on this site, you must use Cash billing.

Configuring Public view - Directory

To customize this area of the public view, go to System Setup and choose the menu items indicated for each public page:

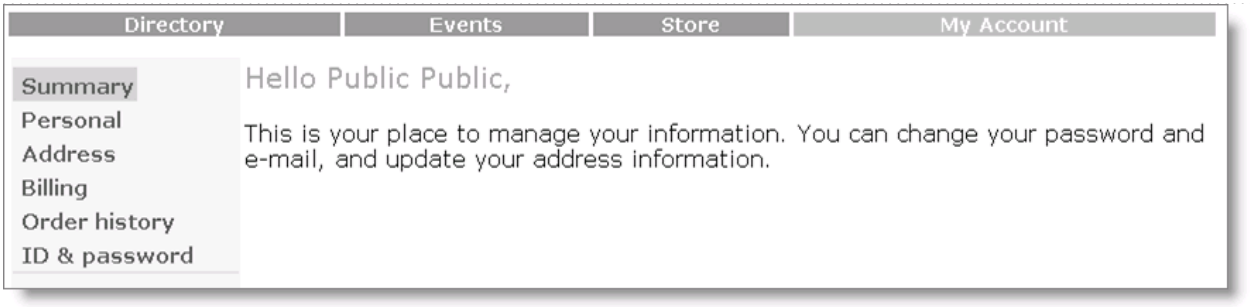
Directory	• Misc label configuration	(none)
Committees	• Misc label configuration	• Committee configuration

To customize queries for the Directory and Committees areas of the Public view

Goal	\ContactManagement \De-	Area seen

	faultSystem\ Queries	
To control which contact records display in the Directory	...\Directory \Contacts	Public view Directory > Directory Web view Directory > Find Contact
To control which contact records display	...\Contacts	Web view Contacts
To control which committees display	...\Directory \Committees	Directory > Committees
To control which committee members display	...\Directory \Committees \Members	Contacts > Committees and then select a committee

Configuring Public view - My Account



To customize this area of the public view, go to System Setup and choose the menu items indicated for each public page:

Create account	Organization configuration	• Create account configuration • Create account page titles • Create account settings • User defined fields • Create account search
Summary	(none)	• Account management configuration

Personal	• Personal label configuration	• Personal information configuration • User defined fields
Address	• Address label configuration	• Address configuration
Billing	(none)	(none)
Order history	(none)	(none)
ID & password	Misc label configuration	(none)

Note: You must populate the prefix and suffix gen_table data in the Expansion field in order to see data in the Prefix or Suffix drop-down lists in the Public view.

Configuring Public view - Events

To customize this area of the public view, go to System Setup and choose the menu items indicated for each public page:

Note: The Event list and Event search pages can be configured to list any type of event. Access the Public queries from the Document system in the Document System (EventManagement > DefaultSystem > Queries). The EventList and EventSearch folders contain the Public view queries that can be modified to filter on event Type. The event type cannot be filtered on the Event calendar.

Event List	• Misc label configuration	• Event setup • Events configuration
Calendar	(none)	(none)
Search	(none)	(none)
Add to Calendar	• Organization configuration • Exchange settings	(none)

Configuring Public view - Store

To customize this area of the public view, go to System Setup and choose the menu items indicated for each public page:

Browse Categories	• Image configuration • Product label configuration	• Store home • Store configuration • Manage product attributes • Manage master products
Search	(none)	(none)
Cart	• General configuration • SSL configuration	• Checkout configuration • Credit card label configuration

- Payment label configuration in Cart manager
- Billing configuration

Configuring Public contacts

Opening the Directory to anonymous access

By default, no unauthenticated site visitor who browses the Public view can see and use the directory. If this conflicts with your business needs, you can expose this information using .NET security: you can remove the authorization code that denies anonymous users all access to the directory.aspx page.

To open the directory to anonymous access, edit the web.config file found in iMIS_Public core folder (default: C:\Program Files\ASI\iMIS\iMIS_public\Core). From your <configuration> section, modify the <deny users=”?”/> to be changed to <allow users=”?”/>:

```
<configuration>
<appSettings/>
<connectionStrings/>
<system.web>
<pages autoEventWireup="true">
</pages>
</system.web>
<location path="directory.aspx">
 <system.web>
 <authorization>
 <deny users="?"/>
 </authorization>
```

</system.web>

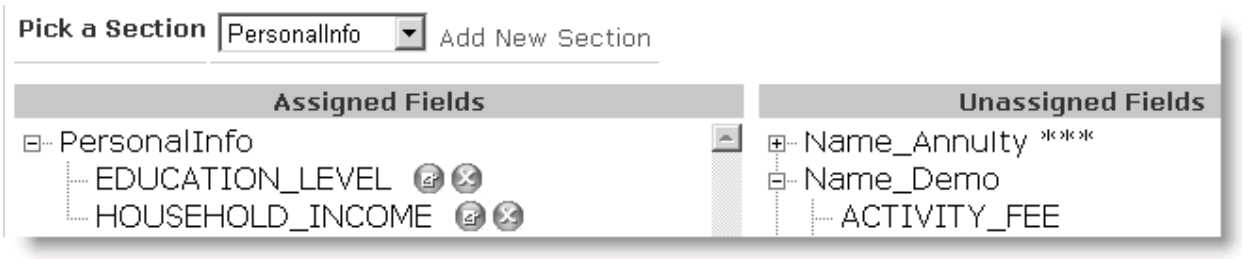
</location>

</configuration>

Note: The default IQA query for the directory page ($/ContactManagement/DefaultSystem/Queries/Directory/Contacts/Default) is set to “Authenticated Users Full Control”. Change the security to “Everyone Full Control” or “Everyone Read.” So that the directory search will show unauthenticated users.

Adding user-defined fields in Public view

The user defined fields (UDF) setup page is part of the Customer administrative section.



From System Setup, Select Set up customer web components > User defined fields

To add fields to a page

The unassigned UDFs appear in a tree format by the table name. All unassigned UDF are listed in the Unassigned Fields section on the right. All UDFs assigned to a page are listed in the Assigned Fields section on the left in a tree format under the page name.

1. Choose a page by making a selection in the Pick a Section drop-down.

   Once you add a field, it immediately appears on the page you have selected in the Contact Management list.

   Note: By default, administrators can assign fields to the Create Account page or to the PersonalInfo page. You can also place an item in the User defined fields page by creating a new section.

2. (Optional) Click the Add New Section link on the user-defined setup screen to add a new item on the User defined fields page. Once an item has been saved, it immediately appears in the User defined fields page in the Contact Management list.

   Note: To enable the User defined fields page in the Public view, you must edit the iMIS site map for the Public view in the C:\Program Files\ASI\iMIS\iMIS_public\web.sitemap file to uncomment the line with the siteMapNode title="User defined fields". Once you enable this line, Public users can then view the new section's UD fields in the Public view.

3. Add a UDF to the page by dragging any unassigned fields from the right side onto the name of the page on the left side.

   To set UDF properties

   Set properties on the user defined field by clicking the Edit icon next to the field name in the assigned fields list. The Setup page displays the properties of the field.

   From System Setup > select Set up customer web components > User defined fields and click the Edit icon next to a field name in the Assigned Fields list

   Regular Expression field - Administrators can force that data be entered in a specific format by entering in a regular expression. For example, if the field is a phone number field, then an administrator can enter in an appropriate regular expression here to for users to follow a specific phone number format before they can proceed.

Note: Public view will not validate that the regular expression is correct and administrators must be sure of their regex formula before entering it here.

Regular Expression Example field - The text entered into this field will appear when a user types in information that doesn't properly validate against the regular expression. It guides the user in formatting the value. Example: Enter your mobile phone number in this format: (555) 555-1212.

Required option - Each UDF can be set up so that is required for a user.

Creating user defined fields for Public view in iMIS Desktop

The Public view administrators can setup user defined fields and pages in the User defined fields page (System Setup > Setup customer web components > User defined fields).

- You can add user defined fields to the Personal information page within account management and to the Create account page of the create account process.
- You can add user defined fields that have not been assigned to a page in Public view to the User defined fields page.

Note: A user defined field must be assigned to a window before it can be used on a Public view page.

Setup in iMIS Desktop

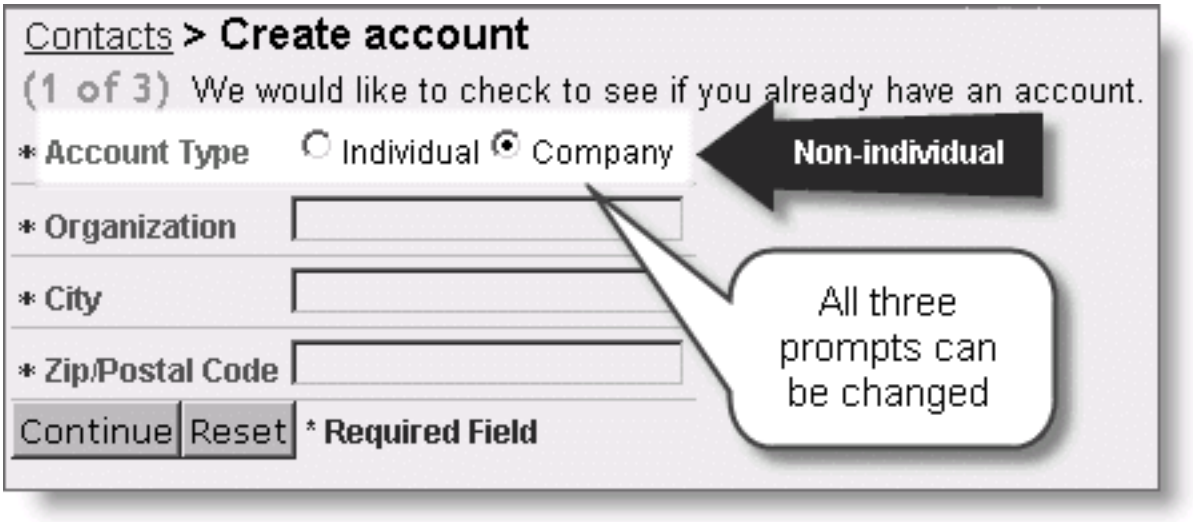
Before using this feature in Public view you must perform the setup of user defined fields in iMIS Desktop (Customers > Set up module > General > Additional Windows > Define Tables).

Note: The Public view does not support multiple instances.

Creating non-individual accounts in Web view

To help distribute workload throughout organizations, iMIS allows both Full and Casual users in the Web view to create accounts for non-individual records. In System Setup, you can configure the prompt for "non-individual" to best suit the needs of the organization.

When creating these accounts, users can choose whether to create an individual or a non-individual (company):



When users choose to create a non-individual account, iMIS changes which fields appear during account creation. Because these accounts are not for individuals, no confirmation emails are sent.

Duplicate checking: Account creation prompts users to search for existing records to prevent creation of duplicates. When duplicate-checking for non-individuals, the Organization (name) field uses a CONTAINS search (versus BEGINS WITH) with an 80 character limit. Likewise, when searching for a Parent Organization, the Organization (name) criteria also has an 80 character limit and uses a CONTAINS search.

Company flowdown: When users select a Parent Organization to associate with the new account, they are prompted to overwrite (flow down) information from that organization. Whether the address flows down is controlled by the setting Customer > Module setup > Advanced, Disable Auto Flow Down of company address Information.

Label configuration: Several prompts for this feature can be configured under System Setup:

- Set up web components
- Quick setup

- The default Customer Type to use when creating new organizations online
- Set up customer web components
- Create account configuration
- Account Type Label (AccountTypeLabel)
- Individual Label (IndividualLabel)
- Non-Individual Label (NonIndividualLabel)
- Create account search
- Title of the Company Search page for individuals (CompanySearchMessage)
- Title of the Company Search page for non-individuals (CompanySearchMessageNonInd)
- Text of the link which allows company selection to be skipped (CompanySearchSkipText)

Configuring Public events

Setting up the system for Public events

Complete the following items in System Setup before creating an event for the Public view.

To prepare for Public events

- Make sure the codes contain only letters, numbers, or an underscore – no special characters.
- Resolve any database issues identified by Public view "pre-queries" prior to implementing Public view.
- Set up the PayPal and internet merchant accounts.
- Set up the SSL certificate for secure processing.

Setting up Customers for Public events

Prepare your customer data before creating an event for the Public view.

To prepare customer data

1. Purge duplicate records.
2. Consider whether individual records have unique e-mail addresses or group e-mail addresses, such as info@company.com, where the event messages may not get to the right person.
3. Consider that each company record has to have a first name and last name in the record, and ensure that the names make sense in the context of sending event registration notices.

Setting up registration for Public events

Keep these tips in mind:

- Use the Registrant Class Determination option in the Set up Event wizard to specify which registrant classes require fees.
- The Public view does not support default pricing. Pricing must be defined for each registrant class.
- HTML codes entered in fields to format display will print on iMIS reports that include those fields.
- Using the ViewAll queries, you can configure Event search and Event list pages to list any type of event for Casual and Full users. To filter event types, access these queries from the Document system in the: EventManagement > DefaultSystem > Queries.

To set up an event for Public registration

1. Create the event and functions in Desktop view (Events > Define an event).
2. Select the Show this event/function on the Web? and the Allow online registration via the Web options for each event and function to be accessed in Public view.

   Note: Complete pricing and event definition before making the event available for Public and setting the status to “A” (Active); otherwise, users might register before pricing is set.

3. Save the event and functions.
4. Use the Set up Event wizard to configure the event's online components.

   Tip: For help with the wizard, see Web setup wizard for events in Events Administration.

   Troubleshooting

   You must populate the Default Terms Code field in AR/Cash > Set up module > Aging with a value. If not, Events functions do not appear when users register on the Public view. You may also see the following error in the Error log: "COrder.TermsCode: The supplied value '0' is not defined in the Financial Terms reference table."

Setting up guest registration

You can structure guest registrations to:

- Allow the user to add guests without additional charges and badge requirements
- Specify fees and/or badge information for guests

To allow users to add guests without fees or separate badge requirements

1. In the iMIS Desktop Event Function Detail window (Events > Define an event> Define a function), make sure the Show on Web option is selected and the Guest Function option is not selected.
2. In the Max Registrations per Registrant field, enter the maximum registrants allowed or an arbitrary large number if there are no limits. An empty or zero amount defaults to one maximum registrant.
3. Click Save.

   The main registrant's name will print on all badges.

   To specify fees and/or badge information for guests

1. In the iMIS Desktop Event Function Detail window (Events > Define an event > Define a function), enable the Guest Function option. The function will not display unless a guest is added during registration.

2. (optional) Use the Web Event Setup Wizard to specify the fees for the function.
3. (optional) Use the Web Event Setup Wizard to specify the required/enabled badge data fields to be included on guest badges.

Example: Specifying complex guest registration rules

In the following example, many registration options are presented to the user.

For the AABA conference, each registrant can register one spouse/significant other and up to six children. The spouse/significant other has the choice of two levels of participation/registration. Optional workshops and social functions can be purchased for any number of guests.

Main registration

1. In the iMIS Desktop Define an event page (Events > Define an event), enter the overall event registration fee.
2. Enter 1 for Max Registrations per Registrant.

Spouse/Significant other registration

The two levels of participation available for a registrant's spouse/significant other are:

- Conference package (150.00)
- Program and tours package (96.00)

The maximum number of registrants allowed is one.

1. In the iMIS Desktop Event Function Detail window (Events > Define an event > Define a function), define each package.
2. Select the Guest Function option.
3. Enter 1 for Max Registrations per Registrant.
4. (optional) Enter a Conflict Code or, if conflict codes have been defined, select the lookup icon to search for the code to ensure that only one package is selected.

5. (optional) In the Web Event Setup wizard, click More > Badges and define the enabled/required fields for guest badge information.

   Child registration

   The two registrations available for a registrant's children are:

- Conference Camp: age 3 to 11 years (250.00)
- Teen Scene: age 12 to 17 years (235.00)

   The maximum number of registrants allowed is six.

1. In the iMIS Desktop Event Function Detail window (Events > Define an event > Define a function), define each function.
2. Select the Guest Function option.
3. Enter 6 for Max Registrations per Registrant.
4. (optional) Enter a Conflict Code or, if conflict codes have been defined, select the lookup icon to search for the code to ensure that only one function is selected for each child.
5. (optional) In the Web Event Setup wizard, click More > Badges and define the enabled/required fields for guest badge information.

   Optional workshops and social functions

   The main registrant may register for pre-conference workshops:

- One-day certification program: Cannot enroll for any other workshops due to schedule conflicts. (295.00)
- Project management: half-day (195.00)
- Roundtable: New Technology (2 hours, 50.00)
- Roundtable: Team Building Ideas (2 hours, 50.00)
- Roundtable: Industry Update (2 hours, 50.00)

   The maximum number of registrants allowed is one.

1. In the iMIS Desktop Event Function Detail window (Events > Define an event > Define a function), define each workshop.
2. Enter 1 for Max Registrations per Registrant.
3. (optional) Enter a Conflict Code or, if conflict codes have been defined, select the lookup icon to search for the code to ensure that there are no scheduling conflicts.
4. (optional) In the Event Web Setup wizard, click More > Badges and define the enabled/required fields for guest badge information.

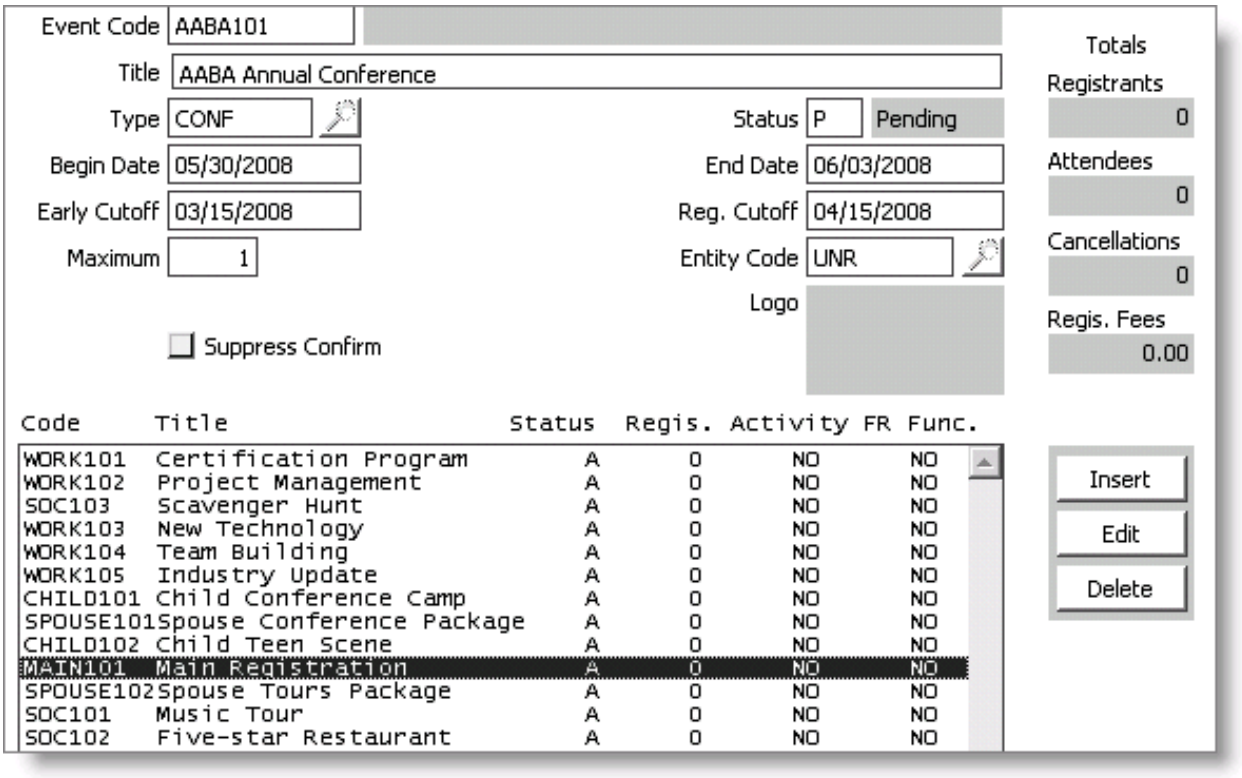
The registrant and any number of guests may register for optional social functions:

- Music tour: Tuesday afternoon (40.00)
- Five-star restaurant: Wednesday night (80.00 Members, 100.00 Non-members)
- Scavenger hunt: Friday afternoon (25.00)

Fees are assessed for each guest. There is no maximum number of registrants.

1. In the iMIS Desktop Event Function Detail window (Events > Define an event > Define a function), define each social function.
2. Select the Guest Function option.
3. Enter a large arbitrary number for Max Registrations per Registrant so that there is no reasonable limit on registrations.

Your event summary may look similar to this example:



Example event with complex guest registration rules

Configuring Public commerce

Note: Web-based shopping carts need to persist cardholder data during the shopping and checkout processes, so iMIS always encrypts such temporary data to protect the cardholder. This encryption occurs even if you do not implement advanced PCI compliance (see "Implementing Advanced PCI Compliance options").

Creating new categories

You can perform the following tasks from the Orders Setup page.

- Create categories and subcategories
- Nest subcategories within existing categories
- Edit categories
- Delete categories

To create new categories

1. Go to System Setup > Setup commerce web components > Store home.
2. In the Category section at the top left of the Orders Setup page, click Store Home.
3. Expand the category list under Store Home until you can select the category under which you want to place a new category.

   The selected category should appear should appear in bold font.
4. Click New.
5. Enter a category, title, and description on the Create A New Category section of the page.
6. Enable Visible Online to make the category visible to users.
7. Click Add Category.

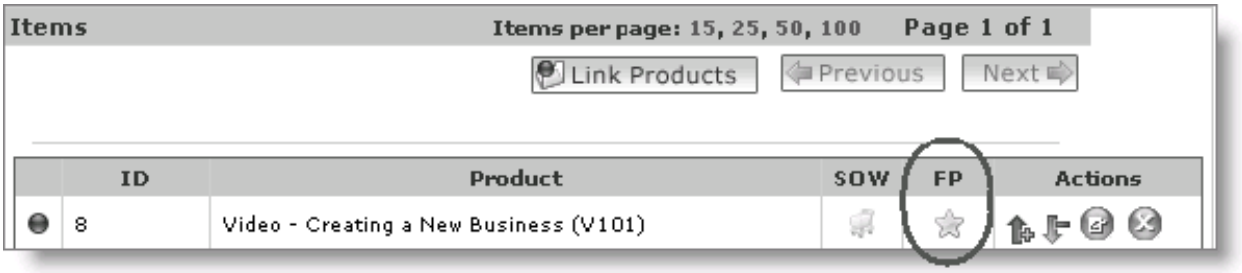
   If the category creation process was successful, the new category should appear beneath Store Home.

Store Home page layout

The Store Home page on the Public view displays product categories and featured products. The arrangement of the featured products and product categories are setup on the Orders Setup page (System Setup > Set up commerce web components > Store home > Orders Setup).

- Product Categories – You can arrange the products in categories using this setup page by creating categories and linking the products to categories. Product categories help the public user to browse the products quickly in an organized format.
- Products – Linking products with categories places them in separate categories on the Store Home page in the Public view.
- Featured Products – Featured products under the Store Home category appear on the Store Home page when it is first displayed. The Featured Product icon is the yellow star under FP column. Clicking on the icon turns it gold and changes it's status to featured product.

Note: The products under the Store Home column are a special category of featured products. The Store Home category is created and named by default. Designating products as featured products under this category gives them prominence by placing the products on the Store Home page in the Public view. Products under this category must be set as featured products using the Featured product icon on the Order Setup window, otherwise they will not appear on the Store Home page in the Public view.



Featured product icon on the Orders Setup page

Store Home page with Featured Product

Linking products to categories

A product will not appear on the Public view until at least one of the following requirements are met:

- The product is linked to a category.
- The product is listed as a featured product. It will appear only on a featured products page and on the Store Home page (System Setup > Set up commerce web components > Store home).

  Note: To enable a product to appear as a featured product under the Store Home column on the Public view Store home page, you must select it as a featured product by clicking on the Featured Product icon in the product list.
- The product is added to a cross-sell list. It will appear only as a recommendation after another product has been added to the cart.

  To link a product to a category

1. Select parent category for the linked products.
2. Click Link Products.
3. From the list of available products, select a product.

   Note: You can adjust the number of items (15, 25, 50 or 100) to view per page.
4. Link individual products by clicking Add icon.

   The product will be associated with the category and removed from the list of available products.
5. To save changes, click Exit Linking Process.

Category details

On the Orders Setup page, (System Setup > Set up commerce web components > Store home) there are 6 columns:

- Product type
- ID
- Product
- SOW

- FP
- Actions

Column 1 (Product Type)

The red or blue dot in Column 1 (leftmost column) represent a product's status in the Public view database. Blue dots mean that the product was entered into iMIS as a normal product.

Public view allows administrators to offer master products. Master products will have a red dot in the leftmost column.

Column 2 (ID number)

Each product entered into the Public view database is assigned a unique identifier. These ID numbers assist in location in the product table. ID numbers are listed in Column 2.

Column 3 (Product)

The product title is located in Column 3.

Column 4 (SOW-Sell on Web)

Some administrators may not want a product to be available for sale online at the time of entry into the database. Column 4 offers three options concerning a product's viewing status:

- Sell on Web
- Show on Web
- None

If an administrator clicks the icon in Column 4, these options will appear with “cancel” as a fourth choice.

Column 5 (FP-Featured Product)

Each category in Public view Store may have any number of Featured Products. A featured product will be highlighted on a category's main page.

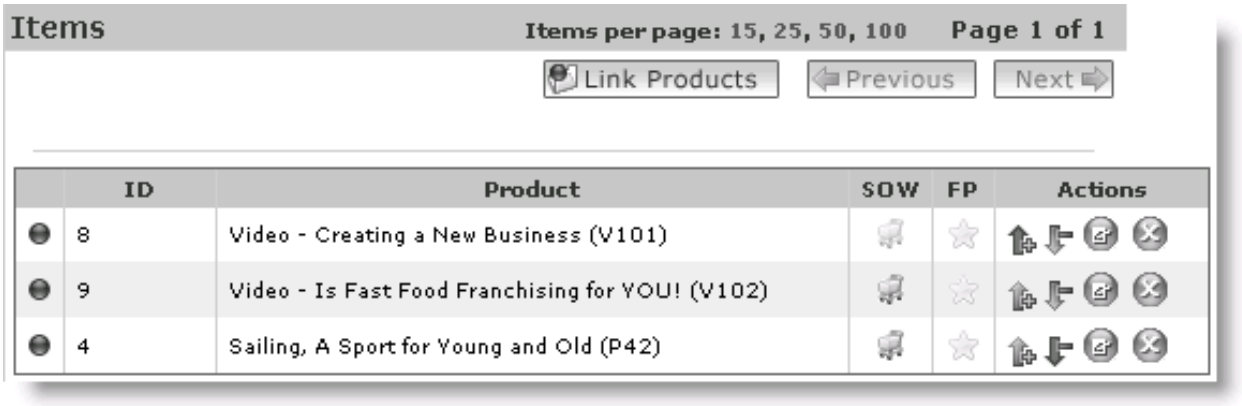
Every product listed possesses a small yellow star icon. To make an item a featured product, click the Featured Product yellow star icon. (It should be dark gold, not light-yellow).

Note: Clicking the Featured Product icon is required for products in the Home Page category. If a product is in the Home Page category, clicking the Featured Product icon will place the product under the Home Page column on the Store Home page in Public view. Otherwise, the product will not appear on the web page.

Column 6 (Product Management Actions)

Actions has four icons.

- Arrow Up moves the item up the list. (The up and down arrows will determine the order in which items are viewed by users.)
- Arrow Down moves the item down the list.
- Edit allows an administrator to edit the product. Clicking edit takes an administrator to a page where detailed information about the product can be modified.
- Delete removes a product from the category's list. This will not delete the item as it appears in Public view Orders.



Customizing product details for the Public view

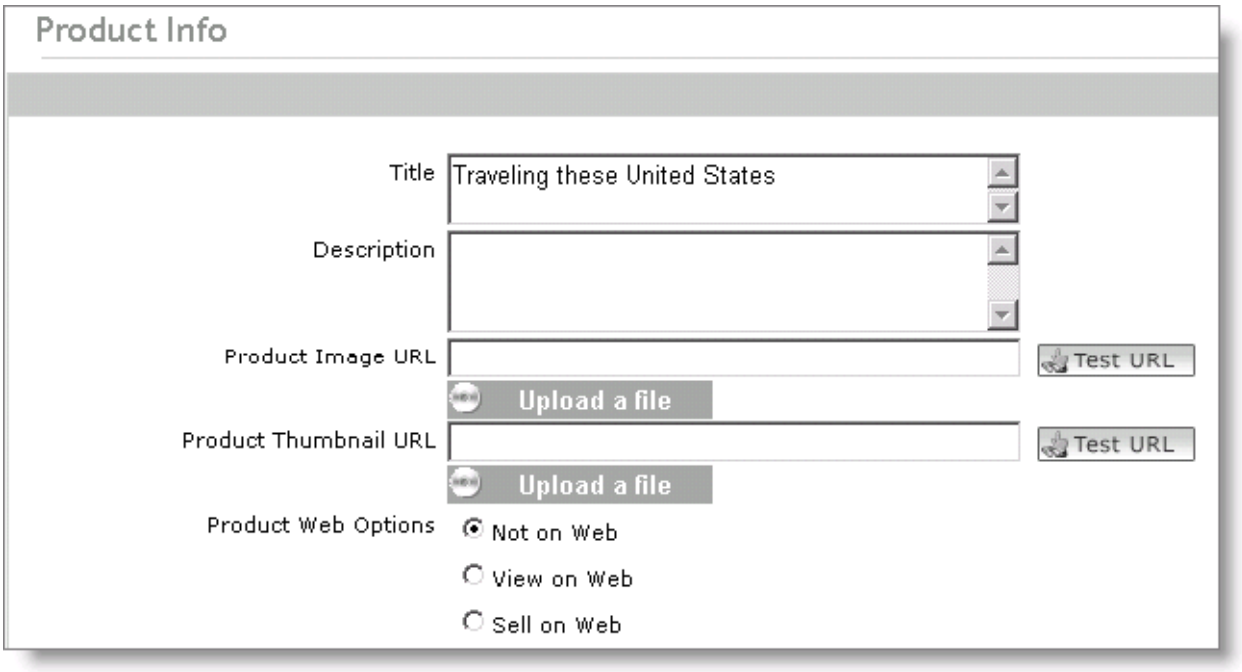
You can make changes to the display of iMIS products on the Public view from Store home > Product info. These are products that were created on iMIS Desktop.

To edit product details

1. Go to Store home.
2. Expand categories in the column.
3. Select a product category.

   The list of linked products is displayed.
4. Click the Edit icon next to the product.
5. On the Product Info page make your modifications.

   Note: Place key search terms within the first 300 characters of the description. In the Public view, search truncates the description to 300 characters, so only text within that range yields search results for users.
6. Click Next to select Cross-Sell products from the Cross-Sell Products page.
7. Click Finish to return to the Orders Setup page.



Prompts that cannot be customized on Order summary Page

The following prompts cannot be customized in the Order Summary pages.

- Order Summary - OrderSummaryPageTitleLabel
- Error messages:
- OrderSummaryPageExpiredErrorLabel
- OrderSummaryEmailErrorLabel
- OrderSummaryEventsErrorLabel
- OrderSummaryProductsErrorLabel, OrderSummaryDuesErrorLabel

  The following prompts cannot be customized on the Orders Summary page.
- Order Date - OrderSummaryOrderDateLabel
- Total Payment - OrderSummaryOrderTotalLabel
- Order Number - OrderSummaryOrderNumberLabel
- Quantity - ProductQuantityLabel
- Price - ProductPriceLabel
- Product - ProductLabel
- Shipping Address - ShippingAddressLabel
- Shipping Method - ShippingMethodLabel
- Shipping and Handling - ShippingHandlingLabel
- Tax - TaxLabel
- Sub Total - TotalLabel

Creating attributes for master products

Attributes help users view all of the distinguishing qualities of iMIS products grouped under one master product. You assign attributes to child products with codes.

- The attribute code is used only in the Public view as a way of distinguishing between similar attributes. Shoppers will never view this code.

- New attributes may only be created before child products are added. To create a new attribute after adding child products, you must remove every product/attribute association and add the attributes again.
- You cannot assign more than one child product the same set of attributes.
- Codes are established to differentiate when assigning attributes.

To create a new attribute

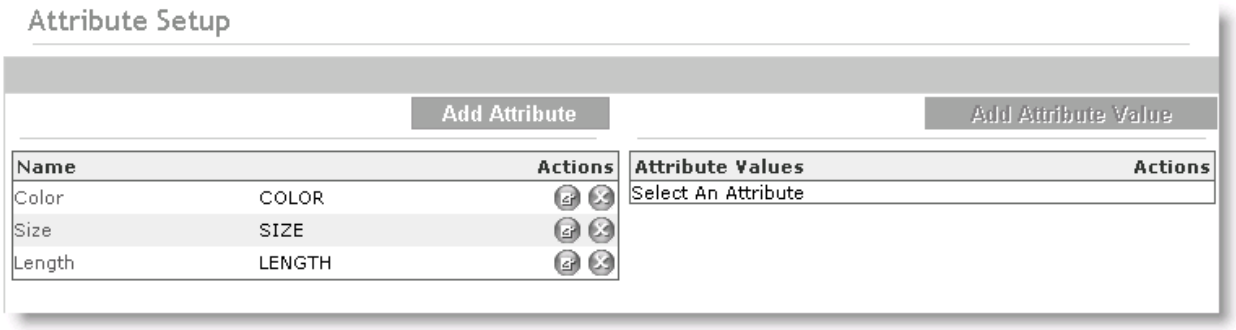
1. On the Manage product attributes page, select Add Attribute (System Setup > Set up commerce web components > Manage product attributes).
2. Select the Define New Attribute link located beneath the drop-down menu.
3. Click Add Attribute.

- Enter the new attribute title.
- This title will be displayed to users in a drop-down menu (For example, Size).
- Enter the attribute code.
- Enter a description.

Viewers will not see the description; it is viewed by the administrator in the Product manager.

4. Click Add.

The new attribute is displayed the list of attributes.



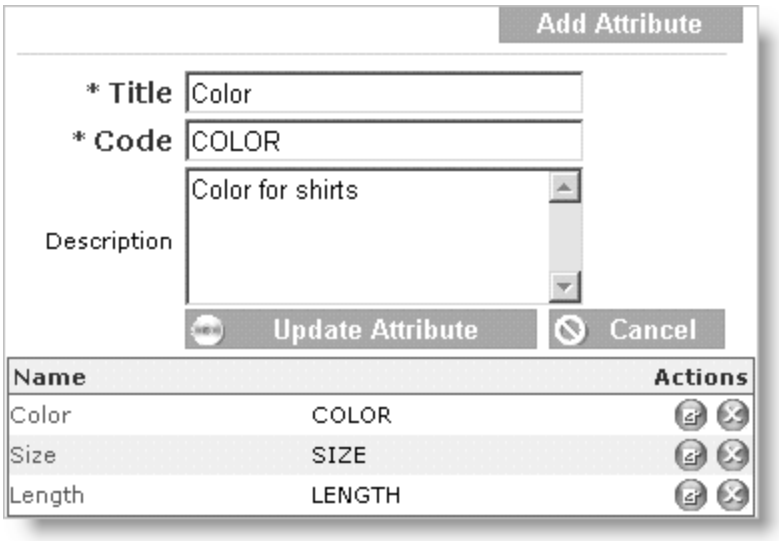
Changing attributes for master products

You can go back to add or delete attributes even after you have created the master product.

To change attribute title, code, or description

1. On the Manager product attributes page, select an attribute (System Setup > Set up commerce web components > Manage product attributes).
2. Click the Edit icon located in the Actions column at attribute setup.

   Note: Clicking Edit will not allow an administrator to add values to attributes.
3. Edit the attribute's title, code, and description.
4. Click Update Attribute to save changes.



Adding values to master product attributes

Clicking Edit in the Actions column at attribute setup does not allow you to add values to attributes; use the Add Attribute Value command.

To add values to attributes

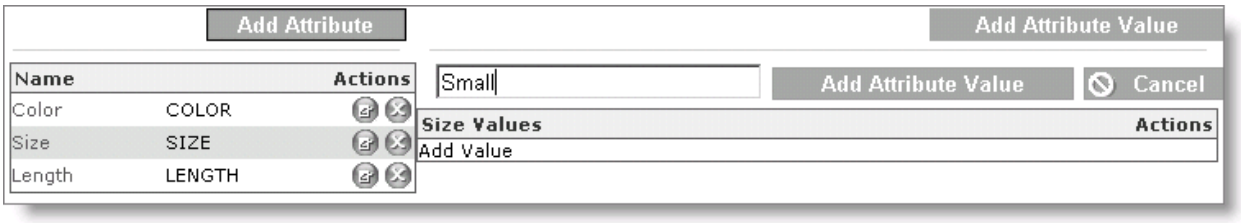
1. On the Manager product attributes page, click Add Attribute (System Setup > Set up commerce web components > Manage product attributes).

The Attribute Setup page is displayed.

2. Click Add Attribute Value.

- Enter the value name.
- Click Add Attribute Value.

The new value should appear at the bottom the list of values at attribute setup.



Renaming the term "cart" on the web

If you need to use a term such as basket instead of cart throughout your iMIS websites, you can do so by modifying these items:

- iMIS navigation labels (requires access and permissions for WCM)
- Labels in the database using a parameter in System Setup
- XML files
- Javascript files
- ASPX files

To change the System Setup navigation labels

See the WCM Reference for information about changing and publishing navigation items. The two navigation items to change are:

- Store > Cart
- System Setup > Set up commerce web components > Cart manager

To change the labels with the label parameter in System Setup

1. Navigate to one of these fields:

- System Setup > Set up web components > Misc label configuration - Label for shopping cart
- System Setup > Set up web components > Address label configuration - Cart Item Label
- System Setup > Set up commerce web components > Checkout configuration - Link for step 1
- System Setup > Set up events web components > Events configuration - Message displayed when there is an incomplete item in the cart

2. Ensure that the preferred term is used in the field.
3. Click Save.

To change specific XML files

1. On the appserver, go to C:\Program Files\ASI\iMIS\Net\bin\ and locate the files Asi.Business.Commerce.xml and Asi.iBO.xml, and locate C:\Program Files\ASI\iMIS\iMIS_public\web.sitemap, and C:\Program Files\ASI\iMIS\iMIS_public\Templates\MasterPages\Public.master.
2. Back up each file.
3. Search for the term cart and replace it with your preferred term in the text and title attributes of the files. Do not change the term in the URL attributes. For example, only change the term in the title of this line in web.sitemap:
<siteMapNode title="Cart" url="~/Core/cart/MyCart.aspx"></siteMapNode>
4. Save the files with the same names as before.

To change specific JavaScript files

1. On the appserver, locate the file C:\Program Files\ASI\iMIS\iMIS_public\Core\Admin\CartManager\CartManager.js.
2. Back up the file.
3. Search for the term cart and replace it with your preferred term for these two confirmation messages:

- Line 32 - var ans = confirm("Are sure you would like to remove all the cart items for this user?");
- Line 56 - var ans = confirm("Are sure you would like to remove this cart item?");

4. Save the files with the same names as before.

To change specific ASPX files

1. On the appserver, locate the file C:\Program Files\ASI\iMIS\iMIS_public\Core\Orders\shoppingcart.aspx.
2. Back up the file.
3. Search for this line and change to your preferred term:

- <asiweb:PanelTemplateControl runat="server" TemplateTitle="Shopping Cart" ID="CartPanel">

4. Save the file with the same name as before.

Tips

The following information can be helpful when changing the term cart to another name.

- You do not need to restart the IIS server for any of these changes to take effect.
- While you can change the two left-hand navigation labels under System Setup, you are not changing the field labels themselves.

Master products

Defining master products allows you to sell different versions of a single product from one page in the Public view. For every master product, you can define attributes, add child products, and list cross-sell products.

For example, without a master product, shirts with different attributes are presented individually: small red shirt, medium blue shirt, etc. If you create a master product for all shirts, you can then define attributes so that your customers can go to one page and choose their preferred shirt color and size with a drop-down list.

Every product in the iMIS database can be added as a child product of a master product.

Managing master products

Here are the basic steps for managing master products.

Note: Defining master products and attributes can be done from System Setup or Orders.

1. Add the individual products that will be added later as child products under the master product
   (Orders > Manage inventory > Manage products). For example, add product TSHRTREDL for red shirts, size large. Be sure to mark the product as Show on web. See Manage products window for more information.
2. Add product attribute(s) that will present choices such as color or size without having to view each as a separate product
   (System Setup > Set up commerce web components > Manage product attributes). See Creating attributes for master products for more information.
3. Create a master product to allow a Public view user the ability to view a product and it's attributes on the same page
   (System Setup > Set up commerce web components > Manage master products). See Creating master products for more information.

- Add child products to the master product that represent the virtual group of products that would normally have to be multiple separate and independent products in iMIS. When adding child products, you can choose one to be the default child product that appears first as the Public view user browses the product listing. For example, a red shirt may be the default child product and other colors would be viewed using a drop down menu.
- Choose cross-sell products that might sell with the master product.

4. Link the master product to a category that will appear in the Public view (System Setup > Set up commerce web components > Store home). Master products appear with a red dot to their left. See Linking products to categories for more information.

Creating master products

To create a master product, you combine two or more existing products, which become child products of the master.

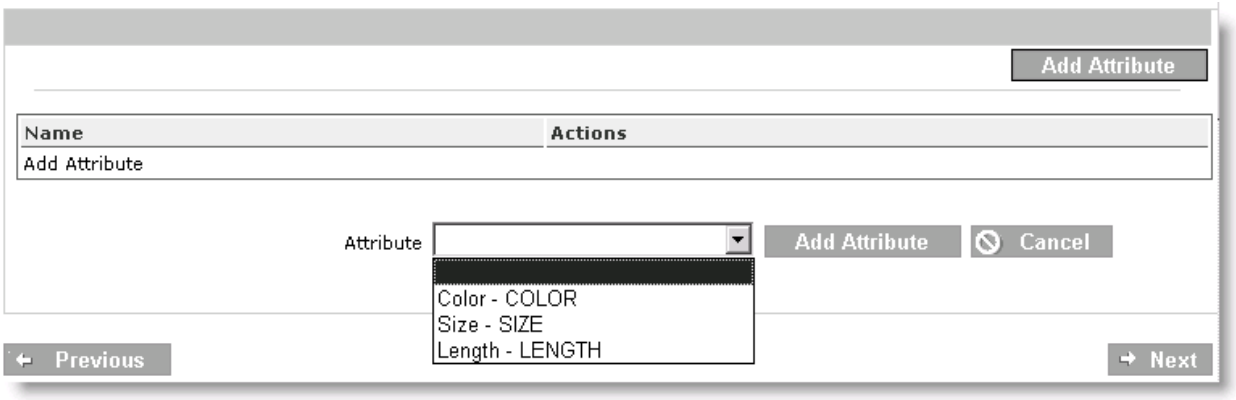
To create a master product

1. On the Manage master products page, click Add master product (System Setup > Set up commerce web components > Manage master products).
2. Enter the product Title, Description, and Product Web Options.
3. Click Next.

   The Edit page is displayed. You are prompted to add attributes to the master product.
4. Click Add Attribute.

   You are prompted to choose attributes for the master product. You can select more than one attribute.

- Select an attribute from the drop-down list and click Add Attribute.
- Continue adding attributes as needed.
- When you are done click Next.



5. From the Child products page, click Add Child Product.

   The iMIS Products list is displayed.

- Select an iMIS product from the list.
- Choose the attributes you want the Public view user to choose from.

  You must select an attribute value for each attribute associated with the master product. A child product must have unique attributes. For example, there is only one small red polo shirt associated with the master product.
- Click Save.

  The sub-product appears in the list.
- Continue adding child products as needed and click Next when you are finished.
- Select a default product from the list by clicking the green check mark next to the product in the list.

  Note: At least one product must be selected as the default before an administrator will be permitted to continue.

  The Cross-Sell page is displayed.

6. Select a cross-sell products from the available products list and click Add.
7. Click Finish.

   The list of master products is displayed on the Manager master products page. You can continue creating Master products as needed.

Adding attributes to master products

You can add attributes after you have created a master product.

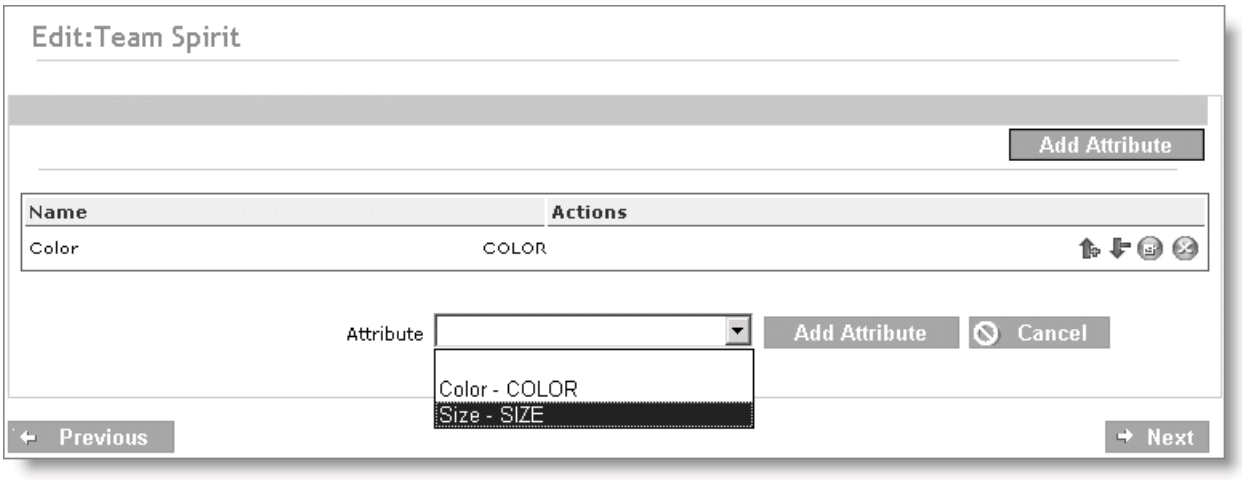
To add an attribute

1. On the Manage master products page, select a master product and page through to the attributes setup page (System Setup > Set up commerce web components > Manage master products).
2. Click Add Attribute.

   The attribute drop-down is displayed.

3. Select a new attribute from the drop-down.
4. Click Add Attribute next to the drop-down.

   The new attribute is displayed in the list.



Adding child products

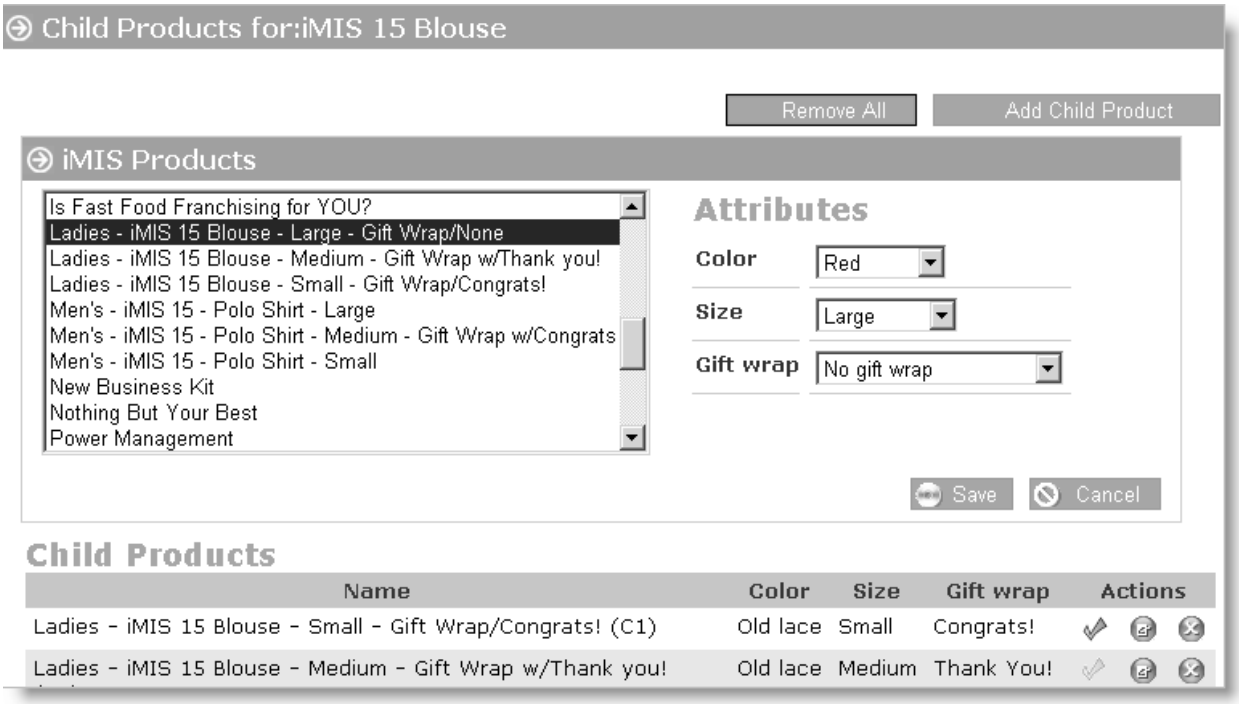
A group of child products are grouped under each master product. At the Child Products page, you can choose the iMIS products that make up a Master product. You can go back to add or delete child products even after you have created the master product. Deleting a child product will not remove it from the iMIS database or the Public view database. Instead, the child product is removed the master product.

To add child products

1. On the Manage master products page, select a master product (System Setup > Set up commerce web components > Manage master products).
2. Page through to the Child products page.
3. Click Add Child Product.
4. Select one desired child product in the iMIS Products list on the left side of the page.
5. Select the product's values from the drop-down menus in the Attribute section.
6. Click Save.

   The product will appear in the list of child products.

7. (optional) In the Actions column of the Child Products list, select a checkmark to designate the default child product.
8. Click Add Child Product to add additional products.

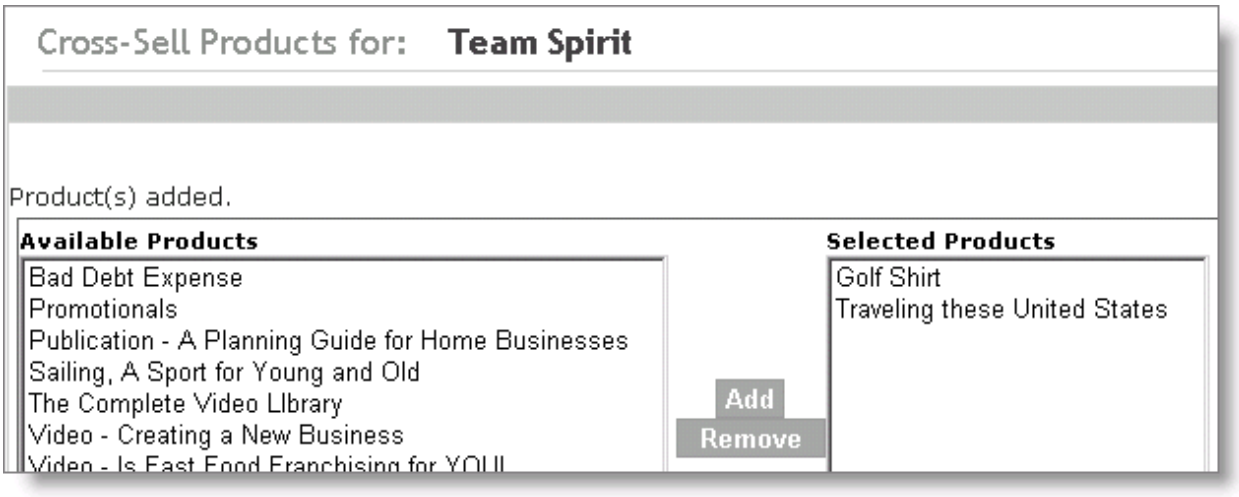


Selecting cross-sells for master products

You can select additional cross-sell products after you create a master product.

To select cross-sell products

1. On the Manage master products page, select a master product (System Setup > Set up commerce web components > Manage master products).
2. Page through to the Cross-Sell products page.
3. Select a cross-sell product from the Available Products list.
4. Add the cross-sell products to the Selected Products list.
5. Click Finish to save the products.
6. The Manage master products page is displayed.



Commerce Setup in iMIS Desktop

Orders setup for Public view

Setting up and troubleshooting freight calculation

On the shipping page, web-based views list the available shipping options for calculating freight charges. Automatic freight will not calculate if the freight by weight, total value, or total quantity is not set up correctly.

When these errors occur, the amount may be set to zero, but the user can proceed with the order without receiving an error message. These errors are logged and emailed to the system administrator.

To set up freight calculation

Freight calculations in the shipping page depend on setups in four areas:

- In iMIS Desktop, go to Orders > Set up module > Set up tables. Set up the tables for freight by weight, total value or total quantity.
- In iMIS Desktop, go to Orders > Set up module > Add-on Charges. Select Automatic Calculation of Freight Charge. Then select a type of Freight charge.
- Go to System Setup > Set up web components > Organization Configuration. In the E-mail address to notify when a product is sold (ProductSaleEmailTo) field, provide an email address for a staff member who performs setup in Orders.

- Go to System Setup > Set up web components > Organization Configuration. In the Email displayed in the From: email field (NoReplyOrgainzationEmailAddress) field, provide an email address for the staff member who performs setup in Orders.

  To access logged freight errors

  Go to System Setup > Set up web components > Error log to see freight calculation errors.

  Setting up Customer's default tax authority

  In order for Public view Orders to run properly, you must set up the Customer's default tax authority (see Using a customer's default tax authority) option on the Web Order Options window (From Orders, select Set up module, and click Web).

  Enabling backordering on the web

  To allow out-of-stock items to be purchased in the web views, enable the Allow purchase of out-of-stock items checkbox (System Setup > Set up commerce web components > Store configuration).

  The backordered purchase is processed as a pro forma order and created as if the item is in stock and will be shipped. However, the product inventory is not affected at the time of the order.

  When an out-of-stock item is in the cart during checkout, the cart issues a message about the backordered state. The backorder quantity displayed is based on the product availability at the time the order is placed.

  You can customize the out-of-stock and backorder messages that appear during the order process. The out-of-stock message appears on the Product Detail page. The backorder message appears on the My Cart, Review, and Order Summary pages, and in the Order Confirmation sent by email.

  If the Allow purchase of out-of-stock items checkbox is cleared, orders containing out-of-stock items can not be processed in the web views.

  To enable backorders in the web views

1. From System Setup, select Set up commerce web components > Store configuration.

2. Select the Allow purchase of out-of-stock items checkbox.
3. (Optional) Customize the out-of-stock and backorder messages.

   Only one backorder message displays in the web views. The backorder message displayed is based on the backorder option selected on the Backorder Processing window (from Orders, select Set up module, and click Backorders).
4. Click Save.

Billing setup for Public view

Users can make payments for their dues and subscriptions in the Public view from Contacts > Contact Management > Billing. Depending on the accounting method you use for renewal billing, it varies which options you must select to allow this self-service functionality.

- All renewal billing processed using the Cash method: Enable the Accept payments on the web option for each billing product you want to enable for payment on the web (Billing > Set up module > Products). With this option, you can pick and choose which products you want to expose for payment.
- All renewal billing processed using the Accrual method: Enable the global System Setup option Allow customers to make accrual dues payments on the web (System Setup > Set up commerce web components > Billing Configuration). With this option, all accrual billed items are exposed for payment on the web, because accrual invoices must be paid in full.
- A mixture of Cash and Accrual renewal billing: Enable the global System Setup option Allow customers to make accrual dues payments on the web, which makes all accrual billings available for payment on the web. Then enable the Accept payments on the web option for each cash billing product you also want to be payable on the web.

Customer setup for Public view

In order for Public view Events to run properly, set up country names in iMIS Desktop.

Fundraising setup for Public view

You can collect donations online through a WCM website for donation features or through the Public view.

You can customize the online donations feature to suit your organization's needs.

Setting up online donations in iMIS Desktop

You must be licensed for Donate to use the online donations feature.

Follow these setup steps in iMIS Desktop to enable online donations. You may have already set up these features for other parts of your iMIS system.

1. Create a payment gateway. (AR/Cash > Set up module > Credit Card Auth).
2. Configure iMIS to use batch control. (AR/Cash > Set up module > Batch Control). Online donations are automatically placed in system-generated Internet Gifts batches that are created based on the date the transaction took place. All of the transactions from a single day are placed in a batch with the same date. If today's Internet Gifts batch is closed, and a new transaction takes place, a new batch is created with today's date.
3. Determine which distributions will be credited with online donations. Either define a new distribution (see Defining distributions and premiums) or select from existing distributions (Fundraising > Set up tables > Distributions and premiums).
4. (optional) Set up a Donor Club (see Defining donor clubs) (Fundraising > Setup tables > Donor clubs > Gift Amount). A Donor Club used for online donations must be set up for cash only payment.

Contact records created by online donations

Clicking the donation link takes donors directly to the I want to donate page, where they can make an online donation in three different capacities.

- Current contacts who are logged on (authenticated users) – The information from the I want to donate page is submitted to the iMIS contact's existing record.
- Current contacts who are not logged on (unauthenticated user) – The information from the I want to donate page creates a duplicate contact record for existing contacts, but it does not create a new public user record. The new contact record is assigned the default

contact type (System Setup > Set up web components > Quick setup).

- Public users who are not registered on the website (anonymous user) - The information from the I want to donate page creates a new iMIS contact record, but it does not create a public user record. The new contact record is assigned the default contact type (System Setup > Set up web components > Quick setup).

Removing the Donate link from the homepage

A link to the donation page appears on the Public view's homepage even if your organization is not licensed for the feature.

To remove the donation link, delete the following line of code from the Default.aspx file using a text editor. In a typical installation, the Default.aspx file is located in the local directory for the iMIS application - c:\Program Files\ASI\iMIS\iMIS_public\Default.aspx.

<a id="ctl00_TemplateBody_HyperLink6" href-
f="Core/Donations/Gift.aspx">Donate to our organization!

Setting up credit card authorization for the Public view

Use the following steps to accept credit card payments in iMIS Public view:

1. Set up credit card authentication (AR/Cash > Set up module > Credit Card Auth). See AR/Cash Credit Card Authorization window.
2. Set up cash accounts for online registration credit cards (AR/Cash > Set up tables > Cash accounts). See Setting up credit/debit card cash accounts in AR/Cash.

   Note: The cash account codes must be prefixed with "W_" (such as "W_VISA") to accept credit card payments via the Public view.
3. Modify the web.config file to include the Gateway Account Code. See Modifying the web.-config file with the credit card gateway.

Web component setup windows

The fields described in this section are used when performing the tasks in this guide.

System Setup: Set up web components

Note: The documentation might not match your product. Your organization can customize iMIS, license fewer features, or limit your security access, all of which affect the fields that you see in the product interface. Moreover, the documentation does not cover every window or window element. Windows and fields that are clearly defined in the product interface itself, or that should otherwise be intuitive, are not described in the documentation.

Public view administrators can use the Setup web components task list on the System Setup feature to configure items for the Public view including labels for the various areas of the site and email and graphics settings.

Quick setup window

This window defines basic connection mappings and organization information required to expose the Public view of iMIS for access by anonymous users and Public users.

From System Setup, select Set up web components > Quick setup window.

Note: An iMIS system administrator can change the information that is returned by search queries for both anonymous users and Public users by modifying a Default query. Refer to Where to configure the Public view Directory area for the locations of the queries.

The full name of the organization that owns the site

Enter the name to appear in the title tag of the front page of the Public view.

The abbreviated name of the organization that owns the site

Enter an abbreviated name if desired. You may leave this field blank.

The default email address for the site

Enter the email address to receive all email by default when errors occur with the site. Typically this email address is for the webmaster and the primary contact for the organization.

The default Customer Type to use when creating new customers online

(Required) Specifies the default Member Type to use when creating a new iMIS contact record for anonymous users who register themselves through the web views of iMIS. This value corresponds to the Description field in the Customer types window (Customers > Set up module > Customer types).

The default Customer Type to use when creating new organizations online

Specifies the default Member Type to use when creating a new iMIS contact record for non-individual entities. This relates to creating non-individual accounts in the Web view (see "Creating non-individual accounts in Web view"), for Full and Casual users to enter new accounts.

General configuration window

This window defines variables that affect the handling of alternative currencies, and which control the title and contents of site-wide error windows.

From System Setup, select Set up web components > General configuration.

Set the Systems Base Currency Code

Specifies the default ISO 4127 currency code (and corresponding pricing) that appears in commerce-oriented windows of the Public view of iMIS.

The control is a drop-down list of ISO 4127 currency codes. When users select an alternative currency code that is different from the base currency code, the system uses values from the Iso_Currency_Codes table and the Exchange_Rate table to calculate exchange rates and display the pricing in the user's chosen currency.

To update these two tables with current exchange rate information, an SQL script called insert_Exchange_Rate_and_Iso_Currency_Codes_values.sql, and instructions for running the script, is available from the Downloads area of the ASI Technical Support site.

Display Alternative Currency

Enables the display of a user-selectable alternative currency control in commerce-oriented windows of the Public view. When cleared, no alternative currency control is available in the Public view, and all prices are displayed according to the base currency code.

Credit card prefix

Public view only:

Specifies the prefix used in a cash account Code (AR/Cash > Set up tables > Cash accounts) to denote cash accounts that are used specifically for web-based credit/debit card transactions. Only cash accounts with a code that contains this prefix value are visible in windows of the Public view related to web-based payment transactions.

The cash account's Title field determines what is displayed in drop-down lists that enable users to specify a credit card type. For example, if your Credit Card Prefix defined in this window is “W_”, and you define a cash account in AR/Cash with W_VISA specified for the Code field and Visa specified for the Title field, then public users would see Visa in the drop-down list when choosing a credit card type for their checkout transaction.

Note: In a new installation of iMIS there are no default web-based cash account Codes. You must use AR/Cash to define web-based cash accounts, and the Code used for each of those web-based cash accounts must use the prefix defined here in this field.

Content item-based websites:

This prefix does not determine which cash accounts are available for web-based transactions. This is determined by Payment Method Sets (see Set up payment method sets).

Generic error message

Specifies the message that will be displayed if the error does not fall into the category of unauthorized access, checkout errors, or invalid licenses.

Organization Configuration window

This window defines your organization information as it appears in the Public view. By default, iMIS pre-populates these fields with the email address entered in the System Setup > Set up web components > Quick Setup: The default email address for the site field.

From System Setup, select Set up web components > Organization configuration

Note: Ensure email addresses are entered correctly. Email notifications rely on having valid email addresses.

Email From (CreateAccountEmailFrom)

Specifies the From address of email messages that are sent in response to create account requests from users who register for membership online. Required before any user may create a new account.

URL of registration page

Specifies the URL of the page for new account registration.

Domain Name

Specifies the domain name you want for all pages related to the Public view.

Contact person Email (EmailFrom)

Specifies the email address that sends email from your organization's Public view. Sometimes, based on your preferences, this email account is an unmonitored email address, one that includes "please do not reply to this address" in the message body. That way, an actual person's email account does not get cluttered with "bounce back" messages.

Email address to notify when an account is updated (SendToEmailOnAccountUpdate)

Designates a contact to receive notification whenever an account is updated. Required before any user may create a new account.

Email address to notify when a product is sold (ProductSaleEmailTo)

Designates a contact to receive notification whenever an order is placed. To disable notification, leave the field blank.

Admin configuration window

This window defines properties of the Error log window.

From System Setup, select Set up web components > Admin configuration.

Number of errors displayed per page

Specifies the default number of error messages displayed per page in the Error log window.

SSL configuration window

This window defines SSL (Secure Sockets Layer) options. SSL is a protocol layer placed between a reliable connection-oriented network protocol layer (TCP/IP) and an application protocol layer (HTTP). An administrator may enable SSL for two areas: Login Validation and Checkout. By default, these options are disabled during installation.

Enabling SSL provides extra security for the site by encrypting information. This security is especially important at checkout, where users may enter credit card information.

Note: These options only apply to non-content item based websites, like the Public view. Enable SSL for content item built sites at the content record level: for any content record that contains a content item that you want to operate using SSL, enable the Content is secure (https://) property.

From System Setup, select Set up web components > SSL configuration.

Use SSL security for checkout (only applies to non-content item-based websites)

When selected, iMIS uses SSL for all shopping activities from the Public view. You must have copied your SSL certificate to the server and ensured that IIS is set up properly.

Note: When you select this option, SSL is enabled for both the Public view (iMISPublic) and the Web view (iMIS). If you have iMISPublic installed on a separate webserver from iMIS webapp, then you need to install an SSL certificate on both servers if you wish to use the checkout feature on both the Web view and the Public view.

Use SSL security for logon (only applies to non-content item-based websites)

When selected, iMIS uses SSL for creating new accounts and after a member is logged on to the Public view all HTTP requests use an SSL layer.

Contact us configuration window

This window defines the information that is displayed on the Contact us form.

Note: Be sure to select the Require a value... checkbox for every corresponding field that you want to denote as required before the user can submit the contact request.

Anyone can view the Contact us form, not just logged on users.

From System Setup, select Set up web components > Contact us configuration.

Be aware that choosing either Show or Require applies when anyone accesses their profile through the Public view My account, and when users access profiles from the web using Contacts.

Message displayed after the form has been submitted

Specifies the text for the body of the page that displays on the Public view after a contact has filled out the Contact us form.

Personal label configuration window

Use this window to define the labels that appear on the Personal page of the My Account area, which corresponds to the basic information in an iMIS contact record.

From System Setup, select Set up web components > Personal label configuration.

Major key

Specifies the label displayed for the field in which a user can define their own iMIS major key. The major key is a user-defined ID value (such as a member number) that can be used as an alternative way to find contact records in iMIS.

Ensure that the label used for this field corresponds to the Major Key Prompt value defined in the Customer Setup - Basic Options window (Customers > Set up module > General, Basic Options). For example, if the Major Key Prompt is defined as "SSN", specify a Major key label here that clearly indicates that the user should enter their social security number.

Designation

This indicates a label for a Designation and the default includes the CPA example. A designation indicates that the member has achieved a certification or other indicator that typically goes after the person's first and last name when appropriate.

Exclude directory

Specifies the label for the checkbox that enables a user to exclude their contact record from the Directory area of the Public view. (The visibility of the checkbox itself is enabled with the Show the Exclude from directory field checkbox on the Personal information configuration window (System Setup > Set up customer web components > Personal information configuration).

VAT Exempt

Label for the member to indicate if they are exempt from Value Added Tax (VAT). With these labels, customers who are subject to any of the many VAT charges for products and services can enter their VAT information online.

VAT Reg Number

Label for the VAT Registration Number for the customer to enter.

VAT Country

Label for the field for the customer to specify the country on which VAT is calculated.

Address label configuration window

This window defines the labels that appear on the Address page of the My Account area, as well as other address-related labels that appear in the Events and Store areas.

From System Setup, select Set up web components > Address label configuration.

Separate labels are available for preferred billing and preferred shipping addresses, so even though there are duplicate field names, they refer to either billing or shipping information.

Cart Item Label

Specifies the text for the label for the purchase items in the user's shopping cart. This label can be changed if you want to rename the term "cart" throughout the web site.

Address type

Specifies the introductory text "This is my" for the different types of address labels.

Update Alternate Address Link Label

Specifies the text that appears as a tooltip in the Full view if a customer has entered an alternate shipping address during the checkout process. The tooltip appears over the edit button next to the alternate shipping address.

Product label configuration window

This window defines the labels that appear on the product pages of the Store area in the Public view.

From System Setup, select Set up web components > Product label configuration.

Quantity

Indicates the label for the field where customers enter the amount of a product sold in the online store.

Product price

Indicates the label for the price of a product for sale in the online store.

Payment label configuration window

This window defines the labels that appear on the credit card checkout page.

From System Setup, select Set up web components > Payment label configuration.

Credit card expires

The default label is "Expires" but you may want to inform customers of the date format.

Credit card type

The default label is "Payment Type" and it is next to a drop-down list containing for example, MasterCard or Visa.

Credit card security code (CSC)

The default label is Security Code but you may want to included the CSC acronym or explain that they flip the card over to find this three-digit code.

Misc label configuration window

This window defines the labels that appear throughout the website.

From System Setup, select Set up web components > Misc label configuration.

Comments, in Contact us

Used as the label for the Comments form in the Contact us page.

Results per page

This field specifies the label for the Directory listing results per page.

User ID Label

Specifies the label for the iMIS identifying number assigned to all user records.

SIC Code

Specifies the label for the Standard Industrial Classifications (SIC) code that identifies the primary business of an establishment.

Label for Shopping Cart

Specifies the preferred term for the online shopping container, such as cart or basket. The default is Cart.

Image configuration window

This window defines the folders in which website images and product images are stored.

From System Setup, select Set up web components > Image configuration.

Images folder path

Specifies the location of the folder that contains all the various images for the Public view of iMIS, most of which are categorized into sub-folders. The default location after installation is C:\Program Files\ASI\iMIS\iMIS_public\images.

If you specify a relative filepath (by using a / character at the beginning of your entry), the root for the relative filepath is C:\Program Files\ASI\iMIS\iMIS_public.

Default product images folder

Specifies the location of the folder that contains all product images used in the Store area of the Public view. If you do not specify an absolute path, iMIS treats your entry as a relative path from the C:\Program Files\ASI\iMIS\iMIS_public\images\ folder.

Note: When specifying a relative path in this field, you do not need to prefix your entry with a / character.

Exchange settings window

This window defines the Microsoft Exchange account in your organization from which event meeting requests are sent to users who register for events through the Public view of iMIS.

From System Setup, select Set up web components > Exchange settings.

Username

Specifies the designated webmaster's domain user name required to log onto the proxy server for Exchange, prefixed by your domain name. For example, mydomain\username.

Password

Specifies the corresponding domain password of the designated webmaster.

Exchange URL

Specifies the URL associated with your Exchange server’s Exchange Web Service page. For example, https://webmail.myorg.com/ews/exchange.asmx/.

Note: You can test these three settings by opening an Internet Explorer browser and entering the Exchange URL that you've specified in this Exchange settings window. A

domain authentication dialog asking for your user name and password should appear. Enter the Username and Password that you've specified. If your settings are correct, an Exchange Services.wsdl page containing .xml content will display.

Maintenance mode window

This window enables you to set the status of the Public view of iMIS to maintenance mode, which prevents user from accessing the Public view. The messages you enter on this page appear while the view is in maintenance mode.

From System Setup, select Set up web components > Maintenance mode.

Set the site in maintenance mode?

When selected, this checkbox sets the Public view into maintenance mode and a message is displayed instead of the usual starting page.

The message that is displayed when user goes to the login page...

Specifies the message to display to users attempting to log on to the Public view while it is in maintenance mode.

The message to be displayed to users when the site is in maintenance mode

Specifies the message that appears on every page of the Public view other than the Logon page. You can use embedded HTML tags in this field.

Error log window

This read-only window enables you to browse the error log for the Public view. The navigation bar enables you to select how many errors to show per page and to jump from page to page.

- To sort the log entries, click column headings.
- To view stack trace details about an error, click the Error ID number.

From System Setup, select Set up web components > Error log.

Email templates window

This window allows you to customize iMIS email templates. You can design the email with HTML or CSS, modify the subject and body text, add CC and BCC email addresses, and use variables in the subject line and body. We have provided a sample email customization to illustrate the possibilities.

In addition to the addresses listed in the template's CC and BCC fields, emails are also sent to the email addresses designated in the Set up web components > Organization configuration window. You can add as many CC and BCC email addresses as you like in a comma-delimited list (bob@xyz.com,susan@xyz.com).

Each template has a set of variables that you can use in the email's subject line and body. When an email is sent, the variables are replaced with the appropriate values. Some of these variables are configured from other System Setup areas and have been noted below.

From System Setup, select Set up web components > Email Templates.

Tips

- HTML and inline styles work best in emails, because some email clients ignore externally linked CSS files. For example, the following inline style turns the header text blue and changes the font:

  <h1 style="color:#0000FF;font-family:Georgia,serif;">Heading text</h1>

- Use full paths to images, not relative paths. For example:

- Test your email messages in different email clients to make sure everything looks the way you want.
- To receive email notifications when an account is updated, you must enable the Send an email to the site administrator when an account is updated option (System Setup > Set up customer web components > Account management configuration).

  Account Updated template

The Account Updated email template can use the following variables:

- [ID]
- [FirstName]
- [LastName]
- [OrganizationLabel] - Configured from System Setup > Set up web components > Personal label configuration.
- [Organization]
- [Email]
- [WorkPhone]
- [HomePhone]
- [WebSite]

Account Address Updated template

The Account Address Updated email template can use the following variables:

- [ID]
- [Purpose]
- [FullAddress]

Create Account template

The Create Account email template can use the following variables:

- [FirstName]
- [LastName]
- [CreateAccountEmailBodyTop]
- [AccountDetails]

- [EmailSignature] - Configured from System Setup > Set up customer web components > Reset password configuration.

  Roster Member Removed template

  The Roster Member Removed email template can use the following variables:

- [ID]
- [FullName]
- [Reason]

  New Account template

  The New Account email template can use the following variables:

- [AccountCreated]
- [AddedBy]
- [AddedByID]
- [ID]
- [Prefix]
- [FirstName]
- [MiddleName]
- [LastName]
- [Suffix]
- [Designation]
- [Informal]
- [Title]
- [OrganizationLabel] - Configured from System Setup > Set up web components > Personal label configuration.

- [Organization]
- [AddressPurpose]
- [Address1]
- [Address2]
- [City]
- [StateProvince]
- [PostalCode]
- [County]
- [Country]
- [Email]

Order Confirmation Resend template

The Order Confirmation Resend email template can use the following variables:

- [OrderDetails]
- [ProductDetails]
- [EventDetails]
- [OrganizationName]
- [Company]
- [FullName]
- [ID]
- [Email]

Order Confirmation template

The Order Confirmation email template can use the following variables:

- [OrderConfirmationNote] - Configured from System Setup > Set up commerce web components > Checkout configuration.
- [BillingConfirmationText] - Configured from System Setup > Set up commerce web components > Billing configuration.
- [Details]
- [OrganizationName]
- [Company]
- [FullName]
- [ID]
- [Email]

The body of the Order Confirmation sent to Webmasters can use the following variables:

- [OrderConfirmationNote] - Configured from System Setup > Set up commerce web components > Checkout configuration.
- [BillingConfirmationText] - Configured from System Setup > Set up commerce web components > Billing configuration.
- [WebmasterCopyDetails]
- [OrganizationName]
- [Company]
- [FullName]
- [ID]
- [Email]

Contact Us template

The Contact Us email template can use the following variables:

- [ContactUsEmailMessage] - Configured from System Setup > Set up web components > Contact us configuration.
- [MailBody]

  Donation template

  Note: The Donation email template is text-only. You cannot modify it with HTML or CSS.

  The Donation email template can use the following variables:

- [Subject]
- [Body]

  The donation variables are configured from properties (see Gift.aspx page properties) of the Gift.aspx page. Its default location is c:\Program Files\ASI\iMIS\iMIS_public\Core\Donations.

  Community Report Inappropriate or Offensive template

  The Community Report Inappropriate or Offensive email template can use the following variables:

- [FullName]
- [ID]
- [Title]
- [Explanation]
- [Title]
- [Body]
- [Link]

  Community Notification template

  The Community Notification email template can use the following variables:

- [Title]
- [NotificationLink]
- [PreferencesLink]

Sample email customization

In the following example, the Order Confirmation email template is customized with HTML and inline styles.

Custom code sample

```
<table width="100%" height="100%" cellpadding="20" cellspacing="0" bgcolor='#cccccc'

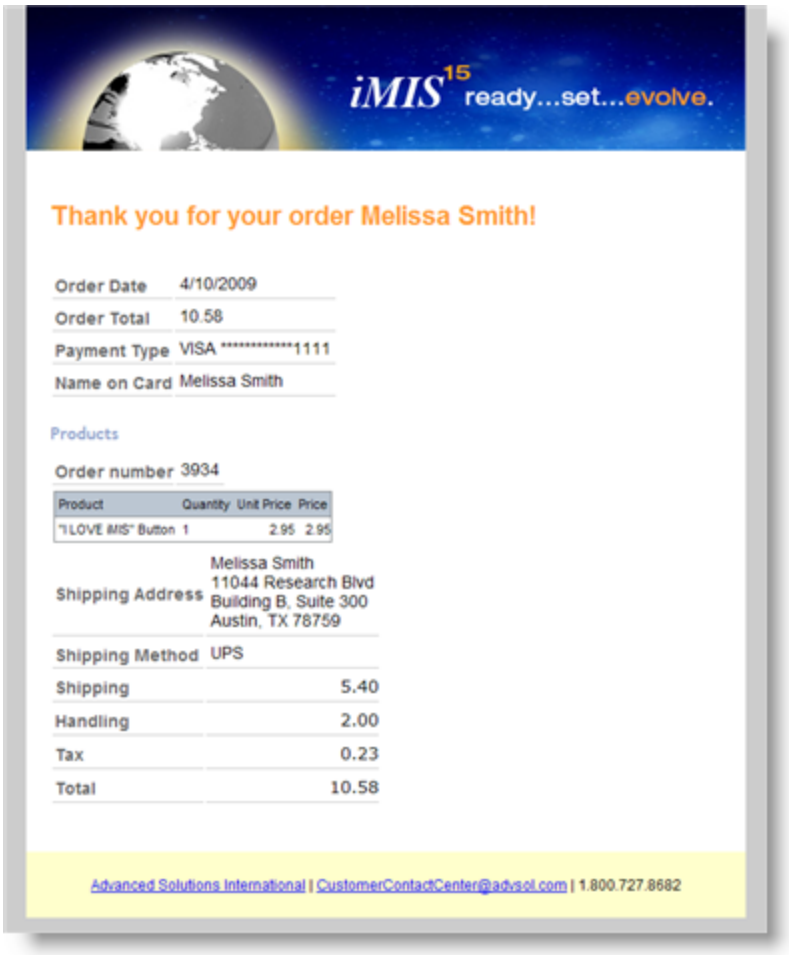
Rendered sample email



System Setup: Set up customer web components

Public view administrators can use the Setup customer web components task list on the System Setup feature to configure items for iMIS accounts which includes user records, passwords, company, committee, and logon information.

Be aware that choosing between either show or require in Set up customer web components applies:

- when anyone accesses their profile through the Public view My account, and
- when users access profiles from web clients using Contacts

Account management configuration window

Account management enhances the customer experience by allowing a customer to control personal information.

You can also change settings for notification email messages such as a listing of account changes or just a notification when an account is updated.

From System Setup, select Set up customer web components > Account management configuration.

Include account changes in the notification Email to the site administrator

When enabled, the modifications that the customer made to their account are included in the email sent to the site administrator.

Number of days that an order is considered recent

Based on a calculation with this value, an order is classified as a recent order as long as the number of days specified has not been passed.

Send an Email to the site administrator when an account is updated

When enabled, the site administrator receives email notifications any time an account is updated at the email address specified in System Setup > Set up web components > Quick setup: The default email address for the site. If you have a different email address in System Setup > Set up web components > Organization configuration: Email address to notify when an account is updated, then that email address receives the account updates.

LogonInformationRequestMessage and PasswordResetRequestMessage

The LogonInformationRequestMessage is sent to users who have submitted the Forgot my logon form. The PasswordResetRequestMessage is sent to users who have submitted the Forgot my password form.

You can use the following variables in the email messages. When an email is sent, the variables are replaced with the appropriate values.

- [UserId]
- [ContactId]
- [Email]
- [LogonUrl]

Use HTML or CSS to modify the look and feel of the email.

Tips

- HTML and inline CSS work best in emails, because some email clients ignore externally linked CSS files. For example, the following inline style turns the header text blue and changes the font:

  <h1 style="color:#0000FF;font-family:Georgia,serif;">Heading text</h1>

- Use full paths to images, not relative paths. For example:

- Test your email messages in different email clients to make sure everything looks the way you want.

Personal information configuration window

Use the Personal information configuration window to select which fields display and which fields require a value when a user selects My Account > Personal or when a staff member selects Contacts > Contact Management > Personal.

From System Setup, select Set up customer web components > Personal information configuration.

Show the Member Type

Allows you to display or hide the Member Type field. If enabled, the next field must be configured.

Allow Member Type to be modified

Determines whether Public users can change their Member Type if displayed. If disabled, the field is visible but read only.

Member Type Choices

If the Allow Member Type to me modified option is enabled, this field accepts a comma-delimited list of just those codes that you want users of the Public view to choose from. For example, most organizations do not allow users to choose to make themselves active members.

Address configuration window

A customer can add and edit address information from the website. The page titles and address prompts are configured on the Address configuration window.

From System Setup, select Set up customer web components > Address configuration.

You can either just show or show and require certain fields.

Create account configuration window

The personal information displayed in the Create account process is specified in the Create account configuration window. You can mark fields as required in this window.

Note: If you have installed a Public view website, you must enter the base URL so users can log on.

From System Setup select Set up customer web components > Create account configuration.

Base url for public website

Enter the base URL, which is the root address for the website that does not include any subfolder names).

Send new account validation email (require that new users be validated before logging on)

Specifies whether Public users who create an account for themselves receive a registration verification email after creating an account. When selected, a user must be validated before going directly to the page they were seeking. The settings for this email are included on this Create account configuration window.

Show the SIC code field/Require the SIC code field

Specifies whether to show and/or require the user to enter the Standard Industrial Classifications (SIC) code that identifies the primary business of an establishment.

Default expiration date, in years from account creation

Specifies how many years the account exists in the system until it is marked as expired.

Tip: Several of the fields on this configuration window relate to creating non-individual accounts (see "Creating non-individual accounts in Web view"), for Full and Casual users to enter new accounts.

Create account page titles window

Page messages and titles for each step in the Create account process are entered in the Create account configuration window.

From System Setup, select Set up customer web components > Create account page titles.

Step n subtitle n

Each of these fields specify the text for the Create Account wizard-like pages on the Public view.

Header before the user information

This text specifies the text the user sees after successfully registering their new account.

Create account search window

On the Create account search page, you can specify certain prompts and the company information you want to be displayed when users search for their company.

From System Setup, select Set up customer web components > Create account search.

Tip: Several of the fields on this configuration window relate to creating non-individual accounts for Full and Casual users to enter new accounts.

Search only among members of this type

Enter the member codes that you want to limit for website visitors to search.

Title of the Company Search page

Specifies the heading text on the page where members search through company records. You may want to modify this if company does not describe the types of records your visitors would search through.

Prompt to show after searching for a company

Specifies the wording for letting a website visitor know about their search results.

User must select his or her company before creating an account

Specifies whether you require that a user selects from existing company records before moving through the account creation process.

Note: If their company does not yet exist in the iMIS database they may enter their company's name when creating their record. However, this does not add the company record to the database or add the user's record to a company roster.

Show... in company search results

Specifies the company information displayed in the company search results.

Roster Management Configuration window

You configure the display and editing of a list of company or trade association members using the Roster Management Configuration window.

From System Setup, select Set up customer web components > Roster Management Configuration.

Roster management enabled in iMIS Web Components

Select this checkbox to allow designated company administrators to view and manage records of all contacts belonging to their company. By assigning certain user records the Company Administrator role, you can enable members to manage their group's roster.

Link displayed when a roster manager unsuccessfully searches for a member to add to a roster

Specifies the text for the option to continue with new account creation when one or more possible matching records are found in system.

Number of members to show at once

Specifies the number of members shown per page in the company roster in the Web and Public views.

New accounts can be created from roster management

Select this checkbox to allow the person with the Company Administrator role to create new accounts when managing the roster.

Subject line for Emails announcing accounts created through roster management

Specifies the subject line for email notification sent when a new account is added to a company roster by a Company Administrator.

Notify the company when a member is removed from its roster

Specifies whether an email notification is sent when a Company Administrator removes a member record from a company roster.

Note: Email notifications are sent to the address specified in System Setup > Set up web components > Organization: Email address to notify when an account is updated.

Warning when removing a member from the roster

Text for warning the Company Administrator that they have selected the option to remove a member from the roster.

Stored procedure that returns all names available for roster management

If you create a new stored procedure for returning the roster list names, you enter the name of the stored procedure here.

Stored procedure that removes a member from a roster

If you create a new stored procedure for removing a name for the roster list, you enter the name of the stored procedure here.

Create account settings window

When users set up an account, they can choose how they would like their information to be handled. In addition, the system administrator can set options for informing the new user about the new account. These preferences can be specified on the Create account settings window.

From System Setup, select Set up customer web components > Create account settings.

Show the Exclude from directory field

Specifies whether to show the checkbox so that the user can choose to be excluded from the Public view directory so that other members cannot search for them.

Require a value in the Exclude from directory field

Specifies whether you require the user to choose to be excluded from the Public view directory.

Show the Exclude from mail field

Specifies whether to show the checkbox so that the user can choose to be excluded from mailings from your organization.

Require a value in the Exclude from mail field

Specifies whether you require the user to choose to be excluded from mailings.

Allow creation of a web logon during account creation

When selected, enables the user to create their own logon when creating an account.

If the record found has no Email address, use the one that was typed in (AllowNewEmail)

When selected, specifies that the user can enter a new email address, carrying forward the newly entered email address into Step 2 of registration.

Logon configuration window

The logon window is the first window a user encounters when creating an account or registering for any service on the Public view website.

Before logging on, users are given options by default:

- Log on
- Look up their account, from a Forgot my ID link
- Create a new account
- Reset my password

These options are set in the Logon configuration window.

From System Setup, select Set up customer web components > Logon configuration.

Remember me time (years) (LoginTimeout)

Specifies the number of years the browser may remember the password.

Show the Create account link

When selected, the Please create a new account link appears on the Public view website. If you want to remove the ability for users to create accounts, clear this selection.

Show the Find me link

When selected, a user can look up their account information with their email address, first name, last name, and zip code through a link under the Log on area of the Public view website.

Show the Reset password link

When selected, a user can have an email sent to them with a new password through a link under the Log on area of the Public view website.

Forgot logon or password configuration window

When a user selects Forgot my ID, iMIS searches the database for an existing record. The search parameters the user enters are defined in the Forgot logon or password configuration window.

From System Setup, select Set up customer web components > Forgot logon or password configuration.

User choice when the desired record was not found, 1

Specifies the message the user sees if iMIS does not find their record.

Find contact: Show results before Emailing password (FindMeShowResultsFound)

Specifies whether results from a search are given before iMIS emails the password to the user conducting the search.

New account: Show results before Emailing password (NewAccountShowResultsFound)

Specifies whether results from a search are given before iMIS emails the password to the user creating a new account.

Reset password configuration window

Every message a user sees during the Reset Password process has been created by an administrator in the Reset password configuration window.

To reset a password, a user account must have been previously created. Resetting a password is a simple process. After clicking the reset password link at Logon, a user types an email address into a text box. After a user clicks submit, iMIS sends an email containing a new password. The two link names by default are Reset My Password and Trouble Logging on.

If a user cannot access the email address used in iMIS, then an iMIS administrator can go into the System Setup > Security administration > Users > User Credentials area and

type in a new password, and then tell the contact over the phone what their new password is set to.

From System Setup, select Set up customer web components > Reset password configuration.

Committee configuration window

The display of the Committees directory is determined by the stored procedures and values entered in the Committee configuration window. The stored procedure pulls the committee description from the database.

Note: To display a committee to web clients, enable its Show on web option (Customers > Setup tables > Committee codes).

To change the search queries for committees, modify $ > ContactManagement > DefaultSystem > Queries > Directory > Committee in the Document System from the Staff site.

From System Setup, select Set up customer web components > Committee configuration.

User defined fields window

The Public view administrators can define custom pages that contain user-defined fields from the User defined fields window under Set up customer web components. These pages appear within account management as another page.

From System Setup, select Set up customer web components > User defined fields.

The Public view administrators can add user defined fields to the personal information page within account management. These will appear in a section of the Create account process pages. Administrators also have the ability to define custom pages within account management and assigned user defined fields to those pages.

It is important to note the following

- All user defined fields (UDF's) must be assigned to a window before that can be used on a Public view page.

- Each table must have the Always Create checkbox checked so that each user has a record inside every user defined table.
- Public view does not support multiple instances.

  The user defined fields setup page can be found within the Customer administrative section.

  Unassigned fields

  All UDF's found will be listed in the Unassigned Fields section on the right side. The UDF's will be listed in a tree format by the table name that the field is assigned to.

  Assigned Fields

  Any UDF that has already been assigned to a page will be displayed in the Assigned Fields section on the left side. The first step in assigning UDF's is to choose the page. By default, administrators can choose to assign fields to the CreateAccount process or to the PersonalInfo page. Once you have selected the page, you can add UDF's to that page by dragging any unassigned fields from the right side onto the name of the page on the left side.

  Adding a UDF to the create account process or the personal information page

  To assign a UDF to a page, simply drag the UDF name from the Unassigned fields onto the name of the page in the Assigned fields section. You can change the order of fields listed by dragging up or down in the list.

  Removing a UDF from a page

  Administrators can remove any UDF from a page by clicking the Delete icon next to the UDF in the Assigned fields section.

System Setup: Set up events web components

Note: The documentation might not match your product. Your organization can customize iMIS, license fewer features, or limit your security access, all of which affect the fields that you see in the product interface. Moreover, the documentation does not cover every window or window element. Windows and fields that are clearly defined in the product

interface itself, or that should otherwise be intuitive, are not described in the documentation.

Public view administrators can use the Setup events web components task list on the System Setup feature to configure items for the Public view including event registration setup and paying for event registration with a credit card.

Event setup window

Use the Event setup window to configure events and functions for online registration.

You must log on as a user with rights to the Administrator or EventCoordinator security key to perform event setup.

From System Setup, select Set up events web components > Event setup, and select an event.

Certain messages have an upper limit for the number of characters the message can contain. For example, the Registrant page message field on the Registrant tab has a character limit of 255 characters maximum for the field.

Tip: You can also select events to define from Events, by selecting Define an event, select or create an event, and click More > Web Setup Wizard.

Events configuration window

The Events web feature messages and default values are set in the Events configuration window. Event registration setup options are also on this page.

Note: You must enable the Allow account creation during Event Registration option if you want the user to be able to create a new account during the registration process.

From System Setup, select Set up events web components > Events configuration.

Create an internet batch for each event (WebBatchOption)

Specify whether to create a new Internet batch for each event. When a user registers for an event over the Web, a batch is created automatically. A batch number generated from a web event registration is identified with a description of “Internet”. The format for the

batch number is dictated by your batch control setting. If the Auto Date Batch Numbers option is enabled, the batch code is XXX-1, XXX-2, XXX-3 where XXX is the date and the 1,2,3 is the consecutive numbering for batches with the same date.

Next button for events calendar (Either text or image)

Enter either an angle bracket as text, or you can enter the HTML tag <img src-c="http://domainname.com/imagelocation/filename.jpg"alt="Next"> if you want to use an image file for the Next or Previous buttons on the events calendar. Note that you do not want to use any other embedded HTML tags, such as wrapping the <img> tag with any link tags (such as <a href="">), because the goal is to use the image as a clickable link to the next or previous page in the events calendar.

Meeting type for alternate registration

Enter the code for the type of meetings that have alternate registration enabled, set in the Type field on the Define an event window. Separate the codes with a comma.

Location of custom event registration

Enter the URL for a custom event registration starting page relative to the base URL of the Public view website.

Location of custom summary page

Enter the URL of a custom event summary page relative to the base URL of the Public view website.

System Setup: Set up commerce web components

Public view administrators can use the Setup commerce web components item on the System Setup window to configure the Public view orders and billing features. Most of the windows in this setup area are self-explanatory. For the more complex procedures you are guided step-by-step for ease of use. Some setup is required in iMIS Desktop.

Note: The documentation might not match your product. Your organization can customize iMIS, license fewer features, or limit your security access, all of which affect the fields that you see in the product interface. Moreover, the documentation does not cover every

window or window element. Windows and fields that are clearly defined in the product interface itself, or that should otherwise be intuitive, are not described in the documentation.

Store home window

Store home is the main setup page for all of Public view Orders setup.

- Set up categories
- Edit categories
- Delete categories
- Associate products with one or more categories
- Assign Featured Products status to items
- Change the web status and sort order of each product

From System Setup, select Set up commerce web components > Store Home.

Store configuration window

Public view administrators use the Store configuration window to control the behavior of Public view components pages such as how icons are displayed, how products are sorted, and messages that are displayed about inventory.

From System Setup, select Set up commerce web components > Store configuration.

To streamline users' view of cart items

By default, users see all of the products, dues, and events they have added to their shopping cart.

To control which types of items are displayed in the cart, use the Show products/dues/events in the cart checkboxes. If you clear one of these checkboxes, then the cart does not display items of that type.

Checkout configuration window

During checkout the user is led through a procedure for verifying the order and submitting shipping and payment information. These options are set on the Checkout configuration page.

From System Setup, select Set up commerce web components > Checkout configuration.

Purchase order value used for no charge checkout

Specifies the code value for a purchase order used for no charge at checkout time.

Show the link to add a meeting to a calendar in Outlook/Exchange

When selected, a link to send a meeting request is displayed in the Public view task list so that the user can add a meeting to their calendar by clicking "Add to calendar" and then selecting which meeting to add. You must ensure that your Exchange account settings are tested and working correctly.

Credit card label configuration window

During checkout users must submit verification of information for a credit cards. These prompts are set on the Credit card label configuration page.

From System Setup, select Set up commerce web components > Credit card label configuration.

Credit card security code (CSC)

Specifies the label for the field that prompts for a CSC code, the three-digit security code on the back of a credit card.

Cart manager window

The Public view administrator can view the items in a user's shopping cart. On the Shopping Cart Manager page, the administrator can change and delete items in the cart including product purchases, event registrations, and dues payments.

From System Setup, select Set up commerce web components > Cart manager.

Manage product attributes window

the Attribute Setup window enables an administrator to:

- Create new attributes.
- Delete attributes.
- Modify existing attributes titles, codes or descriptions.
- Add values to attributes.
- Modify values.

Note: Every attribute must be created and complete with values before you add child products. Modify every attribute before continuing.

A single attribute may be used for several products. You do not need to form new attributes for every master product.

For example, any number of values may be added to a single color attribute. Not all of the colors will display on an item's page. The page only shows that item's available colors.

A pair of pants possessing only two color choices, black and blue, uses the same color attribute as a shirt with 25 different color choices. At the pants information page, viewers see a drop-down menu with 2 choices. At the shirt's page, shoppers see 25 choices. The same color attribute is linked to both products.

Manage master products window

You define master products to sell different versions of a single product from one page in the Public view. For every master product, you can define attributes, add child products, and list cross-sell products.

From System Setup, select Set up commerce web components > Manage master products.

Billing configuration window

The Public view administrator can set prompts for the Billing page on the Billing configuration page.

From System Setup, select Set up commerce web components > Billing configuration.

Billing page text (after title)

Specifies the description for the billing page.

Label for BillingWebUserControl, a web user control that may be used on client sites (Advanced)

Specifies the text that appears on a configured billing page in the Public view.

Add billing information to confirmation e-mail

Select this option to enter custom text for the order confirmation email message. Enter the desired text in the Text that will appear... field. This text appears on the payment email message in addition to all other payment information set up to display in the message.

Allow customers to make accrual dues payments on the web

Enable this option if you want line items billed using the Accrual accounting method to appear in the Public view under Contacts > Contact Management > Billing. All accrual billing items must be paid for at the same time; users cannot optionally select or deselect items that appear in their Billing list. If a contact's items have been billed to another party, those items appear in the Billing list for the Bill to ID. See Billing setup for Public view for more information.

Working with Content Gallery iParts

iParts are the foundation of your iMIS sites that you build with RiSE. This section helps you to understand and master the critical iParts that present attractive and dynamic content to your users.

WWhat are iParts

An iPart is an iMIS-specific web part that represents a building block of features that you can place on a content record with other building blocks to create new pages of features. Multiple iParts can be combined and displayed in a content record as you prefer.

Default iParts appear throughout iMIS. You can modify them for your needs and you can reuse iParts throughout the system. For example, an iPart displaying a roster for a Membership Group can follow the same user behavior patterns as an iPart for a roster in Events.

Configuring iParts

iPart configuration allows you to:

- Define how the iPart will behave
- Control how much access you want end users to have
- Hide configuration details from end users; two instances of the same iPart with different configurations can appear as two different controls to the end user
- Examples:
- Allow users to edit on a staff-facing site, but display the data in read-only mode on a public-facing site
- Use multiple instances of an iPart on one page to access different sets of data

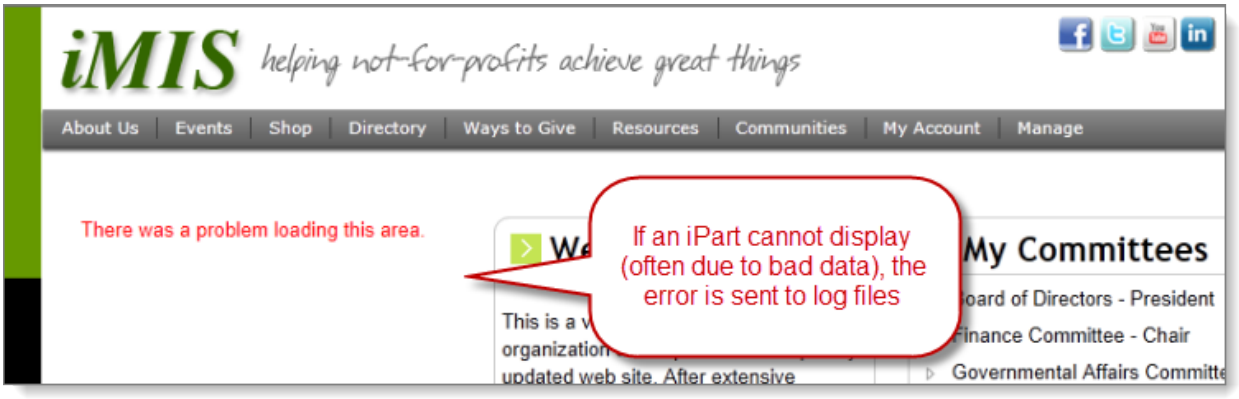
Run-time versus design-time

iParts have two different views:

- Design-time view: What you see in a content record when you add an iPart and configure it.
- Run-time view: What your end-user sees when viewing the iPart within your website. This may differ from what you see in the Design-time view, because some iParts have a different behavior after you publish the content.

Troubleshooting iPart errors

Occasionally, an iPart may fail. However, it will fail gracefully in place, without disabling the whole page. Typically, a “problem loading” error results from some kind of bad data. By default, iMIS hides the error details:



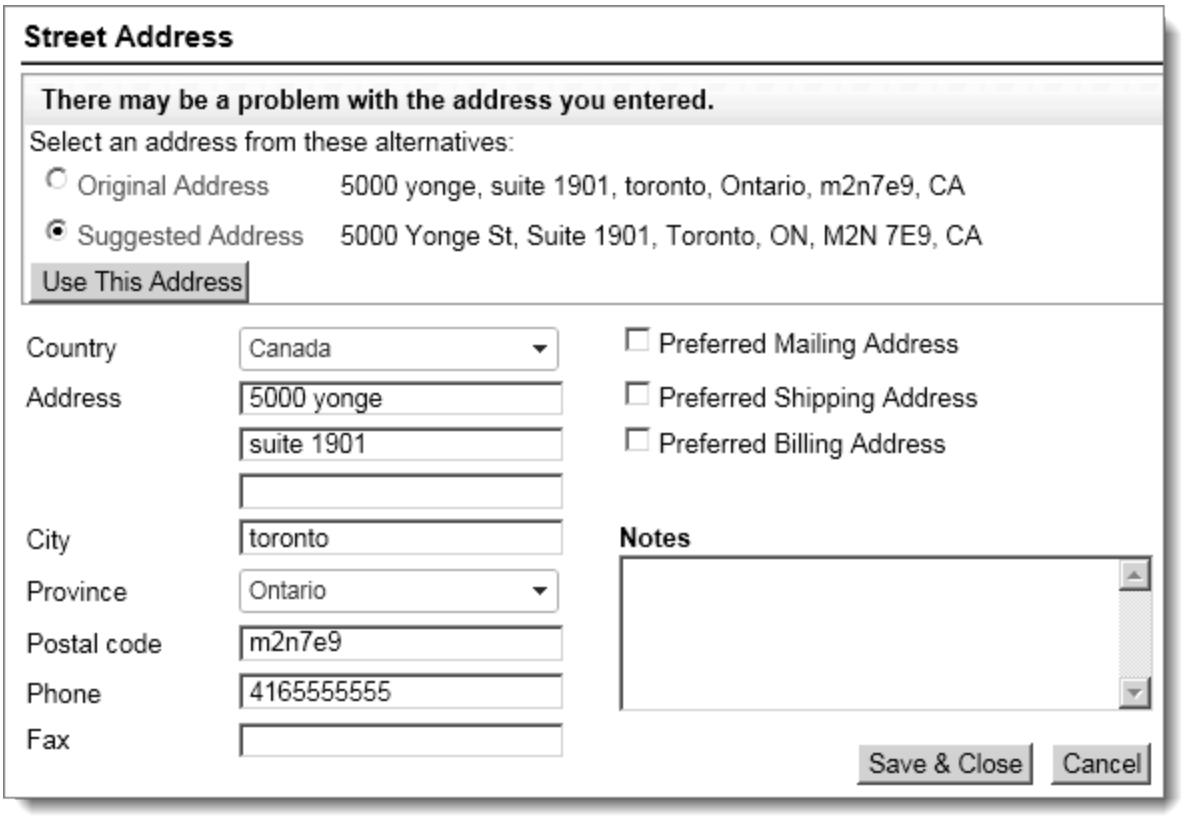
The settings controlling this error logging reside in the <log4net> section of your site’s web.config file. The default settings enable error logging in the Windows Event log and comprehensive logging in the ASI log file, which captures both errors and warnings. This log file, Asi.WebRoot.log, is in the folder above your website root.

Contact your hosting administrator if you need access to information in these logs.

Address verification for iParts

iMIS SOA can perform real-time address verification using web services hosted by ASI. There are several benefits to this:

- Running this verification through the ASI web service frees you from having to install and maintain these data files locally.
- Offloading verification to this service keeps it from adding to the processing load of your page.
- The services of different address providers can co-exist, making it possible to verify addresses across multiple countries.
- The service can support future verification of collections of addresses as well as single ones.
- Postal addresses entered in the Contact Account Creator and Contact Address Editor iParts automatically upload to this service that verifies and standardizes the address. Users can then either accept the suggested address or keep the original as it was entered.



The countries supported by this service are subject to change. Contact your AiSP to obtain an up-to-date list.

Passing URL Parameters

Many iParts allow you to change the content they display based on the value of a URL parameter. This gives you the freedom to create a single content record. This record can be reused and the display can be changed based on a value sent in a link to the page. For example, instead of creating a new content record for every event, you can reuse a single content record that displays different event information based on the EventKey value in the URL.

Parameter values are passed to iParts from a several types of sources:

- Search result links
- IQA query links
- Navigation items
- Relative links
- Absolute links

For any iPart that allows URL parameters to be passed, see the configuration help file for detailed instructions.

Note: Tip: If multiple values are sent to a page for a single URL parameter, the first parameter value wins. For example, if the URL pointing to the Event Display iPart is http://myorg/Events/Event_Display.aspx?EventKey=SPR12&EventKey=FALL12, only the SPR12 event displays.

Note: Note: URL parameters set by navigation items cannot be manually over-ridden in the URL. A user cannot change the parameter value in the URL to display different content.

Specifying commit sequence

If you place more than one iPart on a page, you might need to specify the order in which actions occur on that page. The commit sequence function allows you to explicitly define the execution order of multiple iParts in a content record.

You can define a commit sequence value for the processing order of each iPart relative to the other iParts in the same content record. The commit sequence value must be zero or greater. iParts with a value of zero (the default) are processed after any other iParts with a non-zero commit sequence value that are in the same content record.

Setting a commit sequence is only required in a few scenarios and is noted in an iPart's configuration help if needed.

Security for iParts

Most security is defined at the content record level within iMIS. You can choose that different iParts display for different users. For example, an unauthorized user might see the description of a Special Interest Group, but a signed-in member might see the roster for the group and a staff person might have the privilege to add, edit, or delete the group.

Displaying query results in iParts

The iParts described in this section use IQA queries to drive the data displayed to users. Each iPart provides a unique way to display the data.

Query Chart Viewer iPart

The Query Chart Viewer displays query results in a chart, which can be set to a range of sizes, skins, and chart types.

Designing queries for Query Chart Viewer

The Query Chart Viewer can render any existing query, but you will get the best results by following these guidelines on how to design queries specifically for use with this iPart:

- Queries: The queries you create for the iPart should be structured so that the results are appropriate for charting. For example, if you want the chart to display the total sales per salesperson, then the source query should be written using the Sum function in IQA.

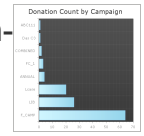
- Query Display Columns: Each property you select on the Display tab in IQA is available in the iPart's configuration page as a Data column display option. Note, however, that you can only select two properties to be displayed in the iPart.
- Aliases: In your source query, enter an Alias for the Display properties you plan to show in the iPart. Relying on the default labels may not be sufficient, especially when your query uses multiple joined sources or custom SQL expressions. If the query does not display as you expect, using an Alias often resolves the issue.
- Sorting: You can sort the query results displayed in your chart in ascending or descending order. To sort your results, edit your source query and, from the Sorting tab, add the property to be sorted.
- Labels: The labels on your chart's x-axis may overlap if there are too many data points or if the labels are too long. You may be able to improve the display through a few methods. In the iPart, you can expand the width of the chart or change the label angle. In the query, you can try to reduce the number of data points.
- Dates: For dates to display correctly, you must cast them as float data types with an offset of 2. You can do this in IQA from the Custom SQL Expression section of the (Display tab). For example, if you want to display the OrderDate property in your chart, add the following expression: CAST(OrderDate AS FLOAT) + 2. Then, when you select this property from the Data column list in your iPart, set the Data column format to a date format.
- Integers: If integers display incorrectly in your chart, cast the column to a data type of INT in the Custom SQL Expression section of IQA's Display tab. For example: CAST (OrderCount AS INT).

Chart Types

You can display the following types of charts in the Query Chart Viewer iPart.

Chart Type	Example
Area - Displays data in an area filled with color to illustrate trends. For example, create an area chart that shows a member's giving history over time. Note: You can only display one area of data in the iMIS Area chart.	

Bar - Horizontal - Displays sets of data with horizontal rectangular bars for comparison. For example, create a horizontal bar chart that shows the number of donations received by each of your fundraising campaigns.



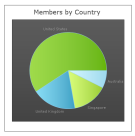
Bar - Vertical - Displays sets of data with vertical rectangular bars for comparison. For example, create a vertical bar chart that shows the distribution of your members across states.

Bubble - Displays data as a series of bubbles. For example, create a bubble chart to show the total number of function registrations for an upcoming conference.

Note: You cannot assign a size value to the bubbles in the iMIS Bubble chart.

Line - Displays data as a series of data points connected by a line to illustrate trends. For example, create a line chart that shows a member's giving history over time.

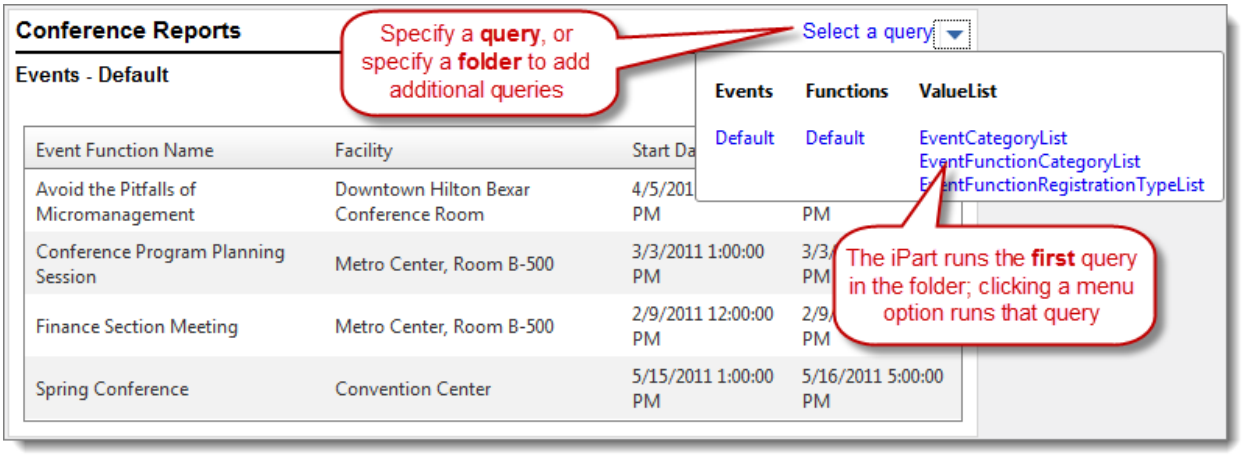
Pie - Displays data in a circular chart divided into sections to illustrate proportion. For example, create a pie chart that shows the proportions of your members by country.



Query Menu iPart

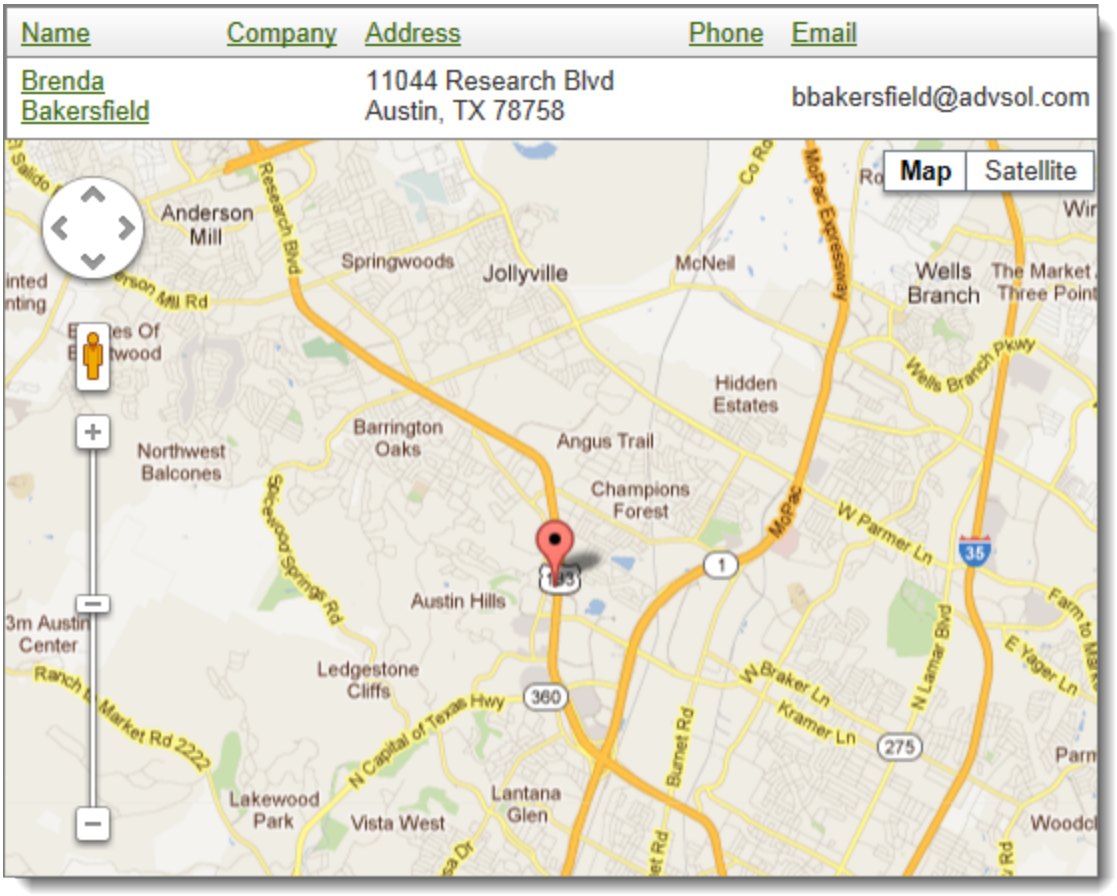
The Query Menu iPart lets you merge query results into your site for tremendous utility. You can set the iPart to display a query, set with whatever title, parameters, columns, labels, and sorting you need, and you can enable exports, which adds icons for sending the data to Word, Excel, PDF, and CSV.

You can also organize helpful queries into a folder and point the iPart to that folder. When the page loads, the iPart displays the first query at the top of that folder, and it presents a drop-down menu of additional queries available, organizing them by subfolders, if any. When the user clicks on a query from the menu, the iPart immediately runs that query and displays the results.



If the query selected contains an address property, you can configure the iPart to automatically map the query results when an address is available. Only one address property per query can be mapped. When this option is enabled, the iPart looks for the following

address properties in this order and maps the first one it finds: FullAddress, Address, FullAddressText, AddressText, Address Text, and Full Address Text.



Related Items iPart

With the Related Items iPart, you can display a list of profile or product pictures based on the results of an IQA query. For example, you can write a query to display the profile pictures of everyone who has registered for an event, made a donation, or ordered a particular product, or to display products in the same category. You can configure the list to display horizontally or vertically, to display a name for the item, and to choose the size of the image. You also have the option to make the profile picture a live link that opens a URL of your choosing, such as the member profile page.

Guidelines for working with the Related Items iPart

- The pictures displayed in the iPart are based on iMIS product or contact IDs. When creating the query for this iPart in IQA, you must select a property that returns an iMIS product or contact ID on the (Display tab). Give this property an Alias of key_Id (the Alias is case sensitive).
- To define the image to display for each record, include a column in your query that specifies the image file name for that record. Give this property an Alias of Image.
- To display a name for each record, include a column in your query for the name of the item or contact. Give this property an Alias of Name.
- When you add Display columns to the query in IQA, they become available within the iPart as Filter columns to filter on.
- You can dynamically filter the query results displayed in the iPart based on the value of another iPart's URL parameter. For example, you can set up your donation page to display the profile pictures of people that have donated to a particular cause (called a distribution in iMIS). The Donation Creator iPart uses the URL parameter itemid to determine which distribution the donation should go towards. If you add your iPart to the same content record as the Donation Creator, then you can set up the Related Items iPart to look at the value of itemid to determine which profile pictures to display. You just have to make sure that your query includes the CsActivity.Product Code property, so that you can select it as a Filter column on the iPart's configuration page. Once selected, enter itemid for the Filter on URL parameter, so that the iPart knows to filter the results based on that URL parameter's value.

  Example: Display other products in the same category

  In this example, the Related Items iPart is set up to display clickable images for other products in the same category as a particular product. This example uses content installed for the sample Member site.

  Go to Content Designer > Manage Content:

1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > RelatedItems. Select RelatedProducts.
4. Filter Options dropdown, select ProductCategory. ProductClassKey.
5. Filter on URL parameter, type in Category.Class.
6. For the Items link to (URL or shortcut), type in ItemDetail?iProductCode={key_Id}&Category={ProductCategory}.ItemDetail?iProductID={key_Id}&Class={ProductClassKey}. This uses the ItemDetail shortcut to link each item in the list to the product page. The particular item's product ID and category are specified in URL parameters so that the correct product and related products are displayed in the resulting product page.
7. Click Save & Publish to complete the content record.

Example: Display other users who have purchased a product

In this example, the Related Items iPart is set up to display clickable profile pictures of other users who have bought a particular product. This example uses content installed for the sample Member site.

Go to Content Designer > Manage Content:

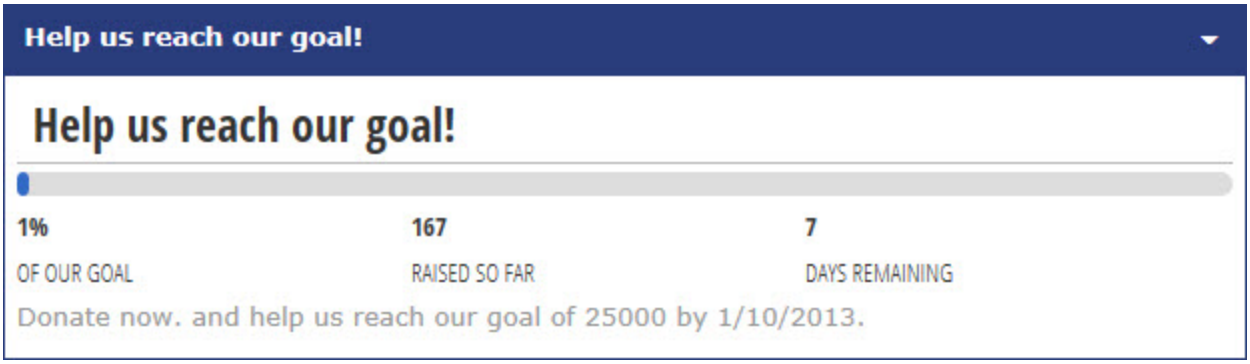
1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Content Types > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > QueryProfilePictureList. Select Orders.
4. Filter column dropdown, select ProductCode.
5. Filter on URL parameter, type in iProductCode. iProductID.
6. For the Items link to (URL or shortcut), type in MBR/Party.aspx. This redirector web page looks for an ID in the URL parameter and then checks the ID's party type and the user's permissions to determine which content record to display. The user's ID is appended to any URL specified in this field.
7. Click Save & Publish to complete the content record.

Progress Tracker iPart

With the Progress Tracker iPart, you can visually display progress towards a goal based on the results of an IQA query. For example, connect this iPart to a fundraising query, so that your members can easily track the progress of a fundraising effort towards a specific goal. Or connect it to an events query, so that you can see at a glance how many people have registered for an event.



To set up the Progress Tracker

1. Create a query for the Progress Tracker.

   Note: For sample queries that will work with this iPart, see $/Samples/ProgressTracker/ in IQA.

The Progress Tracker uses three pieces of information supplied by an IQA query: a goal amount, the sum total of what you are tracking, and the end date (which is optional). When you build your query for this iPart, it must contain specific aliases. In IQA, create a new query and choose the business object you want to query on. Make sure you are in Advanced Mode, then from the Display tab, choose properties to assign the following aliases to:

- Goal_Amount: Indicates which property is the goal amount. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST(25000 AS INT) as a property to set the goal amount to 25,000.
- Sum_Total: Indicates which property is the amount to be summed. The percentage displayed in the Progress Tracker is based on this amount compared to the goal. It can be a monetary amount or any other number, such as the number of event registrations.

  Tip: From the Function dropdown list for this property, select Sum, so that only one row is sent to the iPart. This is not required, but it will improve performance.
- End_Date: Indicates which property specifies the end date. This alias is only required if you want to display an end date in the iPart. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST('2012-12-25' AS DATE) as a property to set the end date to 25 December, 2012.

2. Add the iPart to a content record and configure it.

   Go to RiSE > Content designer > Manage content:

1. Do one of the following:

- Select a Content Folder and click Edit.
- Select New > Website Content.

2. Click add content.
3. Go to ContentTypes > Utility.
4. Select Progress Tracker.
5. Click OK.

6. Enter the iPart CSS class to style the Progress Tracker. Two styles have been pre-defined that you can use in the iPart: ProgressTracker and ProgressTracker2. You can edit these classes to change the look and feel, or you can create your own style for the Progress Tracker.
7. Select a Source query.
8. (optional) Select a data column by which you want to filter. You can use this feature to dynamically update your Progress Tracker, based on the value passed to it in the URL. If you choose to filter on a data column, then also enter the name of the URL parameter, which the iPart uses to identify the value to filter on. For example, to limit the results of an event query to a specific event, you can select the EventCode property and give the URL parameter a name such as EventCode. The progress displayed will then reflect only the event code which is included in the URL as EventCode=[EventCodeValue].
9. (optional) Enter any messages you want to appear in the iPart. The variables below can be used in the descriptions. For example, "Help us reach our goal of {0} new members by {2}!"
   - {0} displays the goal total
   - {1} displays the current sum total or count
   - {2} displays the end date in a long format
   - {3} displays the end date in a short format
10. Select the Caption Options. In addition to the progress bar, you can also display the values as text. If any of the Caption Options are unavailable after selecting a query, this indicates that the required aliases have not been defined in the query.
11. Select the Progress bar location. The bar can be displayed above or below the captions.

    Note: You can also use this iPart to display only a countdown (days remaining to a certain date). In configuration, only select the caption option Display days remaining, then for the Progress bar location, select (None).
12. Click OK.

SSRS Report iPart

The SSRS Report iPart lets you display the results of any IQA query on any page where you place it. The SSRS iPart uses the version 10.0 ReportViewer, which supports IE8 natively and, in IE8, adds a Print button on its toolbar. You can add the SSRS iPart to any content page using CM: open the Utility folder and choose the content type SSRS Report.

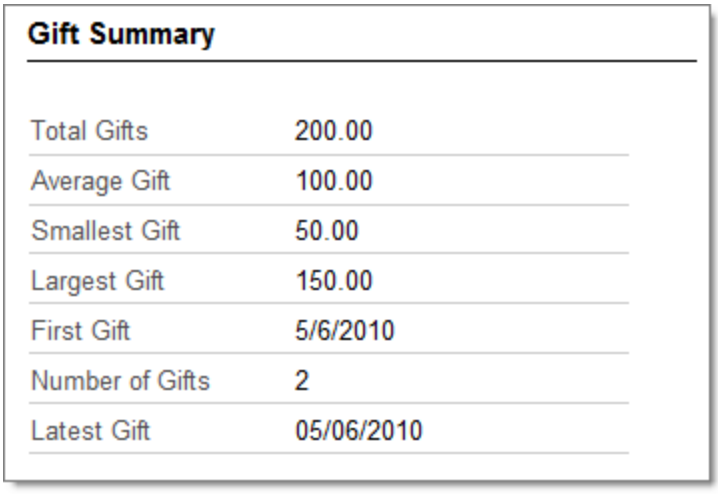
The iPart lets you customize whether to display the export buttons for PDF and Excel versions of the report. You can change the default design (layout, colors, fonts) of your reports by editing the SSRS parameters in the SystemConfig table.

How it works: The process engine specified by the iPart loads a report template (.RDL file) from the document system and creates a report data source (a DataTable) based on an IQA query's SQL source; the report viewer then combines the template and query to generate the report's output. When you configure the iPart, you specify the Document system path to the SSRS Report runtime, which must be a link to an SSRS Process Engine. Click the select link next to the textbox, then browse to your reports (such as $/Samples/ReportingServices), and pick one of the runtime entries.

Note: Tip: Identify a process engine (run-time report) by the arrow on its icon!

Summary Display iPart

The Summary Display iPart displays a single row of query results in a form view.



Gift Summary

Total Gifts	200.00
Average Gift	100.00
Smallest Gift	50.00
Largest Gift	150.00
First Gift	5/6/2010
Number of Gifts	2
Latest Gift	05/06/2010

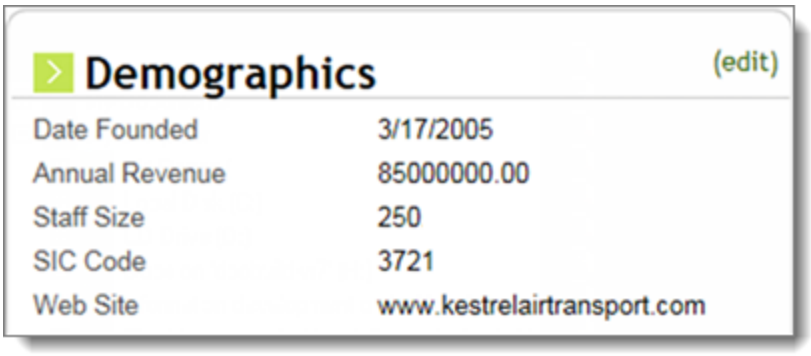
Guidelines for queries displayed in the Summary Display iPart

When creating a query that you want to display in the Summary Display iPart, keep the following guidelines in mind:

- This iPart only displays a single row of query results.
- If you connect the iPart to a query that returns more than one row of results, only the first row is displayed.
- Tip: You can dynamically filter your query results by the currently logged in user, a selected contact, or a date. See Adding dynamic filters to queries for more information.

Panels and custom data

Panels are custom displays of iMIS data that you are able to name, build, arrange in grids, and add to your site. Using panels, your users can browse, edit, add, and delete their data, as you specify:



Panels display within Panel iParts, which allows your users view and edit custom data on the broadest range of browser and platform types that iMIS supports. You can manage your custom data directly and conveniently from the web pages where you place these iParts:

- Panel Editor (which creates panels and shows one panel) --
- Panel Collection Editor (which combines existing panels into tabbed displays)

You can configure the iParts to let your users add and edit that data directly from their browser page. You can import your existing user-defined tables directly from the Panel

Editor iPart configuration. In addition, your Activity table data is automatically available as a source, so that you can use and extend that data. Panel sources can include existing user-defined tables (defined in the UD_Table table) and user-defined sources (listed in the ObjectMetaData table).

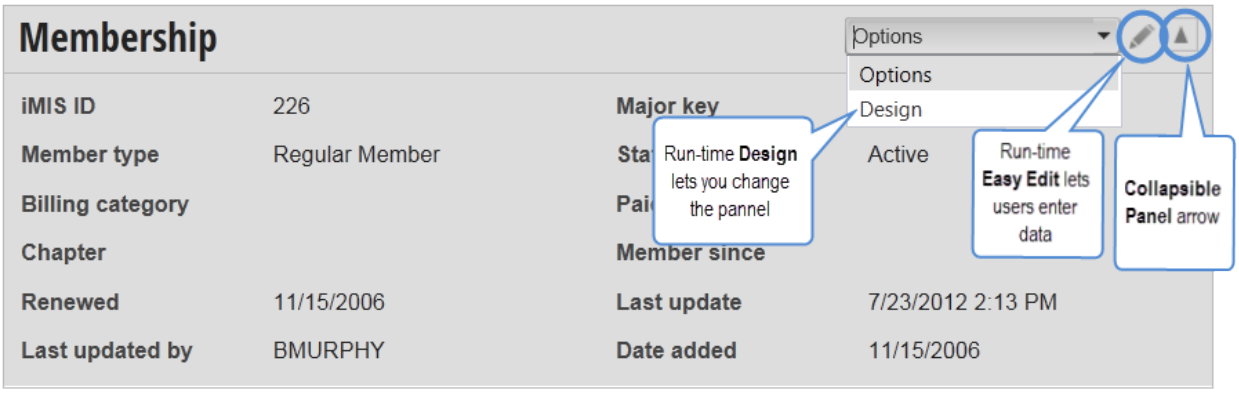
> **Note:** Tip: Panels are shared: when you update one panel, it updates within every iPart that uses it.

Creating custom panels of data

In a few clicks from your browser, you can have a new panel that displays the data you want, labeled and made editable as you need.

1. Enable Easy Edit by clicking on the button at the top right hand corner of the screen.
2. Once Easy Edit has been enabled, you will find and click the icon at the bottom left corner; this is the Content Designer.
3. From the Content Designer, click add content > ContentTypes > Content > Panel Editor
4. Select (New Panel) from the Panel drop-down menu.
5. Drag in and arrange your desired data, then Save & Publish.

   Once you have placed a panel iPart into a content record and published it, you can then edit the panel directly: As a system administrator, you see a run-time Design command, which lets you make quick changes to the panel, changes that save and publish for you automatically. For extensive panel work, such as to change the type of data it shows, use Easy Edit to access all of the content design features.



Best practices for panel layout

Here are key layout features to help you design the best use of screen real estate on the page:

- Multiple columns: Click + or – icons next to the panel layout to add/remove columns in your panel. For best display results, place multi-column panels into single-column content records.
- Hide in Summary View: Check this box on certain properties to trim the initial display of the iPart to the read-only information that is most useful. Only when users open the full window for viewing or adding/editing (as you configured it) do they see the additional information.
- Read-only: Check this box to provide information in read-only form while still allowing users to edit other information on the panel.

  Tip: To prevent editing of all of the properties, simply disable Allow users to edit on the iPart Configuration, rather than in the Panel definition.
- Collapsible panel: In order to maximize utility and minimize scrolling on the page, users are able to click on the arrow to expand and collapse iParts.

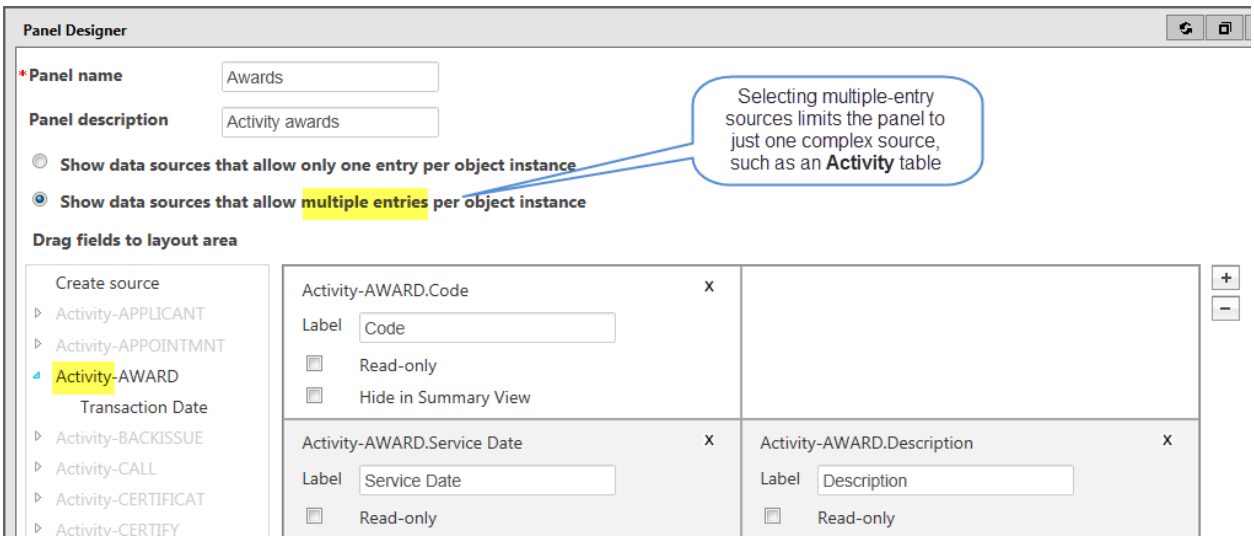
  Tip: Be sure to add an optional Title to any iPart that you make collapsible, so that title bar text guides your users as to what information they will access by clicking Show.

Panels for Activity data

Most organizations need to show activity information on their websites. All of the Activity data in your iMIS database appears as complex (multi-entry) sources when you use Panels.

Suppose you created new award types in the general lookup table called AWARDS and want to add them to a page for dynamic editing. In a few clicks, you can have exactly that:

1. Enable surf-to-edit.
2. Click Add content.
3. Go to ContentTypes > Panel Editor.
4. Click OK.
5. In the Panel list, select (New panel).
6. Select Show data sources that allow multiple entries per object instance.
7. Drag in your new data sources.
8. Click Save & Close.
9. Select Allow users to edit.
10. Click OK.
11. Click Save & Publish.



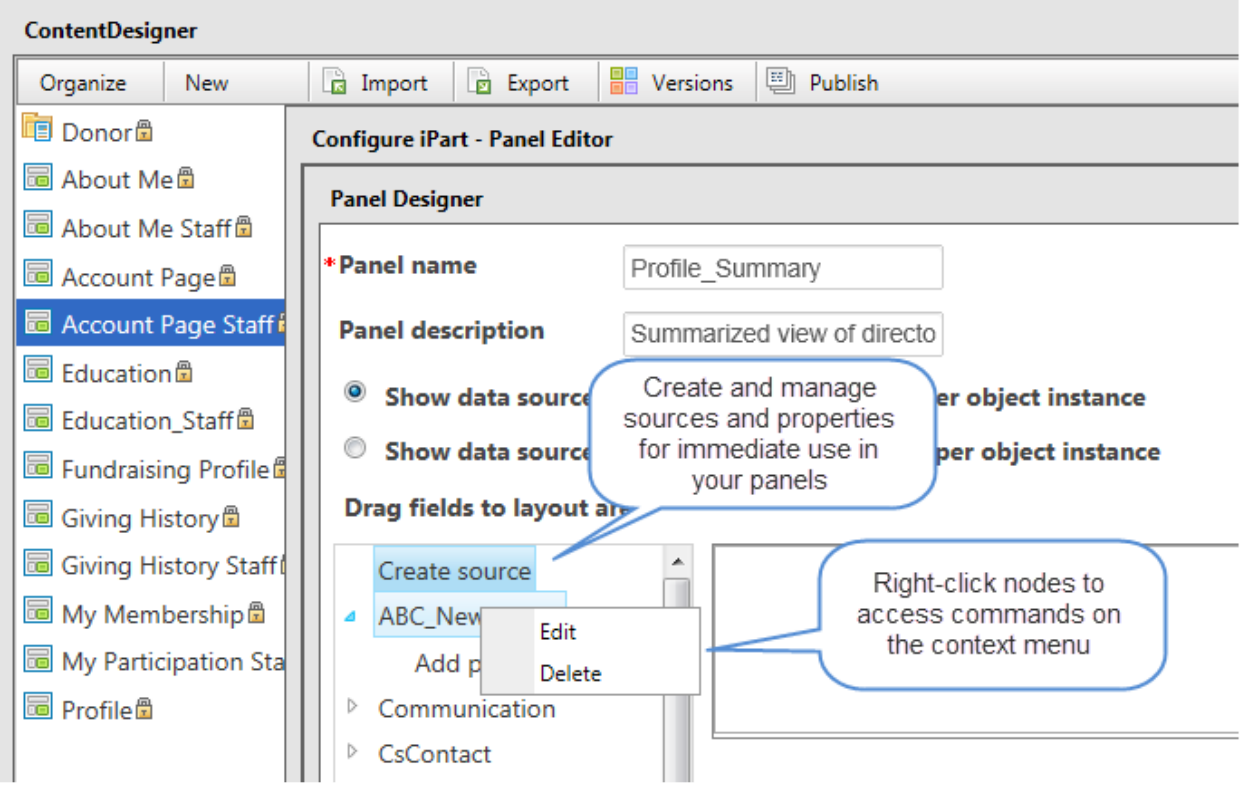
All of your Activity data appears as available sources when you select multiple entries for the type of data source.

Note: Tip: If you want to combine data from different sources, be sure to show simple sources (the first radio button option). Only one complex table can display in a panel, so the others are grayed out as long as any one of them has properties placed in the panel.

Defining your own data with Panel Designer

With the Panel Designer, you can not only craft reusable panels that combine fields from many tables, but you can also define new data structures (business objects and properties) to manage information for your organization. Without special tools or knowledge of the iMIS schema, you can add data sources on the fly, right from your browser. When you save the panel, you have saved your newly created data sources as iMIS business objects.

Note: Tip: You can see your new data source show up as a business object in Business Object Designer, but it will be read-only: continue to edit and manage these special sources in Panel Designer itself.



Access the Panel Designer by editing or creating a panel in a Panel Editor iPart.

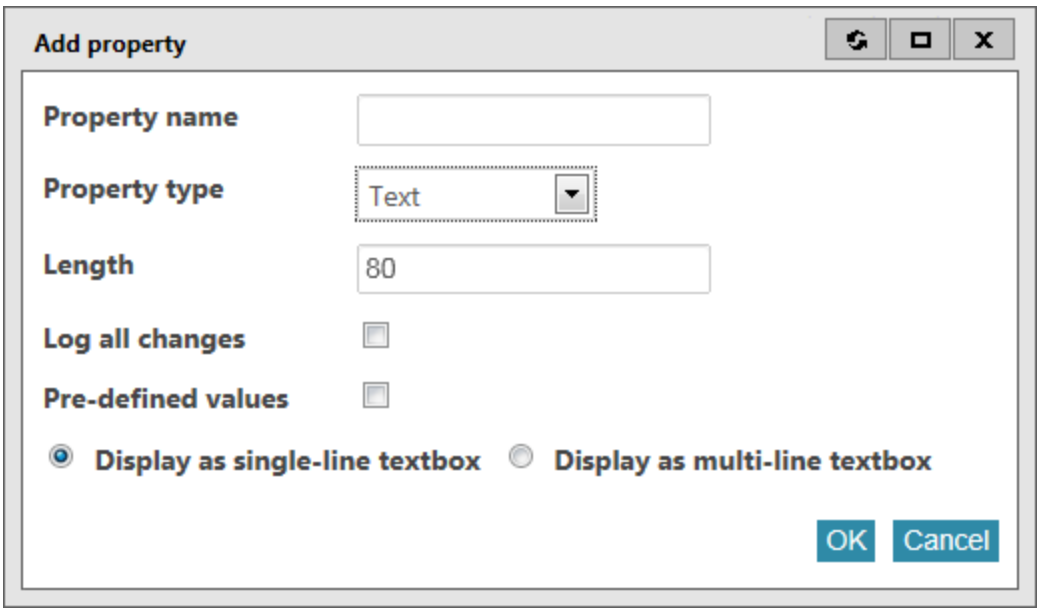
To create a new panel source and properties

To create your own data source with properties, you work within Panel Designer. Each new source you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

1. Select New > Website Content.
2. Click add content.
3. Go to ContentTypes > Content.
4. Select Panel Editor.
5. Click OK.
6. From the Panel drop-down list, select (New panel).
7. At the top of the source tree, select Create Source.

8. Choose a Name for each new Source that meets these criteria and click OK:
   - Starts with a letter
   - Contains only letters, numbers, and underscores
   - Is unique across iMIS, not matching any existing iMIS data or SQL Reserved Words

     Tip: Use an organizational prefix (such as ABC_*) so that your sources are unique, sort together in the tree view, and are easy to identify as ones that you created.
9. Select Add Property for the new source added.



10. Enter a Property Name.
    - Starts with a letter
    - Contains only letters, numbers, and underscores
    - Is unique within its Source
11. Choose a property type that best fits your purpose, within these valid ranges:
    - Currency: 19 total digits (precision), with 4 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Date, Date and Time, Time: January 1st, 1753, through December 31st, 9999

- Decimal: 28 total digits (precision), with 12 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
- Email: Creates a mailto link, which launches the user's default mail application when selected.
- Integer: -2,147,483,648 to 2,147,483,647 (±2 billion)
- Text: By default, the Text Property type allows:
- Free-form entry up to 400 characters (defaults to 80). You can select to display the text-box as a single line or multi-line textbox.
- Pre-defined values from a query or explicit list that display as a drop-down list at runtime:
- Query – For example, you may want to use a query that returns a list of countries.
- Explicit List – For example, you can add a list of colors the user can select as their favorite.
- URL: Creates a live hyperlink, which launches a new instance of the browser to open the link when selected.
- Yes/No: Boolean

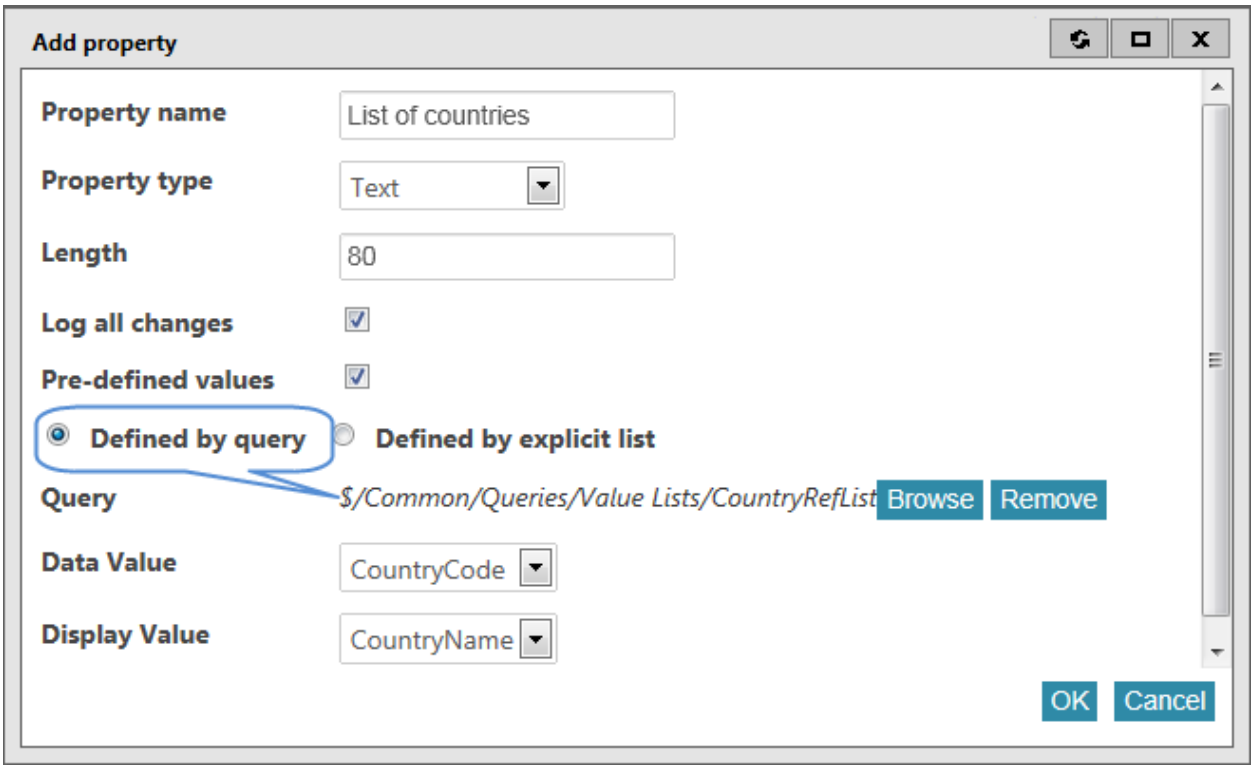
12. Enable the Log all changes if you want to track any data change made to the property you are adding.

    Hint: Add the Change History Display iPart to a content record if you want to display data changes made in the Name and Name_Fin tables as well business objects.

13. (Text Property type only) The Pre-defined values option allows you to present a list from which the user can select.

    - The Query option provides validation-type properties based on the query results. For example, instead of typing out a list of countries, you could select a query that displays country values.
    - Enable the Pre-defined values checkbox and select the Defined by query option.
    - Click Browse, select a query, and click OK.

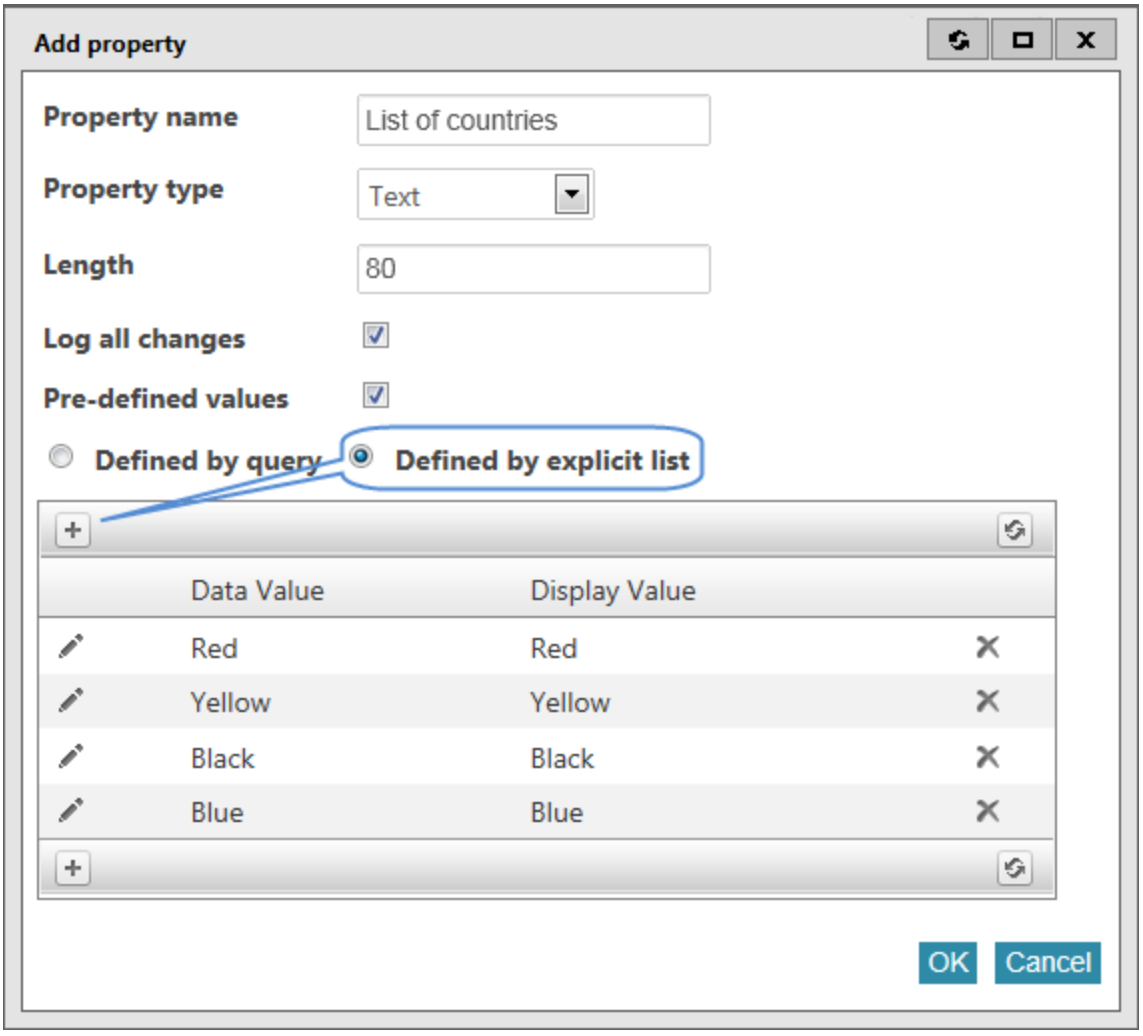
- Two additional fields display, Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel. For example, the country code may not be as clear as the country name.
- Select the fields from the drop-down list in the Data Value and Display Value fields.
- Click OK.



- The Explicit List option allows you to create a list to display on the panel. For example, you may want a user to select their favorite color.
- Enable the Pre-defined values checkbox and select the Defined by explicit option. A table grid displays.
- Click + to add a data row. The data row contains two icons: Insert and Cancel, and two fields: Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a

selection on the panel. While these values can be same, you may want to choose a different value to display on the panel.

- Enter the appropriate values in the Data Value and Display Value fields.
- Click the checkmark located to the left of the data row.
- Click + to add additional data rows.
- Click OK.



14. Drag the field(s) to the layout area.
15. Save the panel to save the source and properties. Once you save a property, you cannot rename it. Note that the sources will alphabetize properly on reopening.

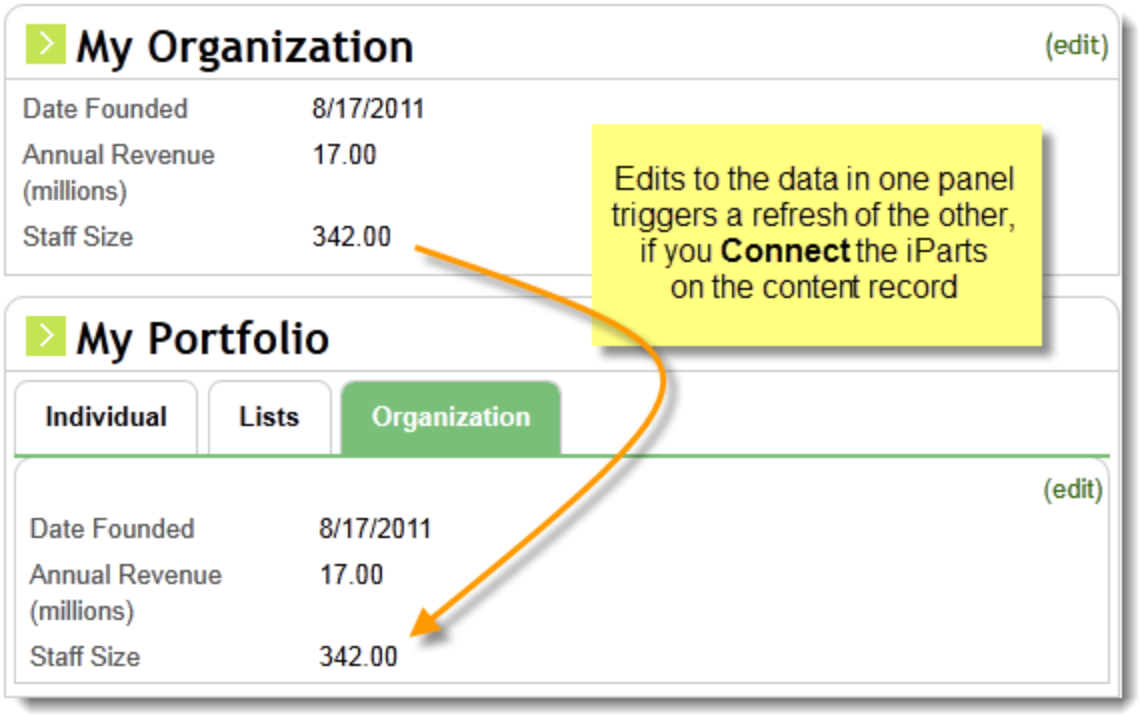
Each new property you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object property is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

Tip: Do not save until you create all of the properties. This way, you can view them as a set of properties and improve your naming convention before it is finalized.

16. Save and close the Panel Designer window.
17. Save & Publish the content record.

Connecting iParts to refresh panels

When you combine panel-displaying iParts on the same content record, data might appear out of sync after the user edits it, if both panels display the same property. You can solve this refresh problem through the iPart's Connect feature, which you enable separately from Configure.



> **Note:** Note: Check an iPart's Configuration Help topic to find out if it supports any connection options. An iPart has no connection support (neither consumer nor provider) unless its author added it.

To connect panels for dynamic updating

1. Edit a content record and add two user-editable iParts that display panels (Panel Editor, Panel Collection Editor).
2. Set up the first connection:

- From the first iPart's title-bar menu, select Connect.

  The Connect box that opens shows you any current connections and lets you disconnect them.

- Select Create a new connection.

  The Connect box that pops up prompts you to create one of four connection types.

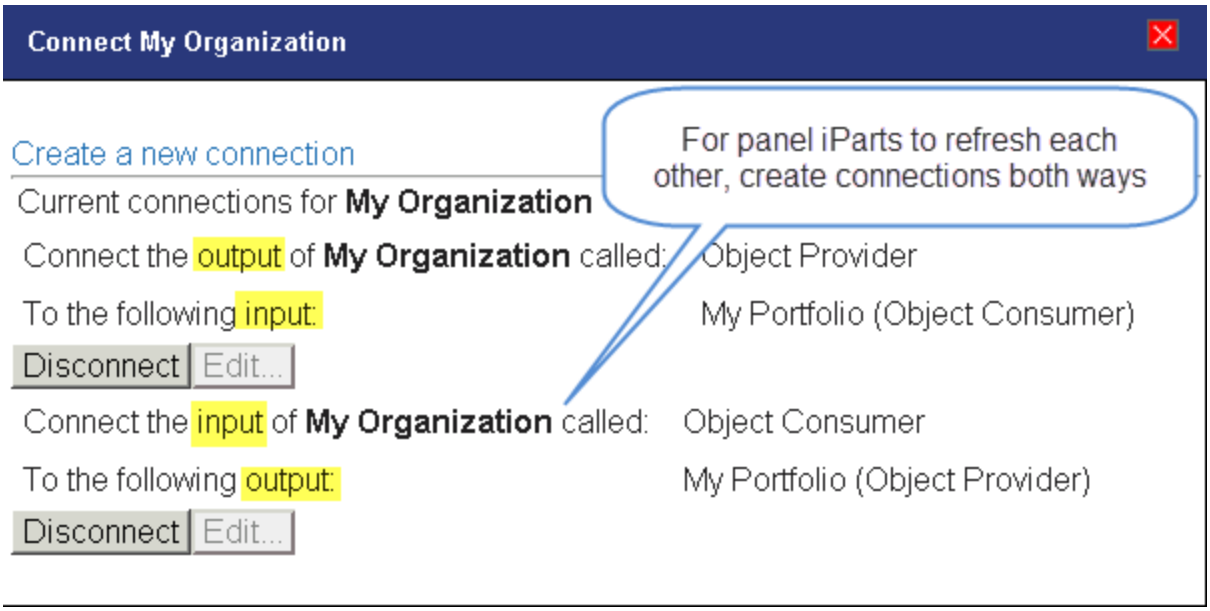
  Tip: Do not be misled by the language of connection. The Consumer is the actor that triggers a refresh on another iPart, and the Provider provides a pointer to itself to the Consumer.

- From the Object Consumer drop list, select the panel iPart you want to refresh.
- Select Connect.

3. Set up the second connection:

- From the second iPart's title-bar menu, select Connect, and select Create a new connection.
- From the Object Consumer drop list, select the first iPart.
- Select Connect.

  You should see a pair of connections, for mutual refreshing.



4. Save and Publish the content record.

Adding existing business objects to panels

Panel Designer lets you create new data sources on the fly, access any user-defined tables, and make full use of the Activity table. It can also display your existing business objects, if they meet these requirements and configuration settings:

Referencing existing business objects

Panel Designer can display existing business objects that have a ContactKey or ID property. When ContactKey or ID is the primary key, Panel Designer treats it as a single-instance table; otherwise, it assumes it to be multi-instance.

Panel Designer cannot display your business objects until you add them to the ObjectMetaData table. While attached to the iMIS database in SQL Server Management Studio, run this SQL statement:

INSERT INTO [dbo].[ObjectMetaData] (ObjectName, RelatedToEntity, IsUserDefined, IsMultiInstance)

VALUES ('MyObject', 'Party', 0, 0)

- Replace MyObject with the name of the business object, table, or view that is related to Party.
- Change the last value to 1 if it is multi-instance.

Settings for Business Object Designer (BOD)

1. In Business Object Designer, edit your object and open the BOD (Properties tab) > (Display tab).
2. To make a property available to your panels, enable its Available to UI? option.

   Tip: To see your BOD changes immediately, restart IIS.
3. To enable multiple selection for a property, select Check box(es) under Display Control so that you can enable the Allow multiple selection? option.
4. To enable HTML editing, select HTML Editor under Display Control. Be sure to use the property in a single-column panel to provide the control adequate width.

   Troubleshooting

   If you get an error when creating a new data instance at runtime (either single- or multi-instance), check that your business object does not have a 'Read-only' constraint set on the ContactKey or ID property's Definition tab.

Connecting picture iParts to Facebook

You can set up the Contact Mini Profile and Contact Profile Picture iParts to prompt people to use their Facebook profile picture in iMIS, instead of uploading a picture. To use this feature, you must do the following:

- Contact your Hosting Administrator to enable Enable the Facebook feature in the web.config file
- Create a Facebook app so that your website can connect to Facebook
- Enable the iPart configuration option to Prompt for Facebook connection

When enabled, signed in users are prompted to connect to Facebook when they edit their profile picture and wherever their profile picture is displayed.

To create your Facebook application and use it in iMIS

1. Contact your Hosting Administrator to request that they do the following: Edit your web-site's web.config file, located by default in C:\Program Files\ASI\imis\net. Find the EnableFacebookApi property, and change the value to true.
2. Create your Facebook application.

- Log in to the Facebook Developers site.
- Click +Create New App.
- Enter an appropriate App Display Name and App Namespace for your organization. Only the App Display Name will be visible to users.
- Click Continue and complete your App creation.
- On the Basic info page for your App, enter the Site URL for your iMIS application.
- Take note of the App ID Facebook has created for you.

3. Contact your Hosting Administrator to request that they do the following: Add your Face-book App information to the required iMIS JavaScript.

- Edit your iMIS Facebook.js file using a text editor. By default it is located in C:\Program Files\ASI\imis\Net\AsiCommon\Scripts\SocialMedia.
- Find the appId value and update it with the ID issued to you by Facebook.

To load the Facebook API

1. Edit your website's master page. By default it is located in C:\Program Files\ASI\im-is\Net\App_Themes.
2. Add the following html within the <body></body> tags of your master page:

To enable the Facebook connection in iParts

Configure each instance of the Contact Mini Profile and Contact Profile Picture iParts used in your website to enable the options Allow picture change and removal and Prompt for Facebook connection.

> **Note:** Note: When the Facebook feature is disabled in the web.config file, the Facebook options do not appear in the Contact Mini Profile or Contact Profile Picture iParts.

Using the Content Block iPart

With the Content Block iPart, you can empower authorized users to create and edit content directly on a page, without using Surf-to-Edit or accessing Tools. Through iPart configuration, you can allow users to insert HTML content, add attachments, create child pages, and submit replies. At its simplest, a content block can be HTML that is read-only unless the user has permissions to see the edit command. At its most complex, a block can act as a message board with multiple posts, child posts, and replies. You can limit the number of posts to a set number, or you can leave it at the default (zero), which lets it grow indefinitely.

How groups own content

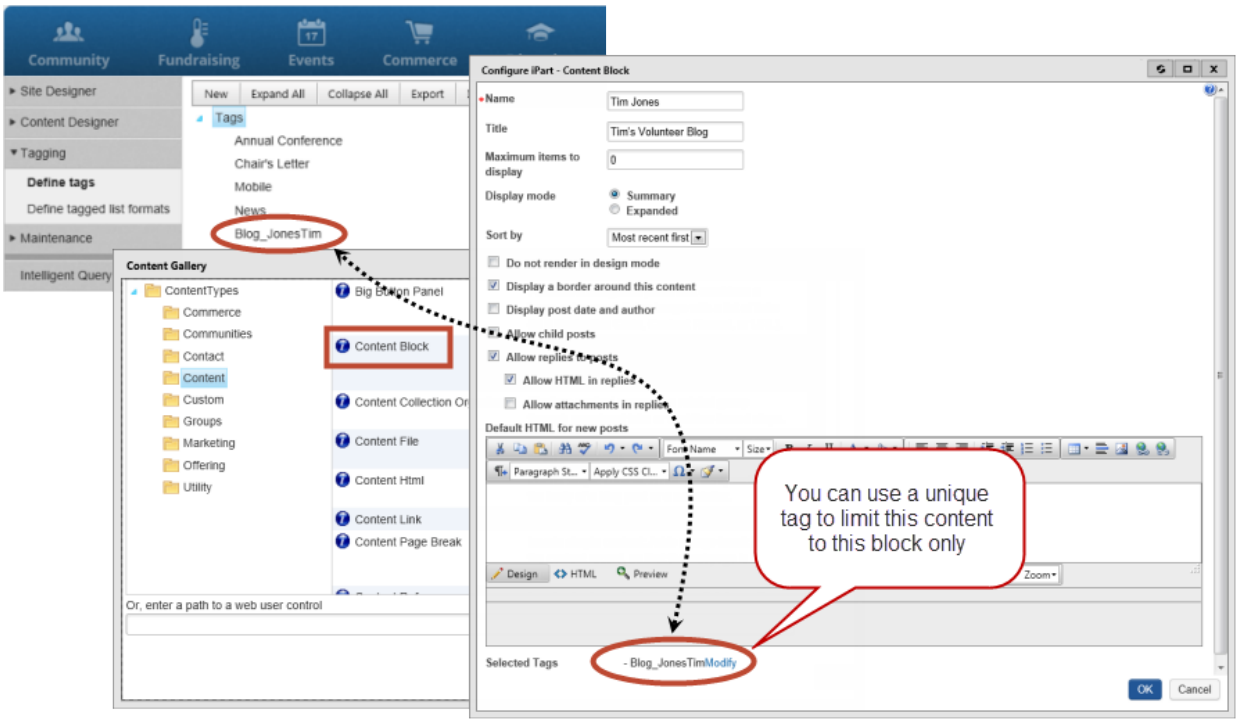
The content created with a Content Block iPart is owned by the Uniform Item associated with the page that contains the iPart. Likewise, the only content displayed is content owned by the page's Uniform Item. The Content Block currently works best with the Group landing page, where it can be used with the Uniform Item for groups. A page's Uniform Item is determined by the iUniformKey parameter passed to the page in the URL.

For example, assume that you have a content record that displays when a user clicks a search result link for a Committee, and it contains a Content Block iPart configured to display content tagged as Announcement. Now a content editor wants to add an announcement for the Planning Committee. After searching for it, he selects the result and goes to the page. The search link sends the iUniformKey for the Planning Committee to the content record through the URL. The Content Block iPart then displays any announcements

(the tag) for the Planning Committee (the Uniform Item). When he adds his new content, it is tagged as an Announcement and is owned by the Planning Committee.

Tagging to filter content

To control what content appears in a Content Block, you create tags specific to ContentBlock Items and apply those tags to specific instances of the iPart. For example, if you want to create a new blog for Tim Jones, you could create a ContentBlock tag such as blog-JonesT, place a new Content Block iPart on a content record, and configure the iPart to display the tag blog-JonesT. Now the content that Tim authors in this blog will be unique to his+ blog, if you do not apply this tag anywhere else:



Content created with anything other than a Content Block iPart will not be displayed, even if it has the same tag. For example, a content record containing HTML tagged with News will not show up in a Content Block that is also using the News tag.

Note: Best practice: Plan for and create the tags you want to use before configuring your Content Block iParts. Content can seem to disappear if you change

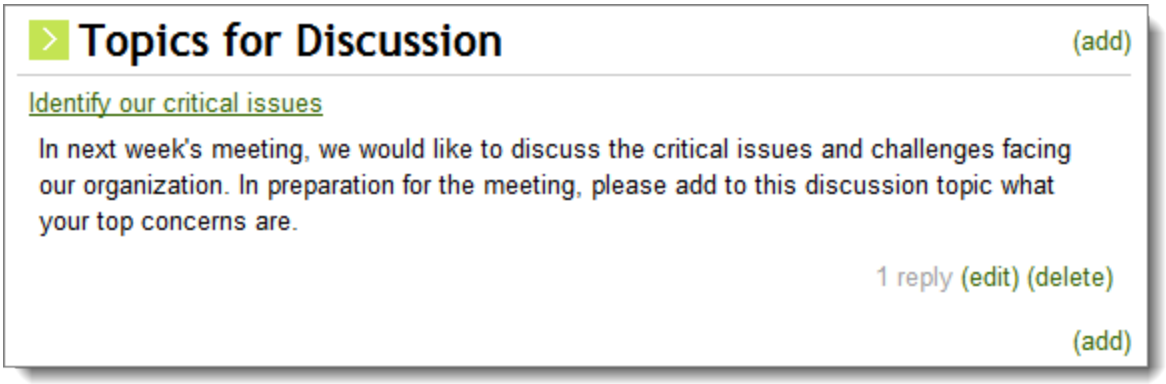
the tags assigned to a content block already in use, because it no longer matches the tag set currently configured.

Creating a message board

Only users with the Content Editor permission may create posts and children, but any authenticated users can reply to a post and edit or delete their own replies. Any authenticated user may create posts and children, reply to a post and edit or delete their own replies.

To use the Content Block as a message board with multiple posts, child posts, and replies, make use of the following configuration options:

- Maximum items to display - Choose the maximum number of posts that will be displayed; 0 indicates an unlimited number of posts.
- Display mode - Expanded display mode will display replies and child posts in-line, while Summary mode only shows replies and child posts when the post is opened.
- Allow child posts - Allow Content Editors to add a child post to existing content. Allow any authenticated user to add a child post to existing content.
- Allow replies to posts - Allow authenticated users to reply to posts; you may indicate whether to allow HTML and/or attachments in the replies.



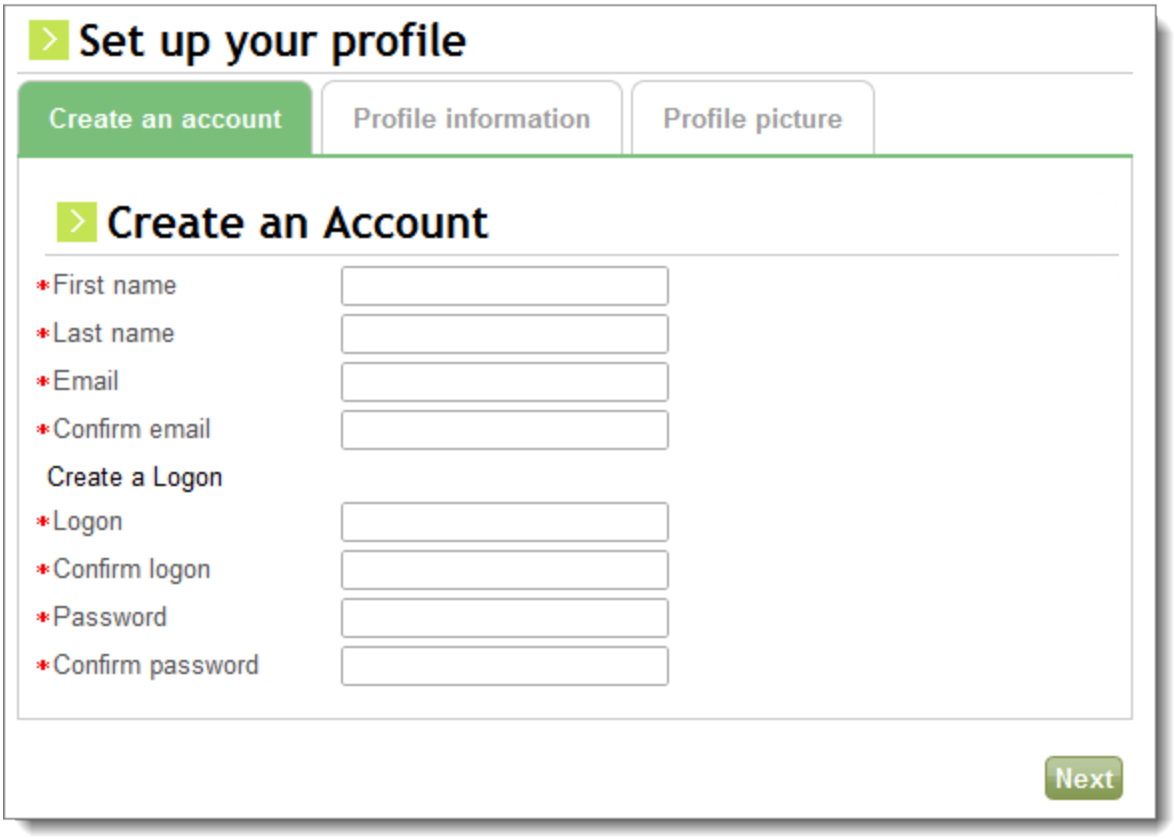
Content Block iPart set up as a discussion board

Using the Content Collection Organizer

Use the Content Collection Organizer to create a collection of pages and assign names to the tabs or headers for each page. In the simplest example, those pages are displayed, the user can access tabs in any order desired, and information is saved independently on each page. The following screenshot shows an example with tabs across the top, configured to display different content pages.

Using the Content Collection Organizer as a Wizard

You can configure the Content Collection Organizer to function as a wizard, which will guide the user through multiple steps. When enabled, Next and Previous buttons display, allowing users to navigate between the steps, as shown below. The user can navigate to any previous tab, but forward only to the next tab in the workflow sequence. The user can also navigate with the browser's Forward and Back buttons, but the data does not commit until the user clicks Next.



Each page in the workflow is validated when the user clicks the Next button. Each iPart's page.Validate method is processed in the order the iParts appear on the page. The order of calls is:

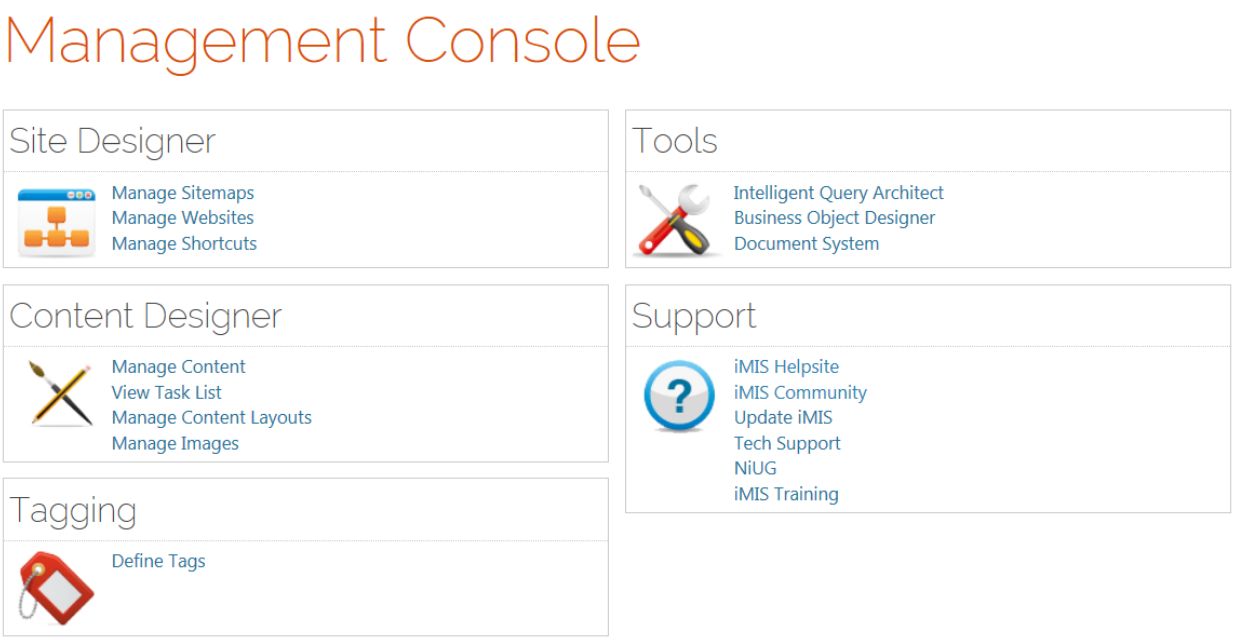
- Validation
- If Validation passes, then PreCommit
- If PreCommit passes, then Commit

If any of the calls fail (the data on a page is incomplete or incorrect), then an error message displays and the user cannot move to the next step until it is corrected.

Using the Big Button Panel iPart

With the iPart, you can display a navigation panel that combines a larger, category-defining image with a list of links, as shown in the screenshot below. You can also use this

iPart to create links that make it easy for staff to perform routine tasks for contacts such as running reports, registering for events, and ordering on their behalf.



Example: Working On Behalf Of contacts and running reports using the Big Button Panel

In this example, we will set up the Big Button Panel on the account page, so that staff can select a contact from the Directory, then quickly run a report, register for an event, make a donation, or order a product for that contact.

1. Edit the account page that displays after a staff user selects a contact from your directory. In the Member site, it is the Account Page Staff content record.
2. Add the Big Button Panel (add content > ContentTypes > Content > Big Button Panel) iPart to the content record and configure it with the following settings:

- Mode: Actions
- Add an action link to run a report:
- Link Text: Print Info
- Link Target: Enter a link to a page that contains the SSRS Report iPart that displays a report such as $/Samples/ReportingServices/MemberProfileQuery_Report.

Note: The SSRS Report iPart must be configured to Hide the parameters section and to enable the option to Inspect query string for parameters. Do not enable the option to Inspect Session for parameters. For more information about SSRS reports, see Creating SSRS reports.

- URL Parameter: ContactKey=@SelectedUser
- Add an action link for event registrations:
- Link Text: Register for an event

  Note: Customize this text for the event you want to register the contact for. For example, Register for the Spring Conference.
- Link Target: Enter a link to the event page
- URL Parameter: EventKey=XYZ (replace XYZ with an event code) EventKey=XYZ (replace XYZ with an event key)
- Use On Behalf Of: Enable
- Add an action link for donations:
- Link Text: Make a donation
- Link Target: Enter a link to your donation page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable
- Add an action link for the shop:
- Link Text: Purchase a product
- Link Target: Enter a link to your Shop page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable

3. Save and Publish the account page.

Using the Group List Editor iPart

The Group List Editor provides a flexible tool for you to display and manage lists of groups, sub-groups, relationships, and/or memberships. You can configure it to serve several different purposes.

Display an organization's roster

A common use for the Group List Editor is to display a list of contacts that belong to an organization.

For example, add the iPart to an organization's profile page, so that the iPart displays memberships for the selected organization. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the roster
- Clicking on a contact opens their profile page: Enable to link contact names directly to their profile page
- Provide option to view and edit membership details: If you want users to have easy access to both the account pages and the Group Member Detail window, also enable this option. Users can click an icon to switch between these options.
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups owned by the parent ID and their members
- Choose the group types to include: Organization
- Automatically create a group if one does not exist: Enable if you have allowed editing (this allows the creation of new rosters)
- Group owner type: Party
- Group type to auto-create: Company
- Choose the group types to include: Ensure that Company is selected

Display a contact's memberships

Another common use for the Group List Editor is to display a list of a contact's memberships in groups such as committees and chapters.

For example, add the iPart to a contact's profile page, so that the iPart displays memberships for the selected contact. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the contact's memberships
- Clicking on a contact opens their profile page: Not applicable
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups that the parent ID is a member of
- Choose the group types to include: Select the group types you want to display, such as Chapters and/or Sections

Relationships in the Group List Editor

You can easily create a link between two contacts using the Group List Editor iPart. The relationships you define show up on the record of both contacts, and you can specify roles for one or both of the contacts. For example, if you edit Jean Smith's record to indicate that she knows Russell Smith, then that relationship will also appear in Russell Smith's record. Alternately, if you edit Jean's record to indicate that Russell is her child, you can also specify that her role is the parent of Russell. Then Russell's record will reflect that Jean is his parent.

There is no limit to the number of relationships you can create or the types of relationships you can create. We have provided a few relationship types out-of-the-box, but you can add additional ones if needed.

Only users with System Administrator or Staff privileges can create relationships between contacts, but any user can view a list of relationships.

Note: Note: To use this relationship feature, you must have the RELATION license.

The following sections walk you through how to create relationship types and how to set up the Group List Editor to display relationships.

Creating relationship types groups and roles

Edit the Customer setup table for Relationship types, adding the relationships that you want to have available in the Group List Editor. For each relationship type you add, you can also define a Reciprocal relationship, which the Group List Editor automatically populates as a set (such as for Parent and Child).

To display and edit relationships in the Group List Editor, you must define a Relationship Group and Roles (relationship types) associated with that group. A sample relationship group type named Connections has been provided. You can create your own group type from Setup > Groups > Types. If you create your own group type, the only requirement is that you select the Relationship Group checkbox, so that the Group List Editor can properly display relationships.

To create Roles used in relationship groups

1. Decide which relationships you want to be able to define for users. For example, Parent-Child, Husband-Wife, etc.
2. Create Roles for each relationship type.

- From Setup > Groups > Roles, click add.
- Enter the Name of the Role and a Description of the role.
- Select the Active checkbox.
- (optional) Select a default Reciprocal Role for this role. For example, if you are creating a Parent role, you may consider selecting Child as the default Reciprocal Role, so that it is automatically selected when someone defines a Parent relationship. If the Reciprocal Role you want to add is not in the list, create it first, then add it to this role.
- Save and repeat for each relationship role you want to define.

3. Edit your relationships group (for example, the group Connections) to add the roles you have defined.

To set up the Group List Editor to display relationships

1. Add the Group List Editor iPart to a content record on which you want to display a list of a contact's relationships. For example, add it to an account page. The iPart displays a list of relationships for the currently selected contact. The selected contact is determined by either a contact ID passed to the page via a URL parameter (from the Directory, for example), the contact selected in the On Behalf Of control, or the currently signed in user.

   Note: Note: For help adding iParts, please see Creating Custom Panels of Data.

2. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit relationships
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Both of the above
- Automatically create a group if one does not exist: Enable
- Group owner type: Party Choose the group types to include: Select Relationships
- Group type to auto-create: Select a relationship group, like Connections
- Choose the group types to include: Ensure that Connections is already selected.

  Note: Only the relationship group type selected to auto-create may be edited. For this reason, if Allow editing is selected, we recommend including only the one relationship group type in this instance of the iPart.

3. Save and Publish the content record.

Using the Content HTML iPart

Using the Content HTML iPart, you can add simple content to your website, anywhere you want. In addition to the WYSIWYG functionality, you can switch to HTML mode to insert JavaScript to embed other sites, display web widgets, and use variables to create relative paths.

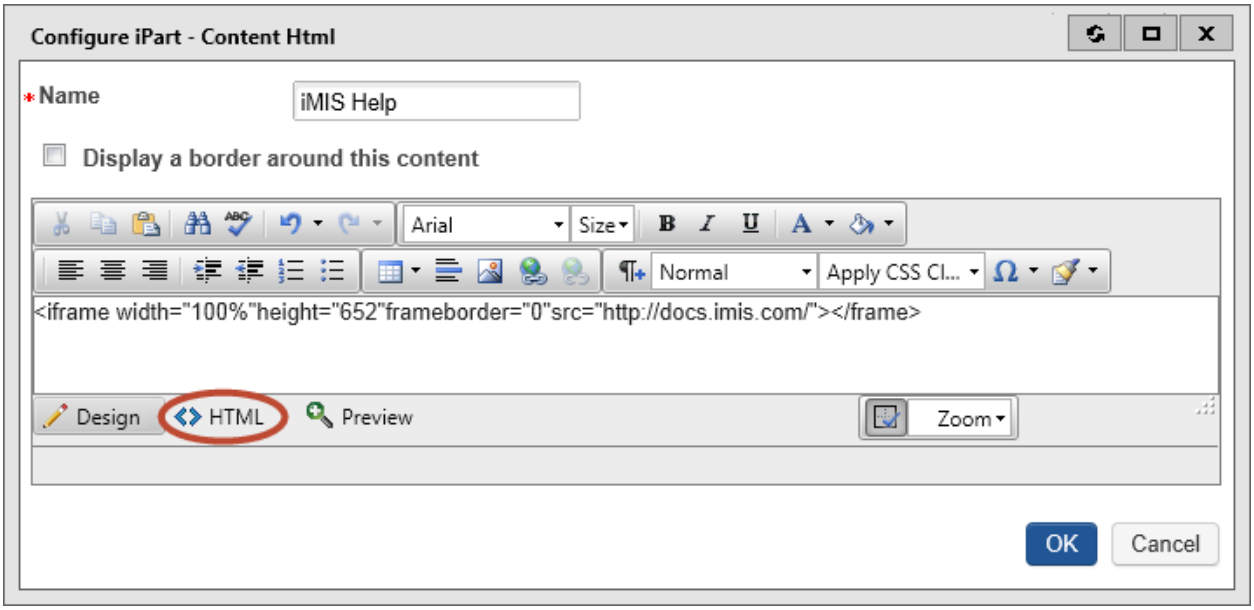
Embedding external sites

To embed any external page into an iMIS site, you can use an <iframe> like this:

1. Go to Content designer, Manage content and create a new content record.
2. Select add content and place a single Content Html iPart on it (from the ContentTypes folder).
3. Show the source by clicking the <> HTML tab and type in an iframe tag, such as this:

   <iframe width="100%" height="652" frameborder="0" src-c="http://docs.imis.com/"></iframe>

4. Go to Tools > Site designer > Manage sitemaps and create a new navigation item that points to the new content record.
5. If appropriate, restrict the navigation item's Access Settings, such as to Authenticated User Full Control.



Displaying web widgets

You can install and display JavaScript-based web widgets (plugins, gadgets) in your WCM-generated websites using the Content HTML iPart. A web widget is a small pro-

gram that your users can execute within a web page and that can provide a wide range of functionality.

For example, Google Gadgets offers thousands of free web widgets including mini applications, games, news feeds, maps, and a wide range of other types of content. Many other websites also provide free widgets that can access data from their site. For example, Twitter provides widgets that let you display Twitter updates on your website. LinkedIn provides plugins that display information such as company profiles, member profiles, and links to share on LinkedIn. You just have to search the web to see what you can find that meets your needs.

> **Note:** Warning: Only embed widgets from authors whom you trust. Malicious code may damage your computer or violate your privacy.

To add a JavaScript-based web widget to a webpage

Go to Content Management > Content designer > Manage content:

1. Create a new content record or edit an existing one.
2. Click add content to find and select the Content Html iPart.

   The Configure iPart window opens.
3. Click < > HTML to switch to HTML mode.
4. Copy the JavaScript embed code for the widget you want to add and paste it into the HTML area.
5. Click OK, then Save and Publish your content record.

   The widget is displayed when that content record is rendered on a webpage.

Creating relative paths using variables

The Content HTML iPart does not support the use of the ~/ (tilde slash) shortcut, often used to automatically build the correct paths when a control is rendered in different domains. However, several variables are available in this iPart that allow you to enter

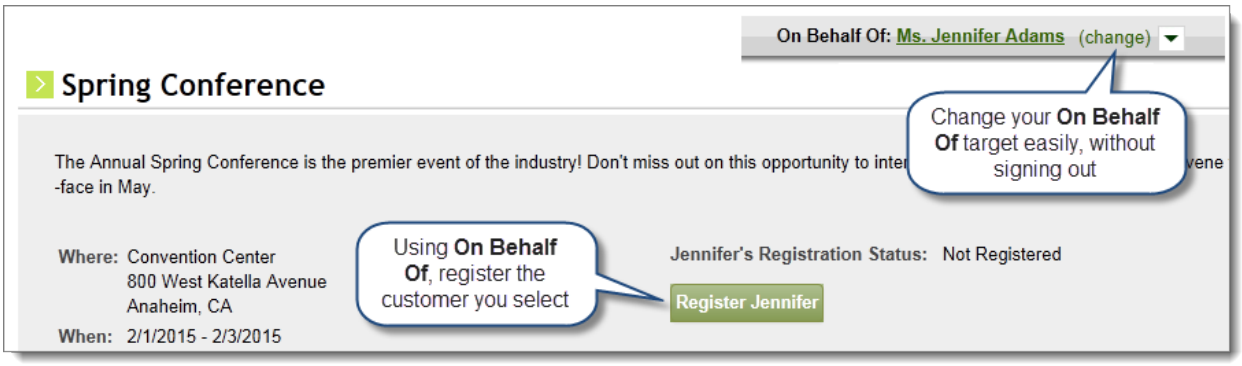
paths for links and resources that are automatically resolved to various folders in your website. The variable names are case-sensitive.

> **Note:** Note: Images do not render in Design mode because the variable is not transformed until the content record is published.

- [Website] – Resolves to the root of the website and contains the website name. Example: [Website]Home.aspx.
- [~] and [Root] - Both variables resolve to the root of the website. Example: [~]Home.aspx resolves to http://mydomain/Home.aspx.
- [Theme] - Resolves to the website's theme folder. Example: [Theme]images/image.png. This variable can be used to access theme resources such as images and CSS.
- [iMIS] - Resolves to the iMIS directory of the website. Example: [iMIS]ContactManagement/CreateAccount.aspx
- [Common] - Resolves to the AsiCommon directory of the website. Example: [Common]Controls/Shared/FormsAuthentication/Login.aspx

On Behalf Of: Customer service mode

Your iPart-based site is not just for self-service: On Behalf Of gives your staff a customer service mode, to complete website commerce on behalf of your customers. When requests for event registrations, product orders, and even membership renewal payments come in by phone, fax, or email, On Behalf Of lets you conduct a secure session during which you can add items to a customer's cart and complete the transaction for them, all without signing out of your own session.



Separate carts, for privacy

To avoid confusion and to protect your customers' privacy as to which items they may have added to their own carts, On Behalf Of sessions create and save carts that are completely separate from those your customers see. For added security, items yet to be purchased are saved in these carts, but not any cardholder information that may have been entered.

For example, if you added a registration to a member's cart but do not submit it, then she will not see the registration in her cart the next time she signs in; however, when you return to registering her on her behalf, you see her cart restored to the state it was in when you left it. Once you complete a purchase on her behalf, both she and you can see the order through her account page.

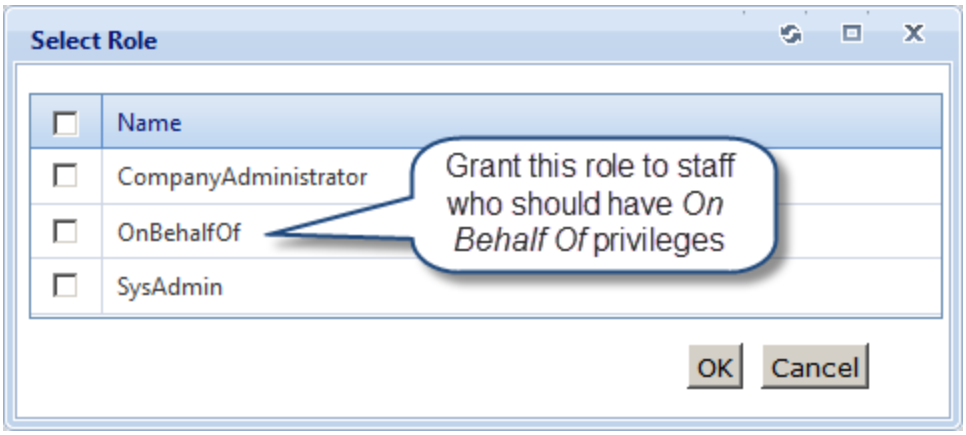
Note: Tip: You can use the audit trails to track which logged-in user performed each action that affected an On Behalf Of transaction.

Who can act On Behalf Of?

To protect the security of contact data, users must be added to the security role SysAdmin or OnBehalfOf to perform actions on behalf of another contact (individual or organization). It is easy to give a staff member On Behalf Of privileges.

Go to System Setup > Security administration > Users:

Find and select a user, and in User Information click add role.



Changing and ending On Behalf Of

When you act on behalf of someone else, all of your commerce-related actions pertain to the target contact until you end the session in one of these ways:

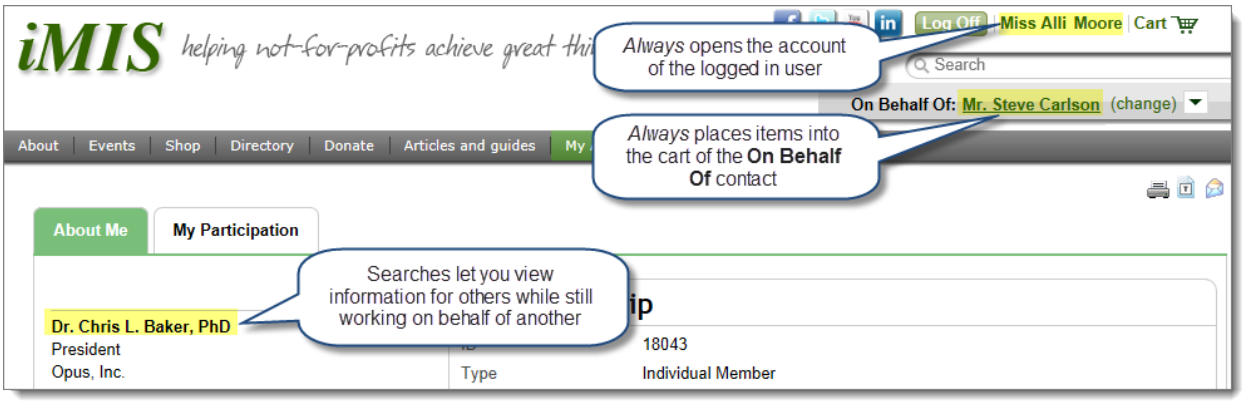
- Select a new target contact: click (change) next to the target contact.
- Clear the selected contact: click the down arrow next to the target contact and select Clear.
- Close the browser.
- Sign out of iMIS.

Whose contact information do iParts show?

Acting on behalf of another contact controls the current cart, but it does not keep you from getting to information for other contacts. An iPart determines whose cart and information to show and update based on this logic:

- If the link's URL specifies an ID (such as for search results), it shows information for that contact.
- If not, it shows information for your On Behalf Of contact, if appropriate. (For example, the Query Menu iPart runs queries regardless of the target contact.)
- Without On Behalf Of, it shows information for you, the logged-in user.
- If no one is signed in, it shows limited information.

For example, you could be working on behalf of one contact when you need to use the Directory to look up an address for another. You can drill down on information from those searches with no effect on your on-behalf-of contact: the iParts pass the queried contact's ID on the URL to show you the information you need. Only when you take actions that add items to the cart is On Behalf Of enforced.



Note: Tip: What never changes is the contact name link in the top navigation: it always shows information for you (the logged-in user).

Working with Content

iParts are the foundation of your iMIS sites that you build with RiSE. This section helps you to understand and master the critical iParts that present attractive and dynamic content to your users.

What are iParts?

An iPart is an iMIS-specific web part that represents a building block of features that you can place on a content record with other building blocks to create new pages of features. Multiple iParts can be combined and displayed in a content record as you prefer.

Default iParts appear throughout iMIS. You can modify them for your needs and you can reuse iParts throughout the system. For example, an iPart displaying a roster for a Membership Group can follow the same user behavior patterns as an iPart for a roster in Events.

Where can I find and use iParts?

To create a new web page containing one or more iParts

1. From RiSE > Content designer > Manage content, create a content record.

   Note: For a detailed explanation of creating a content record, see Managing Content.
2. Click add content and select the desired iPart from the Content Gallery.
3. Enter the applicable information and select the desired options.
4. Click OK.
5. Click Preview to see how the content will be displayed to users.
6. Click Save and then Publish.
7. From RiSE > Site designer > Manage sitemaps, create new website navigation.

   Note: If no owner is specified for the content block, the default organization displays as the owner.
8. Click Publish.

To add an iPart to an existing webpage

All iMIS sample sites come pre-filled

1. From RiSE > Content Designer > Manage Content, select the site you'd like to add the iPart to.
2. Select the Content area in which you would like to place the new iPart.

   For example, if you would like to add a new iPart to the home page, select Home from the content area list.
3. Click Edit.
4. Determine where you would like to place your new iPart, and click add content.
5. The Content Gallery window will pop up. Navigate to the folder that contains your desired iPart.
6. Select the desired iPart and click OK.
7. Configure the iPart by entering applicable information and select the desired options.
8. Click OK.
9. Click Preview to see how the content will be displayed to users.
10. Click Save and then Publish.

To set up a user content area

User content areas are created by using iParts which can be configured to allow a user to post content on the web. Examples of this user-generated content include forums, message boards, or blogs.

1. From RiSE > Content designer > Manage content, create a content record.

   Note: See Managing Content for details.

2. Select the Content Block iPart from the Content Gallery.
3. Enter the applicable information and select the desired options. See the help file for details.
4. Click OK.
5. Add additional content to page, if desired.
6. Click Save.
7. Click Publish.
8. From RiSE > Site designer > Manage sitemaps, create a navigation.

   Note: It if no owner is specified for the content block, the default organization displays as the owner.
9. Click Publish. The page displays as configured with an area dedicated to user content entry directly on the page.

Configuring iParts

iPart configuration allows you to:

- Define how the iPart will behave
- Control how much access you want end users to have
- Hide configuration details from end users; two instances of the same iPart with different configurations can appear as two different controls to the end user
- Examples:
- Allow users to edit on a staff-facing site, but display the data in read-only mode on a public-facing site
- Use multiple instances of an iPart on one page to access different sets of data

> **Note:** Note: a detailed list of configuration options for each iPart is available in the iPart Reference guide.

Run-time versus design-time

iParts have two different views:

- Design-time view: What you see in a content record when you add an iPart and configure it.
- Run-time view: What your end-user sees when viewing the iPart within your website. This may differ from what you see in the Design-time view, because some iParts have a different behavior after you publish the content.

Specifying commit sequence

If you place more than one iPart on a page, you might need to specify the order in which actions occur on that page. The commit sequence function allows you to explicitly define the execution order of multiple iParts in a content record.

You can define a commit sequence value for the processing order of each iPart relative to the other iParts in the same content record. The commit sequence value must be zero or greater. iParts with a value of zero (the default) are processed after any other iParts with a non-zero commit sequence value that are in the same content record.

Setting a commit sequence is only required in a few scenarios and is noted in an iPart's configuration help if needed.

Troubleshooting iPart errors

Occasionally, an iPart may fail. However, it will fail gracefully in place, without disabling the whole page. Typically, a "problem loading" error results from some kind of bad data. By default, iMIS hides the error details:

The settings controlling this error logging reside in the <log4net> section of your site's web.config file. The default settings enable error logging in the Windows Event log and comprehensive logging in the ASI log file, which captures both errors and warnings. This log file, Asi.WebRoot.log, is in the folder above your website root.

Contact your hosting administrator if you need access to information in these logs.

Security for iParts

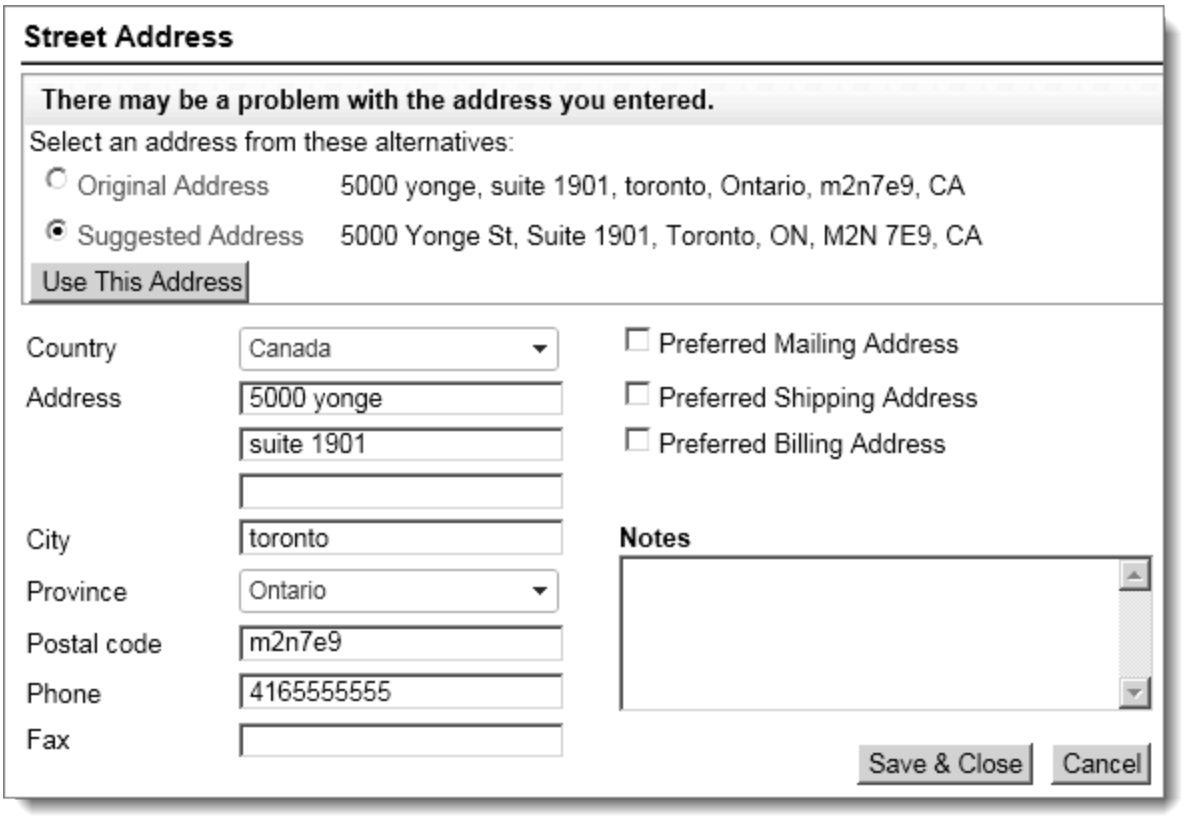
Most security is defined at the content record level within iMIS. You can choose that different iParts display for different users. For example, an unauthorized user might see the description of a Special Interest Group, but a signed-in member might see the roster for the group and a staff person might have the privilege to add, edit, or delete the group.

Address verification for iParts

iMIS SOA can perform real-time address verification using web services hosted by ASI. There are several benefits to this:

- Running this verification through the ASI web service frees you from having to install and maintain these data files locally.
- Offloading verification to this service keeps it from adding to the processing load of your page.
- The services of different address providers can co-exist, making it possible to verify addresses across multiple countries.

- The service can support future verification of collections of addresses as well as single ones.
- Postal addresses entered in the Contact Account Creator and Contact Address Editor iParts automatically upload to this service that verifies and standardizes the address. Users can then either accept the suggested address or keep the original as it was entered.



The countries supported by this service are subject to change. Contact your AiSP to obtain an up-to-date list.

Passing URL Parameters

Many iParts allow you to change the content they display based on the value of a URL parameter. This gives you the freedom to create a single content record. This record can be reused and the display can be changed based on a value sent in a link to the page. For example, instead of creating a new content record for every event, you can reuse a single

content record that displays different event information based on the EventKey value in the URL.

Parameter values are passed to iParts from a several types of sources:

- Search result links
- IQA query links
- Navigation items
- Relative links
- Absolute links

For any iPart that allows URL parameters to be passed, see the configuration help file for detailed instructions.

> **Note:** Tip: If multiple values are sent to a page for a single URL parameter, the first parameter value wins. For example, if the URL pointing to the Event Display iPart is http://myorg/Events/Event_Display.aspx?EventKey=SPR12&EventKey=FALL12, only the SPR12 event displays.

> **Note:** Note: URL parameters set by navigation items cannot be manually over-ridden in the URL. A user cannot change the parameter value in the URL to display different content.

iPart Examples

iParts can be used in a variety of ways, and in many different combinations to meet your organization's needs. This section contains examples of commonly used iParts and provides guidance in maximizing their benefits.

Displaying query results in iParts

The iParts described in this section use IQA queries to drive the data displayed to users. Each iPart provides a unique way to display the data.

Query Chart Viewer iPart

The Query Chart Viewer displays query results in a chart, which can be set to a range of sizes, skins, and chart types.

Designing queries for Query Chart Viewer

The Query Chart Viewer can render any existing query, but you will get the best results by following these guidelines on how to design queries specifically for use with this iPart:

- Queries: The queries you create for the iPart should be structured so that the results are appropriate for charting. For example, if you want the chart to display the total sales per salesperson, then the source query should be written using the Sum function in IQA.
- Query Display Columns: Each property you select on the Display tab in IQA is available in the iPart's configuration page as a Data column display option. Note, however, that you can only select two properties to be displayed in the iPart.
- Aliases: In your source query, enter an Alias for the Display properties you plan to show in the iPart. Relying on the default labels may not be sufficient, especially when your query uses multiple joined sources or custom SQL expressions. If the query does not display as you expect, using an Alias often resolves the issue.
- Sorting: You can sort the query results displayed in your chart in ascending or descending order. To sort your results, edit your source query and, from the Sorting tab, add the property to be sorted.
- Labels: The labels on your chart's x-axis may overlap if there are too many data points or if the labels are too long. You may be able to improve the display through a few methods. In the iPart, you can expand the width of the chart or change the label angle. In the query, you can try to reduce the number of data points.
- Dates: For dates to display correctly, you must cast them as float data types with an offset of 2. You can do this in IQA from the Custom SQL Expression section of the (Display tab). For example, if you want to display the OrderDate property in your chart, add the following expression: CAST(OrderDate AS FLOAT) + 2. Then, when you select this property from the Data column list in your iPart, set the Data column format to a date format.

- Integers: If integers display incorrectly in your chart, cast the column to a data type of INT in the Custom SQL Expression section of IQA's Display tab. For example: CAST (Order-Count AS INT).

Chart Types

You can display the following types of charts in the Query Chart Viewer iPart.

Chart Type	Example
Area - Displays data in an area filled with color to illustrate trends. For example, create an area chart that shows a member's giving history over time. Note: You can only display one area of data in the iMIS Area chart.	
Bar - Horizontal - Displays sets of data with horizontal rectangular bars for comparison. For example, create a horizontal bar chart that shows the number of donations received by each of your fundraising campaigns.	Bar - Vertical - Displays sets of data with vertical rectangular bars for comparison. For example, create a vertical bar chart that shows the distribution of your members across states.	
Bubble - Displays data as a series of bubbles. For example, create a bubble chart to show the total number of function registrations for an upcoming conference. Note: You cannot assign a size value to the bubbles in the iMIS Bubble chart.	
Line - Displays data as a series of data points connected by a line to illustrate trends. For example, create a line chart that shows a member's giving history over time.	
Pie - Displays data in a circular chart divided into sections to illustrate proportion. For example, create a pie chart that shows the proportions of your members by country.	
Query Menu iPart

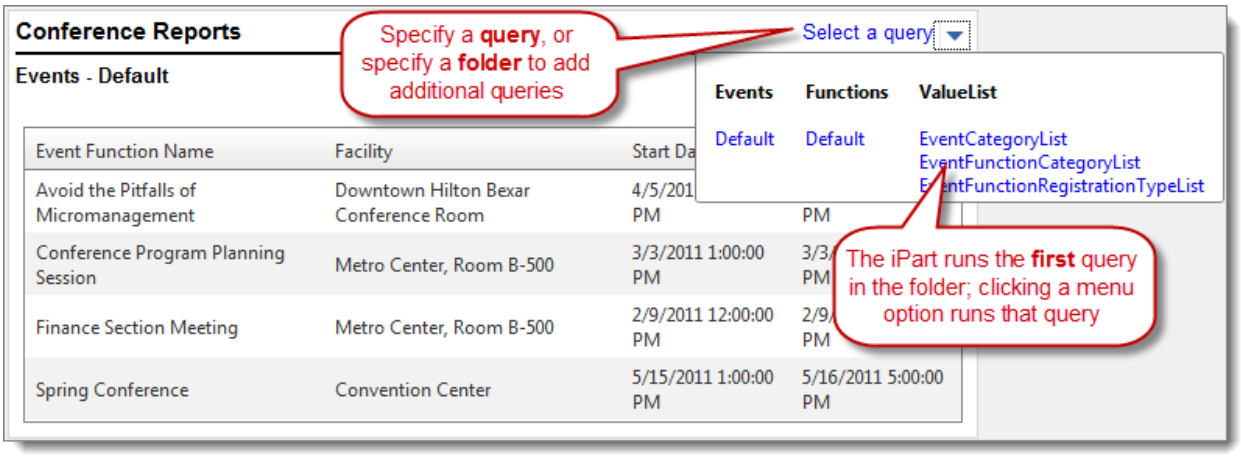
The Query Menu iPart lets you merge query results into your site for tremendous utility. You can set the iPart to display a query, set with whatever title, parameters, columns, labels, and sorting you need, and you can enable exports, which adds icons for sending the data to Word, Excel, PDF, and CSV.

Who is attending?

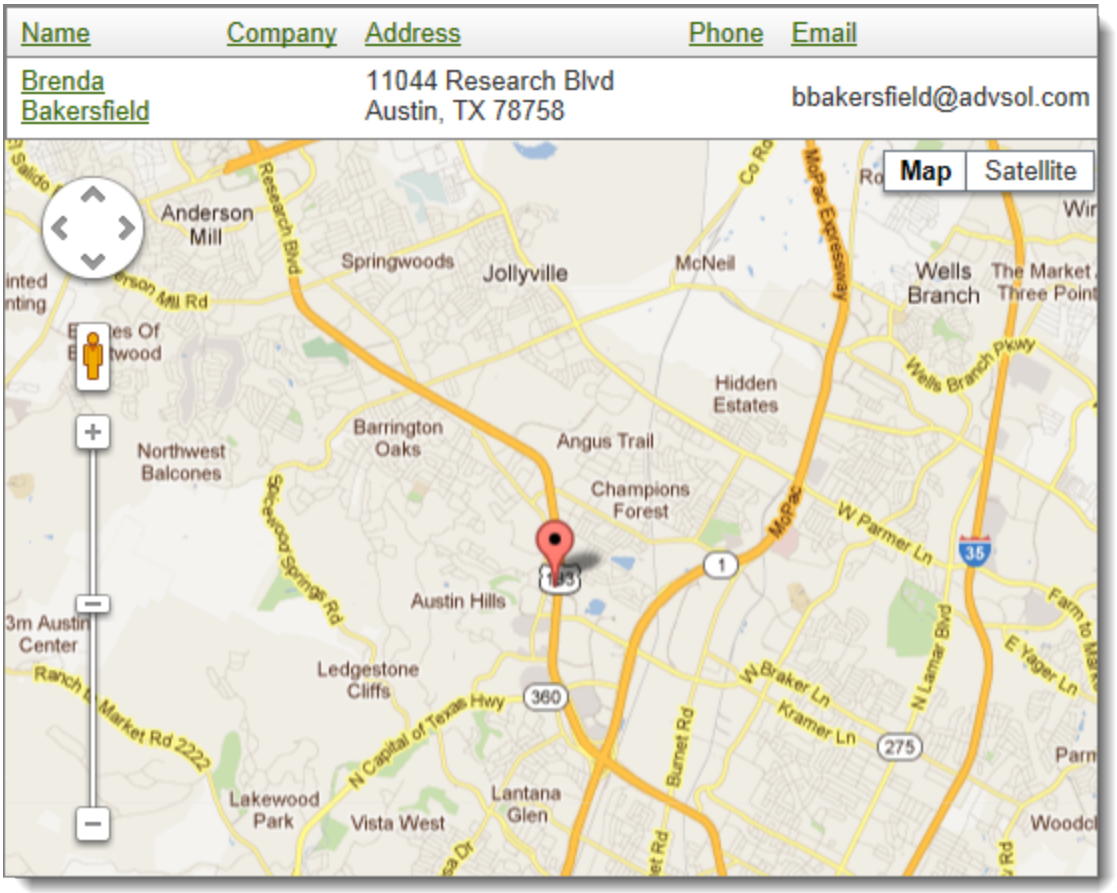
Conference Planning Roster

Registrant	Organization	Title
Hon. Douglas M. Kramer		Representative, State Legislature
Carly L. Kowalski	GEO International	Executive Director
Cecile M. Faciques, CAE	International Association of Business Interests	Director
Charles P. Yusif	International Association of Business Interests	Manager, Education
Steven W. Carlson, CPA	Opus, Inc.	Controller
Sonya Gallora	Publications, Etc.	Executive Officer

You can also organize helpful queries into a folder and point the iPart to that folder. When the page loads, the iPart displays the first query at the top of that folder, and it presents a drop-down menu of additional queries available, organizing them by subfolders, if any. When the user clicks on a query from the menu, the iPart immediately runs that query and displays the results.



If the query selected contains an address property, you can configure the iPart to automatically map the query results when an address is available. Only one address property per query can be mapped. When this option is enabled, the iPart looks for the following address properties in this order and maps the first one it finds: FullAddress, Address, FullAddressText, AddressText, Address Text, and Full Address Text.



Related Items iPart

With the Related Items iPart, you can display a list of profile or product pictures based on the results of an IQA query. For example, you can write a query to display the profile pictures of everyone who has registered for an event, made a donation, or ordered a particular product, or to display products in the same category. You can configure the list to display horizontally or vertically, to display a name for the item, and to choose the size of the image. You also have the option to make the profile picture a live link that opens a URL of your choosing, such as the member profile page.

Guidelines for working with the Related Items iPart

- The pictures displayed in the iPart are based on iMIS product or contact IDs. When creating the query for this iPart in IQA, you must select a property that returns an iMIS product or contact ID on the (Display tab). Give this property an Alias of key_Id (the Alias is case sensitive).
- To define the image to display for each record, include a column in your query that specifies the image file name for that record. Give this property an Alias of Image.
- To display a name for each record, include a column in your query for the name of the item or contact. Give this property an Alias of Name.
- When you add Display columns to the query in IQA, they become available within the iPart as Filter columns to filter on.
- You can dynamically filter the query results displayed in the iPart based on the value of another iPart's URL parameter. For example, you can set up your donation page to display the profile pictures of people that have donated to a particular cause (called a distribution in iMIS). The Donation Creator iPart uses the URL parameter itemid to determine which distribution the donation should go towards. If you add your iPart to the same content record as the Donation Creator, then you can set up the Related Items iPart to look at the value of itemid to determine which profile pictures to display. You just have to make sure that your query includes the CsActivity.Product Code property, so that you can select it as a Filter column on the iPart's configuration page. Once selected, enter

itemid for the Filter on URL parameter, so that the iPart knows to filter the results based on that URL parameter's value.

Example: Display other products in the same category

In this example, the Related Items iPart is set up to display clickable images for other products in the same category as a particular product. This example uses content installed for the sample Member site.

Go to Content Designer > Manage Content:

1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

   Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > RelatedItems. Select RelatedProducts.
4. Filter Options dropdown, select ProductCategory. ProductClassKey.
5. Filter on URL parameter, type in Category.Class.
6. For the Items link to (URL or shortcut), type in ItemDetail?iProductCode={key_Id}&Category={ProductCategory}.ItemDetail?iProductID={key_Id}&Class={ProductClassKey}. This uses the ItemDetail shortcut to link each item in the list to the product page. The particular item's product ID and category are specified in URL parameters so that the correct product and related products are displayed in the resulting product page.
7. Click Save & Publish to complete the content record.

   Example: Display other users who have purchased a product

In this example, the Related Items iPart is set up to display clickable profile pictures of other users who have bought a particular product. This example uses content installed for the sample Member site.

Go to Content Designer > Manage Content:

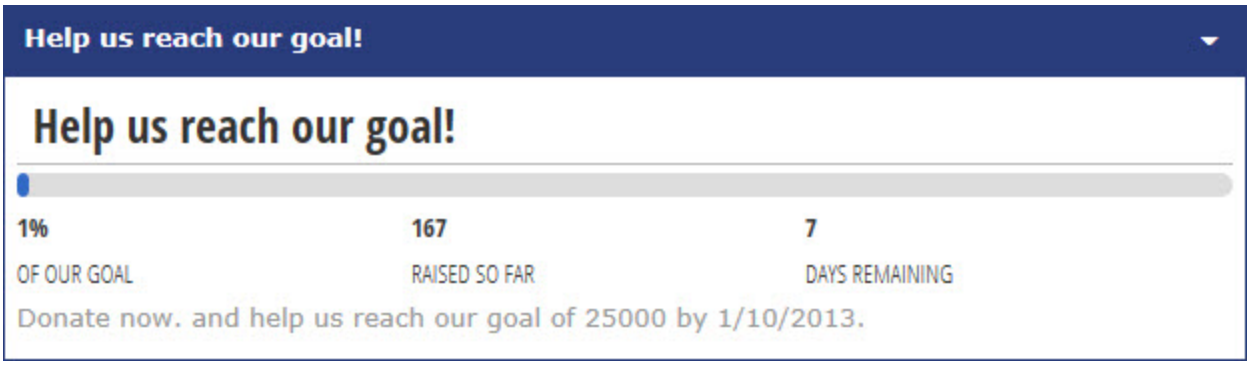
1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

   Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Content Types > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > QueryProfilePictureList. Select Orders.
4. Filter column dropdown, select ProductCode.
5. Filter on URL parameter, type in iProductCode. iProductID.
6. For the Items link to (URL or shortcut), type in MBR/Party.aspx. This redirector web page looks for an ID in the URL parameter and then checks the ID's party type and the user's permissions to determine which content record to display. The user's ID is appended to any URL specified in this field.
7. Click Save & Publish to complete the content record.

Progress Tracker iPart

With the Progress Tracker iPart, you can visually display progress towards a goal based on the results of an IQA query. For example, connect this iPart to a fundraising query, so that your members can easily track the progress of a fundraising effort towards a specific goal. Or connect it to an events query, so that you can see at a glance how many people have registered for an event.



To set up the Progress Tracker

1. Create a query for the Progress Tracker.

   Note: For sample queries that will work with this iPart, see $/Samples/ProgressTracker/ in IQA.

   The Progress Tracker uses three pieces of information supplied by an IQA query: a goal amount, the sum total of what you are tracking, and the end date (which is optional). When you build your query for this iPart, it must contain specific aliases. In IQA, create a new query and choose the business object you want to query on. Make sure you are in Advanced Mode, then from the Display tab, choose properties to assign the following aliases to:

- Goal_Amount: Indicates which property is the goal amount. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST(25000 AS INT) as a property to set the goal amount to 25,000.
- Sum_Total: Indicates which property is the amount to be summed. The percentage displayed in the Progress Tracker is based on this amount compared to the goal. It can be a monetary amount or any other number, such as the number of event registrations.

  Tip: From the Function dropdown list for this property, select Sum, so that only one row is sent to the iPart. This is not required, but it will improve performance.
- End_Date: Indicates which property specifies the end date. This alias is only required if you want to display an end date in the iPart. You can apply this alias to a property of a

business object, or apply it to a Custom SQL Expression property. For example, add CAST('2012-12-25' AS DATE) as a property to set the end date to 25 December, 2012.

2. Add the iPart to a content record and configure it.

   Go to RiSE > Content designer > Manage content:

1. Do one of the following:

- Select a Content Folder and click Edit.
- Select New > Website Content.

2. Click add content.
3. Go to ContentTypes > Utility.
4. Select Progress Tracker.
5. Click OK.
6. Enter the iPart CSS class to style the Progress Tracker. Two styles have been pre-defined that you can use in the iPart: ProgressTracker and ProgressTracker2. You can edit these classes to change the look and feel, or you can create your own style for the Progress Tracker.
7. Select a Source query.
8. (optional) Select a data column by which you want to filter. You can use this feature to dynamically update your Progress Tracker, based on the value passed to it in the URL. If you choose to filter on a data column, then also enter the name of the URL parameter, which the iPart uses to identify the value to filter on. For example, to limit the results of an event query to a specific event, you can select the EventCode property and give the URL parameter a name such as EventCode. The progress displayed will then reflect only the event code which is included in the URL as EventCode=[EventCodeValue].
9. (optional) Enter any messages you want to appear in the iPart. The variables below can be used in the descriptions. For example, "Help us reach our goal of {0} new members by {2}!"

- {0} displays the goal total
- {1} displays the current sum total or count
- {2} displays the end date in a long format
- {3} displays the end date in a short format

10. Select the Caption Options. In addition to the progress bar, you can also display the values as text. If any of the Caption Options are unavailable after selecting a query, this indicates that the required aliases have not been defined in the query.
11. Select the Progress bar location. The bar can be displayed above or below the captions.

    Note: You can also use this iPart to display only a countdown (days remaining to a certain date). In configuration, only select the caption option Display days remaining, then for the Progress bar location, select (None).
12. Click OK.

SSRS Report iPart

PBI- 10759The SSRS Report iPart lets you display the results of any IQA query on any page where you place it. The SSRS iPart uses the version 10.0 ReportViewer, which supports IE8 natively and, in IE8, adds a Print button on its toolbar. You can add the SSRS iPart to any content page using CM: open the Utility folder and choose the content type SSRS Report.

The iPart lets you customize whether to display the export buttons for PDF and Excel versions of the report. You can change the default design (layout, colors, fonts) of your reports by editing the SSRS parameters in the SystemConfig table.

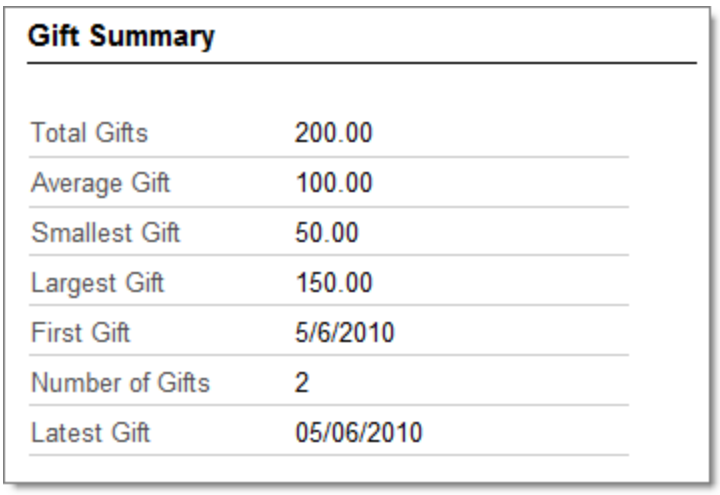
How it works: The process engine specified by the iPart loads a report template (.RDL file) from the document system and creates a report data source (a DataTable) based on an IQA query's SQL source; the report viewer then combines the template and query to generate the report's output. When you configure the iPart, you specify the Document system path to the SSRS Report runtime, which must be a link to an SSRS Process Engine.

Click the select link next to the textbox, then browse to your reports (such as $/Samples/ReportingServices), and pick one of the runtime entries.

> **Note:** Tip: Identify a process engine (run-time report) by the arrow on its icon!

Summary Display iPart

The Summary Display iPart displays a single row of query results in a form view.



Gift Summary

Total Gifts	200.00
Average Gift	100.00
Smallest Gift	50.00
Largest Gift	150.00
First Gift	5/6/2010
Number of Gifts	2
Latest Gift	05/06/2010

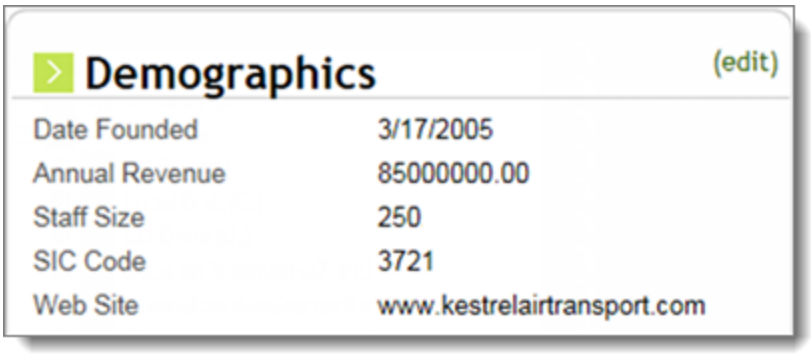
Guidelines for queries displayed in the Summary Display iPart

When creating a query that you want to display in the Summary Display iPart, keep the following guidelines in mind:

- This iPart only displays a single row of query results.
- If you connect the iPart to a query that returns more than one row of results, only the first row is displayed.
- Tip: You can dynamically filter your query results by the currently logged in user, a selected contact, or a date. See Adding dynamic filters to queries for more information.

Panels and custom data

Panels are custom displays of iMIS data that you are able to name, build, arrange in grids, and add to your site. Using panels, your users can browse, edit, add, and delete their data, as you specify:



Panels display within Panel iParts, which allows your users view and edit custom data on the broadest range of browser and platform types that iMIS supports. You can manage your custom data directly and conveniently from the web pages where you place these iParts:

- Panel Editor (which creates panels and shows one panel) --
- Panel Collection Editor (which combines existing panels into tabbed displays)

You can configure the iParts to let your users add and edit that data directly from their browser page. You can import your existing user-defined tables (from iMIS Customizer) directly from the Panel Editor iPart configuration. In addition, your Activity table data is automatically available as a source, so that you can use and extend that data. Panel sources can include existing user-defined tables (defined in the UD_Table table) and user-defined sources (listed in the ObjectMetaData table).

Note: Tip: Panels are shared: when you update one panel, it updates within every iPart that uses it.

Creating custom panels of data

In a few clicks from your browser, you can have a new panel that displays the data you want, labeled and made editable as you need.

1. Enable Easy Edit by clicking on the button at the top right hand corner of the screen.
2. Once Easy Edit has been enabled, you will find and click the icon at the bottom left corner; this is the Content Designer.
3. From the Content Designer, click Add content > Conten tTypes > Content > Panel Editor
4. Select New Panel) from the Panel drop-down menu.
5. Drag in and arrange your desired data, then Save & Publish.

   Once you have placed a panel iPart into a content record and published it, you can then edit the panel directly: As a system administrator, you see a run-time Design command, which lets you make quick changes to the panel, changes that save and publish for you automatically. For extensive panel work, such as to change the type of data it shows, use Easy Edit to access all of the content design features.

   Best practices for panel layout

   Here are key layout features to help you design the best use of screen real estate on the page:

- Multiple columns: Click + or – icons next to the panel layout to add/remove columns in your panel. For best display results, place multi-column panels into single-column content records.
- Hide in Summary View: Check this box on certain properties to trim the initial display of the iPart to the read-only information that is most useful. Only when users open the full

window for viewing or adding/editing (as you configured it) do they see the additional information.

- Read-only: Check this box to provide information in read-only form while still allowing users to edit other information on the panel.

  Tip: To prevent editing of all of the properties, simply disable Allow users to edit on the iPart Configuration, rather than in the Panel definition.

- Collapsible panel: In order to maximize utility and minimize scrolling on the page, users are able to click on the arrow to expand and collapse iParts.

  Tip: Be sure to add an optional Title to any iPart that you make collapsible, so that title bar text guides your users as to what information they will access by clicking Show.

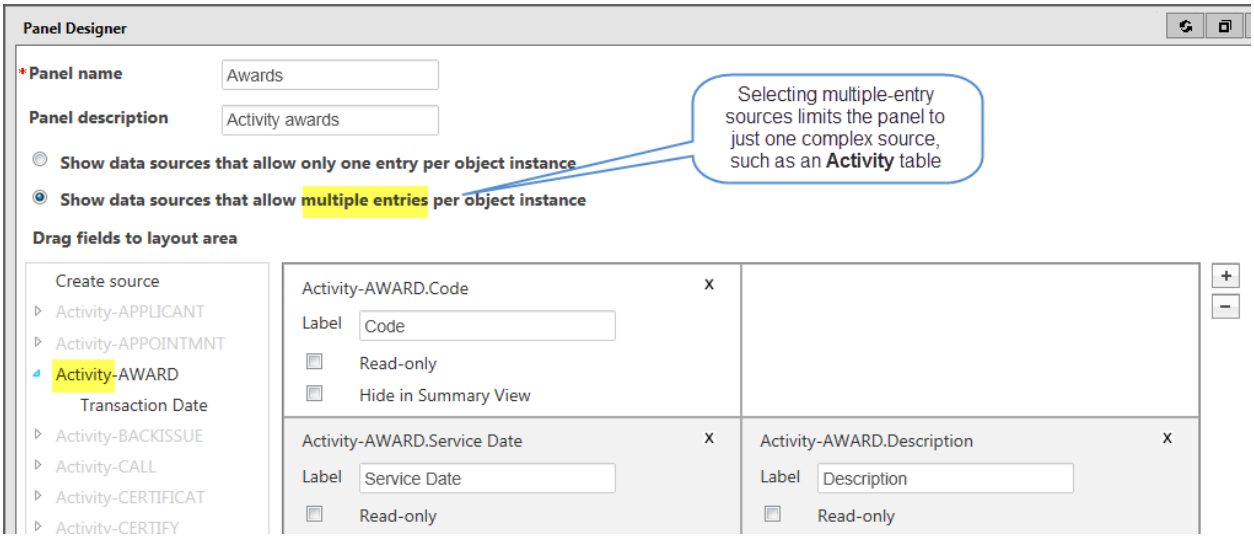
  Panels for Activity data

  Most organizations need to show activity information on their websites. All of the Activity data in your iMIS database appears as complex (multi-entry) sources when you use Panels.

  Suppose you created new award types in the general lookup table called AWARDS and want to add them to a page for dynamic editing. In a few clicks, you can have exactly that:

1. Enable surf-to-edit.
2. Click add content.
3. Go to ContentTypes > Panel Editor.
4. Click OK.
5. In the Panel list, select (New panel).
6. Select Show data sources that allow multiple entries per object instance.
7. Drag in your new data sources.
8. Click Save & Close.
9. Select Allow users to edit.

10. Click OK.
11. Click Save & Publish.



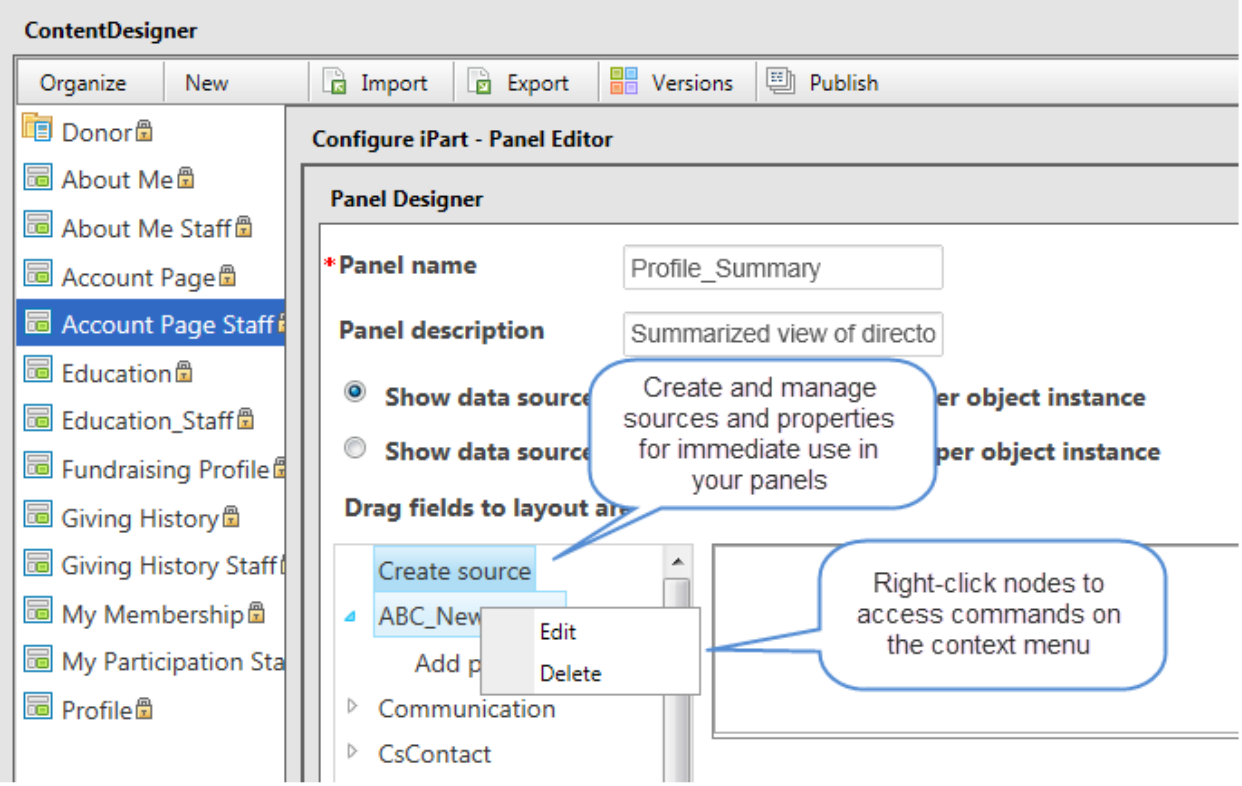
All of your Activity data appears as available sources when you select multiple entries for the type of data source.

> **Note:** Tip: If you want to combine data from different sources, be sure to show simple sources (the first radio button option). Only one complex table can display in a panel, so the others are grayed out as long as any one of them has properties placed in the panel.

Defining your own data with Panel Designer

With the Panel Designer, you can not only craft reusable panels that combine fields from many tables, but you can also define new data structures (business objects and properties) to manage information for your organization. Without special tools or knowledge of the iMIS schema, you can add data sources on the fly, right from your browser. When you save the panel, you have saved your newly created data sources as iMIS business objects.

> **Note:** Tip: You can see your new data source show up as a business object in Business Object Designer, but it will be read-only: continue to edit and manage these special sources in Panel Designer itself.



Access the Panel Designer by editing or creating a panel in a Panel Editor iPart.

To create a new panel source and properties

To create your own data source with properties, you work within Panel Designer. Each new source you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

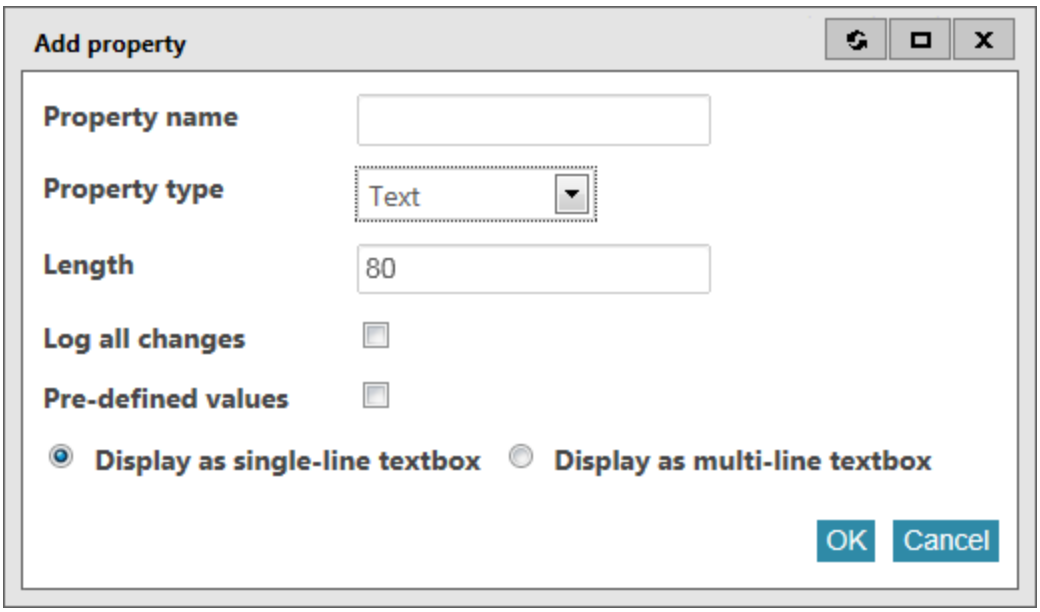
1. Select New > Website Content.
2. Click add content.
3. Go to ContentTypes > Content.

4. Select Panel Editor.
5. Click OK.
6. From the Panel drop-down list, select (New panel).
7. At the top of the source tree, select Create Source.
8. Choose a Name for each new Source that meets these criteria and click OK:

- Starts with a letter
- Contains only letters, numbers, and underscores
- Is unique across iMIS, not matching any existing iMIS data or SQL Reserved Words

  Tip: Use an organizational prefix (such as ABC_*) so that your sources are unique, sort together in the tree view, and are easy to identify as ones that you created.

9. Select Add Property for the new source added.



10. Enter a Property Name.

- Starts with a letter
- Contains only letters, numbers, and underscores

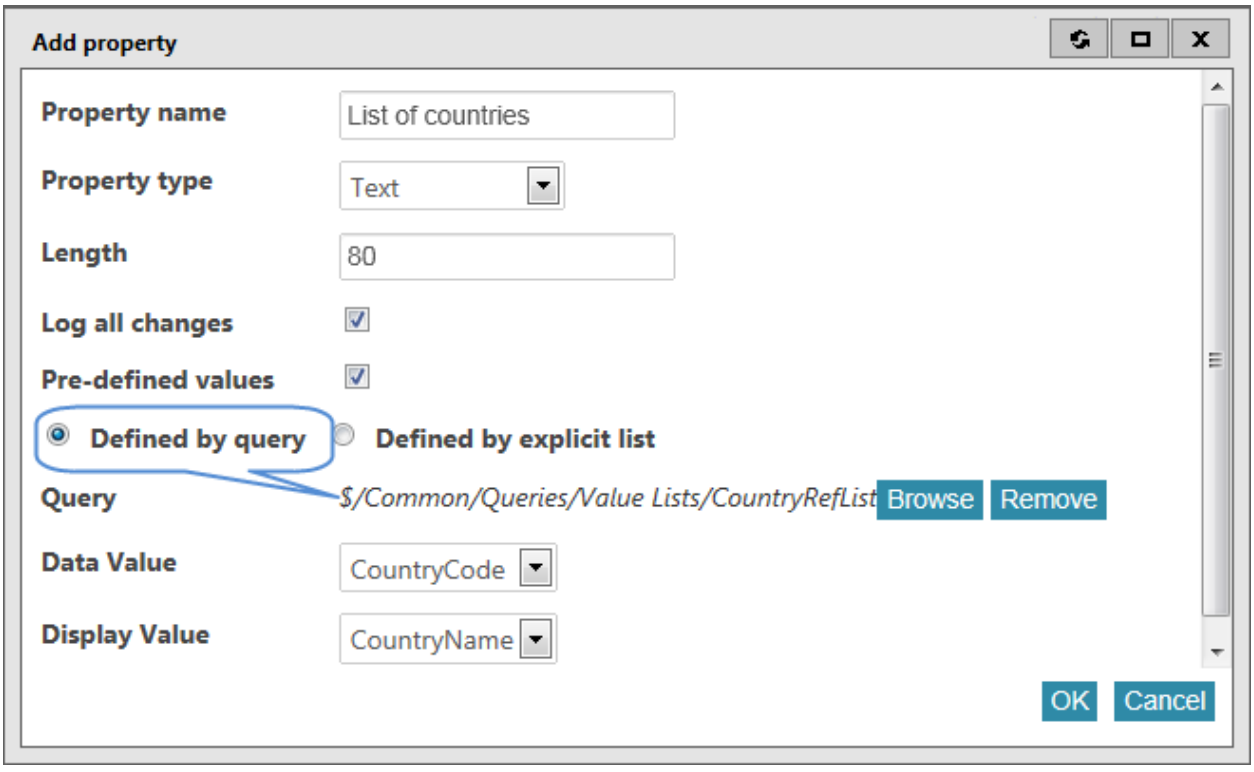
- Is unique within its Source

11. Choose a property type that best fits your purpose, within these valid ranges:
    - Currency: 19 total digits (precision), with 4 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Date, Date and Time, Time: January 1st, 1753, through December 31st, 9999
    - Decimal: 28 total digits (precision), with 12 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Email: Creates a mailto link, which launches the user's default mail application when selected.
    - Integer: -2,147,483,648 to 2,147,483,647 (±2 billion)
    - Text: By default, the Text Property type allows:
    - Free-form entry up to 400 characters (defaults to 80). You can select to display the text-box as a single line or multi-line textbox.
    - Pre-defined values from a query or explicit list that display as a drop-down list at runtime:
    - Query – For example, you may want to use a query that returns a list of countries.
    - Explicit List – For example, you can add a list of colors the user can select as their favor-ite.
    - URL: Creates a live hyperlink, which launches a new instance of the browser to open the link when selected.
    - Yes/No: Boolean
12. Enable the Log all changes if you want to track any data change made to the property you are adding.

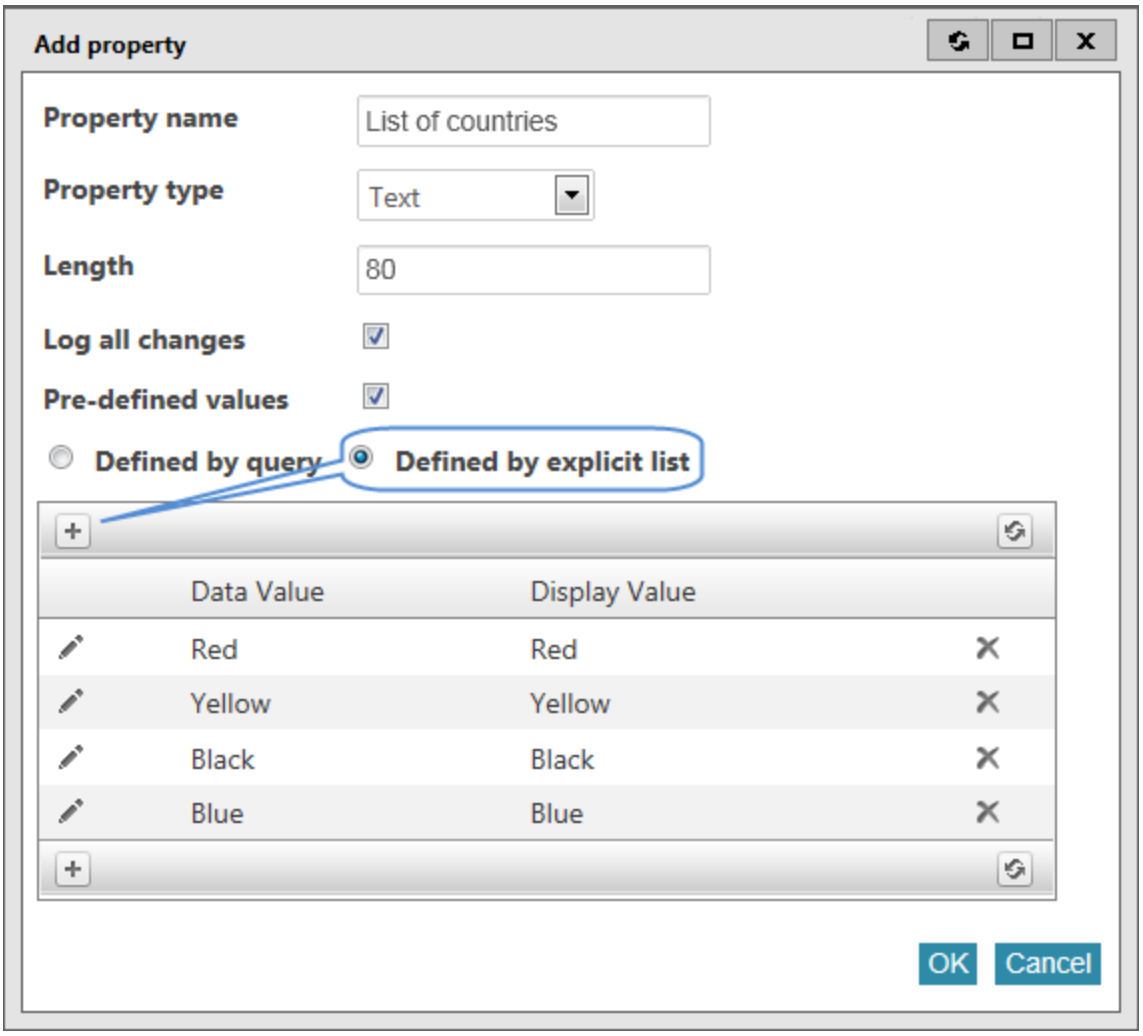
    Hint: Add the Change History Display iPart to a content record if you want to display data changes made in the Name and Name_Fin tables as well business objects.

13. (Text Property type only) The Pre-defined values option allows you to present a list from which the user can select.

- The Query option provides validation-type properties based on the query results. For example, instead of typing out a list of countries, you could select a query that displays country values.
- Enable the Pre-defined values checkbox and select the Defined by query option.
- Click Browse, select a query, and click OK.
- Two additional fields display, Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel. For example, the country code may not be as clear as the country name.
- Select the fields from the drop-down list in the Data Value and Display Value fields.
- Click OK.



- The Explicit List option allows you to create a list to display on the panel. For example, you may want a user to select their favorite color.
- Enable the Pre-defined values checkbox and select the Defined by explicit option. A table grid displays.
- Click + to add a data row. The data row contains two icons: Insert and Cancel, and two fields: Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel.
- Enter the appropriate values in the Data Value and Display Value fields.
- Click the checkmark located to the left of the data row.
- Click + to add additional data rows.
- Click OK.



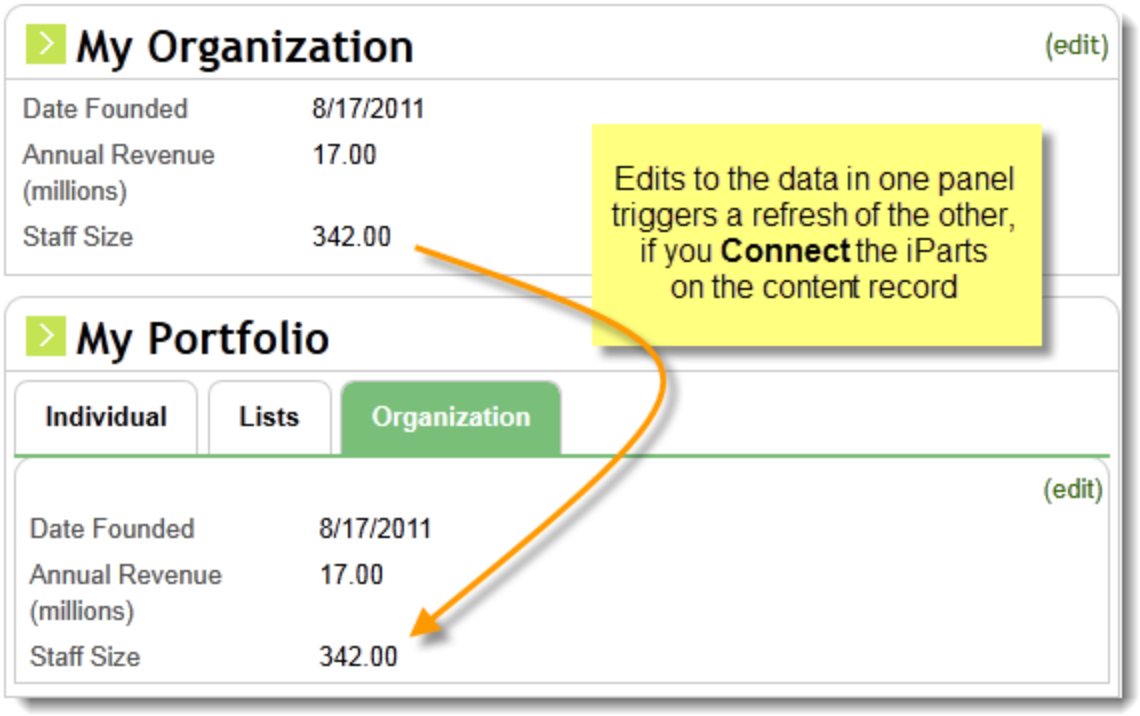
14. Drag the field(s) to the layout area.
15. Save the panel to save the source and properties. Once you save a property, you cannot rename it. Note that the sources will alphabetize properly on reopening.

    Each new property you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object property is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

    Tip: Do not save until you create all of the properties. This way, you can view them as a set of properties and improve your naming convention before it is finalized.
16. Save and close the Panel Designer window.
17. Save & Publish the content record.

Connecting iParts to refresh panels

When you combine panel-displaying iParts on the same content record, data might appear out of sync after the user edits it, if both panels display the same property. You can solve this refresh problem through the iPart's Connect feature, which you enable separately from Configure.



> **Note:** Note: Check an iPart's Configuration Help topic to find out if it supports any connection options. An iPart has no connection support (neither consumer nor provider) unless its author added it.

To connect panels for dynamic updating

1. Edit a content record and add two user-editable iParts that display panels (Panel Editor, Panel Collection Editor).
2. Set up the first connection:

- From the first iPart's title-bar menu, select Connect.

The Connect box that opens shows you any current connections and lets you disconnect them.

- Select Create a new connection.

  The Connect box that pops up prompts you to create one of four connection types.

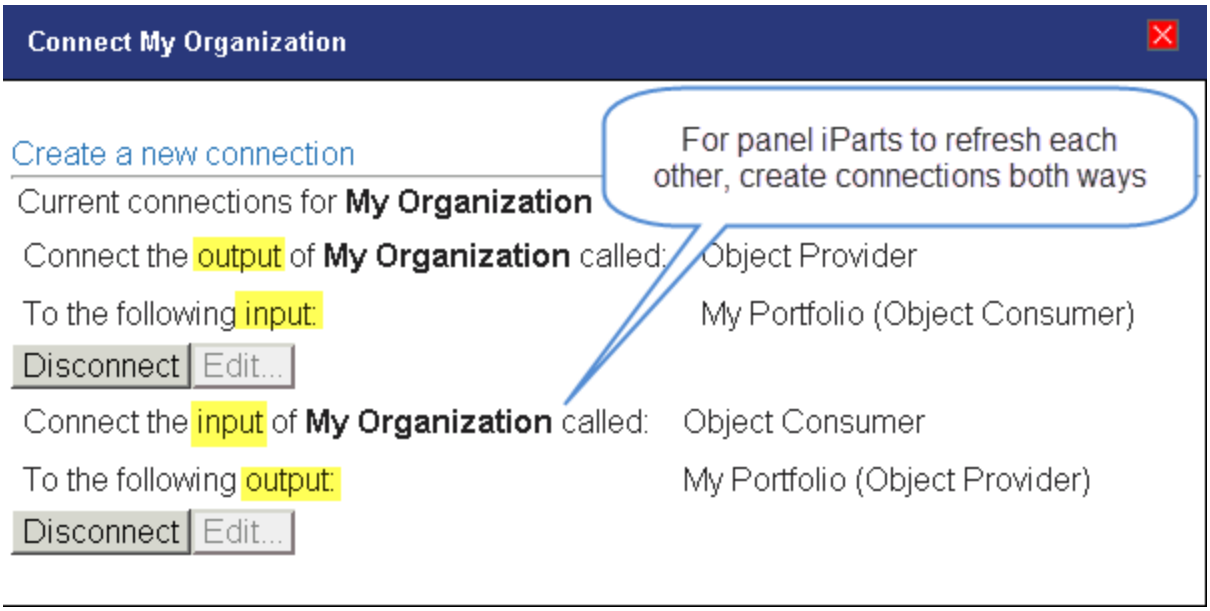
  Tip: Do not be misled by the language of connection. The Consumer is the actor that triggers a refresh on another iPart, and the Provider provides a pointer to itself to the Consumer.

- From the Object Consumer drop list, select the panel iPart you want to refresh.
- Select Connect.

3. Set up the second connection:

- From the second iPart's title-bar menu, select Connect, and select Create a new connection.
- From the Object Consumer drop list, select the first iPart.
- Select Connect.

  You should see a pair of connections, for mutual refreshing.



4. Save and Publish the content record.

Adding existing business objects to panels

Panel Designer lets you create new data sources on the fly, access any user-defined tables, and make full use of the Activity table. It can also display your existing business objects, if they meet these requirements and configuration settings:

Referencing existing business objects

Panel Designer can display existing business objects that have a ContactKey or ID property. When ContactKey or ID is the primary key, Panel Designer treats it as a single-instance table; otherwise, it assumes it to be multi-instance.

Panel Designer cannot display your business objects until you add them to the ObjectMetaData table. While attached to the iMIS database in SQL Server Management Studio, run this SQL statement:

INSERT INTO [dbo].[ObjectMetaData] (ObjectName, RelatedToEntity, IsUserDefined, IsMultiInstance)

VALUES ('MyObject', 'Party', 0, 0)

- Replace MyObject with the name of the business object, table, or view that is related to Party.
- Change the last value to 1 if it is multi-instance.

Settings for Business Object Designer (BOD)

1. In Business Object Designer, edit your object and open the BOD (Properties tab) > (Display tab).
2. To make a property available to your panels, enable its Available to UI? option.

   Tip: To see your BOD changes immediately, restart IIS.
3. To enable multiple selection for a property, select Check box(es) under Display Control so that you can enable the Allow multiple selection? option.

4. To enable HTML editing, select HTML Editor under Display Control. Be sure to use the property in a single-column panel to provide the control adequate width.

   Troubleshooting

   If you get an error when creating a new data instance at runtime (either single- or multi-instance), check that your business object does not have a 'Read-only' constraint set on the ContactKey or ID property's Definition tab.

Connecting picture iParts to Facebook

You can set up the Contact Mini Profile and Contact Profile Picture iParts to prompt people to use their Facebook profile picture in iMIS, instead of uploading a picture. To use this feature, you must do the following:

- Contact your Hosting Administrator to enable Enable the Facebook feature in the web.-config file
- Create a Facebook app so that your website can connect to Facebook
- Enable the iPart configuration option to Prompt for Facebook connection

  When enabled, signed in users are prompted to connect to Facebook when they edit their profile picture and wherever their profile picture is displayed.

  To create your Facebook application and use it in iMIS

1. Contact your Hosting Administrator to request that they do the following: Edit your web-site's web.config file, located by default in C:\Program Files\ASI\imis\net. Find the EnableFacebookApi property, and change the value to true.
2. Create your Facebook application.

- Log in to the Facebook Developers site.
- Click +Create New App.
- Enter an appropriate App Display Name and App Namespace for your organization. Only the App Display Name will be visible to users.
- Click Continue and complete your App creation.

- On the Basic info page for your App, enter the Site URL for your iMIS application.
- Take note of the App ID Facebook has created for you.

3. Contact your Hosting Administrator to request that they do the following: Add your Facebook App information to the required iMIS JavaScript.

- Edit your iMIS Facebook.js file using a text editor. By default it is located in C:\Program Files\ASI\imis\Net\AsiCommon\Scripts\SocialMedia.
- Find the appId value and update it with the ID issued to you by Facebook.

To load the Facebook API

1. Edit your website's master page. By default it is located in C:\Program Files\ASI\imis\Net\App_Themes.
2. Add the following html within the <body></body> tags of your master page:

To enable the Facebook connection in iParts

Configure each instance of the Contact Mini Profile and Contact Profile Picture iParts used in your website to enable the options Allow picture change and removal and Prompt for Facebook connection.

> **Note:** Note: When the Facebook feature is disabled in the web.config file, the Facebook options do not appear in the Contact Mini Profile or Contact Profile Picture iParts.

Using the Content Block iPart

With the Content Block iPart, you can empower authorized users to create and edit content directly on a page, without using Surf-to-Edit or accessing Tools. Through iPart configuration, you can allow users to insert HTML content, add attachments, create child pages, and submit replies. At its simplest, a content block can be HTML that is read-only unless the user has permissions to see the edit command. At its most complex, a block

can act as a message board with multiple posts, child posts, and replies. You can limit the number of posts to a set number, or you can leave it at the default (zero), which lets it grow indefinitely.

> **Note:** Note: for guidance in creating a Content Block, follow the steps outlined in Creating Custom Panels of Data, and select Content > Content Block

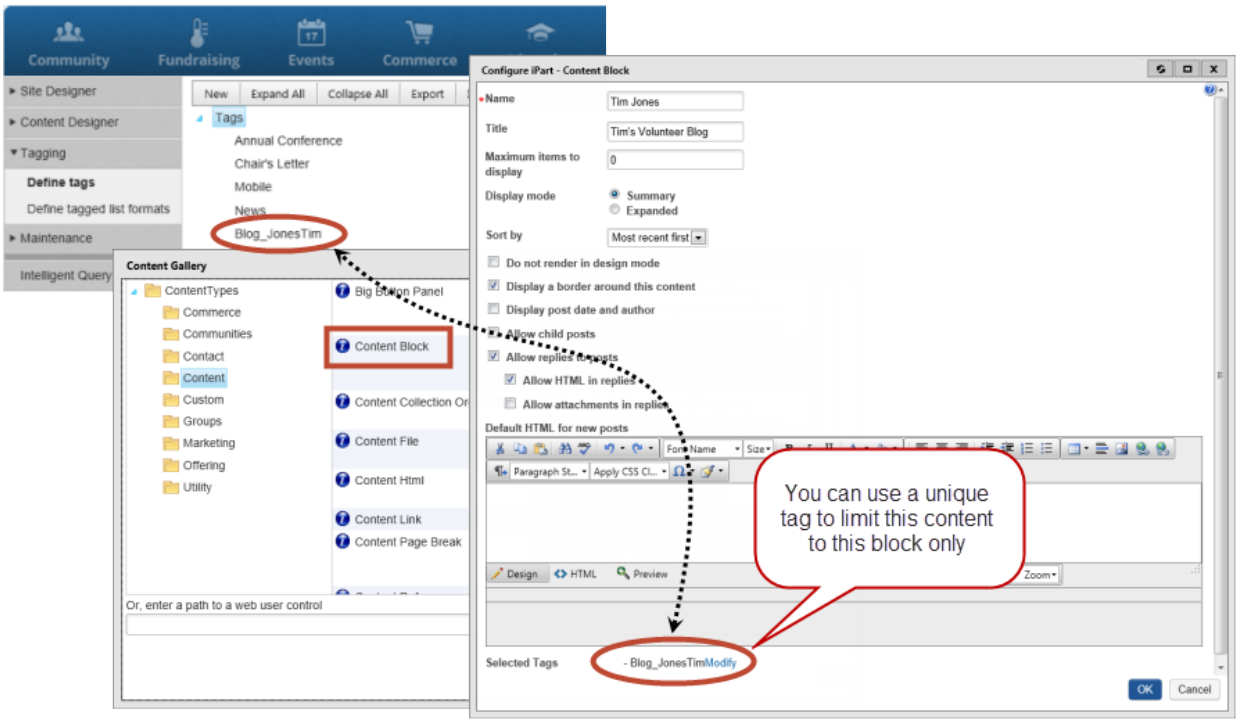
How groups own content

The content created with a Content Block iPart is owned by the Uniform Item associated with the page that contains the iPart. Likewise, the only content displayed is content owned by the page's Uniform Item. The Content Block currently works best with the Group landing page, where it can be used with the Uniform Item for groups. A page's Uniform Item is determined by the iUniformKey parameter passed to the page in the URL.

For example, assume that you have a content record that displays when a user clicks a search result link for a Committee, and it contains a Content Block iPart configured to display content tagged as Announcement. Now a content editor wants to add an announcement for the Planning Committee. After searching for it, he selects the result and goes to the page. The search link sends the iUniformKey for the Planning Committee to the content record through the URL. The Content Block iPart then displays any announcements (the tag) for the Planning Committee (the Uniform Item). When he adds his new content, it is tagged as an Announcement and is owned by the Planning Committee.

Tagging to filter content

To control what content appears in a Content Block, you create tags specific to ContentBlock Items and apply those tags to specific instances of the iPart. For example, if you want to create a new blog for Tim Jones, you could create a ContentBlock tag such as blog-JonesT, place a new Content Block iPart on a content record, and configure the iPart to display the tag blog-JonesT. Now the content that Tim authors in this blog will be unique to his+ blog, if you do not apply this tag anywhere else:



Content created with anything other than a Content Block iPart will not be displayed, even if it has the same tag. For example, a content record containing HTML tagged with News will not show up in a Content Block that is also using the News tag.

Note: Best practice: Plan for and create the tags you want to use before configuring your Content Block iParts. Content can seem to disappear if you change

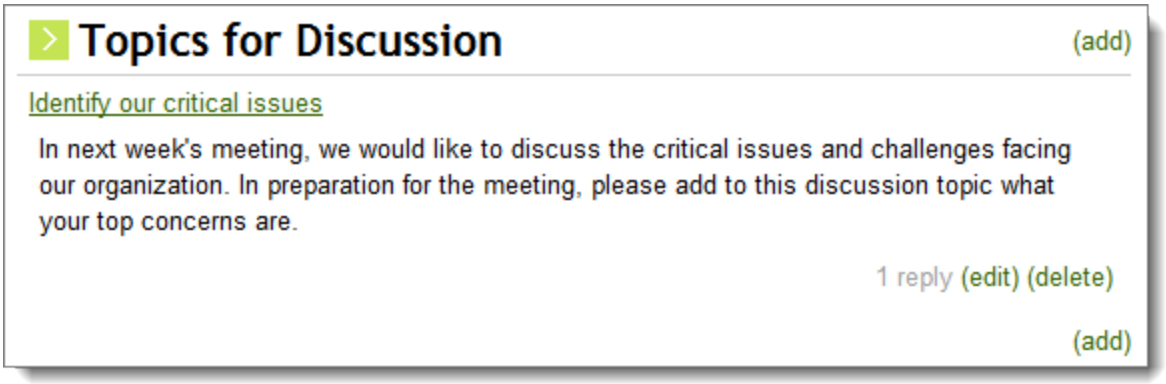
the tags assigned to a content block already in use, because it no longer matches the tag set currently configured.

Creating a message board

Only users with the Content Editor permission may create posts and children, but any authenticated users can reply to a post and edit or delete their own replies. Any authenticated user may create posts and children, reply to a post and edit or delete their own replies.

To use the Content Block as a message board with multiple posts, child posts, and replies, make use of the following configuration options:

- Maximum items to display - Choose the maximum number of posts that will be displayed; 0 indicates an unlimited number of posts.
- Display mode - Expanded display mode will display replies and child posts in-line, while Summary mode only shows replies and child posts when the post is opened.
- Allow child posts - Allow Content Editors to add a child post to existing content. Allow any authenticated user to add a child post to existing content.
- Allow replies to posts - Allow authenticated users to reply to posts; you may indicate whether to allow HTML and/or attachments in the replies.



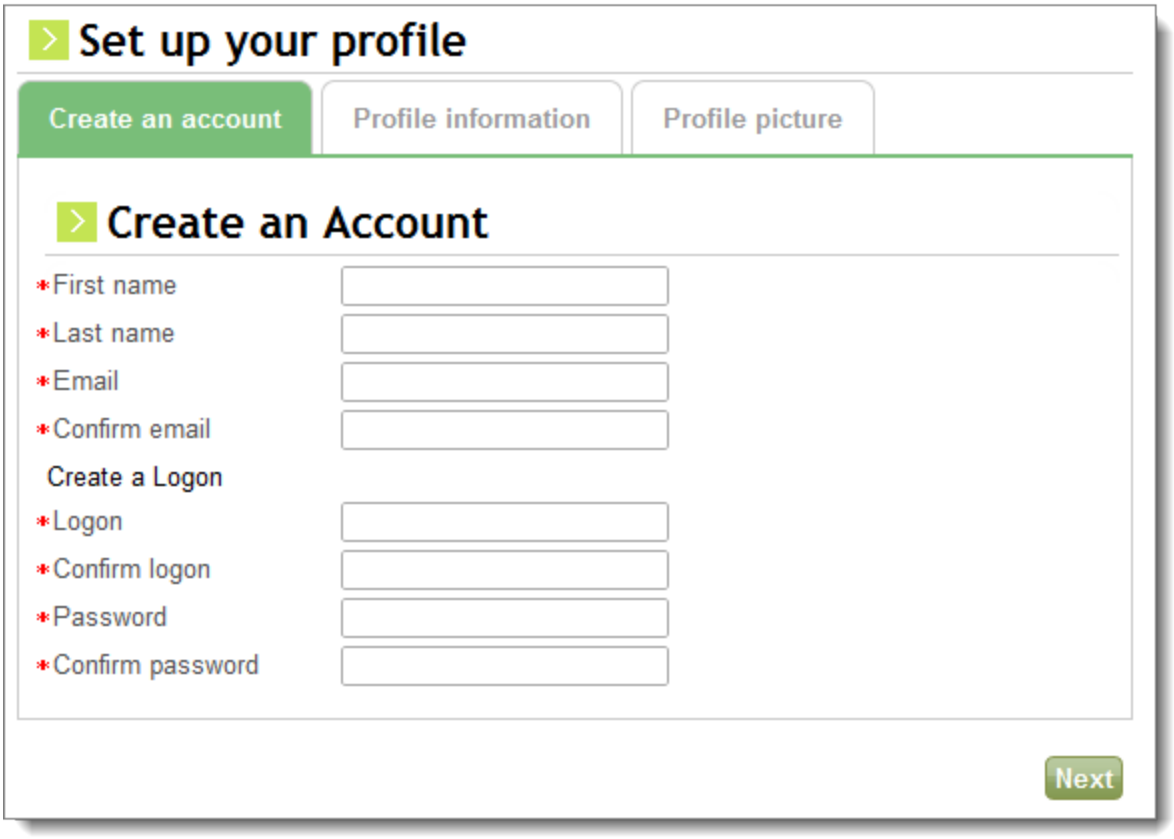
Content Block iPart set up as a discussion board

Using the Content Collection Organizer

Use the Content Collection Organizer to create a collection of pages and assign names to the tabs or headers for each page. In the simplest example, those pages are displayed, the user can access tabs in any order desired, and information is saved independently on each page. The following screenshot shows an example with tabs across the top, configured to display different content pages.

Using the Content Collection Organizer as a Wizard

You can configure the Content Collection Organizer to function as a wizard, which will guide the user through multiple steps. When enabled, Next and Previous buttons display, allowing users to navigate between the steps, as shown below. The user can navigate to any previous tab, but forward only to the next tab in the workflow sequence. The user can also navigate with the browser's Forward and Back buttons, but the data does not commit until the user clicks Next.



Each page in the workflow is validated when the user clicks the Next button. Each iPart's page.Validate method is processed in the order the iParts appear on the page. The order of calls is:

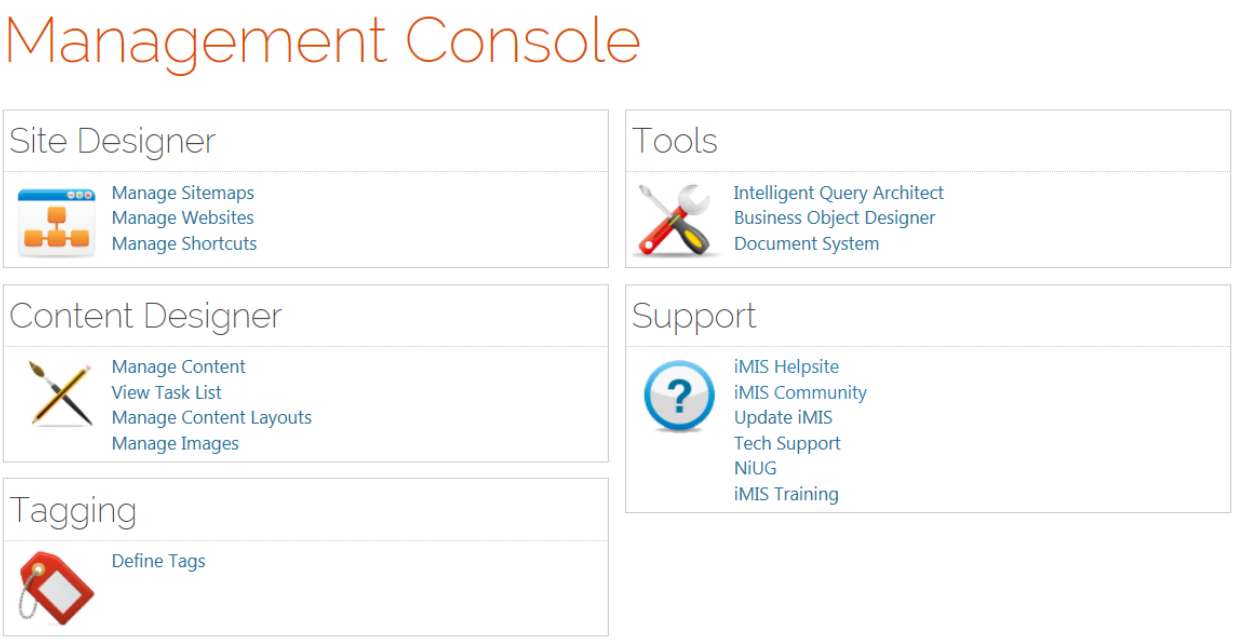
- Validation
- If Validation passes, then PreCommit
- If PreCommit passes, then Commit

If any of the calls fail (the data on a page is incomplete or incorrect), then an error message displays and the user cannot move to the next step until it is corrected.

Using the Big Button Panel iPart

With the Big Button Panel iPart, you can display a navigation panel that combines a larger, category-defining image with a list of links, as shown in the screenshot below. You

can also use this iPart to create links that make it easy for staff to perform routine tasks for contacts such as running reports, registering for events, and ordering on their behalf.



Example: Working On Behalf Of contacts and running reports using the Big Button Panel

In this example, we will set up the Big Button Panel on the account page, so that staff can select a contact from the Directory, then quickly run a report, register for an event, make a donation, or order a product for that contact.

1. Edit the account page that displays after a staff user selects a contact from your directory. In the Member site, it is the Account Page Staff content record.
2. Add the Big Button Panel (add content > ContentTypes > Content > Big Button Panel) iPart to the content record and configure it with the following settings:

- Mode: Actions
- Add an action link to run a report:
- Link Text: Print Info
- Link Target: Enter a link to a page that contains the SSRS Report iPart that displays a report such as $/Samples/ReportingServices/MemberProfileQuery_Report.

Note: The SSRS Report iPart must be configured to Hide the parameters section and to enable the option to Inspect query string for parameters. Do not enable the option to Inspect Session for parameters. For more information about SSRS reports, see Creating SSRS reports.

- URL Parameter: ContactKey=@SelectedUser
- Add an action link for event registrations:
- Link Text: Register for an event

  Note: Customize this text for the event you want to register the contact for. For example, Register for the Spring Conference.
- Link Target: Enter a link to the event page
- URL Parameter: EventKey=XYZ (replace XYZ with an event code) EventKey=XYZ (replace XYZ with an event key)
- Use On Behalf Of: Enable
- Add an action link for donations:
- Link Text: Make a donation
- Link Target: Enter a link to your donation page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable
- Add an action link for the shop:
- Link Text: Purchase a product
- Link Target: Enter a link to your Shop page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable

3. Save and Publish the account page.

Using the Group List Editor iPart

The Group List Editor provides a flexible tool for you to display and manage lists of groups, sub-groups, relationships, and/or memberships. You can configure it to serve several different purposes.

Display an organization's roster

A common use for the Group List Editor is to display a list of contacts that belong to an organization.

For example, add the iPart to an organization's profile page, so that the iPart displays memberships for the selected organization. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the roster
- Clicking on a contact opens their profile page: Enable to link contact names directly to their profile page
- Provide option to view and edit membership details: If you want users to have easy access to both the account pages and the Group Member Detail window, also enable this option. Users can click an icon to switch between these options.
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups owned by the parent ID and their members
- Choose the group types to include: Organization
- Automatically create a group if one does not exist: Enable if you have allowed editing (this allows the creation of new rosters)
- Group owner type: Party
- Group type to auto-create: Company
- Choose the group types to include: Ensure that Company is selected

Display a contact's memberships

Another common use for the Group List Editor is to display a list of a contact's memberships in groups such as committees and chapters.

For example, add the iPart to a contact's profile page, so that the iPart displays memberships for the selected contact. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the contact's memberships
- Clicking on a contact opens their profile page: Not applicable
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups that the parent ID is a member of
- Choose the group types to include: Select the group types you want to display, such as Chapters and/or Sections

Future possible topic: Display a group's members in the Group List Editor

The Group List Editor can also be used to display all of the members of a group.

For example, add the iPart to a group landing page that displays after selecting a group from the Directory. Configure the iPart with the following settings:

Relationships in the Group List Editor

You can easily create a link between two contacts using the Group List Editor iPart. The relationships you define show up on the record of both contacts, and you can specify roles for one or both of the contacts. For example, if you edit Jean Smith's record to indicate that she knows Russell Smith, then that relationship will also appear in Russell Smith's record. Alternately, if you edit Jean's record to indicate that Russell is her child, you can also specify that her role is the parent of Russell. Then Russell's record will reflect that Jean is his parent.

There is no limit to the number of relationships you can create or the types of relationships you can create. We have provided a few relationship types out-of-the-box, but you can add additional ones if needed.

Only users with System Administrator or Staff privileges can create relationships between contacts, but any user can view a list of relationships.

Note: Note: To use this relationship feature, you must have the RELATION license.

The following sections walk you through how to create relationship types and how to set up the Group List Editor to display relationships.

Creating relationship types groups and roles

Edit the Customer setup table for Relationship types, adding the relationships that you want to have available in the Group List Editor. For each relationship type you add, you can also define a Reciprocal relationship, which the Group List Editor automatically populates as a set (such as for Parent and Child).

To display and edit relationships in the Group List Editor, you must define a Relationship Group and Roles (relationship types) associated with that group. A sample relationship group type named Connections has been provided. You can create your own group type from Setup > Groups > Types. If you create your own group type, the only requirement is that you select the Relationship Group checkbox, so that the Group List Editor can properly display relationships.

To create Roles used in relationship groups

1. Decide which relationships you want to be able to define for users. For example, Parent-Child, Husband-Wife, etc.
2. Create Roles for each relationship type.

- From Setup > Groups > Roles, click add.
- Enter the Name of the Role and a Description of the role.
- Select the Active checkbox.

- (optional) Select a default Reciprocal Role for this role. For example, if you are creating a Parent role, you may consider selecting Child as the default Reciprocal Role, so that it is automatically selected when someone defines a Parent relationship. If the Reciprocal Role you want to add is not in the list, create it first, then add it to this role.
- Save and repeat for each relationship role you want to define.

3. Edit your relationships group (for example, the group Connections) to add the roles you have defined.

   To set up the Group List Editor to display relationships

1. Add the Group List Editor iPart to a content record on which you want to display a list of a contact's relationships. For example, add it to an account page. The iPart displays a list of relationships for the currently selected contact. The selected contact is determined by either a contact ID passed to the page via a URL parameter (from the Directory, for example), the contact selected in the On Behalf Of control, or the currently signed in user.
2. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit relationships
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Both of the above
- Automatically create a group if one does not exist: Enable
- Group owner type: Party Choose the group types to include: Select Relationships
- Group type to auto-create: Select a relationship group, like Connections
- Choose the group types to include: Ensure that Connections is already selected.

  Note: Only the relationship group type selected to auto-create may be edited. For this reason, if Allow editing is selected, we recommend including only the one relationship group type in this instance of the iPart.

3. Save and Publish the content record.

Using the Content HTML iPart

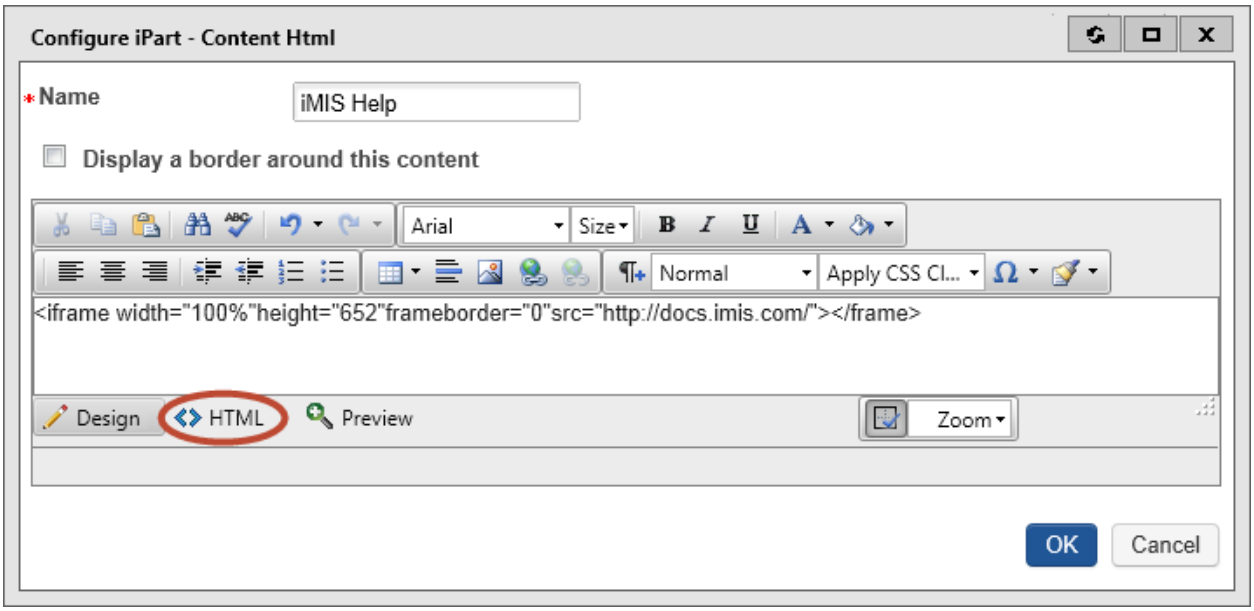
Using the Content HTML iPart, you can add simple content to your website, anywhere you want. In addition to the WYSIWYG functionality, you can switch to HTML mode to insert JavaScript to embed other sites, display web widgets, and use variables to create relative paths.

Embedding external sites

To embed any external page into an iMIS site, you can use an <iframe> like this:

1. Go to Content designer, Manage content and create a new content record.
2. Select add content and place a single Content Html iPart on it (from the ContentTypes folder).
3. Show the source by clicking the <> HTML tab and type in an iframe tag, such as this:

   <iframe width="100%" height="652" frameborder="0" src-c="http://docs.imis.com/"></iframe>
4. Go to Tools > Site designer > Manage sitemaps and create a new navigation item that points to the new content record.
5. If appropriate, restrict the navigation item's Access Settings, such as to Authenticated User Full Control.



Displaying web widgets

You can install and display JavaScript-based web widgets (plugins, gadgets) in your WCM-generated websites using the Content HTML iPart. A web widget is a small program that your users can execute within a web page and that can provide a wide range of functionality.

For example, Google Gadgets offers thousands of free web widgets including mini applications, games, news feeds, maps, and a wide range of other types of content. Many other websites also provide free widgets that can access data from their site. For example, Twitter provides widgets that let you display Twitter updates on your website. LinkedIn provides plugins that display information such as company profiles, member profiles, and links to share on LinkedIn. You just have to search the web to see what you can find that meets your needs.

> **Note:** Warning: Only embed widgets from authors whom you trust. Malicious code may damage your computer or violate your privacy.

To add a JavaScript-based web widget to a webpage

Go to Content Management > Content designer > Manage content:

1. Create a new content record or edit an existing one.

2. Click add content to find and select the Content Html iPart.

   The Configure iPart window opens.

3. Click < > HTML to switch to HTML mode.

4. Copy the JavaScript embed code for the widget you want to add and paste it into the HTML area.

5. Click OK, then Save and Publish your content record.

   The widget is displayed when that content record is rendered on a webpage.

Creating relative paths using variables

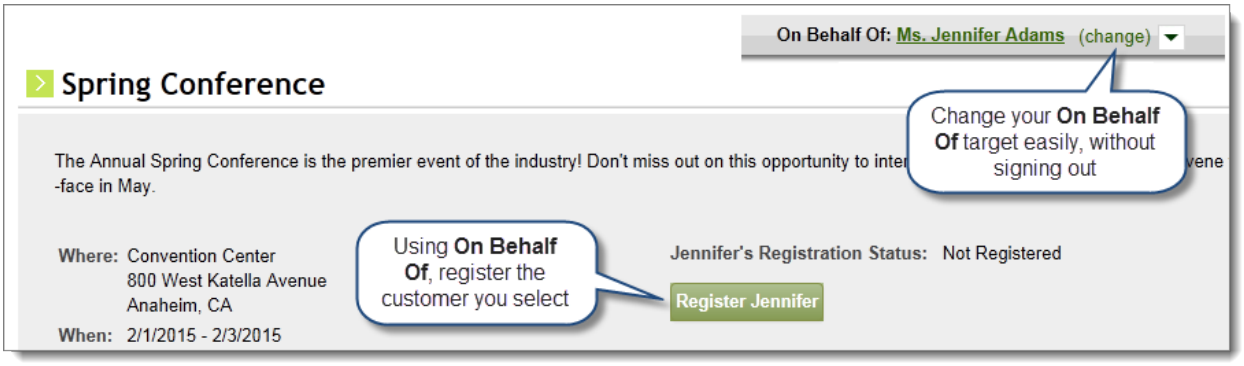
The Content HTML iPart does not support the use of the ~/ (tilde slash) shortcut, often used to automatically build the correct paths when a control is rendered in different domains. However, several variables are available in this iPart that allow you to enter paths for links and resources that are automatically resolved to various folders in your website. The variable names are case-sensitive.

> **Note:** Note: Images do not render in Design mode because the variable is not transformed until the content record is published.

- [Website] – Resolves to the root of the website and contains the website name. Example: [Website]Home.aspx.
- [~] and [Root] - Both variables resolve to the root of the website. Example: [~]Home.aspx resolves to http://mydomain/Home.aspx.
- [Theme] - Resolves to the website's theme folder. Example: [Theme]images/image.png. This variable can be used to access theme resources such as images and CSS.
- [iMIS] - Resolves to the iMIS directory of the website. Example: [iMIS]ContactManagement/CreateAccount.aspx
- [Common] - Resolves to the AsiCommon directory of the website. Example: [Common]Controls/Shared/FormsAuthentication/Login.aspx

On Behalf Of: Customer service mode

Your iPart-based site is not just for self-service: On Behalf Of gives your staff a customer service mode, to complete website commerce on behalf of your customers. When requests for event registrations, product orders, and even membership renewal payments come in by phone, fax, or email, On Behalf Of lets you conduct a secure session during which you can add items to a customer's cart and complete the transaction for them, all without signing out of your own session.



Separate carts, for privacy

To avoid confusion and to protect your customers' privacy as to which items they may have added to their own carts, On Behalf Of sessions create and save carts that are completely separate from those your customers see. For added security, items yet to be purchased are saved in these carts, but not any cardholder information that may have been entered.

For example, if you added a registration to a member's cart but do not submit it, then she will not see the registration in her cart the next time she signs in; however, when you return to registering her on her behalf, you see her cart restored to the state it was in when you left it. Once you complete a purchase on her behalf, both she and you can see the order through her account page.

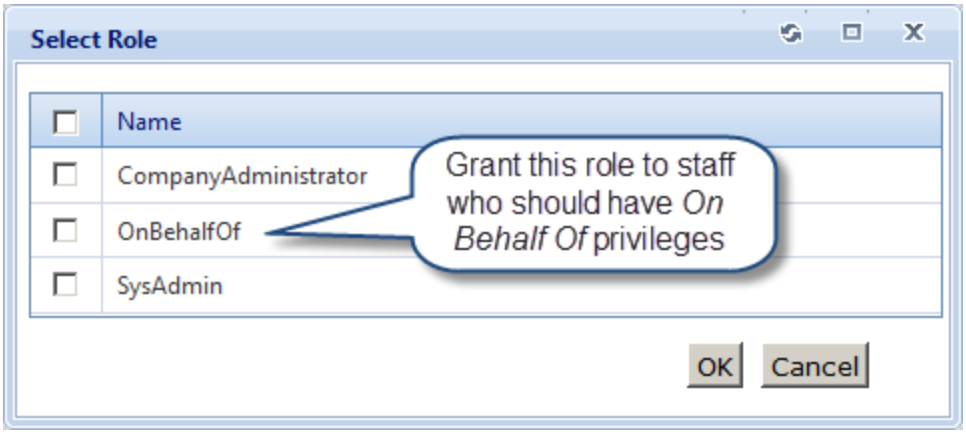
> **Note:** Tip: You can use the audit trails to track which logged-in user performed each action that affected an On Behalf Of transaction.

Who can act On Behalf Of?

To protect the security of contact data, users must be added to the security role SysAdmin or OnBehalfOf to perform actions on behalf of another contact (individual or organization). It is easy to give a staff member On Behalf Of privileges.

Go to System Setup > Security administration > Users:

Find and select a user, and in User Information click add role.



Changing and ending On Behalf Of

When you act on behalf of someone else, all of your commerce-related actions pertain to the target contact until you end the session in one of these ways:

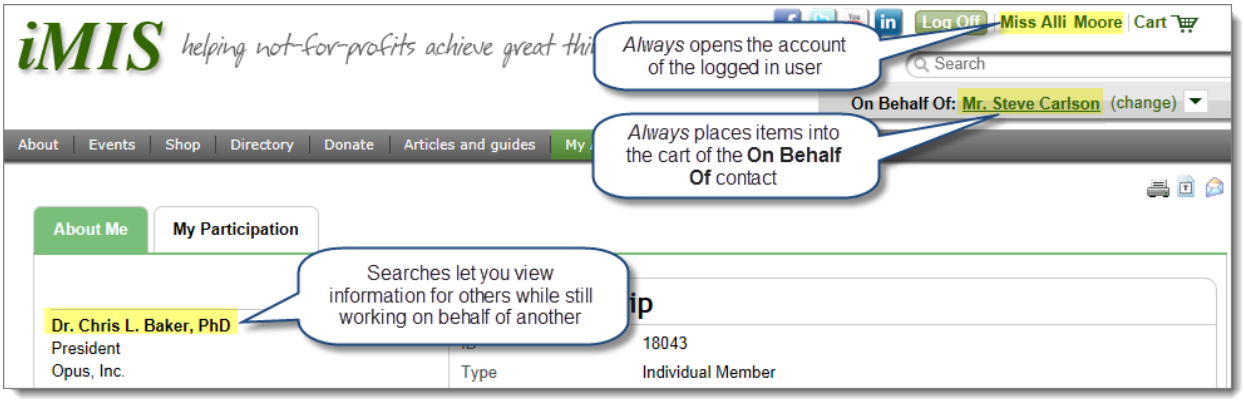
- Select a new target contact: click (change) next to the target contact.
- Clear the selected contact: click the down arrow next to the target contact and select Clear.
- Close the browser.
- Sign out of iMIS.

Whose contact information do iParts show?

Acting on behalf of another contact controls the current cart, but it does not keep you from getting to information for other contacts. An iPart determines whose cart and information to show and update based on this logic:

- If the link's URL specifies an ID (such as for search results), it shows information for that contact.
- If not, it shows information for your On Behalf Of contact, if appropriate. (For example, the Query Menu iPart runs queries regardless of the target contact.)
- Without On Behalf Of, it shows information for you, the logged-in user.
- If no one is signed in, it shows limited information.

  For example, you could be working on behalf of one contact when you need to use the Directory to look up an address for another. You can drill down on information from those searches with no effect on your on-behalf-of contact: the iParts pass the queried contact's ID on the URL to show you the information you need. Only when you take actions that add items to the cart is On Behalf Of enforced.



Note: Tip: What never changes is the contact name link in the top navigation: it always shows information for you (the logged-in user).

Working with iParts

iParts are the foundation of your iMIS sites that you build with RiSE. This section helps you to understand and master the critical iParts that present attractive and dynamic content to your users.

What are iParts

An iPart is an iMIS-specific web part that represents a building block of features that you can place on a content record with other building blocks to create new pages of features. Multiple iParts can be combined and displayed in a content record as you prefer.

Default iParts appear throughout iMIS. You can modify them for your needs and you can reuse iParts throughout the system. For example, an iPart displaying a roster for a Membership Group can follow the same user behavior patterns as an iPart for a roster in Events.

Configuring iParts

iPart configuration allows you to:

- Define how the iPart will behave
- Control how much access you want end users to have
- Hide configuration details from end users; two instances of the same iPart with different configurations can appear as two different controls to the end user
- Examples:
- Allow users to edit on a staff-facing site, but display the data in read-only mode on a public-facing site
- Use multiple instances of an iPart on one page to access different sets of data

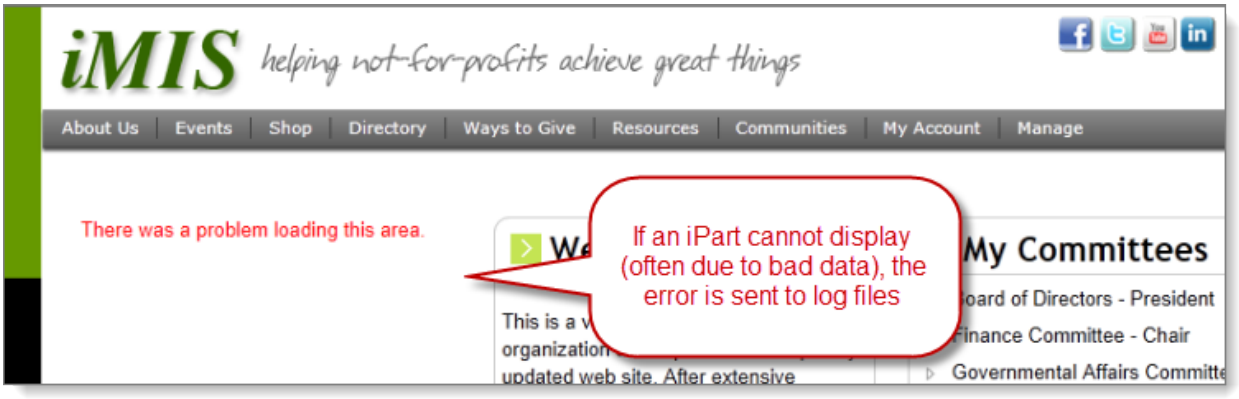
Run-time versus design-time

iParts have two different views:

- Design-time view: What you see in a content record when you add an iPart and configure it.
- Run-time view: What your end-user sees when viewing the iPart within your website. This may differ from what you see in the Design-time view, because some iParts have a different behavior after you publish the content.

Troubleshooting iPart errors

Occasionally, an iPart may fail. However, it will fail gracefully in place, without disabling the whole page. Typically, a “problem loading” error results from some kind of bad data. By default, iMIS hides the error details:



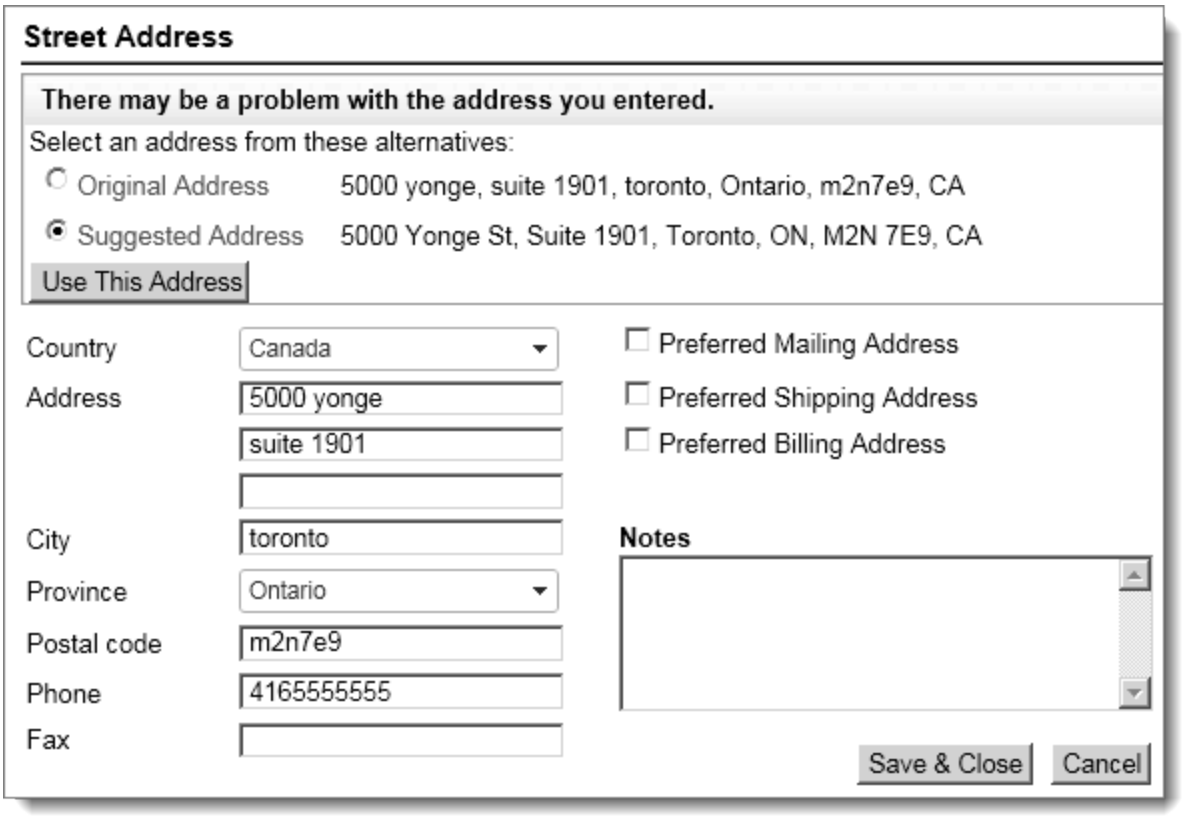
The settings controlling this error logging reside in the <log4net> section of your site’s web.config file. The default settings enable error logging in the Windows Event log and comprehensive logging in the ASI log file, which captures both errors and warnings. This log file, Asi.WebRoot.log, is in the folder above your website root.

Contact your hosting administrator if you need access to information in these logs.

Address verification for iParts

iMIS SOA can perform real-time address verification using web services hosted by ASI. There are several benefits to this:

- Running this verification through the ASI web service frees you from having to install and maintain these data files locally.
- Offloading verification to this service keeps it from adding to the processing load of your page.
- The services of different address providers can co-exist, making it possible to verify addresses across multiple countries.
- The service can support future verification of collections of addresses as well as single ones.
- Postal addresses entered in the Contact Account Creator and Contact Address Editor iParts automatically upload to this service that verifies and standardizes the address. Users can then either accept the suggested address or keep the original as it was entered.



The countries supported by this service are subject to change. Contact your AiSP to obtain an up-to-date list.

Passing URL Parameters

Many iParts allow you to change the content they display based on the value of a URL parameter. This gives you the freedom to create a single content record. This record can be reused and the display can be changed based on a value sent in a link to the page. For example, instead of creating a new content record for every event, you can reuse a single content record that displays different event information based on the EventKey value in the URL.

Parameter values are passed to iParts from a several types of sources:

- Search result links
- IQA query links
- Navigation items
- Relative links
- Absolute links

For any iPart that allows URL parameters to be passed, see the configuration help file for detailed instructions.

Note: Tip: If multiple values are sent to a page for a single URL parameter, the first parameter value wins. For example, if the URL pointing to the Event Display iPart is http://myorg/Events/Event_Display.aspx?EventKey=SPR12&EventKey=FALL12, only the SPR12 event displays.

Note: Note: URL parameters set by navigation items cannot be manually over-ridden in the URL. A user cannot change the parameter value in the URL to display different content.

Specifying commit sequence

If you place more than one iPart on a page, you might need to specify the order in which actions occur on that page. The commit sequence function allows you to explicitly define the execution order of multiple iParts in a content record.

You can define a commit sequence value for the processing order of each iPart relative to the other iParts in the same content record. The commit sequence value must be zero or greater. iParts with a value of zero (the default) are processed after any other iParts with a non-zero commit sequence value that are in the same content record.

Setting a commit sequence is only required in a few scenarios and is noted in an iPart's configuration help if needed.

Security for iParts

Most security is defined at the content record level within iMIS. You can choose that different iParts display for different users. For example, an unauthorized user might see the description of a Special Interest Group, but a signed-in member might see the roster for the group and a staff person might have the privilege to add, edit, or delete the group.

Displaying query results in iParts

The iParts described in this section use IQA queries to drive the data displayed to users. Each iPart provides a unique way to display the data.

Query Chart Viewer iPart

The Query Chart Viewer displays query results in a chart, which can be set to a range of sizes, skins, and chart types.

Designing queries for Query Chart Viewer

The Query Chart Viewer can render any existing query, but you will get the best results by following these guidelines on how to design queries specifically for use with this iPart:

- Queries: The queries you create for the iPart should be structured so that the results are appropriate for charting. For example, if you want the chart to display the total sales per salesperson, then the source query should be written using the Sum function in IQA.

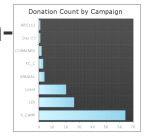
- Query Display Columns: Each property you select on the Display tab in IQA is available in the iPart's configuration page as a Data column display option. Note, however, that you can only select two properties to be displayed in the iPart.
- Aliases: In your source query, enter an Alias for the Display properties you plan to show in the iPart. Relying on the default labels may not be sufficient, especially when your query uses multiple joined sources or custom SQL expressions. If the query does not display as you expect, using an Alias often resolves the issue.
- Sorting: You can sort the query results displayed in your chart in ascending or descending order. To sort your results, edit your source query and, from the Sorting tab, add the property to be sorted.
- Labels: The labels on your chart's x-axis may overlap if there are too many data points or if the labels are too long. You may be able to improve the display through a few methods. In the iPart, you can expand the width of the chart or change the label angle. In the query, you can try to reduce the number of data points.
- Dates: For dates to display correctly, you must cast them as float data types with an offset of 2. You can do this in IQA from the Custom SQL Expression section of the (Display tab). For example, if you want to display the OrderDate property in your chart, add the following expression: CAST(OrderDate AS FLOAT) + 2. Then, when you select this property from the Data column list in your iPart, set the Data column format to a date format.
- Integers: If integers display incorrectly in your chart, cast the column to a data type of INT in the Custom SQL Expression section of IQA's Display tab. For example: CAST (OrderCount AS INT).

Chart Types

You can display the following types of charts in the Query Chart Viewer iPart.

Chart Type	Example
Area - Displays data in an area filled with color to illustrate trends. For example, create an area chart that shows a member's giving history over time. Note: You can only display one area of data in the iMIS Area chart.	

Bar - Horizontal - Displays sets of data with horizontal rectangular bars for comparison. For example, create a horizontal bar chart that shows the number of donations received by each of your fundraising campaigns.



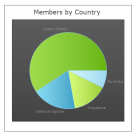
Bar - Vertical - Displays sets of data with vertical rectangular bars for comparison. For example, create a vertical bar chart that shows the distribution of your members across states.

Bubble - Displays data as a series of bubbles. For example, create a bubble chart to show the total number of function registrations for an upcoming conference.

Note: You cannot assign a size value to the bubbles in the iMIS Bubble chart.

Line - Displays data as a series of data points connected by a line to illustrate trends. For example, create a line chart that shows a member's giving history over time.

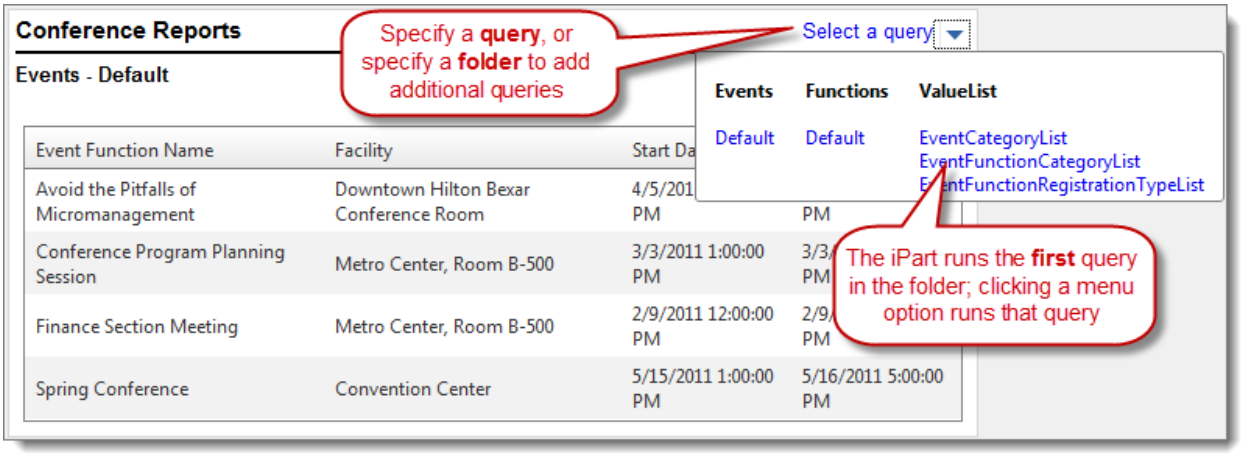
Pie - Displays data in a circular chart divided into sections to illustrate proportion. For example, create a pie chart that shows the proportions of your members by country.



Query Menu iPart

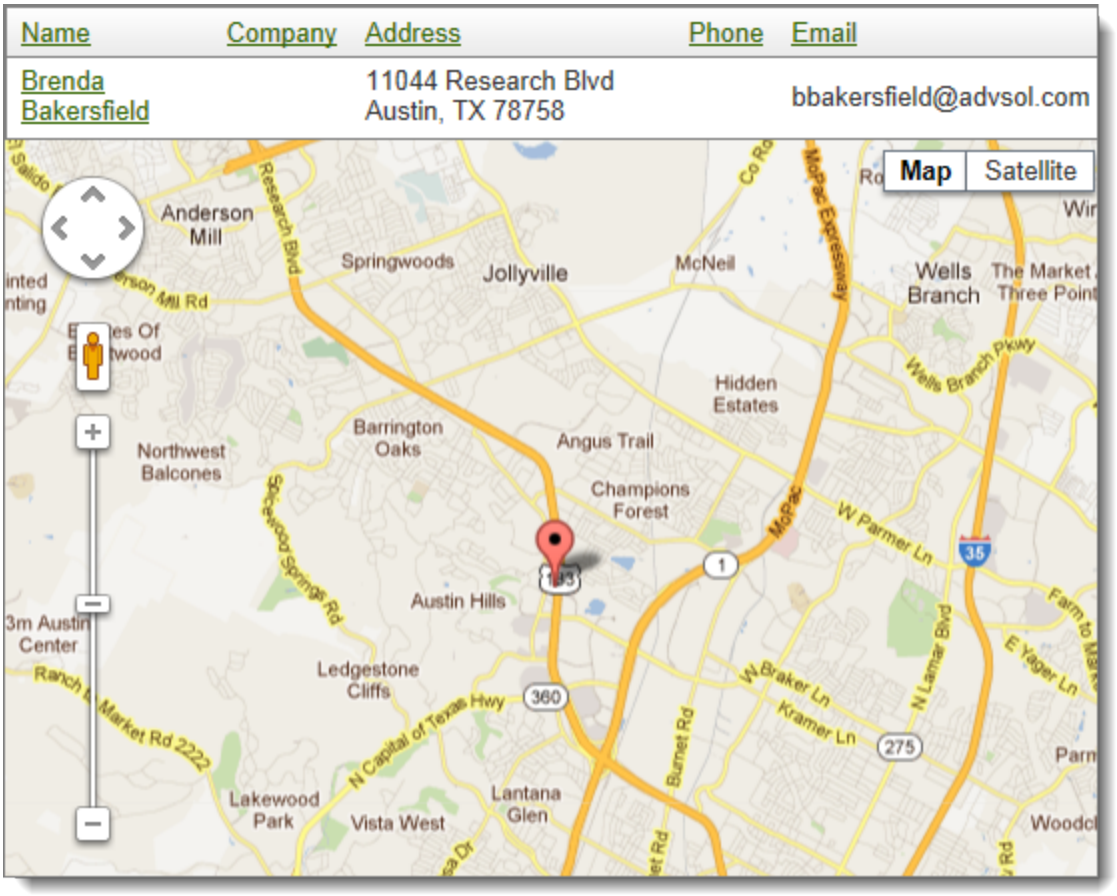
The Query Menu iPart lets you merge query results into your site for tremendous utility. You can set the iPart to display a query, set with whatever title, parameters, columns, labels, and sorting you need, and you can enable exports, which adds icons for sending the data to Word, Excel, PDF, and CSV.

You can also organize helpful queries into a folder and point the iPart to that folder. When the page loads, the iPart displays the first query at the top of that folder, and it presents a drop-down menu of additional queries available, organizing them by subfolders, if any. When the user clicks on a query from the menu, the iPart immediately runs that query and displays the results.



If the query selected contains an address property, you can configure the iPart to automatically map the query results when an address is available. Only one address property per query can be mapped. When this option is enabled, the iPart looks for the following

address properties in this order and maps the first one it finds: FullAddress, Address, FullAddressText, AddressText, Address Text, and Full Address Text.



Related Items iPart

With the Related Items iPart, you can display a list of profile or product pictures based on the results of an IQA query. For example, you can write a query to display the profile pictures of everyone who has registered for an event, made a donation, or ordered a particular product, or to display products in the same category. You can configure the list to display horizontally or vertically, to display a name for the item, and to choose the size of the image. You also have the option to make the profile picture a live link that opens a URL of your choosing, such as the member profile page.

Guidelines for working with the Related Items iPart

- The pictures displayed in the iPart are based on iMIS product or contact IDs. When creating the query for this iPart in IQA, you must select a property that returns an iMIS product or contact ID on the (Display tab). Give this property an Alias of key_Id (the Alias is case sensitive).
- To define the image to display for each record, include a column in your query that specifies the image file name for that record. Give this property an Alias of Image.
- To display a name for each record, include a column in your query for the name of the item or contact. Give this property an Alias of Name.
- When you add Display columns to the query in IQA, they become available within the iPart as Filter columns to filter on.
- You can dynamically filter the query results displayed in the iPart based on the value of another iPart's URL parameter. For example, you can set up your donation page to display the profile pictures of people that have donated to a particular cause (called a distribution in iMIS). The Donation Creator iPart uses the URL parameter itemid to determine which distribution the donation should go towards. If you add your iPart to the same content record as the Donation Creator, then you can set up the Related Items iPart to look at the value of itemid to determine which profile pictures to display. You just have to make sure that your query includes the CsActivity.Product Code property, so that you can select it as a Filter column on the iPart's configuration page. Once selected, enter itemid for the Filter on URL parameter, so that the iPart knows to filter the results based on that URL parameter's value.

  Example: Display other products in the same category

  In this example, the Related Items iPart is set up to display clickable images for other products in the same category as a particular product. This example uses content installed for the sample Member site.

  Go to Content Designer > Manage Content:

1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > RelatedItems. Select RelatedProducts.
4. Filter Options dropdown, select ProductCategory. ProductClassKey.
5. Filter on URL parameter, type in Category.Class.
6. For the Items link to (URL or shortcut), type in ItemDetail?iProductCode={key_Id}&Category={ProductCategory}.ItemDetail?iProductID={key_Id}&Class={ProductClassKey}. This uses the ItemDetail shortcut to link each item in the list to the product page. The particular item's product ID and category are specified in URL parameters so that the correct product and related products are displayed in the resulting product page.
7. Click Save & Publish to complete the content record.

Example: Display other users who have purchased a product

In this example, the Related Items iPart is set up to display clickable profile pictures of other users who have bought a particular product. This example uses content installed for the sample Member site.

Go to Content Designer > Manage Content:

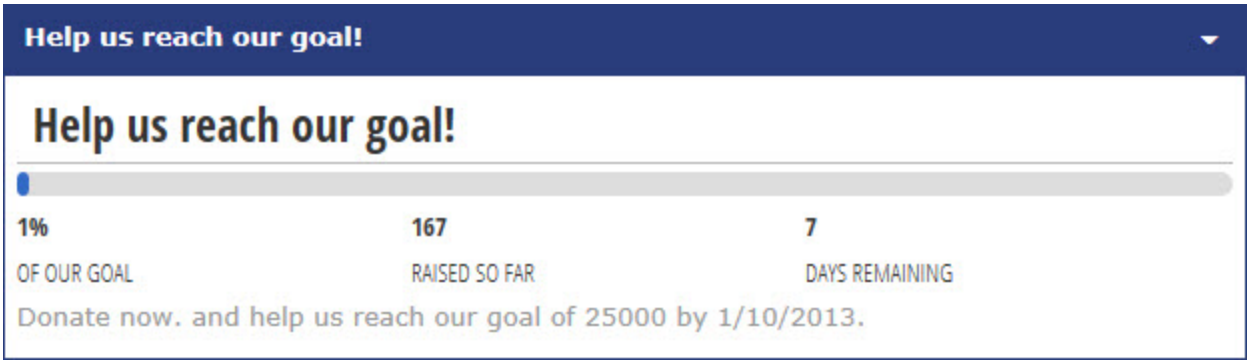
1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Content Types > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > QueryProfilePictureList. Select Orders.
4. Filter column dropdown, select ProductCode.
5. Filter on URL parameter, type in iProductCode. iProductID.
6. For the Items link to (URL or shortcut), type in MBR/Party.aspx. This redirector web page looks for an ID in the URL parameter and then checks the ID's party type and the user's permissions to determine which content record to display. The user's ID is appended to any URL specified in this field.
7. Click Save & Publish to complete the content record.

Progress Tracker iPart

With the Progress Tracker iPart, you can visually display progress towards a goal based on the results of an IQA query. For example, connect this iPart to a fundraising query, so that your members can easily track the progress of a fundraising effort towards a specific goal. Or connect it to an events query, so that you can see at a glance how many people have registered for an event.



To set up the Progress Tracker

1. Create a query for the Progress Tracker.

   Note: For sample queries that will work with this iPart, see $/Samples/ProgressTracker/ in IQA.

The Progress Tracker uses three pieces of information supplied by an IQA query: a goal amount, the sum total of what you are tracking, and the end date (which is optional). When you build your query for this iPart, it must contain specific aliases. In IQA, create a new query and choose the business object you want to query on. Make sure you are in Advanced Mode, then from the Display tab, choose properties to assign the following aliases to:

- Goal_Amount: Indicates which property is the goal amount. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST(25000 AS INT) as a property to set the goal amount to 25,000.
- Sum_Total: Indicates which property is the amount to be summed. The percentage displayed in the Progress Tracker is based on this amount compared to the goal. It can be a monetary amount or any other number, such as the number of event registrations.

  Tip: From the Function dropdown list for this property, select Sum, so that only one row is sent to the iPart. This is not required, but it will improve performance.
- End_Date: Indicates which property specifies the end date. This alias is only required if you want to display an end date in the iPart. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST('2012-12-25' AS DATE) as a property to set the end date to 25 December, 2012.

2. Add the iPart to a content record and configure it.

   Go to RiSE > Content designer > Manage content:

1. Do one of the following:

- Select a Content Folder and click Edit.
- Select New > Website Content.

2. Click add content.
3. Go to ContentTypes > Utility.
4. Select Progress Tracker.
5. Click OK.

6. Enter the iPart CSS class to style the Progress Tracker. Two styles have been pre-defined that you can use in the iPart: ProgressTracker and ProgressTracker2. You can edit these classes to change the look and feel, or you can create your own style for the Progress Tracker.
7. Select a Source query.
8. (optional) Select a data column by which you want to filter. You can use this feature to dynamically update your Progress Tracker, based on the value passed to it in the URL. If you choose to filter on a data column, then also enter the name of the URL parameter, which the iPart uses to identify the value to filter on. For example, to limit the results of an event query to a specific event, you can select the EventCode property and give the URL parameter a name such as EventCode. The progress displayed will then reflect only the event code which is included in the URL as EventCode=[EventCodeValue].
9. (optional) Enter any messages you want to appear in the iPart. The variables below can be used in the descriptions. For example, "Help us reach our goal of {0} new members by {2}!"
   - {0} displays the goal total
   - {1} displays the current sum total or count
   - {2} displays the end date in a long format
   - {3} displays the end date in a short format
10. Select the Caption Options. In addition to the progress bar, you can also display the values as text. If any of the Caption Options are unavailable after selecting a query, this indicates that the required aliases have not been defined in the query.
11. Select the Progress bar location. The bar can be displayed above or below the captions.

    Note: You can also use this iPart to display only a countdown (days remaining to a certain date). In configuration, only select the caption option Display days remaining, then for the Progress bar location, select (None).
12. Click OK.

SSRS Report iPart

The SSRS Report iPart lets you display the results of any IQA query on any page where you place it. The SSRS iPart uses the version 10.0 ReportViewer, which supports IE8 natively and, in IE8, adds a Print button on its toolbar. You can add the SSRS iPart to any content page using CM: open the Utility folder and choose the content type SSRS Report.

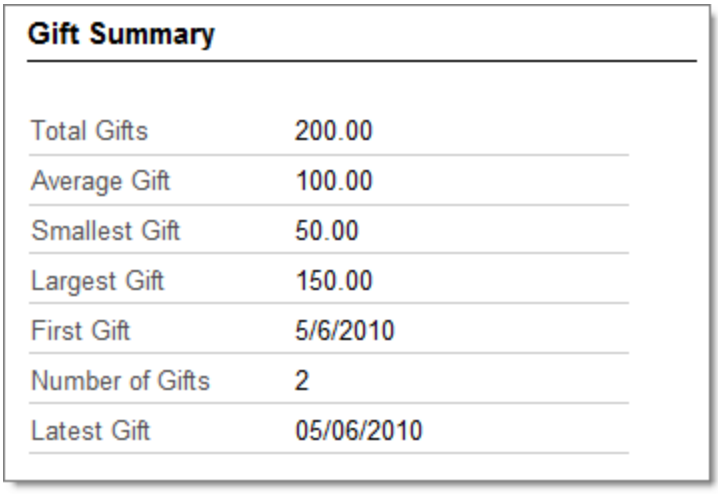
The iPart lets you customize whether to display the export buttons for PDF and Excel versions of the report. You can change the default design (layout, colors, fonts) of your reports by editing the SSRS parameters in the SystemConfig table.

How it works: The process engine specified by the iPart loads a report template (.RDL file) from the document system and creates a report data source (a DataTable) based on an IQA query's SQL source; the report viewer then combines the template and query to generate the report's output. When you configure the iPart, you specify the Document system path to the SSRS Report runtime, which must be a link to an SSRS Process Engine. Click the select link next to the textbox, then browse to your reports (such as $/Samples/ReportingServices), and pick one of the runtime entries.

Note: Tip: Identify a process engine (run-time report) by the arrow on its icon!

Summary Display iPart

The Summary Display iPart displays a single row of query results in a form view.



Gift Summary

Total Gifts	200.00
Average Gift	100.00
Smallest Gift	50.00
Largest Gift	150.00
First Gift	5/6/2010
Number of Gifts	2
Latest Gift	05/06/2010

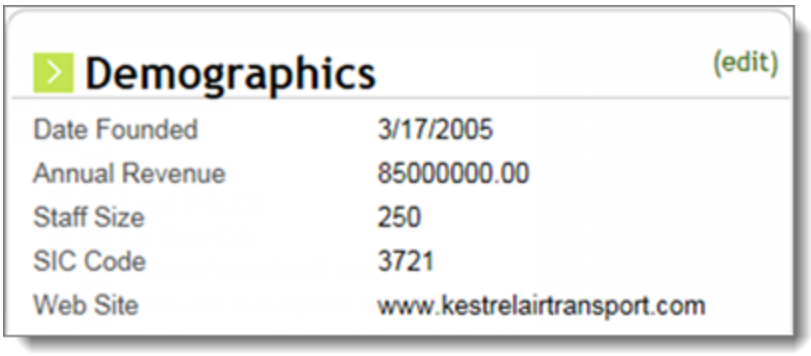
Guidelines for queries displayed in the Summary Display iPart

When creating a query that you want to display in the Summary Display iPart, keep the following guidelines in mind:

- This iPart only displays a single row of query results.
- If you connect the iPart to a query that returns more than one row of results, only the first row is displayed.
- Tip: You can dynamically filter your query results by the currently logged in user, a selected contact, or a date. See Adding dynamic filters to queries for more information.

Panels and custom data

Panels are custom displays of iMIS data that you are able to name, build, arrange in grids, and add to your site. Using panels, your users can browse, edit, add, and delete their data, as you specify:



Panels display within Panel iParts, which allows your users view and edit custom data on the broadest range of browser and platform types that iMIS supports. You can manage your custom data directly and conveniently from the web pages where you place these iParts:

- Panel Editor (which creates panels and shows one panel) --
- Panel Collection Editor (which combines existing panels into tabbed displays)

You can configure the iParts to let your users add and edit that data directly from their browser page. You can import your existing user-defined tables (from iMIS Customizer)

directly from the Panel Editor iPart configuration. In addition, your Activity table data is automatically available as a source, so that you can use and extend that data. Panel sources can include existing user-defined tables (defined in the UD_Table table) and user-defined sources (listed in the ObjectMetaData table).

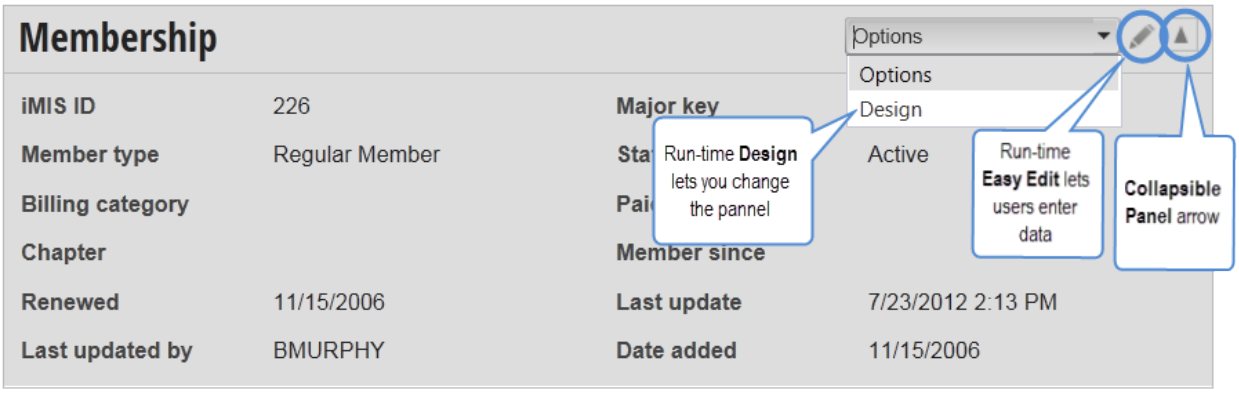
> **Note:** Tip: Panels are shared: when you update one panel, it updates within every iPart that uses it.

Creating custom panels of data

In a few clicks from your browser, you can have a new panel that displays the data you want, labeled and made editable as you need.

1. Enable Easy Edit by clicking on the button at the top right hand corner of the screen.
2. Once Easy Edit has been enabled, you will find and click the icon at the bottom left corner; this is the Content Designer.
3. From the Content Designer, click add content > ContentTypes > Content > Panel Editor.
4. Select New Panelfrom the Paneldrop-down menu.
5. Drag in and arrange your desired data, then Save & Publish.

   Once you have placed a panel iPart into a content record and published it, you can then edit the panel directly: As a system administrator, you see a run-time Design command, which lets you make quick changes to the panel, changes that save and publish for you automatically. For extensive panel work, such as to change the type of data it shows, use Easy Edit to access all of the content design features.



Best practices for panel layout

Here are key layout features to help you design the best use of screen real estate on the page:

- Multiple columns: Click + or – icons next to the panel layout to add/remove columns in your panel. For best display results, place multi-column panels into single-column content records.
- Hide in Summary View: Check this box on certain properties to trim the initial display of the iPart to the read-only information that is most useful. Only when users open the full window for viewing or adding/editing (as you configured it) do they see the additional information.
- Read-only: Check this box to provide information in read-only form while still allowing users to edit other information on the panel.

  Tip: To prevent editing of all of the properties, simply disable Allow users to edit on the iPart Configuration, rather than in the Panel definition.
- Collapsible panel: In order to maximize utility and minimize scrolling on the page, users are able to click on the arrow to expand and collapse iParts.

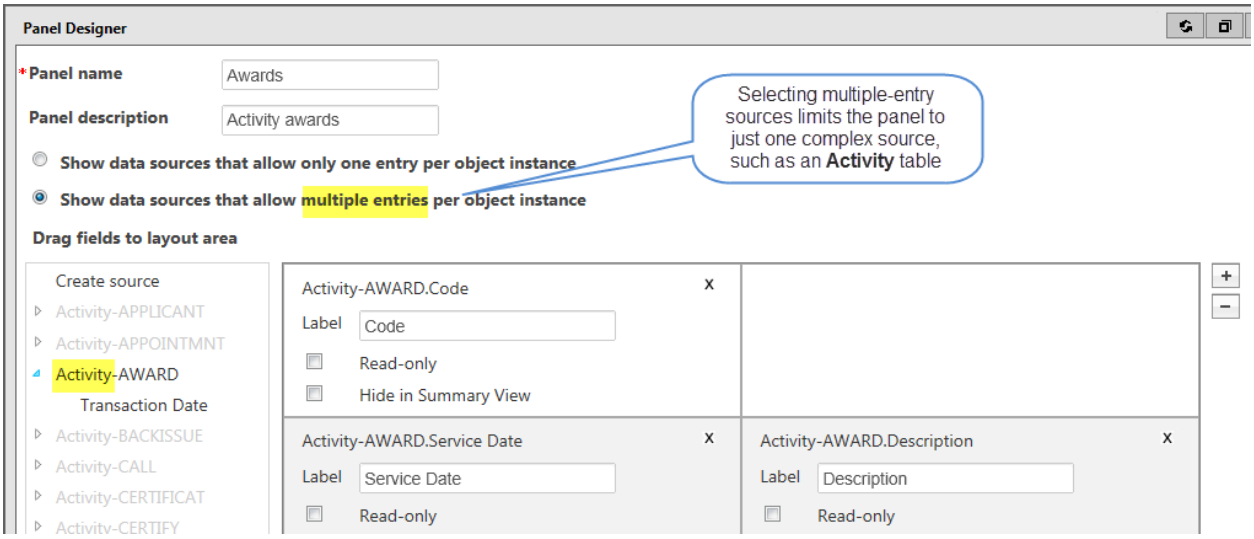
  Tip: Be sure to add an optional Title to any iPart that you make collapsible, so that title bar text guides your users as to what information they will access by clicking Show.

Panels for Activity data

Most organizations need to show activity information on their websites. All of the Activity data in your iMIS database appears as complex (multi-entry) sources when you use Panels.

Suppose you created new award types in the general lookup table called AWARDS and want to add them to a page for dynamic editing. In a few clicks, you can have exactly that:

1. Enable surf-to-edit.
2. Click add content.
3. Go to ContentTypes > Panel Editor.
4. Click OK.
5. In the Panel list, select (New panel).
6. Select Show data sources that allow multiple entries per object instance.
7. Drag in your new data sources.
8. Click Save & Close.
9. Select Allow users to edit.
10. Click OK.
11. Click Save & Publish.



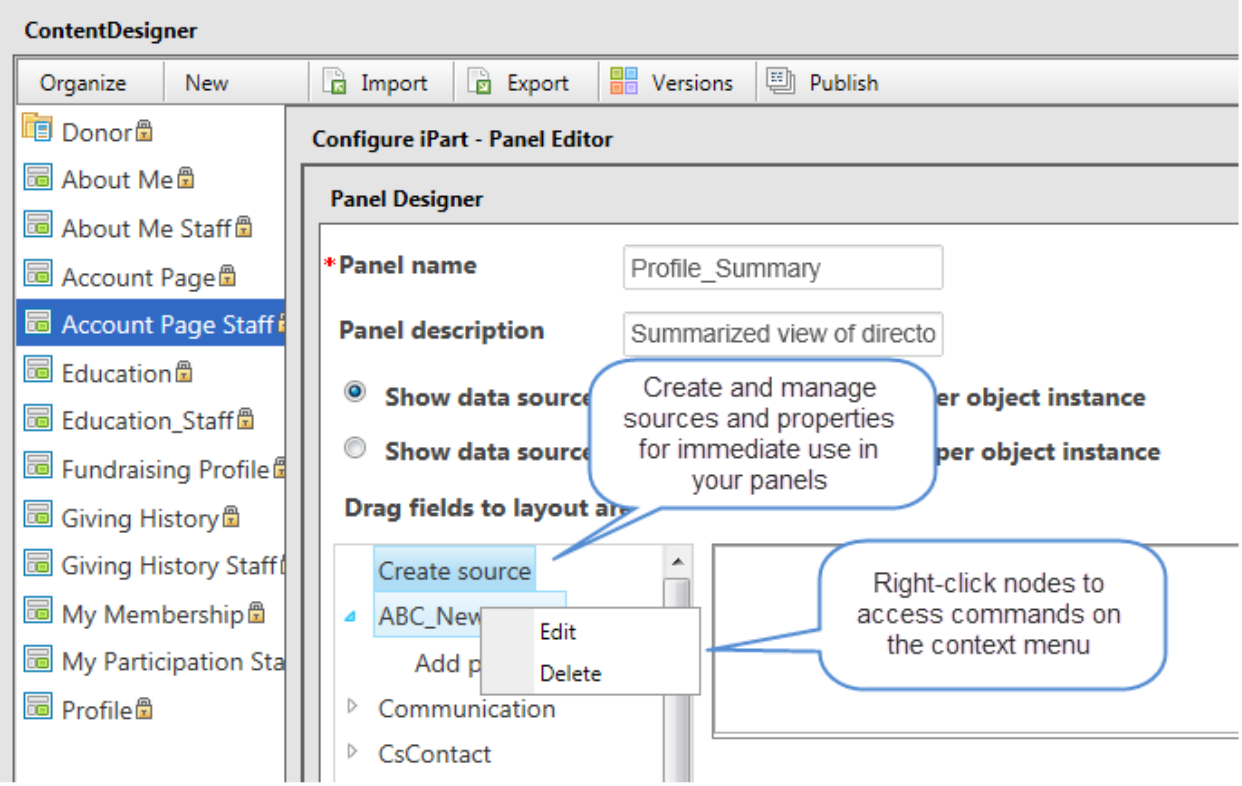
All of your Activity data appears as available sources when you select multiple entries for the type of data source.

Note: Tip: If you want to combine data from different sources, be sure to show simple sources (the first radio button option). Only one complex table can display in a panel, so the others are grayed out as long as any one of them has properties placed in the panel.

Defining your own data with Panel Designer

With the Panel Designer, you can not only craft reusable panels that combine fields from many tables, but you can also define new data structures (business objects and properties) to manage information for your organization. Without special tools or knowledge of the iMIS schema, you can add data sources on the fly, right from your browser. When you save the panel, you have saved your newly created data sources as iMIS business objects.

Note: Tip: You can see your new data source show up as a business object in Business Object Designer, but it will be read-only: continue to edit and manage these special sources in Panel Designer itself.



Access the Panel Designer by editing or creating a panel in a Panel Editor iPart.

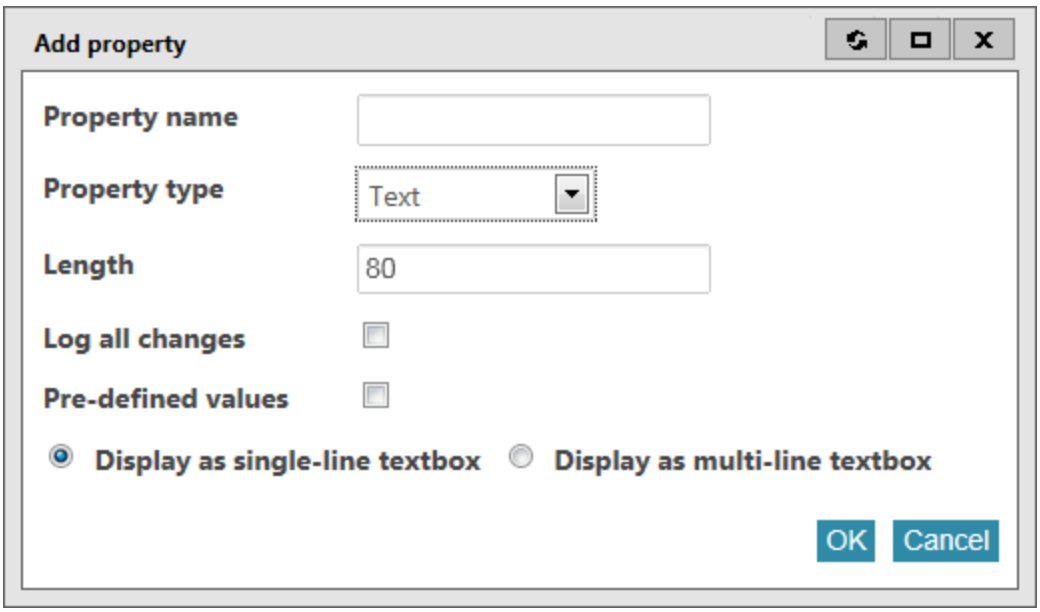
To create a new panel source and properties

To create your own data source with properties, you work within Panel Designer. Each new source you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

1. Select New > Website Content.
2. Click add content.
3. Go to ContentTypes > Content.
4. Select Panel Editor.
5. Click OK.
6. From the Panel drop-down list, select (New panel).
7. At the top of the source tree, select Create Source.

8. Choose a Name for each new Source that meets these criteria and click OK:
   - Starts with a letter
   - Contains only letters, numbers, and underscores
   - Is unique across iMIS, not matching any existing iMIS data or SQL Reserved Words

     Tip: Use an organizational prefix (such as ABC_*) so that your sources are unique, sort together in the tree view, and are easy to identify as ones that you created.
9. Select Add Property for the new source added.



10. Enter a Property Name.
    - Starts with a letter
    - Contains only letters, numbers, and underscores
    - Is unique within its Source
11. Choose a property type that best fits your purpose, within these valid ranges:
    - Currency: 19 total digits (precision), with 4 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Date, Date and Time, Time: January 1st, 1753, through December 31st, 9999

- Decimal: 28 total digits (precision), with 12 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
- Email: Creates a mailto link, which launches the user's default mail application when selected.
- Integer: -2,147,483,648 to 2,147,483,647 (±2 billion)
- Text: By default, the Text Property type allows:
- Free-form entry up to 400 characters (defaults to 80). You can select to display the text-box as a single line or multi-line textbox.
- Pre-defined values from a query or explicit list that display as a drop-down list at runtime:
- Query – For example, you may want to use a query that returns a list of countries.
- Explicit List – For example, you can add a list of colors the user can select as their favorite.
- URL: Creates a live hyperlink, which launches a new instance of the browser to open the link when selected.
- Yes/No: Boolean

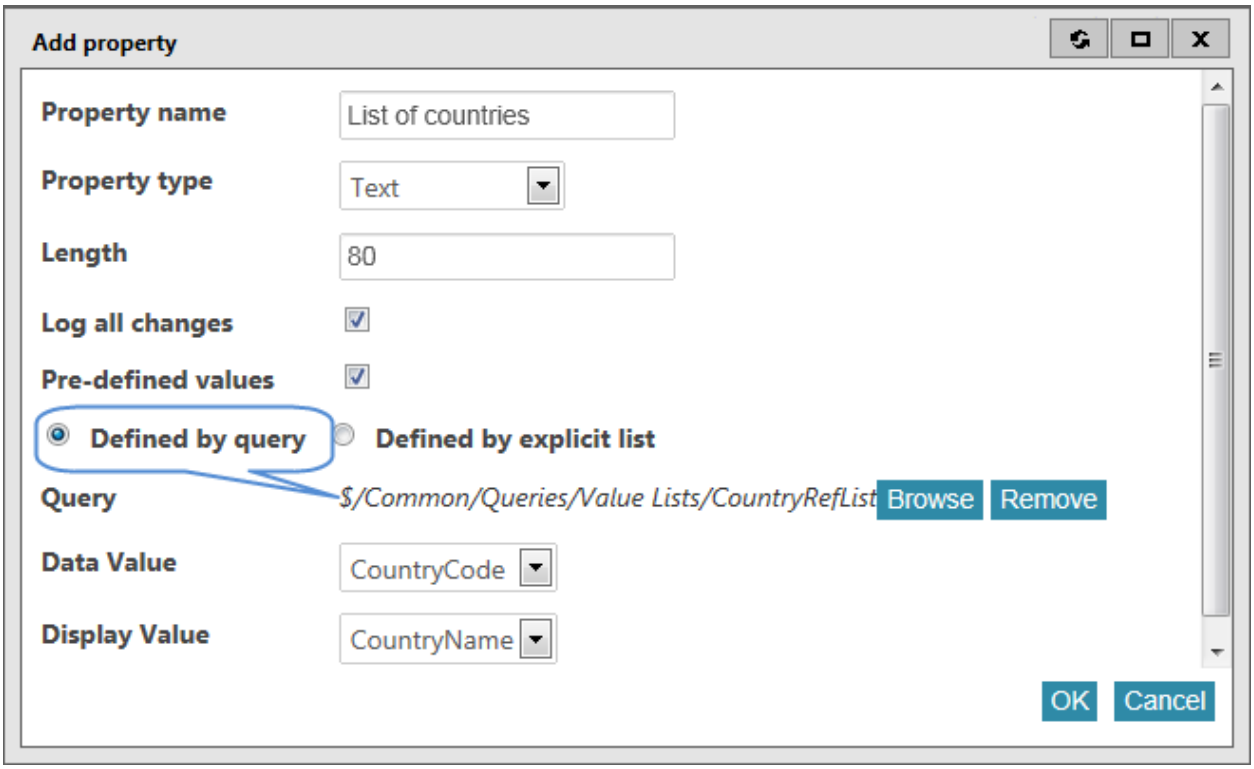
12. Enable the Log all changes if you want to track any data change made to the property you are adding.

    Hint: Add the Change History Display iPart to a content record if you want to display data changes made in the Name and Name_Fin tables as well business objects.

13. (Text Property type only) The Pre-defined values option allows you to present a list from which the user can select.

    - The Query option provides validation-type properties based on the query results. For example, instead of typing out a list of countries, you could select a query that displays country values.
    - Enable the Pre-defined values checkbox and select the Defined by query option.
    - Click Browse, select a query, and click OK.

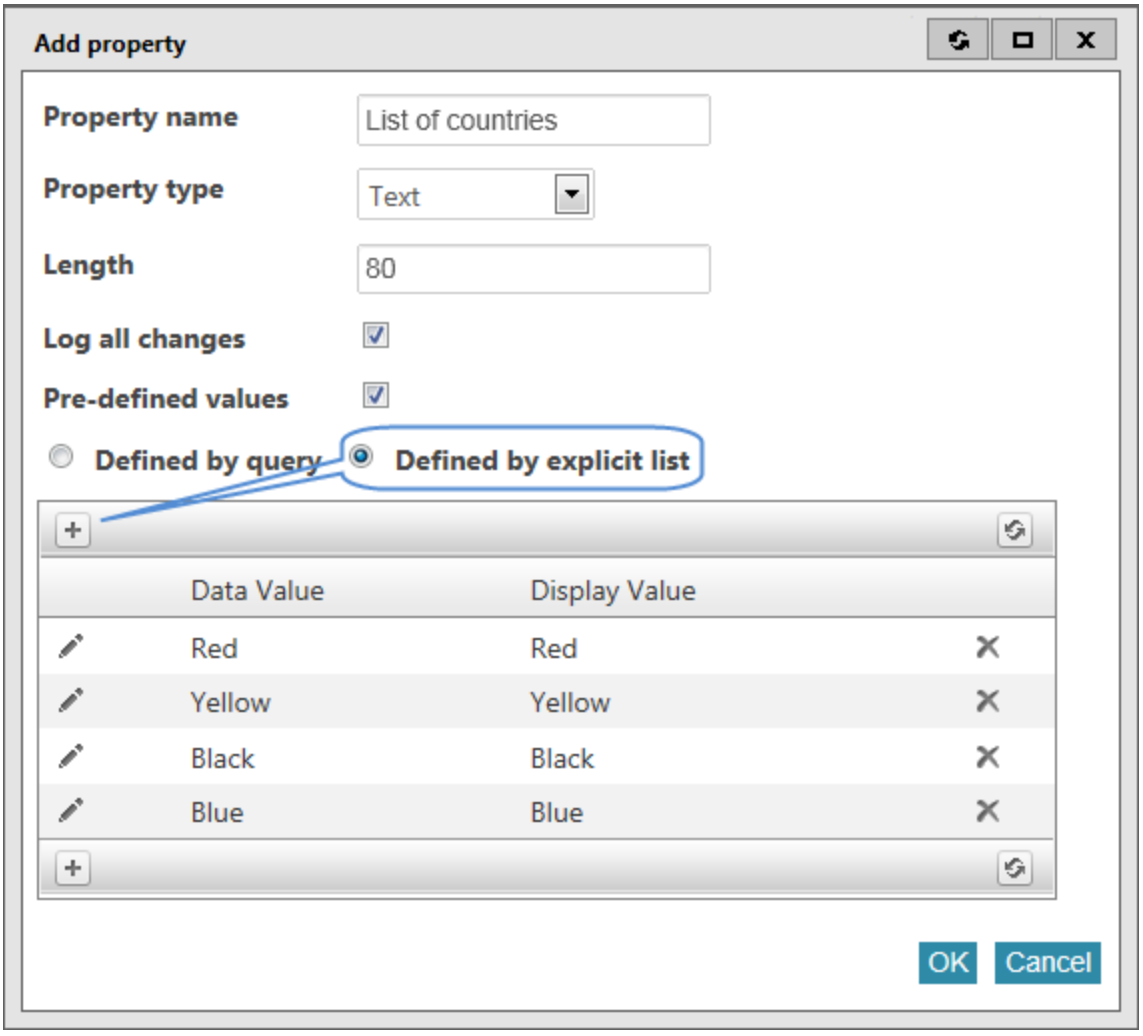
- Two additional fields display, Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel. For example, the country code may not be as clear as the country name.
- Select the fields from the drop-down list in the Data Value and Display Value fields.
- Click OK.



- The Explicit List option allows you to create a list to display on the panel. For example, you may want a user to select their favorite color.
- Enable the Pre-defined values checkbox and select the Defined by explicit option. A table grid displays.
- Click + to add a data row. The data row contains two icons: Insert and Cancel, and two fields: Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a

selection on the panel. While these values can be same, you may want to choose a different value to display on the panel.

- Enter the appropriate values in the Data Value and Display Value fields.
- Click the checkmark located to the left of the data row.
- Click + to add additional data rows.
- Click OK.



14. Drag the field(s) to the layout area.
15. Save the panel to save the source and properties. Once you save a property, you cannot rename it. Note that the sources will alphabetize properly on reopening.

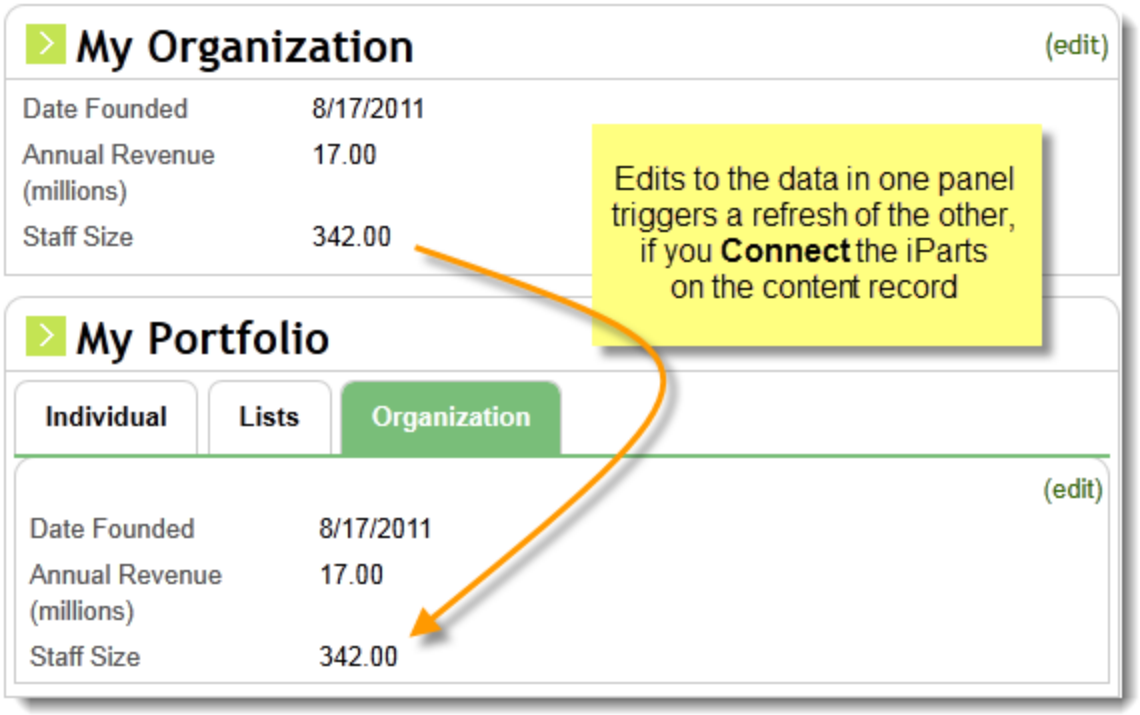
Each new property you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object property is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

Tip: Do not save until you create all of the properties. This way, you can view them as a set of properties and improve your naming convention before it is finalized.

16. Save and close the Panel Designer window.
17. Save & Publish the content record.

Connecting iParts to refresh panels

When you combine panel-displaying iParts on the same content record, data might appear out of sync after the user edits it, if both panels display the same property. You can solve this refresh problem through the iPart's Connect feature, which you enable separately from Configure.



> **Note:** Note: Check an iPart's Configuration Help topic to find out if it supports any connection options. An iPart has no connection support (neither consumer nor provider) unless its author added it.

To connect panels for dynamic updating

1. Edit a content record and add two user-editable iParts that display panels (Panel Editor, Panel Collection Editor).
2. Set up the first connection:

- From the first iPart's title-bar menu, select Connect.

  The Connect box that opens shows you any current connections and lets you disconnect them.

- Select Create a new connection.

  The Connect box that pops up prompts you to create one of four connection types.

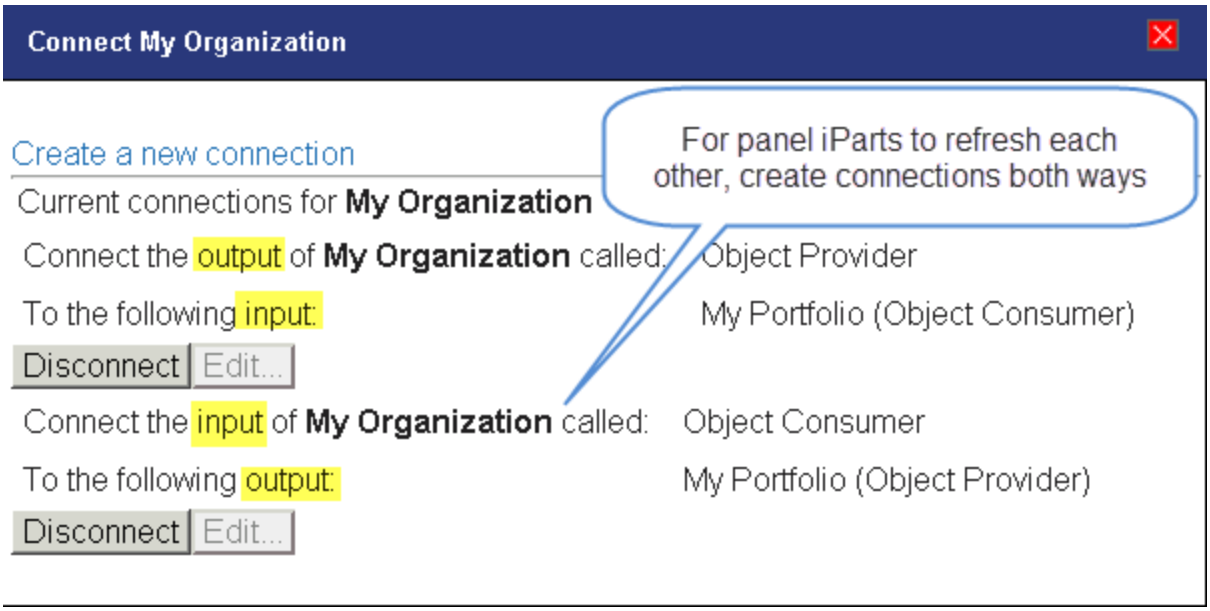
  Tip: Do not be misled by the language of connection. The Consumer is the actor that triggers a refresh on another iPart, and the Provider provides a pointer to itself to the Consumer.

- From the Object Consumer drop list, select the panel iPart you want to refresh.
- Select Connect.

3. Set up the second connection:

- From the second iPart's title-bar menu, select Connect, and select Create a new connection.
- From the Object Consumer drop list, select the first iPart.
- Select Connect.

  You should see a pair of connections, for mutual refreshing.



4. Save and Publish the content record.

Adding existing business objects to panels

Panel Designer lets you create new data sources on the fly, access any user-defined tables, and make full use of the Activity table. It can also display your existing business objects, if they meet these requirements and configuration settings:

Referencing existing business objects

Panel Designer can display existing business objects that have a ContactKey or ID property. When ContactKey or ID is the primary key, Panel Designer treats it as a single-instance table; otherwise, it assumes it to be multi-instance.

Panel Designer cannot display your business objects until you add them to the ObjectMetaData table. While attached to the iMIS database in SQL Server Management Studio, run this SQL statement:

INSERT INTO [dbo].[ObjectMetaData] (ObjectName, RelatedToEntity, IsUserDefined, IsMultiInstance)

VALUES ('MyObject', 'Party', 0, 0)

- Replace MyObject with the name of the business object, table, or view that is related to Party.
- Change the last value to 1 if it is multi-instance.

Settings for Business Object Designer (BOD)

1. In Business Object Designer, edit your object and open the BOD (Properties tab) > (Display tab).
2. To make a property available to your panels, enable its Available to UI? option.

   Tip: To see your BOD changes immediately, restart IIS.
3. To enable multiple selection for a property, select Check box(es) under Display Control so that you can enable the Allow multiple selection? option.
4. To enable HTML editing, select HTML Editor under Display Control. Be sure to use the property in a single-column panel to provide the control adequate width.

   Troubleshooting

   If you get an error when creating a new data instance at runtime (either single- or multi-instance), check that your business object does not have a 'Read-only' constraint set on the ContactKey or ID property's Definition tab.

Connecting picture iParts to Facebook

You can set up the Contact Mini Profile and Contact Profile Picture iParts to prompt people to use their Facebook profile picture in iMIS, instead of uploading a picture. To use this feature, you must do the following:

- Contact your Hosting Administrator to enable Enable the Facebook feature in the web.config file
- Create a Facebook app so that your website can connect to Facebook
- Enable the iPart configuration option to Prompt for Facebook connection

When enabled, signed in users are prompted to connect to Facebook when they edit their profile picture and wherever their profile picture is displayed.

To create your Facebook application and use it in iMIS

1. Contact your Hosting Administrator to request that they do the following: Edit your web-site's web.config file, located by default in C:\Program Files\ASI\imis\net. Find the EnableFacebookApi property, and change the value to true.
2. Create your Facebook application.

- Log in to the Facebook Developers site.
- Click +Create New App.
- Enter an appropriate App Display Name and App Namespace for your organization. Only the App Display Name will be visible to users.
- Click Continue and complete your App creation.
- On the Basic info page for your App, enter the Site URL for your iMIS application.
- Take note of the App ID Facebook has created for you.

3. Contact your Hosting Administrator to request that they do the following: Add your Face-book App information to the required iMIS JavaScript.

- Edit your iMIS Facebook.js file using a text editor. By default it is located in C:\Program Files\ASI\imis\Net\AsiCommon\Scripts\SocialMedia.
- Find the appId value and update it with the ID issued to you by Facebook.

To load the Facebook API

1. Edit your website's master page. By default it is located in C:\Program Files\ASI\im-is\Net\App_Themes.
2. Add the following html within the <body></body> tags of your master page:

To enable the Facebook connection in iParts

Configure each instance of the Contact Mini Profile and Contact Profile Picture iParts used in your website to enable the options Allow picture change and removal and Prompt for Facebook connection.

> **Note:** Note: When the Facebook feature is disabled in the web.config file, the Facebook options do not appear in the Contact Mini Profile or Contact Profile Picture iParts.

Using the Content Block iPart

With the Content Block iPart, you can empower authorized users to create and edit content directly on a page, without using Surf-to-Edit or accessing Tools. Through iPart configuration, you can allow users to insert HTML content, add attachments, create child pages, and submit replies. At its simplest, a content block can be HTML that is read-only unless the user has permissions to see the edit command. At its most complex, a block can act as a message board with multiple posts, child posts, and replies. You can limit the number of posts to a set number, or you can leave it at the default (zero), which lets it grow indefinitely.

> **Note:** Note: for guidance in creating a Content Block, follow the steps outlined in Creating Custom Panels of Data, and select Content > Content Block

How groups own content

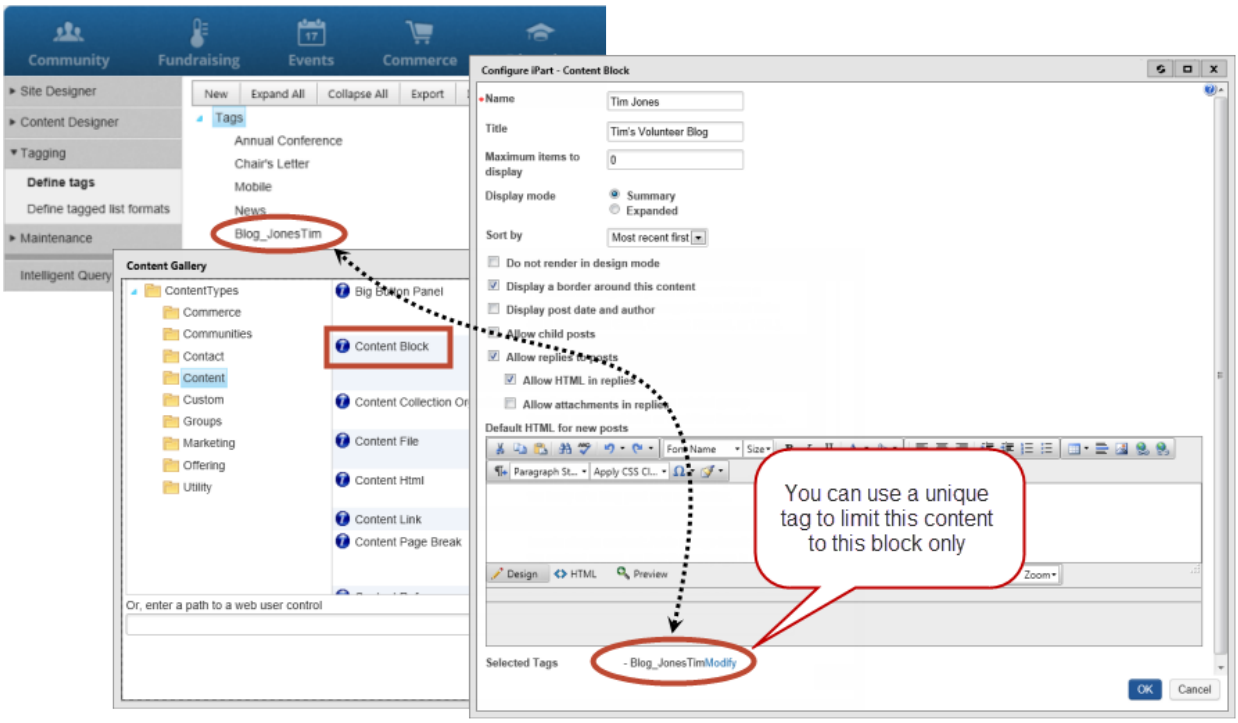
The content created with a Content Block iPart is owned by the Uniform Item associated with the page that contains the iPart. Likewise, the only content displayed is content owned by the page's Uniform Item. The Content Block currently works best with the Group landing page, where it can be used with the Uniform Item for groups. A page's Uniform Item is determined by the iUniformKey parameter passed to the page in the URL.

For example, assume that you have a content record that displays when a user clicks a search result link for a Committee, and it contains a Content Block iPart configured to display content tagged as Announcement. Now a content editor wants to add an announcement for the Planning Committee. After searching for it, he selects the result and goes to

the page. The search link sends the iUniformKey for the Planning Committee to the content record through the URL. The Content Block iPart then displays any announcements (the tag) for the Planning Committee (the Uniform Item). When he adds his new content, it is tagged as an Announcement and is owned by the Planning Committee.

Tagging to filter content

To control what content appears in a Content Block, you create tags specific to ContentBlock Items and apply those tags to specific instances of the iPart. For example, if you want to create a new blog for Tim Jones, you could create a ContentBlock tag such as blog-JonesT, place a new Content Block iPart on a content record, and configure the iPart to display the tag blog-JonesT. Now the content that Tim authors in this blog will be unique to his+ blog, if you do not apply this tag anywhere else:



Content created with anything other than a Content Block iPart will not be displayed, even if it has the same tag. For example, a content record containing HTML tagged with News will not show up in a Content Block that is also using the News tag.

Note: Best practice: Plan for and create the tags you want to use before configuring your Content Block iParts. Content can seem to disappear if you change

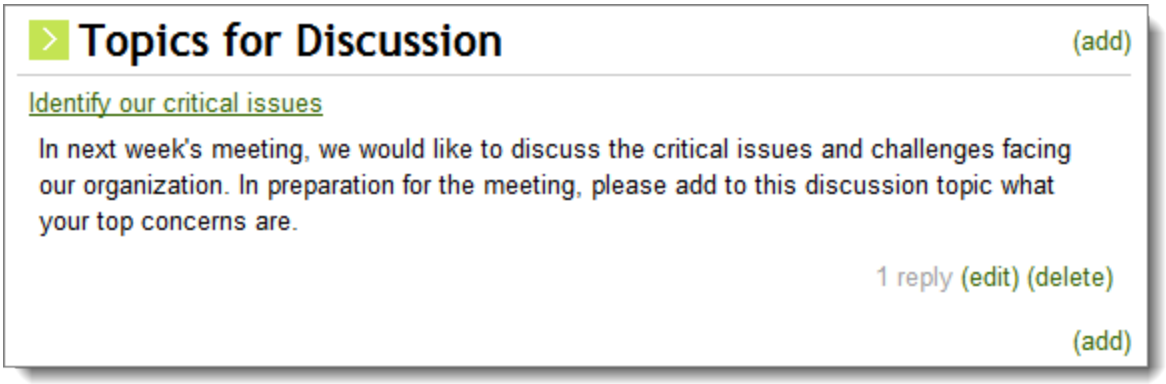
the tags assigned to a content block already in use, because it no longer matches the tag set currently configured.

Creating a message board

Only users with the Content Editor permission may create posts and children, but any authenticated users can reply to a post and edit or delete their own replies. Any authenticated user may create posts and children, reply to a post and edit or delete their own replies.

To use the Content Block as a message board with multiple posts, child posts, and replies, make use of the following configuration options:

- Maximum items to display - Choose the maximum number of posts that will be displayed; 0 indicates an unlimited number of posts.
- Display mode - Expanded display mode will display replies and child posts in-line, while Summary mode only shows replies and child posts when the post is opened.
- Allow child posts - Allow Content Editors to add a child post to existing content. Allow any authenticated user to add a child post to existing content.
- Allow replies to posts - Allow authenticated users to reply to posts; you may indicate whether to allow HTML and/or attachments in the replies.



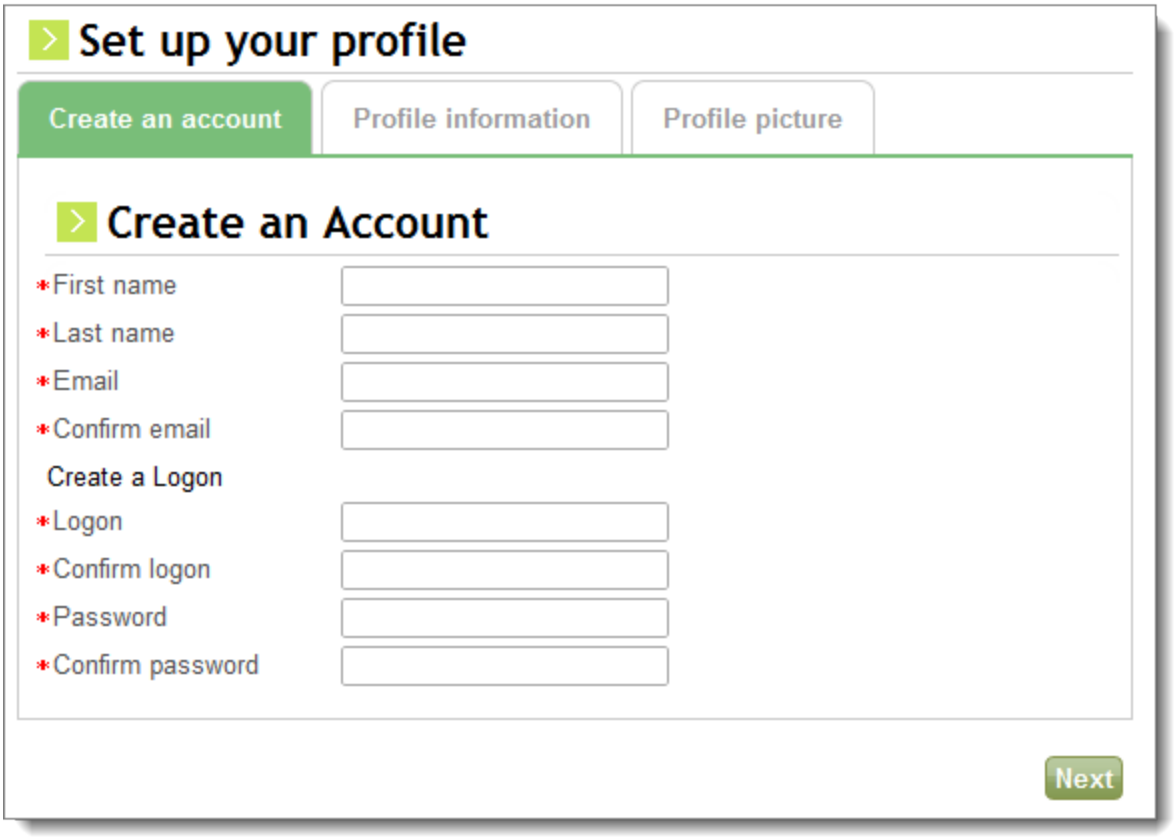
Content Block iPart set up as a discussion board

Using the Content Collection Organizer

Use the Content Collection Organizer to create a collection of pages and assign names to the tabs or headers for each page. In the simplest example, those pages are displayed, the user can access tabs in any order desired, and information is saved independently on each page. The following screenshot shows an example with tabs across the top, configured to display different content pages.

Using the Content Collection Organizer as a Wizard

You can configure the Content Collection Organizer to function as a wizard, which will guide the user through multiple steps. When enabled, Next and Previous buttons display, allowing users to navigate between the steps, as shown below. The user can navigate to any previous tab, but forward only to the next tab in the workflow sequence. The user can also navigate with the browser's Forward and Back buttons, but the data does not commit until the user clicks Next.



Each page in the workflow is validated when the user clicks the Next button. Each iPart's page.Validate method is processed in the order the iParts appear on the page. The order of calls is:

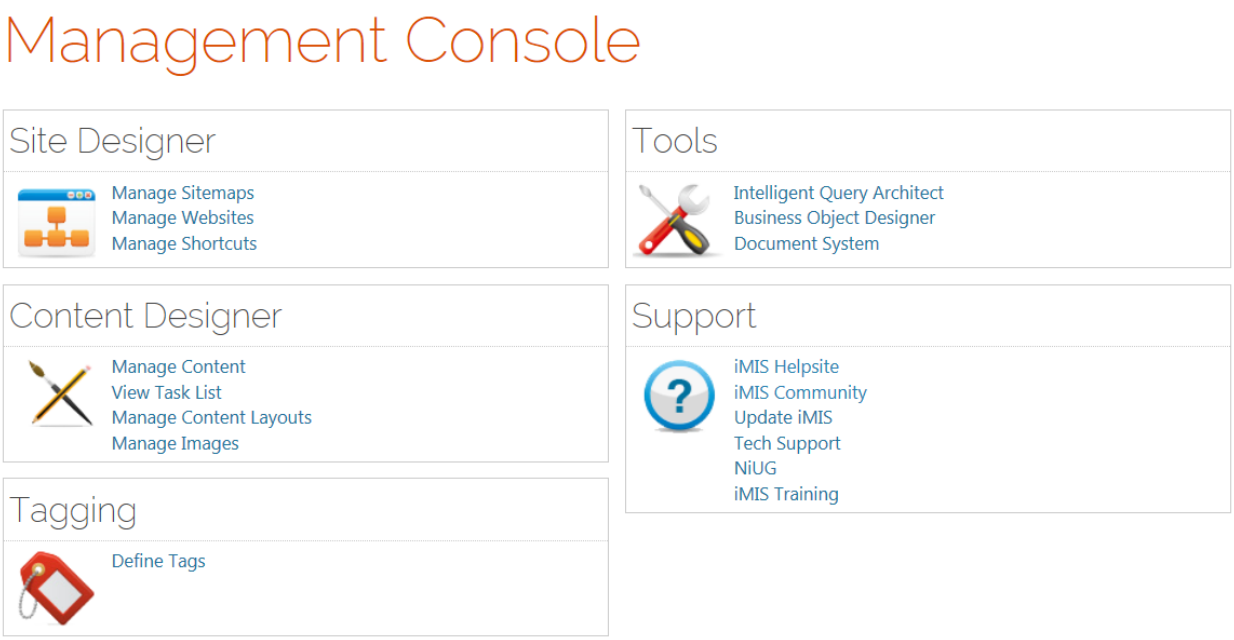
- Validation
- If Validation passes, then PreCommit
- If PreCommit passes, then Commit

If any of the calls fail (the data on a page is incomplete or incorrect), then an error message displays and the user cannot move to the next step until it is corrected.

Using the Big Button Panel iPart

With the Big Button Panel iPart, you can display a navigation panel that combines a larger, category-defining image with a list of links, as shown in the screenshot below. You

can also use this iPart to create links that make it easy for staff to perform routine tasks for contacts such as running reports, registering for events, and ordering on their behalf.



Example: Working On Behalf Of contacts and running reports using the Big Button Panel

In this example, we will set up the Big Button Panel on the account page, so that staff can select a contact from the Directory, then quickly run a report, register for an event, make a donation, or order a product for that contact.

1. Edit the account page that displays after a staff user selects a contact from your directory. In the Member site, it is the Account Page Staff content record.
2. Add the Big Button Panel (add content > ContentTypes > Content > Big Button Panel) iPart to the content record and configure it with the following settings:

- Mode: Actions
- Add an action link to run a report:
- Link Text: Print Info
- Link Target: Enter a link to a page that contains the SSRS Report iPart that displays a report such as $/Samples/ReportingServices/MemberProfileQuery_Report.

Note: The SSRS Report iPart must be configured to Hide the parameters section and to enable the option to Inspect query string for parameters. Do not enable the option to Inspect Session for parameters. For more information about SSRS reports, see Creating SSRS reports.

- URL Parameter: ContactKey=@SelectedUser
- Add an action link for event registrations:
- Link Text: Register for an event

  Note: Customize this text for the event you want to register the contact for. For example, Register for the Spring Conference.
- Link Target: Enter a link to the event page
- URL Parameter: EventKey=XYZ (replace XYZ with an event code) EventKey=XYZ (replace XYZ with an event key)
- Use On Behalf Of: Enable
- Add an action link for donations:
- Link Text: Make a donation
- Link Target: Enter a link to your donation page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable
- Add an action link for the shop:
- Link Text: Purchase a product
- Link Target: Enter a link to your Shop page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable

3. Save and Publish the account page.

Using the Group List Editor iPart

The Group List Editor provides a flexible tool for you to display and manage lists of groups, sub-groups, relationships, and/or memberships. You can configure it to serve several different purposes.

Display an organization's roster

A common use for the Group List Editor is to display a list of contacts that belong to an organization.

For example, add the iPart to an organization's profile page, so that the iPart displays memberships for the selected organization. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the roster
- Clicking on a contact opens their profile page: Enable to link contact names directly to their profile page
- Provide option to view and edit membership details: If you want users to have easy access to both the account pages and the Group Member Detail window, also enable this option. Users can click an icon to switch between these options.
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups owned by the parent ID and their members
- Choose the group types to include: Organization
- Automatically create a group if one does not exist: Enable if you have allowed editing (this allows the creation of new rosters)
- Group owner type: Party
- Group type to auto-create: Company
- Choose the group types to include: Ensure that Company is selected

Display a contact's memberships

Another common use for the Group List Editor is to display a list of a contact's memberships in groups such as committees and chapters.

For example, add the iPart to a contact's profile page, so that the iPart displays memberships for the selected contact. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the contact's memberships
- Clicking on a contact opens their profile page: Not applicable
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups that the parent ID is a member of
- Choose the group types to include: Select the group types you want to display, such as Chapters and/or Sections

Relationships in the Group List Editor

You can easily create a link between two contacts using the Group List Editor iPart. The relationships you define show up on the record of both contacts, and you can specify roles for one or both of the contacts. For example, if you edit Jean Smith's record to indicate that she knows Russell Smith, then that relationship will also appear in Russell Smith's record. Alternately, if you edit Jean's record to indicate that Russell is her child, you can also specify that her role is the parent of Russell. Then Russell's record will reflect that Jean is his parent.

There is no limit to the number of relationships you can create or the types of relationships you can create. We have provided a few relationship types out-of-the-box, but you can add additional ones if needed.

Only users with System Administrator or Staff privileges can create relationships between contacts, but any user can view a list of relationships.

Note: Note: To use this relationship feature, you must have the RELATION license.

The following sections walk you through how to create relationship types and how to set up the Group List Editor to display relationships.

Creating relationship types groups and roles

Edit the Customer setup table for Relationship types, adding the relationships that you want to have available in the Group List Editor. For each relationship type you add, you can also define a Reciprocal relationship, which the Group List Editor automatically populates as a set (such as for Parent and Child).

To display and edit relationships in the Group List Editor, you must define a Relationship Group and Roles (relationship types) associated with that group. A sample relationship group type named Connections has been provided. You can create your own group type from Setup > Groups > Types. If you create your own group type, the only requirement is that you select the Relationship Group checkbox, so that the Group List Editor can properly display relationships.

To create Roles used in relationship groups

1. Decide which relationships you want to be able to define for users. For example, Parent-Child, Husband-Wife, etc.
2. Create Roles for each relationship type.

- From Setup > Groups > Roles, click add.
- Enter the Name of the Role and a Description of the role.
- Select the Active checkbox.
- (optional) Select a default Reciprocal Role for this role. For example, if you are creating a Parent role, you may consider selecting Child as the default Reciprocal Role, so that it is automatically selected when someone defines a Parent relationship. If the Reciprocal Role you want to add is not in the list, create it first, then add it to this role.
- Save and repeat for each relationship role you want to define.

3. Edit your relationships group (for example, the group Connections) to add the roles you have defined.

To set up the Group List Editor to display relationships

1. Add the Group List Editor iPart to a content record on which you want to display a list of a contact's relationships. For example, add it to an account page. The iPart displays a list of relationships for the currently selected contact. The selected contact is determined by either a contact ID passed to the page via a URL parameter (from the Directory, for example), the contact selected in the On Behalf Of control, or the currently signed in user.
2. Configure the iPart with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit relationships
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Both of the above
- Automatically create a group if one does not exist: Enable
- Group owner type: Party Choose the group types to include: Select Relationships
- Group type to auto-create: Select a relationship group, like Connections
- Choose the group types to include: Ensure that Connections is already selected.

  Note: Only the relationship group type selected to auto-create may be edited. For this reason, if Allow editing is selected, we recommend including only the one relationship group type in this instance of the iPart.

3. Save and Publish the content record.

Using the Content HTML iPart

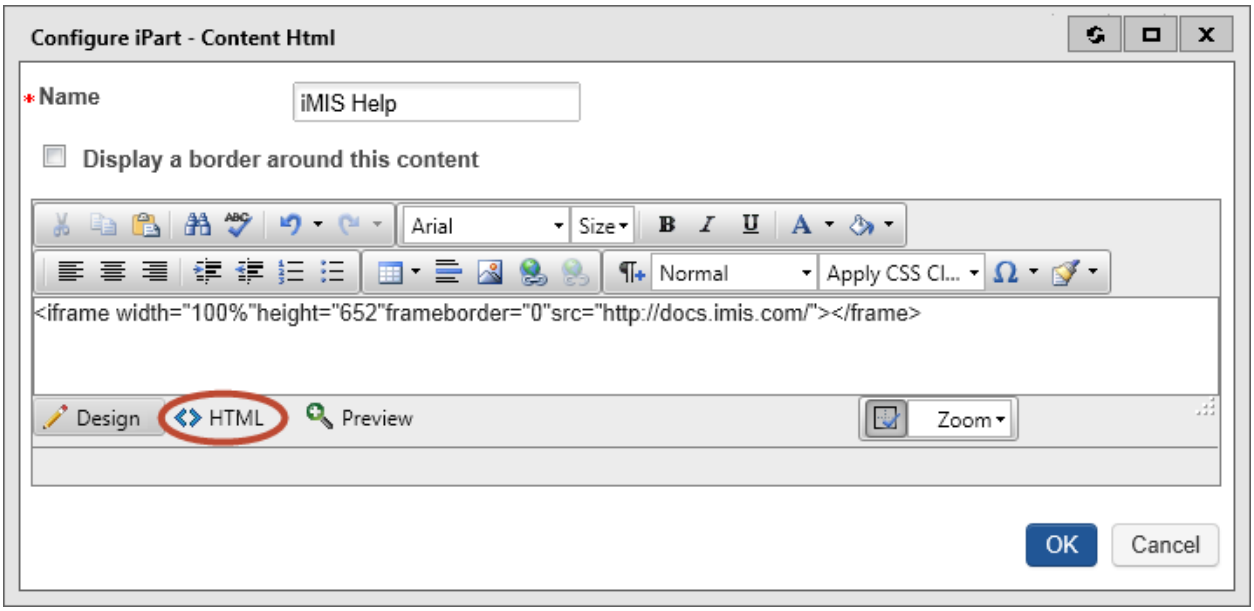
Using the Content HTML iPart, you can add simple content to your website, anywhere you want. In addition to the WYSIWYG functionality, you can switch to HTML mode to insert JavaScript to embed other sites, display web widgets, and use variables to create relative paths.

Embedding external sites

To embed any external page into an iMIS site, you can use an <iframe> like this:

1. Go to Content designer, Manage content and create a new content record.
2. Select add content and place a single Content Html iPart on it (from the ContentTypes folder).
3. Show the source by clicking the <> HTML tab and type in an iframe tag, such as this:

   <iframe width="100%" height="652" frameborder="0" src-c="http://docs.imis.com/"></iframe>
4. Go to Tools > Site designer > Manage sitemaps and create a new navigation item that points to the new content record.
5. If appropriate, restrict the navigation item's Access Settings, such as to Authenticated User Full Control.



Displaying web widgets

You can install and display JavaScript-based web widgets (plugins, gadgets) in your WCM-generated websites using the Content HTML iPart. A web widget is a small program that your users can execute within a web page and that can provide a wide range of functionality.

For example, Google Gadgets offers thousands of free web widgets including mini applications, games, news feeds, maps, and a wide range of other types of content. Many other websites also provide free widgets that can access data from their site. For example, Twitter provides widgets that let you display Twitter updates on your website. LinkedIn provides plugins that display information such as company profiles, member profiles, and links to share on LinkedIn. You just have to search the web to see what you can find that meets your needs.

> **Note:** Warning: Only embed widgets from authors whom you trust. Malicious code may damage your computer or violate your privacy.

To add a JavaScript-based web widget to a webpage

Go to Content Management > Content designer > Manage content:

1. Create a new content record or edit an existing one.
2. Click add content to find and select the Content Html iPart.

   The Configure iPart window opens.
3. Click < > HTML to switch to HTML mode.
4. Copy the JavaScript embed code for the widget you want to add and paste it into the HTML area.
5. Click OK, then Save and Publish your content record.

   The widget is displayed when that content record is rendered on a webpage.

Creating relative paths using variables

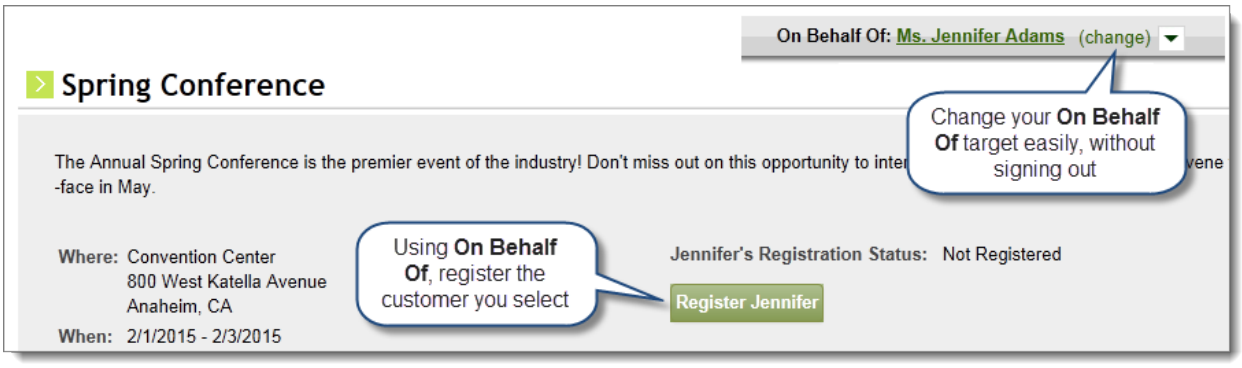
The Content HTML iPart does not support the use of the ~/ (tilde slash) shortcut, often used to automatically build the correct paths when a control is rendered in different domains. However, several variables are available in this iPart that allow you to enter paths for links and resources that are automatically resolved to various folders in your website. The variable names are case-sensitive.

> **Note:** Note: Images do not render in Design mode because the variable is not transformed until the content record is published.

- [Website] – Resolves to the root of the website and contains the website name. Example: [Website]Home.aspx.
- [~] and [Root] - Both variables resolve to the root of the website. Example: [~]Home.aspx resolves to http://mydomain/Home.aspx.
- [Theme] - Resolves to the website's theme folder. Example: [Theme]images/image.png. This variable can be used to access theme resources such as images and CSS.
- [iMIS] - Resolves to the iMIS directory of the website. Example: [iMIS]ContactManagement/CreateAccount.aspx
- [Common] - Resolves to the AsiCommon directory of the website. Example: [Common]Controls/Shared/FormsAuthentication/Login.aspx

On Behalf Of: Customer service mode

Your iPart-based site is not just for self-service: On Behalf Of gives your staff a customer service mode, to complete website commerce on behalf of your customers. When requests for event registrations, product orders, and even membership renewal payments come in by phone, fax, or email, On Behalf Of lets you conduct a secure session during which you can add items to a customer's cart and complete the transaction for them, all without signing out of your own session.



Separate carts, for privacy

To avoid confusion and to protect your customers' privacy as to which items they may have added to their own carts, On Behalf Of sessions create and save carts that are completely separate from those your customers see. For added security, items yet to be purchased are saved in these carts, but not any cardholder information that may have been entered.

For example, if you added a registration to a member's cart but do not submit it, then she will not see the registration in her cart the next time she signs in; however, when you return to registering her on her behalf, you see her cart restored to the state it was in when you left it. Once you complete a purchase on her behalf, both she and you can see the order through her account page.

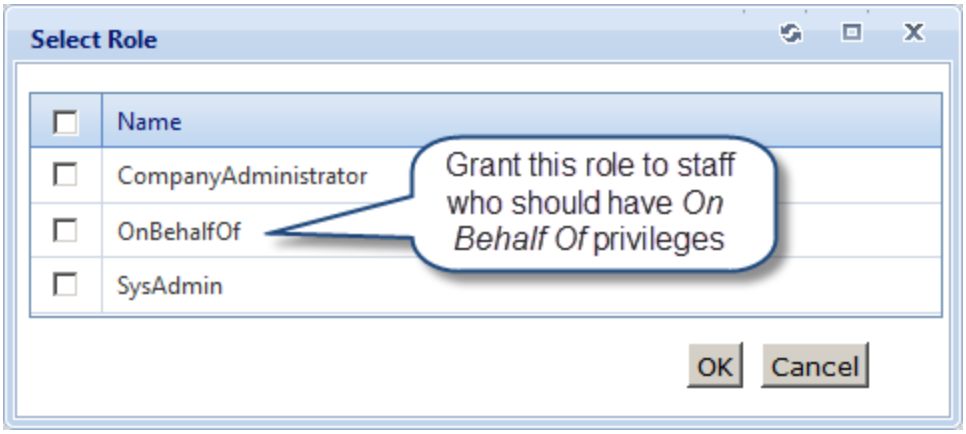
Note: Tip: You can use the audit trails to track which logged-in user performed each action that affected an On Behalf Of transaction.

Who can act On Behalf Of?

To protect the security of contact data, users must be added to the security role SysAdmin or OnBehalfOf to perform actions on behalf of another contact (individual or organization). It is easy to give a staff member On Behalf Of privileges.

Go to System Setup > Security administration > Users:

Find and select a user, and in User Information click add role.



Changing and ending On Behalf Of

When you act on behalf of someone else, all of your commerce-related actions pertain to the target contact until you end the session in one of these ways:

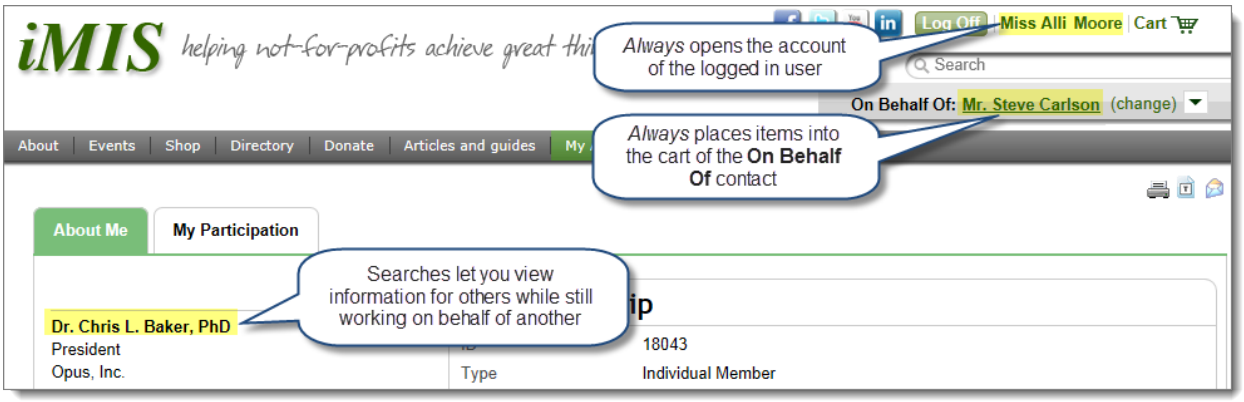
- Select a new target contact: click (change) next to the target contact.
- Clear the selected contact: click the down arrow next to the target contact and select Clear.
- Close the browser.
- Sign out of iMIS.

Whose contact information do iParts show?

Acting on behalf of another contact controls the current cart, but it does not keep you from getting to information for other contacts. An iPart determines whose cart and information to show and update based on this logic:

- If the link's URL specifies an ID (such as for search results), it shows information for that contact.
- If not, it shows information for your On Behalf Of contact, if appropriate. (For example, the Query Menu iPart runs queries regardless of the target contact.)
- Without On Behalf Of, it shows information for you, the logged-in user.
- If no one is signed in, it shows limited information.

For example, you could be working on behalf of one contact when you need to use the Directory to look up an address for another. You can drill down on information from those searches with no effect on your on-behalf-of contact: the iParts pass the queried contact's ID on the URL to show you the information you need. Only when you take actions that add items to the cart is On Behalf Of enforced.



Note: Tip: What never changes is the contact name link in the top navigation: it always shows information for you (the logged-in user).
