Deferred Income in iMIS 365
Working with deferred income 365
Enabling deferred income processing 369
Processing deferred income transactions 371
Deferring events/exhibition/exposition income 371
Deferring dues/subscriptions income 371
Verifying the dues/subscription deferral term 372
Ensuring an accurate deferral term 372
Processing adjustments of deferred income 373
Converting existing deferred income items 374
Conversion methods for building the initial matrix 374
Deferred Income Schedule Records window 376

Deferred income reports 379
Multiple Entity Processing 381
Enabling multi-entity processing 382
DueTo/DueFrom processing 382
Correcting balancing problems 383
Setting up DueTo/DueFrom accounts 383
Set up due to/due from window 383
Determining transaction entity ownership 385
Entity processing in Billing 385
Entity processing in Events and Exhibition 387
Entity processing in Exposition 389
Entity processing in Fundraising 390
Entity processing in AR/Cash - Sales Transactions and Simple Order Entry 391
Entity processing in Orders 393
Entity processing in Credit Memo or Debit Memo/Adjustment Transactions 393
Entity processing in AR/Cash - Cash Receipts 393
Entity processing in Service Central - Enter and edit payments 395
AR/Cash 398
Accounts Receivable and Cash Receipts Overview 398
Batch Control 402
Viewing unposted transactions 403
Examples of unposted transactions 404
Working with batches 405

Manage batches window 405
Selecting an open batch 409
Batch window 411
Posting batches 412
Simple Orders 413
Processing payment amounts 414
Enter and edit orders window - Simple order entry 414
Transaction Ledger window for Simple Orders 424
Cash handling in order processing 425
Controlling the recognition of credit card entries in batches 426
Printing invoices 427
Direct Transactions 430
Enter and edit sales transactions window 431
Deciding to use a simple order entry or a sales transaction 437
Entering cash receipts 438
Enter and edit cash receipts window 439
Adjusting journal entries 446
Enter and edit credit memos window for AR/Cash 447
Enter and edit debit memos window for AR/Cash 450
Recording credit memos 453
Billing Administration 458
Accrual Dues 458
Setting the accrual dues options 458

Creating an accrual dues billing cycle 459
Using batch control with accrual dues 461
Batch control and mass dues billing 461
Batch control and individual dues billing 462
Generating an individual accrual dues billing 463
To generate an individual accrual dues billing 463
Generating a mass accrual dues billing 465
Posting mass accrual dues batches 466
Viewing billing results 467
Processing accrual dues payments 468
Processing adjustments 469
Authorization levels for credit/debit memos 469
Credit memos for accrual dues 470
Enter and edit credit memos window 471
To process an accrual dues credit memo 473
To find an accrual dues credit memo using a transaction number 475
Debit memos for accrual dues 478
Enter and edit debit memos window 478

Terms and Concepts

This glossary is designed to act as a reference guide to help familiarize users with the language used at ASI and within iMIS. Users will be able to search through these terms and concepts alphabetically, without needing to navigate away from the page, or by using the Helpsite Search feature.

A-C

Access keywords

Keywords defined in the ACCESS_KEYWORDS general lookup table that control access to particular iMIS components.

Accounting

The systematic recording, reporting, and analysis of the financial transactions of an organization.

Accounting date

The date assigned to the journal entry (or journal entries) related to the upfront recording and posting of a commerce transaction or to subsequent processing of the commerce transaction related to the change in accounting status. The accounting date should always align with the invoice date for an accrual standard invoice or an accrual adjusting invoice. For a payment, the payment deposit date should be used to record the cash receipts journal entry.

Accounting period

A regular period of time for which a financial statement is produced.

Accounting policy

A systematic routine that determines how the financial transactions of an organization are recorded and reported, such as how income (whether earned or a gift) is received and recognized, how expenses are authorized and paid, and how assets and liabilities are presented on the organization’s financial statements.

Accounts receivable (AR)

Money owed to an organization by customers who have bought goods or services on credit (when income is recorded on the accrual accounting basis). Accounts receivables are current assets that continually turn into cash as customers pay their bills.

Designates the class of accounts that represent the total, cumulative debt owed to you by customers who purchased goods and services on credit.

Accrual basis

The accounting method that recognizes income at the time of sale (when goods are shipped/invoiced or services rendered) and expenses at the time they are incurred, independent of when they are paid for. This method focuses on events that have cash consequences for the organization.

Acknowledgement

A letter or other written notification sent to a donor to inform the donor that a gift or pledge has been received. iMIS allows for acknowledgements to be customized by salutation, body of letter, and sender.

Active contact

In the Advanced Accounting Console or Desktop, this is the member whose record is selected.

Active member

An association member whose dues and membership are up-to-date.

Activity

A record, in iMIS, of a predefined type of interaction with a customer. For example, a cash donation generates a GIFT activity, conference attendance generates a MEETING activity, a solicitation generates a REQUEST activity.

Adjusting invoice

Invoice that is cross-referenced to a standard invoice for the purposes of increasing or decreasing product charges and/or reducing the open balance of the invoice.

Adjustment transaction

A commerce transaction (or a part of a commerce transaction) that impacts the current status of an original posted transaction.

Advanced Accounting Console

One of the Core Sites of iMIS that contains staff functions not yet available on the Staff site.

; A streamlined, easy-to-use interface alternative for customer service and staff functions. Its functionality allows an administrator to define and set up iMIS. Its utilities are installed directly on your machine and are moderated from one central location.

Aging

The length of time an amount is past due for payment on an invoice.

Alias (IQA)

An alternate name for a column (property).

Anniversary billing

Used when the membership terms fluctuate; usually corresponds to each customer's Join Month or subscription Begin Month.

Announcements

Items posted for information only. Announcements typically allow no replies.

Annual billing

Used when all renewing customers have the same Begin and End dates. The Begin Date could vary for new customers who join later in the year, and their dues can be prorated for a partial term.

Annual conference mobile site

A version of the Annual Conference that is optimized behaviorally and formatted for use on smart phones and tablets for both by association members and staff who are attending events. Attendees gain quick access to their personalized programs, activities, and event feeds. Attendees can instantly look up the directory profiles of others attending the conference.

Annual conference site

An out-of-the-box microsite, designed to support critical projects such as an association's annual conference. This site maximizes the impact of the project without affecting the main association site or micro sites from different years, while still seamlessly integrating content between the various sites.

The annual conference site is built using the London_Responsive theme.

Appeal

A short-term activity with a specific objective that is a specific instance of a request, such as a mailing or telemarketing event. Appeals are not required in iMIS Fundraising.

Application

A specialized computer program or software package that performs particular tasks. The iMIS Customer system is an application.

Application Service Provider (ASP)

Third-party entities that manage and distribute software-based services and solutions to customers across a wide area network from a central data center. ASPs can be commercial ventures that cater to customers, or not-for-profit or government organizations, providing service and support to end-users.

Apply

Allocating or charging to an account, product, activity, or period.

Asset

- A non-cash contribution that has monetary value, such as real estate, stocks, or an annuity. An asset differs from an in-kind contribution in that its longevity is generally greater than a year. An asset is treated the same as an in-kind contribution in iMIS.
- Economic resources that are owned or controlled by the organization. Both AR and cash accounts represent assets.
- Something valuable that a financial entity owns, benefits from, or has use of, in generating income. In accounting, an asset is something an entity has acquired or purchased, and which has money value (its cost, book value, market value, or residual value). An asset can be:
- Something physical, such as cash, machinery, inventory, land and buildings
- An enforceable claim against others, such as accounts receivable
- A right, such as copyright, patent, or trademark
- An assumption, such as goodwill

Attendance

The accounting of who was present at an event or function, as opposed to who signed up to attend (see Registration). Because of no-shows, attendance figures will be lower than registration numbers. Accurate attendance tracking is important for awarding continuing education units, so the Update Attendance facility lets you mark verified attendees (or unmark no-shows).

Audit trail

A reference accompanying an entry (posting) to an underlying source record, or a trail of documentary evidence proving that transactions are authorized. A good audit trail lets you efficiently check the accuracy of accounting entries.

Authenticated user

A user who has logged in.

Available

The product quantity on hand less the product quantity reserved.

Backorders

Backorders indicate that insufficient inventory is available to fill an order. Orders that cannot be filled are held in a backorder status until inventory is received.

Badge

A badge is a nametag that is given to each attendee to wear at the event. Badge formats usually feature the individual's nickname or first name (enlarged for readability) and include other identifying information such as full name, title, company, city, and state. Sometimes, each badge is marked with a color-coded strip to differentiate groups of attendees: customers, guests, exhibitors, speakers, and staff.

Balance

The sum of debit and credit entries in an account:

- If positive, it is a debit balance.
- If negative, it is a credit balance.

A balance sheet is a report showing the assets, liabilities, and owner's equity of a business on a certain date.

Batch

A group or collection of transactions of the same general type, identified by a unique name or number. The transactions might be batched together by date or by other parameters.

Bill Begin

Projected Begin Date for an individual dues or subscription product. Refers to the first date of a term through which the item has been billed, whether or not payment has been received.

Bill To

Refers to whoever is responsible for paying the registrant's event fees. This may be the registrant or, as in many cases, a third party such as the registrant's company or employer. When a Bill To party is identified, all accounting and invoice transactions are tracked under the Bill To ID. However, all participation history continues to be tracked under the individual registrant's ID (if represented in the customer database).

Bill to contact

The party financially responsible to pay for an order. A single bill to contact is assigned to each order and to each invoice.

Billed thru

Refers to the projected Paid Thru date (expiration date) for an individual dues or subscription product. It is the term ending date through which the item has been billed, whether or not payment has been received.

Billing

The processing of renewable, specified-term products for a group.

Billing address

The address to which the invoice document should be sent. For online payments, the billing address of the credit card which is used for credit card verification.

Billing category

Optional subcategories of the customer type which define dues amounts when the customer type is not specific enough for an association's needs.

Billing cycle

A defined billing run set up to bill a particular group of people for a particular set of products.

Billing interval

Indicates how frequently customers are billed. The interval can be annual, semi-annual, quarterly, monthly, and so forth.

Billing term

The period of time between the beginning and ending dates for the services or products that are being billed.

Bin

A specific location where a product is stored within a warehouse.

Blog

Chronological listing of entries, often created by one individual.

Book

A set of pages tied together in a hierarchical parent-child relationship. Multiple levels can exist and these can be used for manuals, FAQs, or other content groupings.

Booth inventory

Total number of items that have been generated for a particular booth product. For example, the total number of 10' x 10's would be the booth inventory for that product.

Booth preference management

Strategy for selling booths where preferences are assigned to exhibitors based on priority points or a ranking system other than the first-come-first-served method. This is typically used by organizations that use the lottery method of assigning booths. With booth preferences, exhibitors can select their first, second, and third choices for booths and are assigned preferences based upon specific criteria, such as how long they have been exhibiting and the amount of space they purchase.

Breadcrumb

Text showing the sitemap of a visited page that appears automatically on every site. These navigation areas must be enabled globally in the website’s sitemap.

Business object

A collection of self-contained data that represents an entity or process, and shields the physical data.

Business object designer

An administrative tool for viewing, editing, and creating iMIS business objects that provides a graphical user interface to the properties related to business objects.

Campaign

An orchestrated fundraising effort that lasts for a defined period of time, or a series of appeals. Although frequently used by fundraising organizations, campaigns are not required in iMIS Fundraising.

Cash account

Represents ready money available to the organization. Usually, there is a separate cash account for each bank account in which the organization maintains deposits.

Cash accounting

The system of accounting in which income is recognized when the payment is received for an invoice.

Cash basis

The accounting method in which income and expenses are accounted for on a cash-received and cash-paid basis. Contrast with accrual basis.

Cash GL account

GL Account that aligns with an individual bank account that is owned by a financial entity. Traditional payments, once processed and posted, will result in an increase in the balance of a Cash GL account.

Cash receipt

Cash amount (currency and checks) received and deposited into one of the organization's bank accounts.

Cash receipt document

Document that confirms the receipt of a payment from a customer and communicates information about how the payment was applied (such as applied to a new order or an existing open invoice balance).

Cash receipts journal

Journal in which all cash receipts are recorded before they are posted to the general ledger. These entries are reconciled regularly with the bank statements as an internal auditing measure.

Category

A category is a grouping of components similar to the way university courses are grouped by department. The category is a program requirement. You can group component requirements into categories so that completion of some or all of the components meets the category requirement.

Certificate

An official document awarded to an individual to recognize participation in a specific educational seminar or program. Certificates can be used as proof of participation.

Continuing education units (CEU)

Often expressed in hours or points, can be awarded to individuals who participate in or attend a specific educational seminar or program. These units are important for many professionals to earn certification and meet continuing education requirements.

Chapter

Method to organize contacts by regional areas.

Chart of accounts

- A list of all the accounts (names and numbers) maintained by a business.
- System of accounting records developed by every organization to be compatible with its particular financial structure and with the amount of detail required in its financial statements. The chart of accounts consists of a list of GL account names and numbers

showing classifications and sub-classifications, serving as an index to locate a given account within the general ledger. A company has the flexibility to tailor its chart of accounts to best suit its needs, including adding accounts as needed.

Claim

In security, an individual right or action applicable to a particular resource. Individual rights are granted by a particular Issuer and allow a user to perform a specific operation on a specific resource or group of resources.

Claims set

In security, a collection of claims granted by a particular issuer to a given user or required by a specific resource in order to perform a specific operation.

Classes (Exposition)

Categories or types of exhibitors, for example, member, non-member, and staff.

Client/Server technology

A method of processing data in which data is stored and processed on a central server, but users interact with data using local machines which retrieve data from and send data to the server.

Clipboard

A designated storage area in the operating system to which you can copy data and from which you can paste data. When you copy data in an application, the data is written to the clipboard.

Combo category

A combo category is a grouping of multiple categories.

Commerce

The trading of something of value between two parties, such as goods, services, or money.

Commerce item

A representation of goods or services offered for sale. A commerce item may be a physical item, a service, a downloadable item, an event registration, a subscription, or a donation.

Commerce transaction

The data set result from the recording and processing of any or all of the following items:

- One or more new customer purchases
- One or more prepayments
- An ordered product
- The assignment of payment or billing instructions for an unpaid order balance
- One or more payments of an existing open invoice balance
- An adjustment related to a previously processed and posted transaction

Commissionable product

A product that generates a commission for a salesperson.

Committed

The actual number of products committed to fill open orders or the number of products in inventory that are awaiting shipping. Committed products do not include backorders.

Communities

An online forum that lets a group collaborate on projects, share knowledge, communicate and connect with others, and stay in touch using email subscriptions.

Community list

A grouping of all of the communities associated with a particular organization or user.

Company conflicts

Strategy that lets you identify companies that are in conflict with other companies. For example, the companies might be exhibiting the same or similar products and do not

want their booths in proximity. By defining proximity areas, you can ensure that these conflicting companies do not exhibit their products or services close to one another.

Company flow down

A way to join customers through the Company ID. You can flow down data such as address, phone, and so forth, from the Company ID to the customer record joined by the Company ID.

Comparison method (IQA)

Specifies the method by which data is restricted for a column.

Completed

Indicates that the student has finished the set of requirements of a Certification program or component.

Complex group

A group with roles assigned to some or all members.

Component

- A component is an individual requirement that must be completed before a student can complete a program and achieve certification. Components also can be tracked alone without a program to achieve certification.
- Individual items within a kit.

Confirmation

A letter or notice that is sent to a registrant, confirming receipt of a registration and listing any fees. A confirmation usually lists all of the functions the registrant selected and other details and instructions the registrant included, such as guest information. It might show the current status of the registration and include specific or general comments about the upcoming event, such as instructions for signing in on arrival and reminders of what materials to bring to the event.

Contact

The term used to refer to accounts. Contacts are searchable, can be edited and updated, and can be linked to companies, committees, and workflows.

Contact status

Method to indicate standing within the organization for specific actions, communications, and workflows. Includes the following defaults:

- A – Active
- S – Suspended
- I – Inactive
- D – Mark for Deletion

Contact type

Method to categorize a contact for specific actions, communications, and workflows.

Contact reports

A section of reports that are able to detail activity participation, personal information, and statistics. Users can use these reports to create tables, rosters, and certificates.

Content authority group

A special type of iMIS security group whose members have permissions that are specific only to iMIS content management functionality. Content authority groups are also used to enable content authoring workflow.

Content code

A tool used to help differentiate content records stored in different content folders with the same Publish File Name.

Content gallery

The location of the iMIS Dynamic Content Items as well as traditional content types.

Content items

See also iMIS dynamic content items

Content layout

An iMIS definition object that contains information for how the content zones of a content page will be arranged. A content layout defines only the arrangement of elements that will be displayed for a content page within the main content area. A content layout does not define the overall layout of the website, which is defined by the site's master page.

Content page

An iMIS definition object that contains the content layout information and content items needed to render a web page.

Content record

An iMIS definition object stored in the Document System that specifies all the information needed to render a web page for an iMIS-controlled website.

Content tagging

A method of categorizing website content that helps users retrieve information.

Content type

A registered content item definition that includes the information required by WCM to configure, publish, and display the content item.

Content types

These are the categories within the Content Gallery (divided into sub-folders) that contain the content items.

Continuum

A tab option on the Staff site that contains the reporting system for iMIS

A program of products and services enabling continuous performance improvement for full-cycle organizations

Control account

General ledger account whose balance reflects the total of balances of related subsidiary ledger accounts. Accounts receivable and accounts payable are the most commonly used control accounts, and their balances serve as a crosscheck (control) of the accuracy of the associated subsidiary records.

Content

- Core Content – pages are standard, out-of-the-box which provide core functionality and are generally shared across multiple websites
- Shared Content – pages that are shared across multiple websites so layout and content changes can be made in one place
- Website-specific Content – pages that are designed specifically for the needs of a single website (may still be shared with others)

Credit

Entry on the right side of a journal entry (that is, it carries a negative accounting sign). Credit has the effect of:

- Decreasing an asset or expense GL account balance
- Increasing a capital, liability, or income GL account balance

Credit memo invoice document

Official document sent by an organization to a customer (Bill to contact) stating that an amount has been credited to an original invoice belonging to the customer. A credit memo invoice document is issued for a variety of situations, including when:

- An invoice amount is overstated
- The correct price sheet or promotion was not applied
- The goods spoil within the guaranty period
- The goods do not meet the customer's specifications and are returned

Customer

A person who has met the membership criteria set up by the association.

Customer type

Categories of membership that define the membership levels and amount charged for membership, or dues and subscriptions.

Customers terms

Customers is the core area of functionality where back-office customer relationship management occurs.

Customer Website

Any website created by an organization to meet the specific needs of its members, donors, or other targeted groups. Changes to these websites will not be affected by upgrades except where they incorporate Core Content pages.

Customizer

An iMIS utility used during system setup to create custom tables and windows for an association.

D-L

Dashboard

The landing page for each of the main navigation areas of the staff site. It provides a quick view of important, up-to-date association contact and membership figures.

Database

An interactive collection of related information that is organized into meaningful units (files, records, fields, graphics, and photos) for storing and accessing in order to facilitate searching and updating information.

Date-limited group

A group with specific join and end dates for the group or for a role in the group.

Deadline date

The deadline date is the date by which the program or component requirements must be completed.

Debit

An entry on the left side of a journal (or T) entry (that is, it carries a positive accounting sign). Debit has the effect of:

- Decreasing a capital, liability, or income GL account balance
- Increasing an asset or expense GL account balance

Debit adjustments

Have the opposite effect of credit memos, increasing the debit balance of open accounts receivable, such as increasing or adding a line item charge or bringing a credit balance to zero due to an overpayment, credit memo, or cancellation transaction. Debit adjustments allow one or multiple funds to be debited at month's end.

Debit memo document

Official document sent by an organization to a customer (Bill to contact) stating that a new amount is owed due to a change applied to an original invoice. A debit memo invoice document is issued for a variety of situations, including a product price change.

Default accounts

Accounts assigned to your organization's entities that serve as the default account if a payment is entered without specifically assigning an account for the payment.

Deferred income

The principle of accounting in which the recording of income is deferred until the accounting period when the costs are incurred, related to the generation of the income. For example, for an event, the deferred income is recorded during the month in which the event occurs. For a subscription or membership, it is typically spread evenly across the span of service.

Designation

A designation is an acronym that is appended to an individual's name to indicate the individual has completed a certification program and is certified in a specific area.

Desktop

An iMIS core site that includes extensive configuration for numerous features: contact management, accounting, billing events, fundraising, and orders.

Display order (IQA)

The order that columns display in the results for a query.

Distribution

Refers to an organization's selling, advertising, and delivery activities.

Document system

A server-side file system containing documents and objects (business objects, query objects, and output processes).

Donation

A monetary or in-kind contribution that is associated with an iMIS distribution. This is a pre-defined combination of a campaign, fundraising appeal, and fund.

Donor clubs

A means of recognizing various levels of giving by contributors. For example, an organization might designate a donor as a friend in recognition of contributions of $500 or more, or as a benefactor for donations of $1,000 or more.

Donor site

A rich and highly customizable Web site for fundraisers conducting charitable campaigns and product sales with the public.

Down payment

An initial payment on an installment pledge. A down-payment is treated as a gift.

Due To-Due From processing

A means of correcting balancing problems when a payment is received and is deposited to an account that is owned by an entity other than the owner-entity of the gift or pledge. Due To-Due From entries are generated when transactions are sent to the General Ledger.

Dues

Membership fees charged to customers.

Duplicate record check

A formula used to make sure the same record is not entered in the database twice. Duplicate record checks are often used on the Major Key field (such as Social Security Number).

Easy edit

An icon that enables staff users to edit and configure content items and content directly, rather than through the formal content management process.

Effective date

The date used to determine which customers will be billed. Normally, a customer or subscriber will be billed if they have met the billing selection criteria, their Paid Thru date is before the Effective Date, and if a renewal has not already been generated. If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

Engagement Management System (EMS)

A tool that allows organizations to engage members anytime, anywhere, and from any device. This term applies specifically to iMIS 20 and its rich, cloud-based system that includes member management, member self-service, social engagement, private communities, mobile access, and website management.

End date

The date on which an individual's group membership ends.

Enrolled date

The date that a student enrolled in a program or component.

Equity

Net-value, or the excess of total assets over total liabilities.

Event

- A gathering, such as a seminar, convention, or board meeting, for which you need to organize, plan, and track details, including the list of expected attendees.
- Traditionally occurs at a particular time and place. The event might occur at a particular location and be attended in person (for example, a conference or seminar), or it might occur in a virtual meeting place (for example, a webinar or teleconference).

Event code

A tool used to help differentiate event records stored in different content folders with the same Publish File Name.

Event coordinator

An individual who is responsible for managing the planning and/or operation of the event or some aspect of the event.

Event showcase

The detailed display of information about an event. The showcase can include images and a variety of information.

Exhibitor

An individual representing a company who exhibits the company's products or services at an exposition.

Exhibitor products

Products or services that exhibitors show, demonstrate, and/or sell.

Expense

Money expended or cost incurred in an organization's efforts to generate revenue. An expense is typically an event in which an asset is used up or a liability is incurred, such as cost of goods sold, damaged goods, and bad debt expense.

Expiration date

Date on which a group member's role expires. For example, the treasurer might serve one year, but the chair of a committee serves two years. The individuals are still members of the group after their specific role term expires.

Exposition

Large event featuring many companies exhibiting products and services usually associated with one another by the industry they serve or by a similarity of the products and services they exhibit.

Exposition products

Sold by the exposition organizers to the exposition participants, usually called exhibitors. Exposition products are most commonly booths but also include passes and other products, such as sponsorships and advertisements.

Facility

A location that provides a particular service, typically the venue within which an event is being held, for example, a convention center, hotel, or meeting room.

Fees

- Events – Amount charged for events such as educational workshops, seminars, and conventions. Typically, fees are charged for event registrations, but additional fees may be charged for individual functions (for example, workshops, social functions, and meals). In some cases, an event registration fee may entitle a registrant to attend certain functions, and the registrant can purchase additional guest tickets to those functions. Commonly, fees vary by type of registrant (for example, member, nonmember, and speaker) and by the date of the registration (for example, early, regular, and late).

- Exhibitors – Amounts charged to exhibitors for the various exposition products. Fees can be set by exposition classes/types and by when a product is purchased.

  Field

  An individual data element contained within a record. A field may appear in a data maintenance window in the form of a labeled text box or option. The components of the customer name in the Customer Portfolio, for example, are all fields. Note that field may be referred to as a column in certain cases.

  Filter (IQA)

  One or more column-specific search conditions.

  Financial entity

  A legal entity for which a separate set of balanced financial accounts (or set of books) must be maintained independently. Although accounting information from different entities may be combined for consolidated reporting purposes, all transactions and accounts must be kept in balance for each entity.

  Fiscal period

  A month/year combination expressed in terms of a financial entity's fiscal year (as opposed to the calendar year). For example, if the calendar date of an accounting transaction is April 15, 2009, and the fiscal year begins in April, then the fiscal period is 1/2009. Likewise, if the transaction calendar date is March 15, 2009, the fiscal period is 12/2008.

  Fiscal year

  Accounting period covering 12 consecutive months over which a financial entity determines income and profits. The fiscal year does not necessarily correspond to the calendar year.

  Formal event

  An event for which an official registration or a fee is required as a prerequisite for event participation.

  Formal registration

An official event registration for a formal event. Usually, the registrant is expected to attend (that is, a slot or seat might be held for the registrant) unless the registration is canceled.

Fulfillment

The act in which the selling organization meets its financial obligation of delivering the goods and services that have been ordered by a customer. In the case of a physical product, fulfillment occurs when the product is shipped or physically delivered to the customer.

Function

A single session or activity within an event for which you need to assign fees or track attendees. A function can range from breakout sessions and educational workshops to social events such as golf tournaments, banquets, and tours. Because all fees are processed at the function level, you must set up at least one function record for each event or seminar for which fees are assigned.

Function (in Events)

A sub-event or session that occurs within the context of an overall parent event. For example, a conference might incorporate multiple functions or mini-meetings over the course of the conference date span. Such a conference might include multiple break-out sessions, social events, and networking sessions.

Function (IQA)

Summarizes some characteristics of the current set of rows. The functions that are available depend on the data type of the column you selected.

Fund

A legal entity within the organization with its own sets of books. It is a required component of iMIS Fundraising.

GAAP (Generally Accepted Accounting Principles)

Authoritative rules, practices, and conventions meant to provide broad guidelines and detailed procedures for preparing financial statements and handling specific accounting situations.

General journal

Journal used to record journal entries other than those that are recorded in the Sales and Cash Receipts journal.

General ledger

The final record of the transactions affecting an entity. The ledger contains one page for each account.

General/lookup validation table

A table an administrator creates in the iMIS database that contains the valid values for a given field. You can click the lookup icon to select a value, or place your cursor in the field and press Ctrl+L to see the valid values.

Gift

A payment of cash, cash equivalents, assets, or in-kind donations that has already been received.

Gift item

A commerce item that has a suggested amount price, such as for a donation.

GL account

An individual account within the Chart of Accounts that is used to record a financial amount in a journal entry.

Good thru date

The good thru date is the date by which the student must complete the program requirements in order to attain or maintain certification.

Grace period

A grace period is the additional time given to students to complete a set of maintenance requirements.

Group

A method to organize contacts according to pertinent criteria such as chapters, interest groups, industry, or subscribers.

Group member

A contact that is, has been, or will be a member of the particular group.

Group member status

A potential membership stage or state within a detailed group.

Group role

A classification of the way in which a group member participates in the group.

Group type

A method of classifying similar groups for efficiency in setup and reporting. Default information is assigned to a group type, but can usually be changed at the individual group level.

GUID (globally unique identifier)

A 32-character hexadecimal string used to provide a unique reference number. iMIS often uses a GUID to identify controls and interface objects.

Guided performance scorecard (GPS)

A feature in Continuum which is measure of organizational performance

A report that provides a visual representation of association performance in several key areas including recruitment, engagement, and growth.

ID

The numerical representation assigned to a customer or organization.

Identity claim

A security function that describes a set of attributes about a user or other entity.

iMIS dynamic content items

The unique components of core iMIS functionality that can be placed together on a content page. They are flexible, re-usable and powerful. Most core iMIS functionally is available as dynamic content items. It is an ASP.NET web part control designed for integration with iMIS that allows users to view and, in some cases, create and edit content.

iMIS website

Any website that is installed or updated as part of the iMIS standard installation or upgrade process - Core sites and Quick Start Sites. Changes to these websites (including navigation and related content) are always overwritten by subsequent upgrades

Income

Revenue gained from sales of goods and services.

Income account

- The account number by which income amounts are recorded or recognized. The income account is maintained with the Profit and Loss set of accounts.
- The General Ledger account number to be credited with the fee charged for a particular class/function combination, for example, income or deferred-income account. This information is optional but should be entered if you are want transaction-level reports to print the appropriate account numbers.

Initial requirements

Initial requirements are those requirements that a student must complete to earn initial certification. These can be used with a different set of requirements to maintain certification.

In-kind donation

An in-kind donation is a type of non-cash contribution with market value, such as professional services, equipment, or supplies. It differs from an asset contribution because it can be expected to be used up within a year.

Installment

One of a series of partial payments on an obligation over a period of time. For example, a quarterly installment is paid once every three months.

Instance

An instance is a unique occurrence of a component, such as a specific class. An instance also is called a location.

Instructor

The instructor is the person teaching or presenting a course or component.

Inventory setup options

The accounting treatment to be used for inventory. System defaults are FIFO, LIFO, Average, and Standard.

Invoice

An official object that itemizes all of the product charges and miscellaneous fees involved in a sales transaction. The invoice contains key reference data, such as the invoice number, invoice date, references to the originating order, customer information, and billing instructions.

Invoice date

The date on which the invoice was issued or created, usually the date of product fulfillment. For an accrual invoice, the invoice date is the accounting transaction date for the related sales journal entry.

Invoice distribution line

An object attached to a parent invoice line that carries related accounting information and represents the detailed invoice balance level to which all payments are applied. Individual

invoice distribution lines are created for each income account that is used in booking the income for the parent invoice line.

Invoice document

The printed or electronic invoice information sent to a customer.

Invoice due date

See Payment schedule due date.

Invoice header

The portion of the invoice that contains general information about the invoice, such as the invoice number and date, customer information, and billing instructions.

Invoice line

A sequentially numbered line in an invoice that represents the charges for an individual product line, or a partial quantity of a product line, that has been fulfilled, or a miscellaneous fee, such as taxes or shipping and handling. The extended amounts of all invoice lines should equal the grand total of an invoice.

Invoice number

A unique, sequential number assigned to each invoice as the primary reference.

IQA (Intelligent Query Architect)

The query-building tool used to extract data from the iMIS database.

Issuer

A trusted source for granting Claim Sets based on user authentication.

Item

Generic term for commerce objects. For example, an event item, a dues/billing item, or a gift item. Items can be grouped into item sets.

Item class

The method to assign the default GL accounts, tax schedule, standard discount percentage, and other settings to be used for a type of commerce item, such as Chapter Products or National Events.

Item set

A collection of commerce items with related options and rules. For example, an event plus required functions, a product bundle, or a collection of membership and other fees.

Item showcase

A display of information about a commerce item. The showcase can contain all information and images for the item or can link to other pages.

Item type

A general kind of simple commerce item, usually used to differentiate a gift (donation) with a suggested amount from a commerce item with a set price.

Itinerary

A list of functions a person has chosen for an event. The itinerary can contain an informal choice of functions (pre-registration itinerary) or a formal registration, if required (post-registration itinerary).

Join date

Date on which an individual became a member of a group.

Joins (IQA)

Relationships between data used in query definition. Joins specify which fields are equivalent so the data is associated correctly.

Joint requirements

Joint requirements are those that a student may use if the student is enrolled in two programs.

Journal

Business diary in which all financial data pertaining to the day-to-day business transactions of an organization is recorded. From the journal, debit and credit changes caused by each transaction will be posted to the designated accounts in the general ledger.

Kit

A product set of two or more components (items or services) that are sold for a single price. Kits are often used to present a group of items as a bundled, discounted product. In addition, kits are a useful method to distribute the costs of individual items (components) among multiple income areas for accounting purposes.

Ledger card

Shows the record of the transactions related to the individual currently selected.

Liability

- Claim against the assets or legal obligations of a person or organization. Liabilities include amounts owed to lenders and suppliers, amounts received in advance for a future sale or for a future service to be performed (unearned or deferred income).
- Debt or financial obligations owed to creditors.

Line item

Individual dues or subscription line associated with a specific customer or subscriber.

Linked function

Linking functions is a one-way shortcut for data entry by which registering for a primary function automatically registers for all linked functions, that is, selecting the parent selects the children.

Linked product

Associates a parent or primary product with a child or secondary product. When exhibitors order a primary (parent) product, iMIS automatically adds the linked child product to the order.

List as

An alternative way to list a contributor when the contributor does not want to be acknowledged by name. For example, the contributor might want their gift or pledge listed as:

- in the name of
- the family of
- anonymous

List billing

The generation of a single renewal notice to a Bill To third party, such as a company that will be responsible for paying the fees for multiple customers or subscribers.

M-R

Maintenance requirements

Maintenance requirements are the requirements a student must complete to maintain certification after initial certification is obtained. Maintenance requirements typically must be completed repeatedly over specific time periods.

Mapping

Translates one value into another. For example, iMIS might translate (map) a virtual address to a physical address.

Matching gift

A gift created when a donor's employer has agreed to make a matching contribution (usually a percentage of the employee's gift) when the donor makes a gift. iMIS treats the matching gift as a request or a pledge until the money is received from the company.

Matching plan

A plan set up by a company to match gifts donated by its employees to nonprofit organizations. In iMIS, the matching plan is set up as a percentage of gifts/pledges within a certain monetary range, for example, 25 percent of employee gifts ranging from $20 to $100.

Member mobile site

An out-of-the-box iMIS site that renders a version of the Member site that is optimized behaviorally and formatted for use on smart phones and tablets. This site is accessible by your association members and by your staff who are working off-site or on-the-run.

Member responsive site

An out-of-the-box iMIS site that renders a version of the Member site that is optimized for Responsive Web Design. This version is formatted to be accessed across a variety of devices, and respond dynamically to the variations in device screen sizes. This site is accessible by your association members and by your staff who are working remotely or with a mobile device.

Member site

An out-of-the-box iMIS site that offers a rich self-service experience for your association members and prospects. This site enables you to choose from a variety of visual themes, change navigations in just a few clicks, and add any number of query-driven content items to present dynamic information to your site visitors.

Memorial

A gift or pledge made in memory of someone.

Method of receipt

Indicates whether a purchased item will be shipped to the customer or the customer carries the item out. The method of receipt effects which taxes should be applied.

Monetary application

The link between an invoice distribution line with another object, such as a payment, a payment reversal, or an adjusting invoice, that is applied towards decreasing or increasing the balance of the distribution line. In most cases, a monetary application represents the amount of a payment that is applied towards an individual invoice distribution line.

Multi-entity

For accounting purposes, multi-entity enables you to use distinct financial entities, for which separate accounting statements are prepared, for different purposes within iMIS modules.

Multi-function event

An event that incorporates multiple break-out sessions, social events, networking brown bags, or other functions which a registrant can attend.

Multiple entities

For accounting purposes, defining more than one individual or organization for which accounting statements are prepared. For example, an association might need to assign certain accounts to a nonprofit entity and other accounts to a for-profit entity.

Multi-warehouses

An option that allows you to record and store a stock item's inventory in several different warehouse locations.

Net income

Total income in an accounting period, less all expenses during the same period. If income taxes are not deducted, it is called operating profit (or loss). Also called earnings, net earnings, or net profit.

Non-authenticated user

A user who has not logged in.

Non-commerce event

An event in which there are no fees. Registrations for a non-commerce event are processed on a direct basis, not through a commerce order.

Non-Customer

A person who has not met the membership criteria set up by the association.

Notice specific text

Refers to the additional text that can be printed on the initial, first or second billing and reminder notices.

Notification

The acknowledgement sent to the Notify IDs (family, business associates, and friends) when a gift or pledge is made in memory of or in tribute to their family member, business associate, or friend.

Notify ID

A family member, business associate, or friend of an individual who is being memorialized or honored. Notify IDs will be notified when a gift or pledge is made in memory of or as a tribute to the honoree.

Object (IQA)

Self-contained element that consists of instructions to manipulate data. For example, a business object or query object.

On behalf of (proxy)

Performing an action in place of another person.

On order

The quantity of a product on order with a vendor or supplier.

Open credit

The portion of any payment that is in the unrestricted, unapplied state. An open credit can be applied toward new or existing orders or open invoices.

Open invoice

An invoice with an unpaid balance.

Open item

Any item with a non-zero debit or credit balance.

Open order

An order that is not 100% fulfilled.

Operation

A well-known system function, such as Create, Read, Update, or Delete that can be performed for a specified resource within the application.

Order

A customer request to purchase one or more products.

Order (Exposition)

Commitment by the exhibitor to participate in an exposition by purchasing booth space and possibly some other exposition products.

Order processing stages

Steps orders must go through until the orders are complete. The number and type of order processing stages an order goes through depends on the setup of the order type. Different order types require different order processing stages. Examples of order processing stages include:

- Convert quotes
- Print shipping papers
- Ship orders
- Invoice orders

Order types

Determine how orders are processed. All orders are entered as a specific order type.

Organization

Name for company-type contact record.

Overlay text

Additional or customized text that can be printed over or on top of the preset renewal notices with the standard report elements printed underneath. It behaves similarly to how a transparency would lay on top of a paper.

PAC (Political Action Committee)

A group or committee created to raise money for the purpose of electing a candidate.

Page Builder

A content management tool that allows organizations to build and manage pages of text, multimedia files, and iMIS content items; used for building web pages comprising content items in the Content Gallery. Formerly known as Content Designer.

Paid Thru

Refers to the expiration date of the membership or subscription, or the period through which the customer has paid. It is always the last day of the month.

Parameterized query (IQA)

A query that requires a value from the user at runtime.

Pay priority (commerce)

The order in which payments are applied to invoice line items.

Payer contact

The party that made the payment (officially owns the bank account or credit card being used for the payment). The payer contact is normally, but not always, the same as the bill to contact.

Payment

A sum of money paid.

Payment alternative

A category of payment instructions which are provided in lieu of a traditional payment, such as Bill Me, Bill My Company, or Application of Open Credit. Payment alternatives do not create a new payment object when processed or posted.

Payment date

The date when a payment was deposited into the bank account. The payment date will always be assigned as the accounting transaction date for the related cash receipts journal entry.

Payment instructions

Information collected and/or derived by the system that indicates how a financial obligation will be met.

Payment method

The allowable method of payment a customer can use and the bank account into which the payment should be deposited. The payment method might specify the general type of payment (credit card, cash, check), or it might specify a specific type of payment (VISA, MasterCard).

Payment method set

The collection of pre-defined payment methods that are allowed for a particular commerce transaction process.

Payment reversal

A complete or partial reversal of an original payment stemming from a credit card refund, a bad check, or a credit card charge back.

Payment schedule

The amount due and due date for payments, in accordance with the payment terms.

Payment schedule due date

The date by which the payment for an invoice balance must be received. The due date is typically calculated as a certain number of days from the invoice date, in accordance with the payment terms.

Payment terms

The period of time allowed to pay for the goods and services that have been ordered. Payment terms may include standard terms (such as Net 30) or a specified payment schedule.

Payment type

The highest-level category of payments such as Cash, Credit Card, Debit Card, or Bill Me. The payment type defines the required information to be entered for payment instructions and how the payment transaction should be processed.

Person/People

Name for individual contact record. Contact records contain the descriptive contact and demographic information for each iMIS user (and for non-users). A contact record must be created for a new user before you can create a user record to link to that contact record.

Pledge

A contribution to be made sometime in the future that has not yet been received. A pledge can be a one-time contribution or can be made in installments over time.

Posting (batch)

Procedure that updates accounts with specific transaction amounts or transfers temporary transactions to permanent records (appropriate accounts in the general ledger).

Premium

An incentive gift that a donor may receive for a gift or pledge, such as a coffee mug or T-shirt, in recognition of the contribution. A premium is a distribution with an assigned market value.

Prepayment

A payment that accompanies an order or is made in advance. The prepaid amount is recorded in an Unearned Income liability account until the ordered products are fulfilled and the payment is applied to the associated invoices.

Prerequisites

Prerequisites are the requirements a student must complete before the student can enroll in a certification program.

Price sheet

A set of product prices and price calculation rules assigned to customers or orders of a certain type.

Priority (IQA)

The order in which the data for a particular column is sorted.

Pro forma order

An order initially treated as a price quote that might result in a sales order at a later date.

Process manager

Process manager helps to optimize opportunities presented to an organization, build ongoing relationships, and manage processes assigned to individuals or groups. Process manager provides the means to analyze, forecast, and report on those efforts.

Product

An item or service that your organization offers for sale to its customers.

Product adjustments

Adjustments to inventory due to breakage, pilferage, giveaways, or physical inventory count differences.

Product category

An association-defined classification for products. These are used to assign default accounts and to enable category options for groups of products.

Product codes

Refers to a unique code that identifies a product that will be billed, or for which an organization collects money.

Product conflicts

Strategy for ensuring that companies exhibiting similar products do not exhibit in the same area. Product conflicts are managed by defining proximity areas and only assigning booths to companies exhibiting certain products in those areas.

Product kit

A group of products sold as a single unit for a single price.

Product receipts

Receipts record products received in inventory.

Product transfers

Transfers allow you to transfer a product's inventory from warehouse to warehouse.

Products

A defined commerce item.

Program

A program is the set of requirements a student must complete to achieve certification. A program also may have multiple parts, such as a set of initial requirements to obtain certification and another set of requirements to maintain the certification. You also can specify a specific date by which a program must be completed.

Program groups

An association of multiple certification or experience programs together, requiring one program to be a prerequisite for another program.

Prorating

Allocating or assigning an amount to an activity or product that is proportional to some base (determined by a formula or procedure).

Provider

A provider is the individual or company who sponsors a component instance, such as a class or course.

Proximity

You can identify and define proximity areas as a strategy for managing company and product conflicts. Proximity is defined by location relative to certain areas of the floor, such as the Food Court, or relative to location, such as the Southeast Quadrant. You also can use proximity to group similar vendors together on the floor, such as in the Technology Center or the Education area.

Proxy

See On behalf of (proxy).

Pseudo

These are iMIS-generated GL accounts. The pseudo accounts are duplicates of actual GL accounts. The pseudo accounts contain the Org Code - Module-, Product Code, AR, or Pay.

Publishing server

A local service running on a web server that generates physical files representing the content defined by a content page and adds related search metadata to the search index on the local web server.

Quantity on hand

Specifies how many products are currently in stock. These are products that have been received but not shipped.

Query

User-defined criteria used to retrieve a subset of data.

Quick start sites

Out-of-the-box iMIS websites that are easily copied in order to create customized sites for an organization. Sites include Member, Member Mobile, Donor, Annual Conference, and Annual Conference Mobile. These ready-to-go sites and site templates get you up and running in hours, instead of weeks or months. Formerly known as Sample Sites.

Rapid gift entry

Gives the ability to enter Date Received, Gift Type, Gift Amount, Distribution, Appeal, Campaign, and Fund from the Enter and edit gifts window.

Record

A record is an individual unit within a table that consists of a collection of fields, which are consistent in number and type from one record to the next. For example, there is a separate record for each individual or company whose information is contained in iMIS. Records are sometimes referred to as table rows.

Registrant

An individual that has formally registered to attend a particular event, typically by submitting a registration form along with payment of any registration fees. An individual registrant might not necessarily be a customer of the association holding the event or have a record in the customer database.

Registrant class

A broad group of registrants that enables you to process and handle registrants according to category. Class categories let you assign different fees for members and non-members, print badges separately (such as for color coding), and subdivide summary reports into meaningful registrant classes.

Registrant information

Personal information including, but not limited to, registrant name, address, title and association affiliation. This information is used for reporting, and can also be used for event badges.

Registration

The recording of those signed up for an event or function, as opposed to those who actually attended (see Attendance). Because of no-shows, registration figures will usually be higher than attendance figures.

Registration option

The classes of registration set up for an event. These can be arranged by membership type, payment status, or time of registration.

Registration status

The current state of relationship between a person and an event or function.

Registration type

Designation of an event's requirement for registration or fee.

Relation (IQA)

The part of a query definition that specifies a relationship between two or more sources, which effectively creates a new temporary table against which the query is run.

Relationship

A method for establishing a logical connection between two customers in the database.

Relationship (Join) operator (IQA)

The specific type of relationship between two sources.

Renewal invoice

An invoice generated by the selling organization to request that the customer repurchase or renew a subscription or membership service. The renewal invoice data is generated directly and is not connected to the fulfillment of an order.

Renewal notice

- Accounting – Document that is frequently sent to a customer, rather than a renewal invoice. The renewal notice is typically used in cash basis accounting systems to

document the renewal or continuation of a subscription or membership.

- Membership – Refers to the request for renewal or continuation of a membership or subscription beyond the current expiration (Paid Thru) date.

  Renewed thru

  Refers to the projected Paid Thru date for an overall membership. It is the term-ending date through which the customer has been billed, whether or not payment has been received.

  Reporting

  A set of tools in iMIS that can be used for a wide range of tasks. Reports span a broad range of outputs for all of the iMIS modules, including rosters, status summaries, letters, badges, and statistical reports.

  Request

  A record of a specific request for a donation. A request is recorded at the time the request occurs, such as when you mail a letter or make a telephone call asking for a donation. Entering a request activity can speed the entry of a resulting donation.

  Reservations

  Companies can reserve exposition products without making a payment or placing an order. Exposition products are reserved in the Reservation window where you can assign booth numbers and proximity area. Not all organizations allow companies to reserve exposition products.

  Reserved

  Indicates how many products are in open order status. Reserved orders include both shippable and backordered items.

  Resource

- A type of equipment, an individual, or some other asset needed to perform a task or service at an event function. Within iMIS Events, resources refer to both specific and

categorical groupings used to describe room setup and planning needs.

- An application object that exposes properties and methods to allow users to interact. In claims-based security, such resources are assumed to be secured.

Resource group

A logical group of related resources that share a common set of claims. Such groupings simplify the need for assigning and checking for required claim sets.

Restocking fee

A fee charged to restock returned products.

RFM

A measure of the participation of contacts and prospects in the following:

- Recency – Period of time in days or months that has elapsed since the last transaction between a contact and an organization.
- Frequency – Number of times a contact has transacted with an organization.
- Monetary – Value of a contact's transactions with an organization.

RFM report

Ranks and organizes contacts and prospects into specific groups according to the relative recency, frequency, and monetary value (RFM) scores of their transactions.

RiSE

The Web Engagement Platform in which iMIS is built, and with which you can build and extend your own sites.

Roster

A report listing registrants for events and/or individual functions within an event. This is different from the Company Roster which is shown in the Customer Portfolio.

Rotating requirements

Rotating requirements are requirements that must be completed repeatedly for the student to maintain certification.

S-Z

Sales journal

Journal for first entry of sales invoices issued to customers for goods supplied or services rendered. Entries from this journal are posted to individual customer accounts. The totals are posted to the general ledger as a debit to accounts receivable and a credit to income.

Schema

The structure of a database.

Search index

A database, used by an index server running on a web server, that is updated by the publishing process and is used for quickly retrieving weighted results for website searches and in the compilation of output for tagged list content.

Security administration

Provides options for administering user records and the roles you can associate with user records.

Security groups

Control which iMIS features group members can see, and which capabilities within each feature group members can use. Security groups are defined in the user record.

Security roles

Grant specific administrative privileges to user records. For example, one security role might let you use and edit an iMIS definition object in the Document System, while another security role might let you use that object but not edit, or even see, its properties.

Segmentation

Groups contacts and prospects into targeted audiences to show demographics and behavioral patterns

SEO – Search Engine Optimization

The process of affecting the visibility of a website or a web page in a search engine's natural search results. iMIS users can customize their websites using tags, article titles, quality content, and intuitive links to maximize their SEO.

Shopping cart

A tentative commerce transaction data set that exists for any new commerce transaction until checkout and order submission. The cart might contain products added to the cart, adjustments processed, and the list of open invoices selected for payment. Items can be added, edited, or removed from the cart at any stage before submission.

Shortcut URL

iMIS-supported ability to define a friendly, easy to remember URL (e.g., www.MyOrg.org/AnnualConference, www.MyOrg.org/Events, www.MyOrg.org/Join) that redirects to a specific page. These can be created for any website, and can link to a URL or content record.

Shortcuts frequently access system pages such as SignIn, EventDisplay, ItemDisplay, AccountPage. They are provided out-of-the-box, and can be edited, but not deleted

Simple event

An event with no functions. A simple event can be for information only (no registration required) or can require registration.

Simple group

A group with no assigned roles or date limits.

Simple item

A commerce item that has a single price.

Site Builder

A website and navigation management RiSE tool that allows organizations to establish one or more websites, create navigation menus and connect navigation to content; The tool used for building and managing websites.

Sitemap

- A zero-based hierarchy of navigation within and between websites. There is one sitemap per website. This feature enables:
- Different navigation for different user groups – within the same website (e.g., Staff/Authenticated/Unauthenticated)
- Map navigation to different content for different user groups
- Override behavior of shared content (content items) when accessed via specific navigation
- Override ContentArea source folder (look & feel elements)

Soft credit

A term used to describe a behind-the-scenes individual who helped obtain the gift or pledge, but who is not listed as the donor. Contrast soft credit with the contributor or hard credit (the individual who receives the actual credit for the gift or pledge).

Solicitor

An individual other than the donor responsible for obtaining a specific pledge or gift.

Sort

Dictates the order in which the details are to be displayed or printed in a list or on a report.

Source (IQA)

Object that is available for building query definitions. Sources include both business objects and query objects. Query definitions can be created based on one or more sources.

Source query

The original query or business object from which a new query is run.

Split gift

A gift or pledge that is distributed among more than one fund or that is split within a fund.

Staff site

Offers an easy, cloud-based, convenient way for staff to manage association business from the web. Staff can complete transactions and updates for contacts, assist in renewal, registration, and purchasing. The site also allows staff users to run reports, create and manage events, and utilize the robust RiSE tools, all on the way to moving to a fully web-based system.

Standard invoice

Document issued by a seller to a buyer detailing goods and services sold. Also called a bill of sale or contract of sale, it identifies the trading parties, the assigned invoice number, and the invoice date. It also lists, describes, and quantifies the items sold, shows the date of shipment and mode of transport, lists prices and discounts (if any), and shows delivery and payment terms.

Standard program

A standard program has no maintenance or rotating period. The student is required to complete only one initial set of requirements to achieve certification.

Standard report

Pre-set iMIS report formats including rosters, labels, and statistical reports. Most standard reports allow you to select which records you want, and most let you override the sort order. However, you may be limited to the amount of control you have over the format or layout of the report.

Stock item

A product marked as a stock item allows tracking inventory and recording cost of goods sold, inventory, and accounting entries.

Subscriber

Individual, either customer or non-customer, who has purchased a product of a cyclical nature having a fixed term which can be renewed or repurchased upon term expiration.

Subsidiary ledger

A ledger that contains a group of related detail accounts whose total is shown in a controlling account in the GL

System administrator

A user with complete access and privileges.

System role

Used in claims-based security. System roles include:

- Non-authenticated user – A user who has not logged in.
- Authenticated user – A user who has logged in.
- System administrator – A user with complete access and privileges.

Tag

Keyword or category name used to classify website information.

Tagged list

- Listing of content tagged with a specific keyword and, optionally, related tags.
- A content item which aggregates content pages that contain specified tags and satisfy other defined criteria into a display list. The tagged list definition includes an association with a tagged list format that defines how the aggregated content will be displayed.

Tagged list format

An iMIS definition object that contains information for how a tagged list content item should display details for each content page that is displayed by the tagged list.

Tagging

When a content author tags a content page, the tag is added to the metadata for the content page and to the website's search index. This facilitates the inclusion of the content page in website searches and tagged lists displayed on other content pages.

Tagging hierarchy

Visual means of displaying relationships between content tags.

Target contact

The person on whose behalf you are performing an action.

Tax authority

A jurisdiction or geographical area to which a set of specific taxing rules apply.

Tax category

General collection of items that have common taxation rules.

Tax schedule

All tax authorities that apply to a particular situation, such as:

- the purchaser
- the location
- the item class
- the individual item

Also, the order in which taxes are calculated when more than one tax applies.

Ticket

Preprinted slips of paper that a registrant receives in advance for each function he or she is registered to attend. You can use tickets to control and track function attendance by restricting admission to ticketed registrants and by using collected tickets to verify attendance.

Tickler

A way to notify a customer that they need to take action on a given activity, such as a call. When a member logs on to iMIS, a message displays notifying them of the action needing to be taken.

Traditional payment

A category of payment instructions that, when processed, creates a new payment when the order is fulfilled. Traditional payments include Cash, Check and Credit Card.

Transaction

An event or condition that is recorded in asset, liability, expense, revenue, and/or equity accounts.

Transaction record

A record containing information entered by the user to cause a change to a file. This change is any kind of transfer between the accounting entity and an outside party.

Tribute

A gift or pledge made to recognize an individual's service to an organization, cause, or some other entity.

Unearned income

A liability that is recorded when assets are received before the order is fulfilled. Unearned income can be due to:

- a payment in advance of products or services being supplied
- an unidentified payment
- an overpayment
- a duplicate payment
- a return or cancellation of products or services involved in an early pre-paid sale

Unit of measure

The measurement amount for a product, such as:

- case
- each
- meter
- sheet
- pack
- box

Units

Units are the number value assigned to a component or category in order to measure when the student completes the component or category.

Unposted transaction

Any order, invoice, or payment that has been recorded but remains in a tentative state. While in the unposted state, the transaction can be easily changed or deleted without generating an audit trail of the change.

Upsell

Associates a product with another product as an upsell potential. For example, an exposition might offer other products, such as show directory ads, market research rooms, and sponsorship opportunities. Salespeople can view the upsell options available when marketing a specific product.

User-defined field

A method to add metadata to content and to filter search results.

Valuation method

The method used for valuing product inventory. In iMIS, either the average or the standard cost valuation methods can be used. The average valuation method calculates the total cost of goods sold, divided by the total inventory on hand as averaged over time.

The standard cost valuation method determines the cost of goods sold based on a fixed amount.

Wait list

A list of registrants who are queued in hope of attending a function that has already reached its attendance limit. Wait-list members might be allowed to attend the function if the attendance limit is changed, if additional sessions are added, or if other registrants cancel their registrations for the function.

Wait listing

A strategy that allows an exhibitor to be placed on a waiting list to purchase an unavailable booth or other exposition product. Exhibitors placed on a wait list have the opportunity to buy the exposition product when it does become available due to an order cancellation or expansion of the floor plan.

Web components

A RiSE tool that is customizable and configurable for associations. Components include website defaults, customized error messages, and organization information.

Website

A public-facing, easy-to-create site that fully utilizes content items and SOA.

- Defines a front-end URL for targeted users
- Provides a unique look & feel (branding)
- Restricts access to specific users/groups
- Provides a unique navigation structure

Workflow

Automatic processes that are executed without human intervention. Each has an ownership structure, are related to a specific parent object, like an order, complaint, and so on, have a set of tasks that must be executed according to business rules.

Write-off

Removal of the outstanding value of an invoice that is deemed uncollectible or that carries a trivial positive or negative balance. The result of the write-off transaction is to bring the invoice balance to zero. In the case of an accrual invoice, the amount written off is charged against the net income by recording either a bad debt expense or an adjustment to income.

Accessing the iMIS Advanced Accounting Console from a Web Browser

Using simple IIS web server capability, Microsoft's Remote Desktop ActiveX control, and Internet Explorer, it is possible to access iMIS Advanced Accounting Console functionality from a web browser alone. With the addition of the IE Tab extension from ietab.net, the iMIS Advanced Accounting Console can also be rendered and viewed within Firefox and Google Chrome.

> **Note:** Note: Users can access either the Advanced Accounting Console or the Desktop from a web browser. For more information about switching from the Advanced Accounting Console to Desktop, see iMIS Desktop.

> **Note:** Note: If two or more users attempt to run the Advanced Accounting Console or the Desktop from a web browser at the same time, you must have multiple navigation items created, one for each user.

Setting up the Advanced Accounting Console content item

The Advanced Accounting Console is a streamlined, easy-to-use interface alternative for customer service and other staff functions. The Advanced Accounting Console allows an administrator to define and set up iMIS. Users can now access the Advanced Accounting Console directly though the iMIS Staff site, from a web browser.

The Advanced Accounting Console can be accessed through a navigation link that is included in the iMIS Staff site.

Go to Commerce > Advanced Accounting Console:

When you go to this link, you might see the following message:

Unable to connect to the iMIS Advanced Accounting Console.

If you see this message, your Advanced Accounting Console content item is not configured. You can use a SQL script (UpdateAdminConsoleBlobParameters.sql) to configure the Advanced Accounting Console content item. Go to the default install location to access the SQL script (C:\Program Files (x86)\ASI\iMIS\cleandb\SampleScripts).

This script will configure the following information in the Advanced Accounting Console content item:

- Server address – The address of the server where the Advanced Accounting Console is hosted.
- Windows domain – The domain in which the local user was created.
- Windows username – The local user.
- Windows password – The password for the local user.
- Width – The width of the displayed Advanced Accounting Console in the browser.
- Height – The height of the displayed Advanced Accounting Console in the browser.
- Command line – The standard location where iMIS Desktop is installed, by default. This location can be changed.
- Working directory

> **Note:** Note: You must configure your server and your client before you can access the Advanced Accounting Console from the Staff site. See Configuring the Server and Configuring the Client.

Configuring the Server

Do the following to configure the server:

1. Verify Microsoft OS, IIS, and Remote Desktop Services are installed, active, and updated to the latest Critical, Important, and Recommended updates or hotfixes.
2. Ensure that Internet Explorer Enhanced Security Configuration is disabled for both Administrators and Users:

Go to Start > Administrative Tools > Server Manager:

1. Select Server Manager.
2. In the Security Information area, click Configure IE ESC.
3. Verify that the Off checkboxes for both Administrators and Users are enabled.
3. Ensure that sufficient Remote Desktop Services connection CALs have been applied to the server to accommodate the total number of staff users expected to connect at any given time.
4. Install only the iMIS 20 Desktop client. The default file location is C:\Program Files (x86)\ASI\iMIS\.

   Note: Install or upgrade to the iMIS 20 Application Server web components on a separate web server.
5. Add a local user to the server:

1. Provide a password for the local user.
2. Add the local user to the Users, TS Web Access Computers, and Remote Desktop Users groups.
3. Go to the directory where iMIS is installed, for example, C:\Program Files (x86)\ASI\iMIS\, and give the local user Modify and Write access to all files in that directory. This will be the single Windows credentials account will be used to provide access to the Advanced Accounting Console from a browser.
4. Grant Modify and Write privileges to all files and directories for the instance of the iMIS Desktop client that is specific to each unique local user.
6. Log in to the account to verify the credentials and perform the initial Windows desktop setup.
7. Launch the IE browser and let the browser perform the initial browser setup. This enables JavaScript processing which iMIS requires in the Advanced Accounting Console.

Note: In a multi-instance deployment of the iMIS Desktop client where multiple customers each have their own instance of the Desktop client on the same server, you must create a unique local user for each customer, for example, ClientA for CustomerA, ClientB for CustomerB, ClientC for CustomerC, and so forth.

As an administrator, go to Start > Administrative Tools > Remote Desktop Services > Remote Desktop Session Host Configuration:

8. Ensure that the following General settings are set:

- Delete temporary files on exit – Yes
- Use temporary folders per session – Yes
- Restrict each user to a single session – No
- User logon mode – Allow all connections

1. Right-click the name of the connection (RDP-Tcp), and then click Properties under Connections.
2. (Sessions tab) Select the Override user settings checkbox, and then set the following timeout settings:

- End a disconnected session – 1 minute
- Active session limit – Never
- Idle session limit – 1 hour

3. Select the second Override user settings checkbox.
4. Select the reconnection setting End session.
5. Click OK. Changes to timeout and reconnection settings are not applied to sessions that are connected when the change is made. The changes will take effect the next time the user establishes a new connection to the RD Session Host server.

   Go to Start > Administrative Tools > Remote Desktop Services:

1. Click RemoteApp Manager.
2. (Overview area) Click Change next to RD Session Host Server Settings.
3. (RD Session Host Server tab) Select the Do not allow users to start unlisted programs on initial connection radio button.
4. (RD Gateway tab) Select the Do not use an RD Gateway server radio button.
5. (Common RD Settings tab) Select the Printers and Disk drives checkboxes in the Devices and resources section.
6. (Common RD Settings tab) Select the Allow font smoothing checkbox, and in the User experience section select Highest Quality (32 bit) in the Colors dropdown.
7. Click OK and exit the dialog.
8. In the Actions area, click Add RemoteApp Programs to start the RemoteApp Wizard:

1. Click Next.
2. In the list of available programs, select the iMIS Desktop checkbox.
3. Click Next.
4. Click Finish. iMIS Desktop is displayed in the list of RemoteApp Programs.
5. In the list of RemoteApp Programs, right-click on iMIS Desktop, and select Properties.
6. Select the Allow Any Command-Line Arguments option.
7. Click OK.
8. Click Yes at the RemoteApp Wizard security warning.

Configuring the Client

For all three browser variants, verify they are installed, active, and updated to their latest updates or hotfixes.

Adding the Server Domain as a Trusted Site

Your server domain must be added as a Trusted Site in Internet Explorer, regardless of which supported browser you use to display the Advanced Accounting Console:

Go to Tools > Internet options:

1. (Security tab) Select Trusted sites.
2. Click Sites.
3. Make sure the Require server verification (https:) for all sites in this zone checkbox is not selected.
4. Enter http://<www.yourdomain.com>, where <www.yourdomain.com> is the fully qualified domain name or IP address of the server.
5. Click Add.
6. Click Close.
7. Click OK.
8. Close out of Internet Explorer completely and restart the Internet Explorer browser to make the changes take effect.

Configuring Internet Explorer

Do the following to enable or load the RDP ActiveX control:

1. In Internet Explorer, click Tools.
2. Select Manage add-ons.
3. In the displayed window under the Show: dropdown, select All add-ons.
4. Find the Microsoft RDP Client Control.
5. Click Microsoft RDP Client Control to enable it.

Configuring Firefox

To view the Advanced Accounting Console from a browser, an ActiveX control is required. For Firefox, this requires the installation of an IE Tab add-on.

Do the following to configure the Firefox browser:

1. Click the Firefox tab on the upper-left corner.
2. Click Add-ons.
3. In the search field, enter IE Tab 2.
4. Find IE Tab 2 (FF 3.6+) 4.12.22.2 in the search results.
5. Install the add-on and enable it.
6. In the General Settings tab in the IE Tab Options, ensure the Focus on the new tab when switching engines checkbox is checked.
7. (Sites Filter tab) Ensure the Enable Sites Filter checkbox is checked and enter the following URL in the Add field:

   /https?://<www.yourdomain.com>.*/iParts/Common/AdminConsole/AdminConsoleHost.aspx.*/

   where <www.yourdomain.com> is the fully qualified domain name or IP address of the server.
8. Click Add.
9. Close Firefox.
10. Restart Firefox to make the changes take effect.

Configuring Chrome

To view the Advanced Accounting Console from a browser, an ActiveX control is required. For Chrome, this requires the installation of an IE Tab add-on.

Do the following to configure the Chrome browser:

Go to Tools > Extensions:

1. Click Get more extensions.
2. In the search field, enter IE Tab.
3. Find IE Tab in the search results.
4. Install the add-on and enable it.
5. In the General Options tab in the IE Tab Options, Ensure the Enable Auto URLs and Open pop-up windows with Chrome checkboxes are checked.
6. Under Auto URLs, enter the following URL in the Add field:

   r/https?://<www.yourdomain.com>.*/iParts/Com-mon/AdminConsole/AdminConsoleHost.aspx.*

   where <www.yourdomain.com> is the fully qualified domain name or IP address of the server.
7. Click Add.
8. Close Chrome.
9. Restart Chrome to make the changes take effect.

Address Verification Setup

Accumail and Prosort

The iMIS Postal Modules is the full-featured package that helps you automate your mailing labels so you can receive the maximum allowable discounts from the U.S. Postal Service.

To obtain automation and accuracy in your mailing labels, iMIS has partnered with industry leaders in postal software. This combined technology gives you the ability to add Zip+4, carrier route and delivery point to the addresses in the iMIS database, and to print your labels in the correct order required by the U.S. Post Office complete with delivery point barcodes and DPV (Delivery Point Verification). Refer to the AccuMail documentation for details about label standards and information.

AccuMail

AccuMail™ matches addresses within your iMIS database against the national database of addresses from DataTech. If matched, the iMIS AccuMail module updates your iMIS member records with Zip+4, carrier route, delivery point, and optionally county name and US Congressional district. You can either verify all addresses within the database or verify while the data is entered. Additionally, you can browse the national database in order to correct addresses. The national database typically comes in the form of a DVD but may be stored on a server. Based on your subscription, you receive updated information at regular intervals.

ProSort

ProSort™ uses the names and addresses that have been verified through AccuMail and prepares mailing labels. ProSort sorts the labels and prints delivery point barcodes in order to maximize postage savings.

Note: Note: In order to integrate these modules within iMIS, you must obtain a new Licensed Products key from your AiSP.

Implementing Postal Modules

Make sure you have the following media available before you begin an installation or update:

- AccuMail DVD or files downloaded
- ProSort media
- Update media if updating

> **Note:** Note: The postal tools AccuMail and ProSort are available only in a Windows environment.

To integrate the software with iMIS, please ensure the following:

- Specify x:\AccuMail as the install directory for both products, where x can either be a shared drive on your individual PC or on the network, realizing that users must have drive mapping and permissions for this shared drive.
- The national database of addresses is maintained on a DVD and each iMIS user must have access to the database. To obtain access for users across a network, use one of the following options when installing the AccuMail software:
- install locally for each iMIS user (not recommended for performance and update efficiency reasons)
- install to a network drive (recommended installation configuration)

Note: Refer to AccuMail documentation for the space requirements. When installed, it may take up more than 2 GB disk space.

> **Note:** Note: Please do not call DataTech for technical support or for new CDs: Support is available through your AiSP or through ASI Technical Support.

Installing AccuMail

> **Note:** Note: This installation is performed during initial implementation and each time a new DVD is received.

1. Insert the AccuMail DVD in the install drive. If you do not have a DVD drive, you must download files to install.
2. Follow the instructions on screen to install the software. One of the options is whether to install to a network location or install locally. If you choose to install locally you must repeat the installation process for each computer.
3. Follow the instructions shown in the next section to install ProSort.

Installing ProSort

AccuMail must be installed prior to the ProSort installation. Refer to the previous section.

1. Insert the ProSort Setup CD into the drive.
2. Follow the instructions on screen to complete the installation.

Upgrading AccuMail

If you update AccuMail from the same workstation as it was installed previously, it prompts you to install new or modify an existing installation.

> **Warning!** Caution! Perform the installation from a workstation computer. Do not install directly from the server computer.

1. Insert the AccuMail DVD in a workstation's DVD drive.
2. Choose the network installation option to install the updates to a network drive for multiple users to access, or choose the local installation option to install the updates to the local computer for that computer.

Using Postal Modules with iMIS

Benefits of using Postal Modules

The U.S. Postal Service provides a discount to mailers who can “automate” the labels for their mailing. To receive Automation rates, the mailer must print a bar code representation of the mailing address on the label. The closer the mailer can come to pinpointing the mailing address, the higher the discount. A higher discount is given to those mailers who can provide the carrier route and the delivery point. These fields identify the actual postal carrier route and the actual place of delivery along that route. The mailer receives discounts for bundling the mail pieces when 10 or more pieces go to a same 3-digit or 5-digit zip code.

The iMIS Postal Modules provide you with the ability to add Zip+4, carrier route, and delivery point to the addresses in your database and to sort and print your addresses so that you may receive the maximum allowable discounts. To accomplish this, iMIS has partnered with the industry leader in postal software, Group 1. Group 1 has developed software called AccuMail to CASS (Coding Accuracy Support System) certify addresses. In order to certify an address, it is compared with AccuMail’s national database of addresses. If the address “matches” an address in the database or can be modified slightly to match an address, the Zip+4, carrier route, and delivery point are added to the address record within your iMIS database. Optionally, the county name and congressional district can be added to your iMIS database. AccuMail prints the U.S. Post Office form 3553, which is required to receive the automation rates.

In addition to the ability to CASS certify your iMIS database, the integration of AccuMail with iMIS gives you two more features. You can verify or match addresses as they are entered into the iMIS database or anytime there is a change of address. You can also view the addresses that don’t match and browse the national database of addresses to correct them.

Group 1’s ProSort will organize and print name and address labels from your iMIS database so that you get the maximum discount possible. ProSort is PAVE (Presort Accuracy Validation and Evaluation) certified software and groups the labels by zip codes and carrier routes and prints the bar codes on the labels. It also prints the U.S. Post Office required forms that are required for claiming the PAVE automation rates. ProSort is capable of calculating your savings on each mailing.

> **Note:** Note: U.S. Post Office rules and regulations are discussed in detail in Publication 28, USPS Addressing Standard Guidelines and Publication 25, Designing Letter Mail. Contact a postal business center for complete services.

The following sections discuss how to use the AccuMail and ProSort features with iMIS. Refer to the AccuMail and ProSort manuals that accompanied your software for complete product information.

Verifying batch addresses

The batch address verification procedure allows you to match or verify a subsection or all of the addresses in your iMIS database.

> **Note:** Note: This procedure updates a large number of the database records; therefore, it must run with only one user logged into the system.

1. Select Membership > Utilities > Other Data Utilities > Verify Addresses from the main menu. A warning displays about the length of the process; click Yes to continue or No to cancel.

   The Verify Addresses window opens.

2. Check the addresses you want to verify.
3. Check the Include ONLY Active Members box if you want to ignore all inactive, suspended, or deleted member records.
4. Enter specific member types, separated by commas, in the Member Types box if you want the program to only verify those types of members.
5. Include a date in the Include addresses verified prior to box if you do not want to verify addresses that have been verified and have not changed since the date entered. With this option, addresses verified prior to this date or any changed address will be verified now.
6. Check the Print CASS Report and Print Error Report boxes if you want to print the U.S. Post Office 3553 CASS report and an error report. The CASS report will print to your default printer, while the error report will print to the destination you have currently

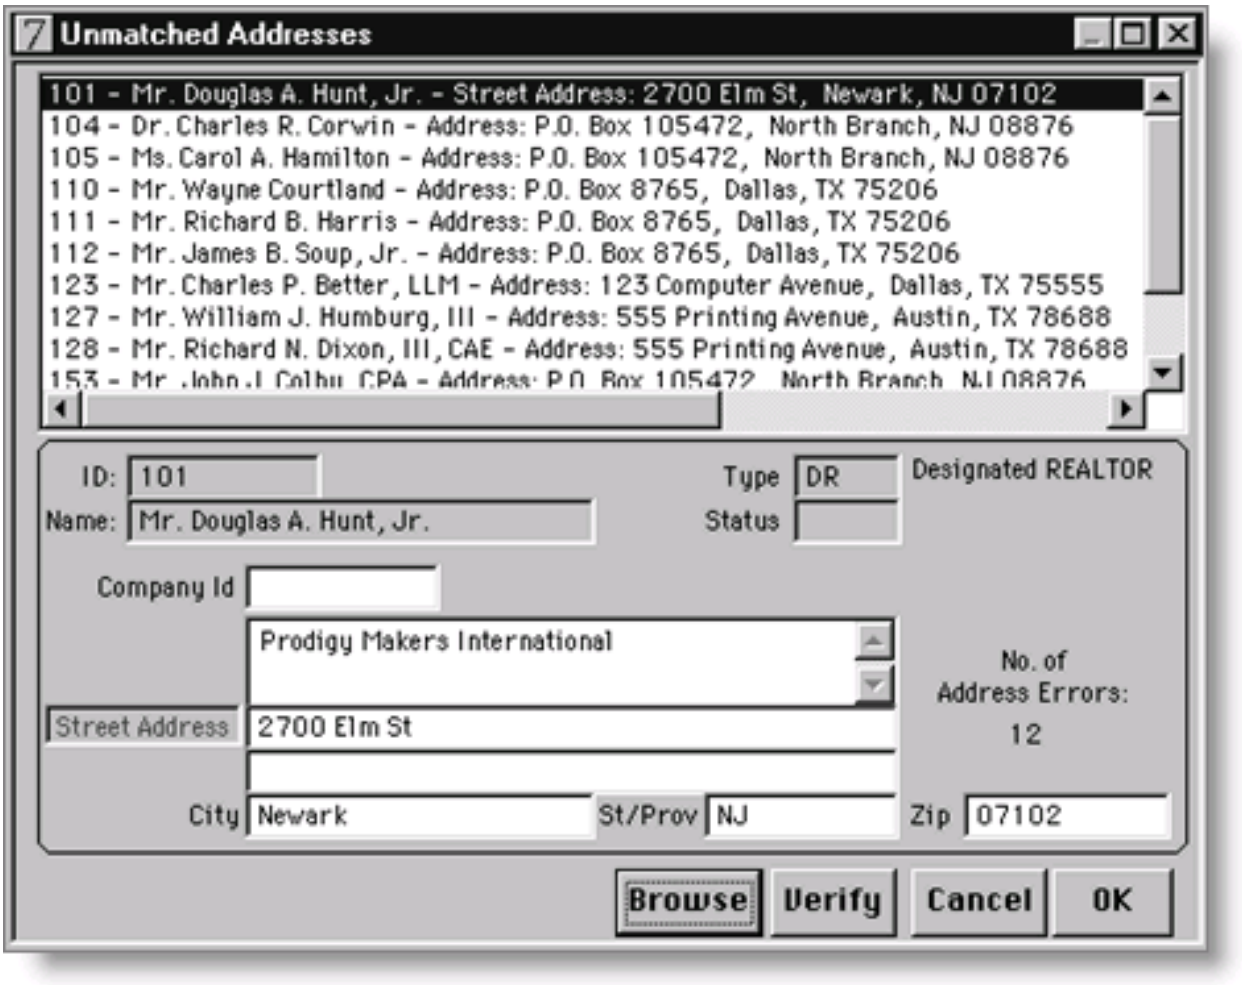
selected for your iMIS session. The CASS report gives you the number of addresses that met the specified criteria and the percentage successfully matched. The error report lists the addresses that did not match and a brief description of the problem.

7. Check the Accept Address Correction box if you want to standardize your addresses to meet the U.S. Post Office preferences. For example, with address correction, “Avenue” will be changed to “Ave” and streets that have alias names will be changed to the Post Office accepted name.
8. Click Run.

> **Note:** You may be required to include the CASS report with your mailings; therefore, make sure to make copies of the report. You can generate a current error report at any time by selecting Membership> Utilities> Other Data Utilities> Print Error Report from the main menu.

Reviewing unmatched addresses

Reviewing unmatched addresses allows you to review all of the addresses that were not matched during the batch verify process.



Select Membership > Utilities > Other Data Utilities > Review Unmatched Addresses

The address records are listed in the top section with the details of the selected record in the bottom section:

- The information displayed in the member ID, Name, Type and Status fields cannot be modified. If the member information is linked to a company record, the company information is displayed in these fields.
- The type of address is listed to the left of the address while the reason the address did not match is displayed below the address. The total number of addresses unmatched within the database displays to the right of the address.
- To print the error report, click the Print button.
- To edit the address or to assign this member to another company, click the Edit button.

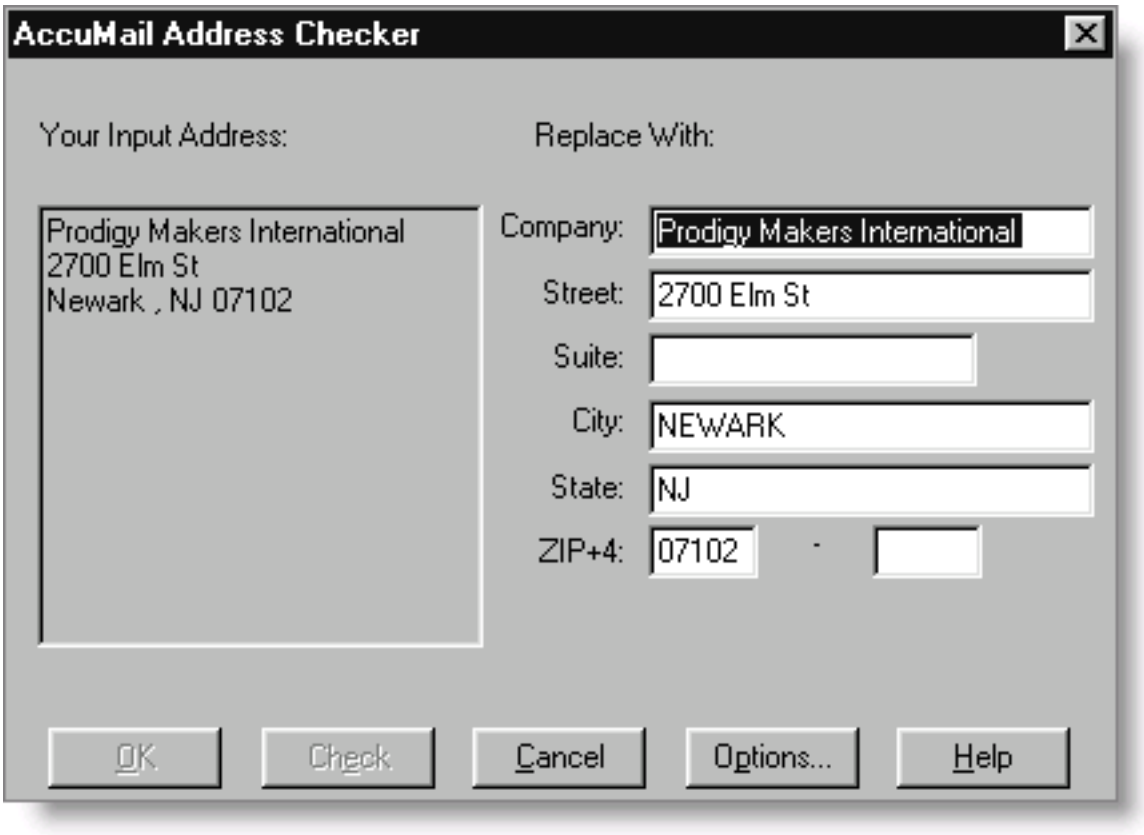
- Enter the correct address information, or to assign this member to another company, press Ctrl+L in the Company Id field to change the company name. Type in the company name or any number of characters in the Begins with field and click OK. A list of companies that match the characters entered is displayed. Select the company and Click OK. You will be prompted to overwrite the old company name address with the selected company information. Click Yes or No.
- When you change the company or address, click the Verify button to attempt to match the new address. If successful, a message displays at the bottom of the screen and the Zip+4, carrier route and delivery point fields are added to the record.
- Once you click the OK button, the record is removed from the screen and the next record becomes selected. If you verify a company record, then all members whose addresses are linked to the company will be updated and removed from the list.

To browse the database

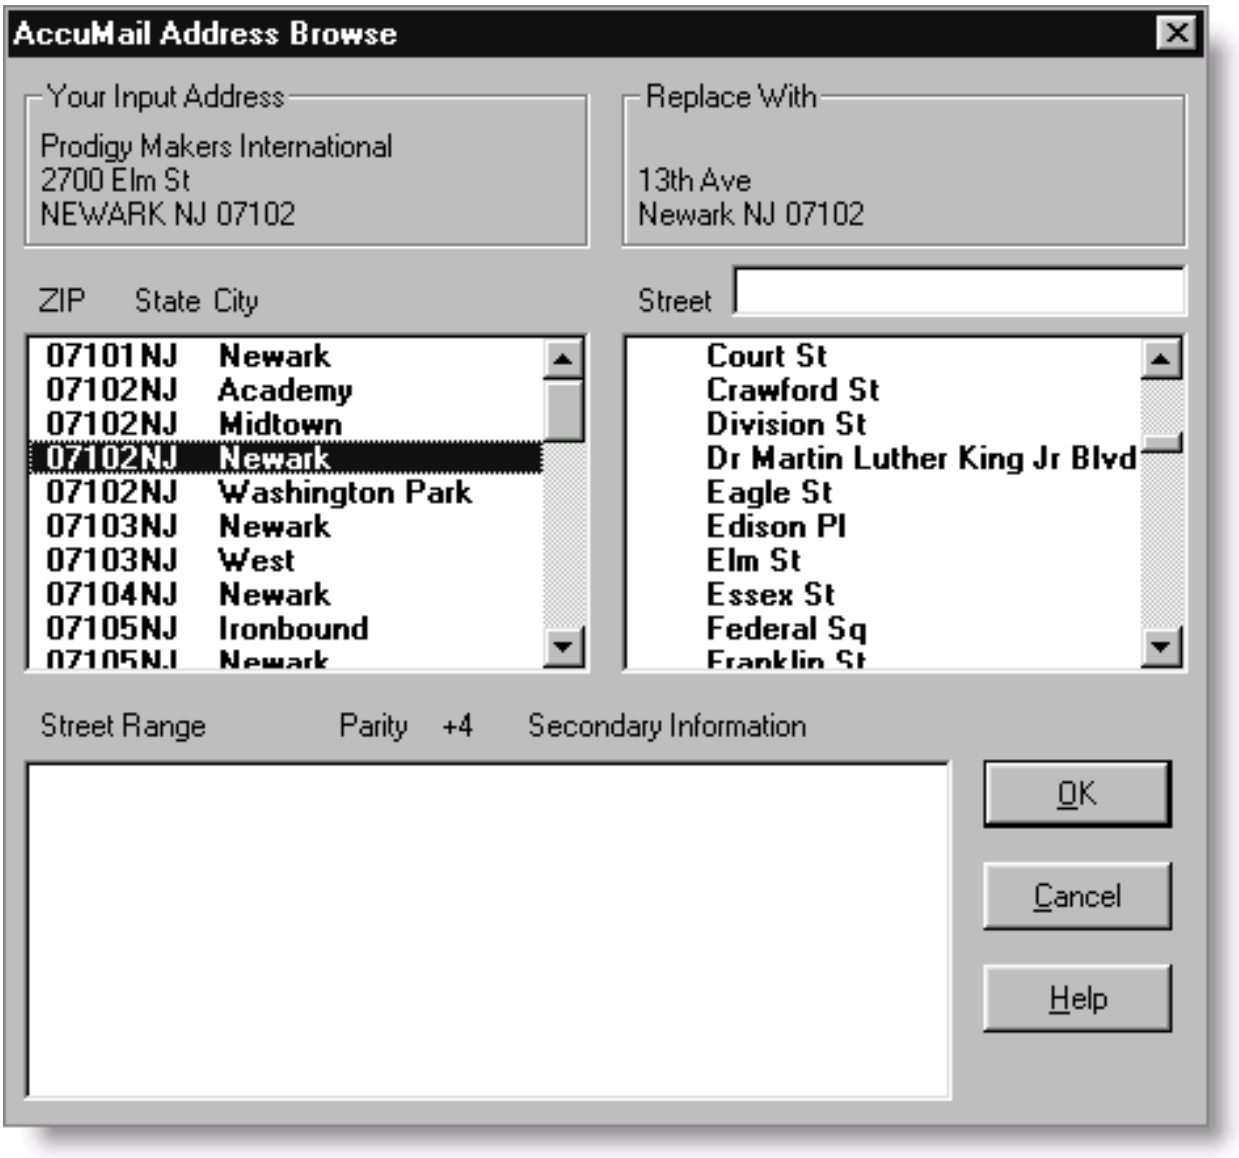
You can browse the database and select address information from a list of possible choices in the database.

1. Click Edit.
2. Click Browse. Two separate error messages describing the reason why a match was not found displays.
3. Click OK after each message to clear the message boxes.

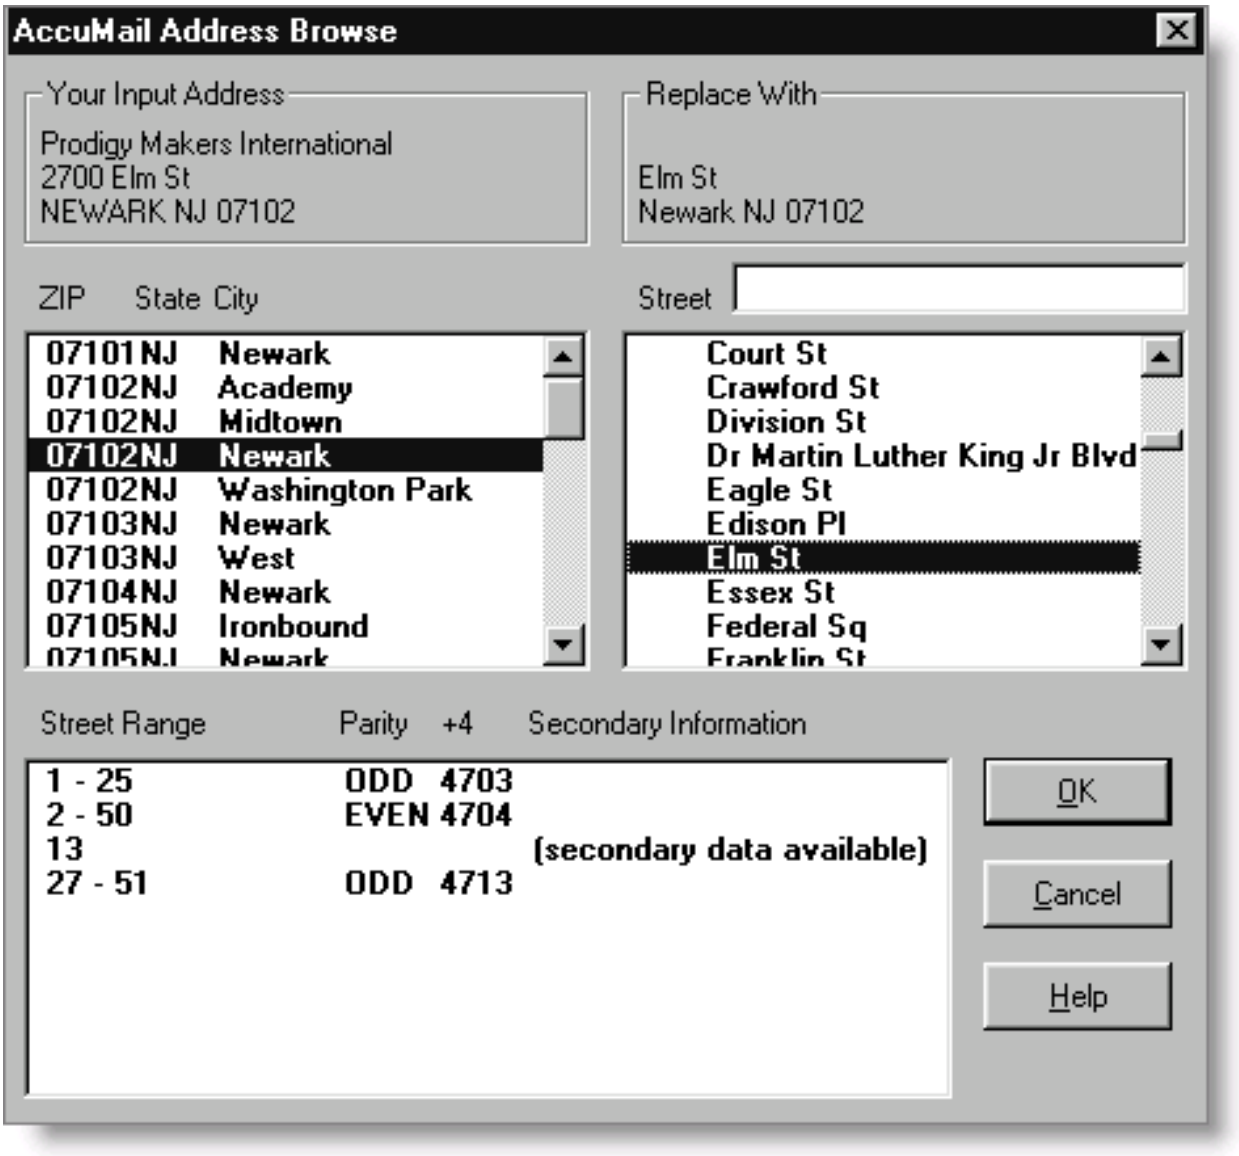
The AccuMail Address Checker window opens.



4. Click Options to open the AccuMail Address Browse window. A list of zip codes that are considered possibilities based on the original address is displayed on the left.
5. Double-click a zip code to see the streets within that zip code listed on the right.

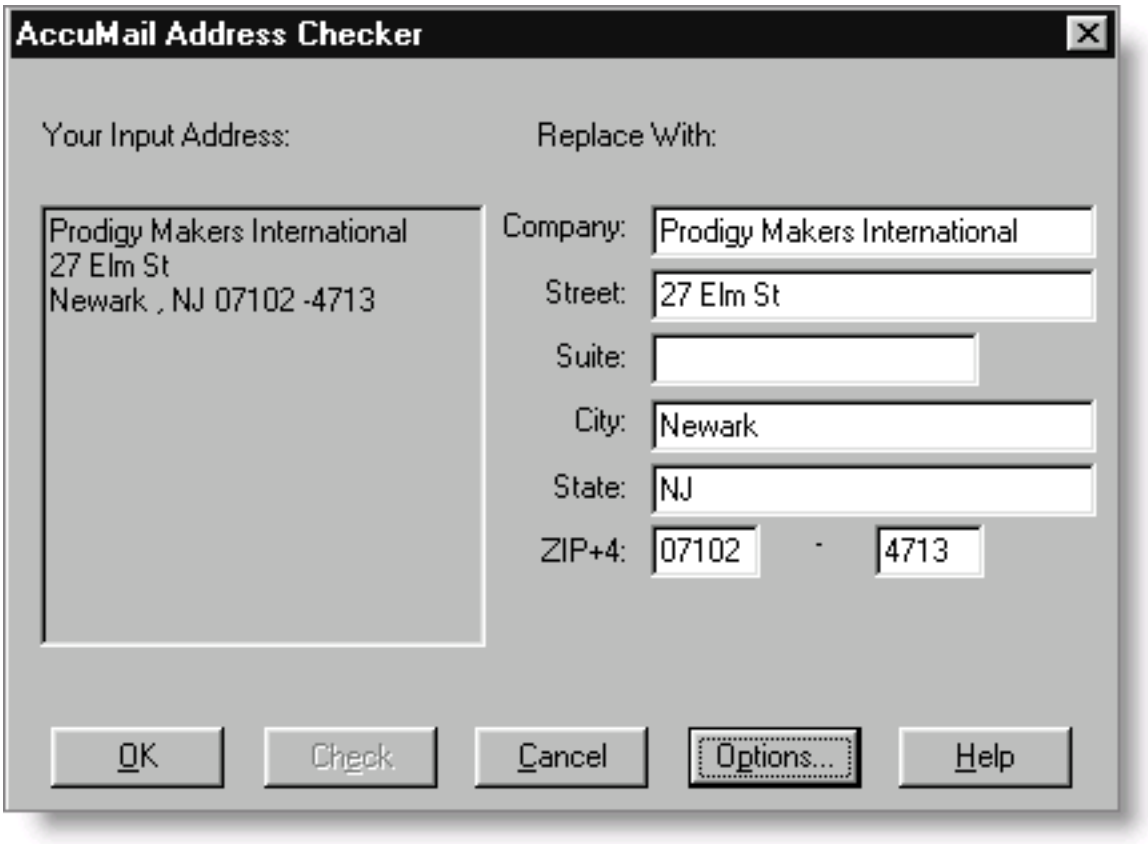


6. Move forward through the list of streets by entering the first few characters of the street address in the Street box. The list will advance to the first street that matches the characters you enter.
7. Double-click a street name to see the address number ranges on that street listed below.

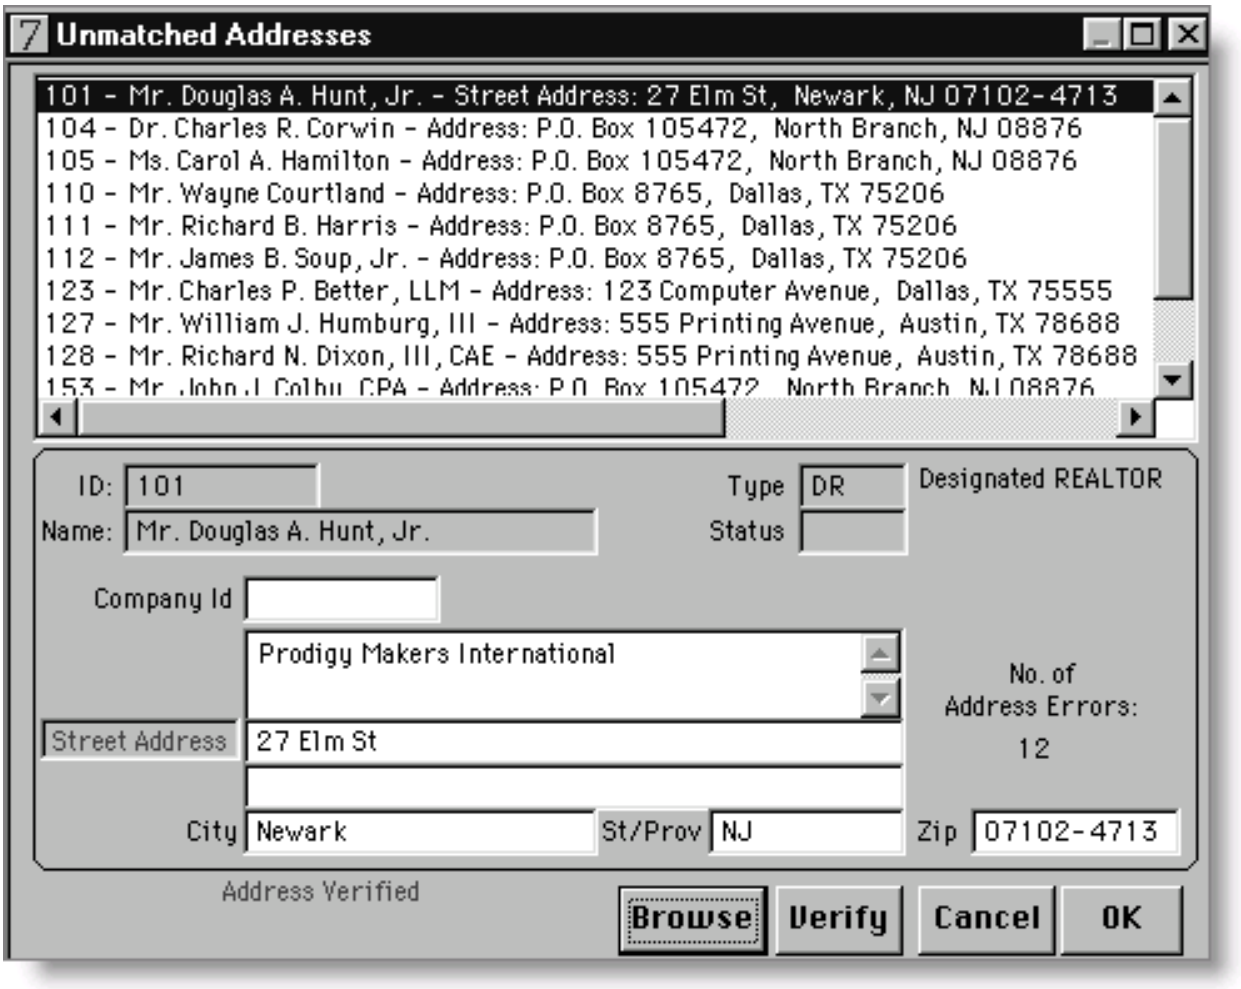


8. Select the appropriate street range in order to match the address and click OK or double-click the street range.

   The AccuMail Address Browse window closes and the selected address is automatically populated in the Replace With field of the AccuMail Address Checker window.



9. If necessary, specify a specific street number and click the Check button in order to get the correct delivery point assigned.
10. Click OK to replace the address in the iMIS database with the address displayed on the right and return to the Unmatched Addresses window.



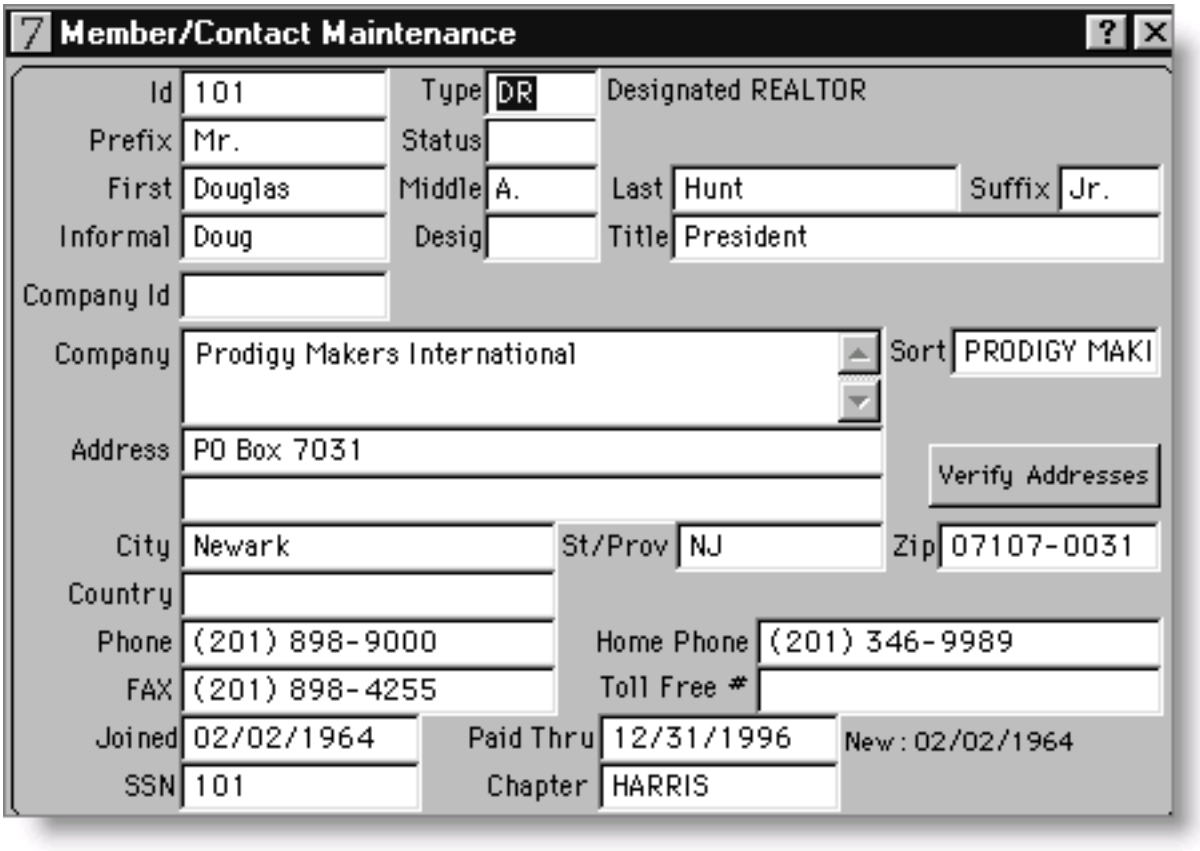
11. Click OK to make the address correction permanent and remove this address from the list. If you verify a company record, then all members whose addresses are linked to the company will be updated and removed from the list.

Verifying addresses online

Online Address Verification is a feature that allows you to verify addresses as you enter or change them. The Verify Addresses button is accessible in the following locations:

- Customers > Manage Customers
- Events > Register a customer > select the Attendees tab
- Orders > Enter and edit orders > in the Bill to ID field, click Add
- Orders > Enter and edit order > select the Ship to Info tab

- Exposition > Process booth orders > click Options and choose Address
- Fundraising > Enter and edit gifts > select the Donor tab
- Fundraising > Enter and edit gifts > select the Soft Credit tab and click Add



Example of the verification of an address

To request address verification

1. Click Edit.

   The Verify Addresses button becomes available. You can click this button at any time during entry or edit.

2. Click Verify Addresses. The system will attempt to verify the member's address(es). If successful, the Zip+4, carrier route, and delivery point fields are added and you receive a message that all addresses were successfully matched. If any of the addresses cannot be matched, the program starts the Browse process.

The system attempts to verify the following:

- All three member addresses in the Member/Contact Maintenance or Address Maintenance window.
- The ship-to address in the Order Entry and Meeting Registration window.

To automatically verify addresses

You can elect to have the system automatically verify the member's addresses every time a member record is saved.

1. Select Membership > Utilities > System Setup from the main menu.
2. Click Address & Notes from the Membership Setup window.
3. Click Edit.
4. Mark the Automatically Verify New/Updated Addresses and Accept Address Correction options.

   Note: Selecting the Accept Address correction option does not override the selection to correct addresses when running the Batch Address Verification process; it only affects online verifications.
5. (optional) Opt to update the county and congressional district fields in the iMIS member database. If you choose this option, you can select which of the three addresses to use in order to determine the appropriate county and congressional district. This option applies to both the batch verify process and the online verification.
6. Click OK.

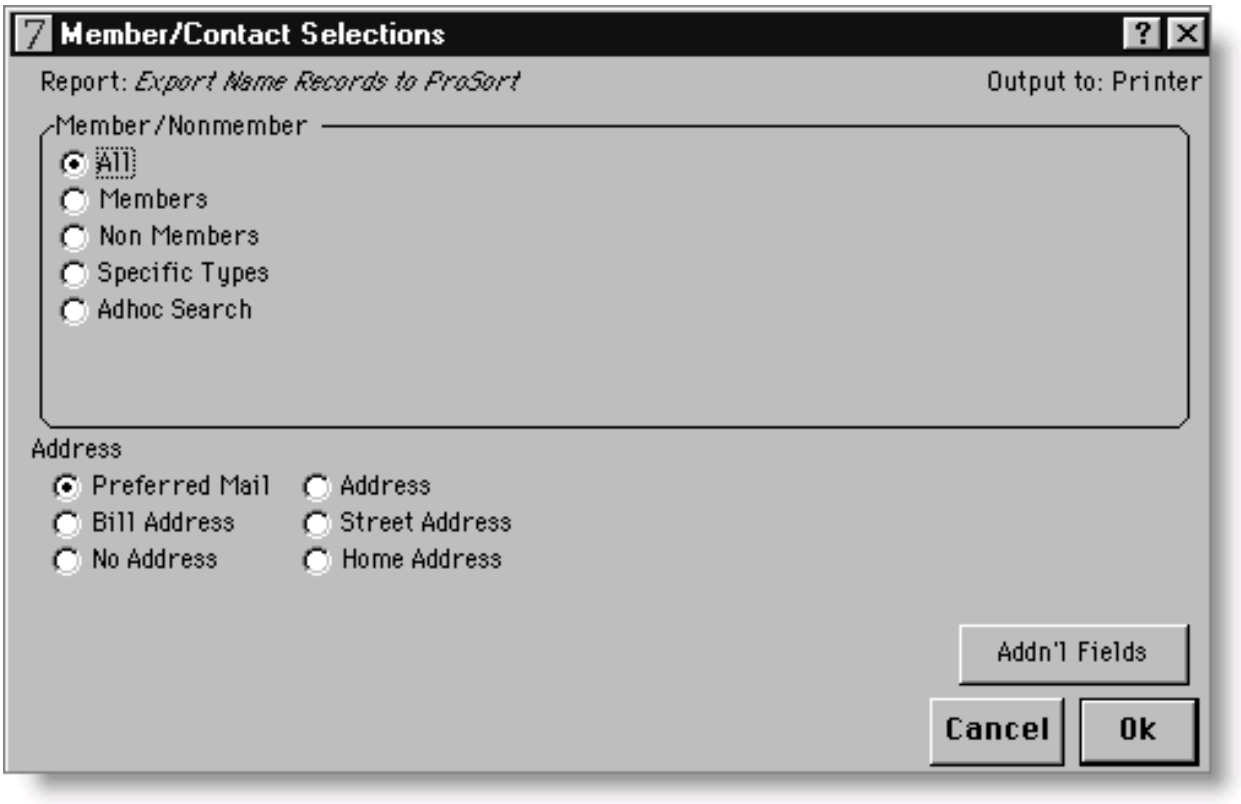
To export records to ProSort

The ProSort feature allows you to print PAVE (Presort Accuracy Validation and Evaluation) certified labels.

1. Select Membership> Utilities> Other Data Utilities> ProSort Export from the main menu.

The ProSort Exports window opens.

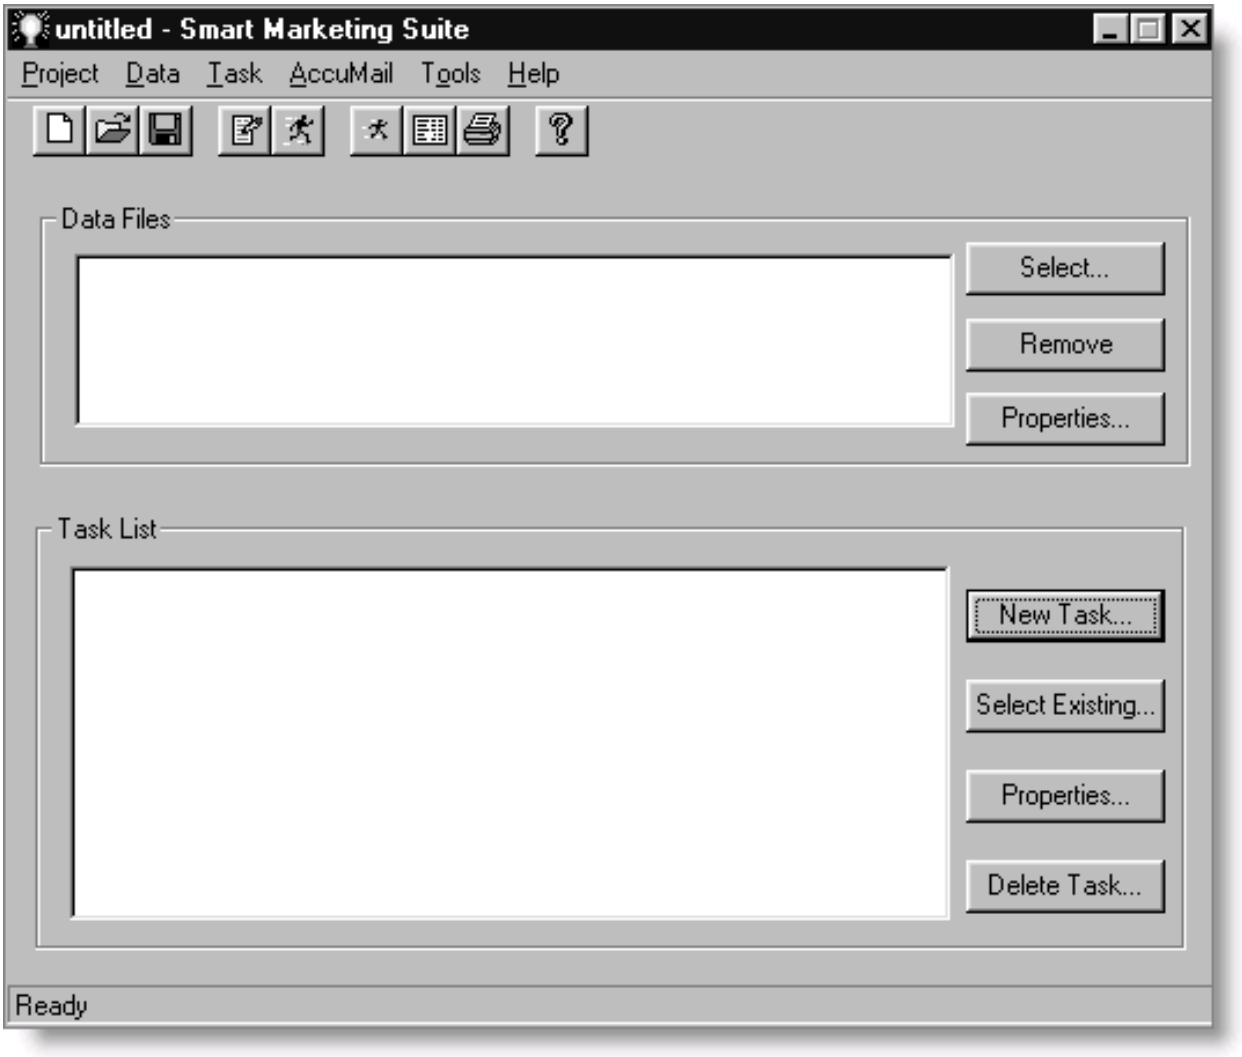
2. Double-click the Export Name Records to ProSort option in the Available Reports area.



The Member/Contact Selections window opens.

3. Use the options on this window to choose the members and their addresses to include in the label run.
4. Click Addn'l Fields to specify a constant to be printed on the labels or you may select field (s) from the iMIS database in addition to the ones listed below. Click OK to accept the additional field.
5. Click OK in the Member/Contact Selections window to accept the information and close the window.
6. Select the location where the export file is to be saved and enter the file name. Click Yes to start the ProSort program.
7. Once the records are selected and exported to the file you selected, the program will attempt to find and start Group 1's Smart Marketing Suite program.

If this is the first time you are using ProSort, the Startup Wizard opens. Click Finish to close the wizard and open the following window.



Group 1's Smart Marketing Suite program

8. When the program starts, select the export file just created and then describe the mailing by creating a ProSort task. To print the labels, run the task. To perform these steps, please refer to the Group 1 ProSort manual.
9. If the installation was successful, the fields in the export file will already be mapped to the appropriate ProSort fields. If the fields are not mapped, use the following information to map the fields correctly:

Field 1:	iMIS control (date, etc.)	Do not map
Field 2:	Member ID	ALT_FIELD1
Field 3:	Full Name	ALT_FIELD2
Field 4:	Company	Company
Field 5:	Address_1	Primary Street
Field 6:	Address_2	Suite/Apt.
Field 7:	City	City
Field 8:	State	State
Field 9:	Zip/Zip+4	Zip/Zip+4
Field 10:	Country Name	Do not map
Field 11:	Country Code	ALT_FIELD3
Field 12:	Delivery Point	Delivery Point
Field 13:	Carrier Route	Carrier Route
Field 14:	Member Code	Subscriber (M if not Comp. Subscription)
Field 15:	Optional Top Line	ALT_FIELD4
Field 16:	First Name	First Name
Field 17:	Last Name	Last Name

Note: Note: Export creates two files: .PRN and .PR^. The .PR^ file contains field mappings. Do not select or delete this file: deleting the file causes the field mappings above to be lost.

Advanced subscriptions

In addition to printing address labels from the iMIS member database as mentioned in the above section, Advanced Subscription customers can print labels and postal reports for publication subscribers and publication back-issue requests. Because Group 1 specializes in monitoring and developing software to meet current postal regulations, the integration of Group 1's software with iMIS will benefit Advanced Subscription clients as

well. The setup and maintenance of publication issues, subscriptions, and back-issue requests remain the same. Instead of iMIS generating the labels, however, the export procedure and interface to ProSort will take place, as described above.

Three report menu items are available:

- Back Issue Labels
- Issue Labels
- Name Labels

QAS Postal Barcoding

The iMIS/QAS Postal Barcoding Module helps organisations ensure accuracy for mailing addresses in Australia, New Zealand, and United Kingdom to obtain the maximum allowable postal discounts.

To achieve this, ASI has partnered with QAS Systems (Pty) Ltd. to integrate QuickAddress Pro v4 and QuickAddress Batch v4 (QAS), which enables international associations to validate addresses against multiple country databases. The combined technology gives the ability to add a postcode, delivery point identifier (DPID) and barcode to accurate addresses in the iMIS database. The addresses can then be printed in the correct format required by Australia Post, complete with barcodes. The user needs to create a Crystal report to include the barcode.

The iMIS/QAS Postal Barcoding Module compares addresses in the iMIS database against the QAS country address databases. If a match is found, the iMIS records will be updated with postcode, delivery point identifier and barcode.

If you are licensed for QuickAddress Pro v4, you can manually verify addresses from within iMIS by clicking Verify Address at various windows that display address information. If you are licensed for QuickAddress Batch v4, you can verify and update addresses in all or part of the iMIS database in a batch mode.

> **Note:** Note: In order to integrate this module with iMIS, you must obtain the appropriate product license keys from your AiSP.

Batch and manual address verification in iMIS

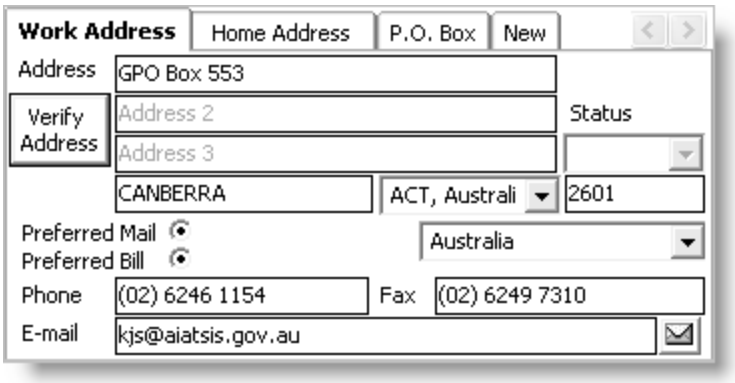
Batch verification

If you are licensed for QAS Batch v4, and have properly implemented the product with iMIS (see "Implementing QAS with iMIS"), a task list item in the Customers module enables you to perform batch verification of iMIS addresses (see "Verifying a batch of addresses with QAS Batch").

Manual verification

If you are licensed for QAS Pro v4, and have properly implemented the product with iMIS (see "Implementing QAS with iMIS"), a Verify Address button is accessible through the following windows:

- Customers > Manage Customers
- Events > Register a customer > select the Attendees tab
- Orders > Enter and edit orders > in the Bill to ID field, click Add
- Orders > Enter and edit order > select the Ship to Info tab
- Exposition > Process booth orders > click Options and choose Address
- Fundraising > Enter and edit gifts > select the Donor tab
- Fundraising > Enter and edit gifts > select the Soft Credit tab and click Add



The Verify Address button

If an address cannot be verified automatically from the address data that has been entered, a new QAS for iMIS window enables you to manually verify an address (see "Manually verifying addresses with QAS").

Manual address verification for QAS requires purchase of a separate license key than that required for QAS batch address verification. There is no dependency between the two licenses. You can have either the batch or on-demand license or both.

Postal Barcoding Terms

The following is a list of terms that are used in this documentation:

4-State Barcode

The barcode format adopted by Australia Post is called the 4-State barcode. The name is derived from the fact that the bars can only be placed in one of four positions: Tracker on its own, Tracker with Ascender, Tracker with Descender, and Tracker with Ascender and Descender.

Address Matching Approval System (AMAS™)

The Address Matching Approval System (AMAS™) has been developed by Australia Post to improve the quality of addressing. AMAS™ is a software approval program that provides a standard by which to test and measure the quality of address matching soft-ware and its ability to append a unique Delivery Point Identifier (DPID) to each address record within a database.

Barcode

A series of bars, which represent letters, numerals, and other human-readable characters which can be deciphered by mail sorting equipment

Barcode Quality Program (BQP)

BQP offers customers the opportunity to check the quality of their barcodes against Post's 4-State barcode acceptance specifications.

Barcode Sorter (BCS)

Mail sorting equipment, which reads a barcode on a piece of mail and sorts the article depending on the information contained within the barcode and a predefined sort plan programmed into the equipment

Country Address Database

QuickAddress Pro v4 and QuickAddress Batch v4 use separate address databases for each supported country. ASI currently supports QAS v4 for use only with v4 country address databases from QAS as they become available for Australia, New Zealand, and United Kingdom.

Delivery Point Identifier (DPID®)

The DPID is an eight-digit number that is appended to all 8.8 million delivery addresses in Australia which uniquely identifies each delivery point to which Australia Post delivers mail.

FuturePOST

FuturePOST is the name of the business unit within Australia Post responsible for implementing the upgrade of the mail-processing network and letter barcoding.

Metering

Metering is one of two lodgment options available to customers. Meters are new generation franking machines.

Manifesting

Manifesting is one of two lodgment options available to customers. A manifest is the supporting documentation that provides dispersions, volumes, and weight per sort plan for PreSort letter lodgments.

Postal Address File (PAF®)

The PAF is a database built and maintained by Australia Post, which contains the 8.8 million deliverable addresses in Australia and their DPIDs. It is privacy-compliant because it does not hold the names of residents but rather, just the delivery address information.

Presorting

The process whereby a customer sorts their mail according to defined sorting breaks prior to lodgment into the Australia Post Network

PreSort Letters Service

A discounted service available to customers who presort their bulk mail lodgements according to Post's PreSort terms and conditions

Benefits of QAS Postal Barcoding Module

Australia Post’s PreSort Letters Service offers reduced prices to businesses that sort their letters into a particular order, place them into appropriately labeled trays, complete documentation and comply with relevant mailing conditions.

A discount applies to all letters that are barcoded and postage-paid by an approved postage meter.

A greater discount is given to those businesses that can print barcodes and sort letters into the Barcode Sort Plan sequence. These fields identify the postal carrier route and the place of delivery along that route. To receive these discounts, 300 or more letters must be mailed at one time.

The iMIS/QAS Postal Barcoding Module will certify addresses and add postcodes, delivery point identifiers and barcodes.

In addition to the ability to AMAS™-certify your iMIS database, the iMIS/QAS Postal Barcoding Module gives you two more features:

- You can verify or match addresses as they are entered into the iMIS database or at any time that there is a change of address.
- You can edit the addresses that do not match, and browse the country address database for the correct address.

The following sections discuss how to install and use the iMIS/QAS Postal Barcoding Module. Refer to QuickAddress Pro v4 and QuickAddress Batch v4 documentation for more information.

> **Note:** Note: Australia Post's rules and regulations are discussed in detail in PreSort Service Guide for Barcoded & Unbarcoded Letters. Contact a postal business centre for complete services.

Implementing QAS with iMIS

It is beyond the scope of iMIS documentation to describe the full installation and configuration process for QAS products. Refer to your QuickAddress Pro v4 and QuickAddress Batch v4 documentation to install, configure, and test the base functionality of these products.

After confirming that QAS is properly functioning in a standalone context, perform the procedures in the following sections to ensure that QAS v4 is properly integrated with iMIS.

Notes

- You must have the correct licence keys to use QAS Pro v4 and QAS Batch v4.
- You must have iMIS version 10.6 or later to use the QAS v4 software.
- ASI supports QAS v4 for use only with v4 country address databases from QAS as they become available for Australia, New Zealand, and United Kingdom.
- iMIS integration with QAS v4 country databases is still limited to the first six main address elements in the database.

Limitations and interaction with AccuMail

iMIS can support only QuickAddress v4 (QAS) or only AccuMail as your address validation system. You cannot use both at the same time, in any combination. If your iMIS licenses contain keys for both QAS and AccuMail components, the QAS keys take precedence and all AccuMail functionality will be suppressed in iMIS.

iMIS 10.6 supports only QuickAddress Pro v4 and QuickAddress Batch v4. If your iMIS system has been integrated with other versions of QAS through a third-party module such as Xtender, these third party modules should continue to function well. The QAS v4 functionality, such as on-demand address verification and the QAS Batch interface, will not be available unless you upgrade to QAS v4.

Installing QAS Pro v4 and QAS Batch v4

It is beyond the scope of iMIS documentation to describe the full installation and configuration process for QuickAddress Pro v4 and QuickAddress Batch v4 products. You should refer to your QuickAddress v4 documentation to install, configure, and test the base functionality of these products.

However, ASI recommends the following general installation order to ensure that both products function correctly with iMIS. See your QuickAddress v4 product documentation for more information.

To install QAS Pro v4 and QAS Batch v4

1. Run the setup.exe program for QAS Pro API.

   Generally, you should accept all default values during setup, except that you must not select the option to install QAS data.

2. Run the setup.exe program for QAS Batch API.

- If you are planning to use QAS Batch to verify US addresses, select the US Component option during setup. If you do not plan to verify US addresses, be sure to clear the US Component option.

- Generally, you should accept all other default values during setup, except that you must not select option to install QAS data.

3. Install QuickAddress Country Data files.

- Run the setup.exe program for each country address database.
- Select Install New Data if this is the first time that you are installing this country's data file. Otherwise, select Update Existing Data if you have previously installed a data file for this country.
- On the Select Programs page, select both QAS Pro & QAS Batch.
- When prompted, enter the appropriate license key(s) provided by QAS.
- Repeat this process for each country database.

Configuring QAS Address and Data Plus formats

The following procedures detail how to configure the Address Format and Data Plus Format in each QAS v4 country address database.

Configuring QAS Pro v4 for Australian addresses

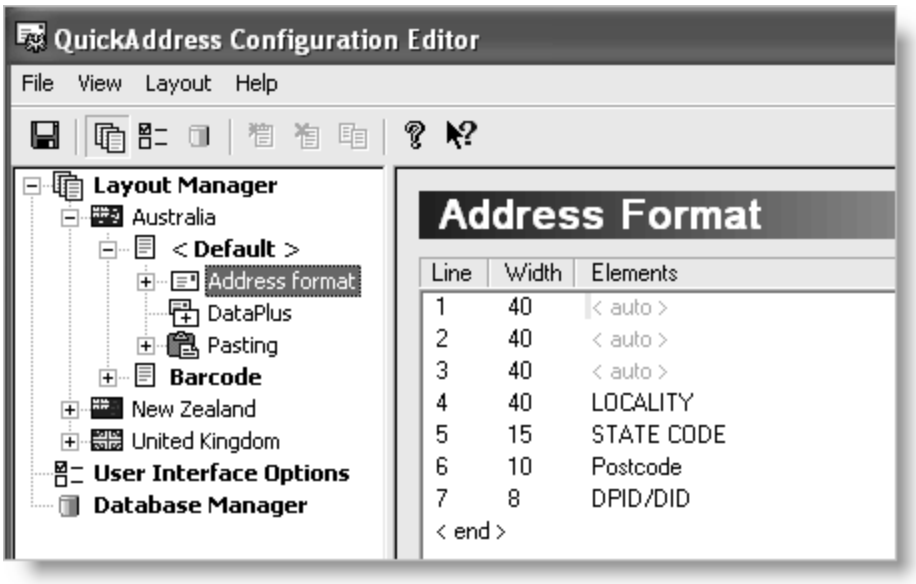
To ensure that QAS can properly verify Australian addresses from iMIS, the Address Format and Data Plus Format in QAS Pro v4 must be configured in the following manner.

Before you begin

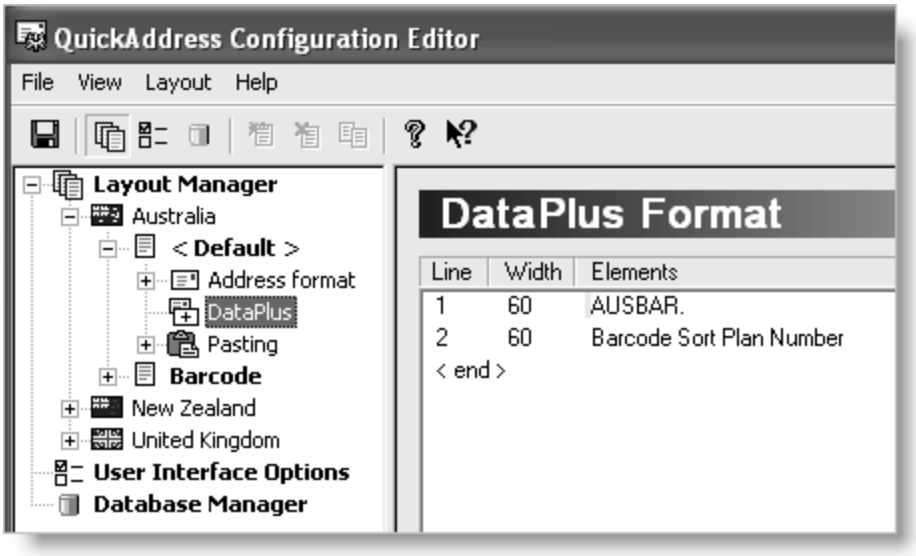
- QAS Pro v4 must be properly installed (see "Installing QAS Pro v4 and QAS Batch v4").
- Ensure that you are generally familiar with the process of using the Layout Manager function to define address layouts. See your QAS Pro v4 documentation for more information.

To configure QAS Pro v4 for Australian addresses

1. Open the QuickAddress Pro Configuration Editor.
2. Use the Layout Manager to define the <Default> address layout for Australia to match these values:



3. Choose File > Save.
4. Use the Layout Manager to define the DataPlus address layout for Australia to match these values.



5. Choose File > Save.

Configuring QAS Pro v4 for New Zealand addresses

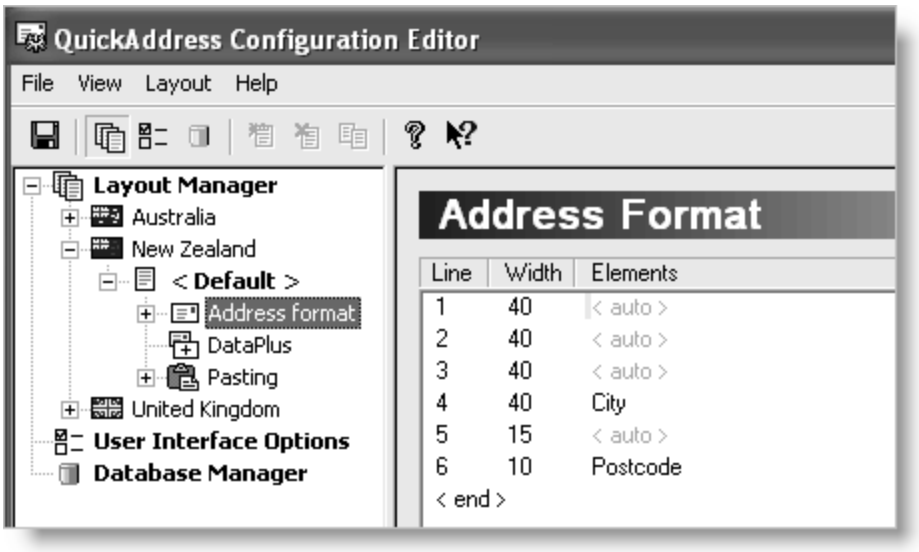
To ensure that QAS can properly verify New Zealand addresses from iMIS, the Address Format and Data Plus Format in QAS Pro v4 must be configured in the following manner.

Before you begin

- QAS Pro v4 must be properly installed (see "Installing QAS Pro v4 and QAS Batch v4").
- Ensure that you are generally familiar with the process of using the Layout Manager function to define address layouts. See your QAS Pro v4 documentation for more information.

To configure QAS Pro v4 for New Zealand addresses

1. Open the QuickAddress Pro Configuration Editor.
2. Use the Layout Manager to define the <Default> address layout for New Zealand to match these values:



3. Choose File > Save.

Configuring QAS Pro v4 for United Kingdom addresses

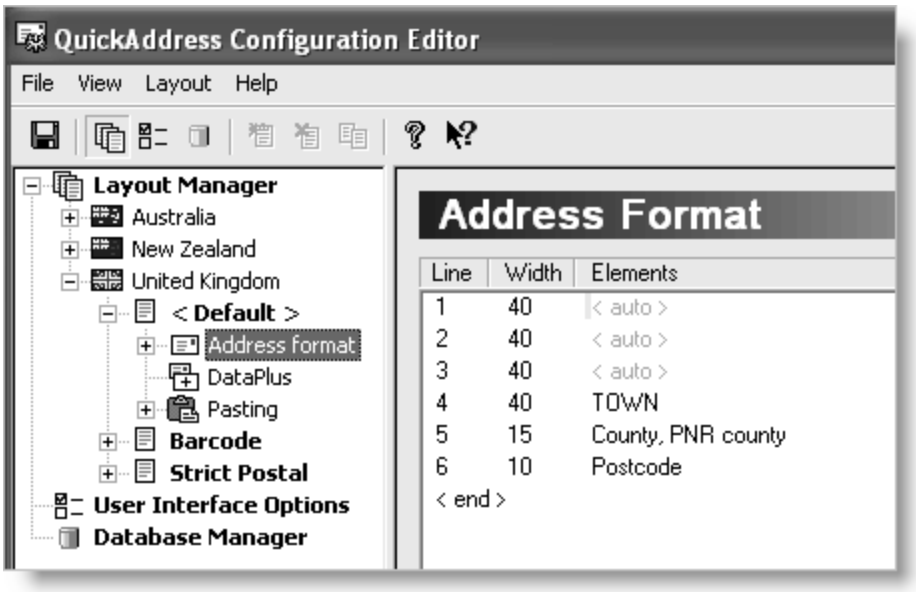
To ensure that QAS can properly verify United Kingdom addresses from iMIS, the Address Format and Data Plus Format in QAS Pro v4 must be configured in the following manner.

Before you begin

- QAS Pro v4 must be properly installed (see "Installing QAS Pro v4 and QAS Batch v4").
- Ensure that you are generally familiar with the process of using the Layout Manager function to define address layouts. See your QAS Pro v4 documentation for more information.

To configure QAS Pro v4 for United Kingdom addresses

1. Open the QuickAddress Pro Configuration Editor.
2. Use the Layout Manager to define the <Default> address layout for United Kingdom to match these values:



3. Expand the Address format node.
4. Select the Auto formatting node.
5. Clear the Organisation checkbox.
6. Choose File > Save.

Configuring QAS Pro v4 for other countries

We have provided specific address layouts for Australia (see "Configuring QAS Pro v4 for Australian addresses"), New Zealand (see "Configuring QAS Pro v4 for New Zealand addresses"), and United Kingdom (see "Configuring QAS Pro v4 for United Kingdom addresses"), all of which have been tested with iMIS 10.6. Examining the differences

between these three address layouts can help you determine a good approach to designing address layouts for other countries in a manner that will be compatible with iMIS country address data.

> **Note:** Note: ASI supports QAS v4 for use only with v4 country address databases from QAS as they become available for Australia, New Zealand, and United Kingdom.

Before you begin

- QAS Pro v4 must be properly installed (see "Installing QAS Pro v4 and QAS Batch v4").
- Ensure that you are generally familiar with the process of using the Layout Manager function to define address layouts. See your QAS Pro v4 documentation for more information.

To configure QAS Pro v4 for other countries

1. Open the QuickAddress Pro Configuration Editor.
2. Use the Layout Manager to define a <Default> address layout for your country, using the following guidelines:

- The first three lines should have a width of 40 and use the <auto> element. These correspond to the three Address fields in iMIS.
- The fourth line should have a width of 40 and use a fixed element that corresponds to the City field in iMIS.
- The fifth line should have a width of 15 and use a fixed element that corresponds to the County field in iMIS.
- The sixth line should have a width of 10 and use a fixed element that corresponds to the Post Code field in iMIS.
- Any additional lines after the sixth line are used only by QAS and will have no impact on address verification in iMIS.

3. Choose File > Save.
4. Test your address layout in iMIS by manually verifying some sample addresses, and also print some reports and labels from iMIS that include some sample addresses.
5. If the addresses do not verify properly, or if anything looks incorrectly formatted in reports and labels from iMIS, change the address layout in QAS Pro and then repeat the testing process until everything works properly in iMIS.

Configuring the QAWORLD.INI file for QAS Batch

You must manually edit various sections in the QAWORLD.INI file for QAS Batch v4 to ensure that QAS Batch functions correctly when used with iMIS.

To define country address layouts if you have a QuickAddress Pro license

QAS Batch does not have a visual interface for defining country address layouts. The easiest way to ensure that QAS Batch has the correct country address layouts to work properly with iMIS is to use the following procedure, which assumes that you also have a QuickAddress Pro license. If you do not have a QuickAddress Pro license, you should adapt this procedure as necessary to manually configure your QAWORLD.INI file.

1. Use the QuickAddress Pro Configuration Editor to define the country address layout for each country address database, as described in the following sections:

- Configuring QAS Pro v4 for Australian addresses
- Configuring QAS Pro v4 for New Zealand addresses
- Configuring QAS Pro v4 for United Kingdom addresses
- Configuring QAS Pro v4 for other countries

2. Open the QAWSERVE.INI file that is located in your QuickAddress Pro API folder.
3. For each country address layout that you have defined, locate the corresponding AddressLineCount, DataplusLines, and AddressLinen settings and copy them to the Windows clipboard.

For example, if your address layout for New Zealand has six lines, you would copy the following settings from the QAWSERVE.INI file:

NZLAddressLineCount=6

NZLDataplusLines=0

NZLAddressLine1=W40

NZLAddressLine2=W40

NZLAddressLine3=W40

NZLAddressLine4=W40,L21

NZLAddressLine5=W15

NZLAddressLine6=W10,C11

4. Paste the copied settings into the appropriate section of the QAWORLD.INI file that is located in your QuickAddress Batch API folder.

   In most cases, you will be replacing existing settings that have different values, so you must carefully examine the contents of your QAWORLD.INI file and ensure that you have completely replaced the appropriate settings with the values copied from the QAWSERVE.INI file from QuickAddress Pro.

5. Delete the three-letter country prefix located at the beginning of each line that you pasted into the QAWORLD.INI file.

   For example, if you pasted the lines corresponding to the address layout for New Zealand, you would edit the pasted lines to look like the following:

   AddressLineCount=6

   DataplusLines=0

   AddressLine1=W40

   AddressLine2=W40

   AddressLine3=W40

AddressLine4=W40,L21

AddressLine5=W15

AddressLine6=W10,C11

To ensure proper behavior when multiple country address databases are used with iMIS

Each country section of the QAWORLD.INI file in the QAS Batch API folder must have a CountryBase setting that first specifies the current country section label, followed by the labels of all other country sections in the file.

For example, if you have three country databases, Australia, United Kingdom, and New Zealand, their respective CountryBase settings must have the following content:

[AUS]
CountryBase=AUS GBR NZL
...rest of the settings for AUS

[GBR]
CountryBase=GBR AUS NZL
...rest of the settings for GBR

[NZL]
CountryBase=NZL AUS GBR
...rest of the settings for NZL

If your CountryBase settings are not formatted in this manner, then iMIS will verify a batch of addresses only against the default country database that is specified in the Customer Setup - QAS Options dialog.

Note: Note: If the United Kingdom (GBR) is one of your multiple country databases, you might encounter errors with the State code of your non-UK addresses being changed from an abbreviated format to a fully-spelled-out format if you select

GBR as your default country database for the batch run. This happens because QAS Batch v4 applies the address formatting for the default country to all addresses processed in the batch, regardless of the individual CountryBase settings for each country. To prevent this problem from affecting your iMIS addresses, you can (a) select a country other than GBR as the default country database before running a QAS Batch job, or (b) edit the [GBR] section of your QAWORLD.INI file to remove the PNR County value (L12) from the format for AddressLine5, like this: AddressLine5=W15,L11.

To prevent API calls not being directed to the correct system path

API calls from iMIS to QAS Batch can sometimes fail, due to a known inconsistency with QAS Batch. Adding a homedir setting to your QAWORLD.INI file for QAS Batch prevents this problem from occurring.

1. Open the QAWORLD.INI file that is located in your QuickAddress Batch API folder.
2. In the [QADEFAULT] section of the file, add a homedir setting that specifies the full path to your QuickAddress Batch API folder.

   The path that you specify can be formatted as a local file path on the iMIS client's computer (for example, C:\Program Files\QAS\QuickAddress Pro API), or it can be formatted as a UNC to a network computer (for example, \\atcserv\C\Program Files\QAS\QuickAddress Batch API).

   For example, if your QuickAddress Batch API folder is located in C:\Program Files\QAS, you would use the following homedir setting:

   [QADefault]

   homedir=C:\Program Files\QAS\QuickAddress Batch API
   ...rest of the settings for QADefault

Specifying QAS API install paths

Your QuickAddress Pro API folder and QuickAddress Batch API folder must be listed in the system PATH variable in Windows for each iMIS client in your organization. Because these folders might not be local to each iMIS user's client computer, iMIS provides an interface that enables you to specify the location of these folders. iMIS then adds these locations to the system PATH variable for the local computer.

Windows and dialogs used in this procedure

- QAS Install Paths window

Before you begin

- QAS v4 must be properly installed (see "Installing QAS Pro v4 and QAS Batch v4").

To specify QAS API install paths

1. In iMIS, choose File > System Setup.

   The System Setup window appears.

2. Click QAS Install Paths.

   The QAS Install Paths window appears.

3. Click Edit to put the window in edit mode.

4. In the QAS Pro Path field, enter a semi-colon followed by the full file path or Universal Naming Convention (UNC) path to your QuickAddress Pro API folder (for example, ;C:\Program Files\QAS\QuickAddress Pro API).

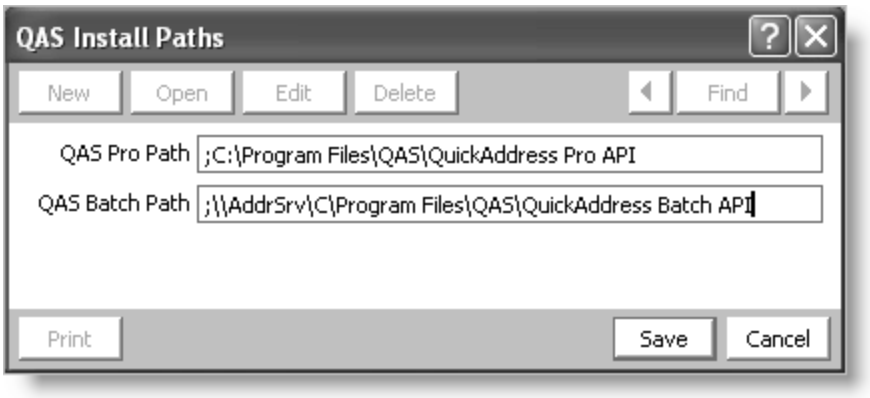
5. In the QAS Batch Path field, enter a semi-colon followed by the full file path or UNC path to your QuickAddress Batch API folder (for example, ;\\atcserv\C\Program Files\QAS\QuickAddress Batch API).

6. Click Save.

QAS Install Paths window

This window specifies the location of the API folders for QAS Pro v4 and QAS Batch v4. When this information is saved, these paths are written to the system PATH variable of

the local computer.



From iMIS, choose File > System Setup, and click QAS Install Paths

QAS Pro Path

Specifies the path to the QuickAddress Pro API folder. The path that you specify can be formatted as a local file path on the iMIS client's computer (for example, ;C:\Program Files\QAS\QuickAddress Pro API), or it can be formatted as a Universal Naming Convention (UNC) path to a network computer (for example, ;\\atcserv\C\Program Files\QAS\QuickAddress Pro API).

Note: Note: You must prefix the file path with a semicolon to ensure that the file path is properly delimited when it is appended to the system PATH variable in Windows.

QAS Batch Path

Specifies the path to the QuickAddress Batch API folder. The path that you specify can be formatted as a local file path on the iMIS client's computer (for example, ;C:\Program Files\QAS\QuickAddress Batch API), or it can be formatted as a UNC path to a network computer (for example, ;\\atcserv\C\Program Files\QAS\QuickAddress Batch API).

Note: Note: You must prefix the file path with a semicolon to ensure that the file path is properly delimited when it is appended to the system PATH variable in Windows.

Specifying the default country database for QAS

Because QAS supports address checking from multiple country address databases, you must specify which address database to use as the default for iMIS.

To specify the default country database for QAS

1. From Customers, select Set up module > General.

   The Set up general options window appears.

2. Click Address and Notes.

   The Customer Setup - Address and Notes window appears.

3. Click QAS Options.

   The Customer Setup - QAS Options window appears.

4. Press Ctrl+E to put the window in edit mode.

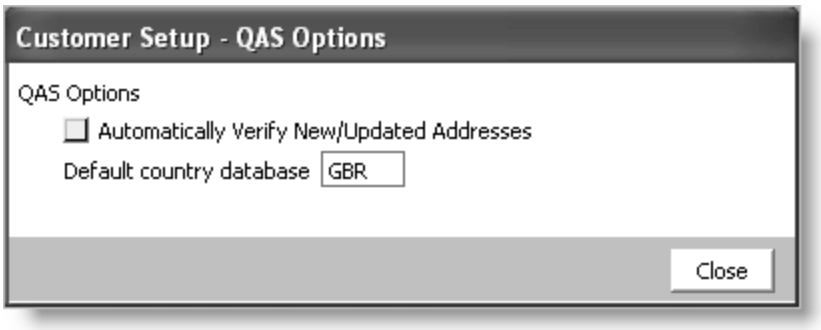
5. In the Default country database field, enter a three-character QAS country code (for example, AUS, GBR, NZL, and so on).

6. Click Close.

7. In the Customer Setup - Address and Notes window, click Save.

Customer Setup - QAS Options window

This window specifies options for QAS Pro and QAS Batch.



From Customers, select Set up module > General, click Address and Notes, and click QAS Options

Automatically Verify New/Updated Addresses

Automatically verifies an address when the address record is being saved. When cleared, no automatic verification takes place when the address record is being saved. The address is verified against the country address database that corresponds to the specified country in the address record. If no country is specified in the address record, the address is verified against the Default country database.

If auto-verification is enabled, this behavior can be overridden in the Customer Management module on a per-address basis by selecting the No auto-verify checkbox in the QAS for iMIS window, which flags a specific address to skip automatic address verification until one of the five address fields is changed. See QAS for iMIS window for more information.

Default country database

Specifies which country database to use as the default for both manual address verification and batch verification. This default value is required for QAS to work properly. The value you enter must be a three-character QAS country code (for example, AUS, GBR, NZL, and so on). See your QuickAddress Country Guide to determine the appropriate country code.

This default address database affects the behavior of both manual and batch address verification.

- When manually verifying addresses with QAS, each address is first checked against this default address database. You can, however, select a different address database as needed during the process.
- When verifying a batch of addresses with QAS Batch, all addresses in the batch are checked against this default address database. If you have enabled user interaction during the batch job, you can select a different address database as needed during the process.

Enabling or disabling address auto-verification for QAS

You can configure iMIS to automatically verify each address against your QAS address databases when you save the address record.

To enable or disable address auto-verification for QAS

1. From Customers, select Set up module > General.

   The Set up general options window appears.

2. Click Address and Notes.

   The Customer Setup - Address and Notes window appears.

3. Click QAS Options.

   The Customer Setup - QAS Options window appears.

4. Press Ctrl+E to put the window in edit mode.

5. Select the Automatically Verify New/Updated Addresses checkbox to enable automatic verification of addresses, or clear the checkbox to disable auto-verification.

6. Click Close.

7. In the Customer Setup - Address and Notes window, click Save.

Verifying a batch of addresses with QAS Batch

You can batch verify addresses with QAS Batch.

Before you begin

- QAS Batch v4 must be installed and properly configured (see "Implementing QAS with iMIS") for integration with iMIS.
- The file path to your QAS Batch API folder must be specified in iMIS (see "Specifying QAS API install paths").
- The default country address database must be specified in iMIS (see "Specifying the default country database for QAS").

To verify a batch of addresses with QAS Batch

1. From Customers, select Manage QAS > QuickAddress Batch.

   The QAS Batch window appears.

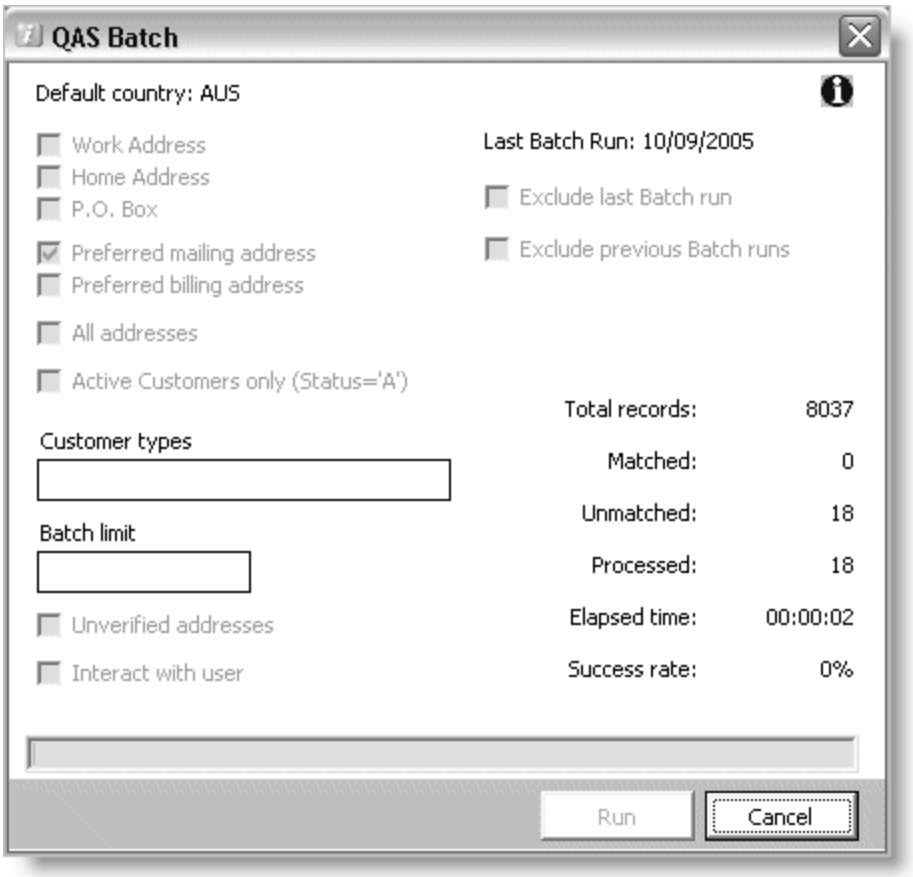
2. Specify the batch options.

3. Click Run.

QAS Batch window

This window provides a convenient interface to QAS Batch v4, enabling you to batch verify all addresses in iMIS. The various options can be used in combination to provide great flexibility. For example, you can process a very large iMIS database in three smaller batch runs, and then make a fourth batch run to manually verify the remaining addresses that could not be automatically verified in the first three batch runs.

Note: Note: iMIS always runs QAS Batch with a high required match success level (Q or R) and a high required match confidence level (9).



From Customers, select Manage QAS > QuickAddress Batch

> **Note:** Note: The Work Address, Home Address, and P.O. Box checkboxes might have different labels if your iMIS administrator has changed the corresponding address tab names in the Customer Management module.

Default Country

(read-only) Specifies the current default country database (which is set in the Customer Setup - QAS Options window window). Addresses in the batch that do not have a specified country are checked against the default country database. Addresses that have a specified country are instead checked against the corresponding QAS country address database, if installed, or they are ignored if there is no corresponding QAS country database.

Work Address

Includes all work addresses (mailing addresses) in the batch run. When cleared, work addresses are ignored.

This filter is additive with all other filters. For example, if you select the Home Address checkbox and you select this checkbox, only home and work addresses are processed in this batch run.

Home Address

Includes all home addresses (residential addresses) in the batch run. When cleared, home addresses are ignored.

This filter is additive with all other filters. For example, if you select the Work Address checkbox and you select this checkbox, only home and work addresses are processed in this batch run.

P.O. Box

Includes all P.O. box addresses (delivery addresses) in the batch run. When cleared, P.O. box addresses are ignored.

This filter is additive with all other filters. For example, if you select the Home Address checkbox and you select this checkbox, only home and P.O. Box addresses are processed in this batch run.

Preferred mailing address

Includes all preferred mailing addresses in the batch run. When cleared, preferred mailing addresses are ignored.

This filter is additive with all other filters. For example, if you select the Home Address checkbox and you select this checkbox, only home and preferred mailing addresses are processed in this batch run.

Preferred billing address

Includes all preferred billing addresses in the batch run. When cleared, preferred billing addresses are ignored.

This filter is additive with all other filters. For example, if you select the Home Address checkbox and you select this checkbox, only home and preferred billing addresses are processed in this batch run.

All addresses

Includes all addresses in the iMIS database in the batch run, and clears all of the preceding checkboxes. When cleared, the preceding checkboxes can be selected.

Active Customers only (Status='A')

Limits processing of the selected address types to only customers who have a Status of A (active). When cleared, all of the selected address types are processed, regardless of the customer's status.

This filter is additive with all other filters. For example, if you select the Home Address checkbox and you select this checkbox, only the home address of customers with a Status of A are processed in this batch run.

Last Batch Run

(read-only) Specifies the date of the last batch run.

Exclude last Batch run

Excludes all records that were processed in the immediately previous batch run. When cleared, the records processed in the previous batch run are included in this batch run.

Note: Note: If the Exclude previous Batch runs option is selected, this checkbox is ignored.

Exclude previous Batch runs

Excludes all records that were processed in the two immediately previous batch runs. When cleared, the records processed in the two previous batch runs are included in this batch run.

You can use this checkbox and the Exclude last Batch run checkbox in combination with the Batch limit field to process a large iMIS database in three separate runs, using the following method:

1. In the Batch limit field, enter a value that is one-third the amount of address records in your iMIS database.
2. Clear both the Exclude last Batch run and Exclude previous Batch runs checkboxes and run the batch to process one-third of your address records.
3. Select the Exclude last Batch run checkbox and run the batch again to process the second third of your address records.
4. Select the Exclude previous Batch runs checkbox and run the batch again to process the remaining third of your address records.

Customer types

Limits processing to the specified comma-delimited list of customer Member Types. Only addresses for customers with this member type are processed in the batch run.

This filter is additive with all other filters. For example, if you select the Home Address checkbox and you enter M,CM in this field, only the home address of customers with a Member Type of M or CM are processed in this batch run.

Batch limit

Specifies the maximum number of address records to include in the batch run. You can use this field in combination with the Exclude last Batch run checkbox to verify a large iMIS database in two separate batch runs, or you can use this field in combination with both the Exclude last Batch run and Exclude previous Batch runs to verify a large iMIS database in three separate batch runs.

This filter is additive with all other filters. For example, if you select the Home Address checkbox and the Active Customers only checkbox, and you specify 1000 in this field, only the first 1000 home addresses of customers with a Status of A are processed in this batch run.

Unverified address

Limits processing to the addresses that have never been fully verified, either by manual verification with QAS Pro or by batch verification with QAS Batch. A fully verified address is one for which QAS has found a match, returned a full address for the match, and the match has been accepted. A skipped or cancelled verification attempt does not flag an address as being fully verified.

This filter is additive with all other filters. For example, if you select the Home Address checkbox and this checkbox, only home addresses that have not been fully verified are processed in this batch run.

Note: Note:

This filter is generally best used in combination with the Interact with user checkbox, because unverified address are likely to need manual verification through the QAS Pro interface.

Selecting this checkbox clears the Exclude last Batch run and Exclude previous Batch runs checkboxes.

Interact with user

(available only if licensed for QAS Pro) Displays the QAS Batch Interaction window for each address in the batch that does not meet the Required match success level and Required confidence level, enabling you to manually verify the address. See QAS Batch Interaction window for more information.

Batch run statistics area

Displays the following statistics about the results of the batch run:

- Total records - specifies the number of iMIS address records searched
- Matched - specifies how many of the Processed records met the required high match success level and confidence level (Q9 or R9)
- Unmatched - specifies how many of the Processed records did not meet the required match success and confidence levels

- Processed - specifies how many of the Total records were in the country specified as the Default Country for the batch run
- Elapsed Time - specifies how long the batch run took to complete
- Success Rate - specifies the percentage of Matched records found in the total number of Processed records

Run

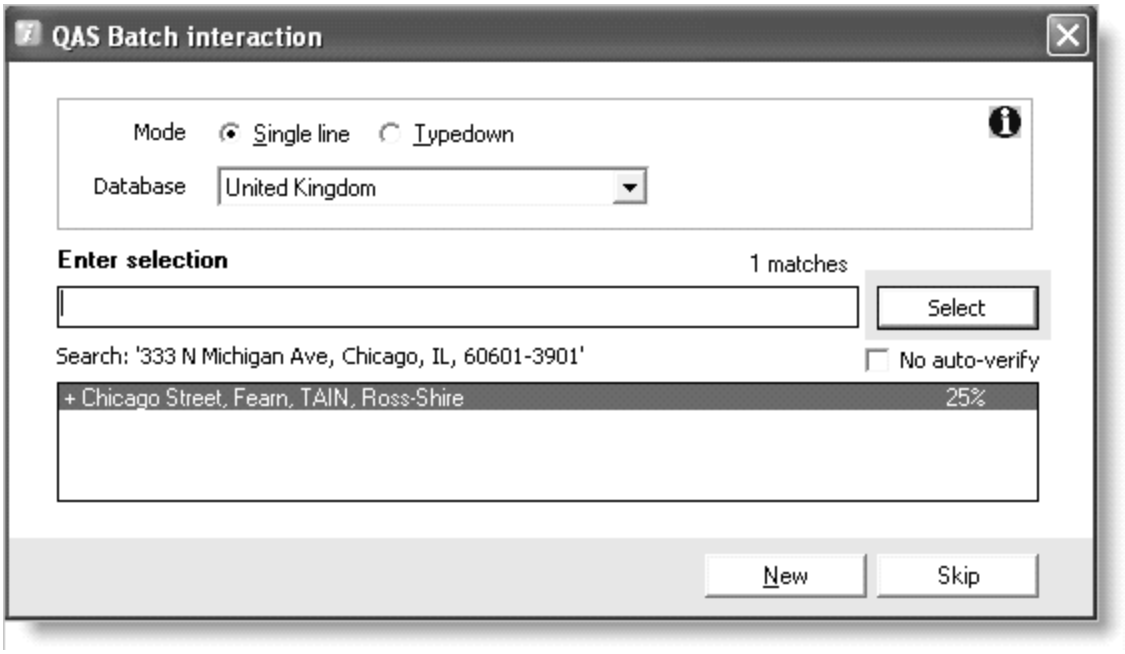
Runs the batch job.

Cancel

Cancels the batch job. This can be done safely at any time because it takes effect only after the current address has fully completed processing.

QAS Batch Interaction window

This window appears when verifying a batch of addresses with QAS Batch if you have selected the Interact with user checkbox on the QAS Batch window.



This window appears automatically during batch address verification if the Interact with user checkbox is selected

The contents of this window are identical to the QAS for iMIS window used for manual address verification. See QAS for iMIS window for more information.

Manually verifying addresses with QAS

In all iMIS modules where address verification is available, you can use the Verify Address button to manually verify an address. You can always manually verify an address even if auto-verification of addresses is enabled.

Before you begin

- QAS Pro v4 must be installed and properly configured (see "Implementing QAS with iMIS") for integration with iMIS.
- The file path to your QAS Pro API folder must be specified in iMIS (see "Specifying QAS API install paths").
- The default country address database must be specified in iMIS (see "Specifying the default country database for QAS").

To manually verify an address with QAS

1. From the iMIS module that displays an address, click Verify Address.

   The QAS for iMIS window appears. The Database field displays the country specified in the address from the iMIS module, provided that you have that country address database installed in your implementation of QAS. Otherwise, the Database field displays the Default country database specified in the iMIS Customer Setup window. The Enter [address type] field is blank, and the search status line displays the address from the iMIS module for which QAS is searching for potential matches.

   After QAS has finished searching for potential matches to the selected address, the status line displays how many matches were found, and the matches are listed in the results area.

2. Does the results area list a correct match for the selected address from the iMIS module?

- If the results area lists a correct match, double-click the match.

The results area displays the full address details for the selected match, and Accept and Cancel buttons appear below the results area.

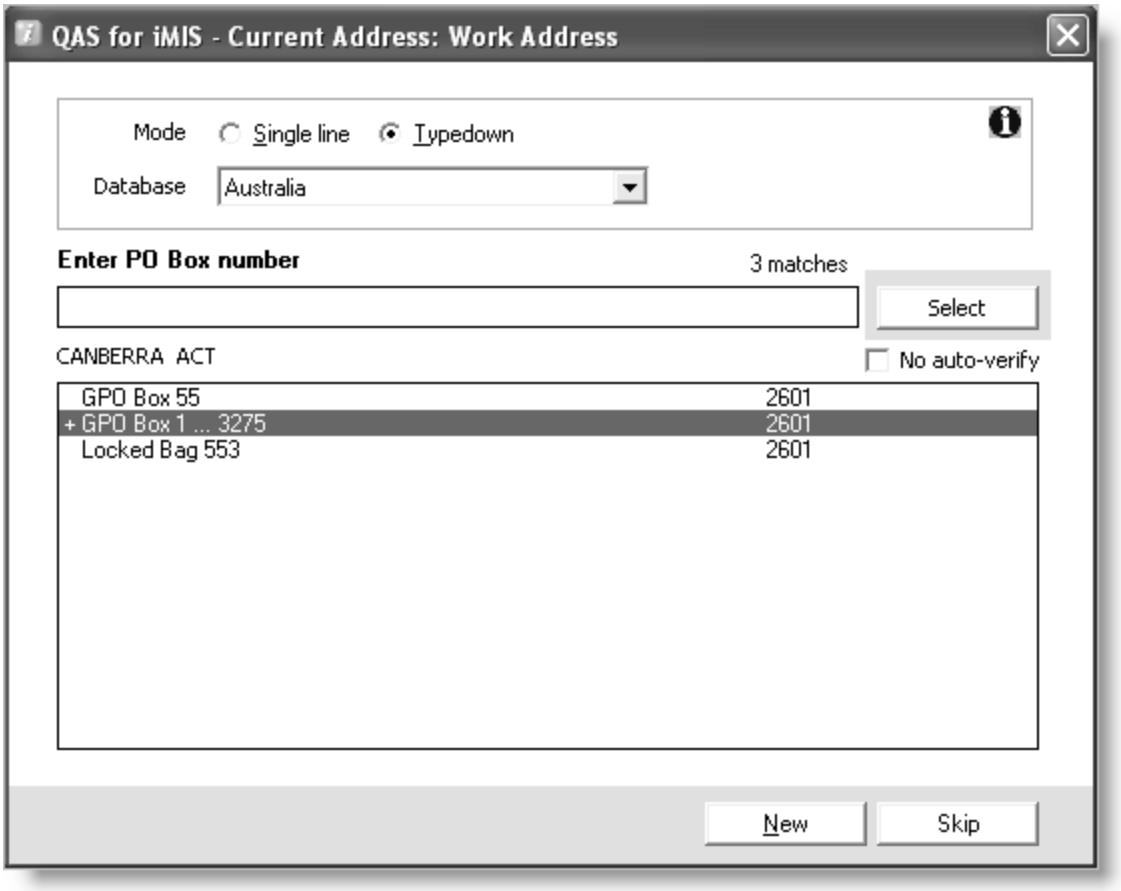
- If the results area does not list any correct matches, or if the area is empty and the search status line displays 0 matches found, perform a type-down search to manually search for a correct match.
- In the QAS for iMIS window, click New. The results area and the Enter [address type] field is cleared.
- From the Mode options, select Typedown.
- From the Database drop-down list, select the country in which you want to search for a matching address.
- In the Enter [address type] field, begin entering either the postcode or the place name in which you think the address might be located. After you've entered enough characters for QAS to narrow down the list of matching postcodes or places, the potential matches are listed in the results area.
- From the list in the results area, double-click the most likely potential match.
- The search status line displays the selected postcode or place name, and the Enter [address type] field is cleared.
- In the Enter [address type] field, begin entering the street name, organization name, or P.O. box number. After you've entered enough characters for QAS to narrow down the list of matching streets, organization names, or P.O. boxes, the potential matches are listed in the results area.
- If the results area lists a correct match, double-click the match. The results area displays the full address details for the selected match, and Accept and Cancel buttons appear below the results area.

3. Click Accept to confirm the address displayed in the results area and update the current address in the iMIS module accordingly.

4. If you are working in the Manage Customers window of iMIS, repeat this process for each of the three customer addresses.

QAS for iMIS window

The QAS for iMIS window enables you to manually verify an address against a QAS country address database. This window appears only when the address cannot be automatically identified with a single match when you click the Verify Address button.



From any module that displays an address, click Verify Address

Mode

Specifies the search mode for address matching.

- Single line - Specifies that no search attempt is made until you enter a full or partial address in the Enter selection field and then click Select.

- Typedown - Specifies that a search attempt is made with every character that you enter in the Enter selection field. As you enter each character, the number of matches displayed in the search status line becomes increasingly smaller. When the number of potential matches becomes small enough, a list of the potential matches is displayed in the results area.

  Database

  Specifies the country address database in which to search for matching addresses.

  Enter [address type]

  Specifies the full or partial address for which QAS should search. The [address type] changes dynamically to indicate the type of address currently being searched. If the Mode is set to Single line, you must click Select to perform the search. If the Mode is set to Typedown, QAS performs a running search with each character that you enter in this field.

  Select

  Searches the specified Database for matches to the full or partial address specified in the Enter [address type] field.

  Search status line

  (read-only) Displays the number of matches found for the full or partial address specified in the Enter [address type] field.

  No auto-verify

  (Customer Management module only) Flags the full or partial address specified in the Enter [address type] field to be excluded from future address verification, which prevents iMIS from continually prompting you to manually verify the address when it fails automatic verification every time you work with the flagged address in the Manage customers window. This feature is useful when one of the alternate addresses for a customer are located in a country for which you do not have a QAS country address database, or for when

you must store an unusual address or an address that is not yet in any of your QAS country address databases.

The flagged address will not be verified even when you subsequently click the Verify Address button. However, the flagged address will be verified if you change any information in the 6 fields associated with the flagged address.

Results area

Performs two different functions depending on whether you are searching for matching addresses or confirming a matched address.

- Searching for addresses - Lists all addresses that match the full or partial address specified in the Enter [address type] field. When performing a search in Typedown mode, some potential matches will be prefixed with a plus sign (+), which indicates that you can double-click that potential match to further refine your search.

  For example, if you have entered Westmi in the Enter [address type] field, this area lists potential matches that include values such as: + Westmill, + West Milton, + Westminster, and so on. The plus sign prefix indicates that there are more potential matches under each of those place names. To refine your typedown search to include only addresses in Westminster, you would double-click the + Westminster item in the list.
- Confirming an address - Lists the full address details of a selected address so that you can confirm the match. The buttons below this area change to Accept and Cancel. Clicking Accept confirms the match. Clicking Cancel rejects the match and redisplays the list of potential matches.

  New

  Clears the results area and the Enter [address type] field, enabling you to start a new search.

  Skip

  Cancels verification of the current address in the iMIS module.

  Accept

Confirms the address displayed in the results area and updates the current address in the iMIS module accordingly.

Cancel

Rejects the address displayed in the results area and redisplays the list of potential matches.

Analytics

About iMIS Analytics

iMIS Analytics brings true business intelligence to your iMIS solution, giving you the power to understand and analyze the performance of your organization in ways that are tedious or impossible with standard reporting tools.

The Problem

The information that you need to identify and respond to performance issues, market trends, and competitive forces is there in your iMIS database, but the sheer volume and variety of data makes it difficult to organize this information. For example, how do you determine whether a sharp revenue drop is just a one-time event in a specific region or is an indication of a larger trend that warrants a massive change in the budget?

iMIS provides many useful reports, and you have probably had many custom reports designed to help you see trends or to investigate performance issues. Unfortunately, it's not practical to continually develop new reports to deal with time-critical issues as they arise, which means that you are often making important decisions based on incomplete information.

Other issues that affect your ability to analyze your organization's performance include the following problems:

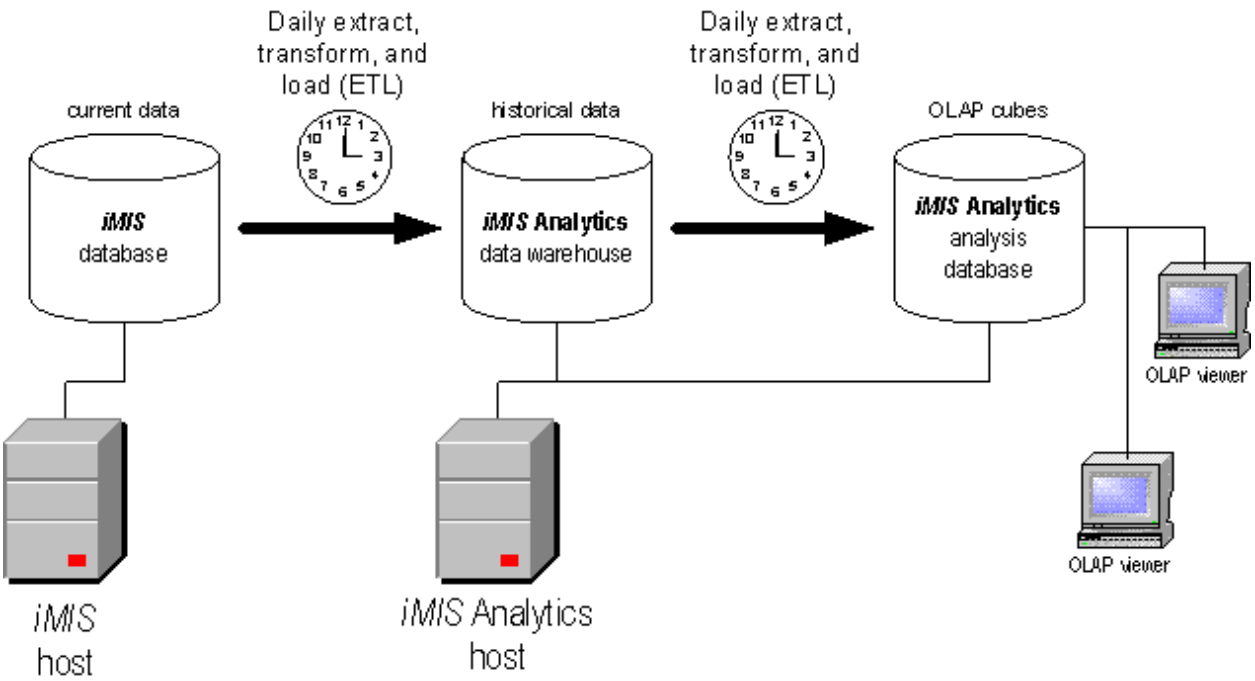
- Frequent reports and queries by your executives and managers can drain the system of resources for your normal business activities.
- Some of the information in your iMIS database is always current data, such as a customer name or address. However, if a customer address changes, for example, reports and queries cannot easily show you the historical addresses.

You might already know that implementing a data warehouse and online analytical processing (OLAP) database can solve these problems, but such an undertaking can be difficult and costly.

The Solution

Analytics is a turn-key business intelligence solution for your iMIS system. Analytics creates a data warehouse and OLAP database that is tailored specifically for your iMIS database. Every night, your data is automatically extracted from the iMIS database and stored in the data warehouse so that you have a complete historical record of all your iMIS data. The OLAP database contains one iMIS cube comprising eight measure groups that are designed to give you the best combination of multi-dimensional views into your iMIS information, and the cube is automatically updated every night with the information from your data warehouse.

You use an OLAP viewer to analyze the information that is stored in the cube, which is a very fast and flexible process that doesn't require knowledge about designing reports or performing SQL queries. This approach eliminates the need to run reports on a daily basis for manual comparison. Instead, you have instant access to key performance indicators, can easily compare multiple information categories, and can easily drill down into any information category. Because you are examining the OLAP database instead of reporting and querying against your iMIS database, your organization's normal business activities are relatively unaffected.



Analytics comes with a predefined Analytics Briefing Book that is designed for the popular OLAP viewer ProClarity Professional. The Briefing Book is filled with many useful views into the iMIS cube, which provides you with a clear picture of your organization's performance in key areas. You can also add your own views to the Briefing Book and share them with other ProClarity Professional users in your organization.

Analytics can be configured to include certain types of custom demographics that you have added to your iMIS solution, making these custom demographics available in your data warehouse and OLAP database.

Benefits for executives and managers

- Extremely fast access to important business performance information
- Easy access to all types of charts, graphs, and metrics
- Great visuals for presentations
- Dynamic charting and analysis of key performance indicators
- Power to manage and plan more effectively
- Ability to add your custom iMIS demographics
- Less reliance on IT Staff for reports

Limitations

Analytics does not include predictive/forecasting capabilities or pattern analysis. These capabilities can be achieved by using a predictive tool that is compatible with Microsoft Analysis Services, which is beyond the scope of ASI support.

Although you can use any OLAP viewer that is compatible with Microsoft Analysis Services to browse and report on the iMIS cube created by Analytics, ASI supports Analytics only for use with ProClarity Professional.

Important Analytics concepts

iMIS Analytics can be installed without any customization, and you will have access to many useful key performance indicators by using the supplied Analytics Briefing Book for ProClarity Professional. You don't need to understand data warehousing or online analytical processing (OLAP) to gain instant value from using Analytics.

If you understand some basic concepts, however, you can take advantage of the full power of Analytics.

- If your executives and managers understand the basic elements of an OLAP cube, they can use OLAP viewers such as ProClarity Professional to create any view of iMIS data that they need, rather than relying only on the predefined views in the Briefing Book.
- If your IT staff understands some basic data warehousing concepts and the general architecture of Analytics, they can:
- Determine how to implement Analytics as a data mart in the bus architecture of a larger enterprise data warehouse solution.
- Determine which of your custom iMIS demographics (custom fields) should be added to the data warehouse to provide you with even stronger business intelligence than that offered by a non-customized implementation of Analytics.

Basic concepts for your executives and managers

iMIS Analytics is a sophisticated product that creates and maintains a robust data warehouse and a powerful OLAP cube in a special analysis database. Most of the product is invisible to you, however, working behind the scenes. If you are using the recommended ProClarity Professional viewer to analyze the data in the cube, your main exposure to the product is through the Analytics Briefing Book.

The Briefing Book contains many predefined views of your iMIS data, but sometimes you will want to see information that is not available in one of the predefined views. In these situations, you will want to use the following special features of ProClarity Professional (see your ProClarity Professional tutorial to learn more about these features):

- drill-downs

displays more granular details of a chart

When viewing any chart, you can drill down to more granular data for a particular data point by left-clicking the data point. You can also "cross-drill" to other closely related data in a background hierarchy by right-clicking the data point and choosing the hierarchy into which you want to drill-down.

- Setup Panel

  creates custom views of your iMIS data

  To define your own custom views, you use the Setup Panel to either modify an existing view in the Briefing Book, or to define an entirely new view.

Basic concepts for your IT staff

In smaller organizations, iMIS Analytics might be the only data warehouse providing you with business intelligence. In larger organizations with several major databases besides your iMIS database, the data warehousing experts in your organization can implement Analytics as a data mart in the bus architecture of a larger enterprise data warehouse solution (per the Kimball model). Describing this type of data mart implementation is beyond the scope of this document, because such implementations are highly customized solutions. A data mart implementation is possible, however, because the Analytics data warehouse uses dimensional models and a star schema, and because the Analytics OLAP cube has been designed around conformed dimensions and conformed measures (facts). Your data warehousing experts can rely on documentation for Microsoft Analysis Services or any related third-party documentation to be applicable to the design of the Analytics data warehouse and analysis database.

Whether Analytics is implemented as your only data warehouse or as a data mart, there are major decisions that you must make when implementing Analytics:

- Should the product be installed in a two-tier or single-tier server configuration?
- Which of your custom iMIS demographics (custom fields) should be added to Analytics?

- Which type of slowly-changing dimension (SCD) should you use for each custom demographic?

  Server configurations

  Analytics server components can be implemented on a single tier with your iMIS database, or spread across two hosts in a two-tier configuration:

- Two-tier: The Analytics data warehouse and analysis database are located together on one SQL Server host (the Analytics host), and your iMIS database is located on a different SQL Server host (the iMIS host). Both the Analytics host and the iMIS host must be members of the same domain.
- Single-tier: The Analytics data warehouse and analysis database are located on the same SQL Server host that contains your iMIS database. In this configuration, the Analytics host is also the iMIS host.

  The single-tier configuration is the easiest to install and use, and generally won't affect performance of your iMIS database unless you have many people constantly using the analysis database. The following information about the three databases involved in an Analytics implementation can help you determine whether a two-tier or single-tier configuration is best for your organization:

- iMIS database

  current data stored in relational tables

  Your iMIS database contains some historical records of things like donations, purchases, etc. Much of the information in your iMIS database, however, is always current data. For example, if a product description or customer's address changes, the old product description or the old customer address is not saved in the iMIS database.

- data warehouse

  historical data stored in dimensional tables using a star schema

  The Analytics data warehouse is a special database that contains a copy of all your iMIS data. The data warehouse does not use relational tables, but instead structures your data

in a dimensional model using a star schema. Because much of the copied data comprises slowly changing dimensions that preserve history (Type 2 SCDs), the data warehouse will grow over time, so space requirements for growth are a factor in determining whether to implement a two-tier or single-tier configuration. However, since the data warehouse is used only during the extraction, transform, and load (ETL) process during off-peak hours, the performance impact on the iMIS host in a single-tier configuration is negligible.

- analysis database - OLAP cube

  OLAP cube derived from data warehouse contents, using conformed dimensions and conformed measures (facts)

  The Analytics analysis database contains a copy of the information from the data warehouse, transformed into a cube in an OLAP database. As with the data warehouse, the analysis database will grow over time, so space requirements for growth are a factor in determining whether to implement a two-tier or single-tier configuration. Unlike the data warehouse, this database might be used heavily during peak hours of the business day. However, OLAP viewers such as ProClarity Professional do not generate heavy SQL activity, so the performance impact on the iMIS host in a single-tier configuration is minimal.

  Custom iMIS demographics

  The Customers feature of iMIS has a feature called the iMIS Customizer, which enables you to create custom tables for use in custom window tabs that capture your own demographic information about each customer. With some limitations, you can configure your implementation of Analytics to include your custom demographic information about each customer in the data warehouse and analysis database. The following limitations apply to custom iMIS demographics:

- Fields from custom tables that are defined to allow multiple table rows for a single customer ID (multi-instance custom tables) cannot be included in Analytics.
- Fields from single-instance custom tables are added as attributes to the Customer Ext Dim dimension.

Examining these limitations in more detail can help you plan how to configure Analytics to track custom iMIS demographics (see "Configuring Analytics to track custom iMIS demographics").

A multi-instance custom table is one for which the Multiple Instances Allowed checkbox was selected when creating the custom table with the iMIS Customizer. In a multi-instance custom table, you can have multiple records for the same customer ID. For example, you might want to send out annual surveys to each of your customers and track the survey results in a custom table that is viewable on a custom Surveys tab in the Manage Customers window. In this scenario, the Surveys tab for a specific customer would show one row for each year's survey results.

In a single-instance custom table, by contrast, there would never be multiple records for the same customer ID. For example, you might have created a custom table that tracks general demographic information for customers, such as their spouse's name and the school they attended. In this scenario, there would never be more than one row needed per customer ID to store the demographic information.

Because multi-instance custom tables can have more than one record per customer ID, Analytics cannot determine which of those multiple records to display as attributes for a specific customer when you are examining the detail information for that customer in an OLAP viewer such as ProClarity Professional. Therefore, only fields from single-instance custom tables can be included in your implementation of Analytics.

The other limitation of custom tables is that the fields from these tables are essentially extended attributes of a specific customer ID, instead of being a category of business information that could be considered a dimension member in its own right. Therefore, the custom fields that you add to Analytics are not treated as members (levels) in a dimension that you can directly graph on a chart in OLAP viewers such as ProClarity Professional. Instead, you can view the custom fields only as attributes of a specific customer, once you have drilled-down far enough into a view to display specific customers.

Slowly changing dimensions

The most difficult decision to make when configuring Analytics to track your custom demographics is which type of slowly changing dimension (SCD) to use for each demographic. In a data warehouse, the measures (facts) change very rapidly, but by comparison, the data in your dimensions change slowly. For example, a custom demographic such as staff size is likely to change over time for a given customer.

Analytics supports two types of slowly changing dimensions, as well as giving you the option to not use a slowly changing dimension for demographics that never change over time. There are two questions you should consider for each demographic that you want to track in Analytics:

- Is this demographic a value that might change over time?
- If the answer is no, then you should configure the demographic to not use a slowly changing dimension.
- If the answer is yes, then you should consider the following question to determine which type of slowly changing dimension to use.
- Do I need to preserve a history of the different values of this demographic as it changes over time, or do I care only about the most current value of this demographic?
- If you need to preserve the historical values of a demographic, you should use a Type 2 SCD.
- If you need only the current value of a demographic, you should use a Type 1 SCD.

The following information about slowly changing dimensions can also help you determine which SCD type to use for each custom field:

- Type 2

  Preserves history

  When changes occur to a Type 2 SCD, a new record is added with the new attribute information, preserving records of the old attribute information. Type 2 SCDs track history very efficiently because they create new records only when the attribute information

changes. However, because Type 2 changes add new records, they can significantly increase the size of your data warehouse.

- Type 1

  Overwrites history

  When changes occur to a Type 1 SCD, no new records are created. Instead, the change overwrites the existing attribute with new information. The old information is lost forever.

- Type 0

  Use no SCD

  A Type 0 SCD is a special value used only in Analytics to indicate that the custom demographic is not a slowly changing dimension. The demographic is a value that will never change for a given customer. The advantage of using a Type 0 SCD for custom demographics that never change is that the data warehouse requires less overhead to maintain that demographic.

Predefined views in the Analytics Briefing Book

The iMIS Analytics Briefing Book, designed for use with the recommended ProClarity Professional OLAP viewer, contains the following predefined views of the measures in the Analytics analysis database. You can easily create your own custom views and add them to the Analytics Briefing Book.

Revenue

- Revenue by Product Class
- Revenue by Country
- Revenue by Customer Type
- Revenue by Campaign
- Revenue by Customer Type - Decomp
- Revenue by Country - Decomp

- Revenue by Product Type -Decomp
- Revenue Growth

  Membership
- Committee Counts
- Membership Dues Counts
- Membership Renewal Rates

  Opportunities
- Opportunities by Stage
- Opportunities Breakdown by Stage
- Forecast Totals by Customer Type
- Opportunities by Channel Type
- Opportunities by Team

  Fundraising
- Pledges by Campaign
- Pledges by Customer Type

  Marketing
- Revenue by Campaign
- Revenue by Response Type
- Revenue by Campaign and Response Type

  Inventory
- Inventory Levels by Product and Warehouse
- Inventory Levels by Product Group

  Issues

- Issues by Issue Type
- Issues by Product Type

Accounting

- General Ledger Activity by Account Number
- General Ledger Activity by Account Name

Analytics dimensions and measures

The iMIS cube in the analysis database contains the following dimensions and measures. If you use the recommended ProClarity Professional OLAP viewer with iMIS Analytics, you can easily browse the dimensions and measures and create any needed view of your iMIS business performance. Once you have created a custom view (see "Viewing the iMIS cube for ad-hoc analysis"), you can add it to the predefined views in the Analytics Briefing Book.

Dimensions

- Campaign
- Channel
- Customer
- Customer Ext Dim (see "Configuring Analytics to track custom iMIS demographics")
- Date
- GL Account
- Group Enroll Type
- Group Expire Type
- Group
- Issue Status
- Issue Type

- Opportunity Status
- Opportunity Type
- Organization
- Product
- Promotion
- Response Media
- Sales Location
- Sales Order Details
- Sales Team
- Shipper

Analytics usage

Because iMIS Analytics conforms to industry standards for OLAP databases, you can use any OLAP viewer that is compatible with Microsoft SQL Server Analysis Services to browse and report on the data in the iMIS cube created by Analytics. To help you get started, however, we have included a briefing book with Analytics that is designed to work

with the ProClarity Professional viewer. If you are using ProClarity Professional, you can open the Analytics Briefing Book and have instant access to many useful business performance views into your iMIS data.

> **Note:** Note: The following procedures assume that you are using the ProClarity Professional viewer. If you are using a different OLAP viewer, you must adapt these procedures as necessary to accommodate your preferred OLAP viewer. Go to Microsoft to download ProClarity Professional.

Analyzing iMIS business performance with the Analytics Briefing Book

The easiest way to analyze your iMIS business performance is to use the predefined iMIS Analytics Briefing Book designed for the ProClarity Professional viewer. The Analytics Briefing Book gives you instant access to many useful views into your iMIS data.

If the predefined Analytics Briefing Book does not provide iMIS business performance data that you would like to examine, you can also use ProClarity Professional to view the iMIS cube directly, drilling down into any dimension you choose. See Viewing the iMIS cube for ad-hoc analysis.

> **Note:** Note: You must use the ProClarity Professional viewer for this procedure because the supplied Analytics Briefing Book is designed for use with it. If you are using a different OLAP viewer, see your viewer's documentation for information on how to create a set of predefined views into the Analytics cubes. Go to Microsoft to download ProClarity Professional.

Before you begin

- Analytics must be properly installed and configured, and the Analytics data warehouse and analysis database must be populated with data from the iMIS database. See "Analytics implementation" for more information.
- ProClarity Professional must be installed on your computer.

- The Analytics Briefing Book must have been installed on your computer. See Installing the Analytics Briefing Book on client computers for more information.

  Scenario

  In the following sample procedure, you are reviewing annual membership dues counts for your organization. The default Analytics Briefing Book view for Membership Dues Counts shows the total annual count of dues and activity fees for active members of your entire organization, but you are interested in comparing this information against the annual growth rate for chapters. You use the Setup Panel feature in ProClarity Desktop Professional to change the rows of the Membership Dues Counts view to display trend lines for both chapter membership counts and annual dues and activity fees.

  To analyze iMIS business performance with the Analytics Briefing Book

  > **Note:** Note: See your ProClarity Professional documentation for more information.

1. In ProClarity Desktop Professional, open the Analytics Briefing Book (iMIS Analytics.bbk).
2. In the Briefing Book area, expand the Membership folder and open the Membership Dues Counts view.

   The view area displays a line chart and associated table that shows the annual number of dues and activity fee payments made by active members across the entire organization.
3. From the main menu, choose View > Setup Panel.

   The Setup Panel appears.
4. In the Rows list, right-click Group Type - Children of Dues and choose Select Items.

   The Select Items tab appears, with the Children of Dues item of the Group Type hierarchy selected.
5. Multi-select the Chapters level and the Dues level (hold Ctrl while clicking each level in the list), ensuring that you first deselect the Children of Dues item.

   The Select Items tab now shows that only Chapters and Dues are selected.

6. From the main menu, choose View > Apply Now.

   The view displays your query results, using a line chart that compares the annual number of dues and activity fee payments to the annual number of members in all chapters.

Viewing the iMIS cube for ad-hoc analysis

If the predefined views in the iMIS Analytics Briefing Book for ProClarity Professional do not provide the specific iMIS business performance data that you would like to examine, you can use the Setup Panel feature of ProClarity Desktop Professional to create custom views of the measures and hierarchies available in the iMIS cube.

The following procedure uses one specific scenario to demonstrate how to create ad-hoc views of the iMIS cube using ProClarity Professional. You can adapt this procedure as necessary to perform ad-hoc analysis of other types of iMIS information.

> **Note:** Note: If you are not using the ProClarity Professional viewer, you must adapt this procedure as necessary for your choice of OLAP viewer. See your viewer's documentation for more information.

Before you begin

- Analytics must be properly installed and configured, and the Analytics data warehouse and analysis database must be populated with data from the iMIS database. See "Analytics implementation" for more information.
- ProClarity Professional must be installed on your computer.
- The Analytics Briefing Book must have been installed on your computer. See Installing the Analytics Briefing Book on client computers for more information.

Scenario

In the following sample procedure, you want to analyze membership data that is not available as a default view in the Analytics Briefing Book. You use ProClarity Professional to create a new view that shows the total count of specific member types per calendar year, based on their membership subscription begin dates. Because this is a view you might

want to review later, you then save the new view for easy access the next time you want to examine the same information.

To view the iMIS cube for ad-hoc analysis

> **Note:** Note: See your ProClarity Professional documentation for more information about performing the following steps.

1. In ProClarity Professional, open the Analytics Briefing Book (iMIS Analytics.bbk).
2. Find a pre-defined view that already uses the type of chart you think would be most appropriate for interpreting the membership data that you want to analyze. For example, the Membership Renewal Rates view uses a line chart that makes it easy to see growth trends, along with a supplemental grid that contains raw counts for each data point.
3. From the main menu, choose View > Setup Panel.

   The Setup Panel appears.
4. In the Hierarchies tab, ensure that the Group Enrollment Fact measure group is the currently filtered list of available hierarchies and measures. If not, click the hierarchy filter beneath the tab name and choose Group Enrollment Fact from the resulting menu.

   The list of available hierarchies in the Group Enrollment Fact measure group appears.
5. Define the rows and columns of your new ad-hoc query.

- Expand the Customer category and drag its Customer.Type hierarchy into the Rows list.
- Drag all other existing hierarchies out of the Rows list.

  The Rows list now contains only the Customer.Type hierarchy.
- In the hierarchy list, expand the Date Begin category and drag its Date Begin.Calendar hierarchy into the Columns list.
- Drag all other existing hierarchies out of the Columns list.

  The Columns list now contains only the Date Begin.Calendar hierarchy.

6. Refine the row and column hierarchies to include only the specific hierarchy members that you want to examine.

- In the Rows list, right-click the Customer.Type hierarchy and choose Select Items.

  The Select Items tab displays the levels and members of the Customer.Type hierarchy.

- Expand the All level and multi-select the customer types that you want to examine (hold Ctrl while clicking each customer type in the list), ensuring that you first deselect the Default (All) level at the top of the list. For example, you might select all of the following customer types:

- Associate Member
- Company Member
- CPA Member
- Individual Member
- Student Member

- In the Columns list, right-click the Date Begin.Calendar hierarchy and choose Select Items.

  The Select Items tab displays the levels and members of the Date Begin.Calendar hierarchy.

- Expand the All level and multi-select the specific calendar years that you want to examine, ensuring that you first deselect the Default (All) level at the top of the list.

7. Define the measure to use for the background of the query.

- In the Background list, right-click the currently-displayed measure and choose Select Items.

  The Select Items tab displays the measures that are available in the Group Enrollment Fact measure group.

- Select the Count measure.

8. (optional) In the Columns list, click the Filter Empty Columns button to ensure that your query won't display years for which there is no data.
9. From the main menu, select View > Apply Now.

   The view displays your query results, using a line chart that enables you to see growth trends and a supplemental grid of tabular membership subscription begin counts for each year.
10. (optional) Change the chart style to a bar chart by right-clicking in the chart area and choosing Chart Type > Bar Chart.

    The view displays a bar chart of the same data, which makes it easy to compare the ratio of membership subscription started in each calendar year.
11. You decide that you want to save this view for easy access in the future. You can do so by either saving it as a personal view under My Views, or by adding the view to the briefing book (which enables you to share it with others by giving them a copy of the briefing book).

Analytics implementation

Business intelligence solutions can be complicated to implement because they require:

- Understanding online analytical processing (OLAP) concepts and implementation.
- Setting up special OLAP databases: the data warehouse and the analysis database.
- Configuring and scheduling Integration Services packages that periodically extract data from your iMIS database, load the data into your data warehouse, and transform the contents of your data warehouse into cubes in the analysis database.
- Learning and using OLAP viewer software to analyze the cubes in your analysis database.

Depending on your organization's experience with implementing business intelligence solutions, you might involve ASI Consulting to ensure you achieve your business intelligence goals quickly.

Analytics system requirements

iMIS Analytics comprises some program files, OLAP database components, and a briefing book designed for the third-party product ProClarity Professional. The OLAP database components can be installed to the same SQL Server host that contains your iMIS database (a single-tier configuration), or they can be installed to a separate SQL Server host (a two-tier configuration).

- The server host on which the Analytics program is installed is the iMIS application server (appserver).
- The SQL Server host on which the OLAP database components reside is the Analytics host.
- The SQL Server host on which the iMIS database resides is the iMIS host.
- If you installed the OLAP database components on the same host as the iMIS database, the Analytics host is also the iMIS host.

  Analytics is installed as an optional component by performing a Custom installation with the iMIS installer on an application server host.

  iMIS application server requirements

- iMIS application server hosts must meet all stated application server requirements for iMIS.
- The database server host that contains the SQL Server instance in which you want to create your Analytics data warehouse and analysis database must also have a default instance of SQL Server installed on it, and that default instance must have Microsoft SQL Server Integration Services (SSIS) installed. This is required by the Integration Services packages used by Analytics.
- ProClarity Professional (version must support SQL Server Analysis Services)

  Caution! Install ProClarity Professional on the iMIS application server before installing Analytics. If it is not present on the appserver when you install Analytics, the Briefing Book will be missing connection information.

- For best results, use the same versions of Windows Server and SQL Server on both the iMIS and Analytics host servers.

  Analytics host system requirements

- The Analytics host must meet all database server requirements for iMIS, as well as these more specific requirements:
- 10/100 Mbps network speed (or faster) connection to all related iMIS application server hosts and to all client computers that are running ProClarity Professional
- Microsoft SQL Server (non-Express Edition version only)
- Microsoft Analysis Services, which must be installed in the default location: C:\Program Files\Microsoft Analysis Services
- Microsoft SQL Server Business Intelligence Development Studio
- The database server host that contains the SQL Server instance in which you want to create your Analytics data warehouse and analysis database must also have a default instance of SQL Server installed on it, and that default instance must have Microsoft SQL Server Integration Services (SSIS) installed. This is required by the Integration Services packages used by Analytics.
- If Analytics is installed on a separate database server host from the iMIS database server host, both hosts must be members of the same Windows domain, and both hosts must be configured to allow network DTC access (see "Enabling network DTC access for multi-server configurations"). This is required by the Integration Services packages used by Analytics.

  iMIS host system requirements

- The iMIS host must meet all stated database server requirements for iMIS.
- The iMIS database must contain the license key for Analytics.

  Workstation requirements

- OLAP viewer software; ProClarity Professional recommended.

Although you can use any OLAP viewer to browse the Analytics cubes, the Analytics Briefing Book is designed to work with ProClarity Desktop Professional. The Analytics Briefing Book contains many useful predefined views to help you analyze your iMIS business performance.

- Processor speed, memory, and disk space sufficient to meet the requirements for ProClarity Professional
- Workstations running ProClarity Professional must be able to address the Analytics host by using a standard Windows domain computer name

> **Note:** Note: Using ProClarity Professional on a remotely-accessed Terminal Server or Citrix machine is untested.

> **Note:** Note: VPN connections from ProClarity Professional on a workstation to the domain containing the Analytics host is untested.

Installing Analytics

You can install iMIS Analytics in a two-tier or single-tier configuration. See Basic concepts for your IT staff to determine which configuration is best for your implementation of Analytics.

Before you begin

- Make sure that the Analytics host, iMIS host, and iMIS application server all meet the Analytics system requirements.
- Note the SQL connection information for the iMIS database on the iMIS host, and for the SQL environment on Analytics host, if you are installing a two-tier configuration.
- Make sure your iMIS product license keys include the key for Analytics.

Installation scenarios

Installing Analytics requires extra steps if you are upgrading iMIS and/or Analytics:

Neither iMIS nor Analytics has been installed in your organization before, so you are installing both products at the same time.	Perform a standard installation of iMIS, choosing a Custom installation and selecting the optional component iMIS Analytics.
Analytics has never been installed before, but you currently have iMIS 15.1.3 or higher installed. You are therefore installing Analytics and upgrading iMIS.	Perform these tasks in the order listed: • Perform a standard upgrade of iMIS, choosing a Complete installation. Warning: do not install Analytics now! • Verify that iMIS is working properly. • Install Analytics from Add/Remove Programs (see below). • Run the package (see "Manually running the Update iAnalytics package") to populate the new analysis database installed by this latest release of Analytics.
You have both Analytics 1.0 and iMIS 15.1.3 or higher installed. You are therefore upgrading both products. Caution: You must do so in two separate passes.	Perform these tasks in the order listed: • Upgrade the SQL Server environment on your Analytics host as needed. • Ensure that the Analytics host meets all requirements. • Perform a standard upgrade of iMIS, choosing a Complete installation. Warning: Do not install Analytics now! • Verify that iMIS is working properly. • Install Analytics from Add/Remove Programs (see below).

- Migrate your data warehouse (see "Migrating the Analytics 1.0 data warehouse") to the newly installed one.
- Run the package (see "Manually running the Update iAnalytics package") to populate the new analysis database.
- Verify that Analytics is working properly.
- Delete the old data warehouse and analysis database from your SQL Server environment. Only the new iMIS_Analytics data warehouse and iAnalytics analysis database should remain.

To configure SQL Server 2012 services for Analytics

If you are using a separate host machine for Analytics, you need to set all of the SQL Server 2012 services to log on with the Local System account.

1. After you install SQL Server 2012, open Start > Administrative Tools > Services.
2. Set Log On > Log on As to use the Local System account on each of the SQL Server services:

- SQL Server
- SQL Agent
- Analysis Service
- Integration Services

3. Restart all of the services.

To install Analytics from Add/Remove Programs

> **Note:** Caution! Perform this procedure only if your scenario above directs you to do so.

1. Modify the existing iMIS installation by using Add or Remove Programs.

- From the application server's desktop, choose Start > Control Panel > Add or Remove Programs.

  The Add or Remove Programs window appears.

- From the list of Currently installed programs and updates, select iMIS and click Change/Remove.

  The welcome page of the iMIS - InstallShield Wizard appears.

- Select Modify and click Next.

  The Select Features page appears.

- Important! Every checkbox that is currently selected should remain selected to prevent the removal of existing iMIS components.

  Caution! If an already-installed component is selected on this page, the wizard should maintain installation of that component in subsequent steps. Ensure that every checkbox remains checked.

- In the Optional Components section, select the iMIS Analytics checkbox and click Next.

  The iMIS Analytics page appears.

2. Specify the connection information for the Analytics data warehouse and analysis database.

- (optional) From the iMIS Analytics SQL Server instance drop-down list, select a different SQL Server instance in which you want to create your Analytics data warehouse and analysis database.

  Caution! The database server host that contains the SQL Server instance you specify must also have a default instance of SQL Server installed on it, and that default instance

must have Microsoft SQL Server Integration Services (SSIS) installed. If not, the Integration Services packages used by Analytics will not run successfully.

- (optional) In the Data warehouse name field, replace the default name for the Analytics data warehouse with a new name of your choosing.
- (optional) In the Analysis database name field, replace the default name for the Analytics analysis database with a new name of your choosing.

3. Click Next.

   The Specify iMIS configuration page appears, but it is blank because you cannot change any values associated with the current iMIS installation.

4. Click Next.

   The Review modify settings page appears.

5. Ensure that the installation settings are accurate and click Next.

   The wizard displays setup status as it copies files and configures Analytics, and then the Maintenance Complete page appears.

6. Review all messages that are displayed on the completion page and take appropriate actions as needed.

7. Click Finish.

Migrating the Analytics 1.0 data warehouse

When upgrading from iMIS Analytics 1.0 to the current release of Analytics, as described in Installing Analytics, you must manually migrate your data warehouse tables from Analytics 1.0 into the new iMIS_Analytics data warehouse that is created when you install the current release of Analytics.

> **Note:** Caution! Certain tables and views must not be imported from the older data warehouse. These objects are listed in the following procedure.

Before you begin

- All Analytics system requirements for the Analytics host must be in place.
- The following procedure must be performed on the Analytics host.

To migrate the Analytics 1.0 data warehouse to the Analytics 15.0.x data warehouse

1. Using Microsoft SQL Server Management Studio, connect to the Database Engine on the Analytics host.
2. In the Object Explorer pane, expand the Databases folder.
3. Right-click the iMIS_Analytics database and choose Tasks > Import Data.

   The welcome page of the SQL Server Import and Export Wizard appears.
4. Click Next.

   The Choose a Data Source page appears.
5. Using the Server name and Database fields, specify your Analytics 1.0 data warehouse, then click Next.

   The Choose a Destination page appears.
6. Click Next without changing any values.

   The Specify Table Copy or Query page appears.
7. Select Copy data from one or more tables or views, then click Next.

   The Select Source Tables and Views page appears.
8. In the first column, select every table except for the following:

- DWMColumn
- DWMTable
- DWParameters

9. Ensure that you have not selected any views in the list, then click Next.

   The Save and Execute Package page appears.

10. Ensure that the Execute immediately checkbox is selected and click Finish twice to begin importing the selected tables from the old data warehouse.

    The wizard displays status while it imports the tables.

Enabling network DTC access for multi-server configurations

Due to stronger security on network communications enabled by recent service packs on Microsoft server operating systems (and present by default in newer server operating systems), network Distributed Transaction Coordinator (MSDTC) access might be disabled on one or both of the SQL server hosts in a multi-server configuration of iMIS Analytics.

If you have installed Analytics in a multi-server configuration, you must ensure that both the iMIS host and the Analytics host are configured to allow network DTC access.

Before you begin

Ensure that both your Analytics host and your iMIS host meet all system requirements (see "Analytics system requirements").

To enable network DTC access for multi-server configurations

1. On the Analytics host, choose Start > Control Panel > Administrative Tools > Component Services.

   The Component Services window appears.

2. In the console tree, click Component Services, then expand the Computers sub-folder.

   The My Computer icon appears in the console tree.

3. Right-click the My Computer icon and choose Properties.

4. On the MSDTC tab, click Security Configuration.

   The Security Configuration window appears.

5. In the Security Settings area, ensure that all of the following checkboxes are selected:

- Network DTC Access
- Allow Remote Clients

- Allow Remote Administration
- Allow Inbound
- Allow Outbound
- Enable XA Transactions

6. In the Transaction Manager Communication section, ensure that the Mutual Authentication Required option is selected.
7. Click OK.

   A confirmation message to stop and restart the MSDTC service appears.
8. Click Yes, then click OK at all further messages and windows.
9. Repeat this process on the iMIS host.

Manually running the Update iAnalytics package

When you install iMIS Analytics, the setup program creates a scheduled Integration Services package named Update instanceName_analysisDBName on the Analytics server host. The package extracts data from the iMIS database, updates the Analytics data warehouse, and updates the Analytics cubes.

The package is scheduled by default to run every night at 4:00 a.m. server time, but you can modify the schedule by using the procedure described in Changing the scheduled run time of the Update iAnalytics package.

You might occasionally need to manually execute this package during the business day, such as after first installing Analytics (to populate the data warehouse and cubes), or when configuring Analytics to track custom iMIS 10 demographics (see "Configuring Analytics to track custom iMIS demographics").

Before you begin

Analytics must be properly installed and configured. See Installing Analytics for more information.

> **Note:** Note: Depending on the size of your iMIS database, this process can take a long time to complete.

To manually run the Update iAnalytics package

1. Launch SQL Server Management Studio.

   Note: For SQL Server 2012, you must run as administrator: right-click SQL Server Management Studio and select Run As Administrator.

2. Connect to the Database Engine on the Analytics host.
3. In the Object Explorer pane, browse to SQL Server Agent > Jobs.

   The Summary Page displays the scheduled jobs on the Analytics host.

4. Right-click the Update instanceName_analysisDBName job and choose Start Job at Step.

   The Start Jobs window appears and displays status while it runs the job. When the job has completed successfully, the Start Jobs window displays a success message.

   Troubleshooting issues with the Update iAnalytics package

   If the facts in the iMIS cube have no data or if the data does not match the contents of the data warehouse after running the Update iAnalytics package (evidenced by the Briefing Book showing no data or incorrect or old data), you must run two stored procedures to fix the problem. This needs to be done only once.

1. Using Microsoft SQL Server Management Studio, connect to the Database Engine on the Analytics host.
2. Use the query window to execute the following two stored procedures, with the listed parameters:

   exec asi_dwSetLAll 1

   exec asi_DWSInitDB

3. Re-run the Update iAnalytics package.

Changing the scheduled run time of the Update iAnalytics package

The Integration Services package Update instanceName_iAnalytics is scheduled by default to run every night at 4:00 a.m. server time, provided that the SQL Server Agent is started. This package extracts data from the iMIS database, updates the iMIS Analytics data warehouse, and updates the Analytics cubes. You can specify any schedule for this package.

> **Note:** Note: Depending on the size of your iMIS database, this process can take a long time to complete.

Before you begin

Analytics must be properly installed and configured. See Installing Analytics for more information.

To change the scheduled run time of the Update iAnalytics package

1. Using Microsoft SQL Server Management Studio, connect to the Database Engine on the Analytics host.
2. In the Object Explorer pane, browse to SQL Server Agent > Jobs.

   The Summary Page displays the scheduled jobs on the Analytics host.
3. Right-click the Update instanceName_iAnalytics job and choose Properties.

   The Job Properties window appears.
4. On the Schedules page, from the Schedule list, select Update instanceName_iAnalytics.
5. Click Edit.

   The Job Schedule Properties window appears, displaying the current schedule for the Update instanceName_iAnalytics job.
6. Modify the schedule and click OK several times to close all open dialogs.
7. If the SQL Server Agent is not already started, right-click the SQL Server Agent object and choose Start.

Installing the Analytics Briefing Book on client computers

Users in the organization who have ProClarity Professional installed on their computers can use the supplied iMIS Analytics Briefing Book to analyze the data on the Analytics host. The Briefing Book is pre-configured with all the required connection information, so you need only to copy the Briefing Book from the iMIS application server where Analytics is installed to each user's computer.

> **Note:** Note: If you did not install ProClarity Professional on the appserver before installing Analytics, the Briefing Book will be missing required connection information. In this case, manually configure the connection information in the Briefing Book before you distribute it to Analytics users.

Before you begin

- Analytics must be properly installed (see "Installing Analytics") and configured.
- A version of ProClarity Professional that supports SQL Server Analysis Services must be installed on the user's computer.
- The client computer must be able to address the Analytics host (the database server host where the Analytics data warehouse and analysis database are installed) by using a standard Windows domain computer name.

To install the Analytics Briefing Book on client computers

> **Note:** Note: See your ProClarity Professional documentation for details.

1. Use Windows Explorer to copy the iMIS Analytics.bbk file from the Analytics folder on an iMIS application server where the optional Analytics product was installed (usually C:\Program Files\ASI\iMIS\Analytics).
2. Paste the iMIS Analytics.bbk file into an appropriate folder in the client computer (such as the user's My Documents folder).
3. Open the iMIS Analytics.bbk file in ProClarity Professional.

The Analytics data appears.

Troubleshooting connection issues with the Analytics Briefing Book

If the Briefing Book does not display the Analytics data, but instead prompts you to enter your username and password, the Briefing Book failed to connect to the Analytics host. This could be caused by one or both of the following issues:

- The SQL Server host where the Analytics data warehouse and analysis databases are located is not addressable from the client computer by using a standard Windows domain computer name.
- The Briefing Book is missing connection information, which can occur if you install Analytics before installing ProClarity Professional on an iMIS appserver.

Use the following steps to correct these issues:

1. Work with your network administrator and your database administrator to ensure that the client computer can address the Analytics host by domain name.
2. In ProClarity Desktop Professional, use the Change Connection Information Wizard to examine and modify the connection information defined in your original copy of iMIS Analytics.bbk Briefing Book. You must ensure that the Briefing Book uses the following values:

- Provider - MSOLAP (SQL 9.0)
- Server Name - the full domain name of the SQL Server instance that contains your Analytics analysis database (the Analytics host). If Analytics is installed in a named instance, you must use the naming convention [hostDomainName]\[instanceName].
- Catalog - iAnalytics (this is configurable)
- Cube - iMIS

Granting read access to the analysis database

To enable people who aren't SQL Server administrators to view the Analytics analysis database by using the Analytics Briefing Book, you must enable the Everyone role in SQL

Server to have read access to the analysis database.

Before you begin

- Analytics must be properly installed and configured. See Installing Analytics for more information.

To grant read access to the analysis database

1. Using Microsoft SQL Server Management Studio, connect to Analysis Services on the Analytics host.
2. In the Object Explorer pane, expand the tree to view the contents of the Databases > iAnalytics > Roles folder.
3. Right-click the everyone role and choose Properties.

   The Edit Role window appears.
4. On the Data Sources page, in the iAnalytics data source row, specify Read access and select the Read Definition checkbox.
5. On the Cubes page, in the iMIS cube name row, specify Read access, Drillthrough local cube/drillthrough access, and select the Process checkbox.
6. Click OK to save your changes.

Configuring Analytics to track custom iMIS demographics

You can track custom iMIS demographics (custom fields) as attributes in the iMIS Analytics customer dimensions. Only fields from single-instance custom tables can be tracked in Analytics. If there is demographic data in multi-instance custom tables that you want to track in Analytics, you must redefine the data in iMIS as a single-instance custom table. Consult your Authorized iMIS Solution Provider (AiSP) for assistance with this process.

Before you begin

- Read Custom iMIS Demographics and Slowly Changing Dimensions in Basic concepts for your IT staff.

- Perform this procedure on the iMIS application server where Analytics is installed.
- If SQL Server Business Intelligence Development Studio (or any Visual Studio-based window) is currently open on the host, close the window before starting this procedure. If Visual Studio is left open during the early parts of this procedure, you might have difficulty viewing newly-added custom fields.

To configure Analytics to track custom iMIS demographics

> **Note:** Caution! The Analytics Configuration tool used in this procedure is meant primarily for advanced development and customization of Analytics. Using this tool for any purpose other than the specific goals of this procedure is unsupported at this time.

1. On the iMIS application server where Analytics is installed, open your Analytics folder, such as C:\Program Files\ASI\iMIS\Analytics.
2. Double-click AnalyticsConfiguration.exe.

   The Analytics Configuration window appears.
3. In the i15.UseCustomerExtensions row, set the Value to 1.
4. Click File > Save.
5. Choose Tools > Mappings.

   The Analytics Mappings window appears.
6. From the Table List, select the CustomerExt dimension table.

   The editor grid displays all of the fields from single-instance custom tables in the iMIS database that can be tracked in Analytics.
7. Select the fields to track and specify their slowly changing dimension (SCD) type:

- In the Active column, select the checkbox corresponding to each custom field that you want to track in Analytics.

- In the SCD Type column, specify which slowly changing dimension type to use for each field that you marked as Active:
- Enter 2 to specify Type 2 (preserves history). Use this slowly changing dimension (SCD) type if you want to preserve a history of older attribute values in the data warehouse (by adding new records) when the custom field is changed in iMIS.
- Enter 1 to specify Type 1 (overwrites history). Use this SCD type if you want to always overwrite the current attribute value in the data warehouse when the custom field is changed in iMIS.
- Enter 0 to never update records. Use this special value for attributes that you never want to update from its original value when first extracted into the data warehouse.

8. Click Save to save the changes that you have made to the CustomerExt table definition.
9. Close the Analytics Mappings window.
10. Connect to the Analytics analysis database
    - Choose Start > All Programs > Microsoft SQL Server > SQL Server Business Intelligence Development Studio.

      The Visual Studio window appears.
    - Choose File > Open > Analysis Services Database.

      The Connect To Database window appears.
    - In the Server field, specify the SQL Server instance that contains your Analytics analysis database. This field is case-sensitive.
    - From the Database drop-down list, select your analysis database (named iAnalytics by default).
    - Click OK.

      The Solution Explorer pane displays the contents of your analysis database.
11. Update the Analytics data warehouse structure to incorporate the new iMIS custom fields.

- In the Solution Explorer, in the Data Source Views folder, right-click the iAnalytics data source view and choose Open.

  The iAnalytics data source view appears.

- In the toolbar area for the data source view, click the Refresh Data Source View icon.

  The Refresh Data Source View window appears. All of the iMIS custom fields that you marked as Active in the Analytics Mappings window should be listed as Added for the DWCustomerExtDim table.

- Click OK.

- The DWCustomerExtDim table in the data source view is updated to include new columns for each of the iMIS custom fields.

- Choose File > Save All to save the changes to the data source view and to update the Analytics data warehouse structure accordingly.

12. Update the Analytics analysis database dimensions to incorporate the new columns that you added to the data warehouse.

- In the Solution Explorer, in the Cubes folder, right-click the iMIS cube and choose Open.

  The Cube Structure tab for the iMIS cube appears.

- In the toolbar area for the Cube Structure tab, click the Add Cube Dimension icon.

  The Add Cube Dimension window appears.

- From the Select dimension list, select Customer Ext Dim and click OK.

  The Customer Ext Dim dimension is added to the Dimensions lists.

- In the Hierarchies tab of the Dimensions list, right-click the Customer Ext Dim dimension and choose Edit Dimension.

  The Dimension Structure tab for the Customer Ext Dim dimension appears.

- In the Data Source View, locate the DWCustomerExtDim data source and scroll the list of columns in the data source until the new iMIS custom fields are visible.

- For each column in the DWCustomerExtDim data source that corresponds to the new iMIS custom fields that you want to track in Analytics, perform the following steps.

1. Multi-select all of the columns (hold Ctrl while selecting each column).
2. Right-click the selected columns and choose New Attribute from Column.

   The columns are added to the Attributes list for the Customer Ext Dim dimension.

- Choose File > Save All to save the changes to the Customer Ext Dim dimension and the iMIS cube in the analysis database.

  The Microsoft Visual Studio window appears, prompting you to reprocess various objects in the analysis database.

- Click Yes.

  The Process Object(s) window appears.

- Click Run.

  The Process Progress window appears and displays status while the analysis database is reprocessed.

- When the reprocessing has completed and the Status field displays Process succeeded, close all SQL Server Business Intelligence Studio windows.

13. Update the data warehouse and analysis database with the new custom fields from the iMIS database by manually running the Update iAnalytics package.
14. Verify that the new custom fields are available in Analytics.

- Open the iMIS Analytics.bbk file in ProClarity Professional.

  The Analytics data appears.

- In the Briefing Book area, expand the Revenue folder and select the Revenue by Product Class view.

  The Revenue by Product Class view appears.

- Choose View > Setup Panel.

The Setup Panel appears.

- Verify that the Customer Ext Dim dimension is listed in the Custom Hierarchies for the view.
- Expand the Customer Ext Dim dimension and verify that the new custom fields from the iMIS database are listed as attributes in the dimension.

15. Create a new view that uses one of the custom fields.

- Ensure that the Revenue by Product Class view is still displayed, and the Customer Ext Dim dimension is still expanded in the Setup Panel.
- Right-click an attribute in the Customer Ext Dim dimension that corresponds to one of the new custom fields and choose Move to Rows.

  The attribute appears at the top of the Rows list of the Setup Panel.
- In the Rows list, select and drag the attribute from the top of the list to the bottom (immediately after the Product Class hierarchy.
- Choose View > Apply Now.

  The table portion of the view changes to display new sub-rows within each of the product class rows, and the graph portion also changes accordingly to show more granular breakdowns of each product class based on the attribute that you added to the view. For more information, see Viewing Analytics cubes for ad-hoc analysis (see "Viewing the iMIS cube for ad-hoc analysis").

Defining a default country code

Several dimensions in the cube created by iMIS Analytics rely on the Country portion of a contact record's address information. For this reason, it is important to assign a default country code to iMIS contact records that are missing country information.

When the Analytics data warehouse is populated, a special country code (USA by default) is inserted into data from iMIS that does not contain country information. You can change this default country code to a different value at any time.

> **Note:** Note: Changes you make to the default country code affect only the Analytics data warehouse and analysis database. This code is not inserted into your iMIS database. Changes that you make to the default country code are not retroactive.The new default country code will be used only for new records that are brought into the data warehouse.

Before you begin

- You must perform this procedure on the iMIS application server where Analytics is installed.
- Analytics must be properly installed and configured. See Installing Analytics for more information.
- If SQL Server Business Intelligence Development Studio (or any Visual Studio 2005-based window) is currently open on the host, close the Visual Studio window before starting this procedure.

To define a default country code

> **Note:** Caution! The Analytics Configuration tool used in this procedure is meant primarily for advanced development and customization of Analytics. Using this tool for any purpose other than the specific goals of this procedure is unsupported at this time.

1. On the iMIS application server where Analytics is installed, open Windows Explorer and navigate to the C:\Program Files\ASI\iMIS\Analytics folder.
2. Double-click AnalyticsConfiguration.exe.

   The Analytics Configuration dialog appears.
3. In the i15.DefaultBlankCountry row, set the Value to a valid 2- or 3-digit country code.
4. Click File > Save.

5. Update the data warehouse and analysis database by manually running the Update iAnalytics Integration Services package. (For more information, see Manually running the Update iAnalytics package.)

Defining the fiscal year used by Analytics

iMIS Analytics is configured at installation time to use the fiscal year that is currently defined in the AR/Cash feature of iMIS. If you later change the defined fiscal year in iMIS, you must manually configure Analytics accordingly so that the fiscal year is the same in both products.

> **Note:** Note: Changes you make to the fiscal year in Analytics affect only the Analytics data warehouse and analysis database.

Before you begin

- You must perform this procedure on the iMIS application server where Analytics is installed.
- If SQL Server Business Intelligence Development Studio (or any Visual Studio 2005-based window) is currently open on the host, close the Visual Studio window before starting this procedure.

To define a default country code

> **Note:** Caution! The Analytics Configuration tool used in this procedure is meant primarily for advanced development and customization of Analytics. Using this tool for any purpose other than the specific goals of this procedure is unsupported at this time.

1. On the iMIS application server where Analytics is installed, open Windows Explorer and navigate to the C:\Program Files\ASI\iMIS\Analytics folder.
2. Double-click AnalyticsConfiguration.exe.

   The Analytics Configuration dialog appears.

3. In the i15.ETL.FiscalYearBegins row, set the Value to a number from 1 to 12 that corresponds to the calendar month in which the fiscal year begins. For example, if the fiscal year begins in April, enter 4.
4. Click File > Save.
5. Update the data warehouse and analysis database by manually running the Update iAnalytics Integration Services package. (For more information, see Manually running the Update iAnalytics package.)

Securing Analytics

iMIS Analytics provides no security capabilities beyond that supported by Microsoft SQL Server. Use Microsoft SQL Server Management Studio to define security roles and permissions for the Analytics data warehouse and for the Analytics cubes.

- Connect to the Database Engine on the Analytics host to define properties for the Analytics data warehouse.
- Connect to Analysis Services on the Analytics host to define properties for the Analytics cubes.

Uninstalling Analytics

Because iMIS Analytics comprises SQL Server and Analysis Services databases, Integration Services packages, jobs, and Briefing Book files for ProClarity Professional, the Windows uninstall process cannot completely remove all Analytics components. After removing Analytics by using the Windows Add or Remove Programs utility, you must also manually remove some Analytics components.

To uninstall Analytics from the Analytics host

1. On the Analytics host, choose Start > Control Panel > Add or Remove Programs.

   The Add or Remove Programs window appears.
2. From the program list, select iMIS and click Change/Remove.

   The Welcome page of the iMIS - InstallShield Wizard appears.

3. Select the Modify option and click Next.

   The Select Features page appears.

4. Clear the iMIS Analytics checkbox located beneath the Optional Components node.
5. Click Next.

   The wizard displays status information as it removes Analytics. When the uninstallation is complete, the Maintenance Complete page appears.

6. Click Finish.
7. Remove SQL Server Analysis Services components that are specific to Analytics.

- Use SQL Server Management Studio to connect to Analysis Services on the Analytics host.
- Remove the database named iAnalytics (the analysis database)

8. Remove SQL Server Database Engine components that are specific to Analytics.

- Use SQL Server Management Studio to connect to Database Engine on the Analytics host.
- Remove the following components:
- The database named iMIS_Analytics (the data warehouse)
- The SQL Server Agent job named Update instanceName_analysisDBName

9. Remove SQL Server Integration Services components that are specific to Analytics.

- Use SQL Server Management Studio to connect to Integration Services on the Analytics host.
- Remove the stored package named Update instanceName_analysisDBName (located in the MSDB folder)

  To uninstall Analytics from client computers

- Use Windows Explorer to remove the briefing book (iMIS Analytics*.bbk).

AR/Cash Administration

Month-End Procedures

There are several month-end procedures associated with AR/Cash.

From AR/Cash, select Process month-end procedures to complete one of the following month-end procedures:

- Create GL journal
- Create credit invoices
- Purge old invoices and transactions

> **Note:** Note: After all transactions have been entered for a month, all batches for the month should first be posted before creating the GL journal, creating credit invoices, and purging old invoices and transactions.

> **Note:** Note: See Deferred Income in iMIS.

Creating the general ledger journal

> **Note:** Note: This feature is available only if you are licensed for General Ledger Interfaces.

The GL Journal feature allows you to transmit your cumulative iMIS-generated accounting transactions to the GL module monthly or more frequently.

Before exporting your GL journal data, print an audit trail report by selecting Transaction Lists from the Report Types drop-down list to review what you are about to export. The appropriate report choice may depend upon the summary level you selected for the GL interface entry. If you summarize at the monthly level, a recommended selection is Transaction Lists from the Report Types drop-down list and then the AR/Cash Distribution Summary report from the Available Reports drop-down list. You should also print a trial

balance by selecting Account Status from the Report Types drop-down list and Trial Balance from the Available Reports drop-down list.

When the GL interface is run, the following actions are performed:

- Entries are created to move deferred income to current income
- Due To-Due From tables are created as needed
- The transaction posting flag is set so that the transaction cannot be posted again

> **Note:** Note: For more on the GL Journal feature and specific GL packages, see General Ledger Interfaces.

Transaction lists report format

Transaction lists reports include the following:

- AR/Cash Daily Distribution Summaries - Provides an accounting entry recap by day for each of the days included in the Select Date Range window.
- AR/Cash Distribution (Detail or Summary) - Lists entries generated throughout all iMIS modules, sorted by pseudo-account number and listing actual GL account numbers, if assigned.
- AR/Cash Transactions - Yields the same format as the transaction journal, but prints transactions generated throughout all iMIS modules. Like the AR/Cash journal, this report lists detail audit trails of transactions and a summary report by GL account (or pseudo GL account). It lists any transactions not purged in the specified date range.

To run the Transaction Lists Distribution Summary

The Transaction Lists: AR/Cash Distribution Summary report provides a simple summary by GL account number. If there is anything wrong (such as invalid account numbers), you can address these errors before proceeding.

1. From AR/Cash, select Generate Reports to open the Generate reports window.

2. Select Transaction Lists from the Report Types drop-down list.
3. Select AR/Cash Distribution Summary from the Available Reports drop-down list.
4. Click Set Report Destination and select a report destination (for example, printer, screen, or file).
5. Select any desired options (for example, margins) from the Options drop-down menu.
6. Click Run.
7. The AR/Cash Distribution Summary: Select Date Range window displays. Enter the date range of the transactions to include in the GL interface entry.
8. Click OK.

To create the GL Journal

1. From AR/Cash, select Process month-end procedures, and click Create GL Journal.

   A message appears requesting verification of the request.

2. Click Yes.

   The General Ledger Interface: Select Date Range window appears.

3. Enter the date range of the transactions to include in the GL interface entry.
4. Click OK.

   The search will not include any previously exported transactions, regardless of the date. If iMIS finds qualified transactions, iMIS displays a message identifying your GL package.

5. Click Yes.

Credit balances

Within iMIS, any AR item with a credit balance can be processed as a refund. Credit balances originate from event cancellations, billing overpayments, and unidentified payments.

Through a special menu option, iMIS allows you to view, analyze, and print a list of credit items and issue refunds, either for all items or selectively for specific items on the open credit list.

When iMIS issues the refunds, iMIS generates adjusting entries to bring the AR credit balances to zero. Refund checks can then be issued through the third-party AP program. Data entry can be done manually using the iMIS refund report as a basis, or the refund data can be automatically generated if your system is licensed for the iMIS AP interface module.

AP interfaces are available for selected third-party AP packages. The iMIS AP interface streamlines the processing of refunds by supplying the vendor and open-item transaction data for the third-party AP package to use to generate refund checks.

Creating credit invoices

The credit invoices feature identifies and lists all AR items with a current credit balance. It provides the necessary options to select and process credit items for refund.

Before using the credit invoices feature, you must assign a refund clearing account for all appropriate entities on the AR/Cash Default Accounts window (from AR/Cash, select Set up module, and click Default Accounts). Assign a default account number in the Refund Clearing field. For more information, see System Setup (see "AR/Cash: Set up module").

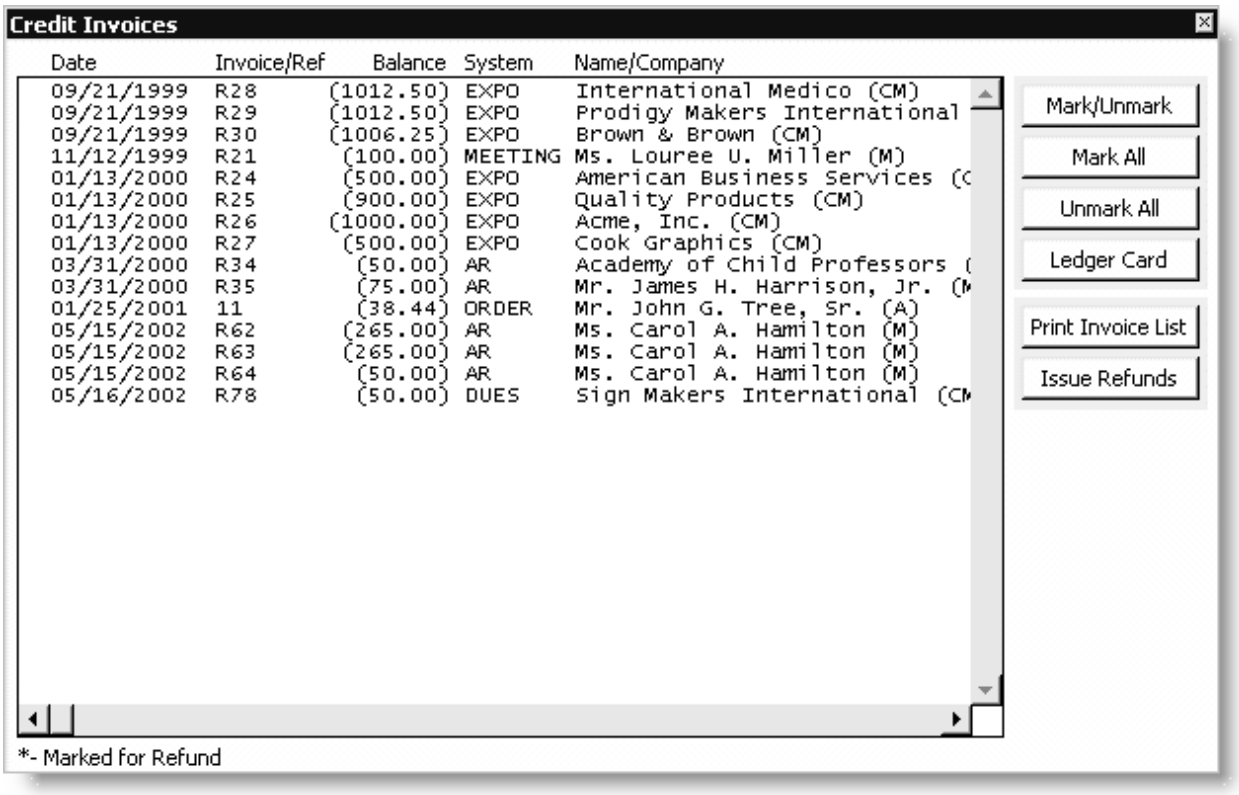
The Refund Clearing account represents a bridge or clearing account between AR and AP. Use the Refund Clearing account for the debit distribution entries in the AP entries in the same manner that you use the clearing account for the credit side of the AR reversal entries.

To create credit invoices (refunds), use the Credit Invoices window (from AR/Cash, select Process month-end procedures, and click Credit Invoices). You can use the Credit Invoices window to perform the following tasks:

- View credit items
- Mark credit items for refunds

- Print the list of open invoice credits
- Issue refunds

Credit Invoices window



From AR/Cash, select Process month-end procedures, and click Credit Invoices

Credit Invoices scrolling list

This area contains a list of all credit invoices, including Date, Invoice/Ref, Balance, System, and Name/Company. Each item is labeled with the initial transaction date, invoice or reference number, credit balance, source system, and customer/customer name.

Mark/Unmark button

Select to mark individual items for refund, which is indicated by an asterisk at the far left. The button toggles (turns off or on) the marking of any selected items.

- * = marked
- (no *) = unmarked

Mark All button

Select to mark all items for refund. Click the Mark/Unmark button to individually unmark each item you do not want refunded.

Unmark All button

Select to unmark from all items.

Ledger Card button

Select to view an item's transaction detail or ledger card history on the Transaction Ledger window. To display this detail, double-click on a line item, or click on a line item and click Ledger Card.

Print Invoice List button

Select to print a report of credit items, including initial transaction date, reference or invoice number, source system, general item description, total charges, total credits and resulting (credit) balance, and the customer ID and name.

Issue Refunds button

Select to reverse the balances (for the marked items only) by generating the necessary debit-adjusting entries and print a report documenting the refunds (reversals).

The entries debit the appropriate AR account for the full balance and credit the default refund clearing account.

In a multiple-entity situation, the owner entity for the generated transaction is assigned according to the owning entity of the initial sales-related transaction. iMIS appropriately uses AR from the initial transaction, and uses the refund clearing account from the default tables for the owning entity.

Note: Note: Use the generated report as the basis for the refund items, which should be processed in AP. The refund clearing account should be entered as the AP offset or distribution account, bringing the net effect on the clearing account to zero.

Accounting transactions created when processing refunds

The accounting transactions created in the iMIS Trans table when issuing refunds include the following:

- A credit is made to the Refund Clearing account that has been set up in the AR/Cash Default Accounts table.
- A debit is made to the Accounts Receivable account that has been set up in the AR/Cash Default Accounts table.

These accounting transactions are imported into your third-party GL package at GL interface time.

If you use an AP interface, one export file contains the transactions that are to be imported into your third-party AP package. This file, usually named invoice.txt, may contain one debit transaction to the Refund Clearing account per refund, or it may contain two transactions per refund including a debit transaction to the refund clearing account and a credit transaction to AP. In the scenario where the export file only contains the debit transaction to the refund clearing account, the third-party AP interface automatically creates the credit transaction to AP when the file is imported.

The final refund-processing step is generating refund checks through your third-party AP package, which will create a debit to the AP account and a credit to the cash account. When writing the refund check in your AP package, two transactions are created, including a credit to cash and a debit to AP.

If your system is not licensed for the iMIS AP module, you can enter the data manually by using the iMIS Refund report as a basis. This report is generated when refunds are processed in iMIS. You should use the refund clearing account as the AP offset or distribution account, bringing the net effect of the clearing account to zero.

Implementing mass write-off of debit/credit balances

The AR/Cash module allows you to perform a mass write-off of debit/credit balances based on a user-defined cutoff date and a maximum dollar amount.

The system setup options for this feature include an AR/Cash Set up module option that allows you to define the maximum default dollar amount to write off. During the write-off process, all debit or credit balances less than or equal to this amount are written off. You can overwrite this default during the actual write-off process.

A default GL account number, entered on the AR/Cash Default Accounts window, that offsets the credit or debit created by the write-off process will be written. For example, if you write off credit balances, iMIS creates a debit to the default AR account and a credit to the write-off offset account specified on the AR/Cash Default Accounts window.

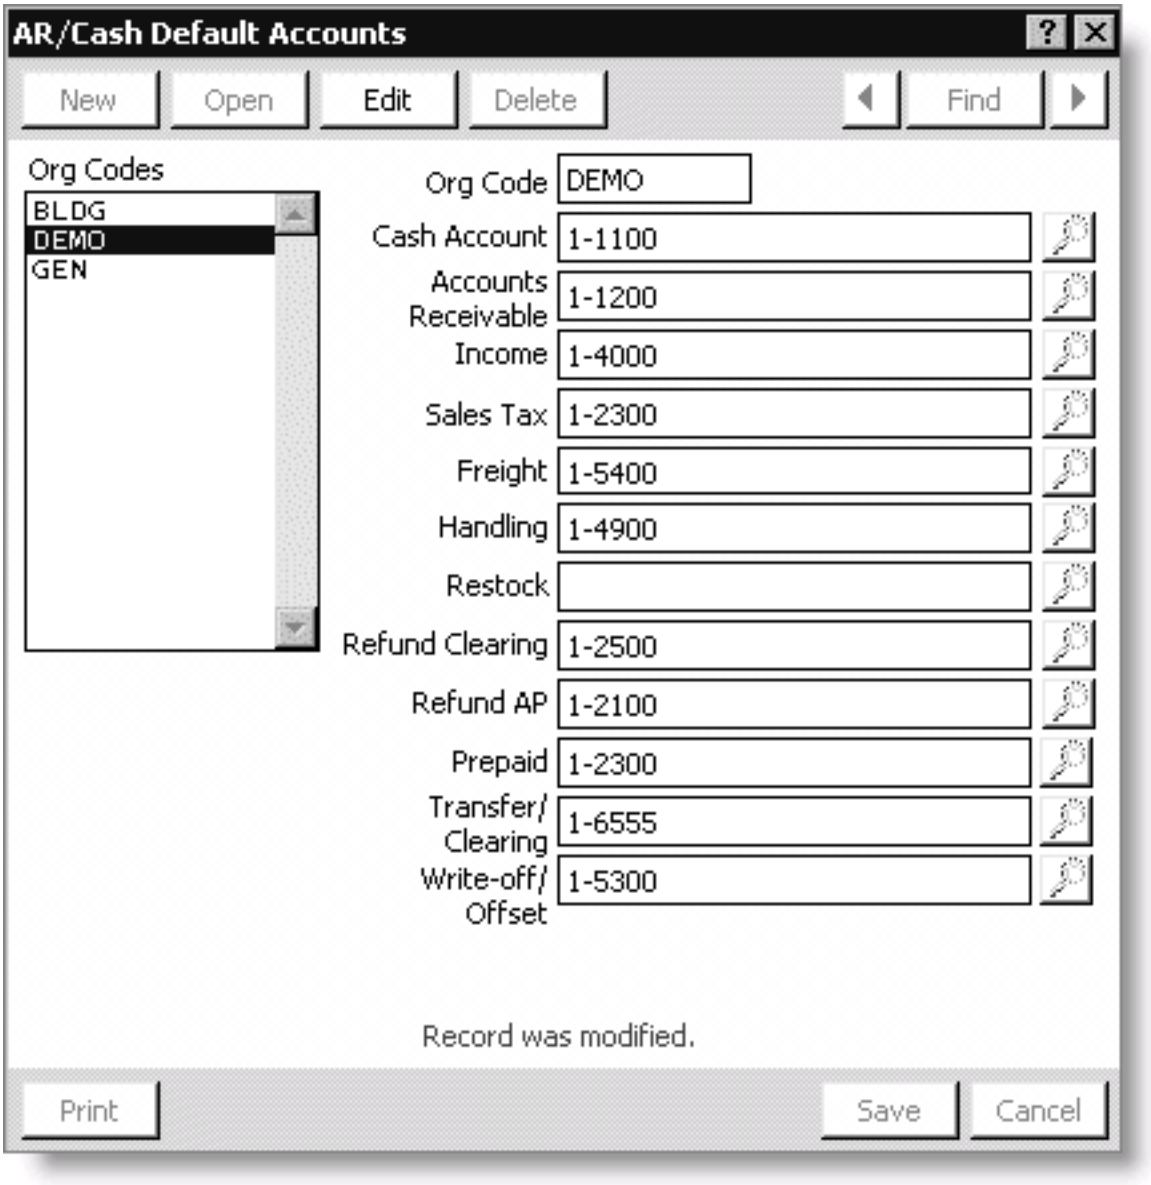
To set the default write-off amount

1. From AR/Cash, select Set up module to open the Set up module window.
2. Click Edit.
3. Enter a default dollar amount in the Default Cut Off Amount for Write-offs field.
4. Click Save.

To enter the default write-off offset account

1. From AR/Cash, select Set up module to open the Set up module window.
2. Click Default Accounts to open the AR/Cash Default Accounts window.
3. Click Edit.
4. Enter the GL account number to which you will be recording the write-offs in the Write-off/Offset field.
5. Click Save.

AR/Cash Default Accounts window



To process mass write-offs

1. From AR/Cash, select Process month-end procedures, and click Credit/Debit Write-Offs to open the Credit/Debit Invoices Write-Off window.

   Note: The Cutoff Date field defaults to the system date and the Amount field defaults to the amount specified on the AR/Cash Set up module window. You can overwrite either or both of these fields as needed. iMIS writes off all debit or credit balances where the

INVOICE_DATE is equal to or older than the date specified in the Cutoff Date field and the balance is equal to or less than the amount specified in the Amount field.

2. Enable Debit or Credit and click Load List. A list of all records that meet the Cutoff Date and Amount criteria are displayed. Select these records for write-off by:

- Selecting an individual record by selecting the item and clicking Mark/Unmark.
- Selecting all records by clicking Mark All.

3. If you need to view the detail for an item, select the item and click Ledger Card. The Transaction Ledger window displays the balance details.
4. Print a list of all displayed items by clicking Print Invoice List for an audit report before processing the actual write-offs.
5. After you verify that the records selected for write-off are correct, click Write Off on the window to process the actual write-offs.
6. You can view the results of the write-off on the customer's Transaction Ledger window. From Customers, select Manage Customers to open the Manage customers window.
7. Click Find.
8. Enter the ID for the customer who had the write-off applied to their account.
9. Select the AR/Cash tab to view the accounts receivable information.
10. Double-click the line item that was written off to open the Transaction Ledger window.
11. Verify that the write-off has been recorded, and click OK.

AR/Cash: Set up module

Configuring the AR/Cash module includes setting up the following options:

- Basic AR/Cash options
- Default accounts
- Aging

- Batch Control
- G/L Interface
- Credit Card Authorization
- Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") options
- (VAT only) Taxation methods (see "Configuring VAT options in AR/Cash")

Financial entities

Before you configure several of the AR/Cash module features, you must define one or more financial entities in the iMIS system setup. Entities are also known as organizations, or in the case of fundraising financial entities, funds.

> **Note:** Note: A fund is an organization or entity that serves as an asset account for fundraising activities. If the entity currently being defined represents a Fund to which Fundraising gifts and pledges may apply, select the Is Fund checkbox in the Organization Names window.

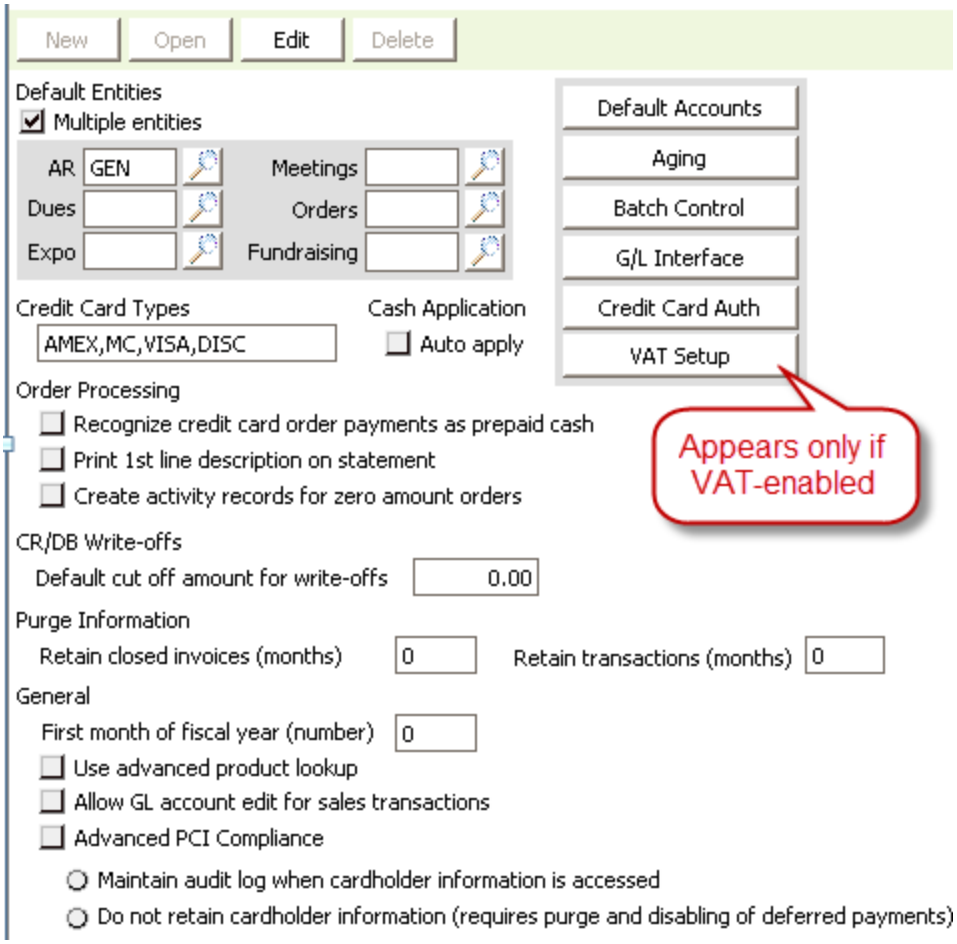
See the System Setup section for help with "Defining an organizational entity".

Setting basic AR options

Use the Setup module window to define high-level options such as:

- Default entities
- Credit card types
- Cash application information
- Order processing information
- Credit/debit write-offs
- Purge guidelines

Configure accounting options window



Desktop: AR/Cash > Set up module

Default Entities

- Multiple Entities - For most organizations, this option should be disabled. When enabled, iMIS separates and processes transactions for multiple financial entities that share a common customer database, and the following fields designate the default entities for their modules:
- AR - entity code for iMIS AR/Cash
- Meetings - entity code for iMIS Events
- Dues - entity code for iMIS Billing
- Orders - entity code for iMIS Orders

- Expo - entity code for iMIS Exposition Management
- Fundraising - entity code for iMIS Fundraising

Credit Card Types

- Designates a comma-delimited list of acronyms (which iMIS stores as uppercase) for credit cards you accept. Common acronyms include Master Card (MC), Visa (VISA), Discovery (DISC), and American Express (AMEX). If you use iMIS authorized forms, such as preprinted invoices that contain a credit card payment box, this list is printed in that box, which allows the customer to see the available credit choices.

  Note: This does not provide credit card validation or credit card processing within iMIS. See Credit Card Authorization for setup details.

Cash Application

- Auto apply - When enabled, incoming cash receipts are automatically applied to invoices beginning with the oldest outstanding balance on an individual's record. This setting can be overridden when entering cash receipts.

  Tip: If you have heavy transaction volumes, do not enable Cash Application Auto apply.

  Note: Auto apply only affects the functionality of the Enter and edit cash receipts window and AR Importer; if Auto apply is disabled, payment records in AR Importer files must contain the invoice number.

Related windows

- Default Accounts opens the AR/Cash Default Accounts window.
- Aging opens the AR/Cash Aging window.
- Batch Control opens the AR/Cash Batch Control window.
- G/L Interface opens the AR/Cash General Ledger window.
- Credit Card Auth opens the AR/Cash Credit Card Authorization window. (Enabled only if your system is licensed for CCAUTH.)

Order Processing

- Recognize credit card order payments as prepaid cash - When enabled, iMIS allows the credit card payment to be handled in the same manner as a cash payment and immediately record the payment into the batch, with an immediate debit to Cash and credit to the Prepaid account. When disabled, iMIS follows standard accounting practices and does not recognize cash for credit card payments until an order is shipped.

  Note: Credit card payments on orders placed in Orders and Service Central are always recognized as prepaid cash regardless of whether Recognize credit card order payments as prepaid cash is enabled.

- Print 1st line desc. on statement - When enabled, the first line of an order or a user comment appears in the AR/Cash tab on the Manage customers window and on the Enter and edit cash receipts window, and it prints on AR Statements. When disabled, only the order number appears.

- Create activity records for zero dollar orders - When enabled, activity records are created for orders that are no-charge orders.

  CR/DB Write-offs

- Default cut off amount for write-offs - Sets the maximum default amount to be written off. During the write-off process, all debit or credit balances less than or equal to this amount are written off. This value can be overridden during the actual write-off process.

  Purge Information

- Retain closed invoices (months) and Retain transactions (months) - Designates how long records can be viewed in iMIS after being closed. Set up your organization's overall purging parameters (months) for the AR/Cash module's housekeeping function.

  Tip: Set both retention periods to the same number of months, which lets you view Ledger Card transaction detail for matching invoice summary lines on the AR/Cash tab on the Manage customers window.

  General

- First month of fiscal year (number) - Designates the first month of your organization's fiscal year. Some GL interface choices will export the fiscal period along with the calendar transaction date of the transactions.

  Note: Annual dues uses this field to determine the Effective Date on the Process billing window.

- Use advanced product lookup - When enabled, enables users to use the Lookup icon to find products when entering and editing AR/Cash sales transactions.
- Allow GL account edit for sales transactions - When enabled, allows editing of the GL Account field for each product selected during sales, credit memo, and debit memo transactions. When disabled, the GL Account field cannot be edited on the Enter and edit sales transactions, Enter and edit credit memos, and Enter and edit debit memos windows.
- Advanced PCI Compliance - Enables iMIS-wide enforcement of the PCI Compliance support (see "Implementing Advanced PCI Compliance options") option that you choose:
- Maintain audit when cardholder information accessed - Directs iMIS to save encrypted cardholder data and to log every system event in which card information is accessed. The log is kept in the PciAuditLog table (see "Reading the PciAuditLog table").
- Do not retain cardholder information - Directs iMIS to save transactions without storing any cardholder data and to show only gateway reference numbers and authorization codes in windows and reports.

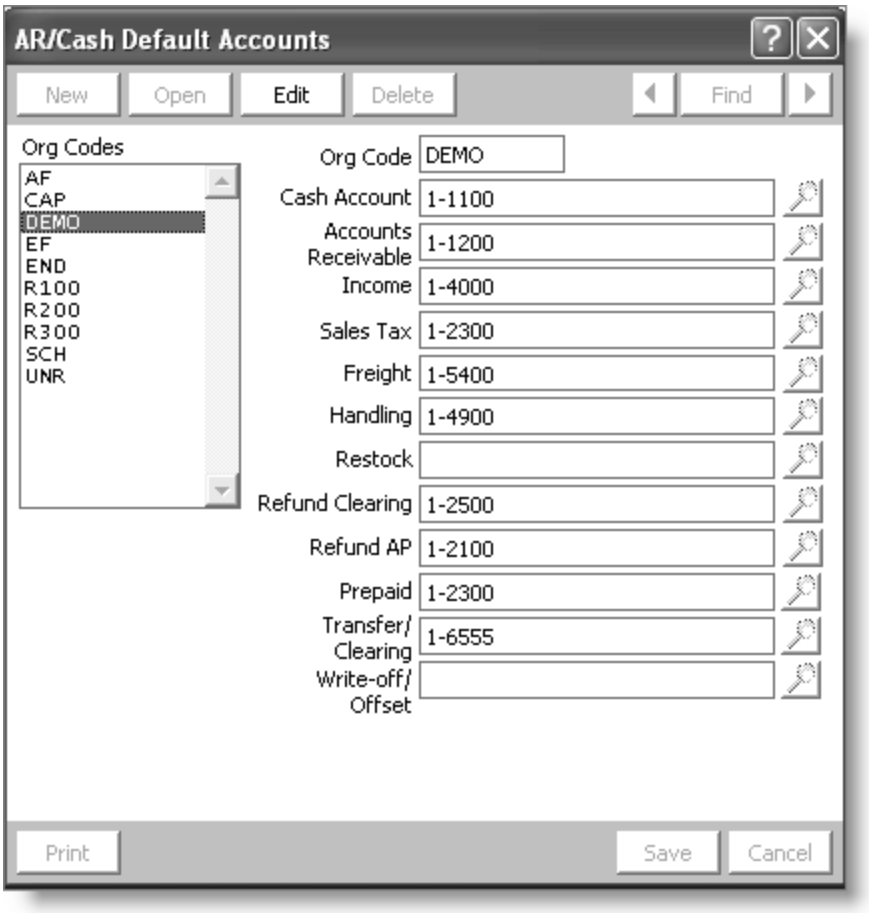
  Caution! To use this option, you must purge existing cardholder data from your database and disable all deferred payment processing in iMIS. See "Implementing Advanced PCI Compliance options".

Defining default general ledger accounts

Default general ledger accounts assign specific account numbers to an entity. They let you:

- Send data to a third-party GL software package using the iMIS GL Interface
- Track and report on accounting transactions accurately
- Perform DueTo/DueFrom processing when needed

Default Accounts window



From AR/Cash, select Set up module, and click Default Accounts

Org Codes

The Org Codes listed are set up in the Organization Names window using the iMIS system setup menu. The selected organization is displayed in the Org Code field.

Cash Account

(Required unless you are using batch control) If you are using batch control, all cash account codes are set by the Cash Account table entry for that batch.

This account is used for all iMIS cash-related transactions unless batch control is enabled or a credit card override account is specified. Multiple cash accounts can be defined and used at the batch control level.

Accounts Receivable

(required) This is the only place you can enter the main AR account code.

This is the main account that iMIS uses whenever full payment is not received for any order (for example, sales item or event registration). You can only have one Accounts Receivable account per organization.

Income

(Required if a specific income account is not supplied at the product level) iMIS uses this default income account only for those transactions where an income account is not specified at the product level.

Sales Tax

(Required if any account codes are not supplied at the tax authority level) iMIS uses this default sales tax account only for those transactions where a sales tax account is not specified at the product level.

Freight

(required) Enter an account code for the freight charges associated with orders.

Handling

(required) Enter an account code for the handling charges associated with orders.

Restock

Enter an account code for the charges associated with restocking returned orders.

Refund Clearing

This default account is the offsetting account that iMIS uses when it clears credit balances marked for refunds. Refund processing is performed on the Credit Invoices window (from AR/Cash, select Process month-end procedures, and click Credit Invoices). For more information, see Creating Credit Invoices.

This account also serves as a suspense (or bridge) account between AR and AP.

Each time iMIS generates a refund, accounts receivable is debited (to clear the credit balance) and the refund clearing account is credited. This credit balance is debited and cleared only when you enter the parallel account payable (AP) entry.

Refund AP

(Required only if you are licensed for the iMIS AP interface and you are importing into your third-party accounts payable software) This account is the accounts payable control account for the AP interface.

Prepaid

iMIS uses this account when a prepaid order is initially entered. The Cash account is debited and the Prepaid account is credited. When the order is invoiced, iMIS clears the prepaid amount and credits (transfers to) the appropriate income account.

This is a required account that is used in conjunction with prepaid order processing (simple or full order entry). The prepaid account is typically a deferred income balance sheet account.

Note: Note: Non-credit card cash order prepayments will involve the prepaid account, because check and currency receipts are immediately recognized upon order entry. Credit card payments will also use the Prepaid account if the Recognize Credit Card Order Payments as Prepaid Cash option is enabled (from AR/Cash, select Set up module). Otherwise, credit card payments are recognized when the order is invoiced.

Transfer/Clearing

This account is reserved for transaction generation where forced balancing is required.

iMIS uses the Transfer/Clearing account for two different system processes:

- Used in conjunction with prepaid order processing (simple and full order entry). It is used as a clearing account in the process to transfer the prepayment offset from prepaid (deferred income) to income.
- Used in the GL interface procedure for certain GL package choices. It is used when GL journal entries are generated and a restricted number of transaction lines are mandated.

> **Note:** Note: When the Transfer/Clearing account is used in a line item within a transaction, there will always be an offsetting line item(s) in an associated transaction to ensure that entries to the transfer account will always balance to zero.

Write-off/Offset

This is the GL account to which the offset credit or debit created by the credit/debit write-off process (from AR/Cash, select Process month-end procedures, and click Credit/Debit Write-Offs) will be written.

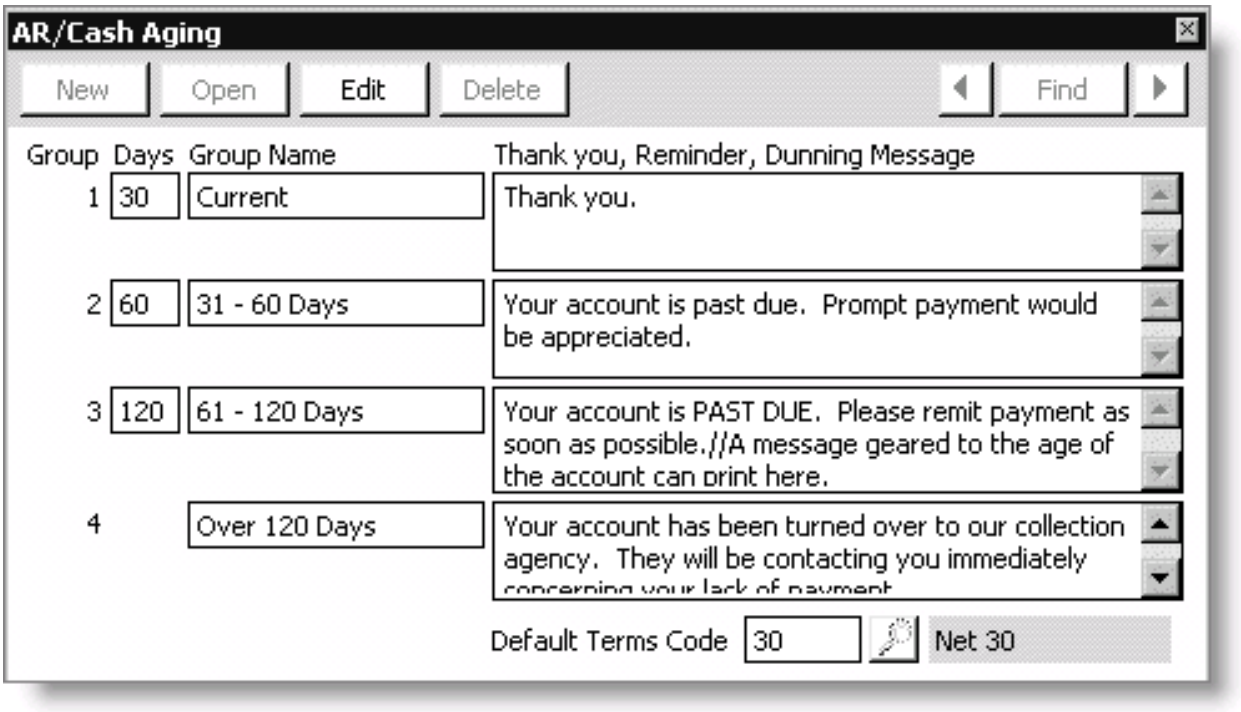
To assign AR/Cash default accounts codes

1. From AR/Cash, select Set up module to open the Set up module window.
2. Click Default Accounts to open the AR/Cash Default Accounts window.
3. From Org Codes, choose an organizational code.
4. Click Edit.
5. Enter the account number (or click the lookup icon to select a value) in each field.
6. Click Save.

Defining aging groups

You must define the guidelines for determining the aging groups to use for statements, aged trial balances, and account inquiries. Aging is the length of time an amount is past due for payment on an invoice.

Aging window



From AR/Cash, select Set up module, and click Aging

Group

Four groups define the guidelines for determining the Aging Groups to use for statements, aging trial balances, and account inquiries.

Days

The number of days indicates how many days old the invoice can be before the invoice moves out of this particular age group. When the invoice passes this age group by one day, the system automatically moves the invoice to the next age group.

Group Name

Enter a short name for each age group that names the group for all statements, aged trial balances, and account inquiries.

Thank you, Reminder, Dunning Message

If you would like a message to appear on statements when an account reaches a certain age, enter the message next to the appropriate age group. You can have different messages print for different ages.

> **Note:** Note: Currently, aging is based on the date of the invoice, not on a due date calculated from payment terms.

Default Terms Code

The Default Terms Code applies to all levels of order entry. Enter the code of the terms you defined on the Set up terms window (from AR/Cash, select Set up tables > Terms) that you want to use by default, or use the lookup icon to select a value. For example, a default term code of 30 would represent Net 30 days.

> **Note:** Note: You must populate the Default Terms Code field in order for Events functions to show for people to register for events on the Public view.

To define aging groups

1. From AR/Cash, select Set up module to open the Set up module window.
2. Click Aging to open the AR/Cash Aging window.
3. Click Edit.
4. Enter the aging information.
5. Click Save.

Setting up batch control

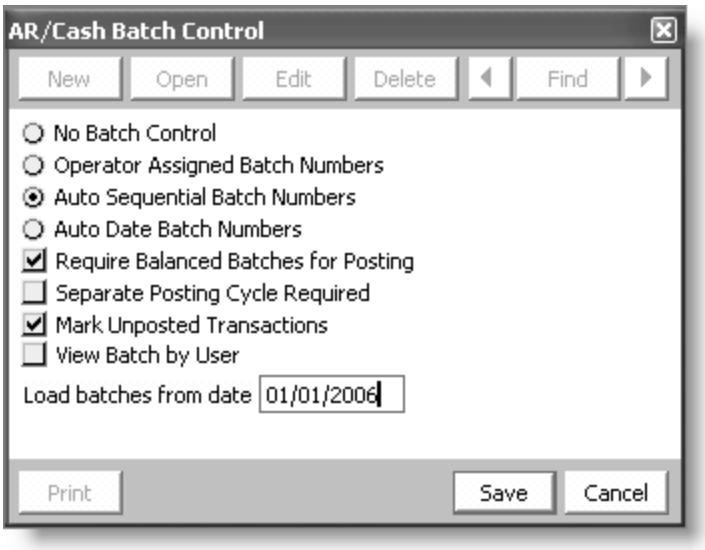
Setting up batch control consists of enabling batch control, configuring numbering and viewing options, and setting up cash accounts. These steps are required even if you only have one account.

> **Note:** Note: AR Importer batches are auto-created and auto-numbered and do not recognize specific iMIS users. These batches are assigned to the “Manager” user

in iMIS, and require a security level of 8 to view, edit, or delete transactions when the View Batch by User option is selected.

AR/Cash Batch Control window

This window specifies whether batch control is enabled, and if it is, the options that apply to batches throughout iMIS.



From AR/Cash, select Set up module and click Batch Control.

Batch control

The following options govern batch control in iMIS:

No Batch Control - Specifies that no batch control is used. This is a good option for simple or low-volume systems.

Operator Assigned Batch Numbers - Specifies that batch control is used and that data-entry operators can create their own batch numbers when needed. The batch number may be a combination of up to 15 alphanumeric characters.

Auto Sequential Batch Numbers - Specifies that batch control is used and that iMIS automatically assigns batch numbers to new batches using a sequential numbering system.

Auto Date Batch Numbers - Specifies that batch control is used and that iMIS automatically assigns batch numbers to new batches using a date-oriented technique. Multiple batches created on the same date are distinguished from each other with a sequential suffix attached to each new batch generated in a day. For example, 020515-1, 020515-2, and so forth.

> **Note:** Note: The following options are not displayed unless you enabled batch control by selecting one of the batch numbering options (Operator Assigned Batch Numbers, Auto Sequential Batch Numbers, or Auto Date Batch Numbers).

Require Balanced Batches for Posting

(Recommended) Specifies that unbalanced batches cannot be posted. For this option, iMIS considers a batch balanced when the following statements are true:

- The control amount is equal to the actual amount.
- The control count is equal to the actual count.

If either or both of the following statements are false, iMIS displays an error message, and does not post the batch.

> **Note:** Note: Hot posting (the default) reports transactions immediately.

Separate Posting Cycle Required

Specifies that transactions are not hot posted. Most users should not enable this option, because it prevents iMIS from automatically posting and updating accounting events to AR/Cash. Instead, transactions are posted only when the batch is posted.

Only in very high volume situations should you consider giving up the hot posting convenience, which saves processing time and speeds data entry.

> **Note:** Note: This option is not compatible with Service Central.

Mark Unposted Transactions

When selected, unposted transactions are preceded by (U) in the Description field on the Transaction Ledger window and line items with unposted transactions in the AR/Cash tab are preceded by (U).

> **Note:** Note: If the Separate Posting Cycle Required option is enabled, transactions are not displayed in the Transaction Ledger window until the batch is posted, so no transactions will be preceded by (U) if the Separate Posting Cycle Required option is enabled.

View Batch by User

Hides batches created by others from users whose authorization level for AR/Cash is less than 8. When this option is not selected, displays batches created by others. Hidden batches include the following batches:

- Accrual billing batches
- Orders with the Create New Batch for Invoicing option enabled
- AVAIL_CREDIT batches
- Importer batches (Billing, AR/Cash, Orders)

Load batches from date

Specifies a default date that is used to filter batches displayed in the Manage batches window. Users can override this filter.

To set up Batch Control

1. From AR/Cash, select Set up module.
2. Click Batch Control to open the AR/Cash Batch Control window.
3. Click Edit.
4. Select a batch control numbering option. The Auto Sequential Batch Numbers option or the Auto Date Batch Numbers option is recommended.

5. (Recommended) Select the Require Balanced Batches for Posting option to require that the control amount equals the actual amount, and the control count equals the actual count, before posting.
6. (optional) Select the Separate Posting Cycle Required checkbox.

   Note: This option is incompatible with Service Central.
7. (optional) Select the Mark Unposted Transactions (see "About marking unposted transactions") checkbox.
8. (optional) Select the View Batch by User (see "Limits on editing and deleting transactions") checkbox.
9. Click Save.
10. From AR/Cash, select Set up tables > Cash accounts to open the Set up cash accounts window.
11. Make an entry for all cash accounts (see "Setting up cash accounts") on the Cash Account window.
12. Click Save.

Limits on editing and deleting transactions

When the View Batch by User checkbox is selected, users can only edit or delete transactions contained in unposted batches that they create. If users attempt to edit or delete a transaction that was created by another user, a message instructs them to select a different transaction.

About marking unposted transactions

You must enable a batch control option and select the Mark Unposted Transactions checkbox on the AR/Cash Batch Control window before transactions can be marked as unposted.

If the Separate Posting Cycle Required option is enabled, unposted transactions will not be displayed in the Transaction Ledger window.

The AR/Cash tab on the Manage customers window shows the summary of an invoice. The summary of the invoice and its related transactions (payments and adjustments) displayed on the AR/Cash tab will be marked with (U) and unmarked as the transactions are created and posted. The Transaction Ledger window shows the detail lines of the invoice. Each of these lines is marked (U) while unposted and then unmarked when posted, and is unaffected by other transaction records.

An invoice will be visually marked as unposted with (U) if there is at least one transaction record linked to that invoice (a payment or an adjustment to that invoice) that meets all three of the following requirements:

- The transaction is linked to a batch.
- The batch has not been closed or posted (the batch has a status of Open or Ready on the Manage batches window).
- The transaction has not been exported through the General Ledger.

> **Note:** Note: Only future transactions are marked as unposted after the Mark Unposted Transactions option is selected.

> **Note:** Note: If the Separate Posting Cycle Required option is enabled, unposted transactions will not show up in the Transaction Ledger window.

Examples of unposted transactions

The following is an example of how transactions are marked unposted.

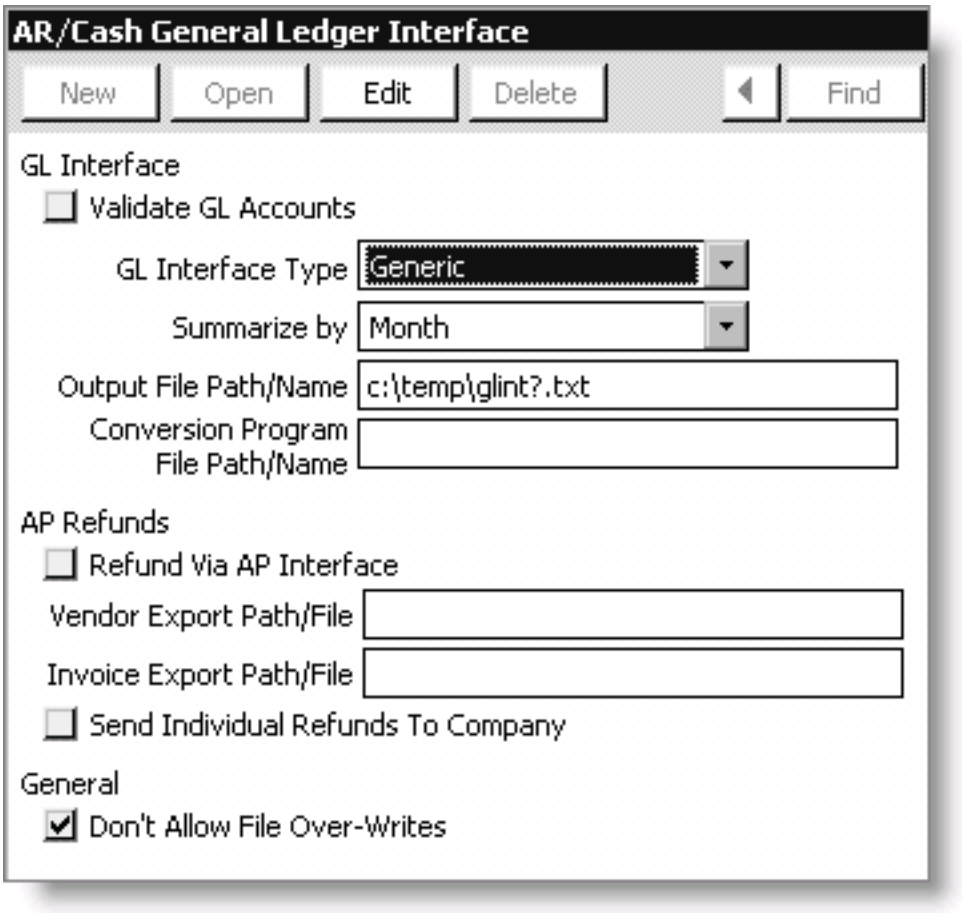
1. Create an invoice for a customer with batch control enabled.
2. View the customer's AR/Cash tab. There is a (U) displayed to the left of the reference number for the unposted transaction.
3. View the customer's Transaction Ledger window for this transaction.
4. Post the batch.

5. View the customer's AR/Cash tab. There is no longer a (U) mark to the left of the reference number for the transaction.
6. View the customer's Transaction Ledger window for this transaction. After the batch is posted, the (U) is removed from the descriptions for transaction number 99.
7. Enter a payment against this invoice in a separate batch.
8. View the customer's AR/Cash tab. There is a (U) to the left of the reference number for the line item with the unposted transaction.
9. View the customer's Transaction Ledger window. Notice that only the AR line for the payment is marked (U), and that the original invoice lines are not marked (U).
10. Post the batch.
11. View the customer's AR/Cash tab. There is no longer a (U) mark next to the reference number for the transaction.
12. View the customer's Transaction Ledger window. Notice that the original invoice and the payment are no longer marked with a (U).

Configuring the general ledger interface

The AR/Cash General Ledger Interface window is used to validate general ledger accounts, configure the general ledger interface type, and configure how refunds for the accounts payable are exported.

General Ledger Interface window



From AR/Cash, select Set up module, and click G/L Interface

GL Interface

Validate GL Accounts - Enable the Validate GL Accounts option if you intend to maintain GL accounting details with true GL account numbers instead of iMIS-generated account numbers and require that the system verify that GL accounts entered throughout the system exist on the GL Accounts table. To integrate iMIS-generated transactions with an outside GL package, you must maintain true GL accounts.

iMIS can validate account numbers entered on the AR/Cash Default Accounts window and in all product code and related tables throughout iMIS.

> **Note:** Note: To define valid GL accounts, build a table (called GL_ACCOUNT) to include all available account numbers on the Set up general lookup/validation window.

> **Note:** Note: The Import button on the Set up general lookup/validation window lets you import your chart of accounts from your third-party GL package.

GL Interface Type - Select a third-party GL software option from this drop-down list. All current third-party GL software options are included on this drop-down list. Select the None option if you are not planning to use a third-party GL software package.

Summarize by - Select one of the following options from this drop-down list to determine the level of summary applied in the creation of the GL interface entries:

- Month – Summarizes all transactions for the entire month (or the date range requested in Create GL Journal, if less than a month) on a per GL account/pseudo-account basis. These entries are posted into a single journal entry in the GL Interface.
- Day - Within the requested date range, this posts a journal entry for each day that contains individual entries summarized per date per GL account/pseudo-account.
- Batch – Within the requested date range, this posts a journal entry for each batch that contains the batch number and a summary on a per GL account/pseudo-account basis.
- Detail – Within the requested date range, this posts a journal entry for each date, but summarizes only the Accounts Receivable entry. Although iMIS supports full detail, export and import procedures can be time consuming. You can produce detail transaction reports directly in iMIS to support more summarized entries.

Output File Path/Name - Designating an Output File Path/Name allows the iMIS interface to automatically create an output file with this path and file name. See Using special characters in file path/name for information on using special characters in the file path/name.

If the Output File Path/Name field is left blank, the system prompts you to provide a valid path and file name when the interface is run. If you do not specify the path and file type for

the export file in this field, you can only specify an Omnis print file with a .prn extension when the interface is run.

> **Note:** Note: iMIS creates the export file and flags the included transactions (so that these transactions are skipped in future interface operations).

If the Output File Path/Name entered is not correct (for example, the referenced directory does not exist), an error message will display and the export is aborted.

Conversion Program File Path/Name - This field specifies the conversion program that will be executed for any GL interface type that begins with generic (not case-sensitive). This field is only displayed for GL interface types that begin with generic.

AP Refunds

- Refund Via AP Interface - Enable this option if you want the iMIS AP interface to process refunds.
- Vendor Export Path/File - Contains the file/pathname for the vendor export file.
- Invoice Export Path/File - Contains the file/pathname for the invoice export file.
- Send Individual Refunds to Company (applies only to refunds) - Enable this option if you want the refund checks that are issued for a non-company member to be issued in the name of the company rather than the individual (even when the Bill To ID is the individual).

  Note: (Solomon only) With this option enabled, the individual's name will be placed into the contact name field of the created Solomon vendor record. However, the Solomon vendor name will be set to the iMIS company name, and the refund invoice will therefore be created payable to the company's name, not the individual. If this option is not selected (disabled), the vendor name for the refund in Solomon will be set to the individual's name and the individual will receive the payment. This option has no impact on the processing or refunds for Bill To IDs where the member type is a company, in which case the vendor name is populated with the company name.

General

Don't Allow File Over-Writes - Enable to prevent iMIS from running the next GL interface and creating duplicate files and file names. Enabling this option also protects your export files from being accidentally overwritten if you have not imported the data into your third-party GL package before the next exports are produced. This option is needed only if you designate fixed file names (export.asc). However, if your third-party GL package prompts you for or allows for a unique import path/file name at run time, use the ? symbol to archive exported files and prevent overwrites.

Using special characters in file path/name

Use two special characters, question mark (?) and number sign (#), in designated file names to have iMIS generate incremental and entity-specific file names when it creates export files.

Question mark symbol

Use the ? symbol to create file names that iMIS increments sequentially at each export. This value is stored in Counter.LAST_VALUE for Counter_name='GL Interface' and will continue to increment indefinitely.

For example, glint?.txt produces glint1.txt, glint2.txt, and so forth.

Number sign symbol

If you are using multiple entities and need separate export/import files generated for each entity, then use the substitution character # to insert the entity code into the generated file names.

For example, if you are exporting data for an entity called NFP (not-for-profit) and the file name designation is #glint.txt, the export file NFPglint.txt will be generated containing only the transactions that belong to the NFP entity.

The new data is not appended to the NFPglint.txt file each time you export data for this entity. The NFPglint.txt file is overwritten, unless you enable the Don't Allow File Over-Writes option in the General Ledger Interface window.

? and #

These special characters can be combined in a single file name.

For example, #glint?.txt produces NFP export files NFPglint1.txt, NFPglint2.txt, and so on.

> **Note:** Note: There are no character limitations in iMIS for the file name. However, you should verify any limitations that may be imposed by your third-party GL package.

To configure the GL interface

> **Note:** Note: These options apply only if you have purchased a license for the iMIS Financial Systems interface or AP interface.

The AR/Cash General Ledger Interface window lets you configure the iMIS GL and AP interfaces, which both require a license.

1. From AR/Cash, select Set up module, and click G/L Interface to open the AR/Cash General Ledger Interface window.
2. Click Edit.
3. Select a general ledger accounting package from the GL Interface Type drop-down list.
4. Select a level of transaction detail from the Summarize by drop-down list.
5. Enter the file path and file name.
6. Enable the Refund Via AP Interface, Send Individual Refunds to Company, and Don't Allow File Over-Writes options if desired.
7. Click Save.

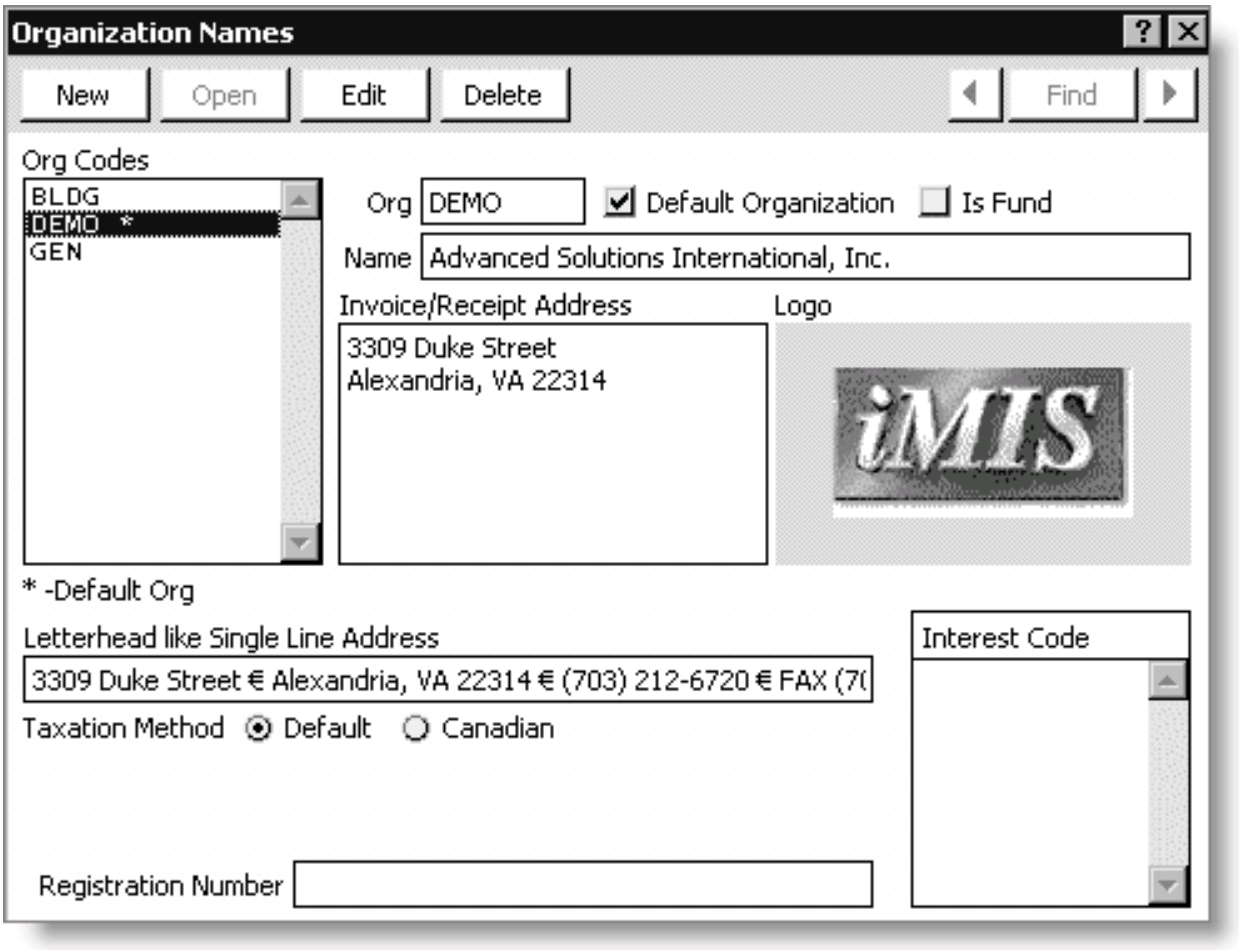
   To create separate GL interface files

   iMIS can segregate transactions by entity and generate separate GL export/import files for each entity. To activate this option, place a pound sign (#) at the desired location in the file name of the transaction export path/file on the AR/Cash General Ledger Interface window. The pound sign (#) symbol sends a signal to iMIS to create separate output files. To

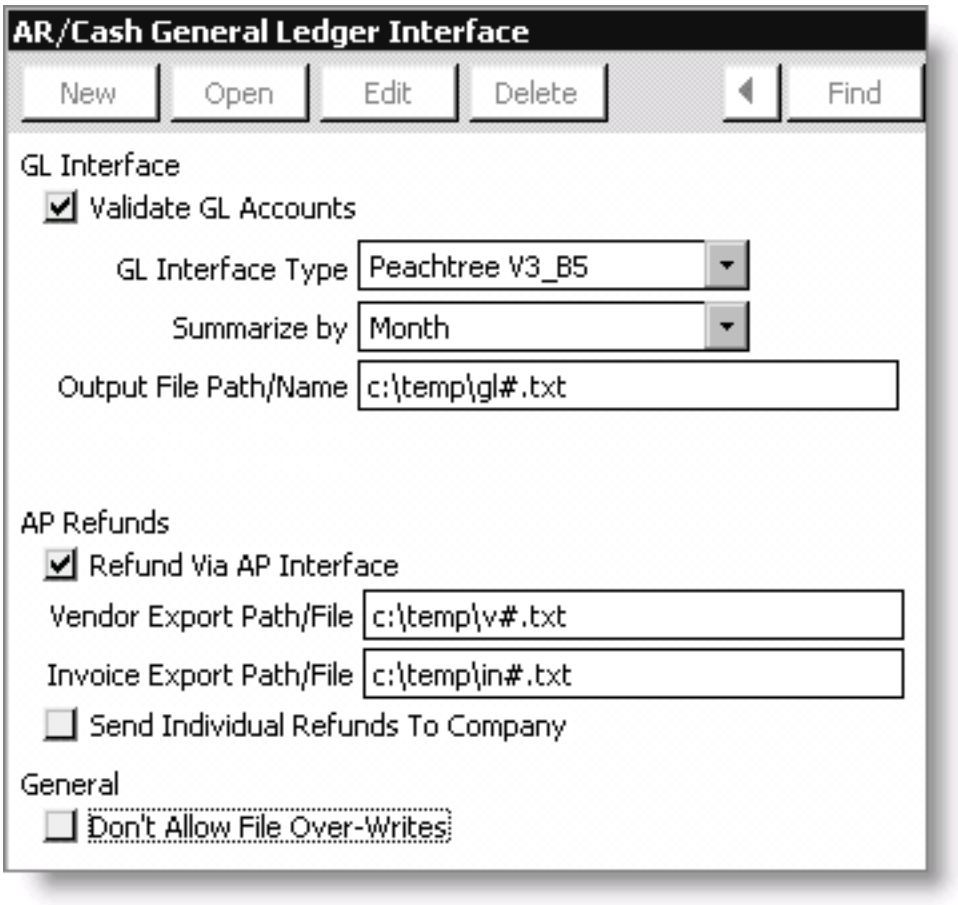
properly distinguish the files, iMIS substitutes the entity organization code in place of the pound sign (#).

> **Note:** Note: In order to limit file names to eight characters, it is important to keep other identifying characters in the file name to a minimum. When assigning entity Org Codes, try to limit the character size of the entity Org Codes also.

On the following Organization Names and AR/Cash General Ledger Interface windows, each time the GL entry is generated, three files will be created in which the organization codes BLDG, DEMO, and GEN, respectively, will be substituted for the pound sign (#) symbol (assuming transactions are interfaced for all three entities). When the processing is complete, GLBLDG.TXT, GLDEMO.TXT, and GLGEN.TXT will reside in the TMP directory.



Select File> System Setup, and click Organization Names



From AR/Cash, select Set up module, and click G/L Interface

Implementing Advanced PCI Compliance options

Implementing Advanced PCI Compliance options in iMIS is only one small part of your organization's journey. Completing the questionnaire is your first step toward certification: you then arrange for an Authorized Scanning Vendor to test each of your e-commerce IP addresses for security flaws, and after that you apply for certification. It can cost about $100 for scanning of one IP address and help in submitting the questionnaire.

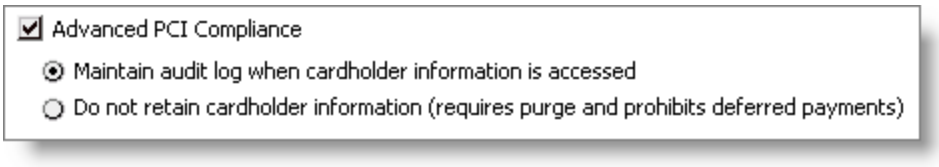
The Payment Card Industry Self Assessment Questionnaire lets your organization determine if you meet mandated security levels for handling credit card transactions. The bulk of the questionnaire deals with firewalls and with clerical and network procedures. It focuses on the effects of software such as Microsoft Windows and SQL Server, as well as

network authorizations and security. It does not apply to the vendors of the software you use, but the design of the software can affect what you must do to stay in compliance. Be sure to follow our guidelines for how to implement iMIS for optimal security.

> **Note:** Note: There are a number of versions of the Questionnaire. Customers that maintain the audit log (option 1, below), must use version SAQ-D. However, if you do not retain cardholder information (option 2) and if you meet other security requirements, including segmenting iMIS from less secure systems, you may be able to use the much shorter SAQ-C. Note that iMIS version 15.1.2 was validated as meeting PCI requirements and is listed on the PCI web site as such.

To set up Advanced PCI Compliance support

1. In iMIS Desktop, open AR/Cash > System Setup.
2. Select Edit.
3. Under General, check Advanced PCI Compliance. Two options appear to specify which method to apply.



Caution! If you bypass these options by putting payment card data into user-defined tables or by using custom encryption methods, you are responsible for PCI Compliance in the handling of that data.

4. Choose between the first and second options and click Save.

Maintain audit log when cardholder information is accessed

This option causes iMIS to perform audit logging each time a user accesses any card-holder information; no log entries exist for access that occurs before the option is enabled or after it is subsequently is disabled. It also logs attempts to access this information by outside processes, such as SQL scripts.

Do not retain cardholder information

This option prevents iMIS from storing any cardholder data. To use this option, you have to disable all CCAuth accounts configured for deferred authorization (or have all related Cash Accounts removed); if you need to support deferred payment card processing, you must use the other option.

Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

5. If you chose the second option, open DB Maintenance (Start > ASI > iMIS > Tools > iMIS DB Maintenance) and complete the database preparation steps for your option on the PCI tab, below.

   DB Maintenance: PCI tab

   Depending on which option you choose in AR/Cash Setup, implementing advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") support requires changes to your iMIS database, either by

- removing all existing cardholder information from your iMIS system that predates your new security measures, or
- resetting the encryption keys (including removal of previous keys) and re-encrypting cardholder data each year, as required

  DB Maintenance lets you complete these processes easily and reliably through the PCI tab.

  Precautions for using DB Maintenance

- Verify that you have a valid backup of your iMIS database before running DB Maintenance commands that modify the database.
- Ensure the database is protected from updates before modifying it, to prevent failures and data problems from changes occurring while entities are being reset/rebuilt/removed:

1. Have all users log out.

2. Stop webservers from updating the database, such as by stopping the AppPool in IIS.

- While users are logged in, you can safely run Analyze Database and Table Details; however, analyzing the database can affect performance.

To reset encryption keys and data

To maintain PCI compliance with stored cardholder data, you must complete all of the steps below.

1. Choose a time when the database can be offline for several hours. Re-encryption can take minutes or hours, depending on your data; once started, it must not be stopped.
2. In DB Maintenance, open the PCI tab.
3. To start the purge, click Reset Encryption Key and Data.

   A warning prompts you to confirm the process.
4. Allow the process to complete without interruption.

   Caution! You risk data corruption if you interrupt the process or close DB Maintenance, which appears unresponsive.

   The output of the process displays in the main window of the utility.
5. Click Remove Historical Encryption Keys, or, if postponing that purge, skip to the next step. (If you do the purge later, be sure to recycle the application pool then, too.)

   Caution! Once you remove previous keys, clicking on any encrypted links that have already been embedded in emails (such as "create new account" emails) will no longer work. The user will see the error "Your session has timed out. Please try your operation again".
6. Recycle the IIS Application Pool (iMISApp AppPool) for each application server that uses this database.

To purge cardholder data

> **Note:** Important: If you implement PCI Compliance (see "Implementing Advanced PCI Compliance options") with audit logging and later switch to storing no data, be aware that this purge routine leaves the existing audit log (PciAuditLog table) intact.

Deferred transactions are lost in a purge, so you need to resolve deferred data and disable settings that allow it.

1. Find and change any gateway that is configured for Deferred Authorization:
   - In Desktop, open AR/Cash > Set up module and select Credit Card Auth.
   - Under Current Accounts, select the first gateway listed.
   - If it is set to Deferred Authorization, change it to Immediate or Manual Authorization.
   - Repeat for all other gateways.
2. Submit any deferred transactions that are pending: In Desktop, open AR/Cash > Credit card reporting and run Print Deferred Pre-authorization Report and Submit Deferred Authorizations.

   Any deferred transaction remaining after the purge has no payment information, so it must be re-entered manually.
3. In DB Maintenance, open the PCI tab.
4. To start the purge, click Purge All Cardholder Information.

   A query runs and the Purge Payment Card Information window opens, reporting the number of records with cardholder information in each table that will be cleared by the purge.
5. If the report surfaces no problems and you want to complete the purge, select Continue with Purge to clear the cardholder information from the database.

   The output of the process displays in the main window of the utility.

   Fields affected by the purge

   Table: [dbo].[ASI_temp_trans] if exists

- [CC_NUMBER] - masked (shows last 4)
- [CC_EXPIRE] - masked
- [CC_NAME] - cleared

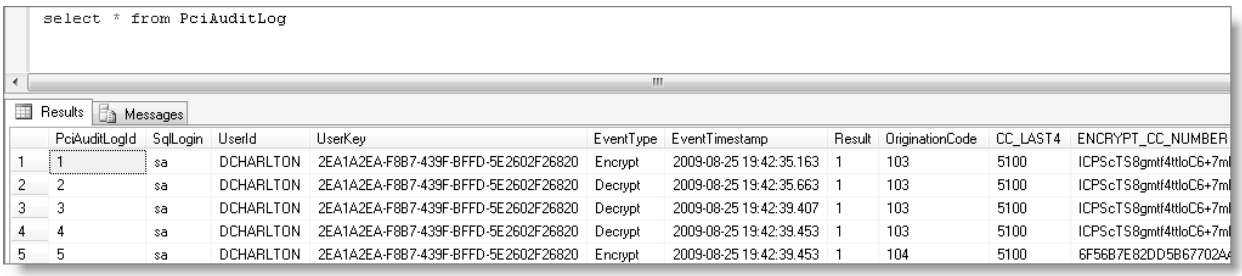
- [CreditCardCountry] - cleared
- [ISSUE_DATE] - cleared
- [ISSUE_NUMBER] - cleared

Reading the PciAuditLog table

Implementing the first option for PCI Compliance logs rather than deletes cardholder information. This option allows you to support deferred payment processing (such as for recurring payments, donations, and subscriptions), which is a common reason for wanting to continue to store cardholder data in iMIS. This audit logging populates the PciAuditLog table, which records information to help you account for and track down incidents: who did the accessing, what triggered the logging, what type of event is being logged, and what cardholder information was accessed.



```
select * from PciAuditLog
```

Results | Messages

	PciAuditLogId	SqlLogin	UserId	UserKey	EventType	EventTimestamp	Result	OriginationCode	CC_LAST4	ENCRYPT_CC_NUMBER

To read the PCI Audit Log

> **Note:** Tip: Focus on the UserID for identification (versus the changeable UserKey), and be aware that each transaction can generate multiple unique records in the audit table, all having similar timestamps.

Five types of data events (EventType) trigger iMIS audit logging:

1. Decrypt - created by any action that requires an encrypted card number to be decrypted (such as selecting Print Deferred Pre-authorization Report or submitting deferred authorizations)
2. Encrypt - created by any action that encrypts a card number (such as entering a credit card payment through any interface)
3. UpdateLog - any attempt to modify an existing entry in the log
4. DeleteLog - any attempt to delete an existing entry in the log
5. ChangedEncryptionKey - any time the Reset Encryption Key and Data command is run from DB Maintenance

   The origination codes (OriginationCode) identify the source of the action that generated the log entry:

- 100 SQL table itself (originated in the trigger: an attempt to delete or change the log using SQL)
- 101 iMIS Desktop: AsiUtil.dll
- 102 Public/Full view: Asi.dll
- 103 Public/Full view: Secure.dll
- 104 Public/Full view: Asi.iBO.dll
- 105 Change to the encryption key

  The Result values tell you about the outcome of the event:

- For Encrypt entries, the result is true if the encryption succeeded (that is, encrypted value exists).
- For UpdateLog and DeleteLog entries, the result is always false because iMIS blocks all updates to and deletions from the log.

Settings for VAT taxation

When your default organization is configured for VAT, then you see a VAT Setup button to the right of the AR/Cash > Set up module options. These options default to the most commonly needed taxation modes.

See "Configuring VAT options in AR/Cash" in International Taxation to ensure that you select the best global configuration for your organization's needs.

AR/Cash: Set up tables

You must set up certain AR/Cash tables as part of your system setup before beginning live operations. There are four tables to maintain for the AR/Cash module. These tables can be accessed from AR/Cash by selecting Set up tables.

- Products
- Terms
- Tax codes
- Cash accounts

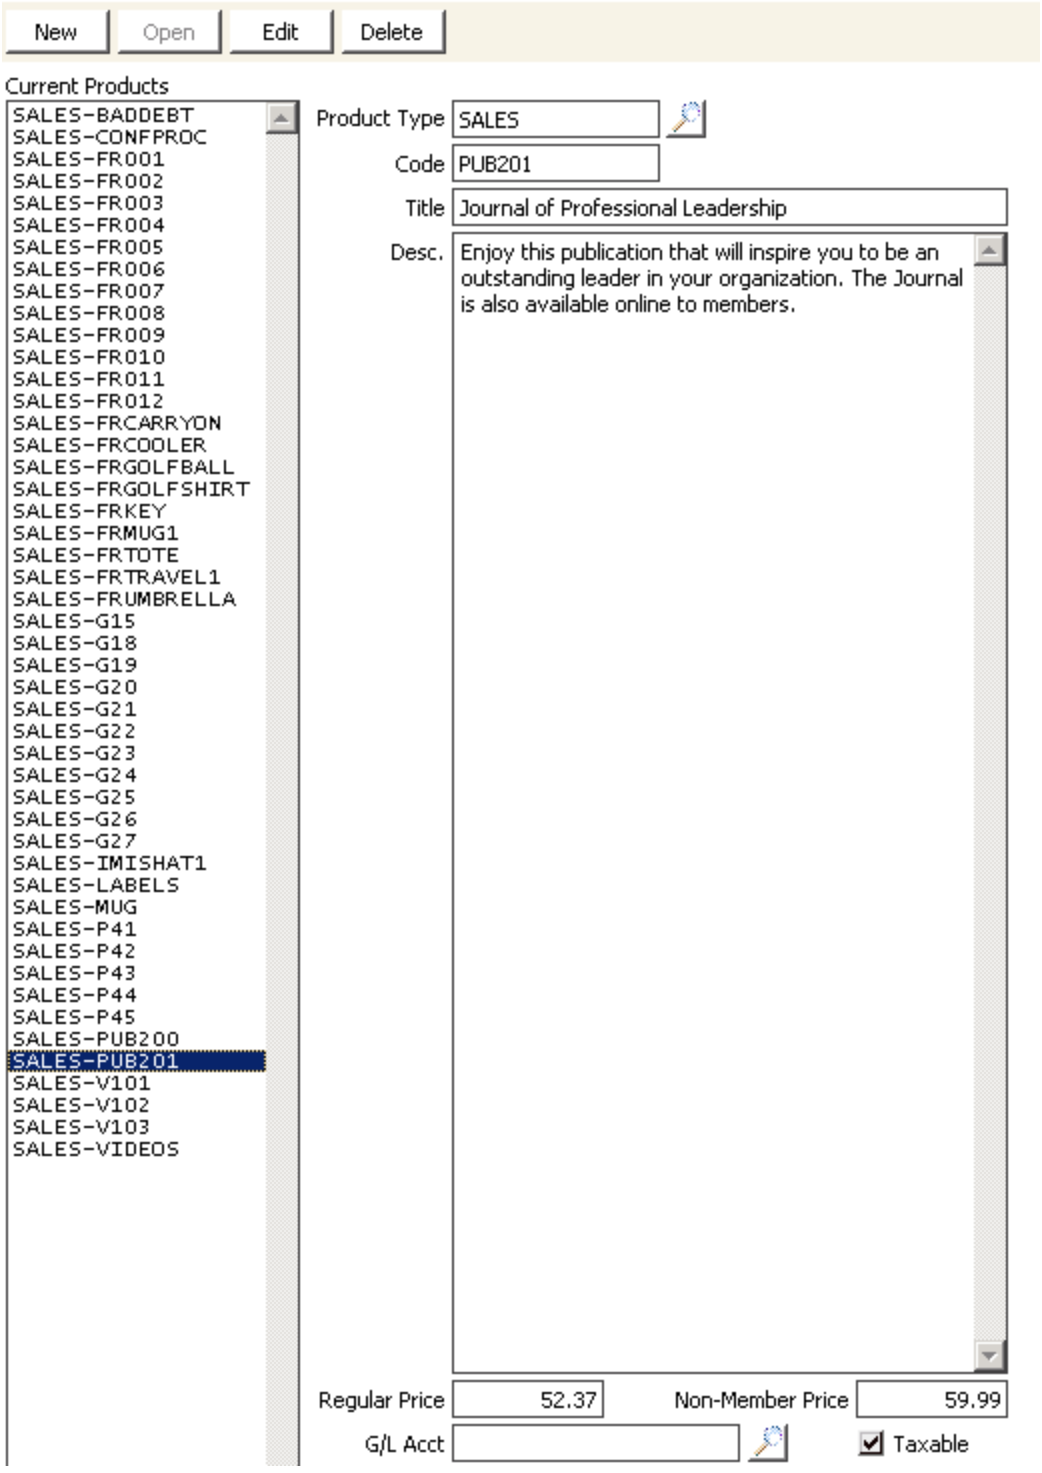
Setting up products

The following iMIS windows use the information on the Set up products window:

- Enter and edit sales transactions - You must first define all sales-related detail items recorded in a sales transaction as products on the Set up products window.
- Enter and edit orders - As you enter sales line items, you must enter the product codes directly or use the standard lookup window to select a value.
- (AR/Cash) Enter and edit credit memos - All adjustment-related line items recorded on the Enter and edit credit memos window must reference a product code entered on the Set up products window.
- (AR/Cash) Enter and edit debit memos - All adjustment-related line items recorded on the

Enter and edit debit memos window must reference a product code entered on the Set up products window.

Set up products window



Desktop: AR/Cash > Set up tables > Products

Current Products

All defined products are displayed in this drop-down list.

Product Type

Dictates which iMIS module relates to the product record. All AR window data entry products must share the common product type of SALES. You can use the lookup icon and select a value.

Code

Assign a primary abbreviation or identification code to represent this product, sales, or adjustment item. There must be one product code for each billable product.

Title

Enter a longer descriptive title for the product or item type. When this product record is referenced on related data-entry windows or reports/inquiries, the product title appears next to the product code.

Desc.

(optional) Enter a note, description, or comment(s) that relates to the product.

Regular Price

Enter the main (default) unit price or the customer price that is automatically applied when you enter a sales line item for this product. You can override this default price while entering data.

Non-Member Price

If you charge a different price for non-members, enter that amount here so that the system can automatically apply the price when this item is purchased by anyone with a non-member status.

G/L Acct

Identifies the GL income account that is credited when entries are made for this product. (You can use the lookup icon and select a value.)

If you leave this field blank, iMIS records the income for this product in the default Income account you designated on the AR/Cash Default Accounts window (from AR/Cash, select Set up module, and click Default Accounts).

It is not necessary to establish GL accounts on the product code tables if you are not using a GL interface and you are not relying on specific accounting reports from iMIS.

Taxable

Enable if the product is subject to sales tax.

Tax Code

(Full Order Entry only) Enter the state sales tax code or use the lookup icon and select a value.

Taxable (GST)

(Canadian Taxation only) Enable the Taxable (GST) option to apply Canadian GST taxation to the product.

Taxable (PST)

(Canadian Taxation only) Enable the Taxable (PST) option to apply Canadian PST taxation to the product.

Print button

Select to print information on all currently defined products. This information includes product type, product code, product title, and product price.

Special Prices button

Opens the Special Pricing window where you can specify pricing based on the Customer Type and other optional categories. The most common use for Special Prices is to provide quantity discounts when someone orders a particular product.

To define product codes

1. From Set up products, click New.
2. Enter a Product Type, or click the Find icon to select a value.
3. Enter the product Code. Special characters such as hyphens are not allowed.
4. Enter a Title that you want displayed on reports.
5. Enter a description of the product in the Desc. field.
6. Enter a Regular Price and a Non-Member Price.
7. Enter the G/L Acct, or click the Find icon to select a value.
8. Enable the appropriate Taxable option if the product is subject to a sales tax.
9. Click Save.
10. (optional) Click Special Prices to open the Special Pricing window.
11. Click New.
12. In the Type field, enter a Customer Type or Customer Type/category combination.
13. In the Description field, enter a name for the special pricing rule.
14. Select a pricing option. For example, select Numeric Table for quantity pricing.
15. In the Source Field, enter the field whose value is the basis for determining the Special Price. For example, for quantity discounts, the ordered quantity is the determining field.

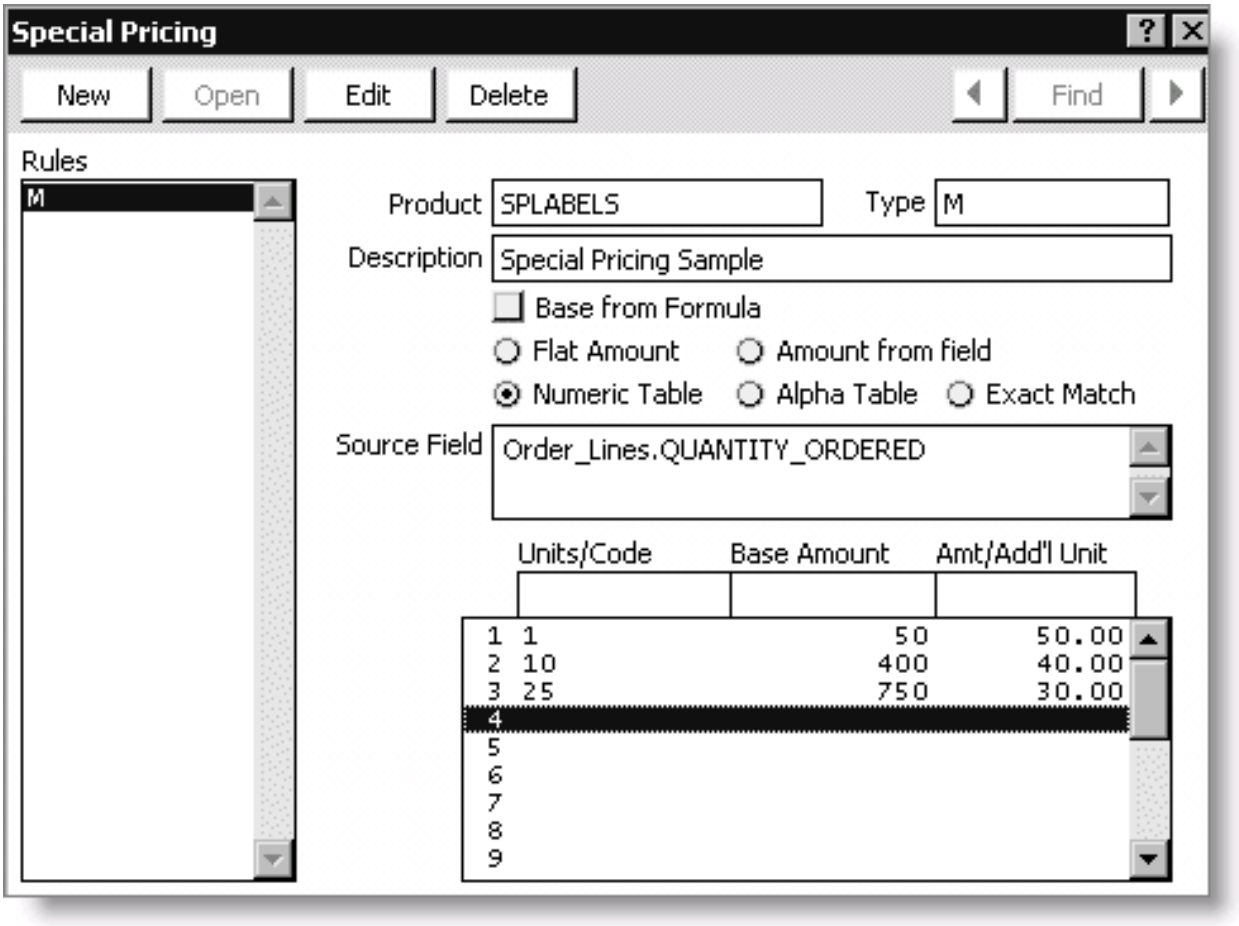
    Order_Lines.QUANTITY_ORDERED

- For each quantity discount pricing level, enter the following:
- Units/Code - The required quantity necessary to receive the quantity price break
- Base Amount - The extended amount of the initial quantity, for example, the value in the Units/Code field times the Amt/Add'l Unit (special unit price) = Base Amount
- Amt/Add'l Unit -The per unit special price amount

The following is a calculation example to determine the special price (discount) if a customer orders a product in volume.

- Line 1 = $50 per unit
- Line 2 = $40 per unit, if the customer orders 10 or more
- Line 3 = $30 per unit, if the customer orders 25 or more

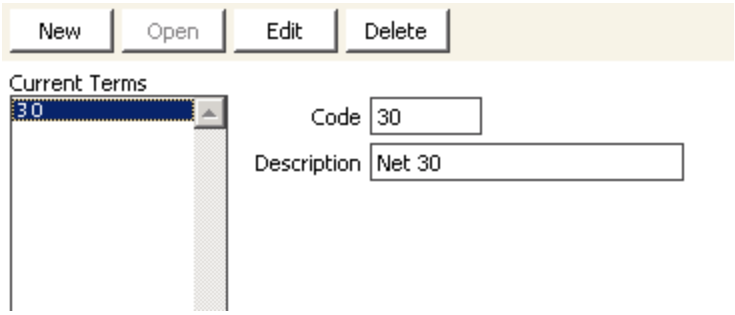
16. Click Save.



Setting up payment terms

The Set up terms window allows you to define the various customer payment terms that your organization allows. Terms allow you to print an appropriate term's description on Order Entry invoices.

Set up terms window



Desktop: AR/Cash > Set up tables > Terms

Current Terms

This list displays the currently defined terms.

Code

This field specifies the code for the terms.

Description

This field contains a description of the terms.

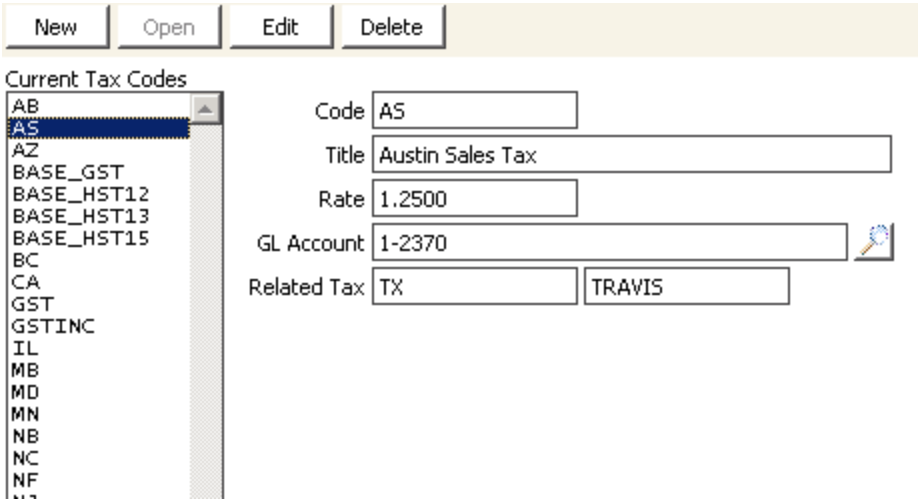
To set up the payment terms

1. From Set up tables terms, click New.
2. In the Code field, enter the code or abbreviation to create the term category.
3. In the Description field, enter the longer description that you want to see printed on invoices for the term category (for example, Net 30).
4. Click Save.

Setting up tax codes

The Set up tax codes window lets you record and use tax information that applies to your product orders.

Set up tax codes window



Desktop: AR/Cash > Set up tables > Tax codes

Current Tax Codes

This list displays the currently defined tax codes.

Code

Enter the abbreviation you want to assign to the tax category. For the best results when defining a state tax, use standard state abbreviation so the tax code on the Enter and edit orders window (from AR/Cash, select Process orders> Enter and edit orders) can automatically default to the customer's state abbreviation.

Title

Enter the full name to assign to the tax code. This description helps users select from the available taxes using the look-up function.

Rate

Enter the percentage rate assigned to the tax.

GL Account

Enter the general ledger account number assigned to the tax code, or use the lookup icon to select a value.

If you leave this field blank, iMIS records this entry in the Sales Tax account that you designated on the AR/Cash Default Accounts window (from AR/Cash, select Set up module, and click Default Accounts).

Related Tax

These fields allow you to piggyback (use multiple) one or two additional Tax Authority codes.

Enter the codes for any other taxes you want to relate to the tax code. As shown on the previous Set up tax codes window, a city tax may always be associated with a county and a state tax. These tax codes must always be set up in distinct accounts so that the taxes can be tracked separately but calculated for the customer as a single amount.

To enter a new tax code

1. From Set up tax tax codes, click New.
2. In the Code field, enter the abbreviation you want to assign to the tax category.
3. In the Title field, enter the full name assigned to the tax.
4. In the Rate field, enter the percentage rate assigned to the tax.
5. In the GL Account field, enter the GL account number assigned to the tax, or click the Find icon to select a value.
6. In the Related Tax field, enter the codes for any other taxes you want to relate to the tax, such as a city or county tax code.
7. Click Save.

Setting up cash accounts

Use the Set up cash accounts window to define the cash accounts where you will record cash deposits and credit and debit card deposits.

It is necessary to create entries on the Set up cash accounts window under the following circumstances:

- If you accept and process credit/debit card receipts, you must create a cash account code to represent each credit/debit card type, along with the cash account where the card receipts should be posted if the card type is unique.
- If you are using batch control, a cash account is required to represent each checking account (even if you have only a single account).
- If you accept in-kind or asset fundraising donations you must set up a cash account for each GL account to which these gifts will be posted.

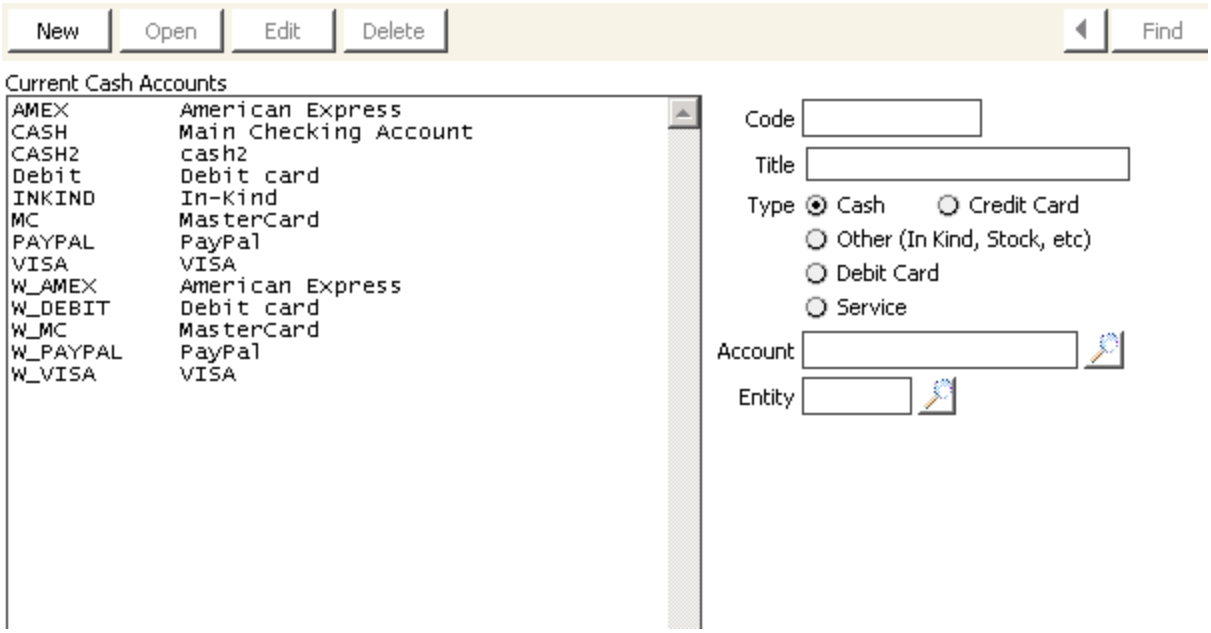
Defining credit/debit card codes and accounts

In order to process credit/debit card receipts, you must define the card codes on the Set up cash accounts window. This setup allows each card to have a unique bank account, for example, VISA=1020, AMEX=1030, DISC=1040 and so forth. This setup also allows card payments to override the batch bank account, because each card has its own bank account.

If the batch control option is not enabled, assigning a GL account number to a credit/debit card code takes precedence over the cash account selected for the batch and the default cash account number.

When you use batch control to define credit/debit card code accounts, you can enter both cash transactions and credit/debit card transactions, creating a mixed batch. iMIS splits and posts the payment transactions accordingly.

Set up cash accounts window



Desktop: AR/Cash > Set up tables > Cash accounts

Current Cash Accounts

This column lists all currently defined cash accounts for recording cash deposits.

Code

Specifies the abbreviation assigned to the currently selected cash account or credit card type.

Title

Specifies the full name assigned to the cash account. This description helps users select from the available cash accounts in a lookup window.

Type

Specifies one of the following account types:

- Cash - Specifies that the account is a checking or other deposit account (other than a credit card account).
- Credit Card - Specifies that the account is a credit card account.

- Other - Specifies that the account is a non-cash asset account.
- Debit Card - Specifies that the account is a European debit card account.
- Service – Specifies that the account is a third-party payment service, such as PayPal Express.

Account

Specifies the GL chart of accounts number for the cash account.

Entity

(Only required for multiple entities (see "Multiple Entity Processing")) Specifies the code for the entity that owns this cash account.

CC Auth Account

Specifies the Account Code of the credit card authorization account as set up in the AR/Cash Credit Card Authorization window.

CSC Required Web Entry

Requires entry of a card's CSC number in payment entry windows in the web-based views of iMIS. When cleared, card information can be submitted without the CSC number in web payment entry windows. This must be set up for each individual credit card or debit card account.

CSC Required Workstation Entry

Requires entry of a card's CSC number in payment entry windows in iMIS. When cleared, card information can be submitted without the CSC number in payment entry windows in iMIS.

Display Issue Number

Displays a field for entering a European debit card's issue number in payment entry windows. When cleared, the Issue Number field is not displayed in payment entry windows.

Display Issue Date

Displays a field for entering a European debit card's issue date in payment entry windows. When cleared, the Issue Date field is not displayed in payment entry windows.

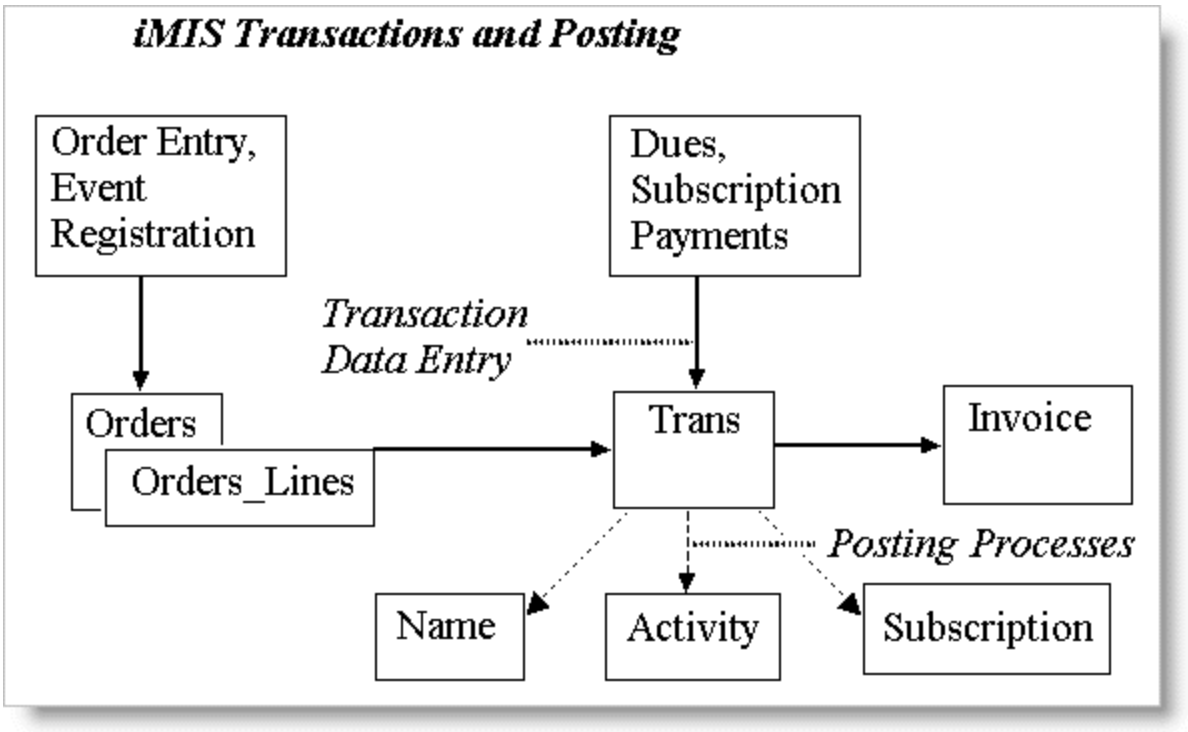
To define cash and credit/debit card codes and accounts

1. From Set up cash accounts, press New.
2. In the Code field, enter the abbreviation you want to assign to the cash account or credit/debit card type you are creating.

   Note: You can use any code you prefer for a credit/debit card, and you can specify a different entity for each credit/debit card code. For example, you can assign VISA1 to GEN, and VISA2 to BLDG.
3. In the Title field, enter the full name you want to assign to the account.
4. Under Type, select the Cash, Credit Card, Other, Debit Card, or Service option.
5. In the Account field, enter the GL chart of accounts number for the cash account assigned to this table entry, or click the Find icon to select a value.
6. (optional) For multiple entities, enter the Entity code, or click the Find icon to select a value.
7. For the Service option, select a gateway such as PayPal Express.
8. Click Save.

Accounting Tables

There are several central tables that track the accounting transactions generated by the iMIS modules. This section describes the central table, summarizes the reports based on those tables, and describes how the tables are updated throughout iMIS.



iMIS Transactions and Posting

Accounting impacts of direct transactions and orders

Accounting effect of direct transactions

The types of AR module direct transactions include sales transactions, cash receipts, credit memos, and debit adjustments

All of these transaction types generate new multiple-line/record Trans entries and generate or update the Invoice table records. With the exception of cash receipts, all generate activity records.

Accounting effect of direct orders

Generates Orders and Order_Lines records only, so there is no accounting effect at this time.

Accounting effect of printing invoices

Generates a single summary Invoice record for each invoice printed and a multiple-line/record Trans entry with these elements:

- Payment in Full - Generates a debit to cash for the payment amount and a credit to income/deferred for total amount of fees
- No Payment - Generates a debit to the default AR account and a credit to income/deferred for the total amount of fees
- Under Payment - Generates a debit to cash for the payment amount, a credit to income/deferred for the total amount of fees, and an additional debit to the default AR account for the remaining amount owed
- Over Payment - Generates a debit to cash for the payment amount, a credit to income/deferred for the total amount of fees, and an additional credit to the default AR account for the amount overpaid

Main accounting tables

iMIS AR/Cash uses two basic tables to track accounting details and status information:

- Trans table
- Invoice table

Trans table

The Trans(action) table is the primary accounting detail table. The Trans table contains normal multiple-line, balancing (debit/credit) accounts transaction entries that affect cash, AR, income, and related GL accounts.

Multiple trans records

Multiple Trans records are generated for each debit or credit line in the entry. All lines for one entry are linked as one through a common system-assigned transaction number: Trans_Number, individual system generated Line_Number.

> **Note:** Note: One multiple-line transaction entry is the same as manual system journal entry.

Trans table fields

The following are some of the fields contained in the trans table.

TRANS_NUMBER

(Part of primary key) A unique sequential number assigned to each set of transaction lines or journal entry representing a single accounting transaction.

LINE_NUMBER

(Part of primary key) A sequential number assigned to each line within the transaction set or journal entry. For example, the number 1 is assigned to the first line for a transaction, the number 2 is assigned to the second line, and so on. There can be duplicate line numbers.

SUB_LINE_NUMBER

(Part of primary key) A sequential number assigned as the sub line number when distributions for an invoice are assigned across multiple entities. The accounting record must then also be split by an entity to keep the accounting straight. For example, this can happen when different entities are assigned to dues products when using accrual dues, and also when processing split gifts in Fundraising.

BATCH_NUM

The number or code representing the batch to which this transaction belongs, typically coinciding with the active batch at the time the transaction was entered or generated. If batch control is not enabled, this field is blank.

TRANSACTION_DATE

The accounting date assigned to the transaction. If batch control is enabled, this should match the batch date.

FISCAL_PERIOD

The month/year combination (YYYYMM) which represents the accounting fiscal period to which the transaction belongs. This is calculated based upon the transaction date in conjunction with the value in the First Month of Fiscal Year (Number) field in the Set up module window (from AR/Cash, select Set up module). This field will only match the

month/year combination of the transaction date if the fiscal year begins in January. Used for interfacing to certain GL packages.

BT_ID

The ID number of the customer who has financial responsibility for this transaction

ST_ID

The ID number of the customer who is the recipient of the goods or services related to the transaction.

CUSTOMER_REFERENCE

The purchase order number or a similar brief reference that needs to be reported to the customer to allow proper identification of the transaction.

SOURCE_CODE

The marketing code, typically used to help analyze and track the success of various marketing programs

SOURCE_SYSTEM

The code representing the iMIS module where the transaction was entered or generated. The common module SOURCE_SYSTEM codes include AR for any transaction entered or generated (simple order entry invoicing) on the AR/Cash menu, MEETING for meeting-registration generated transactions, ORDER for full order entry invoice and credit memo transactions, DUES for cash-based dues payment and accrual-based billing transactions, and FR for pledges and donations entered on the Enter and edit gifts window.

JOURNAL_TYPE

The code representing the general type of transaction or journal entry. These types include the following:

- IN is usually assigned to an initial income recording transaction. Transactions which are assigned IN normally include sales transactions, transactions generated by order invoicing, transactions generated through the event-registration process, and fundraising

gifts and pledges.

- PAY denotes a payment or cash receipt related to open items.
- CM denotes transactions entered through the Enter and edit credit memos window (from AR/Cash, select Enter and edit transactions> Credit memos) or generated by processing a credit-memo order type.
- DM denotes transactions entered through the Enter and edit debit memos window (from AR/Cash, select Enter and edit transactions> Debit memos) or generated by processing a debit-memo order type. This type is used also in the offset entry to the Prepaid Order account when prepaid orders are invoiced.
- REF is the code assigned to transactions generated by the Credit Invoices window (from AR/Cash, select Process month-end procedures, and click Credit Invoices) during the issue refunds process.
- PP is the code assigned to cash/prepaid order transactions generated when cash is entered on an open order.

TRANSACTION_TYPE

The code that denotes the type of individual transaction line. These types include the following:

- AR denotes a debit or credit entry to the accounts receivable account.
- PAY typically denotes an entry to a cash account. The two exceptions are for *Tab transfers, where the PAY line is represents an entry to the accounts receivable account, and refund transactions, where the PAY line represents an entry to the Refund Clearing account. *Tab AR entries disguised as PAY lines are detected by checking for an * in the first position of the Check/CC field. Refund/clearing entries are located by checking for the PAY type and REF journal type combination.
- DIST denotes an entry made to income, expense, or miscellaneous charges.
- PP denotes an entry made to the Prepaid Orders unearned income balance sheet account.

- TR denotes a transfer/clearing entry made in conjunction with *Tab transfers and during the invoicing of prepaid orders. Used to supply the necessary invoice-level transaction audit trail when a single debit or credit line needs to support two separate invoice records simultaneously.

  OWNER_ORG_CODE

  The entity owner of the overall transaction. In the case of an income/invoice related transaction, this is the overall income owner. In the case of a cash-receipt or dues cash payment transaction, this is the cash owner entity (or owner of the open credit when an *Tab transfer is recorded).

  GL_ACCOUNT_ORG_CODE

  The entity owner of the individual transaction account number. In the case of an income/invoice related transaction, this entity may differ from the value of the OWNER_ORG_CODE field on the payment line. In the case of a cash receipt, the value of the application line's GL_ACCOUNT_ORG_CODE field may differ from the value of the OWNER_ORG_CODE field if the open AR line has a different entity owner.

  PRODUCT_CODE

  On DIST or distribution lines, the originating PRODUCT_CODE value is retained here.

  PSEUDO_ACCOUNT

  A system-generated code consisting of the following three components:

- GL_ACCOUNT_ORG_CODE
- SOURCE_SYSTEM
- PRODUCT CODE on a DIST line or TRANSACTION_TYPE on all other lines

  This field is frequently used in the description lines in summary entries in the GL interface export/import files. This field can be used to identify the correct GL account when an account has been left blank or is incorrect.

  GL_ACCOUNT

The actual general ledger account number. In the case of a deferred income transaction, this field represents the future income account.

DEFERRED_GL_ACCOUNT

In the case of a deferred income transaction line, this is the account to which the initial general ledger entry will be made.

EFFECTIVE_DATE

In dues/subscriptions related transactions, this field contains the beginning date of the term being paid for, or in the case of an accrual-dues transaction, the beginning date of the term being billed. In the case of a deferred income transaction line, this field contains the trigger date when the income will begin to be recognized.

MONTHS_PAID

In dues/subscriptions related transactions, this field contains the number of months being paid for within the term, or in the case of an accrual-dues transaction, the number of months being billed within the term. In the case of a deferred income transaction line, this field contains the number of months over which the income will be recognized.

AMOUNT

The actual debit or credit amount

INVOICE_CHARGES

The amount (if any) which has been or will be posted to the linked Invoice summary record's charges total

INVOICE_CREDITS

The amount (if any) which has been or will be posted to the linked invoice summary record's credits total

POSTED

Represents the posted status of the transaction. The possibilities include the following:

- 0 denotes unposted. This value typically exists only if the Separate Posting Cycle Required option is enabled on the AR/Cash Batch Control window (from AR/Cash, select Set up module, and click Batch Control).
- 2 denotes posted to the relevant iMIS tables that are appropriate for the Transaction. These tables may include Invoice, Activity, and Subscriptions.
- 4 denotes transferred to the general ledger through a GL Interface export/import operation.

ENTERED_BY

The USER ID of the iMIS user who initially entered the transaction

DATE_ENTERED

The date and time that the transaction was initially entered

Invoice table

The Invoice table contains a summary of transaction activity for each invoice or related item.

iMIS generates a new invoice record for each new event registration, sales transaction, or (printed) simple order entry invoice, whether or not the item was paid in full.

Future payments or adjustments update the balances/buckets in the appropriate pre-existing invoice record. Therefore, multiple sets of transaction entries are posted to a single invoice record.

Invoice numbers

The key field in the Invoice table is the system-assigned reference number. The system-assigned reference number is different from the invoice number. The system-assigned reference number links transactions to the invoice. For example: Trans.Invoice_Reference_Number = Invoice.Reference_Number

The invoice number, which also is a major key, is assigned only when you run an invoice print procedure (for simple order entry or event registration) or if the operator enters a manual invoice number for a sales transaction.

In many cases, an invoice number may never be assigned, for example, a paid-in-full item, or meeting registrations where the confirmation letters are used in place of official invoice notices.

AR/Accounting table reports

The Trans table and the Invoice table, the two main accounting tables, generate the following types of output:

Trans table reports

- Transaction and Batch Reports in iMIS AR/Cash, Billing, and Events modules
- Detail and summary pseudo and actual GL distribution reports
- Ledger card displays that are found in the following windows:
- AR/Cash tab on the Manage customers window (double-click on a record to see the Trans detail)
- (AR/Cash) Enter and edit orders window (only available when you display an order for which the invoice has been printed)
- Events Register a customer window
- GL interface

Invoice table reports

- AR trial balance report
- AR statements
- Customer AR window (scrolling invoice summary lines)

Other related iMIS tables

Although not considered key accounting tables, the following tables are updated by the procedures/modules that generate the main accounting data.

Subscription Module

The Subscription Module contains primary summary information on the status of each dues/subscription line item billed and/or paid for each customer. For cash-basis dues billing operations, this table also serves as a memo AR type of file with no accounting impact. The Subscription Module is used in these input/output operations to perform the following tasks:

- Generate initial and reminder dues notices
- Record billing payment receipts
- Display in the Billing tab of the Manage customers window

Orders and Order_Lines

The Orders and Order_Lines table serves as the master table for both the event registration function and the simple order entry subsystem function. Orders and Order_Lines are also the main tables for Order Processing. This table is used in the following output operations:

- Events Reports - badges, confirmation letters, labels, tickets, invoices, and rosters
- Simple Order Entry System - Order status report (used for validation purposes) and Invoices

Activity tables

The modules that generate accounting transactions also post monetary long-term history details into the general purpose Activity table. The long-term history details can be used later for inquiry and analysis. The activity updates are the by-product of the following operations:

- Billing Payments - Generates activity records for each line item paid
- Event Close - Generates a single activity record for each (uncanceled) registrant, reflecting the total amount of the registration
- Simple Order Entry & Advanced Order Entry - One product history record is generated for each line item in an invoice order

- AR Transactions - Includes sales transactions, credit memos, and debit adjustments, and generates one product history record for each line item

Deferred Income in iMIS

iMIS Deferred Income is an extension of the iMIS GL interface capabilities available for selected third-party GL software. This subsystem works in combination with AR/Cash, Billing, Events, Exhibitions, and Expositions. It allows your organization to postpone recognition of real income to a future point in time, when the billing period actually begins.

To enable this option, open the System Setup window (select File> System Setup) and edit your iMIS licensing to enable Deferred Income.

The deferred income feature is transparent to the user. If your iMIS system is licensed to run the Deferred Income module and the GL interface, deferred income tracking and processing can be automatically triggered for dues/subscription items, event registrations, and exhibition/exposition orders after your setup is complete.

The following terms are unique to the deferred income process.

Deferred income

Money that is credited to a liability account until it is recognized and transferred to the regular income account.

Earned income

Income that is recognized during a specific accounting period.

Working with deferred income

Deferred income provides delayed recognition of income to coincide with when the income is earned, to match when the related expenses are incurred, rather than when the invoice is generated or the funds are received. Deferred income credits a user-specified deferred income liability account rather than the regular income account when the transaction is initially entered. iMIS manages the recognition of the appropriate income amounts as the income is earned, and generates the corresponding entries to transfer

those amounts from the deferred income account to the regular income account in the General Ledger.

iMIS processes deferred income arising from dues and subscription products differently than event registrations and exhibition/exposition orders. iMIS uses the following deferral methods to handle these transactions:

- Incremental - Deferred income for dues and subscription products is recognized in equal monthly increments over the number of months in the dues or subscription term, starting with the begin date. (iMIS calculates the term from the beginning and ending dates of the dues or subscription term.)

  For example, for a normal 12-month subscription, iMIS recognizes one-twelfth of the income during each month of the subscription term.

- Lump Sum - Deferred income for event registrations and exhibition/exposition orders is recognized in the month that the event occurs.

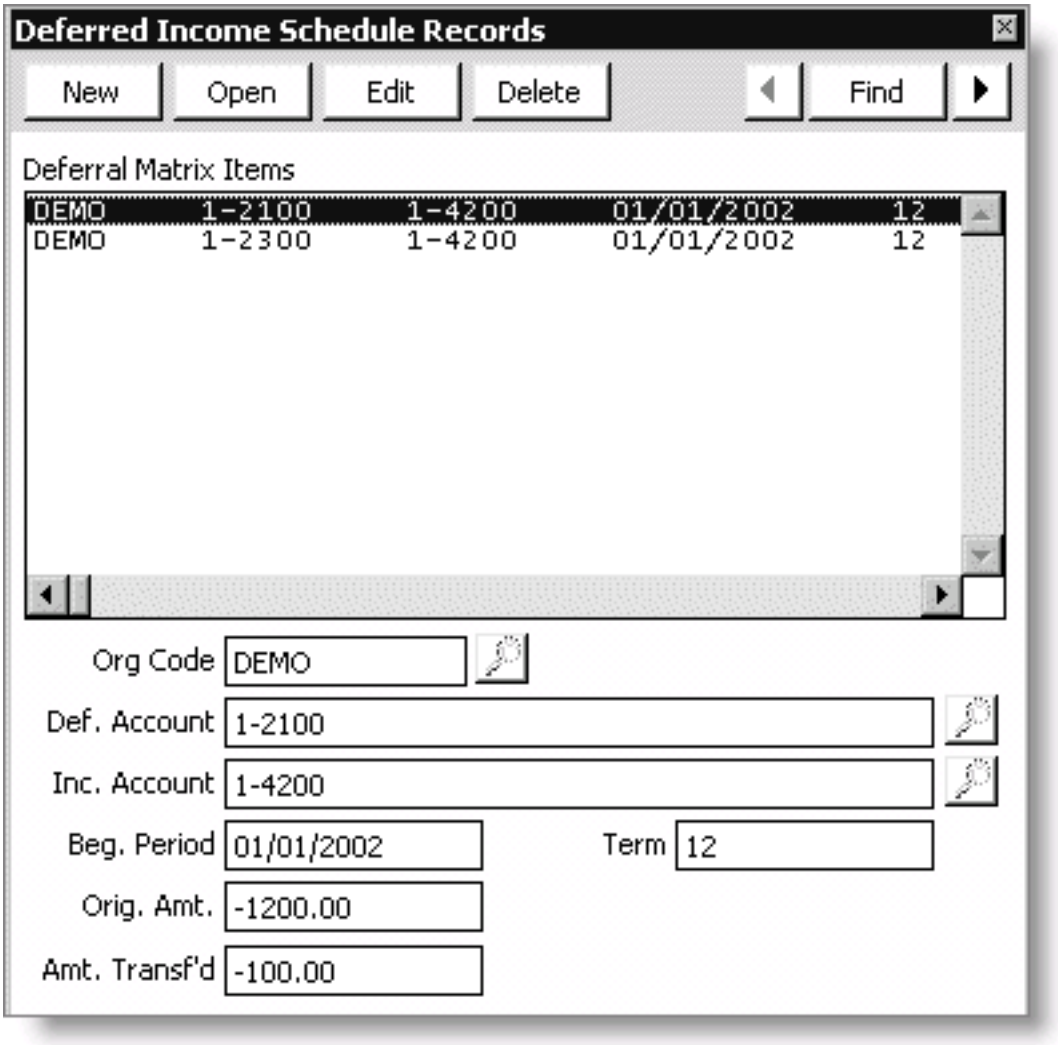
  For example, if the Begin Date of an event/exhibition/exposition is 12/10/2002, iMIS recognizes the entire amount of income on the first day of the month of the Begin Date, 12/01/2002.

  When the deferred income account is referenced for a dues/subscription product or an event/exhibition/exposition product, the full amount charged or received will be booked as deferred income. Each time the GL interface procedure runs; iMIS analyzes which deferred balances can be completely or partially identified as earned income. When iMIS finds deferred income amounts, it automatically generates journal entries to transfer earned income amounts out of deferred income.

  As iMIS processes individual deferred income transactions through the GL interface, the deferred income amounts are posted to a summarized Deferred Income Matrix (AR/Cash>Process month-end procedures>Deferred Income Schedule Records). This table (Deferral_Matrix) keeps track of the total balance in the deferred income account(s), which are divided into the following summary components:

- Deferred Account - Deferred income account number (Trans.DEFERRED_GL_ACCOUNT)
- Income Account - Income Account number (Trans.GL_ACCOUNT)
- Beginning Period - (for example, month-year) Date to begin income recognition (Trans.EFFECTIVE_DATE)
- Term - (for example, number of months) Time frame over which to spread income (Trans.MONTHS_PAID)

  An entry is made into this table for each Deferred Account-Income Account-Beginning Period-Term combination. From this structure, iMIS determines and generates the necessary entries to transfer amounts from deferred income to regular income.



The Deferred Income Schedule Records window

The iMIS GL interface procedure performs the work related to deferred income processing as follows:

1. Creates a deferred income entry to credit the deferred income account instead of the regular income account for the full amount for all deferred income transactions
2. Updates the deferred income matrix table for the combined dollar amount of the transactions involved
3. Analyzes the deferred income matrix and creates the appropriate transfer entries to recognize income

   Note: In some cases, transfer entries work in a catch-up mode. For example, if late cash-basis subscription payments are received and processed after the subscription term has begun, iMIS immediately recognizes the full amount due to be recognized as the accounting period being processed (that is, if a payment entry is recorded six months after a subscription started, iMIS generates an entry to recognize or transfer one-half (6 ¸ 12) of the subscription income amount).

   The following is an example of a GL interface file. Lines 3 and 4 create a deferred income entry to credit the deferred income accounts, and lines 5 and 6 analyze the deferred income matrix and create the transfer entries to recognize income.

   01/01/2002 1-1100 PAY,DEMO-DUES-PAY 1200.00

   01/01/2002 1-1200 AR,DEMO-MEETING-AR 500.00

   01/01/2002 1-2100 DIST,DEMO-DUES-BASIC -1200.00

   01/01/2002 1-2200 DIST,DEMO-MEETING-TECX/MAIN -500.00

   01/01/2002 1-4200 Deferred Income Transfer -100.00

   01/01/2002 1-2100 Deferred Income Transfer 100.00

Enabling deferred income processing

To set up deferred income processing, enter a deferred income account number in addition to the regular income account number for products and functions. You must identify both of these accounts in all relevant modules.

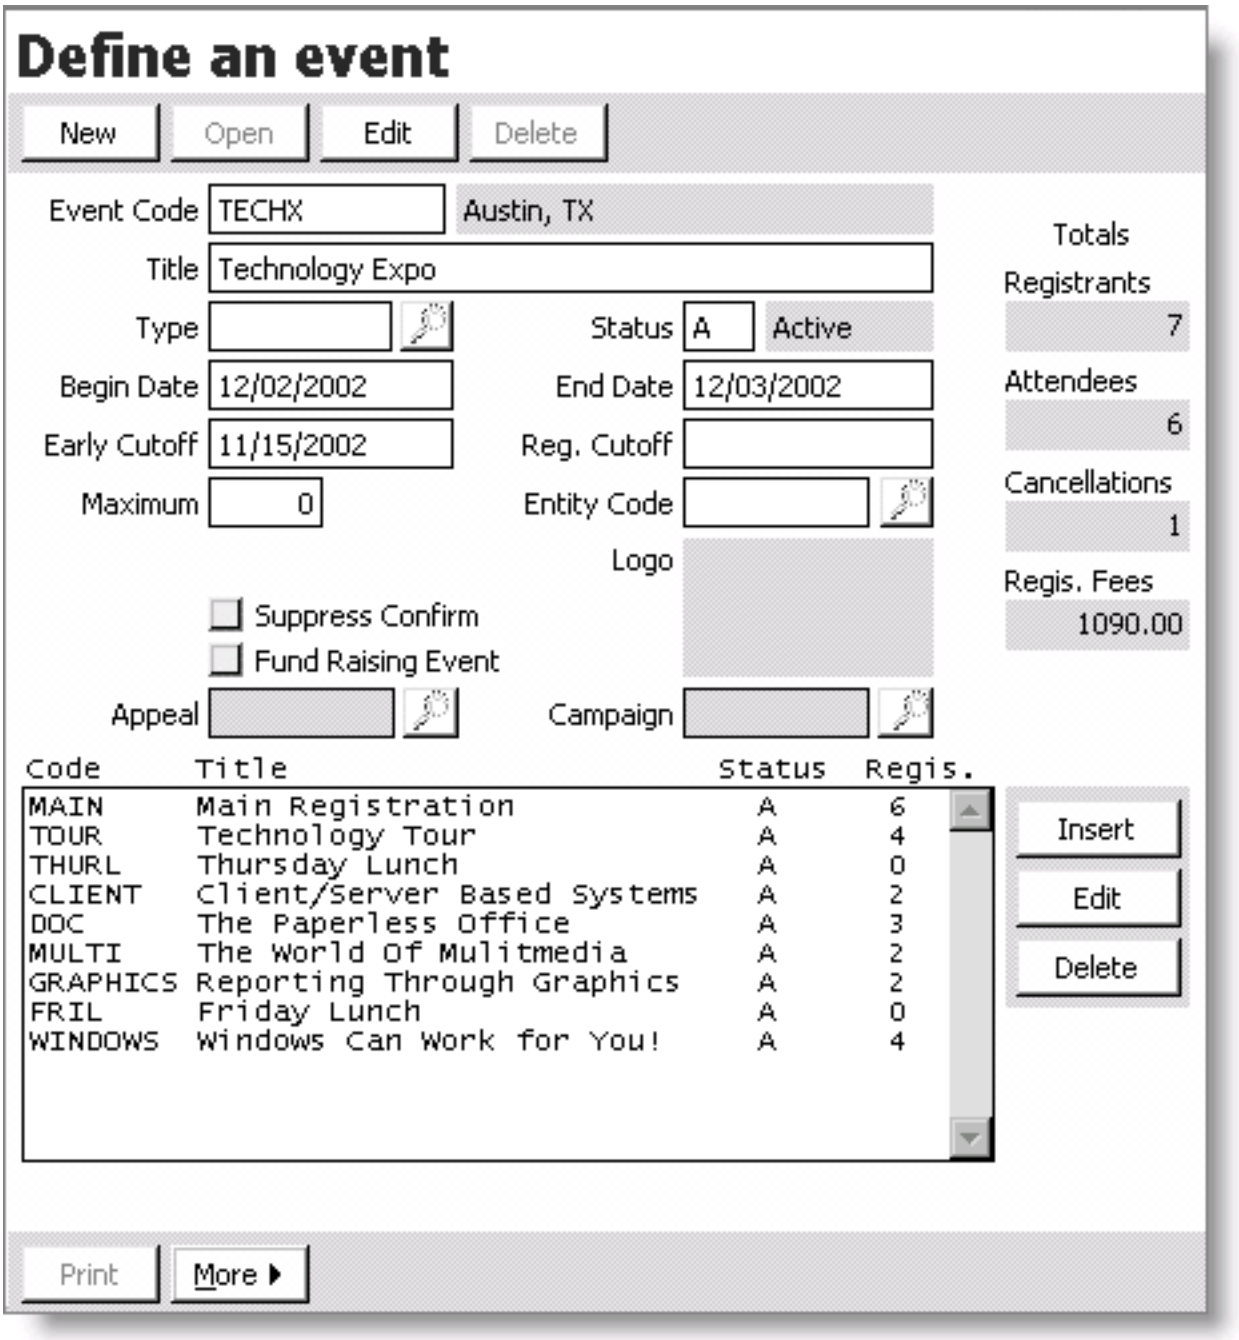
To set up deferred income for a dues or subscription product

1. From Billing, select Set up module > Products to open the Set up products window.
2. Select a current product from the Current Products list.
3. Click Edit.
4. Enter the income account number in the G/L Acct field, or press the lookup icon to select a value.
5. Enter the deferred income account number in the Deferred field, or click the lookup icon to select a value.
6. Click Save.

To enable deferred income for an event function

1. From Events, select Define an event to open the Define an event window.
2. Click on a line item to select an event.
3. Click Edit to open the Define an event window for the selected event.
4. Select the appropriate event function.
5. Click the Edit button displayed to the right of the event functions to open the Event Function Detail window.
6. Click More and select Fees from the drop-down list to open the Event Function Definition - Fees window.
7. On the Event Function Definition - Fees window, select the Default line item to display the Deferred Account field.

8. Enter an account number in the Deferred Account field, or click the Find icon to select a value.
9. Enter an account number in the Income Account field, or click the Find icon to select a value.
10. Click Save.



Processing deferred income transactions

Although the entries to record deferred income and subsequently recognize income are generated during the GL interface procedures, the determination of when the income will be recognized occurs as you process each transaction. Deferred income processing requires the following information:

- Deferred income account codes - The deferred income account must be entered on the Set up products window and the Event Function Definition - Fees window for all relevant products for which income recognition should be deferred. You must specify these accounts to enable deferred income processing.
- Verification of Begin Date and Term - For event registration and exhibition/exposition order transactions, verify that the event's Begin Date is correct. For dues/subscription products, verify that the billing term on each customer/subscriber's deferred line item is correct.

Deferring events/exhibition/exposition income

As event registrations and exhibition/exposition orders are processed and functions are selected which have a defined deferred income account, the income for these functions is automatically triggered for deferral until the month of the event, at which time 100% of the income is recognized.

Deferring dues/subscriptions income

Successful processing of dues/subscription deferred income transactions depends on products with a defined deferred income account number. Both cash dues and accrual dues use deferred income, but the time frame for the deferral varies based on the accounting method used. Cash dues defer income when payments are recorded or reversals are processed. Accrual dues defer income at billing time or when recording credit memos and debit adjustments. The beginning period and term period over which the income is recognized coincides with the beginning and ending date of the dues or subscription term.

Verifying the dues/subscription deferral term

A critical step in processing dues and subscription deferred income transactions is verifying the deferral term. The Begin Date on which the dues or subscription product goes into effect and the Paid Thru ending date, when the term expires, determine the deferral term for any single line item.

The projected dues/subscription term is initially established when the item is billed and displayed on the Dues/Subscription Item Detail window.

To view the projected dues or subscription term

1. From Customers, select Manage customers to open the Manage customers window.
2. Open a customer's record.
3. Select the Billing tab.

   Note: PAC is never deferred.
4. Double-click on a line item in the Billing tab to display the Dues/Subscription Item Detail window.

   The Period (or Begin Date) in the Last Billed section of the Dues/Subscription Item Detail window projects the date that the income begins to be recognized.

   The projected term across which the income will be evenly distributed is represented by the number of months between the Period or Begin Date and the Thru or Paid Thru date of the line item.

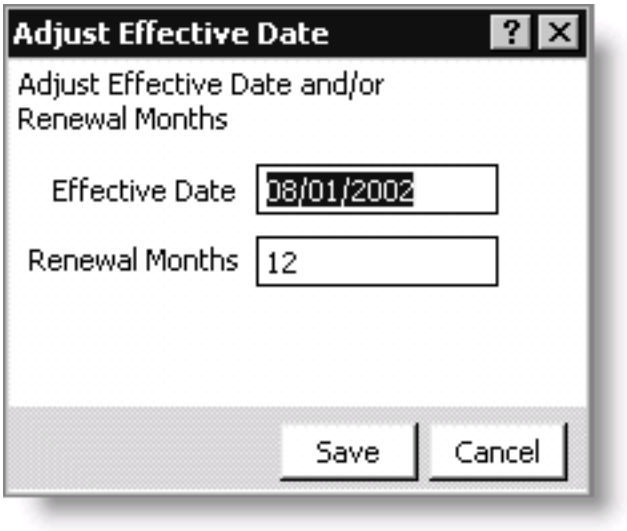
Ensuring an accurate deferral term

The accuracy of the deferral term depends primarily on the accuracy of the dates established in the Last Billed area, in Period (Subscriptions.BILL_BEGIN) and Thru (Subscriptions.BILL_THRU).

To ensure accuracy, you should understand how iMIS dues/subscription product billing and related processing automatically determines these dates. For more information, see How iMIS Works with Dates.

If your dues or subscription billing is done on a cash basis, term overrides can occur at payment time. If you override the system-calculated Paid Thru date on a deferred income line item, a window is displayed which allows verification and adjustment of the Effective Date or term (Renewal Months).

For example, if the projected Paid Thru date of the BASIC line item was changed from 06/30/2003 to 07/31/2003 during the payment data entry, the Adjust Effective Date window is displayed, allowing you to modify the Effective Date (begin date) or Renewal Months (term). If no changes are made, the Effective Date is set to 08/01/2002 and a 12-month term (08/01/2002 - 07/31/2003) is used. If you specify a different Effective Date and press Tab, the resulting term is automatically calculated and displayed in the Renewal Months field. If you specify a new term in the Renewal Months field and press Tab, the resulting begin date is automatically displayed in the Effective Date field.



Adjust Effective Date window

If you process dues on an accrual basis, no subsequent overrides of the system-calculated term are possible. Verify the term dates on your Billing Batch Detail Report or Individual Accrual Dues Posting window before finalizing the billing details.

Processing adjustments of deferred income

Cancellations, reversals, or adjustments of previously deferred dues/subscription income should be processed with the appropriate beginning period and term.

The GL interface procedure will automatically adjust the deferred income matrix for these transactions in iMIS and create the necessary entries to adjust the deferred income and earned income amounts in the General Ledger.

For information on adjustments when using cash dues, see Reversing and Canceling Payment Transactions.

For information on adjustments when using accrual dues, see Processing Adjustments.

Converting existing deferred income items

When you begin using iMIS to manage your deferred income, you have two options for dealing with the balance in the deferred income accounts at conversion time:

- Do Not Convert - Continue to create manual deferred income-to-regular income transfer entries only for the amounts currently in deferred income until all amounts are recognized. This may be the best method if your monthly income figures are already itemized in a manually prepared spreadsheet.
- Convert - Convert the deferred income balance by building an initial deferred income matrix before you begin adding iMIS deferred income transactions through the GL interface procedure.

Conversion methods for building the initial matrix

The conversion methods you can use to build this table include the following:

Conversion method 1

Enter the full amount originally posted to each deferred income account (and subsequent regular income account) combination for each month in the past and future for which there remains a balance to be recognized.

In this case, you must enter both the original amount posted to the deferred income account and the amount that has been transferred to regular income to date.

> **Note:** Note: For the best results, do not use this method unless your existing records lend themselves easily to this conversion.

Conversion method 2

(Recommended) Enter just the current balance remaining in the deferred income accounts by entering the amounts that are yet to be recognized (rather than the original amount posted).

One approach to building the table is to enter only current and future dates for each entry, that is, only the months remaining across which the current balance will be distributed. The net balance yet to be recognized is entered as the Orig Amt and leave the Amt Transf'd at zero. Use negative amounts to denote a credit amount, which is the typical entry for these fields.

Example 1

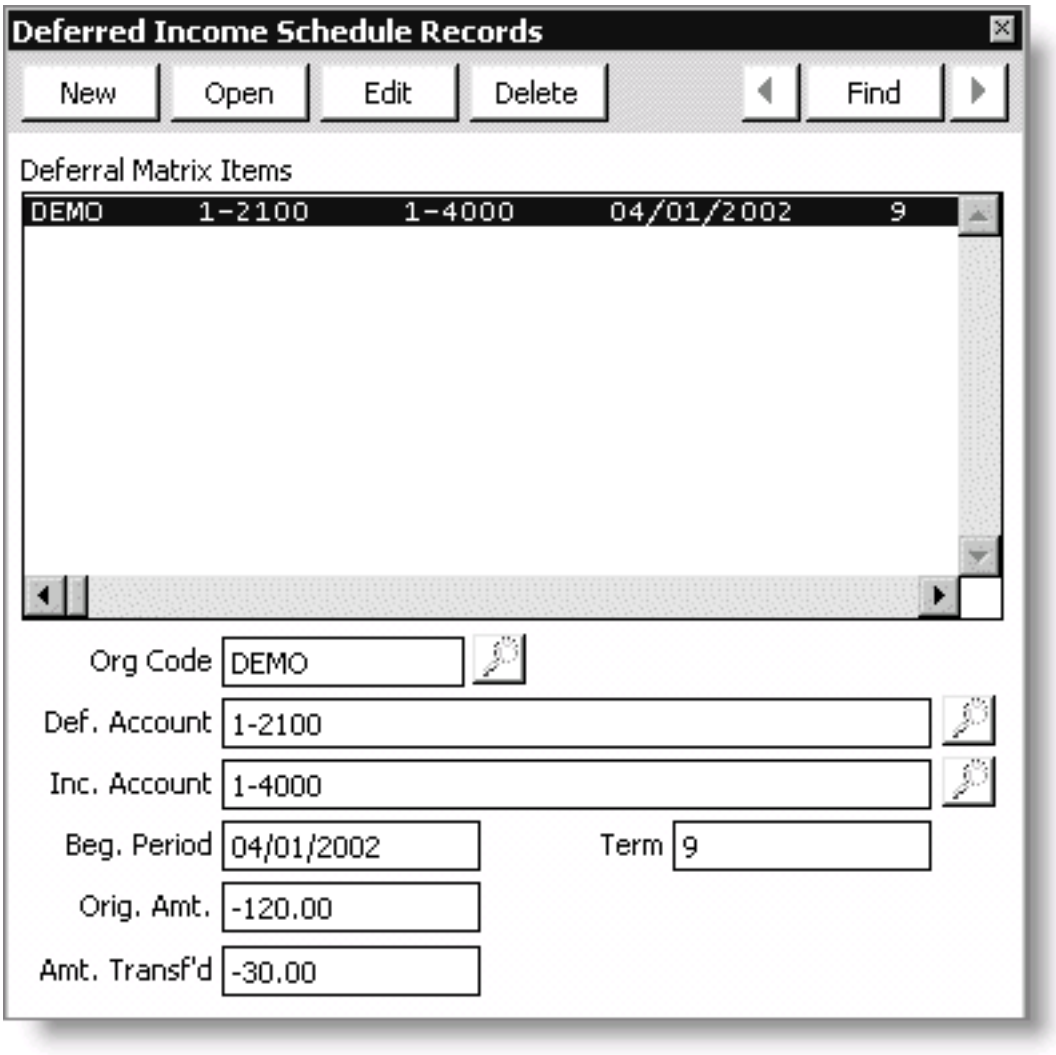
Deferred income transfer entries from January-March 2002 have been generated outside of iMIS, and will be converted effective April 1, 2002. As of the conversion month, only 9 months are left of the original 12-month term, and 3 monthly amounts of $25 have been transferred from the original deferred income balance of $300. The balance yet to be transferred is $225, which you enter as a negative amount in the Orig Amt field.

Another, and perhaps the easiest, approach is to prepare a schedule that itemizes the specific amounts to be transferred each month in the future, and convert the remaining balance by entering these individual monthly amounts in separate matrix records with single-month terms. Use a negative amount to denote a credit amount.

Example 2

Using the previous example where $25 is transferred each month, enter one entry for each month from April to December (totaling nine entries) with a one-month term and an amount of $25.

Deferred Income Schedule Records window



From AR/Cash, select Process month-end procedures, and click Deferred Income Records

To build the deferred income matrix initially, use the Deferred Income Schedules Records window. This window contains the following fields:

Find button

Select to find a deferred income entry. You can specify the Org Code, Def Account, Inc Account, Beg Period, Term, Orig Amt, or Amt Transf'd of the deferral income entry for the search. The first deferral income entry that matches the search criteria will be selected.

Deferral Matrix Items

The list of existing deferred income entries is displayed in this scrolling list.

Org Code

Enter the organization or entity code as established on the Organization Names window (select File> System Setup), or use the lookup icon to select a value.

Def Account

Enter the GL deferred income (liability) account number to which the original amount was initially posted (to await subsequent recognition and transfer to regular income), or use the lookup icon to select a value.

Inc Account

Enter the GL income account to which the amounts will be transferred as the income is earned and recognized, or use the lookup icon to select a value.

Beg Period

Enter the accounting date (typically month, first day of the month, year) either for which the income was initially recognized or will be recognized (Conversion method 1), or for which you want iMIS to begin generating the necessary transfer entries to recognize income and reduce deferred income (Conversion method 2).

Term

Enter the number of months over which the original amount is to be recognized as income. This may be the original term (Conversion method 1), the net number of months remaining within the original term for which income is yet to be transferred, or 1 (Conversion method 2).

Orig Amt

Enter the total dollar amount that will be recognized in prorated monthly amounts over the term of the deferred income item. Because deferred income accounts carry a credit bal-

ance, enter only negative amounts (enter a minus sign followed by the digits that represent the amount).

This field should contain one of the following:

- Original amount posted in the starting month to this deferred income/regular income/term combination (Conversion method 1)
- Net amount remaining to be recognized over the remainder of the term (Conversion method 2)
- Total amount of the existing deferred income balance to be transferred from the deferred income account identified to the regular income account identified for the single-month term (Conversion method 2)

Amt. Transf'd

Enter the dollar amount portion of the original amount already recognized in previous periods. As with the original amount, the amount transferred must be represented by a negative amount. (This field should only be used when using conversion method 1. See “Conversion Methods for Building the Initial Matrix”.)

To build the initial matrix

1. From AR/Cash, select Process month-end procedures.
2. Click Deferred Income Records to open the Deferred Income Schedule Records window.
3. To build the table, you must create one entry for each Deferred Account - Income Account - Beginning Period - Term (or number of months) -combination.
4. Click New.
5. Enter data into the Org Code, Def. Account, Inc. Account, Beg. Period, Orig. Amt., Amt. Transf'd, and Term fields, or click the Find icon to select a value.
6. Click Save.

Deferred income reports

Several summary and detail level reports let you review the status of deferred income. Go to AR/Cash > Generate reports > Deferred Income:

- Deferred Income Analysis/Spread
- Deferred Income Audit Trail (Crystal)
- Deferred Income Detail (Crystal)
- Deferred Income Matrix Summary (Crystal)

Deferred Income Analysis/Spread

Provides a projection of how the current balances in deferred income will be recognized in each future period. This is an important management report.

Deferred Income Audit Trail (Crystal)

Provides a report on the income that was recognized, as well as the deferred income balance that remains at the end of the reporting period. This report is designed to run for a specific monthly period (any month for which the GL interface has already been run). The report is designed as an audit trail report to simulate the income that was recognized, as well as the deferred income balances that remain at the end of the reporting period.

> **Note:** Note: This report is generated using the specified End Date. Only transactions equal to or less than the report's End Date are included. It is important to always enter the last day of the month.

This report is based on deferred income transactions for which the deferral/recognition timeframe is still in effect as of the beginning of the month being reported on (residual income is yet to be recognized either during the report month and/or in a future month).

This report simulates the process that iMIS uses to generate the deferral to income transfer entries with one exception. It depicts the income recognition at the individual detail transaction level, as opposed to the matrix summary level that iMIS uses to generate the actual entries. As a result, the reported income amounts will most likely be different from

the actual amounts by small rounding differences. Nonetheless, the report should give a close approximation of the actual transfer amounts per month as well as the residual balance at the end.

This report is structured as follows:

- The report is based on all transactions dated on or before the reporting end date that have been posted to the deferred income matrix.
- The transactions are grouped, sorted, and subtotaled by the four key deferral matrix elements (deferral account, income account, begin date, and term).
- For identification and cross reference, the Trans #, Trans Date, Bill To ID, Bill To Name, and Product code are listed.
- The transaction amount is listed and subtotaled at the matrix summary level. This subtotal should agree with the original amount on the Deferred Income Matrix Summary report as of the end date of the report (the sign is shown as positive instead of the normal credit balance for easier use of the report).
- For each detail line, the monthly transfer column will show the portion of the income that should have been transferred during the reporting month. In most cases, if the begin date is equal to or less than the reporting period, this will be the transaction amount divided by the term, with appropriate rounding. In some cases, the amount may be more if the transaction date falls within the reporting date and the deferral begin date was within an earlier period. In this case, iMIS works in a catch-up mode on income that needs to be recognized by the reporting date. If the reporting period is the last period within the deferral term, the amount may be smaller or larger to account for any cumulative rounding differential. The transfer amount is summarized at the matrix level and is also subtotaled for each income account. The actual transfer amount can be compared to the total income from transfer for the reporting period.

  Note: If the actual transfer amount differs substantially from the report amount, this may be due to timing issues where the income for certain transactions was not recognized because a future month's GL interface was processed before the affected transactions were processed through an interface cycle.

- The Months Remaining in the deferral term beyond the reporting month is shown for each transaction.
- The deferred income Amount Remaining is shown at the individual transaction level, matrix summary level, and the Total amount by the deferred GL account. It can be compared to the GL balance and/or the Deferred Income Matrix Summary report as of the end of the reporting month. Again, due to the detail basis of the report, this balance will only be an approximation, which may be off by a rounding difference.

  Deferred Income Detail (Crystal)

  Provides a report of transactions to be posted to deferred income. Transactions are sorted by deferred income account, regular income account, beginning date, and term. This report should be printed prior to running the GL interface procedure. Verify the accuracy of the data and make modifications as needed before running the GL interface.

  Deferred Income Matrix Summary (Crystal)

  Provides a current status of the deferred income matrix table and shows the totals that were originally posted to deferred income, how much has been recognized to date, and the amount that remains to be recognized in future months. This report should be printed after each GL interface. The remaining amounts should tie to the deferred income balances in the General Ledger. Save this report and use it as a backup for deferred income transfer entries.

Multiple Entity Processing

iMIS can separate and process transactions for multiple financial entities (or funds) as long as the entities share a common iMIS database.

Each financial entity must maintain a separate set of financial records and must be configured as a separate organizational entity in iMIS.

By default, iMIS uses single-entity processing, but you can use multi-entity processing by configuring the following items:

1. Define the entities (see "Defining an organizational entity") for which you need to keep separate financial records.
2. Enable multi-entity processing in the AR/Cash Set up module window (see "Enabling multi-entity processing").
3. Define default accounts (see "Defining default general ledger accounts") for your entities.
4. Set up cash accounts (see "Setting up cash accounts") for your entities.
5. Set up Due To/Due From processing (see "DueTo/DueFrom processing").

   See the appropriate procedures in the AR Cash guide for configuration details.

Enabling multi-entity processing

Use the Set up module window to enable multiple entities. See the AR/Cash Administration section for help with the Set up module window for AR/Cash.

To enable iMIS multiple-entity processing

1. From AR/Cash, select Set up module to open the AR/Cash Set up module window.
2. Click Edit.
3. Select the Multiple Entities checkbox to process transactions for two or more independent entities (and sets of books).

   Default account fields are activated when you check the Multiple Entities checkbox.
4. (optional) Enter the default entity codes for each iMIS module, or click the lookup icons to select from defined entity codes.

   Note: You only need to enter entity codes for modules whose entity codes are different from the system default organization code.
5. Click Save.

DueTo/DueFrom processing

If you use one entity's cash account to receive income meant for a different entity, you must set up DueTo/DueFrom accounts to ensure that your accounting records are

correct.

Correcting balancing problems

iMIS generates DueTo/DueFrom entries for configured entity relationships when transactions are sent to the general ledger. These entries correct balancing problems created by entities receiving cash for which they do not have matching income, and entities receiving income for which they do not have matching cash.

Due to owner entity

This liability entry is created for the entity that owns the cash account that received the money but is not entitled to the income. This liability entry offsets the cash the entity received but did not own.

Due from cash entity

This receivable entry is created for the entity that owns the income to make up for the asset it is entitled to but did not receive.

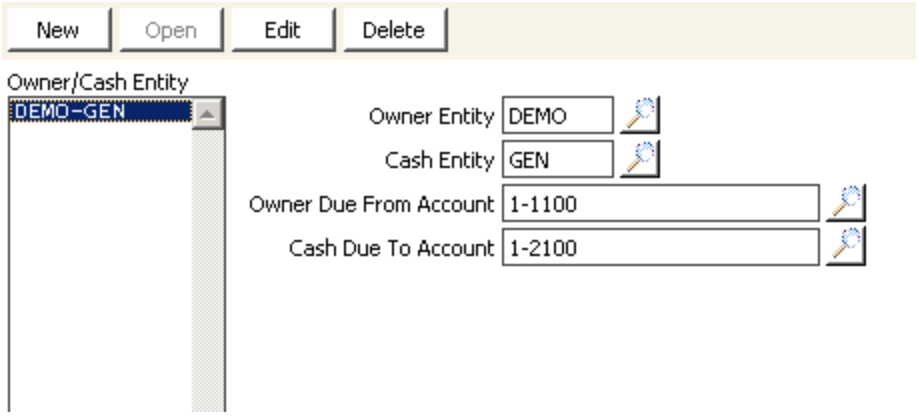
Setting up DueTo/DueFrom accounts

DueTo/DueFrom accounts are set up in the Set up DueTo/DueFrom window. Create one entry for each multiple-entity combination where cash will be received by one entity for a transaction that belongs to a different entity.

Set up due to/due from window

The Set up due to/due from window enables you to define the DueTo/DueFrom relationships between your general ledger accounts.

In this window, you can set up entries for each multiple-entity combination in which cash is received by one entity for transactions that belong to another entity.



Desktop: AR/Cash > Set up tables > DueTo/DueFrom

Owner/Cash Entity

Lists Due To/Due From accounts specifying the source entity and the destination entity.

Owner Entity

Specifies the entity that owns the income.

Cash Entity

Specifies the entity that owns the cash account for the cash received.

Owner Due From Account

Specifies the receivables account number for the entity that owns the income (debit).

Cash Due To Account

Specifies the liability account number for the entity that received the cash (credit).

To set up Due To/Due From accounts

1. From Set up due to/due from window, click New.
2. Enter the Org Code for the entity that owns the income or accounts receivable in the Owner Entity field, or use the lookup icon to select a value.
3. Enter the Org Code for the entity that received the cash in the Cash Entity field, or use the lookup icon to select a value.

4. In the Owner Due From Account field, enter the GL account in which to record the inter-company receivable (debit) transaction for the entity that owns the income, or use the lookup icon to select a value.
5. In the Cash Due To Account field, enter the GL account in which to record the inter-company payable (credit) transaction for the entity in which the cash account resides (cash entity), or use the lookup icon to select a value.
6. Click Save.

Determining transaction entity ownership

Each transaction generated within iMIS is made up of two or more transaction entry lines. Each individual transaction line can be one of the following:

- a cash line, representing a cash payment or reversal
- a distribution line, typically representing an entry to income
- an AR line, normally representing an offset to the accounts receivable account

A due to/due from (see "DueTo/DueFrom processing") situation arises when there is a difference between the entity assigned to the cash line (for example, representing the cash account into which the funds are deposited) and the entity assigned to either a distribution/income or AR line within the same transaction.

The accounts to which transaction lines are assigned depends on the iMIS module and on iMIS configuration options.

Entity processing in Billing

Cash Line

Batch control disabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The default entity for Billing, if any
3. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The default entity for Billing, if any
2. The overall system default entity

Batch control enabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The cash entity specified in the batch, if any
3. The default entity for Billing, if any
4. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The cash entity specified in the batch, if any
2. The default entity for Billing, if any
3. The overall system default entity

Distribution/Income Line

Entity ownership is determined in the following order:

1. The default entity for Billing, if any
2. The overall system default entity

AR Line

Entity ownership is determined in the following order:

1. The default entity for Billing, if any
2. The overall system default entity

Accrual Dues with Multi-Entity enabled

The income for accrual dues items is recorded using the following hierarchy:

1. The designated entity for that product, if any
2. The Dues default entity, if any
3. The overall system default entity

Cash Dues with Multi-Entity enabled

When a cash dues payment is made, the income for the payment is recorded using the following hierarchy:

1. The Dues product entity, if any
2. The Billing module entity, if any

- The overall system default entity

Entity processing in Events and Exhibition

> **Note:** Note: A Due To-Due From situation can occur when a payment is entered for an event registration or exhibition order and the batch or credit card cash account entity does not match the event income entity.

Cash Line

Batch control disabled

For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The default entity for the module, if any
3. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The default entity for the module, if any
2. The overall system default entity

Batch control enabled

For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The cash entity specified in the batch, if any
3. The default entity for the module, if any
4. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The cash entity specified in the batch, if any
2. The default entity for the module, if any
3. The overall system default entity

Distribution/Income Line

The income entity for an Events function is designated by the most specific income entity defined. For example:

1. The entity defined on the Event Function Detail window, if any
2. The entity defined on the Define an event window, if any
3. The default Meeting/Events entity, if any
4. The overall system default entity

The income GL account recorded in the Trans table for event function DIST lines is determined in the following way:

1. The account specified in the Event function detail > Fees window, if any
2. The default income account of the function's fund, if any
3. The default income account of the event's entity, if any
4. The income account of the default meeting entity, if any
5. The default income account for the default system entity.

AR Line

Entity ownership is determined in the following order:

1. The default entity established for the meeting or exhibition, if any

   Note: The entity is assigned to the Invoice related to the meeting registration or exhibition order when the registration or order is initially entered.

2. The default entity for the module, if any
3. The overall system default entity

Entity processing in Exposition

Cash Line

Batch control disabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The default entity for Expo, if any
3. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The default entity for Expo, if any
2. The overall system default entity

Batch control enabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The cash entity specified in the batch, if any
3. The default entity for Expo, if any
4. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The cash entity specified in the batch, if any
2. The default entity for Expo, if any
3. The overall system default entity

Distribution/Income Line

Entity ownership is determined in the following order:

1. The default entity for the exposition, if any
2. The default entity for Expo, if any
3. The overall system default entity

AR Line

Entity ownership is determined in the following order:

1. The default entity for the exposition, if any
2. The default entity for Expo, if any
3. The overall system default entity

Entity processing in Fundraising

Cash Line

Batch control disabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The default entity for Fundraising, if any
3. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The default entity for Fundraising, if any
2. The overall system default entity

Batch control enabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The cash entity specified in the batch, if any
3. The default entity for Fundraising, if any
4. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The cash entity specified in the batch, if any
2. The default entity for Fundraising, if any
3. The overall system default entity

Distribution/Income Line

Entity ownership is derived from the Fund assigned to the related gift or pledge Distribution.

AR Line

Entity ownership is derived from the Fund assigned to the related gift or pledge Distribution.

Entity processing in AR/Cash - Sales Transactions and Simple Order Entry

Cash Line

Batch control disabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The default entity for AR/Cash, if any
3. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The default entity for AR/Cash, if any
2. The overall system default entity

Batch control enabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The cash entity specified in the batch, if any
3. The default entity for AR/Cash, if any
4. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The cash entity specified in the batch, if any
2. The default entity for AR/Cash, if any
3. The overall system default entity

Distribution/Income Line

Batch control disabled - Entity ownership is determined in the following order:

1. The default entity for AR/Cash, if any
2. The overall system default entity

Batch control enabled - Entity ownership is determined in the following order:

1. The cash account entity specified, if any, in the batch in which the transaction or order is entered
2. The default entity for AR/Cash, if any
3. The overall system default entity

AR Line

Batch control disabled - Entity ownership is determined in the following order:

1. The default entity for AR/Cash, if any
2. The overall system default entity

Batch control enabled - Entity ownership is determined in the following order:

1. The cash account entity specified, if any, in the batch in which the transaction or order is entered
2. The default entity for AR/Cash, if any
3. The overall system default entity

Entity processing in Orders

For both regular order processing and credit/debit orders, refer to iMIS Orders for information on entity ownership.

Entity processing in Credit Memo or Debit Memo/Adjustment Transactions

Distribution/Income Line

Uses the owner entity of the original order that is being adjusted

AR Line

Uses the owner entity of the original order that is being adjusted

Entity processing in AR/Cash - Cash Receipts

Cash Line

Batch control disabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The default entity for AR/Cash, if any
3. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The default entity for AR/Cash, if any
2. The overall system default entity

Batch control enabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The cash entity specified in the batch, if any
3. The default entity for AR/Cash, if any
4. The overall system default entity

For a non-credit card payment, entity ownership is determined in the following order:

1. The cash entity specified in the batch, if any
2. The default entity for AR/Cash, if any
3. The overall system default entity

Distribution/Income Line

Not applicable

AR Line

For a payment on an existing open item, uses the owner entity of the original item being paid.

For a credit card payment for a newly created Prepaid Credit Balance item if batch control is disabled, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The default entity for AR/Cash, if any
3. The overall system default entity

For a non-credit card payment for a newly created Prepaid Credit Balance item if batch control is disabled, entity ownership is determined in the following order:

1. The default entity for AR/Cash, if any
2. The overall system default entity

For a credit card payment for a newly created Prepaid Credit Balance item if batch control is enabled, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The cash entity specified in the batch, if any
3. The default entity for AR/Cash, if any
4. The overall system default entity

For a non-credit card payment for a newly created Prepaid Credit Balance item if batch control is enabled, entity ownership is determined in the following order:

1. The cash entity specified in the batch, if any
2. The default entity for AR/Cash, if any
3. The overall system default entity

Entity processing in Service Central - Enter and edit payments

Cash Line

Batch control disabled - For a credit card payment, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The default entity for Service Central, if any

2. The default entity for Service Central, if any
3. The overall system default entity

   For a non-credit card payment for a newly created Prepaid Credit Balance item if batch control is disabled, entity ownership is determined in the following order:

1. The default entity for Service Central, if any

2. The overall system default entity

   For a credit card payment for a newly created Prepaid Credit Balance item if batch control is enabled, entity ownership is determined in the following order:

1. The entity assigned to the credit card cash account, if any
2. The cash entity specified in the batch, if any
3. The default entity for Service Central, if any
4. The overall system default entity

   For a non-credit card payment for a newly created Prepaid Credit Balance item if batch control is enabled, entity ownership is determined in the following order:

1. The cash entity specified in the batch, if any
2. The default entity for Service Central, if any
3. The overall system default entity

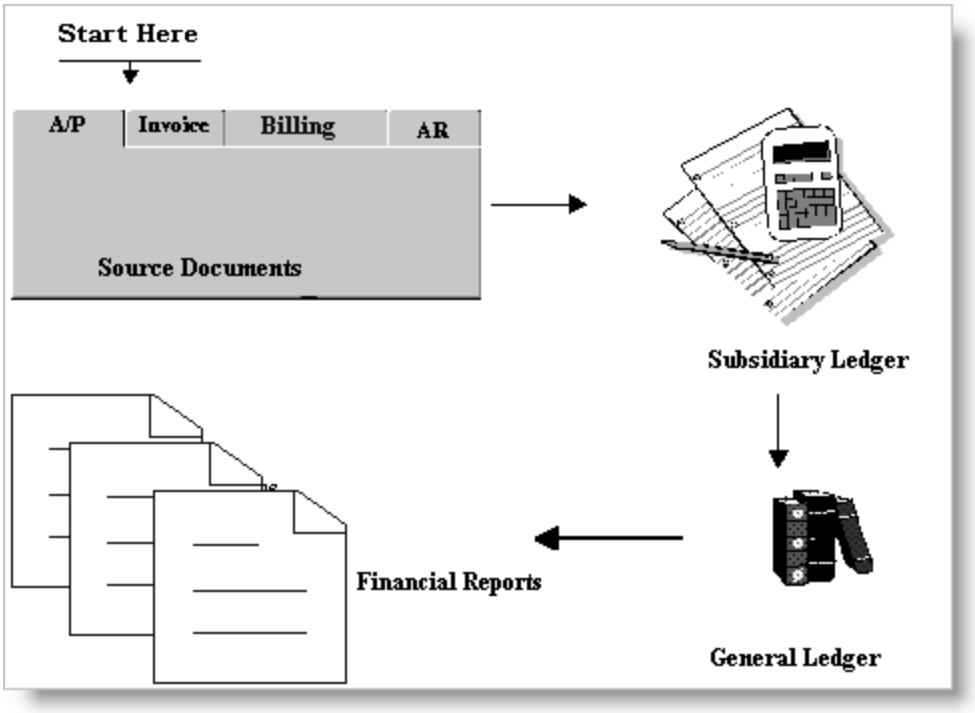
AR/Cash

Accounts Receivable and Cash Receipts Overview

The Accounts Receivable and Cash Receipts (AR/Cash) feature provides the central cash receipt and accounts receivable tracking utility for the entire integrated iMIS system. All accounting-related entries generated by iMIS (through Billing, Events, and so forth) flow through and are managed by AR/Cash. You can also enter other sales, cash receipt, and adjusting entries directly through AR/Cash.

Reviewing the AR/Cash process

The following diagram illustrates how iMIS processes the flow of accounting transactions:



The AR/Cash Process

The flow of accounting transactions includes the following:

- iMIS generates detailed accounting transactions based on the recording of source documents.

- Transactions generated from the source documents are posted to create and update open item balances. The balances that are added together form the accounts receivable subsidiary ledger total.
- Transactions that have been posted are automatically transferred to your third-party General Ledger (GL) through the optional iMIS AR/Cash system or GL interface to produce reports.

  Designed for non-accountant use

  Although iMIS contains a solid accounting foundation, the AR/Cash interface is designed for users who have little or no prior accounting knowledge.

  While all iMIS data entry facilities generate accounting transactions to fit the situation, those users entering the data do not need to be aware of the structure and accounting signs (debits and credits) for those transactions. Detail transaction reports print with natural (as opposed to true accounting) signs for easy examination by non-accounting personnel.

  > **Note:** Note: Crystal reports contain credit and debit columns.

  GL account numbers are only entered in the AR/Cash System Setup areas, so those entering data do not need to be concerned about these account numbers. Instead, users select from logical, abbreviated product codes during their normal transaction processing.

  Flexible processing for cash receipts

  A number of flexible features provide for efficient entering of cash receipts (payments), including the following:

- Account against open receivables
- Sales/income transaction (such as payments that accompany orders and registrations)
- In advance of any application (such as prepaid and unidentified cash receipts)

- Processing cash, check, and credit card receipts as needed (on the Set up cash accounts window, establish which, if any, credit cards to accept)
- Multiple cash accounts

  Optional batch control

  Batch control groups your transactions, giving you more control over the data entry process. Batch control features include:

- Designating user- or system-assigned batch numbering
- Assigning separate batches for different deposits, entry types, or users
- Selecting a different cash account for independent batches
- Monitoring ongoing data entry results against pre-established cash and optional transaction count controls
- Assigning consistent, automatic batch numbers and transaction dates to each transaction entered in an open batch
- Checking transactions and totals with separate batch transactions reporting
- Finalizing all batch transactions on posting/closing the batch

  Immediate or hot posting

  Immediate or hot posting of transactions lets you instantly see the results of transactions as you enter them. Immediate or hot posting is a built-in feature within iMIS when batch control is not enabled. It is also the default setting when batch control is enabled. For more information, see Setting up Batch Control.

  As soon as you enter a transaction, iMIS updates customer accounts and creates any sales activity/history records. Sales orders entered through the simple or full-order entry utility update accounts and history when you print the invoices.

  Entries made on the Enter and edit transactions windows allow immediate or hot posting when:

- Deleting a transaction and iMIS reverses the effects of the initial posting, and reverses the updating of the AR/Cash open item and removes the related sales activity/history records.
- Modifying a transaction and iMIS adjusts the posted results (AR/Cash open items and sales activity/history records) according to the changes you made.

Simple order entry subsystem

The simple order subsystem enables you to produce high-quality invoice documents for miscellaneous sales, including publications, advertising, and labels. The additional features allow you to perform the following tasks:

- Use one invoice-style order-entry window, which supports data entry, data editing (until the invoice is printed), and inquiries
- Override Ship To ID, name, and address information
- Enter multiple order line items and comment lines
- Enter and separately track freight and handling amounts
- Automatically calculate sales tax through the sales tax codes assigned to each order
- Print invoices in a variety of formats with optional user-defined standard messages

> **Note:** Note: See the iMIS Authorized Forms Catalog for examples of many high-quality printing document formats.

Reporting features

These features provide for multi-transaction audit trail selections in addition to traditional aging and customer statement options.

Multiple levels of detail and summary transaction reports are available, from detailed batch or daily transaction reports to month-end GL account-oriented detail and full summary options.

Aging and customer statement options involved in reporting include the following:

- Defining aging groups (length and labels) according to your organization's tracking requirements
- Creating a hard-copy AR/Cash statement format with a variable message to fit the age categories
- Set search parameters for reports using the runtime flexibility

Multiple-entity support

This support allows processing of transactions for two or more independent entities (and sets of books). iMIS also generates intercompany Due To-Due From entries if funds from multiple entities (see "Multiple Entity Processing") are deposited into a shared cash account.

Batch Control

iMIS batch control enables you to segment and control the reporting of accounting transactions. You can establish any number of transaction batches. For example, many organizations open a batch for each deposit or open batches by day or by user. Batch numbering, viewing, posting, and other options are configured by your administrator (see "Setting up batch control").

When batch control is in effect, the Transaction Ledger window appends the batch number to the end of the Description field for each line item.

Benefits of batch control

- Groups and reports transactions by batch
- Allows entry and monitor control totals
- Supports any number of open batches
- Supports any number of users entering transactions into any given batch (for deposit-oriented batch control)
- Supports multiple cash accounts
- Assigns a batch date to each transaction entered (minimizing date override errors)

Uses of batch control

- Payment control
- Bank deposit reconciliation
- Grouping transactions by:
- Deposit (good audit trail support)
- Data entry operator
- Department
- Transaction type
- User-preferred methods
- Module

Where batch control is required

- Multiple cash accounts
- Multiple entities (Due To-Due From processing)
- Accrual billing

Viewing unposted transactions

If your administrator has selected this option (see "About marking unposted transactions"), unposted transactions created with batch control in effect can be identified as unposted on the AR/Cash area of the Manage customers window and on all Transaction Ledger windows.

To view unposted transactions

1. From Customers, select Manage customers to open the Manage customers window.
2. Click Find.
3. Enter the customer ID and press Enter.

4. Select the AR/Cash tab to view the customer's AR/Cash information. (U) is displayed in the column to the left of the Ref Num.
5. Double-click an invoice to open the Transaction Ledger window.
6. The window, as well as the columns in the window, can be resized.
7. Any unposted transactions are marked (U). The description fields are appended with the batch numbers.
8. Click OK to close the window.

Examples of unposted transactions

The following is an example of how transactions are marked unposted.

1. Create an invoice for a customer with batch control enabled.
2. View the customer's AR/Cash tab. There is a (U) displayed to the left of the reference number for the unposted transaction.
3. View the customer's Transaction Ledger window for this transaction.
4. Post the batch.
5. View the customer's AR/Cash tab. There is no longer a (U) mark to the left of the reference number for the transaction.
6. View the customer's Transaction Ledger window for this transaction. After the batch is posted, the (U) is removed from the descriptions for transaction number 99.
7. Enter a payment against this invoice in a separate batch.
8. View the customer's AR/Cash tab. There is a (U) to the left of the reference number for the line item with the unposted transaction.
9. View the customer's Transaction Ledger window. Notice that only the AR line for the payment is marked (U), and that the original invoice lines are not marked (U).
10. Post the batch.

11. View the customer's AR/Cash tab. There is no longer a (U) mark next to the reference number for the transaction.
12. View the customer's Transaction Ledger window. Notice that the original invoice and the payment are no longer marked with a (U).

Working with batches

The Manage batches window enables you to perform several different batch functions:

- Create new batches
- View/list existing batches
- Control which batches display on the window
- Print and post existing batches

> **Note:** Note: If iMIS is configured to hide batches created by other users, you can view only your own batches, unless your logon's authorization level for AR/Cash is 8. This restriction applies to batches that are created automatically by iMIS or by importing transaction data.

Manage batches window

This window displays a table of the batches that are available to you and the commands for editing and managing them. The authorizations (see "Authorization level privileges (Desktop)") and credentials of each user record control what aspects of this feature can be seen and used.

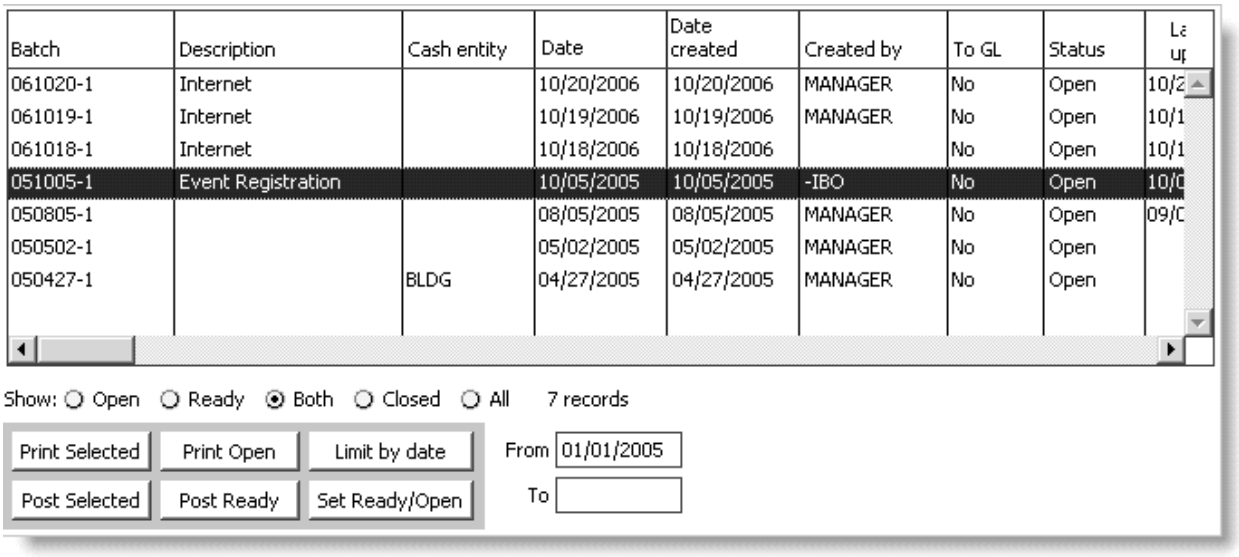
> **Note:** Note: The batches that are available to you depend upon the authorization level and access keywords assigned to your login, and the batch control options that the administrator has selected for your site.

> **Note:** Note: The Manage batches and Open Batches windows are equivalent. The Manage batches window appears only in AR/Cash. The Open Batches window

appears when (a) you are in an iMIS module other than AR/Cash and (b) no open batch is selected when you attempt to enter or edit a transaction.

Note: Note: System-generated batches are designed to be posted unmodified. When you edit a system-generated batch, or add transactions to a system-generated batch, you must designate a cash account for the batch before your changes can be saved, and before the batch is posted.

Note: Note: Window items that are self-explanatory for the typical users of this window are not described.



The Manage batches window batch table and controls

Batch table

This table displays the batches that are available to you. You can sort the batch table by clicking on the column headings. The batch table includes these columns:

- Date - Specifies the transaction date of the batch.
- Date created - Specifies the date that the batch was created.

- To GL - Specifies whether at least one transaction in the batch has been exported to the General Ledger.
- Last updated - Specifies the last date that a change was made to the batch status or transactions in the batch.
- Meeting - (if enabled) Specifies whether the batch is closed when the corresponding meeting is closed.

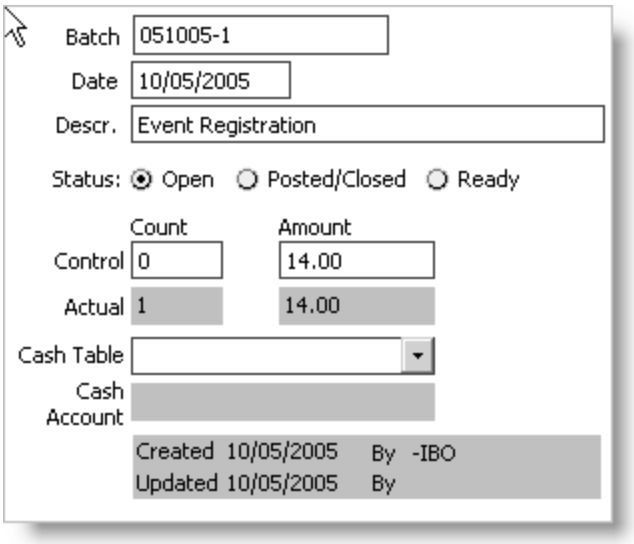
  If the table contains too many batches to view easily, filter the table with the display controls.

  Batch table display controls
- Both - Displays both open and ready batches
- Closed - (if enabled) Displays only closed/posted batches
- All - (if enabled) Displays all of the batches that are available to you
- Limit by date - Displays only batches with creation dates that fall between the dates in the From and To fields

  Batch controls
- Print Open - Prints a transaction report for all open batches
- Post Selected - Posts the selected batch

  Note: To post a batch, the sum of all transaction debits in the batch must equal all transaction credits. In addition, your login must have an authorization level of 4 or higher.
- Post Ready - Posts all ready batches
- Set Ready/Open - Changes the status of the selected batch from open to ready, or from ready to open
- View Batch - Displays the Batch window, which remains open in the area below the task list when you switch to different iMIS modules.

  Batch creation/editing



The Manage batches window data edit/entry area

- Batch - (read-only, unless batch auto-numbering is not enabled) The unique identifier of this batch. (if no auto-numbering) For new batches, you must specify this identifier (maximum: 15 characters).
- Date - The accounting date of all transactions in this batch. For new batches, the default is the current system date.
- Descr - The description of this batch (maximum: 60 characters).
- Status - (read-only, except authorization level 8) The status of this batch.
- Open - Entry/editing/balancing of data is in progress. Authorized users are allowed to add or modify transactions in this batch, and to change the status to Ready.
- Posted/closed - All entry/editing/balancing of data is finalized. No users are allowed to modify transactions in this batch but authorized users can change its status to Open or Ready.
- Ready - Temporary transition between Open and Posted/closed. A batch should only be marked Ready if it is balanced and ready for posting individually or in a group. No users are allowed to modify transactions in this batch but authorized users can change its status to Open or Posted/closed.
- Control Count - The maximum number of transactions this batch can contain.

- Actual Count - (read-only) The current number of transactions in this batch.
- Control Amount - The total value of cash receipts or deposits that can apply to this batch. This enables you to validate the batch balance after data entry.
- Actual Amount - (read-only) The current total value of all transactions in this batch. As you enter transactions, the system keeps an internal count of accumulated transactions.
- Cash Table - The cash account code to which all cash receipts in this batch are assigned.

  Note: This field is required for all user-created batches, even if you only have one cash account, and even if you do not process any cash receipt transactions in this batch.

  Note: If you edit a batch to change the cash account, only receipts entered after you save will reflect the new account and associated GL account information.
- Cash Account - (read-only) The GL account associated with the selected Cash Table value.

  To create a new batch

1. From AR/Cash, select Manage batches.

   The Manage batches window opens.
2. Click New.
3. Enter the batch information.

   Note: You must designate a cash account type in the Cash Table field before you can save a new batch.
4. Click Save.

Selecting an open batch

If you enable batch control, a batch must be selected before you can process transactions. If you do not select a batch after starting an iMIS session, the Open Batches window opens automatically when you attempt to insert or edit a transaction, so that you can

select an open batch. After you select an open batch or create a new batch, the batch remains selected until you select a different batch or exit iMIS.

You can only edit transactions for the currently selected batch. If you try to edit a transaction that was entered in another batch, iMIS prompts you to switch to the originating batch.

To select an open batch

1. From AR/Cash, select Manage batches.
2. In the batch table, double-click a batch to select it.
3. (optional) Click View Batch.

   The Batch window opens, in the lower-left corner of the page.
4. Close the Manage batches window.

To find a specific open batch

1. From AR/Cash, select Manage batches.
2. Click Find.

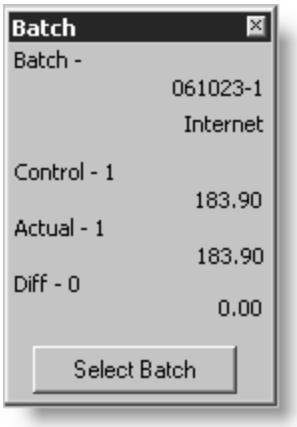
   The Batch field becomes available for data entry. All other fields remain unavailable.
3. Enter as many characters as required to identify the batch.
4. Press Tab.

   iMIS highlights the first batch that matches the characters entered.
5. Repeat steps 3 and 4 as desired.
6. Click Save.

   iMIS cancels the find and populates the fields on the right side with the highlighted batch's data.

Batch window

The Batch window displays information about the current open batch, and provides a button for selecting a different open batch.



From the Manage batches/Open Batches window, click View Batch

This window specifies the following information.

- Batch - The name and description of the current open batch
- Control - The control count and control amount
- Actual - The actual count and actual amount
- Diff - The differences between the control and actual values
- Select Batch - Displays the Open Batches window

To print batches

After you have entered all of the transactions for a batch or group of batches, click Print Selected or Print Open to print the batch transaction report, where you can review the batch details and check the batch balancing

1. From AR/Cash, select Manage batches to open the Manage batches window.

- To print a report for a selected batch, select the batch and click Print Selected.
- To print reports for all open batches, click Print Open.

The batch report lists the detail of each transaction entered and lets you compare the actual figures against the control totals, warning you if they are different. The report also provides a GL accounting summary report.

Posting batches

After you finish your batch transaction work and have verified that the information is accurate and in balance, complete the process by posting the batch. Until you post the batch, you can make changes edit or delete any transaction within the batch (even if you are using the hot posting feature).

> **Note:** Note: If your administrator has selected Require Balanced Batches for Posting (see "AR/Cash Batch Control window"), iMIS will not post a batch unless both the control amount equals the actual amount, and the control count equals the actual count. When you click Post Ready or Post Selected on the Manage batches window and a batch is unbalanced, iMIS displays an error message and does not post the batch.

To post a single batch

1. From AR/Cash, select Manage batches to open the Manage batches window.
2. Select the batch to be posted.
3. Click Post Selected.

   A warning window asks you to confirm that you want to post the batch.
4. Agree to post the batch.

   For each batch posted, iMIS prints the final detail and summary batch transaction report and marks the batch as Posted or Closed.

   Note: After a batch is closed, you cannot add, modify, or delete any transactions in that batch.

To post a group of batches

1. From AR/Cash, select Manage batches to open the Manage batches window.

2. Choose the Show: Both option beneath the batch list.

   This will filter the batches to show only those with an Open or Ready status. Ready batches are ready for posting.

3. Ensure that any batches you want to post have a status of Ready:

- Select an Open batch.
- Click Set Ready/Open.
- Repeat for each Open status batch that you want to post.

4. Ensure that any batches you do not want to post do not have a Ready status:

1. Select a Ready batch.
2. Click Set Ready/Open.
3. Repeat for each Ready batch that you do not want to post.
4. Click Post Ready.

   A warning window asks you to confirm that you want to post the batches.

6. Agree to post the batches.

   All batches with a Ready status are posted.

Simple Orders

The Enter and edit orders window has many of the same fields as the Enter and edit sales transactions window. In addition, the Enter and edit orders window provides the following capabilities:

- Allows for adding new Bill To Id customer records, if the Bill To Id (name and address) is not already in the customer database
- Allows for a separate Ship To ID and/or address
- Tracks freight and handling charges

- Calculates tax (which defaults to either the tax authority established for the Bill To Id, if any, or to the state abbreviation identified in the Ship To address

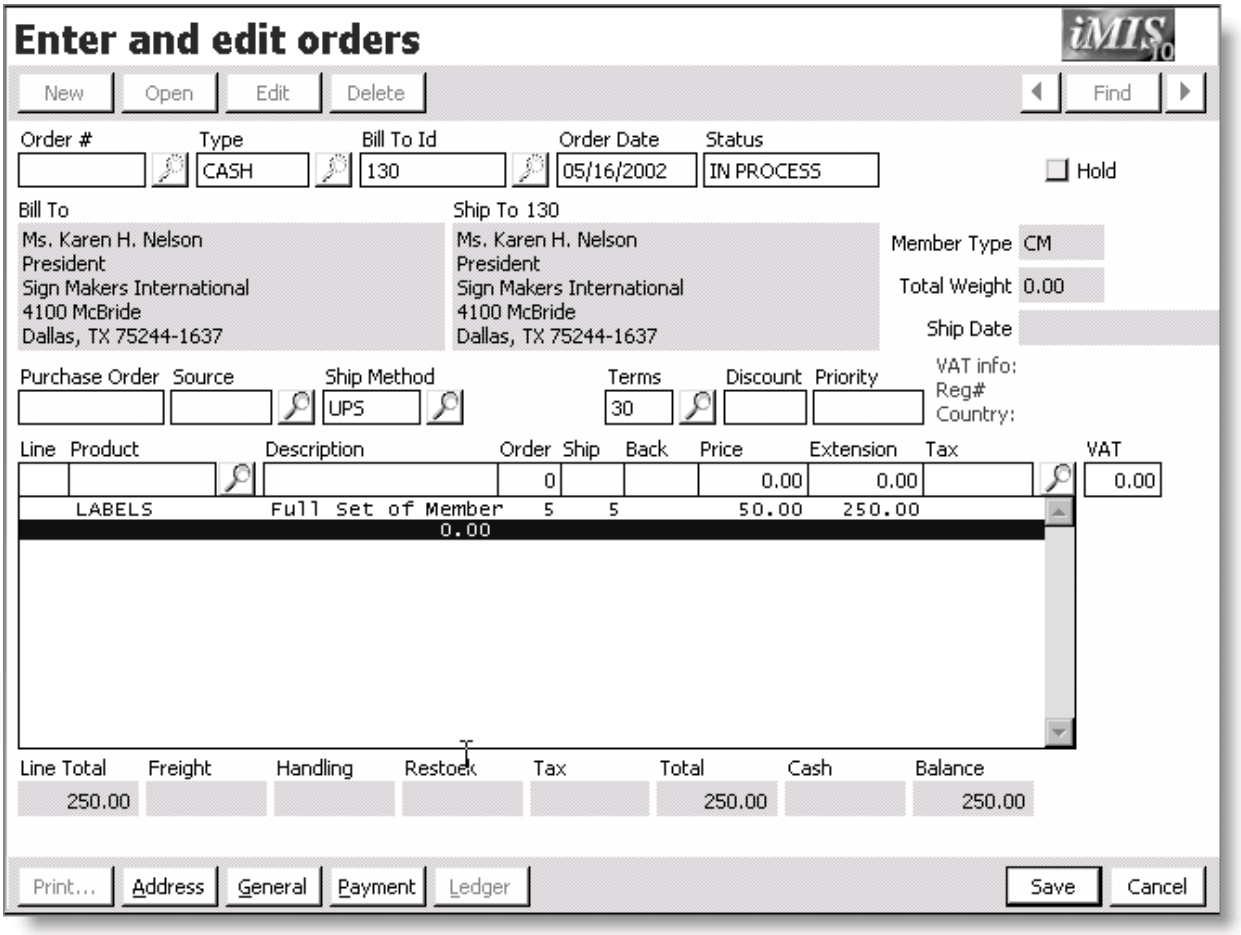
  Most of the fields on the Enter and edit orders window provide a standard lookup window. To use the Lookup feature, use the lookup icon on the field.

Processing payment amounts

iMIS processes payment entries whether payment is made by check or credit card.

- No payment entered - The full amount of the sales order is an open receivable.
- Payment in full entered - No open AR item is tracked through the system.
- Partial payment entered - Offsets or reduces the AR amount.

Enter and edit orders window - Simple order entry



From AR/Cash, select Process orders > Enter and edit orders

Previous

Select to move back through the list of transactions in the Transaction List field.

Order #

The system automatically enters the order number when an order is entered. You can specify an order number in this field when searching for a specific order that was previously entered.

Type

The only Type available in Simple Order Entry is CASH.

Bill To Id

Enter the customer ID to whom this order will be billed, or use the lookup icon to select a value.

If you leave the Bill To Id field blank, a blank Order Entry - Add New Member window displays where you can enter the Customer Type, name, address, and phone number for a new customer.

Order Date

The system automatically defaults to the current system date. You can override this date by selecting the field and entering the date.

Status

The system automatically defaults to the current IN PROCESS status.

Hold

Only applies in the iMIS Full Order Entry module.

Bill To

The Bill To information defaults to the preferred billing address in the customer's record and cannot be modified (updated or changed).

Ship To

(optional) The Ship To information defaults to the preferred shipping address in the customer's record. You can modify the Ship To ID and/or address.

> **Note:** Note: You can modify the customer's Ship To ID or address by clicking the Address button located at the bottom of the Enter and edit orders window.

Member Type

(read only) Customer type.

Total Weight

(read only) Total shipping weight.

Ship Date

Only applies in the iMIS Full Order Entry module.

Purchase Order

If the customer provides a purchase order or other reference number that should appear on the invoice, then enter that number (or alphanumeric combination) in this field or Tab past this field.

If you would like a brief description to display on the AR statement, you should enter that description here when a purchase order number is not given (maximum number of characters = 15).

Source

Optional unless Force Source Coding is enabled on the Customer Setup - Basic Options window (from Customers, select Set up module > General, and click Basic Options).

Using this field may be valuable in tracking a code for an advertising or marketing program. Use the lookup icon to select a value.

All valid Source code options must be added to the SOURCE_CODE table on the Set up general lookup/validation window (from Customers, select Set up tables > General look-up/validation, and select SOURCE_CODE from the drop-down list).

Ship Method

Specifies the desired ship method; the system default ship method is UPS. You can accept the default, enter the desired ship method, or use the lookup icon to select a value.

> **Note:** Note: You can only use a defined ship method. To define a ship method, from Customers, select Set up tables > General lookup/validation to display the Set up general lookup/validation window. Select SHIP_METHOD from the drop-down list and click New. Enter the new ship method Code, Expansion (optional), and Description (optional), and then click Save.

Tax Auth

The system defaults to the tax authority defined in the Default Tax field (from Customers, select Manage customers, open a customer record, press the Financial tab, and select a value from the Default Tax drop-down list) or to the State/Province Code on the Ship To address, if the field is not blank.

(optional) To override the code, use the lookup icon to select a value.

Terms

The Terms code typically represents the number of days from the invoice date that a customer has to make a payment on the order. The description related to the Terms code prints on the invoice document. Use the lookup icon to select a value. Terms are defined in the Set up terms window (from AR/Cash, select Set up tables > Terms).

Discount

Applies in the Full Order Entry module only. The system bypasses all these fields and goes directly to the Product field.

Priority

Applies in the Full Order Entry module only. The system bypasses all these fields and goes directly to the Product field.

Ship Date

Applies in the Full Order Entry module only. The system bypasses all these fields and goes directly to the Product field.

Line

Displays the line number of the currently selected line item.

Product

Repeat data entry for all products and/or comment lines that are associated with the order.

Enter a Product, or use the lookup icon to select a value.

> **Note:** Note: If you leave the Product field blank, you can enter a comment in the Description field; this comment will be printed on the invoice document.

Description

The system automatically fills in the Description for the product. You can click in the Description field and make changes if needed.

Order

Enter the quantity of the requested product.

Ship

Automatically populated with the value entered in the Order field.

Back

Applies in iMIS Full Order Entry module only.

Price

After you enter the order, iMIS defaults to price and automatically fills in the product's unit price if a price has been defined in the Set up products window (from AR/Cash, select Set up tables > Products). You can override the Price field manually by selecting the field and reentering the price.

Extension

The system calculates the Extension by multiplying the Quantity order by the Unit Price.

Line Items

Displays the Line, Product, Description, Order, Ship, Back, Price, and Extension information for each line item.

Line Total

System display-only field (price X extension = line total)

Freight

(read only) The cost for shipping the product

Handling

(read only) The cost for handling the product

Restock

(read only) The cost for restocking the product

Tax

(read only) The tax on the product

Total

(read only) After you enter the Freight and Handling charges on the Order Entry - General Information window, the system recalculates and displays the value in the Balance field (line total + freight + handling + tax = total).

Cash

(read only) The payment amount

Balance

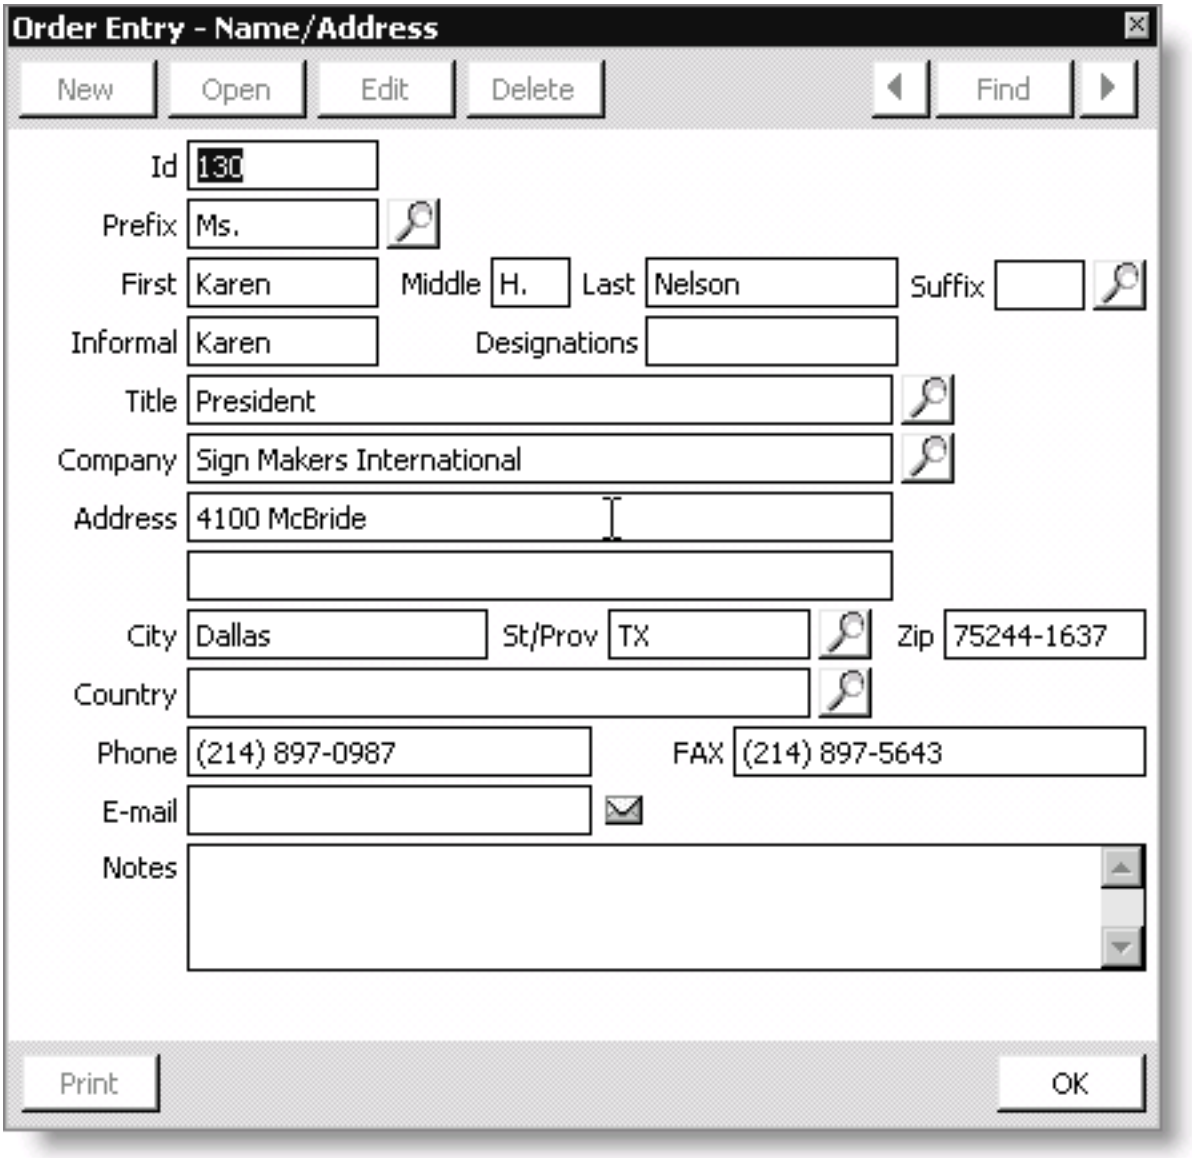
(read only) The remaining balance

Print

Opens the Select Report window, where you can select Order to print an Order detail or Invoice to print an Invoice and to mark the order complete.

Address

Opens the Order Entry - Name/Address window.



Order Entry - Name/Address window

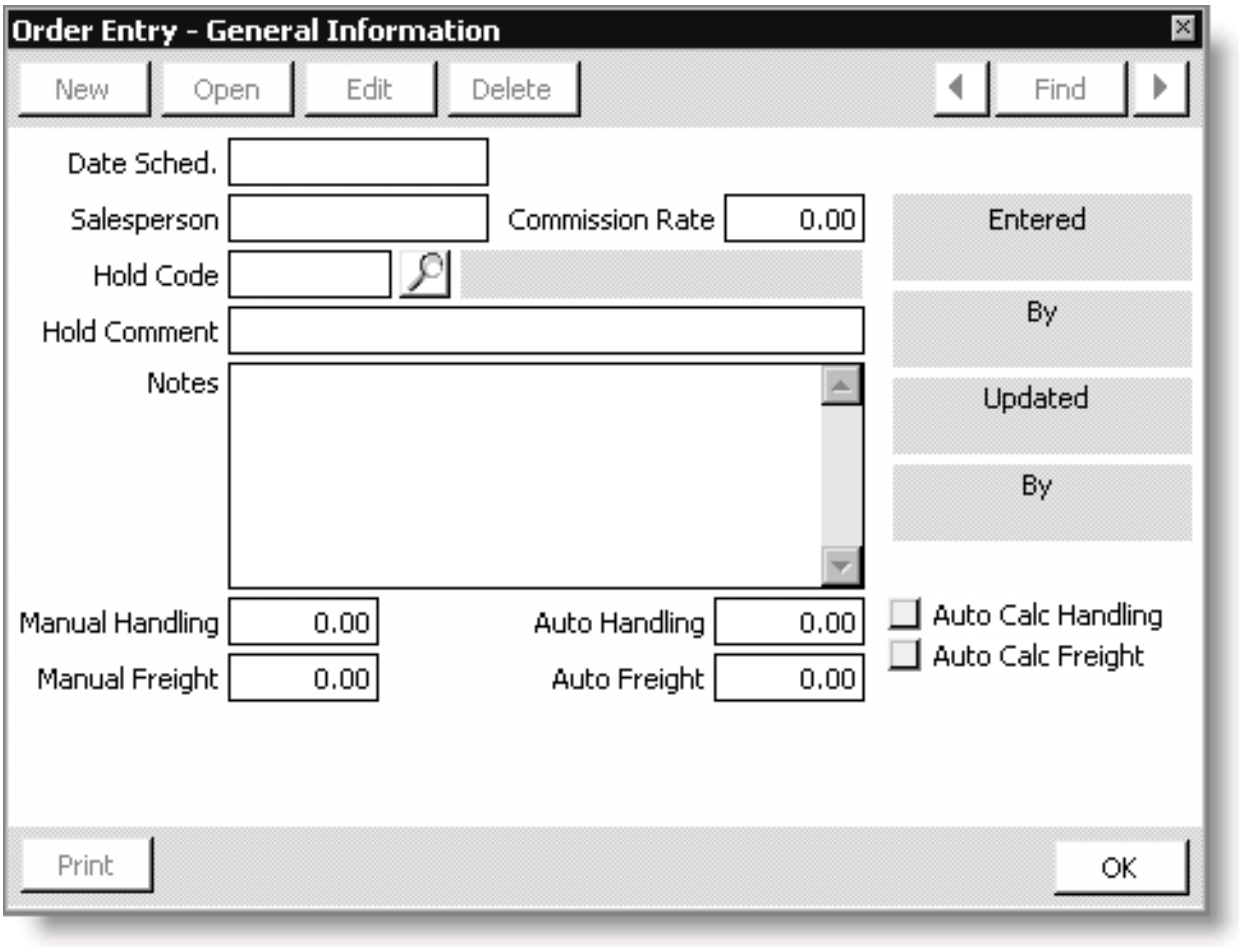
Because the Name, Address, and Telephone fields are copied from the original data, you can change these fields as needed without changing the data in the master file. For example, you can perform the following tasks:

- Change the ID, or use the lookup icon to select a value.
- Modify/change information in all the fields.

> **Note:** Note: If you change the Ship To ID or address on the Order Entry - Name/Address window and then return to the Enter and edit orders window, the Ship To field should now be updated with the new shipping information.

General

Use the Order Entry - General Information window to specify additional order-specific information. You can attach various types of notes to the order, and leave the freight and handling charges as they are on the Enter and edit orders window or override them.



Order Entry - General Information window

Payment

Opens the Order Payment window, where you can enter the check number or credit card information and the payment amount.

Ledger

Opens the Transaction Ledger window for the order.

To enter an order

1. From AR/Cash, select Process orders > Enter and edit orders to open the Enter and edit orders window.

2. Click New.
3. Enter the customer ID in the Bill to Id field.
4. Enter the order information in the Enter and edit orders window.
5. Click Payment to open the Order Payment window.
6. Enter the check number or credit card code and payment amount in the Order Payment window.
7. Click OK.
8. Click General to open the Order Entry - General Information window and enter the general information.
9. Click OK and the system returns to the Enter and edit orders window.
10. Click Address to open the Order Entry - Name/Address window and make any needed changes.
11. Click OK and the system returns to the Enter and edit orders window.
12. Click Save.

To find/view existing orders

You may need to find existing orders for one of the following reasons:

- Edit/correct order data (or delete an order) before the order is invoiced.
- Repeat print an invoice document.
- Review the accounting transaction and status.

The primary method for finding an existing order is to search by either Order or Bill To Id.

To find an existing order by order number

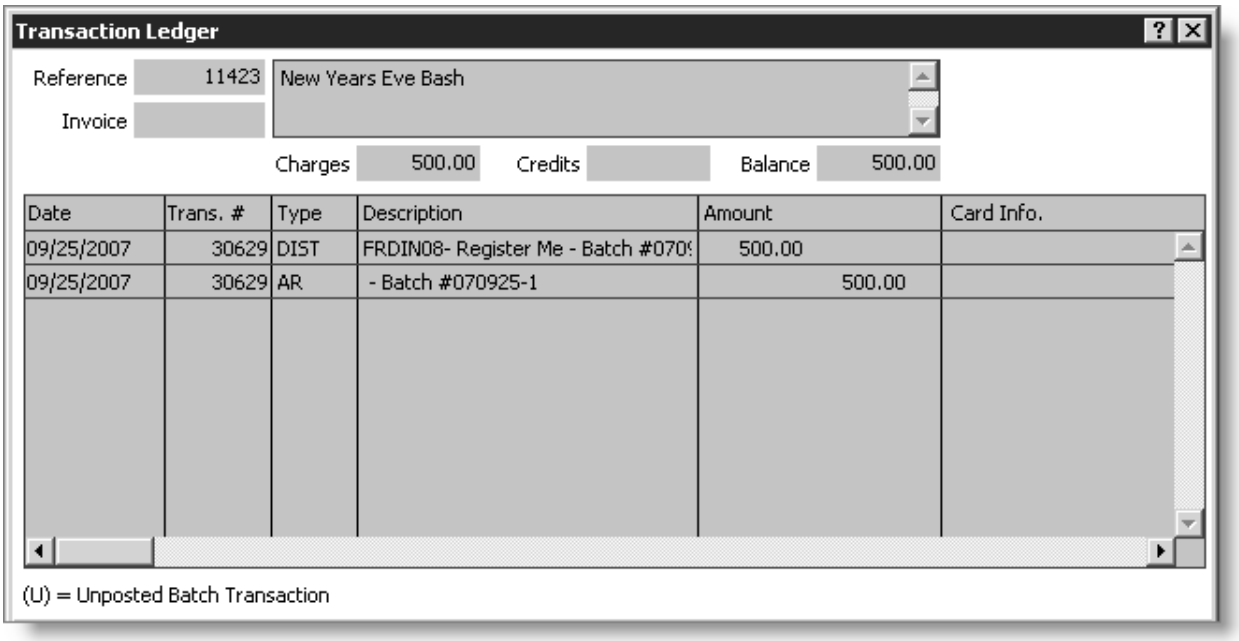
1. From AR/Cash, select Process orders > Enter and edit orders to open the Enter and edit orders window.

2. Click Open.
3. Enter the order number in the Order field, or click the Lookup icon to select a value.

To find an existing order by Bill to ID

1. From AR/Cash, select Process orders > Enter and edit orders to open the Enter and edit orders window.
2. Click Open.
3. Enter the Bill to ID number in the Bill to ID field, or click the Lookup icon to select a value.
4. If there are multiple existing orders for the Bill to ID number, the Order Selector window opens.
5. Select the desired order number and click OK.

Transaction Ledger window for Simple Orders



From Customers, select Manage customers, find a customer's record, select the AR/Cash tab, and double-click a line item

The Transaction Ledger window provides an itemized transaction log related to a specific order/invoice, including fees charged, payments received, and any adjustments made.

Typically, individual lines are displayed for each item and for the payment received and/or the amount charged to AR. If any items are later canceled or adjusted, the Transaction Ledger window also includes lines showing these adjusted amounts. For each transaction line, the Transaction Ledger window shows the date of the transaction, the amount, and the function name or transaction type.

The Description field has this layout, with each element displaying only if it has a value:

Card#, Auth:, Name on Card:, Gateway Ref#, Exp:

> **Note:** Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

To view transactions

1. From Customers, select Manage customers to open the Manage customers window.
2. Click Find to open the Search window.
3. Enter the customer ID or click the Lookup icon to select a value, and press Enter.
4. Select the AR/Cash tab to view the customer's AR/Cash information.
5. To open the Transaction Ledger window, double-click a line item.

> **Note:** Note: AR items that have not been invoiced are referenced with an R preceding the item.

Cash handling in order processing

Order entry handles payments in two different ways according to whether the payment is made by check/cash or credit card.

To apply cash/check payments

When a cash/check payment is applied to an order, iMIS immediately recognizes the payment when the order is entered. A debit to the appropriate cash account is created and a credit is applied to the prepaid account specified in default accounts in AR system setup. Cash or check payments are usually deposited immediately and considered as “cash on hand.” When the order is subsequently invoiced, the prepaid account is debited and the income account specified for the product code is credited.

To apply credit card payments

If the Recognize Credit Card Order Payments as Prepaid Cash option is not enabled (from AR/Cash, select Set up module), payment is not submitted until the product has been shipped and iMIS recognizes the cash at the time the order is invoiced.

When processing orders with credit card payments, you can either enter the amount in the Payment Amount field or leave the field blank. If a credit card code is entered in the Check/CC field and the amount is left blank, iMIS will simply make the cash amount equal to the invoice amount at the time the order is invoiced. If an amount is entered in the Payment Amount field, iMIS will apply this payment against the invoiced amount. In the case of over/under payments, iMIS will create the appropriate AR entry.

Note: Note: If you are processing orders in iMIS, you must populate the transfer clearing and the prepaid default accounts on the Set up cash accounts window (from AR/Cash, select Set up tables > Cash accounts).

Controlling the recognition of credit card entries in batches

If the Recognize Credit Card Order Payments as Prepaid Cash option is enabled, credit card payments are recognized when they are entered. If the Recognize Credit Card Order Payments as Prepaid Cash option is not enabled, credit card payments are not recognized until their orders are invoiced. The batch into which delayed credit card payments are recognized depends on your system configuration, and on the method you use to generate invoices.

If you are licensed for the Full Order Entry module (Orders), you can control the accounting batch to which delayed credit card payments are posted when you run Process orders> Invoice orders:

To recognize credit card payments in a new or current batch

- Enable the Create New Batch for Invoicing option (from Orders, select Set up module > Order staging).

  iMIS will create a new, self-balancing batch for the entries generated by the invoicing process. The batch, which appears on the Manage batches window, is automatically marked ready for posting and must be posted from this window (from AR/Cash, select Manage batches). The only cash entries in this batch are credit card payments.

  Note: System-generated batches are designed to be posted unchanged. When you edit a system-generated batch or add transactions to a system-generated batch, you must designate a cash account for that batch before your changes can be saved and before the batch is posted.

To recognize credit card payments in the batch in which they were entered, even if closed

- Disable the Create New Batch for Invoicing option (from Orders, select Set up module > Order staging).

  Note: When using the Full Order Entry module (Orders), invoices run using the Print button will not make entries into a closed batch, even if the Create New Batch for Invoicing option is disabled.

If you are not licensed for Full Order Entry, or if you are licensed but you disabled the Create New Batch for Invoicing option, credit card payments are recognized in the batch in which they were originally entered. Under these conditions, credit card cash entries may be posted to previously closed batches if invoicing is delayed.

Printing invoices

The invoice printing process prints the invoice and generates the related accounting transactions to record sales. Because orders cannot be modified after they are invoiced, the

printing process represents the final step in the order processing cycle.

If you are licensed for Full Order Entry (Orders) the Create a New Batch for Invoicing option affects the batch into which invoices are generated.

When processing invoices individually using the Print button, the transactions created when you invoice orders are subject to the following rules:

- If you are licensed for Full Order Entry and Create New Batch for Invoicing is enabled, the following rules apply:
- If you have an open batch selected in your current session, invoices will be generated into that open batch.
- If you have no open batch selected in your current session, the system will prompt you to select or create an open batch into which the invoice will be generated.
- If you are licensed for Full Order Entry but Create New Batch for Invoicing is not enabled, the following rules apply:
- If the original batch in which the order was generated is open, the invoice will be generated into that same batch.
- If the original batch in which the order was created is closed, but another batch is selected and open in your current session, the invoice will be created into that batch.
- If the original batch is closed, and there is no batch selected and open in your current session, the system will prompt you to select or create an open batch into which the invoice will be generated.

Note: Caution! Enable the Create New Batch for Invoicing option if you are using the iMIS Orders backorder feature. For example, with the Create New Batch for Invoicing option enabled, an order that is invoiced in April that has a backorder that is filled in June will be in the June batch. Without the Create New Batch for Invoicing option enabled, the invoice for the backorder will be in the original April batch. The invoice will reflect the current date, but the AR statement will reflect the

old batch date, which is incorrect for aging. If the April batch is closed, the invoice for the backorder will be in another batch in the current session or in a new batch.

To print simple order entry invoices

1. From AR/Cash, select Process orders > Generate reports to display the Generate reports window.
2. Select Invoices from the Report Types drop-down list.
3. Select Print New Invoices from the Available Reports drop-down list.
4. Click Set Report Destination to open the Set Report Destination dialog window.
5. Select a report destination and click OK.
6. Click Run. An invoice is produced.

To print selected invoices

1. From AR/Cash, select Generate reports to open the Generate reports window.
2. Select Selected Invoices from the Report Types drop-down list.
3. Select Selected Invoices from the Available Reports drop-down list.
4. Click Set Report Destination to open the Set Report Destination window.
5. Select a report destination and click OK.
6. Click Run.

   The Report: Selected Invoices dialog window displays.
7. Select the type of invoices to include from the Include Invoices area.
8. To limit the invoices to one or more specific entities, enter the desired entities in the Specific Entities field.
9. To limit the printing of invoices to one or more specific system types (for example, DUES,

EXPO, etc.), enter the system types in the Specific System Types field.

10. Click OK. An invoice is produced.

Direct Transactions

Many transactions generated by other iMIS features are passed to iMIS AR/Cash for tracking. This section explains how to enter other sales, cash receipts, and adjusting entries directly through iMIS AR/Cash. Information is provided on the types of direct transactions and on the process of deciding between simple order entry and sales transactions. Batch processing works with transaction data entry, and information on processing different transactions is also included.

Direct transactions types

There are four transaction types you can directly enter using AR/Cash. Each transaction type appears as a separate selection on the Enter and edit transactions submenu:

- Sales transactions
- Cash receipts
- Credit memos
- Debit memos

The following sections provide information on each direct transaction type, as well as the procedures involved.

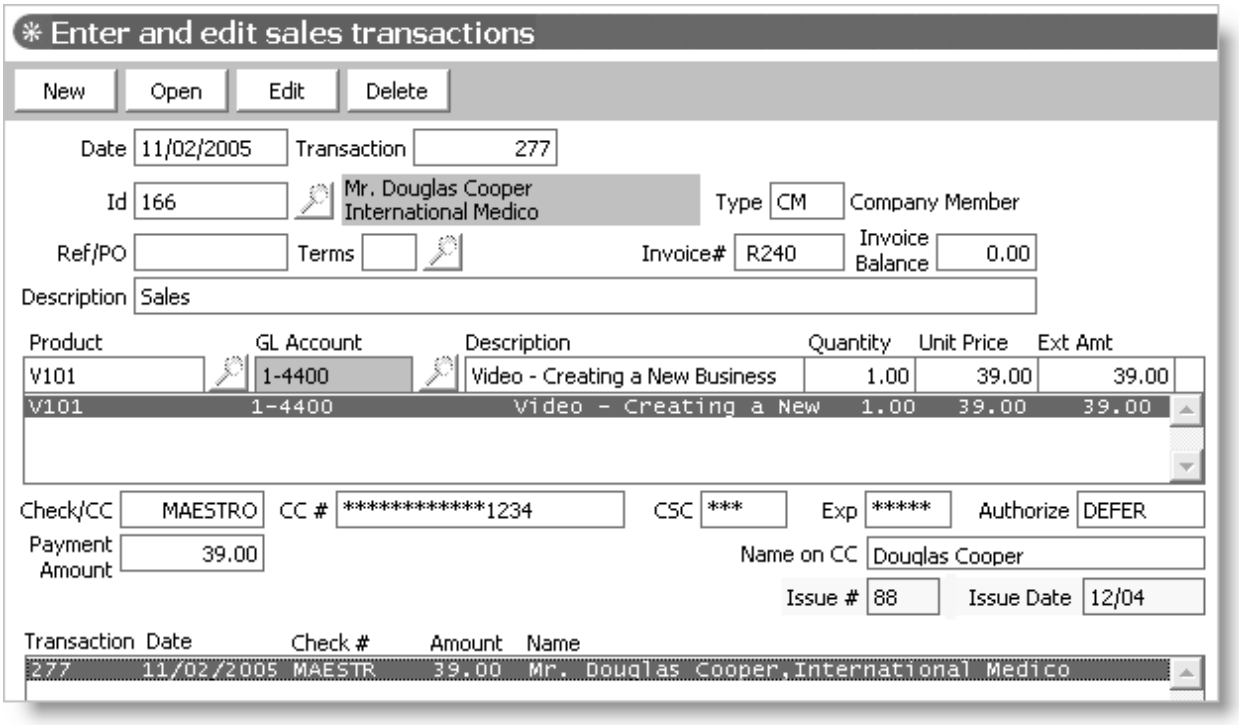
Entering and editing sales transactions

Use the Enter and edit sales transactions window (from AR/Cash, select Enter and edit transaction > Sales transactions) to enter sales transactions that are processed and tracked through iMIS AR/Cash. This window should only be used for transactions that are not processed indirectly through another module.

The purpose for entering data on this window is to record after-the-fact any sales-related transactions, such as manually prepared invoices. iMIS uses the information entered on this window to track several items:

- Product sales items that are passed on to sales history.
- Any outstanding AR amount.
- Any open AR amount that is reduced or eliminated, which is reported on daily and monthly transaction reports.

Enter and edit sales transactions window



From AR/Cash, select Enter and edit transactions > Sales transactions

Date

iMIS automatically enters the current system date (or the date entered earlier in the session) for the transaction date.

To override this date, click on the field (or press Shift+Tab to return to the Date field) and enter a new value.

> **Note:** Note: If you are using batch control, this field defaults to the active batch date and cannot be overridden.

Transaction

(read only) The transaction number is automatically assigned by iMIS after the transaction has been processed.

Id

Enter the customer ID that relates to the sale, or click Find to select a value.

Type

(read only) The customer type that corresponds to the customer ID.

Ref/PO

Enter the customer's purchase number or other reference number that should appear on the invoice. The reference/purchase order value will display on the AR statement.

Terms

(optional) Enter the code for the type of sale terms that apply to this invoice, or click Find to select a value.

Invoice #

Enter the numeric code listed on the manual (paper) invoice. If no code exists and you leave this field empty, iMIS supplies a sequential reference number that appears on all related windows and reports. Reference numbers have a prefix of R.

Invoice Balance

(read only) Running invoice balance automatically updated by iMIS.

Description

Enter the invoice description. This description prints or displays on key reports and creates output, such as statements, trial balances, and account status displays.

Product

Enter a valid product code from the Set up product codes window, or use the lookup icon to select a value.

GL Account

Automatically populated with the GL account number if a GL account number is defined for the product. If the Allow GL Account Edit for Sales Transactions option is enabled (from AR/Cash, select Set up module), you can enter a GL account number if the GL Account field is blank or enter a different GL account number if the GL Account field is populated.

If a GL account number is not defined for the product and you leave the GL Account field blank, the GL Account field is automatically populated with the default Income Account for the transaction's owner entity.

If the Allow GL Account Edit for Sales Transactions option is disabled, this field is display-only and the GL account number cannot be added or changed.

Description

Automatically entered by iMIS, but can be overridden manually.

Quantity

Enter the Quantity of the product being sold. This quantity is applied against the unit price to arrive at the extended amount.

Enter quantities as whole numbers unless you are designating time or other partial quantities. For time or other partial quantities, enter fractions as decimals: (for example, enter 1.5 for 1-1/2)

Unit Price

iMIS automatically fills in the Unit Price if a product price has been defined on the Product Code window.

To override this price, click on the field (or press Shift+Tab to return to the Unit Price field), and enter a new value.

Ext Amt

(read only) iMIS automatically calculates the extended price.

Check/CC

If the payment is made by check, enter the check number. If the payment is made by credit/debit card, enter the abbreviation for the credit/debit card.

To apply a credit balance to an item, enter an asterisk (*) in the Check/CC field and press Tab. Select the credit from the drop-down list on the Select Open Payments window (you can toggle between viewing the individual's available credits and all available third-party credits by clicking the Indiv./All toggle button) and click OK. Enter the credit amount in the Payment Amount field.

> **Note:** Note: Most *Tab transactions generate extra transfer lines to provide the proper audit trail for both invoice summary lines involved in the transfer and to offset each other to provide a net effect of zero.

AR credit card codes should already be set up on the Set up cash accounts (see "Setting up cash accounts") window.

If you enter a valid credit/debit card code, additional payment fields display:

- CC # - Enter the credit/debit card number.
- CSC - (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code. CSC can be a required value (see "Requiring a Card Security Code (CSC) for credit/debit card transactions") for specific cash accounts.
- Exp - Enter the card's expiration month and year (mm/yy).
- Authorize - Enter any authorization code here. (If credit card authorization is enabled, this field populates when the payment is approved.)
- Name on CC - Enter the name as it appears on the payment card.
- Issue # - (Displays only if the associated cash account accepts an issue number) Enter the European debit card's issue number.

- Issue Date - (Displays only if the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).
- Gateway Ref # - Read only: Populates when the gateway provider returns the reference number for the transaction.

> **Note:** Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Payment Amount

Enter the payment amount, whether the payment is made by check or credit/debit card.

Transaction list

Displays the transaction date, check number or credit/debit card type, transaction amount, and customer name.

To record sales transactions

Use sales transactions to record miscellaneous sales and cash receipts that do not fit into any category processed by other iMIS modules, such as Billing, Events, and Order Processing.

Use sales transactions for sales-related entries when you do not need to produce an invoice or a bill. For example, enter sales transactions to record open sales items for a manual (handwritten) invoice and to document paid-in-full transactions without a printed invoice (miscellaneous cash receipts).

1. From AR/Cash, select Enter and edit transactions > Sales transactions to open the Enter and edit sales transactions window.
2. Click New.
3. Enter the customer Id or use the lookup icon and select a value.
4. Place the cursor in the Product field and press Find and select the product.

5. (optional) Place the cursor in the GL Account field and enter or change the GL account number. If the Allow GL Account Edit for Sales Transactions option is not enabled (from AR/Cash, select Set up module), the GL Account field is display-only and the GL account number cannot be added or changed.
6. Place the cursor in the Quantity field and enter the Quantity.
7. Place the cursor in the Check/CC field and enter the check or credit card information.
8. Enter the payment amount in the Payment Amount field.
9. Click Save.

To edit existing sales transactions

To edit a transaction that is still in the system, find the transaction, select edit mode, and make the necessary changes.

> **Note:** Note: You cannot edit transactions that are in a posted or closed batch or transactions that have been transferred to the GL.

You can search for an existing transaction using any of the first three heading fields. After the search, iMIS either displays the transaction you requested or presents a list of transaction options.

> **Note:** Note: iMIS only searches on one field at a time.

1. From AR/Cash, select Enter and edit transactions > Sales transactions to open the Enter and edit sales transactions window.
2. Click Open.
3. Enter a value into one of the first three data entry fields - Date, Transaction number, or Id - and press Enter.

- If iMIS finds your record, then iMIS opens the record in display mode.
- If iMIS finds multiple transactions matching your criteria such as date or ID, it returns a list of potential matches. Double-click on the desired line to open the record in the display mode.

4. Click Edit.
5. Make the necessary changes.
6. Click Save.

Deciding to use a simple order entry or a sales transaction

> **Note:** Note: Simple order entries only appear in systems not licensed for the iMIS Order Processing and iMIS Inventory Control modules.

AR/Cash provides two ways to record miscellaneous sales (whether cash or on account):

- Directly record sales transactions (from AR/Cash, select Enter and edit transactions > Sales transactions)
- Use the built-in simple order entry and billing subsystem (fromAR/Cash, select Process orders > Enter and edit orders)

Selecting the method best for you depends on whether you need to enter certain types of data (such as taxes and handling charges) and whether you need to print invoices.

When to record direct sales transactions

Recording direct sales transactions gives you these benefits:

- Creates sales accounting entries as you enter transactions.
- Immediately updates AR open items, and generates sales history (unless you enable the Separate Posting Cycle Required option with batch control).

However, direct sales transactions do not let you calculate sales taxes or generate invoices. Therefore, use this window to record only after-the-fact sales-related transactions, such as when invoices have already been manually prepared and sent out.

When to use Simple Order Entry

Use simple order entry for sales that have not been processed. When you use the Enter and edit orders window (see "Enter and edit orders window - Simple order entry"), you can apply sales tax, terms, freight, and handling charges on the window. You can also print and send invoice documents.

> **Note:** Note: Initially, the simple order entry only updates the Orders files. When you print invoices for these orders, iMIS then updates the accounting transactions and AR opens items and sales history under the iMIS hot-posting (real-time) feature.

Entering cash receipts

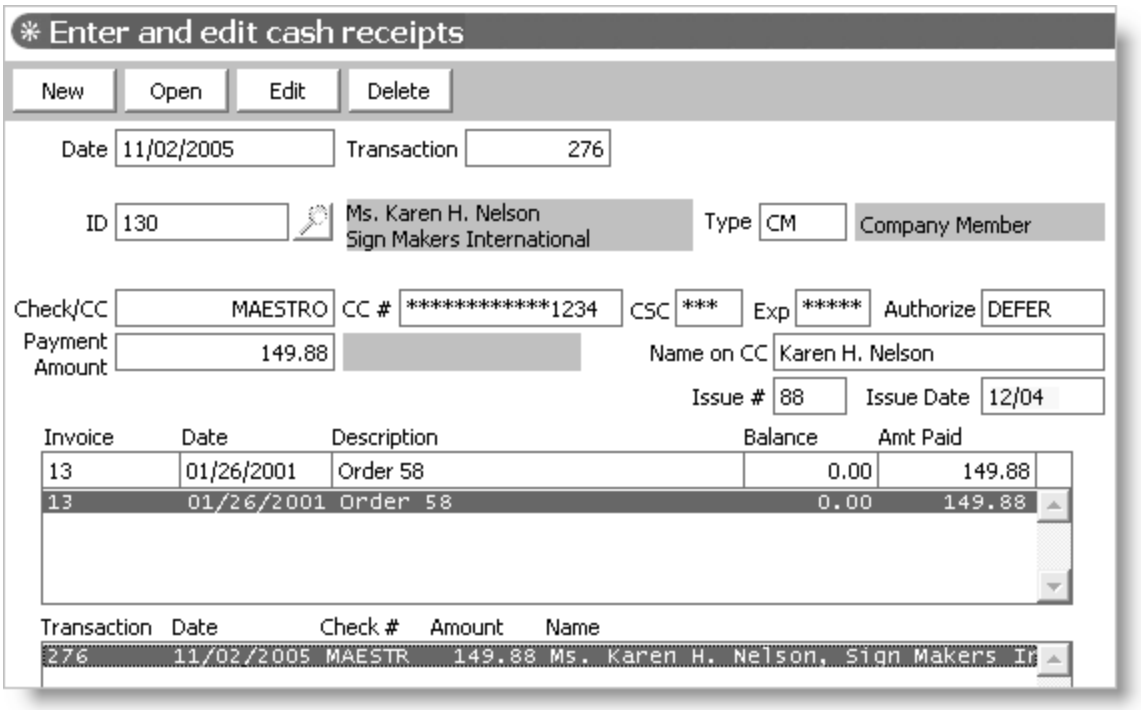
Cash receipts allow you to record payments that are applied against open items, received in advance of sales orders or requests, or of unknown purpose. Typically, cash receipts are the most frequently entered transaction types.

The Enter and edit cash receipts window records amounts received that apply to open AR items. Similar to the Enter and edit sales transactions window, the Enter and edit cash receipts window has a heading section that identifies the following:

- Transaction date
- Customer account ID
- Overall payment information

Below the heading section, the window details the open items where cash can be applied.

Enter and edit cash receipts window



From AR/Cash, select Enter and edit transactions > Cash receipts

Date

iMIS automatically enters the current system date (or the date you entered earlier in the session) for the transaction date.

To override this date, click on the field (or press Shift+Tab to return to the Date field) and enter a new value.

> **Note:** Note: If you are using batch control, this field defaults to the active batch date, which you cannot override.

Transaction

(read only) The transaction number is automatically assigned by iMIS after the transaction has been processed.

Invoice

Enter the numeric code listed on the manual (paper) invoice. If no code exists and you leave this field empty, iMIS supplies a sequential reference number that appears on all related windows and reports. Reference numbers have a prefix of R.

ID

Enter the customer ID that applies to the cash receipt, or use the lookup icon to select a value.

Type

(read only) The customer type that corresponds to the customer ID.

Check/CC

If payment is made by check, then enter the check number. If the payment is made by credit/debit card, then enter the abbreviation for the credit/debit card.

To apply a credit balance to an item, enter an asterisk (*) in the Check/CC field and press Tab. Select the credit from the drop-down list on the Select Open Payments window (you can toggle between viewing the individual's available credits and all available third-party credits by clicking the Indiv/All toggle button) and click OK. Enter the credit amount in the Payment Amount field.

AR credit/debit card codes should already be set up on the Set up cash accounts window. See Setting up Cash Accounts for information on this procedure.

If you enter a valid credit/debit card code, additional payment fields display:

- CC # - Enter the credit/debit card number.
- CSC - (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code. CSC can be a required value (see "Requiring a Card Security Code (CSC) for credit/debit card transactions") for specific cash accounts.
- Exp - Enter the card's expiration month and year (mm/yy).

- Authorize - Enter any authorization code here. (If credit card authorization is enabled, this field populates when the payment is approved.)
- Name on CC - Enter the name as it appears on the payment card.
- Issue # - (Displays only if the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date - (Displays only if the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).
- Gateway Ref # - Read only: Populates when the gateway provider returns the reference number for the transaction.

> **Note:** Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Payment Amount

Enter the payment amount, whether the payment is made by check or credit/debit card.

Invoice

Displays the invoice reference number.

Date

Displays the invoice date.

Description

Displays a brief description of the selected invoice.

Balance

Displays the invoice balance.

Amt Paid

Displays the amount that is being applied to the selected invoice.

Transaction list

Displays the transaction date, check number or credit/debit card type, transaction amount, and customer name.

To enter AR payments

> **Note:** Note: If the Cash Application Auto Apply option is not enabled on the Set up module window (see "Set up module window for AR/Cash"), iMIS enables you to decide the line items where the payment should be applied.

1. From AR/Cash, select Enter and edit transactions > Cash receipts to open the Enter and edit cash receipts window.
2. Click New.
3. Enter the customer ID, or use the lookup icon to select a value.
4. If you want to apply a credit balance to an item, perform the following steps:

1. Enter an asterisk (*) in the Check/CC field and press Tab.
2. Select the credit from the drop-down list on the Select Open Payments window (you can toggle between viewing the individual's available credits and all available third-party credits by clicking the Indiv/All toggle button) and click OK.
3. Enter the credit amount in the Payment Amount field.
4. In the Check/CC field, enter the check number or credit/debit card type, and press Tab. If you entered a valid credit/debit card type in the Check/CC field, enter the following information:

- CC # - Enter the credit/debit card number.
- CSC - (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code. CSC can be a required value (see "Requiring a

Card Security Code (CSC) for credit/debit card transactions") for specific cash accounts.

- Exp - Enter the card's expiration month and year (mm/yy).
- Authorize - Enter any authorization code here. (If credit card authorization is enabled, this field populates when the payment is approved.)
- Name on CC - Enter the name as it appears on the card.
- Issue # - (Displays only if the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date - (Displays only if the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).

  Note: If Advanced PCI Compliance (see "Implementing Advanced PCI Compliance options") > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

6. Enter the payment amount in the Payment Amount field, and press Tab.
7. Select one of the following transaction options:

- To apply cash to an item, double-click on the item in the list and enter the amount to apply to the item in the Amt Paid field.
- To undo the cash application, double-click the item again.
- To apply cash as a future or unidentified credit, double-click the (Pre-Pay - New) line (or single-click and fill in the Amt Paid with the prepayment amount), which creates an item named PrePay: transaction date.
- To partially apply cash to an item, select the line and enter the amount to apply to the item in the Amt Paid field.

8. Click Save.

   To automatically apply AR payments

> **Note:** Note: You can edit only transactions that are in an open batch or that have not been transferred to the GL.

The method for finding and editing AR payment transactions is similar to the sales transaction editing process.

1. If the Enter and edit cash receipts window is not open, from AR/Cash, select Enter and edit transactions > Cash receipts.
2. Click Open.
3. Enter the customer ID or use the lookup icon to select a value, then press Enter.
4. Select the line item for the transaction you wish to alter.
5. Click Edit.
6. Enter the payment amount in the Payment Amount field.
7. Enter the payment amount in the Amt Paid field.
8. Click Save.

To reverse a payment and record returned checks

Use the Enter and edit cash receipts window to record returned checks, or to reverse all or a portion of a payment for a sales transaction or simple order entry transaction if the payment was made through Cash Receipts. The following procedure records a returned check.

1. From AR/Cash, select Enter and edit transactions > Cash receipts to open the Enter and edit cash receipts window.
2. Click New.
3. Enter the customer ID or click the Lookup icon to select a value, then press Enter.
4. Enter the original check number or credit card information.

Note: If you are recording a returned check, you can preface the Check/CC field entry with RET or a similar abbreviation to make it easier to identify return checks in reports and window displays.

5. Enter a negative amount in the Payment Amount field.
6. Select the line item where the payment is to be removed.
7. Enter a negative amount in the Amt Paid field.
8. Click Save. The Enter and edit cash receipts window opens.
9. From Customers, find the customer record, select the AR/Cash tab, and double-click the line item entry for the original transaction to display the Transaction Ledger window.

To record returned checks/payment reversals for dues and subscriptions

Use the Dues/Subscriptions Payments by Individual window to record returned checks or to reverse all or a portion of a payment for a dues or subscription product after the original transaction has been completed.

1. From Customers, select Manager customers to display the Manage customers window.
2. Use the lookup icon, enter the customer ID, and press Enter.
3. Select the Billing tab to display the customer's Billing information.
4. Select the line item associated with the returned check/payment reversal and click Payment to display the Dues/Subscription Payment by Individual window.
5. Click New.
6. Enter the original check number or credit card information.

   Note: If you are recording a returned check, you can preface the Check/CC field entry with RET or a similar abbreviation to make it easier to identify return checks.
7. Enter the returned check amount as a negative amount in the Pay Amount field.
8. Click Save.

9. A warning dialog displays indicating that there is an underpayment. Click Yes on the warning dialog.
10. You can then change the term for the dues or subscription product on the Dues/Subscription Item Detail window.

Adjusting journal entries

You can select Enter and edit transactions to see the Credit memos and Debit memos options.

> **Note:** Note: Use the Enter and edit credit memos and Enter and edit debit memos windows only when you need to change to an existing open item, to credit (reduce) or debit (increase) it.

Credit memos make adjustments that reduce or reverse normal (or debit balance) open AR items. These transactions create accounting entries but no printable documents, other than transaction entries on batch and other audit-trail reports.

Use credit memos (infrequently) to perform the following operations:

- Write off an uncollectible open item (a “bad debt”)
- Reduce or reverse a line item charge, correcting an overcharge
- Reverse an existing sales (or simple order) transaction entirely
- Record a product return to credit the customer

> **Note:** Note: You should not use a credit memo to apply a credit for an event function. To apply a credit against an event function, edit the event registration and remove the function fee only. This will ensure that the correct account transactions are performed.

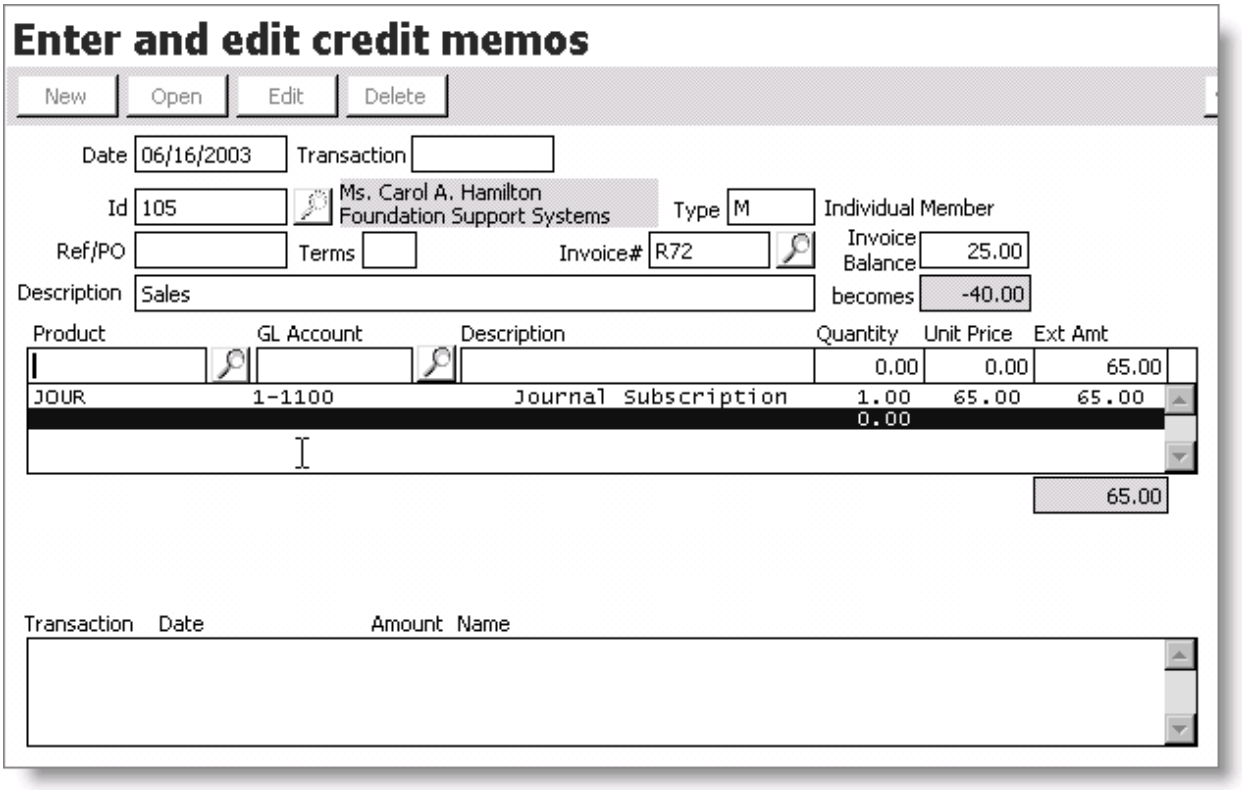
Debit adjustments are the opposite of credit memos. They make adjustments that increase the debit balance of open AR items.

Use debit adjustments (rarely) to perform the following operations:

- Increase or add a line item charge to correct an undercharge
- Zero out a credit balance for a refund due to an overpayment, credit memo, or cancellation transaction

The preferred method to make debit adjustments is to issue refunds in the Credit Invoices window (from AR/Cash, select Process month-end procedures, and click Credit Invoices).

Enter and edit credit memos window for AR/Cash



From AR/Cash, select Enter and edit transactions > Credit memos

Date

iMIS automatically enters the current system date (or the date you entered earlier in the session) for the transaction date.

To override this date, click on the field (or press Shift+Tab to return to the Date field) and enter a new value.

Note: Note: If you are using batch control, this field defaults to the active batch date and cannot be overridden.

Transaction

(read only) The transaction number is automatically assigned by iMIS after the transaction has been processed.

Id

Enter the customer ID that relates to the sale, or use the lookup icon to select a value.

Type

(read only) The customer type that corresponds to the customer ID.

Ref/PO

Enter the customer's purchase number or other reference number that should appear on the invoice. The reference/purchase order value will display on the AR statement.

Terms

(optional) Enter the code for the type of sale terms that apply to this invoice, or use the lookup icon to select a value.

Invoice #

Enter the numeric code listed on the manual (paper) invoice. If no code exists and you leave this field empty, iMIS supplies a sequential reference number that appears on all related windows and reports. Reference numbers have a prefix of R.

Invoice Balance

(read only) Running invoice balance automatically updated by iMIS.

becomes

(read only) Invoice balance after the credit adjustment (only displays when you click New).

Description

(read only) This description is populated by the description in the invoice to which the credit memo is related.

Product

Enter a valid product code from the Set up products window, or use the lookup icon to select a value.

GL Account

Automatically populated with the GL account number if a GL account number is defined for the product. If the Allow GL Account Edit for Sales Transactions option is enabled (from AR/Cash, select Set up module), you can enter a GL account number if the GL Account field is blank or enter a different GL account number if the GL Account field is populated.

If a GL account number is not defined for the product and you leave the GL Account field blank, the GL Account field is automatically populated with the default Income Account for the transaction's owner entity.

If the Allow GL Account Edit for Sales Transactions option is disabled, this field is display-only and the GL account number cannot be added or changed.

(Product) Description

Automatically entered by iMIS, but can be overridden manually.

Quantity

Enter the Quantity of the product being sold. This quantity is applied against the unit price to arrive at the extended amount.

Enter quantities as whole numbers unless you are designating time or other partial quantities. For time or other partial quantities, enter fractions as decimals: (for example, enter 1.5 for 1-1/2)

Unit Price

iMIS automatically fills in the Unit Price if a product price has been defined on the Product Code window.

To override this price, click on the field (or press Shift+Tab to return to the Unit Price field) and enter a new value.

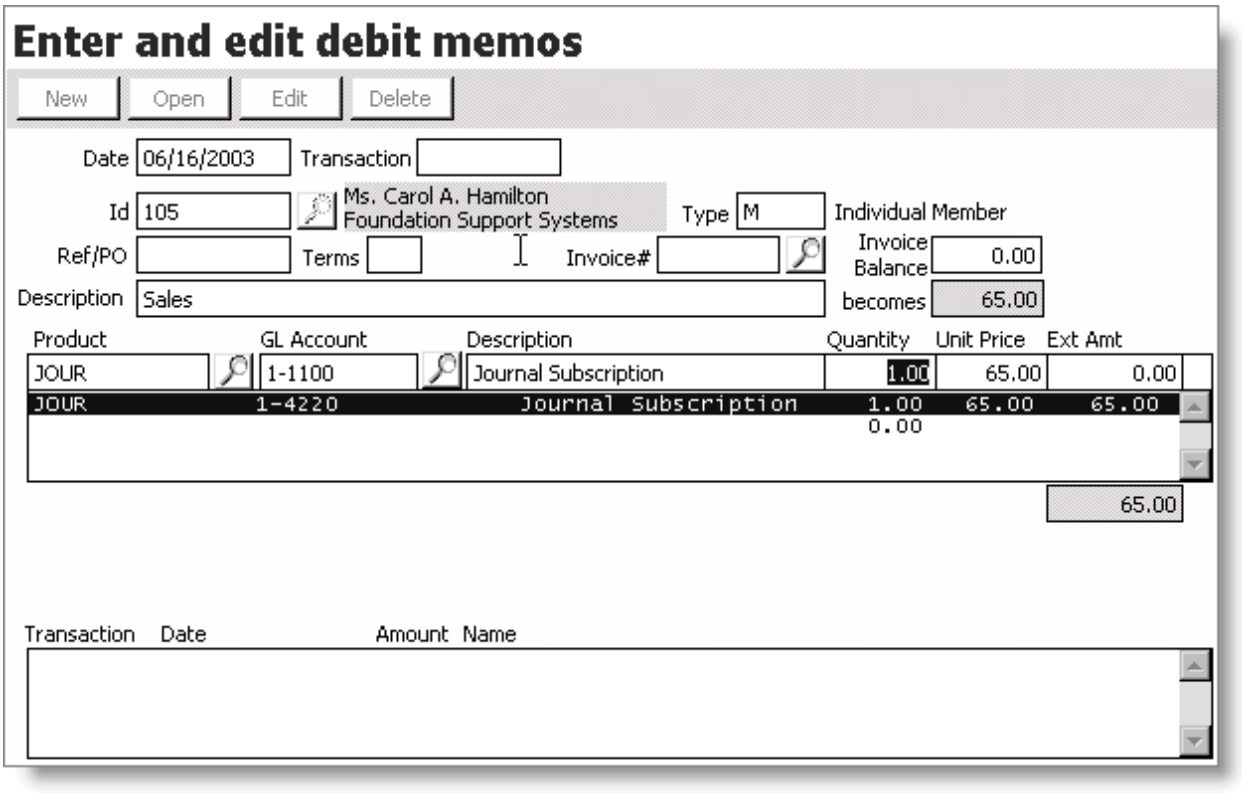
Ext Amt

(read only) iMIS automatically calculates the extended price.

Transaction list

Displays the transaction date, check number or credit card type, transaction amount, and customer name.

Enter and edit debit memos window for AR/Cash



From AR/Cash, select Enter and edit transactions > Debit memos

Date

iMIS automatically enters the current system date (or the date entered earlier in the session) for the transaction date.

To override this date, click on the field (or press Shift+Tab to move the cursor back to the Date field) and enter a new value.

> **Note:** Note: If you are using batch control, this field defaults to the active batch date and cannot be overridden.

Transaction

(read only) The transaction number is automatically assigned by iMIS after the transaction has been processed.

Id

Enter the customer ID that relates to the sale, or use the lookup icon to select a value.

Type

(read only) The customer type that corresponds to the customer ID.

Ref/PO

Enter the customer's purchase order number or other reference number that should appear on the invoice. The reference/purchase order value will display on the AR statement.

Terms

(optional) Enter the code for the type of sale terms that apply to this invoice, or use the lookup icon to select a value.

Invoice #

Enter the numeric code listed on the manual (paper) invoice. If no code exists and you leave this field empty, iMIS supplies a sequential reference number that appears on all related windows and reports. Reference numbers have a prefix of R.

Invoice Balance

(read only) Running invoice balance automatically updated by iMIS.

becomes

(read only) Invoice balance after the credit adjustment displays in this field (only displays when you click the New button)

Description

(read only) This description is populated by the description in the invoice to which the credit or debit memo is related.

Product

Enter a valid product code from the Set up products window, or use the lookup icon to select a value.

GL Account

Automatically populated with the GL account number if a GL account number is defined for the product. If the Allow GL Account Edit for Sales Transactions option is enabled (from AR/Cash, select Set up module), you can enter a GL account number if the GL Account field is blank or enter a different GL account number if the GL Account field is populated.

If a GL account number is not defined for the product and you leave the GL Account field blank, the GL Account field is automatically populated with the default Income Account for the transaction's owner entity.

If the Allow GL Account Edit for Sales Transactions option is disabled, this field is display-only and the GL account number cannot be added or changed.

Product Description

Populated automatically by iMIS, but can be overridden manually.

Quantity

Enter the Quantity of the product being sold. This quantity is applied against the unit price to arrive at the extended amount.

Enter quantities as whole numbers unless you are designating time or other partial quantities. For time or other partial quantities, enter fractions as decimals: (for example, enter 1.5 for 1-1/2)

Unit Price

iMIS automatically fills in the Unit Price if a product price has been defined on the Set up products window.

To override this price, click on the field (or press Shift+Tab to return to the Unit Price field), and enter a new value.

Ext Amt

(read only) iMIS automatically calculates the extended price.

Transaction list

Displays the transaction date, check number or credit card type, transaction amount, and customer name.

Recording credit memos

Credit memos make adjustments that reduce or reverse normal open AR items. Use credit memos to perform the following operations:

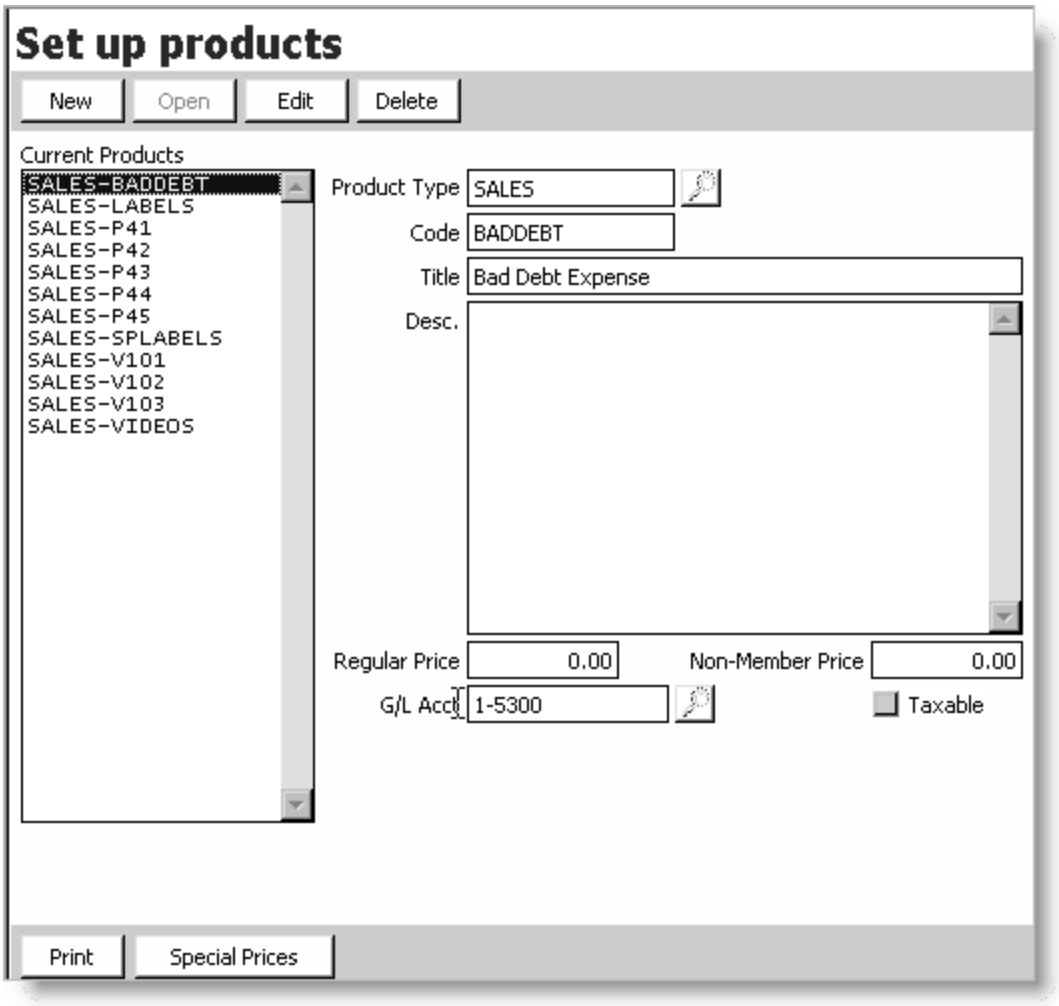
- Write off an uncollectible open item.
- Reduce or reverse a line item charge.
- Reverse a previously entered sales (or simple order) transaction.

> **Note:** Note: Although credit memo transactions create accounting entries that are used to reduce or reverse an open debit item, these transactions do not produce any documents other than normal transaction entries on batch and other transaction-related audit trail reports.

To write off bad debt

iMIS allows you to write off a bad debt, an uncollectible item you do not expect to see fulfilled. In order to write off a bad debt, you must first set up a product that corresponds to the bad debt expense on the Set up products window.

1. From AR/Cash, select Set up tables > Products to open the Set up products window.
2. Click New.
3. Enter SALES in the Product Type field.
4. Enter a code for the bad debt item. BADDEBT is used in this example.
5. Enter a title in the Title field. Bad Debt Expense is used in this example.
6. If desired, enter a short description in the Des. field.
7. Leave the Regular Price and Non-Member Price at zero so that you can enter variable balances.
8. (optional) Place the cursor in the GL Account field and enter or change the GL account number for the bad debt write-off. If the Allow GL Account Edit for Sales Transactions option is not enabled (from AR/Cash, select Set up module), the GL Account field is display-only and the GL account number cannot be added or changed.
9. Click Save. You can now reference the item (in this example, BADDEBT) on the Enter and edit credit memos window and properly track this expense account.



Set up products window showing BADDEBT product code

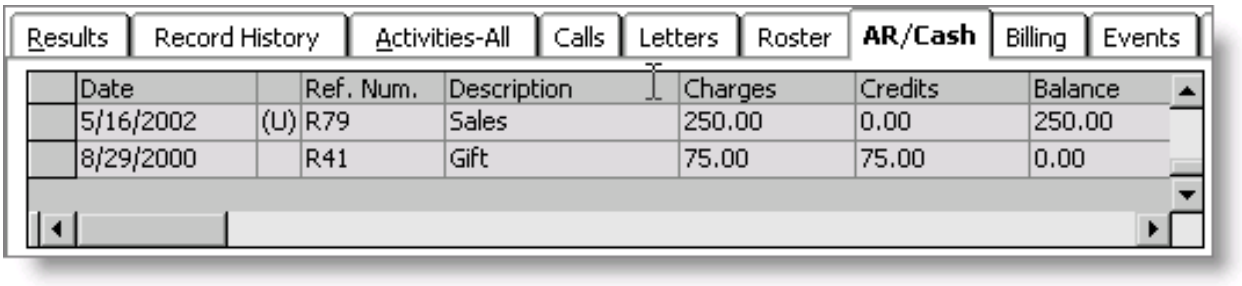
To adjust an open item

To adjust an existing open item, first enter the item's invoice number or reference in the Invoice # field on the Enter and edit credit memos or Enter and edit debit memos window. If you do not know the invoice number or reference:

1. From Customers, select Manage customers to open the Manage customers window.
2. Click Find and enter the customer ID in the Search window, then press Enter.
3. Select the AR/Cash tab to view the AR/Cash information.

If you double-click a record, the Transaction Ledger window displays, showing detailed information.

4. Locate the invoice number or reference you need in the Ref. Num. column.
5. From AR/Cash, select Enter and edit transactions > Credit memos to open the Enter and edit credit memos window (or select Enter and edit transactions > Debit memos to open the Enter and edit debit memos window).
6. Click New.
7. Enter the customer Id, or click the lookup icon to select a value.
8. Enter the invoice or reference number in the Invoice # field, or click Find to look up the invoice or reference number. Make sure to capitalize any letters when you enter the code, for example, R12.
9. Enter the data according to the following adjustment situations in the Product, Quantity, and Unit Price fields. Repeat these steps for all line items that require an adjustment.
10. To apply credit memos to open items, select one of the following options:
    - To write off a bad debt, select the product (for example, BADDEBT), enter the quantity as 1, and enter the unit price as the amount of the balance to be written off.
    - To correct an overcharge, enter original product and quantity; adjust the unit price.
    - To reverse an entire sales transaction, enter the original product, quantity, and price for all line items.
    - To credit a returned product, enter original product, quantity returned, and original price.
11. To make debit adjustments to correct an undercharge, enter the original product and quantity, and adjust the unit price as needed.
12. (optional) Place the cursor in the GL Account field and enter or change the GL account number. If the Allow GL Account Edit for Sales Transactions option is not enabled, the GL Account field is display-only and the GL account number cannot be added or changed.
13. Click Save.



Example of an adjustment to an open item

To record debit adjustments

Debit adjustments make adjustments that increase the debit balance of open AR items. Debit adjustment transactions have the opposite effect of credit memos.

Debit adjustments are used to increase or add a line item charge; bring a credit balance to zero due to an overpayment or credit memo; or cancel a transaction.

Note: Note: iMIS AR/Cash has more automated facilities for processing refunds or application/transfers of credit balances to other sales transactions. See Creating Credit Invoices.

Billing Administration

Accrual Dues

The Process accrual dues task item displays only if Accrual is enabled as the default accounting method on the Set up general options window.

Process accrual dues subtask list

> **Note:** Note: From Billing, select Process accrual dues.

Using the accrual method for managing your dues products, you can book income or deferred income, and create open accounts receivable items whenever you generate bills. The accrual dues method provides the following:

- Creation of unposted transaction records - Option to review, reject, and rerun billing results prior to batch posting
- Two accrual basis dues billing run reports - Dues Batch Summary and Dues Batch Detail reports
- AR Payment Application option - Distribute partial payments by priority or proportionally
- Paid Thru Date Update option - Update Paid Thru date when the invoice is paid in full or at billing time
- Cash/Accrual Option at the Billing Cycle level - Process a mixture of accrual- and cash-based billings

Setting the accrual dues options

Use the General options window to set up accrual dues. See General options window for details.

To set the defaults for accrual dues

> **Note:** Caution! If you plan on running both cash and accrual billing cycles, you must select the Accrual accounting method.

1. From Billing, select Set up module > General options. See General options window for details.
2. Click Edit.
3. Select Accrual accounting method.
4. Select your preferences for Paid Thru Date Update and AR Payment Application.
5. Click Save.

Creating an accrual dues billing cycle

You can set the accounting method for a billing cycle to either Cash or Accrual on the Set up billing cycles window. The Default selection uses the accounting method set on the Set up general options window. This section explains only the fields that need to be set on the Set up billing cycles window for accrual dues. See Creating Billing Cycles for complete field definitions for the Set up billing cycles window.

> **Note:** Note: If the default accounting method in the Set up general options window is set to Accrual, you can select Cash or Accrual as the accounting method for the billing cycle. If the default accounting method is set to Cash, you cannot change the accounting method on the Set up billing cycles window to Accrual. If you try to set the billing cycle accounting method to Accrual when the Billing accounting method system default is Cash, a message is displayed informing you that you must change your accounting method to Accrual.

To add an accrual dues billing cycle

1. From Billing, select Set up module > Billing cycles.
2. Click New.
3. Enter the new billing Cycle Name.

4. Select the customer types you want to bill.

   Note: To select multiple Member Types, Categories, or Products, hold down the Ctrl or Shift (sequential range) while you select your selections.

5. Select the Categories of the customer types you want to include in the billing.
6. Select the Products that will be included in the bill that are not included on the Set up customer types window.
7. Select the options that will be used to format the printed bill:

- Forms -Select the renewal notice format from the list.
- Major Sort - Select the order in which the bills are sorted for printing.
- Member Sort - Select the order in which the individuals (Ship to) are listed on the list bill. (This is used only for list bills in which dues and/or subscriptions for several individuals or branches are itemized on a single bill and sent to a single parent company or third party.)
- Product Sort - Select the order of the line items on the dues bill.

8. Select the Include options that also need to be billed.

   Tip: To select all chapters (CHAPT) and sections (SEC), select the Include all sections and Include all chapters options located in the Other Bill Instr. section.

9. (Required for dues billing) Select the Add Member Type Items option to select all product codes defined on the Set up customer types window.
10. Select the Annual/Anniv drop-down list and select when the billing cycle should be billed (Annual or Anniversary), or retain the default setting. iMIS defaults to the setting specified in system setup.
11. Select the Cash/Accrual drop-down list and select the accounting method of Cash or Accrual, or retain the default setting. iMIS defaults to the setting specified in system setup.

    Note: You can select Cash or Accrual if the default accounting method on the Set up general options window is set to Accrual. If you try to set the billing cycle accounting method

to Accrual when the Dues accounting method system default is Cash, a message is displayed informing you that you must change your accounting method to Accrual.

12. Click Save.

Using batch control with accrual dues

Batch control plays a key role in the accrual dues billing process, even if Batch Control is not enabled on the AR/Cash Batch Control window. See the AR/Cash Batch Control Window for more information.

Batch control and mass dues billing

Each time an accrual mass dues billing is run, a new special-purpose batch is generated.

If the Operator Assigned Batch Numbers option is enabled on the AR/Cash Batch Control window, you are prompted for a batch name when billing begins. Otherwise, the system automatically assigns a batch number according to the method chosen on the AR/Cash Batch Control window. If batch control has not been enabled, the Auto Date assignment method is used.

All transactions within the batch are left unposted; this allows you to review the results. If the results are wrong, you can delete the batch, make necessary changes, and rerun the billing.

> **Note:** Note: The Separate Posting Cycle Required option on the AR/Cash Batch Control window is ignored in the case of a mass accrual dues billing batch. Data will always be generated as if the option is enabled. Until batch posting occurs, no billing data, accounting data, or customer data will be updated.

The Post batches window (from Billing, select Process accrual dues> Post batches) lists all mass dues billing batches. You can print dues-oriented detail and summary reports from this window for review and posting. If the data is wrong, you can also use this window to delete unposted batches. After you make the corrections, you can rerun the billing. If the data is accurate, you can post the batch from this window.

If batch control is enabled, you can also print and post the accrual dues billing batches from the traditional Open Batches window.

When batch control is enabled, iMIS prevents you from using batches generated by an accrual mass dues billing run for any other type of transaction processing. If an accrual dues billing batch is active when you try to enter or edit a transaction, the Open Batches window will automatically open to remind you to select a different batch. Similarly, you cannot use mass billing batches to process individual or one-up dues billings.

Note: Note: If you run an individual accrual billing when a mass accrual dues batch is open, a message is displayed asking you to select another batch or create a new one. Only one batch can be open for each cycle. This feature prevents you from generating duplicate billing transactions.

Note: Note: If you try to generate a mass billing for a cycle that was previously run and has an open batch, a message is displayed informing you that you must cancel or post the previous batch before running another billing for the current cycle.

Batch control and individual dues billing

Billing on an individual or one-up basis works in a more traditional iMIS batch-processing environment. These billings are processed in a batch only if a batch control option is enabled on the AR/Cash Batch Control window. See Accounts Receivable for more information.

The accounting transactions generated by the individual billing process automatically go into any traditional active batch. If there is no active batch, the regular Open Batches window opens so that an open batch can be activated.

The batch verification process for an individual dues billing also validates that the active batch date matches the Run Date on the Process billing window.

Example: If the open batch does not match the Effective Date of the individual billing run, a message is displayed informing you that you must select an open batch whose

Effective Date matches the billing run date. You can select either a batch where the batch date is equal to the dues billing batch, or override the dues billing Run Date to match the batch date.

After you have reviewed and accepted the billing data, all individual-billing transactions will be “hot posted” to facilitate the immediate printing of the renewal notice or initial bill.

> **Note:** Note: The Separate Posting Cycle Required option is ignored in the case of an individual or 1-up dues billing. Data will always be generated as if the option is disabled.

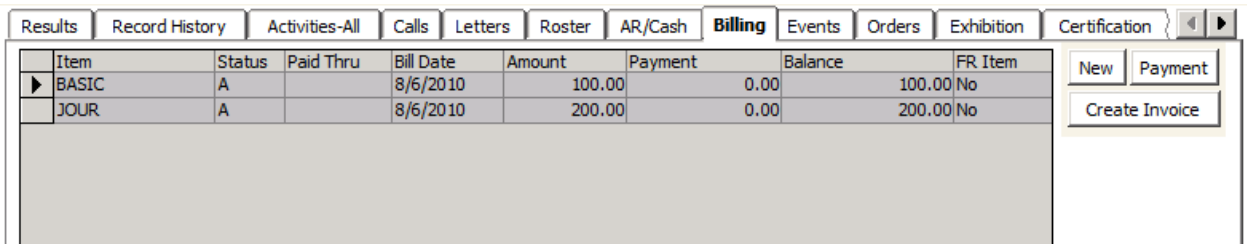
Generating an individual accrual dues billing

When a dues billing is processed for an individual using Accrual basis dues, the Individual Accrual Dues Posting window displays the billing information. This window allows you to review the results of the individual billing and post or cancel the billing.

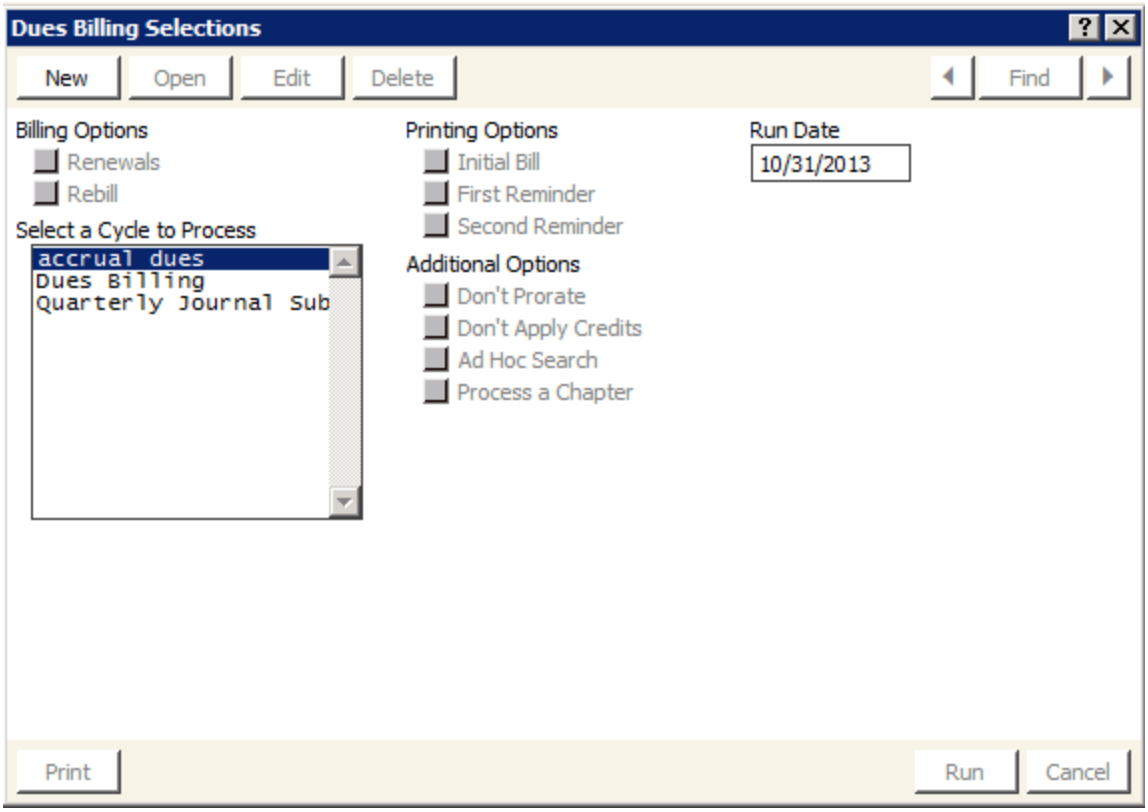
To generate an individual accrual dues billing

> **Note:** Caution! If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer's record or add a new customer.
3. Select the Billing tab.



4. Click Create Invoice to open the Dues Billing Selections window.



Note: Only billing cycles appropriate for the individual customer's type display in the Select a Cycle to Process scrolling list.

5. Click New.
6. Select the Renewals billing options.
7. Select the Printing options. If you want to print a renewal notice for this individual, select the Initial Bill option. Renewal notices may be printed at the same time as billing only for individual accrual dues.
8. Override the Run Date, if necessary.
9. Select the Accrual Billing Cycle to process.
10. Override the Effective Date, if necessary.
11. Click Run. The renewal notice displays.

Generating a mass accrual dues billing

When an accrual method billing cycle is selected, certain areas of the Process billing window may be disabled or grayed out. For example, the rebill and available credit options are not allowed for accrual dues items.

> **Note:** Note: A new batch will be generated for each mass dues billing run even if you do not have Batch Control enabled on the AR/Cash Batch Control window.

To generate a mass accrual dues billing

1. From Billing, select Process billing to open the Process billing window.
2. Click New.
3. Select the Renewals billing option.

   Note: The Rebill option is not allowed for accrual dues items. Adjustments must be made using debits or credits (see Processing Adjustments).

   Note: Printing of renewal notices under accrual dues is not allowed with the generation of the billing. You must post the batch and then print the renewal notices separately (see Printing Renewal Notices).
4. (optional) Override the Run Date.
5. Select an accrual billing cycle.
6. (optional) Override the Effective Date.
7. (optional) Select any Additional Options.

   Note: The AVAIL_CREDIT feature is currently not supported by accrual dues cycles. All accrual dues cycles will operate as if the Don't Apply Credits option on the Process billing window is enabled.
8. Click Run to process the billing run.

Note: A new batch will be generated for each mass dues billing run even if you do not have Batch Control enabled on the AR/Cash Batch Control window. If you have selected Operator Assigned Batch Numbers, iMIS will prompt you for a batch number (maximum of ten characters) when the billing process is started. Otherwise, the system will assign a batch number automatically according to the selection made for batch numbering on the AR/Cash Batch Control window.

Posting mass accrual dues batches

After you have generated a mass accrual dues billing, review and post the batch. The Post batches window allows you to review, post, or cancel individual batches prior to posting the batches to the Transaction table.

To print an accrual dues batch

Before posting an accrual dues batch, click Print Summary or Print Detail to review the results of the accrual dues billing run.

1. From Billing, select Process accrual dues> Post batches to open the Post batches window.
2. Select the batch to be printed.
3. Select File> Report Destination and select the print destination.
4. Click Print Summary to print the Dues Batch Summary Report, or click Print Detail to print the Dues Batch Detail Report.

   The Dues Batch Summary Report summarizes the transaction records for each customer type. It provides subtotals for the number of records and amounts for each product code for that customer type. It also provides a subtotal for each customer type and a grand total for the accrual dues billing run at the end of the report.

   For each customer billed, the Dues Batch Detail Report lists the line items billed (including term dates and amounts) with a subtotal by ID. On a list bill, you can use the Bill to ID to further group and subtotal the details for multiple customers.

   To post a mass accrual dues batch

If the billing transaction data is accurate, you can finalize the transaction by posting the batch.

1. From Billing, select Process accrual dues> Post batches.
2. To post a single batch, select the batch you want to post and click Post Selected.
3. To post multiple batches, double-click each open batch to mark it as ready, select the Ready option to view the ready list, and click Post Ready.

   iMIS processes the batch and prints the Dues Batch Detail Report and the Batch Posting Listing report. The batch status changes to Posted.

   To delete an unposted batch

   If any of the billing transactions are incorrect (such as wrong customers or line items billed, or incorrect term dates or amounts), simply delete the billing results; correct the causes of the errors, and run the billing process again.

   > **Note:** Note: You must delete an unposted batch if you want to rerun the billing cycle.

1. From Billing, select Process accrual dues> Post batches to open the Post batches window.
2. Select the batch you want to delete.
3. Click Delete. A message is displayed asking you to confirm the deletion.
4. Click Yes to delete the batch.

Viewing billing results

You can view the billing results through the following windows located in the History tab area at the bottom of the Manage customers window:

- Billing tab: Select the Billing tab on the Manage customers window.
- Dues/Subscription Item Detail window: Double-click a line item on the Billing tab to open the record in the Dues/Subscription Item Detail window. View the record or click Edit to modify the record.

  Note: Several accounting-oriented fields are unavailable for editing with an accrued line item.
- AR/Cash tab: Select the AR/Cash tab on the Manage customers window.
- Transaction Ledger window: Double-click a line item on the AR/Cash tab to see the transaction details.

> **Note:** Tip: See Billing run troubleshooting.

Processing accrual dues payments

Processing payments in iMIS Desktop

Payments for accrual dues items can be processed on the AR Cash > Enter and edit cash receipts window, or through Payment Entry in iMIS Service Central.

The Enter and edit cash receipts window allows you to enter and edit payments for dues invoices. Payments are applied across Dues open line items either by priority or proportionally, depending on the AR Payment Application option selected on the Set up general options window.

If the Paid Thru Date Update option on the Set up general options window is set to Paid in Full, the following dates are updated:

- The line item's Paid Thru date is advanced to the end of the billing term when the item is paid in full.
- The customer's Paid Thru date is advanced to the end of the billing term when the first item on the Set up customer types window is paid in full.

If the Paid Thru Date Update option on the General options window is set to Billing Time, the Paid Thru date will be updated when the initial accrual dues billing is performed.

New transaction and activity records are created for each payment made to each dues line item.

Processing payments in iMIS Public view

Users can pay for their dues and subscriptions in the Public view from Contacts > Contact Management > Billing. All accrual billing items must be paid for at the same time; users cannot optionally select or deselect items that appear in their Billing list. If a contact's items have been billed to another party, those items appear in the Billing list for the Bill to ID. To allow payments on the web, enable the option Allow customers to make accrual dues payments on the web from System Setup > Set up commerce web components > Billing Configuration.

Processing adjustments

Credit and debit memos can both be used to make adjustments that increase, reduce, or reverse open AR items. Credit memos are used to make adjustments that reduce or reverse open AR items that are typically a debit balance. These transactions create accounting entries but no printable documents, other than transactions on batch and other audit-trail reports.

Authorization levels for credit/debit memos

The Enter and edit credit memos (Billing > Process accrual dues > Enter and edit credit memos) and Enter and edit debit memos (Billing > Process accrual dues > Enter and edit debit memos) windows adhere to the same security rules as the Enter and edit payments window:

- To find and view an existing credit or debit memo, you must have a Billing authorization level of one (1) or greater.
- To enter new accrual dues credit or debit memos, you must have a Billing authorization level of three (3) or greater. A Billing authorization level of three (3) will allow you to edit or delete credit or debit memos you have entered.

- If the View Batch by User option is enabled on the AR/Cash Batch Control window, to edit or delete another user's accrual dues credit or debit memo, you must have a Billing authorization level of four (4) or greater.

  To set the Billing authorization level, select System Setup > Security administration > Users, and make sure the Billing authorization level is set accordingly.

Credit memos for accrual dues

Use credit memos to perform the following tasks:

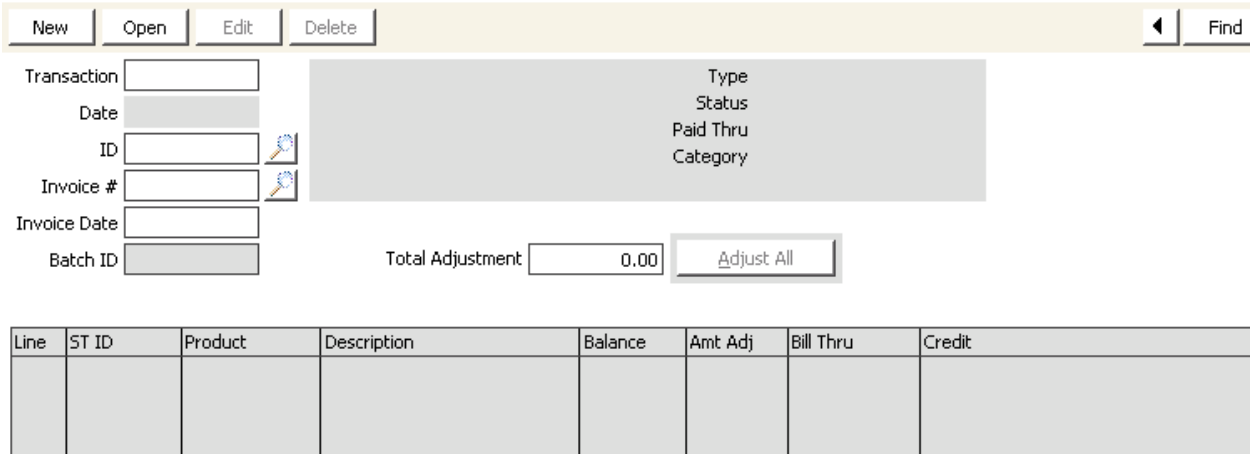
- Write off an open item that cannot be collected
- Reduce or reverse a line item charge
- Reverse a previously entered transaction
- Record product returns and credit the customer

You can process reversals of open accrual dues items on a line-by-line basis on the Enter and edit credit memos window. After the credit memo is processed, the balance reduction is reflected appropriately in the various inquiry windows.

For example, if a customer cancels a single line item on a bill and pays for the remaining items, you should reverse the charge of the canceled item.

> **Note:** Note: Accrual dues credit memos must be processed on the Billing Enter and edit credit memos window. If you attempt to process an accrual dues credit memo from the AR/Cash Enter and edit credit memos window, a message is displayed at the bottom of the window. See To process an accrual dues credit memo for information regarding processing accrual dues credit memos.

Enter and edit credit memos window



Desktop: Billing > Process accrual dues > Enter and edit credit memos

Transaction

This field is automatically populated with the transaction number.

Date

Defaults to the current system date, or the batch date if you are using the batch control option

ID

Specifies the billed customer identification number or. You can also select the lookup icon to select a value.

Invoice #

Specifies the invoice number assigned to the billing transaction or select the lookup icon to select a value.

Invoice Date

This field is automatically populated with the invoice date when you enter a value in the Invoice# field.

Batch ID

This field is automatically populated with the batch number of the current, open batch if batch control is enabled on the AR/Cash Batch Control window.

Original Invoice Balance

Displays the total balance due from the original billing invoice. This option displays when a record is entered.

Total Adjustment

Displays the total amount to be adjusted for the line items as you select them.

Adjusted Invoice Balance

Displays the difference between the Original Invoice Balance and Total Adjustment fields. This option is displayed when a record is entered.

Adjust All button

Used to automatically mark the credit checkbox for all line items.

Line

This column displays all the Invoice_Lines.LINE_NUM fields associated with the Invoice Number.

ST ID

This column displays all the Invoice_Lines.ST_ID fields associated with the Invoice Number.

Product

This column displays all the Invoice_Lines.PRODUCT_CODE fields associated with the Invoice Number.

Description

This column displays the description of the product code. If the invoice is a List Bill, the name of the ST_ID will be concatenated with the product title (for example, Bill Smith, Basic Dues).

Balance

This column displays all Invoice_Lines.BALANCE fields associated with the Invoice Number.

Amt Adj

This column displays the dollar amount to be adjusted from this line item. Entering an amount in this field then tabbing automatically marks the Credit checkbox.

Bill Thru

This column displays all Invoice_Lines.BILL_THRU fields associated with the Invoice Number.

Credit

Select to select a line item to be credited in full.

To process an accrual dues credit memo

You can process reversals of accrual dues items on a line-by-line basis through the Enter and edit credit memos window. For example, if a customer cancels a single line item, you can reverse that one line.

> **Note:** Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any income recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

1. From the Enter and edit credit memos window, click New.

   The Date field defaults to:

- Batch date if Batch Control is used.

  If Batch Control is enabled and an active open batch is not selected, the Batch Control List is displayed. Select or create a batch and click New.

If Batch Control is enabled and an active open batch is selected, the Date field is populated with the date of the batch.

- System date, if Batch Control is not used

  If the system date is overridden, the new date becomes the default value for inserts until the window is closed and reopened.

2. Enter an ID or select the lookup icon to find a customer's record. After the ID field is populated, an address block for the customer displays at the top of the window and the fields labeled Type, Status, Paid Thru, and Category populate. The calculated address block contains a concatenation of the full name, title, company, and full address.

   Note: The CATEGORY field displays prefixed with the label Category if your administrator has enabled the Use Bill Categories option. If this option is not enabled, neither the category value nor the category label will display.

3. Tab to the Invoice Number field.

- Enter the accrual billing invoice number and press Enter, or
- Select the lookup icon to select an invoice.

  Invoice or reference numbers are validated for the following:

- Invoice.SOURCE_SYSTEM is equal to DUES and at least one Invoice_Lines row is linked to the invoice.
- The Invoice.BT_ID is equal to the ID entered for the credit memo.

4. After the invoice number is entered, select from the following options:

- Click Adjust All to select all line items to credit.

  The balance amount displays in the Amt Adj field and the Credit option is selected for each line item.

- Select the Credit option to credit specific line items. For example, select this option for Line 2.

  The balance amount displays in the Amt Adj field.

- Enter an amount to credit in a line item's Amt Adj field. For example, enter 100.00 in the Amt Adj field for Line 1.

  This will automatically enable the Credit option:

5. Click Save to update the record.

   The Total Adjustment field displays the total amount of the credit memo. Line items not adjusted are no longer displayed on the window.

To find an accrual dues credit memo using a transaction number

1. From the Enter and edit credit memos window, click Find or Open.
2. Enter the transaction number and press Enter.

   iMIS verifies that the transaction number is the correct type based on whether Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM. If the transaction number is not correct, a message is displayed informing you that the transaction could not be located.

   > **Note:** Note: Accrual dues credit memos must be processed on the Billing Enter and edit credit memos window. If you attempt to process an accrual dues credit memo from the AR Enter and edit credit memos window, a message is displayed at the bottom of the window. See To process an accrual dues credit memo for details.

   To find an accrual dues credit memo using a transaction date

1. From the Enter and edit credit memos window, click Find or Open.
2. Tab to the Date field and enter a valid date, for example, 04152001, and press Enter.

   iMIS builds a list of potential matches, looking for a match with that date and of the correct type (Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM). If no transactions are found, a message is displayed informing you that no transactions match your criteria.

   The most recent transaction to meet the criteria is displayed. If there is more than one transaction that meets the criteria, the most recent transaction is displayed and the Left

arrow is activated. After viewing the previous transaction, the Right arrow is activated, allowing you to scroll through all transactions based on the date entered (Trans.SOURCE_SYSTEM equal to DUES and Trans.JOURNAL_TYPE equal to CM).

> **Note:** Note: Accrual dues credit memos must be processed on the Billing Enter and edit credit memos window. If you attempt to process an accrual dues credit memo from the AR Enter and edit credit memos window, a message is displayed at the bottom of the window. See To process an accrual dues credit memo for details.

To find an accrual dues credit memo using the customer ID

1. From the Enter and edit credit memos window, click Find or Open.
2. Tab to the ID field, enter a valid ID, and press Enter.

   iMIS will build a list of potential matches, looking for a match with that ID and of the correct type (Trans.SOURCE_SYSTEM is equal to DUES and Trans.JOURNAL_TYPE is equal to CM). If the ID is not correct, a message is displayed informing you the transaction could not be located.

   The most recent transaction to meet the criteria is displayed. If there is more than one transaction that meets the criteria, the most recent transaction is displayed and the Left arrow is activated. After you have viewed the previous transaction, the Right arrow is activated, allowing you to scroll through all valid transactions (Trans.SOURCE_SYSTEM equal to DUES and Trans.JOURNAL_TYPE equal to CM) based on the date entered.

> **Note:** Note: Accrual dues credit memos must be processed on the Billing Enter and edit credit memos window. If you attempt to process an accrual dues credit memo from the AR Enter and edit credit memos window, an error displays at the bottom of the window. See To process an accrual dues credit memo for details.

If more than one Find criteria is entered, iMIS will search on the following:

- Transaction number first, if populated, and ignore the other search criteria.
- Date second, if populated, and ignore the ID.

- ID third, if both Transaction and Date are blank.

To edit an accrual dues credit memo with Batch Control enabled

You can edit an accrual dues credit memo only if it has not been exported through a General Ledger interface. After this occurs, Trans.POSTED is equal to 4, and you will not be able to edit the credit memo.

1. From the Enter and edit credit memos window, find an accrual dues credit memo.
2. Click Edit.

   Note: If a batch is not selected, iMIS will ensure that the batch containing the credit memo is still in an open state and then open the Batch window.

   If a batch is selected, but is not the batch containing the credit memo, a message is displayed asking you to confirm loading a batch other than the one selected. Click No to cancel the edit or click Yes to proceed. Before changing the batch, iMIS will ensure that the batch is still in an open state. If the batch is not open, a message is displayed informing you that the batch is not open and cannot be edited.
3. Tab to the Amt Adj field to edit the amount.
4. Click Save.

To cancel an accrual dues credit memo with Batch Control enabled

You can cancel an accrual dues credit memo only if it has not been exported through a General Ledger interface. After this occurs and the Trans.POSTED_FLAG is equal to four, you will not be able to edit the credit memo.

1. From the Enter and edit credit memos window, find an accrual dues credit memo.
2. Click Delete.

- If a batch is not selected, iMIS will ensure that the batch containing the credit memo is still in an open state, open the Batch window, and ask you to confirm the deletion. Click Yes to delete the transaction or click No to cancel the deletion.

- If a batch is selected, but is not the batch containing the credit memo, a message is displayed asking you to confirm loading a batch other than the one selected. Click Yes to proceed. Before changing the batch, iMIS will ensure that the batch is in an open state. If the batch is open, a message is displayed asking you to confirm the deletion. Click No to cancel the delete or click Yes to delete the transaction. If the batch is not open, a message is displayed informing you that the batch is not open and cannot be edited.

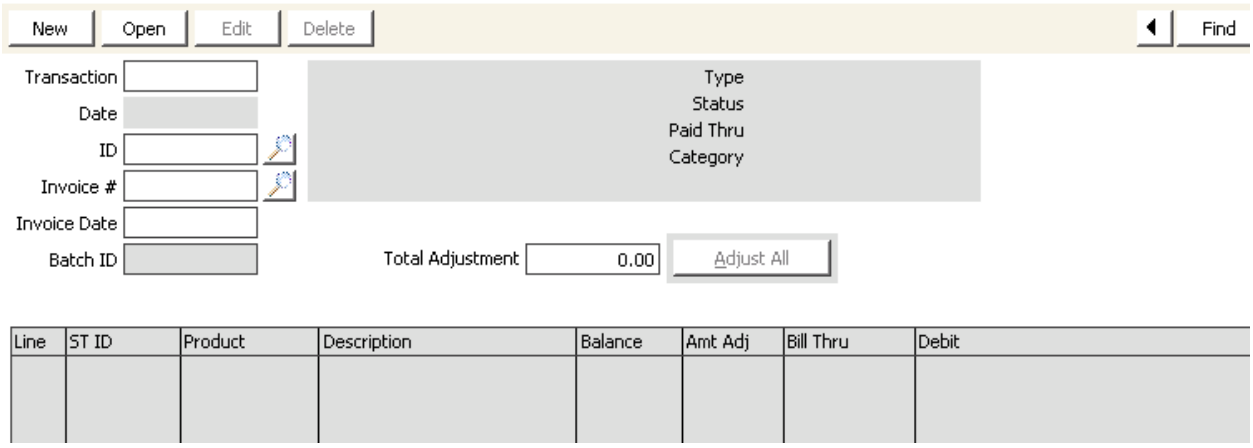
Debit memos for accrual dues

Use debit memos to perform the following tasks:

- Increase a line item charge
- Bring a credit balance to zero due to an overpayment, credit memo, or cancellation transaction

Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

Enter and edit debit memos window



Billing > Process accrual dues > Enter and edit debit memos

Transaction

This field is automatically populated with a transaction number.

Date

Defaults to the current system date, or the batch date if you are using the batch control option.

ID

Enter the customer identification number or, if a company is responsible for the payment, enter the company ID in this field. You can also select the lookup icon to select a value.

Invoice Number

Specifies the invoice number assigned to the transaction or select the lookup icon to select a value.

Invoice Date

The current date automatically displays in this field when a record is entered.

Batch ID

Displays the batch number of the current open batch if batch control is enabled on the AR/Cash Batch Control window.

Original Invoice Balance

Displays the total current balance of the original invoice.

Total Adjustment

Displays the total amount to be adjusted for the selected line items.

Adjusted Invoice Balance

Displays the Original Invoice Balance plus the Total Adjustment field. The value in the Total Adjustment field is typically a negative amount and is therefore deducted from Original Invoice Balance. If Total Adjustment is a positive amount, it is added to Original Invoice Balance.

Adjust All

Used to automatically debit all line items. This button can be used if the overall balance is negative.

Line

This column displays all Invoice_Lines.LINE_NUM fields associated with the Invoice Number.

ST ID

This column displays all the Invoice_Lines.ST_ID fields associated with the Invoice Number.

Product

This column displays all the Invoice_Lines.PRODUCT_CODE fields associated with the Invoice Number.

Description

This column displays the description of the product code. If the invoice is a List Bill the name of the ST_ID will be concatenated with the product title, for example, Bill Smith, Basic Dues.

Balance

This column displays all Invoice_Lines.BALANCE fields associated with the Invoice Number.

Amt Adj

This column displays the dollar amount to be adjusted from the specified line item. Entering an amount in this field automatically enables the Debit option.

Bill Thru

This column displays all Invoice_Lines.BILL_THRU fields associated with the Invoice Number

Debit

Select to have the line item debited.

To process an accrual dues debit memo

You can process reversals of accrual dues items with a credit balance on a line-by-line basis through the Billing Enter and edit debit memos window. For example, if a customer overpays an invoice and you do not intend to refund the overpayment, you should process a debit memo for that amount.

> **Note:** Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any income recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

1. From the Enter and edit debit memos window, click New.

   The Date field defaults to:

- Batch date if Batch Control is used.

  If Batch Control is enabled and an active open batch is not selected, the Batch Control List is displayed. Select or create a batch and click New.

  If Batch Control is enabled and an active open batch is selected, the Date field is populated with the date of the batch.

- System date, if Batch Control is not used

  If the system date is overridden, the new date becomes the default value for inserts until the window is closed and reopened.

2. Press Tab and enter an ID or select the lookup icon to find a customer's record.

   After the ID field is populated, an address block for the customer displays in the upper right-hand corner and the fields labeled Type, Status, Paid Thru, and Category are populated.

   The calculated address block contains a concatenation of Name.FULL_NAME, Name.TITLE (if Use Title is enabled for the preferred mailing address type),

Name.COMPANY (if Use Company is enabled for the preferred mailing address type), and Name.FULL_ADDRESS.

Note: Name.CATEGORY displays prefixed with the label Category: as long as the Use Bill Categories option is enabled on the Customer Setup - Basic Options window. If this option is not enabled, neither the category value nor the category label will display.

3. Tab to the Invoice Number field.

- Enter the invoice number and press Enter, or
- Select the lookup icon and select an invoice:

Invoice or reference numbers are validated for the following:

- Invoice.SOURCE_SYSTEM is equal to DUES and at least one Invoice_Lines row is linked to the invoice.
- The Invoice.BT_ID is equal to the ID entered for the credit memo.

4. After the invoice number is entered, select from the following options:

- Select Adjust All to select all line items to debit.

The balance amount times -1 displays in the Amt Adj field and the Debit option is selected for each line item.

Note: Adjust All is available only when the overall balance is negative.

- Select the Debit option to debit specific line items.
- Enter an amount to debit in the line item's Amt Adj field.

5. Click Save to update the record.

The Total Adjustment field displays the total amount of the debit memo and line items not adjusted are no longer displayed on the window.

After an accrual dues debit memo is applied to an invoice, the Transaction Ledger displays the detail for each amount adjusted.

Billing: Set up module

The general system setup sets overall defaults and operating guidelines. There are many ways to customize the billing process, which allow you to group customers by category, define the product line items that can be billed to customers, and set pricing according to information stored in the customer's data tables or by using a formula.

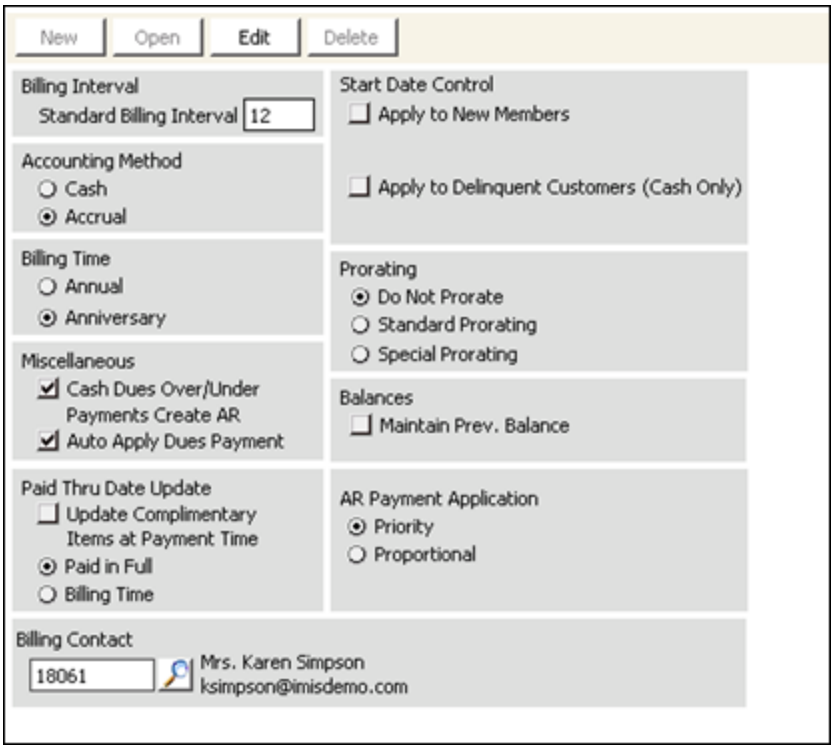
Before a billing cycle is run or a payment is entered, you must define how to bill.

See AR/Cash: Deferred Income for how to defer dues/subscriptions income and event-s/exhibition/exposition income.

Defining general billing options

The default options that you specify on the General options window are used throughout the iMIS Billing module. The options that are displayed on the General options window will vary according to the accounting method you select.

General options window



Desktop: From Billing, select Set up module > General options

Billing Interval

Standard Billing Interval - The billing interval controls the frequency with which you will normally generate bills. You can override the billing interval at the individual customer level, at the product level, or at the individual subscription level. Choose the billing interval as a number of months from 1(monthly), 2(bimonthly), 3(quarterly), 6 (semi-annual), 12 (yearly), or 24 (every 2 years).

> **Note:** Note: The number entered in the Standard Billing Interval field affects billing rates. Unless the billing interval is overridden at the product level, the dollar amounts entered for the products should be in accordance with the Standard Billing Interval. See Set up products window for Billing for detailed information on products.

Accounting Method

- Cash - Enable this accounting method to set up the billing system to recognize income when payment (cash) is received regardless of when bills or invoices were generated. The cash method is preferred for the Billing module.
- Accrual - Enable this accounting method to recognize income by creating open accounts receivable items when bills and invoices are generated.

> **Note:** Note: After you change the accounting method, you must restart iMIS Desktop and ensure that your iMIS Administrator stops and restarts all websites that contain your iMIS 15 applications in order to see the changes in the left navigation area.

> **Note:** If restarting the websites is problematic, you can wait for the cache to refresh (default is 15 minutes wait time, designated by the refresh cache interval), and then your changes appear.

Start Date Control

> **Note:** Note: If there are no Start Date Control options implemented, the New Bill From field on the Dues/Subscription Payments window (from Billing, select Enter and edit payments) defaults to the first day of the current month. See Date Usage in iMIS.

Determines whether the Bill Begin date should be advanced by one month. Start Date Control can be used to advance the start date of newly billed items or to specify a grace period for delinquent customer products. If implemented, the Bill Begin date will be controlled according to the following options:

- Apply to New Members - This option enables you to automatically advance the subscription begin date for new customers according to the parameter set in the Advance Start Month as of field.
- Advance Start Month as of - (Displays once you enable the Apply to New Members or Apply to Delinquent Customers option.) This option is a user-defined parameter used with the Apply to New Members option to allow you to set a specific day of the month on which to advance the begin date for new customers. Valid entries range from 0-28. If the value is 0 or 1, the Bill Begin date will always advance to the beginning of the next month.

  For example, if the Advance Start Month as of field is set to 15 and the Apply to New Members option is enabled, all new customers joining on August 15 will have their billing Begin Date set to 09/01.
- Apply to Delinquent Customers - (Applies to Cash basis and Anniversary items only) This option allows for the calculation of a new billing term when payment is posted to an existing billing record after the Bill Begin date. The new term begin date is determined by the value of the Advance Start Month as of field. If the value is 0 or 1, the new term will always advance to the beginning of the next month.
- Grace Period in Months - (Applies to Cash basis and Anniversary items only and displays only when the Apply to Delinquent Customers option is enabled.) This option refers to the grace period that is allowed for payment after the Bill Begin date.

For example, the Advance Start Month as of field is set to 15, the Apply to Delinquent Member option is enabled, and the Grace Period in Months is set to 3. A customer with a Paid Thru date of 12/31/2001 is billed for a renewal term of 01/01/2002 to 12/31/2002. The customer does not pay until 04/15/2002. The payment transaction date of 04/15/2002 exceeds the Bill Begin date of 01/01/02, and it also exceeds the three-month grace period from the Bill Begin date of 01/01/2002. Therefore, a new product term will be calculated by comparing the payment transaction date to the value of the Advance Start Month as of field. In this example, the payment transaction date of 15 is equal to the value set in the Advance Start Month as of field, and the new term will be calculated as 05/01/2002 to 04/30/2003.

Billing Time

The billing time is a method selected to control the start and end time of a customer or product term.

- Annual - Fixed annual customer term. All customers have the same billing term. The customer term coincides with the fiscal year (begin in any month). Annual fees are commonly prorated for new customers. Different prorating rules apply depending on when a customer joins. For example, if new customers join in July and you renew annually on the calendar year, you might want to prorate their fees by 50 percent.

  Note: If you select Annual as the billing time, you will need to set up the first month of the fixed term or fiscal year on the AR/Cash Set up module window (from AR/Cash, select Set up module). Enter the calendar month (numeric) that represents either your fixed term or fiscal year in the First Month of Fiscal Year (Number) field. The value in the First Month of the Fiscal Year (Number) field auto-populates the Effective Date. If this field does not have a value greater than zero, then the Effective Date must be manually entered on the Process billing window (from Billing, select Process billing).

- Anniversary - Individual renewal date that fluctuates based on each customer's Join Date. For example, if a customer joins on July 1, his or her term would be from July 1-June 30 of the following year. If you select an anniversary billing time, terms will initially

default to a year (or other specified billing interval) from the Join Date, if it exists, or the Effective Date you specified during billing.

Miscellaneous

Cash Dues Over/Under Payments Create AR - When you enable this option, over-payments are tracked in the AR/Cash system to allow the credit to appear on the Credit Invoices window (from AR/Cash, select Process month-end-procedures, and click Credit Invoices). Underpayments are also tracked in AR by considering the item fully paid and maintaining an outstanding balance. Overpayment or underpayment to AR creates an open credit or debit item for that customer. For example, if the customer paid $150 and had been billed $100, a payment of $150 can be entered but only $100 applied. iMIS would create an open credit of $50 for that customer in AR. A full payment of line items advances the Paid Thru date on those items. Credit (overpayments) and outstanding debit (underpayments) balances are maintained by the AR system. In Billing, the item will be treated as fully paid.

Auto Apply Dues Payment - This option is enabled by default. When you disable this option, dues payments are not applied automatically.

Prorating

Prorating applies only to organizations that bill on an annual or fixed-term basis, as opposed to an anniversary or rotating-term basis.

- Do Not Prorate - Enable to specify that fees are the same regardless of when a customer joins the organization.
- Standard Prorating - Enable to specify a global setting that prorates all products for the current year (depends on the billing interval). The following example relates to a billing interval of 12. If a customer joins during a term, iMIS reduces the initial fees based on a standard 12-month calculation. For example, if a customer joins in month 7 and the annual fees are $200, the calculated fees would be 6/12 of the total fees, or $100.
- Special Prorating - Enable to specify user-defined prorating rules according to the needs of your organization. This rule is a per product setting and must be defined and assigned

to individual products. Specify prorating rules on the Prorating window (from Billing, select Set up module > Products, and click Prorate Rules). See Defining Prorating Rules for detailed information.

Note: When a former member, who is still marked as active in the system, rejoins your organization, the rejoin is processed as a renewal and prorating does not apply. See Defining Prorating Rules for more detailed information about how prorating is applied to rejoins.

Balances

Maintain Prev Balance -If this option is enabled, iMIS maintains the previous balances on customers who have made a partial payment or no payment. Previous balances are usually maintained in conjunction with a low Standard Billing Interval. For example, if annual fees were $100 and the customer paid only $80, iMIS would retain a balance of $20. When the customer is billed next year, iMIS would add the previous balance of $20 to the customer's total balance.

Note: Note: The Maintain Prev Balance option applies only to cash-based dues. For accrual-based fees, previous fee balances can be viewed in the individual's AR window because accrual fees billings create invoice records. The PREVIOUS_ BALANCE field in the Subscriptions table will not be populated for an accrual fees billing even if the Maintain Prev Balance option has been checked.

Note: Note: The Maintain Prev Balance option must be enabled for a _CREDIT (user-defined credit) to display on a Renewal Notice.

Note: Note: This option does not apply to voluntary contributions (VOL).

Paid Thru Date Update

The options set in this section set the preference for when the Paid Thru date information is to be updated. The Paid Thru date for the cash accounting method is updated with payment in full.

- Update Complimentary Items at Payment Time - Enable to specify that the Paid Thru date for complimentary items (no charge products) be updated at payment time instead of billing time.
- Paid in Full - (This option displays when the Accrual accounting method is enabled.) Enable to specify that the Paid Thru date be updated when full payment of the associated line item is received.
- Billing Time - (This option displays when the Accrual accounting method is enabled.) Enable to specify that the Paid Thru date will be updated when the initial accrual fees billing is performed.

  AR Payment Application

  (This option displays when the Accrual accounting method is enabled.) Enable to sets the preference for distribution of partial payments across multiple-fee line items on the Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions> Cash receipts). This option allows the choice of whether a partial payment will be applied based on priority established at the product code level or evenly distributed across each fee-based product billed.
- Priority - (default) Enable to apply payments to each open line item in payment priority order until all open line items are paid. If no pay Priority has been set for the products defined on the Set up products window (from Billing, select Set up module > Products), partial payment will be applied to products in alphabetical order.
- Proportional - Enable to apply payments across all the open line items in direct proportion to each line's amount.

  Billing Contact

  Enter the iMIS ID for the person who would like to receive an email message each time someone makes a Billing-related purchase. The email messages is similar to the one the Event Contact receives for an Event purchase.

  To set up general billing options

1. From the Configure billing options window, click Edit.

2. Enter the Standard Billing Interval in months.
3. Select a Billing Time.
4. Select an appropriate Prorating option.

   Note: Prorating applies only when you want to bill on an annual or fixed-term basis, as opposed to an anniversary or rotating term basis. If billing is done for all products (for example, all fees and product billings) on an anniversary basis, you must enable the Do Not Prorate option.
5. Select an Accounting Method. If Accrual is selected, additional options display in the Paid Thru Date Update section and the AR Payment Application section displays. You must make selections in these areas.
6. (optional) Enable the Update Complimentary Items at Payment Time option if you want to advance the Paid Thru date of complimentary products at payment time instead of at billing time.
7. (optional) Select the Start Date Control options to advance the Bill Begin day by one month and create a new billing term.
8. Enable or disable the Cash Dues Over/Under Payments Create AR option.
9. Enable or disable the Maintain Prev. Balance option.
10. Click Save.

    Caution! If Annual is chosen as the Billing Time, be sure to open the AR/Cash Set up module window (from AR/Cash, select Set up module) and enter the calendar month (numeric) that represents either your fixed-term or fiscal year in the First Month of Fiscal Year (Number) field.

    Caution! If Special Prorating is selected, define the product codes as discussed previously and then see Defining Prorating Rules to establish the special prorating table rules.

Creating billing cycles

The final step for Billing setup is to define the necessary billing cycles. The steps for defining billing cycles include the following:

1. Create a new cycle name/edit a current cycle
2. Select whom to bill
3. Select what to bill
4. Define how to present the bill
5. Select how and when to bill

A billing cycle is another name for a billing run. Define a billing cycle to bill a particular group of people for a particular set of products. Two general groups of billing cycles can be set up:

Customers dues billing

A billing run used to collect dues for a given set of customers sorted by type, category, or both.

- The Add Member Type Items option on the Set up billing cycles window must be checked. Selecting this checkbox indicates the billing cycle is a dues product billing.
- The overall customer Paid Thru dates and Renewed Thru dates are used to determine who should be billed.
- The customer Join Date month is used to determine the customer term beginning date (anniversary date) for new customers.
- This billing run will automatically bill all items cross-referenced on the Set up customer types to all customers who are selected for billing. Do not select the same dues products that are listed on the Set up customer types window from the scrolling product list on the Set up billing cycles window.
- This billing run will bill only non-customer type products selected on the cycle if an active subscription record already exists for the customer. For example, Include all sections,

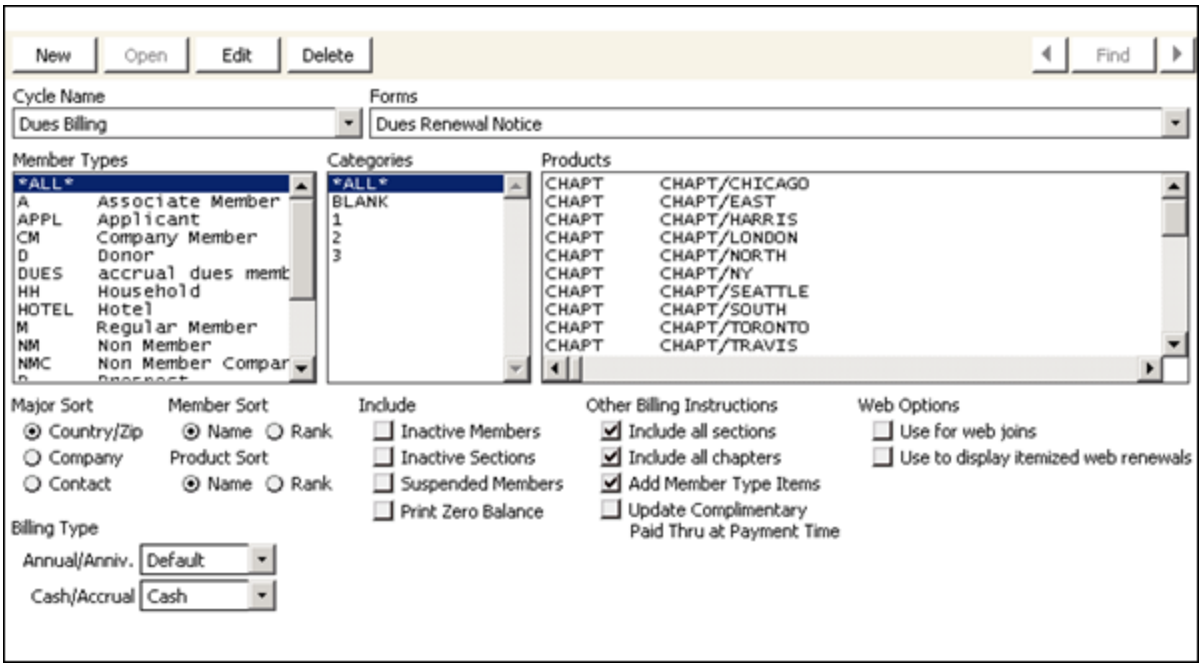
Include all chapters, and any items selected on the scrolling product list.

- All line items will bill uniformly for the same customer term (for example, beginning date and number of months) based on the value in the Renewal Months field on the Financial tab on the Manage customers window if nonzero, the value in the Renewal Months field on the Set up products window, or the overall system setup Standard Billing Interval setting.
- Can bill for all chapters and/or all sections.

  Non-dues billing

  A separate billing run used to collect payments for optional subscriptions for customers or non-customers.
- The Add Member Type Items option on the Set up billing cycles window must not be enabled (checked).
- Evaluates individual subscription line items' Paid Thru and Billed Thru dates in determining whom/what to bill.
- The Subscription Date Added is used to determine the subscription term beginning date for new subscribers.
- This billing run will bill only items chosen on the cycle if an active subscription record already exists for the subscriber. For example, Include all sections, Include all chapters, and any items selected on the scrolling product list.
- Each item's term (number of months) will be calculated independently based on the first nonzero setting of the individual's subscription Billing Period, the product Renewal Months, the subscriber Renew Months (Financial tab), and the overall system setup Standard Billing Interval.

Billing cycles window



Desktop: Billing > Set up module > Billing cycles

Cycle Name

Indicates the designated name for the group of records from which renewal notices will be generated. This name displays on the Process billing window with a list of available cycles.

Forms

Drop-down list of renewal notice formats

Member Types

A list of available customer types available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (selects range) while you select your selections. To bill all customer types, select *ALL* at the top of the scrolling list. For example, for a subscription cycle where the subscription can be purchased by any customer, select *ALL*.

Categories

A list of categories available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (sequential range) while you select your selections. To bill all categories of customers or subscribers, select *ALL* at the top of the scrolling list. If BLANK is selected, only customers or subscribers with a blank or empty category will be selected.

Products

A list of products available to include in the billing cycle. For multiple selections, hold down Ctrl or Shift (sequential range) while selecting other selections. Products selected in this list will be billed only if an active subscription line item already exists for the customer.

For dues product billing, only select products that are optional add-on items to the mandatory or regular dues products. The Add Member Type Items option must enabled. If the Add Member Type Items option is enabled, all products listed on the Set up customer types window for the customer types selected will be billed automatically during this billing cycle. These customer type-referenced products should not be selected on the scrolling list.

Shortcut - To select all chapters (CHAPT) and sections (SEC), enable the Include all sections and Include all chapters options located in the Other Billing Instructions section.

Major Sort

This option specifies the order in which the bills are sorted for printing. The choices include Country/Zip (postal code), Company (company sort), and Contact (individual's last name, first name).

Member Sort

This is used only for list bills (where the dues and/or subscription products for several individuals or branches are itemized on a single bill and sent to a single parent company or a third party). It establishes the order in which the individuals (Ship to) are listed on the list bill. You can sort by Name (last, first) or Rank (under development for a future release).

Product Sort

This option controls the order of the line items on the dues bill. Select Name (to sort alphabetically by product code) or Rank (to sort by the payment priority shown on the Set up products window).

Include

Specific options that are included in the billing cycle, when enabled.

- Inactive Members - Enable to bill customers whose status begins with I (inactive).
- Inactive Sections - Enable to force the billing of SEC-type subscription in which the subscription's status begins with I (inactive).
- Suspended Members -Enable to bill customers whose status begins with S (suspended).
- Print Zero Balance -Enable to print bills with zero balances. For example, if you enable this option, iMIS will generate a bill for a customer who receives a complimentary (zero dollar amount) membership. Not enabling this option causes iMIS to bypass all zero balance bills during the printing process.

  Note: This option applies only to bills with a total balance of zero. To suppress the printing of individual zero balance line items when the grand total is nonzero, see the SUPPRESS_ZERO_ITEMS print options.

Other Billing Instructions

Include all sections -Bills all active subscription records of the product type SEC for the customer types selected. If multiple sections exist, all sections will be included.

Include all chapters -Bills active subscription records of the type CHAPT for the customer types selected. If multiple chapters exist, all chapters will be included.

Add Member Type Items -Use for dues billing. This option bills customers for all product codes defined on the Set up customer types window. If this option is enabled, select only those items in the Products list not covered on the Set up customer types window or by the options Include All Sections and Include All Chapters.

> **Note:** Note: When Add Member Type Items is selected, new subscription records will be created only for items included on the Set up customer types window. All other products selected for the dues billing cycle will be billed only if an existing active subscription record already exists for that customer. The Add Member Type Items option must be enabled for dues billing and should not be enabled for non-dues product billing.

Update Complimentary Paid Thru at Payment Time - When enabled, allows the Paid Thru date for complimentary items (no charge products) for this billing cycle to be updated at payment time instead of billing time. During dues billing, iMIS checks the billing cycle to determine how to handle complimentary item Paid Thru dates.

Web Options

Use for web joins – This option determines whether the billing cycle can be used to allow new members to join on the Web. If this option is selected, the billing cycle is available to be used to join online.

Use to display itemized web renewals – If selected, each individual item in the renewal product is displayed. If not selected, you will see one product that contains the individual items.

> **Note:** Note: To avoid errors in displaying renewal invoices, do not select Add Member Type Items when Use to display itemized web renewals is selected.

> **Note:** Also, do not select *ALL* in the Member Types list. Select each member type individually to view itemized dues renewal options.

For accrual dues, only the most recent billing period's dues are represented in the Renew Now process. If a member has not paid dues for the last two years, then when they click Renew Now they are charged only for this year's dues. After paying this year's dues they will not see that they have a balance due. For cash dues, if the Maintain Prev. Balance

option has been enabled (go to Billing > Set up module > General options), and if a member has carried forward a balance, then the full amount due will be charged.

Note: Note: The Renew Now button will allow a user to modify the renewal invoice only if the following are all true:

--The user was billed using only cash dues. If any dues were billed on a real/accrual invoice, then there will not be a link in the cart entry for the renewal fees, and any adjustments must be performed by Staff users in the Desktop.

--The billed amount and the current balance are the same. If they are not, then the user can pay the full amount due through the web-based sites, but cannot make adjustments. This can happen if the dues item is partially paid, has been manually adjusted by Staff, or has a balance forward from a prior billing period.

--The Use to display itemized web renewals option is selected.

Note: Note: These Web Options apply to RiSE sites. These selections will not affect your Web View or Public View sites.

Note: Note: Make sure that are no dues products with a code that ends with _ CREDIT selected in the Products area of the billing cycle when selecting the Use to display itemized web renewals option.

Billing Type

Annual/Anniv - Drop-down list used to select when the billing cycle should be billed (Annual or Anniversary) or to retain the default setting. iMIS defaults to the setting specified on the Set up general options window. You may want to change the setting if you bill dues products annually and subscriptions by anniversary.

Cash/Accrual - Drop-down list used to select the accounting method of Cash or Accrual or to retain the default setting. iMIS defaults to the setting specified on the Set up general options window. You can select Cash or Accrual if the default accounting method on the

Set up general options window is set to Accrual. If you try to set the billing cycle accounting method to Accrual when the dues product accounting method system default is Cash, iMIS displays a message informing you that the accounting method system setup must be changed to Accrual.

Bills/Reminders

Opens the Billing and Reminder Notices window where you can specify when iMIS should send first and second reminder notices to the customers included in the billing run.

To create a new billing cycle

1. From the Set up billing cycles window, click New.
2. Enter the name of the billing cycle in the Cycle Name field.
3. Select whom to bill.

1. Select the customer types to bill from the Member Types column.
2. Select the Categories to include for this billing cycle.

4. Enable the Other Billing Instructions options, if any.
5. Enable Web Options, if any.

   Note: Web Options apply to RiSE sites. These selections will not affect your Web View or Public View sites.

6. Select the Products to be included in the bill. If you enable the Add Member Type Items option, do not select any customer type-referenced products from the scrolling list.
7. Define how to present the bill.

1. Select the drop-down Forms list to select the renewal notice format for this billing cycle.
2. Select the Major Sort option to be used to sort the order in which the bills are printed.
3. Select the Member Sort option to be used to order the individuals (Ship to) on the list bill.
4. Select the Product Sort option to be used to order the line items on the dues bill.
5. Enable the appropriate Include options, if any that also need to be billed.

8. Select the Annual/Anniv drop-down list, and select when the billing cycle should be billed (Annual or Anniversary) or retain the default setting. iMIS defaults to the setting specified on the Set up general options window.
9. Select the Cash/Accrual drop-down list and select the Cash or Accrual accounting method of or retain the default setting. iMIS defaults to the setting specified on the Set up general options window.
10. Click Save.

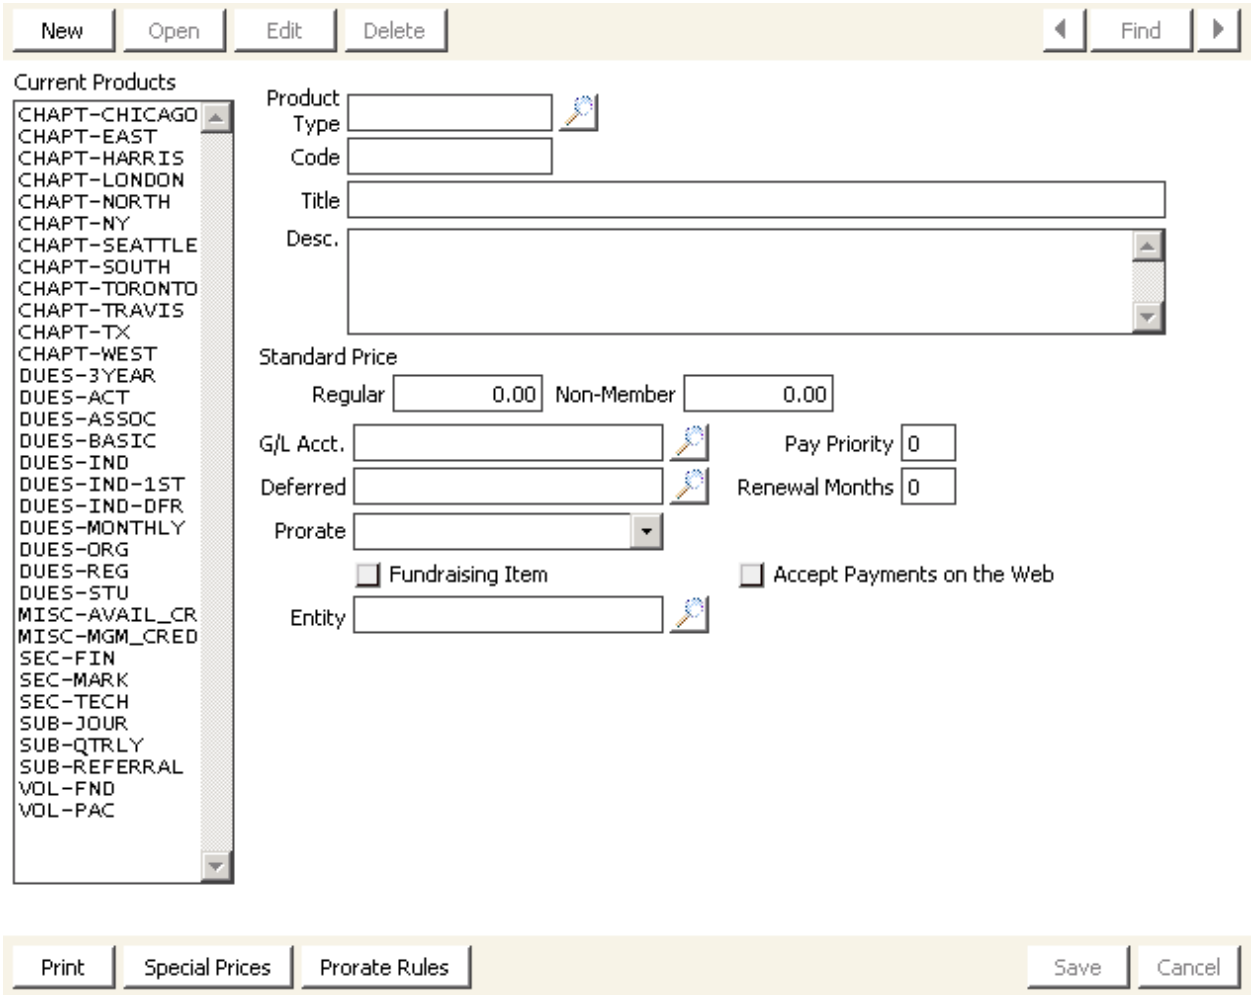
Defining product codes

The Set up products window is used to define or create product codes for products that will be billed or for which your organization collects money. The Set up products window defines product line items, default pricing, and entity and General Ledger account information.

Only products with defined product codes can be billed. One product code should be created for each potential dues or subscription-type product or service that will be billed. Unless General Ledger account numbers vary by Customer type, a single, primary membership dues product can be established.

Note: Note: To determine a price for a given product, iMIS first looks to see if a price is set on the Special Pricing window. If no price is set on the Special Pricing window, iMIS then checks the Set up customer types window. If no price is set or the Comp option is not enabled on the Set up customer types window, iMIS then looks on the Set up products window.

Set up billing products window



Desktop: Billing > Set up module > Products

Current Products

List of defined products.

Product Type

The product type is a system-maintained code that allows iMIS Billing to manage the relationships among files and other modules that are affected by billing.

- CHAPT - Separate dues for chapter or local groups - Use this code for separate chapter membership dues. Chapter products are created automatically when you insert entries on the Chapters window (from Customers, select Set up tables > Chapters) or when you

populate the Chapter field on the Status tab in the Manage customers window. To allow chapter billing, a dollar amount must be assigned to the chapter product, either at the product level or at the special pricing level. If CHAPT is entered in the Product Type field, CHAPT is automatically populated in the Code field and a chapter can be entered in the Chapter field, which displays next to the Code field.

- DUES - Regular membership dues - Use this code for all normal membership dues items. This code normally is used for standard non-optional dues line items that are cross-referenced on the Set up customer types window.
- MISC - Reserved for miscellaneous charges. Normally, special pricing rules dictate the conditions for charging for a miscellaneous item.
  For example, special pricing rules that are based on the Join Date.
- SEC - Sections and specialty groups - Use this code for optional add-on section memberships such as professional specialty groups. Generally, this type would not be put on the Set up customer types window because SEC normally represents groups that are joined only by request. After a customer has subscribed to this product type, iMIS enables you to automatically bill for initial billing and renewals through cycle definition rules.
- SUB - Magazine/journal subscriptions - Use this code for optional subscriptions such as journals and magazines. This product type would not be put on the Set up customer types window because SUB items are optional. After a customer has subscribed to this product type, iMIS enables you to automatically bill for initial billing and renewals through cycle definition rules.
- VOL - Voluntary contributions - Use this code for non-mandatory contributions such as PACs or foundations. VOL typically will be cross-referenced on the Set up customer types window; however, open items of this product type will not appear on Reminder Notices unless non-voluntary items within the same cycle still have open balances.

  Label Preference

  Displays when Use Product Label Preferences is enabled on the Customer Setup - Address and Notes window.

  Code

Specifies a key word that identifies the Product. The code entered should not contain any spaces or special characters other than an underscore (_), and should contain no more than 15 alphanumeric characters. This code is used in the Billing Codes field on the Set up customer types window. Select the lookup icon to search field values.

> **Note:** Note: Product codes that end in _Credit can bill and retain negative or credit balances. For example, the code AVAIL_CREDIT can be used to apply over-payments to offset next year's dues.

Title

Enter a descriptive title of the Product Type in this field. When a billing item is referenced on data entry screens and Renewals Notices, the title will appear next to, or in place of, the billing code.

Desc.

(optional) Enter a detailed description of the product in this field.

Standard Price

Enter the default price for customers and non-customers. Unless the billing interval is overridden in the Renewal Months field, the dollar amounts entered for the products should be in agreement with the Standard Billing Interval set on the Set up general options window. For example, the rate for a product is $120 per year. Enter the flat rate of $120 when the Standard Billing Interval is 12 (every 12 months or annual), $10 when the interval is 1 (once per month), and $240 when the interval is 24 (every 24 months or 2 years).

Different rates for customers and non-customers can be entered.

- Regular - Default standard customer pricing. An entry in the Set up customer types window will override the Standard Price, and an entry in Special Pricing will override both customer-type pricing and Standard Price.
- Non-Member - Default non-customer pricing if there is no entry in Special Pricing or in the Set up customer types window.

Note: Note: A dollar amount specified on the Set up customer types window will override the Standard Price for that particular customer type. Special pricing rules will override fee amounts defined on either the Set up customer types window or in the Standard Price section.

G/L Acct

Enter the general ledger account that will be credited when the payment is received or when the income is recognized. Select the lookup icon to search for values.

Pay Priority

Enter the order in which payments are applied to multiple billing product lines. This can be used to sort the line items during a product billing or on Renewal Notices. A lower number has a higher priority than a larger number. For example, a product with priority 1 will appear on the payment and renewal list before a product with a priority of 2.

Deferred

Enter the deferred income balance sheet account that should receive the credited amount. This option is available only when the system is licensed for the add-on Deferred Income module. A deferred income account should be entered if your system is licensed for the Deferred Income module and the income for this product type should be deferred and recognized during the customer or product term. Select the lookup icon to search for values.

Renewal Months

(optional) Indicates the number of months that the dues product type will be renewed for when payment is received. This number will override the Standard Billing Interval set on the Set up general options window if the product is being billed on a non-dues cycle. The product's Standard Billing Interval will be used only for pricing determination on the dues billing cycle.

For example, an individual purchases a journal subscription as of 9/1/2001. The journal is set as a product with a rate of $45 for both customers and non-customers, with Renewal

Months set at 60 months (five years). On a non-dues billing cycle, the journal line item will be billed for $45 with a Paid Thru date of 8/31/2006.

Accept Payments on the Web

(optional) Enable this option if you want line items billed for this product using the Cash accounting method to appear in the Public view under Contacts > Contact Management > Billing. See Billing setup for Public view for more information.

Prorate

Use this drop-down list to identify the Special Proration table for this specific product. These rules were defined through the Special Pricing window (see Defining Prorating Rules). This feature allows reduced rates for new customers who join after the annual customer term.

> **Note:** Caution! Do not select a prorating rule if the Do Not Prorate or the Standard Prorating option is selected on the Set up general options window (see Defining general setup options).

Entity/Fund

(optional) Specifies the financial entity to which income from this product is assigned. When the product is a standard product, the field is labeled Entity and the lookup list contains all org codes defined on the system. When the product is a fundraising product, the field is named Fund and the lookup list contains only those org codes that are defined as funds.

Fundraising Item

When selected, designates a fundraising product. Checking this box activates the Appeal, Campaign, and Fair Market Value fields and changes the Entity field to the Fund field.

Appeal

(Fundraising products only) Specifies the Fundraising appeal (if any) to which this product is tied.

Campaign

(Fundraising products only) Specifies the Fun Raising campaign (if any) to which this product is tied.

Fair Market Value

The fair market value, for tax purposes, of a fundraising product.

Subscription Info

(Displays only if you have the Advanced Subscription module installed and the product code is SUB). Opens the Publication Information window where you can enter Zone Table and Postal Sort information.

Special Prices

Opens the Special Pricing window where you can define pricing rules for products. See Defining Special Pricing for more details.

Prorate Rules

Opens the Prorating window where you can specify an amount to an activity or product that is proportional to some base.

To define a new product code

1. From the Set up billing products window, click New.
2. Enter a Product Type.
3. Enter a Code that identifies the product.
4. Enter a descriptive Title for the billing product. This title will display on the customer's bill and on other windows.
5. (optional) Enter a detailed description in the Description field.

6. (optional) Set the Standard Price information. As a rule of thumb, if the product will be cross-referenced to a customer type through the Set up customer types window, do not enter an amount in the Standard Price area.

1. Enter the default standard customer pricing, if any, in the Regular field.
2. Enter the default non-customer pricing, if any, in the Non-Member field. Even if the same rate for customers applies to non-customers, enter the rate again in the Non-Member price field.
3. Enter the G/L Acct number. (Required for iMIS G/L interface users)
4. (optional) Enter the Deferred account number. This field is available only when iMIS is licensed for the Deferred Income module.
5. (optional) Select the appropriate prorating rule. See Defining Prorating Rules.

   Caution! Do not select a prorating rule if the Do Not Prorate option or the Standard Prorating option is selected on the Set up general options window (see General options window).

10. (optional) Select the Fundraising Item checkbox if the product is a fundraising product. When the Fundraising Item checkbox is selected, the Fair Market Value, Appeal, and Campaign fields are activated, and the Entity field is changed to the Fund field.
11. (optional) Choose the financial Entity or Fund.
12. (optional) For fundraising products, enter fundraising information (Appeal, Campaign, and Fair Market Value).
13. (optional) Enter the Pay Priority.
14. Enter the Renewal Months if you want to override the Standard Billing Interval set on the Set up general options window.
15. Click Save.

    Note: Chapter product codes are usually added on the Chapters window (from Customers, select Set up tables > Chapters). Pricing for CHAPT type products can be set on

the Set up products window.

Note: If a product code will be linked to a customer types, the pricing for the product code should be set in the Dues Billing section on the Set up customer types window or on the Special Pricing window. Do not set the pricing for a mandatory product item on the Set up products window.

Defining the AVAIL_CREDIT product code

Open credits can be applied to future dues billing amounts. In this case, the credit is retained in the Billing system and is used to automatically offset overpayments against newly billed items on the next renewal billing. The overpayment will only be used against the main dues product (the product that is listed first on the Set up customer types window).

This automatic offset method can be used only in conjunction with a dues product billing cycle. To do this, a product code of AVAIL_CREDIT must be defined on the Set up product codes window.

> **Note:** Note: Any residual credit balance in AVAIL_CREDIT is offset against billing amounts billed automatically during the next dues renewal billing for the customer. Also, the appropriate accounting entry is created to debit (reduce) the AVAIL_CREDIT GL account and credit (increase) the GL account for the offset dues line items (for example, deferred or unrecognized income).

> **Note:** Note: The AVAIL_CREDIT feature is currently not supported by accrual dues cycles. All accrual dues cycles will operate as if the Don't Apply Credits option on the Process billing window is enabled.

Use the following steps to add the AVAIL_CREDIT product code:

1. From Billing, select Set up module > Products. The Set up products window opens with a list of products displayed in the Current Products column.

2. Click New.
3. Enter a Product Type or select the lookup icon to select a value.
4. Enter AVAIL_CREDIT in the Product Code field.
5. Enter a descriptive Title for the billing product. This title will display on the customer's bill and on other windows.
6. (optional) Enter a detailed description in the Description field.
7. (Required for G/L interface) Enter the G/L Acct number of the account that will hold the credit until it is applied.

   Caution! Do not enter the account number of the account that will hold the credit in the Deferred Account field.
8. Click Save.

Configuring VAT or GST for dues products

You can collect Value Added Tax or Goods and Services Tax as an additional product when billing dues.

> **Note:** Note: Pricing can be defined at the dues product level or, if it is a mandatory dues product, at the customer type level.

> **Note:** To determine a price for a given product, iMIS first looks to see if a price is set on the Special Pricing window. If no price is set on the Special Pricing window, iMIS then checks the Set up customer types window. If no price is set or the Comp option is not enabled on the Set up customer types window, iMIS then looks on the Set up products window.

1. Create a Dues product for only the dues portion, such as $60.00 CAD.
2. Create a second Dues product that represents the tax portion of a total amount for dues. For example, if the main Dues product is $60.00 CAD, the second Dues product

representing a 10% Goods and Services Tax should be a $6.00 CAD amount.

3. Depending on the way pricing is defined for you, set up the Special Pricing or the products in Customer Types.
4. Create a billing cycle that includes both Dues products.

Testing the setup

The best method for testing a Billing setup is to bill and rebill a single customer several times while changing any billing-related data between each iteration until each billing scenario has been tested satisfactorily. Ideally, run the test on a test system or, if a test system is not available, insert a single (temporary) customer record to use for testing purposes.

Testing the billing data generation and Renewal/Reminder Notice printing is outlined separately in the following sections.

To test the billing data generation

To test the billing data generation, use a new customer and follow these steps:

1. Make sure the test record has a customer type and category, if necessary. This is included in the specifications for the test billing cycle.

- If you are testing a non-dues product billing subscription cycle, or if you are testing the billing of optional line items on a dues billing cycle (for example, items not linked on the Customer types window), add the line item(s) on the Billing tab. See Running individual dues billing.
- Generate the initial billing data. See Running individual dues billing. (optional) Do not select any of the printing options for subsequent testing of the Reminder Notices.

2. Review the billing data in detail, verifying that the:

- Billing data was generated for all the line items that should have been billed;
- Amounts billed were correct for this particular record's scenario; and
- Billing term was accurate.

Note: You can review the data by looking directly at the line item results on the Current view of the Billing tab. However, to check the billing term, you must double-click each line item to view the Dues/Subscription Item Detail window. The billing term is represented by the Period and Thru dates maintained in the Last Billed section.

3. If the billing data was generated incorrectly, investigate the problem and correct the setup area. Rebill after making the setup correction.
4. To test the next billing section, change one data element that would impact the generation of the billing data, for example:

- Customer type
- Billing category
- User-defined field related to special pricing formula
- Join Date for term testing (prorated term and amount, if annual billing)
- Renew Months on the Financial tab for shortened or extended term and amount testing
- Regenerate the billing data using the "Rebill" procedures as outlined in "Rebilling to Correct an Individual Dues Billing". Leave all Printing Options unselected for subsequent renewal notice testing. If a customer type has been changed and the new customer type has different product code(s) linked to its Customer types window, follow the procedures in "To process and rebill customer type changes".

5. Verify the accuracy of the output. Repeat until all possibilities have been tested successfully. For certain special pricing formulas, it may be impossible to test all possibilities, but you should spot check enough variations to ensure that the formula is calculating accurately.

To test the Reminder Notice printing

The Reminder Notice printing can be tested using the same customer record that was used to test the billing data generation:

1. Make sure the report destination (select Files> Report Destination) is set to the printer (not to screen) to be used to print the notices during a live run. To avoid layout and text

placement distortions, never test the renewal notice by first printing it to the screen and then printing the screen output to the printer.

- Print the Initial Bill. As a guideline, see Running individual dues billing. If billing data already exists as a result of testing the generation of the billing data, leave all Billing Options unselected.

2. To experiment with a different format choice, select a different format from the Forms drop-down list on the Set up billing cycles window. If there is a problem with the text or the placement of the overlay text, edit the Report Specs parameters text. If a change is made in either of these areas or in the Billing and Reminder Title or the notice-specific text area, repeat to check the output.
3. Repeat, testing the First and Second Reminder Notices.

To test Dues billing Renewal Notices

1. Find a customer with one or more line items and a non-zero balance.
2. Select the Billing tab on the Manage customers window.
3. Click Create Invoice. The Dues Billing Selections window opens.
4. Select the Billing Cycle.
5. Select Initial Bill from the Print Options.
6. The Renewed Thru date on the Financial tab must equal the Name.PAID_THRU date on the Manage customers window.

Use the following examples to verify that the Renewed Thru date shown is correct.

Paid Thru	12/31/2001	12/31/2001	12/31/2002
Renewed Thru	12/31/2001	12/31/2002	12/31/2002

Note: Note: Accrual dates give other payment recognition options.

Billing Accounting

Billing system accounting rules

You can set up your billing accounting rules for cash basis or accrual basis. In addition, you can set up multiple entities.

Cash basis operations

Billing generates and updates open subscription records only. These records function as memo AR entries, with absolutely no accounting effect.

The Payment module performs the following activities:

- Updates accumulated payment amount, balance, and expiration or Paid Thru Date on an existing subscription file record. If no billing or payment activity has been recorded for the customer/billing item, a new subscription record is generated.
- Generates multiple-line Trans records, debiting cash and crediting appropriate income entries for all dues line items paid.
- If the appropriate system setup option is enabled, generates a transaction entry to AR and a corresponding Invoice table record for overpayments and, in some cases, under-payments. This occurs in conjunction with the credit invoices/refund function in iMIS.
- Generates activity records for each paid dues item.

Accrual basis operations

The following billing activities take place for payments made using the accrual accounting method:

- Billing generates paid-in-full subscription records and turns all further control and tracking over to the AR/Cash System.
- Each bill generates a multiple-line Trans table record debiting AR and crediting the appropriate income accounts for all billing line items.
- Each bill generates one open invoice record. This item appears with all other invoice

items on standard AR system inquiries and reports (For example, trial balance, AR statements and AR account inquiry).

Payments

Payments are processed through the normal Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions > Cash receipts) instead of the standard Process billing window (from Billing, select Process billing). For more information on the entries generated and the tables updated, see Entering Direct Transactions.

Using multiple entities

You can choose to use more than one financial entity with the Billing module. Multiple entity processing is necessary when you keep more than one set of financial books.

Multiple entity processing is set up through the AR Cash module, but the association of specific Billing products with entities is accomplished using the Billing module.

You can combine products whose income is assigned to different entities within the same billing cycle. This can be used to keep the income of subsidiaries separate, or to keep fundraising and non-fundraising income separate while sending only a single bill to your customers.

Cash dues payments with multi-entity enabled

When a cash dues payment is made, the income for the payment is recorded using the following hierarchy:

- the product entity is used if defined, otherwise,
- the Billing module default entity (set up in AR/Cash) is used if populated, otherwise,
- the iMIS system default entity is used.

If the product is a Fund Raising item, a Gift activity is generated for each payment applied to a dues product.

Accrual dues with multi-entity enabled

The income for accrual dues items is recorded using the following hierarchy:

- the designated entity for that product is used if defined, otherwise,
- the Dues default entity is used if defined, otherwise,
- the system default entity is used.

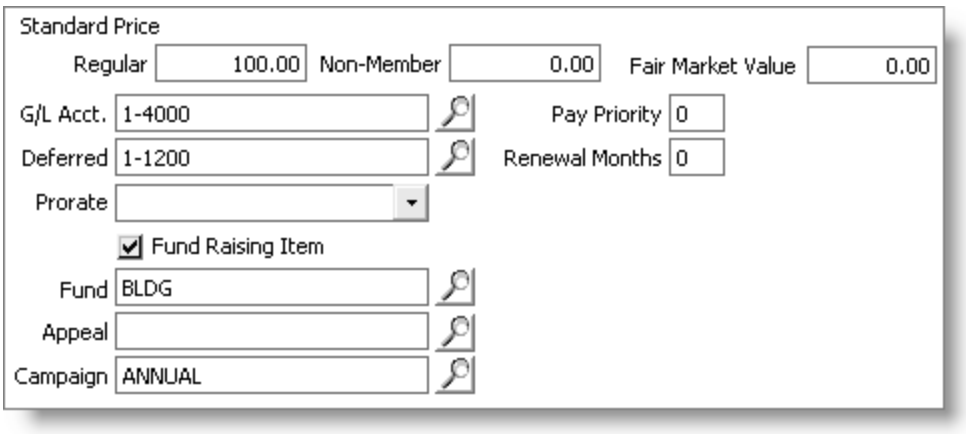
A Pledge activity is created for each separate dues Fundraising product when accrual dues are billed.

Fundraising Dues Items

Dues products can be flagged as Fundraising items. When a payment is made for a cash dues fundraising product, Fundraising data is recorded, Fundraising reports and summaries reflect the payment, and the appropriate level of Donor Club is awarded to the donor.

Dues Fundraising product set up

If you are licensed for Fundraising, you can flag a dues product as a Fundraising Item and can designate the Fair Market Value, Appeal, and Campaign for the item. If you have multi-entity enabled, you can also designate the Fund for the product.



From Billing, select Set up module > Products > New

Note: Note: When multi-entity is enabled and Fundraising Item is checked, the Fund field lookup is populated with Org Codes whose type is Fund. When multi-

entity is enabled and Fundraising Item is cleared (not checked) the Entity field lookup is populated with all Org Codes.

Billing accrual dues with Fundraising items

When accrual dues are billed, Fundraising items are marked as such on reports and invoices.

A Pledge activity is created for each separate dues Fundraising product when accrual dues are billed.

Dues payments

On the Dues payment window, Cash receipt window, and Service Central payment windows, iMIS flags payments made on Fundraising items. A "Gift" Activity is generated for each payment applied to a dues product.

Note: Note:

Credit or Debit Memos applied to Dues Fundraising products are flagged as Fundraising and use the same entities as the dues products they apply to.

Note: Whether on a cash or accrual basis, when a company pays dues for an individual, the individual is considered the donor.

Note: Dues Fundraising products count towards Donor Club membership.

Dues Fundraising items in Customer Portfolio Fundraising history

Accrual dues donations are considered Pledges; cash dues donations are considered Gifts. Dues donations are reflected in the Fundraising Summary in the following locations:

- Summary - Dues transactions are grouped by Trans number and donor ID.
- Donor History - A gift or pledge for multiple donations with different target funds, campaigns, or products is shown as "split" in the Fund, Campaign, or Distribution columns.
- Donor History Detail - Appeal and Campaign are listed at the product level. There are adjustments and payments sections for accrual dues transactions. The payments section for dues pledges shows the pledge, and the pledge amount and balance with pledge payments listed on separate lines below the pledge. There is also a payments section for cash dues, but there is no adjustments section.
- Donor Recognition - shows all of the donor clubs the donor has qualified for, including those qualified for with Dues Fundraising products.

  Fields supporting fundraising on the Customer Portfolio Billing tab and on the Subscriptions window

  The Billing tab in the history section of the Customer Portfolio has the FR Item field, to indicate which items are Fundraising items.

  The Dues/Subscription Item Detail window includes Appeal, Campaign, and Fair Market Value read-only fields for Fundraising products and displays a note at the bottom of the screen designating the product as a Fundraising product.

  Source Codes and Appeal Codes for dues payments

  If there is an Appeal Code defined for a Dues Fundraising product, that Appeal Code will be used for all payments for that product. In the absence of a product-specific Appeal Code, if a Source Code is entered during a payment, that Source Code will be used as the Appeal Code for that payment.

  Gift Portfolio

  If a donor has made prior donations through the Gift Portfolio, the giving summary in the Enter and edit gifts window includes Dues Gifts and Pledges and uses the Total Value options chosen in Fundraising > Set up module.

  *Tab on cash dues payments

The *Tab feature can be used to apply open credit invoices to Gifts (Cash Dues).

Billing Payment Importer

The Billing Payment Importer supports Dues Fundraising products by:

- Flagging them as Fundraising items
- Recording the necessary appeal, campaign, and fund
- Creating a GIFT activity for cash dues
- Awarding Donor Club membership

Import Utility

The Import Utility supports Dues Fundraising products by:

- Flagging them as Fundraising items
- Recording the necessary appeal, campaign, and fund
- Creating a GIFT activity for cash dues
- Awarding Donor Club membership
- Associated subscription lines also store the appeal, campaign, and fund of the product

Billing Table Maintenance

Table maintenance uses the Dues product table to define billing line items, establish default pricing, and establish general ledger accounts. The Customer types window is then used to create customer types, specify product line items that apply to each type, and specify pricing.

Setting up customer types

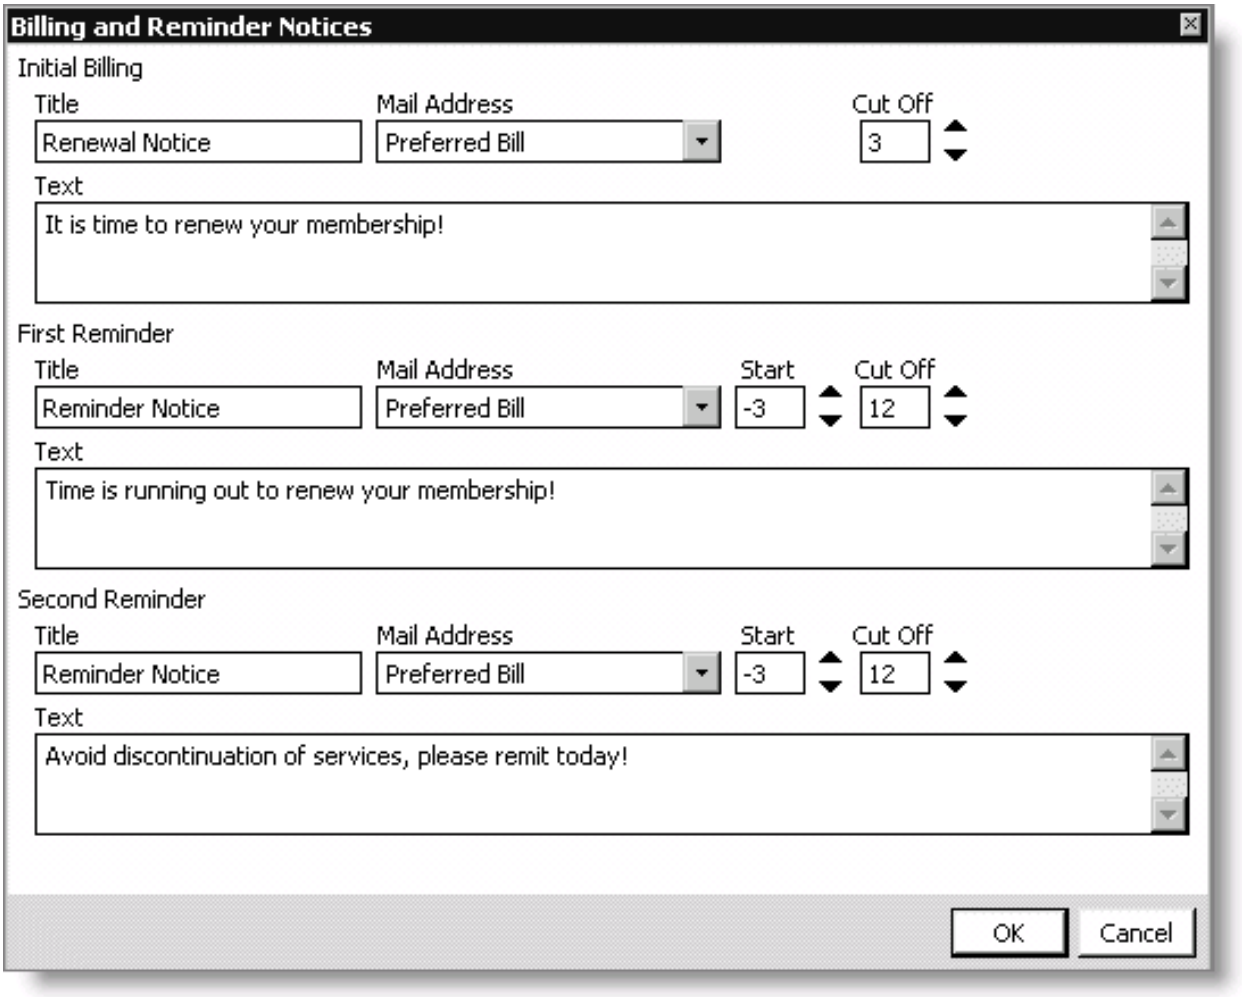
The Customer types window is used to cross-reference mandatory billing product codes with customer types. This information is necessary for generating billing data. See Customer types window.

Setting the billing and reminder notices

The Bills/Reminders button is used to specify when iMIS should send first and second reminder notices to the customers included in the billing run.

Billing and Reminder Notices window

On the Billing and Reminder Notices window, you can enter a title to display at the top of the Billing and Reminder Notice, add overlay text, select a different mail address, and set the default initial and reminder date parameters for each Reminder Notice.



From Billing, select Set up module > Billing cycles, select a Cycle Name, and click Bills/Reminders

Initial Billing, First Reminder, and Second Reminder

Title - Specifies the title to appear on the renewal or reminder notice. For example, Initial Billing, First Reminder, and Second Reminder. You can specify a title for the following renewal notice formats only: Dues Renewal Notice with Reminder Text, Dues Renewal Notice List Bill, and Dues Renewal Notice - No Remittance Stub

Mail Address - Drop-down list for selecting an address option. Options include Preferred Mail, Preferred Bill, or one of the three address purposes defined on the Customer Setup - Address and Notes window (from Customers, select Set up module > General, and click Address and Notes).

Text - Customized text to be added to the billing notice. (Up to 255 alphanumeric characters can be entered.) For most renewal notice formats, the text entered overlays or prints on the preset renewal notice elements. Therefore, add hard returns (press Enter) to shift text down the page far enough to avoid the preset report elements on the form. Full overlay text for all renewal notice formats can be set on the Detail Report Parameters window (select Utilities> Report Specs, and click Parameters).

Examples of notice-specific text:

- Initial Billing - “It is time to renew your membership!”
- First Reminder - “Time is running out to renew your membership!”
- Second Reminder - “Avoid a discontinuation of services, please remit today!”

Note: This feature is available on the following renewal notice formats only: Dues Renewal Notice with Reminder Text, Dues Renewal Notice List Bill, Dues Renewal Notice - No Remittance Stub, Std. Form ASI-018 DBL Column List Bill, Std. Form ASI-019 Dbl Column List Bill, Std. Form ASI-020-Full Page List Bill, and Std. Form ASI-021-Full Page List Bill.

Initial Billing - Cut Off

Use this option to set the default number of months for calculating the billing Effective Date for anniversary billing cycles. For example, if you typically send out your initial billing three months before the renewal or Paid Thru date expires, set the first Cut Off field to 3

on the Initial Billing. If your current run date is 7/25/2001, iMIS will set the default Effective Date to 10/01/2001 for the initial billing, and will bill all customers whose Paid Thru date expires before that date and who have not been billed previously.

On an annual cycle, the Effective Date should always coincide with the first day of the fixed term. iMIS will calculate the Effective Date based upon the First Month of Fiscal Year set on the AR Cash
Set up module window (from AR/Cash, select Set up module). The default always assumes the billing applies to the current fiscal or fixed year. Override the year when you run next year's renewal cycle in advance.

> **Note:** Note: The default Effective Date can be overridden as needed at dues product billing time. If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

First & Second Reminder Start and Cut Off

Use this option to set the Start and Cut Off parameters used to calculate a date range for selecting outstanding billings. The date range, which should include the outstanding bill's original date or Run Date, is determined by subtracting the number of months set in the Start and Cut Off month field from the run date.

For example, if first reminders are typically sent one month after the Initial Billing, specify -2 for the Start field and -1 for the corresponding Cut Off field. In the following example, the current run date is 7/25/2001. iMIS will set a default begin and end date range and print First Reminder renewal notices for those customers whose initial billing was run between 5/01/2001 and 6/01/2001 inclusive and who are currently not paid.

If you want to remind your customers more than twice, set up an additional billing cycle for printing Reminder Notices 3, 4, and so forth to make processing your additional Reminder Notices easier. When you use the Third, Fourth, and Fifth Reminder Notices from a second billing cycle, iMIS will automatically calculate the reminder start and end dates based on the Start Month set up on the Billing and Reminder Notices window. After

the initial bill is printed, the Subscriptions.REMINDER_COUNT field changes from 0 to 1. After the first Reminder Notices is printed, it changes to 2 and will stay at 2 even after you run a 3rd, 4th, or 5th Reminder Notice.

To set the billing and Reminder Notices

1. From Billing, select Set up module > Billing cycles. The Set up billing cycles window opens.
2. Select a Cycle Name.
3. Click Edit.
4. Click Bills/Reminders to open the Billing and Reminder Notices window.
5. Enter the Title information.
6. Select the Mail Address.
7. Enter the customized Text to be added to the billing notice.
8. Select the Initial Billing Cut Off month.
9. Select the First and Second Reminder Start and Cut Off months.
10. Click Save.

Defining special pricing

Pricing can be defined at the dues product level or, if it is a mandatory dues product, at the customer type level.

> **Note:** Caution! To determine a price for a given product, iMIS looks on the Special Pricing window. If no price is set on the Special Pricing window, iMIS checks the Set up customer types window. If no price is set or if the Comp option is not enabled, iMIS looks on the Set up products window.

Use special pricing dues calculations for the following:

- To base billing on customer types that are subdivided into billing categories
- To calculate billing based on data in your demographic fields
- To enter product rates individually because there is no pattern to the rates

Sometimes, pricing for products cannot be represented by simple flat rates at either the default standard customer/non-customer pricing level or by flat rates at the customer type level. If flat rates do not apply at either of these two levels, use the Special Pricing window to define pricing rules.

Special pricing situations may include the following:

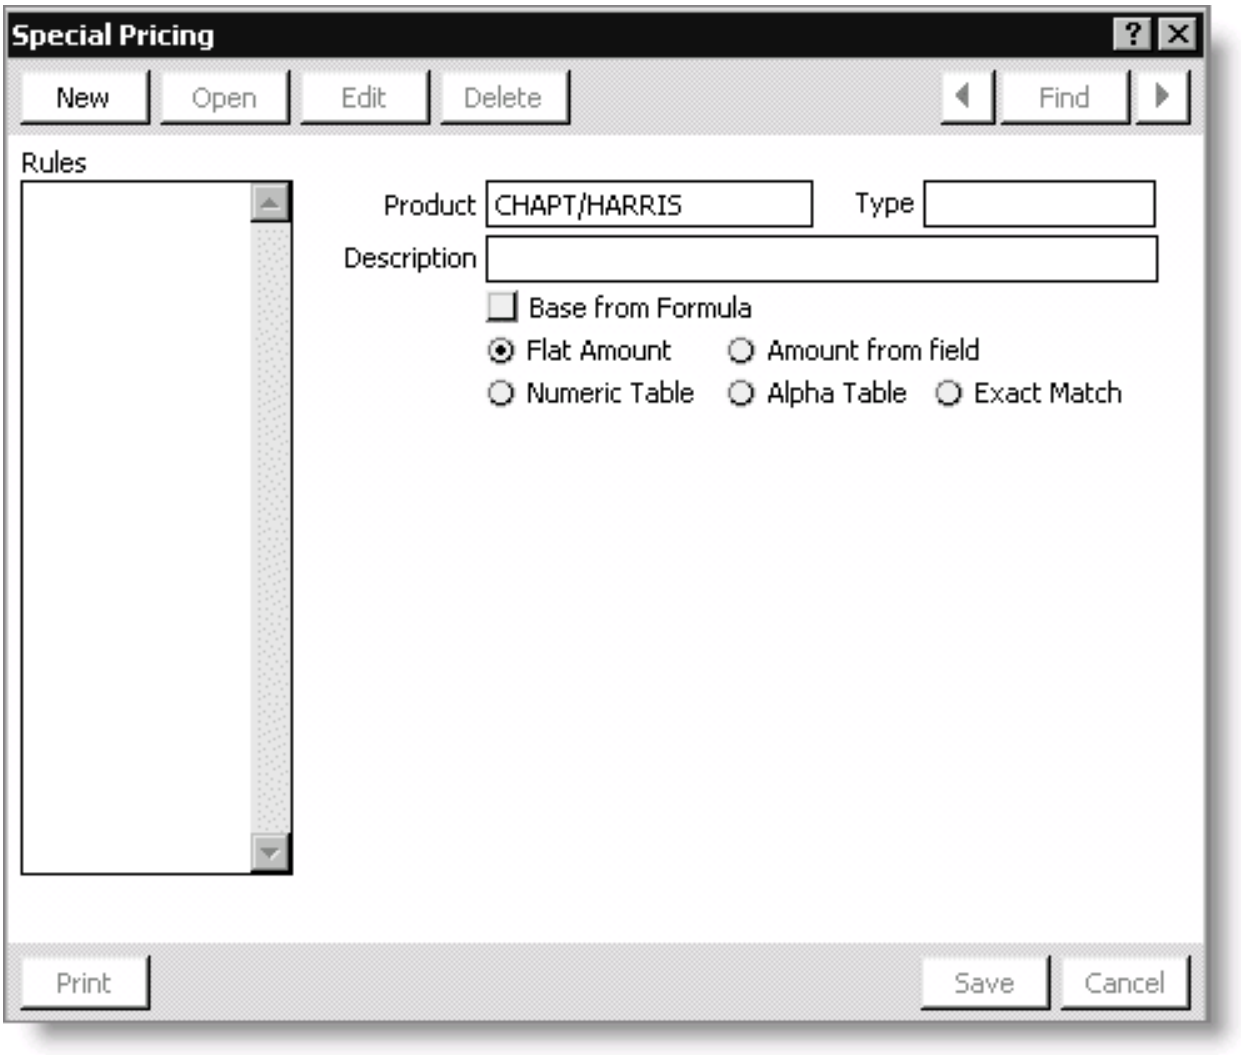
- Calculation of sliding scale rates
- Calculation using minimums and maximums
- Calculations of categories
- Calculations of customized data
- Calculations using yes and no
- Calculations of certification length

Special pricing rules for dues products:

- Keep it simple
- Use SQL syntax
- Use the Name_All view (not table names).

Note: The Name_All view is a combination of multiple Name-related tables. The Name_All view is required for all special pricing other than flat rates. Use Name_All as a prefix for all iMIS source fields instead of the actual file name. See Creating the Name_All View.

Special Pricing window for Billing



From Billing, select Set up module > Products, make a selection from the list of Current Products, and click Special Prices

Rules

A list of defined special pricing rules.

Product

Displays the product type that was selected on the Set up products window.

Type

Specifies the customer type or the customer type/optional category combination (customer type and category codes are separated by a forward (/) slash.)

To define special prices for a predefined category, open the Set up general look-up/validation window to check for the correct category. To create a new category, see Setting Up Customer Type Categories for Special Pricing.

Description

Enter a detailed description of the billing rule for the specified customer type. This field is for reference only and is not displayed on any bill or report.

Base from Formula

Enable when a formula is to be added to the base amount. This option is available only when the Numeric Table, Alpha Table, or Exact Match option is enabled.

Flat Amount

Use this setting for assigning customer type fees that vary by billing category or rates for non-customer type products whose fees vary by customer type. If you select this option, enter a Base Amount value.

Amount from field

Use this setting to reference an exact rate or to enter a formula that calculates a rate based upon a field. If you select this option, enter
a user-defined field in the Source Field. For example, Name_All.ACTIVITY_FEE, or an SQL calculation that references such fields.

Numeric Table

Use this setting to vary rates according to numeric values. You can establish sliding rates based on income/volume, or rates based on length of certification. This option supports a maximum of 20 rows and prompts you to enter numeric values (units/code) and rates (base amount) that serve as starting levels for applying pricing guidelines. An optional additional per-unit charge can be entered in the Amt/Add'l Unit field.

Alpha Table

This field prompts you to complete a table of alphanumeric values. Like the Numeric Table option, this option looks for a range rather than an exact match. Use this setting to create sliding rates based on values matched to alphanumeric or character fields.

Exact Match

Use this field to restrict a character field to an exact match. Enter a setting to create exact rates based on values exactly matched to character fields.

Source Field

Specifies a user-defined field that references the value entered in the Amount from field field. This option is available only when the Amount from field, Numeric Table, Alpha Table, or Exact Match option is enabled.

Units/Code

Specifies the numeric values that serve as starting levels for applying pricing guidelines. This option is available only when the Numeric Table, Alpha Table, or Exact Match option is enabled.

Base Amount

Specifies a rate that serve as a starting level for applying pricing guidelines. This option is available only when the Flat Amount, Numeric Table, Alpha Table, or Exact Match option is enabled.

Amt/Add'l Unit

Specifies an optional additional per-unit charge. This option is available only when the Numeric Table option is enabled.

Setting up customer type categories for special pricing

Customer type categories are used with special pricing. For example, create a billing category of 1 for customers living in Texas and a billing category of 2 for customers living in California. Then go to special pricing and set up special rates for customers who have a customer type of M, a billing category of 1, and who live in Dallas.

To define special pricing

1. From Billing, select Set up module > Products to open the Set up products window.
2. Select a value from the Current Products list to which special pricing will apply (for example, DUES-BASIC).
3. Click Special Prices to open the Special Pricing window. The product code selected from the Set up products window automatically displays in the Product field on the Special Pricing window.
4. Click New. The Base Amount field displays.

   Note: To modify an existing rule, select the rule and click Edit.
5. Define a special pricing rule by entering the Type, Description, and Base Amount. Other options may also be selected such as Flat Amount, Exact Match, and so forth. For more information on defining the options, see Special Pricing Examples.

   Note: Some pricing rules require a basic understanding of SQL and user-defined fields. See a SQL manual for information about entering SQL commands. Also, see Creating the Name_All View.
6. Click Save.

   To create a new billing category

1. From Customers, select Set up module > General to open the Set up general options window.
2. Click Basic Options to open the Customers Setup - Basic Options window.
3. Click Edit.
4. Enable the Use Bill Categories option.
5. Click Save.
6. From Customers, select Set up tables > General lookup/validation to open the Set up general lookup/validation window.
7. Select CATEGORY from the tables drop-down list.

8. Click New.
9. Enter the billing Code. The CODE field must be 5 characters or less; otherwise, it will not display in the Category drop-down list under Customers.
10. Enter a Description that will help identify the billing code.
11. Click Save.

Creating the Name_All view

The Name_All view is a pseudo table, or concatenation, of multiple Name-related tables. It contains fields from all joined files, as well as all related rows from all joined files. An ID that does not have a row in all joined tables will not appear in the view.

The Name_All view automatically includes data from the Name and Name_Fin tables. It is required for all special pricing and should be used as a prefix for all iMIS source fields instead of the actual file name. (See Defining Special Pricing.) Any custom demographic table can be selected for inclusion in the view.

To create a Name_All view

1. Determine the fields necessary for special pricing. If some of your special pricing fields come from a user-defined custom table:

1. From Customers, select Set up module > General to open the Set up general options window.
2. Click Additional Windows to open the Customer Setup - Additional Windows window.
3. Click Define Tables to open the User Defined Tables window.
4. Enable the Always Create and Use for Dues Pricing options for each table that includes a special pricing field. When these options are enabled, the Name_All view is automatically created after you click Save.
5. Click Save.

   Note: You must be logged in as the database owner to perform this operation.

2. Make sure a record exists for all IDs that will be billed at a special price.

Note: If customer records were converted, or the Always Create option was activated before operations were live, you may need to generate the required missing user-defined records before you create the Name_All view. You can use a simple SQL script to do this.

1. To enter the SQL script, select Utilities> SQL Query. The SQL Query window opens.
2. Click New.
3. Enter the script in the SQL Command Text area.
   insert into Name_Demo(ID)
   select ID from Name where not exists
   (select Name_Demo.ID from Name_Demo where Name_Demo.ID = Name.ID)
4. Click Execute.

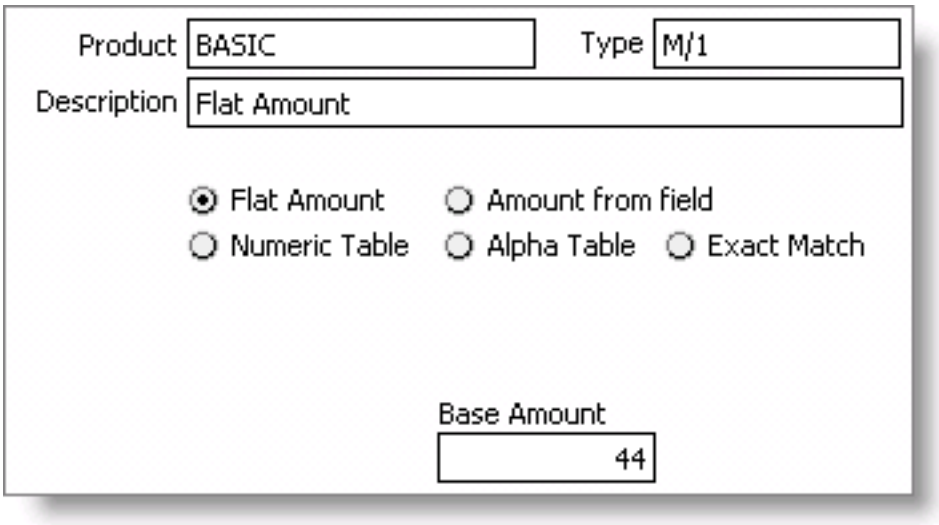
   Note: You can add additional conditions such as customer type qualifications. Keep in mind that if you use a user-defined table in the Name_All view, the user-defined table must exist for every customer that is of a customer type being referenced in a special pricing formula.

Special pricing examples

The Special Pricing window gives you the flexibility to set the pricing for products in many different ways. This section provides specific examples of special pricing.

Flat amount price

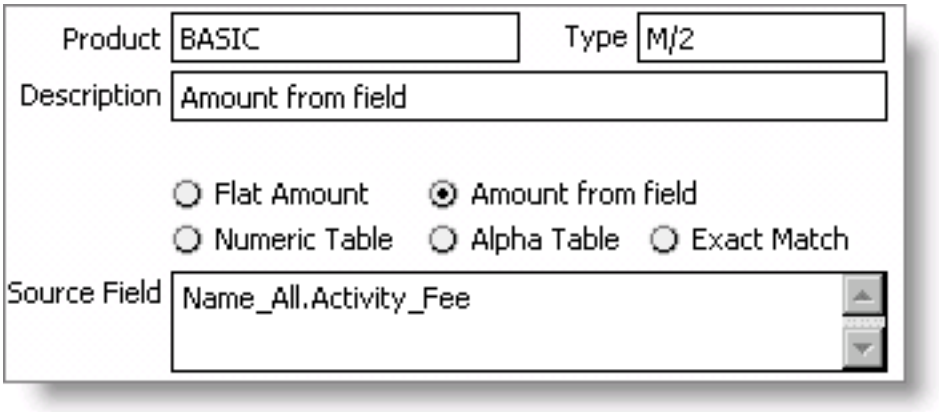
In this example, a flat rate is billed to customers who have a Customer type of M and a billing category of 1.



Special Pricing window with Flat Amount selected

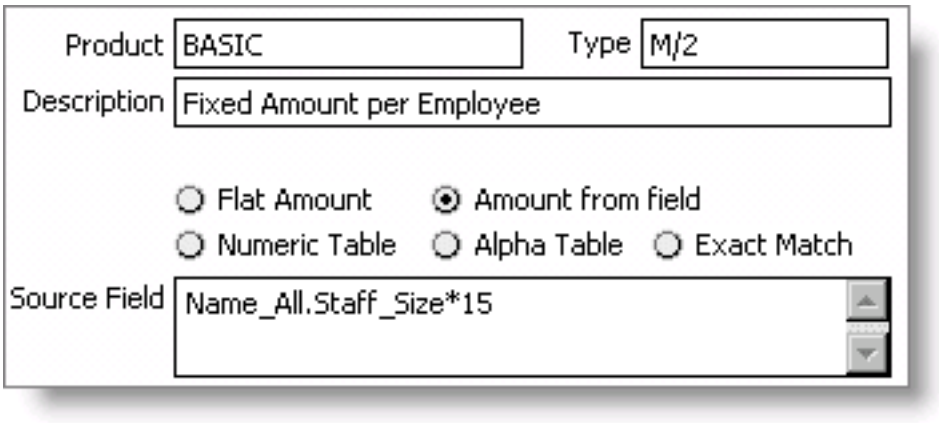
Pricing based on an iMIS field

In this example, rates are billed to customers who have a customer type of M and a billing category of 2. The amount billed is determined by the rate that was manually entered for each customer in the user-defined Activity_Fee field.



Special Pricing window with Amount from field selected

This example shows a simple calculation to determine the amount billed. In this case, the amount billed is $15 times the customer's staff size. The staff size is stored in the user-defined Staff_Size field.



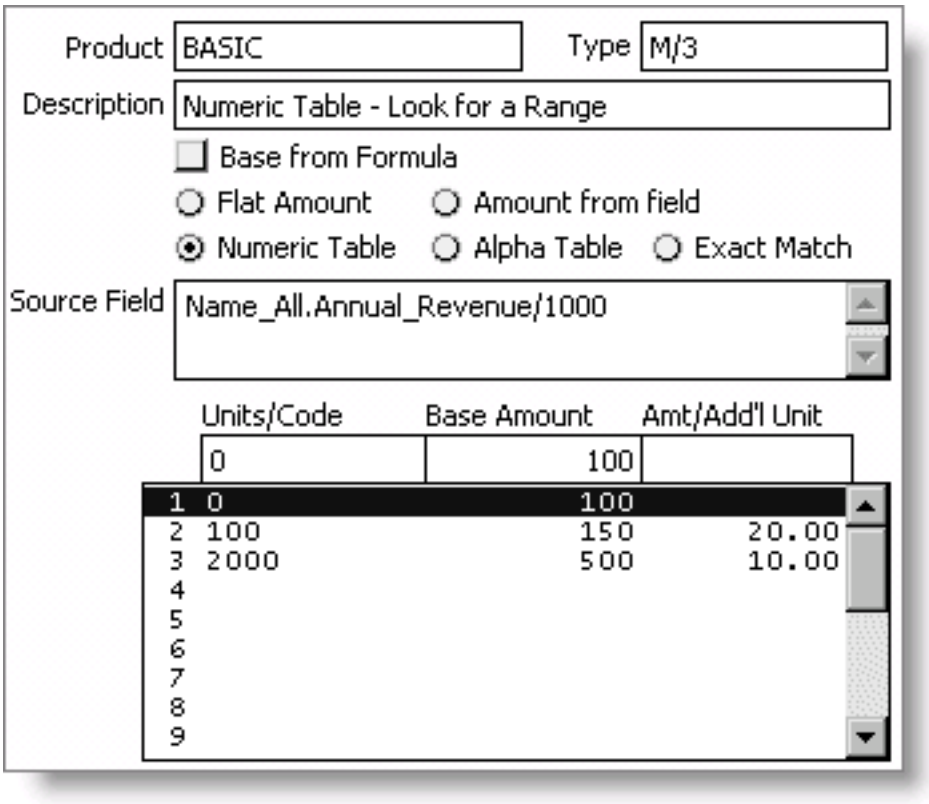
Special Pricing window with Amount from field selected

Note: Note: If you attempt to bill and you receive a SQL error stating you have an invalid column prefix, you have not used the required Name_All prefix in your special pricing formula. Even when you are referencing a field within the Name table, you must set up and cross-reference the Name_All view for all special pricing methods except flat rates.

Pricing based on a numeric table

Example 1

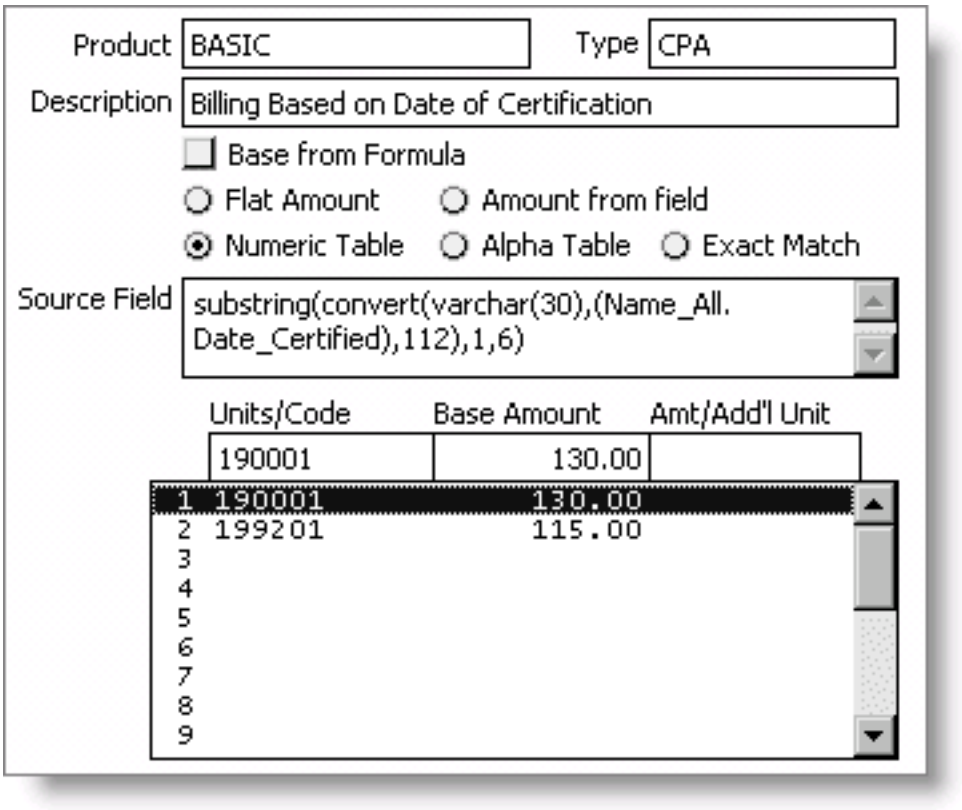
In this example, rates are assigned according to the customer's annual revenue divided by 1,000. If the net result falls between 0-99, the customer is charged $100. If the net result falls between 100-1999, the customer is charged $150 plus $20 for each over the initial value of 100. The revenue information is stored in the user-defined field Annual_Rev.



Special Pricing window with Numeric Table selected

Example 2

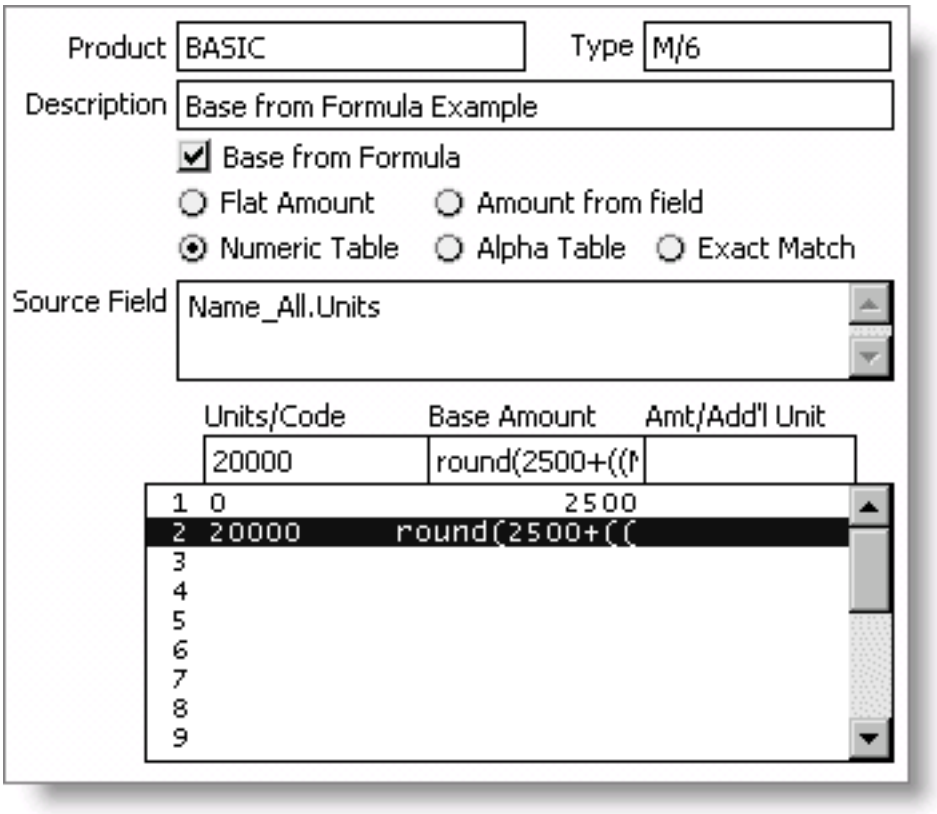
In this example, CPAs certified before 1992 are billed $130. Those certified after 1992 are billed at $115. The certification date is stored in the user-defined Date_Certified field.



Special Pricing window with Numeric Table selected

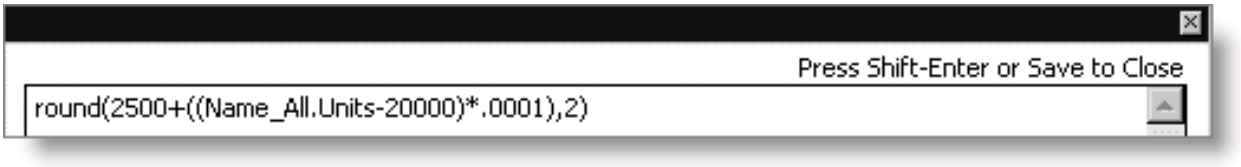
Example 3

In this example, rates are assigned according to the formula that was added to the base amount. According to this formula, a customer will be billed a flat amount of $2,500 until 20,000 units have been billed. After 20,000 units, an additional charge of .0001/unit is billed. The number 2 shown at the end of the formula indicates the amount billed should be rounded to two decimal places.



Special Pricing window with Numeric Table selected

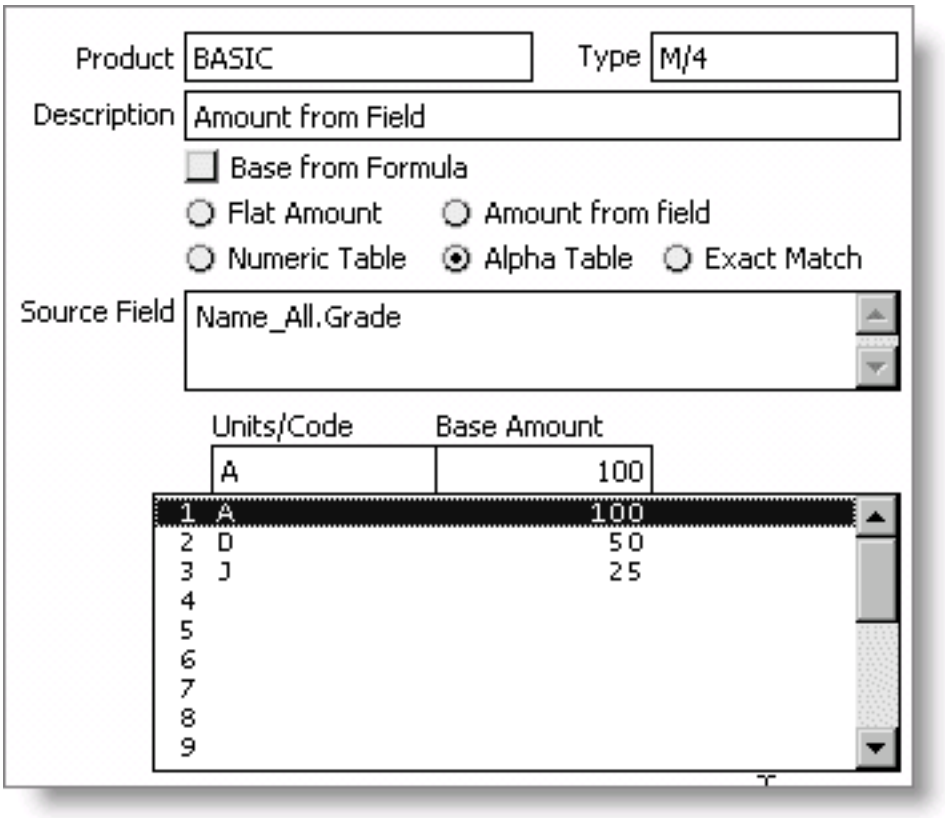
Note: Note: To view the entire formula, press Crtl+Z to expand the formula area.



Expanded Base Amount field showing formula

To define pricing based on an alpha table

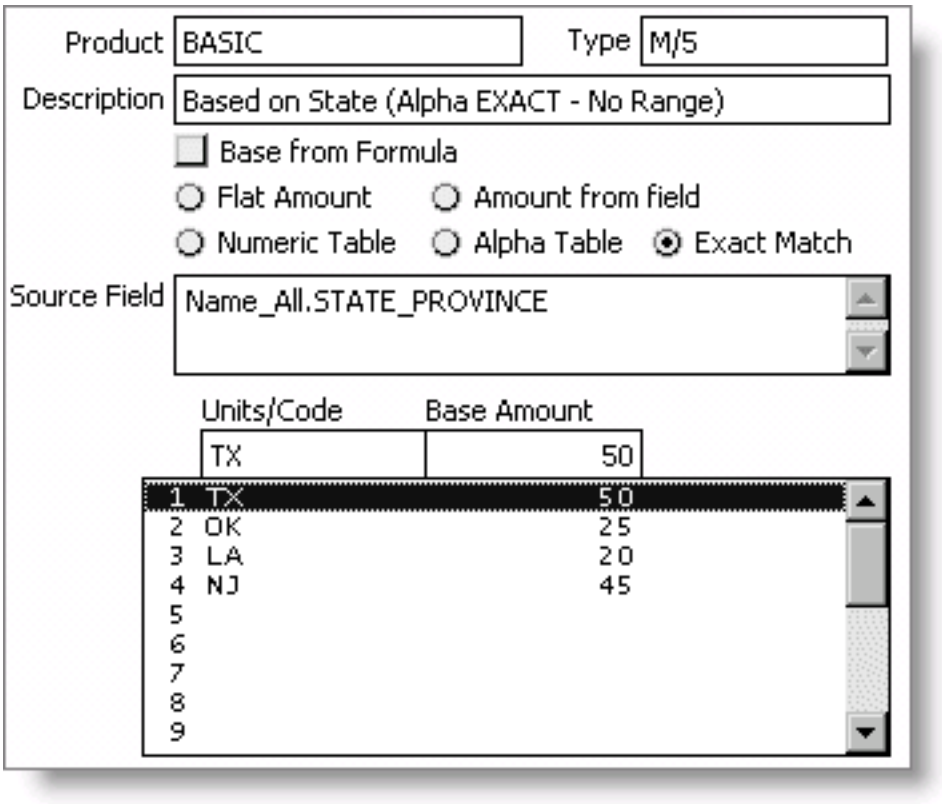
In this example, rates are assigned according to the customer's grade. The grade information is stored in the user-defined Grade field. If the customer's grade is A-C, the billing rate is $100. If the grade is D-I, the billing rate is $50. For grades equal to or greater than J, the billing rate is $25.



Special Pricing window with Alpha Table selected

Define matching based on exact match

In this example, rates are assigned according to the customer's state. The state information is stored in the Name field STATE_PROVINCE. To enter all the state information in the space available (20 lines), it may be more efficient to split the states into categories such as NW, SW, and so forth.



Special Pricing window with Exact Match selected

Additional special pricing examples

In many cases, there may be alternative methods for implementing a special pricing scenario. For example, most table/step special pricing methods could be defined through one or more SQL statements. SQL statements are less limiting (not restricted to 20 table levels) and may make the dues billing run more efficiently.

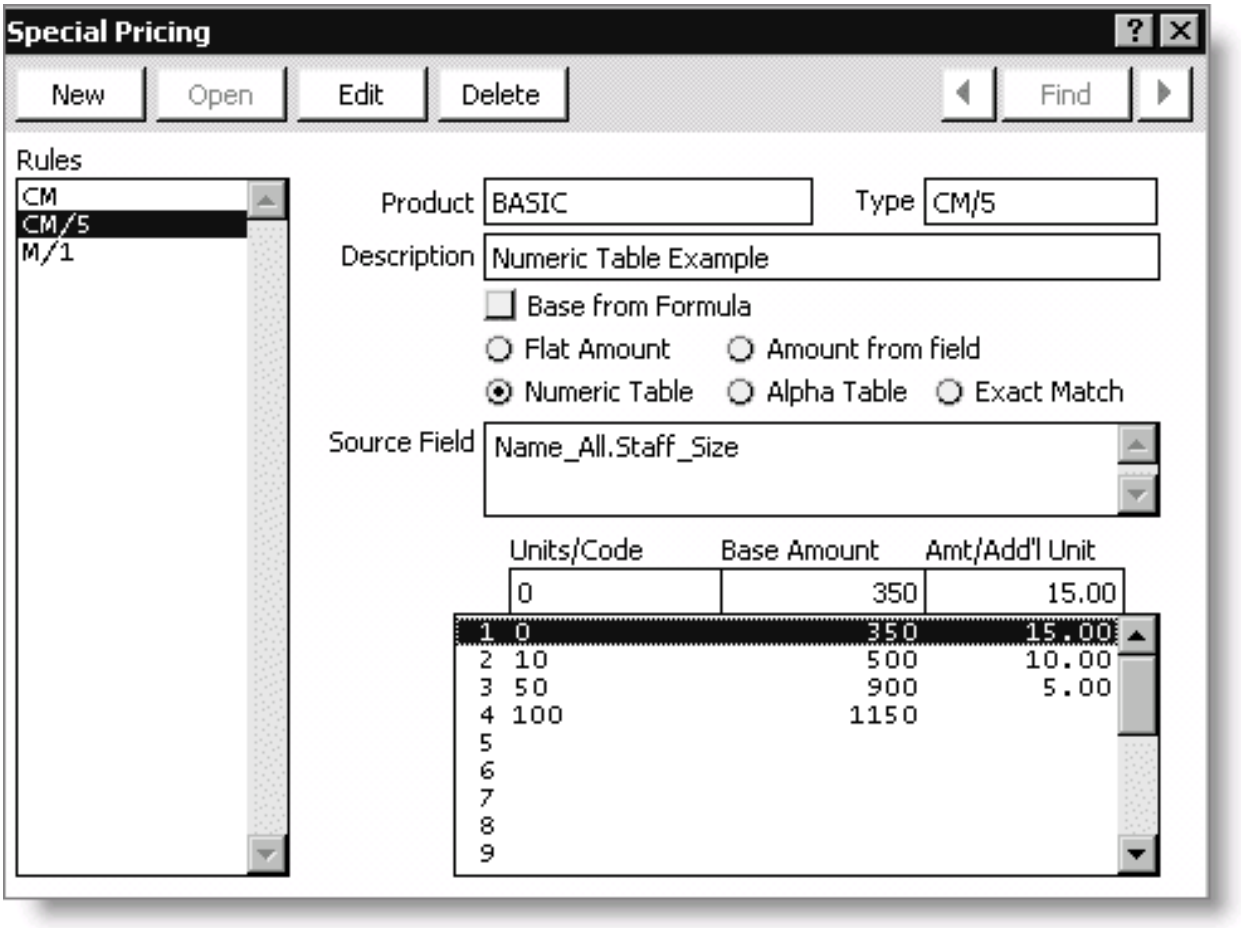
To demonstrate the alternative methods of special pricing implementation, the following examples show the alternative table compared to SQL statements for a simple sliding-scale type billing structure.

Special pricing scenario 1

- Set up dues pricing according to the staff size of an organization.
  For staff sizes from 0-9, the base dues are $350 plus $15 per employee.
- For staff sizes of 10-49, the base rate increases to $500 plus $10 per employee.

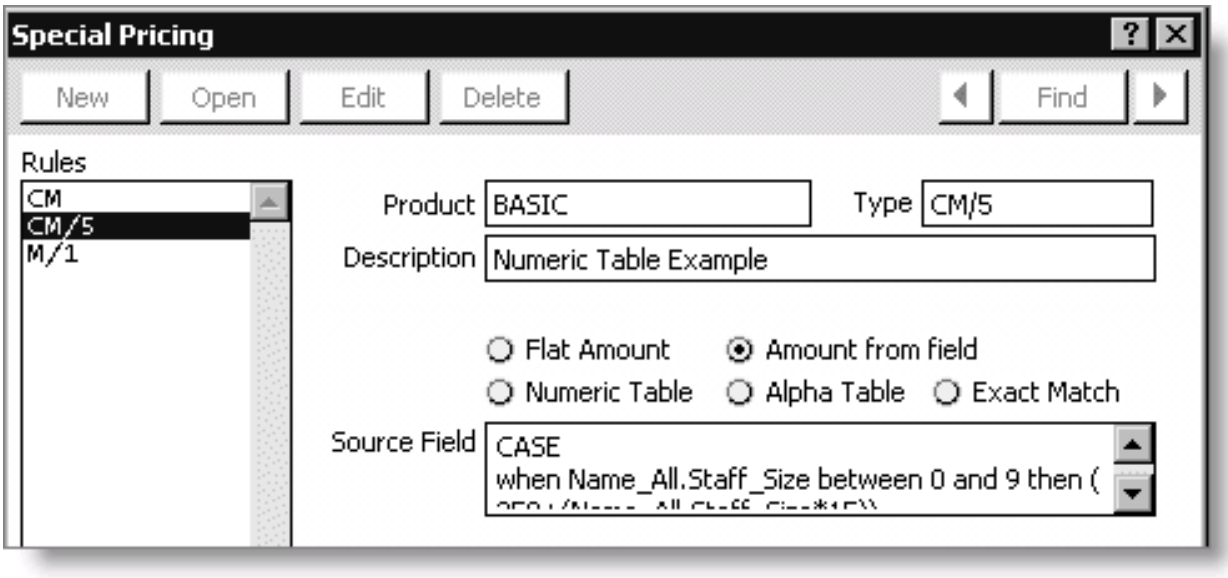
- For staff sizes of 50-99, the base dues are $900 plus $5 per employee.
- The maximum dues charged for an employee count of 100 or more is $1,150.

  For example, an organization with two staff members would be charged $380 [$350 base rate + (2x$15)]. A company with 15 employees would be charged $550 [$500 + (5x$10)].



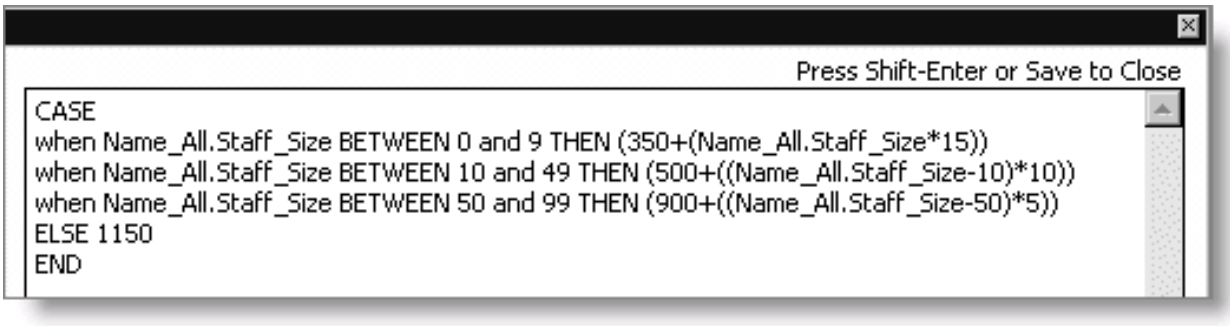
Special Pricing window - Numeric Table example

If your system supports the CASE statement (for example, iMIS for Microsoft SQL running under Microsoft SQL Server version 7 or later), you can implement special pricing with an SQL CASE statement by selecting the Amount from field option.



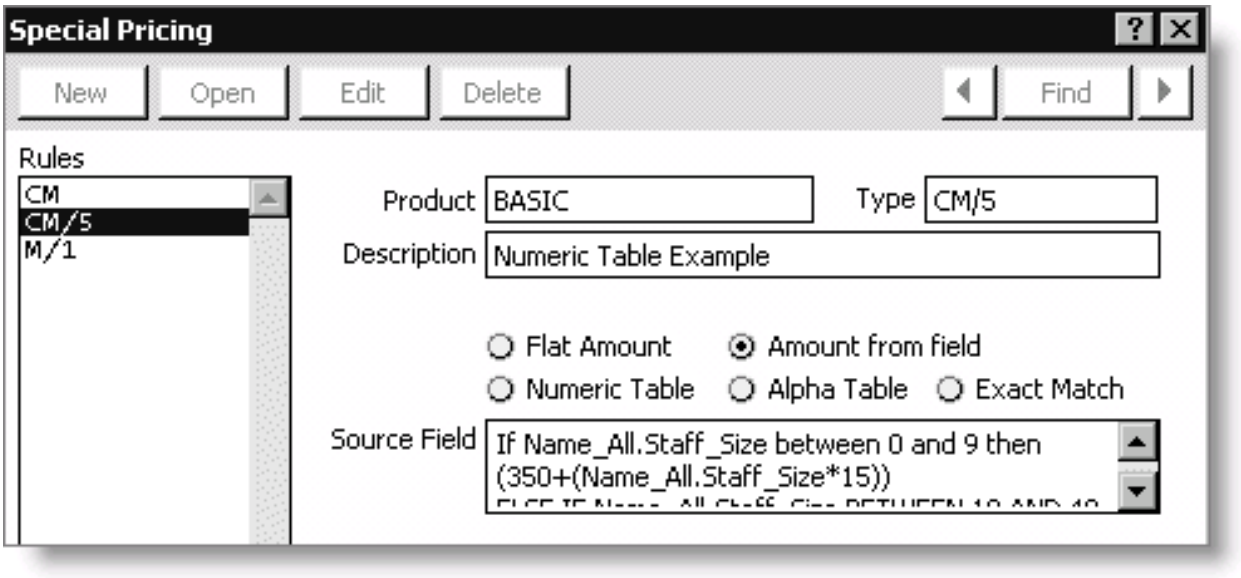
Special Pricing window- SQL CASE Statement example

Note: Note: Press Ctrl+Z to view the entire source field.

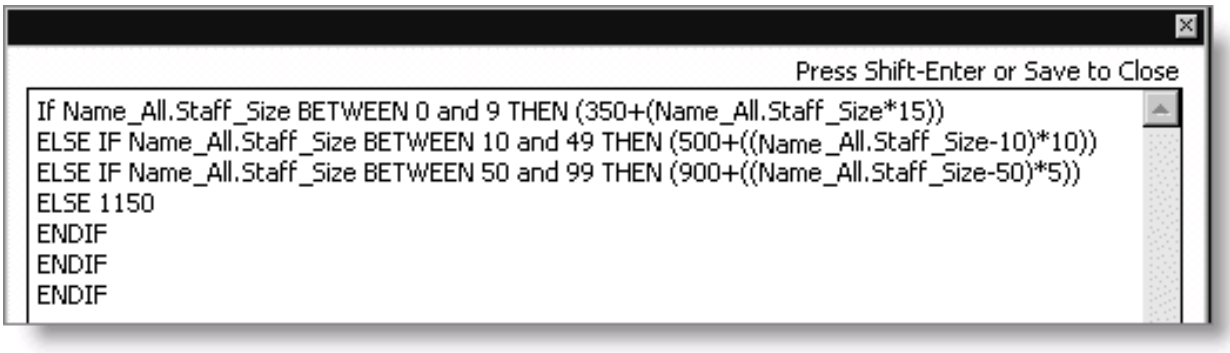


Expanded Source Field showing SQL CASE Statement

If your system supports IF statement logic, you can implement the special pricing with an IF statement by selecting the Amount from field option and entering the IF statement in the Source Field that displays.



Special Pricing window - SQL IF statement example

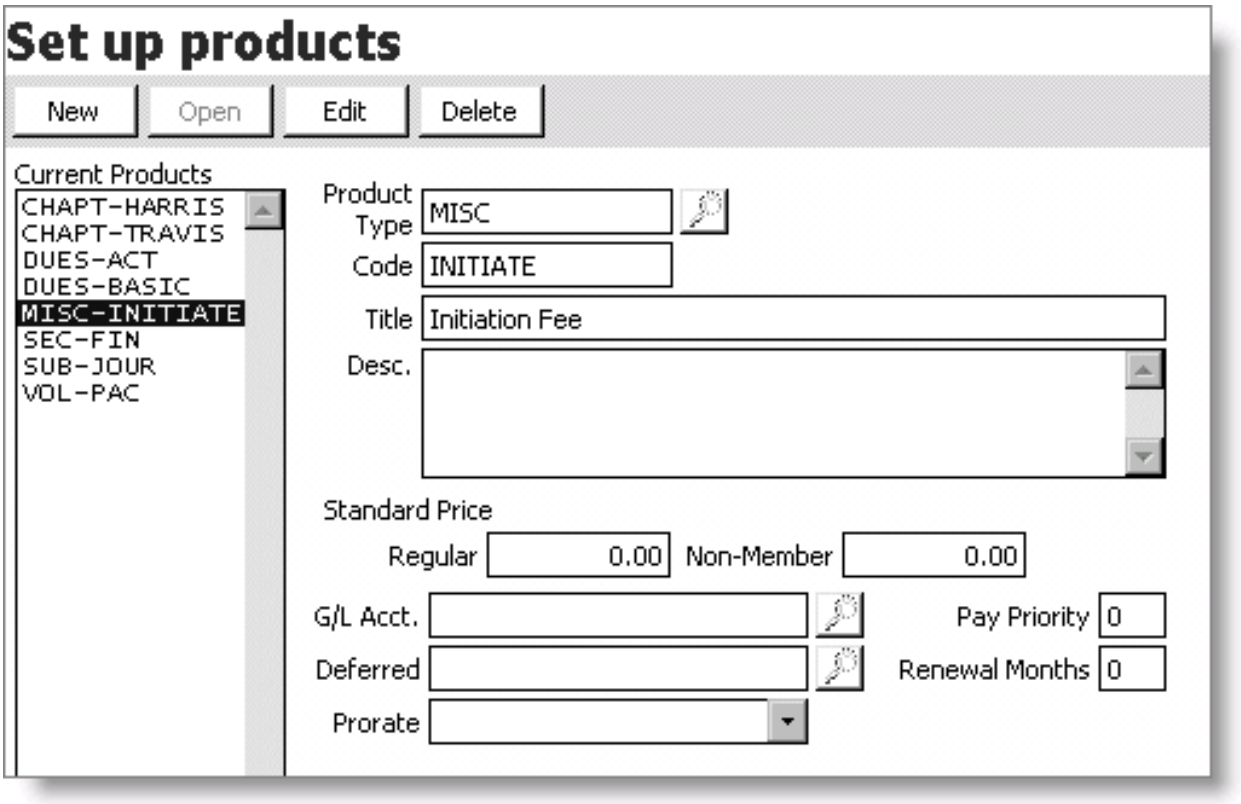


Expanded Source Field showing SQL IF Statement

Special pricing scenario 2

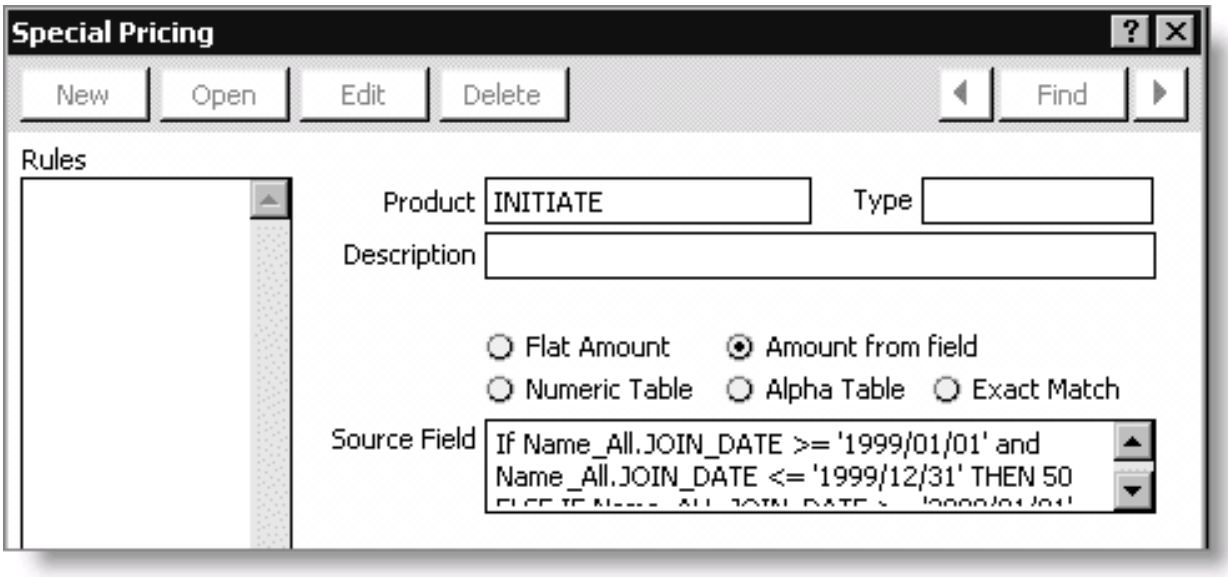
Set up an initiation for all new customers. In this example, special pricing is based on the JOIN_DATE in order to bill the customer only once. In 1999, the initiation fee would be $50. In 2000, the fee would have increased to $55, and then increased again in 2001 to $57.50.

The first step is to set up a MISC product code.



From Billing, select Set up module > Products

On the Special Pricing window, the Amount from field option is selected.



The following formula is entered in Source Field.

Note: Note: The dates will need to be adjusted for the years to which the initiation fees will be applied. The date format is yyyy/mm/dd.

If Name_All.JOIN_DATE >= '1999/01/01' and Name_All.JOIN_DATE <= '1999/12/31' THEN 50

ELSE IF Name_All.JOIN_DATE >= '2000/01/01' and Name_All.JOIN_DATE <= '2000/12/31' THEN 55

ELSE IF Name_All.JOIN_DATE >= '2001/01/01' and Name_All.JOIN_DATE <= '2001/12/31' THEN 57.50

ENDIF

ENDIF

ENDIF

Note: Note: The MISC-INITIATE product code should also be added to the Set up customer types window (from Customers, select Set up module > Customer types) for the BASIC dues product.

Defining prorating rules

Prorating means allocating or assigning an amount to an activity or product that is proportional to some base (determined by a formula or procedure). Prorating is only applied to organizations that bill on an annual or fixed-term basis, as opposed to an anniversary or rotating term basis.

Note: Note: The number of months used by the prorate rule for an individual is Thru Date to Join Date. Prorate only applies if the Join Date is populated before running the billing. See Begin Date for an annual billing cycle.

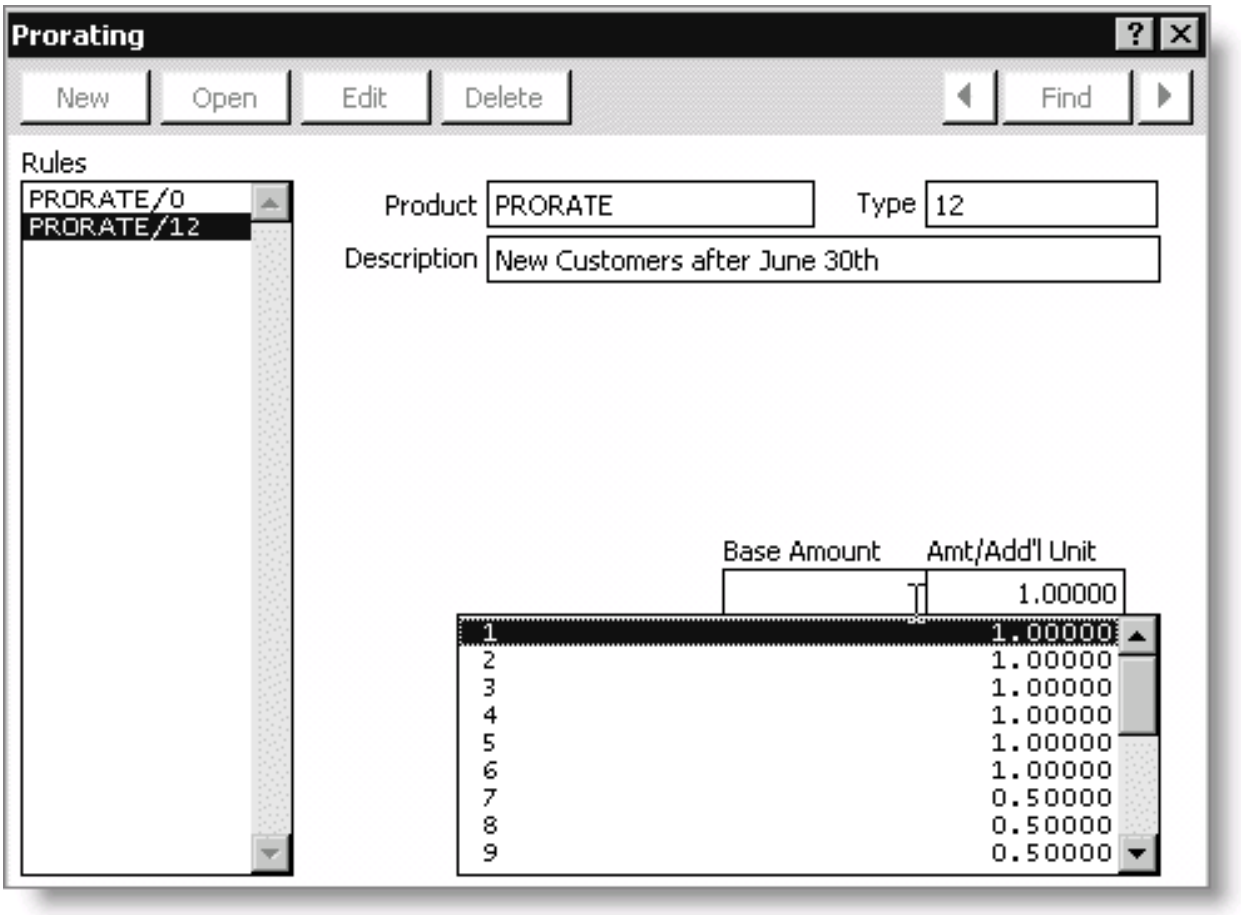
The three options available to define prorating rules include the following:

- Do Not Prorate – Same dues regardless of when customer joins.
- Standard Prorating – Prorating for the current year (depends on the billing interval). For example, if a customer joins in month 7 and annual dues are $200, the calculated dues would be 6/12 of the total dues, or $100.
- Special Prorating – User-defined prorating rules, depending upon the needs of the organization. If the Special Prorating option is enabled, proration rules are created on the Prorating window. Prorating rules can be used for unique situations that require more than simple monthly prorating within the first year, such as:
- Quarterly or semi-annual prorating
- Second-year prorating (receive x% off of next year's dues)

  Note: Second-year prorating does not apply when a member joins online.
- Advancing the membership term to the end of the next year
- Multiple prorating rules

  Tips
- If a former member rejoins your organization (i.e., they already have an existing join date in the system that is earlier than the beginning of the current fixed-term) through the online join page, one of two scenarios can occur:
- If the contact is an active member, the rejoin is processed as a renewal and prorating does not apply. The contact pays the full membership fee for the fixed-term.
- If the contact is not an active member, the join date resets to the current system date and prorating is applied. If your organization needs to maintain a record of the original join date, you can create a user-defined field where a staff members can enter the date before processing the rejoin.

Prorating window



From Billing, select Set up module > Products, and click Prorate Rules

Rules

List of defined prorating rules.

Product

This field is automatically populated with PRORATE. You can edit this value.

Type

Indicates the number of months in the billing period. This number must agree with either the Product Renewal Months, on the Set up products window (see "Set up products window for Billing") or the Standard Billing Interval on the Billing Set up general options window.

Description

Specifies a detailed description of the prorating rule.

Prorating Table Entries

The entries in the prorating table specify the amount that a customer is charged. For example, if month 1 represents an on time payment, for which a customer is charged a full fee (100%), the Amt/Add'l Unit field will hold a "1". There must be one table entry for each month in the renewal cycle as defined in the Type field.

Base Amount

Specifies refinements (if any) to the prorating rule. The following codes can be entered in this field:

- F (Future Credit) - Postpones the prorating discount to the second billing year.

  Note: Future Credit prorating does not apply when a member joins online.

- B (Bump Date) - Advances the end of the billing term to the end of the next term. The amount charged depends on the multiplier entered in the Amt/Add'll Unit field.

Amt/Add'l Unit

Indicates the percentage of the full price to charge customers.

Future credit and bump date prorating

In addition to changing the price a customer is charged in monthly increments, special prorating rules also offer Future Credit and Bump Date prorating.

> **Note:** Note: Future Credit prorating does not apply when a member joins online.

Future credit

Future credit prorating applies any time-based discounts to next year's dues and charges full credit for this year's dues. For example, an organization may charge full annual dues no matter when in the year a customer joins, but give a time-based discount for new members joining after the sixth membership month.

Bump date

Bump date prorating charges a full annual fee no matter when in the membership year a customer joins, but after a named cutoff point, advances the paid thru date to the end of the next billing term.

Future credit and bump date examples

	1.0	The customer is charged the full annual rate.
	0.5	The customer is charged 50% of the annual rate.
F	0.5	The customer is charged the full annual rate but will receive a 50% discount on next year's rate.
B	1	The customer is charged the full annual rate, but the paid through date will be set to the end of next year's term, not this year's term.
B	1.5	The customer is charged 1.5 times the annual rate and the paid through date will be set to the end of next year's term, not this year's term.

Note: Note: If you bill once per year, but want to decrease the amount charged a new customer on a quarterly basis, define a 12-month prorating rule and then use identical line entries for each month in a quarter. For example, the line entries for months 1, 2, and 3 would be identical.

To define special prorating

1. From Billing, select Set up module > General options to open the Set up general options window.
2. Click Edit.
3. Select the Annual option under Billing Time.
4. Select the Special Prorating option under Prorating.

5. Click Save.
6. Select Billing > Set up module > Products.
7. Click Prorate Rules to open the Prorating window.
8. Click New.
9. (optional) In the Product field, rename the rule.
10. In the Type field, enter the number of months in the billing period.
11. In the Description field, enter a description of the prorating rule.
12. (optional) Enter the Base Amount to reflect second-year prorating or an extension of the term to the next year or fixed term.
13. Enter a multiplier in the Amt/Add'l Unit field. For example, 50 percent should be entered as .50.

    Note: The number of lines in the table must equal the number of months specified by the rule type.
14. Click Save.

    To define future credit prorate pricing

    The following example shows a normal prorating setup in which the reduction in the rate is postponed until the second term. If a customer joins during months 4-6, the customer will be billed the full amount the first year and 75% the second year.

1. From Billing, select Set up module > Products to open the Set up products window.
2. Click Prorate Rules to open the Prorating window.
3. Click New.
4. In the Type field, enter 12 as the number of months in the billing period.
5. In the Description field, enter New Customers as the description.
6. Enter a multiplier of 1.0 for months 1-3 in the Amt/Add'l Unit field.

7. Enter F in the Base Amount field and a multiplier of .75 for months 4-6 in the Amt/Add'l Unit field.
8. Enter F in the Base Amount field and a multiplier of .50 for months 7-9 in the Amt/Add'l Unit field.
9. Enter F in the Base Amount field and a multiplier of .25 in the Amt/Add'l Unit field for months 10-12.
10. Click Save.

To advance the billing term with Bump Date prorating

In the following example, no prorating occurs until month 7 when a new customer is charged half of the rate. Customers joining in months 11 or 12 pay the full amount and will receive services for a longer term (13- and 14-months respectively).

1. From Billing, select Set up module > Products to open the Set up products window.
2. Click Prorate Rules. The Prorating window opens.
3. Click New.
4. In the Type field, enter 12 as the number of months in the billing period.
5. In the Description field, enter New Customers after June 30th as the description.
6. Enter a multiplier of 1.0 for months 1-6 in the Amt/Add'l Unit field.
7. Enter a multiplier of 0.5 for months 7-10 in the Amt/Add'l Unit field.
8. Enter B in the Base Amount field and a multiplier of 1.0 in the Amt/Add'l Unit field for months 11-12.
9. Click Save.

Setting up list billing

List billing enables you to generate a single renewal notice to a Bill To third party (such as a company) that is responsible for paying the fees for multiple customers. The multiple

customers and their respective line items would all be listed on the single renewal notice mailed to the Bill To ID.

To generate list bills with iMIS, set up a list billing cycle and establish the Bill To ID.

Depending on the nature of the list billing, Bill To ID criteria can be established at one of four possible levels:

- Set up all line items to be billed to the parent company on the Set up customer types window
- Set up all line items of an individual customer to be billed to a specified third party Bill To ID on the Financial tab
- Set up the Bill To ID for specific line items selected on the Dues/Subscription Item Detail window
- Set up the Bill To ID for specific line items on the Bill to Information window

There is no preferred method for list billing. You should determine your specifications on preferred business practices for your organization.

> **Note:** Note: You can process list payments using the Enter and edit payments window in Service Central.

To set Bill To using the Set up customer types window

This is the most automated method. When a company should be billed for the customer dues products of all individuals or branch customers of a particular customer type, select the Bill Company checkbox on the Set up customer types window.

1. From Customers, select Set up module > Customer types to open the Set up customer types window.
2. Create a customer type and select Bill Company. (See Customer types window).
3. Click Save.

To set Bill To using the Financial tab

When all line items for a customer will be billed to a Bill To ID, set the Bill To ID on the individual's Financial tab.

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer's record.
3. Select the Financial tab.
4. In the Bill To ID field, enter the ID of the company or individual to be billed for this individual's billings or select the lookup icon on the Bill To ID field to select a value.
5. Click Save.

To set Bill To using the Dues/Subscriptions Item Detail window

If only certain line items for an individual will be billed to a third party (which may not be the same as the linked company ID), identify the third party on the individual's Dues/Subscription Item Detail window. For example, a customer may have bought a journal or subscription through an agency rather than through the customer's company.

1. From Customers, select Manage customers to open the Manage customers window.
2. Find a customer's record.
3. Select the Billing tab.
4. Select the line item that will be billed to a third party.
5. Click New on the Billing tab to open the Dues/Subscription Item Detail window.
6. Click New and Save.

> **Note:** Note: To print a list bill, select a list bill renewal notice for the billing cycle.

Billing run troubleshooting

The following list of possible billing problems and solutions can help you in troubleshooting.

Problem

Some old, expired customers were picked up for billing.

Cause

The customer has a Paid Thru date that has been expired for over a year and has never been re-categorized as suspended or as a non-customer.

Solution

Update the customer's status (manually or in mass) to S for suspended or I for inactive, or manually update the customer type from a customer to a non-customer.

Problem

The number of renewal notices printed is greater than the number of customers billed.

Cause

Some customers were manually billed. Generating or printing individual renewal notices does not set the reminder count flag indicating that the renewal notice has been printed. When Printing Options are run separately from the Billing Options, iMIS prints a notice for customers with outstanding balances in which the reminder count is still set to zero.

Solution

The best way to avoid this situation is to select the Billing Options and Printing Options at the same time. To print the initial notices separately, use the Ad hoc Search option to ensure that only the desired notices are printed (for example, those for a specific Bill Date or Run Date).

If you have already encountered the problem and need to reprint only the desired notices, you may be able to work around this situation by printing the initial notices as Reminder Notices. To do this, select First Reminders, for example, and then enter the original Bill Date or Run Date in the both the Begin and End dates of the reminder date range.

> **Note:** Caution! If you have a special notice-specific title or Billing and Reminder Notice text that prints differently for Reminder Notice, this may not be a viable option.

Problem

Too few customers were billed. For example, the pre-billing report shows 1,000 customers have Paid Thru dates expiring within the month. When billing was generated, only 500 notices were generated.

Cause

In order to bill customers, both the Paid Thru date and the Renewed Thru date must be earlier than the billing Effective Date. If too few customers are billed, the problem typically is caused by a Renewed Thru date that is greater than the Effective Date. The Renewed Thru date is advanced to the projected term Paid Thru or expiration date at billing time, preventing the customer from being rebilled for the same customer term in subsequent billing runs. An incorrect Renewed Thru date may result from two different causes:

- A billing run was started but canceled without restoring a backup, or
- The Paid Thru date was manually overridden to an earlier date without a similar modification being made to the Renewed Thru date.

Solution

The Renewed Thru date can be viewed from the individual customer's Financial tab. If only a few customers were missed due to a problem with the Renewed Thru date, the date can be corrected or blanked out through an Edit change and the missed customers can be billed individually (see "Running individual dues billing") by clicking Create Invoice on the Billing tab. If large numbers of customers were missed, you should make mass corrections through a correction script.

> **Note:** Note: You may want to add the Name.PAID_THRU field to the list of Change Logging fields in order to track manual changes made to the Paid Thru date.

Problem

Too many customers were billed. For example, the pre-billing report shows 500 customers have Paid Thru dates expiring within the month. When billing was generated, 1,000 customers were billed.

Cause

This problem usually occurs only on the first dues billing run after conversion to iMIS because billing data, particularly the Renewed Thru date, has not been properly set up during pre-conversion.

This problem may also occur in late billing runs because the Name_Fin records (where the Renewed Thru date is maintained) were not populated in post-conversion. If the Name_Fin record does not exist for the customer at billing time, the billing procedure will not be able to update the Renewed Thru date. This prevents the customer from being rebilled for the same billing term in a subsequent billing run.

Solution

Restore from backup and properly populate the missing Renewed Thru dates.

If the Name_Fin records are missing from a missed post-conversion step, execute the procedure to generate the missing records. Select Utilities> Reports and Queries> Set up tables report type, and execute “Add missing Name_Fin records.”

Problem

Invalid column name error message. When you attempt to bill, you get an SQL error message, such as:

DuesBill1/103 SQL_CHANNEL1 207 Invalid column name “Assets.”

Cause

The column name “Assets” does not exist in the Name_All view because the user-defined table that contains it is not included in the Name_All view.

Solution

Add the table to the Name_All view.

Problem

Invalid column prefix error message. When you attempt to bill, you get an SQL error message, such as:

DuesBill1/103 SQL_CHANNEL1 107 The column prefix 'Name' does not match with a table name or alias name used in the query.

Cause

You have not used the required Name_All prefix in your special pricing formula. Even when you are referencing a field within the Name table, you must set up and cross-reference the Name_All view for all special pricing methods except flat rates.

Solution

Change the prefix in all special pricing field references to Name_All. Be sure to generate the Name_All view.

Problem

Line items are being billed for strange, negative amounts, such as -999.00 or -900.00.

Cause

There is a problem with the application of a special pricing formula during the billing process. This could be caused by:

- The Name_All view does not contain a record for the customers or subscribers who were billed the negative amounts, or
- There is an SQL syntax error in your special pricing calculation.

Solution

Verify the completeness of the Name_All view. Run the following script for one customer who was billed a negative amount:

select ID from Name_All where ID = '101'

Note: Note: Substitute the correct ID in place of 101.

If blank results are returned, the Name_All view is not complete. Check the test script again after populating missing records. Note that the Name_Fin table must also be properly populated in order for the Name_All view to be complete.

If you suspect there may be missing Name_Fin records due to a missed post-conversion step, select Utilities> Reports and Queries. Select the Table Maintenance report type and execute “Add missing Name_Fin records.”

If the Name_All view appears to be complete, check your special pricing formulas for accuracy and correct as needed.

Problem

Customers not being billed for a Dues billing cycle when the Add Member Type Items option is enabled.

Solution

Isolate the problem to a specific customer type/category that is not being billed. Find an individual who should have been billed that has this customer type/category. Verify that the products are set up in the Set up customer types window that the customer type, and that customer and nonmember pricing is correct. Verify that the Name.PAID_THRU date and the Name_Fin.RENEWED_THRU dates are less than the Effective Date. Check the Bill Date in the Billing tab to determine whether the customer was billed, but was billed an incorrect amount. If the customer was billed but billed incorrectly, then verify whether that a special pricing rule was applied.

Run the following SQL query to see if this customer is included in the Name_ALL view: Select ID from Name_ALL where ID = '####'

If this does not return a record, then this customer does not have a record inserted into either the Name_Fin table or in a user-defined table marked “Use for Dues Pricing.”

Problem

Customers not being billed for a non-dues billing cycles when products are manually entered on the Billing tab.

Solution

The subscription record must have been previously created in the Billing tab. Verify the Bill Date on this window to determine if the customer was billed but billed an incorrect amount. If the customer was billed incorrectly, check to see if a special pricing rule was applied. If the customer was not billed, then verify that the Subscriptions.PAID_THRU and Subscriptions.BILL_THRU dates are less than or equal to the Effective Date entered.

Problem

Delays are experienced when processing payments for products on one invoice.

Solution

To speed up processing, add an additional index to the Subscriptions table consisting of INVOICE_REFERENCE_NUM and INVOICE_LINE_NUM.

Problem

You need to add subscription dates to your Renewal Notices.

Solution

Add Subscriptions.BILL_BEGIN in the Parameters window of the report specification. The date will be printed in mm/dd/yyyy format.

Problem

You have a custom field that contains a year and would like to use it for special pricing.

Solution

You can use the SQL Anywhere DATEPART function in special pricing by adding a Name_Custom.MEMBER_YEAR to the Name_All view. The following calculation would then be used for special pricing:

If Name_All.MEMBER_YEAR >= datepart(year,Today(*))
Then 100

Else 200
Endif

The datepart function takes the year from the current date, Today(*).
The “if” statement compares the current year to the Name_All.MEMBER_YEAR, resulting in customers being charged 100 if the Member_Year is greater than the current year, or 200 if the Member_Year is less than the current year.

Problem

You are able to bill individually, but not mass billing or only bill amounts entered as the standard customer or non-customer amounts because special pricing is not being recognized.

Solution

There is a temporary table that is built when running a mass billing which creates a special pricing table for all dues products whether they are included in the billing cycle or not. This temporary table creates the price if special pricing is used, by converting the BASE 1 filed in the Product_Price table to a money field. To verify that there is only numeric data in this field, query the Product_Price table to see if you received any error messages by using the following SQL query:

Select PRODUCT_CODE, BASE_1, PRICE=convert(money,pp.BASE_1) from Product_Price

Problem

If you create a query in MS Query using more than one table, and then try to merge the date in MS Word, the following error message occurs: Word was unable to open the data source.

Solution

An MS Query limitation restricts queries to one table. Perform your queries using only one table or use MS Access to perform the query. For more information, see MS Support Article 193715.

Expired Members

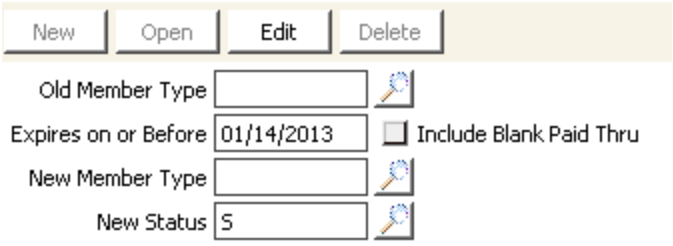
An important maintenance step is dealing with member status and type of those who fail to renew. If member statuses or types aren't changed, they may retain unwarranted access to organizational privileges, and you won't have current records on the overall status of your members. From the Manage expired members window you can process expired memberships throughout your database.

Note that this method makes use of the Paid Thru date in the member's record to perform the status and/or member type conversion. Most users will be set up with cash-based accounting (in Billing system setup), so this utility will work fine. If, however, you are set up for accrual-based accounting, and the Paid Thru dates are updated automatically at each billing, you'll have to convert expired member' statuses by hand, as needed because in some cases accrual updated Paid Thru at payment time.

Managing expired members

To access this conversion utility, select Billing, and select Manage expired members.

Manage expired members window



Desktop: Billing > Manage expired members

Old Member Type

Enter an existing member type that you want to convert or select the lookup icon to select a value.

Expires on or Before

Enter the customer's Paid Thru date.

Include Blank Paid Thru

Check this field if you want the system to find those customers from whom no payment was ever received (resulting in a blank Paid Thru field).

> **Note:** Note: Selecting the Include Blank Paid Thru option may include your newly joined as well as your delinquent customers.

New Member Type

Enter the non-customer type that you want to assign to delinquent or expired customers or select the lookup icon and select a value. You can retain the existing member type designations and simply change their status. To retain the member type, leave the New Member Type field blank.

New Status

(Defaults to S, for Suspended) Enter a status or select the lookup icon to select a value.

To modify a member type or status

> **Note:** Note: Perform the following procedure for a single member type you want to modify. If you have more than one member type to modify, perform the procedure as many times as necessary.

1. Manage expired members window, to open the Manage expired members window, click Edit.
2. Enter the member type you want to modify in the Old Member Type field or click the lookup icon to select a value.
3. Enter the old expiration date to use as the basis of the conversion in the Expires on or Before field. The system finds all of those member types who have a Paid Thru date that matches or precedes the date you enter in this field.
4. (optional) Enable the Include Blank Paid Thru option if you want the system to find those customers from whom no payment was ever received.

5. (optional) Enter the member type you want to assign to delinquent or expired members or select the lookup icon and select a value. You can retain the existing member type designations and simply change their status. To retain the member type, leave the New Member Type field blank.
6. (optional) Enter the New Status or select the lookup icon to select a value. To retain the status, delete the default status of S (Suspended).
7. Click OK.

Date Usage in iMIS

In addition to calculating the billing rate for each product line item, iMIS also calculates a date range to project what a customer's term or subscription will be when the customer pays or renews. Unless manually overridden, the Enter and edit payments window (from Billing, select Enter and edit payments) uses this projected date range to update the new Paid Thru date for each line item when a customer pays a balance in full. When the first cross-referenced customer type item is paid in full, the overall customer Paid Thru date also is updated to agree with that line item's new Paid Thru date.

iMIS uses the following dates:

- Bill Begin - This is the first date of a term through which an individual product line item has been billed, regardless of whether or not payment has been received.
- Billed Thru - This is the ending date of a term through which an individual product line item has been billed, regardless of whether or not payment has been received.
- Paid Thru - This is either the expiration date of a customer's dues or subscription product or the period through which a customer has paid. This date is always the last day of the month.
- Renewed Thru - This is the date through which a customer has been billed for products, regardless of whether or not the customer has paid. This date determines which customers receive renewal notices.

A number of factors determine the projected product term. After iMIS calculates the begin date, it normally derives the Thru Date to be n months later (minus 1 day), where n represents the billing interval. The following example shows the formula for calculating the Thru Date using an annual and quarterly billing interval.

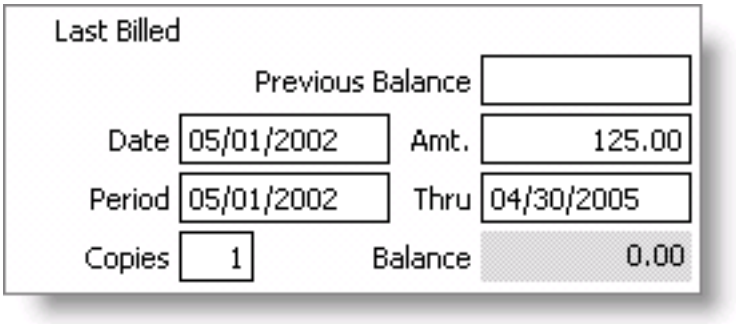
1/01/2003	+ Annual (12)	= 12/31/2003
1/01/2003	+ Quarterly (3)	= 3/31/2003

Viewing the calculated date range

In addition to rates, the projected term is established when the dues billing data is generated either by enabling the Renewals or Rebill option on the Process billing window or by clicking New on the Enter and edit payments window. You can view the dates on the Last Billed section of the Dues/Subscription Item Detail window.

To view the calculated date range

1. From Customers, select Manage customers to open the Manage customers window.
2. Open a customer's record.
3. Select the Billing tab.
4. Double-click a line item to view the Dues/Subscription Item Detail window and the Last Billed section.



Example of the Last Billed section of the Dues/Subscription Item Detail window

The projected term is represented by the Period term begin date and Thru term end date. The Begin Date always falls on the first day of a month and the Thru Date always coincides with the last day of a month.

Calculating dates in billing runs

Calculating the Begin Date for a dues billing run

For a dues billing run, iMIS uses these important factors to determine the Begin Date:

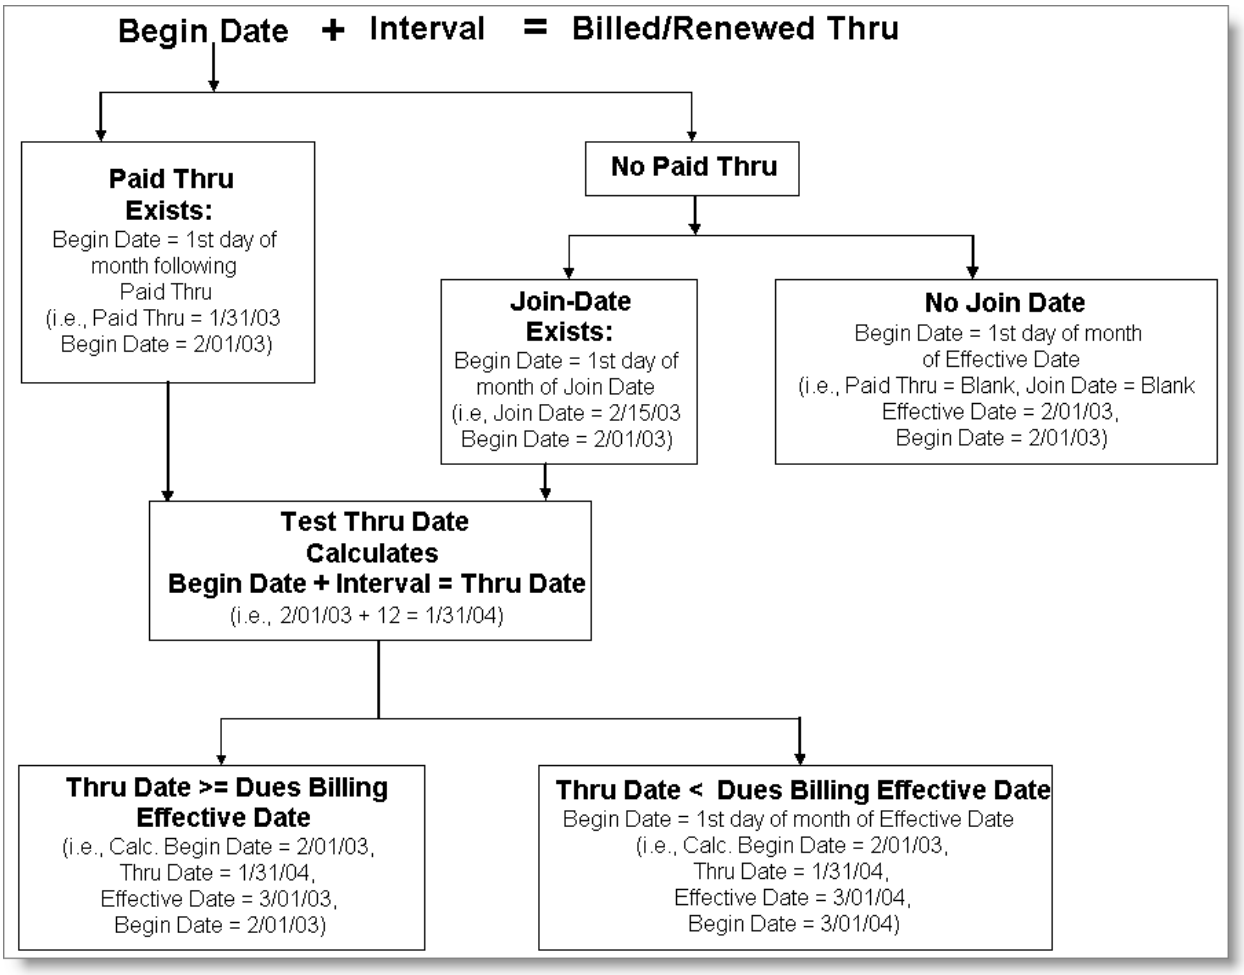
- Whether billing is done on an Anniversary or Annual basis
- The current value of the Paid Thru date
- The Join Date for a new customer
- The Effective Date of the billing run
- The Start Date Control options defined on the Set up general options window

Note: All line items billed on a dues bill have the same calculated Begin Date.

How the Begin Date for an anniversary billing cycle is calculated

Begin Date with no Start Date Control options selected

The following diagram illustrates how the Begin Date is determined for an anniversary dues billing cycle:



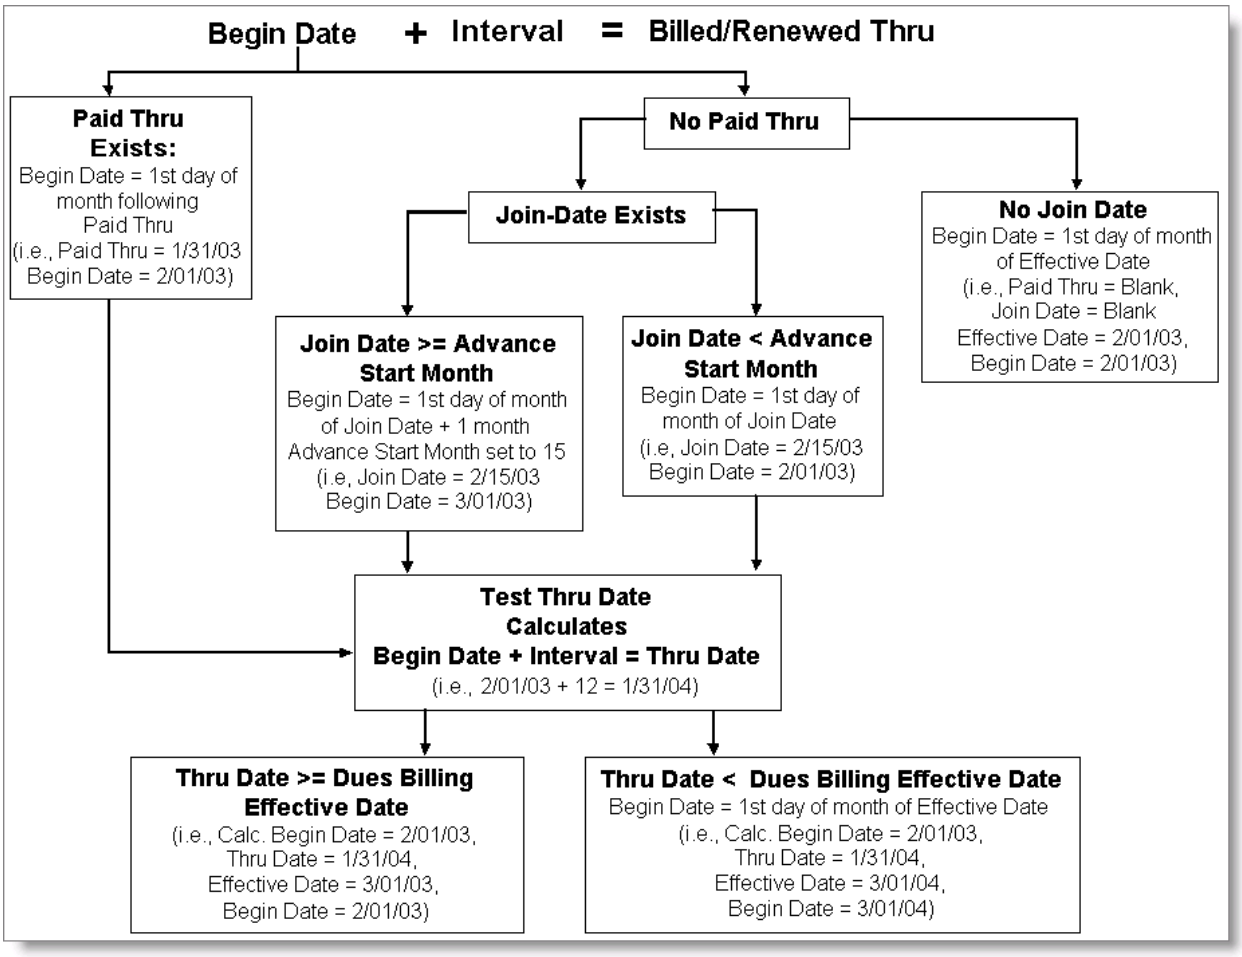
The following table shows examples of the Begin Date calculation using a dues billing Effective Date of 1/01/2004 with a 12-month term interval:

Sally - Renewal	01/01/1996 (NA)	12/31/2003	01/01/2004	Paid Thru
Billy - Did Not Get Billed Yet	12/01/1983 (NA)	11/30/2003	12/01/2003	Paid Thru
John - Hope to Rein-state	1/01/1991 (NA)	12/31/2003	01/01/2004	Effective Date
Mary - New Customer	12/15/2004	Blank	12/01/2004	Join Date

Joyce - New Customer	Blank	Blank	01/01/2004	Effective Date
Dave - Missed the Boat	1/01/1978	Blank	01/01/2004	Effective Date

Begin Date with Start Date Control options selected

The following diagram illustrates how the Begin Date is determined for an anniversary dues billing cycle using the Start Date Control options on the Set up general options window:



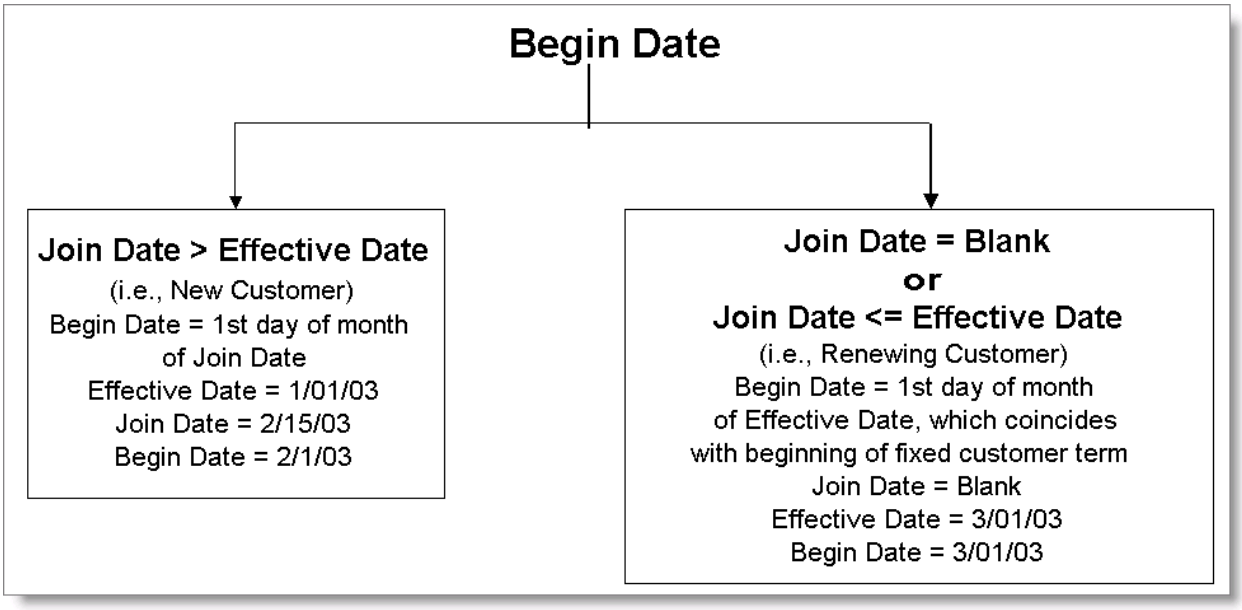
How the Begin Date is determined for an anniversary dues billing cycle.

The following table shows examples of the Begin Date calculation for a 12-month term interval using the Start Date Control options on the Set up general options window:

Mary - New Customer	N/A	04/27/200- 3	25	Yes	Yes	2 months	05/01/2003 - 04/30/2004
Joyce - New Customer	N/A	04/27/200- 3	25	No	No	N/A	04/01/2003 - 03/31/2004
Sally - Renewal	01/01/2002 - 12/31/2002	04/16/200- 3	15	Yes	Yes	3 months	05/01/2003- 04/30/2004
Olga - Old Customer	07/01/2002 - 06/30/2003	08/01/200- 3	15	Yes	Yes	3 months	Term remains the same

Begin Date for an annual billing cycle

The following diagram illustrates how the Begin Date is determined for an annual dues billing cycle.



How the Begin Date is determined for an annual dues billing cycle

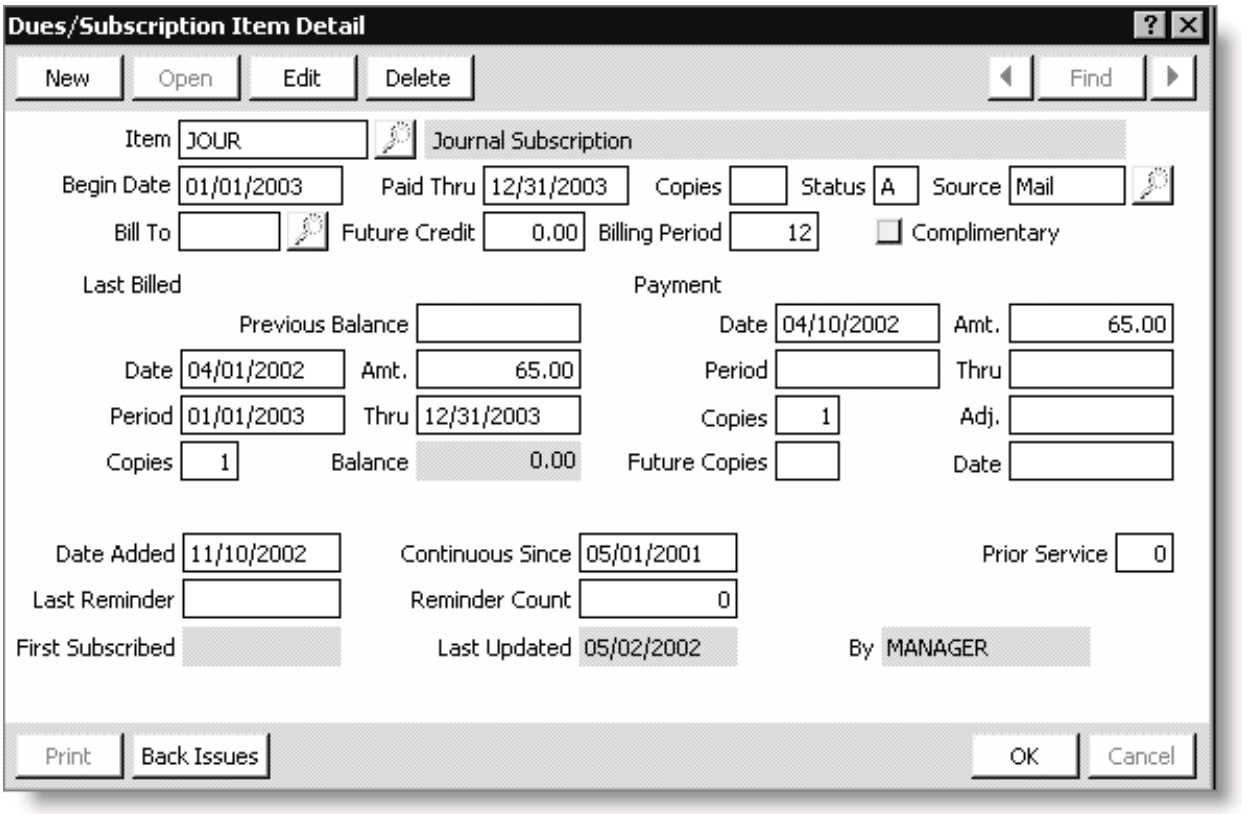
The following table shows examples of the Begin Date calculation using the dues billing Effective Date and fixed annual customer term of 1/01/2003 with a 12-month term interval:

Sally - Renewal	1/01/1996	12/31/2002	1/01/2003	Effective Date
Billy - Paid Thru, Not in Synch	12/01/1983	11/30/2002	1/01/2003	Effective Date
John - Hope to Reinstate	1/01/1991	12/31/2002	1/01/2003	Effective Date
Mary - Mid-term New Customer	7/15/2003	Blank	7/01/2003	Join Date
Joyce - New Customer	Blank	Blank	1/01/2003	Effective Date
Dave - Missed the Boat	1/01/1978	Blank	1/01/2003	Effective Date

Note: Note: If the Paid Thru Date is greater than the Effective Date, the customer is not going to be billed.

Calculating the Begin Date for a non-dues billing run

The same evaluation occurs when determining the Begin Date for a non-dues billing run, except the individual subscription Paid Thru date is used in place of the overall customer Paid Thru date, and the individual subscription Date Added is substituted for the overall customer Join Date. All other processing occurs for a dues billing run (anniversary and annual).

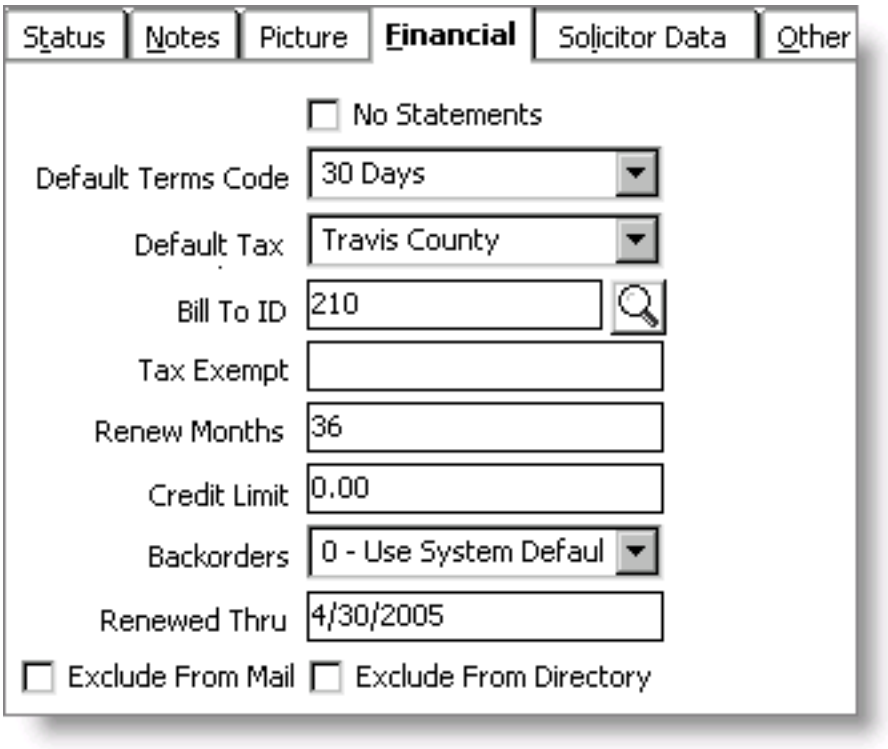


Example of Begin Date calculation for non-dues billing run

Calculating the Billing Interval for a dues billing run

The billing interval for a dues billing run is based upon a specific customer's Renew Months as defined on the Manage customers window's Financial tab (if non-zero) or the default Standard Billing Interval defined on the Set up general options window (from Billing, select Set up module > General options). However, in the case of an annual dues billing cycle, prorating factors may affect the calculated interval.

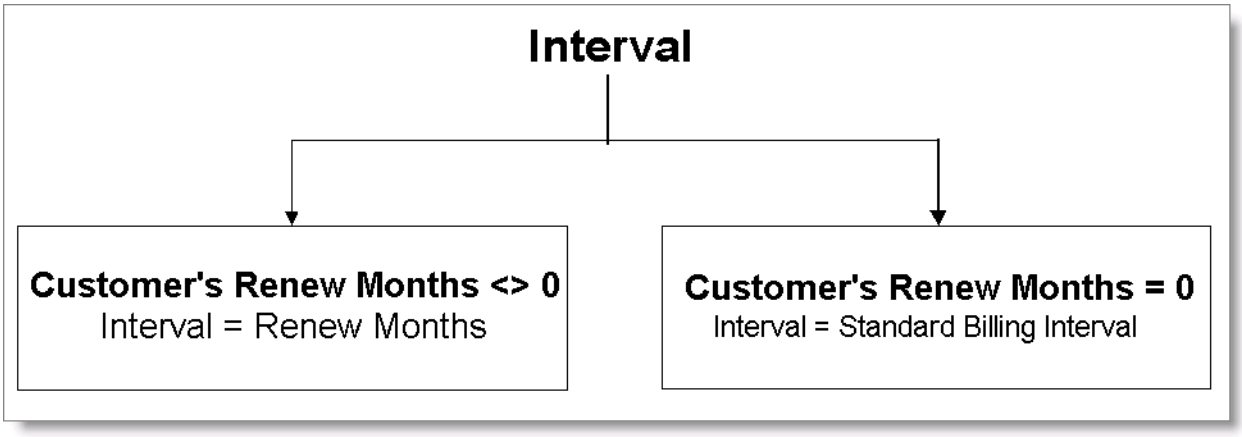
Note: Note: All line items billed on a dues bill have the same interval.



Example of Billing Interval using Renew Months on the Manage customers window Financial tab

Billing interval for anniversary dues billing cycle

The following diagram illustrates how the interval date is determined for an anniversary dues billing cycle.



The following table shows examples of how the billing interval is determined.

Betty - Default	0	12		1/01/2003	12	12/31/2003
Johnny - Quarterly	3	12		1/01/2003	3	3/31/2003
Tommy - Two Year	24	12		1/01/2002	24	12/31/2004

Billing interval for annual dues billing cycle

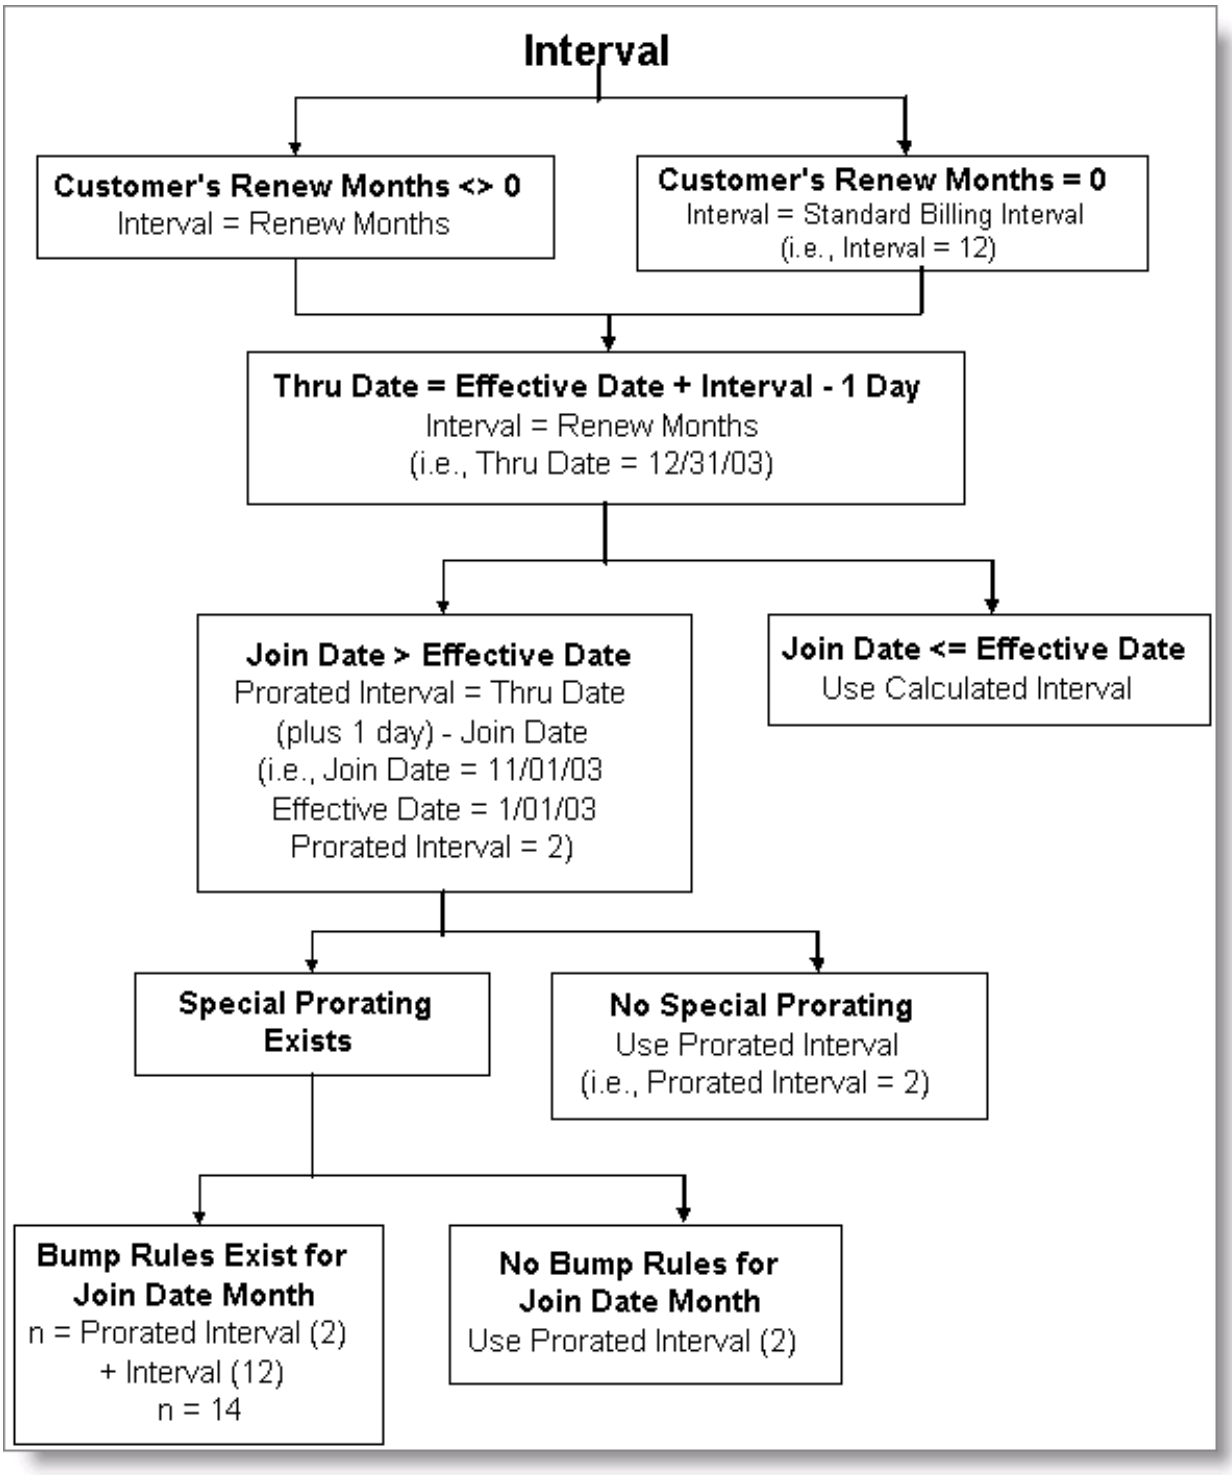
The billing interval calculation for an annual dues billing cycle is slightly different than for the anniversary dues billing cycle. The primary factor used to determine the Thru Date is the Effective Date, to which the interval is added. Although the calculated interval applies to all renewing customers, the interval may be prorated to be shorter (typically) or longer for new customers who join after the fixed customer/subscription term has begun.

> **Note:** Note: For a new customer's interval to be extended, you must set up Special Prorating rules so the “Bump” criteria applies to the customer's join month. See Prorating window.

The following table shows results of the billing interval calculation using a dues billing Effective Date (and fixed annual customer term) of 1/01/2003 with a 12-month Standard Billing Interval.

Betty - Default	0	1/01/1983	N/A	1/01/2003	12	12/31/2003
Johnny - Quarterly	3	1/01/1992	N/A	1/01/2003	3	3/31/2003
Tommy - Two Year	24	1/01/1988	N/A	1/01/2002	24	12/31/2004
Mary - New at Mid Term	0	7/15/2003	No	7/01/2003	6	12/31/2003

Jim - New Quarterly	3	2/01/2003	No	2/01/2003	2	3/31/2003
Sam - Last Minute Joiner	0	11/15/2003	Yes	11/01/2003	14	12/31/2004



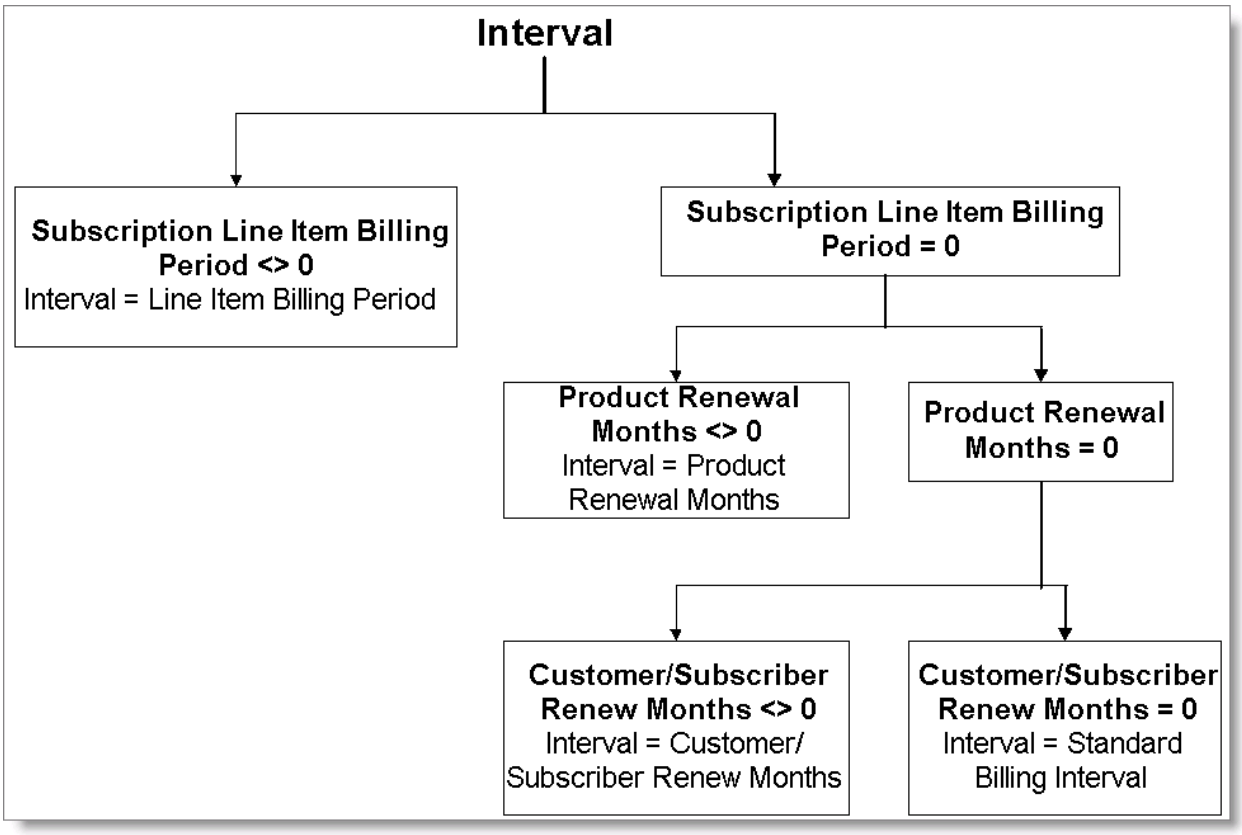
Billing Interval Calculation

Calculating the Billing Interval for a non-dues billing run

The billing interval set at the individual line item level or on the Set up products window takes precedence over the individual subscriber billing interval or the Standard Billing Interval defined on the Set up module window.

Billing interval for anniversary non-dues billing cycle

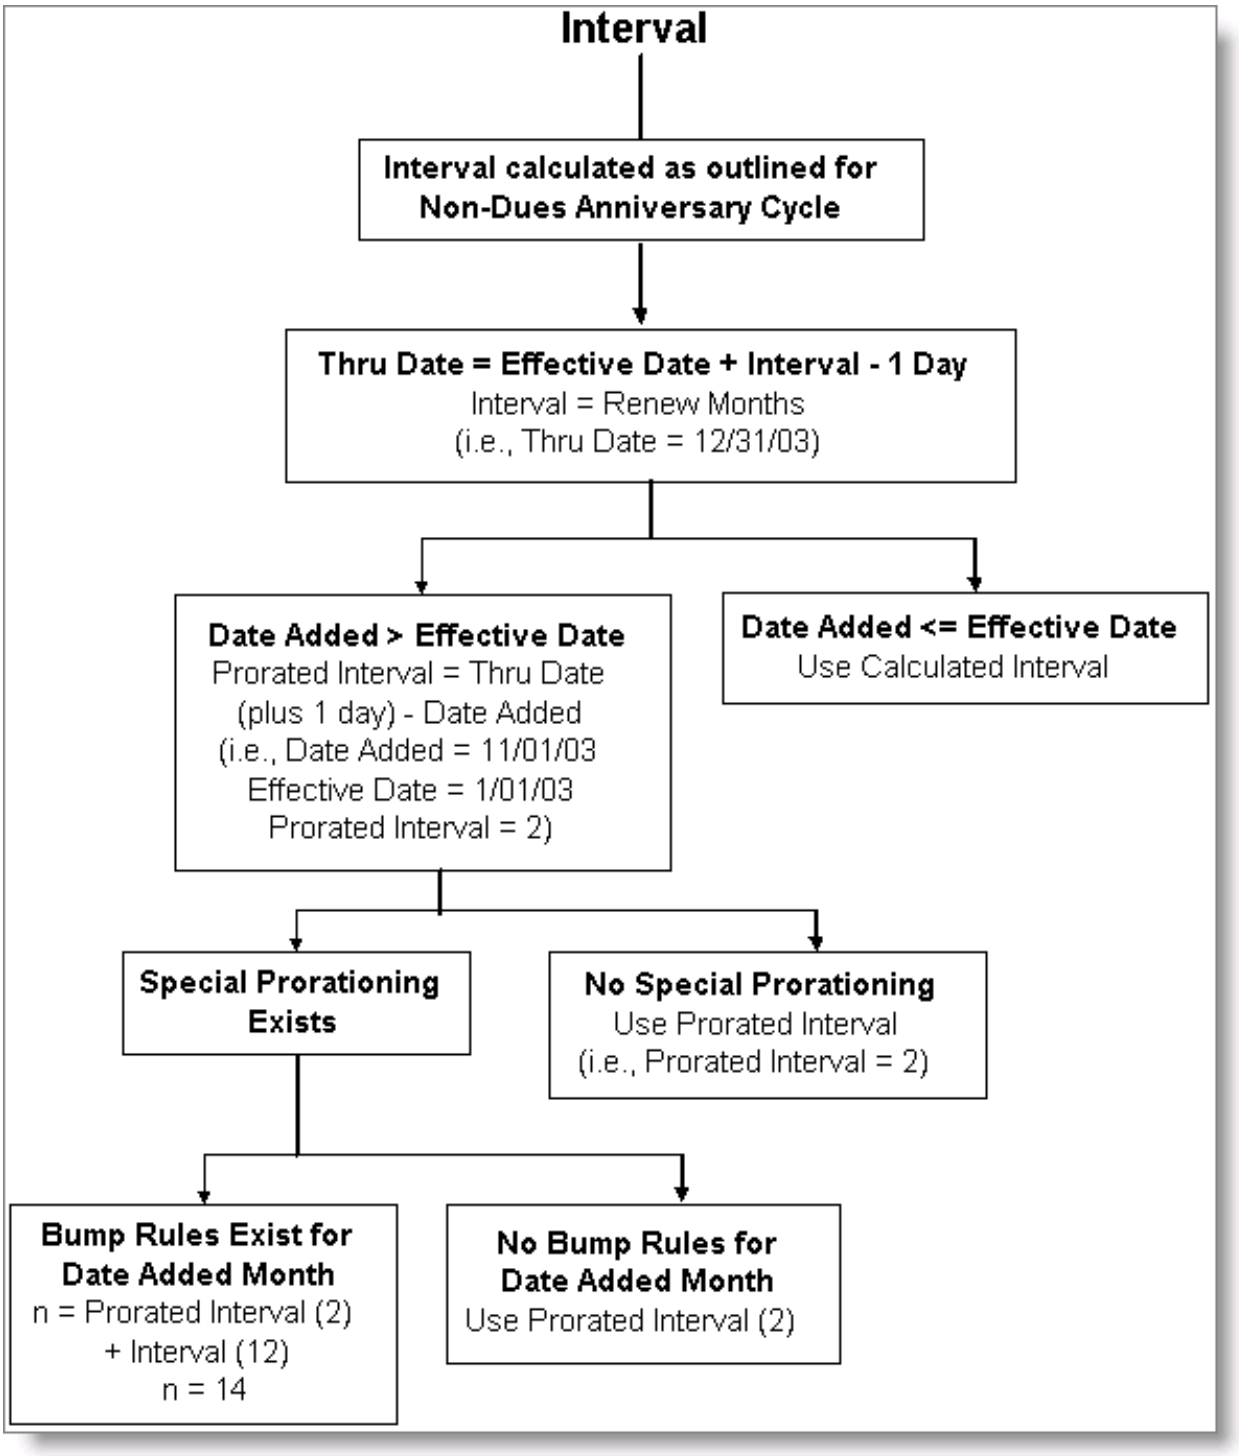
This is how the billing interval for anniversary cycles is determined:



Billing interval for anniversary billing cycle

Billing interval for annual non-dues billing cycle

The non-dues interval is calculated for an annual billing cycle using the non-dues anniversary billing cycle interval and then applying the same prorated or extended-term rules that are used in the dues annual billing cycle, except that it substitutes the line item's Date Added in place of the customer's Join Date.



Billing interval for annual billing cycle

Billing Payment Importer

iMIS Billing Payment Importer provides you with the ability to import financial transactions into iMIS, also referred to as “lockbox processing.” The importer is designed to import and process mass payment data from an external import file, allowing you to avoid entering this data manually, transaction by transaction. This module helps you if your payments are received and recorded by an outside organization, such as a bank (lockbox) or an affiliated organization, if this organization can supply the payment data in a usable electronic form.

This module requires at least two data elements to be resident in your import files: the payment amount and the customer ID (either the primary ID or the Major Key of each customer who has paid). For example, if you will be receiving data from an affiliated organization, such as the national or state organization and the receiving organization does not know the customer ID, be sure to have an organization-wide common identifier (such as a certificate number) in the data. You must maintain this common identifier in the Major Key field.

The benefits of using this interface instead of simply importing the data include the following:

- Provides a single interface for iMIS Billing payment transactions
- Uses the payment records to create dues payment transactions, which debit cash and credit income or deferred income
- Automatically applies each customer payment record amount to that customer's open balances until those balances are closed
- Any residual payment amount creates open credit balances, which you can refund or apply to future sales

The payment data that is imported will only be applied to a line item that already exists on the customer's Billing tab and has an outstanding positive balance. Importing payment data will not create new line items nor apply an amount against a line item that has a zero or negative balance. If the imported payment exceeds the balance, an overpayment will

be applied to the line item. If the line item does not exist, an open AR credit invoice will be created for the payment amount.

To enable the Billing Payment Importer

As with all iMIS modules, you must have this system enabled on the iMIS System Setup level. Refer to your service provider for more details.

To format billing data for import

The transaction format is tab- or comma-delimited input, with various types of records allowed in a single stream. The import file must contain a single batch header record, followed by any number of cash payment records.

> **Note:** Note: You cannot use the Dues Importer for accrual Dues billing cycle. You must use the AR Importer for accrual dues billing. To use the AR Importer, the System field (third field) under the Cash Payment Record should be AR. Make sure to insert the Invoice Number (sixth field) under the Cash Payment Record.

The major transaction formats include the following:

All Records

1	Record Type		Identifies the type of record
2	Batch Number	10 chars, all upper case	

Batch Header

1	Record Type	BH	Always “BH”
2	Batch Number	10 chars, all upper case	

3	Batch Date	Date	Date of batch
4	Batch Description	60 chars	
5	Control Count	Numeric	Optional
6	Control Amount	Monetary	Total of the batch of payments
7	Cash Account Code	10 chars, all upper case	Code assigned through AR/Cash> Set up tables > Cash accounts; indicates the cash account where the funds were deposited

Cash Payment Record

1	Record Type	PAY	Always “PAY”
2	Batch Number	10 chars, all upper case	Optional; if blank, defaults to batch header's batch number
3	System	DUES	
4	Member ID	10 chars, customer ID	Can substitute Major Key, if prefixed with * (asterisk)
5	Date	Date	Optional; if blank, defaults to batch header date
6	Product Code	Character	Optional; payments can be applied to specific Product Codes by including the Product Code in this field
7	Amount	Individual payment amount	Total amount of the check or credit card payment
8	Check/CCType	Check # or credit card type	Optional

9	CCNumber	Credit card #	Optional
10	CCExp	Credit card exp	Optional
11	Name On CC	Name on credit card	Optional
12	CCAuthorize	Credit card authorization code	Optional
13	Name	60 chars for audit trail	Optional but important. Will print on the transaction report to identify the customer/subscriber.
14	Comment	255 chars	Optional but important. Will print on the transaction report and related inquiries to explain the transaction, such as “Dues Payment” or “Subscription Payment."

Example billing import file

In the following import file example, two cash payment records follow the batch header line. Make sure that your Cash Account code exactly matches the setting on the Set up cash accounts window.

BH,DUES030802,3/08/02,Dues Payments for 3/08/02,,195.00,CASH

PAY,DUES030802,DUES,152,3/08/02,,95.00,1234,,,,Marcie Farmhaven,,,Dues Payment

PAY,DUES030801,DUES,111,3/08/02,,100.00,VISA,4610-8904-4005-4568,9/02,,C98084,Richard Harris,Dues Payment

Note: Note: If your import fails, check your import file for stray spaces, missing tabs, and so forth.

To review history before importing billing transactions

Before you introduce third-party transactions into your iMIS data file, view the relevant payment history for items such as dues for a sample customer (one who will be affected by the incoming data).

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer's record.
3. Select the Billing tab.
4. Click the History or Current button located at the bottom of the Billing tab. This is where your imported transactions should appear after the import process.

   Note: You can review the outstanding balances by printing the Open Items by Name report.

   To perform the billing import

   > **Note:** Caution! Back up your database. Before performing the import, it is very important that you make a current backup of your iMIS database. If your import is in error, you can restore your database from the backup copy; otherwise, you must manually delete each transaction in the imported batch.

1. From AR/Cash, select Enter and edit transactions> Import transactions to open the Select import file window.
2. Select the tab- or comma-delimited file that you prepared.

   Note: If a message is displayed indicating that the Cash Account code does not exist, check that the name of the Cash Account code in your import file matches the one in your iMIS-system Cash Account Table on the Set up cash accounts window.
3. When complete, open the Manage batches window.
4. To review the results of the import, select the open import batch on the Open Batches window and click Print Selected.

5. (optional) To finalize the transactions, select the open import batch on the Open Batches window and click Post Selected.

   To verify the billing import

   To verify that your transactions have correctly posted to your iMIS data file, view the relevant payment history again for your sample customer:

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer's record.
3. Select the Billing tab.
4. Click History and compare the contents of the History view, where the imported transactions should appear. Note whether the Paid Thru date advanced.

   To view open credits from a billing import

   If the payment amount imported was larger than the total outstanding balance for a customer, the amount of the overpayment automatically creates an open credit. To view overpayments by an individual:

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer's record.
3. Select the AR/Cash tab.

Billing

Billing Overview

The iMIS Billing feature enables you to process billing and record- related cash receipts for all categories of customers, whether your processing requirements are simple or sophisticated.

The four main functions of the Billing feature include the following:

- Producing billing documents, including Reminder Notices, Renewal Notices, and reports.
- Recording billing payments.
- Tracking long-term subscriptions and payment histories.
- Customizing your billing and renewal processes to fit the needs of your organization.

The Billing system is designed to manage the billing process for cyclical-type products. Cyclical products typically include dues, magazine and journal subscriptions, as well as other products that cover a set time period before becoming eligible for renewal. Billing manages mass renewal processing to bill a group of customers whose cyclical terms are nearing expiration as well as the individual on-demand billing of customers for either renewal or initial billing purposes. For new customers the billing process can be streamlined to be processed simultaneously with recording the payment for the products in a one-step approach

Billing can accommodate a variety of billing situations and scenarios, including those discussed in the following sections.

Dues billing versus non-dues billing

The billing and renewal processes depend on key dates and other factors that signify when a bill should be generated as well as the term (or date range) for which the product is being billed.

Within iMIS Billing, there are two distinct approaches to billing, Dues billing and Non-Dues billing.

Dues billing

Dues billing uses the overall customer to determine the dates and rules for billing. With this approach, multiple products can be billed at one time (i.e., national as well as regional products, optional section or journal products, and voluntary contributions), but the term for all of the products is synchronized in accordance with the key dates and rules tied to the customer. Likewise, the determination of when to generate the bill is also made at the customer level.

Non-dues billing

Non-Dues billing uses the individual subscription to determine the dates and rules for billing. This type of billing is typically used for non-membership dues cycles, such as those established for independent journal billings. With non-dues billing, you can billed the customer simultaneously for multiple products, but only if the cycle incorporates multiple products and then, only if the dates and rules tied to the multiple products happen to coincide.

iMIS can perform a mixture of Dues billing and Non-Dues billing processes. A customer can be billed for one or more products in the context of a membership “Dues Billing” and be subsequently and independently billed for other cyclical products, such as journal subscriptions or insurance.

A table maintenance setup option determines whether a particular billing should use the customer (Dues Billing) or individual subscription (Non-Dues Billing) to determine when to bill and what period to cover.

Annual versus anniversary billing

iMIS Billing can be processed on either an annual basis in which all renewing customers are billed based upon a fixed term such as a fiscal year, or on an anniversary basis in which the renewal billing is tied to the anniversary of the join date or initial term begin date for the cyclical product. iMIS can perform a mixture of annual and anniversary billing processes. It is entirely possible for a customer to be billed on an annual basis for membership dues and on an anniversary basis for an independently billed subscription, or vice versa.

Cash-based versus accrual-based accounting

Although the rest of iMIS uses accrual-based accounting methods, cash-based accounting is the preferred setup for recording customer billing. Cash-based accounting recognizes income only when payment is received, not when a customer is billed. Cash-based accounting is the preferred method for billing because billing payments are always an optional payment for the customer. Open A/R items are created when the accrual-based accounting method is used. If a customer does not make a payment by the end of the defined grace period, the A/R items must be reversed with adjusting transactions.

iMIS Billing terminology

The following terms are frequently used in the Billing module:

Accrual Accounting

Accounting method that recognizes income when income is earned, regardless of when or whether the payment is received. Accounts Receivable open items are created when bills and invoices are generated.

Anniversary Billing

Used when the membership terms fluctuate; usually corresponds to each customer's Join Month or subscription Begin Month.

Annual Billing

Used when all renewing customers have the same Begin and End dates. The Begin Date could vary for new customers who join later in the year, and their dues can be prorated for a partial term.

Batch

A group of transactions identified by a unique name or number.

Bill Begin

Projected Begin Date for an individual dues or subscription product. Refers to the first date of a term through which the item has been billed, whether or not payment has been received.

Billed Thru

Refers to the projected Paid Thru date (expiration date) for an individual dues or subscription product. It is the term ending date through which the item has been billed, whether or not payment has been received.

Billing Category

Optional subcategories of the customer type which define dues amounts when the customer type is not specific enough for an association's needs.

Billing Cycle

A defined billing run set up to bill a particular group of people for a particular set of products.

Billing Interval

Indicates how frequently customers are billed (The interval can be annual, semi-annual, quarterly, monthly, and so forth.)

Billing Term

The period of time between the beginning and ending dates for the services or products that are being billed.

Cash Accounting

The accounting method that recognizes income when payment is received, regardless of when bills or invoices were generated.

Credit

An amount used for accounting purposes that is represented on the right side of the accounting journal (or T) entries. Liabilities, equity, and income accounts carry credit bal-

ances in the General Ledger, so credit transaction amounts posted to them increase balances, while credits to asset and expense accounts decrease them.

Customer

A person who has met the membership criteria set up by the association.

Customer Type

Categories of membership that define the membership levels and amount charged for membership, or dues and subscriptions.

Debit

A positive amount used for accounting purposes that is represented on the left side of the accounting journal (or T) entries. Assets and expenses carry debit balances, so debit transaction amounts posted to these accounts increase their balances.

Effective Date

The date used to determine which customers will be billed. Normally, a customer or subscriber will be billed if they have met the billing selection criteria, their Paid Thru date is before the Effective Date, and if a renewal has not already been generated.

If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

List Billing

The generation of a single renewal notice to a Bill To third party, such as a company who will be responsible for paying the fees for multiple customers or subscribers.

Paid Thru

Refers to the expiration date of the membership or subscription, or the period through which the customer has paid. It is always the last day of the month.

Prorating

Allocating or assigning an amount to an activity or product that is proportional to some base (determined by a formula or procedure).

Renewal Notice

Refers to the request for renewal or continuation of a membership or subscription beyond the current expiration (Paid Thru) date.

Renewed Thru

Refers to the projected Paid Thru date for an overall membership. It is the term ending date through which the customer has been billed, whether or not payment has been received.

Subscriber

Individual, either customer or non-customer, who has purchased a product of a cyclical nature having a fixed term which can be renewed or repurchased upon term expiration.

Navigation for Billing

To gain access to the Billing task list items, select Billing from the navigation bar and the following task list displays.

Enter and edit payments

Select this task to enter payments received from customers.

Process billing

Select this task to bill customers and generate renewal notices. Use this option to specify which billing cycle to use and to select billing options (renewals).

Process accrual dues

(Displays when the Accrual accounting method is enabled on the Set up general options window.) Select this task to view all mass billing batches and print billing-oriented detail and summary reports for review and posting, and to enter adjustments that reduce or reverse normal open AR items.

Generate reports

Select this task to print customer cards, invoices, tables, and transaction lists.

Manage expired members

Select this task to process customers whose customer term has expired.

Set up module

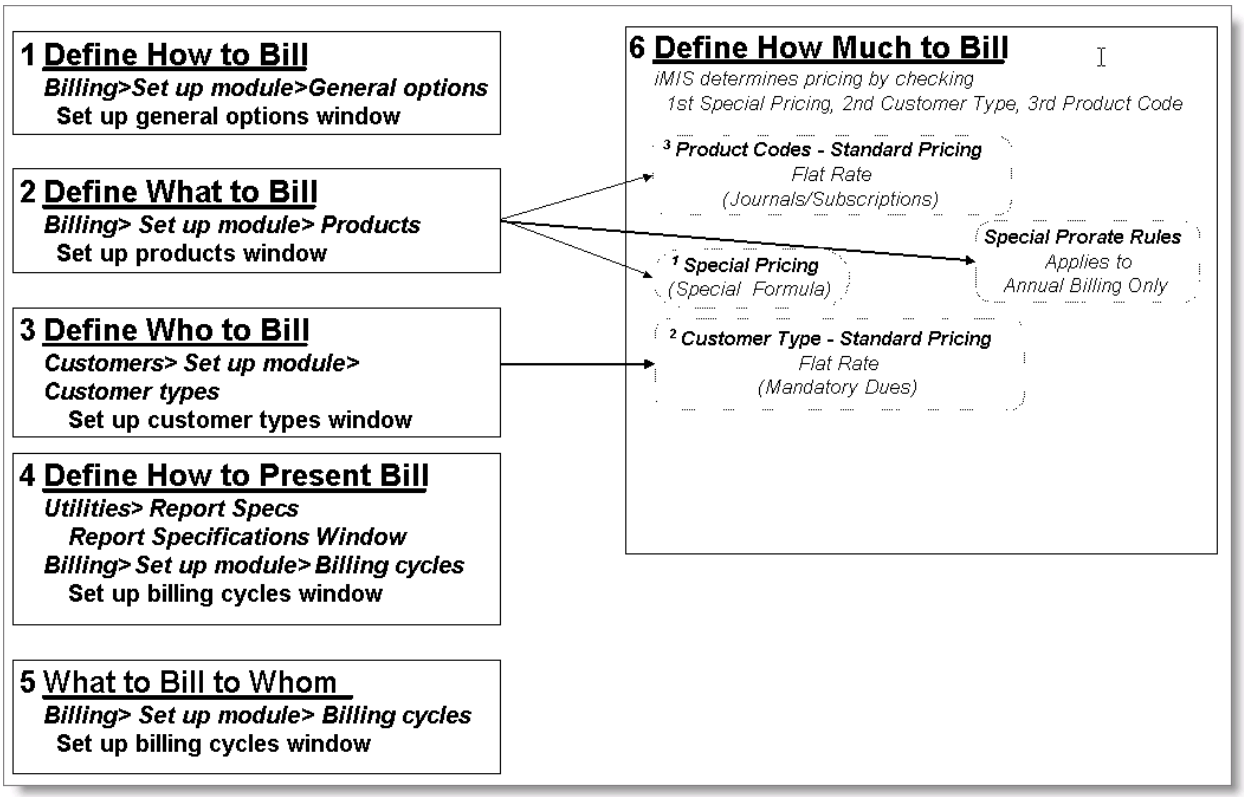
Select this task to set up general billing options, define billing cycles, and create products for billing.

Understanding the billing process

The Billing process includes the following steps:

1. Define who needs to be billed according to customer type and an optional category.
2. Decide for which billing products they are going to be billed and specify how to calculate the charges. In Billing system setup, you define product codes for customer billing.
3. Specify when to generate renewal notices. iMIS calculates renewal notices automatically by monitoring customers' Paid Thru (expiration) dates. Renewal notices can be processed individually or in batches.

The following diagram is an overview of the Billing setup process.



Billing setup process

These are the topics related to these processes:

- How to Bill: Performing Billing for Cash Dues (see "Cash Dues Billing")
- What to Bill: Defining Product Codes
- Who to Bill: Setting up Customer Types
- How to Present the Bill: Customizing the Renewal Notice Formats, Creating Billing Cycles
- What to Bill to Whom: Creating Billing Cycles
- How Much to Bill: Defining Special Pricing, Defining Prorating Rules
- How to Set Up List Billing: Setting up List Billing

Billing product codes

In iMIS Billing, you can categorize your product codes according to the following product-billing types:

- DUES - Represents customer fee items. Products of this type are usually specified for a given customer type (indicated in the Set up customer types window) to enable billing.
- VOL - Represents voluntary items such as donations or PAC (Political Action Committee) contributions. If suggested amounts are billed on an initial renewal notice, open balances for this type of dues product will not appear on the Reminder Notices unless other non-voluntary item(s) with open balances appear as well.
- MISC - Typically used for miscellaneous charges such as initiation fees. If one-time miscellaneous fees of this nature exist, special pricing rules must be defined to dictate the conditions for charging for when and how much to charge for the miscellaneous item. For example, special pricing rules that are based on Join Date.
- SEC - Represents optional additional section organizations, such as professional activity groups. This type should not be entered on the Set up customer types window, because SEC represents only groups that are joined on request. After section items have been subscribed to, the section items appear on Initial and Reminder Notices.
- CHAPT - Products that are defined as CHAPT are automatically created when the Chapter field is populated on the Manage customers window. This designation is used for optional chapter organizations that are available in addition to regular organizations. This type should not be entered on the Set up customer types window because chapter organizations vary from customer to customer.
- SUB - Represents optional billing products, such as journals and magazines that are available in addition to regular memberships. Generally, this type should not be entered on the Set up customer types window because subscription items are ordered only on request (unless they are mandatory and will be billed to all customers). After being subscribed to, SUB items appear on subsequent renewal billings.

Billing cycles

Billing setup enables you to define the billing cycles used to bill a particular group of customers for a particular group of products. The main types of billing cycles include:

- Dues Billing - A billing run used to collect dues for a given set of customers grouped by type, category, or both. This billing run has the Add Member Type Items options enabled.
- Non-Dues Billing - A separate billing run used to collect payments for optional products for customers.

For more information, see Creating an Accrual Dues Billing Cycle and Creating Billing Cycles.

Customer renewal notices

There are three format options for standard Dues Billing and Renewal Notices:

- Plain paper formats that can be customized with an organization's text.
- A variety of preprinted renewal notice forms (displayed in the Authorized iMIS Forms Catalog) are available for purchase. This catalog is a reliable source for quality forms compatible with iMIS, and is available by contacting the form supplier. The supplier's contact information is printed in the catalog.
- Crystal Report options for which both the format and text messages can be customized.

Billing reports

The Generate reports task list item on the Billing task list functions in a manner similar to other iMIS modules. The standard report formats provide a variety of billing cash receipts and other billing-related reports. These reports list unpaid customers and daily and monthly transactions (as they are exported to your General Ledger).

Renewal billing and payment workflow

Whether billing is processed using the cash or accrual accounting method, the initial renewal billing is processed in the same manner. Follow-up reminder notices can also be processed identically thru the Billing system, although optionally, accrual-based open

invoices can also appear on Accounts Receivable statements. In addition, the recording of payments varies slightly for cash-based billing and accrual-based open invoices.

Process for Cash Basis

The following describes a typical scenario of the steps involved in the renewal billing and payment process using the cash accounting method:

1. (Recommended) Run a pre-billing report and review the results to verify the correct group will be billed.
2. Make the appropriate selections on the Process billing window to bill the desired group and print the renewal notices.
3. iMIS will update the Billed Thru date so that non-paid customers will not get billed again in subsequent billing runs intended for a different group of customers. It also will create non-accounting or memo only open items (in the Subscriptions file) for each customer and product billed.
4. If corrections are necessary, appropriate set up adjustments can be made and customers can be rebilled on either an individual or mass- billing basis.
5. Payments are recorded on the Enter and edit payments window. Payment totals are automatically applied to open items using appropriate priority ordering, although the line item application can be overridden.

   iMIS updates the Paid Thru or expiration date to the new date, creates the cash-based accounting transactions, and creates billing history (activity) records for each billing product paid.
6. At appropriate age intervals, selections are made on the Process billing window to print reminder notices for those customers who have not paid.
7. After a grace period, delinquent customers (dues product billing only) can be suspended on a mass billing basis on the Manage expired members window so that they will no longer receive services.

If a suspended customer subsequently pays, they may become reinstated. It is possible to set up the system so that a reinstated customer will have an altered customer term from the one originally billed.

Process for Accrual Basis

The steps vary slightly for accrual-based products. The following is a typical workflow scenario for billings processed on an accrual basis:

1. (Recommended) Run a pre-billing report and review the results to verify the correct group will be billed.
2. Make the appropriate selections on the Process billing window (from Billing, select Process billing) to generate proposed billing data.

   iMIS will create a batch of unposted transactions that should be reviewed and either finalized or deleted.
3. Print the batch detail and/or summary report and review the results.

- If the results are incorrect, delete the batch, make appropriate setup adjustments, and try again.
- If the results are correct, post the batch.
  iMIS will update the Billed Thru date, and if opted for in system setup, also the Paid Thru date (not recommended). It also will create the accrual accounting entries to recognize income/deferred income, which in turn post to and create a summary invoice for each bill generated.

4. Make the appropriate selections on the Process billing window to generate the Initial Bills or Renewal Invoices.
5. As payments are received, they are recorded to the accrual invoice on the Enter and edit cash receipts window.

   The accrual invoice is reflected as a summary amount on the Enter and edit cash receipts window . If multiple line items were billed in relationship to the invoice, the payment will

be automatically applied to the corresponding line items. If a partial payment is entered, the payment will be applied on either a priority or proportional basis.

iMIS updates the Paid Thru or expiration date to the new date (if the system setup option is enabled), creates the transactions to record cash and reverse Accounts Receivable and creates billing history (activity) records for each billing product paid.

6. If adjustments are required, such as billed line items that need to be reversed (or increased), such adjustments should be made before the payment is made on the Enter and edit credit memos window or the Enter or edit debit memos window so that the payment does not get applied to reversed items or gets applied for the correct amount to otherwise adjusted items.
7. At appropriate age intervals, appropriate selections are made on the Process billing window to print reminder notices for those customers who have not paid. Optionally, the open invoices can simply be printed on the standard Accounts Receivable Statements.
8. After a grace period, reverse all remaining unpaid invoices through the Enter and edit credit memos window and manually change the customer's or subscription product's status to suspended or inactive.

Cash Dues Billing

The billing process involves entering payments, updating billing expiration (Paid Thru) dates in each customer's record, creating history (activity) records for each customer and line item paid, and generating cash/income accounting transactions that produce reports and then post to the GL interface.

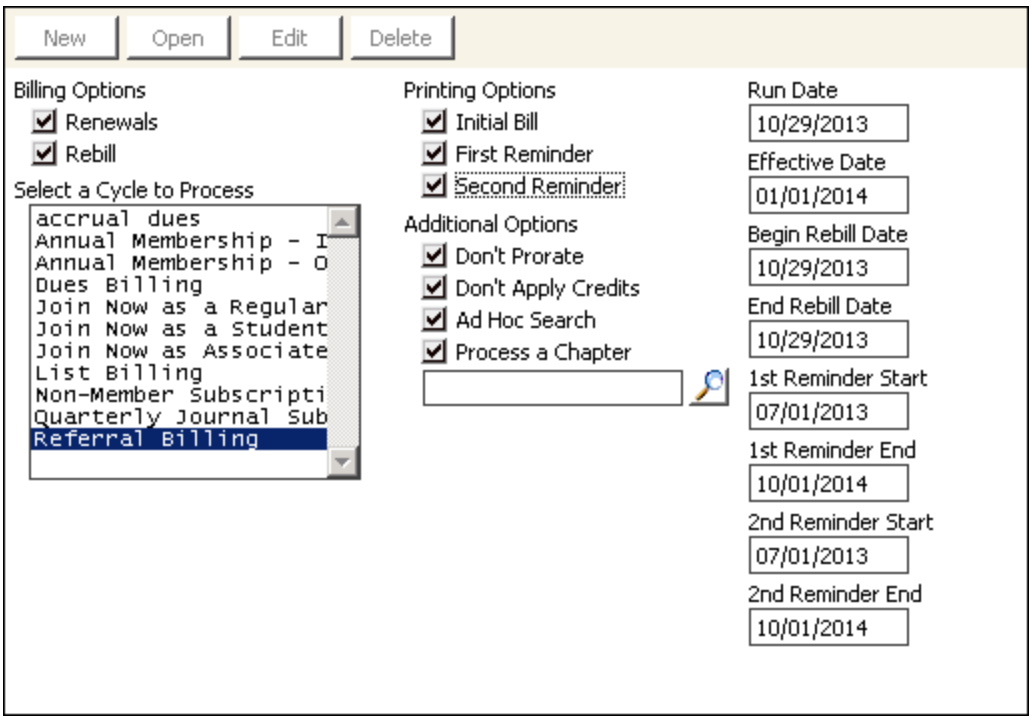
The billing procedure is designed to be as automatic as possible, minimizing extra steps and user intervention. Within one window, you can generate initial and reminder notices, produce bills for a large group of customers, perform individual and mass billing, and run bills for specific selection criteria such as customer type, Paid Thru date, and Renewed Thru date.

iMIS Billing allows multiple line items for each dues bill-up to ten standard items per customer type and optional subscription, section, and chapter lines. The billing periods can

be set up at a system-wide default interval and overridden at the individual customer or product level. Intervals can be controlled to affect the billing amounts and the expiration (Paid Thru) dates.

> **Note:** Caution! Billing affects critical data throughout the database. Never generate Renewal Notices without first creating a backup copy of your iMIS data!

Process billing window



Desktop: Billing > Process billing

Billing Options

Use the options in this section to specify the type of billing process to run.

Renewals - Select this option to generate new billing data for customers who match the billing cycle parameters. When this option is selected, the Effective Date field displays.

Rebill - Select this option to generate an invoice to correct a billing run generated previously. The Rebill option recalculates the billing data only if it finds a customer who was originally billed within the Begin Rebill Date and End Rebill Date range.

> **Note:** Note: Both the Renewals and Rebill options can be selected to bill other renewal candidates who fit the cycle and Effective Date criteria and who did not get billed earlier (for example, if an earlier bill run was canceled).

Printing Options

Use this section to indicate which notices are to be printed.

Initial Bill - Selecting this option prints an invoice when a customer's Paid Thru date expires before the Effective Date and the customer has not been billed previously for the term currently being billed. Select Initial Bill to print Renewal Notices for those customers whose billing dates are generated through the Billing Options selection.

First Reminder -- When selected, this option displays the 1st Reminder Start and 1st Reminder End date fields. This option prints a first reminder for those customers whose Initial Bill was run between the 1st Reminder Start and 1st Reminder End dates and who are currently not paid.

Second Reminder -- When selected, this option displays the 2nd Reminder Start and 2nd Reminder End date fields. This option prints a second reminder for those customers who were sent first reminders between the 2nd Reminder Start and 2nd Reminder End dates and who are currently not paid.

A reminder will be printed if the following criteria are met:

- The original run date falls within the reminder Start and End date range, inclusive,
- There is still at least one non-voluntary line item open, and
- The Paid Thru date has not been advanced.

Run Date

(Defaults to the current system date) Specifies when the billing run is processed. This date can be overwritten.

Effective Date

> **Note:** Note: The Effective Date is available on the Bill membership fees window only when Renewals or Rebill options are selected.

Specifies the first date of the new customer term for individuals to be included in the billing cycle. The Effective Date is a very important factor in determining who gets billed.

All customers who meet the other selection criteria and have a Paid Thru date before the Effective Date will be billed if a renewal has not already been generated. For example, if you enter 9/1/2001 in the Effective Date field, iMIS will bill renewals to individuals who have a Paid Thru date of 8/31/2001 or earlier and have not been billed previously.

For anniversary billing cycles, the Effective Date is calculated based on the Initial Bill Cut Off parameters set on the Billing and Reminder Notices window (from Billing, select Set up module > Billing cycles, select Bills/Reminders).

For annual billing cycles, the Effective Date is set to the first day of the current fiscal year based on the First Month of Fiscal Year field set on the AR/Cash Set up module window (from AR/Cash, select Set up module).

> **Note:** Caution! If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

Begin Rebill Date

Use to indicate the beginning date of a billing run to correct a billing run previously processed.

End Rebill Date

Use to indicate the ending date of a billing run to correct a billing run previously processed.

1st Reminder Start

Default date is based on the First Reminder Start parameter set on the Billing and Reminder Notices window. This date can be overwritten.

1st Reminder End

Default date is based on the First Reminder Cut Off parameter set on the Billing and Reminder Notices window. This date can be overwritten.

2nd Reminder Start

Default date is based on the Second Reminder Start parameter set on the Billing and Reminder Notices window. This date can be overwritten.

2nd Reminder End

Default date is based on the Second Reminder Cut Off parameter set on the Billing and Reminder Notices window. This date can be overwritten.

Select a Cycle to Process

This section contains a list of billing cycles created on the Set up billing cycles window. To define a new billing cycle, see Creating Billing Cycles.

Additional Options

Use this section to specify additional billing options.

Don't Prorate – Enable this checkbox to override prorating options set on the Set up general options window (from Billing, select Set up module > General) or the Set up products window (from Billing, select Set up module > Products). This option bills full-term amounts in all cases.

Don't Apply Credits – Enable this checkbox if you do not want to apply any outstanding AVAIL_CREDIT credit amounts to the renewal calculation run.

Ad Hoc Search – Enable this checkbox to generate additional restriction of the billing cycle based on the Name table.

Process a Chapter – Enable this checkbox to allow the selection of a specific chapter for dues product billing run. If a chapter is selected, only those records selected in the billing cycle whose main chapter code matches the selected chapter will be billed.

Run button

Used to generate and print invoices to your report destination (select File> Report Destination).

Running mass dues billing

Mass billing enables you to process a billing cycle for all customers who match the parameters defined in the selected billing cycle. The system decides which customers to bill by comparing the Paid Thru dates to the renewal Effective Date. iMIS also decides what and how much to bill based on your settings. (See Defining special pricing, Setting up customer types, and Defining product codes). You can run a mass billing cycle to print initial bills, first or second reminders, or run a billing cycle for all print options concurrently.

For example, you enter a Run Date of 9/26/2005 for all print options and the billing reminders that were set on the Billing and Reminder Notices window as:

- Initial Billing Cut Off = 3
- First Reminder Start = -2 and Cut Off = -1
- Second Reminder Start = -3 and Cut Off = -2

iMIS searches the database for customers who match the billing cycle parameters. An initial billing is generated for all customers who have a Paid Thru date before 12/01/2005 (applies to anniversary only). iMIS runs first reminders for unpaid customers whose initial billing was sent between 7/01/2005 and 8/01/2005 and second reminders for those who were initially billed between 6/01/2005 and 7/01/2005.

> **Note:** Caution! Before initial billing is run, print a test-billing run and verify the results.

To verify billing of new renewals

Initial billing is an important process within iMIS. It generates and updates a great deal of information in the customer (Name) and billing files. To avoid errors caused by incorrect settings and dates, follow these steps for every initial billing run:

1. Run a billing procedure report.

1. From Customers, select Generate reports to open the Generate reports window.
2. Select Rosters from the Report Types list.
3. Select Member Index with Additional User Fields from the Available Reports list.
4. Select Options > Additional Fields.
5. Add Name.PAID_THRU to the first field.

   Example ad hoc search comparison lines:

   Name.PAID_THRU <= '12/31/2001'(one day before Effective Date)

   Name.MEMBER_TYPE = M,CM (customer types included in billing cycle)

   Name.STATUS begins with A (assuming inactive and suspended customers are not included in the billing cycle)

   This should agree with the number of renewal notices that the mass billing procedure will generate. If billing on an anniversary basis, narrow down the Name.PAID_THRU date (for example, Name.PAID_THRU >= 12/01/2001 and Name.PAID_THRU <= 12/31/2001). The search criteria leave out one important field, Renewed Thru, which iMIS billing also considers in determining who needs billing. To get an accurate representation of the customers iMIS will bill, run a test on Renewed Thru. To do this, enter an ad hoc selection with a single calculation line. Enter a SQL statement similar to the following example in the Comparison Value Text area:

   from Name, Name_Fin where Name_Fin.ID = Name.ID

   and Name.PAID_THRU < '1/01/2002'

   and Name_Fin.RENEWED_THRU < '1/01/2002'

   and Name.MEMBER_TYPE in ('M','CM')

and Name.STATUS like 'A%'

If the results vary from the first report to the second, there may be a problem with the Name_Fin.RENEWED_THRU date. iMIS will assume the customer has already been billed. See Billing run troubleshooting.

2. Back up your iMIS data.
3. Run the billing. See To run initial mass dues billings for complete instructions.

   Note: Print the initial bills when you generate the billing renewal data. Be careful to use the correct Effective Date. You can override the Run Date if needed.
4. Verify the number of customers billed. Check the number of customers billed against your customer report.
5. (optional) Run the Open Items by Name report. The report's Begin Date and End Date should reflect the same Run Date as the renewal-billing run. This report will give you the count of customers billed.
6. Investigate discrepancies between the reports produced (who should be billed versus who was actually billed).

To run initial mass dues billings

> **Note:** Caution! If you want to override the Effective Date, make the change after selecting a billing cycle. If you change the Effective Date and then select a billing cycle, the Effective Date reverts to the default.

1. From Billing, select Process billing to open the Process billing window.
2. Click New.
3. Select the Renewals Billing Options. The default Effective Date field automatically displays. Select Renewals to process new renewals.
4. Select a billing cycle to process that was previously created in the Set up billing cycles window.

5. Select the Printing Options
6. (optional) Override the Run Date.
7. (optional) Override the Effective Date.
8. (optional) Select the Additional Options.
9. Click Run to process the billing run.

To rebill to correct a mass dues billing

iMIS provides a Rebill feature that enables you to correct a previous mass billing. Rebill a mass run if:

- The pricing table originally used for the renewal bill run was incorrect; or
- The original dues billing did not include a line item.

For example, rebill the sample initial dues bill discussed in To run initial mass dues billings.

> **Note:** Note: A renewal billing can be combined with a rebilling.

1. Correct the reason for the rebill.

- If you need to add a product to the Billing Cycle, see Creating Billing Cycles.
- If you need to change the pricing of a product, see Setting up Customer Types, or Defining Special Pricing.

2. From Billing, select Process billing to open the Process billing window.
3. Click New.
4. Select Rebill to change or correct a billing run generated previously.
5. Select a billing cycle to process.
6. Select the Printing Options.

7. Enter the original Run Date range in the Begin Rebill Date and End Rebill Date fields.
8. Click Run to process the billing run.

> **Note:** Tip: See Billing run troubleshooting.

Running individual dues billing

This section explains how to process renewal and rebill billing cycles for an individual (frequently done when a new customer joins an organization). The process for running individual dues billings includes the following:

1. Select the customer for whom to process a renewal or rebill billing cycle
2. (optional) Add line items
3. Create an invoice
4. Process the billing run

To run individual dues renewal billing

> **Note:** Note: If a dues payment is received with the customer application, see Combining Billing and Payment for a New Customer for instructions on how to add information for a new customer and apply payment simultaneously.

1. From Customers, select Manage customers.
2. Find the customer's record.
3. Select the Billing tab.
4. (optional) Add line items. In billing, line items may need to be added if a customer has elected to:

- Join an optional section;
- Join a secondary chapter (other than the main chapter referenced on the Manage customers window); or

- Subscribe to an optional journal (assuming the billing cycle provides for the billing of such optional items).

  Note: In the case of a non-dues billing run, the line item to be billed must exist in order for the item to be billed.

5. Click New on the Billing tab. An empty Dues/Subscription Item Detail window opens.
6. Click New on the Dues/Subscription Item Detail window.
7. Enter the product code in the Item field or select the lookup icon to find an available value. For this example, a newsletter subscription has been added.
8. Click Save. The Dues/Subscription Item Detail window closes and the new subscription item is inserted as a new billing item on the Billing tab.

   Note: When this customer is billed, the new subscription item will be added to the invoice.
9. Click Create Invoice. The Dues Billing Selections window opens.
10. Click New.
11. Select a billing cycle to process.
12. Select Renewals to generate a new billing.
13. Select the Printing Options. In most cases, when generating a new bill you should select Initial Bill when Renewals is selected.
14. (optional) Override the Run Date.
15. (optional) Override the Effective Date.
16. (optional) Select Additional Options.
17. Click Run to process the billing run.

    For annual billing, the Paid Thru date will be the last day of the fiscal year. In the previous example, the customer is billed on an anniversary basis and the journal subscription on an annual basis.

> **Note:** Tip: See Billing run troubleshooting.

Rebilling to correct an individual dues billing

iMIS provides a rebill feature that allows an additional invoice to be printed to correct the original invoice. Rebill an individual if any of the following apply:

- The pricing table originally used for the renewal bill run was incorrect; or
- Any of the following information on a customer's record has changed: Chapter code, Customer Type, a field that special pricing was based upon, or the customer's Renew Months (for example, billing term change).

To rebill an individual dues billing

In the following example, we rebill an individual. The billing cycle selected is based on billing individuals whose customer type is M.

After you process the billing run, the Dues Billing Selections window closes and the line items that were billed to the individual automatically display on the Billing tab.

In this example, iMIS determined the dues rate used to bill this individual by checking the rates defined in the following windows in the order shown.

> **Note:** Note: Special pricing always overrides what is set in the Set up customer types window and Set up products window.

- First - Special Pricing - For Basic Dues, a special price of $50 has been set for customer type M, category 1 (M/1).
- Second - Set up customer types window - Our customer is classified as customer type M. The Set up customer types window contains a rate of $75 for Basic and a rate of $20 for PAC.
- Third - Product Codes - The standard pricing for Basic was set to zero.

Based on the rates set in these windows, iMIS will bill $50 for the Basic line item for this individual using the rates set in the Special Pricing window.

To process and rebill Chapter changes

Occasionally, a customer's chapter association will change (for example, if the customer moves or if a data entry error was made). To demonstrate this, we will change a customer's chapter affiliation and rebill the customer when the customer has an open dues balance.

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer's record.
3. Select the Status tab and select a different Chapter code.
4. Click Save.
5. Select the Billing tab.
6. Double-click the line item for the old chapter to open the Dues/Subscription Item Detail window.
7. Click Delete. A system message is displayed asking you to confirm the deletion.
8. Click Yes to delete the item record.
9. Note the Bill Date displayed on the existing open dues line items.
10. Click Create Invoice to open the Dues Billing Selections window.
11. Click New.
12. Select the billing cycle.
13. Select Rebill.
14. (optional) Select Initial Bill to print the Renewal Notice.
15. Enter the original Bill Date in the Begin Rebill Date and End Rebill Date fields.
16. (optional) Override the Run Date to agree with the original Bill Date so you can retain the bill's original timing for Reminder Notice printing.

17. Click Run.
18. Verify that the dues amount is calculated properly for the new chapter on the Billing tab.

    If you have a zero balance on a chapter dues item, and you change the chapter on the Manage customers window, the zero balance line item will be deleted and replaced with the new chapter item.

    To process and rebill customer type changes

    Occasionally, you may need to change the customer type for a particular customer (for example, if a customer changes types or if there was a data entry error).

1. From Customers, select Manage customers to open the Manage customers window.
2. Change the Member Type.
3. Click Save.
4. Select the Billing tab.
5. (Recommended) If different dues products are linked to the Set up customer types window for the new customer type, use the following steps to delete the dues item(s) that were billed under the old customer type.

   Note: If the customer will continue to receive any non-dues items such as subscriptions or optional items, do not delete these items. Delete only the customer type items that are not included for the new customer type.

1. Double-click the line item to be deleted.
2. Click Delete.

   Note: Subscription or dues items with payments should not be deleted. The best practice is to set the status to I.

6. Select the Financial tab.
7. Delete the Renewed Thru date.
8. Click Save.

9. Take note of the Bill Date displayed for the open dues line item on the Dues Subscription window.
10. Click Create Invoice to open the Dues Billing Selections window.
11. Select the correct billing cycle.
12. Select both the Renewals and Rebill options under the Billing Options area.
13. (optional) Select Initial Bill to print the Renewal Notice.
14. Enter the original Bill Date in the Begin Rebill Date and End Rebill Date fields.
15. (optional) Override the Run Date to the original Bill Date to retain the bill's original timing for Reminder Notice printing.
16. Click Run.
17. Verify that the main dues amount is calculated properly for the new customer type on the Billing tab.

Printing reminder notices

Reminder Notices can be run at the same time you print Renewal Notices, or you can print them separately.

When you print a reminder notice, the following field conditions are evaluated to determine if a reminder notice will print for a customer.

First reminder

Prints an initial reminder notice for customers with outstanding balances when the following conditions exist:

- The Paid Thru field on the Status tab (Name.PAID_THRU) contains a date that is earlier than the date on the Renewed Thru field on the Financial tab (Name.Fin.RENEWED_THRU) located on the Manage customers window (from Customers, select Manage customers).

- The Status field (Name.STATUS) on the Manage customers window is not set to S (Suspended), I (Inactive), or D (Marked for deletion).
- The balance for the Subscriptions record (Subscriptions.BALANCE) is greater than zero.
- Subscriptions.REMINDER_COUNT is equal to 1
- The Bill Date (Subscriptions.BILL_DATE) is between the 1st Reminder Start and 1st Reminder End dates on the Process billing window.

  Second reminder

  Prints a secondary reminder notice for customers with outstanding balances when the following conditions exist:

- The Paid Thru date on the Status tab (Name.PAID_THRU) contains a date that is earlier than the Renewed Thru field on the Financial tab (Name.Find.RENEWED_THRU) located on the Manage customers window.
- The Status field (Name.STATUS) on the Manage customers window is not set to S (Suspended), I (Inactive), or D (Marked for deletion).
- The balance for the Subscriptions record (Subscriptions.BALANCE) is greater than zero.
- Subscriptions.REMINDER_COUNT is equal to 2.
- The Bill Date (Subscriptions.BILL_DATE) is between the 2nd Reminder Start and 2nd Reminder End dates on the Process billing window.

  To print reminder notices

  Note: Note: Do not check either box in the Billing Options area.

1. From Billing, select Process billing to open the Process billing window.
2. Click New.
3. Select the billing cycle to process.
4. Select the Printing Options.

5. (optional) Override the Run Date.
6. (optional) Select Additional Options.
7. Select your report destination.
8. Click Run to print the reminder notices.

Generating mass billing data

For a dues billing run

When the Renewal billing option is selected on a new mass dues billing, the following decisions are made to determine who gets billed and what gets billed.

Who gets billed

Customers who meet the following requirements:

- Meet the customer type and billing category selection requirements of the selected billing cycle.
- Have an Active status that begins with the A, or have an Inactive status that begins with the letter I, or have a Suspended status that begins with the letter S. Inactive and suspended customers will be billed only if the Include options have been selected for the billing cycle.
- Have an overall customer term Paid Thru date before the Effective Date on the Dues Billing Selections window.
- Have an overall customer term Renewed Thru date before the Effective Date on the Dues Billing Selections window.
- If specified, have a main Chapter Code on the Manage customers window that matches the chapter under the Additional Options - Process a Chapter selection on the Dues Billing Selections window.
- Have data elements that pass the test of the specified Ad Hoc Search under Additional Options on the Dues Billing Selections window (if selected).

What gets billed

Line items that meet the following requirements:

- Are cross-referenced on the Set up customer types window.
- Are not cross-referenced on the Set up customer types window, but have an active status and are included, either directly or indirectly (for example, by type), in the billing cycle's list of products.

  Note: For a dues billing run where the Add Member Type Items option has been enabled, the Paid Thru and Billed Thru dates of the individual lines items are ignored.

  Note: If an individual line item has a different Paid Thru date than that of the overall customer but is included in the dues billing cycle, the new billed term forces that line item to be resynchronized to match that of the overall customer term date status.

For a non-dues billing run

While data for customers of non-dues products must match the criteria as outlined in the following “Who Gets Billed” section, only customers who have one or more line items that meet the billing criteria will be billed.

Who gets billed

Customers of non-dues products who meet the following criteria:

- Meet the customer type and billing category selection requirements of the selected billing cycle.
- Have an Active status that begins with the letter A, have an Inactive status that begins with the letter I, or have a Suspended status that begins with the letter S. Inactive and suspended customers will be billed only if the Include options have been selected for the billing cycle.
- Have a main Chapter code on the Manage customers window that matches the chapter (if specified) under Additional Options - Process a Chapter on the Dues Billing Selections window.
- Have data elements that pass the test of the specified Ad Hoc Search under Additional

Options on the Dues Billing Selections window (if selected).

- Have at least one billable line item that meets the criteria in the list of items to be billed.

What gets billed

Line items that meet the following criteria:

- Already exists in the customer's list of product line items (for example, items displayed on the top half of the Billing tab).
- Are included, either directly or indirectly, in the billing cycle's list of products.
- Have an Active status or, in the case of a section-type product, have an Inactive status.
- Have an individual non-dues product Paid Thru date before the Effective Date on the Dues Billing Selections window.
- Have an individual non-dues product Billed Thru date before the Effective Date on the Dues Billing Selections window.

For a dues rebilling run

When the Rebill billing option is selected on a mass dues rebilling run, the criteria for who gets billed is the same as the requirements for the initial billing run, except that the Renewed Thru date should be in advance of the Effective Date. The original billing date of the main dues product (the product that is listed first on the Set up customer types window) must fall within the specified rebill date range.

Who gets billed

Customers who meet the following criteria:

- Meet the customer type and billing category selection requirements of the selected billing cycle.
- Have an Active status that begins with the letter A, have an Inactive status that begins with the letter I, or have a Suspended status that begins with the letter. Inactive and suspended customers will be billed only if the Include options have been selected for the billing cycle.

- Have an overall customer term Paid Thru date before the Effective Date on the Process billing window.
- Have a main Chapter code on the Manage customers window that matches the chapter (if specified) under Additional Options - Process a Chapter on the Dues Billing Selections window.
- Have data elements that pass the test of the specified Ad Hoc Search under Additional Options on the Process billing window (if selected).
- Have an overall customer term Renewed Thru date in advance of the Effective Date on the Process billing window.
- Have an active line item whose product code matches that of the first cross-referenced item on the associated Set up customer types window and has an original bill date within the Begin Rebill and End Rebill Date range, inclusive.

  What gets billed

  Line items that meet the following criteria:

- Are cross-referenced on the Set up customer types window.
- Are not cross-referenced on the Set up customer types window, but have an active status and are included, either directly or indirectly (for example, by type), in the billing cycle's list of products.

For a non-dues rebilling run

Who gets billed

Customers of non-dues products who meet the following criteria:

- Meet the customer type and billing category selection requirements of the selected billing cycle.
- Have an Active status that begins with the letter A, have an Inactive status that begins with the letter I, or have a Suspended status that begins with the letter S. Inactive and suspended customers will be billed only if the Include options have been selected for the

billing cycle.

- Have a main Chapter code on the Manage customers window that matches the chapter (if specified) under Additional Options - Process a Chapter on the Dues Billing Selections window.
- Have data elements that pass the test of the specified Ad Hoc Search under Additional Options of the Dues Billing Selections window (if selected).
- Have at least one rebillable line item that meets the criteria in the following list.

  What gets billed

  Line items that meet the following criteria:

- Exist in the customer's list of product line items (for example, items displayed on the Billing tab).
- Are included, either directly or indirectly, in the billing cycle's list of products.
- Have an Active status or, in the case of a section type product, have an Inactive status.
- Have an individual non-dues product Paid Thru date before the Effective Date on the Dues Billing Selections window.
- Have an individual non-dues product Billed Thru date later than the Effective Date on the Dues Billing Selections window.
- Have an original Run Date within the Begin Rebill Date and End Rebill Date range, inclusive.

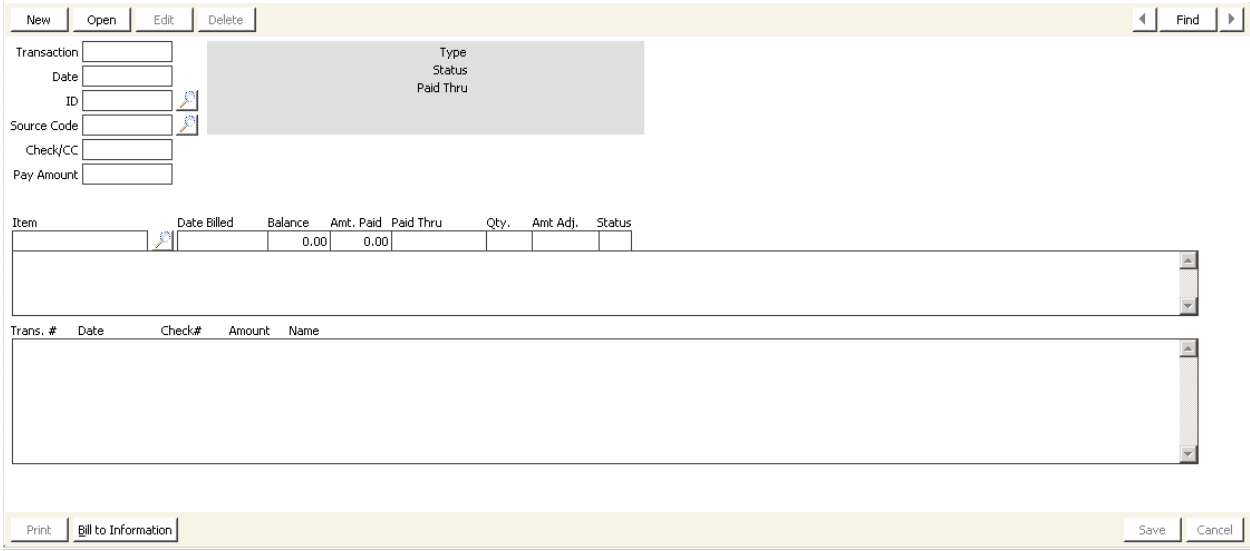
Cash Dues Payments

As you enter a payment, iMIS automatically completes the following tasks:

- Updates the product open item (if any)
- Moves the Paid Thru date forward by a preset period (when paid in full)
- Creates the proper activity/history records

Note: Note: For more on batch control, see Accounts Receivable.

Enter and edit payments window



Desktop: Billing > Enter and edit payments

Transaction

When you complete a payment transaction, iMIS assigns a sequential number in this field. This field cannot be changed.

Date

The transaction date defaults to the current system date and can be overwritten. If Batch Control is used, this date defaults to the batch date and cannot be overwritten.

Id

Specifies a customer ID or select the lookup icon to select a value.

Source Code

Specifies a user-defined code, often used for marketing purposes, or select the lookup icon to select a value. Validates from the SOURCE_CODE table and is required if the Force Source Coding option is enabled on the Customer Setup - Basic Options window.

Check/CC

Specifies the payment's check number or credit/debit card abbreviation (for example, VISA, MC, DISC, or AMEX). To enter a credit/debit card payment, the credit/debit card code must be defined on the Set up cash accounts window. When a credit/debit card code is entered, iMIS displays the following additional fields where you can enter specific card information.

- CC # - Enter the credit/debit card number.

  Note: For credit cards only, if you enter the credit card number incorrectly, a message is displayed informing you that the credit card did not pass validation and asking you if you want to override the validation check. Make sure to reenter the card number correctly.

- CSC - (Displays only if the associated card authorization account uses immediate authorization, or deferred authorization with the Save CSC Prior to Authorization checkbox selected) Enter the Card Security Code (CSC). You can make the CSC a required value for specific credit/debit card cash accounts. See Accounts Receivable for more on making the CSC a required value.
- Exp - Enter the card's expiration date (mm/yy).
- Authorize - Enter any authorization code here.
- Name on CC - Enter the name as it appears on the card.
- Issue # - (Displays only when the associated cash account accepts an issue number) Enter the European debit card's issue number.
- Issue Date - (Displays only when the associated cash account accepts an issue date) Enter the European debit card's issue date (mm/yy).

  Note: Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Pay Amount

Specifies the amount paid. The payment amount is applied automatically to each open line item, beginning with the main customer dues.

Total Balance

This field is automatically populated with the outstanding balance for all product items.

Item

Specifies a line item, or click the lookup icon to select a value. To enter a new line item, highlight a new line and enter the new product.

Date Billed

This field is automatically populated with the date the line item was billed.

Balance

This field is automatically populated with the outstanding balance for the line item.

Amt Paid

Displays the payment amount for the line item selected. You can also use this field to manually override amount paid for an individual line item.

Paid Thru

Specifies the date through which payments have been applied for the line item. As full payment is applied to a line item, the Paid Thru date field advances to the end of the bill term or beyond.

Qty

Specifies the number of the line items purchased.

Amt Adj

Specifies the dollar amount to be adjusted from this line item.

Status

(Defaults to current status) Specifies the product's billing status. The status code field relates to whether the subscription line item is active or inactive. This field determines if this product will be billed again, but does not relate to the Amt Adj field.

Updated information list

Displays the Trans #, Date, Check#, Amount, and Name fields.

New Bill From

(Displays when processing bills for new customers) This option works the same way as the Effective Date on the Process billing window. If billing is based on an annual schedule, the New Bill From date must be set to the first day of the first month of the annual term even if the customer has a Join Date subsequent to that date. (For example, if the annual term starts on 01/01/2001 and the customer joined 07/15/2001, the New Bill From date must be 01/01/2001.)

For anniversary billing, the date is set to the first day of the month in which you are processing the billing payment or to the value entered on the Advance Start Month as of field.

Bill New Mem Type Items

(Displays when processing bills for new customers) Enable to automatically select all Dues products that are listed in the Set up customer types window for that customer type.

Bill to Information

Opens the Bill to Information window where you can enter the Bill to ID, as well as the name and address of the entity being billed.

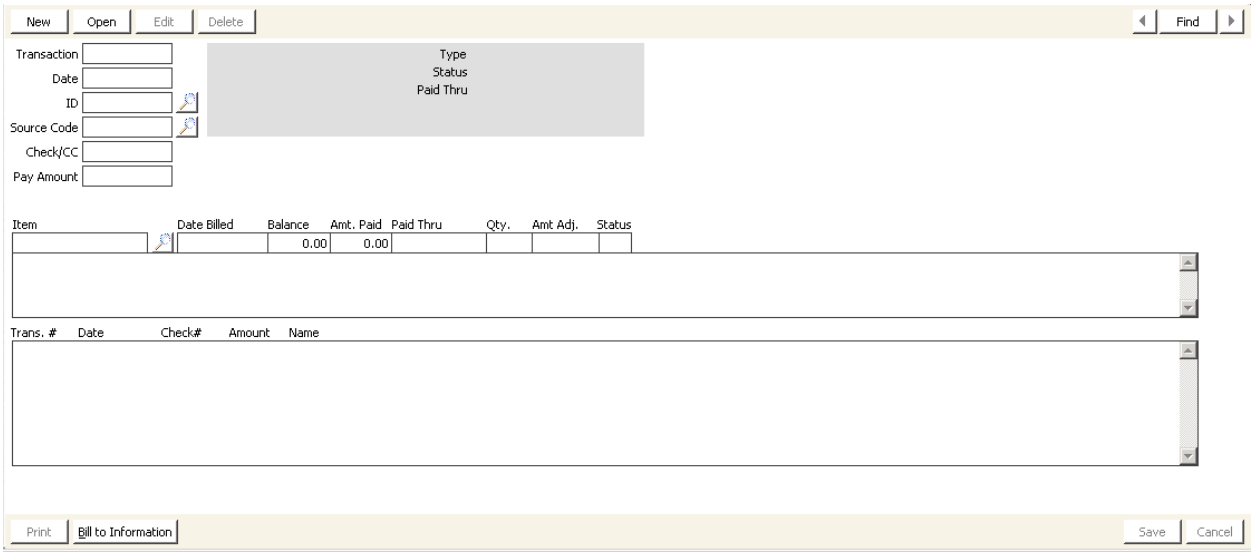
Bill New

Automatically generates and displays billing data for the line item. (Is displayed when the main dues product has never been billed or a new line item is added)

Entering a full payment

You can apply full payments to the open balance line items in product payment priority order.

Enter and edit payments window



Desktop: Billing > Enter and edit payments

To enter a billing payment

1. From Enter and edit payments window, click New.
2. (optional) Override the Transaction Date, if necessary.
3. Enter the customer ID. If you do not know the customer ID, select the lookup icon in the ID field to look up the customer in the database. The window displays any line items associated with the customer ID and the total outstanding balance.
4. Enter the Source Code that prompted this payment and press Tab.
5. Enter the check number or credit/debit card code and press Tab. For credit/debit cards, enter the required card information.
6. Enter the amount of the payment in the Pay Amount field and press Tab.

The payment amount is applied automatically to each open line item, beginning with the main customer dues product. As full payment is applied to a line item, the Paid Thru date field advances to the end of the bill term or beyond.

Note: Complimentary or zero dollar items can be denoted by an asterisk (*) on the Enter and edit payments window. The Paid Thru date advancement for complimentary billing items billed through Create Invoice follows the rule established by the billing cycle that is selected on the Process billing window. To update the Paid Thru date for zero dollar items, double-click the line item.

7. Click Save. Verify that the payment information is updated on the Billing tab.

To apply payment to a different line item

The Enter and edit payments window automatically applies the lump sum amount paid to the open balance line items in product payment priority order. Occasionally, the payment may need to be applied to line items other than the ones the payment window automatically selects. To apply a dues payment to a different line item, perform the following:

1. From Billing, select Enter and edit payments to open the Enter and edit payments window.
2. Click New.
3. Enter the customer ID and press Tab.
4. Enter the payment information. The payment amount is applied automatically to the open (positive) line items according to the payment priority rankings assigned to each product code (from lowest to highest). In the following example, iMIS applied $20 to the Journal Subscription.
5. Double-click the line item to remove the amount paid (in this example, the Journal Subscription line item). You can manually override the amount applied to a line item by selecting the line and entering the desired amount in the Amt Paid field.
6. Double-click the line item where the payment should be applied (for example, PAC Con-

tribution).

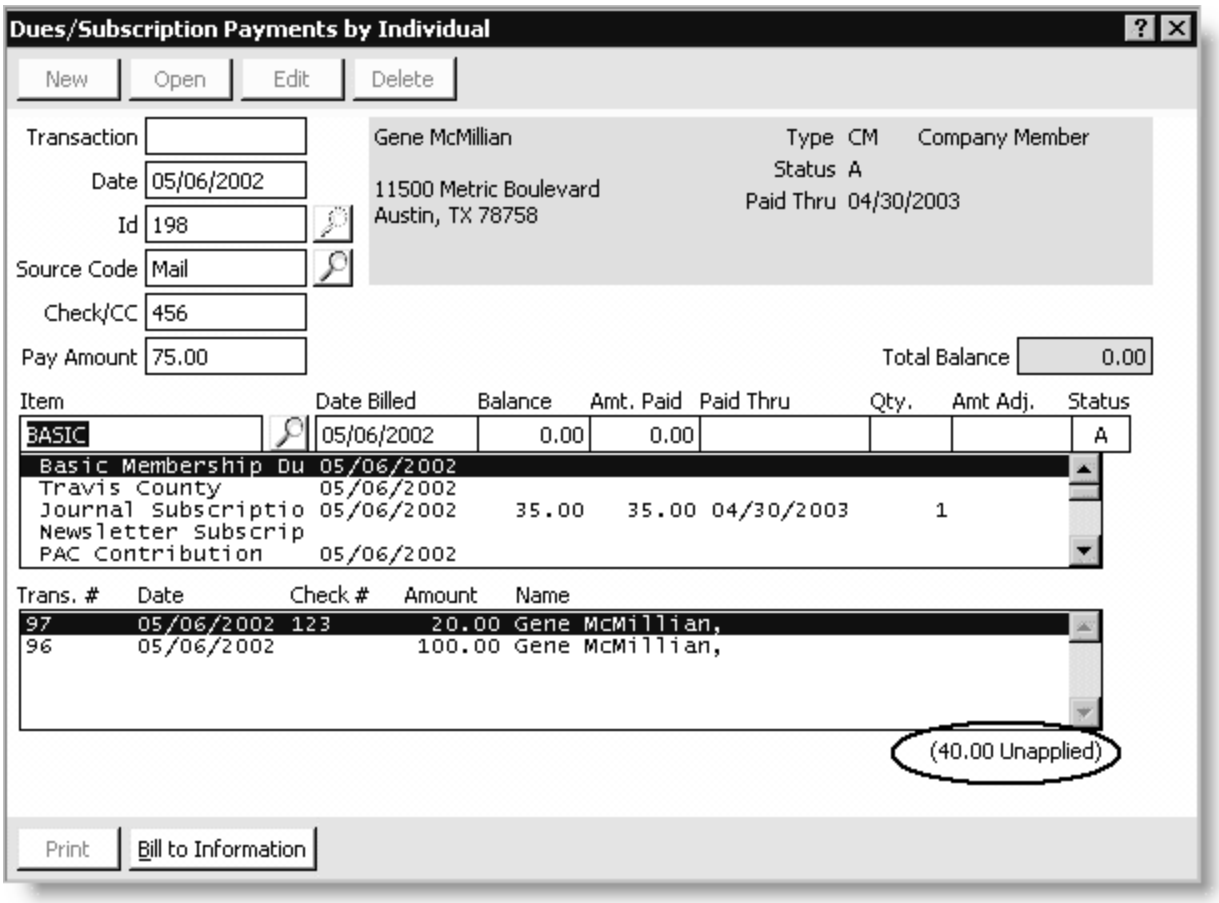
7. Click Save.

Entering an overpayment

Overpayments can be processed in one of three ways:

- Transfer open credit to AR/Cash so you can refund the overpayment or apply the credit to current or future sales items
- Apply overpayment to offset next year's dues by using AVAIL_CREDIT
- Apply overpayment to another product credit by using _CREDIT

If an overpayment for dues is received, process the payment as described in To enter a billing payment. Enter the amount of the actual payment in the Pay Amount field. The amount that is needed to pay the dues items (for example, the remaining balance) will be applied. The overpayment amount (amount not applied) displays in parentheses at the bottom of the window.



Dues/Subscription Payments by Individual window showing overpayment

To transfer open credit to AR/Cash

If you transfer an open credit to AR/Cash, you can refund the over-payment or apply the credit to current or future sales items (such as an order or an event registration).

> **Note:** Note: You cannot create an open AR credit unless the Cash Dues Over-/Under Payments Create AR option is selected on the Set up general options window.

1. From Billing, select Enter and edit payments to open the Enter and edit payments window.
2. Click New.
3. Tab to the ID field and enter the customer ID, or click the lookup icon to select a value.

4. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
5. Enter the check number or credit/debit card code in the Check/CC field, and press Tab. For credit/debit cards, enter the required card information.
6. Enter the amount of the actual payment in the Pay Amount field. The amount needed to pay the billing items (for example, the remaining balance) is applied. The amount of the overpayment (amount not applied) displays in parentheses at the bottom of the window.
7. Click Save. A system message is displayed asking you to confirm the creation of an AR item for the overpayment.
8. Click Yes. This overpayment can be refunded on the Credit Invoices window (from AR/Cash, select Process month-end procedures, and click Credit Invoices), or applied to other open balances such as meeting registrations or orders by using the *TAB feature.

   Note: For more on refunding an overpayment, see Accounts Receivable.

   To apply overpayment to offset next year's billing

   Overpayments can be applied to a special credit product by using the _CREDIT product code. The _CREDIT product code retains credit balances and prints the billed amounts and credits separately.

1. Set up a credit product. The following steps are required to process credits that print as separate line items on subsequent bills:

1. Insert a product code that ends in _CREDIT on the Set up products window (from Billing, select Set up module > Products). Do not use AVAIL_CREDIT.
2. Select the credit product on the scrolling list on the Set up billing cycles window (from Billing, select Set up module > Billing cycles) so it will print on the renewal notice when an overpayment balance exists for a renewing customer.
3. Enable the Maintain Prev Balance option on the Set up general options window (from Billing, select Set up modules > General)

Note: If your billing cycle sort method is by product rank, assign a large number to the credit product if you want the credit listed at the bottom of the line items.

2. From Billing, select Enter and edit payments to open the Enter and edit payments window.
3. Click New.
4. Tab to the ID field and enter the customer ID, and press Tab.
5. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
6. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.
7. Enter the amount of the actual payment in the Pay Amount field. The amount that is needed to pay the dues items (for example, the remaining balance) will be applied. The amount of the overpayment (amount not applied) displays in parentheses at the bottom of the window.
8. Apply the overpayment to the special credit product code. For this example, we have inserted a product code of BILLING_CREDIT.

1. Select the empty space immediately below the last line item displayed.
2. Select the Item field.
3. Enter the product code for the special credit line (for example, BILLING_CREDIT), or select the lookup icon and double-click the DUES_CREDIT product code.
4. Tab to the Amt Paid field and enter the overpayment.
5. Click Save.

The overpayment credit should appear as a separate, negative line item on the next bill generated for this customer. Credit line items must then be offset against positive line items manually on the Enter and edit payments window. If the overall balance of the bill is positive, this manual offset process can occur when the payment is received and entered.

Entering a partial payment

Underpayments can be processed in one of three ways:

- By leaving underpayment balances in Billing;
- By transferring underpayment balances to AR; or
- By adjusting residual balances.

> **Note:** Note:

If Maintain Prev. Balance was selected on the Set up general options window, you can leave underpayments in Billing or you can adjust the balance.

If the Cash Dues Over/Under Payments Create AR option was selected on the Set up general options window, you can transfer underpayment balances to AR.

If both of these options are selected, the underpayment balances can be transferred to AR, left in Billing, or you can adjust the balance.

To leave underpayment balances in Billing

If a partial payment is received, the unpaid balance appears in the Total Balance field, the Paid Thru date is not advanced, and the residual balance continues to be tracked as an open item in the Billing module. Since the Paid Thru date is not advanced, the remaining balance will print on subsequent Reminder Notices until full payment is received.

> **Note:** Note: The remaining balances that print on Reminder Notices for billings with partial payments do not include VOL products.

1. From Billing, select Enter and edit payments. The Enter and edit payments window opens.
2. Click New.
3. Tab to the ID field and enter the customer ID.
4. Press Tab.

5. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.
6. Enter the amount of the actual payment in the Pay Amount field. iMIS automatically applies the amount paid to the open line items until the amount paid has been fully applied. In the following example, the balance due was $115 and we entered a $50 payment.
7. Click Save.

For more information on Paid Thru dates, see Overriding the Paid Thru Date.

To transfer underpayment balances to AR

Use the following steps to enter a partial payment, transfer the underpayment balance to AR, and show dues as paid in full.

1. From Billing, select Enter and edit payments. The Enter and edit payments window opens.
2. Click New.
3. Tab to the ID field and enter the customer ID, and press Tab.
4. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
5. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.
6. Enter the amount of the actual payment in the Pay Amount field. In the following example, the balance due was $95 and we entered a single payment of $55.
7. Select each line item and enter the full amount due in the Amt Paid field.

   As you override the Amt Paid, the difference between the payment entered and the amount applied displays as over applied at the bottom of the window.
8. Click Save. A message is displayed asking you to confirm the creation of an AR item for the over applied payment.

9. Click Yes.

   The remaining balance transfers to AR/Cash as an open receivable. The balance will appear on the AR statements instead of future Dues Billing Reminder Notices.

   To adjust residual balances

   In certain cases, you may want to write off or reduce the residual balance left from an underpayment, particularly if the remaining balance is insignificant. You also may want to use the adjustment method to officially record decisions to award a post-billing discount for a line item.

   > **Note:** Note: Entering this adjustment makes no credit or debit entries into any accounts, including the write-off account.

1. From Billing, select Enter and edit payments. The Enter and edit payments window opens.
2. Click New.
3. Tab to the ID field and enter the customer ID, and press Tab.
4. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
5. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.
6. Enter the amount of the actual payment in the Pay Amount field. In the following example, the balance was $75 and the payment was $60.
7. Select the line item for which the Amt Paid (applied) is less than the balance.
8. Enter the positive difference between the Balance and Amt Paid in the Amt Adj field.
9. Click Save.

   Note: An activity tracking record will be generated even when no payment is applied (for example, when a full complimentary discount is being applied).

Combining billing and payment for a new customer

The Bill New button generates billing data and records payment received with a single window procedure. This option appears when the main Billing product has never been billed or a new item has been added. This feature is helpful when processing bills for new customers who send payment along with their applications and for new prepaid subscriptions. The Bill New Member Type Items option should not be enabled when billing new independent subscription items.

To process billing for new customers

1. From Customers, select Manage customers to open the Manage customers window.
2. Click New to add information for a new customer. Typically, the normal customer data includes the Member Type, the billing Category (if applicable), and the Join Date. Leave the Paid Through Date blank.
3. Click Save.

   Caution! When you process a billing run for a new customer through the Enter and edit payments window, only the products defined on the Set up customer types window display on the Enter and edit payments window; iMIS ignores the billing cycles and any optional items, such as chapters. If your billing cycle includes Other Billing Instructions options, such as Include all chapters, you need to generate your billing using Create Invoice.
4. Select the Billing tab.
5. Click Payment to open the Dues/Subscription Payments by Individual window.
6. Click New. The Dues/Subscriptions Payments by Individual window is populated with products to be billed to the customer from the Set up customer types window.
7. Enable the Bill New Mem Type Items option (if not already selected).

   Note: The Bill New Mem Type Items options should not be selected when billing for new independent subscription products.

8. Verify that the New Bill From date is accurate. The New Bill From date works the same way as the Effective Date on the Process billing window.

   Note: If billing is done annually, the New Bill From date must be set to the first day of the first month of the annual term, even if the customer has a Join Date after that date. For example, if the annual term starts on January 1, 2001 and the customer joined July 13, 2001, the New Bill From date must be 01/01/2001. If this is an anniversary term, the New Bill From field is typically set to the first day of the month in which you are processing the dues payment.

9. Click Bill New. The amount due for each product displays automatically in the Balance column on the Dues/Subscription Payments by Individual window.

10. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.

11. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.

12. Press Tab.

13. Enter the amount of the payment in the Pay Amount field and press Tab.

    The payment amount is automatically posted to each open line item, beginning with the main customer dues. If full payment is received, the Paid Thru date advances to the end of the billed term.

    Note: Complimentary or zero dollar items are denoted by an asterisk (*) on the Enter and edit payments window. The Paid Thru date advancement for complimentary products billed through Bill New follows the default rule established on the Set up general options window (from Billing, select Set up module > General options). To update the Paid Thru date for zero dollar items, double-click the line item.

14. Click Save.

    To process new prepaid subscriptions

To combine billing and payment entry for a new subscription product, you must enter the new line item, generate the balance, and apply the payment.

1. From Billing, select Enter and edit payments to open the Enter and edit payments window.
2. Click New.
3. Enter in the customer number in the ID field and press Tab.
4. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
5. Select the empty space immediately below the last line item displayed.
6. Select the Item field.
7. Enter the product code of the item being billed and paid, or select the lookup icon and double-click the product code.
8. Repeat this process if multiple items are being billed and paid.

   Note: When a new line item is added, new billing options appear on the bottom of the Enter and edit payments window.
9. Verify that the Bill New Mem Type Items option is not selected.
10. Verify that the New Bill From date is accurate.

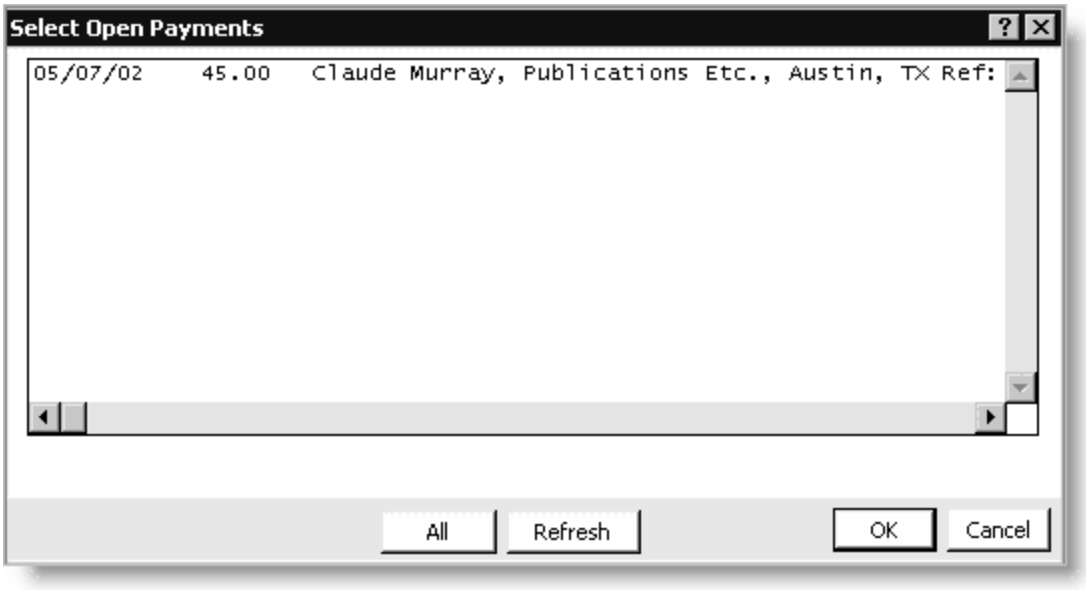
    Note: The New Bill From date works the same way as the Effective Date on the Process billing window. The Billing general setup Billing Time setting (annual or anniversary) is used with the New Bill From date to determine the billing term. See How iMIS Works with Dates (see "Date Usage in iMIS") for further information.
11. Click Bill New.
12. Enter the check number or credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information.

13. Enter the amount of the payment in the Pay Amount field. The payment amount is applied automatically to the newly billed line item(s). If full payment is received, the Paid Thru date advances to the end of the billed term.
14. Click Save.

Using open credit balances as payment (*Tab)

The *Tab command sequence, when entered in the Check/CC field on the Dues/Subscription Payments by Individual or Enter and edit payments window, allows the application of open credit balances as payment for additional items through the Select Open Payments window.

The Select Open Payments window displays a list of open credits that can be applied as payment to an individual customer's account.



Select Open Payments window showing all open credits for individual

Use the scroll bar at the bottom of the window to view the batch number, the amount of the credit, company name, city and state, the reference number of the credit transaction, and the system through which it was generated. In addition, the All and Indiv buttons are available on these windows to toggle between the individual customer's available credit and all open credits currently in AR. Open credits may be applied to any other customers'

accounts by selecting an item in the “All” view. To return to the individual customer's open payments, select the Indiv option.

To apply an open credit, simply double-click the appropriate line and enter the payment amount you wish to apply. It can be all or part of the amount of the credit. If you attempt to apply a payment amount that exceeds the amount of the credit, a message is displayed asking you to confirm the creation of an AR item for the overpayment. After the payment is applied, the Trans.INVOICE_REFERENCE_NUMBER will be the same for both the customer whom the credit came from, and the customer to whose account the credit was applied.

To select open credits to apply as payments

1. From Billing, select Enter and edit payments. The Enter and edit payments window opens.
2. Click New.
3. Tab to the ID field and enter the customer's ID or select the lookup icon to select an ID and press Tab.
4. Enter the code for the marketing program or contact type that prompted this payment in the Source Code field.
5. Enter an asterisk (*) in the Check/CC field and press Tab. The Select Open Payments window opens and displays a list of open credits for that individual that can be applied as payments.
6. Select an open credit by double-clicking the payment you wish to apply.
7. (optional) Click All if you wish to select an open credit from another account to apply to this customer's account.
8. Enter the amount in the Pay Amount field and press Tab.
9. Click Save.

Overriding the Paid Thru date

The Paid Thru date will advance to the end of the billed term (normally a year) if a line item is paid in full. The Paid Thru date can be manually overridden.

> **Note:** Caution! If the overwritten Paid Thru date is less than the calculated default Paid Thru date, manually backdate or blank out the related Renewed Thru date (dues payment) or the subscription Billed Thru date (non-dues payment). This step helps the next billing for this customer or subscriber run smoothly.
>
> For example, suppose iMIS projected the Paid Thru date and Renewed Thru date to be 8/31/2001, but the Paid Thru date was changed at payment time to 6/30/2001. The Renewed Thru date, unless manually changed to the new Paid Thru date or blanked out, would prevent the customer from being billed on a renewal run for those customers expiring in June 2001. Instead, the customer would be renewed two months late.

To edit the Renewed Thru date for a customer

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer's record.
3. Select the Financial tab.
4. Change the Renewed Thru date.
5. Click Save.

Note: It is not necessary to edit the individual line items' Billed Thru dates for a dues product billing payment.

To edit the Billed Thru date for a subscription payment

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer's record.
3. Select the Billing tab.

4. Double-click the line item to be changed to open the Dues/Subscription Item Detail window
5. Click Edit.
6. Change the Thru date in the Last Billed section of the window.
7. Click Save.

   Note: If the customer has elected to change to an alternate term (other than the one billed) at payment time, change the individual's Renew Months (on the Financial tab) or the subscription Billing Period (only on a non-dues bill line item), and rebill before applying the payment. For example, a customer was billed for the default 12-month term, but elected to pay quarterly. You can edit the customer's Renew Months on the Financial tab and then rebill using the procedures outlined in Rebilling to Correct an Individual Dues Billing. The amount, the projected Paid Thru date, and the Renewed Thru date are recalculated appropriately.

Correcting cash billing payments

You cannot make corrections after the transaction has been sent to the general ledger.

To edit a billing payment entry

1. From Billing, select Enter and edit payments to open the Enter and edit payments window.
2. Click Find.
3. Search for the transaction by entering a value in the Transaction (number), Date, or ID field.
4. Click Save.

   Note: You might find multiple transactions if you search by the transaction date or ID. In this case, all possible transactions display in the scrolling list at the bottom of the window. To view the transaction, double-click it.

5. Click Edit.
6. Enter the changes. When the corrections are completed, click Save.

   Note: (optional) If you changed the Paid Thru date to a date earlier than the original posting, the Paid Thru date on the Dues/Subscription Payment by Individual window and the subscription record will not change automatically. You must change these dates manually. To manually backdate a Paid Thru date, see To reverse a payment transaction.

   To delete a cash billing payment entry

1. From Billing, select Enter and edit payments to open the Enter and edit payments window.
2. Click Find.
3. Search for the transaction by entering a value in the Transaction (number), Date, or ID field.
4. You might find multiple transactions if you search by the transaction date or ID. In this case, all possible transactions display in the scrolling list at the bottom of the window. To view the transaction, double-click it.
5. Click Save.
6. Click Delete. A message is displayed asking you to confirm the deletion.
7. Click Yes to delete the transaction or No to cancel the deletion.

   Note: (required) If a Paid Thru date exists on the deleted transaction (for example, not a partial payment), you must manually backdate the Paid Thru date. To manually backdate a Paid Thru date, see To reverse a payment transaction.

Reversing and canceling payment transactions

You can reverse a transaction if a bad check was used for payment or if it is too late to delete the transaction (for example, the transaction has been sent to the General Ledger). You can cancel a payment transaction if the membership or subscription must

be terminated after payment was received but before the prepaid term has reached normal expiration, or if the payment was made to the wrong record.

To reverse a payment transaction

1. From Billing, select Enter and edit payments to open a blank Enter and edit payments window.
2. Click New.
3. Enter the ID number and press Tab.
4. Enter the check number or the credit/debit card type in the Check/CC field. For credit/debit cards, enter the required card information. In the case of a returned check, it may be useful to prefix the check number with a code such as RET.
5. Enter a negative amount in the Pay Amount field.
6. Select the line item.
7. Enter the negative amount in the Amt Paid field.
8. Click Save.

   Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any income recognized for this product during the GL Interface procedure. For more information, see Using Deferred Income.

   Although entering a payment reversal restores the open balance, iMIS does not backdate a Paid Thru date automatically after it has been advanced. You must manually reinstate the previous Paid Thru date.

   Note: In the case of a dues payment reversal, edit the Paid Thru date on the Manage customers window if the primary dues product was reversed.

9. Correct the Paid Thru date for each reversed line item:

1. Select the Billing tab.

2. Double-click the line item that was reversed to open the Dues/Subscription Item Detail window.
3. Click Edit.
4. Backdate the Paid Thru date to its correct value (for example, before the reversal period).
5. Click Save.

To cancel a payment transaction

Canceling a payment transaction is similar to reversing a payment, except that only the income is reversed and it may include a full or partial payment. Because the payment is not also reversed, the cancellation process creates an outstanding credit in Accounts Receivable. This credit can be refunded or applied to other sales transactions at a later time.

> **Note:** Note: To process a cancellation with the following steps, the Cash Dues Over/Under Payments Create AR option must be enabled (see Set up general options window (see "Set up general options window for Billing")).

1. From Billing, select Enter and edit payments to open the Enter and edit payments window.
2. Click New.
3. Enter the ID number and press Tab.
4. Leave the Pay Amount field blank.
5. Select the line item to be canceled.
6. Enter the cancellation amount as a negative amount in the Amt Paid field.
7. Click Save. A message is displayed asking you to confirm the creation of the AR item.
8. Click Yes. The unapplied amount displayed at the bottom of the window generates a credit open item.

Note: If your system is licensed for Deferred Income and the product being reversed is normally deferred, iMIS will automatically adjust the deferred income and any income recognized for this product during the GL Interface procedure.

9. From Customers, select Manage customers to open the Manage customers window.
10. Change the status of the customer or the subscription line item.

In the case of a customer cancellation:

- Change the customer type to a non-customer type code or change the status to a code beginning with S (suspended) or I (Inactive).

For a non-dues billing-related subscription product:

1. Select the Billing tab.
2. Double-click the line item that was canceled to open the Dues/Subscription Item Detail window.
3. Click Edit.
4. Change the Status to I (inactive).
5. Click Save. The Dues/Subscription Item Detail window closes and the status for the journal displays as I in the Billing tab.

Basic Subscription Products

Managing subscriptions involves setting up subscriptions, including automatic, optional, and complimentary subscriptions to journals and other publications for customers. Optional subscriptions can also be added during the payment process. Subscription management also includes processing subscription cancellations after payment has been made.

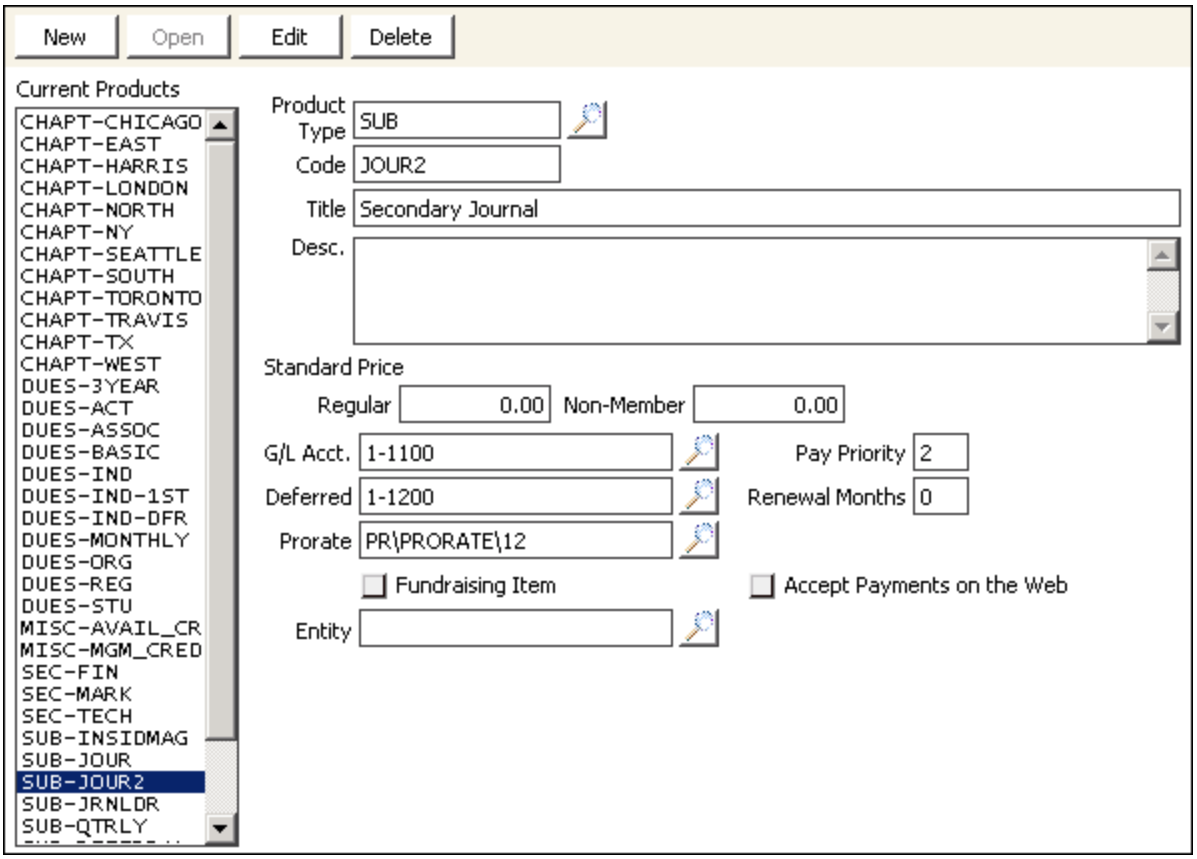
Additional features such as generating labels and managing back issues are available in the Advanced Subscription module. For more information about the features available in the Advanced Subscriptions module, see Subscription Fulfillment.

Creating subscription products

The first step in managing subscriptions is to define or create product codes on the Set up products window for each potential subscription-type product that will be billed.

Setting up subscriptions

To set up subscription orders, you have the option of setting up subscriptions, which are automatically billed depending upon the customer type, or optional subscriptions, which are billed during a non-dues product billing run. For example, subscriptions are often added to the BASIC customer type, and are automatically included in the dues billing run for that customer type.



To set up automatic subscriptions for dues billing

1. From Billing, select Set up module > Products to open the Set up products window.
2. Click New.
3. Select SUB for the Product Type.

4. Enter a product Code (for example, JOUR for a journal subscription). The code entered should not contain any spaces or special characters other than an underscore.
5. (optional) Enter the product Title.
6. (optional) Enter a product Description.
7. (optional) Enter a Standard Price for both Regular members and Non-Regular members.
8. (optional) Enter the G/L Account.
9. (optional) Enter the Pay Priority.
10. (optional) Enter the Deferred account number.
11. (optional) Select the Prorate rule from the list.
12. Click Save.
13. From Customers, select Set up module > Customer types to open the Set up customer types window.
14. Select a Customer Type.
15. Click Edit.
16. Tab to a blank Billing Codes field.
17. Enter the Billing Code that was set on the Set up products window.
18. Enable the Comp option if the dues item will be provided at no charge for this customer type; or enter pricing information in the Fixed Amount field.
19. (optional) Enable Bill Company if the parent company is to receive the bill for the customers of this customer type that are linked to it.
20. Click Save.

> **Note:** Note: For information on setting up product codes, see To add product codes to customer types.

To set up optional subscriptions for non-dues product billing

1. From Billing, select Set up module > Products to open the Set up products window.
2. Click New.
3. Enter SUB for the Product Type.
4. Enter a product Code. The code entered should not contain any spaces or special characters other than an underscore.
5. Enter a product Title.
6. (optional) Enter a product Description.
7. Enter the Regular pricing.
8. (optional) Enter the Non-Member pricing information.
9. (optional) Enter the G/L Account.
10. (optional) Enter the Pay Priority.
11. (optional) Enter the Deferred account number.
12. (optional) Select the Prorate rule from the drop-down list.
13. (optional) Click Special Pricing to enter the special pricing information.
14. Click Save.

To add optional subscription orders for non-dues product billing

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer requesting the subscription.
3. Select the Billing tab.
4. Click New to open the Dues/Subscription Item Detail window.
5. Enter the subscription code in the Item field or select the lookup icon to select the code.
6. Enter the Date Added.

Note: A non-dues item such as a subscription produce uses the Date Added field to calculate the period for the subscription rather than the Begin Date field.

7. Click Save to return to the Billing tab.

To set up complimentary subscription products

1. From Customers, select Manage customers to open the Manage customers window.
2. Find the customer requesting the subscription.
3. Select the Billing tab.
4. Click New to open the Dues/Subscription Item Detail window.
5. Click New.
6. Enter the subscription code in the Item field or click the lookup icon to select the code.
7. Select Complimentary.
8. Enter the Date Added.
9. Click Save.

To create non-customer subscriber types

1. From Customers, select Set up module > Customer types.
2. Click New.
3. Enter SUB as the customer type. Do not enable the Is a Member option.
4. Enter a Description (for example, Subscriber Only)
5. Click Save.

Running a non-dues billing cycle for a subscription product

After the product is added to the Billing tab, it can be billed. The Billing Cycle does not add records for a customer; it only bills the records that have previously been added.

> **Note:** Note: Once the product is added to the customer's billing tab, you still need to bill the customer for the product. Refer to the sections Running mass dues billing or Running individual dues billing.

To set up a non-dues subscription billing cycle

1. From Billing, select Set up module > Billing cycles to open the Set up billing cycles window.
2. Click New.
3. Enter the Cycle Name for your subscription billing.
4. Select a form from the Forms drop-down list.
5. Select the Member Types to bill.
6. Select the Categories to bill.
7. Select the SUB item for the subscription in the Products list.
8. Click Save.

To add subscriptions during dues payments

1. From Billing, select Enter and edit payments. The Enter and edit payments window opens.
2. Click New.
3. Enter the ID, or select the lookup icon to select a value.
4. Select the first empty line in the list of billing items.
5. Enter the subscription product code in the Item field.
6. Enter the Amt Paid and Paid Thru Date.
7. Click Save.

Processing subscription cancellations after payment

Cancellations should be processed with the appropriate beginning period and term. The cancellation term usually coincides with the term of the corresponding income transaction, or at least the portion of the term that is being canceled.

In order to process cancellations, the Cash Dues Over/Under Payments Create AR option must be enabled on the Set up general options window.

Verify that the Period (BILL_BEGIN) and Thru (BILL_THRU) dates on the Dues/Subscription Item Detail window match the term of the dues/subscription to be canceled.

If the cancellation corresponds directly to the full term of the subscription most recently paid (cash basis), these Last Billed dates are correct. However, if the cancellation applies a partial refund to an active subscription term, manually adjust the Period to the first month of the cancellation.

Example: Cancel subscription product

The following example illustrates a scenario where the customer requests a partial cancellation/refund for a journal subscription at the halfway point (July) of a 12-month subscription that originally ran from January through December.

1. From Customers, select Manage customers to open the Manage customers window.
2. Find a customer's record.
3. Select the Billing tab.

   Note: To open this window with data, you must have performed some type of billing transaction first.
4. Double-click a line item to open the Dues/Subscriptions Item Detail window.
5. Click Edit.
6. If a full cancellation is requested, do not make any changes here. However, if you need to implement a partial cancellation with a refund, change the Period field to the desired date (for example, 7/01/2001) for the beginning of the cancellation.

7. Click Save.
8. Click Payment to open the Dues/Subscription Payments by Individual window.
9. Click New to begin recording the cancellation.

To record the cancellation amount

1. Leave the Check/CC and Pay Amount fields blank unless you are recording a returned check or credit card cancellation.
2. Select the line to be canceled and enter the cancellation amount as negative (-65.00) in the Amt Paid field.
3. Tab to the Amt Adj field, and enter the cancellation amount as positive (65.00) to prevent the subscription line from having a positive balance in the end.
4. Click Save. The (65.00 Unapplied) message displayed at the bottom of the window generates a credit open item. A message appears that prompts you to verify the creation of this open AR item.
5. Click Yes.
6. Change the Paid Thru date for the item to reflect the date of the cancellation.
7. Click Save.
8. Close the Dues/Subscription Payments by Individual window.
9. On the Dues Subscriptions window, select the canceled item and click Edit to open the Dues/Subscription Item Detail window in the edit mode.
10. Change the Paid Thru date to match the abbreviated term, and enter I (for inactive) in the Status field.

    Now that the open credit item exists, you can refund the amount on the Credit Invoices window.

Business Object Designer

The Business Object Designer (BOD) is an administrative tool for viewing, editing, and creating iMIS business objects. It provides a graphical user interface to the properties related to business objects.

Note: Important: As of 15.2.10, all Actions and Constraints are now removed from Business Object Designer in order to support optimal performance and scalability. If you added any actions or constraints to your own business objects, be aware that they will no longer run when your business object is used.

Understanding business objects

iMIS ships with an extensive collection of business objects that can be customized and extended. They can also be used as models for new business objects.

What is a business object?

A general definition, from the Object Management Group:

A business object is a representation of a thing active in the business domain, including at least its business name and definition, attributes, behavior, and relationships. A business object may represent, for example, a person, place or concept. The representation may be in a natural language, a modeling language, or a programming language.

An iMIS-specific definition, in terms of the Business Object Designer:

A business object is an iMIS system construct representing the data elements and business rules of a business concept, like a contact. It is implemented using a combination of business rules, a schema definition that describes the data structures of the object's properties, and a database view. Business objects are behind all of the controls within the iMIS database.

The following are the basic elements of an iMIS business object:

- Properties – attributes of the object (typically map to database columns). For example, Contact.LastName
- Branches – used to provide inheritance-like functionality for similar objects, for example, objects similar enough to be represented within a single object definition.

  How is a business object used?

  Business objects are used throughout the iMIS application to model business concepts and rules. They represent database tables, and can add additional logic to operations performed on the database tables. Business objects allow for runtime customization of iMIS behavior without access to source code.

  Business objects are more than just the tables where data is stored. They enable you to present data from within the database in a way that is user friendly and used by queries, windows, and other objects within iMIS.

  How does a business object work?

  After a business object is defined using BOD, its definition is stored and made available to the runtime environment.

  When an instance of a business object is created (instantiated), the business object definition is used to create an in-memory table structure (a .NET DataSet). This structure stores all data related to the instance of the object.

  As the instance of the business object is changed, changes are made to the in-memory structure. Changes are not written to the database until an explicit commit is performed.

Business object physical representation

A business object is composed of many elements:

- one or more database tables
- a schema definition
- a database view

  Database tables

At the lowest level, business objects represent database tables. Business objects can represent one table or multiple tables. BOD builds lists of tables that exist in the database. BOD does not create tables initially.

> **Note:** Note: Tables must be created using SQL Server Enterprise Manager or Query Analyzer.

Schema definition

The schema definition of a business object is stored in the iMIS database. You access the business object using the Document System. The schema definition defines all properties and their types, and is used to create the in-memory runtime representation of the object.

Database view

A database view is created to represent data access for a business object, containing all the necessary tables, columns, and joins. The view is used when running queries against business objects. The naming convention is vBo<BusinessObjectName>. For example, vBoAccessArea is the view associated with the AccessArea business object.

iMIS business object model

A business object is an iMIS system construct representing the data elements and business rules of a business concept like a contact. The business object is implemented using a combination of business rules, a schema definition that describes the data structures of the object's properties, and a database view.

The iMIS business object model sets the framework and foundation for most significant iMIS application objects such as customers, orders, products, inventory, tasks, and so forth. All iMIS business objects share a common construction methodology and standard ways of expressing their properties, attributes, and methods. iMIS business objects are extensible and customizable through the Business Object Designer.

Using the .NET dataset object model

The iMIS business object base classes are based upon the .NET DataSet object model. The .NET DataSet is the main target for data handling as created by the .NET design engineers. Modeling over the .NET DataSet and constituent components has a number of advantages and implications:

- iMIS business objects appear similar to .NET datasets.
- iMIS business objects support automatic binding in the development and runtime environment.
- All objects automatically have an XML representation.
- iMIS business objects utilize the standard DataSet constructs to share and express data and metadata.
- The term metadata is frequently literally defined as data about data. In the context of iMIS business objects, metadata is the structured, persistent data about business object resources, their characteristics, and their behavior.
- All of the properties are exposed to the outside world in the Dataset table/column/row object model.

Base classes for business objects

Business objects are implemented by inheritance from core .NET classes, specific to ADO.NET. This means that the features and power of the base class are available to the business object base classes:

- BusinessContainer – Container of business objects and their instances. Corresponds to a .NET Dataset (System.Data.DataSet class).
- BusinessController – Collection of business object instances and implementer of business logic. Corresponds to a DataTable (System.Data.DataTable class).
- BusinessItem – Contains a single instance of a business object. Corresponds to a DataRow (System.Data.DataRow class).

Benefits of iMIS business objects

This table summarizes the significant gains that business objects bring to the management and protection of both data and business rules:

.NET centric	Auto-binding to runtime controls Can be passed through web services Database persistence and persistence engine ready-made XML-ready .NET standard metadata structures
Automatically implements standardized object and column security for all objects	Keep sensitive data from entire staff or user population.
New types of objects	User-defined tables, survey, application forms, and so forth.
New columns	Extend product, order, referral, opportunities, issue management definitions.
Standard interface for all objects	Can be used directly by query tools, workflow, screen painters, export utilities, mail merge utilities, and so forth.

iMIS business rules

iMIS business rules provide the editable metadata to iMIS business objects. Non-visual classes and visual editors are provided for editing metadata. iMIS business rules provide a technical architectural model for object extensibility as well as a recognizable business concept.

The following types of business rules and metadata are supported:

- Column definitions

Property definitions

- Property type: virtual or persistent
- Data type, length, and so forth
- Captions, default values
- Descriptive dictionary type of information

Working with Business Object Designer

The Business Object Designer (BOD) is an administrator-level tool for viewing, editing, and creating business objects especially for iMIS. It provides a graphical user interface to the properties related to business objects. Do the following to explore Business Object Designer:

Go to RiSE > Business Object Designer:

1. Select a business object in the list, such as Campaign.
2. Click Edit.
3. Explore the Definition, Properties and Database tabs.

Which business objects for which jobs?

Cs* Objects for legacy tables

CS Business Objects (CsContact, CsActivity, and so forth) are objects related to the areas of iMIS you are most familiar with. For example, CsContact is an object that combines data from the Name and Name_Fin tables into a single, simple-to-query object in a location that is easy to find. Cs Business Objects are based on legacy iMIS tables.

Cs Business Objects are used in many instances. For example, if IQA is the only application running in your organization, you will use the CsObjects.

In addition, any tables built through the iMIS Customizer features will appear in the list of business objects as “CsName_” + TableName.

Commonly queried CsObjects include but are not limited to the following:

CsActivity	CsDuesHisotry	CsOrderLines
CsAddress	CsEvent	CsOrders
CsCalls	CsEventHistory	CsPledges
CsCommittee	CsFunction	CsProduct
CsContact	CsGeneralLookupTables	CsRegistration
CsDonations	CsInventory	CsRelationship
CsDonationsDetail	CsMemberType	CsStaffUser
CsDonorData	CsOrderHistory	CsSubscriptions

When to use CsContact versus NetContact

There are two versions of the Contact business object: CsContact and NetContact.

- Organizations that use business objects with IQA only can reliably use CsContact.
- Organizations that are licensed for any component of the Marketing Suite or Process Manager should use NetContact. NetContact is a required object within those modules.

Objects for business rules

Many objects within the list of business objects control how different business rules, most importantly security rules, are managed within the database. These business objects are system objects and should not be modified.

These objects include but are not limited to the following:

AccessArea	Group *	User
AccessItem	Role	UserRole
AccessMain	UniformRegistry	UserToken

Note: * There are many different objects with names beginning with Group.

Objects that support modules

In addition to the objects listed previously, other objects (used specifically by Process Manager, Marketing Suite, or iMIS Web Components) are listed in the Business Object folder. These objects include but are not limited to:

- Process Manager
- OpportunityMember
- OpportunitySales
- OpportunityDonor
- OppMemberContact
- OppSalesContact
- OppDonorContact
- Opportunity
- OpportunityHistory
- OpportunityReport
- OpportunityCompetitor
- OpportunityType
- ActionPlan
- Campaign Management
- Appeal
- AppealParticipation
- AppealProduct
- Campaign
- CampaignParticipation
- CampaignTypeRef

- Solicitation
- SolicitationStatusRef
- SourceCode
- SourceCodeStatusRef
- Package
- PackageItem
- PackageStatusRef
- Supplement
- Segmentation
- SegmentationDef
- SegmentationJob
- SourceList
- ListElement
- RFM Analysis
- RFM Analysis
- Content Management
- Document
- DocumentStorage
- Hierarchy (DocumentHierarchy, NavigationHierarchy, TagHierarchy)
- Perspective
- ContentChangeRequest
- ContentWorkflow
- NavigationPane

- NavigationWorkflow
- PublishMessageLog
- PublishPriority
- PublishRequest
- PublishRequestDetail
- PublishRequestStatus
- PublishServer
- TagRelationship
- TagRelationshipType
- UniformTag
- URLMapping
- UserDefinedField
- WebPartGalleryEntry

Objects built from user-defined tables

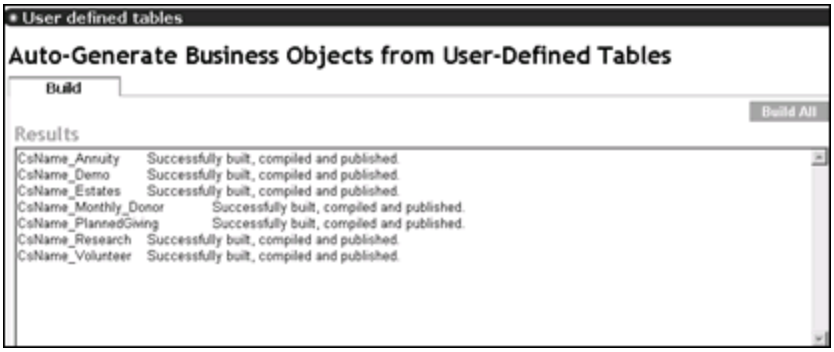
When iMIS is first installed or upgraded, any user-defined tables that are seen within the Customers area of iMIS are automatically built into business objects which can be queried.

Over time, it is often necessary to add new fields to Customers tabs and include those queries in IQA queries. This requires an additional step to complete the field addition after you have finished building the table and tab. Do the following to generate objects from user-defined tables:

Go to Settings > Utilities > User defined tables:

1. Click Build All.

2. When complete, the User Defined Tables window will list the objects and status of the build of all customer tabs as follows:



> **Note:** Note: When the business objects are built they will be named using the following logic: “CsName_”+ Table Name from Customizer.

Accessing business objects

> **Note:** Note: You must have system-level administrator privileges to perform the tasks discussed in this section. Having administrator privileges for a given module is not sufficient authority to change business objects.

Business objects are central to creating IQA queries, generating reports, and running processes. You can view the list of available business objects by navigating to the Common folder in the Central Object Repository.

Finding underlying table data for business objects

Business objects are user-friendly abstractions and collections of data from the iMIS tables. These abstractions enable you to write powerful queries and reports safely, without needing to be familiar with the iMIS database schema.

In most cases, the business object name and the names of its various properties are suggestive enough to guide experimentation. At times, however, it can be useful to trace the properties of a business object to their underlying table columns. Do the following to trace business object properties to their underlying table data.

Go to RiSE > Business Object Designer:

1. Double-click the business object that you want to examine.
2. (Properties tab) Select the property that you want to trace.
3. (Properties tab > Definition tab) The Database Table and Database Column fields specify the table and column from which the property derives its data.
4. (Database tab) It can also be useful to examine the table joins used in a business object that comprises multiple tables. Examine the Joins field.

   Note: All joins in a business object are inner joins.

Building a new business object

To build a new business object, do the following:

- Build a new SQL table or view, or identify an existing one to use.
- Customize the properties for the new business object.
- Build and publish the new business object.

> **Note:** Note: If no table exists for this business object, open SQL Server and create it, granting appropriate permissions.

Go to RiSE > Business Object Designer:

1. Select New > Design Business Definition.
2. (Definition tab) Enter the business object's information.
3. Click Create Object.
4. Add properties to the business object, saving after you edit each tab:

1. (Database tab) Add the tables that contain the columns you want to use in your business object. In the Available Columns list, select which columns to use.
2. Click Add as Properties or Add All as Properties.

3. Select Save.
4. (Properties tab) Select properties from the list to define the property's characteristics. To create a lookup, select the field you want to edit.
5. (Properties tab > Value tab) Define any lookups you need.
6. Edit these values as needed.
7. Click Save.

5. Build and publish the new business object:

1. Select the object.
2. Click Edit.
3. Click Publish.

> **Note:** Note: If an error occurs when publishing the business object, check the Database tab and ensure that appropriate Joins are defined if more than one table is listed in the Tables list.

Reverting damaged business objects

If you have a damaged business object, you can fix it by reverting to a prior version. Access the version history using the Versions command.

> **Note:** Note: After you revert, you still see the damaged version in the list. No versions are destroyed through this process. Reverting to an earlier version copies the business object. You get a new version that matches the definition of the object version you selected.

Do the following to revert a business object.

Go to RiSE > Business Object Designer:

1. Select the damaged business object.

2. Click Versions to access to all prior versions of the object, if any.
3. Select an earlier version you know to be undamaged.
4. Click Revert.
5. Click OK at the following prompt to publish the selected earlier version:

   Are you sure you want to make this version the current working version?

   The selected version becomes the current Working version.

   Note: The object is not reverted until Published.
6. Click Close.
7. Edit the new working version's properties, if desired:

- To simply revert the object to its prior state, do not make any edits.
- To create a modified version based on a prior state, make appropriate edits.

8. Click Publish to publish the object.

Managing business object properties

Changing property displays

A property's display determines what your users see in iMIS. The property's display value is used by default on windows and outputs, but you can design queries to override these defaults.

Do the following to modify a property display.

Go to RiSE > Business Object Designer:

1. Select an object from the list.
2. Click Edit.
3. (Properties tab) Select the property to be changed.
4. (Properties tab > Display tab) Change the value of Prompt for Field.

5. Click Save, and then Publish. Any messages should state that there are no errors.
6. Click Close.
7. Test your changes. Write a query against the object and select the updated property on the (Display tab).

   Adding value lists to properties

   Adding value lists to properties can make querying and data entry easier for end users. Value lists define the values that can be stored or selected for a property.

   There are three ways of adding value lists to properties:

- Use IQA to query the values from an object within the database, for example, General Look Up tables or CsActivityTypes.
- Use a Finder option to search for records within the database. See Defining property values using a Finder for more information.
- Manually add the codes and expansions to the property within the business object. See Adding properties to business objects for more information.

  In many ways, using IQA to manage value lists is the most flexible and user-friendly way to manage a lookup. Values can be added to look up tables and to the modules within iMIS. Interfaces can be modified by adding values to a table that otherwise would not be available to users. These interfaces can be accessed by users who do not have the SysAdmin role access in iMIS. Value lists that are managed within the business object can only be managed through the Business Object Designer.

  The Business Object Designer allows for value displays to be built directly within the object itself.

  Do the following to build a value display manually.

  Go to RiSE > Business Object Designer:

1. Select an object from the list.

2. Click Edit.
3. (Properties tab) Select the property that needs values.
4. (Properties tab > Values tab) Select the Value List radio button.
5. Build your value list by entering the Code into the Data Value property column, and the Expanded Description for the Code into the Display Value column.

   Note: Note: The Data Value can match the Display Value as long as the Code Value is no longer than the Data Type allows. Spaces can be used as well.

6. Click Save, and then Publish. Any messages should state that there are no errors.
7. Click Close.
8. Test your changes. Write a query against the object. Select the property on the Filters tab, and confirm that it now includes a Value list.

Defining property values using IQA

Do the following to build a query:

1. Optional: Build the lookup table that you want to use to manage the value in SQL Server.
2. Build the query that will define the lookup table. Be sure that the (Display tab) displays the code value as well as the expanded description.
3. Save the query in the Document System in Common > Queries > Value Lists.

Do the following to select values to display for a property.

Go to RiSE > Business Object Designer:

1. Select an object from the list.
2. Click Edit.
3. (Properties tab) Select the property that needs values.
4. (Properties tab > Values tab) Select the Query Object radio button.

5. Browse for and select the query you saved.
6. Define the Data Value to match the code that exists in the data.
7. Define the Display Value to match the expanded description that describes the Data Value.
8. Click Save, and then Publish. Any messages should state that there are no errors.
9. Test your changes. Write a query against the object. Select the property on the (Filters tab), and confirm that it now includes a Value list.

Defining property values using a finder

The Document System contains queries that are used in different areas of iMIS to search for customer records. These queries are found in the Common > Queries > Search folder.

The finder allows one of those queries to be used as a pop up search option within a prompt much as the Key Contact search operates within Process Manager.

Do the following to attach a query as a Finder to a field.

Go to RiSE > Business Object Designer:

> **Note:** Note: Make sure you have a query you will reference with your search and that the query includes the ID Number and the Full Name or Company Name on the (Display tab). Save this query in a central location, such as Common > Queries > Search.

1. Select an object from the list.
2. Click Edit.
3. (Properties tab) Select the property that needs values.
4. (Properties tab > Values tab) Select the Finder radio button.
5. Browse and select the query you want to attach.
6. Define the Data Value to match the ID that exists in the data.

7. Define the Display Value to match the expanded description that describes the Data Value.
8. Click Save, and then Publish. Any messages should state that there are no errors.

You can use a finder with a business object as the source for the Finder's data, instead of having to build an IQA query to return the records.

Do the following to use a Finder with a referenced object.

Go to RiSE > Business Object Designer:

1. Select an object from the list.
2. Click Edit.
3. (Properties tab) Select the property that needs a finder.
4. (Properties tab > Definition tab) In the References Object field, enter the name of the business object you want to use to populate the Finder.
5. (Properties tab > Display tab) Select Finder as the Display Control.
6. Click Save, and then Publish. Any messages should state that there are no errors.

Adding properties to business objects

You can add new properties to your objects that are based on a table or view in your iMIS database.

Do the following to add a new property to a business object.

Go to RiSE > Business Object Designer:

1. Select an object from the list.
2. Click Edit.
3. (Database tab) Select the property from the Available Columns that you want to add to the object.

4. Click Add as Properties or Add All Properties to move the property from Available Columns to Used Columns.

   Note: Any properties you add to the business object will display at the end of the list of properties displayed in the (Filters) and (Display) tabs in IQA.

5. Click Save, and then Publish. Any messages should state that there are no errors.
6. Test your changes by writing a query against the object. Add the new property on the Display tab.

Business Object Designer field reference

When editing a business object, you work in the Business Object Designer window. The buttons described in this section are available for each tab of the interface.

The Business Object Designer is found under the RiSE menu.

Go to RiSE > Business Object Designer:

- To create a new object, select New > Design Business Definition.
- To edit an existing object, click Edit.

Commands

- Save – Saves changes to the Business Object Designer object. Changes will not go live in iMIS until the object has been published. You must save an object before you can publish it.
- Publish – Publishes serialized metadata for the Business Object Designer object for use by BusinessRuleBase. Once the object is published, it is available to IQA and other controls within iMIS.

Business Object Designer Definition tab

The Definition tab includes the name of the object, its status (Active or not), and a field to record a metadata description of the business object's role. In addition, certain objects inherit properties from parent objects. The definition of which object inherits properties

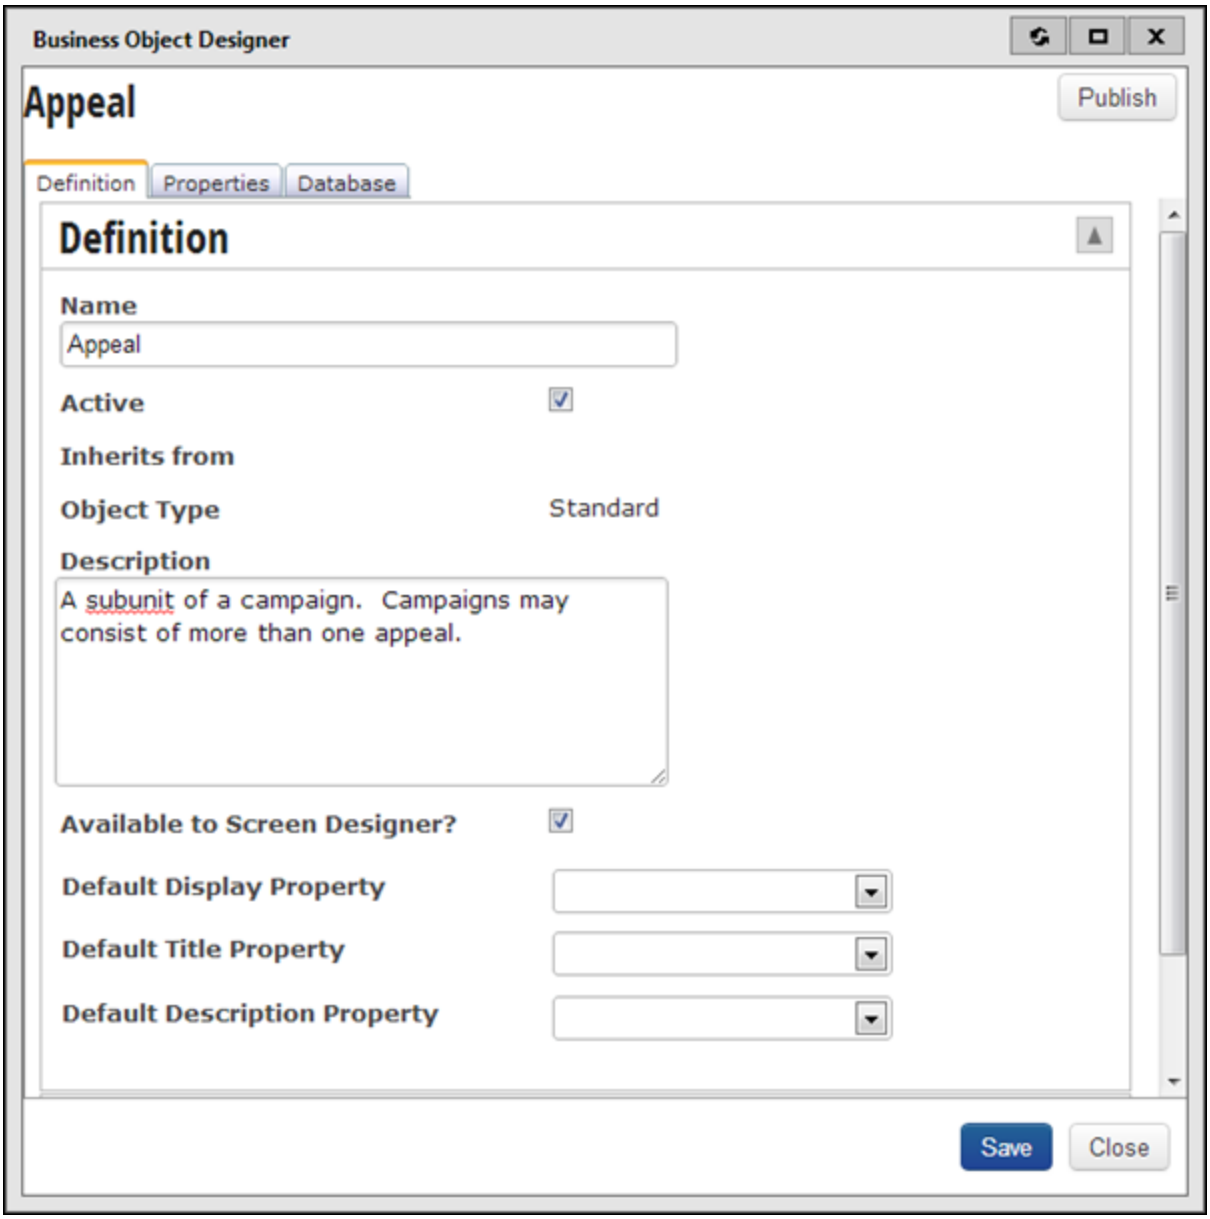
can be viewed on the (Definition tab) as well as the join between the parent and child objects.

> **Note:** Note: The Object Type defaults to Standard, which is editable. Any object that is not a Standard type is generated outside of Business Object Designer. You can use these non-standard objects in your queries and reports, but they are read-only in Business Object Designer to prevent changes to their required structure.

By default, the Business Object Designer (Definition tab) is found under RiSE.

Go to RiSE > Business Object Designer:

- To create a new object, select New > Design Business Definition.
- To edit an existing object, click Edit.
- Select the (Definition tab).



Definition

- Name – The name of the Business Object Designer object.

  Caution! Do not use SQL Server-reserved keywords as object names. Examples include ADD, GOTO, JOIN, and WHILE.

- Active – Indicates whether the object is Active (being used). If unchecked, the object is archived.

- Inherits from – If the object inherits from another object, the name of that object is displayed here and a red X is displayed next to the name. The red X enables you to remove the inheritance, making this object standalone. If the object does not inherit from another, a Browse button is displayed. Click the Browse button to find an object in the document browser. Select that as the base object from which the current object will inherit.
- Description – A text description of what the object is meant to do. This appears in the tool tip help and also in the summary in the Document Browser.
- Available to Screen Designer? – Unused.
- Default Display Property – Indicates which property should be returned when the business object is referenced as a foreign-key by another business object.
- Default Title Property – Unused.
- Default Description Property – Unused.

  Branches

  This section displays a tree view of business objects related to the open object. Branched objects inherit properties from the top Root object. Do the following to establish a branch.

  Go to RiSE > Business Object Designer:

1. Select New > Design Business Definition.
2. (Definition tab) Click Browse.
3. Select the root object.
4. Click OK.
5. Click Create Object. Make any required changes to the branched object.
6. Click Save, and then click Close.

> **Note:** Note: If you create a Copy of a Root object, you must recreate any branched objects that you require. Branch relationships are not saved during the copy. You cannot copy branched objects.

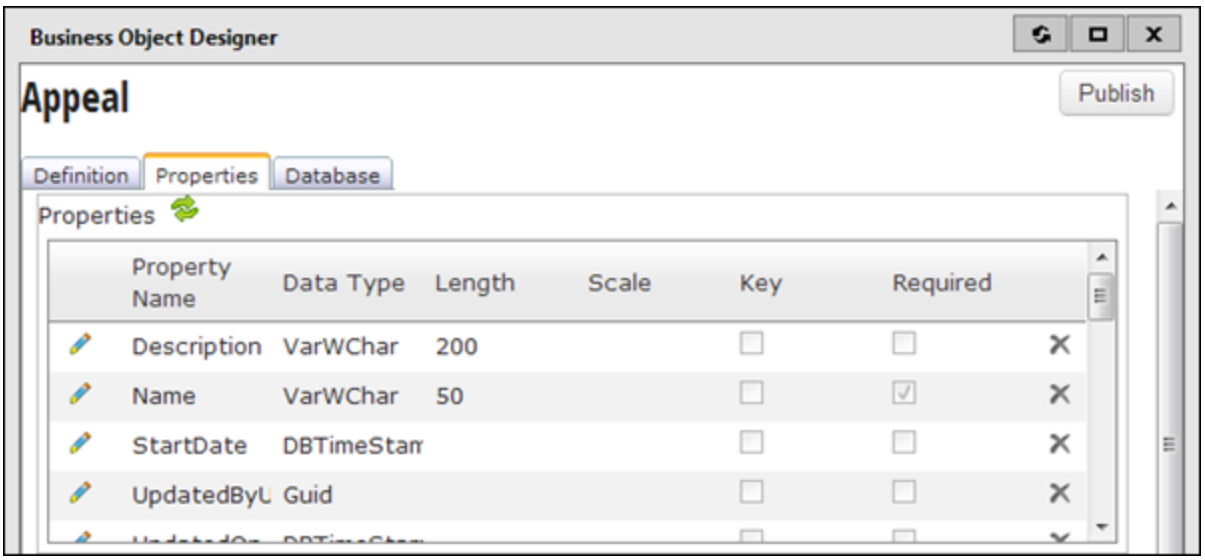
Business Object Designer Properties tab

The Properties tab displays each of the fields within the object and the specific attributes associated with those fields. Properties are defined initially from their SQL tables or views. Properties are attributes of the object (such as Contact.LastName). The Properties section lets you add, remove, and edit property values and their characteristics. The initial property entries that correspond to database columns are typically generated from the Database page.

By default, the Business Object Designer (Properties tab) is found under RiSE.

Go to RiSE > Business Object Designer:

- To create a new object, select New > Design Business Definition.
- To edit an existing object, click Edit.
- Select the (Properties tab).



Properties

- Property Name – The name of the property.

  Caution! Do not use SQL Server-reserved keywords as property names.

- Data Type – A drop down list of available data types for the property. The choice here yields the data type of the property on the object and in the database if the property is to be stored in the database. The drop down list is only available when creating a new object.
- Length – This value is only shown if Data Type can have a variable length (for example, VarWChar, Numeric). It is the maximum length of the data allowed in the property. It is the length of the data in the column in the database if the property is to be stored in the database. It is also the maximum length of the data input field for properties that display in the UI and have a maximum length as a parameter (for example, Text Box).
- Scale – This value is only shown if Data Type is Numeric. It is the number of digits to the right of the decimal point.
- Key – If checked, the property is part of the Primary Key of the object, and the property is part of the database table if the property is stored in the database.
- Required – If checked, the property must be set before the object can be saved or used. This column also marks the corresponding database column as NOT NULL if the property is stored in the database
- X – This column deletes the property from the object. This item also removes the column from the database table after a warning if the property is stored in the database.

Business Object Designer Properties tab – Definition sub-tab

This tab stores the physical data definition of the property. Property definitions are initially defined from SQL and can be refreshed from the database at any time.

By default, the Business Object Designer Definition sub-tab is found under RiSE.

Go to RiSE > Business Object Designer:

- To create a new object, select New > Design Business Definition.
- To edit an existing object, click Edit.

- Select the (Properties tab).

  Caution! Do not use SQL Server-reserved keywords as table or column names.

  Stored in Database?

  This option indicates whether the field is stored in the database. This option is disabled and always set to Yes.

  Database Table

  This drop-down contains any tables used in defining the object, with the default being the table name that matches the object's name, if any.

  Database Column

  This value defaults to PropertyName (from the Property List) if you are creating a new object by adding properties. PropertyName from the Property List defaults to this value if you are reverse-engineering existing tables.

  Allows NULL?

  This option allows a null value to be entered for the property when the property is saved. When this option is cleared, data must be entered for the property before the property can

be saved. This value is inherited from the database, but this value can be manually changed here.

References Object

This field indicates the business object for which this property is a foreign key.

Identity Column?

This option indicates whether the column auto-increments. If enabled, the following values are used:

- Start Value – This is the initial or seed value (integer) of the identity. The default is 1.
- Increment – This is an integer by which the identity is incremented with each new row. The default is 1.

Calculated Value

Unused.

Read Only?

If checked, the property's value cannot be modified. This option is automatically checked if there is an expression for Calculated Value and cannot be changed.

System Property? (Internal Use Only)

Identifies a property as system-defined. When selected, the property can only be modified by an administrator.

Log All Changes?

If checked, any change made to the value stored in this property is logged to the change log.

Query Builder

Enable these options to expose the property for use in queries.

- Available to Query Builder? – Makes the property available for use in IQA whenever the business object is selected as a source.

- Automatically Include in Queries? – Automatically includes the property in an IQA query result set whenever the business object is selected as a source.

  Security

  Unused.

  Description

  A free-form text description for the property. The description is available as a tool tip in the Screen Designer.

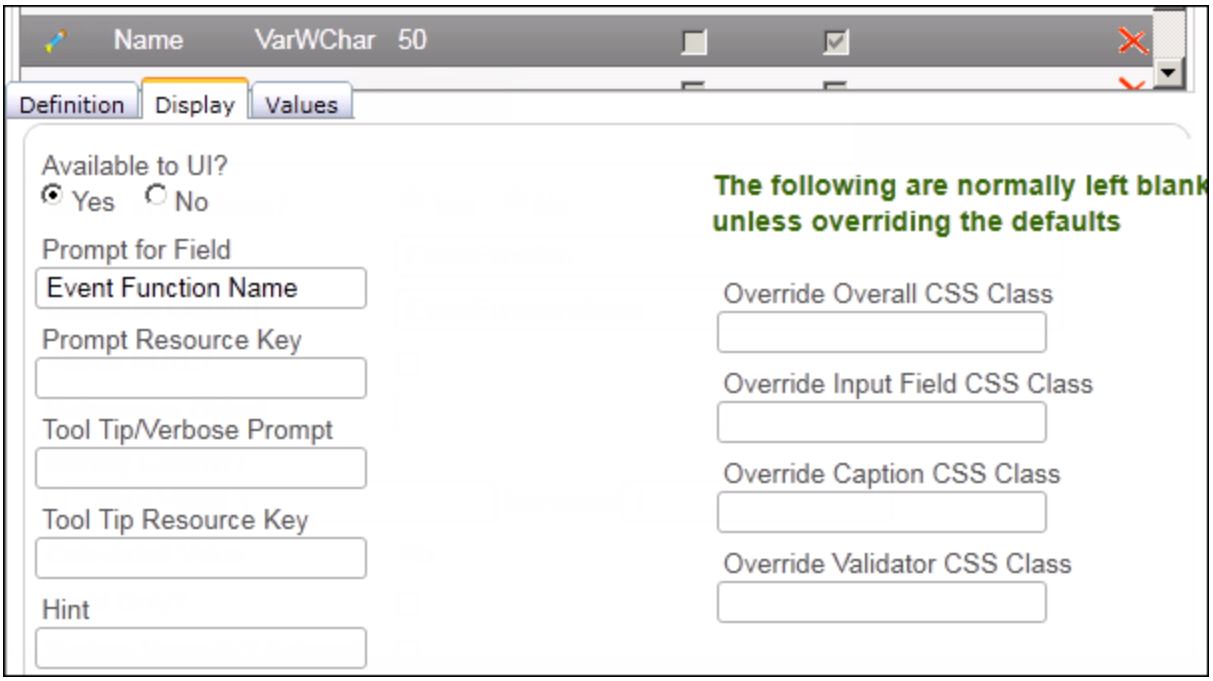
Business Object Designer Properties tab – Display sub-tab

This tab contains data about the caption/prompt for the field, as well as the ability to display or hide a property from IQA. Also, specific properties can be identified as default display values within IQA.

By default, the Business Object Designer Display sub-tab is found under RiSE.

Go to RiSE > Business Object Designer:

- To create a new object, select New > Design Business Definition.
- To edit an existing object, click Edit.
- Select the (Properties tab), then select the Display sub-tab.



Available to UI?

This option exposes the property for use across iMIS, such as for queries.

Prompt for Field

This prompt is displayed in front of the data display or data entry control in the screen designer (previously called Caption).

Prompt Resource Key (under development for future release)

This field specifies the resource key to use when rendering this property's prompt. Enter resource keys in the form [BaseResourceFileName or ClassName].[ResourceID]. For example, WebResources.FirstName.

Tool Tip/Verbose Prompt

This field specifies the text to be displayed in a tooltip when the user hovers over a UI element that is bound to the selected property.

Tool Tip Resource Key (under development for future release)

This field specifies the resource key to use when rendering this property's tool tip. Enter resource keys in the form [BaseResourceFileName or ClassName].[ResourceID]. For example, WebResources.FirstName.

Hint

This field specifies the hint text to be displayed after this property's data entry control.

Hint Resource Key (under development for future release)

This field specifies the resource key to use when rendering this property's hint text. Enter resource keys in the form [BaseResourceFileName or ClassName].[ResourceID]. For example, WebResources.FirstName.

Pop-up Help

This field specifies the help text to be displayed in a pop-up window when the user clicks the help button next to the UI element that is bound to the selected property.

Pop-up Help Resource Key (under development for future release)

This field specifies the resource key to use when rendering this property's pop-up help text. Enter resource keys in the form [BaseResourceFileName or ClassName].[ResourceID]. For example, WebResources.FirstName.

Keyboard Shortcut

This field specifies a keyboard shortcut to access this property.

Display Control

This drop-down allows the object designer to specify what data entry control should be used for this property in the Screen Designer. The choices available are not limited based on the data type of the property or whether the property references another object. Select an appropriate control for the data type.

Display Width

This field is shown only if Display Control is set to a value that takes Width as a parameter, for example, text box, text area. The width is expressed by number of characters in the column.

Display Height

This field is shown only if Display Control is set to a value that takes Height as a parameter, for example, text area, list box.

Allow multiple selection?

This field allows one or more selections to be made from a list of values in this property's control. When cleared, multiple selection is not allowed.

Use Auto Capitalization?

This field applies iMIS auto capitalization rules to the data entered for this property. When cleared, auto capitalization is not applied.

Display Mask

This field is shown only if Display Control is set to a value that allows for display masks, for example, text box. This field lists the pre-built system display masks such as Phone Number, Credit Card, Money, Percent, and so forth.

Format Regular Expression

This field specifies the regular expression to be used to format the data entered for this property.

Watermark Text

This field specifies the text to be shown as a watermark in the data entry control for this property. When cleared, no watermark text appears.

Watermark Resource Key (under development for future release)

This field specifies the resource key to use when rendering this property's watermark text. Enter resource keys in the form [BaseResourceFileName or ClassName].[ResourceID]. For example, WebResources.FirstName.

User Defined Mask

This field is shown only if Display Control is set to a value that allows for display masks, for example, text box). This field allows the object designer to specify a mask using a pre-defined set of formatting symbols. The Help button explains the syntax and provides examples.

Display Orientation

This field is shown only if Display Control is set to a value that takes orientation as a parameter, for example, multiple checkboxes, radio buttons, and so forth. If Horizontal is selected, the choices are displayed from left to right. If Vertical is selected, the choices are displayed from top to bottom.

Display Columns

This field is shown only if Display Control is set to a value that takes Columns as a parameter, for example, multiple checkboxes, radio buttons, and so forth. In conjunction with the Display Orientation field, the number of columns indicates how the set of choices will be displayed on-screen.

Related Property

This field relates this property to another property of the business object.

Show Easy edit?

This option displays the Easy edit button next to this property's data entry control for authorized users. When cleared, the button is not displayed.

Path to Web Service

This field specifies the URL path to a web service that provides data for this property's data entry control.

Web Service Method Name

This field specifies the method name to be called from the web service defined in the Path to Web Service field.

Valid Characters

This field specifies a list of characters that are valid for data entry in this property's data entry control.

Show Password Strength?

This field displays a password strength indicator under this property's data entry control. When cleared, the indicator does not appear.

Starting Path

This field specifies the default path the Document System Browser should start with if this property's data entry control prompts the user to select a path.

Validation Regular Expression

This field specifies the regular expression to be used to validate the data entered for this property.

Validation Message

This field specifies the text to be displayed when the data entry control fails validation.

Validation Message Resource Key (under development for future release)

This field specifies the resource key to use when rendering the Validation Message. Enter resource keys in the form [BaseResourceFileName or ClassName].[ResourceID]. For example, WebResources.FirstName.

Validation Range Start/End

This field specifies the start and end range to be used for the range validation in the Number Up/Down control.

Override Overall CSS Class

This field specifies the default CSS class to use when rendering this property's caption/prompt, read-only control, and data entry control.

Override Input Field CSS Class

This field specifies the default CSS class to use when rendering this property's data entry control.

Override Caption CSS Class

This field specifies the default CSS class to use when rendering this property's caption/prompt.

Override Validator CSS Class

This field specifies the default CSS class to use when rendering this property's validation.

Business Object Designer Properties tab – Values sub-tab

This tab allows users to define lookup values for a property in one of two ways:

- Manually built using codes and values within Business Object Designer.
- Built using a reference IQA query.

By default, the Business Object Designer Values sub-tab is found under RiSE.

Go to RiSE > Business Object Designer:

- To create a new object, select New > Design Business Definition.
- To edit an existing object, click Edit.
- Select the (Properties tab), and then select the Values sub-tab.

Default Value

This field allows the object's designer to indicate what data, if any, should be pre-selected or pre-filled in the field when creating a new instance of the object (Add/New).

> **Note:** Note: Use a predefined Value List value in the Default Value field. Use of a Freeform data entry value is not supported.

Values Come From

This option indicates the source, if any, for the allowed values for this property. The choices are:

- Freeform data entry – The default, if it is available. This option indicates that users should type in the value, for example, for a text box or text area. This choice is only available if the data entry field allows for freeform entry.
- Finder – If the data entry control for the property is a finder, this value is selected and no other choice is available. If the data entry control for the property is not a finder, this choice is not available.
- Query Object – This option indicates that the list of allowed values derives from an IQA query. This choice is only available if the data entry field allows for list type data entry, for example, drop-down list, list box, combo box, radio buttons, multiple check boxes, and so forth.
- Value List – This option indicates that the list of allowed values comes from the object's designer. This choice is only available if the data entry field allows for list type data entry, for example, drop-down list, list box, combo box, radio buttons, multiple check boxes.

Query

This item is shown only if the Values Come From selection is Finder or Query Object. This item specifies which IQA query to use for the finder or list. If specified, the name of the query object is shown read-only. In either case a Browse button is available to enable you to locate the query to use through the Document Browser. There is no delete or clear

button. A Query Object is required for Finder and Query Object types and is not available to other types.

Data Value

This item is shown only if the Values Come From selection is Finder or Query Object. This option indicates which property/field of the Query Object is stored in the Property when you make a selection.

Display Value

This item is shown only if the Values Come From selection is Finder or Query Object. This option indicates which property/field of the Query Object appears on-screen.

Values

This item is shown only if the Values Come From selection is Value List. This item allows the object's designer to enter the allowed values for the field.

- The Data Value fields contain the value to be stored in the property when you select the row.
- The Display Value fields contain the value to be shown to the end user when entering data into this property.
- Select More to append five additional rows for value entries.

Business Object Designer Database tab

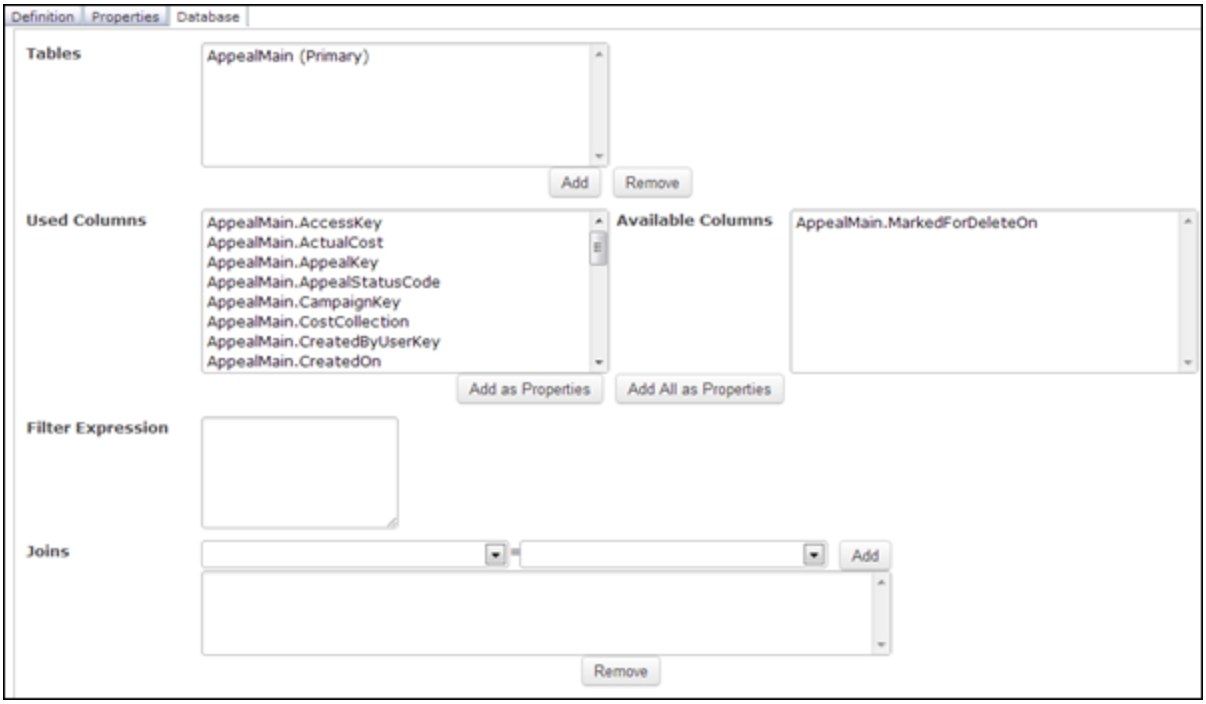
The Database tab defines the connection between physical tables and views within the iMIS database and the properties of the business object. The properties of a business object can comprise single or multiple tables and views. Where multiple tables and views are defined, an appropriate set of inner joins must be defined.

By default, the Business Object Designer (Database tab) is found under RiSE.

Go to RiSE > Business Object Designer:

- To create a new object, select New > Design Business Definition.
- To edit an existing object, click Edit.

- Select the (Database tab).



Tables

This field specifies which tables from the iMIS database are used as the object's data source, similar to the FROM clause of an SQL SELECT statement. To specify the tables in this list, use the Add and Remove buttons. The first table that you add is automatically designated as (Primary), which has no system effect and is meant only to indicate which table was added first to the object.

Used Columns

This field specifies which columns from the tables specified in the Tables field are used as the object's properties, similar to specifying column names in the SELECT clause of a SELECT statement. The columns that you select here are listed on the (Properties tab). To specify the columns in this list, select one or more columns from the Available Columns list, and then click Add as Properties. Press Ctrl or Shift to select multiple columns.

Filter Expression

(Optional) This field specifies a filter expression that further limits the table rows that are acted upon by this business object, similar to the WHERE clause of an SQL SELECT statement. The filter expression is applied after the result set of any Joins specified for this object. You must omit the WHERE keyword itself. If there is more than one table listed in the Tables field, you must use qualified column names to prevent ambiguity, as shown in the following example using the ACTIVITY_TYPE column from the Activity table:

Activity.ACTIVITY_TYPE='F'

You must specify only a single WHERE clause, because multiple tables listed in the Tables field are joined with an inner join.

Available Columns

This field specifies all of the columns that are available for use as properties for this object. The list comprises all columns from all tables specified in the Tables field, minus the columns that have already been added to the Used Columns list.

Joins

This field is required if more than one table is specified in the Tables field. This field specifies inner joins between the tables specified in the Tables field, which limits the table rows on which this business object acts to the result set created by the joins. The drop-down lists enable you to choose the columns for each join. Click Add to add the join to the list of joins for this object.

Multiple joins between the same two tables are expressed with a Boolean AND operator in the same INNER JOIN clause. Every join between a different pair of tables is expressed as a separate INNER JOIN clause.

For example, assume that you've added Table1, Table2, and Table3 to the Tables field, and you have added all of the Available Columns to the Used Columns field. Add the following three joins to the Joins list:

Table1.Column1 = Table2.Column1

Table1.Column2 = Table2.Column2

Table2.Column3 = Table3.Column3

In this case, an analogous SELECT statement would be:

```
SELECT *
 FROM Table1
 INNER JOIN Table2
   ON Table1.Column1 = Table2Column.1
   AND Table1.Column2 = Table2.Column2
 INNER JOIN Table3
   ON = Table2.Column3 = Table3.Column3
```

Business Object Designer does not support the creation of cross joins, outer joins, or any join type other than an inner join. The joins that you define here are available as default joins when using the object in an Intelligent Query Architect (IQA) query, but IQA also gives the option to create different, custom joins for the tables underlying the business objects used in the query.

Examples of business object customizations

Adding a new business object

This example creates a business object for the Name_Note table and exercises the business object with a query.

Go to RiSE > Business Object Designer:

1. Select New > Design Business Definition. The New Object window is displayed.
2. Enter CsName_Note as the Name for this example.
3. Click Create Object.
4. (Database tab) Click Add. A window listing all the iMIS database tables appears.

5. Select the Name_Note table and click OK. The Name_Note table is added to the Tables field, and its columns are added to the Available Columns field.
6. In the Available Columns field, select all the columns except Name_Note.TIME_STAMP, which is used for iBO concurrency, and does not apply to this example.
7. Click Add as Properties.
8. Click Save.
9. On the (Properties tab), examine the automatically generated entries on the Description, Type, Display, and Value tabs.
10. (Properties tab > Definition sub-tab) For the following properties, verify the Available to Query Builder and Automatically Include in Queries options are checked:

- ID
- NOTE
- NOTE_NUM
- PURPOSE

11. Click Save and then Close.
12. Click Publish.
13. Click OK and then Close.
14. Open Intelligent Query Architect.

    Create a new query in a working folder.

    Go to RiSE > Intelligent Query Architect:

1. Select the folder Scratch.
2. Select New > Query.
3. Enter a Name for this query.
4. (Define tab > Sources sub-tab) Click Add Source.

5. In the Document Browser, go to $/Common/Business Objects.
6. Select CsName_Note. Click OK to add it to the Query Sources list.
7. (Define tab > Display sub-tab) The four columns in the display set are selected.
8. Click Save As. On the Document Saver window, enter CsName_Note query as the name for this query.
9. Click OK.
10. Click Run to see the sample output.

Do the following to generate extended results:

1. (Define tab > Sources sub-tab) Click Add Source.
2. In the Document Browser, go to $/Common/Business Objects.
3. Select CsName_Note. Click OK to add it to the Query Sources list.
4. Add the Name table to the business object, display FULL_NAME in the query results, and republish.
5. In BOD, Edit the CsName_Note business object. Select Physical, and add the Name table to the Tables list. Add Name_Note.ID=Name.ID to the Joins list, by selecting the columns from the left and right drop-down lists.
6. Select Columns, select Name.FULL_NAME, and add a property for the column.
7. On the (Properties tab), select the Display sub-tab.
8. Add FullName to the Display Set.
9. Select Save, Close, Build, and Publish.
10. In IQA, open the query for this business object.
11. On the (Sources tab), click the Remove icon to remove the existing source.
12. Click Add Source and re-add CsName_Note.

Note: Business object changes aren't automatically reflected in queries that use them.

13. On the (Display tab), change the order to have Id and Full Name first. Use the Refresh button as you go to confirm the order. Save the query.
14. Select Run to see the query results.
15. On the (Summary tab), switch to Advanced mode to see the SQL for the query.

Editing an existing business object

The following example changes a display property on the Campaign object and shows the change from the application.

Go to Community > Manage marketing campaigns > Define campaigns:

1. Select a campaign. Note the values for Name and Campaign Code. These values come from the business object.

   Go to RiSE > Business Object Designer:

2. Select the Campaign object.
3. Click Edit.
4. (Properties tab) Select the Name property.
5. (Properties tab > Display sub-tab) Change the Prompt for Field entry to the Campaign Name.
6. (Properties tab > Display sub-tab) Change the Description to the Campaign Description.
7. Click Save, and then Close.
8. Click Publish.
9. Click OK, and then Close.

   Go to Community > Manage marketing campaigns > Define campaigns:

10. Select the campaign from Step 1. Note the values for Name and Campaign Code.

Creating business objects for user-defined tables

This example creates, builds, and publishes business objects for all user-defined tables set up in iMIS Customer Management. It edits one of the business objects, changing display set and prompt entries, and tests the new business object in IQA.

1. From Customers, select > Set up module > General and click Additional Windows.

   The Customer Setup window appears.

2. Verify that the Defined Tables list contains the Name_Demo table. This table (included in the demo database) is used in this example.

3. Close the Customer Setup window.

   Go to Settings > Utilities > User defined tables:

   The Auto-Generate Business Objects from User-Defined Tables window is displayed.

4. Click Build All. Wait for iMIS to generate business objects. The Build Results field will display a log of the business objects that were built, compiled, and published.

5. Verify that CsName_Demo is listed in the Build Results field.

6. Go to RiSE > Business Object Designer.

7. Select the CsName_Demo object.

8. Click Edit. The CsName_Demo object is displayed.

9. (Properties tab) Verify that a Property Name value exists for each column in the Name_Demo table.

10. Add the ID, Spouse, and School_Attended properties to the object's display set. Change the displayed caption for School_Attended property:

1. (Properties tab > Display sub-tab) In the Property Name area, select the row containing the ID property. The values shown in the Display sub-tab change to the defined display set values for the ID property.

2. (Properties tab) > (Definition sub-tab) select the Automatically Include in Queries? check-box.
3. (Definition tab) In the Default Display Property? List, select ID.
4. Repeat steps a through c for the Spouse and School_Attended properties.
5. (Properties tab > Display sub-tab) For the School_Attended property, change the Prompt for Field value from School _Attended to Alma Mater.
11. Click Save and wait a moment for your changes to be saved to the business object.
12. Click Publish. A results window is displayed, listing any messages and errors.
13. Ensure that the business object published without errors. Click Close.

    Note: Rerunning the Build All command in the Auto-Generate Business Objects from User-Defined Tables window will cause your changes to be overwritten and lost. The business objects for user defined tables are recreated by that operation.
14. Go to RiSE > Intelligent Query Architect.
15. Select New > Query.
16. Create a new query named New Query.
17. (Sources tab) Click Add Source.
18. Select CsName_Demo.
19. Click OK.
20. Click Save to save the query.
21. Click Run. The result set for the query is displayed. Notice that the three columns shown in the query result set match the three properties that you defined for the business object's display set.
22. Modify the query to return only those records that contain non-null values for either Alma Mater or Spouse. Creating an OR evaluation like this requires you to define two separate filter sets:

1. Click Define.
2. (Filters tab) Select Advanced in the Mode drop-down list.
3. Select Spouse in the Property drop-down list.
4. Select Not Empty in the Comparison drop-down list.
5. Click the Add Line icon +. The filter is added to the filter set.
6. Click Add Filter. A new filter set is added below the first filter set.
7. Select Or in the drop-down list to the left of the Property column header.
8. Repeat steps c through e in the new filter set to add the Alma Mater property and specify a Not Empty comparison value.

23. Click Save to save the query.
24. Click Run. The result set for the query is displayed. Notice that the result set for the query now contains only those records that contain values for Alma Mater or Spouse.

Certification

Welcome to iMIS Certification, a highly organized and integrated tool for managing your organization's certification programs! iMIS Certification assists your organization in giving credits to members for activities or achievements defined by your organization. Providing a certification program on your site keeps your members well-informed and coming back to your site to check on the status of their certification as they complete each program requirement.

iMIS Certification is a self-service feature that gives your members the ability to:

- Stay informed and up-to-date with training and certification programs
- Manage and view their certification progress
- Stay engaged with your organization and your website

iMIS Certification allows your staff to:

- Define and manage a certification program
- Add component requirements
- Offer a variety of ways to complete the requirement
- Link offerings to iMIS products and events as well as HTML links

Requirements:

- Certification license key

Certification example on the sample Member site

The sample Member site shipped with iMIS (RiSE > Site Builder > Manage websites) includes Certification predefined with navigation and content records.

Before you get started, take a tour of the Certification area provided in the Member site included with iMIS to get an idea of the enrollees' experience. If you like it, go ahead and copy the website, sitemap, or navigation.

Sample Certification Programs from the Member site

How Certification works in iMIS

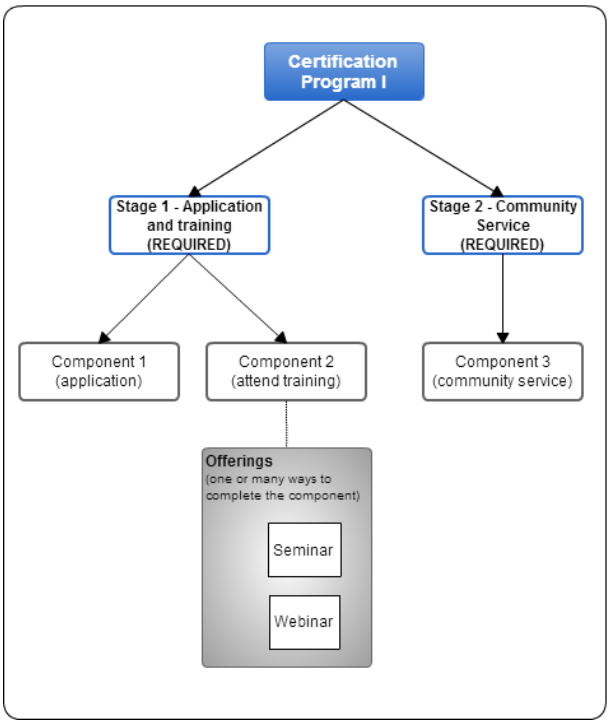
iMIS Certification allows you to create several certification programs, each with a different set of completion criteria. For example, you can set up a simple program requiring customers to attend three of five available seminars over a specified time period, with each seminar defined as a certification component. Attendance at the seminar would be considered credit. You could also create a very complex program with 30 or 40 components and a three-year period for program completion.

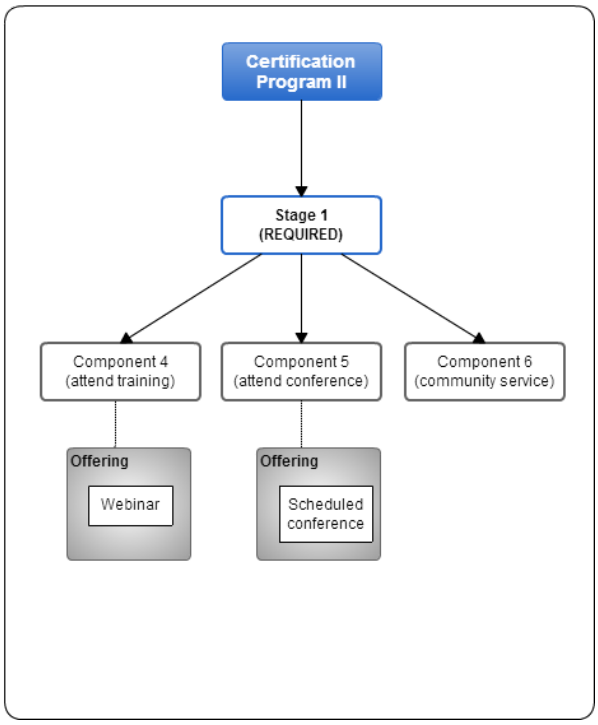
As a convenience to your members, you can create offerings for each component that offer one or many ways for a member to complete a requirement. Offerings can be related to an iMIS event or product, or a custom resource with the specific date, time, and location when a member can complete the component requirement. A component may have multiple offerings, such as different dates when a course is offered. For example, a webinar component may contain an offering with the webinar provided on various dates.

Certification programs can also be set up in ordered stages that require a stage to be completed before proceeding on to the next stage.

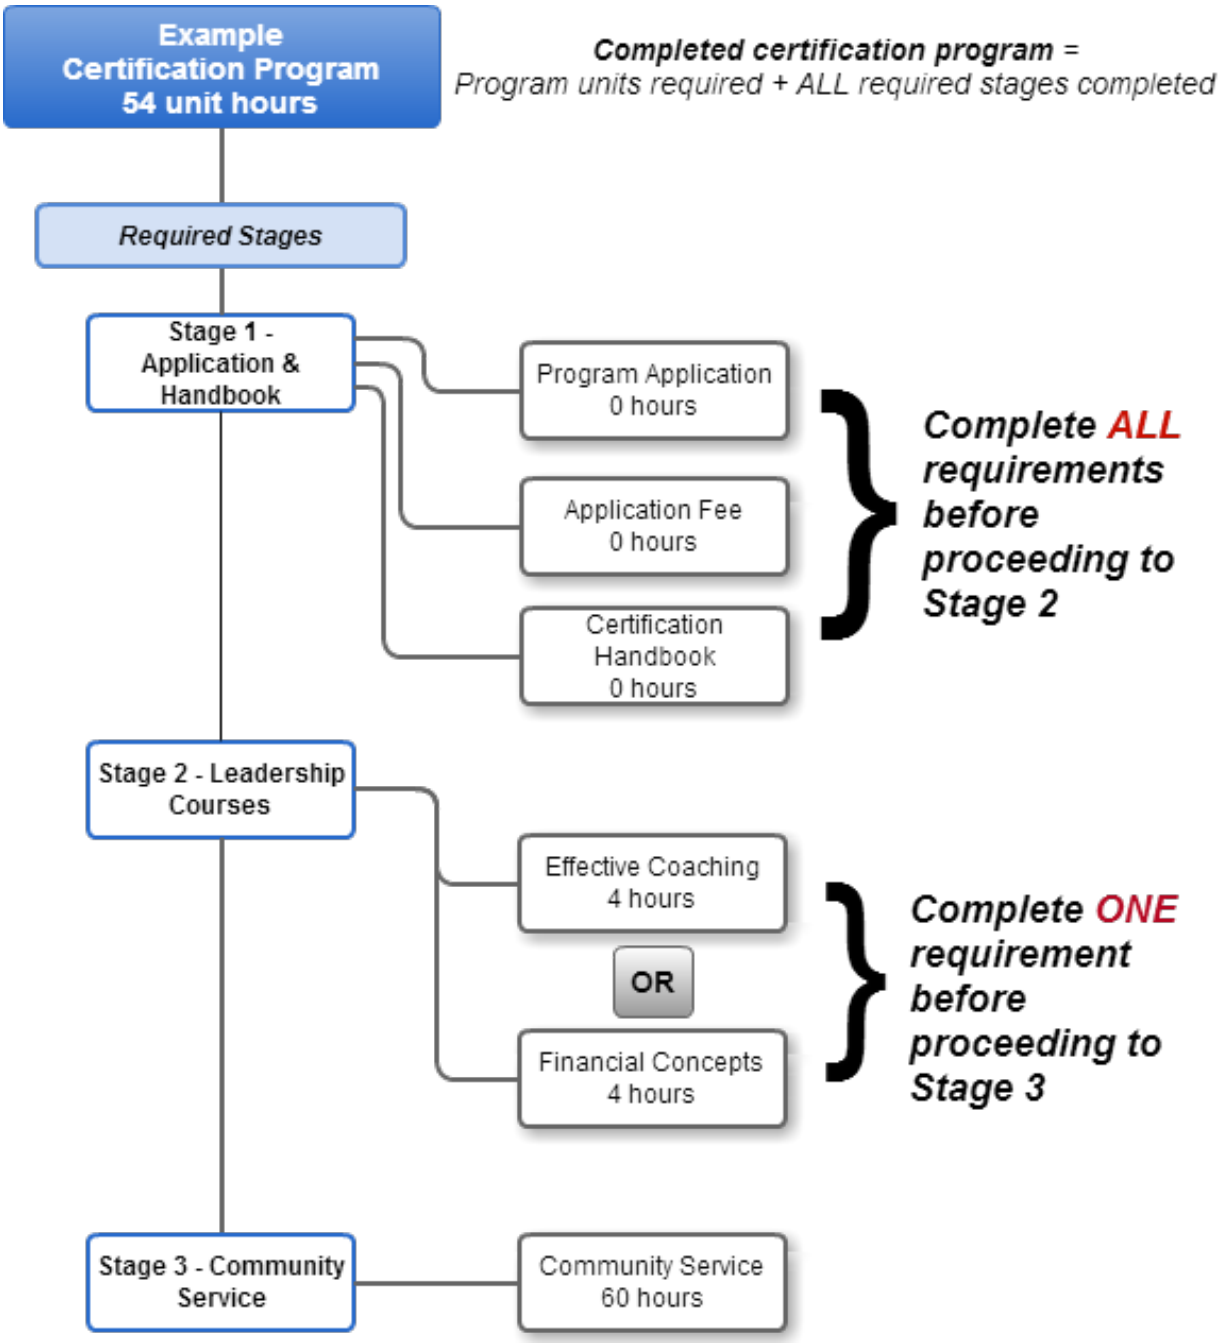
You will use the Staff site to set up and manage your certification programs, define program components, and approve requirement and program completion. A certification program can be set up with just a few requirements for completion, or as a more complex set of requirements with a series of required stages.

Certification – Example 1





Certification – Example 2



Creating a certification program

A certification program is a defined set of components or training programs offered by your organization to members to prove that they have achieved a measured level of knowledge within a designated timeline.

Plan out your certification program carefully since an enrollee must complete the required number of units and all of the required stages in the program before a program is considered complete.

Here are the basic building blocks to setting up or defining your certification program:

- Create a certification program and define the properties
- Define the program components
- Define and structure the program requirements using stages
- Define unit types, program groups, and offering providers as needed
- Add certification to your public-facing website

To define a Certification program

From the Staff site, go to Certification > Set up programs > Certification programs:

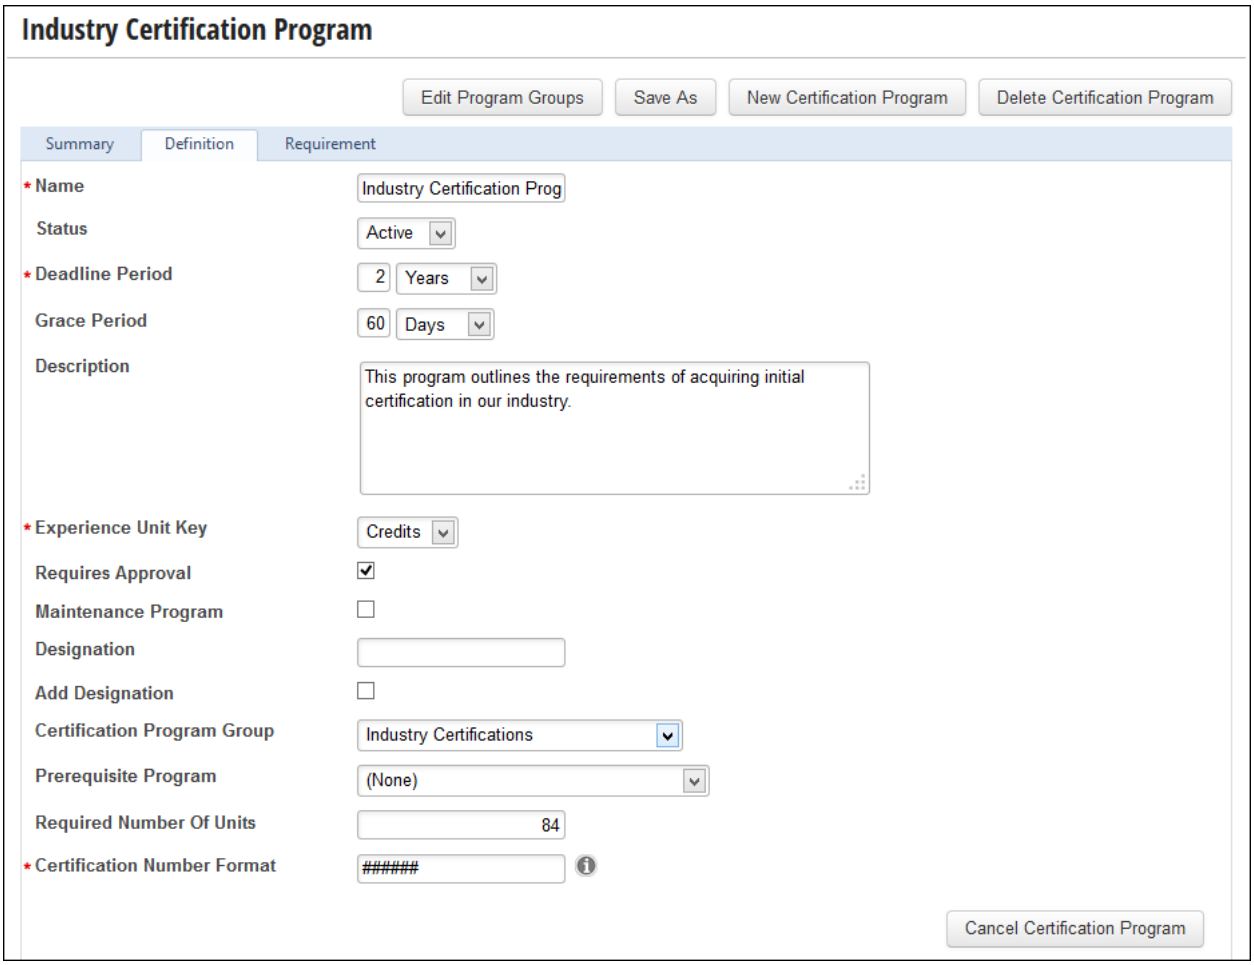
1. Select Create a new Certification program.
2. (Definition tab) Define your certification program information and click Save.

Note: The name and description entered will appear with the program information available to your website visitors.

- Status – Select Active or Inactive. Inactive programs will not be viewable by any users, including staff. However, participants who have already enrolled for the program will be able to see programs marked as inactive.
- Deadline Period – (Required) Provides a time limit in which to complete the program. Enter a numeric value, and choose years, months, weeks, or days from the drop-down menu. Once an enrollee has begun the program, the deadline period will initiate.
- Grace Period - Provides a time extension past the deadline for enrollees to complete the program.
- Experience Unit Key - A unit of measurement to track progress using industry-recognized terminology. Select a unit from the drop-down. If the unit type you need is not available,

you can add one in unit types. Programs without a unit key will not appear to the public.

- Requires Approval - Select this checkbox to require approval of program completion, once an enrollee has completed the required stages and number of units.
- Maintenance Program - Select this checkbox to indicate that the program is repeatable and allows enrollees to enroll again after completion.
- Designation –Describes an acronym, such as CPA, that follows the contact record's name to indicate they have completed the requirements of a certification program and have earned this designation.
- Add Designation - Ensures that the designation is added to the contact record upon successful completion of this certification program.
- Certification Program Group – Select a program group option from the drop-down list. Program Groups can be used with any certification program to associate multiple certification programs together. To add program groups, see Defining program groups.
- Prerequisite Program – Select a program from the drop-down to set it as a prerequisite requirement.
- Automatically enroll when prerequisite is completed - Select this option to automatically enroll a contact in the program if they complete a program defined as a prerequisite. This option is only available if a prerequisite program is defined.
- Required Number of Units – Enter the total number of units enrollees must fulfill for the program to be considered complete.
- Certification Number Format – (Required) Indicates the digits for earned certifications using hash mark symbol (#) as a numeric placeholder for incrementing the value. Use letters, hyphens, and optional numbers to track the certifications that have been awarded within a program in a sequential numeric order. For example, enter CSP-###00 so that the certificate awarded for the first completion is indicated with CSP-00100.



Example Definition of a Certification program

Creating program components

A program component is a single piece of a certification program that is required of a student to complete a certification program. A component must be fulfilled in order for an enrollee to gain credit for a stage of a certification program.

Components may represent any type of program requirement, such as course completion, event attendance, enrollment or application fees, applications, resumes, or letters of recommendation. Components can have one or more offerings which provide the enrollee with a specific way to complete the requirement, such as details about when and where a component can be completed. Offerings can be linked to an iMIS event or product to facilitate completion of the requirement.

Once defined, program components can be added to a program stage as requirements. Components can be re-used across multiple certification programs. For more information, see Defining requirement stages.

Note: If a component is completed in one program and is included/re-used in another program, the enrollee gets credit for the component in *both* programs. For components that shouldn't be given credit in multiple programs when completed (for example, a component requiring an application fee), it is best to make a copy or create a new component.

Before you begin

- If the component represents a fee or charge, the product for that fee must already be defined.
- If you want an event (such as a training class) to be associated with the program, the event must already be defined.

To create a program component

Go to Certification > Set up programs > Program components > Create new Component:

1. On the Definition tab, specify the component properties. This area specifies the details of the component such as the number of units the student earns for completion, or the grade available.

- Name – (Required) Enter the name of the component as it will appear to enrollees in the list of requirements.
- Code – (Required) Indicates the code that you can use to look up the component, up to 50 characters in length. Enter only letters and numbers, no symbols.
- Description – You can enter a description of the component. If you want to provide a link to users, you can enter HTML in this field.
- Number of units – Defines a number value to indicate how many units such as credits, or hours, a student earns upon completing this component. This value may be overridden when the component is added to a program.

- Allow enrollee to report completion – Indicates that a program enrollee can record their own completion of the component.

  Note: The Allow enrollee to report completion option does not apply to staff users. Staff users can always record completion of the component for a program enrollee.

- Requires grade – When selected, requires the user to enter a grade when recording a completion.
- Requires approval – Indicates that staff must approve completion of this component.

  Tip: If Allow enrollee to report completion is not selected, then only staff users may record completion of the requirement, so approval will likely not be required.

- Certification staff only – Indicates that only staff users will see this component when it is included with a program.
- Status - Indicates if the component is currently Active or Inactive. Only components marked Active are available for selection when creating a certification program. You cannot select an Inactive component as part of a certification program.
- Grade – Defines values for the grading system you want to use for this component.
- File attachment – (Required) If the component requires an attachment to fulfill the requirement (i.e. filled out application, proof of completion, etc.), select Required. If the user may include an attachment but it is not required for completion, select Optional.
- Inactivate Component (button) – Select this button if you want to make a component inactive. When you are prompted for confirmation, programs currently using the component are listed.

2. Click Save.

   To create component offerings

   Offerings can be defined for a specific component, which provide enrollees with one or more specific ways to complete the component. An offering may be an event, a product, or a custom collection of information such as date, time, and HTML links. Offerings are optional for components.

Go to Certification > Set up programs > Program components > Create new Component or open an existing component:

1. Save the component if it is a new component.
2. Click the Offerings tab.
3. Click Create new Offering.
4. Enter the information for the offering, including;

- Type – Specify that the offering is a Custom, Event, or Product type of offering.
- Event – (Required if you specify Event as the offering Type) Link the offering to a specific event. Click select to find and select the event.
- Product – (Required if you specify Product as the offering Type) Link the offering to a specific product. Click select to find and select the product.
- Name – (Required) Enter the name of the offering as it will appear to enrollees when they are viewing the component.
- Code – (Required) Defines the code that you can use to look up the component, up to 50 characters in length. Enter only letters and numbers, no symbols.
- Description –You can enter a description of the component offering. If you want to provide a link to users, for example a page or website where they can find more information about the offering, you can enter HTML in this field.
- Status – Specify that the offering is Active or Inactive.
- Date – Specify the date that the offering occurs.

  Note: When defining an offering that is an event, the Date defaults to the event end date, but a staff user can manually change the date. The Date field becomes the Completion date field after saving the Event offering.
- Allow date changes – When selected, this offering allows registrants to change the date when recording completion of the requirement.

Note: If there is no Date defined for the offering, then Allow date changes must be selected so that users can enter the date when they complete the offering.

- Purchase completes requirement – (Available only if you specify Product as the offering Type) This indicates that the requirement is satisfied when the user completes the purchase of the product. If not enabled, the user will have to record completion manually after purchasing the product.

  Tip: For product offerings that represent fees or charges for the certification program, Purchase completes requirement should be enabled so that the fee requirement is marked as completed. If the offering may require that the enrollee do something additional after purchase to complete the requirement, for example reading a book they purchased, then this option should be deselected.

- Provider – Defines the person or company that manages the offering or gives the training. This list is created based on the records selected in the Certification > Manage Providers. For more information see Managing providers.

- Location – If a Provider is defined, this indicates which provider location applies to the offering. Provider locations are also defined in the Certification > Manage Providers area.

- Link Experiences – Not used.

Defining requirement stages

The requirement structure for a certification program consists of one or more stages, each of which can have one or more requirement sets, notes, and email notifications when the stage is completed. A requirement set is a list of components that are required to complete that set. Within a stage, you can use either AND combinations of sets, meaning both are required to pass the stage, or you can use OR combinations of sets, meaning either one or the other allows the member to pass through a stage.

A simple program may have a single stage with a single requirement set containing a list of requirements. Enrollees in this type of program would be able to complete the requirements in any order. Multiple stages can be used to create categories of requirements, or to distinguish between requirements that are required and optional (by setting the stage

to required or optional). You can also define multiple stages to enforce a required order for completing requirements.

Note: Changes to requirement structure (such as stage order and which requirements are included) will not be reflected for users who have already enrolled in the program. The program structure is set at the time of enrollment.

Before you begin

Plan the structure of your program and the requirements that will be needed carefully prior to defining them in iMIS.

You must fill out the Definition tab for a certification program and click Save in order to view the Requirement tab.

You must define components in the Program components area in order to select them as requirements in a requirement set. See Creating program components for details.

From the Staff site, go to Certification > Set up programs > Certification programs > Requirement tab:

1. Enable the Stages must be completed in order checkbox if you will be using multiple stages and would like participants to complete a particular stage of certification before proceeding on to the next stage.

   Note: If this option is selected, then all stages will be set to Required, as enrollees will be required to complete each stage before moving to the next stage.

2. For each stage you want to include, click Add Stage.

- (Optional) Enter the name and description of the stage. The name will appear to enrollees as a section header for the stage's requirements.
- Select the Required checkbox if the enrollee must complete the stage in order to complete the program.

3. Add the component(s) that will be required in the stage. One requirement set is present by default.

- To add a requirement, click Add a Requirement located to the right of the stage.
- Find and select the component you wish to add, and if needed, change the Number of units that will be needed for this component. This will not change units defined in the program component.
- Add each requirement that is needed for the set.

4. Additional requirement sets can be added and combined using AND or OR. For example, you can either require an exam component for entrance into a program or a staff approval component stating the requirement qualifies them for entrance into a certification program.

   To add an additional set to a stage, click Add a new Requirement Set located below the stages requirements tab. Select AND or OR from the drop-down list between the sets as appropriate.

5. To send an email notification when a stage is completed, go to the Email Notifications tab for the stage. Click Add Email. See Defining certification communication for details on creating an email output process.

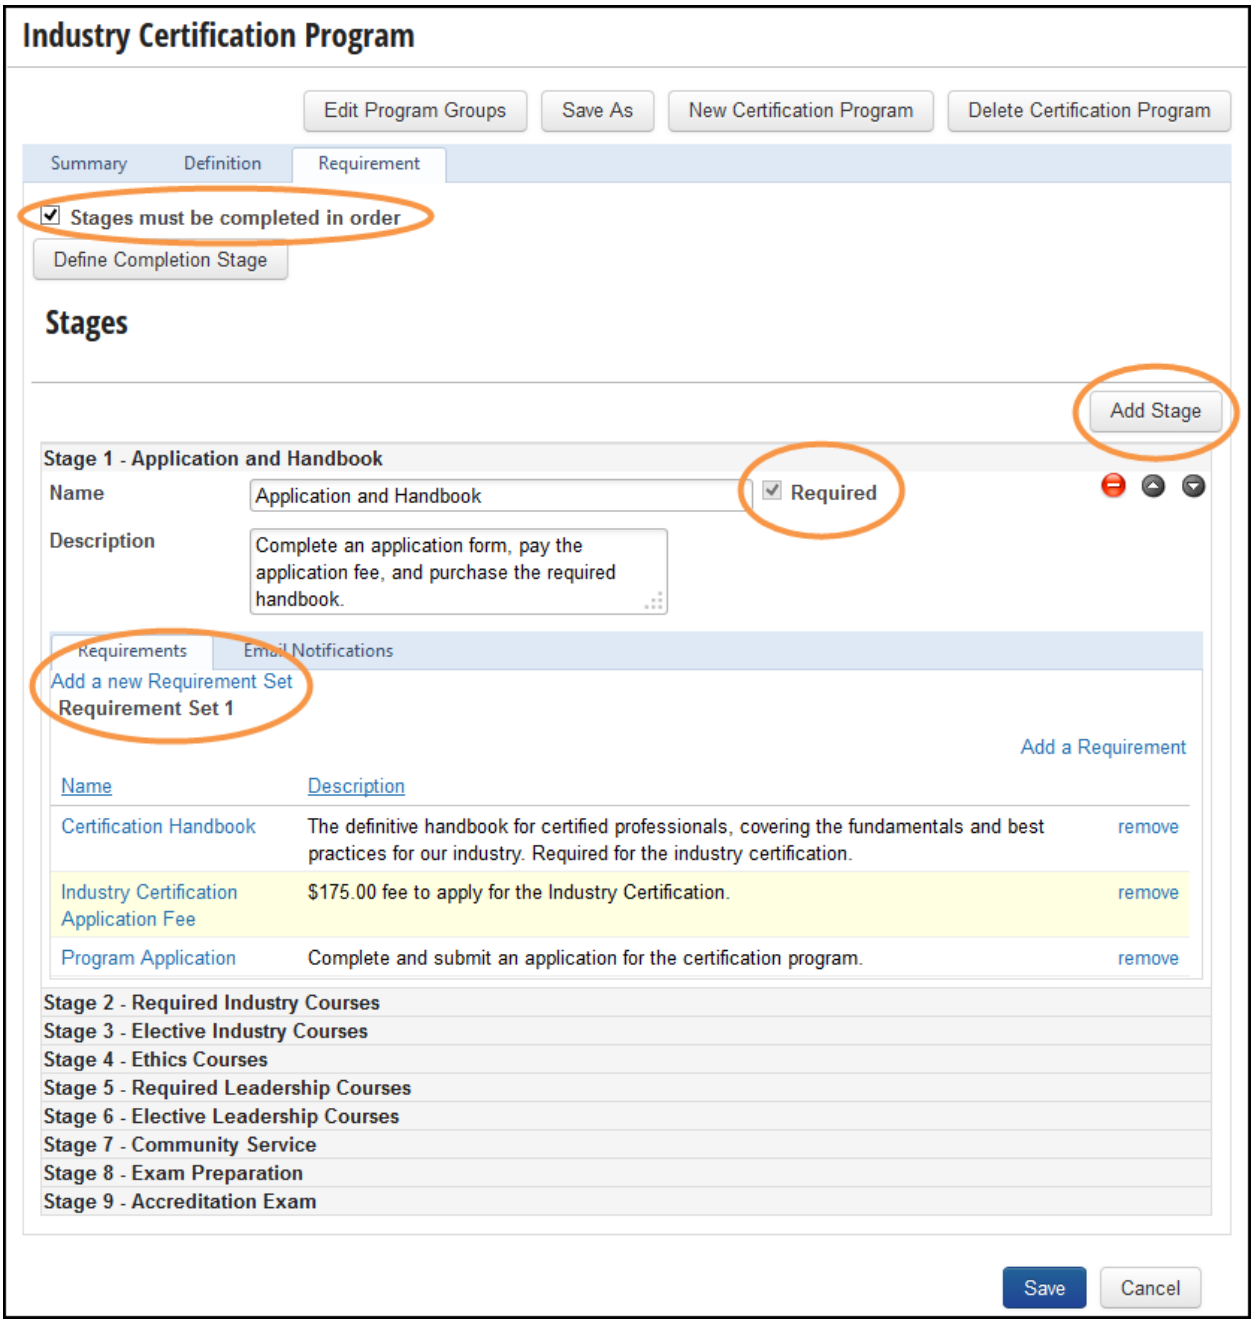
- Provide a Process Name.

  By default, these email queries are located in the document browser at $/Common/Shared Documents/Processes.

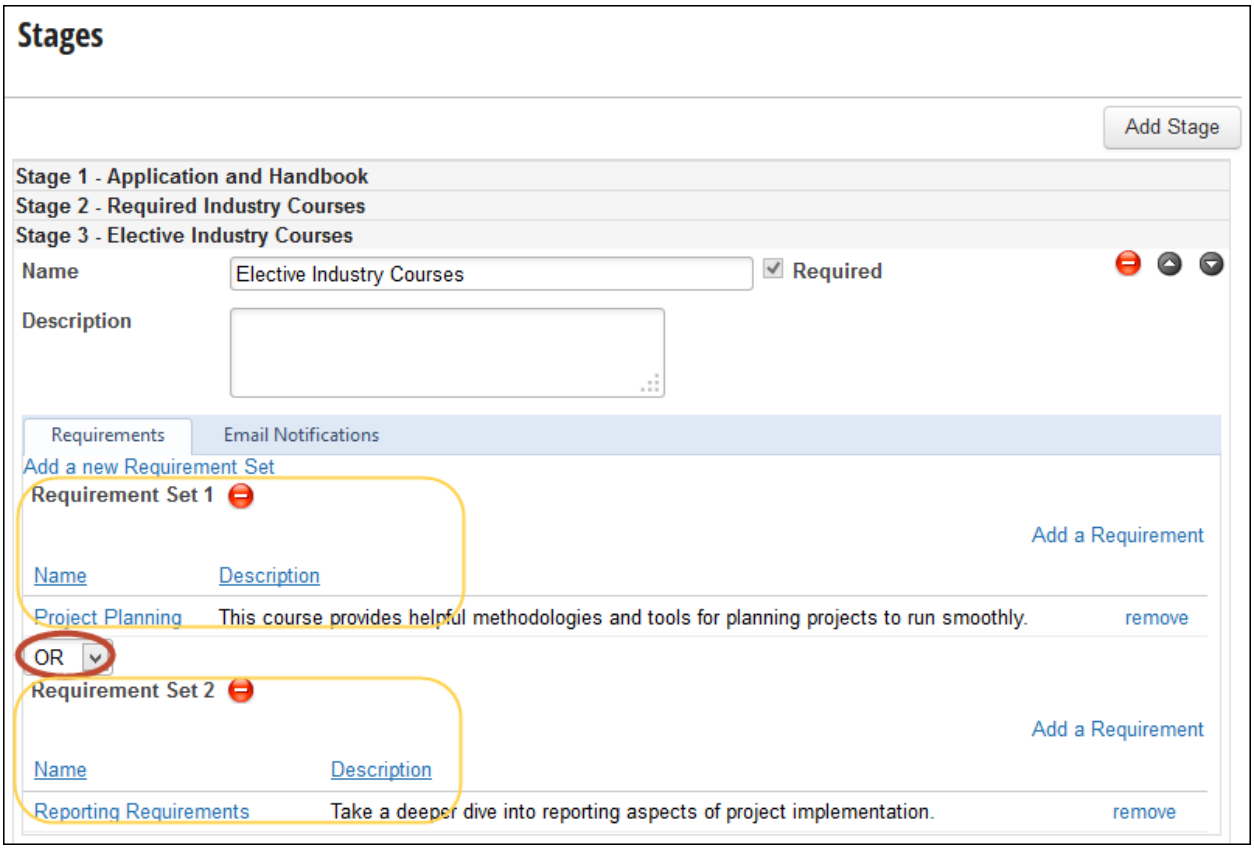
- Select Assignees, select the user(s) to receive email notification and click Continue.

  By default, the available values are Certification User, Certification Manager, Certification Admin, and Registrant.

6. Click Define Completion Stage and specify the completion stage. This completion stage acts as the final stage for a certification program, but is intended for staff use only. It does not contain any requirements. For example, you can use the completion stage to send out an email confirmation when the last program stage has been completed.
7. Click Save.



Example of a Stage containing three requirements



Example of a Stage allowing for one of the two components as required

Defining certification communication

You create email messages that are sent at the start of a stage within a certification component for different reasons and audiences related to certification. For example, you may send notifications to a staff member so that they can review progress through stages. Or, you may need to send an email to all participants in a certification program before a particular offering is available so that they can sign up for the event. You define email merges for certification communication within the Document System in iMIS.

Before you begin

Certification programs must already be defined.

To define certification communication

1. Store the email merge in $ > Common > Shared Documents > Processes folder (or one of its sub-folders) of the Document System.
2. When defining a requirement, define the email notification within a stage and select the email merge output process that you want to be sent when the stage is started.

   When that stage starts, iMIS sends the communication.

   Tips

   The following information can be helpful when defining certification communication.

- If your merge produces any email address duplicates, they result from the query specified in the merge.
- The recipients of the communication are created in a query built in the Document System interface, based on the roles for the stage containing the email notification.

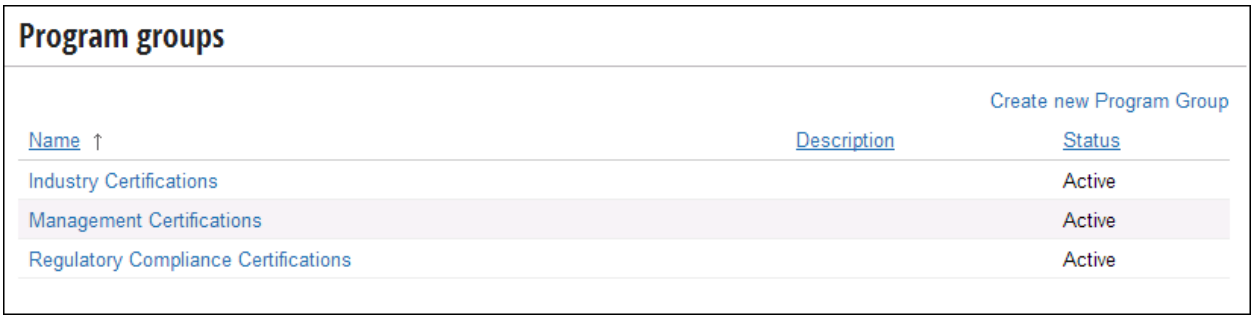
Adding unit types

A unit type determines how the program and the components will be measured. For example, if the program definition uses hours as a unit type and the number of units required is 84, then the completion of the program will require 84 hours. You will select the unit type at the certification program level.

- To view existing unit types, click Find.
- To define unit types, go to Certification > Set up programs > Unit types and select Add new unit type.

Defining program groups

Program groups allow you to categorize or associate multiple programs together. For example, you may have multiple certification programs related to industry certification, including maintenance programs, so you can group these programs together by assigning each to a single program group.



To define a program group

From the Staff site, go to Certification > Set up programs > Program groups:

1. Click Create new Program Group or select the program group you would like to edit.
2. On the (Definition) tab, set the Status to Active or Inactive. Only groups marked Active are available for selection when creating a certification program. You cannot associate a program to an Inactive group.
3. Save.

Managing providers

You can identify iMIS contacts (individuals or organizations) as training providers so that they may be linked to specific offerings that fulfill requirements. Each provider may have multiple locations associated with the contact.

Before you begin

You must define an iMIS contact record for each trainer in order to manage their information as a training provider. If a contact record does not yet exist for the provider, go to Contacts > Contact management. Click Create Account and add contact information for the new provider.

To add a provider

Go to Certification > Manage Providers:

1. Click Add a Provider.
2. Select a provider.

Note: You can sort results by location, committee, contact name, or company name.

3. Provide a location.
4. Provide a status.

   Note: Providers with a status of Inactive will not appear in the Manage Providers list.

   To add an additional location for a provider

5. Locate the provider in the Manage Providers list.
6. Click the Location Name link for that provider.
7. Click Add a Location and provide a location Name.

Adding certification to your website

In order for website visitors to view and enroll in certification programs, you need to add the Certification program list content item to a content record, which may also contain other content items. This content item allows end users to view what programs are available, enroll for a program, record requirement completions, and track their progress in programs in which they are enrolled.

In order to expose the Certification program on your organizations public website, you must add a content item to a content record. When you open the Content Gallery, you can enter the relative path to the Certification program list web user control (~/AsiCommon/Controls/CertificationManagement/CertificationProgramHistory.ascx) in the Or, enter a path to a web user control field. This is a relative URL to the web user control from the root (~) of the physical path for the IIS application or IIS website that hosts iMIS content management websites. By default, the root corresponds to C:\Program Files\ASI\iMIS\Net.

This auto-generates a Content Web User Control content item that points to the Certification program list web user control.

Managing enrollment

Tracking registration for certification courses or certification programs involves knowing who is enrolled and getting counts of the number of registrants.

Students can register themselves from your organization's member site or your staff can register students for programs and components through Certification on the Staff site.

You can test for an individual student's completion of the program after students have completed the requirements for a program or a portion of a program.

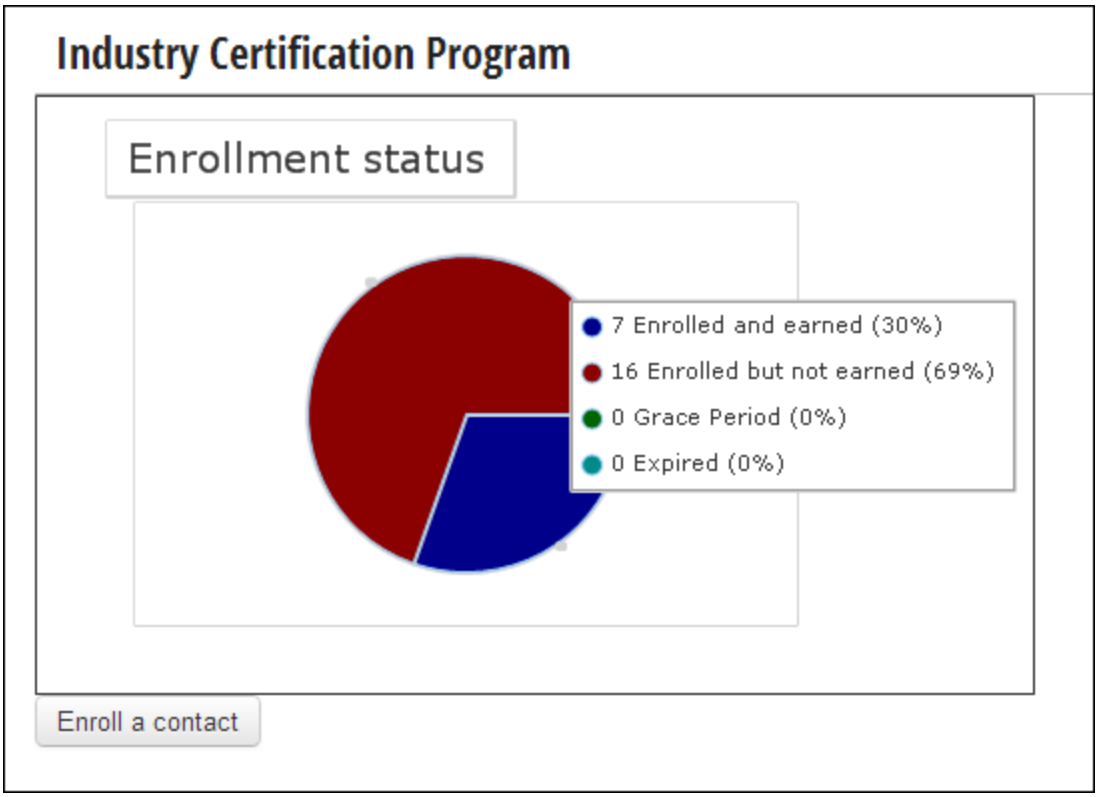
Before you begin

- If a participant is not already a contact record in your iMIS database, add their contact information.
- Ensure that the certification program exists and has a Status of Active.
- Ensure that components and offerings exist for the certification program.

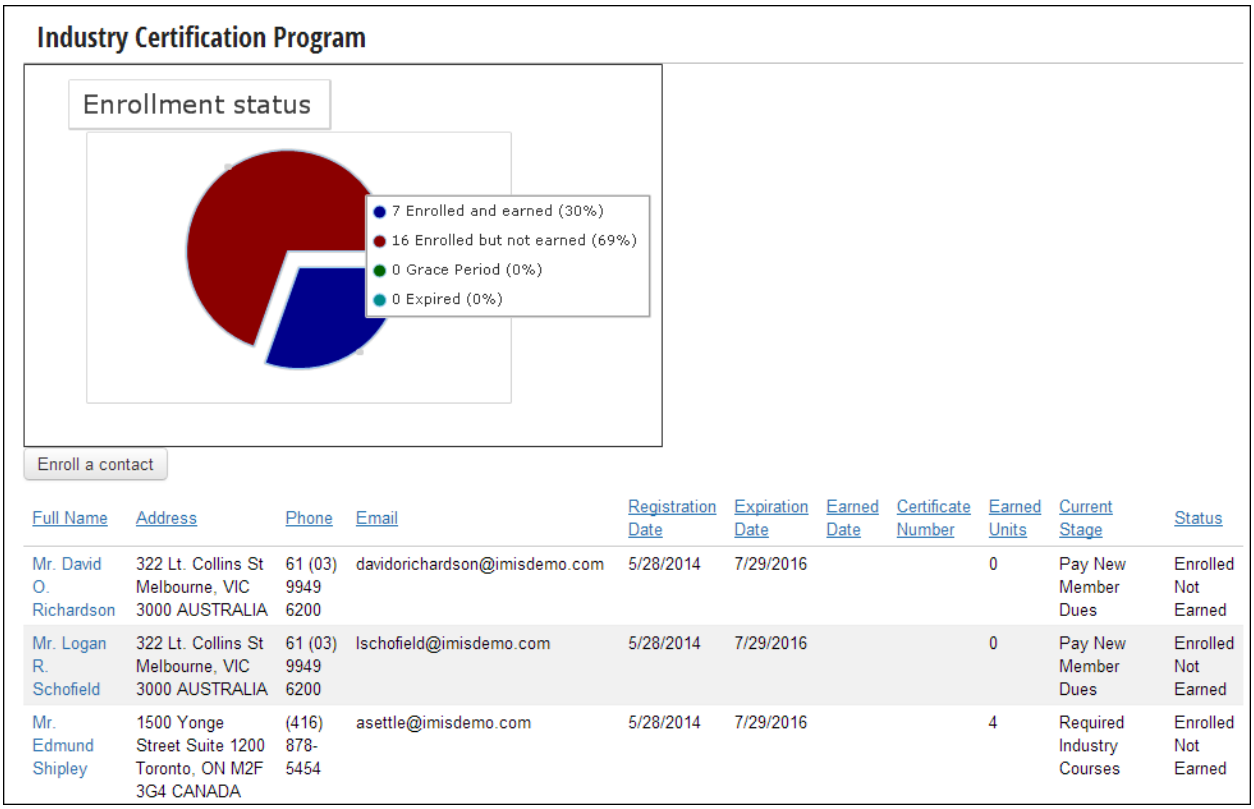
Reviewing enrollments by program

To review enrollee by program

1. Select Certification > Manage enrollment > By program.
2. A pie chart displays with the certification program enrollment status. You can select any item from the chart legend to access that information.

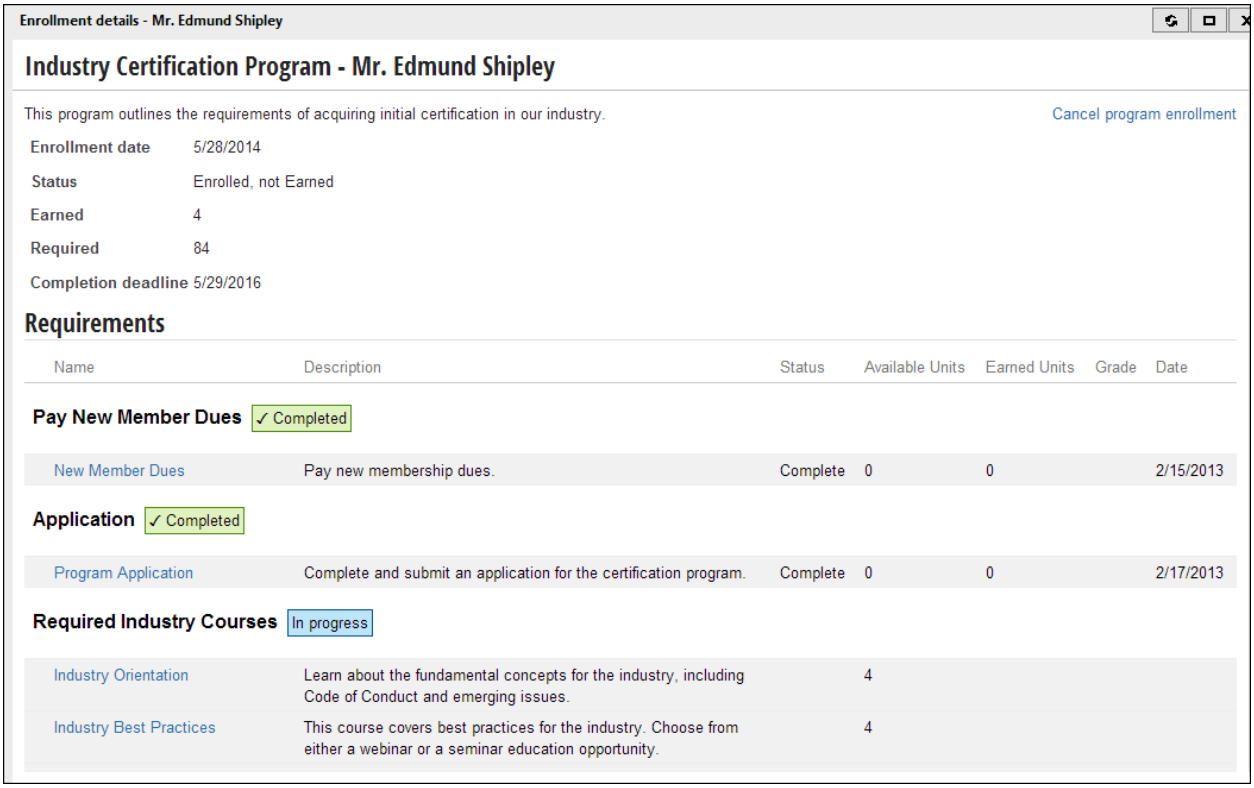


In the following example, the 16 Enrolled by not earned (69%) legend item was selected.



Full Name	Address	Phone	Email	Registration Date	Expiration Date	Earned Date	Certificate Number	Earned Units	Current Stage	Status
Mr. David O. Richardson	322 Lt. Collins St Melbourne, VIC 3000 AUSTRALIA	61 (03) 9949 6200	davidorichardson@imisdemo.com	5/28/2014	7/29/2016			0	Pay New Member Dues	Enrolled Not Earned
Mr. Logan R. Schofield	322 Lt. Collins St Melbourne, VIC 3000 AUSTRALIA	61 (03) 9949 6200	lschofield@imisdemo.com	5/28/2014	7/29/2016			0	Pay New Member Dues	Enrolled Not Earned
Mr. Edmund Shipley	1500 Yonge Street Suite 1200 Toronto, ON M2F 3G4 CANADA	(416) 878-5454	asettle@imisdemo.com	5/28/2014	7/29/2016			4	Required Industry Courses	Enrolled Not Earned

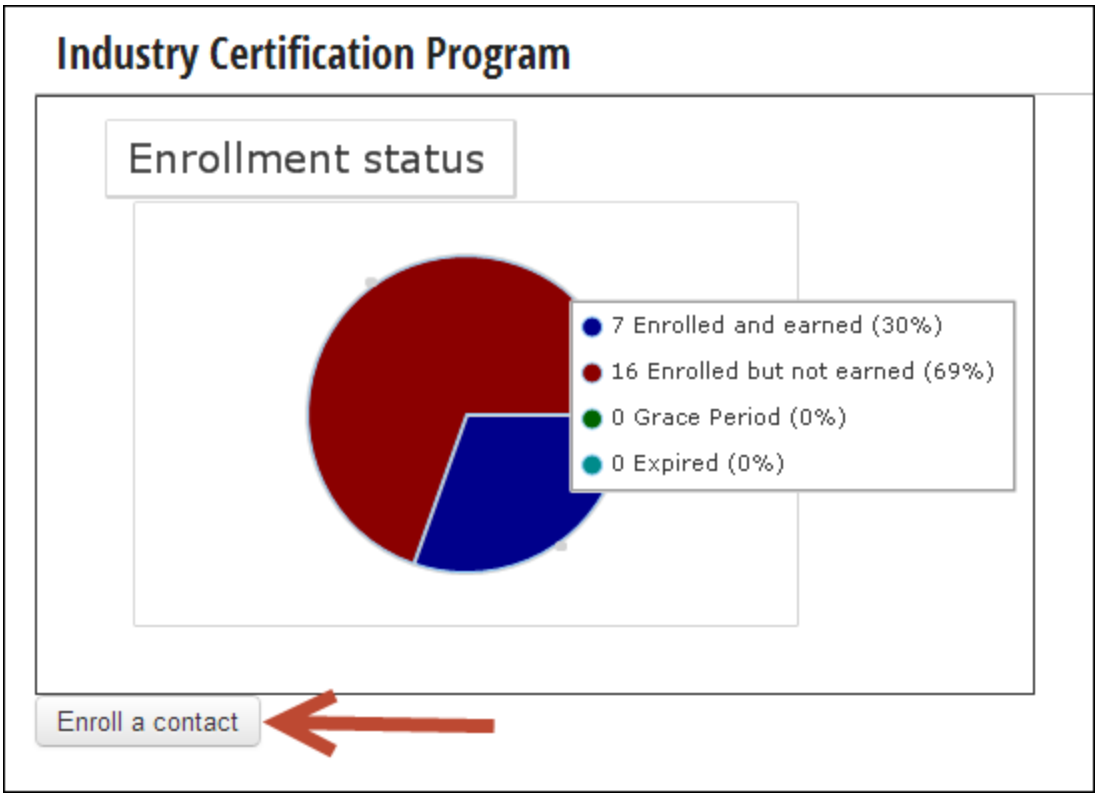
3. Select an enrollee name to review the status of the specific requirements for a contact.



To enroll a contact in a program

Go to Certification > Manage Enrollment > By program:

1. Select a program. The certification program statistics chart displays



2. Under the intended certification program statistics chart, click Enroll a contact.
3. Find the contact you want to register.

- To register multiple contacts, select the checkbox for each contact you want to register.

4. Click Register.

Note: You can confirm the registration by viewing the enrollment status of the enrollee.

Reviewing enrollee's certification programs

To manage a contact's enrollment

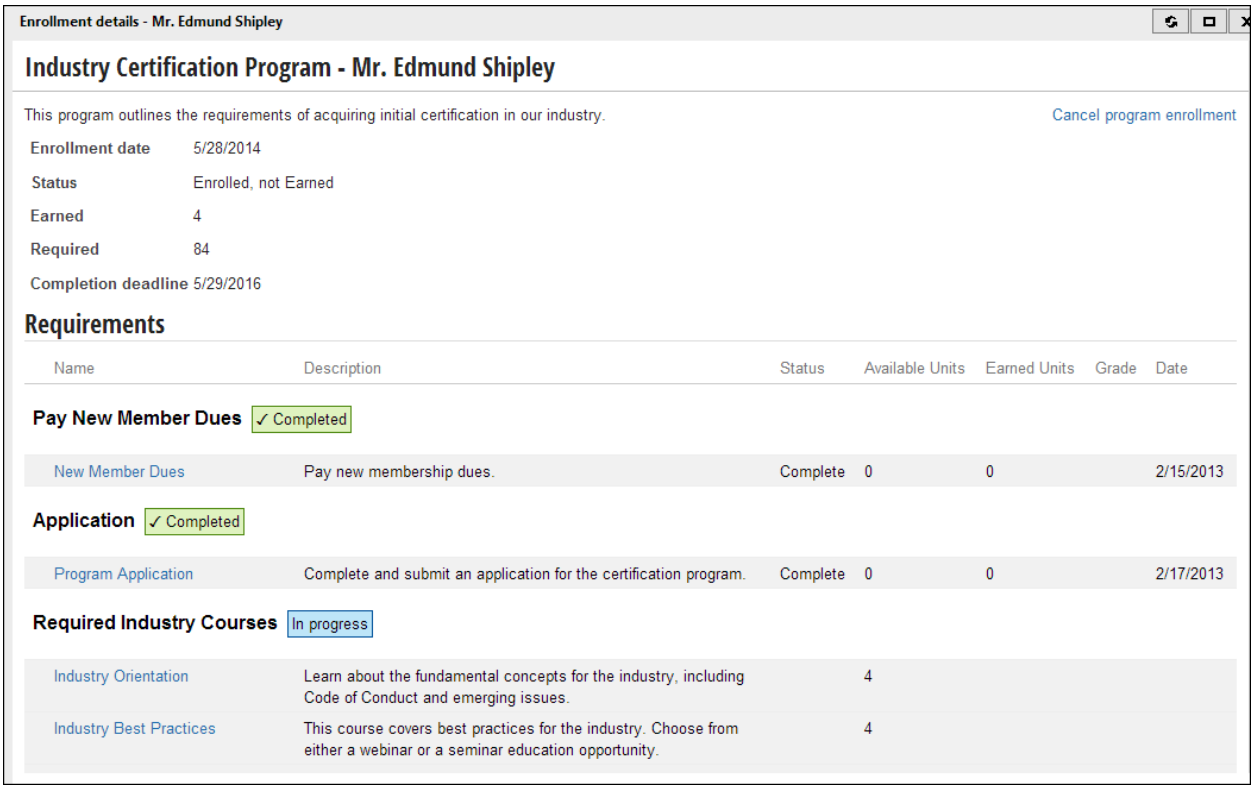
Go to Certification > Manage enrollment > By enrollee:

1. Find and select an enrollee. A high level summary of the enrollee's current certification programs and the certification programs available display.

   View all the programs the contact is both enrolled in and eligible to enroll in.

- Click on the Name of a certification program to view certification requirements.
- Enroll to register the contact for the selected certification program.
- Print Transcript to view the progress of all programs a contact has enrolled in a standard, exportable format.
- View Progress to track the enrollee's progress through the certification program. To review requirement details, select the requirement.
- If the requirement was completed, the date and supplemental information is provided.

- If the requirement has no status, you can register the enrollee.



Removing inactive enrollments

You purge inactive registrations when the member has decided not to continue the program or when the certification program is no longer offered or canceled.

A purge does not delete the contact record; it deletes the related recorded registration information.

Before you begin

You must log on as a user with the role of Certification Manager to purge inactive registrations.

To remove inactive program participants

Go to Certification > Manage enrollment > Inactive enrollments:

1. Search for a specific enrollee or click Find to display all inactive registrations.
2. Select the checkbox for each enrollment to want to remove.

Note: This list displays records of contacts participants that are marked as inactive registrants in the database. These can be purged from a certification program enrollment, but this enrollment purge does not remove the contact record from the database.

3. Click Purge Selected to remove the selected enrollment.

Completing certification programs

You can complete program requirements and review completed requirements for contacts.

To complete requirements for a contact

1. On the staff site, navigate to Certification > Manage enrollment > By enrollee.
2. Find and open the contact for which you want to record the completion of a requirement.
3. Click View Progress for the certification program for which you want to complete a requirement.

   Note: When viewing requirements, only requirements which can be completed are links. If the requirements must be completed in order, then some may not be available until the previous requirements are completed.
4. Click the requirement link. The requirement details display along with any associated offerings, such as classes.
5. If you want to register the contact for an event that meets the requirement, click Register Now for the event offering.

- Register for the event.
- Check out from the cart.

6. To record completion for a requirement, select Record Completion for the offering completed (or for the overall requirement if it has no associated offerings).

   Enter the necessary information.

- Specify a Date.
- (Optional) Enter any necessary Notes.
- If the requirement requires a Grade, specify the Grade.
- If applicable, click Attach file to attach a file. In the File Upload window, select the file and Upload.

7. Save the completion information.

   Note: If the completion requires approval by a staff user, Awaiting Approval displays as the Status. If the requirements must be completed in order, the program enrollee cannot progress to the next stage until the previous requirement has been approved. See Pending approvals for more information.

   To review completed requirements for a contact

1. On the staff site, navigate to Certification > Manage enrollment > By enrollee.
2. Find and open the contact for which you want to review completed requirements.
3. Click View Progress for the certification program for which you want to review completed requirements. A list of program requirements displays where you can view the Status of the requirements:

- No Status – The program enrollee has not completed the requirement.
- Awaiting Grade – The requirement requires that a grade be entered before it can be completed.
- Awaiting Approval – The requirement requires that a staff user approve its completion. See Pending approvals for more information.
- Complete – The requirement has been completed and requires no further action.

  Note: When viewing requirements, only requirements which can be completed at this time or have been previously completed are links. If the requirements must be completed in order, then some may not be available until the previous requirements are completed.

4. Click the link of a completed requirement to review the completion details. Completion details are read-only once a requirement has a Status of Complete.
5. If you want to access a file attached to the requirement, click the file name.

Approving completions

As a best practice, a staff user should review the pending approval lists on a regular basis.

Requirement completions

Requirements that require approval will display in this area after an enrollee records the completion of the requirement. You can choose to filter pending approvals to those requiring grades, or show all requirements approved in the last 30 days. A staff user can select approve if the completion of the requirement has been met. A completion can also be rejected, with the ability to enter notes to the enrollee; they can then re-submit the completion after making the necessary adjustments.

> **Note:** Note: If a requirement does not require approval, the requirement will be set as completed when the enrollee has completed the requirement.

Program completions

When all of the requirements of a program have been completed and approved, a staff user can approve the completion of the program.

> **Note:** Note: If the program does not require approval, the program will be set as completed when the enrollee has fulfilled the number of units required and completed all of the required stages.

To review completion of a certification requirement or program

Go to Certification > Pending approvals > Requirements completions or Program completions.

1. Review the completions, and open the completion to view enrollment details.

2. To approve a completion:

- Select approve for each completion you want to approve.
- Select Approve All to approve all completions.

3. To reject a completion:

- Select reject for the completion.
- Choose Notify Contact to provide notes or instructions to the enrollee. These will appear as the status for the requirement. Otherwise, choose Remove Experience, which will set the status to Rejected.

Canceling certification programs

When you no longer want to offer members a certification program, you can cancel the program. Canceling the program will set the status to Inactive, meaning that new users will not see the program in the program list and so cannot enroll. Any existing enrollees will still be able to see and complete the program, unless you delete it altogether.

To cancel new enrollment for a certification program

1. Select Certification> Set up programs > Certification programs.
2. Select the certification program that you want to cancel.
3. Click the Definition tab.
4. Click Cancel Certification Program.

To delete a certification program

1. Select Certification> Set up programs > Certification programs.
2. Select the certification program that you want to delete.
3. Click the Definition tab.
4. Click Delete Certification Program.

Note: Note: Programs can only be deleted if they do not have any active enrollments. To delete a program, ensure that all enrollments for the program have been purged using the Purge selected button (Certification > Manage enrollment > Inactive enrollments)

Glossary of Certification terms

Certification programs

Certification Programs track participants' progress towards earning certification through requirements built on stages. At the completion of a program through all the stages, you award the member certification in that particular program.

Components

A component is anything that is required of a student to complete a certification program. Usually this is an event, such as a class, seminar, or exam; however, components can be other types of requirements, such as enrollment or application fees, applications, resumes, or letters of recommendation. You can clone or copy components and use them in other programs. You select components in the requirements section of a stage.

Offerings

Offerings are the specific date, time, and location that a member can complete a component or requirement. A component may have multiple offerings, such as different dates when a course is offered. Offerings may be related to an event and a product, such as a fee-required training class offered at a set location on a certain date and time.

Providers

Providers are iMIS contacts (individuals or organizations) that are identified as training providers so that they may be linked to specific offerings that fulfill requirements. Each provider may have multiple locations associated with the contact.

Requirement sets

A program stage may have one or more requirement sets, which contain requirements for that stage. Each stage has at least one requirement set, but additional sets may be added using AND (meaning both are required to pass the stage) or OR (meaning either one or the other allows the member to pass through a stage).

Stages

Program requirements are built using one or more stages. A stage is made up of requirement sets, which contain the requirements for the stage. Multiple stages can be used to create categories of requirements, or to distinguish between requirements that are required and optional (by setting the stage to required or optional). You can also define multiple stages to enforce a required order for completing requirements.

Unit types

A unit type determines how the program and the components will be measured; for example Credits, Hours, or CEUs. A unit type and the number of required units are set in the program definition. Additional unit types can be added if needed.

Commerce Console

Your Advanced Accounting Console includes a Commerce console with quick access to often-used features:

Commerce is a well-equipped area for printing shipping papers, releasing backorders, entering and editing products, posting receipts, and completing other commerce-related tasks.

The license keys needed for this area are:

- Commerce (W_ORDERS or ORDER)

Commerce > Orders	Commerce > Inventory
Invoice orders	Release backorders
Ship orders	Post receipts
Print pick list	Products
Print shipping papers	Receipts and adjustments
Close orders	
Print quotes	
Convert quotes	

Orders

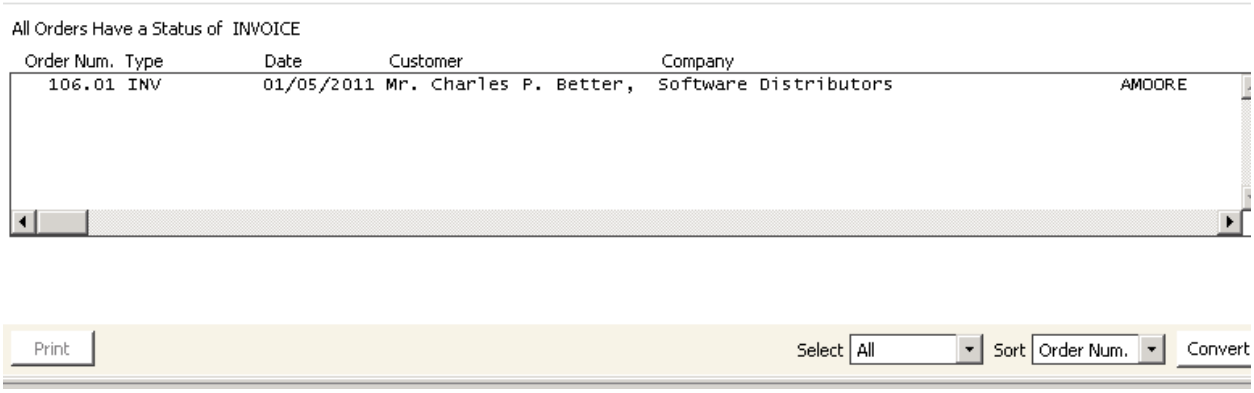
Invoicing orders

The Invoice orders option is used for posting selected sales transactions to iMIS AR/Cash. Once you have invoiced an order, the order cannot be edited or deleted.

Generating an order invoice also creates an accounting entry, affects product inventory, and generates an activity record for a customer. If you enable the Create Activity Records for Zero Dollar Orders option on the AR/Cash Set up module window (from AR/Cash, select Set up module), activity records are generated for zero-dollar orders as well.

To invoice orders

1. From the Invoice orders window, select the order(s) you want to invoice. To edit an order, double-click it to open the order on the Order Entry window.



2. Click Convert. A message displays asking if you want to invoice the order(s) and mark them as completed.
3. Click Yes to invoice the order(s). The Enter Invoice Date window opens.
4. (optional) Edit the invoice date, if necessary.
5. Click OK to invoice the order(s).
6. (optional) If you are using batch control and have enabled the Create New Batch for Invoicing option on the Order Status Defaults window, a message displays stating that a new batch for order invoicing is going to be created by the system.

- Click Yes to continue.

  The Batch # has been created for invoicing message displays with the specified batch number.

- Click OK.

Shipping orders

The Ship orders option is used for shipping orders and is the only order processing stage that does not generate printed output. At this order processing stage, you can open the Ship Orders window to record an order's actual shipping date and shipping method. The Ship Orders window also allows you to edit freight and handling charges and the quantity of items shipped.

To ship an order

1. From the Ship orders window, select the order(s) you want to ship.
2. Click Convert. A message displays prompting you to confirm marking the selected order (s) as shipped.
3. Click Yes. The Shipment Express window opens.
4. If you want to cancel shipping the order, use the following steps:

- Click Cancel. A message displays stating that express shipping was canceled.
- Click OK to cancel shipping the order and return to the Ship orders window.

5. (optional) Edit the Ship Date and/or Ship Method, if necessary.
6. Click OK. A message displays prompting you to remove any previously specified shipping methods.
7. Click No to ship the order, or click Yes to remove any previously specified shipping methods and ship the order.

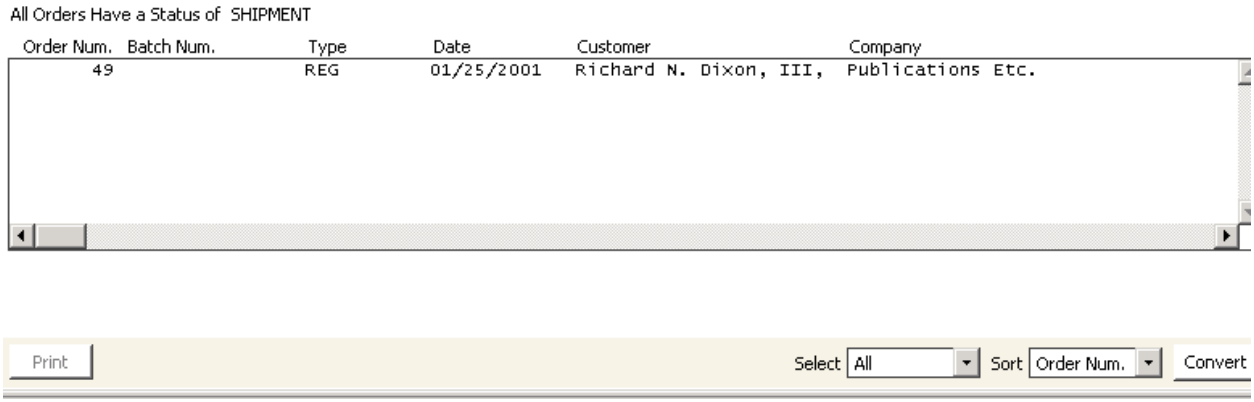
To edit an order's shipping information

You can view and edit an order's shipping information using the Ship Orders window.

1. From the Ship orders window, double-click an order to open the Ship Orders window. Detailed information about the selected order displays on the window.
2. Edit the shipping information, if necessary. For example, edit the Ship Date, select a new Ship Method, or override the freight and handling information.

3. Click OK to mark the order as shipped. The order will ship just as if you had selected it and clicked Convert on the Ship orders window.

Ship orders window



Advanced Accounting Console: Commerce > Ship orders

Order Number

(read only) Displays the number assigned to an order.

Order Date

(read only) Displays the date of an order.

PO

(read only) Displays the purchase order number of an order, if any.

Ship To

(read only) Displays the name and address of the customer to whom an order is shipping.

Ship Date

(Defaults to the system date and time) Enter an order's shipping date and time.

Ship Method

Enter an order's shipping method. Select the Find icon to look up a shipping method.

Shipping methods are defined on the SHIP_METHOD lookup/validation tables (from Settings, select Set up tables > Lookup/validation tables).

Freight

Add a freight charge or override the automatic freight charges generated for an order. You can override a Freight amount by entering a value and pressing Tab; the Auto Calc Freight option will disable.

Auto Calc Freight

This option enables automatically if the Automatic Calculation of Freight Charge option is enabled on the Add-on Charges window (Settings > Commerce, click Add-on Charges).

Handling

Add a handling charge or override the automatic handling charges generated for an order. You can override a Handling amount by entering a value and pressing Tab; the Auto Calc Handling option will disable.

Auto Calc Handling

This option enables automatically if the Automatic Calculation of Handling Charge option is enabled on the Add-on Charges window (Settings > Commerce > click Add-on Charges).

Line

(read only) Displays the line number of an order.

Product

(read only) Displays the product codes of the items ordered.

Description

(read only) Displays the product descriptions of the items ordered.

Order

(read only) Displays the quantity of the items ordered.

Ship

Enter the quantity of items shipped.

Back

Enter the quantity of items on back order.

Printing a pick list

The Print pick list option is used for generating an itemized product list known as a Pick List. Pick lists sort products by product code, order number, and line number, and each product code prints on a separate page. Any user-defined fields populated for an order line item on the Product Detail window will print below each line item on a pick list.

If the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (Settings > Commerce, and click Inventory), products also sort by warehouse and bin. Each product code prints on a separate page, and if a product is ordered from multiple warehouses, a pick list then will sort each product code by warehouse; a separate page will print for each warehouse.

A product's warehouse Location Code prints at the top of a pick list. If a bin is defined for a warehouse, the Bin location prints next to a product line-item on a pick list.

To print a pick list

1. From the Print pick list window, select the order(s) for which you want to generate pick lists. To edit an order, double-click it to open the order on the Order Entry window.
2. Click Convert. A message displays prompting you to confirm printing the pick lists.
3. Click Yes to print the pick lists. A pick list will print for each individual item.

5	5		81	9/24/2002				175.00

Example of a Pick List for item P42 - Multi-Warehouses disabled

Printing shipping papers

The Print shipping papers option is used for generating a shipping paper known as a Packing Slip. Shipping papers generate for individual orders and detail order 'Ship to', Sold To, and content information; each order should ship with shipping papers.

Any user defined fields populated for an order line item on the Product Detail window will print below each line item on a shipping paper. If the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (Settings > Commerce, click Inventory), shipping papers sort by order number, warehouse, and line number.

If the warehouse location changes for an individual product, that product's order information prints on a separate page. The Warehouse location prints at the top of a shipping paper, and, if a bin is defined for a warehouse, the Bin location prints next to the product line-item. In addition, order quantity totals will not print on shipping papers when the Enable Multi-Warehouses option is enabled.

Shipping papers also sort product kits by warehouse location when the Enable Multi-Warehouses option is enabled. A product kit will print on one page, and the kit's items will sort and print on separate pages depending on warehouse location. For example, a product kit consists of four items. Three items are from the Default warehouse, and the fourth item is from the North warehouse. The three items from the Default warehouse will print on one page, and the fourth item from the North warehouse will print on a separate page.

To print shipping papers

1. From the Print shipping papers, select the order(s) for which you want to print shipping papers. To edit an order, double-click it to open the order on the Order Entry window.
2. Click Convert. A message displays prompting you to confirm printing the shipping papers.
3. Click Yes to print the shipping papers. The following is a sample shipping paper:

> **Note:** Note: If you are converting multiple shipping papers and screen is the report destination, canceling the job before all shipping papers are processed will cause errors. These errors will occur for every shipping paper that was not processed, and the unprocessed shipping papers will not print. However, each order still will proceed to the Ship orders stage.

Example of a Packing Slip - Multi-Warehouses disabled; pricing information displays only if the Show Prices On Shipping Paper option is enabled on the Order Status Defaults window (Settings > Commerce, click Order Staging)

Closing orders

The Close orders option is used for closing orders that have a COMPLETED status. Only orders with a COMPLETED status can be closed.

The Close orders option is not a required step, and closing an order changes only the Orders.STAGE field from COMPLETED to CLOSED. It is available as an option for customers who may want to purge or archive order records; you can use the Closed status to indicate which orders are ready for purging or archiving.

To close an order

1. From the Close orders window, select the order(s) you want to close.
2. Click Convert. A message displays prompting you to confirm closing the selected order (s).
3. Click Yes to the close the order(s).

Printing quotes

The Print quotes option is used for printing sales quotes. Used only for pro forma orders, the Print quotes option allows you to print sales quotes without affecting product inventory or account status. You can generate sales quotes and then e-mail, fax, or mail the quotes to customers requesting them.

Sales quotes sort by order number and line item number, and any user defined fields populated for an order line item on the Product Detail window will print below each line item on a sales quote.

To print sales quotes

1. Enter a pro forma order (see "Entering orders").

2. From the Print quotes window, select the order(s) for which you want to generate sales quotes. To edit an order, double-click it to open it on the Order Entry window.
3. Click Convert. A message displays prompting you to confirm moving the pro forma order (s) to the next stage.
4. Click Yes to convert the order(s) and print the sales quote(s).

Converting quotes

The Convert quotes option is used only with pro forma orders. It is the second order processing stage for pro forma orders following the Print quotes stage and automatically converts pro forma orders to actual orders.

You determine which order type pro forma orders convert to in the Convert to Order Type field on the Order Status Defaults window (Settings > Commerce, click Order Staging). A converted order then enters the staging process at the correct order processing stage defined for that order type. The Convert quotes option does not generate printed data.

To convert quotes

1. Complete the Print quotes order processing stage for the pro forma order you want to convert. See Printing Sales Quotes.
2. From the Convert quotes window, select the order(s) you want to convert. To edit an order before converting it, double-click the order to open it on the Order Entry window.
3. Click Convert. A message displays prompting you to confirm converting to the appropriate order type.
4. Click Yes to convert the quote(s) to the appropriate order type. The Convert quotes option does not generate printed data.

Inventory

Releasing backorders

The Manually release backorders option is used to reverse an order's BACKORDER status. A released backorder is removed from the holding stage for orders awaiting

inventory and is returned to its appropriate order processing stage.

The Manually release backorders option is available even if the Automatic Backorder Processing option is enabled on the Backorder Processing window (Settings > Commerce, click Backorders).

To release backorders manually

1. From the Release backorders window, select the order(s) you want to release from BACKORDER status.
2. Click Convert.

   A message displays prompting you to confirm returning the selected order(s) to the appropriate order processing stage.
3. Click Yes to release the backorder(s).

Posting receipts

Upon entering a product inventory transaction and verifying that the transaction information is correct, a transaction can be posted. When an inventory transaction is posted, a product's inventory records are updated with the transaction information.

If you elect to post inventory transactions automatically (not recommended), all transactions are posted when they are entered and saved on the Receipts and adjustments window. Automatically posting inventory transactions is not recommended because it does not allow you to review your transactions and make any necessary corrections before posting the transactions.

By posting transactions manually, you can verify and correct any errors before posting a transaction. This helps protect product inventory, backorder, and cost of goods sold information from inadvertent updates or changes. Inventory transactions are posted manually as long as the Automatically Post Inventory Receipts/Adjustments option is disabled on the Inventory System Setup window (Settings > Commerce, click Inventory).

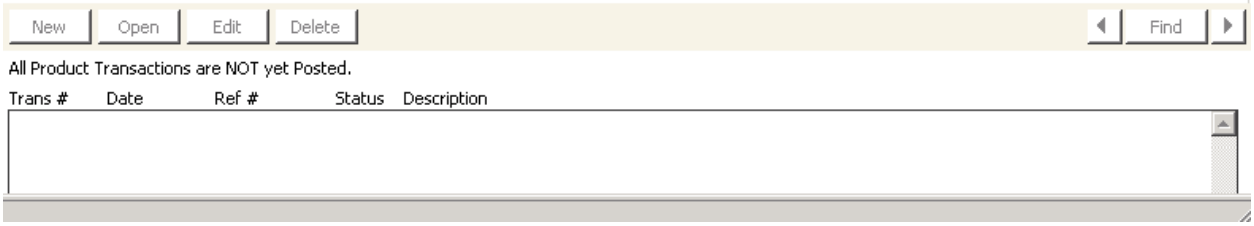
After verifying that your transaction information is correct, you can post your inventory transactions individually, in groups, or all at once using the Post receipts window (Commerce > Inventory > Post receipts).

> **Note:** Caution! Product inventory receipts, adjustments, and transfers can be posted only for products that have an Active, Inactive, or Out of Production status. If a product's status is changed to a status other than Active, Inactive, or Out of Production after a transaction has been entered for the product, the transaction will not display on the Post receipts window and cannot be posted.

To post inventory receipts

1. From the Post receipts window, select the transaction(s) you want to post.
2. Click Post. A message displays prompting you to verify posting the selected transaction (s).
3. Click Yes to post the transaction(s). A Product Posting report generates automatically.

Post receipts window



Advanced Accounting Console: Commerce > Post receipts

Trans #

This column displays the transaction number for the product inventory transaction. iMIS generates the transaction number after the inventory transaction is entered.

Date

This column displays the date of the product inventory transaction.

Ref #

This column displays the number entered in the Invoice # field on the Receipts and adjustments window.

Status

(read only) Displays the product's status. Inventory transactions can be posted only for products that have an Active, Inactive, or Out of Production status.

Description

This column displays the description entered in the Description field on the Receipts and adjustments window.

Sort

(Not shown in example) Use this drop-down list to sort the product inventory transactions on the Post receipts window. The following sorting options are available:

- Trans # – Sorts by transaction number.
- Trans Date – Sorts by transaction date.
- Ref # – Sorts by invoice number.
- Description – Sorts by description.
- Entered By – Sorts according to transaction entry.

Post button

(Not shown in example) Click to post the selected product inventory transaction(s).

Posting transactions for multiple warehouses

While the process of posting inventory transactions for multiple warehouses and standard inventory is the same, you need to be aware of the following when posting transactions for multiple warehouses:

Removing warehouses

Once you remove a product's warehouse, you cannot post any outstanding, non-posted inventory transactions for that warehouse. If you post inventory transactions manually

and remove a product's warehouse, all non-posted inventory transactions will be removed from the Post receipts window. However, non-posted inventory transactions will still display on the Receipts and adjustments window (from Commerce, select Inventory > Receipts and adjustments).

Inventory transfers

Transferring inventory from one warehouse to another affects both product cost and inventory field values when a transfer is posted.

Cost of Goods Sold – Regardless of whether the Average or Standard Cost valuation method is selected when the Cost of Goods Sold option is enabled on the Inventory System Setup window, the following rule applies when posting inventory transfers:

> **Note:** Caution! The extended amount of the transferred product cannot exceed the current total cost of the From Warehouse.

If the extended amount of the transferred product exceeds the current total cost of the From Warehouse, then iMIS will perform the following calculations:

1. The average cost of the From Warehouse will be multiplied by the quantity transferred in determining that the average cost does not exceed the total cost:
2. If the average cost does not exceed the total cost, then the extended amount will be recalculated by multiplying the average cost by the quantity transferred. The unit cost of the transferred product then will be updated by dividing the extended amount by the quantity transferred.
3. If the average cost does exceed the total cost, then the extended amount will equal the total cost of the product inventory. The unit cost of the transferred product then will be updated by dividing the extended amount by the quantity transferred.

Field recalculation

The following fields will be recalculated when transferring inventory from one warehouse to another:

- From Warehouse

Qty on Hand (Products window) will be reduced by the Quantity (Receipts and adjustments window) transferred.

Total cost (Warehouses window) will be reduced by the Ext Amt (Receipts and adjustments window) of the product transferred.

Avg/Std cost (Warehouses window) will be updated by dividing the Total cost (Warehouses window) by the Qty on Hand (Products window).

- To Warehouse

  Qty on Hand (Products window) will be increased by the Quantity (Receipts and adjustments window) transferred.

  Total cost (Warehouses window) will be increased by the Ext Amt (Receipts and adjustments window) of the product transferred.

  Avg/Std cost (Warehouses window) will be updated by dividing the Total cost (Warehouses window) by the Qty on Hand (Products window).

Defining product inventory

Before defining your individual products, you first must define your product categories. Product categories are defined on the Product categories window. For additional information, see Defining product categories.

After defining your product categories, you can define your individual products. Products are defined and managed on the Products window, which allows you to enter and access product codes, titles, descriptions, prices, accounting information, and other specific product options. The Products window also is used for accessing and displaying product inventory information and for designating a product's Process Manager items.

To define a product

1. From the Products window, click New.
2. Define the product:

- Enter a Code for the product. The product code should not contain any spaces or special characters other than an underscore.
- Select a product Category from the drop-down list of available categories.
- Enter a Title for the product.

3. Enter any applicable product descriptions:

- Enter a general product description in the Desc field.
- Enter a product description for a product catalog in the Catalog Desc field.
- Enter any other product description in the Other Desc field.

4. Enter the product's Pricing information:

- Enter a default price for the product in the Regular field.
- (optional) Enter a Non-Member price for the product if applicable.

  Note: If products are used only as kit components, you do not need to enter prices for the individual products that make up the kit. Only the kit itself requires product pricing information.

5. Enter the product's Options:

- Enter the product's Unit of Measure, such as each or sheet.
- (optional) Enable the Commissionable option if a product's sale generates a commission (enter a commission percentage in the Comm % field if you enable the Commissionable option).
- Enter the product's Weight.
- Enable the Stock Item option.
- (optional) Enable the Taxable option if the product is taxable.
- (Optional/For use with Fundraising) Enable the Premium option to use the product as a premium for gifts and pledges, and enter a Fair Market Value.

- (Multi-Warehouses only) Enter the product's Default Warehouse location if you are using Multi-Warehouses. Select the Find icon to look up a warehouse.
- (Multi-Entities only) Enter an Entity for the product.

6. Click Save.

   To edit a product

   When editing a product that is a stock item, you cannot disable the Stock Item option if the product has inventory in stock. A product's inventory must be reduced to zero if you want to indicate the product is no longer a Stock Item. For additional information, see To enter inventory adjustments.

1. From the Products window, select the product you want to edit from the list of Current Products.
2. Click Edit.
3. Make any necessary changes.
4. Click Save.

   Note: Note: If you want to change pricing for a product that has been published on the web with pricing, we recommend making changes in the Staff site. When you make pricing changes in the Advanced Accounting Console, the cache is only refreshed based on the Cache duration configuration value. When you make pricing changes through the Staff site, the changes are published immediately.

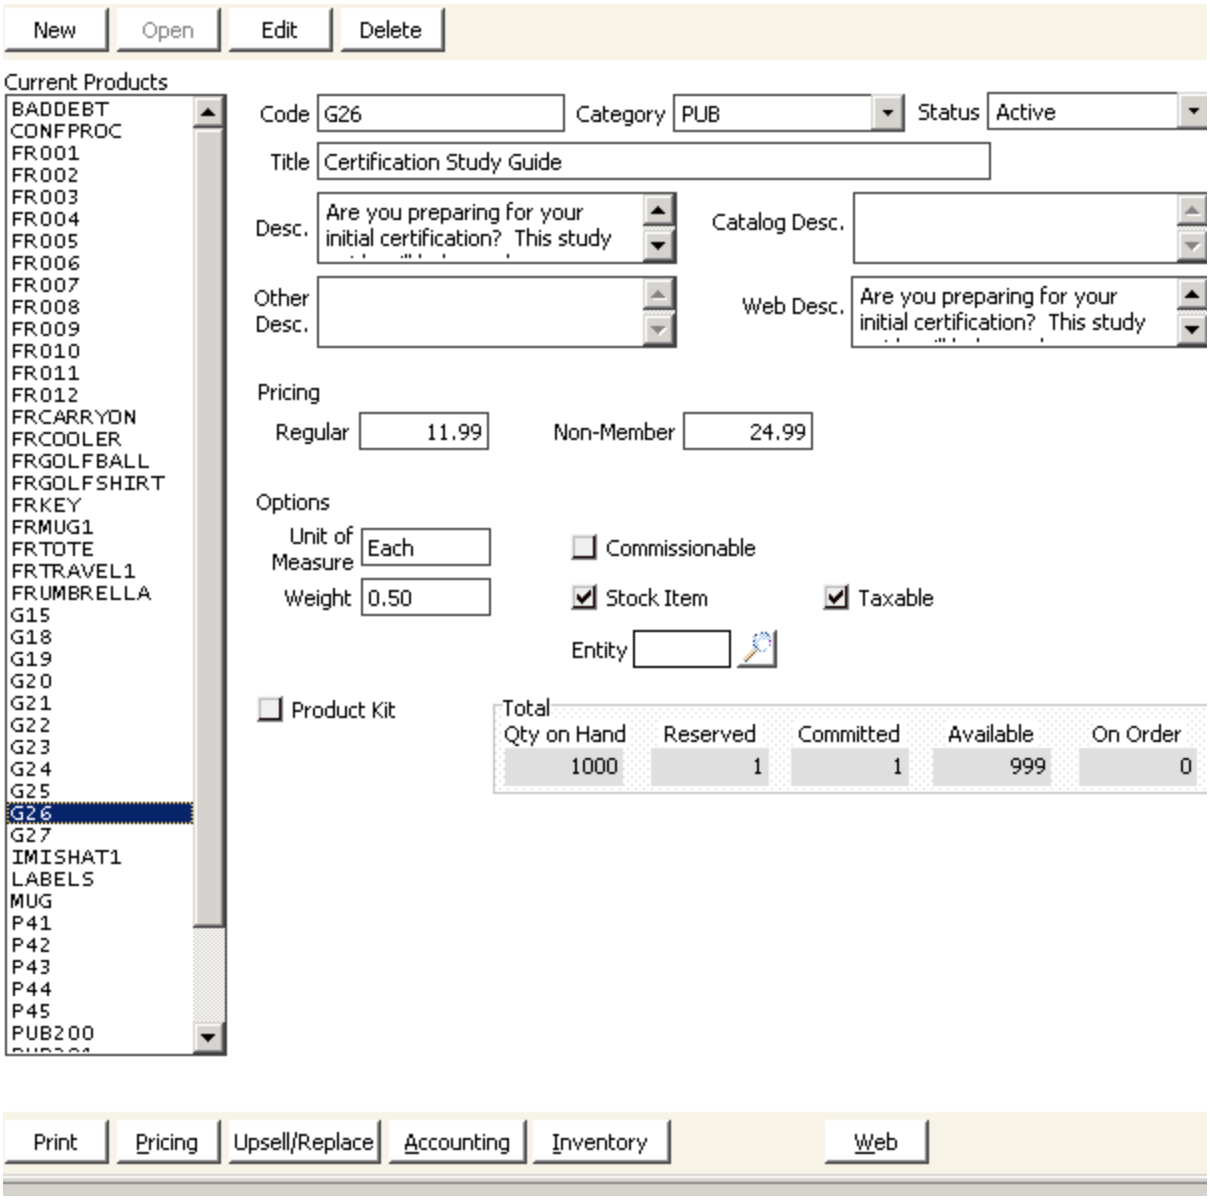
   Note: Note: This does not apply when you initially create the product or initially define pricing for the product using the Advanced Accounting Console.

   To delete a product

   You can delete a stock item only if all inventory quantities are zero. When you delete a product, all of the product's Upsell/Cross-sell/Replacement records also are deleted.

1. From the Products window, select the product you want to delete from the list of Current Products.
2. Click Delete. You are prompted to verify deleting the product.
3. Click Yes to delete the product.

Products window



Advanced Accounting Console: Commerce > Inventory > Products

Current Products

Lists all of the defined product codes. Select a product code from the drop-down list to view the product's details on the Products window.

Code

(required) Enter a specific code for an individual product.

Category

(required) Select a product's category from the drop-down list. Product categories are defined on the Set up product categories window (Settings > Commerce > Set up tables > Product categories).

Status

Select a product's status from the drop-down list. The default status for all new products is Active, and you can assign the following status codes to your products at any time during a product's life cycle:

- Active (A)
- Inactive (I)
- Mark for Deletion (D)
- Not Available (N)
- Out of Production (O)

See Product Status Codes for more on product status code functionality.

Title

Enter a brief, descriptive product title. A product's title displays next to the product's code on windows and reports; product titles can be edited when entering orders.

If the Print 1st Line Desc on Statement option is enabled on the AR/Cash Set up module window (from AR/Cash, select Set up module), the product title entered in the Description field on the Overview tab of the Enter and edit orders window prints on invoices and statements. The product title entered in the Description field also displays on the AR/Cash tab

on the Manage customers window and on the AR/Cash Enter and edit cash receipts window. If the Print 1st Line Desc on Statement option is disabled on the AR/Cash Set up module window, only the order number prints on statements and displays on windows.

Description Fields

All description fields hold product descriptions, to a maximum of 5000 characters:

- Desc

  Enter the product description to be seen by staff. The text entered in the Desc field does not appear on printouts, but it will appear on the product's web description if none exists in Web Desc.

- Catalog Desc

  Unused.

- Other Desc

  Unused.

- Web Desc

  Enter the description to display on the Product Detail page; otherwise, the web page uses the Desc text, if any.

  Note: Place key search terms within the first 300 characters of the description. In the Public view, search truncates the description to 300 characters, so only text within that range yields search results for users.

Pricing

- Regular – Enter a product's default unit price. The price entered in the Regular field will apply for all customers unless you enter a different price in the Non-Member field. You can override a product's default price at order entry.

  The Use Member Pricing option on the Overview tab of the Enter and edit orders window allows you to apply Regular product pricing for non-member customers.

- Non-Member (optional) – Enter a product price for non-member customers. This price applies automatically when you sell a product to any customer with Non-Member status, allowing you to avoid most manual price overrides.

  If the Non-Member field is blank, a product's price defaults to the value entered in the Regular field for non-member customers. You can override a product's default price at order entry, and the Use Member Pricing option on the Overview tab of the Enter and edit orders window allows you to apply Regular product pricing for non-member customers.

- Fair Market Value (Displays only when the Premium option is enabled) – Enter a fair market value for a product used as a premium. You must enter a value in this field, which can be 0.00. The default value is 0.00.

  Options

- Unit of Measure – Enter a product's unit of measure, such as individually, each, foot, yard, sheet, book, or pack.
- Commissionable – Enable if a product's sale generates a commission.
- Comm % – (Displays only when the Commissionable option is enabled) Enter the commission percentage a product's sale will generate.
- Weight – Enter a product's weight. When defining product kits, be sure to enter a Weight. Freight by weight charges will not calculate for a product kit unless a weight has been defined, regardless of whether weight has been defined for the individual kit components.
- Stock Item – Enable to indicate that a product is stored in inventory. When the Stock Item option is enabled, both products in inventory and backorders are tracked in the Qty on Hand, Reserved, Committed, Available, and On Order fields on the Products window.
- Taxable – Enable if a product is taxable. When the Taxable option is enabled, iMIS automatically calculates any applicable taxes for a product according to the tax code entered for an order. When defining a new product, the Taxable option on the Products window enables by default if the Taxable option on the Set up product categories window is enabled for the new product's category.

- Premium – Enable this option to use a product as a premium for gifts and pledges. This option only displays only if Allow Premiums as Products is enabled on the Fundraising Set up module page.

  When an order is generated for a product used as a Fundraising premium, the Notes field on the Order Details tab of the Enter and edit orders window displays the text “Premium order for Transaction TransNum, Batch BatchNum” (for example, Premium order for Transaction 1438, Batch 08062004). See Fundraising Management (see "Fundraising") for details about using premium products.

- Default Warehouse – (Required/Displays only if using Multi-Warehouses) Enter a stock item's default warehouse location. Select the Find icon to look up a warehouse; warehouse locations are defined in the Warehouses window (Settings > Commerce > Warehouses).

  The Default Warehouse field displays only if a product is a stock item and the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (Settings > Commerce, click Inventory). If a default warehouse is defined on the Inventory System Setup window, the Default Warehouse field defaults to the warehouse defined on the Inventory System Setup window. A product's default warehouse can be overridden at order entry on the Product Detail window with a warehouse that is pre-defined for the product.

  Individual warehouses are set up for products on the Warehouses window (Settings > Commerce > Warehouses).

- Entity – (Optional/displays only if Multiple Entities is enabled on the AR/Cash Set up module window) Enter an owner entity for an individual product. Select the Find icon to look up an entity; entities are defined in the Org Codes field on the Organization Names window (select File > System Setup, and click Organization Names).

  An Entity value can be left blank if the entity owner is the same as the default Orders entity assigned on the AR/Cash Set up module window.

  See Understanding Multiple Entities and Orders for more on product-level entities.

  Product Kit

Enable if a product is a kit. A kit is a group of individual products sold as a single unit. The Product Kit option displays only if your system is licensed for product kitting.

Kit button

(displays only when the Product Kit option is enabled) Opens the Kitting window used for defining product kits.

Total

The totals are display only:

- Qty on Hand – the total number of products in inventory. If using Multi-Warehouses, Qty on Hand includes the total number of products in inventory across all warehouses.
- Reserved – the number of products that are in “open order” status, including backorders. If using Multi-Warehouses, Reserved includes the total number of products reserved across all warehouses.
- Committed – the number of shippable products in inventory excluding backorders. If using Multi-Warehouses, Committed includes the total number of products committed across all warehouses.
- Available – the number of products on hand excluding reserved products. If using Multi-Warehouses, Available includes the total number of products available across all warehouses.
- On Order – the number of products on order from suppliers. If using Multi-Warehouses, On Order includes the total number of products on order across all warehouses.

  The number of products displayed depends on the number of products entered in the On Order field on the Inventory / Warehouses window (click Inventory / Warehouses on the Products window).

  Pricing button

  Opens the Special Pricing window used for setting up specific product price calculations.

  Upsell/Replace button

Opens the Upsell/Replace window used for designating Upsell, Cross-sell, and Replacement items for products.

Accounting button

Opens the Accounting window used for entering product account information.

Inventory / Warehouses button

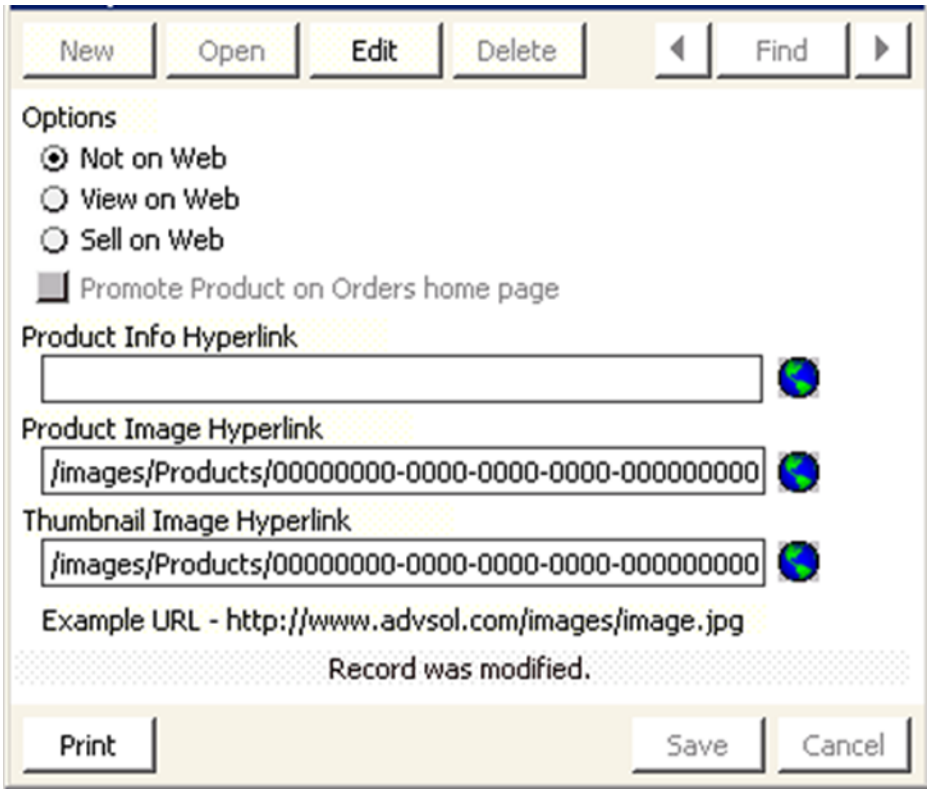
- Inventory button – (Disabled for non-stock items) Opens the Inventory window used for entering product inventory information. The Inventory button displays and replaces the Warehouses button when Multi-Warehouses is disabled.
- Warehouses button – (Disabled for non-stock items) Opens the Warehouses window used for entering inventory information for a product's individual warehouses. The Warehouses button displays and replaces the Inventory button when Multi-Warehouses is enabled.

Publication button

Opens the Publication Demographics window used for defining additional information for publications. The Publication button displays only if the Use Publication Demographics option is enabled for a product's category on the Product categories window (Settings > Commerce > Set up tables > Product categories).

Web button

Opens the Web Options window to display a product on the Web. Products created on RiSE sites are automatically set to Sell on Web and are searchable from your websites.



Defining product kits

If your system is licensed for Kitting, iMIS Orders allows you to create and maintain product kits. Product kits are groups of individual products sold as a single unit for a single price.

A product kit cannot consist of other product kits or be a stock item. However, a product kit can consist of both individual stock and non-stock items. Just as with individual products, you must define a product category before you can define a product kit. In addition, each individual product first must be defined on the Products window before it can be sold as part of a kit.

> **Note:** Note: When defining product kits, be sure to enter a Weight. Freight by weight charges will not calculate for a product kit unless a weight has been defined, regardless of whether weight has been defined for the individual kit components.

Once you define the product kit on the Products window, you can assign the individual products to the kit using the Kitting window.

To define a product kit

When defining product kits, remember the following:

- Your system must be licensed for Kitting.
- A product kit cannot consist of other kits or be a stock item; however, a kit can consist of both individual stock and non-stock items.
- Each individual product must be defined before being sold as part of a kit.

1. From the Products window, click New.
2. Define the kit:

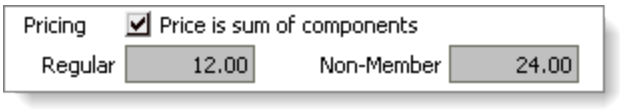
- (required) Enter a Code for the product kit.
- (required) Select a product Category from the drop-down list. The Product Kit option enables and the Kit button displays if the Product Kit option is enabled for the Category on the Set up product categories window.
- Enter a Title for the kit.

3. Enter any applicable product kit descriptions:

- Enter a general kit description in the Desc field.
- Enter a kit description for a product catalog in the Catalog Desc field.
- Enter any other kit description in the Other Desc field.

4. Enter the product kit's Pricing information:

- Price is sum of components – causes the price to be calculated from the sum of its components and so grays out the Regular/Non-Member price fields. The tax for kits is calculated from the Taxable amount of each component, honoring the taxation rules for each.



VAT friendly: A "sum of components" product kit calculates pricing and taxes on the parts of the kit, rather than the kit itself. This supports a mixture of tax rates, which can be required for VAT.

- Regular/Non-Member price fields – Enter a default price for the product kit in the Regular field. This manual kit pricing does not reflect the individual products that make up the kit. Enter a Non-Member price for the kit as well, if applicable.

5. Enter the product kit's Options:

- Enter the kit's Unit of Measure, such as package or group.
- (optional) Enable the Commissionable option if the product kit's sale generates a commission (enter a commission percentage in the Comm % field if you enable the Commissionable option).
- Enter the product kit's Weight if automatic freight charges are calculated by weight. Freight-by-weight charges will not calculate for a product kit unless a weight has been defined.
- (optional) Enable the Taxable option if the kit is taxable.
- (Multi-Entities only) Enter an Entity for the kit.

6. Click Save.

To define a kit's components

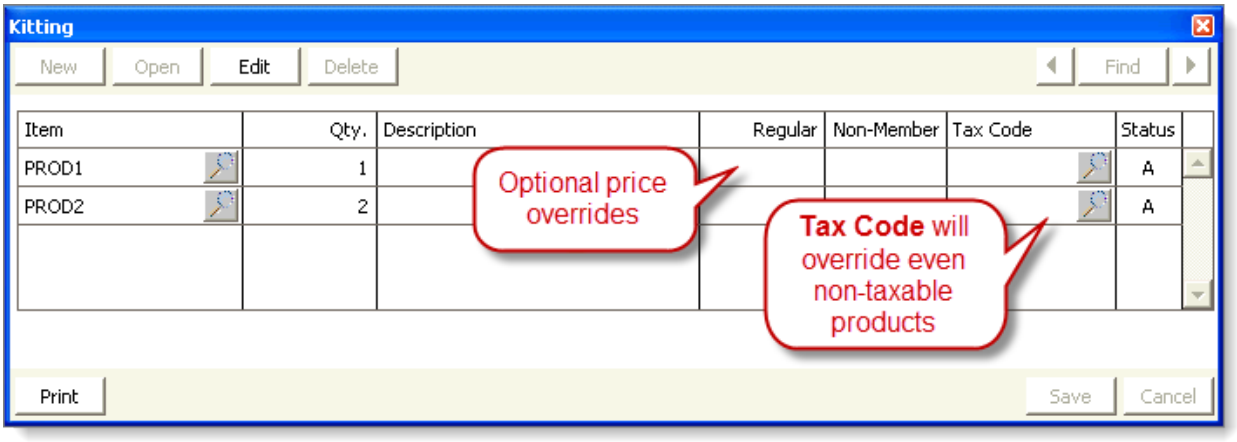
To define a component for a kit, the kit component must have either an Active (A) status or the same status as the parent kit.

1. From the Products window, enter or edit a product.
2. While in the edit mode, click Kit to open the Kitting window.
3. Define the kit's components:

- Enter a component's code in the Item field (select the Find icon to look up a product code).
- Enter the number of components in the Qty field that you are including in the kit.

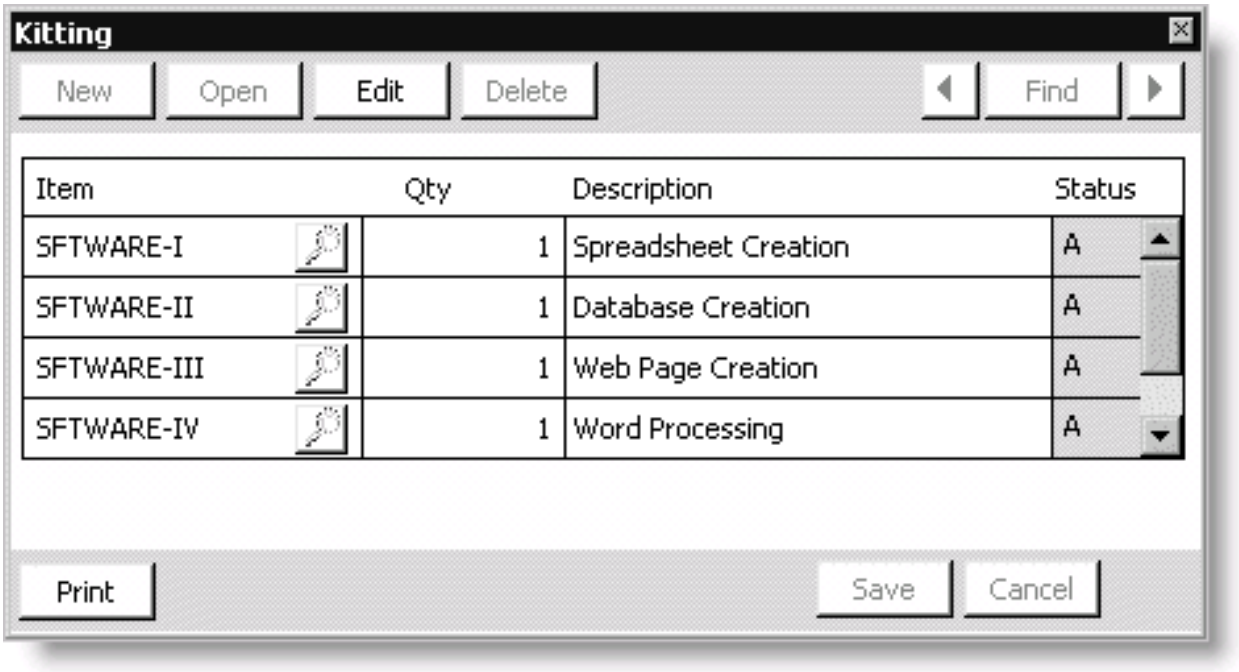
- Enter a Description of the component you are including in the kit. If you leave the Description field blank, the product Title from the Manage products window will print on invoices and orders.
- (VAT only) To override the default product price, you can enter values in the Regular and Non-Member columns. If you leave these fields blank or enter a zero (0) for any component, its pricing will default to the product pricing defined in the Manage products window. You can Find and override the Tax Code as well, but keep in mind that doing so could force a non-taxable product to become taxable.

  Note: The Regular, Non-Member, and Tax Code columns will not appear unless the option, Price is sum of components, is enabled on the Manage Products windows for the kit product.



4. Press Tab to generate another line item, and repeat this process for each additional kit component.
5. Click Save.

Kitting window



From Commerce > Inventory > Products, select a product kit, and click Kit

Item

Enter the codes of the products you want to include in the kit. Select the Find icon to look up products.

Qty

(required) Enter the number of individual products included in the kit. Enter quantities as whole numbers or as partial quantities, such as “1.5.”

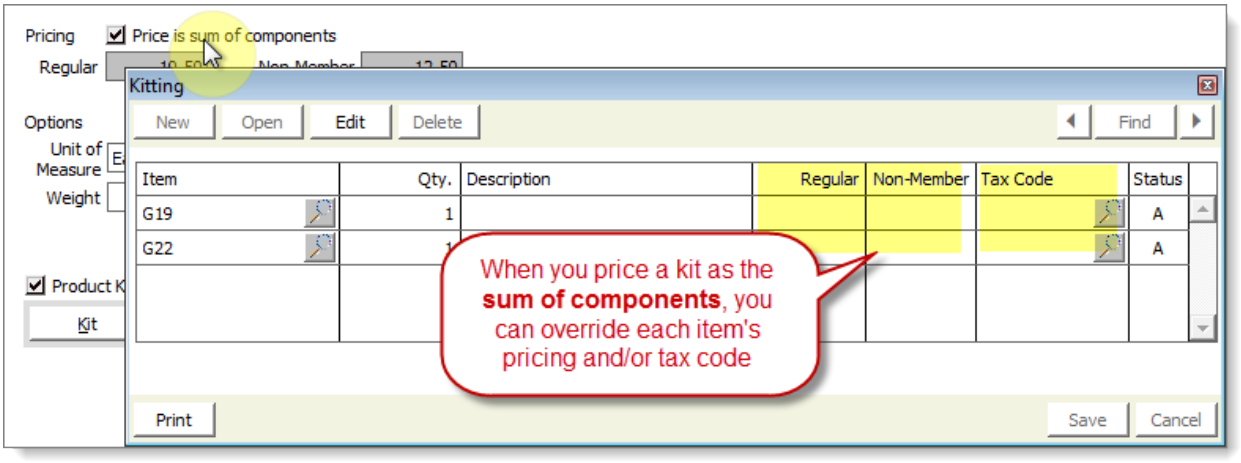
Description

Enter a description of the individual products included in the kit. This product description will print on invoices and orders. If you leave the Description field blank, each individual product's Title from the Manage products window will print.

Regular | Non-Member | Tax Code

(VAT feature; requires Price is sum of components) When you create a "sum of components" product kit, all pricing and tax calculations are based on the sum of the

individual components of the kit, rather than the kit itself. You can override the pricing of one or more items within the kit, and you can override the tax code of individual items as well. To make a kit item non-taxable, for example, you can override the item's tax code to one that you have set to a zero rate. This flexibility supports complex tax situations, which can help you to meet VAT requirements. These overrides work for kit products across all views of iMIS.



Status

Displays the product's status.

Entering receipts and adjustments

The flexibility of Orders simplifies managing product inventory and ensures inventory transactions are recorded efficiently and accurately. How you manage product inventory and process inventory transactions depends on whether your inventory is stored in a single location or in multiple warehouses.

After entering a product inventory transaction, the transaction must be posted. Inventory transactions can be posted either automatically or manually. Manually posting inventory transactions is recommended because it provides an opportunity to review a transaction for errors. Automatic transaction posting does not offer this opportunity.

Entering and posting inventory transactions

Product inventory transactions include inventory receipts, adjustments, and transfers. Automatically posting inventory transactions is not recommended because it does not allow you to review your transactions or make any necessary corrections before the transactions are posted.

By posting transactions manually, you can verify and correct any errors before a transaction is posted. This helps protect product inventory, backorder, and cost of goods sold information from inadvertent updates and changes.

To post inventory receipts and adjustments manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (Settings > Commerce, click Inventory).

All inventory transactions are entered using the Receipts and adjustments window (Commerce > Inventory > Receipts and adjustments).

Entering inventory receipts

Product inventory receipts allow iMIS Orders to record and track your physical product inventory accurately and efficiently. Inventory receipts are recorded when a product is received in inventory, and receipts can be entered only for stock items that have an Active, Inactive, or Out of Production status.

When entering product inventory receipts, enter the transaction date, invoice number, description, and quantity received in inventory for a specific product. When an inventory receipt is entered, a transaction number is generated automatically as a reference for the receipt. When inventory receipts are posted, iMIS automatically updates and adjusts your product inventory records.

To ensure accurate inventory records, manually posting inventory receipts is recommended because it provides an opportunity to review the receipts before they are posted. This helps prevent entering any inadvertent updates or changes. To post inventory receipts manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (Settings > Commerce, click Inventory).

Your method of storage determines how inventory receipts are entered. If an individual product is stored in a single storage facility, you only need to enter a single inventory receipt for a product. If an individual product is stored in multiple warehouses, you have the ability to enter inventory receipts for each warehouse in which a product is stored. In order to record inventory receipts for products stored in multiple warehouses, the Enable Multi-Warehouses option must be enabled on the Inventory System Setup window (Settings > Commerce, click Inventory).

To enter inventory receipts

Follow this procedure if the Enable Multi-Warehouses option on the Inventory System Setup window (Settings > Commerce, click Inventory) is disabled.

1. From the Receipts and adjustments window, click New.
2. (optional) Enter the Date of the inventory receipt, or accept the default system date.
3. Enter an Invoice #, such as the invoice number of the vendor's invoice.
4. Enter a brief Description of the product inventory receipt.
5. Enter the code of the Product received in inventory (select the Find icon to look up a product code). Receipts can be entered only for products that have an Active, Inactive, or Out of Production status.
6. Press Tab. The product's Description and Unit Cost display by default. The Description can be overridden if necessary.
7. Enter the Quantity of the product received in inventory.
8. (optional) Enter the Unit Cost of the product, or accept the default unit cost.
9. Press Tab, and repeat this process for each additional product inventory receipt you want to enter.
10. Click Save.

To enter inventory receipts for multiple warehouses

Follow this procedure if the Enable Multi-Warehouses option on the Inventory System Setup window is enabled.

1. From the Receipts and adjustments window, click New. The Receipt option is enabled by default.
2. (optional) Enter the Date of the product inventory receipt, or accept the default system date.
3. Enter an Invoice #, such as the invoice number of the vendor's invoice.
4. Enter a brief Description of the product inventory receipt.
5. Enter the Product code of the product received in inventory (select the Find icon to look up a product code). Receipts can be entered only for products that have an Active, Inactive, or Out of Production status.
6. Press Tab. The product's default Warehouse, Bin (if applicable), Description, and Unit Cost display by default.
7. Enter the Warehouse for which you are entering the inventory receipt (select the Find icon to look up a warehouse), or accept the product's default warehouse. You also can enter a warehouse that has not been pre-defined for the product:

   Entering a warehouse that has not been pre-defined creates a new warehouse record for that product.
8. Enter the warehouse Bin in which the product is stored, or accept the default bin.
9. (optional) Enter the product's Description, or accept the default product description.
10. Enter the Quantity of the product received in inventory at the warehouse.
11. Enter the Unit Cost of the product, or accept the default unit cost.
12. Press Tab, and repeat this process for each additional product inventory receipt you want to enter.
13. Click Save.

Entering inventory adjustments

Product inventory adjustments allow you to adjust your inventory records for stock items when you need to make corrections. For example, you may need to enter a product inventory adjustment after taking inventory of all products and discovering loss or damage that has decreased a product's physical inventory.

Inventory adjustments are entered just as inventory receipts are entered, and the only difference between the two is that negative quantities can be entered for inventory adjustments. Adjustments can be entered only for products with an Active, Inactive, or Out of Production status, and iMIS automatically updates and adjusts your product inventory records when adjustments are posted.

As with all inventory transactions, manually posting inventory adjustments is recommended. To post inventory adjustments manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (Settings > Commerce, click Inventory).

As with inventory receipts, your method of storage determines how inventory adjustments are entered. In order to record inventory adjustments for a product stored in multiple warehouses, the Enable Multi-Warehouses option must be enabled on the Inventory System Setup window.

To enter inventory adjustments

1. From the Receipts and adjustments window, click New.
2. (optional) Enter the Date of the inventory adjustment, or accept the default system date.
3. Enter an Invoice # for the inventory adjustment.
4. Enter a brief Description of the product inventory adjustment.
5. Enable the Inventory Adjustment option.
6. Enter the code of the Product for which you are entering an inventory adjustment (select the Find icon to look up a product code). Adjustments can be entered only for products that have an Active, Inactive, or Out of Production status.

7. Press Tab. The product's Description and Unit Cost display by default. The Description can be overridden if necessary.
8. Enter the quantity of the inventory adjustment:

- Enter a positive amount in the Quantity field to increase a product's inventory.
- Enter a negative amount in the Quantity field to decrease a product's inventory.

9. Enter the Unit Cost of the product, or accept the default unit cost.
10. Press Tab, and repeat this process for each additional product adjustment.
11. Click Save to enter the inventory adjustment.

To enter inventory adjustments for multiple warehouses

1. From the Receipts and adjustments window, click New.
2. (optional) Enter the Date of the inventory adjustment, or accept the default system date.
3. Enter an Invoice # for the inventory adjustment.
4. Enter a brief Description of the product inventory adjustment.
5. Enable the Inventory Adjustment option.
6. Enter the code of the Product for which you are entering an inventory adjustment (select the Find icon to look up a product code). Adjustments can be entered only for products that have an Active, Inactive, or Out of Production status.
7. Press Tab. The product's Warehouse, Bin (if applicable), Description, and Unit Cost display by default.
8. Enter the Warehouse for which you are entering the inventory adjustment (select the Find icon to look up a warehouse), or accept the product's default warehouse.
9. Enter the warehouse Bin in which the product is stored, or accept the default bin.
10. (optional) Enter the product's Description, or accept the default product description.
11. Enter the quantity of the inventory adjustment:

- Enter a positive amount in the Quantity field to increase a product's inventory.
- Enter a negative amount in the Quantity field to decrease a product's inventory.

12. Enter the Unit Cost of the product, or accept the default unit cost.
13. Press Tab, and this process for each additional product adjustment.
14. Click Save to enter the inventory adjustment.

Entering inventory transfers

If you store individual products in multiple warehouses, iMIS Orders gives you the ability to record product inventory transfers from warehouse to warehouse.

Product inventory transfers may be necessary under a variety of circumstances. For example, a product's inventory at one warehouse may be insufficient to meet immediate customer demand. If another warehouse has excess inventory in stock, you may decide to transfer the excess inventory to the warehouse with insufficient inventory.

When product inventory transfers are posted, iMIS automatically updates and adjusts a product's inventory record for each warehouse involved in the transfer. As with all inventory transactions, manually posting inventory transfers is recommended. To post inventory transfers manually, disable the Automatically Post Inventory Receipts/Adjustments option on the Inventory System Setup window (Settings > Commerce, click Inventory).

To record inventory transfers for a product stored in multiple warehouses, the Enable Multi-Warehouses option must be enabled on the Inventory System Setup window.

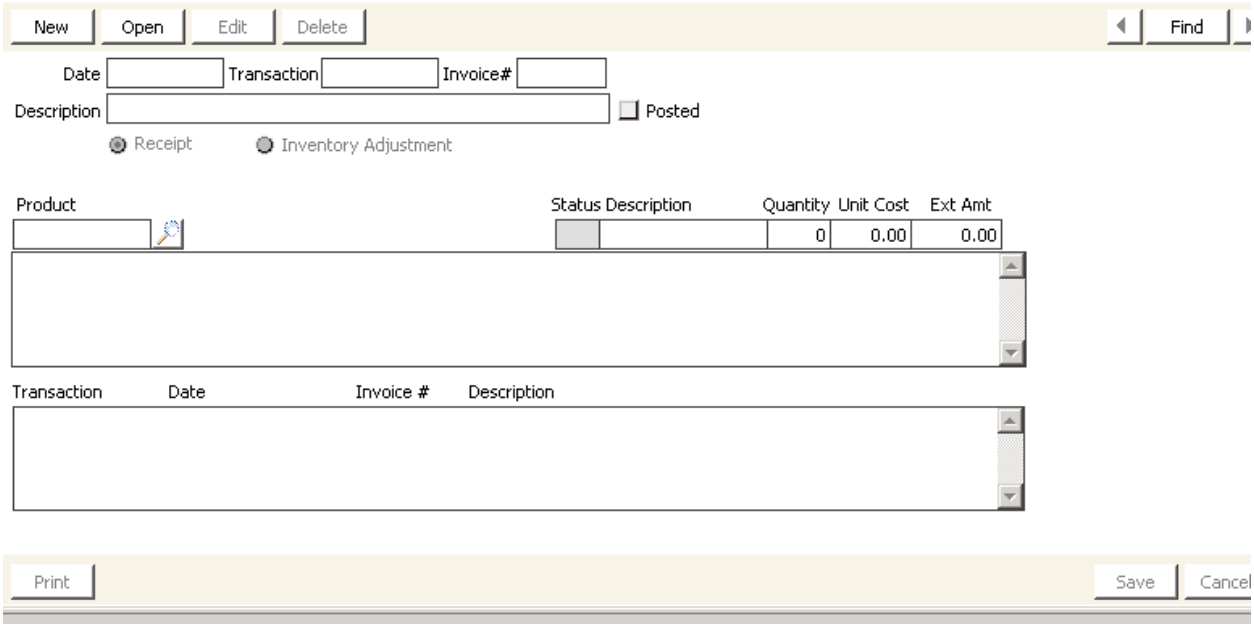
To enter inventory transfers

Transfers can be entered only for products that have an Active, Inactive, or Out of Production status. If you select a To Warehouse that is not already assigned to the product, iMIS automatically assigns the warehouse once you save the inventory transfer and adds it to the product's Warehouses window. Entering or editing a Bin value on the Receipts and adjustments window updates a product's Warehouses window for that To Warehouse.

1. From the Receipts and adjustments window, click New.

2. (optional) Enter the Date of the inventory transfer, or accept the default system date.
3. Enter an Invoice # for the inventory transfer.
4. Enter a brief Description of the product inventory transfer.
5. Enable the Transfer option. The From Warehouse, To Warehouse, and Bin (To Warehouse) fields display.
6. Enter the code of the Product that you are transferring (select the Find icon to look up a product code). Transfers can be entered only for products that have an Active, Inactive, or Out of Production status.
7. Press Tab. The product's From Warehouse, Bin ('From Warehouse'), Description, and Unit Cost display by default.
8. Enter the product's From Warehouse. This is the warehouse from which inventory is transferred. Select the Find icon to look up a warehouse, or accept the product's default warehouse.
9. Enter the 'From Warehouse' Bin, or accept the default bin.
10. Enter the product's To Warehouse. This is the warehouse to which inventory is transferred. Select the Find icon to look up a warehouse.
11. Enter the product's To Warehouse Bin if applicable.
12. (optional) Enter the product's Description, or accept the default product description.
13. Enter the Quantity of the inventory transfer. The quantity entered cannot be a negative value or exceed the From Warehouse's total available inventory.
14. Click Save.

Receipts and adjustments window



Advanced Accounting Console: Commerce > Receipts and adjustments

Date

Enter the date of a product inventory transaction. The Date field defaults to the current system date but can be overridden.

Transaction

Enter a transaction number when opening or editing a product inventory transaction. Transaction numbers are system generated when an inventory transaction is entered.

Invoice #

Enter an invoice number for a product inventory transaction. Using an invoice number from a vendor's invoice is recommended.

Description

Enter a brief description of the product inventory transaction.

Posted

This option enables automatically when the selected inventory transaction has been posted.

Receipt

Enable to record an inventory receipt.

Inventory Adjustment

Enable to record an inventory adjustment rather than an inventory receipt. An inventory adjustment will affect a product's Qty on Hand as displayed on the Products window (Commerce > Inventory > Products).

Transfer

(Multi-Warehouses only) Enable to transfer product inventory from one warehouse to another. The Transfer option displays only if the Enable Multi-Warehouses option is enabled on the Inventory System Setup window (Settings > Commerce, click Inventory).

The following fields display when the Transfer option is enabled:

- From Warehouse – Replaces the Warehouse field
- Bin (From Warehouse)
- To Warehouse
- Bin (To Warehouse)

Product

Enter the product code for which you are entering an inventory transaction (select the Find icon to look up a product code). Inventory transactions can be entered only for products that have an Active, Inactive, or Out of Production status.

Warehouse

(Required/Displays for Multi-Warehouses only) Enter the warehouse for which you are entering a product inventory receipt or adjustment. The Warehouse field is a required

field and defaults to a product's Default Warehouse on the Products window, but it can be overridden.

Select the Find icon to look up a warehouse; warehouses are defined on the LOCATION general lookup/validation table.

From Warehouse

(Replaces the Warehouse field when the Transfer option is enabled) Enter the warehouse from which you are transferring a product's inventory. The From Warehouse field is a required field and defaults to a product's Default Warehouse on the Products window, but it can be overridden to another warehouse that has the same product in stock.

Select the Find icon to look up a warehouse; warehouses are defined on the LOCATION general lookup/validation table.

Bin

(Displays for Multi-Warehouses only) Enter the warehouse bin for which you are entering a product inventory receipt or adjustment, or enter the warehouse bin from where you are transferring a product's inventory. The Bin field defaults to the bin defined for the Default Warehouse, but it can be overridden for any bin (the bin does not have to be pre-defined) when recording inventory transactions.

To Warehouse

(Displays only when the Transfer option is enabled) Enter the warehouse to which you are transferring a product's inventory (this warehouse must be pre-defined for the product). The To Warehouse field is a required field for inventory transfers.

Select the Find icon to look up a warehouse; warehouses are defined on a product's Warehouses window.

Bin

(Displays only when the Transfer option is enabled) Enter the warehouse bin to which you are transferring a product's inventory. The Bin field defaults to the bin defined for a warehouse on the Warehouses window, but it can be overridden.

If you update a To Warehouse's Bin field, the Bin field on the Warehouses window will be updated for that particular warehouse.

Status

(read only) Displays the product's status. Product inventory receipts, adjustments, and transfers can be entered only for products that have an Active, Inactive, or Out of Production status. See Product Status Codes for more on product status codes.

Description

(read only) Displays a description of the product entered in the Product field. The value that displays in the Description field is the value entered in the Title field on the Products window.

Quantity

Enter the number of products involved in the inventory transaction. The following stipulations exist depending on transaction type:

- Receipt – A negative value cannot be entered for an inventory receipt.
- Inventory Adjustment – No stipulations.
- Transfer – A negative value cannot be entered for an inventory transfer, and the value entered in the Quantity field cannot exceed a From Warehouse's available inventory quantity.

Unit Cost

Enter the per-unit cost of a product. For inventory receipts and adjustments, the Unit Cost field defaults to the value displayed in the Last Cost field on a product's Inventory window. You can override a product's unit cost as necessary.

For inventory transfers, the Unit Cost field is display only and cannot be edited. The value that displays in the Unit Cost field depends on the Valuation Method selected on the Inventory System Setup window:

- Standard Cost valuation method
- If the From Warehouse's total product cost equals zero, then the value displayed in the Unit Cost field will be zero.
- If both the From Warehouse's total product cost and standard product cost are greater than zero, then the value displayed in the Unit Cost field will equal a product's standard cost.
- If none of the above are true, then the value displayed in the Unit Cost field will equal a product's average cost.
- Average valuation method
- If the From Warehouse's total product cost equals zero, then the value displayed in the Unit Cost field will equal zero.
- If the From Warehouse's total product cost does not equal zero, then the value displayed in the Unit Cost field will equal the average product cost.

Ext Amt

(read only) Displays the system-generated extended amount of a product's cost, which is the product Quantity times the product Unit Cost.

Product Inventory

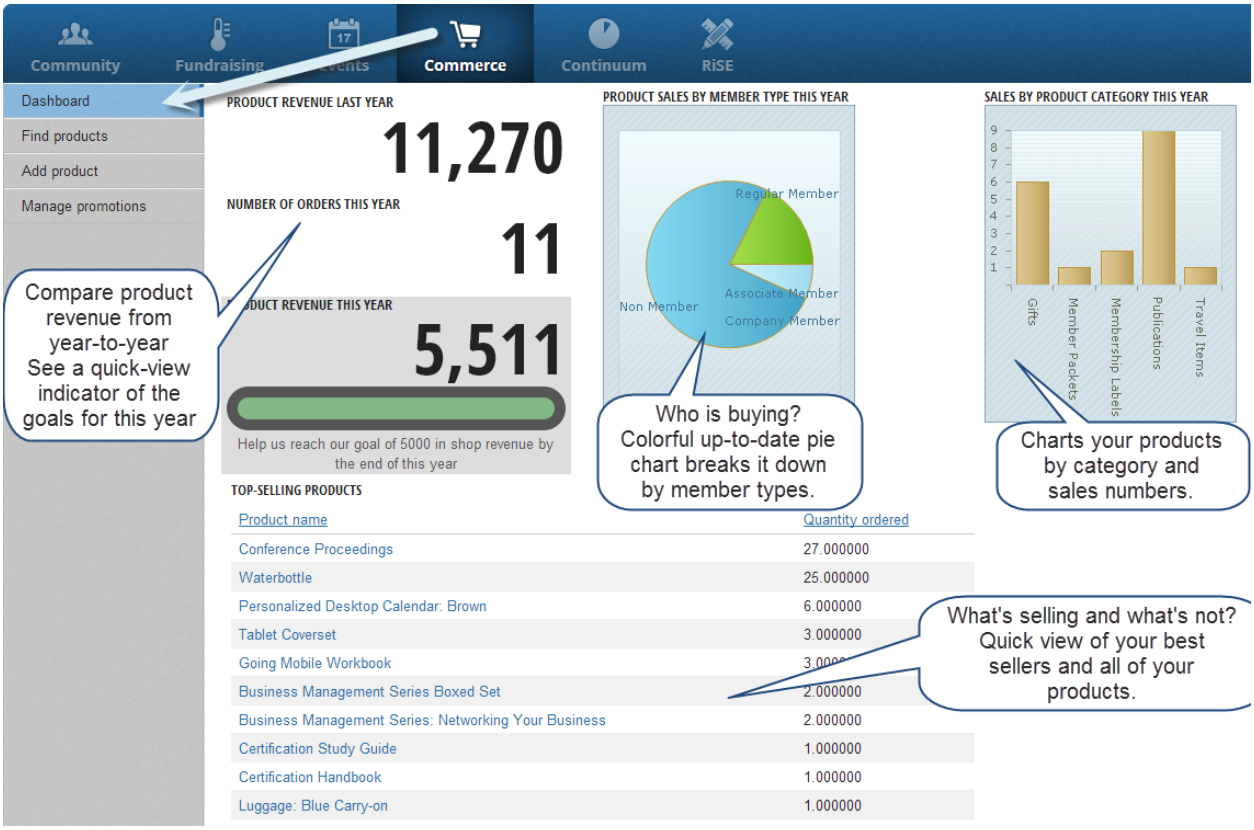
(read only) Displays all of the product line-items for which you entered inventory transactions.

Inventory Transactions

(read only) Displays all of the product inventory transactions processed during the current session.

Commerce

From your Staff site, Commerce offers a quick-view, up-to-date look at key product revenue for your organization.



- Product revenue last year
- Product sales by member type this year
- Sales by product category this year
- Number of orders this year
- Product revenue this year
- Top-selling products
- All products

Adding and Editing Products

The Item Creator content item lets you build new product offerings and edit existing ones. From the content item, you can define product details including the Item Class, Item Code, Name, Pricing information, tax configuration, whether or not the product has inventory, and the GL account. You can edit products in the content item that were created within the Advanced Accounting Console, and vice-versa.

> **Note:** Important: The Not on Web option available within the Advanced Accounting Console does not apply to RiSE (Content Item) based sites, including Member and Staff. Products defined on RiSE sites are automatically set to Sell on Web and are searchable on your RiSE websites.

> **Note:** Note: You can create a collection of items, known as a kit, from the Advanced Accounting Console. This allows you to create complex offerings with quantity requirements. (See Enter and edit products)

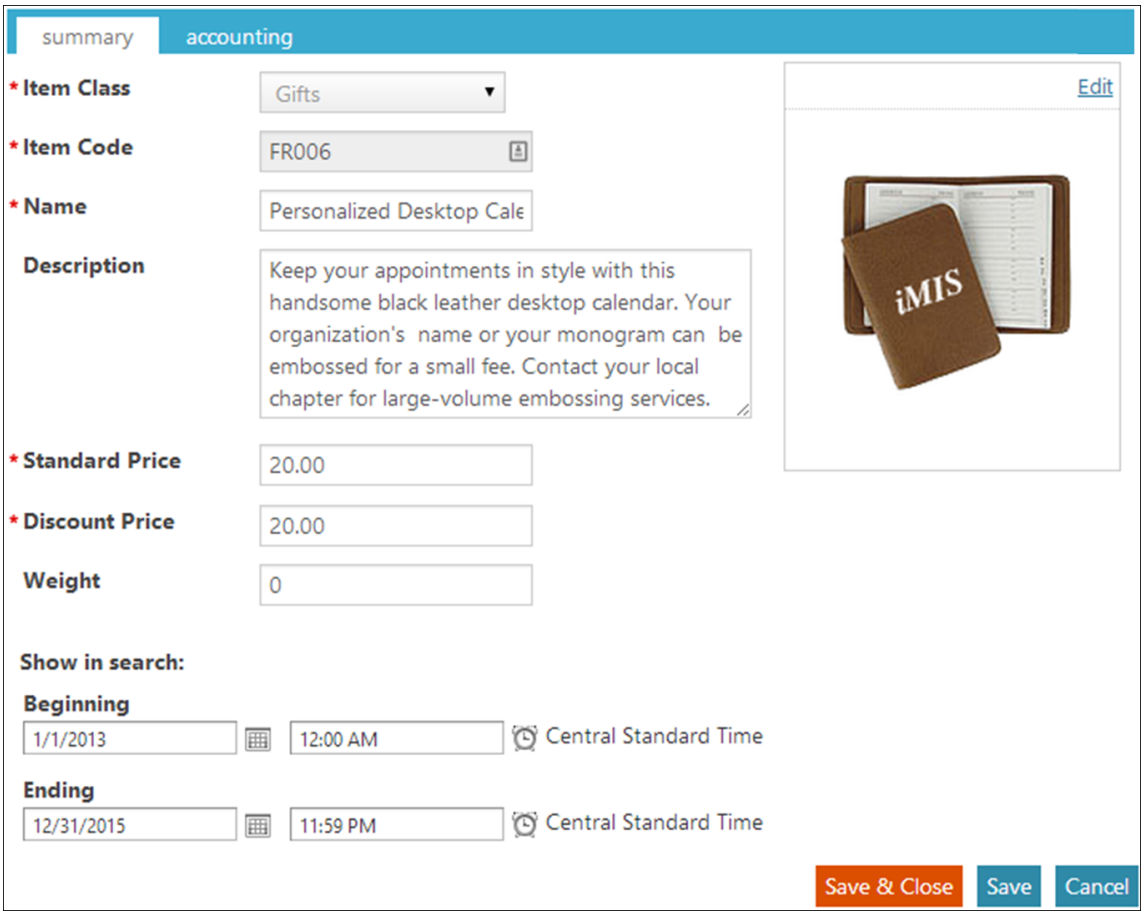
Defining or editing Commerce Items

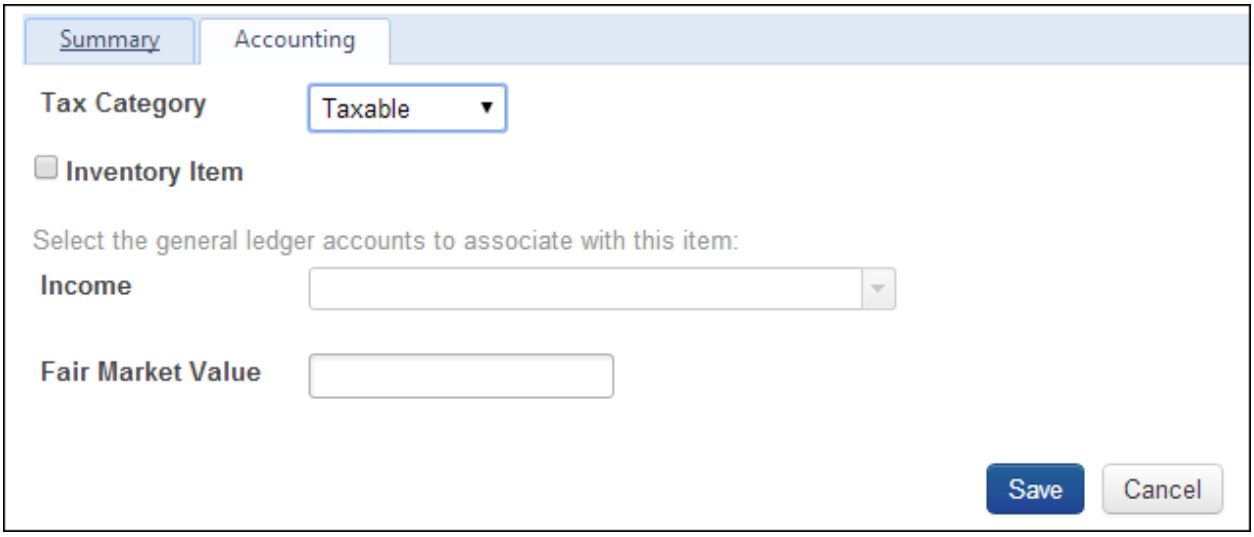
The Item Creator content item has two modes: Add or Edit

- Add mode: Enter the Summary and Accounting information for the product, then Save to create the new product.
- Edit mode: When you pass a product's Item Code to the content item using the iProductCode URL parameter, the content item displays in edit mode.

Go to Commerce > Find products:

1. Click on an item to edit or click + (Add) to define a new item.





Note: If an item is already in your cart, you might need to remove it from the cart before editing it.

2. Select the Item Class.

Note: The Item Class dropdown displays the product categories defined in the Advanced Accounting Console.

3. Enter the Item Code.
4. Enter the Name and Description of the item.
5. Enter the Standard Price (Non-Member) and Discounted Price (Member).
6. (optional) Enter the Weight to help calculate shipping costs
7. (optional) Enter dates and times for Show in Search to provide a date range in which your product will show up in searches.

   Note: Staff users can choose to show inactive products in their search results.
8. (optional) Click Edit and select the picture to display for this item.
9. Select the Accounting tab to review the default settings and make any required changes for the item.

- The Tax Category specifies the taxation rules to be applied. The options available depend on the taxation method set up for your default organization in iMIS Desktop or the Advanced Accounting Console. See Organization names window for more information.
- If your organization uses the default taxation method, select Taxable or Non-Taxable.
- If your organization uses the Canadian taxation method with GST as the taxation authority, select GST/HST or PST. If the product is non-taxable, do not select an option. If the product is taxable, select one or both options.
- If your organization uses the Canadian taxation method with GSTINC as the taxation authority (generally countries in the Asia-Pacific region), select Taxable or Non-Taxable.
- If your organization uses the VAT taxation method, select Taxable or Non-Taxable. If the product is Taxable, enter the VAT Tax Code you want to apply.

  See International Taxation for more information on setting up Canadian and European (VAT) taxation methods in iMIS.

- Enable or disable the Inventory Item checkbox to indicate whether the item has inventory.
- You can override the default General Ledger accounts from the Income dropdown list. Enter the desired amount name or code, and then select the account from a filtered list.
- Provide a Fair Market Value to include in a disclosure statement with receipts to help your members track their donations for tax purposes.

10. Save.

    The item detail page displays as it will appear to users. In addition, the item will display in the list of commerce items. The user can click the item name to view details.

    Note: Product Kits and products with a negative standard price or discount can only be edited through the Advanced Accounting Console. An option to edit these products will not be visible on the Web.

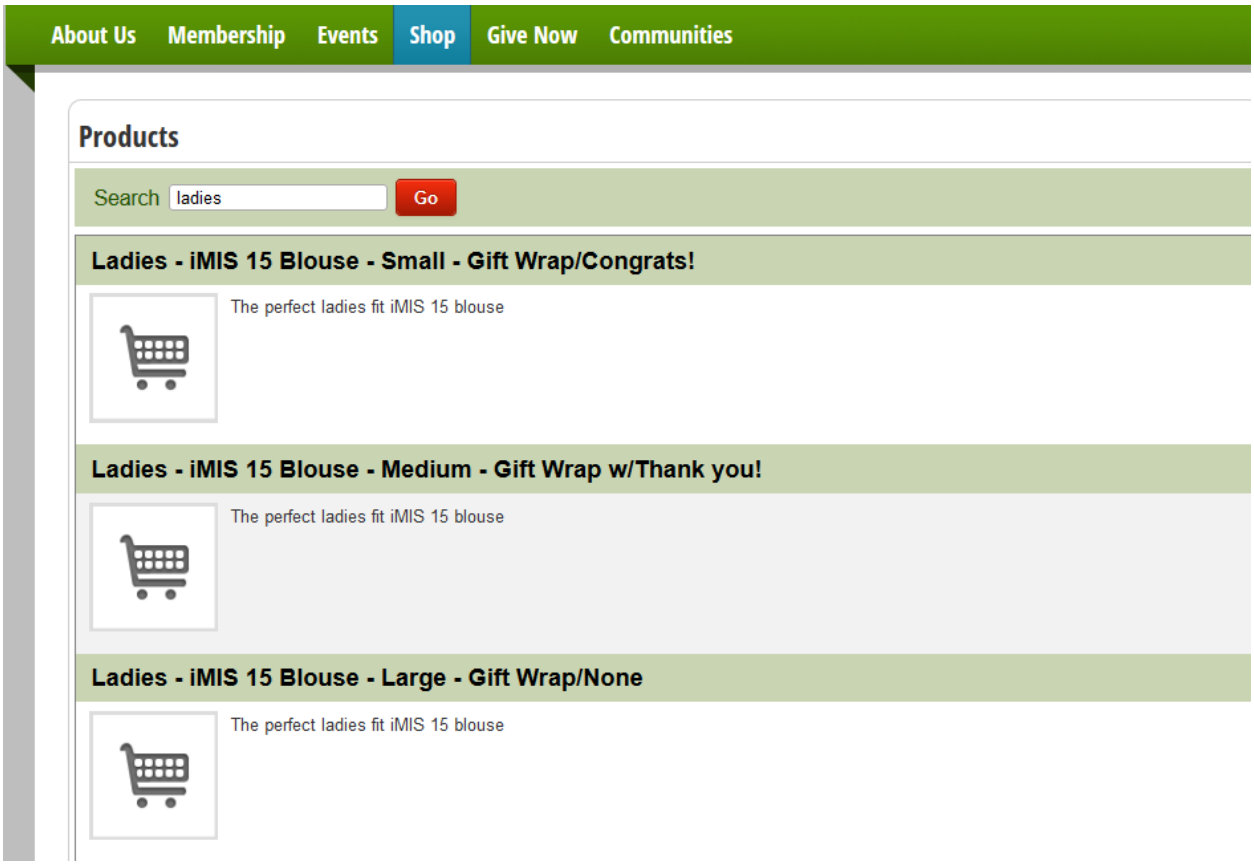
Making a purchase

For yourself or on behalf of another contact, you can browse and search for specific Products and view your Cart, or the Cart of another contact.

> **Note:** Note: If you have opened a contact record, you can click the name of the product and proceed through the purchasing process to checkout.

Searching for a product

From Shop, you can search for a product in the iMIS system.



Tips

- Capitalization does not affect search results.
- Products are searched by name, the first 300 characters of the description, and attributes, such as color or size.

No search results?

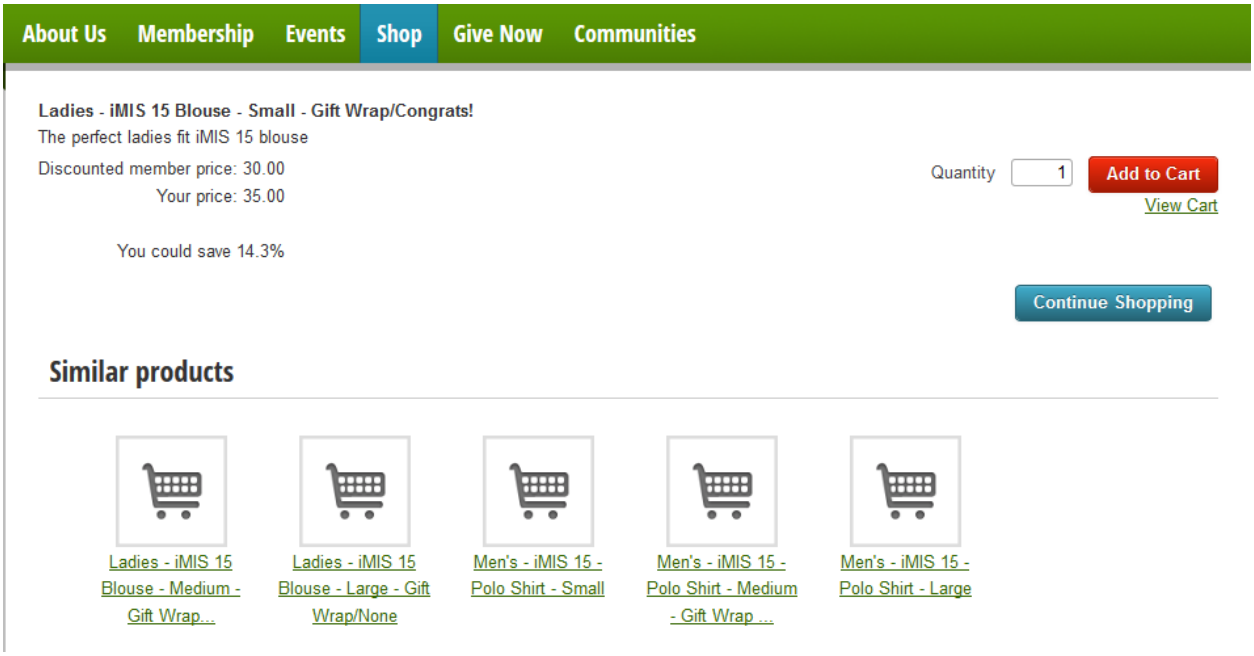
- Search terms must be three or more characters long.
- In some cases, searched terms may exist outside of your 300-character product description. To improve search results, simply enter additional terms.

Using the Cart

From the Store tab, you can view, add, and remove products.

1. Search or Browse for the product.

2. Select the product in the product listing.
3. From the Product Details page, Add To Cart.



4. When you are finished selecting products, Checkout. iMIS will guide you through the rest of the purchasing process.
5. From the Cart page, you can adjust the quantity of or remove products from the cart.

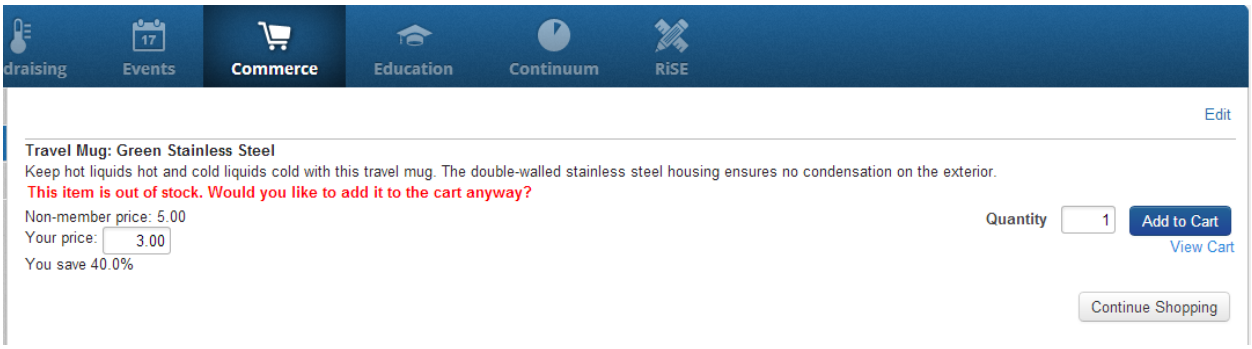
- From the Ship To section, you can select a Shipping To and Shipping Method. You may choose another address if desired.
- From the Payment Details section, enter your payment details.

  Note: You may select a billing address that is different form your shipping address.

6. Submit Order.

> **Note:** Note: If an item is out of stock, as a staff user logged on as yourself or On Behalf Of someone else, you can disregard the “This item is out of stock” error and continue to enter your desired Quantity. At checkout, you will see the message

"Your cart contains errors. Proceed Anyway?" Simply Proceed & Submit, or Continue Shopping.



Overriding a price

If you are a staff user, you can manually override the price on simple items to give your organization's members (and non-members) one-time discounts on simple items in your online store, up to and including a 0.00 price. These items can be added to the cart with the price override included. You can override prices when working On Behalf Of a user, or not.

Note: Note: The ability to override the price of an item is disabled if the system-wide taxation method is set to GSTINC.

1. Go to Commerce > Find products.
2. Navigate to and click on the product you wish to override.
3. On the resulting Product Display, manually edit the price for the item in the editable text field next to Your Price. The Revert to original price link will appear--should you change your mind and want to return the item to the original price, click on this link.
4. When you are ready to check out with the item's new price, click Add to Cart.
5. Once in the cart, you will see the new price listed under Items. You can proceed through checkout as normal.

   Note: After a price is overridden, no further discounts or promotions may be applied to it.

Billing for membership dues

You can use your site to collect membership dues from both members and prospects:

- For existing members who need to renew, just bill as usual:
- Run the billing cycle to generate the invoices. See Running mass dues billing.
- (accrual dues) Post the resulting batch.
- When viewing their profile on your site, members are prompted to renew (as long as the invoice remains unpaid).
- If they opt to renew, the billing item moves to their cart, for payment.

  Note: If a user has purchased a membership (joined) once, the user cannot purchase the same membership again. Even if there is a lapse in a membership, the user can only renew a membership (a staff user must intervene on behalf of the user to do this).
- When guests check out, subscription records synchronized to the same membership term dates are created and the customer type changes to the customer type selected in the billing cycle. If customers choose to make a payment instead of using Bill Me, the paid thru status of the subscriptions will not be updated until the batch of payment transactions posts.

  Note: Join Now functionality is currently implemented for cash-based accounting only. Using Join Now with an accrual dues system will still work, but iMIS will treat the dues as cash. Future renewal billings will be treated as accrual dues.

Join Now functionality is currently implemented to work with Anniversary billing. Join Now can work with a system configured for Annual billing, but it will bill the dues as Anniversary, using the Anniversary through dates.

To set up a "Join Now" billing cycle

In Advanced Accounting Console, check your dues item pricing and create a special billing cycle to use when members join through your website:

1. Verify the pricing for your dues items.

   Tip: Product pricing follows this order: Is there a price on the Special Pricing window? If not, is there a price on the Customer Types window (or is the Comp option enabled)? If not, use the price on the Products window.

- On the Customer setup window for Customer Types, verify the Dues Billing options for your primary membership type (which you will use for Join Now).

  Note: You cannot use a wildcard on the dues product list on the Customer Types window. If you use a wildcard, an error message is displayed, and you will not be allowed to continue to check out.

- On the Billing setup window for Products, verify that you have one product code for each dues or subscription involved in your membership options.
- On the Billing setup window for Products, Special Pricing, define any special pricing for your membership fees, if needed. See Special pricing examples.
- On the Configure billing options window, select the appropriate prorating option if you bill on an annual or fixed-term basis and would like to prorate the membership fee based on the date the member joins or to apply special user-defined prorating rules.

2. In the Set up billing cycles window, create a new billing cycle.

   Note: You may want to begin the Cycle Name with "Join Now" (with a space, not an underscore) to distinguish this billing cycle from others. Multiple Join Now billing cycles can be created by including an additional description in the cycle name, such as Join Now Stu-

dent. The billing cycle name on the Set up billing cycles window should not have underscores in it, only spaces.

3. Select Use for web joins.
4. For Member Types, select only one member type. The contact will be converted to this Member Type when they join using this billing cycle.

- For Products, select products that are not included on the Customer Types table for this member type.

  Note: New members are able to select a chapter during the Join Now process. However, you must set this up by adding a CHAPT product for every chapter option. When a membership is due for renewal, the selected chapter is included in the invoice.

- For Other Billing Instructions, be sure to enable the option for Add Member Type Items to bill for products on the Customer Type table.

5. On the Customer setup window for Activity Types, edit your DUES Description to be how you want it to appear to the public (such as “Membership Fees”).

   To set up a "Join Now" page

   On your members' site, create a Join Now page:

1. Create a Join Now content record and add it to your site navigation.
2. On the content record, add a General Product Display content item. You will need a separate instance of this content item for every Join Now product you want to use on your site.
3. Configure the content item so that Default product to display is the exact name of the billing cycle.
4. Publish the content record, and view it for any changes you may want to make to options and default selections.

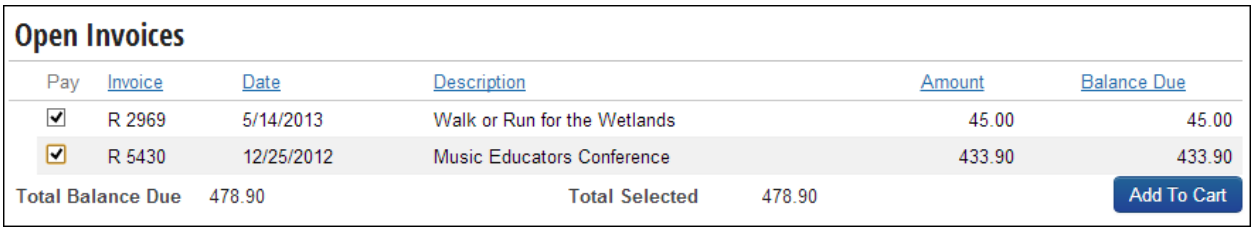
Tip: If you set up Special Pricing for membership fees, be sure to view your Join Now page using test users for each special pricing scenario to ensure that the fees appear as you intend.

Paying open invoices

You can pay any open invoice that you can view in the Open Invoices section of an individual or organization account page. If you are a staff user with On Behalf Of privileges, you can view and pay open invoices for any contact. If you are a Company Administrator, you can view and pay open invoices for your organization and for members of the organization.

Note: Note: Only open invoices for orders, events, and desktop sales transactions display in the Open Invoices section. Pledges and bill invoices do not display.

1. Select Community > Find contacts.
2. Find and open the contact for which you want to pay an open invoice.
3. Click the Participation tab to view the Open Invoices section.



Note: Note: The Open Invoice List Display content item displays by default on the individual and organization account pages, but you can add it to any part of the member site. See Open Invoice List Display for more information.

4. Select the checkboxes in the Pay column to select the invoices you want to pay.
5. Select Add To Cart. The selected invoices are added to your shopping cart.

> **Note:** Note: If you have On Behalf Of privileges, you are automatically transitioned to act On Behalf Of the invoiced contact. The invoices are not added to your own cart. See On Behalf Of: Customer service mode for more information.

6. In the Payment Details area, enter the appropriate information.
7. Select Submit Order.

Configuring order confirmation emails

You can customize the confirmations for content item-based commerce by modifying its HTML template: OrderConfirmationEmailTemplate.htm. To modify this template, locate the template file in your iMIS directory:

...\NET\iparts\Commerce\OrderConfirmationDisplay\

> **Note:** Note: This confirmation template is not related to the Public view.

You can use these properties in your template:

General Order Information

- [LetterheadName]
- [LetterheadAddress]
- [OrderNumber]
- [OrderDate]
- [BillTo]
- [TransTotal]
- [PurchaseOrder]
- [PaymentMethod]
- [NameOnCard]

- [ShipTo]
- [ShipMethod]

Line Item Data

- [Quantity]
- [Item]
- [Price]
- [Total]
- [ItemTotal]
- [Shipping]
- [Handling]
- [TaxAmountsLabel]
- [TaxAmounts]
- [TaxTotal]
- [GrandTotal]
- [InvTotal]
- [TransTotal]

Example customization

Here are some typical customizations you might want to make to your confirmation email:

1. Logo: After the <body> tag, insert the <img> tag that sizes and positions your logo appropriately.

   <img src="http://www.advsol.com/AM/Images/New_Design/logos/imis_15_logo.gif">

2. Message: After the final </table> tag, add a message:

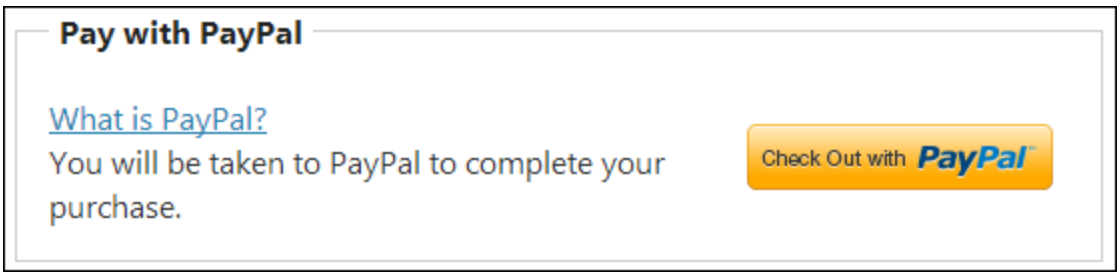
Thanks for your Order and being a great customer! Please contact customer support for any problems at (888) 555.4354.

Don't miss the largest gathering of iMIS Community. The NiUG Asia-Pacific Discovery Conference 26-28 October, Launceston, Tasmania. Details at www.niugap.org.

You can take this a step further by modifying the template to strengthen your brand and messaging in the receipt for your organization. You can even use it to promote upcoming events if you are willing to change the template often.

Enabling PayPal Express

You can set up Express Checkout with PayPal to integrate with your content item-based sites. This payment option is a convenience for your members, customers, registrants, and donors, which means more revenue for your organization.



The Pay with PayPal block appears in the Payment Creator content item if you set up a cash account as a PayPal service.

If you are designing your own checkout pages, be sure that the Payment Creator and Submit Order Button content items are on same page.

To integrate PayPal Express into your site, see PayPal Express Checkout Integration in the Payment Authorization section.

Creating promotion codes

You can create promotions (discount codes) that apply to the entire order, within any date restrictions that you define. Currently, a discount that applies to the entire order can only

be a percentage discount. This discount applies to every order line in the cart, without type-specific exclusions.

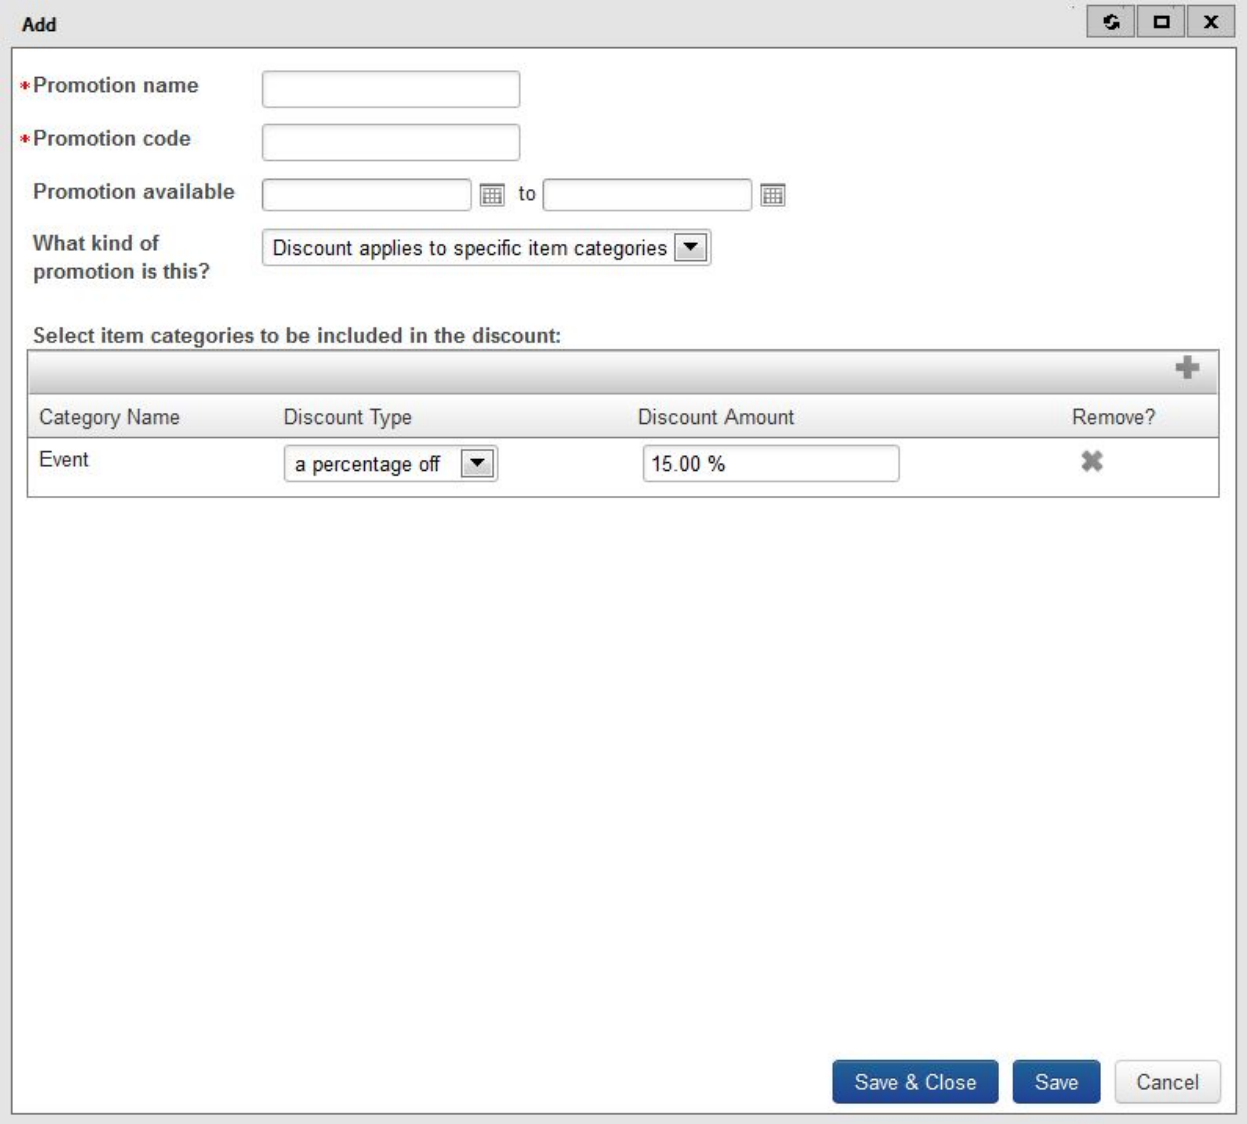
You can also create promotions (discount codes) that apply only to specific items or item categories, and these discounts can be either percentages or fixed amounts.

To create a promotion, you need access to the Promotion Creator content item, which enables you to create and manage promotion codes that give a percentage discount.

1. Go to Commerce > Manage promotions.
2. At right, click the Add (plus sign) icon to create a new promotion.
3. Create a Promotional code name and Promotion code that will help you organize your discounts.

   Tip: Use a naming convention that takes advantage of alphabetical column sorting to group discounts together, such as by year or area prefix.
4. Enter availability dates unless you want your code to never expire.
5. For What kind of promotion is this?, decide if the code will apply to the entire cart or to specific items or kinds of items that might be in the cart.

- Discount applies to entire order: Currently, this percentage discounting applies to every order line in the cart, without type-specific exclusions.
- Discount applies to specific item(s): To the right of Select item(s) to be included in the discount, click the Add (plus sign) icon to select an item and define a new item discount, either percentage or fixed amount.
- Discount applies to specific item categories: To the right of Select item categories to be included in the discount, click the Add (plus sign) icon to select an existing category and define a new category discount, either percentage or fixed amount.



Applying promotions

The Promotion Manager content item lets you make use of the discounts that you define using the Promotion Creator. It lets shoppers enter a promotion code to apply to their entire order. When the code is valid, the order lines update to the new reduced amounts. The content item hides itself if no promotions have been defined or if the cart is empty.

Transaction Grand Total	**330.00**

Promotional Code: Apply

Community

From the Staff site, Community offers a quick-view Dashboard of up-to-date contact and membership figures that are important to your organization. You can also find and add contacts, moderate communities and manage your community preferences.

You can see the following items on the dashboard:

- Active contacts
- Contacts by member type
- Members by region
- Active members
- Renewals this year
- Five newest members

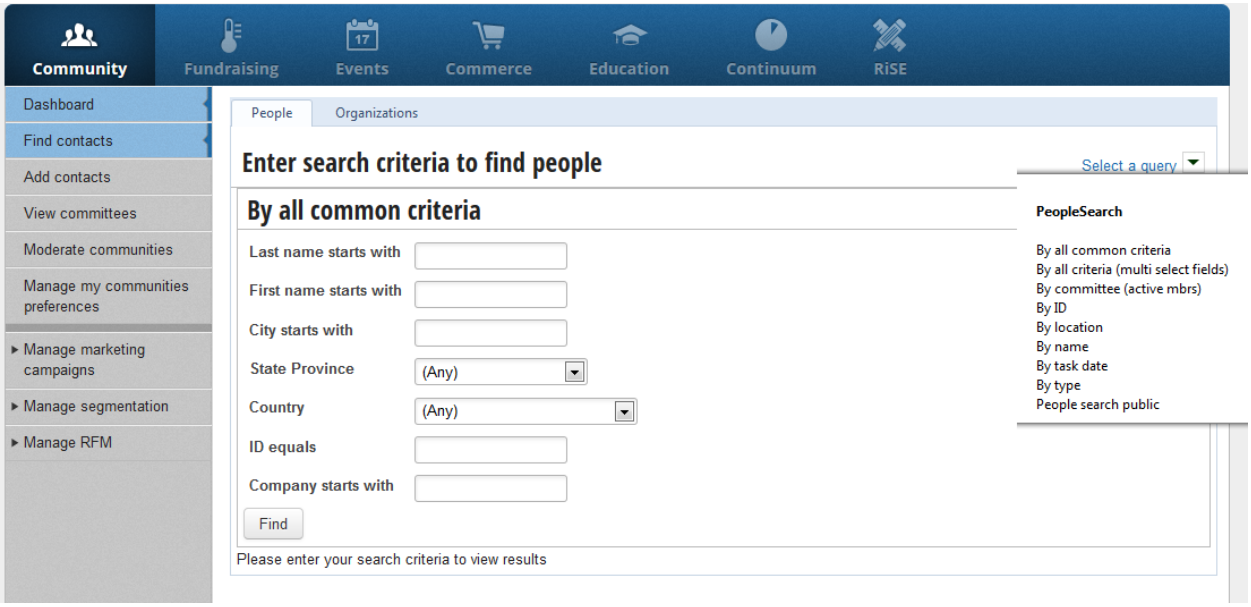
Note: Note: Dashboards are made up of a collection of content items that are configurable to you organization's specific needs. These content items simply call queries that populate the dashboard with your up-to-date, real-time information.

Working with Contacts

From the Community section of the Staff site, the Find contacts page offers a drop-down list of prebuilt searches, which are a set of queries in the Document System:

$/ContactManagement/DefaultSystem/Queries/Directory/PeopleSearch

You can change these queries and add additional ones as fits your organization.

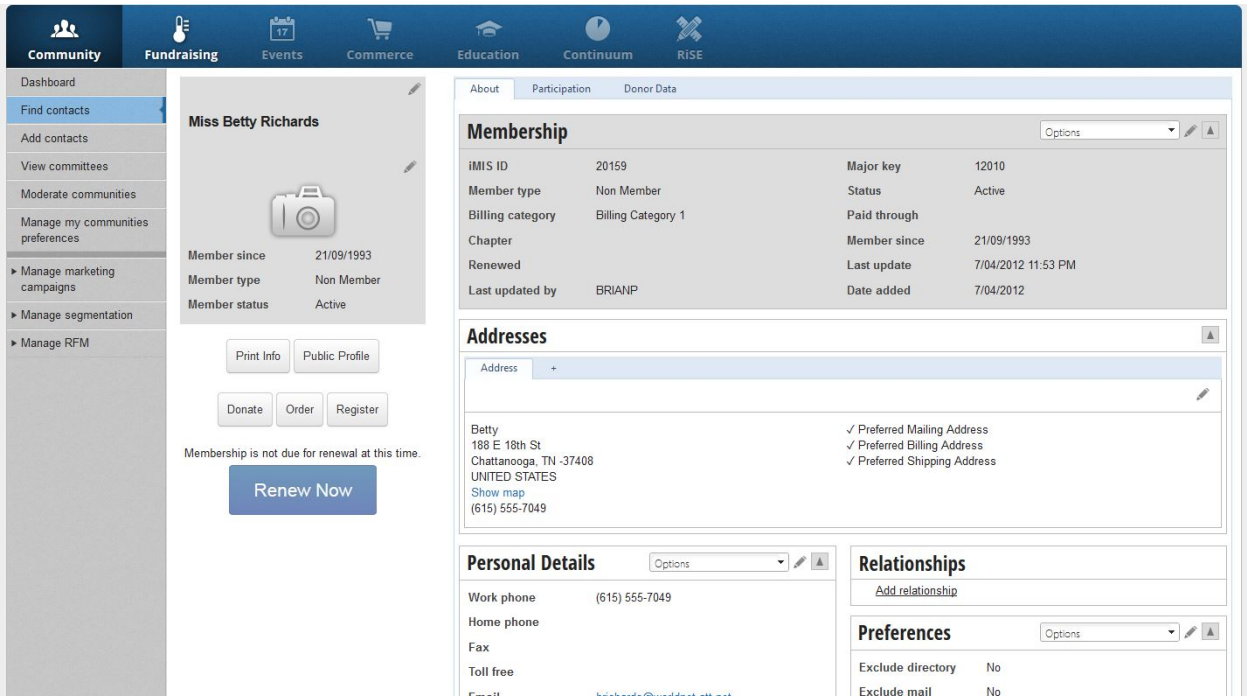


Because these searches use IQA, you can control the formatting of the printed output and let your staff export that contact data to Word, Excel, and data files. See Changing the default layout for SSRS reports.

You can add a new contact, enter contact details, and view a limited set of contact data for others. The process for changing contact records always begins with Find.

To edit contacts

1. Search for the contact by using Find contacts.
2. Once you find the contact, you can change the record by clicking on their ID number and editing information on the resulting profile page.

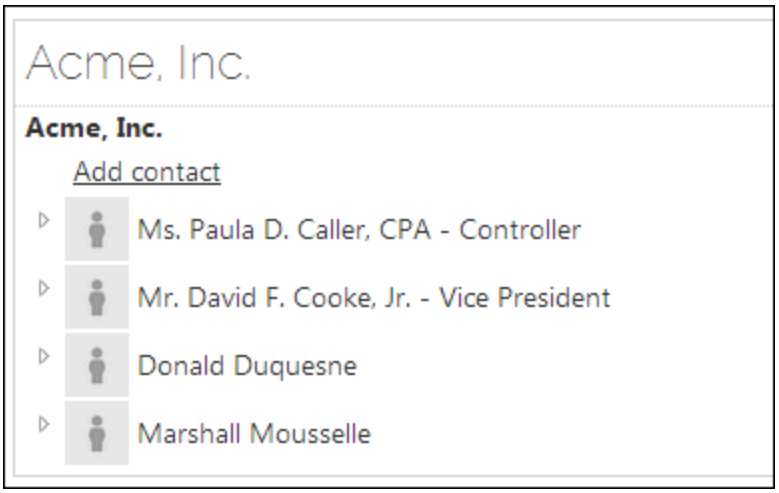


To add contacts

1. Select Add contact and enter the required fields.
2. If you want to create a new account for the contact, check Create an account. You can then enter their user name and password.
3. Click Save.
4. You can add additional contact information on the resulting profile page.

Viewing company participant lists

The company participant allows you to view all members associated with a company record. To view a company record, find and select the organization to view the organization information and the company participant list.



To add a contact to the company participant list

Members with the CompanyAdministrator role can add contacts to a company participant list and edit contact information. Any Staff user can assign a member to the CompanyAdministrator role directly from the company participant list as long a member has a user login. Once a user has been given the CompanyAdministrator role, they can assign it to other members within their company participant list.

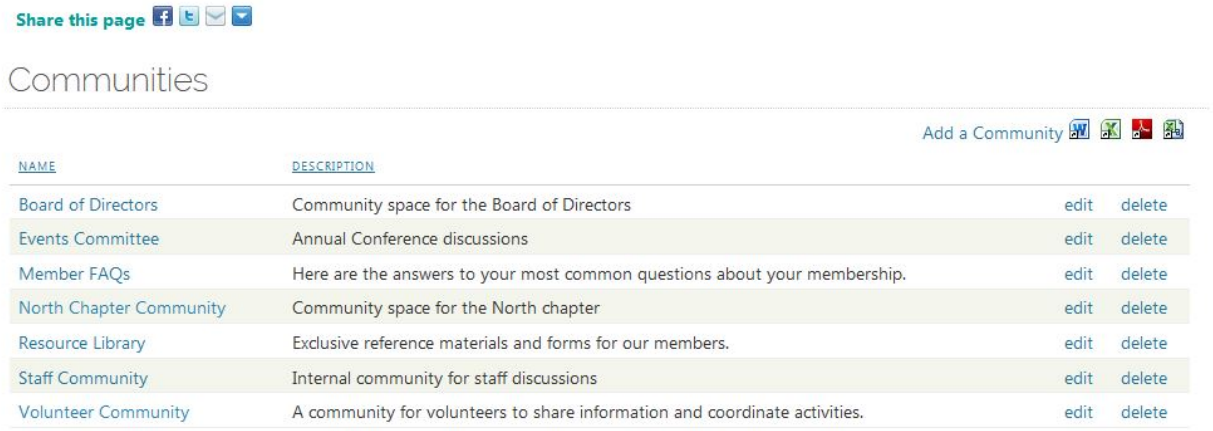
1. Select Community > Find contacts > Organizations.
2. Find and select an organization.
3. Select Add contact in the company participant list.
4. Find an existing contact or select Add New for a new one.

Community Essentials

Start here to learn what you can do in Communities as a member, a subscriber, a moderator, or a wiki author. Moderators and wiki authors are members who hold extra permissions to help do the work of developing and managing the content in a community.

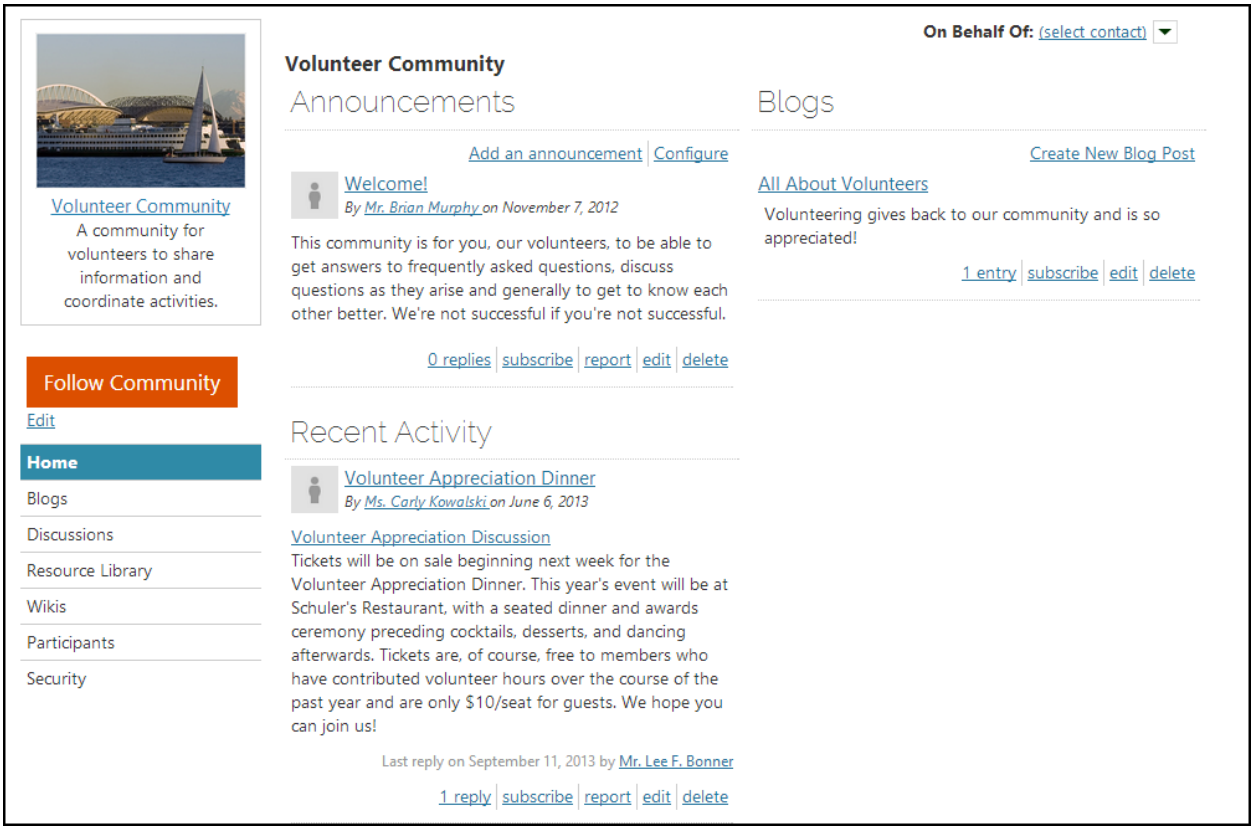
Quick facts: Communities

With Communities, your organization can host multiple communities, each offering its own discussions, document libraries, coauthored wikis, and personal blogs.



Create as many standalone communities as needed to support groups within your organization.

This integrated set of community features offers a robust set of collaboration and communication tools that match and extend your online presence. iMIS Community uses your existing iMIS contact records and leverages iMIS security and website management tools.



Each community has its own set of announcements, discussions, blogs, wikis, resources, and participants.

Community features

- Discussions
- unlimited number of discussions per community
- replies that are threaded with the rest of the topic discussion
- posts that can be reported as inappropriate
- subscribe for email notifications for entire discussions or specific topics
- Blogs
- individuals or groups can start a blog
- linked, dated archive to previous blog entries
- subscribe for email notifications for one or all blogs
- Wikis
- supports collaborative authoring of wiki articles
- articles can have multiple authors, with online identity provided by iMIS
- subscribe for email notifications for any new or changed articles
- Community management
- each community has its own security settings
- same look and feel as the rest of your iMIS website
- subscribe to Recent Activity for updates on any and all content changes
- many choices in subscription granularity: community-level, all discussions/wikis/blogs, individual discussions/wikis/blogs, individual posts within discussions/wikis/blogs
- customizable email notifications

- Resource Libraries
- add documents, videos, audio files, and image files
- maximum file size is adjustable
- folders aid organization and security control
- define security permissions for the resource library the same as for the community

What are communities?

An online community lets a group collaborate on projects, share knowledge, communicate and connect with others, and stay in touch using email subscriptions. Communities have configurable layout pages that help you manage both the shared content and the group that defines the community.

Community management with iMIS offers some distinctly defined tools for collaboration and group work on the website. Use the tool that is right for how you want to disseminate the information. For example, put time-sensitive topics in a blog or discussion, but put knowledge base articles in a resource library or wiki.

Announcements

These posts display in the Announcements area of the Community page and accept no replies. They allow community administrators to broadcast messages to all community subscribers and members.

Discussions

Discussions let community members post and reply to discussions. Discussions contain topics, and subsequent entries on a topic are called posts. When a community member subscribes to a discussion, they receive an email every time that a post is added or when someone replies to a topic with a post.

Blogs

Blogs list entries chronologically, typically from newest to oldest. Group blogs contain entries from multiple authors, though many are created by a single author. Entries might

offer commentary, news, event announcements, or material such as images or photos or links to other blogs. Blogs can be personal or professional. In a non-profit context, blogs are likely to be used for communication, connections, community growth or enhancement, marketing, customer support, or public relations purposes. Blogs allow other readers to write comments for individual entries, and readers can subscribe to a blog to receive every blog entry as an email. Community administrators can edit any blog entry.

Wikis

Wikis are collaborative web pages that are grouped together, enabling quick editing of the pages by allowing community members to add or edit articles to the community website. Wikis allow community authors and community administrators (or anyone, depending on the permissions) to add and edit articles. However, comments, the ability to view revision history, the original author, or subsequent edits of an article are not available for wiki articles. Subscribing to a wiki means that every time an article is added or edited, you will receive an email message indicating what has changed.

Resource Library

Libraries store shared files, which are content such as Word or PDF files, forms, or graphics that you want to make available to everyone in the community to download.

Recent Activity

The Recent Activity area offers a view of every content item that has been added or updated in reverse chronological order. It is available in some of the community portal layouts, and subscribing to the Recent Activity is an easy way to ensure you receive an email notification for every content addition or update across the community.

Subscribers

Community administrators can add members based on any number of criteria, such as location or membership type. The subscriber list comprises the participants for the community.

Using a community

Here are the basics you need to start using Communities:

- Opting Out: When someone subscribes you to a community, you are signed up to get email notifications when community announcements are posted. You can opt out of these emails by clicking the Unsubscribe links for the community, the announcements, or any specific area of the community from which you don't want updates.
- Opting In: When new content is created, you can opt in to get those updates. You can subscribe to any discussions, discussion topics, wikis, blogs, and blog entries that interest you. Pick the granularity that suits you: you can choose to get updates from an entire discussion or just from a single, relevant topic. Subscribing means that you will follow all comments that follow from the original post.

  To set your preferences

  You can use communities without subscribing, but it can be hard to keep up without notifications about what is changing. Taking the time setting your subscription and email preferences is key to achieving the flow of update notifications that works best for you.

  Go to Community > Manage my communities preferences:

  A list of the communities you are following display.

  Tip: If the subscription list is too long for you to easily find items, click the header labels to sort the columns (each click toggles between ascending/descending order).

1. Use the stop following link to leave any communities or content areas (discussions, blogs, etc.) that you do not want to follow.

   Tip: Even if you hate email, stay subscribed at the community level so that you get critical announcements from the administrators.

   To subscribe to a new community

   Go to Community > Moderate communities:

1. Select the name link of the community you want to follow.

2. Click Follow Community to start receiving announcements for that community.
3. Browse through the content areas (blogs, discussions, wikis) and use the subscribe link below each content area to follow updates to those areas that interest you.

To create a post

A post can be a reply, comment, blog entry, discussion topic, or wiki page, as your permissions allow.

1. If you are allowed to create content in the area, you will see an Add link.
2. Click Add and enter a title or subject and text for the body of the post.
3. If available and needed, click attachments to add a file (which is stored in the Document System).
4. Click Save.

> **Note:** Note: When adding an unsecure PDF, TXT, RTF, DOC or HTML attachment the content of the file will be searchable after Java is installed.

To report inappropriate content

Community administrators can fix and even remove objectionable content throughout the community, but only if members alert them to the situation. Whenever you see problems with content in the community, use the report feature to help your administrators deal promptly with the problem.

1. While viewing the post or comment, click the report link.

   The Report Inappropriate Content window appears.
2. Enter an Explanation with reasons for reporting the post or comment.
3. Click Send.
4. Once you see the message that your report has been sent, click Close.

All of your community administrators receive the email about the inappropriate content, which improves how quickly the team can respond to the problem.

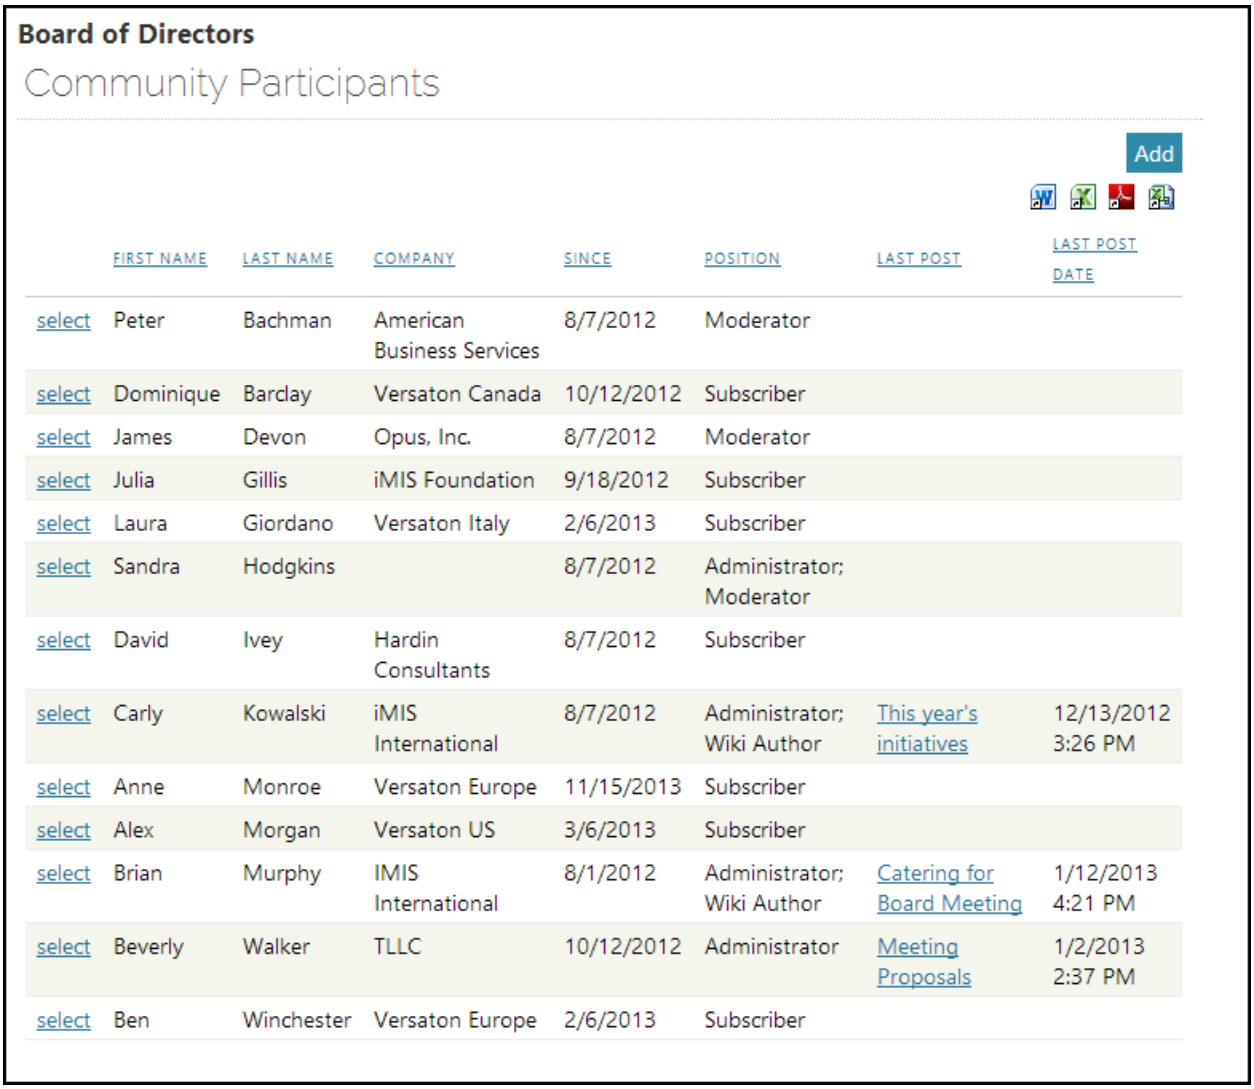
To view community subscribers

The participant list is a list of all subscribers to the community itself. The Position column lists the security role of each member. Most will be Subscriber; a few will be Administrator, Moderator, or Wiki Author.

Go to Community > Moderate communities:

1. Open the community from the Communities list.
2. Click the Participants link in the left navigation to view the expanded list of community members.

   Tip: Click a column heading to sort by that column.



Board of Directors

Community Participants

Add

	FIRST NAME	LAST NAME	COMPANY	SINCE	POSITION	LAST POST	LAST POST DATE
select	Peter	Bachman	American Business Services	8/7/2012	Moderator

select	Ben	Winchester	Versaton Europe	2/6/2013	Subscriber		

To stop following a community

Members can select stop following in order to be removed from the community's participant list.

To remove a member from a community

Staff members with administrative privileges can select a member's record and select remove in order to remove a specific member from the community's participant list.

Creating your blog

Create a blog to publish periodic entries on a particular topic. Your blog entries appear chronologically, with your newest entries topping the list. Blogs serve as collections over time, and the topics can be as serious as reports or as casual as personal online journals. Blogs accept comments, so that readers can respond to the entry and to each other.

To define a blog

Go to Community > Moderate communities:

1. Open the community from the Communities list.
2. Select Blogs from the navigation links.
3. Click Add new blog.
4. Define the blog.

   Tip: Even if you do not enable Allow HTML in posts in the blog, URLs in blog entries still convert to links.
5. Click OK.

Creating a wiki

Add a wiki to create a group authoring area on the website, for a shared writing project, or knowledge base. Wikis are web pages that are grouped by subject, such as Policies and Procedures. They enable quick, collaborative development by allowing more than one author to add and edit articles. Subscriptions aid members in keeping up with changes to a single wiki page or the entire wiki.

Moderating wikis without restricted authoring

Keeping wiki authorship open to all members is best in terms of maximizing contribution, participation, and inclusion of others. If your organization has concerns about incorrect or inappropriate information making it into a wiki, see if moderation by administrators cannot give you the protection you need, as they have the power to correct and delete such content.

If you choose to use moderators for your wiki, be sure that those individuals subscribe to the specific wikis in question, so that they will be notified of all page submissions and can respond promptly.

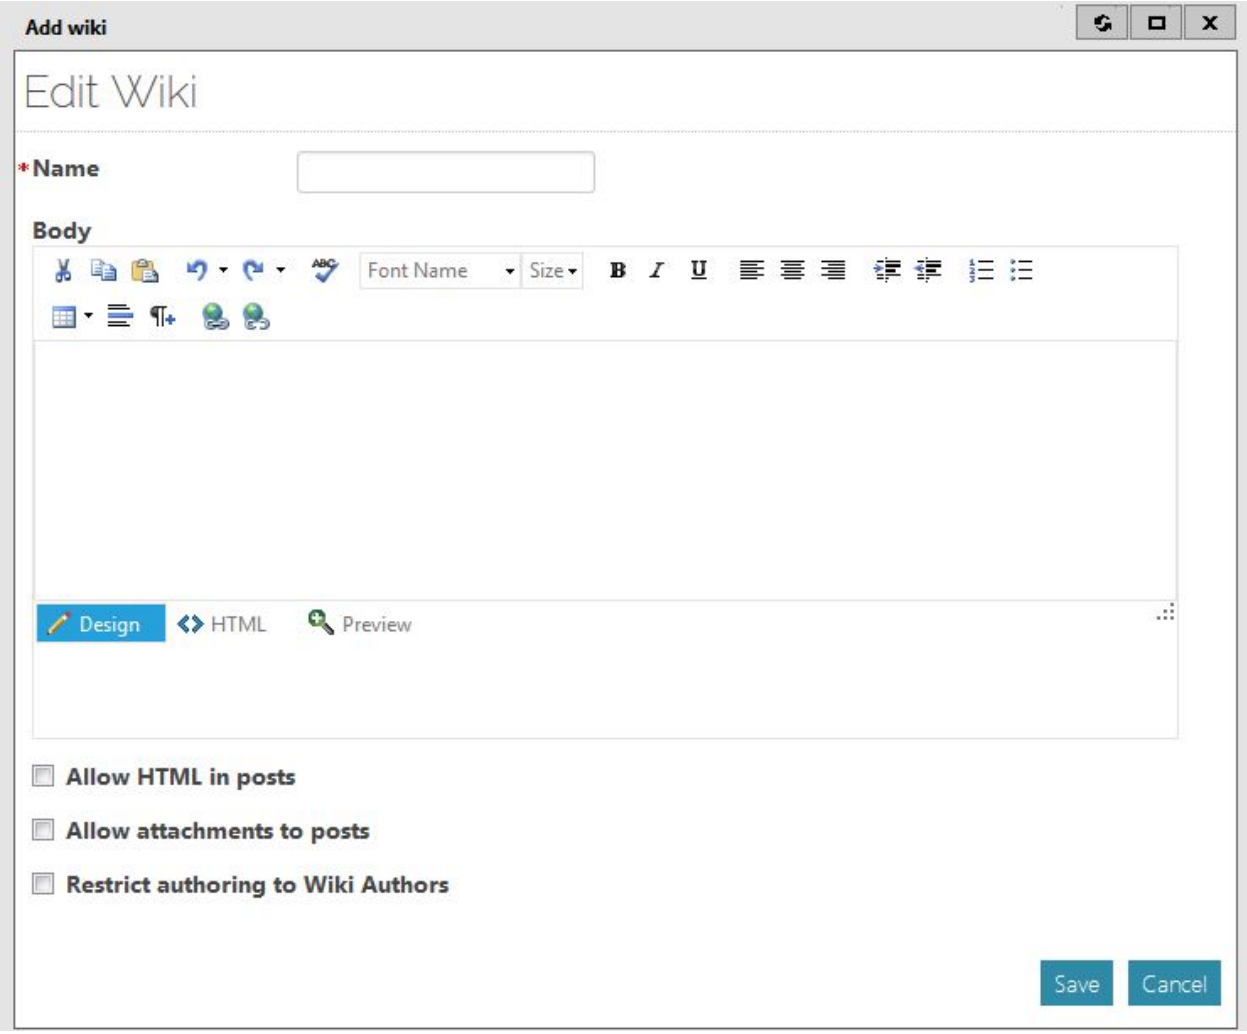
To create a wiki

Go to Community > Moderate communities:

1. Open the community from the Communities list.
2. Click Add a wiki. If you do not see this link, you may need to be assigned as a Wiki Author by your community administrator.
3. Define the wiki. If you enable Restrict authoring to Wiki Authors but are not yourself a Wiki Author, you will not be able to edit the wiki.
4. Click OK.
5. Click Subscribe if you want to receive email notifications of all changes to the wiki.

Edit Wiki window

This window defines a collaborative workspace similar to a wiki where community members can create and share articles with the community.



Select community link > Add a wiki

- Name – Specifies the name of the wiki.
- Body – Specifies a description for the wiki, which is listed on the Community home page. If you find some features of the HTML editor confusing, you can download user documentation for the editor.

  Note: Some features described in this external document have not been enabled for use when defining communities.

  Caution! If you use the HTML editor's built-in Image Editor to modify an image that has a transparent background, the transparent background will be replaced by solid black pixels. If you need to edit images that have a transparent background, you should save a

copy of the image to your local computer and use your preferred image-editing program to modify it. Then upload the new version to iMIS again, overwriting the old version if desired.

- Allow HTML in posts – Select this checkbox to enable the HTML editor so that wiki articles can have HTML in each. If this checkbox is cleared, you enter plain text when creating articles. When you enter a URL, iMIS automatically creates a link within the wiki article, even if this selection is cleared.
- Allow attachments to posts – Select this checkbox to enable a poster to attach files separately to a wiki article, such as a PDF document or an image.

Communities Administration

Community Administrators comprise a team that takes care of developing and maintaining a given community. They share the work of

- creating communities
- broadcasting announcements
- managing files in the resource library
- adding and managing members
- assigning moderators and wiki authors
- defining discussions
- deleting discussions, blogs, and wikis

Creating a community

To enable a group in your organization to collaborate, create a community for them consisting of a web page with preselected layouts, which include and position such things as discussions and blogs.

When you finish defining and populating the main structures of the community (such as its discussions and wikis), you are ready to change the security settings to allow members to see and use the community you created.

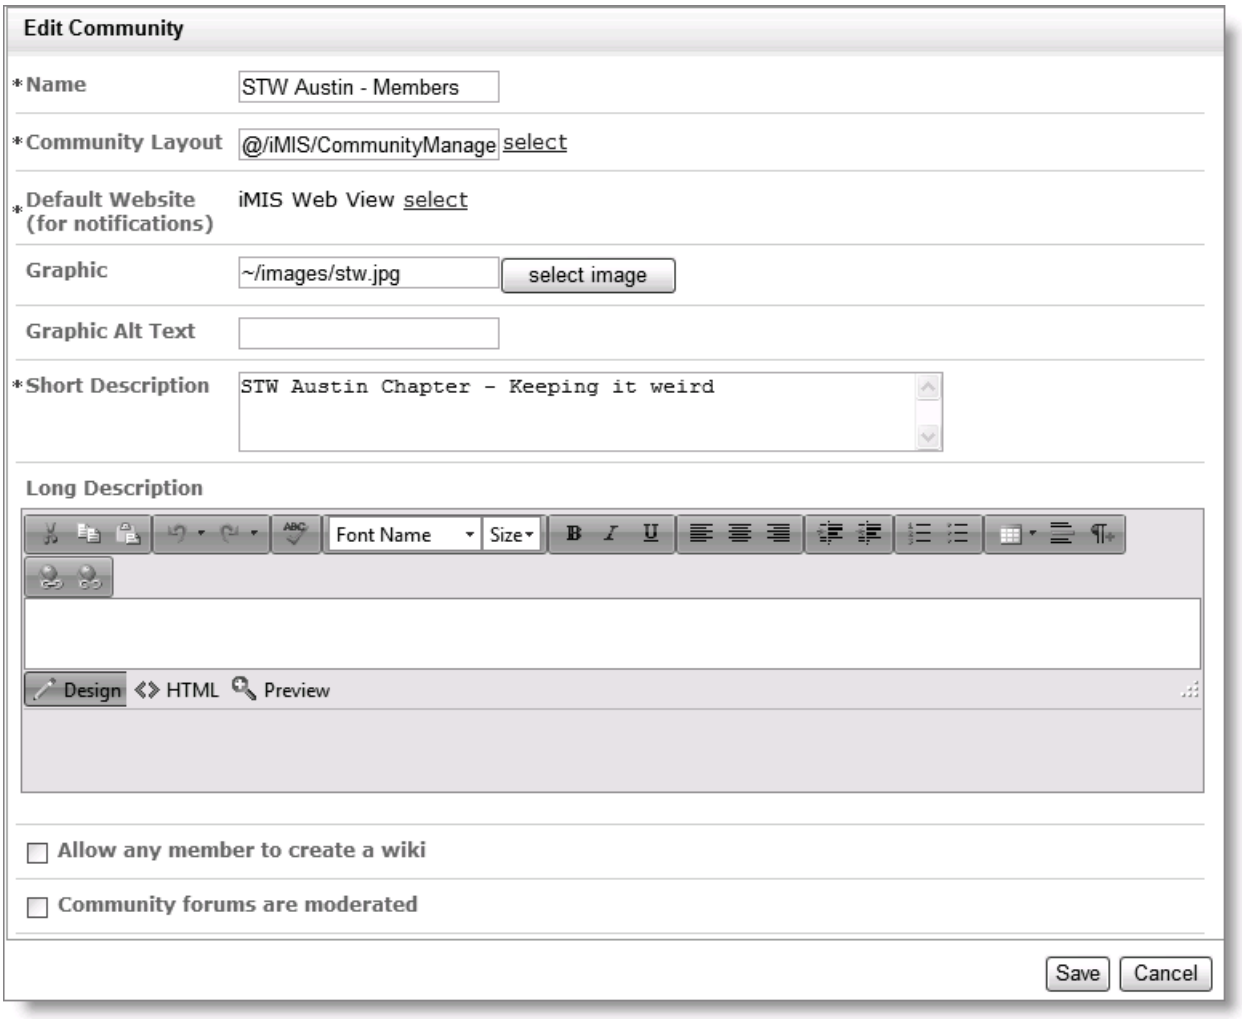
To start a community

Go to Community > Moderate communities:

1. Click Add a Community.
2. Define the community using the fields described below and click Save.
3. Select the community from the Communities list.
4. Create discussions that the members will need.
5. Open the Security link at left and set the Access Settings for the community.
6. On the other Security tabs, add members to the various community roles.
7. Open the Participants link and bulk-add members to the community, which subscribes them to receive community announcements.

Edit Community window

This window defines a community and the graphic that represents the community.



Communities > Community List > Add a community or click the Edit link while viewing the community page

- Name – Specifies the name of the community that is displayed on the web and in email messages sent to subscribers.
- Community Layout – Specifies the content record for the community, which uses a selected layout.
- Default Website – Specifies the website as defined in Content Management > Site Builder > Manage websites. The website must be published (not in a Working status). This setting indicates the website users will see when clicking a link included in a subscription notification or in a "report this post" message. The default website should be a website

that is accessible to all subscribers of the community. Also, do not select the iMIS Desktop View as the default website.

- Graphic – Specifies the image file displayed when readers view the Community on the web.
- Graphic Alt Text – Specifies the alternative text that appears when the image cannot be displayed or when you hover your mouse over the graphic.
- Short Description – Specifies a short description of the community and its purpose in one or two sentences. No HTML coding or CSS styling is enabled in the short description.
- Long Description – Specifies a longer description of the community and allows HTML coding or CSS styling. This description appears in the side bar on the Community main page. If you find some features of the HTML editor confusing, you can download user documentation for the editor.

  Note: Some features described in this external document have not been enabled for use when defining communities.

  Caution! If you use the HTML editor's built-in Image Editor to modify an image that has a transparent background, the transparent background will be replaced by solid black pixels. If you need to edit images that have a transparent background, you should save a copy of the image to your local computer and use your preferred image-editing program to modify it. After you have edited the image locally, upload the new version to iMIS again, overwriting the old version if desired.
- Allow any member to create a wiki – (disabled by default) Permits all authenticated users to create wikis, regardless of their community role.
- Community discussions are moderated – (disabled by default) Forces every discussion on the community to be subject to moderation, which means that community posts cannot publish until a moderator or administrator approves them.

Enabling discussion moderation

Discussion moderation — that is, keeping a discussion posting in queue until a moderator approves (or rejects) it for publication — is sought by organizations that feel urgency to

prevent erroneous, inappropriate, or damaging content from being distributed under their name, so much so that removing such postings and posters after the fact is not good enough. Such organizations are often

- new to social media and reluctant to host discussions at all
- in health care, for which misinformation incurs liability
- involved in industry arbitration, where disgruntled individuals seek to hijack channels for their own ends

Best practices: Controlling discussion postings

Whenever possible, decide against controlling discussion postings on the front end. Enabling this approval workflow creates extra work for moderators, and members experience frustrating delays in seeing their postings broadcast and in getting input or help they may be seeking.

Are you without any control, then? Not at all.

- Be sure to post discussion use policies that make clear your rules for content and behavior as well as the consequences for violation (such as two warnings and then permanent removal from the community).
- Direct your moderators to post warnings, delete inappropriate postings, and have offenders removed from the community, according to your policies. This goes far to covering your accountability.

To enable discussion moderation

If your organization cannot allow any inappropriate postings ever getting through to members and subscribers, even temporarily, you can enable moderation on your discussions. This moderation prevents postings from appearing until a discussion moderator approves it.

> **Note:** Note: Discussion moderation is community-wide: either all discussions are moderated, or none.

1. Log on as an administrator.
2. From the Communities list, click edit for the community whose discussions need moderation.
3. Scroll to the bottom and enable Community forums are moderated and click Save.
4. Open the community and go to Security.
5. Open the Community Moderators tab and add members to the moderation role, to help manage the additional work of a discussion post pre-screening.

Creating announcements

Use announcements when you have news to broadcast to the entire community of members. Think of announcements as discussion topics that are read-only, with no replies allowed. These new items display in the Announcements area of the Community portal and are delivered as emails to all community subscribers.

To create an announcement

1. Log on as a Community Administrator.
2. Open the community where you want to define an announcement.
3. Click Add an announcement.
4. Define the announcement.
5. Click Save.

Defining community membership and subscriptions

While all contacts (Full, Casual, and Public users) are members of your community (unless it was restricted), they do not receive content updates until they are subscribers. To get your community moving quickly, you can bulk-subscribe members to receive community content by selecting their iMIS contact records and adding them to the community participants.

To grant member-level access to a Community

1. Log on as a user who is a member of at least one Master Admin Content Authority Group or a member of the SysAdmin security role.
2. Open the community from the Communities list.
3. Click the Security link in the left-hand navigation area.
4. Select the Access Settings tab.
5. Select Make this available to and then click the Specific Users drop-down arrow.
6. Select Add user.
7. Find the user and click OK to add the member to the community.

To grant administrator-level access to a Community

1. Log on as a user who is a member of at least one Master Admin Content Authority Group or a member of the SysAdmin security role.
2. Open the community from the Communities list.
3. Click the Security link in the left-hand navigation area.
4. Select the Community Administrators tab.
5. Find the user.
6. Click Add to add a person as a community administrator.

To add subscribers to a community through the Participant List (Administrator)

Contact records are members of unsecured communities even if they have subscribed to only one discussion or to nothing at all in the community. However, when you add a contact to the Community Participants, you automatically make them subscribers to all updates from the community.

1. On the Community page, click the Participants link in the left-hand navigation area.

The Community Participant List appears.

2. Click Add.
3. Find the contact.
4. Select a name from the list or click the checkbox in the far left column to select all names in the page.
5. Click OK to add the selected members to the Community Participant list.

   All added members are subscribed to the community for notifications and participant list displays all the new additions.

   Tips for adding multiple contacts

- You gain multi-selection capability when you click Participants in the left-hand navigation. When subscribing people, you select one record at a time.
- You may want to modify the search query used to generate the list of results when adding contacts, so that you can select all members of a committee, or all constituents in a State or Province, for example.
- What users see may be modified by their privileges in the Access Settings for the Community. Refer to Preconfigured security sets Preconfigured security sets, for object-level access for information about preconfigured security sets. For example, you can choose one of the Authenticated Users security sets to require people to logon to the website before using a community.
- There are three types of community membership: member, subscriber, and administrator.
- A member has access to the community, but may or may not be subscribed to any notifications.
- A subscriber receives notifications and appears on the Community Participant List.
- An administrator has access to the community, gets notifications when someone reports a post or comment, and can delete posts or comments.

Creating a discussion

You create discussion to enable discussion on topics related to the community's interests. Only community administrators and SysAdmins can add discussions.

To create a discussion

1. Log on as Community Administrator and open the community from the Communities list.
2. Select Discussions and click Add discussion forum.

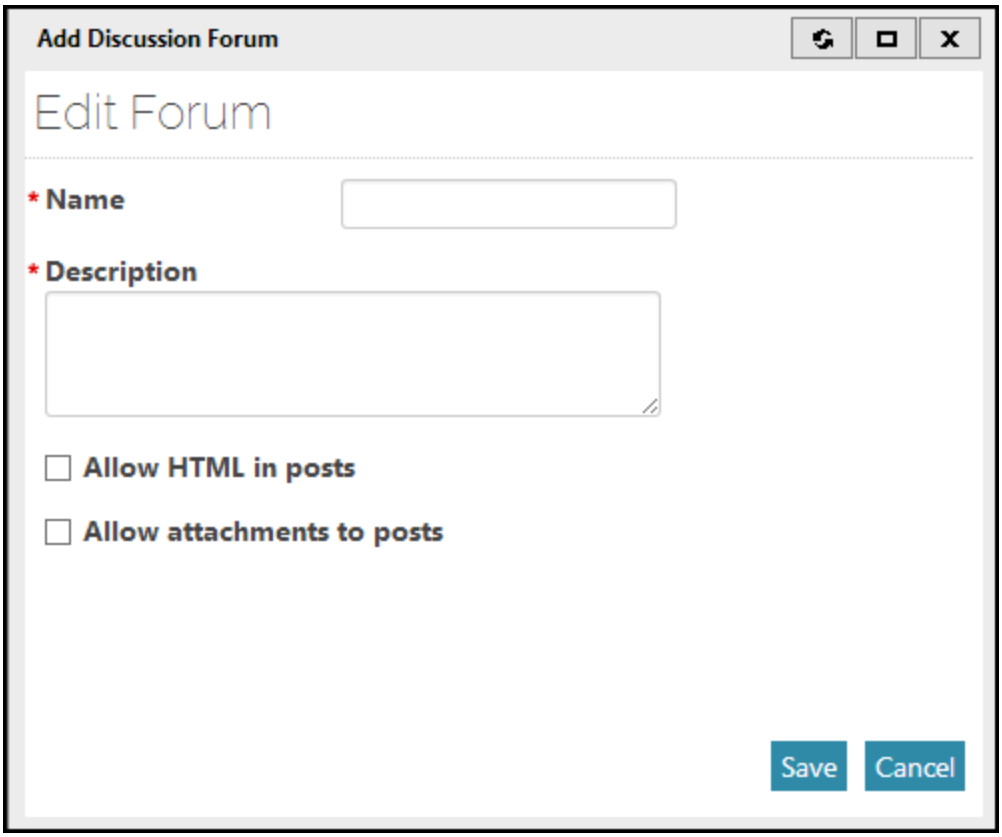
   If you do not see the Add a Discussion link, verify that you are an administrator on the community.
3. Define the discussion.

- Allow HTML in posts – Select this checkbox to enable the HTML editor so that discussion posts can have HTML in each. If this checkbox is cleared, you enter plain text when creating posts. When you enter a URL, iMIS automatically creates a link within the post, even if this selection is cleared.
- Allow attachments to posts – Select this checkbox to enable a poster to attach files separately to a discussion topic, such as a PDF document or an image.

4. Click Save.

Moderating a discussion

Serving as a moderator helps to distribute the load of monitoring the activity of your community's discussions and wikis. Moderators have privileges beyond those of regular community subscribers, including the ability to see who is subscribed to a specific discussion.



To verify your moderator status

1. Log into the site, select Communities, and open your community.
2. On the community Home page, locate the Community Participant List and look for your name.
3. If you do not appear as a Moderator or Administrator, have an administrator change your community role (under Security) so that you can proceed.

To view discussion subscribers

Moderators can see which members are subscribing to a given discussion. Seeing this list of participants allows moderators to evaluate the constituency (are these our experienced members or our newer ones? are any experts subscribed and contributing to the discussion?) and the success of the discussion (should I take action to get other members subscribed?). Monitoring discussion subscriptions helps you understand which topics are of most interest to members and where changes might be needed.

1. Open the discussion you are interested in by clicking on its title.
2. Locate the Subscribers box under the Recent Posts (usually at right).
3. Seeing the subscribers to a discussion in real time gives you valuable management information, but you can do more with those subscriber lists. Use the export commands (Word, Excel, Acrobat PDF, CSV data) as needed to capture the subscriber information for other uses:

- Snapshot the subscriber information over time, for activity analysis by community administrators
- Timestamp the export files, for easy management and future reference
- Share your archives of subscriber data, to help you hand off duties to the new volunteer discussion moderator
- Export the subscriber data for quick mail merges, badge printing, or other service tasks by Public users

To approve discussion postings

Being a moderator for a moderated discussion goes beyond deleting inappropriate content that gets posted: you are a gatekeeper that approves (or rejects) discussion posts before they ever show up on the discussion. Email notifications will alert you when there are new posts waiting for approval.

1. Study the content standards and the action policies of your community, which should specify what content should not be allowed to post and what to do about it.

   Tip: Policies are critical; fights over moderation can poison discussions. If these policies aren't published on the community for the members to follow, insist that your community administrators do so, to avoid future conflicts.
2. Subscribe to every discussion so that you get email notifications about new content publications.
3. When you get an email that a posting was published, click through the link in the email,

log on, and view the discussion.

4. Since new postings can trigger quick responses, scan for new replies.

5. When you find a posting needing approval, open it and scan the body of the posting for inappropriate content (according to your community's policies).
6. Select either approve or decline as appropriate.
7. While you are logged in, open any additional discussions you moderate.

   Tip: Select Home at left, and scan the summary view of the discussions for topics that are awaiting approval, and tend to those.

Adding moderators and wiki authors

If your organization cannot allow incorrect or inappropriate information making it into a discussion or wiki, even temporarily, you can apply discussion moderation and wiki authoring restrictions. Having done that, you should grant Community Moderator and Community Wiki Author roles to specific members to help develop and manage the content in those restricted areas.

To add moderators and wiki authors

1. Log on as an administrator.
2. Open the target community and select Security, at left.
3. Select the Community Moderators tab.
4. Use the Source box to find members (only those not subscribed to the community).

5. Select Add for each member who is joining the moderator role.
6. Important! Click Save before leaving the security tabs.
7. Repeat on the Community Wiki Authors tab, as needed.

To restrict a wiki to wiki authors

To limit authoring privileges on a wiki to a select group in your organization, you must

- edit the wiki and enable Restrict authoring to Wiki Authors
- add Wiki Authors to your community security (or else only administrators can change the wiki)

To enable discussion moderation

To prevent posts from appearing on discussions until they are approved, you must

- edit the community and enable Community discussions are moderated
- add Moderators to your community security (or else only administrators can approve posts)

See Enabling discussion moderation for best practices.

Removing inappropriate posts

Moderating community posts and comments is a job shared by all administrators of a community, to ensure speedy response to problems. Administrators get email notifications when posts and comments are reported as inappropriate, and they have the power to delete such content as needed.

To remove an inappropriate post or comment

1. When you receive an email indicating someone has reported a post or comment, read the content (which is copied into the email) for inappropriateness.
2. If the content seems inappropriate, click the link to go to it on the website, which opens in your default web browser.
3. Log on.

4. Click the edit link on the post and remove the offending portion, or click the delete link to remove the post entirely.

   If you cannot see the delete link, make sure that you are logged on as a moderator.

5. Confirm by clicking OK on the resulting dialog box.
6. If you deleted a post erroneously, contact an iMIS SysAdmin have it restored.

   To restore a post (SysAdmin)

   You restore deleted posts by reverting them in the Document System. Be aware that reverting a post reverts only the selected post; any comments on the post must be individually selected and reverted if you want to also revert comments on a deleted post.

1. Logged in as a SysAdmin, go to RiSE > Document System.
2. Click the Recycle Bin, and then select the post you want to restore.
3. Click Versions.
4. Select the post version that you want to restore.

   Note: If you see an error, the reported post might have been deleted by another administrator.

5. Click Revert.
6. Confirm by clicking OK.

Deleting a discussion, blog, or wiki

Delete community areas carefully: although you can restore content after deletion, it is not convenient.

For example, each blog entry is its own document available in the Document System. You see the blog, all of its entries, and all of the entries' comments as individual items in the Recycle Bin in Document System. By selecting the item and clicking Versions, you can then select the version that you want to restore and click Revert.

> **Note:** Note: Reverting one object does not revert its dependents: you must restore each object individually, by reverting to a previous version.

To delete a discussion, blog, or wiki (SysAdmin)

1. Log on as a user with a SysAdmin security role.
2. Click the delete link for the item you want to delete.
3. Click OK in the resulting dialog box.

Managing resource libraries

To upload resource library files (Administrator)

1. Log on as a user with Administrator privileges.
2. Open the community from the Communities list.
3. Under Resource Library, click New and then select the type of file you want to upload.
4. Select the file to upload and click Upload.

Tips

The following information can be helpful when managing document libraries.

- You create resource libraries or document attachment collections when you want to gather resources into one location for the community to have access to. Anyone can download files from the Resource Library but only administrators can use the Organize, New, Edit, and Versions menus.
- You can upload the configured file types to a document library as described in Managing attachments and uploads.
- A document library may contain policies, meeting minutes, or any document that does not fit a discussion, blog, or wiki content model.
- You can view the Description by selecting the file and then clicking Organize > Properties.

Troubleshooting

If people have trouble uploading files, check both the file type and the maximum file size. If you need to adjust the maximum file size limit, refer to Managing attachments and uploads for more information.

Communities Implementation

Implementing Communities for optimal use requires the actions of an iMIS SysAdmin. During implementation, SysAdmins can

- hide Communities during implementation and then roll it out, using Access Settings
- customize the email notification template
- manage community attachments and uploads
- assign community administrators to their respective communities, to take it from there

Getting started: community management

Community management refers to the process of defining, organizing, and moderating portals that contain a file repository, blogs, discussions, or collaborative workspaces like wikis. Community management comprises the following activities:

- Defining communities and their resource libraries, blogs, discussions, or wikis
- Defining community display, navigation, and structure
- Moderating membership and conversations
- Defining notifications
- Defining security and access
- Managing document attachments

Who depends on this?

Your community management activities must be completed before members can view or post to discussions, blogs, resource libraries, or wikis.

What must be done before you can start?

- You cannot perform some community management tasks until after a Community has been created in iMIS.

Putting it all together

Community management comprises two general workflows:

- The process of defining communities entails the following actions, which must be performed in the order shown:

1. Define a community. By default, a Community contains content items that enable addition of discussions, blogs, wikis, announcements, and items in a resource library.
2. Define the layout of the community's parts.
3. Define notifications for the community.
4. Manage the community participants and subscriptions.
5. (optional) Manage limitations and definitions for file attachments.

- The process of community maintenance entails the following actions, performed as needed:
- Manage security
- Moderate conversations
- Troubleshoot communities

Types of user privileges

There are three system-defined security groups that affect user privileges relevant to managing communities.

- Content Administrator: member of a MasterAdmin Content Authority Group (CAG).
- Community User: A user who views or contributes to or authors community documents such as blogs, libraries, or discussions, and may own a community document.

- Community Administrator: A user with the ability to set up communities and edit Community permissions. Belonging to this security group gives the user the ability to edit or delete community documents, regardless of the document's owner.

Understanding community permissions

The roles you assign to users control what they can do in blogs, wikis, and dicussions, as follows. Access settings are defined in the Community Security window.

> **Note:** Note: Granting a user, group or role ANY level of access to the community (even "Read") gives the user, group or role the ability to view the community and the ability to create posts and edit their own posts.

Hiding and showing Communities

Hiding Communities during testing and content development lets you make sure members don't use their communities before they are ready for roll out.

To hide/show Communities

1. Select RiSE > Site Builder > Manage sitemaps, and select your sitemap from the drop list.
2. Click the Community navigation item, scroll to Access Settings, enable Apply changes to all descendants, and select a new security set.

- Administrators Full Control lets you hide the tab while you implement Communities on the site.

- Authenticated Users Full Control lets you hide the tab until after members log in.
- Everyone Full Control lets the general public see the tab without logging in.

3. Save your work and Preview your changes.
4. Repeat this process for any other sites for which you want to change Community visibility.
5. Publish when ready.

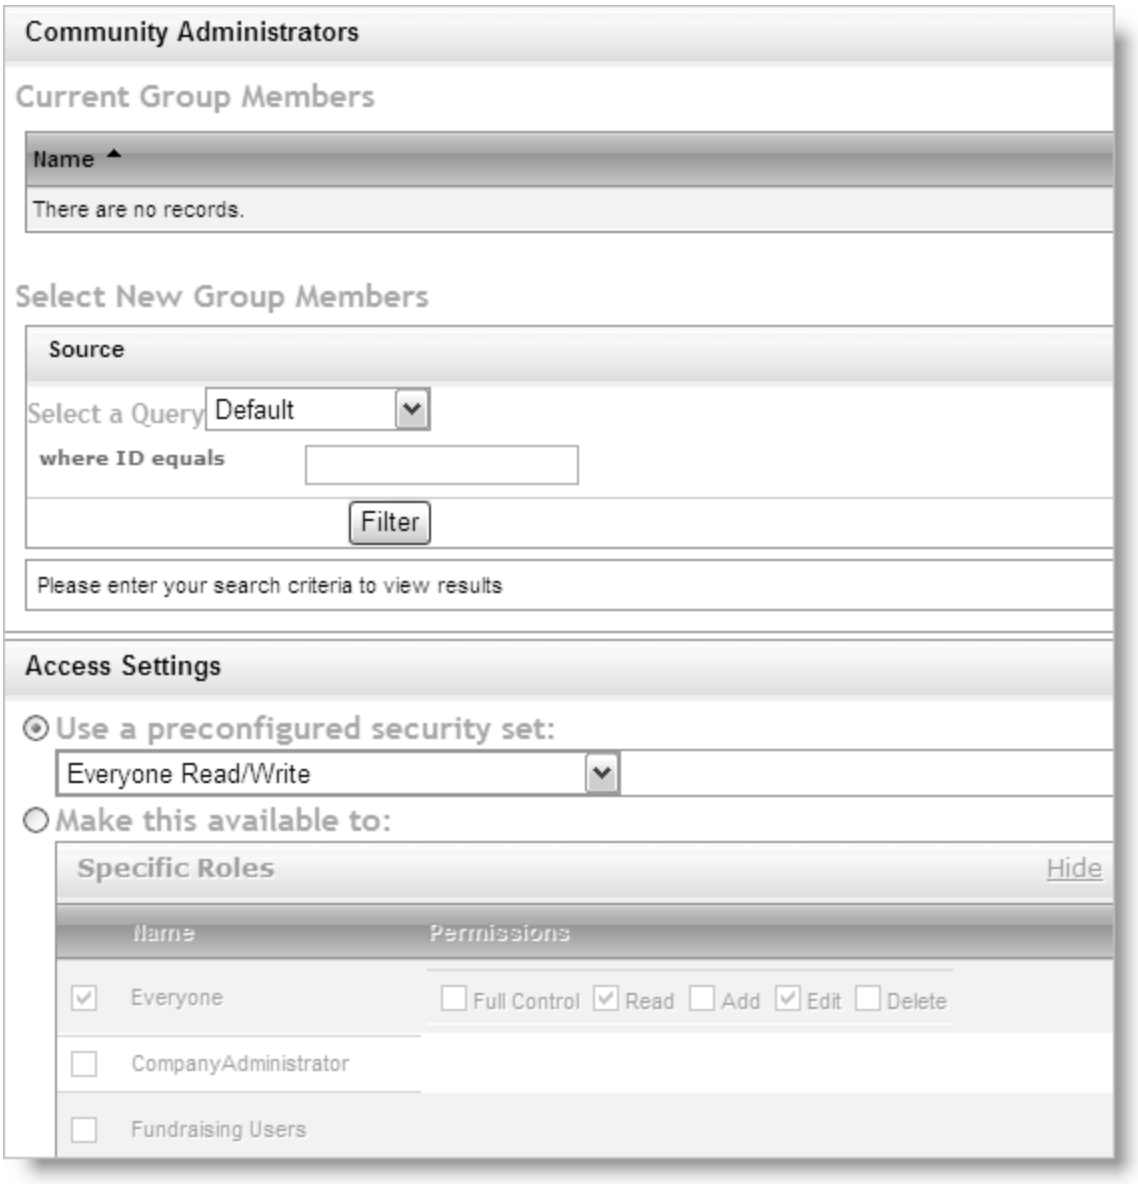
Tip:

- It is possible to mismatch access so that a subscriber cannot access the community. Be sure your Access Settings are compatible between the sitemap and the community's Security.
- The link to Communities displays in a secondary navigation area.

> **Note:** Note: Membership in the SysAdmin security role effectively grants the full set of Document System permissions and the full set of CAG permissions (you are effectively a member of a MasterAdmin CAG too). However, to participate in web content authoring workflow, even members of the SysAdmin role must be an explicitly-listed member of at least one CAG.

Community Security window

This window defines access settings to control access to the community plus indicates which members are community administrators.



Click a link to a specific community, and then click Security

Community Administrators

This area specifies selection of community administrators.

- Current Group Members – Lists the community administrators who have been added to the list. This list does not specifically display iMIS SysAdmin even though people with SysAdmin privileges appear on the community participant list as Administrators.

- Select New Group Members – Specifies the search criteria for adding new community administrators.

  Access Settings

  This area specifies the access settings to the community based either on a preconfigured security set or specific roles, groups, or users.

- Use a preconfigured security set – Specifies a set of permissions for accessing objects. Each security set contains a predefined access list and permissions (Full Control, Read, Add, Delete, Edit) that remain constant. Refer to Preconfigured security sets, for object-level access for information about preconfigured security sets.

- Make this available to – Specifies the Specific Roles, Specific Groups, or Specific Users that may have access to the community.

  > **Note:** Note: Granting a user, group or role ANY level of access to the community (even "Read") gives the user, group or role the ability to view the community and the ability to create posts and edit their own posts.

Defining email notifications

See the Public view setup section for help with the Email templates window and Sample email customization.

To define the email notification address

1. On the appserver, open each iMIS-related web.config file for editing. Its default location is asiPlatform\asiScheduler_iMIS.
2. Edit this line to change the from attribute on the smtp element to the email address you'd like notifications to come from, and ensure your smtp server is properly named in the host attribute:

   <mailSettings>

   <smtp deliveryMethod="network" from="myorg@myorg.com">

   <network host="smtp-server.myorg.local" port="25" defaultCredentials="true"/>

</smtp>

</mailSettings>

3. Save the web.config file.
4. In IIS Manager, restart AsiSchedulerPool.
5. Repeat this process for each iMIS appserver that hosts communities.

To define the email notification message

1. From the Desktop, select System Setup > Set up web components > Email Templates.
2. Change the default templates as you see fit. You can change the subject line, the body, and the footer of the notification email message. You can only change text that is not inside of square brackets.

   Note: Text inside of square brackets [ ] indicates a variable that changes with each message that is sent.
3. Click Save.
4. In IIS Manager, stop AsiSchedulerPool, then restart AsiSchedulerPool.
5. Restart IIS on the server (if your public website is installed on a separate web server) when you have made any modifications to the community notification email templates.

To configure email notifications with the Public view URL

> **Note:** Note: These instructions apply for the scenario where you want the links in email notifications to contain your Public view URL.

1. Log on as a user with the SysAdmin role.
2. Go to RiSE > Site Builder > Manage websites.
3. Create a new web site by clicking New > Website.
4. Enter a name for the Name/Title of this Website field, such as "CommunityNotifications."

   By default, the URL Name of this Website is populated with the same name.

5. Enter the URL of your public-facing website in the URL(s) pointing to the IIS website root field.

   Note: To ensure email notifications are sent, be sure the option The IIS website root (above) points to more than one CM website is NOT selected.

6. Under Site Look and Feel, choose public.master for the MasterPage/Template to use for the site's layout.
7. Select BlueWave for the Theme (colors, fonts, etc.) to use for the site's "look and feel."
8. Save the website.
9. Publish the website.
10. Edit the community and select the newly created and published website to be the Default Website (for notifications).
11. On the appserver, restart the ASIWorkflow20 service.

    Tips

- When a Community Administrator has not yet been selected, notification emails are sent to every user with the SysAdmin role.
- For community subscribers, notifications are sent when someone adds or updates a post (blog entry, discussion post, or wiki article) or comment on any of those items.
- By default, full text of the post or comment is included in the email message to subscribers.
- Any post included in the notification is marked as read by the subscriber.
- iMIS sends a message to the address specified in the web.config file as well as adds the designated email address to the from line because it only sends one e-mail per update and the blind carbon copy (BCC) line contains all of the recipients' email address. This design is more efficient for your mail server than sending out single email messages.

> **Note:** Note: If you are not receiving community email notifications, make sure that the URL(s) pointing to the IIS website root and Secure URL(s) pointing to the IIS website root fields (Manage websites > Properties tab) contain valid URLs for each of your websites. If you make any changes, be sure to restart the ASI Workflow Service.

Managing attachments and uploads

To configure the allowable file types

1. On the appserver, open each iMIS-related web.config file for editing.

- iMIS default location: C:\Program Files\ASI\iMIS\net

2. Edit this line to add or remove file types in the value attributes.

   <add key="Communities.AllowedUploadFileTypes" value-e="DOC,PDF,TXT,HTM,HTML,GIF,JPG,PNG,RTF,ZIP,XML"/>

3. Refer to the list of the allowable file types that are specified in the web.config file entry.
4. Save the web.config file.
5. Repeat this process for each iMIS appserver that hosts communities where you want to change the allowable file types.

AVI	Audio Visual Interleave
BMP	Microsoft device independent bitmap
DOC	Microsoft Word Document
EML	Outlook Express Electronic Mail
FLV	Flash Video File
GIF	GIF Image
HTM	HTML Page

HTML	HTML Page
JPE	JPEG Image
JPEG	JPEG Image
JPG	JPEG Image
MOV	QuickTime Movie
MP3	MP3 Audio
MPG	MPEG Movie
PDF	Adobe PDF File
PNG	PNG Image
PPT	Microsoft PowerPoint Presentation
RA	Real Audio File
RAM	Real Audio File
RPT	Crystal Report Template
RST	SSRS Template
RTF	RTF (Rich Text Format) File
TIF	TIFF Image
TIFF	TIFF Image
TXT	Text File
WAV	WAV Audio File
WMV	Windows Media File
WPD	Word Perfect Document
WRI	Windows Write Document
XLS	Microsoft Excel Workbook
XML	XML File
ZIP	Zip File

To increase maximum upload file size

If your typical uploaded file size in your Resource Library or blog entries for example are larger than 100 MB, you can increase the maximum file size in web.config files associated with iMIS.

1. On the appserver, open each iMIS-related web.config file for editing.

- iMIS default location: ~\ASI\iMIS\net

2. Locate the <httpRuntime> element and modify the maxRequestLength attribute.

   <httpRuntime executionTimeout="3600" maxRequestLength="10240" />

3. Locate the <requestfiltering> element and modify the maxAllowedContentLength attribute.

   <requestLimits maxAllowedContentLength="10485760" />

4. Save the web.config file.

5. Repeat this process for each iMIS appserver that hosts communities where you want greater file sizes for attachments.

   Note: If you plan to upload files larger than 10MB, you must increase both the maxRequestLength and maxAllowedContentLength values

   Tips

   The following information can be helpful when managing file types.

- The MPE file type is sometimes used for MPG Video, but that file type is already in use for Mail Process Engine in iMIS. Rename .mpe files to .mpg in order to upload them to Communities.
- When a user attaches an XML file to a post and another user downloads it, the default file-opening behavior varies depending on the browser. In Internet Explorer, the XML file may take over the iMIS session, forcing the user to reconnect to the community through another browser window.

  Troubleshooting

In order to prevent denial of service attacks, if a user tries to upload a file that is greater in size than the maximum allowed for uploads, the Upload dialog box displays an error. If users report that the Upload dialog box displays an error, check to see if their file exceeds the file size limit.

Be aware that increasing that value could result in a performance penalty on the web-server if the files being uploaded are too large for the server resources available such as available memory and CPU.

Communities Design

You have an advanced set of capabilities available to you, to support the communication and collaboration needs of the groups in your organization. You can

- redesign the layout of your communities (through its templates and themes)
- move and edit community content items
- put community content items into other web pages

Community display

A community content record defines the layout of a community's home page. Default community layouts are provided, but you can move the content items on the page and save the modified version to the Shared Content folder.

> **Note:** Note: The Community Home page is the only editable Community page. Though Easy Edit provides the ability to edit and Save As for any Community page, the updated versions will not be used in iMIS.

Administrators can always view the Communities list, but you will want to allow non-Administrator users to view the Communities once the display is to your liking.

If you want change the look and feel of a community page, you can do so by:

- Editing the website's definition and selecting different master pages and themes.
- Modifying the selected theme (which affects all websites that share it).

- Reorganizing dynamic content items on an existing or new Community layout.

  Community layouts

  Four content records with different layouts for your community content items are provided by default.

- The Community layout provides one of each type of Community content item in a TwoColumns50-50 layout.
- The Community Description layout has two content items – one is an "About" content item that displays the Long Description from the community definition, the second is a Recent Activity content item that displays recent posts and comments.
- The Community Newsfeed layout has three content items – one is an "Announcements" summary content item, the second is a Recent Activity content item that displays recent posts and comments, and the third is a listing of Blogs being used by the community.
- The Community Post Summary layout displays a Recent Activity content item that displays recent posts and comments, an Announcements content item in a SingleColumn layout, and a Community Roster content item in a TwoColumns50-50 layout.

  Content records and content items

  A content record is an iMIS definition object which is stored in the Document System. These records specify all the information needed to render a web page. Instead of hand-coding the contents of a web page for your website, you define some basic properties and tags for the content record, choose a content layout, add various content items to the content item zones in the layout, and then define the properties for each content item. After the content record has been published to an .aspx file on the website, it is available for viewing by web browsers as a complete web page.

  A content item is a web widget in the ASP.NET environment. As with any web widget, you choose from different types of content items to insert in the various content item zones in the content layout, then you configure each content item to populate that instance of it with the desired content. You can easily rearrange the rendered page contents by dragging a content item to a different location within the content item zones. A standard set of

system-defined content items are available in iMIS, but staff or consultants who are experienced in ASP.NET development can also easily add new content items for use when authoring content.

- The standard content items supplied in the Content Gallery all have a corresponding content type, which tells iMIS how to create the corresponding content item within the system, how to edit it, how to display it, how to publish it, and so on.
- New complex content items that you add to your iMIS environment are also listed in the Content Gallery and must also have corresponding content types.
- A special ASI-supplied ContentWebUserControl content type is used as a generic default content type for all simple content items, or for ad-hoc web user controls that have been manually added to a content record.

To see the Communities Content Gallery, you need a COMMUNITIES license.

Defining the display of a community

To upload a graphic or image for the community

1. Log on as a user who is a member of at least one Master Admin CAG or a member of the SysAdmin security role.
2. There are two methods for opening a Community for editing:
   - Select Community > Moderate communities and select edit.
   - On the Community page, click Edit in the left-hand navigation area.
3. Next to Graphic, click Select image.
4. Select an existing image or upload a file and click Insert.

To choose a community layout

1. Log on as a user who is a member of at least one Master Admin CAG or a member of the SysAdmin security role.
2. There are two methods for opening a Community for editing:

- Select Community > Moderate communities and select edit.
- On the Community page, click Edit in the left-hand navigation area.

3. Next to Community Layout, click select.

   The Document System opens to the CommunityLayouts folder (@/Core Content/ Communities folder).

4. Select from one of four community layouts, or create your own content record with Community content items, place it in the folder, and select it.

- The Community layout provides one of each type of Community content item in a TwoColumns50-50 layout.
- The Community Description layout has two content items – one is an "About" content item that displays the Long Description from the community definition, the second is a Recent Activity content item that displays recent posts and comments.
- The Community Newsfeed layout has three content items – one is an "Announcements" summary content item, the second is a Recent Activity content item that displays recent posts and comments, and the third is a listing of Blogs being used by the community.
- The Community Post Summary layout displays a Recent Activity content item that displays recent posts and comments, an Announcements content item in a SingleColumn layout, and a Community Roster content item in a TwoColumns50-50 layout.

5. Save the community with the new layout.
6. To view the community with the new layout, click the link to the community.

   To prepare to modify a community layout

   Since the default Community layouts (@/Core Content/Communities/Community Layout) cannot be modified in their default location, you must create a place to store community layouts (@/Shared Content/Community Layout).

1. From the Staff site, Go to RiSE > Page Builder > Manage content:

2. Select the Shared Content folder in the Content Folders area.
3. Choose New > Website Content Folder.

   The Content Designer will open.
4. Enter Community Layouts for in the Title field.

   A value will auto-populate in the Folder Name field.
5. Save.

   To reposition a content item on a community

1. Go to the community page.
2. Enable the Edit feature: click the Edit icon on the top right corner.
3. Click the Content Record icon that represents the Communities content record, typically in the upper right hand corner of the record. The Content Record window opens .
4. Click the blue bar of the content item and drag it to another location in the content record. An insertion bar indicates where you are inserting the content item.
5. Release the mouse button to "drop" the content item. The content item relocates to the place where the insertion bar displays.
6. If you want to remove a content item completely, click the downward-facing triangle at the far right of the content item's title bar, then choose Remove.
7. Save the content record:

   Note: If you haven’t previously saved this Community Layout to @/Shared Content/Community Layouts, select Save As to save a copy of the content record to that folder.
8. Publish the content record. When you click the link to the community page, your rearranged content items display.

   To style the Communities tab

You may modify the CSS to change the style of the Community page and its content items. You can create your own theme, or modify the CSS files located here: C:\Program Files\ASI\iMIS\net\App_Themes\.

Tips

- The arrangement and relationships of the community parts to each other and to the website as a whole are important aspects of how the website users will navigate and how your website content is structured.
- Privileges determine what users see, and can be modified.
- Only administrators have access to the management of the image associated with a wiki.

Troubleshooting

- If you decide you want to reverse your changes, you can do so. Every time you publish a content record, the previously published version is saved as an Archived version. You can revert to an older archived version by selecting the content record, and then from the toolbar choose Versions. In the resulting window, select an archived version and click Revert.
- Modifications to your master pages may be required if content items appear to overflow the boundaries of content item zones in the rendered pages. In general, this requires modifying the template's master page and accompanying CSS files to make the Home page and interior page layouts larger than their default size.

Community content items

Content Gallery Communities folder

This window lists the available content items used to build community web pages.

Tips

- To see the Communities gallery, you need a COMMUNITIES license.
- To create a link to a content record, use a ContentReference content item from the Content Gallery.

- Announcement Configuration – The edit screen for the Announcements discussion
- Announcements – Displays the list of announcements for a given community
- Attachment List – The rendered list of attachments for a given item
- Attachment Manager – Allows controlling the list of attachments for a given item
- Blog Archive – A list of blog archive links by month and year
- Blog Archive Entries – A list of blog entries belonging to a particular archive set
- Blog Configuration – The edit screen for blogs
- Blog Home – The "home view" of an individual blog. By default, this 2-column view includes recent activity and archives to the right.
- Blog List – A list of blogs for a given community
- Blog List Item – A single blog in a blog listing
- Comment Configuration – The edit screen for comments
- Comment List – A list of comments for a given item
- Comment List Item – A single comment in a comment listing
- Community Breadcrumb – Displays the path to the current object as a breadcrumb
- Community Configuration – The edit screen for a Community
- Community Description – Displays the full description for a Community
- Community List – The list of all available Communities
- Community Recent Activity – Displays recent activity of all types for the entire community, such as new replies on discussion topics, new blog entries, and new wiki articles.
- Community Roster – Displays the list of all members (subscribers and administrators) of a community.
- Community Sidebar Helper – Helper control that inserts the Community Summary into the template's sidebar.

- Community Summary – Displays the item's linked name, image, description, and relevant links.
- Discussion Forum Configuration – The edit screen for a discussion
- Discussion Forum Home – The "home view" for a discussion. By default, this 2-column view includes recent activity to the right.
- Discussion Forum List – The list of discussions for a given community
- Discussion Forum List Item – A single discussion in a discussion listing
- Entry Configuration – The edit screen for blog entries
- Entry Home – The "home view" of an individual blog entry. By default, this 1-column view includes the complete comment thread for the entry.
- Entry List – A list of entries for a given blog
- Entry List Item – A single entry in an entry listing
- Image Manager – Image manager for a community
- Preferences – Manages a user's community preferences and subscriptions
- Recent Activity – Displays a recent activity in an individual blog or discussion in a particular community.
- Resource Library – Displays the Community Resource Library

  Note: This content item is keyboard accessible in our currently supported Internet Explorer browsers. If your organization is seeking full WCAG compliance, it is recommended to limit the content item to use in Internet Explorer browsers only.
- Security – Manages a community's security.
- Subscribers list– Lists subscribers to the current object.
- Subscription Link – Allows a user to subscribe to or unsubscribe from a given item.
- Topic Configuration – The edit screen for a discussion topic.

- Topic Home – The "home view" for a discussion topic. By default, this 1-column view includes the complete reply thread for the topic.
- Topic List – A list of topics for a given discussion
- Topic List Item – A single topic in a topic listing
- Wiki Configuration – The edit screen for a wiki
- Wiki Contents – The Table of Contents list for a given wiki
- Wiki Home – The "home view" of a wiki. By default, this 2-column view includes a table of contents to the right.
- Wiki List – The list of wikis for a given community
- Wiki List Item – A single wiki in a wiki listing

> **Note:** Note: For configuration options and more information about these content items, see iMIS Dynamic Content Items, and locate your desired content item.

Or, enter a path to a web user control

Specifies a relative URL from the root (~) of the physical path for the IIS application or IIS web site that hosts your CM websites to a web user control that you want to insert into this content record. By default, the root corresponds to C:\Program Files\ASI\iMIS\Net. For example, ~/CustomControls/myUserControl.aspx.

> **Note:** Note: Be sure to use forward slashes (/) for the URL segment delimiters.

Including a Community content item on a web page

1. Log on as a user who is a member of at least one Master Admin Content Authority Group or a member of the SysAdmin security role.
2. Create a community and a discussion, blog, resource library, announcement, or wiki that you want to include in another web page.

3. Using a web browser, navigate to the community item that you want to include in another web page.
4. On the web address for the page you want to include, find the iUniformKey=, a string of 36 characters and numbers.
5. Open the content record where you want to include the Community content item. There are two methods for opening a content record for editing:

- In the Definition section of a content record, click add content, then select the Content Gallery and add one of the listed content items to the content record. (Alternatively, for an existing content item, click the down triangle at the far right of the content item's title bar, then choose Configure.)
- When using the Edit, click the Edit icon that relates to various content items in the content records used in the content areas of the page. You must be logged on to the website and have Content Editor permissions in at least one content authority group (CAG).

6. Click add content.
7. Select a content item in the Communities folder, such as Blog List.
8. Enter a name for the new content.
9. Under Community Item Key, enter the iUniformKey you copied from the URL as specified below.
10. Save the content record.
11. Publish the content record.

To locate the Community Item Key

1. Using a browser, navigate to the community item listed in the table below.
2. Copy the 36-character iUniformKey= string from the web address.

Note: Note: If you cannot right-click to see Properties on a link, edit the web.config file for the website. Search for Browser.DisableContextMenu and change the value from "true" to "false."

To get key for:	Copy iUniformKey from:
Community	web address for the Community home page
Announcements discussion	On community home page, right-click the "Configure" link in the Announcements section to view Properties.
Discussion	web address for the discussion home page
Discussion Topic	web address for the topic home page
Discussion Topic Reply	on a reply, right-click the "report" link to view Properties
Blog	web address for the blog's home page
Blog Entry	web address for the blog entry's page
Blog Entry Reply	on a reply, right-click the "report" link to view Properties
Wiki	web address for the wiki home page
Wiki Article	on an article, right-click the "report" link to view Properties

Understanding Marketing Suite

iMIS Marketing Suite gives your organization the flexibility to support any marketing need, from basic to complex. The Marketing Suite helps you manage:

- Fundraising campaigns, such as donor activation, reactivation, and/or renewal
- Membership campaigns, such as membership recruitment, reactivation, and/or retention
- Events and conferences
- Lead generation projects
- Publications marketing
- Public awareness campaigns
- Legislative action initiatives

With the Marketing Suite, you can define and manage a coordinated series of marketing tactics, manage the responses, and analyze the results. Use the Marketing Suite to:

- Plan and create campaigns that follow your organization's goals and requirements
- Match the message to the target
- Simplify campaign execution
- Link packages to customer segments
- Automate response follow-up tasks and move contacts to the appropriate stage in a multi-stage campaign
- Track budgets at a high level or at a detailed level
- Use analysis tools to monitor campaign success at each level

The Marketing Suite offers three areas that can work together to help you achieve your marketing objectives:

- Campaign Management – Plan, create, and track single or multiple campaigns
- Segmentation – Segment contacts and prospects according to demographic and behavioral patterns
- RFM Analytics – Rank a contact's past transactions with your organization

You can use Campaign Management alone or you can use the three solutions together to take advantage of data analytics and advanced segmentation capabilities. This will help your organization target the efforts in the most cost-effective and customer-focused manner.

Campaign Management

Use Campaign Management to plan, create, and track your marketing campaigns. You can manage basic campaigns with a single customer mailing or complex campaigns with multiple appeals and solicitations.

Depending on your organization's needs, you can choose to:

- Define campaigns and categorize them by type
- Define specific goals and measure campaign performance against those goals
- Communicate with targeted prospects through a series of personalized solicitations
- Track and analyze responses

Campaign Management hierarchy

Campaign Management uses a four-tier campaign structure, so you can plan actions and monitor results to the detail level you need. A default hierarchy is supplied with the system. However, you can rename the hierarchy to reflect your organization's or industry's terminology.

Campaign Management tiers

Campaign

A strategy to accomplish a single marketing goal, such as a membership drive, a fundraising campaign, an annual convention, or a legislative initiative. Campaigns are the highest level of measurement and are typically project-driven.

Appeal

Each major marketing effort of a campaign, usually associated with a drop date. An appeal can be:

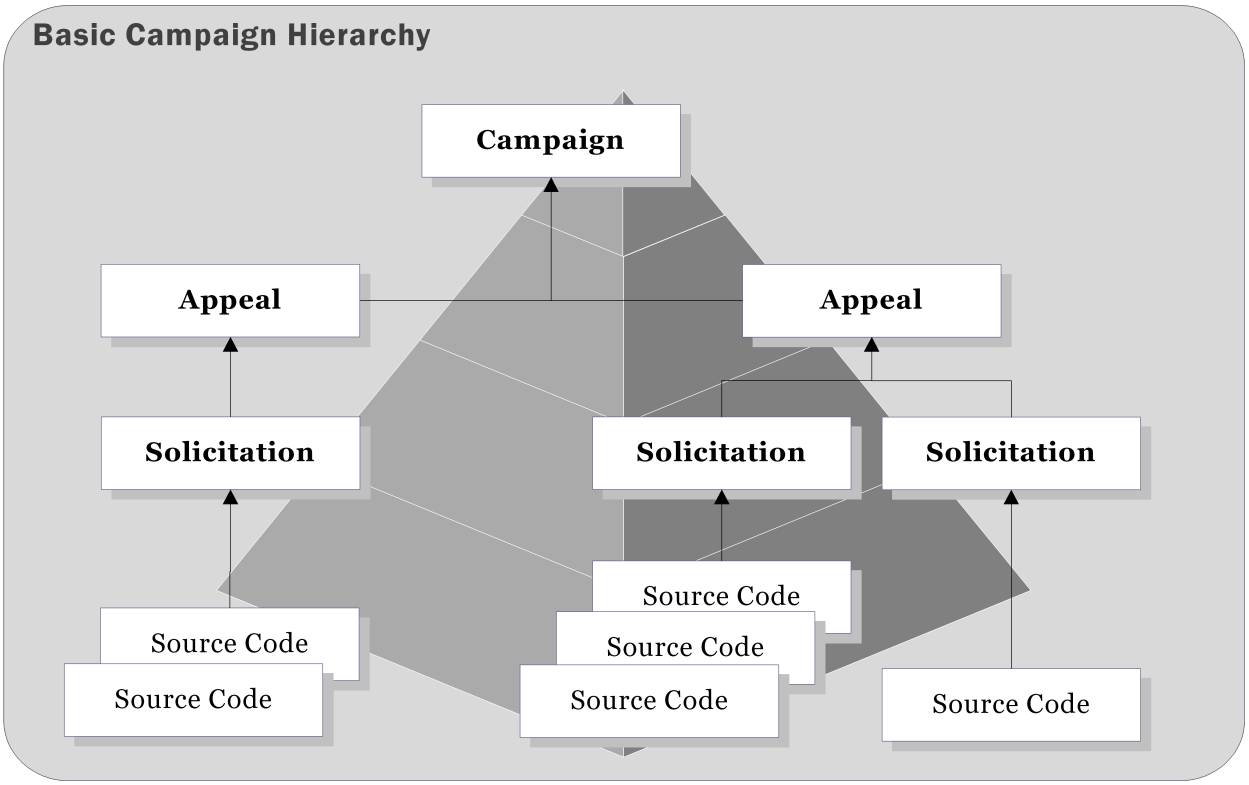
- A phase of the project, such as "First Request" or "Airwaves Blitz"
- A portion of the campaign targeted to a specific group of contacts or prospects
- A portion of the campaign assigned to an internal group (generating mailing lists, designing artwork, managing responses)

Solicitation

A series of communication pieces for an appeal. For example, a "First Request" appeal might direct different messages to previous donors/customers than to prospects.

Source codes

Numbers assigned to each communication piece to track responses. These numbers are associated with reply devices (postcard, website checkbox) so your organization can measure the effectiveness of each solicitation. Source codes are the most granular level of measurement.



Default campaign hierarchy

Basic and complex campaigns

Generally, basic campaigns are sufficient for small events, simple marketing campaigns, limited public awareness campaigns, and similar goals. For the purposes of this discussion, basic campaigns:

- Contain few appeals and related solicitations
- Probably use only one or two source codes per appeal

More complex campaigns require efficient management and tracking of multiple, multi-tiered campaigns. For the purposes of this discussion, complex campaigns:

- Contain many appeals and related solicitations
- Use many source codes
- Often build on the targeting and analytical data generated by Segmentation and RFM Analytics

Segmentation

Use Segmentation with Campaign Management to group contacts and prospects into targeted audiences. With Segmentation, you can:

- Create targeted contact and prospect lists according to demographic and behavioral patterns or other include/exclude criteria
- Split segments into multiple lists and prioritize the segments
- Eliminate duplicates in lists
- Create n-select or random select segments for message or delivery testing
- Get counts for communications collateral before production
- Assign unique source codes to segments to effectively analyze an effort's success

RFM Analytics

Research proves that a contact's past transactions with an organization indicate the likelihood of future responses. The more money a contact spends with an organization and the greater the frequency of the transactions, the more likely the contact will respond to future campaigns.

Use RFM Analytics with Segmentation to rank and organize your contacts and prospects into specific groups according to the relative recency, frequency, and monetary value (RFM) scores of their transactions. RFM Analytics gives you the ability to:

- Rank and organize your contacts into specific groups
- Record a contact's first, last, and highest transaction amounts and the dates of the first and last communication

- Generate segments that divide the population into categories based on RFM criteria
- Create groups, such as quintiles, that reflect the relative ranking of customers according to all RFM measurements

All statistics can be calculated for the source code, solicitation, appeal and/or campaign to provide the amount of summarization your organization requires. The available statistics include:

- Response rate
- Average, highest, and lowest transaction amount
- Dates of first response and last response
- Costs (actual cost, cost per thousand, estimated cost, overhead cost, total cost)
- Revenue (total revenue, net revenue, revenue per thousand, ROI)

Communications and reporting

iMIS communications tools help you to efficiently build customized messages for your contacts and prospects. You can gain valuable information about the effectiveness of your campaign with reports about the campaign or a portion of the campaign. These messages and reports can be generated at any level of a campaign.

Default templates for messages and reports are provided and are easily tailored to your organization's specific needs. In addition, the following communications tools give you the power to construct custom communications pieces:

- MS Word merge
- Email merge
- Crystal Reports
- Broadcast fax

Many iMIS communications features help you perform efficiently:

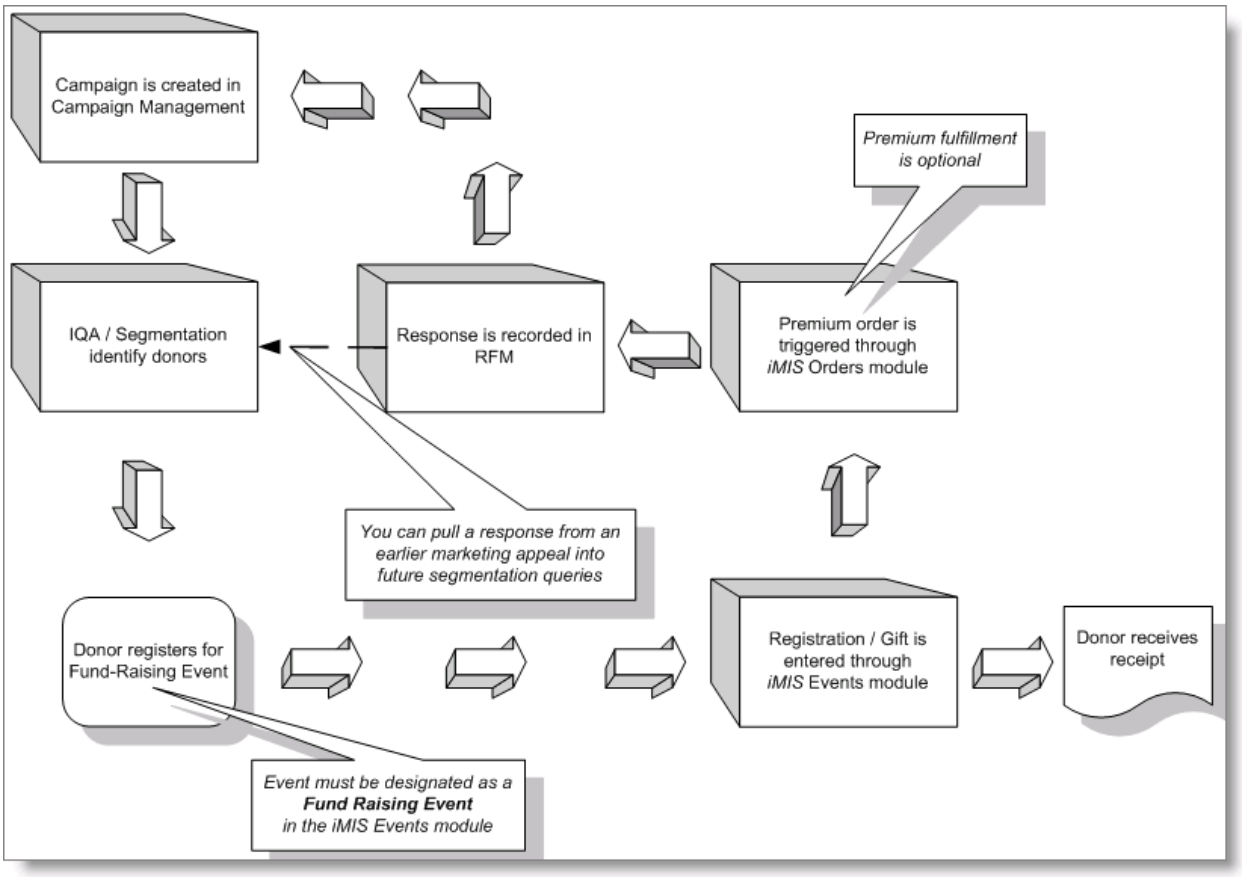
- Use saved report selections from other iMIS functionality for merge lists
- Preview merged messages and edit them before sending
- Combine email merge and fax merge into one mass mailing with timed delivery
- Combine multiple queries into one mailing
- Send merged event confirmations for a single event or for all events
- Export source lists to external vendors, fulfillment providers, or listservs
- Reprint event confirmations as needed
- Send updates to the activity history display
- Collect email bounce-backs
- Ensure that broadcast email messages are not blocked as spam
- Generate projects based on complex business rules or in response to a campaign

Marketing Suite integration across iMIS

The most powerful feature of Marketing Suite is its integration throughout the iMIS system. If you choose, you can:

- Designate appropriate orders and donations as responses to the campaign
- Send personalized acknowledgements to the contact via their preferred method of communication
- Use responses to previous solicitations for future targeting and list segmentation

The following diagram illustrates the advanced integration that is possible between Campaign Management and other iMIS features.



Example of Marketing Suite interaction throughout iMIS

Setting up Marketing Suite

Licensing and installing

Follow standard iMIS procedures for licensing and installing Campaign Management.

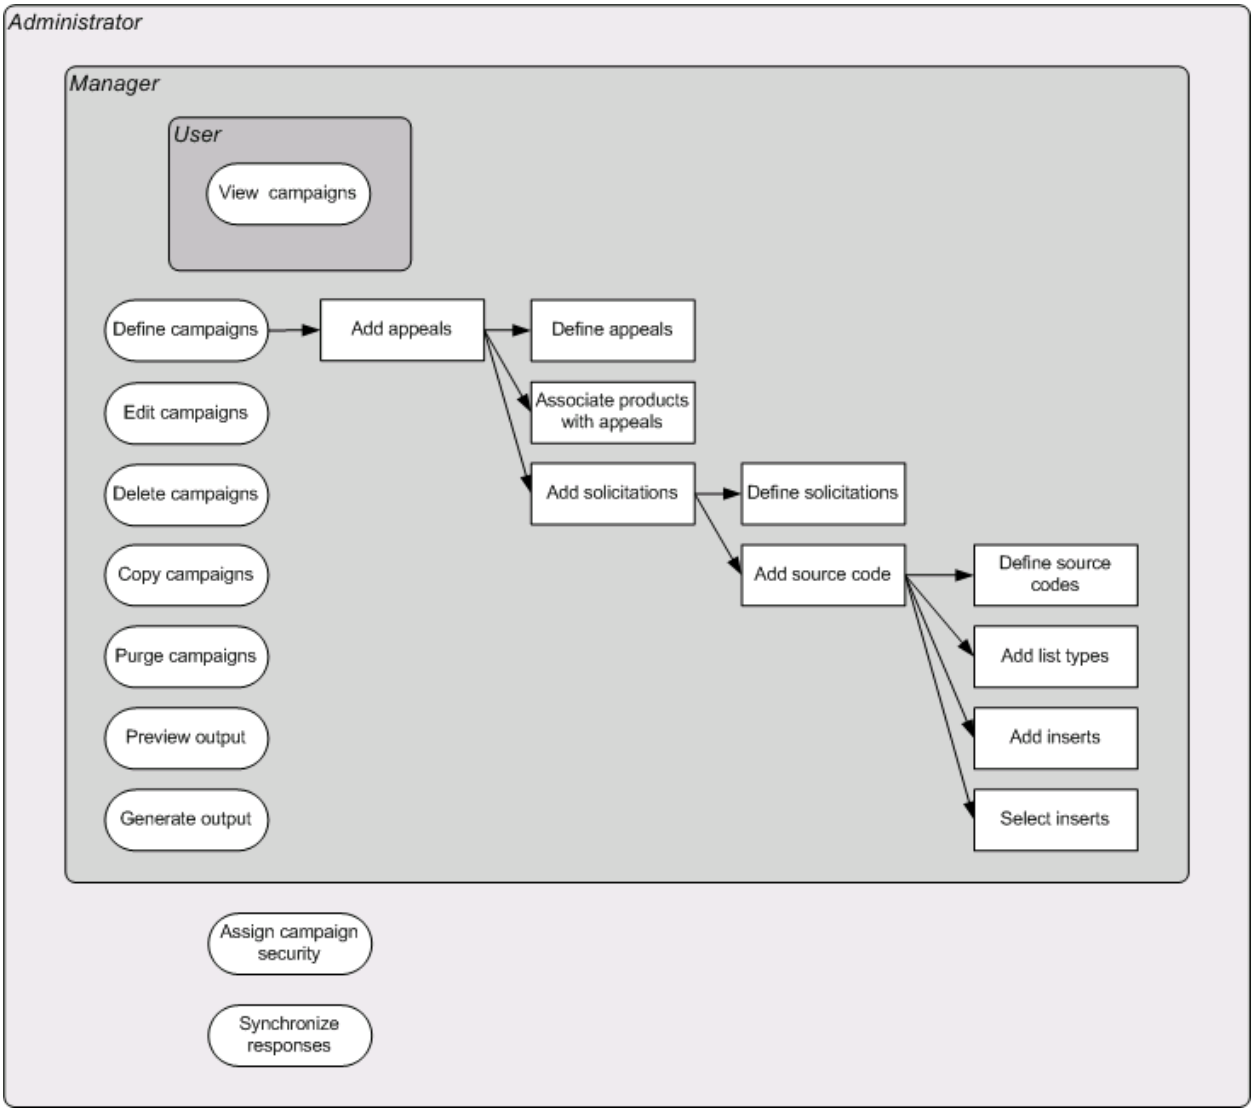
After installation, you must synchronize responses before other setup tasks. This initializes the database to recognize new product sales only so that the response reporting does not include previous sales.

Setting up security groups for campaigns

Security groups specify levels of access and control for users. Each user must have a record in the database before you can add them to a security group.

Campaign Management security groups

- CampaignAdmin: Has full control access for all campaigns.
- CampaignMgr: Has read, add, edit, and delete access for the module and read and edit access for all campaigns.
- CampaignUser: Has read-only access for campaigns.



Campaign tasks by security group

Segmentation security groups

- SegAdmin: Has full control access for all segment setup and segmentation jobs.
- SegMgr: Has read, add, edit, and delete access for all segments and jobs.

- SegUser: Has read-only access for segmentation jobs.

  RFM Analytics security groups

- RFMAdmin: Has full control access for RFM Analysis setup and processes.
- RFMMgr: Has read, add, edit, and delete access for all analysis and reports.
- RFMUser: Has read-only access for reports.

  To add users to security groups

1. From Marketing, select Set up campaign module > Security Groups tab, or Set up segmentation, or Set up RFM.
2. Select a security group.
3. Under Select New Members, search for and select the additional users.
4. Click Save.

Setting up reports and output processes

iMIS communications tools give you the power to optimize communications within your organization and with outside contacts. By using templates and pre-built reports, your staff can be productive immediately. They can generate reports and email messages, send Microsoft Word letters, and export data to Excel spreadsheets or other analysis tools without detailed knowledge of database structure or report configuration. See Communications and reporting for more information.

Setting up Campaign Management

Set up Campaign Management according to the method your organization uses to track and process data. These options apply to all campaigns. Use the Business Object Designer to track additional information that is important to your organization's marketing success.

Source code ID mode

This setting determines whether source codes will be generated manually or automatically.

- Manually – When enabled, the Manually-Assigned option governs the Set up module page's Source Code Name Format field and the source code Definition tab's Code field:
- The Source Code Name Format field is disabled.
- The Code field is editable until the source code is saved; once saved, the Code field cannot be edited.
- The Code field is blank when first creating a source code.
- You must enter a unique value in the Code field to save a source code.
- Automatically – When enabled, the Auto-Assigned option governs the Set up module page's Source Code Name Format field and the source code Definition tab's Code field:
- The Source Code Name Format field is enabled.
- The Code field is read-only.
- The Code field populates automatically with a unique value when saving a source code.

Tracking costs

You can track campaign costs by appeal or by source code.

Tracking by appeal – If the budget and costs are tracked at the appeal level:

- Total costs display at the campaign and appeal levels only.
- Users can view the Total Cost, Target Revenue, Predicted Response Rate, and ROI for a campaign.
- Users can enter and edit the Overhead Cost, Target Revenue, and Predicted Response Rate for an appeal.
- Users cannot view or edit costs for a solicitation or source code.
- Users can enter costs for an insert, but these costs are ignored in the campaign and appeal cost calculations.

Tracking by source code – If the budget and costs are tracked at the source code level:

- Users can view the Total Cost (estimated or actual), Target Revenue, Predicted Response Rate, and ROI for a campaign, appeal, or solicitation.
- Users can edit the Overhead Cost, Target Revenue, and Predicted Response Rate for a source code.
- Users can view the Total Cost (estimated or actual) for a source code.
- Users can enter costs for inserts, which are used for cost calculations.
- The Summary tab for a campaign, appeal, solicitation, and source code display Estimated Cost until output is generated. After generating output, Actual Cost displays. (For a campaign, appeal, or solicitation, the Summary tab displays the Actual Cost if output has been generated for any child source codes; otherwise, Estimated Cost displays.)
- The Calculate Estimated Costs button displays on the campaign, appeal, solicitation, and source code portfolio pages.

About auto-map source codes when retrieving responses

If selected, this setting automatically maps source codes to orders, gifts, and pledges if a source code is not provided when synchronizing responses. The source code is obtained from iMIS Events, Orders, or Fundraising.

If the setting is not selected, iMIS does not recognize responses if an order, gift, or pledge does not have an associated source code.

> **Note:** Note: This feature applies only if one or more products are associated with an appeal.

To set Campaign Management options

1. From Community, select Manage marketing campaigns > Set up campaign module > Options tab.
2. Enable the desired options:

- Choose the Source Code ID Mode: Manually-Assigned or Auto-Assigned.
- If Auto-Assigned is enabled, enter the Source Code Name Format.
- Choose the Budget Level: Appeal or Source Code.
- Check to select Auto-map source codes when retrieving responses.

3. (optional) Enter the Opt Out URL and the Opt Out Key which can be used when editing an email template (see "Defining output processes") for customers who want to be removed from a mailing list.
4. Click Save.

Understanding opt-out configuration

Sometimes people want to be removed from a campaign mailing list. This action is called opting out. Campaign managers want to know the number of people who opt out of a campaign and which source code is related to the opt-out action.

Understanding the tracking of opt-outs helps you analyze the campaign's effectiveness. Opt-outs are tracked from the originating source code so that your campaign manager knows the source code that caused the opt-out action.

Two settings and inserting code into an email template control the opt out configuration:

Go to Community > Manage marketing campaigns > Set up campaign module:

- Opt Out Url field points to a special opt out page, such as http://www.-domainname.org/iMIS/OptOut.aspx. When the person clicks on the link in the email containing the Opt Out code, they are taken to this page. The page can contain instructions for choosing to be removed from the list, or request further information for why the message caused the email recipient to choose to be removed.
- Opt Out Key field contains %OPTOUTURL% by default. This field contains the code that you insert into the email template in the HTML code. You could change it to %REMOVEME% or another variable name, but you must be sure to change the code in the email templates that use the Opt Out Key in them.

When you create an email merge template, use HTML, not plain text, and use %OPTOUTURL% for the URL for the link. For example, add the text, "If you want to be removed from our campaign, click here." Highlight "click here" and insert a link. Enter %OPTOUTURL% as the URL and choose Other as the Type.

Using this email merge, generate output from a source code. The email messages are generated and sent.

When an email recipient clicks the "click here" link in the campaign email, they go to the URL for the Opt Out Url page configured in the Staff site (Community > Manage marketing campaigns > Set up campaign module).

If you have more than one source code in one campaign that solicits the same prospect, opting-out for any one source code should opt-out all source codes in the campaign that have solicited that prospect. In addition, iMIS discontinues all further campaign appeals, solicitations, and source codes for that prospect, even those that are created after the opt-out. In short, any future lists automatically exclude that contact from being selected again.

For example, when you look at the Record Responses area and look up an ID, you see every source code the person with that ID is being solicited for. If a member is solicited by two different source codes within the same campaign, they are shown as opted-out of both campaigns.

Solicited and unsolicited responses

The definition of a solicited response is twofold. One definition is an order (product, event, fundraising) or opportunity that has a source code associated with it and the primary contact (or BT_ID) has been solicited for the source code. The other definition is associated with an order that contains no source code but does contain a product that is associated with an appeal and the primary contact (BT_ID) has been solicited for a source code within the appeal. For the second definition to be recognized as a response, automatic source code mapping must be enabled. Opportunities that do not reference a source code are not calculated as a response.

The definition of an unsolicited response is also twofold. One definition is an order (product, event, fundraising) that has a source code associated with it and the primary contact (BT_ID) was not solicited for the course code. The second definition is an order that contains no source code but does contain a product that is associated with an appeal, but the primary contact (BT_ID) has not been solicited for any source codes within the appeal. For the second definition to be recognized as a response, automatic mapping of source codes must be enabled. Auto-mapping of unsolicited responses is not a perfect implementation.

The begin and end dates of the source code, solicitation, appeal, and campaign are ignored when recognizing responses for both explicit or indirect responses. This design means that an order generated past the campaign end date still generates a response to the campaign.

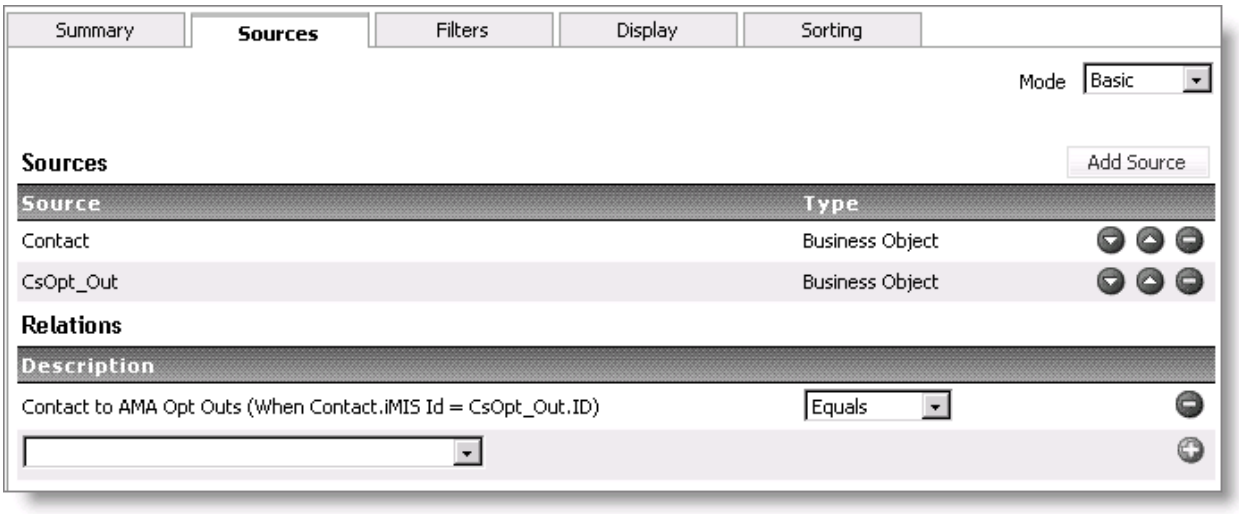
Events and responses

Responses are created as one response per order or event registration. A single event registration for ten contacts would be recorded as a single response.

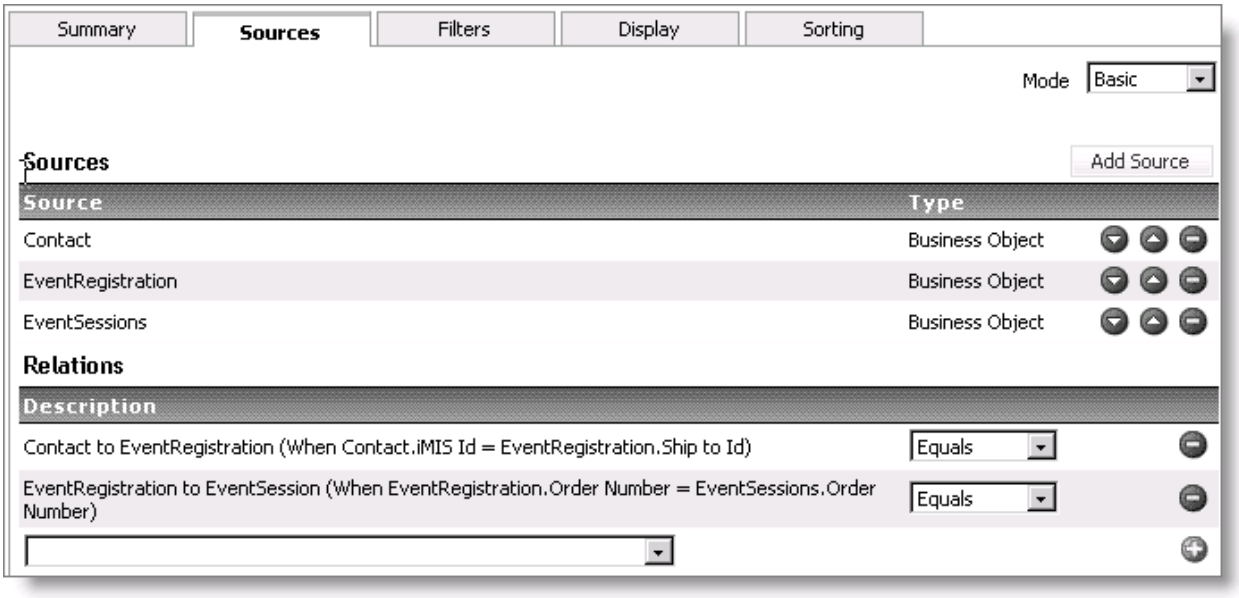
Example: Segmentation queries for RFM analysis

The following example illustrates queries for segmentation and RFM analysis.

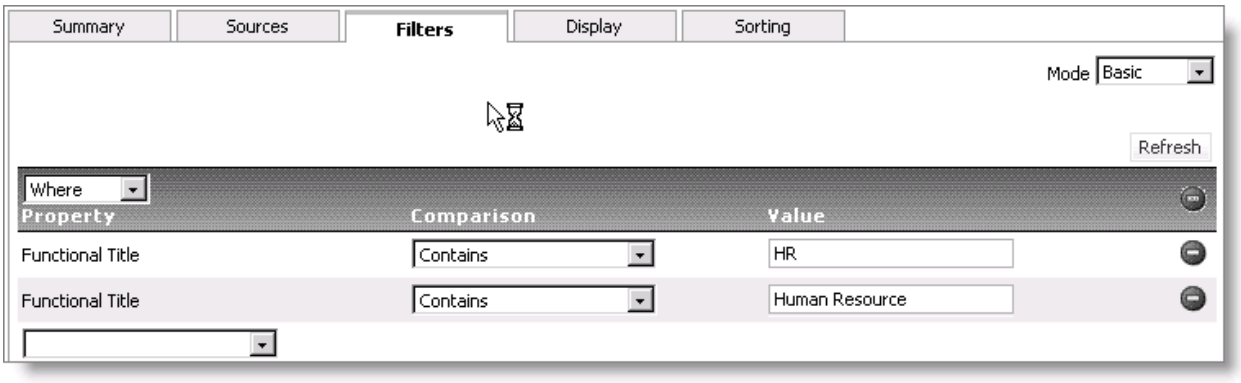
1. In IQA, create the segment queries.
2. Write a query to suppress Opt Out responses. For example:



3. Write the query for a Segment Definition 1. This segment includes anyone who has purchased seminar 6515 this year.



4. Write the query for Segment Definition 2. This segment includes HR Professionals.

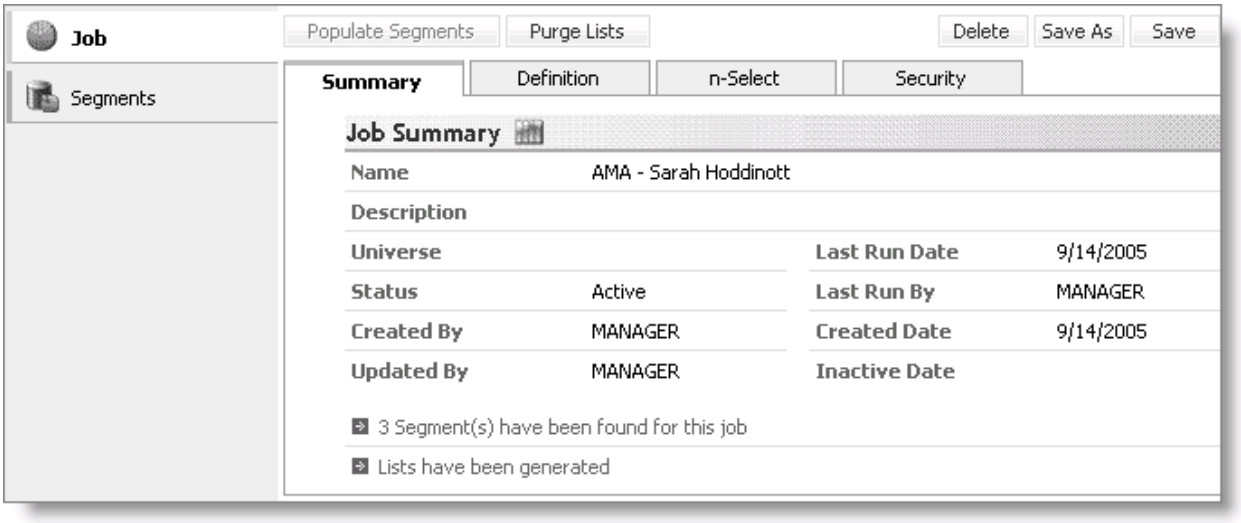


5. Create the job. The job is a container for all of the segments to be run.

- Create the first segment: Suppress query – Catalog opt outs
- Add the remaining segments.

6. Populate the segments.

   Your results page may look like the following example:



Setting up Basic Campaigns

Campaign Management helps your campaign staff set up and manage "basic" campaigns easily. For the purposes of this document, basic campaigns:

- Contain few appeals and related solicitations
- Generally use only one or two source codes per appeal

- Use the Select and Send model – Select the target audience from the iMIS database or an external list, send communications to that audience, and track incoming responses

With Campaign Management, campaign staffers can:

- Plan and define basic campaigns
- Create and send appropriate communications material
- Monitor campaign performance

What must be done before you can start?

You cannot set up a basic campaign until the following setup tasks are complete:

- Define setup options for all campaigns
- Set up security groups for campaigns

Putting it all together

The process of basic campaign management includes the following actions:

- Plan the campaign
- Define the campaign
- Define the appeals and solicitations in the campaign
- Specify communications efforts
- Monitor and measure performance

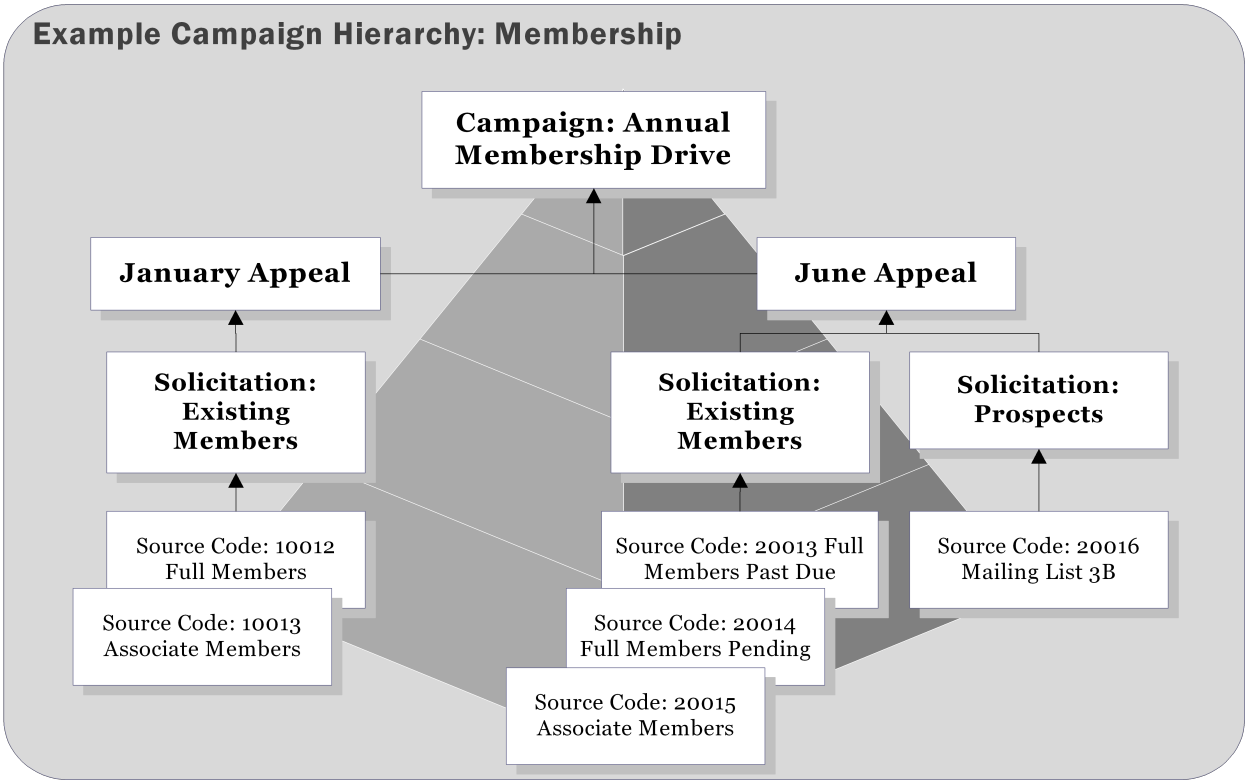
Campaign hierarchy

Campaign Management uses a hierarchical system to give you the flexibility to manage campaigns at the level of detail you require. The four levels are:

1. Campaign – A strategy to accomplish a single marketing goal. The campaign is the highest level of organization and measurement.
2. Appeal – Each major marketing effort of a campaign, usually associated with a drop date (the date the effort is sent out). Appeals are the building blocks of your campaign.

3. Solicitation – A communication effort sent to a targeted group. Solicitations can be sent as letters, email messages, phone calls, or other means.
4. Source Codes – Numbers assigned to each possible response for a specific solicitation (such as reply cards, phone calls, donations, or purchases). Your organization tracks responses with these numbers to measure the effectiveness of each solicitation. Source codes are the most granular level of measurement in a campaign.

   The following diagram illustrates an example hierarchy for a basic member retention campaign.



Example membership campaign

Viewing campaigns

Campaign Management provides you the flexibility to view campaign information in a variety of ways. You can choose to:

- Filter campaigns by desired criteria
- Sort campaign lists by name or date

- Change the default sort order
- View the campaign structure to the level of detail you need

To filter campaigns by criteria

1. From Community, select Manage marketing campaigns > Define campaigns.

   By default, iMIS displays all Active campaigns for which you have security access privileges.
2. Choose a filter, if desired.
3. Click a column header to sort by that column.

   Note: To change the default sort order when appeals are listed, edit the query named " (Default)" in CampaignManagement/DefaultSystem/Queries/CampaignAppealsList/. However, you cannot edit the query to change sort order if solicitations or source codes are displayed.
4. Select the campaign you want to view. The campaign overview displays.

   The tabs along the top of the campaign display information about the campaign:

- The Summary tab displays general information about the campaign.
- The Profile tab displays general information for editing.
- The Appeals tab displays the appeals associated with the campaign.
- The Security tab displays access levels for defined security roles.

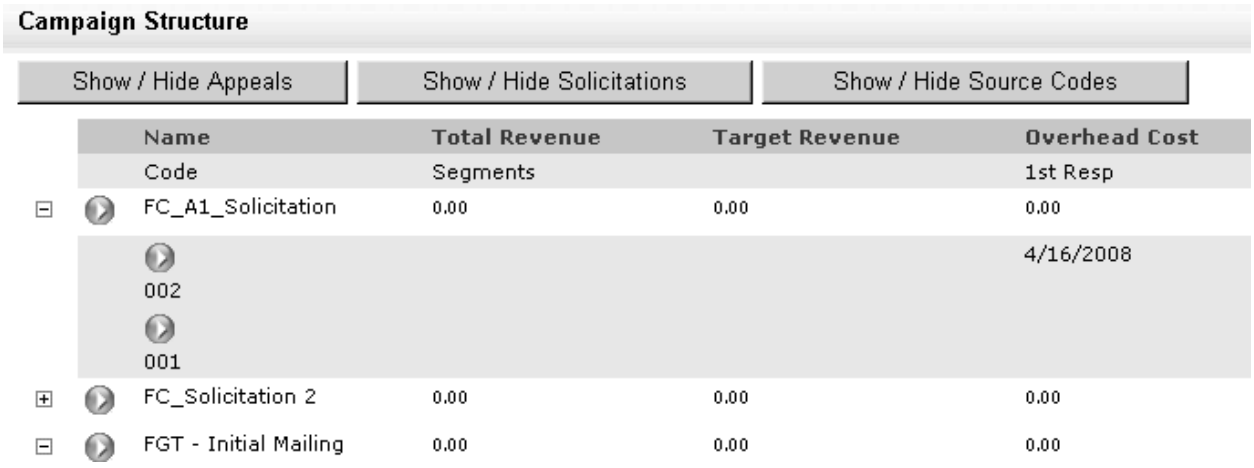
To view campaign details

1. From Community, select Manage marketing campaigns.
2. Choose the level of detail to view:

- Show / Hide Appeals
- Show / Hide Solicitations
- Show / Hide Source Codes

Campaign Structure page

The Campaign Structure page displays a clear picture of campaign structure in a single display.



From Marketing, select Campaign management

Buttons across the top of the window (Show / Hide Appeals, Show / Hide Solicitations, Show / Hide Source Codes) enable you to collapse or expand the list to show the appeals, solicitations, and source codes for each campaign. Select links at the left of each row enable you to go directly to definition windows for solicitations and source codes.

Planning the campaign

By planning your campaign carefully, you and your staff can perform efficiently and effectively. The planning process includes:

1. Setting goals for the campaign
2. Defining campaign components and hierarchy
3. Defining the budget and cost tracking, if any
4. Identifying targets
5. Specifying marketing efforts
6. Defining campaign performance measurement

Your campaign might be an isolated, one-time-only campaign, or part of an annual or multiple-year strategic plan. Factor this into your planning.

Setting goals for the campaign

The goals and objectives for your campaign are unique to your organization. A goal is a simple statement that expresses what you want to do, such as:

- Increase the number of new donors
- Enroll new members
- Sell a new product
- Solicit advertisers for your periodicals
- Get a message out

An objective then states a measurable amount, such as:

- Increase new donor count by 5%
- Enroll 150 people
- Sell 2,000 units
- Increase ads placed by 15%
- Contact 15,000 prospects

You might set response rate goals, enrollment goals, sales goals, or budget goals. Knowing this information in advance can help you determine how best to set up your campaign.

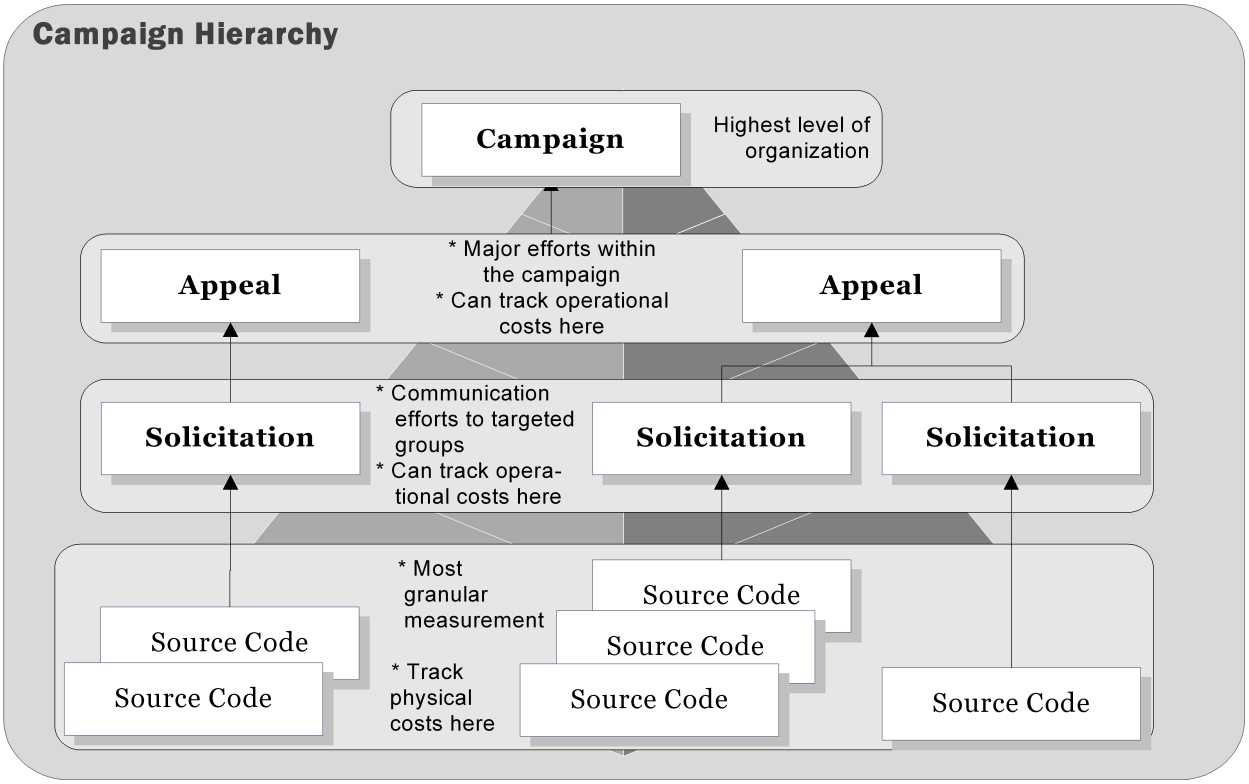
Defining campaign components and hierarchy

A campaign is an organized set of appeals that you create to accomplish your marketing goal. The campaign can consist of one or many appeals and solicitations.

Tips on defining campaign hierarchy

- Use appeals to split your campaign into major efforts.
- Define one or more solicitations for each appeal by target group, message, or delivery method.
- Assign one or more source codes to each solicitation to track responses.
- Create unique names at all levels: each campaign, each appeal within a campaign, each solicitation within an appeal, and each source code within a solicitation. The naming convention might be by department, type of campaign, year or quarter, or other meaningful methods.

  It might be useful to sketch your campaign hierarchy in advance, for example:



Description of campaign hierarchy

Defining cost tracking data

In marketing campaigns, costs are tracked to calculate metrics such as Net Revenue, Cost per Thousand, Revenue per Thousand and Return on Investment. The cost of a

campaign includes the overall operational costs of the campaign and the individual costs of each "package" that is sent.

Operational costs

Operational costs include any items that are applied to the entire marketing effort, such as:

- Paper
- Printing
- Letter shopping

You can track these costs at the appeal or source code level. In a basic campaign, you will probably define few source codes. In this case, it is effective to track operational costs at the source code level.

However, you may choose to track operational costs at the appeal level if you are managing a complex campaign with dozens or hundreds of source codes.

Package costs

Package costs include any items that are applied to the actual insert or package, such as:

- Postage
- Outer envelope
- Business reply envelope
- Business reply device
- Telemarketing costs

These costs are tracked at the source code level.

Identifying targets

Getting the right message to the right person at the right time is critical to the success of your campaign. With Marketing Suite, you can target prospects with simple or sophisticated tools. By precisely defining target markets, you can refine campaign messages

with great accuracy. And you can measure the response rate to the messages for specific groups of people.

Think about which factors should be included and which should be excluded for each targeted group. You will use these factors to define the segment of prospects that you will be targeting for each solicitation.

Plan for the cases where customers 'opt-in' and 'opt-out' of different marketing activities. After the targeted message is delivered, the prospect will or will not respond. Marketing Suite gives you the power to define and manage processes for either case.

Using external lists

Some organizations use external lists to identify targets for their campaigns. External lists are brokered with individual list agreements that govern how the list can be used and for how long. Sometimes lists are given to the organization with all names and contact information attached. Other times, lists are used once and the organization only sees the contact information when the customer responds.

Planning communications efforts

Plan the efforts you will use to communicate with contacts or prospects. Each effort can be a combination of brochures, email messages, promotional goods, or whatever items you deem necessary. Define the contents and drop date for each package.

In addition, plan how you will communicate among the team and among your organization. Are there specific reports that will be useful for staff? Will you need to send email messages to the team upon completion of certain tasks?

Defining campaign performance

Measuring the success of your campaign will help improve your next marketing effort. Each time the cycle repeats itself, you become more efficient at honing your message and delivering the right message to the right person at the right time. As a result, you are able to set ever higher goals for your organization.

iMIS provides you with analysis, workflow design, and communications tools to optimize the marketing cycle throughout your organization. Effective analysis allows you to target your time, energy, and budget to those pursuits, which are most likely to be profitable.

The iMIS database stores all of your important transactional, historic, and demographic data, giving you the power to prioritize the data and present it to stakeholders in a meaningful manner.

Make sure you define how you will track data to determine performance. Some suggestions:

- Run counts and statistics on your database before you start the campaign to define your starting point.
- Specify your predicted response rate.
- Determine the metric you will use to show success.
- Synchronize responses regularly. This helps you stay up-to-date with metrics.

Defining marketing campaigns

After you plan the campaign, you are able to set up the campaign structure efficiently.

Business Goals

To define a campaign:

1. Enter basic information such as name, status, and start date.
2. Designate the general type of campaign. Use the defaults or custom types designed for your organization.
3. (optional) Enter predicted information, such as end date and predicted response rate.

If there is an existing campaign in place, you can create a new campaign quickly by copying it (cloning it) and editing it. See To clone a campaign.

If you delete a campaign, appeal, solicitation, or source code, all the lower levels of the hierarchy will also be deleted, regardless of status.

To create a campaign

1. From Community, select Manage marketing campaigns > Define campaigns.
2. Click Add a Campaign.
3. Define the campaign:

- Enter a Name and Campaign Code.
- (optional) Enter a Status (Active or Inactive).

  If the status is changed from Active to Inactive, the status of all child entities is set to Inactive.

  If the status is changed from Inactive to Active, the status of child entities is not affected.

  The status of a child entity cannot be changed to Active if any parent entities have an Inactive status.
- Enter a campaign Type:
- None
- Annual – A campaign that occurs every year
- Designated – Funds generated by the campaign that are committed to a specific entity
- (optional) Enter a Start Date and an End Date.
- (optional) Enter a Predicted Response Rate (the estimated percentage of contacts that will respond to the appeal) and the Last Response Date.
- (optional) Enter a Description.

4. Click Save.

   To clone a campaign

   A cloned campaign is an exact duplicate of the original campaign with the following exceptions:

- The Name and Campaign Code are different.
- The Created Date equals the copy date.
- The Created By field equals the user who copied the campaign.
- The Start Date, End Date, and Reminder Date are adjusted automatically for the copied campaign.
- The copy has the same structure as the original campaign, including all appeals, solicitations, and source codes.
- All copied source codes contain the same inserts and messages as the original campaign.
- Source lists are not copied.
- If Campaign Management is configured to assign source codes automatically, all new source codes are regenerated automatically.
- If Campaign Management is configured to assign source codes manually, all new source codes are formatted as 'Copy of (original code).' If this code already exists, the code is copied until a unique code is found: 'Copy (sequence #) of (original code).'

To create a new campaign quickly, you can clone an existing one and edit it.

1. Select Community > Manage marketing campaigns > Define campaigns.
2. Select a campaign.
3. Click Save As.
4. Enter the new campaign Name, Campaign Code, and Type.
5. Click Save.

To edit campaign security settings

Default campaign security settings are set up when the Marketing Suite is set up. However, if you are authorized, you can grant specific users and/or groups access to a campaign.

1. Select Community > Manage marketing campaigns > Define campaigns.
2. Select a campaign.
3. Click the Security tab.
4. Select an Access Mode:

- Share (Everyone) – Grants everyone full control.
- Private – Grants full access to those assigned to the project.
- Advanced – Enables the Access Mode drop-down list and allows you to edit the access list. You can select one of the listed access areas or select Custom to choose from a list of defined security roles.

5. Click Save.

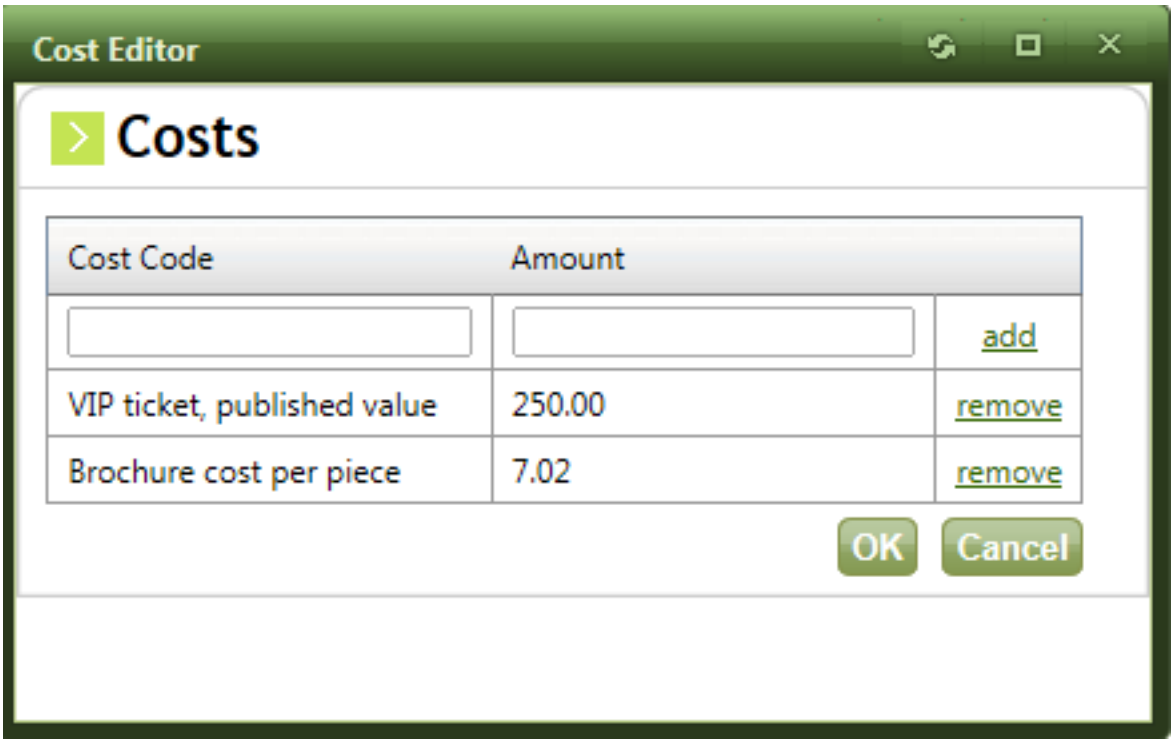
Tracking costs for campaigns

To track costs at the Appeal level

1. Select Community > Manage marketing campaigns > Track campaigns.
2. Click Show / Hide Appeals and open an appeal.
3. (optional) Click the Profile tab and click the plus sign next to the Overhead Cost field.
4. Add an additional cost and click Save.

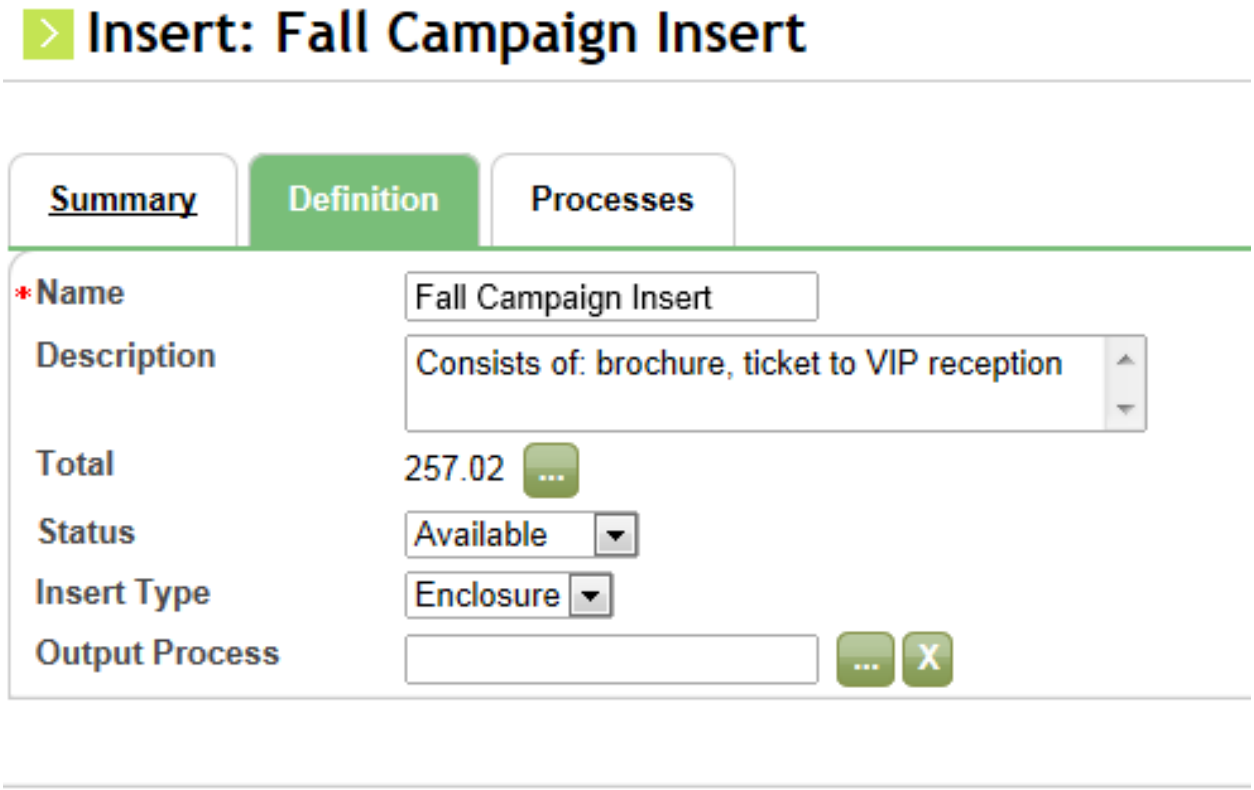
To track costs for an insert

1. Select Community > Manage marketing campaigns > Define inserts.
2. Select an insert.
3. Click the browse icon next to Total.
4. Enter a value in the Cost Code and a cost per piece in the Amount.
5. Click + for each cost code you want to add.



6. Click OK to save the values.

   Confirm that the Total on the Insert window now shows the sum of the values entered on the Costs pop-up.



Sum of inserts

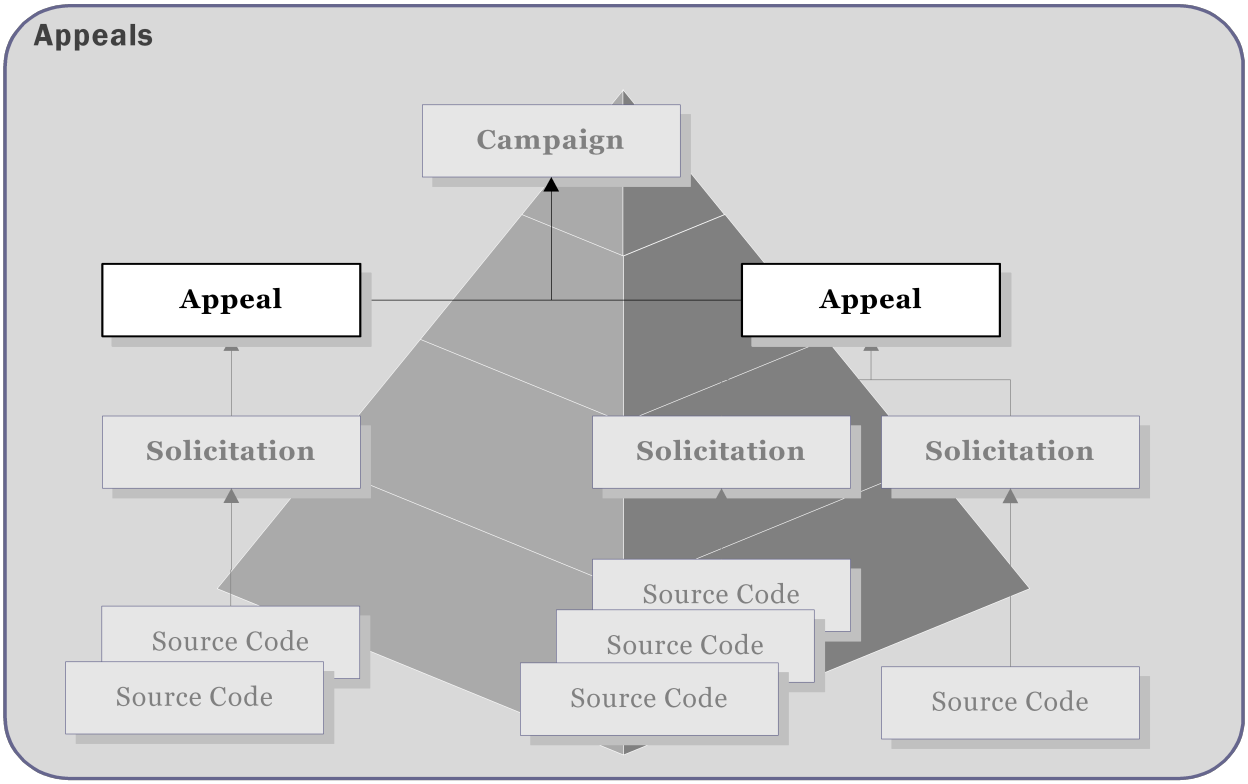
Tips

- Operational costs should be tracked at the Appeal or Source Code. The choice of tracking overhead costs at the Appeal or Source Code level is made in Community > Manage marketing campaigns > Set up campaign module.
- Package costs include any items that are applied to the actual insert or package: Those are tracked with the insert costs.
- Overhead Costs refer to any cost that is applied to the mailing or marketing effort as a whole. These costs tend to be difficult to break down on an item by item or cost per piece basis. You want to be able to track the costs against the appeal as a whole rather than trying to break out the costs against different source codes. This is especially true when you have multiple source codes within a marketing effort.
- Some costs apply only to a particular Source Code or part of a marketing effort, such as list rental costs or the difference between different packages sent. Even if you choose to

track overhead costs at the Appeal level in your Community > Manage marketing campaigns > Set up campaign module options, you still have the option to be able track those additional costs. They are tracked as part of the package attached to the source code.

Defining campaign appeals

The appeal level is the anchor that binds the different elements of a marketing campaign.



Appeal level in campaign hierarchy

An appeal is the level of a campaign where you:

- Link specific products to the campaign
- Assign drop dates for media and other efforts
- Track costs, if desired

Important prerequisites to defining appeals

- You must have a campaign set up before you can add an appeal.
- Make sure that all products are created before you link them to an appeal. The purchase of these products will be tracked to help you measure the campaign's success.

Business goals

To define appeals for your campaign, you will:

1. Link specific products to the campaign. Your campaign might include physical products such as apparel, books, and documents or non-physical products such as event functions, gifts, and pledges.

- From the iMIS Advanced Accounting Console, set up the products in the appropriate area before assigning them to the campaign.
- Fundraising events: Events > Define an event or from the Staff site, select Events > Add event.
- Gifts and pledges: Settings > Fundraising > Set up tables > Appeals or Distributions and premiums
- Physical products: Commerce > Inventory > Products
- Add the products to the appeal(s) in the campaign.
- (optional) Set up minimum required gift amount to receive each product.

2. Assign drop dates.

The definition of drop date depends on the media involved:

- Direct mail – Date the post office starts to deliver the mailing
- Telemarketing – Date the calls begin
- Media spots (TV, radio, webcast) – Date of airing
- Newsletters – Date of mailing, by issue
- Online campaigns – Date the email messages are sent

Drop dates for other efforts can include:

- Mailing list generation
- Creative concepts/artwork complete
- Response management process set up

3. Track costs (optional).

   If your organization tracks operational costs at the appeal level, you will need to enter cost information when you set up the appeal.

   Next step

   You will define solicitations as the different messages or groups of responses.

   To create an appeal

1. Select Community > Manage marketing campaigns > Define campaigns.
2. Select the appropriate campaign.
3. Click the Appeals tab.
4. Click Add an Appeal.
5. Define the appeal:

- Enter a Name.
- Select a Status (Active or Inactive).
- If the status is changed from Active to Inactive, the status of all child entities is set to Inactive.
- If the status is changed from Inactive to Active, the status of child entities is not affected.
- The status of a child entity cannot be changed to Active if any parent entities have an Inactive status.
- (optional) Enter an Overhead Cost, or click the plus icon to add multiple costs.
- (optional) Enter a Start Date and an End Date.

- (optional) Enter a response rate next to Predicted Response Rate (the estimated percentage of contacts that will respond to the appeal) and the Last Response Date.
- (optional) Enter a dollar amount for a Target Revenue value.
- (optional) Enter a Description.

6. Click Save.

   The system displays the status on the Summary tab. Click on the link for more details.

   To assign a product to an appeal

1. Open a campaign.
2. Click the Appeals tab and select an appeal.
3. Click the Products tab.
4. Select a Query to view:

- All Products
- Products By Code

5. Select the desired products.

   The added products display in the list of Selected Products.

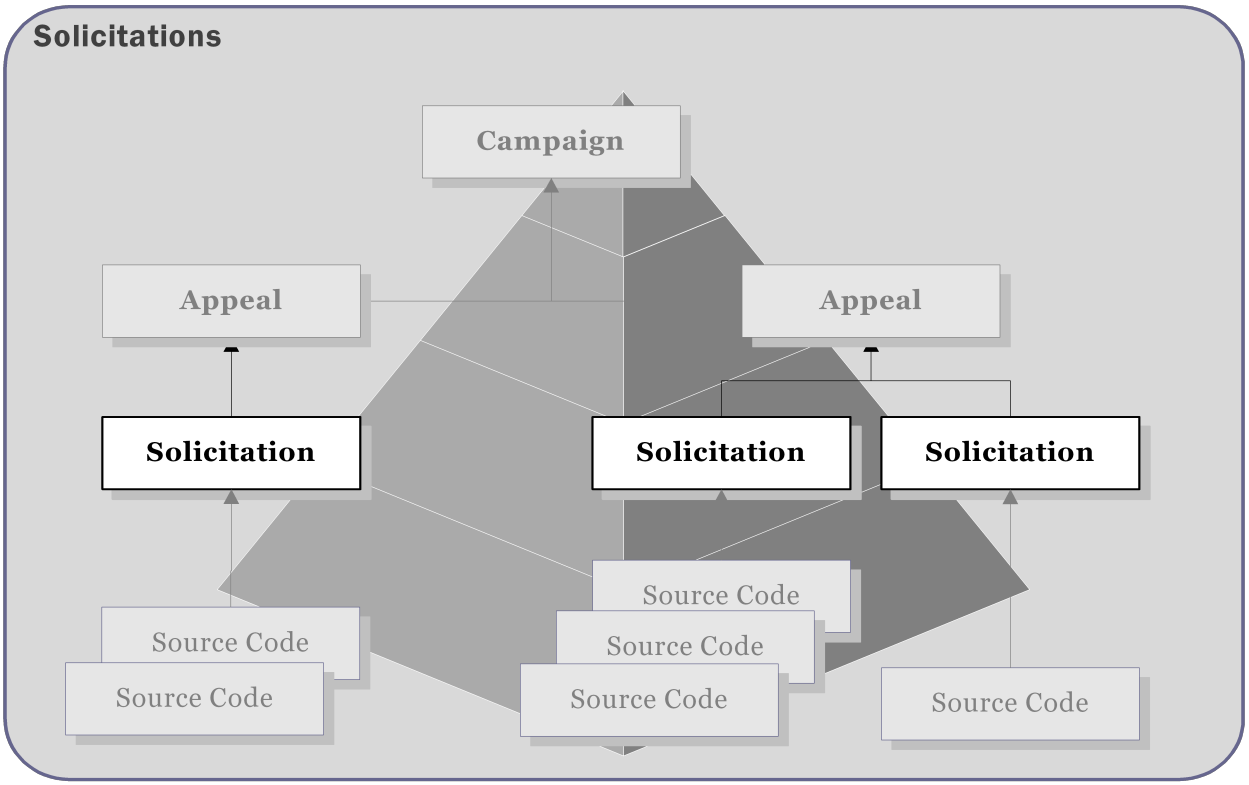
6. Click Save.

   Note: When you delete a product after it has been assigned to an appeal, the Products tab displays only the product code of the deleted product.

Defining solicitations

A solicitation is an organizing function that allows you to track responses by targeted groups. The solicitation is a series of source codes that requests a response from contacts and prospects (such as a reply, donation, or purchase). Using source codes, you create solicitations to target a specific marketing appeal for different groups of contacts

and prospects. Solicitations can be in the form of letters, phone calls, personal conversations, or other methods of contact.



Solicitation level in campaign hierarchy

Solicitations can be:

- Message-based – The message is divided into different letter contents or package concepts. For example, if a mailing has an inexpensive package that will be sent to contacts who are least likely to respond, you can set up one solicitation for the less expensive package and a separate one for the more expensive package.
- External group-based – Different messages are sent to targeted groups of contacts.
- Internal group-based – Different messages are sent by different groups within your organization.

Organizations with multiple source codes within their organization probably need to measure responses in groups of source codes as well as at the source code level itself. See Setting up complex campaigns.

To create a solicitation

Before you begin

You must define one or more appeals before you define solicitations.

1. Select Community > Manage marketing campaigns > Define campaigns.
2. Select a campaign and then select an appeal.
3. Click the Solicitations tab.
4. Click Add a Solicitation.
5. Define the solicitation:

- Enter a Name.
- Select a Status (Active or Inactive).
- If the status is changed from Active to Inactive, the status of all child entities is set to Inactive.
- If the status is changed from Inactive to Active, the status of child entities is not affected.
- The status of a child entity cannot be changed to Active if any parent entities have an Inactive status.

6. (optional) Enter a Start Date and an End Date.
7. (optional) Enter a Display Predicted Response Rate (the estimated percentage of contacts that will respond to the appeal), Description, Reminder Date, and Last Response Date.
8. Click Save.

The system displays the status on the Summary tab. Click on the link for more details.

Tips

- Combine multiple source codes and list sources into a single solicitation.
- Use consistent naming conventions when creating solicitations.

Specifying communication efforts

Business goals

To define a communications effort for a campaign, you will:

1. Define source codes.
2. Create inserts.
3. Create or select target groups (source list).
4. Select a source list (who is selected to receive the message) and an insert (what will be sent) for each source code.
5. Generate output.

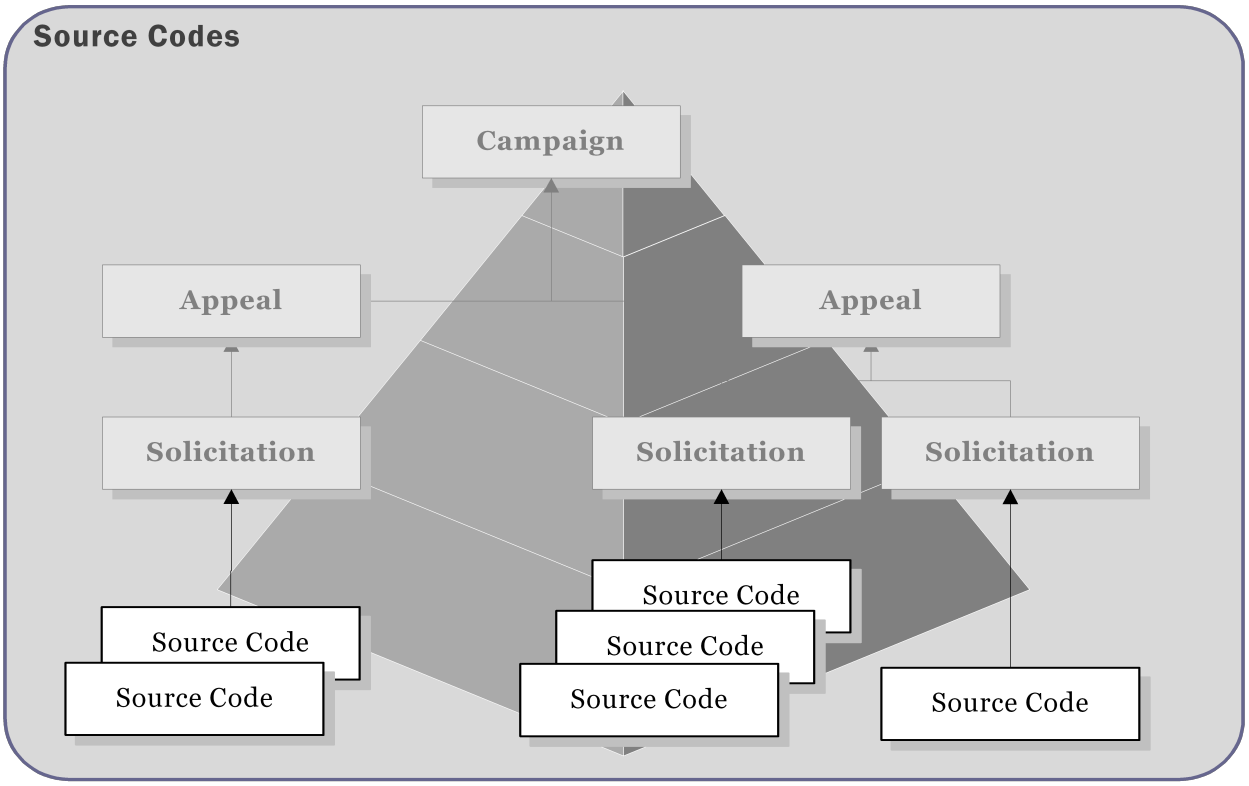
Defining source codes

Source codes are the most granular level of measurement in Campaign Management. These codes are used to identify messages you send out and track the responses to these messages. Source codes are linked to reply devices such as postcards, website links, donations, and purchases.

Use sources codes to:

- Tag the marketing message for each targeted group and to track the responses.
- Use questions such as "How did you hear about us?" to identify the message or call to action that prompted the response.
- Set up codes for bounce-backs and responses that cannot be linked to a specific message.

For a basic campaign you might define only a few (or even one) source code.



Source code level in campaign hierarchy

There are three general kinds of source codes:

- Codes assigned to outgoing marketing efforts to track the incoming responses to the effort. Sometimes a contact receives more than one solicitation from your organization in a certain timeframe.
- Generic codes that are assigned to ongoing passive ways in which a customer can support your organization, such as web transactions, word-of-mouth, or calls to action.
- Codes that are assigned to capture responses when the actual source code is not known.

Important prerequisites for defining source codes

Before you can define source codes:

- Define one or more solicitations.
- Set up source lists.
- Create an insert for the source code.

Tips for defining a source code

- Use consistent naming conventions when creating source codes. Your administrator can set up automatically generated source codes that follow your organization's standards.
- To ensure accurate response data, do not edit a source code after the responses are processed.

To create a source code

1. Open a campaign, appeal, and solicitation.
2. Click the Source Codes tab.
3. Click Add a Source Code.
4. Define the source code:

- Enter a Code (if not automatically generated).
- Select the Source Code Status (Active or Inactive).
- (optional) Enter a Description.
- Select the List Member Type:
- Contact – Queries contain the NetContact business object.
- Prospect – Queries contain the Prospect business object.
- (optional) Enter the Predicted Response Rate, Last Response Date, and Last Drop Date.
- (optional)Select the Source Code Type:
- RunOnce – The source code will be used only once.
- RunMany – The source code will be used more than once.
- ExternalList – The source list is an external file. Enter the External File Name and External List Count.

5. Click Save.

Defining inserts

Inserts are the physical items you send to contacts and prospects, such as letters, pre-printed collateral, and envelopes. After you create an insert, you can reuse it in other campaigns.

Typically, a source code is linked to each insert item. Multiple inserts (such as letter, brochure and envelope) are combined into a single package for delivery. All responses to the solicitation are then tracked by the source code. This is a useful way to perform market testing because you can choose the most effective creative package or target a test group to receive the package.

In addition, you can track the cost of each insert to determine the return on investment and to monitor budget amounts.

Output processes

To further customize an insert, you can assign queries and output processes that generate customized letters, email messages, faxes, labels, participant lists, and physical file formats in a specific order.

To create an insert

Before you begin

Make sure all applicable queries and output processes are set up.

1. Select Community > Manage marketing campaigns > Define inserts.
2. Click Add an Insert.
3. Define the insert:

- Enter a Name.
- (optional) Enter a Description.
- Click the Browse icon for Total cost information.
- (optional) Select the Status (Available or Unavailable) and Insert Type:

- None
- Brochure
- Envelope
- Form
- Postage

4. Browse to select an Output Process.
5. Click Save.

Tips

- Merges used for inserts must use either the Contact or the Prospect business object as a source.

> **Note:** Note: You can also create a new insert for a solicitation by clicking the New Insert button while viewing the solicitation.

> **Note:** Note: When output is generated from Campaign Management using a project process engine, the query and source code specified in the campaign automatically override the query and source code specified in the project process engine definition.

Selecting target groups

Use one or more source lists to identify a targeted group for your message. Basic campaigns typically use one or more of the following types of source lists:

- Lists from previous campaigns – Stagnant lists for repeat audiences. You could use lists of all contacts who were solicited in a previous campaign or only those who responded.
- Queries – Dynamic lists that can change with criteria that you specify. You can choose from queries that are set up in your system or you can create new ones.
- External lists – Purchased prospect lists from other businesses or organizations.

Complex campaigns often use Segmentation to compile lists of contacts. See About Segmentation.

To create a source list

Before you begin

- Make sure all applicable queries are defined.
- Create all applicable segmentation jobs and definitions.
- Create multiple source lists for use with single source codes.

1. Open the campaign.
2. Select a source code.
3. Click the Source Lists tab. (If the source code uses an external list, the Source Lists tab is not available.)
4. Under Add Source List, choose the Select Type:
   - Segment Definition – Select a segmentation job.
   - Solicitation Response – Select a campaign.
   - Query – Select a stored query.
5. Click Save.

> **Note:** Note: Throughout Marketing, NetContact is a required business object. Make sure that you include NetContact when you create source lists using queries.

Generating marketing output

Run output processes to generate customized letters, email messages, faxes, labels, participant lists, and physical file formats in a specific order. Running the output process also calculates the non-responses for each appeal. The following output processes are available:

- MS Word merge – Print letters, acknowledgements, and other MS Word documents.
- Email merge – Send email messages to contacts.
- Campaign list export – Generate a list of contacts for an external service or for mass email output.
- RFM definition – Rank records based on Recency, Frequency, and Monetary value.
- Project process outputs – Generate projects for further relationship building.

Important prerequisites for generating output

Before you run output processes:

- Make sure valid output process types are set up.
- We recommend you generate and check a test output to make sure the message and target group is correct.

Business goal

To run output processes, you will:

1. Select the type of output process for the insert.
2. Define the specific output process.
3. Generate output.
4. View the results.

To generate output

1. Open a campaign, appeal, and solicitation.
2. Click the Source Codes tab.
3. Select a source code or create a new one.
4. Click Save.
5. Click the Inserts tab.

6. Select an insert or create a new one.
7. Click Save.
8. Click the Source Lists tab.
9. Select a source list or create a new one.
10. Click Save.
11. Click Generate Output.

    The system displays the status on the Summary tab. Click on the link for more details.

> **Note:** Note: If the output is generated at a level higher than source code, output can be generated only once. If the output is generated at the source code level, output can be generated repeatedly.

Monitoring and measuring performance

Measuring the success of your campaign helps you improve your next marketing effort. Each time the cycle repeats itself, you become more efficient at honing your message and delivering the right message to the right person at the right time. As a result, you are able to set ever higher goals for your organization, such as acquiring more members, logging more donations, selling more products, or getting your message to a larger audience.

Marketing Suite provides progress and performance feedback at many levels of the campaign. You can view a real-time summary of the campaign's performance, including:

- The progress of each solicitation, source codes that have been generated, and source codes that have been dropped
- The number and type of responses resulting from each solicitation
- The progress, response, and accumulated revenues/costs for each source code
- The actual revenues and costs compared to the target figures for each source code and

appeal

- Performance information to guide future actions and campaigns

These powerful performance monitoring features are usually sufficiently rigorous for basic campaigns. For more complex campaigns, use RFM Analytics.

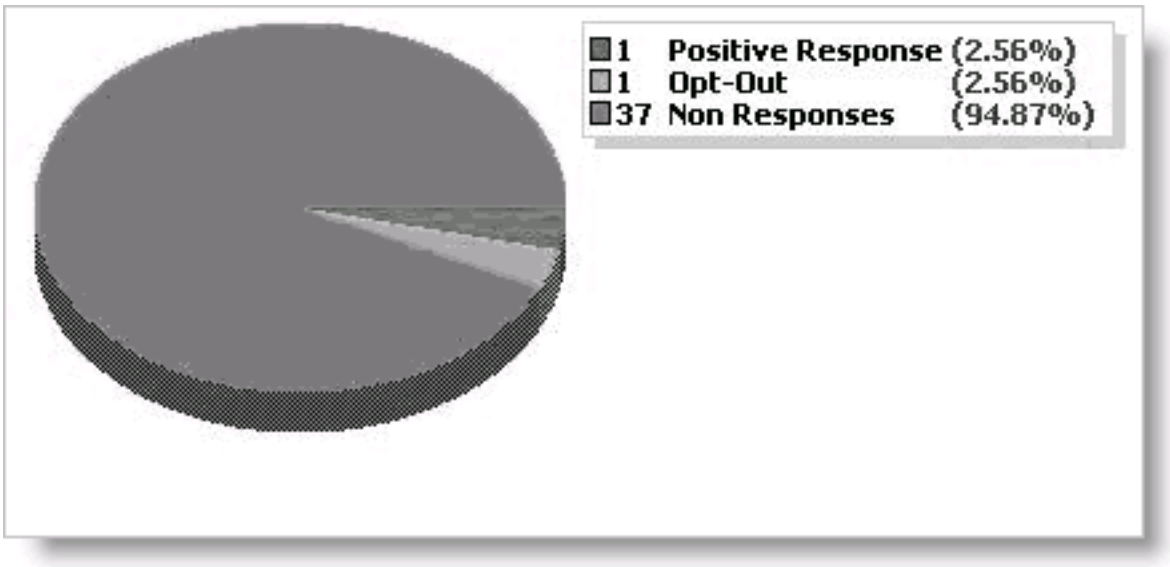
Tracking responses

Campaign Management gives you the power to track different types of responses to a campaign. This allows your organization to:

- Maintain a history of all customer responses to marketing efforts and every message that was sent
- Define specific tasks that execute automatically when prospects respond or do not respond to solicitations
- Generate personalized emails, faxes, and letters based on user-defined settings

Responses to solicitations are captured automatically. All tracking areas are synchronized, upon command, to consolidate responses. This tracking information includes:

- Contacts associated with the source code
- Non-responses and opt-outs
- (optional) Financial transactions associated with the campaign (orders, events, gifts, pledges, billings)



Example display of responses to a solicitation

Tips for tracking responses

- If you plan to track product orders associated with the campaign, make sure all appropriate products are set up.

Business goals

To track the responses to your campaign, you will:

1. Enter orders and associate them with a source code.
2. Synchronize responses.
3. View the results file or the summary pie chart of each level of the campaign.
4. (optional) Use communications tools to generate messages automatically when a response is received.
5. (optional) Use Process Manager to kick off projects or processes associated with each type of response or target group.

Events responses

You can associate events with your campaign and track responses:

- Event responses are tracked through registration data, not through payment data.
- Registration for multiple event functions that have the same source code are counted as one response. Registrations for multiple event functions that have different source codes are counted as multiple responses.

  Adding an event function to an event registration is counted as a response and affects all revenue and response attributes, such as response dates, response amounts, and response count.

  Removing an event function from an event registration affects total revenue but does not affect other revenue and response attributes such as response dates, response amounts, and response count. Removing an entire event registration decreases response count and revenue.

Dues responses

You can associate payments with your campaign and track responses:

- Payments for multiple products that have the same source code are counted as one response. Payments for multiple products that have different source codes are counted as multiple responses.
- Cancelling a billing fundraising item decrements total revenue, but does not affect other campaign statistics.

  If you change the source code for a payment after running response synchronization, the response is not updated.

Synchronizing campaign responses

Each time you synchronize responses, only those product sales that have occurred since the last time the process was run are processed.

If you synchronize responses for an inactive campaign, no responses are generated. If you change a campaign status to Active and then synchronize responses, only those responses entered after activating the campaign are recorded. iMIS ignores the responses entered when the campaign was inactive.

To synchronize responses

1. Select Community > Manage marketing campaigns > Define campaigns.
2. Click Sync. Responses.

   A status message displays noting that the responses are being synchronized.
3. Go to RiSE > Workflow > Monitor processes to observe the synchronization's status.

   Caution! Do not edit a campaign source code after processing responses for the source code.

Creating projects from Campaign Management

You can easily create projects that correspond to your campaign and manage them in Process Mgr. Create these projects by defining, editing, or selecting the following information for the new projects:

- A query
- A project process output
- A source code

To create projects from a campaign

1. Select Community > Manage marketing campaigns > Define inserts.
2. Select an insert that already contains a project output process, or create a new one.
3. Click the browse icon to select the Output Process or click the Processes tab and select New Insert to define a new process.
4. For a new process, click the Sources tab and browse for the Source Data Query and Template Name. Click Save.
5. Click OK.
6. Click Generate Output.

   The system displays the status on the Summary tab. Click on the link for more details.

> **Note:** Note: When output is generated from Campaign Management using a project process output, the query and source code specified in the campaign automatically override the query and source code specified in the project process output definition.

Acting on responses

You can easily set up your campaign so that specific tasks are generated when a prospect responds or fails to respond to a solicitation. This helps you to:

- Acknowledge positive responses
- Send a cross-promotional solicitation to positive responders
- Initiate reminders to prospects who do not respond to initial solicitations
- Make sure that prospects who opt out of the campaign do not receive further solicitations

To create a response stage

You can define response stages in the source code so a contact moves through campaign stages (solicitations) as they respond to solicitations.

1. Open a campaign, appeal, and solicitation.
2. Select the Source Codes tab and select a source code.
3. Click the Source Lists tab.
4. In the Add Source List area, Select Type of Solicitation Response.
5. Select a campaign.
6. For each campaign response stage:

- Select an Appeal.
- Select a Solicitation.
- Select a Source Code.
- Select a Comparison value (Equal or Not Equal).

- Select a response State:
- Solicited – Contact has been solicited but has not responded.
- SolicitedResponse – Contact has responded to a solicitation.
- UnsolicitedResponse – Contact has responded but was never solicited.
- OptOut – Contact has opted out of the solicitation and will be excluded from any future lists for this campaign, appeal, and source code.

  Note: If a source code is provided with the response, the system assumes the contact was solicited.
- Click add.
- Select a Global Operator that applies to all solicitation state expressions (AND or OR).

7. Click Save.

   The solicitation response displays in the Source Lists.

   > **Note:** Note: You can choose to automatically assign source codes to responses in Set up campaign module.

   To view responses

   Before you begin

   Before you can view responses, you must:

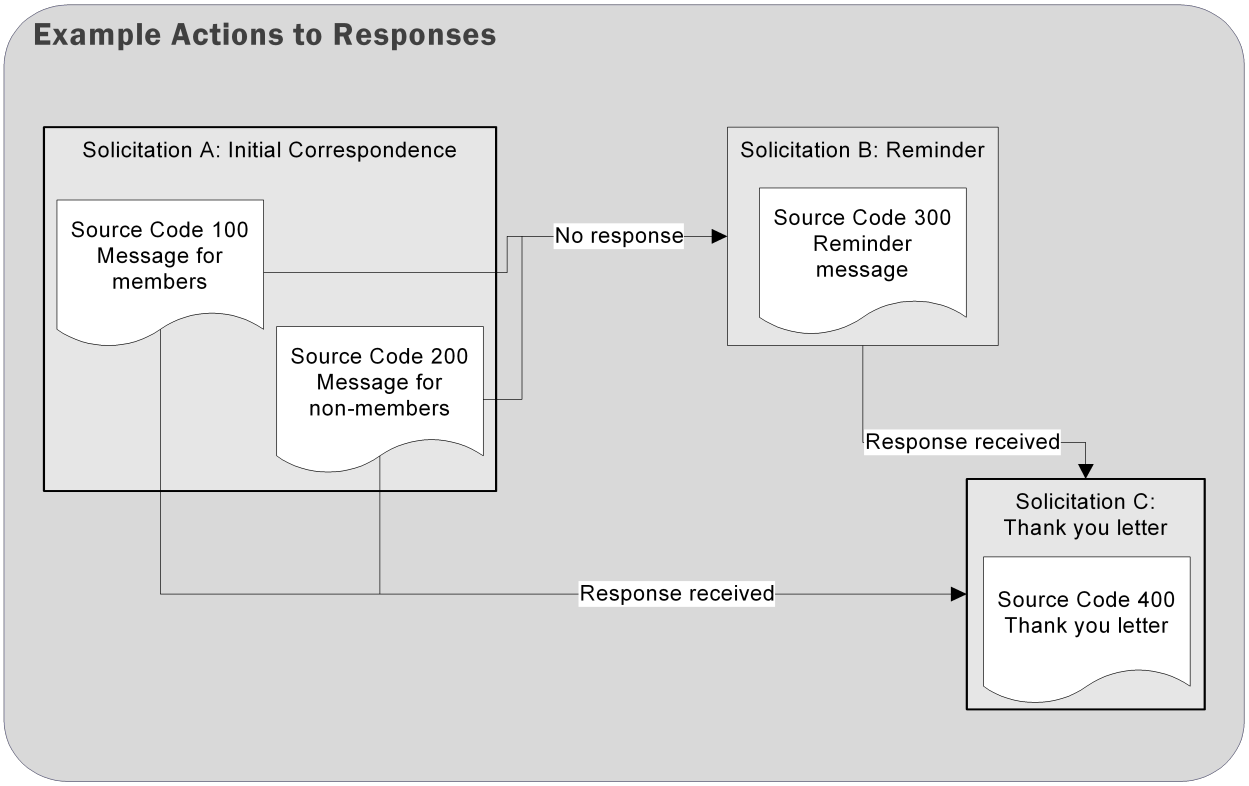
- Create response stages
- Synchronize the responses

1. Select Community > Manage marketing campaigns > Record responses.
2. Find the desired contact.

   The system displays a list of responses for that contact by source code, appeal, and campaign.

Example: Response actions

The following campaign is defined so that a response to Solicitation A (initial correspondence) automatically moves the contact into Solicitation C (thank you letter). After a period of time (or a non-response to Solicitation A), the contact automatically moves into Solicitation B (reminder). A response to Solicitation B automatically moves the contact into Solicitation C.



Response process example

Basic campaign example: Professional conference

The following is an example of a basic campaign for a professional conference. This example follows the business goals for Campaign Management:

1. Plan the campaign.
2. Define the campaign.
3. Define the appeals and solicitations for the campaign.
4. Specify communication efforts.

5. Tracking responses
6. Monitor and measure performance.

Planning the campaign

The ABBA professional society hosts a major conference each year. The goal of the Annual Conference Campaign is to recruit 20% more attendees than last year.

Overhead costs are tracked at the appeal level. For the first appeal, the first two solicitations have different creative concepts to test effectiveness. The more successful concept will be used for the brochure and conference signage. One source code is assigned to each solicitation.

The hierarchy for this appeal is simple:

Campaign = Annual Conference

Appeal = Save the Date postcard

Solicitations = Creative A to Segment 1 (source code 000134), Creative B to Segment 2 (source code 000135)

First Mailing

The first mailing is a Save the Date post card. The goal is to get people to put the conference date on their calendar and to plan to attend. Because there is not a true call to action associated with this mailing, it is an ideal situation for testing a creative concept. There will be inquiries from:

- People who want to register right away
- Companies looking for sponsorship opportunities
- Companies looking for exhibitor opportunities

These inquiries indicate the more successful concept to be used throughout the campaign.

Second Mailing

After determining the more successful concept, ABBA incorporates the concept into the full conference brochure. The brochure contains sections on schedule, tracks, speakers, and entertainment options and is the most important mailing in the campaign.

The basic structure for this appeal is:

Annual Conference	Full Conference Brochure	Past Attendees	000234: Attended last year
			000235: Attended year before
			000236: Attended earlier
		People who have never attended	000334: Members
			000335: Non-members

So far, ABBA has a sound plan:

- The appeals help them separate out invoices for each mailing to determine the true return on investment for each one.
- Solicitations break down the mailings into logical and broad groups of records with varying estimated response rates. It is likely there will be a higher response rate from past attendees than from people who have never attended.
- Source codes further break down the groups for customized mailings and different estimated response rates. The source codes can be seen as declining levels of expected positive responses.

Defining the campaign

Campaign definition is straightforward:

- Name = Annual Conference
- Status = Active

- Start date = today's date
- Campaign type = Event
- Predicted end date = today's date + three months

Defining the appeals

Define each appeal:

- Name = Save the date postcard
- Status = Active
- Start Date = today's date
- End Date = today's date + three weeks
- Predicted Response Rate = 10%
- Name = Conference brochure
- Status = Active
- Start Date = today's date + 6 weeks
- End Date = today's date + 3 months
- Predicted Response Rate = 30%

Defining the solicitations

Define each solicitation similarly to the first one:

- Name = Conference Save the Date Postcard Creative A
- Status = Active
- Start Date = today's date + 1 week
- End Date = today's date + 1 month
- Predicted Response Rate = 5%

Specifying communication efforts

This is the point at which the target groups, inserts, source codes, and packages are defined.

Select target groups

ABBA will use the same lists as last year: Segment 1 and Segment 2.

Create inserts

Create inserts for each mailing similarly to the first one:

- Name = Annual Conference Template_NS_Segment1
- Status = Active
- Insert Type = None

Define source codes

The inserts will be attached to a source code and combined as packages for each mailing.

Set up source codes similarly to the first one:

- Code = 000134
- Description = Segment 1
- Status = Active
- Predicted Response Rate = 7.5%
- Target Revenue = $7500 (from attendees who want to register immediately)
- Source Code Type = Run Once
- List Member Type = Contact
- List Type = Segment Definition
- Add Segment 1
- Attach insert to a package: Add Conference Save the Date Postcard Creative A.

Generate output

Generate output for the first appeal to produce labels for the postcards and to ensure that responses will be tracked:

- Open the appeal and generate output.
- Output process = Postcard labels (from list of available choices)

Repeat for the second appeal when appropriate.

Example display

This example campaign will display similarly to:

	Name	Total Revenue	Target Revenue	Overhead Cost	ROI %	Start Date	End Date	Status
	Code	Segments		1st Resp	Last Drop	Type	Member Type	Status
⊟	Annual conference - Full Conference brochure							
⊞ select	Past attendees	0.00	0.00	0.00	0	1/3/2009	3/31/2009	Active
⊞ select	People who have never attended	0.00	0.00	0.00	0	1/3/2009	3/31/2009	Active
⊟	Annual conference - Save the Date postcard							
⊟ select	Creative B with green to Segment 2	0.00	0.00	0.00	0	1/3/2009	2/21/2009	Active
	select 000135					RunOnce	Contact	Active
⊟ select	Creative A with blue to Segment 1	0.00	0.00	0.00	0	1/3/2009	2/21/2009	Active
	select 000134					RunOnce	Contact	Active

Example: Professional conference display

Getting Started: Complex Campaigns

Complex campaigns for the purposes of this document:

- Contain many appeals and related solicitations
- Use many source codes
- Often build on the targeting and analytical data generated by Segmentation and RFM Analytics

Setting up complex campaigns

To set up a complex campaign, follow this process for best efficiency.

In Segmentation

1. Write the universe query that defines who receives the marketing effort.
2. Create the segmentation job or optionally, attach the universe query to the job.
3. Write the segment queries that will separate your universe into smaller target groups, such as by membership category or by transaction types or by event.
4. Create the segment(s) by attaching segment queries to each segment.
5. Populate the segments.

In Campaigns

1. Create the insert(s).
2. Set up the campaign, appeals, solicitations and source codes (one source code per segment).
3. Attach the segments and inserts to the source codes.
4. Generate output.

Tips for setting up complex campaigns

- Plan first. Building a spreadsheet of the basic structure early makes it easier to test and train users.
- Think about data criteria. Most marketing efforts use inclusion and exclusion criteria to generate their list within their system. In fundraising organizations, this is particularly so. How are you going to determine what that criteria is and how are you going to manage the information as customers 'opt-in' and 'opt-out' of different marketing activities?
- Think end-to-end marketing. Many marketing efforts are not isolated campaigns but are part of a broader, cyclical plan. Be prepared for that and factor it into your planning.
- You can track budgets at the appeal level or the source code level. This tracking allows you to define overhead costs and the cost of individual inserts. The method you use to track budgets also determines how costs are entered, recorded, and calculated within the

Campaign Management module.

- If your organization does not use complex segmentation, set the budget level to Appeal.
- If your organization uses complex segmentation, especially with insert testing, set the budget level to Source Code.
- Decide whether you need a single source code or several:
- Newsletters and similar mailings are rarely personalized beyond the mailing label attached to the piece. For this reason, although a template segmentation job is probably going to be used, a single source code will be assigned for each issue. This may be printed on the newsletter or mailing but it may not be. The issue number or cover article may be enough to be able to track the source code at the customer level.

  In this case, multiple segments = a single source code.
- Marketing efforts that are less informational and more "call-to-action oriented" (targeted marketing campaigns) require a high level of personalization. For these types of campaigns, each segment should be assigned a unique source code.

  In this case, individual segments = distinct source codes.
- If you want each RFM score to be a segment, assign a source code to each segment.

  If your campaign has only one source code, you can:
- Add one or more inserts (including more than one of the same insert).
- Generate customized lists of contacts and prospects using any combination of multiple source lists.
- Create all applicable inserts, queries, and segmentation jobs before you create a source code.

About Segmentation

Use Segmentation with Campaign Management to group contacts and prospects into targeted audiences. With Segmentation, you can:

- Create targeted contact and prospect lists according to demographic and behavioral patterns or other include/exclude criteria.
- Split segments into multiple lists and prioritize the segments.
- Eliminate duplicates in lists.
- Perform controlled and repeatable list pulls.
- Create n-Select or random select segments for message or delivery testing.
- Get counts for communications collateral before production.
- Assign unique source codes to segments to effectively analyze an effort's success.
- Copy segmentation jobs and purge inactive jobs.
- Reuse query definitions for multiple campaigns.

  Segmentation drives the criteria that will be used to select and segment those customers who will receive our marketing efforts. A segmentation job is a set of queries that are run in a specific order and result in the selection of the first occurrence of each matching record.

  Segmentation data is prepared and run before it is attached to its source code and the final output is generated. This allows for data criteria testing, test or dummy selects, or to get counts before the final list is prepared. And, because the data can be purged and lists can be run again, you can continue to target your message.

  Segmentation jobs have two levels of hierarchy:

- The job: the job can have a 'universe query' attached to it. It's not essential that a universe query be attached to a job.
- The segment: the segment definition also has a query associated with it. This query is called the 'population' query and contains the minute criteria we need to define who falls into which segment.

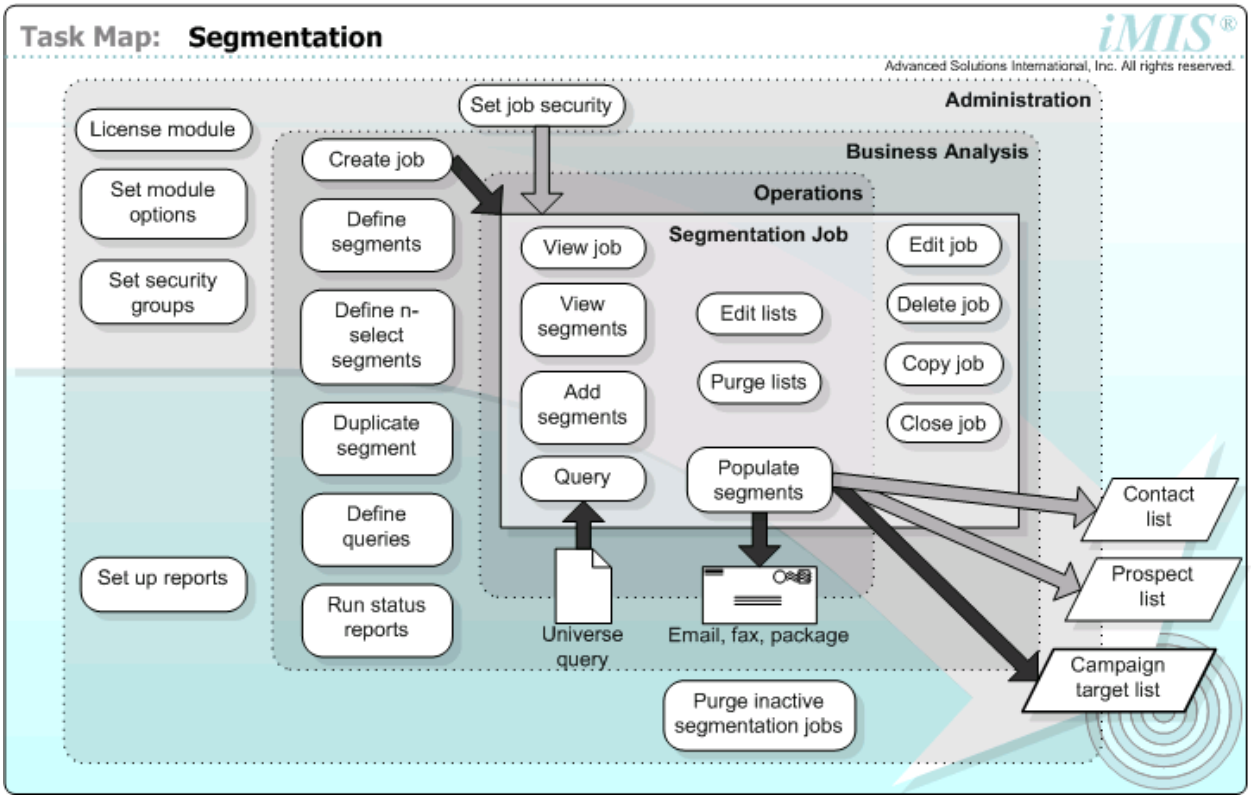
  Business goals

  The steps to create segmented lists are:

1. Create a segmentation job.
2. Add, split, and/or delete segments.
3. Populate the segments to create lists.

Task Map: Segmentation

This diagram maps out the core tasks in Segmentation by the approximate order they occur (top-left to bottom-right) and by the organizational area that usually performs them.



Task map: Segmentation

Viewing segmentation jobs

You can view all segmentation jobs or you can filter your view of segmentation jobs by creation date, creator, description, name, or by active jobs.

If you filter the segmentation jobs view by description, all segmentation jobs with matching description fields display.

If you filter the segmentation job view by creation date, you can view segmentation jobs created on a specified date or during a specified date range:

- To view segmentation jobs created on a specified date, enter the date.
- To view segmentation jobs created during a specified date range, enclose each date in double quotes and separate the dates with a comma (for example, “1/4/2008,” ”1/8/2008” specifies jobs created January 4, 2008 through January 8, 2008, inclusive).

Creating a segmentation job

A segmentation job contains the job definition, security settings, and segment definitions used to generate contact or prospect lists.

There are two types of segmentation jobs:

- Contact jobs – All queries for a Contact segmentation job must contain the Contact business object as a source.
- Prospect jobs – All queries for a Prospect segmentation job must contain the Prospect business object as a source.

> **Note:** Note: When you set the type as Contact or Prospect, the system automatically defaults to the correct business object.

Each segment is assigned an execution order to make sure duplicates are not generated. What is often different from appeal to appeal is the exclusion criteria you apply.

> **Note:** Note: After selecting an additional source table, you must define a Custom relationship between the tables; in most cases, you can use the ID field for the join.

Universe queries

A "universe" query defines the entire population of contacts for a segmentation job. When a universe query is present, a contact must be a member of the universe query for the contact to be included in any of the segments within the segmentation job.

If a universe query is defined for the segmentation job, it must be included as a source for any segment-level queries. The system automatically populates this. Universe queries are required only when defining n-Select segments.

> **Note:** Note: When adding a pre-existing universe query, check the source to make sure that the Contact business object is one of the sources. If Contact is not a declared source, the query will fail.

n-Select segments

n-Select segments list contact/prospect records returned by a selection filter in a number (n) of segments, with an equal number of contacts or prospects in each segment.

To create n-Select segments, you must include a universe query in the segmentation job. The universe query can include the results of a previous segmentation job as a source.

> **Note:** Note: If you have defined n-Select segments for a segmentation job, you must create these segments before you can populate the lists.

To ensure that your n-Select segments are successfully populated, make sure you do not exceed the total number of records returned by the universe query when you define the n-Select segments. For example, if the query returns 500 records, you can define n number of segments, each consisting of x number of contacts or prospects per segment, as long as n times x is less than or equal to 500.

Exclusion segments

Exclusion segments are any segments in the segmentation job that are not linked to a source code. Since each record can only be retrieved once, creating an exclusion segment in the segmentation job results in any records retrieved by an exclusion segment not being retrieved by later segments. For example, if two appeals are being dropped in a short period of time, you may want to include one or more segments in one appeal but not in the other.

Exclusions are applied at the segment level, and they can appear anywhere within a list of included segments, with these exceptions:

- Universal exclusions (No Mail Flag or Bad Address) should be the first segments entered in the segmentation job.
- Include segments have a link to a defined source code and should be defined after any universal exclusion segments.

If you specify a number of random records to return for a segment, the resulting list may contain fewer than the specified number of records. The segments are first populated and then checked for duplicate contacts or prospects. If duplicates are found, they are removed, and the segments from which they were removed will contain fewer than the specified number of records.

To create a segmentation job

1. From Community, select Manage segmentation > Define segments.
2. Select Add a Job and enter the job definition.
3. From the drop-down menu, select the Type.
4. (optional) Apply a filter (universe) query to the job. You can create a new query or use an existing query. These queries can be added later.
5. (optional) To define and create n-Select segments, click the n-Select tab. Enter the number of segments and the number of contacts per segment.
6. (optional) To modify the security settings for the job, click the Security tab.
7. (optional) To define explicit segments, click Segments:

- Enter segment definitions.
- Select an existing query or create a new query.
- (optional) Select the number of random records to use to populate the segments.
- (optional) Modify the Priority.

8. Select Save.

> **Note:** Note: Add or edit segments before closing the job.

Creating source codes based on segment definitions

Before you begin

- Create the source lists for which you want to create source codes.
- Create the segmentation job and add segments to the job.
- Generate output so that the lists are populated.

To automatically create source codes based on segment definitions

1. Select Community > Manage marketing campaigns > Define campaigns.
2. Open a campaign, appeal, and solicitation.
3. Select a solicitation.
4. Click Create Source Codes from List.
5. Create the source codes:

- If you want to build source codes based on solicitation lists, click an available solicitation to add it to the Current Solicitations list and then click Create Source Codes.
- If you want to build source codes based on segments, click the Create from Segments tab, and then click an available populated segmentation job to add it to the Select Segmentation Definition list. If you select Job Name, you automatically select all the segments in the job, or you can pick and choose among the segments by selecting just the segments from which you want to create source codes. Click Create Source Codes.

6. To view the automatically created source codes, click the Source Codes tab on the campaign.

Reusing and copying segmentation jobs

By reusing segmentation jobs or copying and editing them, you can work efficiently. After a targeted list pull, you can save the job and refresh the list to run it again. As the

campaign progresses, you can copy the job, rename it, and adjust the segments to be included.

Consider creating segmentation templates that can be copied and reused with minimal manipulation. If you build a template with the core of the segmentation requirements, the user can copy it and modify it at any time.

Tips for copying a segmentation job

- All segments in a segmentation job are copied when the segmentation job is copied. However, any contacts or prospects contained in a segment are not copied. You must populate the segments in the copied segmentation job to generate contacts or prospects to fill the segments.
- When you copy an existing segmentation job, for convenience the new segmentation job is named "Copy of OriginalJobName" (for example, "Copy of Contacts"). Rename the copied segmentation job and edit it as desired.
- If any segment editor pages from the original job were open when the job was copied, these windows will still reference the original job. To edit the segments in the copied segmentation job, you must select the Segments tab after copying the segmentation job and open the segments individually.

To copy a segmentation job

1. Select Community > Manage segmentation.
2. Open an existing job. Click Save As and rename it.
3. Open the new job.
4. Edit, add, and/or remove segments.
5. Adjust query filters.
6. Click Populate Segments.

Example: Creating a segmentation job

In this example, we want to mail catalogues to individuals who have not yet registered for conference and exclude those who have registered.

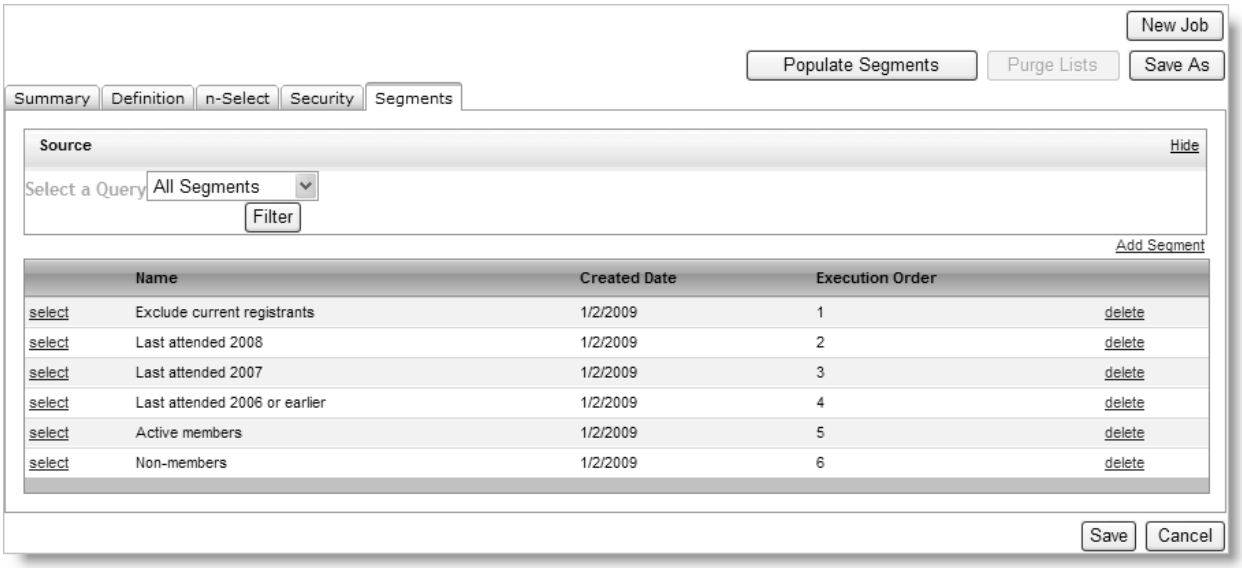
Exclude: Already Registered for the Conference

Include:

- Last attended 2008
- Last attended 2007
- Last attended in 2006 or earlier
- Never attended – Members
- Never attended – Non-members

Execution order is important. We want to first exclude those who have registered, and then populate the list with contacts in each segment who have not registered.

This example displays as:



Example: Segmentation job

Managing segments in a job

Viewing segments

You can view all segments or filter your view of segments by creation date, description, or name.

To view segments

1. Select Community > Manage segmentation.
2. Open the segmentation job.
3. Select the Segments tab.
4. (optional) Select a filter (by creation date, description, or name) if needed. By default, all segments display.
5. Select the segment to view. The segment definition displays.
6. If the segments have been populated, select the Results tab to view the segment contents.

Adding and editing segments

A segment definition is used to generate contacts or prospects based on demographic behaviors (for example, gender, location, age) and/or transactional behaviors (for example, attending events, purchasing books, or making donations).

> **Note:** Note: After selecting an additional source table, you must define a Custom relationship between the tables; in most cases, you can use the ID field for the join.

> **Note:** Note: Add or edit segments before closing the job.

To add or edit a segment

1. Select Community > Manage segmentation.
2. Open the segmentation job.
3. Select the Segments tab and add a new segment.

4. Enter the segment definition.
5. Using the Population buttons, select an existing query or create a new query.
6. (optional) Select the number of random records to use to populate the segments.
7. (optional) Modify the Priority.
8. Click Save.

Copying segments

If there is an existing segment definition that is similar to the segment definition you need to create, you can duplicate the existing segment definition and modify it as needed.The new (duplicated) segment appears in the same segmentation job as the original.

If you add or insert a new segment in an existing segment, you must manually change the order numbers of all the segments within the segmentation job.

To duplicate a segment

1. Select Community > Manage segmentation.
2. Open the segmentation job.
3. Select the Segments tab.
4. (optional) Select a filter (by creation date, description, or name). By default, all segments display.
5. Select the segment to view.

   The segment definition displays. The Duplicate Segment button does not display until the segment definition has been saved and the segment has been reopened in the Segment Definition Editor window. The Duplicate Segment button does not display when a segment definition is initially created and saved.

   If you do not see the Duplicate Segment button enabled when you open an existing segment definition, either you lack permissions to edit the definition or the lists have not been generated for the segmentation job.
6. Click Duplicate Segment.

The Segment Definition Editor page closes and the new (duplicated) segment displays in the segments list directly above the segment that was duplicated. Both segments will have the same name.

7. Open the new (duplicated) segment.
8. Edit the segment definition.
9. Click Save.

Splitting segments

You can split a segment into multiple segments (A/B split) by creating additional segments that use the same query.

1. Define the segments in sequence (using the same query).
2. Run the query to determine the segmentation count.
3. After deciding how many records should be retrieved for each segment, retrieve each segment and specify the count for each segment.

> **Note:** Note: Do not specify a count for the last segment; the last one will return all of the unretrieved records.

Deleting segments

You can delete a segment from a segmentation job if the segments have not yet been populated. To delete a segment from a job after the segments have been populated, you must first purge the lists (see "Purging lists").

> **Note:** Caution! Deleting a segment that is referenced in a campaign source code renders that source code unusable.

Populating segments

After you create a segmentation job and add segments, populate the segments in the job to create contact or prospect lists.

When segments are populated, iMIS ensures that segments are not populated with any record that would be a duplicate of a record in another segment that is defined for the same segmentation job.

Populating segments can be a very lengthy operation. Segments are populated as a workflow task; you can continue using iMIS for other tasks while segments are being populated.

You cannot view the results in the populated segments until the segment population workflow task has been completed.

To repopulate segments that have already been populated, you must first purge the lists and then populate the segments.

After the segments have been populated, you cannot edit the segment definitions. To edit a segment definition after the segments have been populated, you must first purge the lists.

To populate segments

1. Select Community > Manage segmentation.
2. Open the segmentation job.
3. Click Populate Segments.

   If no segments are defined, an error message displays.

   If the segments have already been populated, Populate Segments is disabled.
4. Select the segment to view.
5. Select the Results tab to view the segment contents.

Managing segmentation lists

Editing lists

After lists have been populated, you can add contacts or prospects as well as disable any that are already listed (contacts and prospects are enabled by default).

Before you begin

Verify that contacts or prospects to be added are not already in the list. No duplicate checking runs for manually added contacts/prospects.

To edit a contact or prospect list

1. Select Community > Manage segmentation.
2. Open the segmentation job.
3. Select Segments.
4. Select the segment that contains the list to be edited.
5. Select the Results tab.
6. (optional) To add a contact or prospect, click Add Contact.
7. (optional) To enable or disable a contact or prospect, select or deselect the checkbox displayed to the left of the contact or prospect.
8. Select Save.

Purging lists

Purge lists to remove those that you no longer need or to repopulate segments.

> **Note:** Note: The Purge Lists button is available only if the segments are populated.

To purge segmentation lists

1. Select Community > Manage segmentation.
2. Select the segmentation job.
3. Click Purge Lists.

Using external lists

Organizations may use external lists. External lists are brokered with individual list agreements that govern how long and how the use can be used.

Sometimes lists are given to the organization with all names and contact information attached. Other times, lists are used once with the organization only seeing the names of the contacts within it when the customer responds.

Lists with Names

Lists with names can be imported into the iMIS Acquisition Management tool. Campaigns and Segmentation can query this list and generate lists from it. One of the most important segmentation considerations is being able to test against different list rentals, therefore, it's important to have a testing model.

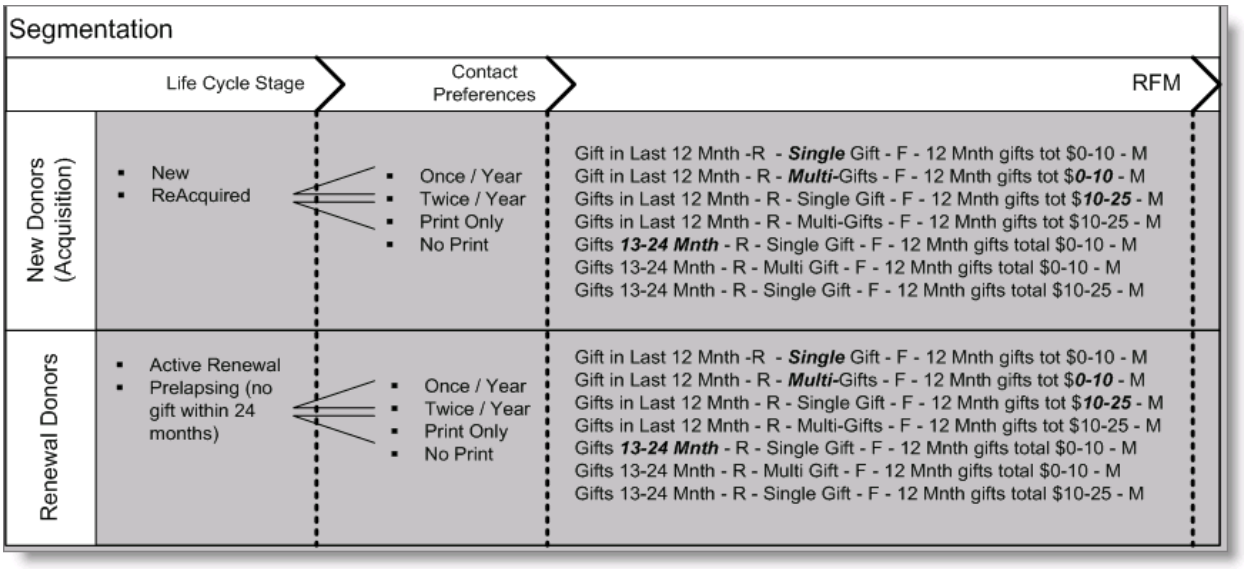
Lists without Names

Lists without names can still be tracked in Campaigns. At the source code level, assign the quantities included in the list rental. Track the list rental/purchase cost at the package level. Remember that the package gets attached to the source code. Different packages have different list costs so it's important to apply the cost to the package to properly calculate the ROI.

Example: Donor Segmentation

The following is an example of how a segmentation strategy can appear or be mapped during implementation. This example shows one audience that is separated into "life stages." It relies upon keeping track of customer contact preferences and uses RFM as the fundamental segmentation strategy.

For this example, Life Cycle Stage and Contact Preferences are the include/exclude selection criteria. RFM segment definitions will apply to everyone who has who has been selected during core criteria segmentation.



Example: Life cycle stages

Example: Event marketing

Organization XYZ is preparing to market its annual conference. The venue is booked and sponsors and expo sales are under way. It's time to start raising awareness for the event and getting event registrations through the door.

In this example,there are two different marketing efforts that the organization runs to meet these goals. The first is one tests a creative concept for the event. They want to understand which creative concept is more likely to get people to register.

After the creative concept is finalized and 80% of the speakers have been set, the organization is ready to recruit attendees by mailing the event brochure.

Marketing Goal

To recruit attendees for the annual conference.

Marketing Objective

To recruit 500 full conference attendees, 200 partial attendees.

The goals and objectives for this campaign are fairly straight forward. But accomplishing these goals is more complex.

First Mailing: Post Cards

First, XYZ does an A/B Split of the file to understand which creative concept is the better one to use for the rest of the conference marketing series.

Second Mailing: Full Brochure

The second mailing is where we apply some value ranks to our mailing. Full conference brochures are expensive and our goal is to cut numbers to save costs from groups who are least likely to respond.

Planning the campaign

Segmentation will be used in two different ways:

- Mailing 1 = Simple Split
- Mailing 2 = Ordered from most to least likely to respond

Annual Conference	Save the Date Postcard Mailing	Fountain Creative A	Source Code
		Dessert Creative B	Source Code
	Full Brochure Mailing	Past Attendees	Last Attended 08
			Last Attended 07
			Last Attended 06 or earlier
		Non-Attendees	Active Members
			Non-Members

Business Goals

The process to accomplish this scenario is:

1. Create a segmentation job with an A/B split.
2. Build the campaign structure for the event.
3. Generate output and pickup file for the solicitation.

4. Review responses to choose most successful concept.
5. Create a segmentation job with all segment definitions.
6. Mail brochure to list.

Creating a segmentation job with an A/B split

Add a new segmentation job:

- Name = Annual Conference

Create a new query:

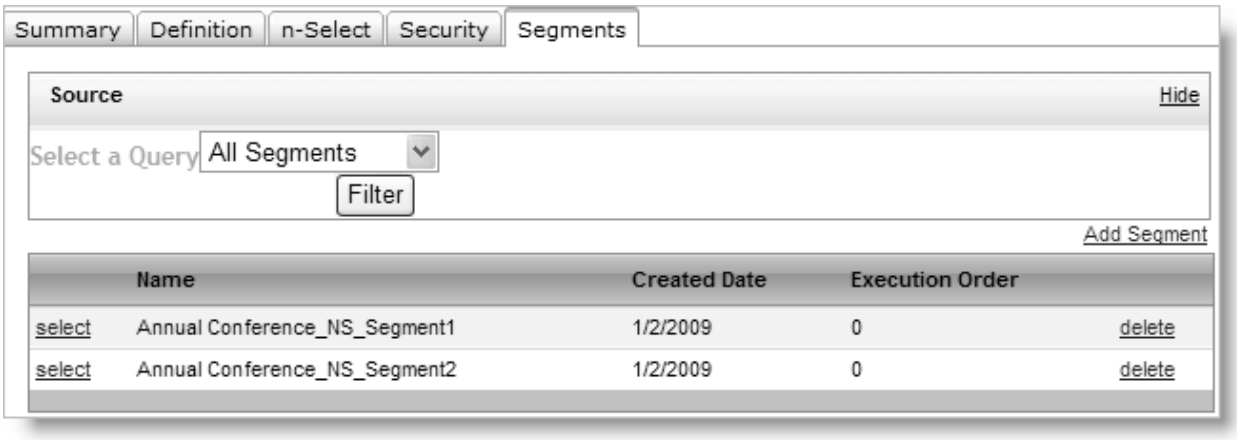
- Source - NetContact.
- Filter - Is A Company = No.

Define the n-Select segments:

- Number of Segments = 2
- Use all query results = selected
- Contacts per Segment: Enter the number of records at which you want to cap your segments. If you want two random groups with no cap, leave the 'Use All query Results' checked and enter the number of segments as two.

Populate the segments.

Two segments are created; both have an Execution Order of zero.



Example: Conference post card list with A/B split

Building the campaign structure for the event

Define the campaign structure:

- Name = Annual Conference
- Appeal = Save the Date postcard
- Solicitations = Creative A and Creative B

Attach the populated segments to the campaign:

- Select the job that contains the A/B split.
- Select a source code. The source code is attached automatically as the source list for the query.
- Select an insert and attach it to the source code.

Generating the output and the pick-up file

After the list and insert are attached, generate the output on the source code. This process will:

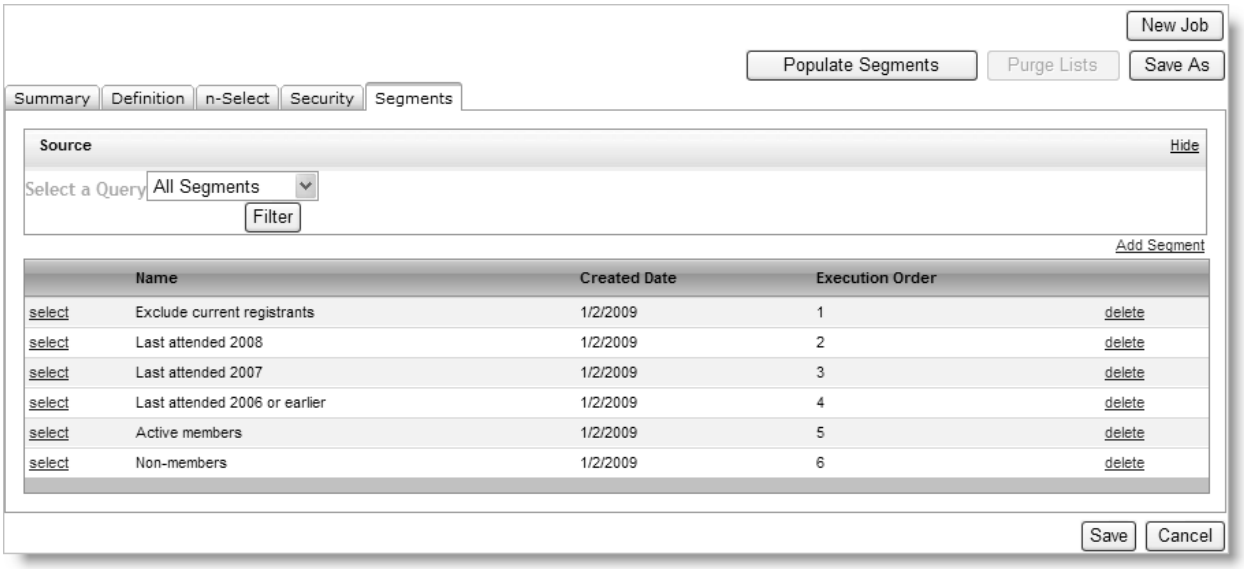
- Update the pie chart and metrics for non-responders
- Produce the output defined in the insert

Setting up the brochure mailing

The brochure mailing will use many different segments. Each segment will become a source code.

Annual Conference Full Brochure Mailing	Past Attendees	Last Attended 08
		Last Attended 07
		Last Attended 06 or earlier
	Non-attendees	Active Members
		Non-members

Open the segmentation job for this mailing and click the Segments tab. Your display may look like the following example:



Example: Segments list

Set up six segments.

The first segment is called Exclude - Current Registrants. It includes a query that produces a list of people who are already registered for the conference. By creating this first segment, XYZ will be able to use this job repeatedly.

The Execution Order determines the order in which records will be selected. A loyal member has probably:

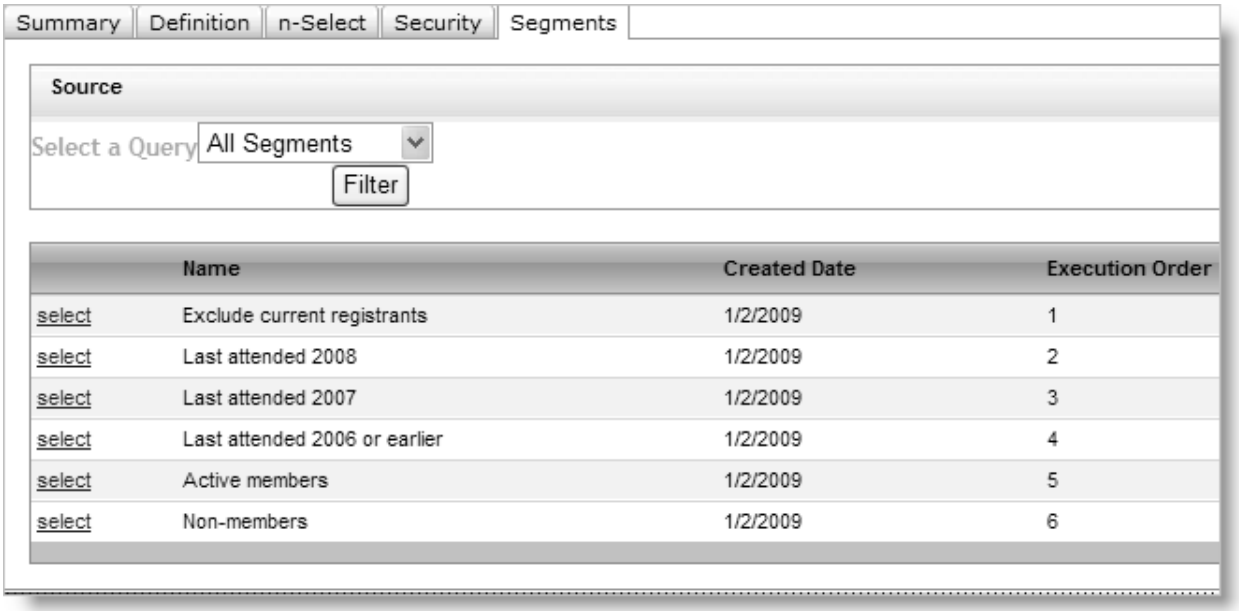
- Registered for this year's event
- Attended last year's and prior years
- Renewed their membership so they're an active member

Therefore, attach all of the segments to the job except the first. Duplicates in the file will be checked automatically to make sure that a record is only selected once.

- Select everyone who has registered for the event (don't mail them).
- Of the records left in the database, select everyone who registered last year. That segment is the first source code and are also the most likely people to respond this year
- Of the records left in the database, select everyone who registered the year before last. That segment is the second source code and are the second-most likely to respond this year
- Of the records left in the database, select everyone who attended two years ago. That segment is the third source code.
- Continue with the remaining segments.

Creating a segmentation job with all segment definitions

1. Add a new segmentation job.
2. Define the first segment by writing a simple query that defines who should be selected.
3. Define the remaining segments.
4. Assign each segment an execution order that determines the order in which to execute the duplicate checking process.
5. Populate the segments.



Adding to the campaign structure

- Campaign = Annual Conference
- Appeal = Full Conference Brochure
- Solicitations:
- Past attendees
- People who have never attended
- Source Codes (first mailing):
- Last attended last year
- Last attended two years ago
- Last attended three or more years ago
- Source Codes (second mailing):
- Never attended (members)
- Never attended (non-members)

Tracking costs for campaigns

To track costs at Appeal or Source Code level

1. Select Community > Manage marketing campaigns > Track campaigns.
2. Click Show / Hide Appeals and open an appeal.
3. Go to the Profile tab and open the Overhead Cost panel.
4. Add an additional cost and click Save.

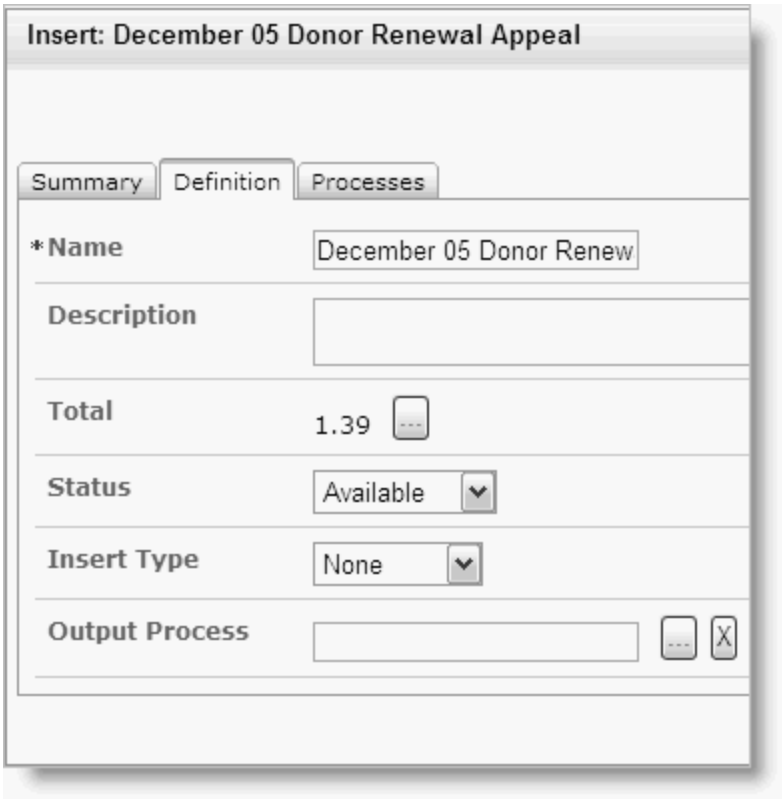
   The overhead cost calculation increases.

   To add cost to an insert

1. Select Community > Manage marketing campaigns > Define inserts.

2. Select an Insert.
3. Click the browse button next to Total.
4. Enter a value in the Cost Code and a cost per piece in the Amount.
5. Click + for each cost code you want to add.
6. Click OK to save the values.

   Confirm that the Total on the Insert window now shows the sum of the values entered on the Costs pop-up.



Sum of inserts

Tips

- Operational costs should be tracked at the Appeal or Source Code. The choice of tracking overhead costs at the Appeal or Source Code level is made in Campaign Management > Set Up Module.

- Package costs include any items that are applied to the actual insert or package: Those are tracked with the insert costs.
- Overhead Costs refer to any cost that is applied to the mailing or marketing effort as a whole. These costs tend to be difficult to break down on an item by item or cost per piece basis. You want to be able to track the costs against the appeal as a whole rather than trying to break out the costs against different source codes. This is especially true when you have multiple source codes within a marketing effort.
- Some costs apply only to a particular Source Code or part of a marketing effort, such as list rental costs or the difference between different packages sent. Even if you choose to track overhead costs at the Appeal level in your Campaign Management > System Setup options, you still have the option to be able track those additional costs. They are tracked as part of the package attached to the source code.

About RFM Analytics

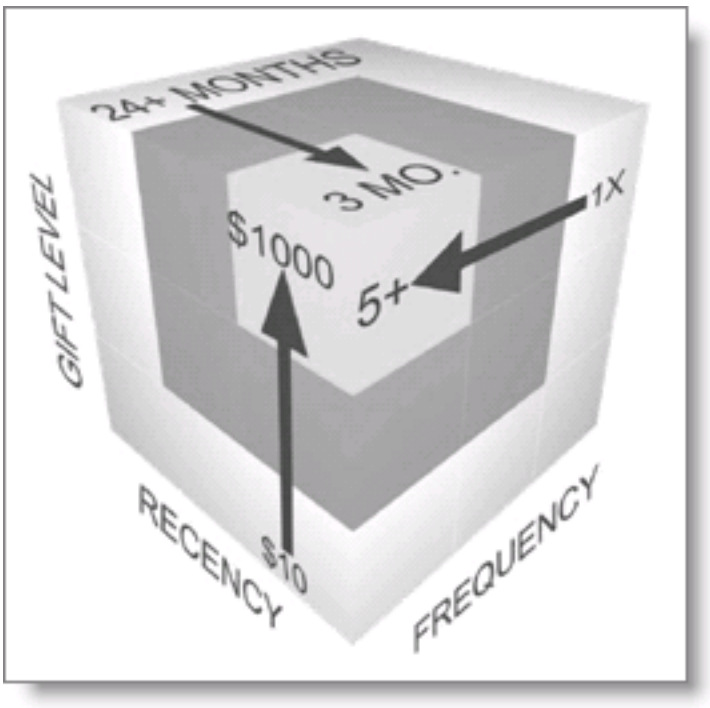
RFM Analytics is an analytical tool that provides rankings for your contacts based upon their financial participation with the organization. It is a very commonly used tool for fundraising, but its applications are not limited to the fundraising marketplace. Any organization that targets contacts based on past participation can benefit from RFM Analytics.

With RFM Analytics, you can:

- Rank and organize your customer population into specific groups manually or automatically.
- Define ranking scores for recency, frequency, monetary, combined (calculated), and total (calculated) values.
- Create groups, such as quintiles, that reflect the relative ranking of customers according to all RFM measurements.
- Analyze transaction patterns to accurately predict future behavior.
- Define different customer population and transaction queries to include in each analysis.

RFM Analytics relies upon three core elements that turn transactional data into a three-dimensional score based on:

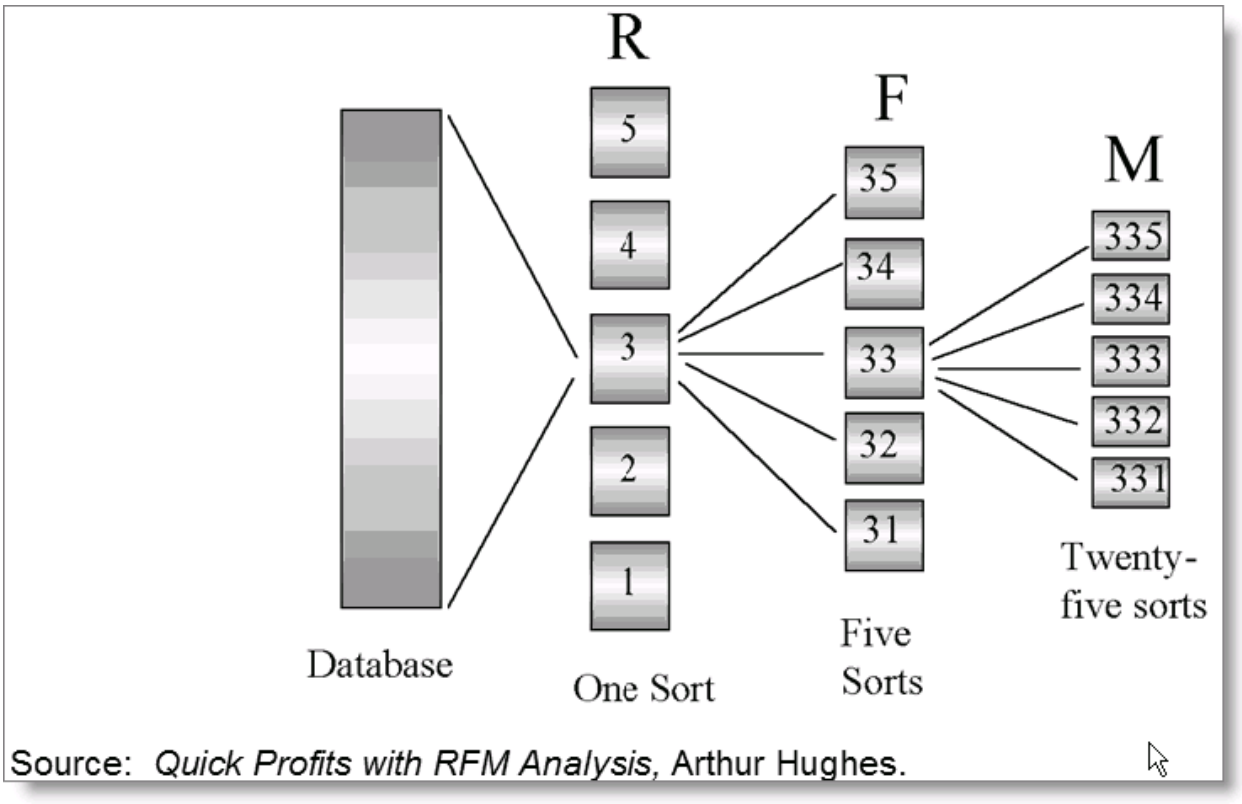
- Recency – How long since the last transaction?
- Frequency – How often does this transaction occur?
- Monetary Value – How much are these transactions worth?



RFM Analytics scoring

Rankings, once run, result in a score being assigned to each record. This score is important because ranks contacts/prospects within a matrix of highest to lowest values.

There are different schools of thought about how to use RFM scores. Some organizations use the total score (1+1+1 = 3). Others use the product of the score (1*1*1 = 1) and others use a concatenation of the scores (111).



Example RFM ranking

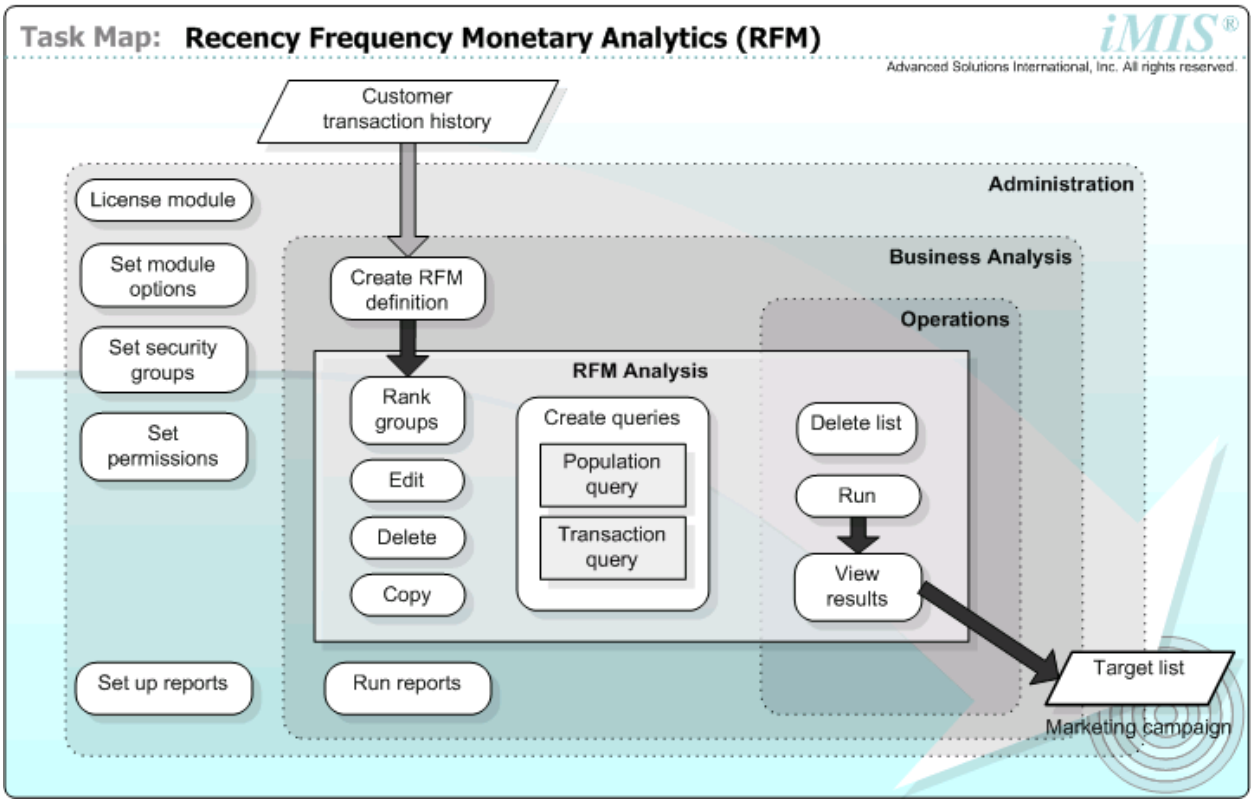
Tips for implementing RFM Analytics

- If you are running an RFM ranking for the first time, the automatic ranking might be able to help establish a first pass at quartiles or quintiles. However, make sure to review the results to see whether these rankings are correct for your organization. There is a danger in using and re-using automatic rankings for target marketing purposes. Automatic rankings will always produce equal buckets rather than telling you who is falling where based on typical transactional behaviors. After determining some basic highs and lows for each category, use the manual ranking to define those buckets and continue to evaluate the results.
- The key to successfully using RFM Analytics in any organization is having the patience to watch how people perform over a long period of time. Remember that anything can impact behavior and do not react immediately to changes. RFM buckets tend to remain stable.

- Build your queries separately. Do not use Save As to copy queries. There may be some unwanted criteria carried over from the original query.
- Make sure the transaction query Includes Quantity, Amount, and Transaction Date. These properties are used for the ranking. You can alias other properties if you wish, such as aliasing Date Received or Effective Date as the Transaction Date.

Task Map: RFM Analytics

This diagram illustrates RFM Analytics core tasks by the approximate order they occur (top-left to bottom-right) and by the organizational area that performs them.



Task Map: RFM Analytics

Example: Interpreting RFM rankings

The following example uses RFM rankings to identify prospects for a specific campaign.

Interpreting recency rankings

In this case, low values correspond to the most recent transactions.

Interpret these rankings as:

- 1 – Received within the last day
- 13 – Received from 2 to 13 days ago
- 25 – Received from 14 to 25 days ago
- 37 – Received from 26 to 37 days ago
- 49 – Received from 38 to 49 days ago
- 61 – Received from 50 to 61 days ago

Interpreting frequency rankings

Interpret these rankings as:

- 1 – Donated once
- 5 – Donated from 2 to 5 times
- 10 – Donated from 6 to 10 times
- 15 – Donated from 11 to 15 times
- 20 – Donated from 16 to 20 times
- 25 – Donated from 21 to 25 times

Interpreting monetary value rankings

Interpret these rankings as:

- 250 – Amount donated is 250 or less
- 500 – Amount donated is 251 to 500
- 750 – Amount donated is 501 to 750
- 1500 – Amount donated is 751 to 1500
- 2000 – Amount donated is 1501 to 2000

- 2500 – Amount donated is 2001 to 2500
- 3000 – Amount donated is 2501 to 3000

Creating RFM analysis definitions

RFM Analytics requires that two queries work together:

- Population query – Determines who will be analyzed
- Transaction query – Determines what will be analyzed (for example, date, quantity, amount)

Tips for creating RFM Analytics definitions

- You can copy and edit existing RFM definitions for efficiency.
- After you define the RFM analysis, you can run it repeatedly to create or update the list of segments generated.

Before you begin

Make sure the population query and transaction query are set up.

To create an analysis definition

1. Select Community > Manage RFM.
2. From the New drop-down list, select RFM Definition.
3. Identify each RFM model with a unique name (duplicate names are allowed).
4. Determine whether ranges should be set automatically or manually:

- When setting ranges automatically, enter a value greater than zero for at least one range.
- When setting ranges manually, specify the Recency, Frequency, and Monetary ranges.

The query is saved to the default RFM Process Engine folder unless specified otherwise.

Ranking groups automatically

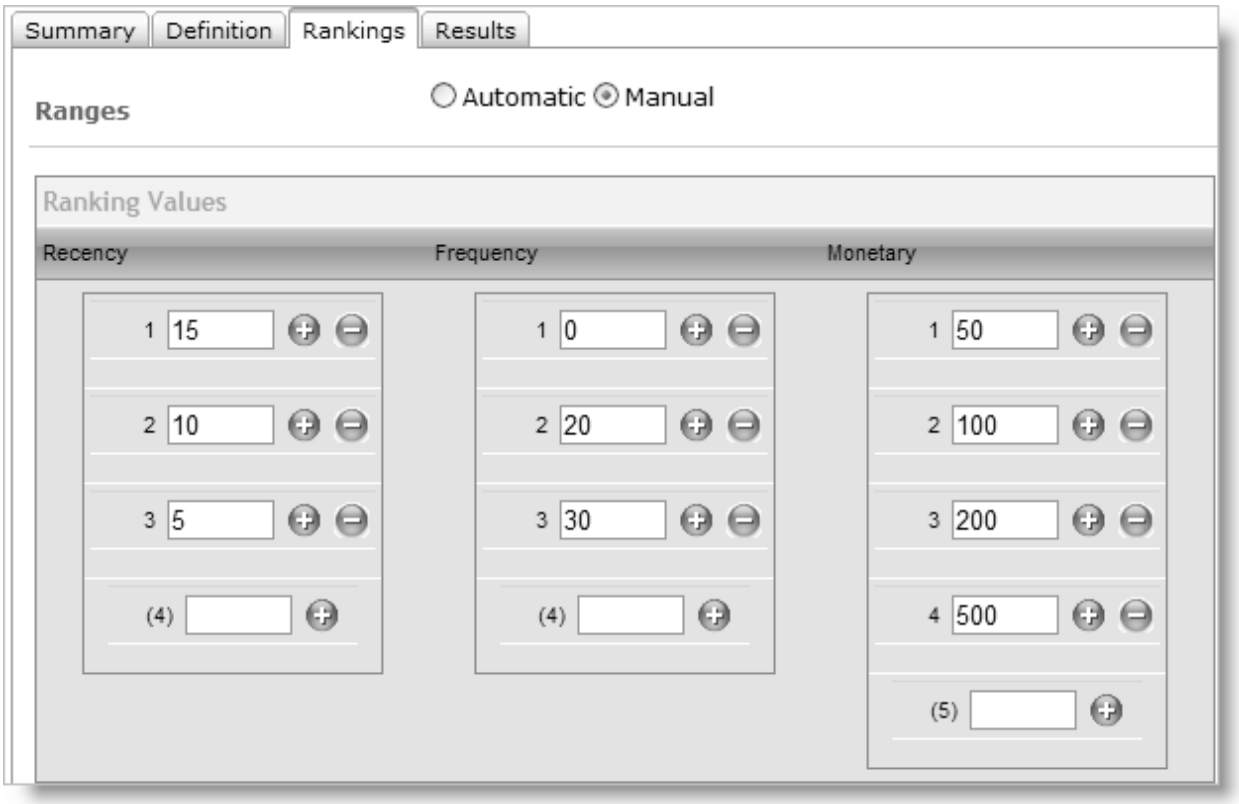
RFM Analytics divides the number of groups specified using the following procedure when groups are ranked automatically:

- Sorts lists based on criteria (Recency, Frequency, and Monetary)
- Divides the population equally into the specified number of groups
- Starts at the top of the list and ranks each contact based on the group
- Creates an equal number of contacts for each group:
- The lowest-numbered group corresponds to the least desirable ranking.
- The highest-numbered group corresponds to the most desirable ranking.
- The last group may contain a different number of contacts than the other groups depending on the population and number of groups.
- Some groups will be empty if the number of contacts is less than the number of groups.
- Two contacts with the same score may be placed in different groups.

Ranking groups manually

When ranking groups manually, you must enter criteria for each ranking group.

> **Note:** Note: When defining your manual rankings, you should use higher numbers for more desirable rankings and lower numbers for less desirable rankings to conform to industry standards for RFM rankings.



Example: Manually ranking RFM values

Recency

The criteria for ranking Recency is based on the last time the individual had contact with the organization. The date used is based on the Transaction Date specified in the Transaction Query. The following example illustrates how Recency is ranked:

- Group 1: >10 days and <=15 days, value = 15
- Group 2: >5 days and <=10 days, value = 10
- Group 3: <=5 days

Frequency

The criteria for ranking Frequency is based on the number of times the individual had contact with the organization. The value is calculated by the number of records for an individual in the Transaction Query. The following example illustrates how Frequency is ranked:

- Group 1: <20 times and >=0 times, value = 0
- Group 2: <30 times and >=20 times, value = 20
- Group 3: <50 times and >=30 times, value = 30
- Group 4: >=50 times, value = 50

Monetary

The criteria for ranking Monetary is based on the amount of money the individual has spent with the organization. The amount is based on the total amount from the Transaction Query. The following example illustrates how Monetary is ranked:

- Group 1: <0 and >=50, value = 50
- Group 2: <50 and >=100, value = 100
- Group 3: <100 and >=200, value = 200
- Group 4: >200 and >=500, value = 500

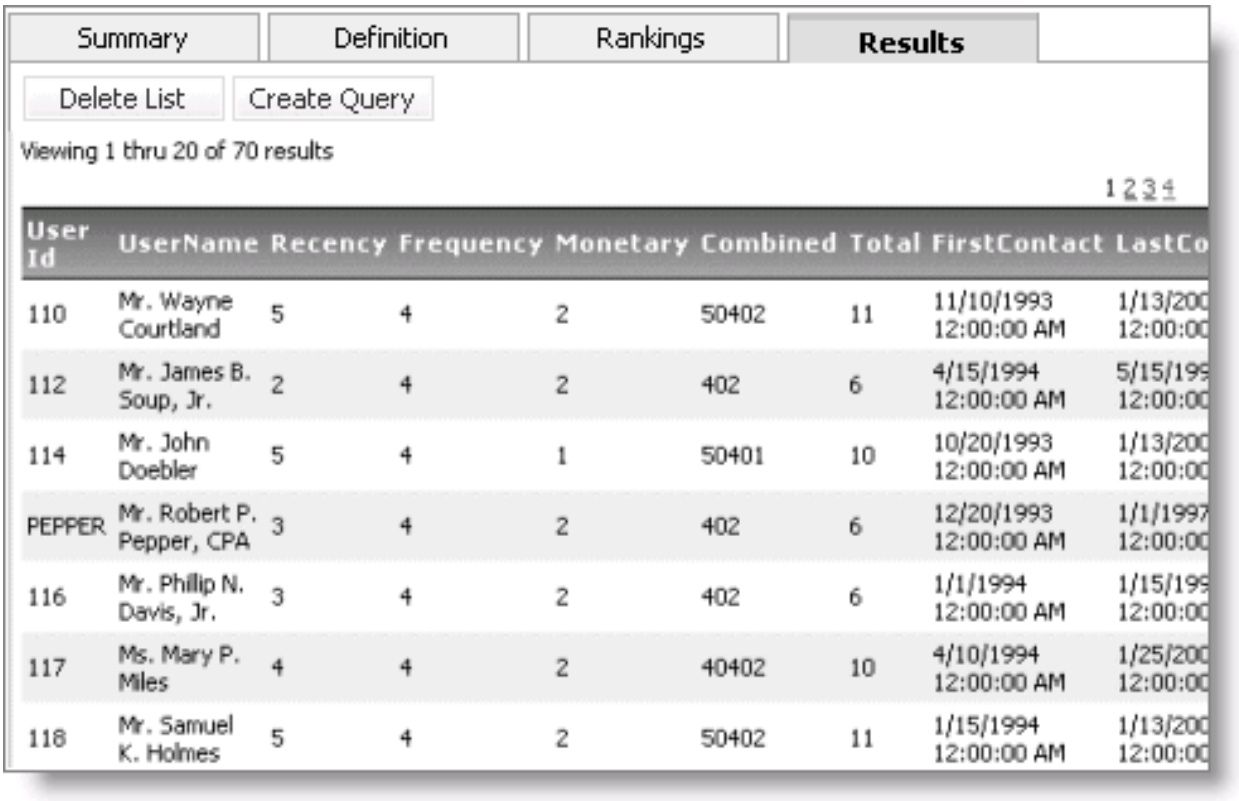
Generating and querying RFM analysis results

To generate and query RFM results

1. Select Community > Manage RFM > Run RFM Analytics and open the RFM analysis definition.
2. Click Run.

   A status message displays on the Summary tab. If an error message such as "An error has occurred while generating Lists" appears, click on the message to see more details.
3. View the results on the Results tab.

   Your results may look similar to the following example:



User Id	UserName	Recency	Frequency	Monetary	Combined	Total	FirstContact	LastCo
110	Mr. Wayne Courtland	5	4	2	50402	11	11/10/1993 12:00:00 AM	1/13/200 12:00:00
112	Mr. James B. Soup, Jr.	2	4	2	402	6	4/15/1994 12:00:00 AM	5/15/199 12:00:00
114	Mr. John Doebler	5	4	1	50401	10	10/20/1993 12:00:00 AM	1/13/200 12:00:00
PEPPER	Mr. Robert P. Pepper, CPA	3	4	2	402	6	12/20/1993 12:00:00 AM	1/1/1997 12:00:00
116	Mr. Phillip N. Davis, Jr.	3	4	2	402	6	1/1/1994 12:00:00 AM	1/15/199 12:00:00
117	Ms. Mary P. Miles	4	4	2	40402	10	4/10/1994 12:00:00 AM	1/25/200 12:00:00
118	Mr. Samuel K. Holmes	5	4	2	50402	11	1/15/1994 12:00:00 AM	1/13/200 12:00:00

To query the results of an RFM analysis

1. Select Community > Manage RFM > Run RFM Analytics and open the RFM analysis definition.
2. Select contacts from the following RFM criteria:

- Recency ranking
- Frequency ranking
- Monetary ranking
- Combined ranking
- Total ranking
- First amount
- First amount date
- Last amount

- Last amount date
- Highest amount
- Highest amount date

3. To purge the results, select Delete List.
4. To create a query for use in Campaigns, select Create Query.

Using RFM Analytics with Segmentation

RFM rankings can be used as the basis for segmentation. Segmentation assists with targeting the market or the segment of the database who is most likely to respond to the marketing effort. For example, if your marketing department is trying to mail the company contact of their best conference attendees, they might look for:

- Recency going back 5 years
- Frequency of attendance being greater than ten times attending (because this would imply that at least two attendees from that company attended within those 5 years)

  and

- Value = to increments of conference registration because that's the value of their attendance (anyone with a value higher than that might have purchased books at the conference or made a donation above and beyond the registration fee).

  You can use the same ranking model against different groups or populations within your database to be able to make predictions and better target who is most likely to respond to a particular marketing effort. The RFM rankings may look the same, but the numbers within each rank may be quite different.

Example: Creating a fundraising campaign

In this example, the campaign manager for the Research Foundation wants to create a fundraising campaign. The Research Foundation, which researches human diseases and develops vaccines, is preparing for its annual Ride for Research fundraising event.

The Ride for Research event is a weekend-long bicycle ride that has been very successful in generating revenue and awareness for the foundation's research. To attract riders for this year's event, the foundation will conduct a direct-mail marketing campaign that targets past and potential riders.

Create the campaign

Define the campaign:

- Name: Ride for Research
- Campaign Code: 05RR
- Description: Our annual series of events that serve as our major outreach and awareness campaign. The series culminates in our annual bicycle ride.
- Campaign Type: Annual
- Status: Active
- Start Date: 03/01/2006
- End Date: 02/27/2007
- Predicted Response Rate: 14.00

Create the direct mail appeal

Define the direct mail appeal:

- Name: Direct Mail Appeal
- Description: Direct mail appeal to attract riders for the Ride for Research event.
- Status: Active
- Start Date: 04/01/2006
- End Date: 04/30/2006
- Predicted Response Rate: 11.00

Create the products monitored by the campaign

When a monitored product (product linked to the campaign at the appeal level) is purchased (or a donation is made), the response management feature of Campaign Management automatically captures the product sale, which then is used for monitoring and measuring the campaign's performance.

In the iMIS Events module, define the event:

- Event Code: 05RR
- Title: 2005 Ride for Research
- Status: A
- Begin Date: 02/26/2006
- End Date: 02/27/2006
- Maximum: 25000
- Fundraising Event: Enabled
- Entity Code: General Fund
- Campaign: 05RR

Define the Event Registration function:

- Function Code: REG
- Title: Event Registration
- Type: REG
- Status: A
- Begin Date: 02/26/2006
- Time: 7:00 AM
- End Date: 02/27/2006
- Time: 5:00 PM
- Description: Registration for the Ride for Research fundraising event.

- Maximum: 25000
- Automatic Option: Enabled
- Fees: 100.00 Regular
- Income Account: General Income

In the iMIS Orders module, create the Product category:

- Category: Product
- Description: Order Products
- Stock Item: Enabled
- Taxable: Enabled

Create the Ride for Research coffee mug product:

- Code: RR-MUG
- Category: Product
- Status: Active
- Title: 2005 Ride for Research Coffee Mug
- Pricing: 8.00 Regular
- Unit of Measure: Each
- Weight: .5
- Stock Item: Enabled
- Taxable: Enabled

Add the products to the direct mail appeal

Assign the monitored products (05RR and RR-MUG) to the campaign's Direct Mail Appeal.

Create the solicitation for riders

The marketing plan is to solicit all Research Foundation members to ride in the Ride for Research event.

Define the Solicitation for Riders:

- Name: Solicitation for Riders
- Description: Core solicitation with specific requests for participating in and sponsoring the Ride for Research event.
- Status: Active
- Reminder Date: 04/09/2006
- Start Date: 04/10/2006
- End Date: 04/17/2006
- Predicted Response Rate: 14.00

Create the source code package for potential riders

This source code package will be sent to all potential riders in the Ride for Research event.

Define the Riders source code:

- Code: Riders
- Description: Package to contacts for riding in the Ride for Research event.
- Status: Active
- Overhead Cost: CC_01 = Cost Code, 500 = Amount
- Predicted Response Rate: 14.00
- Target Revenue: 75000
- Source Code Type: Run Many
- List Member Type: Contact

Create the source list: All Contacts query

Create the inserts

Create the following inserts:

- 10" x 15" envelope
- Brochure
- Business return envelope
- Postage
- Registration form

Add the inserts to the source code

Add the following inserts to the Riders source code:

- ENV10X15
- BRCHR
- RTNENV
- POSTAGE
- RegForm

Communications and Reporting

Communications tools help you build messages to be sent to targeted contacts. In addition, you can run reports about a campaign or a portion of a campaign. These messages and reports are considered “output” and can be generated at any of the four campaign levels:

- Campaign
- Appeal
- Solicitation
- Source code

In addition, you can import and export source lists.

Lists with names can be imported into iMIS Acquisition Management. Campaign Management and Segmentation can query this list and generate lists from it. One of the most important considerations is being able to test against different list rentals. Therefore, it is important to have a testing model.

Lists without names can still be tracked in Campaign Management. At the source code level, assign the quantities included in the list rental. Track the list rental/purchase cost at the package level. Remember that the package will be attached to the source code. Different packages have different list costs, so it is important to apply the cost to the package to properly calculate the ROI.

Kill files

Kill files may be prepared to accompany marketing campaigns, particularly acquisition campaigns. To prevent redundancy, an organization should run a de-duping or merge/purge of their house file (the active names) within their iMIS database and the lists that they rent.

If your organization is using these files, prepare both a segmentation job and output file specific to kill files.

Setting up output processes

Output processes are the means to generate collateral for your campaign:

- Word Merge – Print a mail merge document
- Email Merge – Send an email message
- Campaign List Export – Generate a list to be sent to an external vendor for letter shopping or to contacts via listserv
- RFM Analytics – Rank records based on Recency, Frequency and Monetary Value
- Opportunity Process Engine – Generate projects/opportunities based on complex business rules or in response to a campaign.

You can generate output from a campaign, appeal, solicitation or source code. When you generate output from one level, such as an appeal, output for all of the components beneath it generates. For example:

- Appeal – generates output for all solicitations and source codes beneath it
- Solicitation – generates output for all source codes linked to it
- Source Code – generates output for that one source code only

Word merges and campaign list export files are stored inside Campaign Management after running. Use the View Output menu to see the results.

Tips for setting up output processes

- Throughout the Marketing Suite, NetContact is a required business object. Make sure that you include it in all of your queries, regardless of whether they are used as source lists for source codes or as output queries for an output process attached to a source code.
- Use templates for best efficiency. Some templates are designed through third-party packages which integrate with iMIS; for example, Microsoft Word documents, emails, and report files. Most output processes allow you to define and save the template while you build the process itself.
- Process Manager must be set up before running the opportunity output process.

Business goals

The process for generating output is:

1. Build the campaign structure first and define the source list (query, a previous solicitation, or a segmentation job).
2. Define an insert.
3. Customize the insert template, if necessary, for this specific need.
4. Attach the output process insert to one or more source codes.
5. Generate the output.

Seed lists for campaigns

A seed list is a list of the individuals within your organization concerned with the campaign. Seed lists are often used to confirm the mail date and to distribute samples internally.

Seed lists are often attached to campaigns but usually not to source codes so that the seed list is not included in the return on investment (ROI) calculations.

Queries for output processes

Using queries to generate output

When a process is run independently of Campaign Management, the process uses the query in its definition to determine the set of generated records. When the same process is executed as part of a campaign's output generation process, the set of records is determined by joining the query with the campaign's target list to form a subset of records. If the process's query does not have records in common with the target list, no output will be generated for that source code.

The source that you should use for the query depends on how you will use the output process.You must typically define two separate output processes for marketing inserts because source codes and job segments differentiate between contacts and prospects.

- Job segments are defined as a contact job or as a prospect job.
- Source codes are designated as a contact source codes or as a prospect source code.

So, to send marketing inserts to both your contacts and your prospects, you would need to create two different inserts:

- One insert must use an output process whose query source is the NetContact business object
- The other insert must use an output process whose query source is the Prospect business object.

> **Note:** Note: You should not use CSContact or CSProspect as the query source for any output process associated with marketing inserts. Use only the NetContact or the Prospect business object as appropriate, depending on the associated source codes and job segments.

Marketing Concepts and Terms

Basic and closed-loop marketing principles

There are many different types of marketing efforts used by a variety of different sectors, such as:

- Retail marketing
- Fund raising
- Brand marketing
- Membership
- Issue awareness
- Event marketing
- Calls to action

Each of these forms of marketing uses a series of principles and practices to meet their goals. The principles discussed in the following topics reference database marketing practices for the not-for-profit sector. These are general, high-level concepts, but each organization performs marketing in a unique manner.

Customer-focused marketing

Being customer-focused means that marketing efforts need to balance the goals of the organization with the needs of their "customers" (contacts, members, donors, prospects, legislators).

Customer-focused organizations integrate their customer service department and website content with current marketing efforts to offer choices. By offering choices, they open

opportunities for customers to respond to the call to action. That way, the customer chooses when and how they want to hear from the organization.

For years, these organizations have used focus groups and other consumer index information to help determine what their product offering should be. More and more, focus groups and customer surveys are being used to determine how an organization is perceived by its supporters. After the questions are asked and the numbers are in, organizations are changing how they speak to their supporters.

Customer satisfaction is a relatively new key metric that organizations seek to determine. Ways to measure customer satisfaction include:

- Conducting a survey – Extract a list from your database, develop customer satisfaction questions, call or send the survey to your customers, record the responses, and analyze the results.
- Integrating short surveys into your customer service activities – Add questions to a donor reply device or a membership renewal package.
- Offering a survey on your website.
- Encouraging your customer service staff to ask questions when they are on the phone with your customer and to record the answers.

A key component to being customer-focused is responding to supporters when they take the time to ask a question or express a concern. Respect for the customer is the key to maintaining high customer satisfaction ratings.

Measuring customer satisfaction is integrally tied to managing your key business processes well, particularly your customer service processes.

Closed-loop marketing

The closed-loop marketing approach measures the results of marketing and communication initiatives by tracking the response of targeted groups. The results of responses, such as completed surveys, promotional entries, coupon redemptions and purchase behavior, are added to a database for tracking and evaluation to improve future

marketing decisions. Marketing campaigns can then continuously adapt to the customers' wants and needs, creating a true relationship. Simply put, marketers can develop and monitor targeted strategic campaigns based on a wide variety of customer histories and behaviors.

Closed-loop marketing process

Organizations do not leap into target marketing. Organizations that are working towards a targeted closed-loop approach plan the introduction carefully and over some time, beginning with developing a segmentation strategy.

Closed-loop marketing involves a never-ending cycle of ongoing analysis, ongoing marketing, and ongoing response management. As we market, we learn. As we learn, we develop new marketing strategies. New marketing strategies lead to changes in how we manage responses.

New market opportunities are identified through trend analysis. A new opportunity may address a weak area within a marketing plan or may identify a new group.

Closed-loop marketing refers to the cycle of:

- Developing metrics and benchmarks for the desired transactional behavior
- Ensuring that business processes are in place to maximize the customer's experience and to build loyalty.

In essence, once a customer is introduced into our loop, we ensure that they never want to leave.

The role of segmentation

Segmentation is the science of dividing up all of the records in an organization's database into small groups that can be marketed to and measured over time. It is the way in which we apply demographic, mood, and transactional data to our marketing activities.

Most organizations that have a segmentation model are able to provide detailed descriptions of what those segments are and when they approach them. Organizations without a segmentation model need to plan one carefully. Segmentation strategies change from organization to organization. This is because the mission of each organization is unique and the characteristics that make up its supporter base are equally unique.

Segmentation usually begins by defining broad audience groups. However, audiences should not be considered as isolated groups; they may support the organization in a

variety of ways. By recognizing that these relationships exist, an organization can offer personalized targeted marketing.

Types of data

A variety of data can be used for targeted marketing:

- Demographics
- Psychographics
- Transactional data

In order to be customer-focused, an organization's data segmentation strategy must include customer communication preferences and can include individual customer satisfaction rankings.

Demographics

Demographic data helps identify groups based on information like age, gender, geographic location and marital status. Demographic data is core to understanding what groups may be likely to perform in what way.

Acquiring demographic data about customers may or may not be easy to do. Some organizations require that date of birth and other demographic information be provided. Other organizations may be bound by privacy rules that may make it harder to capture this information.

Demographic data can be acquired from outside sources. For instance, you can recruit the services of a vendor who has access to income tax data and other filed information.

Psychographics

Psychographics refers to how someone behaves: their likes, dislikes, interests, and key values. Although demographic data generally remains consistent, psychographics change. A key measurement of psychographics is customer mood. Customer moods change based upon how an organization interacts with a customer.

Psychographic data is usually gathered through polls and surveys.

Transactional Data

Analyzing transactional data is critical to measuring customer satisfaction and loyalty.

RFM (Recency, Frequency, Monetary Value) is a common way of scoring transactions and determining loyalty and value. By establishing a matrix of values, you can measure where a customer ranks within the matrix and the direction they are migrating.

RFM is the science of developing this matrix of scores based on values we associate with the scores. In the end, records are grouped together based on their rankings. They share their support in common. Because the rankings are standardized, it is a very statistically valid way of building a standardized segmentation model. The RFM scoring process inherently converts flat data files into three dimensional data files.

Other ways of looking at transactional data are available but they are one dimensional in nature:

- Last Year But Unfortunately Not This (LYBUNT)
- Second-to-Last Year But Unfortunately Not This (SYBUNT)
- Third-to-Last Year But Unfortunately Not This (TYBUNT)

This data measures only one RFM characteristic: Recency. You cannot use a LYBUNT, SYBUNT, TYBUNT report for identifying your best customers; its purpose is to identify the erratic donor.

High-value customer reports are also common for measuring value, but judgments made solely upon value can be misleading in determining customer strategies. For example, should you spend time building a relationship with a customer who has given you a lot of money but not for the past five years? Or, should you spend time building a relationship with a customer who has given less financial support but given it very recently? Or, very loyally every year for the past ten years?

Reports and analytics that focus on only one element of the transaction can be mis-leading. The RFM approach is preferred because of its ability to slice data three ways.

RFM is also ideal because it can be implemented easily and regularly within a database. Ideally, data should be reviewed with a vendor/partner who specializes in understanding marketing statistics and segmentation, but this is not always necessary. Other more advanced data analytic services are also available, but can be expensive and difficult to implement and are best used to develop a predictive model.

A predictive model is used to consolidate all of the demographic, psychographic, and transactional data available to the organization into a data algorithm that can be used to target records that appear to be becoming a target market. For example, a "lapsing customer" model can identify customers whose loyalty is waning before they disappear. Or, a "planned giving" model can identify the point at which we've learned the two or three key criteria that we need to gather to qualify a planned giving prospect.

Predictive models generate leads for a different marketing strategy. Marketing campaigns/appeals follow through on those leads. Data underlies the success of these marketing efforts.

Using Different Types of Data to Enhance Marketing Efforts

Source Code assignments fall into three basic categories:

- Codes assigned to outgoing marketing efforts to track the incoming responses to the effort that recruited the support
- Generic codes that are assigned to ongoing 'passive' ways in which a customer can support an organization, such as web transactions, general acknowledgement responses, pass-to-a-friend, catalogs, or cards
- Unknown codes that are assigned to capture responses when the actual source code is not known

Assign source codes to outgoing marketing efforts to be able to track how contacts respond. A source code is assigned to each segment within an outgoing marketing effort and is printed on a reply device (the form the customer returns to the organization). Printing the source code on the information the contact receives allows for it to be data entered easily when an incoming transaction is received. Essentially, source codes

should exist at any time that a contact is presented with a project to support. This opportunity is a call to action.

Source code tracking is important. To maintain the highest possible accuracy in recording the actual source code assigned to a contact's response, key processes have to be highlighted. Data entry staff need to know the importance of accurate data entry and, in a customer-focused closed-loop model, quick and accurate acknowledgements should be sent to the contact, thanking them for their response.

Entering the correct source code on incoming transactions is important for thanking the contact properly. An error might result in a complaint to your customer service staff or it might convince the contact to stop supporting your organization.

What feeds source codes into Campaign Management?

Campaign Management: The 'source' for the Campaign is your source code. The source code is your list of members/prospects that a campaign/appeal/solicitation is targeted to and the output is generated for. This list of members for a specific source code comes from a segmentation job or definition, a query or a group of solicitation responses.

Segmentation: When you generate a segmentation job consisting of 1 or more segment definitions you are creating a source list for your campaign/appeal/solicitation. A source code in Campaign Management can pull from the whole job or just one of the segment definitions.

RFM Analytics: You can use RFM analysis to generate queries to use in Segmentation to help create the segments. In this way, RFM helps create the segment definition that is used as a source list for a source code in Campaign Management.

Process Management: When you create a new opportunity, on the Definition you can select a Source Code. This is more informational than functional in that it lets you record which Source Code for a specific campaign/appeal/solicitation may have generated the opportunity.

Testing the marketing plan

The move from mass marketing to targeted closed-loop marketing is usually accomplished through testing. Best practices for testing include:

- Test one thing at a time.
- Determine a goal/objective for your test. It is important to know that you are doing what you set out to do.
- Understand what makes for a statistically valid result. The simple rule of thumb is to include enough records in your test to ensure that you receive at least 100 responses.

  Market testing within your own database requires that you use random segmentation selections. This means that you establish a group that you would expect to perform in a particular way and then randomly select the number of records you want to test against.

  Statistical validity is measured not just by having test groups of the right size, but also by the use of control groups. Test groups must be measured against a control group. The control group will receive the same package as usual or be the same group as usual. This group will receive the usual expected result unless an outside phenomenon changes the outcome. The test group will perform differently than the control group.

  If the objective is to “recruit more donors,” then you cannot say that the test failed because the return on investment is lower than the control group. Return on Investment is a different metric than percentage return. The percentage return better measures if this objective was met.

  To accurately determine whether a test is successful, it should be repeated. Future campaigns should repeat the test on new groups of randomly selected records. After the test has produced similar results three or four times, consider increasing the size of your test groups and introducing your new tactic on a permanent basis. Again, vendors can work with you in developing tests, measuring their effectiveness, and deciding when the test has finished successfully.

Terms to know: Campaign Management

actual cost

Calculated as follows when Budget Level is set to Source Code:

(total insert costs x actual number of contacts solicited) + (overhead costs of source codes for which output has been generated)

appeal

Each major marketing effort of a campaign, usually associated with a drop date. An appeal can be:

- A phase of the project, such as "First Request" or "Airwaves Blitz"
- A portion of the campaign targeted to a specific group of contacts or prospects
- A portion of the campaign assigned to an internal group (generating mailing lists, designing artwork, managing responses)

average transaction amount

Total Revenue divided by the total number of all orders, gifts, and pledges attributed to one of the following:

- Source code
- All source codes within a campaign, an appeal, or a solicitation

campaign

A strategy to accomplish a single marketing goal, such as a membership drive, a fundraising campaign, an annual convention, or a legislative initiative. Campaigns are the highest level of measurement and are typically project-driven.

campaign type

Object for organizing and grouping specific and similar campaigns. The following campaign types are available by default:

- None
- Annual – Campaign that occurs every year
- Designated – Funds generated by the campaign are committed to a specific entity

- Undesignated – Funds generated by the campaign are not committed to a specific entity. The organization decides how to allocate the funds, unless specified by the donor.

cost per thousand

Equal to the following:

- For each campaign, appeal, and solicitation:

(Actual Cost x 1000) / number of pieces mailed

- For each source code when Budget Level is set to Source Code:

(Total Cost x 1000) / number of pieces mailed

count

Total records in an external list

current response rate

Equal to the following for each campaign, appeal, solicitation, and source code:

number of responses received / number of pieces mailed

date of first response

Date a contact first responds for each campaign, appeal, solicitation, and source code

date of last response

Date a contact last responded for each campaign, appeal, solicitation, and source code

drop date

The definition of drop date depends on the media involved:

- Direct mail – Date delivery begins
- Telemarketing – Date calls begin
- Media spots (TV, radio, webcast) – Air date

- Newsletters – Date of issue mailing
- Online campaigns – Date email messages are sent

Drop dates for other efforts can include:

- Date the mailing list is generated
- Date the creative concepts/artwork is complete
- Date the response management process is set up

dummy/test selects

Practise run to verify counts. Many organizations run dummy or test selects prior to their anticipated mail date to see the final counts and to modify the criteria if the numbers are not what they anticipate.

During the production process, counts are usually required for:

- Accurately determining postage costs (usually pre-paid)
- Determining print quantities
- Determining print quantities by package

estimated cost

Calculated as follows when Budget Level is set to Source Code:

(total insert costs x estimated number of contacts solicited) + (source code overhead costs)

external filename

Name of an external list

highest transaction amount

Maximum of all orders, gifts, and pledges attributed to one of the following:

- Source code
- All source codes within a campaign, an appeal, or a solicitation

insert

Physical item sent to a contact such as a merge letter, pre-printed collateral, or envelope

insert type

Object for organizing and grouping specific and similar inserts. The following insert types are available by default:

- None
- Brochure
- Envelope
- Form
- Postage

kill file

Files from an external source that have been checked for duplications and merged/purged with an organization's iMIS database and rented lists

last drop date

Date of the last output generation

list member type

Method of grouping list members into general types. The default list member types are Contact and Prospect.

list type

Method of organizing source lists by type. The default List Types are Query, Segment Definition, and Solicitation Response.

lowest transaction amount

Minimum of all orders, gifts, and pledges attributed to one of the following:

- Source code
- All source codes within a campaign, an appeal, or a solicitation

net revenue

Calculated at the campaign, appeal, solicitation, and source code levels as:

Total Revenue – Actual Cost

operational costs

Costs for anything that is applies to the marketing effort as a whole, such as:

- Lettershopping
- Printing
- Paper

output process

A process-oriented task, for example, a Crystal report, MS Word merge, or query

overhead cost

The sum of expenses entered for each appeal (when Budget Level is set to Appeal) or source code (when Budget Level is set to Source Code)

package costs

Costs for anything applied to the package, such as:

- Postage
- Outer envelope
- BRE
- BRD
- Telemarketing costs

predicted response rate

Percentage estimate of contacts responding to each appeal (when Budget Level is set to Appeal) or source code (when Budget Level is set to Source Code)

response media

The origin of an opportunity, such as email, web, telephone, or postal mail

response stage

Pre-defined stages in the source code so that a contact moves through campaign stages as they respond to solicitations

response state

The configuration setting for including contacts in specific campaign stages based on response history:

Solicited – Contact has been solicited but has not responded.

SolicitedResponse – Contact has responded to a solicitation.

UnsolicitedResponse – Contact has responded but was never solicited.

OptOut – Contact has opted out of the solicitation.

revenue per thousand

Equal to the following for each campaign, appeal, solicitation, and source code:

(Total Revenue x 1000) / number of pieces mailed

ROI percentage

Equal to the following for each campaign, appeal, solicitation (Budget Level set to Source Code), or source code (Budget Level set to Source Code):

(Total Revenue – Actual Cost) / Actual Cost

seed lists

Lists of individuals within the organization sending the campaign. These lists are often included to confirm the mail date and to distribute samples internally.

solicitation

A series of communication pieces for an appeal. For example, a "First Request" appeal might direct different messages to previous donors/customers than to prospects.

source code

Numbers assigned to each communication piece to track responses. These numbers are associated with reply devices (postcard, website checkbox) so your organization can measure the effectiveness of each solicitation. Source codes are the most granular level of measurement in a campaign.

source code ID mode

Configuration setting to generate source codes manually or automatically

source code type

Indicates whether source code list sources are defined by internal data or by an external file. Default source code types are Run Once, Run Many, and External List.

source list

List specifying contacts to be solicited

synchronize responses

Option that triggers the response recognition process

target revenue

Monetary goal for each campaign and appeal (when Budget Level is set to Appeal) or for each solicitation and source code (when Budget Level is set to Source Code)

total cost

Calculated according to budget level:

- Budget Level is set to Appeal – equals the sum of all overhead costs for an appeal and for all appeals within a campaign. Insert costs are ignore). The displayed Total Cost is always up-to-date with the current cost of all sub-items. Because Total Cost calculation relies solely on overhead costs, Total Cost is never estimated.
- Budget Level is set to Source Code – Total Cost (Actual or Estimated) displays for each campaign, appeal, solicitation, and source code

  total revenue

  The sum of all orders, gifts, and pledges attributed to all source codes within a campaign, an appeal, or a solicitation

Terms to know: Segmentation

n-Select segments

A portion of the entire population that is the target for a campaign. The results returned by a selection filter are divided into a number (n) of segments, with the same number of contacts or prospects in each segment.

segment

Portion of the entire population that is the target for a particular marketing campaign. A segment organizes customers and prospects according to demographic and behavioral patterns.

segment definition

Specifications for an individual segment within a segmentation job. A segment definition can be a query segment or an n-Select segment.

segmentation job

A mechanism for establishing all of the segments in a marketing campaign. This allows segments to be added, deleted, and tested. The segments can then be assigned to individual source codes and created in one process rather than individually creating each segment.

Terms to know: RFM Analytics

frequency

Number of times a contact has transacted with an organization

monetary

Individual or cumulative value of a contact's transactions with an organization

population query

Defines the population (contacts) used for RFM analyses. The population query references an IQA query that extracts users from an existing set.

quintile

Any of the four values that divide the items of a frequency distribution into five classes with each containing one-fifth of the total population

recency

Period of time (in days or months) that has elapsed since the last transaction between a contact and an organization

transaction query

Defines the transactions considered for RFM analysis. The transaction query references an IQA query.

iMIS

Configuration Console

Your Administrative Console includes a Configure tab, which presents quick access to the tools that your staff need most frequently in order to configure aspects of your web-sites:

Membership	Events	Fundraising
Configure membership options	Configure event options	Configure Fundraising options
Set up customer types	Set up registrant classes	Set up sender codes
Set up activity types	Set up event resources	Set up interest codes
Update area codes		Set up memorial/tribute codes
Set up country names		Set up tables
Set up country address lay-outs		
Set up state/province codes		
Set up lookup/validation tables		
Set up chapters		
Set up committee codes		
Set up committee positions		
Set up relationship types		

Billing	Commerce	Certification
Configure billing options	Configure commerce options	Configure Certification options
Set up billing cycles	Set up warehouses	Set up component categories
Set up billing products	Set up order types	Set up subcomponents
	Set up product categories	

Set up tax codes
Set up freight by weight
Set up freight by total value
Set up freight by total quant-
ity
Set up shipping zones

Continuum Console

Your Advanced Accounting Console includes Continuum, offering quick access to tools for producing a wide range of reports:

Membership Reports offers contact and billing reports. Report types include activity records, labels, rosters, open invoices, and transactions.

From Event Reports, you will find a menu of report types, including, but not limited to: badges, certificates, invoices, levels, rosters, tickets, transaction lists, labels, order status, product, and product transactions.

Fundraising Reports is where you run reports on appeal and campaign activities, as well as on distribution and fund activities. Report types include badges, certifications, confirmation, hotel, invoices, and many more. With executive reports, you might choose top donors, a yearly giving comparison, donor club summary, or a previous/current period report.

Other Reports include accounting reports that include on-screen account inquiries, transactions reports and journals, trial balance reports, as well as deferred income, selected invoices, order status, product transactions, and credit/debit card authorization reports. Credit card reports include, among other options, deferred income, reconciliation, authorization audit, credit card post authorization, and debit card post authorization reporting.

Depending on your license keys, some areas might not be listed in your Administrative Continuum. The license keys needed for each area are:

- Membership Reports (MEMBERSHIP or DUES or EDUES or CERT or CERTIFICATION or REFERRAL)
- Events Reports (MEETINGS or WMEET)
- Fundraising Reports (FUNDR or FUNDRAISING)
- Other Reports (CASH, ORDER, W_ORDERS, or SERVCEN)

Note: In order to access Continuum, staff (Full User) must be assigned to the Reporting user group. To assign users to groups, go to System Admin > iMIS Management > Security administration > Users; in the User Information section, click add group, select the Reporting option, and click OK.

Note: Note: The current reporting tool in iMIS is Microsoft SQL Server Reporting Services (SSRS). You can access Microsoft SQL Server Reporting Services reports and queries through the RiSE tool on the Staff or Member web sites. However, you can use Continuum from the Advanced Accounting Console to access older Omnis and Crystal reports.

Continuum > Membership Reports	Continuum > Event Reports
Contact reports	Event reports
Billing reports	

Continuum > Fundraising Reports	Continuum > Other Reports
Fundraising reports	Accounting reports
Executive reports	Credit card reports
	Customer service reports
	Order processing reports

Membership Reports

When you select Membership Reports, the standard iMIS report window displays. The window offers you a variety of printed output, including Rosters, Statistics, and Activity reports. The window is identical to that of every iMIS module. It gives you access to many categories of reports and options, from which you select specific formats and output. It also lets you choose the printer with Set Report Destination or other output device, and you can often vary the sort order and control the inclusion of providers and records, as well as other report-related items.

- Contact reports
- Billing reports
- Certification reports
- Referral reports

Open Items by Product report

The Open Items by Product report lists open billing amounts (sorted by product) that have been billed through the system and have not been paid. By default, the report lists all items that are open when the report is run. You can use ad hoc selection criteria to reduce the number of items selected. (Click Options and select Search Format before clicking Run.)

Fundraising Dues items are flagged (**) and the report includes the footer "** = Voluntary Donation".

Event Reports

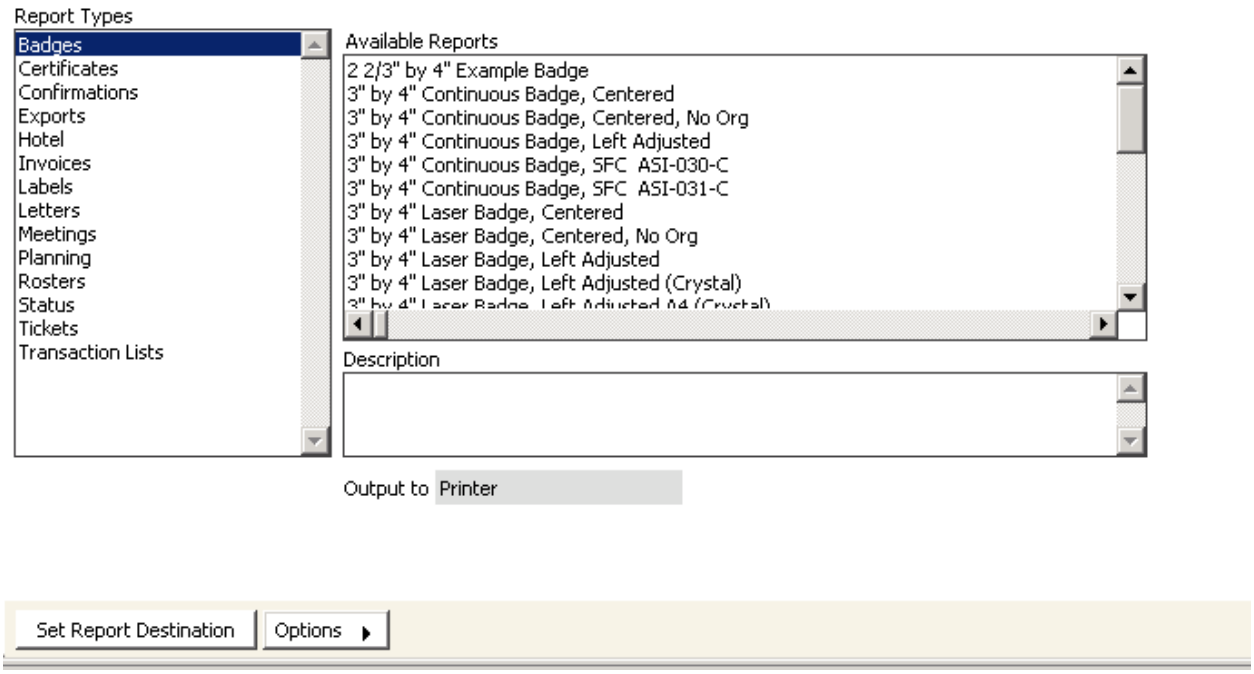
Event reports window



Continuum > Event Reports > Event reports

Events-Specific Report Options

The report options Print_Guest and Print_Additional_Badges enable you to include Event badge holders other than conference registrants in several Events reports. The check-boxes for these options, Guest and Additional Badges, are included under the Print Options area of the Event Selections window.

> **Note:** Note: Badge holder information is entered on the Event Registration > Badge Information window.

Print_Guest affects Events badge holders whose BADGE_TYPE is GUEST.

> **Note:** Note: The GUEST type must be defined in the BADGE_TYPE General Look-up/Validation table for the report option to work correctly.

Print_Additional_Badges affects Events badge holders whose BADGE_TYPE is any type other than PRIMARY.

The following reports accommodate the use of Print_Guest and Print_Additional_Badges:

- Formal Meeting Roster, Alpha by Name (Crystal) – the report format groups and sorts by the primary registrant's last name, with associated badge holders, sorted by their last names, directly following the primary registrant.
- Formal Meeting Roster, by Company (Crystal) – the report format groups and sorts primary registrants by their company names, with associated badge holders, sorted by their last names, directly following the primary registrant. Company names are not listed for non-primary badge holders.
- Preregistration List (Crystal) – the report format groups and sorts by Meeting Title, Order Number, Primary Registrant, and associated badge holders.

The following reports offer the Print_Guest and Print_Additional_Badges options but have not been specially formatted to use them:

- Formal Meeting Roster, by Company/Institute (Crystal) – no change to report format
- Preregistration List
- Export Registrants to Microsoft Word
- All Labels by Zip
- All Badges reports except Combination Badge and Ticket reports

> **Note:** Note: Combination Badge and Ticket reports automatically print a badge for the Registrant and a badge for the next badge holder listed in that registrant's Badges tab. This feature cannot be turned off.

Modifying invoice reports for zero balance and payment details

The following reports, when the search condition is modified in the report specification, can print invoices for registrants with a zero balance:

- MeetingInvoicesOE4
- MeetingInvoicesOE4_VAT
- MeetingInvoicesOE1
- MeetingInvoicesOE1_VAT

These changes are intended only for customized and cloned reports. The standard reports will not differ from their previous versions. You can clone any of the above reports or customized versions of these reports and manually modify the relevant report specification to achieve the intended results.

To modify an invoice to print zero-balance invoices

1. Clone the desired Meeting Invoices report.
2. Click Parameters to display the Detail Report Parameters window.
3. In the Search field, remove the Orders.BALANCE <> 0 criteria.
4. Click Save. You can now run the cloned report.

The Multi Payments option enables you to print payment details for event registrations. The description field for each payment indicates the type of payment (check or credit card name) and the check number or credit card name (the credit card number is masked).

To print payment lines from Events > Generate reports, enable the Multi Payments option. If you want to print payment details on invoices generated from the Register a customer window, you must modify the invoice's report specification.

To modify an invoice to print payment details

1. Clone the desired Meeting Invoices report.

2. Click Parameters to display the Detail Report Parameters window.
3. Click Edit.
4. Change NO_MULTI_PAYMENTS to PRINT_MULTI_PAYMENTS in the Options field.
5. Click Save.

Sample Events Reports

Activity Planning report

The Activity Planning report lists total event definition, including event/function names and descriptions.

While the event is open, use the Room Setup report to view function-level speaker data (evaluation criteria, scores, and comments recorded).

Using Hotel Room Reports

The three hotel room reports together provide a comprehensive packet to give to hotel personnel. They itemize the room assignments, the room sharing requested, and the changes that occurred throughout the event registration. These reports are:

- Hotel Room Bookings/Availability
- Hotel Room Change Roster
- Hotel Room Roster

The Hotel Room Roster has an option for including phone numbers, which adds the telephone number of the person with whom to confirm the reservation.

To report on sharing of multiple rooms

If a primary room holder registers multiple rooms and then shares these rooms, each room appears as a separate event function with the appropriate pricing, and all people sharing with the primary room holder appear under both functions in the report.

Therefore, individuals can appear twice in the Hotel Room Roster report and be shown as sharing both of these functions. The primary room holder is responsible for allocating those rooms within hotel regulations.

Hotel Room Bookings/Availability report

This report shows the number of rooms contracted for the event, and the number of rooms that are currently shown as reserved, committed, available, or on a wait list.

Continuum > Event Reports > Event reports > Hotel > Hotel Room Bookings / Availability

Hotel Room Roster report

If you have entered Arrival and Departure dates for all individuals, you can generate the Hotel Room Roster report to get a complete breakdown of who is sharing a room at any one time. Notice that the arrival and departure dates are mandatory only if registering for a room.

iMIS does not warn or control how many people share a room because every hotel has its own rules and capabilities to accommodate this. Instead, generate a Hotel Room Roster report, which allows a hotel auditor to see who is sharing a room and when. As the report indicates, pricing is not split between sharing registrants; billing for the room goes to the primary registrant.

Hotel Room Change Roster report

The Hotel Room Change Roster report records housing cancellations. This report sorts registrations by their Added, Changed, or Dropped status.

If a couple is in the Dropped section, you also see them in the Added section, because they had to register for a room to be able to cancel that room. They will also be listed in the Changed section if they had a change before they dropped.

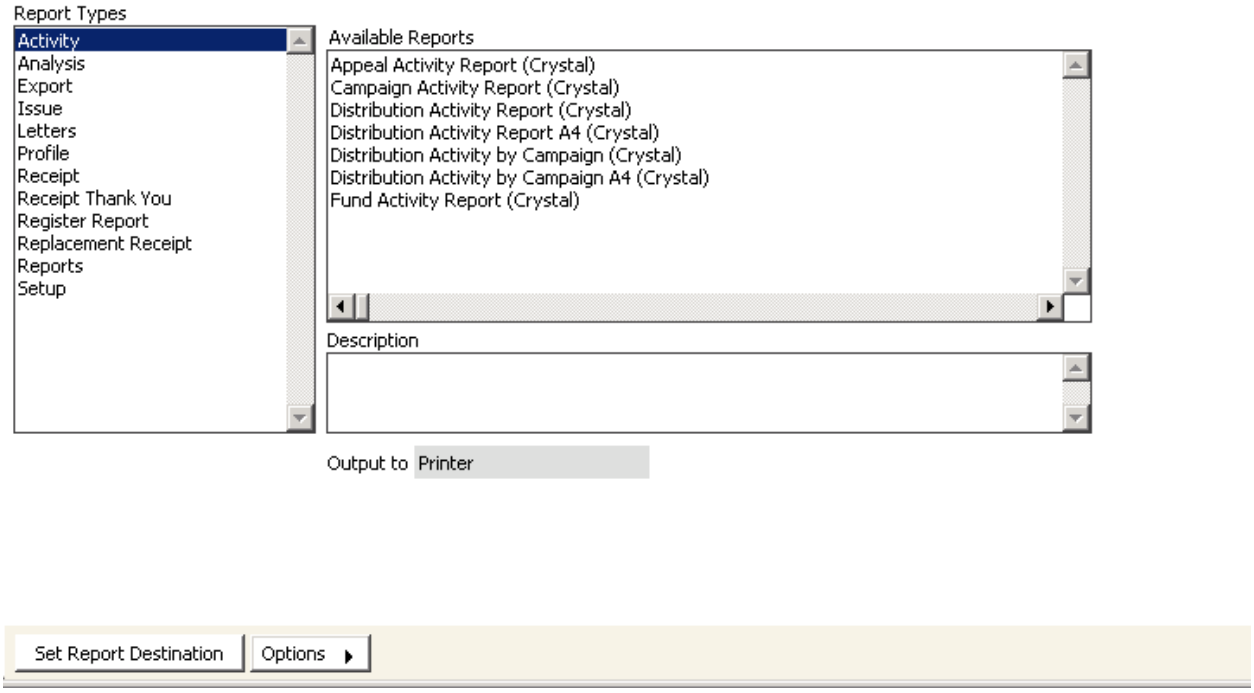
- Executive reports

Fundraising Reports

Fundraising reports window



Continuum > Fundraising reports

Report Types

The reports and outputs available through the iMIS Customer Management, Events, and Fundraising modules are generated from information gathered during customer entry, registration entry, gift entry, order entry, and planning processes. The following standard reports are available:

- Activity – Generates a list of activities for individuals.
- Badges – Prints groups of badges using a variety of formats for both continuous-fed and laser printers. (Events only)
- Certificates – Formats and produces continuing education, appreciation, and customer certificates at the event, function, or committee level. (Customer Management and Events)

- Confirmations – Prints confirmation letters or postcards for event registrations. Each printing run consists of the new registrants entered since the last printing run. (Events only)
- Export – Exports a variety of field and file data.
- Hotel – Prints hotel booking/availability, rosters, and transfer information. (Events only)
- Invoices – Prints invoices for event registrations and orders. (Events and Orders only)
- Issue – Prints reminders for donors who have made pledges or who have committed to new gifts on a certain date. (Fundraising only)
- Labels – Prints groups of labels using a variety of sizes and layouts. (Customer Management and Events)
- Letters – Selects letter formats for printing mass mailings for event registrations and other customer activities. (Customer Management, Events, and Fundraising)
- Meetings – Generates event reports from a group of indexes that list the events and related functions. (Events only)
- Order Status – Generates a variety of detailed summary reports on open orders.
- Planning – Generates room setup and general planning reports. (Events only)
- Product – Prints product and product inventory reports.
- Product Transactions – Generates reports on both posted and unposted product inventory transactions.
- Profiles – Prints customer profile information.
- Receipt – Prints receipts. (Fundraising only)
- Receipt Thank You – Prints thank you letters. (Fundraising only)
- Register Report – Prints detailed and summarized reports of receipts printed. (Fundraising only)
- Replacement Receipt – Prints replacement receipts. (Fundraising only)
- Reports – Prints detailed and summarized reports and analyses. (Fundraising only)

- Rosters – Generates a variety of detailed rosters that list registrants or committee members for events or functions.
- Statistics – Generates statistical analysis of data including event registrations and customer participation. (Customer Management only)
- Status – Prints summary reports that recap registration and cancellation counts and fees. (Events only)
- Tickets – Prints personalized tickets for functions. Each printing consists of new registrants entered since the last printing run. (Events only)
- Transaction Lists – Generates accounting audit trail details and recaps reports that list activities based on the transactions generated through AR/Cash, Billing, and Events.

Generating Letters from the Fundraising Overview Tab

To streamline fundraising processes, you can generate thank-you letters directly from the Overview tab of Fundraising, while the donor's record is open.

To generate a Fundraising letter

To generate a letter, the donor record opened must display a valid gift transaction. To access this feature, you must have Word Integration installed on the iMIS system.

1. From Fundraising > Enter and edit gifts, open the gift record for the contact for whom you are generating a letter.

   Note: To generate a letter, the record opened must display a valid gift transaction.
2. Click Letter at the bottom. The Fundraising Standard Letters window opens.
3. Choose the letter you want you use from the Fundraising Standard Letters window.

   Note: If you are creating a new letter or editing an existing letter, see To create a new letter or To edit an existing letter.
4. Click Merge.
5. Choose one or both of the following options: Create Activity Records with Merge and/or Create EMAIL Activities Records with Merge.

6. Click Continue.
7. A dialog box prompts: The System has X Activities to insert. Do you wish to write these activities? Click Yes or No. Microsoft Word opens and displays the Template.
8. To create the merged output, select Merge to New Document from the Word toolbar.
9. To print the letter, select File > Print.
10. Select File > Save As to save the letter to a folder on your computer.

To create a new letter

1. Click New. The New Standard Letter window opens.
2. Complete the Report Title and Report File fields.
3. Click OK. Microsoft Word opens.
4. Create the letter by selecting merge fields and entering text.
5. When you finish, click the Save icon or select File> Save.
6. To save the letter to another location outside of iMIS, select File> Save As and save a copy in another location.
7. Close Microsoft Word.

To edit an existing letter

1. Select the title of the letter you wish to edit and click OK.
2. Once the letter opens in Microsoft Word, edit it.
3. When you finish, select File> Save.
4. If you also want to save the letter to another location outside of iMIS, you can select File> Save As and save a copy in another location.
5. Close Microsoft Word.

Fundraising Receipts

Receipt Reports

The Fundraising module offers several receipting reports. All of these reports are Crystal reports, which can be customized.

Receipt (Conforms to the Canadian tax publication IT-110R3 Interpretation Bulletin for Gifts and Official Donation Receipts)	Sample Auto Receipt	Generates a receipt that includes the following fields: Registration Number, Receipt Number, Issued Date, Amount, and Original Receipt Number
Receipt Thank You	Sample Thank You	Sample receipting thank you letter that includes receipt amount and breakdown of gifts received
Register Report	Sample Register Report 1	Sample register report that includes a detail report of receipts printed
Register Report	Sample Register Report 2	Sample register report that includes a summary of receipts printed
Replacement Receipt (Conforms to the Canadian tax publication IT-110R3 Interpretation Bulletin for Gifts and Official Donation Receipts)	Duplicate Receipt	Generates a duplicate receipt that includes the following fields: Registration Number, Receipt Number, Issued Date, Amount, and Original Receipt Number

Assigning Receipting Intervals to Customer Records

One of the benefits of the Fundraising receipting function is the ability to assign receipting intervals to donors. For example, if you set the receipting interval to annual, the donor receives one receipt per year.

Other donors may have a monthly donation schedule and receive a receipt every 30 days. By enabling a receipting interval option, the donor's receipts are filtered out from the rest of the auto-generated receipts until the desired receipting interval has passed.

The Last Receipt Date field on the Donor Data tab of the Manage customers window is updated when a receipt is issued. The last date that a receipt was printed for the donor is displayed on the Donor Data tab.

Receipts are printed when the interval preference is greater than or equal to the difference between the current receipts issued date (system date) and the donor's Last Receipt Date. For example, a donor's receipt interval is set to Monthly and the donor makes a new gift (with payment) within 30 days after their last receipt was printed. If an auto-receipt run is initiated on the 31st day after the last receipt was printed, a receipt prints for the gift. However, a receipt does not print if a receipt run is initiated within 30 days after the donor's last receipt was printed.

Receipting intervals for customers are selected in the customer's Donor Data tab on the Manage customers window. See Adding Fundraising Information to a Customer Record.

Generating Receipts

Gift receipts are not generated until you run the auto-receipting batch query report. You can also generate receipts if batch control is not enabled. You cannot edit a gift after a receipt has been issued for the gift because an accounting record has been generated. With the Fundraising module, you can print receipts, thank you letters, and register reports in one linear process or you can print each separately.

Note: Note: If you use multiple entities, batch control should be enabled.

Printing receipts uses the same batch logic that is used in AR/Cash and Billing. A batch is used to select and group receipts. It also can be used as part of the selection criteria for other receipting reports. You can select an AR/Cash batch that has been used to record payments, or you can use a receipt batch created for receipting purposes only.

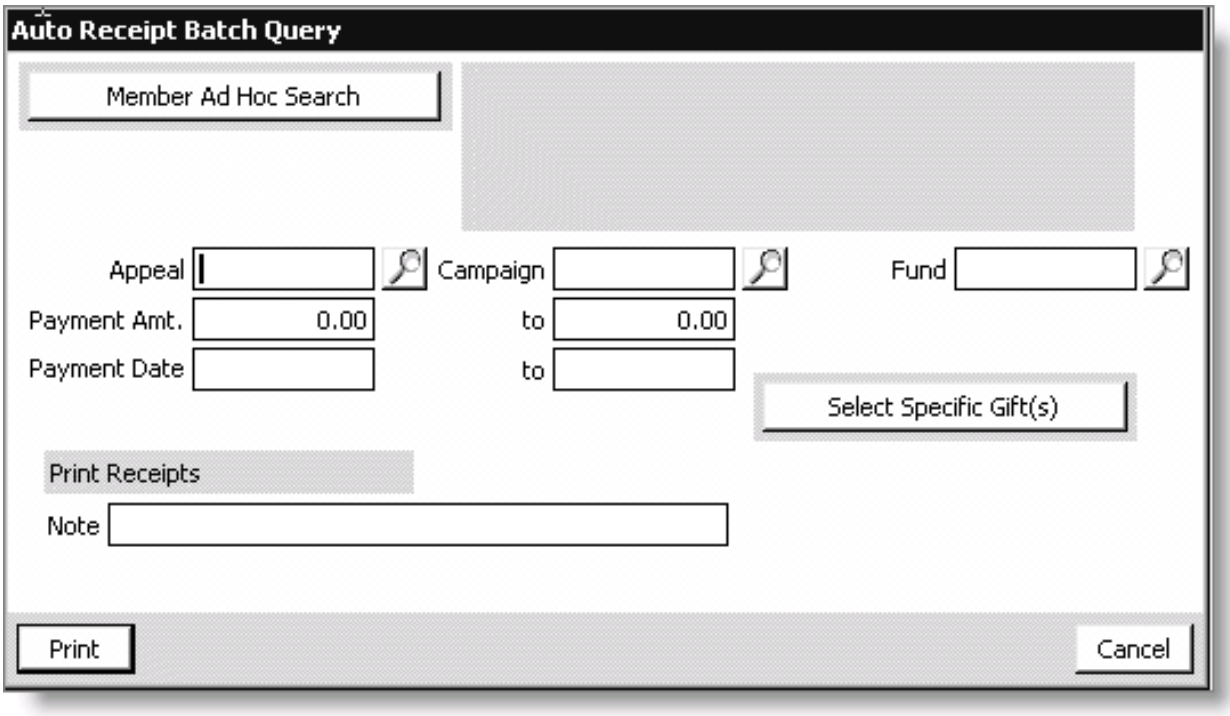
> **Note:** Note: If you use a mixed batch (one that contains receipts and payments) and post the batch, you cannot open the batch to print thank you letters or register reports unless you change the batch's status to open. However, you can enter the closed batch name or number as selection criteria for thank you letters, register reports, or replacement receipts.

Auto Receipt Selection Criteria

You can select from several methods for printing receipts:

- Set a Receipting Interval at the donor level.
- Use selection criteria from the Auto Receipt Batch Query window.
- Conduct an ad hoc search from the Select Search Instructions window.
- Use selection criteria from the Select Specific Gift(s) window.
- You can generate receipts from the Auto Receipt Batch Query window.

Auto Receipt Batch Query window



Continuum > Fundraising reports > Receipt > Sample Auto Receipt (Crystal)

Member Ad Hoc Search

(optional) Enables you to display the Select Search Instructions window for options to conduct an ad hoc search.

Appeal

(optional) Enter the appeal to be included in the search criteria for the auto receipt report.

Campaign

(optional) Enter the campaign to be included in the search criteria for the auto receipt report.

Fund

(optional) Enter the fund to be included in the search criteria for the auto receipt report.

Payment Amt

(optional) Enter the minimum payment amount for the payment amount range criteria for issuing the receipts.

to

(optional) Enter the maximum payment amount for the payment amount range criteria for issuing the receipts.

Payment Date

(optional) Enter the beginning payment date range criteria for issuing the receipts.

to

(optional) Enter the ending payment date range criteria for issuing the receipts.

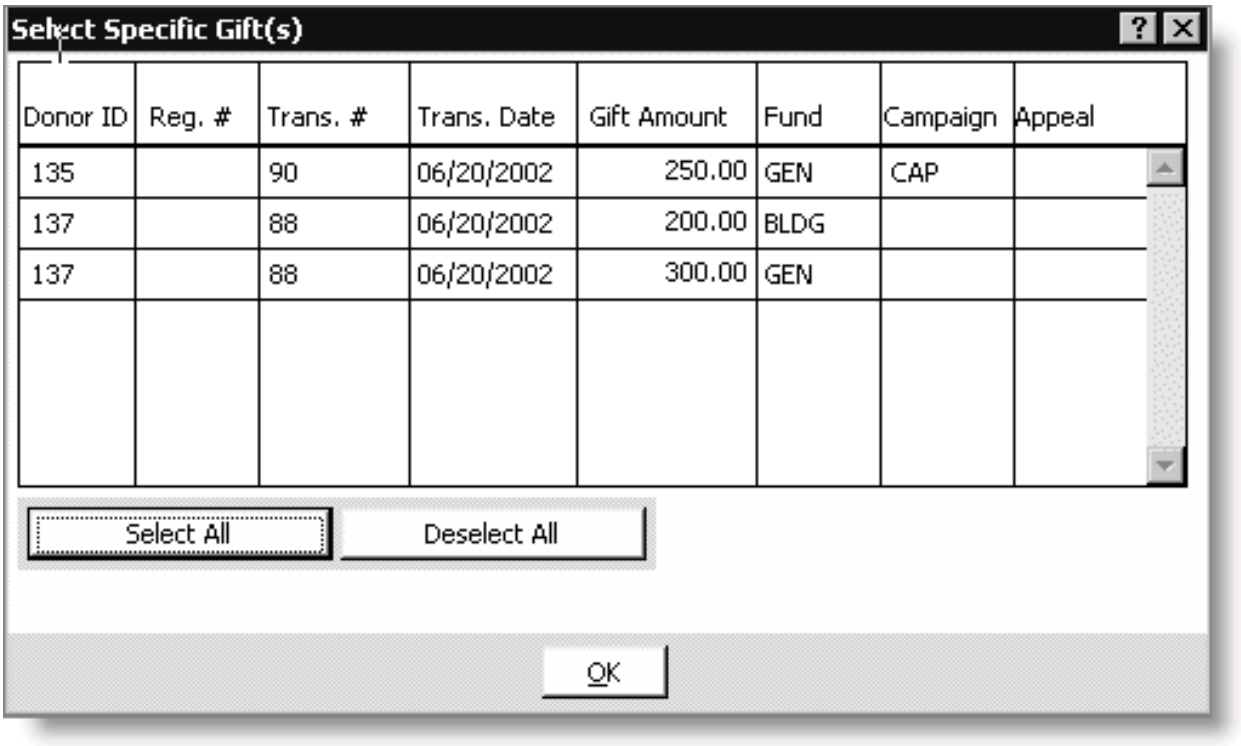
Select Specific Gift(s)

(required) Enables you to display the Select Specific Gift(s) window to select from a list of gifts. You cannot print receipts unless you click this button and select at least one gift in the Select Specific Gift(s) window.

Note

Enter additional information to be printed on the receipt.

Select Specific Gift(s) window



Use the Select Specific Gift(s) window to select specific gifts for donation receipts after the search criteria have been entered on the Auto Receipt Batch Query window. You may also use the Select Specific Gift(s) window as the sole selection of gifts for donation receipts.

Donor ID

Displays the customer ID number of the donor associated with the gift.

Reg #

Displays the registration number of the fund or organization associated with the gift.

Trans #

Displays the transaction number associated with the gift.

Trans Date

Displays the date of the transaction associated with the gift.

Gift Amount

Displays the amount of the gift.

Fund

Displays the fund associated with the gift.

Campaign

Displays the campaign associated with the gift.

Appeal

Displays the appeal associated with the gift.

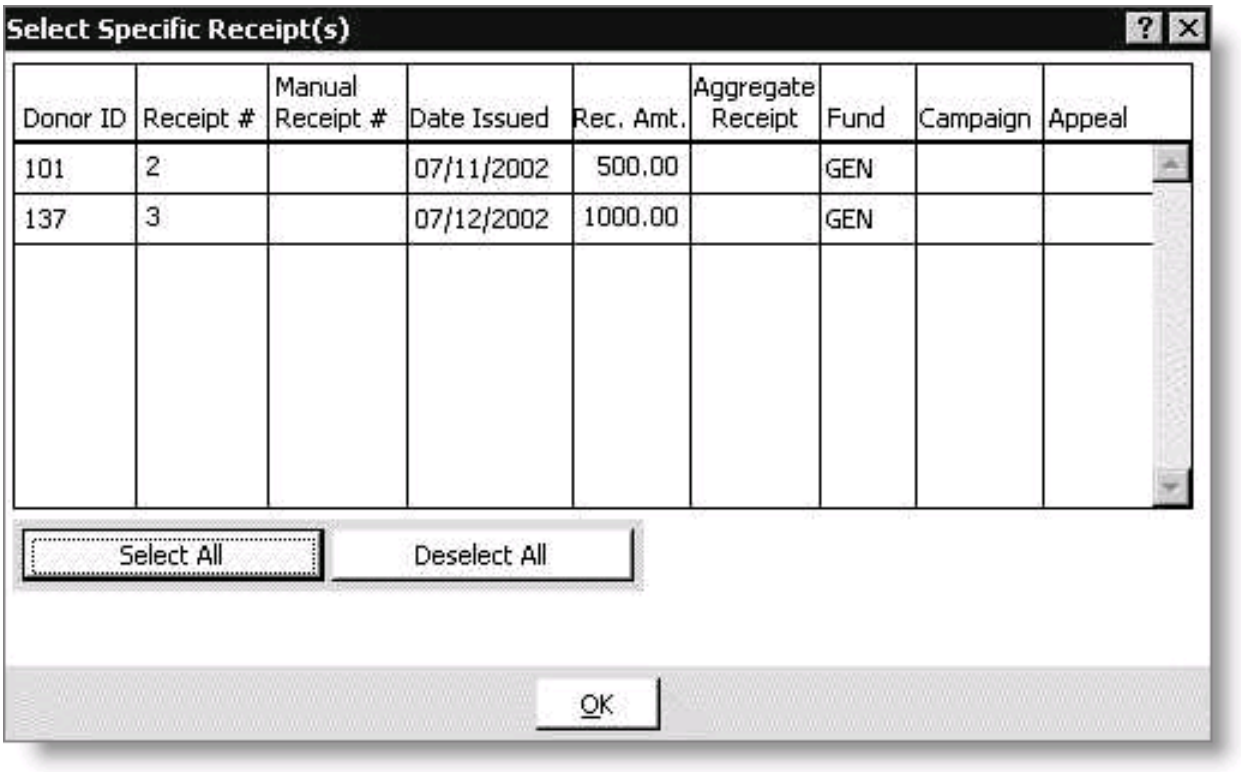
Select All

Enables you to select all the gifts in the window.

Deselect All

Enables you to deselect all selected gifts in the window.

Select Specific Receipt(s) window



Continuum > Fundraising Reports > Receipt Thank You > Sample Thank You (Crystal)

Use the Select Specific Receipts(s) window to select specific receipts for thank you receipts after the search criteria have been entered on the Auto Receipt Batch Query window. You may also use the Select Specific Receipts(s) window as the sole selection of receipts for thank you receipts.

Donor ID

Displays the customer ID number of the donor associated with the receipt.

Receipt #

Displays the automatically generated receipt number.

Manual Receipt #

Displays the manual receipt number.

Date Issued

Displays the date the receipt was issued.

Rec Amt

Displays the receipt amount.

Aggregate Receipt

Displays Yes if the receipt is an aggregate receipt.

Fund

Displays the fund associated with the receipt.

Campaign

Displays the campaign associated with the receipt.

Appeal

Displays the appeal associated with the receipt.

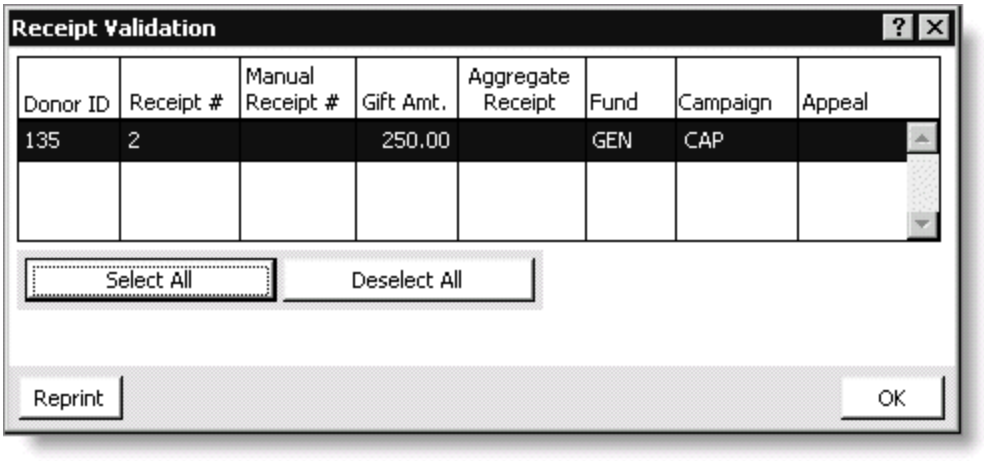
Select All

Enables you to select all the gifts in the window.

Deselect All

Enables you to deselect all selected gifts in the window.

Receipt Validation window



Continuum > Fundraising Reports > Receipt > Sample Auto Receipt (Crystal)

After you print receipts, you can either validate or reprint the receipts. All receipt numbers in the current batch that have been printed are listed in the Receipt Validation window.

Donor ID

Lists donors by ID number.

Receipt #

Lists receipt numbers for recently printed receipts.

Manual Receipt #

Lists manual receipt numbers for recently issued receipts.

Gift Amt

Lists gift amounts for the recently issued receipts.

Aggregate Receipt

Displays Yes if the receipt is an aggregate receipt.

Fund

Displays the fund associated with the printed receipt(s).

Campaign

Displays the campaign associated with the printed receipt(s).

Appeal

Displays the appeal associated with the printed receipt(s).

Select All

Enables you to select all the receipts in the window.

Deselect All

Enables you to deselect all the receipts in the window.

Reprint

Enables you to reprint all selected receipts in the window.

> **Note:** Note: When you click the OK button, you are prompted to print a thank you letter report and a register report. Before you click OK, verify that the receipts printed correctly. After you click OK, the receipts cannot be reprinted. However, the original receipts can be canceled and you can issue replacement receipts with new receipt numbers.

To generate auto receipts

When issuing receipts, you are prompted to issue thank you letters and register reports during the process. You can issue these additional reports at this time or to postpone printing them.

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Auto Receipt Batch Query window opens.
6. Enter the search parameters for finding the receipts.
7. Click Select Specific Gift(s). The Select Specific Gift(s) window opens.

- If you did not enter specific search criteria in the Auto Receipt Batch Query window and only clicked Select Specific Receipt(s), a confirmation message is shown before the list of receipts is built. Click Yes to proceed.

  The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a thank you receipt was printed or not.

8. Select the gifts for which to generate receipts, or click Select All to select all of the gifts.
9. Click OK to return to the Auto Batch Receipt Query window.

10. (optional) Add a note of up to 30 characters in the Note field. This information is printed on all receipts generated in this batch.
11. Click Print.
12. Click OK to print the receipts.
13. (optional) To reprint the receipt, click Reprint.
14. Click OK after you have checked the receipts and verified that they have printed correctly. A message asks if you want to print the thank you letter now.

    To print the thank you letter:

- Click Yes.
- Click OK.
- The Fundraising Reports window opens.
- Select the Sample Thank You (Crystal) report.
- Click OK.

    A message asks if you want to print the Register Report.

15. To print the Register Report, click Yes.
16. Click OK. The Fundraising Reports window opens.
17. Select the Register Report to print and click OK.

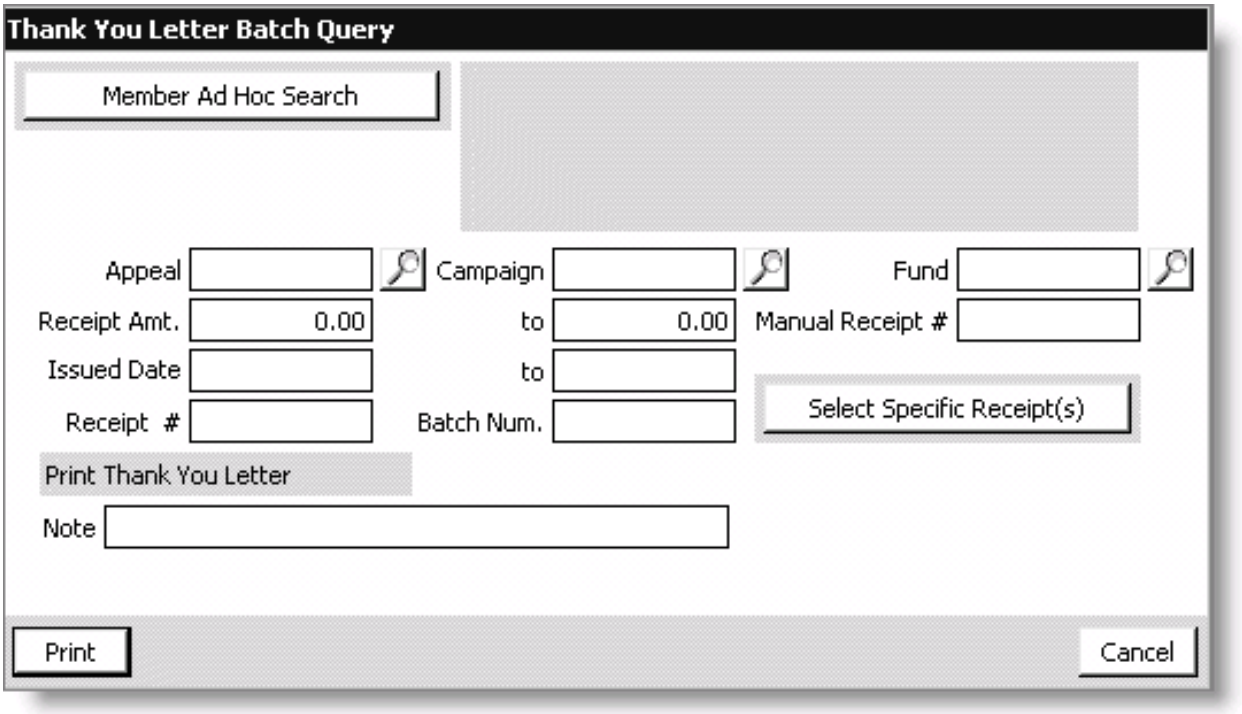
    To print a thank you letter after auto receipting

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt Thank You from the list of Report Types.
3. Select Sample Thank You (Crystal) from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Thank You Letter Batch Query window opens.

6. Enter the search parameters.
7. Click Select Specific Receipt(s).

- If you did not enter specific search criteria in the Thank You Letter Batch Query window and only clicked Select Specific Receipt(s), a confirmation message is displayed before the list of receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a thank you receipt was printed or not.

8. Select the receipts to be generated, or click Select All to select all of the receipts.
9. Click OK to return to the Thank You Letter Batch Query window.
10. (optional) Add a note of up to 30 characters in the Note field. This information displays on all receipts generated in this batch.
11. Click Print to generate the report and close the Thank You Letter Batch Query window.



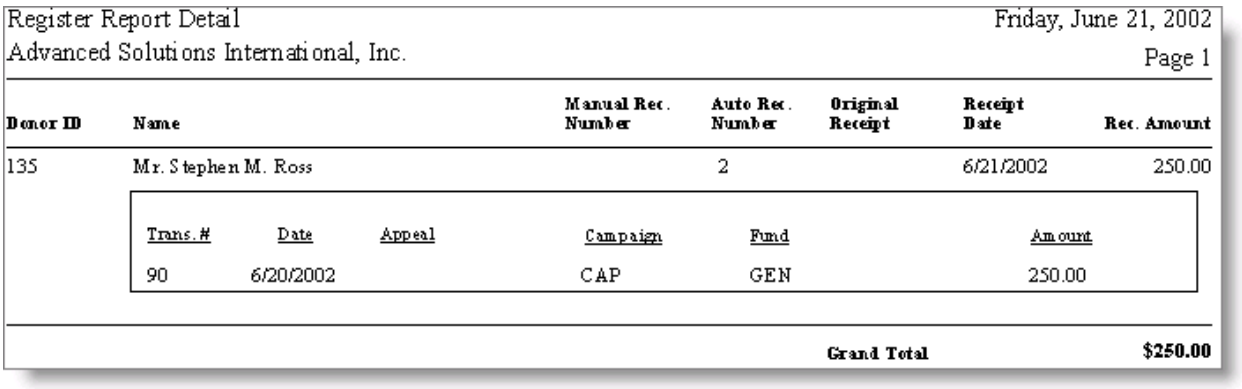
Thank You Letter Batch Query window

To print a Register Report after auto receipting

1. From Fundraising, select Generate reports to open the Generate reports window.
2. Select Register Report from the list of Report Types.
3. Select one of the register reports from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Batch Receipt Query window opens.
6. Enter the search parameters.
7. Click Select Specific Receipt(s).

- If you did not enter specific search criteria in the Batch Receipt Query window and only selected Select Specific Receipt(s), a confirmation message displays before the list of receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a register report was printed or not.

8. Select the receipts to be generated, or click Select All to select all of the receipts.
9. Click OK to return to the Batch Receipt Query window.
10. (optional) Add a note of up to 30 characters in the Note field. This information displays on all receipts generated in this batch.
11. Click Print to generate the report and close the Batch Receipt Query window.



Register Report Detail — Friday, June 21, 2002
Advanced Solutions International, Inc. — Page 1

90	6/20/2002		CAP	GEN	250.00

Grand Total $250.00

Sample Register Report

Generating Receipts Using Special Search Criteria

You can conduct specific searches using a wide range of options when generating donation receipts and receipt reports. For example, you can narrow your search to a specific appeal, campaign, or fund, or you can specify a date or amount range. In addition, you can conduct ad hoc searches on the Name table, the Name_FR table, or both.

To generate receipts using a date and amount range

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
4. Click Run. The Auto Receipt Batch Query window opens.
5. Enter the Campaign.
6. Enter the Fund.
7. Enter an amount range in the Payment Amt and to fields.
8. Enter a date range in the Payment Date and to fields.
9. Click Select Specific Gift(s) and select records for which receipts will be issued.
10. Click OK to return to the Auto Receipt Batch Query window.
11. Click Print to run the report.

To generate receipts using an ad hoc search

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Receipt from the list of Report Types.
3. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
4. Click Run. The Auto Receipt Batch Query window opens.
5. Click Member Ad Hoc Search. The Select Search Instructions window opens.
6. Click New. The Search Instructions window opens.

7. Enter the name of the search in the Search Name field.
8. Select a Mode.
9. Select a Comparison File from the drop-down list.
10. Select a Comparison Field from the drop-down list.
11. Select a comparison operator from the list of comparison options.
12. Enter the desired value in the Comparison Value data entry area.
13. Click Save to save the search instructions and return to the Select Search Instructions window.
14. Click OK to return to the Auto Receipt Batch Query window. The search parameters display to the right of the Member Ad Hoc Search button.
15. Click Select Specific Gift(s). The Select Specific Gift(s) window opens.
16. Select the receipt to be generated, or click Select All to select all of the receipts.
17. Click OK.
18. Click Print to generate the report.

Generating Replacement Receipts

You can generate replacement receipts with the receipting function. Replacement receipts are issued to replace previously issued receipts. To provide an audit trail, the original receipt number is canceled and a new replacement receipt number is issued. Only receipts that have not been canceled can be selected to print replacements. When the receipt is selected, the original receipt number is canceled and the next available auto-generated receipt number is assigned.

> **Note:** Note: When printing replacement receipts, if you do not enter information in the Note field on the Replacement Receipt Batch Query window, the receipt prints the note from the original receipt. For example, if the original note was January 99 receipts and a replacement receipt is issued in July, the note on the receipt will still

> read January 99 receipts if you do not enter a new note in the Note field. If a new entry is made in the Note field, this entry overrides the original note text.

To generate replacement receipts

1. From Fundraising, select Generate reports to display the Generate reports window.
2. Select Replacement Receipt from the list of Report Types.
3. Select Sample Replacement Receipt (Crystal) from the list of Available Reports.
4. (optional) Click Set Report Destination to change the report destination.
5. Click Run. The Replacement Receipt Batch Query window opens. This window is similar to the Auto Receipt Batch Query window in that it also allows you to specify search criteria to generate receipts.
6. (optional) Enter the search criteria.
7. Click Select Specific Receipt(s) to display the Select Specific Receipts window.

- If you did not enter selection criteria on the Replacement Receipt Batch Query window and only clicked Select Specific Receipt(s), a confirmation message displays before the list of receipts is built. Click Yes to proceed. The Select Specific Receipt(s) window displays a record for every donor for which an auto receipt was previously run, regardless of whether a register report was printed or not.

8. Select the receipts for which to generate replacements, or click Select All to select all of the receipts.
9. Click OK to return to the Replacement Receipt Batch Query window.
10. Click Print to generate the replacement receipts. You are prompted to change the printer settings if necessary.

- To change the printer selection, select the destination from File> Report Destination.

11. Click OK.

- A message is printed on the receipt indicating that it is a replacement receipt. The original receipt number is also printed on the receipt. The Receipt Validation window opens after the receipt prints.

12. Click OK. A message displays asking if you want to print a thank you letter for this receipt.
13. Click Yes to print the letter, or No to skip printing the letter. After you print the thank you letter or click No, a second message displays asking if you want to print a register report for this receipt.
14. Click Yes to print the register report, or No to skip printing the register report.

Generating Aggregate Receipts

The receipting feature allows you to generate aggregate receipts. An aggregate receipt can be a single receipt for multiple payments or for one payment split among multiple funds.

An aggregate receipt prints under the following conditions:

- A donor made multiple payments to one fund (one registration number)
- A donor made one payment distributed to multiple funds that meet the specified selection criteria, but the funds have the same registration number
- A donor made a payment to a fund that does not have a registration number (receipts for payments to funds without registration numbers are aggregate receipts by default)

To generate an aggregate receipt

1. From Fundraising, select Enter and edit gifts to display the Overview tab on the Enter and edit gifts window.
2. Enter a gift. See To enter a single gift or single pledge for information on entering a single gift.
3. Click New and enter a second gift using the same donor ID, but to a different fund, and click Save.
4. From Fundraising, select Generate reports to display the Generate reports window.

5. Select Receipt from the list of Report Types.
6. Select Sample Auto Receipt (Crystal) from the list of Available Reports.
7. Click Run to display the Auto Receipt Batch Query window.
8. Click Select Specific Gift(s) to display the Select Specific Gifts window. Select the two gifts you just entered.
9. Click OK to return to the Auto Receipt Batch Query window.
10. Click Print.
11. Click OK when the system prompts you to change printers.

- In this example, a single receipt was issued for both gifts. The gift amount of $500 displays in the Gift Amt. field in the Receipt Validation window. This is the total of the two gifts. Yes displays in the Receipt Validation window to indicate that this is an aggregate receipt. Because this is an aggregate receipt, only one receipt number displays.

12. Click OK. A message displays asking if you want to print a thank you letter for this receipt.
13. Click Yes to print the letter, or No to skip printing the letter. After you print the thank you letter or click No, a second message displays asking if you want to print a register report for this receipt.
14. Click Yes to print the register report, or No to skip printing the register report.

Manual Receipting

Although the Fundraising module provides a robust auto-receipting feature, you can use the user-generated manual receipting function when necessary. Because manual receipting and auto receipting are mutually exclusive, if you enter a manual receipt for a gift, a receipt is not auto-generated for the gift. Manual receipts are never printed; they are stored with the gift. Manual receipt numbers cannot be entered for single pledges or installment pledges. If you select a Gift Type of Single Pledge or Installment, the Receipt Number field and the Do not Print Receipt option are disabled on the Enter and edit gifts window.

To issue manual receipts

1. From Fundraising, select Enter and edit gifts to display the Overview tab on the Enter and edit gifts window.
2. Enter a gift.
3. Enter a manual receipt number in the Receipt Number field.
4. Click Save.

> **Note:** Note: When you enter a receipt number, the Do not Print Receipt option is automatically selected and cannot be cleared. You cannot edit a gift associated with a manual receipt after the gift has been saved.

Sample Fundraising Reports

Fundraising reports are used to generate detail and summary reports on many aspects of fundraising.

Donor Club Summary as of July 23rd, 2002

Page 1

Sorted by Date

Advanced Solutions International, Inc.

Date	Donor Clubs Awarded	Donor Clubs	Donor Club Title
08/29/2000	1	BRICK	Brick Donor Club
07/15/2002	2	AMBASSADOR	Ambassador Donor Club

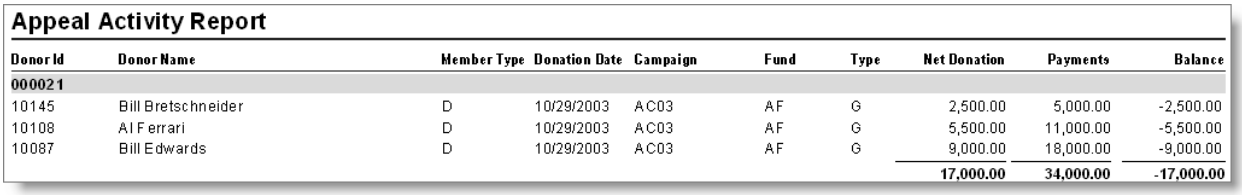
Appeal Activity Report (Crystal)

The Appeal Activity Report is a detailed listing of all of the Donation (Gifts and Pledges) Activities, listed by Appeal for a given period of time. Run this report from:

Continuum > Fundraising Reports > Fundraising reports > Activity

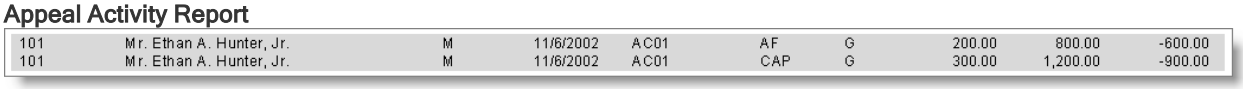
Notes

- Donations include Gifts and Pledges, including unpaid pledges.
- The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.
- In this report, Donations include Fundraising, Events, and Dues donations.
- Split donations will be displayed on two or more shaded lines.
- If the donor is a company, company name is displayed. If the donor is a person, Full Name is displayed.



Appeal Activity Report

Donor Id	Donor Name	Member Type	Donation Date	Campaign	Fund	Type	Net Donation	Payments	Balance
000021									
10145	Bill Bretschneider	D	10/29/2003	AC03	AF	G	2,500.00	5,000.00	-2,500.00
10108	Al Ferrari	D	10/29/2003	AC03	AF	G	5,500.00	11,000.00	-5,500.00
10087	Bill Edwards	D	10/29/2003	AC03	AF	G	9,000.00	18,000.00	-9,000.00
							17,000.00	34,000.00	-17,000.00



Appeal Activity Report

101	Mr. Ethan A. Hunter, Jr.	M	11/6/2002	AC01	AF	G	200.00	800.00	-600.00
101	Mr. Ethan A. Hunter, Jr.	M	11/6/2002	AC01	CAP	G	300.00	1,200.00	-900.00

Split donations are shown on consecutive shaded lines

Appeal Performance Analysis (Crystal)

The Appeal Performance Analysis is a comprehensive summary of appeal results and statistics. The report provides a snapshot of each appeal. It lists the total number and total amount of gifts, pledges, and donations; the number of donors; the appeal goal and the amount and percentage difference between the goal and the actual proceeds. Run this report from:

Continuum > Fundraising Reports > Executive reports

Note: Note: In this report, Donations include Fundraising, Events, and Dues donations.

Note: The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

This report cannot be filtered for Distribution. Adding Report Spec parameters for Distribution will produce an error.

Appeal Performance Analysis report

Appeal Expense report

You can enter these search criteria when printing an Appeal Expense report (Fundraising > Generate reports > Reports > Appeal Expense):

- Appeal code
- Campaign code
- Fund code
- Date range
- Amount range

The system searches for the expense items with exact match on Appeal, Campaign, or Fund if any of these fields are populated.

Date searches

Date searches work with these conditions:

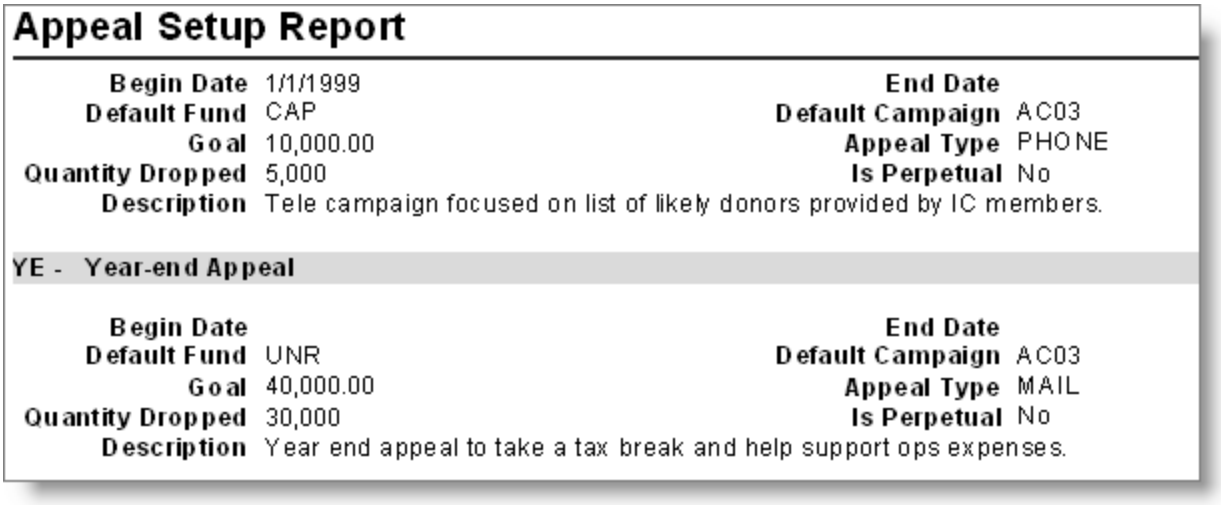
- If only the minimum date is populated, the system searches for any expense items that are equal to or greater than the minimum date.
- If only maximum date is populated, the system searches for any expense items that are equal to or less than the maximum date.
- If both minimum and maximum date are populated, the system finds the expense items that are greater than or equal to minimum date but less than or equal to maximum date.

The rules applied to the amount range are the same as for the date range.

Appeal Setup Report (Crystal)

The Appeal Setup Report lists each Fundraising Appeal and its current configuration in iMIS. Run this report from:

Continuum > Fundraising Reports > Fundraising reports > Setup



Appeal Setup Report

Begin Date	1/1/1999	**End Date**	
Default Fund	CAP	**Default Campaign**	AC03
Goal	10,000.00	**Appeal Type**	PHONE
Quantity Dropped	5,000	**Is Perpetual**	No
Description	Tele campaign focused on list of likely donors provided by IC members.		

YE - Year-end Appeal

Begin Date		**End Date**	
Default Fund	UNR	**Default Campaign**	AC03
Goal	40,000.00	**Appeal Type**	MAIL
Quantity Dropped	30,000	**Is Perpetual**	No
Description	Year end appeal to take a tax break and help support ops expenses.		

Appeal Setup Report

Campaign Activity Report (Crystal)

The Campaign Activity Report is a detailed listing of all of the Donation (Gifts and Pledges) Activities listed by Campaign for a given period of time. The report lists campaign, donor, appeal, and payment related information. Run this report from:

Continuum > Fundraising Reports > Fundraising reports > Activity

Note: Note: In this report, Donations include Fundraising, Events, and Dues donations.

Note: The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

Note: Donations include Gifts and Pledges, including unpaid pledges.

Note: Split donations will be displayed on two or more shaded lines.

Request Report

Soft Credit Report (Crystal)

The Soft Credit Report is a transaction-based report that lists all gifts and pledges that have soft credits. The report is grouped by campaign, original transaction, and donor ID.

Note: Note: If a donor made multiple contributions to one or more campaigns, the Donor Name may be repeated in the report.

Run this report from:

Continuum > Fundraising Reports > Fundraising reports > Reports

Continuum > Fundraising Reports > Executive reports

Note: Note: Donations include Gifts and Pledges, including unpaid pledges.

The amounts for Gifts and Pledges have been adjusted by any Credit/Debit memos.

Yearly Giving Comparison by Calendar Year

Reporting performance for large Fundraising data sets

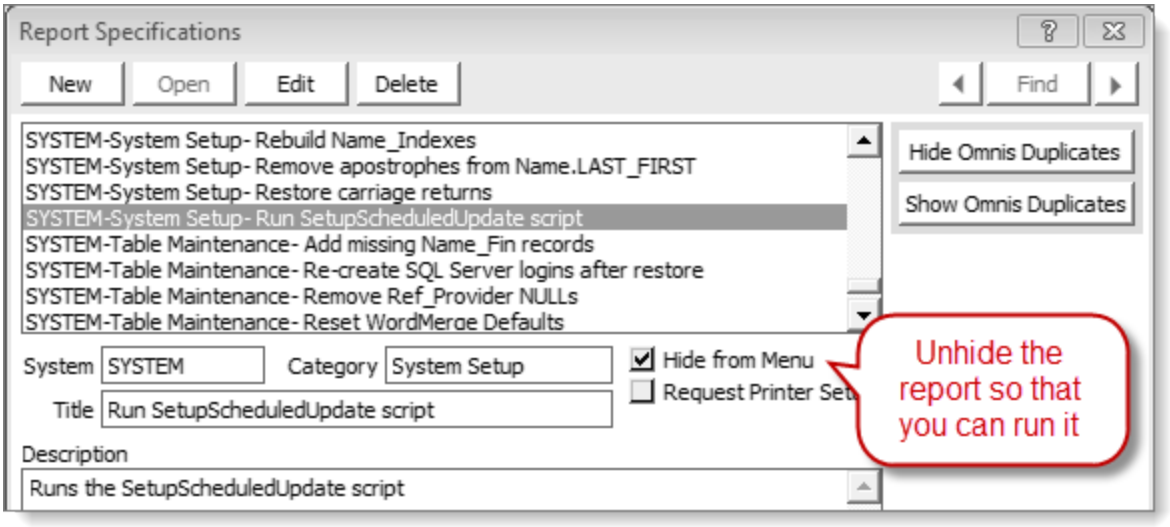
If you have a large amount of Fundraising data, you can enhance the performance of your Fundraising reports by periodically updating the Fundraising report summary tables. These tables act as a cache of pre-calculated data, so that when a report runs, only the data collected since the last time you updated the summary files must be combined, filtered, and calculated.

> **Note:** Note: Do not use these tables to create customizations. Instead, use the views that support Fundraising. These views are optimized each time you run the update procedure.

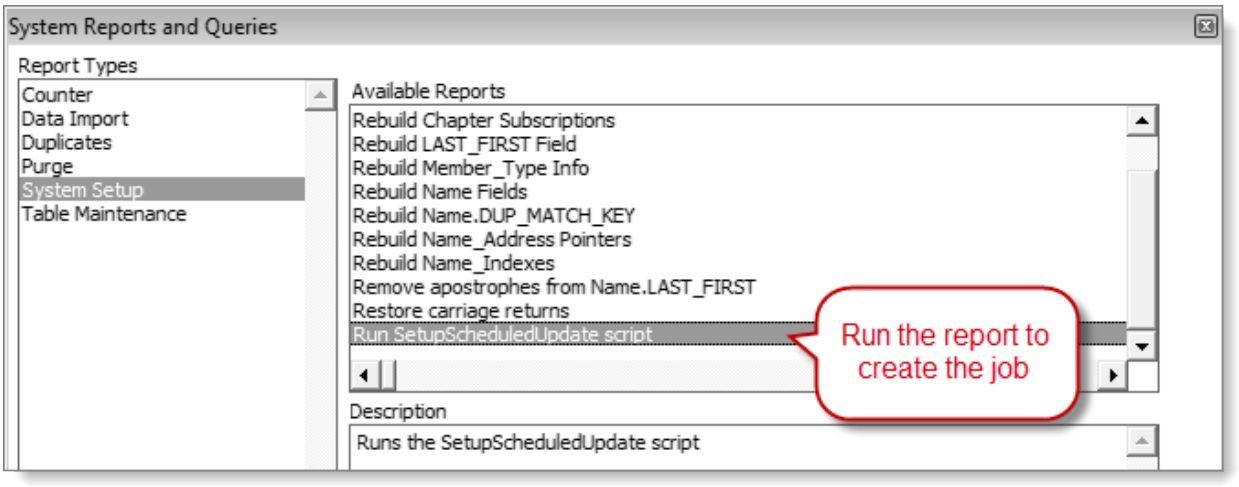
To create the job that updates FR report data

To create the job that updates these fundraising tables, unhide and then run a special report within Desktop. Once the job exists, you can run the update manually as needed.

1. From the Desktop menu, select Utilities > Report Specs.
1. Select the item titled SYSTEM-System Setup-Run SetupScheduledUpdate script.
2. Select Edit, uncheck Hide from Menu, and Save.



3. To run the script, select Utilities > Reports and Queries.
4. From Report Types, select System Setup.
5. From Available Reports, select Run SetupScheduledUpdate script.
6. Click Run.



To automate the job that updates FR report data

In SQL Server Agent, configure the update job to run automatically.

1. Enable the job titled ASI Update Fundraising Views.
2. As needed, change the job's scheduled run time, which defaults to 2:00 AM daily.

   Tip: Avoid running updates during hours when iMIS usage is heavy to avoid affecting performance.
3. After you enable the ASI Update Fundraising Views job, configure SQL Server Agent to start whenever the operating system restarts.

Hands-on exercise: Generate reports

1. From Fundraising, select Generate reports to open the Generate reports window.
2. Export a report in Microsoft Word for all gifts made during August 2009:

- Report Types: Export
- Available Reports: All Gifts to Microsoft Word

1. Click Run to display the Select Date Range window.
2. Enter 08/01/2009 in the Begin Date field.
3. Enter 08/31/2009 in the End Date field.
4. Click OK to display the Set print file name window.

5. Browse to the desired folder for the file.
6. Enter August 2009 in the File name: field.
7. Click Save.

3. Issue a reminder for installments due during August 2009:

- Report Types: Issue
- Available Reports: Reminder for Installments Due

1. Click Run to display the Select Date Range window.
2. Enter 08/01/2009 in the Begin Date field.
3. Enter 08/31/2009 in the End Date field.
4. Click OK. The Set report destination window opens.
5. Select Screen and click OK.

4. Generate a summary of all gifts made during August 2009, sorted by campaign:

- Report Types: Reports
- Available Reports: Giving Summary

1. Click Run to display the Reports window.
2. Enter ANNUAL in the Campaign field.
3. Enter 08/01/2009 in the Date field.
4. Enter 08/31/2009 in the Thru field.
5. Click Run.

5. Generate a detailed list of all pledges made to the General (GEN) fund from August 1, 2009 through November 1, 2009, sorted by customer ID:

- Report Types: Reports
- Available Reports: Pledge Summary

1. Click Run to display the Reports window.
2. Select Member Number from the Sort & Summarize by scrolling list.
3. Delete ANNUAL from the Campaign field (if still displayed from the last report run).
4. Enter GEN in the Fund field.
5. Enter 08/01/2009 in the Date field.
6. Enter 11/01/2009 in the Thru field.
7. Click Run.

Hands-on exercise: Generate reports from the Generate executive reports window

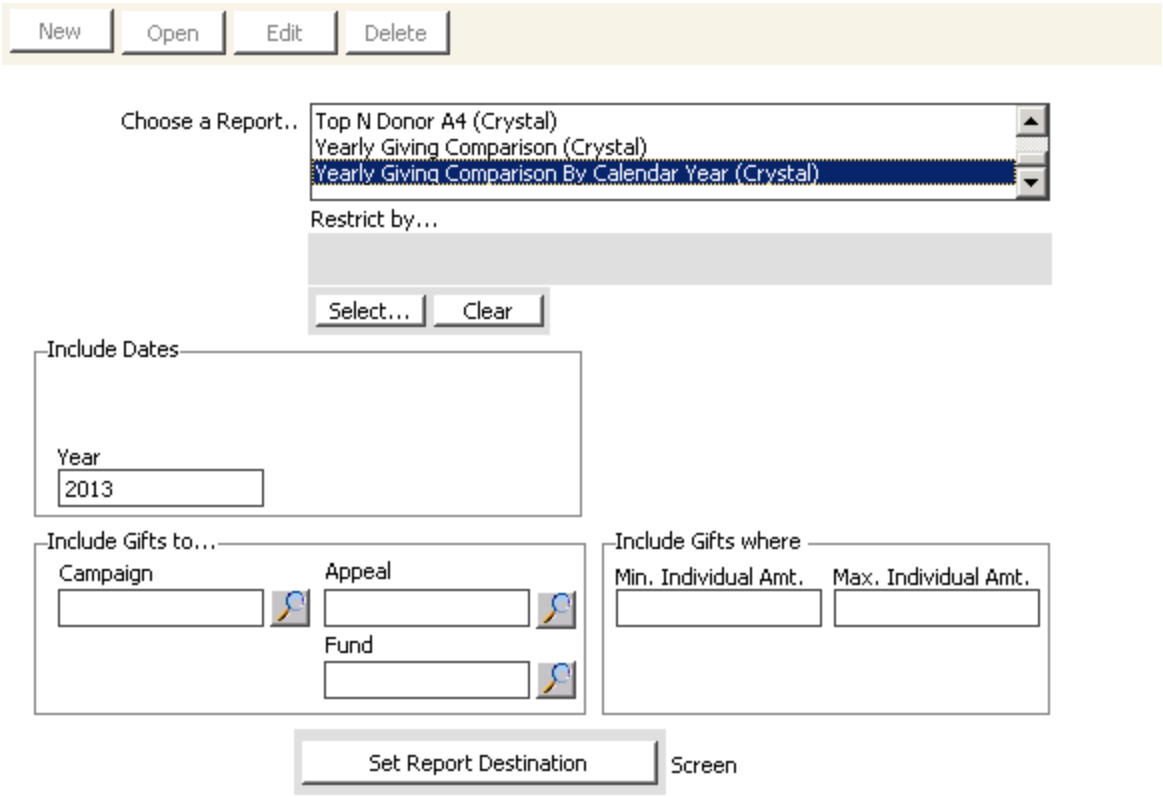
1. From Fundraising, select Generate executive reports to open the Generate executive reports window.
2. Click New.
3. Select Pledge from the Choose a Report.. scrolling list.
4. In the Comparison to Previous Period area, enter 08/01/2009 in the From field and 11/01/2009 in the Thru field.
5. Click Run.

Executive Reports in Fundraising

The Generate executive reports window is an abbreviated version of the Fundraising Generate reports window. The Generate executive reports window allows you to generate several of the detail and summary reports that are available in the Fundraising Generate reports window. The Generate executive reports window is just that – a window designed to allow the fundraising executive to view or print detail or summary reports of gifts, pledges, and donor clubs, and to view or print comparisons between current and previous time periods – all without having to go to the Generate reports window.

The Generate executive reports window has some limitations. You cannot rename reports in the Generate executive reports window, nor can you export, issue, or run letters reports as you can in the Generate reports window.

Executive reports window



Continuum > Fundraising Reports > Executive reports

Choose a Report

This area contains a scrolling list of all reports available from the Generate executive reports window. For each available report displayed in this area, you can select either a detail or summary report by enabling either the Detail or Summary option.

- Pledge – Select this report to generate either a detail or summary report of all pledges entered. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Donor Club and Meeting. The report lists the amounts pledged and paid as well as balances remaining. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.

- Giving – Select this report to generate either a detail or summary report of all gifts and pledge/installment payments. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Donor Club and Meeting. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.
- Prev/Curr Period – Select this report to generate a detail or summary list of gifts given per user-selected sort, comparing these amounts between two defined time periods. These reports show the difference in amounts and the percentage of change, with single gifts and pledges broken down by fund. To run the Prev/Curr Period report, you must enter values in the Comparison to Previous Period From and Thru date fields.
- Donor Club – The Donor Club Detail (lndscape) report allows you to generate a list of all individuals who have attained a donor club, subtotaled by individual donor clubs with a total of all donor clubs achieved. The report displays the date the donor club was achieved and the Solicitor, Donor, List As, Fund, Campaign, and Appeal associated with each donor club. Subtotal the report by sorting on any of the options in the Sort and Summarize by area except Meeting and Donor Club. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date. The solicitor is determined by the solicitor specified in the Solicitor field on the Donor Data tab on the Manage customers window (from Customers, select Manage customers, open a customer record, and select the Donor Data tab) rather than the solicitor specified in the Solicitor field on the Enter and edit gifts window (from Fundraising, select Enter and edit gifts).
- The Donor Club Summary report lists only the fund, campaign, and appeal codes for each specified donor club. The solicitor is determined by the solicitor specified in the Solicitor field on the Donor Data tab on the Manage customers window rather than the solicitor specified in the Solicitor field on the Enter and edit gifts window. Selecting the Summary option allows you to generate a list of all donor clubs achieved. Subtotal the report by sorting on any of the options in the Sort & Summarize by area of the window except Meeting and Donor Club. Search on Member ID, All Members, Member Type, Solicitor ID, Fund, Campaign, Appeal, and Transaction Date.

Sort & Summarize by

Select from the following options to sort and summarize your report:

- Date – Subtotal your report by sorting by date or date range. The date cannot be selected for Prev/Curr Period reports.
- Fund – Subtotal your report by sorting on Fund. This sorting option is available for all applicable reports.
- Campaign – Subtotal your report by sorting on Campaign. This sorting option is available for all applicable reports.
- Appeal – Subtotal your report by sorting on Appeal. This sorting option is available for all applicable reports.
- Member Number – Subtotal your report by sorting on the donor's customer ID. This sorting option is available for all applicable reports.
- Solicitor – Subtotal your report by sorting on solicitor. This sorting option is available for all applicable reports. In all reports except for the Donor Club reports, the solicitor entered in the Solicitor field on the Enter and edit gifts window restricts each report. The Donor Club reports search on the solicitor entered in the Solicitor field on the Donor Data tab on the Manage customers window.
- Donor Club – Subtotal your report by sorting on donor club. This sorting option works only for Donor Club Detail and Donor Club Summary reports.
- Meeting – Subtotals report by sorting on events. This sorting option is available only for Donor Club reports.

Restrict by

There are several options in this area of the window for restricting report output.

Member – Enter the customer ID for the report, or click the lookup icon to select an ID.

Select – (optional) Lets you open the Member/Contact Selections window to select customer type options for setting your report parameters. All is the default. You can select from one of the following options:

- All (all customer types)
- Members
- Non Members
- Specific Types
- All (all company and individual customers)
- Company Only
- Individual Only

> **Note:** Note: If you select the Specific Types field, a blank field displays where you can enter one or more customer types (to enter multiple customer types, enter a comma (but no space) between customer types).

Clear – Lets you clear the values entered on the Member/Contact Selections window.

Solicitor

(optional) Enter the customer ID of the solicitor associated with the report, or click the lookup icon to select an ID.

Gifts To

Enter an Appeal, Campaign, and Fund for your report in these fields. You can click the lookup icon to select an appeal, campaign, or fund code. For all reports except Donor Club reports, the Appeal, Campaign, and Fund are determined by the information that was entered in the Appeal, Campaign, and Fund fields on the Enter and edit gifts window (from Fundraising, select Enter and edit gifts).

Date

Enter the beginning date for the reporting period. The system searches on the actual transaction date for all reports except for Prev/Curr Period reports.

Thru

Enter the report ending date.

Comparison to Previous Period

The following fields and options are used in conjunction with the Prev/Curr Period reports:

- From – Enter the beginning date of the previous comparison period.
- Thru – Enter the ending date of the previous comparison period.
- All – Enable to print all records for the specified time period. This is the default value.
- Lapsed – Enable to print a record with subtotals that have previous amounts and zero current period amounts.
- Decreased by – Enable to print records with a specified subtotal where the percentage change is equal to (=) or less than (<) the percentage specified in the Percent field.
- New – Enable to print only records with subtotals in the current period and zero amounts in previous time periods.
- Increased by – Enable to print only records with a specified subtotal where the percentage change is equal to (=) or greater than (>) the percentage specified in the Percent field.
- Percent – Enter the percentage for a Decreased by or Increased by comparison.

Detail

Enable to specify a detail report.

Summary

Enable to specify a summary report.

Set Report Destination

Opens the Set report destination window to set the report output destination. The initial default output device is Printer. You can change the default output device and save this setting (select File> Report Destination, select the desired default output device, and click Save) so that the desired default output device is selected each time you start iMIS.

Note: Note: Set the report destination to Screen to avoid the unnecessary printing of reports.

Note: Note: To print the report, from the Report Destination window select the Printer option rather than printing the report from the screen. The printed reports will not align exactly as they appear on the screen if you print them from the screen; printing from the Printer option will prevent this problem.

To generate reports in the Generate executive reports window

1. From Executive reports, click New.
2. From Choose a Report, select a report.
3. Select the search options for the report. The options available vary based on the report selected.
4. Click Run.

To upgrade a cloned Fundraising Profile Crystal report

If you cloned a Fundraising Profile Crystal report for use in a previous iMIS release, make sure you add the date range parameters to the cloned report description, or the report will not print from the Fundraising History window or any location in iMIS. (The standard Fundraising Profile Crystal report specification file is updated automatically when you upgrade to iMIS 10.5. You need to manually update this type of report specification file only if you created a clone and saved it with a customized name or location.)

To add date range parameters manually to a cloned Fundraising Profile Crystal report specification file, use the following steps.

1. Select Utilities > Report Specs.

2. In the Report Specifications window, select the cloned Fundraising Profile Crystal report from the list, then click Parameters.
3. In the Detail Report Parameters window, click Edit, then click Crystal Params.
4. In the Crystal Parameters window, add the new parameters:

- BeginDate

  Select Insert. In Parameter Name, enter BeginDate. In Variable Name (or String), enter RV.BeginDate.

- EndDate

  Select Insert. In Parameter Name, enter EndDate. In Variable Name (or String), enter RV.EndDate.

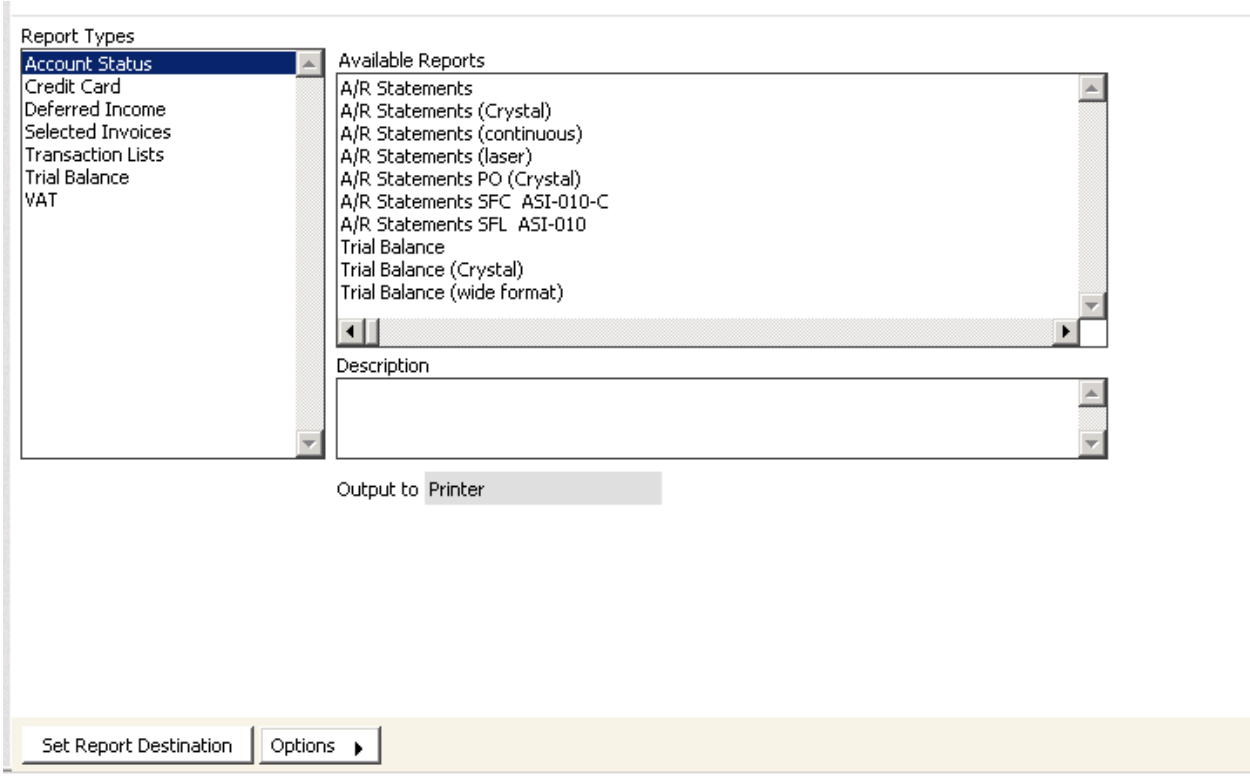
5. Click OK in the Crystal Parameters window.
6. Click Save in the Detail Report Parameters window.
7. Close the Detail Report Parameters and the Report Specifications windows.

Other Reports

- Accounting reports
- Credit card reports
- Customer service reports
- Order processing reports

Accounting Reports

Accounting reports window



Continuum > Other Reports > Accounting reports

The following reports are the most frequently used in Accounting, and are often used on a daily basis:

- On-screen account inquires
- Accounting Transaction reports
- Accounting Transaction journal
- Accounting Statements reports
- Trial Balance reports
- Deferred Income reports

- Selected Invoices reports
- Credit/Debit Card Authorization reports

To view on-screen account inquiries

Perhaps the most important inquiry tool you will use is located in the customer's record. For example, if a customer asks for instant information on the status of an account item, you can immediately open screens that show overall and detailed data on open items.

1. From Accounting reports, find a customer's record.
2. The name and address data for the selected customer displays on the Manage customers window.
3. Select the AR/Cash tab.
4. Double-click on a line item to display the transaction details on the Transaction Ledger window.
5. Click OK.
6. Click Print Trial Balance on the AR/Cash tab. The system automatically generates a Trial Balance report for the specified customer ID.

Sample Accounting Reports

Account Status - AR Statements report

The AR Statements report produces a Statement of Account for any customer that has an outstanding balance. The search features on the A/R Statements dialog window determine the range of information printed on the report.

The statements print on plain paper designed for laser printers. The statements list all open items in the body and provide an aged summary at the bottom of the report. Depending on the age of an open account, you have the option of a pre-configured message at the bottom of the report that lines up with text entered on the AR/Cash Set up module window (from AR/Cash, select Set up module). The AR Statements reports are primarily used for sending reminders out to customers who are overdue in paying one or more invoices.

Account Status - Selected Invoices report

Invoice reports are frequently used to verify the accuracy of a billing run and to see which customers or subscribers have not paid.

The invoice printing process prints the invoice and generates the related accounting transactions to record the sales. Because orders cannot be modified after they are invoiced, the printing process represents the final step in the order processing cycle.

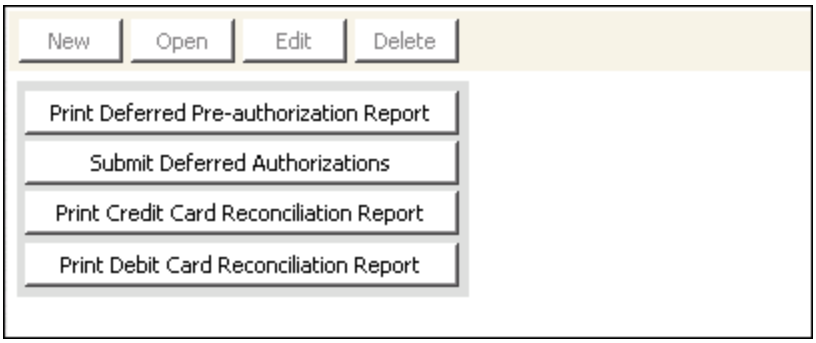
Credit card reports

Credit card authorization window

Note: Note: If you have not set up credit card cash accounts in the AR/Cash module, the Credit card reporting menu item is disabled.



The following report options display on the Credit card authorization window:

- Print Deferred Pre-authorization Report – Prints a report of deferred credit/debit card transactions. The report parameters include Date Range and Org Code.
- Submit Deferred Authorizations – Sends transactions flagged for deferred authorization. All flagged transactions are submitted immediately. This applies only to deferred credit/debit card authorizations.
- Print Credit Card Reconciliation Report – Prints a credit card reconciliation report.
- Print Debit Card Reconciliation Report – Prints a European debit card reconciliation report.

  Note: If you have not set up European debit card cash accounts in the AR/Cash module, the Print Debit Card Reconciliation Report button is not available.

Credit Card Authorization Audit report

This report prints a list of all credit card transactions that were authorized within the given date range and/or Org Code. You can use this report to compare with the results of queries you receive from your gateway provider. Run this report from:

Continuum > Other Reports > Accounting reports > Credit Card > Credit Card Authorization Audit (Crystal)

> **Note:** Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

Debit Card Reconciliation report

Deferred income reports

Several summary and detail level reports let you review the status of deferred income. Go to AR/Cash > Generate reports > Deferred Income:

- Deferred Income Analysis/Spread
- Deferred Income Audit Trail (Crystal)
- Deferred Income Detail (Crystal)
- Deferred Income Matrix Summary (Crystal)

Deferred Income Analysis/Spread (see "Deferred Income - Deferred Income Analysis/Spread report (Crystal)")

Provides a projection of how the current balances in deferred income will be recognized in each future period. This is an important management report.

Deferred Income Audit Trail (Crystal)

Provides a report on the income that was recognized, as well as the deferred income balance that remains at the end of the reporting period. This report is designed to run for a specific monthly period (any month for which the GL interface has already been run). The report is designed as an audit trail report to simulate the income that was recognized, as well as the deferred income balances that remain at the end of the reporting period.

> **Note:** Note: This report is generated using the specified End Date. Only transactions equal to or less than the report's End Date are included. It is important to always enter the last day of the month.

This report is based on deferred income transactions for which the deferral/recognition timeframe is still in effect as of the beginning of the month being reported on (residual income is yet to be recognized either during the report month and/or in a future month).

This report simulates the process that iMIS uses to generate the deferral to income transfer entries with one exception. It depicts the income recognition at the individual detail transaction level, as opposed to the matrix summary level that iMIS uses to generate the actual entries. As a result, the reported income amounts will most likely be different from the actual amounts by small rounding differences. Nonetheless, the report should give a close approximation of the actual transfer amounts per month as well as the residual balance at the end.

This report is structured as follows:

- The report is based on all transactions dated on or before the reporting end date that have been posted to the deferred income matrix.
- The transactions are grouped, sorted, and subtotaled by the four key deferral matrix elements (deferral account, income account, begin date, and term).
- For identification and cross reference, the Trans #, Trans Date, Bill To ID, Bill To Name, and Product code are listed.
- The transaction amount is listed and subtotaled at the matrix summary level. This subtotal should agree with the original amount on the Deferred Income Matrix Summary report as of the end date of the report (the sign is shown as positive instead of the normal credit balance for easier use of the report).
- For each detail line, the monthly transfer column will show the portion of the income that should have been transferred during the reporting month. In most cases, if the begin date is equal to or less than the reporting period, this will be the transaction amount divided by

the term, with appropriate rounding. In some cases, the amount may be more if the transaction date falls within the reporting date and the deferral begin date was within an earlier period. In this case, iMIS works in a catch-up mode on income that needs to be recognized by the reporting date. If the reporting period is the last period within the deferral term, the amount may be smaller or larger to account for any cumulative rounding differential. The transfer amount is summarized at the matrix level and is also subtotaled for each income account. The actual transfer amount can be compared to the total income from transfer for the reporting period.

Note: If the actual transfer amount differs substantially from the report amount, this may be due to timing issues where the income for certain transactions was not recognized because a future month's GL interface was processed before the affected transactions were processed through an interface cycle.

- The Months Remaining in the deferral term beyond the reporting month is shown for each transaction.
- The deferred income Amount Remaining is shown at the individual transaction level, matrix summary level, and the Total amount by the deferred GL account. It can be compared to the GL balance and/or the Deferred Income Matrix Summary report as of the end of the reporting month. Again, due to the detail basis of the report, this balance will only be an approximation, which may be off by a rounding difference.

  Deferred Income Detail (Crystal)

  Provides a report of transactions to be posted to deferred income. Transactions are sorted by deferred income account, regular income account, beginning date, and term. This report should be printed prior to running the GL interface procedure. Verify the accuracy of the data and make modifications as needed before running the GL interface.

  Deferred Income Matrix Summary (Crystal)

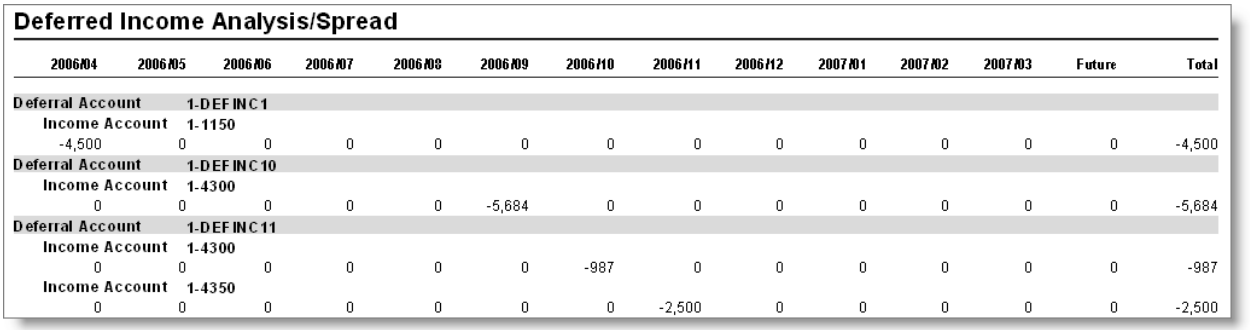
  Provides a current status of the deferred income matrix table and shows the totals that were originally posted to deferred income, how much has been recognized to date, and the amount that remains to be recognized in future months. This report should be printed after each GL interface. The remaining amounts should tie to the deferred income

balances in the General Ledger. Save this report and use it as a backup for deferred income transfer entries.

Deferred Income - Deferred Income Analysis/Spread report (Crystal)

The Deferred Income Analysis/Spread report (Crystal) provides a projection, sorted by deferral account, of how the current balances in deferred income will be recognized over the next twelve months. It also summarizes all amounts projected beyond one year in the Future column, and shows the total of all deferred amounts in the Total column.

> **Note:** Note: The total deferred amount equals Original Amount - Amount Transferred - Amount already realized.



Deferred Income Analysis/Spread

MenuTransJournal - AR/Cash Transactions report

The AR/Cash Transactions report runs the following reports:

- Credit Memo Journal – This report groups together adjusting transactions that typically reduce or reverse income, such as credit memo transactions entered in AR/Cash, Billing (from adjusting accrual dues invoices), Fundraising, and Order Entry (from invoicing Credit Memo type orders).
- Debit Memo Journal – This report groups together adjusting transactions that typically increase income, such as debit memo/adjustment transactions entered in AR/Cash, Billing (from adjusting accrual dues invoices), Fundraising, and Order Entry (from invoicing debit memo type orders).
- Payments Journal – This report focuses primarily on cash receipt transactions, such as those entered in the (AR/Cash) Enter and edit cash receipts, (Billing) Enter and edit payments, (Fundraising) Process payments, and (Service Central) Enter and edit payments windows.
- Refund Journal – This reported provides information on transactions generated as a result of refunds issued from AR/Cash (from AR/Cash, select Process month-end procedures, click Credit Invoices, select one or more credit invoices, and click Issue Refunds).
- Revenue-Sales Journal – This report provides a detailed audit trail of all AR/Cash transactions entered through AR/Cash.
- Transaction Recap – This report provides an accounting summary showing the net effect of the transactions.

These documents do not include transactions generated through other modules, such as Events.

Note: Note: If you have batch control enabled (from AR/Cash, select Set up module, and click Batch Control) print your transaction journal from the Manage batches window (from AR/Cash, select Manage batches). You can also select batch-specific printing options on the Manage batches window.

The detail journal separates transactions by type. Transactions entered on the Enter and edit sales transactions window (from AR/Cash, select Enter and edit transactions> Sales transactions) print with summary totals followed by a page break before printing transactions entered on the Enter and edit cash receipts window (from AR/Cash, select Enter and edit transactions> Cash receipts).

Note: Note: Remember to select the output destination (printer, screen, file, and so on) before you generate this journal.

The Transaction Journal - Transaction Recap

> **Note:** Note: The AR Cash Transactions (Crystal) report prints as two different pages on the same report. Use the scroll feature on the Print window to view Transaction Recap.

Reconciliation - Credit Card Reconciliation report

The Credit Card Reconciliation report shows a list of all credit card transactions for the selected batch, sorted by BT ID and Org code. Run this report from:

Continuum > Other Reports > Credit card reports > Print Credit Card Reconciliation Report

Troubleshooting

- The Print Credit Card Reconciliation Report button is only available if you have defined a credit card authorization gateway and a cash account for credit cards.
- To return results, you need to select a batch with at least one credit card transaction. Otherwise, the report is empty.

Note: Note: If Advanced PCI Compliance > Do not retain cardholder information is enabled, iMIS saves transactions without cardholder data and shows only gateway reference number and authorization code fields.

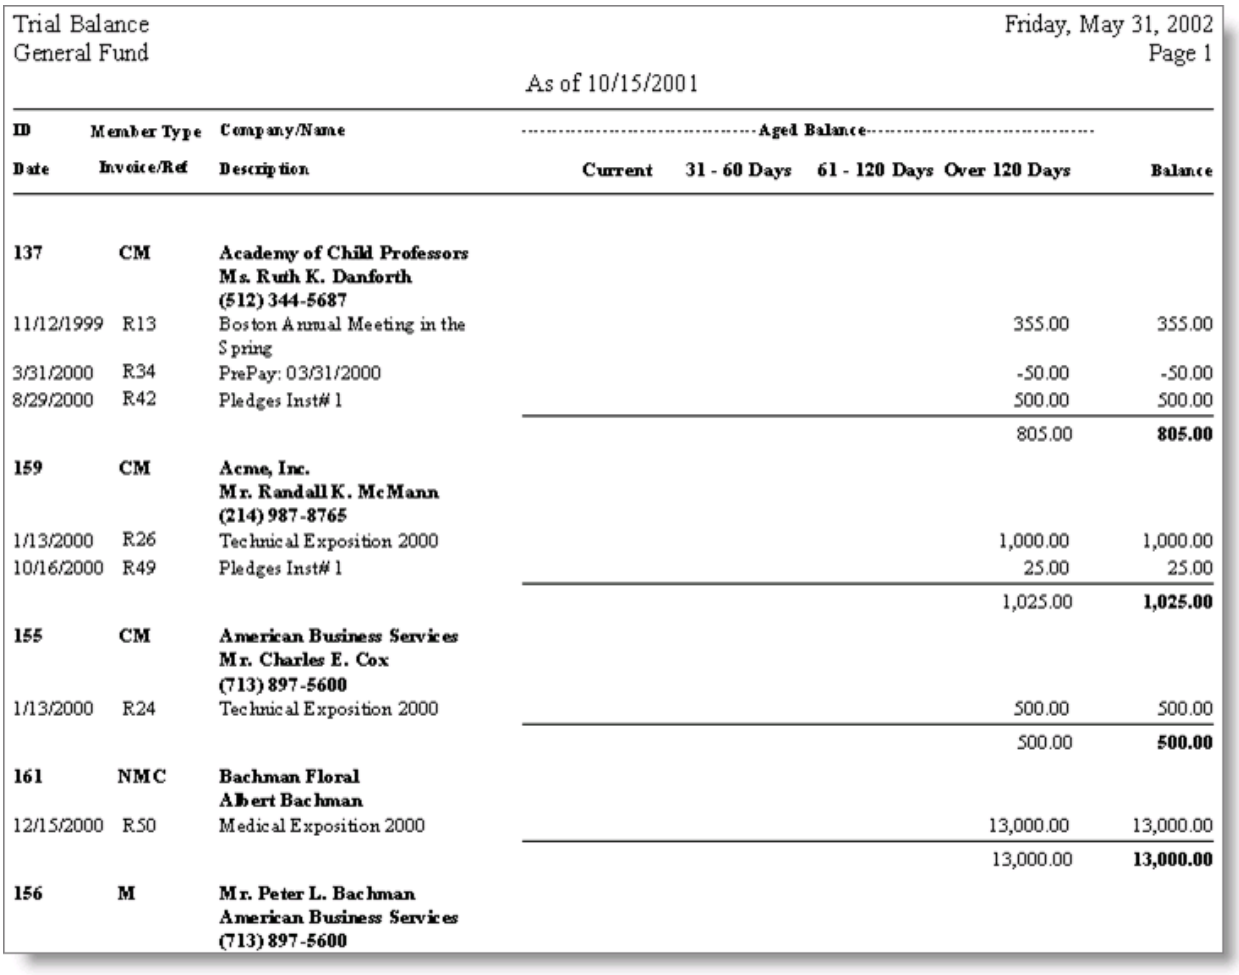
Batch Distribution Summaries report

Trial Balance - Trial Balance report

The Trial Balance report lists customer accounts with an open balance, and provides contact name, company name, telephone number, a line for each open item, a summary aging for each account, and a total.

The Trial Balance report is used as a collection report to locate and call overdue customers and is also a month-end accounting report used to balance the iMIS AR subsidiary ledger against the general ledger AR control account.



Trial Balance

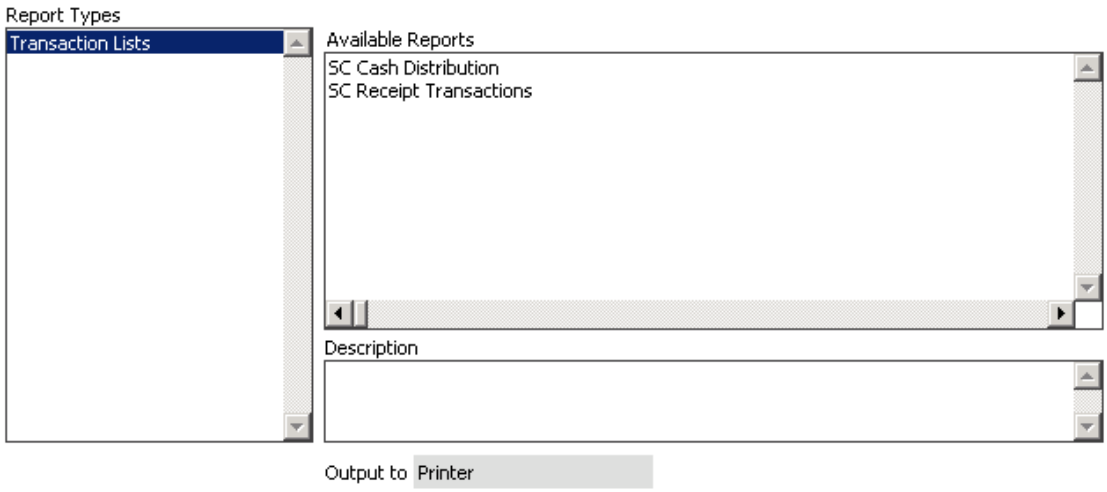
Reports for Customer Service

Customer service reports window



Continuum > Other Reports > Customer service reports

You can generate two reports through Customer service reports by utilizing Service Central: SC Cash Distribution and SC Receipt.

Transaction. The SC Cash Distribution report is a monthly transaction detail report, sorted by income and account number. The SC Receipt Transaction report is a daily receipts detail report showing all payment details, including a recap by income account.

Printing Service Central Reports

You can print Service Central reports in the same manner as other iMIS modules.

To print Service Central reports

1. From Customer service reports, select a report.

2. Click the Set Report Destination button and select where you want the view the output.
3. Click Run. The Date Range window opens.
4. Enter a Begin Date and End Date for the report.

   Note: Enter a date range that is not greater than 30 days. If you enter a date range that exceeds 30 days.
5. Click OK to run the report.

Sample Service Central Reports

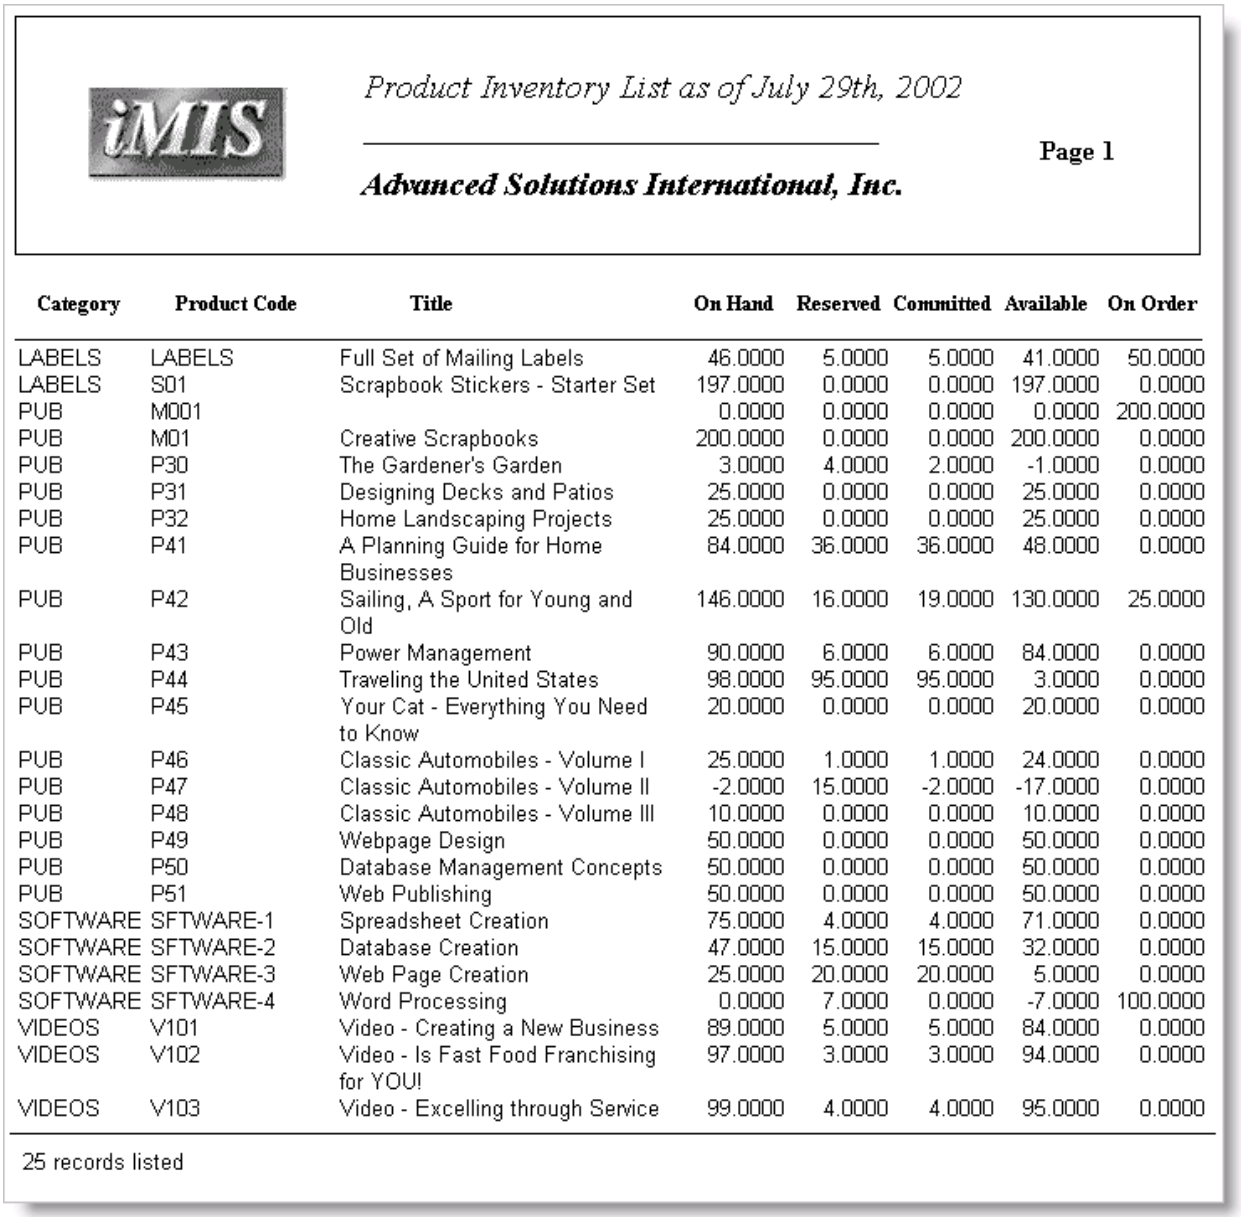
Product Inventory List report

The Product Inventory List report lists all of your products and each product's inventory levels. You can generate a list for products that are on hand or for all of the products that your organization offers for sale. You also have the option of sorting the products by either product category or product code.



Product Inventory List as of July 29th, 2002

Warehouse Availability Analysis report

The Warehouse Availability Analysis report generates a list of order line items for back-ordered products. Separated by products on backorder, each line item lists specific order information including order number, order date, order priority, and product quantity. The product quantity information lists the number of products Ordered, Shipped,

Backordered, and Fillable. If you are using multiple warehouses, the report also lists a product's availability at each warehouse.

If a product's default warehouse does not have sufficient inventory in stock, you can run the report to view a product's availability at other warehouses. If another warehouse has available inventory, you can edit an order to ship a product from a warehouse with sufficient inventory.

Continuum Reporting

Document System

The Document System is the web-based document management system for your entire iMIS system, providing unified management, versioning, and security of your organizational content assets. It lets you view and maintain the full range of definition objects for iMIS:

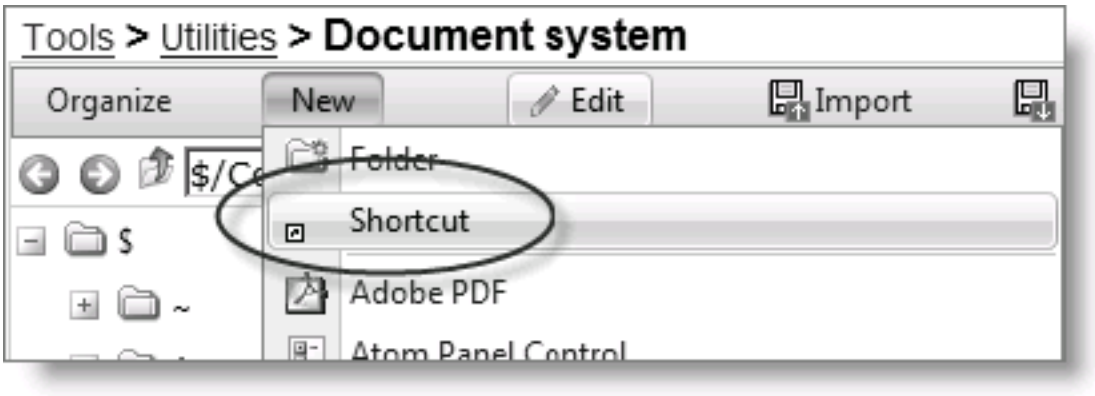
- Business objects, used by Business Object Designer (BOD)
- Queries, used by Intelligent Query Architect (IQA)
- Workflow definitions
- Reports
- HTML files and Microsoft Word files, used for mail merge output

Filtered views

When you use Tools > Document System, you see every type of object (document), but when you see the Document Browser throughout the rest of iMIS, the view is filtered to show you only what you need for that situation. For example, when working with IQA, the Document Browser only shows you queries. In the same way, toolbar commands such as New are filtered so that, when you are working in Business Object Designer, you can create only business objects.

Shortcuts

In the Document System, you can move and copy objects and folders to other folders. Beyond this, you can also create a virtual link (alias) in one folder that points to another object or folder, which keeps you from duplicating objects or folders that you want to share in different contexts.



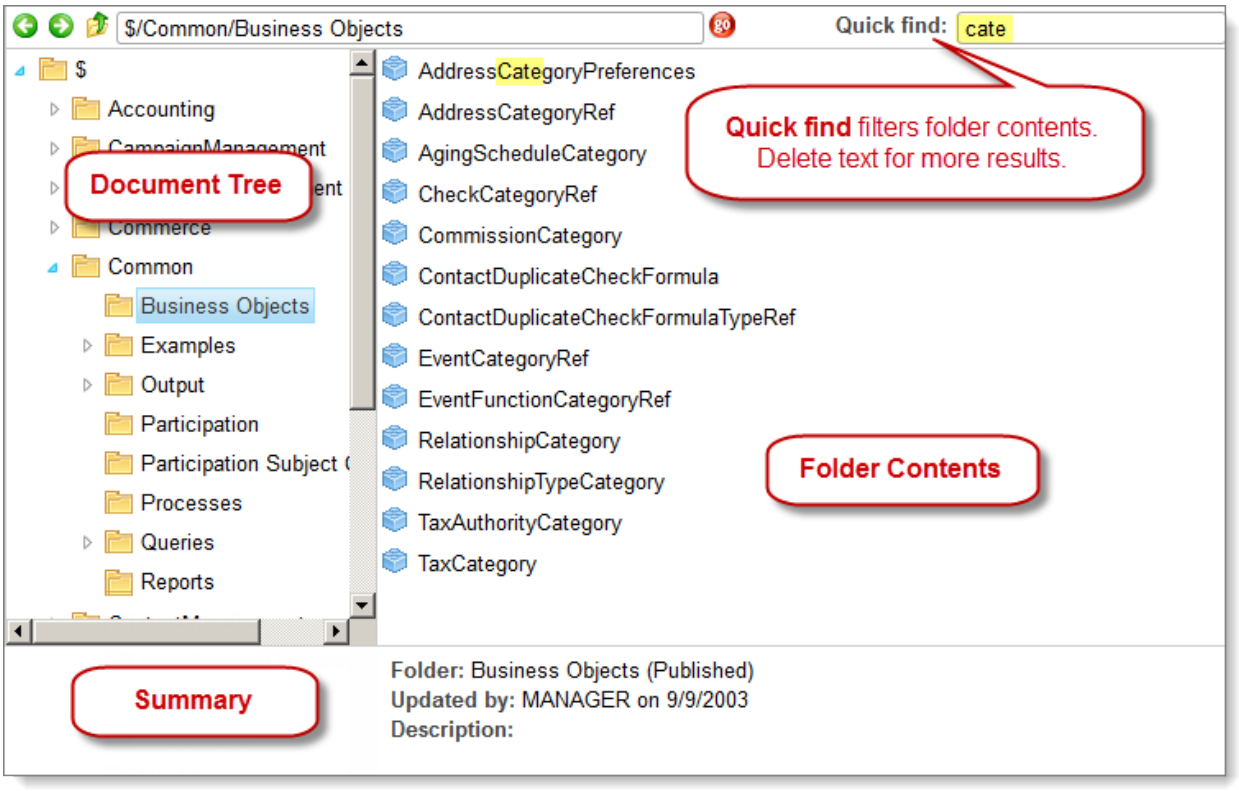
Security access

iMIS users that belong to the SysAdmin security role can see and maintain all definition objects that exist in the Document System. Users who do not belong to the SysAdmin role see a more limited set of definition objects that is determined by the security privileges that are set on each object or on each folder that contains objects.

For example, you can limit the visibility of an entire folder and its definition objects to a specific user-defined security role such as Fundraising Users. Alternatively, you could define that same folder to be visible to Everyone, but limit a few definition objects in that folder to be visible only to Fundraising Users.

Document Browser

Selecting Tools > Document System opens the Document System, which has a toolbar at the top and the three-pane Document Browser below it:



The Document Browser also appears throughout iMIS for locating relevant objects, which it does by filtering the view so that you only see folders and objects that are appropriate for your current task. The Document Browser always appears with these three panes:

1. Document tree (left pane): displays all folders that are relevant to the context in which the Document System is displayed.
2. Folder contents (right pane): displays the contents of the folder that is selected in the document tree area. Folder contents can comprise definition objects, subfolders, or links to items that are located in a different folder.

   Tip: The Quick find box dynamically filters the folder contents, to help you to find items quickly when there are large numbers in the folder. Delete text to see more results. In Desktop, press F12 to apply the filtering.
3. Summary (bottom pane): summarizes the basic properties of the item that is selected in the folder contents area. To show or hide the summary area, select Organize > Display Summary.

Managing document folders

The document tree area of the Document System lists the folders available in the current view of the Document System. The folders that are visible depend on the roles and groups assigned to your user record as well as by what feature of iMIS you are using. The full extent of the folders available in the Document System can be seen only by SysAdmins.

Multiple hierarchies, different roots

There are several Document System hierarchies, each used for different areas of iMIS:

- $/ – Business Object Designer (BOD) has its own hierarchy of business objects. The root is represented by a $ character.
- @/ – Content folders and content records exist in their own hierarchy. The root is represented by a @ character.
- ~/ – Sitemaps each exist as their own hierarchy. The roots are represented by ~ characters.
- $/– All other definition objects exist in the main Document System hierarchy, portions of which are also exposed in other features of iMIS. The root is represented by a $ character.

Tasks that you can perform

- Click an item to select it for use with a toolbar command and to display a read-only summary of its basic properties in the summary area.
- Double-click a folder to open the folder and display its contents.

Toolbar behavior when folders are selected

When a folder in the document tree area is selected, the toolbar commands behave as follows:

- Organize > Refresh refreshes the document tree.
- Organize > Cut, Organize > Copy, and Organize > Paste enable you to copy or move entire folders, including all of their descendants. The cut or copied folder and all of its descendants are placed inside the folder that is selected when you use the Organize > Paste command.
- Organize > Select All selects all contents within the selected folder.
- Organize > Delete moves the selected folder and all of its descendants to the Recycle Bin.
- Organize > Properties shows a read-only summary of the selected folder's basic properties.
- Organize > Display Summary shows or hides the summary panel for the object selected.
- New displays a drop-down list from which you can choose a new folder or definition object type to create in the selected folder. When you select an object type, a properties window appears in which you can define the object. The object types shown in the drop-down list are determined by the properties of the selected folder, which you can examine by using the Edit toolbar command.
- Edit opens a window that enables you to edit the definition of the selected folder.
- Import imports an external XML file (created by the Export command on a different iMIS database) into objects in the Document System. (You cannot use Export and Import to make copies of objects within the same iMIS database.)

  The Upload button reads the XML file contents and displays a list of the definition objects that were exported to the XML file. You can select which of the objects to import, and whether to overwrite objects with the same database GUID in the destination folder or to create new copies of the objects. You can also opt to import the objects to the folder from which they were originally exported, or to override that default destination with the selected folder.

For versioned document types, if a newer version of the object exists in the Document System, then the newer version is not overwritten during the import. Instead, the imported object is added as an archived version of the object. To replace the newer version of the object with the imported object, select Versions from the toolbar, choose the correct version, and click Revert.

- Export exports all selected folders and definition objects into a single XML file, which can later be used to import those objects into the same folder or a different folder in a different iMIS database. (You cannot use Export and Import to make copies of objects within the same iMIS database. To make copies, use Organize > Copy and Organize > Paste.)
- Versions displays a list of the existing versions of the folder, from which you can:
- Export a specific version to an XML file.
- Purge a specific version from the version list, removing all traces of that version from the system.
- Copy a specific version to a new folder with a different name.
- Create an new version based on any existing version by selecting the version, clicking Revert (which creates a new working version), and then publish the working version. If you make no changes to the working version you are effectively reverting to the state of the selected version, although technically it becomes a more recent version in the list of versions.
- Run cannot be used in this context. You must use this command from the folder contents area.
- Publish transforms all working versions of the descendant definition objects in the selected folder into published versions of those objects. Only the most recent published version (of a versionable object) is actively used by the system. You must select the Publish children as well? checkbox when publishing a folder.

To manage folders and objects in the Recycle Bin

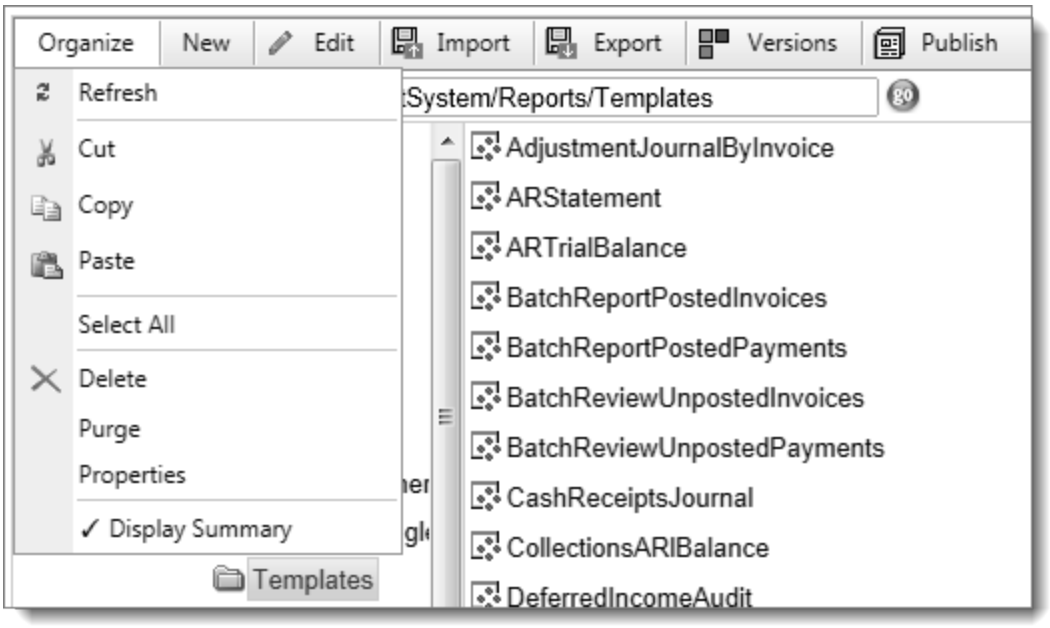
Folders and definition objects that have been deleted are moved to the Recycle Bin at the bottom of the Document System hierarchy.

- To permanently delete individual folders and definition objects that you do not think you'll ever need again, select an object listed in the recycle bin and from the toolbar choose Organize > Purge. To permanently delete the entire contents of the recycle bin, select the Recycle Bin itself and from the toolbar choose Organize > Empty the Recycle Bin.
- To restore a deleted definition object, select it and from the toolbar choose Versions. In the version history that appears, click the Recycled version at the top of the list and click Revert. The definition object is moved to its original parent folder in the hierarchy, and its status changes to Working. You must then re-publish the definition object to make it active again.

> **Note:** Note: If the definition object's original parent folder no longer exists, the restored object is placed in the root folder of the Document System hierarchy. You must move it out of the root into another folder before you'll be able to publish the object.

Managing folder contents

The folder contents area of the Document System lists the definition objects, subfolders, and links that are stored in the folder selected in the document tree area.



Example of the folder contents area of the Document System

Tasks that you can perform

- Click an item to select it for use with a toolbar command and to display a read-only summary of its basic properties in the summary area.
- Select multiple items for use with a toolbar command or right-click command by holding down Shift or Ctrl while clicking each item. The last object you select is the one whose properties are displayed in the summary area.
- Double-click a definition object to perform one of the following actions (depends on the type of object):
- Open a properties window that enables you to edit the definition of the object.
- Open the Document Utility.
- Double-click a folder to open the folder and display its contents.

Toolbar behavior when items are selected

When an item in the folder contents area is selected, the toolbar commands behave as follows:

- Organize > Refresh refreshes the document tree.
- Organize > Cut, Organize > Copy, and Organize > Paste enable you to copy or move the selected definition objects. The cut or copied objects are placed inside the folder that is selected when you use the Organize > Paste command.
- Organize > Select All selects all contents within the folder.
- Organize > Delete moves the selected objects to the Recycle Bin.
- Organize > Properties shows a read-only summary of the selected object's basic properties.
- Organize > Display Summary shows or hides the summary panel for the object selected.
- New displays a drop-down list from which you can choose a new folder or definition object type to create. When you select an object type, a properties window appears in which you can define the object. The object types shown in the drop-down list are determined by the properties of the folder in which you are working. You can examine these folder properties by selecting the folder in the document tree area, then choosing the Edit toolbar command.
- Edit opens a window that enables you to edit the definition of the selected folder, object, or of the object to which a selected link points.
- Import imports an external XML file (created by the Export command on a different iMIS database) into objects in the Document System. (You cannot use Export and Import to make copies of objects within the same iMIS database.)

  The Upload button reads the XML file contents and displays a list of the definition objects that were exported to the XML file. You can select which of the objects to import, and whether to overwrite objects with the same database GUID in the destination folder or to create new copies of the objects. You can also opt to import the objects to the folder from which they were originally exported, or to override that default destination with the current folder.

- Export exports all selected folders and definition objects into a single XML file, which you can use later to import those objects into the same folder or a different folder in a different iMIS database. (You cannot use Export and Import to make copies of objects within the same iMIS database; to make copies, use Organize > Copy and Organize > Paste.)
- Versions displays a list of the existing versions of a versionable object, from which you can:
- Export a specific version to an XML file.
- Purge a specific version from the version list, removing all traces of that version from the system.
- Copy a specific version to a new definition object with a different name.
- Create a new version based on any existing version by selecting the version, clicking Revert (which creates a new working version), and then publish the working version. If you make no changes to the working version, you are effectively reverting to the state of the selected version, although technically it becomes a more recent version in the list of versions.
- Run executes a selected query, report, or other object types that are designed to be run. If the selected object is a .PDF, .DOC, or .XLS file, this command opens the file in its assigned editor.
- Preview displays a fully rendered view of the selected navigation item, content record, or other CM object types that are designed to be previewed.
- Publish transforms a working version of an object into a published version. Only the most recent published version (of a versionable object) is used actively by the system.

Virtual linking among folders

Many Document System folders in iMIS contain a default virtual link to the Common > Shared Documents folder, which is the central location for definition objects that are available without restriction to all staff users. These virtual links enable users who are given

only limited access to the Document System functionality to easily navigate back to the top of the Shared Documents sub-tree.

> **Note:** Caution! These default virtual links to the Shared Documents folder can be deleted by any user that belongs to the SysAdmin role.

There are also some hard-coded virtual links within the Document System, which exposes specific folders in various locations throughout the iMIS interface.

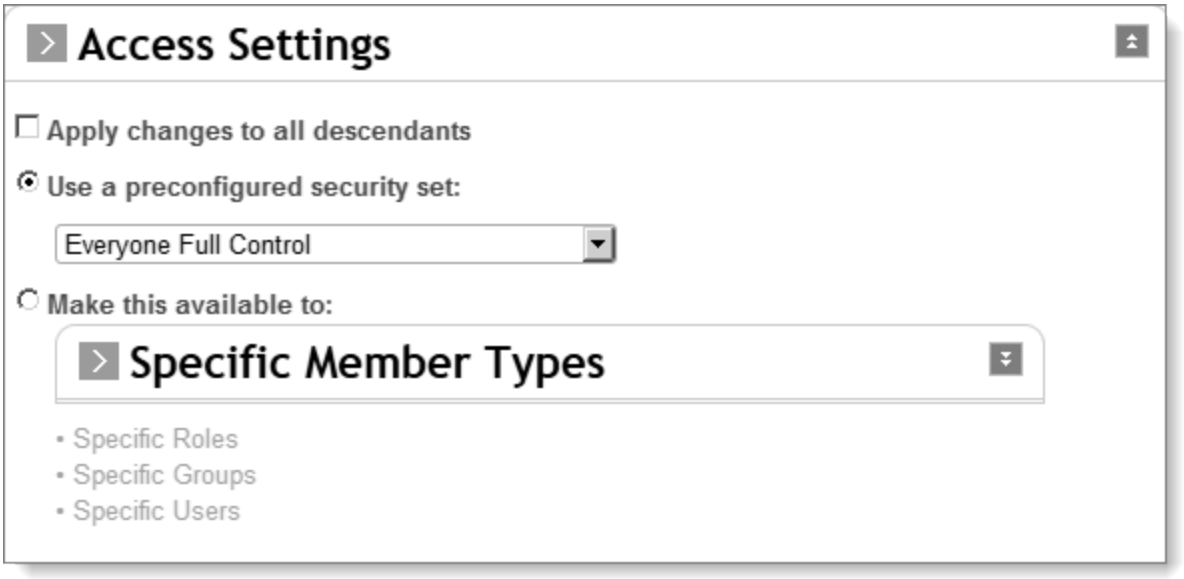
Using Access Settings

Access Settings give you a consistent way to apply security (grant permissions) to folders and objects throughout iMIS: entire websites, individual navigation items, content

records, queries, business objects, and the wide array of objects that you can define, import, and store in the Document System.



Access Settings are immensely flexible: they let you tie an object's permissions to iMIS security roles, security groups, specific users, member types, or your organization's staff (licensed iMIS users).

> **Note:** Tip: You can meet most of your needs using the preconfigured security sets that ship with iMIS, so become familiar with those.

- Apply changes to all descendants – (Document System folder objects) Changes to this section, when saved, flow automatically to all descendant definition objects. When cleared, changes to this section apply only to the current definition object.
- Use a preconfigured security set - Specifies a preconfigured security configuration to use for this definition object, which is the default and preferred way to set permissions for definition objects. You can see the specific permissions that make up the security set in the Make this available to area.

  Tip: If a preconfigured security set is close to what you need, select it and then select Make this available to, so that the permissions granted by the security set are copied for you to work from.

- Make this available to - Lists the roles, groups, users, member types, or authorization levels that may define or view rendered output from this object. If none of the pre-configured security configurations meets your needs, you can set custom permissions here.

  The SysAdmin, Content Administrator, and Everyone roles are default system-defined security roles that are assigned to every definition object. The SysAdmin role is assigned in the definition of an iMIS user record, but the Content Administrator role is automatically assigned to every iMIS user who is a member of a content authority group (CAG) that is designated as a Master Admin CAG.

  The permissions that can be assigned to each entry in the list are:

- Full Control - Enables all of the following permissions.
- Read - Enables users to see this object both in definition windows and as rendered output in websites, but they cannot change the object's definition.
- Add - Enables users to create new objects, or to paste or import an object into the Document System.
- Edit - Enables users to edit this object's definition, but not to delete the object.
- Delete - Enables users to delete this object.
- Select - Enables users to assign a tag to content folders and content records.

  Custom security groups (use sparingly)

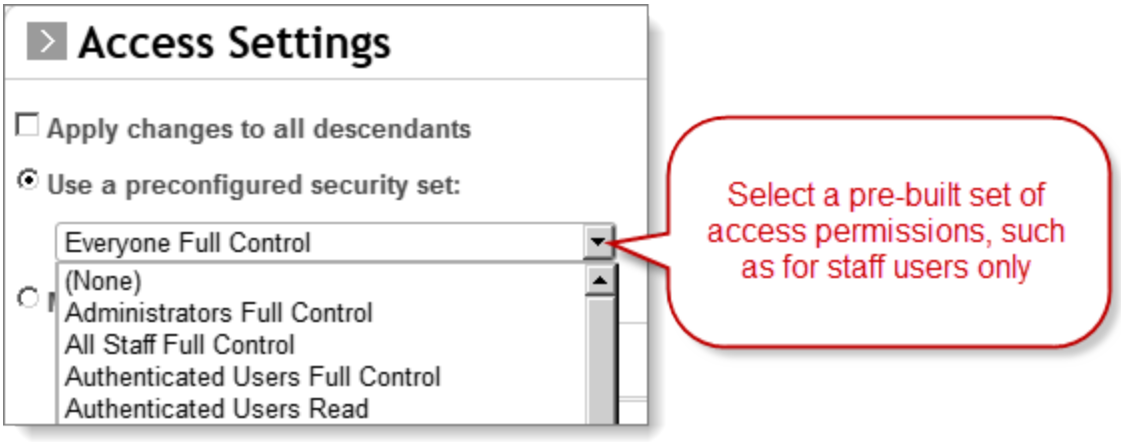
  You can add/remove specific Roles, Groups, and Users and assign them each a specific set of permissions. Making this type of change to the security for an object results in a new unique AccessKey for the specified Access List permissions.

  You can create a custom security group by tweaking a predefined group or building your own from scratch (using the Make available to radio button). While a custom security group offers great flexibility, it jeopardizes performance, because it adds several rows per object. If the security tables get too large (given that they are joined on every query), your system can slow significantly.

> **Note:** Caution! To minimize performance impacts, avoid using custom security groups where their effect multiplies: folders, Navigation items, and all children the same (unless you are using shared security, or it is mission-critical).

Preconfigured security sets

Throughout iMIS, whenever you configure Access Settings, you see a drop-down list of available security settings that you can apply to individual folders and objects. These security sets offer you easier control and faster iMIS performance than defining custom ones.



These are the key security sets you should use, from most permissive to least:

- Everyone * – no restrictions, including the public (if they can access this level/context).
- Authenticated Users * – restricts access to users who are signed in (both staff and public members).
- * Staff * – restricts access to users by licensing: Full Staff Full Control limits to Full users, Casual Staff Full Control limits to Casual users, and All Staff Full Control limits to Full and Casual users.
- Administrators * – restricts access to users with the SysAdmin role.

> **Note:** Tip: If you do not have the feature named in the security set (such as Certification), do not use the set.

iMIS ships with these pre-built security sets to cut down on the customization you need, for objects that should be neither unsecured (Share) nor locked for you alone (Private). Each security set contains a predefined Access List and permissions (Full Control, Read, Add, Delete, Edit) that are constant for all objects that use it. A Select permission is also available for tagged objects.

When you choose a set, the Current Access List below it updates to show the settings it includes. Look at those details to decide if the selected security set has the permissions you need.

Feature-specific default security

Most feature-specific security sets have three levels (Admin, Manager, User), each of which allows access for any level above it. For example, "Certification Users" grants access for Managers and Admins as well. Note that you can define your own access settings based on User-level security: Roles and Groups.

For example, applying Segmentation Job Default Access security means that

- users in the "SegAdmin" group get control privileges
- users in the "SegMgr" group get Read+Add+Edit+Delete privileges
- users in the "SegUser" group get Read-only privileges
- users in the "SysAdmin" role get control privileges

Setting access for folders and objects

iMIS SysAdmins have Full Control access to all folders and objects in the Document System, so they can also define security privileges for every folder and object.

Caution

- New folders have unrestricted access: When a new folder is created, the Everyone role is granted Full Control by default.
- Folder permissions are not the same as per-object permissions: you can set Control/Read/Add/Edit/Delete privileges individually for most definition object types in the Security page of its properties window, independent of the folder.
- IQA folders are special: Certain folders within the Document System are exposed through the IQA task list item in Customers, Events, Billing, Fundraising, and Orders. These folders and all sub-folders that they contain behave differently when viewed from the IQA task list item:
- You can create only queries in these folders even if the folder is defined to allow any type of definition object. Only members of the SysAdmin role who edit these folders from Tools > Document System can create the other types of allowable objects.
- If any user modifies the folder definition to disallow the creation of Query objects, the folder and all of its contents become invisible from within an IQA task list item. Only members of the SysAdmin role who are viewing the entire Document System via Tools > Document System are subsequently able to see the folder.

To define security access for a folder

1. In the Document System, select a folder and click the Edit toolbar command.
2. In the Only allow certain types of objects in the folder? area, specify the objects to be allowed in the folder.

   Multi-select object types from the list by holding Shift or Ctrl while clicking items in the list.
3. For the Access Settings, select Private or else select Use a preconfigured security set and select a set from the list, if any apply.

   Tip: For best performance, use Preconfigured security sets.
4. If you need custom access settings, enable Make this available to and complete the panel.

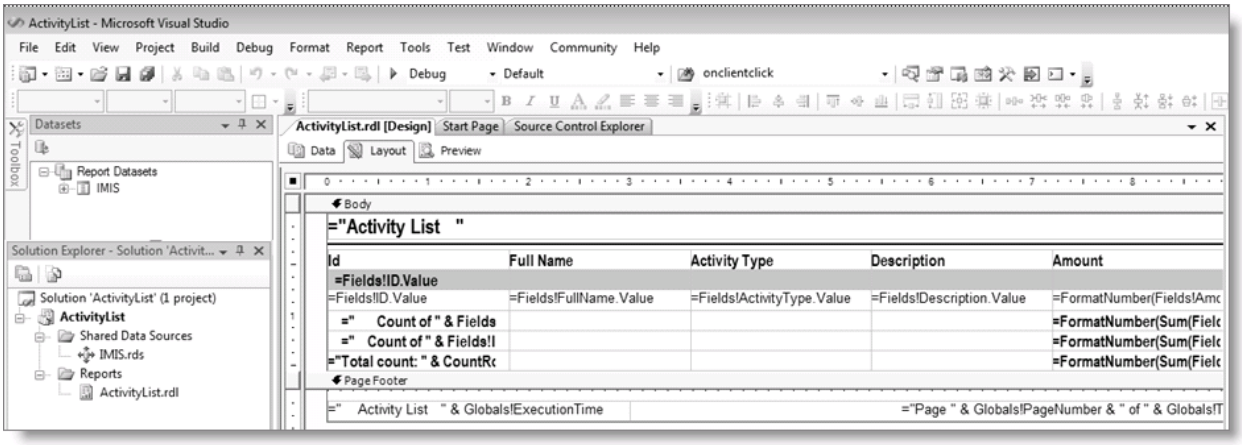
- For Specific Roles, select the checkbox for each system-defined role that should have access to the folder. For each role, you can click the Edit icon next to the role name to define the specific privileges for that role.
- For Specific Groups and Specific Users areas, add the groups and users that should have access to this folder, and click the Edit icon next to each entry to define the specific privileges for that entry.

5. At the bottom of the folder security definition window, click Save to commit the changes.

Quick facts: SSRS reports

iMIS natively supports SQL Server Reporting Services (SSRS) for both static and dynamic reporting capability with SQL Server databases. Reporting Services includes everything you need to create, distribute, and manage reports.

> **Note:** Important: iMIS supports Crystal Reports, but all new iMIS reports use SSRS.



What do I need to license or buy?

Nothing! iMIS installs the SSRS Report Viewer control for ASP.NET applications that comes with Microsoft Visual Studio. iMIS uses the Report Viewer control, which offers a document map, jump-to-page, zoom, and search. iMIS enables the control's built-in

report navigation (pagination), parent report support, and export functionality, including Excel (XLS) and PDF formats.

- Microsoft freely distributes the Report Viewer control
- You can edit the XML-based report format in any text editor
- Visual report designers, Report Builder and Business Intelligence Development Studio, are free for download

How do I run reports in iMIS?

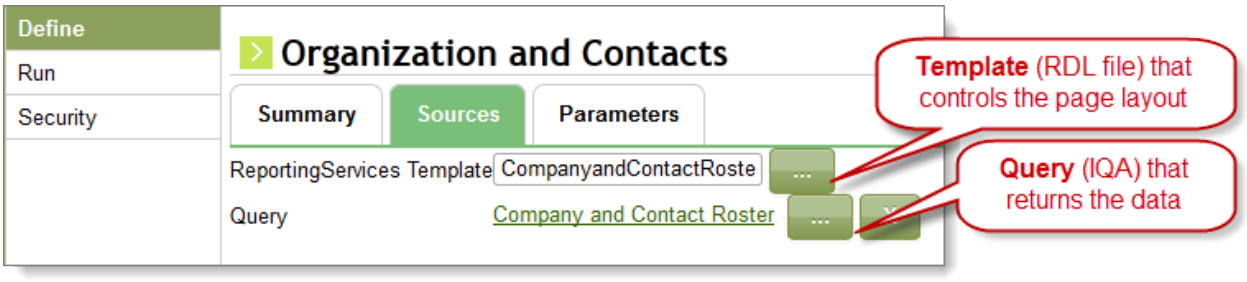
- Generate a default SSRS report on the fly using the Report command in IQA.
- Browse to a content record that has an SSRS Report iPart configured on it.
- Open a navigation item that lists all of the reports in a given folder, and select one.
- Run SSRS reports directly from the Document System.

Where to find samples: In the Document System, go to $\Samples\ReportingServices to access example SSRS reports (each of which has a query, a template, and a run-time report).

Creating SSRS reports

To use SSRS reports natively in iMIS, you work with three associated objects:

1. Query – provides the data needed for the report.
2. Template (Reporting Services Template, the .RDL file) – provides the formatting to display the results, such as a matrix or pie chart. IQA uses a default template that you can generate from any query, either to save in the Document System or to export as an RDL, for editing and reimport.
3. Report (the runtime report, an iMIS output process) – binds the query and the template, sets the name, parameters, and security, and makes the report usable from an iPart or list of reports.



You can generate a default table-based SSRS report just by using the Report command in IQA. These you can export so that you can craft production-quality page layouts or add charting and graphing.

Can't I just use IQA?

Yes, take advantage of queries and special iParts to filter and present iMIS data to your users. See Displaying query results in iParts for the growing number of query-based iParts available.

But some situations require the full power of Reporting Services. You might, for example, need

- a different type of chart or graph than is available
- to change the chart from listing counts to showing percentages
- to add special header/footer and page layout for production quality
- to output the records in list format, one per page

How hard is adding a report?

Faster than you can brew a cup of tea, you can publish a new report in iMIS. Suppose that you need a new report, and you want this report added to your site, for easy access. Without using report editors at all, you can achieve this in a few steps:

1. Create and save your query.
2. Click Report to generate the default report.

Tip: If you want to adjust any layout defaults, you can do so in SystemConfig table settings. See Changing the default layout for SSRS reports.

3. Click Save Report Definition to iMIS. Select the name and location you want and click Save, which creates the template and report file, already bound to your query.
4. Add access to your new report by adding an SSRS Report iPart (Utility folder) to an appropriate content record. Enable Excel and PDF exporting as needed.

   Tip: Most reports display best on content records that use single-column layouts.

   What is the easiest way to change a report?

   Suppose that you already added a default report to your site, but you now need to add a pie chart. The essential process is this:

1. Download the RDL template: edit the query, click Report, click Save Report Definition to Workstation, and Save it.
2. Edit it in your report writer.

- Tutorial: Adding a Pie Chart to a Report
- How to: Display Data Point Labels Outside a Pie Chart

3. Upload it to iMIS as a new template: in the Document Browser, select New > Reporting Services Template, and browse to your RDL file.
4. Update the report runtime to use it: edit the report file, and browse to your new template.

   See Getting report layouts from *iMIS*.

Using iMIS to generate SSRS reports

You can take advantage of the dynamic reporting feature of IQA to generate many of the reports you need, without using any report editors:

1. In the Document System, browse to your query and choose Edit.
2. Click Report to generate a report that is dynamically formatted using the settings you control through SystemConfig parameters.

3. Under Options, select Save Report Definition to iMIS.
4. Browse to the save location you specified and edit the outputs as needed:

- Reporting Services Template: , which exports as [QueryName].rdl
- Reporting Services Report: , which exports as [Query Name] and binds template to query

  For example, you might edit the report's Parameters tab to hide the report's parameters at run-time or to preset values (such as to make this report display Texas locations only).

5. Create a content record with an SSRS iPart to display your new report:

- In Content Designer > Manage content, open an appropriate folder to house your new report.
- From the toolbar, select New > Website content.
- For add new content, open the Utility folder and select the SSRS Report iPart.
- Configure the iPart to point to the report ( ) you just created.

6. Deploy the content into the site through a new navigation item, tagging, or other method.

Creating reports in SQL Server tools

1. Install the free report writing tool that works with your version of SQL Server:

- Microsoft SQL Server 2008 R2 Report Builder 3.0
- Microsoft SQL Server 2005 Express Edition Toolkit, which installs SQL Server Business Intelligence Development Studio (BIDS)

2. Reuse or copy reports created in other editions. When you publish a report created in an earlier version of Reporting Services, it upgrades to the newer format.
3. Create reports using any Reporting Service features: drill-through reports, sub-reports, and parameterized reports that include charts, tables, matrices, and lists.

4. Publish to a report server. To make a published report available to users, use Report Manager to create role assignments that grant access to it.

Adding custom SSRS reports and subreports

If you have designed your own RDL source files, you can upload them into iMIS templates, create reports (which link templates to queries), and display those reports with SSRS iParts.

> **Note:** Note: In Reporting Services, subreports are stored as separate RDL files that the main report references. Therefore, you need to upload them into iMIS separately.

To add an SSRS report to iMIS

1. Import your template (RDL) into iMIS as a Reporting Services Template:

- In the Document System, open the \Reports\Templates folder for the target module.
- From the toolbar, select New > Reporting Services Template.
- Browse to the source RDL file on your file system.

2. Create a report that will bind a query to this template as a Reporting Services Report:

- In the Document System, open the \Reports folder for the target module.
- From the toolbar, select New > Reporting Services Report. This object is a process engine.
- On the Sources tab, specify which Reporting Services Template and IQA query to use.
- On the Parameters tab, choose whether to show the report's parameters at run-time and whether to preset their values (such as to make this report display Texas locations only).

3. Create a content record with an SSRS iPart to display your new report:

- In Content Designer > Manage content, open an appropriate folder to house your new report.

- From the toolbar, select New > Website content.
- For add new content, open the Utility folder and select the SSRS Report iPart.
- Configure the iPart to point to the report ( ) you just created.

4. Deploy the new content into the site through a navigation item, tagging, or other method.

   To add SSRS subreports to iMIS

   Creating a report that has subreports is the same process, except that you also import the subreport RDL files into the same folder as the main (parent) RDL file.

1. Import your template (RDL) into iMIS as a Reporting Services Template:
2. In the same folder, also create templates for each subreport RDL used by the main report. iMIS can run the subreports specified in the main report only if they are in the same folder.
3. Create a report that will bind a query to this template as a Reporting Services Report:
4. Create a content record with an SSRS iPart to display the main report:
5. Deploy the content into the site through a new navigation item, tagging, or other method.

Direct URL calls to run one-off reports

Content Management also supports direct calls to its reports from your web page code, so that you can create one-off reports you may need. This sample code for a Print Detail button on the Batch details page shows the process:

1. Call a content item (@/iMIS/Accounting/BatchDetailReport).
2. Pass it a parameter (Batch Number) as a URL parameter.

```
protected void PrintDetailClick(object sender, EventArgs e)
{
   Guid documentKey = DocumentSystem.DocumentKeyByPath("@/iMIS/Accounting/BatchDetailReport");
```

```
    Document d = DocumentController.Document(documentKey);

    Business.ContentManagement.Content content = Business.ContentManagement.Content.GetFromDocument(d);

    string url = string.Format(CultureInfo.InvariantCulture, "{0}?&Batch Number={1}", content.GetNavigateUrl(), Batch.BatchNumber);

    Response.Redirect(url);
}
```

Customizing SSRS reports

For a hands-on walkthrough of how to create a customized report template for use in iMIS, see Tutorial: Customizing a report template.

Changing the default layout for SSRS reports

Your iMIS database stores configuration parameters that control the layout and design of reports generated through Reporting Service (SSRS). These parameters in the SystemConfig table control the look and feel of SSRS reports being created system-wide.

For example, if you have international customers, a helpful change might be to configure the reports for A4 format (21.0 x 29.7 cm).

> **Note:** Tip: Like Word templates, these configuration settings control new reports only; layout changes do not propagate to existing reports. Therefore, test and perfect your settings before creating new SSRS reports, to minimize rework later.

To change SSRS layout parameters

3. Use your favorite SQL query tool to access the SystemConfig table in iMIS.

4. Change the values as needed.

   Tip: For valid color names and samples, search the web for aspnet named colors.

5. Restart IIS (or reboot the server) to clear the cache and apply the changes.

   SSRS layout parameters

   You can generate the table below using this query:

   select ParameterName, ParameterValue, Description

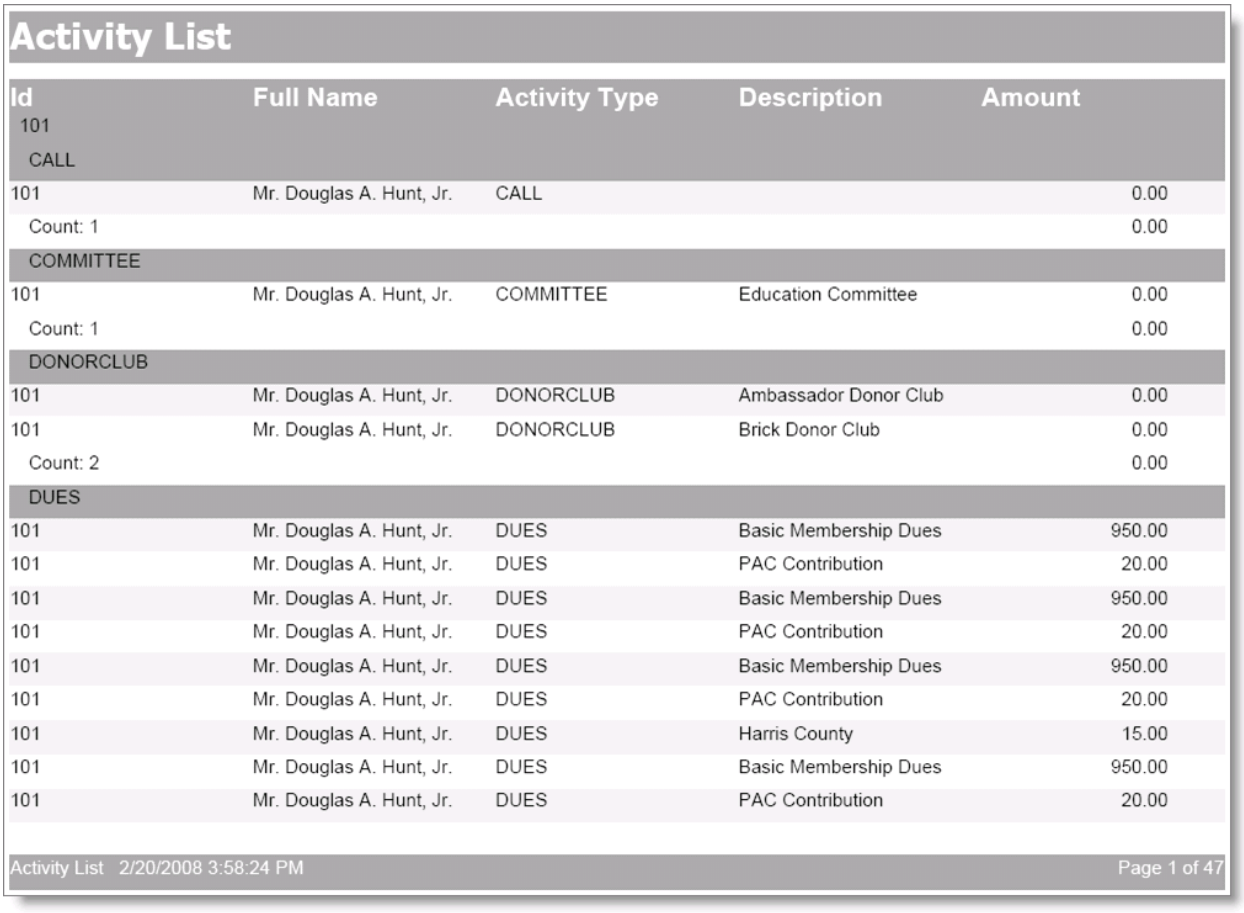
   from SystemConfig where ParameterName like 'SSRS%'

   order by ParameterName

.BodyReportItemsHeight	0.2	Body report items height (units only, no UOM) used when generating SSRS reports
.BottomMargin	0.5	Bottom margin (units only, no UOM) used when generating SSRS reports
.DetailFont	Arial	Detail font for generated SSRS reports
.EnableGreenBar	false	Turns on alternating background color in rows of generated SSRS reports
.FieldHeaderBackgroundColor	White	Named color used when generating SSRS reports
.FieldHeaderForegroundColor	Black	Named color used when generating SSRS reports
.FooterHeight	0.3	Footer height (units only, no UOM) used when generating SSRS reports
.GreenBarBackgroundColor	LightSteelBlue	Named background color used when EnableGreenBar is true for generated SSRS reports
.GroupHeaderBackgroundColor	LightSteelBlue	Named color used when generating SSRS reports

.GroupHeaderForegroundColor	Black	Named color used when generating SSRS reports
.HeaderFont	Arial Narrow	Header font for generated SSRS reports
.HeaderHeight	0.25	Header height (units only, no UOM) used when generating SSRS reports
.LandscapeTotalWidth	11	Total page width (units only, no UOM) for landscape orientation paper used when generating SSRS reports
.Language	en-US	Default language used when generating SSRS reports
.LeftMargin	0.5	Left margin (units only, no UOM) used when generating SSRS reports
.PageFooterBackgroundColor	White	Named color used when generating SSRS reports
.PageFooterForegroundColor	Black	Named color used when generating SSRS reports
.PageHeaderBackgroundColor	White	Named color used when generating SSRS reports
.PageHeaderForegroundColor	Black	Named color used when generating SSRS reports
.PortraitTotalWidth	8.5	Total page width (units only, no UOM) for portrait orientation paper used when generating SSRS reports
.RightMargin	0.5	Right margin (units only, no UOM) used when generating SSRS reports
.SeparatorLineColor	DarkBlue	Color of the separator line for generated SSRS reports
.TableCellWidth	1.8	Width for table cells (units only, no

		UOM) used when generating SSRS reports
.TopMargin	0.5	Top margin (units only, no UOM) used when generating SSRS reports
.UnitOfMeasure	in	Unit of measure used when generating SSRS reports



Activity List

Id	Full Name	Activity Type	Description	Amount
101				
CALL				
101	Mr. Douglas A. Hunt, Jr.	CALL		0.00
Count: 1				0.00
COMMITTEE				
101	Mr. Douglas A. Hunt, Jr.	COMMITTEE	Education Committee	0.00

101	Mr. Douglas A. Hunt, Jr.	DUES	Basic Membership Dues	950.00
101	Mr. Douglas A. Hunt, Jr.	DUES	PAC Contribution	20.00
101	Mr. Douglas A. Hunt, Jr.	DUES	Basic Membership Dues	950.00
101	Mr. Douglas A. Hunt, Jr.	DUES	PAC Contribution	20.00
101	Mr. Douglas A. Hunt, Jr.	DUES	Harris County	15.00
101	Mr. Douglas A. Hunt, Jr.	DUES	Basic Membership Dues	950.00
101	Mr. Douglas A. Hunt, Jr.	DUES	PAC Contribution	20.00

Example of an Activity List report using the EnableGreenBar feature to highlight alternating lines.

Getting report layouts from iMIS

The SSRS template file format is Report Definition Language, which uses an .RDL extension. These are much like Crystal .RPT files, but they are defined in XML. Because they are XML, you can edit .RDL files in any text editor; however, you need free tools available for your version of SQL Server to design the report visually and to preview your report layouts with data.

To generate RDL files from IQA

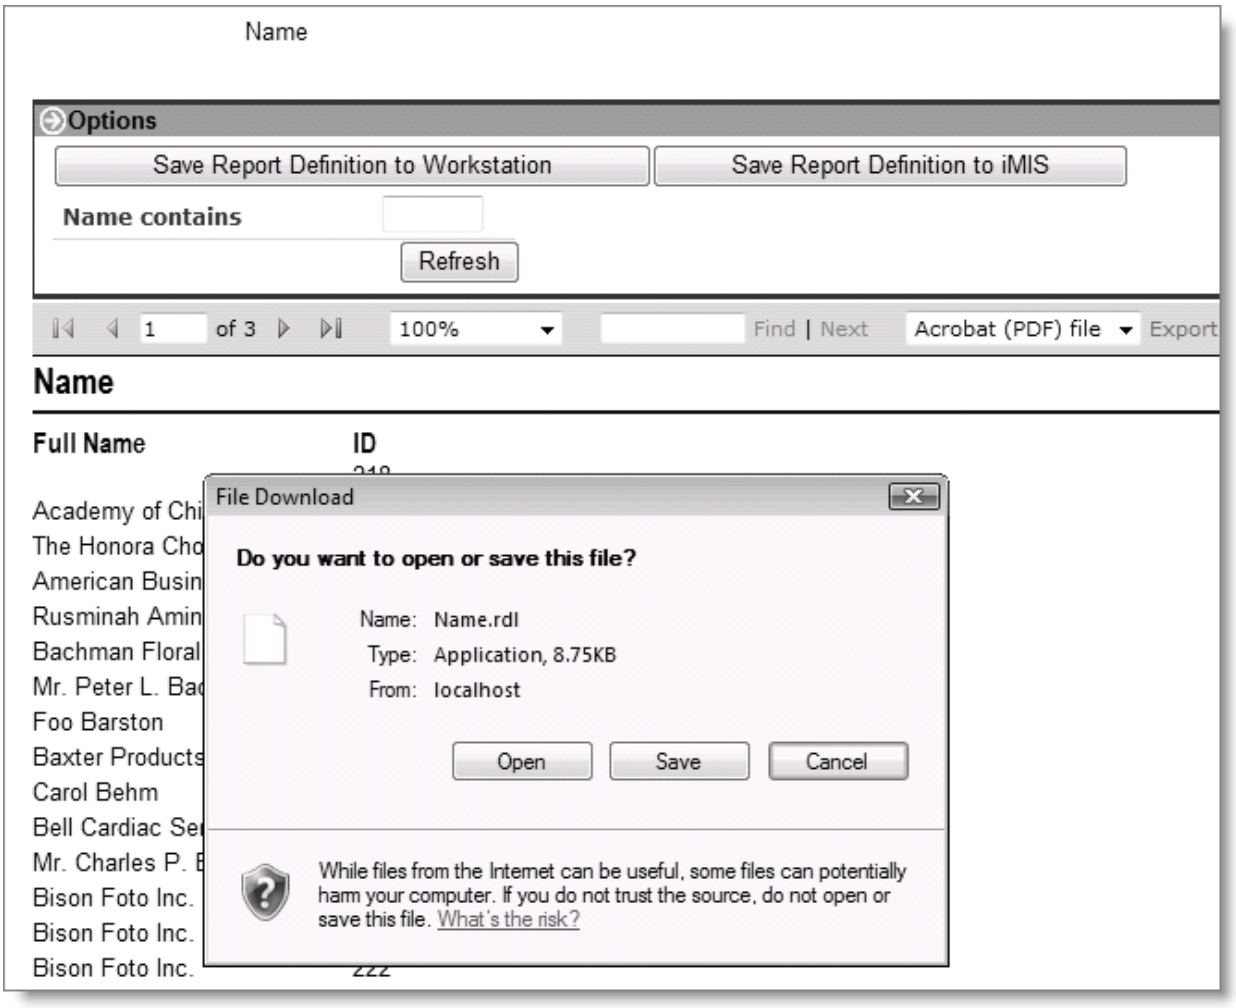
1. From the query definition, click Report.

   iMIS generates the report in memory; nothing is saved to database or disk yet.

2. If the query results need adjustment, click Define, make your changes, and click Report.
3. When the results are good, save the report to a permanent format:

- Save Report Definition to iMIS copies the report to the Document System, for future availability in iMIS.
- Save Report Definition to Workstation copies the report to your file system, for editing outside of iMIS:

  When prompted, choose Open to launch the file in the application is associated with the .RDL extension, or choose Save to copy the file to the locally.



To retrieve an .RDL from the Document System

1. Locate the .RDL template within the Document System.

   Tip: Be sure you're selecting the template, not the output process!

2. Select the Run icon.

3. When prompted, select Open.

   Tip: You can choose Save rather than Open, but be aware that BIDS will copy the file into its project location when you add it to a project, regardless. However, be sure to re-import your edited version, not the original!

4. Edit the file, and save it to your file system.
5. Import the edited file into the Document System, either as an updated version or as a new template.

Setting up SQL Server tools to edit iMIS reports

You can customize Reporting Services reports using free SQL Server tools:

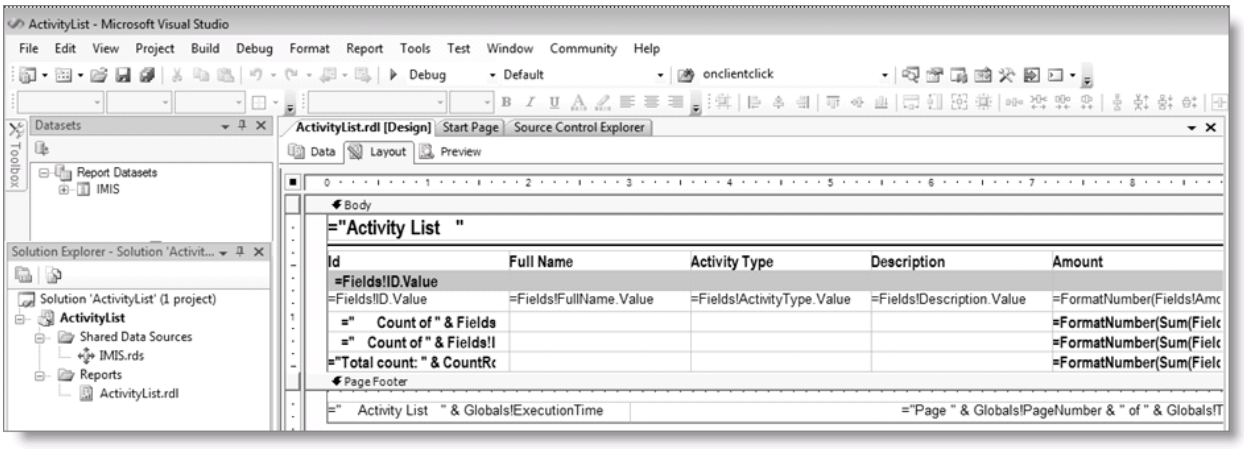
- Microsoft SQL Server 2008 R2 Report Builder 3.0
- SQL Server Business Intelligence Development Studio (BIDS) installs with the SQL Server 2005 Express Edition Toolkit.

To prepare your environment

1. Uninstall any beta or Community Technology Preview (CTP) versions of SQL Server Management Studio Express.
2. Verify you have administrative rights and ample free space on the machine where you will be working with reports: 600 MB for the toolkit.
3. Install Microsoft .NET Framework 4.0.
4. Install your version of Microsoft SQL Server Express Edition.
5. Install your report tool using the links above.

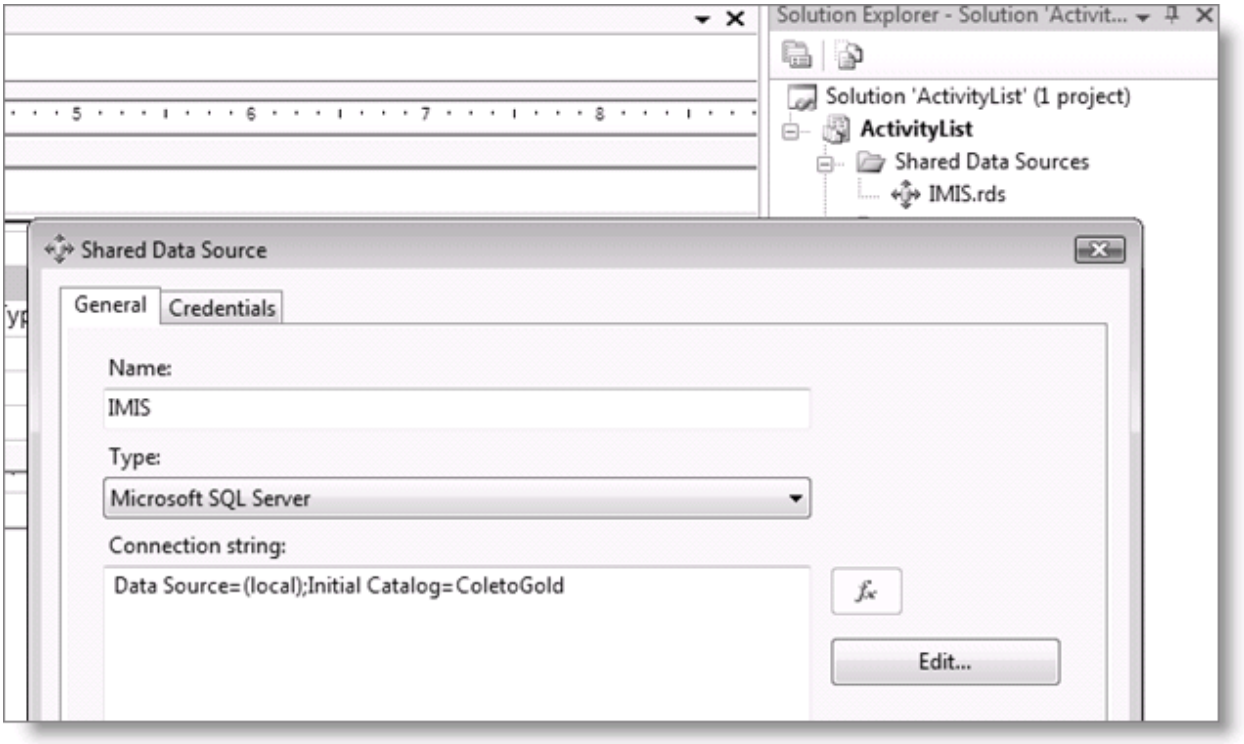
To work with an .RDL in BIDS

1. Create a new Report Server project (File > New > Project > Report Server Project).



2. For the project, create a new Shared Data Source.

- Name it IMIS.
- Use Edit... to specify your server and database.
- Select the Credentials tab to specify your SQL Server login.

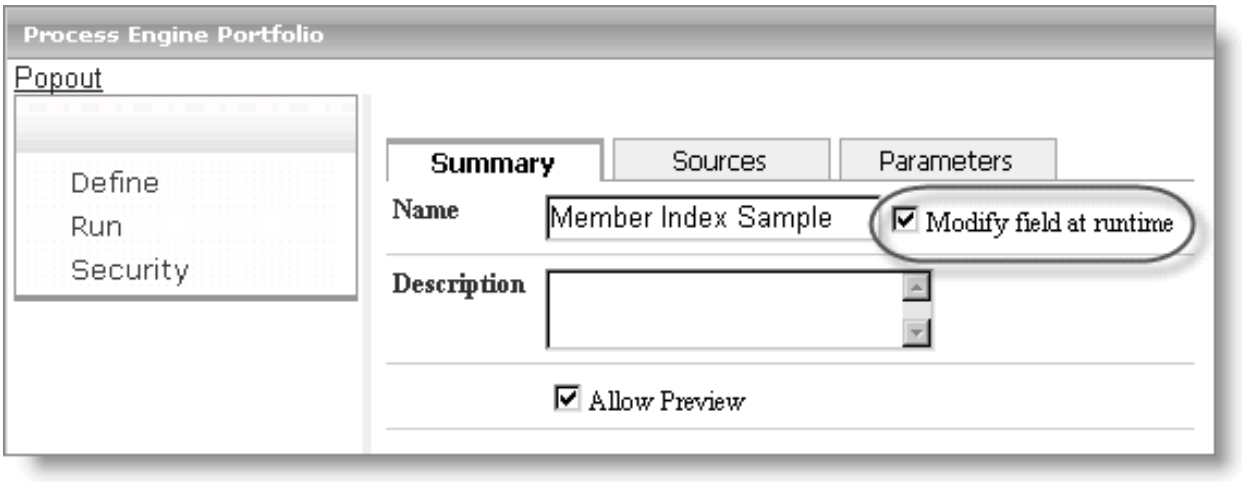


3. In the Solution Explorer, right-click Reports, Add / Existing Item, and browse to the .RDL file downloaded from IQA.

4. Edit the report definition, and select Save.
5. Import the report back into the Document System, or use it in a separate SQL Server Reporting Services server environment, as needed.

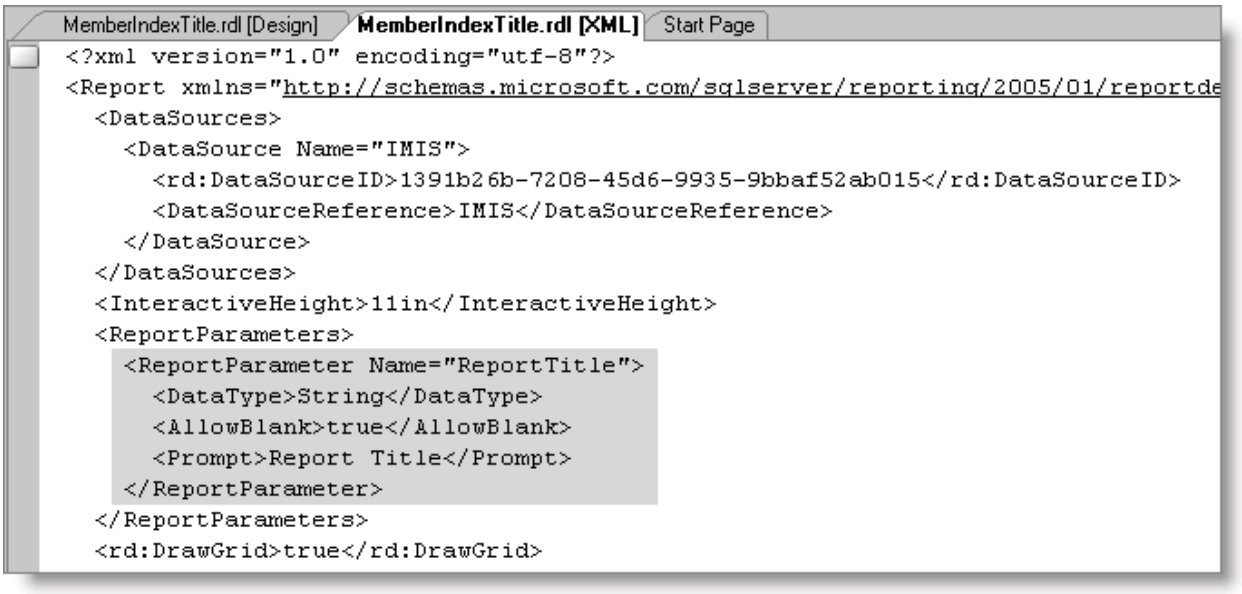
Making report titles editable at runtime

IQA adds a parameter to its SRSS reports to let users modify the report title at run-time, so that the title that displays on the report is changed just for that run. To prevent users from changing report titles at run-time, you just disable the Modify field at runtime check-box on the reports you save.



The availability of the Modify field at runtime option is controlled by report parameters in the .RDL.

If you create any RDL files outside of iMIS, you can give them this functionality by adding the ReportTitle parameter on the XML tab:



The "ReportTitle" parameter controls how users can affect the report's title, if at all.

Code for the ReportTitle parameter

<ReportParameters>

<ReportParameter Name="ReportTitle">

<DataType>String</DataType>

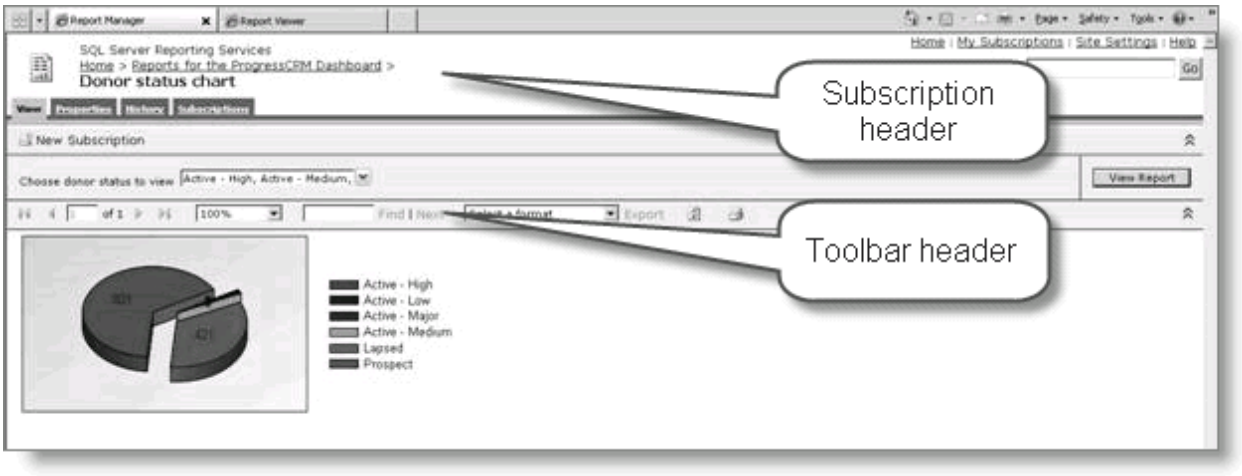
<AllowBlank>true</AllowBlank>

<Prompt>Report Title</Prompt>

</ReportParameter></ReportParameters>

Customizing headers in SSRS reports

By default, Reporting Services reports output with two headers. When these headers are not useful or take up too much space in the page design, you can control it by changing the URL through which the report is run.



SSRS reports include two headers, Subscription and Toolbar.

To suppress the Subscription header

When you publish a report, Report Manager generates a URL that includes the Subscription header:

http://-
loc-
alhost/Re-
ports/Pages/Re-
port.as-
px?ItemPath=%2fReports+for+the+ProgressCRM+Dashboard%2fDonor+status+chart

To run the report without the Subscription header, call a different command, formed like this:

http://-
loc-
alhost/re-
portserver-
?%2fRe-
ports+-
for+the+ProgressCRM+Dashboard%2fDonor+status+chart&rs:Command=Render

To suppress the Toolbar header

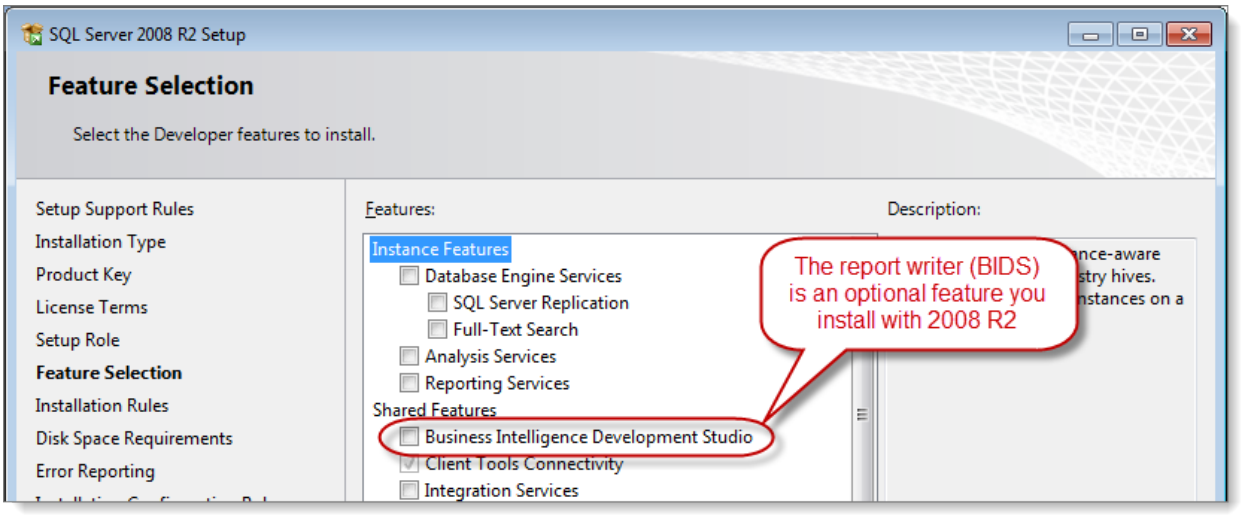
To run the report with the Toolbar header, which includes parameter and export options, add &rc:Toolbar=false to the end:

http://-
loc-
alhost/re-
portserver-
?%2fRe-
ports+-
for+the+Pro-
gressCRM+Dashboard%2fDonor+status+chart&rs:Command=Render&rc:Toolbar=false

Tutorial: Customizing a report template

This demonstration walks you through the entire process of creating a reporting project, getting a report template from iMIS, editing it to add a pie chart, and getting the template back into iMIS.

1. If needed, install the Business Intelligence Development Studio (BIDS) feature.



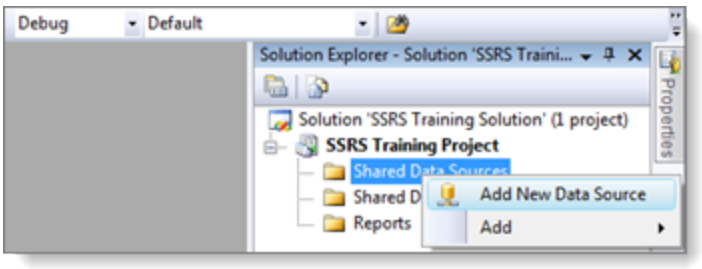
2. Open your report writer and create a new solution.

- Open BIDS: go to All Programs > Microsoft SQL Server 2008 R2 > SQL Server Business Intelligence Development Studio.

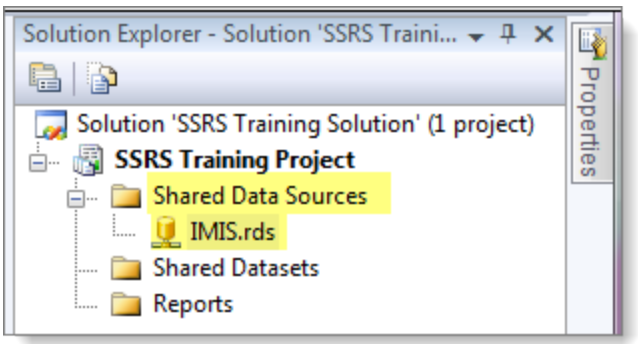
- Select File > New > Project.
- Select Report Server Project.
- (Project name) Name: SSRS Training Project
- (Default location) Location: C:\...\Visual Studio 2008\Projects
- Solution Name: SSRS Training Solution
- Click OK.

3. Add Shared Data Source called iMIS.

- Right-click the Shared Data Sources folder inside the SSRS Training Project within the Solution Explorer and select Add New Data Source.



- Name the Data Source IMIS so that it will work with the RDL that you will export from iMIS.
- Click Edit and add the connection information for your local database.
- Select Test Connection to verify that it works.
- Note the new connection within the Shared Data Sources folder.



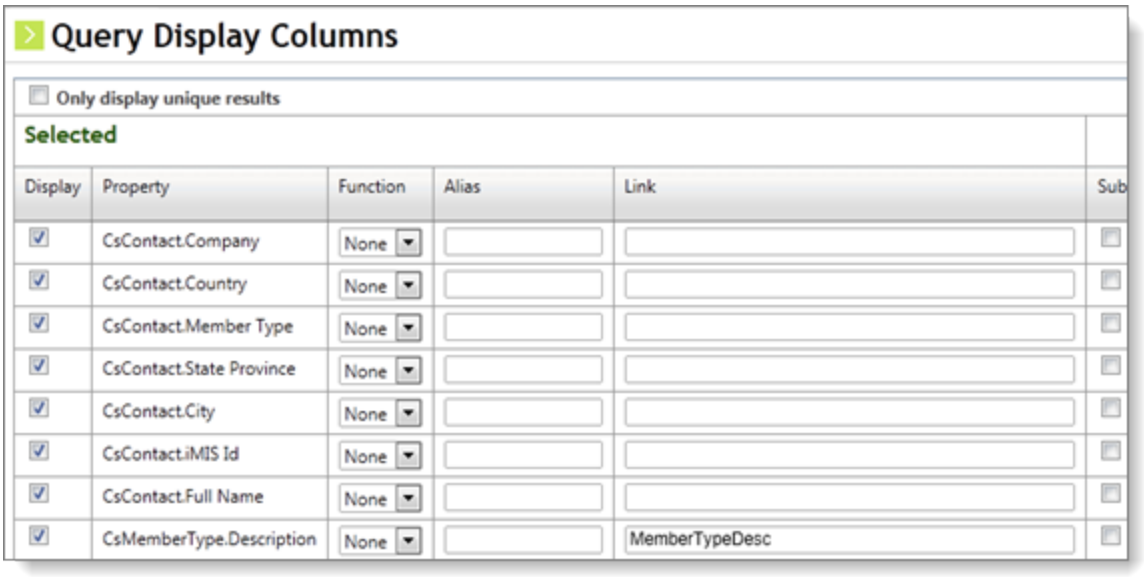
4. Create a data source and default report template (RDL) using IQA.

- Select Manage > Intelligent Query Architect.
- Browse to $/Samples/ReportingServices.
- Create a new IQA that grabs the data you need for your report.

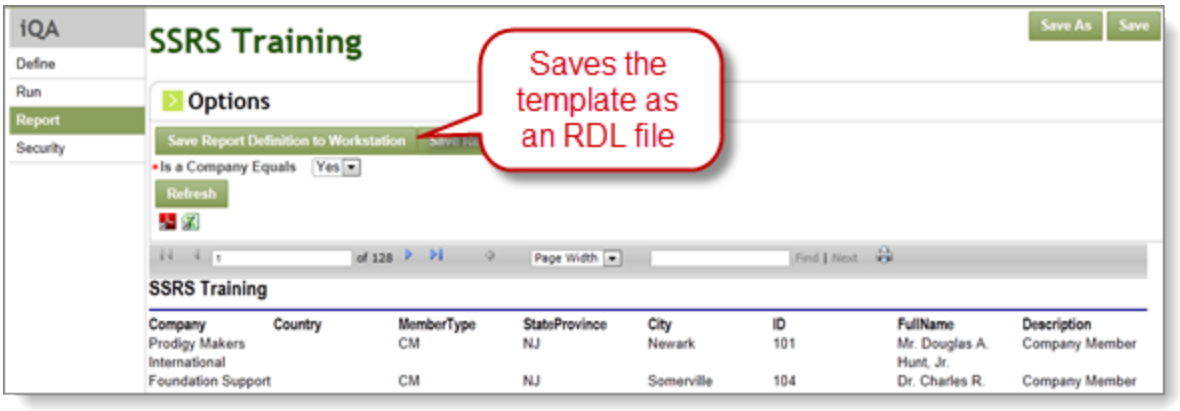
  Sources: CsContact and CsMemberType business objects

  Filters: CsContact.Is a Company

  Display: Defaults & CsMemberType.Description



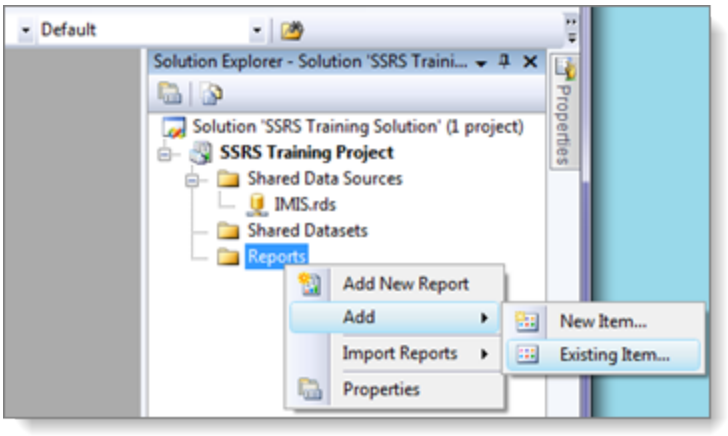
- Go to the Report tab and click Save Report Definition to Workstation to export the default RDL file to your workstation.



- Save the RDL to your project folder.

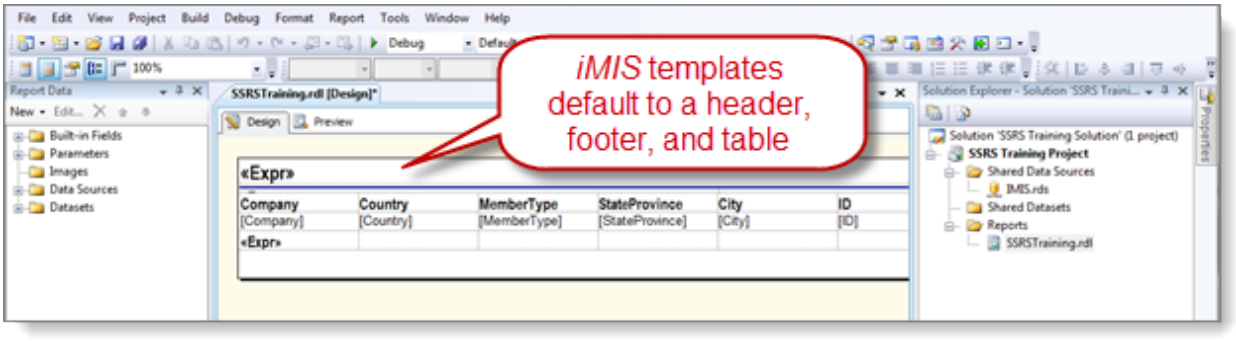
5. Add the exported template to your reporting project.

- Go back to BIDS and add the RDL to the Reports folder within the SSRS Training Project.
- Right-click Reports and select Add, Existing Item.



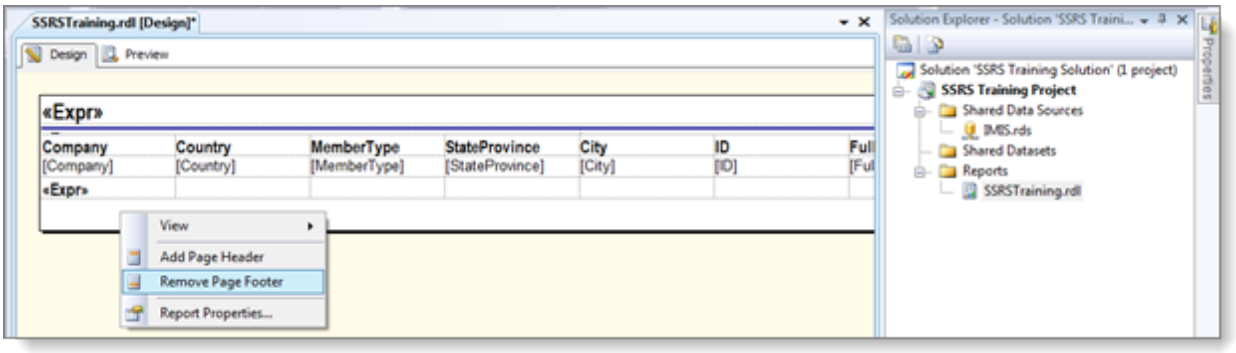
- Find the RDL you exported from IQA (note that name defaults to the name of the query).
- Double-click on the name of the report to open it for editing. You'll see the default template that IQA uses for all IQA report definitions which includes a header, a table to dis-

play the results set, and a footer.

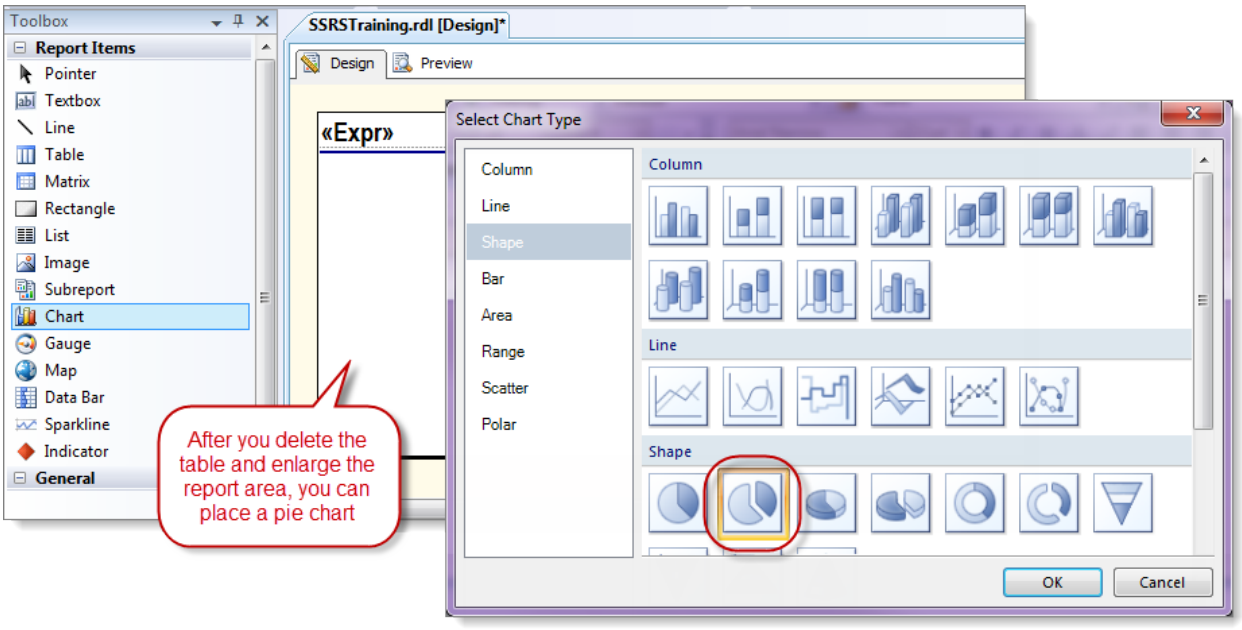


6. Change the report template into a pie chart that shows the percentage of members within a given member type.

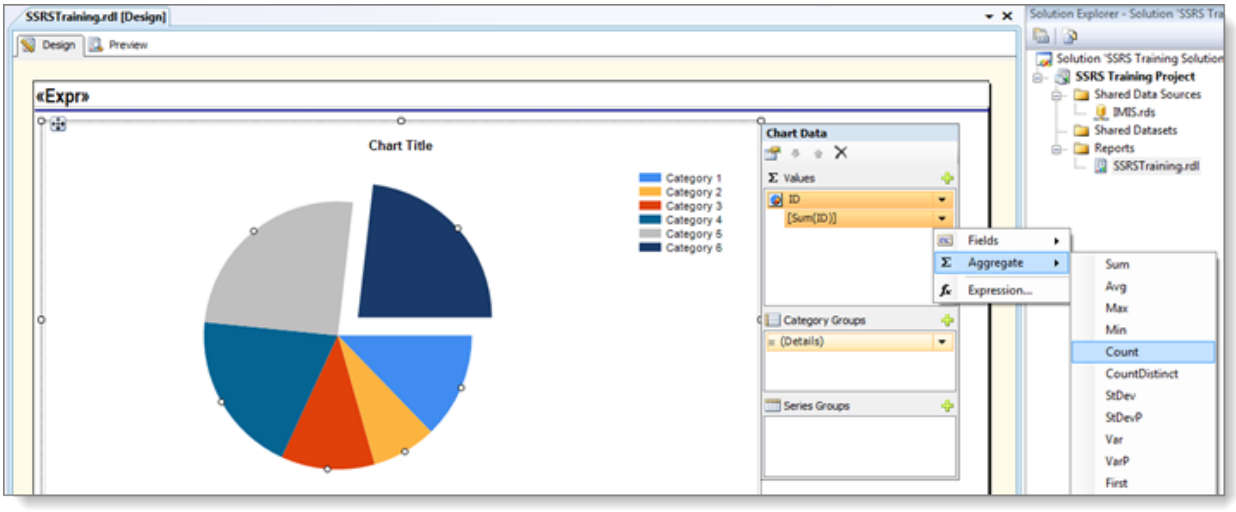
- Right-click on the footer and select Remove Page Footer.



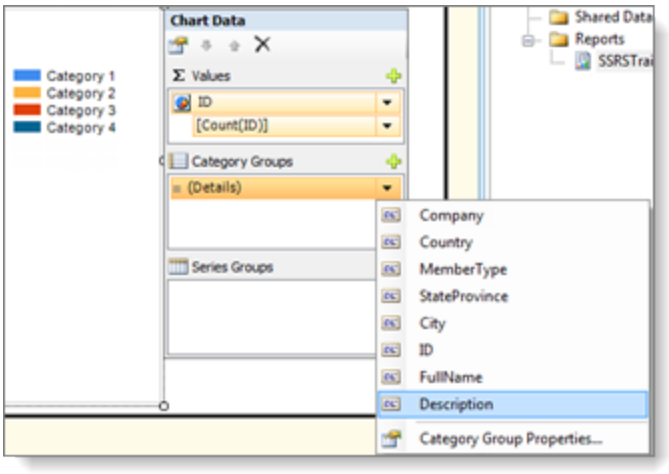
- Select the table, click the top left corner, and press the Delete button on your keyboard.
- Drag the bottom of the report to give yourself more room to add the chart.
- From the toolbox, drag and drop the Chart report item onto the body of the report.
- The Select Chart Type window opens.
- Select the exploded pie chart and click OK and expand the pie chart to fill in the area as needed.



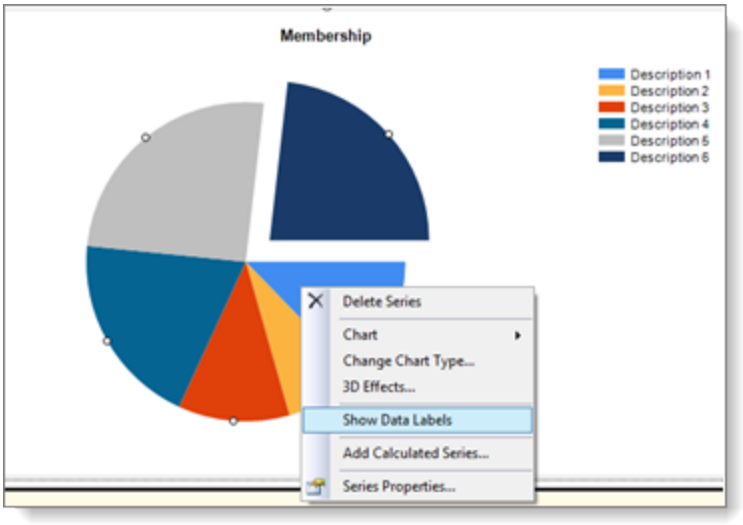
- Right-click on the chart itself to show its properties, which open in the Chart Data pane to the right of the chart.
- In the Value section, select ID.
- Change the Aggregate type from Sum to Count.



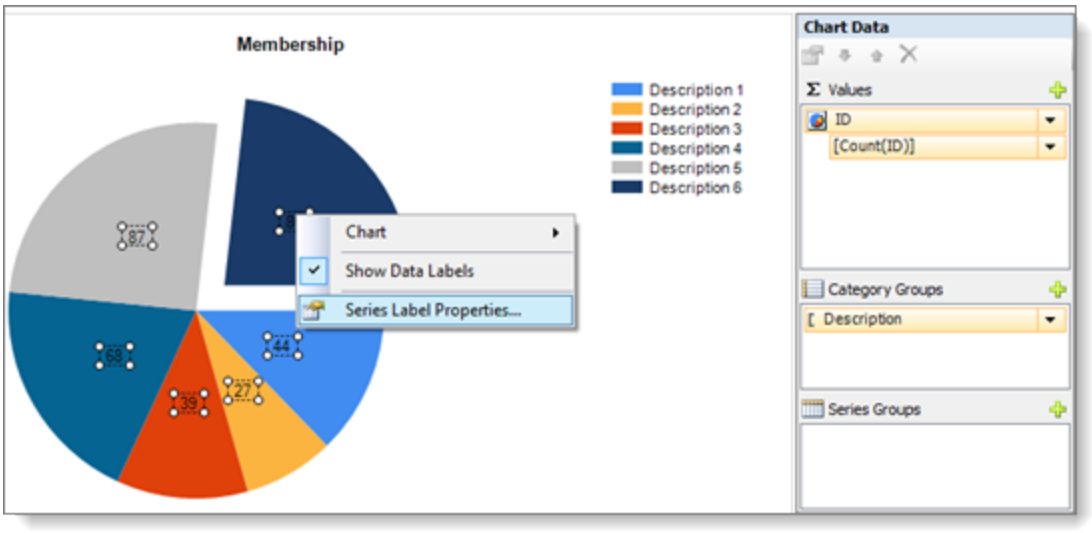
- In the Category Groups section, select Description (which is the Member Type Description).



- Change the title of the report by clicking the area that says Chart Title and typing.
- Add labels that show the counts-per-member type by right-clicking on the chart and selecting Show Data Labels.



- Click Preview to see the new report (there is a default parameter for the report title – click the View Report button on the top right to preview the report).
- Change the chart to show percentages instead of counts.
- Right-click on any of the labels in Design mode.
- Select Series Label Properties.



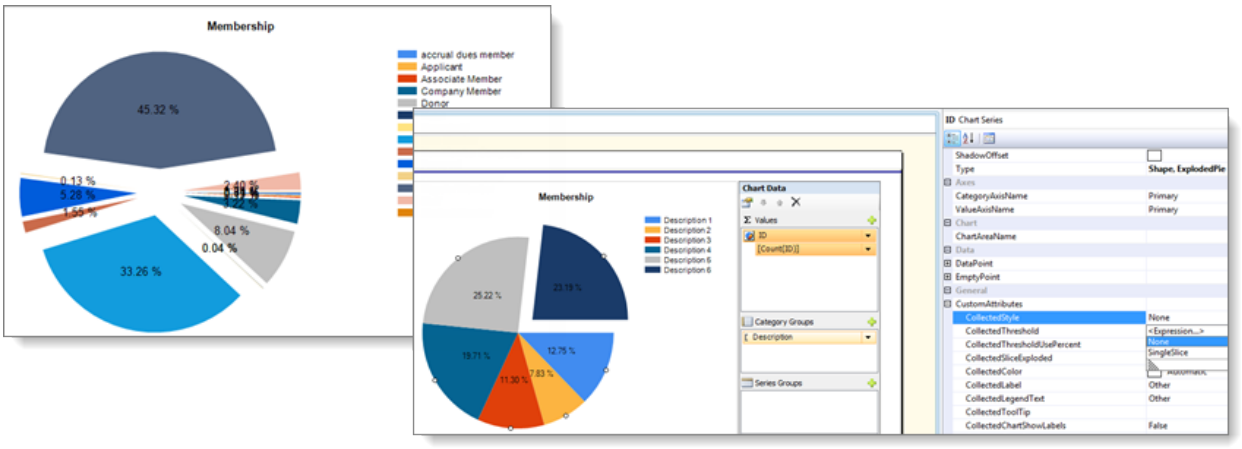
- Add #PERCENT to the Label data field so that the labels show the percent instead of the count.
- When prompted, This property will not have effect unless UseValueAsLabel is set to False. Do you want to set the UseValueAsLabel to False?, click Yes.
- Click OK.

7. Combine all member types that have less than 5% into one pie slice called Other.

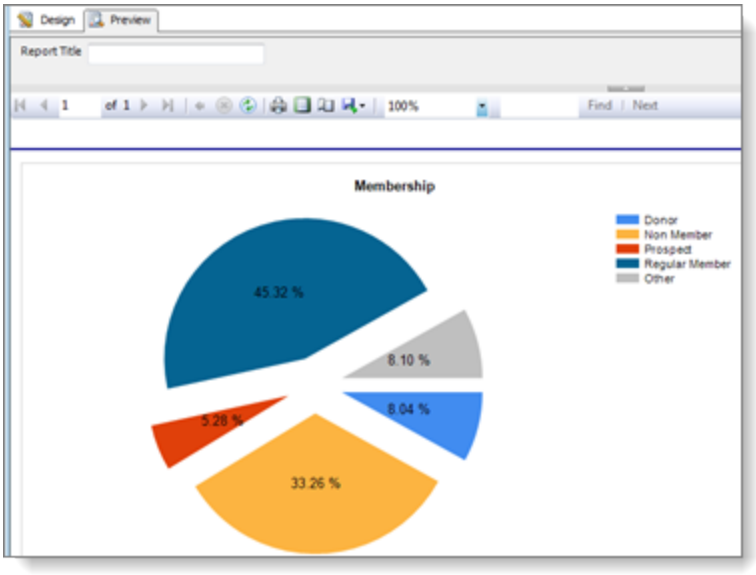
- Go back to the Design view by clicking the Design tab.
- If you do not see the chart properties, select View > Properties Window.
- Click a pie slice to select the chart area (you will see the Chart Data pane at right).
- On the Properties menu to combine all of the less than 5% member types:
- Find the General sub menu, double-click the CustomAttributes section, and find and set two properties:

  CollectedStyle = SingleSlice

  CollectedThreshhold = 5

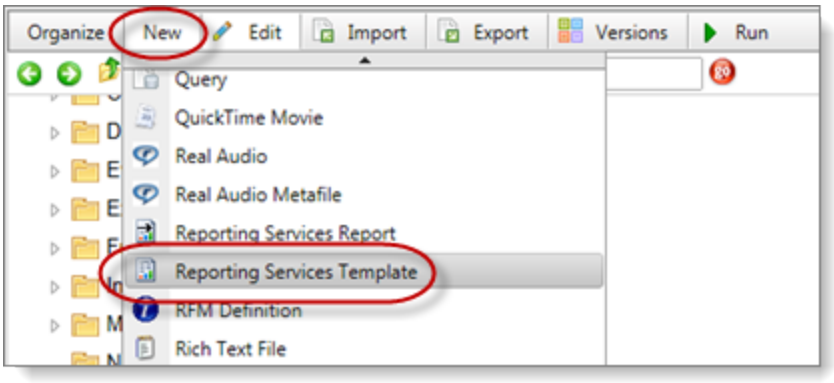


8. Preview, adjust as needed, and Save.

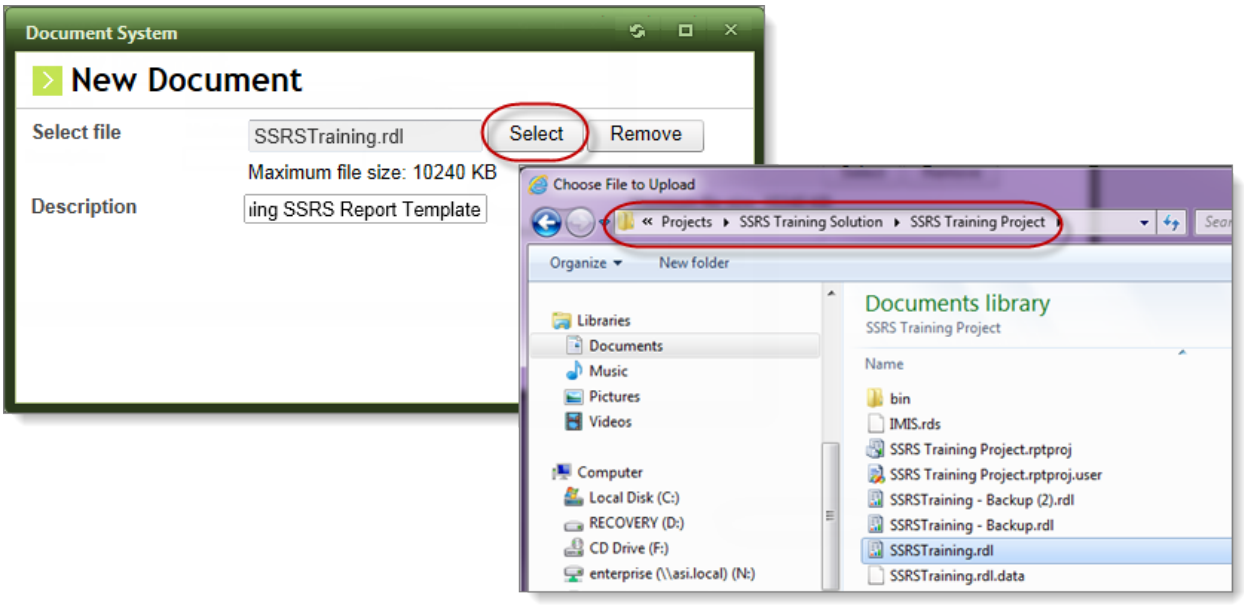


9. Add your template to your report in iMIS.

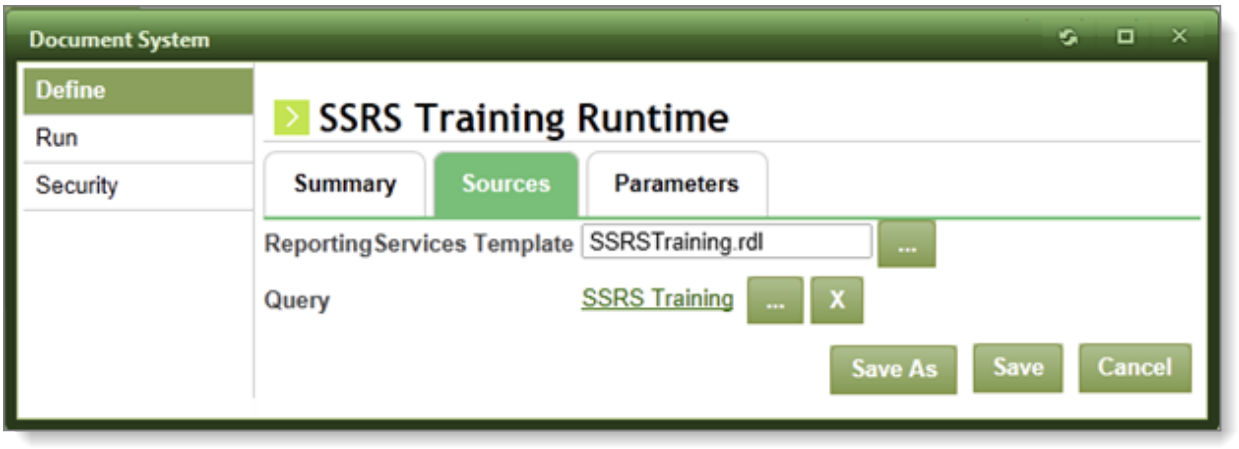
- On your Member site, open the Document System: select Manage > Document System.
- Browse to the location of the original template : $/Samples/ReportingServices.
- Bring your template into iMIS as a new object: select New > Reporting Services Template.



- Upload your RDL file: Click Select and browse to the file that you turned into a chart template: ..\Visual Studio 2008\Projects\SSRS Training Solution\SSRS Training Project.

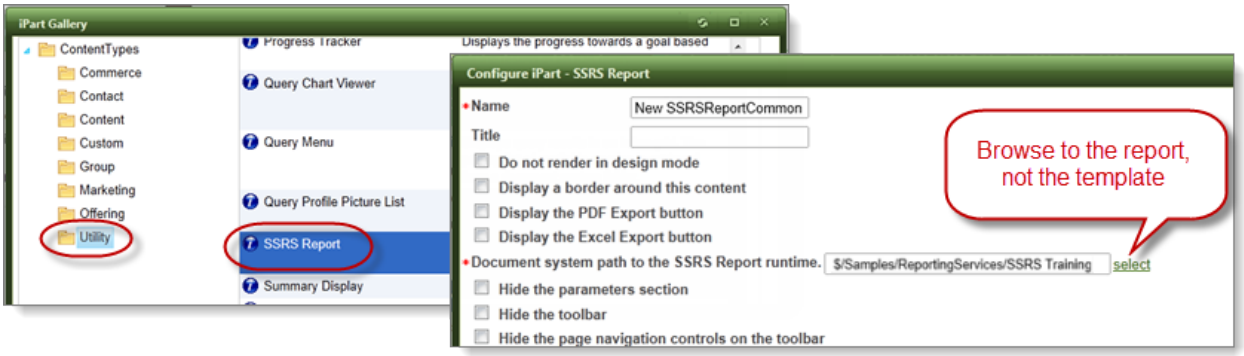


- Create a report runtime to use your template with your query: select New > Reporting Services Report.
- On the Sources tab, use the browse buttons to select your template and your query.



- Click Run to preview the report.
- When you Save the new report, verify the folder to which you are saving: $/Samples/ReportingServices.

10. Publish your report using the SSRS Report iPart.
    - Edit a new or existing content record.
    - Select add content and select the SSRS Report, in the Utility gallery.



- Select Hide the toolbar, since pagination isn't needed.
- Save & Publish, and view your report.

Creating communications with iMIS

The iMIS Communication Creator allows you to design and send email communications to your members. You can create a query to generate a list of members to email, tailor an email message, and add attachments. For example, you may want to send a welcome message to new members of your organization or to remind members to pay for their overdue membership renewal.

To set up a communication email, a Staff user will need to:

- Create a query-based contact list to determine the recipients to email
- Add the Query menu content item to a content record with a link to the query
- Add the content record containing the query to a content page or sitemap

Creating a list of contacts to email

To get started, you will need to create a query that displays a list of contacts or recipients you want to include in the email communication. The results of the query determine the list of recipients and the database property fields that can be used in the email communication.

1. From the Staff site, go to RiSE > Intelligent Query Architect.
2. Select the folder where you want the query to be stored.
3. Define a new query. See Intelligent Query Architect (IQA) for more information on creating queries.

1. Select New > Query and enter a name for the query.
2. Select the Advanced mode.
3. Select the source business object(s).
4. Add property filters if you want to narrow the query list.

Note: If you require a Prompt for the user to select a parameter value before displaying the contact list, the Configure Recipient Sources button will be hidden, and you will not be able to configure the recipient list before an email is sent.

5. Select the columns you want to display.

1. (Required) You must select one of the following properties as a column or use one of these terms as a column alias: ContactId, Contact Id, CustomerId, Customer Id, iMISId, iMIS Id, PartyId, Party Id, StudentId, Student Id, or Id. The aliases are not case sensitive. When an email is sent from a list, the parameter {#party.Email} is included in the email To field so the email is sent to the entire list.

   Note: If you do not want the required column or alias to display in the Query Menu content item on your website, use code_ to preface the alias (e.g., code_PartyId or code_iMIS Id).

4. Run the query to review the results. The results of the query determine the list of recipients to include in your email communication.

5. Save the query.

Adding the communication query to a content record

Before you can send an email communication, you will need to add the Query Menu content item to a content record and display that content record on a content page or sitemap.

1. From the Staff site, select RiSE > Page Builder > Manage content.

2. Select the folder where you want the content record to be stored.

3. Select New > Website Content.

4. Enter the content name and select the layout.

5. Select Add content.

6. From the Utility folder, select Query Menu.

7. Configure the Query Menu content item:

1. (Required) Select the Enable email merge from query results option. This option activates and displays the Email button below the query results and merges the email contact list from the query results.
2. Select the query you want to use as the Source query.
3. Click OK.
8. Save and publish the content record.

Adding the communication query to a sitemap

Another alternative is to create a new sitemap navigation item to provide a convenient way for your staff to access the list of contacts to email. For example, you might consider creating a Communication navigation item that points to the content record containing the query. The content record could also contain multiple queries for different email communications.

> **Note:** Note: The sitemaps for Core Sites and Quick Start Sites are protected for use by iMIS and are subject to being overwritten during an upgrade. However, adding a new navigation item to any of these sites is preserved during an upgrade.

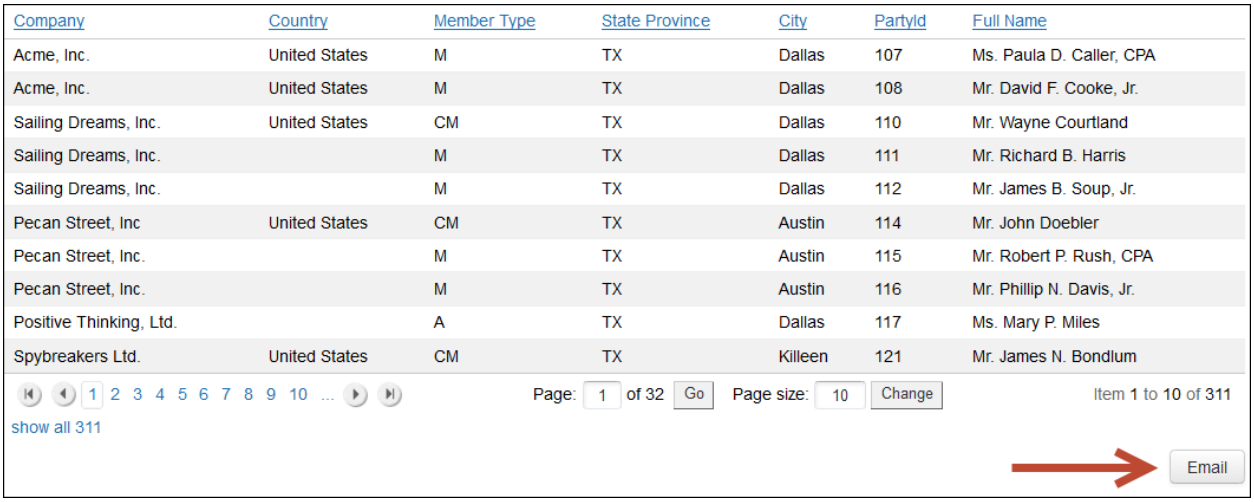
1. From the Staff site, select RiSE > Site Builder > Manage sitemaps.
2. Select the website from the drop-down arrow.
3. Select New > Website Navigation Item.
4. Enter the navigation name and sitemap parameters.
5. Select the content record containing the communication query previously added.
6. Save and publish the new navigation item.
7. Select the navigation and locate the query Email button to send an email.

Sending an email to a list of contacts

An iMIS staff user can send an email to any query-based list of contacts if the Email button displays below the list. You can review the list, remove contacts from the list, and include attachments before sending the email.

> **Note:** Note: If the query prompts the user to select a parameter value before displaying the contact list, the Email button will display after the parameter value is selected. For these types of queries, the Configure Recipient Sources button will be hidden, and you will not be able to configure the recipient list before an email is sent.

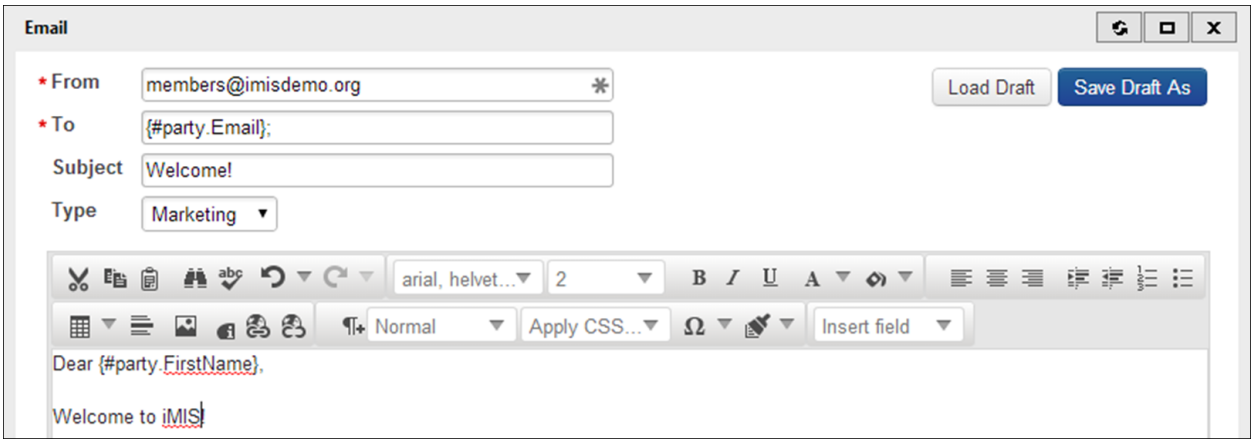
1. Open the query-based contact list from the content record.



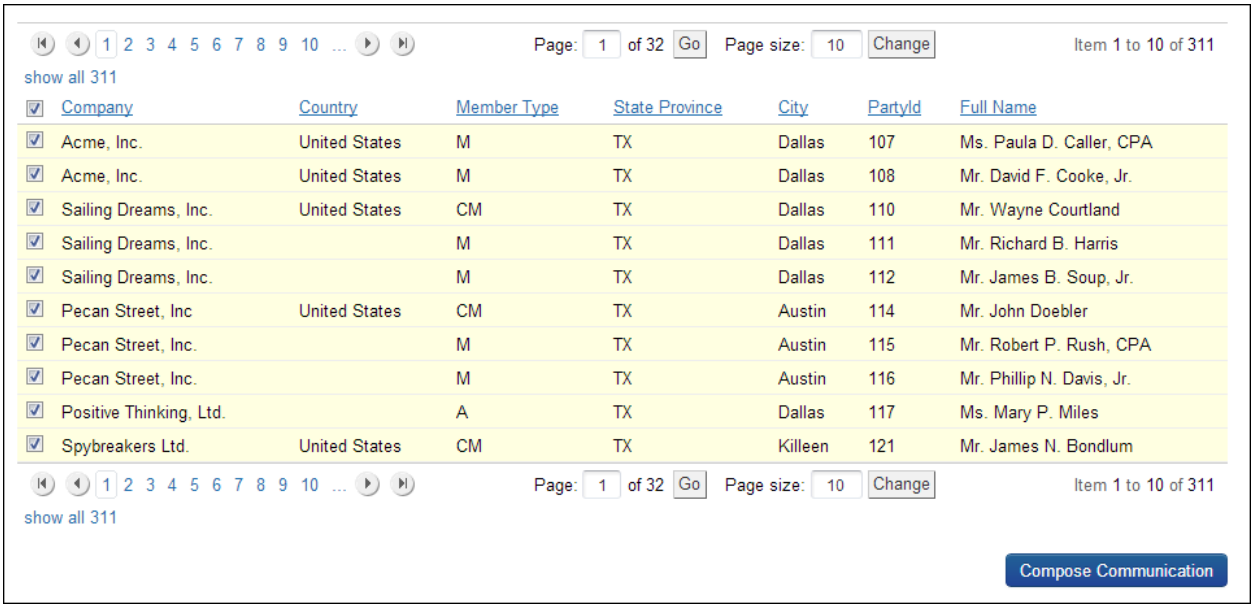
2. Click Email to open the email editor. Two parameters are auto-filled:

- The email To field includes the parameter {#party.Email}, which will automatically include all contacts from the query results.
- The salutation includes {#party.FirstName}, which will add the recipient's first name when the email is sent.

3. Compose the email. Enter the From, Subject, Type, and email message. You can insert additional property fields, such as Prefix, City, or First name.



4. (Optional) To save the email as a draft for future use, select Save Draft As. The email message draft is stored in the $/Common/Communications folder of the Document System.
5. (Optional) Click Load Draft to select a previously saved email message draft.
6. (Optional) Click Configure Recipient Sources to review the contact list generated from the original query. By default, all recipients are selected. To remove recipients from the list, uncheck the option box for each name you want to exclude.



7. Click Compose Communication to return to the email.

8. Click Add attachment to select a static document previously uploaded in the Document system or a Reporting Services templates (RDL).

   Note: An iMIS staff user can attach a Reporting Services template from the Document system, if the communication dataset contains a PartyId property and the Reporting Services template has a PartyId as a parameter. A Reporting Services template is run for each email, using each PartyId included in the communication dataset. A PDF of the individual reports, and a personalized invoice for all of the people in the result dataset, is generated. If the communication dataset does not contain a PartyId property, the report will not be attached to the email.

9. Click Preview to see how the message will appear for each selected recipient. Click Prev or Next to review the email for each recipient.

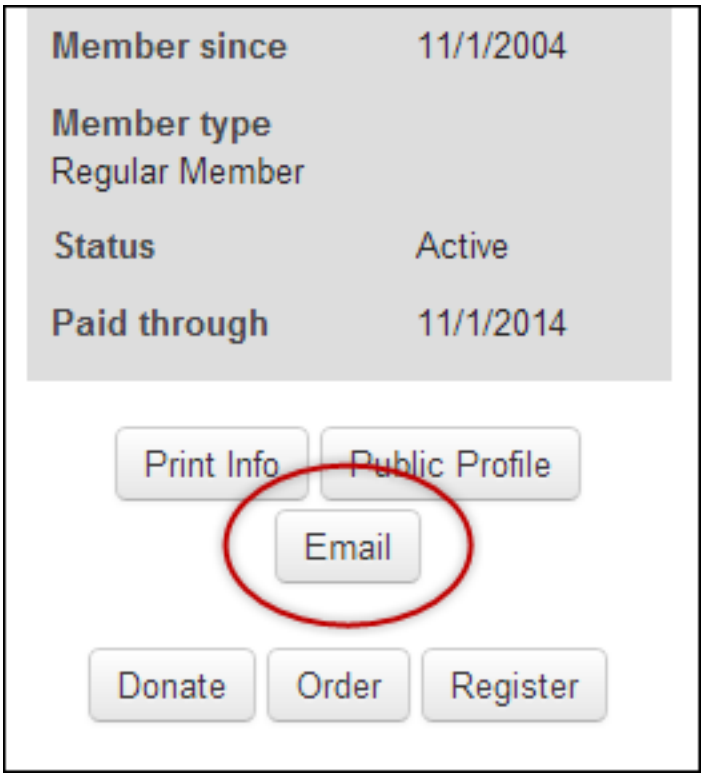
10. Send the email communication. A confirmation notification is displayed. The confirmation indicates that the number of messages attempted matches the number of results selected. Errors are listed individually explaining why the email was not sent.

Sending an email to an individual contact

You can send an email to an individual contact from their account page profile:

1. Navigate to an individual's account page profile.

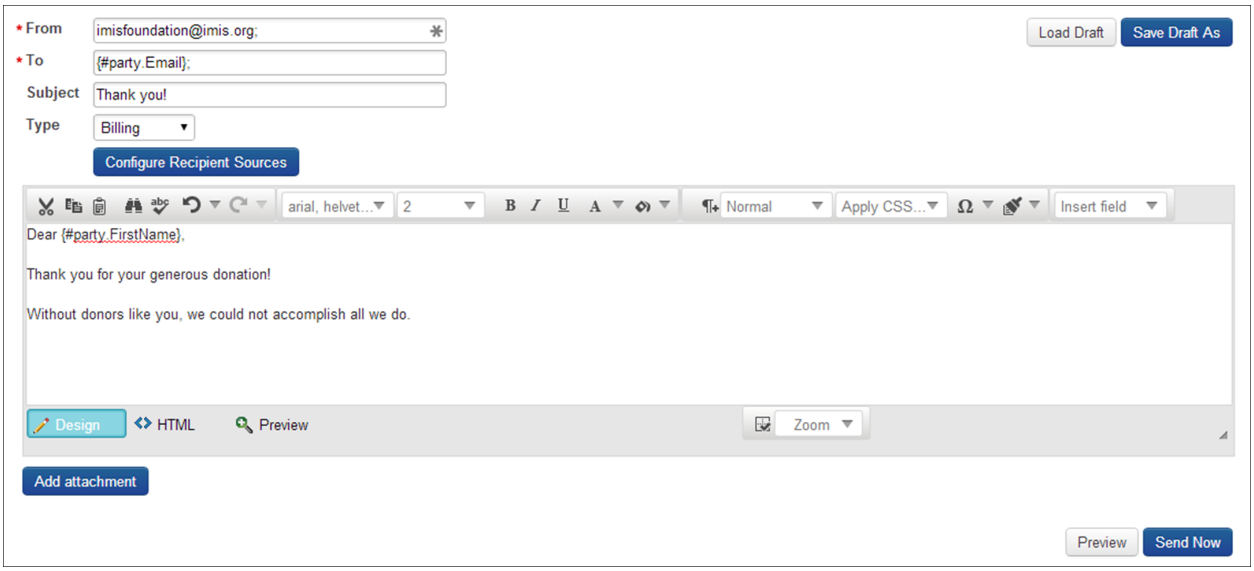
2. Click Email to open the email editor.



An email editor opens with the {#party.Email} and {#party.FirstName} auto-filled in the To field and in the salutation.

3. Add a subject line and type in the email you want to send and click Send Now.
4. Optionally, you can add an attachment, load a previously saved email template, or save the email as a draft for future use.

5. Click Preview or Send Now.



Working with email message drafts

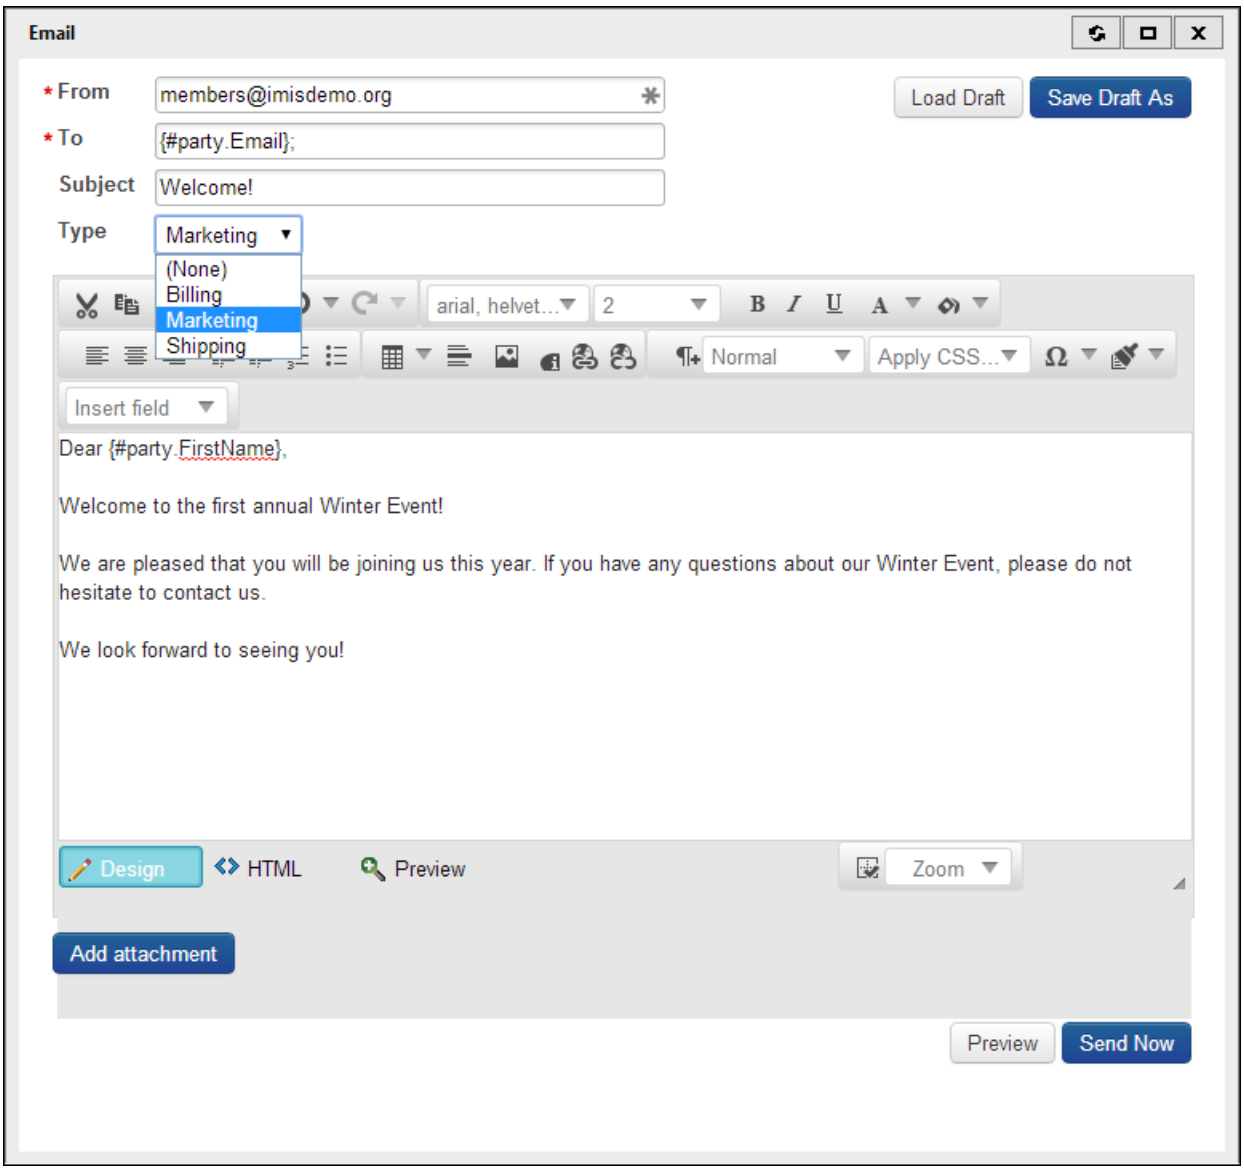
Email drafts allow for repeat communications using a common query data source, for example, a draft to mail a list of new members at the end of each month. When you send an email, the results of the query determine the list of recipients, regardless of the email draft used. When you send or preview a communication the query data source is ree-valuated. This means that every send or preview could result in a different set of contacts based on the parameters of the associated query.

You can create an email message draft by selecting Email from any query list or editing a previously saved draft from the Document system in the Staff site (RiSE > Document system). Email drafts are stored in the $/Common/Communications folder of the Document system.

Create a new email message draft:

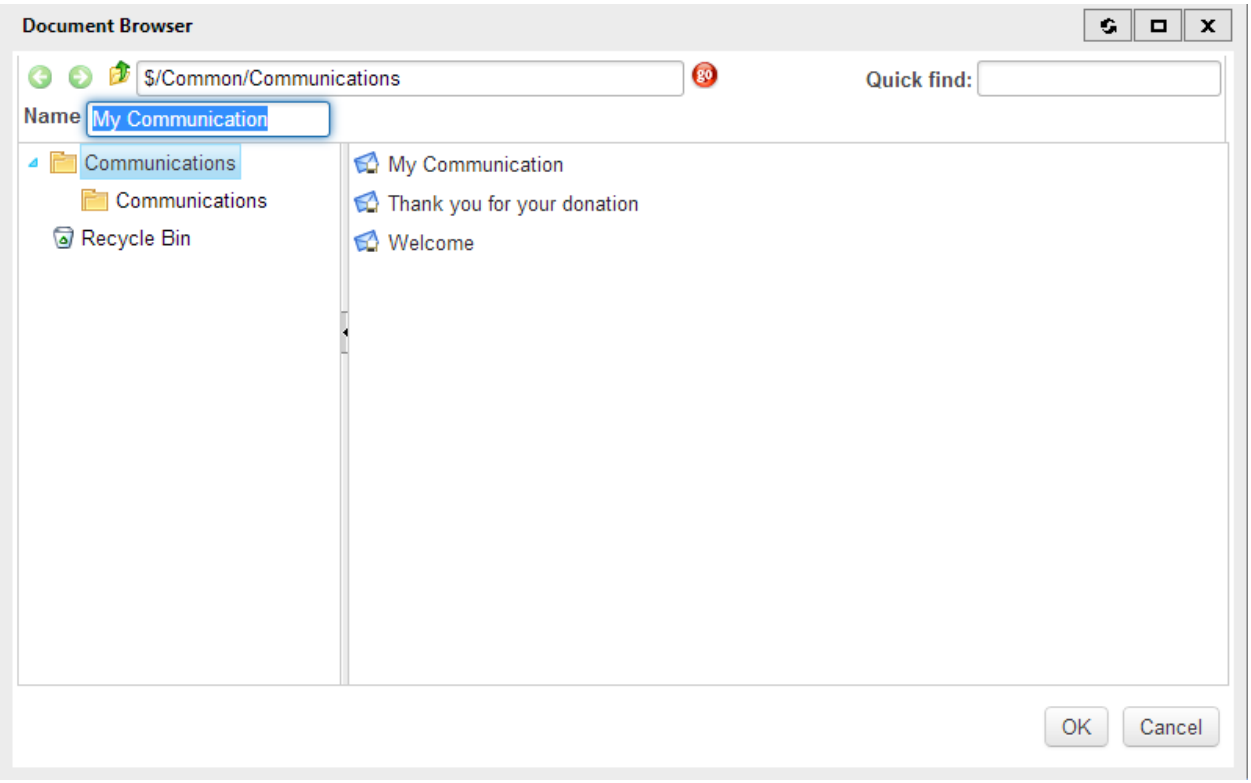
1. Click Email from the content record containing the list of contacts or from a member's profile page.
2. After you compose the email, click Save Draft As.

Note: Any attachments you have added to your email will be saved with the draft. iMIS supports RDL and PDF email attachments.



3. Enter a name for the email draft.

   The name defaults to My Communication and is stored in $/Common/Communications folder of the Document System.



4. Click OK.

Modify a saved email draft

You can open a saved email message draft directly from the contact list by selecting the Email button or from the Document system.

1. To modify an email draft directly from the contact list:

1. Click Email from the content record containing the list of contacts or from a member's profile page to open the email editor.
2. Click Load Draft.
3. Select an existing draft and click OK. The draft opens with the content previously saved in the draft. Using a draft does not affect or overwrite the list of contacts.
4. To update the email template, click Save Draft.

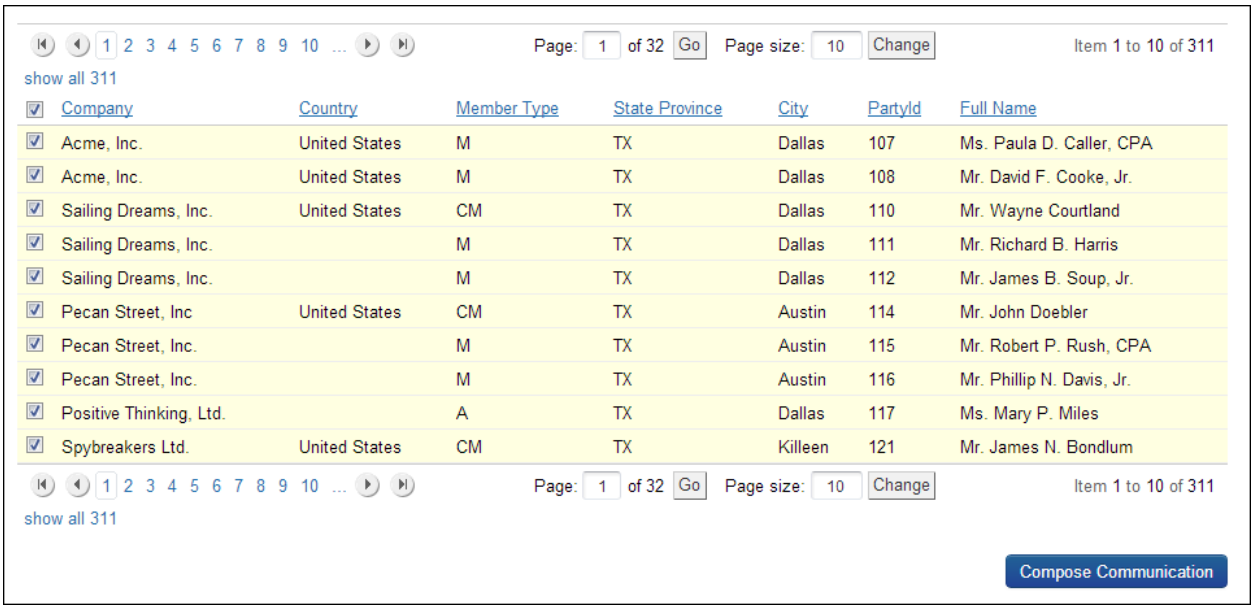
2. To modify an email draft from the Document system:

1. From the Staff site, select RiSE > Document system from.
2. Go to $/Common/Communications.
3. Edit the email draft.
5. Click Save Draft.

Customizing the email recipient list

A staff user can review the recipient list, and then select or deselect contacts from the list before sending the email communication. This allows the staff user to select only those contacts who they want to receive the communication.

1. Open the query-based contact list from the content record.
2. Click Configure Recipient Sources. You will see a grid showing the full results of the original source query.



3. Select specific rows in the results to determine who will receive the communication. By default, all rows are selected.
4. Click Compose Communication to return to the email editor.

5. Click Preview to see how the message will appear for each selected recipient when merged. The preview includes only the specific recipients selected.
6. Send the communication. A confirmation notification is displayed. The confirmation indicates that the number of messages attempted matches the number of results selected. Only the recipients selected by the user receive the communication.

Add an attachment to an email

An iMIS staff user can add attachments to communications. The attachments can be static documents chosen through the Document system or a Reporting Services template (RDL).

An iMIS staff user can attach a Reporting Services template from the Document system, if the the communication dataset contains a PartyId property and the Reporting Services draft has a PartyId as a parameter. A Reporting Services template is run for each email, using each PartyId included in the communication dataset. A PDF of the individual reports, and a personalized invoice for all of the people in the result dataset, is generated. If the communication dataset does not contain a PartyId property, the report will not be attached to the email.

> **Note:** Note: The PartyId or code_PartyId alias should be assigned to the iMIS ID property.

Do the following to add an attachment to an email:

1. Open the email editor from an IQA query.
2. Click Add attachment to open the Document Browser window.
3. Browse to the content you want to attach to the email. Select the content.
4. Click OK.

Note: If you choose to save your email communication after including an attachment, those attachments will also be saved.

Note: iMIS supports RDL and PDF email attachments.

Creating Dynamic Content Items

iMIS Dynamic Content Items are unique components that can be placed together on content pages of your iMIS sites that you build with RiSE. This section helps you to understand how to present attractive and dynamic content to your users.

What are Dynamic Content Items?

An iMIS Dynamic Content Item is an iMIS-specific web part that represents a building block of features that you can place on a content record with other building blocks to create new pages of features. Multiple content items can be combined and displayed in a content record as you prefer.

Default dynamic content items appear throughout iMIS. You can modify them for your needs and you can reuse content items throughout the system. For example, a Dynamic Content Item displaying a roster for a Membership Group can follow the same user behavior patterns as Dynamic Content Item for a roster in Events.

Where can I find and use Dynamic Content Items?

To create a new web page containing one or more content items

Go to RiSE > Page Builder > Manage content:

1. Select New > Website Content.

   Note: For a detailed explanation of creating a content record, see Managing Content.

2. Select Add content and select the desired content item from the Content Gallery.
3. Enter the applicable information and select the desired options.
4. Click OK.
5. Click Preview to see how the content will be displayed to users.

6. Click Save and then Publish.
7. From RiSE > Site Builder > Manage sitemaps, create new website navigation.

   Note: See Defining Sitemaps for more information about creating navigations for your site.

   Note: If no owner is specified for the content block, the default organization displays as the owner.
8. Click Publish.

   To add content item to an existing webpage

   All iMIS sample sites come pre-filled:

   Go to RiSE > Page Builder > Manage content:

1. Select the content record and click Edit.
2. Select Add content to open the Content Gallery window.
3. Navigate to the folder that contains the content item you want to add, select the desired content item and click OK.
4. Configure the content item by entering applicable information and select the desired options.
5. Click OK.
6. Click Preview to see how the content will be displayed to users.
7. Click Save and then Publish.

   To set up a user content area

   User content areas are created by using content items which can be configured to allow a user to post content on the web. Examples of this user-generated content include forums, message boards, or blogs.

   Go to RiSE > Page Builder > Manage content:

1. Create a content record.

Note: See Managing Content for details.

2. Select the Content Block content item from the Content Gallery.
3. Enter the applicable information and select the desired options. See the help file for details.
4. Click OK.
5. Add additional content to page, if desired.
6. Click Save.
7. Click Publish.
8. Go to RiSE > Site Builder > Manage sitemaps.
9. Create a navigation.

   Note: See Defining Sitemaps for details. Note that if no owner is specified for the content block, the default organization displays as the owner.
10. Click Publish. The page displays as configured with an area dedicated to user content entry directly on the page.

Configuring content items

Content item configurations allow you to:

- Define how the content item will behave
- Control how much access you want end users to have
- Hide configuration details from end users; two instances of the same content item with different configurations can appear as two different controls to the end user
- Examples:
- Allow users to edit on a staff-facing site, but display the data in read-only mode on a public-facing site
- Use multiple instances of a content item on one page to access different sets of data

Run-time versus design-time

Content items have two different views:

- Design-time view: What you see in a content record when you add a content item and configure it.
- Run-time view: What your end-user sees when viewing the content item within your website. This may differ from what you see in the Design-time view, because some content items have a different behavior after you publish the content.

Specifying commit sequence

If you place more than one content item on a page, you might need to specify the order in which actions occur on that page. The commit sequence function allows you to explicitly define the execution order of multiple content items in a content record.

You can define a commit sequence value for the processing order of each content item relative to the other content items in the same content record. The commit sequence value must be zero or greater. Content items with a value of zero (the default) are processed after any other content item with a non-zero commit sequence value that are in the same content record.

Setting a commit sequence is only required in a few scenarios and is noted in the content item's configuration help if needed.

Troubleshooting errors

Occasionally, an content item may fail. However, it will fail gracefully in place, without disabling the whole page. Typically, a "problem loading" error results from some kind of bad data. By default, iMIS hides the error details:

The settings controlling this error logging reside in the <log4net> section of your site's web.config file. The default settings enable error logging in the Windows Event log and comprehensive logging in the ASI log file, which captures both errors and warnings. This log file, Asi.WebRoot.log, is in the folder above your website root.

Contact your hosting administrator if you need access to information in these logs.

Security for content items

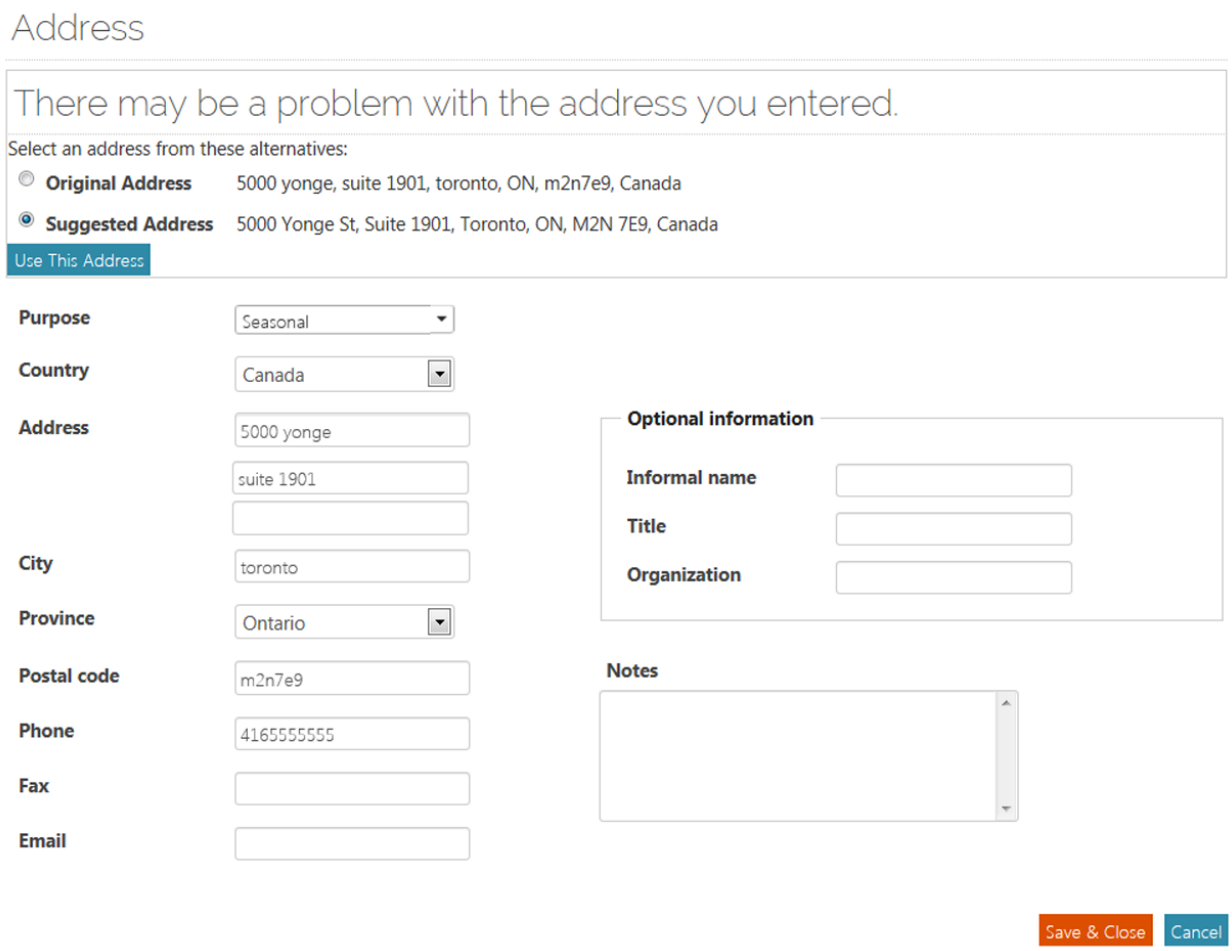
Most security is defined at the content record level within iMIS. You can choose that different content items display for different users. For example, an unauthorized user might see the description of a Special Interest Group, but a signed-in member might see the roster for the group and a staff person might have the privilege to add, edit, or delete the group.

Address verification for content items

iMIS SOA can perform real-time address verification using web services hosted by ASI. There are several benefits to this:

- Running this verification through the ASI web service frees you from having to install and maintain these data files locally.
- Offloading verification to this service keeps it from adding to the processing load of your page.
- The services of different address providers can co-exist, making it possible to verify addresses across multiple countries.

- The service can support future verification of collections of addresses as well as single ones.
- Postal addresses entered in the Contact Account Creator and Contact Address Editor content items automatically upload to this service that verifies and standardizes the address. Users can then either accept the suggested address or keep the original as it was entered.



The countries supported by this service are subject to change. Contact your AiSP to obtain an up-to-date list.

AVS Data Updates

Melissa data is used to provide address verification for US and Canadian addresses. ASI provides updates to Melissa data at unspecified intervals.

Passing URL Parameters

Many content items allow you to change the content they display based on the value of a URL parameter. This gives you the freedom to create a single content record. This record can be reused and the display can be changed based on a value sent in a link to the page. For example, instead of creating a new content record for every event, you can reuse a single content record that displays different event information based on the EventKey value in the URL.

Parameter values are passed to content items from a several types of sources:

- Search result links
- IQA query links
- Navigation items
- Relative links
- Absolute links

For any content item that allows URL parameters to be passed, see the configuration help file for detailed instructions.

Note: Tip: If multiple values are sent to a page for a single URL parameter, the first parameter value wins. For example, if the URL pointing to the Event Display content item is http://myorg/Events/Event_Display.aspx?EventKey=SPR12&EventKey=FALL12, only the SPR12 event displays.

Note: Note: URL parameters set by navigation items cannot be manually overridden in the URL. A user cannot change the parameter value in the URL to display different content.

Dynamic content item examples

Content items can be used in a variety of ways, and in many different combinations to meet your organization's needs. This section contains examples of commonly used content items and provides guidance in maximizing their benefits.

Displaying query results in content items

The content items described in this section use IQA queries to drive the data displayed to users. Each content item provides a unique way to display the data.

Query Chart Viewer

The Query Chart Viewer displays query results in a chart, which can be set to a range of sizes, skins, and chart types.

Designing queries for Query Chart Viewer

The Query Chart Viewer can render any existing query, but you will get the best results by following these guidelines on how to design queries specifically for use with this content item:

- Queries: The queries you create for the content item should be structured so that the results are appropriate for charting. For example, if you want the chart to display the total sales per salesperson, then the source query should be written using the Sum function in IQA.
- Query Display Columns: Each property you select on the display tab in IQA is available in the configuration page as a Data column display option. You can select up to three properties to be displayed on the content item if you want to display a chart with multiple data values.

  Note: In order to display multiple data values in a chart, a property in the display tab must have the checkbox checked in the Subtotal column. The properties for which the checkbox is selected in the Subtotal column will be available as options for the Series data column configuration option in the content item.

- Aliases: In your source query, enter an Alias for the display properties you plan to show in the content item. Relying on the default labels might not be sufficient, especially when your query uses multiple joined sources or custom SQL expressions. If the query does not display as you expect, using an Alias often resolves the issue.
- Sorting: You can sort the query results displayed in your chart in ascending or descending order. To sort your results, edit your source query and, from the sorting tab, add the property to be sorted.
- Labels: The labels on your chart's x-axis might overlap if there are too many data points or if the labels are too long. You might be able to improve the display through a few methods: In the content item, you can expand the width of the chart or change the label angle. In the query, you can try to reduce the number of data points.
- Dates: For dates to display correctly, you must cast them as float data types with an offset of 2. You can do this in IQA from the Custom SQL Expression section of the display tab. For example, if you want to display the OrderDate property in your chart, add the following expression:

  CAST(OrderDate AS FLOAT) + 2

  Then, when you select this property from the Data column list, set the Data column format to a date format.
- Integers: If integers display incorrectly in your chart, cast the column to a data type of INT in the Custom SQL Expression section of the display tab. For example:

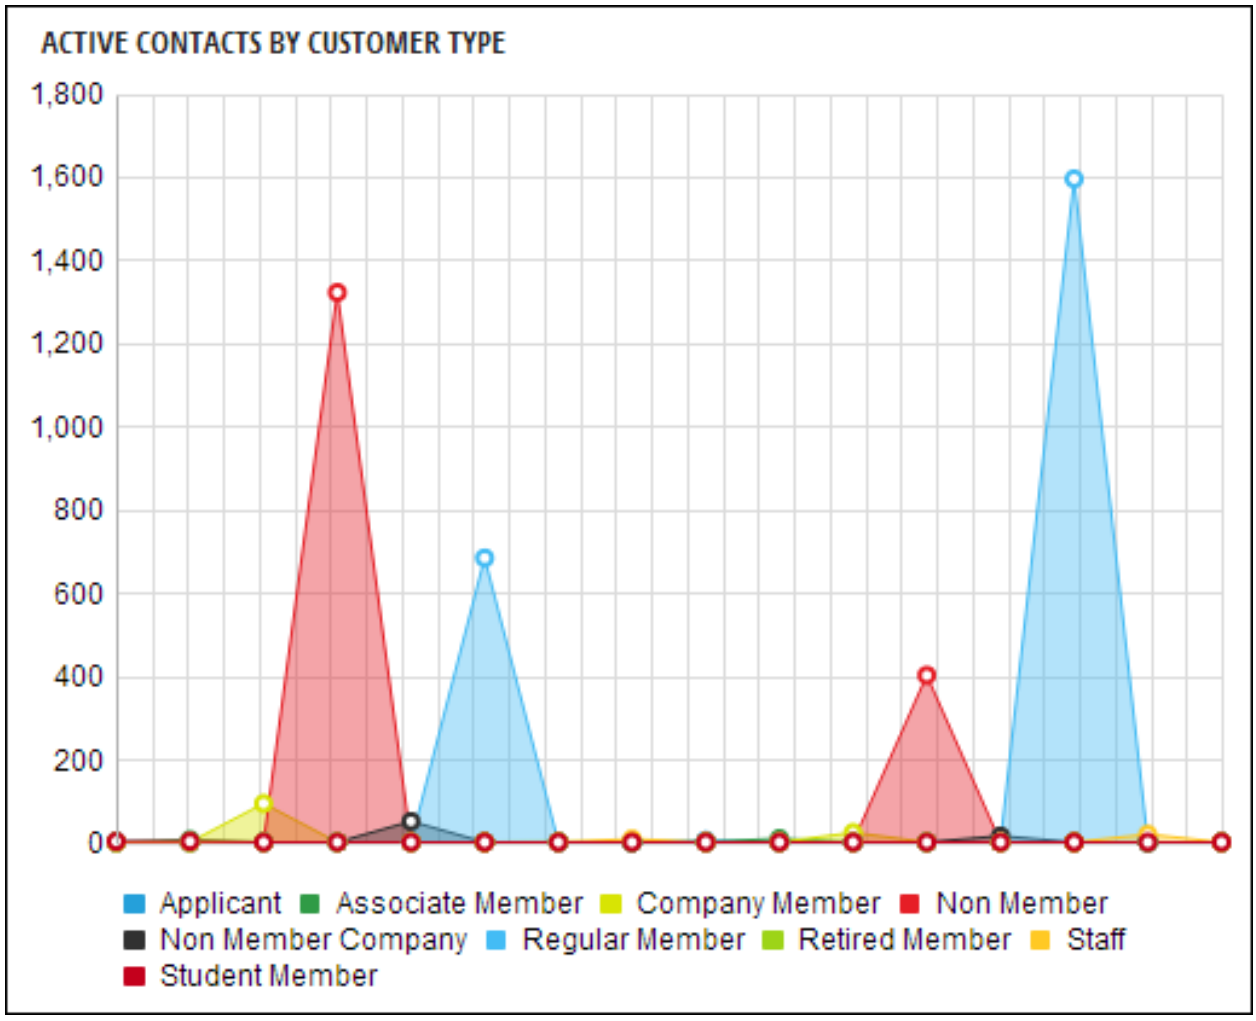
  CAST (OrderCount AS INT)

  Chart Types

  The following are examples of chart types in the Query Chart Viewer:

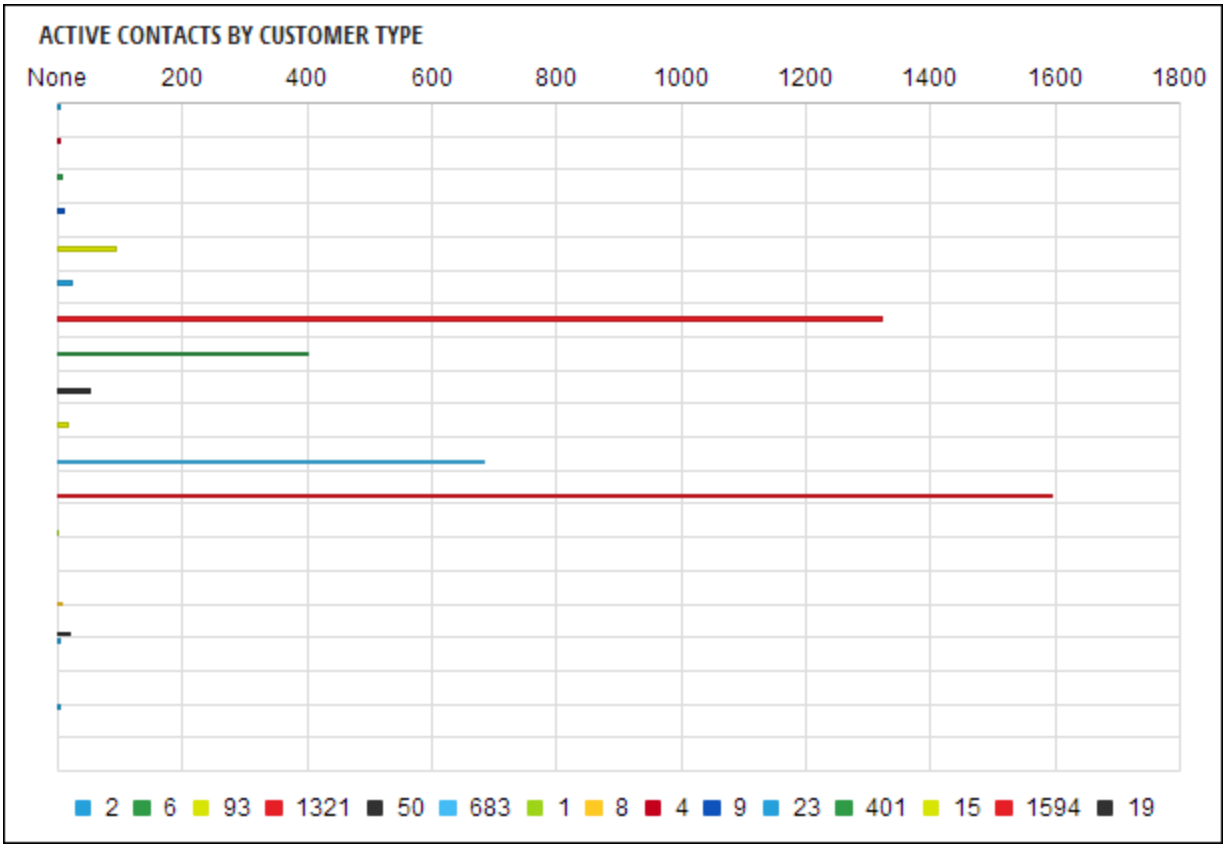
  Area – Displays data in an area filled with color to illustrate trends.

  > **Note:** Note: You can display multiple data values in an Area chart.

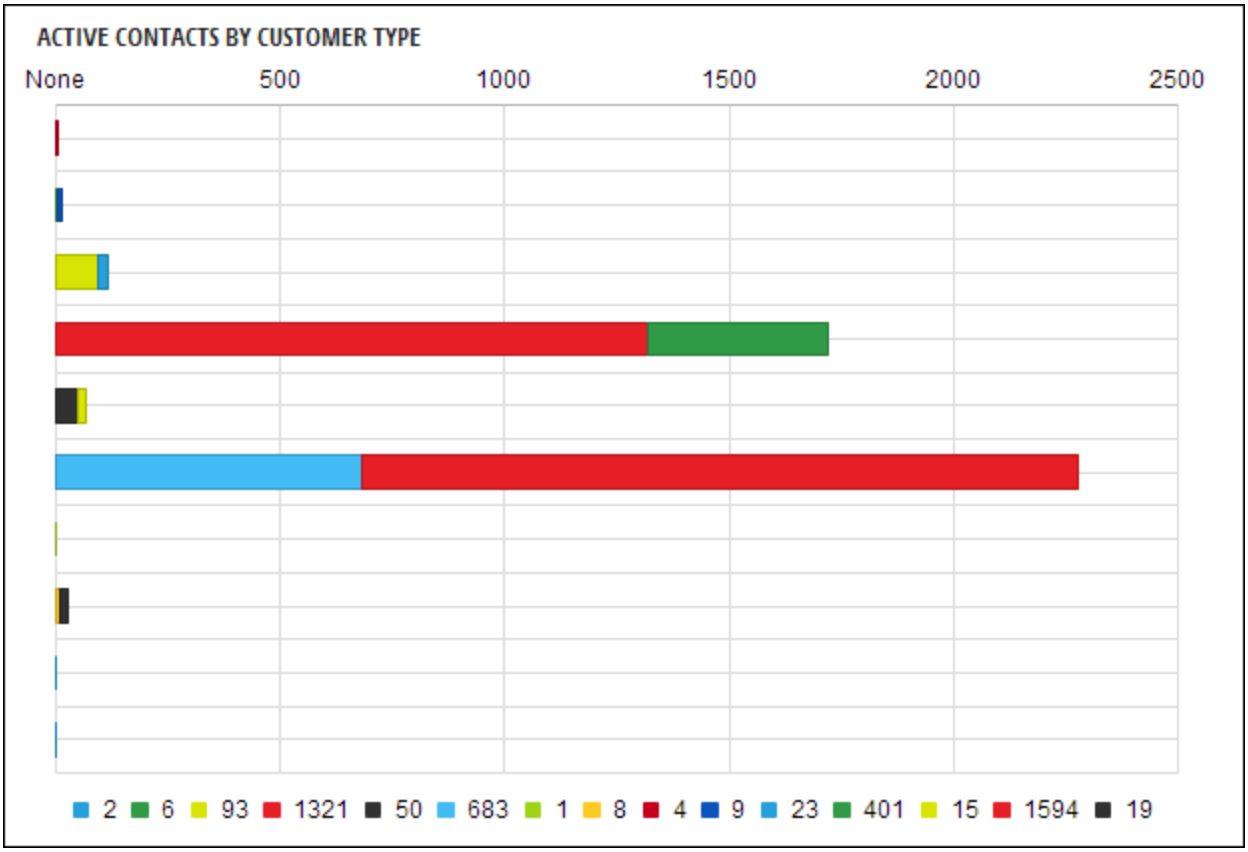


Bar - Horizontal – Displays sets of data with horizontal rectangular bars for comparison.

Note: Note: You can display multiple data values in a Bar - Horizontal chart.

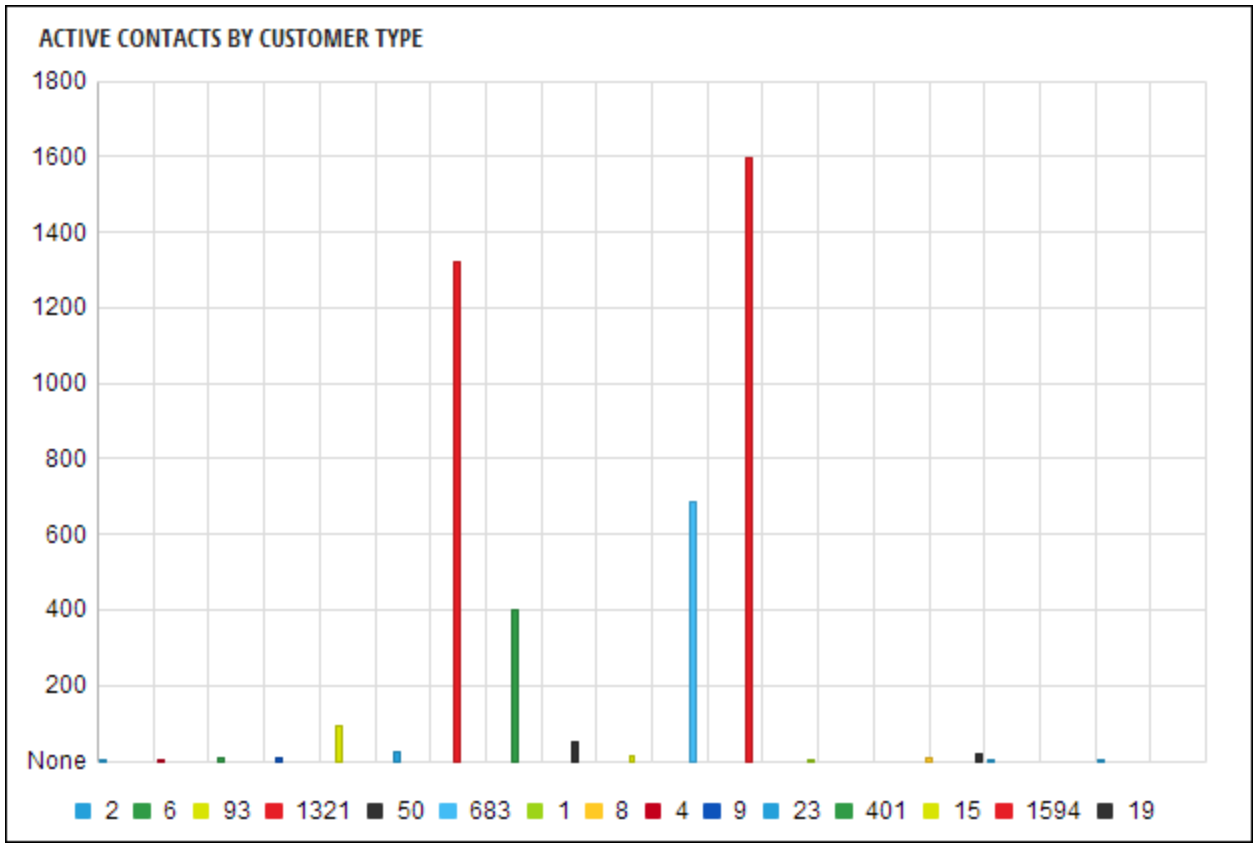


You can also select Enable stacked series. This option allows related data to be stacked on the same data-point bar. This option is only available for Bar - Horizontal and Bar – Vertical charts.

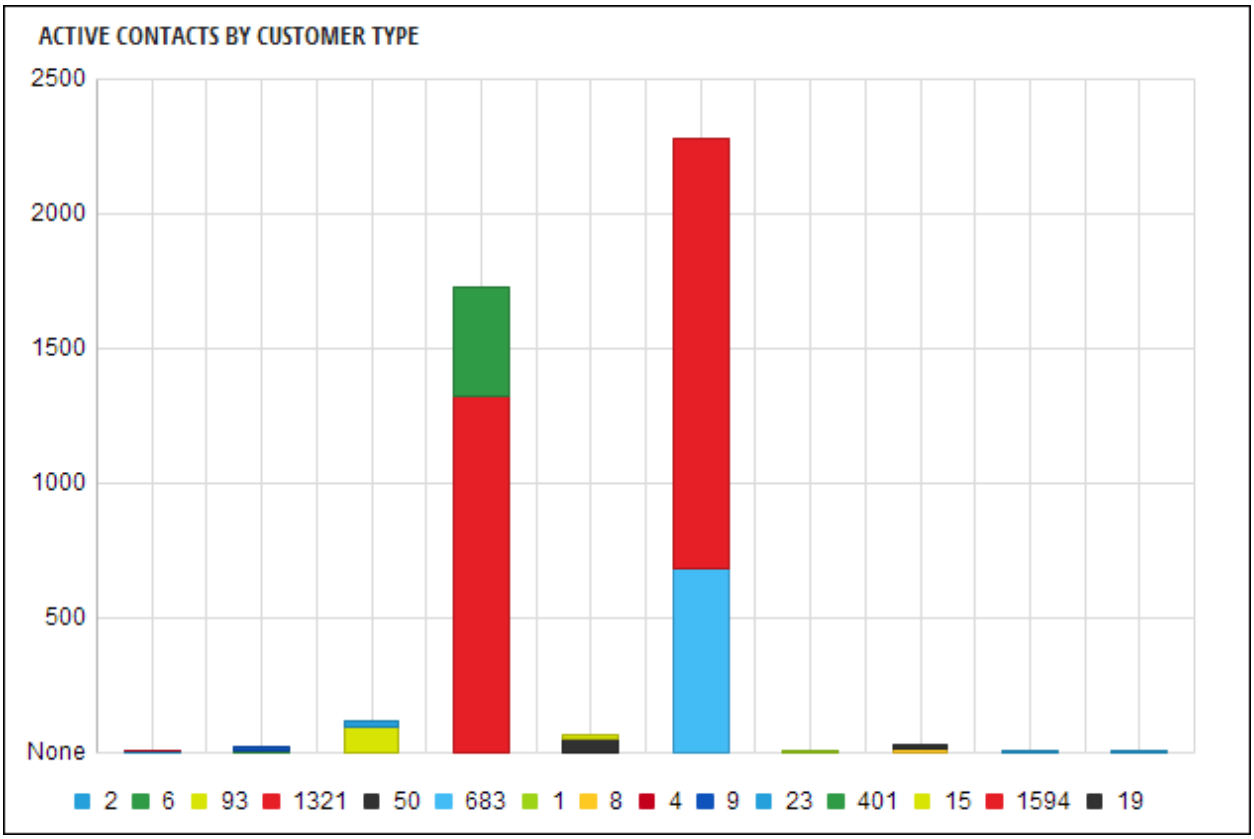


Bar - Vertical – Displays sets of data with vertical rectangular bars for comparison. For example, create a vertical bar chart that shows the number of contacts in your organization by customer type.

Note: Note: You can display multiple data values in a Bar - Vertical chart.

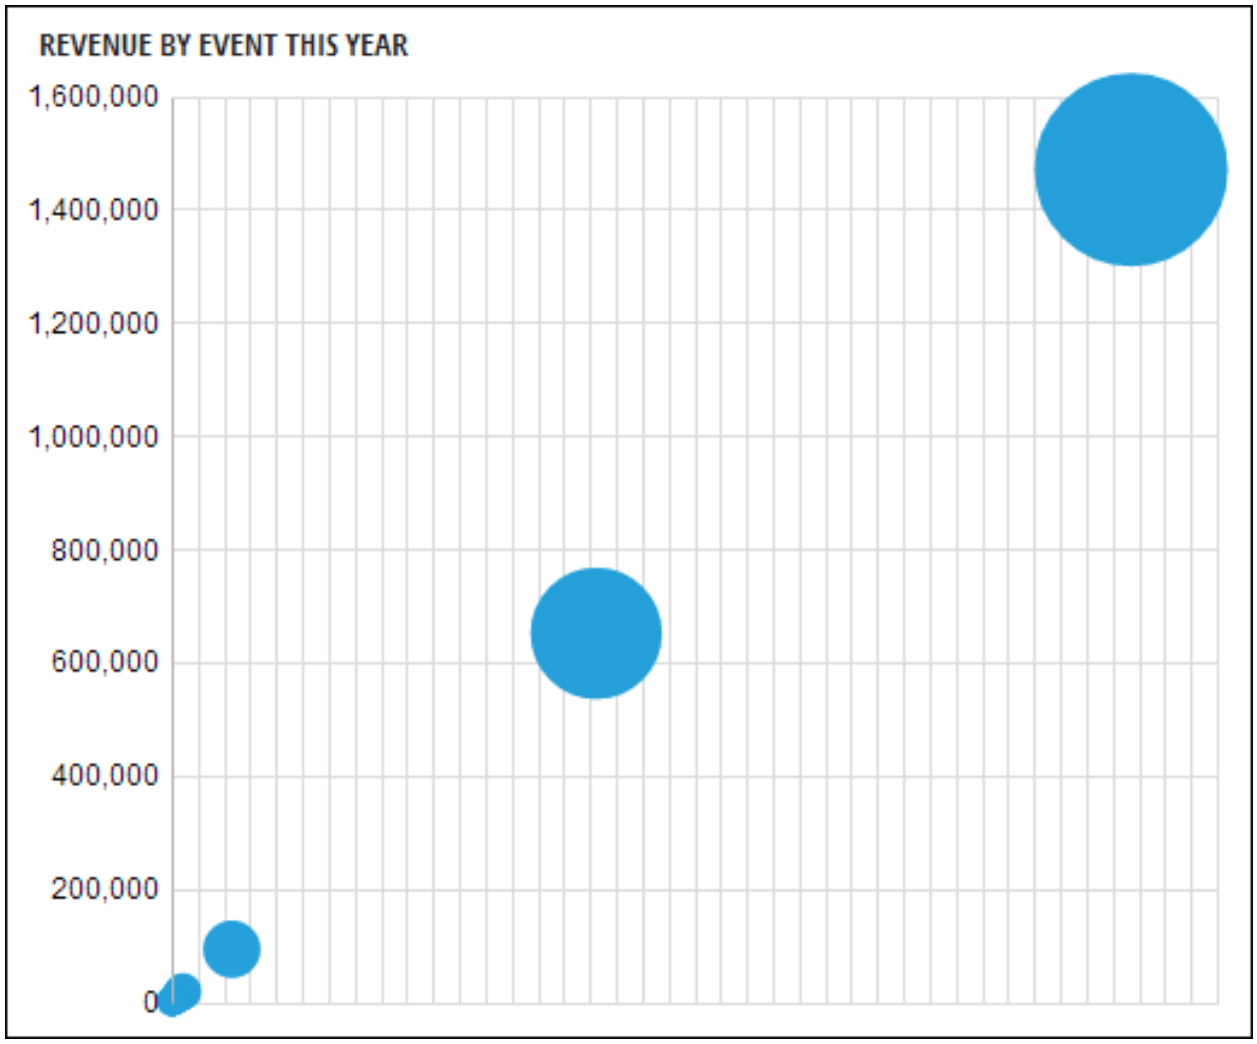


You can also select Enable stacked series. This option allows related data to be stacked on the same data-point bar. This option is only available for Bar - Horizontal and Bar – Vertical charts.

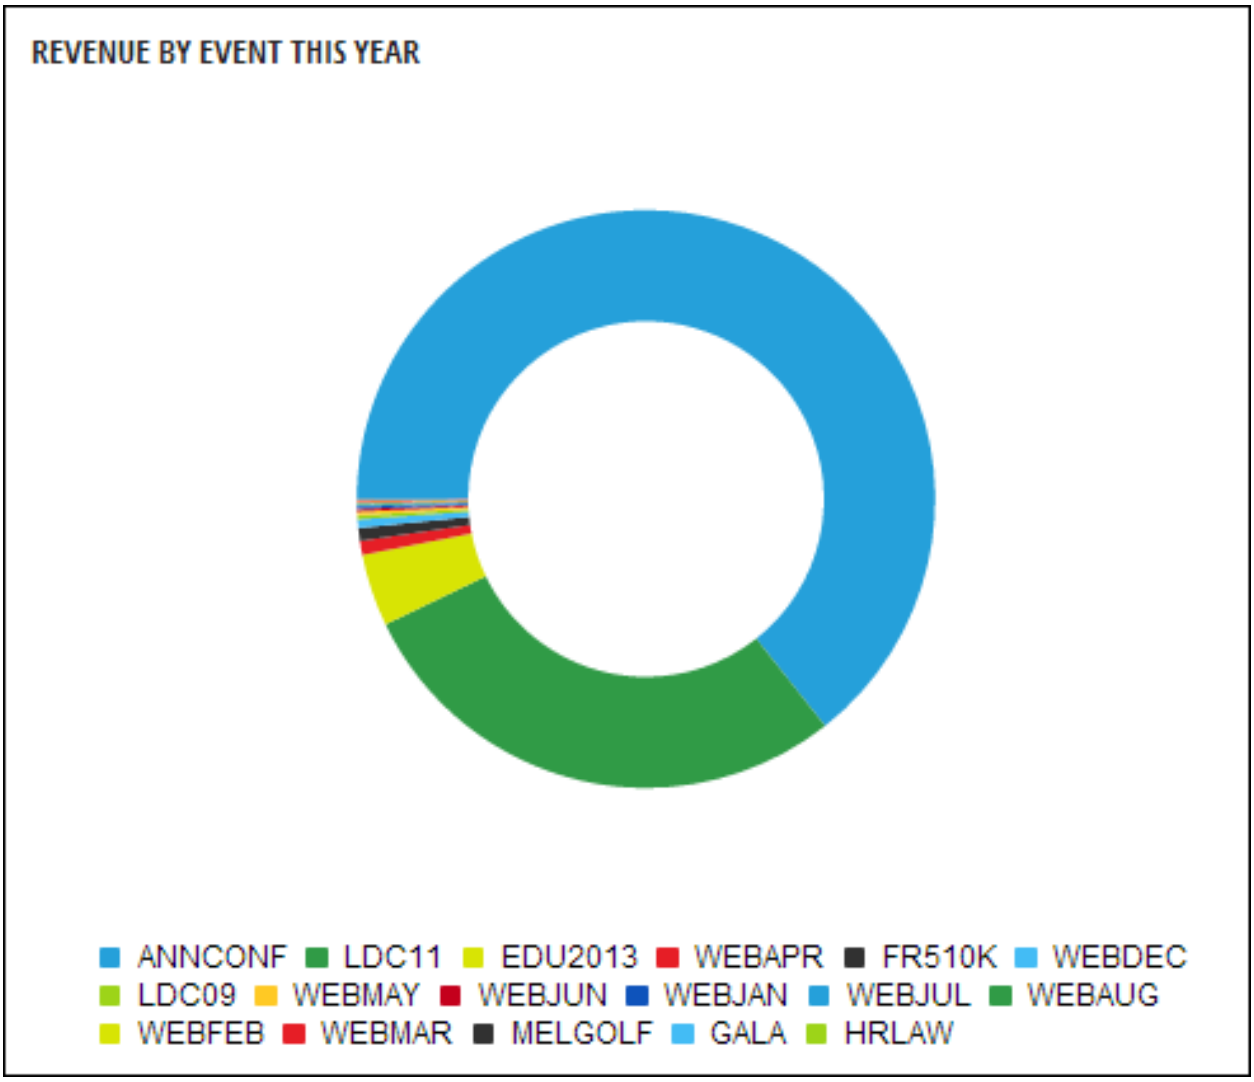


Bubble – Displays data as a series of bubbles.

Note: Note: You cannot assign a size value to the bubbles in the Bubble chart.

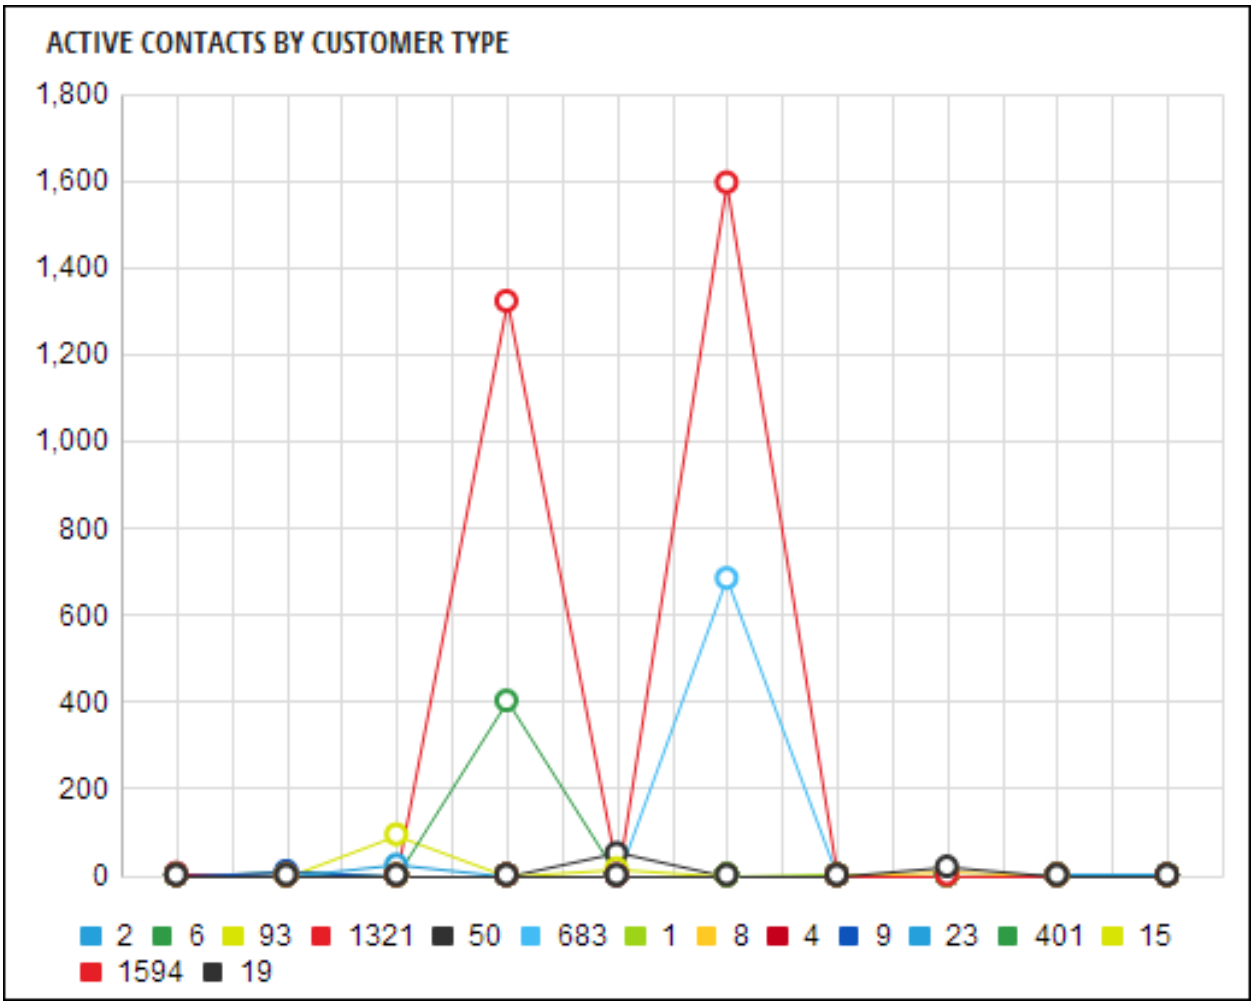


Donut - Functionally identical to a pie chart, with the exception of a blank center and the ability to support multiple statistics at once.

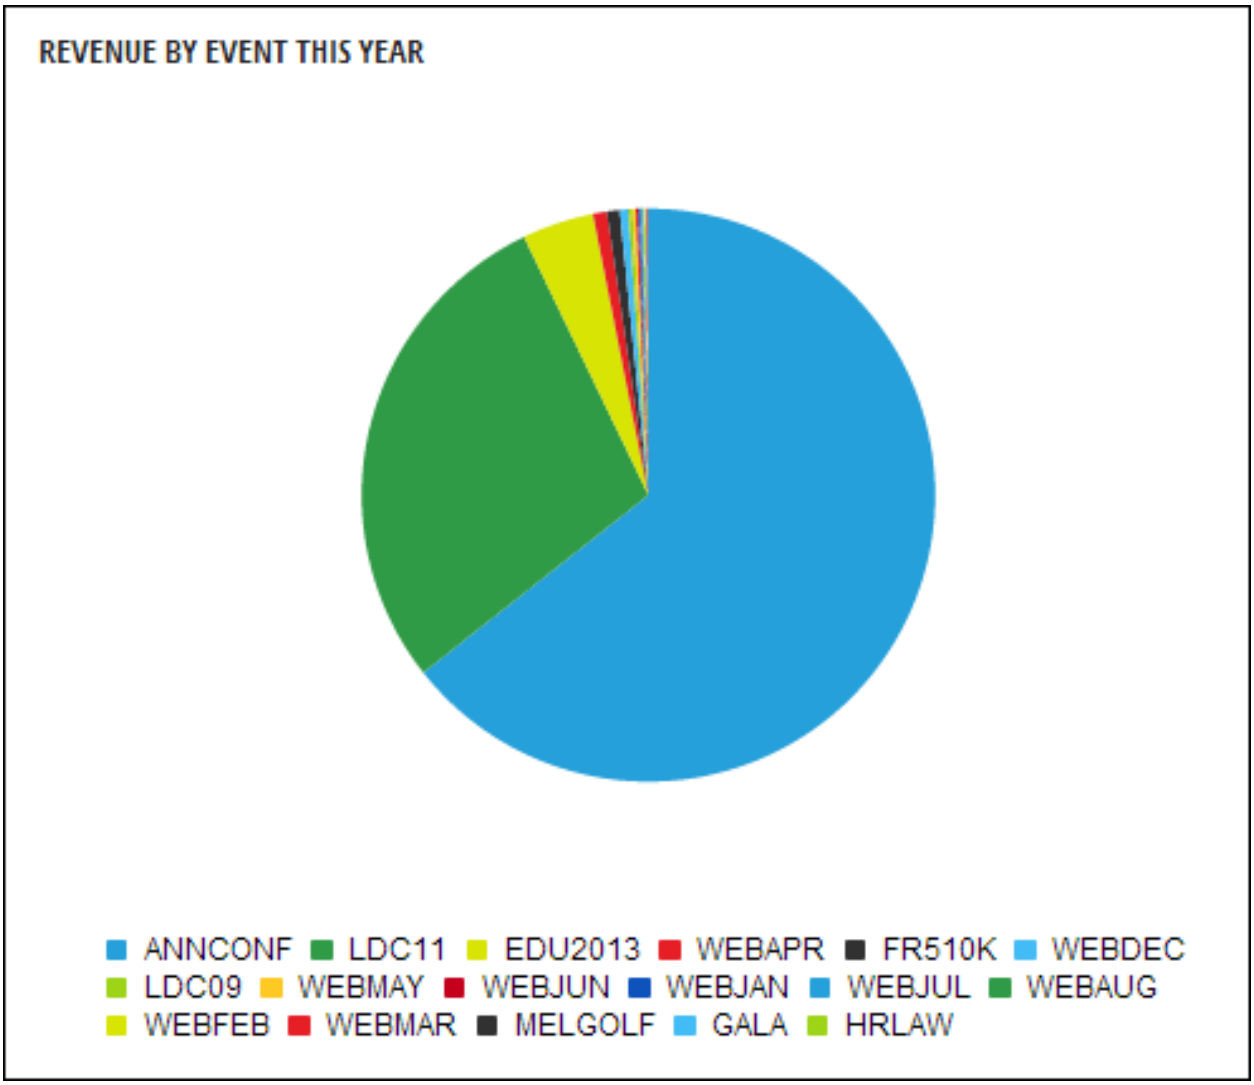


Line – Displays data as a series of data points connected by a line to illustrate trends. For example, create a line chart that shows the number of contacts in your organization by customer type.

Note: Note: You can display multiple data values in a Line chart.



Pie – Displays data in a circular chart divided into sections to illustrate proportion.



Query Menu

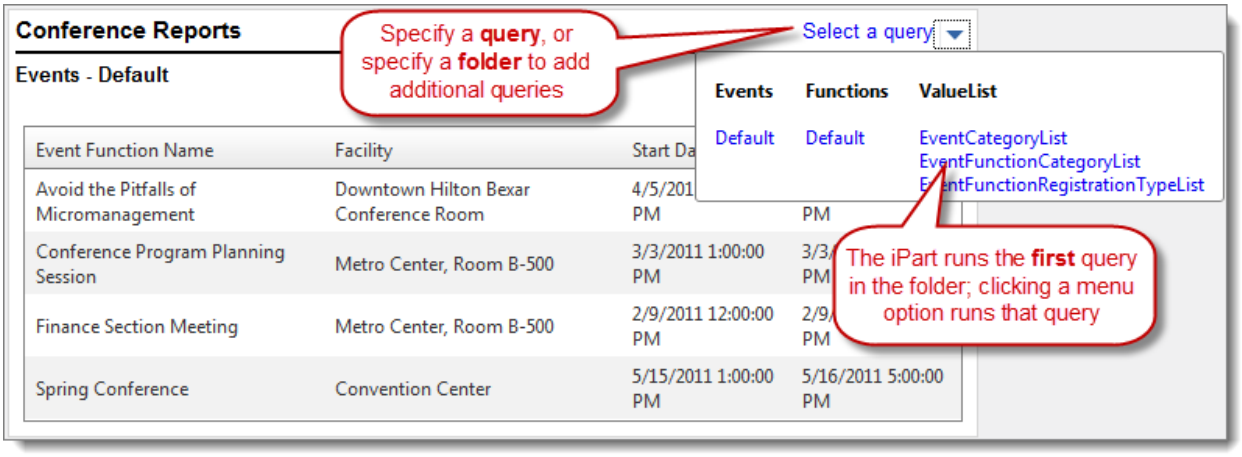
Query Menu lets you merge query results into your site for tremendous utility. You can set the content item to display a query, set with whatever title, parameters, columns, labels, and sorting you need, and you can enable exports, which adds icons for sending the data to Word, Excel, PDF, and CSV.

Who is attending?

Conference Planning Roster

Registrant	Organization	Title
Hon. Douglas M. Kramer		Representative, State Legislature
Carly L. Kowalski	GEO International	Executive Director
Cecile M. Faciques, CAE	International Association of Business Interests	Director
Charles P. Yusif	International Association of Business Interests	Manager, Education
Steven W. Carlson, CPA	Opus, Inc.	Controller
Sonya Gallora	Publications, Etc.	Executive Officer

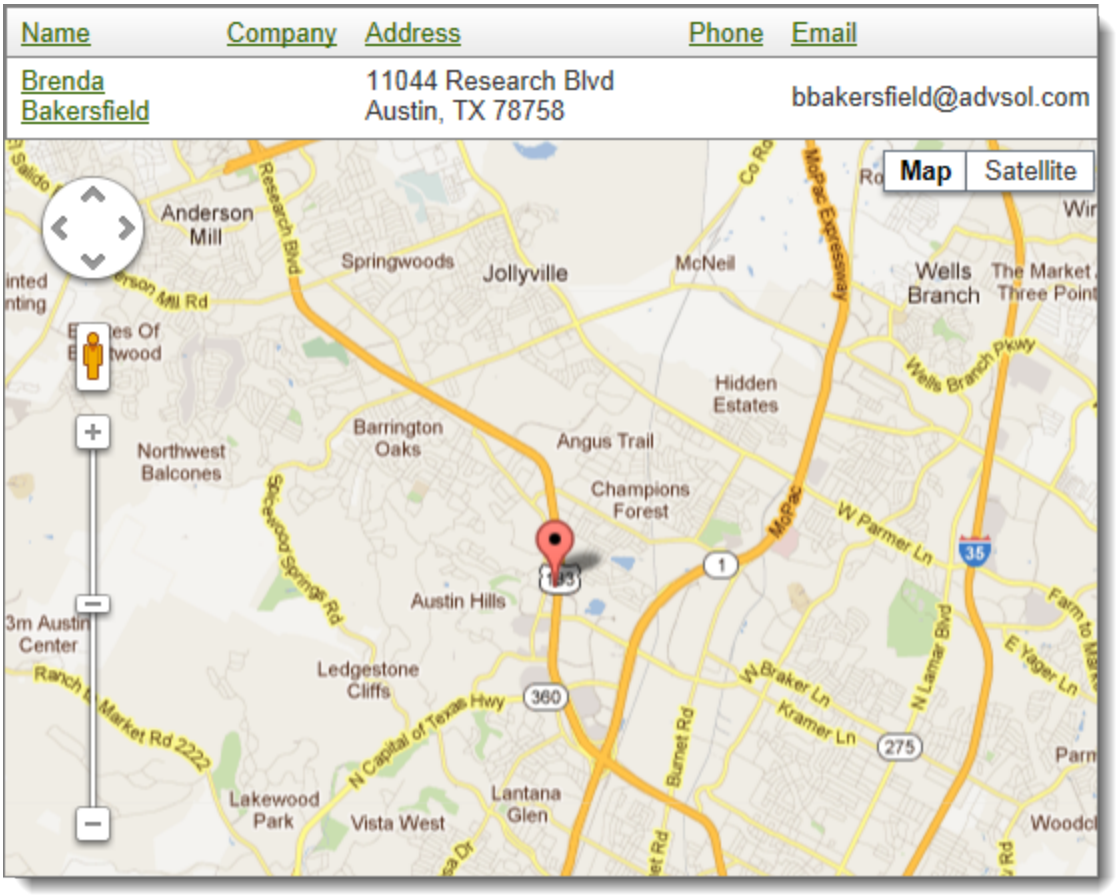
You can also organize helpful queries into a folder and point the content item to that folder. When the page loads, the content item displays the first query at the top of that folder, and it presents a drop-down menu of additional queries available, organizing them by subfolders, if any. When the user clicks on a query from the menu, the content item immediately runs that query and displays the results.



If the query selected returns contacts, Query Menu provides the ability to send an email to all of the contacts using the Communication Creator content item. You can use the Email button in the Query Menu to email the entire contact list if the query contains a

required Id column or column alias. See Creating a list of contacts to email to view a list of columns and column aliases that you can use to enable mass emailing of the contact list.

If the query selected contains an address property, you can configure the content item to automatically map the query results when an address is available. Only one address property per query can be mapped. When this option is enabled, the content item looks for the following address properties in this order and maps the first one it finds: FullAddress, Address, FullAddressText, AddressText, Address Text, and Full Address Text.



Related Items

With the Related Items content item, you can display a list of profile or product pictures based on the results of an IQA query. For example, you can write a query to display the profile pictures of everyone who has registered for an event, made a donation, or ordered a particular product, or to display products in the same category. You can configure the list to display horizontally or vertically, to display a name for the item, and to choose the

size of the image. You also have the option to make the profile picture a live link that opens a URL of your choosing, such as the member profile page.

Guidelines for working with the Related Items content item

- The pictures displayed in the content item are based on iMIS product or contact IDs. When creating the query for this content item in IQA, you must select a property that returns an iMIS product or contact ID on the (Display tab). Give this property an Alias of key_Id (the Alias is case sensitive).
- To define the image to display for each record, include a column in your query that specifies the image file name for that record. Give this property an Alias of Image.
- To display a name for each record, include a column in your query for the name of the item or contact. Give this property an Alias of Name.
- When you add Display columns to the query in IQA, they become available within the content item as Filter columns to filter on.
- You can dynamically filter the query results displayed in the content item based on the value of another content item's URL parameter. For example, you can set up your donation page to display the profile pictures of people that have donated to a particular cause (called a distribution in iMIS). Donation Creator uses the URL parameter itemid to determine which distribution the donation should go towards. If you add your content item to the same content record as the Donation Creator, then you can set up the Related Items content item to look at the value of itemid to determine which profile pictures to display. You just have to make sure that your query includes the CsActivity.Product Code property, so that you can select it as a Filter column on the content item's configuration page. Once selected, enter itemid for the Filter on URL parameter, so that the content item knows to filter the results based on that URL parameter's value.

  Example: Display other products in the same category

  In this example, the Related Items content item is set up to display clickable images for other products in the same category as a particular product. This example uses content installed for the sample Member site.

Go to Page Builder > Manage Content:

1. Click Core Content > Shop > Store Layouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

   Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Select Add content > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > RelatedItems and select Related Products.
4. Filter Options dropdown, select ProductCategory. ProductClassKey.
5. Filter on URL parameter, type in Category.Class.
6. For the Items link to (URL or shortcut), type in ItemDetail?iProductCode={key_Id}&Category={ProductCategory}.ItemDetail?iProductID={key_Id}&Class={ProductClassKey}. This uses the ItemDetail shortcut to link each item in the list to the product page. The particular item's product ID and category are specified in URL parameters so that the correct product and related products are displayed in the resulting product page.
7. Click Save & Publish to complete the content record.

   Example: Display other users who have purchased a product

   In this example, the Related Items content item is set up to display clickable profile pictures of other users who have bought a particular product. This example uses content installed for the sample Member site.

   Go to Page Builder > Manage Content:

1. Click Core Content > Shop > StoreLayouts > Item Detail. open the Core Content > Commerce folder and edit the Product Display content record.

Note: The Item Detail content record displays product pages in the Member sample site's Shop. The product displayed is based on the value of the URL parameter iProductCode. iProductID.

2. Click add content > Content Types > Utility > Related Items.
3. For the Source query, click select. Navigate to $ > Samples > QueryProfilePictureList. Select Orders.
4. Filter column dropdown, select ProductCode.
5. Filter on URL parameter, type in iProductCode. iProductID.
6. For the Items link to (URL or shortcut), type in MBR/Party.aspx. This redirector web page looks for an ID in the URL parameter and then checks the ID's party type and the user's permissions to determine which content record to display. The user's ID is appended to any URL specified in this field.
7. Click Save & Publish to complete the content record.

Progress Tracker

With Progress Tracker, you can visually display progress towards a goal based on the results of an IQA query. For example, connect this content item to a fundraising query, so that your members can easily track the progress of a fundraising effort towards a specific goal. Or connect it to an events query, so that you can see at a glance how many people have registered for an event.

To set up the Progress Tracker

1. Create a query for the Progress Tracker.

Note: For sample queries that will work with this content item, see $/Samples/ProgressTracker/ in IQA.

The Progress Tracker uses three pieces of information supplied by an IQA query: a goal amount, the sum total of what you are tracking, and the end date (which is optional). When you build your query for this content item, it must contain specific aliases. In IQA, create a new query and choose the business object you want to query on. Make sure you are in Advanced Mode, then from the Display tab, choose properties to assign the following aliases to:

- Goal_Amount: Indicates which property is the goal amount. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST(25000 AS INT) as a property to set the goal amount to 25,000.
- Sum_Total: Indicates which property is the amount to be summed. The percentage displayed in the Progress Tracker is based on this amount compared to the goal. It can be a monetary amount or any other number, such as the number of event registrations.

  Tip: From the Function dropdown list for this property, select Sum, so that only one row is sent to the content item. This is not required, but it will improve performance.
- End_Date: Indicates which property specifies the end date. This alias is only required if you want to display an end date in the content item. You can apply this alias to a property of a business object, or apply it to a Custom SQL Expression property. For example, add CAST('2012-12-25' AS DATE) as a property to set the end date to 25 December, 2012.

2. Add the content item to a content record and configure it.

   Go to RiSE > Page Builder > Manage content:

1. Do one of the following:

- Select a Content Folder and click Edit.
- Select New > Website Content.

2. Click add content.
3. Go to ContentTypes > Utility.

4. Select Progress Tracker.
5. Click OK.
6. Enter the CSS class to style the Progress Tracker. Two styles have been pre-defined that you can use in the content item: ProgressTracker and ProgressTracker2. You can edit these classes to change the look and feel, or you can create your own style for the Progress Tracker.
7. Select a Source query.
8. (optional) Select a data column by which you want to filter. You can use this feature to dynamically update your Progress Tracker, based on the value passed to it in the URL. If you choose to filter on a data column, then also enter the name of the URL parameter, which the content item uses to identify the value to filter on. For example, to limit the results of an event query to a specific event, you can select the EventCode property and give the URL parameter a name such as EventCode. The progress displayed will then reflect only the event code which is included in the URL as EventCode=[EventCodeValue].
9. (optional) Enter any messages you want to appear in the content item. The variables below can be used in the descriptions. For example, "Help us reach our goal of {0} new members by {2}!"
   - {0} displays the goal total
   - {1} displays the current sum total or count
   - {2} displays the end date in a long format
   - {3} displays the end date in a short format
10. Select the Caption Options. In addition to the progress bar, you can also display the values as text. If any of the Caption Options are unavailable after selecting a query, this indicates that the required aliases have not been defined in the query.
11. Select the Progress bar location. The bar can be displayed above or below the captions.

Note: You can also use this content item to display only a countdown (days remaining to a certain date). In configuration, only select the caption option Display days remaining, then for the Progress bar location, select (None).

12. Click OK.

SSRS Report

The SSRS Report content item lets you display the results of any IQA query on any page where you place it. SSRS Report uses the version 10.0 ReportViewer, which supports IE8 natively and, in IE8, adds a Print button on its toolbar. You can add the SSRS Report content item to any content page using CM: open the Utility folder and choose the content type SSRS Report.

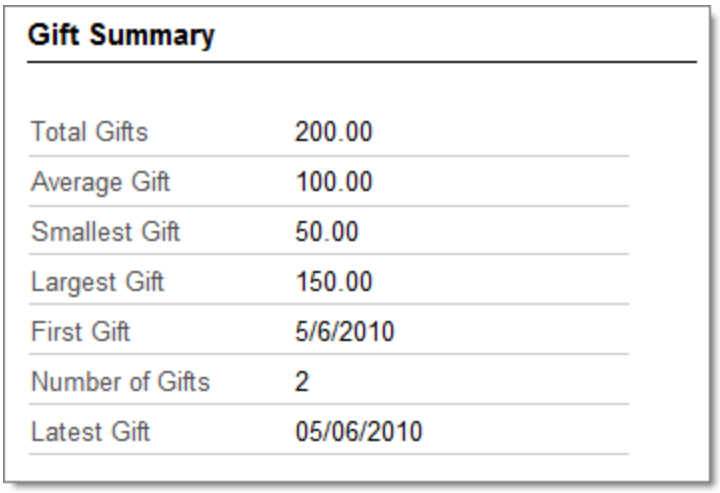
This content item lets you customize whether to display the export buttons for PDF and Excel versions of the report. You can change the default design (layout, colors, fonts) of your reports by editing the SSRS parameters in the SystemConfig table.

How it works: The process engine specified by the content item loads a report template (.RDL file) from the document system and creates a report data source (a DataTable) based on an IQA query's SQL source; the report viewer then combines the template and query to generate the report's output. When you configure the content item, you specify the Document system path to the SSRS Report runtime, which must be a link to an SSRS Process Engine. Click the select link next to the textbox, then browse to your reports (such as $/Samples/ReportingServices), and pick one of the runtime entries.

Note: Tip: Identify a process engine (run-time report) by the arrow on its icon!

Summary Display

The Summary Display content item displays a single row of query results in a form view.



Gift Summary

Total Gifts	200.00
Average Gift	100.00
Smallest Gift	50.00
Largest Gift	150.00
First Gift	5/6/2010
Number of Gifts	2
Latest Gift	05/06/2010

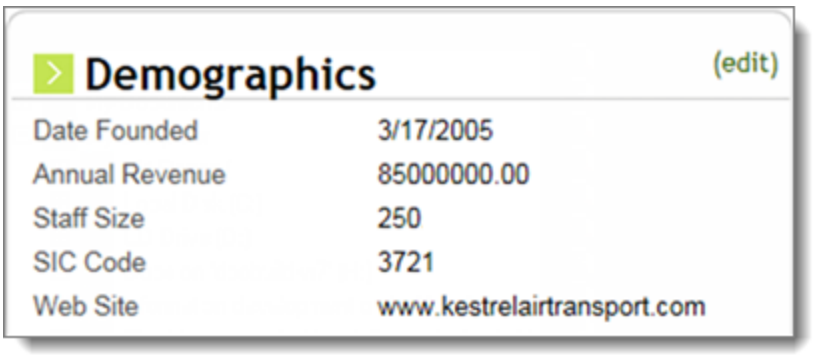
Guidelines for queries displayed in Summary Display

When creating a query that you want to display in the Summary Display content item, keep the following guidelines in mind:

- This content item only displays a single row of query results.
- If you connect the content item to a query that returns more than one row of results, only the first row is displayed.
- Tip: You can dynamically filter your query results by the currently logged in user, a selected contact, or a date. See Adding dynamic filters to queries for more information.

Panels and custom data

Panels are custom displays of iMIS data that you are able to name, build, arrange in grids, and add to your site. Using panels, your users can browse, edit, add, and delete their data, as you specify:



Demographics (edit)

Date Founded	3/17/2005
Annual Revenue	85000000.00
Staff Size	250
SIC Code	3721
Web Site	www.kestrelairtransport.com

You can manage your custom data directly and conveniently from the web pages where you place these content items:

- Panel Editor (which creates panels and shows one panel) --
- Panel Collection Editor (which combines existing panels into tabbed displays)

You can configure content items to let your users add and edit that data directly from their browser page. You can import your existing user-defined tables (from iMIS Customizer) directly from the Panel Editor content item configuration. In addition, your Activity table data is automatically available as a source, so that you can use and extend that data. Panel sources can include existing user-defined tables (defined in the UD_Table table) and user-defined sources (listed in the ObjectMetaData table).

> **Note:** Tip: Panels are shared: when you update one panel, it updates within every content item that uses it.

Creating custom panels of data

In a few clicks from your browser, you can have a new panel that displays the data you want, labeled and made editable as you need.

1. Enable Easy Edit by clicking on the button at the top right hand corner of the screen.
2. Once Easy Edit has been enabled, you will find and click the icon at the bottom left corner; this is the Page Builder.
3. From the Page Builder, click add content > ContentTypes > Content > Panel Editor
4. Select (New Panel) from the Panel drop-down menu.
5. Drag in and arrange your desired data, then Save & Publish.

Once you have placed a panel into a content record and published it, you can then edit the panel directly: As a system administrator, you see an Edit panel command, which lets you make quick changes to the panel, changes that save and publish for you auto-

matically. For extensive panel work, such as to change the type of data it shows, use Easy Edit to access all of the content design features.

Best practices for panel layout

Here are key layout features to help you design the best use of screen real estate on the page:

- Multiple columns: Click + or – icons next to the panel layout to add/remove columns in your panel. For best display results, place multi-column panels into single-column content records.
- Hide in Summary View: Check this box on certain properties to trim the initial display of the content item to the read-only information that is most useful. Only when users open the full window for viewing or adding/editing (as you configured it) do they see the additional information.
- Read-only: Check this box to provide information in read-only form while still allowing users to edit other information on the panel.

  Tip: To prevent editing of all of the properties, simply disable Allow users to edit on the content item configuration, rather than in the Panel definition.
- Collapsible panel: In order to maximize utility and minimize scrolling on the page, users are able to click on the arrow to expand and collapse content items.

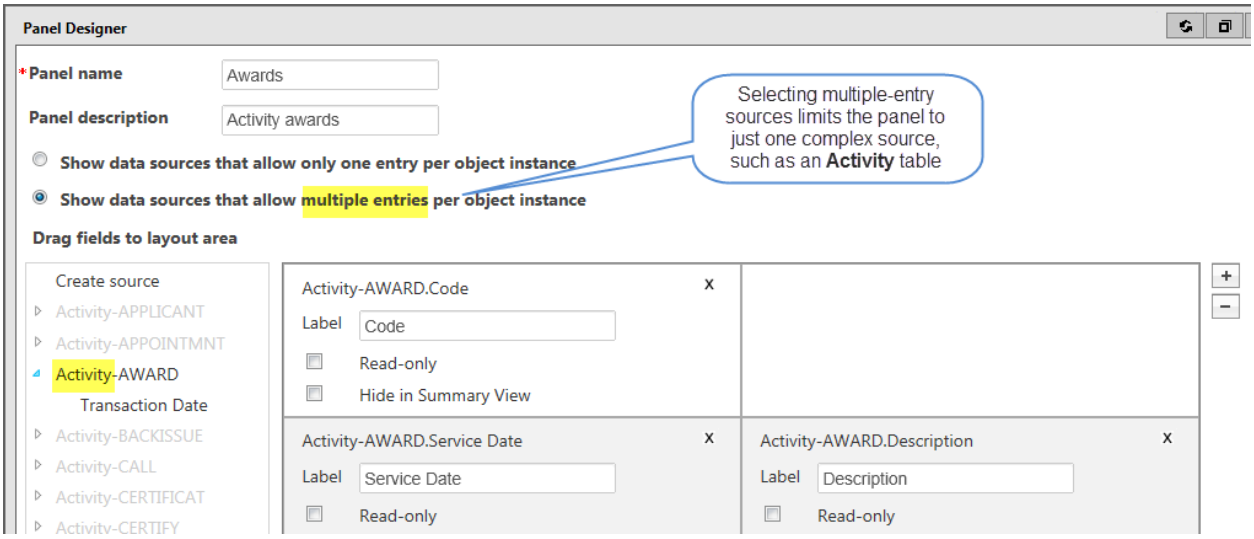
  Tip: Be sure to add an optional Title to any content item that you make collapsible, so that title bar text guides your users as to what information they will access by clicking Show.

Panels for Activity data

Most organizations need to show activity information on their websites. All of the Activity data in your iMIS database appears as complex (multi-entry) sources when you use Panels.

Suppose you created new award types in the general lookup table called AWARDS and want to add them to a page for dynamic editing. In a few clicks, you can have exactly that:

1. Enable Easy edit.
2. Click add content.
3. Go to ContentTypes > Panel Editor.
4. Click OK.
5. In the Panel list, select (New panel).
6. Select Show data sources that allow multiple entries per object instance.
7. Drag in your new data sources.
8. Click Save & Close.
9. Select Allow users to edit.
10. Click OK.
11. Click Save & Publish.



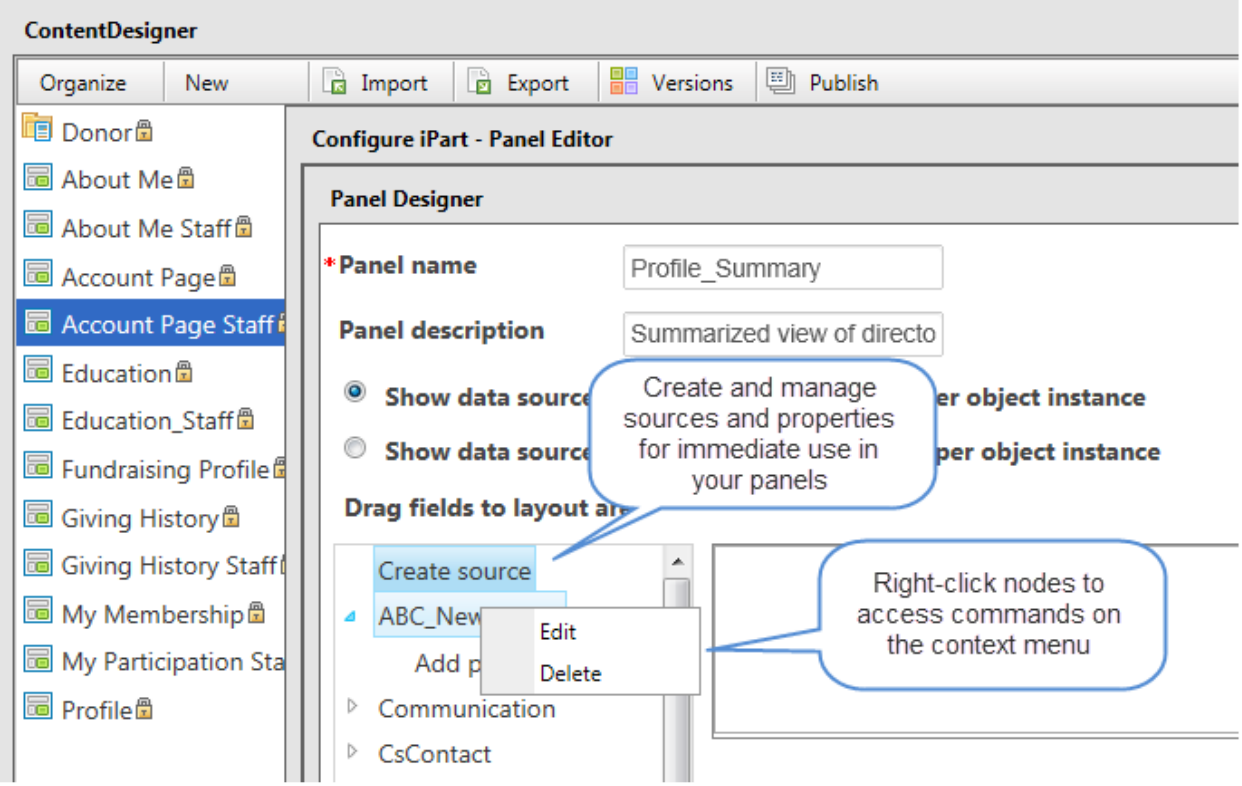
All of your Activity data appears as available sources when you select multiple entries for the type of data source.

Note: Tip: If you want to combine data from different sources, be sure to show simple sources (the first radio button option). Only one complex table can display in a panel, so the others are grayed out as long as any one of them has properties placed in the panel.

Defining your own data with Panel Designer

With the Panel Designer, you can not only craft reusable panels that combine fields from many tables, but you can also define new data structures (business objects and properties) to manage information for your organization. Without special tools or knowledge of the iMIS schema, you can add data sources on the fly, right from your browser. When you save the panel, you have saved your newly created data sources as iMIS business objects.

Note: Tip: You can see your new data source show up as a business object in Business Object Designer, but it will be read-only: continue to edit and manage these special sources in Panel Designer itself. A ContactKey is automatically generated for the business object that represents the panel data source. The ContactKey is a unique value used to join the business object to other panel data sources and business objects in IQA. It is also used as the iMIS ID for linking in IQA.



Access the Panel Designer by editing or creating a panel in a Panel Editor content item.

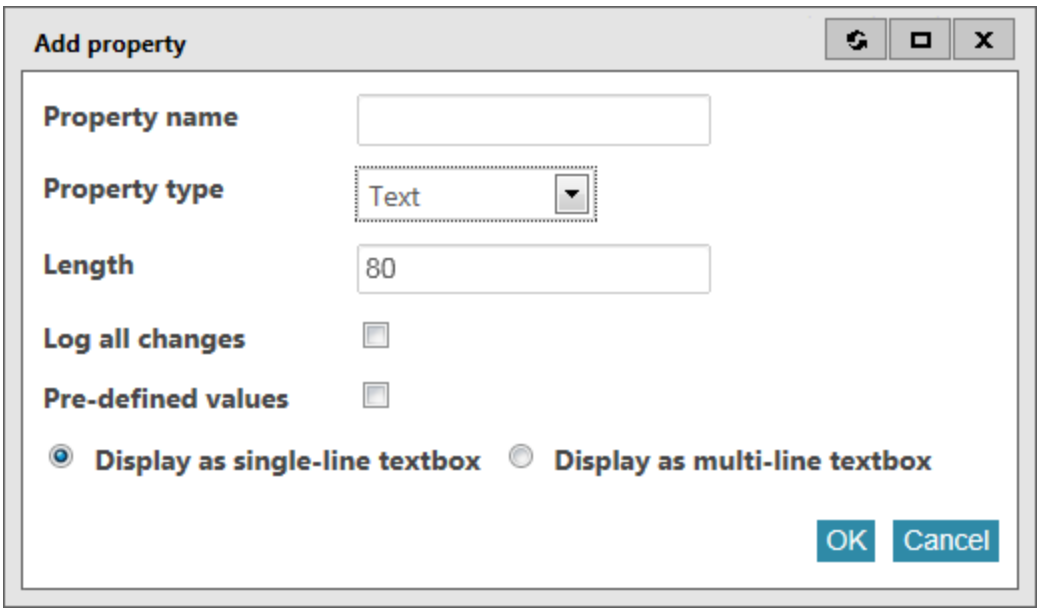
To create a new panel source and properties

To create your own data source with properties, you work within Panel Designer. Each new source you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

1. Select New > Website Content.
2. Click add content.
3. Go to ContentTypes > Content.
4. Select Panel Editor.
5. Click OK.
6. From the Panel drop-down list, select (New panel).
7. At the top of the source tree, select Create Source.

8. Choose a Name for each new Source that meets these criteria and click OK:
   - Starts with a letter
   - Contains only letters, numbers, and underscores
   - Is unique across iMIS, not matching any existing iMIS data or SQL Reserved Words

     Tip: Use an organizational prefix (such as ABC_*) so that your sources are unique, sort together in the tree view, and are easy to identify as ones that you created.
9. Select Add Property for the new source added.



10. Enter a Property Name.
    - Starts with a letter
    - Contains only letters, numbers, and underscores
    - Is unique within its Source
11. Choose a property type that best fits your purpose, within these valid ranges:
    - Currency: 19 total digits (precision), with 4 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
    - Date, Date and Time, Time: January 1st, 1753, through December 31st, 9999

- Decimal: 28 total digits (precision), with 12 digits to the right of the decimal point (scale). The default masking shows 2 decimal places.
- Email: Creates a mailto link, which launches the user's default mail application when selected.
- Integer: -2,147,483,648 to 2,147,483,647 (±2 billion)
- Text: By default, the Text Property type allows:
- Free-form entry up to 400 characters (defaults to 80). You can select to display the text-box as a single line or multi-line textbox.
- Pre-defined values from a query or explicit list that display as a drop-down list at runtime:
- Query – For example, you may want to use a query that returns a list of countries.
- Explicit List – For example, you can add a list of colors the user can select as their favorite.
- URL: Creates a live hyperlink, which launches a new instance of the browser to open the link when selected.
- Yes/No: Boolean

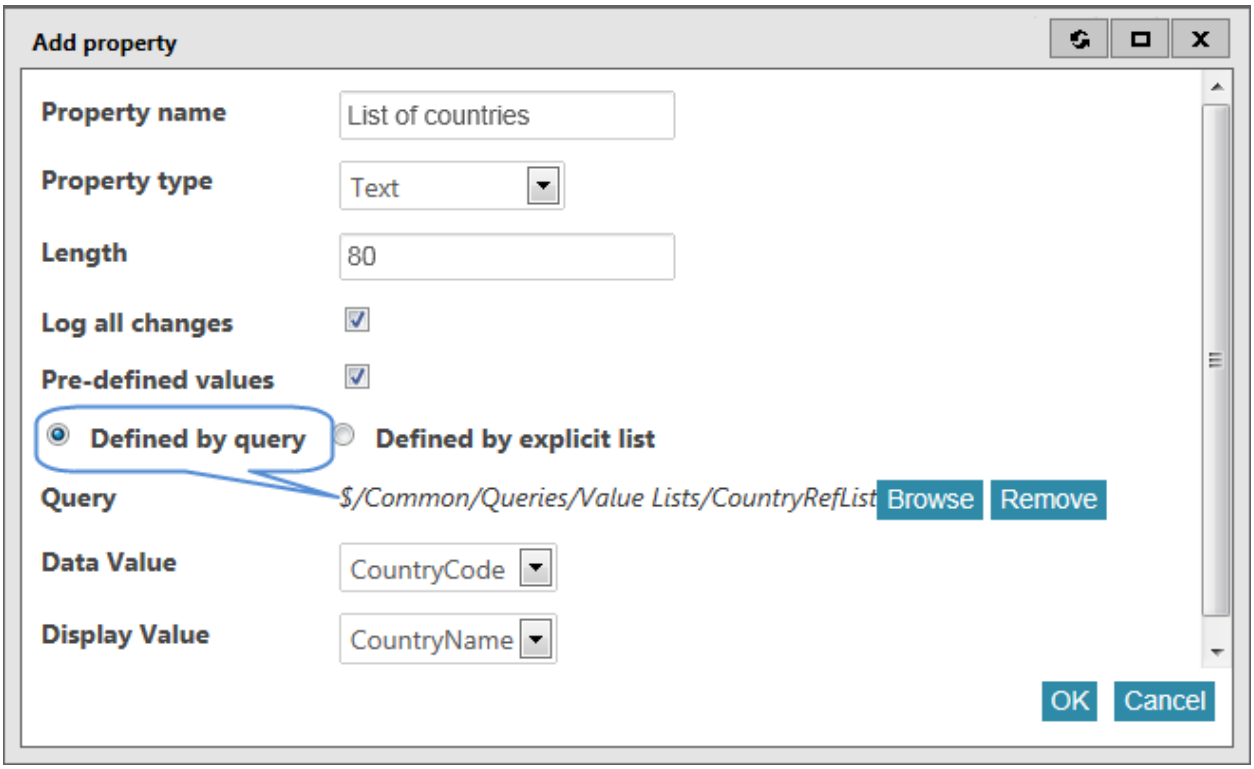
12. Enable the Log all changes if you want to track any data change made to the property you are adding.

    Hint: Add the Change History Display content item to a content record if you want to display data changes made in the Name and Name_Fin tables as well business objects.

13. (Text Property type only) The Pre-defined values option allows you to present a list from which the user can select.

    - The Query option provides validation-type properties based on the query results. For example, instead of typing out a list of countries, you could select a query that displays country values.
    - Enable the Pre-defined values checkbox and select the Defined by query option.
    - Click Browse, select a query, and click OK.

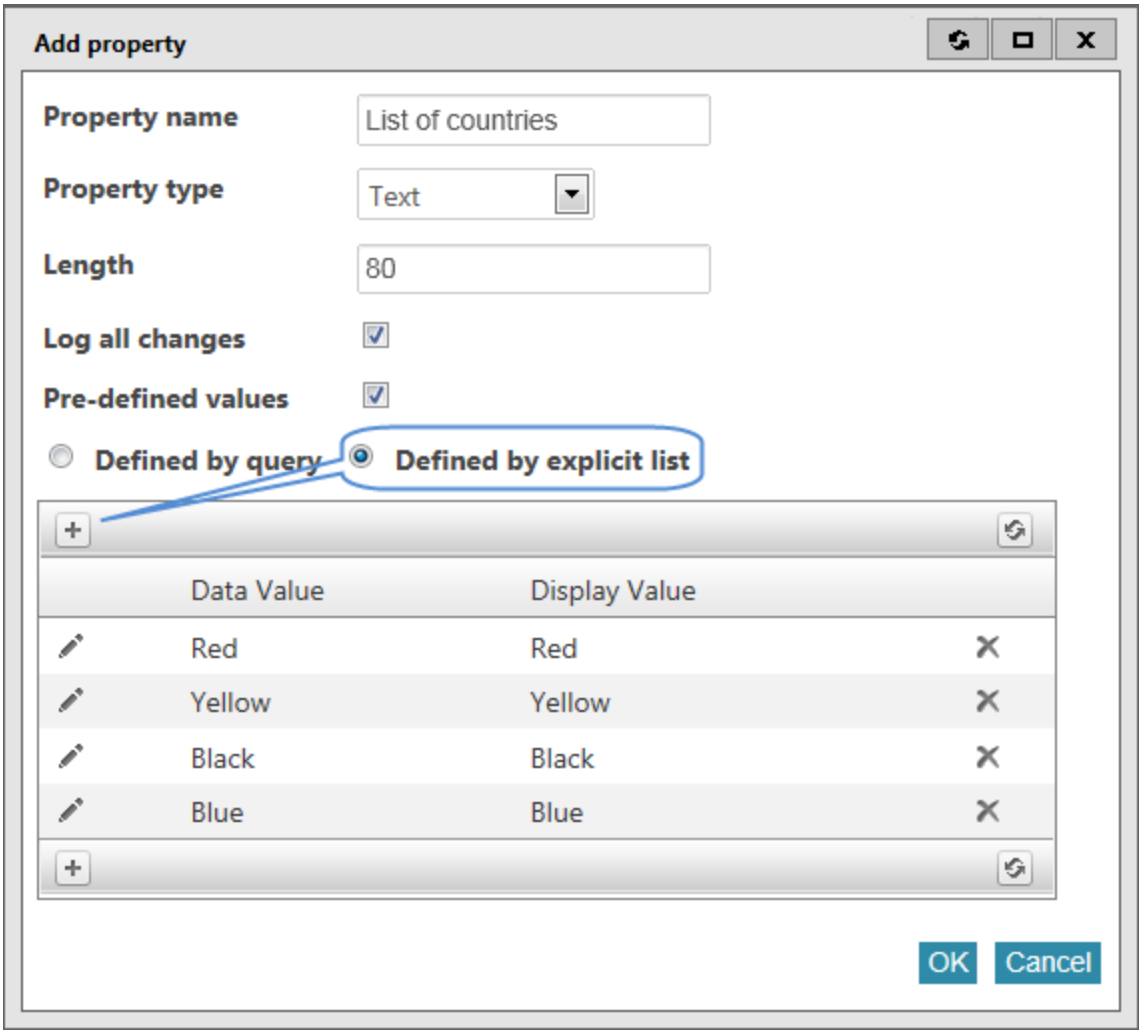
- Two additional fields display, Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a selection on the panel. While these values can be same, you may want to choose a different value to display on the panel. For example, the country code may not be as clear as the country name.
- Select the fields from the drop-down list in the Data Value and Display Value fields.
- Click OK.



- The Explicit List option allows you to create a list to display on the panel. For example, you may want a user to select their favorite color.
- Enable the Pre-defined values checkbox and select the Defined by explicit option. A table grid displays.
- Click + to add a data row. The data row contains two icons: Insert and Cancel, and two fields: Data Value and Display Value. The Data Value is the field you want saved in the database. The Display Value is the field you want displayed in the list presented as a

selection on the panel. While these values can be same, you may want to choose a different value to display on the panel.

- Enter the appropriate values in the Data Value and Display Value fields.
- Click the checkmark located to the left of the data row.
- Click + to add additional data rows.
- Click OK.



14. Drag the field(s) to the layout area.

    Tip: You can also double-click a property to add it to the next available space in the layout area.

15. Save the panel to save the source and properties. Once you save a property, you cannot rename it. Note that the sources will alphabetize properly on reopening.

    Each new property you create is available for immediate use in the current panel, but it is not limited to it: when you Save the panel, that new business object property is saved into iMIS for use throughout the system. Once you save it, you cannot rename it.

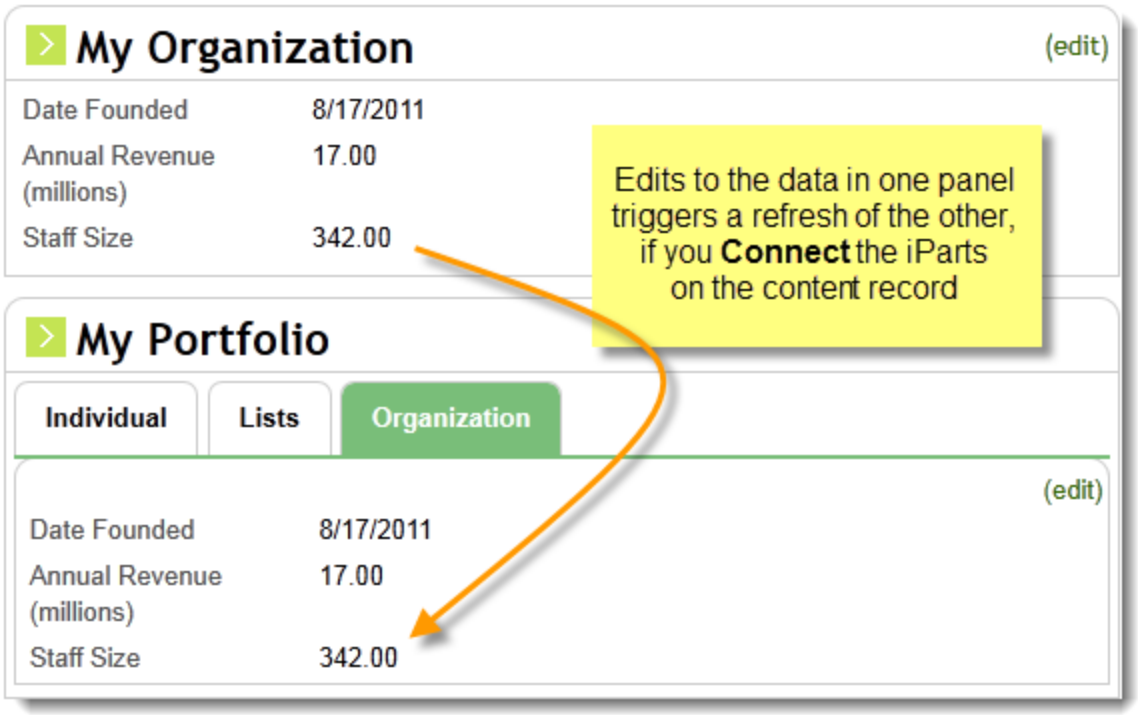
    Tip: Do not save until you create all of the properties. This way, you can view them as a set of properties and improve your naming convention before it is finalized.

16. Save and close the Panel Designer window.

17. Save & Publish the content record.

Connecting content items to refresh panels

When you combine panel-displaying content items on the same content record, data might appear out of sync after the user edits it, if both panels display the same property. You can solve this refresh problem through the content item's Connect feature, which you enable separately from Configure.



> **Note:** Note: Check a content item's configuration Help topic to find out if it supports any connection options. A content item has no connection support (neither consumer nor provider) unless its author added it.

To connect panels for dynamic updating

1. Edit a content record and add two user-editable content items that display panels (Panel Editor, Panel Collection Editor).
2. Set up the first connection:

- From the first content item's title-bar menu, select Connect.

  The Connect box that opens shows you any current connections and lets you disconnect them.

- Select Create a new connection.

  The Connect box that pops up prompts you to create one of four connection types.

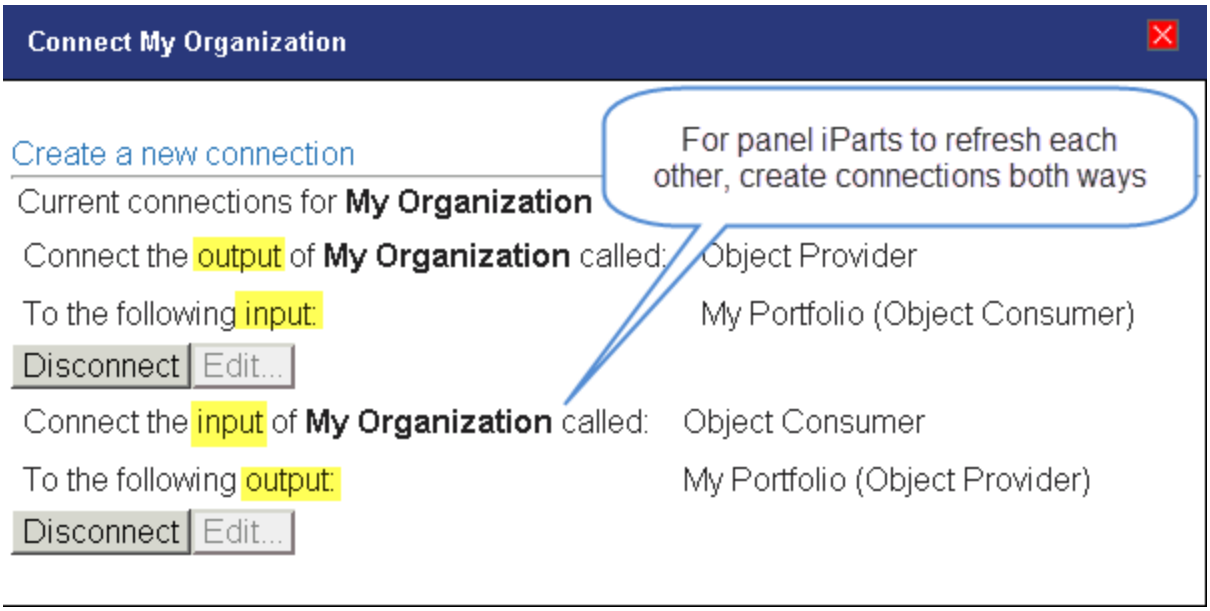
  Tip: Do not be misled by the language of connection. The Consumer is the actor that triggers a refresh on another content item, and the Provider provides a pointer to itself to the Consumer.

- From the Object Consumer drop list, select the panel content item you want to refresh.
- Select Connect.

3. Set up the second connection:

- From the second content item's title-bar menu, select Connect, and select Create a new connection.
- From the Object Consumer drop list, select the first content item.
- Select Connect.

  You should see a pair of connections, for mutual refreshing.



4. Save and Publish the content record.

Adding existing business objects to panels

Panel Designer lets you create new data sources on the fly, access any user-defined tables, and make full use of the Activity table. It can also display your existing business objects, if they meet these requirements and configuration settings:

Referencing existing business objects

Panel Designer can display existing business objects that have a ContactKey or ID property. When ContactKey or ID is the primary key, Panel Designer treats it as a single-instance table; otherwise, it assumes it to be multi-instance.

Panel Designer cannot display your business objects until you add them to the ObjectMetaData table. While attached to the iMIS database in SQL Server Management Studio, run this SQL statement:

INSERT INTO [dbo].[ObjectMetaData] (ObjectName, RelatedToEntity, IsUserDefined, IsMultiInstance)

VALUES ('MyObject', 'Party', 0, 0)

- Replace MyObject with the name of the business object, table, or view that is related to Party.
- Change the last value to 1 if it is multi-instance.

Settings for Business Object Designer (BOD)

1. In Business Object Designer, edit your object and open the BOD (Properties tab) > (Display tab).
2. To make a property available to your panels, enable its Available to UI? option.

   Tip: To see your BOD changes immediately, restart IIS.
3. To enable multiple selection for a property, select Check box(es) under Display Control so that you can enable the Allow multiple selection? option.
4. To enable HTML editing, select HTML Editor under Display Control. Be sure to use the property in a single-column panel to provide the control adequate width.

   Troubleshooting

   If you get an error when creating a new data instance at runtime (either single- or multi-instance), check that your business object does not have a 'Read-only' constraint set on the ContactKey or ID property's Definition tab.

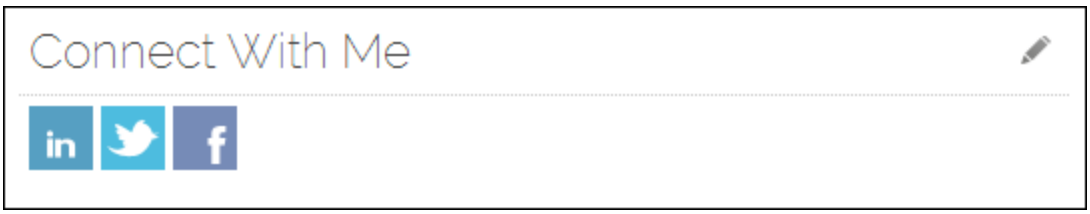
Displaying social network profiles for contacts

The Social Profile List Creator content item displays the social network profiles for an individual user as an icon link list. Clicking on an individual social network icon will open the user's profile page for that network in another browser window. Mousing over the individual icon will display the URL of the user’s profile page in a tooltip.

Usage Example:

You can use this content item to provide a way for members to display their social network profiles in the context of their own personal account pages or on public profile pages. (You can also do this for companies and their social network profiles.) When vis-

itors click on the icons, they are taken to the site of the social network profile that the user has defined.

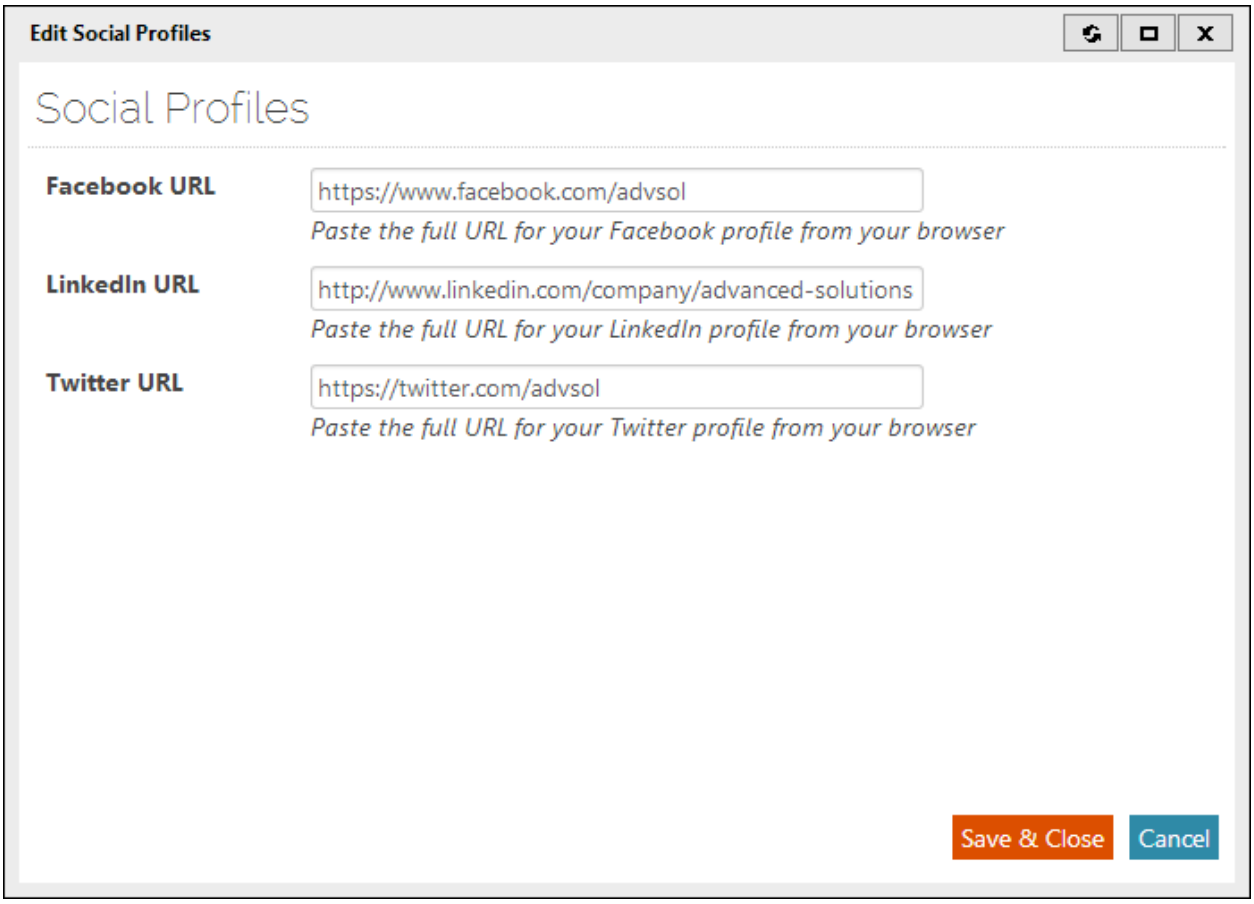


To define the social network profile URLs for your own account page, click on the edit icon next to the content item and enter the full URLs for each network. For example:

Facebook URL: http://www.advsol.com/profilename

LinkedIn URL: http://www.linkedin.com/in/profilename for an individual, or http://www.linkedin.com/company/companyprofilename for a company

Twitter URL: https://www.twitter.com/profilename

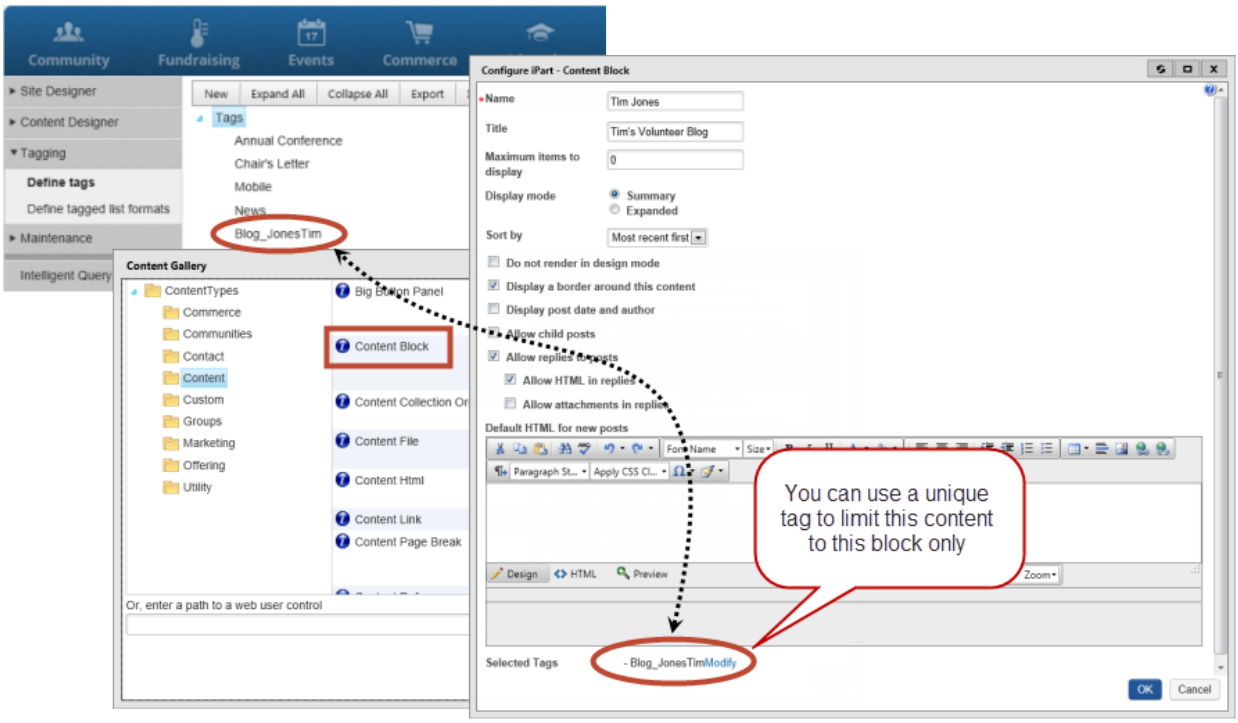


Using the Content Block content item

With the Content Block content item, you can empower authorized users to create and edit content directly on a page, without using Easy edit or accessing Tools. Through the configuration, you can allow users to insert HTML content, add attachments, create child pages, and submit replies. At its simplest, a content block can be HTML that is read-only unless the user has permissions to see the edit command. At its most complex, a block can act as a message board with multiple posts, child posts, and replies. You can limit the number of posts to a set number, or you can leave it at the default (zero), which lets it grow indefinitely.

Tagging to filter content

To control what content appears in a Content Block, you create tags specific to ContentBlock Items and apply those tags to specific instances of the content item. For example, if you want to create a new blog for Tim Jones, you could create a ContentBlock tag such as blog-JonesT, place a new Content Block content item on a content record, and configure the content item to display the tag blog-JonesT. Now the content that Tim authors in this blog will be unique to his+ blog, if you do not apply this tag anywhere else:



Content created with anything other than a Content Block content item will not be displayed, even if it has the same tag. For example, a content record containing HTML tagged with News will not show up in a Content Block that is also using the News tag.

Note: Best practice: Plan for and create the tags you want to use before configuring your Content Block content items. Content can seem to disappear if you

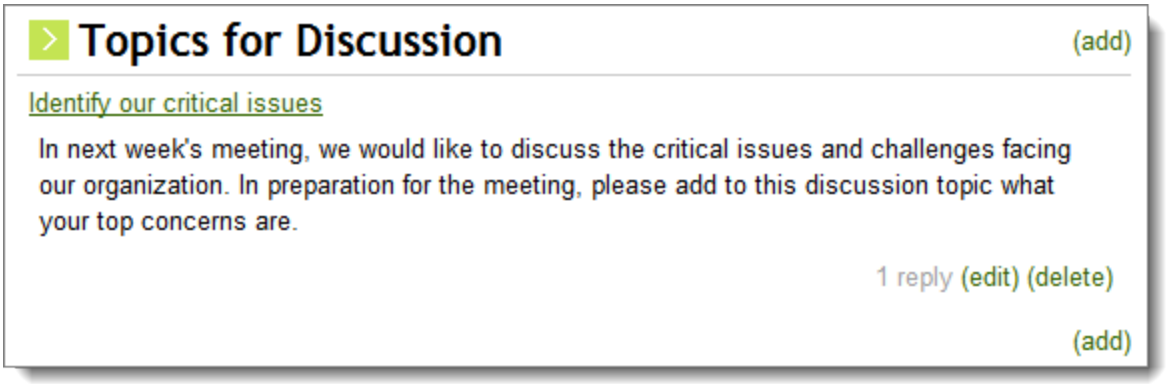
change the tags assigned to a content block already in use, because it no longer matches the tag set currently configured.

Creating a message board

Only users with the Content Editor permission may create posts and children, but any authenticated users can reply to a post and edit or delete their own replies. Any authenticated user may create posts and children, reply to a post and edit or delete their own replies.

To use the Content Block as a message board with multiple posts, child posts, and replies, make use of the following configuration options:

- Maximum items to display – Choose the maximum number of posts that will be displayed; 0 indicates an unlimited number of posts.
- Display mode – Expanded display mode will display replies and child posts in-line, while Summary mode only shows replies and child posts when the post is opened.
- Allow child posts – Allow Content Editors to add a child post to existing content. Allow any authenticated user to add a child post to existing content.
- Allow replies to posts – Allow authenticated users to reply to posts; you may indicate whether to allow HTML and/or attachments in the replies.



Content Block set up as a discussion board

Using the Content Collection Organizer

The Content Collection Organizer content item enables users to create a collection of pages and assign names to the tabs or headers for each page. In the simplest example, those pages are displayed, the user can access tabs in any order desired, and information is saved independently on each page.

Users accessing a content record with the Content Collection Organizer will only see the tabs that they are permitted to view.

On the other hand, if members with correct access settings cannot see particular tabs, the culprit could be broken links. Broken content links will result in tabs not appearing to your members. Authorized Staff can simply click on the tab to troubleshoot and fix the broken link.

Displaying in tab format

In Content Collection Organizer, content pages can be displayed in a tab format. The following screenshot shows an example content item with tabs across the top, configured to display different content pages.

You simply determine the number of tabs you want to display, and provide names for each tab. Then, point each tab to the content you want to display.

Using the Content Collection Organizer to show or hide tabs

Users accessing a content record with the Content Collection Organizer might see tabs depending on the access granted. See Using Access Settings to set specific permissions for content tabs. You can also delete or break content links to make tabs no longer appear.

> **Note:** Tip: Do you have members with correct Access Settings that can't see a particular tab? Planned or unplanned, broken content links will result in tabs not being displayed to your members. Authorized staff can simply click on the tab to troubleshoot and fix the broken link.

Using the Content Collection Organizer as a wizard

You can configure the Content Collection Organizer to function as a wizard. The wizard can guide a user through multiple steps of an end-to-end process, for example, setting up a new account. When the Content Collection Organizer is enabled as a wizard, Next and Previous buttons are displayed, allowing users to navigate between the steps. Users can navigate to any previous tab, but can only navigate forward to the next tab in the workflow sequence. The user can also navigate with a browser's Forward and Back buttons, but the data is not committed until the user clicks Next.

Next

As you add steps to the wizard, you define a name for the step, as well as select the content you want to display on that step. You can also define where the wizard will take a user if a step is successful or fails.

Each page in the workflow is validated when the user clicks Next. If any of the data on a page is incomplete or incorrect, an error message is displayed and the user cannot proceed to the next step until the error is corrected.

You can also define the destination to which users are directed when they click Finish in the wizard. To do this, you must define the Finish button redirect. Select the Content record or URL radio button, then select the content or URL to which you want the user redirected. This defines the action that will happen once a user clicks the Finish button in a wizard process.

Note: Note: It is not recommended to point to content records that contain embedded content records. This can interfere with the behavior of pop-up windows. Also, if you are creating a wizard that is intended to be displayed in a pop-up window, it is not recommended to add any other content items to the wizard content record.

Creating an account using the Content Collection Organizer as a wizard

You can set up a Content Collection Organizer content item wizard to walk users through the process of creating an account. To do this, you must add a Content Collection Organizer content item to a content record.

Add a name for the Content Collection Organizer and a title, and make sure you select Function as a wizard. You can select the content to redirect a user to when they are finished with this wizard. Because we are walking users through the process of creating an account, let's redirect the user to their new account page upon completing this wizard. Select @/iCore/Contacts/ContactLayouts/AccountPage for the Finish button redirect content.

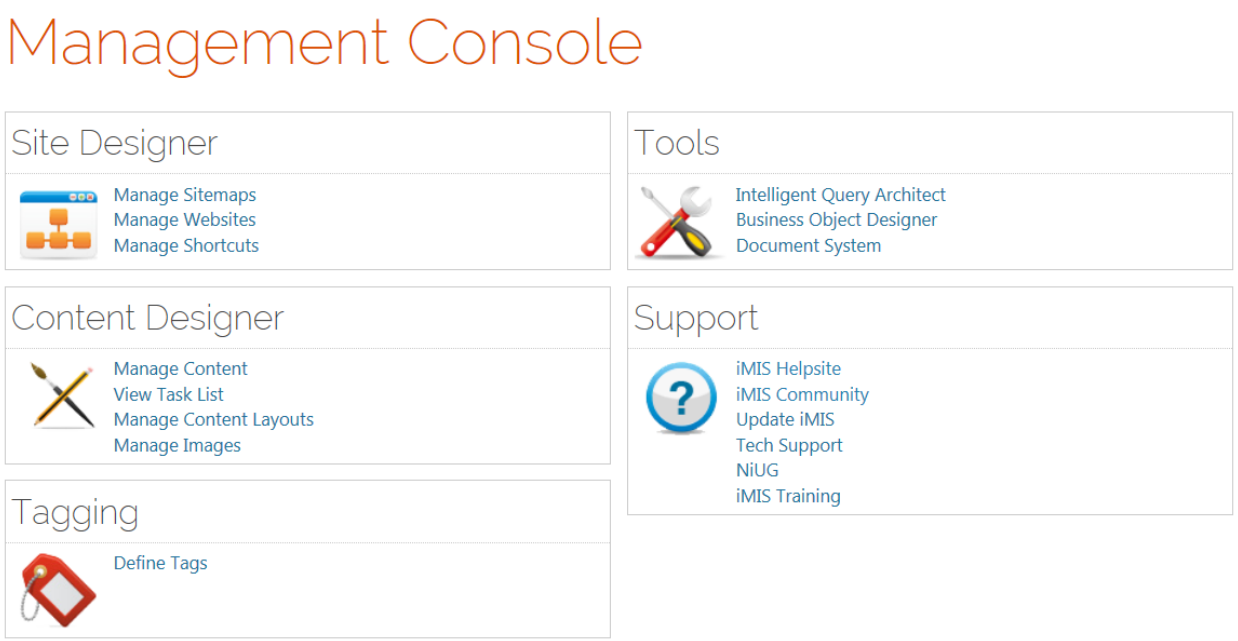
Now create a first step. This wizard is to create an account, so you are going to select a content record with a Contact Account Creator content item, for example, @/iCore/Contacts/CreateAccount.

The Contact Account Creator content item must have specific configuration options set. First, you must select Hide for authenticated users. You must also select the Include option to create an account and Require username and password options. Finally, the Redirect to option must be set to Do not redirect.

You can now add as many additional steps as you like. On the last step, a Finish button will be added. You have already added a redirect link for this button. Click OK to save your wizard, save and publish, and add this content record to your website.

Using the Big Button Panel

With the Big Button Panel content item, you can display a navigation panel that combines a larger, category-defining image with a list of links, as shown in the screenshot below. You can also use this content item to create links that make it easy for staff to perform routine tasks for contacts such as running reports, registering for events, and ordering on their behalf.



Example: Working On Behalf Of contacts and running reports using the Big Button Panel

In this example, we will set up the Big Button Panel on the account page, so that staff can select a contact from the Directory, then quickly run a report, register for an event, make a donation, or order a product for that contact.

1. Edit the account page that displays after a staff user selects a contact from your directory. In the Member site, it is the Account Page Staff content record.
2. Add the Big Button Panel (add content > ContentTypes > Content > Big Button Panel) content item to the content record and configure it with the following settings:

- Mode: Actions
- Add an action link to run a report:
- Link Text: Print Info
- Link Target: Enter a link to a page that contains the SSRS Report content item that displays a report such as $/Samples/ReportingServices/MemberProfileQuery_Report.

  Note: The SSRS Report content item must be configured to Hide the parameters section and to enable the option to Inspect query string for parameters. Do not enable the option to Inspect Session for parameters. For more information about SSRS reports, see Creating SSRS reports.
- URL Parameter: ContactKey=@SelectedUser
- Add an action link for event registrations:
- Link Text: Register for an event

  Note: Customize this text for the event you want to register the contact for. For example, Register for the Spring Conference.
- Link Target: Enter a link to the event page
- URL Parameter: EventKey=XYZ (replace XYZ with an event code) EventKey=XYZ (replace XYZ with an event key)
- Use On Behalf Of: Enable
- Add an action link for donations:

- Link Text: Make a donation
- Link Target: Enter a link to your donation page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable
- Add an action link for the shop:
- Link Text: Purchase a product
- Link Target: Enter a link to your Shop page
- URL Parameter: (Leave blank)
- Use On Behalf Of: Enable

3. Save and Publish the account page.

Using the Group List Editor

The Group List Editor provides a flexible tool for you to display and manage lists of groups, sub-groups, relationships, and/or memberships. You can configure it to serve several different purposes.

Display an organization's roster

A common use for the Group List Editor is to display a list of contacts that belong to an organization.

For example, add the content item to an organization's profile page, so that the content item displays memberships for the selected organization. Configure the content item with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the roster
- Clicking on a contact opens their profile page: Enable to link contact names directly to their profile page

- Provide option to view and edit membership details: If you want users to have easy access to both the account pages and the Group Member Detail window, also enable this option. Users can click an icon to switch between these options.
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups owned by the parent ID and their members
- Choose the group types to include: Organization

  Note: To limit the amount of information about an organization's members, deselect the Allow expanding lists box.
- Automatically create a group if one does not exist: Enable if you have allowed editing (this allows the creation of new rosters)

Display a contact's memberships

Another common use for the Group List Editor is to display a list of a contact's memberships in groups such as committees and chapters.

For example, add the content item to a contact's profile page, so that the content item displays memberships for the selected contact. Configure the content item with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit the contact's memberships
- Clicking on a contact opens their profile page: Not applicable
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Groups that the parent ID is a member of
- Choose the group types to include: Select the group types you want to display, such as Chapters and/or Sections

Relationships in the Group List Editor

You can easily create a link between two contacts using the Group List Editor content item. The relationships you define show up on the record of both contacts, and you can

specify roles for one or both of the contacts. For example, if you edit Jean Smith's record to indicate that she knows Russell Smith, then that relationship will also appear in Russell Smith's record. Alternately, if you edit Jean's record to indicate that Russell is her child, you can also specify that her role is the parent of Russell. Then Russell's record will reflect that Jean is his parent.

There is no limit to the number of relationships you can create or the types of relationships you can create. We have provided a few relationship types out-of-the-box, but you can add additional ones if needed.

Only users with System Administrator or Staff privileges can create relationships between contacts, but any user can view a list of relationships.

Note: Note: To use this relationship feature, you must have the RELATION license.

The following sections walk you through how to create relationship types and how to set up the Group List Editor to display relationships.

Creating relationship types groups and roles

Edit the Customer setup table for Relationship types, adding the relationships that you want to have available in the Group List Editor. For each relationship type you add, you can also define a Reciprocal relationship, which the Group List Editor automatically populates as a set (such as for Parent and Child).

To display and edit relationships in the Group List Editor, you must define a Relationship Group and Roles (relationship types) associated with that group. A sample relationship group type named Connections has been provided. You can create your own group type from Setup > Groups > Types. If you create your own group type, the only requirement is that you select the Relationship Group checkbox, so that the Group List Editor can properly display relationships.

To create Roles used in relationship groups

1. Decide which relationships you want to be able to define for users. For example, Parent-Child, Husband-Wife, etc.

2. Create Roles for each relationship type.

- From Setup > Groups > Roles, click add.
- Enter the Name of the Role and a Description of the role.
- Select the Active checkbox.
- (optional) Select a default Reciprocal Role for this role. For example, if you are creating a Parent role, you may consider selecting Child as the default Reciprocal Role, so that it is automatically selected when someone defines a Parent relationship. If the Reciprocal Role you want to add is not in the list, create it first, then add it to this role.
- Save and repeat for each relationship role you want to define.

3. Edit your relationships group (for example, the group Connections) to add the roles you have defined.

To set up the Group List Editor to display relationships

1. Add the Group List Editor content item to a content record on which you want to display a list of a contact's relationships. For example, add it to an account page. The content item displays a list of relationships for the currently selected contact. The selected contact is determined by either a contact ID passed to the page via a URL parameter (from the Directory, for example), the contact selected in the On Behalf Of control, or the currently signed in user.
2. Configure the content item with the following settings:

- Allow editing: Enable, if you want System Administrators or Staff to edit relationships
- Is the page context (parent) for this iPart a group?: No
- Display a list of: Select Both of the above
- Automatically create a group if one does not exist: Enable
- Group owner type: Party Choose the group types to include: Select Relationships

- Group type to auto-create: Select a relationship group, like Connections
- Choose the group types to include: Ensure that Connections is already selected.

  Note: Only the relationship group type selected to auto-create may be edited. For this reason, if Allow editing is selected, we recommend including only the one relationship group type in this instance of the content item.

3. Save and Publish the content record.

Using the Content HTML content item

Using the Content HTML content item, you can add simple content to your website, anywhere you want. In addition to the WYSIWYG functionality, you can switch to HTML mode to insert JavaScript to embed other sites, display web widgets, and use variables to create relative paths.

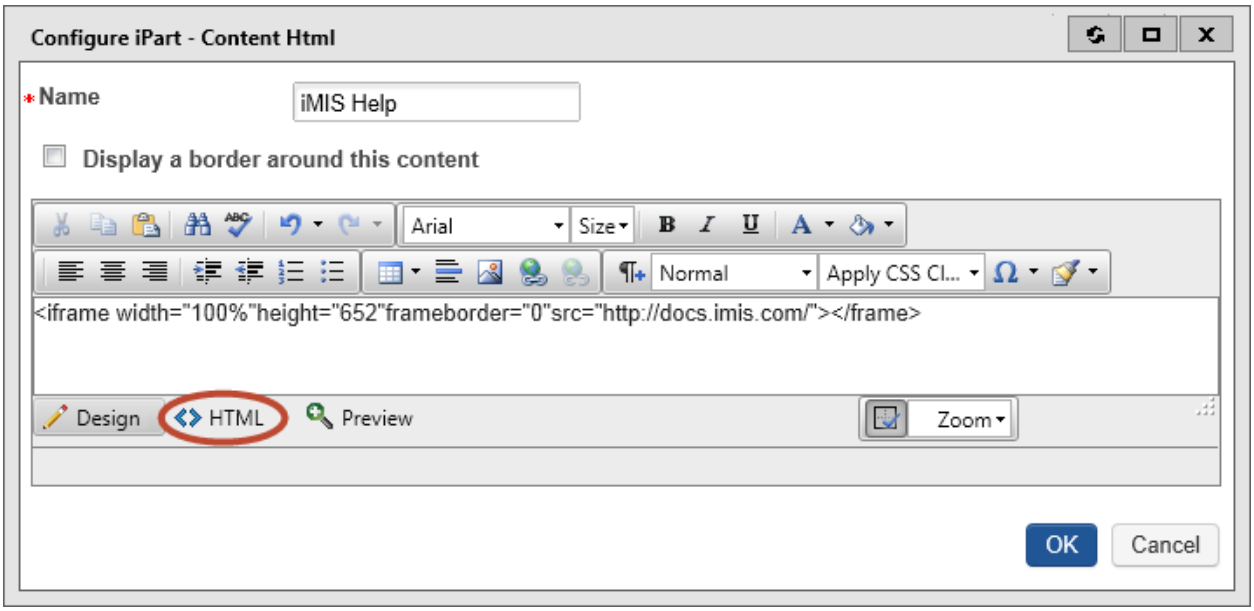
Embedding external sites

To embed any external page into an iMIS site, you can use an <iframe> like this:

1. Go to Page Builder > Manage content and create a new content record.
2. Select add content and place a single Content Html content item on it (from the ContentTypes folder).
3. Show the source by clicking the <> HTML tab and type in an iframe tag, such as this:

   <iframe width="100%" height="652" frameborder="0" src-c="http://docs.imis.com/"></iframe>

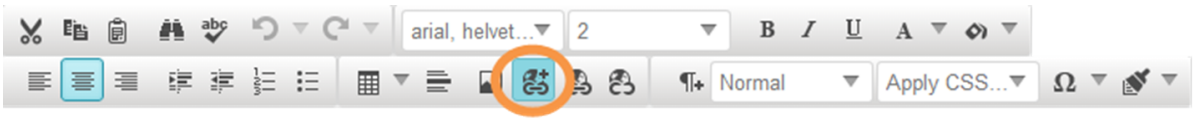
4. Go to RiSE > Site Builder > Manage sitemaps and create a new navigation item that points to the new content record.
5. If appropriate, restrict the navigation item's Access Settings, such as to Authenticated User Full Control.



Inserting links to iMIS content

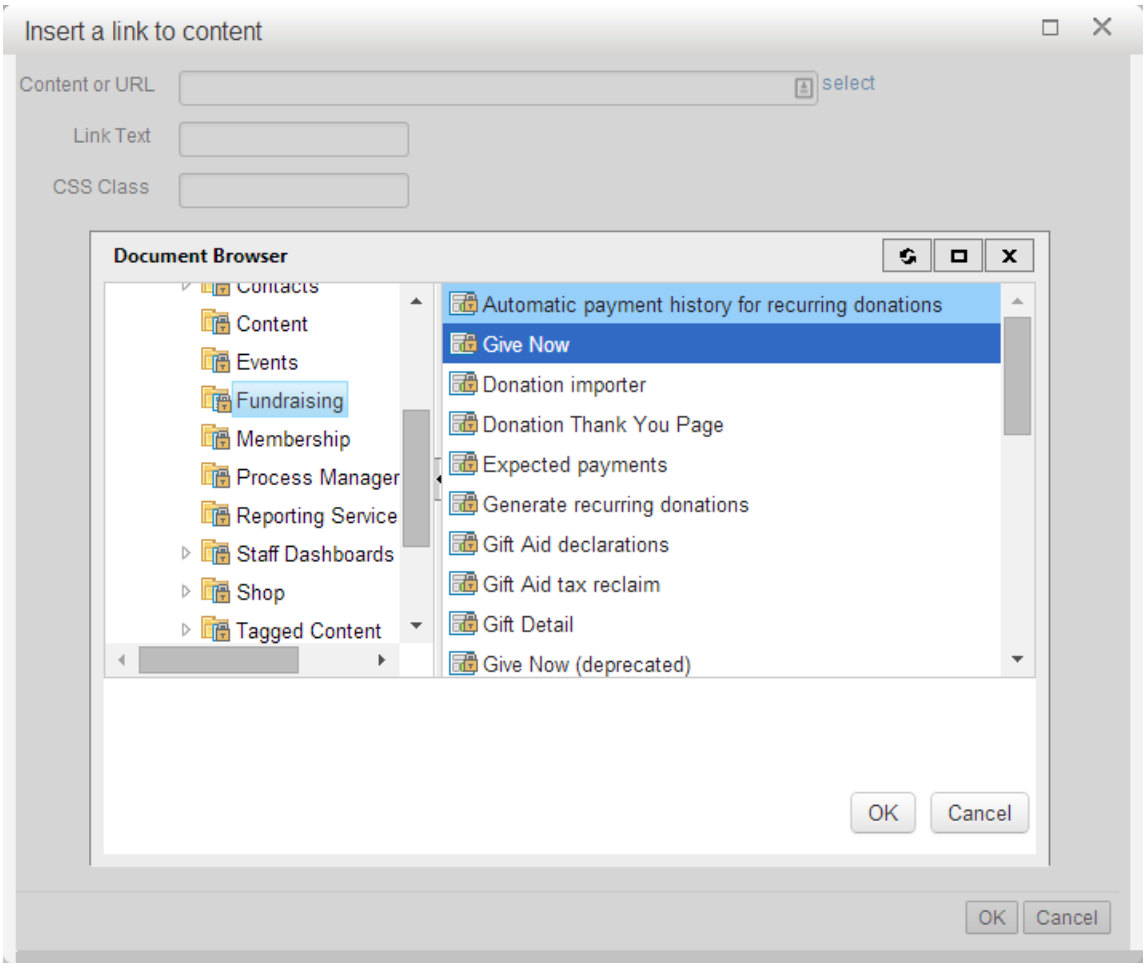
To insert a direct link to any content in iMIS onto an iMIS page, you can use the content link manager:

1. Create a new content record with the Content HTML content item or edit an existing record to insert a link.
2. Enter the HTML content you want to display, and highlight the text you would like to link to
3. From the editor toolbar, select the content link manager icon:



4. Use the Select button to navigate through the Document Browser to the content you would like to link to.

   Alternately, you can type in a shortcut URL to the content you link to. This will preserve the link even if the content is moved in the document system.



5. Click OK to insert your link.

Displaying web widgets

You can install and display JavaScript-based web widgets (plugins, gadgets) in your WCM-generated websites using the Content HTML content item. A web widget is a small program that your users can execute within a web page and that can provide a wide range of functionality.

For example, Google Gadgets offers thousands of free web widgets including mini applications, games, news feeds, maps, and a wide range of other types of content. Many other websites also provide free widgets that can access data from their site. For example, Twitter provides widgets that let you display Twitter updates on your website. LinkedIn provides plugins that display information such as company profiles, member profiles, and

links to share on LinkedIn. You just have to search the web to see what you can find that meets your needs.

> **Note:** Warning: Only embed widgets from authors whom you trust. Malicious code may damage your computer or violate your privacy.

To add a JavaScript-based web widget to a webpage

Go to RiSE > Page Builder > Manage content:

1. Create a new content record or edit an existing one.
2. Click add content to find and select the Content Html content item.
3. Click < > HTML to switch to HTML mode.
4. Copy the JavaScript embed code for the widget you want to add and paste it into the HTML area.
5. Click OK, then Save and Publish your content record. The widget is displayed when that content record is rendered on a webpage.

Creating relative paths using variables

The Content HTML content item does not support the use of the ~/ (tilde slash) shortcut, often used to automatically build the correct paths when a control is rendered in different domains. However, several variables are available in this content item that allows you to enter paths for links and resources that are automatically resolved to various folders in your website. The variable names are case-sensitive.

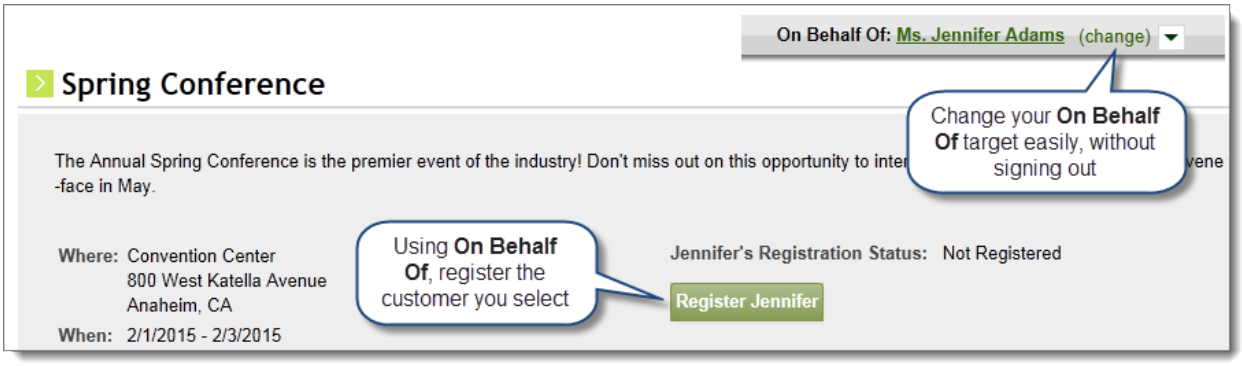
> **Note:** Note: Images do not render in Design mode because the variable is not transformed until the content record is published.

- [Website] – Resolves to the root of the website and contains the website name. Example: [Website]Home.aspx.
- [~] and [Root] – Both variables resolve to the root of the website. Example: [~]Home.aspx resolves to http://mydomain/Home.aspx.

- [Theme] – Resolves to the website's theme folder. Example: [Theme]images/image.png. This variable can be used to access theme resources such as images and CSS.
- [iMIS] – Resolves to the iMIS directory of the website. Example: [iMIS]ContactManagement/CreateAccount.aspx
- [Common] – Resolves to the AsiCommon directory of the website. Example: [Common]Controls/Shared/FormsAuthentication/Login.aspx

On Behalf Of: Customer service mode

Your site is not just for self-service: On Behalf Of gives your staff a customer service mode, to complete website commerce on behalf of your customers. When requests for event registrations, product orders, and even membership renewal payments come in by phone, fax, or email, On Behalf Of lets you conduct a secure session during which you can add items to a customer's cart and complete the transaction for them, all without signing out of your own session.



Separate carts, for privacy

To avoid confusion and to protect your customers' privacy as to which items they may have added to their own carts, On Behalf Of sessions create and save carts that are completely separate from those your customers see. For added security, items yet to be purchased are saved in these carts, but not any cardholder information that may have been entered.

For example, if you added a registration to a member's cart but do not submit it, then she will not see the registration in her cart the next time she signs in; however, when you

return to registering her on her behalf, you see her cart restored to the state it was in when you left it. Once you complete a purchase on her behalf, both she and you can see the order through her account page.

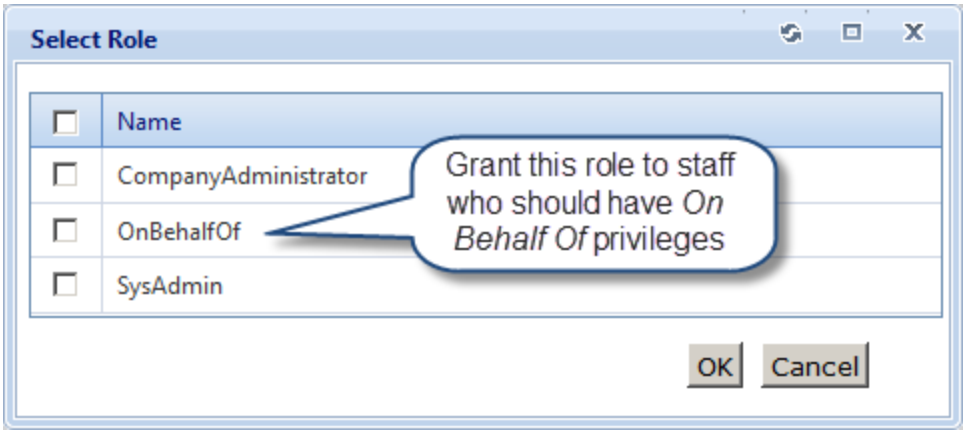
> **Note:** Tip: You can use the audit trails to track which logged-in user performed each action that affected an On Behalf Of transaction.

Who can act On Behalf Of?

To protect the security of contact data, users must be added to the security role SysAdmin or OnBehalfOf to perform actions on behalf of another contact (individual or organization). It is easy to give a staff member On Behalf Of privileges.

Go to Settings > Security administration > Users:

Find and select a user, and in User Information click add role.



Changing and ending On Behalf Of

When you act on behalf of someone else, all of your commerce-related actions pertain to the target contact until you end the session in one of these ways:

- Select a new target contact: click (change) next to the target contact.
- Clear the selected contact: click the down arrow next to the target contact and select Clear.

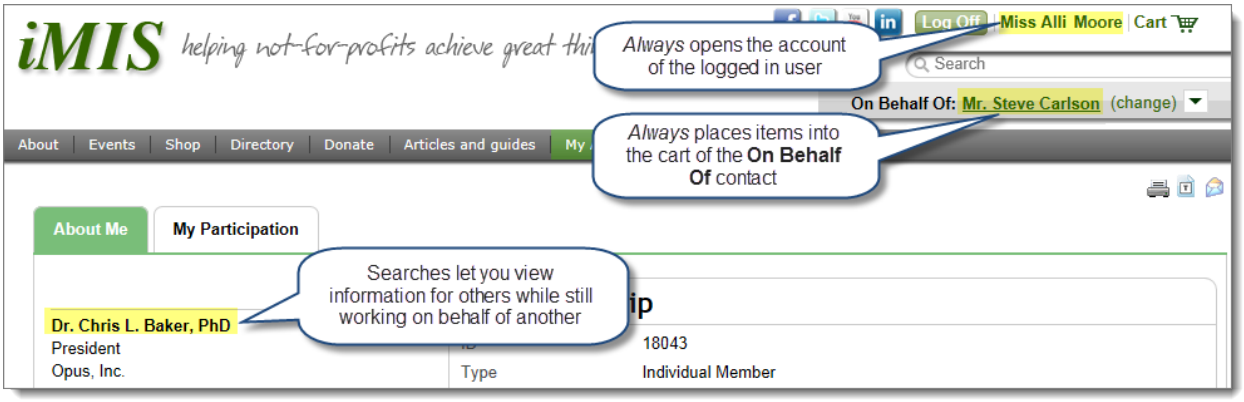
- Close the browser.
- Sign out of iMIS.

Whose contact information do content items show?

Acting on behalf of another contact controls the current cart, but it does not keep you from getting to information for other contacts. An content item determines whose cart and information to show and update based on this logic:

- If the link's URL specifies an ID (such as for search results), it shows information for that contact.
- If not, it shows information for your On Behalf Of contact, if appropriate. For example, the Query Menu content item runs queries regardless of the target contact.
- Without On Behalf Of, it shows information for you, the logged-in user.
- If no one is signed in, it shows limited information.

For example, you could be working on behalf of one contact when you need to use the Directory to look up an address for another. You can drill down on information from those searches with no effect on your on-behalf-of contact: the content items pass the queried contact's ID on the URL to show you the information you need. Only when you take actions that add items to the cart is On Behalf Of enforced.



Note: Tip: What never changes is the contact name link in the top navigation: it always shows information for you (the logged-in user).

Creating websites

Creating a website is simple with iMIS! You can simply make a copy of one of the Quick Start Sites installed with iMIS and select a look and feel template and theme that is the best match for the look that you want for your new site.

Creating a site

To create a public-facing website that makes full use of content items and SOA, it is easiest to copy an existing Quick Start Site, such as Member, and change it to meet your needs.

When you copy a website, iMIS duplicates the site navigation and content records for the new site.

Go to RiSE > Site Builder > Manage websites:

1. Select a website from the list of websites and review the following fields before you proceed:

- (Properties tab) Make sure the folder selected for the Website-specific parent content folder field contains the content unique to this website. Only the content in this site-specific folder will be copied. Any content shared with another website should be placed in a separate, shared folder.
- (Look and Feel tab) The Folder containing template content is normally a sub-folder of the parent folder. If the template content (footer area, header logo, and so forth) is stored in a different folder, select that folder instead.

2. Copy a website:

1. Select Organize > Copy.
2. Select the folder where you want to paste the new website.
3. Select Organize > Paste.

4. Enter the Name of the new website, for example, MemberCopy. Do not use special characters or punctuation.

   Note: During the copy process, Content Codes are cleared from content records because this code must be unique for each content record. A warning message displays a list of the content records where the Content Code was cleared. See the log files for details.

3. Copy an out-of-the-box Master Page and Theme to be unique to your new website.

   Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme. Creating a copy of a theme also ensures that you do not compromise your ability to fall back to a working original. Follow these steps to copy a theme, which is far easier than creating one from scratch.

1. Select your new website.
2. (Look and Feel tab) Select the master page and theme that you want for your new site.
3. Locate the theme folder (such as \Aspen), which defaults to C:\Program Files (x86)\ASI\iMIS\Net\App_Themes.
4. Copy, paste, and rename \Aspen to your new site name (\ABC).
5. Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages
6. Copy, paste, and rename Forest.master to your new site name (MemberCopy.master).
4. Edit your site to use your new theme files.

- Select Site Builder > Manage Websites and highlight your site (ABC).
- Edit the site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save.

5. Click the expand icon in the Status area, and enable the Is this website active option.
6. Publish the website. Select the website and click Publish.
7. Publish the new website's content:

   Go to RiSE > Page Builder > Manage content:

   Note: When creating a copy of a sample website, the copied website's content will not be included in search results until the content has been published and the Default Website (for search) has been selected for the copied website's content folder.

1. Select the copied website's content folder.
2. Click Edit.
3. For the Default Website (for search) field, click select.
4. Select the website for which you want searches to always include the content records within this content folder.
5. Click Save and then close the window.
6. Publish the website's content folders. Select the content folder of the copied website.
7. Select Publish. As each folder and content record publishes, the status will change from Publish Pending to Published.
8. If the website is hosted on a separate web server, publish the Core Content folder.

   Go to Page Builder > Manage content:

1. Select the Core Content folder.
2. Select Publish menu and choose the Publish All Items option. As each folder and content record publishes, the status will change from PublishPending to Published.
8. After all content folders are published, log off and close the browser.

Note: Note: If you need to set up specific payment method sets for your various websites, this easily be done via the Accounting area of the iMIS Advanced Accounting Console.

Note: Note: If the website you copied contains URL shortcuts, be sure to review those shortcuts in your new website to determine if you need to create fresh shortcuts. For example, when you select the iMIS logo in the Member site, the page redirects to the shared Member Home content record. When you make a copy of the Member site and you select the iMIS logo from the new site, you will be redirected to the same shared Member Home content record. To resolve this, create a fresh shortcut that will point to your new Member Home.

Deleting a website

A website administrator can delete a website and the content records associated with the website. However, you should proceed with caution, as a deleted website cannot be retrieved. Ensure the website is not a production site.

Go to RiSE > Site Builder > Manage websites:

1. Select the website you want to delete (such as MemberCopy).
2. Select Organize > Delete. A warning message is displayed.
3. Click OK. A results window is displayed.
4. Click Close.
5. Select Recycle Bin.
6. Select Organize > Empty the Recycle Bin. A warning message is displayed.
7. Click OK. A results window is displayed.
8. Click Close.

Go to RiSE > Page Builder > Manage content:

9. Select the content folder of the copied website.
10. Select Organize > Delete. A warning message is displayed.
11. Click OK. A results window is displayed.
12. Click Close.
13. Select Recycle Bin.
14. Select Organize > Empty the Recycle Bin. A warning message is displayed.
15. Click OK. A results window is displayed.
16. Click Close.

Importing content from a staging server

To prepare the staging server for revision/testing

In a staged development environment, you use a separate staging iMIS application server to develop and test new CM websites, content, and navigation before putting these additions and changes on your production iMIS application server. A staging server must use a different iMIS database than your production server.

To prepare the staging server for first use, after iMIS is installed and properly working with a copy of your production iMIS database, you must export all of your CM definition objects from your production server and import them into the staging server. After this point, all new development for your CM environment should be performed only on your staging server. After testing your changes, you export the new or changed definition objects from the staging server, then import them into your production server. The objects that you'll be exporting and importing are: websites (and subfolders in the website tree that contain websites), navigation items, content folders, content records, content layouts, content types, tags, and tagged list formats.

> **Note:** Note: One special requirement for working with a staged development environment is that your tag hierarchy must always be identical on both servers before you begin exporting and importing other objects. Therefore, any changes you make to the tag hierarchy itself must always be exported and imported first, before any other objects. This requirement means that when you are preparing your staging server for first use, you must import the tag hierarchy from your production server first, before importing everything else.

To export and import objects between your staging and production servers

Whether you are preparing your staging server for first use or subsequently moving new content from your staging server to your production server, the general export and import process is exactly the same. A general rule of thumb to speed the process is that you can export and import entire folders or nodes in a tree hierarchy of objects to process all descendant objects at once. When you import an XML file containing multiple objects, you are able to specify exactly which of them to import (except for tags, which are a special case).

> **Note:** Caution! To ensure that dependencies between objects are always maintained, you must import objects in a specific order as described in the following steps.

1. In a browser window connected to the Web view of the server from which you are exporting content (the source server), export your entire tag hierarchy and import it to the target server.

- From Content Management, select Tagging > Define tags.
- Select the root Tags object in the tag hierarchy, then from the toolbar, click Export.
- When the export begins, you are asked by Windows where to save the exported XML file on your local computer. At this point you can rename the XML file if you prefer to give it a more meaningful name.

- In a browser window connected to the Web view of the target server, select the root Tags object in the tag hierarchy, then from the toolbar choose Import.
- A window appears that enables you to browse for the location of the XML file on your local computer.
- Click Browse to select the XML file, then click Upload to begin the import process.

  Unlike when importing other types of objects, you are not asked which tags you'd like to import. Instead, the entire tag hierarchy of the target server is overwritten by the tag hierarchy contained in the XML file.

2. In a browser window connected to the Web view of your source server, ensure that all the objects you plan to export are in a Published state. Objects that are still in a working state will not be included in the XML file created by the Export command. If you are preparing a staging server for first-time use, you must ensure that all CM definition objects on the production server are in a published state, because you must export all of them.
3. For each type of definition object, select the objects that you want to export and create an exported XML file.

- It can be helpful to export objects in the following order, to help you remember to import them to the target server in the same order:
- Content types
- Tagged list formats
- Content layouts
- Content records
- Websites
- Navigation items
- You can export the entire contents (all descendants) of a content folder, sub-folder in the websites tree, or all navigation items in a branch of a sitemap by selecting a folder or navigation item that contains descendants.

- You can export a portion of a content folder, or a portion of the websites in a given folder of the websites tree, or a portion of the navigation items within one branch of the sitemap hierarchy by holding Shift or Ctrl while selecting each object. For all other exportable object types (content layouts, content types, and tagged list formats), you can likewise multi-select any portion shown.

4. From the toolbar, choose Export.

- If the selected object type is a content folder, navigation item, or sub-folder in the web-sites tree, you are presented with the option to Export children as well?
- Select this checkbox to export all Published descendants of the object that you selected for export.
- Clear this checkbox to export only the object that you selected.
- When the export begins, you are asked by Windows where to save the exported XML file on your local computer. At this point you can rename the XML file if you prefer to give it a more meaningful name.

5. In a browser window connected to the Web view of your target server, select the location into which you want to import the contents of the XML file, then from the toolbar choose Import.

   A window appears that enables you to browse for the location of the XML file on your local computer.

6. Click Browse to select the XML file, then click Upload to begin the import process.

   Caution! You must import these XML files in the order shown in Step 3, to ensure that dependant objects are present in the target database when the object that depends on them is imported.

   A window appears that enables you to selectively choose which objects in the XML file to import, and other options that affect the import results.

- In the Import File Contents area, ensure that the checkbox for every object that you want to import is selected. Note that if you choose not to import any folders that are listed in the

XML file, the system will create a new folder with the same exact name (because the folder's children must still be placed in a folder with that name), but the definition of that new folder will comprise system-assigned defaults instead the original folder's definition.

- In this context of importing changes and additions between staging and production servers, it does not matter whether the Overwrite existing objects checkbox is selected or not. The only objects from the XML file that will actually be imported are those that are completely new to the target server (they were initially created on the source server), or those that are a more recently published version than the same content record already existing on the production server.
- In this context of importing changes and additions between staging and production servers, you should generally leave the Override destination with checkbox cleared. When selected, this option ignores the original folder paths of the objects in the XML file and instead places all of the objects in a single flat level inside the definition object you selected as the target location for the imported objects, which is probably not the result that you want. For example, assume that on your staging server, you exported content folder A, which contained several content records and a sub-folder B, which in turn contained several content records. On your production folder, you selected content folder C before beginning the import. In this scenario:
- If you leave this checkbox cleared, the imported result will be a content folder A with several content records and a sub-folder B with several content records in it. In other words, an exact copy of the exported structure from your staging server.
- If you select this checkbox, all of the content records from both folder A and folder B will be placed directly in folder C. Additionally, both folder A and folder B will also be placed inside of folder C, with nothing inside of them.

7. Click Import. When the import is complete, review the Messages area to ensure that no unexpected import errors occurred. Note that it is entirely normal to receive various Document already exists in a different path errors. This means that some of the objects in your XML file were identical to an object in the target database. For example, assume that you have exported an entire content folder from your staging server, but only a few of the

content records in that folder had been modified since the last time this content folder had been imported to your production server. When you import this XML file into your production server, you would receive this error for all of the content records that you had not changed since the last time you had imported this content folder from the staging server.

Note: If further edit on a sitemap is necessary, modify the navigation item on the staging server and then export only the affected sitemap node, instead of exporting the entire sitemap at its root level.

8. All of your imported objects on the target server are now in a working state, so you'll need to re-publish them before they can be used (or will appear on a rendered website).

Troubleshooting

- For an import to succeed, one of the following conditions must be true on the target database:
- All of the objects in the XML file must never have existed in the target database
- All of the objects in the XML file must have been completely purged from the target database. To completely purge an object you must delete it so that it ends up in the Recycle Bin, and then either purge that specific object from the Recycle Bin or empty the Recycle Bin entirely.
- All of the objects in the XML file must be replacing older published versions on the target database. For example, if you export objects from a production server to a staging server and make changes to them on the staging server, then you export the newer versions from the staging server and import them back to the production server, the versions from the staging server are newer than the versions on the production server, so the import will complete successfully.
- All of the objects in the XML file must be replacing completely different objects that have the same path and name AND you must select the Overwrite existing objects checkbox on import. For example, if you create a content record called MyContent in the content folder called MyFolder directly beneath the root (@) content folder, the path for this content record is @/MyFolder/MyContent. If you export the MyContent content record, then

delete and purge the original MyContent content record, then create a brand new content record called MyContent in that same MyFolder content folder, then the import will complete successfully.

- Remember that multiple definition objects are required to render what end-users experience as "your website". If you import only a website object, that's not enough information to produce a rendered website in IIS. You must also import navigation items, content records, and so on. Every one of the following definition objects are potentially needed to render a website in IIS, so to "import an entire website" from one iMIS database to another, you need to import all of the following object types: websites, navigation items, content folders, content records, content layouts, content types, tags, and tagged list formats.
- Tags that are assigned to content records and content folders are not saved in the definition of the content record or content folder. Instead, the entire tag hierarchy is used to create an internal table that is associated with content records and content folders by using internal object IDs. This is why you must always import the entire tag hierarchy first before importing any other CM definition objects.
- You must have been granted the appropriate CAG permissions and Document System permissions in iMIS to use the Export and Import commands for all CM definition objects on both your staging server and on your production iMIS application server.

Defining user-defined fields (UDFs)

To define user-defined fields (UDFs)

In the Maintenance area of Content Management, select User defined fields. Select an existing CM user-defined field (UDF) to change its properties, or you can add or delete a UDF.

Verify a CM UDF's appearance and behavior by editing any content record and looking in the Properties section, between the Mark as important until field and the Help URL field.

> **Note:** Note: When you add, change, or delete a CM UDF, existing content records and their rendered .aspx files will not reflect the changes until you edit the content record, specify the desired value for the UDF, then re-publish the content record.

Website maintenance

Website maintenance comprises the ongoing tasks that you periodically perform to help you troubleshoot your CM websites and manage the publishing queue for each publishing server.

To manage the priority of pending publication requests

In the Maintenance area of Content Management, select Publishing servers. If the Number of Pending Requests for a publishing server is a non-zero value, click detail to view the current publishing requests queue. Change a request's priority in the queue by using the Priority drop-down list. Click Save to process these changes.

To view CM reports

In the Reports area of Content Management, select a report, then from the toolbar, choose Run. If a query parameters window appears, specify the additional required parameters that you are asked for, then click Run.

To create new CM reports

All CM reports are standard Document System report definition objects that are based on Intelligent Query Architect (IQA) queries. Some default reports are included with CM, and you can define additional reports using the techniques described in Reporting Essentials.

Implementing a mobile site

The Member Mobile Quick Start Site is optimal for mobile devices like smart phones and tablets, featuring accessible content and a sitemap for members needing information on the go. The master page Sapling places key information at the top of the screen and works with the Aspen Mobile and Austin Mobile themes; featured styles are sized appropriately for smaller screens.

If you want to provide a mobile site for your members, we recommend that you start with a copy of the Member Mobile Quick Start Site, and then apply your changes. When you make a copy of the site, iMIS creates a copy of the website, content, and sitemap.

> **Note:** Note: Before the following required steps, you must complete your copy of the mobile site.

To implement a mobile site, do the following:

Go to RiSE > Site Builder > Manage sitemaps:

1. Choose your copy of the Member Mobile site.
2. Edit the Full Site navigation item to add your main site's URL to the Content or URL to Link to.
3. Go to RiSE > Page Builder > Manage content, then select the content folder created for your copy of the mobile site.
4. From the ContentAreas folder, edit the following content records:

- Social Networking Images: Configure the Social Networking instance of the Content Html content item, and from the <>HTML tab, update the href's to link to your social media accounts or remove any links you do not want to appear.
- Header Logo: Configure the Header Logo Span instance of the Content Html content item and update the logo to your organization's logo.
- Footer Copyright: Configure the Footer Copyright instance of the Content Html content item, and update the content and link for your organization.

Tips and reminders

- Trim content – For easier reading on small screens, and to decrease page load time, keep content simple.
- Automatic redirect – Consider adding some JavaScript to redirect users automatically to the mobile site when they try to access your full site on mobile devices.

- Add favicon – Update the favicon used for your mobile site, apple-touch-icon, located by default in C:\Program Files (x86)\ASI\iMIS\Net.
- Easy edit limits – When you access the mobile site, Easy edit is only available when you access the website from a browser with a width larger than 700 pixels.

Customizing the Staff Account Page

iMIS provides a Staff Account Page with content records displayed in a tabbed format. These content records are stored in a system-protected folder (@/iCore/Contacts/ContactLayouts/Staff/Tabs) and are subject to being overwritten during an upgrade.

If your organization wants to display custom content records on the Staff Account Page, a staff user can place those content records in a shared folder (@/Shared_Content/Staff/Tabs) that will not be overwritten during an upgrade. You can also copy an existing content record from a system-protected folder to the shared folder.

The display order of tabs is sorted in alphabetical or numerical order by the content record Publish file name. For example, if you have two content records and the Publish file names are 2Creator and 1Record, 1Record will be displayed in the first tab before 2Creator.

> **Note:** Note: Numerical items have precedence for display order.

The label for each tab is the Title for each content record.

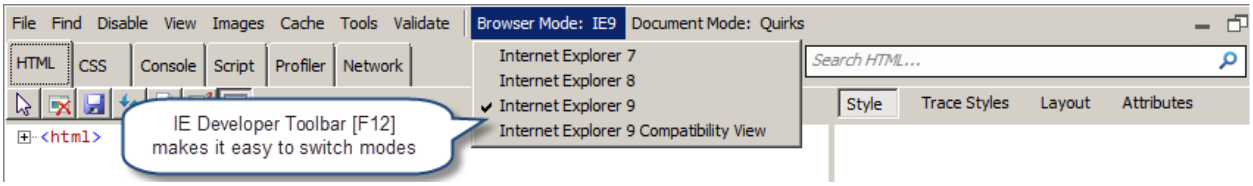
Modifying site themes

Several themes have been created for the Quick Start Sites. You can modify these themes to help identify and personalize your organization's website.

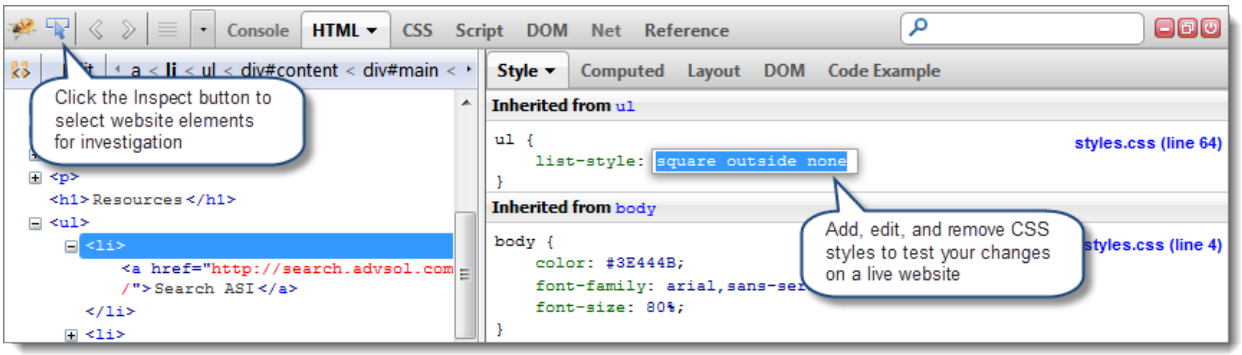
Best practices for theme development

- Caution: Never change the core style sheets 00-Reset.css and 10-UltraWave.css. All derivative themes inherit from these files, and any changes you make to them are lost on upgrade. Instead, override the base styles in your 99-[theme].css.

- Before modifying a theme, find the best one: apply all of the themes to the default Member site in turn, and decide which theme is closest to the final look and layout that you want.
- Always work from your copy of the theme, so that you can begin again. See Copying a theme.
- Make changes only to websites that you create. When a Quick Start Site is updated with each release, the iMIS Upgrader overwrites any changes you made to it.
- Take advantage of browser-based developer tools to test and troubleshoot changes before committing them to your style sheets:
- Internet Explorer and Chrome: Press F12 to toggle the Developer Toolbar.



- FireFox: Install the Firebug add-on to see a wealth of information about the structure of the website and the styles it is using. Turn on the element inspector and click a piece of content to see the styling that it is implementing:

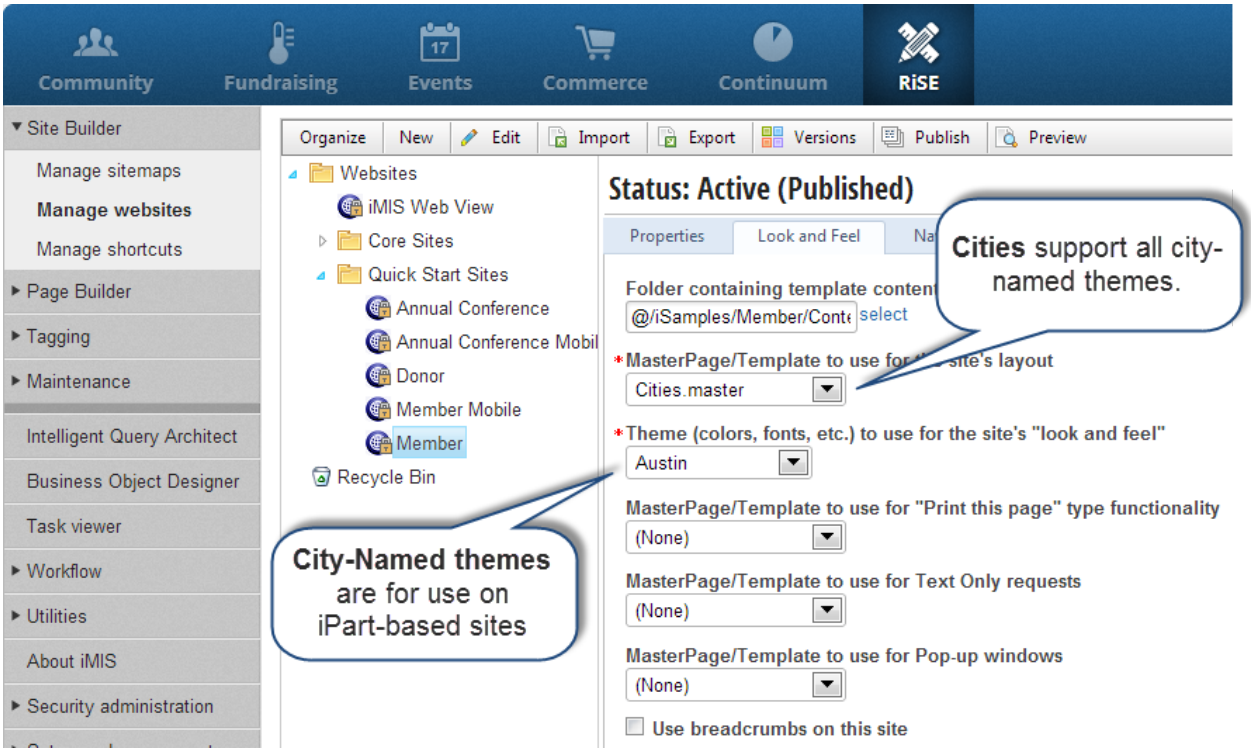


Working with Sample Themes and Master Pages

You can change the look and feel of the Quick Start Sites by selecting different combinations of a Master Page and its matching Theme. If you want to modify a particular

design for your website, make sure you create a copy of the master page and theme before making any changes. See Creating a site for more information.

> **Note:** Note: iMIS themes give you a head start on developing your website. To provide you an idea of how things could look, we have used numerous pictures, illustrations, and images that we purchased under a limited license for ASI's use. The icons can be used on your website, but if you reuse any of the other images, you will need to buy a license. We acquire the majority of our images from iStock-Photo and most are available in the range of $15-$50; much less than the cost and labor of creating them on your own. If you have any questions, please contact us.



Example: Selecting a theme created for the Cities Master Page

> **Note:** Important: If possible, avoid customization to Master Pages. If you do need to make changes, make the changes in a copy of the master page. Any customizations performed to the out-of-the-box master pages will be overwritten after an upgrade.

The following designs are available out-of-the-box for iMIS Quick Start Sites.

Cities.master

The set of city-named themes support RiSE sites and can be used interchangeably with the Cities master page.

Available theme:

Austin

Cities_Responsive.master

The set of responsive city-named themes support RiSE sites and can be used interchangeably with the Cities_Responsive master page.

All About Certification Discussion
We have had many members ask if we will be sponsoring weekend study sessions for the upcoming certification exams. I'm pleased to let you know that we will be doing this again this year! Each regional chapter will set the dates and location of their own sessions and will include a light dinner and refreshments as well as any necessary study materials. Please let us know if you would like to be a part of the study sessions in your area!

Questions about our finances
By Charlotte Richards on February 28, 2013
Chapter Finances Blog
At some of our past chapter meetings members have asked me to include more information on our financial status. We receive these reports every month:
1. The balance sheet gives an overview snapshot of our bottom line.
2. The profit and loss statement gives us a look at where we are relative to our budget according to each account.
Please let me know if you would like additional information.

UltraWave and Universal Design

The Quick Start Site themes and master pages build upon a new underlying template called UltraWave. UltraWave incorporates structure and styling for Universal Design. Universal Design seeks to make web content "barrier-free," making sites accessible to all challenged users. Challenged users include not only the millions of physically or cognitively impaired, but also seniors, non-native speakers, and those in other countries and cultures (localization).

Universal Design has benefits beyond helping websites meet the myriad of web accessibility standards: it also aids in breaking technology and human barriers. Universal Design is the foundation for transforming pages and content into outputs and displays your members may need, including print presentation, net book usage, and even cell phone applications.

> **Note:** Important: UltraWave themes only support RiSE sites.

Features of the template include:

- Developed toward W3C standards to help meet accessibility requirements
- Clean, minimal design uses neutral shades and layout
- Offers a streamlined set of stylesheets and skins
- Easily customized with logos, fonts, and colors
- Designed to be easily rebranded by your organization

Working with website themes

Using the Style Guide

iMIS Member and Donor sites include a style guide that allows users with administrative privileges to see the impact of changes to site themes from one central location. Content editors are able to preview their site themes and changes. Theme designers who choose to dive deeper into stylesheets are able to see their work in a single central location.

There is no longer a need to navigate to several different pages or content records to see the effects of customization.

The style guide displays the basic HTML elements in an attractive, easy to navigate manner. Content includes headings, paragraphs, links, images, lists, block quotes, user messages, and emphasis classes. This helpful guide is available at Manage > Style Guide > Base Elements.

Copying a website theme

Themes control the layout, font, and colors of your iMIS sites. The Quick Start Sites come with a set of special themes, designed for RiSE sites. See Quick Start Site themes and master pages for a list of available themes.

Creating a copy of a theme also ensures that you do not compromise your ability to fall back to an original that works. Follow these steps to copy a theme, which is far easier than creating one from scratch.

> **Note:** Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme, as outlined below.

1. Copy an out-of-the-box theme and master page to be unique to your new site.

- Locate the theme folder (such as \Aspen), which defaults to C:\Program Files (x86)\ASI\iMIS\Net\App_Themes.
- Copy, paste, and rename \Aspen to your new site name (\ABC).
- Locate the master page (such as Forest.master), which defaults to C:\Program Files (x86)\ASI\iMIS\Net\Templates\MasterPages.
- Copy, paste, and rename Forest.master to your new site name (ABC.master).

Go to RiSE > Site Builder > Manage websites:

2. Edit your site to use your new theme files.

- Highlight your site (ABC).
- Edit the Site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save and Publish.

3. Edit your theme files as needed to tailor the design.

Changing theme headers

The first elements to change on your website are the highly visible elements that public visitors see and use in the header: logo, social networking links, welcome banner, and the favicon.

Logo

The header logo is contained in a content record: @\[theme]\ContentAreas\Header Logo. To add your own logo, edit this content record, remove the contents in the HTML Content Item, and replace with your own logo.

> **Note:** Note: Alternatively, you can change the logo in the CSS. The logo is set in 99-[theme].css by the selector #masterHeaderImage. Change the background image and the dimensions to match your own logo.

Social networking links

The links to the social networking sites in the top (auxiliary) navigation are also defined in a content record: @\[theme]\ContentAreas\Social Networking Images.

To change the links to navigate to your own social networking pages, edit the content record and change the links on the icons.

In the HTML editor, replace the href on each <a> tag with the appropriate URL. For example:

Favicon

The favicon is the little icon that displays next to the website in your bookmarks and on the browser tab in modern browsers. Changing it to your organizations' icon is simple: create an icon sized either 32x32 or 64x64 pixels and name it Favicon.ico. Then overwrite the original file:

C:\Program Files (x86)\ASI\iMIS\Net\Favicon.ico

Update the copyright statement

The copyright statement is contained in a content record within your copied site's ContentAreas folder: Footer Copyright. Edit the Footer Copyright instance of the Content Html content item on that page to update the copyright.

Changing theme colors

The next step in customizing your theme is to change to colors that support your branding & style. You will make these changes in both CSS and in images.

CSS colors

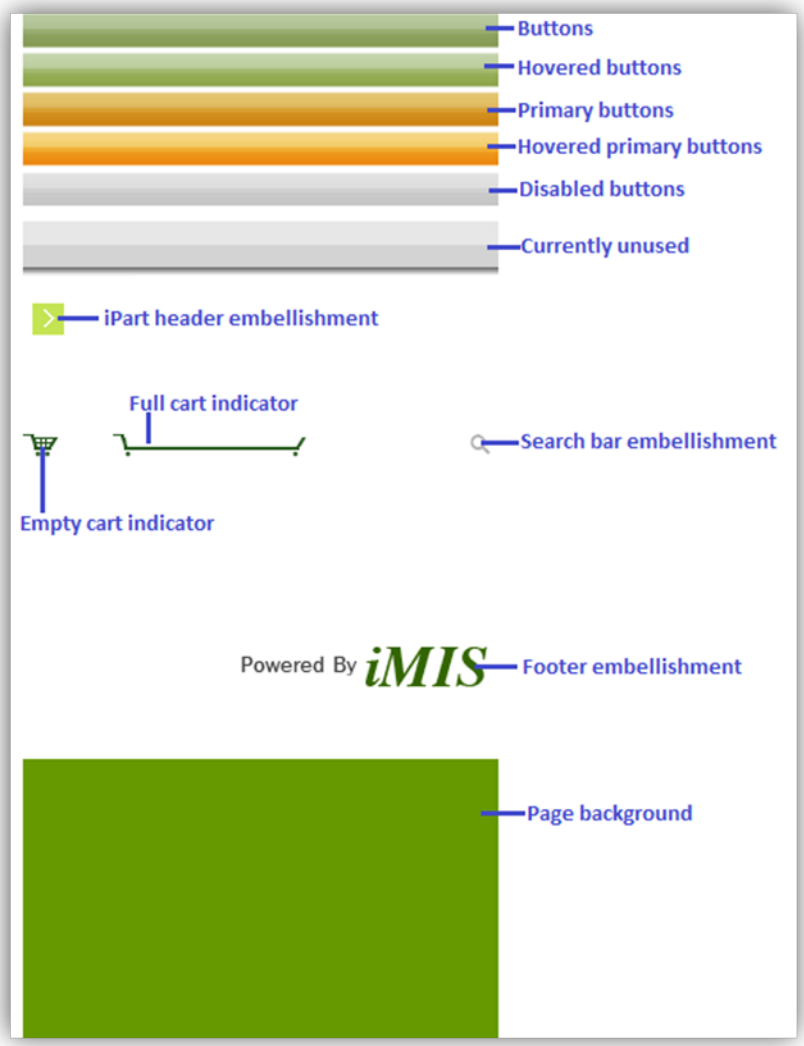
All theme-specific color and styling is located in 99-[theme].css. To find all color references that you might want to change, search the CSS file for these strings:

- color
- border
- background

We also recommend using your browser development tools to help you identify which styles you need to update for your color changes.

Sprite colors

A few of the theme's use sprites to control some of the site colors. A sprite is a single image that combines several commonly used images into one file. CSS then defines which part of the image displays for various purposes. Because your server only has to load a single image instead of several, using sprites reduces load time for your website. To improve performance, the new Quick Start Sites use sprites when possible. The image below shows a sprite used in the theme Aspen, and labels where each image is used:



You can either edit the sprite we have provided (which is easier), or create your own.

- When editing the provided sprite, keep all elements in their original pixel coordinates, so that you do not have to edit the related CSS.

- The .png version of the sprite is located in images/[theme]_sprite.png. You can edit this image in your favorite image editor, but we do not recommend editing in MS Paint, as you will lose the background transparency.
- Your theme's \Resource folder also includes a .psd source file of each sprite. You can edit the .psd with Photoshop or GIMP, a free image editor that can edit and save images in .psd and web-safe formats.
- If you edit the .psd, save your new image as a .png, and place it in the images folder of your theme.

For greater design control, you also have the option of creating your own sprite. If you choose that option, you may also need to update your theme CSS for the new coordinates of the sprite. To help you with this process, we recommend the following resources:

- CSS Sprites: What They Are, Why They're Cool, and How To Use Them
- Sprite Cow calculates the pixel positions of the various images inside your sprite.
- CSS Sprite Generator lets you upload a zip file of images and get back a sprite file with the corresponding CSS.

Changing theme home pages

The Member site uses a pair of home pages: one that appears to guests (unauthenticated view) and another that appears to those who have signed in (authenticated view). You can change one or both of them, or drop one entirely and have one home page appear to all.

Do the following to change the unauthenticated home page:

Go to RiSE > Page Builder > Manage content:

> **Note:** Note: To have your own home page behave like the default one (switch to the authenticated home page when the user signs in), you need to add the code-bearing HTML content item that does so.

1. Create a new content record for your unauthenticated home page.

2. Copy the AuthScript code to your new home page:

- Edit the unauthenticated home page content record @\iSamples\Member\Home.
- Locate the HTML content item named AuthScript.
- Select Move To and select your unauthenticated home page.
- Now edit your unauthenticated home page and move the AuthScript content item to the top of the content record.
- Save and Publish your home page.

3. Make your site's home page link to your new home page.

- Go to Site Builder > Manage sitemaps.
- Select your website.
- Edit the default navigation item (flagged with ★) and select your new home page for Content or URL to Link to.
- Save and Publish your sitemap.

Do the following to change the authenticated page:

Go to RiSE > Page Builder > Manage content:

> **Note:** Note: To have your own authenticated home page appear as soon as the user signs in, you need to edit the code-bearing HTML content item that calls it.

1. Edit your unauthenticated home page content record.
2. Locate the HTML content item named AuthScript.
3. Select Configure and switch the editor's view from Design to HTML, to view the code.
4. Edit the path to be the published path of your new authenticated home page:

path = "~/Mbr/Home/[theme]/MemberHome.aspx";

Do the following to use only one home page.

You can drop to a single home page either by:

- Removing the script that opens the authenticated home page:
- Go to Page Builder > Manage content and Edit the unauthenticated home page @\[site]\Home and delete the HTML content item named AuthScript.
- Substituting your own page entirely:
- Go to Site Builder > Manage sitemaps and set your desired content record to be the default home page of your website.

Working with the Cities Home Page banner

1. Copy the content record located at

   @/iSamples/Member/ContentAreas/Home_Page_Full_Width_Area

   to your website's Content Areas folder.

2. Anything you add to this content record will now appear in the banner area of your website's home page. If you like the look and feel of our sample banner you can reuse the styles in your own themes. Simply change the background image and color of the banner using inline styling on the SliderPage1 div like so:

   The background color is used as a backup for before the image is loaded, so be sure to pick the predominant color of your background image. Then replace the text and button with your own content.

   Tip: Choose an image that looks great at very wide resolutions, as the image will always stretch the full width of the browser.

   Example code:

```
<div class="SliderPage1" style="background-color: #000000; background-image: url (http://upload.wikimedia.org/wikipedia/commons/4/47/Montreal_Twilight_Panorama_2006.jpg);">

<div class="SliderContent">

<h1>New Montr&eacute;al Chapter</h1>

<div class="SliderText">

<h2>Welcome Montr&eacute;al Members!</h2>

<p>We are thrilled to announce our newest chapter in Montreal, Quebec! We already have 10 new members including Chairman Felix Lapointe and Secretary Olivia Nadea. Join us in a celebration in downtown Montr&eacute;al!</p>

<br />

<p><strong>June 5, 2013<br />

Dieu du ciel, Montr&eacute;al</strong></p>

</div>

<div class="ActionButton">

<a href="[~]MontrealChapter" class="btn PrimaryButton MediumButton">Learn More</a>

</div>

</div>

</div>

</div>
```

Changing Telerik skins

Several content items throughout the product use Rad Controls developed by Telerik. These controls require a few steps to style, and Telerik resources can help you get started:

- Telerik Control Guide – an overview of Telerik controls, including available skins.
- Telerik Visual Style Builder – generates CSS and some images for skinning Telerik controls.

  Every [theme].skin file lists all of the Telerik skins that it uses to style controls. If a control does not explicitly define a theme, then it uses the Default Telerik skin.

  Rad Window control

  This control is the pop-up window that we see in many content items. Its skin is set by two lines in Aspen.skin:

  <asiweb:Window runat="server" Skin="Metro" />

  <asiweb:WindowManager runat="server" Skin="Metro" />

  Metro is a skin designed by Telerik and is available on most Telerik controls, along with a handful of other Skins. You can preview available Telerik skins for this control.

  > **Note:** Tip: Telerik skins are easy to switch out and virtually maintenance-free. However, they are difficult to customize, so avoid this route unless you can use the skins as-is.

  Rad Tab Strip

  This control is used by the Content Collection Organizer (CCO), the Contact Address Editor, and most other places where you see a tab strip. This line defines the skin:

  <telerik:RadTabStrip runat="server" Skin="Aspen" EnableEmbeddedSkins="false" />

  The definition for this look and feel is near the bottom of the 99-[theme].css, under the heading RadTools Styles.

  Rad Menu control

  This control displays the primary navigation area. There is wrapper for this control called PageNavR, so this line defines the skin:

  <asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" … />

The styling for the Rad Menu is located in Menu.[theme].css, and the image sprite is under [theme]\Menu\rmSprite.png. The easiest way to customize this control is to use Telerik's Visual Style Builder. (Tip: This tool works best in Internet Explorer.)

Styling your website's primary navigation

If you customize your website with a new look and feel, you will want to restyle the primary navigation to match the rest of the site. To customize the look of the navigation, you must be using iMIS 15.2 or later along with an UltraWave-derivative theme such as Aspen, Austin, or Birch. In iMIS, the primary navigation bar is built with Telerik RadControls; providing powerful tools for creating dynamic menu systems.

You can change your navigation menu's style by:

- Choosing an out-of-the-box skin provided by Telerik
- Customizing the font or color of an existing Telerik skin using Telerik's Visual Style Builder
- Styling your menu with CSS instead of using the Telerik tools

What is PageNavR?

PageNavR is a control that iMIS uses to display a website's primary navigation. The navigation bar automatically populates with each top-level navigation item, and each sub-item displays in a drop-down list that can expand to multiple levels. PageNavR wraps around a Telerik RadMenu control, so all PageNavR styles are controlled by Telerik's base styles.

What is a .skin file?

Skin files allow you to override default control behaviors in a theme-dependent way. If you set a property for a control in one theme's skin file, it will not affect how the control displays in other theme's skin files.

Take a look at this section of the Aspen.skin file in App_Themes/Aspen:

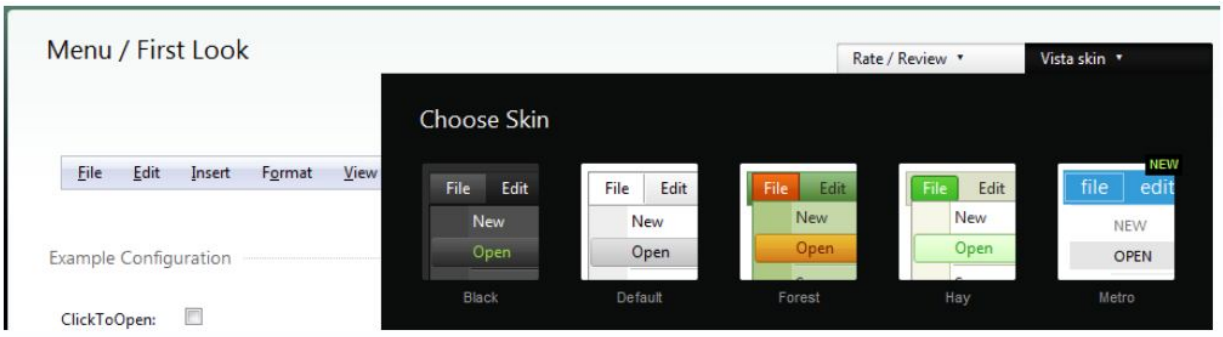
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" EnableRootItemScroll="false" Flow="Horizontal" DefaultGroupSettings_Flow-w="Vertical" DefaultGroupSettings_OffsetX="0" Width="100%"/>

These are just a few of the PageNavR properties available for the control in the skin file. The two properties which affect the navigation bar's style are "Skin" and "EnableEmbeddedSkins."

The "EnableEmbeddedSkins" property determines whether Telerik embedded skins should be loaded as the default. If you are creating your own custom skin, you MUST set this property to "false."

To style the navigation using a skin provided by Telerik

1. Choose an existing Telerik skin to style the navigation menu at [Telerik RadMenu Demo: First Look](#).



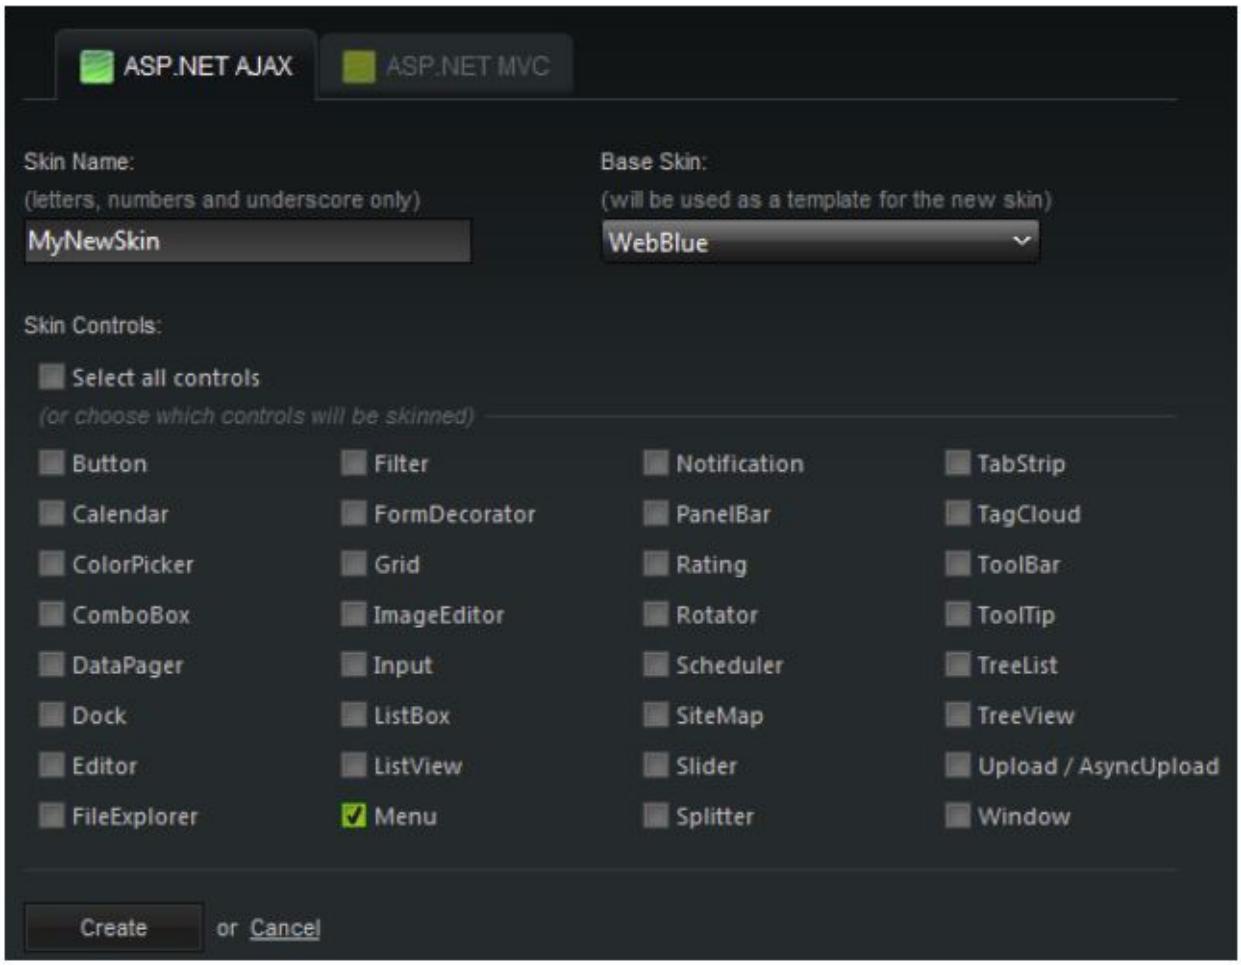
2. Change the "Skin" property of the PageNavR control in the theme's skin file to the name of the skin you selected.
3. Change the " EnableEmbeddedSkins=" property of the PageNavR control to "true." The navigation bar's styling will change to that of the Telerik skin you selected.

For more information, see MSDN's guide to [ASP.NET Themes and Skins](#).

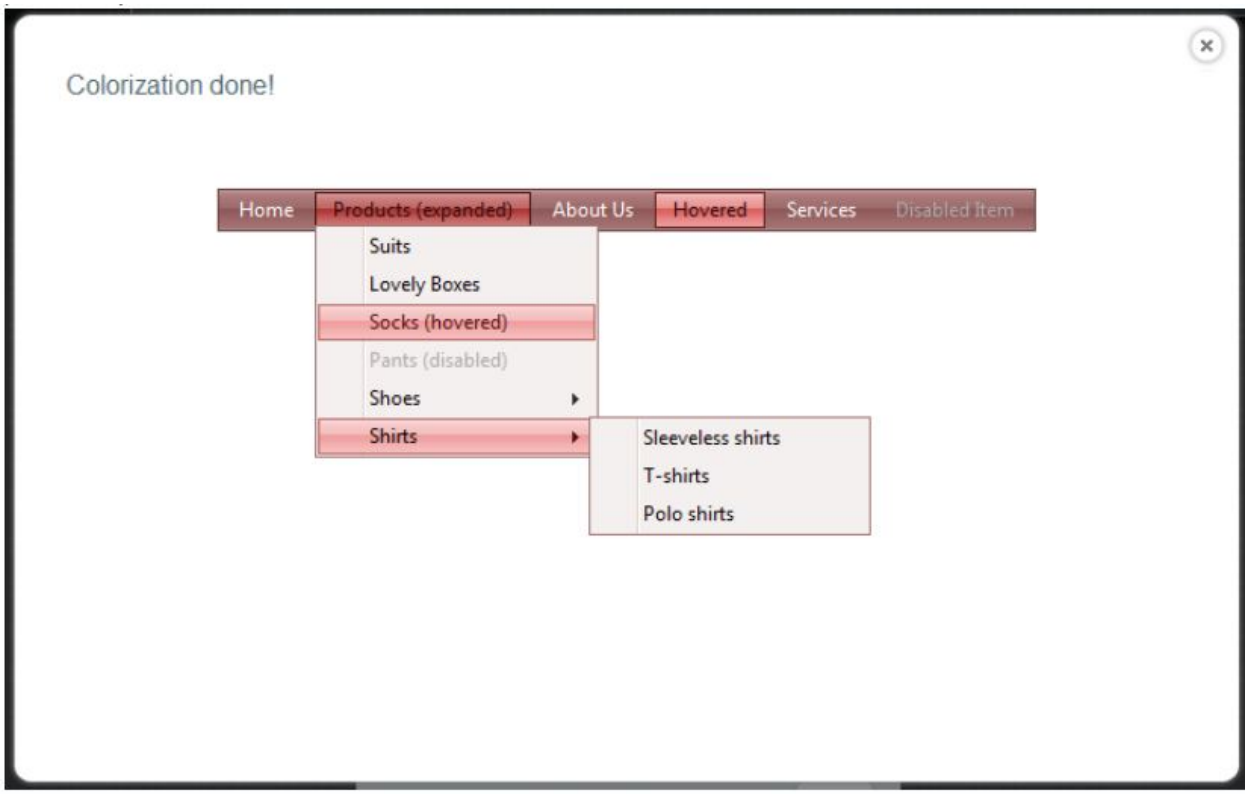
To style the navigation by customizing an existing Telerik skin using Visual Style Builder

If you want to customize the colors or font for a particular Telerik skin, you can use Telerik's Visual Style Builder:

1. Open the Telerik Visual Style Builder and select New Skin. (Note: The Visual Style Builder is in beta. For best results, use Internet Explorer as it is not fully functional in any other browser.)
2. Name your new skin, select your base skin, and check the Menu checkbox.
3. Click Create. Visual Style Builder will open on the Colorize tab.



4. Select your preferred color for the menu. You can fine-tune the hue and saturation of the color on the Shift colors tab in the color window that is open.
5. Click Save to see a preview of your new skin. If you are satisfied with the outcome, you can now download the generated images and CSS and skip to step 9.



6. For additional customizing, click the Fine-tune tab of the Style Builder itself in the top left.

> **Note:** Tip: The fine-tune functionality can be unpredictable. Save frequently so that if you don't like the way a change turns out, you can click "load last save" to undo it.

7. Begin with any universal changes you would like to make, such as changing the font on the navigation nodes. Click the Main items bubble to make changes to the font on the main navigation node.

   Each time you make a change the example dynamically responds. Each of the blue bubbles opens a different set of configuration options.

8. When you are finished, click Save and then Download to get the necessary code and images.
9. Copy the unzipped files to your theme's folder. Open the .skin file and set “EnableEmbed-dedSkins” to “false” and “Skin” to the name of your new skin.

   For more information and a video tutorial, see Telerik's Visual Style Builder Overview.

   To style the navigation using CSS

   If you do not like the Telerik provided skins, you can create, with the aid of your browser’s developer tool, your own image-free styling using CSS. If you choose to work by hand, you may find it helpful to start with a working skin, and adjusting to suit your needs.

1. Rename all of the base-level selectors in your working skin file to RadMenu_[Your theme name] .
2. Use your browser’s developer tools to help you figure out how to modify the CSS to get the desired result.
3. In your theme's skin file set “EnableEmbeddedSkins” to "false" and “Skin” to the name of your skin.

   Helpful Links

   Here are some links that may be helpful to you while theming your website:

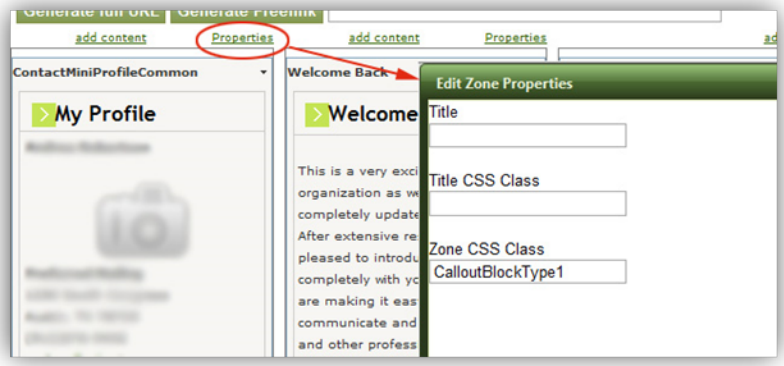
Changing zone properties

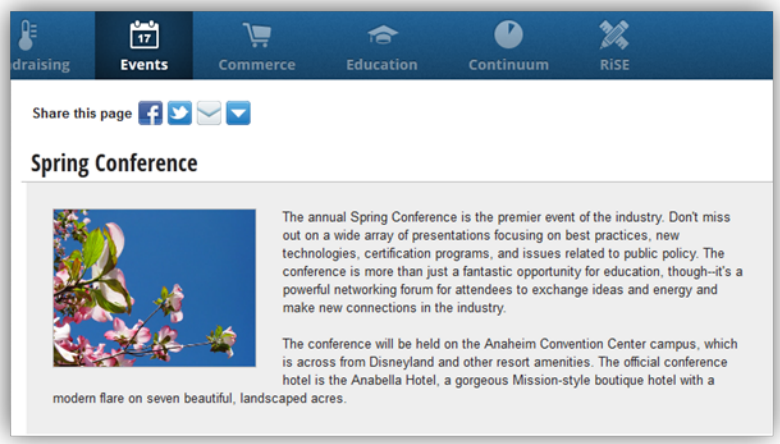
Zone properties make it easy to apply unique styling to specific content items, for emphasis and contrast.

To apply a style to a content item's zone property, edit the content record, click Properties, and enter the name of the class in Zone CSS Class:



You can add more if needed, but all tree-name themes contain the following three zone style classes:

- TitleBarNoBorder – simply removes the bottom border from content item headers
- CCOGrayBg – applies a gray background to content appearing in CCO tabs



- CalloutBlockType1 – accentuates an content item whose border is enabled

Birch:

Creating custom themes and master pages for RiSE

You are not restricted to modifying our out-of-the-box master pages and themes – you can create your own if you need to have greater creative control over the design. This section covers the basic pieces required to build your own master page and theme.

Making your new theme and master page available in RiSE

1. Add a new theme folder to the App_Themes folder, located by default in C:\Program Files (x86)\ASI\iMIS\Net\App_Themes. The topic Creating a custom theme describes what files you'll need to add in this folder and other information about custom themes.
2. Add the new master page to the MasterPages folder, located by default in C:\Program Files (x86)\ASI\iMIS\Net\Templates\MasterPages. The topic Creating a custom master page describes the required elements you'll need in your custom master page.

   After you add the theme folder and master page to these locations, you can select both on the Look and Feel tab when editing a website in RiSE.

Creating a custom theme

To create custom themes for iMIS, we recommend you copy one of our provided themes and customize it. However, you can build a new theme if desired. Place all of your custom theme's .skin, CSS, and image files within your theme folder located in ~/App_Themes.

This section describes the required elements you must include when creating your custom theme:

- CSS files
- A reference to the UltraWave style sheets within one of your theme's CSS files
- A .skin file (one to two is best)
- Required images

  Theme CSS files

  The theme CSS files control the styles displayed within your website. It is easiest to start from a copy of another theme's CSS files, but you also have the option to build one. When designing your custom CSS, test thoroughly to make sure you include the selectors required for iMIS to display as you prefer.

  A ThemeSettings.xml file

The required base style sheet, UltraWave, is dynamically included in any theme based on its ThemeSettings.xml file. To ensure these styles are included in your theme, add a ThemeSetting.xml file to your theme folder with the following contents:

<?xml version="1.0" encoding="utf-8" ?>

<ThemeSettings ThemeID="[ThemeName]" UltrawaveBased="True">

</ThemeSettings>

where [ThemeName] is replaced with your theme's name.

If your theme is responsive, also include the property Responsive="True" in your theme settings. For example:

<?xml version="1.0" encoding="utf-8" ?>

<ThemeSettings ThemeID="Austin_Responsive" UltrawaveBased="True" Responsive="True">

</ThemeSettings>

A .skin file

Skin files contain property settings for controls such as buttons, labels, and grids. Each theme must have a skin file that includes several required elements so that these controls render correctly in your website. We recommend that you start with a copy of one of our theme’s .skin files and customize it as needed (each theme folder within /App_Themes contains skin files you can use for this purpose). When you upgrade, you should compare your theme’s .skin files with those in a provided theme. Be sure to copy over any missing lines.

Required images

There are several images required for a theme to display properly, including images for icons, user messages, and other elements. Many of the required images are referenced in the .skin files. We recommend that you copy an images folder from one of the existing themes into your custom theme folder. You can replace or edit any of these images according to your needs.

Additional resources

For help with CSS visit www.w3schools.com .

Creating a custom master page

Whenever possible, we highly recommend using one of the out-of-the-box master pages we provide for your website. Doing so helps us to better support your site and it will make upgrading your site simpler. However, if you need to create a custom master page, you have a choice: either start with a copy of an existing master page and adjust or remove items as needed; or start with a new page and build it piece-by-piece to add the required items. Either way, start by adding your .master file to the ~/Templates/MasterPages folder so that it shows up in the master page drop-down list in Manage websites.

This section describes the required and optional portions of a custom master page.

Required master page elements

The following section describes the master page elements that are required for your web-site to display correctly. To see an example of how to fully implement each of these, search of the relevant IDs (or other provided strings) within one of the sample master pages located in the ~/Templates/MasterPages folder.

Basic structure

The following is an example of the basic structure of a custom master page:

```
<%@ Master Language="C#" Inherits="Asi.Web.UI.UltraWaveMasterPageBase" %>

<!-- import and register statements go here -->

<script language="C#" runat="server">

   <!-- C# scripts go here -->

</script>

<html id="MainHtml">

   <head id="Head1" runat="server">
```

```
    <!-- head content goes here -->
  </head>
  <body id="MainBody">
    <form id="TemplateForm" method="post" runat="server">
      <header>
        <!-- header content goes here -->
      </header>
      <div id=”bd”>
        <!-- content goes here -->
      </div>
      <footer>
        <!-- footer content goes here -->
      </footer>
    </form>
  </body>
</html>
```

Classes

All UltraWave-based master pages must inherit from UltraWaveMasterPageBase by including the following line at the top of the .master file:

```
<%@ Master Language="C#" Inherits="Asi.Web.UI.UltraWaveMasterPageBase" %>
```

Content placeholders

Content placeholders define where certain types of content should go in the page. They are used to define header metadata, the main content area, and the JavaScript that loads

at the bottom of the page. The following content placeholders are required for all master pages:

- TemplateHead – Inserts iMIS metadata into the page. Include this placeholder within the <head> tags of your master page.

  <asp:ContentPlaceHolder ID="TemplateHead" runat="server" />

- SideBarPlaceHolder – Most often displays on the left- or right-hand side of the page and is used to display some controls such as the community navigation control. It also may contain the sub-navigation control if you choose to implement it (see Displaying left navigation).

  <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server">

- TemplateUserMesages – Displays error, warning, information, or success messages at the top of the page. Make sure to add this within an update panel so that the messages properly display on post back.

  <asp:ContentPlaceHolder ID="TemplateUserMessages" runat="server">

- TemplateBody –Displays the main content of the page

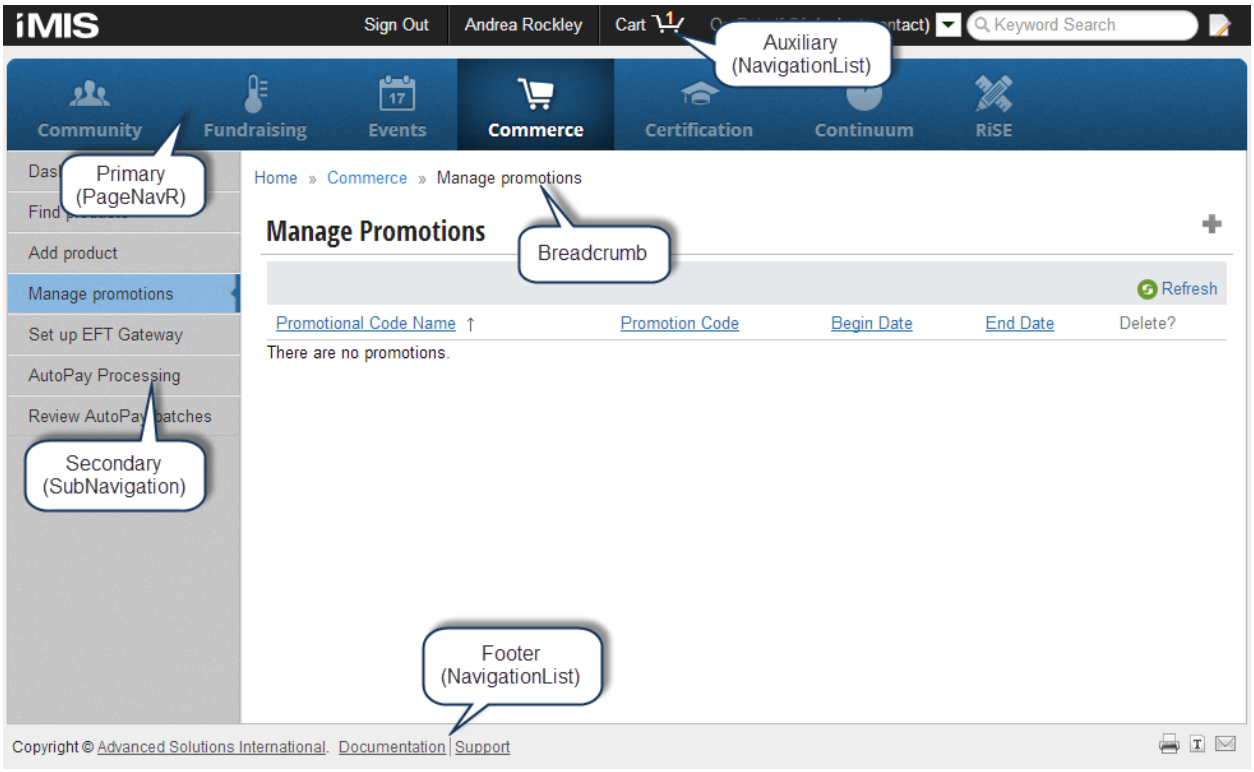
  <asp:ContentPlaceHolder ID="TemplateBody" runat="server">

- TemplateScripts – Loads JavaScript from Page.RegisterStartupScript

  <asp:contentplaceholder id ="TemplateScripts"
  runat="server"></asp:contentplaceholder>

  Navigation

  Four different navigation controls are available that can be used to display different styles of navigation. Choose the navigation controls that best fit your needs.



- NavigationList – Displays a simple list-style navigation that is limited to a single level. In the iMIS master pages, it is used to display the Auxiliary and Footer navigation.

  <asiweb:NavigationList ID="Auxiliary" runat="server" NavigationPaneCode="4"

  AnonymousOnly="<%# IsAnonymous %>"/>

- NavigationPaneCode identifies the navigation area to display – in this example it is the auxiliary navigation. This code is defined in Navigation Areas.

- AnonymousOnly works in conjunction with the IsAnonymous property in the scripts section to determine when to hide anonymous-only links.

- PageNavR – Displays the primary navigation. A register statement is required at the top of your master page from this control.

  The register statement:

  <%@ Register TagPrefix="asi" TagName="PageNavR" Src-c="~/AsiCommon/Controls/Navigation/PageNavR.ascx" %>

  The control:

<asi:PageNavR ID="Primary" runat="server" NavigationPaneCode="1" StartFromRootNode="true" SelectDefaultNode="true" />

- NavigationPaneCode – Currently only “1” is supported for this control.
- StartFromRootNode – Currently only “true” is supported for this control.
- SelectDefaultNode – Currently only “true” is supported for this control.
- SubNavigation – Displays second-level navigation. See Displaying left navigation.
- Breadcrumb – Displays the breadcrumb trail of the current page. This control hides dynamically if the website is not configured to display breadcrumbs.

  <asiweb:SiteMapPath ID="BreadCrumb" runat="server" SiteMapProvider="AsiSiteMapProvider">

  <NodeTemplate>

  <asp:HyperLink ID="NodeLink" runat="server" NavigateUrl='<%# Eval("Url") %>' Text='<%# Eval("NavigationHierarchy.Navigation.BreadCrumbName") %>' CssClass="BreadCrumbLink"></asp:HyperLink>

  </NodeTemplate>

  <CurrentNodeTemplate>

  <asp:Label ID="CurrentNodeLabel" runat="server" Text='<%# Eval("NavigationHierarchy.Navigation.BreadCrumbName") %>'></asp:Label>

  </CurrentNodeTemplate>

  </asiweb:SiteMapPath>

- NodeTemplate – The template used to display links in the breadcrumb
- CurrentNodeTemplate - The template used to display the navigation name of the current page

  Other Required Controls

- RadScriptManager – Combines multiple Telerik scripts into a single HTTP request.

<telerik:RadScriptManager ID="ScriptManager1" runat="server" EnableCdn="false" EnablePageMethods="true" EnablePartialRendering="true" EnableScriptGlobalization="true" EnableHistory="true" EnableSecureHistoryState="false" AsyncPostBackTimeout="3600" />

- UpdateProgress – Displays a visual indicator of loading progress.

```
<asp:UpdateProgress ID="TemplateFillLoadingPanel" runat="server" Visible="true">
  <ProgressTemplate>
    <div class="NotPrinted ProgressDiv" id="FillProgressDiv">
      Loading
      <asp:Image ID="ProgressImage2" runat="server" OnLoaded="ProgressImage2Load" AlternateText="Loading" />
    </div>
  </ProgressTemplate>
</asp:UpdateProgress>
```

> **Note:** Note: In addition, define the ProgressImage2Load method in your master page's C# scripts (example below).

```
protected void ProgressImage2Load(object sender, EventArgs e)
  {
    Image image = sender as Image;
    if (image != null)
      image.ImageUrl = Asi.Web.Utilities.GetTildeExpansion() + "/images/ImageLibrary/loading.gif";
  }
```

- Sign In/Sign Out Link – Displays a link to allow the user to sign in or out of the website.

<asp:LoginStatus ID="LoginStatus1" runat="server" LoginText="Sign In" LogoutTex-t="Sign Out" AccessKey="I" OnLoggedOut="LoginStatus1_OnLoggedOut" OnPreRender-r="LoginStatus1_OnPreRender" />

Note: Note: In addition, define the methods for OnLoggedOut and OnPreRender (examples below).

```
protected void LoginStatus1_OnLoggedOut(object sender, EventArgs e)
  {
    Asi.Web.Security.RevokeAppContext(HttpContext.Current);
    if (Page is Asi.Web.UI.DisplayPageBase && ((Asi.We-
b.UI.DisplayPageBase)Page).iMISWebsite != null)
      Response.Redirect(((Asi.We-
b.UI.DisplayPageBase)Page).iMISWebsite.WebsiteLink, true);
    else
      Response.Redirect(FormsAuthentication.LoginUrl, true);
  }

protected void LoginStatus1_OnPreRender(object sender, EventArgs e)
  {
    // Make Sure that Logoff and Log On Text is set properly
    if (!AppContext.CurrentIdentity.IsAuthenticated)
      LoginStatus1.LogoutText = ResourceManager.GetPhrase("Security.SignOut",
"Sign Out");
  }
```

- Universal Search field – Allows the user to search the entire website for content, a product, an event, and other indexed items.

  <asiweb:SimpleSearchField ID="SearchField" runat="server" AdvancedLinkVisible="false" PromptText="Keyword Search" />

- PromptText – The text that appears in the search box before the user selects the box
- AdvancedLinkVisible – Currently only “false” is supported for this control.
- Easy Edit toggle – Displays a button to allow staff and Content Authority Group members to turn Easy Edit on and off.

  <asp:ContentPlaceHolder ID="AuxiliaryNavigationSupplementalContent" runat="server" />

- Keep Alive – Increases performance by helping the client keep a single session running.

  <asp:Image ID="KeepAliveTarget" runat="server" ImageUrl="~/AsiCommon/Images/3x3.gif" AlternateText=" " />

  <asiweb:KeepAliveExtender ID="KeepAliveControl" runat="server" TargetControlID="KeepAliveTarget" />

- On Behalf Of – Displays the visual control and indicator that allows users with On Behalf Of rights to set or clear the On Behalf Of target.

  <asi:ProxyPanel id="panProxy" runat="server" TargetContactProfileShortcut="~/Party.aspx" ></asi:ProxyPanel>

- TargetContactProfileShortcut – The shortcut or URL for the link on the contact’s name. If not included, this property defaults to ~/Party.aspx.
- Button Bar – Displays action buttons (save, submit, cancel) when there is a form on the page.

  <asiweb:CommandButtonBar ID="ButtonBar" runat="server" TargetControlID="ContentDiv" />

Also works in conjunction with a placeholder, which can be used to add additional content next to the buttons.

<asp:ContentPlaceHolder ID="TemplateButtonBar" runat="server">

Optional master page elements

The following section describes some of the optional master page elements. To see an example of how to fully implement each of these, search the relevant IDs (or other provided strings) within one of the sample master pages located in the ~/Templates/MasterPages folder.

Accessibility controls

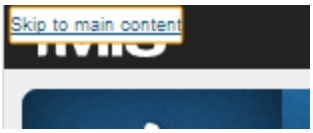
Add the following optional controls to increase the accessibility of your website.

- Skip Links – Helps screen readers and tab-only users skip over repetitive content, such as the header.

  Skip to main content

- href – Make sure this links to the ID of your main content area or to an anchor at the top of the content area. For example:

  In our example master pages, we also include a skip link around the breadcrumb. If you choose to do this, be sure to hide the link dynamically if the breadcrumb is hidden.



- Maintain Focus on Post Back – Sometimes when the page refreshes, screen readers and tab users lose their focus on the page and have to navigate back to their desired location. By including an optional control to remember their last-focused element, you can fix this behavior.

  <input type="hidden" id="lastClickedElementId" runat="server"/>

Content Template Areas

Content Template Areas are a very powerful tool for your master page because they allow you to insert RiSE-built content into your master page wherever you need it. The content can be controlled separately in each website, making it useful for logos, links to your organization's social networking pages, and footer copyright statements.

1. To add one or more Content Template Areas, first declare them in an EnsureContentAreas() method in your master page.

   ```
   override protected void EnsureContentAreas()
   {
      PageContentAreas = new List<ContentTemplateArea>(
         new[] { HeaderLogo });
   }
   ```

   Include the IDs of all content areas for your website in a comma-separated list within the array.

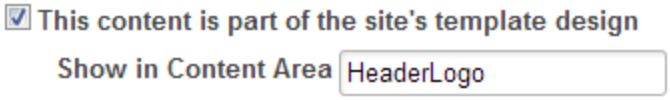
2. Next, for each content area you want to add, place a ContentTemplateArea control in your master page where you want the content to display.

   ```
   <asiweb:ContentTemplateArea ID="HeaderLogo" TemplateAreaName="HeaderLogo" HonorContentRecordLayout="true" runat="server" />
   ```

   - TemplateAreaName – The name used to identify this content area
   - HonorContentRecordLayout – Determines whether to include the grid layout used in your content definition

3. Define the content to be displayed within the Content Template Area.
4. In your website definition, you should have a defined location for all of your template content (Manage websites > Look and Feel tab, Folder containing template content). Create your content within this folder in Manage content.

5. On the Properties tab of the content, enable This content is part of the site's template design.
6. In Show in Content Area, enter the same name you used for the Content Template Area control's TemplateAreaName.



Homepage or interior content areas

You can also define content areas that display only on the home page or only on interior pages.

1. In EnsureContentAreas() identify the content areas as either HomepageContentAreas or InteriorContentAreas.

```
override protected void EnsureContentAreas()
{
  HomepageContentAreas = new List<ContentTemplateArea>(
    new[] { HomepageContentArea1 });
  InteriorContentAreas = new List<ContentTemplateArea>(
    new[] { InteriorContentArea1 });
}
```

2. Include the ContentTemplateArea as in normal content areas.

```
<asiweb:ContentTemplateArea ID="HomepageContentArea1" Tem-
plateAreaName="HomepageContentArea1" HonorContentRecordLayout="true" run-
at="server" />
```

3. Also include a required HomePageContent panel and/or InteriorPageContent panel on the master page.

```
<asp:Panel ID="HomePageContent" runat="server" Visible="false" />
```

<asp:Panel ID="InteriorPageContent" runat="server" Visible="false" />

4. Define the content to be displayed with the Content Template Area (see the previous section Content Template Areas).

   Properties and Methods

   You may also want to include some C# properties and methods in your master page. These should go in the <script language="C#" runat="server"></script> at the top of your master page. You may want to include:

- CartItemCount (property) – Defines a template used to display a cart count indicator in the auxiliary or footer navigation. Replaces [CartItemCount] in the navigation text (see Modifying dynamic navigation items).
- OverrideLinkText (property) – Defines text that replaces [OverrideLinkText] in navigation text. It is typically used to display the logged-in user's name (see Modifying dynamic navigation items).
- For example, instead of displaying the Full Name of the logged in user, you may want to display only their First Name. To make this change, edit the ContactDetail property to replace all instances of FullName with FirstName. The result should look like this:

```
/// <summary>
 /// Logged in contact
 /// </summary>
 public string OverrideLinkText
 {
     get
     {
        return Asi.Business.Contact.Contact.GetCachedFirstName(AppContext.CurrentIdentity.UserKey, AppContext.CurrentContext.StatefulBusinessContainer);
     }
```

}

Note: The GetCachedFirstName method is used, rather than the default GetCachedFullName.

- IsAnonymous – Used in conjunction with NavigationListControl, this determines who should be allowed to see anonymous-only links.

Other optional items

- PageTasks – Displays buttons to allow users to email the page to a friend, print the current page, or set the “Text Only” mode.

<asp:Panel ID="PageTasksPanel" runat="server" CssClass="PageTasksPanel NotPrinted">

<asp:ContentPlaceHolder ID="TemplatePageTasks" runat="server"></asp:ContentPlaceHolder>

</asp:Panel>

You can selectively turn off any of these buttons by including one or more of the following statements in the overridden CreateChildControls() method:

ShowTextOnly = false;

ShowEmailAFriend = false;

ShowPrintThisPage = false;

- Dynamic Content Items – You can also include iMIS Dynamic Content Items in your master page. Simply register them and include them as you would any other control.

Designing site navigation

Displaying left navigation

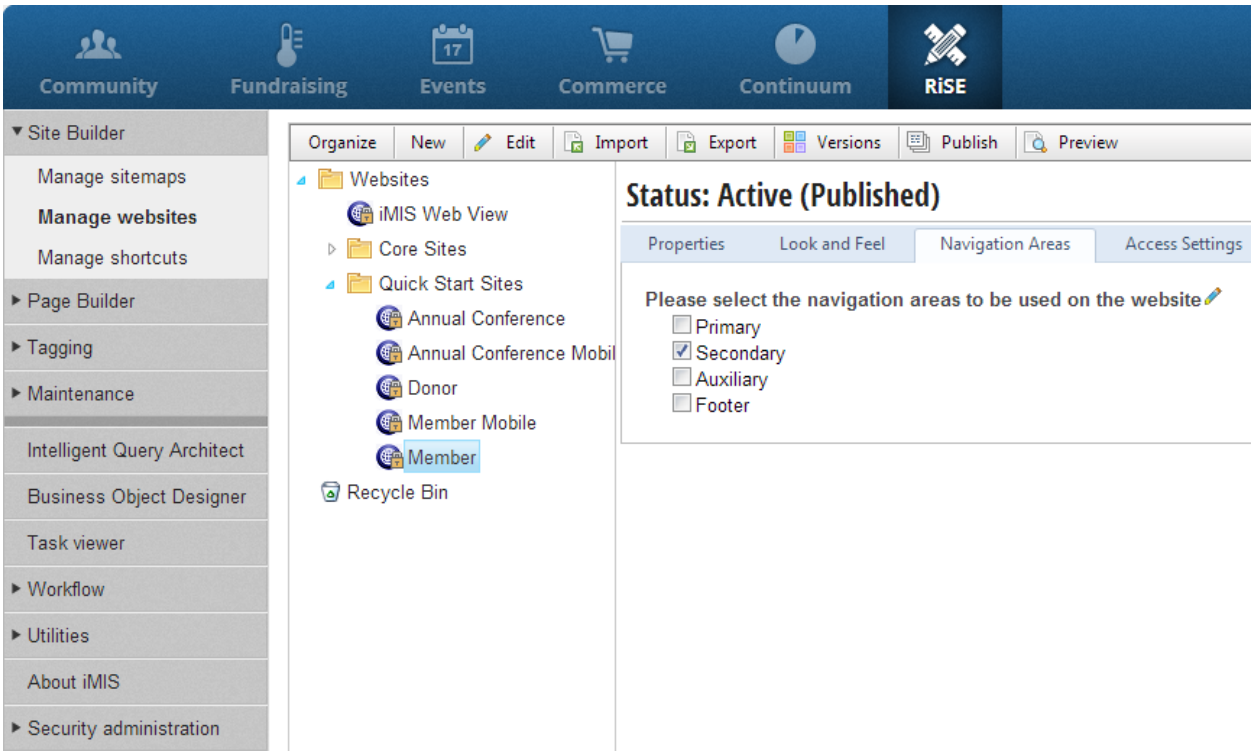
You can display website left navigation in a hierarchical format with a few changes to your theme’s master page and skin file.

Do the following to implement left navigation:

Go to RiSE > Site Builder > Manage websites:

1. Define how many levels of navigation to display.

- Select the website.
- Select the Navigation Areas tab and select the Secondary navigation area.
- Save and publish your changes.



2. Edit the website theme's master page.

- Using your preferred text editor, find and open the website theme's master page. Master pages, by default, are located in C:\Program Files (x86)\ASI\iMIS\Net\Templates\MasterPages.
- Register the control by adding the following line to the top of the master page, just below the other registered controls:

  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>
- Add the following scripts to the <script language="C#" runat="server"> section:

  protected override SiteMapNode GetStartingNode()

  {

  return Secondary.GetStartingNode();

  }

  protected override SiteMapNode GetCurrentNode()

```
{
   return Secondary.GetCurrentNode();
}
```

- Find the masterSideBarPanel div. It should look like this:

```
<div id="masterSideBarPanel" class="yui-b">
   <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server">
     </asp:ContentPlaceHolder>
</div>
```

- Update the masterSideBarPanel div so that it contains the following:

```
<div id="masterSideBarPanel" class="yui-b">

    <asp:Panel ID="SubNavPanel" runat="server" >
       <asp:ContentPlaceHolder ID="PageSubNavigationPlaceHolder" runat="server">
       <asp:Panel id="SubNavHead" runat="server" class="SubNavigationHead">
       <asp:Literal ID="SubNavPanelTitle" runat="server" />
       </asp:Panel>
       <asp:Panel id="SubNavBody" runat="server" class="SubNavigationBody">
       <asi:SubNavigation id="Secondary" runat="server" NavigationPaneCode="2"
         StartingNodeOffset="1" StartFromCurrentNode="true"
         StartingNodeOffsetAutoSet="true" SelectDefaultNode="false" />
       </asp:Panel>
       </asp:ContentPlaceHolder>
      <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server" />
```

```
    </asp:Panel>

</div>
```

- Find the masterWrapper div, and add the yui-t2 class to it:

  ```
  <div id="masterWrapper" class="yui-t2">
  ```

- To improve JavaScript performance for websites using hierarchical sub-navigation, find the following script:

  ```
  <script type="text/javascript">
      // if there is something in the side bar this converts the layout to 2 columns
      if ($('masterSideBarPanel').children.length != 0) {
        $('masterWrapper').setAttribute("class", "yui-t2 HasSubNav");
      }
  </script>
  ```

- Update that script to the following:

  ```
  <script type="text/javascript">
      // if there is something in the side bar this converts the layout to 2 columns
      if ($('masterSideBarPanel').children.length === 0) {
        $('masterWrapper').removeAttribute("class");
      }
  </script>
  ```

3. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files (x86)\ASI\iMIS\Net\App_Themes.

- Register the control by adding the following line to the top of the skin file, just below the other registered controls:

  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>

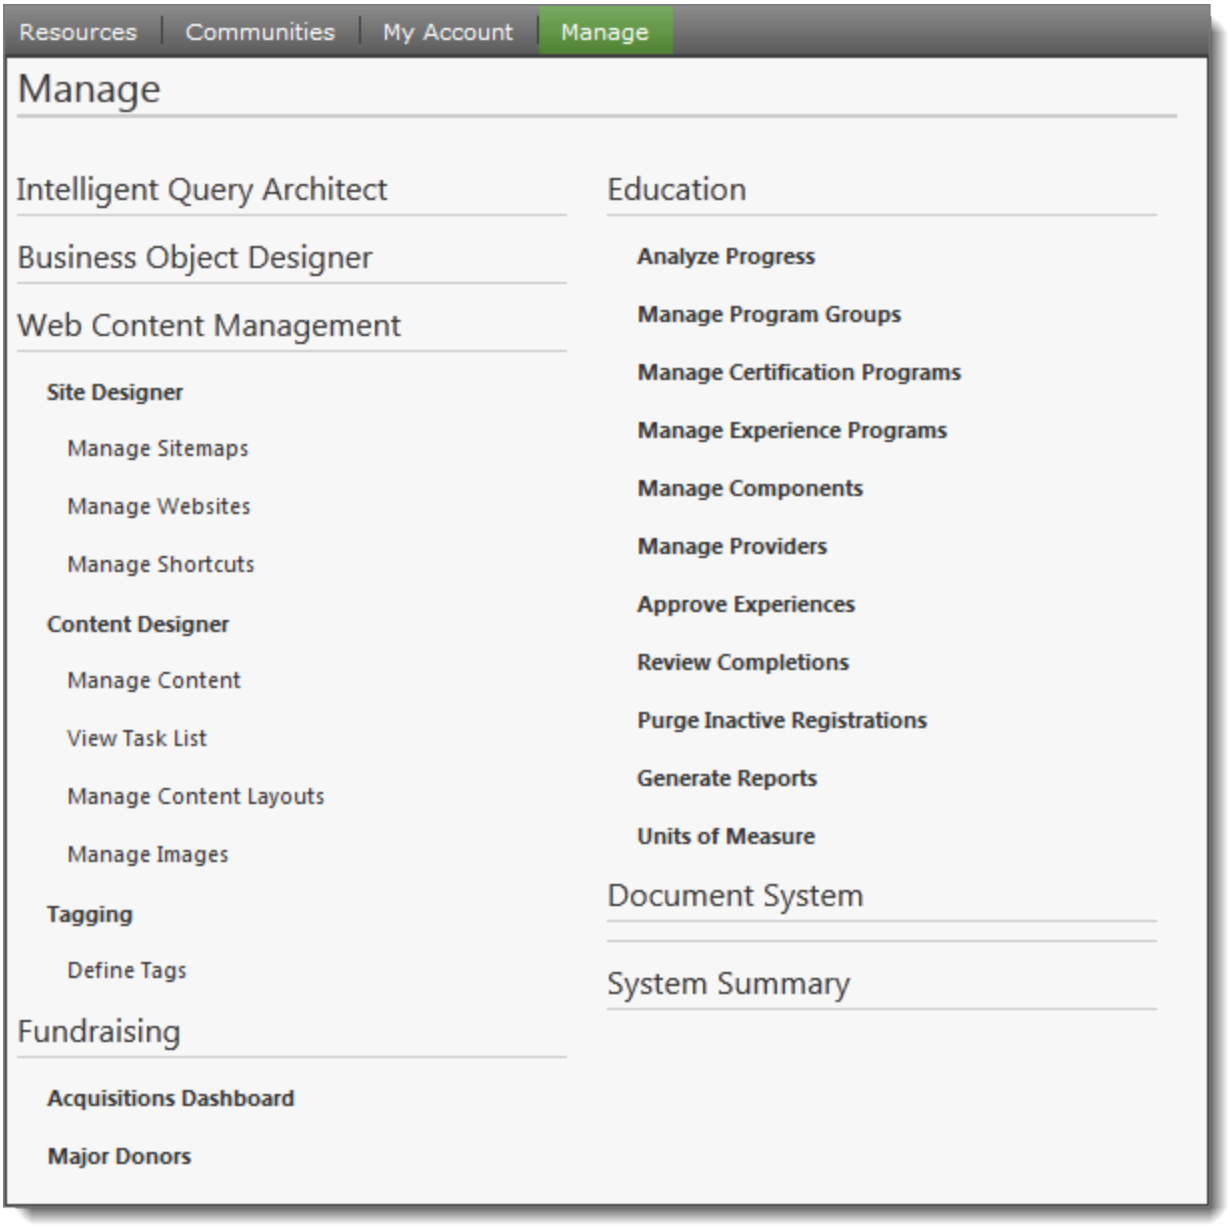
- Just below the section registering controls, add the following line:

  <asi:SubNavigation runat="server" Skin="Aspen" EnableEmbeddedSkins="false" SingleExpandPath="true" ShowLineImages="false" />

- (optional) If you are familiar with skin controls, you can configure how the SubNavigation control behaves using the following properties:
- string NavTreeSkinId – A unique ID for the skin if needed. The default is RadTreeView.
- bool SingleExpandPath – Gets or sets a value indicating if only the current branch of the tree is expanded. The SingleExpandPath property, when set to True, automatically collapses nodes that are not on the path of the currently expanded node. Use the SingleExpandPath property when you need to conserve screen space and make navigating nodes easier.
- public bool ShowLineImages – Gets or sets a value indicating if the tree node line images display or not.
- string Width – Gets or sets width of the control. Specify in pixels (px) or percentage (%) e.g. 500px, 90%.
- bool EnableEmbeddedSkins – Gets or sets a value indicating if the built in skins should be used on the navigation tree.
- int MaxDataBindDepth – Gets or sets the maximum number of levels to bind to the navigation tree.
- bool WrapNodeText – Gets or sets the option to wrap text if it is wider than the trees allowed width.
- bool ExpandAllNodes – Gets or sets the option to expand all of the nodes when the navigation tree renders.

Displaying mega drop-downs

You can display mega drop-downs from your primary navigation with a few changes to your theme's skin file and menu CSS. Mega drop-downs display navigation items within large panels, grouped by level, which reduces scrolling and improves the usability of site navigation.



Implementing mega drop-downs

Do the following to implement a mega drop-down:

1. Ensure that all navigation items in the sitemap have a value for Content or URL to Link to. Otherwise, the navigation hierarchy might not render properly.
2. Edit the website theme's skin file:

- Using your preferred text editor, find and open the website theme's skin file (for example, Austin.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableMegaDropDownMenu="true"
- (optional) If you are familiar with skin controls, you can configure how the mega drop-down behaves by altering the following properties:
- EnableMegaDropDownMenu – Enables the mega drop-down.
- MegaDropDownMenuShowStartingNode – Displays the parent navigation node as the first item in the mega drop-down. Enter true or false.
- MegaDropDownMenuLevelSettingLevel – This property sets specified menu nodes per level with a default per level of "1", and a minimum per level of "1". This property defines the navigation level at which the number of columns set for MegaDropDownMenuRepeatColumns starts to take effect. For example, if you set MegaDropDownMenuRepeatColumns="3" and set MegaDropDownMenuLevelSettingLevel="2", then the mega drop-down displays three columns for the second navigation level and higher, and the first level has one column only.
- MegaDropDownMenuRepeatColumns – Defines the number of columns used to display the navigation. This property sets the number of display columns for the mega drop-down menu's specified number of columns (default is "2", minimum is "2").
- MegaDropDownTooltipLocation – This option only applies to tooltips defined for top-level navigation items in the primary navigation. When defined, it specifies the location of the tooltip text if a tooltip is defined for that navigation item. Enter either Menu (displays the tooltip directly beneath the top-level navigation item) or Append (displays to the right of

the navigation text within the drop-down). If you do not define this property, navigation tooltips are not displayed in the drop-down.

- MegaDropDownMenuRepeatDirection – This property sets the mega drop-down menu repeat direction and determines the order in which items are rendered as either Horizontal or Vertical (default is Vertical). If set to Vertical, the items display in columns loaded from top to bottom, then left to right, until all items are rendered. If set to Horizontal, the items display in rows loaded from left to right, then top to bottom, until all items are rendered.

3. Edit the theme's menu CSS to tailor the display of the mega drop-down for the theme's look and feel.

- Using your preferred text editor, find and open the website theme's menu CSS file (for example Menu.Aspen.css). Menu CSS files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.

  Note: The styling for the Austin drop-downs are included in 99-Austin.css.

- Find the MegaDropDownMenu Styling section and edit the styles as needed:

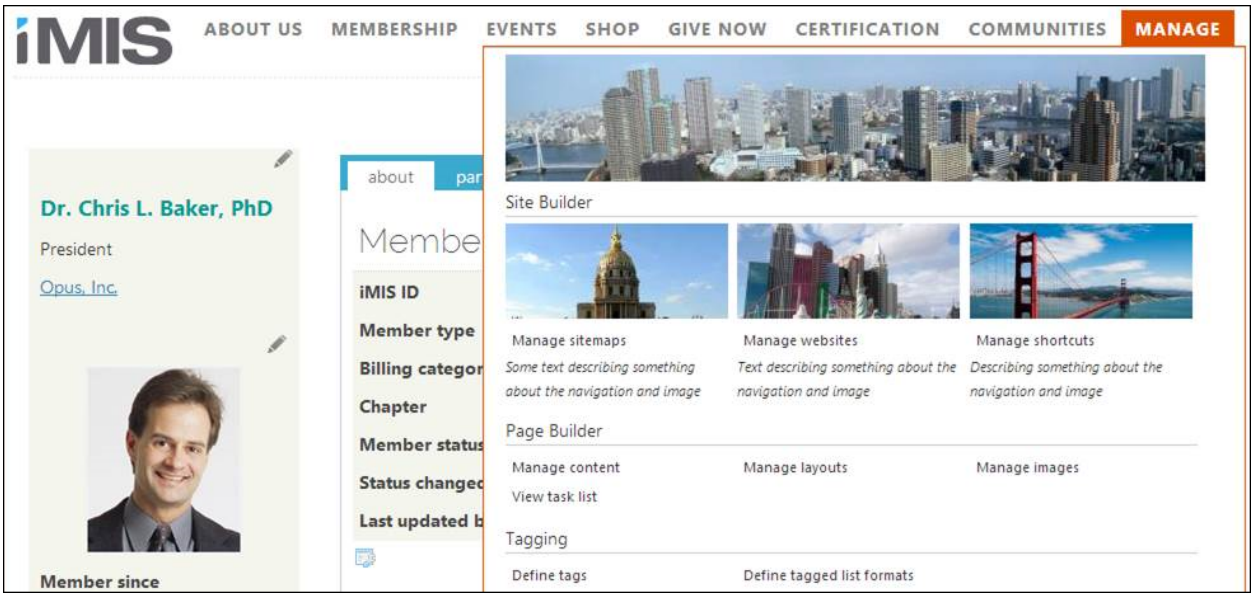
```
/* ############################ */
/*  MegaDropDownMenu Styling  */
/* ############################ */
.RadMenu .rmGroup .MegaDropDownMenuOuter .rmText {
   padding: 0;
   margin: 0;
   width: 600px !important;
}
div.MegaDropDownMenu
{
   background-color: #f8f7f7;
```

```
    padding-left: 5px !important;
    padding-right: 5px !important;
}
.MegaDropDownMenuToolTip
{
    padding: 5px;
}
```

Styling mega drop-downs

You are able to make changes to the layout and look of your mega drop-downs. You can add control properties in the .skin file, and you can add custom CSS classes.

For example, you could style your mega drop-down to look like the following:



To create a mega drop-down that looks like this, you would first set the control properties in the pageNavR control in the .skin file. For example, for the Austin theme, you would edit the Austin.skin file:

<asi:PageNavR runat="server" Skin="Austin" EnableEmbeddedSkins="false" EnableRootItemScroll="false"

Flow="Horizontal" DefaultGroupSettings_Flow="Vertical"

DefaultGroupSettings_OffsetX="0" Width="100%"

EnableMegaDropDownMenu="true"

MegaDropDownMenuShowStartingNode="false"

MegaDropDownMenuLevelSettingLevel="0"

MegaDropDownMenuRepeatColumns="3"

MegaDropDownTooltipLocation="Append"/>

Next, add custom CSS classes to the 99-Austin.css file:

```
.SiteBuilderNode:before {
    padding-right: 5px;
    content: url(http://lorempixel.com/output/city-q-c-550-100-5.jpg);
}
.ManageSitemapNode:before {
    padding-right: 5px;
    content: url(http://lorempixel.com/output/city-q-c-175-75-6.jpg);
}
.ManageSitemapNode:after {
    padding-right: 5px;
    font-style: italic;
    float:right;
    content: "Some text describing something about the navigation and image";
```

```
}
.ManageWebsitesNode:before {
    padding-right: 5px;
    content: url(http://lorempixel.com/output/city-q-c-175-75-3.jpg);
}
.ManageWebsitesNode:after {
    padding-right: 5px;
    font-style: italic;
    float:right;
    content: "Text describing something about the navigation and image";
}

.ManageShortcutsNode:before {
    padding-right: 5px;
    content: url(http://lorempixel.com/output/city-q-c-175-75-9.jpg);
}

.ManageShortcutsNode:after {
    padding-right: 5px;
    font-style: italic;
    float:right;
    content: "Describing something about the navigation and image";
}
```

Using image sprites for navigation items

A sprite is a collection of images combined into a single image. Using CSS, you can shift the image around to display only parts of it. The advantage of using sprites is that they reduce the number of server requests to load images (only one is loaded), leading to improved performance.

One way to use sprites in iMIS is for rollover effects on navigation items.

To implement image sprites for navigation items

1. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files (x86)\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableImageSprites="true"

  When enabled, a new class named rmLeftImage is added to root level links in PageNavR.

2. Create the sprite file.

- Using an image editor like Adobe Photoshop, or a free alternative like GIMP, create your sprite by adding the images you want to a single image, like the following:

- Save the sprite to the website theme's image folder.

3. Edit the theme's 99-[theme].css file to define the classes to control the sprite.

- Use a tool like SpriteCow to determine the position values of the images in the sprite.
- Using your preferred text editor, find and open the website theme's 99-[theme].css file, located by default in the theme folders within C:\Program Files (x86)\ASI\iMIS\Net\App_Themes.
- Add styles for the sprite. For example:

```
.RadMenu a.rmRootLink.CartLink .rmLeftImage
{
   Background-image: url(images/cartsprite.png);
   Background-repeat: no-repeat;
   Background-position: -1px -1px;
   Width: 48px;
   Height: 36px;
}
.RadMenu a.rmRootLink.CartLink:hover .rmLeftImage, .RadMenu
a.rmRootLink.CartLink.rmExapnded .rmLeftImage, .RadMenu
a.rmRootLink.CartLink.rmFocused .rmLeftImage
{
   Background-position: -1px -39px;
}
```

The first group of selectors sets the resting position for the image sprite. The second group of selectors defines the hover state and shifts the image when the link is rolled over.

Go to RiSE > Site Builder > Mange websites:

4. Apply the sprite class to the appropriate navigation items.

- Edit the navigation item for which you want to apply the sprite hover effect (for example, the Shop).
- For the CSS Class property, enter the sprite class (for example, CartLink).
- Save and Publish the navigation items.

Controlling sitemap behavior

This section explains sitemap behavior, including:

- Content records, content items, and shortcuts used for searching.
- How to modify the [OverrideLinkText] and [CartItemCount] dynamic navigation items
- Profile pages linked from the Member site's Directory, which uses an ASPX web page to redirect users to a navigation item based on a set of criteria

How search works with navigation

Three elements make search work in the Quick Start Sites:

- The search content records: The Quick Start Sites use search content records that are dynamically populated with an initial search result set based on a URL parameter value. These content records contain the Common Search content item and are located within @/iCore folders.
- The pages that display the initial search results: The Shop and Events navigation items are linked to the Search content records. These navigation items have a unique value for the InitialArea URL parameter, which defines the result set generated when the pages are first displayed (i.e. products or events).
- The page displayed when a user clicks a search result link are based on:

1. Shortcuts: the shortcuts defined from Site Builder > Manage shortcuts. The following shortcuts display search result links in the Quick Start Sites:

- ItemDetail –The ItemDetail shortcut displays the Item_Detail content record, which uses Product Display to display the item selected

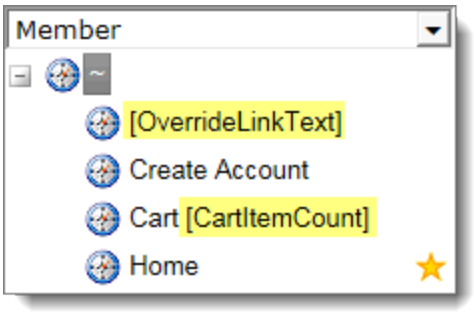
- GiftDetail – The GiftDetail shortcut displays the Gift_Detail content record, which uses Donation Creator to display donation pages selected from search results.

2. Redirectors: users are redirected to different shortcuts depending on permissions

- Event.aspx
- The EventDetail shortcut displays the Event_Display content record, which uses Event Display and Event Program Display to display event pages selected from search results.
- The EventDashboard shortcut displays the Event_Dashboard content record, which uses Content Collection Organizer to display the Event Console for the event selected from search results.
- Party.aspx
- People: System Administrators and Staff users with Contacts level 1 permissions viewing any user's account are redirected the Full Account shortcut
- Public users viewing their own accounts are redirected to the MyAccount shortcut.
- Public users viewing another contact's accounts are redirected to the Profile shortcut.
- Organizations: System Administrators and Staff users with Contacts level 1 permissions viewing any company, and Company Administrators viewing their own company will be redirected to the OrganizationAccount shortcut
- Public users viewing any company are redirected to the Organization shortcut.

Modifying dynamic navigation items

The default sitemaps include variables that dynamically generate the text displayed for two navigation items. [OverrideLinkText] displays the Full Name of the logged in user by default. [CartItemCount] displays the number of items a user has added to the Cart.



If you want to add new navigation items that use these variables, or if you want to modify the existing ones, keep the following guidelines in mind:

- Navigation areas and master pages – The variables only work in the Auxiliary and Footer navigation areas of websites using one of the Quick Start Site master pages (or copies of these files) or 1700.master. To specify a navigation area, edit a navigation item and in the Options section, select Auxiliary, Footer, or both from the Show in the following navigation areas options.
- [OverrideLinkText] – You can use this variable on its own or with other text. For example, if you only enter the variable, then only the logged in user's name is displayeds as a link. However, if you enter [OverrideLinkText]'s Profile, and Bob Smith logs in, then Bob Smith's Profile is displayed as a link.
- [CartItemCount] – You can use this variable on its own or with other text, but we recommend that you only use it with other text. Otherwise, when no items are in the cart, nothing is displayed for this navigation item.

  To change the data displayed for [OverrideLinkText]

  The variable [OverrideLinkText] can be changed to display a different value. For example, you may wish to display only the user's first name instead of their full name. To do so, you will need to edit the OverrideLinkText property in your custom master page. See Optional master page elements for more information.

  Note: If you want to customize one of the out-of-the-box themes, we recommend that you start with a copy, so that your changes are preserved when you upgrade.

Account and profile pages in the Directory

When users select a result after searching the Member site's Directory, or when they navigate to the account pages, the content record that displays depends on the user's permissions. The rules that determine where a user is redirected are defined in the Party.aspx file, located by default in C:\Program Files (x86)\ASI\iMIS\Net.

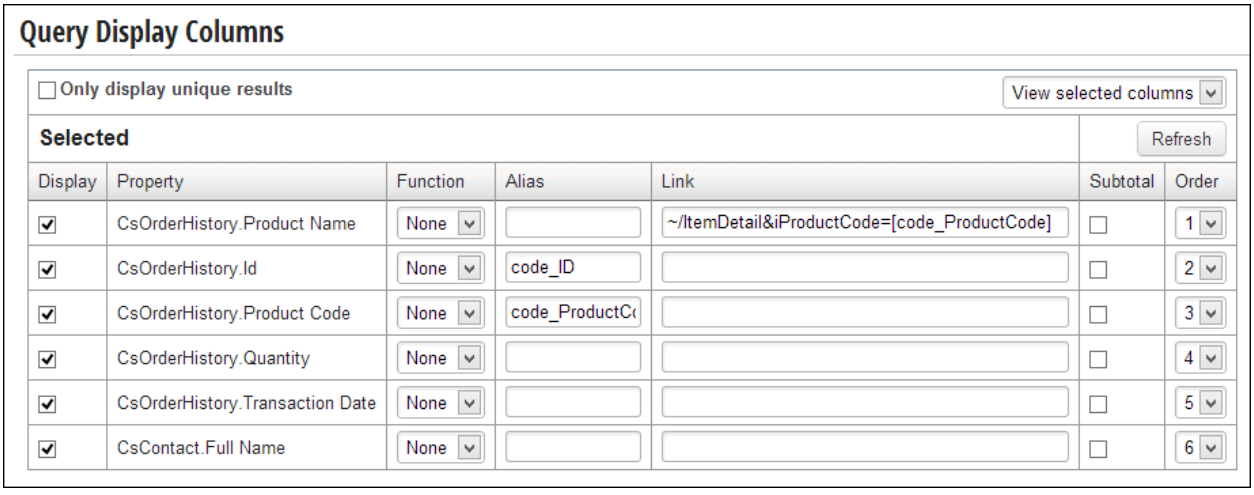
You can modify the information displayed on the account and profile pages by editing the content records described below from Page Builder > Manage content.

> **Note:** Note: In the Member Mobile site, only simple profile pages are shown for member and organization accounts to restrict the amount of information displayed on small screens.

Redirector Pages

Redirector pages can be used to dynamically redirect a user to the correct page based on certain criteria. iMIS offers a redirector page out-of-the-box to help you easily create links in HTML or in IQA queries.

IQA Example:



The link on the product name in this IQA query will direct to the correct product item detail page.

Party.aspx

Party.aspx directs users to the correct account pages depending on their permissions. If no target Contact ID is provided the user will be directed to their own account page.

For viewing people:

System Administrators and Staff users with Contacts level 1 permissions viewing any user's account will be redirected the FullAccount shortcut.

- Public users viewing their own accounts will be redirected to the MyAccount shortcut.
- Public users viewing another contact's accounts will be redirected to the Profile shortcut.

For viewing companies:

System Administrators and Staff users with Contacts level 1 permissions viewing any company, and Company Administrators viewing their own company will be redirected to the OrganizationAccount shortcut.

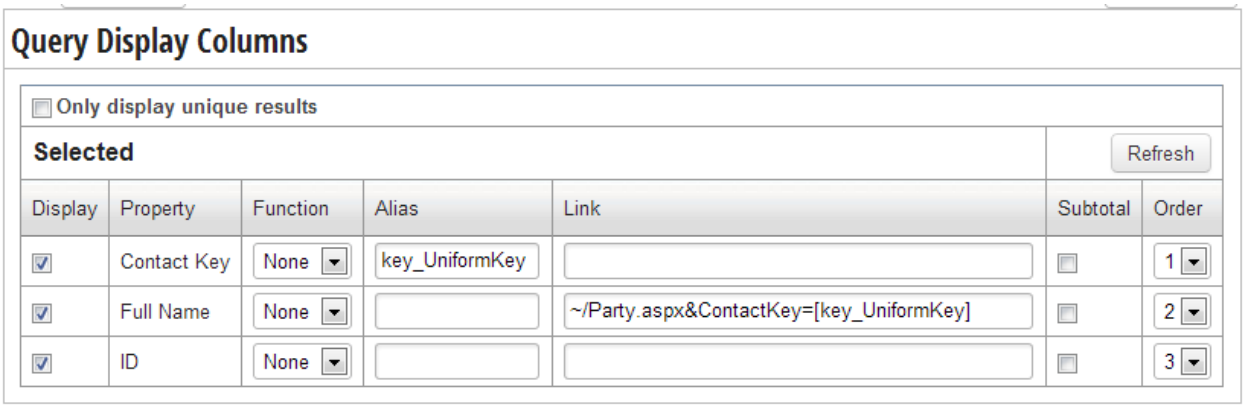
- Public users viewing any company will be redirected to the Organization shortcut.

Examples:

HTML Example:

Please review your account settings and fix any inaccuracies.

IQA Example:



Page descrip-	Users directed	Content record:	Shortcut

tion	to the page	@/iCore/Contacts/*	
Detailed page for staff to manage member accounts	System Administrators Staff with an authorization level of 1 or higher in Customers	ContactLayouts/Account_Page_Staff	FullAccount
Detailed page for member to manage own account	Contacts selecting their own record	ContactLayouts/AccountPage	MyAccount
Detailed Organization account page	System Administrators Staff Organizations selecting their own record	OrganizationLayouts/Account_Page	OrganizationAccount

Tracking your site with Google Analytics

Google Analytics tracks and collects important data on how visitors interact with a website. Google Analytics provides reports on the data collected allowing you to assess whether your website is meeting its goals. This tracking is accomplished by adding a Google Analytics script to the website. A new parameter was added to the Manage websites window if you want to use Google Analytics to track data on an iMIS website.

Do the following to track your site with Google analytics:

1. Create a Google Analytics account: google.com/analytics
   - Configure the account.
   - Google Analytics will provide the code for you to paste in the Manage websites window.
2. Add the script to your iMIS website.

   Go to RiSE > Site Builder > Manage websites:
   - Select the website to which you want to add a Google Analytics script.
   - (Properties tab) Expand the Advanced section and paste the entire script, including the tags, in the Google Analytics script field.
   - Click Save.
   - Publish the website.
3. Visit your Google Analytics account to review the data collected.

Synchronizing content on multiple servers

If you have more than one server hosting the same website, take steps to synchronize all servers that host the website. The following are issues to address:

- Theme files: If you modify the website's CSS or master page, or if you apply a different theme, copy the changed files to all other servers.

- Uploaded images: Copy your folder for uploaded images to all other servers, either by direct FTP or by file copy.

  Tip: This is not necessary for ContentFile Content Item attached files, which are automatically copied to remote servers when published.

- Hard-coded image paths: If you use different virtual directories on any of your servers, you need to put a variable in any hard-coded image paths to make them publish correctly on all servers. When including images in Content HTML, modify the default Image URL and replace the server name and virtual directory with [Root]. For example, if the Image URL is …/iMIS/images/mypic.jpg, change it to [Root]/images/mypic.jpg.

  Note: When you edit Content Html, the image appears as a missing-image red X, but it displays correctly when published.

- Navigation area properties: If you modify navigation area properties (using the Easy edit link in the Navigation Areas section of the Website Edit screen) you might need to reset the server's worker process to get it to pick up the changes.

- Publishing servers: When publishing content, iMIS will not consider the content successfully published until all relevant publishing servers have finished publishing it without error. That means that if one of the publishing services corresponding to any of the publishing servers listed in RiSE > Maintenance > Publishing servers is stopped or otherwise inactive, content records will remain in the PublishPending state until the publishing service is started or the entry in Publishing servers is removed and the content is republished.

  Note: Images used in content records such as Content HTML, are automatically regenerated into the /images folder on all web servers when published.

Improving performance for remote servers

The Easy edit feature of your iMIS content management website might be sluggish on some of your external web servers due to latency in communicating with the iMIS database. For example, it is common for your public-facing web servers to be hosted at a different data center than your iMIS database. You can improve performance by setting up a

mirror of the website on your iMIS application server, then directing your frequent Easy edit users to the appserver's URL for the website instead of using the public URL.

> **Note:** Note: If your Easy edit users are working at computers that are outside your organization's firewall, they will need VPN access (or access through a terminal server, for example) to connect to the appserver-hosted version of the website.

Changes to the website's content records and navigation items that are made on any server that hosts the website are automatically picked up by every other server when you publish the changes. However, images that are uploaded during Easy edit sessions must be manually copied to all other servers. Additionally, changes that your web admins make to the site's CSS, master page, and other aspects of the site's template on one server must also be manually copied to all other servers.

Improving Easy edit performance

The following procedure assumes that you already have an external iMIS content management website on which your Easy edit users are experiencing slow performance. You will be changing the website's definition to also host the website on your application server, then advising your Easy edit users to use the new appserver-hosted website for their Easy edit sessions:

1. Modify the website's definition to specify that it be hosted by your iMIS application server as well:

   Go to RiSE > Site Builder > Manage websites:

1. Select the website you want to modify.
2. Click Edit.
3. In the URL(s) pointing to the IIS website root field, enter a comma-delimited list of URLs that point to the root of the iMIS application on your iMIS appserver and to the root of the iMIS content management application that you installed on each external web server. For example, if you already had two external web servers defined for this website, the list should look similar to the following when you have added the URL that points to your iMIS

appserver: http://www.my-
pub-
lic-
domain1.or-
g/wcm/,http://www.mypublicdomain2.org/wcm/,http://www.myiMISappserver.com/iMIS/

4. If using SSL, add the secure addresses to the Secure URL(s) pointing to the IIS website root field in the same order as above.

   Important: Restart IIS whenever you change the Secure URL(s) pointing to the IIS website root setting. Note that localhost is not a valid Secure URL.

5. Click Save to save your changes.
6. Click Cancel.
7. From the toolbar, click Publish.
8. Select Publish children as well? to publish all of the website's navigation items to the new instance of this website on the iMIS application server.
9. Click OK. Note that the website's content records will not be visible on this new instance until a later step. It may take up to 15 minutes for the public and internal sites to reflect the updated navigation.
10. Click Close.

2. Modify the definition of all content folders used by this website to also publish their content records to the new instance of this website on the iMIS application server. This will usually be only the website's root content folder (the one with the same name as the website itself), but your organization might also have some additional content folders that are used for content shared among several different websites. For each of these content folders, do the following:

1. Go to RiSE > Page Builder > Manage content.
2. Select the content folder you want to configure.

3. Click Edit.
4. From the Publish on Servers dropdown list:
   - If the current value is Inherit, do not change the value.
   - If the value is Custom, then leave all currently selected checkboxes and also select the checkbox for the publishing server code used by your iMIS application server.
5. Click Save to save your changes.
6. Click Cancel.
7. From the toolbar, select Publish.
8. Select Publish All Items to include all of the folder's content records.
9. Click OK.
10. Click Close. Repeat the steps for each content folder used by the website.

3. Make sure the website's template files exist on the public iMIS content management server, the appserver, and the internal iMIS content management server, if applicable. If the files are missing from any of the servers, manually copy the files to the corresponding locations.
4. Visit your public iMIS content management website and the appserver's website to verify that your changes are successful.
5. Advise your frequent Easy edit users to visit the URL for the iMIS appserver-hosted instance of the website and avoid using the public-facing URLs.

Complying with the EU's Electronic Privacy Directive

To comply with the EU Directive on Privacy and Electronic Communications, iMIS has added support for your organization to display a pop-up notification informing visitors that cookies are used on your site. This popup also includes a link to a longer sample privacy

policy we have provided. You can find more information about this law on the ICO web-site.

Setting up cookie notifications requires that you edit your master page, review (and modify as needed) the privacy policy provided, and add a JavaScript file to iMIS.

To display cookie notification popups

1. Edit the master page of your website (by default located in C:\Program Files (x86)\ASI\iMIS\Net\Templates\MasterPages) to add the following items:

- Just under the , add the following divs:

Note: You can edit this content to change the look and feel of the popup to match the design of your site.

```
<div id="EUCookieMessage" style="display: none;">
        <div id="EUCookiewarningBack" style='z-index:999; position:absolute; width:100%;height:100%;background: rgb(0, 0, 0) transparent;background: rgba(0, 0, 0, 0.6);filter:progid:DXImageTransform.Microsoft.gradient(startColorstr=#99000000, endColorstr=#99000000);-ms-filter: \"progid:DXImageTransform.Microsoft.gradient (startColorstr=#99000000, endColorstr=#99000000)\"'>
        <div id="EUCookiewarning" style-='margin:19%;padding:10px;width:62%;height:20%;background:white;color:black'>
        <span id="EUCookiewarningtext"></span>
        <a href="#" class="close-notify">Continue</a>
        </div>
        </div>
        </div>
```

- At the bottom of the master page, just before the line <!-- Facebook API is loaded into here -->, add the following JavaScript reference:

<script type="text/javascript" src="AsiCommon/Scripts/EUCookieWarning.js"></script>

2. Review the sample privacy policy provided as a content record in RiSE > Page Builder > Manage content (@/iCore/Privacy_Policy), and update it as needed for your organization.

   Note: If you need a privacy policy specific to your organization, copy the Privacy_Policy or create a new content record. Be sure to note the content folder where the content record is stored as you will need to reference it in the new JavaScript file (EUCookieWarning.js) shown in step below.

3. Create a JavaScript file named EUCookieWarning.js containing the code below, and add it to the Scripts folder (by default located in C:\Program Files (x86)\ASI\iMIS\Net\AsiCommon\Scripts).

   Note: The displayNotification function in this file contains the content of the popup notification displayed to users the first time they visit a page in your website. Be sure to update the privacy policy link in this message to point to the content record you want to display for this purpose. You can also edit the rest of the content for the needs of your organization.

```
function getCookie(c_name)
{
var i,x,y,ARRcookies=document.cookie.split(";");
for (i=0;i<ARRcookies.length;i++)
 {
 x=ARRcookies[i].substr(0,ARRcookies[i].indexOf("="));
 y=ARRcookies[i].substr(ARRcookies[i].indexOf("=")+1);
 x=x.replace(/^\s+|\s+$/g,"");
```

```
  if (x==c_name)
    {
    return unescape(y);
    }
  }
}

function displayNotification()
{
if (typeof jQuery('#EUCookieMessage' != 'undefined'))
{
      jQuery('#EUCookieMessage').fadeIn("slow");
      if (typeof jQuery('##EUCookiewarning #EUCookiewarningtext' != 'undefined'))
      {
            jQuery("#EUCookiewarning #EUCookiewarningtext").append("In order for this site to work correctly we need to store a small file - called a cookie - on your computer.<br/>");
            jQuery("#EUCookiewarning #EUCookiewarningtext").append("<br/>");
            jQuery("#EUCookiewarning #EUCookiewarningtext").append("We use cookies to store information to make your visit to this site richer and to personalize information according<br/>");
            jQuery("#EUCookiewarning #EUCookiewarningtext").append("to your interests. See our <a href=\"@/iCore/Privacy_Policy.aspx\" target=\"_blank\">privacy policy</a> for more information on what cookies are, how we use them<br/>");
```

```
        jQuery("#EUCookiewarning #EUCookiewarningtext").append("and how to change your preferences.<br/>");
        jQuery("#EUCookiewarning #EUCookiewarningtext").append("<br/>");
        jQuery("#EUCookiewarning #EUCookiewarningtext").append("By continuing to use this site you are consenting to our use of cookies.<br/>");
        jQuery("#EUCookiewarning #EUCookiewarningtext").append("<br/>");
    }
    var closeBtn = jQuery('#EUCookieMessage a.close-notify');
    closeBtn.click(function() {
    setCookie("IMISEUCookieConfirm",null,3650);
    jQuery('#EUCookieMessage').fadeOut("slow");
    return false;
        });
    }
}

function setCookie(c_name,value,exdays)
{
var exdate=new Date();
exdate.setDate(exdate.getDate() + exdays);
var c_value=escape(value) + ((exdays==null) ? "" : "; expires="+exdate.toUTCString());
document.cookie=c_name + "=" + c_value;
}
```

```
function checkCookie()
{
var cookieName="IMISEUCookieConfirm";
var cookieChk=getCookie(cookieName);
if ( typeof cookieChk === "undefined")
 {
 displayNotification();
 }
}

checkCookie();
```

Responsive Web Design

Austin_Responsive, Toronto_Responsive, and London_Responsive are the first responsive themes available in iMIS. Websites that use these themes, such as the Member Responsive site, are responsive by default – the layout and appearance changes based on the size of the device used to visit the site, so that the website looks good and is usable on any screen size.

The content in this section only applies to websites using a responsive theme in iMIS, whether it is the out-of-the-box Austin_Responsive, Toronto_Responsive or London_Responsive theme, a modified copy of them, or an original theme you have created to be responsive.

The topics that follow cover some general Responsive Web Design concepts and describe the elements in iMIS that are responsive or can be configured to be responsive as needed, including:

- Responsive layouts – iMIS content layouts define a grid structure for the body of a web page. They determine how many rows or columns each page will have. A responsive layout adjusts that structure fluidly based on the size of the device or browser used to visit the site.
- Responsive content – Many content items in iMIS respond to screen sizes automatically. You can also configure content items and HTML content to show or hide content based on the size of the device or browser used to access the content.
- Responsive navigation – The navigation is responsive. This includes elements like the primary, auxiliary, and secondary navigation.

  Responsive Web Design concepts

  Responsive Web Design (RWD) is an approach for creating websites that provide an optimal viewing experience – easy reading and navigation with a minimum of resizing, panning, and scrolling across a wide range of devices, from mobile phones and tablets to desktop computer monitors.

  Creating websites specific to the physical limitations of a variety of devices – different hardware, with different screen sizes, with different resolutions – causes increased maintenance.

  A site designed with RWD adapts the layout to the viewing environment by using fluid, proportion-based grids, flexible images, and CSS3 media queries.

  The fluid grid concept calls for page-element sizing to be in relative units, such as percentages, rather than absolute units, such as pixels or points.

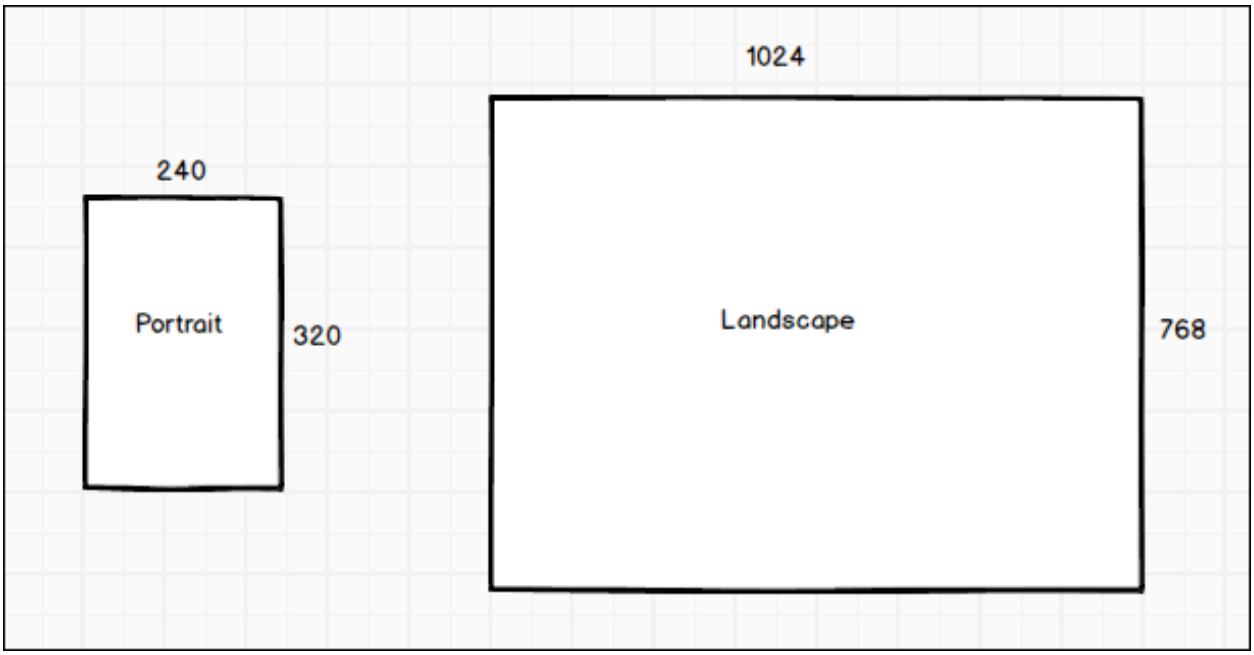
  Flexible images are also sized in relative units, to prevent them from displaying outside their containing element.

  In iMIS RWD sites, we use media queries to apply different CSS styles based on the dimensions of the device the site is being displayed on.

  For more detailed information about the concept of Responsive Web Design, see http://alistapart.com/article/responsive-web-design by Ethan Marcotte.

  What does Responsive Web Design respond to?

New devices with new screen sizes are being developed every day, and each of these devices might handle variations in size, functionality and even color. Many new devices are able to switch from portrait to landscape at the user's discretion.



In addition to both landscape and portrait orientations, consider the hundreds of different screen sizes.

RWD sites respond to both the size and orientation of the device used to access the web-site.

Does RWD affect Accessibility?

A responsive site does not automatically meet accessibility guidelines just because it is responsive.

But responsive Web design and accessibility are ways of making a site flexible. When designing a responsive Web page, Web designers begin by thinking about Web pages as a collection of elements that can be rearranged. When designing a Web page to meet accessibility requirements, Web designers begin by thinking about different ways a user might interact with a Web site.

Regardless of how responsive a web site is, if the data and content you are trying to convey to the user are not thought out and planned correctly, you can still have accessibility issues. Responsive design is about content and interaction, about look and feel, regardless of the device on which the content is being accessed.

Responsive layouts

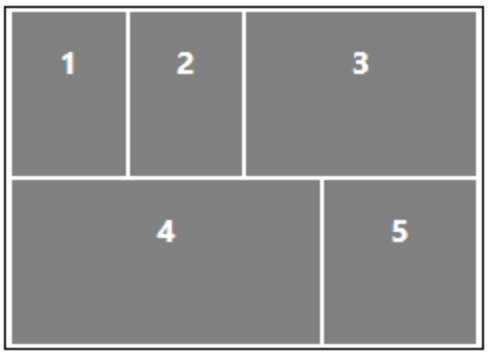
iMIS content layouts define a grid structure for the body of a web page. They determine how many rows or columns each page will have. A responsive layout adjusts that structure fluidly in response to the size of the browser or device used to visit the site.

The out-of-the-box content layouts available in iMIS are based on the Bootstrap grid system. These work in any website, but when used within an iMIS theme specifically created to be responsive, such as Austin Responsive, then you can take full advantage of this fluid, percentage-based grid system.

There are three parts to the content layout grid:

- A container (defined in the master page)
- Any number of rows within the container
- Up to twelve columns per row

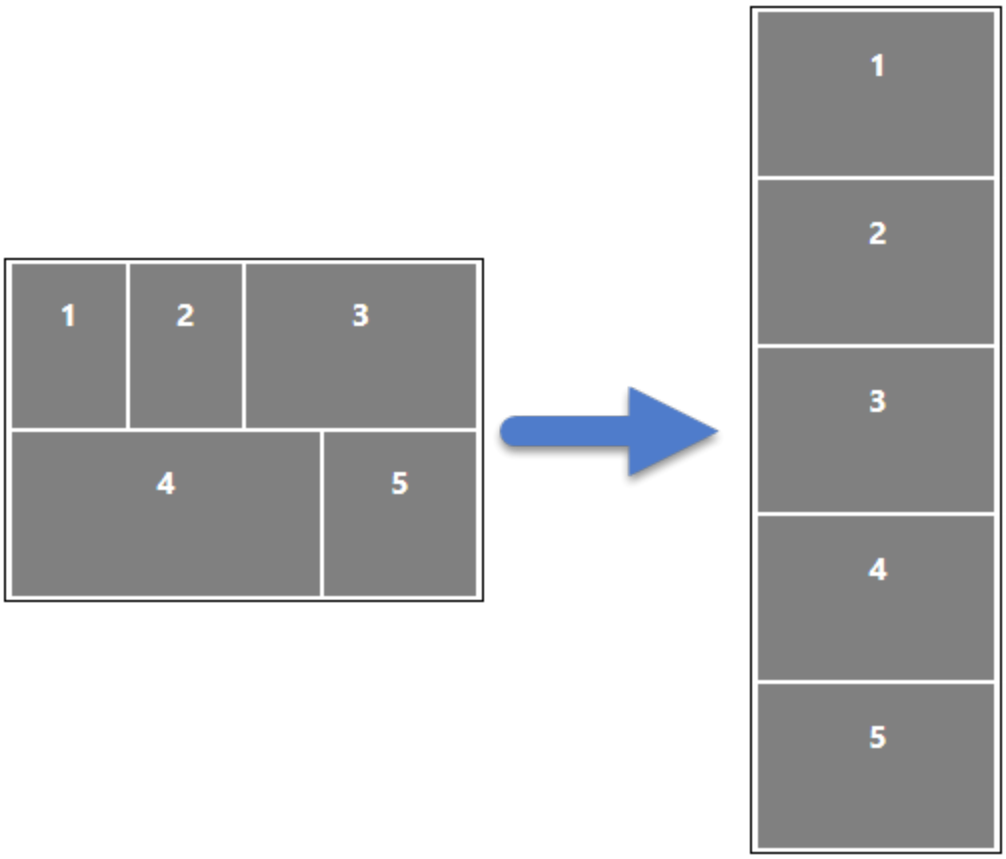
The following is an example of a content layout:



Each numbered section is a column. Columns 1, 2, and 3 are in one row, and columns 4 and 5 are in the second row. Each numbered section can contain different types of content, whether it is a content item or HTML content.

When you resize a page that contains a responsive layout:

- The width of each column adjusts proportionally to the rest of the page and expands or contracts accordingly.
- When the page is resized to a width less than 768px (or if you visit the site using a device that has a width smaller than 768px), then each of the columns collapse into a single column as shown below.



The best part of this system is that it just works. You do not need to do anything special to use responsive layouts in your website. When you create a new piece of content and select any of the out-of-the-box layouts, the layout will automatically have everything you need for your content to be responsive. You can also create new layouts if needed. For more information, see Defining layouts and Creating custom layouts using Bootstrap grids.

Responsive content

Users can configure any of their websites that use a responsive theme to selectively show or hide various content based on the screen size of the browser or device used to visit the site. For example, an organization might want to have two versions of the About Us content: a longer About Us description when a user is visiting the site using a large or medium-sized screen, and a shorter description when the user is visiting using a smaller screen, for example, on a mobile device. On the Directory page, an organization might want to show more detailed results on larger screens, and less detailed results, with a smaller number of columns, on smaller screens.

iMIS provides two ways to accomplish this:

- Many dynamic content items include a configuration option that allows you to show or hide the content item on different screen sizes.
- iMIS also provides four utility classes that you can use within any dynamic content item that supports HTML editing.

When designing content for your responsive website, we suggest making your pages as small as possible. The goal is to create pages that work well on all device sizes. However, when needed, you can use these options and classes to hide content on particular screen sizes if something does not work with the overall design. Be careful when using these options, however: they only hide content. These options do not prevent content from being downloaded. This means that even though you can configure a page to look simplified on small devices, the page size can still be fairly large, which could lead to slower performance. You should only use these options to improve the UI design when needed, not to minimize page size.

Configuring display options in content items

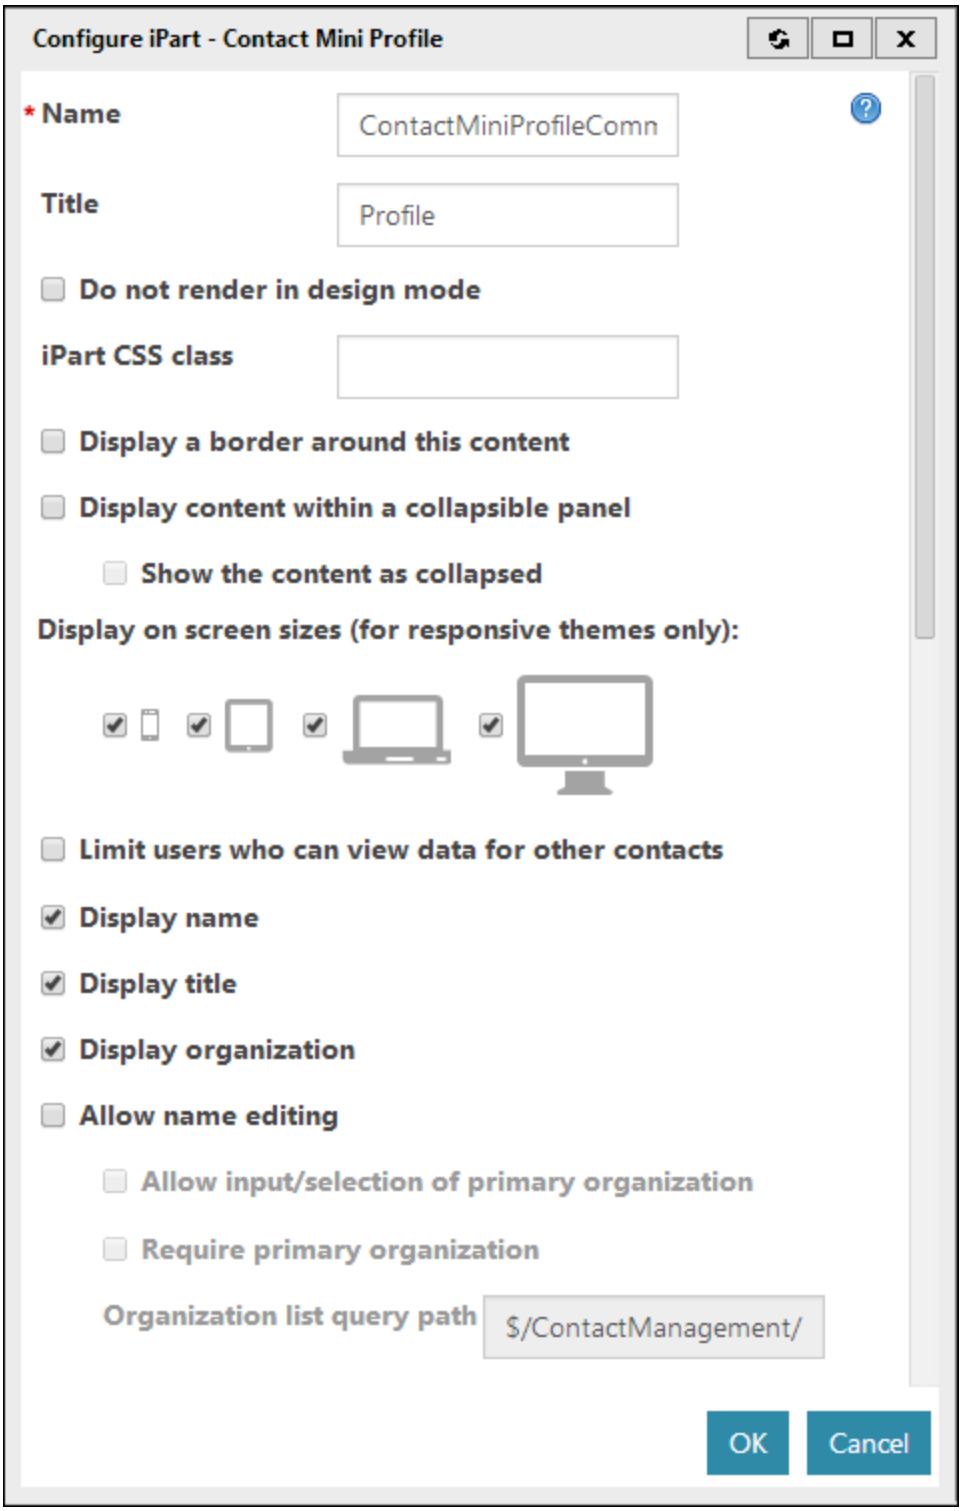
You can select how dynamic content items are displayed on various devices. Many content items provide a configuration option where you can choose how your content items are displayed.

Select one of the following display options:

- Extra-small screens – When disabled, this content item is hidden on extra small devices, such as smartphones, where the width of the screen is less than 768px.
- Small screens – When disabled, this content item is hidden on small devices, such as tablets, where the width of the screen is greater than 768px and less than 991px.
- Medium screens – When disabled, this content item is hidden on medium devices, such as laptops, where the width of the screen is greater than 992px and less than 1199px.
- Large screens – When disabled, this content item is hidden on large devices, such as wide computer monitors, where the width of the screen is greater than or equal to 1200px.

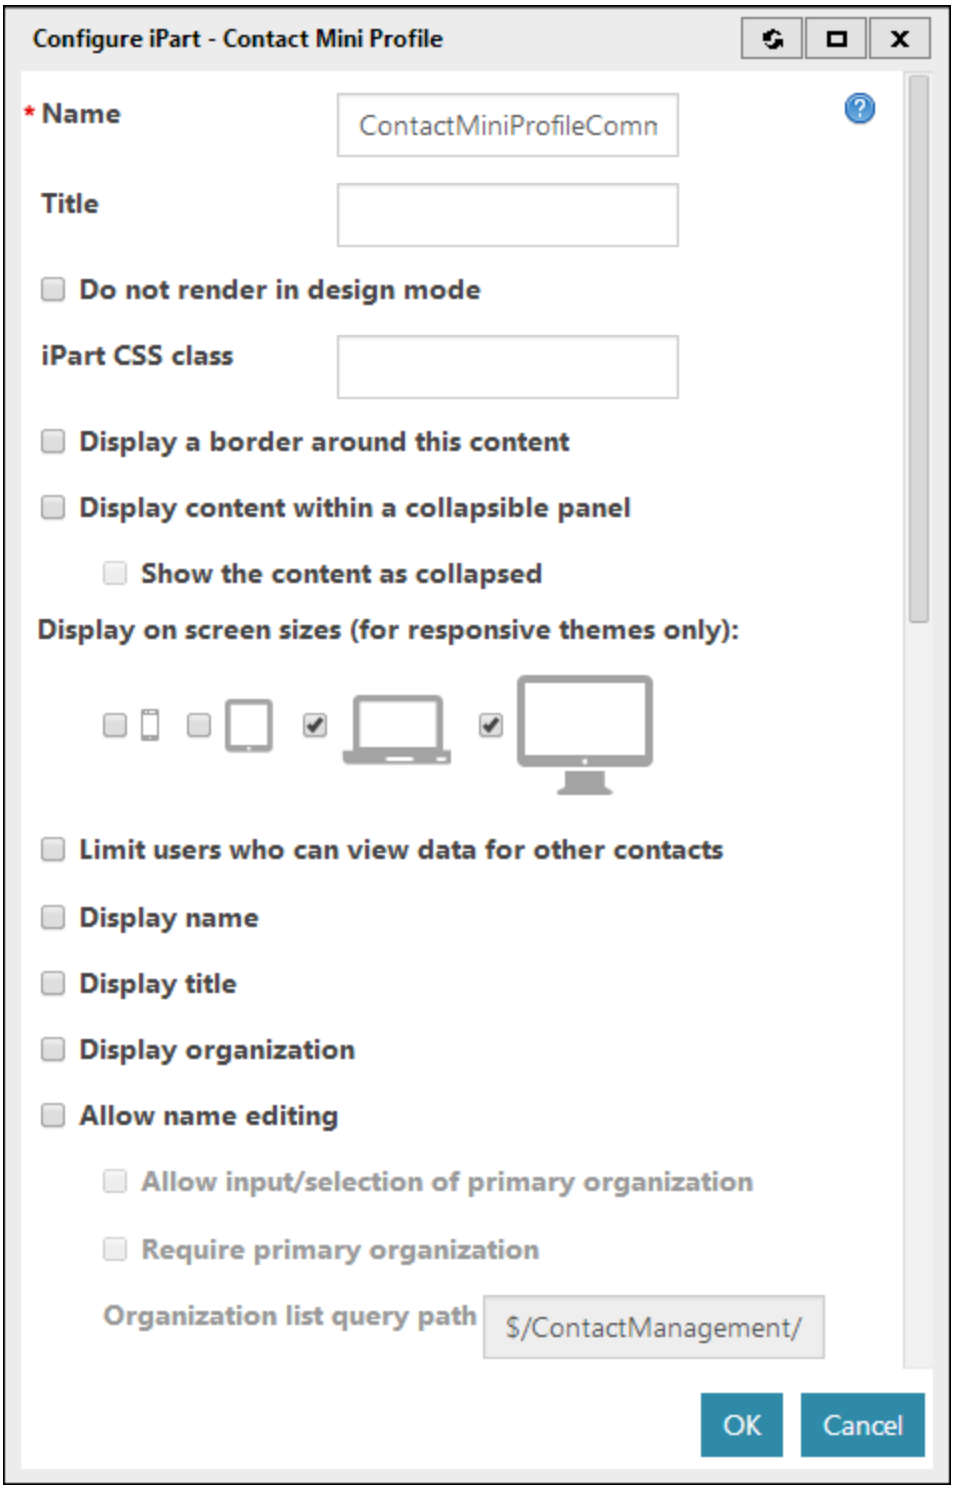
> **Note:** Note: When Easy Edit is enabled, all content items for a page are displayed, regardless of the Display on screen sizes (for responsive themes only) options that are selected.

For example, you might want to make a contact profile page that displays less information on smaller devices. You can accomplish that by using two Contact Mini Profile content items and the screen display configuration options. Add two Contact Mini Profile content items to a page on the member site. Configure the first content item to only display the user's name, title, organization, and profile picture, then enable it to be shown on all screen sizes.

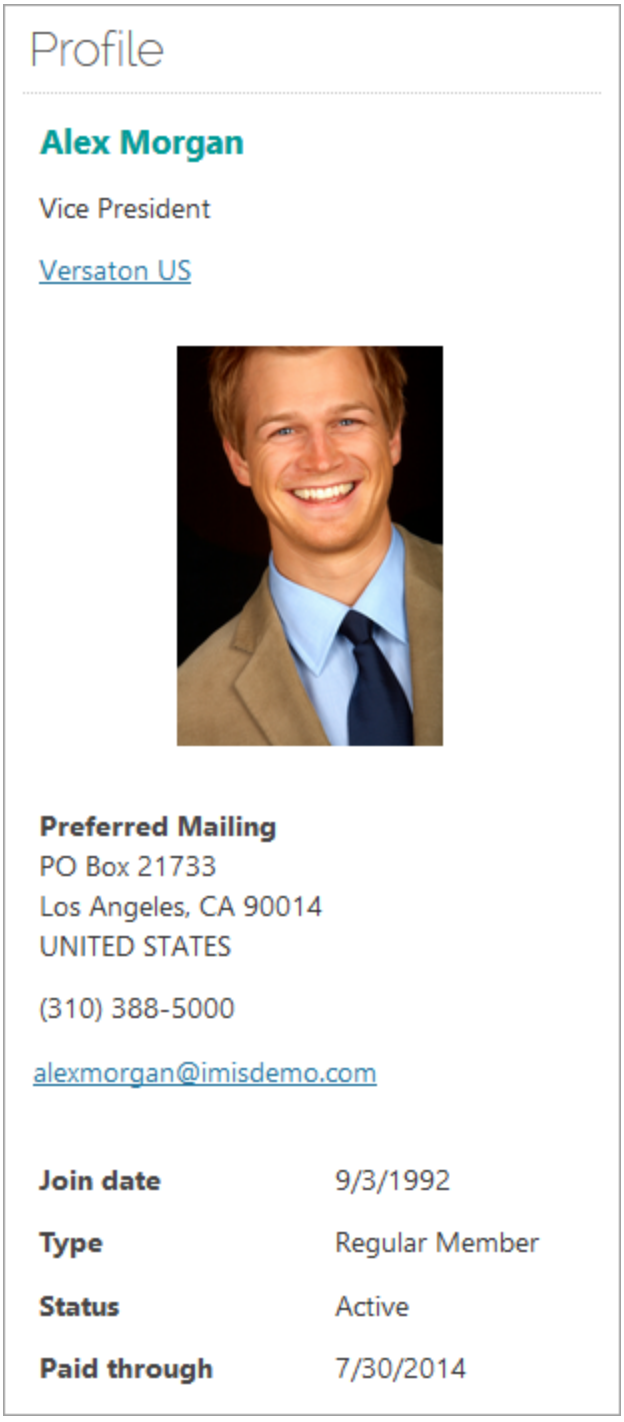


Now add a second Contact Mini Profile content item on that same page. This time, configure the content item to not display the contact's name, title, organization, and picture,

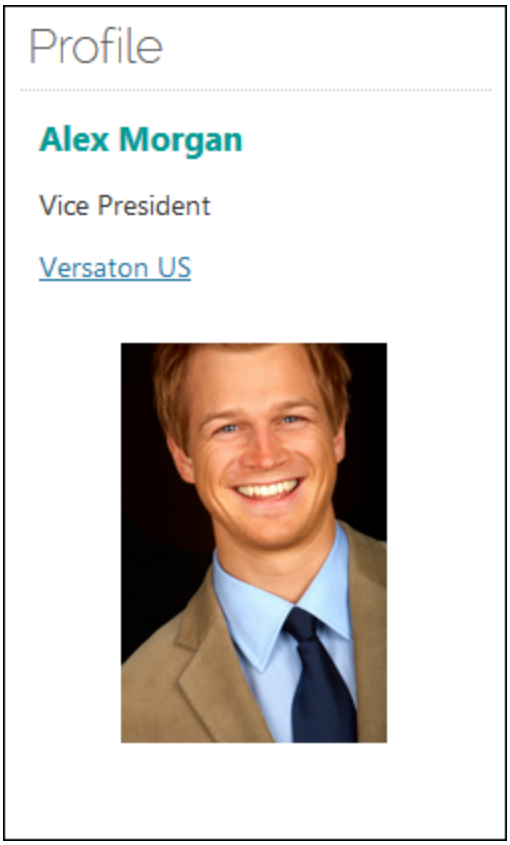
but enable it to display all of the other Mini Profile options, such as displaying the user's address, join date, and paid through date. Only enable this content item to display on medium and large screen sizes.



After adding this page to your responsive website, users that visit the page using large or medium sized screens, such as like desktop monitors or laptops, will see a longer version of the Mini Profile.



Users that visit the page using extra-small or small sized screens (like mobile devices or tablets) will see a shorter version of the profile, because the second Mini Profile that contains the more detailed information will be hidden.



Applying display utility classes in HTML

iMIS provides four utility classes that you can use within any dynamic content item that supports HTML editing or within any content record zone (using the Zone CSS class), so that you can have granular control over the content that is shown on various screen sizes.

> **Note:** Note: These classes only work when applied to block-level elements. Use with inline and table elements is currently not supported.

- hidden-xs – When applied to any page element, the contents are hidden on extra small devices, such as smartphones, where the width of the screen is less than 768px.

- hidden-sm – When applied to any page element, the contents are hidden on small devices, such as tablets, where the width of the screen is greater than 768px and less than 991px.
- hidden-md – When applied to any page element, the contents are hidden on medium devices, such as laptops, where the width of the screen is greater than 992px and less than 1199px.
- hidden-lg – When applied to any page element, the contents are hidden on large devices, such as wide computer monitors, where the width of the screen is greater than or equal to 1200px.

Classes	Extra Small Devices Smartphones (less than 768px)	Small Devices Tablets (greater than or equal to 768px)	Medium Devices Laptops (greater than or equal to 992px)	Large Devices Desktop monitors (greater than or equal to 1200px)
hidden-xs	Hidden	Visible	Visible	Visible
hidden-sm	Visible	Hidden	Visible	Visible
hidden-md	Visible	Visible	Hidden	Visible
hidden-lg	Visible	Visible	Visible	Hidden

To configure your responsive website to selectively show or hide various content based on the screen size of the device used to visit the site, open the content item and select the <>HTML tab. This allows you to directly edit the HTML content. For any content that you want to hide on a particular screen size, apply the appropriate class to either a specific tag or to a div tag surrounding a group of elements you want to hide.

For example, consider a page like the following:

<h1>Our Association</h1>

We are the leading association for the industry. We help professionals develop their skills and further their careers by providing access to unique and relevant content and exclusive member services. We provide continuity and support, guidance and leadership development opportunities to over 200 local and regional chapters.

Our independent non-profit association was created to provide leadership for the development, promotion, and improvement of our profession. Our strategic plan calls for continued work in the areas of advocacy, diversity, education, and organizational excellence.

If a user wants to hide the second paragraph on extra-small devices, apply the hidden-xs class to the paragraph:

Our independent non-profit association was created to provide leadership for the development, promotion, and improvement of our profession. Our strategic plan calls for continued work in the areas of advocacy, diversity, education, and organizational excellence.

When displayed in a browser, that paragraph will display on all screen sizes, except for extra-small screens, such as smartphones.

Responsive navigation

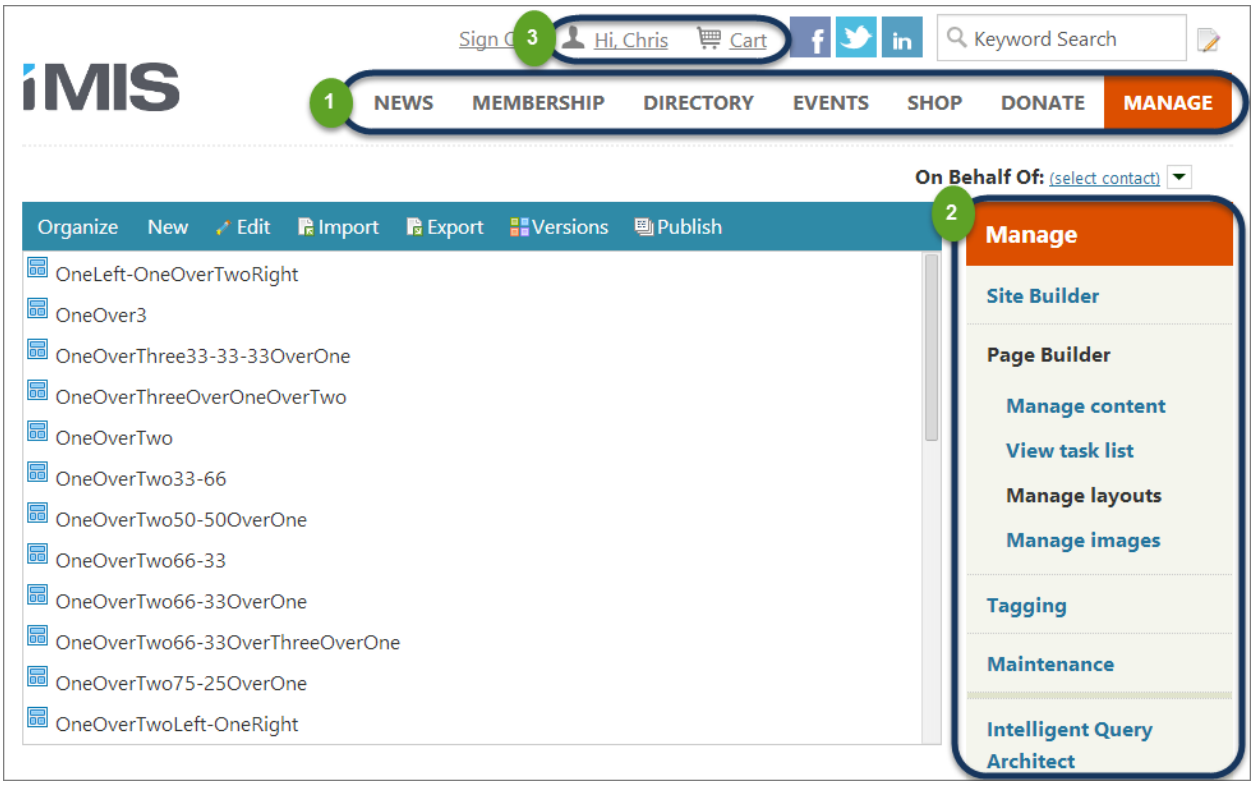
iMIS has three levels of responsive navigation in responsive-themed websites. The list below describes the out-of-the-box behavior of navigation in the Austin Responsive theme.

- Primary navigation – On larger screens and devices, the primary navigation displays along the top of the page. But when resized below 768px, the primary navigation is hidden within a toggle on your website which remains hidden until the toggle is clicked.

- Sub-navigation – If any of the primary navigation items have sub-navigation, then these items are displayed on the page in two ways: 1) when you hover over the primary navigation item (most useful for Desktop users) and 2) on the page itself (most useful for touchscreen devices, some of which do not support hovering). In the Austin Responsive theme, the sub-navigation moves from the right column on larger displays to the bottom of the page on displays smaller than 768px wide.
- Auxiliary navigation – On larger screens and devices, the auxiliary navigation displays at the very top of the page. When resized to a width below 768px, navigation icons are displayed in place of the text.

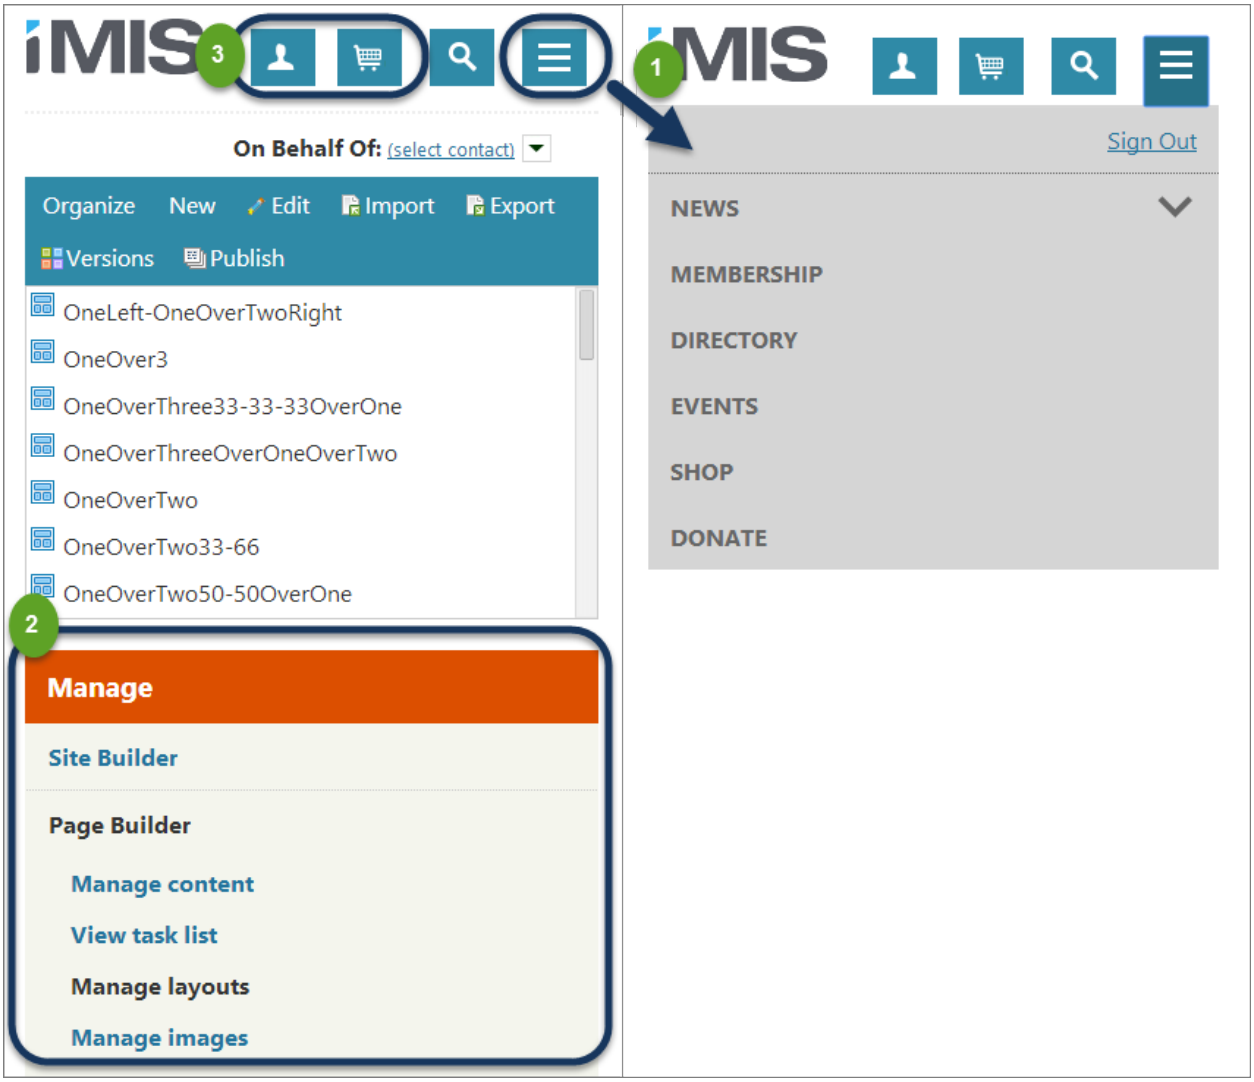
  The following image demonstrates the navigation areas in the Austin Responsive theme on a wider screen size:

- (1) Primary navigation
- (2) Sub-navigation
- (3) Auxiliary navigation



The following image demonstrates the navigation areas in the Austin Responsive theme on a smaller screen size to demonstrate how the navigation areas move around to accommodate less screen real estate:

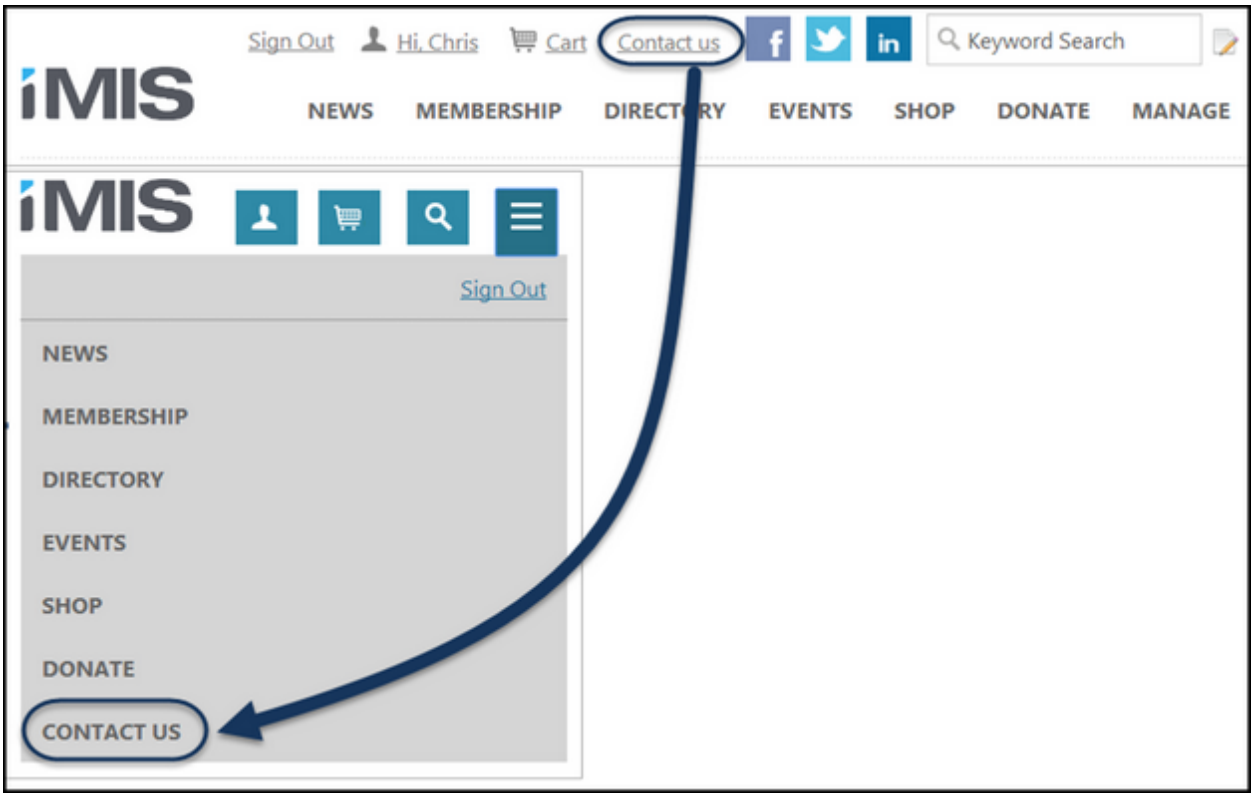
- (1) Primary navigation (a toggle that when clicked expands to display the primary navigation items)
- (2) Sub-navigation
- (3) Auxiliary navigation



Responsive navigation utility classes

If you want to implement your own auxiliary navigation items in your site that mimic the style of the out-of-the-box auxiliary navigation items provided in the Member Responsive site, you can use the following utility classes. To use these classes, enter the value in the CSS Class field when defining the navigation item in Manage sitemaps.

- The class nav-aux-account adds a Person icon to the left of the navigation item in the auxiliary menu.
- The class nav-aux-cart will add a Cart icon to the left of the navigation item. This class displays the quantity of items in the cart above the cart icon when the user has any items in their cart.
- The class nav-aux-button, when added to either of these classes, changes the link to a button when the screen has a small width. For example, in the account link navigation item, enter nav-aux-account nav-aux-button. This will create an account button.
- The class nav-aux-primary-switch moves a navigation item from the auxiliary navigation area to the primary navigation area when the screen size is less than 768px wide. To use this class, configure your navigation item to not be hidden, and to display in the auxiliary navigation area.



Website concepts

The terms described in this section explain the basic concepts of iMIS content management.

Concept: master pages and themes

The look and feel of an iMIS content management website comprises the general page layout, colors, graphics, and fonts used for all rendered pages in the website. This look and feel is defined by the design's master page and theme. Master pages and themes are basic elements of ASP.NET websites, and detailed information about developing and customizing master pages and themes can be found in Microsoft developer resources for ASP.NET development such as the Microsoft Developer Network.

- If you want to customize one of the out-of-the-box themes, we recommend that you start with a copy, so that your changes are preserved when you upgrade. See Copying a website theme for more information.

- If you prefer to use your own hand-built master pages and themes, you must first place them in the appropriate MasterPages and App_Themes folders beneath the IIS website root that you plan to associate with this iMIS content management website. This ensures that the master pages and themes are available for selection when defining the properties of the website. You must also ensure that the master pages meet all requirements for compatibility with iMIS content management.

  The master page is an ASP.NET file that specifies the general page layout of all pages in the website. Do not confuse this with the content layout used for the main content area of each page. The master page defines everything that appears on a rendered page, and where they appear, except for two things:

- The rendered content visible in the Main Content Area of each page is controlled by the navigation item for that page. The master page defines only where this content area appears on the website pages, and the content area's exact dimensions.
- The navigation items in the website's sitemap define the actual navigation link text and breadcrumb text shown in the navigation areas. The master page defines only the location, appearance, and behavior of the available navigation areas for the website. Which of the available navigation areas are actually used for the website is defined in the properties of the website itself, and each navigation item specifies the exact navigation areas in which it is displayed.

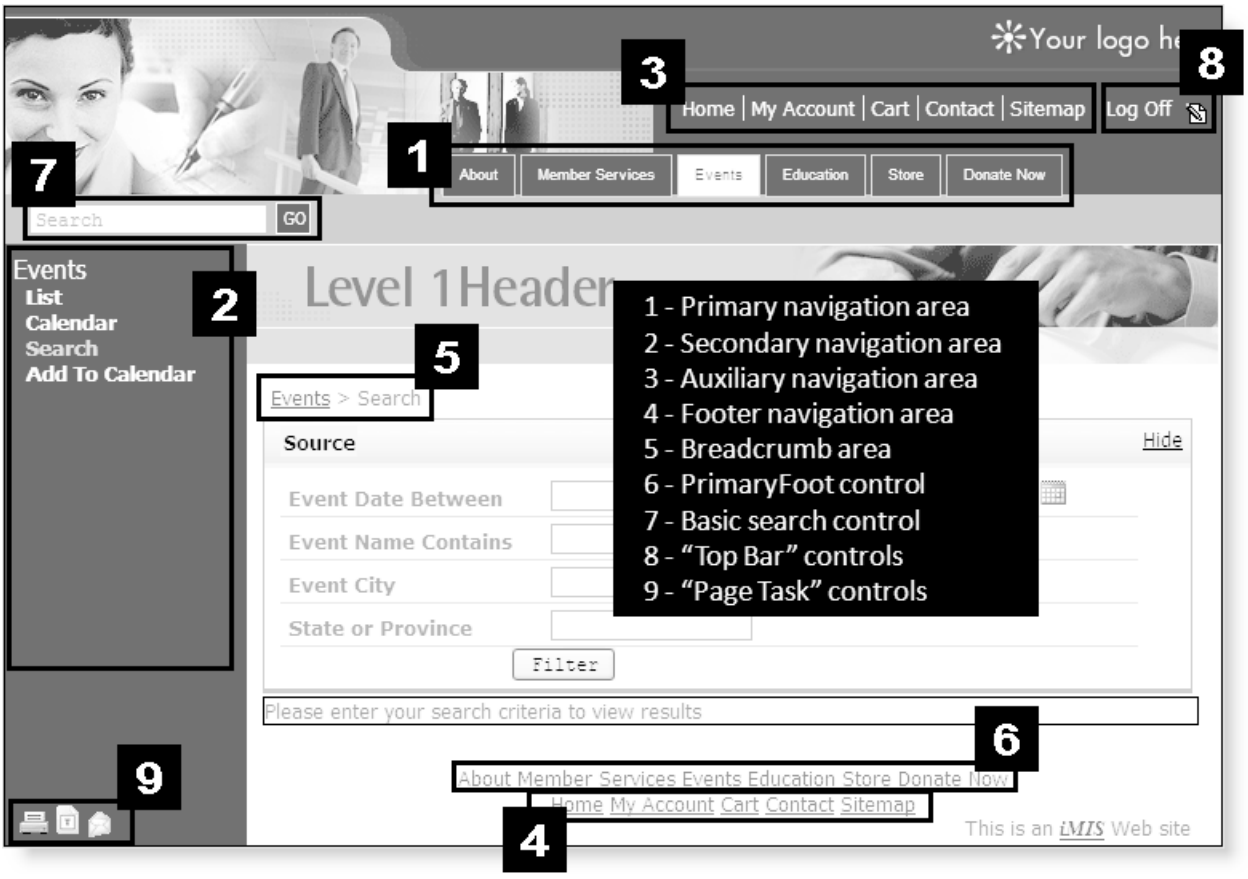
  The theme is a collection of files that specify exactly which colors, graphics, and fonts are used in all rendered website pages, giving them a consistent appearance. The theme comprises all the cascading style sheets used by the master page and available for use in a content layout's content item zones and content items, as well as all the graphics used by the master page, as opposed to graphics used in content records. Some themes might also include ASP.NET skin files, which define property settings for ASP.NET Web server controls.

Concept: navigation areas and breadcrumb areas

Navigation areas are special ASI-developed controls used in master pages that create automated lists of navigation links. All ASI-developed master pages are designed to

support the four default navigation areas and the breadcrumb area shown in the following diagram, but you can define up to 30 navigation areas in the system and add the corresponding elements to support those navigation areas to any master page.

The breadcrumb area appears automatically on every site, but you must specify exactly which navigation areas to enable globally for use by the navigation items in the website's sitemap. The four default navigation areas provided with iMIS content management are shown in the following diagram:



When a navigation area is globally enabled in the definition for an iMIS content management website, a checkbox representing that navigation area becomes available for selection when you are defining navigation items in the sitemap for the website. Whether a particular navigation item actually appears in one of the enabled navigation areas of the website is determined by the specific navigation area checkboxes you select for that navigation item when you are defining it.

All master pages fully support the breadcrumb area and all four of the default navigation areas. However, if you modify the definition of any of the default navigation areas in iMIS content management, you might need to revise the master pages to support the changes that you have made.

To integrate your own hand-built master pages with iMIS content management, if you plan to use the breadcrumb area and navigation areas available to iMIS content management websites, you must ensure that you add the appropriate elements to your master page to support them. Similarly, if you define additional navigation areas in iMIS content management, you must modify your master pages to support these additional navigation areas.

Note: Note: The controls that display the Logon/Logoff link and the icon that toggles Easy edit mode, both of which appear by default at the right of the Auxiliary navigation area, are not a part of the Auxiliary navigation area, so they are unaffected if you remove or move the location of this navigation area.

Concept: publishing iMIS content

When you create or change an existing iMIS content management website, navigation item, content folder, content record, or any other iMIS content management definition object in the Document System and click Save, nothing happens except that iMIS stores a Working version of that object in the iMIS database. It is only when you click Publish that iMIS actually implements the new version of the definition object, replacing the previous Published version of the object with this new Working version and then marking it with a status of Published to indicate that it is now the current active version.

When you publish the various types of iMIS content management definition objects, different things happen depending on what type of object is published.

Note: Note: The following descriptions generally apply to the publishing option Publish Working Items Only. If you select either of the other publishing options, then objects in any state are published.

- Websites – No downstream processes happen other than iMIS content management creates a corresponding sitemap if it is an entirely new website, so that you have a structure into which you can add navigation items. If you have developed your own custom master pages and themes, the people in your organization who perform website administration should have already placed the necessary files on the servers that will host the website.
- Navigation items – When a browser first requests a website URL from the iMIS application server or an external web server that has been prepared to host iMIS content management websites, the iMIS content management code on that server examines the Published sitemap object in the iMIS database and then builds a corresponding in-memory representation of the sitemap's navigation structure. A timer process then rechecks the iMIS database every five minutes by default to determine whether a newer version of the sitemap object has been published, and, if so, the iMIS content management code on that server rebuilds its in-memory sitemap structure for that website.

  Note: You can change this default five-minute polling interval if desired, but be aware that each polling process consumes a small amount of system resources so there is a performance tradeoff in specifying a more frequent polling interval. To change the polling interval, edit the value of the Sitemap.CachePeriod key (expressed in minutes) in the <SystemParams> declaration in the web.config file for the iMIS application (IIS application \iMIS).
- Content folders – No downstream processes happen other than iMIS checks the status of all descendant content records and sub folders and if iMIS finds any that are currently in a Working state, iMIS automatically publishes them as well. This enables you to spend several days working on a major change to your website content that encompasses many content records, and then publish all those changes in one action by publishing a content folder high enough in the folder hierarchy to cover all the content records that are in a Working state.

  Changes made to the Access Settings of a content folder that are applied to all descendants are saved to the Published descendant content records without the need to republish each record. Security checks to determine whether the rendered version of a content record should be served to the requesting browser are performed by examining the

current Access Setting values of the Published content record object in the iMIS database.

- Content records – iMIS checks the value of the Publish on Servers field in the parent content folder to determine which publishing servers should handle the publishing of the content record. iMIS then creates a separate publishing request in the iMIS database for each associated publishing server. The initial polling of data happens only when the AsiScheduler starts. After that, changes in the database trigger a PUSH to AsiScheduler.

  If so, the publishing service examines the Published content record object in the iMIS database and then renders a corresponding .aspx file and places that file in the appropriate location in the server's local file system so that IIS can serve that page to browsers that request the content record's corresponding navigation item link.

  Note: You can change this default five-minute polling interval if desired, but be aware that each polling process consumes a small amount of system resources so there is a performance tradeoff in specifying a more frequent polling interval. To change the polling interval, edit the definition for the corresponding publishing server and specify the desired polling interval in the Frequency field.

  Note: The iMIS content management configuration field CM.PublishingMaxNumOfAttempts (located in Set up content management > Page Builder configuration) determines how many times each publishing service will attempt to process a system publishing request before it flags the request as failed. This prevents overconsumption of system resources if there is a connection issue or other issue that is preventing the publishing service from successfully processing the request.

- Content layouts – No downstream processes happen. When you define a content record, iMIS populates the list of available Page Layouts by examining all the Published versions of content layout objects in the iMIS database.

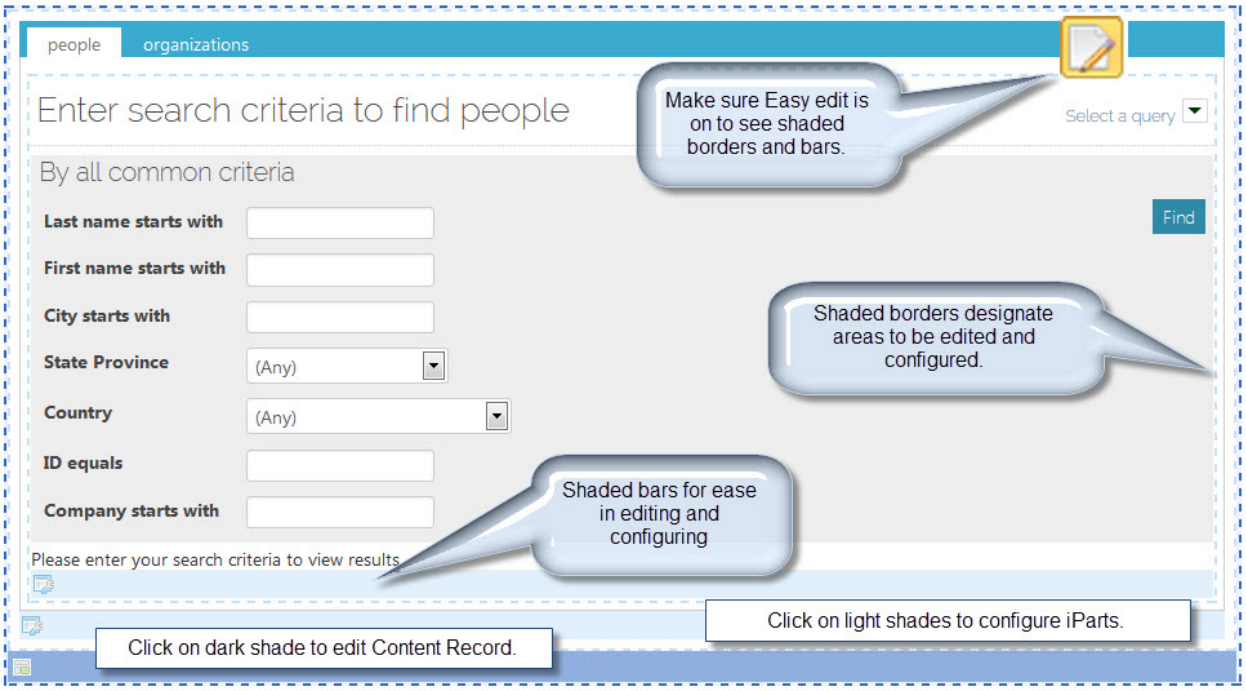
- Content types – No downstream processes happen. When you define a content record, iMIS examines the Published content type objects in the iMIS database to determine how to display the corresponding content item when added to the content record.

- Tagged list formats – No downstream processes happen. When you add a ContentTaggedList content item to a content record, iMIS populates the list of available List Formats by examining all the Published tagged list format objects in the iMIS database.

Concept: Easy edit

The Easy edit feature enables you to browse, or surf, to update your content records in their rendered form. You can quickly open a web page's underlying content record (or even a specific content item within the content record) for editing. When you have saved your changes, you can continue surfing the website and making further content revisions as needed.

Full, Casual and Public users of iMIS can use the Easy edit feature, provided they are members of at least one content authority group (CAG) and they have been granted the necessary Document System permissions on content records. This is the only way that Casual and Public users can define iMIS content management content.



Concept: user-defined fields (UDFs)

User-defined fields (UDFs) in iMIS content management are created differently, and serve a very different purpose, than user-defined fields in iMIS contact records:

- The UDFs found in iMIS contact records enable you to collect custom information about a contact. These contact UDFs are not available for use in iMIS content management.
- The UDFs found in iMIS content management are primarily useful as a way to capture additional properties of the content in content records, and to provide a controlled list of search criteria for use in iMIS content management only. These iMIS content management UDFs can be used in three ways:
- As a value added to the keywords <META> element in the rendered page for the content record, which enables searches performed through the iMIS content management search engine (but not by typical external web-based search engines) to locate the content record by searching for this value. This behavior is controlled by the Use in Search? property of an iMIS content management UDF.
- As a search filter in AdvancedSearch content items, applied to the initial result set based on the tags and keywords specified in the search.
- As both filtering criteria and sorting criteria in ContentTaggedList content items. A date-oriented UDF can be used to filter the initial result set based on the chosen tags, and a different UDF of any type can be used to sort the the final result set.

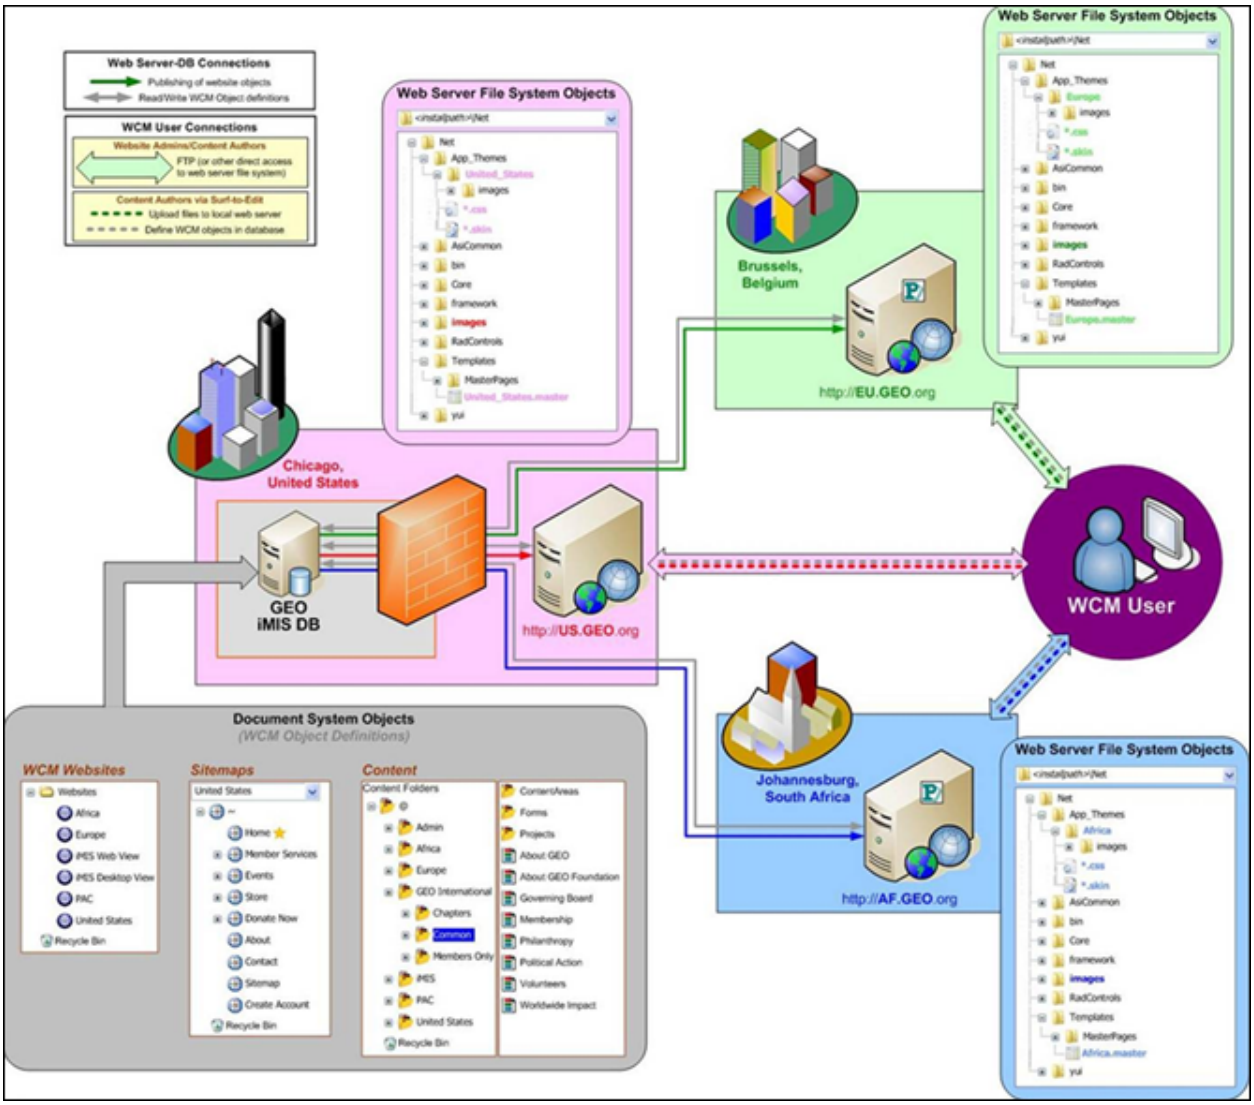
  Every UDF defined in iMIS content management is added as a new custom property to every content record, and can be displayed in a wide variety of formats, from a simple text field to a drop-down list, to a calendar control, to a set of radio buttons, and so on. In the advanced search panel rendered from an AdvancedSearch content item, the user-defined field appears exactly the same way that it does in content records. This enables iMIS content management website users to specify UDF values for advanced searches in the same manner that the UDF values are chosen when authoring content. For example, a date-oriented UDF will have a calendar control that makes it easy to select a date.

Concept: websites and web server interaction with iMIS

An iMIS content management website is slightly different from a Microsoft Internet Information Services (IIS) website. While the rendered output of an iMIS content management website provides a total website experience for visitors to the site, a single iMIS content management website can actually be hosted on multiple web servers even though you

are only maintaining a single website in your iMIS content management environment. Within the internal structure of IIS, an iMIS content management website is usually maintained as a subset of the iMIS application, but you can configure IIS to host iMIS content management websites as individual IIS applications or even as individual IIS websites.

The following diagram illustrates the connection points between multiple IIS web servers that host *iMIS* content management websites, the *iMIS* database, and users.



Creating your own websites

This section guides you in developing, implementing, and maintaining your websites.

Working with RiSE Sites

Because new and improved iParts and features are added to iMIS with every update, iMIS installs sample sites and a demo database that, together, fully demonstrate the more complex enhancements. These sample sites and data will remain synchronized with the ever-evolving state of iMIS, and will showcase new iParts, functionality, and UI improvements as they become available.

Using sample sites

iMIS installs with sample sites, such as Member and Member Mobile. The Member site shows how to build a RiSE site for your members and how to combine related iParts for features such as Commerce and Events. The Member Mobile site shows how to build a site optimized for mobile devices, such as smart phones and tablets.

It is easy to create your own customized website by using and copying a sample site. For detailed instructions on this process, see the topic Creating a site.

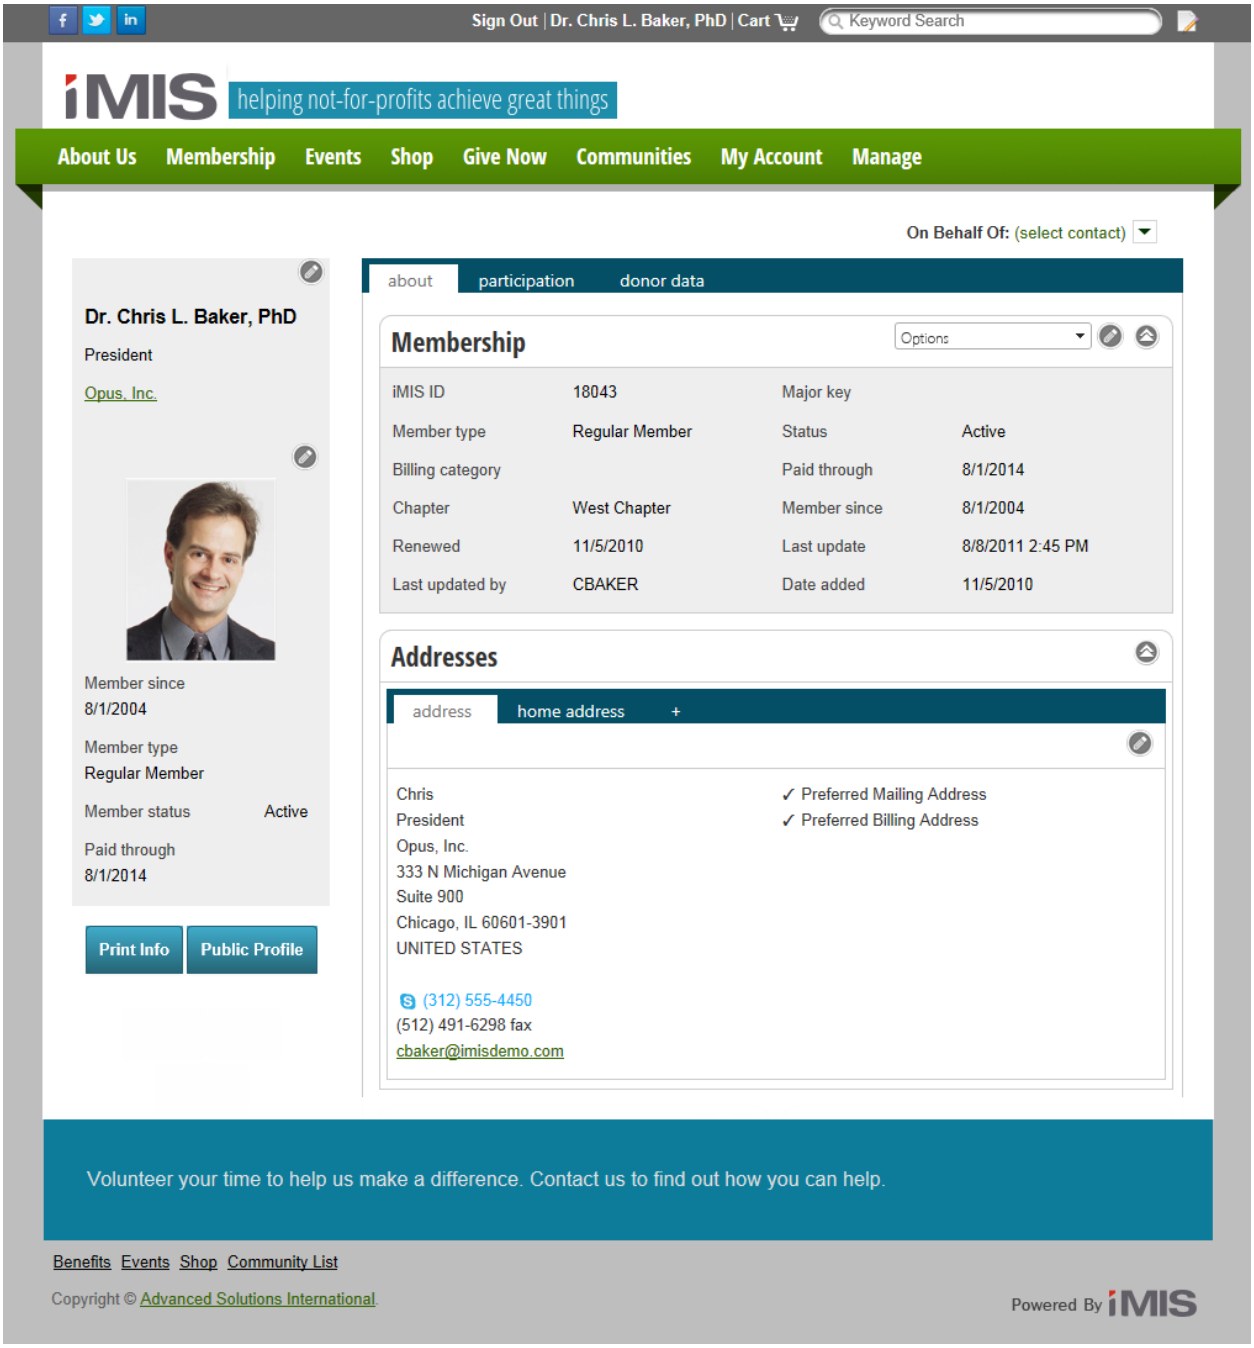
> **Note:** Note: By default, the starter sample sites are marked as Inactive. If you want to use a sample site, copy the site and enable the Is this website active option (RiSE > Manage websites > click the expand icon in the Status area).

By browsing to your Member site (http://yourvirtualroot/mbr), and to your Member Mobile site (http://yourvirtualroot/mobile), you can see how the iParts and pages present your current users and content. For example, if you have events currently defined and set to Show on web, you will see them populated on the Events page.

> **Note:** Tip: Upgrades overwrite the Member and Member Mobile sites, but you can add new content records and navigation items to the site for your own testing purposes. Upgrades will preserve your test objects.

Member site

The Member site offers a rich self-service experience for your members and prospects. This site enables you to choose from a variety of visual themes, change navigation in just a few clicks, and add any number of query-driven iParts to present dynamic information to your site visitors.



Member Mobile site

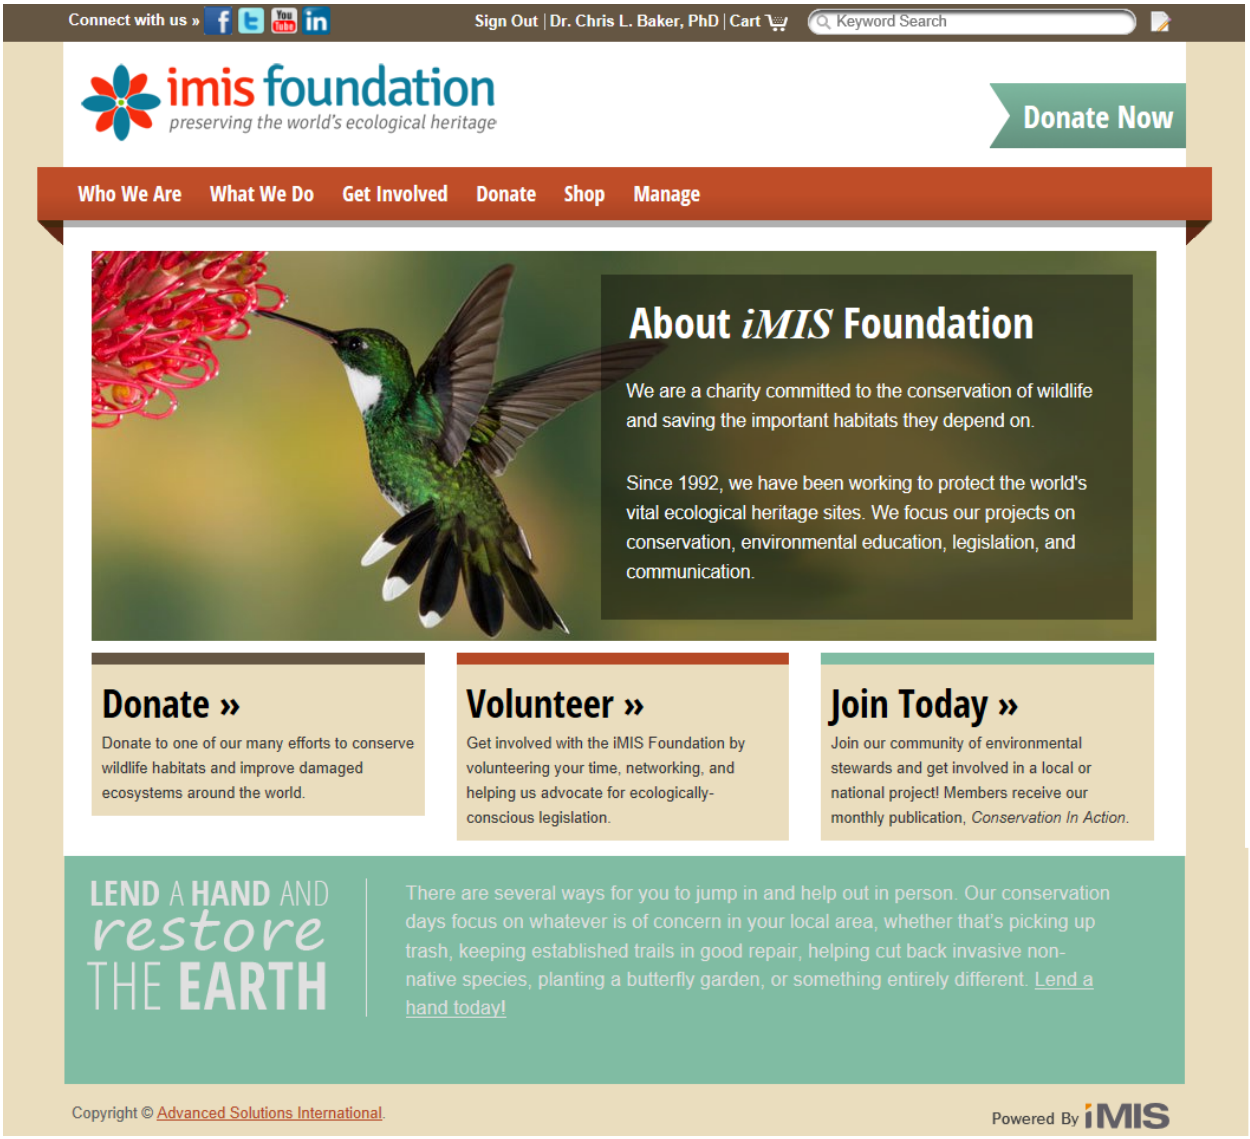
The Member Mobile site renders a version of the Member site that is optimized behaviorally and formatted for use on smart phones and tablets. This site is accessible by your members and by your staff who are working off-site or on the run.

Upcoming Spring Conference

Don't miss out on this year's annual spring conference! The program includes plenty of networking opportunities, workshops to sharpen your skills and sessions to keep you up-to-date with the latest technological advances.
To register for this and other upcoming events click on the events link below.

Donor site

The Donor site offers a rich and highly customizable experience for fundraisers conducting charitable campaigns and product sales with the public.



Annual Conference site

The Annual Conference site offers a "micro site" experience to support your critical projects, such as an organization's annual conference. By shaping the site with unique content and structure, you can maximize the impact of the project without affecting your main

site or micro sites from different years. At the same time, iMIS seamlessly integrates content between your various sites.

Annual Conference Mobile site

The Annual Conference Mobile site renders a version of the Annual Conference that is optimized behaviorally and formatted for use on smart phones and tablets for both by your members and staff who are attending events. Attendees gain quick access to their personalized programs, activities, and event feeds – and can instantly look up directory profiles of those attending with them.

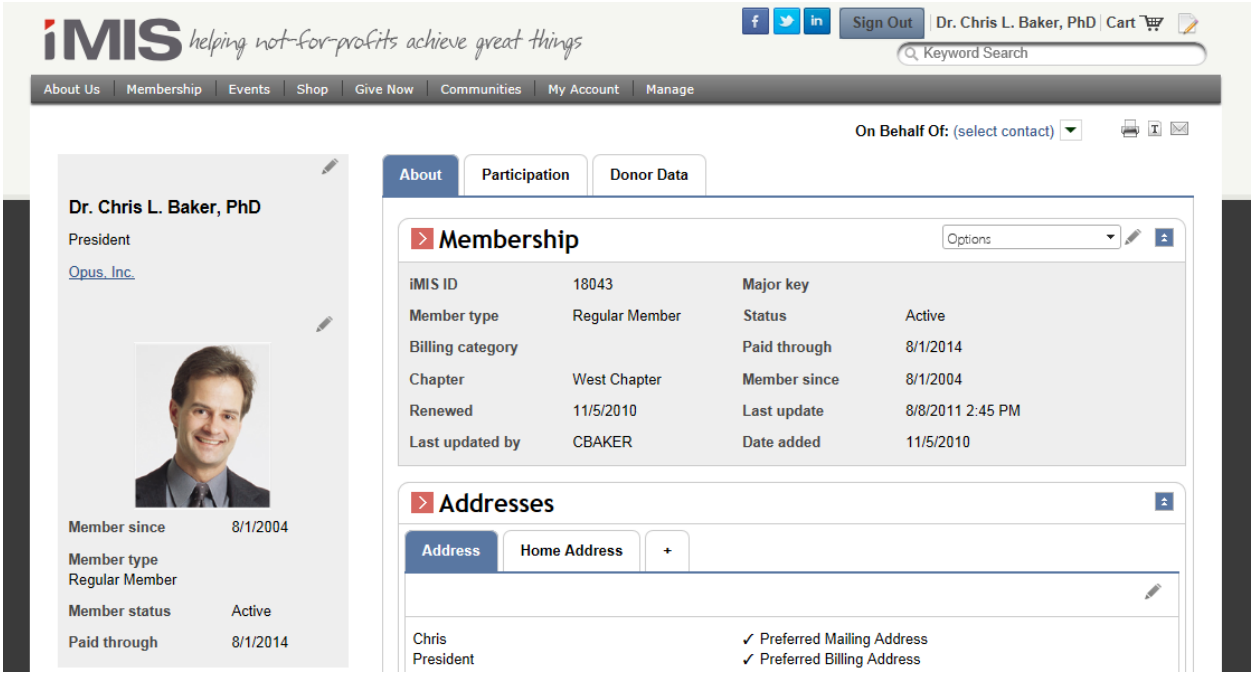
To use the DemoDB with the sample sites

To see the sample sites in action with sample data, you can connect to the demonstration database (DemoDB). This database includes a set of users and content sufficient to experience how the iParts work together.

1. Point your instance of iMIS to the DemoDB, which installs with iMIS.
2. Browse to the sample sites for this instance.
3. Sign in as Chris Baker: cbaker/cbaker.

   This user has full privileges to the system, so you can exercise all aspects of content lay-out, iPart configuration, and use.



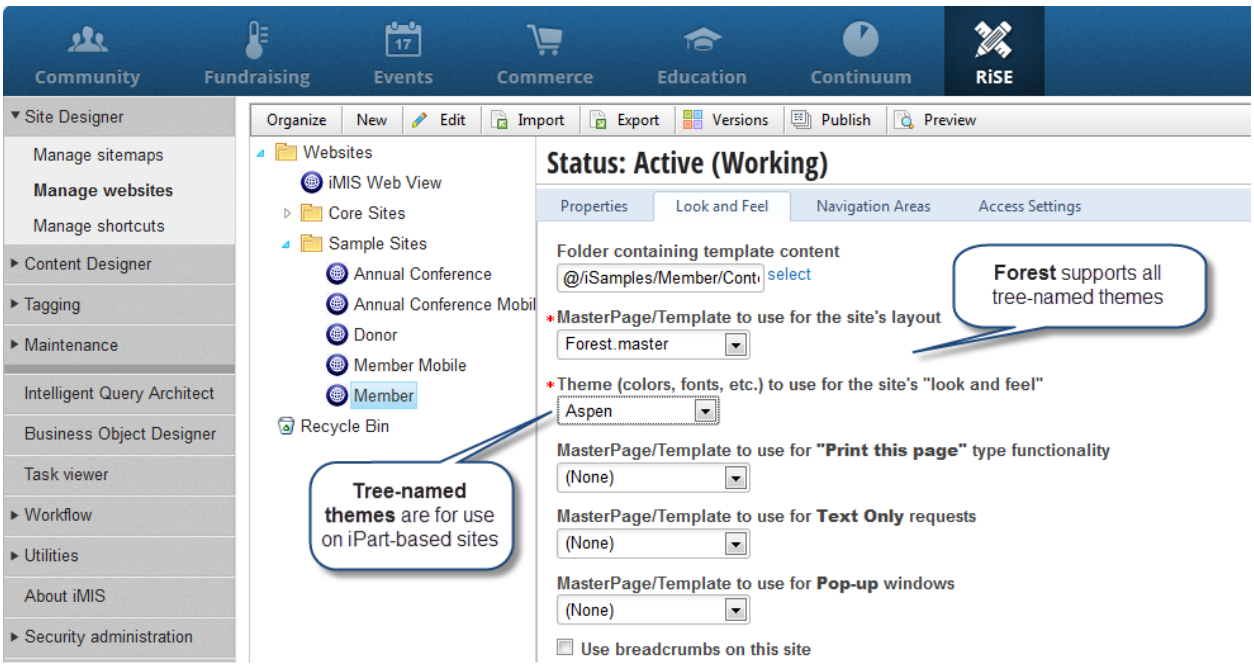
4. Change the password for this user if you want to prevent unauthorized access to your demo site.
5. When you are ready to start making changes to the site you must make a copy. This helps you to avoid losing your changes when you upgrade iMIS. For more information on this strategy, see Creating a site. Items affected by upgrades span the demo data and the site itself:

- Site definition and navigation items
- Content records, including iPart configuration, arrangement, and connection
- User records and demo data (products, events, subscriptions)

Sample themes and master pages

You can change the look and feel of the sample sites by selecting different combinations of a Master Page and its matching Theme. If you want to modify a particular design for your website, make sure you create a copy of the master page and theme before making any changes. See Creating a site for more information.

> **Note:** Note: iMIS themes give you a head start on developing your website. To provide you an idea of how things could look, we have used numerous pictures, illustrations, and images that we purchased under a limited license for ASI's use. The icons can be used on your website, but if you reuse any of the other images, you will need to buy a license. We acquire the majority of our images from iStock-Photo and most are available in the range of $15-$50; much less than the cost and labor of creating them on your own. If you have any questions, please contact us. (Gabe wrote this note to address the Time Lords' concern about image licensing)



Example: Selecting a theme created for the Forest master page

> **Note:** Important: If possible, avoid customization to master pages. If you do need to make changes, make the changes in a copy of the master page. Any customizations performed to the out-of-the-box master pages will be overwritten after an upgrade.

The following designs are available out-of-the-box for iMIS sample sites.

City.master

The set of city-named themes support RiSE sites and can be used interchangeably with the City master page.

Available theme:

Austin

Forest.master

The set of tree-named themes support RiSE sites and can be used interchangeably with the Forest master page.

Creating a site

To create a public-facing website that makes full use of iParts and SOA, it is easiest to copy an existing sample site, such as Member, and change it to meet your needs.

When you copy a website, iMIS duplicates the site navigation and content records for the new site.

Do the following to copy a sample site.

Go to RiSE > Site Designer > Manage websites:

1. Select a website from the list of websites.

- (Properties tab) Make sure the Folder selected for the Website-specific parent content folder field contains the content unique to this website. Only the content in this site-specific folder will be copied. Any content shared with another website should be placed in a separate, shared folder.
- (Look and Feel tab) The Folder containing template content is normally a sub-folder of the parent folder. If the template content (footer area, header logo, etc) is stored in a different folder, be sure to select that folder instead.

2. Select Organize > Copy
3. Select the folder where you want to paste the new website.
4. Select Organize > Paste.
5. Enter the Name of the new website. Do not use special characters or punctuation.

   Note: During Copy, Content Codes clear from content records because this code must be unique for each content record. A warning displays a list of content records where the Content Code was cleared. See log files for details.

6. Copy an out-of-the-box Master Page and Theme to be unique to your new website.

   Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme. Creating a copy of a theme also

ensures that you do not compromise your ability to fall back to a working original. Follow these steps to copy a theme, which is far easier than creating one from scratch.

- (Look and Feel tab) Select the Master page and theme that is the best match for the look that you want for your new site.
- Locate the theme folder (such as \Aspen), which defaults to C:\Program Files\ASI\iMIS\Net\App_Themes.
- Copy, paste, and rename \Aspen to your new site name (\ABC).
- Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages
- Copy, paste, and rename Forest.master to your new site name (ABC.master).

7. Edit your site to use your new theme files.

- Select Site Designer > Manage Websites and highlight your site (ABC).
- Edit the site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC
- Theme: select ABC
- Select Save.

8. Click the expand icon in the Status area, and enable the Is this website active option.
9. Publish the website:

- Select the newly copied website and select Publish.
- Publish the website's content folders:
- Go to Content Designer > Manage content.
- Select the content folder of the copied website.
- Select Publish. As each folder and content record publishes, the status will change from PublishPending to Published.

- If the website is hosted on a separate web server, publish the Core Content folder. See Installing WCM on web servers for more information on hosting a site on a separate web server.
- Go to Content Designer > Manage content.
- Select the Core Content folder.
- Select Publish menu and choose the Publish All Items option. As each folder and content record publishes, the status will change from PublishPending to Published.

10. After all content folders are published, log off and close the browser.

> **Note:** Note: If the website you copied contains URL shortcuts, be sure to review those shortcuts in your new website to determine if you need to create fresh shortcuts. For example, when you select the iMIS logo in the Member site, the page redirects to the shared Member Home content record. When you make a copy of the Member site and you select the iMIS logo from the new site, you will be redirected to the same shared Member Home content record. To resolve this, create a fresh shortcut that will point to your new Member Home.

Implementing a mobile site

The Member Mobile sample site is optimal for mobile devices like smart phones and tablets, featuring accessible content and a sitemap for members needing information on the go. The master page Sapling places key information at the top of the screen and works with the Aspen Mobile and Austin Mobile themes; featured styles are sized appropriately for smaller screens.

If you want to provide a mobile site for your members, we recommend that you start with a copy of the Member Mobile sample site, and then apply your changes. When you make a copy of the site, iMIS creates a copy of the website, content, and sitemap.

> **Note:** Note: Before the following required steps, you must complete your copy of the mobile site. See Copying a website.

To implement a mobile site, do the following:

Go to RiSE > Site Designer > Manage sitemaps:

1. Choose your copy of the Member Mobile site.
2. Edit the Full Site navigation item to add your main site's URL to the Content or URL to Link to.
3. Go to RiSE > Content Designer > Manage content, then select the content folder created for your copy of the mobile site.
4. From the ContentAreas folder, edit the following content records:

- Social Networking Images: Configure the Social Networking instance of the Content Html iPart, and from the <>HTML tab, update the href's to link to your social media accounts or remove any links you do not want to appear.
- Header Logo: Configure the Header Logo Span instance of the Content Html iPart and update the logo to your organization's logo.
- Footer Copyright: Configure the Footer Copyright instance of the Content Html iPart, and update the content and link for your organization.

Tips and reminders

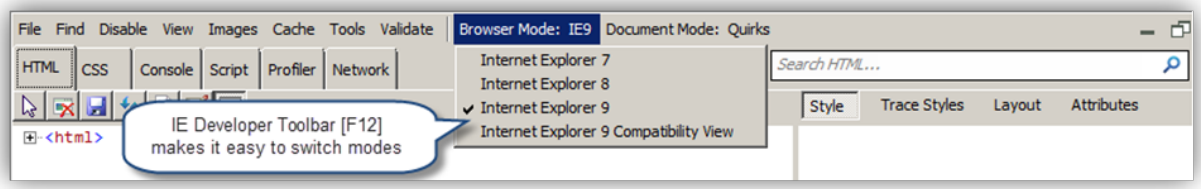
- Trim content — For easier reading on small screens, and to decrease page load time, keep content simple.
- Automatic redirect — Consider adding some JavaScript to redirect users automatically to the mobile site when they try to access your full site on mobile devices.
- Add favicon — Update the favicon used for your mobile site, apple-touch-icon, located by default in C:\Program Files\ASI\iMIS\Net.
- Easy edit limits — When you access the mobile site, Easy edit is only available when you access the website from a browser with a width larger than 700 pixels.

Modifying site themes

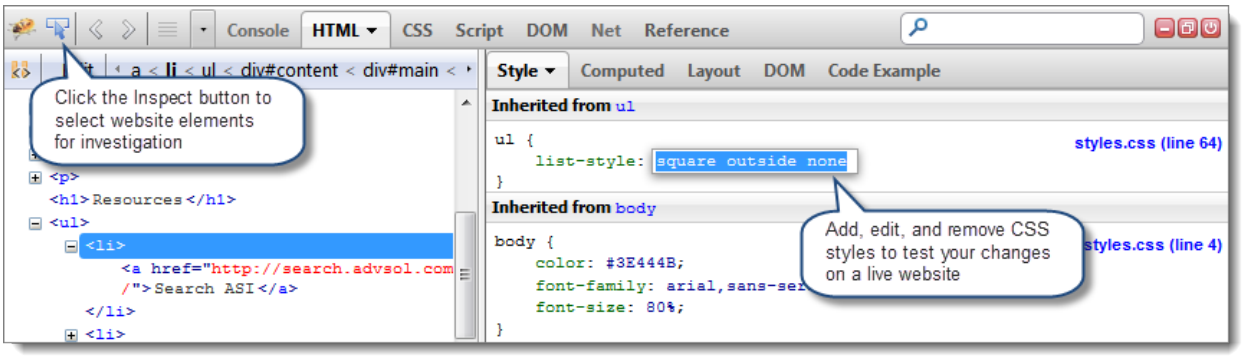
Several themes have been created for the sample sites. You can modify these themes to help identify and personalize your organization's website.

Best practices for theme development

- Caution: Never change the core style sheets 00-Reset.css and 10-UltraWave.css. All derivative themes inherit from these files, and any changes you make to them are lost on upgrade. Instead, override the base styles in your 99-[theme].css.
- Before modifying a theme, find the best one: apply all of the themes to the default Member site in turn, and decide which theme is closest to the final look and layout that you want.
- Always work from your copy of the theme, so that you can begin again. See Copying a website theme.
- Make changes only to websites that you create. When a sample site is updated with each release, the iMIS Upgrader overwrites any changes you made to it.
- Take advantage of browser-based developer tools to test and troubleshoot changes before committing them to your style sheets:
- Internet Explorer and Chrome: Press F12 to toggle the Developer Toolbar.



- FireFox: Install the Firebug add-on to see a wealth of information about the structure of the website and the styles it is using. Turn on the element inspector and click a piece of content to see the styling that it is implementing:



UltraWave and Universal Design

The Sample site themes and master pages build upon a new underlying template called UltraWave. UltraWave incorporates structure and styling for Universal Design. Universal Design seeks to make web content "barrier-free," making sites accessible to all challenged users. Challenged users include not only the millions of physically or cognitively impaired, but also seniors, non-native speakers, and those in other countries and cultures (localization).

Universal Design has benefits beyond helping websites meet the myriad of web accessibility standards: it also aids in breaking technology and human barriers. Universal Design is the foundation for transforming pages and content into outputs and displays your members may need, including print presentation, net book usage, and even cell phone applications.

> **Note:** Important: UltraWave themes support RiSE sites, which are an alternative to Public view. They do not support existing Public views.

Features of the template include:

- Developed toward W3C standards to help meet accessibility requirements
- Fluid-width template dynamically reflows content to fit your user's browser window
- Clean, minimal design uses neutral shades and layout
- Offers a streamlined set of stylesheets and skins

- Easily customized with logos, fonts, and colors
- Designed to be easily rebranded by your organization

Copying a website theme

Themes control the layout, font, and colors of your iMIS sites. The sample sites come with a set of special themes, designed for RiSE sites. See Sample site themes and master pages for a list of available themes.

Creating a copy of a theme also ensures that you do not compromise your ability to fall back to an original that works. Follow these steps to copy a theme, which is far easier than creating one from scratch.

> **Note:** Note: The themes change and develop with every iMIS update. To avoid losing your changes, be sure to work from a copy of the theme, as outlined below.

1. Copy an out-of-the-box theme and master page to be unique to your new site.

- Locate the theme folder (such as \Aspen), which defaults to C:\Program Files\ASI\iMIS\Net\App_Themes.
- Copy, paste, and rename \Aspen to your new site name (\ABC).
- Locate the master page (such as Forest.master), which defaults to C:\Program Files\ASI\iMIS\Net\Templates\MasterPages.
- Copy, paste, and rename Forest.master to your new site name (ABC.master).

Go to RiSE > Site Designer > Manage websites:

2. Edit your site to use your new theme files.

- Highlight your site (ABC).
- Edit the Site Look and Feel to point to your new theme files:
- MasterPage/Template: select ABC

- Theme: select ABC
- Select Save and Publish.

3. Edit your theme files as needed to tailor the design.

Changing theme headers

The first elements to change on your website are the highly visible elements that public visitors see and use in the header: logo, social networking links, welcome banner, and the favicon.

Logo

The header logo is contained in a content record: @\[theme]\ContentAreas\Header Logo. To add your own logo, edit this content record, remove the contents in the HTML iPart, and replace with your own logo.

> **Note:** Note: Alternatively, you can change the logo in the CSS. The logo is set in 99-[theme].css by the selector #masterHeaderImage. Change the background image and the dimensions to match your own logo.

Social networking links

The links to the social networking sites in the top (auxiliary) navigation are also defined in a content record: @\[theme]\ContentAreas\Social Networking Images.

To change the links to navigate to your own social networking pages, edit the content record and change the links on the icons.

In the HTML editor, replace the href on each <a> tag with the appropriate URL. For example:

Favicon

The favicon is the little icon that displays next to the website in your bookmarks and on the browser tab in modern browsers. Changing it to your organizations' icon is simple: create an icon sized either 32x32 or 64x64 pixels and name it Favicon.ico. Then overwrite the original file:

C:\Program Files\ASI\iMIS\Net\Favicon.ico

Update the copyright statement

The copyright statement is contained in a content record within your copied site's ContentAreas folder: Footer Copyright. Edit the Footer Copyright instance of the Content Html iPart on that page to update the copyright.

Changing theme colors

The next step in customizing your theme is to change to colors that support your branding & style. You will make these changes in both CSS and in images.

CSS colors

All theme-specific color and styling is located in 99-[theme].css. To find all color references that you might want to change, search the CSS file for these strings:

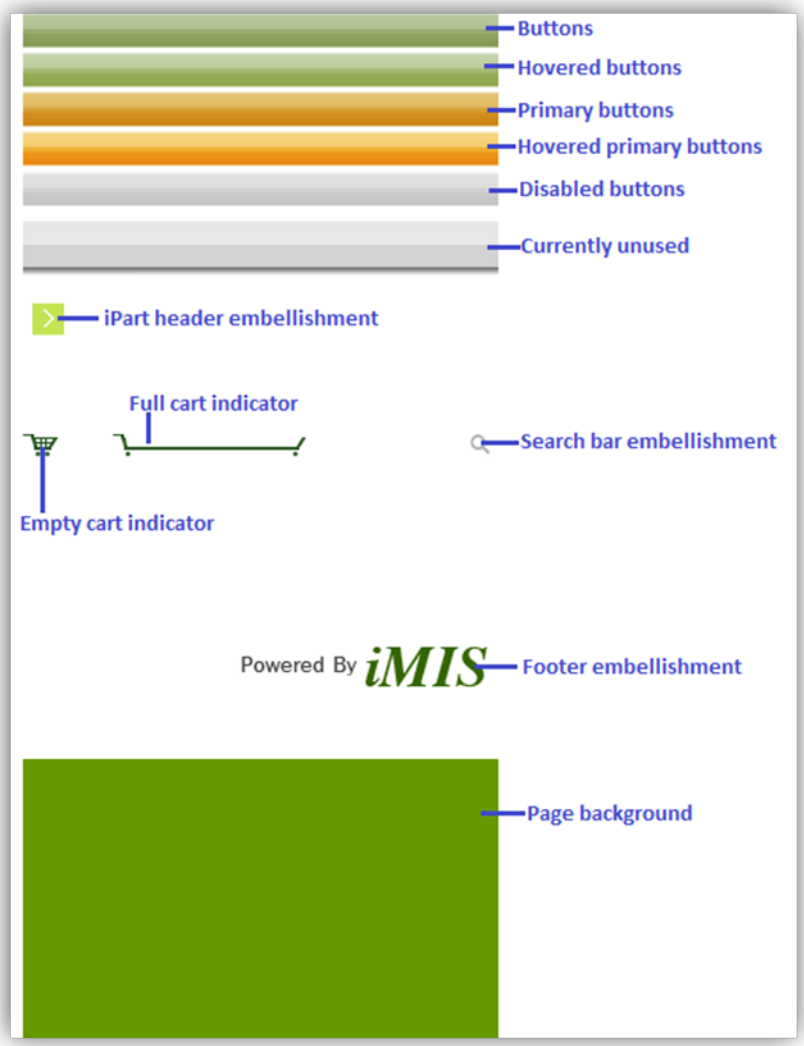
- color
- border
- background

We also recommend using your browser development tools to help you identify which styles you need to update for your color changes.

Sprite colors

A few of the theme's use sprites to control some of the site colors. A sprite is a single image that combines several commonly used images into one file. CSS then defines which part of the image displays for various purposes. Because your server only has to load a single image instead of several, using sprites reduces load time for your website.

To improve performance, the new sample sites use sprites when possible. The image below shows a sprite used in the theme Aspen, and labels where each image is used:



You can either edit the sprite we have provided (which is easier), or create your own.

- When editing the provided sprite, keep all elements in their original pixel coordinates, so that you do not have to edit the related CSS.
- The .png version of the sprite is located in images/[theme]_sprite.png. You can edit this image in your favorite image editor, but we do not recommend editing in MS Paint, as you will lose the background transparency.

- Your theme's \Resource folder also includes a .psd source file of each sprite. You can edit the .psd with Photoshop or GIMP, a free image editor that can edit and save images in .psd and web-safe formats.
- If you edit the .psd, save your new image as a .png, and place it in the images folder of your theme.

  For greater design control, you also have the option of creating your own sprite. If you choose that option, you may also need to update your theme CSS for the new coordinates of the sprite. To help you with this process, we recommend the following resources:

- CSS Sprites: What They Are, Why They're Cool, and How To Use Them
- Sprite Cow calculates the pixel positions of the various images inside your sprite.
- CSS Sprite Generator lets you upload a zip file of images and get back a sprite file with the corresponding CSS.

Changing theme home pages

The Member site uses a pair of home pages: one that appears to guests (unauthenticated view) and another that appears to those who have signed in (authenticated view). You can change one or both of them, or drop one entirely and have one home page appear to all.

Do the following to change the unauthenticated home page:

Go to RiSE > Content Designer > Manage content:

> **Note:** Note: To have your own home page behave like the default one (switch to the authenticated home page when the user signs in), you need to add the code-bearing HTML iPart that does so.

1. Create a new content record for your unauthenticated home page.
2. Copy the AuthScript code to your new home page:

- Edit the unauthenticated home page content record @\iSamples\Member\Home.
- Locate the HTML iPart named AuthScript.
- Select Move To and select your unauthenticated home page.
- Now edit your unauthenticated home page and move the AuthScript iPart to the top of the content record.
- Save and Publish your home page.

3. Make your site's home page link to your new home page.

- Go to Site Designer > Manage sitemaps.
- Select your website.
- Edit the default navigation item (flagged with ★) and select your new home page for Content or URL to Link to.
- Save and Publish your sitemap.

Do the following to change the authenticated page:

Go to RiSE > Content Designer > Manage content:

> **Note:** Note: To have your own authenticated home page appear as soon as the user signs in, you need to edit the code-bearing HTML iPart that calls it.

1. Edit your unauthenticated home page content record.
2. Locate the HTML iPart named AuthScript.
3. Select Configure and switch the editor's view from Design to HTML, to view the code.
4. Edit the path to be the published path of your new authenticated home page:

path = "~/Mbr/Home/[theme]/MemberHome.aspx";

Do the following to use only one home page.

You can drop to a single home page either by:

- Removing the script that opens the authenticated home page:
- Go to Content Designer > Manage content and Edit the unauthenticated home page @\[site]\Home and delete the HTML iPart named AuthScript.
- Substituting your own page entirely:
- Go to Site Designer > Manage sitemaps and set your desired content record to be the default home page of your website.

Changing Telerik skins

Several iParts throughout the product use Rad Controls developed by Telerik. These controls require a few steps to style, and Telerik resources can help you get started:

- Telerik Control Guide – an overview of Telerik controls, including available skins.
- Telerik Visual Style Builder – generates CSS and some images for skinning Telerik controls.

Every [theme].skin file lists all of the Telerik skins that it uses to style controls. If a control does not explicitly define a theme, then it uses the Default Telerik skin.

Rad Window control

This control is the pop-up window that we see in many iParts. Its skin is set by two lines in Aspen.skin:

<asiweb:Window runat="server" Skin="Forest" />

<asiweb:WindowManager runat="server" Skin="Forest" />

Forest is a skin designed by Telerik and is available on most Telerik controls, along with a handful of other Skins. You can preview available Telerik skins for this control.

> **Note:** Tip: Telerik skins are easy to switch out and virtually maintenance-free. However, they are difficult to customize, so avoid this route unless you can use the skins as-is.

Rad Tab Strip

This control is used by the Content Collection Organizer (CCO) iPart, the Contact Address Editor iPart, and most other places where you see a tab strip. This line defines the skin:

<telerik:RadTabStrip runat="server" Skin="Aspen" EnableEmbeddedSkins="false" />

The definition for this look and feel is near the bottom of the 99-[theme].css, under the heading RadTools Styles.

Rad Menu control

This control displays the primary navigation area. There is wrapper for this control called PageNavR, so this line defines the skin:

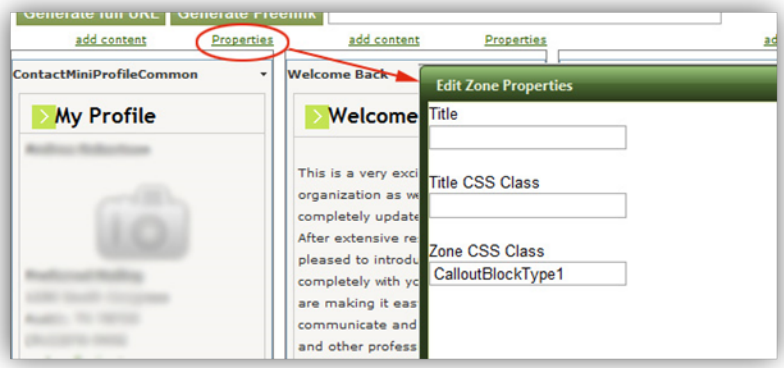
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" … />

The styling for the Rad Menu is located in Menu.[theme].css, and the image sprite is under [theme]\Menu\rmSprite.png. The easiest way to customize this control is to use Telerik's Visual Style Builder. (Tip: This tool works best in Internet Explorer.)

Changing zone properties

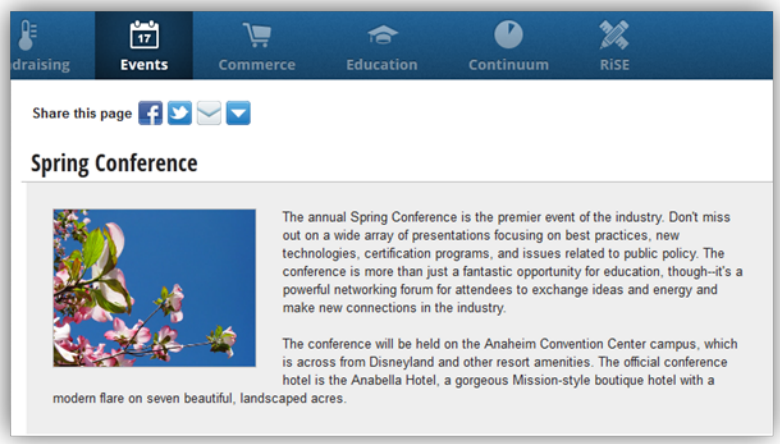
Zone properties make it easy to apply unique styling to specific iParts, for emphasis and contrast.

To apply a style to an iPart's zone property, edit the content record, click Properties, and enter the name of the class in Zone CSS Class:



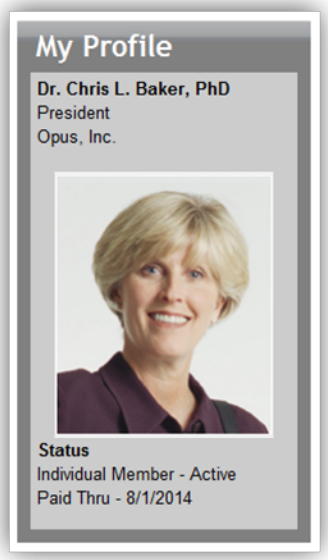
You can add more if needed, but all tree-name themes contain the following three zone style classes:

- TitleBarNoBorder – simply removes the bottom border from iPart headers
- CCOGrayBg – applies a gray background to content appearing in CCO tabs

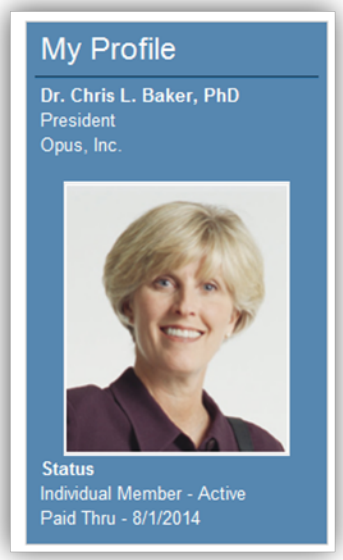


- CalloutBlockType1 – accentuates an iPart whose border is enabled

Aspen:



Birch:



Creating a new theme

Instead of editing a copy of Aspen or Birch, you can also start from scratch when designing your own theme. However, you must include the 00-Reset.css and10-UltraWave.css in your new theme. To do so, begin your new style sheet with these lines:

```
/*##########################################*/
/*     Import UltraWave StyleSheets     */
/*##########################################*/
@import url("../UltraWave/00-Reset.css");
@import url("../UltraWave/10-UltraWave.css");
```

Resources for CSS

- w3schools.com – a great resource for CSS and HTML information and examples.
- CSS3 Generator – a tool to help generate CSS for rounded corners, box shadows, background gradients, and opacity. (Note: CSS3 is not fully supported in all browsers.)

Designing site navigation

Displaying left navigation

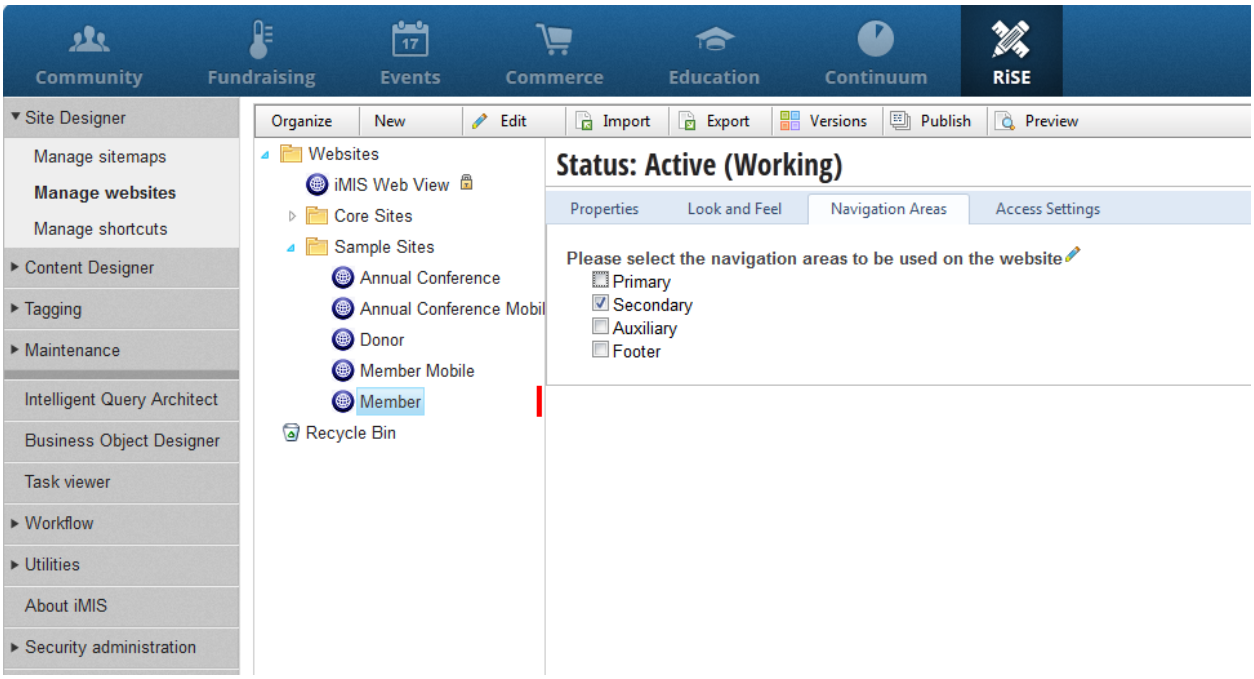
You can display website left navigation in a hierarchical format with a few changes to your theme's master page and skin file.

Do the following to implement left navigation:

Go to RiSE > Site Designer > Manage websites:

1. Define how many levels of navigation to display.

- Select the website.
- Select the Navigation Areas tab and select the Secondary navigation area.
- Save and publish your changes.



2. Edit the website theme's master page.

- Using your preferred text editor, find and open the website theme's master page. Master pages, by default, are located in C:\Program Files\ASI\iMIS\Net\Templates\MasterPages.
- Register the control by adding the following line to the top of the master page, just below the other registered controls:

<%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>

- Add the following scripts to the <script language="C#" runat="server"> section:

```
protected override SiteMapNode GetStartingNode()
{
   return Secondary.GetStartingNode();
}
protected override SiteMapNode GetCurrentNode()
{
   return Secondary.GetCurrentNode();
}
```

- Find the masterSideBarPanel div. It should look like this:

```
<div id="masterSideBarPanel" class="yui-b">
   <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server">
     </asp:ContentPlaceHolder>
</div>
```

- Update the masterSideBarPanel div so that it contains the following:

```
<div id="masterSideBarPanel" class="yui-b">

    <asp:Panel ID="SubNavPanel" runat="server" >
        <asp:ContentPlaceHolder ID="PageSubNavigationPlaceHolder" runat="server">
        <asp:Panel id="SubNavHead" runat="server" class="SubNavigationHead">
        <asp:Literal ID="SubNavPanelTitle" runat="server" />
        </asp:Panel>
        <asp:Panel id="SubNavBody" runat="server" class="SubNavigationBody">
```

```
        <asi:SubNavigation id="Secondary" runat="server" NavigationPaneCode="2"
          StartingNodeOffset="1" StartFromCurrentNode="true"
          StartingNodeOffsetAutoSet="true" SelectDefaultNode="false" />
        </asp:Panel>
        </asp:ContentPlaceHolder>
      <asp:ContentPlaceHolder ID="SideBarPlaceHolder" runat="server" />
    </asp:Panel>

  </div>
```

- Find the masterWrapper div, and add the yui-t2 class to it:

  ```
  <div id="masterWrapper" class="yui-t2">
  ```

- To improve JavaScript performance for websites using hierarchical sub-navigation, find the following script:

  ```
  <script type="text/javascript">
      // if there is something in the side bar this converts the layout to 2 columns
      if ($('masterSideBarPanel').children.length != 0) {
        $('masterWrapper').setAttribute("class", "yui-t2 HasSubNav");
      }
  </script>
  ```

- Update that script to the following:

  ```
  <script type="text/javascript">
      // if there is something in the side bar this converts the layout to 2 columns
      if ($('masterSideBarPanel').children.length === 0) {
  ```

```
        $('masterWrapper').removeAttribute("class");
    }
</script>
```

3. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Register the control by adding the following line to the top of the skin file, just below the other registered controls:

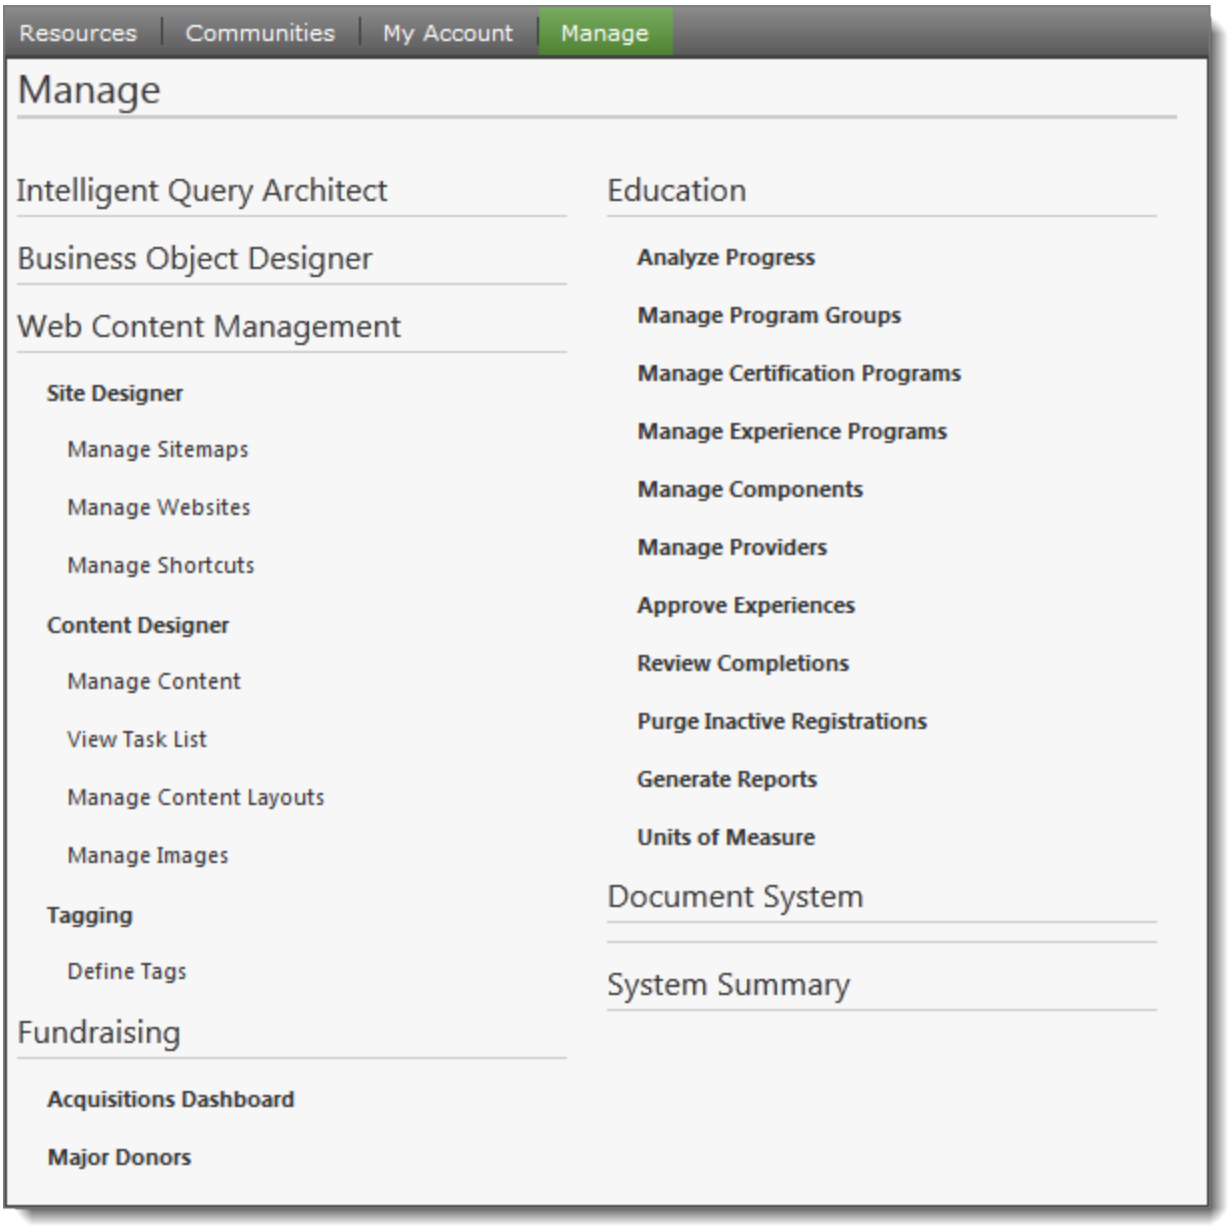
  <%@ Register TagPrefix="asi" TagName="SubNavigation" Src-c="~/AsiCommon/Controls/Navigation/SubNavigation.ascx" %>
- Just below the section registering controls, add the following line:

  <asi:SubNavigation runat="server" Skin="Aspen" EnableEmbeddedSkins="false" SingleExpandPath="true" ShowLineImages="false" />
- (optional) If you are familiar with skin controls, you can configure how the SubNavigation control behaves using the following properties:
- string NavTreeSkinId – A unique ID for the skin if needed. The default is RadTreeView.
- bool SingleExpandPath – Gets or sets a value indicating if only the current branch of the tree is expanded. The SingleExpandPath property, when set to True, automatically collapses nodes that are not on the path of the currently expanded node. Use the SingleExpandPath property when you need to conserve screen space and make navigating nodes easier.
- public bool ShowLineImages – Gets or sets a value indicating if the tree node line images display or not.
- string Width – Gets or sets width of the control. Specify in pixels (px) or percentage (%) e.g. 500px, 90%.

- bool EnableEmbeddedSkins – Gets or sets a value indicating if the built in skins should be used on the navigation tree.
- int MaxDataBindDepth – Gets or sets the maximum number of levels to bind to the navigation tree.
- bool WrapNodeText – Gets or sets the option to wrap text if it is wider than the trees allowed width.
- bool ExpandAllNodes – Gets or sets the option to expand all of the nodes when the navigation tree renders.

Displaying mega drop-downs

You can display mega drop-downs from your primary navigation with a few changes to your theme's skin file and menu CSS. Mega drop-downs display navigation items within large panels, grouped by level, which reduces scrolling and improves the usability of site navigation.



To implement mega drop-downs

1. Ensure that all navigation items in the sitemap have a value for Content or URL to Link to. Otherwise, the navigation hierarchy may not render properly.
2. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program

Files\ASI\iMIS\Net\App_Themes.

- Find the pageNavR control and update it to add the following property:

  EnableMegaDropDownMenu="true"

- (optional) If you are familiar with skin controls, you can configure how the mega drop-down behaves by altering the following properties:

- EnableMegaDropDownMenu – Enables the mega drop down.

- MegaDropDownMenuShowStartingNode – Displays the parent navigation node as the first item in the mega drop down. Enter true or false.

- MegaDropDownMenuLevelSettingLevel – Defines the navigation level at which the number of columns set for MegaDropDownMenuRepeatColumns starts to take effect. For example, if you set MegaDropDownMenuRepeatColumns=”3” and set MegaDropDownMenuLevelSettingLevel=”2”, then the mega dropdown displays three columns for the second and higher navigation levels, and the first level only has one column.

- MegaDropDownMenuRepeatColumns – Defines the number of columns used to display the navigation.

- MegaDropDownTooltipLocation – This option only applies to tooltips defined for top level navigation items in the primary navigation. When defined, it specifies the location of the tooltip text if a tooltip is defined for that navigation item. Enter either Menu (displays the tooltip directly beneath the top level navigation item) or Append (displays to the right of the navigation text within the dropdown). If you do not define this property, navigation tooltips are not displayed in the dropdown.

3. Edit the theme’s menu CSS to tailor the display of the mega drop-down for the theme’s look and feel.

- Using your preferred text editor, find and open the website theme’s menu CSS file (for example Menu.Aspen.css). Menu CSS files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.

- Find the MegaDropDownMenu Styling section and edit the styles as needed:

```
/* ########################### */
/*  MegaDropDownMenu Styling  */
/* ########################### */

.RadMenu .rmGroup .MegaDropDownMenuOuter .rmText {
   padding: 0;
   margin: 0;
   width: 600px !important;
}

div.MegaDropDownMenu
{
   background-color: #f8f7f7;
   padding-left: 5px !important;
   padding-right: 5px !important;
}

.MegaDropDownMenuToolTip
{
   padding: 5px;
}
```

Using image sprites for navigation items

A sprite is a collection of images combined into a single image. Using CSS, you can shift the image around to display only parts of it. The advantage of using sprites is that they reduce the number of server requests to load images (only one is loaded), leading to improved performance.

One way to use sprites in iMIS is for rollover effects on navigation items.

To implement image sprites for navigation items

1. Edit the website theme's skin file.

- Using your preferred text editor, find and open the website theme's skin file (for example Aspen.skin). Skin files, by default, are located in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Find the pageNavR control and update it to add the following property:

  EnableImageSprites="true"

  When enabled, a new class named rmLeftImage is added to root level links in PageNavR.

2. Create the sprite file.

- Using an image editor like Adobe Photoshop, or a free alternative like GIMP, create your sprite by adding the images you want to a single image, like the following:

- Save the sprite to the website theme's image folder.

3. Edit the theme's 99-[theme].css file to define the classes to control the sprite.

- Use a tool like SpriteCow to determine the position values of the images in the sprite.
- Using your preferred text editor, find and open the website theme's 99-[theme].css file, located by default in the theme folders within C:\Program Files\ASI\iMIS\Net\App_Themes.
- Add styles for the sprite. For example:

```
.RadMenu a.rmRootLink.CartLink .rmLeftImage
{
   Background-image: url(images/cartsprite.png);
   Background-repeat: no-repeat;
   Background-position: -1px -1px;
   Width: 48px;
   Height: 36px;
}
.RadMenu a.rmRootLink.CartLink:hover .rmLeftImage, .RadMenu a.rmRootLink.CartLink.rmExapnded .rmLeftImage, .RadMenu a.rmRootLink.CartLink.rmFocused .rmLeftImage
{
   Background-position: -1px -39px;
}
```

  The first group of selectors sets the resting position for the image sprite. The second group of selectors defines the hover state and shifts the image when the link is rolled over.

  Go to RiSE > Site Designer > Mange websites:

4. Apply the sprite class to the appropriate navigation items.

- Edit the navigation item for which you want to apply the sprite hover effect (for example, the Shop).
- For the CSS Class property, enter the sprite class (for example, CartLink).
- Save and Publish the navigation items.

Styling your website's primary navigation

From http://www.imiscommunity.com/styling_your_website_s_primary_navigation

If you customize your website with a new look and feel, you will want to restyle the primary navigation to match the rest of the site. To customize the look of the navigation, you must be using iMIS 15.2 or later along with an UltraWave-derivative theme such as Aspen, Austin, or Birch. In iMIS, the primary navigation bar is built with Telerik RadControls; providing powerful tools for creating dynamic menu systems.

You can change your navigation menu's style by:

- Choosing an out-of-the-box skin provided by Telerik
- Customizing the font or color of an existing Telerik skin using Telerik's Visual Style Builder
- Styling your menu with CSS instead of using the Telerik tools

What is PageNavR?

PageNavR is a control that iMIS uses to display a website's primary navigation. The navigation bar automatically populates with each top-level navigation item, and each sub-item displays in a drop-down list that can expand to multiple levels. PageNavR wraps around a Telerik RadMenu control, so all PageNavR styles are controlled by Telerik's base styles.

What is a .skin file?

Skin files allow you to override default control behaviors in a theme-dependent way. If you set a property for a control in one theme's skin file, it will not affect how the control displays in other theme's skin files.

Take a look at this section of the Aspen.skin file in App_Themes/Aspen:

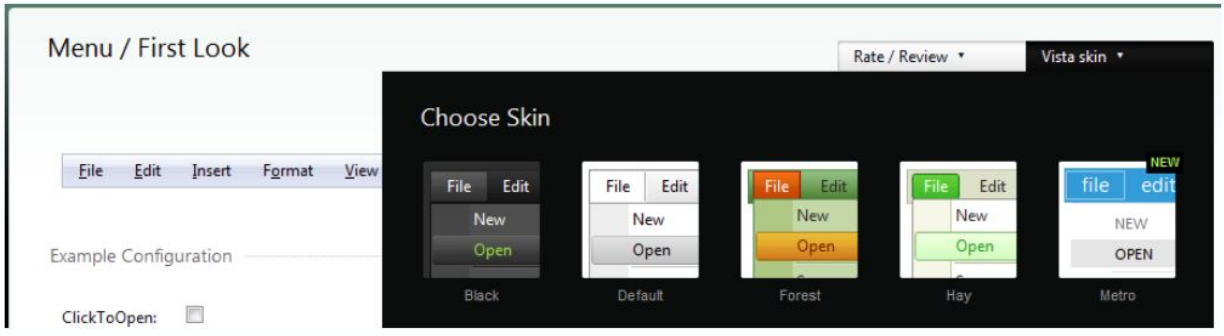
<asi:PageNavR runat="server" Skin="Aspen" EnableEmbeddedSkins="false" EnableRootItemScroll="false" Flow="Horizontal" DefaultGroupSettings_Flow-w="Vertical" DefaultGroupSettings_OffsetX="0" Width="100%"/>

These are just a few of the PageNavR properties available for the control in the skin file. The two properties which affect the navigation bar's style are "Skin" and "EnableEmbeddedSkins."

The "EnableEmbeddedSkins" property determines whether Telerik embedded skins should be loaded as the default. If you are creating your own custom skin, you MUST set this property to "false."

To style the navigation using a skin provided by Telerik

1. Choose an existing Telerik skin to style the navigation menu at [Telerik RadMenu Demo: First Look](#).



2. Change the "Skin" property of the PageNavR control in the theme's skin file to the name of the skin you selected.

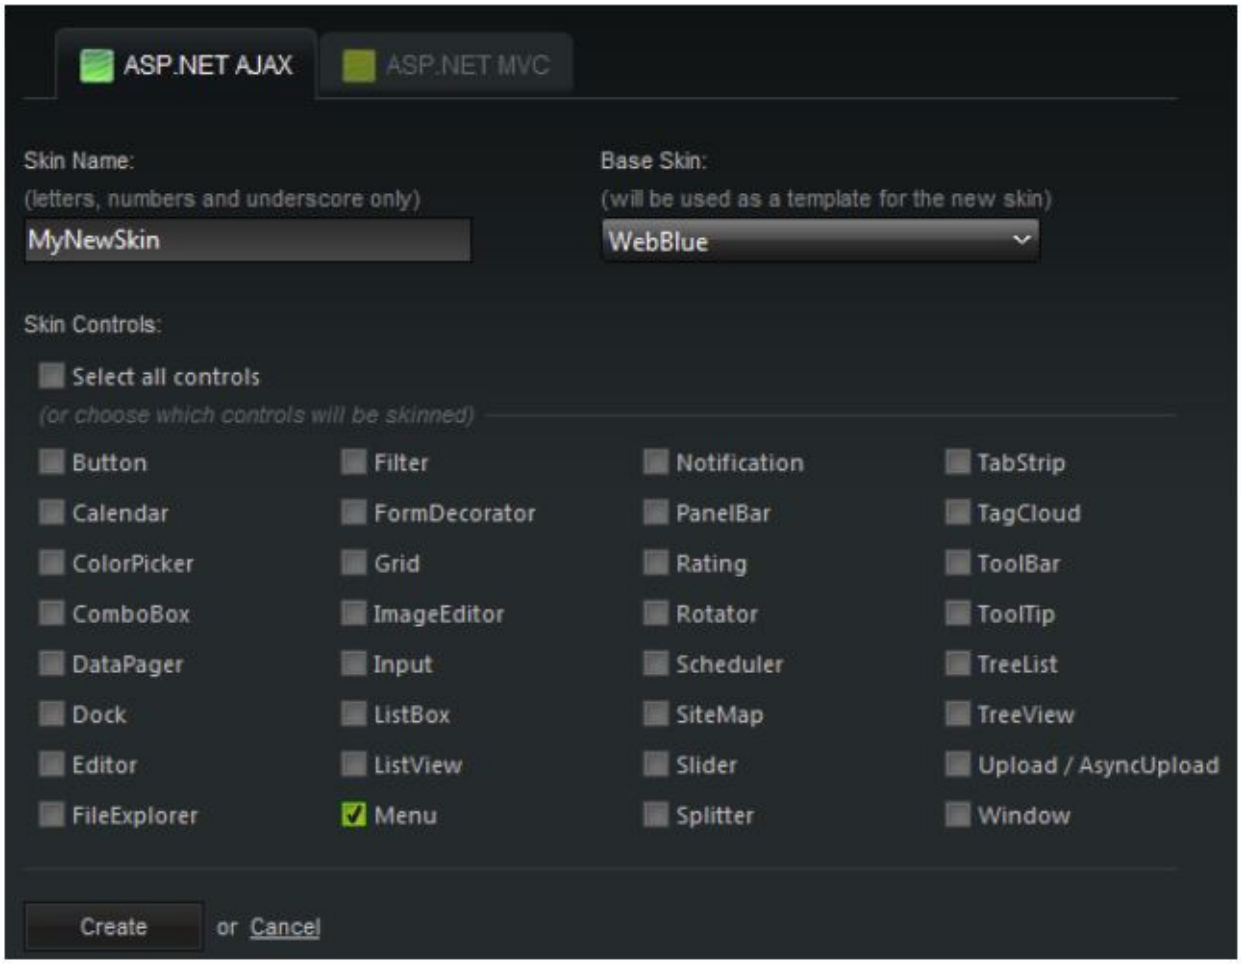
3. Change the “ EnableEmbeddedSkins=" property of the PageNavR control to “true." The navigation bar’s styling will change to that of the Telerik skin you selected.

For more information, see MSDN's guide to ASP.NET Themes and Skins.

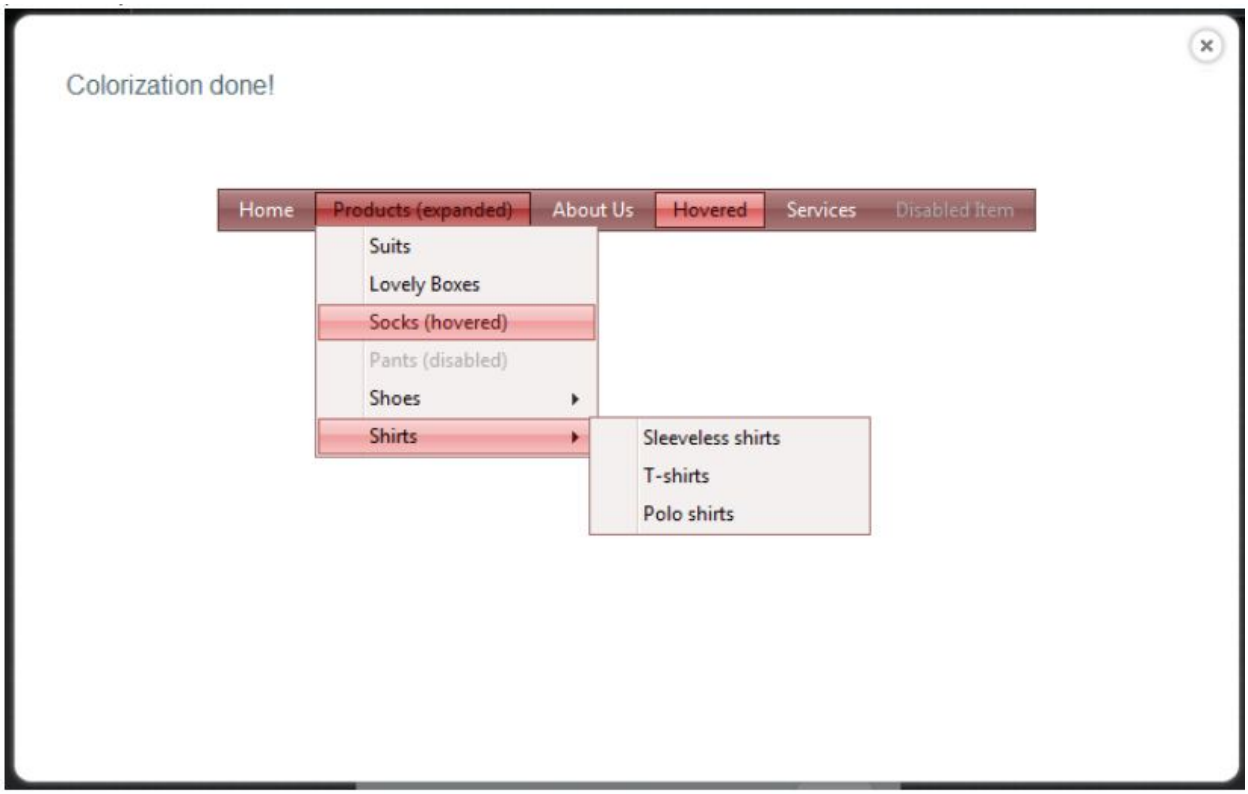
To style the navigation by customizing an existing Telerik skin using Visual Style Builder

If you want to customize the colors or font for a particular Telerik skin, you can use Telerik's Visual Style Builder:

1. Open the Telerik Visual Style Builder and select New Skin. (Note: The Visual Style Builder is in beta. For best results, use Internet Explorer as it is not fully functional in any other browser.)
2. Name your new skin, select your base skin, and check the Menu checkbox.
3. Click Create. Visual Style Builder will open on the Colorize tab.



4. Select your preferred color for the menu. You can fine-tune the hue and saturation of the color on the Shift colors tab in the color window that is open.
5. Click Save to see a preview of your new skin. If you are satisfied with the outcome, you can now download the generated images and CSS and skip to step 9.

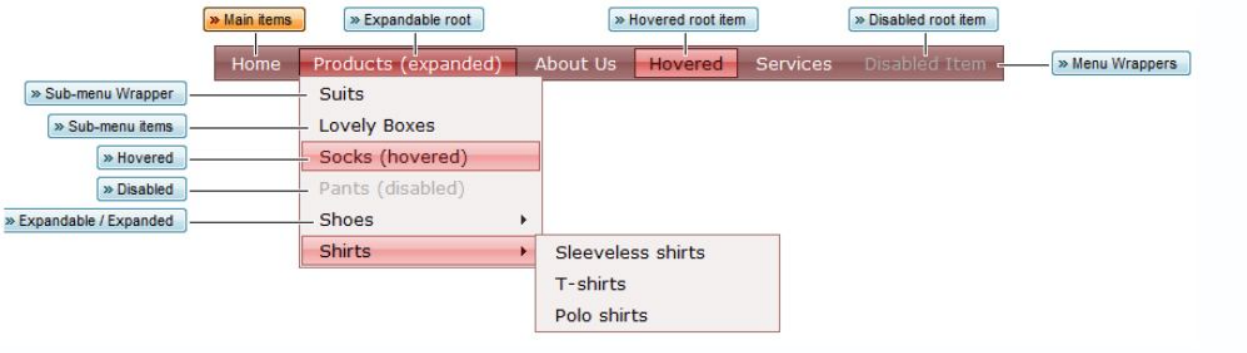


6. For additional customizing, click the Fine-tune tab of the Style Builder itself in the top left.

> **Note:** Tip: The fine-tune functionality can be unpredictable. Save frequently so that if you don't like the way a change turns out, you can click "load last save" to undo it.

7. Begin with any universal changes you would like to make, such as changing the font on the navigation nodes. Click the Main items bubble to make changes to the font on the main navigation node.

   Each time you make a change the example dynamically responds. Each of the blue bubbles opens a different set of configuration options.



8. When you are finished, click Save and then Download to get the necessary code and images.
9. Copy the unzipped files to your theme's folder. Open the .skin file and set “EnableEmbed-dedSkins” to “false” and “Skin” to the name of your new skin.

   For more information and a video tutorial, see Telerik's Visual Style Builder Overview.

   To style the navigation using CSS

   If you do not like the Telerik provided skins, you can create, with the aid of your browser’s developer tool, your own image-free styling using CSS. If you choose to work by hand, you may find it helpful to start with a working skin, and adjusting to suit your needs.

1. Rename all of the base-level selectors in your working skin file to RadMenu_[Your theme name] .
2. Use your browser’s developer tools to help you figure out how to modify the CSS to get the desired result.
3. In your theme's skin file set “EnableEmbeddedSkins” to "false" and “Skin” to the name of your skin.

Controlling sitemap behavior

This section explains sitemap behavior, including:

content records, iParts, and shortcuts used for searching.

- How to modify the [OverrideLinkText] and [CartItemCount] dynamic navigation items
- Profile pages linked from the Member site's Directory, which uses an ASPX web page to redirect users to a navigation item based on a set of criteria

How search works with navigation

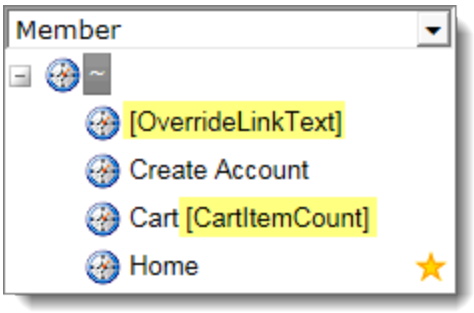
Three elements make search work in the sample sites:

- The search content records: The sample sites use search content records that are dynamically populated with an initial search result set based on a URL parameter value. These content records contain the Common Search|topic=Search (Common Search) iPart and are located within @/iCore folders.
- The pages that display the initial search results: The Shop and Events navigation items are linked to the Search content records. These navigation items have a unique value for the InitialArea URL parameter, which defines the result set generated when the pages are first displayed (i.e. products or events).
- The page displayed when a user clicks a result: The page displayed when a user clicks a search result link are based on the shortcuts defined from Site Designer > Manage shortcuts. The following shortcuts display search result links in the sample sites:

- ItemDetail –The ItemDetail shortcut displays the Item_Detail content record, which uses the Product Display iPart to display the item selected.
- GiftDetail – The GiftDetail shortcut displays the Gift_Detail content record, which uses the Donation Creator iPart to display donation pages selected from search results.
- EventDetail – The EventDetail shortcut displays the Event_Display content record, which uses the Event Display and Event Program Display iParts to display event pages selected from search results.

Modifying dynamic nav items

The default sitemaps include variables that dynamically generate the text displayed for two navigation items. [OverrideLinkText] displays the Full Name of the logged in user by default. [CartItemCount] displays the number of items a user has added to the Cart.



If you want to add new navigation items that use these variables, or if you want to modify the existing ones, keep the following guidelines in mind:

- Navigation areas and master pages – The variables only work in the Auxiliary and Footer navigation areas of websites using one of the Sample Site master pages (or copies of these files) or 1700.master. To specify a navigation area, edit a navigation item and in the Options section, select Auxiliary, Footer, or both from the Show in the following navigation areas options.
- [OverrideLinkText] – You can use this variable on its own or with other text. For example, if you only enter the variable, then only the logged in user's name is displayeds as a link. However, if you enter [OverrideLinkText]'s Profile, and Bob Smith logs in, then Bob Smith's Profile is displayed as a link.

- [CartItemCount] – You can use this variable on its own or with other text, but we recommend that you only use it with other text. Otherwise, when no items are in the cart, nothing is displayed for this navigation item.

  To change the data displayed for [OverrideLinkText]

  The variable [OverrideLinkText] can display any property of the NetContact business object. You can change the property displayed by editing the ContactDetail property in your copy of one of the Sample Site themes, or in 1700.master.

  For example, instead of displaying the Full Name of the logged in user, you may want to display only their First Name. To make this change, edit the ContactDetail property to replace all instances of FullName with FirstName. The result should look like this:

```
public string ContactDetail
  {
    get
    {
      if (ViewState["ContactDetail"] != null)
        return (string)ViewState["ContactDetail"];
      _contact = Asi.Business.Contact.ContactController.Contact(Asi.AppContext.CurrentIdentity.UserKey,
                                                  Asi.AppContext.CurrentContext.
                                                    StatefulBusinessContainer);
      return _contact.FirstName != "GUEST" ? _contact.FirstName : String.Empty;
    }
    set { ViewState["ContactDetail"] = value; }
  }
```

Account and profile pages in the Directory

When users select a result after searching the Member site's Directory, or when they navigate to the account pages, the content record that displays depends on the user's permissions. The rules that determine where a user is redirected are defined in the Party.aspx file, located by default in C:\Program Files\ASI\iMIS\Net.

You can modify the information displayed on the account and profile pages by editing the content records described below from Content Designer > Manage content.

> **Note:** Note: In the Member Mobile site, only simple profile pages are shown for member and organization accounts to restrict the amount of information displayed on small screens.

Page description	Users directed to the page	Content record: @/iCore/Contacts/*	Shortcut
Detailed page for staff to manage member accounts	System Administrators Staff with an authorization level of 1 or higher in Customers	ContactLayouts/Account_Page_Staff	FullAccount
Detailed page for member to manage own account	Contacts selecting their own record	ContactLayouts/AccountPage	MyAccount
Detailed Organization account page	System Administrators Staff Organizations	OrganizationLayouts/Account_Page	OrganizationAccount

	selecting their own record		
Simple (non-editable) Contact profile page	Users who do not have permission to edit the account	ContactLayouts/Profile	Profile
Simple (non-editable) Organization profile page	Users who do not have permission to edit the account	OrganizationLayouts/Organization_Profile	Organization

Complying with the EU's Electronic Privacy Directive

To comply with the EU Directive on Privacy and Electronic Communications, iMIS has added support for your organization to display a pop-up notification informing visitors that cookies are used on your site. This popup also includes a link to a longer sample privacy policy we have provided. You can find more information about this law on the ICO website.

Setting up cookie notifications requires that you edit your master page, review (and modify as needed) the privacy policy provided, and add a JavaScript file to iMIS.

To display cookie notification popups

1. Edit the master page of your website (by default located in C:\Program Files\ASI\iMIS\Net\Templates\MasterPages) to add the following items:

- Just under the , add the following divs:

Note: You can edit this content to change the look and feel of the popup to match the design of your site.

```
<div id="EUCookiewarningBack" style='z-index:999; position:absolute; width:100%;height:100%;background: rgb(0, 0, 0) transparent;background: rgba(0, 0, 0, 0.6);filter:progid:DXImageTransform.Microsoft.gradient(startColorstr=#99000000, endColorstr=#99000000);-ms-filter: \"progid:DXImageTransform.Microsoft.gradient (startColorstr=#99000000, endColorstr=#99000000)\"'>

Customer Administration

Committee Management

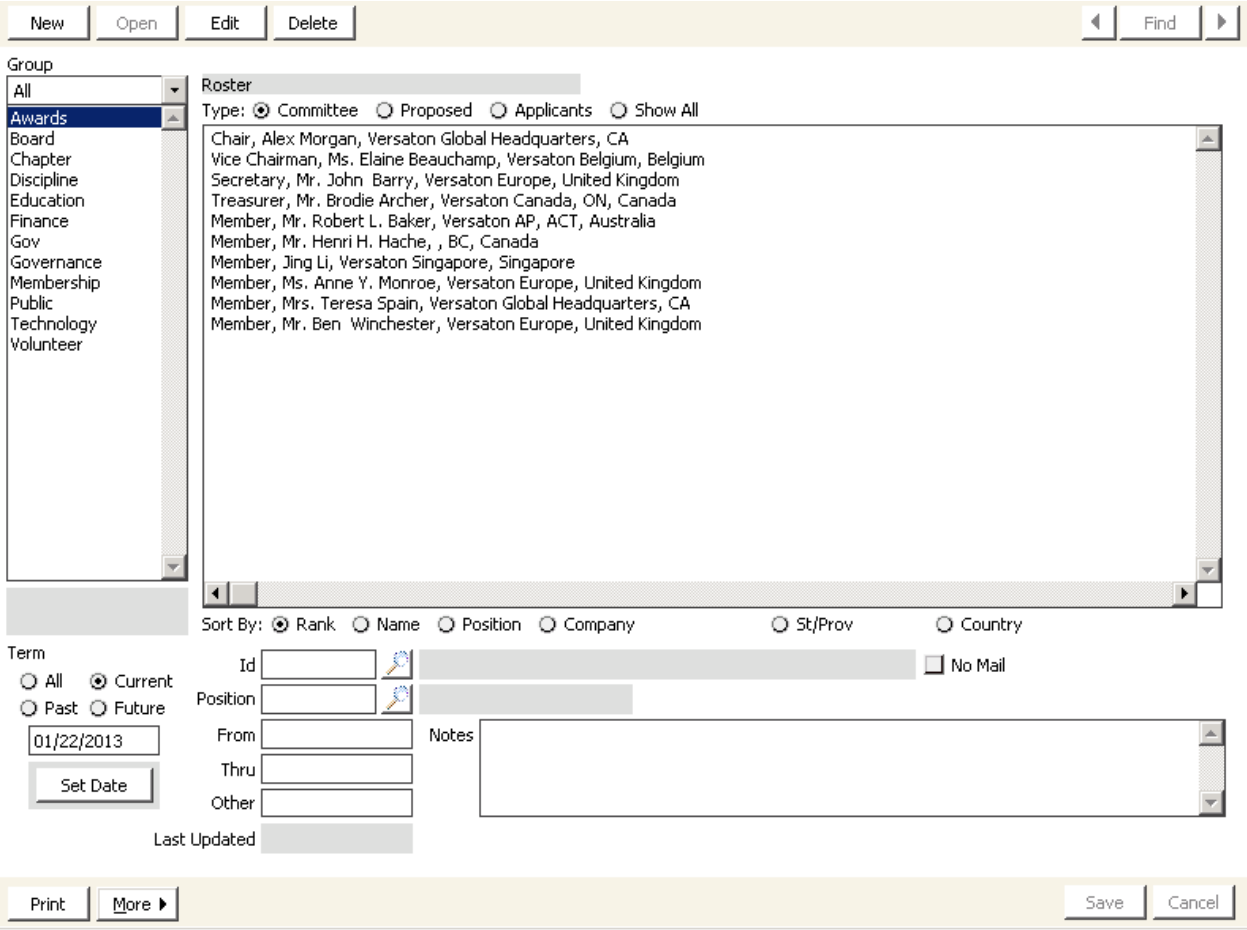
The Committee subsystem of iMIS Customer Management tracks committee members, their respective terms, and the positions they have held. The Manage committees window gives you full access to all committee data maintenance, inquiry, and reporting functions, enabling you to do the following:

- View committee rosters of past, current, and future members
- Maintain a list of members and their positions and terms
- Maintain a list of committee applicants and proposed members
- Create and store minutes on any committee meeting or activity
- Print a detailed roster of past, current, and future committee members and applicants
- Print personalized letters to any committee grouping
- Print labels for any committee list
- Maintain the tables of committee codes and positions

Managing committees

The Manage committees window enables you to assign customers to a committee, edit their assignments, delete assignees, and report this information to other committee members. This window also enables you to enter and track applicants and proposed committee members in advance of actual appointments being made.

Manage committees window



Desktop: Customers > Manage committees

Filter by Co ID

The Filter by Co ID option is visible only if enabled during system setup. Although rarely used, this feature enables you to link a committee to the ID of a company record. For example, if you have set up a committee named Awards, and a company has 25 branches and each branch has an Awards committee, you normally would need to create 25 separate Awards committees with each having a slightly different name. Instead, you create 25 company name records that represent your branches.

With Filter by Co ID enabled, you can open the Awards committee and set the filter to work with only one of the 25 branches. A Find window will open so you can locate the company ID to filter by.

Group

The Group field is a drop-down list that enables you to view either all committees or committees that have been assigned to a specific group.

Committees

The Committees field displays the current list of the committee codes that have been defined in the Committee Codes window.

Type

Designates one of the following display filters:

- Committee - All committee members are displayed.
- Proposed - Proposed committee members are displayed.
- Applicants - Committee applicants are displayed.
- Show All - Committee members, proposed members, and applicants are displayed.

Roster

The Roster field displays the currently selected committee's member list (affected by Type and Term choices).

Sort By

Designates one of the following sort orders:

- Rank - Sorts members by the rank assigned to their positions in the Committee Positions window.
- Name - Sorts members alphabetically by last name.
- Position - Sorts members alphabetically by position title.
- Company - Sorts members alphabetically by company name.
- St/Prov - Sorts by the member's Name.STATE_PROVINCE, then Name.LAST_FIRST, both in alphabetic ascending order (A-Z, a-z).

Note: The State/Province radio button will be labeled according to the value set up in Customer Setup – Address and Notes > State/Province.

- Country - Sorts by the member's Name.COUNTRY, then Name.STATE_PROVINCE, then Name.LAST_FIRST, all three in alphabetic ascending order (A-Z, a-z).

Term

Designates on of the following term filters:

- All - Displays all members who have served, are serving, or will be serving on the committee.
- Current - Displays only those members who are currently serving on the committee.
- Past - Displays only those members whose terms have concluded.
- Future - Displays only those members whose terms begin in the future.

Set Date

Activates the date field by which member terms are evaluated (date defaults to the current system date).

ID

Designates the ID of the currently selected or added member.

No Mail

Exempts the committee member from committee-specific label runs.

Position

Designates the position the member holds in the selected committee.

From

(required) Designates the start of the member's committee term.

Thru

Designates the end of the committee member's term. It defaults to the specified Default Duration (usually 12 months) after the From date.

Other

Designates a user-defined value corresponding to the type or category of educational credit awarded the member, if applicable. The value specified is displayed in the bottom of the member's Activity Detail window if your administrator has defined a prompt for the CEU Type field for the COMMITTEE activity type.

Last Updated

(read only) Shows the last date the record was updated.

Preference

Indicates an order of preference expressed by applicants for more than one committee position. For example, if an applicant wants to be President of a committee but has a second choice of Vice President, create two committee records for the applicant. The first record would have a position of President and a preference of 1. The second record would have a position of Treasurer and a preference of 2. This field is only displayed when Proposed or Applicants is enabled.

Notes

Specifies notes about the individual.

Print

Opens the Committee Reports window from which you can print committee reports.

More

Opens a menu of maintenance choices:

- Minutes - Opens the Minutes window where you can maintain minutes for the active committee. Minutes are accessed by the date that they were stored. You can open the minutes for any meeting and view or transfer them to a letter, report, or other area for printing. You can open an existing minute's entry to work from or to insert a new set of

minutes. Each entry consists of the date and the text of the minutes. All standard data maintenance procedures apply.

- Committee Codes - Opens the Committee Codes window where you can add, edit, and delete committee codes.
- Committee Positions - Opens the Committee Positions window where you add, edit, delete, and assign the rank for committee positions.
- Move to Committee - Assigns the currently selected individual to the currently selected committee as a member.
- Move to Proposed - Assigns the currently selected individual to the currently selected committee as a proposed member.
- Move to Applicant - Assigns the currently selected individual to the currently selected committee as an applicant.
- Check Paid Thru - Checks the currently selected individual's name and linked chapter or area with that chapter's paid thru date. If the selected individual is not linked to any chapter or area, iMIS displays a prompt to notify you.

To assign a member to a committee

To add a member to a committee, you need the following information:

- Customer ID
- Code for the position in which the member will serve
- Date range for the appointed term

1. From Manage committees window, select the committee code that you want the member to be associated with from the Committees field.
2. Select the appropriate type by enabling one of the following options:

- Committee
- Proposed

- Applicants
- Show All

  For example, if you want to add applicants instead of actual committee members, enable the Applicants option before entering the applicant. Otherwise, iMIS assumes you want to enter an appointee.

3. Click New. Your insertion point moves to the ID field.
4. Enter the customer ID of the appointee, or click the lookup icon to select an available value.
5. (optional) Enable the No Mail option to exclude the given appointee from committee-specific label runs.
6. Enter the appointee's position code in the Position field or click the lookup icon to select an available value.
7. Enter the start date of the appointee's committee term in the From field.
8. Enter the ending date of the appointee's committee term. If the default committee duration has been defined by your administrator, you can keep or override this value.
9. Enter any additional information you want to record for the appointee in the Notes field.
10. Click Save.

    To edit a committee appointment

    In the Manage committees window, you can edit any information on a particular appointee except:

- The committee to which the member record is assigned
- The ID associated with the record

  If either the committee or the customer ID is wrong, delete the existing record and insert a new record containing the correct information.

1. From Customers, select Manage committees to open the Manage committees window.

2. Select the committee code from the list in the Committees field (including any necessary filtering selections). Make sure you include a term selection that includes the member's record.
3. Highlight the customer record in the list of committee appointees.
4. Click Edit.
5. Make any necessary changes.
6. Click Save.

To delete an appointee from a committee

1. From Manage committees window, select the committee code from the list in the Committees field. Make sure you include a term selection that includes the customer's record.
2. Highlight the customer record in the list of committee appointees.
3. Click Delete. A system message prompts you to verify the deletion of the selected record.
4. Click Yes.

To change a committee appointment type

After preliminary or final appointment selections have been made, you can change the appointee's status as necessary.

1. From Manage committees window, select the committee code from the list in the Committees field (including any necessary filtering selections). Make sure you include a term selection that includes the customer's record.
2. Highlight the customer record in the list of committee appointees.
3. Select More on the Manage committees window to display a menu of maintenance choices.
4. Select one of the following options:

- Move to Committee to change the member to a permanent appointee
- Move to Proposed to change the member to a proposed appointee

- Move to Applicant to reassign a member to an applicant

  A warning message box is displayed.

5. Click Yes.

   To insert committee minutes

1. From Manage committees window, select the committee code from the list in the Committees field.
2. Click More, and select Minutes to open the Minutes window.
3. Click New.

   Note: The cursor moves to the Date field and automatically populates it with the current date.

4. Enter the date for which you want the minutes to be recorded in the Date field.
5. Enter the minutes of the committee meeting in the Minutes field.
6. Click Save.

   Note: Recorded minutes are listed by date in the Minutes List field of the Minutes window.

   To print committee minutes

1. From Manage committees window, select the committee code from the list in the Committees field.
2. Click More, and select Minutes to open the Minutes window.
3. Select the minutes to be printed from the Minutes List field.
4. Click Print.

Chapter Management

The Chapters subsystem of iMIS Customer Management enables you to track chapter memberships. From the Manage chapters rosters window you have full access to all

chapter data maintenance, inquiry, and reporting functions. This access enables you to do the following:

- Activate and view chapter rosters of current, past, or future enrollees
- Maintain a list of enrollees and their terms
- Print a detailed roster of current, future, or past chapter enrollees
- Maintain the tables of chapter codes

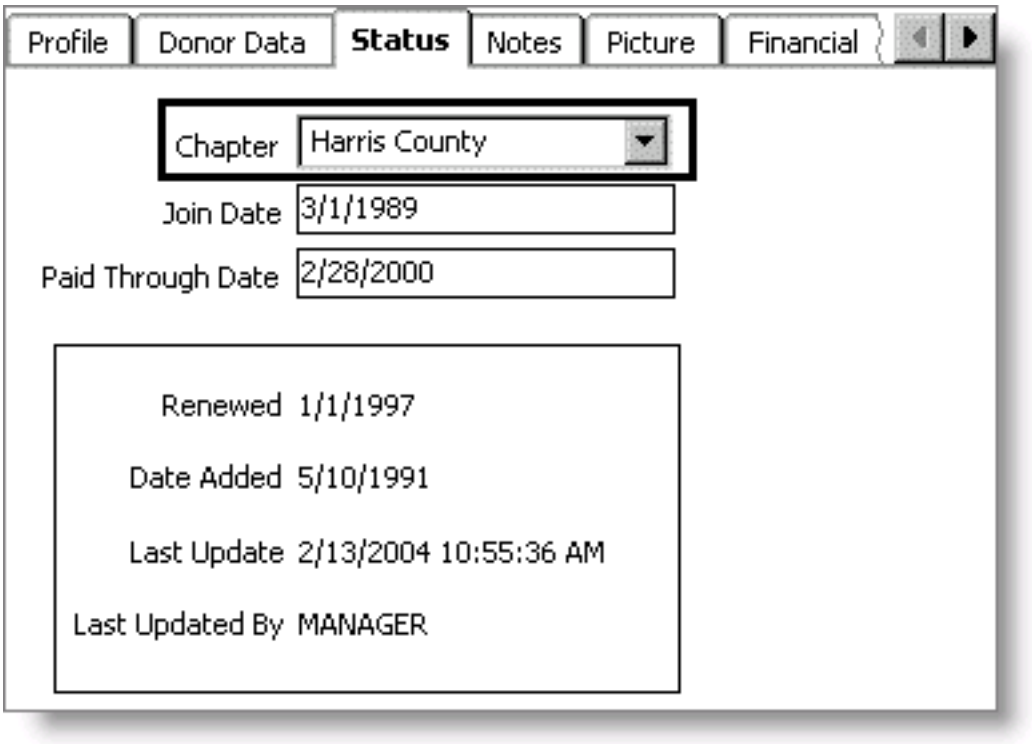
The reporting support for Chapter Management includes a full set of rosters and labels, as well as comprehensive statistical reports that reflect member additions and cancellations, movement from chapter to chapter, and other changes in status.

The Manage chapters rosters task list item displays on the Customers task list when iMIS is licensed for CHAPTERS.

Managing chapter members

When a customer belongs to only one chapter, you only need to select the appropriate chapter code in the appropriate field on the Status tab on Customers > Manage customers. The label that displays on the Status tab depends on the value you entered in the Chapter Prompt field on the Customer Setup - Basic Options window.

Note: Note: The Customers module is available only in Desktop.

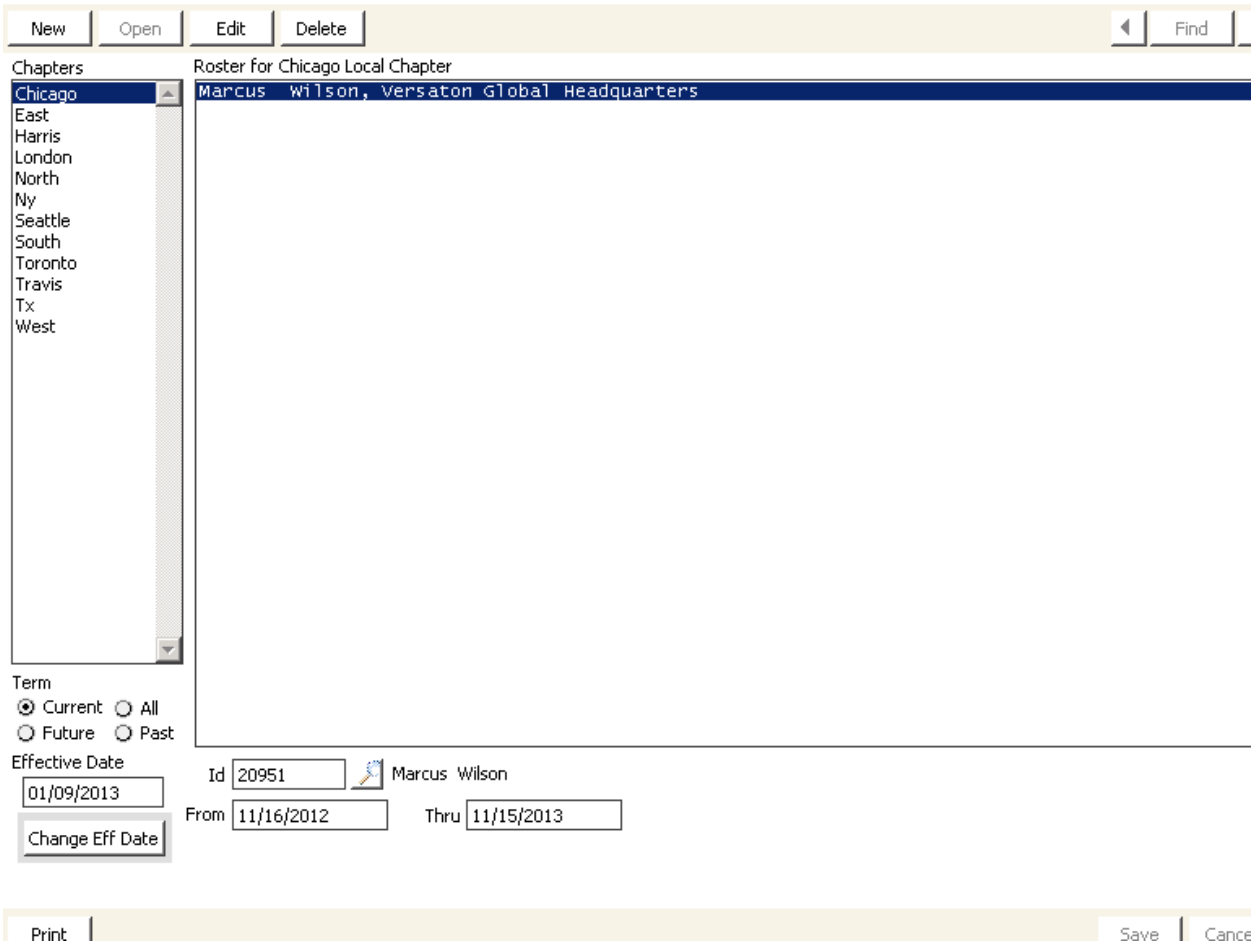


From Customers, select Manage customers, enter/edit a customer record, and select the Status tab

iMIS also supports situations in which you need to enroll customers in multiple chapters, or perform chapter maintenance.

Note: Note: The ability to manage chapter rosters is available in both Desktop and Advanced Accounting Console.

Manage chapters window



Desktop: Customers > Manage chapter rosters

Chapters

Lists the chapters.

Roster for

Displays the members enrolled in the selected chapter for the selected term.

Term

- Current - Enable to display only those members who have terms that include the date displayed in the Effective Date field. The From date must be on or before this date and the Thru date must be on or after this date.b

- All - Enable to display in the roster, all members who have served, are serving, or will be a member of the chapter.
- Future - Enable to display only those members whose term beings in the future (the From date is after the Effective Date).
- Past - Enable to display only those members whose terms have expired (the Thru date is before the Effective Date).

  Effective Date

  Displays the date upon which the radio button selections are based. Defaults to the current system date.

  Change Eff Date

  Enables edit of the Effective Date field.

  Id

  Specifies the member's ID number, or click the lookup icon to select an ID. When you enter the ID, the member's full name displays to the right of the field.

  From

  Specifies the start date of the term.

  Thru

  Specifies the end date of the term.

  Print

  Opens the Chapter Reports window where you can export chapter membership data as well as print rosters and a month-end report based on chapter enrollments, statistical reports, and labels.

  To assign a member to a chapter

To add a member to a chapter, you need their customer ID and the code for the chapter to which you are adding the member. Before you can enter lists of chapter enrollees, you must define chapter codes on the Manage chapters window.

1. From Manage chapters window, select the chapter from the Chapters scrolling list to which you want to add the member.
2. Click New.
3. Enter the member's Id, or click the lookup icon to select an ID.
4. Select the appropriate enrollment Term.
5. (optional) Enter the From and Thru dates of the enrollment period.

   Note: When you enter the From date and press Tab, iMIS automatically populates the Thru field with a date one full year from the From date. You can override this value.
6. Click Save.

To edit a chapter enrollment

In the Manage chapter rosters window you can edit any information on a particular enrollee except the chapter to which the member is assigned, and the ID associated with the record.

1. From Manage chapters window, select the chapter from the Chapters list and a term selection that includes the record.
2. Select the record from the roster.
3. Click Edit.
4. Make your changes.
5. Click Save.

To delete a chapter enrollment

1. From Manage chapters window, select the chapter from the Chapters scrolling list and a term selection that includes the record.

2. Select the record from the roster.
3. Click Delete. A message displays prompting you to confirm the deletion.
4. Click Yes.

Acquisition Management

The Acquisition Management feature allows you to import prospects and search an external prospect table from the iMIS global name lookup. For example, if you obtain a list of names and addresses of prospective clients, you can import the data into iMIS and create a mass mail merge to solicit funds from the prospects. Once you locate a prospect record, you can convert the record to a customer record.

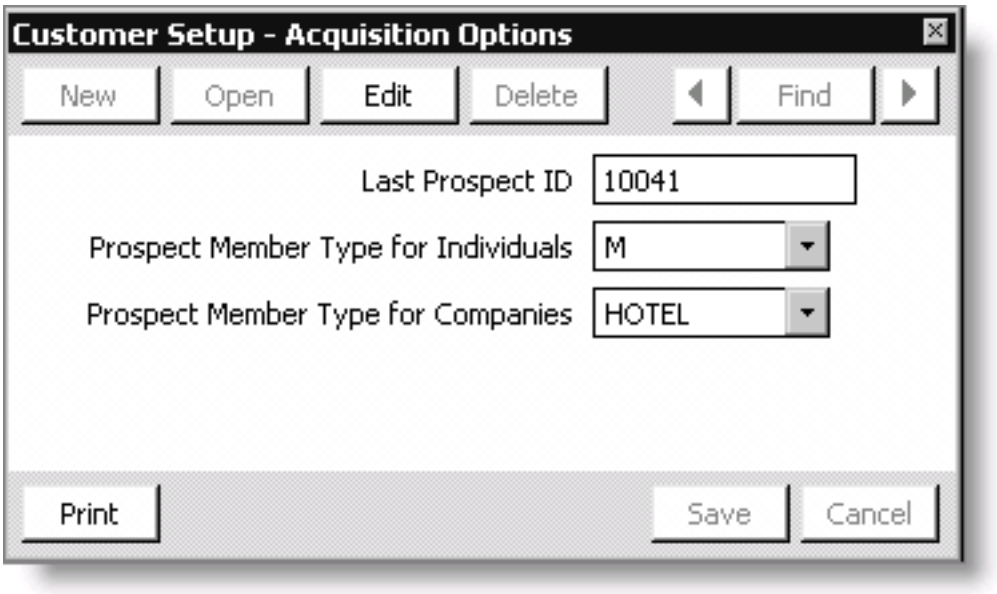
Note: Note: You must be licensed for Acquisition Management.

Note: Note: Acquisition Management is available only in Desktop.

Setting acquisition options

On the Customer Setup - Acquisition Options window you can specify the member type to associate with individual and company prospect records you import into iMIS.

Customer Setup - Acquisition Options window



From Customers, select Set up module > General, click Basic Options, and click Acquisition Options

The Customer Setup - Acquisition Options window includes the following fields and options:

Edit

Used to specify the acquisition options.

Last Prospect ID

(Display-only) The last prospect ID that was assigned

Prospect Member Type for Individuals

Use this drop-down list to select the member type to use when converting individual prospects from the drop-down list.

> **Note:** Note: When you import prospect records into iMIS, the system determines a record is an individual record if the import file contains a value for FirstName, LastName, or FullName.

Prospect Member Type for Companies

Use this drop-down list to select the member type to use when converting company prospects from the drop-down list.

> **Note:** Note: When you import prospect records into iMIS, the system determines a record is a company record if the import file does not contain a value for FirstName, LastName, or FullName.

Print

Used to generate and send a system settings report to your report destination.

To set Acquisition options

1. From Customers, select Set up module > General.
2. Click Basic Options to open the Customer Setup - Basic Options window.
3. Click Acquisition Options.
4. Click Edit on the Customer Setup - Acquisition Options window.
5. Select the Prospect Member Type for Individuals from the drop-down list.
6. Select the Prospect Member Type for Companies from the drop-down list.
7. Click Save.
8. Restart iMIS for your changes to take effect.

Importing prospect records

You can import prospect records from a tab-delimited file into iMIS. The prospect import file must contain data matching the following columns. Column values can be blank. However, if the FirstName, LastName, and Organization columns are all blank, the record is deleted during the import process.

- Prefix
- FirstName

- MiddleName
- LastName
- Suffix
- FullName
- Title
- Organization
- Address1
- Address2
- Address3
- City
- State/Province
- PostalCode
- Country
- HomePhone
- WorkPhone
- Fax
- E-mail

> **Note:** Note: The Prospect table cannot be truncated with the iMIS DB Maintenance utility. You must manually truncate the Prospect table.

> **Note:** Note: The column names in the iMIS Prospect table are mixed case. Column names in standard iMIS tables are uppercase.

SQL Server Tools required to import prospect records

When importing a prospect file, iMIS uses the SQL Server utilities osql and bcp. These utilities require that your computer have access to the SQL Server Tools. It is not common for every iMIS client computer to have the SQL Server Tools installed, so to perform this procedure successfully, you might need your system administrator to ensure the following conditions in your environment:

- A computer with SQL Server Tools has the folder with osql.exe (or sqlcmd.exe) and bcp.exe set for file sharing (this is typically the BINN folder, such as C:\Program Files\Microsoft SQL Server\MSSQL.1\MSSQL\Binn).
- An entry that points to that shared folder containing osql.exe (or sqlcmd.exe) and bcp.exe is added to your client computer's PATH variable.

  For example, assume your organization has one computer with SQL Server Tools installed in the default location. Your system administrator would need to share the BINN folder on that computer and would need to add a UNC entry similar to the following to your client computer's PATH variable:

  \\computerName\sharedPathToSqlServerTools;

  Where computerName is the name of a computer in your organization that has the SQL Server Tools installed, and sharedPathToSqlServerTools is the shared file path to the folder that contains the osql.exe (or sqlcmd.exe) and bcp.exe files.

  To import a prospect file

1. Select Utilities > Reports and Queries.
2. Select Data Import from the Report Types list.
3. Select Import data into the Prospect table from the Available Reports list.
4. Click Run. A confirmation message displays.
5. Click Yes. The Select import file window displays.
6. Select the prospect import file.
7. Click Open. The Prospect Import - Set Values window opens.

8. (required) Enter the Prefix for Imported IDs. This value must be 1-5 alpha characters. For example, PROSP. (This value displays as part of the ID field in Customers > Manage customers.)
9. (required) Enter the Imported List Code. (This value displays in the Member Type field in Customers > Manage customers.)
10. Click Save. A DOS window displays a confirmation message.
11. Press any key to continue. The file is imported.
12. Press any key again when the file has imported successfully.

Finding and converting prospect records

Finding prospect records is similar to finding customer records. The only difference is you must enable the Include acquisitions in search option on the Search window. Once you find a prospect record, you have the option to convert it to an iMIS customer record.

Customer records in iMIS sort by last name and then first name if there is a last name. Otherwise, records sort by company. When you include prospect in your search and the system finds duplicate names, the iMIS record displays first in the list.

To find a prospect record

1. From Customers, select Manage customers.
2. Open the Search window:

- Click Find; or
- Press Ctrl+F

Note: You can press Ctrl+F to open the Search window (perform a Find) only when the Manage customers window is not in edit mode and you are not in a single-instance, user-defined tab.

3. Select the search criteria from the drop-down list, for example, Name.
4. Enter the search value in the Begins with field, for example, c.

5. Enable the Include acquisitions in search option to include acquisitions from the Prospect table in the search.

   Note: The Include acquisitions in search option is retained on a per-user basis.

6. Click Go. The Results tab is updated.

   To convert a prospect record to a Name record

   Once you find a prospect record, you have the option to convert the record to a customer record. When a prospect record does not already have an iMIS ID assigned, the data in the prospect record is automatically imported into the Name table and all associated tables in the same manner as when a new customer record is entered. If the prospect record already has an iMIS ID assigned, the existing Name record associated with the prospect is used. If a prospect record is converted to a customer record during an iMIS operation (for example, when entering a gift or order) and the operation is cancelled, the new customer Name record is retained. Once a prospect record is converted to a customer Name record, the process cannot be reversed.

   Note: Note: You must have a Customers authorization level of 3 or higher to convert a prospect record to a customer Name record.

   Note: Note: When a prospect record is converted to a customer Name record, the ID number is automatically assigned regardless of the setting of the Auto Assign Member Numbers option on the Customer Setup - Basic Options window.

   Duplicate checking for a prospect functions in the same manner as duplicate checking for customers. When you select a prospect record for conversion, a window displays if a duplicate record exists. You can perform the conversion or cancel it.

   After you import a prospect record into iMIS, the prospect record is flagged with the associated iMIS ID and cannot be accessed by a Find operation unless an ID search on the prospect ID is performed.

1. From Customers, select Manage customers.

2. Open the Search window:

- Click Find; or
- Press Ctrl+F

3. Select your search criteria.
4. Enable the Include acquisitions in search option and click Go.
5. Double-click a prospect record to convert. The record loads in the Manage customers window in Edit mode.
6. Make any necessary changes to the record.
7. Click Save.

Relationship Management

iMIS Relationships offers you a way to manage relationships that exist between your contact records. It enables you to connect your contact records by connecting individuals to individuals, individuals to companies, companies to individuals, and companies to companies. It works as an extension of iMIS Customer Management, and its thorough integration with Customer Management makes maneuvering through related records clear and efficient.

> **Note:** Note: The Relationships tab displays on the Manage customers window when iMIS is licensed for Relationships.

> **Note:** Note: Relationship Managementis available only in Desktop.

Relationships features

Relationships enables you to accomplish the following tasks:

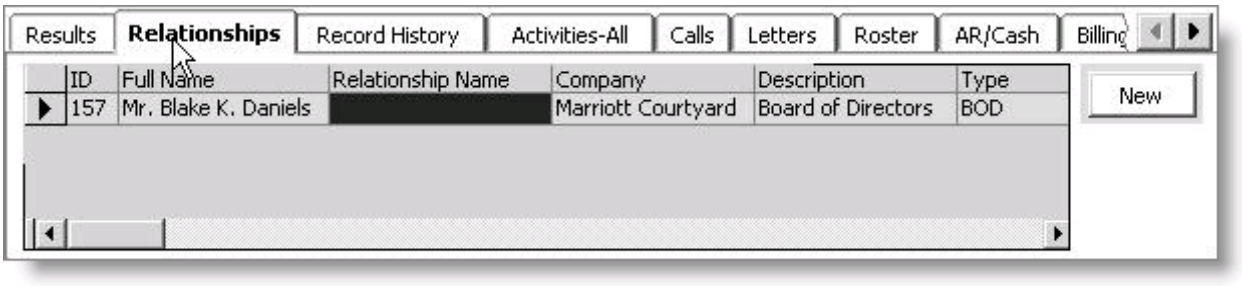
- Easily manage and view multiple relationships for individual contacts or company contacts
- Place time limits on relationships

- Use relationship codes to specify roles within an organization (for example, President)
- Use relationship codes in contact notifications (for example, one code would specific family members, another code would identify co-workers, etc.)
- Record specific details about related contacts

Managing relationships activity records

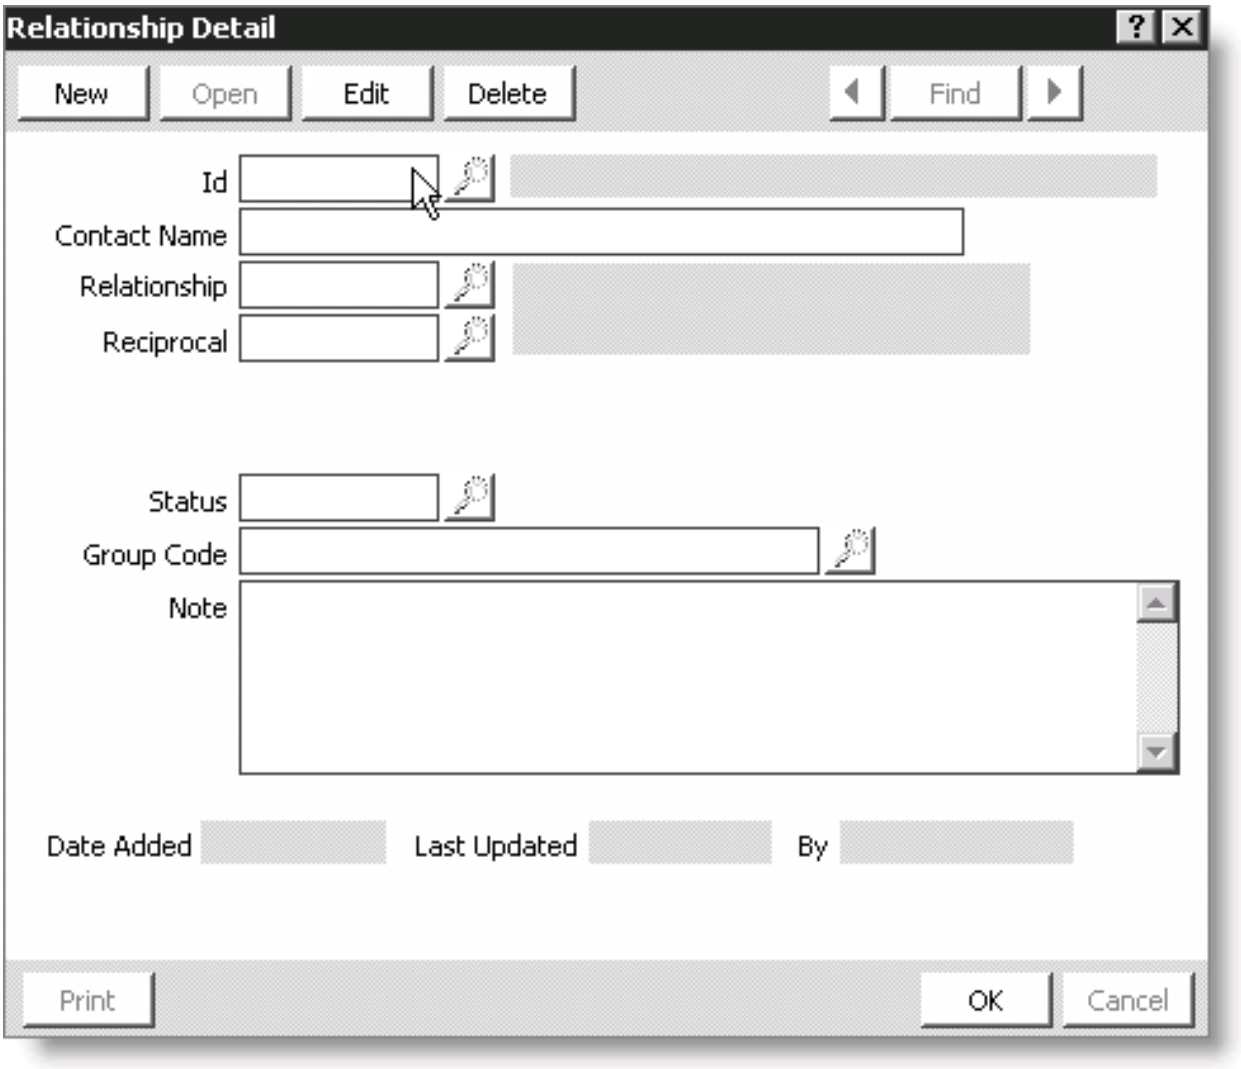
The Relationships tab in the Activity/History area of Customers > Manage customers contains the relationship log for contact records.

Manage customers window - Relationships tab



From Customers, select Manage customers, find customer record, and select Relationships tab

Relationship Detail window



Relationship detail window

Id

Specifies the ID of the contact, or click the lookup icon to search for the contact's ID.

Contact Name

Specifies the name of the contact when the ID is not in the contact database.

Relationship

Specifies the relationship code for the contact, or click the lookup icon to select the relationship code from a list.

Reciprocal

If the relationship code you entered in the Relationship field has a reciprocal relationship with another type, the code for that reciprocal relationship type automatically displays in this field.

Status

Specifies the status of the contact (Active, Marked for deletion, or Suspended), or click the lookup icon to select a value.

Group Code

Specifies a code for the group type (ROLE or DONOR), or click the lookup icon to select a group type.

Note

Specifies any notes you want to keep about the contact.

Date Added

This is a display-only field that shows when a relationship was added.

Last Updated

This is a display-only field that shows when a relationship was updated.

By

This is a display-only field that displays the ID of the person who entered the update to the relationship information.

To add a relationship to a customer record

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.

4. On the Relationships tab, click New. The Relationship Detail window opens.
5. On the Relationship Detail window, click New.
6. In the Id field, enter a contact ID, or click the lookup icon to select the contact's ID.

   Note: If you're adding a relationship with a contact that does not exist in the customer database, leave the ID field blank and enter the contact's name in the Contact Name field.
7. In the Relationship field, enter the relationship code, or click the lookup icon to select the appropriate code. If the relationship code you entered has a reciprocal relationship with another relationship type, the Reciprocal field auto-populates.
8. (optional) Enter a Title, or click the lookup icon to select a value.

   Note: The Title and Functional Title fields only display when the relationship type entered has the Use Title option enabled in the Relationship types window.
9. (optional) Enter a Functional Title, or click the lookup icon to select a value.
10. (optional) Enter a Status, or click the lookup icon to select a value.

    Note: Status codes are limited to 5 characters.
11. (optional) Enter the From and Thru dates.

    Note: The From and Thru date fields only display when the relationship type entered has the Use Dates option enabled in the Relationship types window.
12. (optional)Enter a Group Code, or click the lookup icon to select a value. (For more information on using Group Codes to display relationships on the Role tab, see the Managing Role Activities section of this chapter.)
13. (optional) Enter any additional information in the Note field.
14. Click Save.

    To view an existing relationship

1. Select Customers.

2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. Double-click on the relationship you want to view to open the Relationship Detail window for that relationship.

To edit an existing relationship

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. Double-click on the relationship you want to edit to open the Relationship Detail window for that relationship.
5. On the Relationship Detail window, click Edit.
6. Make the desired edits. At least two fields must contain information: the Relationship field and either the Id or the Contact Name field.
7. Click Save.

To delete an existing relationship

You can delete relationship records that display on the Relationships tab, provided your administrator has assigned you the appropriate authorization level.

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. Double-click on the relationship you want to delete to open the Relationship Detail window for that relationship.
5. On the Relationship Detail window, click Delete. A message displays asking you to confirm the deletion.

6. Click Yes to have the record deleted from the tab and the database or click No to cancel the deletion.

> **Note:** Note: You can also delete a record by pressing the Delete key on the key-board.

Managing role activities

The Role tab is an option available to users licensed for Relationships. The Role tab enables you to see a subset of a contact's relationships, based on relationship type. This is helpful if you have a contact with a large number of relationships, and you want easier access to just a few specific types of relationships for that contact.

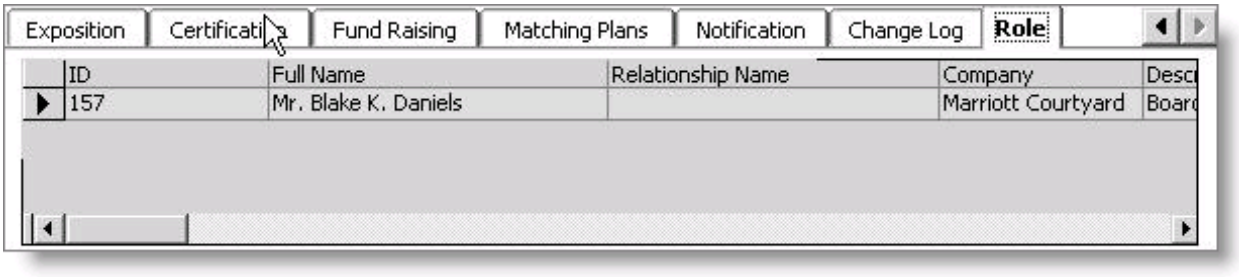
> **Note:** Note: All relationships on the Role tab will also appear on the Relationships tab.

> **Note:** Note: Managing role activities is available only in Desktop.

The Role tab will display only when the following requirements are met:

- You are licensed for Relationships.
- Your administrator has defined the ROLE code in the GROUP_CODE General Look-up/Validation table.

Manage customers window - Role tab



From Customers, select Manage customers, find customer record, and select Role tab

In order for relationships to appear on the Role tab, they must have the code ROLE entered in the Group Code field on the Relationship Detail window.

To view the Role tab

1. Open a customer's record in the Manage customers window.
2. Select the Role tab. The relationships that have been assigned the ROLE group code display in the tab area.

   Note: If you do not see the Role tab, right-click in the History Tabs section of the page, select Edit Tab Preferences, and make sure that Role is in the Visible History Tabs box.

To display an existing relationship on the Role tab

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab to display the contact's relationships.
4. Double-click on the relationship you want to edit to open the Relationship Detail window for that relationship.
5. Click Edit.
6. Enter ROLE in the Group Code field.
7. Click Save.

To add a relationship that will display on the Role tab

1. Select Customers.
2. Click the lookup icon to open a contact's record in the Manage customers window.
3. Select the Relationships tab.
4. Click New on the Relationships tab to open the Relationship Detail window.
5. Click New on the Relationship Detail window.
6. In the Id field, enter a contact ID, or click the lookup icon to select the contact's ID.

Note: If you're adding a relationship with a contact that does not exist in the customer database, leave the ID field blank and enter the contact's name in the Contact Name field.

7. In the Relationship field, enter the relationship code, or click the lookup icon to select the appropriate code. If the relationship code you entered has a reciprocal relationship with another relationship type, the Reciprocal field auto-populates.
8. (optional) Enter a Title, or click the lookup icon to select a value.

   Note: The Title and Functional Title fields only display when the relationship type entered has the Use Title option enabled in the Relationship types window.
9. (optional) Enter a Functional Title, or click the lookup icon to select a value.
10. (optional) Enter a Status, or click the lookup icon to select a value.

    Note: Status codes are limited to 5 characters.
11. (optional) Enter the From and Thru dates.

    Note: The From and Thru date fields only display when the relationship type entered has the Use Dates option enabled in the Relationship types window.
12. (required) Enter ROLE in the Group Code field, or click the lookup icon and select Role from the list.
13. (optional) Enter any additional information in the Note field.
14. Click Save.

Customers: Set up tables

To derive the most benefit from the iMIS Customer Management system, you need to customize it to meet the unique requirements of your organization. A large part of the iMIS Customer system is customized through its system tables, which support customer data entry and processing. Once built, these tables supply pertinent information to iMIS about your organization's processing requirements. These tables fill the following important roles:

- Data validation - Most of the tables verify specific data elements during data entry. For all fields or data elements for which a supporting table exists, iMIS performs a look-up and refuses any codes not found in the table.
- Clarification - Most tables provide full descriptions of the codes to which they correspond, which display on windows and print on reports.
- Processing controls - Some tables have characteristics that guide or alter iMIS's processing, let you activate features under a certain set of circumstances, or help you establish data organization and hierarchy.
- Typing shortcuts - To keep keystrokes to a minimum, some tables enable expansion that replaces codes with expanded text.

  iMIS's tables are powerful and important elements of your customized system. Building these table entries in line with your processing needs is an important prerequisite to beginning live operations with customer data.

iMIS table layout

The Name family of tables holds information about customers, prospects, subscribers, and any other individuals or companies for whom you want to keep information. These tables are as follows:

- Name
- Name_Address
- Name_Fin
- Name_Demo
- Name_Indexes
- Name_Note
- Name_Picture
- Name_Log
- Activity

- Lookup and Validation Tables
- Customizer (such as Demographics)

Name

For each name record in the Name table, there is always a corresponding record in the Name_Address and Name_Fin tables. The Name table consists of the following:

- Primary Name (individual or company)
- Category and Status
- Standard Addresses (first three)

Name_Address

The Name_Address file contains an unlimited number of addresses for each record in the Name file.

Name_Fin

The Name_Fin file contains financial and other associated data on your customers. ID is the primary key that references back to the Name table.

Name_Demo

The Name_Demo file contains user-defined fields, check box fields, and list string fields. You can customize these fields with your association's demographic data.

Name_Indexes

This file is automatically populated by iMIS and contains index information based on user-definable indexes that were created during Customer module setup.

Name_Note

The Name_Note file contains optional note fields specified for a customer.

Name_Picture

The Name_Picture file contains bit map images of customers.

Name_Log

The Name_Log file stores a log of the changes made to the database and who made the change. You have the ability to customize the information you want to store.

Activity

The Activity file contains historical records for various modules in iMIS:

- Committee Management
- Billing
- Fundraising
- Events
- Order Processing

Items that are included in this file are customer history information such as event attendance, billing payments, products ordered, and user-defined items such as a call log.

Lookup and validation tables

During system setup, your System Administrator must set up a number of small tables to provide lookup choices and validation (see "General lookup/Validation tables") during data entry for coded fields such as committees, chapters, and customer types.

Customizer tables

The iMIS Customizer lets you create many user-defined fields, windows, and tables during module setup. The user-defined windows make it easy to store and access demographics and other customizable data. To access the Customizer, from Customers, select Set up module > General, and click Additional Windows.

Building tables guidelines

While the number and types of data elements or fields that compose a table entry vary from table to table, they all contain two similar definition fields, the code and a longer description. The code is usually an all upper-case abbreviation that represents or

corresponds to the longer table entry description. For example, in the table of states, the standard 2-character abbreviation (TX) is the code, and the state name (Texas) is the description.

The code is a critical field and is:

- The primary access key for the table entry through which the table entry is stored and retrieved
- A validation check against input to the field it supports

In most fields, iMIS only lets you enter or select a code that exists in a table entry definition. In a field referencing the STATE_PROVINCE table, for example, iMIS would reject the code “TT” as not being a valid table entry.

In assigning codes, follow these guidelines:

- Assign meaningful codes that best represent the description.
- Make the codes long enough to be unique in the table but keep them as short as possible.
- Do not use spaces, apostrophes ('), quotation marks (“), or special characters other than underscores.

Using international address formatting

International address formatting enables you to format and store up to 256 different address layouts. These address layouts can be formatted to reflect the address layouts that are used by different countries, and they can be used in iMIS reports.

International address formatting in iMIS reports

International address formatting requires reports in all modules to use the FULL_ADDRESS, Name.FULL_ADDRESS, Name_Address.FULL_ADDRESS, Orders.FULL_ADDRESS, or Order_Badge.FULL_ADDRESS fields rather than a concatenation of the individual address fields.

These fields are calculated based upon the address format associated with the Country name in the Name Address record. Whenever FULL_ADDRESS is calculated, it is built based upon the appropriate address format.

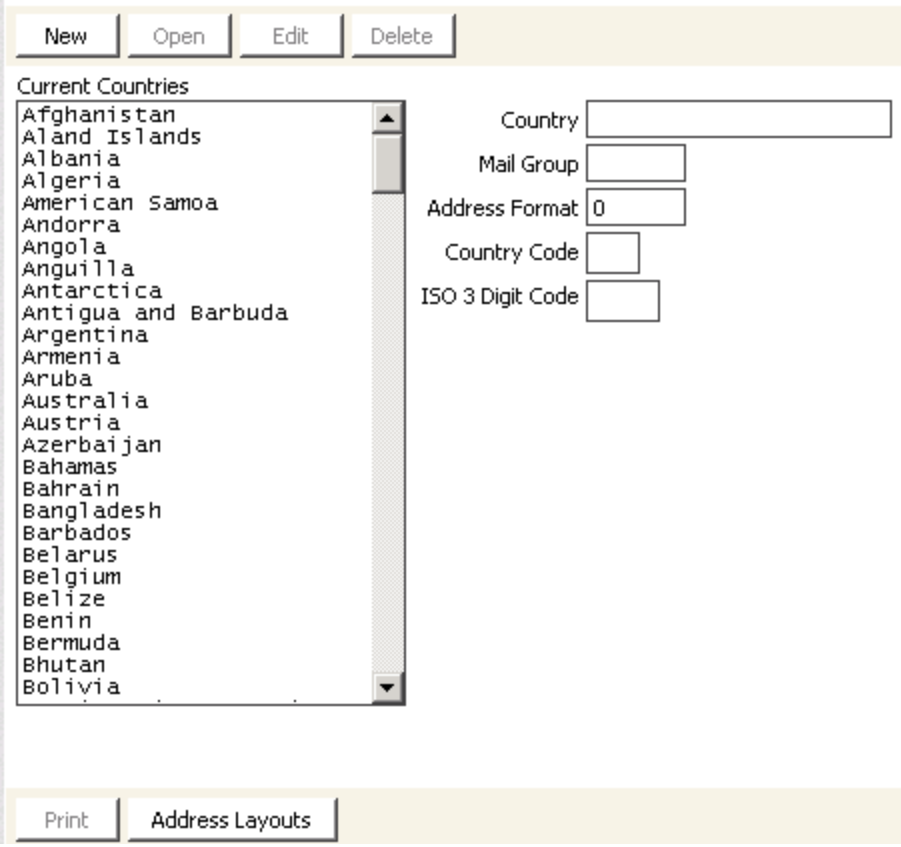
If international address formatting is set up, these FULL_ADDRESS fields are calculated based upon the address format associated with the Country name on the Name Address record. When a new record is inserted into the database, a new ASI stored procedure called sp_asi_AddressUpdate calculates all FULL_ADDRESS values based upon the country specific address formats.

To update the FULL_ADDRESS fields for existing records in the database, you will need to execute the 'Run AddressUpdate' script (select Utilities > Reports and Queries > Table Maintenance). This script calls the ASI AddressUpdate stored procedure that recalculates the FULL_ADDRESS fields based upon the appropriate address format.

If you have to run the 'Rebuild Name_Address Pointers' script for any reason, please note that you will also need to run the 'Run AddressUpdate' script in order to rebuild FULL_ADDRESS based upon the international address formats.

Set up country names window

The Set up country names window is used to add country records to the Country_Names table. The records entered in the Country_Names table then are linked with the appropriate address formats that are stored in the Country_Addr_Layouts table.



Desktop: Customers > Set up tables > Country names

Current Countries

Lists the current countries.

Country

(required) Enter the country name in this field (Country_Names.COUNTRY).

Mail Group

This field is reserved for future use (Country_Names.MAIL_GROUP).

> **Note:** Note: The Mail Group field is used in the Advanced Subscriptions module for reporting purposes. You do not need to enter anything in the Mail Group field if you do not intend to separate by mail group in the Advanced Subscriptions module.

Address Format

Displays the Address Format assigned to the country (Country_Names.ADDRESS_FORMAT).

Country Code

Designates the two letter code that stands for this country.

ISO 3 Digit Code

Designates the ISO 3 digit code that stands for this country.

Address Layouts

Opens the Country Address Layouts window to view the address format that is assigned to the country.

The Country table is a combination validation/expansion table for the Country field used for customer addresses. You need to specify values, either abbreviations for expansion and/or for full country names, for all the countries in which your customers may maintain a residence, a mailing address, or a billing address.

Address layouts

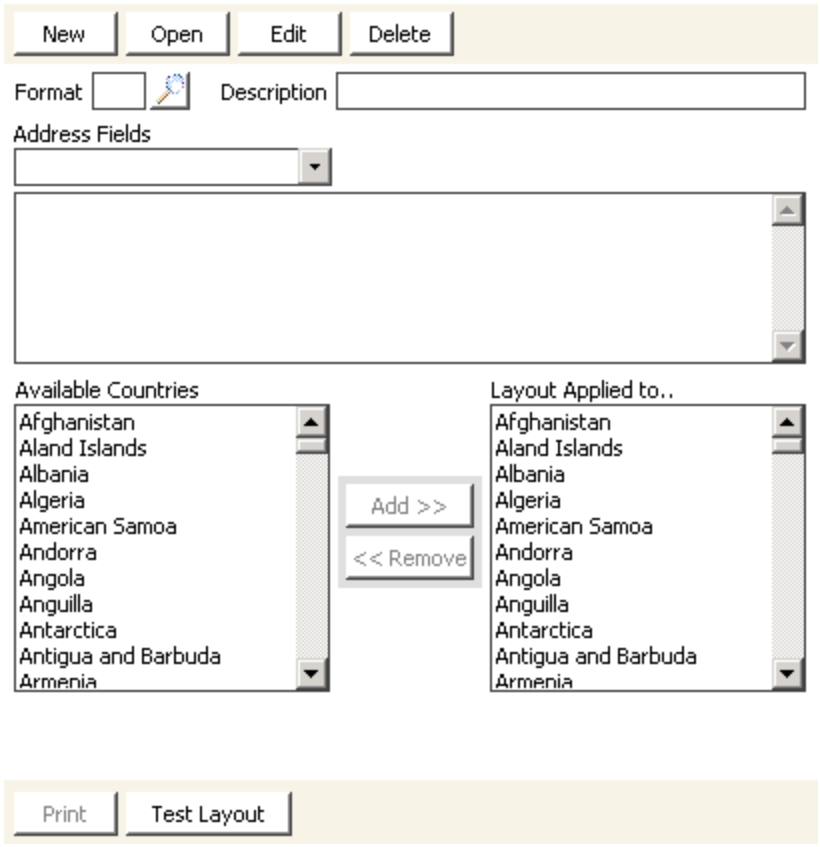
iMIS ships with the following address formats predefined for specific countries. For example, format 12 is applied to Bulgaria, format 13 is applied to Japan, and format 14 is applied to Korea. We recommend that you review these formats to be sure that they fit your business needs. If necessary, you can modify the formats (for example, change the format that applies to a country). For countries that have not had address formats applied to them, you will need to format address layouts and apply them to the countries.

0	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[C][S]STATE_PROVINCE[S][S]ZIP[N][U]COUNTRY
3	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[N][U]ZIP[N][U]COUNTRY
4	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[N][U]COUNTRY

5	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[N]STATE_PROVINCE[N][U]COUNTRY
6	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[S]STATE_PROVINCE[N][U]COUNTRY
7	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]CITY[S][U]ZIP[N][U]COUNTRY
8	CITY[N]ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] ZIP[N]STATE_PROVINCE[N][U]COUNTRY
9	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] CITY[N]ZIP[S][U]COUNTRY
10	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] ZIP[S]CITY[N]STATE_PROVINCE[S]COUNTRY
11	ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N] [U]ZIP[S][U]CITY[N][U]COUNTRY
12	COUNTRY[N]STATE_PROVINCE[N]ZIP[S]CITY[N] ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N]
13	COUNTRY[N]ZIP[S]STATE_PROVINCE[S]CITY[N] ADDRESS_1[N]ADDRESS_2[N]ADDRESS_3[N]
14	COUNTRY[N]ZIP[N]STATE_PROVINCE[S]CITY[S] ADDRESS_1[S]ADDRESS_2[N]ADDRESS_3[N]

Set up country address layouts window

The Set up country address layouts window is used to enter format codes, to modify existing format codes, to format address layouts, and to apply formatted addresses to specific countries defined in the Country_Names table. This address format information is stored in the Country_Addr_Layouts table.



Desktop: Customers > Set up tables > Country address layouts

Format

This field contains an address format code that will be auto-assigned to an address format (Country_Addr_Layouts.ADDRESS_FORMAT).

Description

Specifies a description for the address format (Country_Addr_Layouts.DESCRIPTION).

Address Fields

Use this drop-down list to select the fields that you want to use in the address format.

Use the area located below the Address Fields field to format the address layout (Country_Addr_Layouts.ADDRESS_LAYOUT). The formatted address layout combines the component fields of the address with four formatting codes:

- [U] - Uppercase. Enter [U] before a component field to make the data in the field all uppercase. For example, [U]CITY would generate all capital letters for a city such as NEW YORK or LONDON.
- [N] - New line. Enter [N] after a component field to insert a carriage return. For example, ADDRESS_1[N] would generate a carriage return and place the next component field on a different line in the address.
- [S] - Space. Enter [S] after a component field to insert a space between component fields. For example, [U]STATE_PROVINCES[S][U]ZIP would display as TEXAS 75208 when generated in an address.
- [C] - Comma. Enter [C] after a component field to insert a comma between component fields. For example, CITY[C][S][U]STATE[S][U]ZIP would display as Dallas, TEXAS 75208 when generated in an address.

  Available Countries

  Lists the countries that have not had address formats applied to them.

  > **Note:** Note: Countries must be entered on the Country names window before they will be available for address formatting.

  Add

  Used to move selected countries from the Available Countries list to the Format Applied to list. This action is part of the process of applying an address format to a country.

  Remove

  Used to move selected countries from the Format Applied to list to the Available Countries list. This action is part of the process of removing an address format from a country.

  Layout Applied to

  Lists the countries for which address formatting has been applied.

  Test Layout

Opens the Address Layout Tester window that is used to verify that an address is formatted correctly.

To enter an address format

1. From Country address layouts window, click New. The Format field automatically populates with the next succeeding format code. For example, if the last format code created was 15, then format code 16 will be entered automatically in the Format field.
2. Enter a Description for the country address format.
3. Arrange the component fields in the area located below the Address Fields field to suit the desired address layout. For example, if you want the country name to display on the first line in the address layout, press Enter before ADDRESS_1[N] to move it to the second line, highlight COUNTRY and press Ctrl+X, then press Ctrl+V.
4. Enter the formatting codes in the Address Layouts field to format the address.
5. Click Save.

To apply an address format to a country

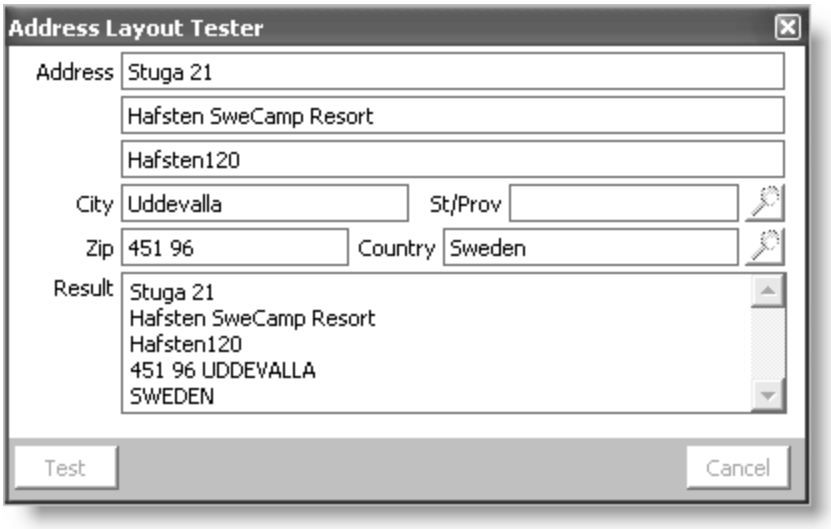
Make sure the country that you want to apply an address format to has been added to the Country_Names table.

1. From Country address layouts window, click Find.
2. Click the lookup icon in the Format field to choose the format code for the address format that you want to modify.
3. Click OK. The address format assigned to that code opens in the window. The countries for which no address formatting has been applied display in the Available Countries drop-down list.
4. Click Edit.
5. Select the country (or countries) from the Available Countries list for which you want to apply address formatting.

6. Click Add to move the selected country from the Available Countries list to the Layout Applied to list.
7. Click Save to apply the address format to the country.
8. (optional) Select Test Layout to verify that the formatted address layout produces the desired result.

Address Layout Tester window

The Address Layout Tester window is used to test and verify that a formatted address layout produces the desired result.



From Customers, select Set up tables > Country address layouts, and select Test Layout

Address

Specifies an address to test a formatted address layout.

City

Specifies a city to test a formatted address layout.

St/Prov

Specifies a state/province to test a formatted address layout.

Zip

Specifies a zip code to test a formatted address layout.

Country

Specifies a country name to test a formatted address layout.

> **Note:** Note: The address format that applies to a given layout is based upon the value entered in the Country field, so be sure to enter a value in this field. If the incorrect value is entered in this field, the test will not function correctly.

Result

Displays the results of the formatted address layout using the values entered in the above fields.

Test

Used to display the test results in the Result field.

To test an address format

1. From Customers, select Set up tables > Country address layouts to open the Country address layouts window.
2. Click Find.
3. Click the lookup icon in the Format field to choose the format code for the address format that you want to test.
4. Click OK to open the address format on the Country address layouts window.
5. Click Test Layout to open the Address Layout Tester window.
6. Enter an address in the first Address field.
7. (optional) Enter an address in the second Address field.
8. Enter a City.
9. Enter a state or province in the St/Prov field.
10. Enter a Zip code.
11. (required) Enter a Country that has had the selected address format applied to it.

Note: The address format that applies to a given layout is based upon the value entered in the Country field, so be sure to enter a value in this field. If the incorrect value is entered in this field, the test will not function correctly.

12. Click Test to view the results of the formatted address in the Result field.

To view the address format applied to a country

1. From Customers, select Set up tables > Country names to open the Country names window.
2. Select the country from the Current Countries field. The code for the address layout applied to the country displays in the Address Format field.

   Note: If an address format has not been applied to a country, the Address Format will reflect a zero (0) for the format code.
3. Click Address Layouts to open the Country Address Layouts window and view the address layout.

To remove address formatting from a country

1. From Customers, select Set up tables > Country names to open the Country names window.
2. Select the country from the Current Countries field. The code for the address format applied to the country displays in the Address Format field.
3. Click Address Layouts to open the Country Address Layouts window.
4. Click Edit.
5. Select the country from the Layout Applied to list for which you want to remove address formatting.
6. Click Remove to move the selected country from the Layout Applied to list to the Available Countries list and remove the address formatting.
7. Click Save.

To edit an address format

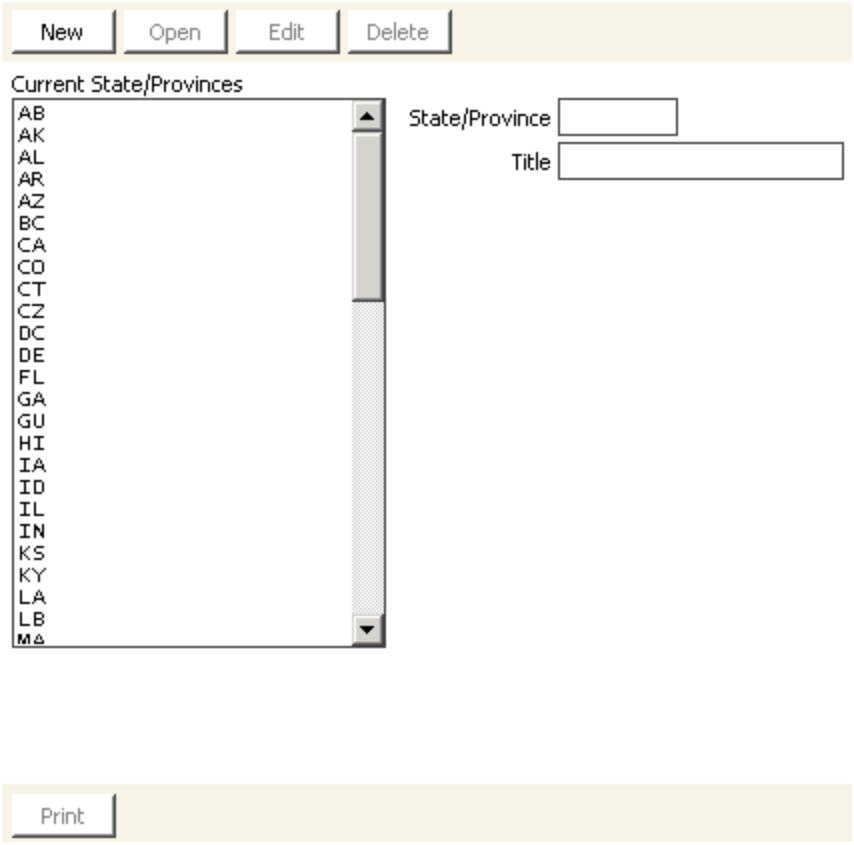
1. From Customers, select Set up tables > Country address layouts to open the Country address layouts window.
2. Click Find.
3. Click the lookup icon in the Format field to choose the format code for the address format that you want to edit.
4. Click OK.
5. Click Edit and make the change.
6. Click Save.

To delete an address format

1. From Customers, select Set up tables > Country address layouts to open the Country address layouts window.
2. Click Find.
3. Click the lookup icon in the Format field to choose the format code for the address format that you want to delete.
4. Click OK.
5. Click Delete.
6. Click Yes.

Set up state/province codes window

The State_Code table is a combination validation/expansion table for the St/Prov field used for customer addresses. This table is preloaded with all 50 two-character state abbreviations and full name descriptions. It also contains valid codes for the District of Columbia, other related U.S. regions, and Canadian provinces. You can add any entries you need.



Desktop: Customers > Set up tables > State/province codes

Current State/Provinces

This field contains a list of defined state/province codes.

State/Province

Enter the state/province code in this field.

Title

Enter the full name of the state/province in this field.

To define state/province codes

1. From Set up state/province codes window, click New.
2. Enter the code for the state/province you want to add to your validation/expansion table in the State/Province field.

3. Enter the full name of the state/province in the Title field.
4. Click Save.

Customer general lookup/validation and expansion tables

There are several general lookup/validation tables in iMIS (see General lookup/validation tables). Many of these tables are optional, but provide a way to maintain consistency in data entry. The following tables are most commonly set up to support Customers:

- ADDRESS_PURPOSE - enables you to have an unlimited number of addresses per customer.
- BAD_ADDRESS - enables you to mark address that do not pass validation with codes such as “moved”, “no_such_addr”, and so on.
- SALUTATION_CODE - provides pre-defined salutations such as “Dear Friends”, Dear <name>, and so on.
- DESIGNATION - provides a pre-defined list of designations such as “MD”, “CPA”, and so on.
- COMMITTEE_GROUPS - provides a pre-defined list of categories into which you can group committees. For example in a large organization there might be several committees that focus on outreach, education, and so on.
- GROUP_CODE - in order to use the Relationships module you must define the GROUP_CODE “Role”.

Setting up Chapter Management

Setting up Chapter Management consists of the following:

- Setting field prompts
- Defining chapter codes

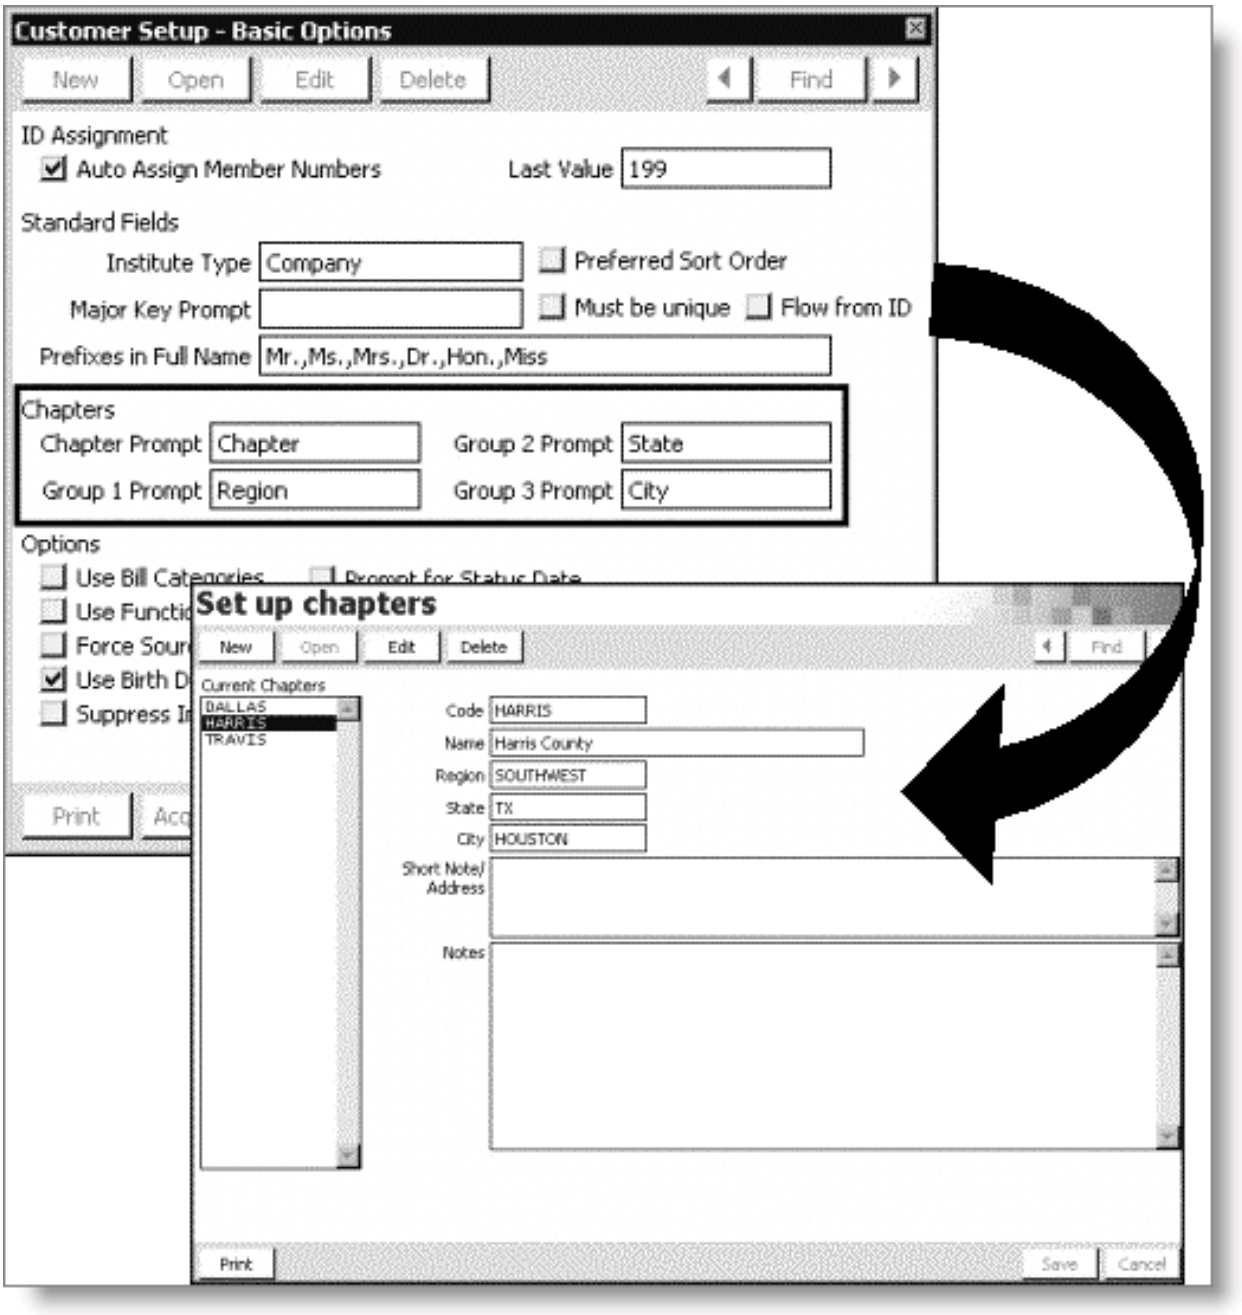
Once setup is complete, you can enter the chapter enrollments for anyone maintained in your customer database.

To use the chapter-tracking feature, your administrator must specify a Chapter Prompt field on the Customer Setup - Basic Options window.

If needed your administrator can also establish a hierarchical structure of up to three levels for your chapters by specifying group prompts on the Customer Setup - Basic Options window. For example, if your chapters are grouped by region, the proper region for the chapter can be designated. This will let you group customers by region (on reports, searches, etc.). With this added capability, you can produce detail or summary reports by region with the information sorted by region overall and chapter under that.

To set chapter prompts

1. From Customers, select Set up module > General, and click Basic Options to open the Customer Setup - Basic Options window.
2. Click Edit.
3. Enter a Chapter Prompt for tracking customers who belong to a particular chapter.
4. (optional) Enter a prompt in the Group 1 Prompt, Group 2 Prompt, and Group 3 Prompt fields. The prompts you define display between the Name and Short Note/Address fields on the Chapters window (from Customers, select Set up tables > Chapters). These groups allow you to specify and maintain hierarchies among your chapters, which facilitates targeted mailings and reporting. Examples of groupings include countries or regions, states, and counties and cities.
5. Click OK.



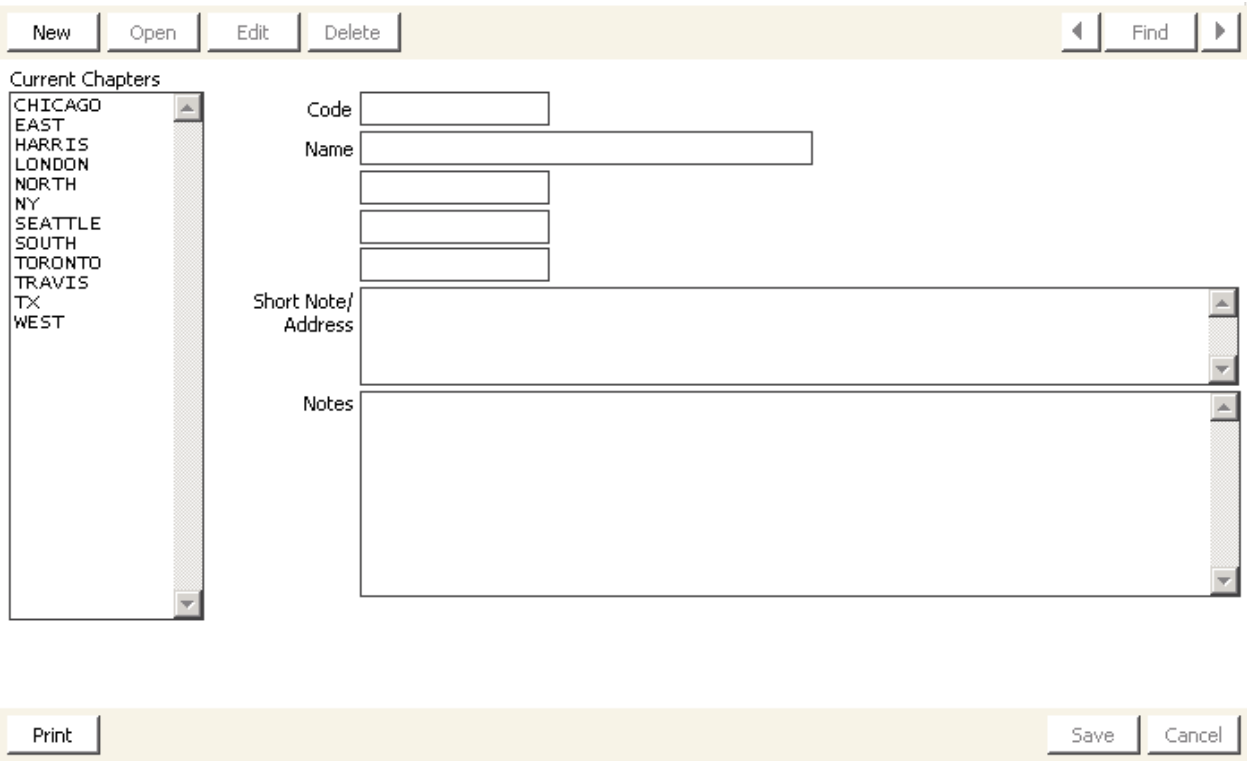
Sample chapter prompts defined on Customer Setup - Basic Options window displaying on Chapters window

Defining chapter codes

With the Chapter Codes table, you can easily track chapter members through iMIS. To maintain chapter designations, you only have to set up a table of chapters and enter a

chapter code for relevant customers in your file. The chapter table entry can be as simple as a chapter code and a chapter name, but you can add additional information such as an address or a note.

Set up chapters window



Desktop: Customers > Set up tables > Chapters

Current Chapters

Lists the codes assigned to each chapter.

Code

(required) Use this field to assign a unique code to each chapter. This field holds a maximum of 15 characters.

Name

Use this field to assign a name to each chapter.

Chapter prompts

Specify codes for three groups that correspond to the chapter hierarchy. You define the labels that display for these fields on the Customer Setup - Basic Options window

- Use the first field to enter a code for the highest level grouping of your chapter hierarchy (if applicable). For example, if you have a chapter organizational structure containing several sub-groupings, the Region code could represent the highest level.
- Use the second field to enter a code for the second-highest level grouping of your chapter hierarchy (if applicable).
- Use the third field to enter a code for the third-highest level grouping of your chapter hierarchy (if applicable).

Short Note/Address

Specifies miscellaneous notes about a chapter, as well as an address for the chapter.

Print

Prints information stored in the Chapter Description table.

To define a chapter code

1. From Set up chapters window, click New.
2. Enter an abbreviation for the chapter in the Code field.
3. Enter the full name of the chapter in the Name field.
4. (optional) Enter a code in the three fields between the Name and Short Note/Address fields.
5. (optional) Enter a note or address for the chapter in the Short Note/Address field.
6. (optional) Enter a note for the chapter in the Notes field.
7. Click Save.

To modify a chapter code

1. From Set up chapters window, select the Chapter code you wish to modify.

2. Click Edit.
3. Edit the fields you wish to change.
4. Click Save.

To delete a chapter code

1. From Set up chapters window, select the chapter code you wish to delete.
2. Click Delete.

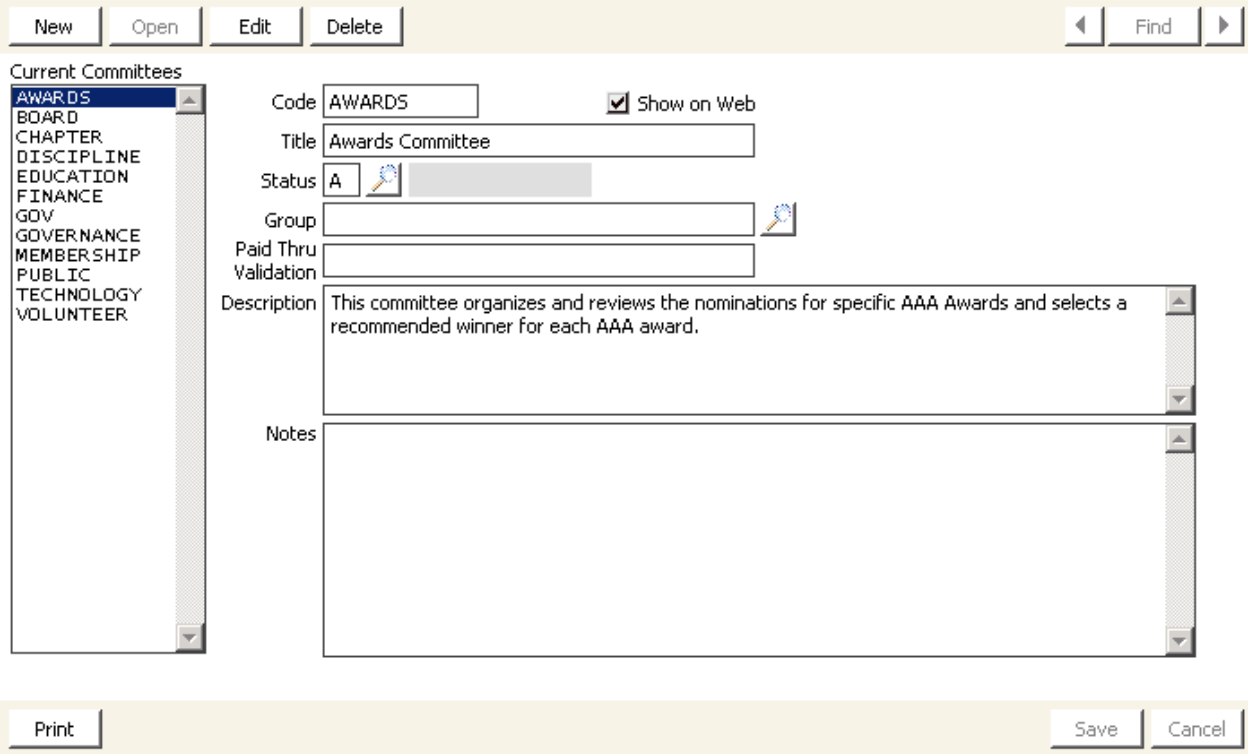
Setting up committees

To set up committees you must:

1. Define committee groups.
2. Define committee codes.
3. Define committee positions.
4. Set committee options and membership duration.

After you set up these tables and options, you can enter the committee assignments (current, future, and historical) for any individuals maintained in your customer file.

Set up committee codes window



Desktop: Customers > Setup tables > Committee codes

Current Committees

Lists the codes assigned to each committee.

Code

Specifies a unique code for each member. The maximum length is 15 characters.

Show on Web

Enables all committees and committee members associated with this committee code to be listed on the Committees page of the Public view components site. Clear this check-box to prevent the associated committees and committee members from being listed.

Title

Specifies a descriptive name for the committee. The maximum length is 60 characters.

Status

Use this field to identify the status of the committee as A for active or I for inactive. If you wish to discharge a committee, set its status to I for inactive. Click the lookup icon to select an available value.

> **Note:** Note: To use the search feature, the COMMITTEE_STS general look-up/validation table must be set up.

Group

Use to collectively group related committees together. Click the lookup icon and select an available value.

> **Note:** Note: To use the search feature, the COMMITTEE_GROUP general look-up/validation table must be set up.

Paid Thru Validation

Specifies a validation code that links a committee to a dues-product code for a given chapter or area. This field is used to verify that a potential committee member has purchased the required chapter or area dues-product. Click Edit to see a drop-down list of available chapters.

Description

Describes the purpose of the committee. This description is displayed in the committee roster and is available for printing on other reports. The maximum length is 255 characters.

Notes

Stores miscellaneous notes that are printed on reports and directories. The maximum length is 32,000 characters.

Print

Prints information stored in the Committee Codes tables.

To define committee codes

For each committee in your customer system, you must define an alphabetic committee code and a title for the committee that you are setting up in the Committee Codes table. Define committee codes and assign committees to groups after defining the committee groups.

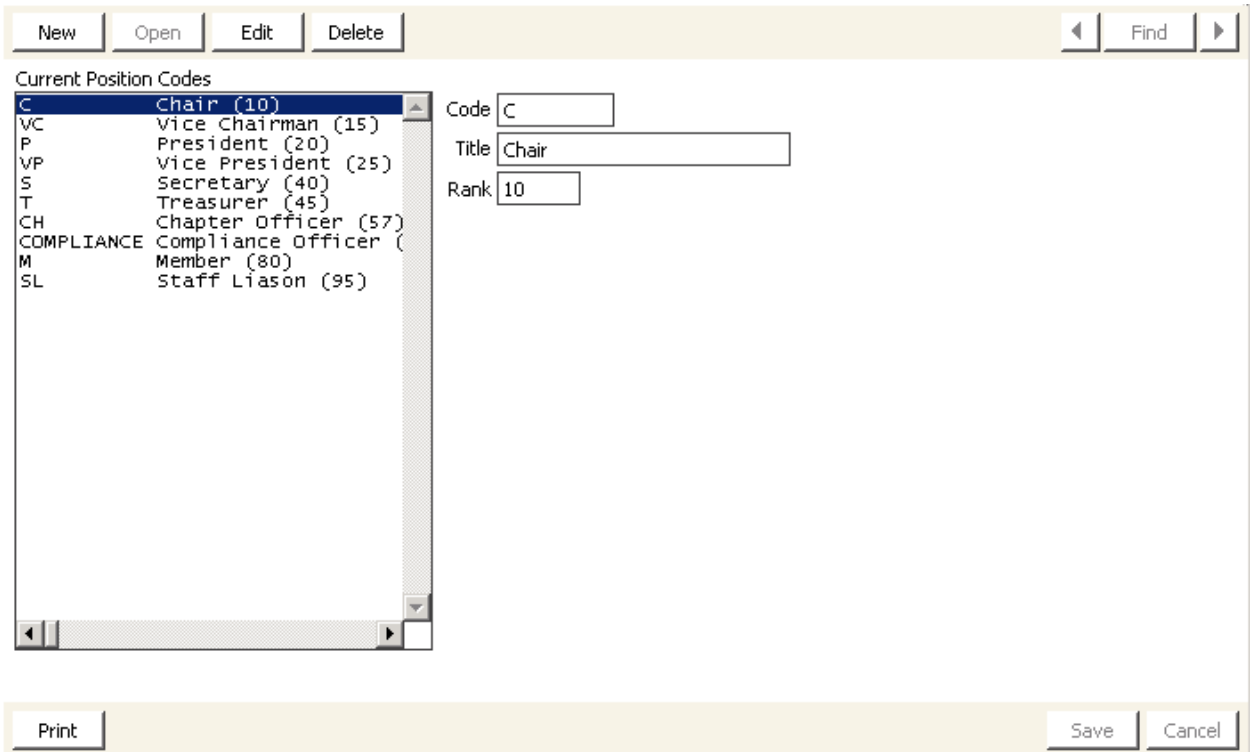
1. From Set up committee codes window, click New to create a new committee code, or select an existing one from the Current Committees list and click Edit to modify it (or click Delete to remove the committee code).
2. Specify the committee code information.
3. Click Save.

To change a committee status

1. From Set up committee codes window, from the Current Committees list, select the committee whose status you want to change.
2. Click Edit.
3. Enter I for Inactive in the Status field.
4. Click Save. A warning message box displays.

   Note: When you change a committee to inactive, iMIS searches the Activity table for any committee members with a Thru date greater than today. If any are found, iMIS will notify you and ask if you want those Thru dates automatically changed to yesterday's date. If you answer yes, iMIS will set those activities' Thru dates back to the previous day's date.
5. Click Yes.
6. Click Save on the Committee codes window.

Set up committee positions window



Desktop: Customers > Set up tables > Committee positions

Current Position Codes

Displays the various positions that can be held within any committee.

Code

Specifies a code that represents each position that can be held within any committee. Create codes to represent all committee appointees, even those who do not hold officer-level positions. Characters entered in this field are capitalized automatically.

Title

Specifies the descriptive name for the committee position.

Rank

Specifies a unique number that corresponds to the order in which you want committee members who hold this position to display on committee rosters and other related reports.

For example, enter 1 for the Chair (to display first on the roster), enter 2 for the next most important position, and so on. Assign the highest number to the lowest position such as a regular committee member.

You can reassign these ranks at any point, but in order to more easily add new positions in the future, you may wish to skip numbers between ranks. For example, if Chair is ranked as a 1, enter a 3 for the second most important position. If you do not enter a rank, iMIS sorts the members in alphabetic order.

Print

Used to print information stored in the Committee Position tables.

To define committee positions

After setting up the Committee Codes table, you must set up the Committee Positions table before you can enter committee appointments. In the Committee positions window, you assign a code, a description, and a rank (order indicator) for each position that may be held within any committee.

1. From Set up committee positions window, click New.
2. Enter a code in the Code field that represents the position you are defining.
3. Enter the descriptive name for the committee position in the Title field.
4. (optional) Enter a unique number that represents the order of importance in the Rank field.
5. Click Save.

To set committee options and membership duration

By default, iMIS sets the membership duration (the date represented in the Thru field in the Manage committees window) to 12. For example, when you type a date in the From field, the Thru date will default to 12 months from that date.

1. From Customers, select Set up module > General, and click Advanced to open the Customer Setup - Advanced window.

2. Click Edit.
3. Set up the options and customer duration for your committees.
4. (optional) Enter labels in the Minutes 1, 2, 3, and 4 Prompts for options that activate in the Minutes window. The option(s) activate in the Minutes window only when a label is entered in a Minutes Prompt field in the Customer Setup - Advanced window.
5. (optional) Enter the number of months in the Default Duration (months) field that you want iMIS to use when calculating the default Thru date in the Manage committees window. To indicate that the committee appointment does not expire, leave this field blank or set it to 0.
6. (optional) Enable the Use Co ID Hierarchy option to link a committee to the ID of a company record. A sub-set of customers associated with the company branch of the committee is created.
7. Click Save.

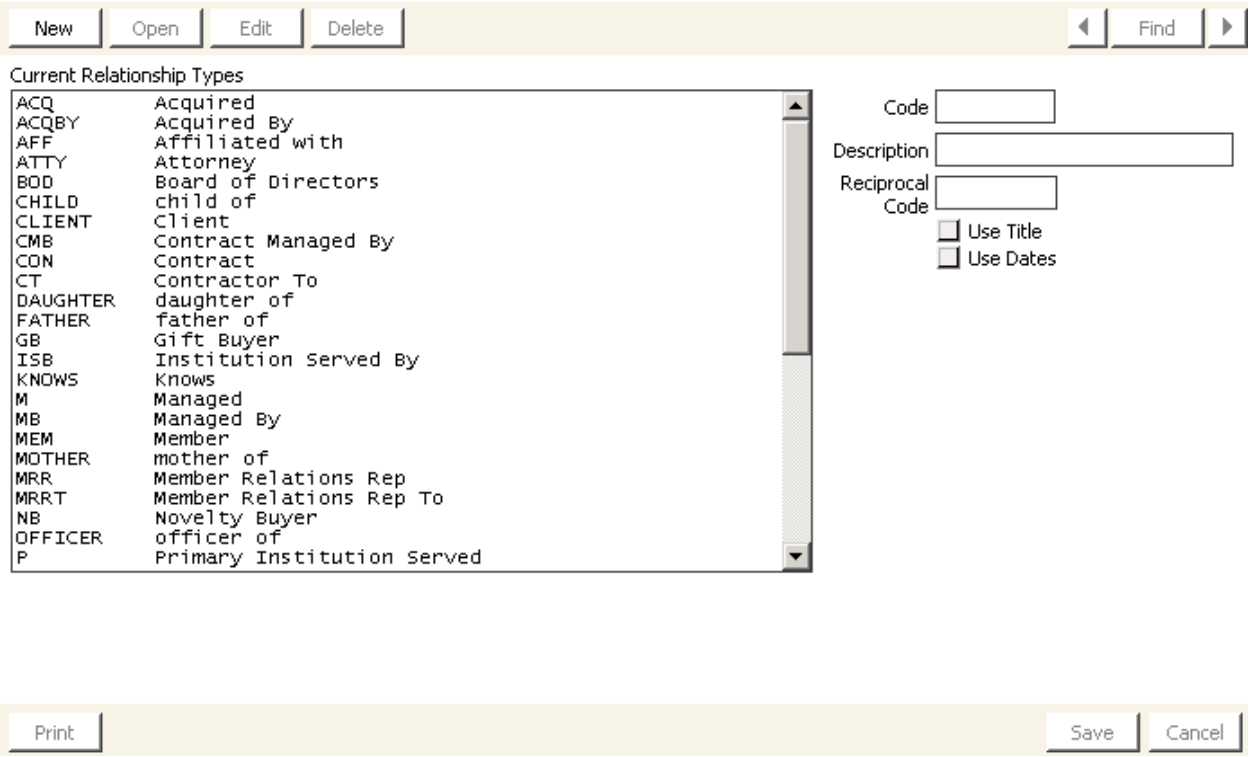
Setting up relationship types

Use the Relationship types window to add, edit, and delete relationship types.

Configuring Relationships

In order to use the Relationships module, you must set up a GROUP_CODE general look-up/validation table.

Set up relationship types window



Desktop: Manage customers > Set up tables > Relationship types

Code

Specifies a code that you want to represent the relationship.

Description

Use this field to describe the relationship code. Code descriptions display next to their corresponding code on the Relationship Detail window when you select the lookup icons for the Relationship and Reciprocal fields.

Reciprocal Code

(optional) Enter the code (existing or yet to be defined) for the relationship you want to link to this code to in order to create paired relationship records (for example, you can make MOTHER the reciprocal code for the relationship type DAUGHTER).

Use Title

(optional) Enable if you want the Title and Functional Title fields to display in the Relationship Detail window.

Use Dates

(optional) Enable if you want to display fields for the beginning (From) and ending (Thru) dates of the relationship in the Relationship Detail window. Use this option for time-bound activities such as appointments.

To add a new relationship type

1. In the Set up relationship types window, click New.
2. In the Code field, enter a value that you want to use to represent the relationship.
3. In the Description field, enter information that describes the relationship. The description displays on the Relationship Detail window for this code.
4. (optional) If desired, enter the code for the relationship you want linked to your new relationship type in the Reciprocal Code field.

   Note: If you leave the Reciprocal Code field blank for relationship type, two contacts connected with that relationship type will be displayed with that same type.
5. (optional) Enable the Use Title option if you want to display the Title and Functional Title fields in the Relationship Detail window.
6. (optional) Enable the Use Dates option if you want to display fields for beginning (From) and ending (Thru) dates of the relationship in the Relationship Detail window.
7. Click Save.

To edit a relationship type

You can change the Description, Reciprocal Code, and the Use Title or Use Dates options for any of the standard relationship types that are shipped with iMIS, and you can edit any customized relationship types that you created.

1. In the Set up relationship types window, select a code from the list of relationship types.

2. Click Edit.
3. Enter the new information.
4. Click Save to save the changes, or click Cancel to cancel your changes.

To delete a relationship type

1. In the Set up relationship types window, select a code from the list of relationship types.
2. Click Delete. A message displays asking you to confirm the deletion:

- Click Yes to remove the type.
- Click No to cancel the deletion.

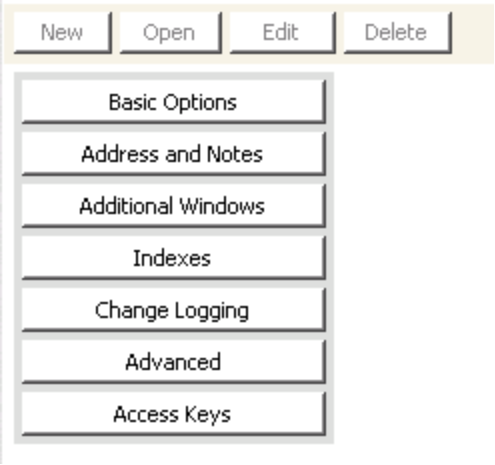
> **Note:** Note: Before deleting a relationship type, check to be sure that your system does not have any relationships set up that use that relationship type.

Customers: Set up module

Customer Management is usable out of the box but is designed to be customized to your specific organization's structure and operation. For this reason, you must work with your System Administrator to set up and configure it to meet the needs of your organization. This area outlines the steps required in setting up iMIS for maintaining your customer data according to organizational requirements for:

- Basic customer options.
- Customer addresses and notes.
- Lookup information for searching with the Find window.
- Fields in the Change Log.
- Advanced customer options.

Configure membership options window



Desktop: Customers > Set up module > General

Basic Options

Opens the Customer Setup - Basic Options window.

Address and Notes

Opens the Customer Setup - Address and Notes window.

Additional Windows

Opens the Customer Setup - Additional Windows window.

Indexes

Opens the Customer Setup - Indexes window.

Change Logging

Opens the Customer Setup - Change Logging window.

Advanced

Opens the Customer Setup - Advanced window.

Access Keys

Opens the Customer Setup - Access Keys window.

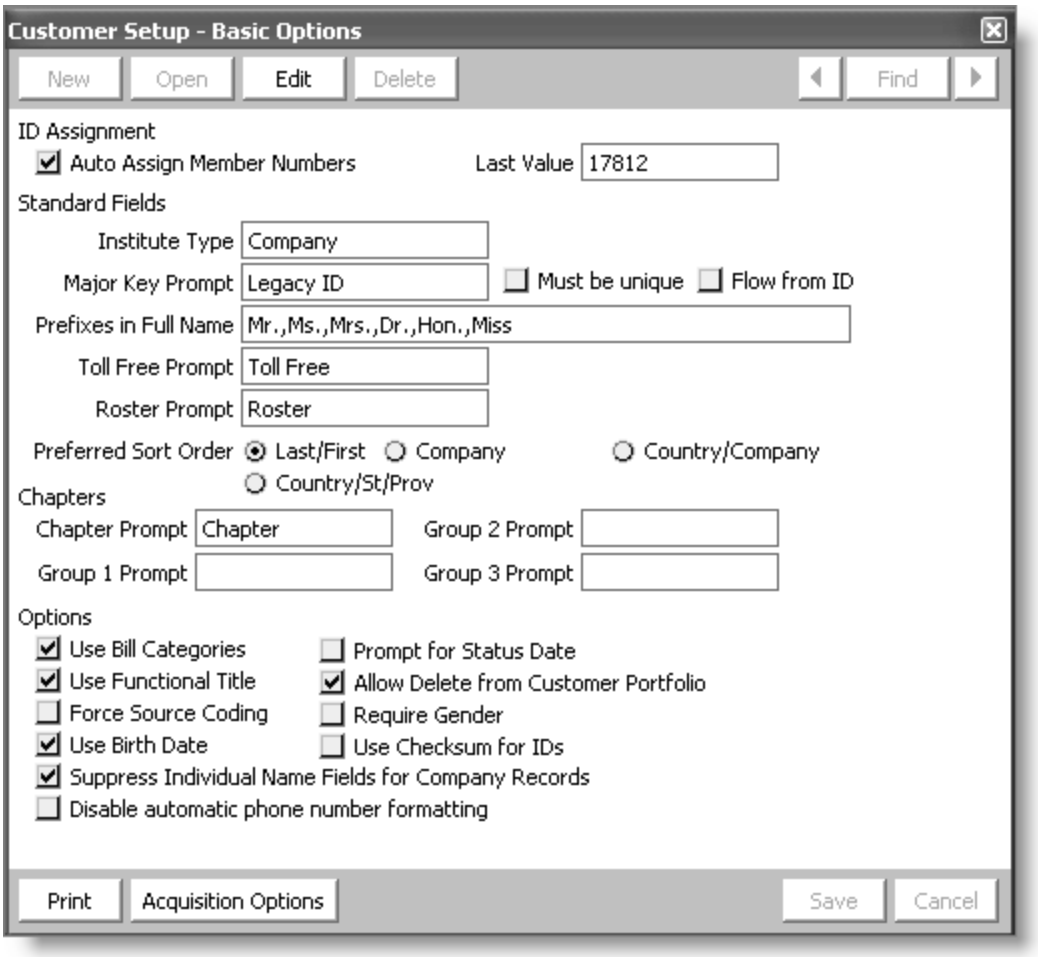
Print

Used to generate and send a system settings report to your report destination.

Setting basic customer options

The Customer Setup - Basic Options window lets you set up user-defined fields that, once defined, will be displayed in the appropriate data maintenance windows. In addition, you can enable and adjust several important system features through this window.

Customer Setup - Basic Options window



From Customers, select Set up module > General, and click Basic Options

Auto Assign Member Numbers

When selected, iMIS assigns a unique customer identification number (ID) to each new customer. This option is required if you allow users to create new accounts in iMIS Public or Web views.

Last Value

Displays the sequential counter iMIS uses in auto-assigning IDs and only has relevance if Auto Assign Member Numbers is enabled. Unless the auto-assign option is disabled, this value will be blank (or zero) for a newly installed system and cause the first ID to be assigned as one (1). If you need to have the first assigned ID be other than one, you can enter a value of one less than what you want the first number to be. You can only enter a value between 0 and 2147483647; otherwise an error will occur.

Institute Type

Assigns a label to the standard company field. The default label is Company. If you assign a different label, that label is used in the Customers Results tab, and in various reports and windows. You may want to assign this label according to the types of customers you serve. For example, if your customers are hospitals, assign Hospital.

Example of Institute Type with the Company label assigned

Preferred Sort Order

Designates the sort order of search results as one of the following:

- Last/First - results are sorted by last name, first name.
- Company - results are sorted by the designated company sort, last name, first name.
- Country/Company - results are sorted by country, state/province, company sort, last

name, first name.

- Country/St/Prov - results are sorted by country, state/province, last name, first name.

> **Note:** Note: The sort options use the labels you configured for Institute Type (by default "Company") and State/Province (by default "St/Prov").

With the exception of certain types of searches for which the default sort order would not be appropriate, results will are sorted according to the sort order chosen. The following types of searches override the default sort order:

- Name - results are sorted by last name, first name, then if prospects are included in searches, whether the person is an existing customer or a prospect.
- Company/Company Only - results are sorted by the designated company sort, then the preferred sort order.

  Note: The Company search (which includes personal records that are associated with company records) adds prospect status as the final sort column.
- Task Date - ignores the preferred sort order; data is not sorted.
- Ad Hoc - if the ad hoc search uses company ID as a criterion, the results are sorted by the designated company sort field. Otherwise, the preferred sort order is followed.

  Major Key Prompt

  (optional) Specifies a primary field through which you can retrieve records. Enable the option by entering a prompt (label) in the field. iMIS then makes the field available for referencing and searching for customer records throughout the system. Useful reference keys are social security numbers, certificate numbers, license numbers, and old customer ID numbers.

> **Note:** Note: The data entered in this field displays in parentheses next to the main ID on most customer reports.

  Must be unique

When selected, the Major Key Prompt field is validated for uniqueness during data entry.

Flow from ID

When selected, links the Major Key field with the Id field, populating the Major Key field with the user's ID.

Prefixes in Full Name

Specifies which prefixes from the PREFIX general lookup table are included in Name.FULL_NAME. The prefixes you enter in this field must match either the Code or the Expansion for the corresponding prefix entered in the PREFIX general lookup table. When entering a list of prefixes, values must be separated by commas. The total length of this field is 5000 characters.

Toll Free Prompt

Specifies a label for toll free numbers. This customized prompt is displayed on several iMIS windows in Orders, Fundraising, Events, Exhibitions, Exposition, and in the Customers area.

Roster Prompt

Specifies the a heading for the Roster tab.

Chapter Prompt

Specifies a prompt (label) for tracking customers who belong to a particular chapter or for similar tracking purposes. You can use the chapter-tracking feature for tracking at levels other than chapter such as district and region.

> **Note:** Note: The Chapter field will be activated only if you enter a label in the Chapter Prompt field. The Chapter field, with your user-defined label, displays on the Status tab.

The group prompt fields within the Chapters area of the Customer Setup - Basic Options window are used to further expand and define chapter affiliation and association. Think of the groups as levels with Group 1 being the first level and largest division of the

association. Chapter would be the fourth level and smallest division of the association. These prompts display in the Chapters window (from Customers, select Set up tables > Chapters).

Group 1 Prompt

Specifies the region the chapter is in. Examples could be country or region such as Western or Central.

Group 2 Prompt

Specifies the division the chapter is in and to further define Group 1. Examples could be states.

Group 3 Prompt

Specifies the area the chapter is in and to further define Group 2. Examples could be counties and cities.

Use Bill Categories

When selected, establishes a sub-grouping of customers. The Category field is shown to the right of the Type field in Customers > Manage customers. Its primary purpose is to sub-categorize customers for billing purposes. For example, if the dues amount for sustaining customers is any of five different sums based on organization size, you can track those size levels in the Category field.

Note: Note: Since it is best to maintain a small group of customer types, use the secondary Category field when you need to break down many different billing levels. See Billing for more.

Force Source Coding

When selected, requires a source code entry for income-oriented transactions.

Use Birth Date

Select to display the Birth Date field on the Other tab.

Suppress Individual Name Fields for Company Records

When selected, hides the Name area of Customers > Manage customers, and when a user views a company record, moves the Company area up.

When inserting a new company record, the fields in the Name area are dimmed (unavailable) and cleared of any values as soon as the Customer Type field is set to a company customer type. When a record is saved as a company record, the data is refreshed so that the company fields shift to the top of the area and the Name area is no longer visible.

> **Note:** Note: If a customer type is later changed from a company to an individual, the fields in the Name area of the record are restored; however, any values that existed for those fields are not restored.

Disable automatic phone number formatting

When entering phone numbers in iMIS, the numbers are automatically formatted in the U.S. format of (xxx) xxx-xxxx. When this option is selected, no formatting is applied and the phone number is displayed as typed.

Prompt for Status Date

When selected, iMIS prompts the user to accept or override the customer's status date (not recommended for most users).

Allow Delete from Customer Portfolio

When selected, authorized users can delete customer records directly by clicking Delete on the Customers area (Customers > Manage customers). A warning box prompts the user to verify the deletion.

> **Note:** Note: Disabling this option offers a safeguard against the accidental deletion of records. To delete customer records, mark them for deletion with “D” (or a code-string beginning with D) in the Status field of Customers > Manage customers (recommended).

Require Gender

When selected, displays the Gender field on the Other tab. This option does not automatically require a gender (M or F) be entered in the field. iMIS automatically populates the Gender field based on the entry in the Prefix field of the Customers area. Prefixes that do not indicate gender (such as Dr.) will not be automatically populated, and the entry will need to be made manually.

Use Checksum for IDs

When selected, adds checksum digits to IDs that are automatically generated for Name records.

> **Note:** Note: This checksum digit will only apply to IDs automatically generated for Name records. It is not used for other automatically assigned IDs.

Print

Generates and sends a system setting report to your report destination.

Acquisition Options

Opens the Customer Setup - Acquisitions Options window where you can specify the member types to use when converting prospect record to Name records.

> **Note:** Note: This button is displayed when iMIS is licensed for Acquisition Management.

About iMIS IDs

iMIS uses the ID internally to store and access customer records. For this reason, you can never change the ID that you assign to a newly entered customer.

Most users should allow iMIS to assign IDs to new customers code for the following reasons:

- The ID must be unique to each customer record. Once it's assigned, you can never change it. If you enter an incorrect ID assignment, you have to delete the entire customer record and reenter it. This can create problems if other records are linked to the incorrect

ID.

- The customer ID is not critical for searching, so it does not need to be easily remembered. iMIS provides search methods such as name, company, and customer type for finding customer records.
- You can label and use a second, optional user-entered ID (or major key) for iMIS to maintain. This Major Key field can serve as your primary look-up key throughout iMIS. This user-entered ID can be validated to be unique, such as a social security or license number.
- Having users assign IDs is complicated by the fact that iMIS tracks prospects in the main database, and all of these records must be assigned unique IDs. The volume of these records could make it hard to maintain a user-assigned series of IDs.
- Some features, such as Add to Master in iMIS Events, will auto-assign IDs.

> **Note:** Note: If you allow iMIS to assign the ID, give some consideration to the starting ID. If you are doing an automatic conversion of records from another system and you are retaining the old ID numbers, set the last ID of the original record to any number equal to or higher than the highest pre-established ID number in the data you will be converting. The first system-assigned ID will be one greater than the last ID number of the original record.

> **Note:** Note: If you allow users to create new accounts in iMIS Public or Web views, be sure to enable the Auto Assign Member Numbers option (Customers > Set up module > General > Basic Options).

To facilitate statistical reporting on your organization's customer activity, iMIS automatically tracks a customer's overall status (Name.MEMBER_STATUS) based on status-relevant events: customer type changes, status field changes, and billing payments. These changes are stored with the effective date of the change.

Source codes

Certain income-oriented data entry processes throughout iMIS let you enter a source code for each transaction. This source code, retained in the activity records generated from the transaction, lets you track the campaign or other source that motivated the purchase which can then be used for analysis or searches. Although the Source Code is a data entry field in all appropriate transaction entry windows, users do not have to enter a source code unless you enable this option.

Note: Note: To use this feature, you need to establish a table of valid source codes. See System Management for more.

Customer status

By default, iMIS automatically updates Name.MEMBER_STATUS_DATE to the current system date (or the dues payment's transaction date) for status changes (except when you enter a JOIN_DATE for a new record, in which case the JOIN_DATE is used).

If you select the Prompt for Status Date option, iMIS will prompt you to accept or override the default effective date for the change. The prompt will only occur if you change the status from an active status (status = A or begins with A) to an inactive status (S, I, D or statuses that begin with S, I, or D) and vice versa. A user-defined status that does not begin with those letters may not work with this feature. Most users do not need to manually control these dates, so they should not enable this setup option.

ID Checksum digits

Checksum digits give IDs a more unique value than simple sequentially assigned numbers. The checksum is not a random number; it is derived from the ID using a specific set of algorithms. The check digit calculation used to derive a checksum is the standard Mod 11 check digit algorithm.

Allowed symbols in iMIS IDs

iMIS does not allow these symbols in the ID field: &, \, [,], |, \, ", ', #, +, <. Remember that the Auto Assign Member Numbers option must be cleared in order for you to enter IDs in the ID field.

Preferred sort order options

You can select from several options when configuring how search results are sorted in the Customers Results tab. The Customer Setup - Basic Options window offers you the following choices of Preferred Sort Order:

- Last/First - results are sorted by last name, first name.
- Company - results are sorted by the designated company sort, last name, first name.
- Country/Company - results are sorted by country, state/province, company sort, last name, first name.
- Country/St/Prov - results are sorted by country, state/province, last name, first name.

> **Note:** Note: The sort options use the labels you configured for Institute Type (by default "Company") and State/Province (by default "St/Prov").

The Preferred Sort Order options let you choose the order in which Find results are displayed

With the exception of certain types of searches for which the default sort order would not be appropriate, results are be sorted according to the sort order chosen. The following types of searches override the default sort order:

- Name - results are sorted by last name, first name, then if prospects are included in searches, whether the person is an existing customer or a prospect.
- Company/Company Only - results are sorted by the designated company sort, then the preferred sort order.

  Note: The Company search (which includes personal records that are associated with company records) adds prospect status as the final sort column.
- Task Date - Ignores the preferred sort order; data is not sorted.

Ad Hoc - If the ad hoc search uses company ID as a criterion, the results are sorted by the designated company sort field. Otherwise, the preferred sort order is followed.

To set basic customer options

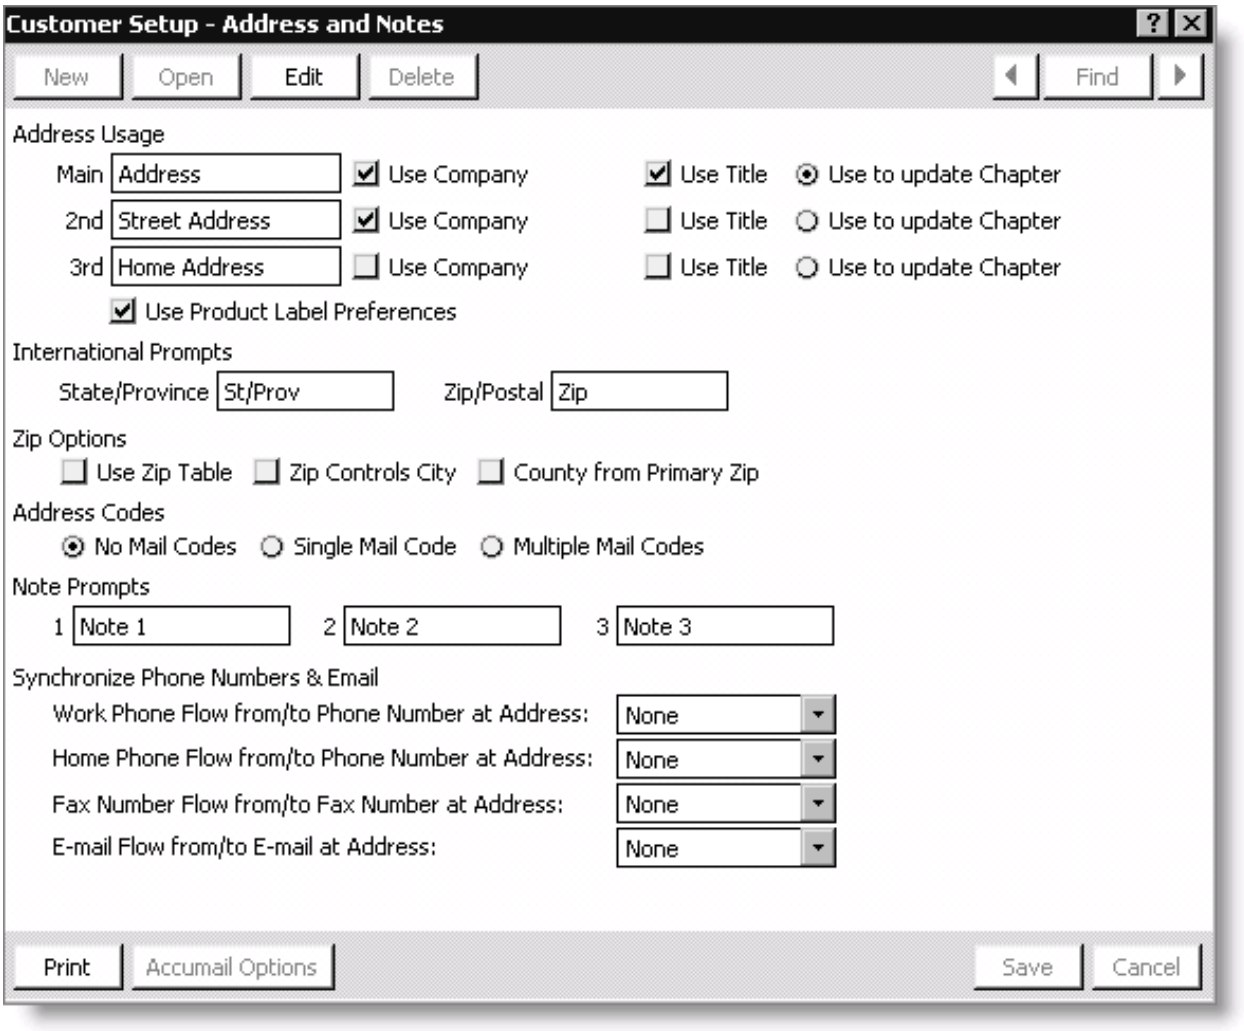
1. From Customers, select Set up module > General, and click Basic Options to open the Customer Setup - Basic Options window.
2. Click Edit.
3. Configure the iMIS options you prefer.
4. Click Save.

Setting customer address and notes

The Customer Setup - Address and Notes window gives you control over the address fields on the Address tab and Notes tab on the Manage customers window and enables you to identify or label the types of addresses you want to maintain for your customers. Within iMIS, up to three address blocks can be maintained for each entity or individual. By labeling the three addresses, you can designate which types of addresses to use in which address blocks. For your address labels or prompts, use a descriptor such as Street, Home, or Business.

Note: Note: Additional address tabs can be added to the Manage customers window be defining an ADDRESS_PURPOSE general lookup/validation table (see "ADDRESS_PURPOSE (Validation)").

Customer Setup - Address and Notes window



From Customers, select Set up module > General, and click Address and Notes

Address Usage

Main - Specifies the label (purpose) for the primary (main) address block of the customer. The main address displays on both Customers > Manage customers and the Address tab.

2nd and 3rd - Use these fields to enter the labels (purposes) for the secondary addresses (if any) of the customer. These addresses display only on the Address tab.

Use Company and Use Title - Enable these fields to designate whether or not to print an individual's title and company name. For example, enable both options to include the title and company for a business address. For a home address, disable one or both options, as appropriate. If you use small (1-inch) labels, you may need to disable these options so that the address fits within the 5-line limit.

> **Note:** Note: You can toggle the Use Company and/or Use Title fields between special purpose label runs. For example, if you normally include titles on your larger labels but today need to run a set of 1-inch labels, temporarily disable the Use Title field.

Use to Update Chapter - Enable these fields to automatically update the chapter when inserting and editing an address.

> **Note:** Note: You will need to populate the Zip_Code.CHAPTER field using SQL for each zip code, or a range of zip codes, in the table before this option will automatically update the chapter. You must also enable the Use Zip Table and County from Primary Zip options located under Zip Options.

Use Product Label Preferences - Select to allow selecting specific label preferences for any mailing label on a per-customer basis. For example, you may wish to mail a social invitation to a customer's home address instead of the default office address.

> **Note:** Note: You can also use this feature to assign specific label addresses for billing products on a per-customer basis.

International Prompts

Specify labels for address information that varies depending on your locale.

State/Province - Specifies the appropriate label (prompt) for the state or province fields. For example, if most of your customers live in the United States, label the field State. If most live in Canada, label the field Province.

Zip/Postal - Specifies the appropriate label (prompt) for the zip code or postal code fields. For example, if most of your customers live in the United States, label the field ZIP. If most live in Canada, label the field Postal Code.

> **Note:** Note: The Customer Management system comes with a table of U.S. ZIP codes with their corresponding cities, states, and counties. Using this table, iMIS offers a variety of ZIP Code look-up features that you can activate.

Zip Options

Use Zip Table - When selected, speeds up the initial data entry process by automatically filling in the city and state values when a ZIP code is entered. With this option enabled, iMIS auto-fills the city and state when those fields are left blank.

Zip Controls City - When selected, causes ZIP code look-up to over-ride and correct any city and state values that don't match the city/state table values for the ZIP code. This correction only occurs when you enter or edit a ZIP code.

> **Note:** Note: If you enable the Use Zip Table and Zip Controls City options, you can still override the city name after you enter the zip code, if necessary. To do this, enter the zip code for the address; the city and state fields display default values. Replace the city name with the value you want and save the record (tabbing through the zip code field will not change the city back to the default). To revert to the default city, delete the city, state, and zip values. Then save and edit the record, and re-enter the zip.

County from Primary Zip - Select to fill in the county field from the ZIP code. The county is derived from the ZIP code entered in Customers > Manage customers.

> **Note:** Note: If you are licensed for AccuMail and have enabled the AccuMail option Update County/Congressional District, that AccuMail option will override the County from Primary Zip option.

Address Codes

No Mail Codes - Select this field if you do not need the Mail Code field. This deactivates the Mail Code field in Customers > Manage customers.

Single Mail Code - Select this field if you want to use the Mail Code field but only need a single mail code to apply to any of the available three addresses. This activates the single Mail Code field in Customers > Manage customers although it will be used with all of the customer's addresses.

Multiple Mail Codes - Select this field if you want to use the Mail Code field and need a distinct mail code for each alternative address. Choose this option if you have special groupings to apply to customers only when a certain address is specified, such as a business versus a home address.

> **Note:** Note: To use the Single Mail Code and Multiple Mail Codes options, the MAIL_CODE lookup/validation table must be set up. See System Management for more.

Note Prompts

Note 1, 2, and 3 - Use these fields to label the note field headings on the Notes tab and on the reports that include notes. As with other optional fields, these fields display on the Notes tab only if you labeled (activated) them.

Label the note fields to standardize their purpose or usage for all customers. For example, you could reserve one for internal-use notes or reminders, one for text to display in the customer directory, and the last to record directions to a customer's office.

Synchronize Phone Numbers & Email

Work Phone Flow from/to Phone Number at Address - Select the address purpose whose phone number field you want to map to the Work Phone field on the Profile tab.

Home Phone Flow from/to Phone Number at Address - Select the address purpose whose phone number field you want to map to the Home Phone field on the Profile tab.

> **Note:** Note: Home Phone Flow from /to Phone Number at Address and Work Phone Flow from/to Phone Number at Address cannot be mapped to the same address purpose.

Fax Number Flow from/to Fax Number at Address - Select the address purpose whose fax number field you want to map to the Fax field on the Profile tab.

E-mail Flow from/to E-mail at Address - Select the address purpose whose e-mail address field you want to map to the E-mail field on the Profile tab.

Print

Used to generate and send a system setting report to your report destination.

Accumail Options (QAS Options)

Opens an options window for your address verification software (either AccuMail or Quick-Address).

To set customer address and notes options

> **Note:** Note: We recommend specifying a prompt for each of the three default notes. If you do not specify a prompt for these notes, they display as disabled blank notes on the Notes tab.

1. From Customers, select Set up module > General, and click Address and Notes to open the Customer Setup - Address and Notes window.
2. Click Edit.
3. Configure Address and Notes options.
4. Click Save.

To identify your e-mail program

iMIS is programmed to look in the Windows™ System directory for the MAPI32.DLL file and access the e-mail program that is configured to the MAPI32.DLL. MAPI is the

Messaging Applications Programming Interface that enables you to send and receive e-mail.

To use the e-mail feature in iMIS, your e-mail program must be MAPI compliant. The versions (or later versions) of the following messaging programs are MAPI compliant.

- Outlook 97/98 or higher
- GroupWise 5.2 or higher
- Eudora Pro 2.2 or higher
- Eudora 3.0 and higher

> **Note:** Note: There is a conflict when both Eudora and Microsoft™ Exchange are installed. In order to use Eudora, you have to uninstall Microsoft Exchange.

You can tell what e-mail program your MAPI 32.DLL is configured to by looking at the properties of the MAPI32.DLL.

1. Right click on the Start button on your Windows Taskbar and select Explore.
2. Navigate to the \Windows\System or \Winnt\System32 directory.
3. Locate the MAPI32.DLL file.
4. Right click on the MAPI32.DLL file and select Properties.
5. Select the Version tab.
6. Highlight the Company Name. The Company Name will be the vendor of your e-mail package, for example, Microsoft, Eudora, and so forth.

> **Note:** Note: You may have to contact your software vendor to make sure they issue a MAPI32.DLL with their e-mail software package.

To create the EMAIL activity type

Sending e-mail to a customer will generate an activity record for that customer if the EMAIL activity type has been created.

1. From Customers, select Set up module > Activity types to open the Activity types window.
2. Click New.
3. Enter EMAIL in the Type field.
4. Enter a Description for the activity.
5. Enter a prompt for Description.
6. Enter a prompt for Note.
7. Enter a prompt for Source.
8. Enter additional prompts, if needed.

   The prompts entered in the Activity types window dictate which fields are enabled and visible in the Activity Detail window.
9. Click Save to update the activity type.

Troubleshooting: Email

Problem: Selecting the E-mail icon in iMIS prompts you to choose a profile.

Solution: A profile is a group of settings that define how your e-mail is set up for a particular user. If you get this message, choose a profile by typing in your profile name or selecting your name from a drop-down list. If you do not have profiles set properly, go back to your e-mail program and configure the profiles properly.

Problem: Multiple e-mail programs conflict with each other.

Solution: It is best not to have multiple e-mail programs loaded at one time. Uninstall the program(s) you are not using.

Problem: MAPI32.DLL was overwritten when a new software package was installed.

Solution: This is a common problem and often happens when installing any type of software, not just e-mail programs. After installing the software product, reinstall your e-mail

program in order to reinstall the e-mail version of the MAPI32.DLL. This problem often occurs when using the GroupWise e-mail program. After installing any software product, reinstall the GroupWise e-mail program.

Synchronizing phone and email data

You can map the Work Phone, Home Phone, Fax, and E-mail fields (Name table) on the Profile tab on the Manage customers window to the Phone, Fax, and E-mail fields (Name_Address table) on any address purpose defined in the Main, 2nd, or 3rd fields on the Customer Setup - Address and Notes window.

By mapping these fields, the data defined in these fields automatically populates the corresponding fields on the Profile tab or the address purpose tab (Name_Address data to Name data and vice versa). The data in the mapped address purpose field takes precedence over the data in the field on the Profile tab. Synchronization enables data to match and eliminates the need to enter data twice.

The following fields on the Customer Setup - Address and Notes window can be synchronized:

- Work Phone Flow from/to Phone Number at Address
- Home Phone Flow from/to Phone Number at Address
- Fax Number Flow from/to Fax Number at Address
- E-mail Flow from/to E-mail at Address

> **Note:** Note: User-defined company flow down does not support the Work Phone, Home Phone, Fax, and E-mail fields. No error message displays if you specify these fields in the User Defined Company Flow Down field on the Customer Setup - Advanced window, but specifying these fields in the User Defined Company Flow Down field has no effect on user-defined company flow down. The Work Phone and Fax fields are part of automatic company flow down, which can be used separately or in addition to user-defined company flow down.

The fields in the Profile tab of the Detail area and the fields in the Address area are listed in the following table. Also listed are the iMIS table names where the data is stored. A “Yes” is marked next to the fields that are automatically included in child records that are linked to company records.

Detail area Profile tab		
Work Phone	Name.WORK_PHONE	Yes
Home Phone	Name.HOME_PHONE	
Fax	Name.FAX	Yes
Toll Free	Name.TOLL_FREE	Yes
Email	Name.EMAIL	
Web Address	Name.WEBSITE	
Address area Main Address		
1st line Address	Name_Address.ADDRESS_1	Yes
2nd line Address	Name_Address.ADDRESS_2	Yes
City	Name_Address.CITY	Yes
State	Name_Address.STATE_PROVINCE	Yes
Zip	Name_Address.ZIP	Yes
Preferred Mail	Name_Address.PREFERRED_MAIL	
Preferred Bill	Name_Address.PREFERRED_BILL	
Phone	Name_Address.PHONE	
Fax	Name_Address.FAX	
Email	Name_Address.EMAIL	
2nd Address		
Address	Name_Address.ADDRESS_1	
2nd line Address	Name_Address.ADDRESS_2	
City	Name_Address.CITY	
State	Name_Address.STATE_PROVINCE	

Zip	Name_Address.ZIP
Preferred Mail	Name_Address.PREFERRED_MAIL
Preferred Bill	Name_Address.PREFERRED_MAIL
Phone	Name_Address.PHONE
Fax	Name_Address.FAX
E-mail	Name_Address.EMAIL
3rd Address	
Address	Name_Address.ADDRESS_1
2nd line Address	Name_Address.ADDRESS_2
City	Name_Address.CITY
State	Name_Address.STATE_PROVINCE
Zip	Name_Address.ZIP
Preferred Mail	Name_Address.PREFERRED_MAIL
Preferred Bill	Name_Address.PREFERRED_MAIL
Phone	Name_Address.PHONE
Fax	Name_Address.FAX
E-mail	Name_Address.EMAIL

Note: Note: You can include additional fields to flow down from company (parent) records to linked (child) records. From Customers, select Set up module > General, and click Advanced to open the Customer Setup -Advanced window. Enter the Table.FIELD in the User Defined Company Flow Down field. For example, to include the Web Address shown on the Profile tab as a company flow down field, enter Name.WEBSITE.

Customers synchronization behavior

Synchronization behavior is dependent on the address purpose selected in the Customer Setup - Address and Notes window (Synchronize Phone Numbers & Email area).

> **Note:** Note: If you populate a field on a mapped address tab that does not contain an address, make sure to enter an address to avoid blank address labels.

- If None is selected, the field on the Profile tab can be edited and the value in the field is not automatically synchronized with any field on any address purpose tab.
- If a value other than None is selected and:
- The mapped field on the address tab is not blank - The field on the Profile tab is automatically populated with the value from the mapped field on the address tab and is read-only.

  Note: If the field on the Profile tab previously contained a value, this value is overwritten by the value in the mapped field on the address tab.
- The mapped field on the Main address tab is blank, but the field on the Profile tab is not blank - The mapped field on the main address tab is automatically populated with the value from the field on the Profile tab.
- The mapped field on a secondary address tab is blank, but the field on the Profile tab is not blank - The mapped field on the secondary address tab is automatically populated with the value from the field on the Profile tab only if the secondary address record already exists.
- If the mapped field is on a secondary address tab and that secondary address record does not already exist, the mapped field on the secondary address tab is not automatically populated with the value from the Profile tab and the field on the Profile tab can be edited. If you click in the mapped field on the secondary address tab, this field is automatically populated with the value from the Profile tab and the field on the Profile tab becomes read-only. Any subsequent changes must be made in the mapped field on the address tab.
- Both the mapped field on the address tab and the field on the Profile tab are blank - Neither field contains a value and both fields can be edited.

- If you enter a value in the mapped field on the address tab, the field on the Profile tab is automatically populated with this value and the field on the Profile tab is read-only.
- If you enter a value in the field on the Profile tab, the mapped field on the address tab is automatically populated with the value from the Profile tab (unless the mapped field is on a secondary address tab and the secondary address record does not already exist) and the field on the Profile tab is read-only.

Imported records and synchronization

> **Note:** Caution! (Applies to records imported with iMIS Importer, NRDS, or any other import method) Due to the complexities of phone/e-mail synchronization, synchronization will only work one way from Name to Name_Address, and not from Name_Address to Name.

If you are importing data and using synchronization, the imported phone, fax, and e-mail data must be imported directly to the Name table. If updates are made directly to the Name_Address table through an import and you are synchronizing data, the Name_Address phone, fax, or e-mail value will immediately be overwritten by the current Name value, even if the Name value is blank.

Running the synchronization SQL script

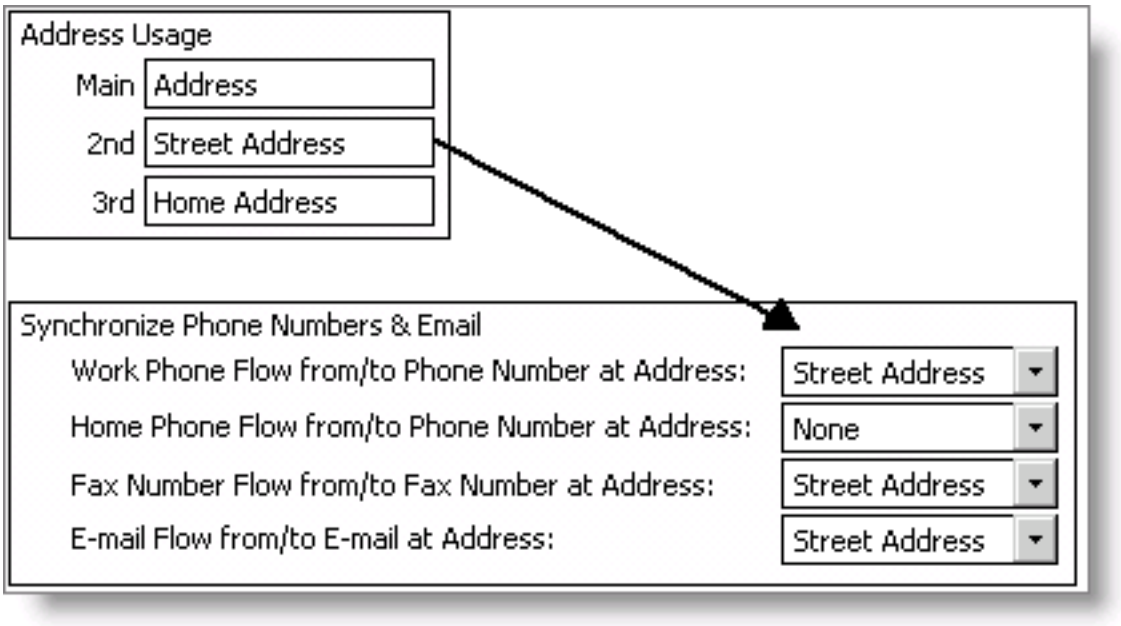
If you choose to synchronize phone numbers and e-mail addresses, you must run the Run Name_Address to Name Global Sync resynchronization SQL script located on the System Reports and Queries window (select Utilities > Reports and Queries, select Table Maintenance from the Report Types list, and select the Run Name_Address to Name Global Sync report). This script updates all existing records in the iMIS database based on the values you entered in the synchronized fields.

You must be logged into iMIS as the database administrator (dba or sa) to run this script. If the Name_Address field is not blank and is different than the Name field, a change log entry is created for each Name record changed. If multiple changes are made for a given Name record, there is a separate log entry for each field.

You must run the resynchronization SQL script every time a change is made to any of the Synchronize Phone Numbers & Email fields, except when changing a value to None. You must restart iMIS after running the synchronization SQL script.

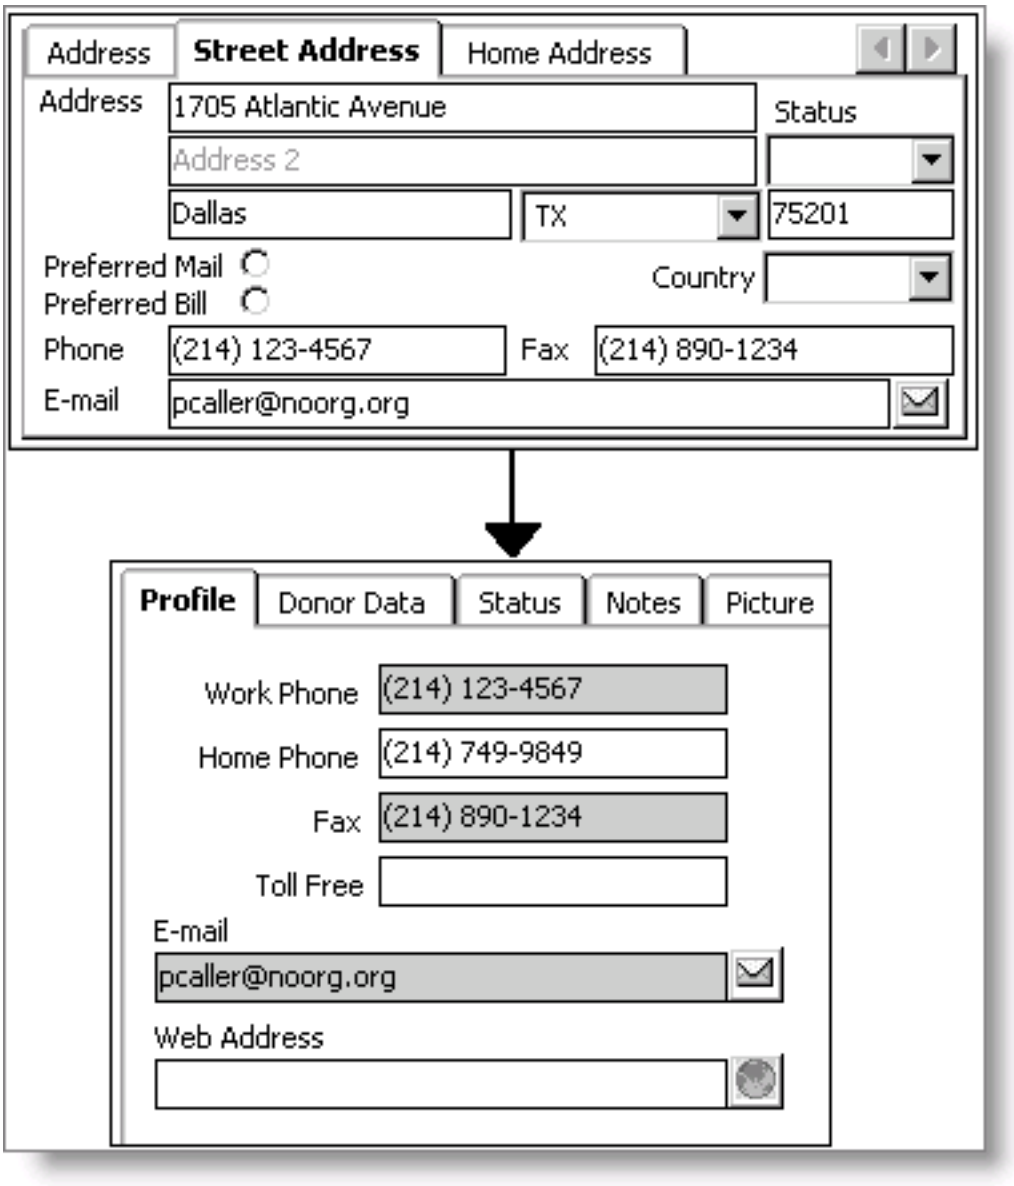
Synchronizing work phone, fax, and email example

In this example, the second address purpose, specified in the 2nd field on the Customer Setup - Address and Notes window, is Street Address. Street Address is selected from the Work Phone Flow from/to Phone Number at Address, Fax Number Flow from/to Fax Number at Address, and E-mail Flow from/to E-mail at Address drop-down lists.



Address flow down

The Work Phone, Fax, and E-mail fields on the Profile tab are automatically populated with the information from the Phone, Fax, and E-mail fields on the Street Address tab. The Work Phone, Fax, and E-mail fields are read-only since the Phone, Fax, and E-mail fields on the Street Address tab are not blank.



Phone number and email flow down

Automatic updating and synchronization

When a user or system action updates a customer's phone number, fax number, or e-mail address on the address tab that corresponds to the Profile tab specified in one of the Synchronize Phone Numbers & Email fields, iMIS automatically performs the following actions:

- Updates the Work Phone, Home Phone, Fax, and E-mail fields on the Profile tab as needed
- Performs any synchronization/flow-down tasks needed to keep the Work Phone, Home Phone, Fax, and E-mail fields accurately synchronized with the customer address record.

Avoiding blank address records

It is possible to create address records that contain a phone number but no address. For example, if you enter a value in a field on the Profile tab and the secondary address record that corresponds to the mapped field does not exist, the mapped field on the secondary address tab is not automatically populated with the value from the Profile tab. If you click in the mapped field on the secondary address tab, the field is populated with the value from the Profile tab, but the other fields, including the address fields, of the secondary address tab will still be empty. This can result in the printing of blank labels during a label run.

If you need to track secondary phone number values such as pager and cell phone numbers, you should create user-defined tables and custom tabs in Customers for this purpose rather than storing these numbers in address purpose fields. This prevents the creation of address records that contain a phone number but no address.

> **Note:** Note: If you populate a field on a secondary address tab that does not contain an address, make sure to enter an address to avoid blank address labels.

To synchronize phone numbers and e-mail

1. From Customers, select Set up module > General.
2. Click Address and Notes to display the Customer Setup - Address and Notes window.
3. Click Edit.
4. Select the work phone address mapping from the Work Phone Flow from/to Phone Number at Address drop-down list. The default address mapping is None.

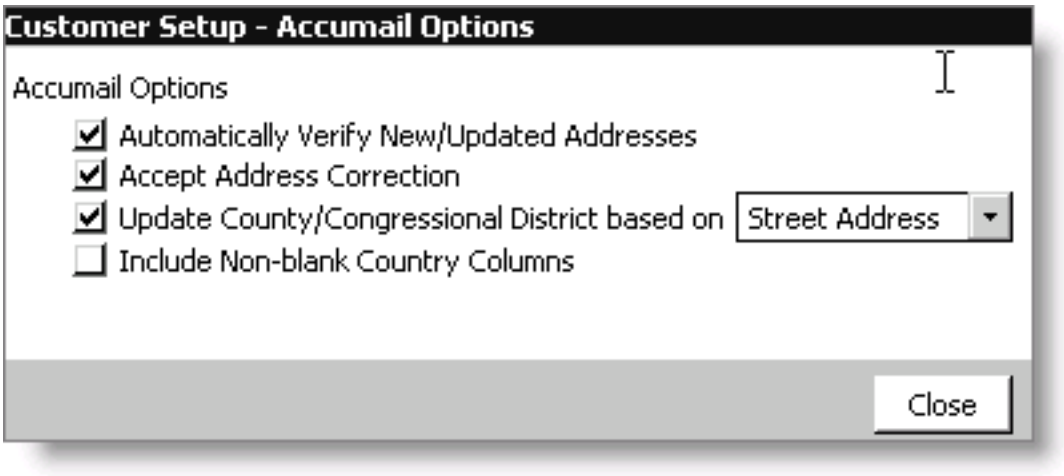
5. Select the home phone address mapping from the Home Phone Flow from/to Phone Number at Address drop-down list. The default address mapping is None.

   Note: Home Phone Flow from/to Phone Number at Address and Work Phone Flow from/to Phone Number at Address cannot be mapped to the same address purpose.
6. Select the fax number address mapping from the Fax Number Flow from/to Fax Number at Address drop-down list. The default address mapping is None.
7. Select the e-mail address mapping from the E-mail Flow from/to E-mail at Address drop-down list. The default address mapping is None.
8. Click Save.
9. Ensure that no other users are logged in to iMIS.
10. Select Utilities > Reports and Queries.
11. Select Table Maintenance from the Report Types scrolling list.
12. Select Run Name_Address to Name Global Sync from the Available Reports scrolling list.
13. Click Run. The Run Name_Address to Name Global Sync window and a confirmation message display. Click Yes.
14. Exit and restart iMIS.

> **Note:** Note: You must exit and restart iMIS immediately after running the Run Name_Address to Name Global Sync script for synchronization to occur.

Setting Accumail options

The Accumail options are set on the Customer Setup - Accumail Options window.



From Customers, select Set up module > General, click Address and Notes, and click Accumail Options

- Automatically Verify New/Updated Addresses - Enable to ensure that the database will always contain certified address information.
- Accept Address Correction - Enable to standardize your addresses to meet the US Post Office preferences. For example, Avenue will be changed to Ave, and streets that have alias names will be changed to the accepted Postal street name.
- Update County/Congressional District based on - Enable to update the county/-congressional districts based on the address purpose chosen from the dropdown. Any of the three available addresses can be used.
- Include Non-blank Country Columns - Enable to cause iMIS to verify addresses with populated country fields.

To set customer Accumail options

1. From Customers, select Set up modules > General, and click Address and Notes to open the Customer Setup - Address and Notes window.
2. Click Edit.
3. Click Accumail Options to display the Customer Setup - Accumail Options window.
4. Enable or disable the Accumail options as desired.

5. Click Close.
6. Click Save.

Defining lookup indexes for the Find window

iMIS maintains a number of standard indexes that enable you to retrieve customer information quickly.

The customer ID is an indexed field, and all records are stored by their ID. You can locate records by ID at any time. In addition, iMIS keeps alternative indexes such as alphabetical key (combined last name, first name), company sort name (which displays to the right of the Company field in the Customer Portfolio), and the optional Major Key (social security number, license number, etc.).

Having iMIS maintain these keys is like having a filing system that uses multiple filing methods simultaneously: numerical, alphabetic, and alphabetic by company name. You can retrieve a record by entering the ID or all or part of the name key or company name.

In addition to these four standard indexed fields, you can establish up to four more indexes. These user-specified indexes can be based on any field in the customer file including user-defined demographics. For more power, you can designate a list string field as an index, causing index entries to be maintained for each of the codes in a list. You can also specify a formula based on a combination or manipulation of one or more fields. For example, you can specify a customer type/category combination, a set of initials (first letter of first, middle, and last fields), or the month/year of the join date.

If you define any additional indexes, they display as choices when you request a customer look-up (Find, lookup icon, or Ctrl+L) throughout iMIS.

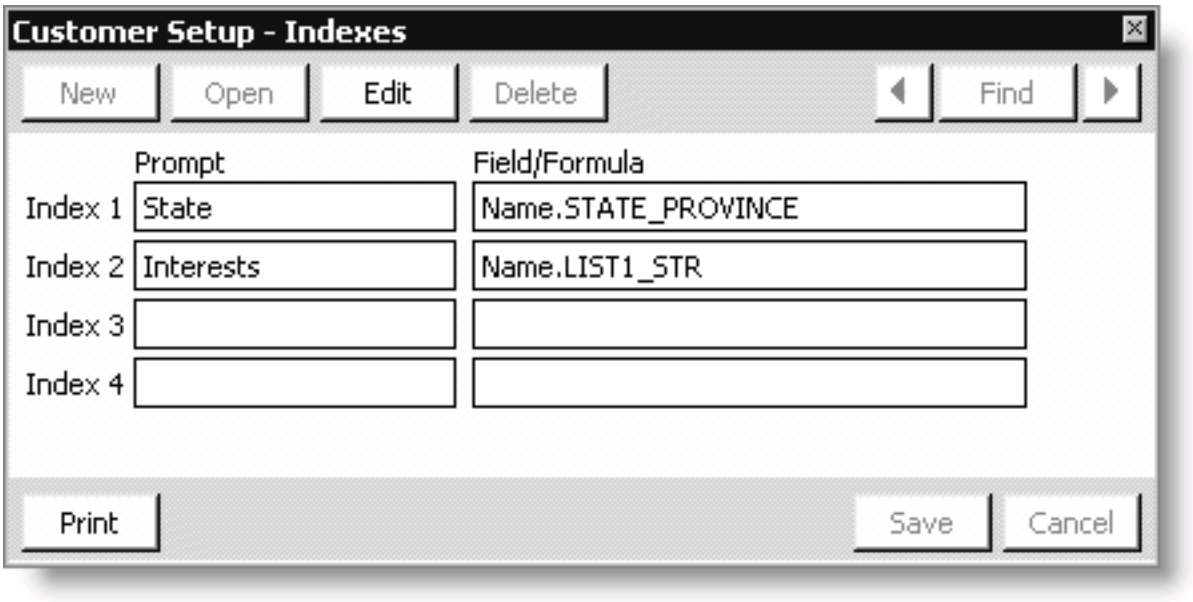
For best results, only create indexes for the key fields for which you plan to conduct daily searches. Every additional index increases the overhead burden on the system and affects performance. For less-critical searches by field, plan to use the ad hoc searching feature of the Find window.

Note: Note: When you create additional indexes on the Customer Setup - Indexes window, you must run the Rebuild Name_Indexes script to update the Name_ Indexes table and then change the parameters for report specifications to match the order of your indexes. For more information, see the iMIS Utilities Menu.

Note: Note: Results for user-defined indexes are returned in ID order.

Note: Note: You cannot create a user-defined index using a multi-instance table.

Customer Setup - Indexes window



From Customers, select Set up module > General, and click Indexes

The Customer Setup - Indexes window enables you to specify up to four additional indexes. Beginning at the top, fill in the fields for Index 1, and continue down for as many of the four available indexes as you need.

When you make a change in this window, you must update the Parameters for Report Specs to make the parameters to be the same order as your indexes.

Index 1, 2, 3, and 4 Prompts

Use these fields to enter the prompts (labels) to represent the indexes in the Find window. If an index is based on a single field (rather than a field combination or formula), use the same label that represents that field on other windows or reports.

Index 1, 2, 3, and 4 Field/Forms

Use these fields to define the indexes to be maintained by specifying the exact field name or formula based on one or more field names. The field name to specify here is the internal system name for the field versus the label that displays for that field on windows and reports.

To use the fields, you have to format the field names exactly. These names need precise capitalization and punctuation: File_Name.FIELD_NAME. File names display with initial capitals (with underscores as needed), field names display in all capitals (with underscores as needed), and the two parts are connected with a period.

> **Note:** Note: You can only assign indexes to fields in the Name and single instance user-defined tables

Print button

Used to generate and send a system setting report to your report destination.

To define user-defined lookup indexes

1. From Customers, select Set up module > General, and click Indexes to open the Customer Setup - Indexes window.
2. Click Edit.
3. Enter a label in the Prompt section (Index 1, Index 2, Index 3, and Index 4) to represent the index to display in the Find window.
4. Enter the field name or formula in the Field/Formula section to define the label.
5. Click Save.

Adding and deleting fields in the change log

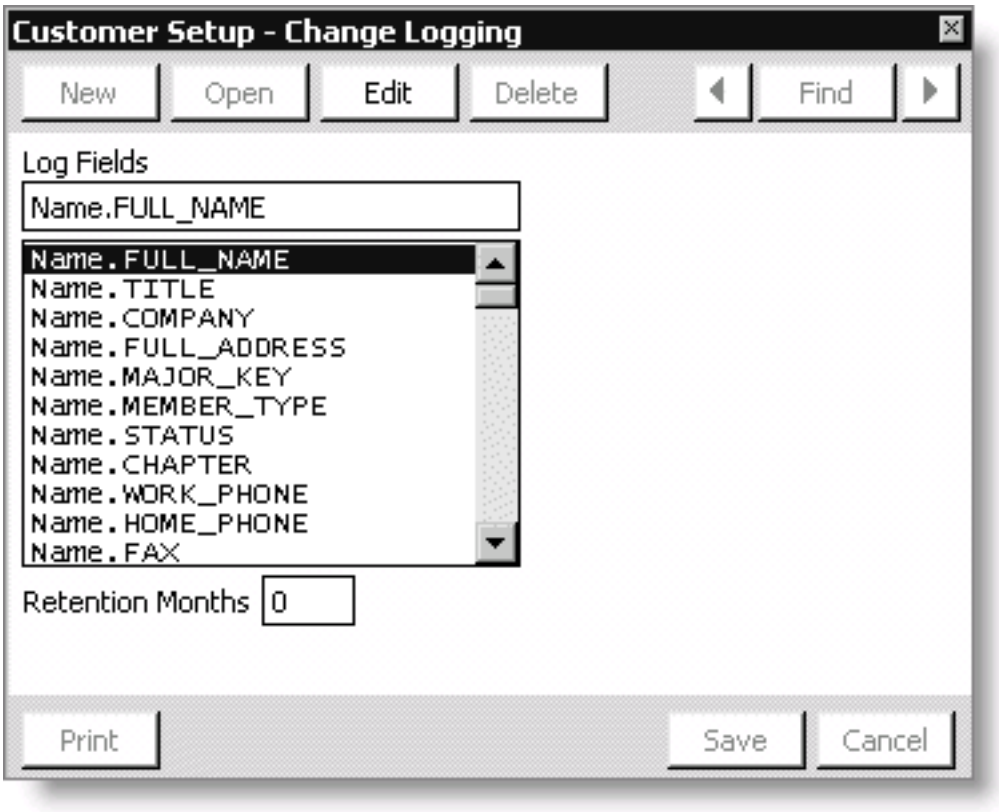
iMIS includes a change logging feature through which you can maintain before-and-after change histories for specified customer fields. While iMIS comes with a preset standard list of fields that it tracks, you can alter this list by adding or deleting fields through the Customer Setup - Change Logging window.

The only fields that can be added to change logging are:

- Any field from the Name table
- Any field from single instance user-defined tables
- The following fields from the Name_Fin table
- TAX_EXEMPT
- CREDIT_LIMIT
- BACKORDERS
- NO_STATEMENTS
- TERMS_CODE
- RENEW_MONTHS
- BT_ID
- TAX_AUTHOR_DEFAULT
- USE_VAT_TAXATION
- VAT_REG_NUMBER
- VAT_COUNTRY

> **Note:** Note: You cannot use Name_Fin.ID, Name_Fin.Renewed_Thru, or Name_Fin.TIME_STAMP in the Change Log.

Customer Setup - Change Logging window



From Customers, select Set up module > General, and click Change Logging

Log Fields

Lists the existing fields for which to track change log history.

Retention Months

Specifies the number of months you want to retain the change log history for a particular field.

Print

Generates and sends a system setting report to your report destination.

To add a field to Change Logging

Fields in the change log list must be in the format: TableName.FIELD_NAME. Most iMIS table names are spelled with initial capital letters; most iMIS field names are spelled with

all capital letters (with underscores as needed); iMIS table and field names are always connected by a period ".".

> **Note:** Note: You can only track fields from the Name and Name_Fin tables and from any single-instance user-defined table.

1. From Customers, select Set up module > General, and click Change Logging to open the Customer Setup - Change Logging window.
2. Click Edit.
3. Scroll to the bottom of the fields listed in the Customer Setup - Change Logging window, and select the space below the last field, highlighting the blank slot. The edit box at the top of the list is activated.
4. In the edit box, enter the field name you want to track in the format TableName.FIELDNAME.
5. Click Save.

To remove a field from Change Logging

1. From Customers, select Set up module > General, and click Change Logging to open the Customer Setup - Change Logging window.
2. Click Edit.
3. Scroll to and select the field you want to remove.

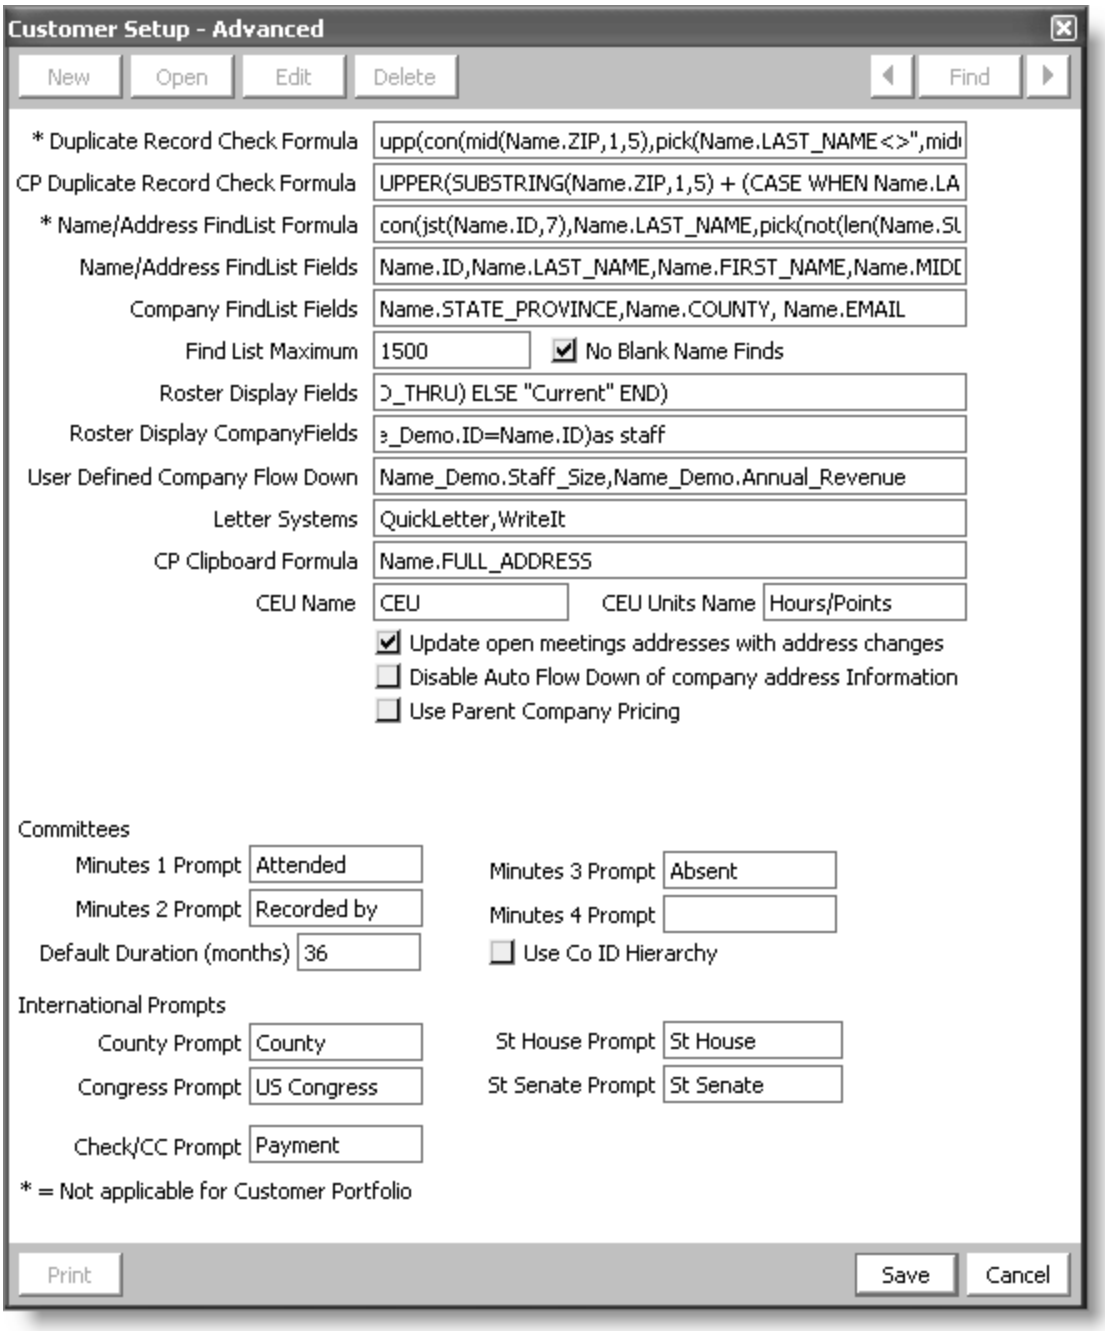
   The field name is displayed in the editing box at the top of the window.
4. In the editing box, delete the field name (press Backspace to delete the field name, or highlight the field name and press Delete).
5. Click Save.

Setting advanced customer options

The Customer Setup - Advanced window lets you enter formulas to customize the operation of the customer windows. Formulas combine fields or portions of fields according to

specified guidelines.

Customer Setup - Advanced window



From Customers, select Set up module > General, click Advanced

Duplicate Record Check Formula

Prevents duplicate records from being entered in iMIS by specifying an Omnis duplicate match key formula.

> **Note:** Note: The Duplicate Record Check formula does affect Customers. The CP Duplicate Record Check Formula governs duplicate checking within th at area.

CP Duplicate Record Check Formula

Prevents duplicate records from being entered in Customers > Manage customers by specifying a SQL duplicate match key formula.

> **Note:** Caution! To maintain data integrity, the two duplicate record check formulas must be equivalent. If the two formulas are not equivalent, duplicate record checking in Customers does not detect duplicates of entries made outside of Customers and duplicate record checking in areas other than Customers does not detect duplicates of entries made in Customers.

Name/Address FindList Formula

(required) Specifies, along with Name/Address Find List Fields, what is displayed in each line in the Find window. These lines are composed of the contents of specified fields from the Name table. This formula specifies the format for how those fields are displayed in each line.

> **Note:** Note: To have a field displayed in the Find window's display lines, include it in both the list formula and the list field.

> **Note:** Note: This field does not apply to Customers > Manage customers.

The default formula combines ID, customer name, customer type, title, and company (entity) name on each line. To improve the appearance of the output, it has provisions to print certain fields only when they have a value. If you change this formula, keep in mind

that the character limit is 255. To create space for fields you want to add, remove other fields such as Name.MIDDLE.

Name/Address FindList Fields

Specifies the fields that are displayed in the Results tab and the Record History tab of Customers > Manage customers. When you enter fields in the Name/Address FindList Fields field, use a comma to separate the fields. For example, enter Name.ID, Name.LAST_NAME, Name.FIRST_NAME, Name.TITLE, Name.COMPANY, Name.MEMBER_TYPE, Name.COMPANY_SORT to display the ID, Last Name, First Name, Title, Company, Member Type, and Company Sort for each customer record in the Results tab.

Note: Note: The following fields are required in the Name/Address FindList Fields field: Name.ID, Name.FIRST_NAME, Name.LAST_NAME, and Name.MEMBER_TYPE.

Note: Name.ID must be the first field shown in the list, and must be included even if you do not intend to display it.

Note: Note: Only fields from the Name table can be entered in the Name/Address FindList Display Fields field.

Note: Note: You must restart iMIS for your changes to take effect.

Company Find List Fields

Specifies the fields that are displayed in the Company Find window in Customers > Manage customers. This can be especially useful when you want to find a particular branch of a company.

> **Note:** Note: To include additional fields in the Results and Record History tabs, you must add the field names to the Name/Address FindList Fields configuration option, not the Company FindList Fields configuration option.

Find List Maximum

Specifies the limit on how many records the Find window locates before it stops the search. This provides a practical limit to boost performance. This maximum only comes into play when you enter non-specific selection criteria for the search that could return many or all records in the database.

No Blank Name Finds

Prevents blank space searches from being performed when selected. For example, when the option is enabled, searching for a name through the Find window requires that you enter a letter or series of letters in the Name field. When the option is cleared, searches can be completed without entering search criteria. Blank searches return all records.

Roster Display Fields

Specifies the display fields for member records (see "Customizing roster display fields") viewed in the Roster tab. Notes:

- If a customer record does not contain a value for a field specified in the Roster Display Fields field, a value will not exist for the field and the next value in the list is displayed.
- Only fields from the Name table can be entered in the Roster Display Fields field.
- You must restart iMIS for your changes to take effect.

Roster DisplayCompany Fields

Specifies the display fields for company records (see "Customizing roster display fields") viewed in the Roster tab.

User-defined Company Flow Down

Specifies the customer fields that flow down from a company (parent) record to a linked, child (non-company) record. By default, iMIS flows down main address, county, telephone, and company customer fields (as long as the user has not disabled the flowdown feature). This feature adds additional information to flow down. See also About User Defined Company Flow Down.

Note: Note: Table names in iMIS are case-sensitive. When entering fields in the User Defined Company Flow Down field, make sure the case is correct. For example, Name_Demo.STAFF.

Note: Note: Company flowdown is not implemented in iMIS web views.

Letter Systems

Specifies your preference the default tool within the standard letter system: QuickLetter or WriteIt. QuickLetter is the simplest to learn and use. It provides a quick mechanism for producing simple letters and memos. WriteIt provides traditional word processing formatting: font styles and sizes, tabs, etc.

To set your default preference, enter the keyword for your first choice followed by a comma and the keyword for the alternative; for example, QuickLetter,WriteIt.

CP Clipboard Formula

Specifies the fields that are copied to the clipboard (see "Customizing clipboard fields") when the Clipboard icon is clicked in Customers > Manage customers.

CEU Name

Specifies a label for iMIS CEU (Continuing Education Units) fields.

Note: Note: For iMIS to create activities for the label you enter in the CEU Name field, you must create an activity type with the same name on the Activity types window.

CEU Units Name

Specifies the label for the units awarded for continuing education. For example, Hours or Points. This label displays in appropriate CEU-related windows and reports.

Update open meetings addresses with address changes

Allows address changes in Customers > Manage customers to flow down to the Attendee tab on the Events > Register a customer window when selected.

Disable Auto Flow Down of company address Information

Disables the flow down of company (parent) address information to linked (child) records when selected.

Use Parent Company Pricing

Flows company (parent) pricing to linked (child) records in Orders and Events when selected. For example, if you enable this option, a non-member gets customer pricing if their parent company is a customer. This option forces iMIS to look at the company's status to ensure that they are active. It also forces iMIS to look at the customer type of the company record so it can calculate the correct pricing for the individual.

Minutes 1, 2, 3, and 4 Prompts

Specifies the labels for options that are active in the Manage committees > More > Minutes window.

> **Note:** Note: The option(s) are active in the Minutes window only when a label is entered in a Minutes Prompt field.

Default Duration (months)

Specifies the number of months that you want iMIS to use when calculating the default through date in the Manage committees window.

> **Note:** Note: To indicate that the committee appointment does not expire, leave this field blank or set it to zero.

Use Co ID Hierarchy

When selected, links a committee to the ID of a company record. A sub-set of customers associated with the company branch of the committee is created. For example, a committee called Awards has been set up. Your association has 25 branches with their own Awards committees. Normally, you would create 25 separate Awards committees with a different name for each branch. Now, you can create 25 company name records that represent each branch. You can then open the Manage committees window and set the filter to work with only one of the 25 branch company IDs. This feature also enables you to create separate customer rosters for each branch or a report of all Awards committee members regardless of branch.

You will see a Filter by Company ID option on the Manage committees window once the Use Co ID Hierarchy field has been enabled. Select Filter by Company ID to open the Find window to allow selecting a company record that represents a special division of your organization. When you make a selection in the Find window, the ID and name of the organization display in the top of the Manage committees window.

The Filter by Company ID option also filters the committee members. When an ID has been selected and is displayed in the top row of the window, inserting a new member to the committee will add the member to that company's committee.

County Prompt

Specifies the label for the County field on the Other tab.

Congress Prompt

Specifies the label for the US Congress field on the Other tab.

St House Prompt

Specifies the label for the St House field on the Other tab. (St stands for U.S. State.)

St Senate Prompt

Specifies the label for the St Senate field on the Other tab.

Check/CC Prompt

Specifies the label for the Check/CC field for all iMIS payment windows.

> **Note:** Note: The length of this field is limited to 10 characters.

Print

Generates a system setting report and sends it to your report destination.

To set up advanced options

> **Note:** Note: Advanced configuration fields are described in the topic Customer Setup - Advanced window.

1. From Customers, select Set up module > General, and click Advanced to open the Customer Setup - Advanced window.
2. Click Edit.
3. Enter your setup options.
4. Click Save.

About user defined company flow down

You can choose to have one or more customer fields flow down from company (parent) records to linked (child) records. iMIS already flows down, or synchronizes, the main address, county, telephone, and company customer type fields. This feature adds additional information to flow down.

> **Note:** Note: Do not include the Name.EMAIL field as a company flow down field because data synchronization is not properly maintained.

How company flow down works

iMIS automatically passes down key company information (main address, telephone, and company customer type) to individual customer records when the existing data matches. For example, when you edit a company's main address, iMIS checks each individual or branch record associated with that company to determine whether the main address matched the company's main address before the change was made. When it matches,

iMIS updates the individual's main address fields; when it does not, iMIS preserves the individual's main address. This flow down happens without any set up on your part.

The User Defined Company Flow Down field lets you identify extra customer data fields to be copied down automatically to the linked (child) records. This feature specifies fields in addition to the main address, telephone, and company customer type fields that iMIS inherently maintains. This feature minimizes data entry and allows you to broaden your search capabilities.

> **Note:** Note: If you are using list billing, do not enter Name.PAID_THRU in the User Defined Company Flow Down field since this may cause the parent and child records to not match.

The flow down of data to individual customers occurs whenever you edit a field in a company record that is specified in the synchronizing field.

Deciding which fields to flow down

Unlike the company name and address fields, a User-Defined Company Flow Down field will always be copied down, overwriting any existing data in the fields. Therefore, be sure to avoid selecting flow down fields that could cause you to lose data you meant to keep such as an individual's secondary address.

> **Note:** Note: Table names in iMIS are case-sensitive. When entering fields in the User Defined Company Flow Down field, make sure the case is correct. For example, Name_Demo.STAFF.

The following is the list of available fields from the Name table that you can specify to flow down from a company record to individual records.

- Name.CATEGORY
- Name.CHAPTER
- Name.COMPANY
- Name.DESIGNATION

- Name.EXCLUDE_DIRECTORY
- Name.EXCLUDE_MAIL
- Name.FIRST_NAME
- Name.FUNCTIONAL_TITLE
- Name.GENDER
- Name.INFORMAL
- Name.JOIN_DATE
- Name.LAST_NAME
- Name.MAJOR_KEY
- Name.MEMBER_STATUS
- Name.MEMBER_STATUS_DATE
- Name.MIDDLE_NAME
- Name.PAID_THRU
- Name.PREFIX
- Name.SIC_CODE
- Name.STATE_HOUSE
- Name.STATE_SENATE
- Name.STATUS
- Name.SUFFIX
- Name.TITLE
- Name.US_CONGRESS
- Name.WEBSITE

> **Note:** Note: If you enter Name.STATUS field in User Defined Company Flow Down, you must also include the Name.MEMBER_STATUS and Name.MEMBER_STATUS_DATE fields.

User-defined company flow down does not support the Work Phone, Home Phone, Fax, and E-mail fields. No error message displays if you specify these fields in the User Defined Company Flow Down field on the Customer Setup – Advanced window (from Customers, select Set up module> General, and click Advanced), but specifying these fields in the User Defined Company Flow Down field has no effect on user-defined company flow down. The Work Phone and Fax fields are part of automatic company flow down, which can be used separately or in addition to user-defined company flow down.

Customizing clipboard fields

You can choose which additional fields are copied to the clipboard when a user clicks the Clipboard icon. The default behavior is to copy the customer's Name.FULL_ADDRESS, but you can designate additional database fields to be copied.

When a user clicks the Clipboard icon, the following information is copied from the current contact's information:

- Full name followed by a carriage return
- Title followed by a carriage return
- Company followed by a carriage return

  Note: Title and Company are copied if the these options are selected in Customer Setup > Address and Notes.
- Administrator-selected fields from the following tables:
- Name
- Name_Fin
- Name_Address
- any single-instance user defined table

Configure the information that is copied to the clipboard by entering a CP Clipboard Formula in the Customer Setup - Advanced window that follows these rules:

- Fields must be named Table.FIELD_NAME and should be separated by the following special tags:
- [N] - insert a carriage return (new line)
- [C] - insert a comma
- [S] - insert a space
- [U] - convert the next field's value to uppercase
- No spaces can be included in the formula.

  For example, Name.WORK_PHONE[S]Name.HOME_PHONE not Name.WORK_PHONE [S] Name.HOME_PHONE
- Special tags must be in upper case.

  For example, [N] not [n], [S] not [s], [C] not [c], and [U] not [u].

  The following CP Clipboard Formula entry copies the customer's work phone number, adds a space, copies the home phone number, adds a comma, copies the email address, starts a new line, and copies the VAT country:

  Name.WORK_PHONE[S]Name.HOME_PHONE[C]Name.EMAIL[N]Name_Fin.VAT_COUNTRY

  Notes
- If there is no value in a particular field, it is treated as if it didn't exist in the copy to clipboard definition.
- This feature uses the same formatting conventions as International Address Formatting. See Customer Management (see "Customers") for more information.
- If you use the incorrect format in the CP Clipboard Formula field, nothing will be copied to

the clipboard when a user clicks the Clipboard icon.

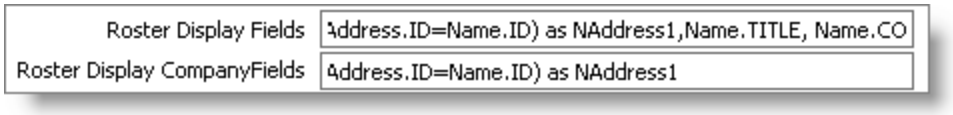
- You must restart iMIS before your changes take effect.

Customizing roster display fields

You can now configure the items displayed in the Roster listing to vary based on whether the record displayed is a member record or a company record. You can set the configuration options by selecting Customers > Set up module > General > Advanced.

The Roster Display Fields configuration option enables you to designate what is displayed when listing an individual member record in the Roster.

The Roster Display Company Fields configuration option enables you to designate what is displayed when listing a company record.

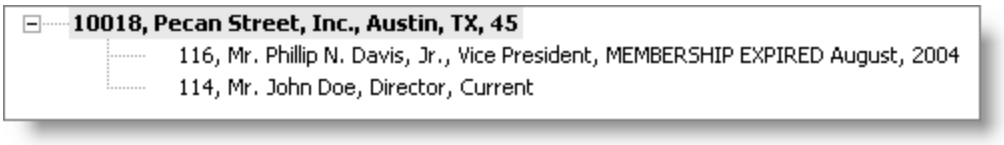


Configure the fields displayed for member and company roster listings in the Customer Setup - Advanced window.

A valid configuration line consists of a list of comma-separated field names in the format Name.FIELD_NAME, which is a maximum of 255 characters long. In addition to Name table fields, you can also include subqueries in your configuration subject to the following restrictions:

- only one value can be returned per subquery
- only one row can be returned per subquery

For example, in the configuration line Name.FULL_NAME, Name.ID,(select top 1 ADDRESS_1 from Name_Address where Name_Address.ID=Name.ID) as NAddress1,Name.TITLE, Name.COMPANY the subquery begins with "select top 1". This is necessary because the address table may have more than one address linked to a member.



Custom company and member roster display fields

Subqueries can select data from valid iMIS tables.

Example 1

The following Roster Display Fields entry displays the member's ID, full name, title (if any), and then displays either "current" or "MEMBERSHIP EXPIRED [Month, Year]" depending on the value in Name.PAID_THRU.

Name.ID, Name.FULL_NAME, Name.TITLE, (select expstat = case when Name.PAID_THRU < GETDATE() THEN "MEMBERSHIP EXPIRED " + DATENAME (Month, Name.PAID_THRU) + ", " + DATENAME (Year, Name.PAID_THRU) ELSE "Current" END)

Example 2

The following Roster Display Company Fields entry displays the company ID, name, city, state/province, country, and staff size:

Name.ID, Name.COMPANY, Name.CITY, Name.STATE_PROVINCE, Name.COUNTRY, (select Staff_Size from Name_Demo where Name_Demo.ID-D=Name.ID)as staff

Note: Note:

Roster display values assigned through a SELECT statement must be assigned a name, either by using (select [name] = ...)(shown in Example 1) or by using (select ...)as (shown in Example 2).

You must restart iMIS for your changes to take effect.

Formula for checking for duplicate records

You can create custom duplicate match key formulas to prevent the entry of duplicate customer records in the Name table. One formula, the Duplicate Record Check Formula, affects records entered anywhere in iMIS except in Customers > Manage customers. The CP Duplicate Record Check Formula is specific to Customers > Manage customers. In order for duplicates to be detected properly, these two formulas must be equivalent.

Your formulas can combine fields or portions of fields to compare a record being entered against records that already exist in the database. When a possible match is found, iMIS presents a match list and warns the data entry user that the record may be a duplicate. Based on this information, the user can continue or can cancel the insertion.

Default formulas

The default CP Duplicate Record Check Formula specifies the same criteria as the Duplicate Record Check Formula, but uses SQL instead of Omnis.

By default, the Duplicate Record Check Formula field contains the following Omnis formula:

upp(con(mid(Name.ZIP,1,5),pick(Name.LAST_NAME<>",mid(Name.COMPANY,1,5),-con(mid(Name.LAST_NAME,1,4),mid(Name.FIRST_NAME,1,1)))))

By default, the CP Duplicate Record Check Formula field contains the following SQL formula:

UPPER(SUBSTRING(Name.ZIP,1,5) + (CASE WHEN Name.LAST_NAME<>'' THEN (SUBSTRING(Name.LAST_NAME,1,4) + SUBSTRING(Name.FIRST_NAME,1,1)) ELSE SUBSTRING(Name.COMPANY,1,5) END))

Note: Caution! If you customize the Duplicate Record Check Formula and CP Duplicate Record Check Formula ensure that the formulas contain equivalent selection criteria. Although it is possible to specify different criteria in these fields, if you do not use equivalent formulas, identical records entered through different

modules will end up with different duplicate match keys and will therefore not be identified by iMIS as potential duplicates.

When entering a custom formula in the CP Duplicate Record Check Formula field, the formula can contain up to 255 characters, and the resulting duplicate match key can contain up to 20 characters. You can use the following Name fields when entering a custom duplicate check formula in the CP Duplicate Record Check Formula field:

Name.FIRST_NAME	Name.LAST_NAME
Name.COMPANY	Name.ZIP
Name.CITY	Name.STATE_PROVINCE
Name.COUNTRY	Name.ORG_CODE
Name.MEMBER_TYPE	Name.MAJOR_KEY
Name.WORK_PHONE	Name.HOME_PHONE
Name.FAX	Name.EMAIL
Name.COUNTY	Name.TOLL_FREE
Name.CHAPTER	Name.JOIN_DATE
Name.BIRTH_DATE	Name.GENDER

Note: Note: This facility cannot protect against all data-entry problems, such as address changes, variable name spellings, and typing errors. For best results, use standard lookup before adding questionable database records.

Example duplicate record check formulas

The following CP Duplicate Record Check Formula and Duplicate Record Check Formula specify a duplicate match key using the first three digits/characters of the zip code, the first four characters of the last name (if one exists), the first character of the first name, or if the customer did not have a last name, the first five characters of the company name:

CP duplicate record check formula

UPPER(SUBSTRING(Name.ZIP,1,3) + (CASE WHEN Name.LAST_NAME<>'' THEN (SUBSTRING(Name.LAST_NAME,1,4) + SUBSTRING(Name.FIRST_NAME,1,1)) ELSE SUBSTRING(Name.COMPANY,1,5) END))

Duplicate record check formula

upp(con(mid(Name.ZIP,1,3),pick(Name.LAST_NAME<>'',mid(Name.COMPANY,1,5),-con(mid(Name.LAST_NAME,1,4),mid(Name.FIRST_NAME,1,1)))))

For customer Diane Block with an address of 500 Main Street, Austin, Texas 78708, the following duplicate match key would be created:

787BLOCD

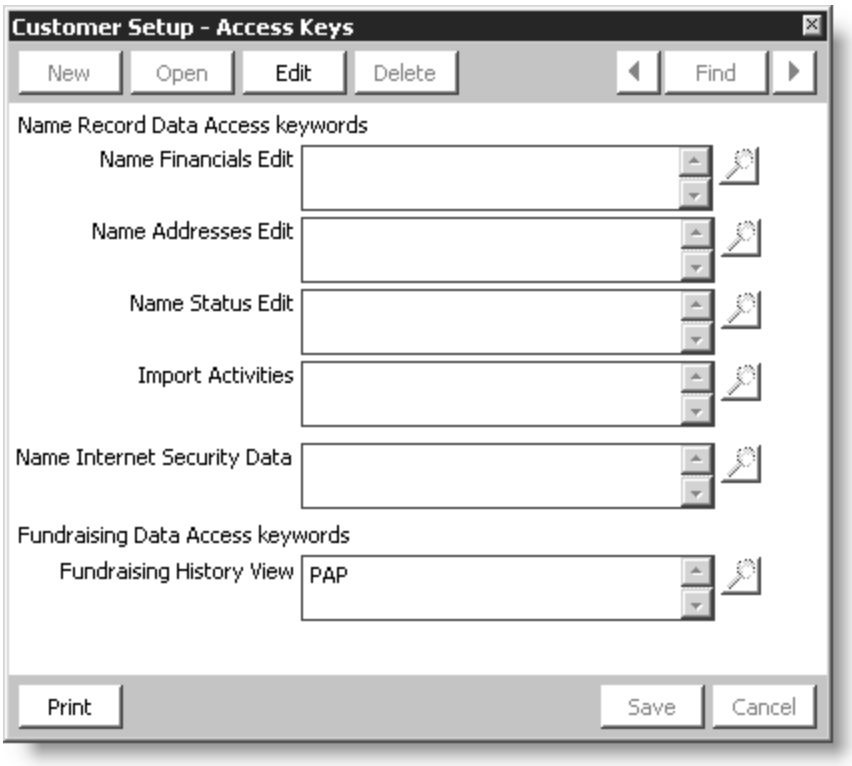
Customer Setup - Access Keys window

This window defines access keys that an administrator can assign to selected iMIS users for authorizing them to view and edit customer information such as fundraising or financials.

Note: Note: Prior to selecting these Access Keys, an administrator must set ACCESS_KEYWORDS in Customers > Set up tables > General lookup/validation.

Note: Note: After you assign the access keywords in this window, users cannot edit certain areas of customer data unless the user has been assigned at least one of the access keywords through the Customers > Set up module > General > Access Keys area.

Note: The authorization limit views in iMIS only, these access keys do not authorize or limit direct access to the database.



Customers > Set up module > General, and then click Access Keys

Name Record Data Access keywords

This area specifies access for financials, addresses, status, and whether the user can import activities.

- Name Financials Edit - When you assign an access keyword here, the user cannot edit customer financial data.
- Name Addresses Edit - When you assign an access keyword here, the user cannot edit customer addresses.
- Name Status Edit - When you assign an access keyword here, the user cannot edit customer status data.
- Import Activities - Limits access to activity import functions but only if other prerequisites are in place. Access controls whether the Input from Query and Transformation Query fields on the Import activities window are enabled.
- Name Internet Security Data - Limits access for changing passwords or revoking access.

This area specifies access for fundraising information on individuals.

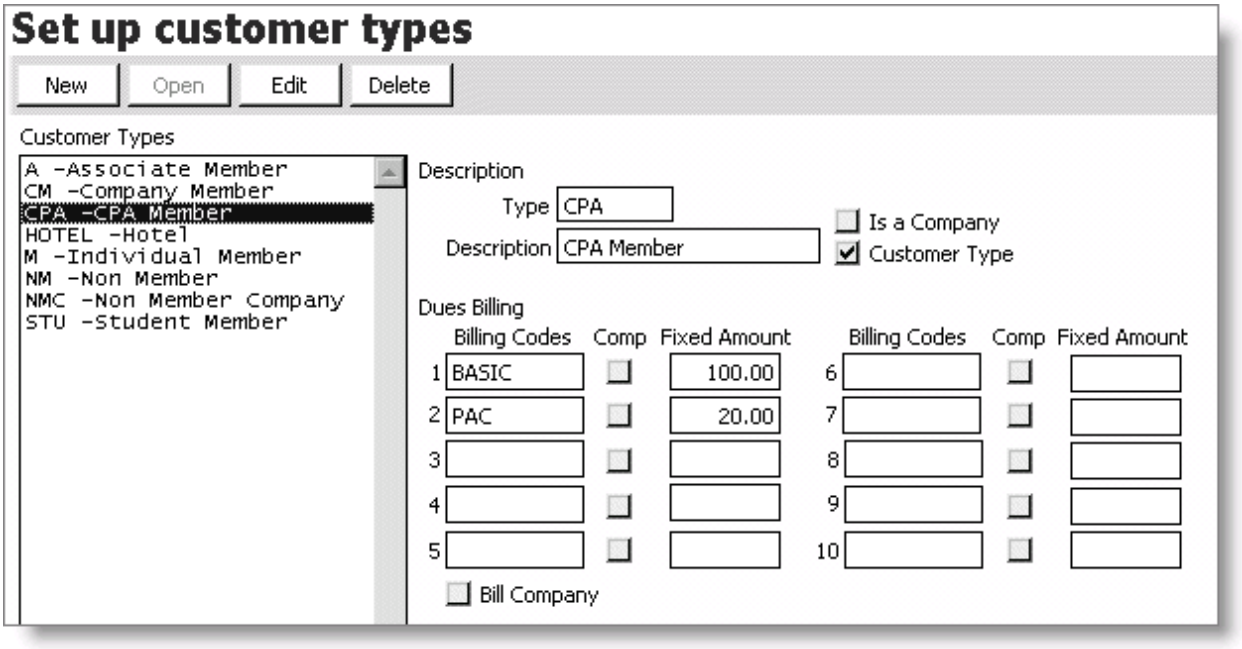
- Fundraising History View - When you assign an access keyword here, the user does not see a Fundraising tab on the Customer tab.

Defining customer types

The Customer types window defines the categories to which you assign each customer record. These types designate the broad classification of customer categories. Assign a different type to each major customer class (Individual Member, Associate Member, Student Member, Hotel, etc.) and at least one type to the Nonmember category.

When you define a type through the table, be sure to indicate whether the type represents a customer and whether the type defines a company/entity or an individual. This helps iMIS differentiate between the different records.

Customer types window



From Customers, select Set up module > Customer types

Customer Types

Lists the codes and descriptions for the defined customer types.

Type

Specifies a unique code to represent a specific grouping (Max. characters 5). This code corresponds to the Type field in the Manage customers window.

Description

Specifies the descriptive, full name of the customer or nonmember group that corresponds to the abbreviated type code you assigned. This description displays in the drop-down list on the Manage customers window. If the Description field does not contain a value, the value in the Type field is used.

Is a Company

Enable to indicate that the customer type you are defining represents companies or other entities rather than individuals. By enabling this option, iMIS will be able to maintain relationships between companies and individuals for the purpose of maintaining current company rosters and other related lists.

Is a Member

Enable to indicate that the group represents a customer category rather than a nonmember. By enabling this option, iMIS can distinguish between members and nonmembers regardless of how many types or categories you maintain. This provision lets you produce quick lists, reports, and counts by members or nonmembers.

Billing Codes

Use these fields to enter up to 10 product codes for each customer type. These entries dictate the dues products that automatically will be billed for each customer type. Only link dues products that should be billed to all members within the type. Do not enter add-on products that are optional or vary from member to member.

All codes entered here display on dues bills for this customer type unless the line item bills at zero dollars and the renewal notice option to suppress the printing of zero balance line items is active.

The first product cross-referenced is the key product because it controls the advancing of the overall membership paid thru date. For best results, enter the primary dues product code in the first Billing Codes field.

> **Note:** Note: Unless all line items for the type are complimentary or are to be billed zero dollars, do not insert a product in the first line that will have a zero price amount such as a complimentary product. When a product line item is billed and a zero amount has been set, the paid thru date will automatically advance.

Comp

Enable if the dues item will be provided at no charge for this customer type.

Fixed Amount

Specifies a fixed rate that applies to all or most customers of this type.

Bill Company

Enable if the parent company is to receive the bill for customers of this customer type that are linked to it; for example, if a List Bill requirement exists.

Print

Used to generate and send a customer type table report to your report destination.

To define customer types

1. From Customer types window, click New.
2. Enter a meaningful, unique code to represent a specific grouping in the Type field.
3. In the Description field, enter the descriptive, full name of the customer group that corresponds to the code you assigned in the Type field.
4. (optional) If the customer type you are defining represents a company or entity other than an individual, enable the Is a Company option.
5. (optional) If the customer type you are defining represents a member rather than a non-member category, enable the Is a Member option.

6. Click Save.
7. Exit iMIS.

To add billing codes to customer types

1. From Customer types window, click New.
2. Enter a meaningful, unique code to represent a specific grouping in the Type field.
3. In the Description field, enter the descriptive, full name of the customer group that corresponds to the code you assigned in the Type field.
4. (optional) If the customer type you are defining represents a company or entity other than an individual, enable the Is a Company option.
5. (optional) If the customer type you are defining represents a member rather than a non-member category, enable the Is a Member option.
6. (optional) Enter the Billing Codes that were set on the Set up products window (from Billing, select Set up module > Products). These entries dictate the dues products that will be automatically billed for each customer type. Only link dues products that should be billed to all customers within the type. Do not enter add-on products that are optional or that vary from customer to customer.

   Caution! Unless all line items for the type are complimentary or are to be billed zero dollars, do not insert a product in the first line that will have a zero price amount, such as a complimentary product. When a product line item is billed and a zero amount has been set, the Paid Thru date will automatically advance.

1. Enable the Comp option if the dues product will be provided at no charge (complimentary) for this customer type.
2. Enter a Fixed Amount if a fixed rate applies to all or most customers of this type.
3. Enable the Bill Company option if the parent company is to receive the bill for customers of this customer type that are linked to it.

7. Click Save.
8. Exit iMIS.

To use wildcard product codes to update PAID_THRU date

A special wildcard option enables you to control the overall customer term Paid Thru date when there is not a single main dues product (the product that is listed first on the Customer types window) to be billed for the customer type. In order to use the wildcard feature, all potential products, which may be used to control the customer term Paid Thru date, must be established with the same initial string of characters in their product codes. A partial product code string followed by % designates a wildcard in the first product code slot on the customer types table. This option allows different products to be the main dues product for one customer type. This feature enables ties to use dues product billing and to control the customer Paid Thru date even when there is not a consistent dues product billed to all customers.

Example

An organization bills only chapter dues products and the chapter codes vary from customer to customer. In this case, CHAPT% would be entered in the first Billing Codes field on the Customer types window because all chapter product codes automatically begin with CHAPT (for example, CHAPT-HARRIS, CHAPT-TRAVIS). Payment of the first product whose code begins with the wildcard string will update the overall customer term or name PAID_THRU date. An example of a wildcard used on the Set up customer types is shown in the following picture with the corresponding product code defined on the Set up products window (see Defining Product Codes) In this case, only chapter dues products are billed. Customers can join from a group of chapters. In this example, the wildcard option is used for all chapters that begin with CHAPT.

Note: Note: The customer's overall Paid Thru date will be advanced the first time a payment is fully applied to a line item whose product code begins with CHAPT.

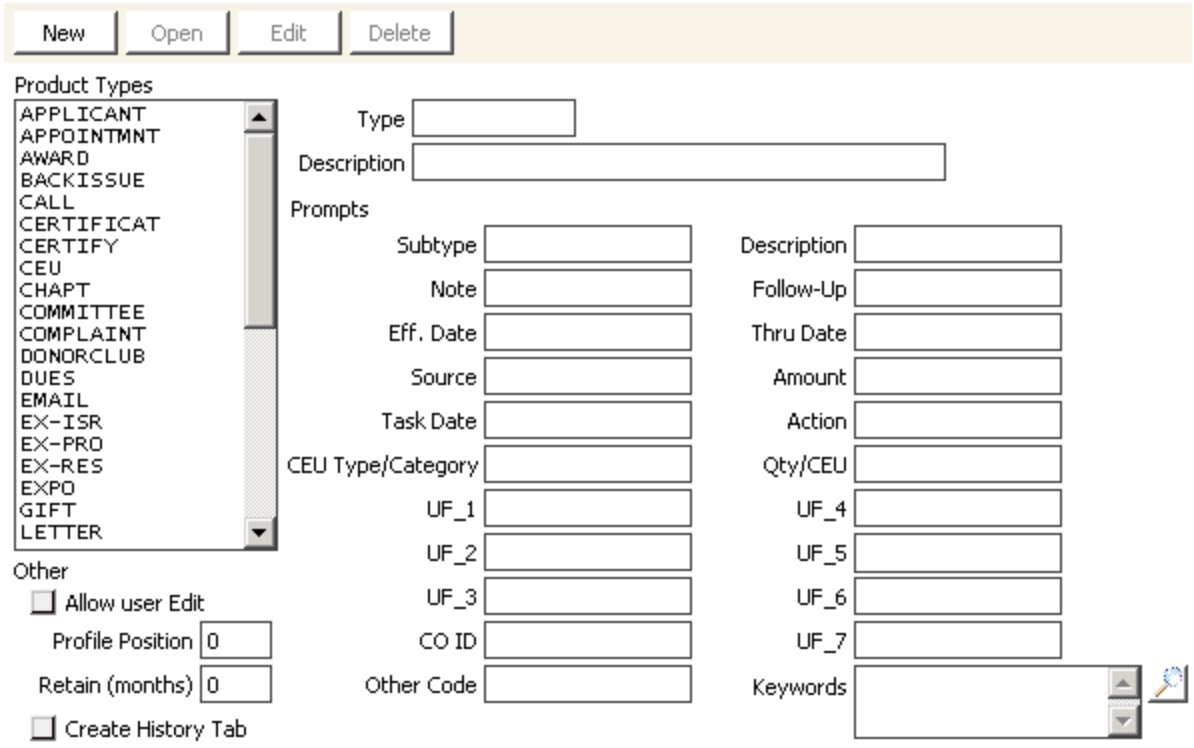
Implementing and managing activity types

The Activity Detail window contains both standard and user-defined fields. These fields are assigned according to your organization's needs and are set up in the Activity types window. You establish which fields are displayed for a given Activity Detail window.

> **Note:** Note: When creating an activity type you must enter a value in the Type and Description fields, and you must define at least one field prompt.

See the Fundraising Administration section for details about Setting up Request, Gift, and Pledge activity types.

Activity types window



Desktop: Customers > Set up module > Activity types

Product Types

The Product Types field lists the activity types. iMIS comes with default activity product types which may be edited to include additional fields or to change field labels. Additional activity product types may be defined.

Type

(required) Specifies the activity category or code that corresponds to the code in the Activity Types table. This code determines which fields are used in the Activity Detail window and cannot be changed once the record is stored.

Description

(required) Describes the activity type.

Subtype

Specifies a sub-type of the activity type. The Subtype field enables you to sub-categorize the activity type. For example, a product code is a sub-type of the activity type Sales.

Description

Describes the sub-type. If this field is activated, a text box is created within the Activity Detail window that enables up to 255 characters of text.

Note

Specifies notes you want to keep. If activated, a large text box is created within the Activity Detail window that enables up to 32,000 characters.

Follow-Up

Specifies follow-up comments. If activated, a large text box is created within the Activity Detail window that enables you to enter up to 32,000 characters.

Eff Date

Specifies an additional date field (The activity date is system generated). Used if another date field is necessary for the activity. For example, for tracking the begin date of a committee appointment.

Thru Date

Specifies an end date. For example, the ending date of a committee appointment.

Source

Specifies either a marketing code, or an individual to which an item will be assigned. For example, if an order sale is made over the phone, the code used to track this information might be Phone. Codes may be set up for advertising, catalogs, salespeople, etc.

To track the source of Event registrations, enter Source in this field. This activates the Source lookup field on the Register for an Event window's Overview tab.

> **Note:** Note: For task or call logging activities, the name or user ID for which this reminder should be logged is entered in the Source field. If Assigned To is entered in this field, the lookup feature is available for all user IDs. If the field is blank, the reminder message will display in all users' task activities.

Amount

Specifies a monetary amount for the activity.

Task Date

Specifies the date on which an activity record will be displayed in the user's task list (user defined in Source).

Action

Specifies the type of action taken on a task item.

CEU Type

Specifies the type or category of educational credit awarded (With CEU add-on module only).

Qty/CEU

Specifies the number of credit hours awarded for a CEU course, or specifies the frequency of a recurring request.

> **Note:** Note: For SALES and ORDER activity types, the system stores the value entered in the Qty/CEU field in Activity.QUANTITY. For all other activity types, the system stores the value entered in the Qty/CEU field in Activity.UNITS.

UF_1, UF_2, and UF_3

Specify user-defined character information, that will be displayed in the bottom half of the Activity Detail window. For example, the GIFT and PLEDGE activities define these fields as List As, Campaign Code and Fund Code.

UF_4 and UF_5

Specify user-defined numeric information.

UF_6 and UF_7

Specify user-defined date information. For example, the REQUEST activity defines these fields as End Date and Last Reminder.

CO ID

Specifies an ID number. For example, the REQUEST, GIFT, and PLEDGE activity types define this field as Solicitor ID.

Keywords

Specifies a keyword to restrict access to this type of activity record.

Allow user Edit

When selected, enables users to edit detailed activity records of this type.

Profile Position

Specifies the order in which you want this type of activity to be printed on the customer profile report. If this field is left blank, the activity type will not be printed on the customer profile report.

Retain (months)

Specifies the number of months you wish to retain this type of activity record. Items older than the retention period are deleted when your system administrator purges old activities.

Create History Tab

When selected, creates a new tab for this type of activity in the Customer Portfolio. The tab will contain a New Activity button that enables you to enter new activities of this type, provided that you have also selected the Allow user Edit checkbox.

Tab Name

(Displayed only when Create History Tab checkbox is selected) Specifies the name of the Customer Portfolio history tab that shows this type of activity.

> **Note:** Note: The activity tab will not be displayed in the history area of the Manage customers window until you select the tab from the Customer Portfolio Tab Preferences window.

Print

Generates and sends a customer type table report to your report destination.

> **Note:** Note: The Type, Subtype, and user-defined character fields can have a general lookup/validation table. The table can vary by activity type. For example, the CALL sub-type might generate a list of CALL types such as question, problem, or other while the EXPERIENCE activity sub-type might generate a list of experience subtypes such as work experience, academic, etc.

To create an activity type

1. From Activity types window, click New.
2. Enter the activity category or code in the Type field.
3. Enter a Description of the activity type.

4. Enter additional prompts, if needed.
5. Click Save to update the activity type.

To edit an activity type

1. From Activity types window, select an activity from the Product Types column.
2. Select the activity to open it in the Activity types window.
3. Click Edit.
4. Make any necessary edits.

   Note: The Type field cannot be edited.
5. Click Save to update the record.

To delete an activity type

1. From Activity types window, select an activity from the Product Types column.
2. Select the activity to open it in the Activity types window.
3. Click Delete. A system message prompts you to verify the deletion of the selected record.
4. Click Yes.

To create the LETTER activity type

1. Create a new activity type using the following settings:

- Type: LETTER
- Prompts for Description, Note, and Source.
- Additional prompts, if needed.

  Note: The prompts entered in the Activity types window dictate which fields are enabled and visible in the Activity Detail and Activity Importer windows.

2. Click Save to update the activity type.

To display activity records in customer profiles

You can configure an activity type to be displayed in customer profiles. If a customer does not have an activity record for a particular activity type, then that activity type will not be displayed in the customer's profile. Activity records are grouped according to type, and you can specify the order in which the activity types display.

1. From Activity types window, select an activity type from the Product Types list.
2. Click Edit.
3. Enter a Profile Position to display the activity type and related activity records. You have several options:

- To not display an activity type and its related activity records, enter a Profile Position of zero. The default Profile Position is zero.
- To display an activity type and its related activity records in the customer's profile, assign a number greater than zero to the Profile Position to display the activity type. For example, enter a 1 for the Email activity type.
- To sort the order in which the activity types display, enter numbers in succeeding order for each activity type. An activity type with a Profile Position of 1 will display ahead of an activity type with a Profile Position of 2, and an activity type with a Profile Position of 2 will display ahead of an activity type with a Profile Position of 3.

  For example, if you want the customer's Call Log activity records to display first in the customer's profile and the customer's Award activity records to display second, enter a 1 for the Call activity's Profile Position and a 2 for the Award activity's Profile Position.
- To order the activity types alphabetically, assign the same Profile Position to each activity type. For example, enter a 1 for each activity type's Profile Position.

4. Click Save.

Creating tabs for activity types

You can create a History tab for specified activity types and display it according to your tab preferences.

To create a tab for an activity type

1. From Activity types window, select the activity type from the Product Types scrolling list.
2. Enable the Create History Tab option. The Tab Name field displays to the right of the Create History Tab option after the Create History Tab option is enabled.
3. Enter the tab name in the Tab Name field.
4. (optional) Enable the Allow user Edit option if you want to allow iMIS users, with a Customers authorization level of three (3) or higher, to edit the data on the Manage customers window.
5. Click Save to update the activity type.
6. Restart iMIS.

To display an activity tab

1. On the Manage customers window, place the cursor over the detail or history tabs, right-click, and select Edit Tab Preferences.

   The Customer Portfolio Tab Preferences window opens.
2. Select the History tab.
3. Move the new activity tab to the Visible History Tabs list.

   Note: The tab is initially placed at the end of the Visible History Tabs list. You can move the tab to the desired position by selecting the tab and clicking the Top, Up, Down, or Bottom buttons.
4. Click Save to update the tab preferences profile.
5. Restart iMIS.

Activity attachments

In some cases, you may want to attach a file to an activity record.

To enable the activity attachment feature

> **Note:** Note: Some activity types are system-generated (for example, Order) and are not intended for editing. However, if you want to attach a file to one of these activity types you must enable the Allow user Edit option. Enable the Allow user Edit option on the Activity types window.

1. Select File > System Setup to open the System Setup window.
2. Click Edit.
3. Enable the Activity Attachments allowed option.
4. Enter a value in the Maximum file size (KB) field. See Specifying maximum size of activity attachments for more information.

   A message informs you that the maximum file size you specified may not be practical and may have adverse effects on performance.
5. Click OK.
6. Click Save.

Activity attachment fields

To support the activity attachment feature, the following fields in the Activity_Attach table are used:

ACTIVITY_SEQN	long integer	Used to store a reference to an associated activity record
FILE_NAME	varchar (255)	Attachment's file extension
FILE_TIMESTAMP	Datetime	Date the attachment was last modified
ATTACH_IMAGE	image	File's binary data
INTENT_TO_	varchar	Indicates whether a user has started an edit operation

EDIT	(40)	(Date/Time + “#” + <User ID>)
READ_ONLY	Boolean	Indicates whether the attachment is available for editing by non-administrator users

To purge activity attachments created before a specified date

To delete activity attachments with a timestamp before a specified date, you must modify the Purge old Activity attachments report spec to include a date in the purge script from which you want to delete activity attachments, and then run the purge script.

Note: Note: You must have an authorization level of 8 or higher to modify a report spec.

Note: Note: The FILE_TIMESTAMP date that you modify in the purge activity attachment script refers to the date that displays in the File Date column on the Activity Attachment window for the attachment. The File Date displays the date the attachment was last modified. However, if the attachment has not been modified, the date that displays corresponds to the date the file was created.

1. Select Utilities> Report Specs to open the Report Specifications window.
2. Scroll down to the SYSTEM module.
3. Select the SYSTEM-Purge-Purge old Activity attachments report.
4. Click Parameters to open the Detail Report Parameters window.
5. Click Edit.
6. Using the format YYYYMMDD, modify the FILE_TIMESTAMP value of the Purge old Activity attachments script. In the following example, the script has been modified so that activity attachments with a File Date earlier than October 10, 2002 will be deleted:

delete Activity_Attach where FILE_TIMESTAMP< '20021010' and ACTIVITY_SEQN> 0 and READ_ONLY=0

7. Click Save.
8. Select Utilities> Reports and Queries.
9. Select Purge from the Report Types scrolling list.
10. Select Purge Old Activity attachments from the Available Reports scrolling list.
11. Click Run. A message displays informing you that you should make a backup of your database before running the activity attachment purge utility, and asks if you want to continue running the utility. Click Yes to continue running the utility, or No to cancel.
12. The Purge old Activity attachments window displays showing the number of attachments that were deleted from the iMIS database.

> **Note:** Note: In an environment where users are importing activities simultaneously, you must ensure that the users do not attempt to import the same files or run the same queries. To prevent a user from inadvertently affecting records another user is processing, you can limit access to the advanced Activity Importer features so that processing is restricted to records imported by a user's specific session.

Creating mailing and address lookup and validation

The Label Preferences tab enables you to select specific label addresses for any mailing label on a per-customer basis.

To enable product label preferences

The Label Preferences tab enables you to select specific label addresses for any mailing label on a per-customer basis. Before inserting product label preferences, you must enable the Use Product Label Preferences option.

1. From Customers, select Set up module > General, and click Address and Notes to open the Customers Setup - Address and Notes window.

2. Click Edit.
3. Enable the Use Product Label Preferences option.
4. Click Save to update the record.
5. Close iMIS Desktop to enable Use Product Label Preferences.
6. Ensure that your iMIS Administrator stops and restarts all websites that contain your iMIS 15 applications.

   If restarting the websites is problematic, you can wait for the cache to refresh (default is 15 minutes wait time, designated by the refresh cache interval) and then your changes appear.

   Note: Upon enabling Use Product Label Preferences, the Product Label Preference table activates, allowing you to create user-defined label codes. The Label Preferences tab displays on the Manage customers window when you enable this feature.

   To insert product label preference codes

1. From Customers, select Set up product label preferences to open the Set up product label preferences window.
2. Enter new codes:

- Click New.
- Enter a code for the label in the Code field and a name for the label in the Name field.
- Click Save.
- Repeat until you have entered all of the codes.

iMIS Customizer

The iMIS Customizer (Customer Setup – Additional Windows window) makes customization easy for both programmers and non-programmers. Through the Customizer, users can create user-defined tables. The tables contain user-defined data fields that store data that is captured and displayed in user-defined or custom tabs.

Customizer features include the following:

- Customization of iMIS customer data
- Automatic and custom tab layout for capturing and displaying data
- Data lookup and validation
- Different demographics for different customer types
- Multiple instances of each window for each customer
- Custom fields with user-assigned names

> **Note:** Note: Excessive customization may slow processing when users log on to iMIS.

Custom table features

- Fields organized into multiple SQL tables
- Tables designed so that different customer types have unique demographic fields and tabs
- Option provided to have “multiple instances” of a table row for a single ID
- Table used for dues pricing identified and included in the Name_All view

Custom field features

- Create any number of custom fields
- Assign any valid SQL name (not just UF_1, UF_2...) to fields
- Designate a custom prompt for each field
- Use a wider variety of field types: characters, notes, numbers, integers, checkboxes, date, time, date/time
- Assign validation and lookup tables for single or multiple values
- Designate uppercase or upper/lower (title case) auto-formatting

Custom tab features

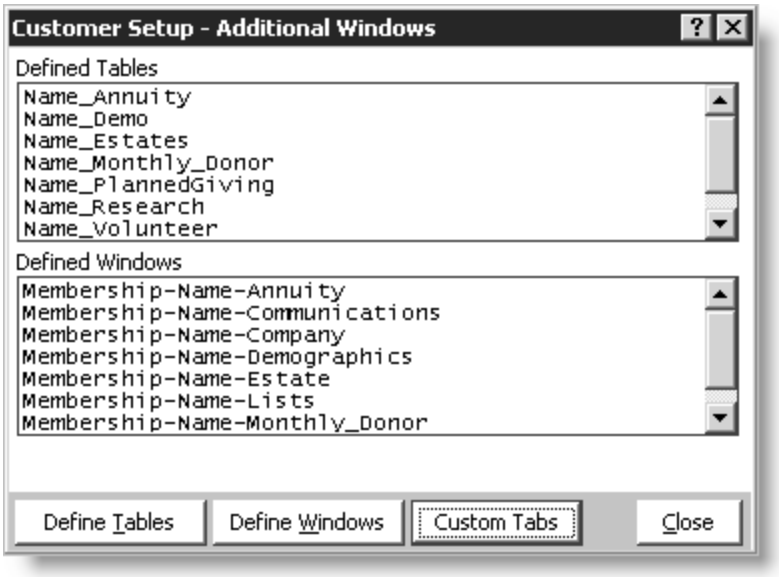
- Organize fields into multiple tabs
- Define your own layout and content for each tab; easy layout/definition process
- Mark tab fields as “display only”
- Provide different demographic subsets for different tabs (for example, for each department)
- Designate tab fields and data to display on customer profile reports
- Provide for "tab level” security; access modes include full, view only, and none (see Limiting Access and/or Hiding Tabs).

Apply demographics to a new task

The unprecedented flexibility in field, table, and page configuration allows you to implement many optimized uses for iMIS:

- Separate individual customer demographic data from organizational demographic data
- Define specific demographic data for different companies and organizations
- Define specific demographic data for special customers, such as chapters, legislators, and advertisers
- Define specialized window tabs for surveys and other detailed information

Customer Setup - Additional Windows window



Customers > Set up module> General, and click Additional Windows

Defined Tables

Displays existing user-defined tables. You can have an unlimited number of tables with many user-defined tabs accessing the same table.

Defined Windows

Displays existing user-defined tabs.

Define Tables button

Opens the User Defined Tables window used for defining tables.

Define Windows button

Opens the Window Designer window used for creating user-defined tabs.

Custom Tabs button

Opens the Custom Tab Designer window used for creating custom tabs.

To access the Customizer

Before you begin configuring your user-defined tables and user-defined tabs, be sure to launch iMIS in the proper mode for system alteration.

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Log onto iMIS as MANAGER.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.

Creating a user-defined table

To add a user-defined demographics tab, you first need to name and define its data table, unless a previously defined table contains the fields you want to add to the tab you are designing.

If you want to display the data from this newly designed table, after the table is defined, create the tab, and add the data fields that you want to display on the tab. Here's an overview of the process:

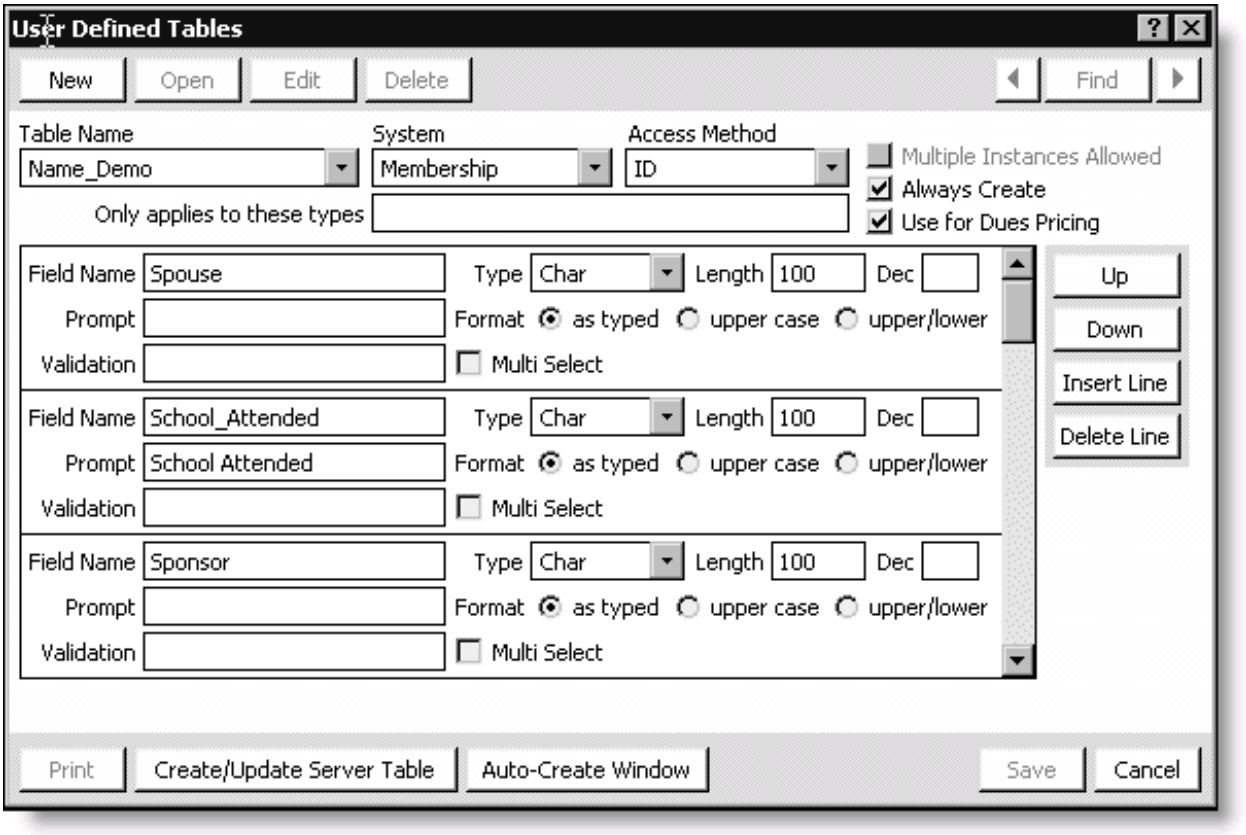
1. Create the table (see "To create a user-defined table") and add the fields.
2. Create a window (see "To create a user-defined tab") - either auto-created or create your own.
3. Use the Build command in Tools > User defined tables > Build to build the underlying business object.
4. Add the window to user tab preferences (see "To create custom tabs").
5. Enter data for members and then the definition is complete.

> **Note:** Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).

Note: Note: If you assign a numeric Type format to a field, iMIS automatically formats the numbers entered in the field with commas. If you do not want a user-defined field to be automatically formatted, assign the data type to Char.

User Defined Tables window

The User Defined Tables window is used to create new tables, add data fields, and modify existing tables.



From Customers, select Set up module> General, click Additional Windows, and click Define Tables

Table Name

Specifies the name of the table you are creating. Use an underscore (_) to separate words; do not use spaces.

System

(Not currently in use) Accept the default (Membership).

Access Method

(Not currently in use) Accept the default (ID).

Multiple Instances Allowed

Enable to allow multiple instances of each user-defined tab for each customer. For example, if you create a Survey tab for the year 2003 and want to re-use it in succeeding years, this feature allows customers to enter information in the same tab, using the same customer ID, for each year.

When creating multiple instance of a user-defined tab, a unique identifier is not required. However, we recommend using the first field as a unique identifier or key field that allows you to stack the data. When Multiple Instances Allowed is enabled, and you designate the first field as a key field, the first field Type must be designated as character (Char). The first field also should be a field that will designate the instance. For example, if you set up a tab for customer surveys, you would want to use SURVEY_YEAR as your first field.

If you select the Auto-Create Window option after defining a tab, iMIS automatically creates a tab with the tab title based on the table name. iMIS defines the table layout and includes all the fields with the Field Name used as the field label.

Always Create

Enable to create records automatically according to the Access Method selected for the appropriate customer types. Make sure to enable this option if the table contains fields used for Dues special pricing.

Use for Dues Pricing

Enable to use the table for Billing special pricing.

Note: Note: If the Always Create and Use for Dues Pricing options are enabled, the Name_All view is automatically created when you click Save.

Only applies to these types

Specifies specific customer types (separated by commas) if you want to restrict availability to a demographic table. Do not use this option if you plan to use the table for Billing special pricing.

Field Name

Use to define a SQL field name. Use an underscore (_) to separate words; do not use spaces.

Type

Select a field type from the drop-down list to define the field format: character, integers, numbers, money, checkboxes, date, time, date/time, and image. (Defaults to character.)

> **Note:** Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).

Length

Use to define the size of a character type field, for example, 20 characters.

Dec

Use to define the number of decimal places for specific field types.

Prompt

Specifies the field label you want displayed on the tab. (Defaults to the Field Name. For example, if the Field Name is TEST_EXAMPLE, the Prompt defaults to Test Example.)

Format

The character format option allows you to select an auto capitalization option: as typed, upper case (for codes), and upper/lower case (for titles). If you select upper case or upper-/lower, the character format will be auto-corrected. (Defaults to as typed.)

Validation

Specifies which general lookup/validation table to use for data entry. You must refresh the libraries to see the defined values when using the lookup feature on a user-defined field. (Defaults to all caps, exact spelling.)

> **Note:** Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).

Multi Select

Enable to allow users to make more than one selection from the validation table.

> **Note:** Note: When creating a general lookup/validation table for a multi-select field in a user-defined table, the Description field on the Set up general lookup/validation window must contain a unique value for each Code.

Up button

Used to move the selected field up in placement.

Down button

Used to move the selected field down in placement.

Insert Line button

Used to insert a new field.

Delete Line button

Used to delete an existing field.

Create/Update Server Table button

Used to update the selected table.

Auto-Create Window button

Used to create a user-defined tab automatically with the title based on the table name. iMIS defines the table layout and includes all of the fields with the Field Name used as the

field label. Use the automatic window creation feature when you add a new user-defined table or make changes to an existing user-defined table (for example, if you add or delete a field from a user-defined table).

To create a user-defined table

A table is made up of data fields. You define your table's data fields so users can enter or select specific data in user-defined or custom tab.

> **Note:** Note: A single table cannot contain more than 398 fields.

> **Note:** Caution! Take a snapshot of your database with customizations. All customized objects (triggers, additional indexes, special permissions) are lost when user-defined tables are rebuilt.

1. Have all users exit iMIS.
2. Back up your data.
3. Log into iMIS as the database owner.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Tables to open the User Defined Tables window.
6. Click New.
7. Enter a new Table Name. The table names are case-sensitive, so plan to use ALL CAPS or Initial Caps consistently. Table names must be unique:

- Unique name across iMIS: Make sure any table or field you add does not match the name of any other iMIS table or field or any of the SQL Reserved Words. If you enter an iMIS table name, you are warned that the iMIS table may be overwritten.

8. Press Tab. When iMIS prompts you to verify the table creation, click Yes.

Note: The scrolling list box of field entries is cleared until you complete the table's heading fields.

9. Accept the System and Access Method defaults.
10. (optional) Enable the Multiple Instances Allowed option if you want customers to have more than one user-defined tab that will contain the same fields, for example, quarterly or annual surveys.

    Note: If you enable the Multiple Instances Allowed option, the Always Create and Use for Dues Pricing options are grayed out. Enabling the Always Create and Use for Dues Pricing options grays out the Multiple Instances Allowed option.
11. (optional) Enable the Always Create option if you want records to be created automatically for the appropriate customer types and are using the fields for Dues special pricing. Press Tab.
12. (optional) Enter specific customer types in the Only applies to these types field to restrict access to the demographic table, and separate customer types by commas. Leave the field blank to allow access to all customers. Press Tab.
13. Enable the Use for Dues Pricing option if you are using the fields for Billing special pricing. Press Tab. iMIS displays a definition area for the first field for this table.
14. Enter a valid SQL Field Name, and press Tab.

    Note: Do not use ID as a Field Name. iMIS automatically assigns each user-defined table with an ID field.
15. (Multiple Instances Allowed only) If you are creating multiple instances of this table, we recommend making your first field contain the information that will distinguish the multiple instances from each other. For example, if you plan to have a table in each customer record for each year's survey data, the first field name should be Year.
16. Select a field format from the Type drop-down list. Press Tab.
17. (Multiple Instances Allowed only) Create multiple instance tables with a first field type of character (Char).

Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).

Note: If you assign a numeric Type format to a field, iMIS automatically formats the numbers entered in the field with commas. If you do not want a user-defined field to be automatically formatted, assign the data type to Char.

18. Enter the field size in the Length field if it is a Character field. Press Tab.
19. (Optional for Int, Number, or Money fields) If a decimal can be entered in the field, enter the number of decimal places to be accepted in the Dec field.
20. In the Prompt field, enter the name of the field that will display on the tab. The default is Field Name.
21. Select the Format option for the data entered in the field on the tab.
22. (optional) In the Validation field, enter the general lookup/validation table that will be used to validate the data at the time of data entry. To enable this field you must build the corresponding general lookup/validation table in the Set up general lookup/validation window (from Customers, select Set up tables > General, and select General lookup/validation).

    A general lookup/validation table is required for a multiple instance table or if you enable the Multi Select option.

    Note: When creating a general lookup/validation table for a multi-select field in a user-defined table, the Description field on the Set up general lookup/validation window must contain a unique value for each Code.

    Note: Lookup is unavailable for numeric user-defined fields. When defining a field that uses a general lookup/validation table, make sure you do not assign a numeric Type to the format (for example, a number).
23. Enable the Multi Select option if you entered a table name in the Validation field and you want to allow the user to make more than one selection from the validation table.

24. Click Save. iMIS prompts you to set up the new table with the server.
25. Click Yes to have iMIS create the server table. This prompt is equivalent to clicking Create/Update Server Table.
26. (optional) Click Auto-Create Window. iMIS automatically creates a user-defined tab with the title based on the table name. iMIS defines the table layout and includes all the fields with the Field Name used as the field label.
27. Click OK if prompted to restart iMIS.
28. Click Close to close the User Defined Tables window.
29. From Tools > Utilities, select User defined tables. Click Build All to generate business objects from user defined tables.
30. Exit iMIS immediately.
31. (content items using UD tables) Restart IIS so new fields are included as available fields in existing content items.

To modify a user-defined table

> **Note:** Caution! If your user-defined table contains customized objects (triggers, additional indexes, special permissions), they will be lost when the table is rebuilt.

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Log on as the database owner: MANAGER.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Tables to open the User Defined Tables window.
6. Select the Table Name drop-down list, and select the table you want to modify.
7. Make the necessary changes:

- To add a field to the table, place the cursor anywhere in the field row where you want the new field to follow, and click Insert Line on the User Defined Tables window. A new field row is inserted, and the new field information can be added here.
- To delete a field on the table, place the cursor anywhere in the field, and click Delete Line on the User Defined Tables window.
- To reorder the fields, select the field, and click Up or Down on the User Defined Tables window.

8. Click Save. iMIS prompts you to update the server table.
9. Click Yes.
10. Click OK if prompted to restart iMIS.
11. Click Auto-Create Window.
12. Click Close to close the User Defined Tables window.
13. From Tools > Utilities, select User defined tables. Click Build All to generate business objects from user defined tables.
14. Exit iMIS immediately.
15. (content items using UD tables) Restart IIS so any new field added to a user defined table is included as available fields in existing content items.

To delete a user-defined table

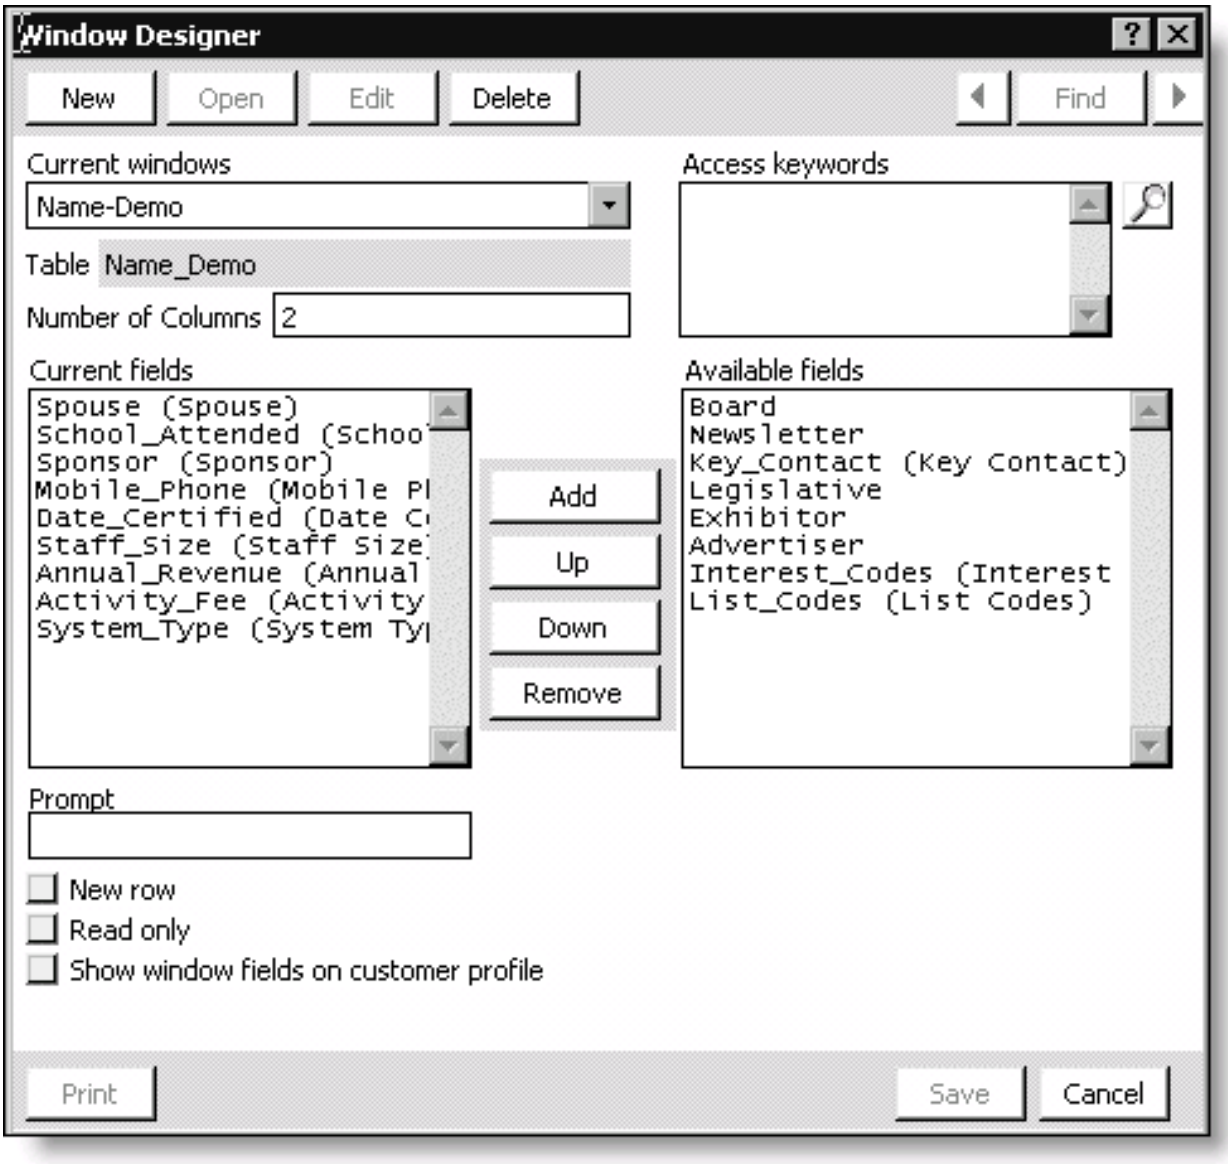
1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Log into iMIS with the MANAGER logon.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Tables to open the User Defined Tables window.
6. Select the table you want to delete from the Table Name drop-down list.

7. Click Delete. iMIS prompts you to confirm the deletion.
8. Click Yes to delete the table.
9. Click Cancel to close the User Defined Tables window.
10. Use SQL Server tools to drop the user-defined table that was deleted.
11. Exit iMIS immediately.

Creating a user-defined tab

The user-defined tab you create will use the data fields from a previously defined table (see To create a user-defined table).

Window Designer window



From Customers, select Set up module> General, click Additional Windows, and click Define Windows

Current windows

Displays a drop-down list of current user-defined tabs.

Access keywords

(optional) Specifies access keywords. Keywords prevent unauthorized users from entering data on the user-defined tab. See Limiting Access and/or Hiding Tabs for more. Select the Find icon to look up defined keywords.

Table

(read only) This field identifies the table used with the tab.

Number of Columns

(Required for single-instance tabs) Specifies the number of columns to display for a single-instance tab.

Current fields

Lists all of the fields that will display on the tab.

Available fields

Lists all of the fields that are available but not displayed on the tab.

Add button

Used to move the selected field from the Available fields list to the Current fields list.

Up/Down buttons

Click these buttons to move the selected field's placement up or down in the Current fields list.

Remove button

Used to move the selected field from the Current fields list to the Available fields list.

Prompt

Specifies the field label that will display on the tab.

New row

Enable if you want the field to display in a new row in the tab.

Read only

Enable to allow users to view but not edit a tab's data.

Show window fields on customer profile

Enable if you want all of the Current fields displayed when you print a customer's profile.

To create a user-defined tab

After you name and define a data table, you can create and customize a user-defined tab based on the data fields.

> **Note:** Note: If you selected Auto-Create Window when you defined the table, a user-defined tab based on the table name was created automatically. If a tab was created automatically, you can modify it (see "To modify a user-defined tab").

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Using the iMIS Desktop, connect to iMIS with the MANAGER logon.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Windows to open the Window Designer window.
6. In the Window Designer window, name the user-defined tab, enter the table name that contains the data fields, and select the fields you want displayed on the tab. In the following example, the Name-Demo tab is created using fields from the Name_Demo table. Although the Name_Demo table contains 17 data fields, only nine fields are used for this tab. The field labels that display on the tab are the same as the data field names unless prompts are defined for the fields. In this case, the field labels display in parentheses, for example (Mobile Phone).
7. Click New.
8. Enter the tab name in the Current windows field.
9. Press Tab. iMIS prompts you to confirm the creation of the new tab.

10. Click Yes. iMIS prompts you for the table name.
11. Enter the Table Name that contains the fields you want to use for the tab.
12. Click Save. iMIS prompts you for the tab title.
13. Click Save to accept the default title, or type in a different title.
14. Click Save. The Window Designer window displays the tab name and the Available fields from the selected table.
15. Press Tab.
16. (optional) Enter any Access keywords, or select the Find icon to select keywords (see "Limiting access and/or hiding tabs") for the tab.
17. (Required for single-instance tabs) Enter the Number of Columns you want to display for the tab.
18. Select a data field from the Available fields list, and click Add to move the field to the Current fields list. Repeat this step for every data field to be displayed on your tab.

    Note: If there is a subset of fields in your table that need to be confidential among a smaller group of users, remove them from the tab and create a new restricted-access tab containing only these confidential fields.
19. (optional) Select a data field from the Current fields list.
20. Click Up or Down to reorder the field as it appears on the tab.

1. If you want a different Prompt than the one specified in the User Defined Tables window, enter the new prompt.
2. (optional) Enable the New row option to display a field in the first column of a new row.
3. Select the Read only option to create a special display-only field that cannot be edited.

   Note: Use Read only to create versions of the same tab for different user groups: one group can enter data in those fields, while another only can view the data. The Read only option requires the Access Keywords (see "Limiting access and/or hiding tabs") feature.

21. (optional) Enable the Show window fields on customer profile option to show the Current fields on the customer's profile.
22. Click Save. iMIS saves the tab definition and creates the tab format.
23. Click OK if prompted to restart iMIS.
24. Click Close to close the Window Designer window.
25. Exit iMIS immediately for the changes to take effect.

To modify a user-defined tab

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Using the iMIS Desktop, connect to iMIS with the MANAGER logon.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Windows to open the Window Designer window.
6. Select the Current windows drop-down list, and select the tab you want to modify.
7. Make the necessary changes:

- To add a field to the tab, select the field from the Available fields list, and click Add on the Window Designer window.
- To remove a field from the tab, select the field from the Current fields list, and click Remove on the Window Designer window.
- To reorder the fields, select the field, and click Up or Down on the Window Designer window.

8. Click Save to save the changes.
9. Click OK if prompted to restart iMIS.

10. Click Close to close the Window Designer window.
11. Exit iMIS immediately for your changes to take effect.

To delete a user-defined tab

1. Make sure all other users exit the iMIS system.
2. Back up your data.
3. Log onto the iMIS Desktop as MANAGER.
4. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.
5. Click Define Windows to open the Window Designer window.
6. Select the Current windows drop-down list, and select the user-defined tab you want to delete.
7. Click Delete. iMIS prompts you for confirmation of the deletion.
8. Click Yes to delete the tab.
9. Click Cancel to close the Window Designer window.
10. Exit iMIS immediately.

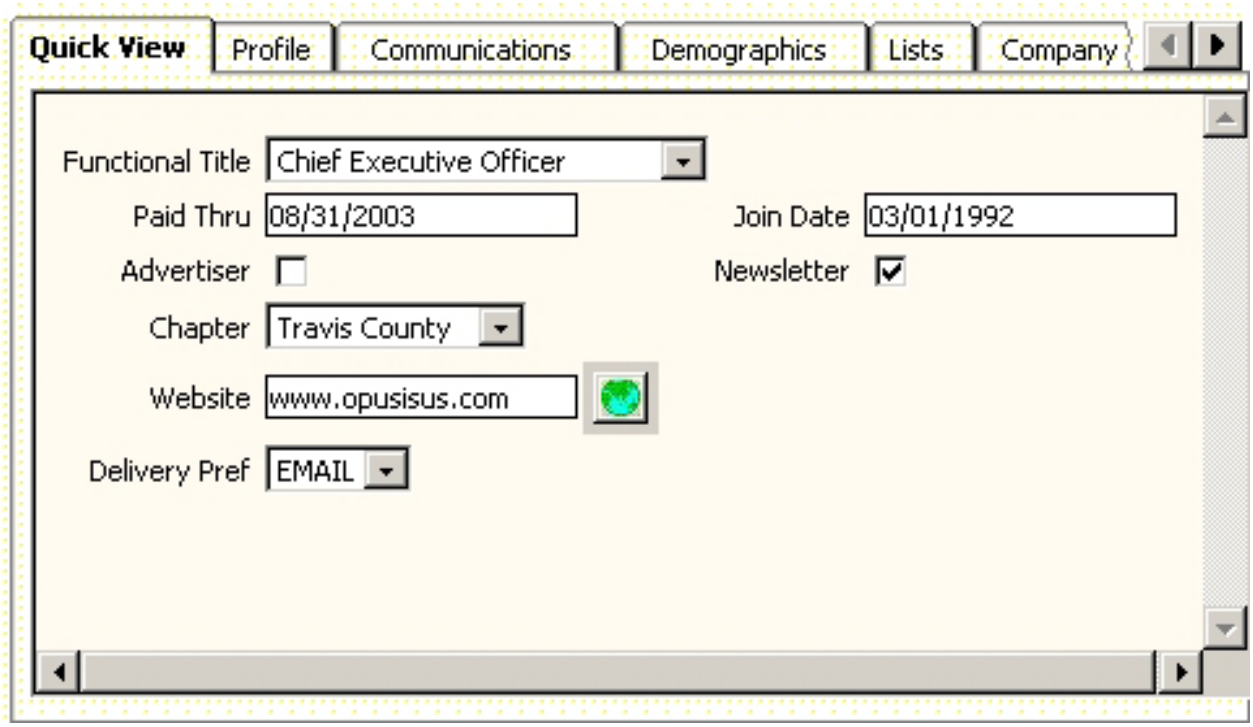
To display custom window fields in customer profiles

1. From Customers, select Set up module > General, and click Additional Windows to open the Customer Setup - Additional Windows window.
2. Click Define Windows to open the Window Designer window.
3. Enable the Show window fields on customer profile option.
4. Click Save.

   Note: You must restart iMIS for your settings to take effect.

Creating custom tabs

A system administrator can create custom tabs for the Details pane of the Customers > Manage customers window. For example, a custom tab can display your most frequently used contact information, so you do not have to look for these field values on separate tabs. In the following example, the Quick View tab contains the contact data your staff might need to view and edit frequently.



Customers > Custom tab example

The custom tabs you create in this way are similar to tabs you create by using iMIS Customizer, except that you can add fields from a wider variety of sources. You can use the following features for defining the tabs:

- Add fields from single-instance user-defined tables, the Name table, the Name_Fin table, or add SQL formula fields based on these tables.
- Specify the field prompt – the text that appears next to the field (optionally).
- Set individual field values to be read-only.
- Assign access keywords to limit which users have access to the tabs.

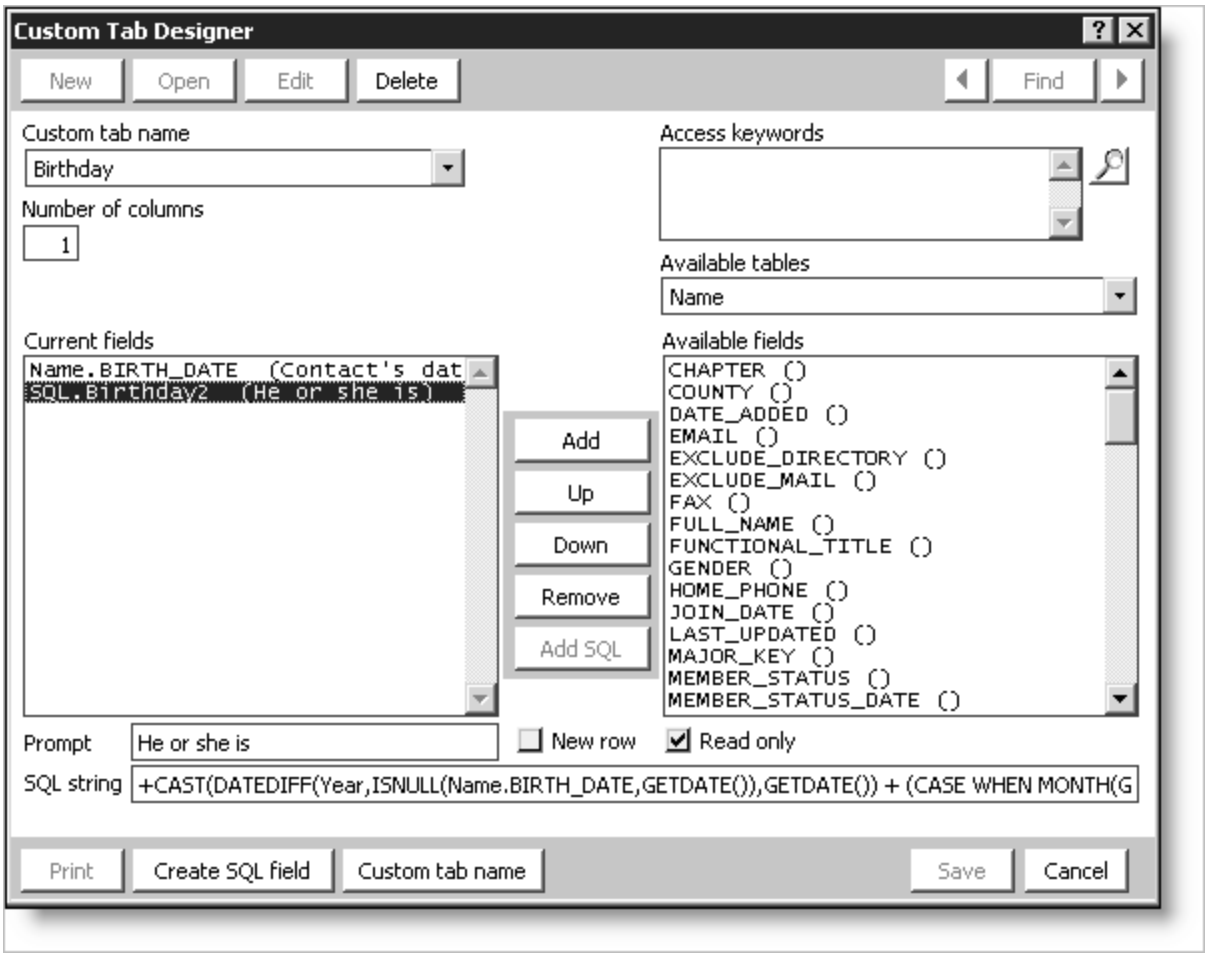
Fields that are always read-only

To protect data integrity, certain fields are read-only on custom tabs:

- Fields based on SQL formulas.
- System-generated fields (for example, Name.FULL_NAME, Name.DATE_ADDED, and Name.LAST_UPDATED).
- The Name_Fin.BILL_TO field.
- Any phone number or e-mail address field used in a synchronization rule: Name.WORK_PHONE, Name.HOME_PHONE, Name.FAX, and Name.EMAIL.
- The Name.COUNTY field, if either one of the options to auto-populate the county name is enabled in system setup:
- Zip Option - Customers > Setup Module> General> Address and Notes> Zip Options> County from Primary Zip
- Accumail Option - Customers> Setup Module> General> Address and Notes> Accumail Options> Update County/Congressional District based on [specified address purpose]
- Any field protected by an access keyword, if an access keyword is specified for any of the Name Record Data groups, such as Name Financials Edit, Name Addresses Edit, or Name Status Edit.

> **Note:** Note: If a user-defined Company Flow Down field is added to a custom tab, the field appears to be editable unless the Read only option is applied to it in the Custom Tab Designer window. If the record the user is editing is linked to a company record, however, the edits to the user-defined flow-down field do not take effect. As soon as the user selects Save, the edited value will be overwritten by the value associated with the company record.

Custom Tab Designer window



Customers > Set up module> General, click Additional Windows, and click Custom Tabs

Custom tab name

The name that displays on the custom tab.

Access keywords

(optional) Specifies access keywords. Keywords prevent unauthorized users from entering data on the user-defined tab. See Limiting access and/or hiding tabs for more. Select the Find icon to look up defined keywords.

Number of Columns

Specifies the number of columns to display for the tab.

Available tables

(read only) Select the table containing the fields you want displayed on the custom tab. You can select from a user-defined table or the Name or Name_Fin table.

Current fields

Lists all of the fields that will display on the tab.

Available fields

Lists all of the fields that are available but not displayed on the tab.

Add button

Used to move the selected field from the Available fields list to the Current fields list.

Up/Down buttons

Click these buttons to move the selected field's placement up or down in the Current fields list.

Remove button

Used to move the selected field from the Current fields list to the Available fields list.

Add SQL button

Used to move the selected SQL formula from the Current fields list to the Available fields list.

Prompt

Specifies the field label that will display on the tab.

New row

Enable if you want the field to display in a new row in the tab.

Read only

Enable to allow users to view but not edit a tab's data.

Create SQL field button

Used to create a SQL formula.

To create custom tabs

> **Note:** Note: In order to create custom tabs, the user must have authorization level 8 for Customers or log on as MANAGER.

1. Make sure all users exit iMIS before creating or modifying a tab.
2. Back up your data before creating or modifying a tab.
3. Make sure the field or tab does not have the same name as any table/field in iMIS or any SQL reserved word.
4. Log on to the iMIS desktop as MANAGER.
5. From Customers, select Set up module > General.
6. In the Set up general options window, select Additional Windows.
7. In the Customer Setup - Additional Windows window, select Custom Tabs.
8. Click <New custom tab> in the Custom tab name drop down list.

   If a custom tab already exists, click the Custom tab name drop down list, choose <New custom tab>, and then enter the name for the tab.
9. In the Custom Tab Designer window, specify the following options:

- Custom tab name field – Enter the text to use as the tab label. You can use spaces and underscores (_), but do not use punctuation (',"), special characters, or SQL reserved words.

  Caution! If you use unsupported characters in the tab name, the next time you start iMIS, the Customers module may be inaccessible.
- Number of columns field - Enter the number of columns to use for displaying the fields.

10. Add fields to the custom tab:

- Fields from Tables - For each field you want to add from an existing table, select the source table from the Available tables list, select the field name in the Available fields list, then click Add.
- Fields from SQL Formulas - For each field you want to create from a SQL formula, select Create SQL field, specify a Prompt value and a valid SQL formula, then click Add SQL.

  You can create SQL fields to display values calculated from values in any of the available tables. For example, the custom tab could display a contact's age (calculated from the birth date) or the tab could include extra information for a contact whose income is in a specified range.

11. (optional) To customize the prompt (text) that appears next to the active field (the field selected in the Current fields list), edit the text in the Prompt field. The Current fields list shows the Prompt setting for each field in parentheses after the field name.
12. (optional) To make the active field appear at the beginning of a row, select the New row check box.
13. (optional) To prevent users from editing the contents of the active field, select the Read only check box.
14. (optional) To assign keyword access to the tab so that only authorized users have viewing or editing rights, use the Access keywords field. Set up access keywords just as you would for any user-defined window (as described in iMIS Customer Management).
15. Optional: To reorder or remove fields, use the Up, Down, and Remove buttons.
16. When you finish specifying tab settings, select Save, then Close. (Close the Customer Setup Additional Windows window also.)
17. To set the new tab to appear at the next iMIS startup, right-click in the top of the History or Detail pane of the Manage customers window and select Edit Tab Preferences. In the Customer Portfolio Tab Preferences window, add the new tab to the Visible Detail tabs list. You can use the Top, Up, Down, and Bottom buttons to order the tabs. Select Save, then close the window.

After you create the table or field, a message notifies you to restart iMIS for your changes to take effect.

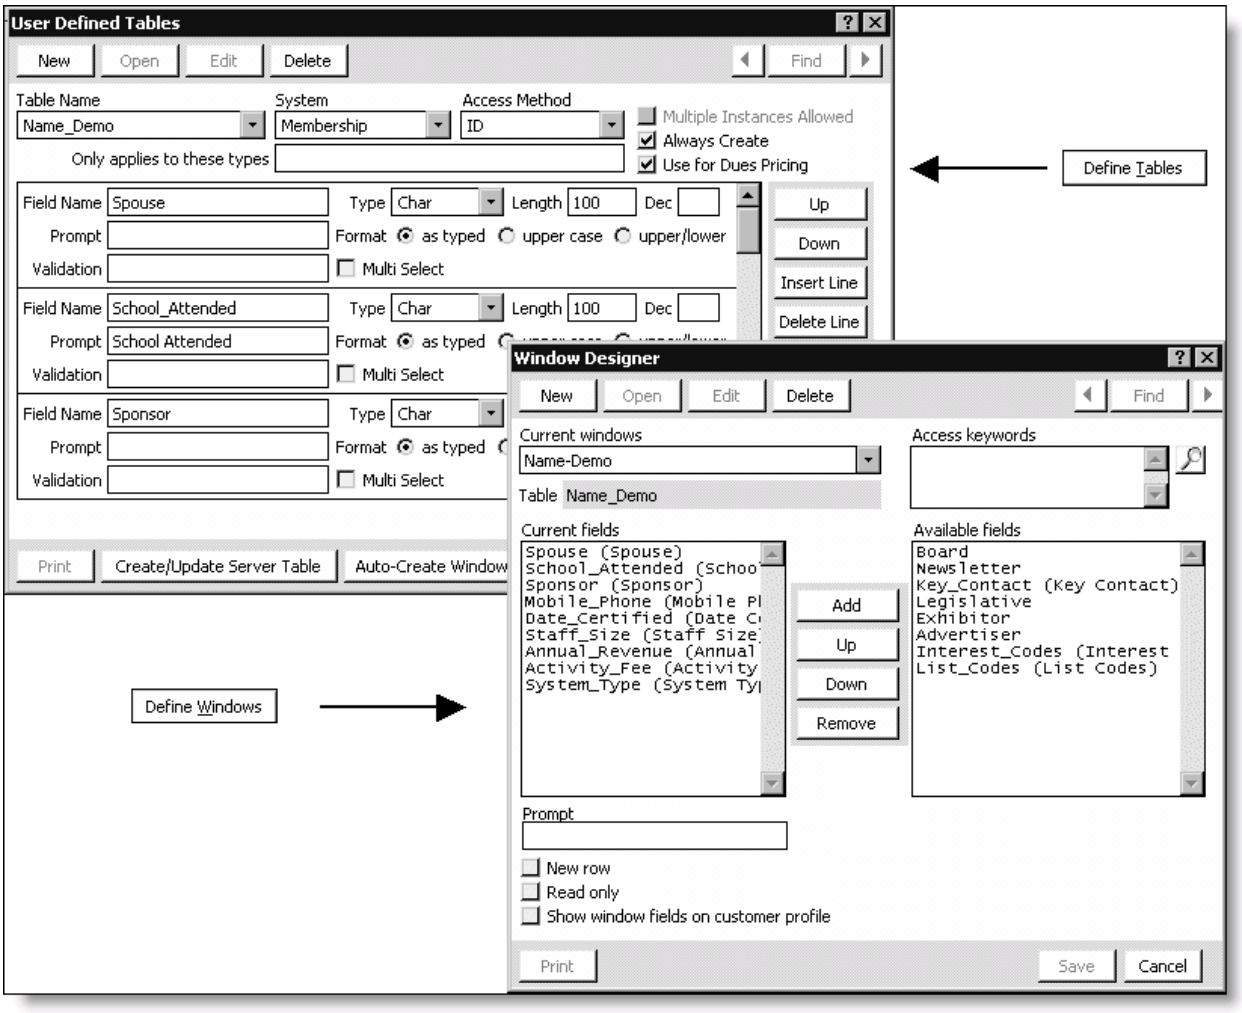
18. Restart iMIS and check for the custom tab you created.

    The next time a user starts iMIS, the newly created or edited custom tab appears in the Details pane of the Manage customers window, provided the following conditions are met:

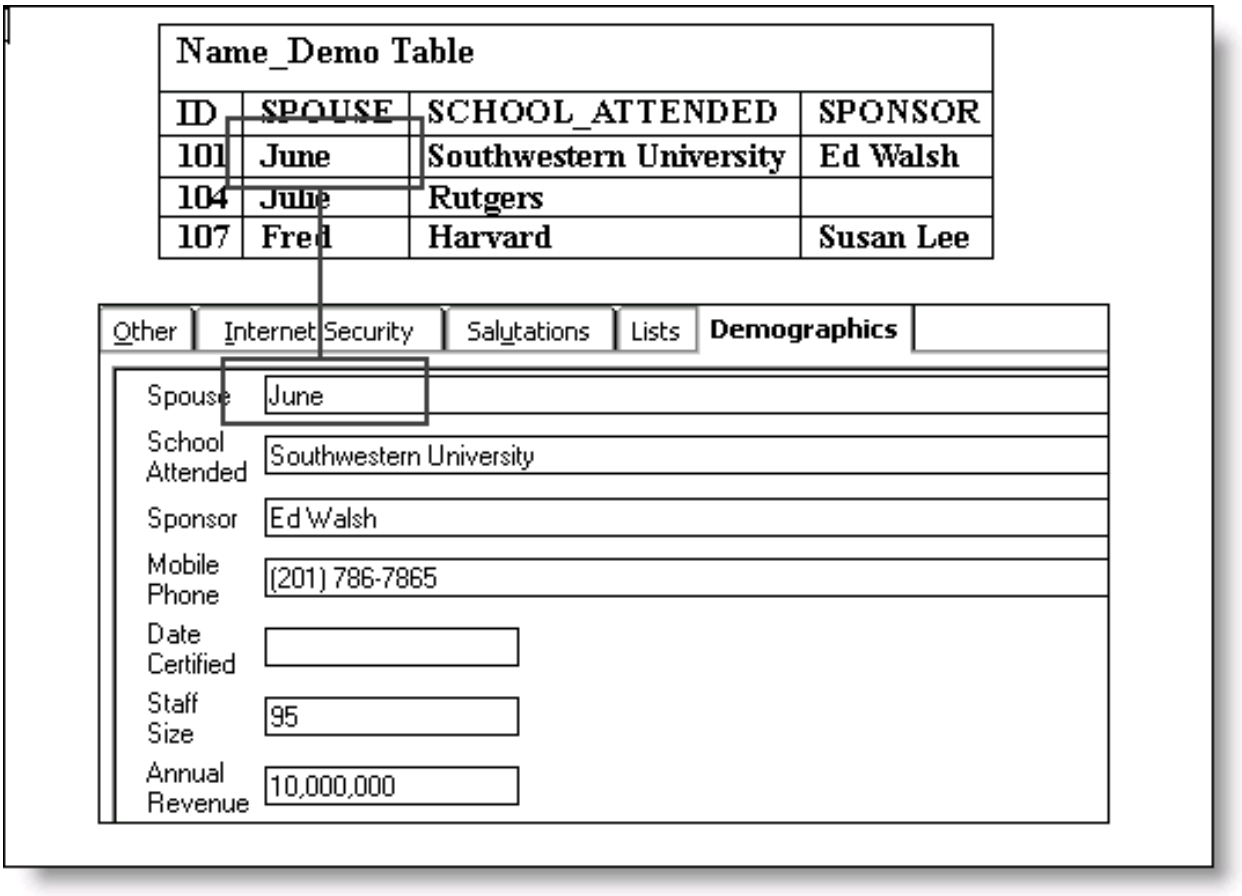
- The tab is included in the Visible Detail tabs list in the Customer Portfolio Tab Preferences window (as described in the previous step).
- The system administrator has added the custom tab to the default Tab Preferences profile, and the user does not have a customized personal Tab Preferences profile.
- If access keywords are assigned to hide the tab from unauthorized users, the system administrator has to assign the needed keywords to the user.

Reviewing the Customizer interface

The following diagram shows the iMIS Customizer windows that you access when you select Define Tables and Define Windows.



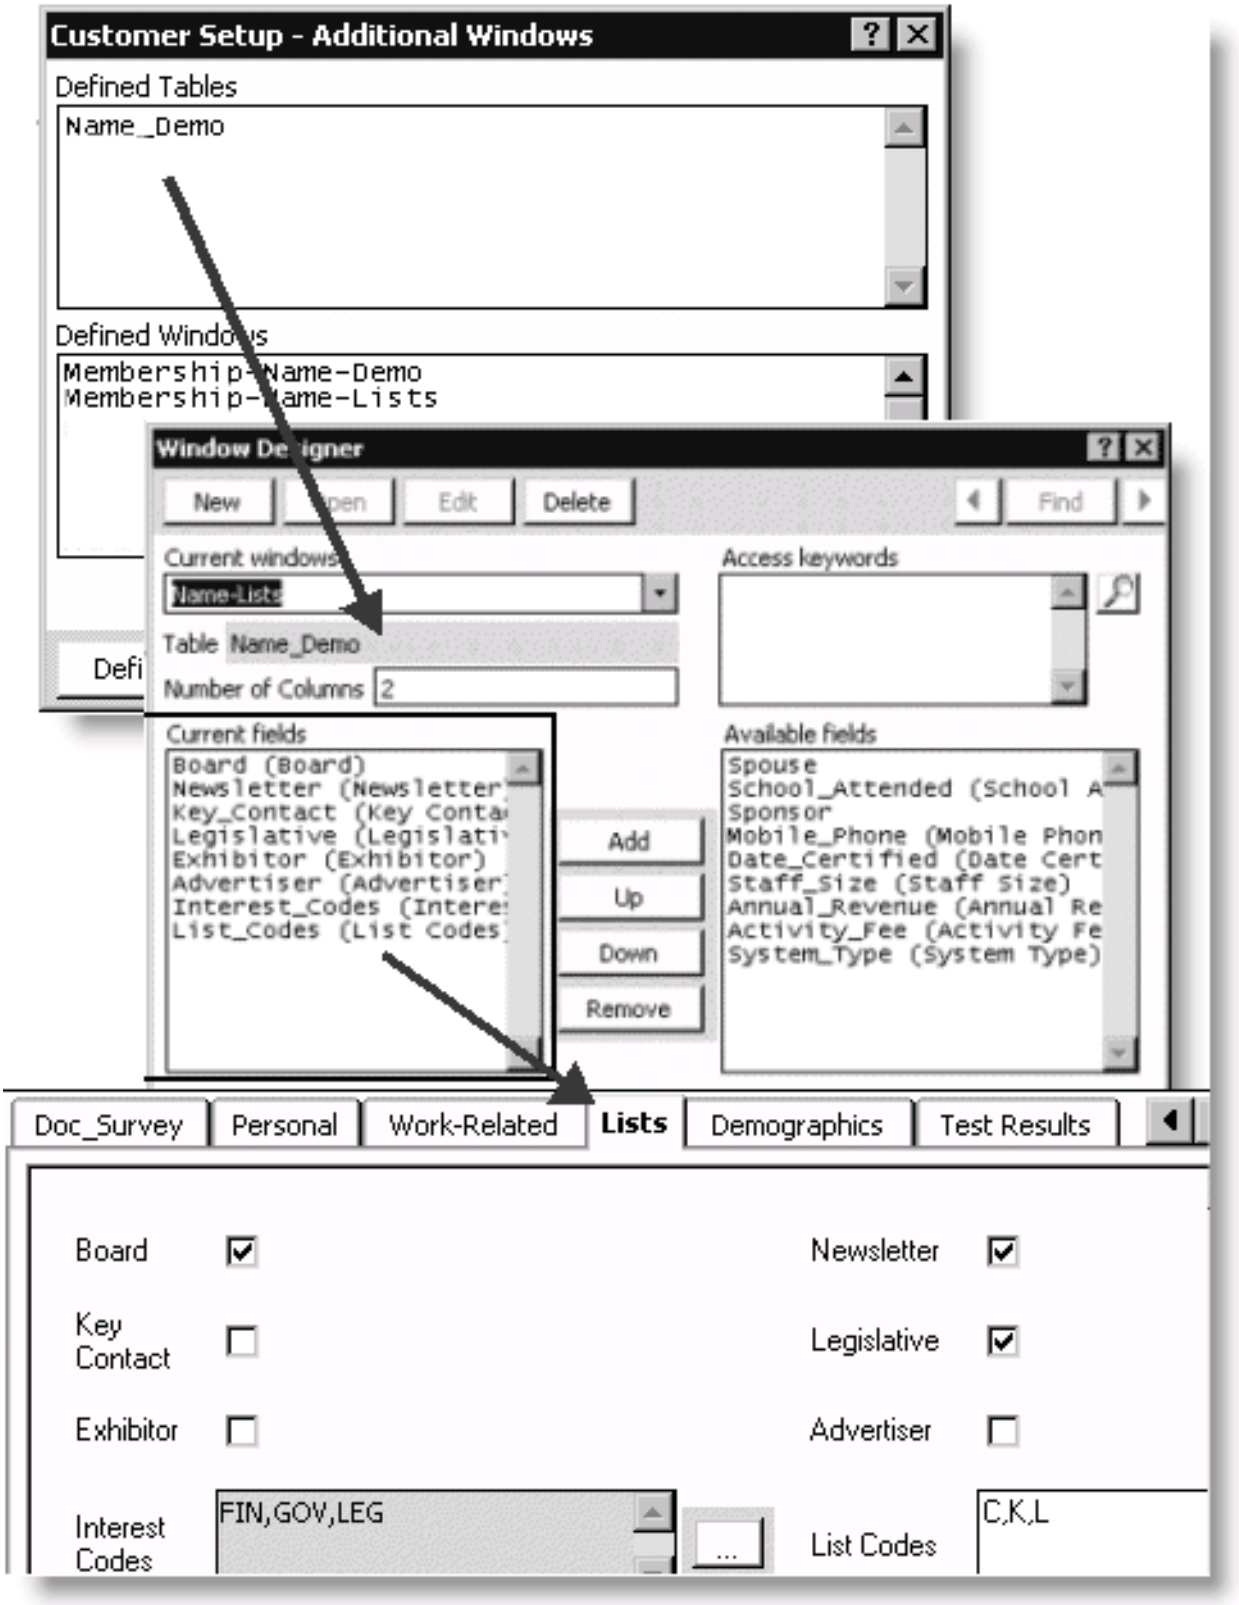
In the User Defined Tables window, we selected the Name_Demo table and defined the fields we wanted to use. When we created the user-defined Demographics tab, we chose the Name_Demo table, and selected only nine fields from the table to display in our Demographics tab.



When we enter data in the Demographics tab, the Name_Demo table stores the data, and the Demographics tab displays the data.

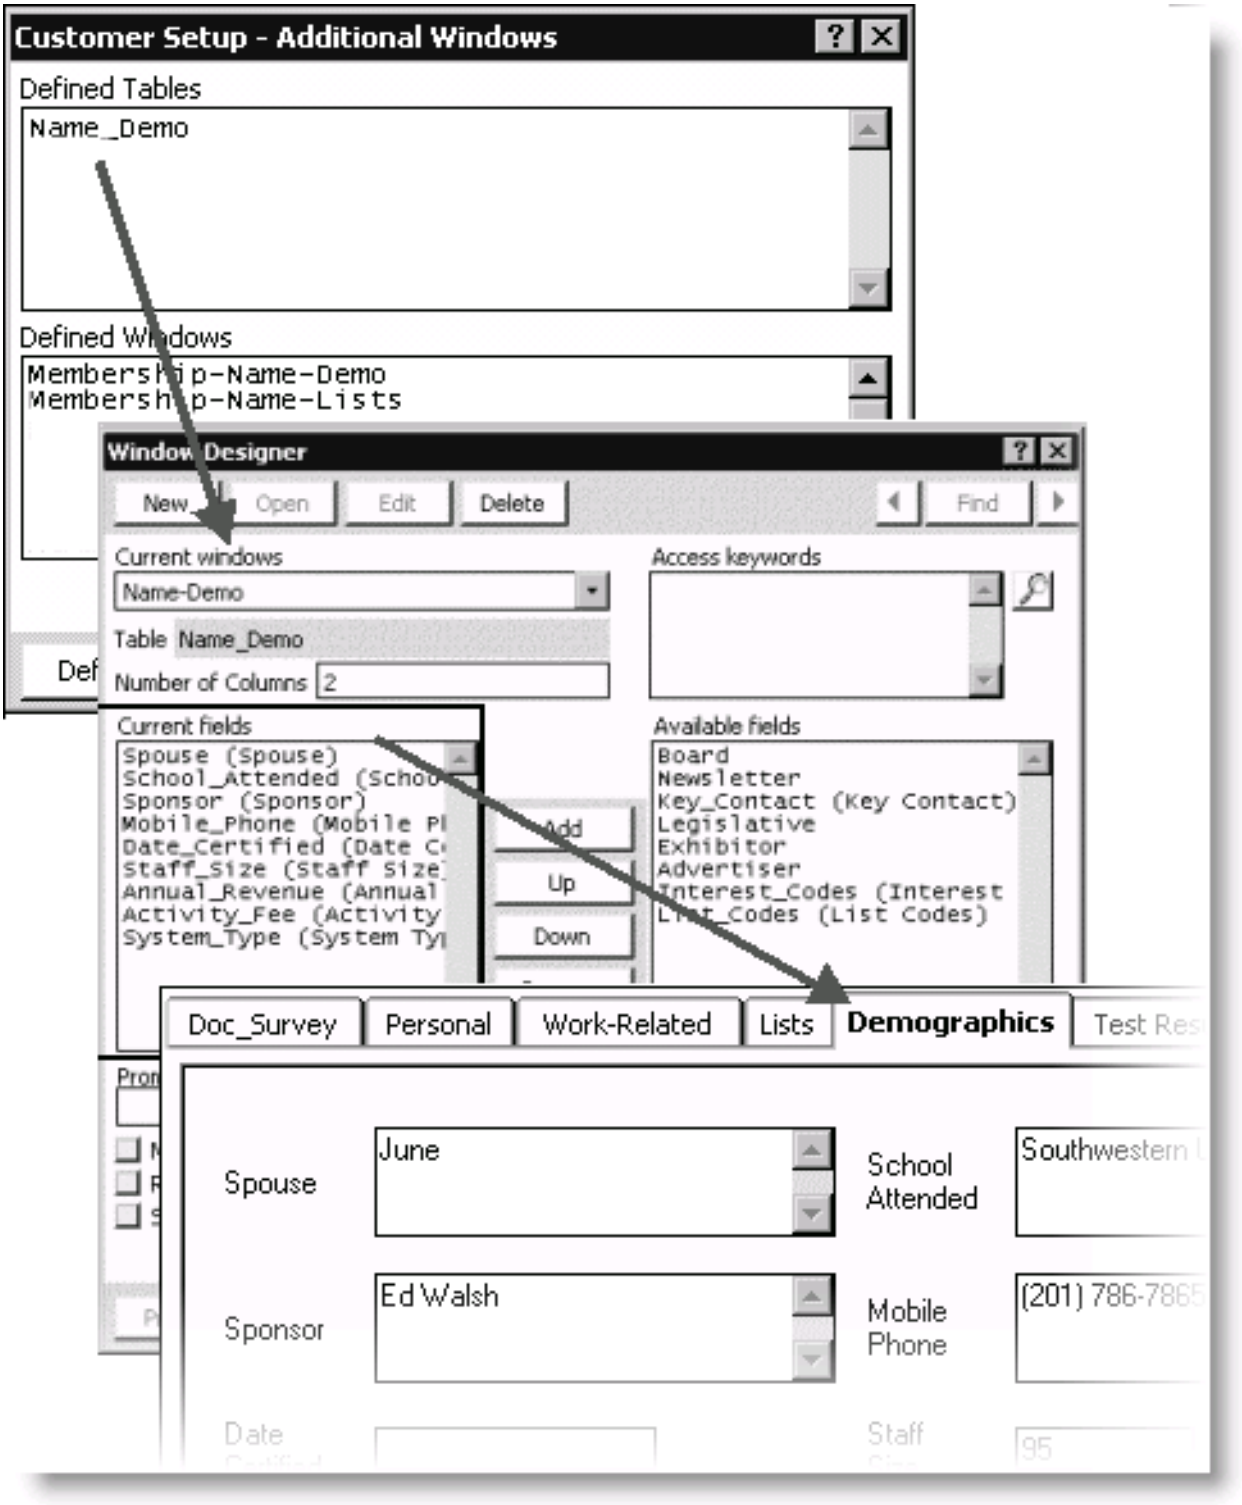
Sample user-defined tabs

The following example illustrates how the data fields in the Name_Demo table were used on the Name-Lists window to create the user-defined Lists tab.



Sample Lists window tab

The following example illustrates how the data fields in the Name_Demo table were used on the Name-Demo window to create the user-defined Demographics tab.



Sample Demographics window tab

Entering user-defined data

Before you begin, make sure you followed the instructions in Creating a User-Defined Table and in Creating a User-Defined Tab.

> **Note:** Note: This is available only in Desktop.

To enter single-instance, user-defined information

1. From Customers, select Manage customers to open the Manage customers window.
2. Open the customer's record.
3. Select the specific tab, and enter the appropriate data.

   Note: To select values for a field defined as a Multi Select field (for example, the Interest Codes field in the sample Lists user-defined tab), click the Select Values button located to the right of the field to open the Select Values – Web Page Dialog window.
4. Click Save to save the data.

To enter multi-instance, user-defined information

If you use the first field on a multi-instance tab as a key field, the first field must have a Type equal to Char and a general lookup/validation table. This field acts as the key field that allows you to stack data. For example, you may have a questionnaire that is distributed to customers, and you want to track responses for each occurrence. The questionnaire would be entered one time for each ID and could be tracked by the distinct name (key field).

> **Note:** Note: When creating a general lookup/validation table for a multi-select field in a user-defined table, the Description field on the Set up general lookup/validation window must contain a unique value for each Code.

1. From Customers, select Manage customers to open the Manage customers window.

2. Open the customer's record.
3. Select the specific tab in which you want to enter data.
4. Place your cursor in the first field of the bottom (empty) row. A drop-down list will display.

   Note: To select values for a field defined as a multi-select field, click the drop-down arrow on the field to open the Select Values window.
5. Select a value. Repeat this step for each additional field in the row.
6. Click Save.

To edit a multi-instance, user-defined record

1. From Customers, select Manage customers to open the Manage customers window.
2. Open the customer's record.
3. Select the specific tab that you want to edit.
4. Place your cursor in the field that you want to edit. A drop-down list will display.
5. Expand the drop-down list, and select a value. Repeat this step for each additional field you want to modify.
6. Click Save.

To view a multi-instance, user-defined record

1. From Customers, select Manage customers to open the Manage customers window.
2. Open the customer's record.
3. Select the tab containing the record you want to view.

To delete a multi-instance, user-defined record

1. From Customers, select Manage customers to open the Manage customers window.

2. Open the customer's record.
3. Select the tab containing the record you want to delete and use one of the following methods:

- Select the entire row in a tab and press the Delete key on your keyboard. If you select this method, the entire row of data is deleted from the tab from which you are performing the delete, as well as any other customer tab that contain those fields.
- Select the data in a field and press the Delete key on your keyboard. If you select this method, only the data from the field you select is deleted from the tab from which you are performing the delete, as well as any other tab using the field.

4. Place your cursor in the field containing the data to be deleted. A drop-down list will display.
5. Expand the drop-down list, and select an empty (blank) value from the bottom of the list. Repeat this step for each field in the record that you want to delete.
6. Click Save.

   Note: When deleting data from multi-instance tab, a data row is not permanently removed from the database until all the fields for the multi-instance table are deleted, either by selecting and deleting an entire row or blanking data from a field.

Viewing data on multiple-instance, user-defined tabs in non-grid format

You can view or enter/edit data in a multi-instance, user-defined tab in a non-grid format by opening a window for a specific row in the data grid. The row-specific data window displays if you double-click on an empty data grid row.

If you have permission to edit the values in the data grid, you can edit values in the row-specific data window. Any values changed in this window are automatically updated in the corresponding data grid rows when you click OK on this window. If you click Cancel, any values changed in the window will not be transferred to the corresponding grid row.

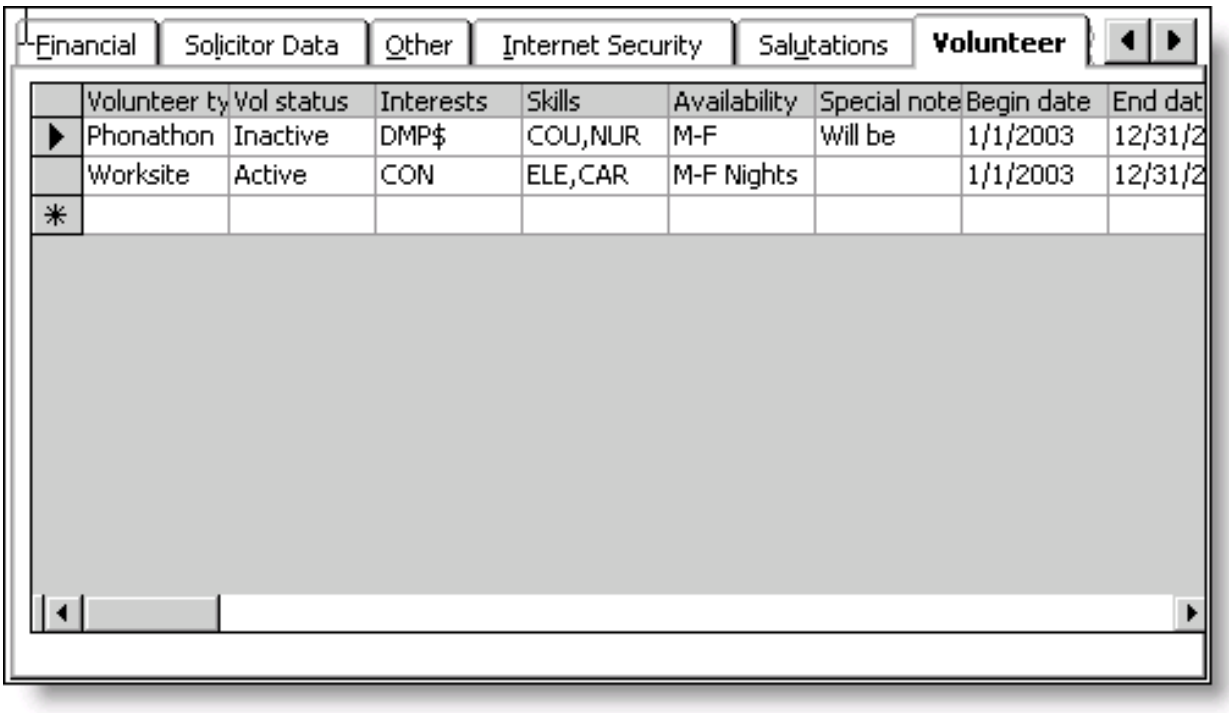
If you have permission to enter records in the data grid, you can enter new records directly in the row-specific data window. Records entered in the row-specific data window will be added to the data grid when you click OK.

Changes or additions made in the row-specific data window are not saved to the database until you click Save on the Manage Customers window.

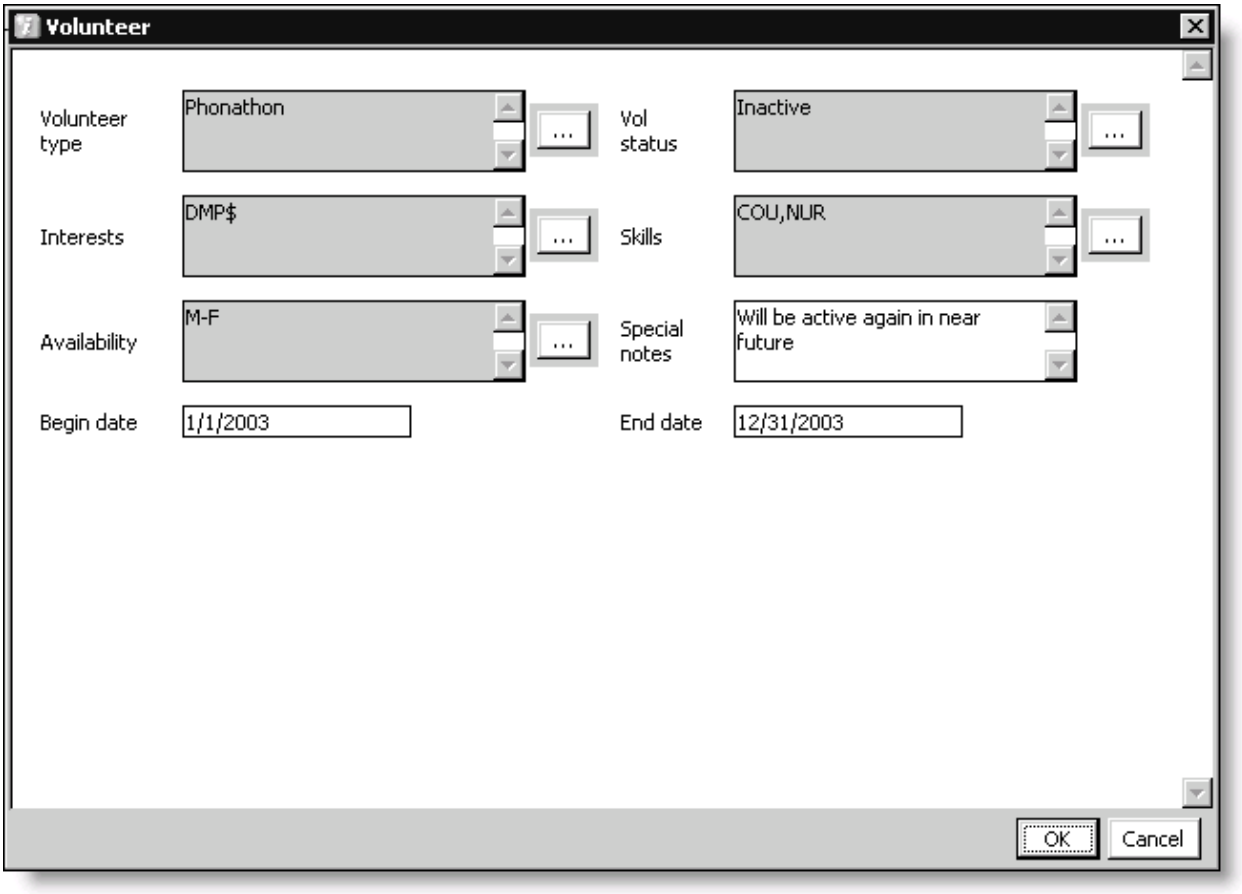
If the data grid is read-only, a record can be viewed in a row-specific data window, but the information in the window cannot be edited and you cannot enter new records in the window.

Validation of values entered in the row-specific data window uses the same logic as the validation of values entered in the data grid. Values entered in the row-specific data window are saved to the database after you click OK on the row-specific data window and then clicking Save on the Manage customers window.

Note: Note: This is available only in Desktop.



Example of user-defined tab (from Customers, find a customer record, then select the user-defined tab)



Example of the first row from the multi-instance user-defined tab shown in previous example displayed in a window format (in the data grid, double-click on the gray box located to the left of the row you want to view)

To view data on multiple-instance, user-defined tabs in a non-grid data window

1. From Customers, click Find and open a customer record.
2. Select the multiple-instance, user-defined tab.
3. Double-click on the gray box located to the left of the row you want to display in a non-grid data window.
4. Click Cancel to close the non-grid data window.

To edit data on multiple-instance, user-defined tabs in a non-grid data window

1. From Customers, click Find and open a customer record.
2. Select the multiple-instance, user-defined tab.
3. Double-click on the gray box located to the left of the row you want to display in a non-grid data window.
4. Make any changes to fields in the window.
5. Click OK.
6. Click Save on the Manage Customers window.

Viewing read-only fields in user-defined windows

Tooltips make it easier to view read-only data in multi-select and text fields in user-defined tabs.

Note: Note: To display user-defined tabs, you must add the tab to the list of visible tabs on the Customer Portfolio Tab Preferences window (from Customers, select Manage customers, then right-click on a tab and select Edit Tab Preferences or press Ctrl+T).

Note: Note: This is available only in Desktop.

Limiting access and/or hiding tabs

iMIS allows you to limit user access to confidential information on a user-defined or custom tab. You can restrict access to information and limit data entry and editing to only authorized users by setting access authorization levels (see "Access security levels") in iMIS.

Note: Note: This is available only in Desktop.

To implement the iMIS security measures, you must perform the following steps:

1. Create the ACCESS_KEYWORDS lookup table.
2. Assign access keywords to user-defined or custom tab.
3. Assign access keywords to users.

To create access keywords

The first step in implementing security measures is to create the ACCESS_KEYWORDS lookup table for the user-defined or custom tab. The access keywords for your tab should include the reserved keyword HIDDEN and a code for each tab.

> **Note:** Note: HIDDEN is a reserved keyword that, when used with an access keyword for a tab, hides the tab to all users who have not been assigned the access keyword.

1. From Customers, select Set up tables > General lookup/validation tables to open the Set up general lookup/validation window.

   Note: Unlike other general lookup/validation tables, users must have an authorization level of 8 or higher to edit ACCESS_KEYWORDS.
2. Select (New Table) from the list of table types. The New Table Type window opens.
3. Enter ACCESS_KEYWORDS in the data entry field, and click Save to return to the Set up general lookup/validation window.
4. Click New.
5. Enter the Code and Description for the access keyword(s). The security for the customized windows is managed by the name of the tab; therefore, the Code entered should reflect the name of the user-defined or custom tab.
6. Click Save. Repeat the process for each additional access keyword.
7. Restart iMIS.

To assign access keywords to user-defined or custom tabs

User-defined or custom tabs can store detailed information about your customers such as annual salary, major gifts, and political affiliations. However, you might not want all system users to view this information or to enter or edit information in the tab.

iMIS allows you to assign access keywords that allow only certain users to view or to enter and edit information on user-defined or custom tabs. You can apply the access keywords on a tab-by-tab basis.

1. Create the tabs' access keywords in the ACCESS_KEYWORDS lookup table.
2. From Customers, select Set up module> General, and click Additional Windows to open the Customer Setup – Additional Windows window.

- For a user-defined tab, click Define Windows to open the Window Designer window.
- For a custom tab, click Custom Tab to open the Custom Tab Designer window.

3. Select the user-defined or custom tab.
4. Enter the Access keywords. (Select the Find icon to open the Select ACCESS_ KEYWORDS value(s) window, and select from the available access keywords.) You can assign access keywords in three ways:

- Assign one or more access keywords to the tab, but do not assign the reserved keyword HIDDEN. In this case, all users will be able to see the tab, but only those with one of the access keywords will be able to enter and edit information on the tab.
- Assign both the reserved keyword HIDDEN and one or more access keywords to the tab. The tab will be hidden from all users except those who have one of the access keywords for the tab.
- Assign neither the reserved keyword HIDDEN nor the access keyword to the tab. In this case, everyone will be able to see the tab as well as enter and edit information on it.

5. (Using the Find icon/Select ACCESS_KEYWORDS value(s) window only) Double-click keywords to move them from the Available to the Selected field on.
6. (Using the Find icon/Select ACCESS_KEYWORDS value(s) window only) Click OK.

   The keywords selected display in the Access keywords field on the window.

7. Click Save to save the information.

   If you have assigned access keywords to a tab, follow the steps in the following section to give the appropriate users permission to view, enter, and edit information on a tab.

   To assign access keywords to users

   Now that you have defined the ACCESS_KEYWORDS values and assigned the keywords to the tabs, you are ready to assign access keywords to the individuals who will be using the tabs.

   If a multi-instance tab has an access keyword associated with it, only users that have the matching access keyword and a Customers authorization level of three or higher will be permitted to edit the tab; the tab will display in read-only mode for users who do not have the matching access keyword.

   You may limit user access to information in the Customers feature of the Desktop view.

   > **Note:** Note: You must create access keywords before you assign them to user records.

1. Log on to iMIS as MANAGER.
2. From System Setup, select Security administration > Users.
3. Find a Full or Casual user and open their user record.
4. In the bottom half of the User Access area of the Users window, enter one or more access keywords in the Access Keywords field, or click the Find icon to select keywords.

   Note: If you create access keywords and apply them to specific areas in Customers, but do not specify the keywords in a user record, that user cannot enter or edit information in those areas of Customers.

5. Click Save.

   Exit and restart iMIS Desktop.

Access security levels

0 – No Access	Menu item is grayed (under File Menu)	Module does not appear on the menu	Module does not appear on the menu	Module does not appear on the menu	Module does not appear on the menu
1 – Basic Display Only	Module appears on the menu System set up options are enabled	Module appears on the menu. Main display window enabled with other options grayed. **The Delete function is enabled only if the Allow Delete from Customer Portfolio option is enabled on the Customer Setup - Basic Options window (from Customers, select Set up module> General, and click Basic Options).

SQL reserved words

Do not use iMIS table or field names or SQL reserved words for user-defined tables and field names. Examples of reserved words for SQL Server include CLOSE, MANUAL, and VISIBLE.

Using iMIS or SQL reserved names may overwrite crucial existing tables and fields. Refer to the Microsoft SQL Server documentation for the SQL reserved keywords.

Customizer tips

The following are tips or useful information that help you create user-defined or custom tabs.

Troubleshooting user-defined or custom tabs

To make sure the user-defined or custom tabs are created properly, these pre-requisites must be in place.

1. Make sure all users exit iMIS before creating or modifying a tab.
2. You must have an authorization level of Customers level 8 to create a tab, (see "To create custom tabs") so either log on as a user with that authorization level or log on as MANAGER before creating a tab.
3. Back up your data before creating or modifying a tab.
4. Make sure the field or tab does not have the same name as any table/field in iMIS or any SQL reserved word (see "SQL reserved words").

   Unique table and field names

   When creating a user-defined table, you must use unique tables and fields. You cannot use an iMIS table name, an iMIS field name, or a SQL reserved word.

   > **Note:** Tip: To ensure unique naming, prefix acronyms to tables and fields you create. For example, organization ABC could define tables in the form ABC<TableName>; so, a table for the Discovery Conference could be ABC_DiscoveryConference, and its Name field could be DC_NAME.

   Limits for fields and window tabs

   There are no technical limitations on the number of fields for each user-defined tab; however, if a tab contains more than 50 fields, the tab becomes cluttered. This design may prevent users from viewing some fields.

   To see a list of the user-defined tabs displays in the Customer Setup – Additional Windows window, from Customers, select Set up module> General, and click Additional Windows. This menu can display up to 20 tabs. If your tabs exceed this amount, consider consolidating the data so fewer tabs are needed.

   The maximum length for a character field in a tab is 255 characters. If you define a field with over 255 characters, the data type becomes a Text data type.

User-defined fields in iMIS special pricing

If you have a user-defined field that contains a year and would like to use it in special pricing, you can use the datepart function. In the following example, the field is Name_Custom.MEMBER_YEAR. It is a character field with a length of four. Add the field to the Name_All view, and you can use this calculation in special pricing:

```
If Name_All.MEMBER_YEAR >= datepart (year,Today(*))
Then 100
Else 200
Endif
```

The datepart function in this example takes the year from the current date, Today(*). The IF statement compares the current year to Name_All.MEMBER_YEAR, resulting in customers being charged 100 if the MEMBER_YEAR is greater than or equal to the current year, or 200 if the MEMBER_YEAR is less than the current year.

Troubleshooting Customizer

The following are solutions to problems you may experience while creating user-defined or custom tabs:

- Problem: Tab not retaining data

  This is caused when the tabs get out-of-sync with the database, usually because more than one person was logged on while the tab was being created or edited.

  Solution: Make sure all users exit iMIS before creating or editing a tab. Edit the field or tab, change it back to activate the Save button, and then save the field or tab.

- Problem: Data not displaying correctly

  Solutions: If the data in a tab is not displaying correctly, verify the following solutions.

1. Delete and recreate the tab if the tab definition has not changed since the data was added, but fields were moved around in the tab.
2. No one was logged into iMIS when the table and tab were defined. Make a minor change to the table and tab (move fields up and down), and save.

3. Close iMIS after updating tables or tabs.
4. Run a query to determine if the data has been saved in the user-defined table but is not displaying in the tab.

- Problem: Validation table (the lookup feature) does not display for a custom field

  Solution: Make sure the validation table exists. Refresh the iMIS libraries.

Customer System Maintenance

Note: Note: This is available only in Desktop.

Permanently deleting customer records

You can permanently delete iMIS customer records using two different methods:

- Permanently delete individual records (select the record in Manage Customers and click Delete) or
- Mark the record for deletion to be deleted at a later time by selecting the record in Manage Customers and changing the status to Marked for deletion. This will mark the record in the database with a status of D. You must then run the appropriate script for your database to permanently remove these customer records.

  iMIS does the following when you run a script to permanently delete customer records marked with a status of D:

- A record is added to the Name_Log table. The record will have the following values: Date/Time,CHANGE,DELETE,GUEST,id,last_first,company
- The Activity table is updated. For every customer record that is deleted, all of that customer's activity records will have the ID set to ''.
- All references to deleted customers are removed from user-defined tables.
- All records for deleted customers are removed from the following tables:
- Name

- Name_Address
- Name_Fin
- Name_Note
- Name_Picture
- Name_Indexes
- Name_Security
- Name_Security_Groups
- Prospect
- Subscriptions

There are certain cases when the customer record will not be deleted:

- The customer has open orders. The script checks for the following field values in the Orders table:

  ID = ID to be deleted and

  STAGE <> "CLOSED" and STAGE <> "CANCELLED" and

  STAGE <> "COMPLETED"

- The customer has an outstanding invoice balance. The script checks for the following field values in the Invoice table:

  BT_ID = ID to be deleted and BALANCE <> 0

- The customer has active subscriptions. The script checks for the following field values in the Subscriptions table:

  STATUS LIKE 'A%'

- The customer has an entry in the Referral module, and this customer owes money. The script checks for the following values in the Referral table:

  PROVIDER_ID = ID to be deleted and

REFERRAL_FEE > 0 and READY_TO_INVOICE = 1 and ORDER_NUMBER = 0

- Deleting this customer will leave orphaned records. Examples of orphaned records include the following:
- Name record with a Bill_TO ID, where the Bill_To ID no longer exists.
- Name record with a Company_ID, where the Company_ID no longer exists.
- Name_Fin record, where the Bill_To ID no longer exists.
- Cert_Register records, where the Bill_To ID no longer exists.

  For example, if ID 110 and 200 both have Cert_Register records with 110 as the Bill To Id, and ID is marked for deletion, and ID 200 isn't, ID 110 won't be deleted since that would leave ID 200 with a non-existent Bill To ID.

  To permanently delete a customer record (SQL database)

  Use the following instructions to permanently delete a customer record that has been marked for deletion (records in the database with a status of D). You can also run the Purge_MSSQL7.zip file available in the Tech Support Download area of the ASI website.

  > **Note:** Note: This procedure will only delete entries from Client Server tables. To remove entries from .NET tables, you need to use the DB Maintenance tool. See "Purging user and contact records".

1. Select Utilities> Reports and Queries to open the System Reports and Queries window.
2. Select the Purge report type.
3. Select the Membership Purge for MS SQL report for you database.
4. Click Run. A message displays asking you to confirm the deletion.
5. Click Yes.

Customer record database schema

The main contact-related tables within the iMIS database are Name, ContactMain, Individual and Institute. All basic contact information defined in customer portfolio is stored in the Name table and duplicated to the other three tables, depending on what kind of record it is (Individual, Institute or Combo*). ContactMain, Individual and Institute are often used in iMIS web features (Process Manger, Marketing Suite, WCM, etc.). For each row in Name, there is usually one row in ContactMain and one row in either Individual OR Institute. For a combo record* however, for each row in Name there are two rows in ContactMain (one for the individual and one for the institute), one row in Individual AND one row in Institute. The only place this difference surfaces is when using the NetContact business object as a source within IQA .

Over time, your database may end up with orphaned rows in the ContactMain, Individual and Institute tables. This can happen when a record type changes from an individual to an institute, or when a record has been deleted within iMIS Desktop. These orphaned records do not interfere with the application, as their references back to the original contact are removed and they are updated to have a status of 3 (deleted). But from time to time you may want to purge these orphans. If you wish to do so, refer to the section Purging user and contact records. Note that if an orphaned record is still in use (e.g. Updated By/Created By fields in iMIS web modules), then it cannot be purged.

*What is a combo record?

A combo record is a Company record that also contains a first or last name. This case will only occur if customer portfolio is not set to Suppress Individual Name Fields for Company Records (see Customer Setup - Basic Options window for details.)

Troubleshooting iMIS

Shortcut limitation with multiple instances

If you are using a Windows shortcut to access iMIS and you are opening multiple instances of the Manage customers window, you may encounter an Omnis error. If this happens, consult with your administrator.

This error appears to be related to the length of the target path shown in the shortcut.

Workaround
